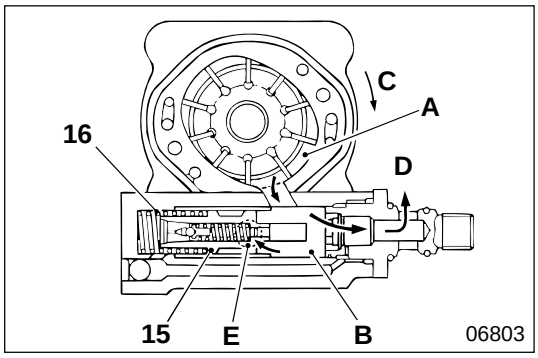
(1) When not operating (Oil pump rotating at low speed)

Since pressure generated from pressure chamber **A** is low when the oil pump is rotating at low speed, fluid pressure in chamber **B** is also low. Therefore, relief valve assembly **15**, which is pressed by the repercussive force of flow control spring **16** is not activated.

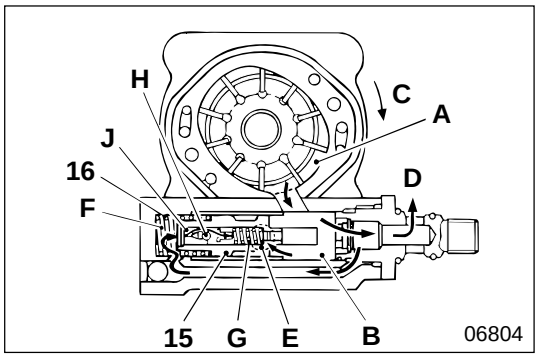
C : Direction of rotation

D : To the power steering booster



(2) When operating (Oil pump rotating at middle or high speed)

Since pressure generated from pressure chamber **A** is high when the oil pump is rotating at middle or high speed, fluid pressure in chamber **B** is also high. This will activate relief valve assembly **15**, overcoming the repercussive force of flow control spring **16**, and open port **E**, making excess fluid return to the inlet port to adequately regulate the flow of fluid to power steering booster **D**.



● **Operation of relief valve**

When the steering is lock-to-lock, pressure in chambers **B** and **F** increases and overcomes the repercussive force of relief spring **G** opening relief valve **J**, which was closed by steel ball **H**, causing the fluid to be returned to the inlet port through port **E**. Thus, if pressure in chamber **F** decreases, the relief valve closes again.

Possible causes \ Symptoms		Steering wheel operation heavy	Steering wheel play excessive and unstable	Steering wheel pulls to one side	Steering wheel vibration	Steering wheel self-return bad	Steering wheel does not turn	Steering angle insufficient or difference between right and left	Fluid leaking	Oil pump fluid pressure abnormal	Oil pump gurgles	Oil pump squeaks	Oil pump growls	Remarks

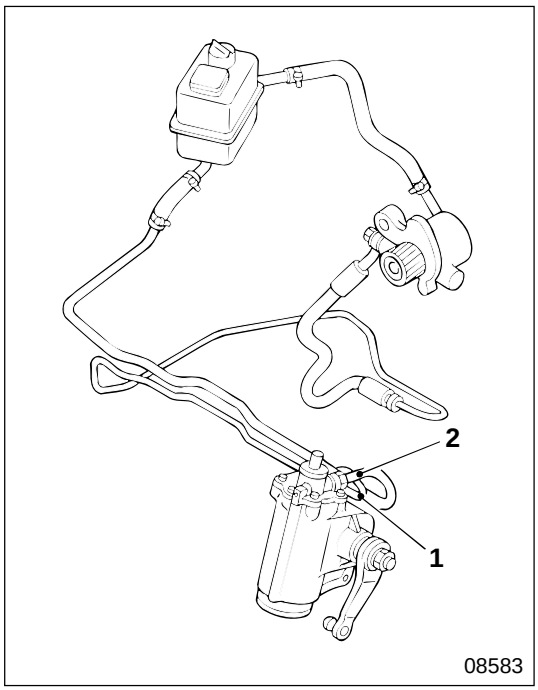
Change of Power Steering Fluid

Tightening torque

Unit : N·m {ft.lbs, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
1	Pressure tube	29 to 39 {21 to 29, 3 to 4}	—
2	Return tube	39 to 49 {29 to 36, 4 to 5}	—



[Draining]

- Jack up the front wheels.
- Release pressure tube **1** and return tube **2** connected to the power steering booster.
- Turn the steering wheel fully left and right repeatedly, and drain the fluid from the power steering booster.
- After draining the fluid, tighten pressure tube **1** and return tube **2** at specified torque.

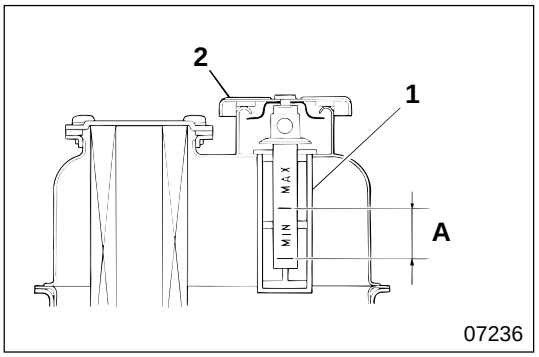
[Filling]

P37-12

Bleeding of Power Steering System

Fluid

Location	Points of application	Specified fluid	Quantity
—	Power steering oil tank	Automatic transmission fluid (DEXRON or DEXRON II type)	Filler cap dipstick between MIN and MAX



CAUTION

Do not keep the steering wheel turned fully to the left or right for more than fifteen seconds when the engine is running, as this can cause the power steering oil pump to seize up.

- Pour fluid into power steering oil tank up to the inner port of strainer **1**.
- With the engine stopped, jack up the front wheels and support with rigid racks. Turn the steering wheel fully left and right repeatedly. When the fluid level has dropped, add fluid to maintain the fluid level within range **A**.

NOTE

Check the fluid level without screwing on filler cap 2.

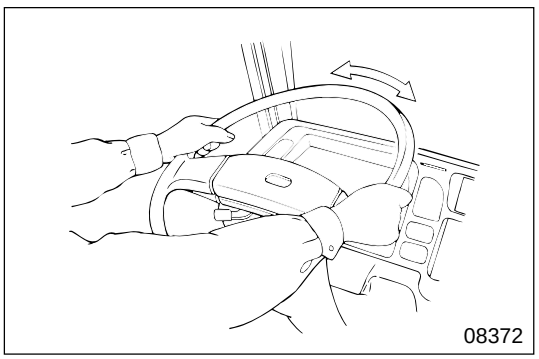
- Start the engine and letting it idle, turn the steering wheel fully left and right repeatedly. When the fluid level has dropped, add the fluid to maintain the fluid level within range **A**. Repeat these steps until the fluid level does not drop.
- If there is an abnormal noise, air is still in the system. Turn the steering wheel several times to raise fluid temperature to approximately 60 to 80°C {140 to 176°F}, then stop the engine and wait for approximately five minutes.
- Lower the front wheels and turn the steering wheel several times. If there is no noise, bleeding is completed.
- When bleeding is finished, check fluid level of power steering oil tank, and pipe and hose connections for fluid leaks.

Steering Wheel Play

Service standards

Unit : mm {in.}

Location	Maintenance item	Standard value	Limit	Remedy
—	Steering wheel play (Measure at the outer circumference of steering wheel)	0 to 50 {0 to 1.97}	—	Adjust

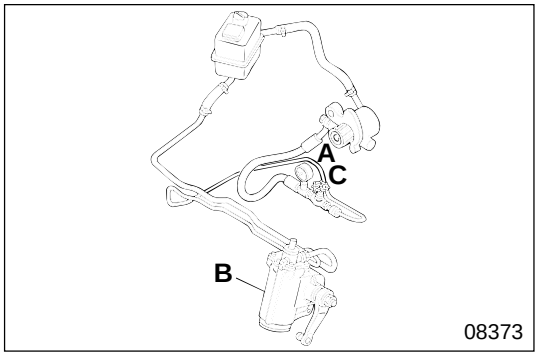


Point the wheels directly forward, start the engine and gently turn the steering wheel left and right to measure play at the outer circumference. If the play deviates from the standard value, adjust tightening points and power steering booster backlash. P37-26

Performance Verification Test of Power Steering System

Service standards

Location	Maintenance item	Standard value	Limit	Remedy
—	Steering system fluid pressure (With hands off steering wheel)	490 kPa {71 psi, 5 kgf/cm²}	—	Repair
—	Relief set pressure (Measure with engine speed at 1000 to 1500 rpm and stop valve closed)	9.3 MPa {1350 psi, 95 kgf/cm²}	Maximum +200 kPa {29 psi, 2 kgf/cm²} Minimum –300 kPa {43 psi, 3 kgf/cm²}	Replace



Verify that the power steering booster and the power steering oil pump are operating properly by testing the following items.

CAUTION

Do not keep stop valve C closed for more than fifteen seconds when the engine is running, as this can cause the power steering oil pump to seize up.

NOTE

If the fluid pressure is higher than 490 kPa {71 psi, 5 kgf/cm²} with engine idling and the steering wheel free, inspect power steering booster B and fluid circuit for clogging.

Test item	Test procedure	Assembly standards
Verification of smooth operation	Jack up the front wheels and support with rigid racks. Turn steering wheel fully left and right	Smooth operation throughout test
Measurement conditions	• Install oil pressure gauge **A** capable of measuring above 10.8 MPa {1570 psi, 110 kgf/cm²} and stop valve **C**, then bleed air and keep the stop valve opened. • With engine idling, turn steering wheel left and right several times to raise fluid temperature to 50 to 60°C {122 to 140°F} • Keep the engine idling, with opening stop valve **C** fully.	
Measurement of fluid pressure	• Measure fluid pressure with hands off steering wheel	490 kPa {71 psi, 5 kgf/cm²}
Measurement of relief pressure	• Gradually increase engine speed and maintain it at 1000 to 1500 rpm, and close stop valve **C** to measure maximum fluid pressure	Relief set pressure 9.3 MPa {1350 psi, 95 kgf/cm²}

Follow the removal sequence in reverse.

Tightening torque

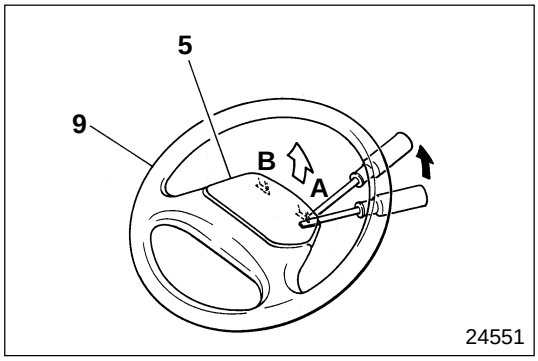
Unit : N·m {ft.lbs, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
6	Nut (Telescopic lever mounting)	8.8 to 9.8 {6.5 to 7.2, 0.9 to 1.0}	—
8	Nut (Steering wheel assembly mounting)	39 to 49 {29 to 36, 4 to 5}	—
14	Screw (Combination switch mounting)	2.5±0.5 {1.8±0.4, 0.25±0.05}	—
17	Head cutting bolt (Starter switch mounting)	14.2±1.5 {10±1.1, 1.45±0.15}	—
21	Nut (Steering column subassembly and power steering booster mounting)	53 to 65 {39 to 48, 5.4 to 6.6}	—
25	Bolt (Steering column at floor side mounting)	17 to 26 {12 to 19, 1.7 to 2.6}	—
26	Bolt (Steering column subassembly to instrument panel side mounting)	17 to 26 {12 to 19, 1.7 to 2.6}	—
28	Pressure tube	29 to 39 {22 to 29, 3 to 4}	—
29	Return tube	39 to 49 {29 to 36, 4 to 5}	—
31	Nut (Power steering booster mounting)	84 to 108 {61 to 80, 8.5 to 11.0}	—
33	Nut (Tie rod assembly mounting)	93±25 {69±18, 9.5±2.5}	—

Lubricant

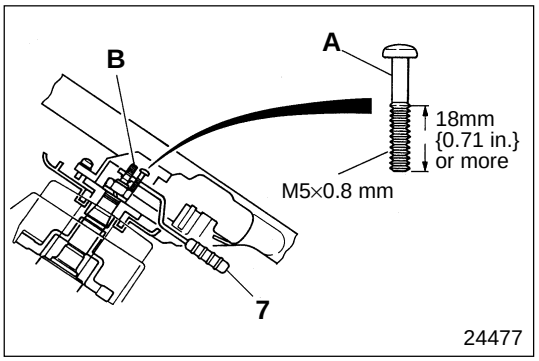
Location	Points of application	Specified lubricant	Quantity
12	Contact area between combination switch of cover assembly and horn contact	Wheel bearing grease [NLGI No.2 (Li soap)]	As required

◆ Service procedure



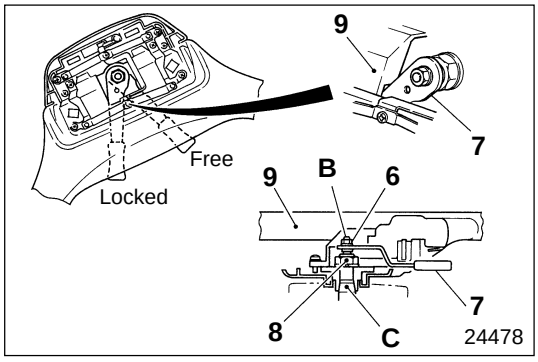
5 **Removal of horn pad**

- Insert a flat-tip screwdriver into the space between steering wheel assembly **9** and shoulder sections **A**, **B** of horn pad **5**, and disengage the latch by prying open the horn pad with the screwdriver until a clicking sound is produced.
- Insert fingers into the space behind lifted horn pad **5** and remove the horn pad.



7 **Telescopic lever**

[Removal]
Secure screw **A** (M5×0.8 mm) in tapped hole in telescopic lever **7** and remove telescopic lever from telescopic shaft **B**.



[Installation]
Make adjustment so that telescopic lever **7** positioned at the designated location applies the specified torque on telescopic shaft **B**.

CAUTION ⚠

Be careful not to damage the threads on the tip of telescopic shaft B.

C : Telescopic shaft assembly

Start procedure

Install steering wheel assembly **9**. Using a long socket wrench, tighten nut **8** at specified torque 39 to 49 N·m {29 to 36 ft.lbs, 4 to 5 kgf·m}

Rotate telescopic shaft **B** counterclockwise with your fingers and check for looseness

Looseness found

No looseness

Using a flat-blade screwdriver turn telescopic shaft **B** clockwise and drive it in until it hits lightly with a "clunk", but do not turn it any further

CAUTION

Be careful not to over tighten or you will crush the end of the telescopic shaft, requiring replacement of telescopic shaft assembly C

Install telescopic lever **7** at a location that allows easy tightening, then tighten nut **6** until the telescopic lever will not slip

Tighten telescopic shaft **B** at operating torque 6.9 to 7.8 N·m {5.1 to 5.8 ft.lbs, 0.7 to 0.8 kgf·m}. (Tighten telescopic bar **7** at torque 69 to 78 N {16 to 18 lbf, 7 to 8 kgf} at 100 mm {3.94 in.} from the center of steering wheel assembly **9**)

To maintain lock, hold telescopic lever **7** clockwise, then loosen and remove lock nut **6**

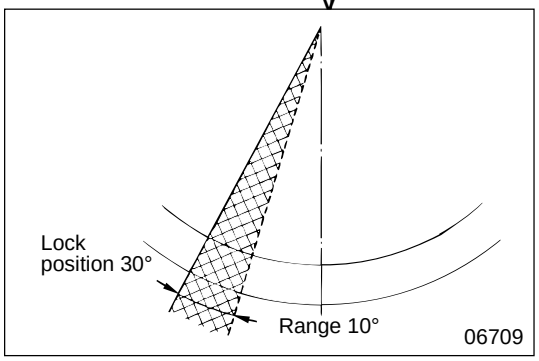
Remove telescopic lever **7**

NOTE

Remove telescopic lever 7 following the description under [Removal], taking care not to loosen telescopic shaft B.

Set telescopic lever **7** to specified lock position (within 10° before the position at which telescopic lever contacts steering wheel assembly **9**).

Tighten nut **6** at specified torque 8.8 to 9.8 N·m {6.5 to 7.2 ft.lbs, 0.9 to 1.0 kgf·m}



When telescopic lever **7** is released, and telescopic shaft **B** is retightened at operating torque 6.9 to 7.8 N·m {5.1 to 5.8 ft.lbs, 0.7 to 0.8 kgf·m}, the telescopic lever should lock in the 10° range this side of specified lock position 30°

Out of the range

Within the range

Jiggle steering wheel assembly **9** up and down and check for looseness

Looseness found

No looseness

Remove nut **6**

Procedure is completed

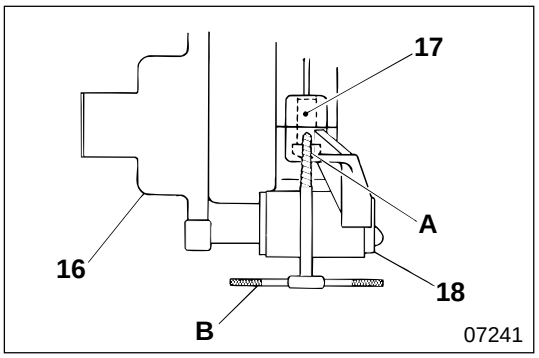
Remove telescopic lever **7**

CAUTION

Be sure not to operate telescopic shaft B while steering wheel assembly 9 is removed.

NOTE

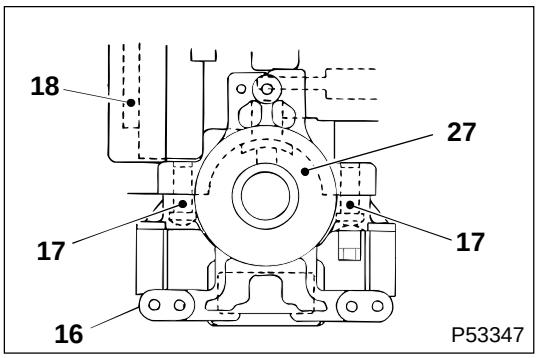
Be sure to assemble telescopic lever 7 only after steering wheel assembly 9 has been installed.



17 **18** **Head cutting bolt, starter switch**

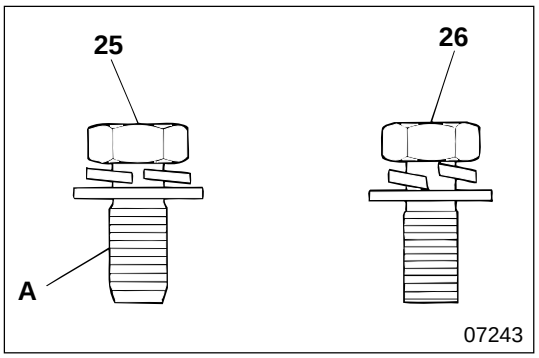
[Removal]

- After removing bracket **16**, drill a ø5.5 to 6.0 mm {0.22 to 0.24 in.} hole 10 to 15 mm {0.39 to 0.59 in.} deep on cutting face **A** of head cutting bolt **17** for mounting starter switch **18**.
- Screw in screw extractor **B** counterclockwise, then pull out head cutting bolt **17**.



[Installation]

- When install starter switch **18** on steering column assembly **27**, tighten new head cutting bolt **17** at specified torque to cut the head off the bolt.
- After installing bracket **16**, verify operation of the steering lock function of starter switch **18**.

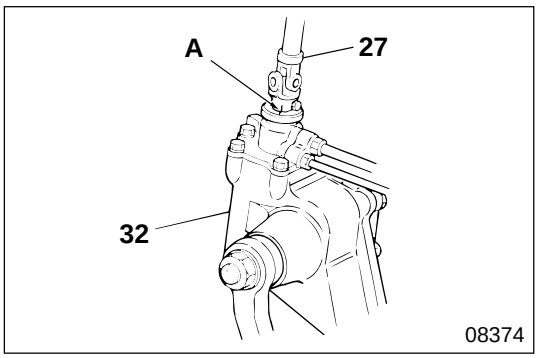


25 **26** **Installation of bolt**

Bolts **25** and **26**, differ in shape. Do not mix them up when installing.

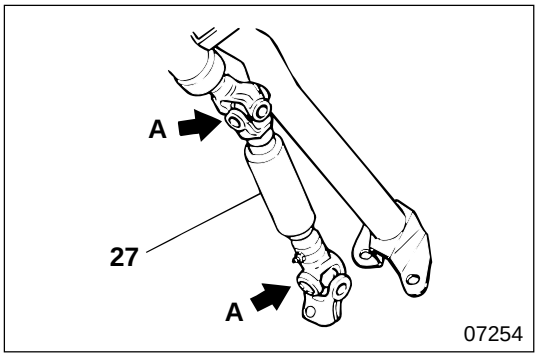
NOTE

Thread area A of bolt 25 is elliptical to facilitate grounding of the horn circuit.



27 **32** **Removal and installation of steering column subassembly and power steering booster**

Before removing steering column subassembly **27**, power streering booster **32**, be sure to make alignment mark **A**.



27 **Steering column subassembly**

When the spline of steering column subassembly **27** is disconnected, align the yokes to the same direction **A**.

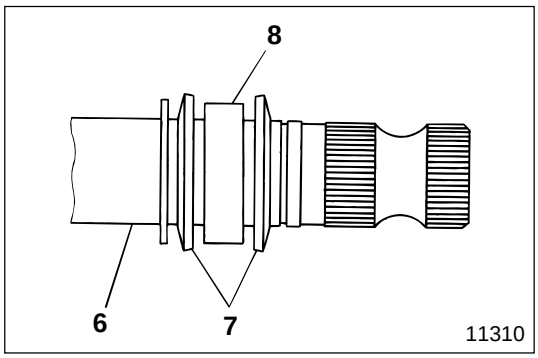
Lubricant and/or sealant

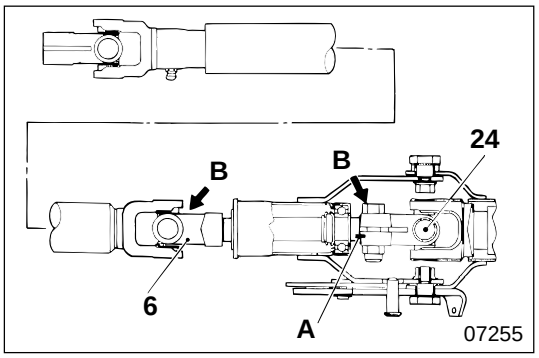
Location	Points of application	Specified lubricant and/or sealant	Quantity
9	Supply via grease nipple	Wheel bearing grease [NLGI No.2 (Li soap)]	As required
14	Friction surface of return spring and washer	Wheel bearing grease [NLGI No.2 (Li soap)]	As required
15	Friction surfaces of lever support and snap ring	Wheel bearing grease [NLGI No.2 (Li soap)]	As required
17	Friction surfaces of cam and lock plate return spring clevis pin	Wheel bearing grease [NLGI No.2 (Li soap)]	As required
22	Thread area of bolt	THREEBOND thread lock super 103Q or LOCTITE 271	As required
	Friction surface of column support upper and bolt	Wheel bearing grease [NLGI No.2 (Li soap)]	As required

◆ Service procedure



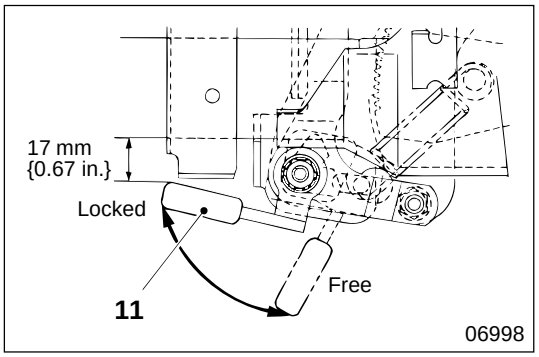
7 **Installation of stopper**

Install stoppers **7** on steering shaft assembly **6** in the direction as illustrated so that they straddle bearing spacer **8**.



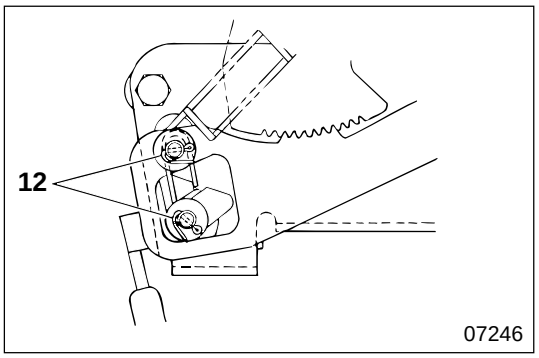
6 **Steering shaft assembly**

- Before removing steering shaft assembly **6**, be sure to make alignment mark **A**.
- Install the steering shaft with direction **B** of the telescopic shaft assembly **24** yoke and steering shaft assembly **6** yoke aligned or at phase angle of 90°.



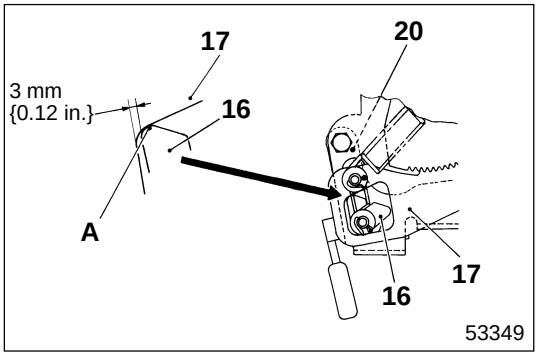
11 **Installation of lock lever**

- Install lock lever **11** so that it is stopped at the dimension position as illustrated when locked.
- After installing lock lever **11**, make sure that the lever operates smoothly (operating force less than 49 N {11 lbf, 5 kgf}). With the lever free, make sure that high tilt operates smoothly.



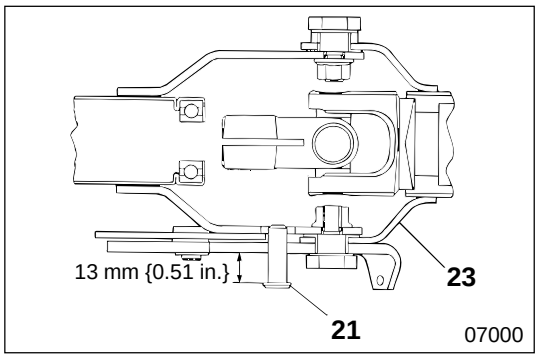
12 **Installation of split pin**

Bend split pin **12** to face outwards as illustrated.



16 **Installation of cam**

Adjust lever support **20** so that the top surface **A** of cam **16** is within the dimension of lock plate **17** to install the cam as illustrated.



21 **Installation of clevis pin**

Drive clevis pin **21** into column support upper **23** so that the drive dimension is obtained.

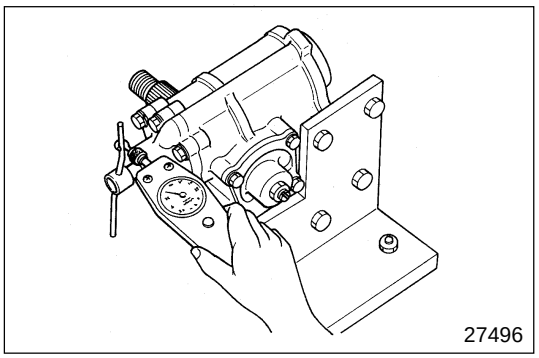
Special tools

Unit : mm {in.}

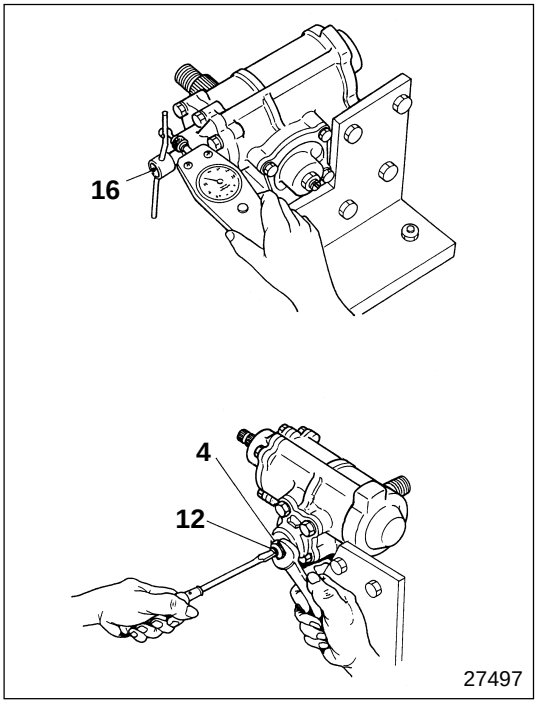
Location	Tool name and shape	Part No.	Application
2	Pitman arm puller 	MH062472	Removal of pitman arm

◆ Service procedure



● **Inspection before disassembly**

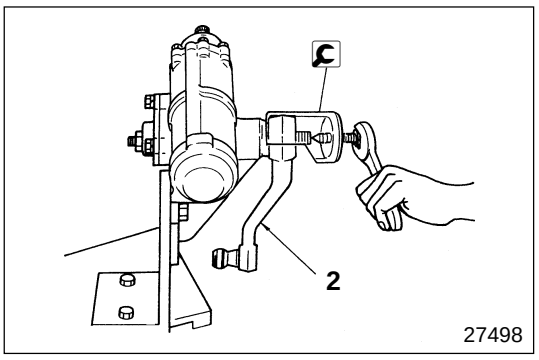
[Measurement of total starting torque]
Before disassembly, measure the total starting torque for a reference during assembly.



● **Inspection after assembly**

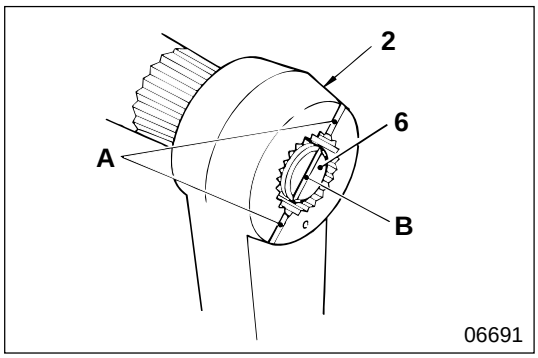
[Measurement of total starting torque]

- While turning ball screw set shaft **16**, one quarter of a turn left and right from the neutral position using a torque meter, drive adjusting bolt **12** in, then adjust so that the total starting torque or the engagement torque is within the standard value.
- After adjustment, tighten nut **4** at specified torque.

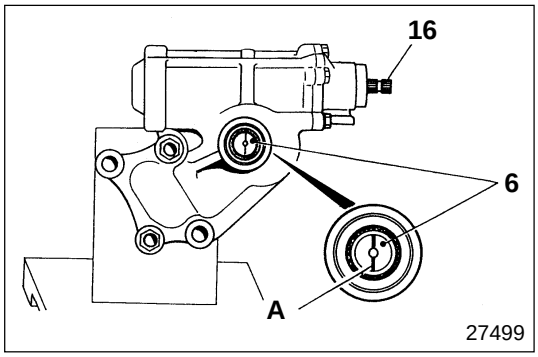


2 **Pitman arm**

[Removal]
: Pitman arm puller



[Installation]
Align slit **B** of the V-groove of sector shaft **6** on the same line as slit **A** of the V-groove of pitman arm **2** when installing it.



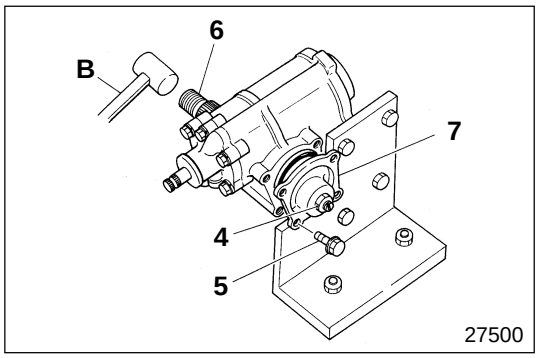
6 **7** **Sector shaft and side cover**

[Removal]

- Turn ball screw set shaft **16** counterclockwise to the lock position, then turn it clockwise approximately 2.6 turns, so that slit **A** of the V-groove at the end of sector shaft **6** is in the neutral position as illustrated.

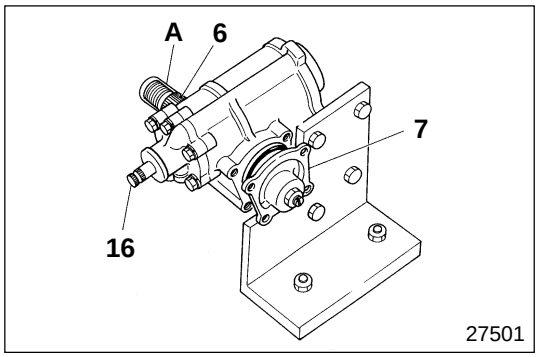
NOTE

At this time, make sure that slit A of the V-groove at the end of sector shaft 6 is at right angles to the axial line of ball screw set shaft 16.



- Loosen nut **4** and remove bolt **5**. After making sure that sector shaft **6** is in the neutral position, tap the end of the sector shaft, and pull out side cover **7** together with the sector shaft.

B : Plastic-headed mallet



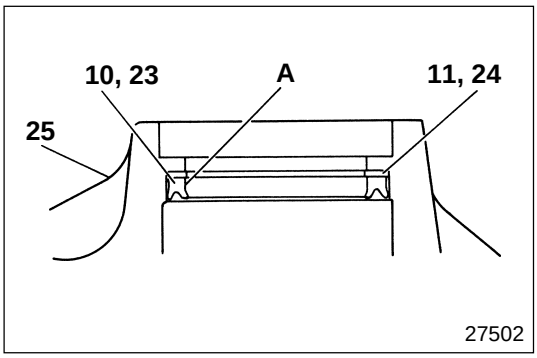
[Installation]
With ball screw set shaft **16** in the neutral position, insert sector shaft **6** and side cover **7**.

CAUTION

Insert sector shaft 6 with the thread area of the shaft end and serration area protected by cover A to prevent damage to the oil seal.

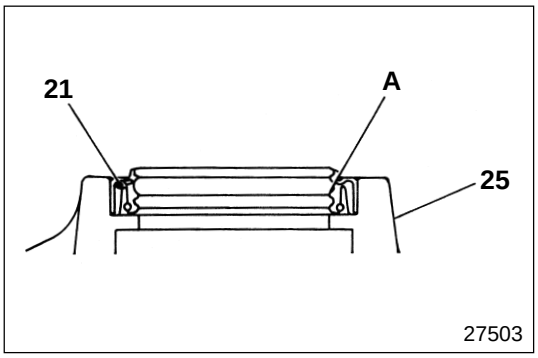
NOTE

- **Turn ball screw set shaft 16, and make sure that the shaft rotates approximately five turns lock-to-lock.**
- **If the number of turns is less, inspect engagement of ball screw set shaft 16 and sector shaft 6.**



10 **23** **Installation of Y-packing**

Apply grease to lip area **A** of Y-packing **10, 23** and install into gear box **25** as illustrated.



21 **Installation of oil seal**

Apply grease to lip area **A** of oil seal **21** and install into gear box **25** as illustrated.

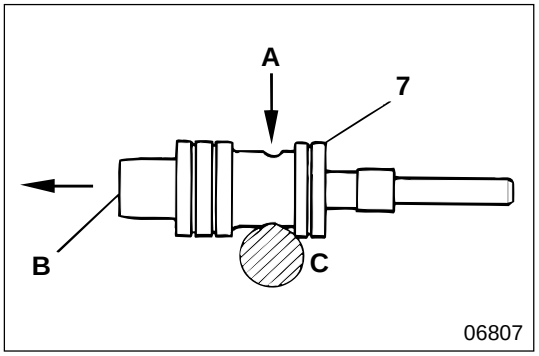
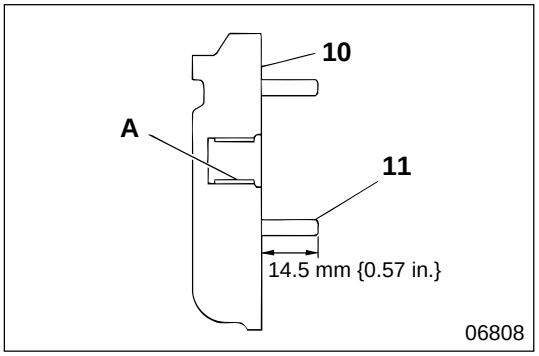
◆ Service procedure



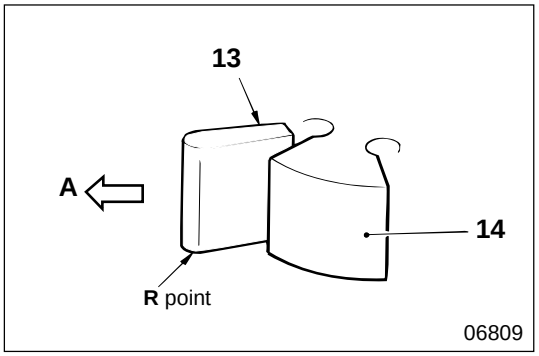
7 **Inspection of relief valve assembly**

Block one side of the hole of relief valve assembly **7**, with your finger **C**, then when air pressure **A** of 390 to 490 kPa {57 to 71 psi, 4 to 5 kgf/cm^2} is applied from the other side, check whether air is released from small hole **B** at the rear. If air is not released, it is normal.



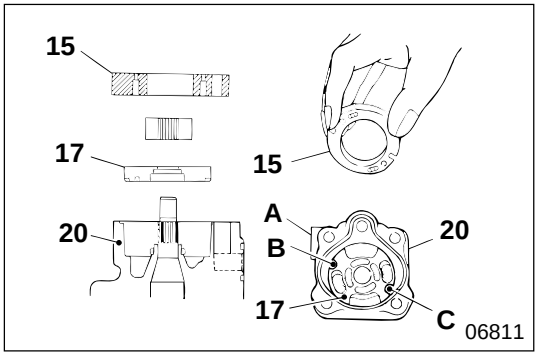
10 **11** **Installation of pin and cover**

- Press-fit pin **11** into cover **10**, to the press-fitting height.
- Apply hydraulic oil to bushing area **A** of the cover.



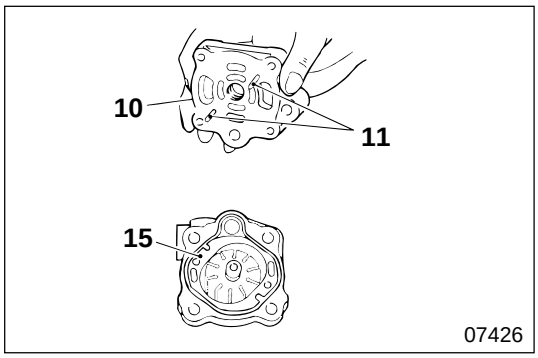
13 **Installation of vane**

With **R** point of vane **13** facing outside **A**, install it on rotor **14** and make sure that the vane moves smoothly. If it is faulty, replace cartridge **12**.



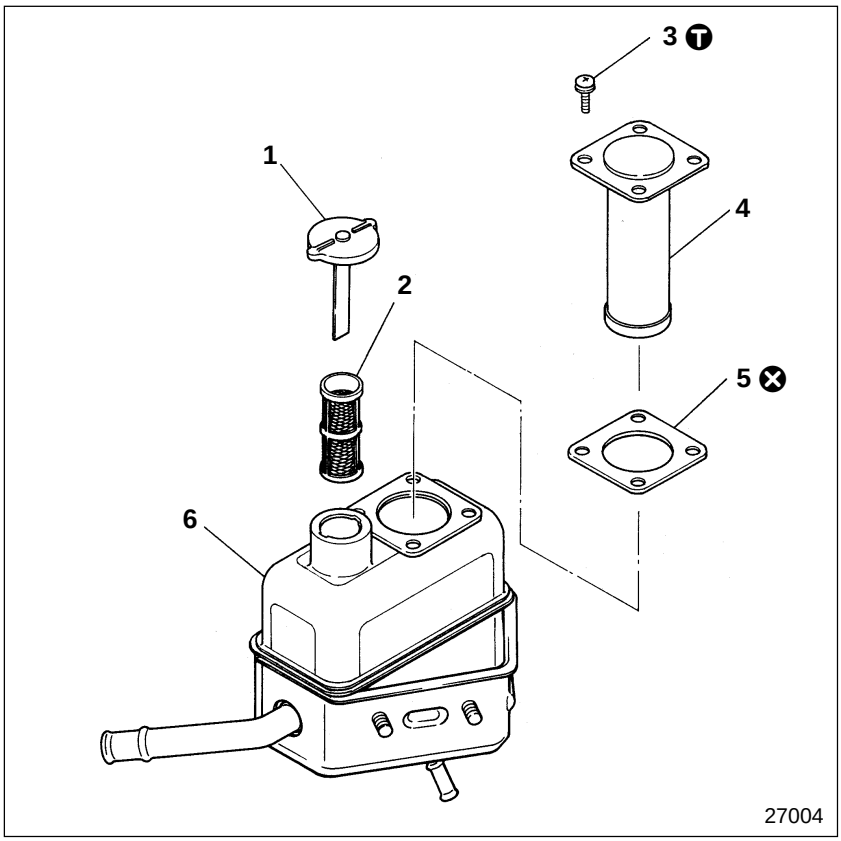
15 **17** **Installation of cam ring and side plate**

- Since the mounting direction of side plate **17** is determined, mount the side plate, so that relief valve side **A** is aligned with round hole **B** (standard pin side) and slotted hole **C** is located on a diagonal.



- Align cam ring **15** with pin **11** of cover **10**, then install the cam ring.

POWER STEERING OIL TANK



● **Disassembly sequence**

1 Filler cap
2 Strainer
3 Screw
4 Filter
5 Packing
6 Tank

⊗ : Non-reusable parts

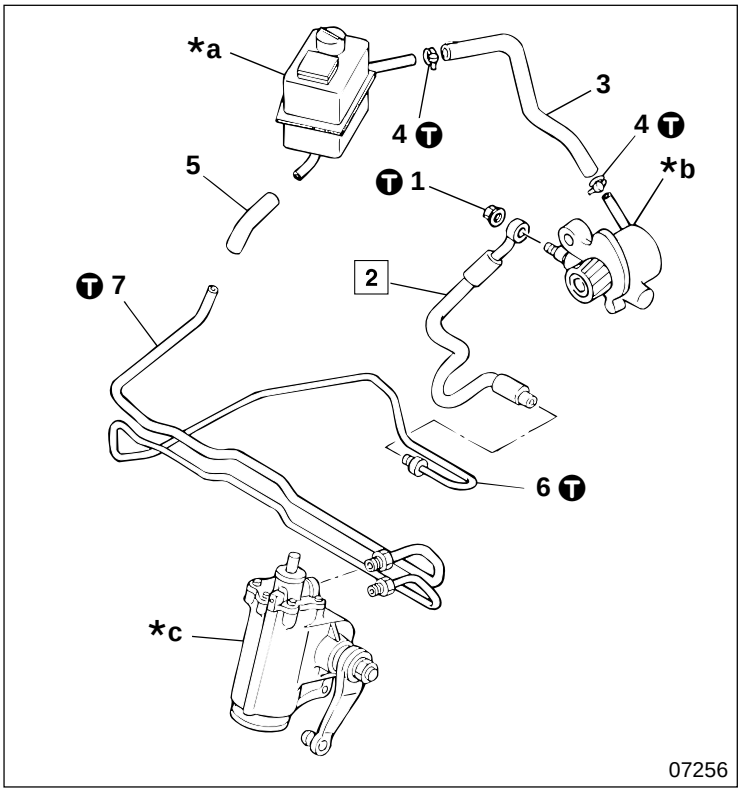
● **Assembly sequence**

Follow the disassembly sequence in reverse.

Ⓣ Tightening torque

Unit : N·m {ft.lbs, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
3	Screw (Filter mounting)	1.27±0.29 {0.94±0.21, 0.13±0.03}	—



● **Removal sequence**

1 Nut
2 Pressure hose
3 Rubber hose
4 Clamp
5 Rubber hose
6 Pressure tube
7 Return tube

***a** : Power steering oil tank
***b** : Power steering oil pump
***c** : Power steering booster

● **Installation sequence**

Follow the removal sequence in reverse.

CAUTION ⚠

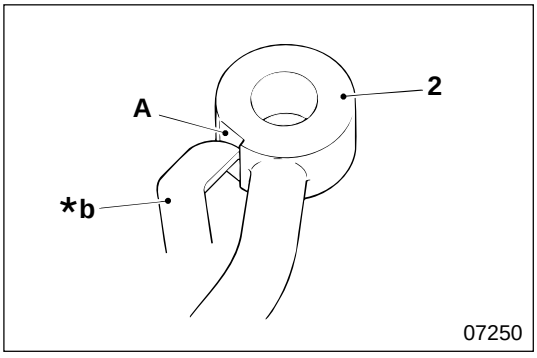
Be sure to bleed air if the fluid line was removed, failure to do so would cause the power steering to malfunction. P37-12

T Tightening torque

Unit : N·m {ft.lbs, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
1	Nut (Pressure hose mounting)	29 to 39 {21 to 29, 3 to 4}	—
6	Pressure tube (Pressure hose and power steering booster connection)	29 to 39 {21 to 29, 3 to 4}	—
7	Return tube (Power steering booster connection)	39 to 49 {29 to 36, 4 to 5}	—
4	Clamp (Rubber hose mounting)	2.9 to 3.4 {2.1 to 2.5, 0.30 to 0.35}	

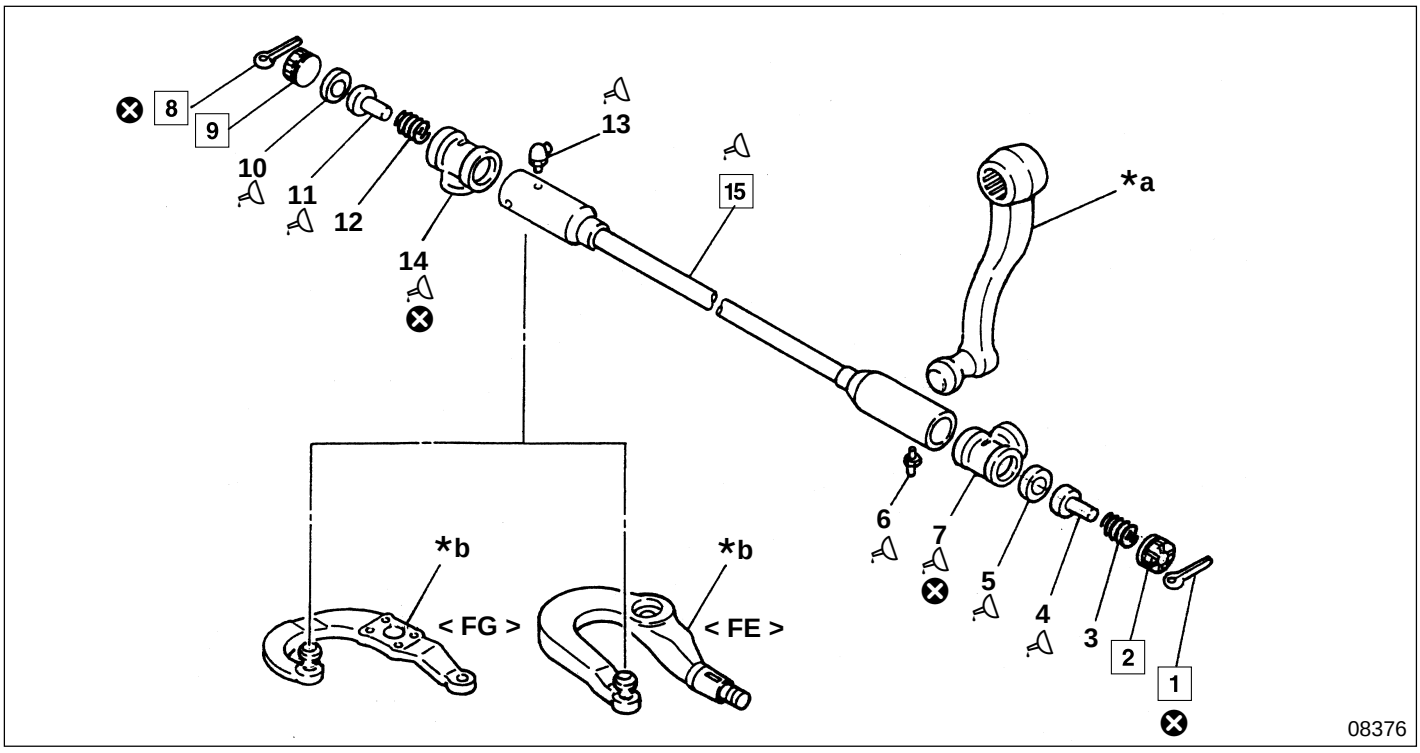
◆ Service procedure



2 **Installation of pressure hose**

Install pressure hose **2** so indent **A** of pressure hose **2** contacts the suction connector of power steering oil pump ***b**.

DRAG LINK



● **Disassembly sequence**

1 Split pin
2 End plug
3 Spring
4 Ball stud seat
5 Ball stud seat
6 Grease nipple
7 Dust cover
8 Split pin
9 End plug
10 Ball stud seat
11 Ball stud seat
12 Spring
13 Grease nipple
14 Dust cover
15 Drag link

***a** : Pitman arm
📖 P37-24
***b** : Knuckle arm
< FE > Gr 26A
< FG > Gr 26B
⊗ : Non-reusable parts

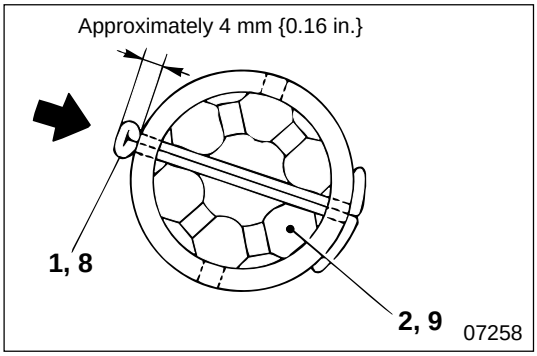
● **Assembly sequence**

Follow the disassembly sequence in reverse.

Lubricant

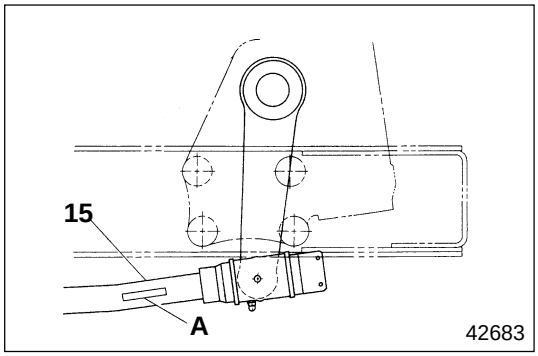
Location	Points of application	Specified lubricant	Quantity
4, 5, 10, 11	Whole area of ball stud seat	Chassis grease [NLGI No.1 (Ca soap)]	As required
6, 13	Supply via grease nipple	Chassis grease [NLGI No.1 (Ca soap)]	As required
7, 14	Arm mounting port of dust cover	Chassis grease [NLGI No.1 (Ca soap)]	As required
15	Pack interior of drag link	Chassis grease [NLGI No.1 (Ca soap)]	As required

◆ Service procedure



1 **2** **8** **9** **Installation of split pin and end plug**

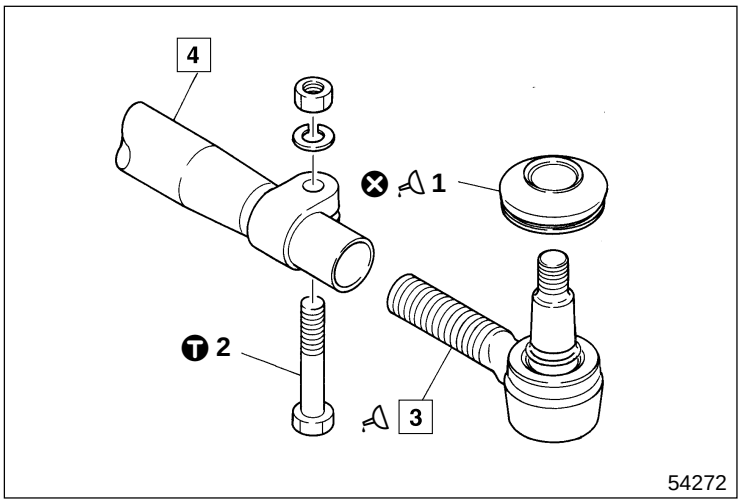
- Tighten end plug **2, 9** fully, then slacken it off by one half of a turn.
- Place split pins **1**, **8** so that the heads face the outside of the vehicle.
- Stake the heads of split pins **1**, **8** until they are approximately 4 mm {0.16 in.} thick.



15 **Installation of drag link**

Install drag link **15** with label **A** attached, facing the front of the vehicle.

TIE ROD ASSEMBLY



● **Disassembly sequence**

1 Dust cover
2 Clamp bolt
3 Tie rod end
4 Tie rod

NOTE

Do not remove dust cover 2 unless it is faulty.

● **Assembly sequence**

Follow the disassembly sequence in reverse.

Service standards

Unit : mm {in.}

Location	Maintenance item	Standard value	Limit	Remedy
4	Bend of tie rod	1 {0.039} or less	1 {0.039}	Replace

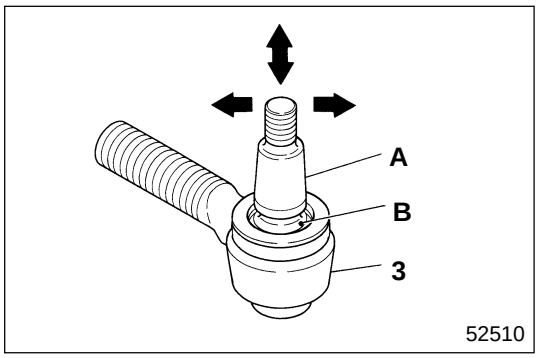
Tightening torque

Unit : N·m {ft.lbs, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
2	Clamp bolt (Tie rod end clamp tightening)	20 to 29 {15 to 21, 2 to 3}	—

Lubricant

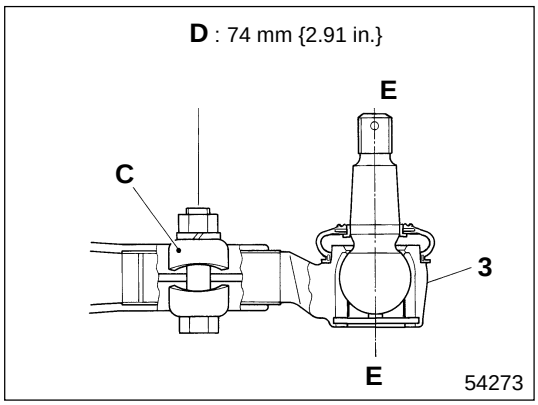
Location	Points of application	Specified lubricant	Quantity
1	Lip area of dust cover	Wheel bearing grease [NLGI No.2 Li soap]	As required
3	Pack interior of dust cover of tie rod end	Wheel bearing grease [NLGI No.2 Li soap]	As required



◆ Service procedure

3 Tie rod end

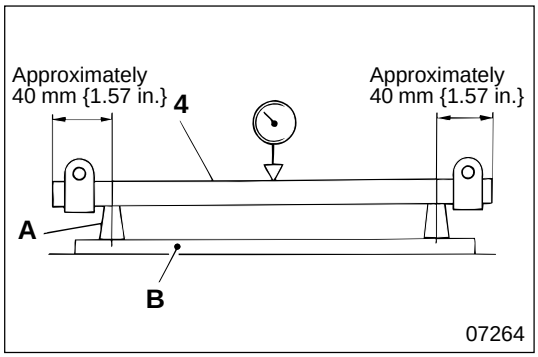
[Inspection]
Move ball stud area **A** vertically and horizontally to inspect for looseness. Ensure that ball **B** rotates evenly.



[Installation]
- Screw in tie rod end **3** so that dimension **D** of the tie rod end and clamp **C** differs by 1.5 mm {0.059 in.} or less between left and right.
- Secure axis **E – E** so that it is parallel both left and right.

NOTE

Deviation of the left and right screw-in amount of tie rod end 3 should be within one turn.



4 Bending of tie rod

Measure the bend of tie rod **4** at the center point. If the measured value exceeds the limit, correct or replace the tie rod.

NOTE

To measure the deflection of tie rod 4, turn it one full rotation and read the dial gauge indicator. The deflection is one half of the indicated value.

A : V-block
B : Surface plate

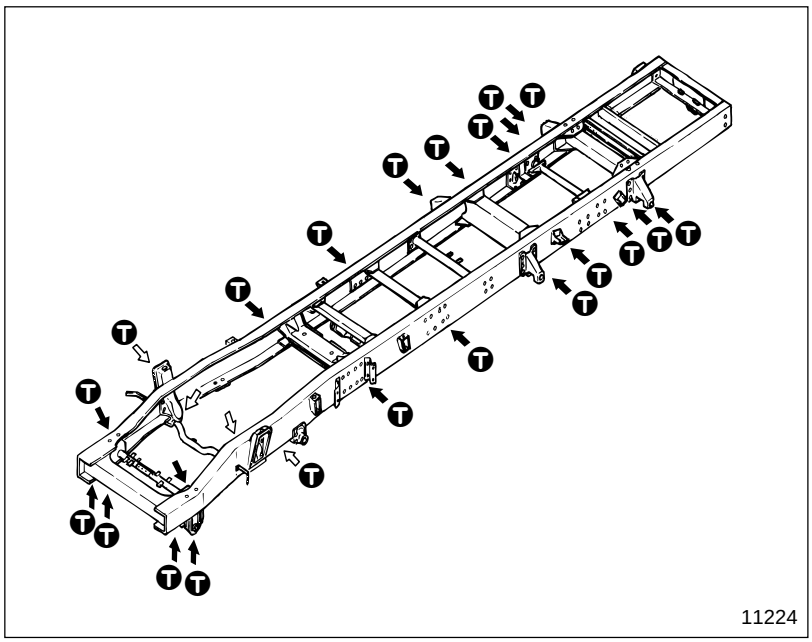
INSPECTION AND REPAIR OF FRAMES



⬅ : Bolt (M10×1.25)
⇦ : Bolt (M12×1.25)

Tightening torque

Unit : N·m {ft.lbs, kg·m}

Location	Parts to be tightened	Tightening torque	Remarks
—	Bolt (⬅ area bolt : M10×1.25)	60 to 80 {43 to 58, 6 to 8}	—
—	Bolt (⇦ area bolt : M12×1.25)	98 to 120 {72 to 87, 10 to 12}	—

◆ Service procedure

● Cleaning of frame

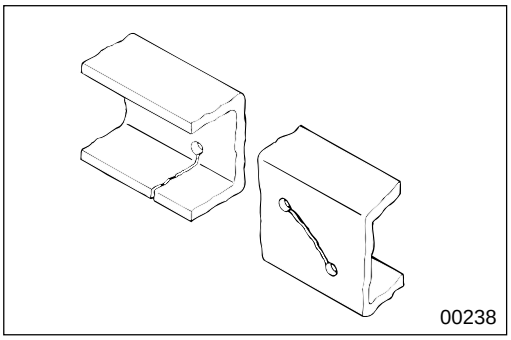
Carefully remove mud, grease, rust, etc. that is stuck to the outer and inner surfaces of the frame.

● Inspection for frame deformation

If any fault such as deformation is found, repair the frame.

● Inspection for cracks in frame

- Remove paint from any areas that are seemingly faulty and carefully inspect.
- If visual inspection is difficult, inspect using color contrast penetrant examination or other methods.
  If a crack is found, repair as follows.

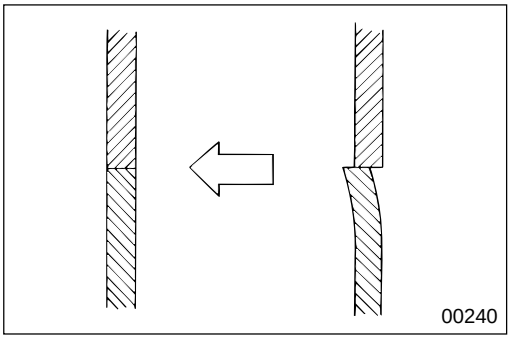


● Repair of crack in frame

- With the vehicle unloaded, level the frame.
- Drill a hole, about twice the thickness of the frame, 10 mm {0.39 in.} from the end of the crack.

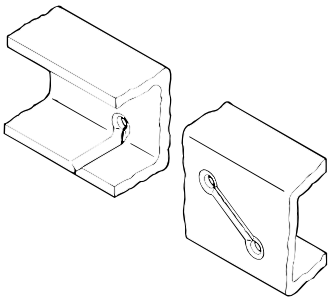
NOTE

If a crack is found inside the frame, drill holes at both ends of the crack.

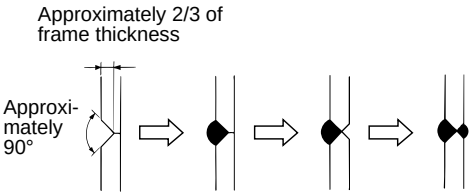


- If the edges of the crack are not flush, make them flush with each other.

INSPECTION AND REPAIR OF FRAMES



00241



00242

- Using a grinder, etc., grind a 90° V-section channel, two-thirds of the frame thickness, then weld.

WARNING

You must cover any flammable materials, such as pipelines, wiring harnesses, rubber parts, and the fuel tank, that are near the welding site.

CAUTION

- **Do not use gas welding because the high temperature produced alters the material properties and weakens the welded area. Be sure, therefore, to use electric welding.**
- **Be sure to remove the negative terminal of the battery, then ground the welder near the area to be welded to prevent reversed flow of current from the welder which might burn out electrical components.**
- **Be sure to protect mountings such as main sills that can be damaged by heat, by using heat insulators, etc.**

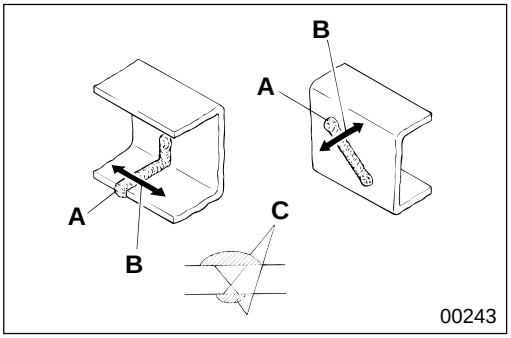
NOTE

- **Use low-hydrogen type coated CO_2 and arc welding electrodes for welding to prevent harmful defects such as undercutting, blow holes, etc.**
- **Preheat the area to be welded to approximately 50 to 350°C {122 to 662°F} before welding when the workshop temperature is below 0°C {32°F}.**

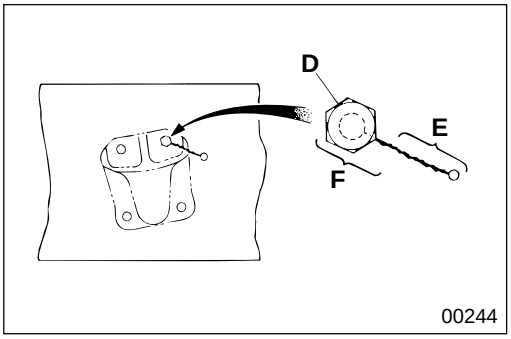
- Next, grind a V-section channel, as described above, on the opposite side of the weld and weld. At the same time, fill the holes at both ends of the crack by welding.

NOTE

In cold districts, heat the welded area to approximately 200°C {392°F} after welding.

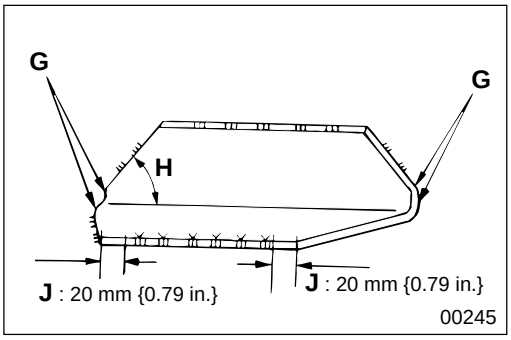


- After welding, grind bead **A** at right angles **B** to remove shaded area **C** as illustrated and grind the area flat.
- Finish the surface so that the frame thickness is identical to the original thickness.



[Repairing cracks caused by rivets or bolt holes]

- To make the edges of the holes flush at the cracked area, temporarily tighten bolt **D** in the hole.
- Weld cracked point **E** at least 20 mm {0.79 in.} from the center of the bolt.
  For welding method refer to the above-mentioned procedures for repairing cracks. P41-3.
- After removing the bolt and making the edges flush, weld remaining area **F** and fill the hole.
- After drilling a hole in the filled area, install a rivet or bolt.

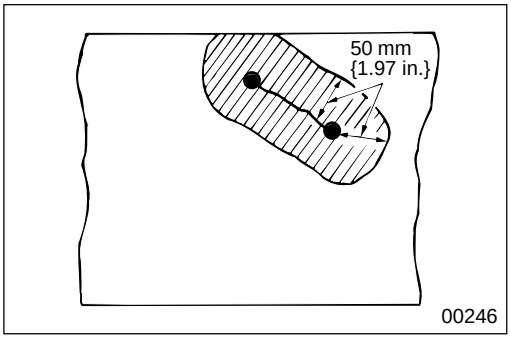


[Repairing using reinforcement plate]

- To prevent concentrated stress being produced at ends **G** of the reinforcement plate, weld the plate with angle **H** at both ends opened 30° or less.
  Do not weld area **J**.
- The reinforcement plate must have enough strength for the cracked area.

NOTE

- **Thickness of reinforcement plate : same as frame thickness**
- **Reinforcement plate material : SAPH440 (hot-rolled sheet steel for automobiles), SS400 (sheet steel for general construction), or equivalent strength.**

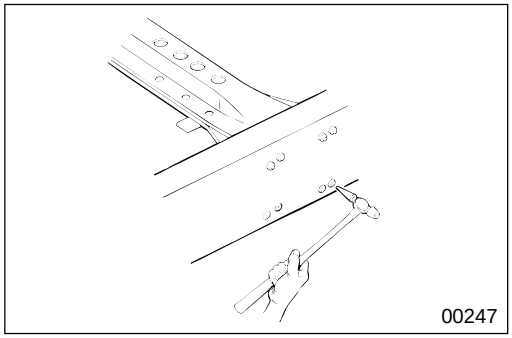


- After welding, heat the shaded area to 600 to 700°C {1112 to 1292°F}.

CAUTION

Be sure to protect mountings such as main sills that can be damaged by heat, by using heat insulators, etc.

INSPECTION AND REPAIR OF FRAMES

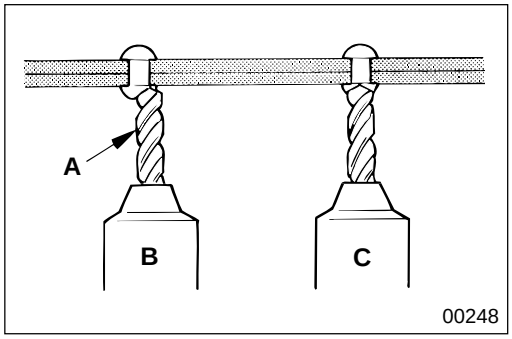


● **Inspection for loose rivets**

- Gently tap the rivet head using an inspection hammer and judge the condition by checking the vibration using the tip of your finger, or by listening to the sound.
- Rust between rivet and frame indicates that the rivet is loose.

CAUTION⚠

Be sure to replace loose rivets because they can break or cause cracking of the frame in the area around the rivet hole, causing accidents.

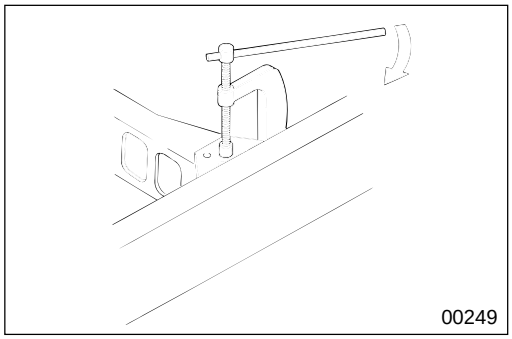


● **Repair of rivet**

- When removing rivets, use a center punch to make an indent in the center of the rivet head; then, drill out using drill **A** or grind.
  B : Incorrect
  C : Correct

CAUTION⚠

Make sure that you do not damage the rivet hole.



- When rivetting, first clamp both plates tightly near the rivet hole using a clamp to eliminate gaps between plates.

- Using a rivetting machine, insert the rivet (cold rivet).
- If rivetting is impossible, ream the rivet hole, drive in a reamer bolt, fully tightening the nut, then weld it in place.
  A flange bolt and flange nut should be used for the reamer bolt and nut.

● **Inspection for loose bolts and nuts**

- Inspect the mounting bolts in all areas for looseness. Loosened bolts should be tightened at specified torque. 🕮 P41-2

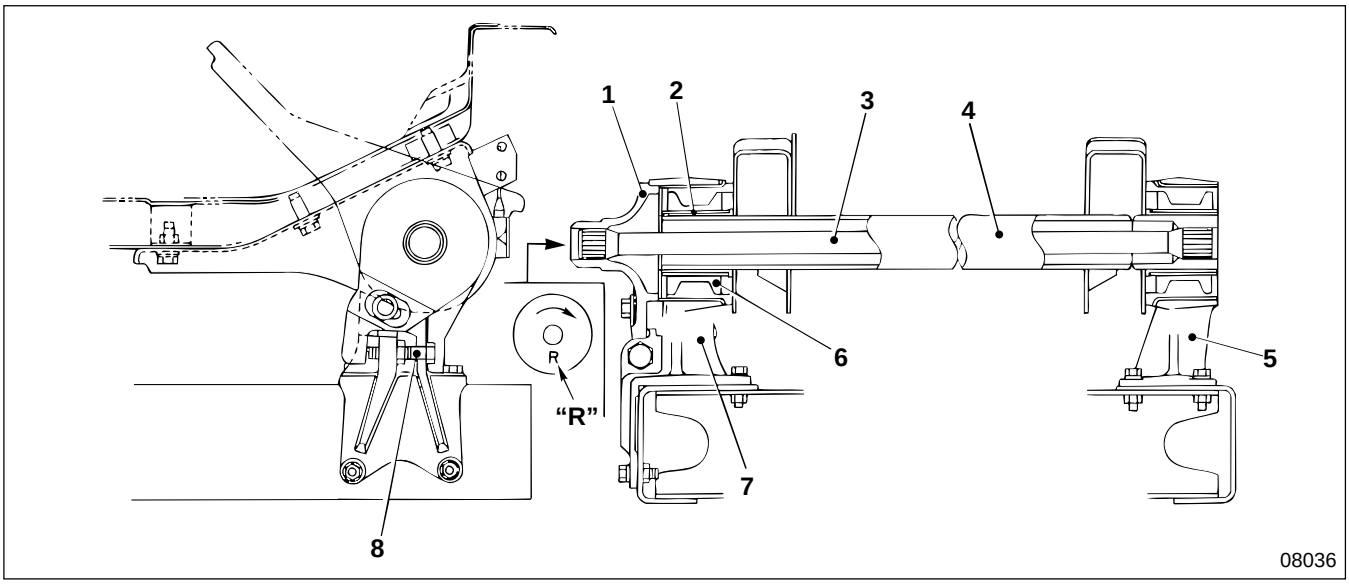
*: Fixed cab is used only for crew cab.

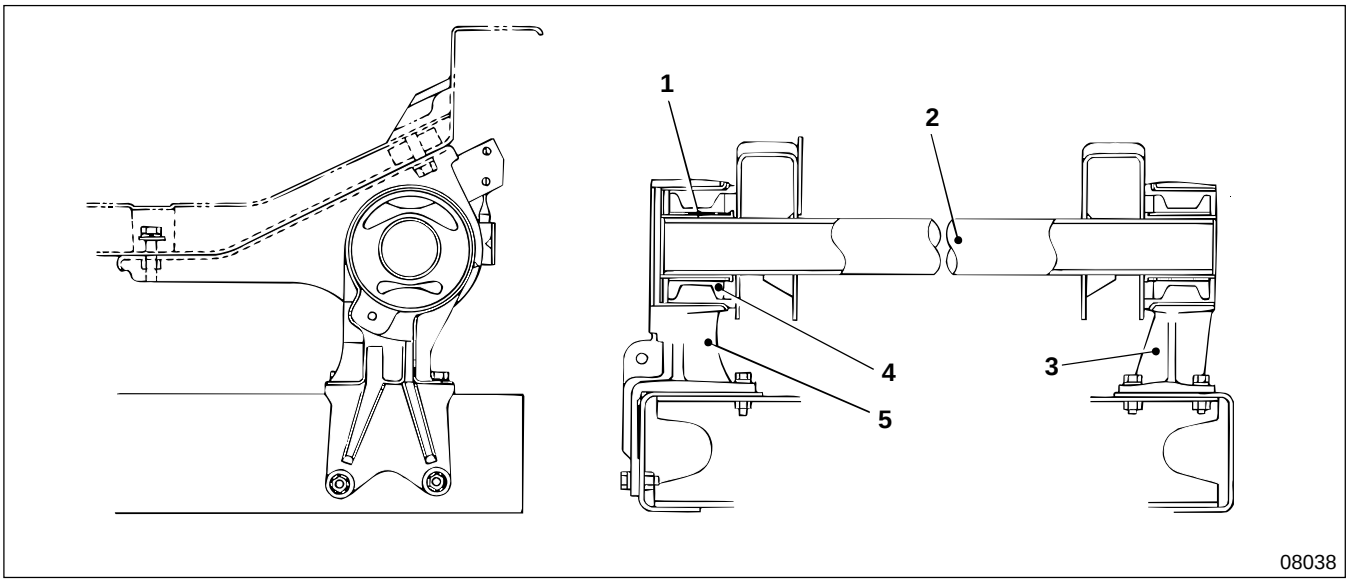
Front Cab Mounting < Tilt Cab >



1 Anchor lever
2 Bushing
3 Torsion bar
4 Front floor cross member assembly
5 Front cab mounting bracket, LH
6 Front rubber assembly
7 Front cab mounting bracket, RH
8 Adjusting bolt

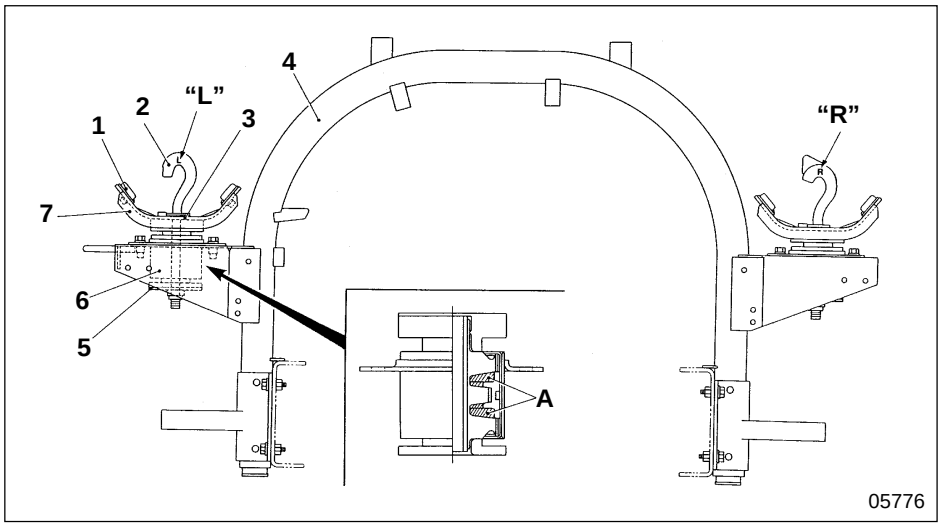
Since torsion bar **3** has torsional direction, it is marked **"R"** on its right end to indicate the torsional direction, preventing mistaken installation.

Front Cab Mounting < Fixed Cab >



1 Bushing
2 Front floor cross member assembly
3 Front cab mounting bracket, LH
4 Front rubber assembly
5 Front cab mounting bracket, RH

Rear Cab Mounting < Tilt Cab >

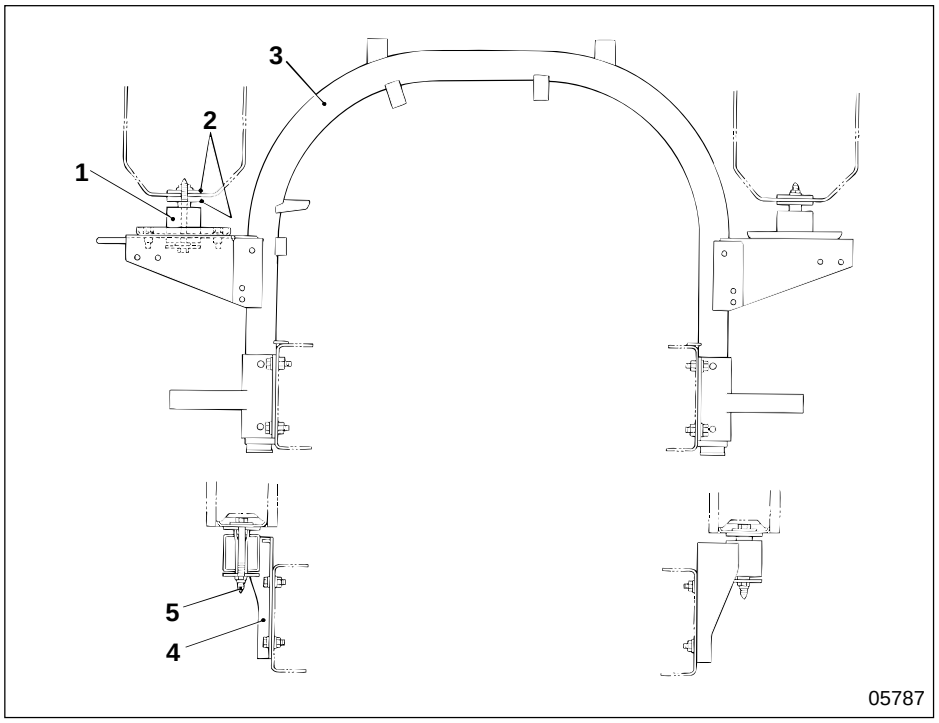


1 Side rubber
2 Anchor hook
3 Spacer
4 Rear mounting post
5 Plate
6 Rear rubber assembly
7 Cab hold bracket

A : Liquid

- Anchor hooks **2** are marked **"L"** and **"R"** to identify left and right.
- Between anchor hook **2** and cab hold bracket **7** is spacer **3**. By increasing or decreasing the number of spacers, the cab tilt operating force can be adjusted.
- Rear rubber assembly **6** is filled with liquid **A** that reduces vibration and noise.

Rear Cab Mounting < Fixed Cab >



1 Rubber assembly
2 Plate
3 Rear mounting post
4 Cab bracket assembly
5 Cone point bolt

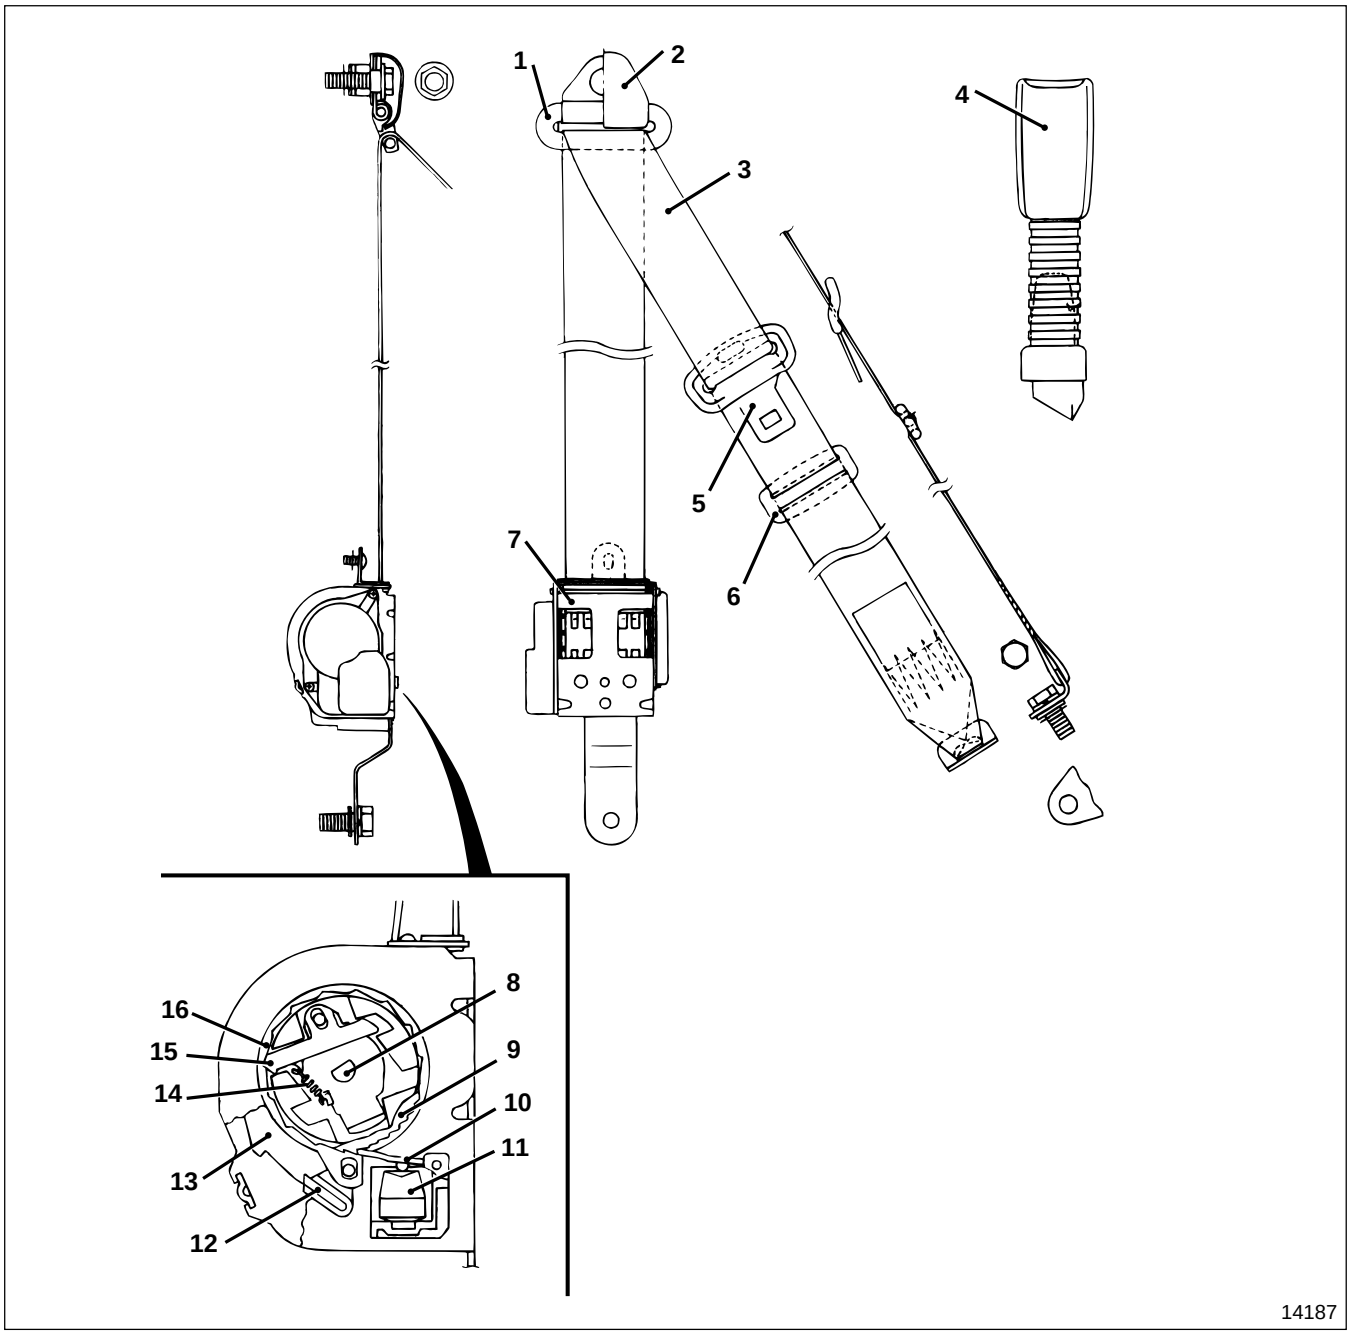
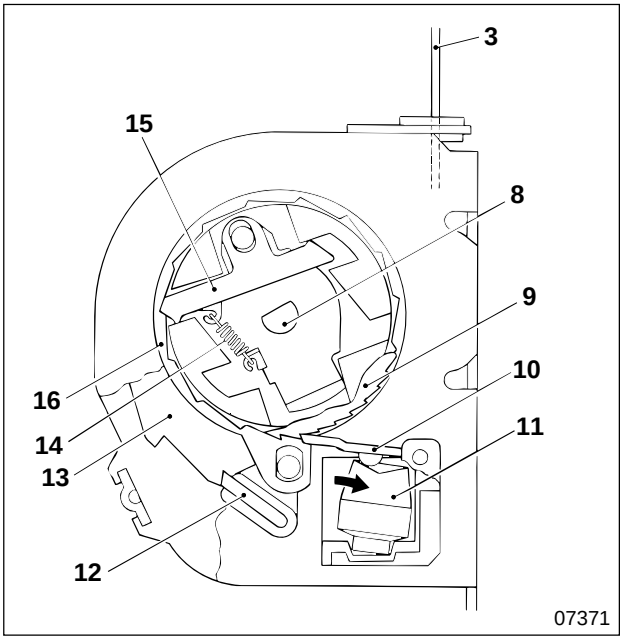
Emergency Locking Retractor (ELR) Type Seat Belt



1 Sash guide
2 Cover
3 Webbing
4 Buckle assembly
5 Tongue plate
6 Tongue stopper
7 Emergency locking retractor assembly
8 Spindle
9 Locking gear
10 Mechanism lever
11 Mechanism weight
12 Pawl
13 Ratchet gear
14 Sensor spring
15 Lock arm
16 Clutch

CAUTION⚠

Do not disassemble emergency locking retractor assembly 7, or malfunctions might occur.



Webbing detecting lock

- When the vehicle is subjected to a sudden impact, such as a crash, webbing **3** retracts according to the movement of passengers, and spindle **8** rotates.
- As the rotation of spindle **8** is higher than the specified value, the repercussive force of sensor spring **14** can no longer retain lock arm **15**. Then, the arm is pulled out from the specified position and is locked by clutch **16**.
- If spindle **8** further rotates, clutch **16** lifts pawl **12** to lock with ratchet gear **13**, making spindle rotation impossible.

Body detecting lock

- When the body is tilted excessively, mechanism weight **11** is tilted, engaging mechanism lever **10** with locking gear **9**, locking it.
- If spindle **8** further rotates, clutch **16** operates as described above, and the spindle cannot rotate.

Cab as a Whole

Possible causes \ Symptoms		Cab shimmy (pitching and rolling vibration)	Cab or steering wheel high-frequency vibration (above 20 Hz) or noise	Cab cannot be tilted up	Cab cannot be locked to rear mounting post	Cab tilt warning lamp does not light	Cab tilt warning lamp does not go out	Remarks
Cab-related	Cab mounting loose or play	○						
	Front rubber, rear rubber deteriorated		○					
	Cab mounted incorrectly		○					
	Link assembly from anchor hook does not release			○				
	L-lever release faulty			○				
	Torsion bar damaged or fatigued			○				
	Torsion bar arm installation position incorrect			○				
	Link assembly not hooked to anchor hook				○			
	Link assembly contact with side cushion incorrect				○			
	Cab tilt lock switch adjusted incorrectly					○	○	
	Cab tilt lock switch faulty					○	○	
	Cab tilt warning lamp bulb burnt-out					○		
	Fuse, high-current fuse blown					○		
	Wiring broken or connection faulty					○		
Engine-related	Crossed axes angle of propeller shaft excessive due to increased tilt caused by deteriorated engine mounting		○					
	Engine installation faulty		○					Gr 11
	Intake and exhaust system installation faulty		○					
Transmission-related	Transmission installation faulty		○					Gr 22, 23
Propeller shaft-related	Propeller shaft run-out excessive		○					
	Universal joint worn excessively		○					
	Slip yoke joint spline play		○					
	Center bearing play excessive		○					Gr 25
	Crossed axes angle of mounting dimension excessive due to deteriorated center bearing cushion rubber, etc.			○				
	Crossed axes angle of propeller shaft excessive due to increased tilt of drive axis caused by overloading		○					

Possible causes / Symptoms		Cab shimmy (pitching and rolling vibration)	Cab or steering wheel high-frequency vibration (above 20 Hz) or noise	Cab cannot be tilted up	Cab cannot be locked to rear mounting post	Cab tilt warning lamp does not light	Cab tilt warning lamp does not go out	Remarks
Front axle-related	Axle seat resonance	○						Gr 26
Rear axle-related	Reduction gear engaged incorrectly		○					Gr 27
	Differential gear engaged incorrectly		○					
Wheel and tire-related	Wheel and tire run-out excessive	○						Gr 31
	Wheel and tire unbalanced	○						
	Size and kinds of tire unequal	○						
	Wheel mounting surface warped	○						
Front suspension-related	Leaf spring friction between leaves excessive	○						Gr 33
Brake-related	Brake drum unbalanced	○						Gr 35A
	Brake drum eccentric	○						
	Rotor of disc brake eccentric	○						

Door Lock

Symptoms / Possible causes	Door latch does not engage, and door does not close	Door does not lock when door lock knob is pressed	Door does not lock when key is turned	Remote door lock does not operate	Door does not open when outside door handle is operated	Door does not open when inside door handle is operated	Inside door handle does not return properly to original position	There is interference between door and cab	Remarks
Door installation faulty		○							○
Striker installation faulty		○							
Faulty door locking mechanism of door latch		○	○	○		○	○		
Door latch rod deformed			○				○		
Door latch rod disconnected			○	○			○		
Door latch rod interference								○	
Door lock cylinder deformed				○					
Faulty auto door lock switch in power window & door lock switch					○				Gr 54
Door lock actuator faulty					○				
Fuse or high-current fuse blown					○				
Open circuit or faulty connection of wire					○				
Left-side outside door handle faulty						○			
Inside door handle installation faulty							○		
Spring fatigue in inside door handle								○	

Power Window

Symptoms / Possible causes	Door window glass drops of its own accord while cruising	Abnormal noise from power window regulator while cruising	Power window does not operate	Power window does not stop	Abnormal noise while power window operating	After the starter switch has been turned OFF the window does not operate within 30 seconds of the power window switch being operated	After the starter switch has been turned OFF and although the doors have been opened within 30 seconds, the window does not operate within 30 seconds of the power window switch being operated	Remarks
Power window switch faulty			○	○		○	○	
Power window regulator faulty	○		○	○	○			
Power window regulator mounting faulty					○			Gr 54
Fuse and high-current fuse burnt-out			○					
Wiring broken or connection faulty			○					
Power window glass and door belt line molding rattling		○						

Wiper and Washer

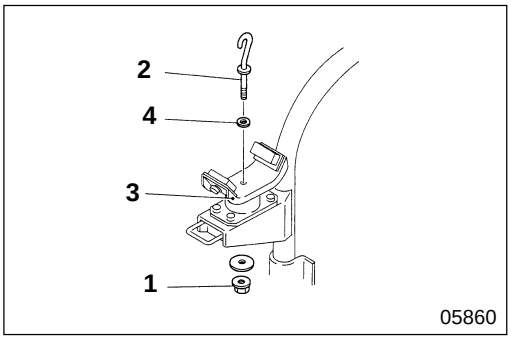
Symptoms / Possible causes	Wiper does not work	Wiper does not stop	Wiper intermittent operation does not work	Wiper blade stop position incorrect	Wiper operation inadequate	Noise during wiper operation	Washer motor does not work	Washer fluid jetting insufficient	Washer fluid does not jet	Remarks
Wiper motor faulty	○	○		○		○				
Washer motor faulty							○	○	○	
Wiper and washer switch faulty	○	○	○				○			
Multipurpose timing control unit faulty			○							Gr 54
Wiper relay faulty	○						○			
Fuse, high-current fuse blown	○						○			
Wiring broken or connection faulty	○		○				○		○	
Wiper motor crank arm set position faulty				○						
Wiper link and wiper arm connection faulty						○				
Wiper blade faulty					○	○				
Wiper arm faulty					○					
Washer hose twisted								○		
Washer hose connected incorrectly									○	
Washer nozzle clogged								○	○	
Washer fluid insufficient									○	

Adjustment of Cab Tilt

Ⓣ Tightening torque

Unit : N·m {ft.lbs, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
1	Lock nut (Anchor hook mounting)	83 to 98 {61 to 72, 8.5 to 10.0}	—
5	Bolt (Lock handle mounting)	29 to 39 {22 to 29, 3.0 to 4.0}	—

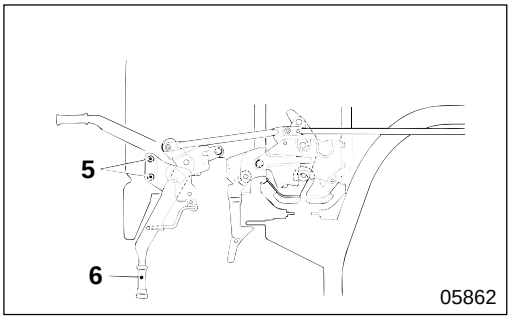


(1) Adjustment of lock handle operating force

- After removing lock nut **1**, remove anchor hook **2**.
- Adjust the operating force by increasing or decreasing the number of spacers **4** between anchor hook **2** and cab hold bracket **3**.

	Number of spacers
Heavy operating force	Increased
Light operating force	Decreased

- After adjustment, tighten lock nut **1** at specified torque:



(2) Adjustment for unsmooth latch

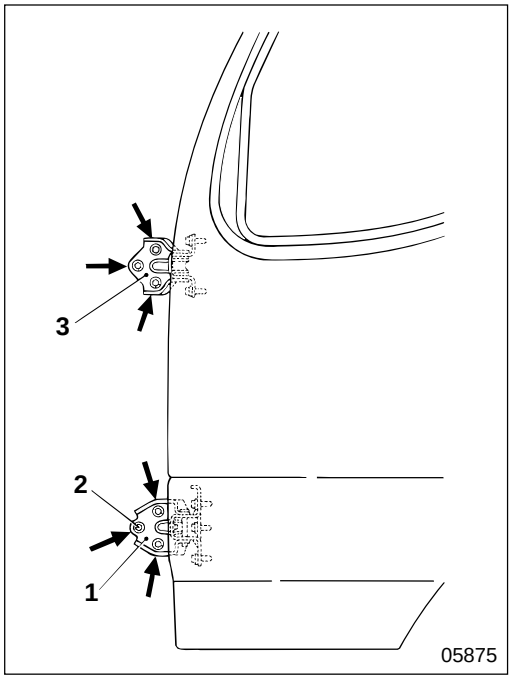
If latch operation is not smooth, loosen bolt **5**, and adjust installation of lock handle **6**.

Adjustment of Door Fitting

Tightening torque

Unit : N·m {ft.lbs, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
2	Bolt (Upper and lower hinge mounting)	17 to 25 {12 to 19, 1.7 to 2.6}	—
7	Screw (Striker mounting)	8.8 to 14 {6.5 to 10, 0.9 to 1.4}	—

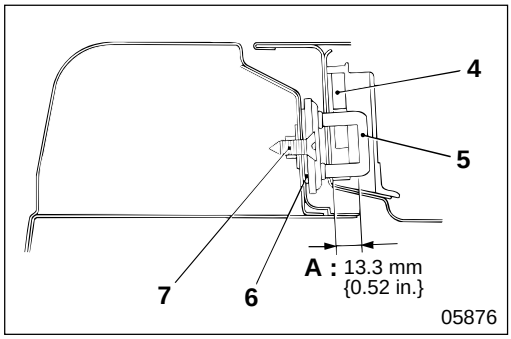


Adjust door fitting at hinge and striker.
(For door fitting dimensions: P42-19.)

(1) Adjustment of hinge

For adjustment, use front-side bolt **2** of lower hinge **1** as the reference point.

3 : Upper hinge



(2) Adjustment of striker

Engagement condition between door lock latch **4** and striker **5** should be adjusted with shim **6** within illustrated range **A**.

7 : Screw

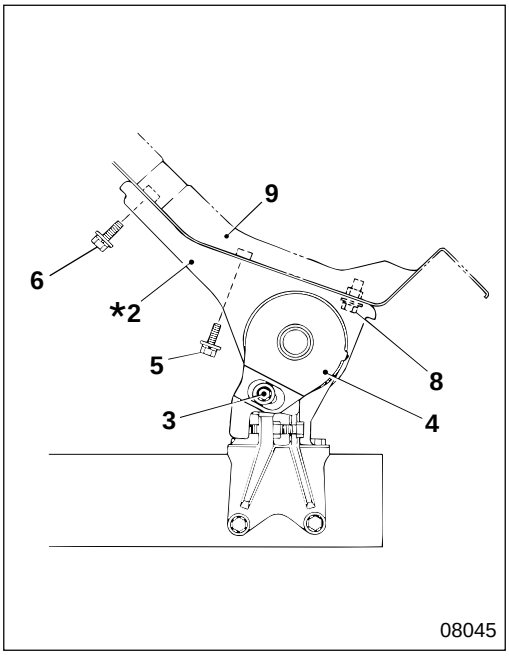
T Tightening torque

Unit : N·m {ft.lbs, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
1	Nut (Anchor lever adjusting bolt locking)	59 to 83 {43 to 60, 6 to 8.5}	—
3	Bolt (Anchor lever mounting)	34 to 54 {25 to 40, 3.5 to 5.5}	—
5, 6, 8	Bolt (Front floor cross member mounting)	70 to 95 {51 to 70, 7.1 to 9.7}	—
7	Bolt (Cab stay mounting)	19 to 27 {14 to 21, 1.9 to 2.8}	—

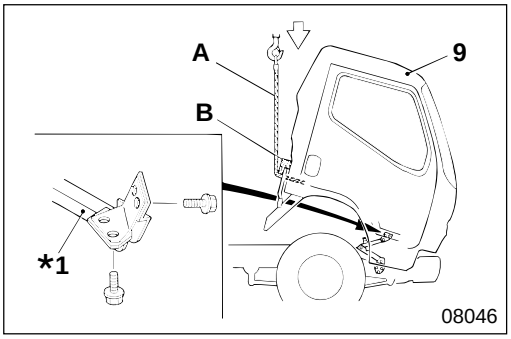
◆ Service procedure



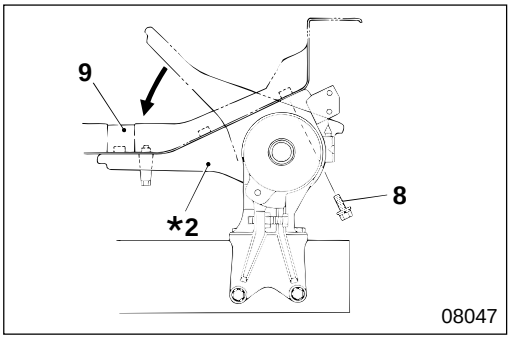
9 **Cab assembly**

[Removal]

- Tilt cab assembly **9** and lock cab stay ***1** securely.
- Remove bolt **3**, and remove anchor lever **4**.
- Of the three bolts that retain front floor cross member ***2**, remove bolts **5**, **6** at rear side, leaving bolt **8** at front side.

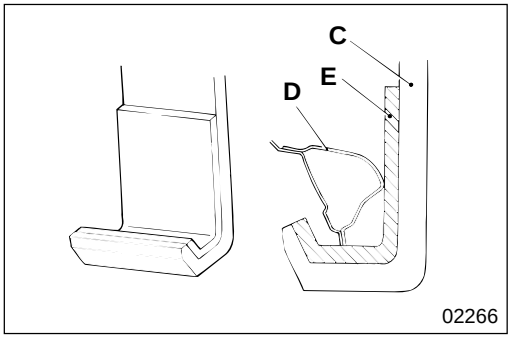


- To separate cab stay ***1** from cab assembly **9**, support the cab securely using crane **A** that is capable of lifting the cab.
  B : Use a wood block for protecting the rear of the cab
- Using crane **A**, lower cab assembly **9** until cab stay ***1** can be removed, then remove it.



- Fully lower cab assembly **9** to remove remaining bolt **8** that retains front floor cross member ***2**.

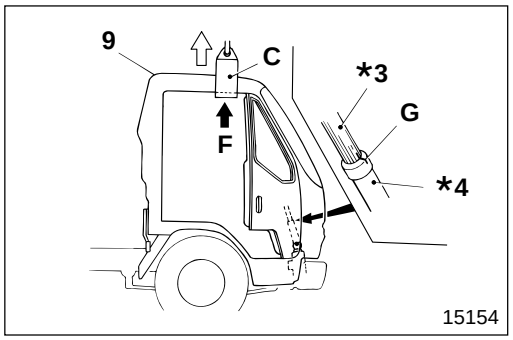
REMOVAL AND INSTALLATION OF CAB < TILT CAB >



- Set up hoist attachment **C** for the cab as illustrated.

CAUTION

- **Make sure when you set up hoist attachment C that it is capable of lifting cab assembly 9 which weighs approximately 390 kg {860 lb}.**
- **Make sure you install rubber E on hoist attachment C to prevent cab roof D being deformed when the cab is lifted.**



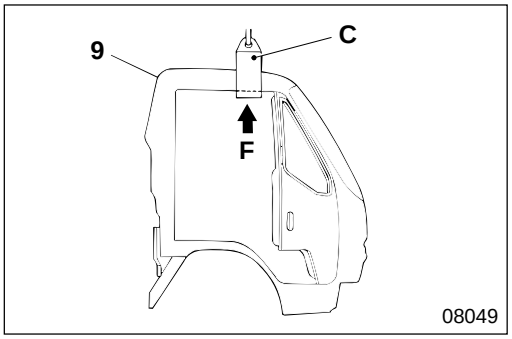
- Mount hoist attachment **C** at center-of-gravity point **F** of cab assembly **9**. Verify the position at which the cab can be lifted horizontally when the cab is lifted slightly.
- Slowly lift cab assembly **9** straight up, and finish lifting when steering yoke ***3** is pulled out from steering shaft ***4**. Make alignment mark **G** before the steering yoke is pulled out from the steering shaft.

WARNING

Never get under cab assembly 9 when it is being lifted.

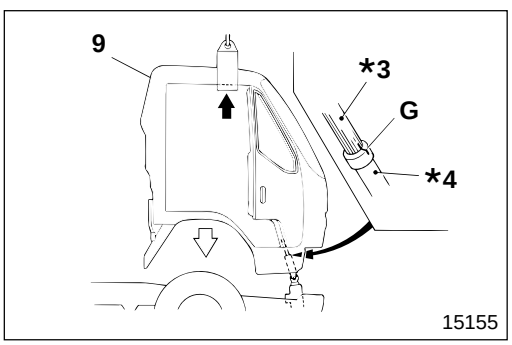
CAUTION

Make sure, when lifting cab assembly 9, that the wiring harness, cable, hoses, etc. are completely disconnected when the cab is lifted slightly.

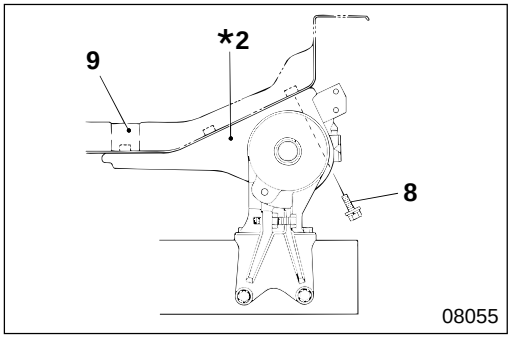


[Installation]

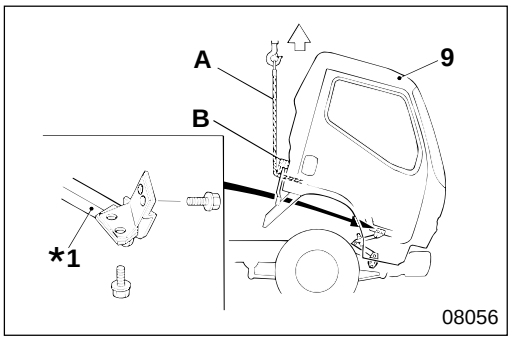
- Mount hoist attachment **C** at center-of-gravity point **F** of cab assembly **9**.



- Slowly lower cab assembly **9** horizontally to insert steering yoke ***3** into steering shaft ***4**, aligning alignment mark **G**.



- Slowly lower cab assembly **9** further, and remove hoist attachment **C** after it comes down fully.
- Tighten front bolt **8**, one of the three bolts used for installing front floor cross member ***2**.

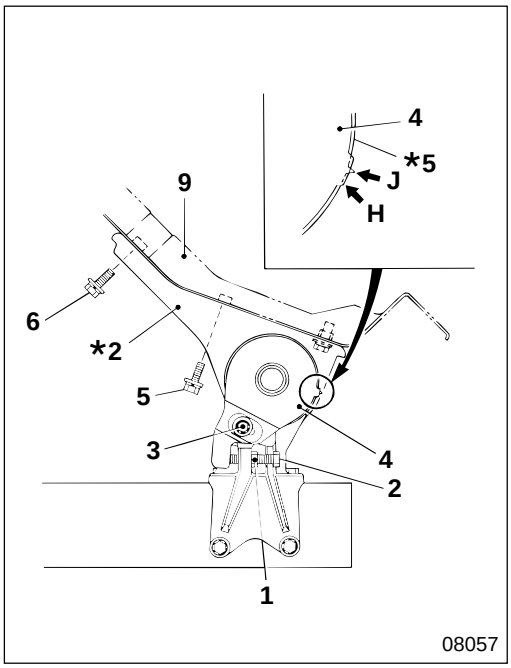


- Securely support cab on crane **A** to tilt cab assembly **9**.
  B : Use a wood block for protecting the rear of the cab
- Using crane **A** tilt cab assembly **9**, and install cab stay ***1**.

WARNING

You must pay close attention to the tilt angle when tilting cab assembly 9 using crane A. It is very dangerous to tilt the cab excessively because it will topple over.

- After installing cab stay ***1**, tilt cab assembly **9** slowly until it is completely tilted, securely lock cab stay, then detach the cab from crane **A**.



- Tilt cab assembly **9**, and securely lock cab stay ***1**.
- Tighten bolts **5**, **6** to install front floor cross member ***2**.
- Position and install pointer **J** of front cab mounting bracket ***5** in convex area **H** of anchor lever **4** and fix it with bolt **3**.
- Position bolt **2** on anchor lever **4** and lock it with nut **1**.
- After mounting cab assembly **9**, check and adjust the operating force required for the lock handle. P42-17

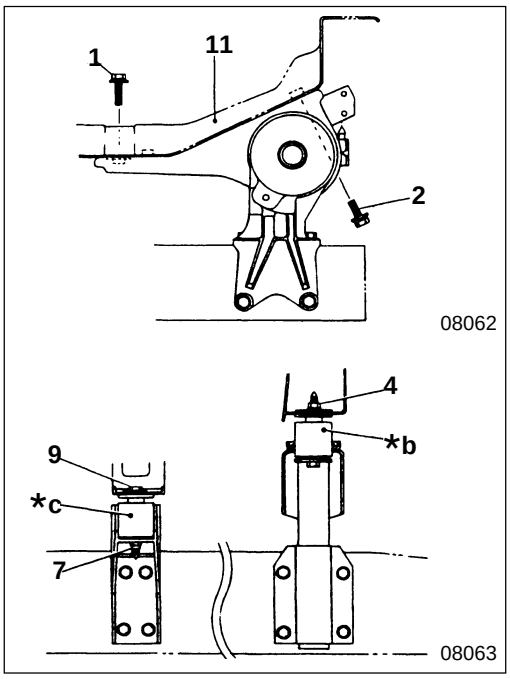
Ⓣ Tightening torque

Unit : N·m {kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
1	Bolt (Front floor cross member mounting)	33 to 49 {3.4 to 5.0}	—
2	Bolt (Front floor cross member mounting)	70 to 95 {7.1 to 9.7}	—
4	Nut (Rubber assembly mounting)	39 to 59 {4 to 6}	—
7	Nut (Rear rubber assembly mounting)	59 to 69 {6 to 7}	—

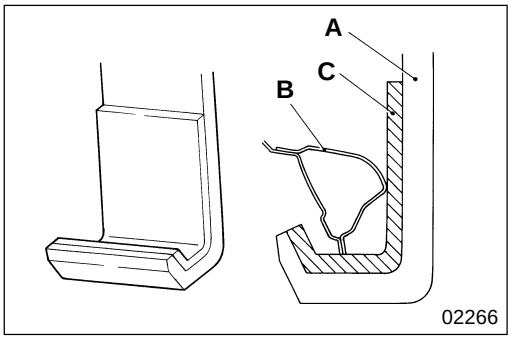
◆ Service procedure



11 **Cab assembly**

[Removal]

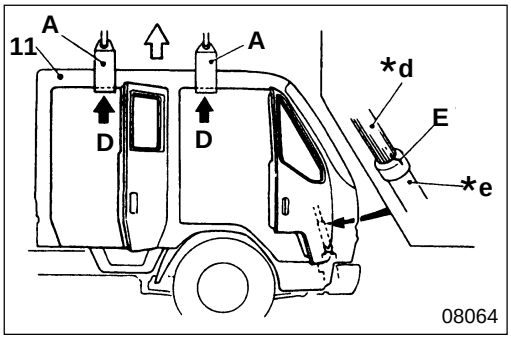
- Remove bolt **1** from the inside of cab assembly **11**, and bolt **2** from the outside.
- Remove nut **4** that fixes rubber assembly ***b**, then remove cone point bolt **9** and nut **7** that fix rear rubber assembly ***c**.



- Set up hoist attachment **A** as illustrated.

CAUTION

- **Make sure when you set up hoist attachment A that it is capable of lifting cab assembly 11 which weighs approximately 510 kg for the standard cab, and approximately 580 kg for the wide cab.**
- **Make sure you install rubber C on hoist attachment A to prevent cab roof B being deformed when the cab is lifted.**
- **Make sure you install hoist attachment A on both the front door side and the rear door side because installation of the hoist attachment on one side only causes deformation of the cab.**



- Mount hoist attachment **A** at center-of-gravity point **D** of cab assembly **11**. Verify the position at which the cab can be lifted horizontally when the cab is lifted slightly.
- Slowly lift cab assembly **11** straight up, and finish lifting when steering yoke ***d** is pulled out from steering shaft ***e**. Make alignment mark **E** before the steering yoke is pulled out from the steering shaft.

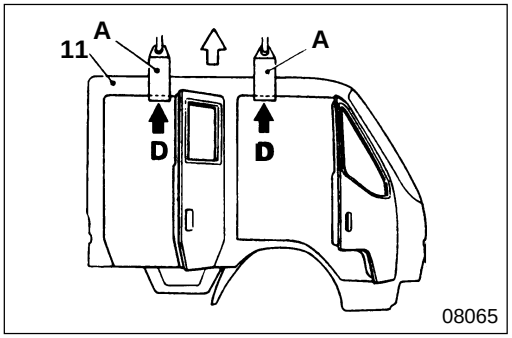
WARNING

Never get under cab assembly 11 when it is being lifted.

CAUTION

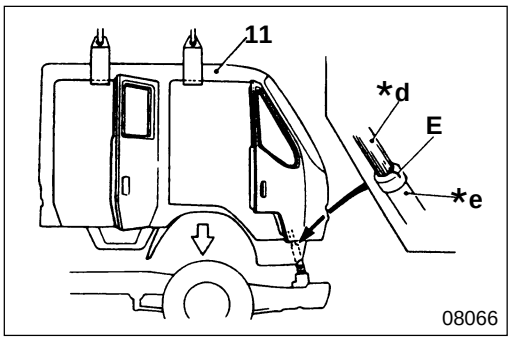
Make sure, when lifting cab assembly 11, that the wiring harness, cable, hoses, etc. are completely disconnected when the cab is lifted slightly.

REMOVAL AND INSTALLATION OF CAB < FIXED CAB >

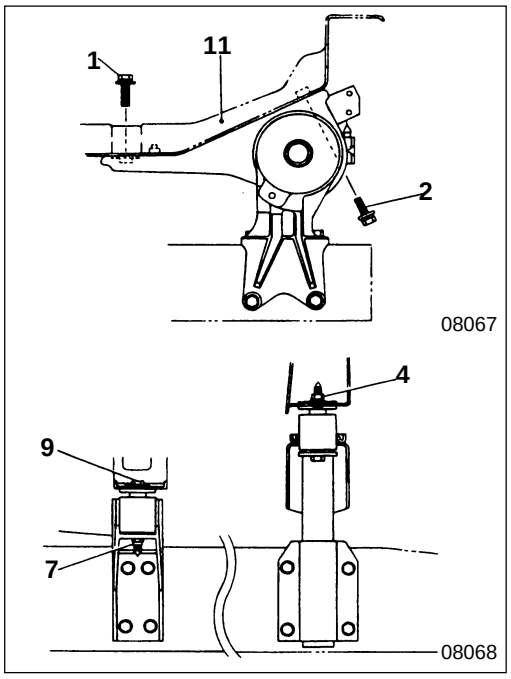


[Installation]

- Mount hoist attachment **A** at center-of-gravity point **D** of cab assembly **11**. P42-33



- Slowly lower cab assembly **11** horizontally to insert steering yoke ***d** into steering shaft ***e**, aligning alignment mark **E**.



- Slowly lower cab assembly **11** further, and remove hoist attachment **A** after it comes down fully, then tighten bolts **1**, **2**, **9** and nuts **4**, **7** at specified torque.

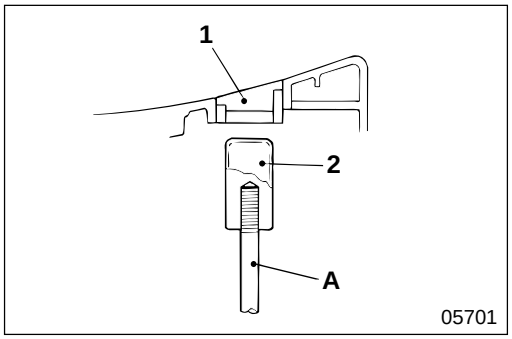
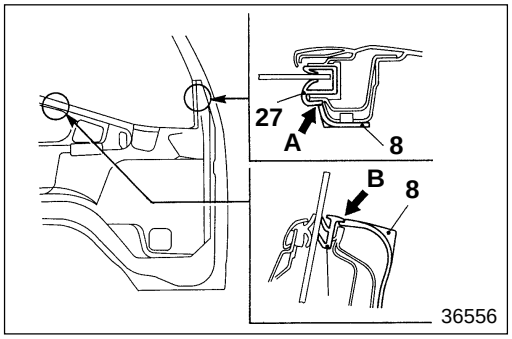
24	Threads of nut	Loctite (Japan) Drylock No. 203	As required
25	Threads of glass holder bolt	Loctite (Japan) Drylock No. 203	As required
29	Sliding surfaces of regulator & rail assembly	Dynamic GB	As required
31	Waterproof cover installation surface of door panel	Butyl tape	As required

◆ Service procedure



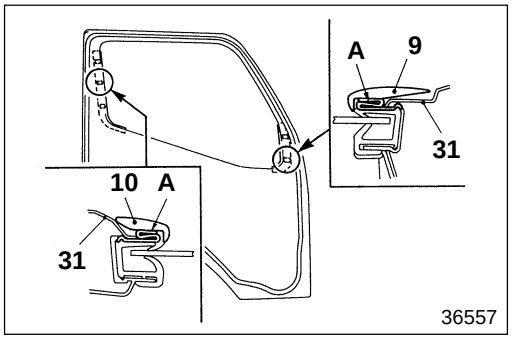
2 **Installation of door lock knob**

- Install door lock knob **2** to door lock rod A of door lock actuator **21**, and turn the knob fully in clockwise direction.
- Back off door lock knob **2** by turning it 1 or 2 turns in counterclockwise direction.
- Position cover **1** to prevent door lock knob **2** from turning.



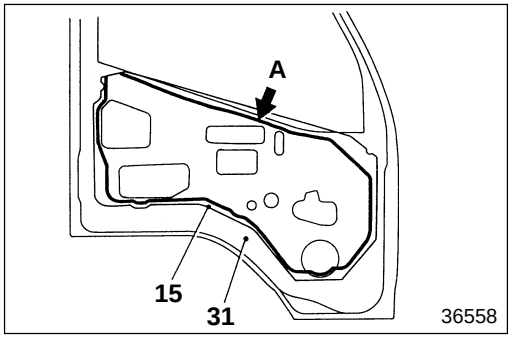
8 **Installation of door trim**

- On the front pillar section, install door trim **8** by pressing it to lip section **A** of run channel **27**.
- On the belt line section, install door trim **8** by pressing it to lip section **B** of inner weather strip **14**.



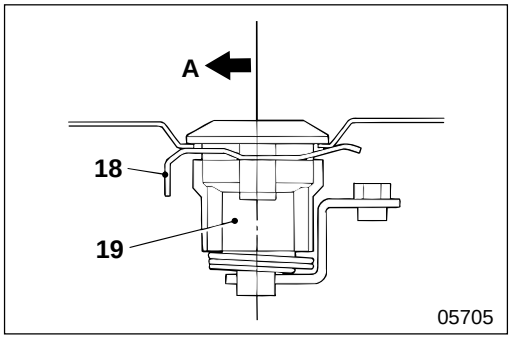
9 **10** **Installation of front and rear garnishes**

- Install clips **A** to door panel **31** prior to the installation of the garnishes.
- Install front garnish **9** and rear garnish **10** to clips **A**.



15 **Installation of waterproof cover**

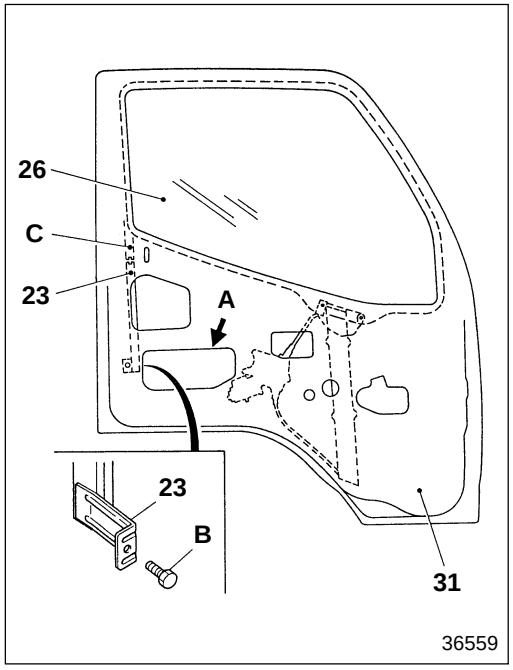
- Apply butyl tape **A** to door panel **31**, as indicated in the illustration.
- Install waterproof cover **15** by pasting onto butyl tape **A**.



19 **Installation of door lock cylinder**

Install door lock cylinder **19** to clip **18** in the direction indicated in the illustration.

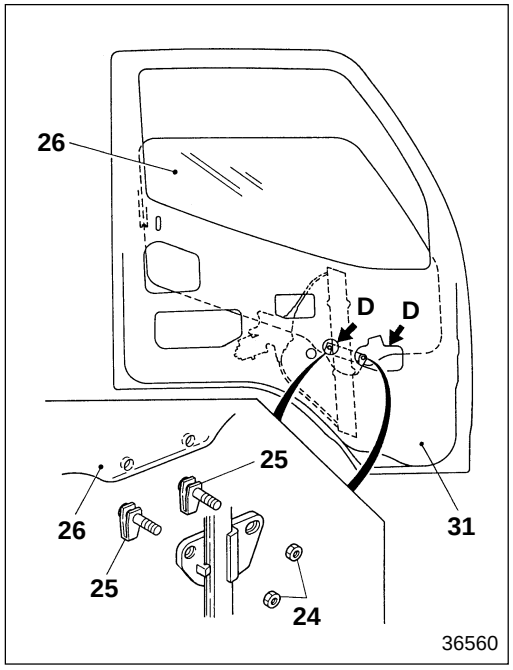
A : Vehicle front side



26 **Removal and installation of door glass**

Remove all parts supporting door glass **26**, then remove the door glass through the open space in the door.

- Pull door glass **26** all the way to the top.
- Remove bolt **B** through hole **A** in door panel **31**, and remove lower sash **23**.
  Note that the lower sash is inserted in upper sash **C**.



- Lower door glass **26** until nut **24** becomes visible through hole **D** in door panel **31**.
- Support door glass **26** by hand, then remove glass holder **25**.
- Remove door glass **26** through the open space in the door.
- To install door glass **26**, follow the removal procedure in reverse.

◆ Service procedure

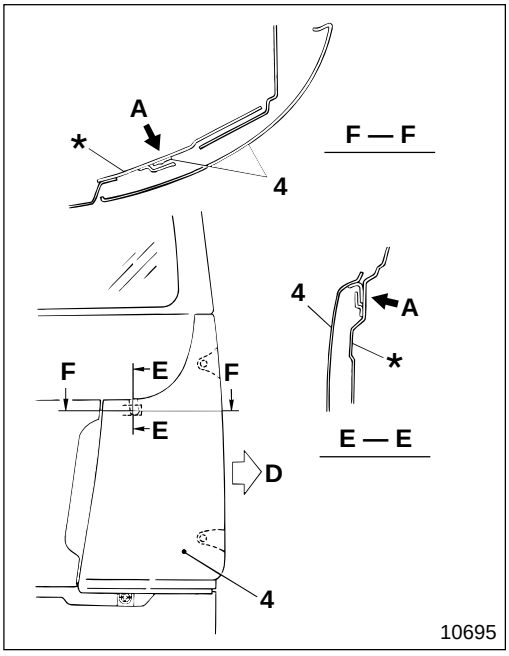
2 Removal and installation of front grille

- Remove screws **1** (two points) from front grilles **2**.
- Lift up the ends of clips **C** (two points), located in the center of front grilles **2**, using a screwdriver, and unlock them from the clips.
- Pull out front grille **2** horizontally, in the vehicle forward running direction, to remove them.

CAUTION

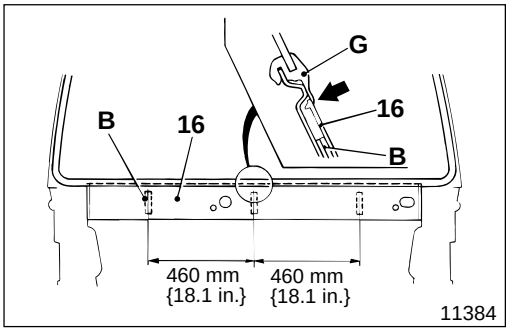
- **Be careful not to apply too much force to front grilles 2, because this would damage them. Be especially careful to avoid applying force to clips D at both sides, support the clips using your hands. If it is hard to remove the front grilles, remove them using nylon jig E as illustrated.**
- **Be careful not to use force when you pull out clips F (five points) from the tops of front grille 2, because this would damage them.**

- For installation, follow the removal sequence in reverse.



3 4 Installation and removal of front side panels RH, LH

- Move front side panels RH **3**, LH **4** to the outside of the vehicle to remove them from the cab assembly *.
  A : Pawl
  (The illustration shows front side panel LH **4**.)
- For installation, follow the removal sequence in reverse.



16 Installation of front garnish

NOTE

When installing front garnish 16, be careful not to catch weatherstrip G of the windshield.

12 Main mirror stay
13 Outside mirror stay assembly, RH

⊗ : Non-reusable parts

● **Installation sequence**

Follow the removal sequence in reverse.

NOTE

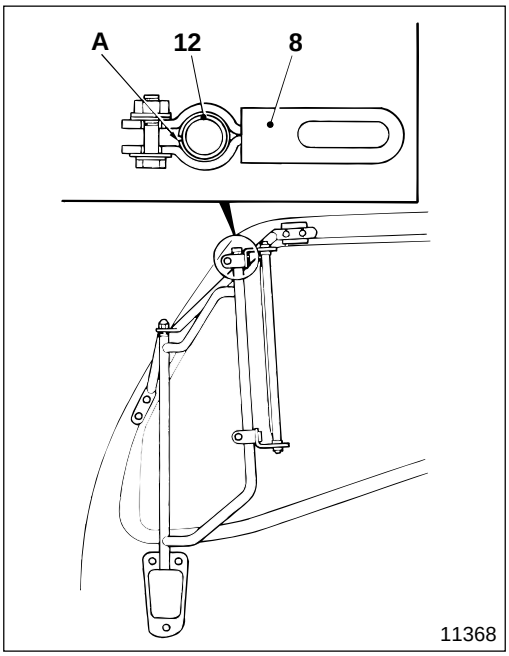
For outside mirror stay assembly RH 13, follow the same service procedure as for outside mirror stay assembly LH 1.

Ⓣ Tightening torque

Unit : N·m {ft.lbs, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
2	Nut (Sub mirror stay and main mirror stay mounting)	24.5 to 29.4 {18 to 22, 2.5 to 3.0}	—

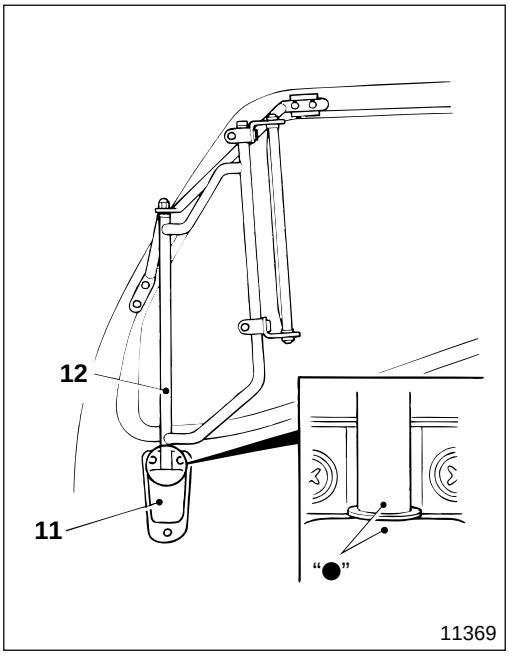
◆ Service procedure



8 **Installation of mirror holder**

Install mirror holder **8** onto main mirror stay **12** in the direction as illustrated.

A : Indent of main mirror stay **12**.



12 **Installation of main mirror stay**

Install main mirror stay **12** and lower bracket **11** so that alignment marks "●" are aligned.

WIPER AND WASHER

22 Packing washer
23 Nut
24 Bolt (L : 16 mm {0.63 in.})
25 Bolt (L : 12 mm {0.47 in.})
26 Wiper motor bracket
27 Bolt
28 Wiper motor Gr 54

***1** : Front garnish
***2** : Assistant driver's side lower panel P42-66

NOTE

Before disassembling parts 11 to 28, remove the instrument panel to allow access to them. P42-66

● **Assembly sequence**

Follow the disassembly sequence in reverse.

Service standards

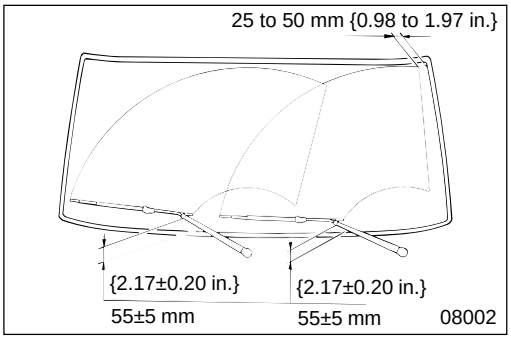
Location	Maintenance item	Standard value	Limit	Remedy
2	Wiping force of wiper arm	5.7±0.49 N {1.28±0.11 lbf, 0.58±0.05 kgf}	—	Replace

Tightening torque

Unit : N·m {ft.lbs, kgf·m}

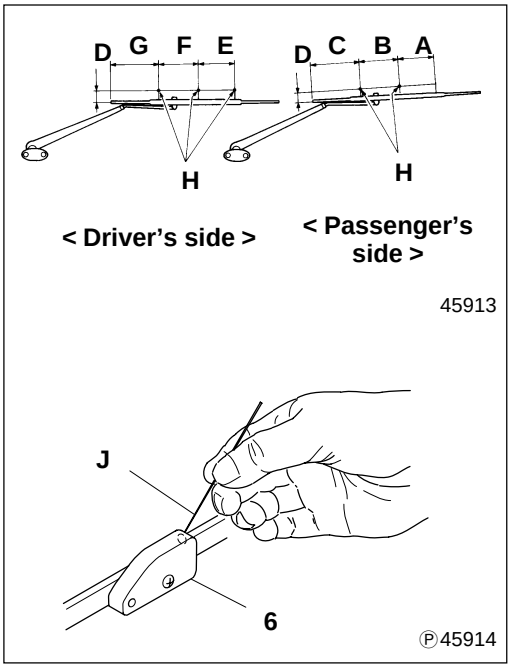
Location	Parts to be tightened	Tightening torque	Remarks
1	Nut (Wiper arm and blade assembly mounting)	9.8 to 15 {7.2 to 11, 1 to 1.5}	—
10	Nut (Packing washer mounting)	14 to 20 {10 to 14, 1.4 to 2}	—
12	Nut (Hose joint mounting)	0.6 to 0.9 {0.4 to 0.7, 0.06 to 0.09}	—
19	Nut (Wiper link mounting)	9.8 to 15 {7.2 to 11, 1 to 1.5}	—
23	Nut (Wiper motor and wiper link mounting)	1.7 to 2.4 {1.2 to 1.7, 0.17 to 0.24}	—
24, 25	Bolt (Wiper motor bracket mounting)	9.8 to 15 {7.2 to 11, 1 to 1.5}	—
27	Bolt (Wiper motor mounting)	5.4 {4, 0.55}	—

◆ Service procedure



2 **Installation of wiper arm and blade assembly**

Install wiper arm and blade assembly **2** so that dimensions from the edges of the weatherstrip are as illustrated.



6 **Inspection of washer nozzle assembly**

Make sure that washer fluid spreading target positions **H** are within dimensions **A** to **G**. (Illustration shows the view from inside cab.)

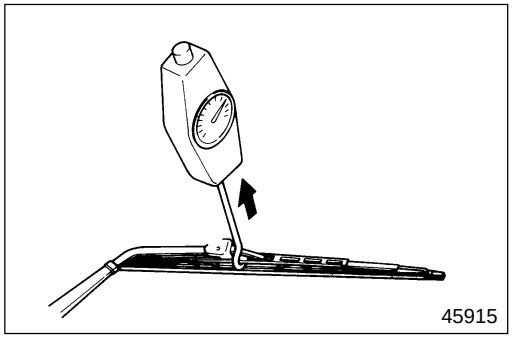
Unit : mm {in.}

		H
Passenger's side	A	–
	B	195 {7.68}
	C	129 {5.08}
Driver's side	D	13.5 {0.53}
	E	–
	F	212 {8.35}
	G	124 {4.88}

If washer fluid spreading target positions **H** deviate from these dimensions, adjust the jet hole angle of washer nozzle assembly **6** using wire **J**.

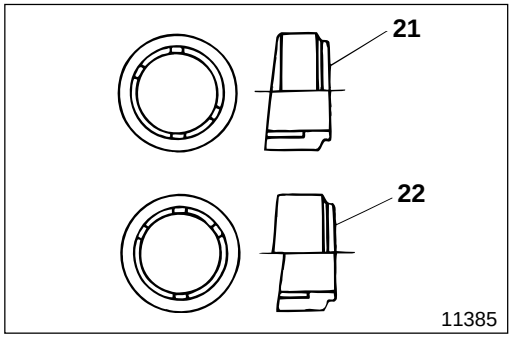
CAUTION⚠

Be careful not to damage the jet hole of washer nozzle assembly 6 with wire J when adjusting the angle.



8 **Inspection of wiper arm**

If the measured value deviates from the standard value, replace wiper arm **8**.



21 **22** **Packing washer**

Because the shape of packing washer **21** for the passenger's side and packing washer **22** for the driver's side are different, be careful not to mix them up during assembly.

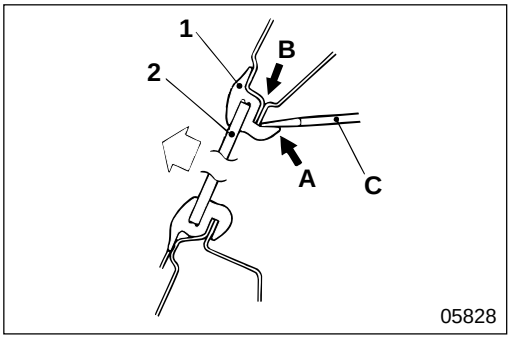
Lubricant

Location	Points of application	Kinds	Quantity
1, 3	Lip area of weatherstrip	Soapy water	As required

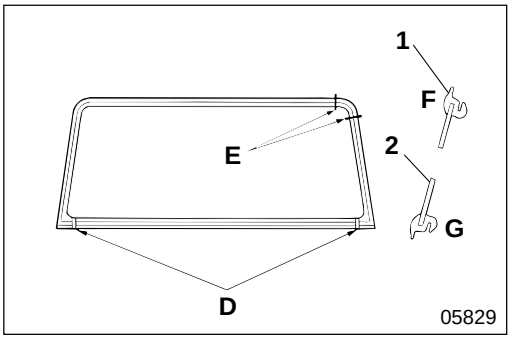
◆ Service procedure



1 **2** **Weatherstrip and windshield**

[Removal]

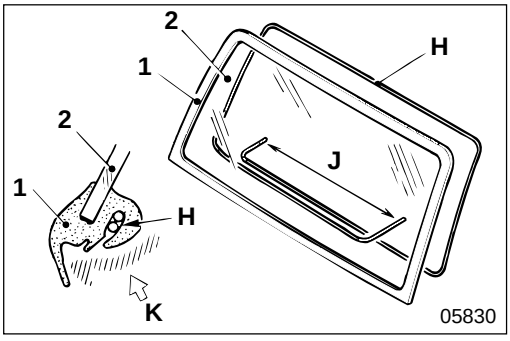
- From the inside of the cab, separate lip **A** of weatherstrip **1** from flange lip **B** of the cab.
  C : Screwdriver
- Push windshield **2** outward to remove it from the cab.



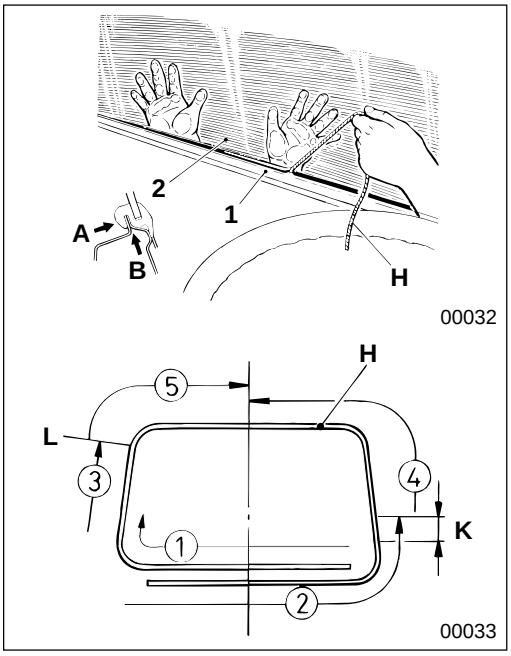
[Installation]

When installing the windshield, pull cord **H** attached to weatherstrip **1** and turn over lip **A**, following the procedure below:

- Position drain hole **D** and joint part **E** of weatherstrip **1** as illustrated and install them on windshield **2**.
  F : Outside
  G : Inside



- Lay cord **H** in the cab mounting groove of weatherstrip **1** as illustrated, and overlap the cord at the lower side of the glass by the specified length, see **J**.
- Apply soapy water **K** to weatherstrip **1**.
- Align windshield **2** with the cab.

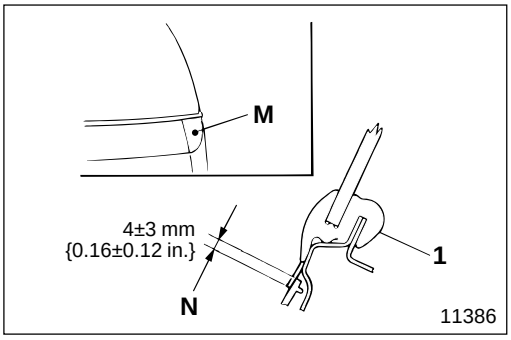


- Push windshield **2** inward from the outside of the cab firmly.
- Inside the cab, pull one end of cord **H** to install lip **A** of weatherstrip **1** into flange lip **B** of the cab.

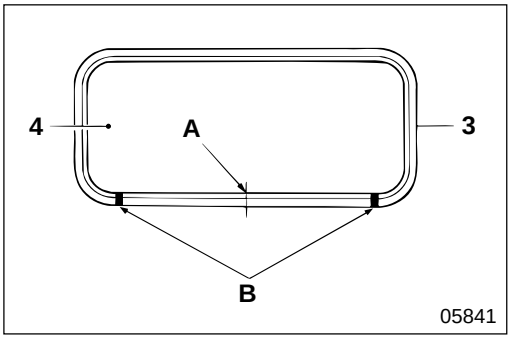
- Pull cord **H** in the numbered order as illustrated and at the same time have someone push windshield **2** into weatherstrip **1**, tapping the windshield with a rubber-headed mallet.
  - **K** : approximately 100 mm {3.94 in.} from the starting point of the straight section
  - **L** : up to the end of the straight section

CAUTION ⚠

Make sure that windshield 2 is installed correctly into the cab before hitting the windshield with the rubber-headed mallet, otherwise the windshield might be broken.



- Provide an overlapped margin **N** on weatherstrip **1** and side garnish **M** to prevent water flowing backwards from the water drain hole.



3 **4** **Weatherstrip, rear window glass**

- Install so that joint **A** of weatherstrip **3** is at the bottom center of rear window **4**.
  - **B** : Water drain hole
- Except for the point mentioned above, follow the same service procedure as for installation of the windshield. 🕮 P42-70

HOW TO READ THIS GROUP

HOW THIS GROUP IS STRUCTURED 2

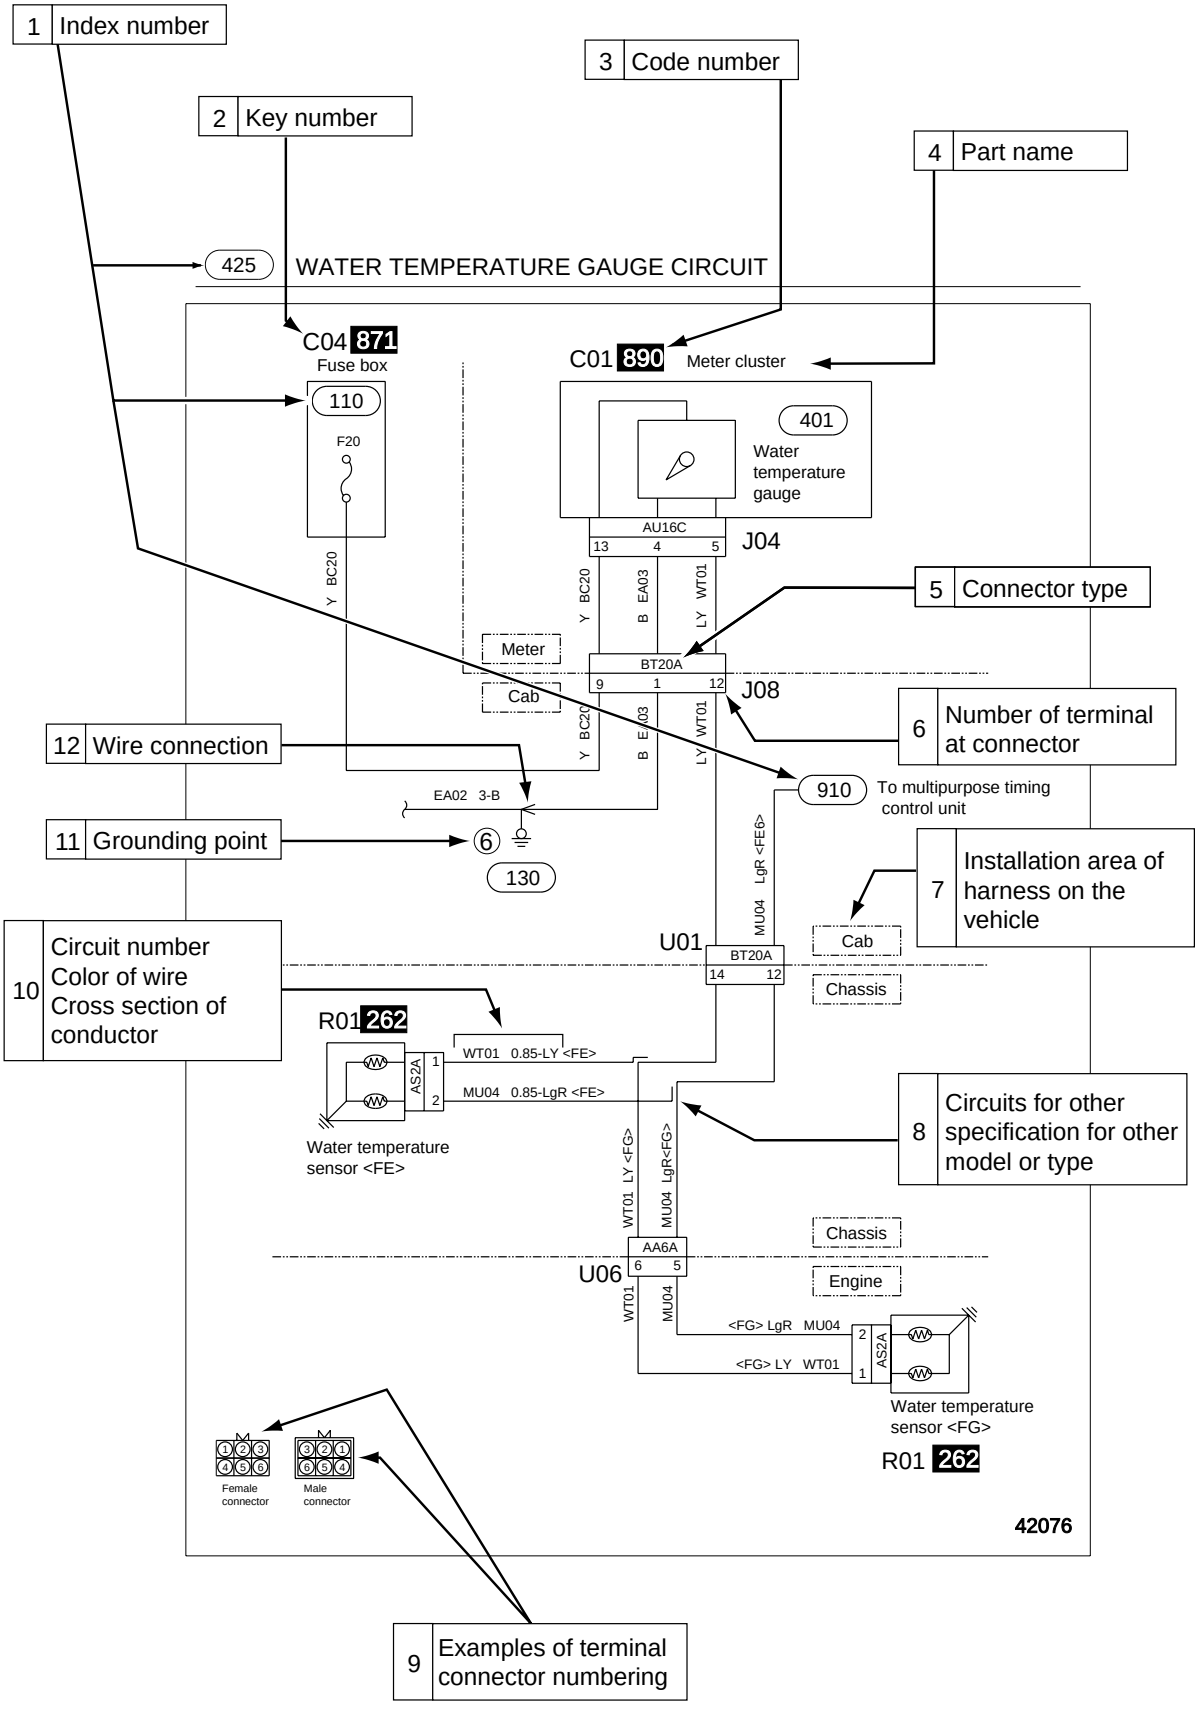
HOW TO READ CIRCUITS(GROUP 54)



1 Index number: (110)

Each circuit has its own Index number respectively and has three digits ((110)).
How to read index number

- By proper using of the index number, it is possible to locate the correct place immediately since the circuit drawing of this manual book are classified as function by function. (including “POWER CIRCUIT” (110) and “GROUND” (130) .)
- How to check the location of circuit drawing in each part
  The circuit drawing which can not be diagramed in one page due to its complicated structure (such as meter cluster and electronic control unit etc.), has its remarked index number to be connected to other circuit drawing. ((401) , (910) , etc.)

2 Key number: A01~

Key number is the number to indicate the installation position of the parts, and is shown by A01 ~ Z.
The details of the installation position are described in GROUP 10 .

3 Code number: **001** ~

Code number is the number to indicate the one portion of the parts to be checked and has three digits (**001**).
The details of the parts to be checked are described in GROUP 11 .

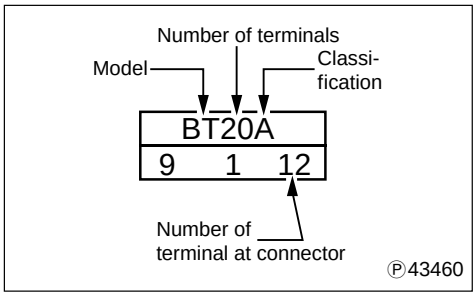
4 Part name

5 Connector type

Connectors are shown by □ without mentioning Male or Female and in the box it is described model of connector, number of terminals and its classification, etc.
Table of connectors is described in GROUP 14.

6 Number of terminal at connector

Terminal numbers of connector are shown by figures in the box.



7 Installation area of harness on the vehicle

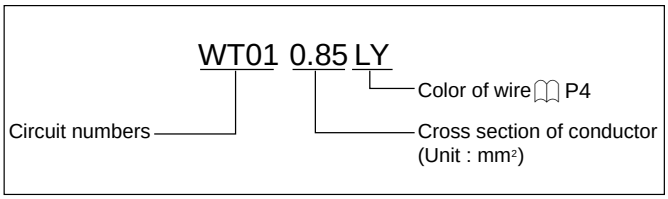
The location and boundary of the harnesses in the vehicle are shown in the each circuit drawing and it may help to check mounting position of connectors.

8 Circuits for other specification for other model or type

9 Examples of terminal connector numbering

As it is shown, for female connectors, with placing the lock upward then starting to put numbers from the upper left. And when it is male connector, put numbers from the upper right, also with placing the lock upward.

10 Circuit number, color of wire, and cross section of conductor are shown in circuit drawings.



Except for 0.5mm², Wire thickness is described in the circuit drawing. The reason why only wire thickness, 0.5 mm² is not described in the drawings is 0.5mm² is so common and so that the circuit drawing can be seen more easily.
(Examples) 0.5mm²: Y
0.85mm²: 0.85 — LY
3mm²: 3 — B

11 Grounding point

The actual locations of grounding points on the vehicle are shown. Refer to (130) for detailed information.

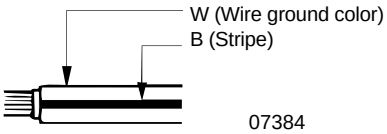
12 Wire connection

When the wires are connected into one point of the harnesses, the circuit drawing shows “Arrow mark”.

CAUTION !
Be careful that direction of the arrow does not show the direction of the electric current flow.

● Wire Colors

Example: WB means a wire whose ground color is white and whose stripe is black.



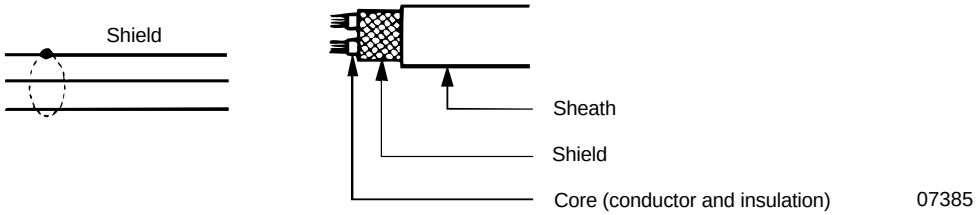
07384

Wire ground color		Wire ground color + Stripe							
W	White	WR	White red	WB	White black	WL	White blue	WG	White green
B	Black	BW	Black white	BY	Black yellow	BR	Black red		
R	Red	RW	Red white	RB	Red black	RY	Red yellow	RG	Red green
Y	Yellow	YR	Yellow red	YB	Yellow black	YG	Yellow green	YL	Yellow blue
G	Green	GW	Green white	GR	Green red	GY	Green yellow	GB	Green black
Br	Brown	BrW	Brown white						
L	Blue	LW	Blue white	LR	Blue red	LY	Blue yellow	LB	Blue black
Lg	Yellow green	LgR	Yellow green red	LgY	Yellow green yellow	LgB	Yellow green black	LgW	Yellow green white
O	Orange								
P	Pink	PB	Pink black						

● Shield Wire

A shield wire is clearly identified as follows:

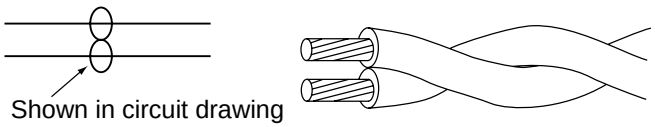
Example



07385

● Twist wire

Twist wires are made by twisting the core of wires by the constant pitch.
Example:



Ⓟ43533

0 GENERAL

SPECIFICATIONS

Battery

Item	Specifications
Model	115E41R
Voltage × Quantity	12 × 2 (Parallel connection)
Capacity (5-hour rating)	88

Alternator

Item	Specifications	
	4D3	4M5
Manufacturer	MITSUBISHI ELECTRIC	
Type	Alternator with built-in regulator (without brush external fan)	
Model	A4TU0488	A4TU0781
Output V-A	12-100	

Engine starter, Glow

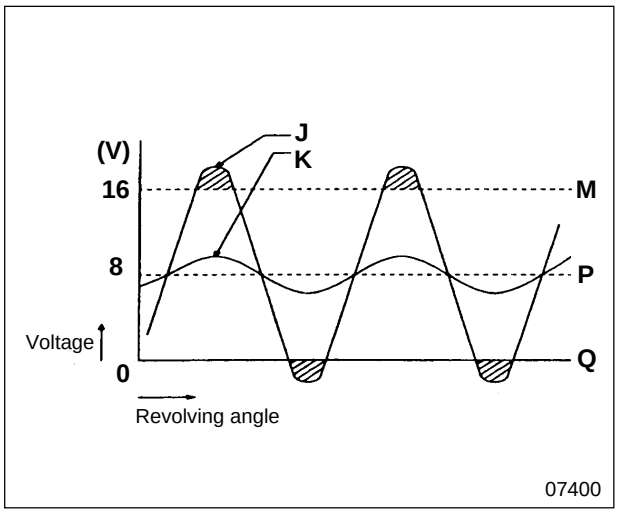
Features of alternator with neutral diodes

- The alternator is the same as the current alternator except neutral diodes **C** and **D** added.
- These neutral diodes **C** and **D** enable this alternator to provide higher DC output during operation at high speeds than the alternator without neutral diodes.

A : Stator coil
B : Alternator terminal B
E : Alternator terminal E
F : IC regulator
L : Alternator terminal L
N : Neutral point
R : Alternator terminal R



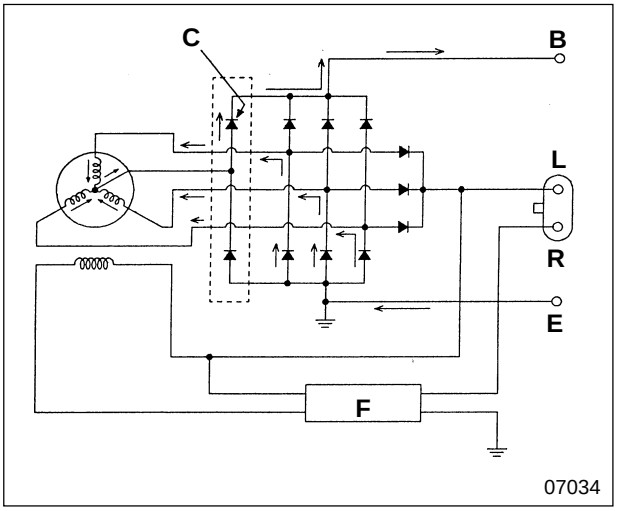
Variations of voltage at neutral point and operation of neutral diodes

- The potential at the neutral point **N** varies up and down with the neutral point DC voltage **P** as a center as shown.
- When alternator is operated at high speeds, the voltage at the neutral point **N** can increase to exceed the output voltage **M** (16 volts) and decrease to become lower than the ground voltage **Q** (0 volt). To adjust these over-voltage and under-voltage (shaded portions of diagram) the current from the excess voltages is taken by neutral diodes **C** and **D** and added to the DC output.

J : Voltage waveform at neutral point during high speed operation
K : Voltage waveform at neutral point during low speed operation
M: Output voltage
P : Average voltage at neutral point (1/2 of output voltage)
Q: Ground potential

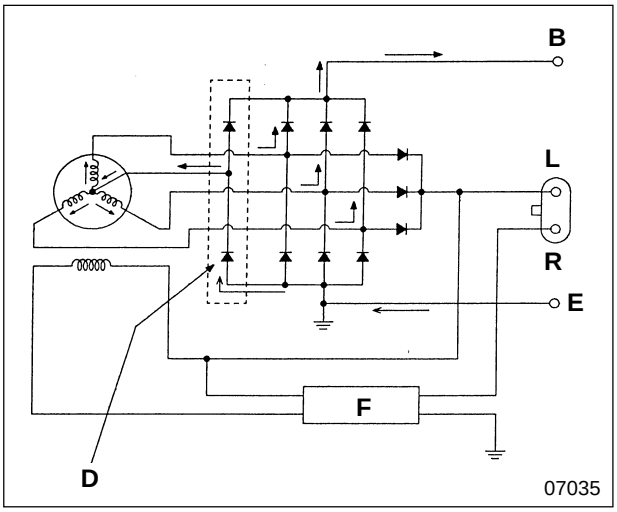
The operation of neutral diodes **C** and **D** for each voltage and potential is as follows.

- When the voltage at neutral point is in the range from 0 to 16 volts, the other 6 diodes are operated. Neutral diodes are not operated.



● **When the voltage at neutral point exceeds 16 volts**

The positive diode **C** adds extra output to the DC output for supply to each electric equipment.

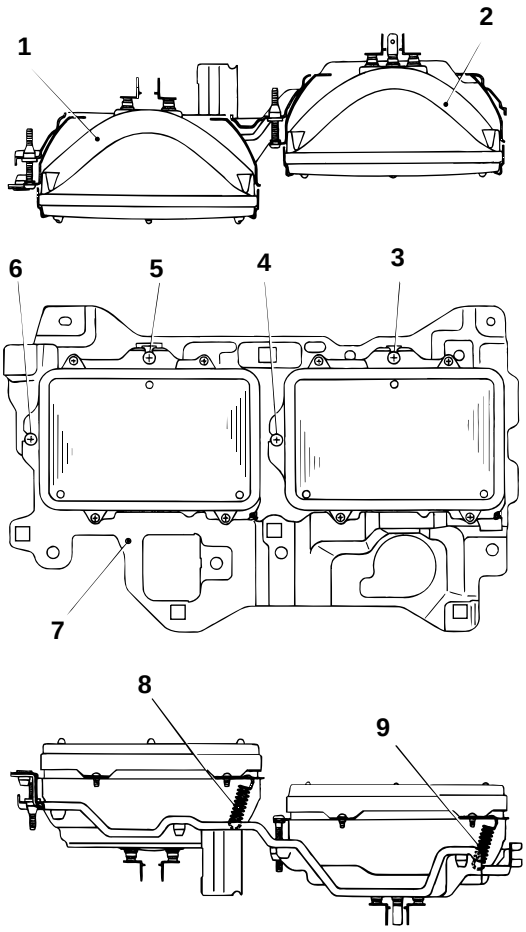


● **When the voltage at neutral point drops below 0 volt**

The negative diode **D** supplies the output from neutral point through the other 3 diodes.

3. Lamp

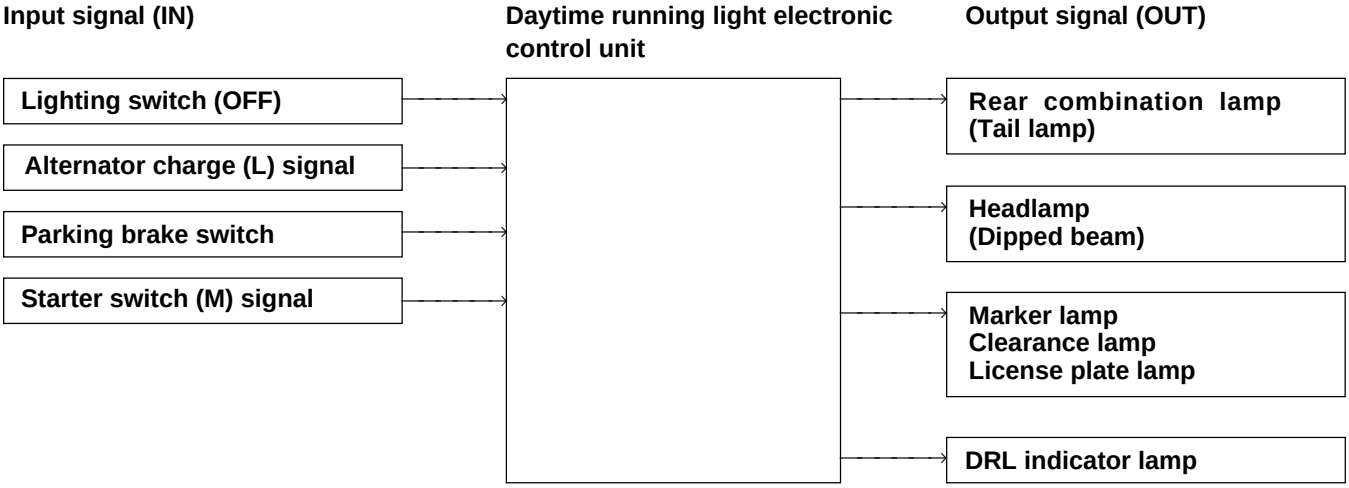
Headlamp



1 Sealed beam unit (Main beam)
2 Sealed beam unit (Dipped beam)
3 Screw (Dipped beam, vertical adjustment)
4 Screw (Dipped beam, horizontal adjustment)
5 Screw (Main beam, vertical adjustment)
6 Screw (Main beam, horizontal adjustment)
7 Housing
8 Extension spring
9 Extension spring

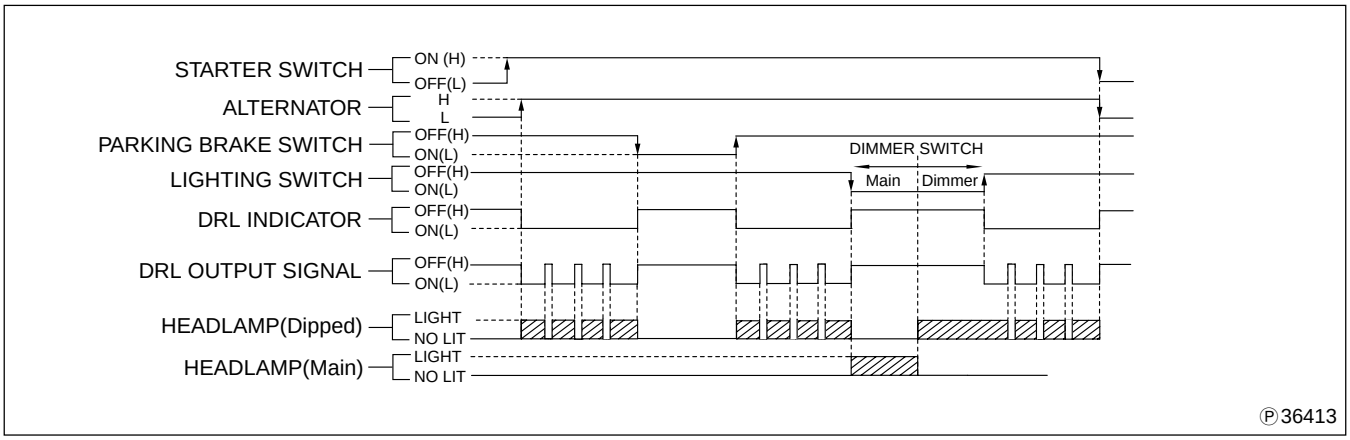
- The headlamp unit consists of sealed beam units **1, 2** separately installed in housing **7**. Sealed beam unit **1** is for Main beam, and sealed beam unit **2** is for Dipped beam.
- The headlamp aiming can be adjusted by changing the installation angle of sealed beam units **1, 2**.
- To adjust the installation angle of sealed beam unit **1**, turn screws **5, 6**. Extension spring **8** sets the angle of the sealed beam unit.
- To adjust the installation angle of sealed beam unit **2**, turn screws **3, 4**. Extension spring **9** sets the angle in the same way as for sealed beam unit **1**.

Daytime running light system



- In a daytime running light system, regardless the position of lighting switch while engine is running, the dipped beam of the headlamp and the tail lamp of the rear combinations, position lamp, license plate lamp will light on.
- Except for that the lighting switch is OFF or when the passing switch is ON, the same lamps as usual switch operation will light.

• Timing chart



Headlamps repeat ON/OFF operations at 120 Hz according to the above timing chart. Because of the cyclic ON/OFF operations, the headlamps are dimmer than when the headlamp switch is ON.

Explanation of timing chart

- After the engine starts, when alternator begins generating electricity with starter switch in the ON position, headlamps light.
- When parking brake switch is ON, the DRL turns off to switch off the headlamps.

4. MUTIC (Multipurpose Timing Control Unit)

- This control unit is an integrated control unit for controlling the following functions.

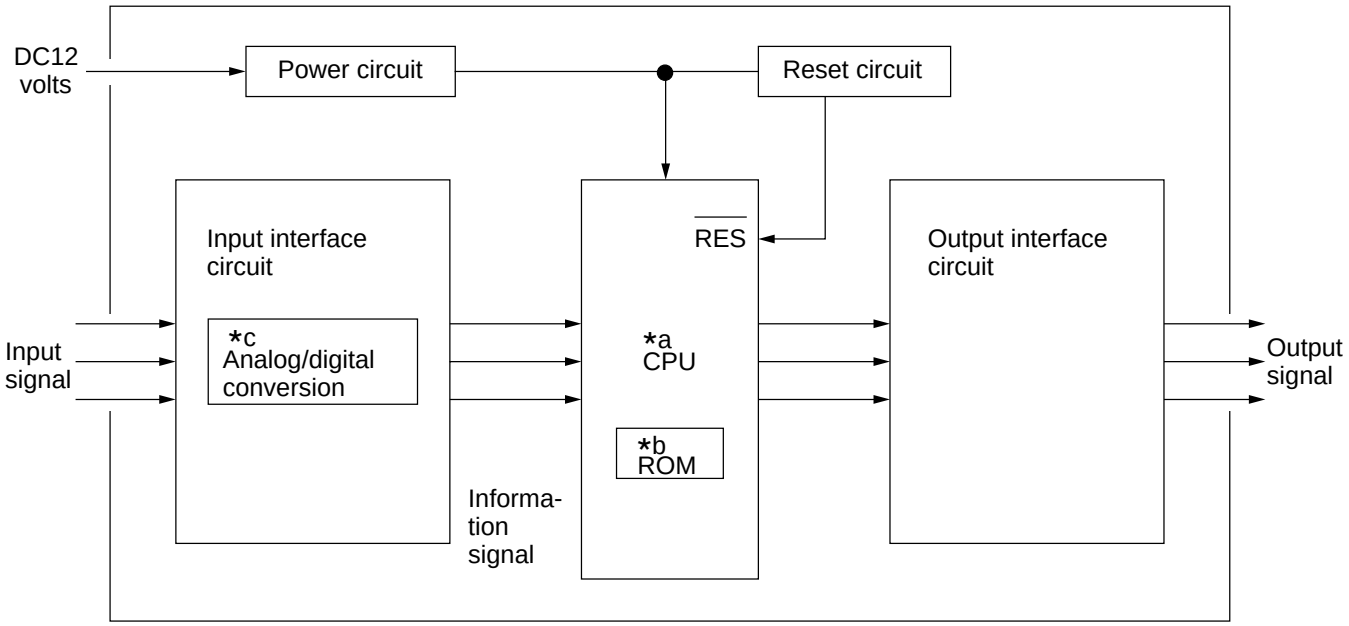
Preheating function 🕮 P54-0-20

Intermittent wiper activation function 🕮 P54-0-19

Starter continuous-ON prevention function 🕮 P54-0-22

- For controlling each function, sensors and switches are needed as sources of information, and they are provided for respective systems.
- Based on the information provided by the sensors and switches, the MUTIC controls above functions by means of the circuits inside itself.

● **Internal structure of MUTIC**



- The MUTIC is internally made up roughly of the input interface circuit, CPU*a, ROM*b, and output interface circuit.
  *a: An abbreviation for Central Processing Unit. It compares the input information and the information stored in the ROM and makes a decision and sends commands to the outputs.
  *b: An abbreviation for Read-Only Memory. It is an element used exclusively to have its contents read. It stores fixed data and program, and such retained information is not deleted even after power is cut off.
- Information sources such as sensor, switch send input signal to the input interface circuit.
- The input interface circuit performs A/D conversion*c of the input signals, and the converted signals are transmitted to the CPU as information signals.
  *c: An abbreviation for Analog/Digital conversion. It is a conversion from analog to digital signals. This conversion enables calculation to be made in the CPU.
- The CPU compares the received signals with the data in the ROM, makes a decision, and sends the results to the output interface circuit.
- The output interface circuit transmits these results to each system as output signals to instruct operations.
- Performing these series of operations continuously enables optimum control of each function.

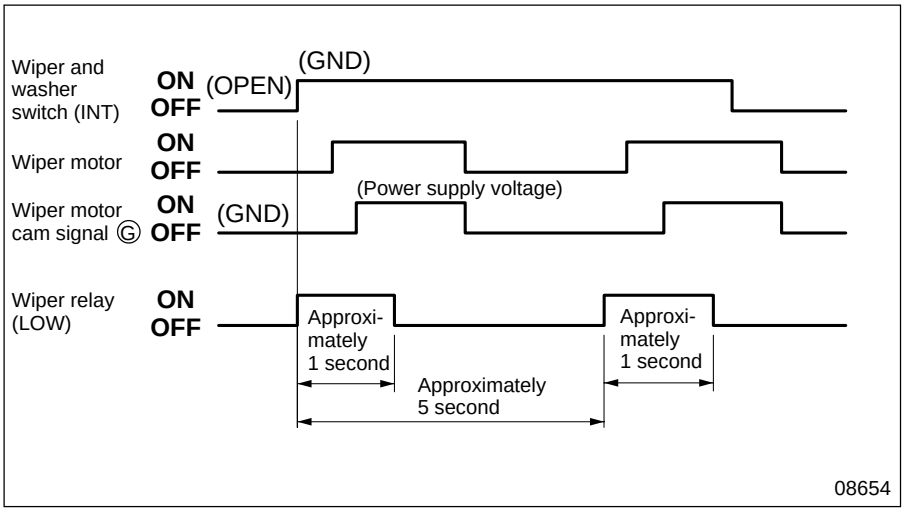
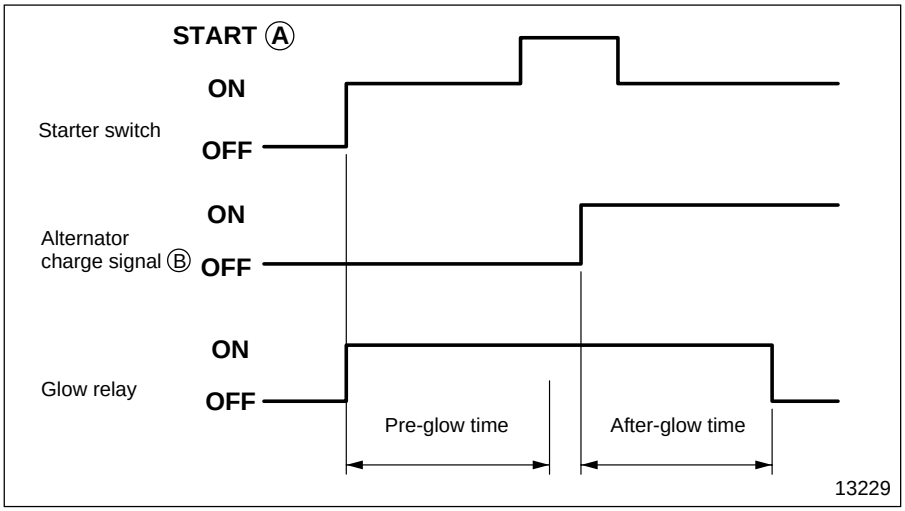
Intermittent Wiper Activation Function



The operation of intermittent wiper is controlled by MUTIC in a mode as shown.

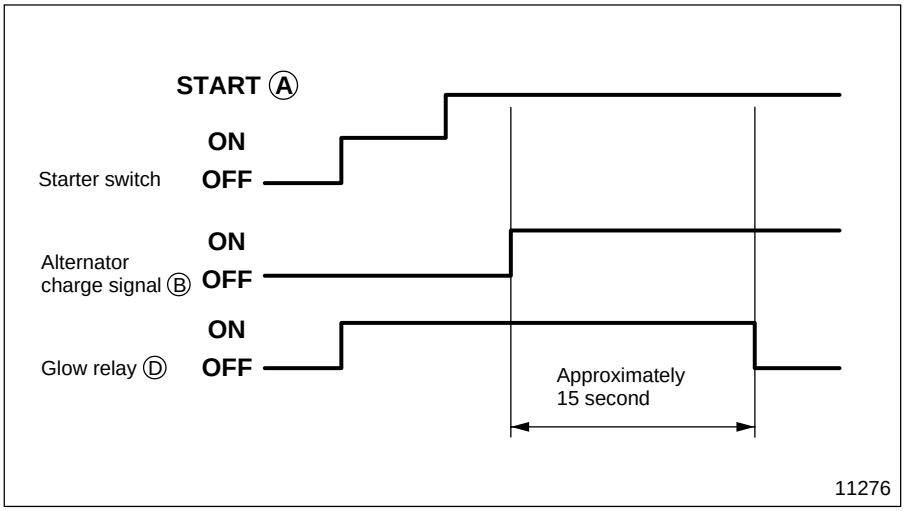
Preheating Function

This preheating function aims to enhance the engine start up when the engine coolant is low in cold weather or temperature.
MUTIC (Multipurpose Timing Control Unit) controls the entire function as follows:



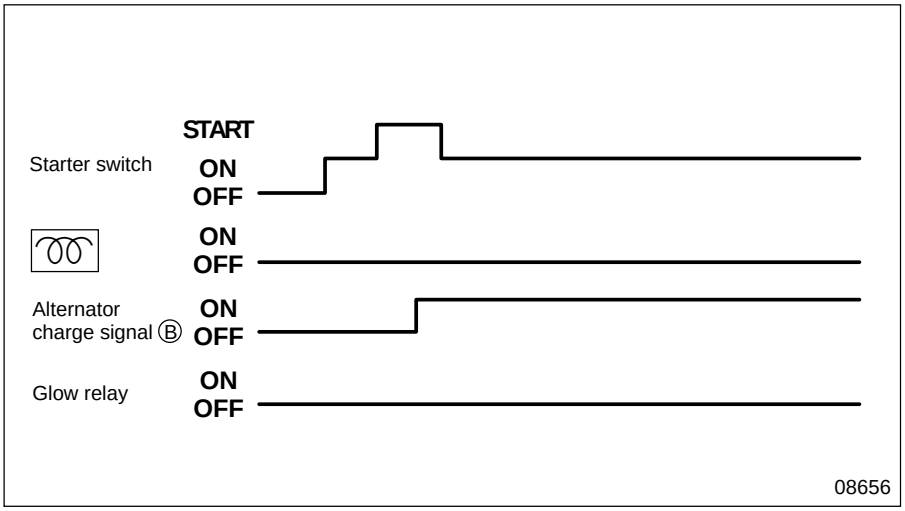
Pre-glow and After-glow

The preheating is operated with a pre-glow before the engine starting and an after-glow after the engine starting, which are controlled by the starter switch (S terminal) signal Ⓐ and the alternator (L terminal) signal Ⓑ.



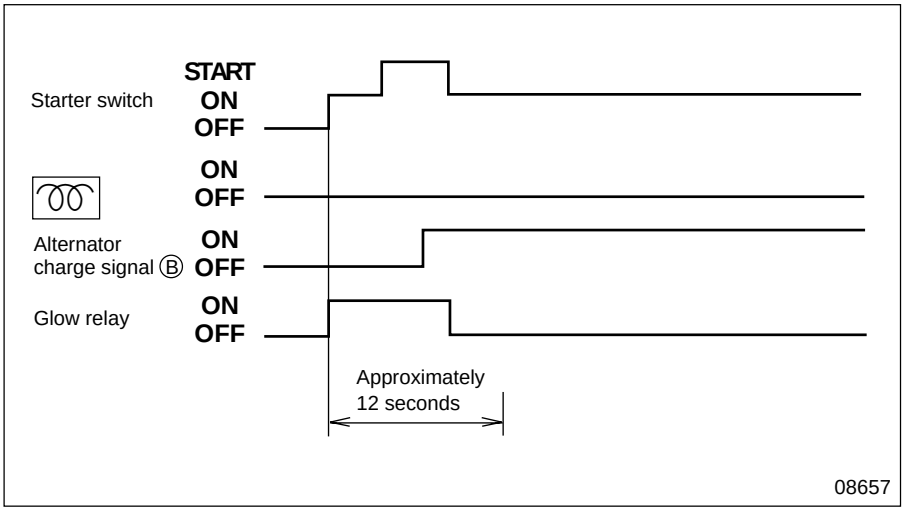
Fail Safe

- In case the contact point operating the glow relay in MUTIC has melted, the preheating indicator lamp flashes to warn this abnormality.
- Operation mode turns glow relay activation signal Ⓓ to OFF only after all the following condi-tions are met.
  - Where the engine coolant temperature is 60°C or less.
  - Alternator (L terminal) signal Ⓑ is ON for 15 seconds continuously.
  - Starter switch (S terminal) signal Ⓐ is ON.

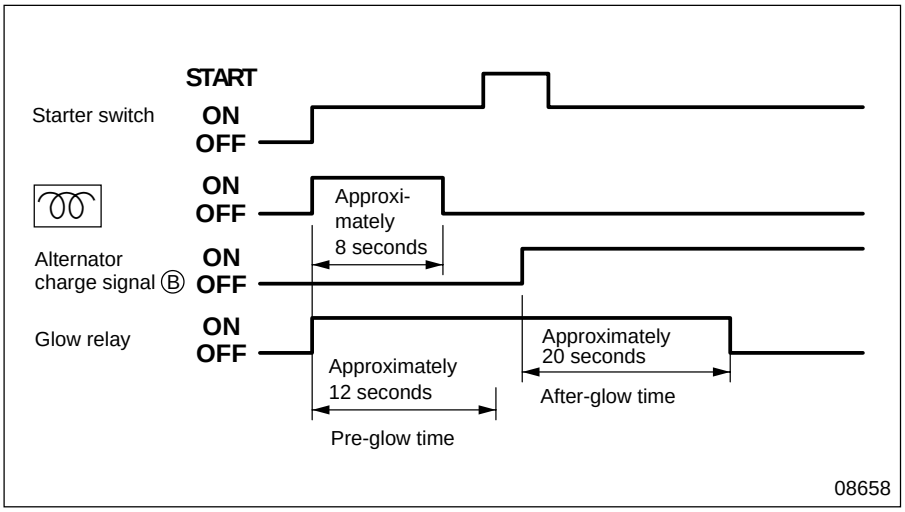


Operation mode

- Where the engine coolant temperature is 60°C {140 °F} or more.



- Where the engine coolant temperature is 0 to 60°C {32 to 140°F}.



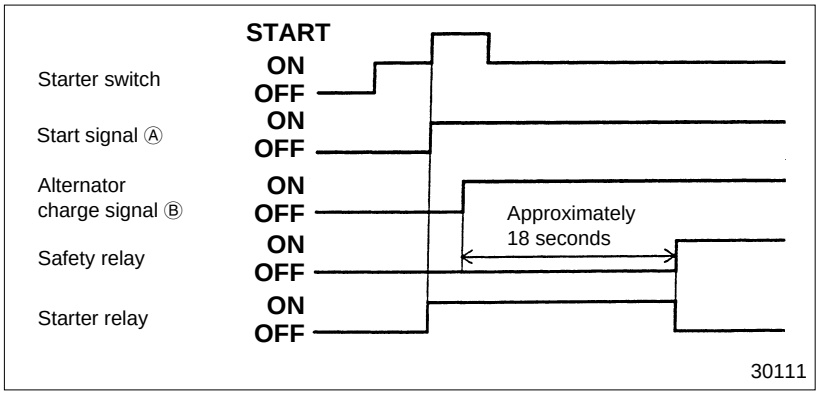
- Where the engine coolant temperature is 0°C {32°F} or less.

Starter Continuous-ON Prevention Function

- This function prevents a starter overrun.
- If the starter continues to operate for more than a preset time after the engine starts, the MUTIC detects a starter continuous-ON condition, and stops the current to the starter and starter relay to prevent the starter from seizing.

When a preset time elapses after the engine starts, the safey relay is activated (opening of contact) by signal Ⓑ from the alternator (terminal L).

Operation mode



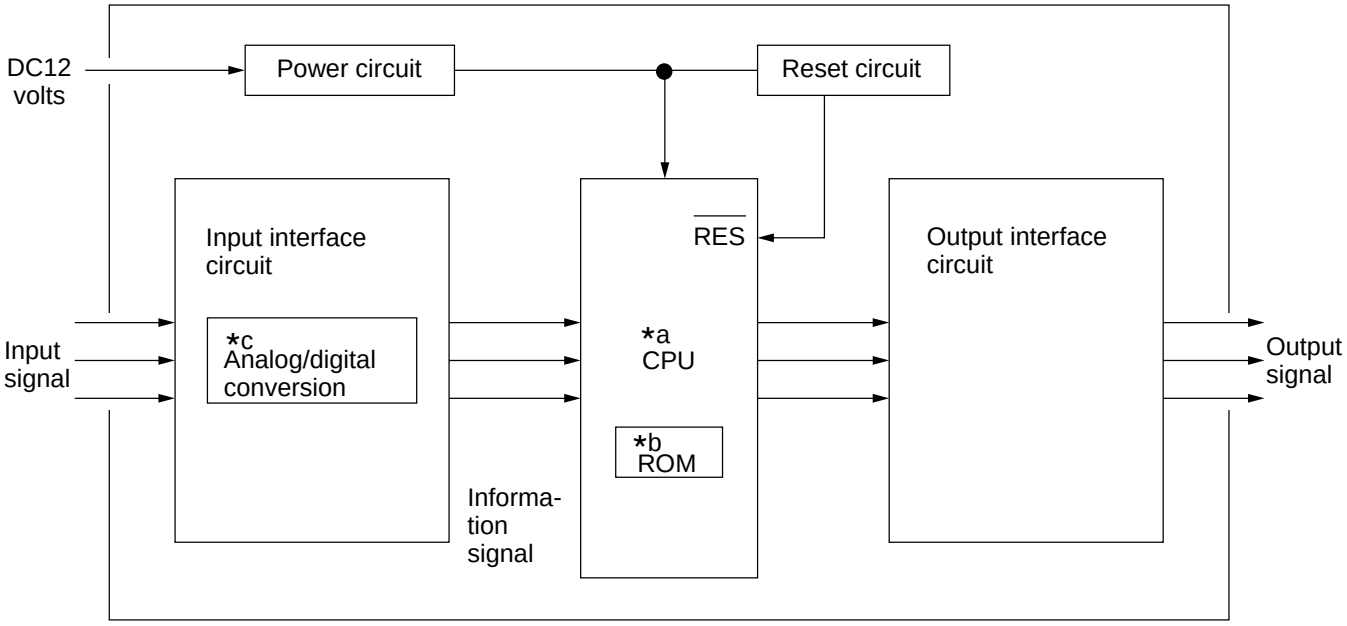
5. LAC (Lighting and Alarm Control Unit)

- This control unit is an integrated control unit for controlling the following functions.

Brake pad wear alarm function 🕮 P54-0-25

- For controlling each function, sensors and switches are needed as sources of information, and they are provided for respective systems.
- Based on the information provided by the sensors and switches, the LAC controls above functions by means of the circuits inside itself.

● **Internal structure of LAC**



- The LAC is internally made up roughly of the input interface circuit, CPU*a, ROM*b, and output interface circuit.
  *a: An abbreviation for Central Processing Unit. It compares the input information and the information stored in the ROM and makes a decision and sends commands to the outputs.
  *b: An abbreviation for Read-Only Memory. It is an element used exclusively to have its contents read. It stores fixed data and program, and such retained information is not deleted even after power is cut off.
- Information sources such as sensor, switch send input signal to the input interface circuit.
- The input interface circuit performs A/D conversion*c of the input signals, and the converted signals are transmitted to the CPU as information signals.
  *c: An abbreviation for Analog/Digital conversion. It is a conversion from analog to digital signals. This conversion enables calculation to be made in the CPU.
- The CPU compares the received signals with the data in the ROM, makes a decision, and sends the results to the output interface circuit.
- The output interface circuit transmits these results to each system as output signals to instruct operations.
- Performing these series of operations continuously enables optimum control of each function.

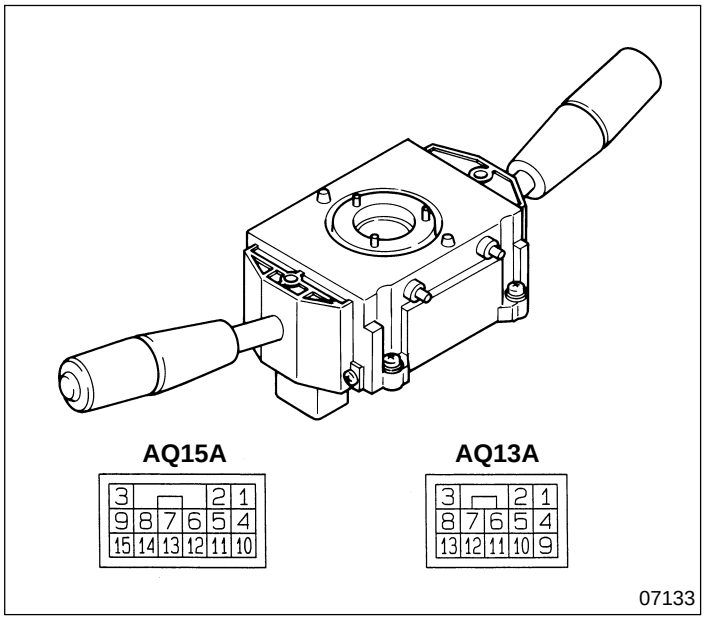
11 INSPECTION OF PARTS



001 Inspection of combination switch

- Follow the table below to check for continuity.
  ○—○ : There is continuity between terminals.
- If any fault is found, replace the switch.

AQ13A Connector connection table

002 Inspection of starter switch

- Follow the table below to check for continuity.
- If any fault is found, replace the switch. Gr 37

(1) Inspection of continuity

	AP2A		AN6A		
	②	①	③	④	②
LOCK					
• (OFF)					
ACC	○		○		
ON	○	○	○	○	
START	○	○		○	○
	B	M	A	F	S

○—○ : There is continuity between terminals.

(2) Inspection of key interlock solenoid <automatic transmission>

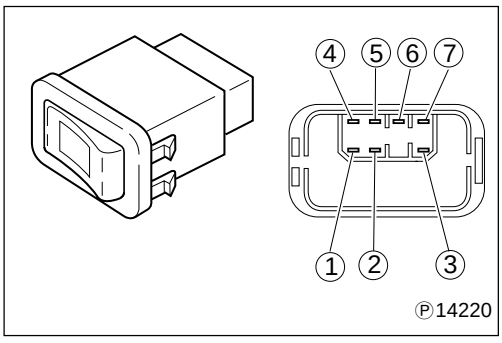
	AN2A ①	AN2A ②	LOCK	ACC	ON	START	Condition of plunger C
Motion of Starter	⊖	⊕		←	—	→	Plunger C is locked and starter key D cannot be pulled out
Key D				←	—	→	Plunger C is free and starter key D can be pulled out

⊕—⊖ : Indicates the terminals where battery voltage is to be applied.

E : Key interlock solenoid

011 Inspection of rheostat switch

- Rheostat switch contains a control circuit, because of this it is difficult to inspect rheostat switch independently, therefore you should inspect the rheostat switch indirectly, by inspecting the system harness and the related parts.
- If no fault is found in the related parts but the system is faulty, replace the switch.



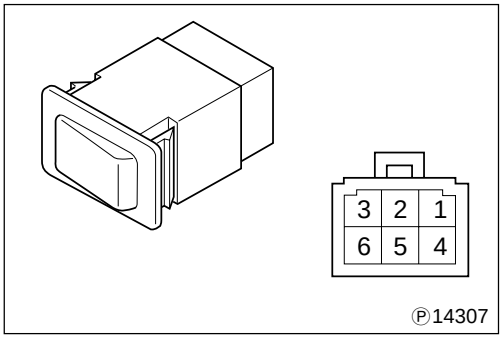
012 Inspection of warm-up switch

- Follow the table below to check for continuity.

	①	⑤
ON	○	○
OFF		

○—○ : There is continuity between terminals.

- If any fault is found, replace the switch.



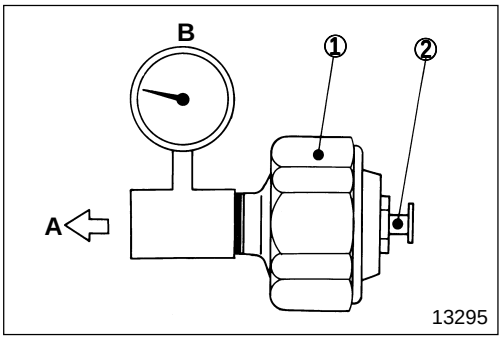
020 Inspection of engine oil level check switch

- Follow the table below to check for continuity.

	①	③
ON (CHECK)	○—○	
OFF		

○—○ : There is continuity between terminals.

- If any fault is found, replace the switch.



023 Inspection of vacuum switch

Perform the following checks, and if any fault is found, replace the switch.

(1) Inspection by without applying vacuum

Make sure that if there is no continuity between terminals ① and ② (body).

(2) Inspection by applying vacuum

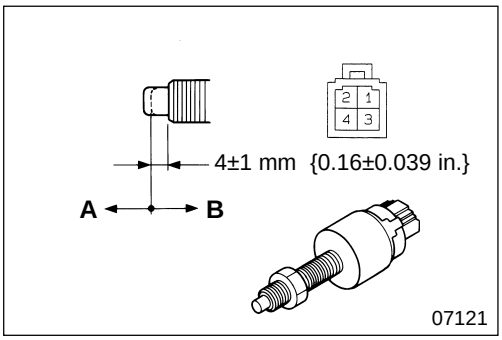
- Gradually apply vacuum **A** to vacuum switch starting from 0 kPa {0 in.Hg, 0 mmHg}.
- Measure the degree of vacuum at the moment when continuity is detected between terminals ① and ② (body), and make sure to confirm if the value meets to the standard.

B: Vacuum gauge

Standard value	$-(47^{+3.3}_{-4.0})$ kPa {$-(13.8^{+0.98}_{-1.18})$ in.Hg, $-(350^{+25}_{-30})$ mm Hg }

027 Inspection of power window switch, and power window and auto door lock switch

- Switch contains a control circuit, because of this is difficult to inspect switches independently, therefore you should inspect the system harness, power window motor, door lock actuator etc. the related parts.
- If no fault is found in the related parts but the system is faulty, replace switches.



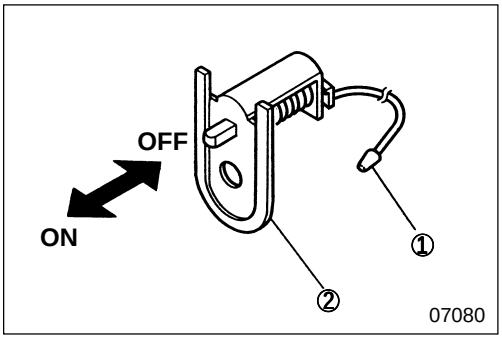
031 Inspection of clutch switch

- Follow the table below to check for continuity.

	①	②	③	④
A	○			○
B		○	○	

○—○ : There is continuity between terminals.

- If any fault is found, replace the switch. Gr 21



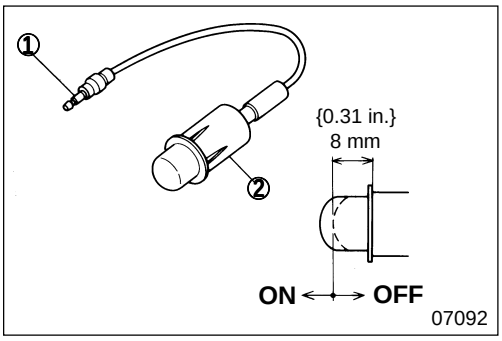
035 Inspection of door switch

- Follow the table below to check for continuity.

	①	②
OFF		
ON	○—○	

○—○ : There is continuity between terminals.

- If any fault is found, replace the switch. Gr 42



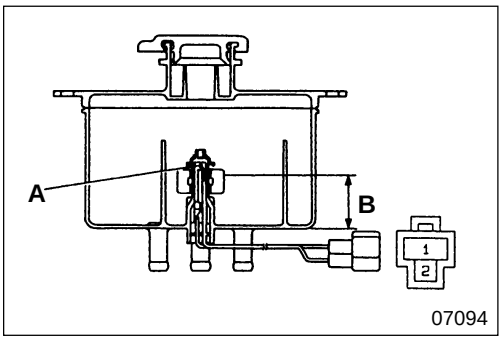
038 Inspection of parking brake switch

- Follow the table below to check for continuity.

	①	②
OFF		
ON	○—○	

○—○ : There is continuity between terminals.

- If any fault is found, replace the switch. Gr 36



041 Inspection of brake fluid level switch

- Remove brake fluid slowly from fluid tank assembly.

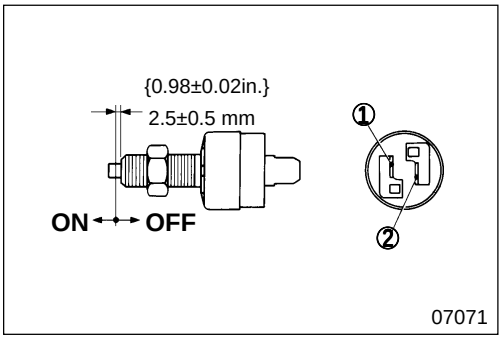
CAUTION ⚠

If brake fluid gets on a painted surface it will dissolve the paint, so wipe it off immediately.

- Measure the height **B** of switch **A** when the continuity is detected between terminals ① and ②.

Standard value	41.0±3 mm {1.61±0.12 in.} (equivalent to 120cm³ {7.32 cu.in., 0.12L})

- If the measured value deviates from the standard value, replace the brake fluid tank assembly. Gr 42



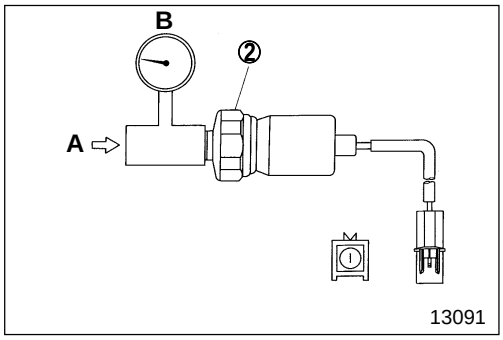
042 Inspection of stop lamp switch

- Follow the table below to check for continuity.

	①	②
ON	○—○	
OFF		

○—○ : There is continuity between terminals.

- If any fault is found, replace the switch. Gr 35A



044 Inspection of engine oil pressure switch

Perform the following checks, and if any fault is found, replace the switch.

(1) Inspection by without applying air pressure

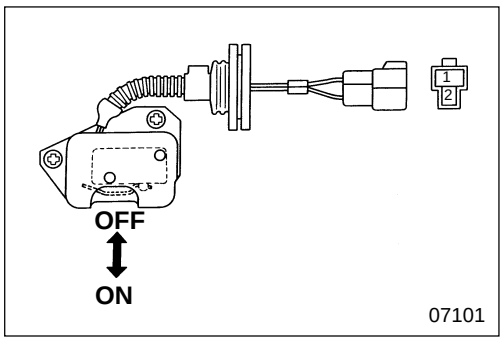
Make sure that there is continuity between terminals ① and ② (body).

(2) Inspection by applying air pressure

- Gradually apply air pressure **A** to the switch starting from 0 kPa {0 psi, 0 kgf/cm²}.
- Measure the degree of air pressure at the moment when continuity is not detected between terminals ① and ② (body), and make sure to confirm if the value meets the standard.

B : Air pressure gauge

Standard value (operating pressure)	49±9.8 kPa {7.1±1.4 psi, 0.5 ± 0.1 kgf/cm²}



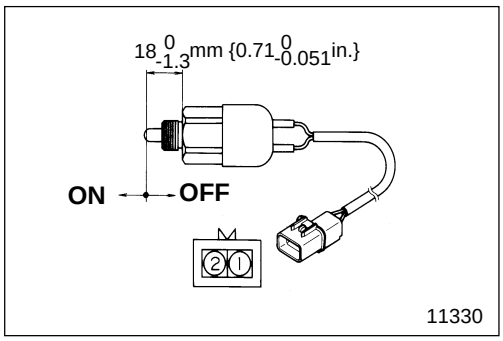
045 Inspection of cab tilt lock switch

- Follow the table below to check for continuity.

	①	②
ON	○—○	
OFF		

○—○ : There is continuity between terminals.

- If any fault is found, replace the switch.



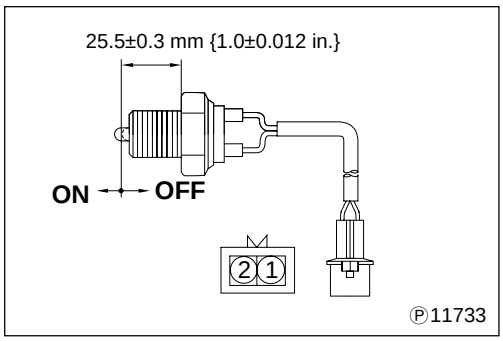
054 Inspection of switch

- Backup lamp switch
- Transfer low switch
- Transfer four-wheel drive switch
  - Follow the table below to check for continuity.

	①	②
OFF		
ON	○—○	

○—○ : There is continuity between terminals.

- If any fault is found, replace the switch.



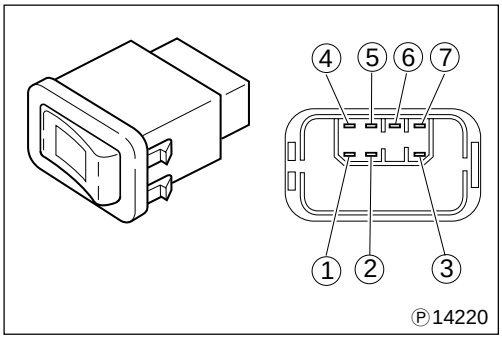
056 Inspection of transmission neutral switch

- Follow the table below to check for continuity.

	①	②
OFF		
ON	○—○	

○—○ : There is continuity between terminals.

- If any fault is found, replace the switch. Gr 22



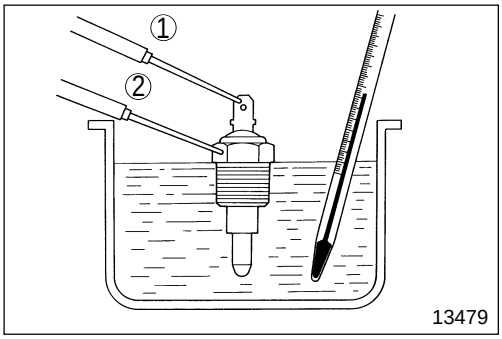
087 Inspection of van body dome light switch

- Follow the table below to check for continuity.

	①	⑤	⑦	LED (Operation indication light	③
ON	○—○		○	⟋⟍⟋ ▷|	○
OFF					

○—○ : There is continuity between terminals.

- If any fault is found, replace the switch.

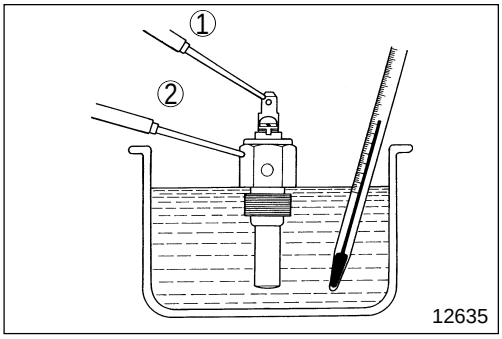


088 Inspection of thermostat switch

- Place the switch in engine oil in a container.
- Raise the oil temperature to the specified values and stir the oil.
- Measure the operating temperature between terminals ① and ② (body) respectively.

Standard Value	When temperature increase (ON→OFF)	77±3°C {170±37°F}
	When temperature decrease (OFF→ON)	70°C {158°F}

- If the measured value deviates from the standard value, replace the switch. Gr 12

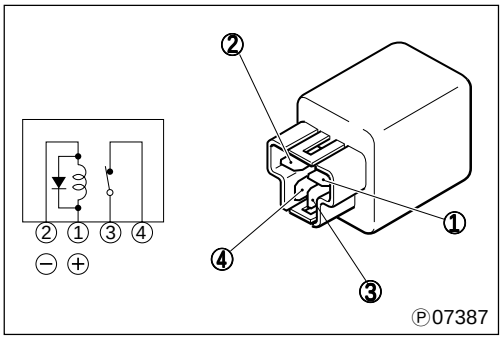


160 Inspection of overheating switch

- Place the switch in engine oil in a container.
- Raise the oil temperature to the specified values and stir the oil.
- Measure the operating temperature between terminals ① and ② (body) respectively.

Standard Value	When temperature increase (ON→OFF)	110±2°C {230±36°F}
	When temperature decrease (OFF→ON)	110°C±4°C {230±39°F}

- If the measured value deviates from the standard value, replace the switch. Gr 14



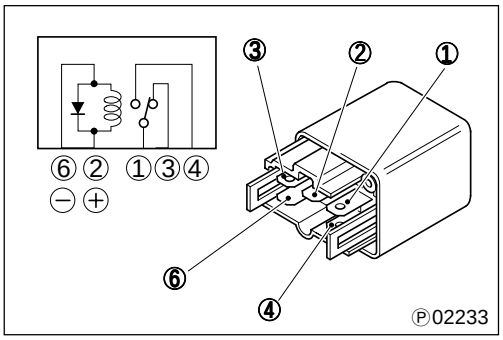
180 Inspection of relay (Close type 4-pin)

- Follow the table below to check for continuity and operation.

	①	②	③	④
No current	○—○		○—○	
Current	⊕	⊖	◌---◌	

○—○ : There is continuity between terminals.
⊕—⊖ : Indicates the terminals where battery voltage is to be applied.
◌—◌ : Indicates the terminals across which there is no continuity.

- If any fault is found, replace the relay.



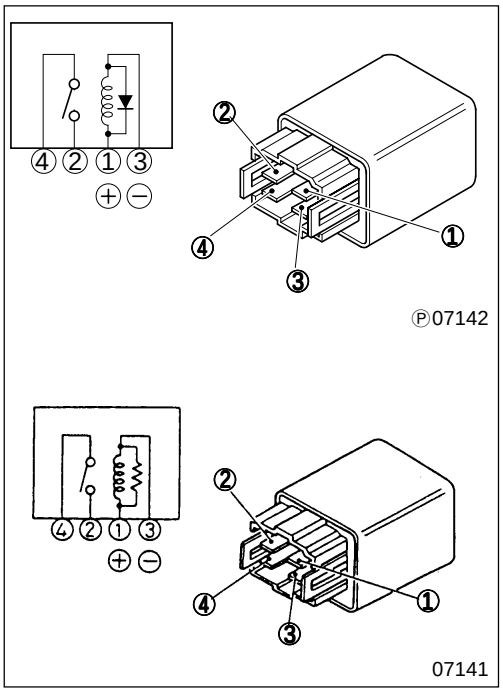
182 Inspection of relay (Open type 6-pin)

- Follow the table below to check for continuity and operation.

	①	②	③	④	⑥
No current	○	○	○		○
Current	○	⊕		○	⊖

○—○ : There is continuity between terminals.
⊕—⊖ : Indicates the terminals where battery voltage is to be applied.

- If any fault is found, replace the relay.



185 Inspection of relay (Open type 4-pin)

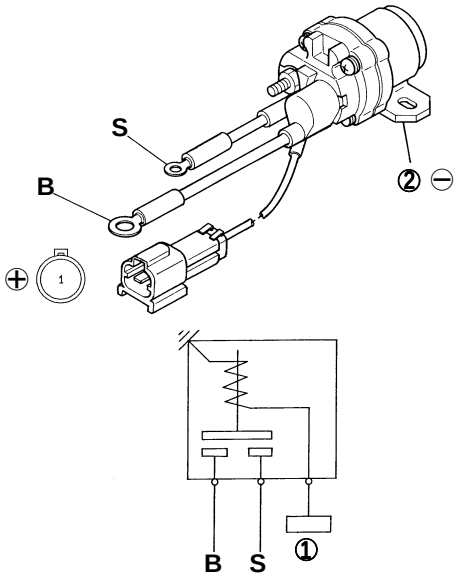
- Follow the table below to check for continuity and operation.

	①	②	③	④
No current	○		○	
Current	⊕	○	⊖	○

○—○ : There is continuity between terminals.
⊕—⊖ : Indicates the terminals where battery voltage is to be applied.

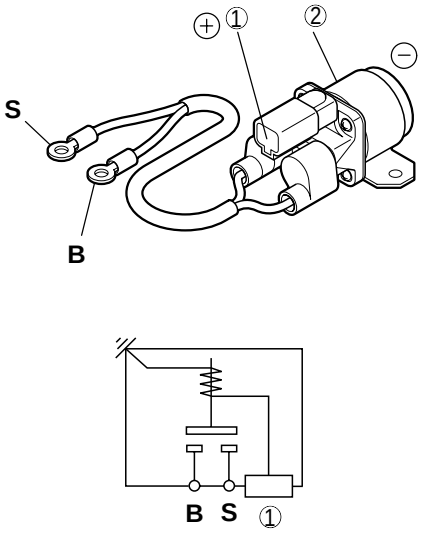
- If any fault is found, replace the relay.

< 4D3 >



07053

< 4M5 >



Ⓟ41157

187 Inspection of starter relay

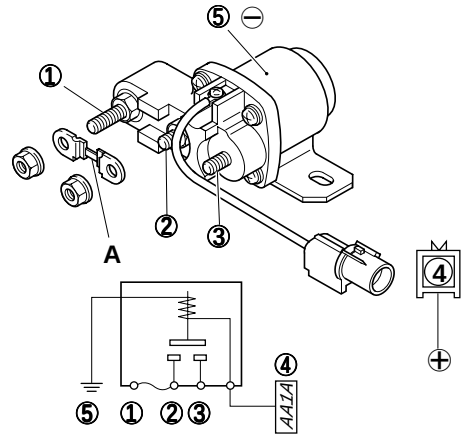
- Follow the table below to check for continuity and operation.

	B	S	①	②
No current			○—○	
Current	○—○		⊕—⊖	

○—○ : There is continuity between terminals.
⊕—⊖ : Indicates the terminals where battery voltage is to be applied.

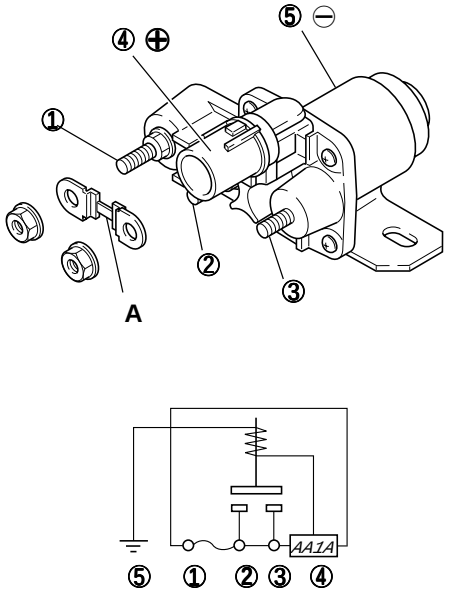
- If any fault is found, replace the relay.

< 4D3 >



Ⓟ24853

< 4M5 >



Ⓟ33889

195 Inspection of glow relay

(1) Inspection of fuse

If any fault is found, replace the fuse **A** (127 ampere).

(2) Inspection of main body

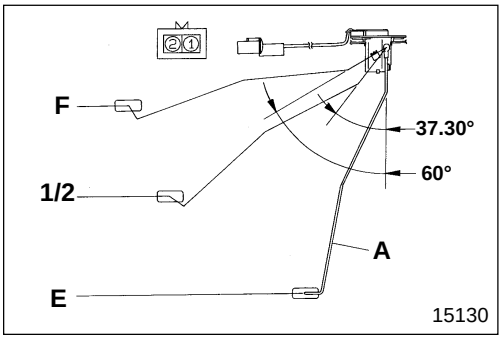
- Follow the table below to check for continuity and operation.

	①	②	③	④	⑤ (Body)
OFF	○	○		○	○
ON	○	○	○	⊕	⊖

○—○ : There is continuity between terminals.

⊕—⊖ : Indicates the terminals where battery voltage is to be applied.

- If any fault is found, replace the relay.

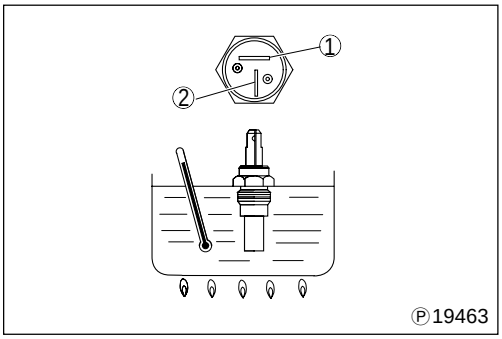


258 Inspection of fuel level sensor

- Measure the resistance between terminals ① and ② when float arm **A** contacts to both stoppers (positions **E** and **F**) and also 1/2 position.

Standard value	F (FULL position)	0^{+2}_{0} Ω
	1/2	50±3 Ω
	E (EMPTY position)	150±10 Ω

- If the measured value deviates from the standard value, replace the sensor. Gr 13A,B



262 Inspection of water temperature sensor

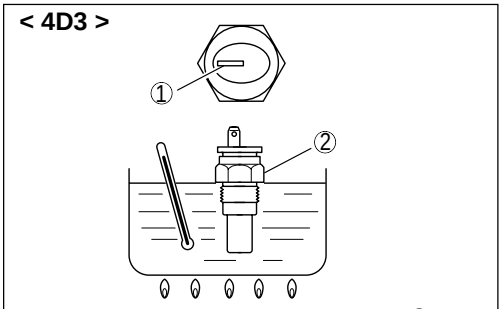
< For multipurpose timing control unit >

- Place the sensor in engine oil in a container.
- Raise the oil temperature to the specified values and stir the oil.
- Measure the resistance between terminals ① and ②, and the body respectively.
  Terminal ① : Water temperature gauge connection
  Terminal ② : Multipurpose timing control unit connection

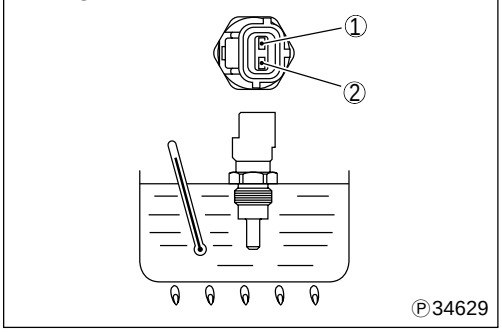
Standard Value	①—Body (connection side of water temperature sensor)	50°C {122°F}	153.9 Ω (Reference value)
		80°C {176°F}	$51.9^{+4.9}_{-4.4}$ Ω
		100°C {212°F}	$27.4^{+1.9}_{-1.2}$ Ω
	②—Body (connection side of multipurpose timing control unit)	20°C {68°F}	3.25 ± 0.33 kΩ
		60°C {140°F}	620 Ω (Reference value)
		80°C {176°F}	300 Ω (Reference value)

- If the measured value deviates from the standard value, replace the sensor. Gr 14

< 4D3 >



< 4M5 >

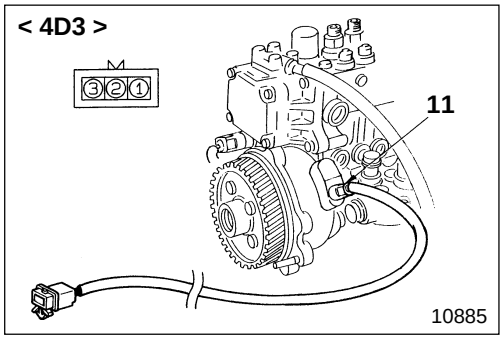


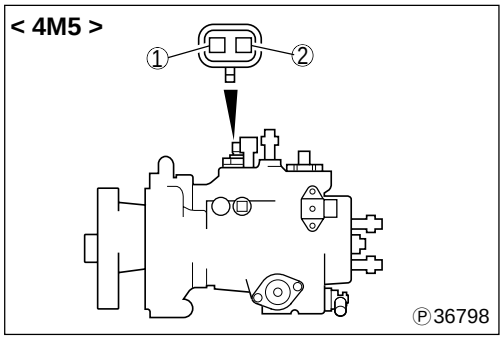
< For engine control >

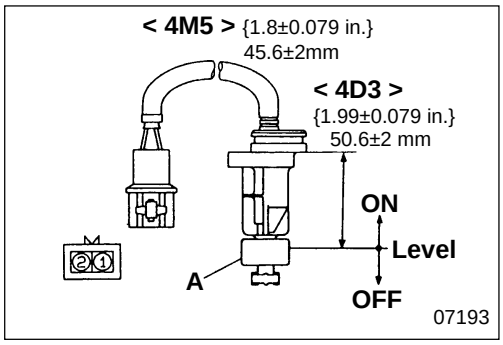
- Place the sensor in engine oil in a container.
- Raise the oil temperature to the specified values and stir the oil.
- Measure the resistance between terminals ① and ②(body).

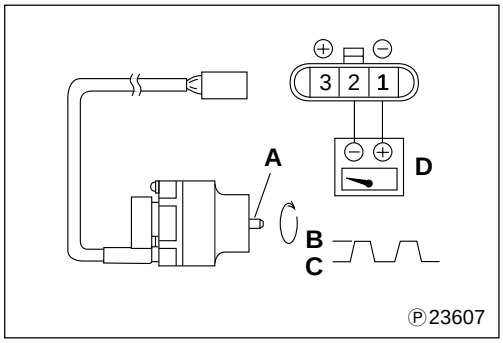
Standard value	4D3	20°C {68°F}	3.25 kΩ (Reference value)
		60°C {140°F}	620±62 Ω
		80°C {176°F}	300 Ω (Reference value)
	4M5	20°C {68°F}	2.3 to 2.6 kΩ
		80°C {176°F}	0.3 to 0.34 kΩ

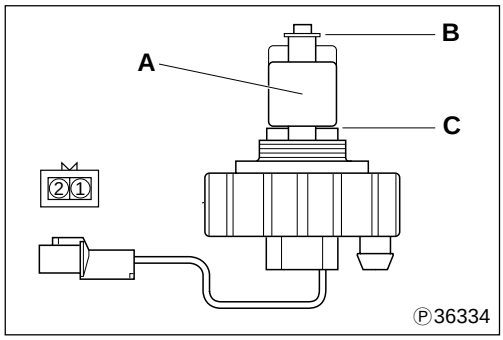
- If the measured value deviates from the standard value, replace the sensor. Gr 14











263 Inspection of engine speed sensor

< 4D3 >

- Measure the resistance between terminals ① and ②.

Standard value (at 25°C {77°F})	2.1 to 2.5 kΩ

- If the measured value deviates from the standard value, replace the sensor. Gr 13B

< 4M5 >

- Measure the resistance between terminals ① and ②.

Standard value (at 20°C {68°F})	230±25 Ω

- If the measured value deviates from the standard value, replace the sensor. Gr 13A

264 Inspection of engine oil level sensor

- Follow the table below to check for continuity.

	①	②
ON	○—○	
OFF		

○—○ : There is continuity between terminals.

A : Float

- If any fault is found, replace the sensor. Gr 12

265 Inspection of vehicle speed sensor

Perform the following checks, and if any fault is found, replace the sensor. Gr 23

- Turn slowly the portion **A** of the sensor with battery voltage applied between terminals ① and ③.
- Mesure the maximum value (high level **B**) and minimum value (low level **C**) of the voltages generated between terminals ① and ②.

D : Tester

Standard value	Low level of pulse	0.5 V or less
	High level of pulse	8±1 V

274 Inspection of water separator sensor

- Move float B to the specified positions to check continuity.

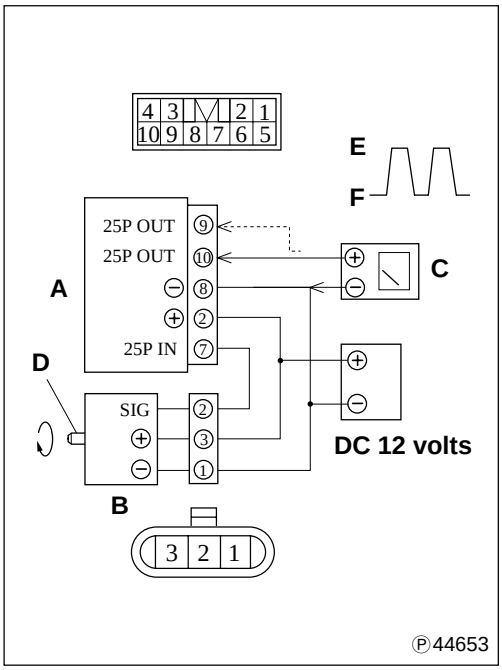
	①	②
B (maximum water level)	○—○	
C (minimum water level)		

○—○ : There is continuity between terminals.

- If any fault is found, replace the sensor.

350 Inspection of control units and other units

- Since the units alone cannot be readily checked in the off-vehicle state, check the harness, switch and other related parts in each system.
- If any fault is not found in the related parts, and the problem still remains in the system, replace the control units or other units.

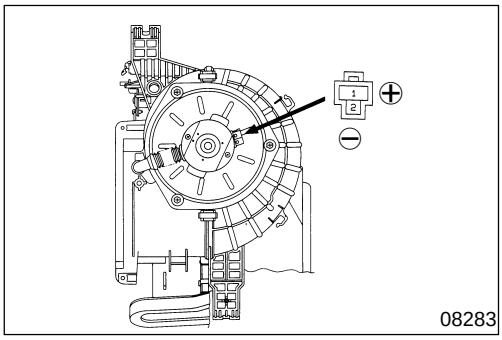


351 Inspection of pulse divider

- Connect the pulse divider **A** as shown.
  B : Vehicle speed sensor (25-pulse)
  C : Tester
- Slowly rotate the shaft **D** of the vehicle speed sensor **B** by hand and measure the maximum voltage (high pulse voltage **E**) and the minimum voltage (low pulse voltage **F**) of the voltage generated across each of the output terminals ⑨, ⑩ and terminal ⑧ of the pulse divider **A**.

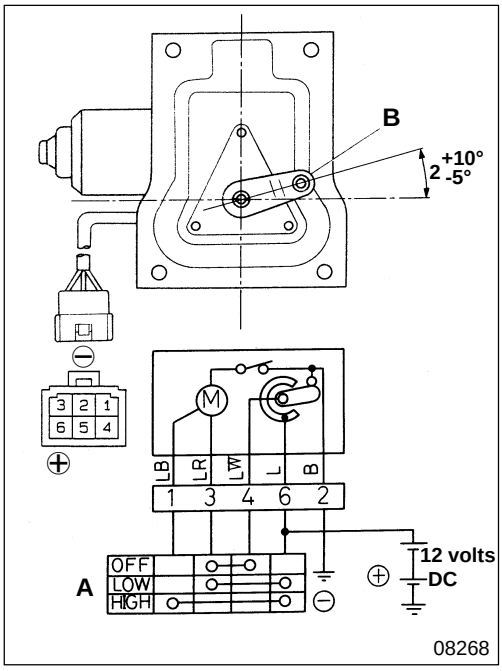
Standard value	Low pulse voltage **H**	0.6 V or less
	High pulse voltage **G**	8±1 V

- If the measured value deviates from the standard value, replace the pulse divider **A**.



411 Inspection of blower motor

- Make sure that the motor operates when battery voltage is applied between terminals ① and ②.
- If any fault is found, replace the motor. Gr 55



422 Inspection of wiper motor

- Connect a switch to the motor as shown.

  A : Switch

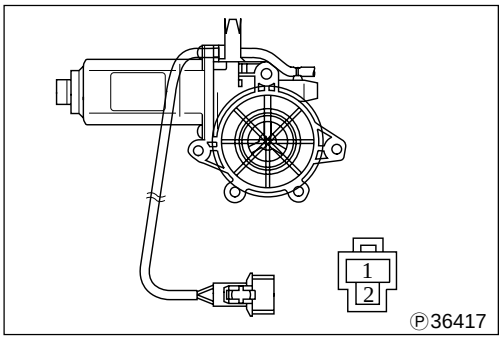
- Check the motor for correct operation as follows. If any fault is found, replace the motor. Gr 42

(1) Inspection of motor operation

- Set switch **A** in HIGH position to check that the motor rotates at high speed.
- Set switch **A** in LOW position to check that the motor rotates at low speed.

(2) Inspection of automatic stop position

- Set switch **A** in LOW position to let the motor rotates at low speed.
- When crank arm **B** is at a position other than the automatic stop position (outside the angles shown), set switch **A** in OFF position.
- Check to see the crank arm **B** stops at the automatic stop position (within the angles range shown).



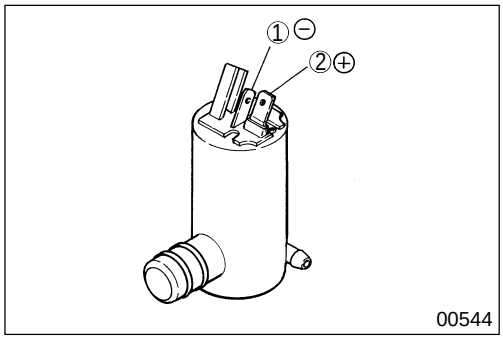
423 Inspection of power window motor

- Follow the table below to check for operation.

	①	②
UP	⊕	⊖
DOWN	⊖	⊕

⊕——⊖: Indicates the terminals where battery voltage is to be applied.

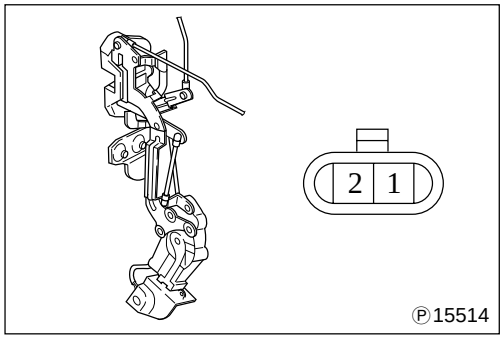
- If any fault is found, replace the motor. Gr 42

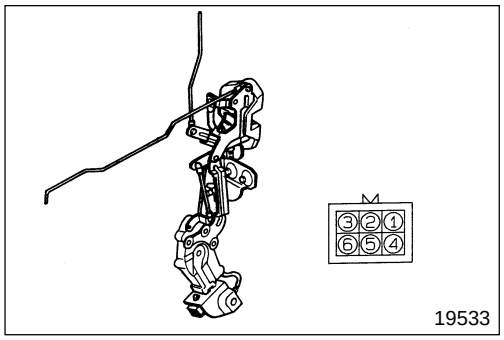


428 Inspection of windshield washer motor

- Make sure that the motor operates when battery voltage is applied between terminals ① and ②.
- If any fault is found, replace the motor. Gr 42

510 to 559 ACTUATOR





510 Inspection of door lock actuator (Assistant driver's seat side)

- Follow the table below to check for operation.

	①	②
LOCK	⊕	⊖
UNLOCK	⊖	⊕

⊕——⊖ : Indicates the terminals where battery voltage is to be applied.

- If any fault is found, replace the actuator. Gr 42

511 Inspection of door lock actuator (Driver's seat side)

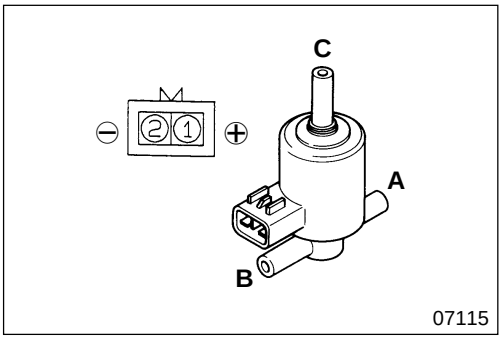
- Follow the table below to check for continuity and operation.

	①	③	②	④	⑤
LOCK		○——○		⊖	⊕
UNLOCK	○——○			⊕	⊖

○——○ : There is continuity between terminals. (OFF in LOCK position)

⊕——⊖ : Indicates the terminals where battery voltage is to be applied.

- If any fault is found, replace the actuator. Gr 42



565 Inspection of exhaust brake 3-way magnetic valve

Perform the following checks, and if any fault is found, replace the 3-way magnetic valve.

(1) Operation test

- Gradually apply battery voltage between terminals ① and ② from 0 volt.
- Measure the voltage (minimum operating voltage) at the moment when the 3-way magnetic valves starts operating. (The OFF to ON operating can be noticed from a sound the magnetic valve generates.)

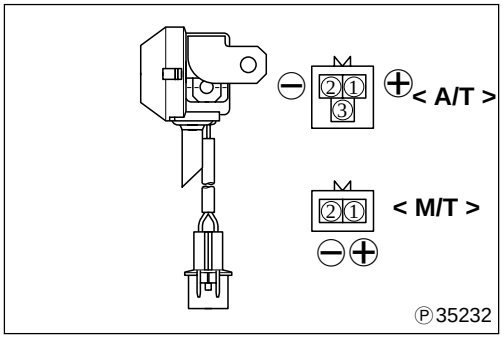
Standard value (Minimum operating voltage)	11V or more

(2) Continuity and airtightness test

Follow the table below to check for continuity.

	Input port A	Output port B	Exhaust port C
ON	○———	———○	
OFF		○———	———○

Air circuit table (○———○ : Air passage is open between ports.)
Negative pressure at the time of check : –100kpa
{–2.95in.Hg,–750mmHg}



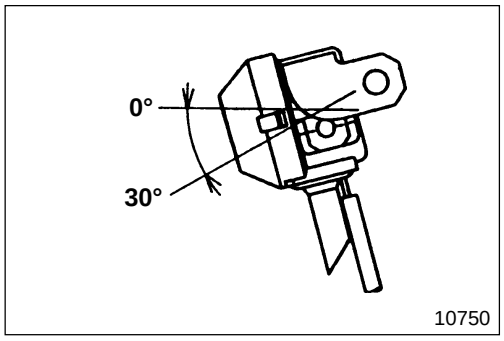
614 Back buzzer

[Inspection]
Perform the following checks, and if any fault is found, replace the buzzer.

(1) Back buzzer terminal
Make sure that the buzzer sounds intermittently when battery voltage is applied between terminals ① and ②.

(2) Automatic transmission reverse buzzer terminal
Make sure that there is continuity between terminals ② and ③.

M/T: Manual transmission
A/T: Automatic transmission

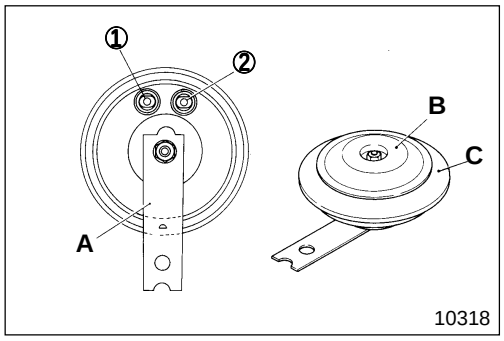


[Installation]
Attach the buzzer to the frame at an angle within the range shown.

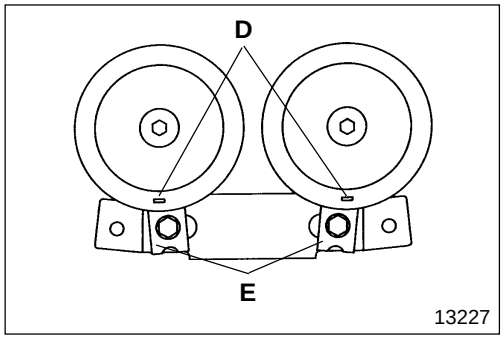
CAUTION
Be careful to install the buzzer within the illustrated angle range or the buzzer will not be drained normally.

615 Inspection of electric horn

CAUTION
Do not bend or damage stay A or the sound quality of electric horn may be changed and the horn capacity can deteriorate.

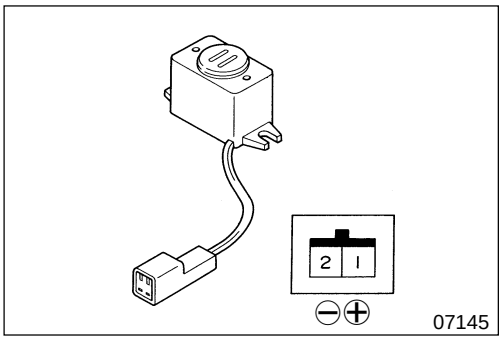


[Inspection]
- Apply battery voltage between terminals ① and ② (No polarity) to make sure that the horn sounds.
- If any fault is found, replace the horn.
- Remove foreign particles from resonator **B** or vibration plate **C**, if any.



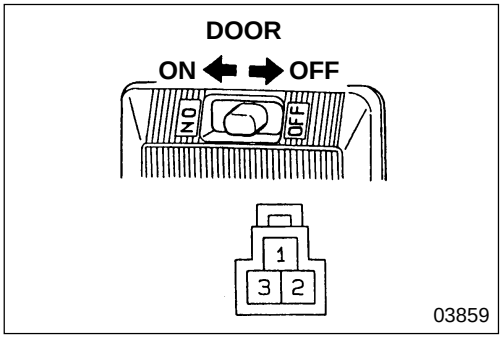
[Installation]
D : Water drain hole
E : Bolt

Tightening torques : Bolt (N·m {ft.lbs, kgf·m})	12 to 16 {8.7 to 12, 1.2 to 1.6}



616 Inspection of reverse warning buzzer

- Make sure that the buzzer sounds when battery voltage is applied between terminals ① and ②.
- If any fault is found, replace the buzzer.



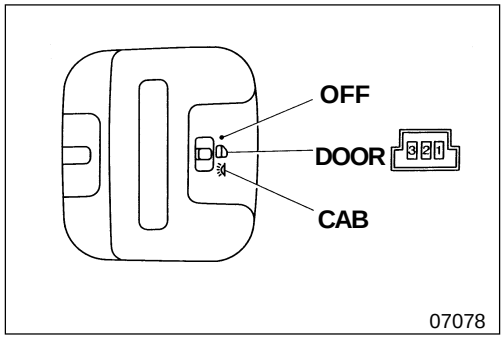
655 Inspection of rear cab lamp

- Follow the table below to check for continuity.

	①	②	③
OFF			
ON	○—○		
DOOR	○—○	○—○	

○—○ : There is continuity between the terminals. (when bulb is installed).

- If any fault is found, replace the lamp.



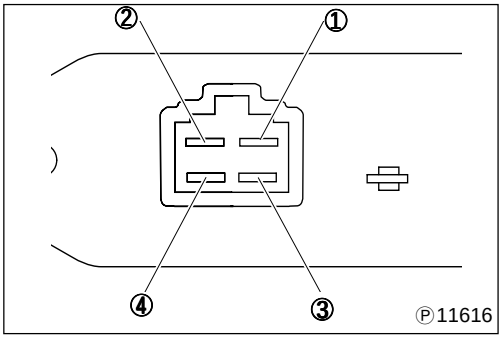
656 Inspection of cab lamp

- Follow the table below to check for continuity.

	①	②	③
OFF			
DOOR	○—○		
CAB	○—○	○—○	

○—○ : There is continuity between the terminals. (when bulb is installed).

- If any fault is found, replace the lamp.

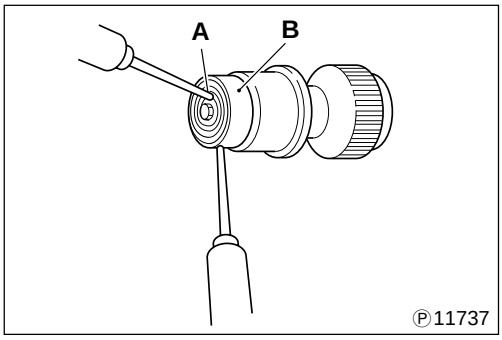


750 Inspection of blower resistor

- Follow the table below to check for resistance of between terminals.

Standard value	MIDDLE LOW	①—②	0.81 Ω
	MIDDLE HIGH	①—③	0.28 Ω
	LOW	①—④	1.94 Ω

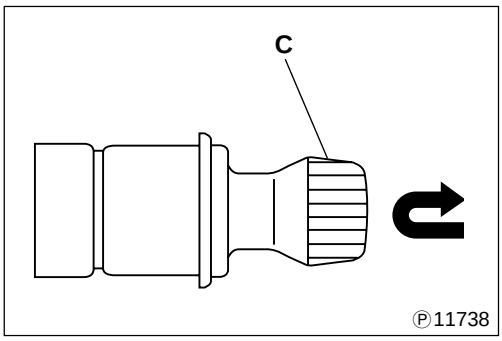
- If the measured value deviates from the standard value, replace the blower resistor.



754 Inspection of cigarette lighter

Perform the following checks, and if any fault is found, replace the cigarette lighter.

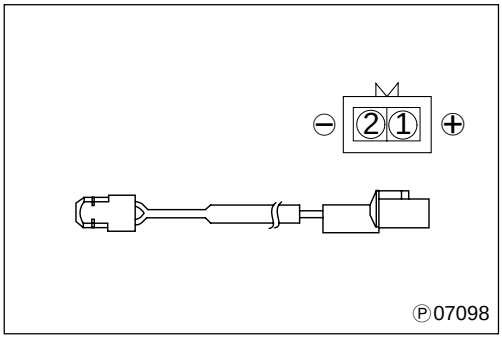
- Make sure that there is continuity between heater element **A** and body **B**.



- Make sure that when plug **C** is pushed in by hand, it immediately returns to its original position.
- Turn the starter switch at ACC or ON position.
- Push plug **C** into the socket in the cab.
- Measure the time required for plug **C** automatically returns.

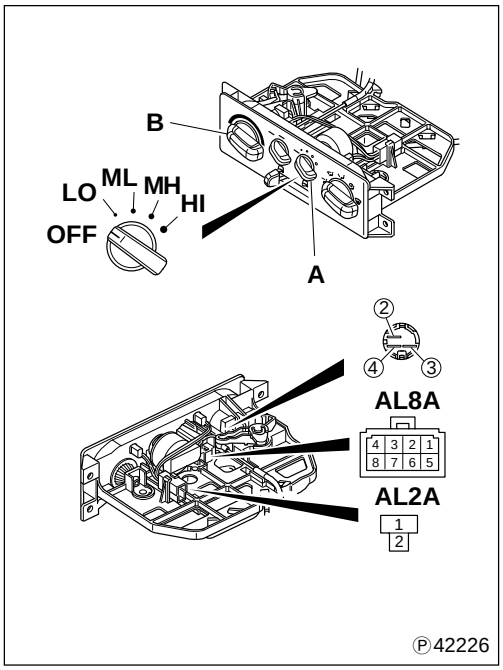
Standard value	15±5 seconds

- Check to see that heater element **A** is red-hot.



759 Inspection of brake pad wear indicator

- Make sure that there is continuity between terminals ① and ②.
- If any fault is found, replace brake pad wear indicator. Gr 35



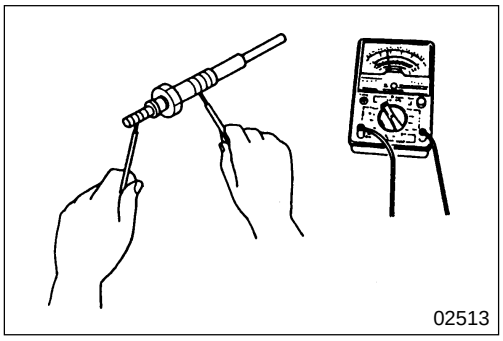
763 Inspection of heater control assembly

- Follow the table below to check for continuity.

	AL8A							AL2A	
	⑧	②	⑦	③	⑥	⑤	④	①	②
OFF									
LO (LOW)	○	○				○	○		
ML (MIDDLE LOW)	○		○			○	○		
MH (MIDDLE HIGH)	○			○		○	○		
HI (HIGH)	○				○	○	○		

○—○ :There is continuity between terminals.

- If any fault is found, replace the switch **A** or heater control assembly.
- If the illumination lamp has blown out, replace the bulb.



764 Inspection of glow plug

- Measure the resistance of glow plug as shown.

Standard Value (Cold resistance of glow plug)	1.0 Ω (Reference value)

- If the measured value deviates from the standard value, replace the glow plug. Gr 11

860 BATTERY

DANGER⚠

- **Because flammable hydrogen gas is generated from battery, be sure to obey the following:**
  - **Never attempt to short-circuit the positive and negative terminals of battery, and generate sparks, or smoke a cigarette near it.**
  - **Do not wear metal objects on your arms or do not lean over battery.**
- **Sulfuric acid of the electrolyte is very corrosive. Whenever handling battery, wear safety goggles and rubber gloves to protect your eyes and hands.**
- **Battery posts, terminals and related accessories contain lead and lead compounds. Wash hands after handling.**

WARNING⚠

- **When you disconnect battery cables, disconnect the negative battery cable ⊖ first.**

CAUTION⚠

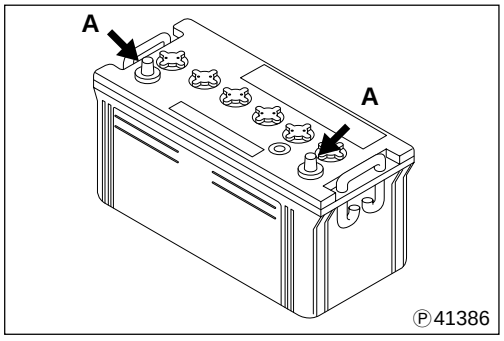
- **Make sure that all electrical switches of the vehicle are off before connecting battery cables.**
- **Be sure to connect the positive battery cable ⊕ first before you connect the negative battery cable ⊖.**
- **To prevent a short-circuit, take care that disconnected battery cables may not accidentally touch the battery terminals.**

Service standards

Location	Maintenance item	Standard value	Limit	Remedy
—	Specific gravity of battery electrolyte (20°C {68°F})	1.220 to 1.290	—	Charge or replace

◆ Service procedure

Inspection of battery

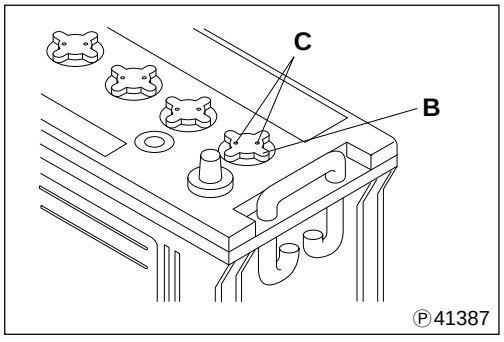


(1) Visual inspection

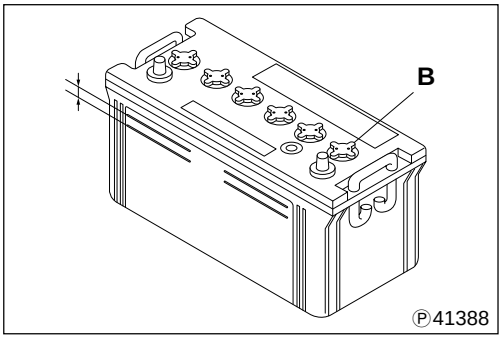
- If terminal **A** is corroded, scrub off the corrosion from it using a wire brush.
- If cracks or defects are found on battery, replace it since the cracks or defects can cause liquid spills.

CAUTION⚠

Make sure you grease the ⊕ side of terminal A because it is easily corroded.

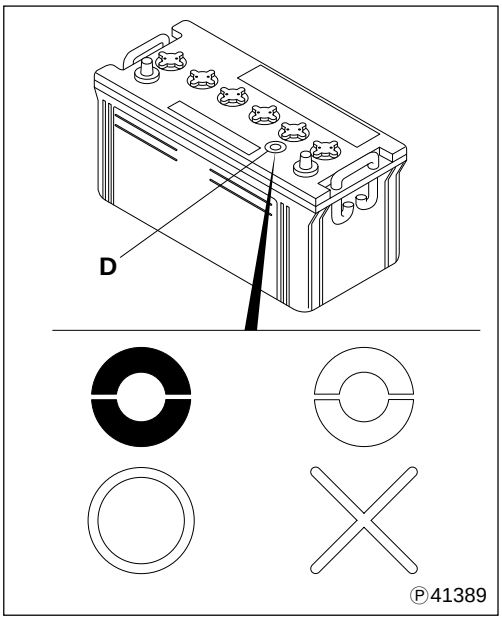


- If bleed hole **C** of vent plug **B** is clogged, clean the hole.



(2) Inspection of fluid level

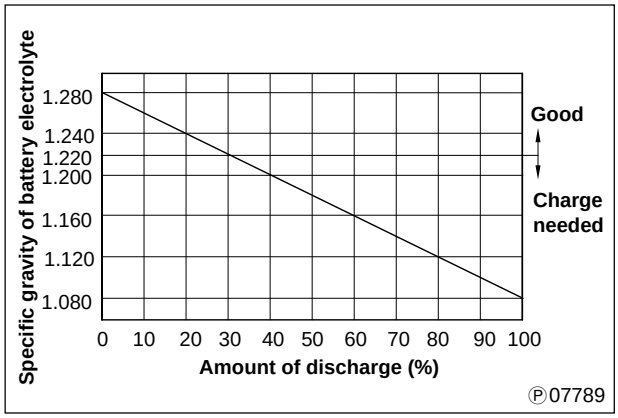
- Make sure that the battery electrolyte level is between UPPER and LOWER.
- If the level is below LOWER, remove vent plug **B** and fill the battery with distilled water or battery replenisher to UPPER.



(3) Measurement of specific gravity

You can tell the specific gravity of the battery electrolyte by the color shown in indicator **D**.

Blue	: Good
White	: Charge or replace



(4) Charging

- Although, as a rule, battery charging should be done with the battery removed from the vehicle, if you have to charge the battery while it is on the vehicle, make sure that you stop the engine and disconnect battery cable ⊖.
- Remove vent plug before charging the battery.
- For the recommended charge time and current, see the following table to avoid overcharging.

	Charge current (A)	Charge time (H)	Upper limit of fluid temperature (°C {°F})
Normal charge	$\frac{\text{Value of 5-hour rating capacity}}{10}$	$\frac{\text{*Amount of discharge (Ah)}}{\text{Charge current (A)}} \times 1.2$ (to 1.5)	45 {113}
Quick charge	$\frac{\text{Value of 5-hour rating capacity}}{1.5}$	0.5	55 {131}

* Amount of discharge (Ah)=5-hour rating capacity (Ah)$\times \frac{\text{Amount of discharge (\%)}}{100}$

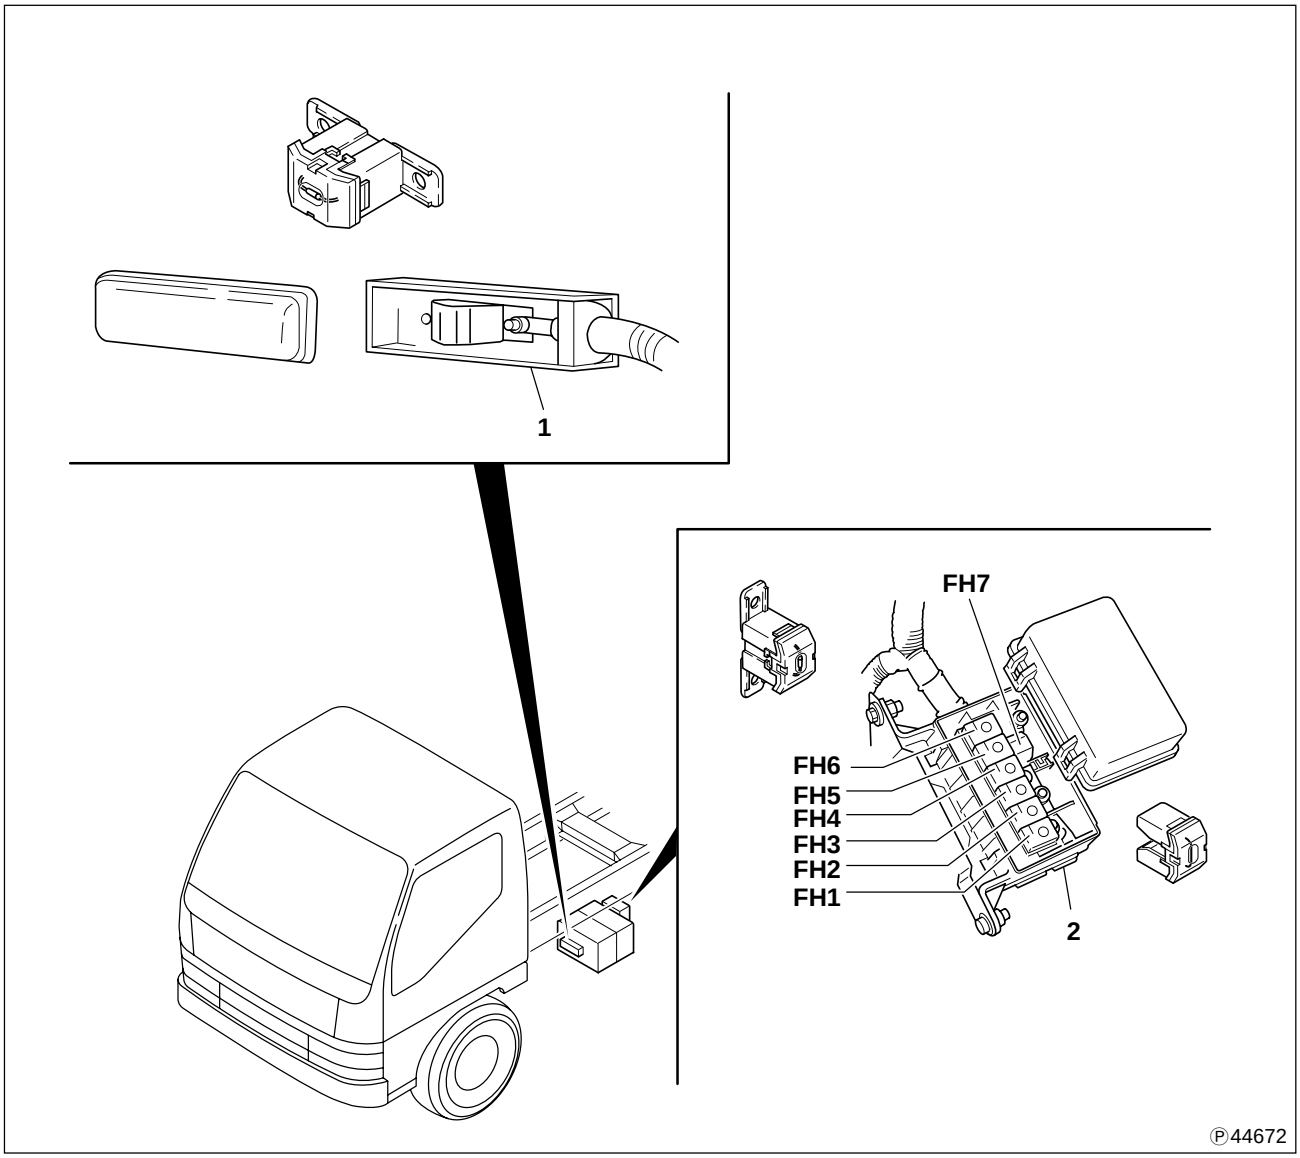
- Use the graph shown on the left to calculate the amount of discharge (%).
- Use diluted sulfuric acid, made up of sulfuric acid and refined or distilled water, as the battery electrolyte.
- The specific gravity of fully-charged battery electrolyte is 1.280 with the temperature at 20°C {68°F}.

DANGER ⚠

- **Do not let the battery electrolyte level rise and overflow while charging the battery.**
- **Keep open flame away from the battery while charging it or it might explode.**
- **Be careful not to generate sparks while charging the battery because it is dangerous.**
- **After charging the battery, tighten the vent plugs, wash away sulfuric acid from the battery using water, and dry the surface.**
- **Be sure to check the electrolyte level before charging the battery. Charging with the electrolyte level below the lower limit (LOWER LEVEL) can cause premature deterioration, heat generation and explosion of the battery.**

M E M O

870 Hgih-current fuse box



1 Main high-current fuse
2 High-current fuse box

WARNING⚠

To prevent possible injury, be sure to disconnect the negative terminal ⊖ of the battery and insulate it with tape before removing high-current fuses (FH1 to FH7). 🕮 860

With the negative terminal ⊖ of the battery connected, battery voltage is always applied to each fuse.
The battery voltage is applied to the fuses under the following conditions:
Always (directly connected to the battery): FH1 to FH7

CAUTION⚠

- **If a fuse blows out, identify and remedy the cause, then replace the fuse.**
- **Be sure to use a fuse of the specified ampere.**

Main high-current fuse

Fuse No.	Main load	Capacity
—	Alternator	100A

High-current fuse box

Fuse No.	Main load	Capacity
FH1	Fuse box (F1 to F4)	50A

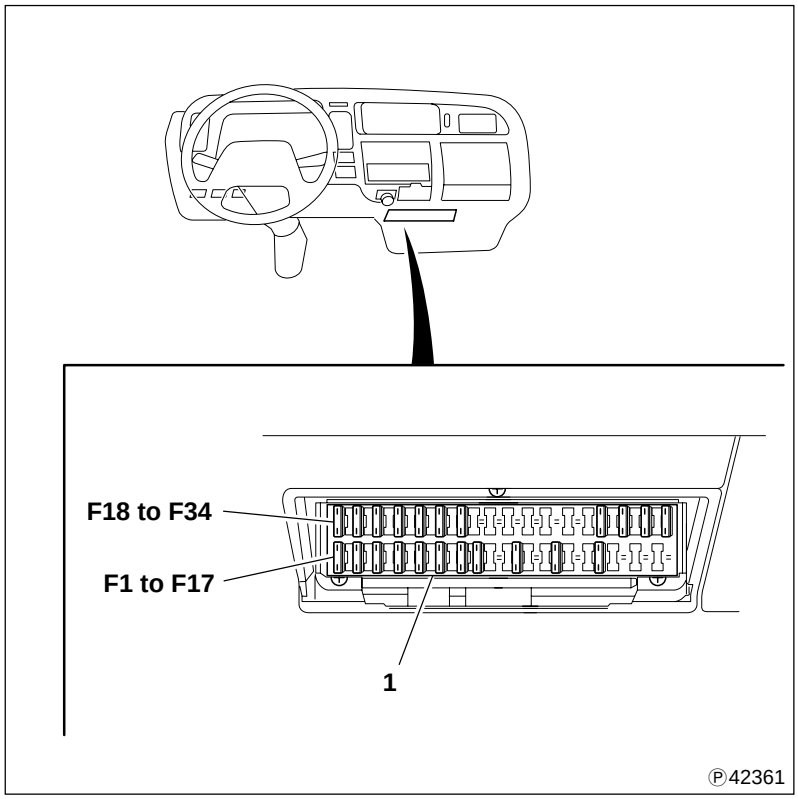
FH3	ABS	40A
FH4	ABS	30A
FH5	Starter switch (Terminal B)	50A
FH6	Fuse box (F31 to F34)	50A
FH7	Alternator	100A

ABS: Anti-lock brake system

870 to 889 FUSE

871 Fuse box



1 Fuse box

WARNING

To prevent possible injury, be sure to disconnect the negative terminal of the battery and insulate it with tape before removing fuses (F1 to F34). 860

With the negative terminal ⊖ of the battery connected, battery voltage is always applied to each fuse.
The battery voltage is applied to the fuses under the following conditions:

- **Always (directly connected to the battery): F1 to F12,F17,F31 to F34**
- **When starter switch is in ON position : F19 to F30**
- **When starter switch is in ACC position : F13 to F15**
- **When starter switch is in START position : F18**

CAUTION

- **If a fuse blows out, identify and remedy the cause, then replace the fuse.**
- **Be sure to use a fuse of the specified ampere.**

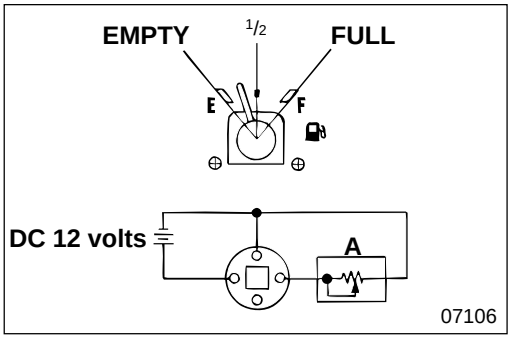
			At 2500 rpm	2500±110 rpm		
			At 3000 rpm	3000±110 rpm		
			At 4500 rpm	4500±125 rpm		

◆ Service procedure

3 Inspection of speedometer

- Use the speedometer tester to check that the indication area of speedometer **3** does not deviate from the standard value at each speed.
- If the measured value deviates from the standard value, replace the speedometer.



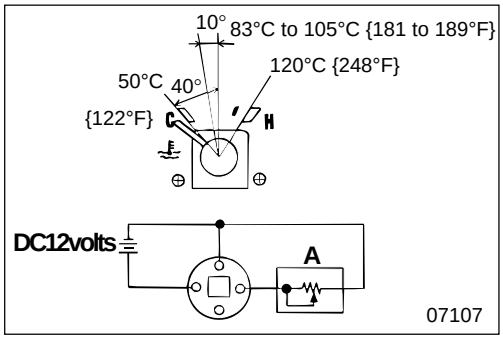
4 Inspection of fuel gauge

- Connect a variable resistor to fuel gauge **4** as shown.
  A : Variable resistor
- Measurement order
  FULL → 1/2 → EMPTY

NOTE

The movement of the gauge needle is subject to hysteresis (oscillation). Be sure to measure following the measurement order.

- Increase the value of variable resistor **A** gradually from 0 Ω.
- Measure the resistance respectively when the needle of fuel gauge **4** indicates FULL, 1/2, and EMPTY.
- If the measured value deviates from the standard value, replace fuel gauge **4**.



5 **Inspection of water temperature gauge**

- Connect a variable resistor to water temperature gauge **5** as shown.
  A : Variable resistor
- Measurement order
  50°C {122°F}→ 120°C {248°F}

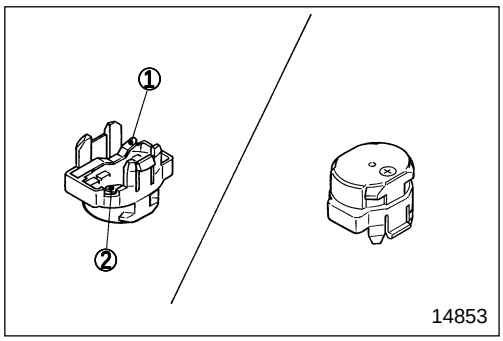
NOTE

The movement of the gauge needle is subject to hysteresis (oscillation). Be sure to measure following the measurement order.

- Increase the value of variable resistor **A** gradually from 0 Ω.
- Measure the resistance respectively when the needle of water temperature gauge **5** indicates 50°C {122°F}, 83°C {181°F} to 105°C {189°F}, and 120°C {248°F}.
- If the measured value deviates from the standard value, replace water temperature gauge **5**.

6 **Inspection of tachometer**

- Use the engine revolution counter to check that the indication area of tachometer **6** is in the standard value at each revolution.
- If the measured value deviates from the standard value, replace tachometer **6**.



12 **Inspection of meter warning buzzer**

- Make sure that the buzzer operates when battery voltage is applied between terminals ① and ②.

CAUTION

- **Be careful not to mix up ⊕ and ⊖ when you apply voltage to the buzzer 12, because this would damage the buzzer.**
- **Make sure you check ⊕ and ⊖ on the top of the buzzer 12.**

- If any fault is found, replace the buzzer **12**.

12 STARTER AND ALTERNATOR

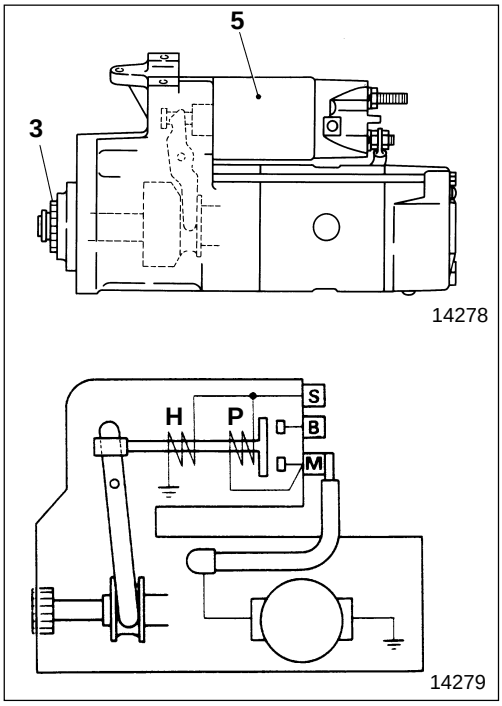
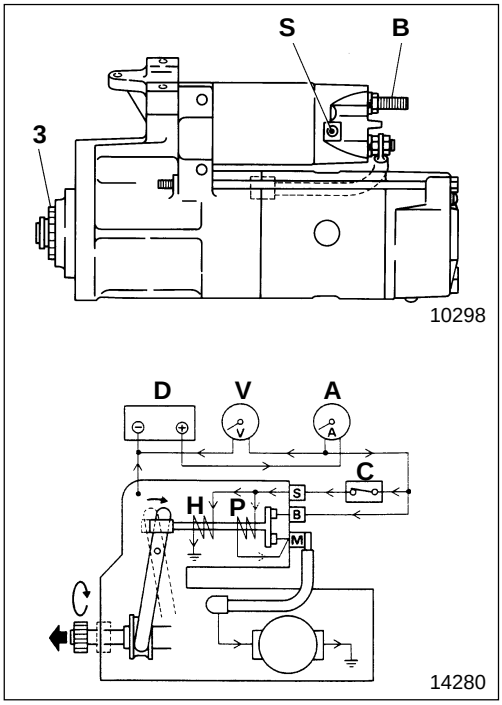
38	Oil Seal	Multipurpose grease [NLGI No.2 (Li soap)]	As required





◆ Service procedure

● Inspection after assembly

Inspection after assembling the starter should be carried out with current fed to the starter.

WARNING

- **Do not touch pinion 3 because it jumps out and turns when current is fed to the starter.**
- **Take care not to burn your hand, magnetic switch assembly 5 might be hot during inspection.**

CAUTION

- **The current feeding time to the starter should be within 10 seconds at pull-in coil P side and within 30 seconds at holding coil H side. If the current feeding time exceeds these limits the coil might burn due to overheating.**
- **The current, when fed to the starter, is over 100 amperes. When inspecting, use thick cable, such as a booster cable, and make secure connections.**

(1) Performance test

- Connect the starter as shown.
  A : Ammeter
  B : Terminal B of starter
  C : Switch
  D : 12 volts DC
  S : Terminal S of starter
  V : Voltmeter
- Set the voltage to 11 volts DC.

CAUTION

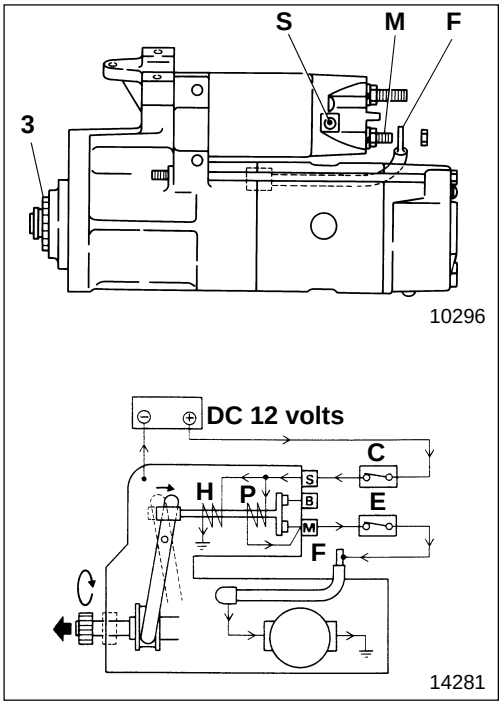
Up to 12 volts can be loaded.

- The following work should be done with current fed to the starter. You must complete measurement of the current and the number of revolutions within 30 seconds.
  - Turn switch **C** ON and feed current to the starter. In this state, pinion **3** jumps out and rotates.

  CAUTION

  When switch C is turned ON, current is fed both to pull-in coil P and holding coil H. When a large amount of current is fed into terminal M from DC power supply D, via terminal B of the starter, the current stops flowing into the pull-in coil but continues to flow into the holding coil.
  To avoid burning the holding coil, be sure to carry out the performance test within 30 seconds.

  - Measure the current and the number of revolutions of the starter. Train a strobe light on pinion **3** to measure the number of revolutions.
  - Turn switch **C** OFF to stop current to the starter.
- If the measured value deviates from the standard value, disassemble the starter again and inspect it.



(2) Pinion gap

[Inspection]

- Connect the starter as shown.
  C : Switch
  E : Switch
  F : Cable
  M : Terminal M of starter
  S : Terminal S of starter

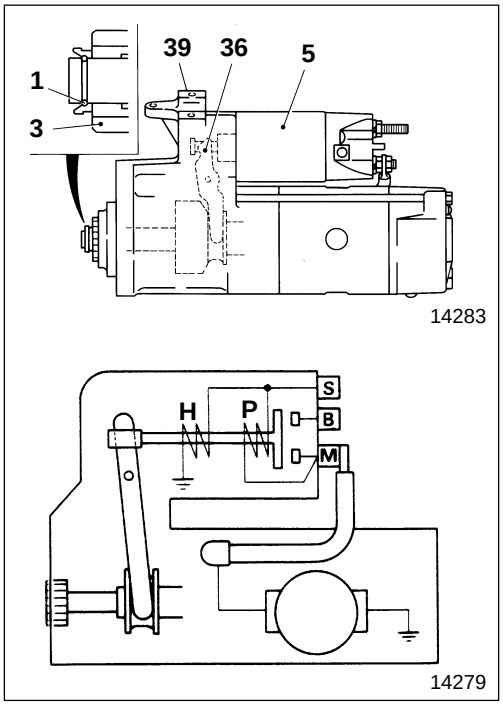
- The following work should be done with current fed to the starter. You must complete measurement of the pinion gap within 30 seconds.
  - Turn switches **C** and **E** ON and feed current to the starter. In this state, pinion **3** jumps out and rotates.

  - Within 5 seconds of pinion **3** rotating, turn switch **E** OFF to stop rotation of the pinion.

CAUTION ⚠

When switches C and E are turned ON, current is fed both to pull-in coil P and holding coil H. The circuit is wired in such a way that the voltage is not applied to terminal B of the starter, so the current continues to flow into the pull-in coil while pinion 3 rotates.
To avoid burning the pull-in coil, be sure to turn switch E OFF within 5 seconds of the pinion rotating.

  - Hold the end of overrunning clutch **33** with fingers, and pull it. Measure the distance **G** (pinion gap) in the shaft direction that the overrunning clutch moves when it is lightly pushed back by hand.
  - Turn switch **C** OFF to stop current to the starter.
- If the measured value deviates from the standard value, replace lever **36**.



3 **Pinion**

[Removal]

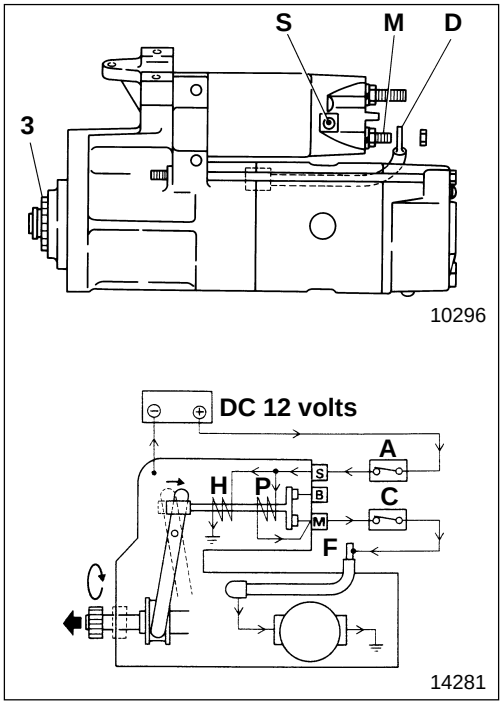
Feed current to the starter and protrude pinion **3** to remove the pinion.

WARNING⚠

- **Do not touch pinion 3 because it jumps out and turns when current is fed to the starter.**
- **Take care not to burn your hand, magnetic switch assembly 5 might be hot after inspection.**

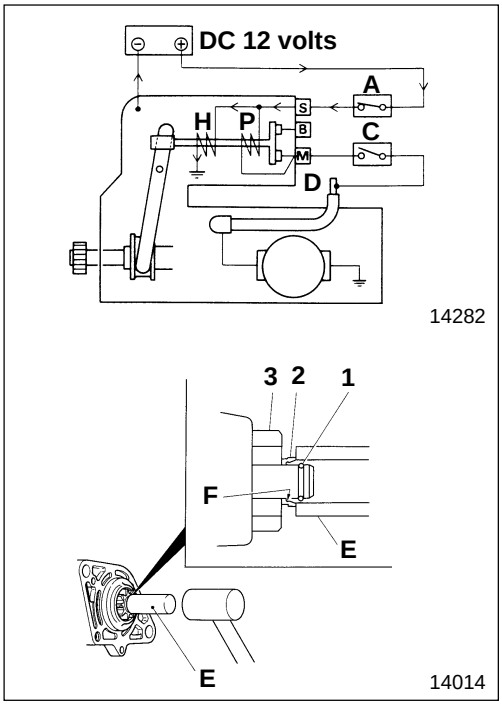
CAUTION⚠

- **The current feeding time to the starter should be within 10 seconds at pull-in coil P side and within 30 seconds at holding coil H side. If the current feeding time exceeds these limits, the coil might burn due to overheating.**
- **Before making pinion 3 jump out, be sure to feed current to the starter to obtain the correct state. If current is not fed to the starter and lever 36 is pulled to protrude the pinion, front bracket 39 or the lever might be damaged due to the shock produced on removal of stopper ring 1.**
- **The current, when fed to the starter, is over 100 amperes. When inspecting, use thick cable, such as a booster cable, and make secure connections.**



- Connect the starter as shown.
  A : Switch
  C : Switch
  D : Cable
  M : Terminal M of starter
  S : Terminal S of starter

- The following work should be done with current fed to the starter. You must complete removal of pinion **3** within 30 seconds.
  - Turn switches **A** and **C** ON and feed current to the starter. In this state, pinion **3** jumps out and rotates.



- Within 5 seconds of pinion **3** rotating, turn switch **C** OFF to stop rotation of the pinion**.**

CAUTION

When switches A and C are turned ON, current is fed both to pull-in coil P and holding coil H. The circuit is wired in such a way that the voltage is not applied to terminal B of the starter, so the current continues to flow into the pull-in coil while pinion 3 rotates.

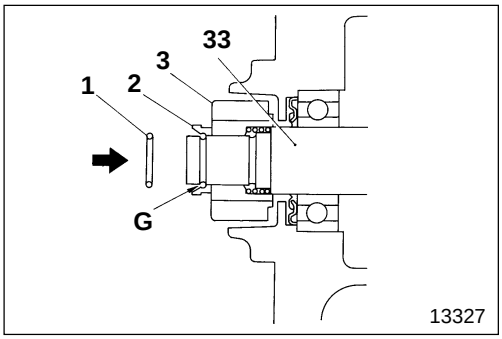
To avoid burning pull-in coil P, be sure to turn switch C OFF within 5 seconds after the pinion rotates.

- Apply pipe-shaped tool **E** onto pinion stopper **2**.
- Hit tool **E** lightly using a mallet to remove stopper ring **1** from ring groove **F** of pinion stopper **2**.
- Remove stopper ring **1** and pinion **3**.
- Turn switch **A** OFF to stop current to the starter.

NOTE

When the current to the starter is stopped, stopper ring 1 might fall back into ring groove F of pinion stopper 2 because pinion 3 is pushed inside.

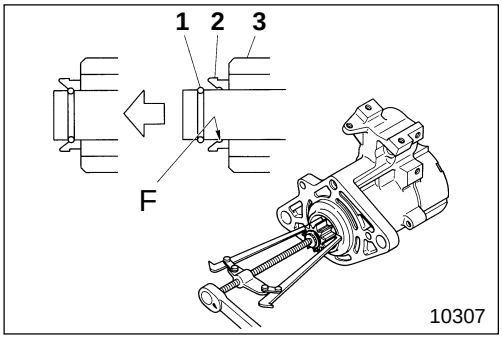
If this occurs, feed current to the starter again and carry out the work.



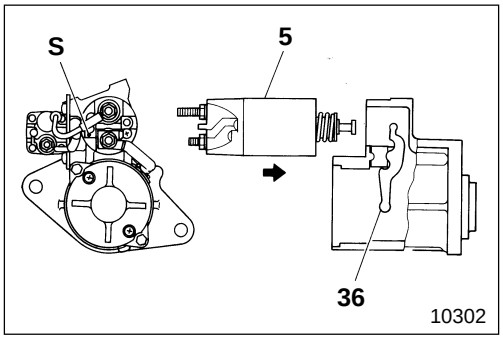
[Installation]

When installing pinion **3**, it is not necessary to feed current to the starter.

- Install pinion stopper **2** and pinion **3** onto overrunning clutch **33** in the direction as shown.
- Fit stopper ring **1** into ring groove **G** of overrunning clutch **33**.

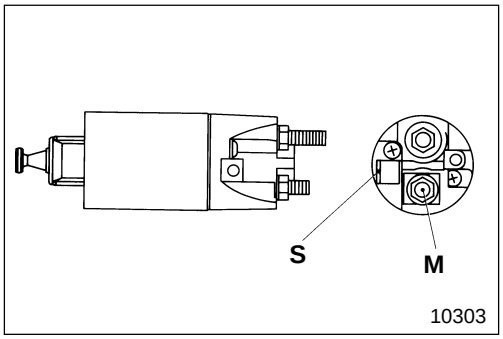


- Pull pinion **3** firmly and set stopper ring **1** on groove **F** of pinion stopper **2** securely.



5 Magnetic switch assembly

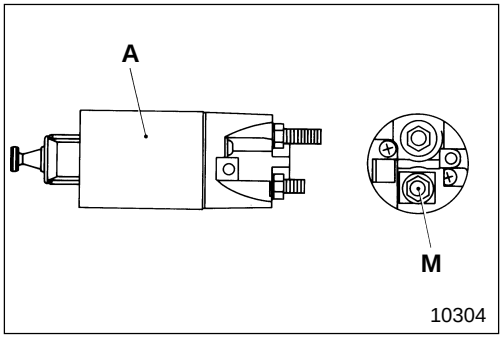
[Installation]
Install magnetic switch assembly **5** to lever **36**, with terminal **S** facing the direction as shown.



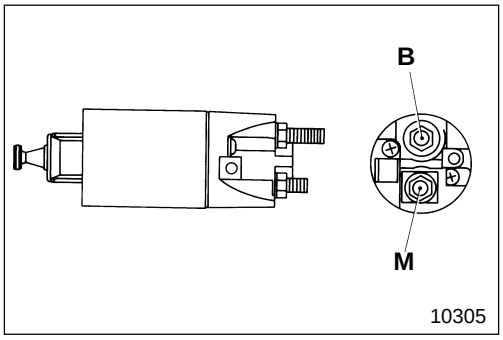
[Inspection]

(1) Testing for coil breakage

- Make sure that there is continuity between terminals **S** and **M**.
- If there is no continuity, replace magnetic switch assembly **5**.

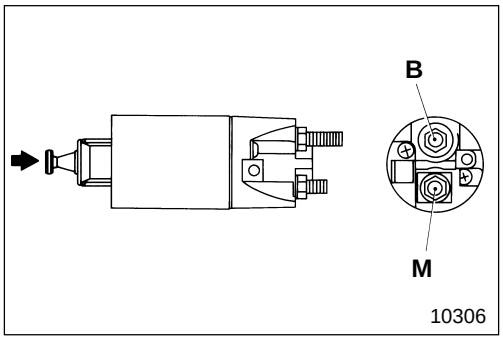


- Make sure that there is continuity between terminal **M** and body **A**.
- If there is no continuity, replace magnetic switch assembly **5**.



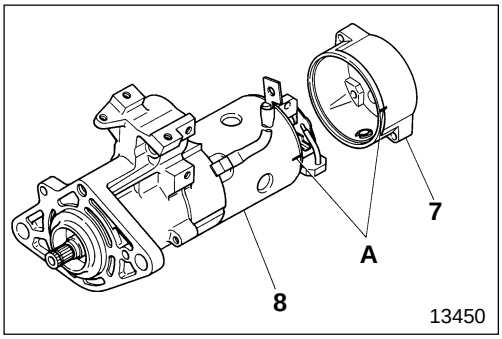
(2) Inspection of welded connections

- Make sure that there is no continuity between terminals **B** and **M**.
- If there is continuity, replace magnetic switch assembly **5**.



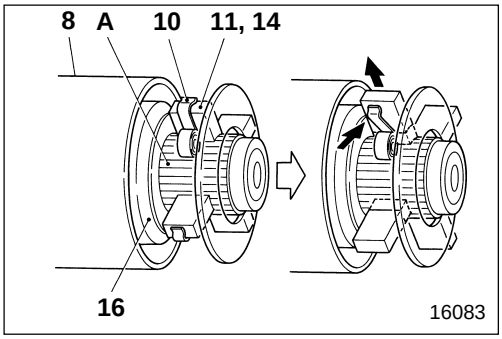
(3) Inspection of connections

- Push the tip of magnetic switch assembly **5** to close the internal connection.
  Make sure that there is continuity between terminals **B** and **M**.
- If there is no continuity, replace magnetic switch assembly **5**.



7 **Installation of rear bracket**

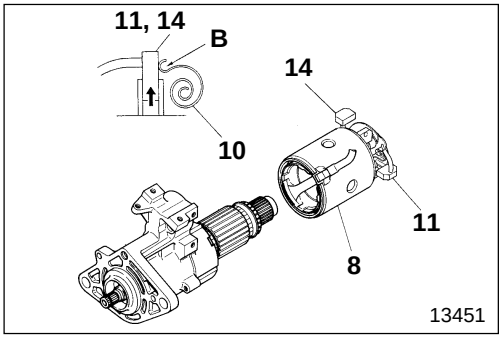
A : Alignment mark



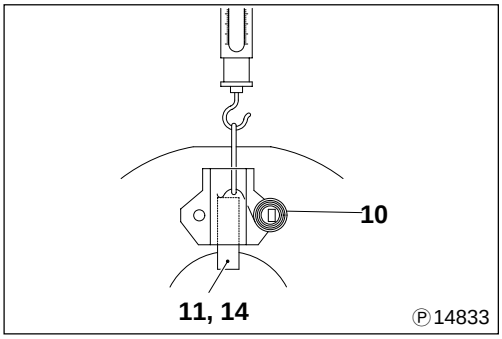
8 **Removal and installation of yoke and brush holder assembly**

Use the following method to remove the yoke and brush holder assembly **8** in order to prevent the commutator **A** of the armature assembly **16** from being damaged by the brushes **11** and **14**.

- Lift the brushes **11** and **14** away from the commutator **A** and hold them lifted by applying the brush springs **10** against the sides of the brush springs.

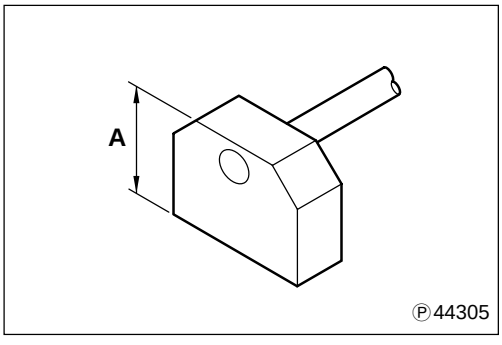


- Pull part **B** of each brush spring **10** and pull up the brushes **11** and **14**.
- Hold the brushes **11** and **14** in position with brush spring **10** as shown.
- Remove yoke and brush holder assembly **8**.
- To reinstall the yoke and brush holder assembly **8**, follow the removal instructions in, reverse.



10 **Inspection of brush spring**

- Use new brushes **11, 14** and measure the load when brush spring **10** is detached from the brushes.
- If the measured value is lower than the limit, replace brush spring **10**.



11 **14** **Inspection of brush**

(1) Length of brush

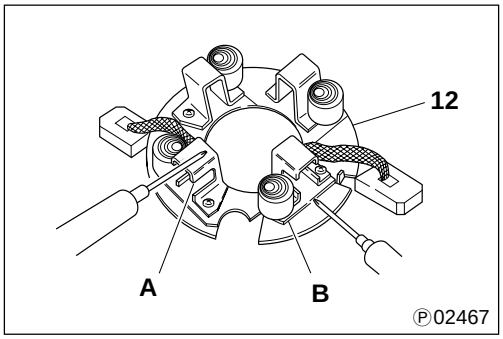
If the measured value **A** is lower than the limit, replace brushes **11, 14**.

NOTE

To replace brush ⊖ 11, replace entire brush holder assembly 12.

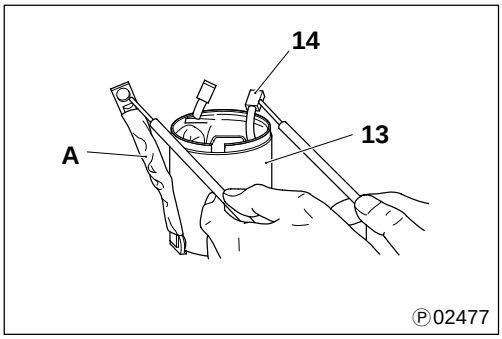
(2) Contact surface with commutator

If the surface where the brushes contact the commutator is rough or is worn unevenly, polish the surface with emery paper (300 to 500 grit).



12 Inspection of brush holder assembly

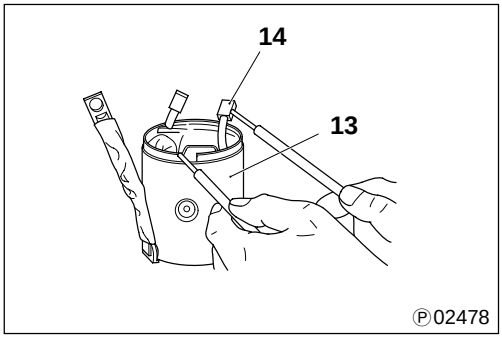
- Cleaning the brush holder **A** and holder plate **B**.
- Make sure that there is no continuity between the ⊕ side of the brush holder **A** and the ⊖ side of the holder plate **B**.
- If there is continuity between them, they are short-circuited. Replace brush holder assembly **12**.



13 Inspection of yoke assembly

(1) Testing for coil breakage

- Make sure that there is continuity between cable **A** and brush ⊕ **14**.
- If there is no continuity, they are broken. Replace brush ⊕ **14** or yoke assembly **13**.

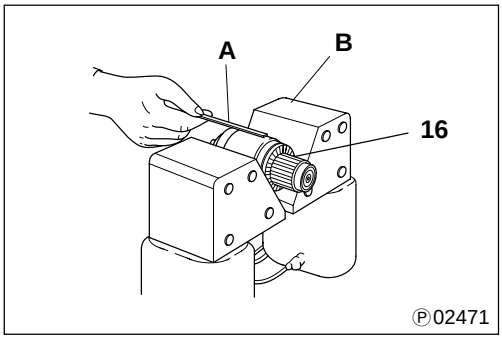


(2) Testing for coil grounding

- Make sure that there is no continuity between yoke assembly **13** and brush ⊕ **14**.
- If there is continuity, they are short-circuited. Inspect the insulated point. If it is hard to repair, replace brush ⊕ **14** or yoke assembly **13**.

NOTE

The coil may be short-circuited to the yoke assembly 13 due to the accumulation of worn-off metal particles from the brushes and/or armature.



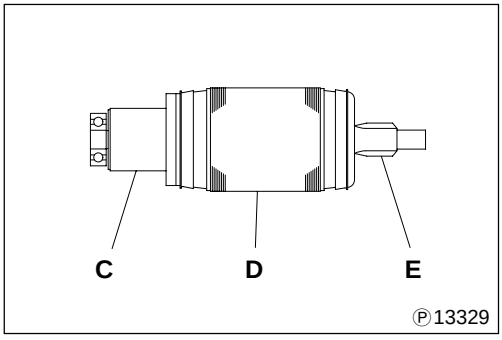
16 Inspection of armature assembly

(1) Testing for coil short-circuit

- Hold an iron rod **A** parallel with the armature assembly **16**.

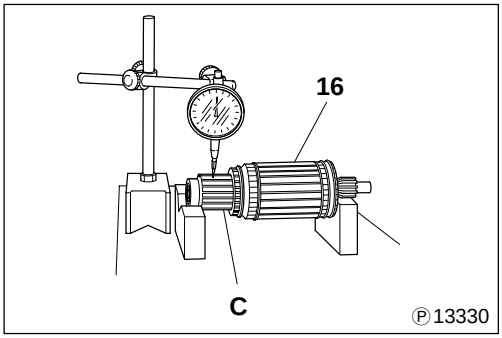
B : Armature tester

- Slowly rotate the armature assembly **16** by hand.
- If the iron rod **A** vibrates or is pulled toward the armature assembly **16**, the coil is short-circuited and the armature assembly must be replaced.



(2) Testing for coil grounding

- Make sure that there is no continuity between commutator **C** and core **D** (or shaft **E**).
- If there is continuity between them, they are short-circuited. Replace armature assembly **16**.

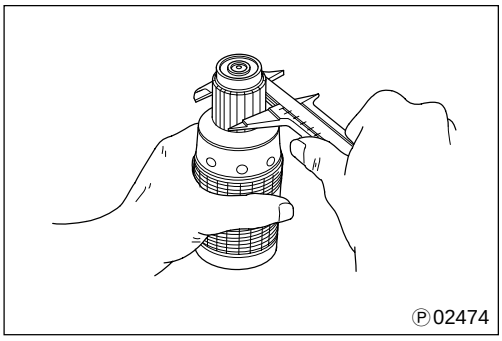


(3) Deflection of commutator

If the measured value is higher than the limit, correct the outer diameter of commutator **C** within the limit.

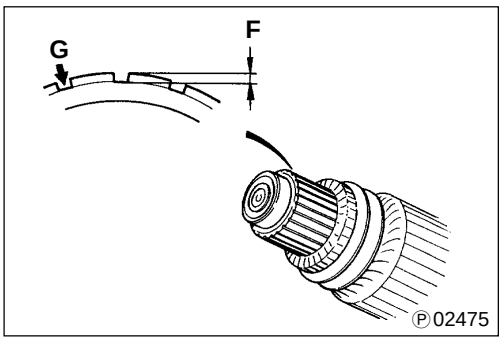
(4) Condition of the surface of commutator

- If the surface is rough or has stepped wear, polish the surface with emery paper (300 to 500 grit).
- After polishing, check deflection of commutator **C**.



(5) Outer diameter of commutator

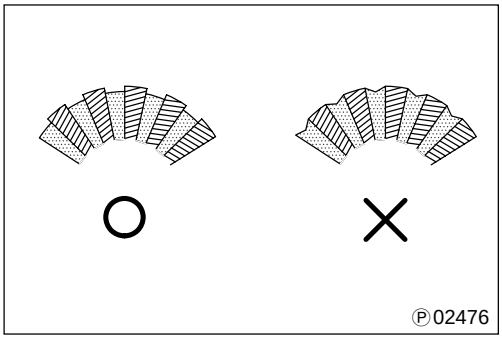
If the measured value is lower than the limit, replace armature assembly **16**.



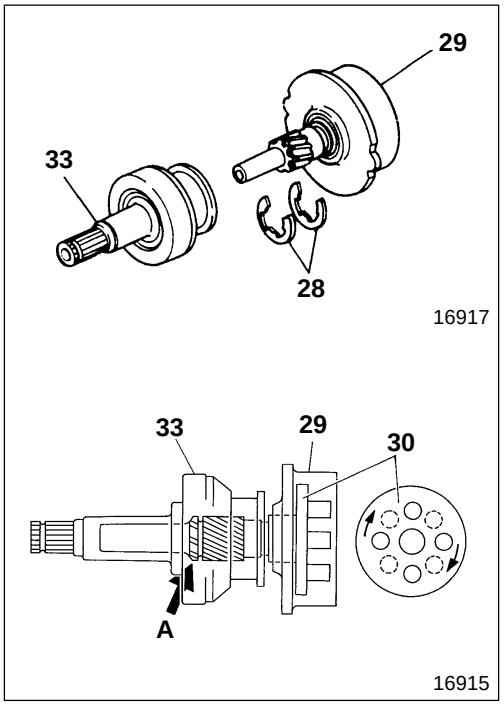
(6) Mold depth between segments

- If the measured value is lower than the limit, replace armature assembly **16**.
  F : Mold depth

- To rectify the armature assembly **16**, grind the shown portions **G**.



- If the mold is worn as shown, correct or replace armature assembly **16**.
  ○ : Good
  × : Faulty

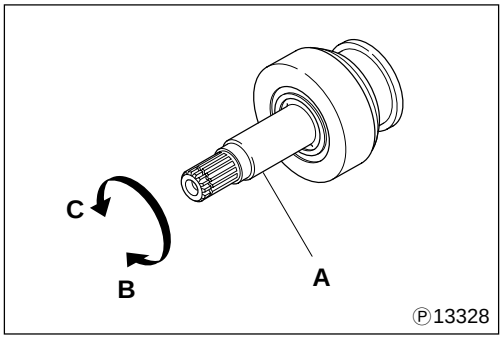


29 **Removal of gear shaft and internal gear assembly**

Remove the E-rings **28** and then the gear shaft and internal gear assembly **29** from the overrunning clutch **33**.

Proceed as follows if the gear shaft and internal gear assembly **29** cannot be removed due to interference of the splined section **A** of gear shaft assembly **30** with internal parts of the overrunning clutch **33**.

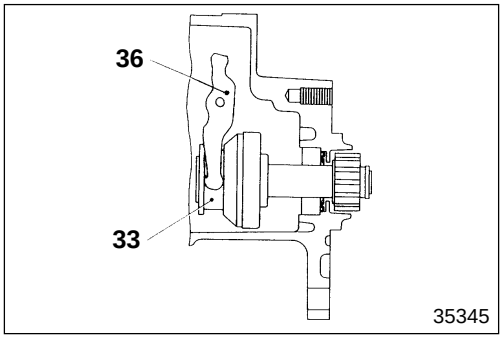
- Press the gear shaft assembly **30** against the overrunning clutch **33**.
- Turn the gear shaft assembly **30** approx. 1/8 of a turn to change the position of splined section **A**.



33 **Inspection of overrunning clutch**

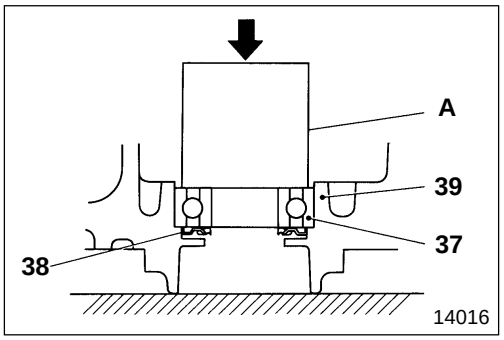
Perform the following checks, and if any fault is found, replace the overrunning clutch **33**.

- Make sure that shaft **A** turns smoothly when turned in direction **B**.
- Make sure that shaft **A** locks when turned in direction **C**.



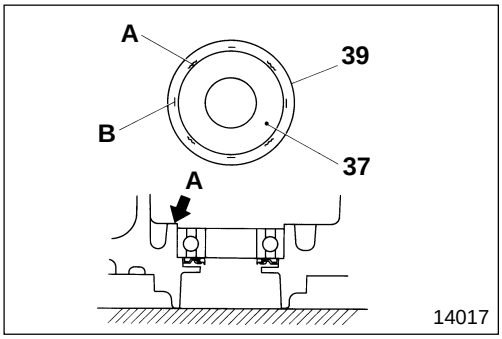
36 **Installation of lever**

Install lever **36** onto overrunning clutch **33** in the direction as shown.



37 **Installation of front bearing**

- Install oil seal **38** before press-fitting front bearing **37**.
- Press-fit front bearing **37** into front bracket **39** using pipe-shaped tool **A**.



- Re-caulk the side of front bracket **39**.

NOTE

Do not re-caulk previously caulked points B.

A : Caulking points (4 points)

◆ Service procedure

● Inspection after assembly

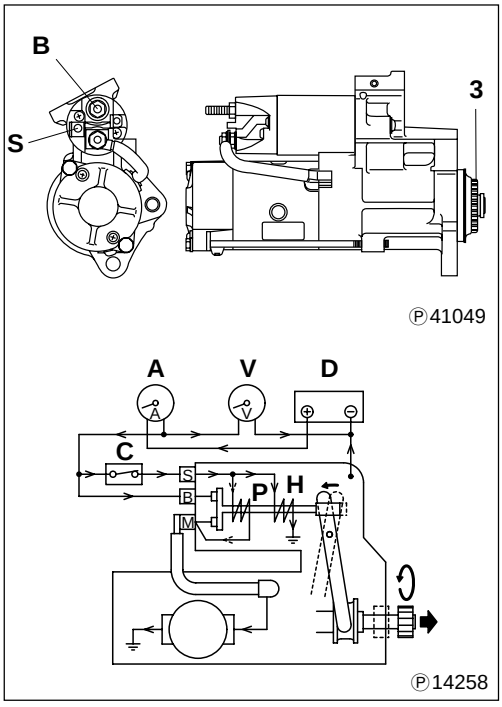
Inspection after assembling the starter should be carried out with current fed to the starter.

WARNING⚠

- **Do not touch pinion 3 because it jumps out and turns when current is fed to the starter.**
- **Take care not to burn your hand, magnetic switch assembly 5 might be hot during inspection.**

CAUTION⚠

- **The current feeding time to the starter should be within 10 seconds at pull-in coil P side and within 30 seconds at holding coil H side. If the current feeding time exceeds these limits the coil might burn due to overheating.**
- **The current, when fed to the starter, is over 100 amperes. When inspecting, use thick cable, such as a booster cable, and make secure connections.**



(1) Performance test

- Connect the starter as shown.
  A : Ammeter
  B : Terminal B of starter
  C : Switch
  D : 12 volts DC
  S : Terminal S of starter
  V : Voltmeter
- Set the voltage to 11 volts DC.

CAUTION⚠

Up to 12 volts can be loaded.

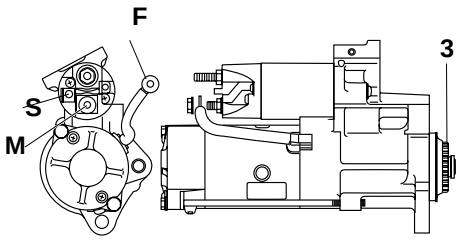
- The following work should be done with current fed to the starter. You must complete measurement of the current and the number of revolutions within 30 seconds.
  - Turn switch **C** ON and feed current to the starter. In this state, pinion **3** jumps out and rotates.

CAUTION⚠

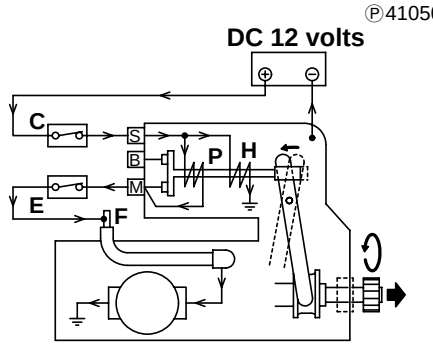
When switch C is turned ON, current is fed both to pull-in coil P and holding coil H. When a large amount of current is fed into terminal M from DC power supply D, via terminal B of the starter, the current stops flowing into the pull-in coil but continues to flow into the holding coil.

To avoid burning the holding coil, be sure to carry out the performance test within 30 seconds.

  - Measure the current and the number of revolutions of the starter. Train a strobe light on pinion **3** to measure the revolutions.
  - Turn switch **C** OFF to stop current to the starter.
- If the measured value deviates from the standard value, disassemble the starter again and inspect it.



Ⓟ41050



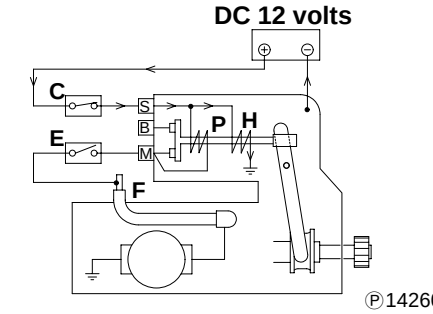
Ⓟ14259

(2) Pinion gap

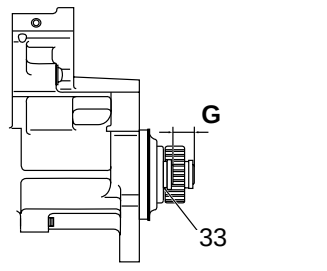
[Inspection]

- Connect the starter as shown.
  C : Switch
  E : Switch
  F : Cable
  M : Terminal M of starter
  S : Terminal S of starter

- The following work should be done with current fed to the starter. You must complete measurement of the pinion gap within 30 seconds.
  - Turn switches **C** and **E** ON and feed current to the starter. In this state, pinion **3** jumps out and rotates.



Ⓟ14260



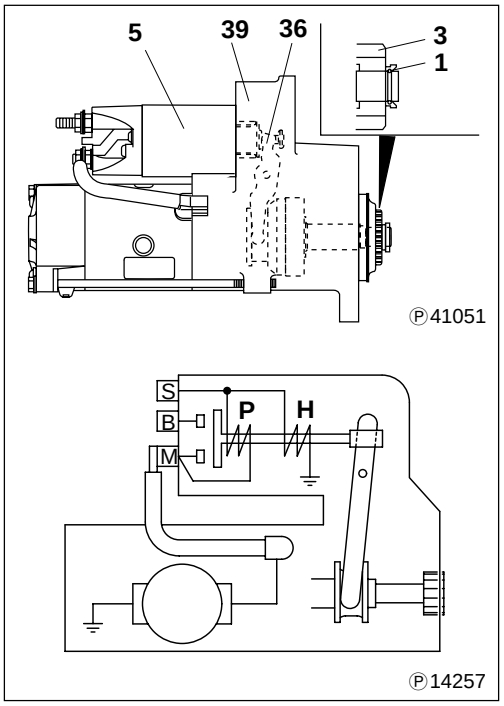
Ⓟ34689

  - Within 5 seconds of pinion **3** rotating, turn switch **E** OFF to stop rotation of the pinion.

CAUTION⚠

When switches C and E are turned ON, current is fed both to pull-in coil P and holding coil H. The circuit is wired in such a way that the voltage is not applied to terminal B of the starter, so the current continues to flow into the pull-in coil while pinion 3 rotates.
To avoid burning the pull-in coil, be sure to turn switch E OFF within 5 seconds of the pinion rotating.

  - Hold the end of overrunning clutch **33** with fingers, and pull it. Measure the distance **G** (pinion gap) in the shaft direction that the overrunning clutch moves when it is lightly pushed back by hand.
  - Turn switch **C** OFF to stop current to the starter.
- If the measured value deviates from the standard value, replace lever **36**.



3 **Pinion**

[Removal]

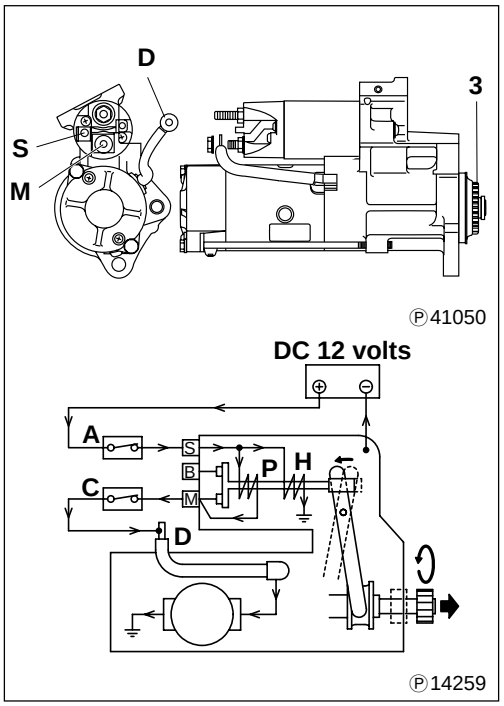
Feed current to the starter and protrude pinion **3** to remove the pinion.

WARNING⚠

- **Do not touch pinion 3 because it jumps out and turns when current is fed to the starter.**
- **Take care not to burn your hand, magnetic switch assembly 5 might be hot after inspection.**

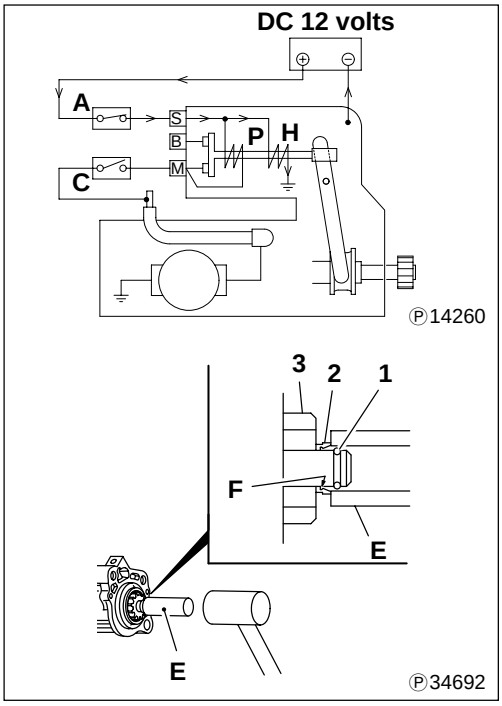
CAUTION⚠

- **The current feeding time to the starter should be within 10 seconds at pull-in coil P side and within 30 seconds at holding coil H side. If the current feeding time exceeds these limits, the coil might burn due to overheating.**
- **Before making pinion 3 jump out, be sure to feed current to the starter to obtain the correct state. If current is not fed to the starter and lever 36 is pulled to protrude the pinion, front bracket 39 or the lever might be damaged due to the shock produced on removal of stopper ring 1.**
- **The current, when fed to the starter, is over 100 amperes. When inspecting, use thick cable, such as a booster cable, and make secure connections.**



- Connect the starter as shown.
  A : Switch
  C : Switch
  D : Cable
  M : Terminal M of starter
  S : Terminal S of starter

- The following work should be done with current fed to the starter. You must complete removal of pinion **3** within 30 seconds.
  - Turn switches **A** and **C** ON and feed current to the starter. In this state, pinion **3** jumps out and rotates.



- Within 5 seconds of pinion **3** rotating, turn switch **C** OFF to stop rotation of the pinion**.**

CAUTION

When switches A and C are turned ON, current is fed both to pull-in coil P and holding coil H. The circuit is wired in such a way that the voltage is not applied to terminal B of the starter, so the current continues to flow into the pull-in coil while pinion 3 rotates.

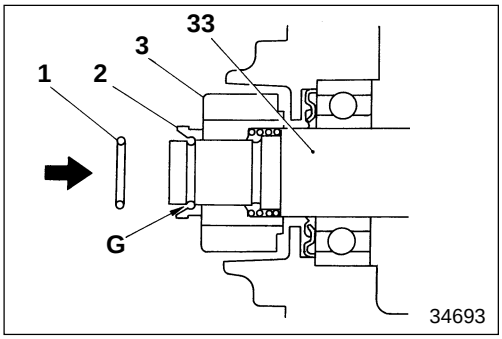
To avoid burning pull-in coil P, be sure to turn switch C OFF within 5 seconds after the pinion rotates.

- Apply pipe-shaped tool **E** onto pinion stopper **2**.
- Hit tool **E** lightly using a mallet to remove stopper ring **1** from ring groove **F** of pinion stopper **2**.
- Remove stopper ring **1** and pinion **3**.
- Turn switch **A** OFF to stop current to the starter.

NOTE

When the current to the starter is stopped, stopper ring 1 might fall back into ring groove F of pinion stopper 2 because pinion 3 is pushed inside.

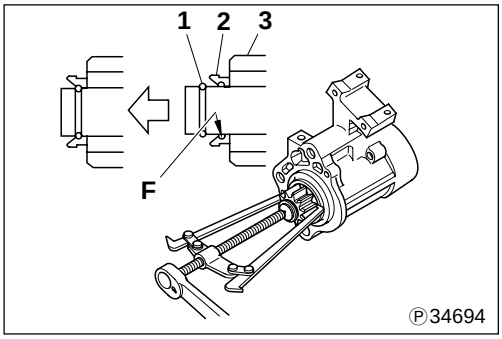
If this occurs, feed current to the starter again and carry out the work.



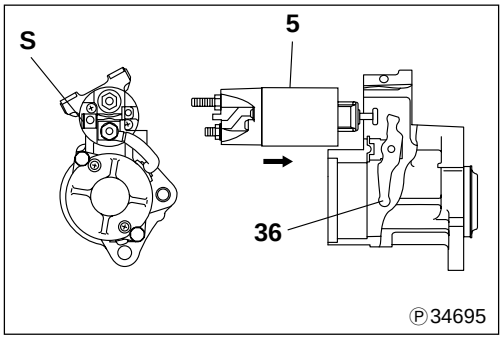
[Installation]

When installing pinion **3**, it is not necessary to feed current to the starter.

- Install pinion stopper **2** and pinion **3** onto overrunning clutch **33** in the direction as shown.
- Fit stopper ring **1** into ring groove **G** of overrunning clutch **33**.

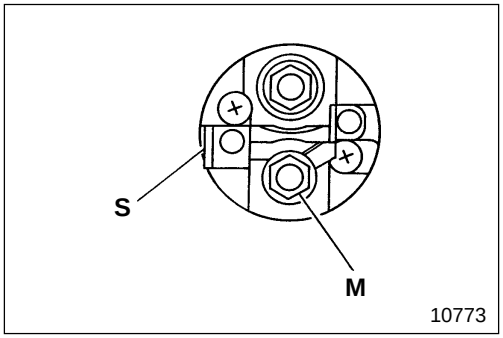


- Pull pinion **3** firmly and set stopper ring **1** on groove **F** of pinion stopper **2** securely.



5 Magnetic switch assembly

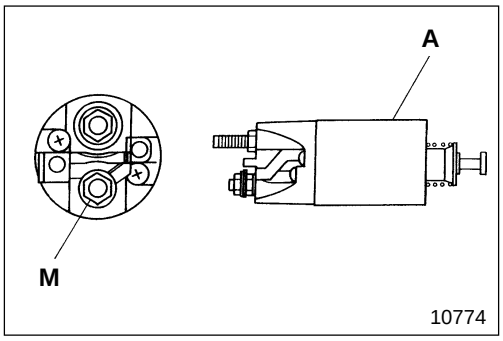
[Installation]
Install magnetic switch assembly **5** to lever **36**, with terminal **S** facing the direction as shown.



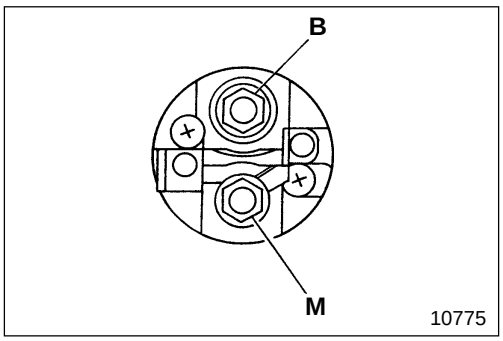
[Inspection]

(1) Testing for coil breakage

- Make sure that there is continuity between terminals **S** and **M**.
- If there is no continuity, replace magnetic switch assembly **5**.

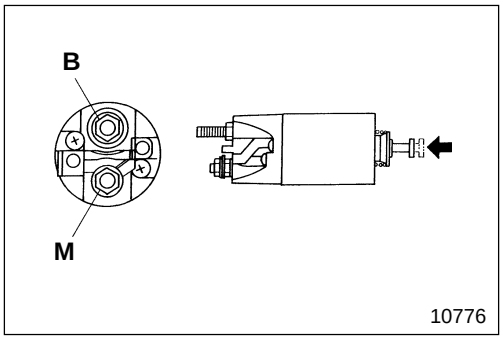


- Make sure that there is continuity between terminal **M** and body **A**.
- If there is no continuity, replace magnetic switch assembly **5**.



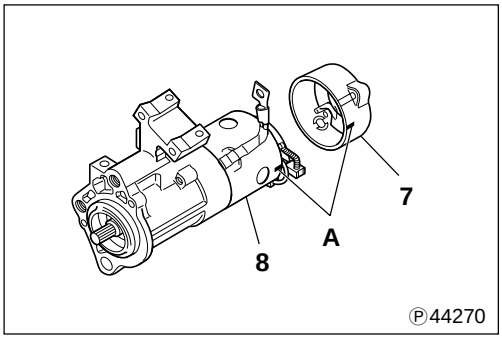
(2) Inspection of welded connections

- Make sure that there is no continuity between terminals **B** and **M**.
- If there is continuity, replace magnetic switch assembly **5**.



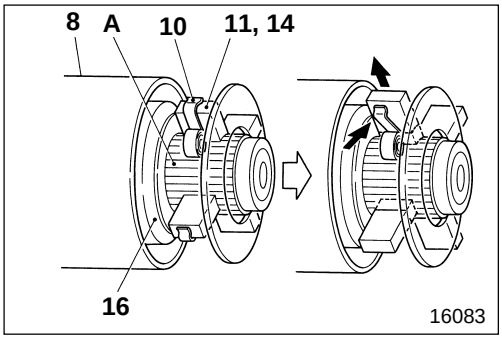
(3) Inspection of connections

- Push the tip of magnetic switch assembly **5** to close the internal connection.
  Make sure that there is continuity between terminals **B** and **M**.
- If there is no continuity, replace magnetic switch assembly **5**.



7 **Installation of rear bracket**

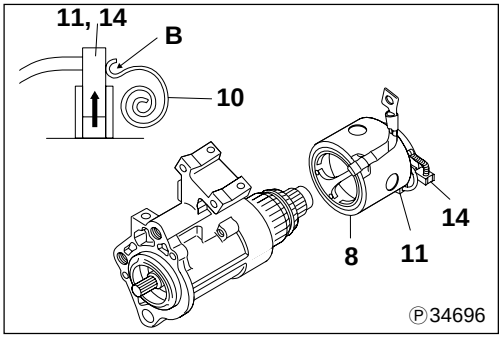
A : Alignment mark



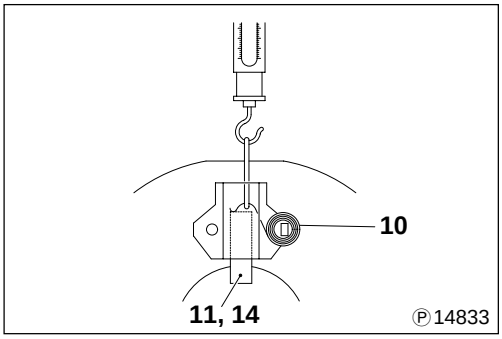
8 **Removal and installation of yoke and brush holder assembly**

Use the following method to remove the yoke and brush holder assembly **8** in order to prevent the commutator **A** of the armature assembly **16** from being damaged by the brushes **11** and **14**.

- Lift the brushes **11** and **14** away from the commutator **A** and hold them lifted by applying the brush springs **10** against the sides of the brush springs.

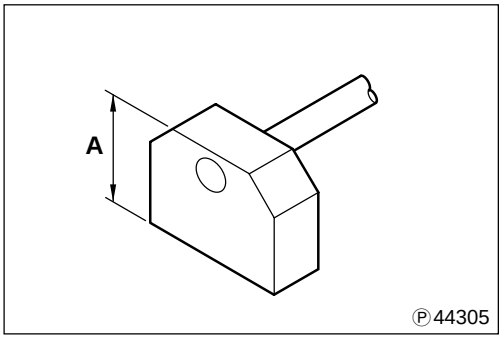


- Pull part **B** of each brush spring **10** and pull up the brushes **11** and **14**.
- Hold the brushes **11** and **14** in position with brush spring **10** as shown.
- Remove yoke and brush holder assembly **8**.
- To reinstall the yoke and brush holder assembly **8**, follow the removal instructions in, reverse.



10 **Inspection of brush spring**

- Use new brushes **11, 14** and measure the load when brush spring **10** is detached from the brushes.
- If the measured value is lower than the limit, replace brush spring **10**.



11 **14** **Inspection of brush**

(1) Length of brush

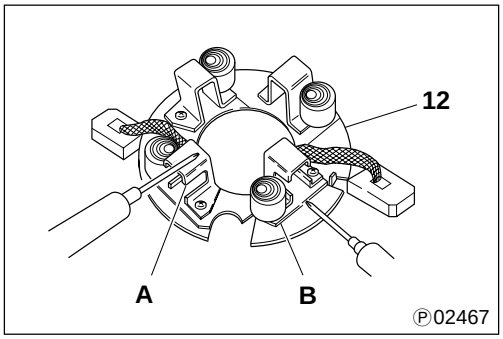
If the measured value **A** is lower than the limit, replace brushes **11, 14**.

NOTE

To replace brush ⊖ 11, replace entire brush holder assembly 12.

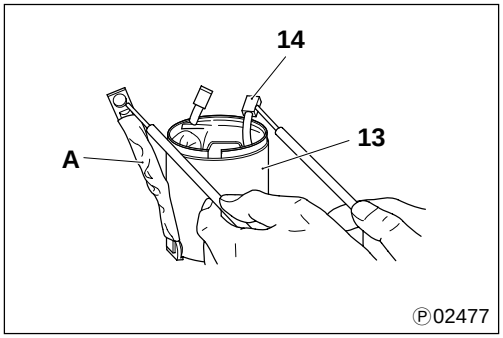
(2) Contact surface with commutator

If the surface where the brushes contact the commutator is rough or is worn unevenly, polish the surface with emery paper (300 to 500 grit).



12 Inspection of brush holder assembly

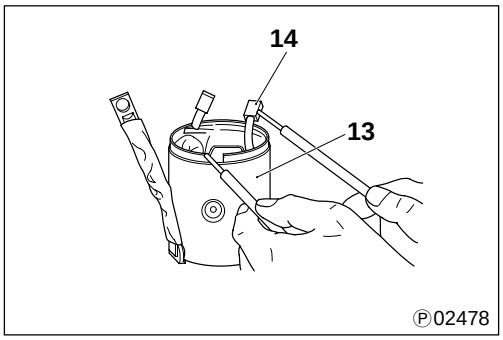
- Clearing the brush holder **A** and holder plate **B**.
- Make sure that there is no continuity between the ⊕ side of the brush holder **A** and the ⊖ side of the holder plate **B**.
- If there is continuity between them, they are short-circuited. Replace brush holder assembly **12**.



13 Inspection of yoke assembly

(1) Testing for coil breakage

- Make sure that there is continuity between cable **A** and brush ⊕ **14**.
- If there is no continuity, they are broken. Replace brush ⊕ **14** or yoke assembly **13**.

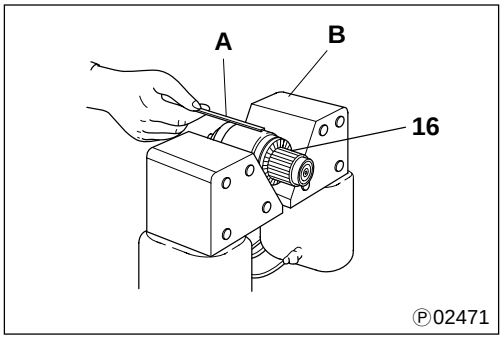


(2) Testing for coil grounding

- Make sure that there is no continuity between yoke assembly **13** and brush ⊕ **14**.
- If there is continuity, they are short-circuited. Inspect the insulated point. If it is hard to repair, replace brush ⊕ **14** or yoke assembly **13**.

NOTE

The coil may be short-circuited to the yoke assembly 13 due to the accumulation of worn-off metal particles from the brushes and/or armature.



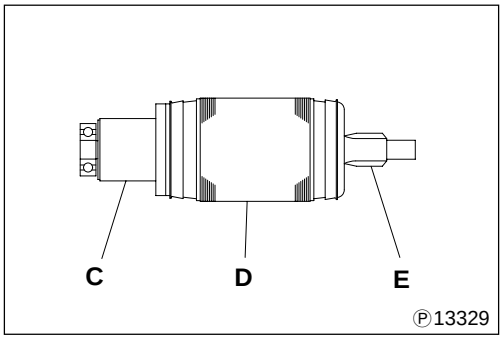
16 Inspection of armature assembly

(1) Testing for coil short-circuit

- Hold an iron rod **A** parallel with the armature assembly **16**.

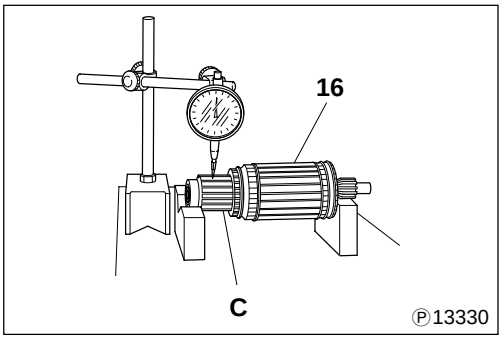
B : Armature tester

- Slowly rotate the armature assembly **16** by hand.
- If the iron rod **A** vibrates or is pulled toward the armature assembly **16**, the coil is short-circuited and the armature assembly must be replaced.



(2) Testing for coil grounding

- Make sure that there is no continuity between commutator **C** and core **D** (or shaft **E**).
- If there is continuity between them, they are short-circuited. Replace armature assembly **16**.

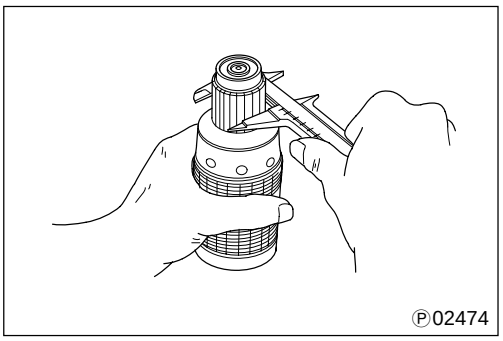


(3) Deflection of commutator

If the measured value is higher than the limit, correct the outer diameter of commutator **C** within the limit.

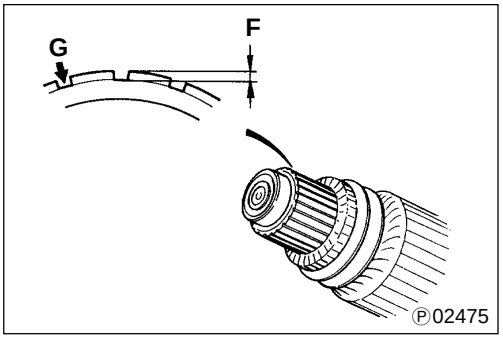
(4) Condition of the surface of commutator

- If the surface is rough or has stepped wear, polish the surface with emery paper (300 to 500 grit).
- After polishing, check deflection of commutator **C**.



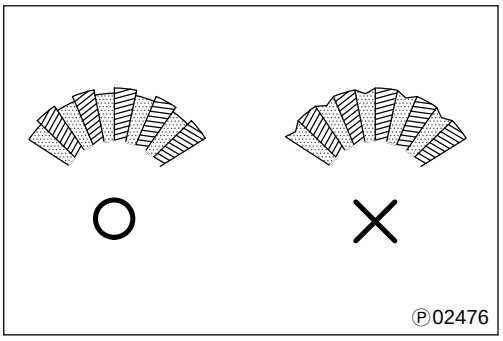
(5) Outer diameter of commutator

If the measured value is higher than the limit, replace armature assembly **16**.

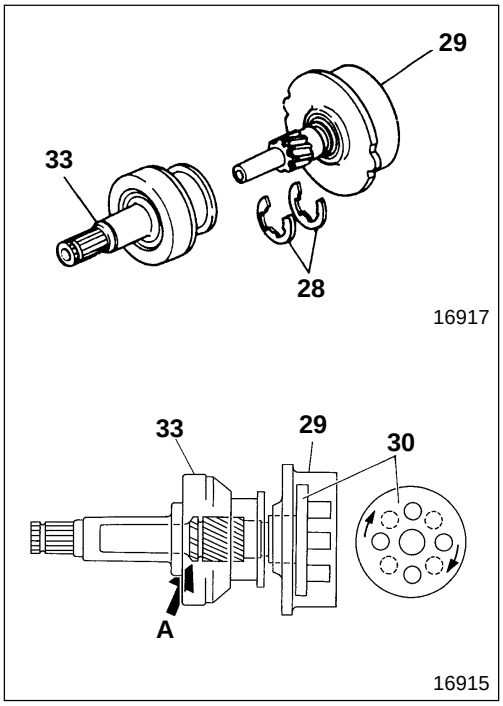


(6) Mold depth between segments

- If the measured value is lower than the limit, replace armature assembly **16**.
  F : Mold depth
- To rectify the armature assembly **16**, grind the shown portions **G**.



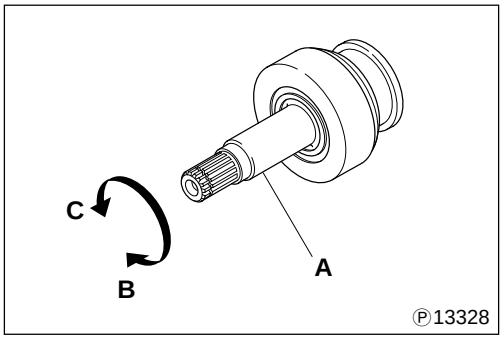
- If the mold is worn as shown, correct or replace armature assembly **16**.
  ○ : Good
  × : Faulty



29 Removal of gear shaft and internal gear assembly

Remove the E-rings **28** and then the gear shaft and internal gear assembly **29** from the overrunning clutch **33**.
Proceed as follows if the gear shaft and internal gear assembly **29** cannot be removed due to interference of the splined section **A** of gear shaft assembly **30** with internal parts of the overrunning clutch **33**.

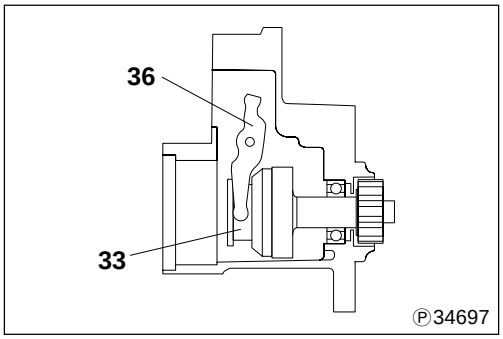
- Press the gear shaft assembly **30** against the overrunning clutch **33**.
- Turn the gear shaft assembly **30** approx. 1/8 of a turn to change the position of splined section **A**.



33 Inspection of overrunning clutch

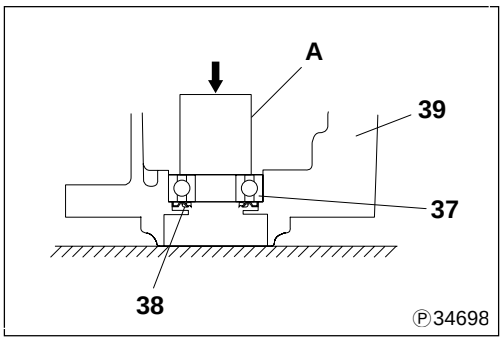
Perform the following checks, and if any fault is found, replace the overrunning clutch **33**.

- Make sure that shaft **A** turns smoothly when turned in direction **B**.
- Make sure that shaft **A** locks when turned in direction **C**.



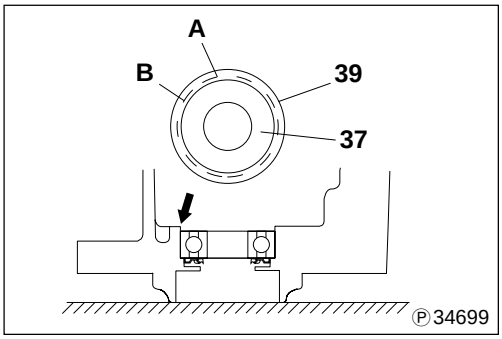
36 Installation of lever

Install lever **36** onto overrunning clutch **33** in the direction as shown.



37 Installation of front bearing

- Install oil seal **38** before press-fitting front bearing **37**.
- Press-fit front bearing **37** into front bracket **39** using pipe-shaped tool **A**.



- Re-caulk the side of front bracket **39**.

NOTE

Do not re-caulk previously caulked points B.

A : Caulking points (4 points)

3 Adjusting bolt
4 V-belts
5 Adjusting plate
6 Alternator 📖 P54-12-32

A : To terminals L and R
B : To terminal B
C : To crankcase
E : To terminal E

WARNING ⚠

To prevent possible injury, be sure to disconnect the negative terminal ⊖ of the battery and insulate it with tape before removing alternator 6.
With the negative terminal ⊖ of the battery connected, battery voltage is always applied to the terminal B.

● **Installation sequence**

Follow the removal sequence in reverse.

● **Adjustment after installation**

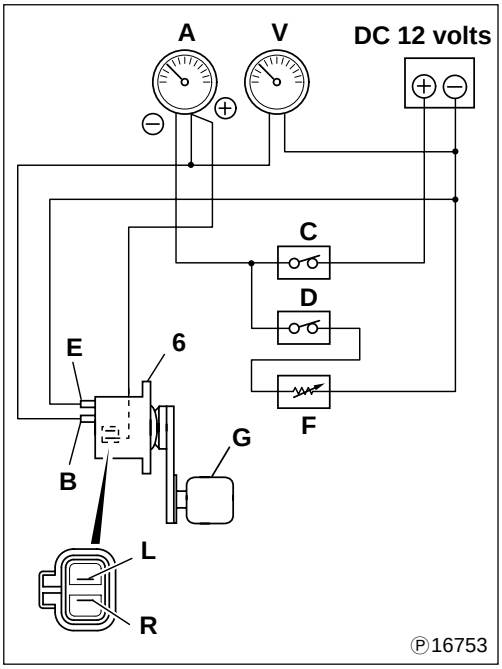
For adjustment of V-belt 4 tension
📁 Gr 14

Service standards

Location	Maintenance item		Standard value	Limit	Remedy
6	Alternator output current (*When alternator is hot and producing 13.5V)	At 1500 rpm	53 A or more	—	Inspect
		At 2500 rpm	84 A or more	—	
		At 5000 rpm	102 A or more	—	
	Adjustment voltage of regulator (At 5000 rpm, 5A or less load)		14.7±0.3V	—	Replace

*The hot condition is the one after the alternator has been run at normal ambient temperature with 5000 rpm and maximum output for 30 minutes.

◆ Service procedure



6 **Inspection of alternator**

(1) Alternator performance check (bench test)

- Connect the alternator **6** as shown.

CAUTION⚠

Sufficiently thick wires should be used for wiring and each connection should be securely fastened.

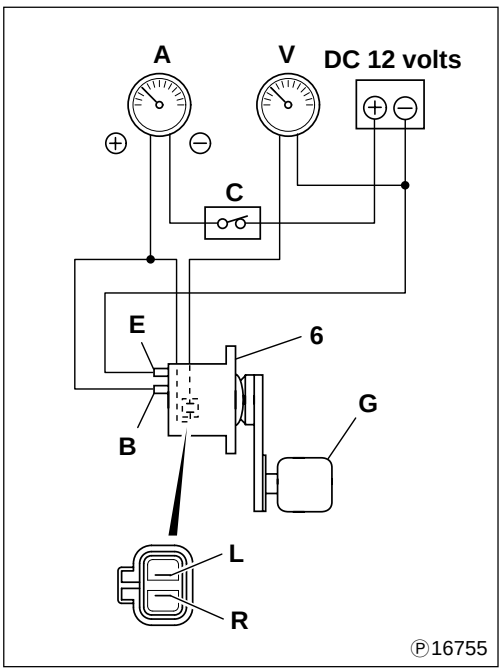
A : Ammeter
B : Alternator terminal B
C : Switch
D : Switch
E : Alternator terminal E
F : Load resistance (variable resistance)
G : Alternator drive motor
L : Alternator terminal L
R : Alternator terminal R
V : Voltmeter

- Increase load resistance **F** to the maximum (condition which the load current hardly flow).
- Turn switches **C** and **D** ON.
- Run alternator at 5000 rpm for 30 minutes by adjusting load resistance **F** so that electric current can conform to the specified standard.

  Alternator nominal current

  12V-100A

- Measure the current at each specified revolution of alternator **6**.
- If the measured value deviates from the standard value, disassemble and check alternator **6**. 📖 P54-12-32



(2) Regulator performance check (bench test)

- Connect the alternator **6** as shown.

A : Ammeter
B : Alternator terminal B
C : Switch
E : Alternator terminal E
G : Alternator drive motor
L : Alternator terminal L
R : Alternator terminal R
V : Voltmeter

- Turn switches **C** ON.
- Run alternator **6** at low speeds.
- Increase the speed of alternator **6** to 5000 rpm and measure the voltage (adjustment voltage) at this speed. At the same time, make sure that the current is 5 amperes or less at 5000 rpm.
- If the measured value deviates from the standard value, do as follows:
  - If higher than the standard value: Replace the regulator.
  - If below the standard value: Inspect the alternator related parts before replacing the regulator.

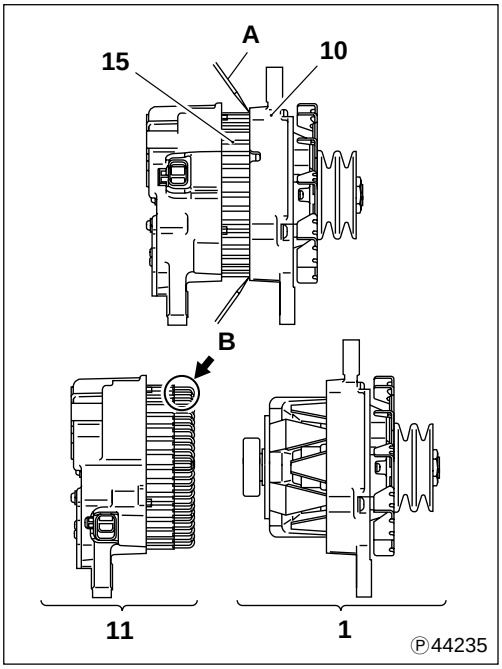
Tightening torque

Unit : N·m {ft.lbs, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
2	Nut (Pulley mounting)	132 to 162 {98 to 120, 13.5 to 16.5)	—



◆ Service procedure

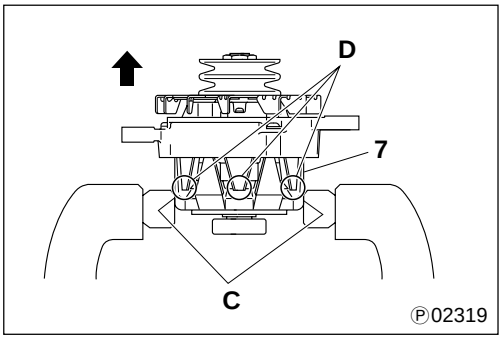
1 Rotor and front bracket assembly

[Removal]

- Insert a screwdriver **A** between front bracket **10** and stator assembly **15**.
- Use the screwdriver **A** to pry rotor and front bracket assembly **1** away from stator and rear bracket assembly **11**.

CAUTION

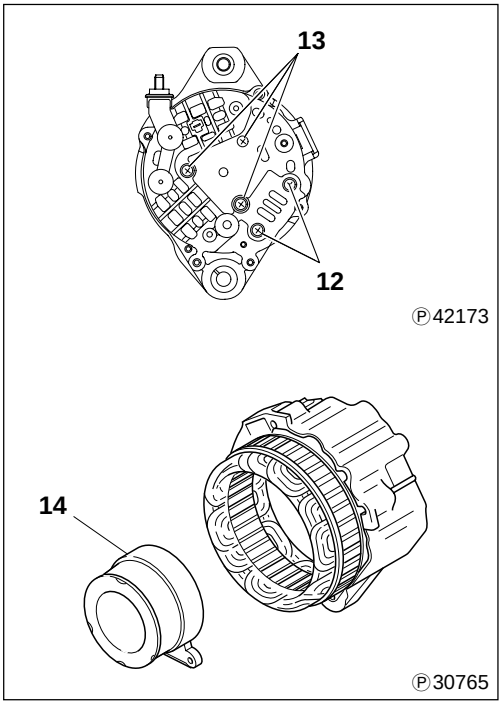
Be careful not to insert the screwdriver A too deep or it will damage coil B of stator assembly 15 and might cause a short-circuit.



[Disassembly]

CAUTION

Make sure, when you hold rotor assembly 7 in a vise, to grip root C of the core claws. Gripping claws D can damage them.



14 Field coil

[Removal]

- Remove screw **12** (2 places).

CAUTION

If screw 13 are removed first, the weight of field coil 14 may be placed on the joining portion with regulator 16 which is fixed with screw 12, causing break of the joining portion. To avoid this, remove screw 12 first.

- Remove screw **13** (3 places).

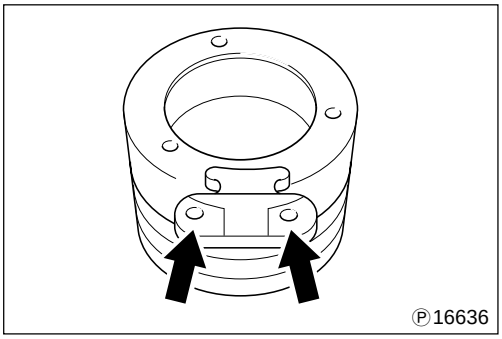
CAUTION

If screw 13 are removed, field coil 14 falls under its own weight. Keep the field coil supported by your hand.

- Remove field coil **14**.

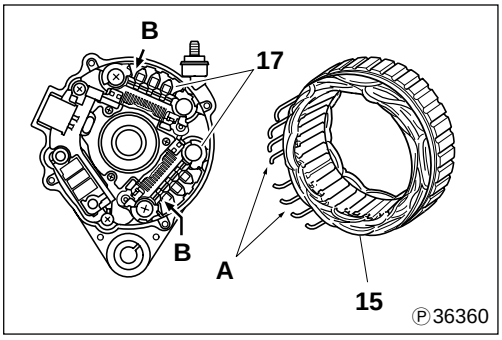
CAUTION

Do not take out field coil 14 forcibly. Otherwise the joining portion with regulator 16 may be caught by the stator coil.



[Inspection]

- Measure the resistance between the terminals of field coil **14**.
- If the measured value deviates from the standard value, replace field coil **14**.



15 Stator assembly

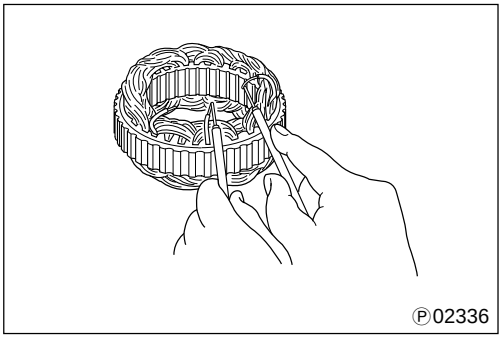
[Removal and installation]

- Disconnect lead **A** of stator assembly **15** from rectifier **17**. The lead is soldered to diode **B** of the rectifier at 8 places. (Each of the 2 rectifiers has 4 soldered sections.)

CAUTION

Unsolder within as short a time as possible (within 5 seconds), or diode can be easily damaged by heat.

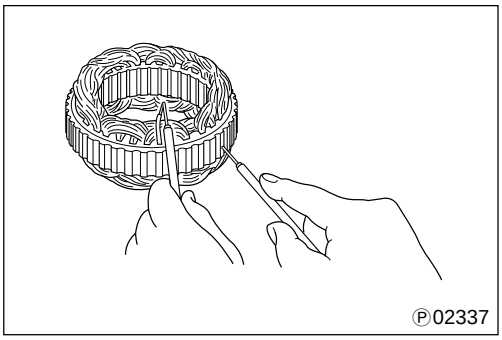
- To install, follow the removal sequence in reverse.



[Inspection]

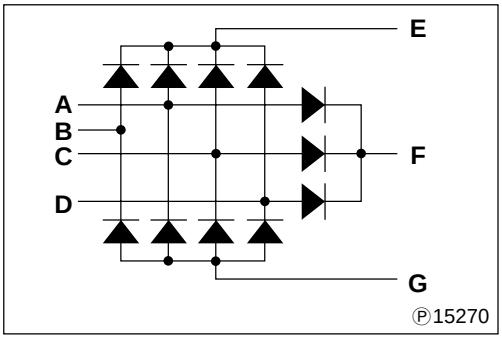
(1) Continuity between each lead wire

- Check that there is continuity between each stator lead.
- If there is no continuity, the lead is broken. Replace stator assembly **15**.



(2) Continuity between each lead wires and the core

- Check that there is no continuity between lead wires and the core.
- If there is continuity, the lead wires is short-circuited. Replace the stator assembly **15**.

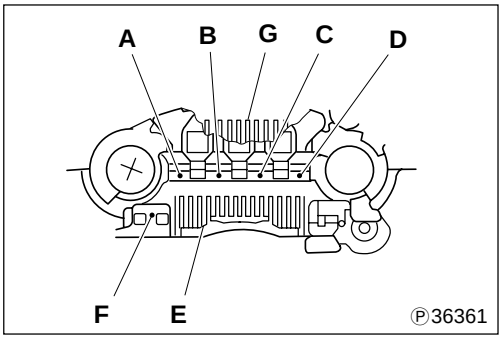


17 Inspection of rectifier

- Check the function of diodes within rectifier **17** properly. If any fault is found, replace the rectifier.

  If resistance is infinite in both cases, the diode is open.
  If resistance is close to 0Ω in both cases, the diode is shorted

  A, **B**, **C**, **D** : Lead connecting area of stator coil
  E, **G** : Heat sink area
  F : Regulator connecting area



- Inspection should be repeated with the positive probe and the negative probe of the tester changed over.

CAUTION ⚠

When inspecting using a tester, the current flowing through rectifier 17 is smaller than usual. Therefore, an incorrect resistance value might be indicated on the tester.
Also, incorrect indication become larger as the range of the tester gets smaller. Set the tester to a largest possible scale.

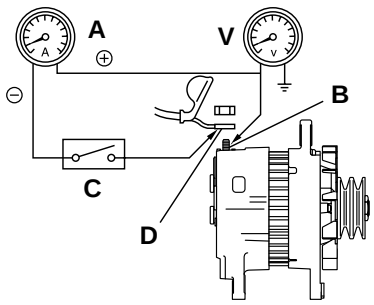
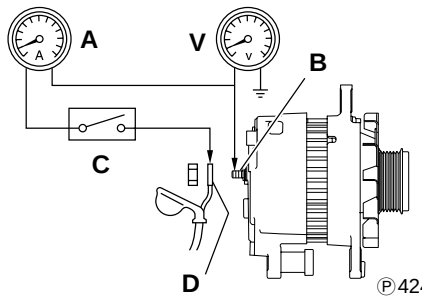
950 INSPECTION OF ALTERNATOR

< 4D3 >



Ⓟ42489

< 4M5 >



Ⓟ42490

Performance test

- Connect the meters to the alternator as shown.

  A : Ammeter (100 amperes class)
  B : Alternator terminal B
  C : Switch
  D : Terminal
  V : Voltmeter

WARNING

- **To prevent possible injury, be sure to disconnect the negative terminal of the battery and insulate it with tape before working on the wiring. With the negative terminal ⊖ of the battery connected, battery voltage is always applied to the terminal B.**
- **To connect to switch C, use a lead wire with the same or larger diameter than that of the chassis harness connected to terminal B.**

- Turn on switch **C** and make sure that voltmeter **V** indicates battery voltage.
- Start the engine.
- Immediately turn on the switches for all lamps on the vehicle.
- Immediately accelerate the engine to the speed indicated below and measure the alternator's output current.

Engine speed	2100 to 2400 rpm

- The alternator is considered to be good if the measured value is 70% or more of the nominal output current.
  Alternator nominal output

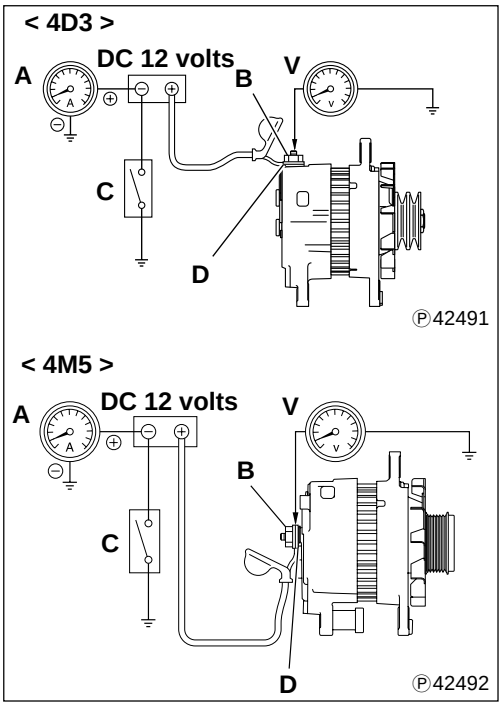
Voltage	Output current
12V	100A

NOTE

The on-vehicle inspection is only a simplified check. Use a test bench for accurate checking. 📖 940

Service standards

Location	Check item	Standard value	Limit	Remedy
—	Regulator adjusting voltage	14.7 ± 0.3V	—	Replace



- Connect the meters to the alternator as shown.

  A : Ammeter (100 amperes class)
  B : Alternator terminal B
  C : Switch
  D : Terminal
  V : Voltmeter

WARNING

- **To prevent possible injury, be sure to disconnect the negative terminal of the battery and insulate it with tape before working on the wiring. With the negative terminal ⊖ of the battery connected, battery voltage is always applied to the terminal B.**
- **To connect to switch C, use a lead wire with the same or larger diameter than that of the chassis harness connected to terminal B.**

- Turn off the switches for lamps, heater, etc. so that electric loads may not be applied during the inspection.
- Turn on switch **C** and then start the engine.
- If the output current is 5 amperes or less when the engine speed is raised to the appropriate speed indicated below, then measure the voltage at terminal **B**.

Speed (rpm)
Approx. 2400

CAUTION

If the output current is in the range from 5 to 10 amperes, the measured value (regulated voltage) will be slightly lower.
16V – 0.2 to 0.3V

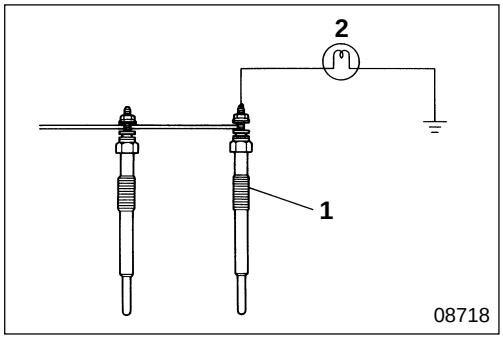
- If the output current is 5 amperes or more, do one of the following:
  - Run the engine for a while to charge the battery.
  - Replace the battery with a fully-charged one.
- If the measured value deviates from the standard value, conduct checking again on the test bench.

13 ON-VEHICLE INSPECTION AND ADJUSTMENT

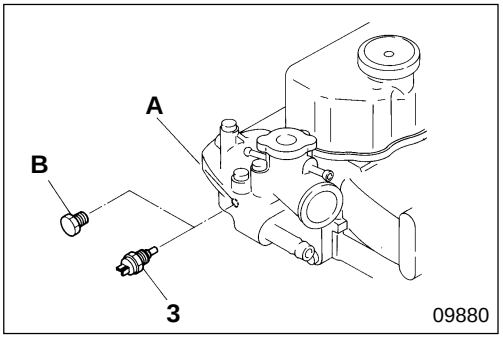
955 INSPECTION OF PREHEATING SYSTEM

Service standards

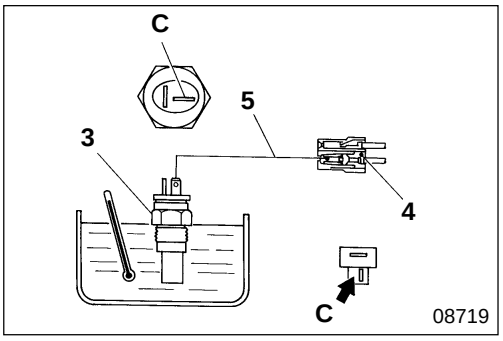
Location	Maintenance item			Standard value	Limit	Remedy
—	Pre-glow time	Coolant temperature	60°C {140°F} or more	Does not pre-glow	—	Inspect
			0 to 60°C {32 to 140°F}	About 12 seconds	—	
			0°C {32°F} or less	About 12 seconds	—	
	After-glow time	Coolant temperature	60°C {140°F} or more	Does not after-glow	—	
			0 to 60°C {32 to 140°F}	Does not after-glow	—	
			0°C {32°F} or less	About 20 seconds	—	
	Indicator lamp ON time	Coolant temperature	60°C {140°F} or more	Does not illuminate	—	
			0 to 60°C {32 to 140°F}	Does not illuminate	—	
			0°C {32°F} or less	About 8 seconds	—	



- Turn the starter switch to OFF.
- Connect a check lamp **2** to the glow plug **1** as shown.



- Remove the water temperature sensor **3** from the engine, and close the sensor mounting hole **A** with the plug **B** (M16 × 1.5 mm) {0.059 in.}.
  Removal and installation of the water temperature sensor **3** Gr 14



- Connect the extension harness **5** between the water temperature sensor **3** and connector **4**.

NOTE

Connect the extension harness 5 to the terminal C on the MUTIC (multipurpose timing control unit).

- Put water temperature sensor **3** into a container filled with water.
- Carry out the following inspection while changing the water temperature in the container. If any fault is found, inspect each unit.

(1) Inspection of pre-glow time and indicator lamp lighting time

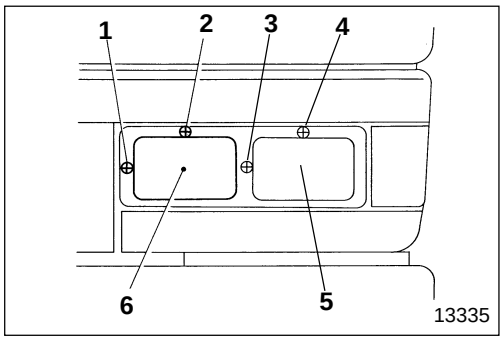
Turn the starter switch ON but do not start the engine. Make sure that the pre-glow time and the indicator lamp lighting time at each water temperature conform to the standard value.

- For pre-glow time inspection, measure the lighting time of inspection lamp **2**.
- For indicator lamp lighting time inspection, measure the lighting time of lamp within the meter cluster directly.

(2) Inspection of after-glow time

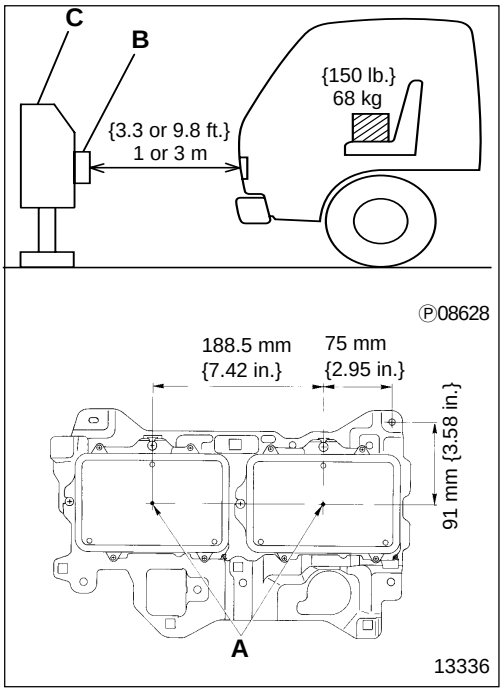
Start the engine and measure the lighting time of inspection lamp **2** from the point lamp within the meter cluster goes off, and make sure that the after-glow time conforms to the standard value.

960 HEADLAMP AIMING



1 Screw (Main beam, horizontal adjustment)
2 Screw (Main beam, vertical adjustment)
3 Screw (Dipped beam, horizontal adjustment)
4 Screw (Dipped beam, vertical adjustment)
5 Dipped beam
6 Main beam

To adjust the headlamp move the optical axis of Main beam **6** by turning screws **1, 2** and move the optical axis of Dipped beam **5** by turning screws **3, 4**. You need to adjust the aiming of both the Main and the Dipped beams on both the left and right headlamps.



(1) Preparation work before adjustment

- Park the vehicle on a level place.

WARNING

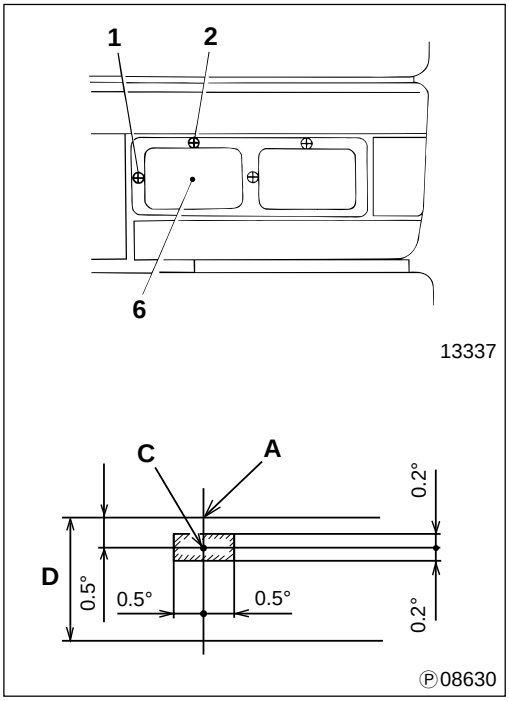
Be sure to put tire chocks securely in place.

- Unload the vehicle and make sure no one is in it.
- Inflate the tires to the specified pressure. Gr 31
- Seat one person of an equivalent mass (68 kg {150 lb}) in the vehicle
- Start the engine and check that the battery is being charged.
- Place convergent headlamp tester **C** in line with Main beam **6** or Dipped beam **5** of either the left or right headlamp at a distance of 1 m {3.3 ft.} or 3 m {9.8 ft.}.
- Align the center of convergent lens **B** of convergent headlamp tester **C** with lamp center **A** of Main beam **6** or Dipped beam **5**. (The illustration shows a left headlamp.)
- When adjusting one headlamp, mask the other to avoid light leakage.

(2) Adjustment

WARNING

Do not mask a lit headlamp for more than 10 minutes or the heat generated might cause a fire.



● **Adjustment of Main beam unit**

- Turn on Main beam **6**.
- Adjust as follows so that the optical axis (max luminous illumination point) **C** of Main beam **6** is located as shown:
  - Vertical adjustment: Turn screw **2** to adjust.
  - Horizontal adjustment: Turn screw **1** to adjust.

  The aiming of both left and right Main beams **6** should be adjusted to the position as shown.

▨ : Tolerance of adjustment

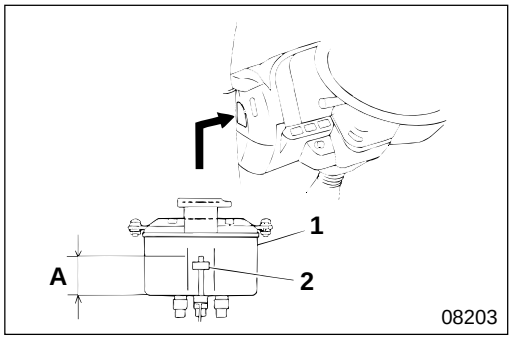
965 INSPECTION OF BRAKE FLUID LEVEL SWITCH

Service standards

Unit : mm {in.}

Location	Maintenance item	Standard value	Limit	Remedy
—	Warning lamp lighting position for brake fluid level switch	41.0±3 {1.61±0.12}	—	Replace



- Start engine.
- Drain the brake fluid gradually from fluid tank assembly **1**.

CAUTION

If brake fluid is spilled on any part of the vehicle, wipe it off immediately, since the solvent in the fluid can damage the paintwork.

- Measure height **A** of brake fluid level switch **2** when BRAKE warning lamp within the meter cluster lights.
- If the measured value deviates from the standard value, remove and check fluid tank assembly **1**.

FOREWORD

This service manual describes the maintenance data consisting of construction & outline, inspection, and repair service of MITSUBISHI FUSO GENUINE TRUCK CAB AIR CONDITIONER

Table of contents

1. SPECIFICATIONS ---- 1
2. OUTLINES OF REFRIGERATION SYSTEM ---- 2
3. CONSTRUCTION ---- 4
4. TROUBLE SHOOTING ---- 11
5. REMOVAL AND INSTALLATION ---- 18
6. TREATMENT AFTER INSTALLATION ---- 21
7. MAINTENANCE ---- 27
8. COOLING UNIT ASSEMBLY ---- 28
9. COMPRESSOR & CLUTCH ASSEMBLY ---- 30

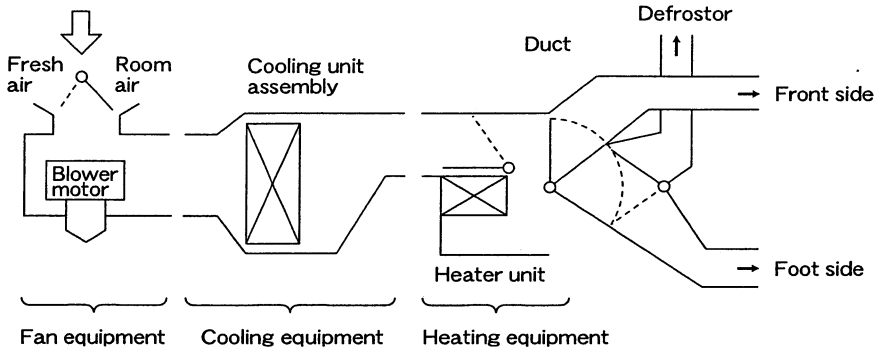
1. SPECIFICATIONS

Item			Specification
Vehicle model			FE・FG 2002
* Cooling capacity (on JIS conditions)			4,200W
Compressor	Model		MSC90T
	Displacement		90cm³
	Maximum revolution		MAX 9,000min^{-1}
	Compressor oil		SUN PAG 56, 120cm³
Magnetic clutch	Type		Dry single disc magnet
	Voltage & input		DC24V(4D34T4)
Cooling unit assembly	Type		Laminated fin type
Controls	Air flow control		Rotary switch, Four step type
	Temperature control		Air mix control
Condenser	Type		Corrugate fin type
Receiver assembly			Cylinder type, approx 350cm³
Protective equipment	Frost prevention (Thermostat)		OFF : 0.5℃ ON : 3.5℃
	Releif valve		Open : 3.50~4.10MPa Close : 2.94MPa
	Dual pressure switch	Low pressure switch	OFF : 0.2MPa ON : 0.22MPa
		High pressure switch	OFF : 2.94MPa ON : 2.35MPa
	Fuse (Fan equipmemt) Fuse (Magnetic clutch)		10A 10A
Refrigerant and quantity			HFC-134a, 23oz

- The * marked cooling capacity is based on JIS conditions.
- Compressor speed : 1,800min^{-1}
- Condensing temperature : 55℃
- Cooling unit inlet air dry bulb temperature : 27℃
- Cooling unit inlet air wet bulb temperature : 19.5℃
- Terminal voltage : DC24V

2 . OUTLINES OF REFRIGERATION SYSTEM

2.1 Air system



Cooling operation

Fresh air is induced to the cooling unit assembly by a blower fan. where it is cooled down and dehydrated, charged at the front side outlet through a duct.

Heating operation

Fresh air is induced to the heater unit by a blower fan through the cooling unit assembly, where it is heated, then discharged at the foot side outlet through a duct.

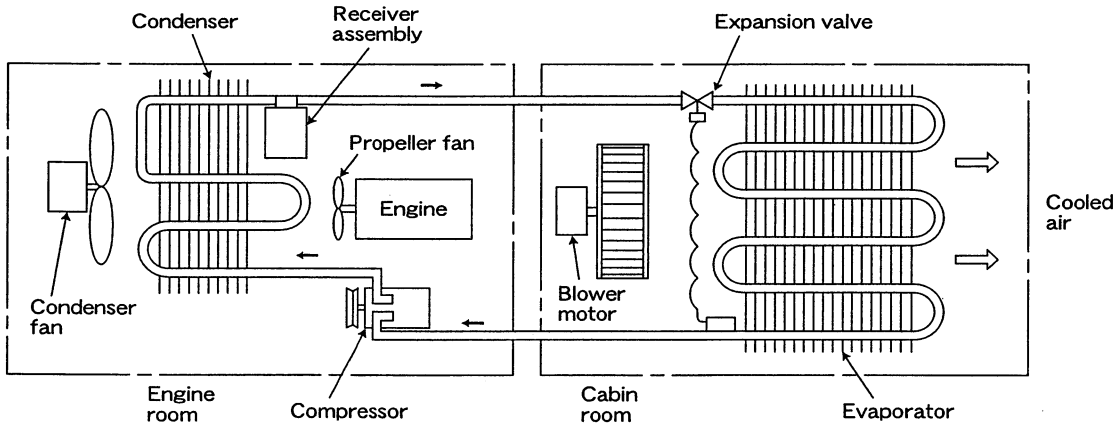
Dehumidifying operation

Fresh air is induced to the cooling by a blower fan, where it is cooled down and dehydrated, and succeedingly to the heater unit for warming, then discharged at the front side outlet through a duct.

Temperature control

Cooled air and warmed air are mixed for temperature control of the room inside.

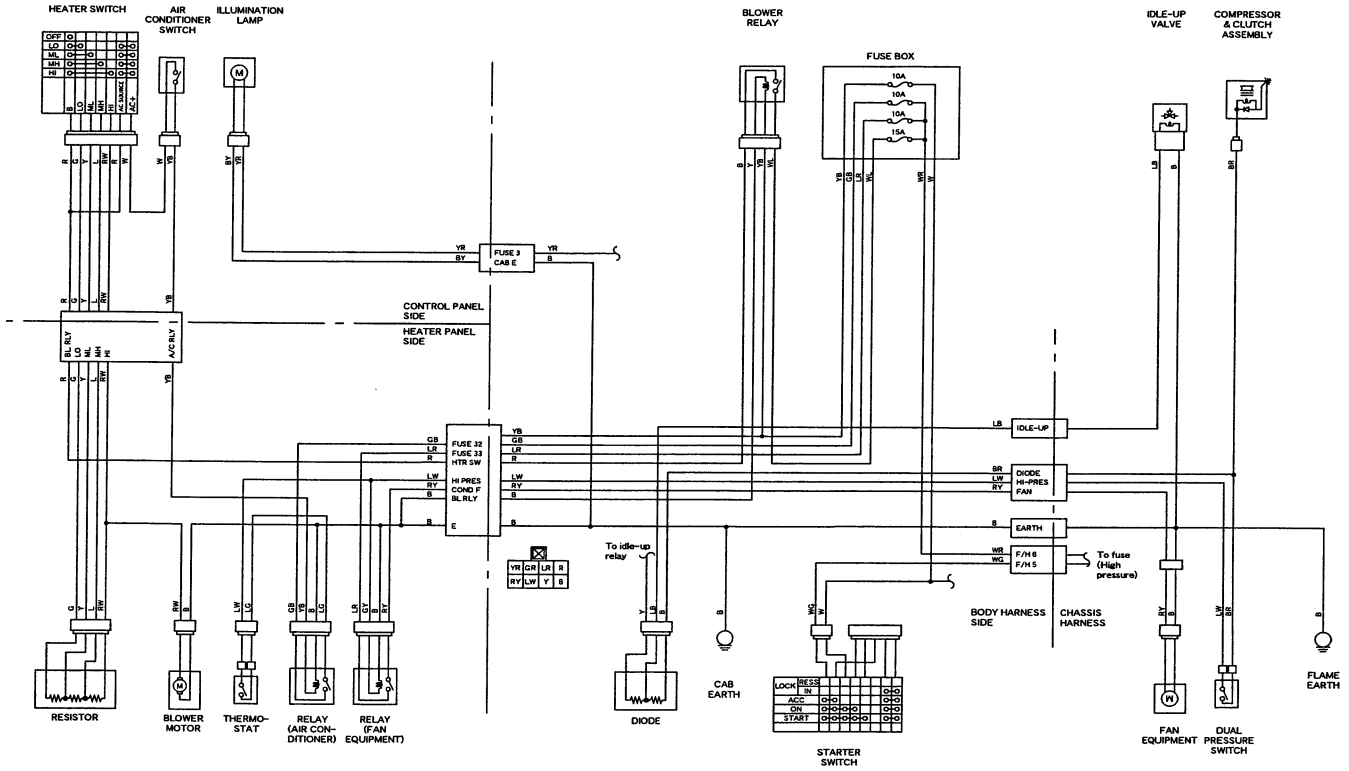
2.2 Refrigerating cycle



While the refrigerant, HFC-134a is cooling the air drawn into the evaporator, it evaporates and becomes a gas. This gas is compressed to high pressure and temperature in the compressor, and sent into the condenser, where it is cooled and becomes liquid.
This cooling in the condenser is carried out by the open air passing through the condenser sucked by radiator fan and vehicle motion of the vehicle.
The liquid refrigerant flows through the receiver assembly where water and dirt are removed, and then it enters the expansion valve. Here the liquid refrigerant is throttled and changed to a mixture of liquid and gas in low temperature and low pressure, and is sent to the evaporator.

In the evaporator, the refrigerant absorbs heat from the surroundings and becomes a gas. That is, because the evaporator it self is cooled at this time, the return air to the cooling unit assembly is cooled,
and the interior of the vehicle becomes cool. In this way the refrigerant flow makes a complete circuit.

2.3 Electrical system



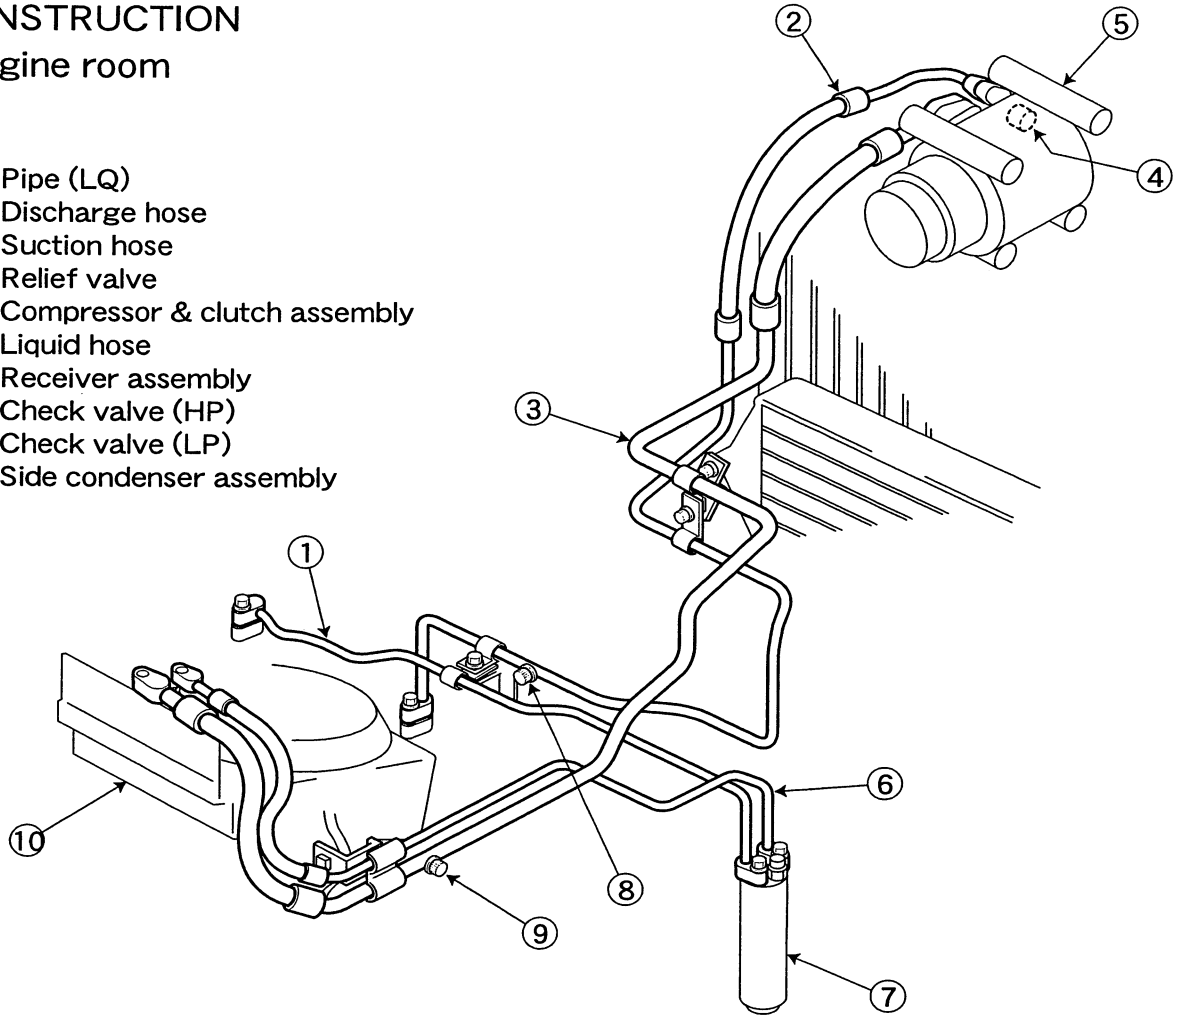
The power source is supplied from the TRUCK battery. When the blower switch is put ON, the power relay becomes ON, and electricity is connected to the magnetic clutch of the compressor. The magnetic clutch switches ON or OFF by air conditioner switch, fin thermo, and low pressure switch as the controls for operation service, or safety protection.

The cabin room air temperature is set to a preset point by adjusting the temperature control lever, and the opening degree of the air mix damper.

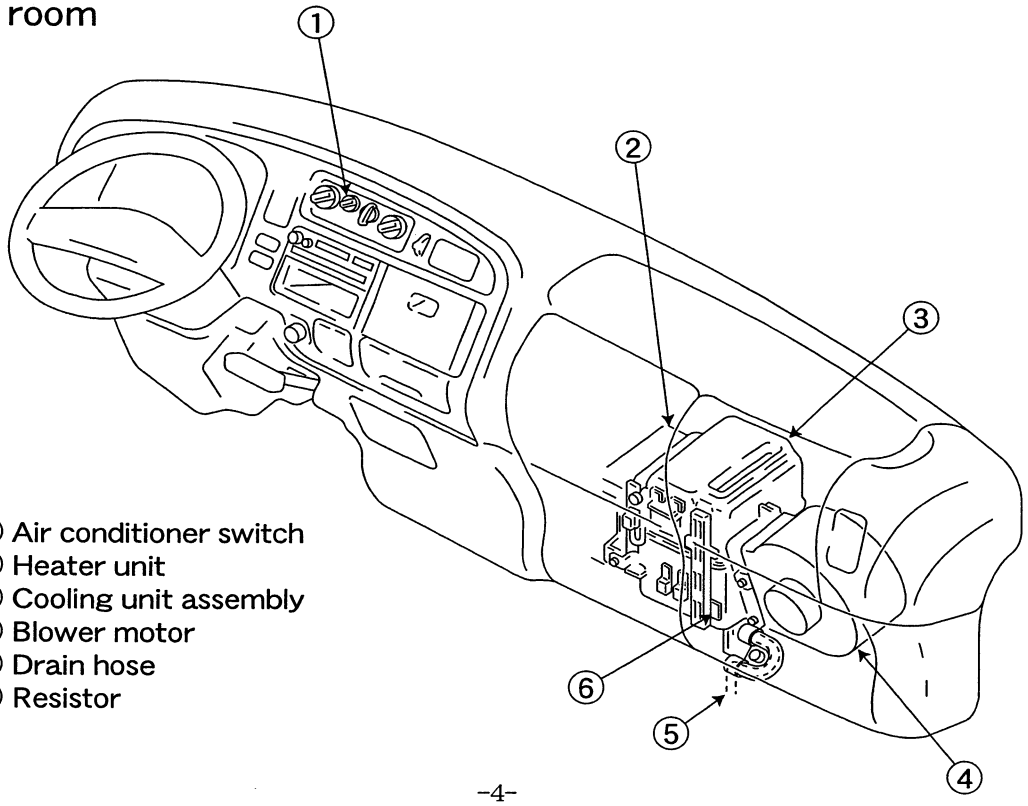
3 . CONSTRUCTION

3.1 Engine room

① Pipe (LQ)
② Discharge hose
③ Suction hose
④ Relief valve
⑤ Compressor & clutch assembly
⑥ Liquid hose
⑦ Receiver assembly
⑧ Check valve (HP)
⑨ Check valve (LP)
⑩ Side condenser assembly



3.2 Cabin room



① Air conditioner switch
② Heater unit
③ Cooling unit assembly
④ Blower motor
⑤ Drain hose
⑥ Resistor

3.3 Control system

(1) Control in panel

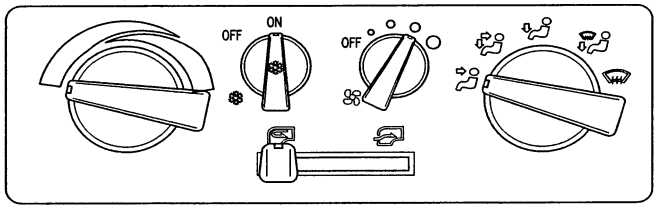
☐ Air conditioner switch
By select the air conditioner switch initially in cooling or drying operation, the compressor starts running.

☐ Fan switch
The air flow is selectable, out of the below four volume.

OFF	No air flow
◦	Gentle
◦	Low
○	Medium
○	High

☐ Air outlet mode select switch
The air outlet is selected by positioning in cooling and heating operation.

- ----- The conditioned air is discharged at the center and both side outlets directed by the louvers as reguired.
- ----- The conditioned air is discharged at the center and both side and foot outlets directed by the louvers as reguired.
- ----- The conditioned air is discharged at the foot outlets directed by the louvers as reguired.
- ----- The conditioned air for dehumidifying is discharged at the foot outlets and to the front glass.
- ----- The conditioned air for dehumidifying is discharged to the front glass.



☐ Temperature control switch
The discharged air temperature is controllable by selecting the position of the control lever in cooling, heating or drying operation.
BLUE ZONE ------ For cool air flow
RED ZONE ------- For warm air flow
By turning the switch toward the BLUE and RED ZONE sides, the supply air temperature becomes more cooler and warmer respectively.

☐ Shift lever, air circulation
The recirculation air is selectable out of the below sirculation modes.

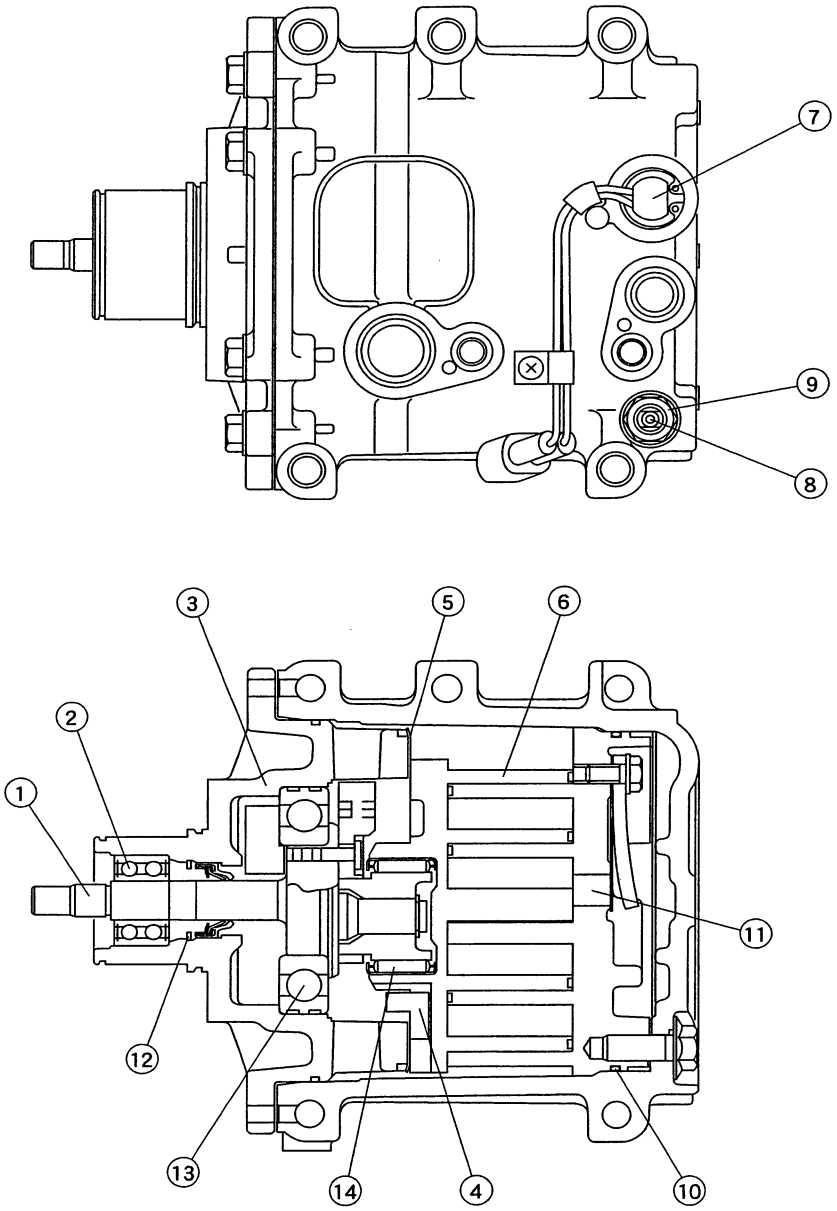
- ----- Room circulation
- ----- Fresh air intake

(2) Operation control

Operation mode	Setting control lever	Air delivery	Remarks
COOL			Earlier cooling service, or conditioning at dusty, polluted air prevailing places : Shift lever : Air circulation ——
HEAT			Earlier cooling service, or conditioning at dusty, polluted air prevailing places : Shift lever : Air circulation Air outlet mode select switch ——
DEHUMIDIFY			Wetty conditioning in head cooled, and foot warmed : Shift lever : Air outlet Air outlet mode select switch ——
DEFROST			
VENTILATION			

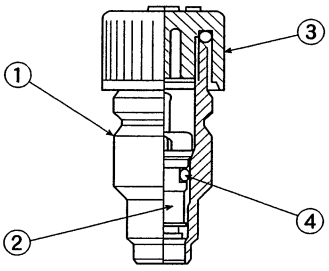
3.4 Compressor and clutch assembly

3.4.1 Compressor



① Crankshaft
② Bearing
③ Front case assembly
④ Housing assembly
⑤ Thrust plate
⑥ Orbit scroll assembly
⑦ Thermostat
⑧ Dust seal
⑨ H/P relief valve
⑩ O-ring
⑪ Port hole
⑫ Shaft seal
⑬ Bearing
⑭ Needle bearing

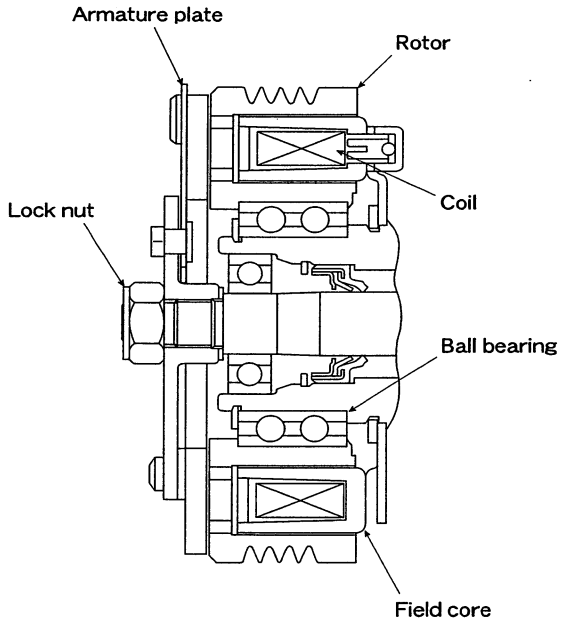
3.4.2 Check valve



① Valve body ③ Cap
② Valve core ④ Packing

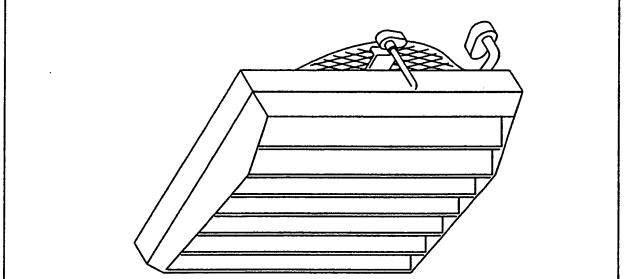
The suction hose and discharge hose are provided with check valve, and designed for gas evacuation and charging service. (shown above)
In the valves, a valve rubber tube, as in automobile tire tubes, is provided as shown in the figure.
Stackening the flare nut on the gauge manifold causes the passage to close automatically by the spring force, and tightening the flare nut causes the passage to open while pressing the compressed spring.

3.4.3 Magnetic clutch



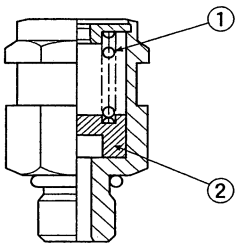
The magnetic clutch is mounted on the compressor crankshaft to start and stop the compressor.
This means that the magnetic clutch is actuated to control the compressor operation electrically by the thermostat.

3.5 Side condenser assembly



The condenser is a means to liquefy the refrigerant gas. As the condenser is cooled by the air pulled in by the condenser fan, the refrigerant in the condenser is cooled into liquid. Therefore, when any obstacle prevents the air from flowing evenly to the condenser or the air flow is short circuited, the cooling effect is reduced, with a decrease in the performance of the condenser. When the vehicle is driven at a high speed, the air flow increases resulting in an increase of the cooling effect, and performance of the condenser.

3.6 Relief valve



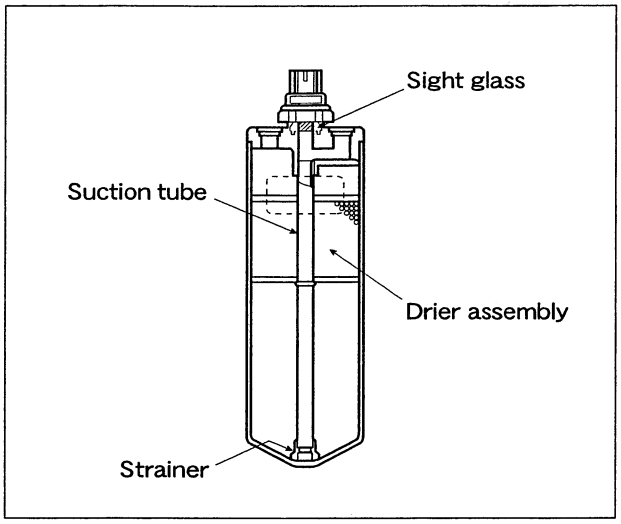
① Spring ② Valve

The relief valve is mounted to the compressor & clutch assembly. The releif valve is usually closed by spring. If pressure of refrigerant in air conditioner system is higher than spring pressure, refrigerant is discharged from relief valve. The pressure drop due to discharge refrigerant, and relief valve is closed again.

Unit : MPa

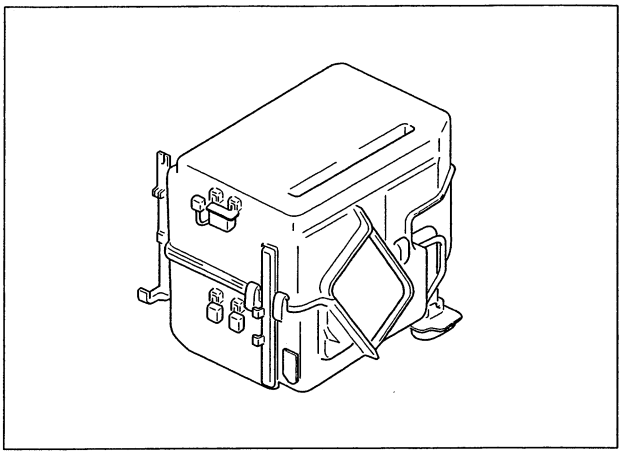
Open	3.50~4.10
Close	2.94

3.7 Receiver assembly



The receiver assembly is served as a refrigerant reservoir located between the condenser and expansion valve. The receiver assembly consists of a filter and a sight glass. The filter is used to remove dust , the drier is used to remove moisture from the refrigerant in the circuit, and the sight glass is used to check the refrigerant charge. Any moisture in the refrigerant may not only corrode metal surfaces in the refrigerant circuit, but also cause the throttle of the expansion valve to be frosted, resulting in the interruption of refrigerant circulation.
Therefore, the receiver assembly must be handled very carefully. When storing or installing it, care should be taken to protect it from the deterioration of drying performance due to exposure to the air.
The retardation of heat exchange, or any fire around the refrigerant circuit will cause excessive pressurization or heating of the refrigerant. Should such an accident occur, the refrigerant in the circuit must be expelled to the outside to prevent the above hazards.
The sight glass is a sort of peep window used to check the refrigerant flow in the refrigerant circuit.
The sight glass appears clear when the refrigerant flow is enough, and shows bubbles flowing when the refrigerant flow is short.

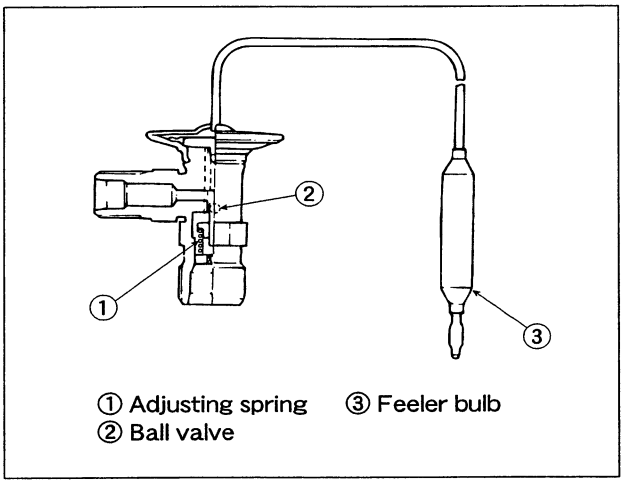
3.8 Cooling unit assembly



The evaporator core is a type of corrugated fin and tube. The tube is arranged in zigzag to achieve high effciency, and to make the core system compact.
A thicker reinforced plastic plate is used as the enclosure to inclease heat and shock resistance, and to protect the core from humidity. This case is a split type, and in a simple design to facilitate installation on the floor panel and the instrument panel frame of the vehicle.

3.8 Expansion valve

The expansion valve is mounted at the inlet of the cooling unit. The liquid refrigerant from the receiver is led to it through a narrow passage (for throttle action), where-in, the liquid refrigerant is condensed with pressure dropping and at the same time the flow rate is adjusted before the refrigerant is sent to the cooling unit.
The refrigeration load in the cooling unit is not constant, but usually fluctuates over a certain range. So the refrigerant flow should under go the control in design.
An automatic expansion valve performs this function automatically. The air condenser uses a thermal type automatic expansion valve.

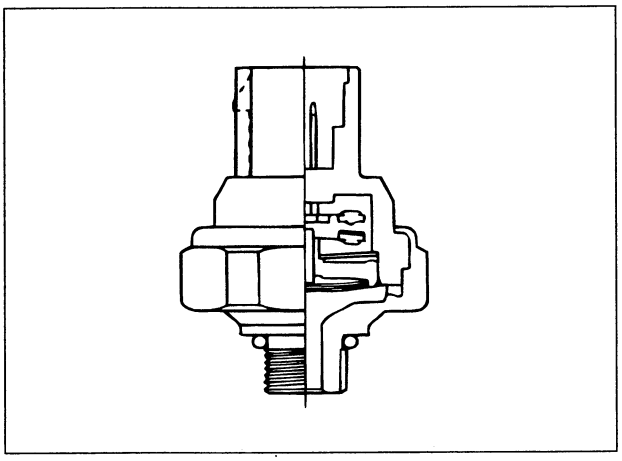


3.10 Dual pressure switch

The dual pressure switch, fixed to the receiver functions as a protector for stopping the compressor (OFF) at a preset value of pressure in the refrigerant circuit.

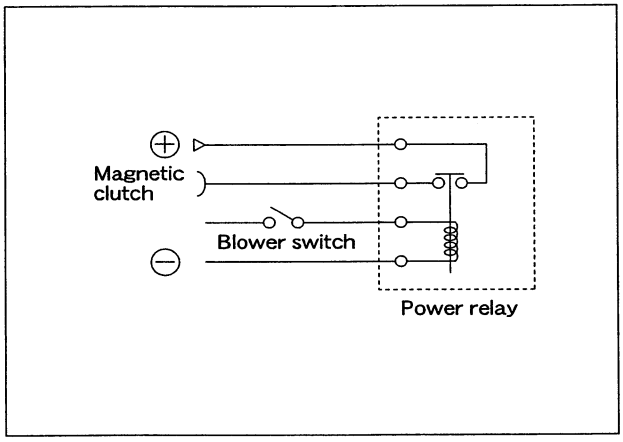
Unit : MPa

	LP side	HP side
OFF	0.2	2.94
ON	0.22	2.35



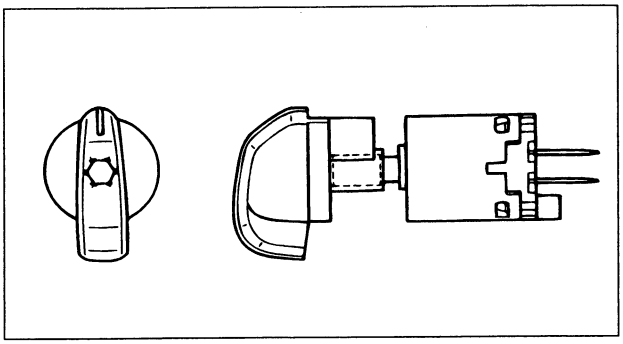
3.11 Power relay

The power relay is excited at a closed position of the micro switch and enables the magnetic clutch to be ready for engaging electically.



3.12 Air conditioner switch

The air conditioner switch function as an operation controller for starting or stopping the compressor in cooling and dehumidifying.
Set the it to the "ON" position, the magnetic clutch becomes engaged and the compressor starts.
Set the it to the "OFF" position, the magnetic clutch becomes disengaged and the compressor stops.

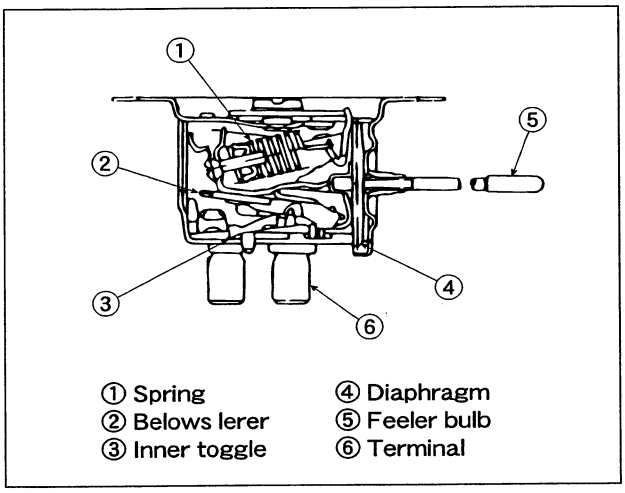


3.13 Thermostat

The thermostat is mounted on the evaporator case. It senses the temperature of evaporator fins, and controls the compressor operation for ON or OFF as specified below.

Unit : ℃

OFF	0.5
ON	3.5



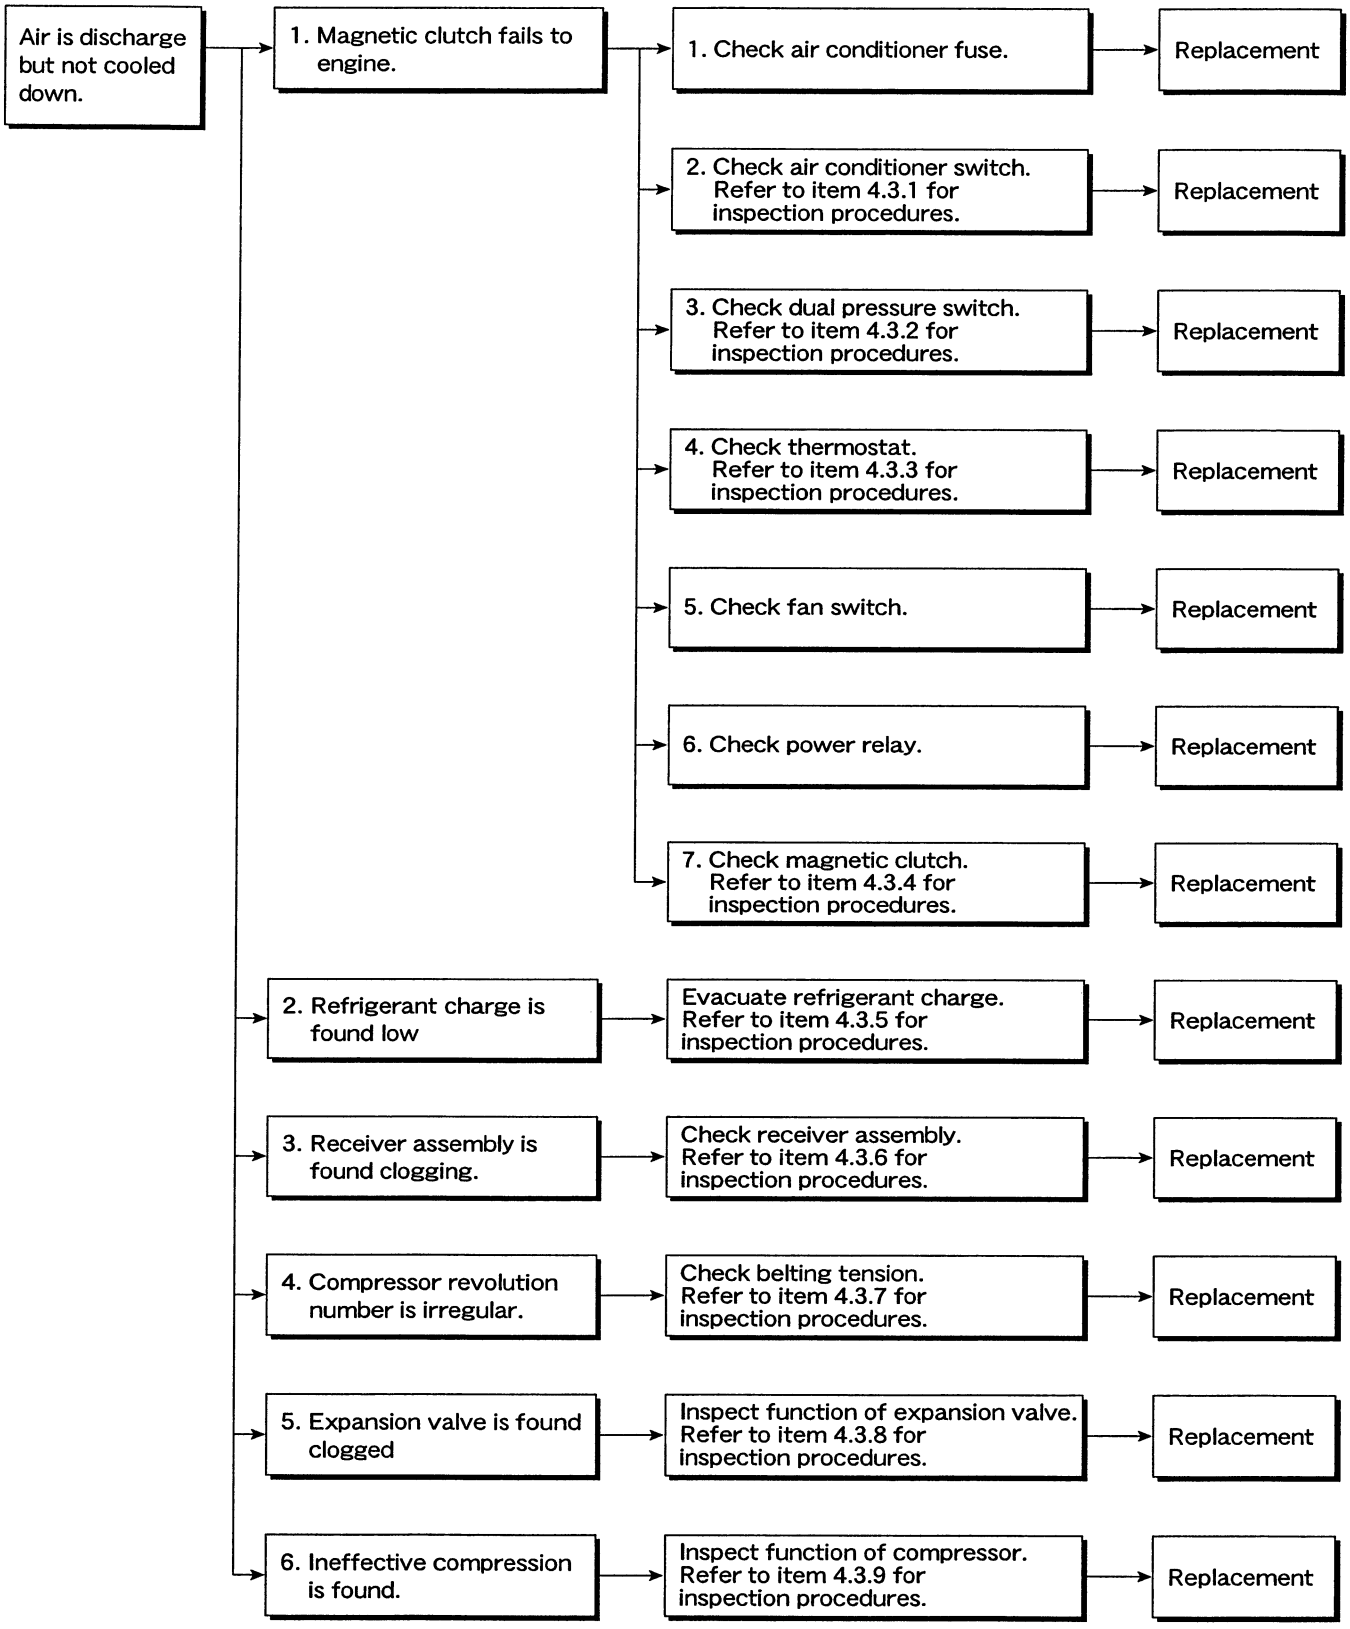
4 . TROUBLE SHOOTING

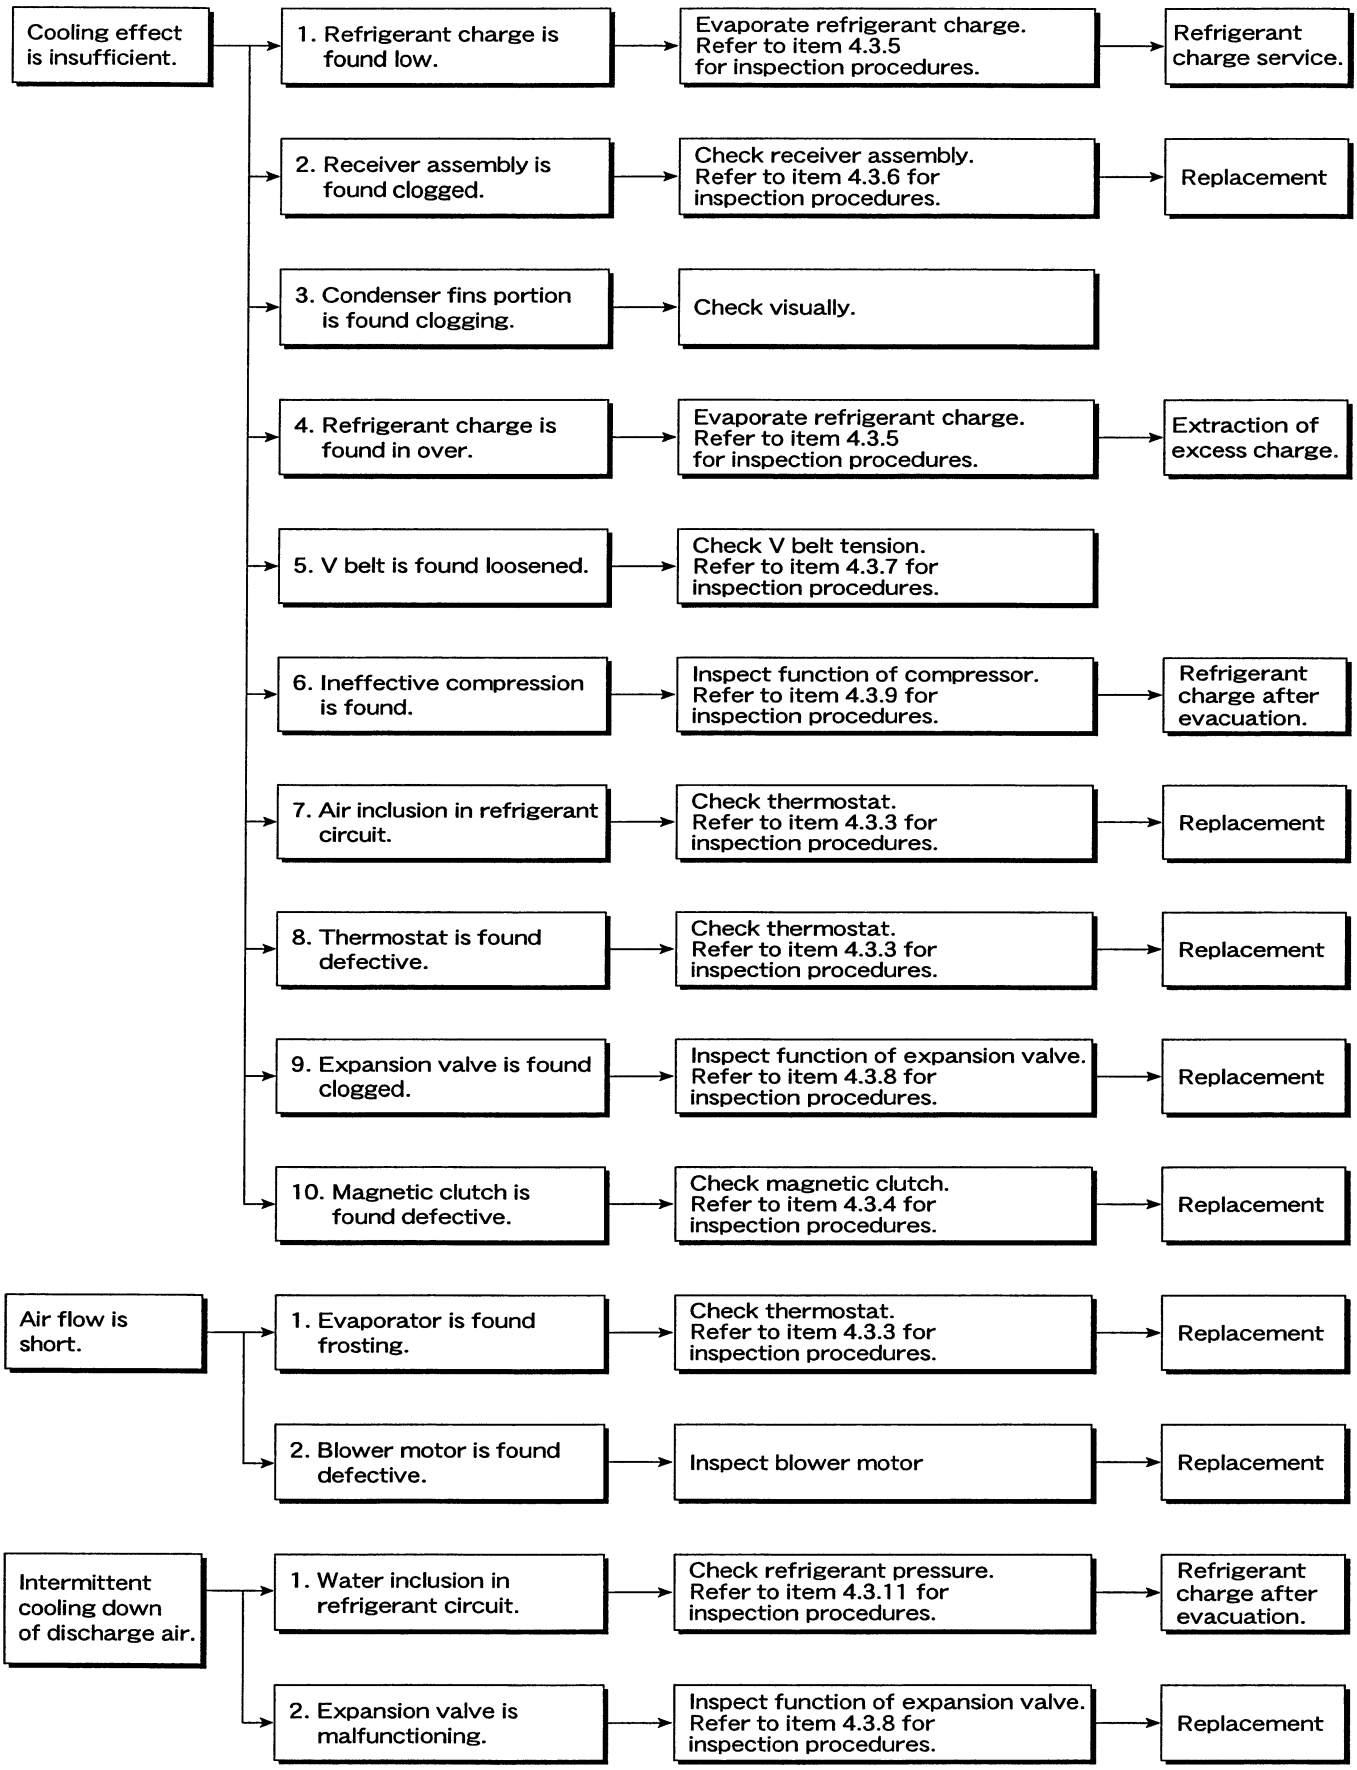
4.1 General precaution

(1) When handling refrigerant (HFC-134a), the following precautions must be observed.
   a. Allways wear eye protection and a pair of gloves which handling refrigerant.
   b. Be careful the liquid refrigerant dose not contact the skin.
   c. Keep the refrigerant container blow 40 degrees C.
   d. Do not handle the refrigerant in an enclosed area having an open flame. The refrigerant may produce a poisonous gas.
   e. When dumping the refrigerant from the system, release it slowly so as not to expell all the compressor oil.

(2) If liquid refrigerant strikes eye or skin.
   a. Do not rub eye or skin.
   b. Splash large quantities of cool water on the eye or skin.
   c. Rush to a physician or hospital for immediate professional treatment.

4.2 Trouble cause and remedy





Cooling effect is insufficient.
1. Refrigerant charge is found low.
Evaporate refrigerant charge. Refer to item 4.3.5 for inspection procedures.
Refrigerant charge service.
2. Receiver assembly is found clogged.
Check receiver assembly. Refer to item 4.3.6 for inspection procedures.
Replacement
3. Condenser fins portion is found clogging.
Check visually.
4. Refrigerant charge is found in over.
Evaporate refrigerant charge. Refer to item 4.3.5 for inspection procedures.
Extraction of excess charge.
5. V belt is found loosened.
Check V belt tension. Refer to item 4.3.7 for inspection procedures.
6. Ineffective compression is found.
Inspect function of compressor. Refer to item 4.3.9 for inspection procedures.
Refrigerant charge after evacuation.
7. Air inclusion in refrigerant circuit.
Check thermostat. Refer to item 4.3.3 for inspection procedures.
Replacement
8. Thermostat is found defective.
Check thermostat. Refer to item 4.3.3 for inspection procedures.
Replacement
9. Expansion valve is found clogged.
Inspect function of expansion valve. Refer to item 4.3.8 for inspection procedures.
Replacement
10. Magnetic clutch is found defective.
Check magnetic clutch. Refer to item 4.3.4 for inspection procedures.
Replacement
Air flow is short.
1. Evaporator is found frosting.
Check thermostat. Refer to item 4.3.3 for inspection procedures.
Replacement
2. Blower motor is found defective.
Inspect blower motor
Replacement
Intermittent cooling down of discharge air.
1. Water inclusion in refrigerant circuit.
Check refrigerant pressure. Refer to item 4.3.11 for inspection procedures.
Refrigerant charge after evacuation.
2. Expansion valve is malfunctioning.
Inspect function of expansion valve. Refer to item 4.3.8 for inspection procedures.
Replacement

4.3 Inspection procedure

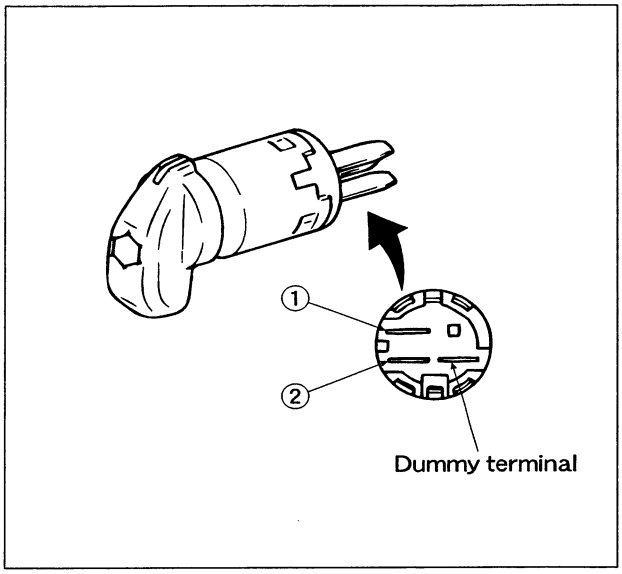
4.3.1 Air conditioner switch

(1) Unplug the air conditioner switch.
(2) Check the continuity between terminals of the air conditioner switch with a tester.

Continuity

Switch position	Terminal's number	Result, in normal
OFF	①-②	No
ON	①-②	Yes

Switch position \ Terminal's number	1	2
OFF	○	
ON	○	○

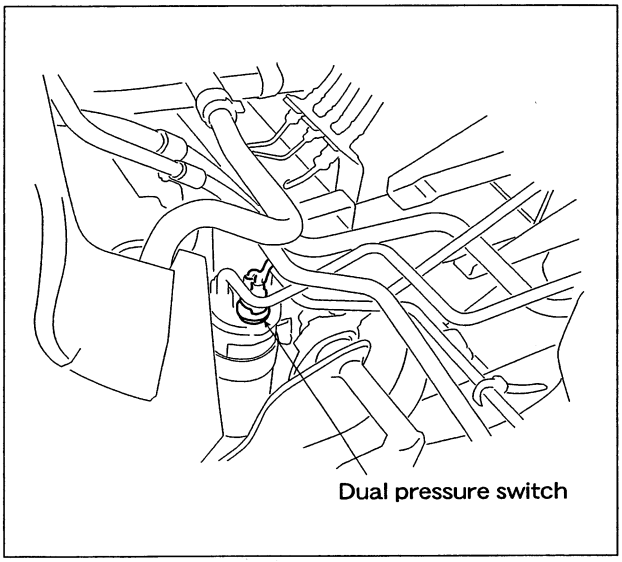


4.3.2 Dual pressure switch

The dual pressure switch is attached to the receiver assembly for controlling the operation of the air conditioner by checking the inside pressure of the receiver assembly.

Unit : MPa

	LP side	HP side
OFF	0.2	2.94
ON	0.22	2.35



(1) Unplug the connector at the receiver assembly.
(2) Check the continuity between terminals of the connector with a tester.
(3) When electric continuity is found, connect the connector to the high pressure switch.
(4) Attach the high pressure gauge and low pressure gauge.
(5) Operate the air conditioner.
(6) Cover the surface of the condenser by using a piece of paper.
(7) When the high pressure exceeds 2.94 MPa, if the magnetic clutch is turned off, the switch is normal.
(8) If the magnetic clutch is not turned off, replace pressure switch with new one.
(9) Check the accuracy of the preset as below.
  (a) Stop the air conditioner.
  (b) Purge the air conditioner of refrigerant slowly starting at over 0.22 MPa.
  (c) At reading the pressure 0.2 MPa, the switch opens.
  (d) Here, stop the purging, then turn it to charging.
  (e) At reading the pressure 0.22 MPa , the switch closes.

If the dual pressure switch does not meet specifications, replace the switch.

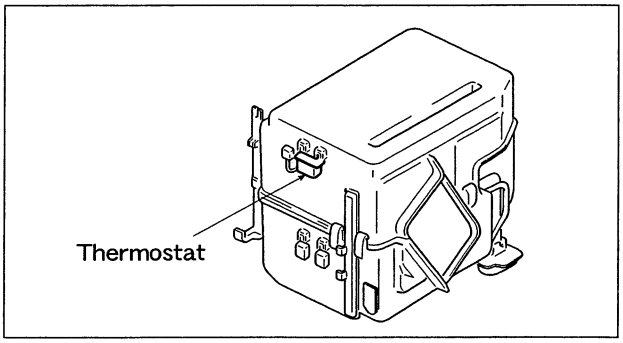
4.3.3 Thermostat

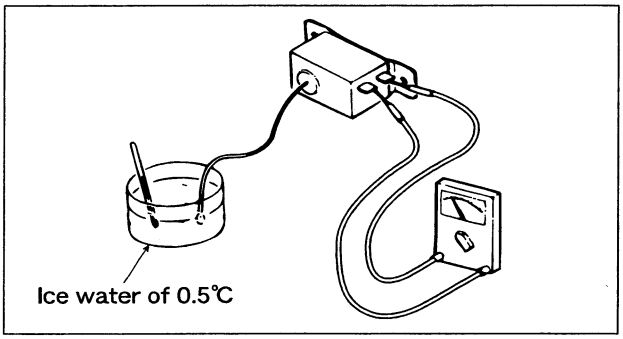
The thermostat is mounted on the evaporator case. It controls the operation of the air conditioner by sensing the temperature of the evaporator fins.

Unit : ℃

OFF	0.5
ON	3.5

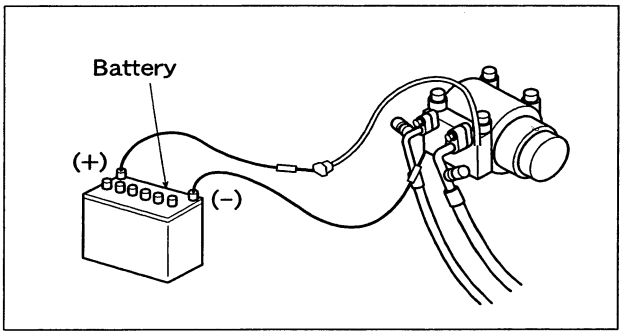
(1) Check the accuracy of the preset as below.
  (a) Soak the sensor of the thermostat in ice-water of below 0.5℃.
  (b) Check the continuity between the switch terminals.
  (c) Pull the senser out of the ice-water, and check the continuity at over 3.5℃ of the senser.





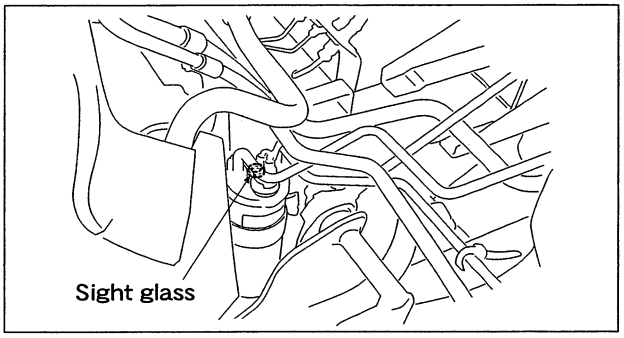
4.3.4 Magnetic clutch

(1) Disconnect the wiring to the magnetic clutch.
(2) Apply a positive side power voltage to the magnetic clutch through the wiring.
(3) In the case of regular functioning, the pulley and magnetic clutch are engaged with a clicking sound. The falling means any malfunction of the magnetic clutch.



4.3.5 Refrigerant charge

(1) Set the temperature control lever at the cool position.
(2) Open doors of the room.
(3) Set the blower switch at the ON position.
(4) Adjust the engine revolution at 1500min^{-1}.
(5) Operation the air conditioner switch for comp. ON.
(6) Watch the sight glass of the receiver assembly at the inside of the engine room.
  (a) If judged insufficient refrigerant charging, repair the leaks, then charge it additionally.
  (b) If judged as over charging of refrigerant, extract an excess refrigerant.
(7) Diagnosis by pressure reading.
  (a) Short of refrigerant:
    Lower pressure for both LP and HP reading.
  (b) Express of refrigerant:
    Higher pressure for LP and HP reading.

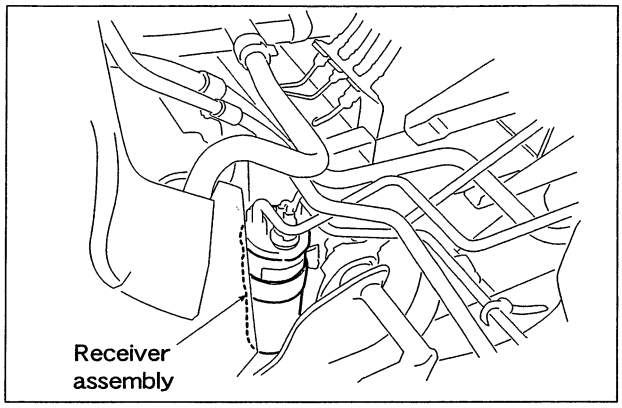


Sight glass		Remarks
Proper refrigerant level	Bubble	1. Bubble occasionally appears. 2. Bubble disappear if speed is a little increased.

Sight glass		Remarks
Insufficient refrigerant	Bubble	Considerable bubbles appear. If the system is extremely short of refrigerant, the sight glass appear white.
Excessive refrigerant		1. No bubbles appear. 2. Slight bubbles appear if speed is decreased.

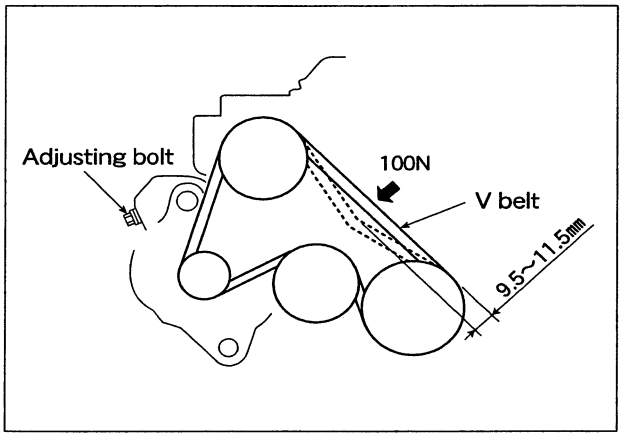
4.3.6 Receiver assembly

(1) While operating the air conditioner, touch the refrigerant piping with a hand at the inlet and outlet portions.
  (a) Sensed temperature difference:
    It is possible that clogging is happening at the inside, liquid receiver assembly is to be replaced with a new one.



4.3.7 Belt tension

(1) Depress the V belt with a thumb at the ⬅ marked position, and adjust the stretching as below.
  Stretching degree : 9.5~11.5 mm
(2) Adjustment
  (a) Loosen the nut of the tension pulley.
  (b) Control the belting tension by the adjusting bolt.
  (c) After finishing, retighten the nut as before.

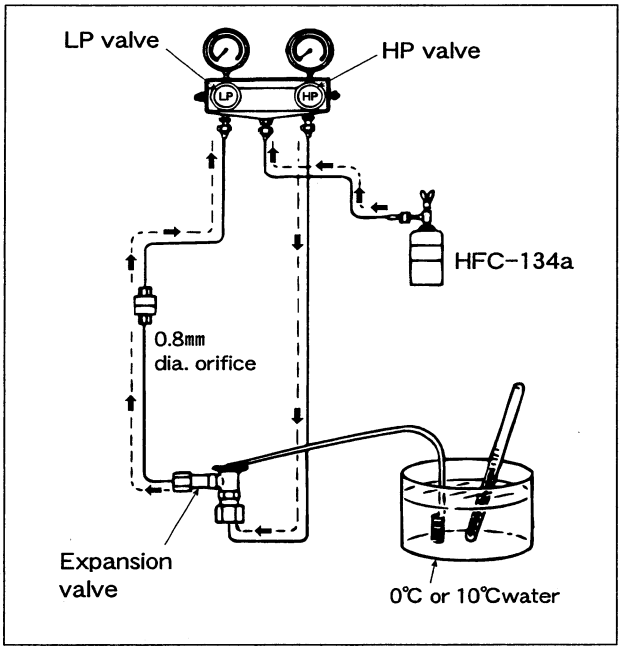


4.3.8 Expansion valve

⚠ CAUTION

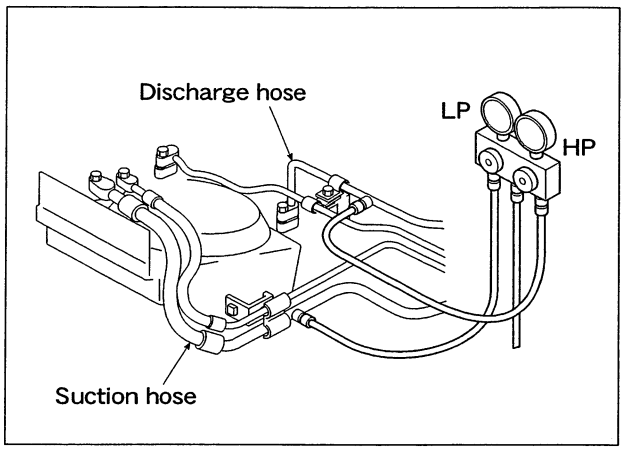
The test should be applied to only the case of the other components being free from troubles, and the expansion malfunctioning singly.

(1) Build up the test circuit with a gauge manifold.
(2) Soak the sensor bulb in ice water of 0℃, and of 10℃ respectively.
(3) Pressurize the HP side with dry nitrogen gas of 1.03MPa.
(4) Check the reading of the LP side pressure gauge for the standard range.
  At 0℃ ····0.127MPa
  At 10℃ ····0.23MPa



4.3.9 Pressure check

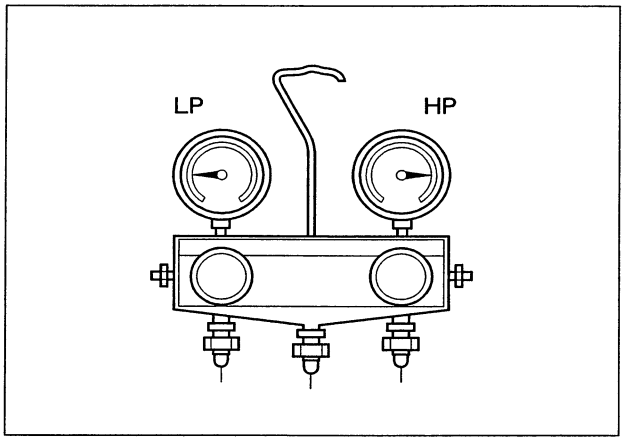
(1) Mount a low pressure gauge hose and a high pressure gauge hose on the check valve.
(2) Drive the air conditioner.
(3) Showing of higher LP side pressure and lower HP side pressure evidences ineffective compression.
Standard pressure
LP side pressure About 0.26MPa
HP side pressure About 1.42MPa



4.3.10 Air inclusion in ref.circuit

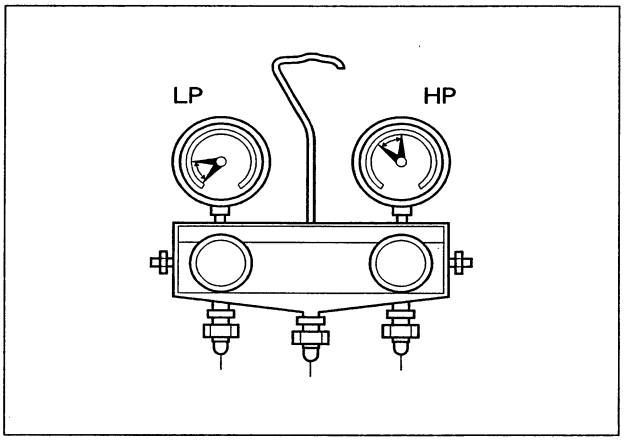
The abnormal reading of refrigerant circuit evidences air inclusion.

A little higher LP side pressure. Noticeably higher HP side pressure.



4.3.11 Moisture inclusion in ref.circuit

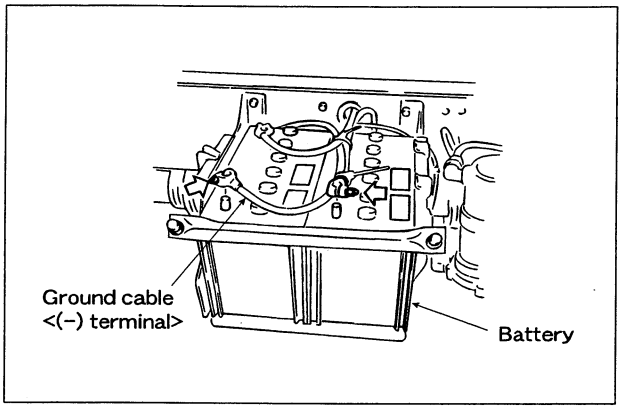
(1) During the operation, cooled air supply is interrupted periodically with a time interval.
This phenomenon evidences water inclusion.
(2) Check the refrigerant pressure at a stop of the cooled air supply to make sure of the water inclusion.
LP side pressure ····Almost vacuum
HP side pressure ····Noticeably low



5. REMOVAL AND INSTALLATION

5.1 Precaution for removal and installation

(1) Disconnect the (-) ground cable from the battery, and place a cover on the battery.

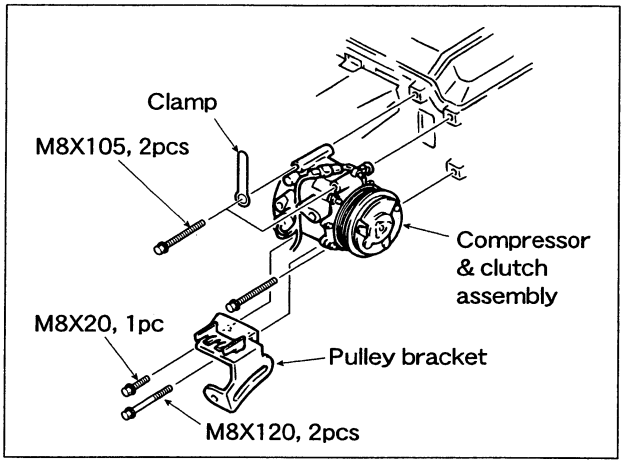


(2) Make certain all the openings are covered with caps in order to prevent entry of foreign substances such as dust and dirt.
(3) Never tamper with the brake and fuel systems, including the brake tubes and hoses.
(4) Avoid doing the work in a dusty place or outdoors in rainy weather. If tubes or functional parts are removed, put a cap in position immediately in order to prevent entry of dust and moisture.
(5) Connect the charging hose of the gauge manifold to the check valves (suction and discharge) of the suction hose and discharge hose, and recover the refrigerant by refrigerant recovery unit until its pressure is reduced to 0 kPa.
(Make sure that there is no internal pressure in the equipment.)
About discharging might result in the discharge of the refrigerant oil from the compressor.
(6) When coupling the flared tube, coat the flared portion with the compressor oil at the inner side.
(7) Make sure to use the wheel chocks.

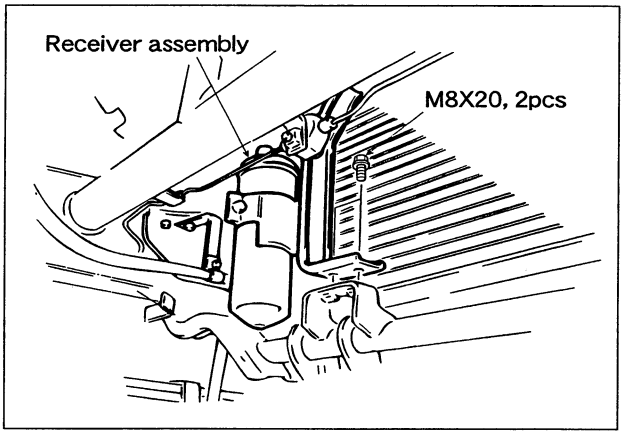
5.2 Removal

5.2.1 Inside engine room

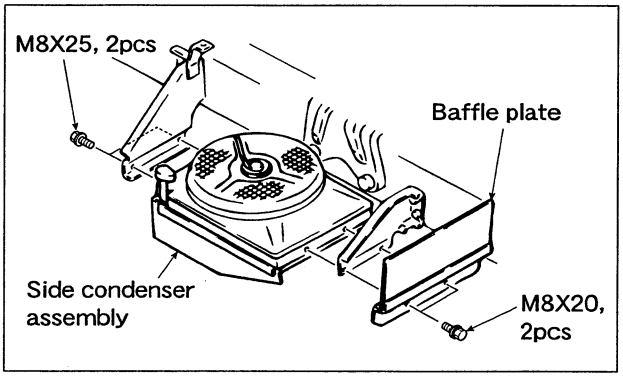
(1) Compressor & clutch assembly
(a) Withdraw the wiring of the magnetic clutch at the connector.
(b) Remove the V belt by loosening fixature of the tension pulley
(c) Take off the fixing bolts : M8X105, 2pcs and M8X 120, 2pcs. (with clamp)
(d) Dismount the compressor.



(2) Reciever assembly
(a) Unplug the dual pressure switch at the connector.
(b) Separete the interconnecting refrigerant pipe of the receiver assembly.
(c) Take off the fixing bolt : M8X20, 2pcs.
(d) Dismount the receiver assembly.



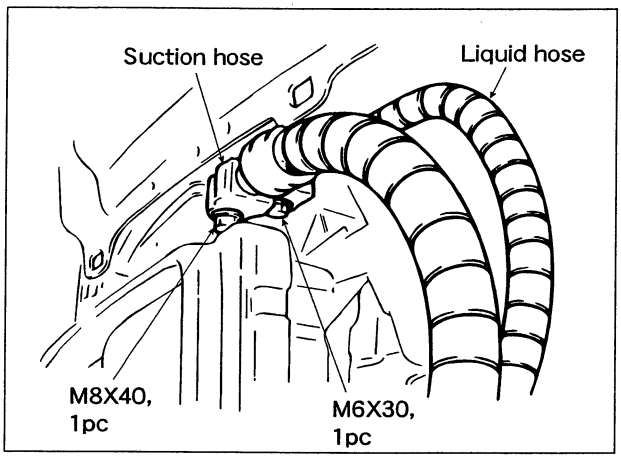
(3) Side condenser assembly
(a) Unplug the condenser fan harness at the vehicle side harness.
(b) Take off the fixing bolt : M8X20, 2pcs and M8X25, 2pcs.
(c) Dismount the side condenser assembly (and baffle plate).



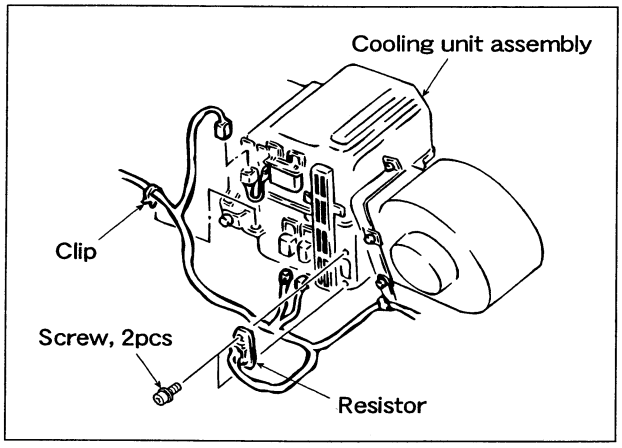
5.2 Cabin room

(1) Cooling unit assembly

(a) Separate the interconnecting refrigerant pipes of the cooling unit assembly.



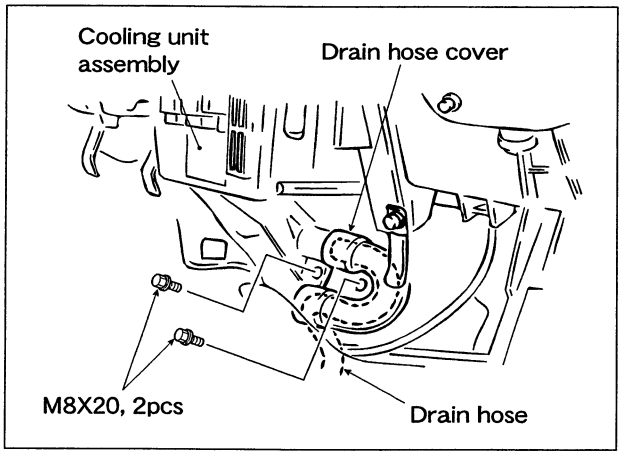
(b) Withdraw the wiring of the cooling unit assembly at the connectors.



(c) Take off the fixing bolt : M8X20, 2pcs.

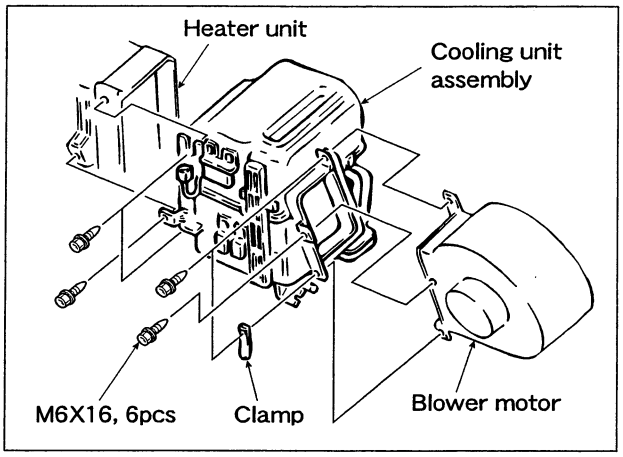
(d) Dismount the drain hose cover.

(e) Reconnect the drain hose from the cooling unit assembly.



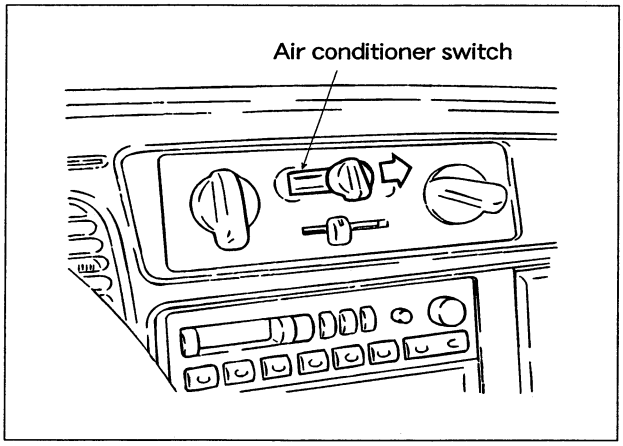
(f) Take off the fixing screws : M6X16, 6pcs.

(g) Dismount the cooling unit assembly.



(2) Air conditioner switch

Pull out the air conditioner switch.



5.3 Installation

Installation is performed in the opposite sequence of removal.

○ Torque for tightening coupler of refrigerant tubing.

Unit : N・m

Compressor suction hose	29~34
Compressor discharge hose	20~25
Condenser inlet hose	20~25
Condenser outlet hose	12~14
Liquid receiver assembly inlet and outlet hoses	12~14
Cooling unit inlet hose	12~14
Cooling unit outlet hose	29~34

○ Torque for tightening general bolt and nut

Unit : N・m

Nominal size	Pitch	Tightening torque		
		Head mark 4	Head mark 7	Head mark 8
M5	0.8	3~4	5~6	5~7
M6	1.0	5~6	9~11	8~12
M8	1.25	12~14	19~24	19~29
M10	1.25	24~29	38~48	43~58
M10	1.5	17~26	32~48	41~58
M12	1.25	34~43	58~77	82~106
M14	1.5	72~82	115~134	125~173

NOTE

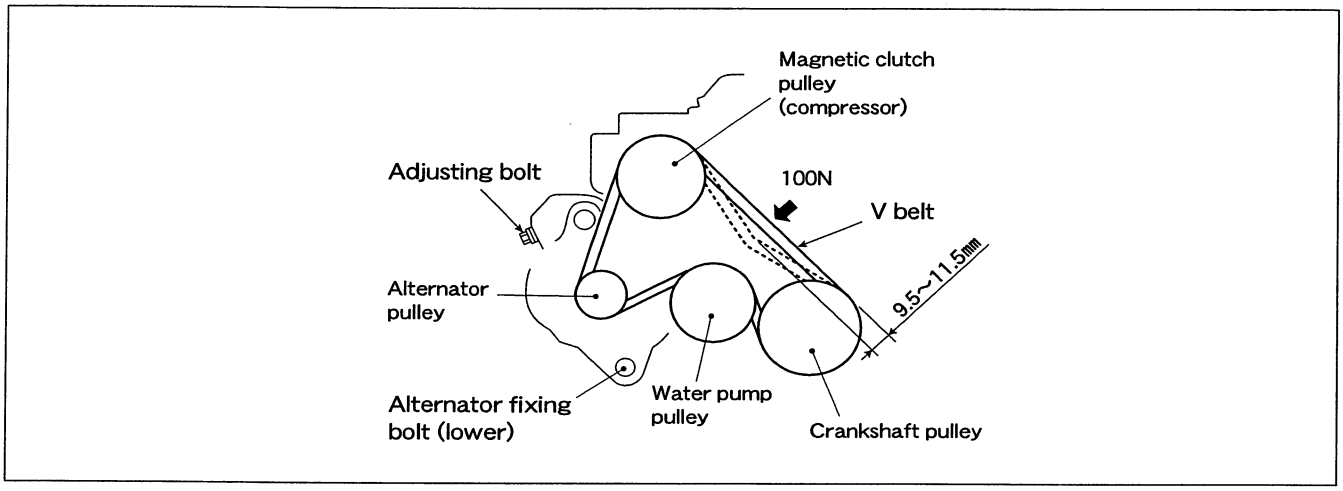
For the cases of spring washer seated, and thread or seating surface coated with oil, the value shall be reduced down to 85 percent of the data listed.

6. TREATMENT AFTER INSTALLATION

6.1 Check and adjustment

After installation, check the following points and confirm that everything is normal, then charge the gas, and do the performance and operation tests.

(1) Check if any abnormal vehicle performance, happens or not by installing the air conditioner.
(2) Check the operation of the magnetic clutch. (with the compressor disengaged)
(3) Check if any parts left unmounted or any tool left in the vehicle.
(4) Check to ensure that the temperature control lever operates properly.
(5) Check the tension of the belt.



6.2 Leak test

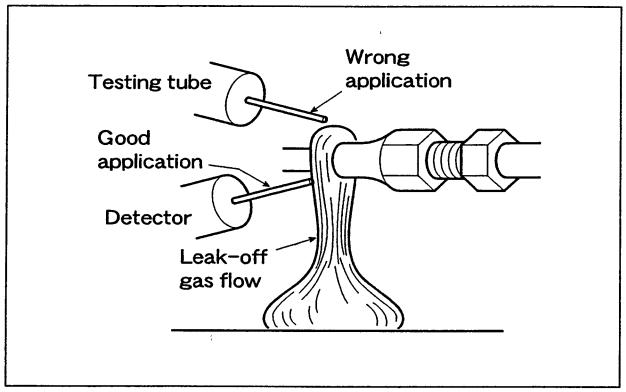
After all the piping works are completed, conduct an leak test by the following procedure to check any leaks at the flare coupling, etc. and then evacuate the system. If this leak test is omited and evacuation is immediately started, there is no way of detecting possible leak. If there are leaks, the specified vacuum cannot be attained. In order to save the service time be sure to conduct the leak test before evacuation.

6.2.1 Test point

(1) All pipe joint.
(2) Shaft seal and check valve on the compressor.

6.2.1 Test point

(1) For the gas leak test, the use of an electric gas leak detector is recommended. (HFC-134a SAE Approved)
(2) Perform the test at a place as in free from air flowing.
(3) The refrigerant is heavier than air. Leaks will concentrate at the bottom. Make certain that the testing tube is applied below the check point.



(4) The test should be performed patiently. Make certain that testing tube is moved slowly [approx. 10mm/sec.].
(5) The high pressure side refrigerant circuit should be tested for gas leaks during operation. Those areas which are dangerous or hard to test during operation (including areas around the compressor and condenser) should be tested direct after shutdown.

(6) The low pressure side refrigerant circuit should be tested during shutdown after the gas pressure has balanced.
(7) The test should be performed on the basis of the following standards:

Gas leak test standards

test point / Instrument	Compressor shaft seal	Other parts
Electric gas leak detector	Pointer shall not swing more than 0.1mA at the low sensitivity.	Pointer shall not swing more than 0.1mA at the low sensitivity.
handle torch gas leak detector	Flame colour (moss green) shall not change.	

⚠ WARNING

- Smoking should be forbidden if a gas leak is detected.
- If a flame is applied to the refrigerant, toxic phosgene gas will be produced. Do not keep the detector in contact with a leaky point for a long time.

- Leak test procedure

1. Attach refrigerant supply and gauge set as shown with all valves closed. Open refrigerant supply valve on can.
2. Loosen the center charging hose fitting at the gauge manifold end to blow any air from the hose until it hisses for a few seconds, then refrigerant.
3. Open both gauge valves to partially charge the system and then close both valves.
4. The system can then be checked for leaks using an electronic leak detector.
5. If leaks are found that require the system to be opened (to repair or replace hoses, fittings, etc.), release any charge in the system.
6. After checking and repairing leaks, system must be evacuated.

6.3 System charging

GENERAL PRECAUTIONS

⚠ WARNING

When handling refrigerant (HFC-134a), the following precautions must be observed.

- Always wear eye protection and gloves while handling refrigerant.
- Be careful that liquid refrigerant does not contact the skin.
  If liquid refrigerant strikes eye or skin:
  - Do not rub on skin.
  - Splash large quantities of cool water on the eye or skin.
  - Flush eyes or skin with cool water for 5 minutes.
  - Rush to a physician or hospital for immediate professional treatment.
  - Do not attempt to treat it yourself.
- Keep the refrigerant (HFC-134a) container below 40℃.
- Do not handle the refrigerant in an enclosed area having an open flame; the refrigerant may produce a poisonous gas.
- Use approved recovery equipment to recover HFC-134a refrigerant before attempting service of this or any other HFC-134a system.
- Do not attempt to leak test an HFC-134a system with high pressure air or nitrogen. Mixing HFC-134a with a concentrated quantity of air may be combustible in the presence of ignition.

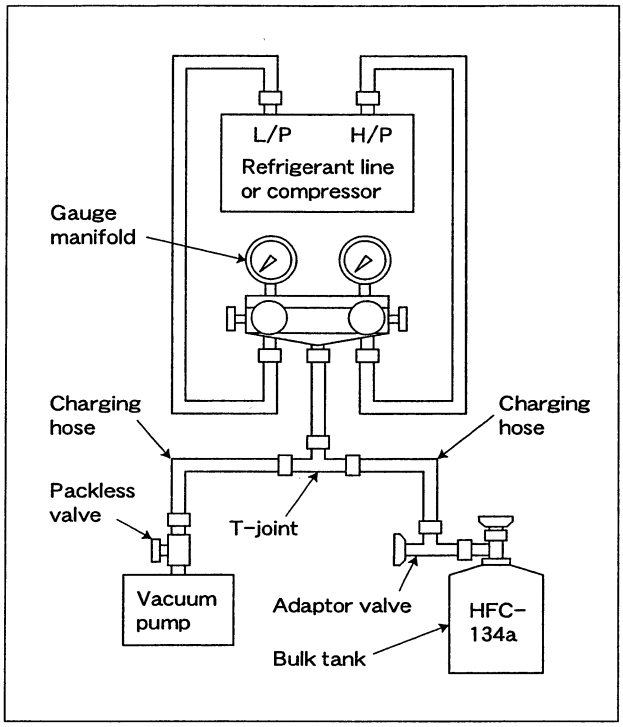
6.3.1 Evacuation

INSTALLATION OF CHARGE EQUIPMENT

(1) Connect the gauge manifold to the service valves.
(2) Connect the packless valve to the vacuum pump.
(3) With the charge valve handle turned back all the way, install the bulk tank.
(4) Connect each charge equipment as illustrated.

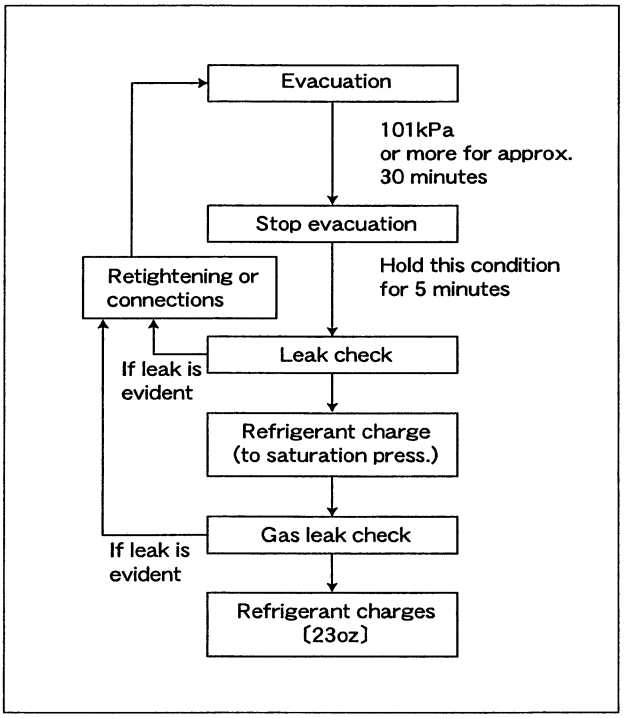
⚠ CAUTION

1. Do not connect the high and low pressure sides adversely. (Connect high pressure side to the condenser and low pressure side to the cooling unit.)
2. The indications "DIS" and "SUC" on the compressor indicate high and low pressure sides respectively.



6.3.2 Evacuate the system

The refrigerant system must have been evacuated using the previous procedure before charging. Charge using only HFC-134a refrigerant. HFC-134a is available in bulk tank. Follow the safety precautions for handling HFC-134a as listed in this section.
Follow the evacuation procedure below and at right.
This procedure assumes no HFC-134a refrigerant has been introduced into the system. If evacuating a charged system, it is necessary to recover the existing HFC-134a refrigerant before continuing with these instructions.
Refer to the recover equipment manufacture's instructions for proper refrigerant recovery.



CHARGING WITH BULK TANK

When using disposable cans of this type, follow carefully the tank manufactures instructions.

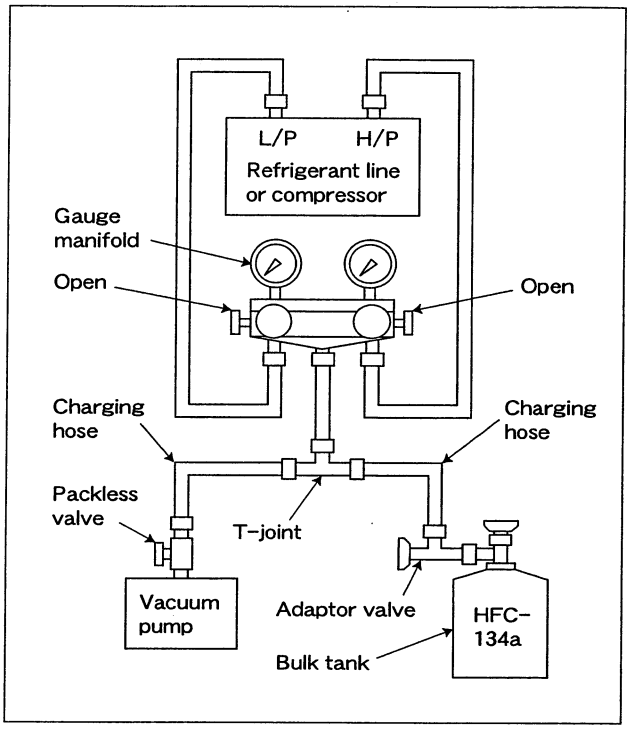
(1) Start up the vacuum pump.

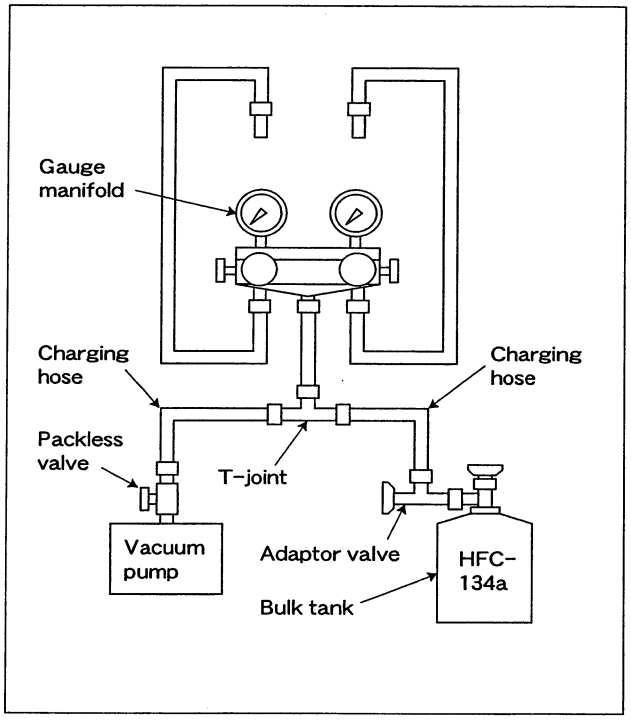
> ⚠ CAUTION
>
> 1. Do not use the compressor for evacaution.
> 2. Do not operate the compressor in the vacuum condition; damage may occur.

(2) Open the gauge manifold handles and the packless valve.
(3) Evacuate to a vacuum reading of 101kPa higher (approx.30 minutes).
(4) Turn back the packless valve all the way and close the bulk tank.
(5) Stop the vacuum pump and allow to stand for 5 minutes.
(6) Check for leak. (Good if the vacuum is held.)
(7) Tighten the charge valve handle to puncture the bulk tank.
(8) Open the charge valve to charge the system with refrigerant.
(9) When the refrigerant is no longer drawn in, turn back the high pressure side gauge manifold handles.
(10)Check for gas leaks using a leak detector.
(11)Start the engine.
(12)Operate the air conditioner and set at the lowest temperature (MAX. COOL).
(13)Fix the engine speed at 1500min^{-1}.
(14)Continue charging system until proper refrigerant quantity is introduced into the system.

> ⚠ CAUTION
>
> If the bulk tank is inverted, liquid refrigerant may be drawn into the compressor damaging it by liquid compression. Keep the bulk tank upright to ensure that refrigerant is charged in gas state.

(15)Upon completion of charging, turn back the low pressure side gauge manifold handles.





6.3.3 Removal of charge equipment

(1) Close the charge valve.
(2) Remove the gauge manifold from each service valves.

> ⚠ CAUTION
> Do not remove the bulk tank, T-joints and adaptor valves but keep them connected for next charge operation.

OPERATING LOW REFRIGERANT LEVEL

Locate the souce of the low refrigerant level, recover system, repair system, evacuate system, charge ststem, check for leaks.

> ⚠ CAUTION
> If the bulk tank is not emptied completely, keep the charge valve connected to the tank for next charging.

6.3.4 Discharging system

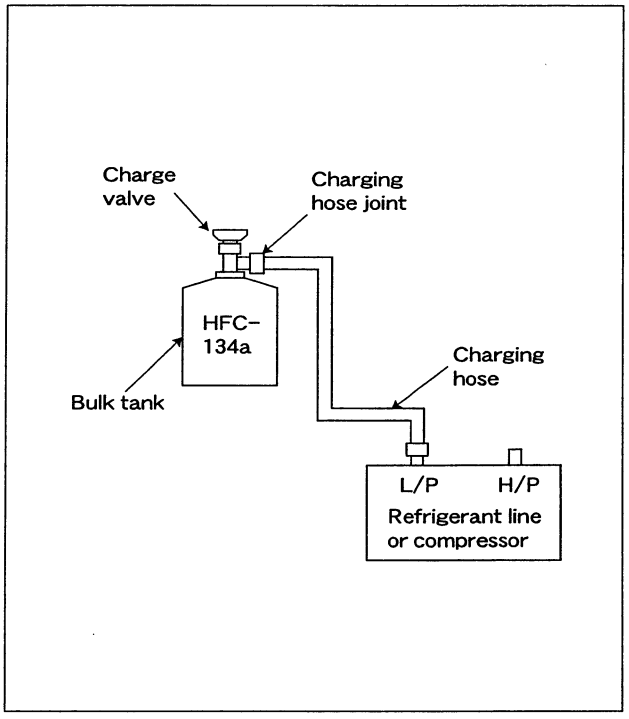
Use the refrigerant recovery unit which can be purchased in local market to discharge refrigerant gas from the system.

> ⚠ CAUTION
> Refer to that Refrigerant Recovery Unit Instruction Manual for operation which is attached on the unit.

LIQUID CHARGE, through high side using charging station:

> ⚠ CAUTION
> Do not run engine when performing liquid charge; compressor will be damage.

(1) After the system is evacuated, close gauge valves, connect center hose to refrigerant supply. Loosen center fitting at gauge to blow any air out of the hose and then retighten.
(2) Following charging station manufacture's instructions charge the system until 23oz of refrigerant is pumped into the system.
(3) When system is fully charged, close high gauge valve and refrigerant supply valve, then quickly disconnect gauge hoses from service
(4) After charging the system, refer to pre-delivery inspection.



6.4 Performance test

6.4.1 Preparation

Reinstall all vehicle parts that were removed for installation of the air conditioner at their original positions, adjust the mounting, and test the following items.

(1) Installation of grommets.

Install the specified grommets.

6.4.2 Stationary performance test

(1) Operating conditions

(a) Place the vehicle in the shade with doors open.

(b) Keep the return air temperature between 25 to 30℃ (Adjust by changing the opening degree of the doors).

(c) Set the fan switch to the max position.

(d) Turn the thermostat control lever to the cool position.

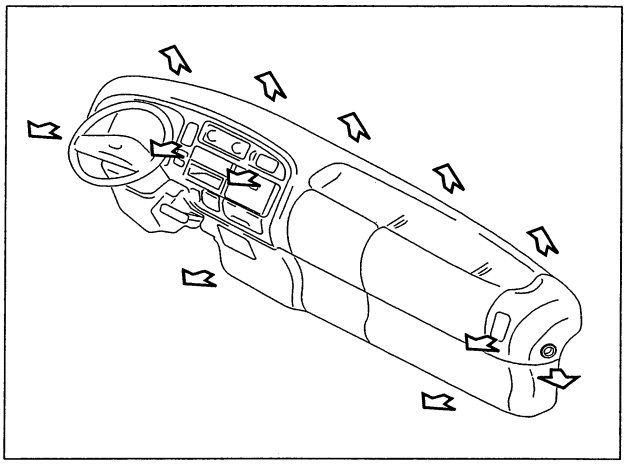
(e) Set the engine speed to approx. 1500min^{-1}.

(f) Set the high pressure at 1.17 to 1.37 MPa.

(If the high side pressure does not rise up, place paper or the like in front of the condenser.)

(2) Test procedure

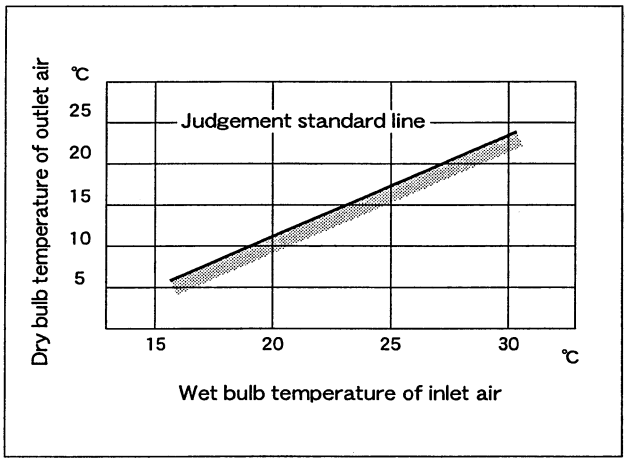
Operate the air conditioner for more than 10 minutes under the above operating conditions in order to stabilize the high and low pressures. Then perform the test by the following procedure:



(a) Measure the outlet air temperature at the inside space of the outlet grille.

(b) Measure the air conditioner intake air temperature, humidity, etc, and the items shown in the Table of Measuring Items at a position free from the effects of cool outlet air.

(c) The intersecting point of the plotted line perpendicular to the point which corresponds to the air conditioner intake and outlet air temperature difference and the plotted line perpendicular to the relative humidity of intake air should be between the oblique lines in figure.



7. MAINTENANCE

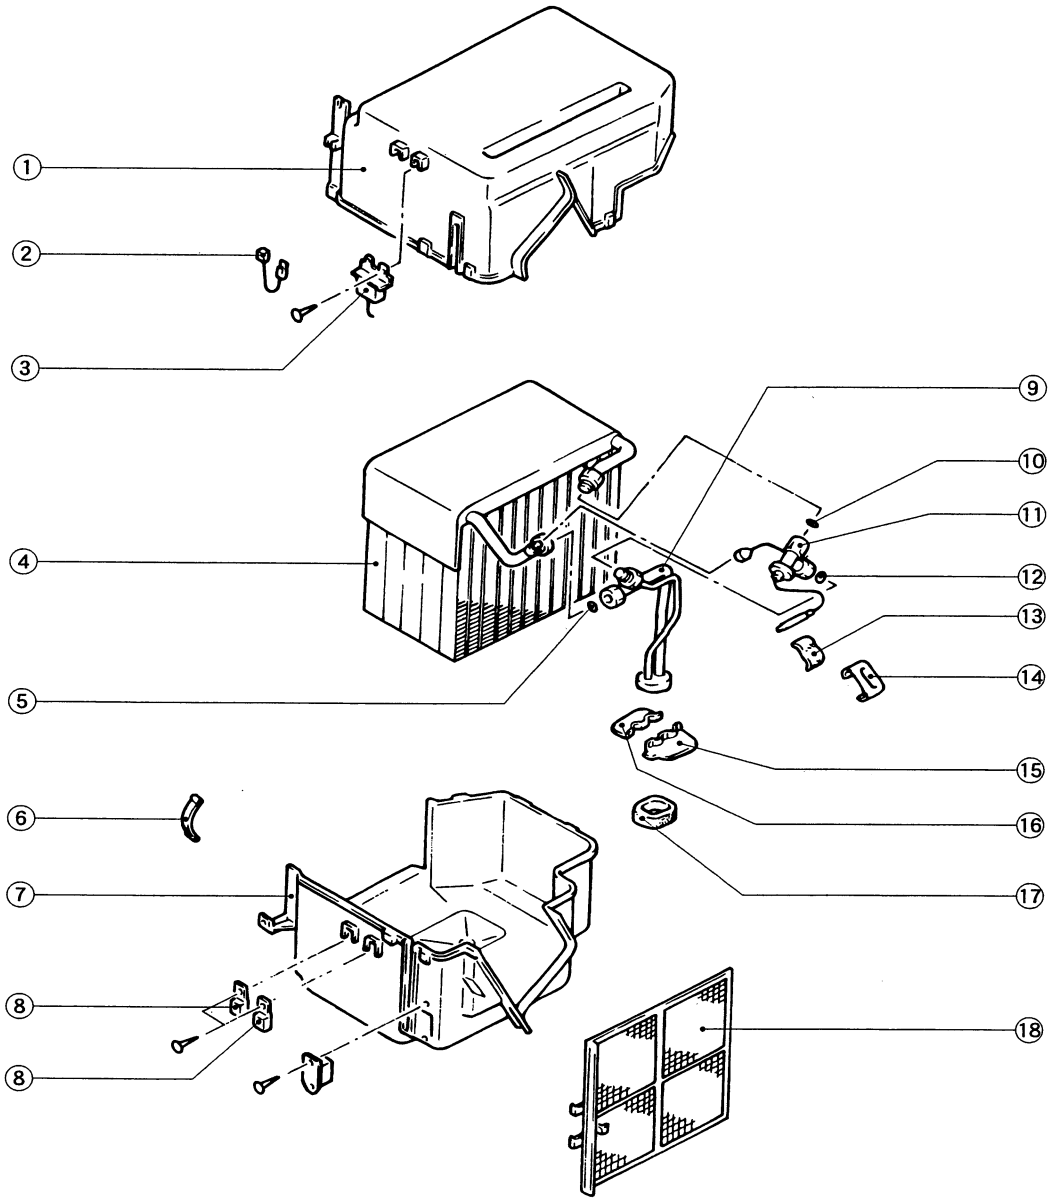
No.	Check point	Service and inspection intervals				
		When used only in summer (approx. for three months)		When used in all seasons		
		At the beginning or season	At the end of season	Every 5,000km (3,000miles)	Every 10,000km (6,000miles)	Every 20,000km (12,000miles)
1	Check condenser and radiator fin for clogging.	○	○	○		
2	Retighten all bolts.	○			○	
3	Check for refrigerant leaks.	○			○	
4	Check refrigerant level.	○		○		
5	Check V-belt tension.	○		○		
6	Check operation of magnetic clutch.	○			○	
7	Check operation of thermostat.	○				○
8	Cooling unit assembly performance test.	○		○		
9	Compressor overhaul.			Every four years		Every 40,000km (24,000miles)

⚠ WARNING

Even after the hot season is over, the air conditioner should be kept ready for operation all year round. Do not remove the V-belt or other parts.
This is because the air conditioner must be operated once a week for several minutes regardless of the season in order to prevent gas leaks caused by drying of the compressor shaft seal, and also to maintain the compressor itself in the best condition.

8. COOLING UNIT ASSEMBLY

8.1 Components



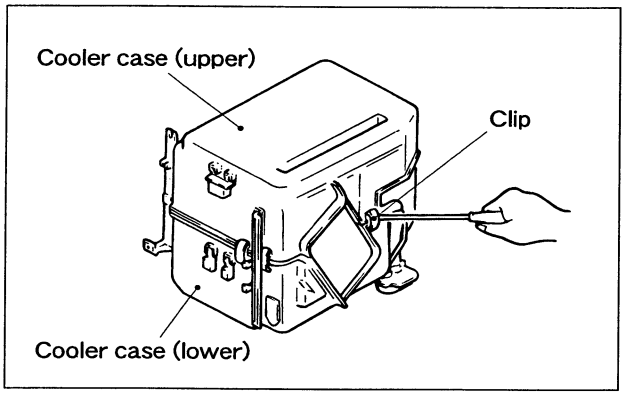
① Cooler case (upper)
② Joint harness
③ Thermostat
④ Evaporator
⑤ O-ring
⑥ Clip
⑦ Cooler case (lower)
⑧ Power relay
⑨ Pipe assembly
⑩ O-ring
⑪ Expansion valve
⑫ O-ring
⑬ Insulation rubber
⑭ Clip
⑮ Baffle plate
⑯ Baffle plate
⑰ Insulation rubber
⑱ Air filter

8.2 Cautions in disassembling

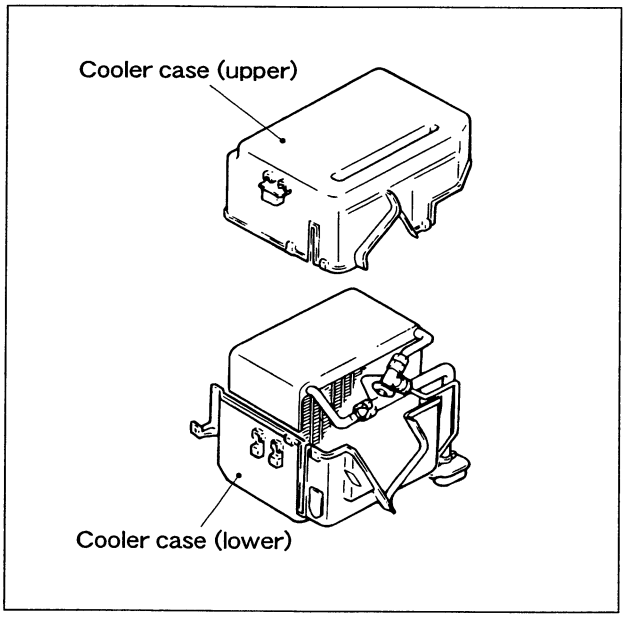
(1) Direct after disconnecting the refrigerant piping plug the opening to prevent dust and moisture etc. from entering in it.
(2) When disconnecting the expansion valve, surely apply two spanners to prevent unstable twisting from applyng with the one for supporting and the other for torquing at the connection.
(3) Pipings in the cooling unit assembly should be handled gently. Particularly, during the installation and removal.
(4) If the cooling unit assembly is stored, or transported on disassembled condition, be careful not to deform the fins.
(5) When disconnecting the wiring, avoid pulling it with the insulation cover catched, but apply force by pinching the terminals or by catching the connectors.

8.3 Disassembling

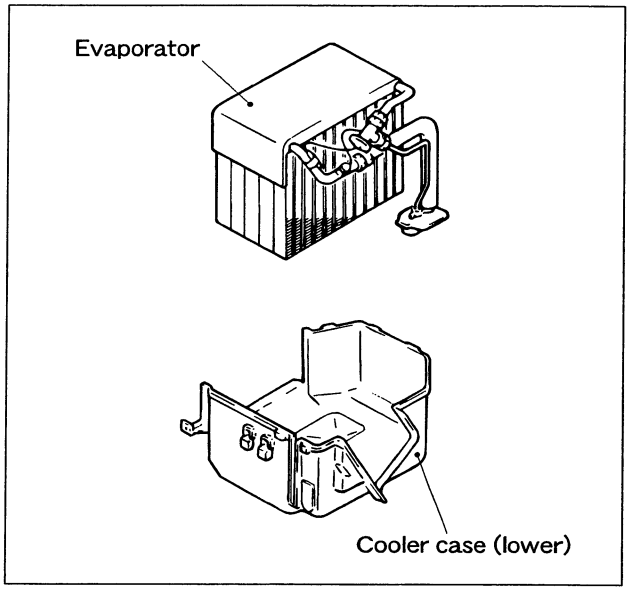
(1) Remove the clips for jointings the upper & lower side cooler case with a flat type screwdriver.



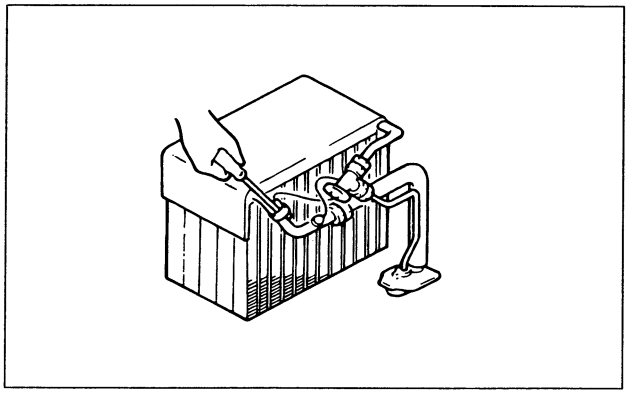
(2) Dismount the cooler case (upper).



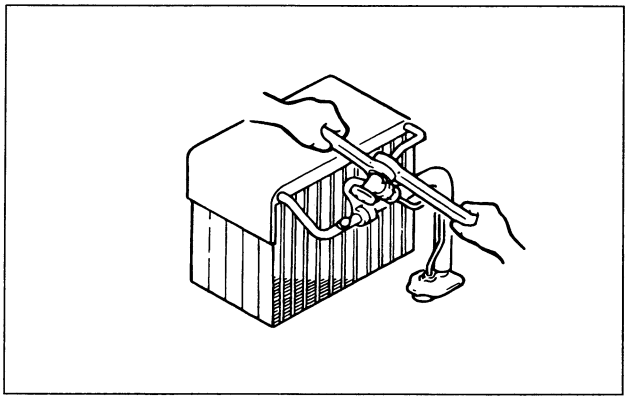
(3) Dismount the evaporator.



(4) Separate the expansion valve.
Dismount the feeler bulb at the suction side.

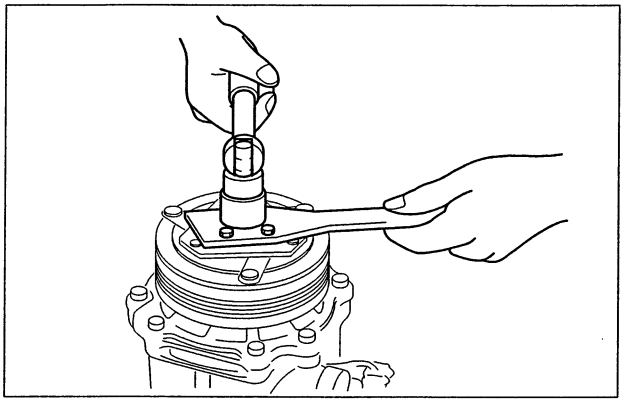


(5) Dismount the expansion valve from the circuit.

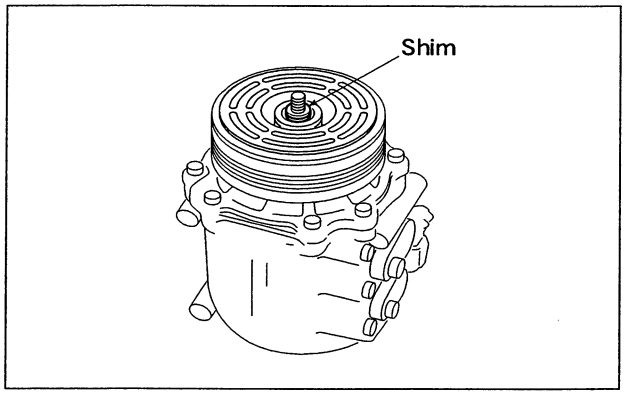


9. COMPRESSOR & CLUTCH ASSEMBLY

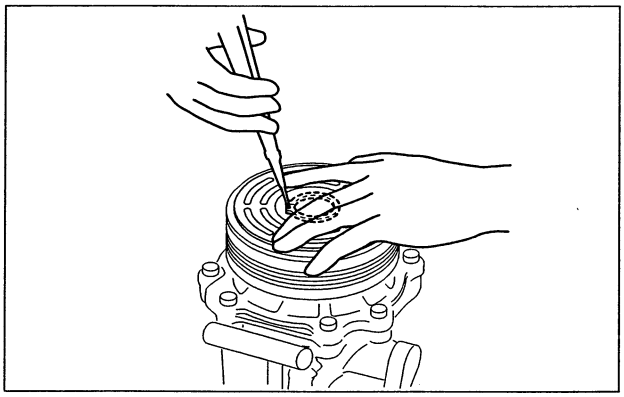
9.1 Disassembling the clutch



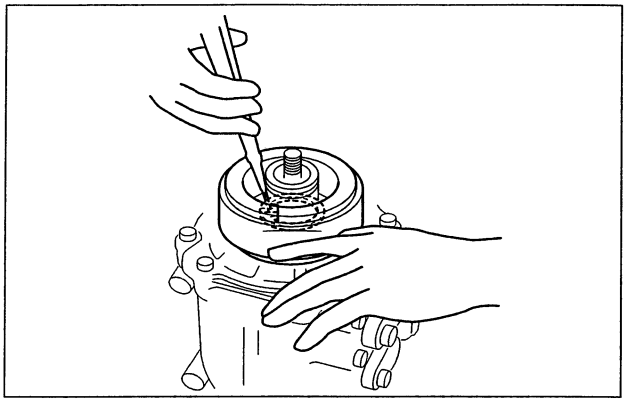
(1) Removal of armature plate.
  (a) Lock up the armature plate with a armature plate fixture and remove the lock nut.
  (b) Remove the armature plate.



(2) Remove the shim.



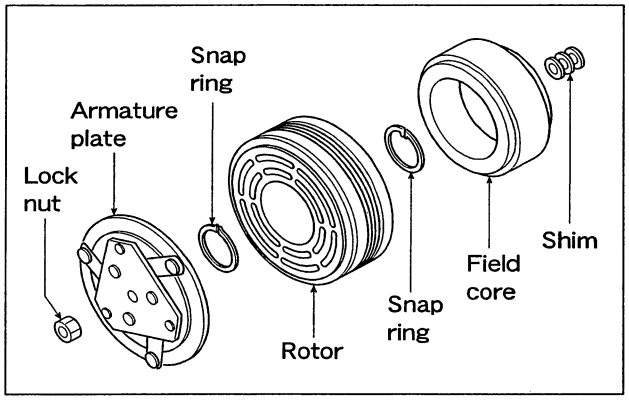
(3) Withdrawing rotor.
  (a) Remove the snap ring at the front case side with snap ring pliers.
  (b) Withdraw the rotor toward you and remove it from the front case.



(4) Removal of field core.
  (a) Remove the snap ring for fixing the field core with snap ring pliers.

  (b) Remove the ground wire with a cross point screw-driver and withdraw the field core toward you to remove it from the crank case.

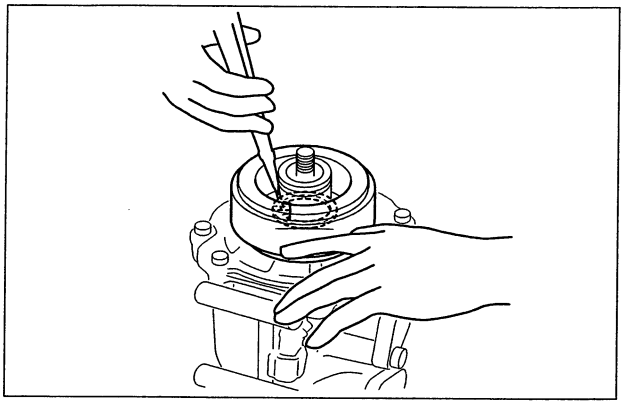
(5) Removal of key.
  Remove the key from the shaft using the top of a flat type screwdriver.



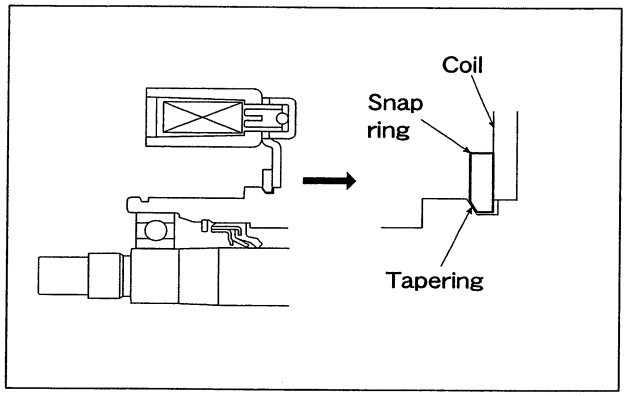
(6) Components of magnetic clutch.

9.2 Reassembly the clutch

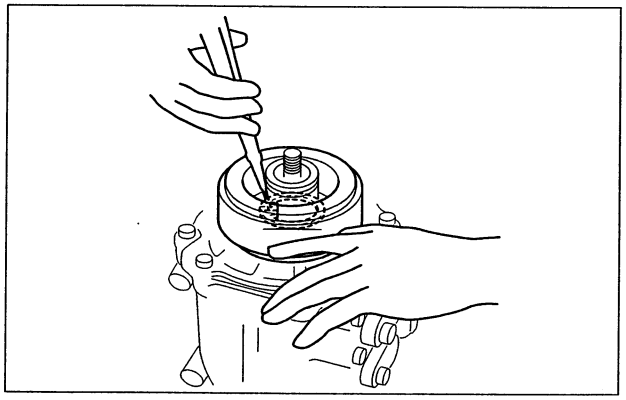
(1) Insert the key into the clankshaft.
(2) Insert the field core.



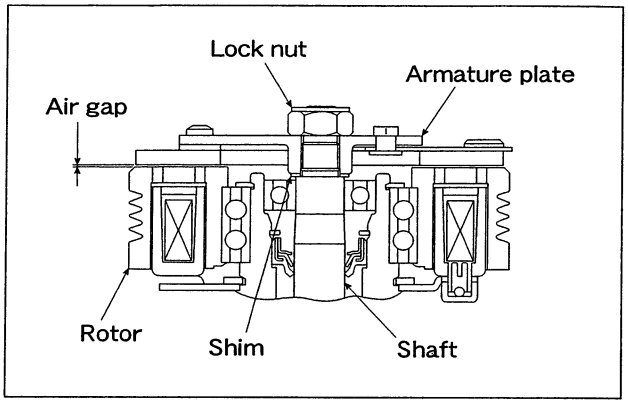
(a) Insert the field core into the front case and position it with a knock pin.
(b) Insert the snap ring for fixing field core into the groove and fix it with snap ring pliers as shown the below.



(c) Connect the ground wire.
(3) Insert the rotor into the front case.



(4) Insert the snap ring for the front case side into the groove with snap ring pliers.



(5) Insert the armature plate.
(a) Place a shim on the end of the shaft and insert the armature plate, adjusting to the key.
(b) Tighten the center bolt to the specified torque, 15.7N.m, with in between plain washer.
(c) Measure the air gap.
The air gap should be within 0.4 to 0.65 ㎜.
Adjust it by shim if it is not within the specifications.
Adjusting shim : 0.1, 0.3, 0.5, or 0.8 ㎜.

9.3 Special tool figure

The dimensions are in millimeter

(1) Armature plate fixture

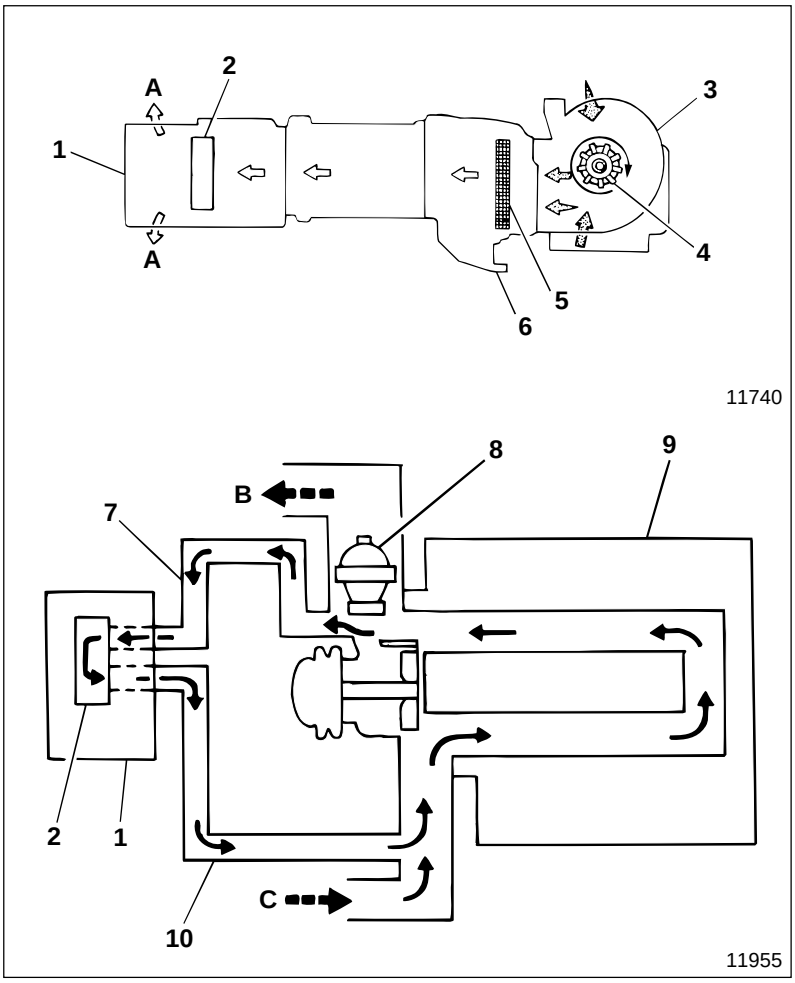
SPECIFICATIONS

Items		Specifications
System	Type	Inside/outside air combining, hot-water type heating system
	Standard voltage V	12
	Damper changeover system	Manual cable type
Blower assembly	Manufacturer	DENSO
	Power consumption W	170
	Maximum rotation rpm	3450
Heater unit assembly	Manufacturer	DENSO
	Temperature control system	Air mixing type
	* Heating performance kW {BTU/h, kcal/h}	*3.53 {12060, 3040}

* : Heating performance is shown under the following conditions.
Temperature difference : 65°C {119°F}
Water flow : 6 L/min {0.0035 ft^3/s}
Voltage : 12 V DC

Heater



1 Heater unit
2 Heater core
3 Blower assembly
4 Fan
5 Air filter
6 Duct assembly
7 Heater hose (Heater in)
8 Thermostat
9 Engine
10 Heater hose (Heater out)

A : To duct
B : To radiator
C : From radiator

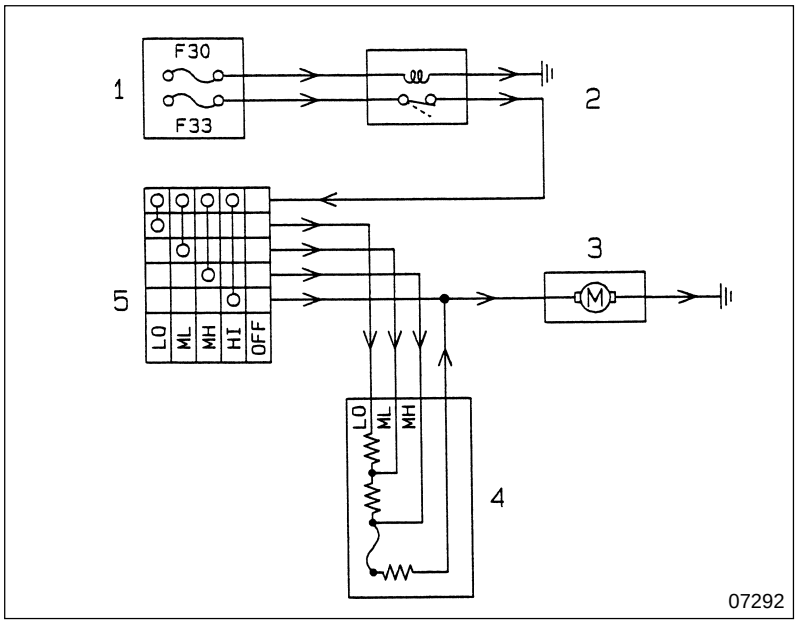
Outside air (Intake)

Inside air (Circulation)

Filtered air

- Warm engine coolant that has absorbed heat from engine **9** does not flow through thermostat **8** but circulates as follows:
  7→**2**→**10**→**9**
- Air sent to heater unit **1** from blower assembly **3** is warmed by heater core **2** (heat exchanger). Then the ducts deliver the warmed air to the cab.

Heater Electric Circuit



1 Fuse box
2 Blower fan relay
3 Blower motor
4 Blower resistor
5 Fan switch (Heater switch)

- The resistance of blower resistor **4** controls blower motor **3**, which in turn controls the air flow, except when the air flow is set to HI (high speed). When the air flow is set to HI, the current does not flow through the blower resistor.

Fan switch 5 set to LO position

- **1** (F30)→**2** (coil)→Ground
- **1** (F33)→**2** (contact point)→**5** (LO)→**4** (LO)→**3**→Ground

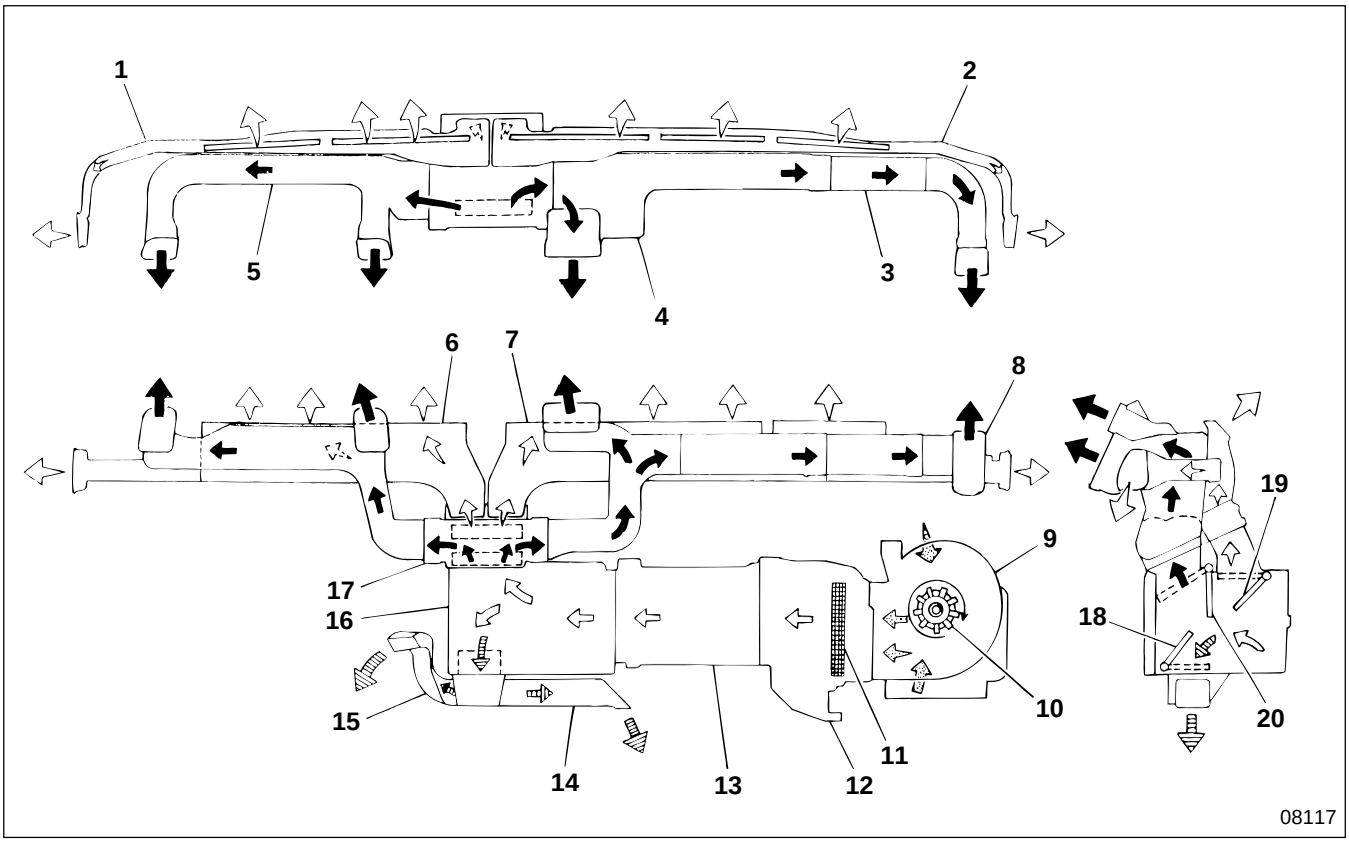
Fan switch 5 set to HI position

- **1** (F30)→**2** (coil)→Ground
- **1** (F33)→**2** (contact point)→**5** (HI)→**3**→Ground

Fan switch 5 set to either ML or MH position

The current flows through blower resistor **4** in the same way as when set to LO position, routing ML or MH respectively instead of LO.

Air Duct

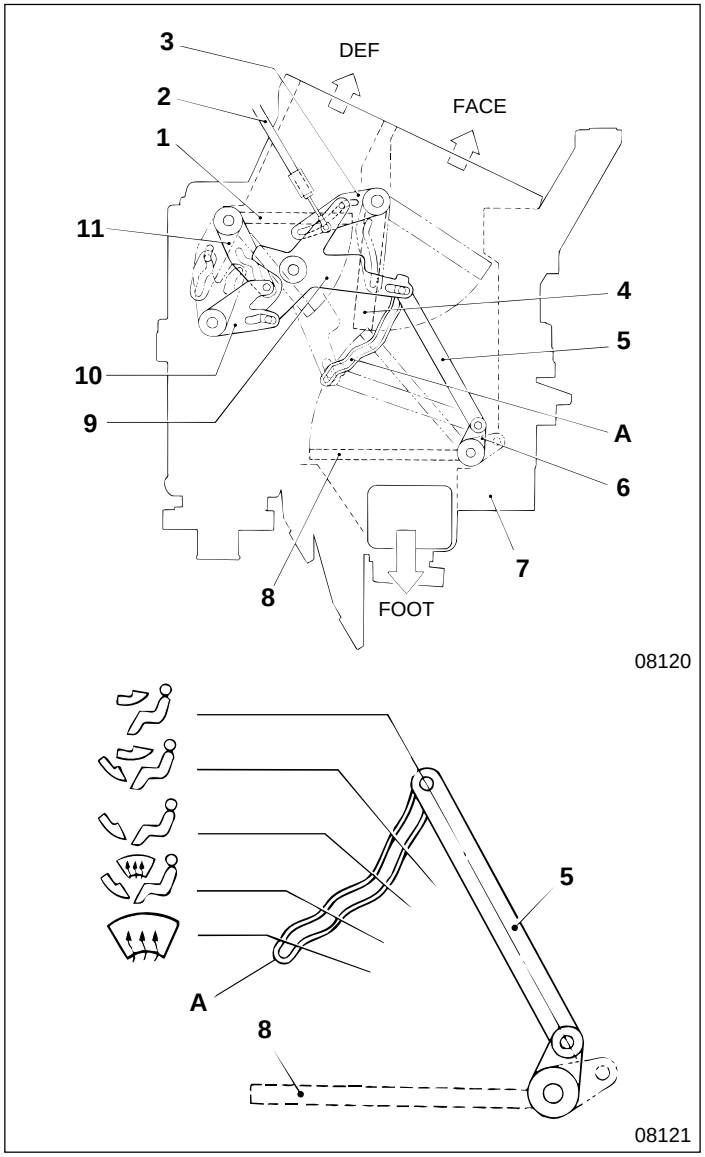


1 Defroster side duct, LH
2 Defroster side duct, RH
3 Face duct B
4 Center face duct
5 Face duct, LH
6 Front defroster, LH
7 Front defroster, RH
8 Face duct A
9 Blower assembly
10 Fan
11 Air filter
12 Duct assembly < without air-conditioner >
Cooling unit < with air-conditioner : option >
13 Joint duct
14 Foot duct, RH
15 Foot duct, LH
16 Heater unit
17 Center duct
18 Damper (FOOT)
19 Damper (DEF)
20 Damper (FACE)

Outside air (Intake) Inside air (Circulation) Filtered air (in heater and cooling unit)

Air (FACE) ( )Air (DEF) Air (FOOT)

Since dampers **18**, **19, 20** of heater unit **16** are opened and shut by the switching operation of the heater control assembly, the outside air and inside air coming from blower assembly **9** flow as illustrated.



● **Mode changeover system**

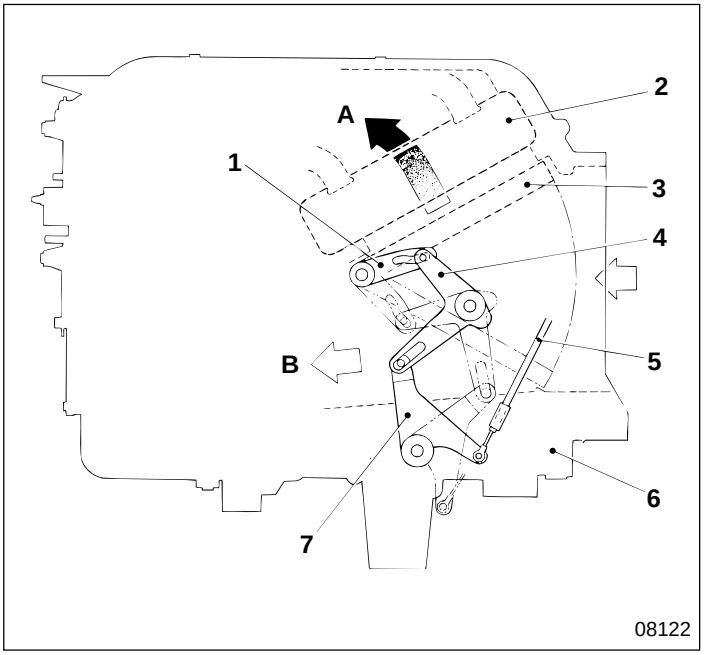
1 Damper (DEF)
2 Mode changeover control cable
3 Lever
4 Damper (FACE)
5 Lever
6 Lever
7 Heater unit
8 Damper (FOOT)
9 Lever
10 Lever
11 Lever

A : Rail

- The opening and closing of dampers **1**, **4**, **8** is mechanically controlled by the movement of mode changeover control cable **2**, transmitted as follows:
  2→**9**→**3**→**4** (FACE)
  →**5**→**6**→**8** (FOOT)
  →**10**→**11**→**1** (DEF)

  Levers **3**, **5**, **6**, **10**, **11** move together with lever **9**. Dampers **1**, **4** , **8** move together with levers **3**, **6**, **11**, the degree of opening is determined by the shape of the lever grooves.

- Lever **5** is connected to rail **A**. Since the lever moves along the groove of the rail, damper **8** (FOOT) can be opened and closed in combination with other modes to activate bi-level mode.

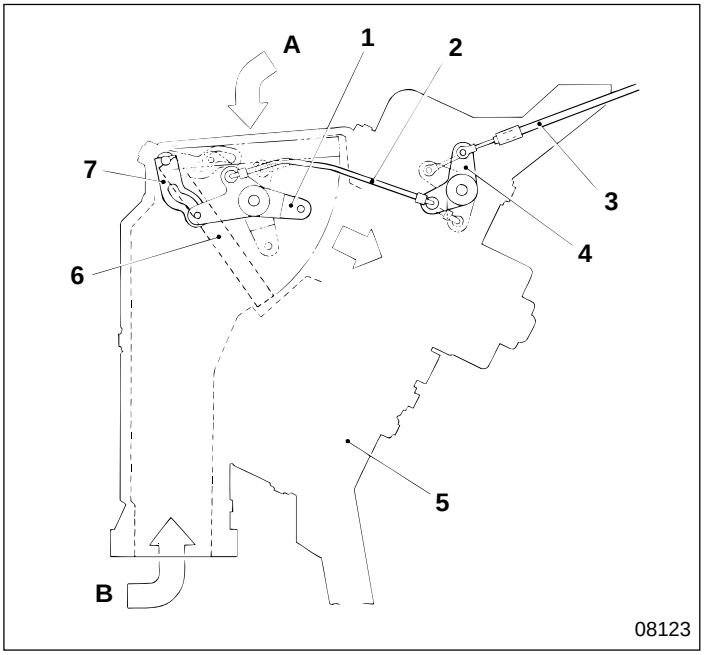


● **Air mixing control**

1 Lever
2 Heater core
3 Damper
4 Lever
5 Air mixing control cable
6 Heater unit
7 Lever

A : Warm air
B : Unwarmed air

- The degree of opening of damper **3** controls the flow of both air **A** that has passed through and been warmed by heater core **2**, and air B that has not been warmed.
- Damper **3** is mechanically operated by the movement of air mixing control cable **5**, transmitted as follows:
  5→7→4→1→3
  Lever 1 moves together with damper **3**.

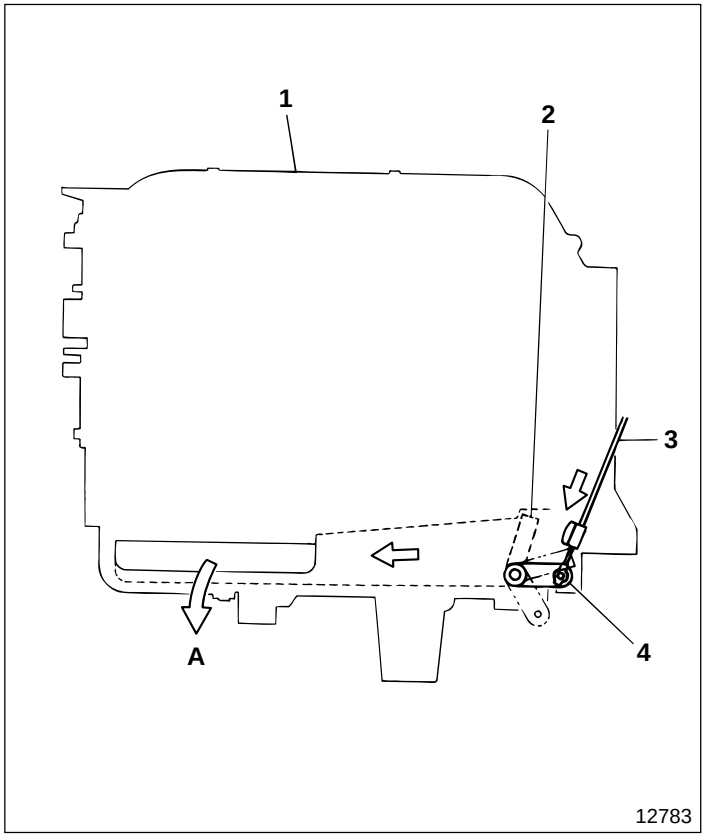


● **Air intake control**

1 Lever
2 Rod
3 Inside/outside air changeover control cable
4 Lever
5 Blower assembly
6 Damper
7 Lever

A : Inside air
B : Outside air

- Changeover of air intake from inside to outside is controlled by the opening and closing of damper **6**.
- Damper **6** is mechanically operated by the movement of inside/outside air changeover control cable **3**.
  3→4→2→1→7→6
  Lever 7 moves together with damper **6**.



● **Air flow bypass changeover**

1 Heater unit
2 Damper
3 Air flow bypass changeover control cable
4 Lever

A : Air not warmed by heater core

- Damper **2** is opened and closed to change the air flow from warm air to air that has not passed through and been warmed by heater core **2**.
- Damper **2** is mechanically operated by the movement of air flow bypass changeover control cable **3**, transmitted as follows:
  3→**4**→**2**
  Lever **4** moves together with damper **2**.

Symptoms / Possible causes	Air does not flow from vents	Heater does not work well	Airflow control setting cannot be changed	Drafts from vents	Temperature control setting cannot be adjusted	Outside/inside air control cannot be changed	Air volume from vents unstable	Control switches operation heavy	Air flow bypass cannot be changed	Remarks
Blower motor coil broken or short-circuited	○									
Blower motor relay contact point melted, coil broken or short-circuited	○									
Blower resistor operation malfunctioning							○			
Mode damper opening and closing faulty			○	○				○

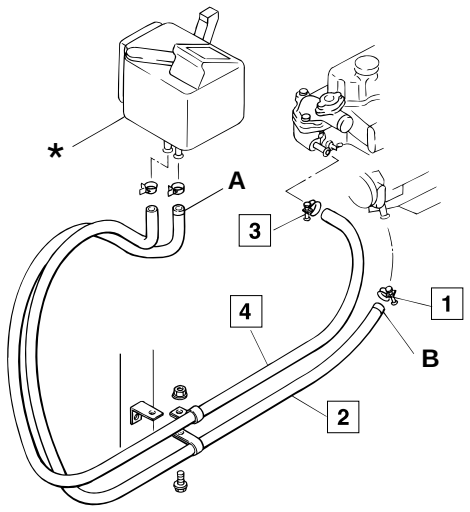
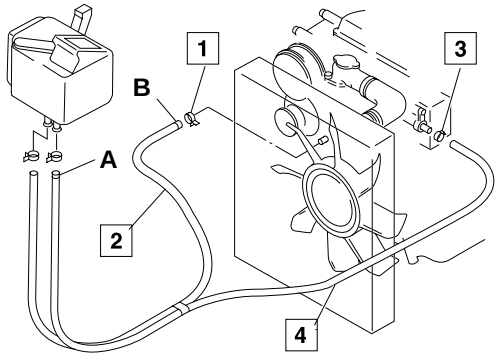
HEATER HOSE

< 4D3 >



11728

< 4M5 >



Ⓟ45223

● **Disassembly sequence**

1 Hose clamp
2 Heater hose (Heater out)
3 Hose clamp
4 Heater hose (Heater in)

***** : Heater unit
A : White mark
B : Yellow mark

NOTE

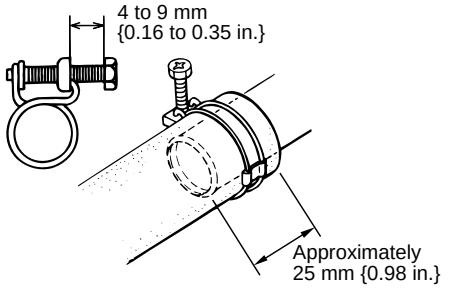
- **Drain engine coolant from radiator before removing hoses.** **Gr 14A, B**
- **Make sure that yellow mark B on heater hose 2 and white mark A on heater hose 4 are clearly visible before removing parts. If there are no marks, make identification marks before removing parts.**

● **Assembly sequence**

Follow the disassembly sequence in reverse.

CAUTION⚠

- **Be sure that hoses are inserted securely to prevent coolant leaking.**
- **Make sure not to mix up heater hoses 2, 4 when connecting them because mistaken connection would damage the heater unit.**



11845

◆ Service procedure

1 **to** **4** **Installation of heater hose and hose clamp**

- Install heater hoses **2**, **4** to conform to the dimension as illustrated.
- Tighten hose clamps **1**, **3** to conform to the dimension as illustrated.

● **Disassembly sequence**

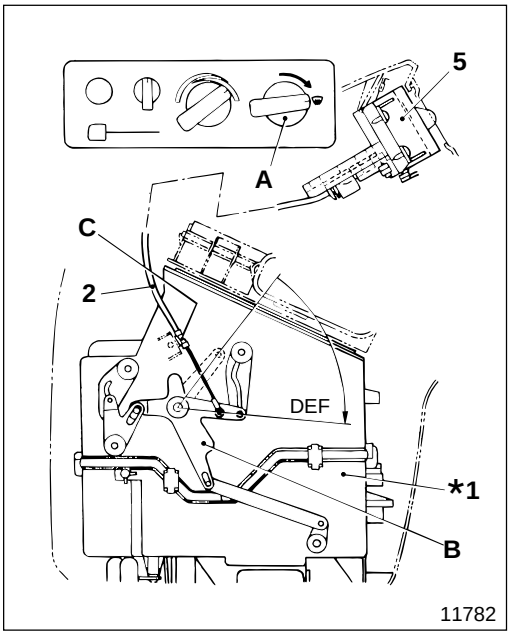
1 Harness
2 Mode changeover control cable
3 Inside/outside air changeover control cable
4 Air mixing control cable
5 Heater control assembly Gr 54
6 Air bypass changeover control cable
7 Air bypass control lever

***a** : Heater unit assembly P55B-16
***b** : Blower assembly P55B-16

● **Assembly sequence**

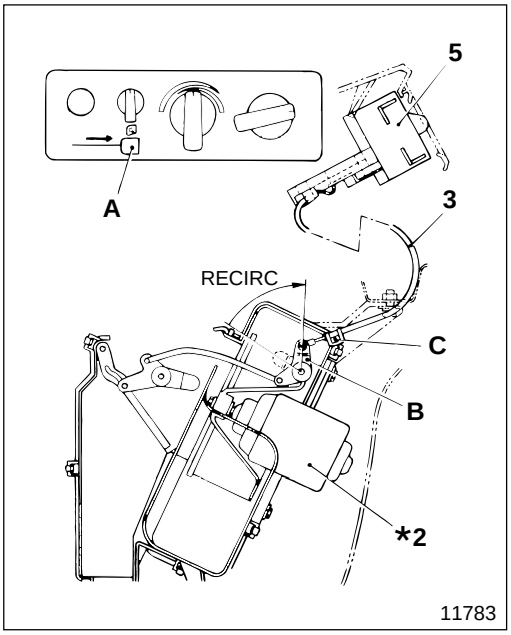
Follow the disassembly sequence in reverse.

◆ Service procedure



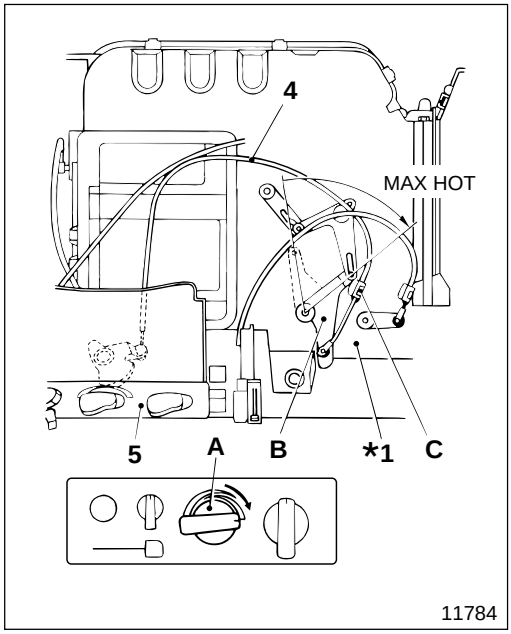
2 Installation of mode changeover control cable

- Turn mode changeover control dial **A** of heater control assembly **5** to (DEF).
- Turn mode changeover damper lever **B** of heater unit assembly ***1** to DEF.
- Under these conditions, install mode changeover control cable **2** onto mode changeover damper lever **B** and fasten it with clip **C**.



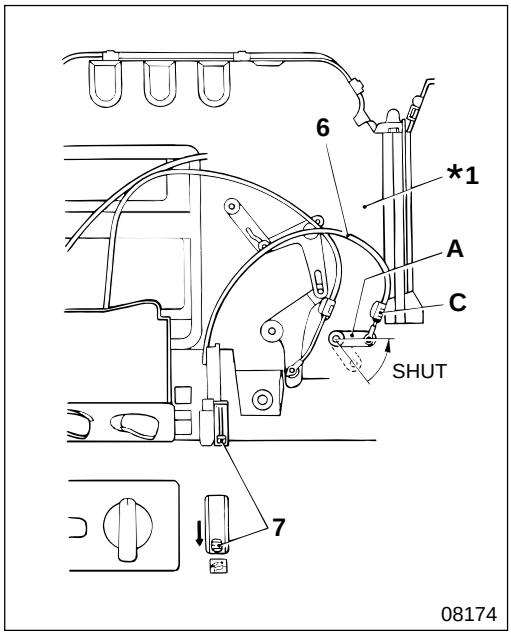
3 Installation of inside/outside air changeover control cable

- Set inside/outside changeover lever **A** of heater control assembly **5** to (RECIRC : Inside air).
- Turn inside/outside air changeover damper lever **B** of blower assembly ***2** to RECIRC.
- Under these conditions, install inside/outside air changeover control cable **3** onto inside/outside air changeover damper lever **B** and fasten it with clip **C**.



4 Installation of air mixing control cable

- Fully turn temperature control dial **A** of heater control assembly **5** clockwise to MAX HOT (maximum heating).
- Turn air mixing damper lever **B** of heater unit assembly ***1** to MAX HOT (maximum heating).
- Under these conditions, install air mixing control cable **4** onto air mixing damper lever **B** and fasten it with clip **C**.



6 Installation of air bypass changeover control cable

- Set air bypass changeover control lever **7** to SHUT.
- Set air bypass lever **A** of heater unit assembly ***1** to SHUT.
- Under these conditions, install air bypass changeover control cable **6** onto air bypass lever **7** and fasten it with clip **C**.

SERVICE MANUAL
2003 Model

FOREWORD

This Service Manual contains maintenance and repair methods for personnel involved in the maintenance and repair of the Mitsubishi Fuso Truck FH Series. Read this manual carefully as an aid to providing correct, efficient and fast maintenance. Please note, however, that due to continued vehicle improvements the specifications and numbers given for use in maintenance might change without notice. If you have any questions, or encounter a problem, please do not hesitate to contact your nearest Mitsubishi Fuso Dealer or Distributor.

11 Support lever
12 Release lever
13 Bushing
14 Pressure plate

Ⓟ Positioning pin
⊗ : Non-reusable part

NOTE
Do not remove the bushing 13 unless it is defective.

● **Assembly sequence**
Reverse the order of disassembly.
Repair kit : Clutch release
Lever kit

● **Post-assembly Inspection and adjustment**
P21-44

23926

NOTE

This mark indicates a part that cannot be reused.

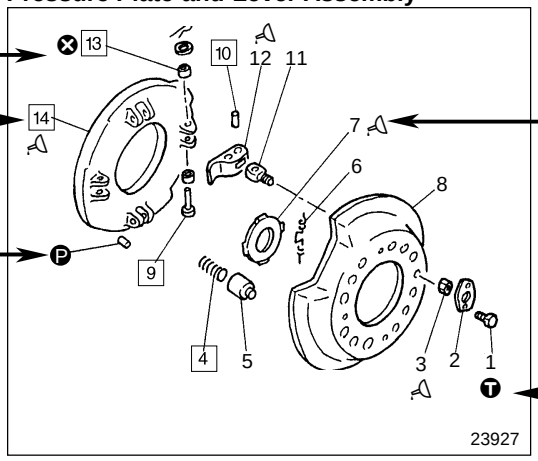
NOTE

The key number enclosed with a square indicates that the part is mentioned in the service procedure.

NOTE

Ⓟ: Indicates positioning pin.

Pressure Plate-and-Lever Assembly



23927

NOTE

This mark indicates that lubricant or sealant must be applied to the part.

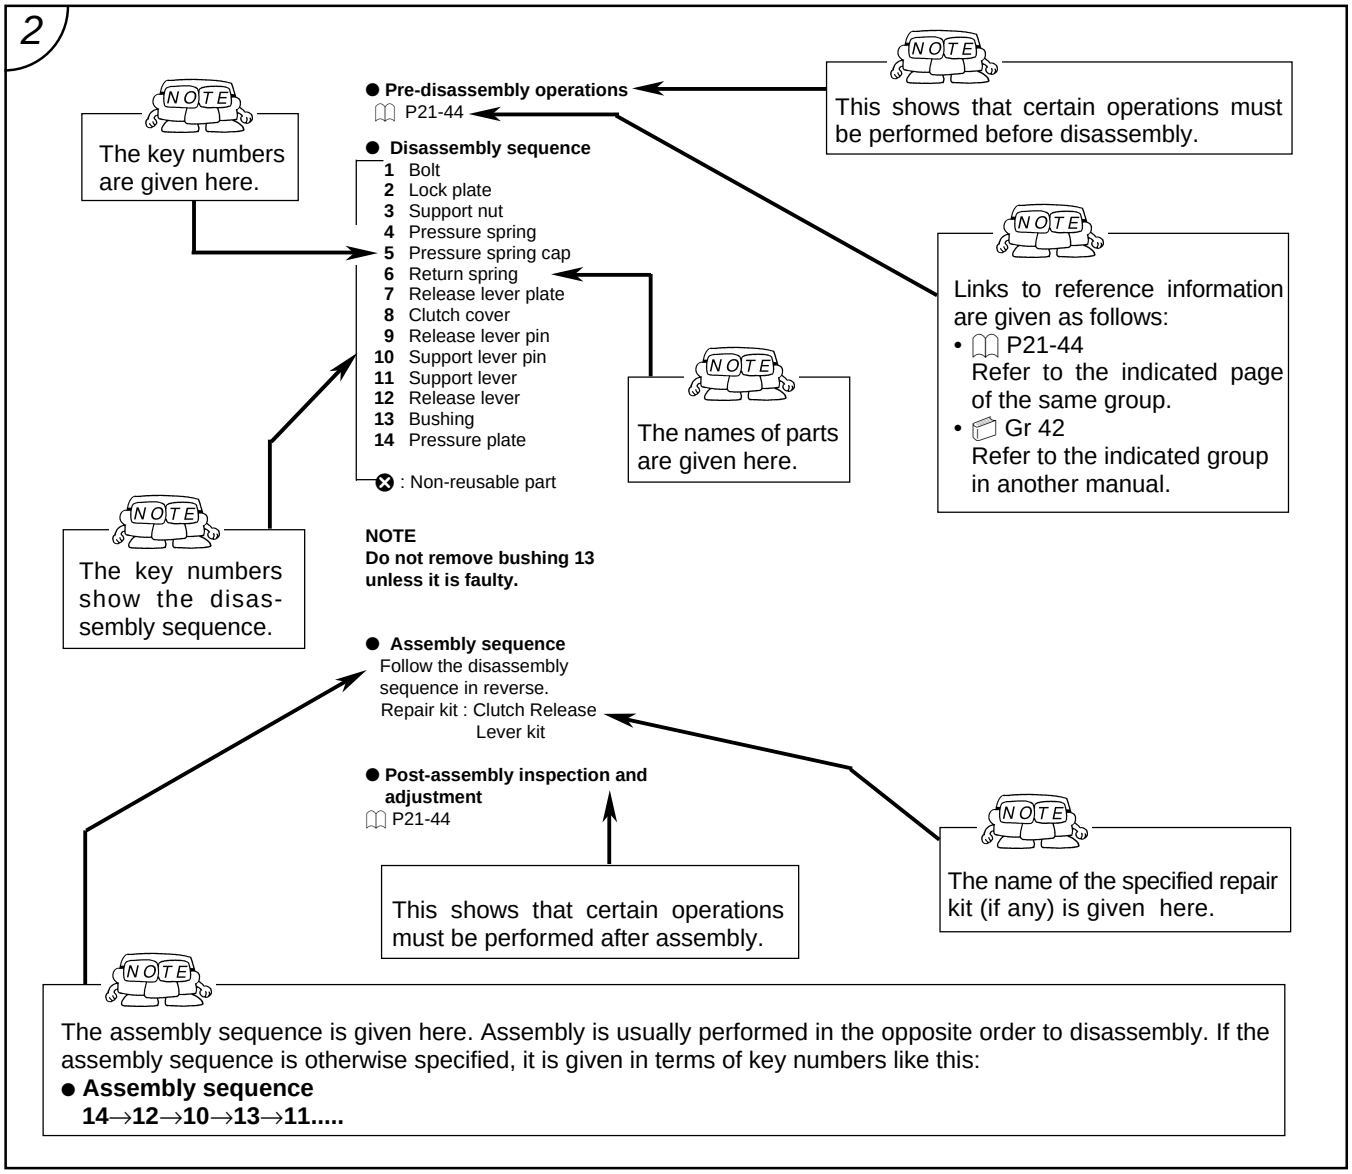
NOTE

This mark indicates that a tightening torque is specified for the part.

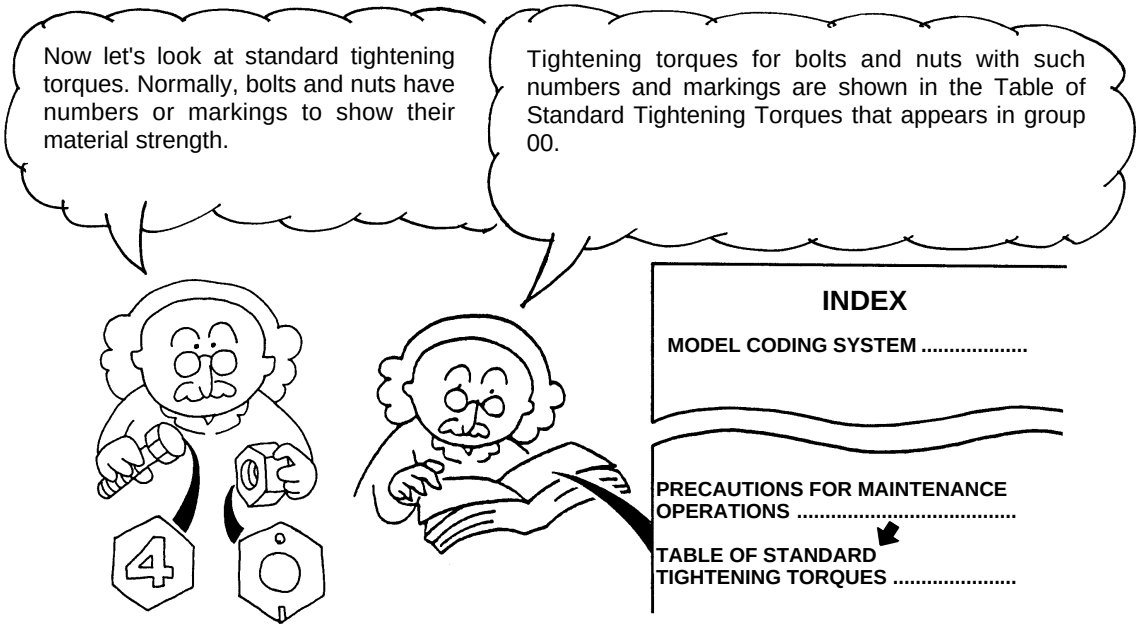
So parts without Ⓣ marks don't have specified tightening torques ?

No, they don't. But every bolt and nut must be tightened to a standard torque. A Ⓣ mark shows either that the part must be tightened to a torque other than the standard torque or that the standard torque cannot be determined from the part's shape or markings.
Standard tightening torques are explained at the bottom of the next page.

23928



2
NOTE
This shows that certain operations must be performed before disassembly.
● Pre-disassembly operations
P21-44
NOTE
The key numbers are given here.
● Disassembly sequence
1 Bolt
2 Lock plate
3 Support nut
4 Pressure spring
5 Pressure spring cap
6 Return spring
7 Release lever plate
8 Clutch cover
9 Release lever pin
10 Support lever pin
11 Support lever
12 Release lever
13 Bushing
14 Pressure plate
: Non-reusable part
NOTE
Links to reference information are given as follows:
• P21-44
Refer to the indicated page of the same group.
• Gr 42
Refer to the indicated group in another manual.
NOTE
The names of parts are given here.
NOTE
The key numbers show the disassembly sequence.
NOTE
Do not remove bushing 13 unless it is faulty.
● Assembly sequence
Follow the disassembly sequence in reverse.
Repair kit : Clutch Release Lever kit
● Post-assembly inspection and adjustment
P21-44
NOTE
The name of the specified repair kit (if any) is given here.
This shows that certain operations must be performed after assembly.
NOTE
The assembly sequence is given here. Assembly is usually performed in the opposite order to disassembly. If the assembly sequence is otherwise specified, it is given in terms of key numbers like this:
● Assembly sequence
14→12→10→13→11.....



Now let's look at standard tightening torques. Normally, bolts and nuts have numbers or markings to show their material strength.
Tightening torques for bolts and nuts with such numbers and markings are shown in the Table of Standard Tightening Torques that appears in group 00.
INDEX

HOW THIS MANUAL IS STRUCTURED

② Service standards

Service standards

Unit : mm {in.}

Location	Maintenance item		Standard value (Basic diameter in [ ])	Limit	Remedy
4	Pressure spring	Installed load (Installed length 49.1 {1.93})	885 N {200 lbf, 90.2 kgf}	750 N {170 lbf,76.7 kgf}	Replace
		Squareness	2.9 {0.11} or less	5.0 {0.20}	Replace
7	Release lever plate height		53.8±0.7 {2.12±0.028}	Relative difference 0.5 {0.020} maximum	Adjust
10, 13	Clearance between release lever pin and bushing		[10 {0.39}] 0.02 to 0.11 {0.00079 to 0.0043}	0.4 {0.016}	Replace
14	Pressure plate	Thickness	23.6±0.1 {0.93±0.0039}	21 {0.83}	Replace
		Flatness	0.05 {0.0020} or less	0.2 {0.0079}	Correct or replace
		Strap bolt hole I.D.	10.2 to 10.25 {0.40 to 0.40}	10.5 {0.41}	Replace

NOTE

Number(s) in this column match the key number(s) on the exploded view ①.

③ Tightening torques

Tightening torque

Unit : N·m {ft.lbs, kgf.m}

Location	Parts to be tightened	Tightening torque	Remarks
1	Bolt (Lock plate mounting)	5.9 to 7.8 {4.3 to 5.8, 0.6 to 0.8}	—

NOTE

Number(s) in this column match the key number(s) on the exploded view ①.

NOTE

If oil or grease must be applied to threads before tightening, the word "Wet" appears in this column.

	Remarks
	Wet

④ Lubricants, fluids and/or sealants

Lubricant

Location	Points of application	Specified lubricant	Quantity
3	Threads and spherical surface of support nut	Anti-seizure compound	As required
7, 12	Sliding surfaces of release lever plate and release lever	Molybdenum disulfide grease [NLGI No.2 (Li soap)]	As required
11, 12	Sliding surfaces of support lever and release lever	Molybdenum disulfide grease [NLGI No.2 (Li soap)]	As required
11, 14	Sliding surfaces of support lever and pressure plate	Molybdenum disulfide grease [NLGI No.2 (Li soap)]	As required

NOTE

Number(s) in this column match the key number(s) on the exploded view ①.

NOTE

The specified types/brand are shown here.

⑤ Special tools

Special tools Unit : mm {in.}

Location	Tool name and shape	Part No.	Application
8	Clutch Installer  01277	MH061051	Removal and installation of clutch cover

NOTE
Number(s) in this column match the key number(s) on the exploded view ①. For any special tool that is not a Mitsubishi genuine part, no illustration is shown; only the part number is given, as shown below.

Special tools

Location	Tool name and shape	Part No.	Application
21	Insertion Tool	*910-24461	Installation of O-ring
32	Retainer	*910-24590	Retention of primary piston

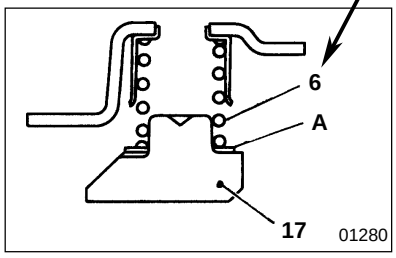
* BOSCH BRAKING SYSTEMS Co. Ltd. product number

⑥ Service procedure

1

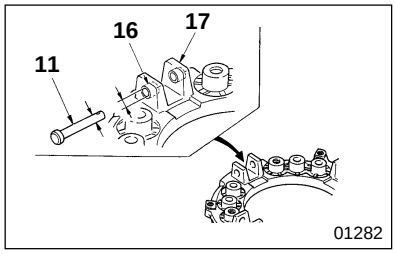
NOTE
Number(s) is this column match the key number(s) exploded view ①.

NOTE
The service procedure gives instructions in order of key numbers.



6 **Installation of pressure spring**
If the pressure plate **17** has been reqround, insert between the pressure plate and pressure spring **6** an adjusting washer **A** whose thickness matches that of the ground off material.

Regrind amount	Thickness and number of washer(s)
Less than 1 mm {0.039 in.}	Not required
1 mm {0.039 in.} (or more) to less than 2 mm {0.079 in.}	1.2 mm {0.047 in.}×1
2 mm {0.079 in.} (or more) to less than 3 mm {0.12 in.}	1.2 mm {0.047 in.}×2 or 2.3 mm {0.091 in.}×1



11 16 **Clearance between release lever pin and bushing**
If the measurement exceeds the specified limit, replace the defective part(s).

NOTE
Perform this check with the bushing 16 press-fitted into the pressure plate 17.

HOW THIS MANUAL IS STRUCTURED

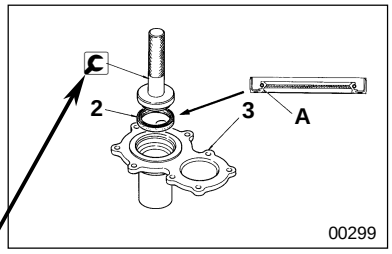
2

Service procedures contain a variety of symbols and other indications. Let's look at some examples.

23931

Key number

[Example 1: Special tools]

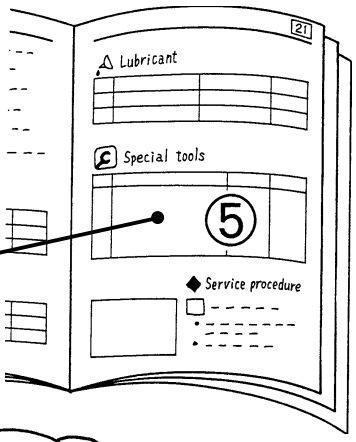


00299

2 Installation of oil seal

- Apply grease to the lip **A** of the oil seal **2**.
- Using the Oil Seal Installer, fit the oil seal **2** into the front bearing retainer **3**. Make sure the oil seal is aligned as illustrated.

Name of special tool



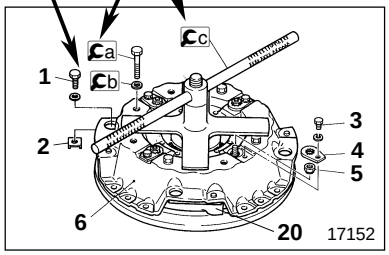
26315

Every special tool is indicated by a symbol. The text of the service procedure also includes the special tool's name. To see the part number and shape of a special tool, find the tool's key number and name in the "Special tools" table ⑤.

23932

If more than one special tool is used, the symbols are supplemented by letters (for example, a, b and c) to enable cross-referencing between the exploded view and service procedure.

20277



17152

6 Removal and installation of clutch cover

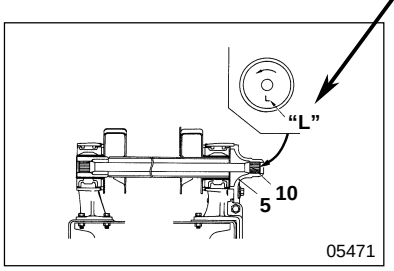
[Removal]

- Compress the pressure spring **8** using the c Clutch Installer, then remove the a Stopper Bolt, b Washer, strap bolt **1**, washer **2**, bolt **3**, lock plate **4** and support nut **5**.
- Gradually loosen the c Clutch Installer until the pressure spring **8** is ineffective, then remove the clutch cover **6**.

3

[Example 2: Identification or mating marks]

NOTE Any mark on an actual part is given in quotation marks " " in the service procedure.

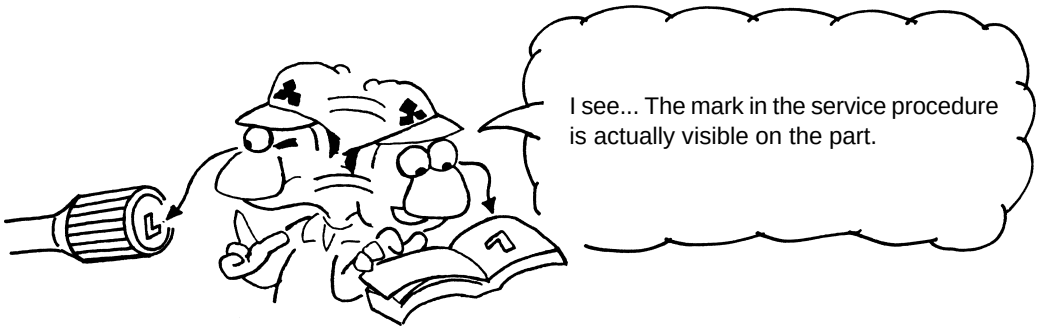


10 Installation of torsion bar

Fit the torsion bar **10** such that the "**L**" identification mark is on the side of the anchor lever **5**.

CAUTION ⚠

Make sure the torsion bar 10 aligned as specified. If the torsion bar is installed the wrong way around, the torsion direction will be reversed, resulting in damage.

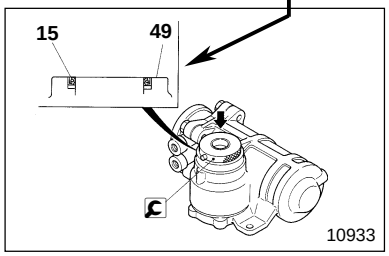


26304

4

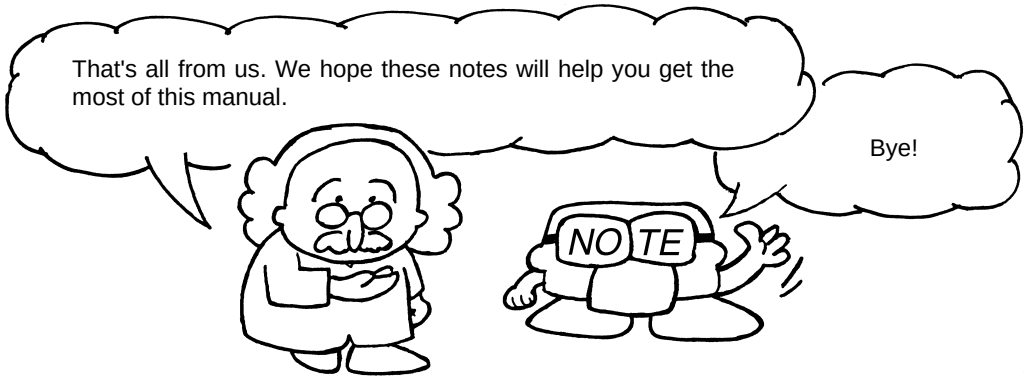
[Example 3 : Alignment of parts]

NOTE All illustrations show the correct alignment/direction of parts relative to each other. Provided the alignment/direction is shown clearly in the exploded view ①, no further explanation is given in the text of the service procedure.



15 Installation of oil seal

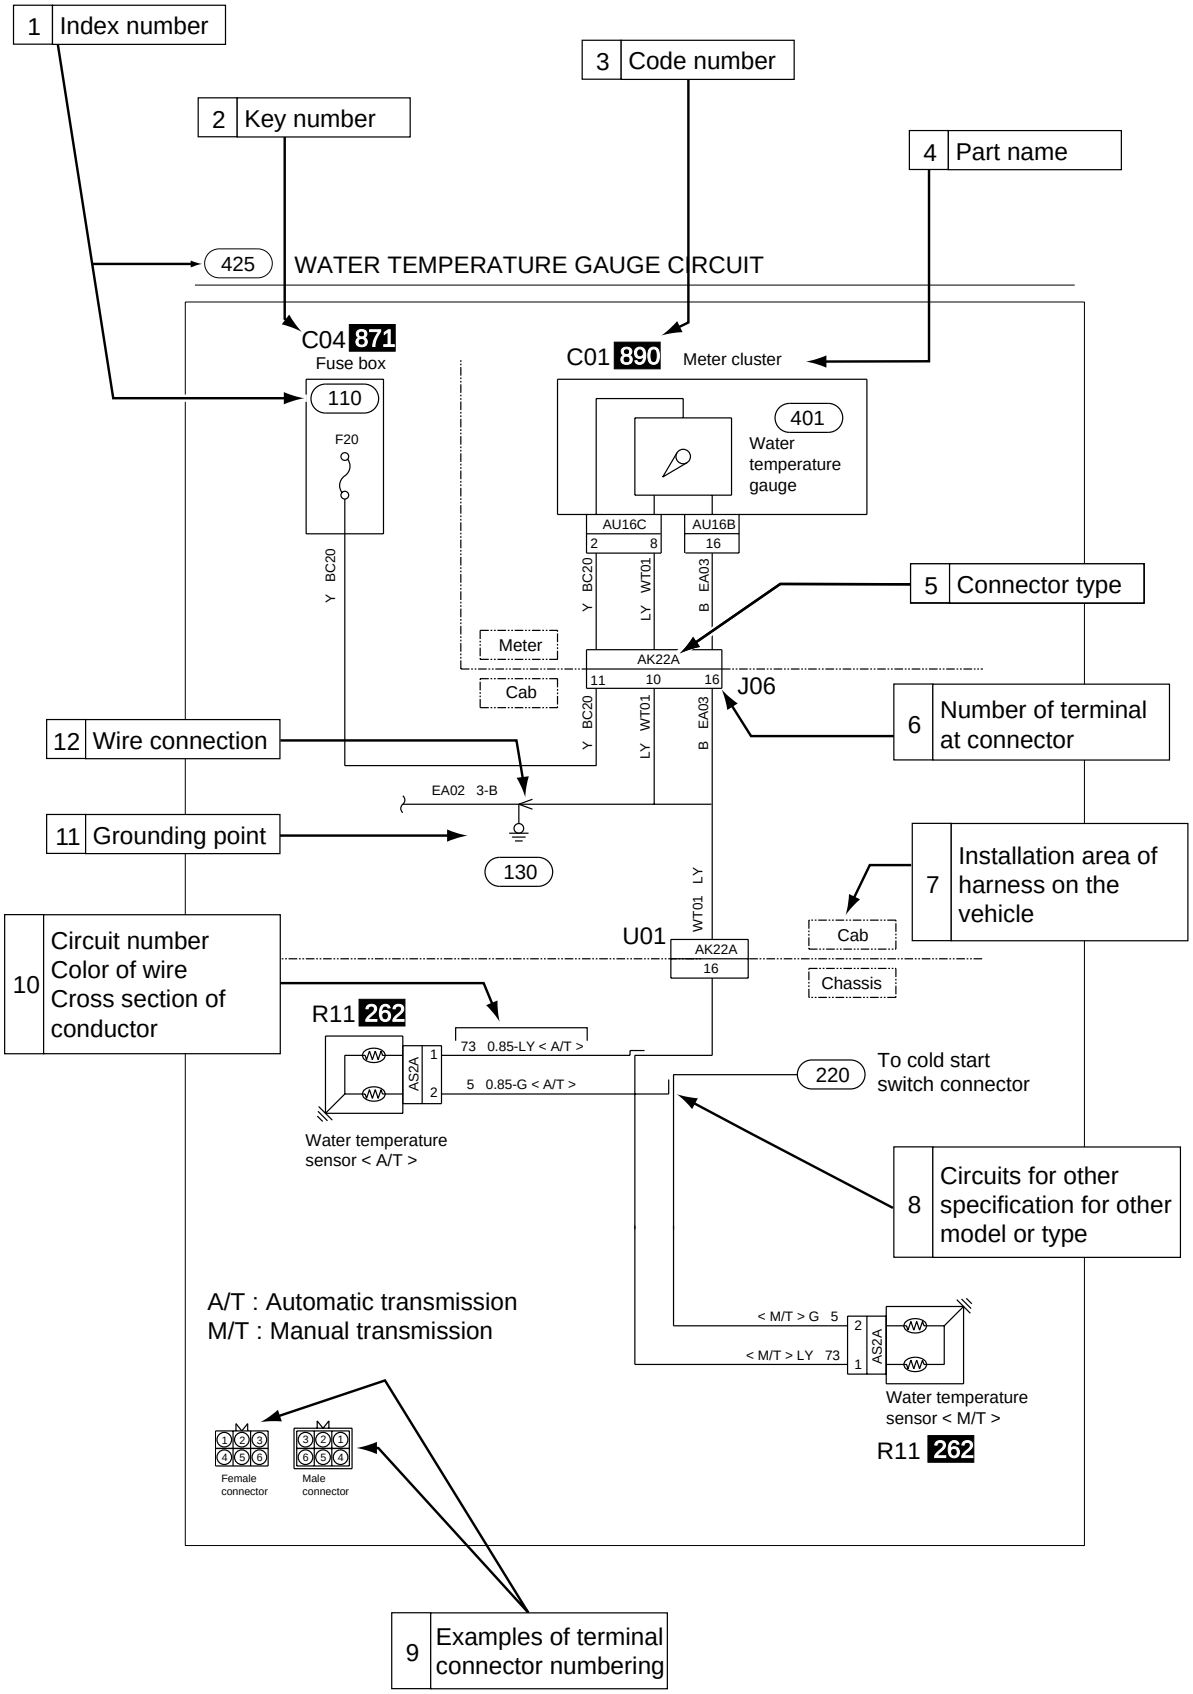
Fit the oil seal **15** into the body **49,** making sure it is aligned as illustrated.



23934

HOW THIS MANUAL IS STRUCTURED

HOW TO READ CIRCUITS (GROUP 54)



Ⓟ45405

1 Index number: (110)

Each circuit has its own Index number respectively and has three digits ((110)).
How to read index number

- By proper using of the index number, it is possible to locate right place immediately since the circuit drawing of this manual book are classified as function by function. (including “POWER CIRCUIT” (110) and “GROUND ” (130) .)
- How to check the location of circuit drawing in each part
  The circuit drawing which can not be diagramed in one page due to its complicated structure (such as meter cluster and electronic control unit etc.), has its remarked index number to be connected to other circuit drawing. ((401) , (910) , etc.)

2 Key number: A01~
Key number is the number to indicate the installation position of the parts, and is shown by A01 ~ Z.
The details of the installation position are described in GROUP 10.

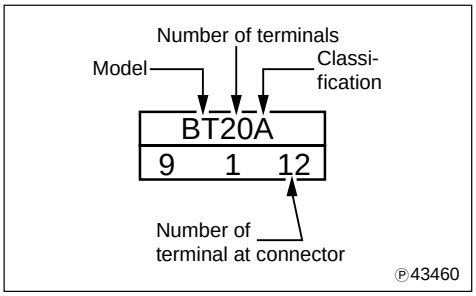
3 Code number: **001** ~

Code number is the number to indicate the one portion of the parts to be checked and has three digits (**001**).
The details of the parts to be checked are described in GROUP 11.

4 Part name

5 Connector type
Connectors are shown by □ without mentioning Male or Female and in the box it is described model of connector, number of terminals and its classification, etc.
Table of connectors is described in GROUP 14.

6 Number of terminal at connector
Terminal numbers of connector are shown by figures in the box.

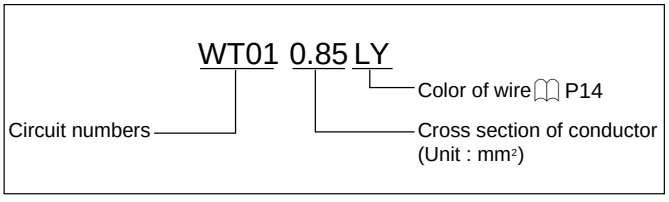


7 Installation area of harness on the vehicle
The location and boundary of the harnesses in the vehicle are shown in the each circuit drawing and it may help to check mounting position of connectors.

8 Circuits for other specification for other model or type

9 Examples of terminal connector numbering
As it is shown, for female connectors, with placing the lock upward then starting to put numbers from the upper left. And when it is male connector, put numbers from the upper right, also with placing the lock upward.

10 Circuit number, color of wire, and cross section of conductor are shown in circuit drawings.



Except for 0.5mm², Wire thickness is described in the circuit drawing. The reason why only wire thickness, 0.5 mm² is not described in the drawings is 0.5mm² is so common and so that the circuit drawing can be seen more easily.
(Examples) 0.5mm²: Y
0.85mm²: 0.85 — LY
3mm²: 3 — B

11 Grounding point
The actual locations of grounding points on the vehicle are shown. Refer to (130) for detailed information.

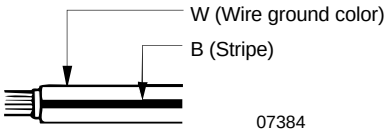
12 Wire connection
When the wires are connected into one point of the harnesses, the circuit drawing shows “Arrow mark”.

CAUTION !
Be careful that direction of the arrow does not show the direction of the electric current flow.

HOW THIS MANUAL IS STRUCTURED

● Wire Colors

Example: WB means a wire whose ground color is white and whose stripe is black.

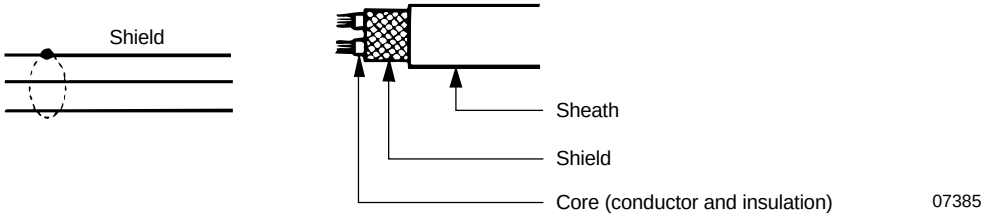


Wire ground color		Wire ground color + Stripe									
W	White	WR	White red	WB	White black	WL	White blue	WG	White green		
B	Black	BW	Black white	BY	Black yellow	BR	Black red				
R	Red	RW	Red white	RB	Red black	RY	Red yellow	RG	Red green	RL	Red blue
Y	Yellow	YR	Yellow red	YB	Yellow black	YG	Yellow green	YL	Yellow blue	YW	Yellow white
G	Green	GW	Green white	GR	Green red	GY	Green yellow	GB	Green black	GL	Green blue
Br	Brown	BrW	Brown white								
L	Blue	LW	Blue white	LR	Blue red	LY	Blue yellow	LB	Blue black	LO	Blue orange
Lg	Yellow green	LgR	Yellow green red	LgY	Yellow green yellow	LgB	Yellow green black	LgW	Yellow green white		
O	Orange										
P	Pink	PB	Pink black								

● Shield Wire

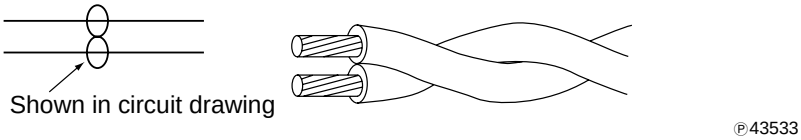
A shield wire is clearly identified as follows:

Example



● Twist wire

Twist wires are made by twisting the core of wires by the constant pitch.
Example:



The terms in this manual are defined as follows.

● This service manual contains important cautionary instructions and supplementary information under the following four headings which identify the nature of the instructions and information:

DANGER⚠ Precautions that should be taken in handling potentially dangerous substances such as battery fluid and coolant additives.

WARNING⚠ Precautionary instructions, which, if not observed, could result in serious injury or death.

CAUTION⚠ Precautionary instructions, which, if not observed, could result in damage to or destruction of equipment or parts.

NOTE Suggestions or supplementary information for more efficient use of equipment or a better understanding.

● **Front and rear**

The terms “front” is the fan side and “rear” the flywheels side of the engine.

● **Left and right**

The terms “right” and “left” shall be used to indicate the side as viewed from the flywheel side of the engine.

● **Terms of service standards**

(1) Standard value

Standard value dimensions in designs indicating: the design dimensions of individual parts, the standard clearance between two parts when assembled, and the standard value for an assembly part, as the case may be.
The figure in [ ] is the basic diameter.

(2) Limit

When the value of a part exceeds this, it is no longer serviceable in respect of performance and strength and must be replaced or repaired.

● **Tightening torque**

Appropriate tightening torque has particular importance in respect of performance. Accordingly, tightening torque is specified in locations that are to be tightened.
Where there is no specified figure for tightening torque, follow the table covering standard tightening torques.
When the item is to be tightened in a “wet” state, wet is indicated. Where there is no indication, read it as dry, and tighten at specified torque.

MODEL CODING SYSTEM

Equipment Model Code

Equipment name	Model description	Code description
Engine		With turbocharger Stands for automobile } These are omitted in the Remodeling sequence } Service Manual Version number Series number Stands for diesel engine No. of cylinders
Clutch		Disc outer diameter Facing material (M : Cera-metallic) Loading capacity of major type (tonnage) Stands for clutch
Transmission		No. of forward speeds Meshing (S : Synchromesh, A : Automatic) Loading capacity of major type (tonnage) Stands for transmission
Propeller shaft		Loading capacity of major type (tonnage) Stands for propeller shaft
Reduction and differential		Teeth shape (H : hypoid gear) Loading capacity of major type (tonnage) Stands for reduction and differential

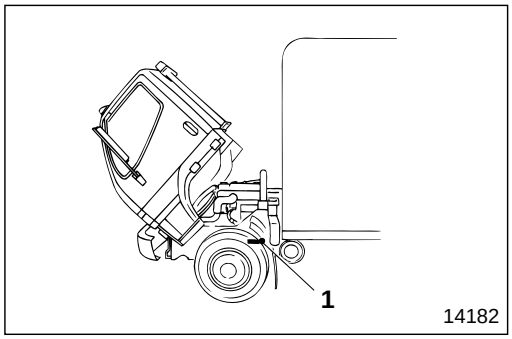
POWER TRAIN TABLE

Model	Engine model	Clutch model	Transmission model	Propeller shaft	Rear axle model	Final reduction and gear ratio
FH210, E, G, H, J, K G. V. W. 8120 kg {17995 lb}	4M50T2 175 HP/2700 rpm 347 ft.lbs/2000 rpm (SAE, Gross)	Torque converter (ø288H)	M035A4 (AISIN A445 3.018/0.703	P4	R040T	D040H 5.571
FH211C G. V. W. 8160 kg {17995 lb}	6D34T2 175 HP/2900 rpm 325 ft.lbs/2000 rpm (SAE, Gross)	C5M33	M050S5 6.875/1.000			D040H 4.111
FH211E, G, H, J, K G. V. W. 8160 kg {17995 lb}			M050S6 6.523/0.803			D040H 4.625
FH211C, E, G, H, J, K G. V. W. 8160 kg {17995 lb}		Torque converter (TC290-1.72)	M4A4 (Allison AT542 or AT545) 3.454/1.000			D040H 4.111

CHASSIS NUMBER AND ENGINE NUMBER/POWER TRAIN LABEL

CHASSIS NUMBER AND ENGINE NUMBER

The serial numbers for chassis and engines are assigned to the respective vehicles and engines in manufacturing sequence: every vehicle and engine has its own numbers. These numbers are required for registration and incidental inspection of the vehicle. Please do not fail to mention these numbers to the dealers when ordering spare parts.



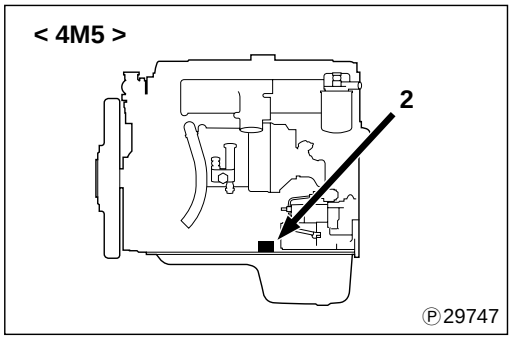
Chassis number

Chassis number **1** is punch-marked on the frame by the left-side front wheel.

Example : FH21□□–□□□□□□

Vehicle model

Chassis number



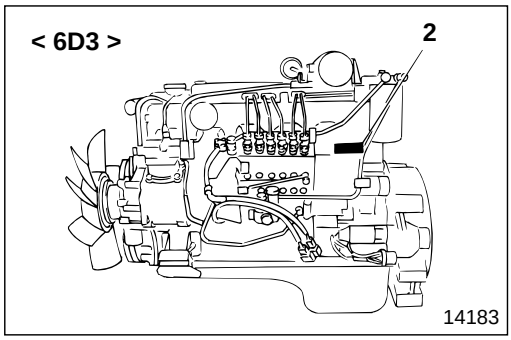
Engine number

Engine number **2** is punch-marked on the left of the crankcase.

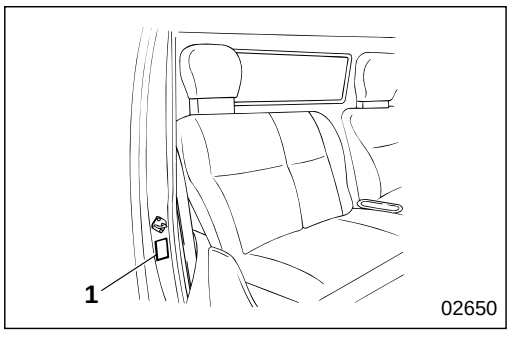
Example : 6D34–□□□□□□

Engine number

Engine model

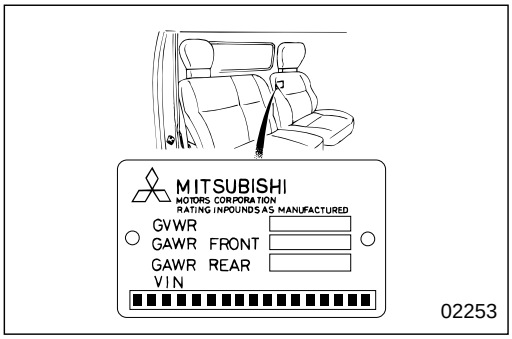


POWER TRAIN LABEL



Power train label **1** located in the position illustrated indicates the vehicle model, chassis number and information relevant to the vehicle's power transmission components.

VEHICLE IDENTIFICATION NUMBER



The vehicle identification number is punch-marked on the plate, which is attached in the position as illustrated.
The vehicle identification number consists of a 17-digit set of alphanumeric characters. Each digit represents the following specifications.

J W 6 C C C 1 G □ 3 □ □ □ □ □ □ □

① ② ③ ④ ⑤ ⑥ ⑦ ⑧ ⑨ ⑩ ⑪ ⑫

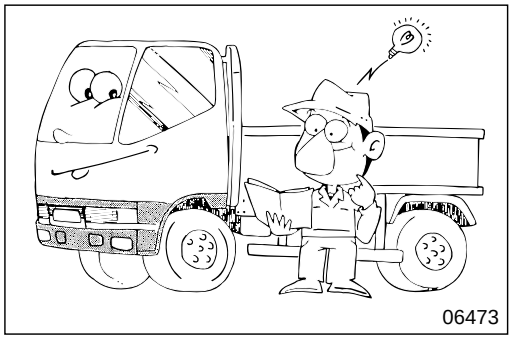
PRECAUTIONS FOR MAINTENANCE OPERATION

DANGER⚠

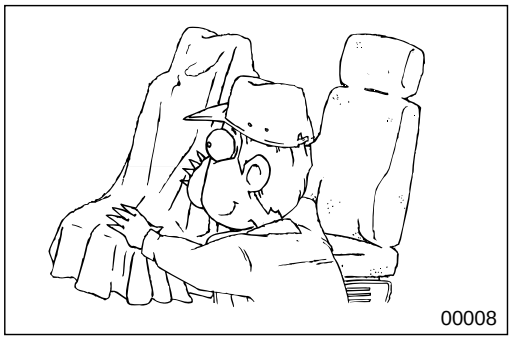
This product contains or emits chemicals known to the State of California to cause cancer and birth defects or other reproductive harm.

In order to determine the condition of the vehicle adequately, attend the vehicle beforehand to find and keep record of the accumulated mileage, operating condition, what the customer's demand is, and other information that may be necessary. Prepare the steps to be taken and perform efficient and wasteless maintenance procedure.



06473

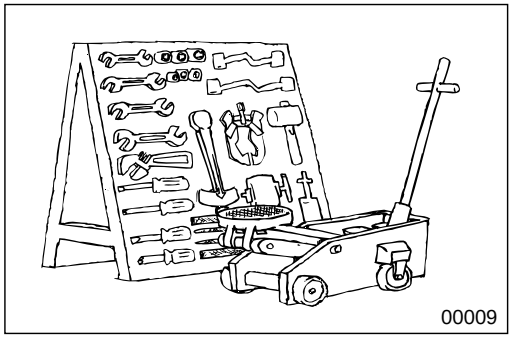
Determine where the fault exists and check for the cause to see whether removal or disassembly of the part is necessary. Then follow the procedure specified by this manual.



00008

Perform maintenance work at a level area.
Prepare the following.

- To prevent the seats, upholstery, floor and bodywork from being spoiled or scratched, cover with workshop sheet cover(s).

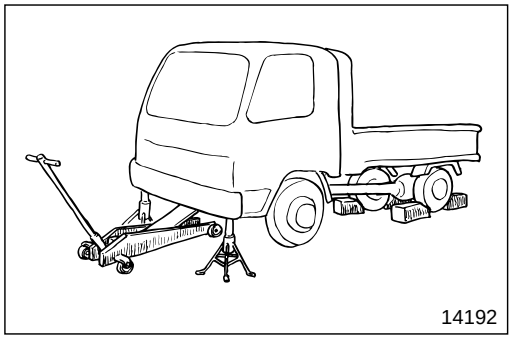


00009

- Prepare general and special tools necessary for the maintenance work.

WARNING⚠

Do not attempt to use tools other than special tools where use of special tools is specified in this manual. This will avoid injury or damage.



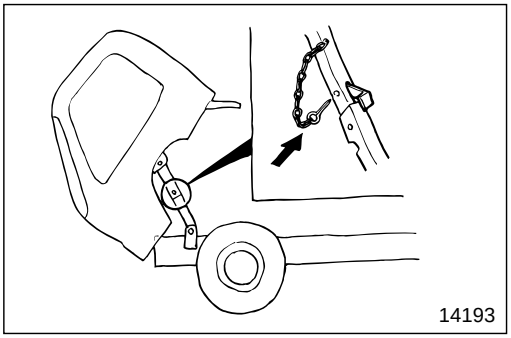
14192

When jacking up the vehicle to work under the vehicle, carry out the following preparatory work:

- Chock the wheels on both sides.
- Jack up the vehicle using a garage jack.
- Support the frame on rigid racks.

WARNING⚠

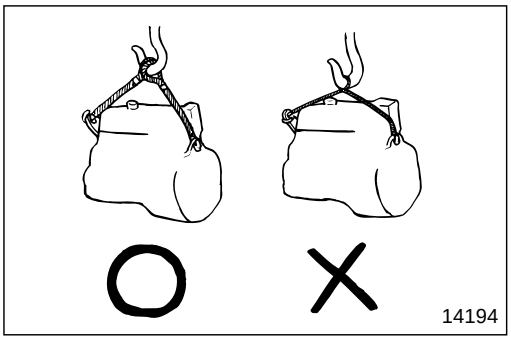
- **Chock the wheels securely so the vehicle does not move.**
- **Do not remove the chocks until the entire operation is completed.**
- **Supporting a vehicle on a garage jack only is extremely dangerous, so always support the frame on rigid racks.**
- **Leave the garage jack and rigid racks in place until the entire operation is completed. Never remove them during the operation.**



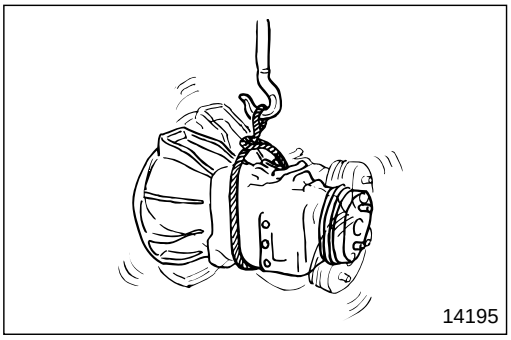
When tilting the cab, be sure to insert the safety pin into the cab stay so that the cab stay remains locked and is not released when the cab is tilted.

Pay special attention to safety when removing or installing heavy items such as engines, transmissions and axles.

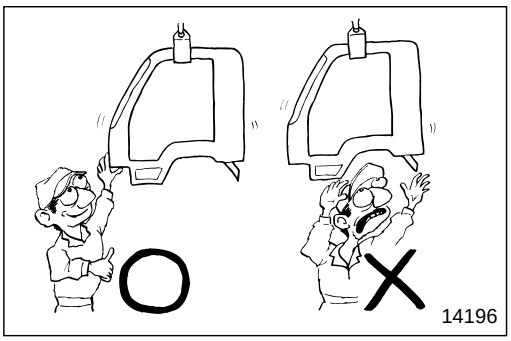
When lifting up heavy items using cables, pay special attention to the following points:



- Check the mass of the item to be lifted and use a cable capable of lifting that mass.

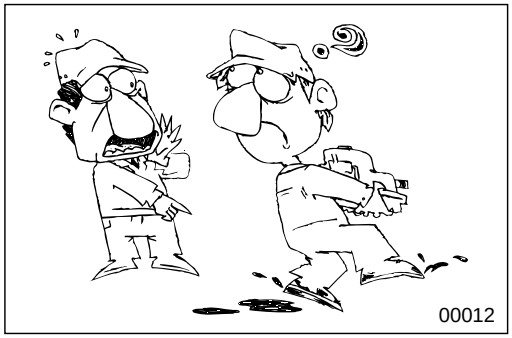


- If you do not have the specified lifting hanger, secure the item using cable taking the point-of-balance of the item into consideration.

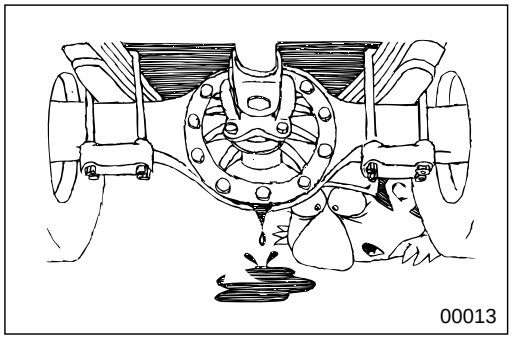


- You must work in a position where you will not be injured even if the cable comes undone and the lifted item falls.

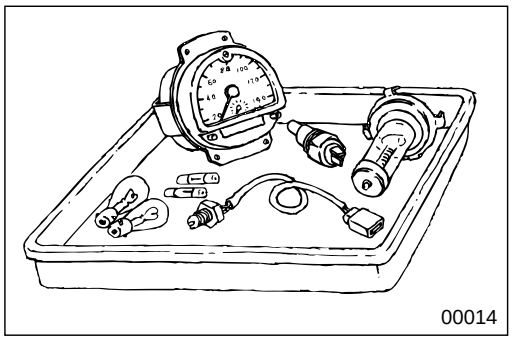
PRECAUTIONS FOR MAINTENANCE OPERATION



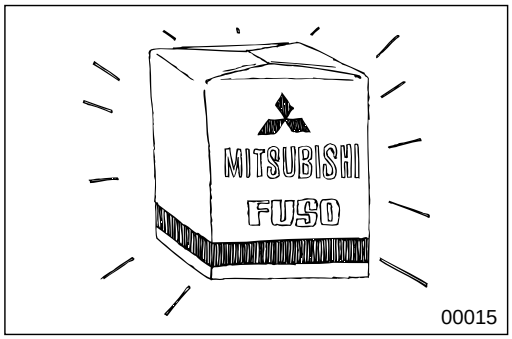
Be particularly careful not to work in shoes that have oily soles and are slippery. When working as a team of two or more, arrange signals in advance and keep confirming safety. Be careful not to accidentally bump switches or levers.



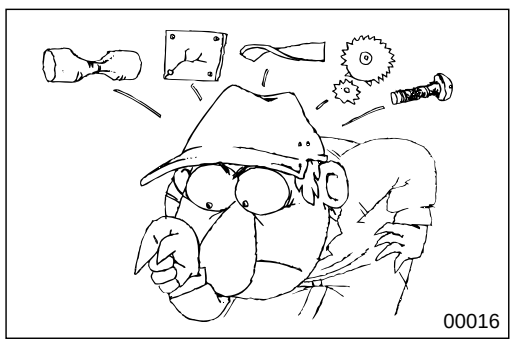
Check for oil leakage before cleaning the area having the fault otherwise you might miss detecting the leakage.



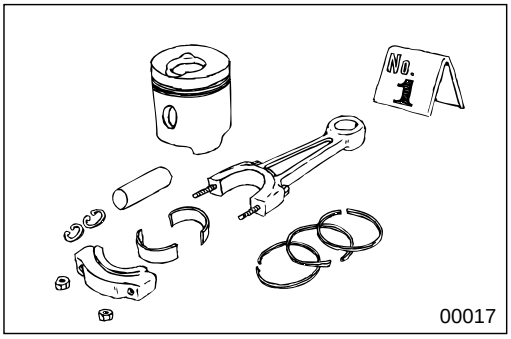
Prepare replacement part(s) beforehand.



Replace oil seals, packing, O-rings and other rubber parts; gaskets and split pins with new parts whenever any of them has been removed. Use only genuine MITSUBISHI replacement parts.



On disassembly, visually inspect all parts for wear and tear, cracks, damage, deformation, degradation, rust, corrosion, smoothness in rotation, fatigue, clogging and any other possible defect.

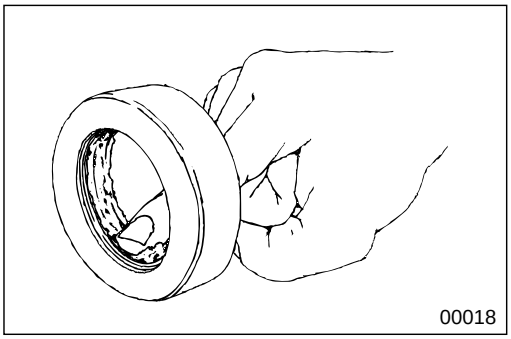


00017

Put alignment marks on part combinations before disassembly and arrange the disassembled parts neatly. This will help avoid mismating of the parts later.
Put the alignment marks, punch marks, etc. where performance and appearance will not be affected.
Cover the area left open after removal of parts to keep it free from dust.

CAUTION⚠

- **Take care to avoid mixing up numerous parts, similar parts, left and right, etc.**
- **Keep new parts for replacement and original (removed) parts separate.**

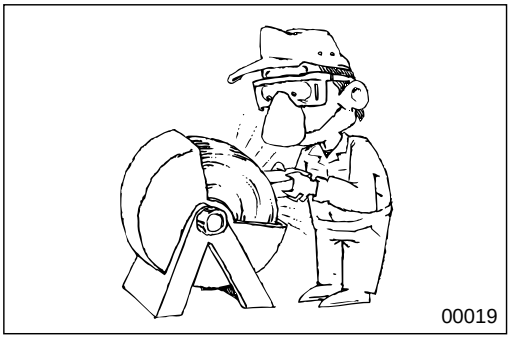


00018

Apply the specified oil or grease to U-packings, oil seals, dust seals and bearings during assembly.
Use only the specified oil, grease, etc. for lubricant, remove the excess immediately after application with a piece of waste, etc.

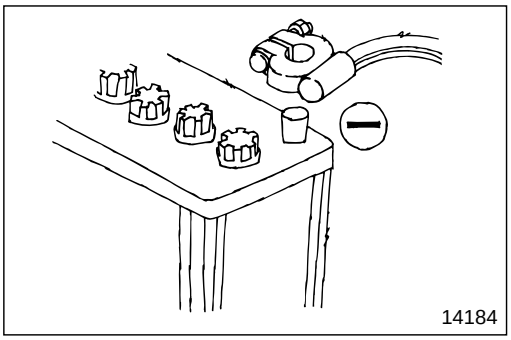
CAUTION⚠

When the specified lubricant, fluid and sealant is not available, you may use an equivalent.



00019

Wear goggles when using a grinder or welder. Pay full attention to safety by wearing gloves when necessary. Watch out for sharp edges, etc. that might injure your hands or fingers.



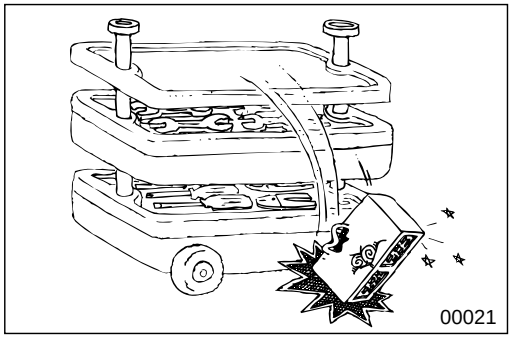
14184

Before carrying out maintenance work on the electric system, disconnect the negative terminals of the batteries to prevent them from short-circuiting and burning-out.

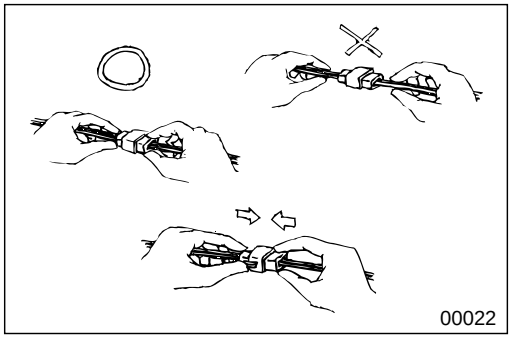
CAUTION⚠

Be sure to turn starter and lighting switches, etc. off before disconnecting or connecting battery terminals, because the semiconductors can be damaged.

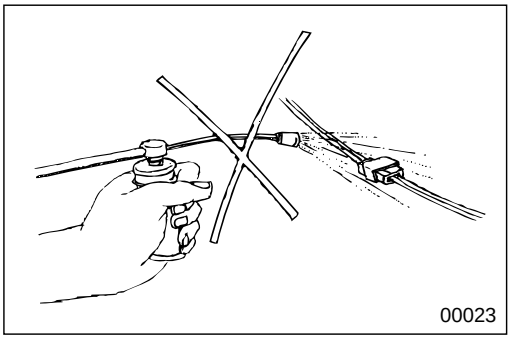
PRECAUTIONS FOR MAINTENANCE OPERATION



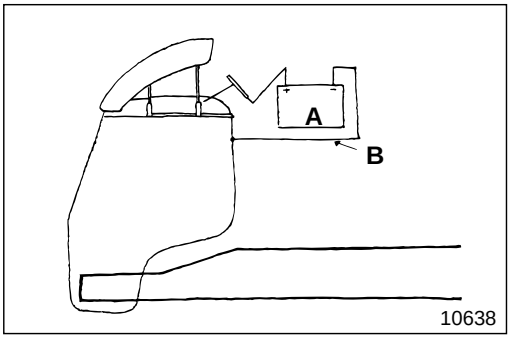
Take care when handling sensors, relays, etc. which are vulnerable to shock and heat. Do not attempt to remove the cover from, or apply paint to, the electronic control unit.



Pull the connector, and not the harness lead, to separate connectors. To separate a lock-type connector, first push toward arrow mark. To reconnect a lock-type connector, press the separated parts until they click together.



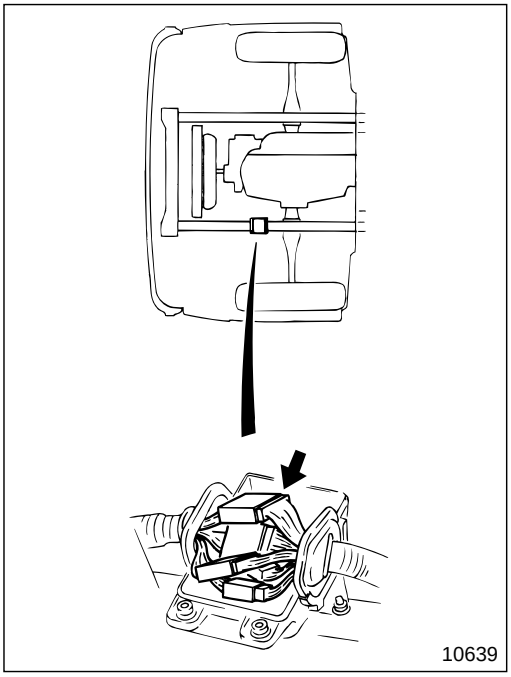
When washing the vehicle, cover the electric system parts and instruments with waterproof material beforehand (Cover with vinyl sheet or the like). Keep water away from harness wire connectors and sensors. If any of them should get wet, wipe them off immediately.



When using an electric welder, such electronic parts that are directly connected to the batteries might be damaged due to the flow of current from the welder that flows through the negative circuit. Parts that have switches might be subject to the same danger if the switches are left on. Therefore, do not fail to observe the following.

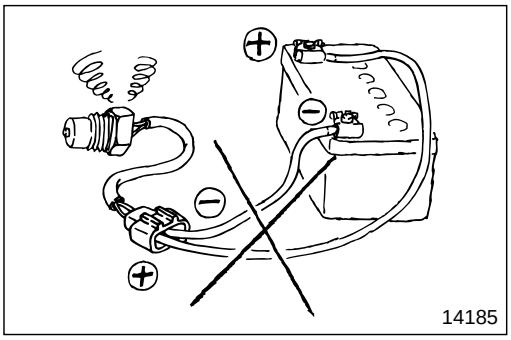
A : Welder

B : Connect the negative terminal of the welder as near as possible to the area that is to be welded.



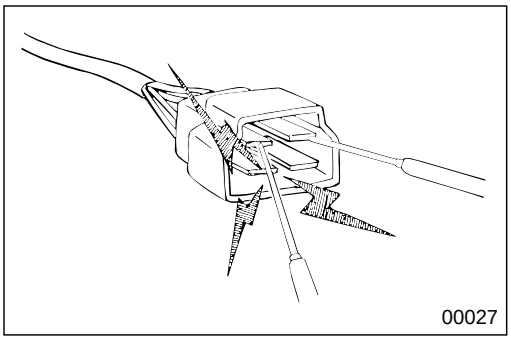
10639

- Disconnect the negative terminals of batteries.
- Disconnect connections between the cab harness wires and the chassis harness wires.



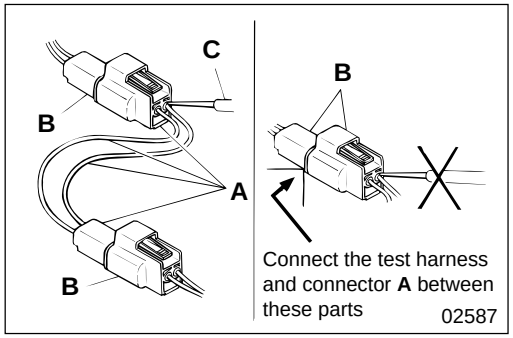
14185

To apply voltage for testing, check that the positive and negative cables are connected properly, then increase voltage gradually from 0 volt. Do not apply voltage higher than the specified value.
In particular, pay close attention to the electronic control unit and sensors, since they are not always fed the battery voltage.



00027

When using testers or the like for continuity tests, be careful not to allow test probes to touch the wrong terminals.



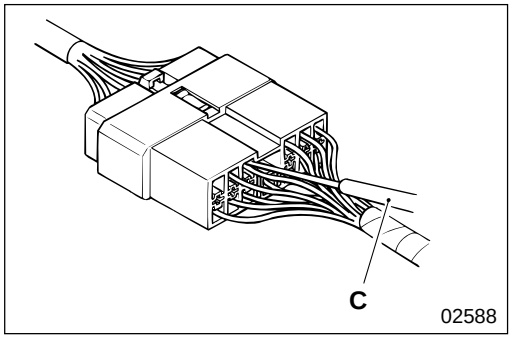
Measurement procedures using connectors

- **Test with connectors engaged (continuity through circuit obtained)**

  < Waterproof connector >

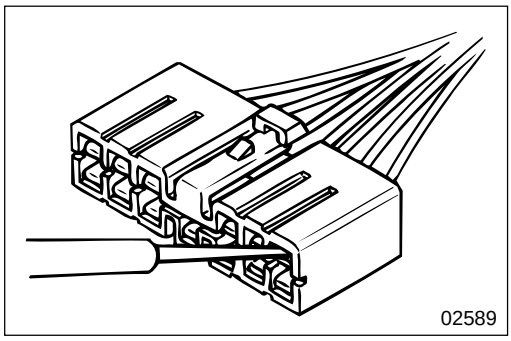
  Prepare a test harness and connectors **A**, then connect if between the two parts of harness **B** that is to be tested. Check the circuit by touching test probe **C** to the test connector.

  Never insert the test probe from the harness side of the waterproof connection, or waterproof performance might be diminished causing corrosion of the connector.



< Non-waterproof connector >

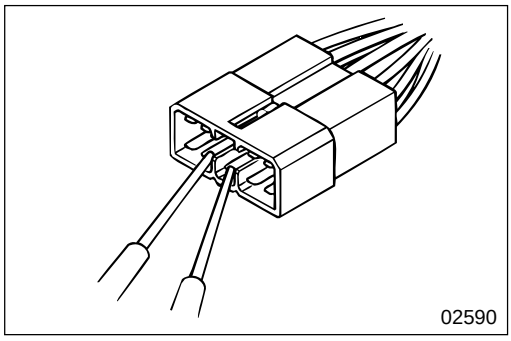
Insert test probe **C** from the harness side of the connector. Where control units, etc. have connectors that are too small to accept the test probe, do not force the test probe into them.



- **Test with connectors disengaged**

  Using female pins

  Insert a test probe into a terminal. However, do not force the probe into the terminal, or it will cause a poor contact.

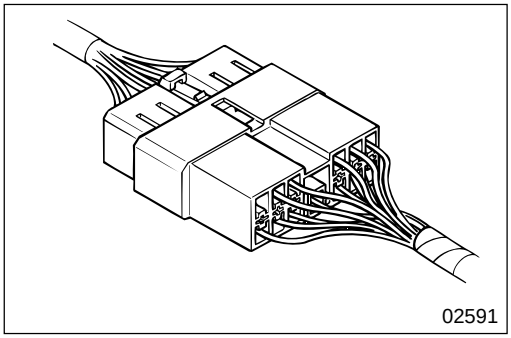


Using male pins

Touch the pins directly using test probes.

CAUTION⚠

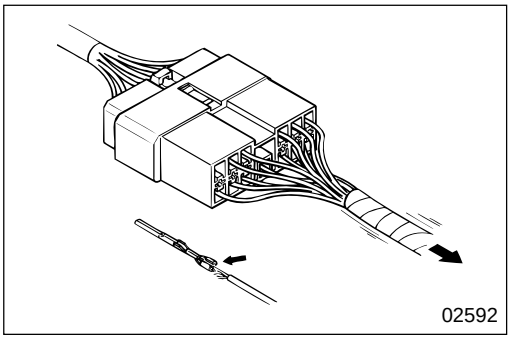
Be sure that you do not short circuit the connector pins when you use the test probe because this could damage the internal circuit of the electronic control unit.



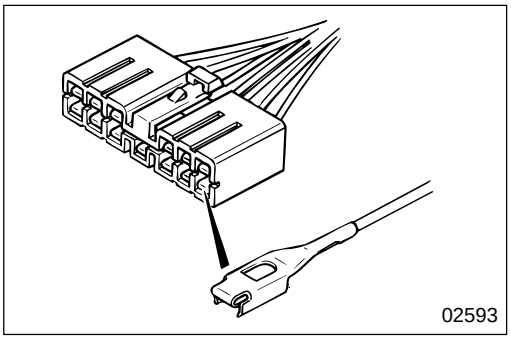
Connector inspection procedures

- **Visual inspection**

  Check for loose connection and poor engagement.

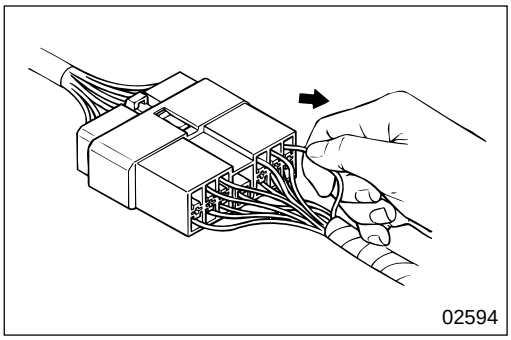


Check if harnesses are broken by pulling gently around the terminals.



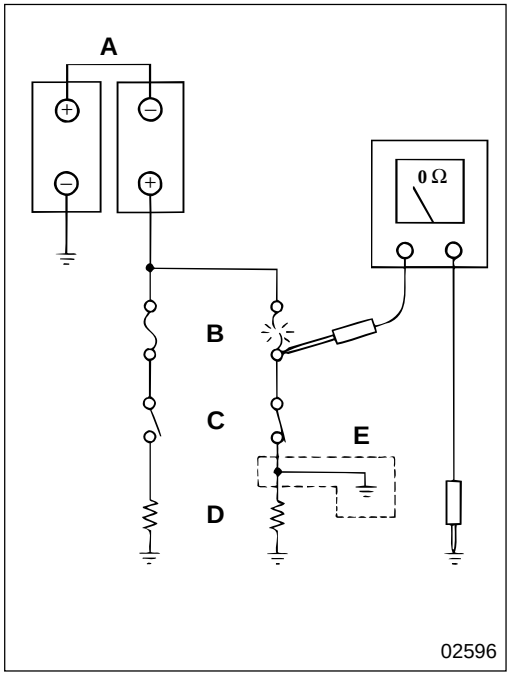
Check for a decrease in contact pressure between the male and female terminals.

Check for poor contact caused by connector pins having fallen out, rusted terminals or foreign particles.



- **Connector pin fall out inspection**

  Damaged connector pin stoppers can cause poor engagement of the terminals (male and female pins) even if the connector body is secured, and might cause some pins to fall out. Check if the pins have fallen out from the connector by pulling each harness gently.

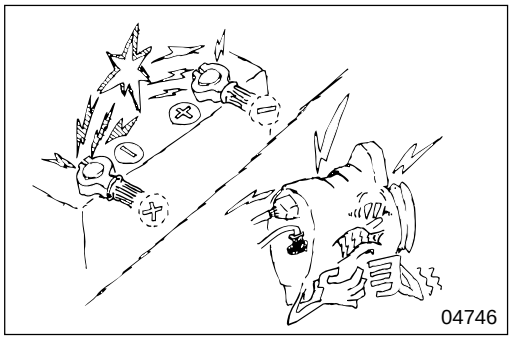


Inspection procedures for blown fuses

Remove fuse **B** and measure resistance between the loaded side of the fuse and ground.
Turn on all circuit switches (connected to the fuse). If the resistance value reading is approximately 0 Ω, a short has occurred between the switch and the loaded point. A value of other than zero may indicate that the fuse was blown by a temporary short but the short is no longer present.

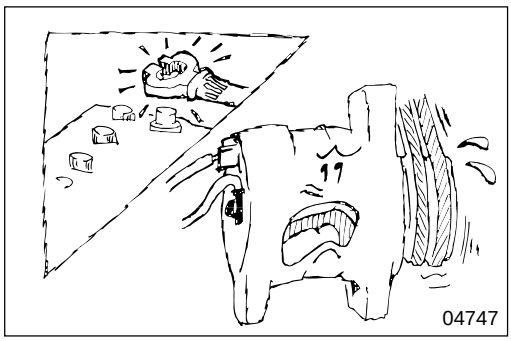
The major causes of a short circuit are as follows:
- Harness stuck onto the vehicle body.
- Harness sheath damaged by friction or heat.
- Water in connectors or circuits.
- Mistakes (accidental short circuits)

  A : Battery
  B : Fuse
  C : Loaded switch
  D : Load
  E : Short circuit

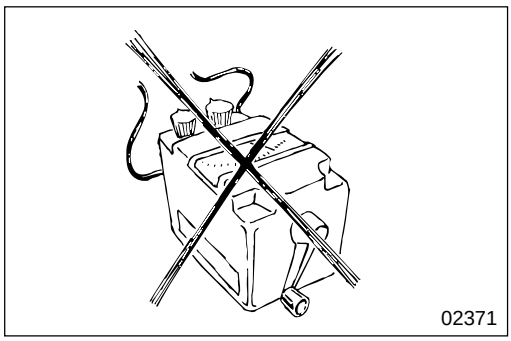


Precautions for handling alternator

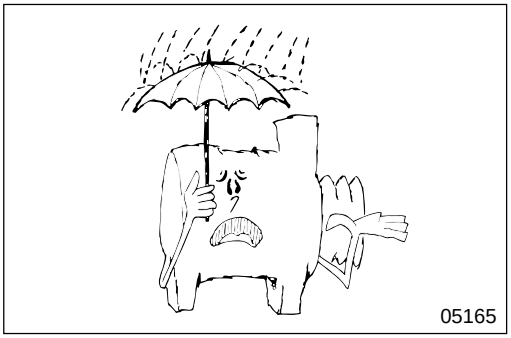
When servicing the alternator, pay attention to the following :
- Do not connect the alternator with battery polarities reversed.
  If the alternator is connected with reversed polarities, a large current flow from the battery to the alternator occurs, and the diode or regulator might be damaged.



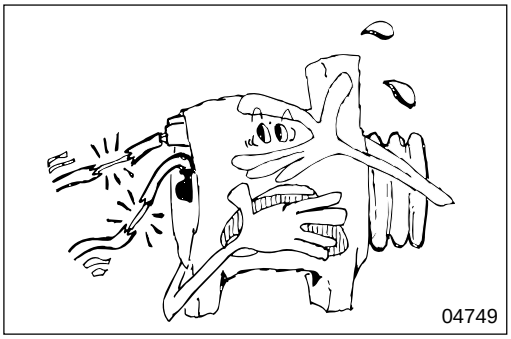
- While the engine is running, do not remove the battery terminals. If the battery terminals are removed at that time, a surge voltage is generated and the diode or regulator might be weakened.



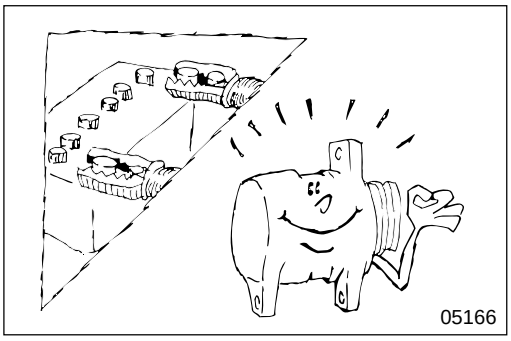
- Do not use a high-voltage tester such as a megger for inspection.
  If a high-voltage tester is used, the diode or regulator might be destroyed.



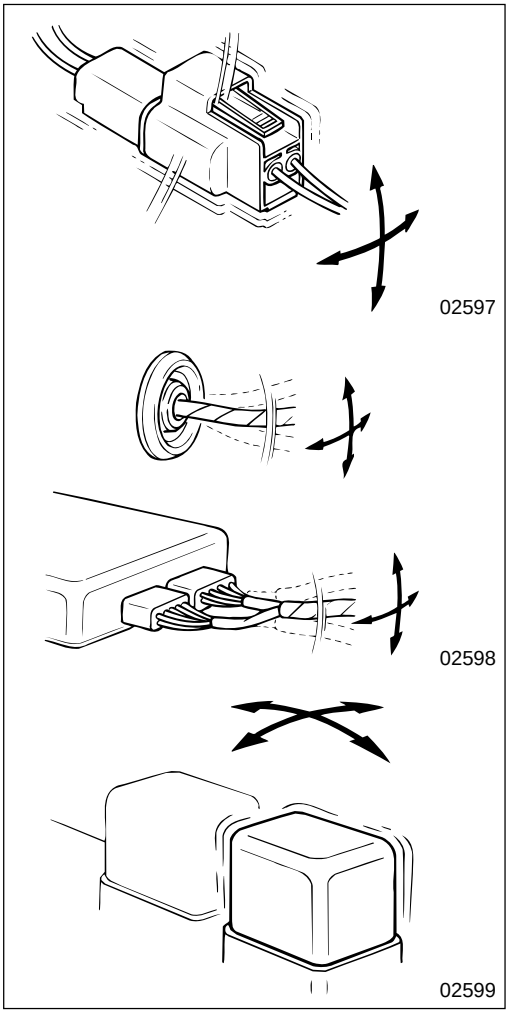
- Do not splash water over the alternator.
  If water is directly splashed over the alternator, individual components will be short-circuited and might be destroyed.



- Do not short-circuit terminal **B** and terminal **L** while running the alternator.
  If the terminals are short-circuited while the alternator is running, the diode trio might be destroyed.



- Disconnect the battery terminals before quick-charging the battery. Quick-charging without disconnecting the battery terminals might damage the diode or regulator.



Measures for temporary faults

Temporary faults often occur under certain conditions. So identifying those conditions helps to find possible causes. To find the conditions under which temporary faults occurred, you need to reproduce the faults after interviewing customers in detail about actual driving conditions, weather, frequency of occurence and fault phenomena.
Then determine if the faults were caused by vibration, temperature or other possible elements depending on the actual conditions identified.
If vibration is suspected as a possible cause, inspect individual connectors as follows to check if the fault will occur:

- Shake the connector gently in all four directions of the arrows as illustrated.
- Shake the wiring harness gently in all four directions of the arrows as illustrated.
- Wiggle each sensor or piece of equipment by hand.
- Gently shake the wiring harnesses near movable parts such as suspensions.

The inspection subjects include possible causes related to the diagnosis code outputs and faults, as well as the connectors and other parts in the inspection procedure.

M E M O

TABLE OF STANDARD TIGHTENING TORQUES

- Use specified bolts and nuts and tighten them at specified torques according to the following table, unless otherwise specified.
- Threads and contact seats shall be dry.
- Where there is a difference in strength classification between the nut and bolt (or stud bolt), the torque specified for the bolt shall apply.

Hex-head Bolt and Stud Bolt

Unit : N·m {ft.lbs, kgf·m}

Strength classification	4 T		7 T		8 T

HOW TO READ THE MAINTENANCE SCHEDULE TABLES 01- 2

MAINTENANCE SCHEDULE TABLES 01- 3

MAINTENANCE OPERATIONS

- Replacement of Oil Filter 01- 8
- Replacement of Fuel Filter 01- 10
- Draining of Water Separator Condensation 01- 12
- Cleaning of Fuel Feed Pump Gauze Filter < 6D3 > 01- 12
- Bleeding of Air from Fuel Line 01- 13
- Adjustment of V-Ribbed Belt Tension < 4M5 > 01- 14
- Adjustment of V-Belt Tension < 6D3 > 01- 16
- Cleaning and Replacement of Air Cleaner Element 01- 18
- Inspection of Clutch Pedal Free Play 01- 19
- Tire 01- 19
- Inspection of Brake Pedal Free Play 01- 25
- Inspection of Clearance between Brake Pedal and Floor Panel 01- 25
- Inspection of Brake Lining Thickness 01- 26
- Battery 01- 26
- Fuse 01- 29

LUBRICATION TABLES 01- 31

LUBRICATION

- Engine Oil 01- 32
- Clutch Fluid (Brake Fluid) 01- 36
- Manual Transmission Gear Oil 01- 38
- Automatic Transmission Fluid < FH210 > 01- 39
- Automatic Transmission Fluid and Oil Filter < FH211 > 01- 41
- Rear Axle Gear Oil 01- 44
- Power Steering Fluid 01- 45
- Brake Fluid 01- 47
- Greasing Various Areas of Chassis 01- 52

HOW TO READ THE MAINTENANCE SCHEDULE TABLES

Example Table :

*1 : 30000 km/18000 miles or 6 months, whichever occurs first.
*2 : 60000 km/36000 miles or 12 months, whichever occurs first.
Ⓔ : Exhaust emission items
Ⓝ : Noise control items

Inspection and maintenance (1)		Time of inspection and maintenance (2)					Working procedures (3)	Remarks (4)
		Pre-operation checks	New vehicle at 4000 km/2500 miles	Inspection interval: Every 10000 km/6000 miles	Inspection interval: Every 30000 km/18000 miles *1	Inspection interval: Every 60000 km/36000 miles *2		
ENGINE								
1	Air, fuel, oil or coolant leaks from engine			×			Check engine for air, fuel, oil and coolant leaks	Gr 11, 12, 13, 14
2	Ⓔ Ⓝ Engine starting performance, speed, noise and exhaust gas conditions			×			Check for engine starting performance, idling speed, abnormal engine noise, black smoke or other abnormal exhaust gas during idling and acceleration. Check engine speed on tachometer	Gr 11, 13, 15
3	Retightening of inlet and exhaust manifold bolts					×	Check manifold bolts for looseness	Gr 15
4	Ⓔ Valve clearance		×			×	Check valve clearance with feeler	Gr 11
5				Every 20000 km /12000 miles			Replace element	

(1) This column contains the maintenance and inspection items.
(2) The periods between inspection and service are based on the assumption that the vehicle will be driven approximately 60000 kilometers (36000 miles) per year.
Inspections which must be made are indicated by an "×" or by the appropriate period between servicing.
(3) This column provides a simplified explanation of the operational procedures involved for each inspection or maintenance item.
(4) The Gr. No. refers to the "group number" in this vehicle Service Manual. For visual checks and simple inspections, see the sections labelled "Working Procedures".

< 4M5 >

Ⓔ : Exhaust emission items
Ⓝ : Noise control items

	Inspection and maintenance	Time of inspection and maintenance: New vehicle at 4000 km/2500 miles	Inspection interval: Every 10000 km/6000 miles	Every 20000 km/12000 miles	Every 30000 km/18000 miles	Every 40000 km/24000 miles	Every 50000 km/30000 miles	Every 90000 km/54000 miles	Every 250000 km/150000 miles	Working procedures	Remarks
ENGINE											
1	Manifold bolts and nuts torque						×			Check inlet and exhaust manifold bolts and nuts for looseness	Gr 15A
2	Ⓔ Check and adjust valve clearance	×					×			Check valve clearance with feeler gauge	Gr 11A
3	Ⓔ Oil filter replacement		Every 10000 km/6000 miles or 12 months							Replace oil filter	P01-8
4	Ⓔ Injection nozzle Ⓝ							×	×	Check and clean injection nozzle	Gr 13A
5	Ⓔ Fuel filter replacement		Every 20000 km/12000 miles or 12 months							Replace fuel filter	P01-10
6	Ⓔ Fuel line		Every 20000 km/12000 miles or 12 months							Inspect fuel tank, cap and lines for damage causing leakage	Gr 13A
7	Ⓔ V-ribbed belts or V-belts tension and Ⓝ damage		Every 10000 km/6000 miles or 12 months							Inspect V-ribbed belt or V-belts for cracks, wear and tension	P01-14
8	Ⓔ Cooling system			×						Check radiator and radiator cap for sealing performance and mounting condition. Inspect hoses for looseness, deterioration, damage causing leakage. Remove dust and foreign deposits from radiator and intercooler front	Gr 14A
9	Coolant replacement		Every 24 months							Replace coolant	Gr 14A
10	Ⓔ Turbocharger rotor play								×	Check turbocharger rotor play	Gr 15A
11	Air cleaner element		Every 5000 km/3000 miles							Clean air cleaner element by blowing clean compressed air	P01-18
12	Ⓔ Air cleaner element Ⓝ replacement					×				Replace air cleaner element	Gr 15A
13	Ⓔ Exhaust system Ⓝ			×						Inspect exhaust system for damage, corrosion and loose connection causing leakage	Gr 15A

MAINTENANCE SCHEDULE TABLES

< 6D3 >

*1 : 30000 km/18000 miles or 6 months, whichever occurs first.
*2 : 60000 km/36000 miles or 12 months, whichever occurs first.
Ⓔ : Exhaust emission items
Ⓝ : Noise control items

Inspection and maintenance		Time of inspection and maintenance					Working procedures	Remarks
		Pre-operation checks	New vehicle at 4000 km/2500 miles	Inspection interval: Every 10000 km/6000 miles	Every 30000 km/18000 miles *1	Every 60000 km/36000 miles *2		
ENGINE								
1	Air, fuel, oil or coolant leaks from engine			×			Check engine for air, fuel, oil and coolant leaks	Gr 11B, 12B, 13B, 14B
2	Ⓔ Ⓝ Engine starting performance, speed, noise and exhaust gas conditions			×			Check for engine starting performance, idling speed, abnormal engine noise, black smoke or other abnormal exhaust gas during idling and acceleration. Check engine speed on tachometer	Gr 11B, 13B, 15B
3	Retightening of inlet and exhaust manifold bolts					×	Check manifold bolts for looseness	Gr 15B
4	Ⓔ Valve clearance		×			×	Check valve clearance with feeler gauge	Gr 11B
5	Ⓔ Oil filter replacement			Every 20000 km/12000 miles On new vehicles, replace the first filter at 10000 km/6000 miles			Replace element	P01-8
6	Ⓔ Ⓝ Check injection nozzles			Every 90000 km/54000 miles			Check and clean of injection nozzles	Gr 13B
7	Ⓔ Ⓝ Fuel injection pressure and spray pattern of injection nozzles			Every 250000 km/150000 miles			Remove injection nozzle and check with nozzle tester	Gr 13B
8	Ⓔ Ⓝ Fuel injection timing					×	Turn crankshaft in normal running direction and check injection starting timing of No.1 cylinder	Gr 13B
9	Ⓔ Cleaning fuel feed pump gauze filter					×	Remove connector from fuel feed pump inlet and clean filter inside connector with diesel fuel	P01-12
10	Ⓔ Fuel filter replacement				×		Replace element	P01-10
11	Ⓔ Water separator water discharge	×					Loosen water separator drain plug to discharge water	Gr 13B
12	Ⓔ Draining water and sediment from fuel tank			Every 24 months			Remove fuel tank drain plug and remove water and sediment	P01-12
13	Retightening of fuel tank bracket bolts			×			Check the bolts for looseness and retighten to a torque of 34 to 54 N·m {25 to 40 ft.lbs, 3.5 to 5.5 kgf·m}	Gr 13B
14	Ⓔ Replacing fuel hose in engine compartment			Every 24 months			Replace fuel hose in engine compartment	Gr 13B
15	Ⓔ Check fuel line outside the engine compartment			Every 24 months			Check fuel line outside the engine compartment. Replace if necessary	Gr 13B
16	Ⓔ Ⓝ V-belt tension and damage	×		×			Press midpoint of V-belt firmly with your finger to measure deflection and check for belt damage	P01-16
17	Coolant level and leaks from cooling system	×					Check coolant level and if level is low, check for coolant leaks	Gr 14B
18	Coolant replacement			Every 24 months			Replace with new coolant	Gr 14B
19	Surge tank cap condition			×			Check surge tank cap for sealing and mounting condition	Gr 14B
20	Ⓔ Cooling system hose clamp position and clamping condition			×			Check clamp position and clamping condition of cooling system hose	Gr 14B
21	Ⓔ Turbocharger rotor play			Every 250000 km/150000 miles			Check rotor for excessive end play by using a dial indicator	Gr 15B
22	Ⓔ Ⓝ Cleaning the air cleaner element	×		×			Check air cleaner dust indicator. If red signal appears, clean the element	P01-18
23	Ⓔ Ⓝ Air cleaner element replacement			Every 50000 km/30000 miles			Replace element	P01-18
24	Ⓔ Ⓝ Damage of air intake system, looseness of clamp and loss of parts			×			Check air intake system for damage and inspect all parts for installation	Gr 15B
25	Ⓝ Looseness and damage of exhaust pipe and muffler			×			Check installation and connection to ensure that there are no damage and exhaust gas leaks	Gr 15B
26	Starter function					×	Operate starter switch and check the switch for proper function	Gr 54
27	Alternator function					×	Check for function with a circuit tester	Gr 54

< Chassis >

*1 : 30000 km/18000 miles or 6 months, whichever occurs first.
*2 : 60000 km/36000 miles or 12 months, whichever occurs first.

Inspection and maintenance		Time of inspection and maintenance					Working procedures	Remarks
		Pre-operation checks	New vehicle at 4000 km/2500 miles	Inspection interval: Every 10000 km/6000 miles	Inspection interval: Every 30000 km/18000 miles *1	Inspection interval: Every 60000 km/36000 miles *2		
POWER TRAIN								
28	Oil leaks from power train			×			Check power train for oil leaks	
29	Clutch pedal play			×			Press clutch lightly and check that its play is adequate	🕮 P01-19
30	Clutch function			×			(1) Press the clutch pedal to check for unusual noise or stiffness. Also check if gear engages quietly (2) Check that clutch does not slip and engages smoothly	🗀 Gr 21
31	Manual transmission gearshift control looseness				×		In NEUTRAL position, check gearshift lever for looseness. With gearshift lever in each gear position, check all gears engage smoothly without excessive looseness. Also check that control rod is not bent or damaged	🗀 Gr 22
32	Automatic transmission range selector linkage and throttle (modulator) linkage condition				×		Shifting to each position must be correct and secure	🗀 Gr 23B
33	Propeller shaft couplings and bearings looseness		×	×			(1) Check flange yoke bolts and center bearing bolts for looseness (2) Turn propeller shaft manually to check for loose spline coupling (3) Check for looseness between spider and needle roller bearing	🗀 Gr 25
			On new vehicle inspection at 4000 km/2500 miles, check only the looseness of blots					
FRONT AND REAR AXLES								
34	Axle shaft torsion and cracks					×	Remove axle shaft and check for torsion, bend, and cracks	🗀 Gr 27
35	Front wheel hub bearing looseness				×		With front axle jacked up, move the wheel up and down by holding tire's top and bottom to check for bearing looseness	🗀 Gr 26
36	Rear wheel hub bearing damage					×	Disassemble rear wheel and check for hub bearing wear and damage	🗀 Gr 27
37	Retightening wheel nuts		×	×			Check wheel nuts for looseness after replacing tires, also after 1000 km/600 miles	🕮 P01-19
38	Disc wheel damage			×			Check disc wheel for corrosion, deformation and cracks	🗀 Gr 31
39	Tire inflation pressure, cracking, tread groove depth, abnormal wear, etc.	×		×			(1) Measure inflation pressure with tire gauge, and check that tire tread groove is deep enough (2) Check tire tread and side walls for cracks, damage, uneven wear, stepped wear and other abnormal wear	🕮 P01-19
40	Tire rotation			×			Rotate all tires	🕮 P01-19
SUSPENSION SYSTEM								
41	Looseness, play and damage of suspension system				×		Check suspension system for looseness, play and damage	🗀 Gr 33, 34
42	Damage and looseness of leaf springs	×			×		Check leaf springs for damage and looseness	🗀 Gr 33, 34
43	Retightening U-bolts		×		×		Check U-bolts for looseness	🗀 Gr 33, 34
44	Oil leaks and damage of shock absorbers				×		Check for oil leaks and damage of cylinder, etc.	🗀 Gr 33, 34
BRAKING SYSTEM								
45	Fluid leaks from braking system and power steering system			×			Check braking system and power steering system for fluid leaks	🗀 Gr 35A, 37
46	Looseness, play and damage of braking system parts			×			Check braking system parts for looseness, play and damage	🗀 Gr 35A
47	Brake pedal play and stroke	×		×			Depress the brake pedal lightly and check that play is not as specified. While the engine is idling, fully depress the brake pedal and check the distance between pedal and floor	🕮 P01-25
48	Brake booster (hydraulic booster) emergency pump	×					With the engine stopped, depress the brake pedal and check the operating sound of the emergency pump	🗀 Gr 35A

MAINTENANCE SCHEDULE TABLES

*1 : 30000 km/18000 miles or 6 months, whichever occurs first.
*2 : 60000 km/36000 miles or 12 months, whichever occurs first.

	Inspection and maintenance	Time of inspection and maintenance					Working procedures	Remarks
		Pre-operation checks	New vehicle at 4000 km/2500 miles	Inspection interval: Every 10000 km/6000 miles	Every 30000 km/18000 miles *1	Every 60000 km/36000 miles *2		
49	Service brake effectiveness	×		×			While driving the vehicle at low speed, check braking effect and check for uneven braking	Gr 35A
50	Operation of exhaust brake	×		×			Check exhaust brake operation	Gr 35A
51	Exhaust brake vacuum chamber diaphragm replacement			Every 12 months			Check exhaust brake vacuum chamber diaphragm; replace if necessary	Gr 35A
52	Brake shoe clearance				×		Measure clearance with feeler gauge	Gr 35A
53	Brake lining wear				×		Check lining wear	P01-26
54	Brake drum wear					×	Disassemble and check drum for wear, cracks and damage	Gr 35A
55	Parking brake effectiveness			×			On a slope, check that vehicle can be held stationary	Gr 36A, B
56	Parking brake lever stroke	×		×			With lever fully pulled, check that lever is locked completely and that there is allowance in pulling stroke	Gr 36A, B
57	Parking brake drum and lining wear					×	Disassemble and check drum for wear, cracks and damage and check lining for wear	Gr 36A, B
58	Wheel cylinder piston cup and dust seal replacement			Every 12 months			Check wheel cylinder piston cup and dust seal; replace if necessary	Gr 35A
59	Brake hose replacement			Every 12 months			Check brake hose; replace if necessary	Gr 35A
60	Brake fluid reservoir tank tube replacement			Every 24 months			Check and replace brake fluid reservoir tank tube	Gr 35A
STEERING SYSTEM								
61	Fluid leaks from steering system			×			Check steering system for fluid leaks	Gr 37
62	Steering wheel play	×		×			Turn steering wheel right and left to measure play at steering wheel rim. Measure while engine is running	Gr 37
63	Steering operating condition	×		×			Check steering wheel to see if it vibrates, pulls to one side or requires unusual steering effort	Gr 37
64	Looseness and play of steering system (including hoses and pipes)			×			(1) Check steering system for looseness and play (2) Check power steering hoses and pipes for looseness	Gr 37
65	Wheel alignment					×	Measure toe-in, camber, caster and kingpin inclination angles	Gr 26
66	Right and left turning angles and power steering function					×	Check that stopper bolt is sufficiently tight, without damage, and that steering linkage operates smoothly until blocked by stopper bolt. Also check that steering wheel does not make contact with other parts	Gr 26
67	Power steering booster and oil pump internal rubber parts replacement			Every 48 months			Replace internal rubber parts	Gr 37
68	Power steering hose replacement			Every 48 months			Replace power steering hose	Gr 37
CAB AND FRAME								
69	Looseness and damage of chassis and body			×			(1) Check frame, cross members and other parts for loose rivets (2) Also check for body damage and loose mounting bolts	Gr 41, 42
70	Heater and defroster operation			×			Check operation and installation of defroster	Gr 55
71	Reflection of rearview mirrors and reflectors	×					Check for reflecting condition, stains and damage	Gr 42
72	Door lock function			×			Check door lock mechanism functions properly	Gr 42
73	Seat belt mounting condition			×			Check seat belt for damage, buckle and retracting function and mounting condition	Gr 42
ELECTRICAL SYSTEM								
74	Looseness and damage of electrical wiring and connections			×			Check wiring, connectors and battery terminals for looseness and corrosion	Gr 54

*1 : 30000 km/18000 miles or 6 months, whichever occurs first.

Replacement of Oil Filter
< 4M5 >

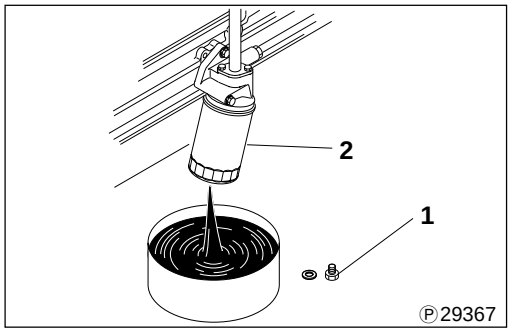
Lubricant

Location	Points of application	Specified lubricant	Quantity
2	Oil filter	Engine oil (API CD or higher)	Approximately 1 L {1.1 qts}

Special tools

Unit: mm {in.}

Location	Tool name and shape	Part No.	Application
2	Oil Filter Element Socket  08550	OBTAIN LOCALLY	Oil filter removal
	Oil Filter Wrench ø107 to 120 {ø4.21 to 4.72} 01503	OBTAIN LOCALLY	



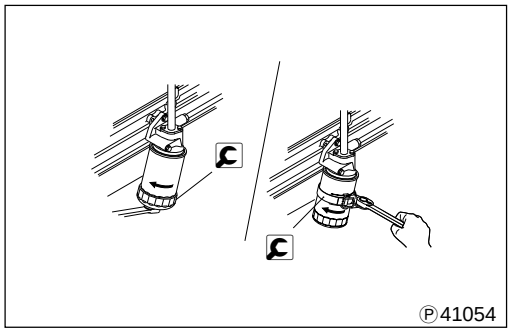
Ⓟ29367

WARNING ⚠

- **Wipe up any spilled engine oil since it may cause a fire.**
- **Do not touch oil when the engine is hot since it can inflict severe burns.**

CAUTION ⚠

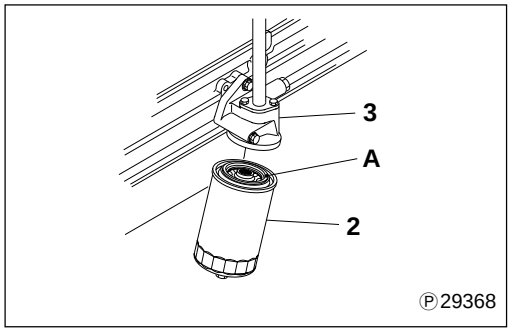
When pouring oil into the engine, take care not to spill any on the V-ribbed belt. Contact with oil could make the V-ribbed belt slip, rendering the cooling system less effective.



Ⓟ41054

Loosen oil filter drain plug **1** to drain the engine oil from inside the filter **2**.
[Removal]

: Oil Filter Element Socket or Filter Wrench



Ⓟ29368

[Installation]

- Clean the surface of oil filter head **3** to which oil filter **2** is fitted.
- Apply a thin coat of engine oil to the gasket **A** of oil filter **2**.
- Screw oil filter **2** into oil filter head **3** by hand until gasket **A** contacts the oil filter head. Then, tighten oil filter **2** further by giving it a 3/4 turn.
- After installing the oil filter, start the engine and check gasket **A** for oil leakage.
- Check to see if the engine oil level is in the specified range.

< 6D3 >

Lubricant

Location	Points of application	Specified lubricant	Quantity
2	Inside oil filter	Engine oil	Approximately 1 L {1.1 qts}
	Gasket area of oil filter with thin application	Engine oil	As required

Special tools

Unit : mm {in.}

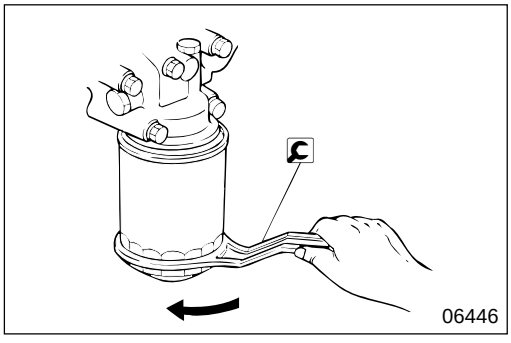
Location	Tool name and shape	Part No.	Application
2	Oil filter wrench  06478	MH061587	Removal of oil filter

WARNING

- **Wipe up any engine oil that has been spilled because it can cause a fire.**
- **Do not touch the engine while it is hot because it will burn you.**

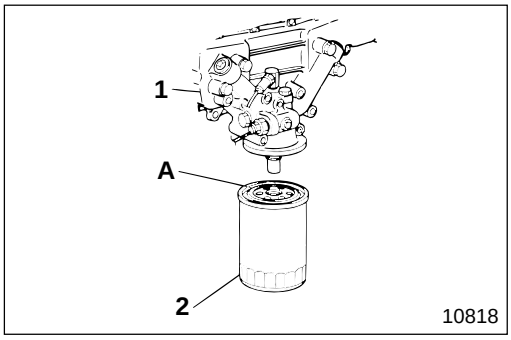
CAUTION

Take care not to spill engine oil on the V-belts, because this would cause them to slip, reducing service life.



[Removal]

: Oil filter wrench

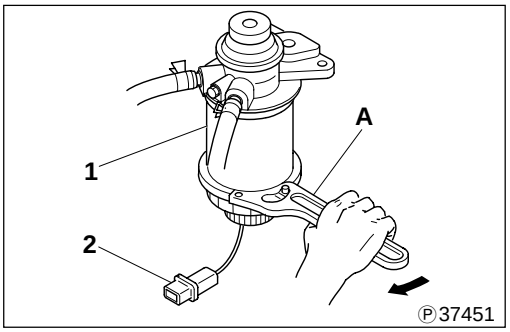


[Installation]

- Clean the surface of oil cooler body **1** that makes contact with oil filter **2**.
- Apply engine oil thinly and evenly to gasket area **A** of oil filter **2**.
- Screw oil filter **2** into oil cooler body **1** until gasket area **A** sits on the body. From this position, tighten further by rotating by three quarters of a turn.
- After installation, run the engine and check that there is no oil leakage from gasket area **A**.
- Check the oil level and if it is low, top it up.

Replacement of Fuel Filter
< 4M5 >
Lubricant

Location	Parts to be tightened	Specified lubricant	Quantity
3	Gasket for fuel filter cartridge	Engine oil	As required



[Removal]

A: Filter Wrench
(Commercially available one: For filter diameter of approx. 90 mm {3.54 in.})

WARNING
- **Fuel is highly flammable. Keep it away from flames and sources of heat.**
- **To minimize the risk of fire, wipe up any spilled fuel.**

CAUTION
- **The water level sensor 2 may be reused if it properly functions.**

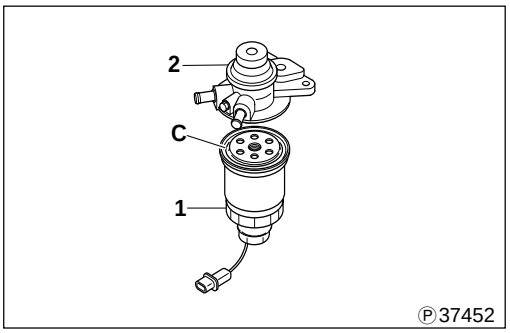
[Installation]

WARNING

Use of an unsuitable fuel filter cartridge 1 can lead to fuel leaks and fires. Be sure to use a genuine filter.

CAUTION

To prevent injection failures, keep dust and dirt out of the fuel filter cartridge 1 and the fuel pipe.



- To fit the fuel filter cartridge **1**, turn it until the gasket **C** touches seal surface of the fuel filter head **2**. Be sure to turn the filter by hand clockwise.
  Then, tighten the filter by 3/4 turn.
- After fitting the filter, start the engine and check that no fuel leakage occurs.
- Bleed all air out of the fuel system. P01-13

< 6D3 >

Lubricant

Location	Points of application	Specified lubricant	Quantity
2	Gasket contact surfaces of fuel filter and fuel filter head	Engine oil	As required

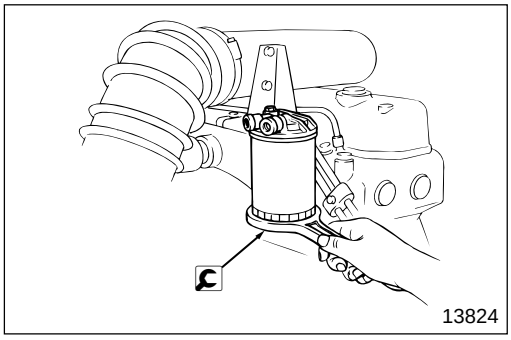
Special tools

Unit : mm {in.}

Location	Tool name and shape	Part No.	Application
2	Filter wrench  01882	MH061572	Removal of fuel filter

WARNING

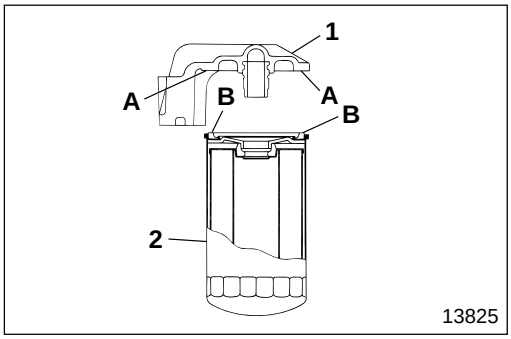
- **Fuel ignites easily. Do not get it near flame or heat.**
- **Wipe up any diesel fuel that has been spilled because it can cause a fire.**
- **Do not use an unsuitable filter because it can cause a fire.**



13824

[Removal]

: Filter wrench



13825

[Installation]

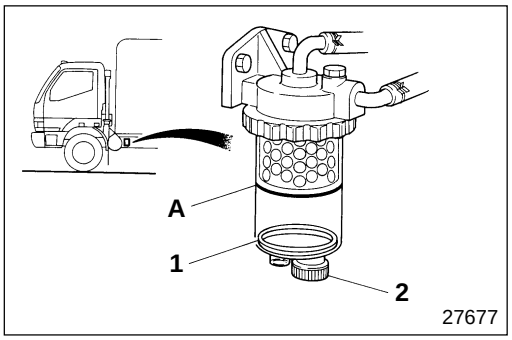
- Install by tightening three quarters to one full turn after contact surface **A** of fuel filter head **1** makes contact with gasket **B** of fuel filter **2**. Be sure to tighten by hand.
- After installation, run the engine and check for fuel leakage.

Draining of Water Separator Condensation

Tightening torque

Unit : N·m {ft.lbs, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
2	Drain plug	3 to 4 {2.2 to 2.9, 0.3 to 0.4}	—



Visually inspect the water separator before driving.
When float **1** reaches red line **A**, drain the condensation as follows:

- Loosen drain plug **2** and drain out the condensation.
- When float **1** has dropped to the bottom, tighten drain plug **2**.
- Carefully wipe the water separator and the surrounding area.
- Check for fuel leakage.

Cleaning of Fuel Feed Pump Gauze Filter < 6D3 >

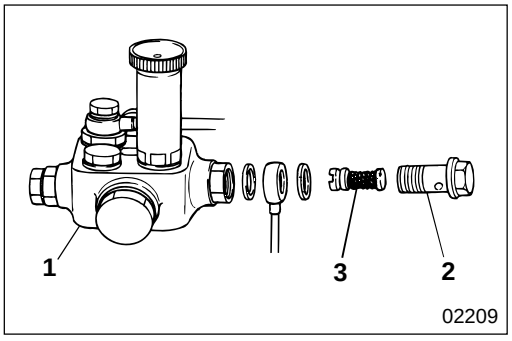
Tightening torque

Unit : N·m {ft.lbs, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
2	Eye bolt	25 to 29 {18 to 22, 2.5 to 3}	—

WARNING

- **Fuel ignites easily. Do not get it near flame or heat.**
- **Wipe up any diesel fuel that has been spilled because it can cause a fire.**



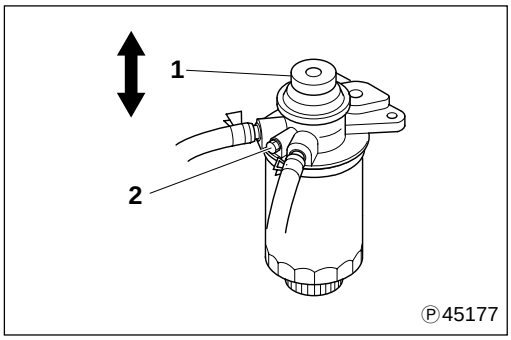
- Remove eye bolt **2** on the inlet side of fuel feed pump **1**.
- Remove gauze filter **3** from eye bolt **2**.
- Clean gauze filter **3** with gas oil.
- Follow the removal sequence in reverse and reinstall gauze filter **3**. Install eye bolt **2** in the fuel feed pump.
- Bleed the air from the fuel line.
- Start the engine and check for fuel leakage.

Bleeding of Air from Fuel Line
< 4M5 >

Tightening torque Unit : N·m {ft.lbs, kgf·m}

Location	Parts to be tightened		Tightening torque	Remarks
2	Air vent plug	4M5	6±1 {4.3±0.7, 0.6±0.1}	—

WARNING⚠
- **Fuel is highly flammable. Keep it away from flames and sources of heat.**
- **Be sure to wipe up all spilled fuel. Unless it is wiped up, it could catch fire.**

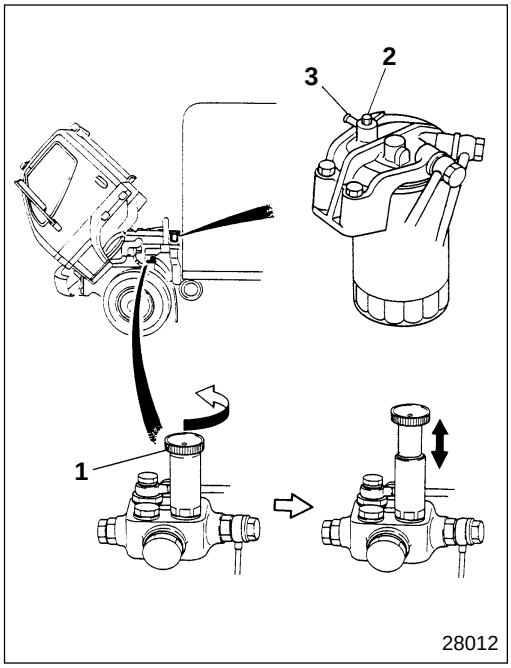


- Loosen the fuel filter air vent plug **2**.
- Operate the priming pump **1** to pump up fuel.
- Continue to pump fuel until no air bubbles are found in the fuel flowing out from the air vent plug **2**.
- After ascertaining that air bubbles have completely disappeared, tighten the air vent plug **2** securely.
- Operate the priming pump **1** further until it feels heavy.
- Wipe up all spilled fuel, then start the engine.
- Check that no fuel leakage occurs.

< 6D3 >

Tightening torque Unit : N·m {ft.lbs, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
2	Air vent plug	7.8 to 12 {5.8 to 8.7, 0.8 to 1.2}	—



WARNING⚠
- **Fuel ignites easily. Do not get it near flame or heat.**
- **Wipe up any diesel fuel that has been spilled because it can cause a fire.**

- Turn the top of priming pump **1** of the injection pump counterclockwise and pull it up so the top protrudes.
- Loosen air vent plug **2** of the fuel filter and move the top part of priming pump **1** up and down.
- Move priming pump **1** up and down repeatedly until air bubbles are no longer present in the fuel drained from air vent cock **3**.
- When the fuel being drained is free of air bubbles, tighten air vent plug **2**.
- After moving priming pump **1** up and down another five or six times, push the top down and turn clockwise tighten.
- After bleeding the air, carefully wipe up spilled fuel and start the engine.
- Check for fuel leakage.

Adjustment of V-Ribbed Belt Tension < 4M5 >

Newly installed V-ribbed belt can stretch during their initial running-in period. To prevent this from becoming a problem, run the engine for several minutes after installing the V-ribbed belt, then readjust. Perform this cycle several times.

WARNING⚠

You must take special precautions to prevent the engine from rotating while a V-ribbed belt or is being inspected or adjusted.

CAUTION⚠

- **Make sure that you turn off the engine before attempting to inspect or adjust the V-ribbed belt.**
- **Make sure that you fasten all bolts and nuts securely after adjusting the V-ribbed belt. Remember that too much tension can damage the V-ribbed belt and bearings.**
- **Do not grease V-ribbed belt. This causes them to slip, which reduce service life.**

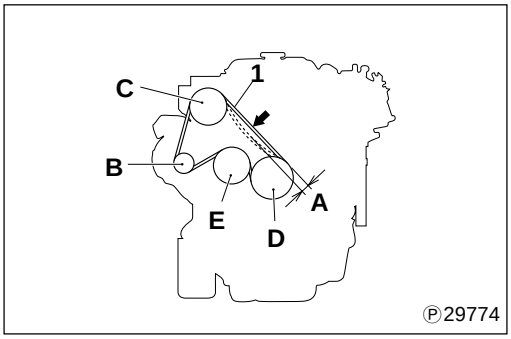
Service standards

Unit : mm {in.}

Location	Maintenance item		Standard value	Limit	Remedy
1	V-ribbed belt tension	When belt is new	9 to 11 {0.35 to 0.43}	—	Adjust
		When belt in use is re-tensioned	11 to 13 {0.43 to 0.51}	—	

Special tools

Location	Tool name and shape	Part No.	Application
1	Belt tension gauge  03612	MH062345	Measurement of tension of V-ribbed belt



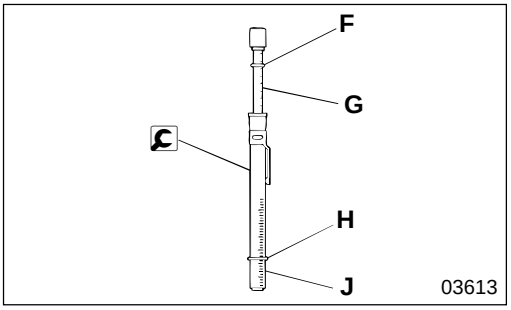
[Inspection]

NOTE

Before checking for tension, crank the engine one turn or more clockwise.

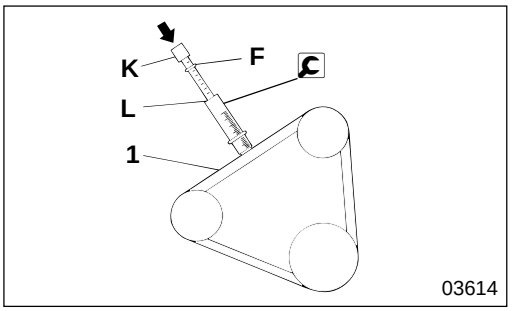
Apply force of approximately 98 N {22 lbf, 10 kgf) to the span center of the V-ribbed belt **1** and measure the extent of belt deflection **A**.

A : Alternator pulley
C : Air-conditioner compressor pulley or tension pulley
D : Fan pulley
E : Water pump pulley

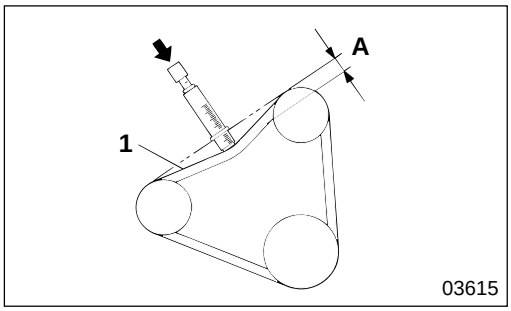


Use of belt tension gauge

- Set the upper O-ring **F** of the Belt Tension Gauge to a push load of 98 N {22 lbf, 10 kgt} on scale **G**.
- Set the lower O-ring **H** of the Belt Tension Gauge to the belt's specified maximum deflection value on scale **J**.



- Apply the Belt Tension Gauge to the center of V-ribbed belt **1** and push **K** until the upper O-ring **F** reaches the flange **L**.

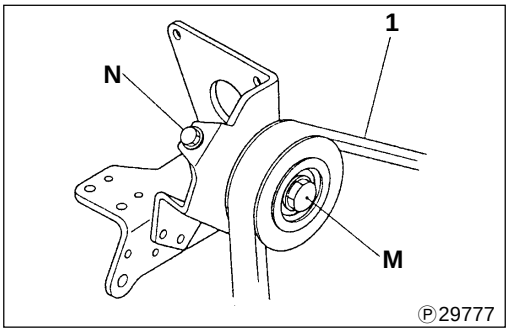


- Measure the deflection **A** of the V-ribbed belt **1**. If the measurement does not comply with the standard value, adjust the tension in accordance with the following procedure.

[Adjustment]

CAUTION ⚠

- **Excessive tension in the V-ribbed belt 1 may damage the belt and related bearings.**
- **Keep the V-ribbed belt 1 free of oil. If the belt becomes oily, it may slip, resulting in overheating of the engine and insufficient charging of the battery.**



- Loosen the tension pully mounting sleeve **M** and adjust the tension of the V-ribbed belt **1** using the adjusting bolt **N**.
- After the adjustment, tighten the sleeve **M** securely.

Adjustment of V-Belt Tension < 6D3 >

Newly installed V-belts can stretch during their initial running-in period. To prevent this from becoming a problem, run the engine for several minutes after installing the V-belt, then readjust. Perform this cycle several times.

WARNING⚠

You must take special precautions to prevent the engine from rotating while a V-belt is being inspected or adjusted.

CAUTION⚠

- **Make sure that you turn off the engine before attempting to inspect or adjust the V-belts.**
- **Make sure that you fasten all bolts and nuts securely after adjusting the V-belts. Remember that too much tension can damage the V-belts and bearings.**
- **Do not grease V-belts. This causes them to slip, which reduce service life.**

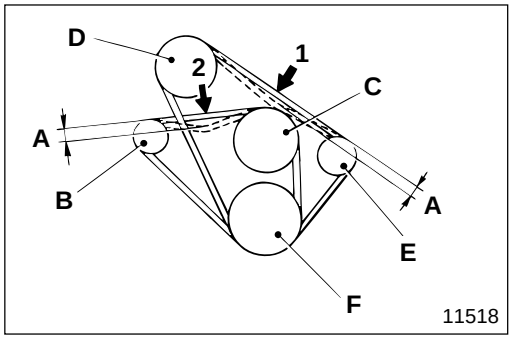
Service standards

Unit : mm {in.}

Location	Maintenance item		Standard value	Limit	Remedy
1, 2	V-belt tension (Each one)	Fan	12 to 16 {0.47 to 0.63}	—	Adjust
		Air-conditioner	16 to 20 {0.63 to 0.79}		

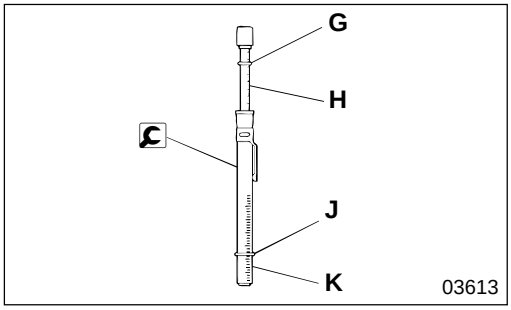
Special tools

Location	Tool name and shape	Part No.	Application
1, 2	Belt tension gauge 03612	MH062345	Measurement of tension of V-belt



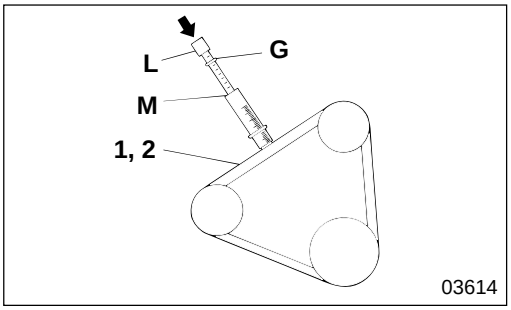
[Inspection]
Measure the extent of flex **A** when the center of V-belts **1**, **2** as illustrated is depressed with a force of 98 N·m {72 ft.lbs, 10 kgf·m}.

B : Alternator pulley
C : Water pump pulley
D : Cooler compressor pulley (Air-conditioner)
E : Tension pulley
F : Crankshaft pulley

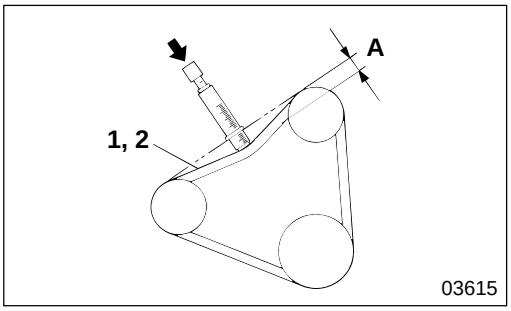


Use of special tool belt tension gauge

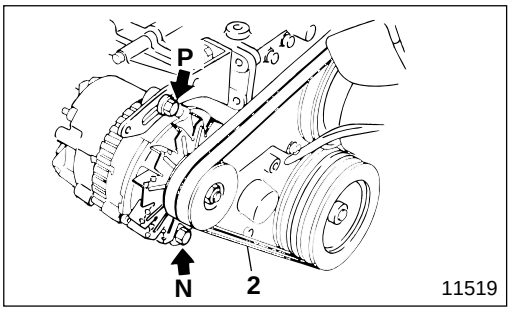
- Set upper O-ring **G** of 🔧 belt tension gauge to 98 N·m {72 ft.lbs, 10 kgf·m} (push load) on graduation **H**.
- Set lower O-ring **J** of 🔧 belt tension gauge to graduation **K** (maximum flex of belt).



- Place 🔧 belt tension gauge at the center of V-belts **1**, **2** perpendicularly as illustrated and push top **L** all the way down until upper O-ring **G** hits upper edge **M**.



- Measure the extent of flex **A** of V-belts **1**, **2** at this point, and if the measured value deviates from the standard value, adjust as follows:



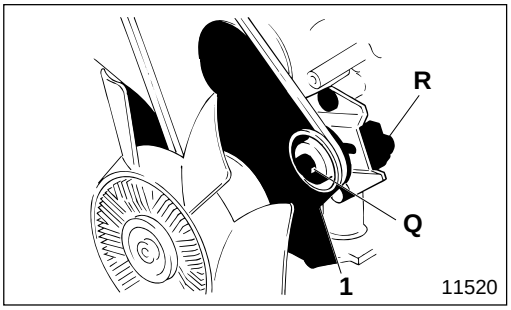
[Adjustment]

(1) Adjustment of tension of V-belt for fan

- Loosen alternator mounting bolts **N** (two points), and adjust the tension of V-belts **2** by moving adjusting bolt **P**.
- After adjustment, tighten the bolts **N**, **P** securely.

CAUTION⚠

- **Bear in mind that excessive tension of V-belts 2 might damage the belts and bearings that engage with the V-belts.**
- **Be sure to replace V-belts 2 as a set to maintain even tension between them.**
- **Be careful not to let oil stick to V-belts 2. If oil gets onto the belts, it causes slipping, resulting in overheating and insufficient battery charging.**



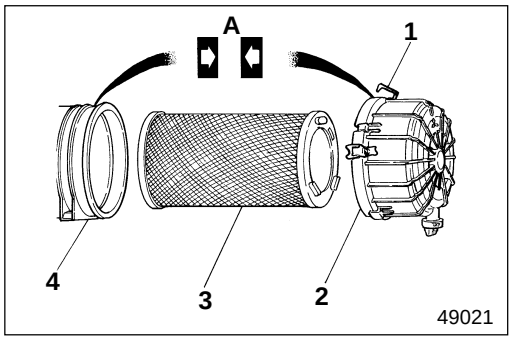
(2) Adjustment of tension of V-belt for air-conditioner

- Loosen tension pulley mounting nut **Q**, and adjust the tension of V-belt **1** moving adjusting bolt **R**.
- After adjustment, tighten mounting nut **Q** securely.

CAUTION⚠

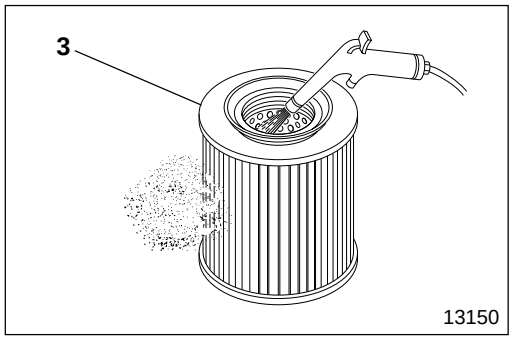
- **Bear in mind that excessive tension of V-belt 1 might damage the belt and bearings that engage with the V-belt.**
- **Be careful not to let oil stick to V-belt 1. If oil gets onto the belt, it causes slipping, resulting in poor performance of the air conditioner.**

Cleaning and Replacement of Air Cleaner Element



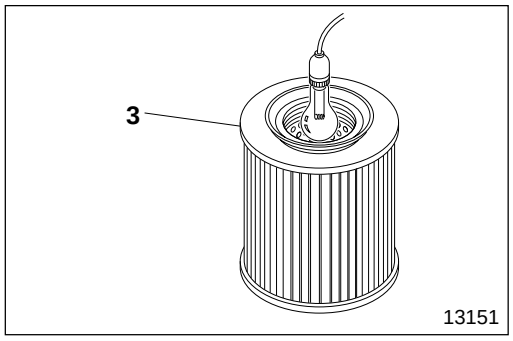
[Removal]
- Remove clamp **1** to remove cover **2**.
- Remove air cleaner element **3**.

[Installation]
Install case **4** and cover **2** by aligning arrows **A**.



[Cleaning]
- Blow compressed air of 685 kPa {100 psi, 7 kgf/cm^2} or less through air cleaner element **3** from the inside.
- When using compressed air, move the blower's nozzle up and down along the pleats of air cleaner element **3** evenly.

CAUTION⚠
- **Do not tap or hit air cleaner element 3 to remove dust.**
- **Do not blow compressed air through air cleaner element 3 from the outside.**



[Inspection]
- Illuminate the inside of air cleaner element **3**.
- If parts of the filter paper are torn or thin, or if the packing of the upper surface of air cleaner element **3** is damaged, replace the air cleaner element.

NOTE

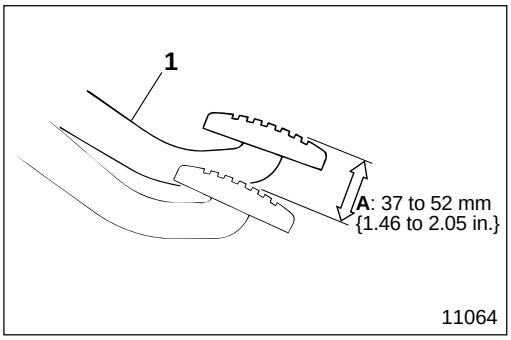
If the dust on air cleaner element 3 is wet due to oil smoke or soot, replace the air cleaner regardless of the scheduled replacement interval.

Inspection of Clutch Pedal Free Play

Service standards

Unit : mm {in.}

Location	Maintenance item	Standard value	Limit	Remedy
1	Clutch pedal free play	37 to 52 {1.46 to 2.05}	—	Adjust or replace



[Confirmation]
Push clutch pedal **1** with your hand and measure the amount of movement **A** (free play) until you meet resistance. If the measured value does not conform to the standard value, adjust by stroke of clutch power cylinder push rod, or replace the clutch disc.

[Clutch operation]
- Check for unusual noises when clutch pedal **1** is pressed while the engine is idling, and also for abnormally heavy clutch operation. Also check to be certain that it is not difficult to shift the vehicle into first and reverse gears.
- Gradually release clutch pedal **1** to set the vehicle in motion.
  Check to be sure there is no slippage, and that the clutch engages smoothly.

Tire

Service standards

Unit : mm {in.}

Location	Maintenance item	Standard value	Limit	Remedy
1	Depth of tire tread grooves	—	1.6 {0.063}	Replace

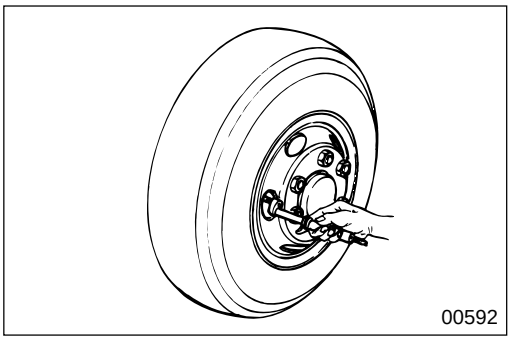
Tightening torque

Unit : N·m {ft.lbs, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
2	Wheel nut	370 to 410 {275 to 305, 38 to 42}	Wet

Lubricant

Location	Points of application	Specified lubricant	Quantity
2	Wheel nut spherical area	Chassis grease [NLGI No.1 (Ca soap)] or Wheel bearing grease [NLGI No.1 (Li soap)]	As required
4	Wheel nut (inner) at thread area and spherical area		
6	Thread area of hub bolt		



00592

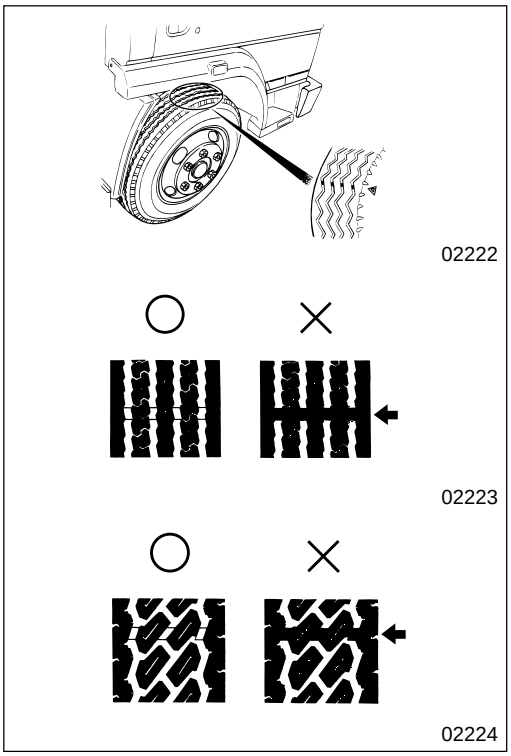
Air pressure

Tire air pressure should be checked before the vehicle is driven, while the tires are still cool.

Tire Size	Air Pressure kPa {psi, kgf/cm^2}
215/75R 17.5 124/123L	700 {100, 7.00}

CAUTION

- **Make certain that there is no difference in the air pressure between the inner and outer rear tires.**
- **Make certain you use valve caps on the air valves.**
- **It is not necessary to increase the air pressure for high-speed driving.**



02222

02223

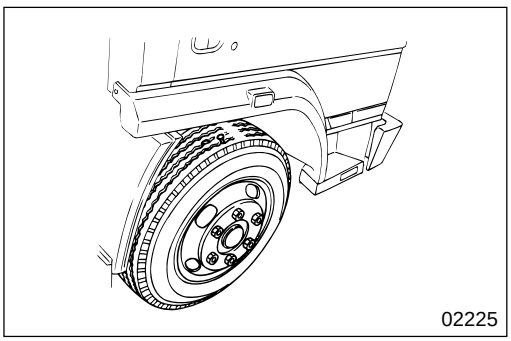
02224

Checking tread depth

- Check all around the tire treads to make sure that the depth of the tread grooves is above the wear limit.
- If the tread grooves are not deep enough, slip sign **A** appears at the position of the ⚠ mark, where the tread groove has worn away.

WARNING

If the depth of the tread grooves is not adequate, the tires will slip on wet roads and present a hazard. Such tires are also extremely dangerous because they are more susceptible to hydroplaning when the vehicle is running at high speeds in the rain. Such tires must be replaced with new ones as soon as possible.



02225

Checking for cracks, damage, and objects embedded in the treads

- Check the tire treads and walls for cracks and damage.
- Check tire treads for uneven wear or other abnormal wear.
- Check if metal objects or nails have penetrated the tires.
- Check for stones embedded between double tires.

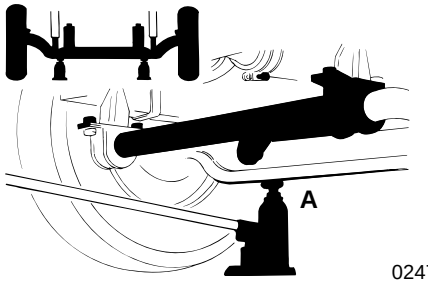
WARNING

Badly damaged or worn tires are extremely dangerous, because they can be punctured more easily when the vehicle is running, they must be replaced with new ones as soon as possible.

Removing tires

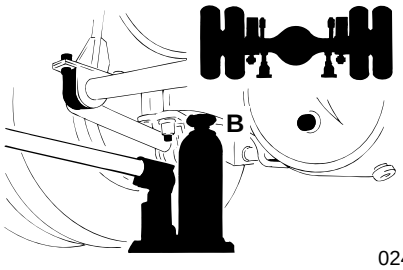
- Jacking up point
  - For front wheels : Front axle bottom **A**
  - For rear wheels : Rear axle tube bottom **B**

< Front wheel >



02476

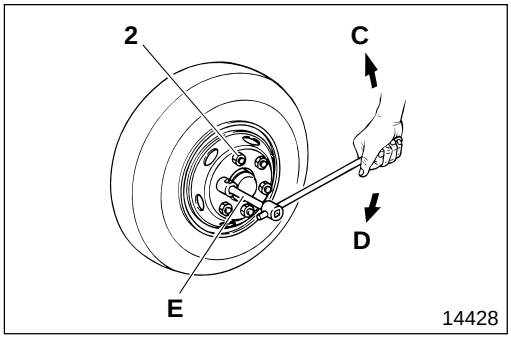
< Rear wheel >



02479

WARNING

- **The jack should be placed on flat, solid ground, and should not be used to raise the vehicle higher than necessary.**
- **Do not use the jack at vehicle locations other than those illustrated.**
- **Keep in mind the danger of a slipping jack. Never crawl under the vehicle while the jack is in use or rock the vehicle. Also, do not start the engine while the vehicle is jacked up.**
- **To increase safety, use supports for the vehicle when it is necessary to leave it jacked up for long periods.**
- **Chock both the tire to be removed and the tire diagonally opposite to it so that they will not rotate when you are removing the tire.**



14428

- Loosen wheel nuts **2** slightly. The wheel nuts for right tires **C** have right-hand threads "**R**", and the wheel nuts for left tires **D** have left-hand threads "**L**".

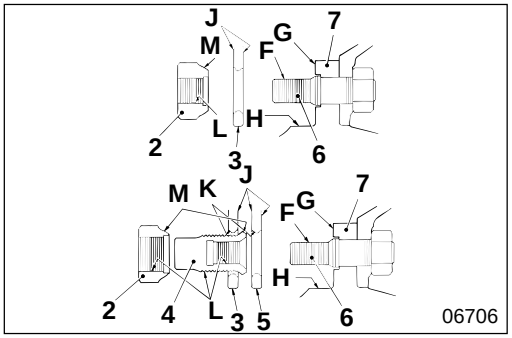
WARNING

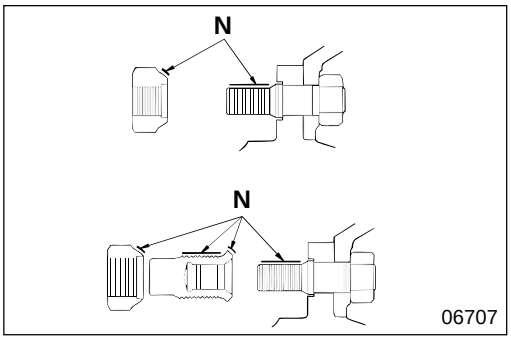
Make certain that wheel nut wrench E is fully engaged, all the way to the back of nuts 2. If it is not, it could slip.

CAUTION

Only loosen wheel nuts 2 slightly. Do not remove them.

- Jack up the vehicle carefully, until the tire is slightly off the ground. Remove wheel nuts **2**, then remove the tire.
- When working on the double tires at the rear of the vehicle, first remove the outside tire, then lower the vehicle and loosen the nuts on the inside tire. After doing this, jack the vehicle back up and remove the tire.



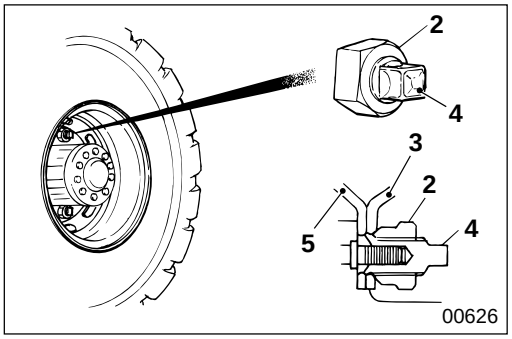


Mounting tires

- To prevent wheel nuts **2**, **4** and hub bolt **6** from becoming loose and to prevent mounting parts (tire assemblies **3**, **5** and hub **7**) from being damaged, remove rust, dust, additional coatings of paint, and foreign particles from the following areas:
  F : Hub bolt thread area
  G : Wheel mounting surface of hub
  H : Wheel alignment area of hub
  J : Disc wheel mating surface
  K : Disc wheel nut mounting surface
  L : Wheel nut thread area
  M : Wheel nut spherical area
  N : Grease application area

WARNING⚠

Never use grease containing molybdenum disulfide, since it can cause loosening of fitted screws.



- Put on the double rear tires as follows:
  - After mounting inner tire **5** and fully tightening inner wheel nuts **4**, jack the vehicle up and mount on outer tire **3**, then tighten outer wheel nuts **2**.
  - Even if only outside tire **3** is to be changed, do not mount it until inner wheel nuts **4** have been fastened at the specified torque.
  - Slide the air valves on the inside and outside tires down when mounting the tires.

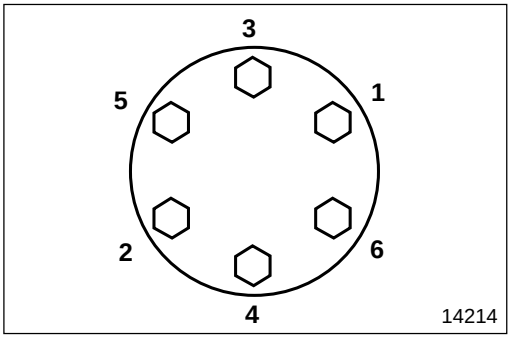
WARNING⚠

If the threads are scored, or the disc wheel is deformed or cracked, change bolts 6, nuts 2, 4 and disc. Driving the truck before correcting such problems can cause the tire in question to come loose, which could be the source of major accidents.

CAUTION⚠

Check hub bolt 6 threads carefully for scratches before putting the tire on.

- Place the tapered end of wheel nuts **2, 4** towards the disc wheel and fasten temporarily. Center so that there is no eccentricity between bolts **6** and the disc wheel bolt holes.
- Lower the vehicle.



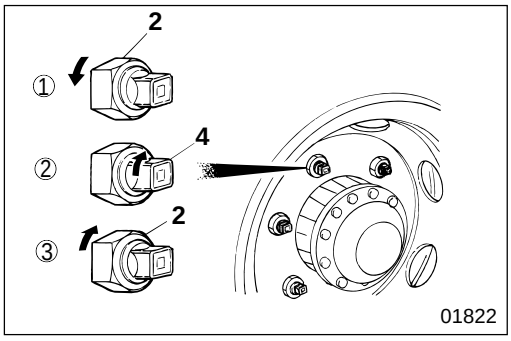
- Tighten the nuts in the order as illustrated, tightening each nut two or three times. To finish, tighten each nut at the specified torque.

WARNING

Always use the specified torque when tightening the wheel nuts. If the wheel nuts are not tightened properly, the wheels could come loose while the vehicle is being driven, which could result in life threatening accidents or the truck being disabled.

CAUTION

Over-tightening the wheel nuts can damage them.



Checking the wheel nuts for looseness

The wheel nuts should be checked for looseness every 10000 km (6000 miles). All nuts should be tightened at the specified torque.

- Check the double rear tires for looseness as follows:

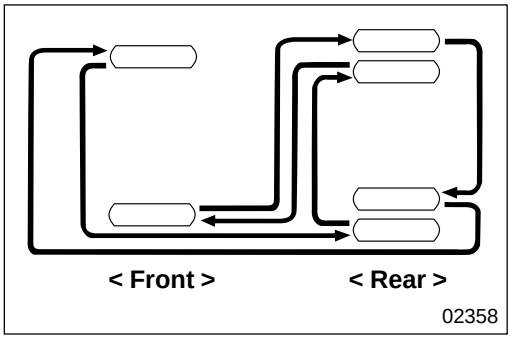
① Loosen outer wheel nuts **2**.
② Tighten inner wheel nuts **4** at specified torque.
③ Tighten outer wheel nuts **2** at specified torque.

CAUTION

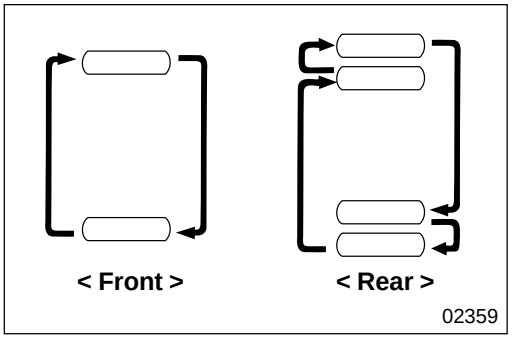
If outer wheel nuts 2 are tightened without first being loosened, it might not be possible to tighten them at the specified torque.

Tire rotation

Tires wear differently, according to the location where they are mounted. To make this wear uniform and prolong the life of your tires, they should be rotated every 10000 km (6000 miles) in the rotation order shown below:



- When the tread patterns for all tires are identical:



- When the tread patterns are different for the front and rear tires:

CAUTION⚠

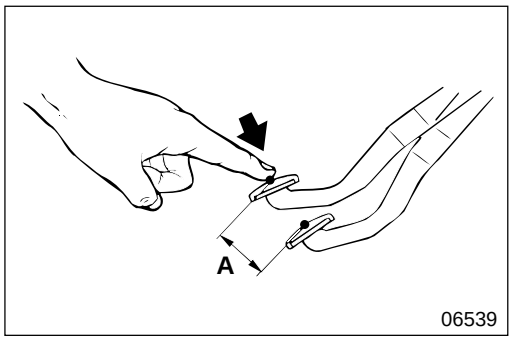
- **Always adjust air pressure after running-in new tires.**
- **When using tires of different tread patterns, use rib-type patterns for the front tires and traction type patterns for the rear tires.**
- **Avoid using both radial and biased tires on the same vehicle.**

Inspection of Brake Pedal Free Play

Service standards

Unit : mm {in.}

Location	Maintenance item	Standard value	Limit	Remedy
—	Free play of brake pedal	10 to 15 {0.39 to 0.59}	—	Adjust



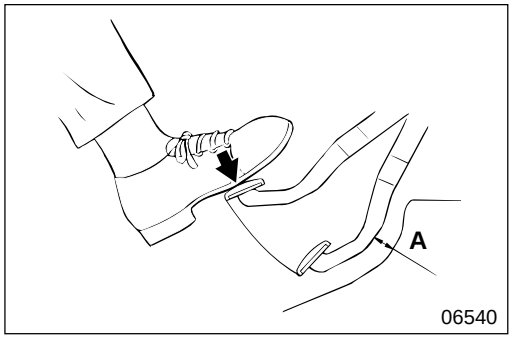
[Inspection]
Check if brake pedal free play **A** confirms to the standard valve with starter switch OFF. If the measured value deviates from the standard value, adjust the position of the brake pedal.

Inspection of Clearance between Brake Pedal and Floor Panel

Service standards

Unit : mm {in.}

Location	Maintenance item	Standard value	Limit	Remedy
—	Clearance between brake pedal and floor panel (with pedal depressed at 490 N {110 lbf, 50 kgf}	34 {1.34} or more	—	Adjust



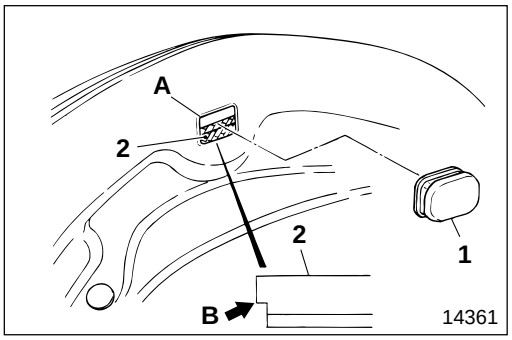
[Inspection]
Depress the brake pedal using 490 N {110 lbf, 50 kgf} when the engine is idling to check if clearance **A** between the brake pedal and the floor panel conforms to the standard value. If the measured value deviates from the standard value, adjust the position of the brake pedal.

Inspection of Brake Lining Thickness

Service standards

Unit : mm {in.}

Location	Maintenance item	Standard value	Limit	Remedy
2	Thickness of brake lining	—	5 {0.20} (Wear limit at side step)	Replace



NOTE

Be sure to inspect at two points for each wheel per side.

- Remove check hole plug **1** from the packing plate.
- Inspect through check hole **A** whether brake lining **2** is worn to the point of side shoulder **B** of the brake lining (the limit).
- If the measured value is lower than the limit, replace brake lining **2** on the same axle as a unit.
- After inspection, be sure to reinstall check hole plug **1**.

Battery

DANGER⚠

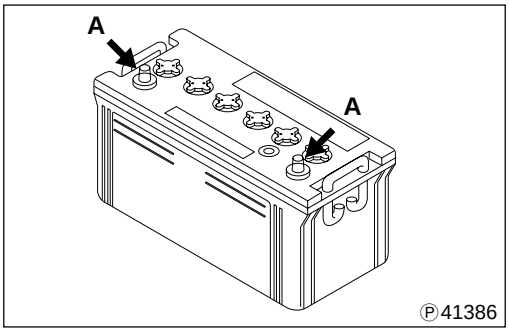
- **Since flammable hydrogen gas is generated by the battery, be sure to obey the following warnings :**
  - **Do not short-circuit the ⊕ and ⊖ terminals on the battery.**
  - **Keep sparks and lit cigarettes away from the battery.**
  - **Do not wear metal objects on your arms and lean over the battery.**
- **Because the battery electrolyte is diluted sulfuric acid and is corrosive, when handling the battery wear safety glasses and rubber gloves to protect the eyes and hands.**
- **Battery posts, terminals and related accessories contain lead and lead compounds. Wash hands after handling.**

WARNING⚠

To prevent a short-circuit be sure that disconnected the battery cables do not accidentally touch the battery terminals.

CAUTION⚠

- **Make sure that you disconnect the battery cable ⊖ first when you disconnect the battery cables.**
- **Make sure that all electrical switches of the vehicle are OFF before connecting the battery cables.**
- **Make sure that you connect the battery cable ⊕ before you connect the battery cable ⊖.**

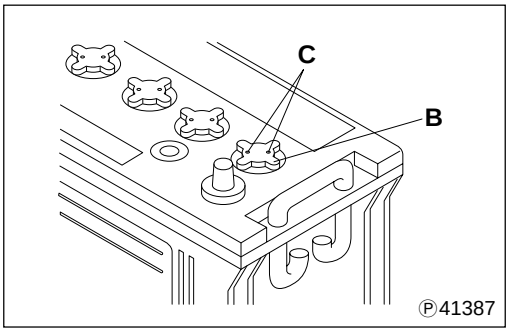


Visual inspection

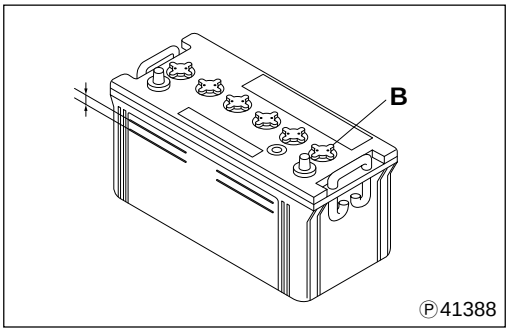
- If terminal **A** is corroded, scrub the corrosion off of it using a wire brush.
- If cracks or defects are found on the battery, replace it since the cracks or defects can cause liquid spills.

CAUTION⚠

Make sure you grease the ⊕ side of terminal A because it is easily corroded.

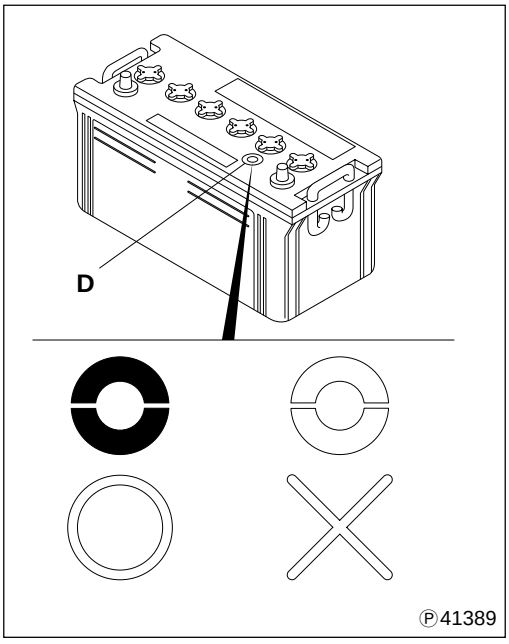


- If bleed hole **C** of vent plug **B** is clogged, clean the hole.



Inspection of fluid level

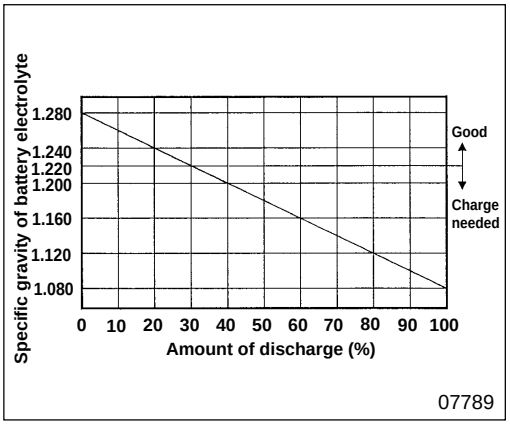
- Make sure that the battery electrolyte level is between the UPPER and LOWER level lines.
- If the level is below the LOWER level line, remove vent plug **B** and fill the battery with distilled water or battery replenisher to the UPPER level.



Measurement of specific gravity

You can tell the specific gravity of the battery electrolyte by the color shown in indicator **D**.

Blue : Good
White : Charge or replace



Charging

- Although, as a rule, charging of the battery should be done with the battery removed from the vehicle, if you have to charge the battery while it is on the vehicle, make sure that you stop the engine and disconnect the battery cable ⊕.
- Remove vent plug **B** before charging the battery.
- For the recommended charge time and current, see the following table to avoid overcharging.

	Charge current (A)	Charge time (H)	Upper limit of fluid temperature (°C {°F})
Normal charge	$\frac{\text{Value of 5-hour rating capacity}}{10}$	$\frac{\text{* Amount of discharge (Ah)}}{\text{charge current (A)}} \times 1.2$ (to 1.5)	45 {113}
Quick charge	$\frac{\text{Value of 5-hour rating capacity}}{1.5}$	0.5	55 {131}

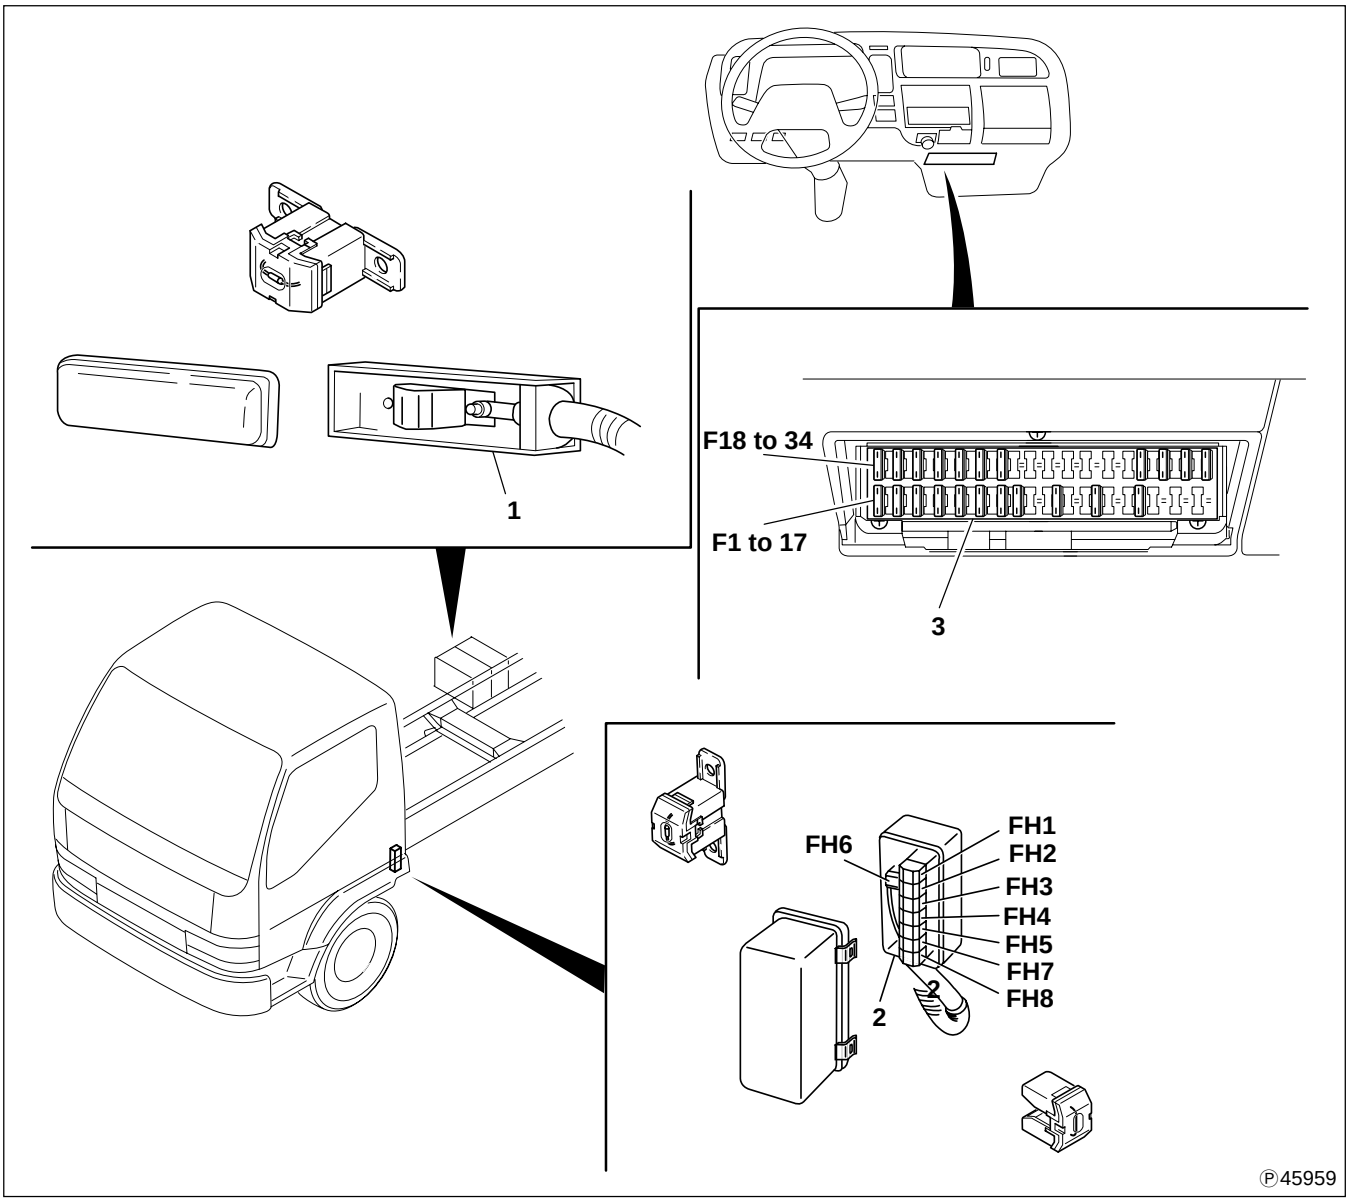
* Amount of discharge (Ah) = 5-hour rating capacity (Ah) $\times \frac{\text{Amount of discharge (\%)}}{100}$

- Use the graph shown on the left to calculate the amount of discharge (%).
- Use diluted sulfuric acid, made up of sulfuric acid and refined or distilled water, as the battery electrolyte.
- The specific gravity of fully-charged battery electrolyte is 1.280 with the temperature at 20°C {68°F}.

DANGER ⚠

- **Do not let the battery electrolyte level rise and overflow while charging the battery.**
- **Keep unprotected lights away from the battery while charging it or it might explode.**
- **Be careful not to generate sparks while charging the battery because it is dangerous.**
- **After charging the battery, tighten vent plug B, wash away sulfuric acid from the battery using water, and dry the surface.**
- **Be sure to check the electrolyte level before charging the battery. Charging with the electrolyte level below the lower limit (LOWER LEVEL) can cause premature deterioration, heat generation and explosion of the battery.**

Fuse



1 Main high-current fuse
2 High-current fuse box
3 Fuse box

CAUTION⚠

- **If a fuse blows, make sure you identify and remedy the cause, then replace the fuse.**
- **Make sure that you replace the fuse with one having the same rating.**
- **Make sure that you remove the ⊖ terminal of the battery cable before removing main high-current fuse 1 and high-current fuses FH1 to 8.**

Main high-current fuse

LUBRICATION

Engine Oil
< 4M5 >

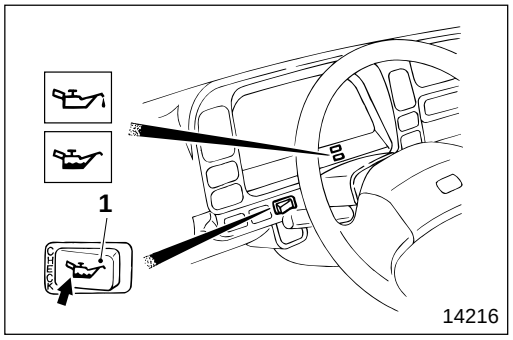
Tightening torque

Unit : N·m {ft.lbs, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
4	Oil pan drain plug	34.3 to 43.1 {25 to 32, 3.5 to 4.4}	—
5	Oil filter drain plug	9.8±1.96 {7.2±1.4, 1.0±0.2}	—

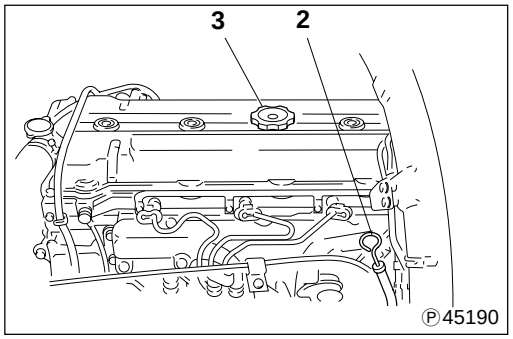
Lubricant

Point of application	Specified lubricant	Quantity	Remarks
Oil pan	Engine oil (API CD or higher)	Approximately 9 L {9.5 qts}	—
Oil filter		Approximately 1 L {1.1 qts}	—

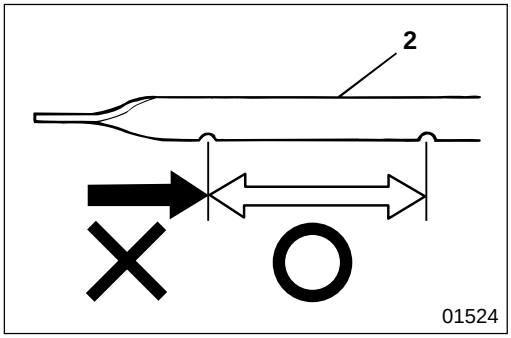


[Inspection]
There are two methods for inspecting the engine oil level; using oil level check switch **1**, and using dipstick **2**. Inspection using the oil level check switch is a simple inspection method. For a more accurate inspection use the dipstick.

- Inspection using oil level check switch **1** (simple inspection)
  - Press oil level check switch **1** before starting the engine. Check the oil level using the illuminated lamp.
    lamp (green) : Correct oil level
    lamp (red) : Low oil level
  - If the level is low, fill to correct level.



- Inspection using dipstick **2**
  - Tilt the cab.
  - Pull out dipstick **2**, wipe off the oil with a cloth.
  - Reinsert dipstick **2**, then pull it out carefully.
  - Oil level is correct if there is oil sticking to the dipstick between the two notches.
  - If the level is low, fill to correct level.



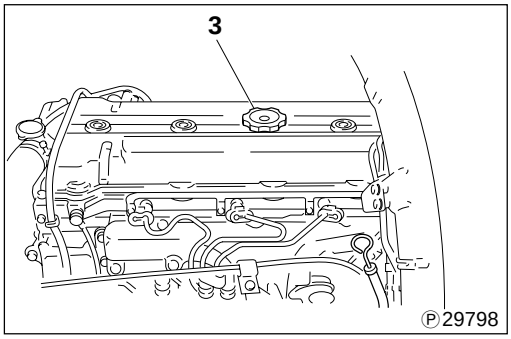
[Replenishment]
- Clean the area surrounding oil filler cap **3** and prevent dust from entering through the filler.
- Remove oil filler cap **3** and top up with engine oil.
- Wait five minutes before checking the oil level.
- Replace filler cap **3**.

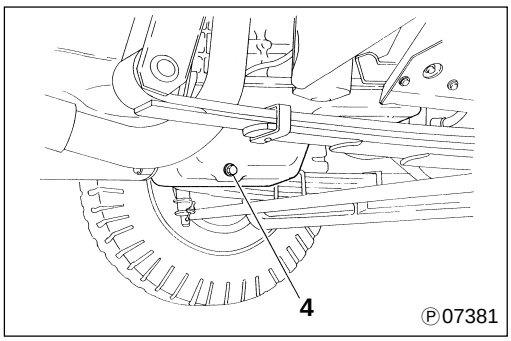
WARNING⚠

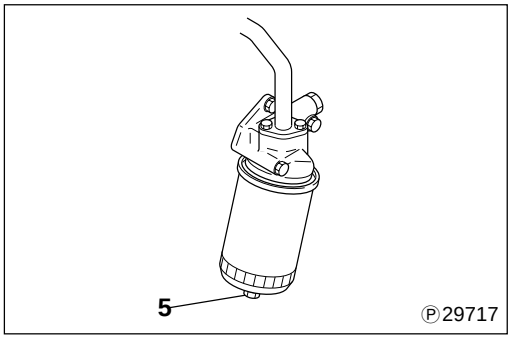
Wipe up any spilled engine oil since it can cause a fire.
Do not touch oil when the engine is hot since it can inflict severe burns.

CAUTION⚠

When pouring oil into the engine, take care not to spill any on the V-ribbed belt. Contact with oil could make the V-ribbed belt slip, rendering the cooling system less effective.







[Draining]
- Warm up the engine, then remove oil filter cap **3**.
- Remove oil pan drain plug **4** and oil filter drain plug **5**. Then, drain the engine oil.

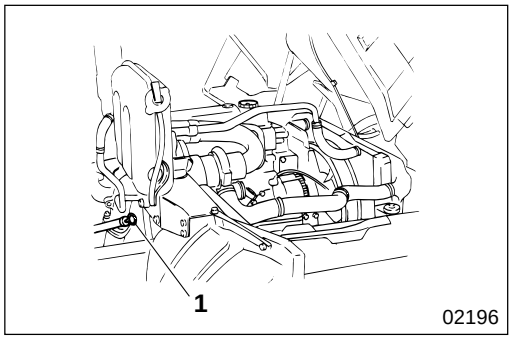
[Filling]
Tighten oil pan drain plug **4** and oil filter drain plug **5** to their specified torques. Then, add new engine oil to the specified level.

< 6D3 >

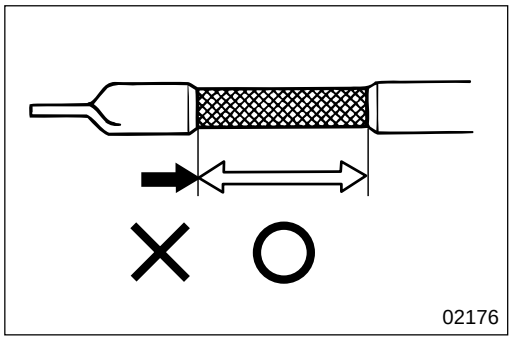
Tightening torque

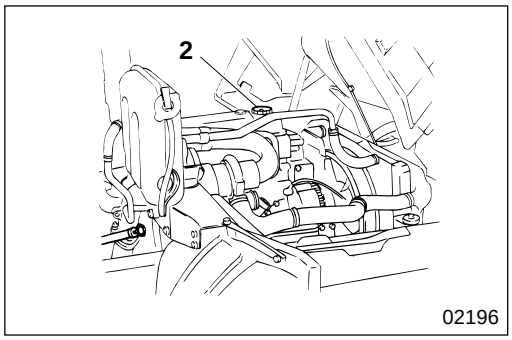
Unit : N·m {ft.lbs, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
3	Oil pan drain plug	69 {51, 7}	—



[Inspection]
- Pull out dipstick **1**, wipe off the oil with a cloth.
- Reinsert dipstick **1**, then pull it out carefully.
- Oil level is correct if there is oil sticking to dipstick **1** within the hatched area.
- If the level is low, top it up.
- Tilt the cab.



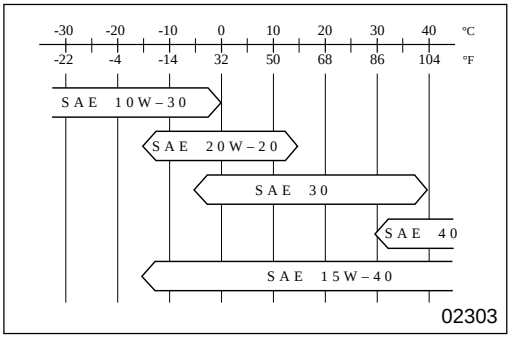


[Replenishment]
- Clean the area surrounding oil filler cap **2** and prevent dust from entering through the filler.
- Remove oil filler cap **2** and top up with engine oil.
- Wait five minutes before checking the oil level.
- Replace filler cap **2**.

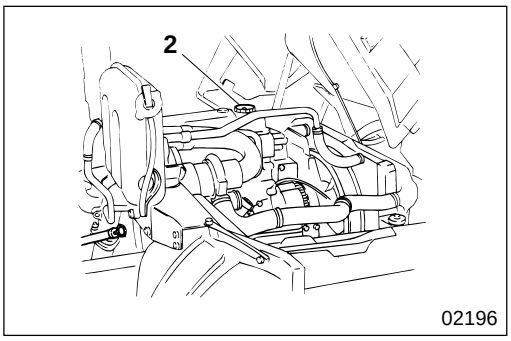
WARNING⚠
- **Wipe up any engine oil that has been spilled because it can cause a fire.**
- **Do not touch the engine while it is hot as it will burn you.**

CAUTION⚠

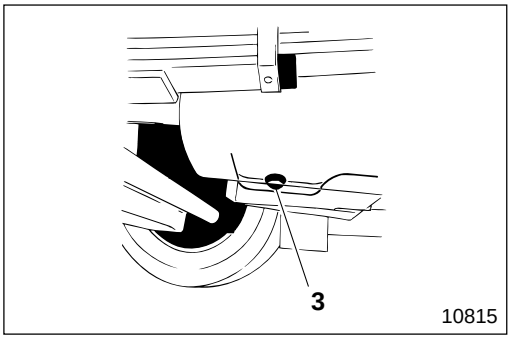
Take care not to spill engine oil on the V-belts, because this would cause them to slip, reducing service life.



[Replacement]
Since engine oil greatly influences the performance, the life expectancy, and the ability to start the engine, use only oil of the specified grade and viscosity.
The chart illustrates the relationship between oil viscosity and the ambient air temperature.



- Clean the area surrounding oil filler cap **2** and prevent dust from entering through the filler.
- Remove oil filler cap **2**.
- Remove oil pan drain plug **3**, and drain the oil. At the same time replace the oil filter.
- After reinstalling drain plug **3**, slowly add engine oil through the oil filler.
- Using the dipstick, check the oil level after more than six minutes have passed.
- Start the engine and let it idle. When the oil has reached all parts, stop the engine. Let 30 minutes pass before checking the oil level again.



Clutch Fluid (Brake Fluid)

Tightening torque

Unit : N·m {ft.lbs, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
2	Air bleeder	25 to 34 {18 to 25, 2.5 to 3.5}	—

Fluid

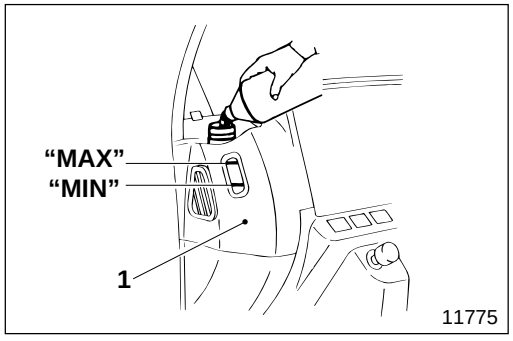
Location	Points of application	Specified fluid	Quantity
1	Fluid tank	Brake fluid (SAE J1703f or FMVSS No.116 DOT3)	As required

WARNING

- **The clutch fluid system and the brake fluid system use the fluid tank in common.**
- **You must use new brake fluid (SAE J1703f or FMVSS No.116 DOT3). Do not add different quality fluid or mineral oil (gas oil, engine oil, gear oil, automatic transmission fluid, etc.) to the clutch system, because this will cause the rubber parts of the clutch system and brake system to swell, resulting in faulty clutch operation, as well as ineffective braking and brake dragging.**
- **Do not allow foreign particles or water to become mixed into the brake fluid when refilling, because this will result in ineffective clutch and brake operations.**
- **If you use a mug for adding brake fluid, keep it solely for that purpose.**

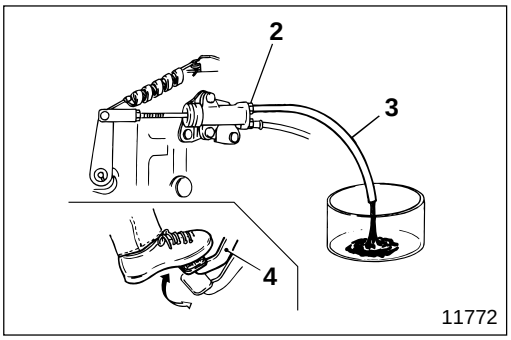
CAUTION

- **Be careful not to splash brake fluid on related parts as this could damage the paintwork.**
- **Be sure to wipe off brake fluid immediately if you splash it on the paintwork.**



[Inspection and replenishment]

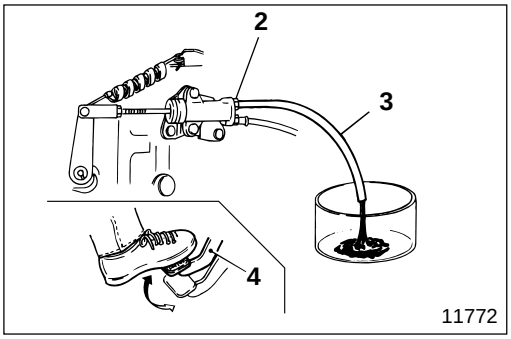
- Inspect the level of the brake fluid in fluid tank **1**. It should fall between the "**MAX**" and "**MIN**" levels.
- If it is below the "**MIN**" level, lift up the lid flap and remove the cap from fluid tank **1**, then supply the specified brake fluid until the level has come up to the "**MAX**" level. Do not fill above the "**MAX**" level.



[Replacement]

- Attach vinyl pipe **3** to air bleeder **2** of the clutch power cylinder.
- Loosen air bleeder **2** and depress clutch pedal **4** several times to drain brake fluid completely.

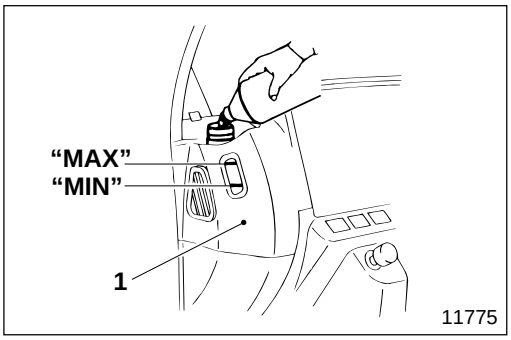
- Supply new brake fluid to the **"MAX"** level of fluid tank **1**. Depress clutch pedal **4** repeatedly until the old brake fluid discharged from vinyl pipe **3** is replaced by the new brake fluid.



NOTE

Carry out this operation maintaining the brake fluid level in fluid tank 1 between "MAX" and "MIN".

- Attach vinyl pipe **3** to air bleeder **2** of the clutch power cylinder as in the replacement procedure.
- Fill fluid tank **1** with brake fluid, and loosen air bleeder **2** of the clutch power cylinder then depress clutch pedal **4** continuously.
- Keep depressing clutch pedal **4**, and tighten air bleeder **2** when air is bled completely.
- Depress clutch pedal **4** several times again, then keep it depressed at its fullest extent.
- With clutch pedal **4** depressed, loosen air bleeder **2** to drain brake fluid containing air. Release the pedal after tightening the air bleeder.



- Repeat this operation until air is no longer present in the fluid being drained.
- When this operation is completed, tighten air bleeder **2** at specified torque.
- Check that brake fluid is at the "**MAX**" level of fluid tank **1**, and supply new brake fluid if necessary.
- Check for brake fluid leakage from each of the parts with clutch pedal **4** depressed.

Manual Transmission Gear Oil

Tightening torque

Unit : N·m {ft.lbs, kgf·m}

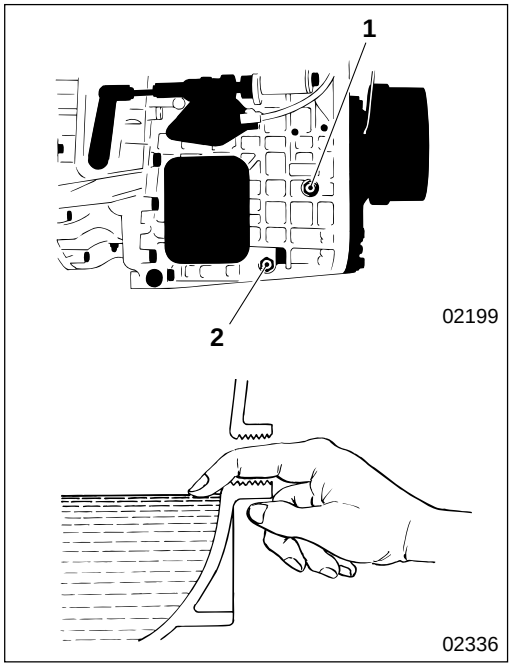
Location	Parts to be tightened	Tightening torque	Remarks
1	Inspection plug	69±15 {51±11, 7±1.5}	—
2	Drain plug	69±15 {51±11, 7±1.5}	—

Sealant

Location	Points of application	Specified sealant	Quantity
1	Thread area of inspection plug	THREEBOND 1105D	As required
2	Thread area of drain plug	THREEBOND 1105D	As required

WARNING

The oil temperature is high immediately after the vehicle stopped, so take care not to scald yourself.



[Inspection and replenishment]

- Remove inspection plug **1** and check whether the oil level is up to the edge of the entrance.
- If the level is low, add oil through the inspection plug hole until the level comes up to the edge of the entrance.

[Replacement]

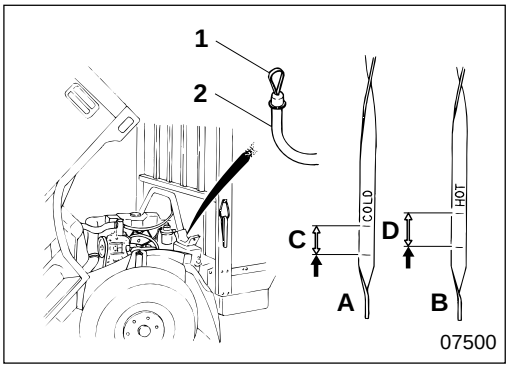
- Drain the oil after removing inspection plug **1** and drain plug **2**.
- Remove any metal particles sticking to the magnetic part of drain plug **2** before reinstalling the plug.
- Add oil through the inspection plug hole until the level comes up to the edge of the entrance.
- Reinstall inspection plug **1**.

Automatic Transmission Fluid < FH210 >

Tightening torque

Unit : N·m {ft.lbs, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
3	Drain plug	29 to 39 {22 to 29, 3 to 4}	—



[Inspection and replenishment]

- Park the vehicle on level ground, make sure that the parking brake is fully activated and chock the wheels to keep them from rolling.
- Start the engine and let it idle. To fill the hydraulic circuit with automatic transmission fluid, slowly shift the range selector lever once through the P to L ranges and finally shift into the N range.
- While the engine is still idling, pull out dipstick **1** and wipe off the fluid sticking to it. Reinsert the dipstick, then pull it out again and check the fluid level.
- If the fluid level is inspected right after the engine is started and the fluid temperature is still low (40±15°C {104±27°F}) the level should be within area **C** marked COLD on dipstick **1** as illustrated in **A**.
- If the fluid level is inspected after the vehicle has been driven and the fluid temperature is high (65±15°C {149±27°F}) the level should be within area **D** marked HOT on dipstick **1** as illustrated in **B**.

WARNING⚠

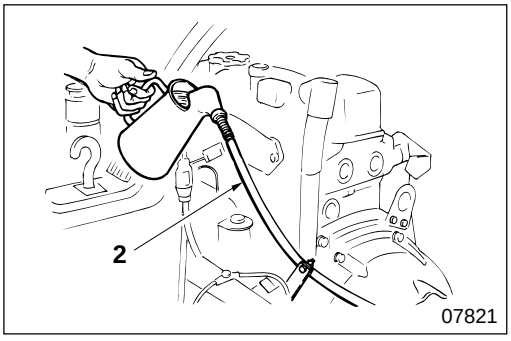
Take care during the inspection because the engine will be running. Take sufficient care to avoid burns or injuries resulting from contact with moving parts.

CAUTION⚠

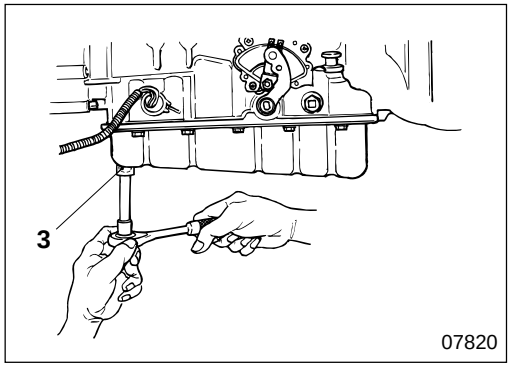
Be sure to wipe off the dust from the safety cap and the upper part of filler tube 2 before you pull out dipstick 1.

NOTE

- **Make sure the vehicle is parked on level ground when you are checking the fluid level.**
- **Make sure the range selector lever is in the N range and the engine is idling when you are checking the fluid level. When the engine is at standstill, the fluid level appears higher than it actually is.**
- **To ensure the fluid is correct, reinspect the fluid level after an actual drive.**



- If the fluid level is low, top it up to the specified level by supplying automatic transmission fluid (DEXRON III type) through filler tube **2**.



[Replacement]

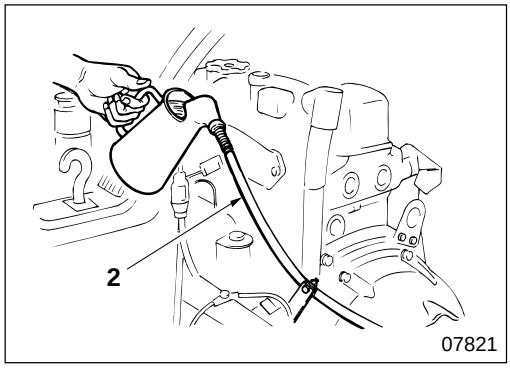
- Place a container under the oil pan, remove drain plug **3** in the front of the oil pan and drain the fluid.

WARNING

Take care because the automatic transmission fluid temperature immediately after the engine has stopped is very high. To avoid scalds, wait until a safe temperature has been reached before draining the fluid.

NOTE

- **The fluid will drain faster if the engine is first run to raise the fluid temperature.**
- **The fluid cannot be drained from the hydraulic circuit, the torque converter or the oil cooler.**



- Reinstall the gasket, and oil pan drain plug **3**.
- Add automatic transmission fluid (DEXRON III type) through filler tube **2**.

CAUTION

Make sure that dirt and foreign particles do not become mixed in with the fluid when it is added.

- Shift the range selector lever into the N range, start the engine and let it idle for at least two minutes.
- After shifting the lever through all ranges once, shift it back into N.

CAUTION

To prevent burning out the interior of the automatic transmission assembly, make sure that the engine is not allowed to race when you do the above.

- Supply the fluid until the fluid level is at the lower limit of the specified area on dipstick **1**. Next, check the fluid level to make sure it is within the specified limit.

NOTE

- **Determining the fluid level immediately after supplying the fluid might be difficult due to the fluid stuck in the inside of the filler tube. Therefore, check the fluid level a few times between intervals.**
- **If the fluid is overfilled, it will overflow and can be mistaken for leakage.**
- **Let the engine idle and, while paying attention to the fluid level, pour in the fluid slowly.**

Automatic Transmission Fluid and Oil Filter < FH211 >

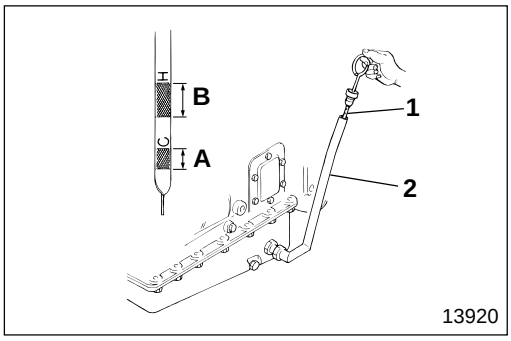
Tightening torque

Unit : N·m {ft.lbs, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
4	Drain plug	20 to 27 {15 to 20, 2.05 to 2.75}	—
5	Dipstick guide connector	125 to 135 {91 to 100, 12.55 to 13.76}	—
6	Bolt (Oil pan mounting)	14 to 18 {10 to 13, 1.4 to 1.8]	—
8	Bolt (Oil filter mounting)	14 to 18 {10 to 13, 1.4 to 1.8]	—
12	Oil filter	9.8 to 20 {7 to 14, 1 to 2}	—

Fluid

Location	Points of application	Specified fluid	Quantity
11	Body of O-ring	Automatic transmission fluid (DEXRON or DEXRON II type)	As required
12	Gasket of oil filter with thin application	Automatic transmission fluid (DEXRON or DEXRON II type)	As required



[Inspection and replenishment]

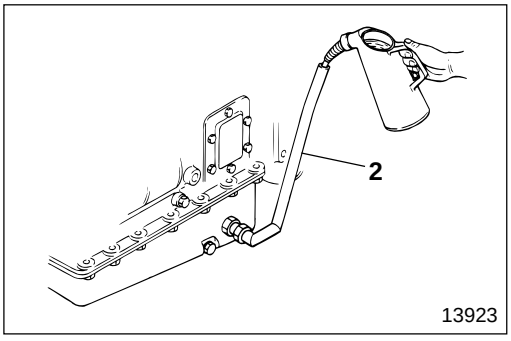
- Park the vehicle on level ground, make sure that the parking brake is fully activated and chock the wheels to keep them from rolling.
- Start the engine and let it idle. To fill the hydraulic circuit with automatic transmission fluid, shift the range selector lever from N → R → N → D → 2 → D → N. Repeat this process five times, finally shifting to N.
- While the engine is still idling, pull out dipstick **1** and wipe off the fluid sticking to it. Reinsert the dipstick, then pull it out again and check the fluid level.
- If the fluid level is inspected right after the engine is started and the fluid temperature is still low (approximately 15 to 49°C {60 to 120°F}), the level should be within area **A** marked COLD on dipstick **1**.
- If the fluid level is inspected after the vehicle has been driven and the fluid temperature is high (approximately 71 to 93°C {160 to 200°F}), the level should be within area **B** marked HOT on dipstick **1**.

WARNING

Take care during the inspection because the engine will be running. Take sufficient care to avoid burns or injuries resulting from contact with moving parts.

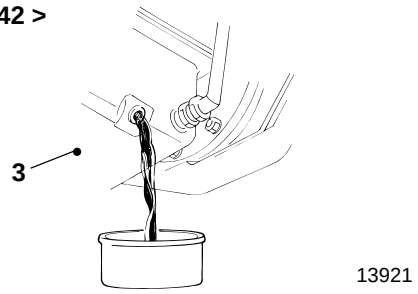
NOTE

- **Make sure the vehicle is parked on level ground when you are checking the fluid level.**
- **Make sure the range selector lever is in the N position and the engine is idling when you are checking the fluid level. When the engine is stopped, the fluid level appears higher than it actually is.**
- **Be sure to wipe off the dust from the safety cap and the upper part of dipstick guide 2 before you pull out dipstick 1.**
- **To ensure the fluid is correct, reinspect the fluid level after an actual drive.**



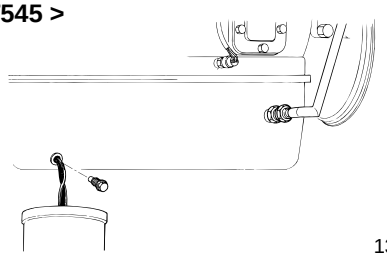
- If the fluid level is low, add automatic transmission fluid (DEXRON or DEXRON II type) through dipstick guide **2** until the correct level on dipstick **1** is reached.

< AT542 >



13921

< AT545 >



13922

[Replacement]

- Park the vehicle on level ground, chock the wheels and shift the range selector lever to the N position.
- Place a container under oil pan **3**, remove drain plug **4** and drain the fluid.

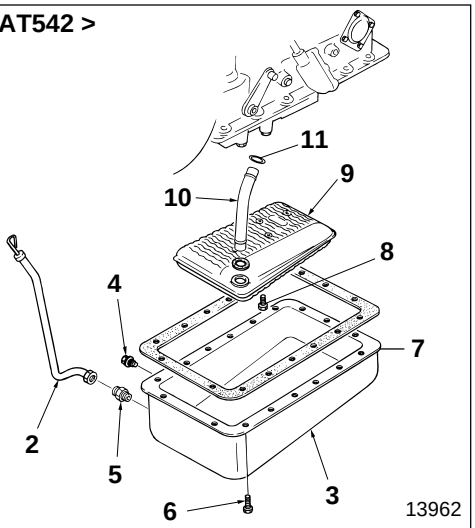
WARNING⚠

Take care because the fluid temperature immediately after the engine has stopped is very high. To avoid scalds, wait until a safe temperature has been reached before draining the fluid.

NOTE

- **The fluid will drain faster if the engine is first run to raise the fluid temperature.**
- **The fluid cannot be drained from the hydraulic circuit, the torque converter or the oil cooler.**
- **Check the drained fluid for dirt, metal particles and metal fragments.**

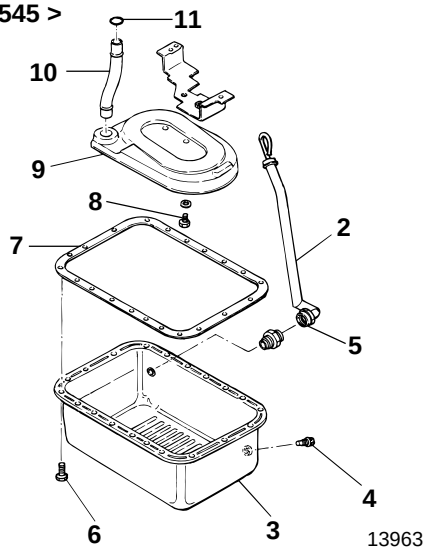
< AT542 >



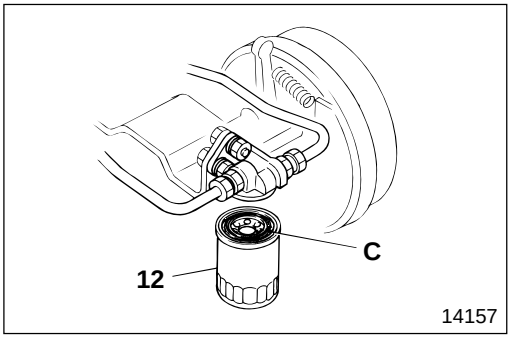
13962

- Remove oil pan **3**, intake pipe **10**, O-ring **11**, gasket **7** and oil filter **9**.
- Clean oil pan **3**.
- Replace O-ring **11**, gasket **7** and oil filter **9**.

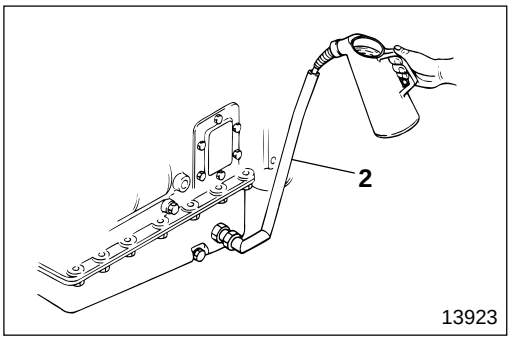
< AT545 >



13963



- Remove oil filter **12** (for oil cooler) by turning it counterclockwise.
- Lightly coat gasket **C** with the fluid before installing oil filter **12**. Then tighten the oil filter.



- Supply fluid through dipstick guide **2**.

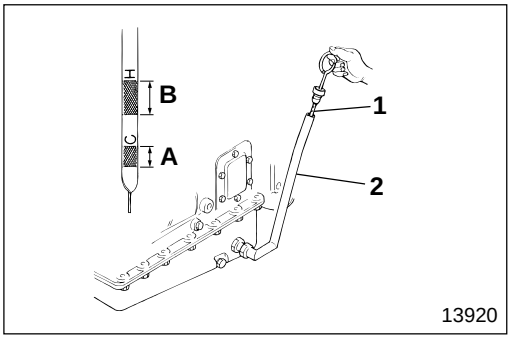
CAUTION

Make sure that dirt and foreign particles do not become mixed in with the fluid when it is added.

- Shift the range selector lever to the N position, start the engine and let it idle for about one minute.
- After shifting the lever through all positions once, shift it back to N position.

CAUTION

To prevent burning out the interior of the automatic transmission assembly, make sure that the engine is not allowed to race when you do the above.



- Check and adjust so that the fluid level is within the specified area on dipstick **1**.

NOTE

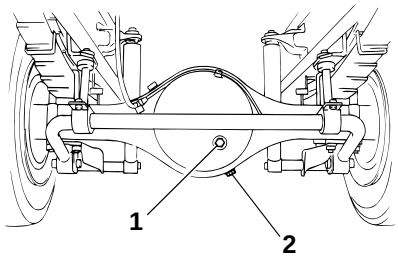
- **As the temperature of the fluid rises, so does the fluid level. If you add fluid while the temperature is still low (approximately 15 to 49°C {60 to 120°F}), make sure that the level stays within area A, marked COLD on dipstick 1.**
- **Let the engine idle and, while paying attention to the fluid level, pour in the fluid slowly.**
- **It is sometimes hard to check the fluid level, immediately after supplying fluid, because of the fluid adhering to the interior of dipstick guide 2. If this is the case, check the fluid level several times at intervals.**
- **Be careful not to supply too much fluid because you might mistake the fluid that overflows from the air breather for fluid leakage.**

Rear Axle Gear Oil

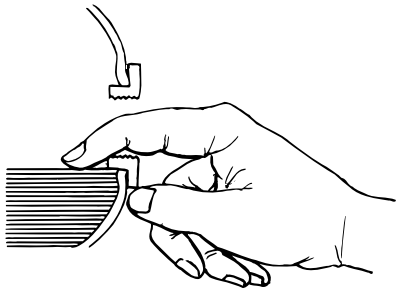
Tightening torque

Unit : N·m {ft.lbs, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
1	Inspection plug	98 to 115 {72 to 87, 10 to 12}	—
2	Drain plug	98 to 115 {72 to 87, 10 to 12}	—



02201



02340

[Inspection and replenishment]

WARNING

The oil temperature is high immediately after the vehicle has stopped, so take care not to scald yourself.

- Remove inspection plug **1**, check the oil level and make sure it is up to the edge of the entrance.
- If the oil level is low, add oil through the inspection plug hole until the level comes up to the edge of the entrance.
- Insert inspection plug **1**.

[Replacement]

- Drain the oil after removing inspection plug **1** and drain plug **2**.
- Remove any metal particles sticking to the magnetic part of drain plug **2** before reinstalling the plug.
- Supply oil through the inspection plug hole until the level comes up to the edge of the entrance.
- Reinstall the inspection plug.

Power Steering Fluid

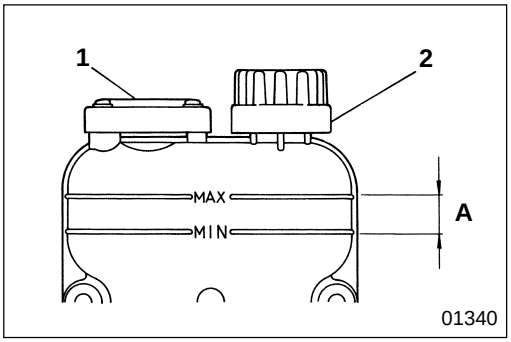
Tightening torque

Unit : N·m {ft.lbs, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
3	Oil pipe	66.69±12.75 {49±9.4, 6.8±1.3}	—

Fluid

Location	Points of application	Specified fluid	Quantity
1	Power steering oil tank	Automatic transmission fluid (DEXRON or DEXRON II type)	Between "MAX" and "MIN" on the power steering oil tank



WARNING⚠

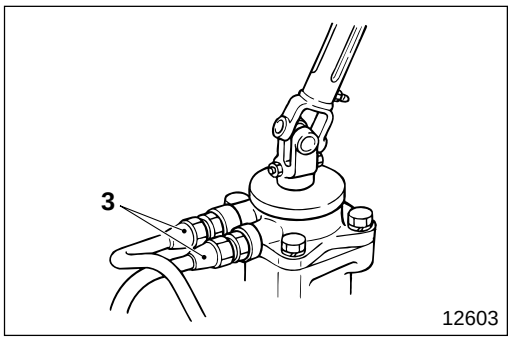
Because the brake booster (hydraulic booster) uses power steering fluid, do not let other fluids such as brake fluid, etc. get mixed with the power steering fluid inside the power steering oil tank.

[Inspection and replenishment]

- Straighten the front wheels and stop the engine.
- Inspect the level of the fluid in power steering oil tank **1**. It should fall between fluid level range **A**.
- If it is below the **"MIN"** level, remove filler cap **2** from power steering oil tank **1**, then supply the specified fluid until the level has come up to the **"MAX"** level. Do not fill above the **"MAX"** level.

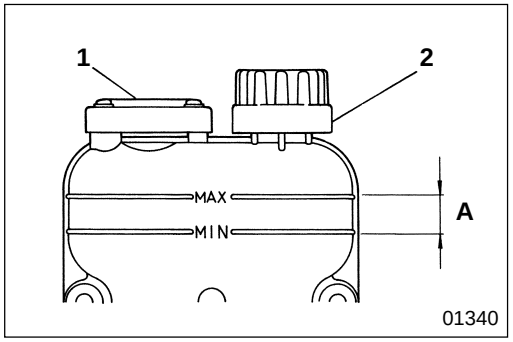
CAUTION⚠

If the fluid level is far below the recommended range, the fluid may be leaking.



[Replacement]

- Drainage
  - Jack up the front wheels.
  - Disconnect oil pipe **3** connected to the power steering booster.
  - Turn the steering wheel fully left and right repeatedly, and drain the fluid from the power steering booster.
  - After draining the fluid, tighten oil pipe **3** at specified torque.



[Supply]

- Supply fluid into power steering oil tank **1** up to filler cap **2**.
- With the engine stopped, jack up the front wheels and turn the steering wheel fully left and right repeatedly. When the fluid level has dropped, add fluid to maintain the fluid level within range **A**.
- Start the engine and letting it idle, turn the steering wheel fully left and right repeatedly. When the fluid level has dropped, add fluid to maintain the fluid level within range **A**. Repeat these steps until the fluid level does not drop.
- Depress the brake pedal fully several times repeatedly, until as in the case of the steering wheel, the fluid level does not drop anymore. (The steering wheel at such time does not need to be operated)
- If there is an abnormal noise, air is still in the system. Turn the steering wheel several times, next depress the brake pedal several times to raise the fluid temperature to approximately 60 to 80°C {140 to 176°F}, then stop the engine and wait for approximately five minutes.
- Lower the front wheels and turn the steering wheel several times to make sure there is no abnormal noise.
- With the engine stopped, depress the brake pedal several times, activate the brake booster (hydraulic booster) emergency pump and bleed air.
- When there is no abnormal noise after the above procedure has been performed, bleeding is completed. Check oil tank **1** fluid level, and pipe and hose connections for fluid leakage.
- After bleeding is completed, inspect brake booster (hydraulic booster) performance (input and output characteristics). Gr 35A

Brake Fluid

Tightening torque

Unit : N·m {ft.lbs, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
2	Air bleeder	7.8 to 12 {5.8 to 8.5, 0.8 to 1.2}	—

Fluid

Location	Points of application	Specified fluid	Quantity
1	Fluid tank	Brake fluid (SAE J1703f or FMVSS No.116 DOT3)	As required

Special tools

Unit : mm {in.}

Location	Tool name and shape	Part No.	Application
2	Vinyl hose 	MH033102	Air bleeding

WARNING

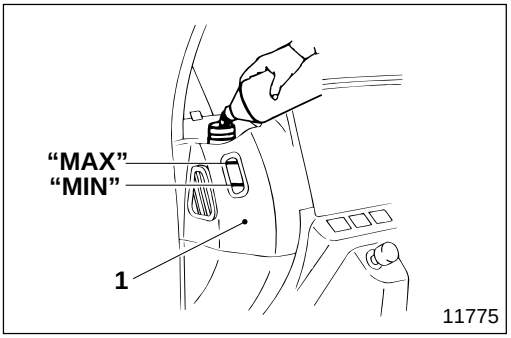
- **The clutch fluid system and the brake fluid system use the fluid tank in common.**
- **You must use new brake fluid (SAE J1703f or FMVSS No.116 DOT3). Do not add different quality fluid or mineral oil (gas oil, engine oil, gear oil, automatic transmission fluid, etc.) to the clutch system, because this will cause the rubber parts of the clutch system and brake system to swell, resulting in faulty clutch operation, as well as ineffective braking and brake dragging.**
- **Do not allow foreign particles or water to become mixed into the brake fluid when refilling, because this will result in ineffective clutch and brake operations.**
- **If you use a mug for adding brake fluid, keep it solely for that purpose.**

CAUTION

- **Be careful not to splash brake fluid on related parts as this could damage the paintwork.**
- **Be sure to wipe off brake fluid immediately if you splash it on the paintwork.**

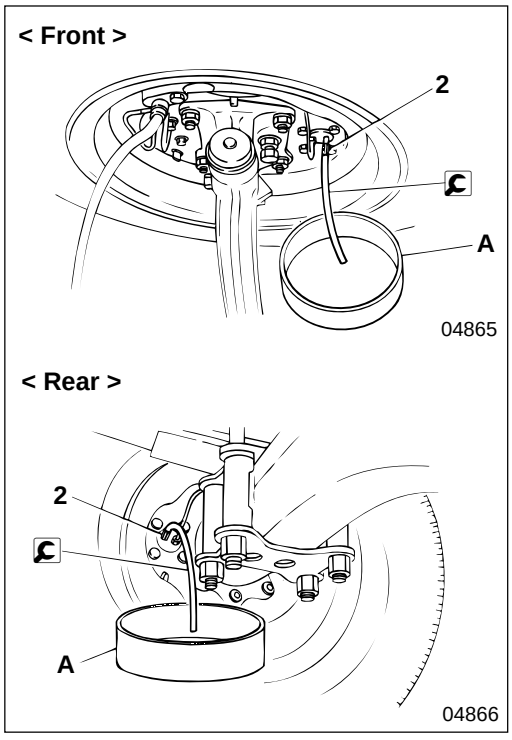
NOTE

Supply and maintain brake fluid level to the "MAX" level of the fluid tank.

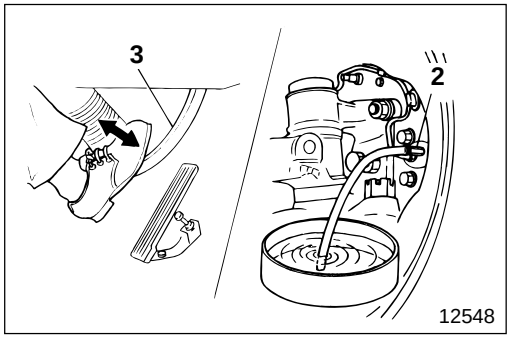


[Inspection and replenishment]
- Inspect the level of the brake fluid in fluid tank **1**. It should fall between the "**MAX**" and "**MIN**" levels.
- If it is below the "**MIN**" level, remove the cap from fluid tank **1**, then supply the specified brake fluid until the level comes up to the "**MAX**" level. Do not fill above the "**MAX**" level.

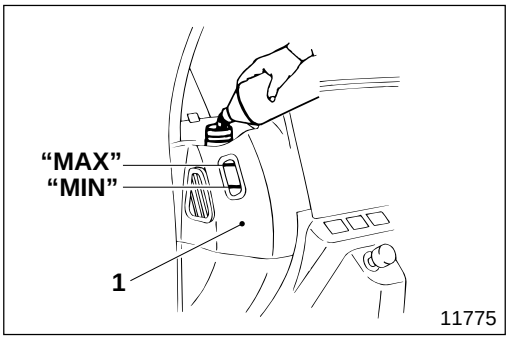
[Replacement]
- Start engine and let it idle until brake fluid replacement is completed.



- Attach one end of vinyl hose to air bleeder **2** and place the other end in container **A**.

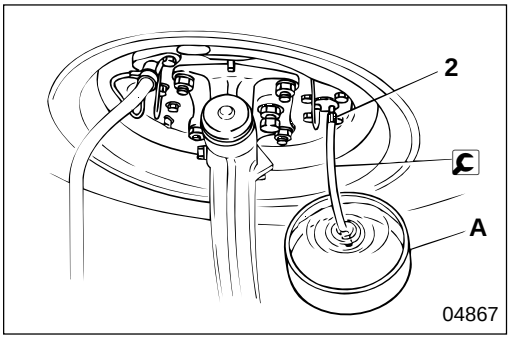


- Loosen air bleeders **2** and depress brake pedal **3** several times to drain brake fluid completely.



- Maintaining a supply of new brake fluid up to the "**MAX**" level of fluid tank **1**, depress brake pedal **3** repeatedly until the old brake fluid of the brake system is replaced with new fluid.
- Carry out air bleeding of the brake system.

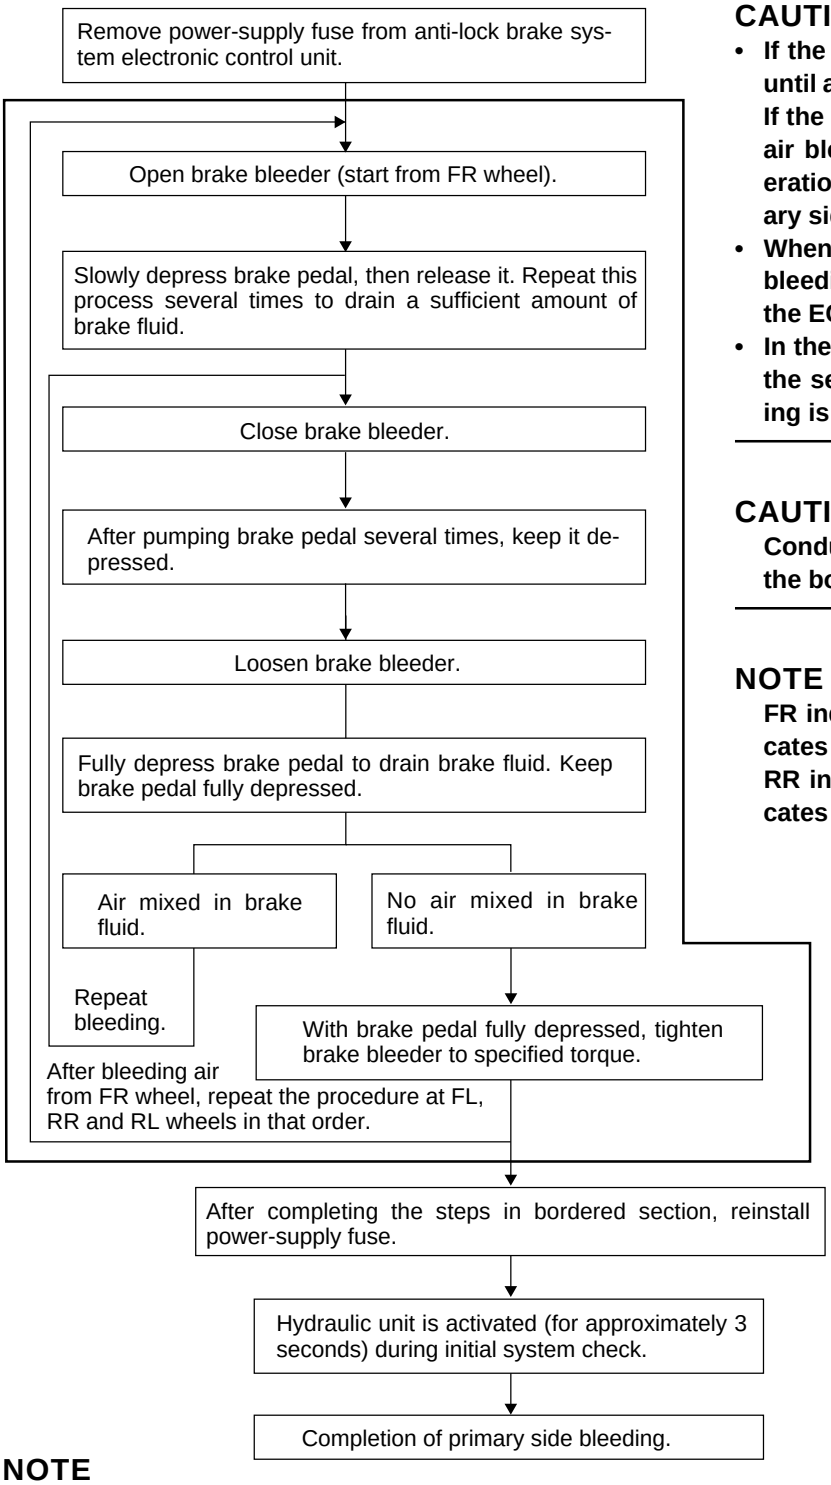
[Air bleeding]



- Start the engine and let it idle until brake fluid replacement is completed.
- Attach one end of vinyl hose to air bleeder **2** of the wheel brake. Place free end in container **A** filled with brake fluid.
- Carry out air bleeding in the following sequence:

(1) Air bleeding during regular maintenance, and hydraulic unit replacement

When air bleeding is conducted during regular maintenance or when the hydraulic unit is replaced, brake fluid flows into the secondary side (operating circuit) of the hydraulic unit. Therefore, bleed the primary side (normal circuit) by following the procedures below. In the event air enters the secondary side, bleed air by following the procedures described in (2).



CAUTION

- **If the battery is disconnected, do not reconnect until air bleeding of the primary side is complete. If the battery is reconnected before primary side air bleeding is complete, the system check operation is activated and air can enter the secondary side.**
- **When the battery must be connected prior to air bleeding, remove the power-supply fuse from the ECU.**
- **In the event air enters the secondary side, bleed the secondary side after primary side air bleeding is complete.**

CAUTION

Conduct the air bleeding operation described in the bordered section at every wheel.

NOTE

FR indicates front-axle right wheel, and FL indicates front-axle left wheel.
RR indicates rear-axle right wheel, and RL indicates rear-axle left wheel.

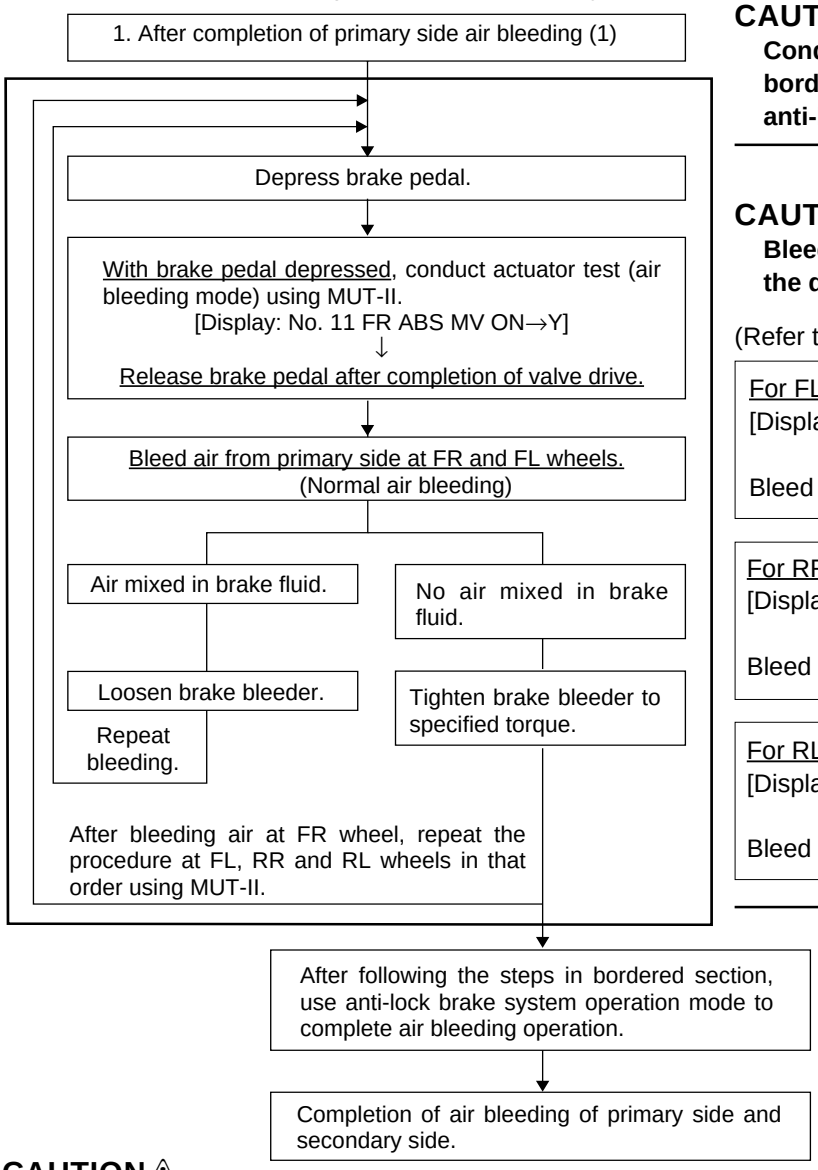
NOTE

- **The primary side (normal circuit) is a hydraulic circuit formed when the system is in non-operation.**
- **The secondary side (operating circuit) is a hydraulic circuit which connects with the primary side only when the system is in operation (when the system is in non-operation, the secondary side is disconnected from the primary side).**

(2) Air bleeding of secondary side

If the system starts operating before air bleeding of the primary side is complete, air can enter the secondary side. In the event the system accidentally starts before the completion of primary side air bleeding, follow the procedures below to bleed air. If air enters the secondary side, air flows into the primary side when the system starts, and this can extend the brake pedal stroke.
During air bleeding, use the MUT-II to conduct an actuator test (anti-lock brake system operation mode) at all wheels.

Use the MUT-II when bleeding air from the secondary side.



CAUTION

Conduct air bleeding operation described in the bordered section at every wheel by using the anti-lock brake system operation mode.

CAUTION

Bleed air from wheels other than FR according to the directions below.

(Refer to NOTE below)

For FL wheel
[Display: No. 12 FL ABS MV ON→Y]
↓
Bleed air from primary side at FR and FL wheels.

For RR wheel
[Display: No. 13 RR ABS MV ON→Y]
↓
Bleed air from primary side at RR and RL wheels.

For RL wheel
[Display: No. 14 RL ABS MV ON→Y]
↓
Bleed air from primary side at RR and RL wheels.

CAUTION

- **Avoid continuous execution of the actuator test (anti-lock brake system drive) using the MUT-II; otherwise, excessive heating of the anti-lock brake system motor, valve and other parts can cause hydraulic unit damage.**
- **Do not conduct the actuator test with the MUT-II while bleeding air from the primary side; otherwise, air can enter the secondary side from the primary side.**
- **When mixing of air was found after air bleeding is conducted to correct an excessive brake pedal stroke, bleed air from the secondary side, too.**

NOTE

- **For the MUT-II operation for the actuator test during air bleeding, refer to section 4.**
- **If a drive operation is conducted for the FR and RL wheels at one time using the MUT-II, subsequent air bleeding of the primary side conducted at each wheel will not remove air from the secondary side.**

● Greasing Various Areas of Chassis

Carefully clean away all dust and dirt from the grease nipples, and use the specified type of grease. The areas to be greased are shown in the following illustration.

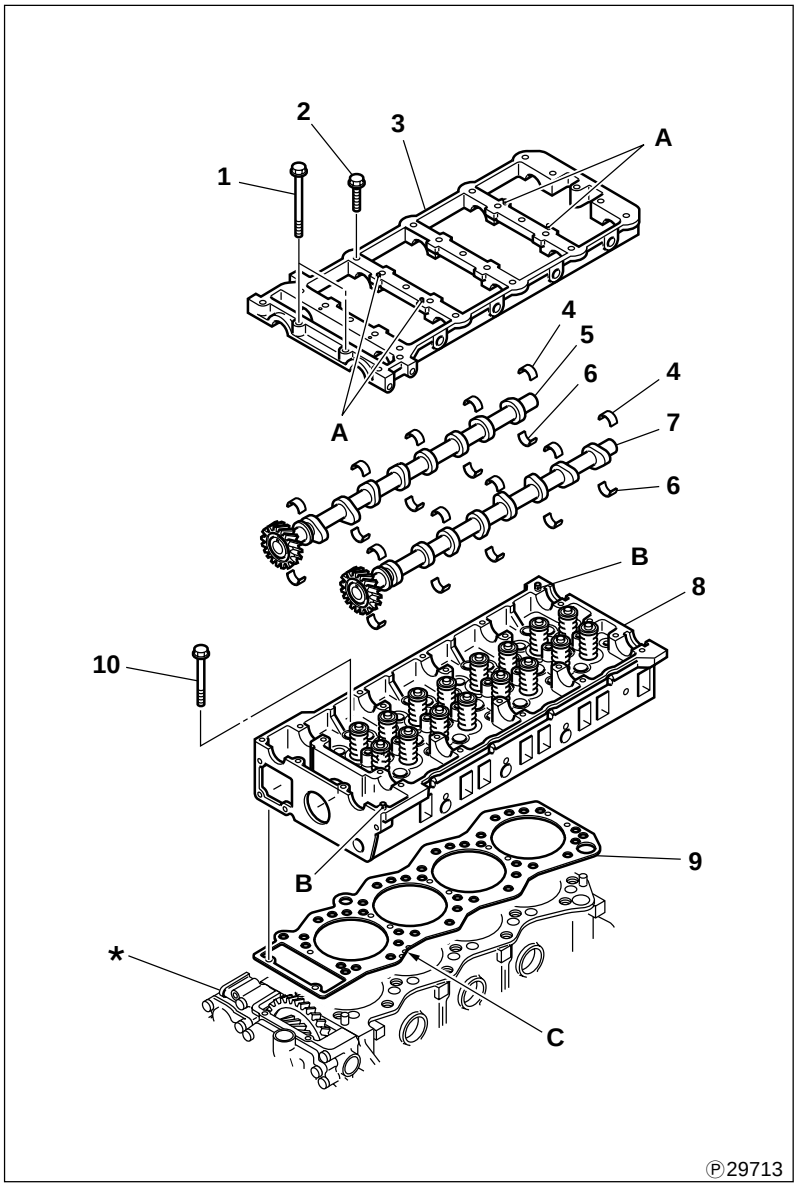
The 4M50T2 engine is of the double overhead camshaft (DOHC) type. The valve mechanism and timing gear arrangement is illustrated above.

Cylinder Head, Cylinder Head Gasket, Camshaft and Camshaft Frame

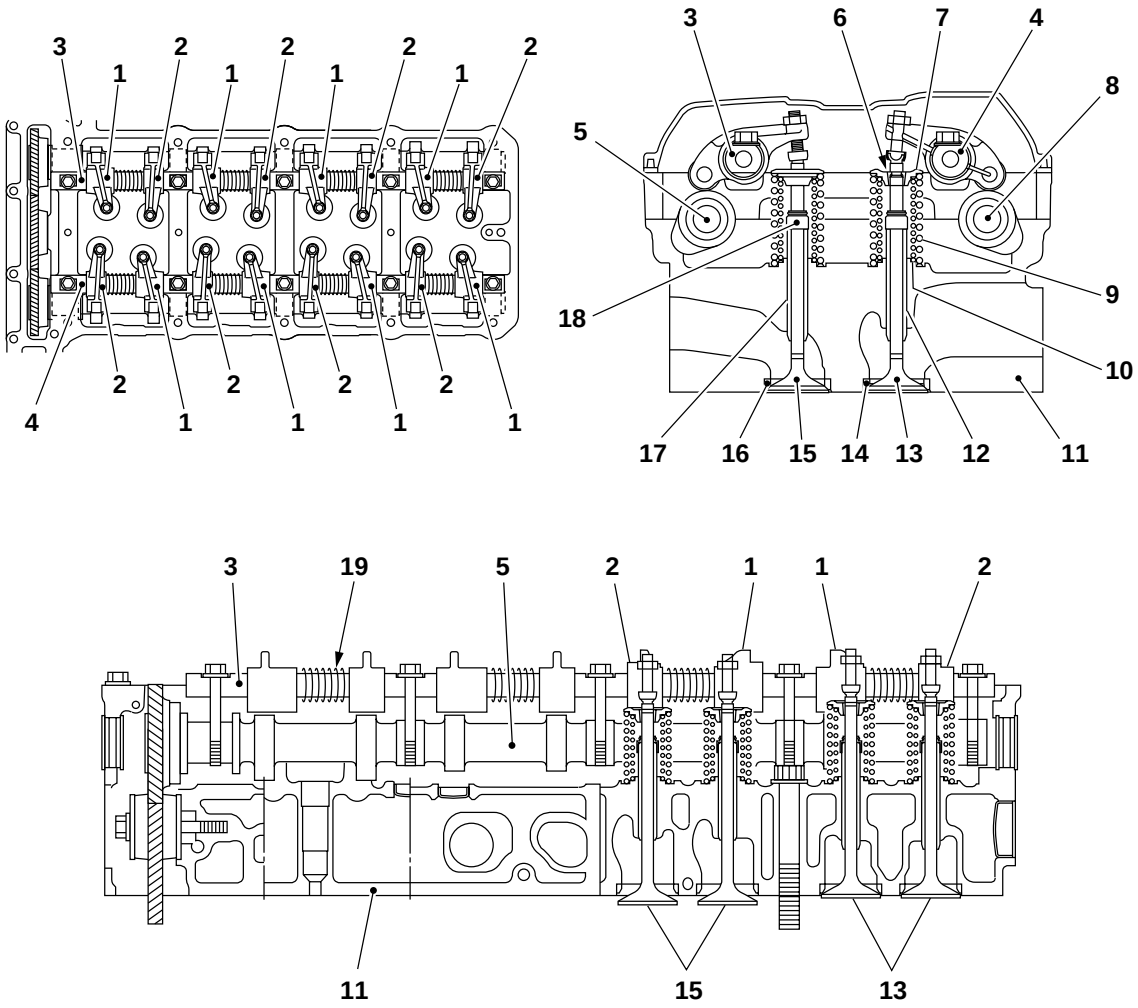


1 Bolt (× 2)
2 Bolt (× 13)
3 Camshaft frame
4 Camshaft bearing (Upper)
5 Exhaust camshaft
6 Camshaft bearing (Lower)
7 Inlet camshaft
8 Cylinder head
9 Cylinder head gasket
10 Cylinder head bolt

A : Locating pin
B : Locating pin
C : Notched portion
*** :** Front

- The camshafts **5** and **7** have their journals supported by the cylinder head **8**, and are held down from above by the camshaft frame **3**.
- The camshaft bearings **4** and **6**, both upper and lower, are identical parts. When they are reassembled, however, be sure to reinstall them in their original positions, as they were before disassembly.
- The exhaust camshaft **5** and the inlet camshaft **7** have the same gears but use different cams. Use care not to confuse them at reassembly.
- As for the cylinder head gasket **9**, select and use one of proper thickness suitable for the projection of piston. The thickness of gaskets is identifiable by a difference in the shape of the notched portion **C**.
- The bolts **2** (× 13) are threaded into the cylinder head **8**, whereas the bolts **1** (× 2) are threaded into the front case *****.

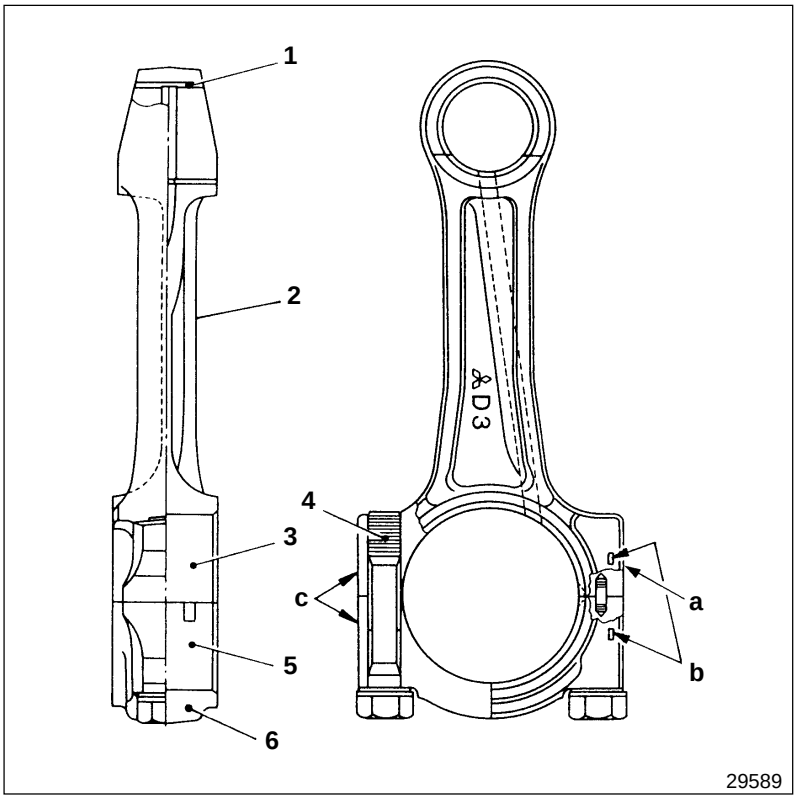
Valve Mechanism



1 Short rocker
2 Long rocker
3 Exhaust rocker shaft
4 Inlet rocker shaft
5 Exhaust camshaft
6 Valve collet
7 Upper retainer
8 Inlet camshaft
9 Outer valve spring
10 Inner valve spring
11 Cylinder head
12 Inlet valve guide
13 Inlet valve
14 Inlet valve seat
15 Exhaust valve
16 Exhaust valve seat
17 Exhaust valve guide
18 Valve stem seal
19 Rocker shaft spring

- The rockers come in two types; short rockers **1** and long rockers **2**, and are mounted in different directions as illustrated.
- The valve springs include the outer springs **9** and inner springs **10**. A pair of outer and inner springs are used for a valve.

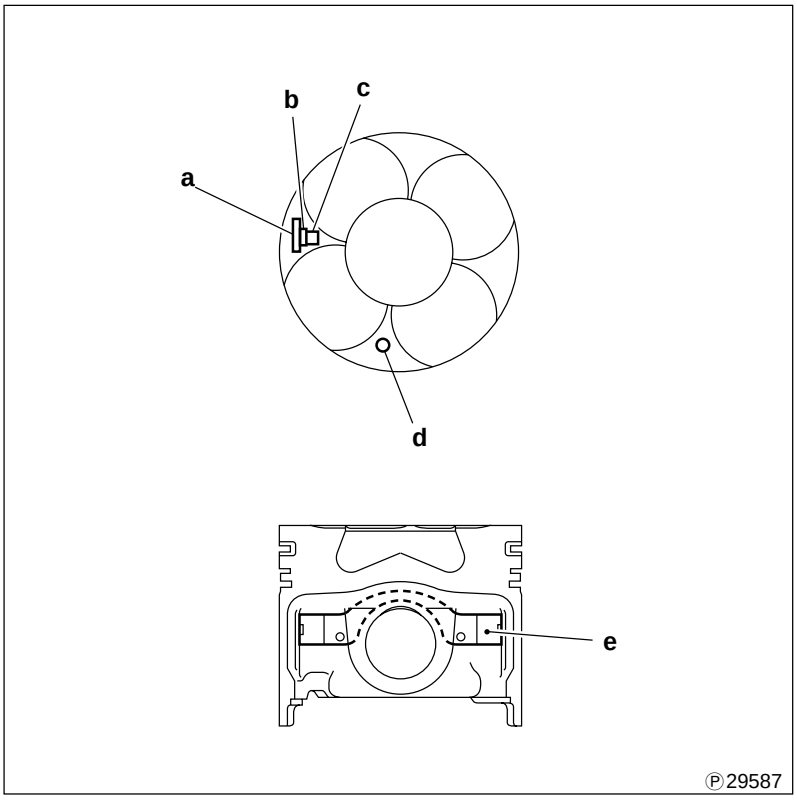
Connecting Rods



1 Connecting rod bushing
2 Connecting rod
3 Upper connecting rod bearing
4 Connecting rod bolt
5 Lower connecting rod bearing
6 Connecting rod cap

***a :** Weight mark stamp
"A" to "G"
(where "A" indicates the maximum connecting rod weight.)
***b :** Alignment mark
***c :** Alignment mark

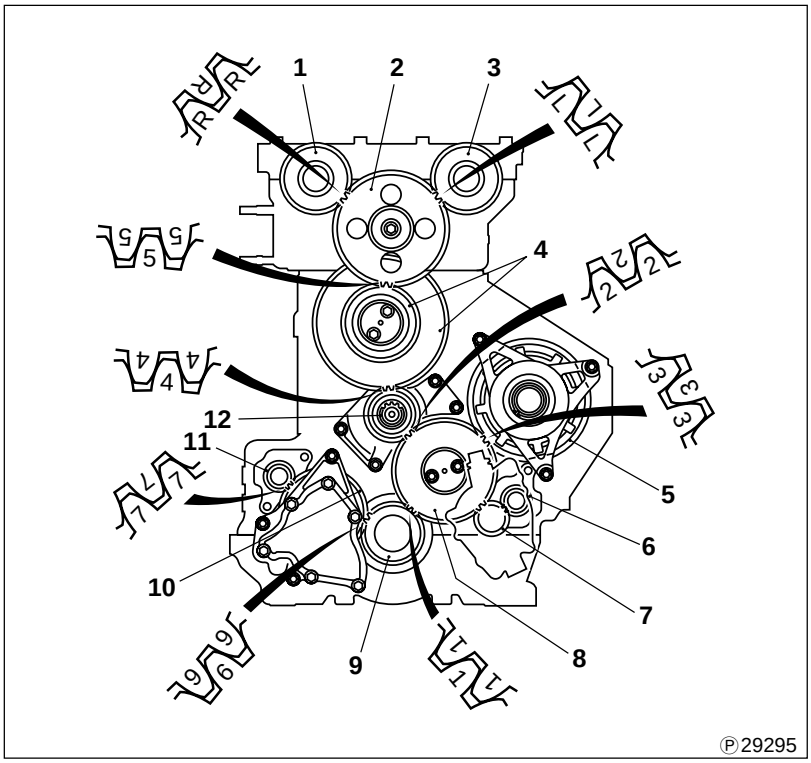
Pistons



a : Part number
b : Weight mark
c : Size mark
"**A**", "**B**"
Pistons marked "**B**" are larger than those marked "**A**" in the outside diameter.
d : Front mark
Indicated by "○".
e : Strut

- Pistons to be used can be selected by matching the size mark of the piston with that of the cylinder liner. 📖 P11A-11
- The piston is made of special aluminum alloy. Its total height is relatively low and both end faces of the piston in the direction of the piston pin are concaved for weight reduction.
- The piston is an autothermic piston reinforced with strut **e**.

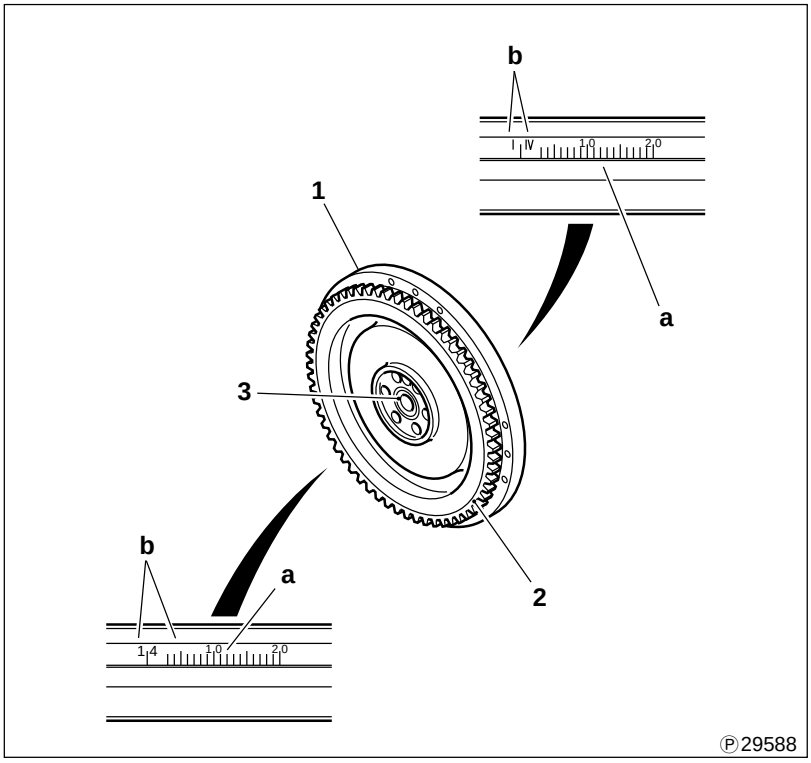
Timing Gears



1 Camshaft gear RH (32)
2 Head idler gear (54)
3 Camshaft gear LH (32)
4 Idler gear (63, 36)
5 Injection pump gear (56)
6 Balance shaft gear LH (14)
7 Vacuum pump gear (15)
8 No. 1 idler gear (49)
9 Crankshaft gear (28)
10 Oil pump gear (41)
11 Balance shaft gear RH (14)
12 Fan shaft (25)
Number of teeth shown in parentheses

Each of the timing gears (except the vacuum pump gear) has alignment marks to ensure correct assembly.

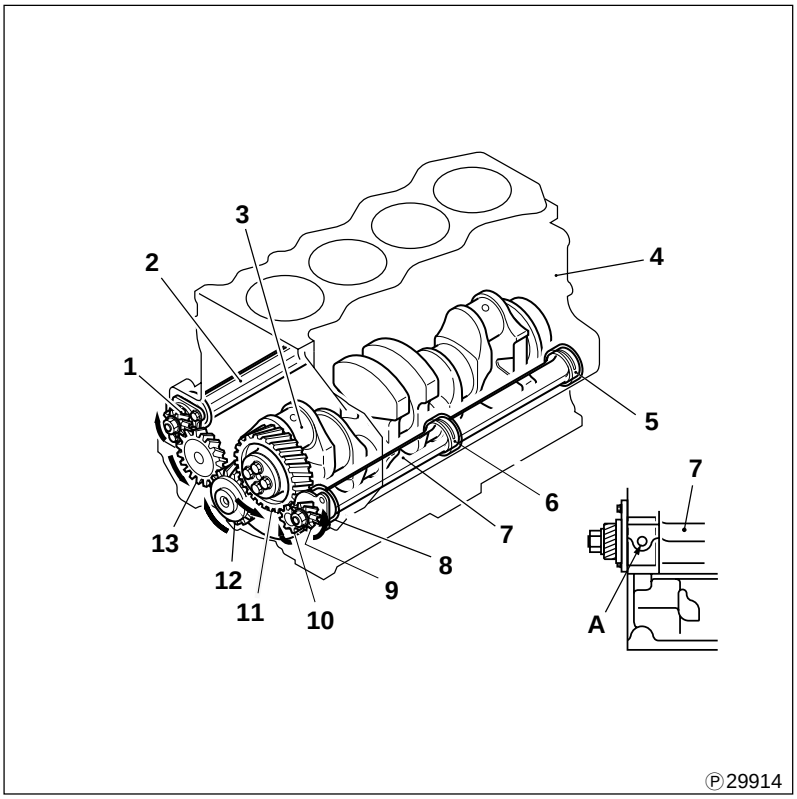
Flywheel



1 Flywheel
2 Ring gear
3 Pilot bearing

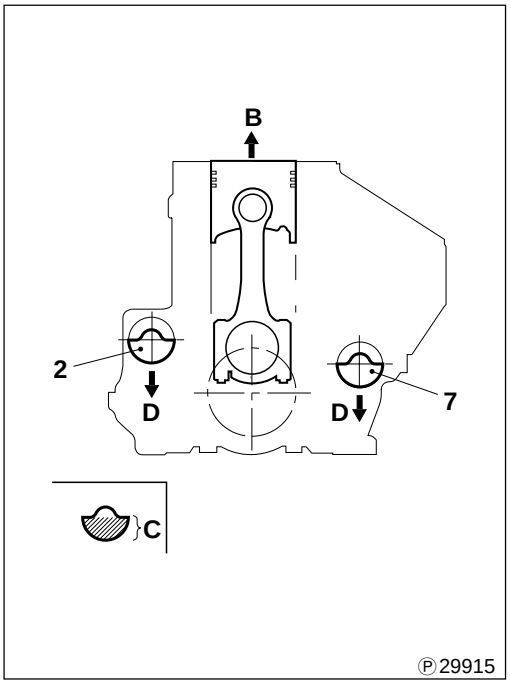
a : Angle scale
b : Cylinder No. (“1 4”, “I IV”)

Balance Shaft



1 Balance shaft gear RH
2 Balance shaft RH
3 Crankshaft
4 Upper crankcase
5 No. 3 balance shaft bushing
6 No. 2 balance shaft bushing
7 Balance shaft LH
8 No. 1 balance shaft bushing
9 Balance shaft gear LH
10 Vacuum pump gear
11 No. 1 idler gear
12 Crankshaft gear
13 Oil pump gear

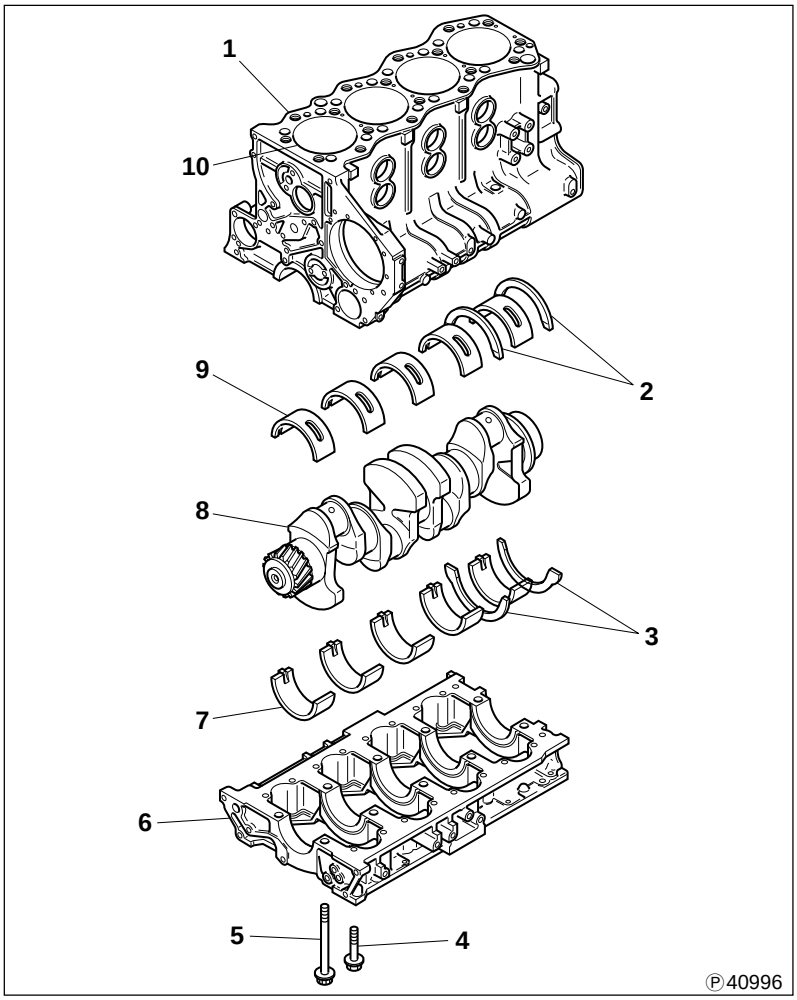
- The balance shafts RH **2** and LH **7** are mounted in the upper crankcase **4** with the crankshaft **3** sandwiched in between, and serve to reduce the engine vibration caused by rotation of the crankshaft.
- Both balance shafts RH **2** and LH **7** are supported by the three balance shaft bushings **5**, **6** and **8** mounted in upper crankcase **4** and driven by the timing gears (🕮 P11A-8).
- The balance shaft LH **7** is provided with a positioning hole **A** to ensure correct assembly. 🕮 P11A-63



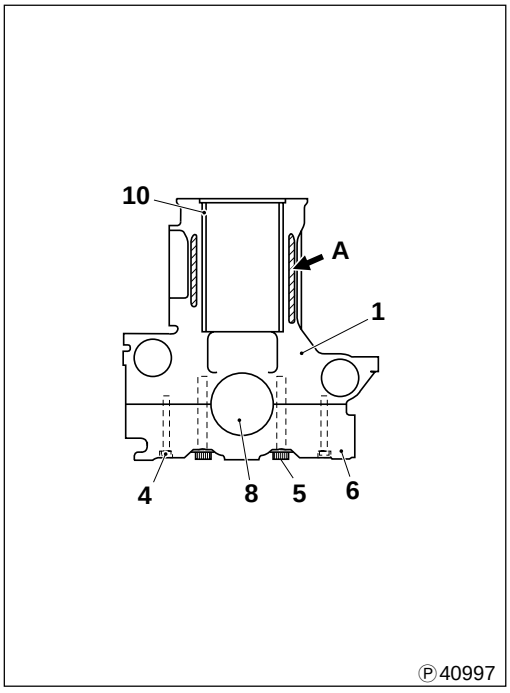
● **Reduction of vertical vibration (Secondary components)**

- The reciprocating motion of the piston produces inertial force **B**, the source of vertical vibration, at the top and bottom dead centers of the piston.
- The balance shafts RH **2** and LH **7** rotate in such a way that at the top and bottom dead centers of the piston, the semi-circular weight portion **C** will always be placed opposite to the piston head in terms of top or bottom position.
- As a result, at the top and bottom dead centers of the piston, both balance shafts RH **2** and LH **7** produce equal centrifugal force **D** to offset inertial force **B** of the piston, thereby reducing vertical vibration.
- In addition, in the medium and high engine speed ranges, the crankshaft rotation moments (secondary components) are also reduced by the balance shafts.

Crankcase and Main Bearings

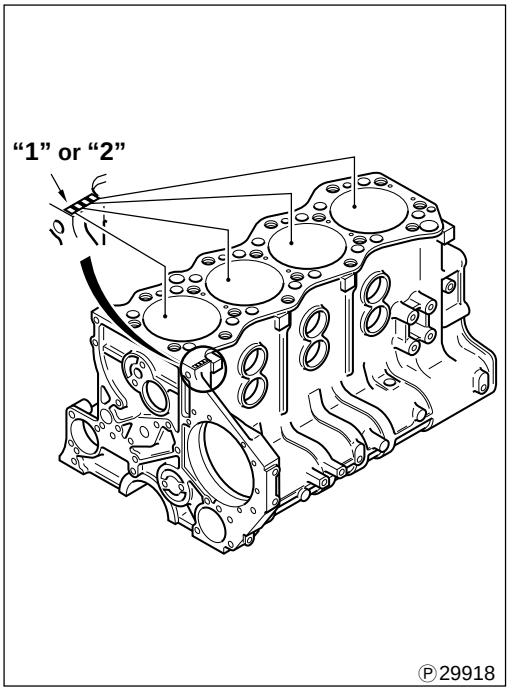


1 Upper crankcase
2 Upper thrust plate
3 Lower thrust plate
4 Bolt
5 Main cap bolt
6 Lower crankcase
7 Lower main bearing
8 Crankshaft
9 Upper main bearing
10 Cylinder liner

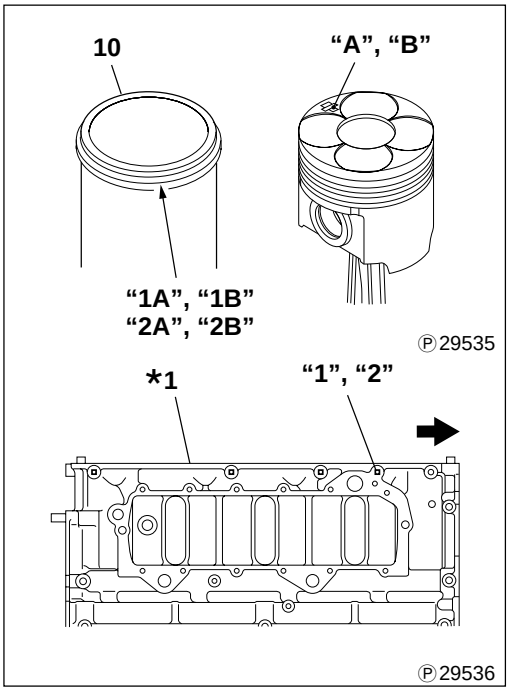


● **Crankcase**

- The crankcase is composed of two parts; upper crankcase **1** and lower crankcase **6**, which are coupled together with crankshaft **8** in between.
- The upper crankcase **1** has four cylinder bores provided into which cylinder liners **10** are fitted.
- Water jacket **A** is provided around the cylinders to cool down the cylinder liners **10**.
- The bolts **4** used to couple the upper crankcase **1** and the lower crankcase **6** and the main cap bolts **5** require the specified procedure to be followed when tightened. P11A-83



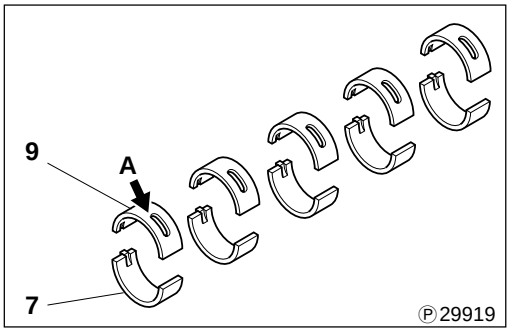
- Size mark "**1**" or "**2**" is stamped on the upper crankcase **1** for selective fitting of pistons in the crankcase.
- The size marks for the four cylinders are collectively stamped at a single location, and indicate the sizes of the respective cylinder liners as illustrated. P11A-7



● **Cylinder liner**

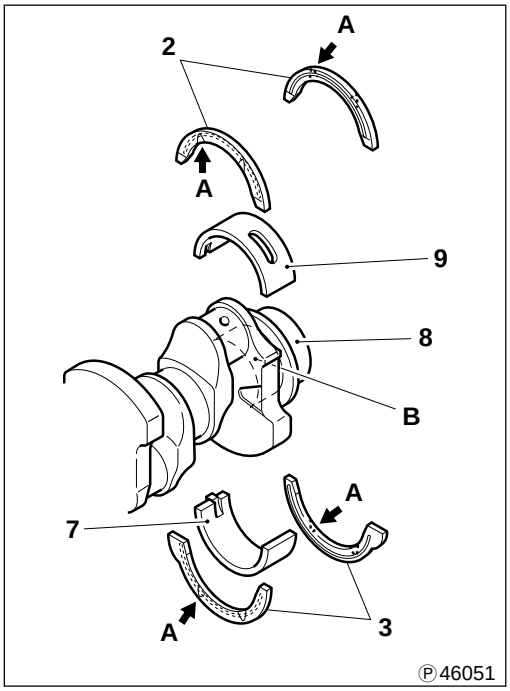
- Select a cylinder liner **10** which has the same size mark as those stamped on the upper crankcase ***1** the piston.
- The size marks on the upper crankcase ***1** are arranged in the order of No. **1**, **2**, **3** and **4** cylinders starting from the engine front **C**.

Size marks on upper crankcase	Size marks on cylinder liners	Size mark on pistons
"1"	"1A"	"A"
	"1B"	
"2"	"2A"	"B"
	"2B"	



● **Main bearings**

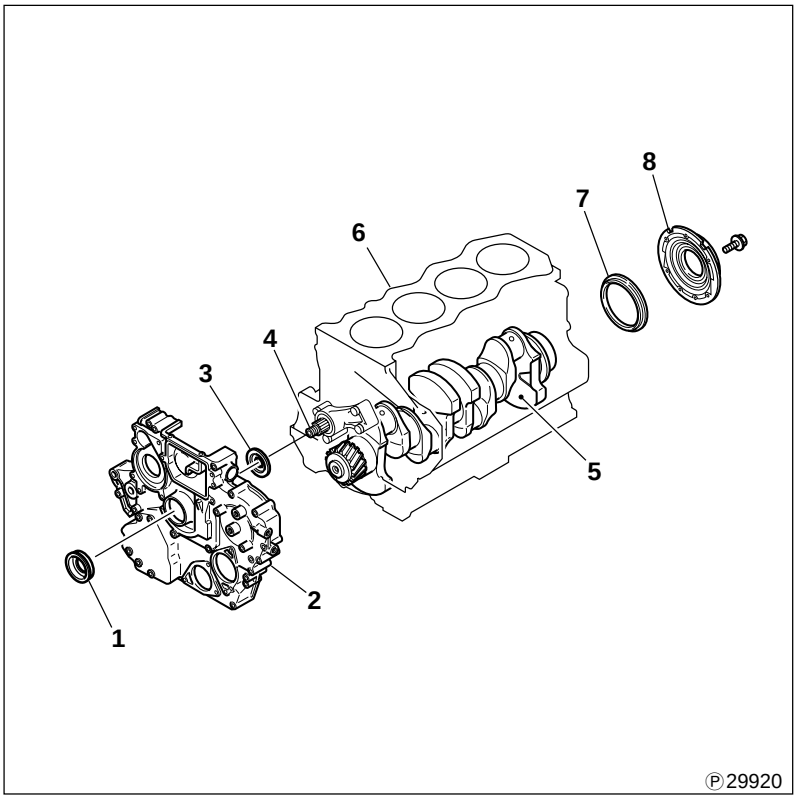
The upper main bearing **9** has an oil hole **A** through which engine oil is supplied to the journal of the crankshaft **8**.



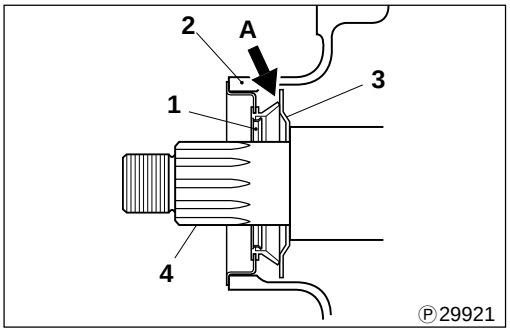
● **Thrust plates**

- The thrust plates include upper thrust plates **2** and lower thrust plates **3**. They are mounted at both ends of the upper main bearing **9** and the lower main bearing **7** at the rearmost portion of the crankshaft **8**.
- The thrust plates to be used should have a proper thickness suitable for the end play of the crankshaft **8**.
  Each thrust plate has an oil groove in two places to assure its smooth sliding on the journal **B** of the crankshaft **8**.

Oil Seals

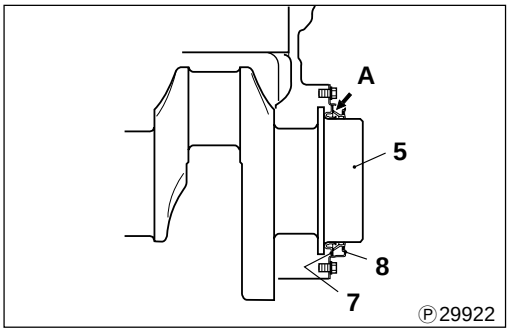


1 Front oil seal
2 Front case
3 Front oil seal slinger
4 Fan shaft
5 Crankshaft
6 Crankcase
7 Rear oil seal slinger
8 Rear oil seal



● **Front Oil Seal**

- The front oil seal **1** is mounted on the front case **2**. Its lip **A** is in contact with the front oil seal slinger **3** for sealing.
- The front oil seal slinger **3** is fitted on the fan shaft **4**.



● **Rear Oil Seal**

- The rear oil seal **8** is mounted on the crankcase **6**. Its lip **A** is in contact with the rear oil seal slinger **7** for sealing.
- The rear oil seal slinger **7** is press-fitted on the rear end of the crankshaft **5**.

TROUBLESHOOTING

Possible Causes \ Symptoms		Low power output	Abnormal engine noise	Remarks
Cylinder head and valve mechanism	Incorrect valve clearance	○	○	
	Defective cylinder head gasket	○	○	
	Worn valve and valve seat, and deposited carbon	○	○	
	Weakened valve spring	○	○	
	Defective rocker shaft and bracket		○	
	Poor lubrication of rocker shaft bracket		○	
Timing gears	Incorrect backlash in timing gears		○	
	Poor lubrication of timing gear peripheries and idler shafts		○	
Camshaft	Excessive end play in camshaft		○	
	Worn camshaft		○	
Pistons and connecting rods	Worn/damaged piston ring groove(s)	○	○	
	Worn/damaged piston ring(s)	○	○	
	Worn piston pin and connecting rod small end bushing		○	
Crankshaft	Excessive end play in crankshaft		○

MEMO

ON-VEHICLE INSPECTION AND ADJUSTMENT

Measuring Compression Pressure
Service standards

Location	Maintenance item		Standard value	Limit	Remedy
–	Compression pressure	Each cylinder (at 200 rpm)	2550kPa {370 psi, 26 kgf/cm²}	1960 kPa {285 psi, 20 kgf/cm²}	Inspect
		Cylinder-to-cylinder pressure difference	–	0.4 kPa {57 psi, 4 kgf/cm²}	Inspect

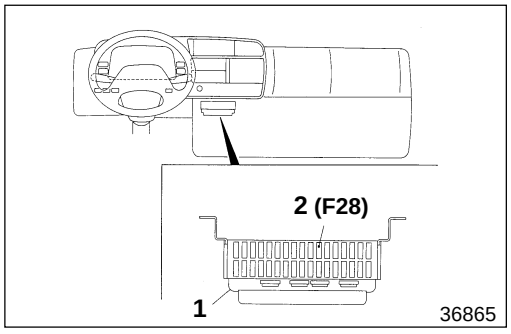
Special tools

Unit: mm {in.}

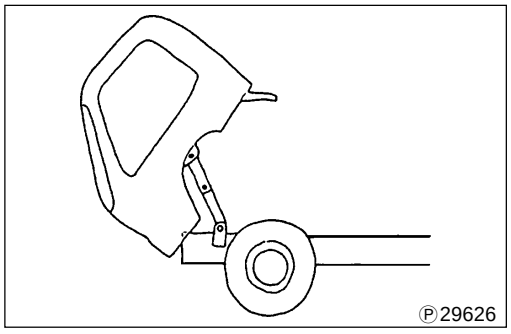
Location	Tool name and shape	Part No.	Application
–	Compression Gauge Adapter 	MH063434	Measuring compression pressure

A drop in compression pressure should be used as a guide in determining a time to overhaul the engine.
Measure the compression pressure at regular intervals, and keep track of its transition which will provide a useful tool for troubleshooting. On a new vehicle, or for a while after replacement of parts with new ones, the compression pressure will be somewhat higher, depending on the break-in condition of piston rings, valve seats, etc., but will return to normal as the parts wear down.

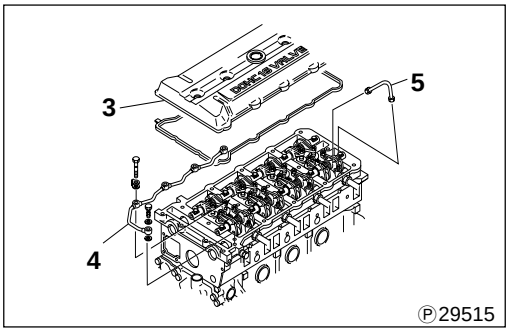
- Prior to an inspection, check to ensure that the engine oil, starter and battery are in normal condition.
- Place the vehicle in the following condition.
  - Warm up the engine until the coolant temperature reaches approx. 75 to 85 °C {167 to 185 °F}.
  - Turn off the lights and auxiliaries.
  - Place the transmission in neutral.
  - Place the steering wheel in the straight-ahead position.



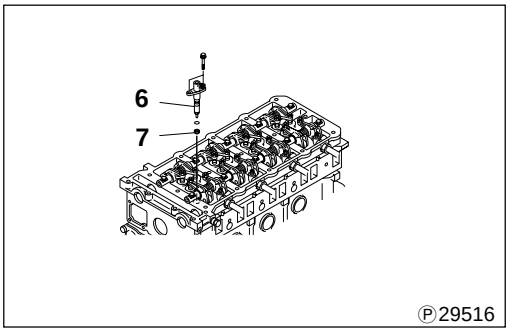
- Remove the fuel cut motor fuse **2** from the fuse box **1** in the cab to make sure that the fuel is not injected when the engine is cranked by the starter.



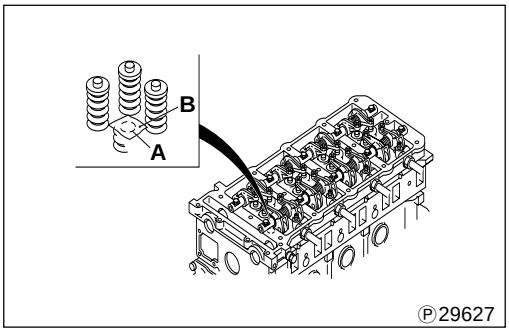
- Tilt the cab.



- Remove the rocker cover **3**, fuel leak-off pipe **4** and injection pipe **5**.
  P11A-24



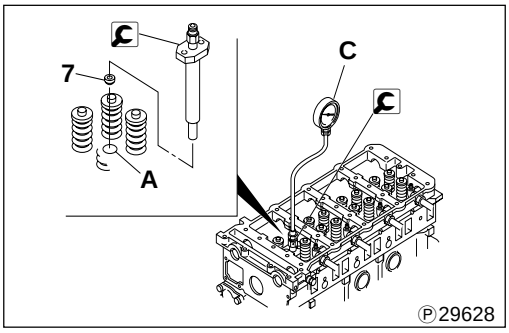
- Remove all injection nozzle assemblies **6** and nozzle gaskets **7**.
  P11A-38



- Cover the injection nozzle mounting holes with pieces of waste cloth **B**. After cranking the engine by the starter, check to ensure that no foreign substances are deposited on the waste cloth.

WARNING ⚠

If there is a crack in any of the cylinders, some of the coolant, engine oil, fuel, etc. will enter the cylinder through the crack. If the engine is cranked in such a condition, these substances heated to high temperatures will blow out from nozzle mounting holes A and can be very dangerous. When the engine is cranked, therefore, stay away from the nozzle mounting holes.



- Fit the nozzle gasket **7** and the Compression Gauge Adapter onto the injection nozzle mounting hole **A** and mount the compression gauge **C**.
- Crank the engine and measure the compression pressure.
- On all of the cylinders, measure the compression pressure and determine the pressure difference between cylinders.
- If any compression pressure or cylinder-to-cylinder pressure difference is out of the limits, pour in a small amount of engine oil from injection nozzle mounting hole **A** and check by measuring the compression pressure again.
  - If the compression pressure increases:
    Worn/damaged piston rings and cylinder inner surfaces are suspected.
  - If the compression pressure remains unchanged:
    A seized valve, incorrectly seated valve or defective cylinder head gasket is suspected.

ON-VEHICLE INSPECTION AND ADJUSTMENT

Inspecting and Adjusting Valve Clearances

Service standards

Unit: mm {in.}

Location	Maintenance item		Standard value	Limit	Remedy
–	Valve clearance (when cold)	Inlet	0.4 {0.016}	–	Adjust
		Exhaust	0.5 {0.020}	–	Adjust

Tightening torques

Unit: N·m {ft.lbs, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
2	Lock nut (adjusting screw tightening)	11.2 {8.25, 1.14}	–

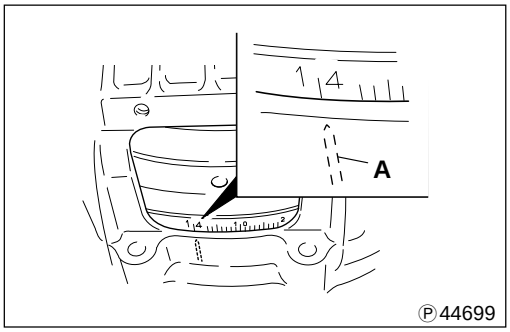
Special tools

Location	Tool name and shape	Part No.	Application
–	Cranking handle Ⓟ45041	MH063568 < without refrigerator > MH063569 < with refrigerator >	Turning fan pulley

Valve clearances should be checked and adjusted as follows while the engine is cold.

[Inspection]

- Tilt the cab.
- Remove the rocker cover. P11A-24
- To place the piston No. 1 or No. 4 at the top dead center on the compression stroke, crank the engine until the pointer **A** in the converter housing (on automatic transmission) inspection window is aligned with the mark between "**1** and **4**" inscribed in the flywheel.

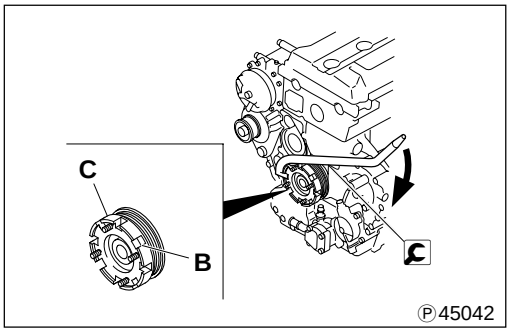


Ⓟ44699

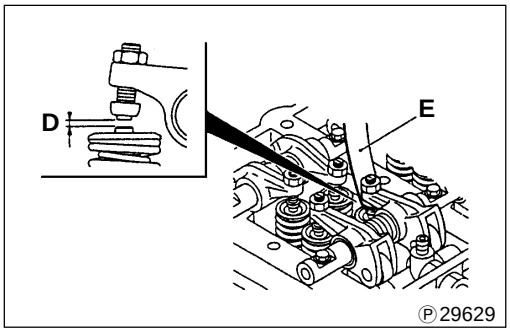
NOTE

Find the cylinder where the rocker arms for both the inlet and exhaust valves can be pushed down. The piston of the cylinder is at the top dead center (TDC) on the compression stroke.

- Use the cranking handle to crank the engine: set it in the groove **B** located on the outer circumference of the fan pulley **C** to turn the crank shaft.



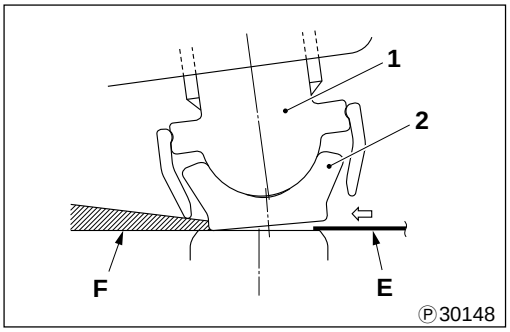
Ⓟ45042



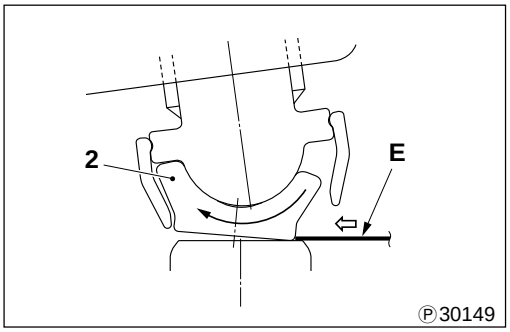
Ⓟ29629

- With the piston No. 1 or No. 4 at the top dead center (TDC) on the compression stroke, measure the valve clearance **D** at the valves marked × in the following table.

Cylinder No.	1		2		3		4	
Valve arrangement	IN	EXH	IN	EXH	IN	EXH	IN	EXH
Piston No. 1 at TDC on compression stroke	×	×	×	–	–	×	–	–
Piston No. 4 at TDC on compression stroke	–	–	–	×	×	–	×	×



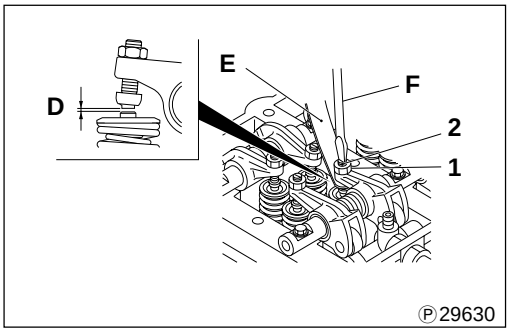
- When measuring the clearances, push the pad **2** of the adjusting screw **1** with the tip of a plain screwdriver **F** or something else from opposite the side where the feeler gauge **E** is to be inserted to open a gap as illustrated, then insert the feeler gauge in the gap.



- If an attempt is made to insert a feeler gauge **E** without opening a gap, the pad will be tilted as illustrated, making it impossible to insert the feeler gauge.

NOTE

- **The feeler gauge E must have a slight drag when taking a measurement.**
- **If the feeler gauge moves without any resistance, the measurement is incorrect (too loose).**

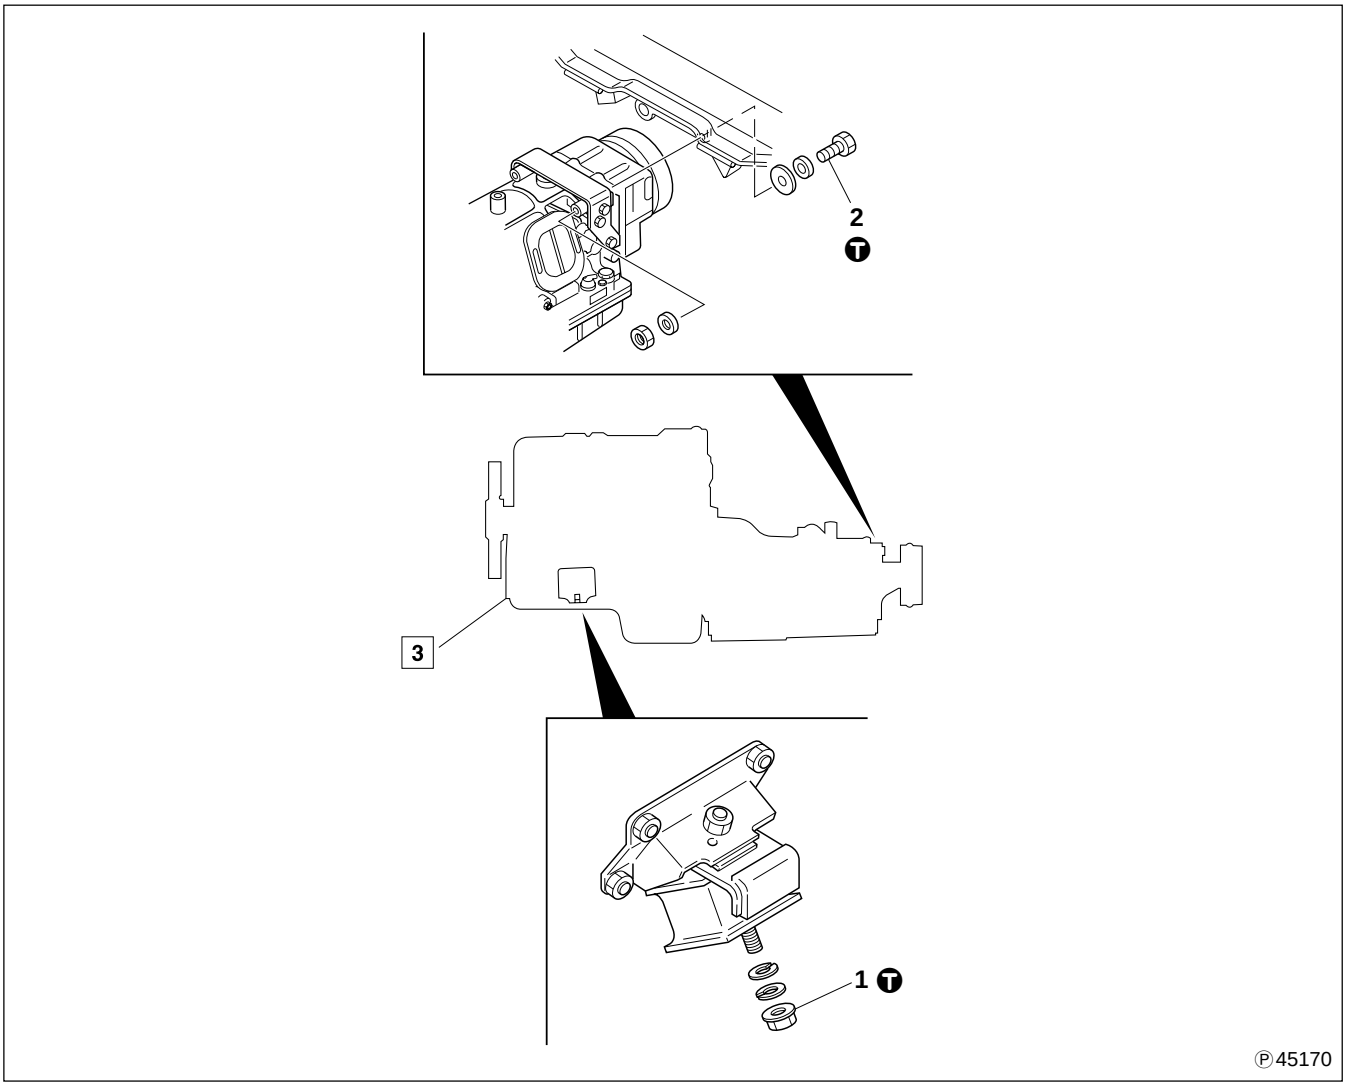


- If the reading is out of specification, adjust by the following procedures.

[Adjustment]

- To adjust the valve clearance **D**, loosen the lock nut **1** and rotate the adjusting screw **2** to adjust the clearance to the extent that the feeler gauge **E** is somewhat hard to move.
- After the adjustment, hold the adjusting screw **2** in position with a screwdriver **F** and tighten the lock nut **1** to the specified torque.
  Thereafter, re-check the valve clearance **D** with the feeler gauge **E**.

REMOVAL AND INSTALLATION OF ENGINE



● **Removal Squence**

1 Nut
2 Bolt
3 Engine and automatic transmission assembly

WARNING ⚠

When lifting the engine and automatic transmission assembly 3, be sure to use a lifting gear or engine hoist capable of lifting an engine of 3.9 to 4.7 kN {880 to 1060 lbs, 400 to 480 kg}

● **Intallation sequence**

Follow the removal sequence in reverse.

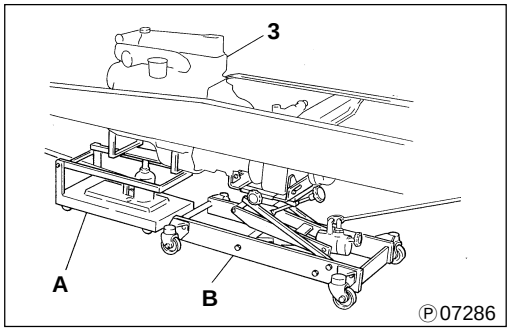
T Tightening torque Unit: N·m{ft.lbs, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
1	Nut (For attaching front mounting)	69 to 99 {51 to 65, 7 to 9}	–
2	Bolt (For attaching rear mounting)	83 to 105 {61 to 80, 8.5 to 11.0}	–

Special tools

Location	Tool name and shape	Part No.	Application
4	Engine front hanger  Ⓟ29983	MH062781	Removal and installation of engine
4	Flange bolt  Ⓟ29984	MF140234 MF140235	Mounting of hanger

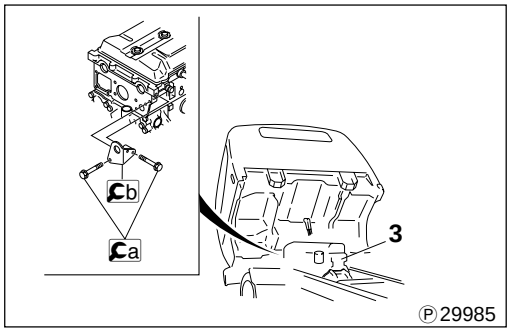
◆ Service procedure



Ⓟ07286

● **Preparatory operation for removal < Fixed cab >**

- Support engine and transmission assembly **3** on engine lifter **A** and transmission jack **B**.
- Make sure that the wiring and hoses are disconnected.

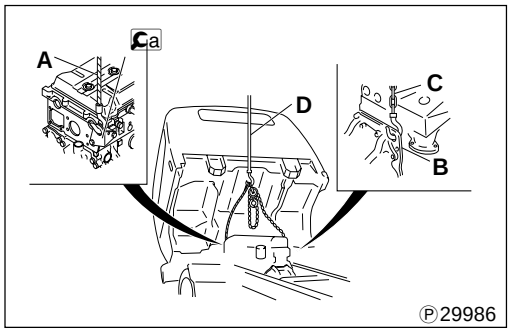


Ⓟ29985

3 **Removal of engine and transmission assembly**

Using a flange bolts, install b engine front hanger to engine and automatic transmission assembly **3**.

REMOVAL AND INSTALLATION OF ENGINE



- Attach wire rope **A** to Ca engine front hanger, and chain block **C** to rear plate **B**. Use crane **D** to make the ropes taut.

WARNING ⚠

To lift engine and automatic transmission assembly 3, use hanging hardware suitable for hoisting an engine weighing 3.9 to 4.7 kN {880 to 1060 lbs, 400 to 480 kg}.

- Make sure that harnesses and pipes are disconnected.
- Slowly lift engine and automatic transmission assembly **3**, making sure that the assembly does not contact the frame or cab.

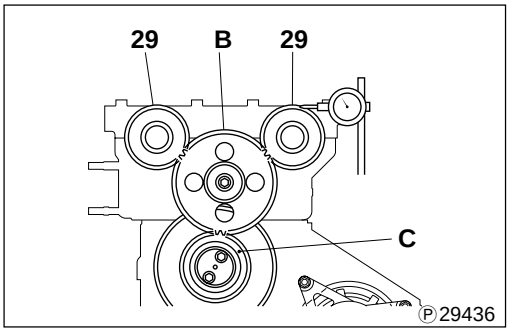
Lubricant and sealant

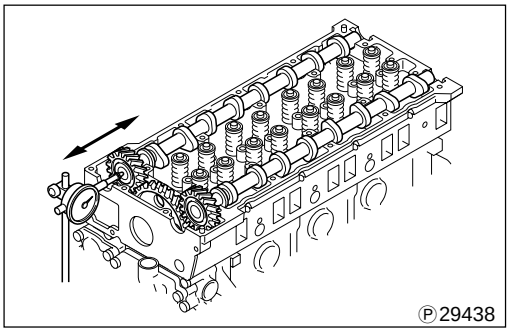
Location	Points of application	Specified lubricant and/or sealant	Quantity
17, 18	Bolt threads and seating surface	Engine oil	As required
22	Surface of camshaft frame which makes contact with cylinder head	THREEBOND 1207C or D	As required
24, 28	Inside surface of camshaft bearing	Engine oil	As required
25	Circumference of packing	THREEBOND 1207C or D	As required
31, 32	Journal and cam portions of camshaft	Engine oil	As required



● **Pre-disassembly inspection**

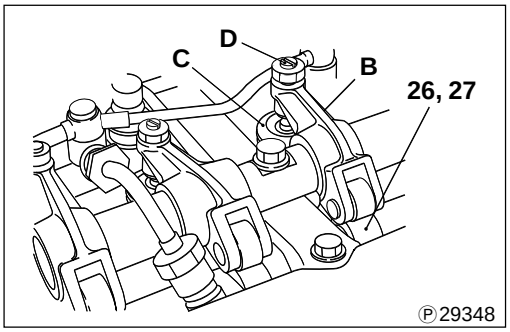
(1) Backlash between head idler gear B and camshaft gear 29 and idler gear assembly C

On a pair of gears, measure backlash at more than three positions. If the reading is more than the limit, replace defective parts.



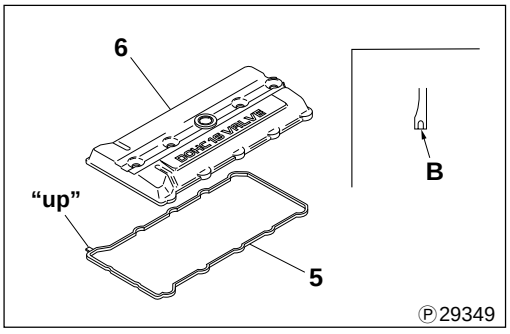
(2) End play of camshaft

If the reading is more than the limit, replace defective parts.



● **Pre-disassembly work**

If the rocker **B** forced up by the camshaft **26** or **27** is pressing the valve spring **C** down, loosen the adjusting screw **D** of the rocker to set the valve spring free.



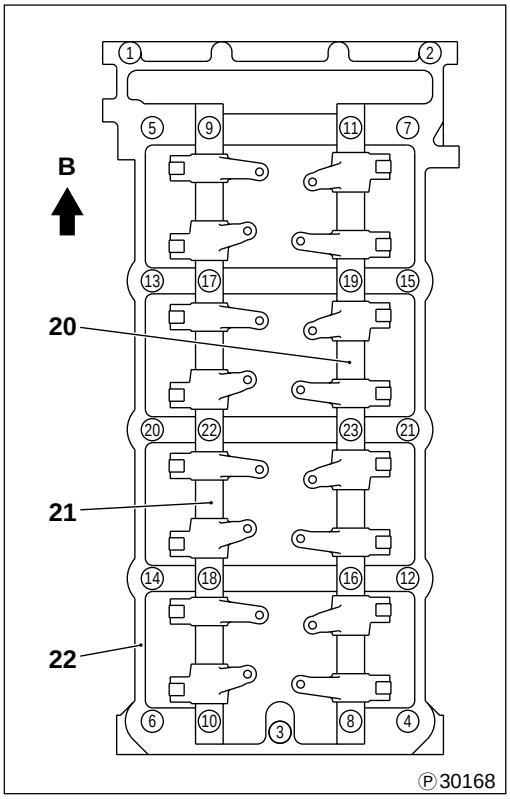
◆ Service procedure

5 **6** **Installation of rocker cover and rocker cover gasket**

- Before installing the rocker cover **6**, remove oil and other deposits thoroughly from the gasket groove **B**.
- Face the rocker cover gasket **5** as illustrated when it is installed on the rocker cover **6**.

CAUTION ⚠

Make sure that the rocker cover gasket 5 is not twisted when installed.

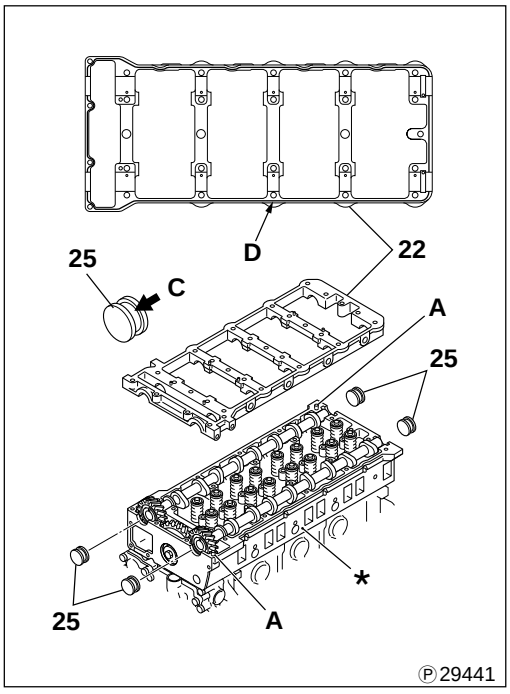


20 to **22** , **25** **Rocker shaft assemblies, camshaft frame and packing**

[Removal]

Loosen the bolts **18** and **19** (① through ㉓) one after another, a small amount at a time, in the numbered sequence shown in the illustration. Then remove the rocker shaft assemblies **20** and **21** and the camshaft frame **22**.

B : Front of engine



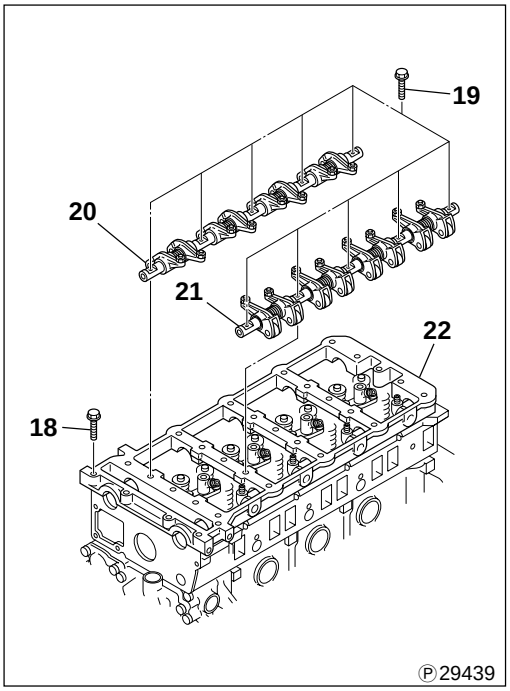
[Installation]

- Apply an even bead of sealant (ϕ 2 ± 1 mm {ϕ 0.079 ± 0.039}) without any break to all around the illustrated portion **C** of the four packings **25**.
- Apply an even bead of sealant (ϕ 1 mm {0.039}) without any break on the circumference **D** of the camshaft frame **22**.
- After the sealant application, install the camshaft frame **22** and the packings **25** on the cylinder head assembly * in less than three minutes.

CAUTION ⚠

- **Check to ensure that the sealant application surfaces C and D are clean and free from any oil or other deposits.**
- **When installing the parts, make sure that the sealant is not forced out of position.**
- **Do not start the engine in less than an hour after installation.**

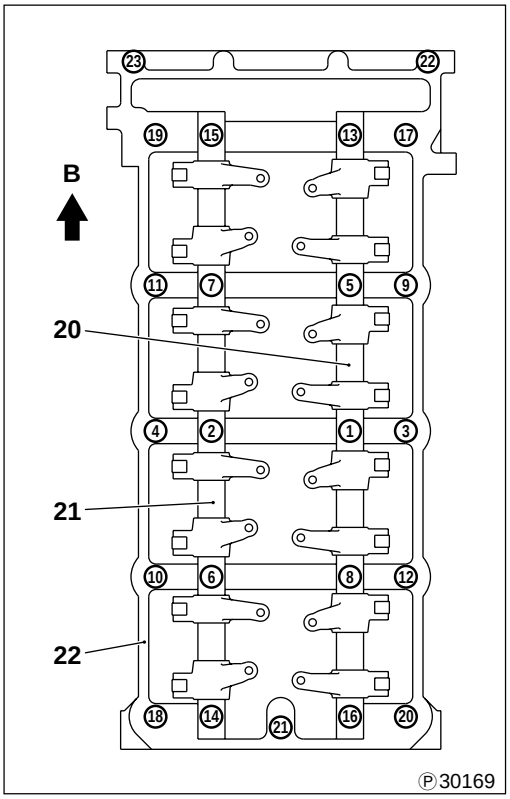
A : Locating pin



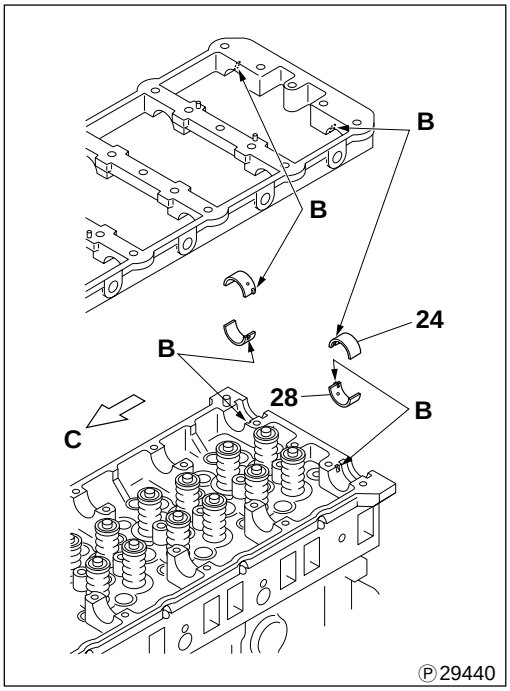
- The bolts **18** (× 13) and **19** (× 10) must be tightened in the following sequence. Therefore, secure the rocker shaft assemblies **20** and **21** together with the camshaft frame **22**.

CAUTION ⚠

When the bolts 18 and 19 were loosened or removed after installation, be sure to re-apply sealant.



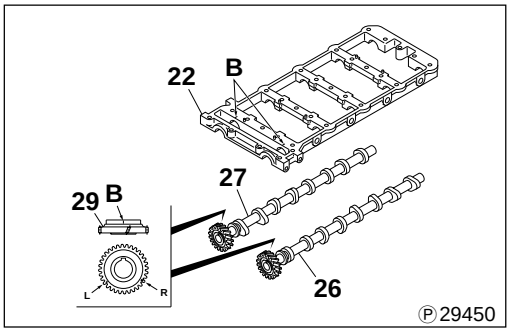
- Tighten the bolts **18** and **19** (① through ㉓) to the specified torque in the numbered sequence shown in the illustration.



24 **28** **Installation of camshaft bearings**

Be sure to fit the lugs **B** of the camshaft bearings **24** and **28** in the mating notches.

C : Front of engine

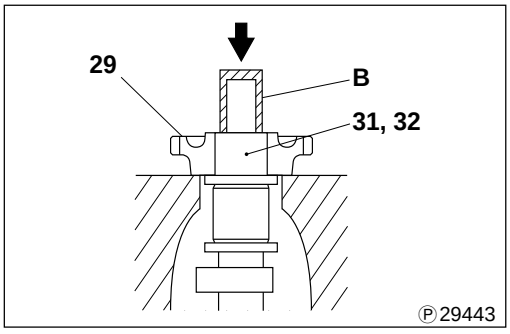


26 **27** **Installation of camshaft assemblies**

- Place the piston of No. 1 cylinder at the top dead center on the compression stroke.
- Install the camshaft assemblies **26** and **27** with the alignment marks **B** on the camshaft gear **29** and on the camshaft frame **22** in alignment.

NOTE

The alignment marks "L" and "R" on the camshaft gear 29 and those on the head idler gears need not always be in alignment, because the alignment mark of the head idler gears, depending on their mounted condition, does not always match that of the camshaft gear.



29 **Camshaft gear**

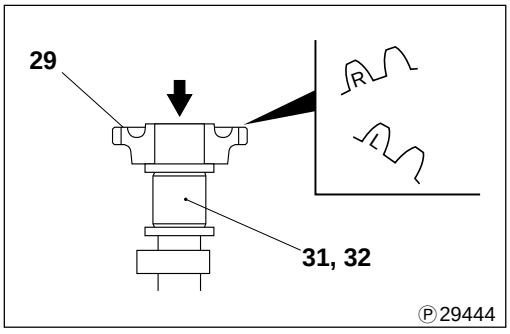
[Removal]

Remove the camshaft gear **29** by pressing the camshaft end with a press.

B : Removal block

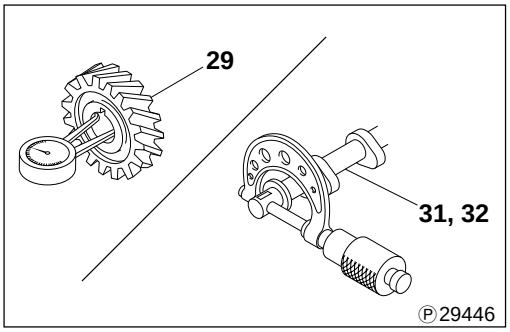
CAUTION ⚠

Never strike the camshaft gear 29 with a hammer to remove it. Be sure to use a press or a similar tool.



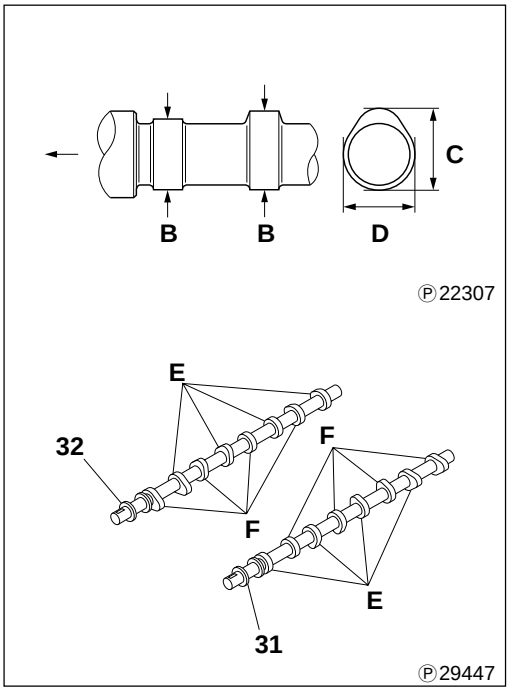
[Installation]

- Heat the camshaft gear **29** to 150 °C {302°F} by a piston heater or a similar tool and install it with the alignment mark "R" or "L" directed as shown.
- Install the camshaft gear **29** such that it is held tightly against the camshaft **31** or **32**.



29 31 32 Camshaft gear and camshaft interference

If the reading is out of the standard values, replace defective parts.



31 32 Inspection of camshafts

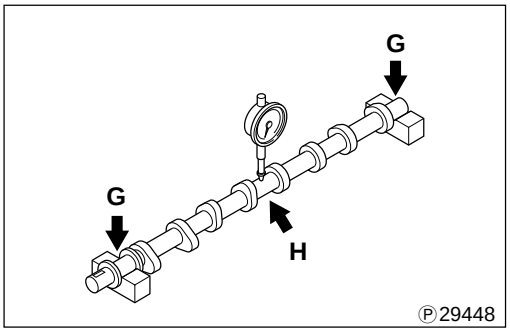
(1) Cam lift (Difference between lobe height and base circle diameter)

If the reading is less than the limit, replace the camshafts **31** and **32**.

B : Measuring position
C : Cam lobe height
D : Base circle diameter
E : Long rocker side cam
F : Short rocker side cam

NOTE

The cam dimensions are different between the long rocker side cams E and the short rocker side cams F.

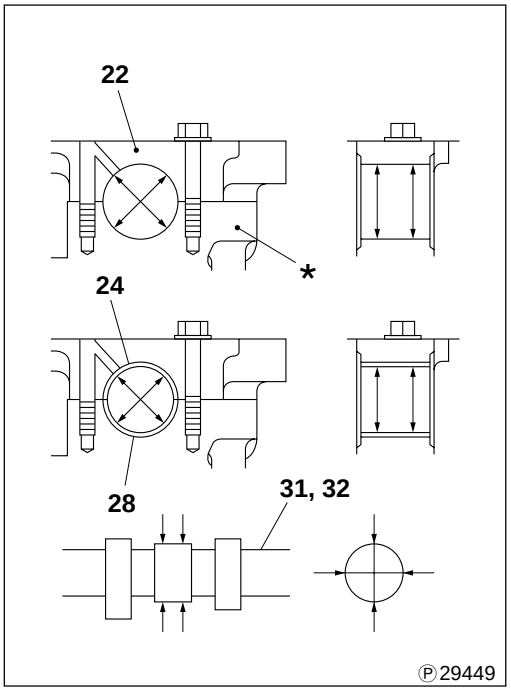


(2) Bend

Measure the bend of the camshafts **31** and **32** at the journal **H** with the journals **G** supported. If the reading is in excess of the limit, replace the camshaft.

NOTE

The bend of the camshafts 31 and 32 is one half of the reading of the dial indicator taken after turning the camshaft through a rotation.



(3) Oil clearance between journals and bearings

Measure the oil clearance. If the reading is in excess of the limit, replace defective parts.

CAUTION ⚠

If a camshaft bearing 24 or 28 is to be replaced, make sure that both upper and lower halves are simultaneously replaced as a pair.

MEMO

ROCKER COVER, ROCKER ASSEMBLIES AND CAMSHAFTS

Location	Tool name and shape	Part No.	Application
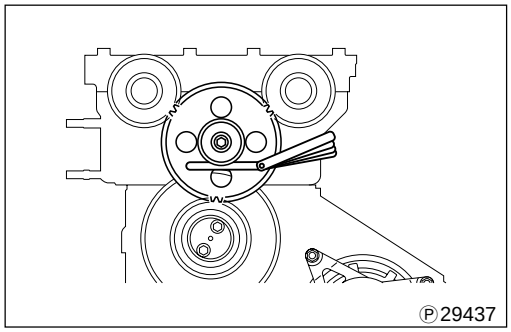
11	Idler Gear Bushing Puller 	MH061779	Removal and installation of idler gear bushing

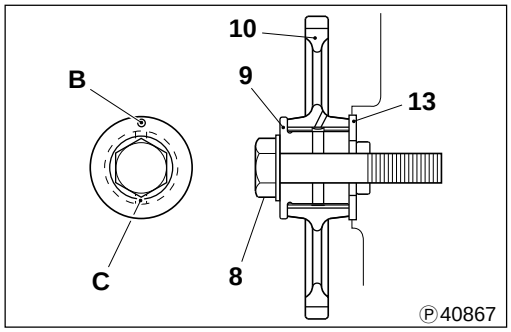


◆ Service procedure

● **Pre-disassembly inspection**

End play of head idler gear assembly

If any measurement exceeds the specified limit, replace the defective part(s).



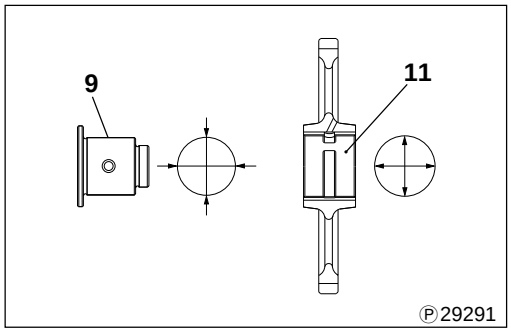
9 **Installing head idler shaft**

Install the head idler shaft **9** as illustrated.

B : Depression
C : Oil hole

CAUTION ⚠

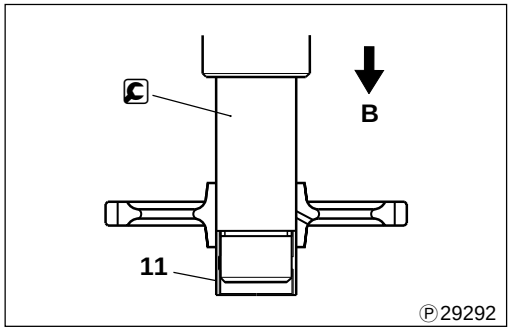
Don't forget to install the thrust plate 13.



9 **11** **Head idler shaft and head idler gear bushing**

[Inspection]

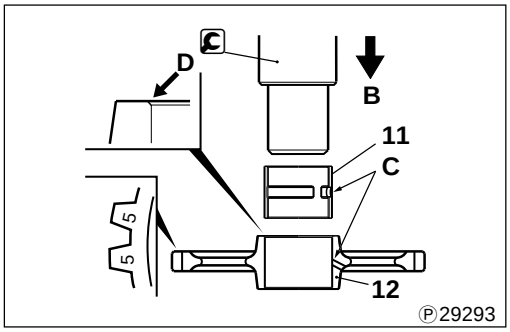
If the clearance exceeds the specified limit, replace the defective part(s).



Head idler gear bushing

[Removal]

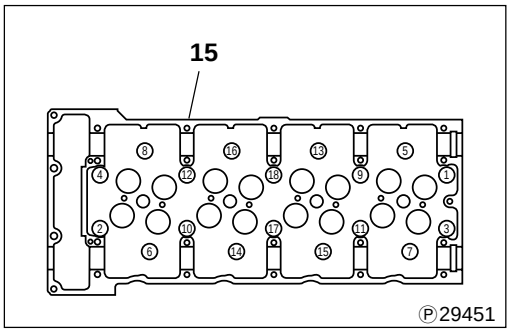
B : Press
Special tool : Idler Gear Bush Puller



[Installation]

- Fit the idler gear bushing **11** in the head idler gear **12** in the illustrated direction so that the oil holes **C** may be aligned with each other when press-fitted.
- Using the C Idler Gear Bush Puller, press the bushing into the head idler gear **12** until its end face becomes flush with the chamfered end **D** of the gear.

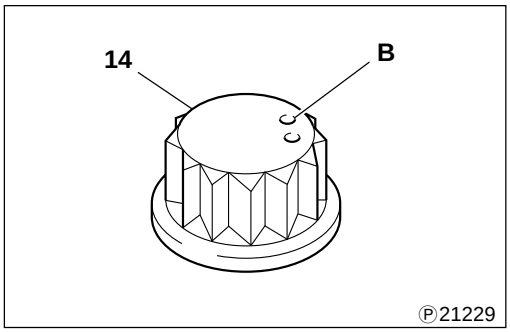
  B : Press
- After press-fitting, measure the clearance again. If the measurement is below the specified limit, ream the head idler gear bushing **11** to the standard value.



15 Cylinder head assembly

[Removal]

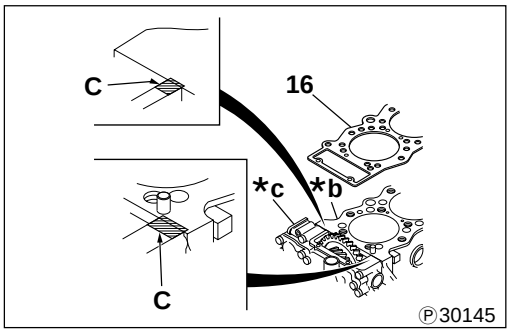
Loosen and remove the cylinder head bolts **14** in the sequence shown (① to ㉒). Each cylinder head bolt should be loosened a little at a time.



[Fitting]

CAUTION ⚠

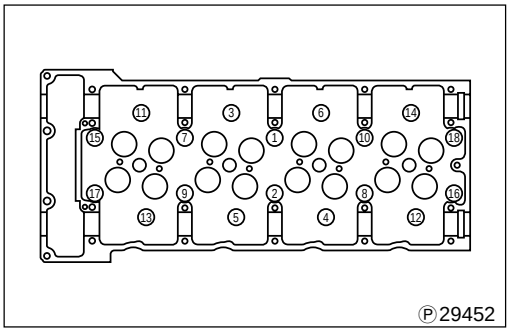
- **Before fitting any cylinder head bolt 14, check the punch marks B on its head. Do not use bolt if there are more than two punch marks.**
- **The punch marks indicate the number of times each bolt has been tightened using the torque-turn tightening method. Any bolt that already has three punch marks must be replaced.**



- Select an appropriate cylinder head gasket **16**. 📖 P11A-42
- Apply a coat of specified sealant to the upper surface **C** of the joint section between the frontcase assembly ***c** and the crankcase assembly ***b**.
- Within 3 minutes after the sealant application, install the cylinder head assembly to the crankcase assembly ***b** together with the cylinder head gasket **16**.

CAUTION ⚠

- **Check to ensure that the sealant application surface C is clean and free of oil and other foreign matter.**
- **During installation of the cylinder head assembly, use care to ensure that the sealant is kept in place.**
- **Do not start the engine for at least 1 hour after the cylinder head assembly is installed.**
- **Whenever the cylinder head bolt 14 is loosened or removed after the cylinder head assembly has been installed, always apply a fresh coat of specified sealant.**

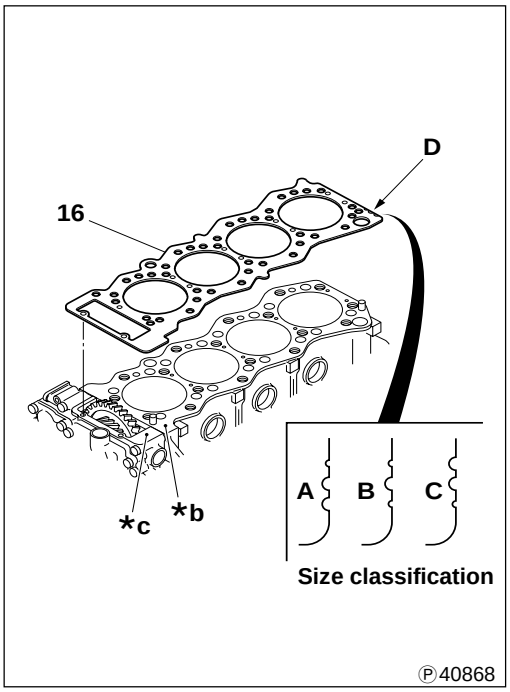


Ⓟ29452

- Tighten the cylinder head bolts **14** (① through ⑱) to a torque of 145 N·m {110 ft.lbs, 15 kgf·m}(wet) in the sequence shown.
  After tightening,give the bolts an additional 90 degree turn in the sequence of the numbers shown.
- After tightening the cylinder head bolts **14** using the torque-turn tightening method, make a punch mark on the head of each one to indicate the times of use.

CAUTION ⚠

Since the cylinder head bolts utilize the torque-turn tightening method, they must not be tightened further after the angular tightening procedure has been performed.



Ⓟ40868

16 Cylinder head gasket

[Removal]

CAUTION ⚠

Be careful not to scratch cylinder head assembly 15, the crankcase assembly *b and the front case assembly *c when removing cylinder head gasket 16.

[Installation]

Cylinder head gasket **16** installed must be the one which can accommodate the piston projection. Select such a gasket as follows:

- Measure the piston projection at each cylinder. 🕮 P11A-66
- Select a cylinder head gasket **16** appropriate for the piston projection average value from the following table.
- If any of the piston projection measurements is more than 0.05 mm {0.002 in.} larger than the average value, then use the gasket one rank higher than that rank (**A** → **B**, **B** → **C**).

Unit: mm {in.}

Average value of piston projection	Cylinder head gasket	
	Size classification	Thickness when tightening
–0.088 to –0.027 {–0.0034 to 0.0106}	A	0.75 ± 0.03 {0.029 ± 0.0012}
–0.027 to –0.033 {–0.0106 to 0.0129}	B	0.80 ± 0.03 {0.031 ± 0.0012}
–0.035 to –0.094 {–0.0129 to 0.0370}	C	0.85 ± 0.03 {0.033 ± 0.0012}

- The classification (size) of the cylinder head gasket **16** can be known from the shape of the notches **D** cut in the gasket edge.
- Install the cylinder head gasket **16** on the crankcase ***b** in the direction as illustrated.

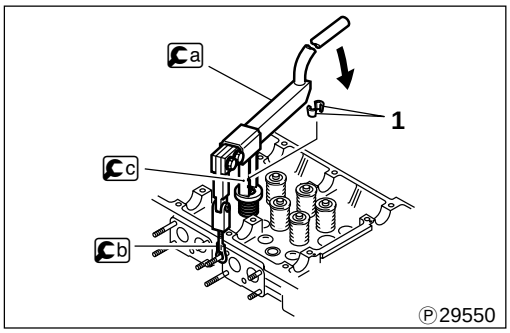
8, 9	Valve Guide Remover 	Obtain Locally	Removing valve guides
	Valve Guide Installer 	MH063604	Installing valve guides
10, 11	**A**: Caulking Tool Body **B**: Caulking Ring 	Use Equivalent	Installing inlet and exhaust valve seats

◆ Service procedures



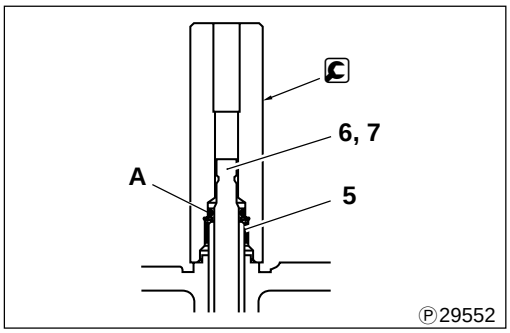
1 Valve cotter

[Removal]

To remove the valve collets **1**, use the a Valve Lifter, b Valve Lifter Hook and c Valve Lifter Seat to evenly compress the valve springs **3**, **4**.

[Installation]

To install valve collets, follow the removal instructions in reverse.

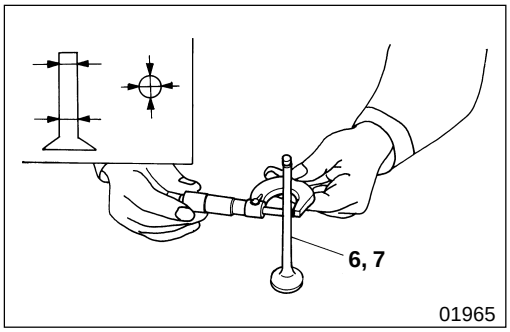


5 Installing valve stem seals

- Apply engine oil to the lip **A** of the valve stem seal **5**.
- Install the valve stem seal **5** using the Valve Stem Seal Installer.
- Strike the Valve Stem Installer until it sits snugly on the cylinder head **18**.

CAUTION ⚠

After installing the valve stem seal 5, check that its spring area is neither deformed nor damaged.



6 7 Inlet and exhaust valves

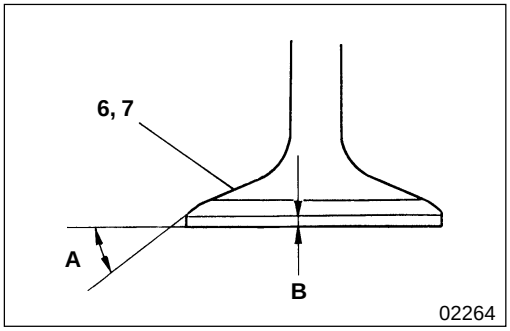
[Inspection]

(1) Valve stem outside diameter

Replace the valve **6**, **7** if its stem's outside diameter is below specification or severely worn.

CAUTION ⚠

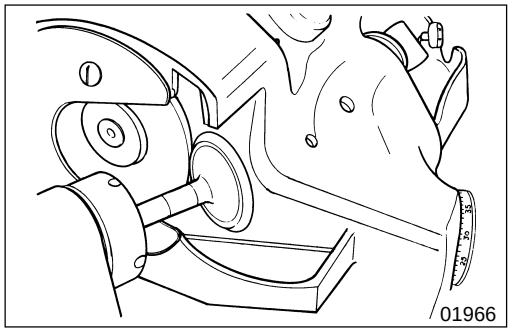
Whenever a valve 6, 7 is replaced, be sure to lap the valve and valve seat 10, 11. 📖 **P11A-49**



(2) Valve seat angle and valve margin

Reface or replace the valve **6**, **7** if the valve seat angle or valve margin exceeds the specified limits.

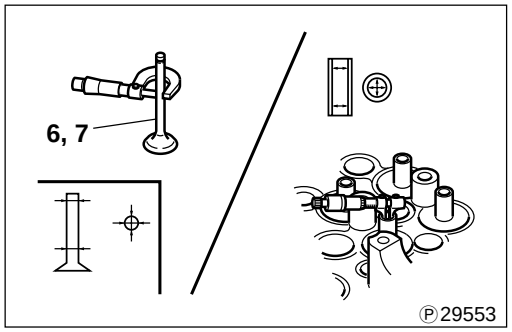
A : Valve seat angle
B : Valve margin



[Rectification]

NOTE

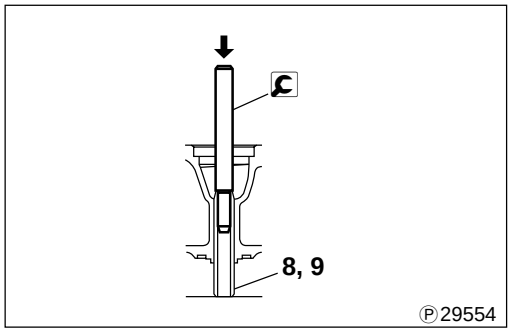
- **Keep grinding to a minimum.**
- **If the valve margin is below specification after grinding, replace the valve 6, 7.**
- **After grinding, be sure to lap the valve 6, 7 and valve seat 10, 11.** **P11A-45**



6 to 9 Valve and valve guides

[Inspection]

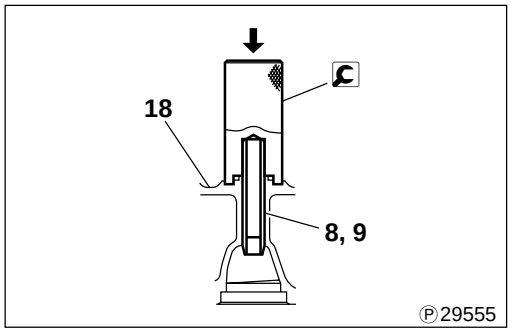
If any clearance exceeds the specified limit, replace the defective part(s).



Valve guides

[Removal]

: Valve Guide Puller

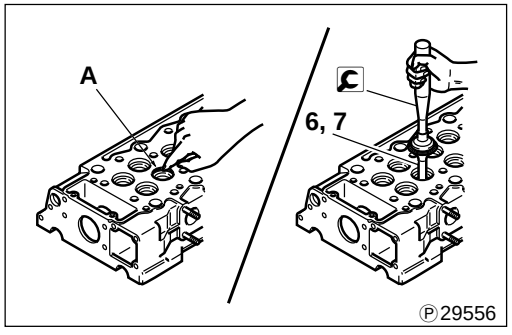


[Installation]

Using the Valve Guide Installer, install the valve guide **8**, **9** until the tool sits snugly on the cylinder head **18**.

CAUTION

- **The valve guides 8, 9 must be pressed in to the specified depth.Be sure to use the Valve Guide Installer for this operation.**
- **Exhaust valve guides 8 are longer than inlet valve guides 9.Be sure to install the correct type of guide in each location.**



6 7 10 11 Valves and valve seats

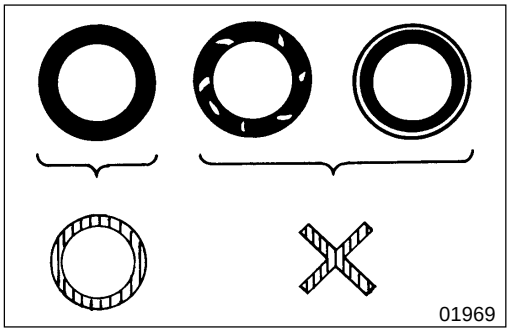
[Inspection]

- Apply an even coat of prussian blue to the valve seat **10**, **11** surface **A** that makes contact with the valve **6**, **7**.
- Strike the valve **6**, **7** against the valve seat **10**, **11** once. Do not rotate the valve during this operation.

: Valve Lapper

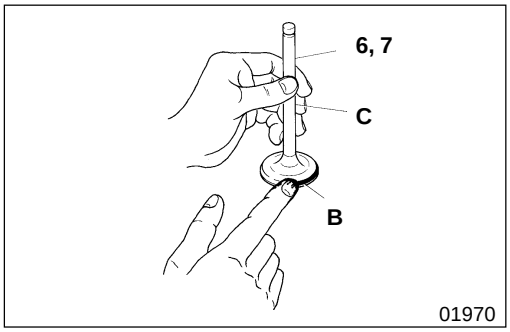
NOTE

Carry out these inspections after inspecting the valves 6, 7 and valve guides 10, 11.



- If the prussian blue deposited on the valve **6**, **7** indicates a poor contact pattern, rectify the contact pattern as follows:

Contact	Corrective action
Minor defect	Lapping
Serious defect	Reface or replace valve and valve seat



[Refacing]

Lap the valve in accordance with the following procedure:

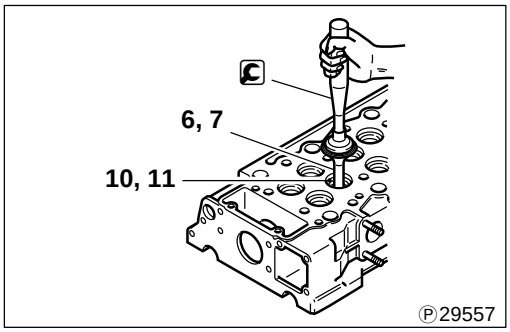
- Apply a thin, even coat of lapping compound to the surface **B** of the valve **6**, **7** that makes contact with valve seat **10**, **11**.

CAUTION ⚠

- **Ensure that no compound adheres to the stem C of the valve 6, 7.**

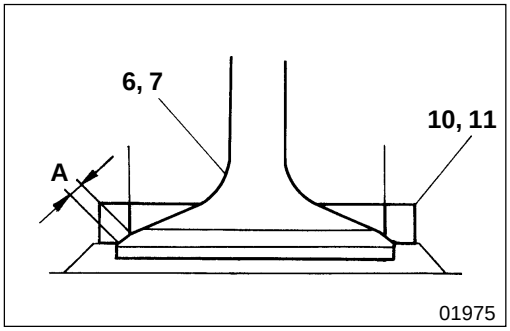
NOTE:

- **Start with intermediate-mesh compound (120 to 150 mesh) and finish with fine-mesh compound (200 mesh or more).**
- **The addition of a small amount of engine oil makes lapping compound easier to apply.**



- Strike the valve **6**, **7** against the valve seat **10**, **11** while turning it little by little.

  : Valve Lapper
- Wash away the compound with cleaning fluid.
- Apply engine oil to the contact surfaces of the valve seat **10**, **11** and rub it in so that the contact surfaces are lubricated and mate together snugly.
- Inspect the contact pattern of the valve **6**, **7** and valve seat **10**, **11** once more.
- If the contact pattern is still defective, replace the valve seat **10**, **11**.



10 **11** **Valve seats**

[Inspection]

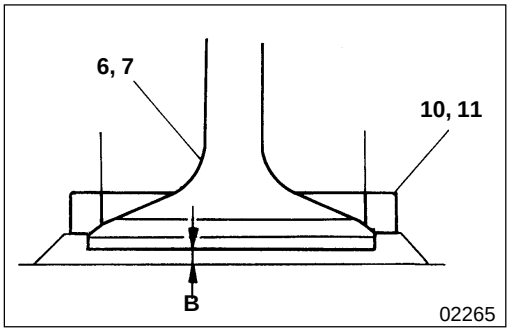
(1) Valve seat width

If the measurement exceeds the specified limit, rectify or replace the valve seat **10**, **11**.

A : Valve seat width

NOTE

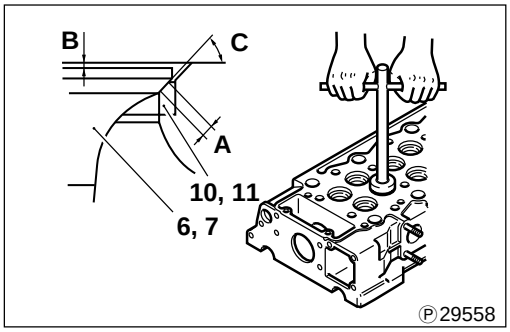
Whenever a valve seat 10, 11 is rectified or replaced, be sure to lap the valve seat and valve 6, 7.



(2) Valve sinkage from cylinder head bottom surface

If any measurement exceeds the specified limit, rectify or replace the defective part(s).

B : Valve sinkage



[Rectification]

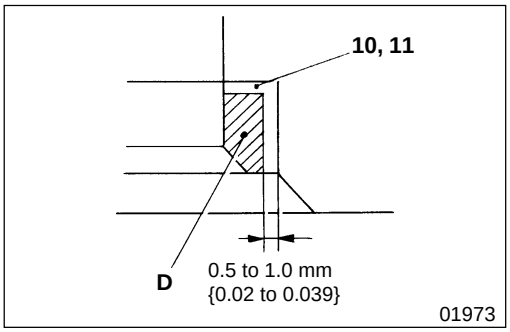
- Grind the valve seat **10**, **11** using a valve seat cutter or valve seat grinder.
- Use a 15° or 75° cutter to achieve the specified valve seat width **A** of the valve **6**, **7**.
- After grinding, put some sandpaper of around #400 grade between the cutter and valve seat and grind the valve seat lightly.

C : Valve seat angle

CAUTION ⚠

Ensure that grinding does not cause the sinkage B of the valve 6, 7 to exceed the specified limit.

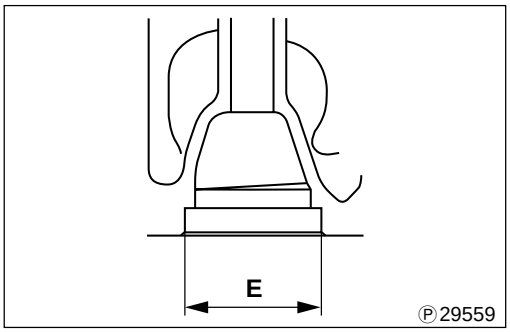
- After rectification, lap the valve **6**, **7** and valve seat **10**, **11**.
  📖 P11A-49



[Removal]

Valve seats **10**, **11** are installed by expansion fitting. To remove a valve seat, grind the inside surface to reduce its thickness, then remove the valve seat at room temperature.

D : Material to be ground

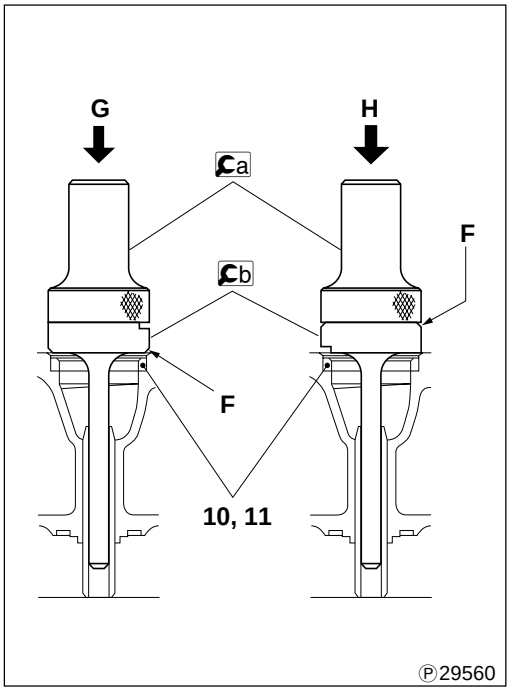


[Installation]

- Check that the valve seat hole diameter **E** in the cylinder head **18** conforms with the value shown below.

Unit: mm {in.}

	Hole diameter
Valve seat hole: **E**	$38\ ^{+0.025}_{0}$ {$1.49\ ^{+0.00098}_{0}$}



- Cool the valve seat **10**, **11** by immersing it in liquid nitrogen.
- Install the valve seat **10**, **11** in the cylinder head **18** using the a Caulking Tool Body and the b Caulking Ring.

CAUTION ⚠

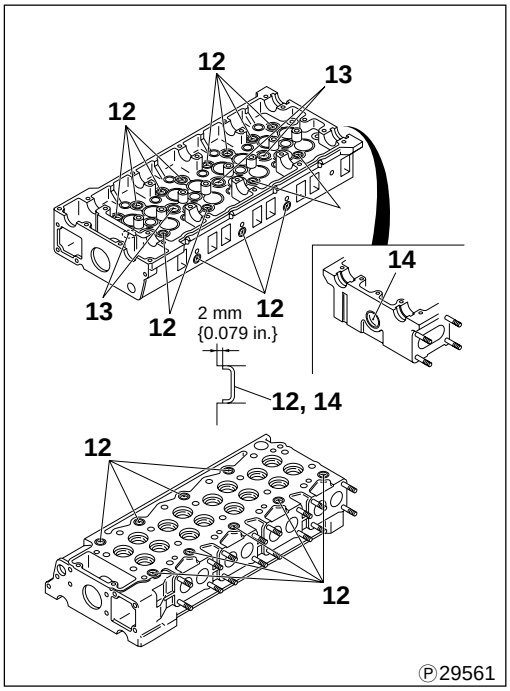
- **For installation, the chamfered side F of the b Caulking Ring must be against the valve seat 10, 11.**

G : Configuration for installation

- Invert the b Caulking Ring such that its chamfered side **F** is against the a Caulking Tool Body, then caulk the valve seat **10**, **11**.

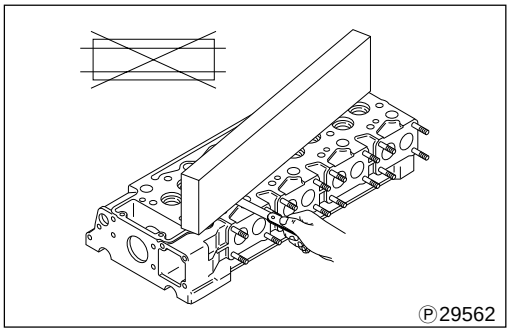
H : Configuration for caulking

- After installing the valve seat **10**, **11**, lap the valve seat and valve **6**, **7**. P11A-49



12 to 14 Installing sealing cup plugs

Drive the sealing cups **12** to **14** in the cylinder head **18** until the specified depth is reached.



18 Inspecting cylinder head

Measure the extent of distortion in the cylinder head **18** bottom surface. If the degree of distortion exceeds the specified limit, rectify the distortion with a surface grinder.

CAUTION ⚠

Ensure that grinding does not cause the cylinder head 18 top surface-to-bottom surface distance to fall below the specified limit.

CAUTION ⚠

- **When the vacuum pump assembly 19 is removed, be sure to follow the specified procedure. Blind removal will result in failure of the assembly being positioned with the balance shaft assembly LH *c.**
- **Do not remove the front oil seal 21 unless something wrong is evident.**

● **Assembly sequence**

Follow the disassembly sequence in reverse.

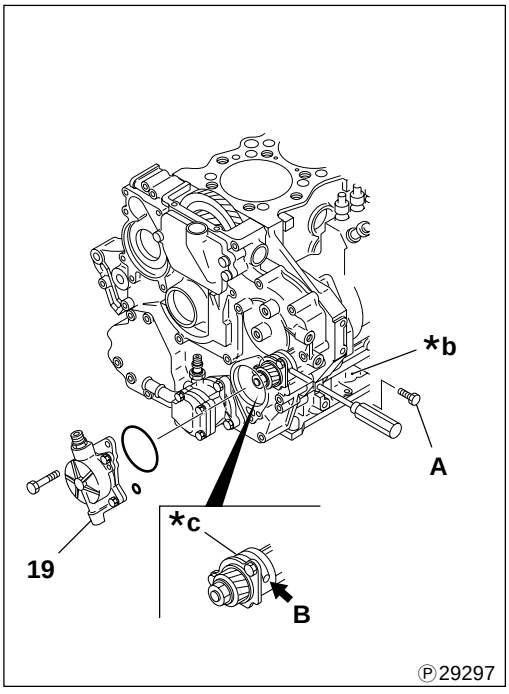
Tightening torques

Unit: N·m {ft.lbs, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
1	Bolt (mounting front case cover)	2.9 to 3.9 {2.2 to 2.9, 0.3 to 0.4}	–
6	Nut (mounting fan pulley)	196.1 {145, 20.0}	–
8	Bolt (mounting water pump assembly)	23.5 {17, 2.4}	–
10	Bolt (mounting breather cover)	2.9 {2.2, 0.3}	–
14	Engine speed sensor	29.4 {22, 3.0}	–
15	Bolt (mounting power steering oil pump assembly)	23.5 {17, 2.4}	–
18	Bolt (mounting vacuum pump assembly)	23.5 {17, 2.4}	–
22	Bolt (mounting front case)	23.5 {17, 2.4}	–
24	Eye bolt (mounting oil jet)	10 {7.4, 1.0}	–

Lubricant and sealant

Location	Points of application	Specified lubricant and/or sealant	Quantity
14	Threaded portion of engine speed sensor	THREEBOND 1104J	As required
17, 20	All around O-ring	Engine oil	As required
21	Lip of front oil seal	Engine oil	As required
23	Front case mounting surface	THREEBOND 1207C or D	As required



◆ Service procedure

19 Installation of vacuum pump assembly

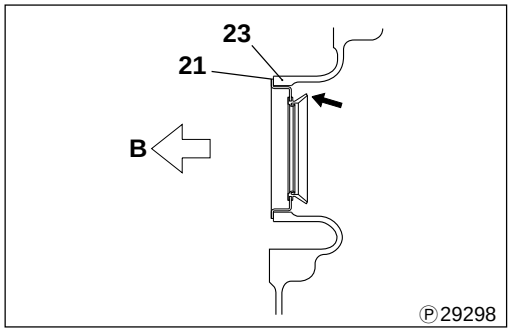
The vacuum pump assembly **19** serves also to position the balance shaft assembly LH ***c**. For this reason, before the assembly is installed, the balance shaft assembly must be kept in the right position by the following procedure.

- Place the piston of cylinder No. 1 at the top dead center on the compression stroke.
- Remove plug **A** from the upper crankcase ***b**.
- Insert a screwdriver into the hole from which the plug **A** was removed until it slightly touches the balance shaft assembly LH ***c**.

CAUTION ⚠

Be sure not to force the screwdriver in, as there is danger of damage to the No. 1 journal of the balance shaft assembly LH *c.

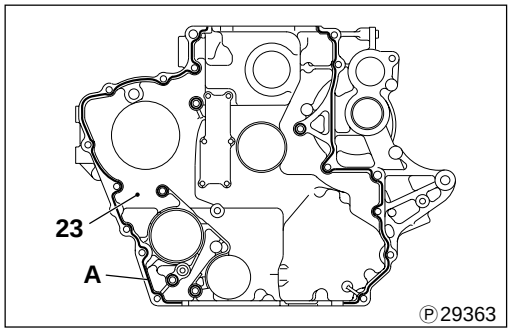
- Slowly rotate the balance shaft assembly LH ***c** to align the tip of the screwdriver with the shaft support hole **B** in the No. 1 journal of the balance shaft.
- Supporting the balance shaft by inserting the screwdriver in the hole, install the vacuum pump assembly **19**.
- After the installation, remove the screwdriver.



21 **Installation of front oil seal**

Install the front oil seal **21** on the front case **23** in the illustrated direction after applying engine oil to the lip **A**.

B : Front of vehicle

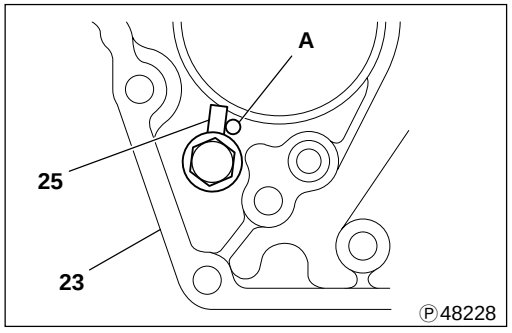


23 **Installation of front case**

- Apply sealant **A** evenly without any break to the mounting surface of the front case **23** as shown. (Approximately ϕ 1 mm {ϕ 0.0393})
- After application of sealant **A**, install the front case **23** in less than three minutes.

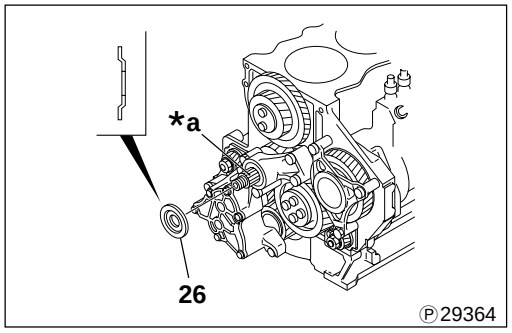
CAUTION ⚠

- **Check to ensure that the sealant application surface is clean and free from any oil and other deposits.**
- **When installing the parts, make sure that the sealant is not forced out of position.**
- **Do not start the engine less than an hour after installation.**
- **If the mounting bolts were loosened or removed after installation of the front case 23, be sure to re-apply sealant A.**



25 **Installation of oil jet**

Install oil jet **25** to the front case **23** in the direction as shown with boss **A** contacting to oil jet.



26 **Installation of front oil seal slinger**

Install the front oil seal slinger **26** on the fan shaft assembly ***a** in the illustrated direction.

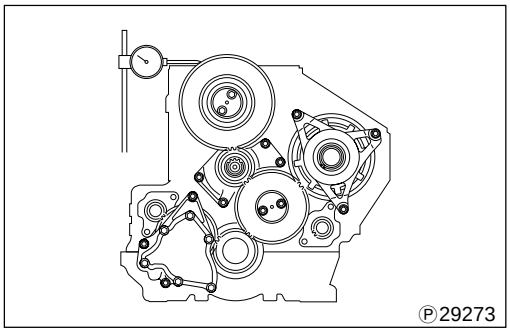
10	Idler Gear Bushing Puller 	MH062601	Installation and removal of fan shaft case bushing
18	Idler Gear Bushing Puller 	Use Equivalent	Installation and removal of No. 1 idler gear bushing

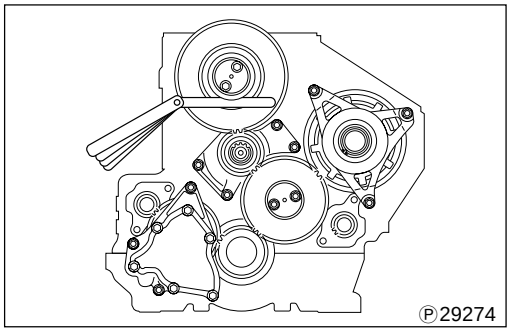


◆ Service procedure

● **Pre-disassembly inspection**

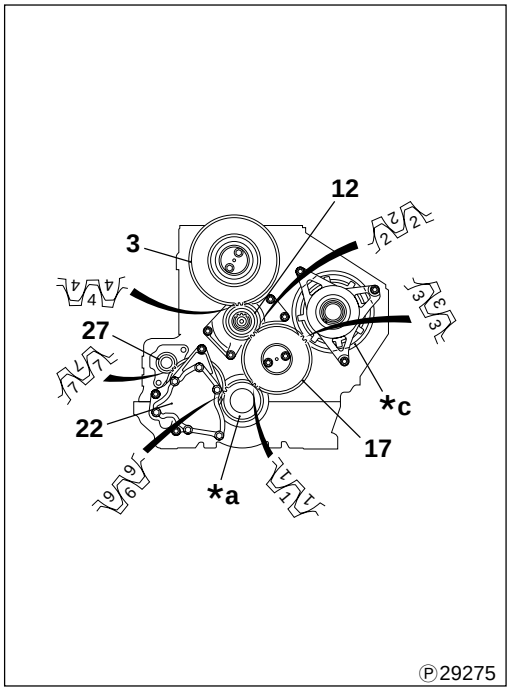
(1) Backlash between gears

On a pair of gears, measure backlash at more than three positions. If the reading is more than the limit, replace defective parts.



(2) End play of each gear and shaft

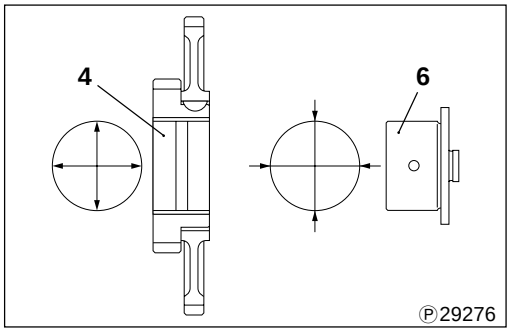
If the reading is more than the limit, replace defective parts.



3 12 17 22 Installation of timing gears

Install the timing gears in the following sequence.

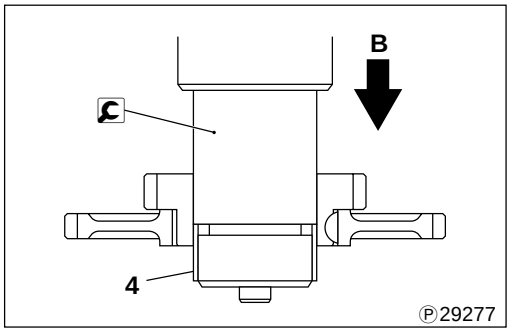
- Place the piston of No. 1 cylinder at the top dead center to position the crankshaft gear ***a**.
- Install the gear of the oil pump assembly **22** while aligning the alignment marks "**6**" and "**7**" with those on the crankshaft gear ***a** and balance shaft gear RH **27**, respectively.
- Install No. 1 idler gear assembly **17** while aligning the alignment marks "**1**" and "**3**" with those on the crankshaft gear ***a** and injection pump gear ***c**, respectively.
- Install the fan shaft assembly **12** while aligning the alignment mark "**2**" with that of No. 1 idler gear assembly **17**.
- Install the idler gear assembly **3** while aligning the alignment mark "**4**" with that of the fan shaft assembly **12**.



4 6 Idler gear bushing and idler shaft

[Inspection]

If the reading is more than the limit, replace defective parts.

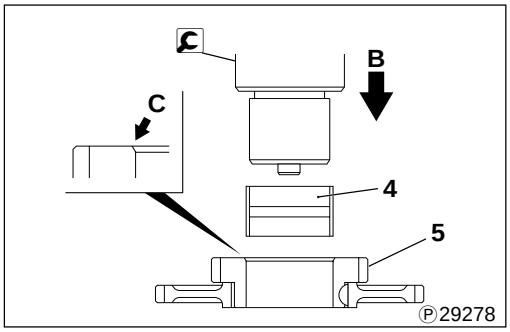


Idler gear bushing

[Removal]

B : Press

**: Idler Gear Bushing Puller

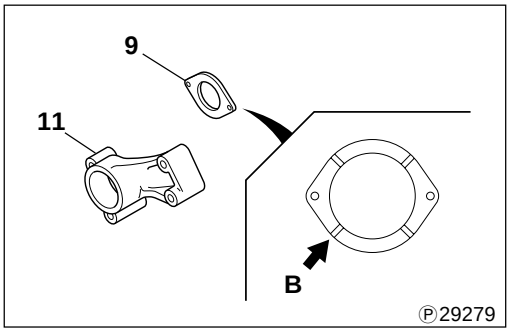


[Installation]

- Face the idler gear **5** in the illustrated direction. Using 🔧 Idler Gear Bushing Puller, press-fit the idler gear bushing **4** into the idler gear up to the chamfered portion **C**.

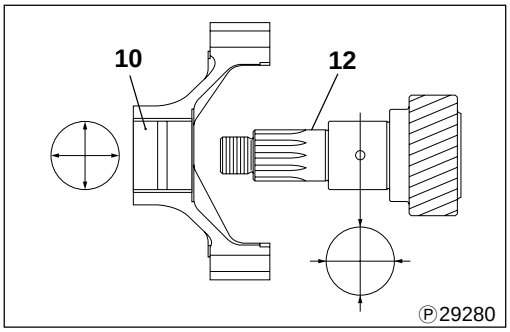
  B : Press

- After press-fitting the bushing, re-measure the clearance. If the reading is less than the standard limits, ream the idler gear bushing **4** until the clearance falls within the standard limits.



9 **Installation of thrust plate**

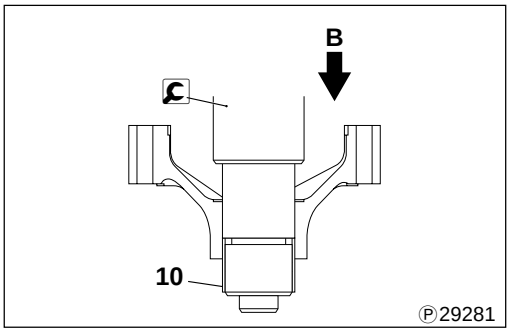
Install the thrust plate **9** with that side which does not have oil grooves **B** toward the fan shaft case **11**.



10 **12** **Fan shaft case bushing and fan shaft assembly**

[Inspection]

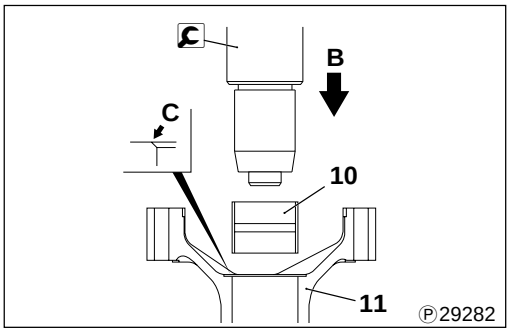
If the clearance is more than the limit, replace defective parts.



Fan shaft case bushing

[Removal]

B : Press
🔧 **:** Idler Gear Bushing Puller

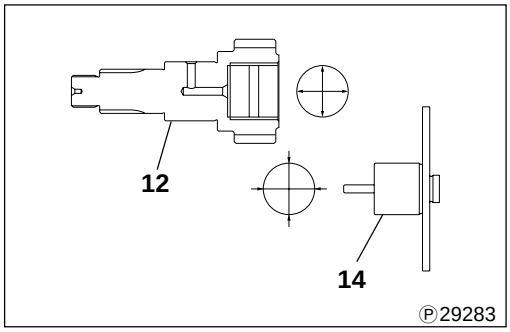


[Installation]

- Face the fan shaft case in the illustrated direction. Using 🔧 Idler Gear Bushing Puller, press-fit the fan shaft case bushing up to the chamfered portion **C** of the fan shaft case.

  B : Press

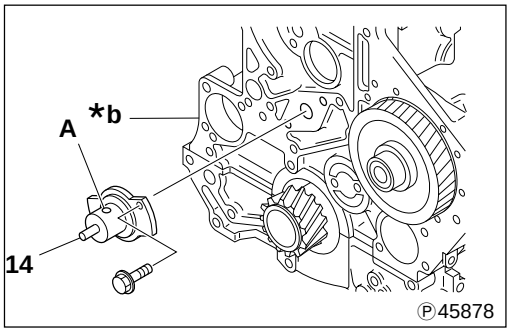
- After press-fitting the bushing, re-measure the clearance. If the reading is less than the standard limits, ream the fan shaft case bushing **10** until the clearance falls within the standard limits.



12 **14** **Fan shaft assembly and fan gear shaft**

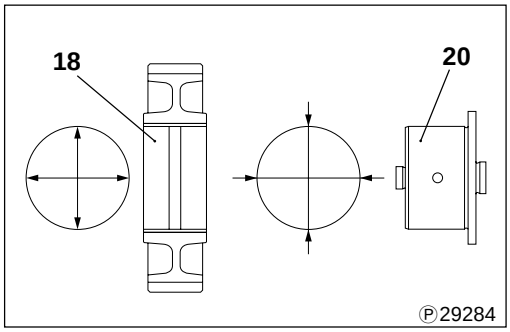
[Inspection]

If the clearance is more than the limit, replace defective parts.



14 **Installation of fan gear shaft**

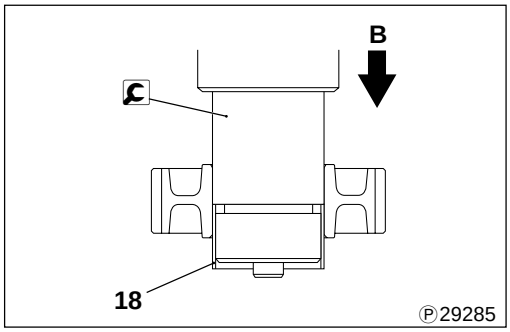
With oil hole **A** in fan gear shaft **14** facing up, install the fan gear shaft to upper crankcase ***b**.



18 **20** **No. 1 idler gear bushing and No. 1 idler shaft**

[Inspection]

If the clearance is more than the limit, replace defective parts.

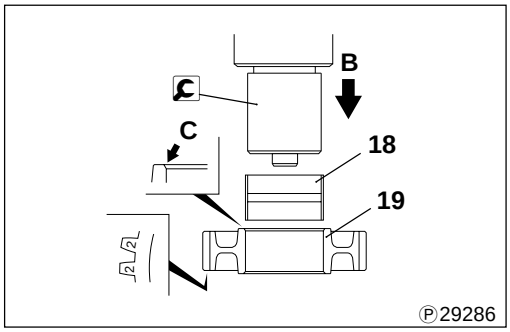


Idler gear bushing

[Removal]

B : Press

C : Idler Gear Bushing Puller

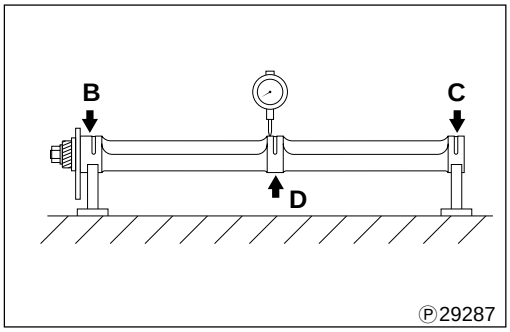


[Installation]

- Face the No. 1 idler gear **19** in the illustrated direction. Using C Idler Gear Bushing Puller, press-fit the idler gear bushing up to the chamfered portion **C** of the No. 1 idler gear.

  B : Press

- After press-fitting the bushing, re-measure the clearance. If the reading is less than the standard limits, ream the No. 1 idler gear bushing **18** until the clearance falls within the standard limits.



25 **33** **Balance shaft assembly**

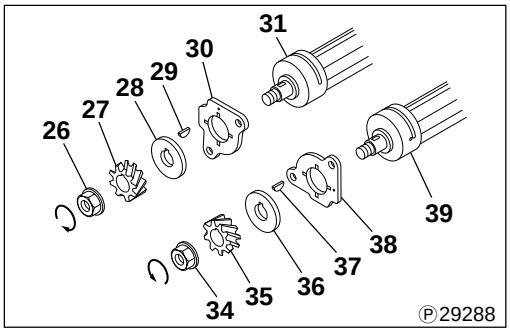
[Inspection]

- Check the balance shaft assemblies RH **25** and LH **33** for bend.
- Measure the balance shaft bend at No. 2 journal **D** while supporting the shaft at No. 1 journal **B** and No. 3 journal **C**.

NOTE

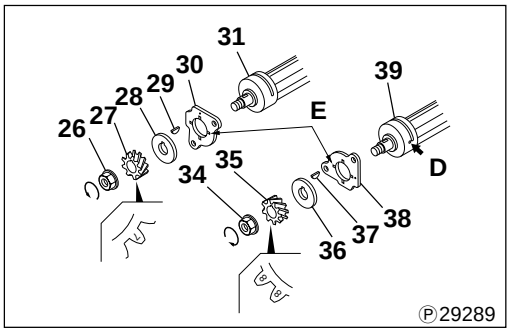
The bend of the balance shaft assemblies RH 25 and LH 33 is one half of the reading of the dial indicator taken after turning the balance shaft assembly through a rotation.

- If the reading exceeds the limit, disassemble the balance shaft assembly RH **25**, LH **33**, and replace the balance shaft RH **31**, LH **39**.



[Disassembly]

- The nut **26** of the balance shaft RH **31** and the nut **34** of the balance shaft LH **39** are different in the thread cutting direction.
- Remove the nut **26** by turning counter-clockwise. Remove the nut **34** by turning clockwise.



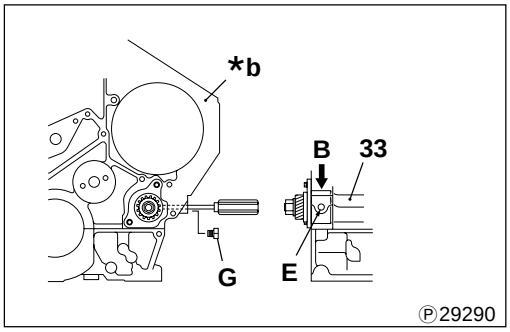
[Assembly]

- Of the balance shaft RH **31** and LH **39**, one with a shaft support hole **D** (ϕ 5 mm {ϕ 0.2 in.}) in No. 1 journal is the balance shaft LH **39**.
- Install the thrust plates **30** and **38** in the illustrated direction.

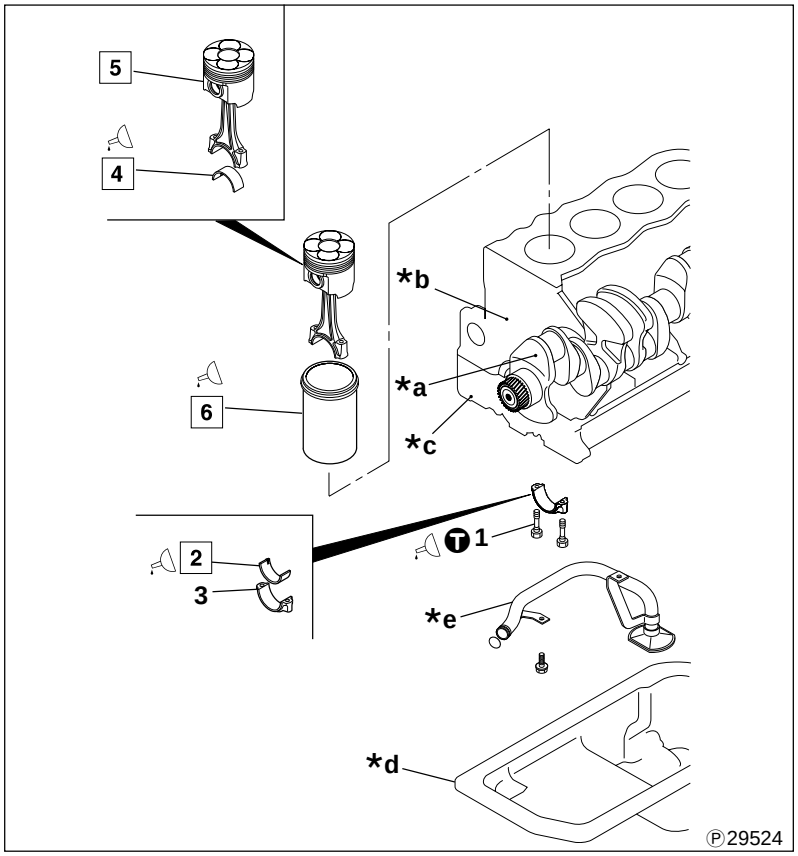
  E : Oil groove
- Install the balance shaft gears RH **27** and LH **35** in the illustrated direction.
- Install the nut **26** by turning clockwise. Install the nut **34** by turning counter-clockwise.

[Installation]

- The installation position of the balance shaft assembly RH **25** is determined by the gears to put in mesh when oil pump assembly **22** is installed. 🕮 P11A-60
- The balance shaft assembly LH **33** is not brought in mesh with any gear until when the vacuum pump assembly is installed with the front case attached. Therefore, the following steps must be performed before installation.
  - Remove the plug **G** from the upper crankcase ***b**.
  - Insert a screwdriver from the hole from which the plug **G** was removed into the shaft support hole **E** (ϕ 5 mm {ϕ 0.2 in.}) provided in the No. 1 journal **B** of the balance shaft assembly LH **33** to support the balance shaft assembly.
  - Align the alignment marks of all the timing gears. 🕮 P11A-60
  - By so doing, the balance shaft assembly LH **33** can be positioned. Keep it in position until the vacuum pump assembly is installed (🕮 P11A-53).



PISTONS, CONNECTING RODS AND CYLINDER LINERS



● **Pre-disassembly inspection**

P11A-65

● **Removal sequence**

1 Bolt
2 Lower connecting rod bearing
3 Connecting rod cap
4 Upper connecting rod bearing
5 Piston and connecting rod assembly P11A-71
6 Cylinder liner
***a :** Crankshaft assembly P11A-80
***b :** Upper crankcase P11A-80
***c :** Lower crankcase P11A-80
***d :** Oil pan Gr 12A
***e :** Oil strainer Gr 12A

NOTE

Since the bolts 1 (for installing connecting rod cap 3) utilize the torque-turn tightening method, they must not be removed unless it is absolutely necessary.

● **Installation sequence**

Follow the removal sequence in reverse.

Service standards

Unit: mm {in.}

Ⓟ29525

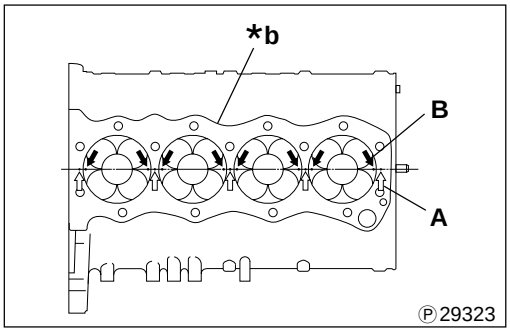
◆ Service procedure

● **Pre-disassembly inspection**

CAUTION ⚠

The cylinder liners 6 may be forced out if the upper crankcase *b is turned over or if the crankshaft assembly *a is rotated with the pistons inserted. Before beginning with inspection procedures, be sure to hold each cylinder liner at its flange section using a washer A or a similar tool.

PISTONS, CONNECTING RODS AND CYLINDER LINERS



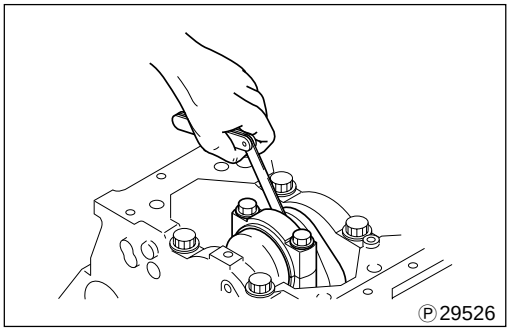
(1) Piston protrusion from crankcase top surface

NOTE

The piston protrusion affects engine performance and must therefore be checked.

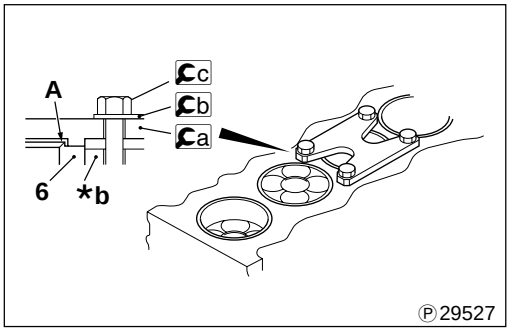
- Set the piston at top dead center.
- Make standard points **A** (five points) on upper crankcase assembly ***b** the 0 (zero) point and measure any protrusion relative to this point.
- Measure at four points on each piston at the nearest standard point from the zero point and produce the average value.

  B : Measurement point (16 points)
- If the average value is out of specification, check the clearances between all relevant parts.



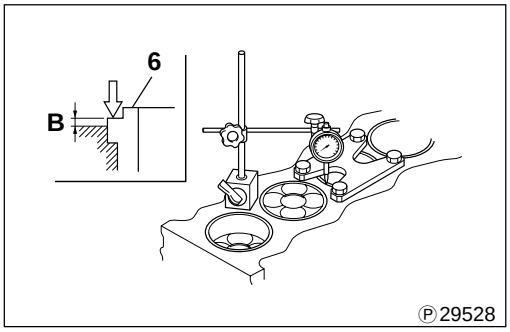
(2) Connecting rod end play

- Measure the end play every connecting rod.
- If any measurement exceeds the specified limit, replace the defective part (s).



(3) Cylinder liner flange protrusion amount and its difference between adjacent cylinders.

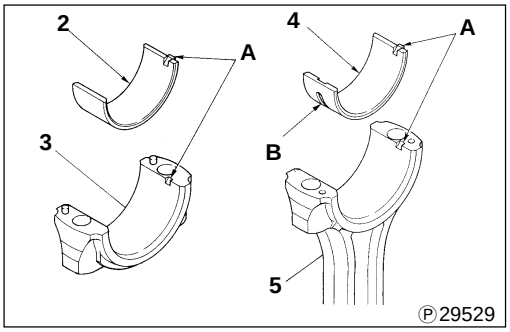
- Install the a Adapter on the upper crankcase in such a way that it may not ride on the flange **A** of the cylinder liner **6** and secure it by tightening the b Washer and c Bolt to a torque of 49 N·m {36 ft.lbs, 5 kgf·m}.



- Measure the protrusion amount **B** of flange of the cylinder liners **6**.
- If the measurement is out of specification, replace the defective part(s).
- Calculate the differences of the protrusion amounts between adjacent cylinders. If any difference is out of specification, check the mounting condition of the liners and replace the defective part(s).

CAUTION ⚠

If the cylinder liner 6 flange protrusion is insufficient, bearing pressure on the cylinder head gasket will be too low in the region of the bore, possibly causing gas to leak.



2 4 Connecting rod bearings

[Installation]

Fit the lower connecting rod bearing **2** into the connecting rod cap **3**, and fit the upper connecting rod bearing **4** into the piston and connecting rod assembly **5.** Make sure the lugs **A** on the bearings are fitted into their respective grooves.

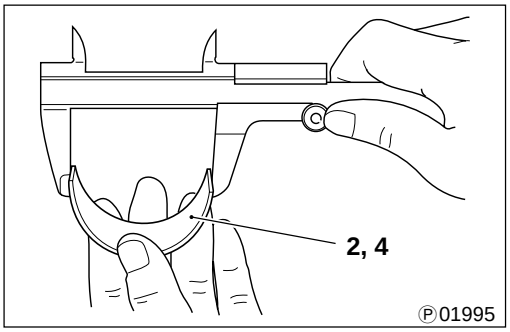
CAUTION ⚠

The upper connecting rod bearing 4 has an oil hole B. The lower connecting rod bearing 2 has no oil hole. Take care not to confuse the upper and lower parts.

[Inspection]

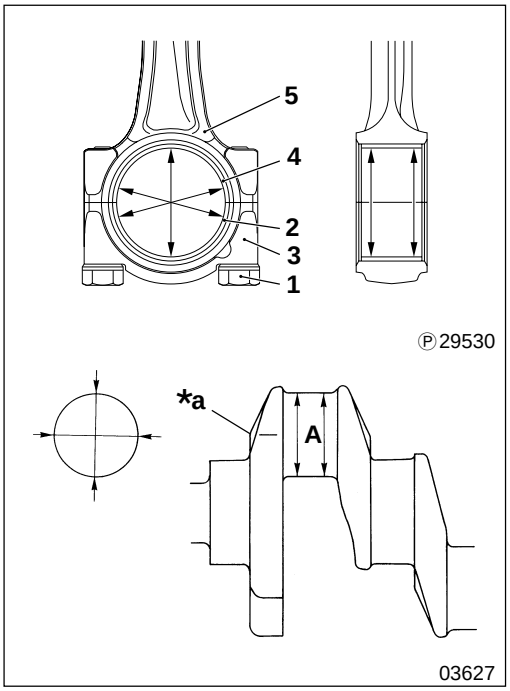
CAUTION ⚠

- **Do not attempt to manually expand a connecting rod bearing 2, 4 if its span is insufficient.**
- **Upper and lower connecting rod bearing 2,4 must be replaced as a set.**



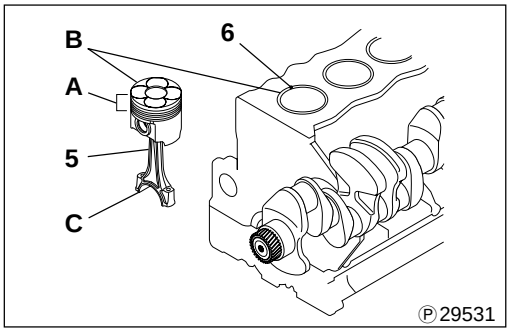
(1) Span when free

If the span is less than the specified requirement, replace the upper and lower connecting rod bearings **2**, **4** as a set.



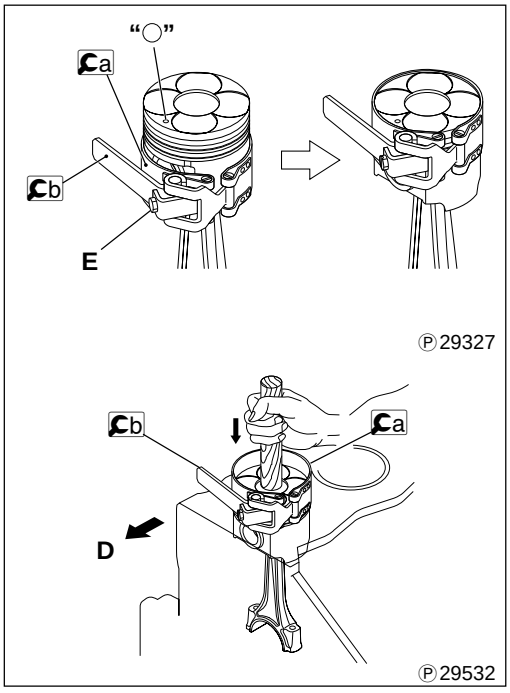
(2) Connecting rod bearing-to-crankshaft pin clearance (oil clearance)

- Fit the lower connecting rod bearing **2** into the connecting rod cap **3**, and fit the upper connecting rod bearing **4** into the piston and connecting rod assembly **5**. Then, tighten the bolts **1** to the specified torque.
- Measure the inside diameter of the connecting rod bearings **2**, **4** and the outside diameter of the crankshaft ***a** pin **A**. If the clearance exceeds the specified limit, replace the defective part(s).
- If the connecting rod bearing **2**, **4** have to be changed to undersized ones, adjust crankshaft ***a** pin outer diameter **A** in accordance with the specified procedure to fit the undersized dimensions. 🕮 P11A-86

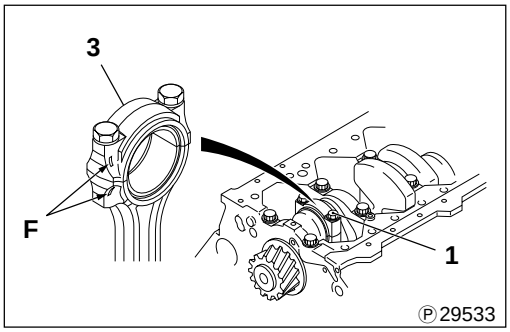


5 Installing piston and connecting rod assembly

- Ensure the gaps of the piston rings **A** remain in their correct positions. 🕮 P11A-74
- Check that the size marks **B** on the piston and cylinder liner are the same. 🕮 P11A-69
- Use care to prevent the connecting rod **C** from damaging the cylinder liner **6** and crankshaft pin.



- With the piston's front mark "○" facing the front of the engine **D**, carefully insert the piston and connecting rod assembly into the cylinder liner.
- Using the bolt **E** of the ⓑ Piston Guide Lever, adjust the inside diameter of the ⓐ Piston Guide Clamp such that it matches the piston's outside diameter.
- After adjustment, remove it from the piston and smear engine oil over the following items**:**
  - Outside of piston
  - Inside of the ⓐ Piston Guide Clamp
  - Inside of the cylinder liner

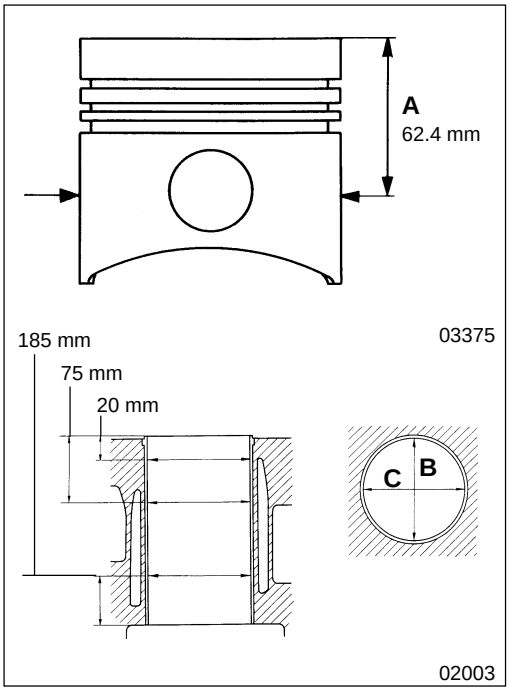


- With the piston installed, align the mating marks **F** on the connecting rod and connecting rod cap **3** and tighten the bolts **1** to the specification.
- Tighten bolts **1** alternately in the following manner.
  - First tighten to a torque of 29 N·m {22 ft.lbs, 3 kgf·m}.
  - Then tighten further 90° ± 5°.

NOTE

After installation of connecting rod cap 3, inspect the following points:

- **End play of the connecting rod: 🕮 P11A-66**
- **Piston Protrusion: 🕮 P11A-66**



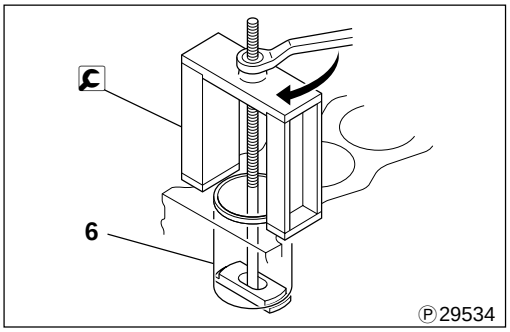
5 **6** **Piston-and-connecting rod assembly and cylinder liners**

[Inspection]

- Take measurements to determine the clearance between the piston and cylinder liner **6**.

  A : Outside diameter measurement position
  B : Direction of crankshaft axis
  C : Perpendicular to crankshaft axis

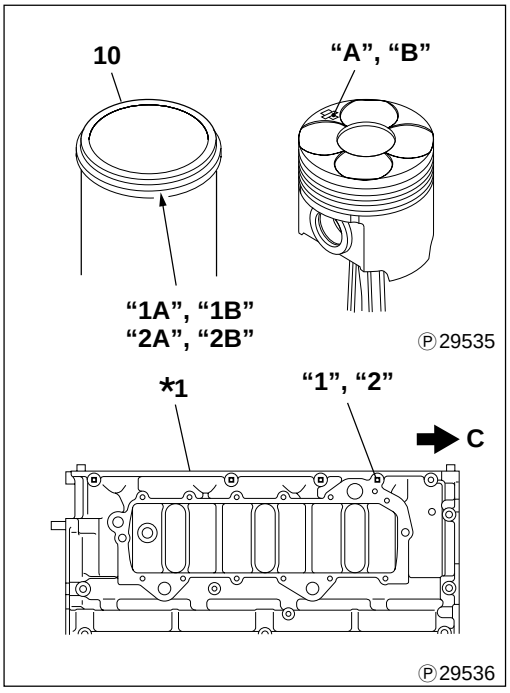
- If the clearance is out of specification, replace the defective part(s).



Cylinder liners

[Removal]

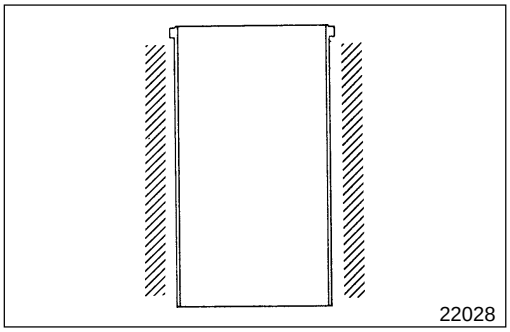
: Cylinder Liner Extractor



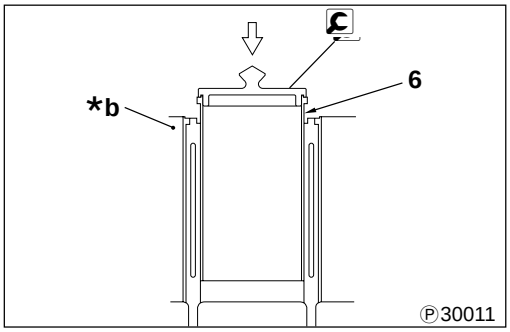
[Installation]

- Select a cylinder liner **6** which has the same size mark as those stamped on the upper crankcase ***b** and the piston.
- The size marks on the upper crankcase ***b** are arranged in the order of No. **1**, **2**, **3** and **4** cylinders starting from the engine front **C**.

Size marks on upper crankcase	Size marks on cylinder liners	Size mark on pistons
"1"	"1A"	"A"
	"1B"	
"2"	"2A"	
	"2B"	"B"



- Apply engine oil to the indicated ▨ parts of the cylinder liner **6**.



- Using the Cylinder Liner Installer, gently tap down the cylinder liner **6** until it is snugly seated on the upper crankcase ***b**.

CAUTION ⚠

The cylinder liner 6 is thin in wall thickness.
Use utmost care when handling it.

Piston and Connecting Rod Assembly

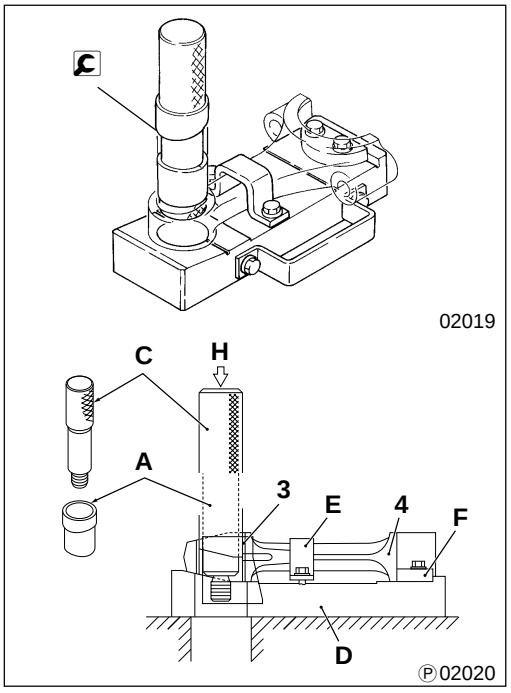
◆ Service procedure

2 **3** **Piston pin and connecting rod**

[Inspection]

If the clearance exceeds the specified limit, replace the defective part(s).



02019
Ⓟ02020

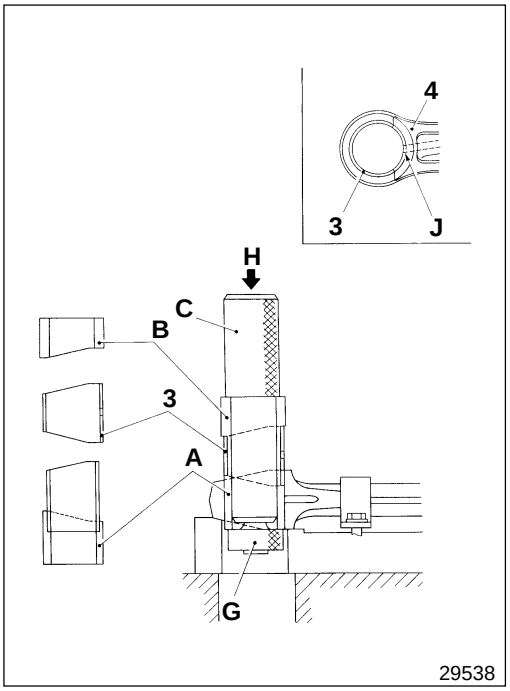
Connecting rod bushing

Replace the connecting rod bushing **3** using the Connecting Rod Bushing Puller Kit.
(Components of the Connecting Rod Bushing Puller Kit)

- **A :** Collar
- **B :** Collar
- **C :** Puller
- **D :** Base
- **E :** Bracket
- **F :** Plate
- **G :** Nut

[Removal]

- Remove the upper bearing (if fitted) from the big end of the connecting rod **4**.
- Mount the connecting rod **4** on the base **D** and lock it in position with the bracket **E** and place **F**.
- Fit the Collar **A** over the Puller **C** in the direction shown. Then, slowly apply pressure of approximately 49 kN (11020 lbf, 5,000 kgf) **H** until the connecting rod bushing **3** is pressed out.

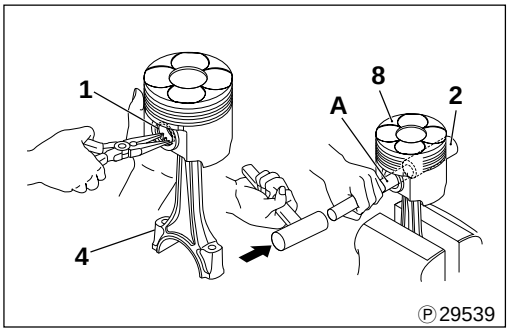


[Installation]

- Apply engine oil to the small end of the connecting rod **4** and to the outer surface of the connecting rod bushing **3**.
- Fit the Collar **B** over the Puller **C**, position the connecting rod bushing **3** and the Collar **A**, and lock this arrangement together with the Nut **G**.
- Align the oil holes **J** in the connecting rod bushing **3** and in the small end of the connecting rod **4**. Then, use a press to slowly apply pressure of approximately 49 kN (11020 lbf, 5,000 kgf) **H** until the bushing is pressed into place.
- After press-fitting the connecting rod bushing **3**, ream it to achieve the specified normal clearance between the bushing and piston pin **2**.

NOTE

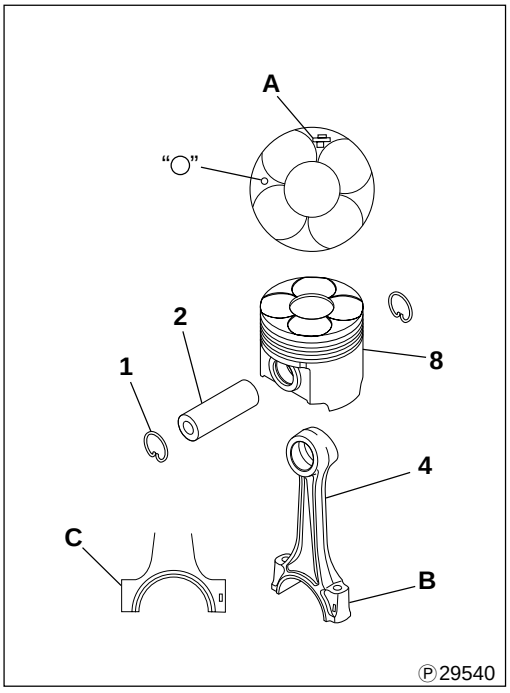
After reaming the connecting rod bushing 3, insert the piston pin 2 and check that it turns smoothly and without play.



2 | 4 | 8 Piston Pin, connecting rod, and piston.

[Removal]

- Removal the snap ring **1** and tap out the piston pin **2** using a rod **A** and hammer.
- If the piston pin **2** is difficult to remove, heat the piston **8** in hot water or using a piston heater.

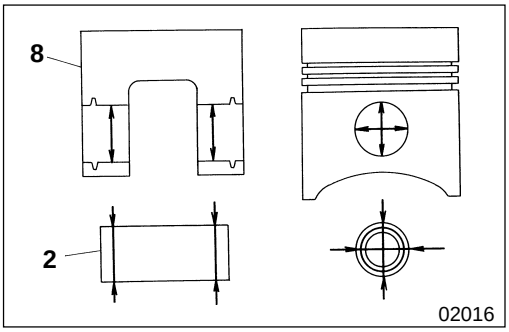


[Installation]

- Apply engine oil to the piston pin **2**. With the connecting rod **4** and piston **8** and aligned as illustrated, insert the piston pin to hold these components together.
  - **A :** Weight mark
  - **B :** Weight mark (**A** through **G**: "**A**" stands for the largest weight)
  - **C :** Alignment mark for connecting rod cap
  - "○"**:** Front mark
- If the piston pin **2** is difficult to insert, heat the piston pin **8** in hot water or using a piston heater.

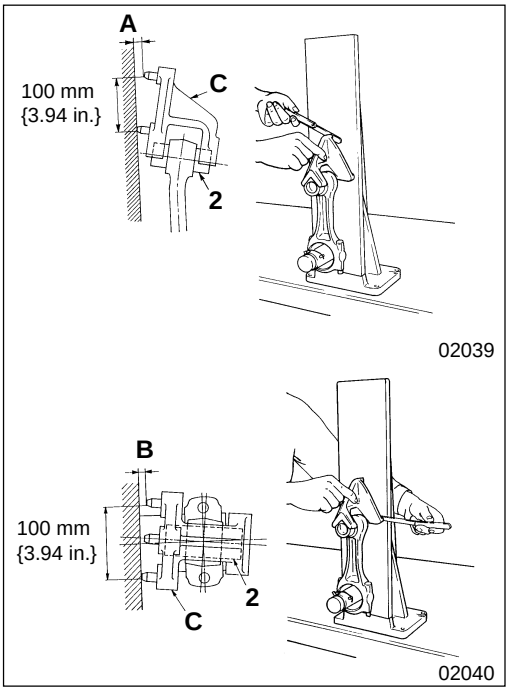
CAUTION ⚠

- **Make sure that all pistons have the same weight mark.**
- **The connecting rods must all have the same weight mark.**
- **After inserting the pin 2, check that it turns smoothly and without play.**



2 **8** **Piston pin-to-piston clearance**

If the clearance exceeds the specified limit, replace the defective part(s).



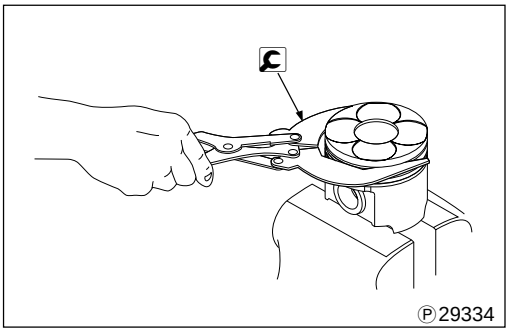
4 **Connecting rod bend and twist**

- Fit the connecting rod bushing **3** and piston pin **2** in their respective positions of the connecting rod **4**.
- Measure the extent of bending **A** and twisting **B** in the connecting rod **4**. If either measurement exceeds the specified limit, replace the connecting rod.

  C : Connecting rod aligner (Measurement device)

NOTE

- **Before mounting the connecting rod 4 on the connecting rod aligner C, install the upper and lower connecting rod bearings in their respective positions.** **P11A-67**
- **Measurements must be made with the connecting rod cap mounting bolts tightened to the specification.** **P11A-67**

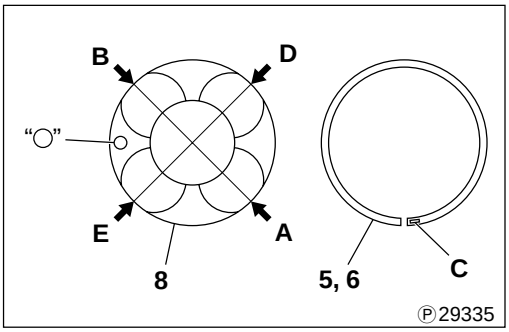


5 **to** **8** **Piston rings and piston**

Piston rings

[Removal]

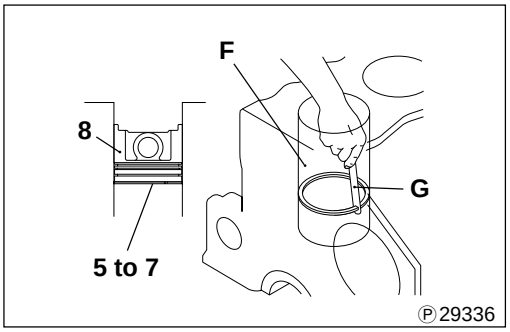
C **:** Piston Ring Tool



[Installation]

- Fit the oil ring **7** onto the piston **8** with its gap **A** and the expander spring end joint **B** in the position illustrated.
- Fit the piston ring **5**, **6** onto the piston **8** such that the manufacturer's marks **C** near the gaps face upward.
- Align the gaps **D**, **E** of the piston ring **5**, **6** as illustrated.

  D **:** 1st compression ring gap
  E **:** 2nd compression ring gap
  "○" **:** Front mark



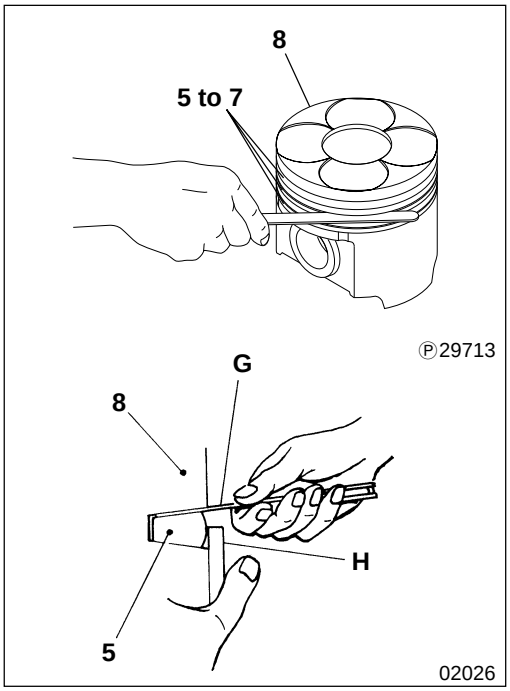
[Inspection]

(1) Piston ring end gap

- Using the crown of a piston **8**, push the piston ring **5**, **6** or **7** horizontally into a cylinder liner **F** in the upper crankcase for measurement.
- Taking care not to remove the piston ring **5**, **6** or **7**, measure the end gap using a thickness gauge **G**. Replace all the rings of piston if any gap exceeds the specified limit.

NOTE

- **To keep the piston ring 5, 6 or 7 horizontal, be sure to insert them into the cylinder liner F using a piston 8.**
- **Push the piston ring 5, 6 or 7 down to the bottom of cylinder liner F; the bottom should be less worn than the top.**
- **Piston rings 5, 6 or 7 must be replaced as a set. Never replace piston rings individually.**



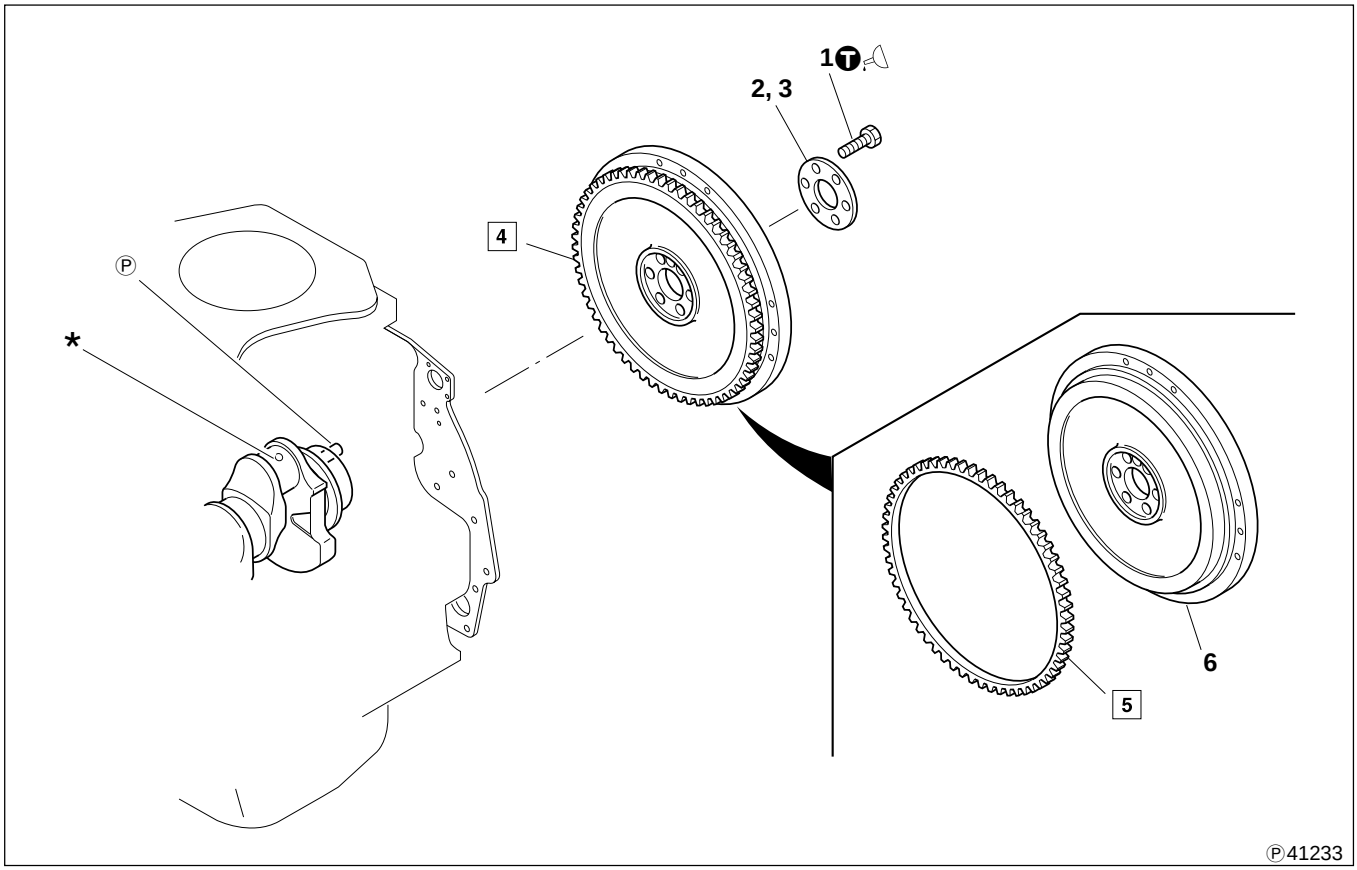
(2) Piston ring-to-piston ring groove clearance

- If any measurement exceeds the specified limit, replace the defective part(s).
- Measure the 1st compression ring **5** clearance with a thickness gauge **G** while pressing the ring against the piston **8** with a straight edge **H**.

NOTE

- **Remove any carbon deposits from the ring groove of the piston 8 and measure the clearance around the piston's entire periphery.**
- **Piston ring 5, 6, 7 must be replaced as a set. Never replace piston rings individually.**

FLYWHEEL



● **Disassembly sequence**

1 Bolt
2 Plate
3 Pilot bearing
4 Flywheel assembly
5 Ring gear
6 Flywheel
***** : Crankshaft assembly P11A-80
Ⓟ : Locating pin

● **Assembly sequence**
Follow the disassembly sequence in reverse.

CAUTION ⚠

- **Make sure that the mounting surface of the flywheel assembly 4 is free from any foreign substances, oil and detrimental flaws.**
- **After installing flywheel assembly 4, check for runout.**

NOTE

- **Do not remove the pilot bearing 3 or ring gear 5 unless an abnormality is evident.**

Ⓣ Tightening torques

Unit: N·m {ft.lbs, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
1	Blot (flywheel assembly installation)	39.0 {29.0, 4.0} +40°	Wet

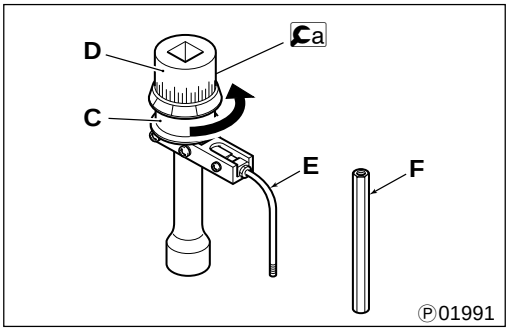
Lubricant

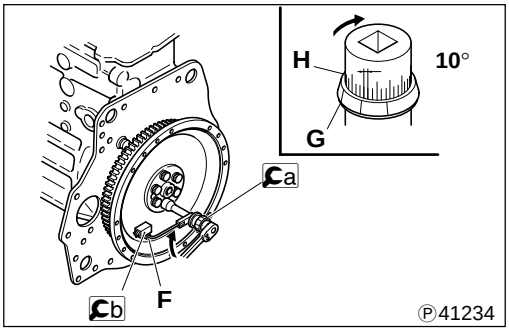
Location	Points of application	Specified lubricant	Quantity
1	Blot threads	Engine oil	As required

Special tools

Unit: mm {in.}

Location	Tool name and shape	Part No.	Application
4	Socket Wrench  Width across flats: 22 {0.87} Ⓟ01984	Obtain Locally	Installation of flywheel
	Magnet Base  00471	Obtain Locally	





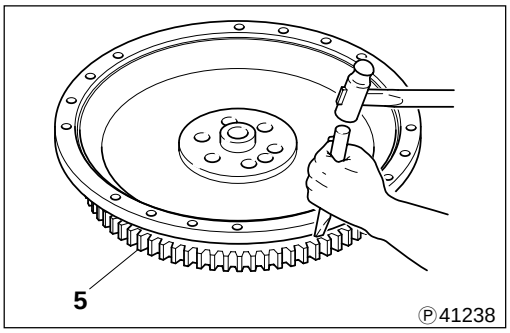
◆ Service procedure

5 Installation of flywheel assembly

- Tighten the bolts **1** to the specified torque (39.0 N·m {29 ft.lbs, 4.0 kgf·m}. After that, turn the bolts further in accordance with the following procedure.
- Turn the holder **C** of the Ca Socket Wrench counterclockwise to the tension the built-in spring.

  D : Socket
  E : Rod
  F : Rod (extension)

- Fit the Cb Magnet Base on the flywheel at a position where it can come in contact with the Rod **F** (for extension) as shown in the illustration.
- Set the rod **F** (for extension) such that it may be pressed against the Cb Magnet Base by the spring force.
- Align any inscribed line **G** on the holder **C** with any inscribed line **H** on the socket **D**. (Use this point as reference 0° position.)
- From the above reference position, turn the socket **D** clockwise by 40° to tighten the bolt further.



5 Ring gear

[Inspection]

Inspect ring gear **5** for damage and abnormal wear. If any defect is evident, the ring gear must be replaced.

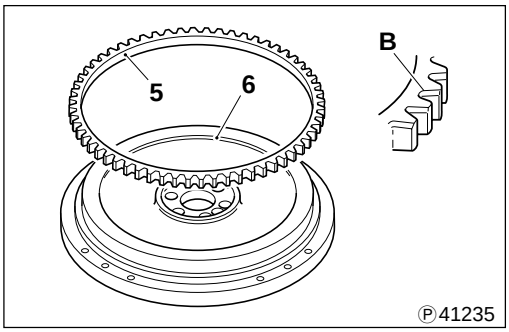
[Removal]

Heat the ring gear **5** evenly with an acetylene torch or the like.

WARNING ⚠

Be careful not to get burned.

- Remove the ring gear **5** from the flywheel by tapping around its entire periphery.



[Installation]

Using an acetylene torch or the like, heat the ring gear **5** to approximately 100 °C {212 °F} for **3** minutes.

WARNING ⚠

Be careful not to get burned.

- Fit the ring gear **5** with the non-chamfered side of its teeth toward the flywheel **6**.

  B : Chamfered side of ring gear **5**.

MEMO

CRANKSHAFT AND CRANKCASE

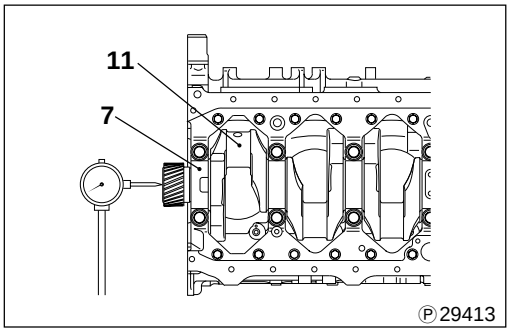
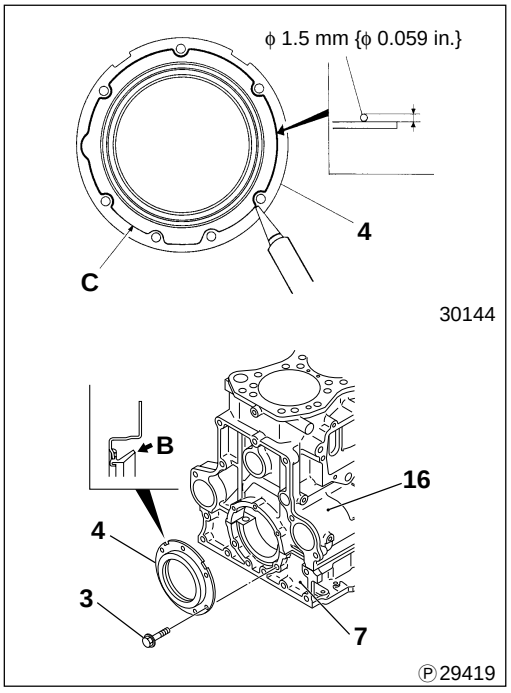
◆ Service procedure



Ⓟ29413

● **Pre-disassembly inspection**
Crankshaft end play

- Before removing the lower crankcase assembly **7**, measure the extent of crankshaft end play.
- If the measurement exceeds the specified limit, replace the thrust plates with oversize ones. P11A-85



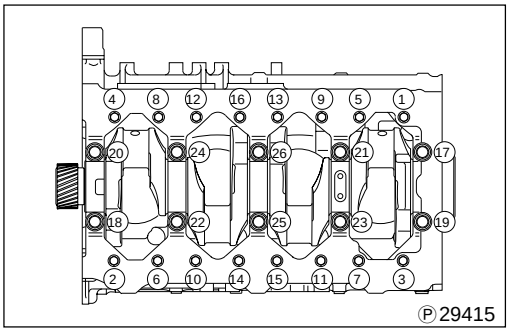
Ⓟ29419

4 **Mounting of rear oil seal**

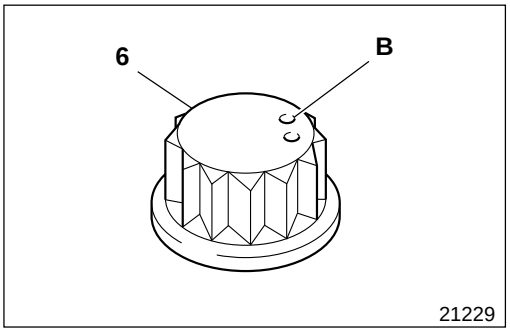
- Apply engine oil to lips **B** of rear oil seal **4**.
- Apply sealant **D** along black line **C** stamped on the rear oil seal **4** evenly without break. (ϕ 1.5 mm {ϕ 0.059 in.})
- After applying sealant **D**, install the rear oil seal **4** between the lower crankcase assembly **7** and upper crankcase assembly **16** within three minutes.

CAUTION ⚠

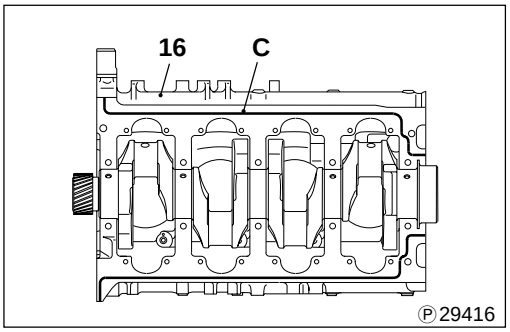
- **Make sure that the sealant application surfaces are clean and free from grease and oil.**
- **Use care not to let the applied sealant slip out of place during installation.**
- **After fitting rear oil seal, wait at least an hour before starting the engine.**
- **Apply a new bead of sealant D whenever mounting bolts 3 of rear oil seal have been loosened.**



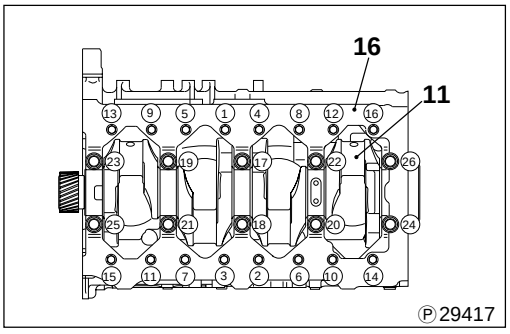
Ⓟ29415



21229



Ⓟ29416



Ⓟ29417

7 Lower crankcase assembly

- ① – ⑯ : Bolt **5**
- ⑰ – ㉖ : Main cap bolt **6**

[Removal]

- Gradually loosen the bolts **5** in the sequence of numbers ① – ⑯ shown in the illustration.
- Then, gradually loosen the main cap bolts **6** in the sequence of numbers ⑰ – ㉖ shown, and remove.

[Installation]

CAUTION ⚠

- **Before installing the lower crankcase assembly check the head of the main cap bolt 6 for punch marks B.**
- **The number of punch marks corresponds to the number of times the bolt has been tightened using torque-turn method (bolts with two or less punch marks are reusable). If there are three, replace the main cap bolt.**

- Apply ϕ 2 mm {ϕ 0.079 in.} thick bead of specified sealant **C** to the fitting surface of the upper crankcase assembly **16** as shown.
- After applying sealant **C**, install the lower crankcase assembly **7** to the upper crankcase assembly **16** within three minutes and secure with the main cap bolts **6** and the bolts **5** as follows:

CAUTION ⚠

- **Make sure that the sealant application surfaces are clean and free from grease and oil.**
- **Use care not to let the applied sealant C slip out of place during installation.**

- Apply a thin coat of engine oil to the threaded part and seating surface of each main cap bolt **6**, then tighten the bolts to a torque of 49 N·m {36 ft.lbs, 5.0 kgf·m} in the sequence of the numbers shown (⑰ – ㉖)
- After tightening, give the bolts an additional 90° turn.
- Following the main cap bolts **6**, tighten the bolts **5** to the specified torque in the sequence of the numbers shown (① – ⑯).

CAUTION ⚠

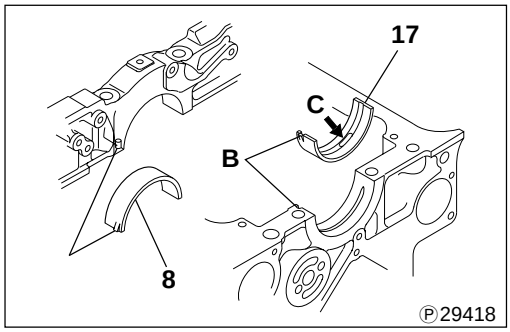
- **After installation, wait at least an hour before starting the engine.**
- **Apply a new bead of sealant C whenever the bolts 5 or the main cap bolts 6 have been loosened.**

- After tightening the main cap bolts **6** using the torque-turn tightening method, make a punch mark on the head of each one to indicate the time of use.

NOTE

Since bolts 1 utilize the torque-turn tightening method, they must not be tightened further after this procedure.

- After installing the lower crankcase assembly, check the following:
  - Smooth rotation of crankshaft assembly **11**
  - End play of the crankshaft assembly **11** P11A-82



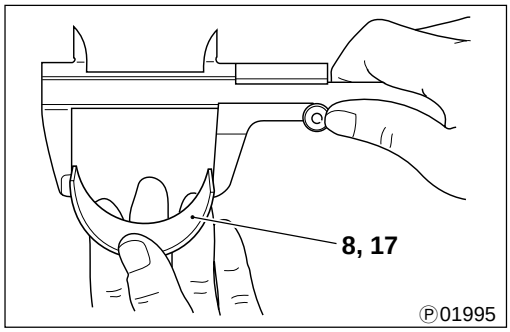
8 **17** **Main bearings**

[Installation]

Install the main bearings **8**, **17** such that their lugs **B** fit into the corresponding grooves.

CAUTION

The upper main bearing 17 has an oil hole C. The lower main bearing 8 has no oil hole. Take care not to confuse the upper and lower parts.



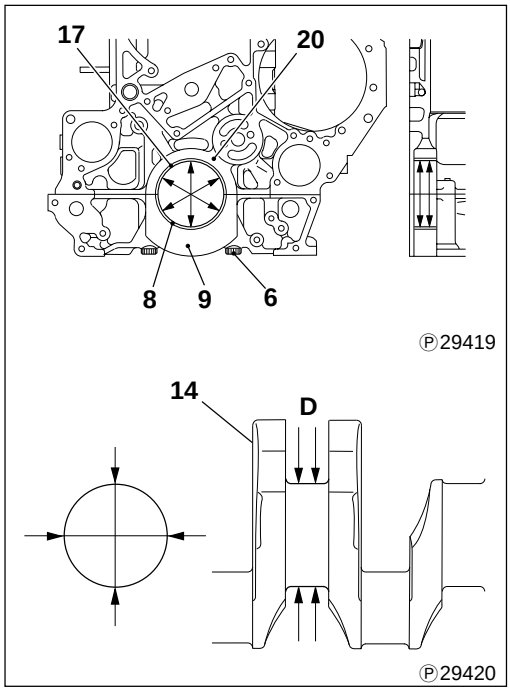
[Inspection]

CAUTION

- **Do not attempt to manually expand either bearing 8, 17 if its span is insufficient.**
- **Upper and lower bearings 8, 17 must be replaced as a set.**

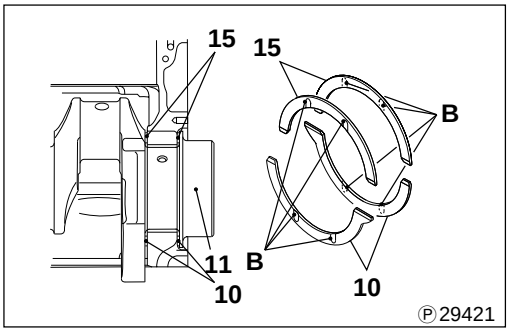
(1) Span when free

If either bearing's span when free exceeds the specified limit, the bearings **8**, **17** must be replaced.



(2) Main bearing-to-crankshaft clearance

- Fit the upper main bearing **17** into the upper crankcase **20** and the lower main bearing **8** into the lower crankcase **9**. Then, tighten the main cap bolts **6** to their specified torque (49 N·m {36 ft.lbs, 5.0 kgf·m}).
- Measure the internal diameters of the main bearings **8**, **17** and the journal outside diameter **D** of the crankshaft **14**. If the clearance exceeds the specified limit, replace the defective part(s).

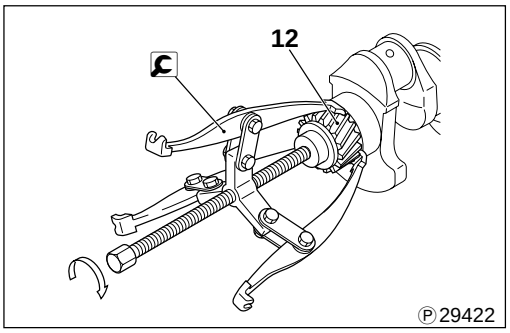


10 **15** **Thrust plate**

Install the thrust plates **10**, **15** to the crankshaft assembly **11** at No. 5 journal only. Install all halves of the thrust plates with the oil groove **B** oriented outward.

NOTE

If any oversize thrust plates are to be used, be sure to use an upper thrust plate 15 and lower thrust plate 10 of the same size at one side. However, using the same size upper (or lower) thrust bearings on both sides is not necessary.
Available oversize: 0.15, 0.30, 0.45 mm {0.0059, 0.012, 0.018 in.}



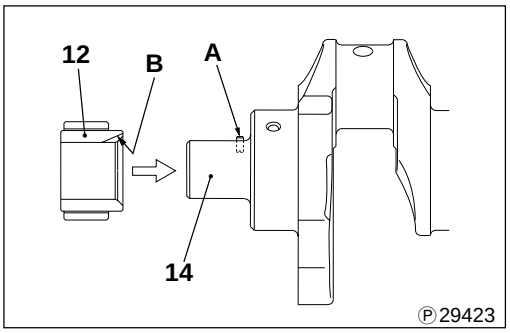
12 **Crankshaft gear**

[Removal]

: Gear Puller

CAUTION ⚠

Do not tap off the crankshaft gear 12 since this could damage it.



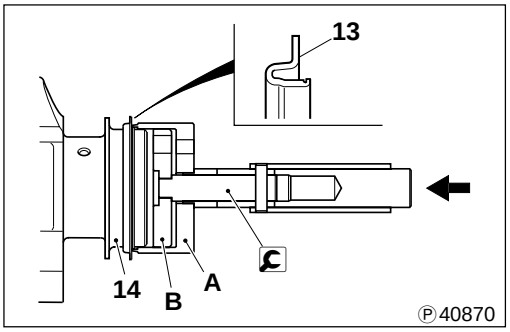
[Installation]

- Using a piston heater or the like, heat the crankshaft gear **12** to a temperature of approximately 150 °C {302 °F}.

WARNING ⚠

Be careful not to get burned.

- Align the location pin **A** on the crankshaft **14** with the notch **B** in the crankshaft gear **12**. Then, drive the gear into position by striking its end face with a plastic mallet.



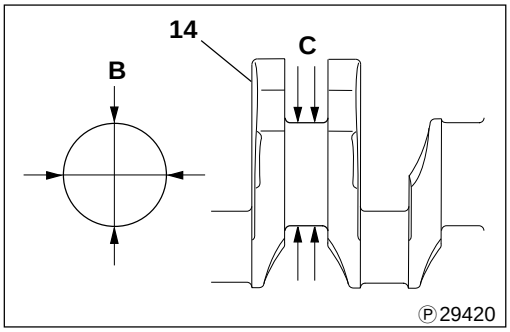
13 **Rear oil seal slinger**

[Removal]

Taking care not to damage the crankshaft **14**, split the oil seal slinger using a chisel or the like.

[Installation]

With the rear oil seal slinger **13** directed as illustrated, drive it onto the crankshaft using the Rear Oil Slinger Installer until the tools end face **A** is pressed firmly against the guide **B**.



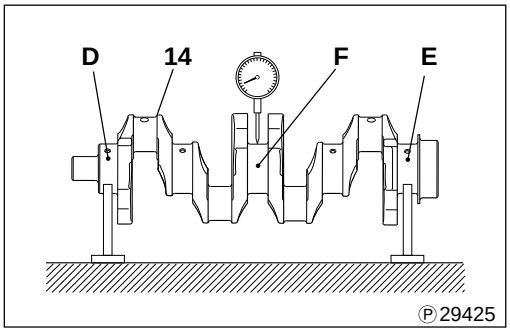
14 Crankshaft

[Inspection]

(1) Roundness and cylindricity of crankshaft journal and pin

If either measurement exceeds the specified limit, grind it to undersize or replace the crankshaft **14**.

B : Roundness
C : Cylindricity

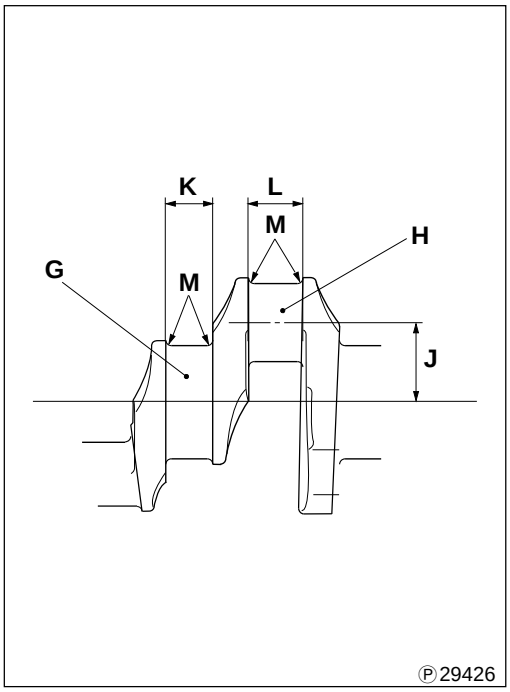


(2) Bend

- Support the crankshaft **14** at its No. 1 journal **D** and No. 7 journal **E**. Measure the extent of bending in the crankshaft at the center of the No. 4 journal **F**.
- If the measurement exceeds the specified limit, replace the crankshaft **14**.

NOTE

Turn the crankshaft 14 through one revolution. One-half of the dial indicator reading represents the extent of bending.



[Rectification]

NOTE

If the crankshaft 14 is rectified by grinding, the main bearings 8, 17 must be replaced with undersized ones.
Available undersizes: 0.25 mm, 0.50 mm 0.75 mm, 1.00 mm {0.0098, 0.02, 0.03, 0.039 in.}

- Grind such that the center-to-center distance **J** between the journal **G** and pin **H** never be changed.

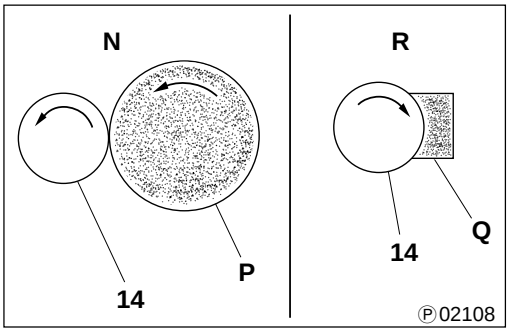
  J : 60 ± 0.05 mm {2.36 ± 0.002 in.}
- Grind such that the journal width **K** and pin width **L** do not change.

  K : 33.5 mm {1.32 in.} (No. 1 journal)
  35 mm {1.38 in.} (No. 2 to No. 4 journals)
  $35^{+0.039}_{0}$ mm {$1.38^{+0.0015}_{0}$ in.} (No. 5 journal)
  L : $41^{+0.2}_{0}$ mm {$1.61^{+0.0079}_{0}$ in.}
- Finish the corner fillet smoothly and to the specified radius M.

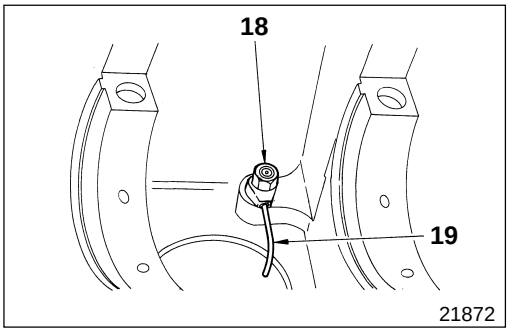
  M : 4 mm {0.16 in.}
- Carry out a magnetic inspection to check for cracks caused by grinding. Also, check that the Shore hardness of the surface has not dropped below Hs 75.

Crankshaft undersize dimensions Unit: mm {in.}

		Degree of undersize			
		0.25 {0.0098}	0.50 {0.020}	0.75 {0.030}	1.00 {0.039}
Finished journal diameter	No. 1, 2, 4, 5	85.68 to 85.70 {3.373 to 3.374}	85.43 to 85.45 {3.363 to 3.364}	85.18 to 85.20 {3.353 to 3.354}	84.93 to 84.95 {3.343 to 3.344}
	No. 3	85.66 to 85.68 {3.372 to 3.373}	85.41 to 85.43 {3.362 to 3.363}	85.16 to 85.18 {3.352 to 3.353}	84.91 to 84.93 {3.342 to 3.343}
Finished pin diameter		64.69 to 64.71 {2.546 to 2.547}	64.44 to 64.46 {2.537 to 2.5378}	64.19 to 64.21 {2.527 to 2.528}	63.94 to 63.96 {2.517 to 2.518}
Roundness		0.01 {0.00039} or less			
Cylindricity		0.006 {0.00024} or less			



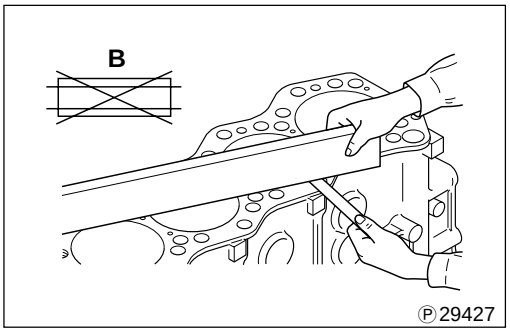
- When grinding **N**, turn the crankshaft **14** counter-clockwise as viewed from its front end. The grinder **P** should rotate in the same direction.
- When finishing **R** the crankshaft **14** with whetstone or sandpaper **Q**, rotate the crankshaft clockwise.



18 **19** **Installation of check valve and oil jet**

CAUTION ⚠

Do not overtighten the check valve 18. If the tightening torque exceeds the specified one, the check valve may malfunction, resulting in seizure of the engine.



20 **Inspecting upper crankshaft**

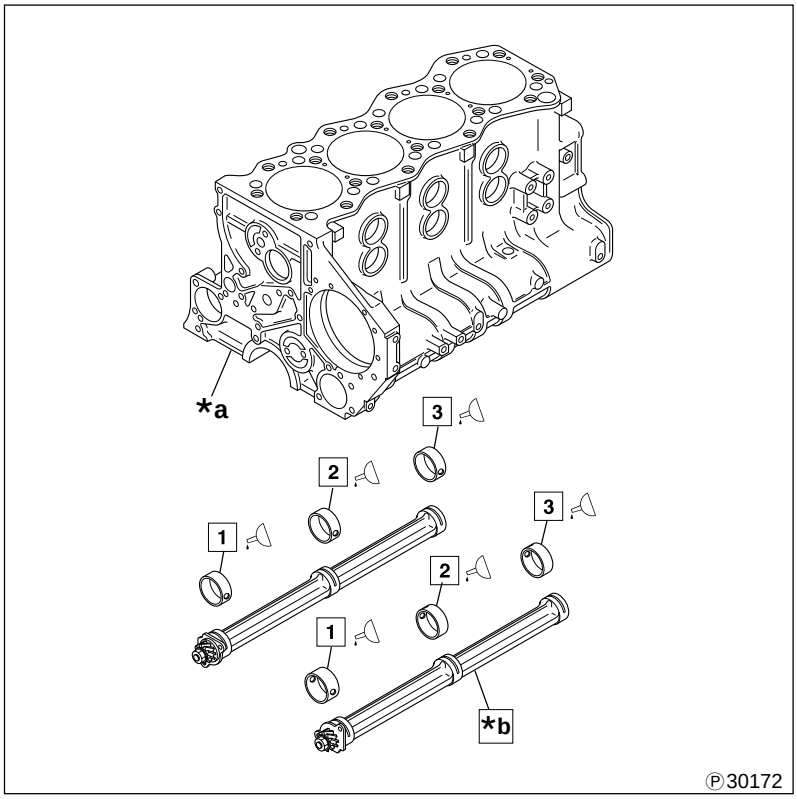
- Measure the upper surface distortion of the upper crankcase **20**.
- If distortion exceeds the specified limit, correct it with a surface grinder.

B : Measurement positions

CAUTION ⚠

When grinding the crankcase 20, take care that the piston protrusions stay within specification.

BALANCE SHAFT BUSHINGS



● **Disassembly sequence**

1 No. 1 balance shaft bushing
2 No. 2 balance shaft bushing
3 No. 3 balance shaft bushing

***a** : Upper crankcase 🕮 P11A-80
***b** : Balance shaft 🕮 P11A-56

CAUTION ⚠

Do not remove the balance shaft bushings 1 through 3 unless something wrong is evident.

● **Assembly sequence**

Follow the disassembly sequence in reverse.

Service standards

Unit: mm {in.}

***b, 1 to 3**	Clearance between balance shaft and balance shaft bushing	No. 1 journal	[51.5 {2.027}] 0.055 to 0.099 {0.0021 to 0.0039}	0.15 {0.0059}	Replace
		No. 2 journal	[51 {2.0}] 0.075 to 0.119 {0.0029 to 0.0046}		
		No. 3 journal	[50.5 {1.98}] 0.055 to 0.099 {0.0021 to 0.0039}		

Lubricant

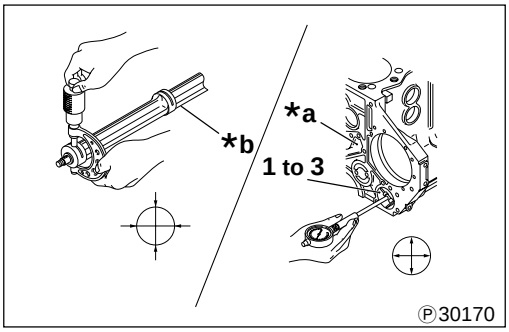
Location	Points of application	Specified lubricant and/or sealant	Quantity
1 to 3	Inside surface of balance shaft bushing	Engine oil	As required

Special tools

Unit: mm {in.}

Location	Tool name and shape	Part No.	Application
1 to 3	Balance shaft bushing installer and extractor (See table below)  02083	MH062782	Installation and removal of balance shaft bushing

	Dimensions A and C	Dimension B
No. 1	ϕ 55.25 {ϕ 2.175}	ϕ 51.5 {ϕ 2.027}
No. 2	ϕ 55 {ϕ 2.165}	ϕ 51 {ϕ 2.007}
No. 3	ϕ 55.75 {ϕ 2.155}	ϕ 50.5 {ϕ 1.988}



◆ Service procedure

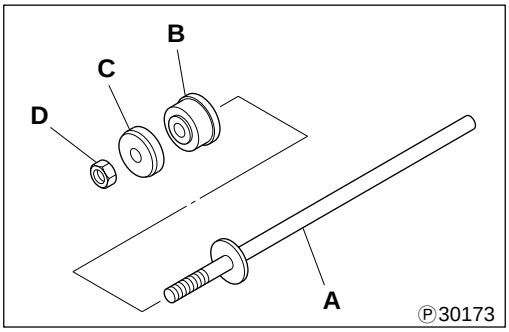
[*b] [1] to [3] Balance shaft and balance shaft bushing

[Inspection]

If the clearance is more than the limit, replace defective parts.

NOTE

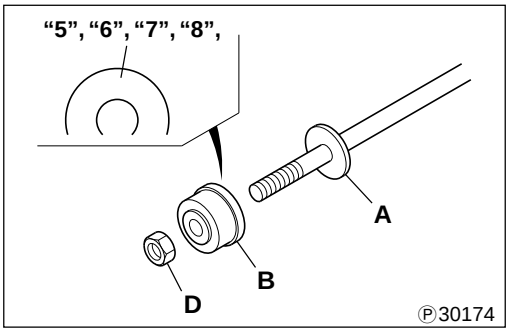
Measure the inner diameter of the balance shaft bushings 1 through 3 with the bushings installed on the upper crankcase *a.



Balance shaft bushing

Use the [SST] Balance Shaft Bushing Installer & Extractor to replace the balance shaft bushings **1** through **3**.
(Components of [SST] Balance Shaft Bushing Installer & Extractor)

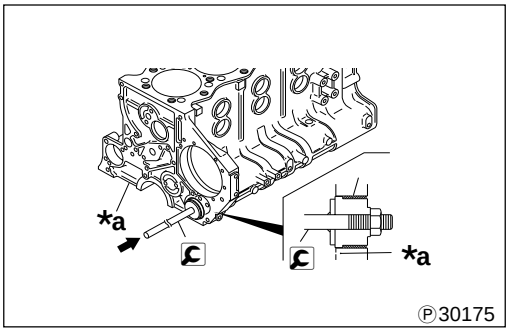
A : Rod
B : Adapter
C : Guide piece
D : Nut



[Removal]

- Drive out the balance shaft bushings **1** to **3** using the [SST] Balance Shaft Bushing Installer & Extractor consisting of the adapter **B** appropriate to each bushing secured on rod **A** with nut **D**.

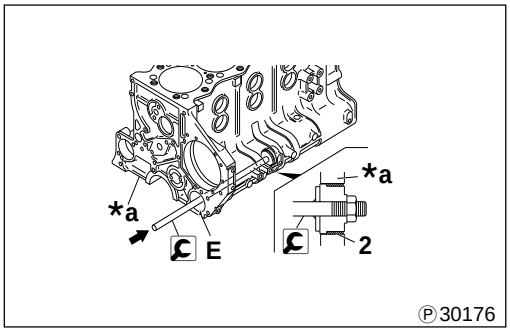
Balance shaft bushing		Identification mark of adapter **B**
No. 1	Left	5
	Right	6
No. 2		7
No. 3		8



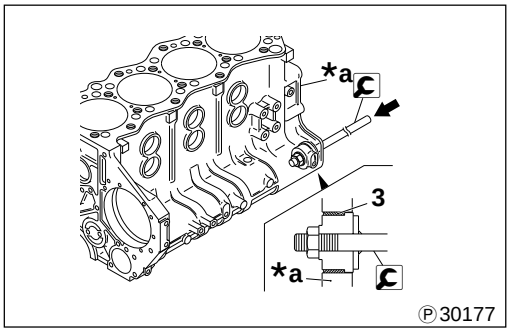
- Remove the No. 1 balance shaft bushing **1** from the front side of the upper crankcase ***a**.

[SST] **:** Balance Shaft Bushing Installer & Extractor

BALANCE SHAFT BUSHINGS

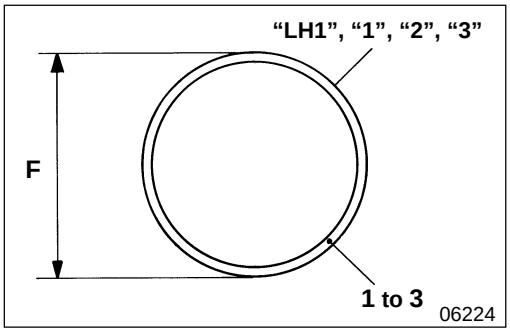


- Remove the No. 2 balance shaft bushing **2** from the upper crankcase ***a** by inserting the 🔧 Balance Shaft Bushing Installer & Extractor through the hole **E** from which the No. 1 balance shaft bushing was removed.



- Remove the No. 3 balance shaft bushing **3** from the rear side of the upper crankcase ***a**.

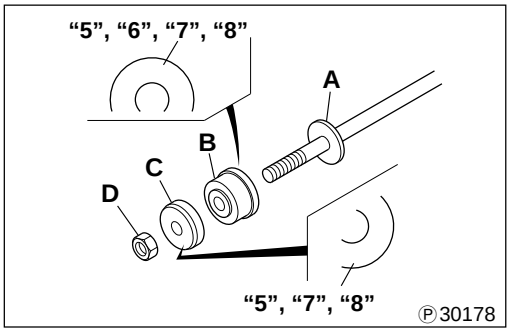
  🔧 **:** Balance Shaft Bushing Installer & Extractor



[Installation]

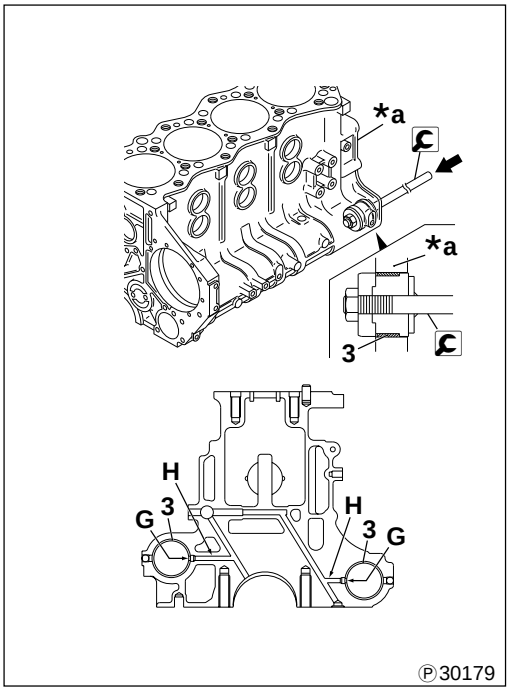
- Identify balance shaft bushings **1** through **3** by the marks "1", "2", "3" or "LH1" stamped on each bushing.
  If the mark on a bushing is unclear, identify the bushing by measuring the outside diameter **F** of the bushing.

Balance shaft bushing (from front of engine)		Mark	Outside diameter (mm {in.})
No. 1	Left (two oil holes)	LH1	ϕ 55.25 {ϕ 2.175}
	Right (one oil hole)	1	
No. 2		2	ϕ 55 {ϕ 2.165}
No. 3		3	ϕ 54.75 {ϕ 2.155}

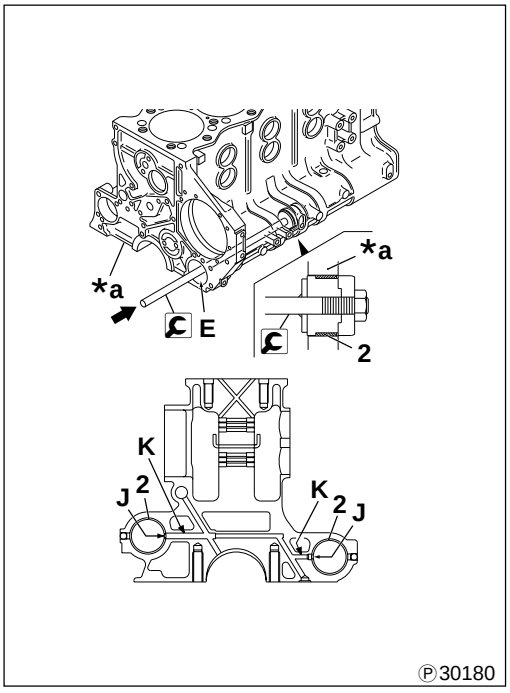


- Drive the balance shaft bushings **1** through **3** in position by hammering on the 🔧 Balance Shaft Bushing Installer & Extractor consisting of the adapter **B** and guide piece **C** appropriate to each bushing secured on the rod **A** with nut **D**.

Balance shaft bushing		Identification mark of adapter **B**	Identification mark of guide piece **C**
No. 1	Left	5	5
	Right	6	
No. 2		7	7
No. 3		8	8

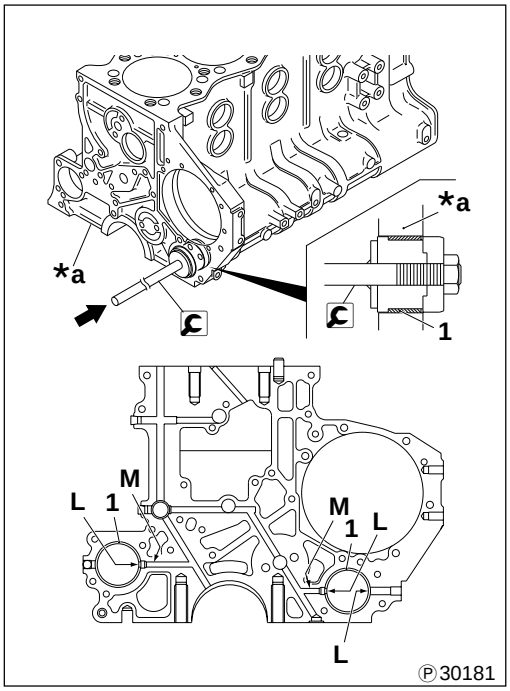


- Install the No. 3 balance shaft bushing **3** from the rear side of the upper crankcase ***a**.
  In this case, make sure that the oil hole **G** in the bushing matches the oil passage **H** in the crankcase.
  : Balance Shaft Bushing Installer & Extractor



- Install the No. 2 balance shaft **2** by inserting the Balance Shaft Bushing Installer & Extractor through the No. 1 balance shaft bushing mounting hole **E** of the upper crankcase ***a**.
  In this case, make sure that the oil hole **J** in the bushing matches the oil passage **K** in the crankcase.
  : Balance Shaft Bushing Installer & Extractor

BALANCE SHAFT BUSHINGS



- Install the No. 1 balance shaft bushing **1** from the front side of the upper crankcase ***a**.
  In this case, make sure that the oil hole **L** in the bushing matches the oil passage **M** in the crankcase.

  : Balance Shaft Bushing Installer & Extractor

CAUTION ⚠

- **The No. 1 balance bushings 1 include the right and left ones which are different from each other. Use care to prevent confusion when installing them.**
  The left one has two oil holes, whereas the right one has one oil hole.
- **Before installing No. 1 balance bushing 1, check to ensure that No. 2 balance shaft bushing 2 has been installed.**

Crankshaft pulley mounted incorrectly		○	
Air cleaner or muffler malfunctioning		○	Gr 15B
Rocker shaft and bracket faulty		○	
Rocker shaft bracket lubrication faulty		○	
Timing gear backlash faulty		○	
Timing gear system and idler shaft lubrication faulty		○	
Connecting rod small end bushing worn and piston pin worn		○	
Crankshaft pin and big end bearing of connecting rod worn or damaged		○	
Crankshaft journal and main bearing worn or damaged		○	
Crankshaft and camshaft end play excessive		○	
Tappet and camshaft worn		○	

Inspection of Engine Compression

Service standards

Location	Maintenance item		Standard value	Limit	Remedy
—	Engine Compression	Each cylinder (200 rpm)	2550 kPa {370 lbf/in^2, 26 kgf/cm^2}	1960 kPa {285 lbf/in^2, 20 kg/cm^2}	Inspect
		Pressure difference between each cylinder	—	within 390 kPa {57 lbf/in^2, 4 kgf/cm^2}	Inspect

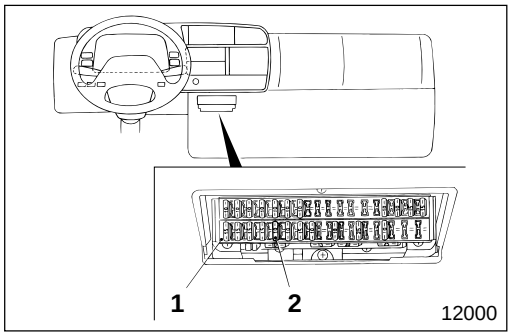
Special tools

Unit : mm {in.}

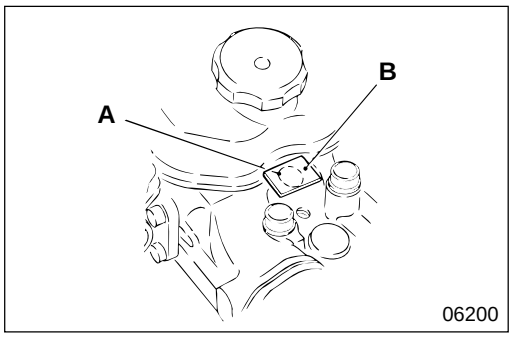
Location	Tool name and shape	Part No.	Application
—	Compression gauge adapter  06197	MH061460	Measurement of engine compression

The decrease of engine compression is a signal that it is time to overhaul the engine. It is strongly recommended that this item is inspected periodically and that you record the history of deterioration in engine performance as this will help you to diagnose causes of future irregularities.
When the vehicle is still new or immediately after installation of new parts, there may be a slight increase in engine compression, but normal performance will be restored soon.

- Before inspection make sure that engine oil, starter and battery are in normal condition.
- Before inspecting the vehicle do the following:
  - Run the engine to bring the temperature of the coolant up to approximately 75 to 85°C {167 to 185°F}.
  - Turn all the lights and accessory equipment OFF.
  - Put transmission in neutral. (N range for automatic transmission)
  - Set the steering wheel at center and straight position.



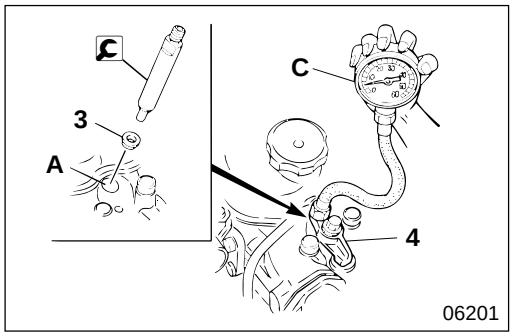
- Remove fuse **2** for the fuel-cut motor from fuse box **1** inside the cab to prevent the fuel from being injected when the engine is cranked by the starter.



- Remove all the injection nozzles. Gr 13B
- Check that no foreign particles are sticking to waste cloth **B** covering injection nozzle mounting hole **A** after cranking the engine.

WARNING⚠

You must stay clear of injection nozzle mounting hole A when you crank the engine during this inspection. Assume that all cylinders have cracked, and that coolant, engine oil, fuel, etc. have seeped into the cylinder chambers. If this is the state when the engine is cranked, there is an extreme danger of these substances being injected out of the injection nozzle mounting hole at high temperature.



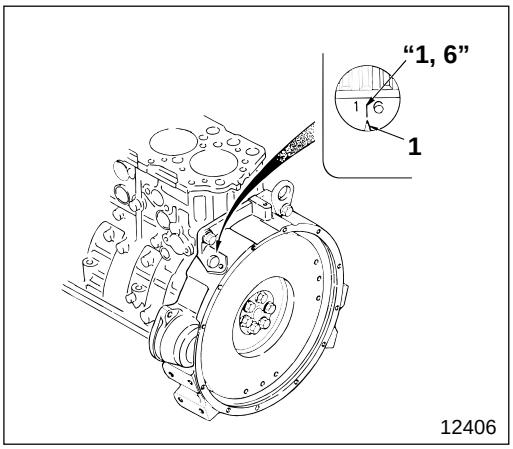
- Mount gasket **3** and compression gauge adaptor in injection nozzle mounting hole **A** and fasten them with nozzle bridge **4**, then mount compression gauge **C**.
- Measure engine compression while cranking the engine.
- Measure engine compression of cylinders and calculate the difference among the cylinders.
- If the engine compression and pressure difference between each cylinder deviate from the limit, reinspect by pouring a small amount of engine oil into injection nozzle mounting hole **A**.
  - When pressure is high : It is likely that either wear or damage of the slide-contact area of both the piston ring and the cylinder inner surface has taken place.
  - When pressure is low : It is likely that burning of the valve, faulty contact of valve surfaces and/or faults in the cylinder head gasket have developed.

Inspection and Adjustment of Valve Clearance

Service standards

Unit : mm {in.}

Location	Maintenance item	Standard value	Limit	Remedy
—	Valve clearance (When engine is cold)	0.4 {0.016}	—	Adjust



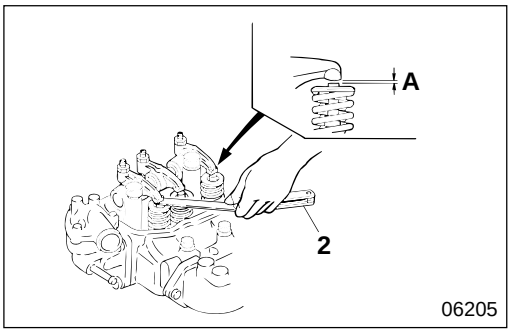
Inspect and adjust the valve clearance while the engine is cold in the following way.

[Inspection]

- Crank the engine to move No.1 or No.6 piston to top dead center, and align stamped marks "**1**, **6**" on the flywheel with pointer **1** on the flywheel housing.

NOTE

The cylinder whose push rod is not pushing up the inlet/outlet rocker is the one whose piston is at top dead center.



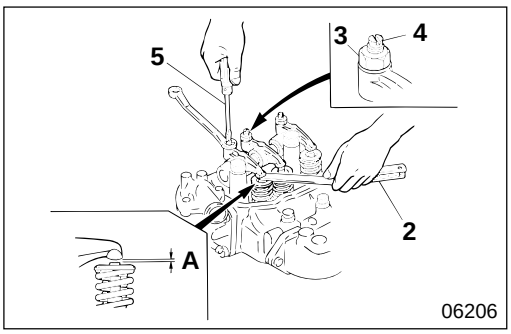
- Measure valve clearance **A** when either No.1 or No.6 piston is at top dead center in accordance with the following tabulated sequence of each valve.

Piston No.	1		2		3		4		5		6	
Valve arrangement	In-take	Ex-haust	In-take	Ex-haust	In-take	Ex-haust	In-take	Ex-haust	In-take	Ex-haust	In-take	Ex-haust
No.1 piston at top dead center	○	○	○	×	×	○	○	×	×	○	×	×
No.6 piston at top dead center	×	×	×	○	○	×	×	○	○	×	○	○

NOTE

Be sure when taking measurements using feeler gauge 2 that some resistance is felt when inserting the gauge. If the gauge can be inserted freely without any resistance, an accurate measurement cannot be obtained.

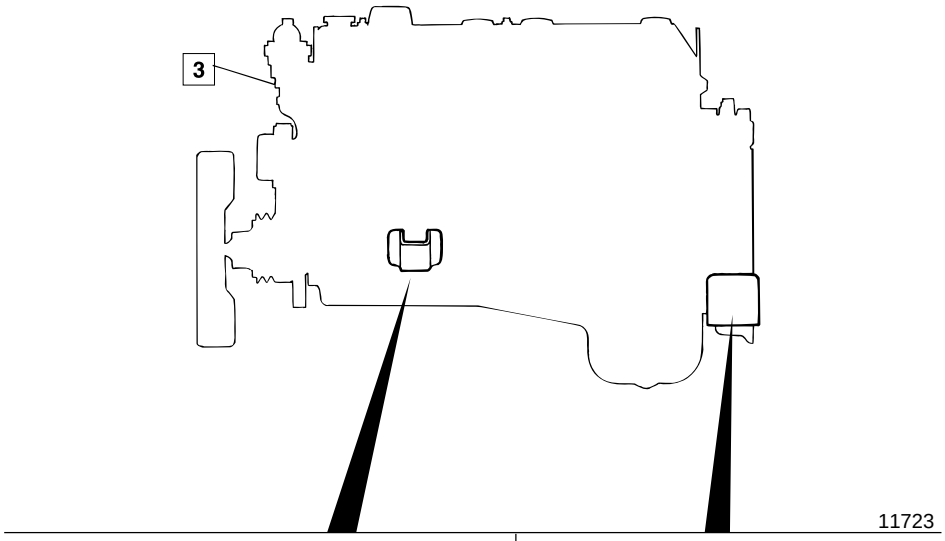
- If the measured value deviates from the limit, adjust as follows:



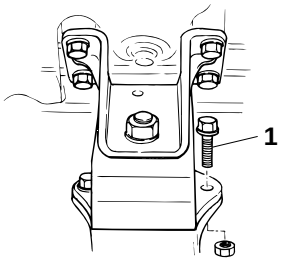
[Adjustment]

- Adjust valve clearance **A** so that feeler gauge **2** encounters some resistance when it is inserted. Do this by loosening lock nut **3** and turning adjusting screw **4**.
- After adjusting, tighten adjusting screw **4** using screwdriver **5** and tighten lock nut **3**. Reinspect valve clearance **A** using feeler gauge **2**.

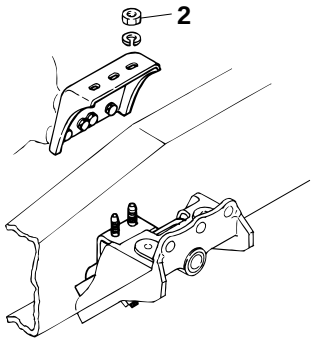
REMOVAL AND INSTALLATION OF ENGINE



11723



11724



11725

● **Removal sequence**

1 Bolt
2 Nut
3 Engine assembly

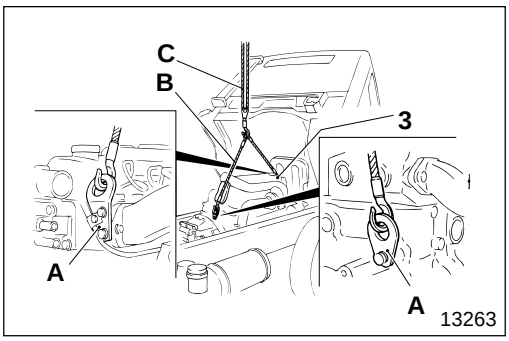
WARNING ⚠

When you lift engine assembly 3, you must use lifting gear that is strong enough to lift the mass of the engine (approximately 550 kg {1210 lb}).

● **Installation sequence**

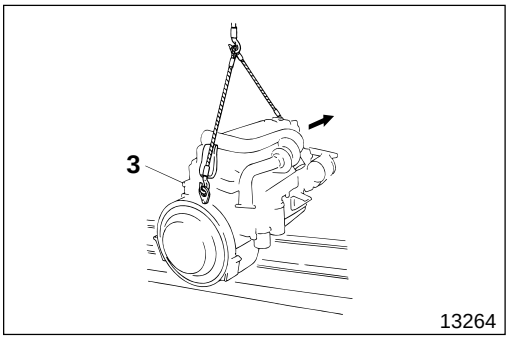
Follow the removal sequence in reverse.

◆ Service procedure



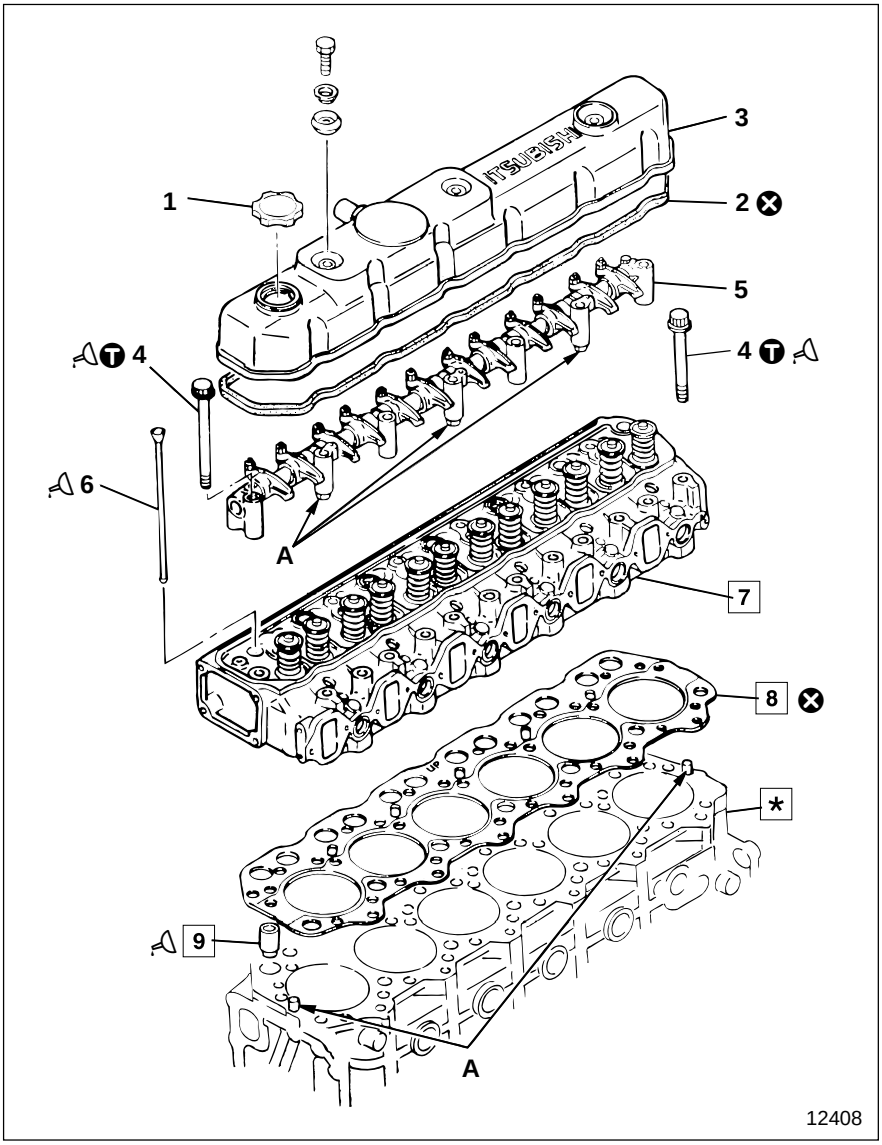
3 Removal of engine assembly

- Hook lifting gear **B** to two hangers **A** on engine assembly **3** and lift the engine using crane **C** until the lifting gear becomes taut.
- Make sure that wiring and hoses are disconnected.



- Lower engine assembly **3** slowly so that it does not hit the frame or cab.
- When the lower part of engine assembly **3** appears from the frame, turn the engine assembly 90° to remove it.

CYLINDER HEAD AND VALVE MECHANISM



● **Disassembly sequence**

1 Oil filler cap
2 Rocker cover gasket
3 Rocker cover
4 Cylinder head bolt

⊗ **:** Non-reusable parts

● **Assembly sequence**

Follow the disassembly sequence in reverse.

Service standards

Unit : mm {in.}

Location	Maintenance item	Standard value (Basic diameter in [ ])	Limit	Remedy
6	Push rod deflection	—	0.4 {0.016}	Replace
9, *	Clearance between tappet and crankcase tappet hole	[28] 0.05 to 0.09 {[1.10] 0.0020 to 0.0035}	0.2 {0.0079}	Replace

Ⓣ Tightening torque

Unit : N·m {ft.lbs, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
4	Cylinder head bolt	145 {110, 15}+90°	Wet Reuse up to three times

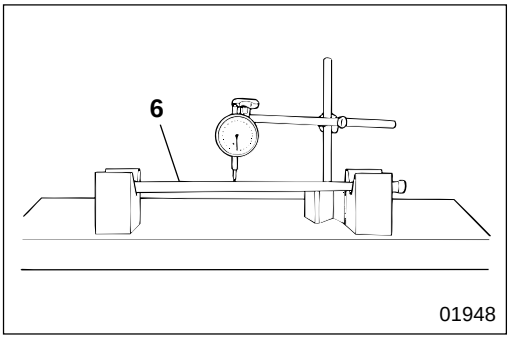
Lubricant

Location	Points of application	Kinds	Quantity
4	Thread area of cylinder head bolt	Engine oil	As required
6	Both ends of push rod	Engine oil	As required
9	External periphery of tappet	Engine oil	As required

Special tools

Location	Tool name and shape	Part No.	Application
7	Socket wrench  01984	MH061560	Installation of cylinder head and valve assembly
9	Tappet extractor  03320	MH063329	Removal of tappet

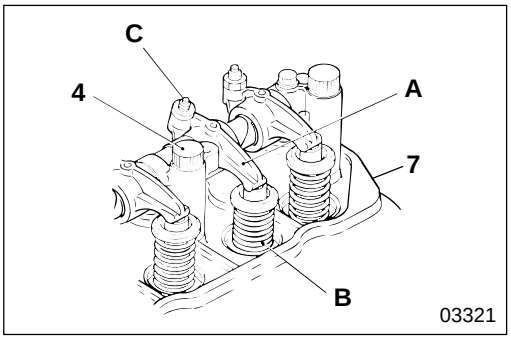
◆ Service procedure



01948

6 **Push rod deflection**

If the measured value is higher than the limit, replace push rod **6**.

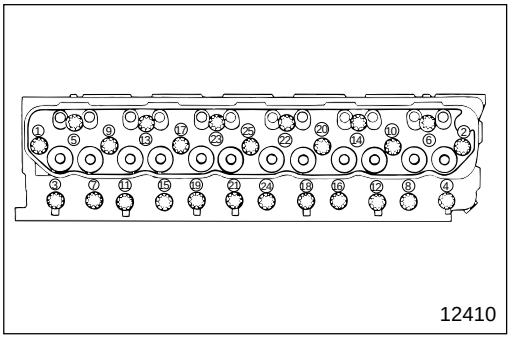


03321

7 **Cylinder head and valve assembly**

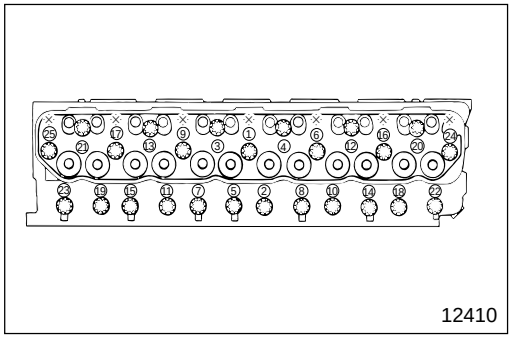
[Removal]

- Before undoing cylinder head bolts **4**, first loosen adjusting screw **C** of rocker **A** that pushes down valve spring **B**.



12410

- First loosen cylinder head bolts **4** in the numbered order as illustrated, then remove them.



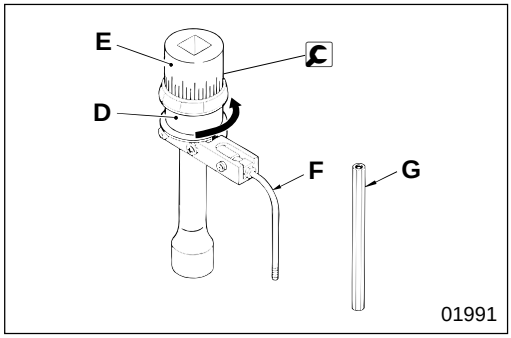
[Installation]

- Center punch the heads of cylinder head bolts **4** before installation.

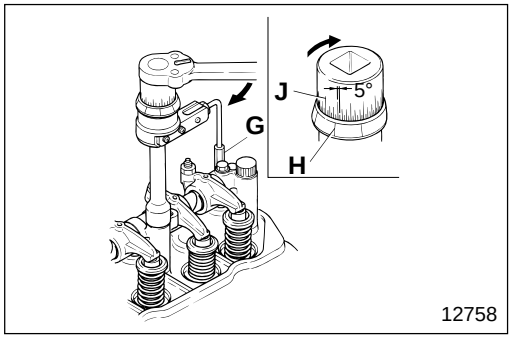
CAUTION⚠

If there are already three center-punch marks, replace the cylinder head bolt with a new one.

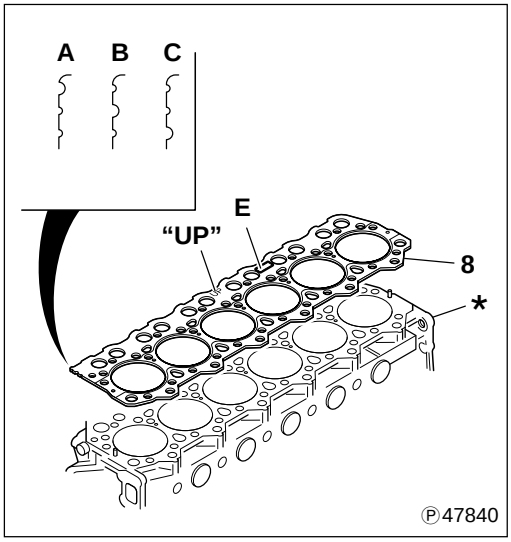
- After tightening cylinder head bolts **4** at specified torque in the numbered order as illustrated, tighten further as follows:
  ·⁜· : Tightened simultaneously with rocker and bracket assembly



- Turn socket wrench holder **D** counterclockwise and keep the spring in the wrench compressed.
  E : Socket
  F : Rod
  G : Rod (for connection)



- Set socket wrench holder **D** so that the repercussive force of the spring presses rod **G** (for connection) against adjacent parts such as, the rocker shaft bracket or the injection pipe.
- Select a scale that is convenient for reading graduation **H** on holder **D**.
- Tighten further by turning socket **H** clockwise by 90° (setting is in 5° increments), referring to graduation **J** on the selected scale.



8 **Cylinder head gasket**

[Removal]

CAUTION

Be careful not to scratch the cylinder head or crankcase * when you remove cylinder head gasket 8.

[Installation]

Select proper cylinder head gasket **8** with the following procedures.

- Measure the piston protrusion value of each cylinder. P11B-38
- Then, select the cylinder head gasket **8** with thickness corresponding to its average piston protrusion value from the table below.
- If there are one cylinder or more which have average piston protrusion value with 0.05 mm or more compared with the average piston protrusion value, use the gasket with one-rank-up thickness (A→B, B→C).

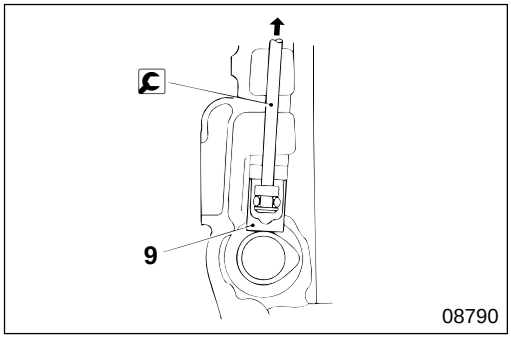
Unit: mm

Average protrusion value of piston	Cylinder head gasket	
	Size classification	Thickness when tightened
0.463 to 0.530	A	1.30 ± 0.05
0.531 to 0.598	B	1.35 ± 0.05
0.599 to 0.666	C	1.40 ± 0.05

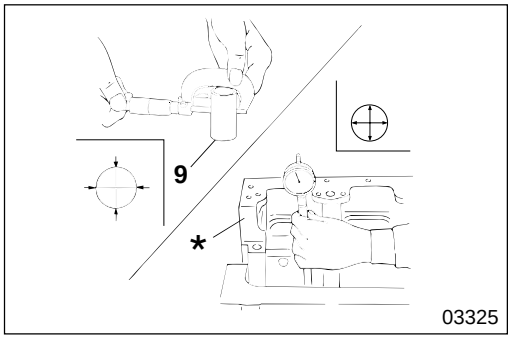
- Identify the kind of cylinder head gasket **8** is based on the notched part **D**.
- Install cylinder head gasket **8** to crankcase * in the direction as shown.
  E : parts number

CAUTION

When changing piston, connecting rod, etc., make sure to measure the protrusion value of piston because it varies.



9 **Removal of tappet**



9 ***** **Clearance between tappet and crankcase tappet hole**

If the measured value is higher than the limit, replace the faulty parts.

CYLINDER HEAD AND VALVE MECHANISM

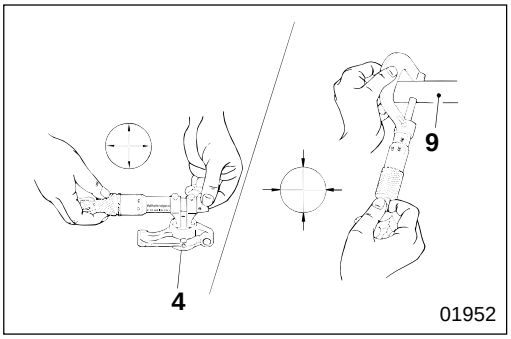
4	Inner surface of rocker bushing	Engine oil	As required

Special tools

Unit : mm {in.}

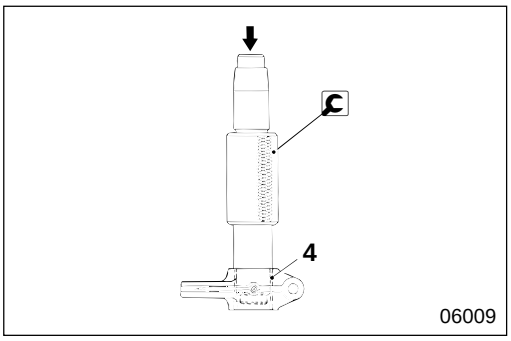
Location	Tool name and shape	Part No.	Application
4	Rocker bushing puller 	MH061378	Removal and installation of rocker bushing

◆ Service procedure



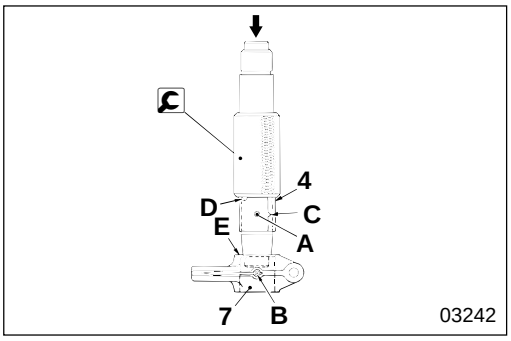
4 **9** **Rocker bushing and rocker shaft**

[Inspection]
If the clearance is higher than the limit, replace the faulty parts.

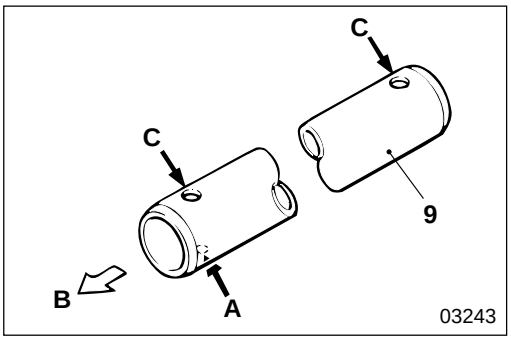


Rocker bushing

[Removal]



[Press-fitting]
- Align oil hole **A** of rocker bushing **4** with oil hole **B** of rocker **7**.
- Position clinch **C** and split **D** of rocker bushing **4** in the direction as illustrated.
- Press-fit rocker bushing **4** from chamfered side **E** of rocker **7**.



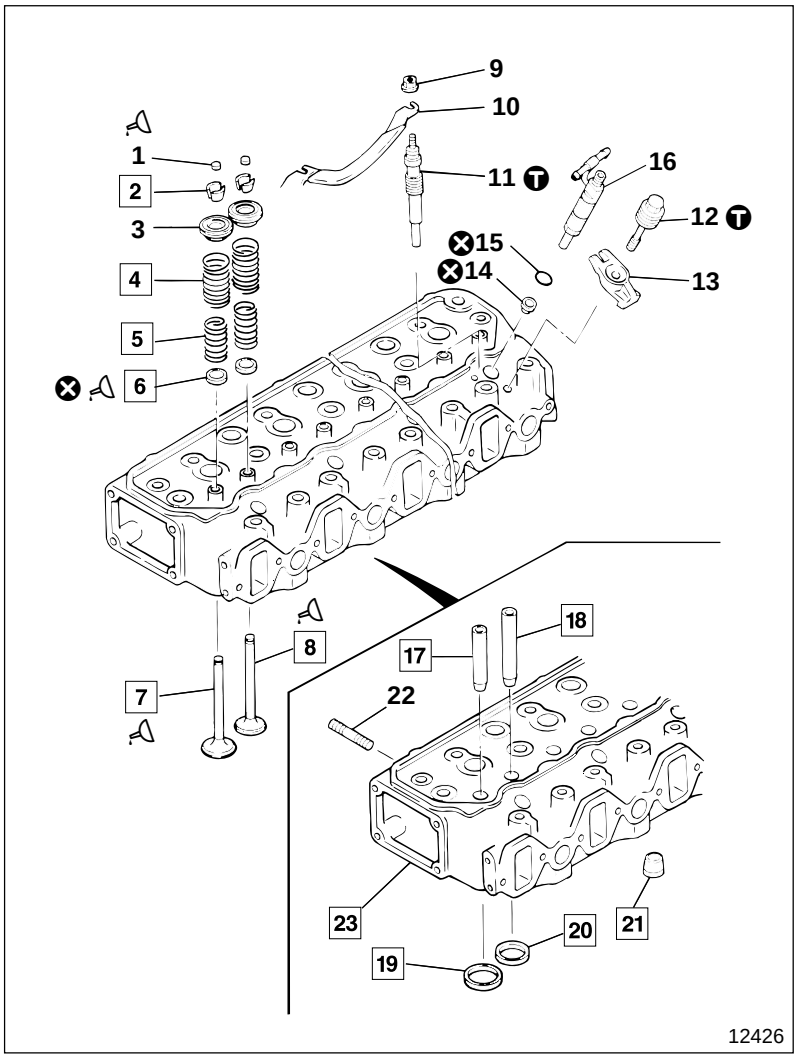
9 **Installation of rocker shaft**

When installing rocker shaft **9**, bring oil passage hole for lubrication **A** to front side **B**.

C : Fixing hole of the set bolt.

CYLINDER HEAD AND VALVE MECHANISM

Cylinder Head and Valve Assembly



● **Disassembly sequence**

1 Valve cap

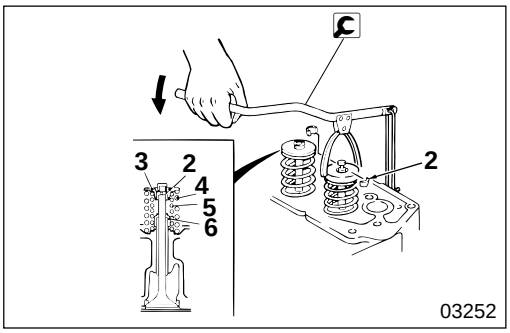
19, 20	**A** : Caulking tool body **B** : Caulking ring | | **C** dimension | | Inlet | ø47.6 {1.87} | | Exhaust | ø40.6 {1.60} |  01961	**A** : MH061067 **B** : MH061275 (Inlet) MH061069 (Exhaust)	Press-fitting of valve seat

◆ Service procedure



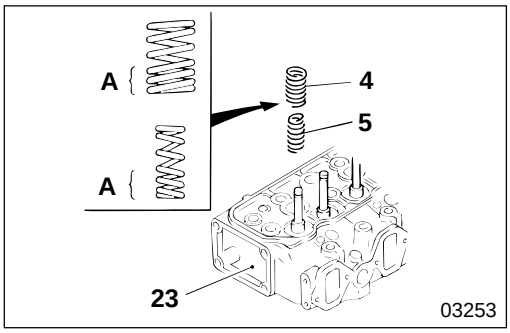
2 **Valve cotter**

[Removal]
Remove valve cotter **2** making sure that valve springs **4**, **5** are squarely and evenly pressed down by 🔧 valve lifter.

[Installation]
Follow the removal procedure in reverse.

CAUTION⚠

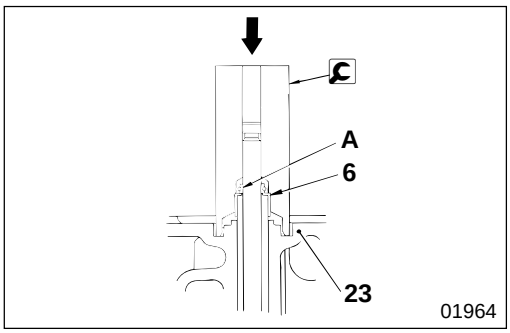
Be sure not to press down on valve springs 4, 5 too hard because this would cause upper retainer 3 to contact valve stem seal 6 and damage it.



4 **5** **Installation of outer and inner valve springs**

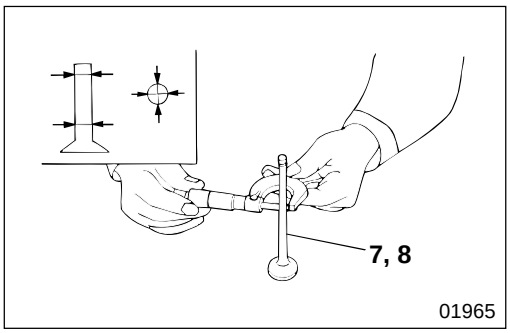
Install outer springs **4** and inner springs **5** in cylinder head **23** in the direction as illustrated.

A : Closely wound area



6 **Installation of valve stem seal**

- Apply engine oil to lip **A** of valve stem seal **6**.
- Tap down 🔧 valve stem seal installer until it hits cylinder head **23**.



7 **8** **Inlet valve and exhaust valve**

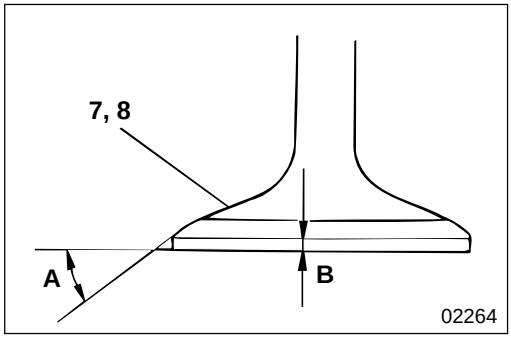
[Inspection]

(1) Inspection of stems

If the measured value is lower than the limit or in the case of excessive wear, replace valves **7**, **8**.

CAUTION⚠

Be sure to lap valve seats 19, 20 when valves 7, 8 are replaced with new ones. 🕮 **P11B-21**

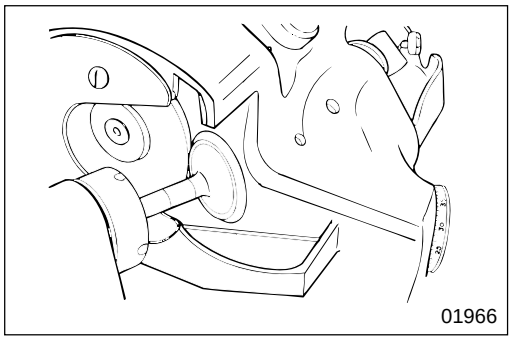


(2) Valve seat angle and valve margin

If the measured value is higher than the limit, correct or replace valves **7**, **8**.

A : Valve seat angle

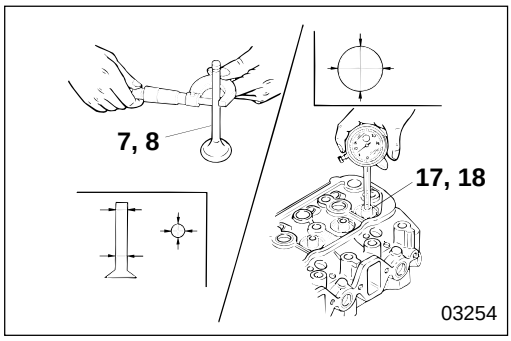
B : Valve margin



[Correction]

NOTE

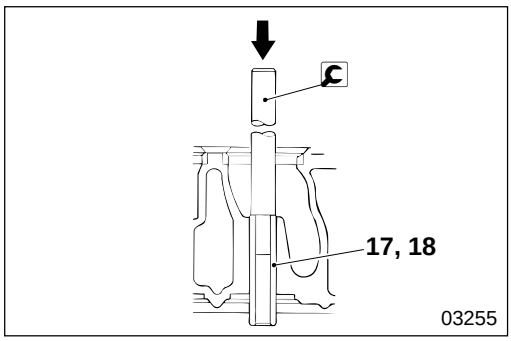
- **Be sure to keep the grinding work as light as possible.**
- **Be sure to replace valves 7, 8 after grinding if valve margin deviates from the limit.**
- **Be sure to lap valve 7, 8 and valve seats 19, 20 after grinding.** **P11-21**



7 **8** **17** **18** **Valve and valve guide**

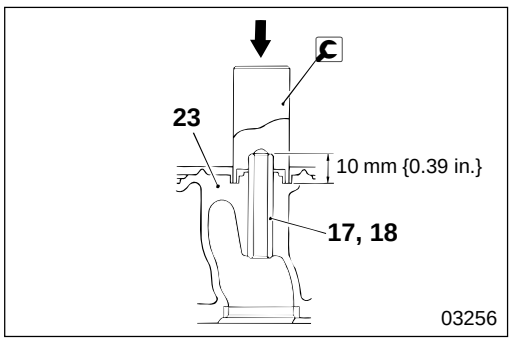
[Inspection]

When the clearance is higher than the limit, replace the faulty parts.



Valve guide

[Removal]

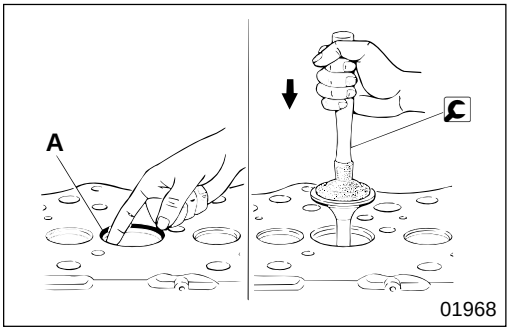


[Installation]

- Tap down valve guides **17**, **18** with 09916-58210 valve guide installer until it hits cylinder head **23**.

CAUTION

- **The length of fit of valve guides 17, 18 is standardized. Be sure to use 09916-58210 valve guide installer.**
- **Be sure to distinguish between valve guides 17, 18. Exhaust valve guide 18 is longer.**



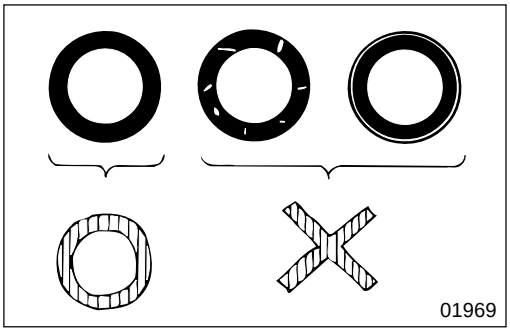
7 **8** **19** **20** **Valve and valve seat**

[Inspection]

- Apply red lead evenly to entire surface **A** of valve seats **19**, **20** that contact valves **7**, **8**.
- Fit valves **7**, **8** to valve seats **19**, **20** and tap once without rotating.

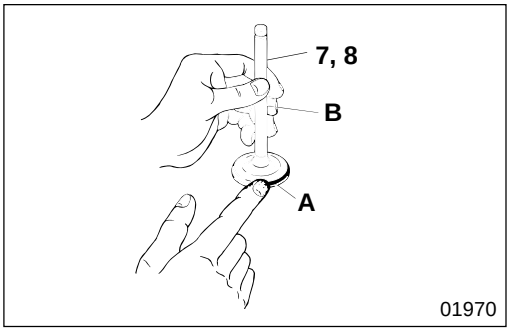
NOTE

Be sure to carry out inspection under the condition that valves 7, 8 and all parts of valve guides 17, 18 are normal.



- Check how much red lead has transferred to valves **7**, **8** to determine the contact of the valve and the seat. According to the degree of abnormality, take proper measures to correct it.

Contact conditions	Correction measures
Minor fault	Valve lapping
Major fault	Repair of valve and seat or replacement of both



[Correction]

Valve polishing is done in the following manner:

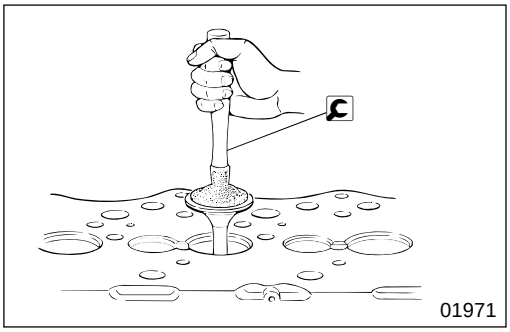
- Apply valve lapping compound thinly to contact surface **A** of valves **7**,**8** with valve seats **19**, **20**.

CAUTION

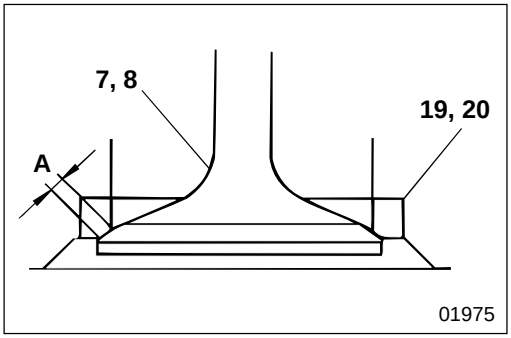
Take care not to smear stems B of valves 7, 8 with the compound.

NOTE

- **Start with medium grit compound (120 to 150 grit) and for finishing up, use finer grit (200 grit or finer).**
- **Mixing with a small amount of engine oil will make the compound consistent and make even application easier.**



- Tap valves **7**, **8** against valve seats **19**, **20** several times while rotating the valves slightly at each strike.
- Clean off the compound with gas oil.
- Apply engine oil to contact surface **A** of valve seats **19**, **20** and smooth the surface.
- Check the contact of valves **7**, **8** and valve seats **19**, **20**.
- If contact does not take place completely around the seat, replace valve seats **19**, **20**.



19 **20** **Valve seat**

[Inspection]

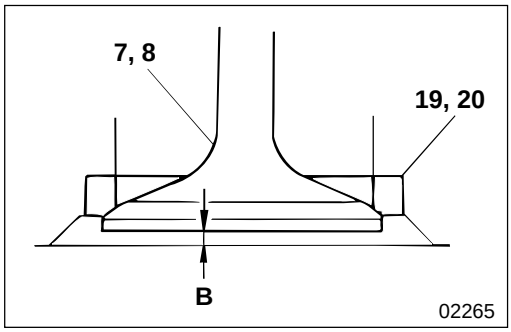
(1) Valve seat width

If the measured value is higher than the limit, replace valve seats **19**, **20**.

A : Valve seat width

NOTE

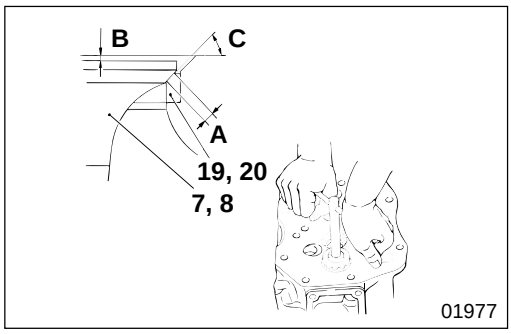
Be sure to lap and fit valves 7, 8 and valve seats 19, 20 after correction or replacement.



(2) Extent of valve recess from the bottom surface of cylinder head

If the measured value is higher than the limit, correct or replace the faulty parts.

B : Extent of valve recess



[Correction]

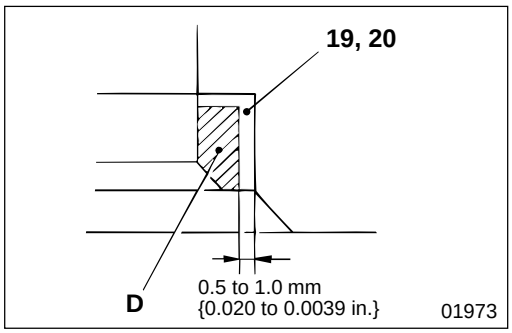
- Grind valve seats **19**, **20** using valve seat cutter or valve seat grinder.
- After grinding, do another light abrasion using 400 grit emery paper placed between the cutter and the seat.
- Adjust the seat width **A** of valves **7**, **8** using 15° or 75° cutter to make seat width conform to the standard value.

C : Valve seat angle

CAUTION ⚠

Be sure that as a result of grinding, recess B of valves 7, 8 does not become higher than the limit.

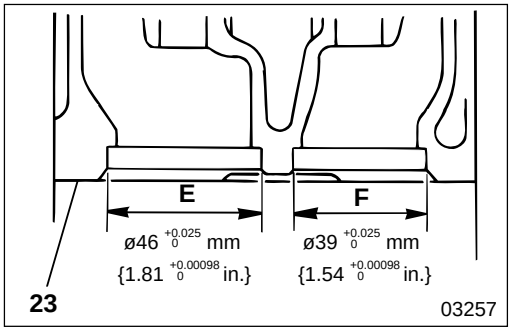
- After correction is done, be sure to carry out lapping and fitting on valves **7**, **8** and valve seats **19**, **20**.



[Removal]

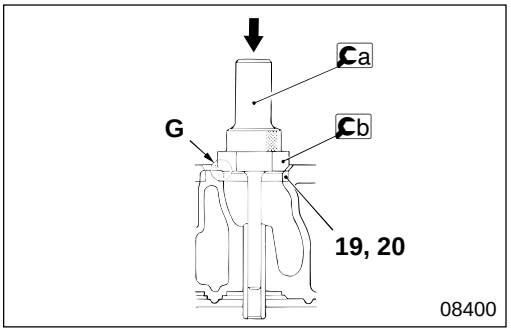
- Valve seats **19**, **20** have been set in by the cooling-off-process, and have to be thinned by grinding off the inner side for removal under normal temperature.

D : Part to be ground



[Installation]

- Make sure that the diameter of valve seat hole of cylinder head **23** conforms to the standard value.
  E : Inlet valve seat hole diameter
  F : Exhaust valve seat hole diameter

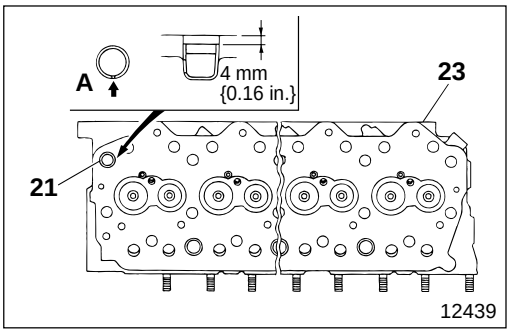


- Immerse valve seats **19**, **20** in liquid nitrogen and cool them substantially. Press-fit into the cylinder head using Ca caulking tool body and Cb caulking rings inlet and exhaust.

CAUTION

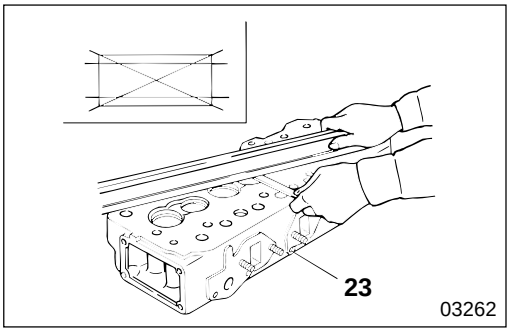
Be sure, when press-fitting, to place the chamfered side G of Cb caulking rings inlet and exhaust against valve seats 19, 20.

- After installation of valve seats **19**, **20**, work until they contact valves **7**, **8** smoothly.



21 Installation of water director

- With indent **A** set in the direction as illustrated, press-fit water director **21** into cylinder head **23** to the specified depth.



23 Inspection of cylinder head

Measure the extent of distortion of the bottom of cylinder head **23**, and if the measured value is higher than the standard value, grind using a surface grinder.

CAUTION

Be sure to keep the amount of grinding within the limit of the height of cylinder head 23.

TIMING GEAR

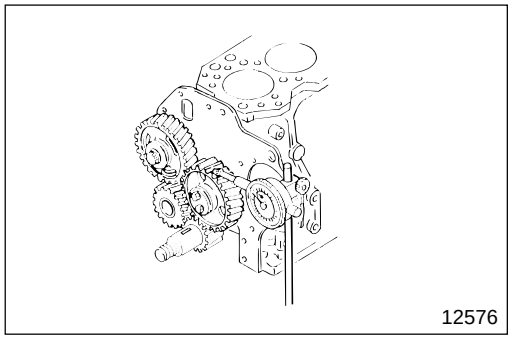
Location	Tool name and shape	Part No.	Application
2	Cone puller  12708	MH062496	Removal of taper cone
13	Idler gear bushing puller  03532	MH062224	Removal and installation of idler gear bushing

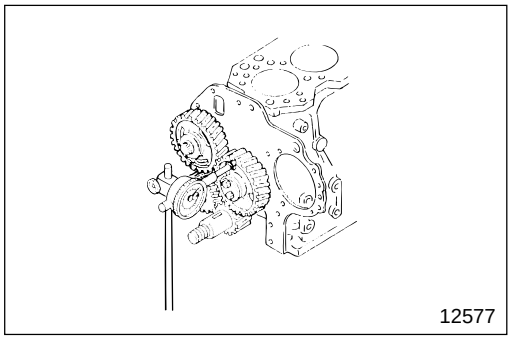
◆ Service procedure



● **Inspection before disassembly**

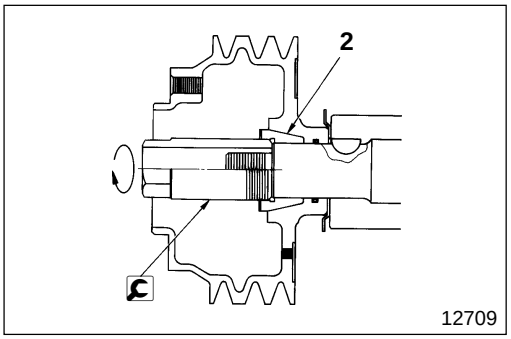
(1) Backlash of each gear

Measure three or more locations on the pairing gears and if the measurements are higher than the limit, replace the faulty parts.

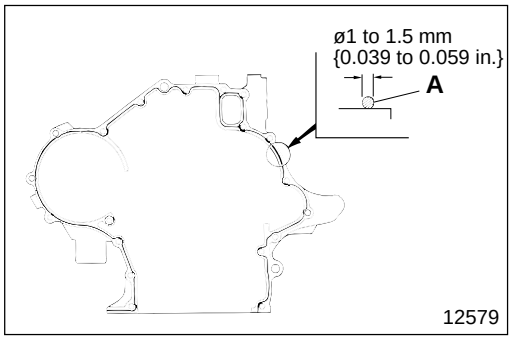


(2) End play of idler gear

If the measured value is higher than the limit, replace the faulty parts.



2 **Removal of taper cone**

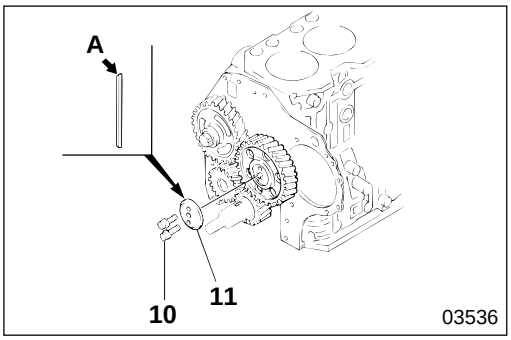


9 **Installation of timing gear case**

Apply sealant **A** to the mounting surface of timing gear case **9** evenly without break. After applying sealant, within three minutes, mount to the front plate.

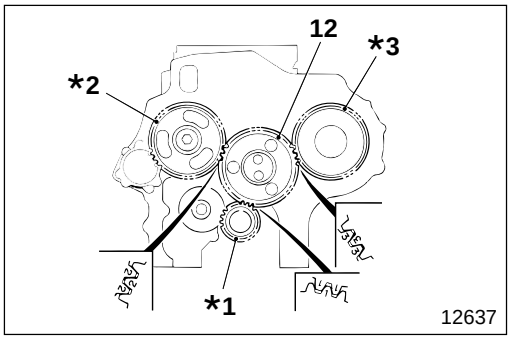
CAUTION⚠

- **Be sure to clean and wipe off oily substances from the surface where sealant A is to be applied.**
- **Make sure that sealant A is not transferred to other areas while the mounting work is being done.**
- **Be sure to reapply sealant A if the bolts are loosened or removed by any cause whatsoever after mounting.**
- **Do not start the engine within an hour of mounting.**



11 **Installation of thrust plate**

A : Chamfered side



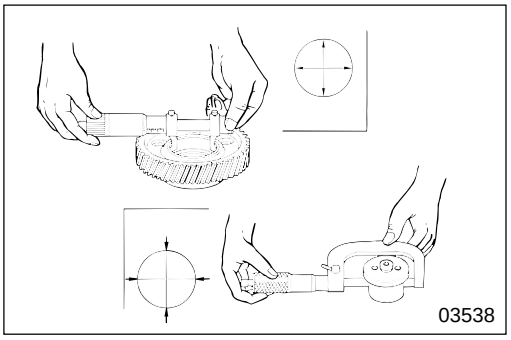
12 **Installation of idler gear assembly**

Install idler gear assembly **12** by matching alignment marks **"1"**, **"2"**, **"3"** on the gears that engage with those on the assembly.

***1** : Crankshaft gear
***2** : Camshaft gear
***3** : Air compressor gear

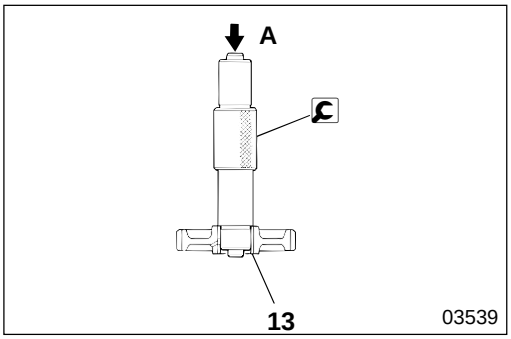
NOTE

When aligning each gear with its alignment mark, make sure that pistons No.1, 6 are higher than top dead center.



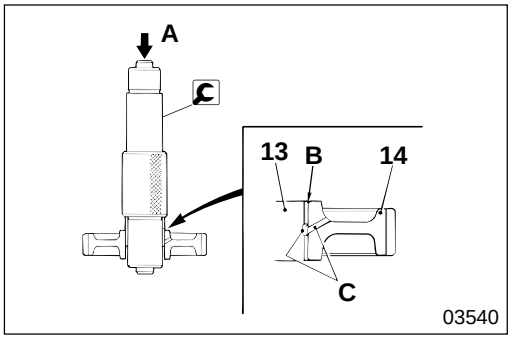
13 **15** **Idler gear bushing and idler shaft**

[Inspection]
If the clearance is higher than the limit, replace the faulty parts.



Idler gear bushing

[Removal]
A : Press idler gear bushing 13 using 🔧 idler gear bushing puller.



[Press-fitting]

- Press-fit idler gear bushing **13** from chamfered side **B** of idler gear **14** and align oil holes **C** of the idler gear and the bushing.
- After press-fitting, finish the fitting by bringing the clearance between idler gear bushing **13** and the idler shaft to the standard value.

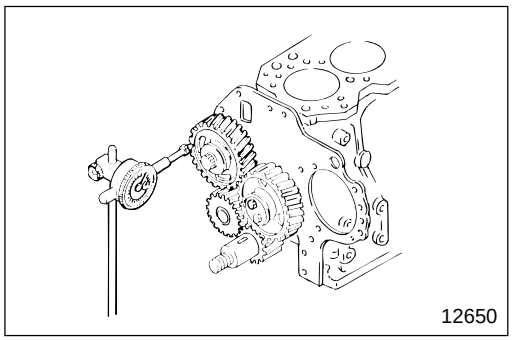
◆ Service procedure

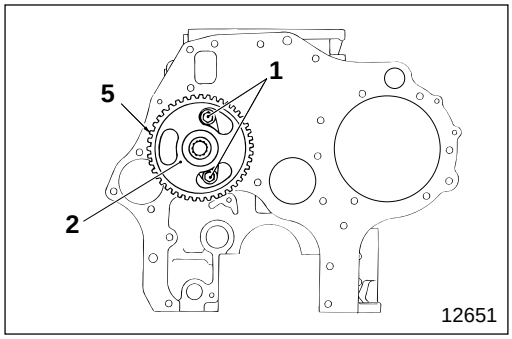


12650

● Inspection before disassembly

Camshaft end play

If the measured value is higher than the limit, replace the faulty parts.



12651

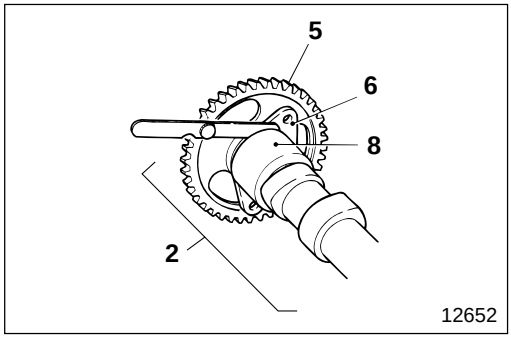
2 Camshaft assembly

[Removal]

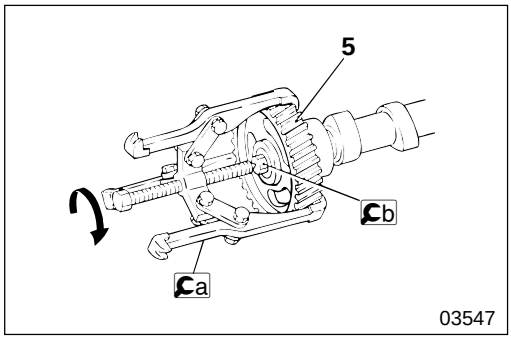
Remove camshaft assembly **2** by undoing bolts **1** through the holes in camshaft gear **5**.

CAUTION

Be careful not to damage the camshaft bushings when you remove camshaft assembly 2.

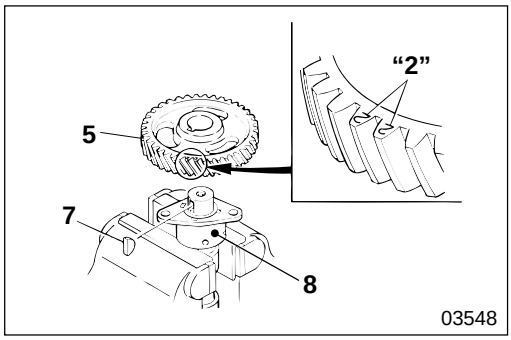


[Installation]
- Before installing camshaft assembly **2**, measure the end play between thrust plate **6** and camshaft **8**.
- If the measured value is higher than the limit, replace the faulty parts.
- Install the camshaft assembly by matching the alignment mark on camshaft gear **5** with the alignment mark on the idler gear. 📖 P11-

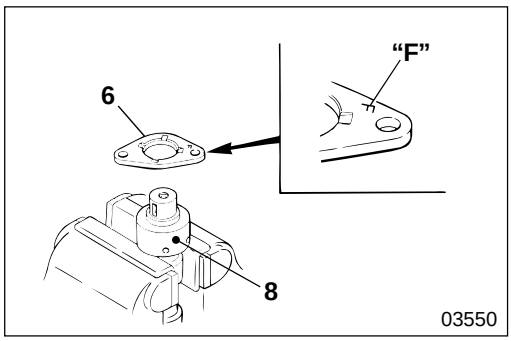


5 **Camshaft gear**

[Removal]
- Never remove camshaft gear **5** by striking, hitting, or hammering it.

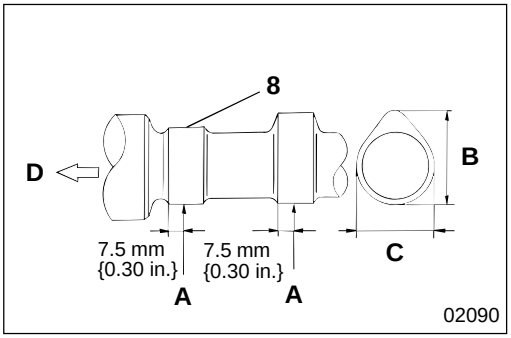


[Installation]
- Install camshaft gear **5** onto camshaft **8** in the direction as illustrated.
- Be sure when finishing the installation to install key **7**.



6 **Installation of thrust plate**

Install thrust plate **6** onto camshaft **8** in the direction as illustrated.



8 Inspection of camshaft

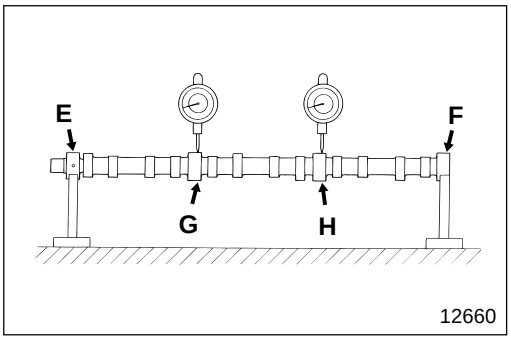
(1) Difference between long diameter and short diameter

If the measured value is lower than the limit, replace camshaft **8**.

NOTE

Measure at point A, as illustrated, because the cam is tapered.

B : Long diameter
C : Short diameter
D : Front of the engine

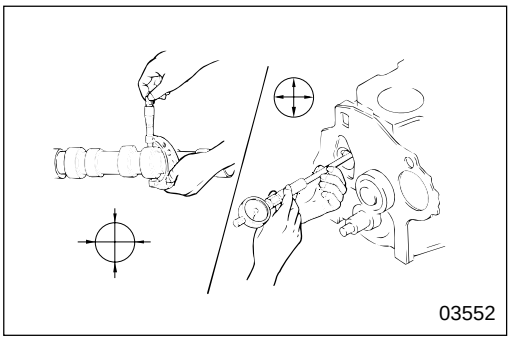


(2) Degree of bend

To measure deflection, support camshaft **8** at area **E** of No.1 journal, and area **F** of No.4 journal . Then, measure the amount of deflection at area **G** of No.2 journal, and area **H** of No.3 journal. If any of the measured values is higher than the limit, replace the camshaft.

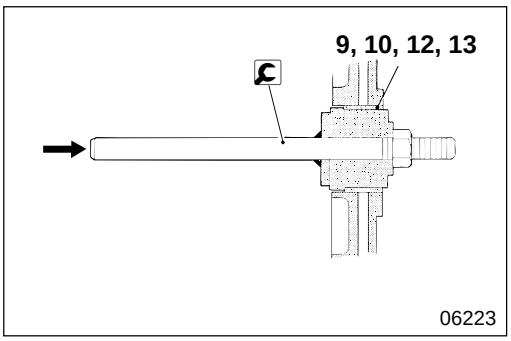
NOTE

Degree of bend of camshaft 8 is a half of the indicated value of the gauge after rotating the shaft 360°.



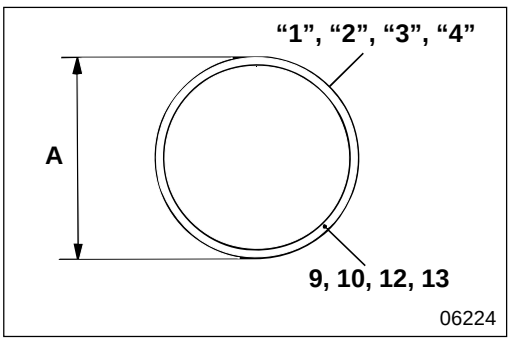
8 to 10 12 13 Camshaft and camshaft bushing

[Inspection]
If the clearance is greater than the limit, replace the faulty parts.



Camshaft bushing

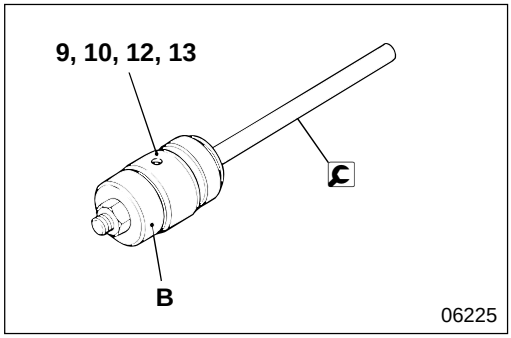
[Removal]
Remove No.3 camshaft bushing **13**, and No.4 camshaft bushing **12** from the rear end of the crankcase.



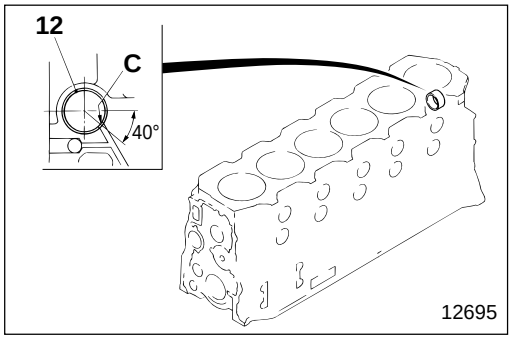
[Press-fitting]

- Identify, by referring to the table below, No.1 to No.4 camshaft bushings by noting marks **"1"**, **"2"**, **"3"**, **"4"** on camshaft bushings **9**, **10**, **12**, **13**. If you cannot identify the mark, measure outer diameter **A** of the bushing and refer to the table below.

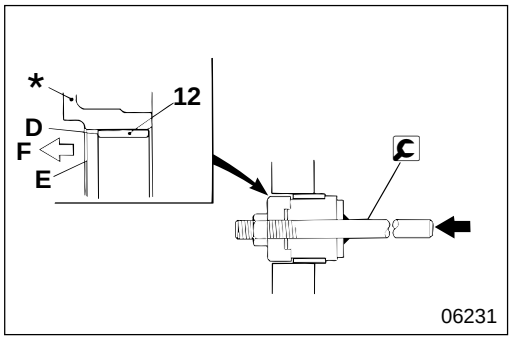
Bushing No. (from the front of the engine)	Mark	Outer diameter A (mm {in.})
No.1	1	ø58.50 {2.30}
No.2	2	ø58.06 {2.28}
No.3	3	ø57.5 {2.26}
No.4	4	ø57.06 {2.25}



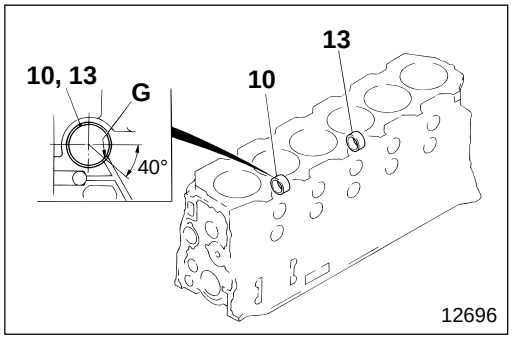
- For press-fitting, mount guide **B** to camshaft bushing installer and extractor.
- Install camshaft bushings **9**, **10**, **12**, **13** in descending order, from No.4 to No.1.
- Install No.4 camshaft bushing **12** from the rear end of the engine, and No.3 to No.1 camshaft bushings **9**, **10**, **13** from the front end of the engine.



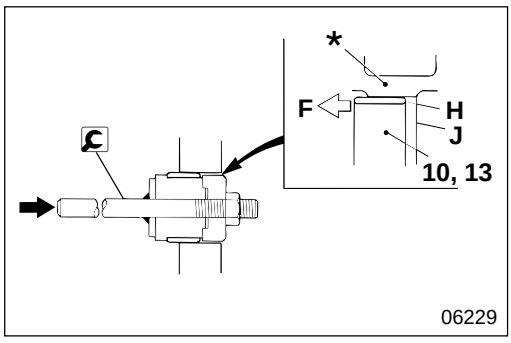
- Align oil hole **C** of No.4 camshaft bushing **12** in the direction as illustrated.



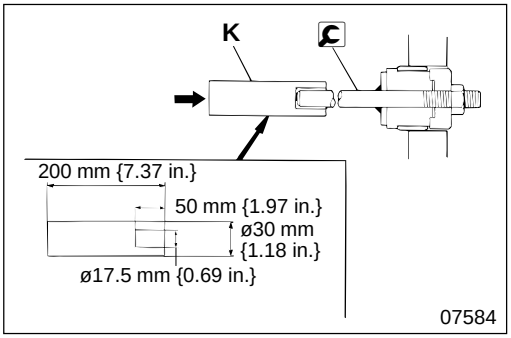
- Press in until surface **D** of No.4 camshaft bushing **12** is flush with chamfered part **E** of crankcase *.
  F : Front of the engine



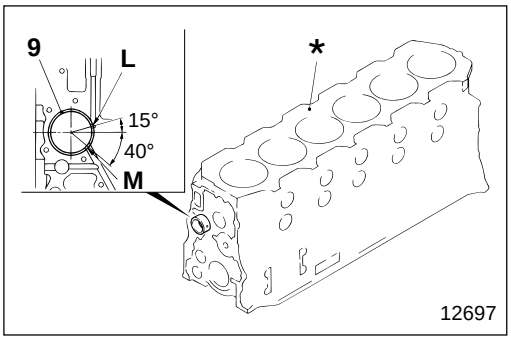
- Align oil hole **G**, of No.2 to No.3 camshaft bushings **10**, **13**, in the direction as illustrated, and press-fit in the order of No.3, 2.



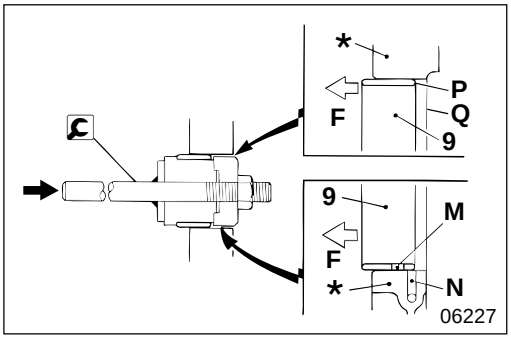
- Press in until surface **H** of No.2 to No.3 camshaft bushings **10**, **13** is flush with surface **J** of crankcase *.
  F : Front of the engine



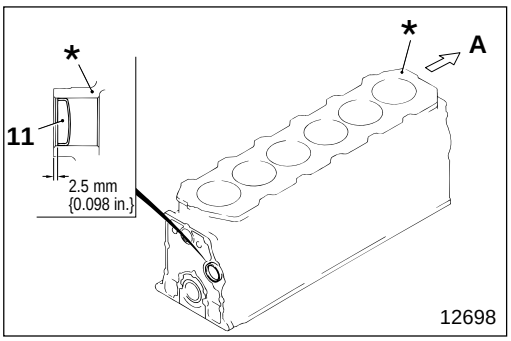
- For press-fitting of No.3 camshaft bushing **13**, use tool **K** as illustrated.



- Align oil holes **L**, **M** of No.1 camshaft bushing **9** in the direction as illustrated.
  L : ø3 mm {0.11 in.}
  M : ø8 mm {0.31 in.}
  ***** : Crankcase



- Align oil hole **M** of No.1 camshaft bushing **9** with oil hole **N** of crankcase ***** and press in until camshaft bushing surface **P** is flush with crankcase surface **Q**.
  F : Front of the engine



11 **Installation of sealing cap**

Press-fit sealing cap **11** into crankcase ***** to the specified depth.
A : Front of the engine

PISTON, CONNECTING ROD AND CYLINDER SLEEVE

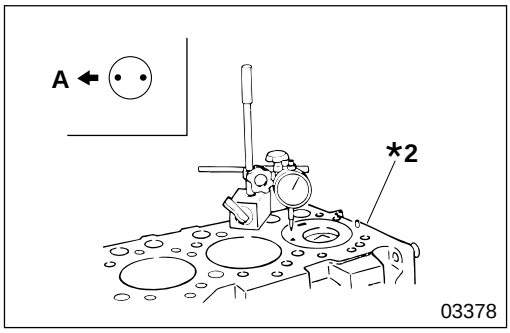
Special tools

Unit : mm {in.}

Location	Tool name and shape	Part No.	Application
5	Socket wrench  01984	MH061560	Installation of piston and connecting rod assembly
	A : Piston guide clamp **B** : Piston guide lever  01981	**A** : MH061890 **B** : MF061658	
6	Cylinder sleeve installer  ø103 {4.06} 03377	MH062228	Installation of cylinder sleeve

◆ Service procedure



03378

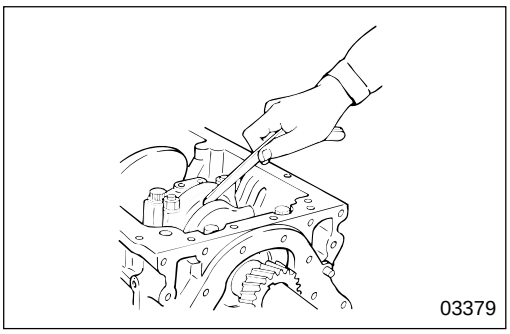
● **Inspection before disassembly**

(1) Extent of piston protrusion from the upper surface of crankcase *2

NOTE

Always inspect the extent of piston protrusion because it affects the engine performance greatly.

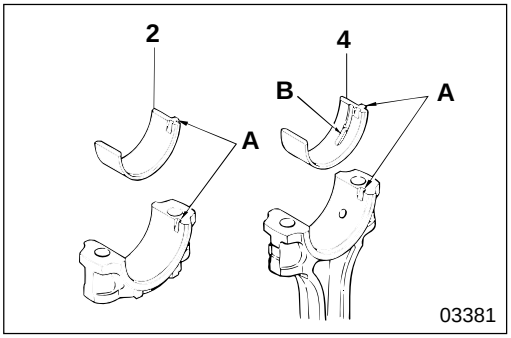
- Measure piston protrusion at two points on the top of the piston, and produce the average value.
  A : Front of the engine
- If the average valve deviates from the limit, inspect clearance of the related parts.



03379

(2) End play of connecting rod

- Measure the end play of each connecting rod.
- If the measured value is higher than the limit, replace the faulty parts.



2 **4** **Connecting rod bearing**

[Installation]
Install connecting rod bearings **2**, **4** by matching lugs **A** to the connecting rods.

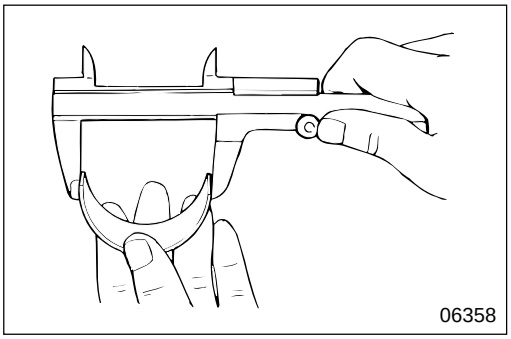
CAUTION

Be sure to distinguish between upper and lower connecting rod bearings 2, 4. The upper bearing has oil opening B while the lower bearing has no oil opening.

[Inspection]

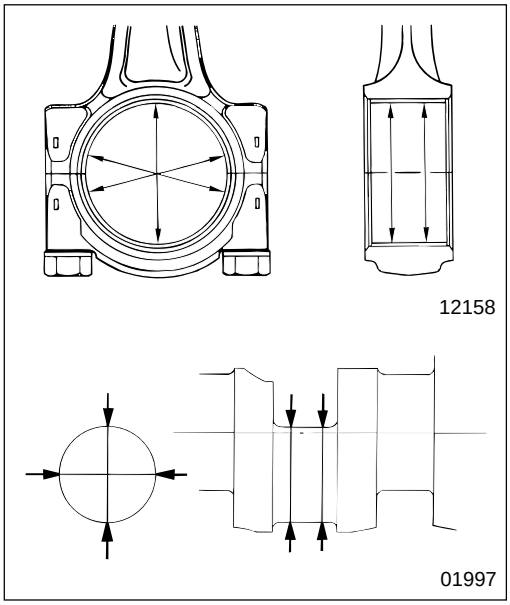
CAUTION

- **Do not forcibly open or expand connecting rod bearings 2, 4.**
- **When either upper or lower connecting rod bearings 2, 4 needs replacing, replace as a set.**



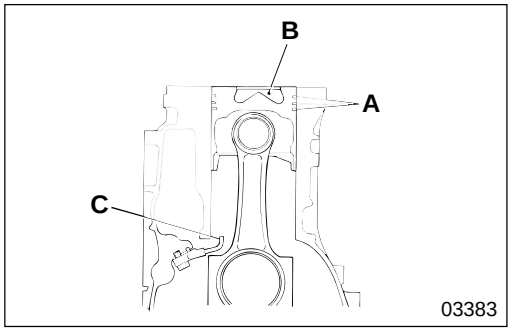
(1) Expansion at free state

If the measured value is lower than the limit, replace connecting rod bearings **2**, **4**.



(2) Clearance between connecting rod bearing and crankshaft

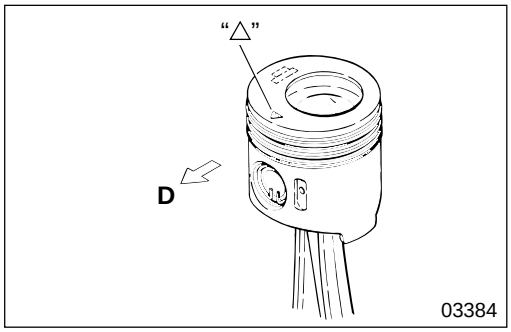
If the clearance between connecting rod bearing **2**, **4** and crankshaft ***1** is lower than the limit, replace the faulty parts.



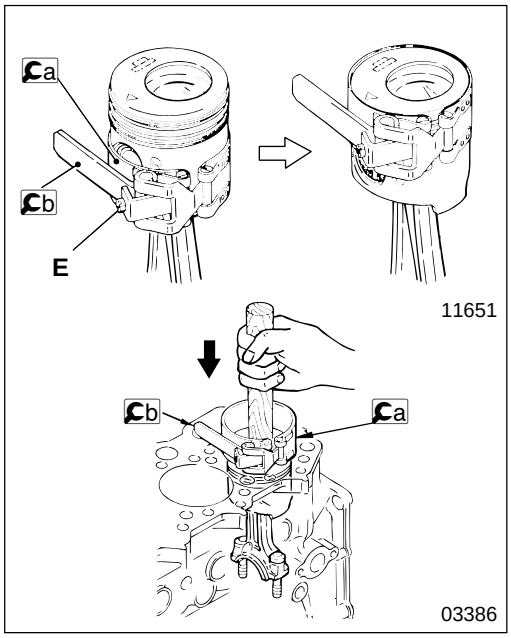
5 **Installation of piston and connecting rod assembly**

CAUTION

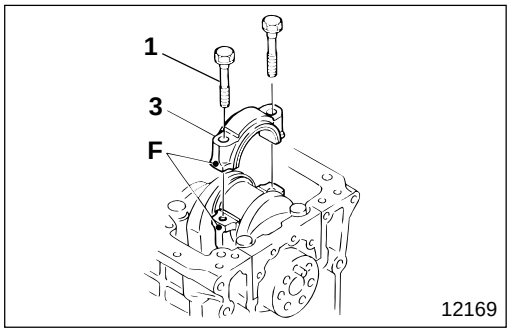
- **Be sure to fit piston ring A in the correct position.**
  P11-48
- **Be careful not to scratch or damage head B of the piston (a part of the combustion chamber).**
- **Make sure that the connecting rod does not hit oil jet C.**



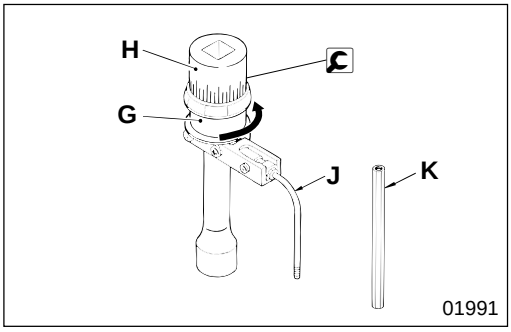
- Install piston front mark "△" directed towards the front of the engine using the following procedure.
  D : Front of the engine



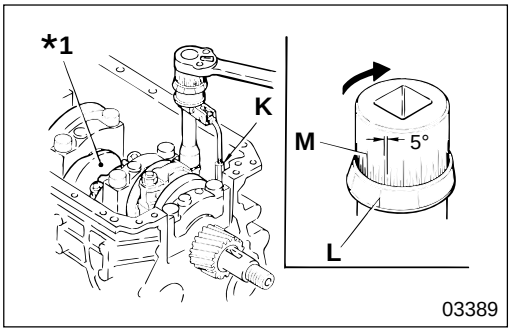
- Match the inner diameter of a piston guide clamp to the outer diameter of the piston skirt by turning adjusting bolt **E** of b piston guide lever.
- After adjusting, set a piston guide clamp and b piston guide lever at the top of the piston so that the clamp is flush with the top of the piston.



- After the piston is inserted, align alignment marks **F** on the connecting rod with the alignment marks on connecting rod cap **3** and tighten bolt **1** at specified torque. Then tighten the bolt further as follows:



- Turn 🔧 socket wrench holder **G** counterclockwise and keep the spring in the wrench compressed.
  H : Socket
  J : Rod
  K : Rod (for connection)

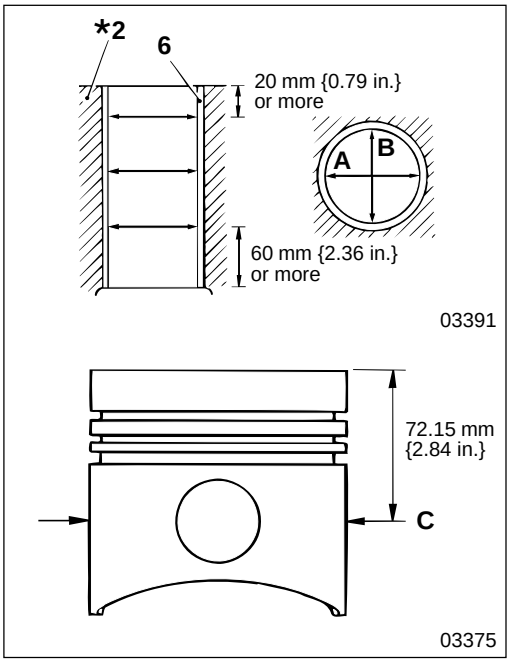


- Set 🔧 socket wrench holder **G** so that the repercussive force of the spring presses rod **K** (for connection) against crankshaft ***1**.
- Select a scale that is convenient for reading graduation **L** on holder **G**.
- Tighten further by turning socket **H** clockwise by 90°±5° (setting is in 5° increments), referring to graduation **M** on the selected scale.

NOTE

After installation of connecting rod cap 3, inspect the following points :

- **End play of the connecting rod : 🕮 P11B-38**
- **Piston protrusion : 🕮 P11B-38**



5 **6** **Piston and connecting rod assembly, and cylinder sleeve**

[Inspection]

- If the inner diameter of cylinder sleeve **6** is higher than the limit, bore the cylinder sleeve oversize and use an oversized piston.
  A : In the direction of the crankshaft axis
  B : At right angles to the crankshaft axis

- If the clearance between piston **5** and cylinder sleeve **6** deviates from the standard value, even when the inner diameter of the cylinder sleeve is within the limit, replace the piston.

[Selection of oversized piston]

Extent of oversize : 0.50, 1.00 mm {0.020, 0.039 in.}

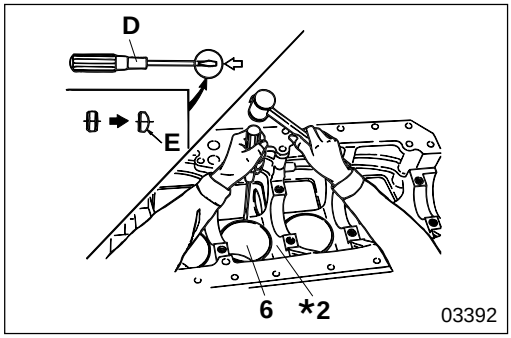
- Determine the extent of oversize by measuring the inner diameters of all the cylinders and calculating the maximum wear amount of all the cylinders.
- Measure the outer diameter of the oversized piston to be used.
  C : Position to measure the outer diameter of the piston

- Bore cylinder sleeve **6** and hone it to make the clearance between piston **5** and the cylinder sleeve conform to the standard value.

NOTE

- **Even if only one cylinder sleeve 6 requires boring, all the other cylinder sleeves must be bored to the identical oversize.**
- **Piston rings must be replaced with the corresponding oversized ones.**

PISTON, CONNECTING ROD AND CYLINDER SLEEVE



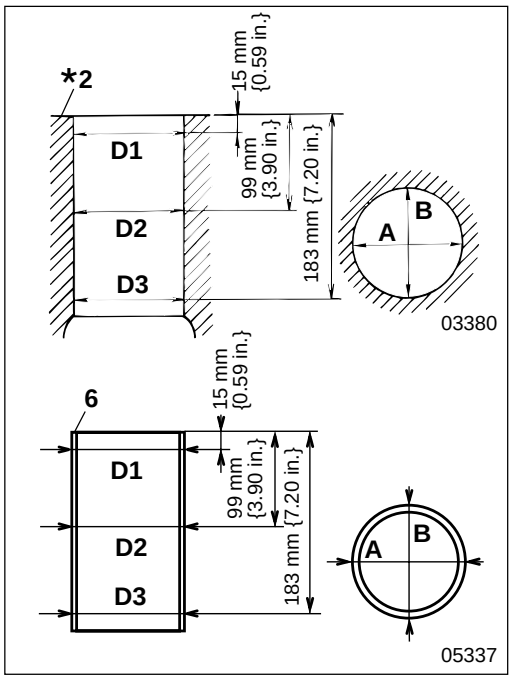
Cylinder sleeve

[Removal]

- Mount a boring machine on crankcase ***2** and center. Centering must be done at the lower part of cylinder sleeve **6** which is less unevenly worn.
- Bore until the thickness of cylinder sleeve **6** is approximately 0.5 mm {0.020 in.}.
- Insert tool **D** (a modified screwdriver) between crankcase ***2** and cylinder sleeve **6**, break the sleeve by tapping it gently, then remove.

CAUTION

Make sure when inserting tool D that round part E is facing crankcase *2.



[Installation]

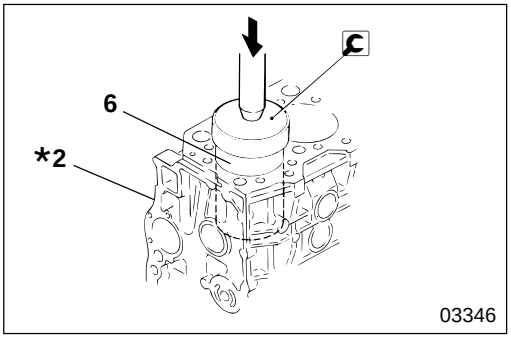
- Inspect sleeve hole of crankcase ***2** before installing cylinder sleeve **6**. If there are irregularities, such as defects or insufficient interference, correct them by boring.

NOTE

- **Pull out cylinder sleeve 6 of all cylinders and bore the sleeve holes perfectly round when you bore the sleeve holes of crankcase *2.**
- **Apply spindle oil (ISO VG 32) when you push cylinder sleeve 6 into the sleeve hole of crankcase *2.**

Inspection of interference must be carried out as follows.

- Measure the inner diameter of the sleeve hole of crankcase ***2** and the outer diameter of cylinder sleeve **6** at the specified positions illustrated.
- Take the average value at the top, middle and bottom (**D1**, **D2**, **D3**) and across the diameter (**A**, **B**). If the interference is lower than the limit, bore the sleeve hole of crankcase ***2** oversize.



< If interference is sufficient >

- Press-fit cylinder sleeve **6** into crankcase ***2** from the chamfered end using [C] cylinder sleeve installer.

NOTE

Align the top of cylinder sleeve 6 with the top of crankcase *2 when press-fitting.

- After press-fitting, make the inner diameter of cylinder sleeve **6** conform to the standard value by honing the surface.

< If interference is insufficient >

- Prepare cylinder sleeve **6** which is 0.5 mm {0.020 in.} oversize in diameter.
- Hone crankcase ***2**, making the clearance between the outer diameter of cylinder sleeve **6** and the sleeve hole of crankcase ***2** conform to the standard value.
- Press-fit cylinder sleeve **6** into crankcase ***2** from the chamfered end using [C] cylinder sleeve installer.

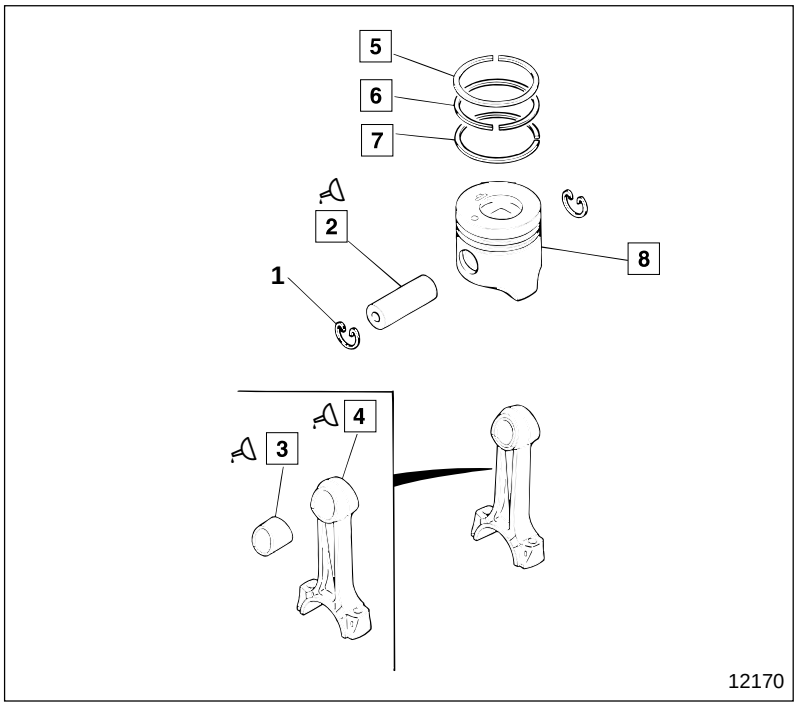
NOTE

Align the upper face of cylinder sleeve 6 with the upper face of crankcase *2 when press-fitting.

- After press-fitting, make the inner diameter of cylinder sleeve **6** conform to the standard value by honing the surface.

PISTON, CONNECTING ROD AND CYLINDER SLEEVE

Piston and Connecting Rod Assembly



● **Disassembly sequence**

1 Snap ring
2 Piston pin
3 Connecting rod bushing
4 Connecting rod
5 1st compression ring
6 2nd compression ring
7 Oil ring
8 Piston

● **Assembly sequence**

Follow the disassembly sequence in reverse.

Service standards

Unit : mm {in.}

Location	Maintenance item		Standard value (Basic diameter in [ ])	Limit	Remedy
2, 3	Clearance between piston pin and connecting rod bushing		[36] 0.03 to 0.04 {[1.42] 0.0012 to 0.0016}	0.1 {0.0039}	Replace
2, 8	Clearance between piston and piston pin		[36] 0.007 to 0.021 {[1.42] 0.00028 to 0.00083}	0.05 {0.0020}	Replace
4	Degree of bend and distortion of connecting rod		—	0.05 {0.0020}	Repair or replace
5 to 7	Deviation of piston ring fitted position	1st compression ring	0.3 to 0.45 {0.012 to 0.018}	1.5 {0.059}	Replace
		2nd compression ring	0.4 to 0.55 {0.016 to 0.022}		
		Oil ring	0.25 to 0.45 {0.0098 to 0.018}		
5 to 8	Clearance between piston ring and piston ring groove	1st compression ring	0.02 to 0.10 {0.00079 to 0.0039}	0.2 {0.0079}	Replace
		2nd compression ring	0.05 to 0.08 {0.0020 to 0.0031}	0.15 {0.0059}	
		Oil ring	0.03 to 0.06 {0.0012 to 0.0024}		

Lubricant

Location	Points of application	Kinds	Quantity
2	Exterior of piston pin	Engine oil	As required
3	Exterior of connecting rod bushing	Engine oil	As required
4	Bushing attachment area of connecting rod	Engine oil	As required

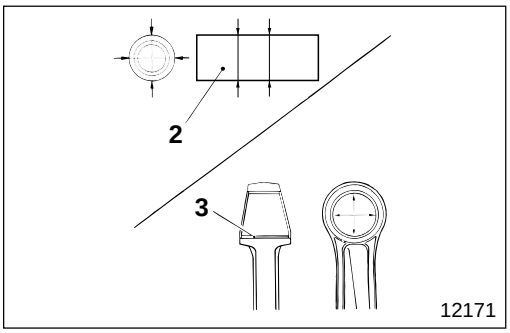
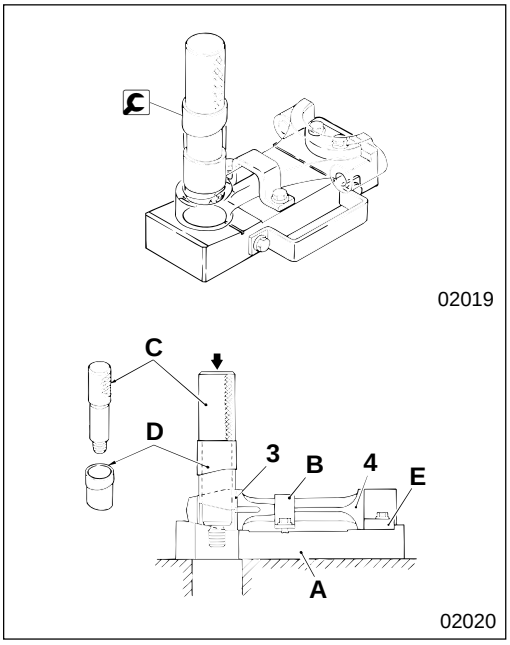
◆ Service procedure



12171

2 **3** **Piston pin and connecting rod bushing**

[Inspection]
If the clearances are higher than the limit, replace the faulty parts.



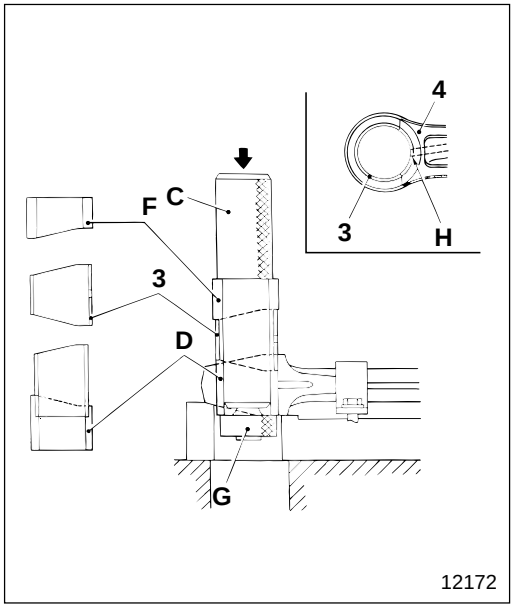
02019
02020

Connecting rod bushing

Use 🔧 connecting rod bushing puller kit to replace connecting rod bushing **3**.
(Components of 🔧 connecting rod bushing puller kit)
A : Base **B** : Bracket **C** : Puller **D** : Collar
E : Plate **F** : Collar **G** : Nut

[Pulling-out]

- Remove upper connecting rod bearing from the big end of connecting rod **4**.
- Place connecting rod **4** on base **A** and fix it to the base at two points, bracket **B** and plate **E**.
- Fit collar **D** in puller **C** in the direction as illustrated, and pull out connecting rod bushing **3** with a gradual load of approximately 49 kN {11020 lbf, 5000 kgf}.

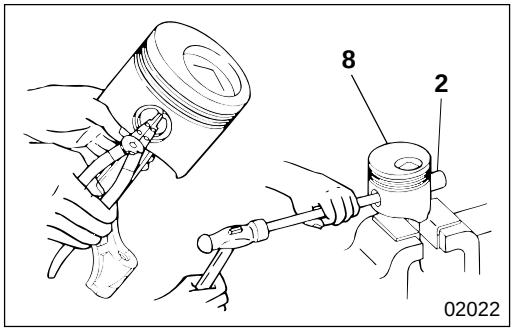


[Press-fitting]

- Apply engine oil to the exterior peripheral area of connecting rod bushing **3** and the inner area of the bushing fitting ring of connecting rod **4**.
- Fit collar **F**, connecting rod bushing **3** and collar **D** in puller **C** in the arrangement and direction as illustrated and mount them with nut **G**.
- Align oiling holes **H** of connecting rod bushing **3** and connecting rod **4**, and gradually press in the bushing with approximately 49 kN {11023 lbf, 5000 kgf} load.
- After press-fitting, ream connecting rod bushing **3** to make its clearance with piston pin **2** conform to the standard value.

NOTE

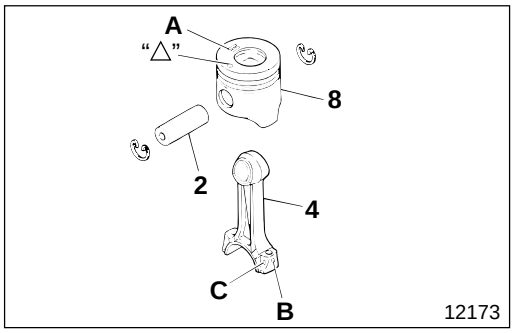
After press-fitting bushing 3, insert piston pin 2 and make sure that the rod moves smoothly without any excessive play.



2 4 8 Piston pin and connecting rod and piston

[Disassembly]

- Drift out piston pin **2** using a rod.
- When removal of piston pin **2** is difficult, warm piston **8** using a piston heater or hot water.

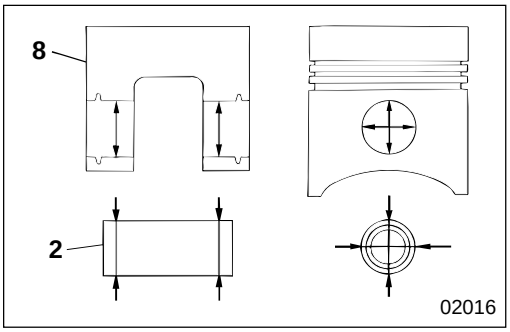


[Installation]

- Apply engine oil to piston pin **2** and assemble connecting rod **4** and piston **8** in the direction as illustrated.
  A : Piston mass (Mass of piston is marked)
  B : Connecting rod mass mark (Alphabetical: A, B, C, D, E, F, G)
  C : Mounting base of connecting rod cap
  △ : Front mark
- When piston pin **2** insertion is difficult, warm piston **8** using a piston heater or hot water.

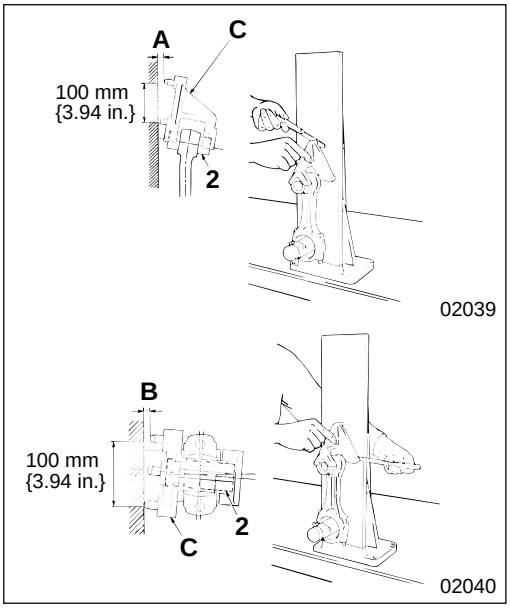
CAUTION⚠

- **Make sure that the total mass error of all pistons 8 in one engine is 10 g {0.35oz} or less.**
- **Be sure to install connecting rods 4, to be used in one engine, that have identical mass mark B.**
- **Be sure that after inserting piston pin 2 the connecting rod operates smoothly without excessive play.**



2 **8** **Clearance between piston pin and piston**

If the clearance is higher than the limit, replace the faulty parts.



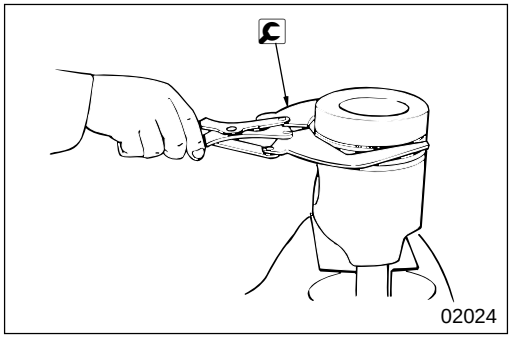
4 **Degree of bend or distortion of connecting rod**

- Mount connecting rod bushing **3** and piston pin **2** to connecting rod **4**.
- Measure degree of bend **A** and distortion **B** of connecting rod **4**. If the measured value is higher than the limit, repair or replace the connecting rod.
  C : Connecting rod aligner (Measuring instrument)

NOTE

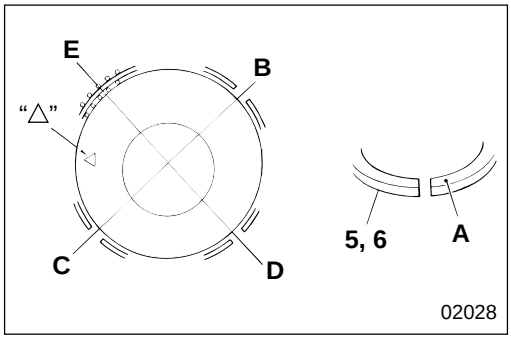
- **When making measurements by mounting connecting rod 5 to connecting rod aligner C, make sure that the upper connecting rod bearing and the lower connecting rod bearing are mounted on the rod.**
- **Mount the connecting rod cap by tightening the bolt at specified torque.** 🕮 **P11B-36**

PISTON, CONNECTING ROD AND CYLINDER SLEEVE

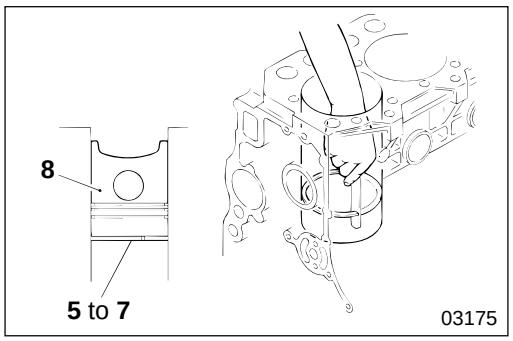


5 to 8 Piston ring and piston

Piston ring
[Removal]



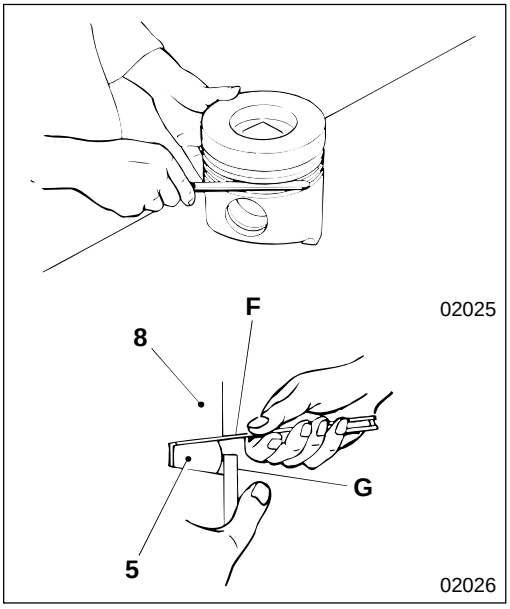
[Installation]
- Install oil ring **8** so that split **D** and the butting joint of expander spring **E** come to the points as illustrated.
- Compression rings **5** and **6** have a manufacturer's mark **A** at the split, and installation should be made with the mark outward.
  B : The split of the 1st compression ring
  C : The split of the 2nd compression ring
  D : Oil ring slit
  E : Oil ring expander spring butt joint
  △ : Front mark of piston



[Inspection]

(1) Clearance of piston ring slit
- Install piston rings **5** to **7** into the crankcase cylinder sleeve using the head of piston **8** to level the piston ring.
- Measure the clearance of the piston ring split while keeping them level and stationary. If the measured value is higher than the limit, replace the piston ring.

NOTE
- **Use piston 8 to ensure that piston rings 5 to 7 are kept level when inserting them into the crankcase cylinder sleeve.**
- **Insert piston rings 5 to 7 into the lower part of the crankcase cylinder sleeve, where the area is less worn, when measuring clearance of piston ring split 5 to 7.**
- **Exchange the whole set of piston rings 5 to 7 as a set if any of the rings is faulty.**



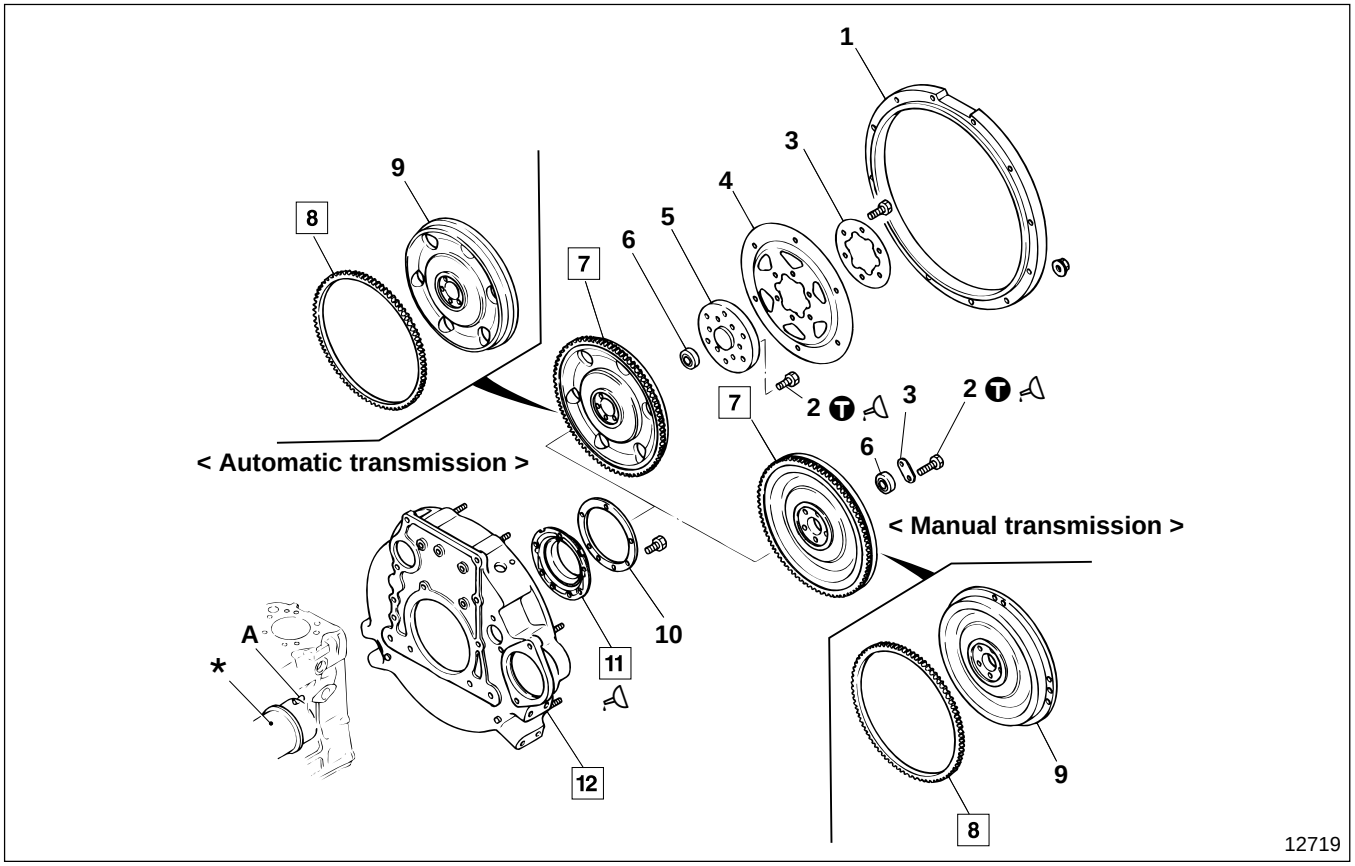
(2) Clearance between piston ring and ring groove

- If the measured value is higher than the limit, replace the faulty parts.
- Measure using feeler gauge **F**, by pressing 1st compression ring **5** against piston **8** with straight edge **G**.

NOTE

- **Measurement has to be conducted around the whole periphery of piston 8 after removing carbon deposits.**
- **Be sure to exchange the whole set of piston rings 5 to 7 as a set if any of the rings is faulty.**

FLYWHEEL



● **Disassembly sequence**

1 Flywheel housing adaptor < Automatic transmission >

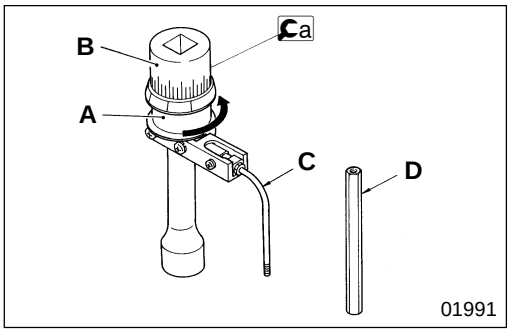
7	Socket wrench  01984	MH062183	Installation of flywheel
	Magnetic base  00471	MH062356	

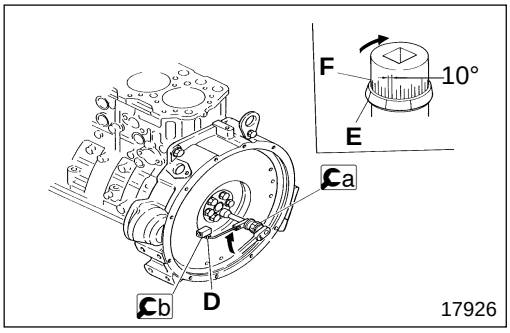


01991

◆ Service procedure

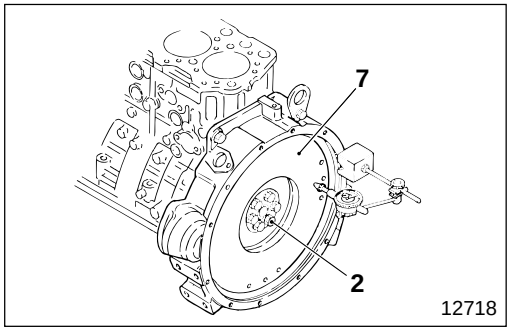
7 Flywheel assembly

- After tightening bolt **2** at specified torque, tighten further as follows:
- Turn a socket wrench holder **A** counterclockwise and keep the spring in the wrench compressed.
  B : Socket
  C : Rod
  D : Rod (for connection)



17926

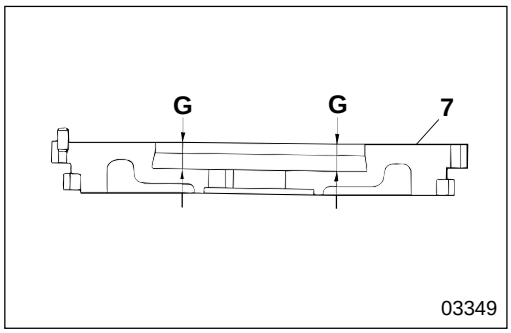
- Install b magnetic base in a position where it makes contact with rod **D** (for connection) as illustrated.
- Set a socket wrench holder **A** so that the repercussive force of the spring pressed rod **D** (for connection) against b magnetic base.
- Select a scale that is convenient for reading graduation **E** on holder **A**.
- Tighten further by turning socket **B** clockwise by 47°±3° (setting is in 10° increments), referring to graduation **F** on the selected scale.



[Inspection]

(1) Wobble

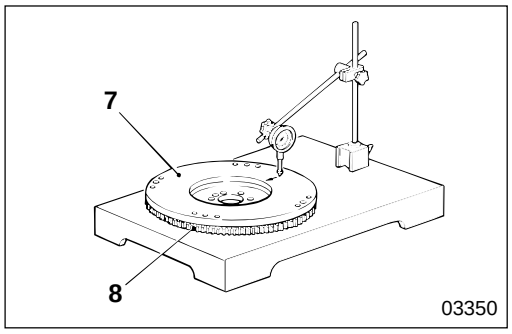
If the measured value is higher than the limit, check the fastening of bolt **2**, the attachment surface of crankshaft assembly, and depending on the condition found, either repair or replace flywheel assembly **7**.



(2) Height of friction surfaces

If the measured value is lower than the limit, repair or replace flywheel assembly **7**.

G : Height from bolt mounting surface to friction surface

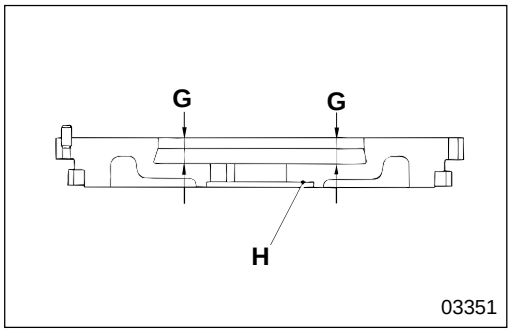


(3) Distortion of friction surface

If the measured value is lower than the limit, repair or replace flywheel assembly **7**.

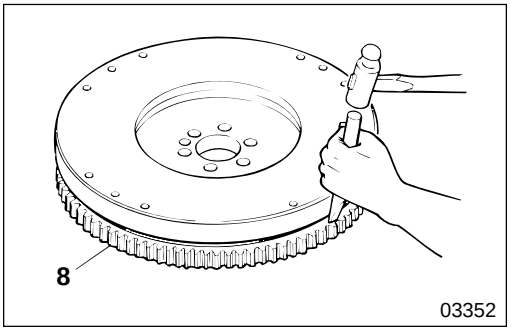
NOTE

If any fault is found in ring gear 8, replace it first, then begin the inspection.



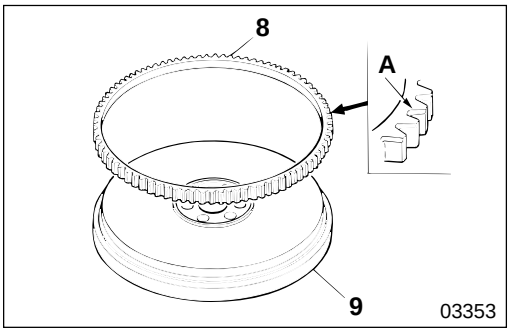
[Correction]

Make sure when grinding the friction surfaces for correction, that height **G** is not lower than the limit while maintaining the degree of parallel with surface **H** within 0.1 mm {0.0039 in.}.

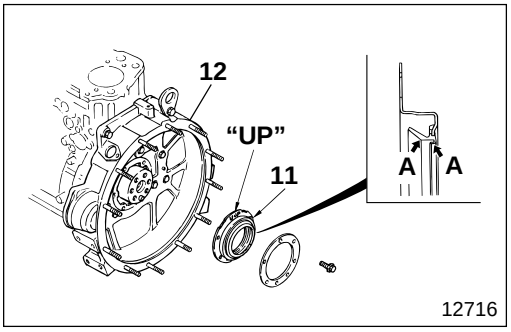


8 Ring gear

[Inspection]
Check and see if there is any damage, wear or other fault, and if any fault is found, replace ring gear **8**.
[Removal]
- Heat up ring gear **8** evenly using an acetylene torch.
- Hammer the outer edge of ring gear **8** evenly until it drops off.

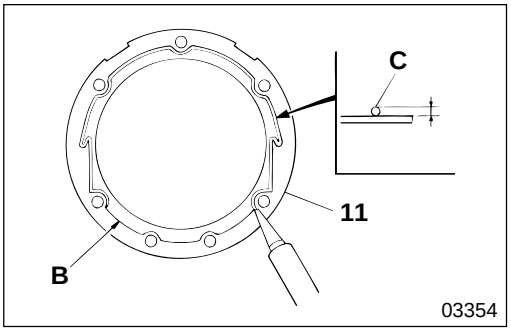


[Installation]
- Heat up ring gear **8** using a piston heater to approximately 100°C {212°F} for three minutes.
- With the side of the chamfered teeth of ring gear **8** facing you, mount it on flywheel **9**.
  A : Chamfered ring gear side



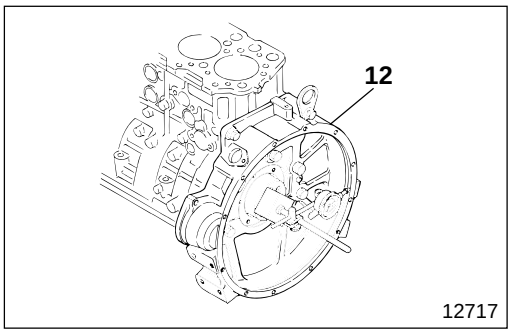
11 Mounting of rear oil seal

- Apply engine oil to lip area **A** of rear oil seal **11**.
- Install rear oil seal **11** in flywheel housing **12** in the direction as illustrated.



- Apply sealant **C** along line **B** on rear oil seal **11** evenly without break
- After applying sealant **C**, within three minutes, mount rear oil seal **11**.

CAUTION ⚠
- **Do not start the engine within an hour of installing rear oil seal 11.**
- **Be sure to reapply sealant C if the bolts (for mounting rear oil seal 11) are loosened or removed by any cause whatsoever after mounting.**



12 Inspection of flywheel housing

Mount of eccentricity
- If the measured value is higher than the limit, reassemble flywheel housing **12**.
- After reassembly, if the measured value is still higher than the limit, replace the faulty parts.

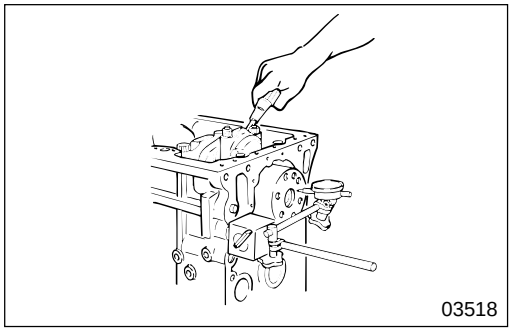
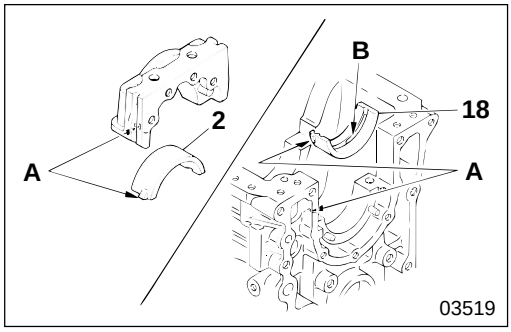
◆ Service procedure



● **Inspection before disassembly**

Crankshaft assembly end play
If the measured value is higher than the limit, replace thrust plates **10** with oversized ones. 🕮 P11B-58
< Available oversize ones >
+0.15, +0.30, +0.45 mm
{+0.0059, +0.012, +0.018 in.}

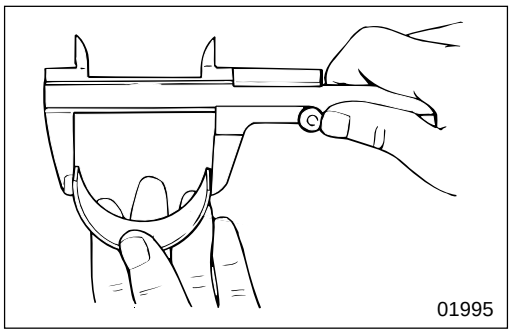


2 **18** **Main bearing**

[Installation]
When installing main bearings **2**, **18**, align lugs **A**.

CAUTION⚠

Be sure to distinguish between main bearings 2, 18. The upper bearing has oil opening B while the lower bearing has no oil opening.



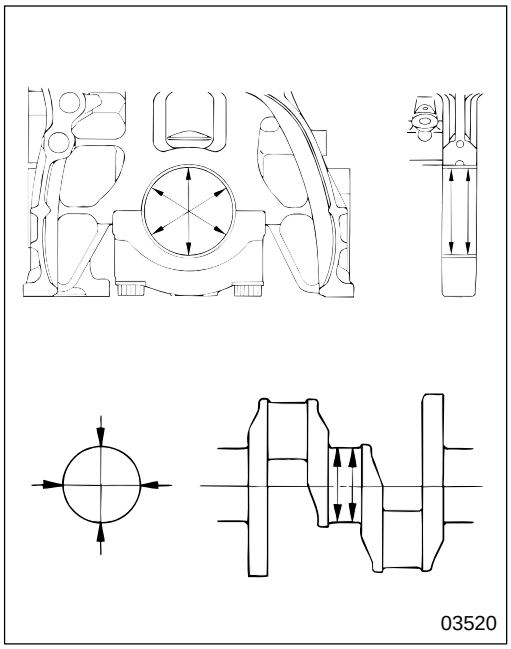
[Inspection]

CAUTION⚠

- **Do not forcibly expand main bearings 2, 18.**
- **Be sure to replace both upper and lower main bearings 2, 18 as a pair when replacement is necessary.**

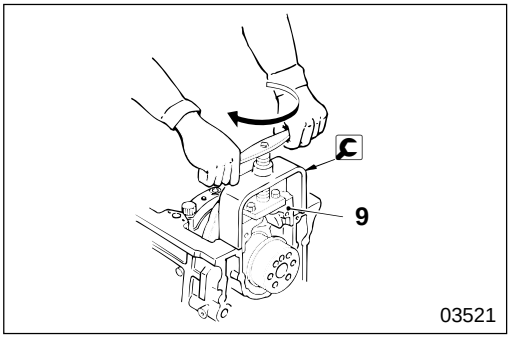
(1) Expansion at free state

If the measured value is lower than the limit, replace main bearings **2**, **18**.



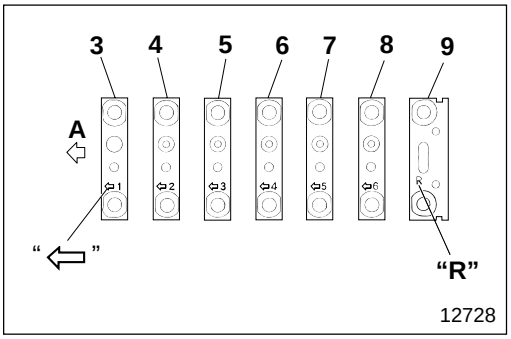
(2) Clearance between main bearing and crankshaft

If the measured value is lower than the limit, replace faulty parts.

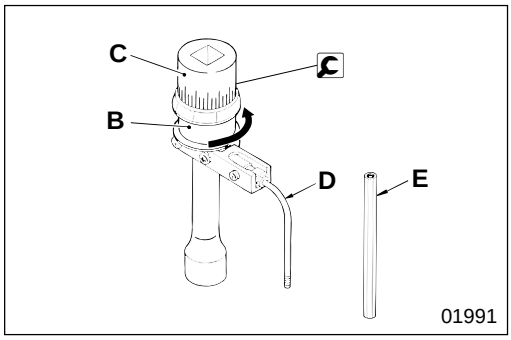


3 to **9** **Main bearing cap**

[Removal]
Use bearing cap extractor to remove rear main bearing cap **9** because side seal **11** is installed between crankcase **21** and the rear main bearing.



[Installation]
- Install main bearing caps **3** to **8** in the direction as illustrated.
  A : Front of engine

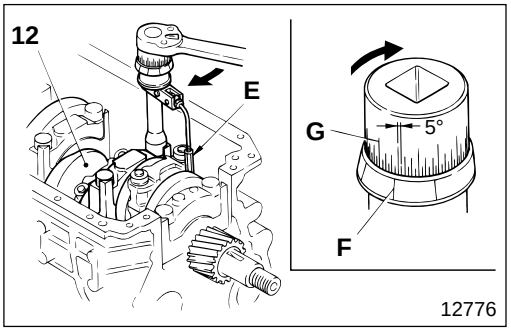


- Center punch the head of bolt **1** before installation.

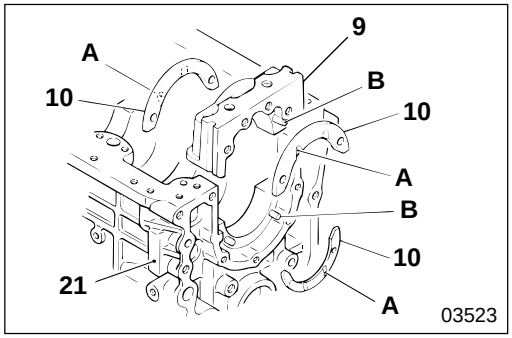
CAUTION⚠

If there are already three center-punch marks, replace the cylinder head bolt with a new one.

- After tightening bolt **1** at specified torque, tighten further as follows:
- Turn socket wrench holder **B** counterclockwise and keep the spring in the wrench compressed.
  C : Socket
  D : Rod
  E : Rod (for connection)



- Set socket wrench holder **B** so that the repercussive force of the spring presses rod **E** (for connection) against crankshaft assembly **12**.
- Select a scale that is convenient for reading graduation **F** on holder **B**.
- Tighten further by turning socket **C** clockwise by 90° (setting is in 5° increments), referring to graduation **G** on the selected scale.
- After installation, check the following points :
  - Crankshaft assembly **12** can be rotated easily by hand.
  - The end play of crankshaft assembly **12**. P11B-56



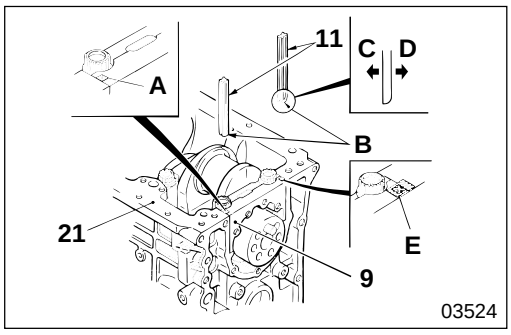
10 **Installation of thrust plate**

Install thrust plates **10** on both ends of rear main bearing **9** and the rear end of crankcase **21** in the direction as illustrated.

A : Oil groove
B : Positioning pin

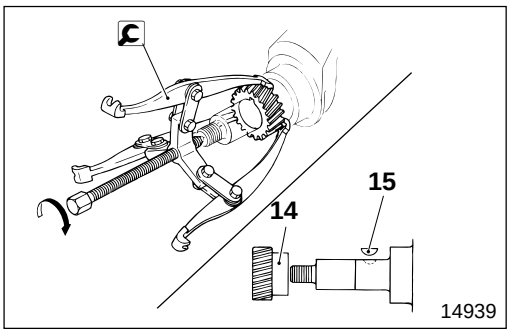
CAUTION

When installing oversized thrust plates 10, mount them on the front and rear of rear main bearing cap 9. It is not necessary that the thrust plates used are all of the same size, but use the same-size-combination of thrust plates for mounting on the rear of crankcase 21 and on the rear of the rear bearing cap.



11 **Installation of side seal**

- Supply sealant in side seal mounting groove **A** of rear main bearing cap **9**.
- Apply sealant at end **B** of side seal **11**.
- Press in side seal **11** between rear main bearing cap **9** and crankcase **21** in the direction as illustrated.
  C : Rear main bearing cap side
  D : Crankcase side
- After pressing in, apply sealant to side seal mounting **E** of rear main bearing cap **9**.



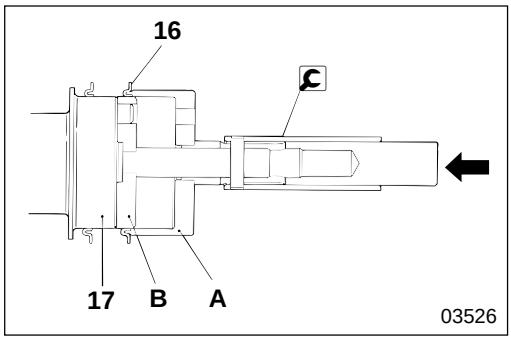
14 **Crankshaft gear**

[Removal]
Never remove crankshaft gear **14** by striking, hitting or hammering it.

[Installation]
Before installing heat up crankshaft gear **14** using a piston heater or similar device to approximately 100°C {212°F}.

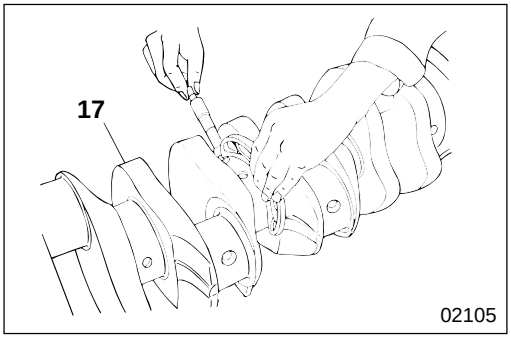
NOTE

Install key 15 to prevent rotation.



16 **Installation of rear oil seal slinger**

Install rear oil seal slinger **16** using oil seal slinger installer. Strike installer **A** until it hits guide **B** positively.

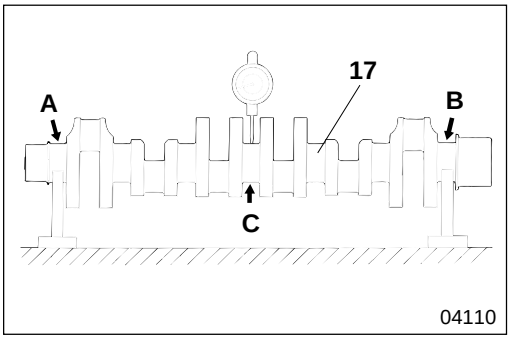


17 Crankshaft

[Inspection]

(1) Cylindrical and circular accuracy of the journal and the pin

If the measured value is higher than the limit, grind and correct crankshaft **17** to convert it to the undersize specifications or replace it.

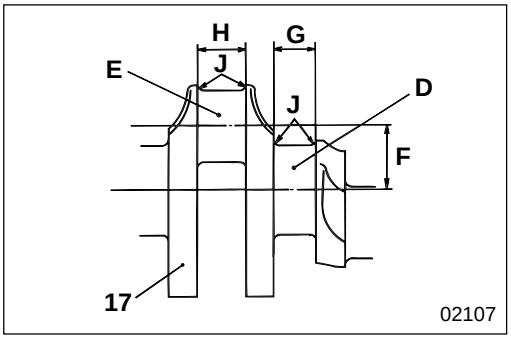


(2) Degree of bend

The degree of bend of crankshaft **17** is measured at No.4 journal **C** by supporting No.1 journal **A** and No.7 journal **B.** If the measured value is higher than the limit, replace the crankshaft.

NOTE

The degree of bend of crankshaft 17 is half of the indicated value of the gauge after rotating the shaft 360°.



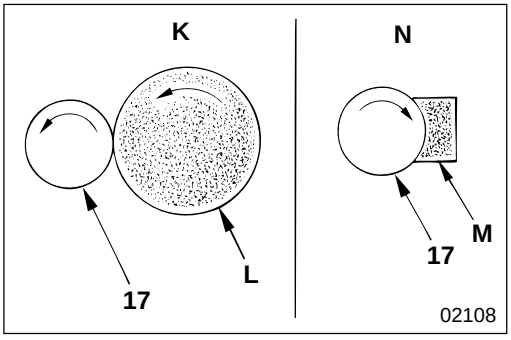
[Correction]

NOTE

Be sure to replace main bearings 2, 18 with those that meet the undersize specifications after crankshaft 17 is corrected by grinding.

- Set **F**, distance between the center line of the journal **D** and that of the pin **E**, constant.
  F : 57.5±0.075 mm {2.26±0.0030 in.}
- Set the width of journal **G** and pin **H** so they are constant.
  G : 35 mm {1.38 in.} (32 mm {1.26 in.} for No.1 journal)
  H : $41\ ^{+0.2}_{0}$ mm
  $\{1.61\ ^{+0.0079}_{0}$ in.$\}$

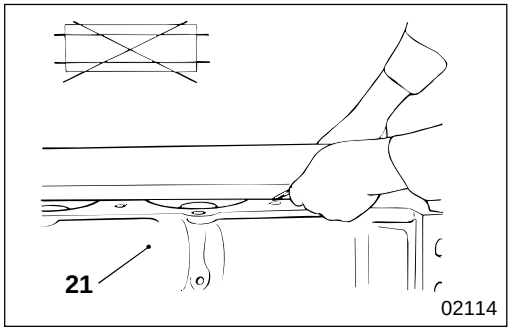
- Finish the fillet **J** smoothly.
  J : R4±0.2 mm {0.0079 in.}
- Check and confirm that there has been no cracking caused by grinding using the magnetic particle inspection method (Magnafluxing).
  Also make sure the surface hardness has not deteriorated (Shore hardness to be maintained at not less than Hs 75).
- When grinding **K**, set crankshaft **17** and grinder **L** so that they both rotate counterclockwise as viewed from the front of the crankshaft.
- To finish grinding **M** using a grindstone or emery paper **N,** rotate crankshaft **17** clockwise.



Undersize specifications of crankshaft

Unit : mm {in.}

	Undersize scales			
	0.25 {0.0098}	0.50 {0.020}	0.75 {0.030}	1.00 {0.039}
Finish outer diameter of journal	77.69 to 77.70 {3.058 to 3.059}	77.44 to 77.45 {3.048 to 3.049}	77.19 to 77.21 {3.038 to 3.039}	76.94 to 76.95 {3.0291 to 3.0295}
Finish outer diameter of pin	64.69 to 64.71 {2.546 to 2.547}	64.44 to 64.46 {2.5370 to 2.5377}	64.19 to 64.21 {2.5271 to 2.5279}	63.94 to 63.96 {2.517 to 2.518}
Circular accuracy	0.01 {0.00039} or less			
Cylindrical accuracy	0.006 {0.00024} or less			



21 **Crankcase top surface distortion**

If the measured value is higher than the limit, grind and correct using a surface grinder.

CAUTION⚠

When grinding crankcase 21 be sure that the extent of piston protrusion does not deviate from the standard value.
Piston protrusion : 🕮 P11B-38

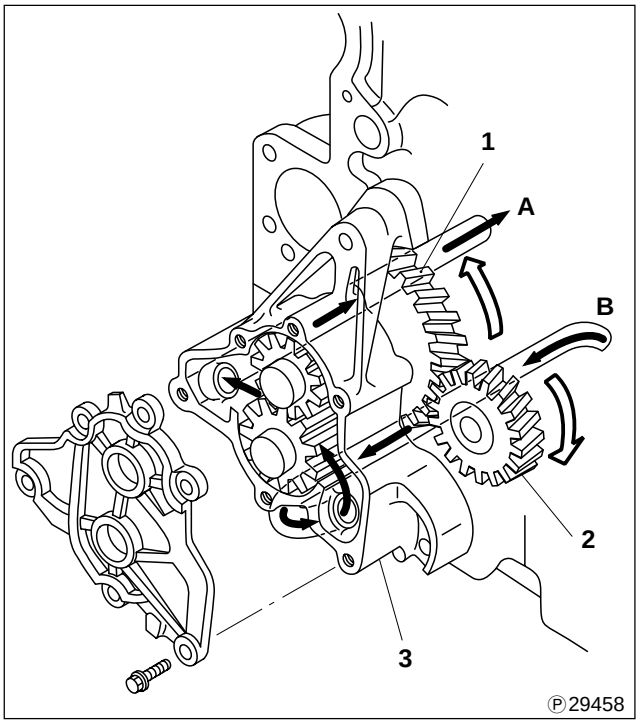
25 Rocker roller
26 Oil pan

A : Orifice

Oil Pump

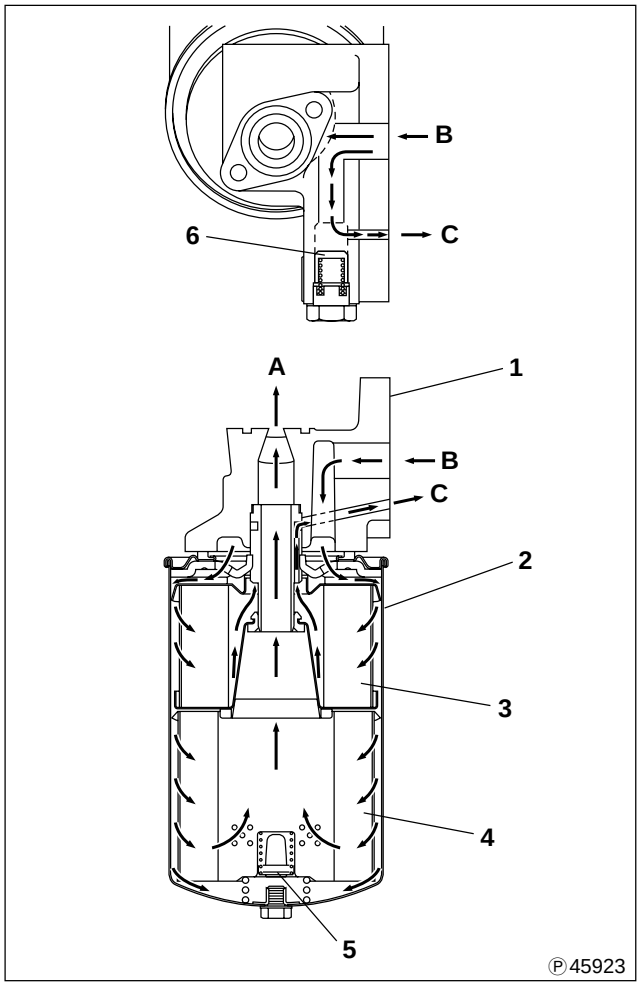


1 Oil pump gear
2 Crankshaft gear
3 Oil pump

A : To oil filter
B : From oil strainer

Oil pump **3** is a gear type. It is driven by rotation of the crankshaft via crankshaft gear **2** and oil pump gear **1**.

Oil Filter

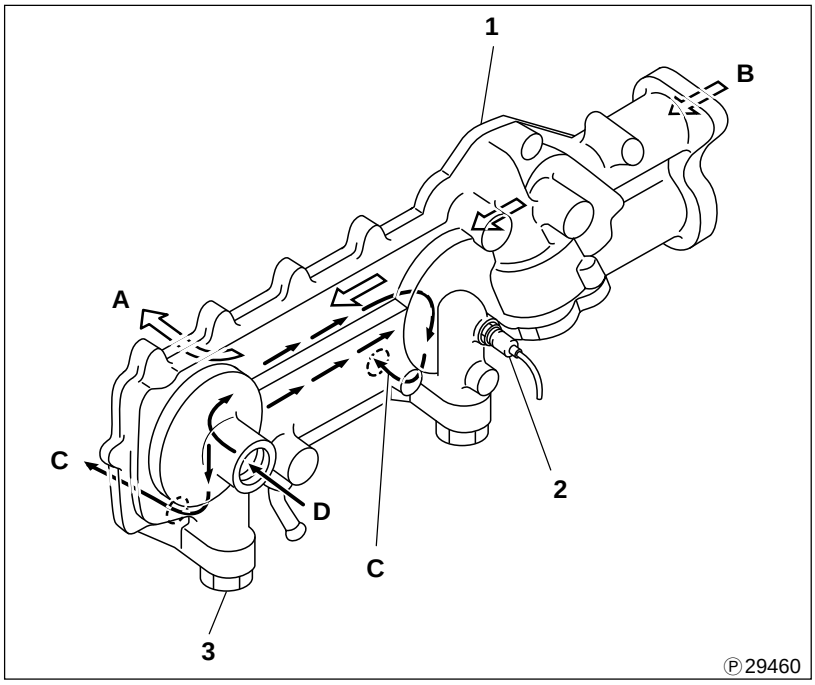


1 Oil filter head
2 Oil filter
3 Bypass filter
4 Full-flow filter
5 Bypass valve
6 Regulator valve

A : To oil cooler
B : From oil pump
C : To oil pan

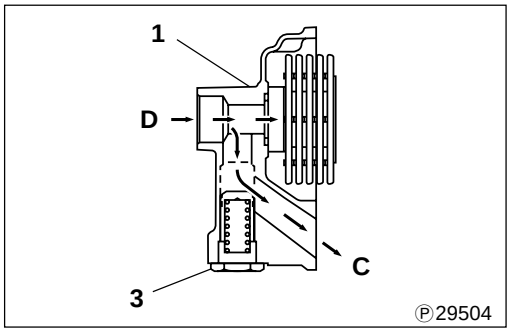
- The oil filter is a spin-on filter-paper type incorporating a bypass filter **3** and a full-flow filter **4**.
  A bypass valve **5** is fitted at the bottom of the filter assembly. If the elements become clogged, the bypass valve opens and allows oil to flow to oil cooler without passing through the elements. This operation prevents seizure of the engine.
- When the pressure of oil going to the main oil gallery exceeds a specified level, regulator valve **6** opens, allowing some of the engine oil to return to the oil pan. The oil pressure is thus constantly regulated.

Oil Cooler



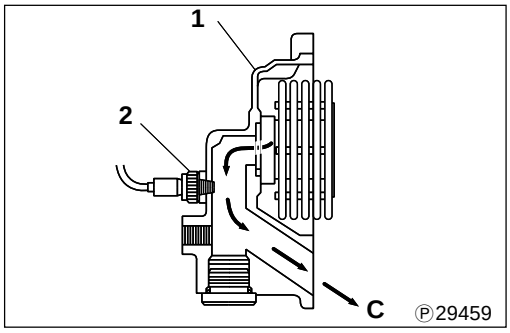
1 Oil cooler
2 Engine oil pressure switch
3 Bypass valve

A : Coolant outlet
B : Coolant inlet
C : To main oil gallery
D : From oil filter



● **Bypass valve**

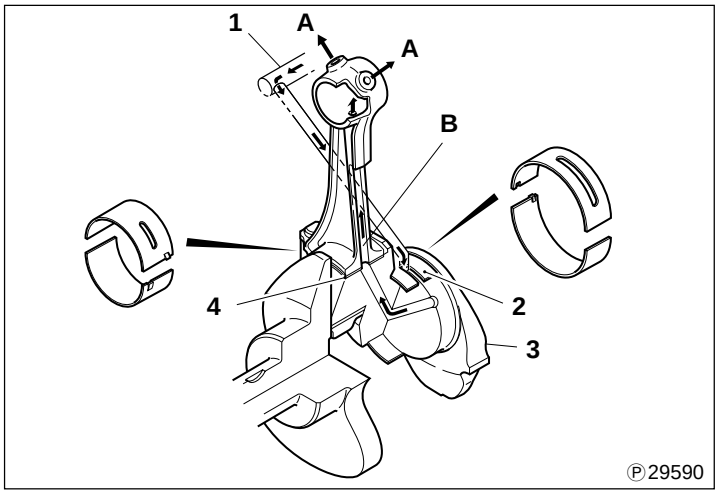
When the oil's viscosity is high at low temperatures or when oil cooler **1** element is clogged and resists the oil's flow, bypass valve **3** opens, thus allowing engine oil to flow to main oil gallery without passing through the cooler.



● **Oil pressure switch**

If the pressure of oil fed to main oil gallery drops below the specified level, electric contacts close inside engine oil pressure switch **2**. As a result, a warning lamp illuminates in the meter cluster to alert the driver.

Lubrication of Related Parts

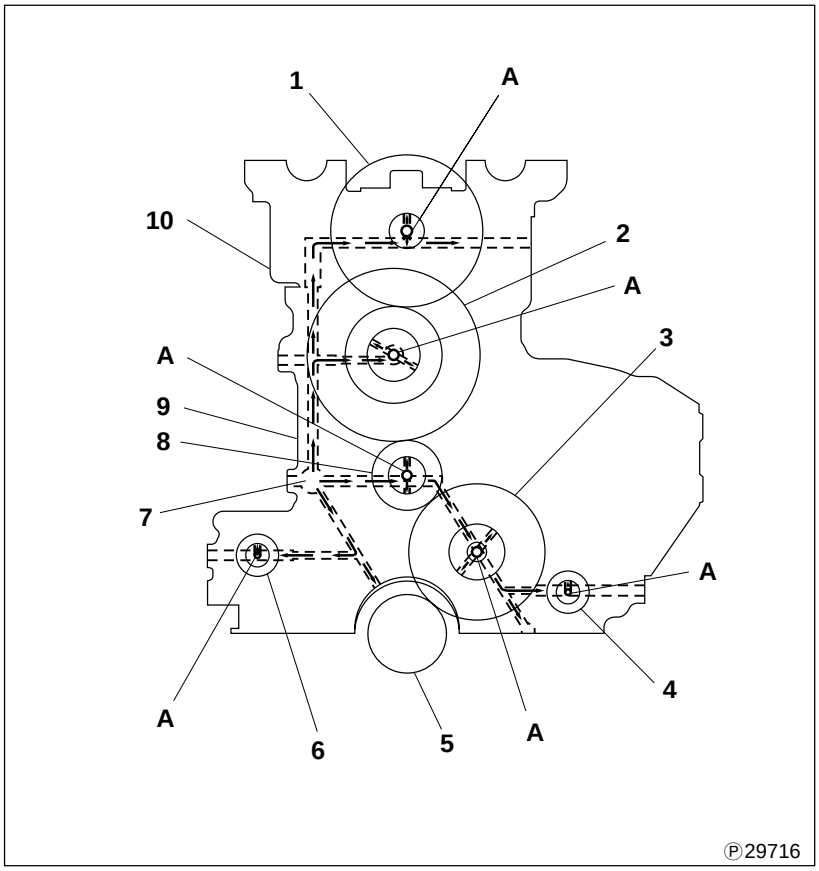


● **Main bearing and connecting rod bearing**

1 Main oil gallery
2 Main bearing
3 Crankshaft
4 Connecting rod bearing

A : Oil jet
B : Connecting rod oil passage

Oil supplied via the oil passage in the crankshaft flows through oil passage **B** in the connecting rod to lubricate the connecting rod's small end. The oil then sprays out from oil jet **A** at the top of the connecting rod to cool the piston.

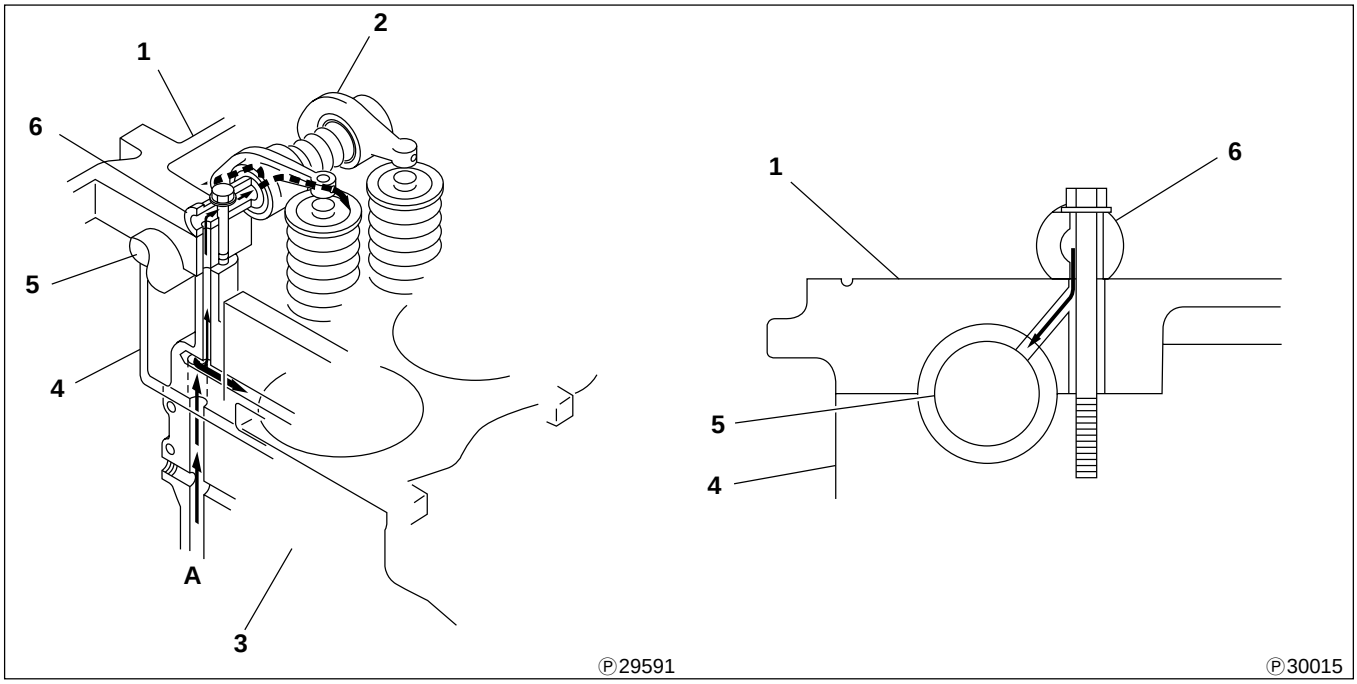


● **Timing gear**

1 Head idler gear
2 Idler gear A, B
3 Idler gear No.1
4 Balanceshaft gear LH
5 Crankshaft gear
6 Balanceshaft gear RH
7 Main oil gallery
8 Fan shaft assembly
9 Upper crankcase
10 Cylinder head

A : Oil hole

Engine oil from main oil gallery **7** passes through upper crankcase **9** and cylinder head **10** to lubricate the journals of the gears. The oil that has lubricated head idler gear **1** sprays out of oil hole in the gear boss and returns to the oil pan through inside the front case while lubricating the gears.

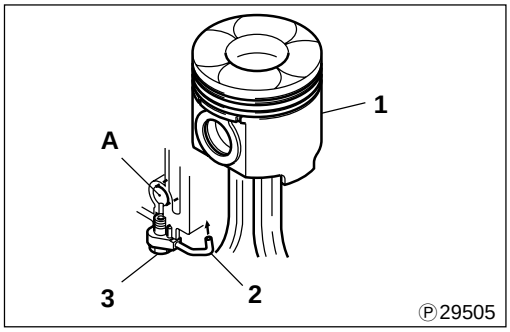


● **Valve mechanism**

1 Camshaft frame
2 Rocker arm
3 Upper crankcase
4 Cylinder head
5 Camshaft
6 Rocker shaft

A : From main oil gallery

Engine oil from main oil gallery **A** passes through upper crankcase **3**, cylinder head **4** and camshaft frame **1** to rocker shaft **6**. Then, the oil flows through the oil passage of rocker shaft and returns to the oil pan while lubricating rocker arm **2** and camshaft **5**.

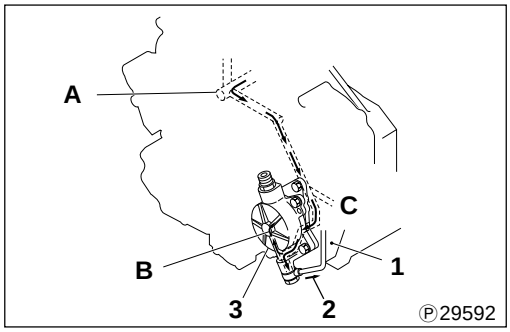


● **Oil jet**

1 Piston
2 Oil jet
3 Check valve

A : Main oil gallery

An oil jet **2** is fitted in the lower part of the main oil gallery **A** for each cylinder. These oil jets cool the pistons **1** by injecting oil into them. Each oil jet is fitted with check valve **3** that opens and closes at specified oil pressure levels. At low engine speeds, these check valves close to maintain the required volume of oil in the lubrication system and prevent reductions in oil pressure.



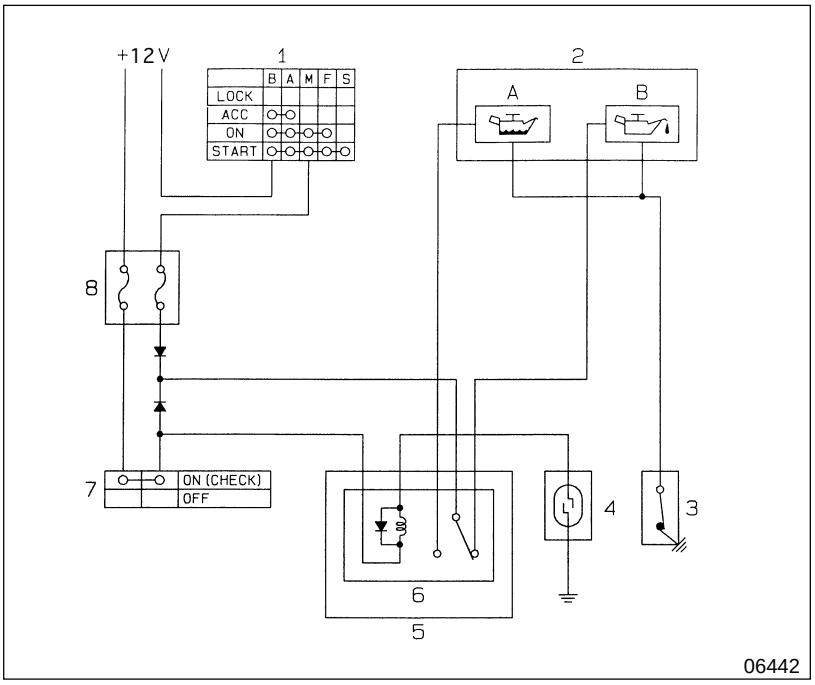
● **Vacuum pump**

1 Front case
2 Oil pipe
3 Vacuum pump

A : Main oil gallery
B : To front case
C : To automatic timer

Engine oil delivered from main oil gallery **A** flows to vacuum pump **3** where it branches into two flows; one is, after lubricating the vanes, discharged into front case **1** from the air vent hole and returns to the oil pan. The other passes through oil pipe **2** to lubricate various parts of the automatic timer and then returns to the oil pan.

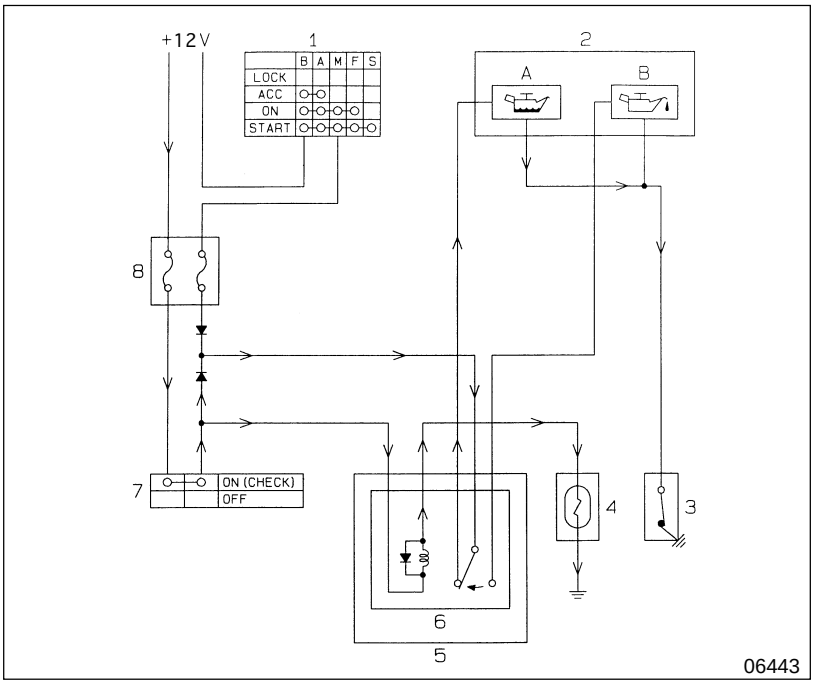
Lubrication System Monitoring Circuit



1 Starter switch
2 Meter cluster
3 Oil pressure switch
4 Oil level sensor
5 Relay box
6 Oil level relay
7 Oil level check switch
8 Fuse box

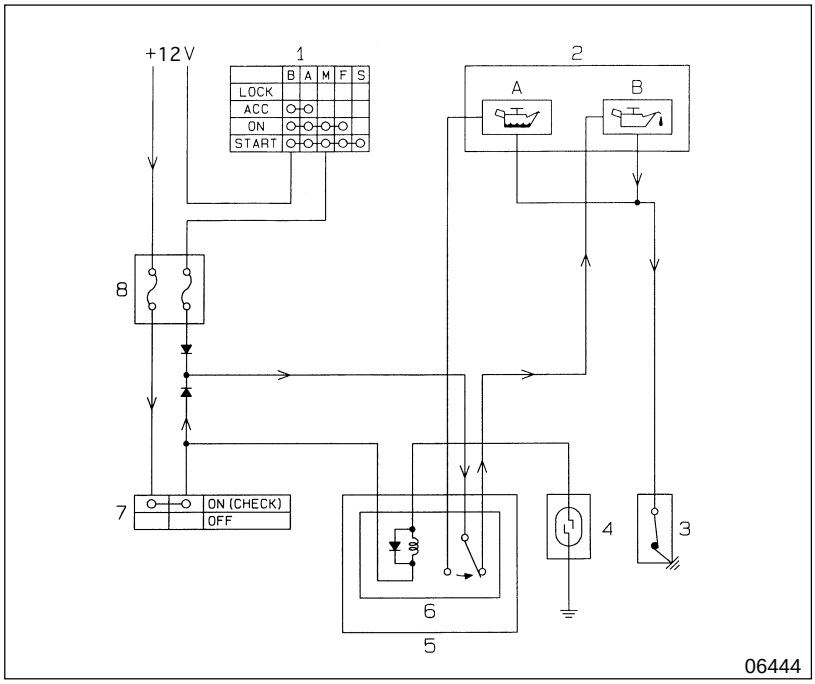
A : Oil level indicator lamp
B : Oil pressure warning lamp

This circuit monitors the lubrication system by detecting the pressure and level of engine oil.



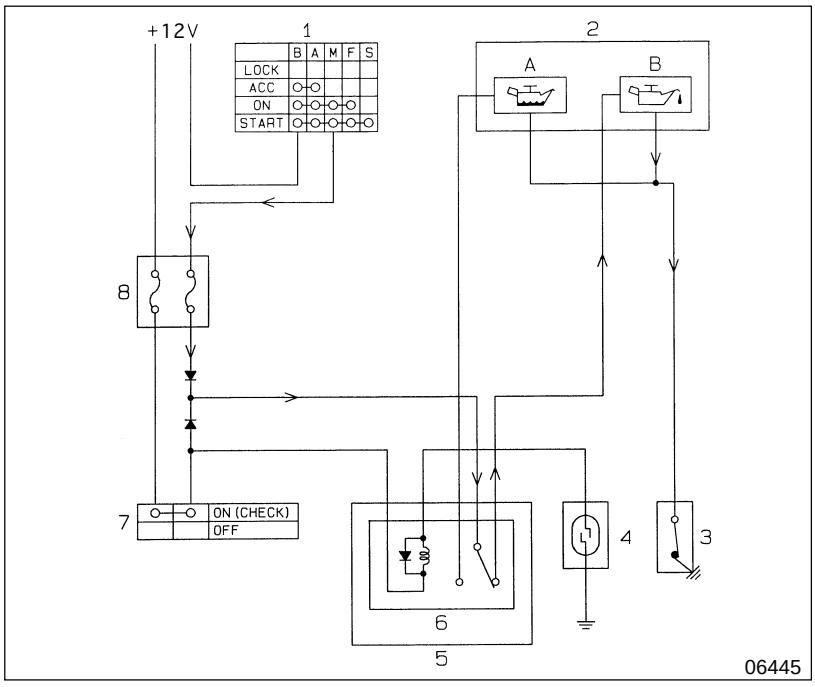
● Oil level normal (oil level sensor ON)
When oil level check switch **7** is turned ON while the engine is not running (oil pressure switch **3** ON), oil level sensor **4** is grounded and therefore oil level relay **6** is energized. This allows current to flow through the route given below and turn on oil level indicator lamp **A**.

Fuse box **8** → oil level check switch **7** → relay box **5**
→ oil level relay **6** → oil level sensor **4** → ground
→ meter cluster **2** → oil level indicator lamp **A**
→ oil pressure switch **3** → ground



● Oil level low (oil level sensor OFF)
Even when oil level check switch **7** is turned ON while the engine is not running (oil pressure switch **3**: ON), oil level relay **6** is not energized because oil level sensor **4** is off. This causes the current to flow through the route given below and turn on oil pressure warning lamp **B**.

Fuse box **8** → oil level switch **7** → Relay box **5** → oil level relay **6** → meter cluster **2** → oil pressure warning lamp **B** → oil pressure switch **3** → ground



● Oil pressure abnormal (oil pressure switch ON)
The oil pressure drops while the engine is running oil pressure switch **3** turns ON. As a result, current flows through the route given below to turn on oil pressure warning lamp **B**. When oil pressure is normal, oil pressure switch **3** remains off and no current flow.

Starter switch **1** → fuse box **8** → relay box **5** → oil level relay **6** → meter cluster **2** → oil pressure warning lamp **B** → oil pressure switch **3** → ground

Possible causes \ Symptoms		Engine hard to start	Overheating	Low oil pressure	Excessive oil consumption (oil leakage)	Remarks

ON-VEHICLE INSPECTION AND ADJUSTMENT

Oil Filter Replacement

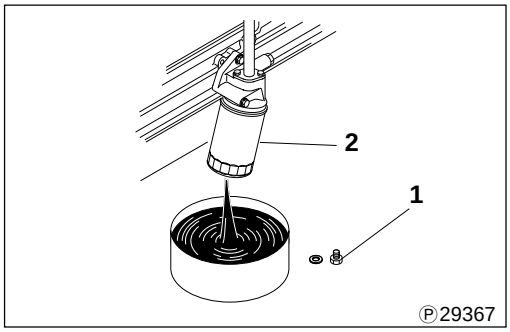
Lubricant

Location	Points of application	Specified lubricant	Quantity
2	Oil filter	Engine oil (API CD or higher)	Approximately 1 L {1.1 qts}

Special tools

Unit: mm {in.}

Location	Tool name and shape	Part No.	Application
—	Oil Filter Element Socket  08550	MH061566	Oil filter removal
	Oil Filter Wrench  ø107 to 120 {ø4.21 to 4.72} 01503	MH063200	



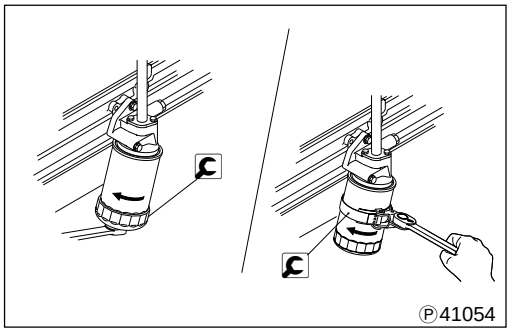
Ⓟ29367

WARNING ⚠

- **Wipe up any spilled engine oil since it may cause a fire.**
- **Do not touch oil when the engine is hot since it can inflict severe burns.**

CAUTION ⚠

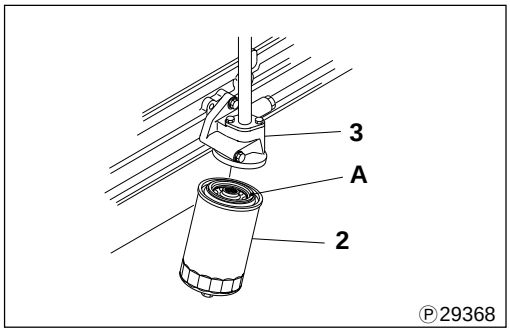
When pouring oil into the engine, take care not to spill any on the V-ribbed belt. Contact with oil could make the V-ribbed belt slip, rendering the cooling system less effective.



Ⓟ41054

Loosen oil filter drain plug **1** to drain the engine oil from inside the filter **2**.
[Removal]

: Oil Filter Element Socket or Filter Wrench



Ⓟ29368

[Installation]

- Clean the surface of oil filter head **3** to which oil filter **2** is fitted.
- Apply a thin coat of engine oil to the gasket A of oil filter **2**.
- Screw oil filter **2** into oil filter head **3** by hand until gasket **A** contacts the oil filter head. Then, tighten oil filter **2** further by giving it a 3/4 turn.
- After installing the oil filter, start the engine and check gasket **A** for oil leakage.
- Check to see if the engine oil level is in the specified range.

Engine Oil Replacement

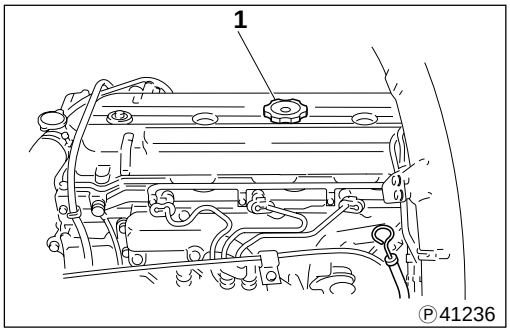
Tightening torques

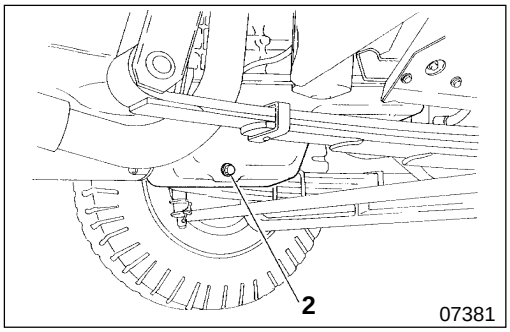
Unit: N·m {ft.lbs, kgf·m}

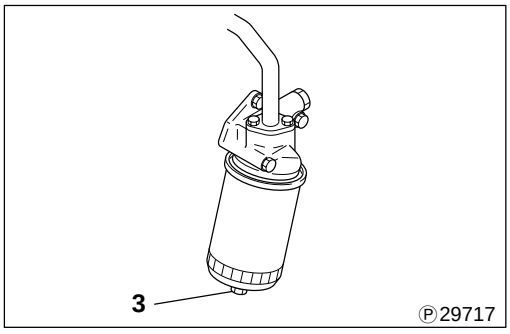
Location	Parts to be tightened	Tightening torque	Remarks
2	Oil pan drain plug	34.3 to 43.1 {25 to 32, 3.5 to 4.4}	—
3	Oil filter drain plug	9.8±1.96 {7.2±1.4, 1.0±0.2}	—

Lubricant

Location	Points of application	Specified lubricant	Quantity
—	Oil pan	Engine oil (API CD or higher)	Approximately 9 L {9.5 qts}
—	Oil filter	Engine oil (API CD or higher)	Approximately 1 L {1.1 qts}







WARNING ⚠

- **Wipe up any spilled engine oil since it can cause a fire.**
- **Do not touch oil when the engine is hot since it can inflict severe burns.**

CAUTION ⚠

When pouring oil into the engine, take care not to spill any on the V-ribbed belt. Contact with oil could make the V-ribbed belt slip, rendering the cooling system less effective.

[Draining]

- Warm up the engine, then remove oil filler cap **1**.
- Remove oil pan drain plug **2** and oil filter drain plug **3**. Then, drain the engine oil.

[Filling]

Tighten oil pan drain plug **2** and oil filter drain plug **3** to their specified torques. Then, add new engine oil to the specified level.

ON-VEHICLE INSPECTION AND ADJUSTMENT

Oil Pressure Measurement
Service standards

Location	Maintenance item		Standard value	Limit	Remedy
—	Oil pressure (at oil temperature of 158 to 194°F, 70 to 90°C)	At no-load minimum speed	145 kPa {21 psi, 1.5kgf/cm^2}	49 kPa {7.1 psi, 0.5 kgf/cm^2}	Check
		At no-load maximum speed	295 to 490 kPa {43 to 71 psi, 3 to 5 kgf/cm^2}	195 kPa {28 psi, 2 kgf/cm^2}	

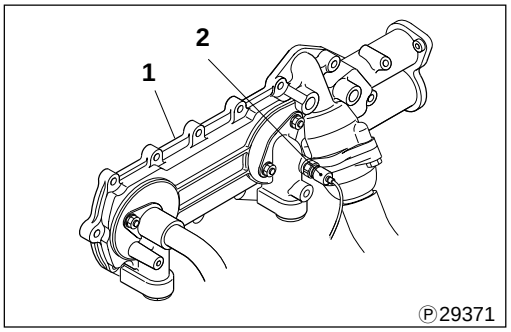
Tightening torque

Unit: N·m {ft.lbs, kgf·m}

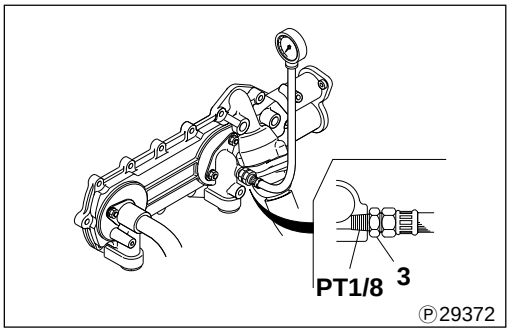
Location	Parts to be tightened	Tightening torque	Remarks
2	Engine oil pressure switch	7.8 to 14.7 {5.8 to 11.0, 0.8 to 1.5}	Check with engine cold

Sealant

Location	Point of application	Specified sealant	Quantity
2	Threaded part of engine oil pressure switch	Teflon tape	3 and half turns



- Remove engine oil pressure switch **2** from oil cooler **1**.



- Fit adapter **3** onto the engine oil pressure switch **2** mounting, then fit the oil pressure gauge onto the adapter.
- Warm up the engine until the oil temperature reaches 158 to 194°F (70 to 90°C).
- Measure the oil pressure at no-load minimum speed and at no-load maximum speed. If the measured values are below the specified standard values, overhaul the lubrication system.
- After taking measurements, fit oil pressure switch **2** and tighten it to the specified torque.

CAUTION ⚠

Oil pressure switch 2 must be fitted when the engine is cold.

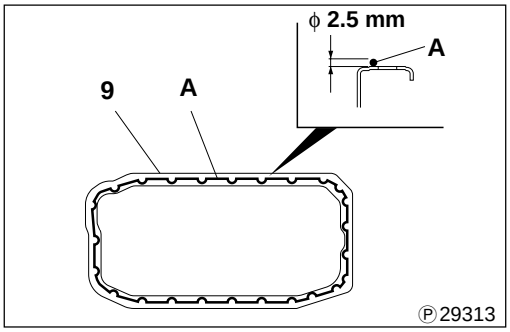
12, 15	Entire circumference of O-ring	Engine oil	As required
17	Threads of check valve	Engine oil	As required



◆ Service procedure

9 **Fitting oil pan**

- Apply sealant **A** to the mounting surface of oil pan **9** as illustrated. Apply the sealant evenly and without breaks.
- Within three minutes of applying sealant **A**, fit oil pan **9** onto the crankcase*.

CAUTION ⚠

- **Clean the oil pan mounting surface and ensure it is free of oily substances before applying sealant.**
- **Carefully mount oil pan exactly in the correct position. Ensure that sealant A does not spread to other areas.**
- **After fitting oil pan 9, wait at least one hour before starting the engine.**
- **Reapply sealant A to the oil pan mounting surface whenever the mounting bolts 8 of oil pan 9 have been loosened.**

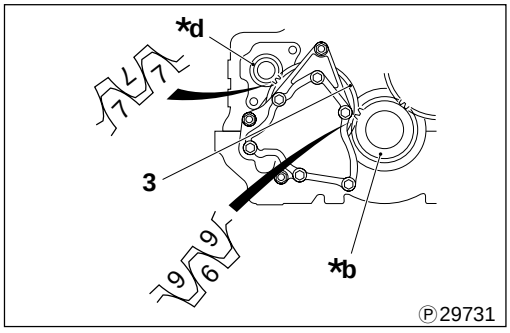
Special tools

Unit: mm {in.}

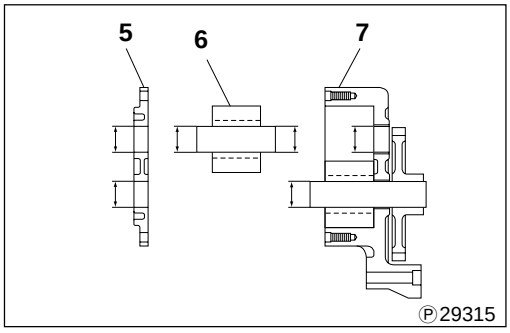
Location	Tool name and shape	Part No.	Application
5	Pump Cover Pin 	MH063431	Oil pump cover installation



◆ Service procedure

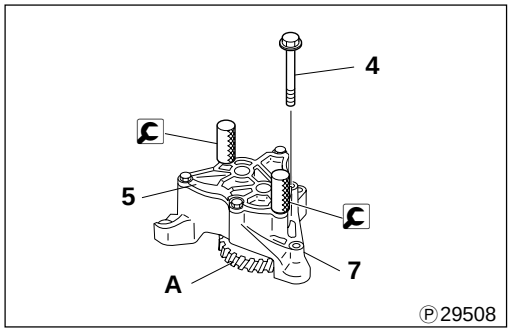
3 Installation of oil pump assembly

- With No. 1 cylinder set at its top dead center, position crankshaft gear ***b**.
- Install oil pump assembly **3** while meshing its gear with crankshaft gear ***b** and balance shaft gear RH ***d** at the match marks "**6**" and "**7**" as shown.



5 to 7 Inspection of oil pump cover, driven gear assembly and oil pump case assembly

Measure the clearance between each gear shaft and oil pump case assembly **7** or cover **5**. Replace the oil pump assembly if any measurement is out of specification.

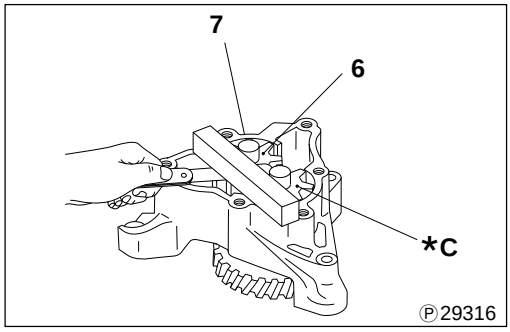


5 **7** **Installation of oil pump cover and oil pump case assembly**

- Position oil pump cover **5** on oil pump case assembly **7** using two 🔧 Pump Cover Pins.
- Fit bolt **4** and tighten it to the specified torque.
- Remove 🔧 Pump Cover Pins, then fit other bolts **4** and tighten them to the specified torque.

CAUTION ⚠

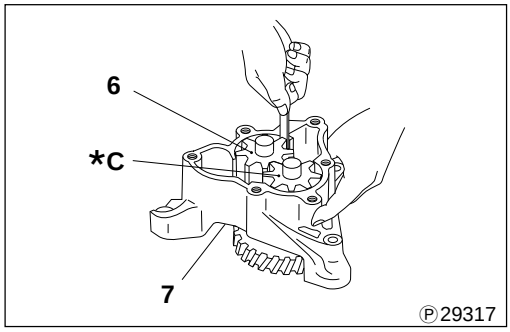
- **Before assembly, apply engine oil to various parts. Pour approximately 5 cm³ {0.3 Cu.in.} of engine oil into the assembly from the oil outlet before installing to the engine.**
- **After assembly, turn the oil pump gear A by hand and check that it rotates smoothly. If the gear does not rotate smoothly, disassemble and reassemble the components.**



6 **7** **Inspection of driven gear assembly and oil pump case assembly**

(1) Differences between gear heights and oil pump case depth

Replace the oil pump assembly if the measurement is out of specification.



(2) Clearance between gear teeth tip and oil pump case

Replace the oil pump assembly if the measurement is out of specification.

Lubricant

Location	Points of application	Specified lubricant	Quantity
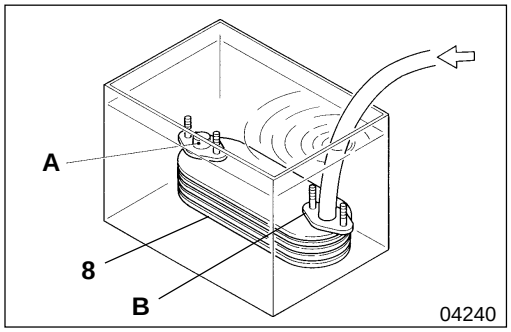
12, 15	Entire circumference of O-ring	Engine oil	As required

◆ Service procedure

● Cleaning

- Check whether carbon deposits or sludge have accumulated in the oil passage of oil cooler element **8** or in the oil cooler's bypass arrangement. Remove any deposits with cleaning solvent.
- Clean out any water scale or fur that has accumulated in the oil cooler element **8** or oil cooler body **19**.



8 **Inspection of oil cooler element**

- Plug outlet **A** of oil cooler element **8** and connect a hose to the oil inlet **B**. Then, immerse the oil cooler element in a tank of water.
- Apply an air pressure of 980 kPa {140 psi, 10 kgf/cm^2} via the hose and check that no air leaks from the oil cooler element **8**.
- If any air leaks, replace the oil cooler element **8**.

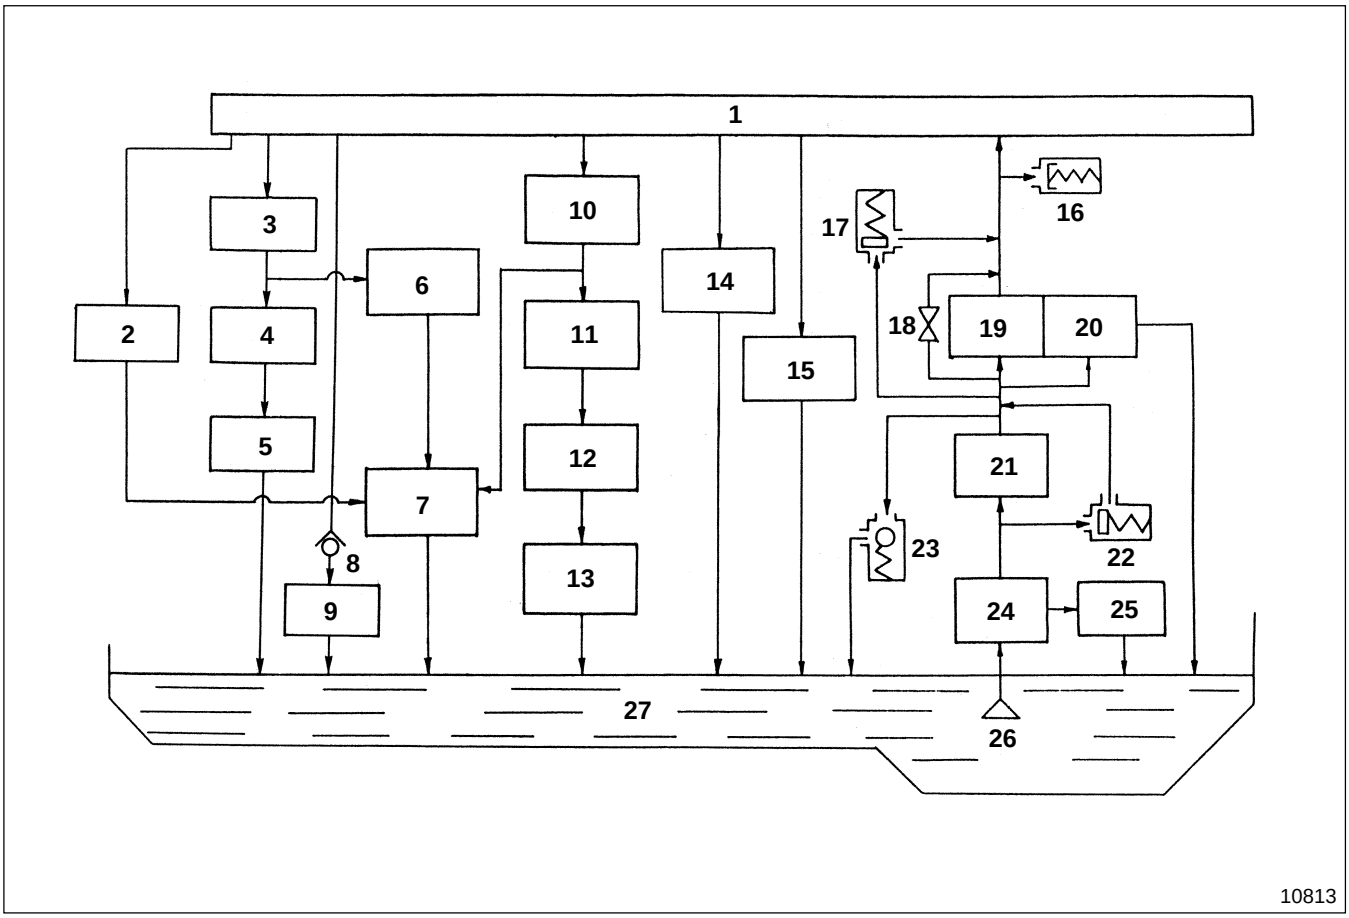
OIL PUMP 12B-18

OIL COOLER AND OIL FILTER 12B-22

SPECIFICATIONS

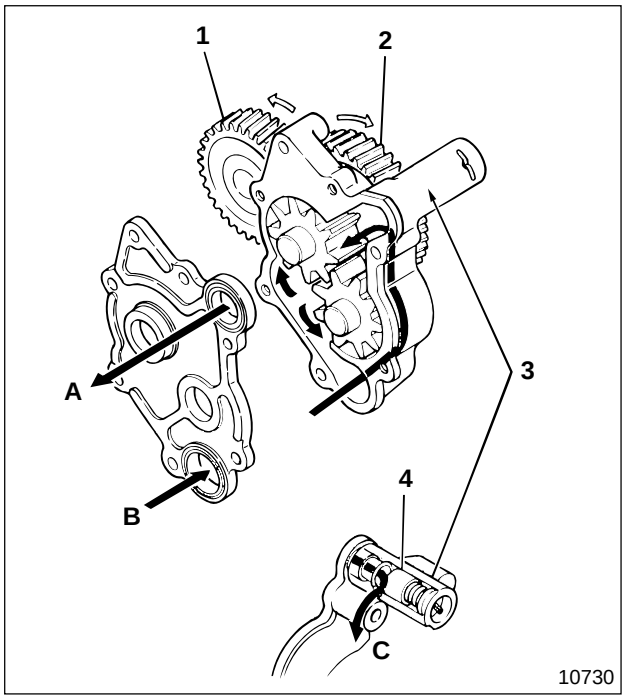
Item			Specifications
Mode of lubrication			Oil pump type
Oil filter type			Spin-on filter paper type
Oil cooler type			Shell and plate type (Multiple-plate type)
Engine oil	Grade		Grade CD or above as per API classification
	Quantity of oil L {qts}	Oil pan	Approximately 9.5 {10}
		Oil filter	Approximately 1 {1.1}

Lubrication System (Flow of Oil)



1 Main oil gallery
2 Air compressor
3 Crankshaft main bearing
4 Connecting rod bearing
5 Connecting rod busing
6 Idler gear bushing
7 Timing gear
8 Check valve for oil jet
9 Piston
10 Camshaft bushing
11 Rocker bushing
12 Push rod
13 Tappet
14 Injection pump
15 Turbocharger
16 Engine oil pressure switch
17 Engine oil bypass alarm switch
18 Bypass valve (Built-in within oil pump)
19 Full-flow filter element
20 Bypass filter element
21 Oil cooler
22 Bypass valve
23 Regulator valve
24 Oil pump
25 Relief valve (Built-in within oil pump)
26 Oil strainer
27 Oil pan

Oil Pump

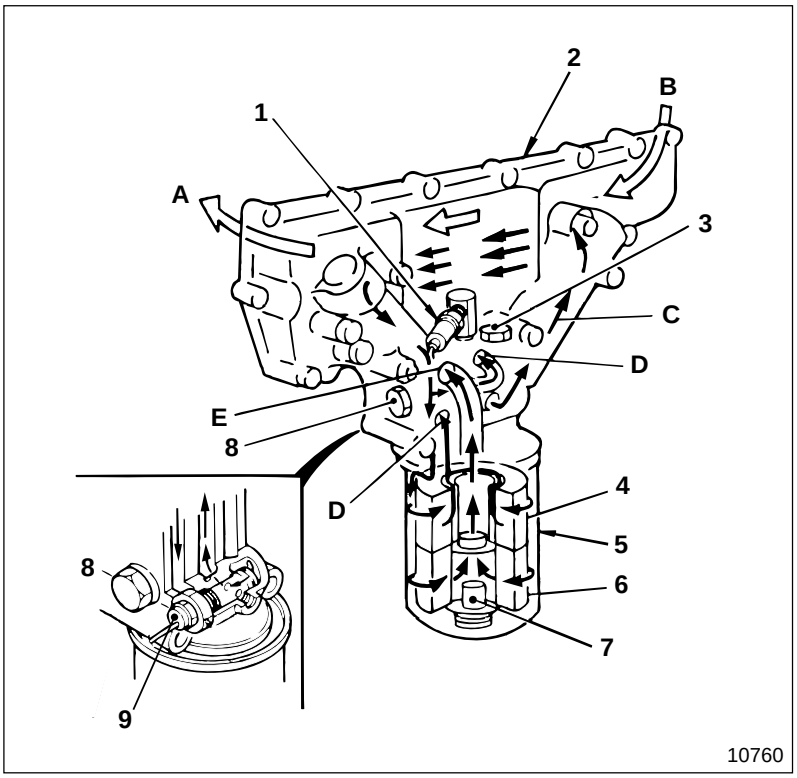


1 Crankshaft gear
2 Oil pump gear
3 Oil pump
4 Relief valve

A : To oil cooler
B : From oil strainer
C : To oil pan

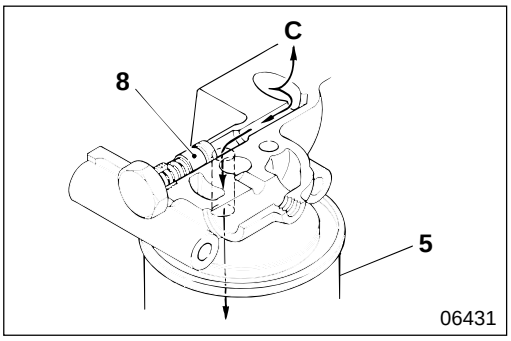
Oil pump **3** is a gear type, driven by rotation of the crankshaft transmitted by crankshaft gear **1** that engages oil pump gear **2**. Relief valve **4** is installed on the oil pump and when the oil pump discharge pressure becomes higher than the standard pressure level, part of the engine oil is returned to the oil pan by relief action of the valve, protecting the lubricating system from breakdown caused by excessive oil pressure.

Oil Cooler and Oil Filter



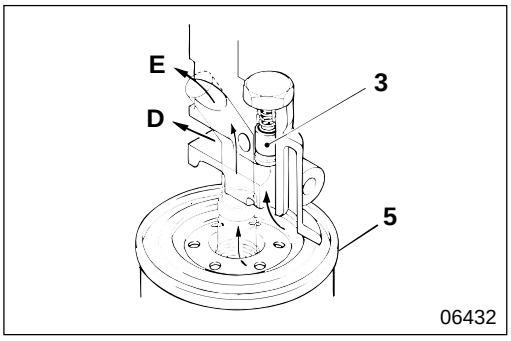
1 Engine oil pressure switch
2 Oil cooler
3 Regulator valve
4 Bypass filter element
5 Oil filter
6 Full-flow filter element
7 Bypass valve
8 Bypass valve
9 Engine oil bypass alarm switch

A : Coolant exit port
B : Coolant entry port
C : To oil cooler
D : To oil pan
E : To main oil gallery



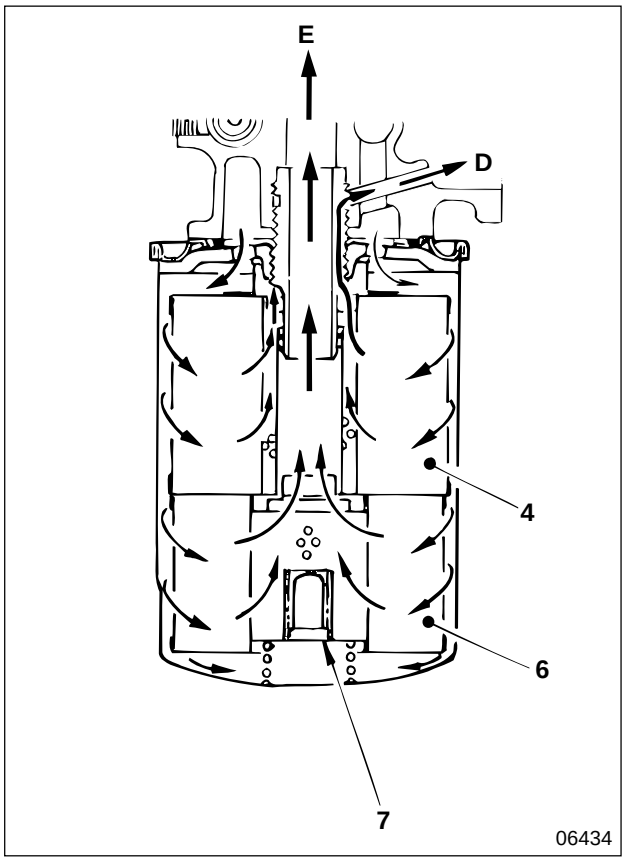
Operation of bypass valve

When the viscosity of the engine oil is high at low temperatures, or when oil cooler **2** element is clogged, flow resistance is high, and if this happens, bypass valve **8** opens to let the engine oil return directly to oil filter **5** without going through the oil cooler.



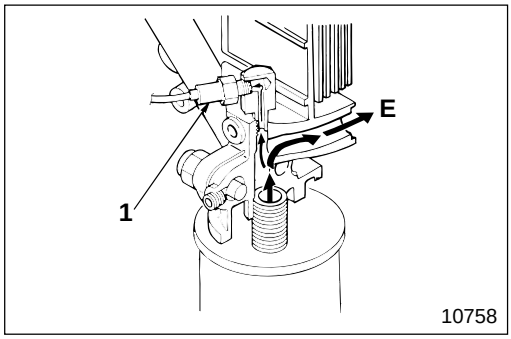
Operation of regulator valve

When the oil pressure in the main oil gallery becomes higher than standard, regulator valve **3** opens to let part of the oil return to oil pan **D**, thereby regulating the oil pressure.



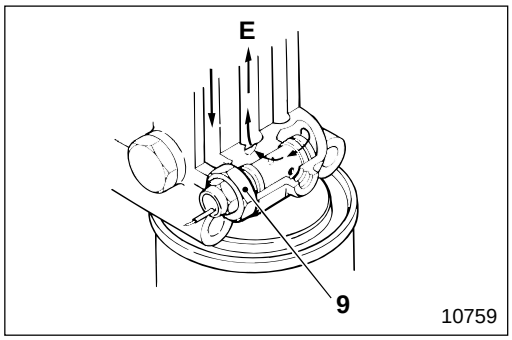
● **Oil filter element**

This oil filter uses a spin-on, filter paper type element, that integrates full-flow filter element **6** and bypass filter element **4**. When the filter element is clogged, bypass valve **7**, installed at the base of the filter, opens to let the oil bypass the element and flow directly to main oil gallery **E**, preventing engine seizure.



Operation of engine oil pressure switch

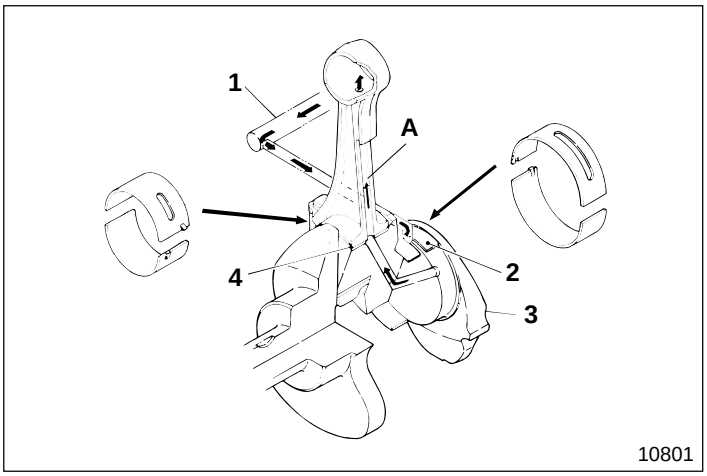
When pressure for delivering the oil to main oil gallery **E** becomes lower than standard, the built-in electric contact point of engine oil pressure switch **1** closes to light warning lamp in the meter cluster, warning the driver that the oil pressure is abnormal.



Operation of engine oil bypass alarm switch

- When the oil filter element is clogged, the engine oil level becomes low and might cause seizure of engine parts, engine oil bypass alarm switch **9** is installed to prevent this.
- When the oil filter element is clogged, engine oil bypass alarm switch **9** lets the oil flow directly to main oil gallery **E**, bypassing full-flow filter element **6**. When the engine oil bypass alarm switch is activated it lights the warning lamp, warning the driver that the oil filter element is clogged.

Lubrication of Related Parts

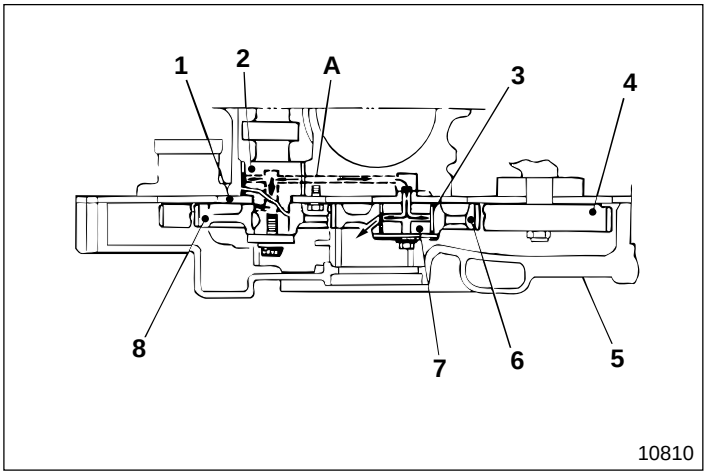


● **Main bearing and connecting rod bearing**

1 Main oil gallery
2 Main bearing
3 Crankshaft
4 Connecting rod bearing

A : Connecting rod oil passage

Engine oil supplied through the oil passage drilled in crankshaft **3** flows through connecting rod oil passage **A** to lubricate the small end of the connecting rod.

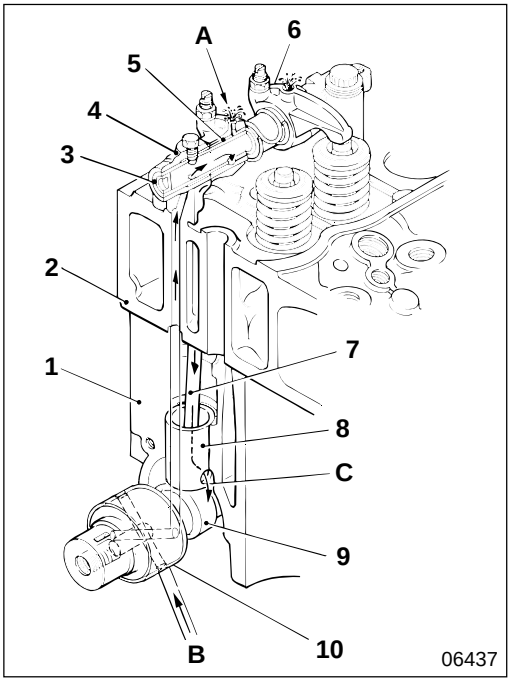


● **Timing gear**

1 Thrust plate
2 Camshaft
3 Idler gear bushing
4 Air compressor gear
5 Timing gear case
6 Idler gear
7 Idler shaft
8 Camshaft gear

A : From main oil gallery

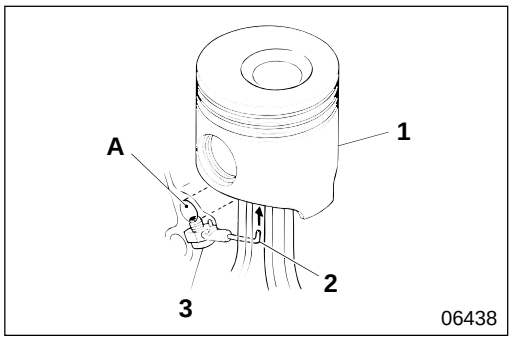
Engine oil from main oil gallery **A** flows through the inside of camshaft **2** and idler shaft **6** and lubricates each gear.



● **Valve mechanism**

1 Crankcase
2 Cylinder head
3 Rocker shaft
4 Rocker shaft bracket
5 Rocker bushing
6 Rocker
7 Push rod
8 Tappet
9 Camshaft
10 No. 1 camshaft bushing

A : Rocker oil hole
B : From main oil gallery
C : To oil pan

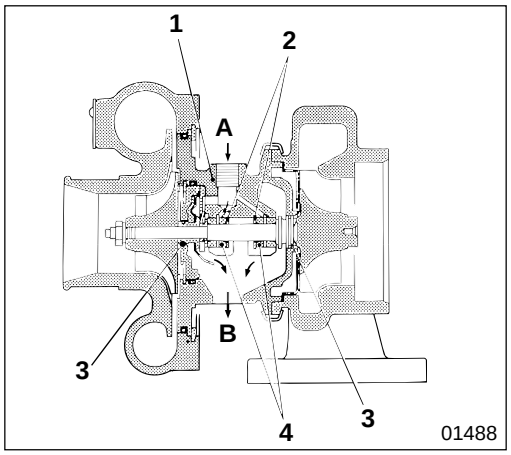


● **Oil jet**

1 Piston
2 Oil jet
3 Check valve

A : Main oil gallery

An oil jet **2** is installed, in the lower part of main oil gallery **A**, for each cylinder and cools piston **1** by injecting engine oil toward the inside of the piston. The oil jet is fitted with check valve **3** which opens and closes at standard oil pressure levels. This prevents a decrease of oil volume at low oil pressure as well as a decrease of oil pressure itself.

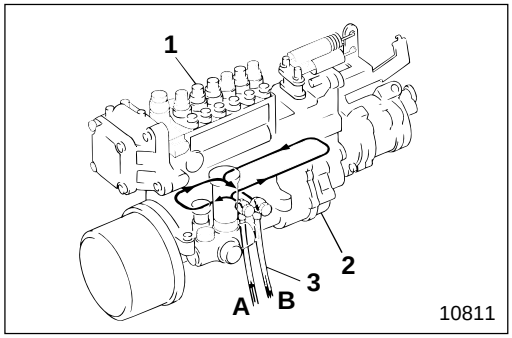


● **Turbocharger**

1 Bearing housing
2 Snap ring
3 Piston ring
4 Bearing

A : From main oil gallery
B : To oil pan

Engine oil is delivered from the main oil gallery to bearing housing **1** through the oil pipe to lubricate bearing **4**. Piston ring **3** installed at both ends of the turbine wheel shaft works as an oil seal.

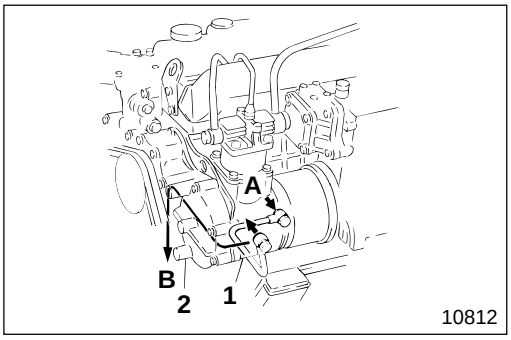


● **Injection pump**

1 Injection pump
2 Governor
3 Oil return pipe

A : From main oil gallery
B : To oil pan

Engine oil that has lubricated injection pump **1** and governor **2** returns to the oil pan through oil return pipe **3**.



● **Air compressor**

1 Air compressor
2 Timing gear case

A : From main oil gallery
B : To oil pan

Engine oil from the main oil gallery lubricates the inside of air compressor **1** and returns to the oil pan through timing gear case **2**.

ON-VEHICLE INSPECTION AND ADJUSTMENT

Replacement of Oil Filter

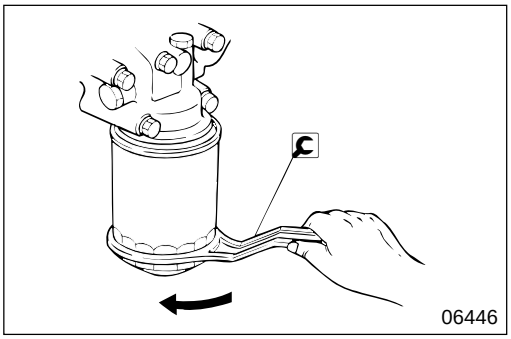
Special tools

Unit : mm {in.}

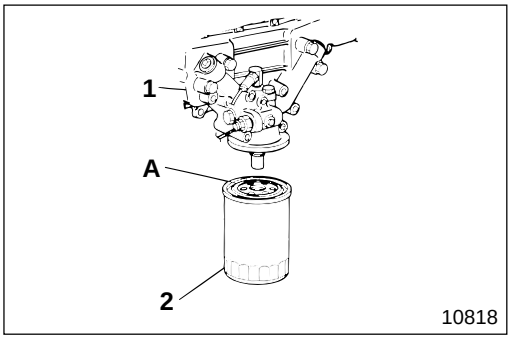
Location	Tool name and shape	Part No.	Application
2	Oil filter wrench  06478	MH061587	Removal of oil filter

WARNING

- **Wipe up any engine oil that has been spilled because it can cause a fire.**
- **Do not touch the engine while it is hot because it will burn you.**
- **When replacing oil filter 2, take care not to spill oil on the V-belt.**



[Removal]



[Installation]

- Clean the surface of oil cooler body **1** that makes contact with oil filter **2**.
- Apply engine oil thinly and evenly to gasket area **A** of oil filter **2**.
- Screw in oil filter **2** to oil cooler body **1** until gasket area **A** sits on the body. From this position, tighten further by rotating by five eighths of a turn.
- After installation, run the engine and check that there is no oil leakage from gasket area **A**.
- Check the oil level and if it is low, top it up.

Replacement of Engine Oil

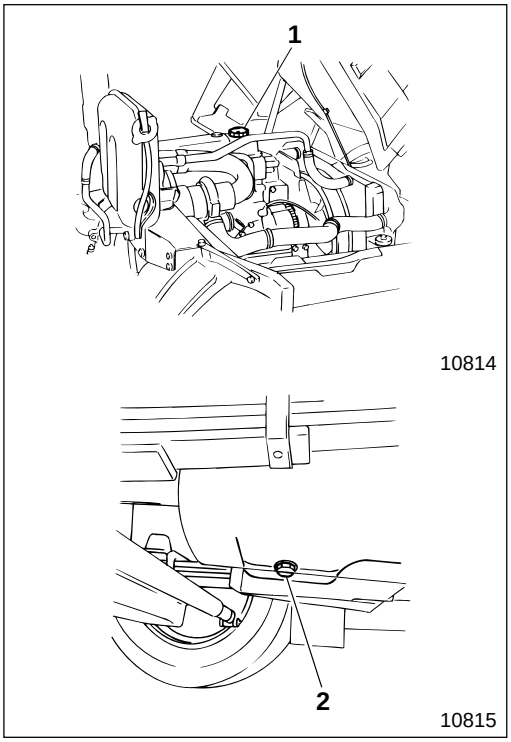
Tightening torque

Unit : N·m {ft.lbs, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
2	Oil pan drain plug	69 {51, 7}	—

Lubricant

Location	Points of application	Kinds	Quantity
—	Oil pan	Engine oil (Grade CD or above as per API Classification)	Approximately 9.5 L {10 qts}
—	Oil filter	Engine oil (Grade CD or above as per API Classification)	Approximately 1 L {1.1 qts}



[Draining]
After warming-up the engine, remove oil filler cap **1** and remove drain plug **2** of the oil pan and drain the engine oil.

[Refilling]
Tighten drain plug **2** of the oil pan at specified torque and fill with the specified quantity of engine oil.

WARNING

- **Wipe up any engine oil that has been spilled because it can cause a fire.**
- **Do not touch the engine while it is hot because it will burn you.**
- **When replacing engine oil take care not to spill oil on the V-belt.**

ON-VEHICLE INSPECTION AND ADJUSTMENT

Measurement of Oil Pressure

Service standards

Location	Maintenance item		Standard value	Limit	Remedy
—	Oil pressure (Oil temperature 70 to 90°C {158 to 194°F})	At no-load minimum revolution	145 kPa {21 psi, 1.5 kgf/cm^2}	49 kPa {7.1 psi, 0.5 kgf/cm^2}	Inspect
		At no-load maximum revolution	295 to 490 kPa {43 to 71 psi, 3 to 5 kgf/cm^2}	195 kPa {28 psi, 2 kgf/cm^2}	

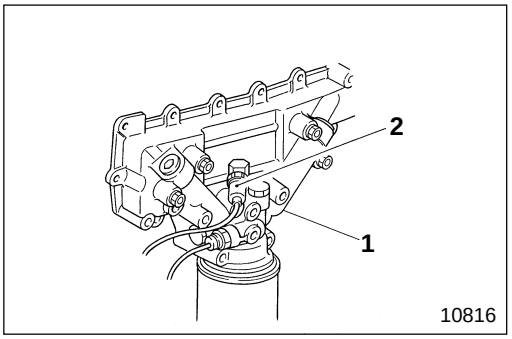
Tightening torque

Unit : N·m {ft.lbs, kgf·m}

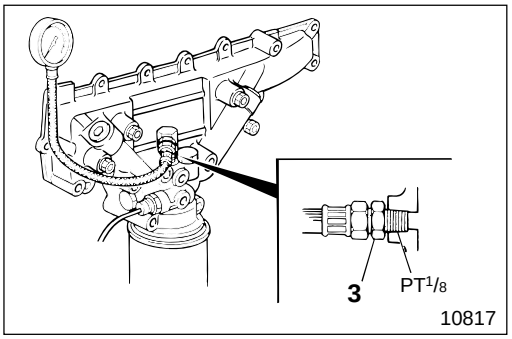
Location	Parts to be tightened	Tightening torque	Remarks
2	Engine oil pressure switch	15 to 22 {11 to 16, 1.5 to 2.2}	When engine is cold

Sealant

Location	Points of application	Kinds	Quantity
2	Thread area of engine oil pressure switch	Teflon tape	3 1/2 turns



- Remove oil pressure switch **2** from oil cooler **1**.
- Mount the oil pressure gauge after installing adaptor **3** onto oil cooler **1**.
- Warm up the engine until the oil temperature reaches 70 to 90°C {158 to 194°F}.
- Measure oil pressure at no-load minimum revolution and at no-load maximum revolution. If the measured values are lower than the limit, overhaul the lubricating system.



- After measurement, install engine oil pressure switch **2** and tighten at specified torque.

CAUTION

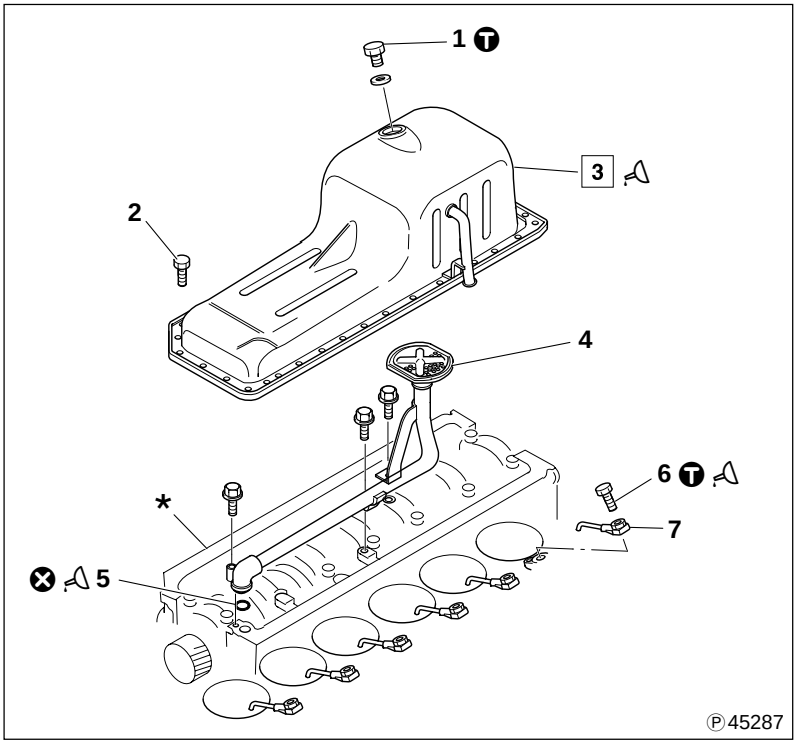
Be sure to install oil pressure switch 2 when the engine is cold.

Inspection of engine oil pressure switch

Gr 54

M E M O

OIL PAN, OIL STRAINER AND OIL JET



● **Disassembly sequence**

1 Drain plug
2 Bolt
3 Oil pan
4 Oil strainer
5 O-ring
6 Check valve
7 Oil jet

***** : Crankcase
⊗ : Non-reusable parts

● **Assembly sequence**

Follow the disassembly sequence in reverse.

CAUTION ⚠

Make sure that you do not tighten check valve 10 higher than the specified torque. Overtightening will cause damage to the check valve, resulting in serious overheating damage to the engine.

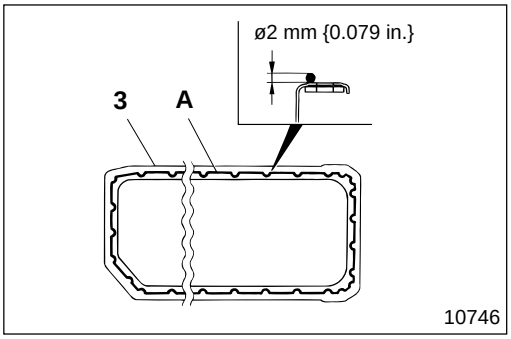
Ⓣ Tightening torque

Unit : N·m {ft.lbs, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
1	Drain plug	69 {51, 7}	—
6	Check valve	29 {22, 3 }	Wet

Lubricant and sealant

Location	Points of application	Kinds	Quantity
3	Oil pan to crankcase connecting surface	THREEBOND 1207C	As required
5	Body of O-ring	Engine oil	As required
6	Thread area of check valve	Engine oil	As required



◆ Service procedure

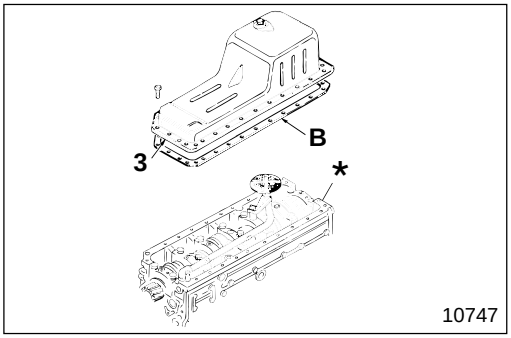
3 **Installation of oil pan**

< When using sealant >

- Apply sealant **A** to lower connecting surface of oil pan **3** as illustrated evenly without break.
- After applying sealant **A**, within three minutes, mount oil pan **3** to crankcase *****.

CAUTION ⚠

- **Be sure to clean and wipe off oily substances from the surface where sealant A is to be applied.**
- **Make sure that sealant A is not transferred to other areas while the mounting work is being done.**
- **Do not start the engine within an hour of mounting oil pan 3.**
- **Be sure to reapply sealant A if bolts 2 (for mounting oil pan 3) are loosened or removed by any cause whatsoever after mounting.**

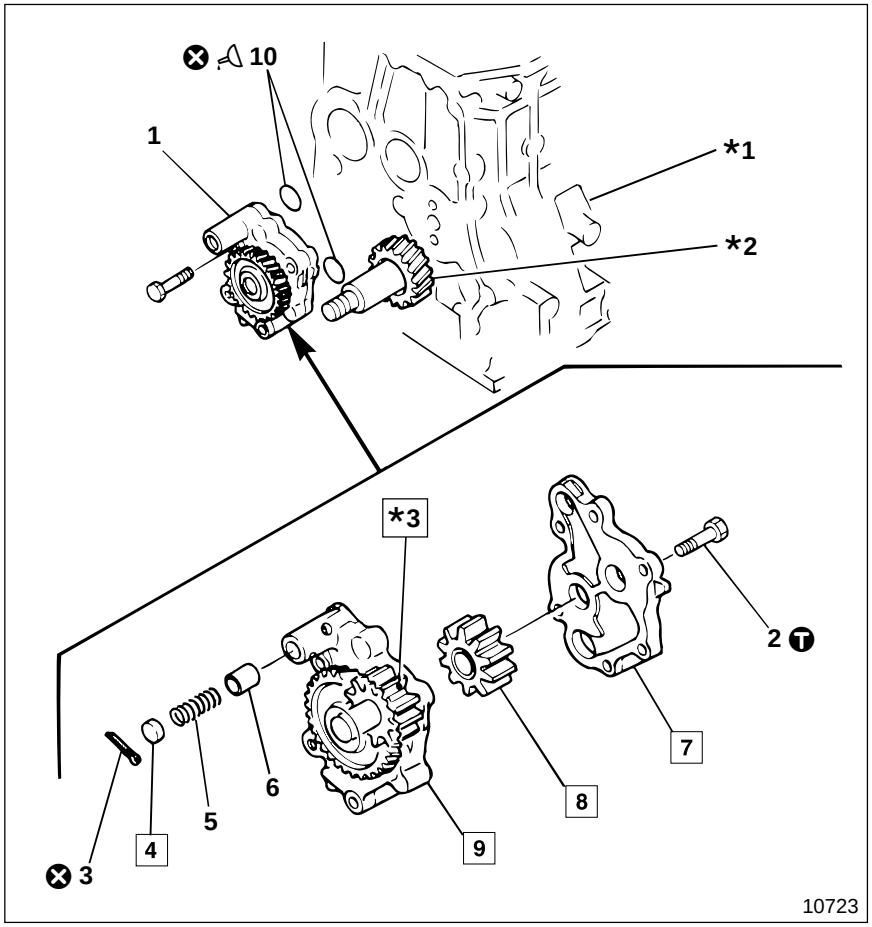


< When not using sealant >

NOTE

If sealant is not available, install oil pan 3 to crankcase * using sheet gasket B.

OIL PUMP



● **Disassembly sequence**

⊗ : Non-reusable parts

● **Assembly sequence**

Follow the disassembly sequence in reverse.

Service standards

Unit : mm {in.}

Location	Maintenance item	Standard value (Basic diameter in [ ])	Limit	Remedy
—	Backlash between oil pump gear and crankshaft gear Gr 11B	0.09 to 0.18 {0.0035 to 0.0071}	0.3 {0.012}	Replace
5	Relief valve spring load (Installed length 38 {1.50})	225 N {51 lbf, 23.15 kgf}	—	Replace
6	Relief valve opening pressure	1080±98 kPa {155±14 psi, 11±1.0 kgf/cm^2}	—	—
7, *3	Clearance between gear shaft and oil pump cover	[20] 0.04 to 0.07 {[0.79] 0.0016 to 0.0028}	0.15 {0.0059}	Replace
8, 9	Clearance between gear shaft and driven gear	[20] 0.04 to 0.07 {[0.79] 0.0016 to 0.0028}	0.15 {0.0059}	Replace
8, 9, *3	Difference between height of each gear and depth of oil pump case	0.01 to 0.07 {0.00039 to 0.0028}	0.18 {0.0071}	Replace
	Clearance between tooth tip of each gear and oil pump case	0.10 to 0.19 {0.0039 to 0.0075}	0.2 {0.0079}	Replace

Ⓣ Tightening torque

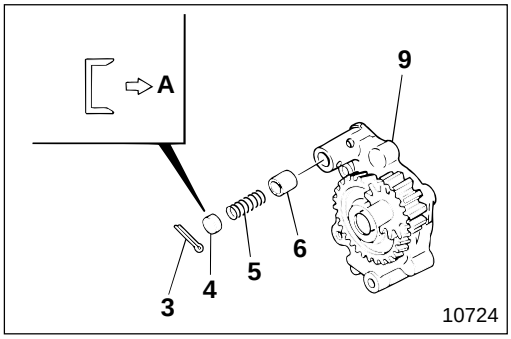
Unit : N·m {ft.lbs, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
2	Bolt (Oil pump cover mounting)	9.8±2.0 {7.2±1.4, 1.0±0.2}	—

Lubricant

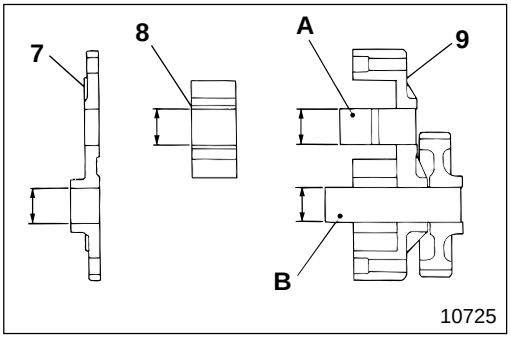
Location	Points of application	Kinds	Quantity
10	Body of O-ring	Engine oil	As required

◆ Service procedure



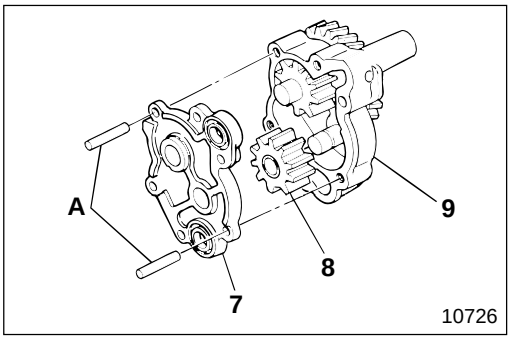
4 **Installation of seat**

A : Oil pump case assembly side



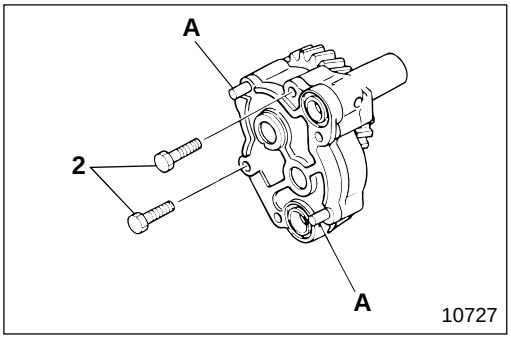
7 **to** **9** **Inspection of oil pump cover, driven gear assembly, and oil pump case assembly**

- Measure the clearance between oil pump cover **7** and drive gear shaft **B**, and between driven gear assembly **8** and driven gear shaft **A**.
- If the measured value is lower than the limit, replace the faulty parts.

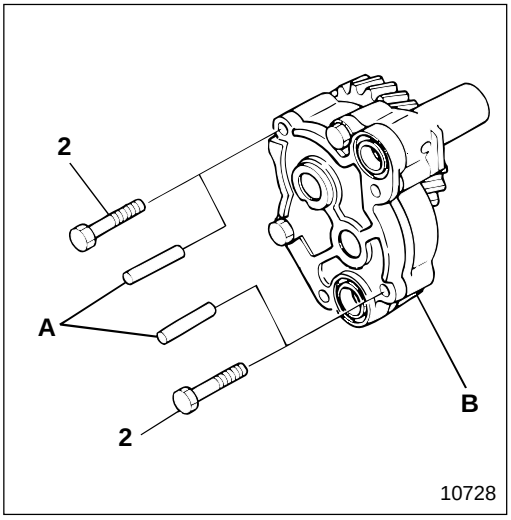


7 **9** **Installation of oil pump cover and oil pump case assembly**

- Prepare two pins **A** of 9 mm {0.35 in.} in outer diameter and position oil pump cover **7** and oil pump case assembly **9** as illustrated.



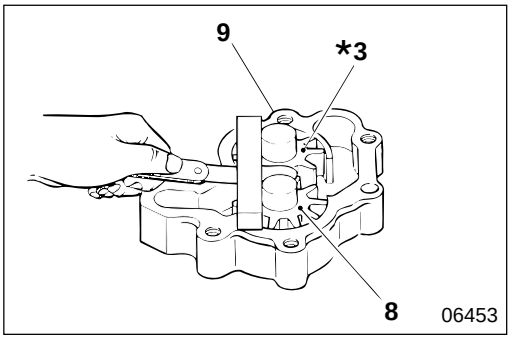
- Tighten the illustrated bolts **2** at specified torque.



- Remove pins **A**, replacing them with bolts **2** and tighten at specified torque.

NOTE

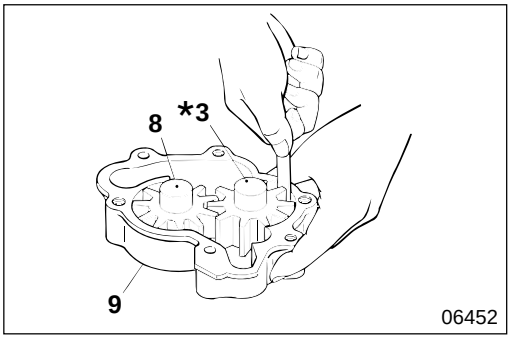
Confirm smooth movement by rotating oil pump gear B by hand. If it catches, disassemble and reassemble it.



8 9 *3 Inspection of driven gear assembly, and oil pump case assembly

(1) Difference between height of each gear and depth of oil pump case

If the measured value is higher than the limit, replace the faulty parts.



(2) Clearance between tooth tip and oil pump case

If the measured value is higher than the limit, replace the faulty parts.

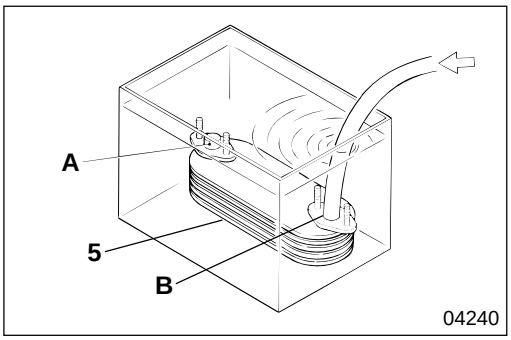
1	Gasket area of oil filter with thin application P12B-12	Engine oil	As required
4	Body of O-ring	Engine oil	As required
6	Thread area of engine oil pressure switch	Teflon tape	3 1/2 turns

◆ Service procedure

● Cleaning

- Check and see if any carbon deposits or sludge have developed in the oil passage of oil cooler element **5** or its bypass. Clean any deposits off thoroughly with cleaning solvent.
- Also clean any water scale or fur found in oil cooler element **5** or oil cooler body **17**.



5 **Inspection of oil cooler element**

- Immerse oil cooler element **5** in a water tank after plugging exit port **A** and connecting the hose to engine oil entry port **B**.
- Apply air pressure of 980 kPa {140 lbf/in², 10 kgf/cm²} via the hose and see if there is any air leakage from any part of oil cooler element **5**.
- If you see any leakage, replace oil cooler element **5**.

FUEL TANK 13A-14

FUEL FILTER 13A-15

INJECTION PUMP 13A-16

INJECTION NOZZLE 13A-20

For system control of the electronically controlled injection pump, refer to Group 13EA Electronically Controlled Fuel System.

SPECIFICATIONS

Injection Pump Assembly

Item		Specification
Manufacturer		DENSO
Model		V4
Type		Distributor type electronically controlled pump
Spill valve solenoid		Electronically controlled
Timer	Control	High-pressure chamber control
	Drive	Timer controlled valve (TCV)
Feed pump type		Vane

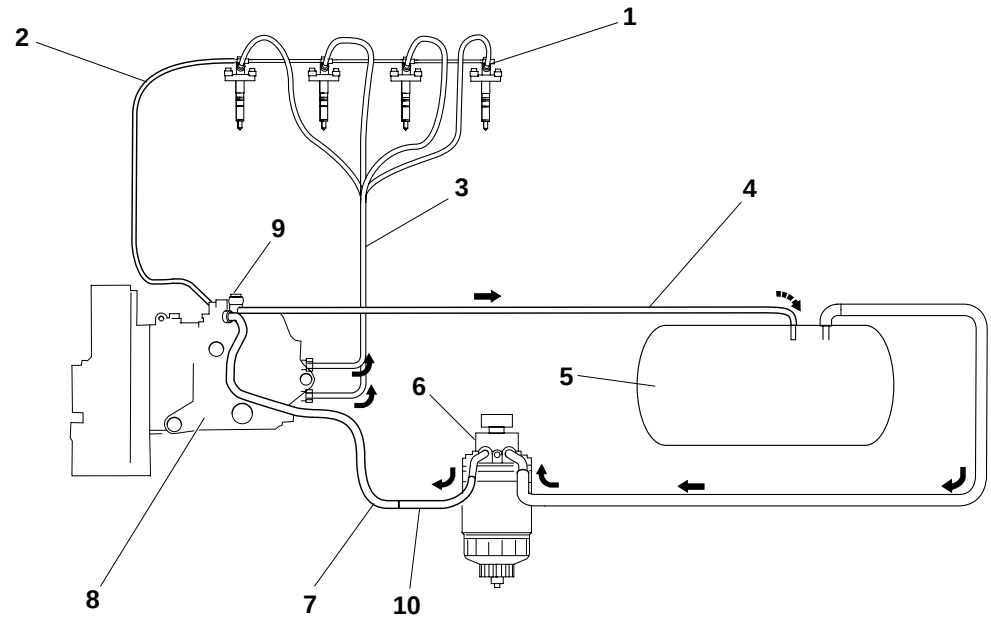
Injection Nozzle Assembly

Item	Specification
Manufacturer	DENSO
Type	Hole-type (2-spring)
No. of holes	6
Hole diameter mm {in.}	ϕ 0.20 {0.0079}

Fuel Filter

Item	Specification
Fuel filter type	Spin-on type (paper filter)
Water level alarm	Provided
Priming pump	Provided

1. Fuel System (Fuel flow)

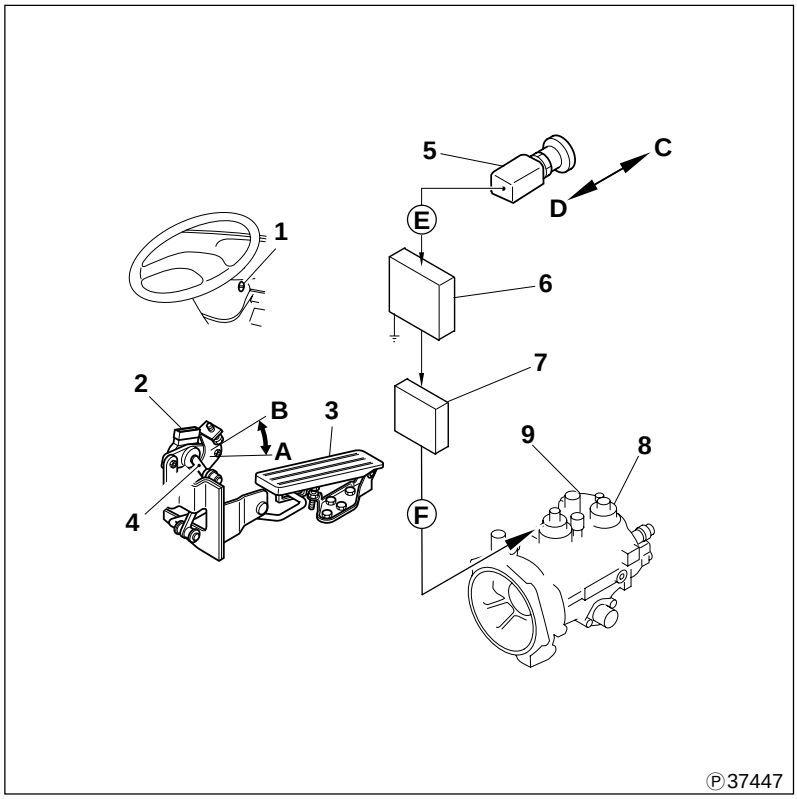


Ⓟ49019

1 Injection nozzle
2 Fuel leak-off pipe
3 Injection pipe
4 Fuel return pipe
5 Fuel tank
6 Fuel filter
7 Fuel suction pipe
8 V4 injection pump
9 Overflow valve
10 Fuel hose

- Fuel from the fuel tank **5** is drawn up by the feed pump, which is driven by the V4 injection pump **8**. Then, the fuel is delivered into the V4 injection pump through the fuel filter **6**.
- After filtration, the fuel is fed to the V4 injection pump **8**. From there, it is fed under high pressure to the injection nozzles **1**. The injection nozzles spray the fuel into the combustion chambers.
- Excess fuel from the injection nozzles **1** returns to the fuel tank **5** by way of the fuel leak-off pipe **2**.
- If the fuel pressure in the V4 injection pump **8** exceeds a preset level, the overflow valve **9** opens to allow excess fuel to return from the fuel return pipe **4** to the fuel tank **5**.

2. Engine Control



1 Starter switch
2 Accelerator position sensor & accelerator switch assembly
3 Accelerator pedal
4 Lever
5 Emergency engine stop switch
6 Engine control unit
7 Drive Unit
8 Spill valve
9 V4 injection pump assembly

A : Idling position
B : Full-load position
C : Engine stopping position
D : Engine starting position
E : Fuel cut signal
F : Power supply

● **Accelerator position sensor & accelerator switch unit**

The accelerator position sensor & accelerator switch unit **2** consists of an accelerator position sensor and a built-in accelerator switch.

- The accelerator switch responds to the foot pressure acting upon the accelerator pedal **3**.
- The accelerator position sensor detects the movement of the accelerator pedal **3** and outputs an electric signal to the engine control unit **6**. The lever **4** is constantly pulled by the return spring toward the idling position **A**.

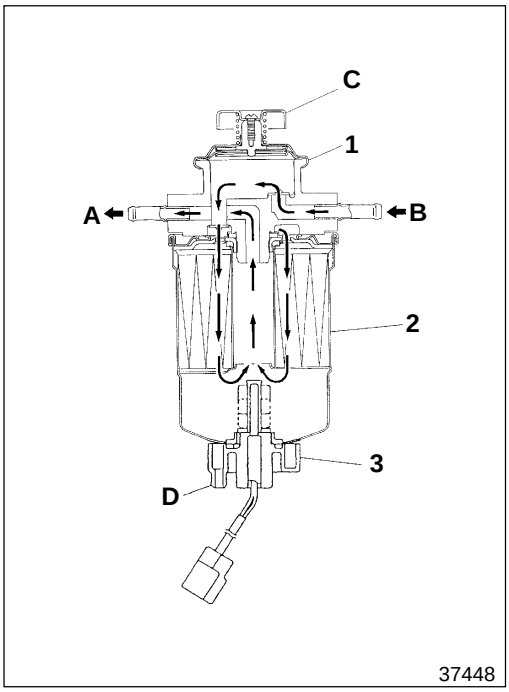
● **Emergency engine stop switch**

The emergency engine stop switch **5** is used to stop the engine when the starter switch **1** placed in the ACC position fails to do it due to a system failure or for other reason. If the switch is pulled into the engine stopping position **C**, a fuel cut signal **F** is sent to the engine control unit **6**, which in turn supplies power **F** to the spill valve **8** of the V4 injection pump assembly **9** to stop the engine.

CAUTION ⚠

When restarting the engine stopped by means of the emergency engine stop switch 5, set the starter switch 1 to the ACC or LOCK position beforehand to initialize the computer in the engine control unit 6.

3. Fuel Filter



1 Fuel filter head
2 Fuel filter cartridge
3 Water level sensor

A : To injection pump
B : From fuel tank
C : Priming pump
D : Drain port

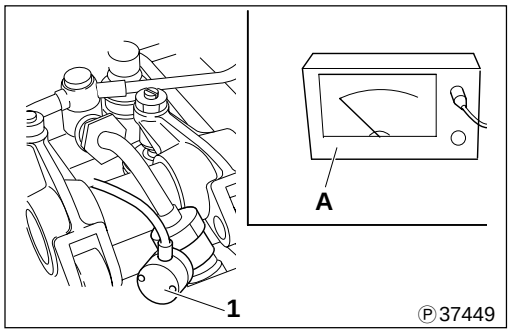
The fuel filter cartridge **2** serves also as a water separator, it separates water from fuel as well as removes impurities. Separated water is collected in the lower part of the filter. The filter is provided with a water level sensor **3**. When water is collected to a certain level, this sensor turns on the warning lamp in the meter cluster.
Collected water can be drained away through the drain port **D** by loosening the water level sensor **3**. The fuel filter head **1** is equipped with a priming pump **C** for bleeding the fuel system.

ON-VEHICLE INSPECTION AND ADJUSTMENT

1. Checking Minimum and Maximum No-Load Speeds

Service standards

Location	Maintenance item	Standard value	Limit	Remedy
–	No-load minimum speed (Idling speed)	650±25 rpm	–	Check
–	No-load maximum speed	3400±50 rpm	–	Check



● **No-load minimum speed**

Prepare the vehicle for inspection as follows.

- Engine coolant temperature: 176 to 203°F {80 to 95°C}
- Lamps and electrical equipment: Off
- A/T: “P” range
- Steering wheel: Neutral position
- Connect a tachometer **A** to the injection nozzle **1** or the injection pipe.

NOTE

Before connecting the tachometer A to the injection pipe, undo all clamps from the pipe.

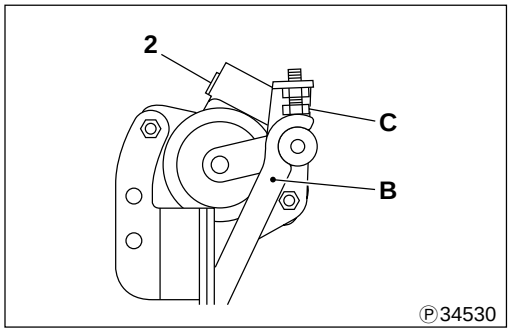
- Check that the minimum speed meets the standard value when the accelerator pedal is free of foot pressure.
- If the reading deviates from the standard value, check the accelerator position sensor & accelerator switch unit **2** for malfunction. Gr 13EA
- If the accelerator position sensor & accelerator switch unit **2** is found normal, check the fuel system diagnosis code, injection pump and ECU. Gr 13EA

● **No-load maximum speed**

- Connect a tachometer **A** to the injection nozzle **1** or the injection pipe.

NOTE

Before connecting the tachometer A to the injection pipe, undo all clamps from the pipe.



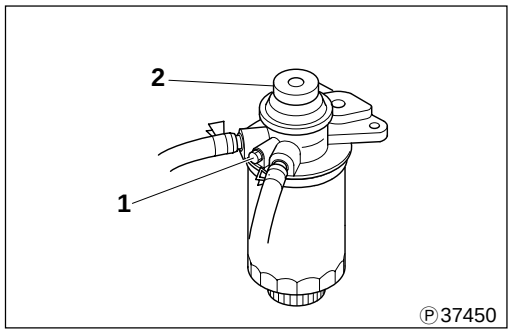
- Check that the maximum speed meets the standard value when the lever **B** of the accelerator position sensor & accelerator switch unit **2** is in contact with the full load stopper bolt **C**.
- If the reading deviates from the standard value, check the accelerator position sensor & accelerator switch unit **2** for malfunction. Gr 13EA
- If the accelerator position sensor & accelerator switch unit **2** is found normal, check the fuel system diagnosis code, injection pump and ECU. Gr 13EA

2. Bleeding Air from Fuel System

Tightening torque

Unit: N·m {ft.lbs, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
1	Air vent plug	6±1 {4.3±0.7, 0.6±0.1}	–



- Loosen the fuel filter air vent plug **1**.
- Operate the priming pump **2** to pump up fuel.
- Continue to pump fuel until no air bubbles are found in the fuel flowing out from the air vent plug **1**.
- After ascertaining that air bubbles have completely disappeared, tighten the air vent plug **1** securely.
- Operate the priming pump **2** further until it feels heavy.
- Wipe up all spilled fuel, then start the engine.
- Check that no fuel leakage occurs.

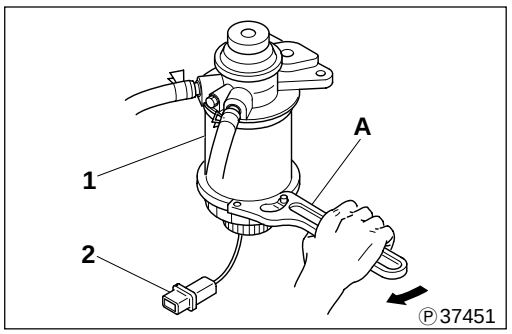
WARNING ⚠

- **Fuel is highly flammable. Keep it away from flames and sources of heat.**
- **Be sure to wipe up all spilled fuel. Unless it is wiped up, it could catch fire.**

3. Replacing Fuel Filter

Lubricant

Location	Point of application	Specified lubricant	Quantity
1	Gasket for fuel filter cartridge	Engine oil	As required



[Removal]

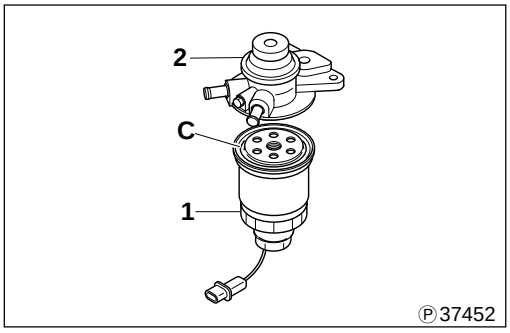
A: Filter Wrench
(Commercially available one: For filter diameter of approx. 90 mm {3.54 in.})

WARNING ⚠

- **Fuel is highly flammable. Keep it away from flames and sources of heat.**
- **To minimize the risk of fire, wipe up any spilled fuel.**

CAUTION ⚠

- **The water level sensor 2 may be reused if it properly functions.**



[Installation]

WARNING ⚠

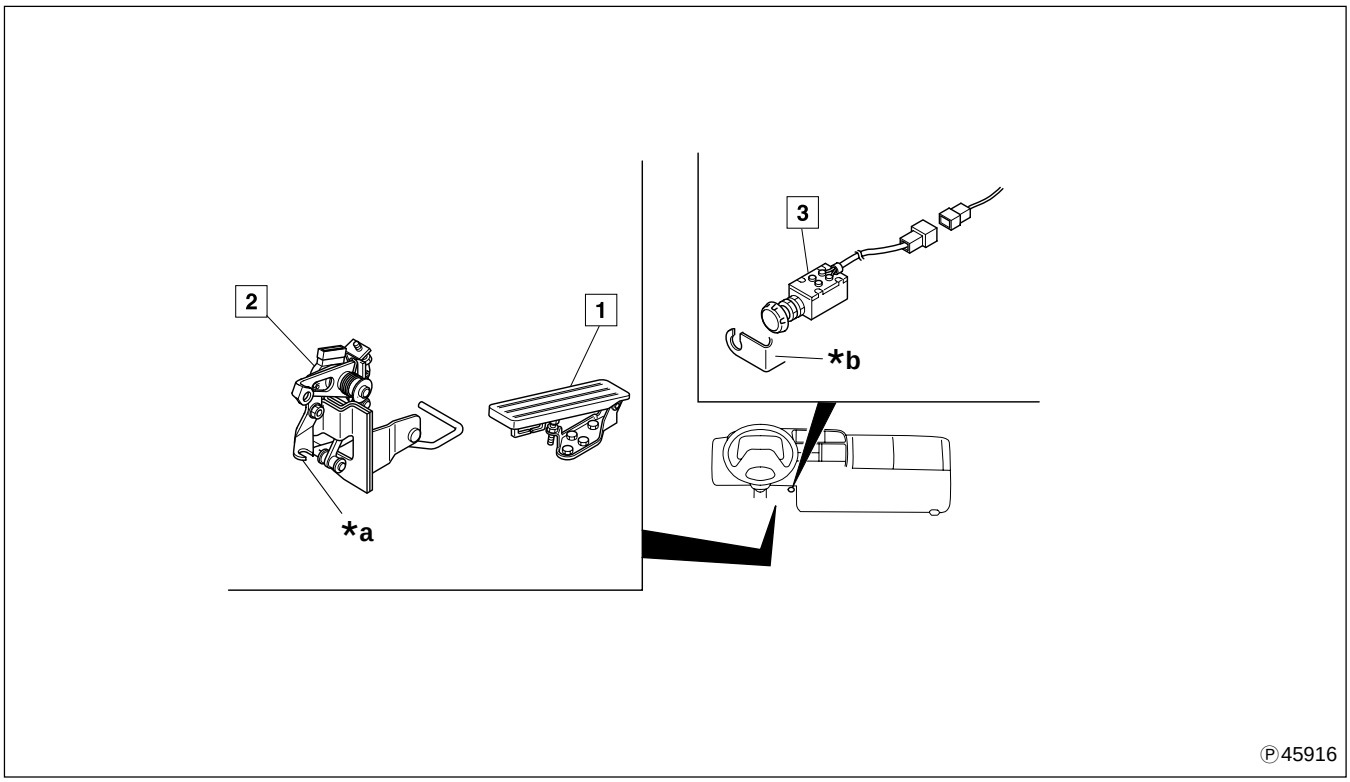
Use of an unsuitable fuel filter cartridge 1 can lead to fuel leaks and fires. Be sure to use a genuine filter.

CAUTION ⚠

To prevent injection failures, keep dust and dirt out of the fuel filter cartridge 1 and the fuel pipe.

- To fit the fuel filter cartridge **1**, turn it until the gasket **C** touches seal surface of the fuel filter head **2**. Be sure to turn the filter by hand clockwise.
  Then, tighten the filter by 3/4 turn.
- Bleed all air out of the fuel system. 🕮 P13A-7
- After fitting the filter, start the engine and check that no fuel leakage occurs.

M E M O



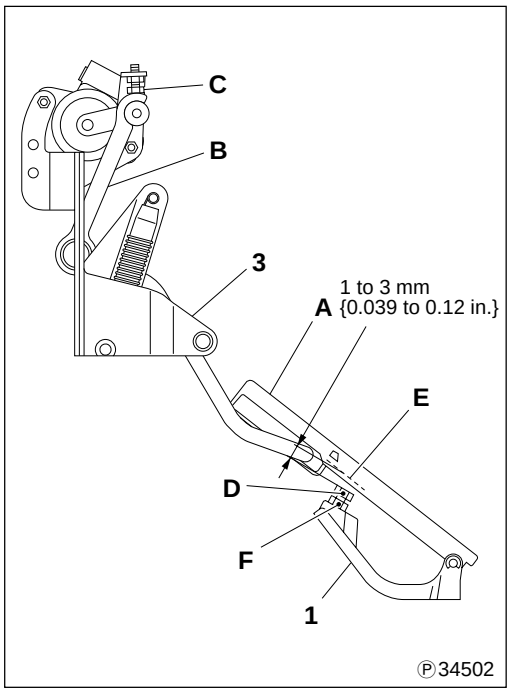
● **Removal sequence**

1 Accelerator pedal assembly 🕮 P13A-12
2 Accelerator pedal position sensor assembly 🕮 P13A-13
3 Emergency engine stop switch Gr 13EA

***a :** Lever and bracket assembly
***b :** Bracket

● **Installation sequence**

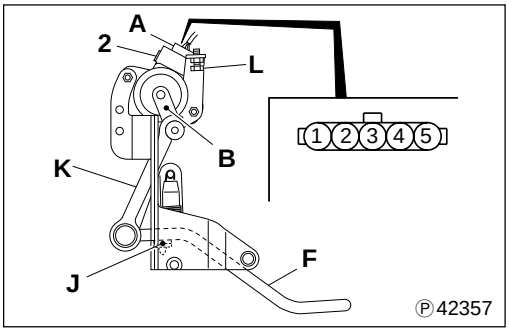
Follow the removal sequence in reverse.



◆ Service procedure

1 **Installation of accelerator pedal assembly**

- Fit the accelerator pedal assembly **1** onto the accelerator pedal position sensor assembly **3**.
- Depress the accelerator pedal **A** until the accelerator control extension **B** touches the stopper bolt **C** of the accelerator pedal position sensor assembly **3**.
- Check that the clearance between the stopper bolt **D** and the stopper bolt contact surface **E** of the accelerator pedal **A** is as shown in the illustration.
- Adjust the stopper bolt **D**, if necessary, to achieve the illustrated clearance. Lock the stopper bolt with the nut **F** after adjustment.



2 **Inspect the accelerator pedal position sensor**

[Inspection]

- Set the starter switch to ON.
- Measure the output voltage of the accelerator position sensor **2** from the back side of harness connector **A** according to the following table.

		Accelerator Position Sensor I		Accelerator Position Sensor II		Accelerator Switch	
		②	①	②	⑤	②	③
Lever **B** position		⊕	⊖	⊕	⊖	⊕	⊖
Standard value	Idling position **C**	0.85±0.1 V		0.85±0.1 V		4V or more	
	Accelerator operating position **D**	1.0±0.24 V		1.0±0.24 V		1V or less	
	Full load position **E**	4.0±0.1 V		4.0±0.1 V			

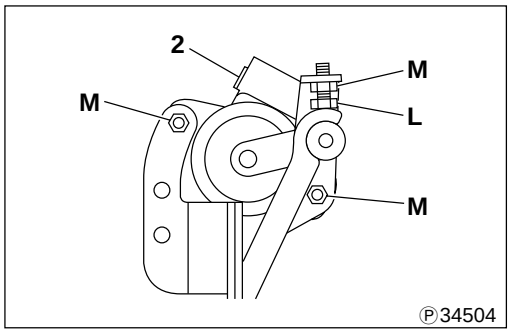
◯——◯ : There must be continuity between the pins.
⊕——⊖ : Polarity when voltage is measured.

C : Where accelerator control arm **F** is in contact with stopper **J**.

D : Where voltage across pins ② and ③ is reduced to 1V or less by slowly depressing the accelerator pedal.

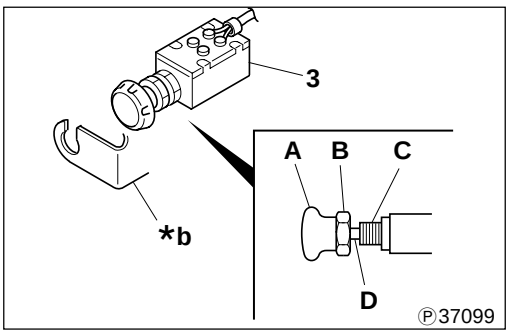
E : Where accelerator control extension **K** is in contact with stopper bolt **L**.

- If the output voltage is out of the standard value range, adjust by the following procedures.



[Adjustment]

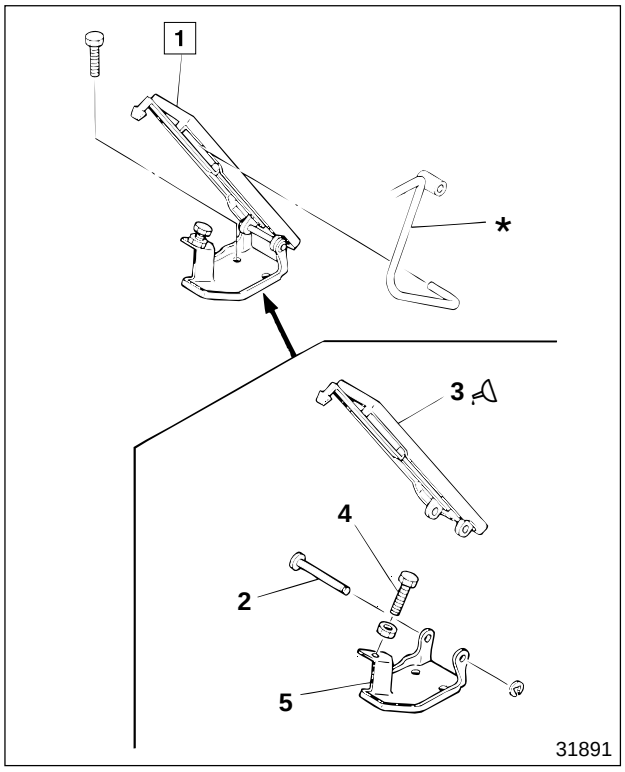
- Adjust the output voltage at the idling position **C** by loosening the screw **M** and moving the accelerator position sensor **2**.
  After the adjustment, retighten the screw.
- Adjust the output voltage at the full load position **E** by loosening the nut **M** and adjusting the stopper bolt **L**.
  After the adjustment, lock the bolt with the nut.



3 **Installation of emergency engine stop switch**

- Pull the knob **A** of the emergency engine stop switch **3** into the OFF position. Loosen the nut **B** to remove from the threaded end **C** of the switch.
- Set the shaft **D** in the bracket ***b**.
- Position the shaft **D** properly in the hole of the bracket ***b** and tighten the nut **B**.

Accelerator Pedal Assembly



● **Disassembly sequence**

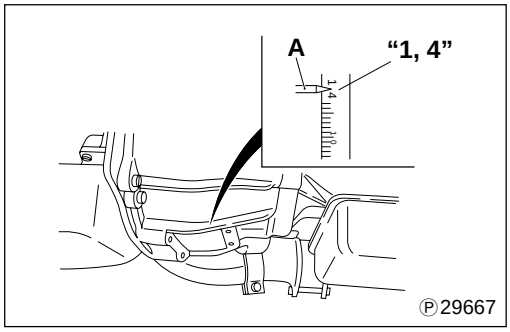
21	Bolt (sensor plate mounting)	4.9 {3.6, 0.5}	–

Lubricant

Location	Points of application	Specified lubricant	Quantity
20	O-ring	Engine oil	As required



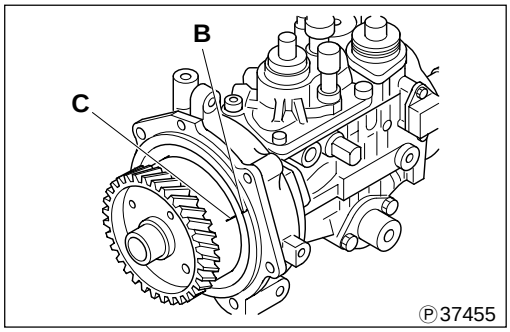
◆ Service procedure

23 Installation of injection pump assembly

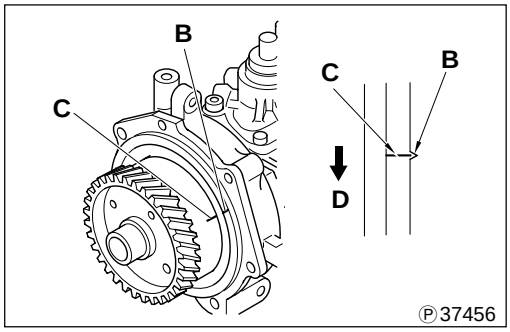
- Crank the engine clockwise to bring the cylinder No. 1 piston to the top dead center of compression stroke; align the pointer **A** in the torque converter housing inspection opening with the inscribed mark between "**1**" and "**4**" on the flywheel.
- Check that the rocker arms of both inlet and exhaust valves of the cylinder No. 1 move.
- If the rocker arms still hold the valves down, give the engine another turn.

NOTE

There are two kinds of marks inscribed in the flywheel, "I" and "IV" and "1" and "4". Do not confuse.



- Align the notch **B** in the flange plate with the inscribed mark **C** on the injection pump gear.



- Ascertaining the alignment between notch **B** and inscribed mark **C**, push in the injection pump assembly to install in position. At this time, the inscribed mark moves in the direction **D**.

21. Adjusting shim (for adjustment of 1st valve opening pressure)
22. Nozzle holder
23. Nozzle gasket

*: Cylinder head Gr 11A
⊗: Non-reusable part

● **Assembly sequence**

Follow the disassembly sequence in reverse.

CAUTION⚠

- **Take care not to touch the sliding part of the needle valve 14. It could be scratched or corroded in the worst case, resulting in the loss of airtightness between the valve and the nozzle 15.**
- **Under no circumstances change the needle valve 14 and nozzle 15 combination between cylinders.**
- **Dirt particles can seriously detract from engine performance. To prevent ingress of dirt, cover parts to which the injection nozzle assemblies 8 were fitted after removal.**

NOTE

Clean off any carbon deposits before disassembling, reassembling or adjusting the injection nozzle assembly 8. Before disassembly, check the pressure and shape of the spray and inspect the assembly for fuel leads. If no abnormality is apparent, do not commence disassembly.

Service standards

Unit: mm {in.}

Location	Maintenance item		Standard value	Limit	Remedy
8	Injection nozzle assembly injection pressure (valve opening pressure)	1st valve opening pressure	$16.18\,^{+0.98}_{0}$ MPa $\{2346\,^{+142}_{0}$ psi, $165\,^{+10}_{0}$ kgf/cm$^2\}$	–	Adjust
		2nd valve opening pressure	20.10±0.49 MPa {2915±71 psi, 205±5 kgf/cm^2}	–	
–	Prelift		0.08±0.01mm {0.0031±0.14in}	–	Adjust
–	Needle valve lift		$0.25\,^{+0.03}_{-0.02}$ $\{0.0098\,^{+0.0012}_{-0.00079}\}$	–	Adjust

Tightening torques

Unit: N·m {ft.lbs, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
1	Union nut (injection pipe mounting)	38.2 {28, 3.9}	–
2	Eyebolt (leak-off pipe (nozzle side) mounting)	29.4 {22, 3.0}	–
4	Eyebolt (leak-off pipe (head side) mounting)	20.6 {15, 2.1}	–
6	Bolt (injection nozzle assembly mounting)	14.7 {11, 1.5}	–
9	Retaining nut	25 to 34 {18 to 25, 2.5 to 3.5}	–

Special tool

Location	Tool name	Part No.	Application
–	Nozzle Cleaning Tool	***105789-0010**	Cleaning injection nozzle assemblies
–	Tool Set	*95093-00040	Disassembly, assembly and adjustment of injection nozzle
–	*1 Attachment Measure	*95093-10300	Measurement of prelift
–	*1 Base	*95093-10230	Assembly of injection nozzle
–	Master Spring Seat	*95093-10330	Adjustment of 2nd valve opening pressure

* : DENSO product number
*1 : Component of Tool Set (95093-00040)

◆ Service procedure

● Inspection before disassembly

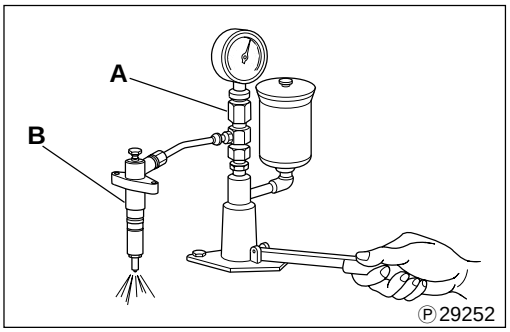
Fit the injection nozzle assembly **8** onto the nozzle tester **A** ready for inspection.

WARNING ⚠

Do not touch the spray that comes out of the nozzle.

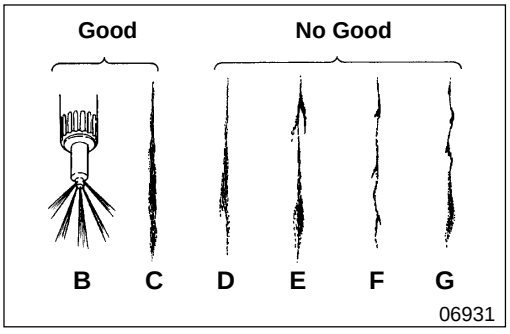
NOTE

Before commencing inspection, operate the lever on the nozzle tester A two or three times to bleed all air out of the arrangement.



(1) Checking valve opening pressure

- Push down the lever on the nozzle tester **A** at a rate of 1 to 2 seconds per stroke. The pressure gauge reading will gradually rise, then the needle will suddenly deflect. Note the pressure when the needle starts to deflect.
- If the measurement is out of specification, disassemble the nozzle, clean it and make adjustments by changing the shims **17**, **21**.
- If the measurement is still out of specification after adjustment, replace the injection nozzle assembly **8**.

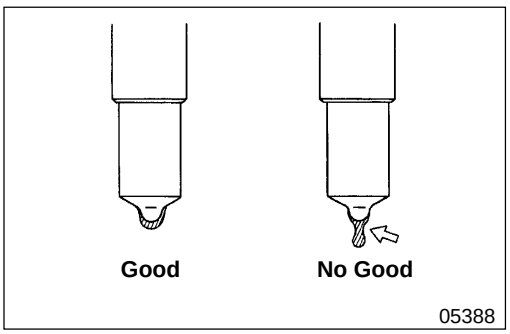


(2) Inspecting spray condition

- Pump the lever on the nozzle tester **A** at a rate of about 1 to 2 strokes per second and maintain a continuous spray.

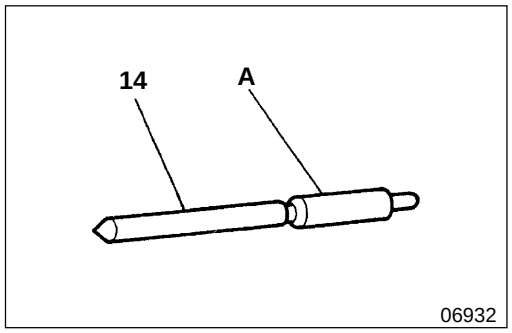
  B : Even spray from all five injection orifices (Good)
  C : Even and symmetrical spray (Good)
  D : Asymmetrical spray (No Good)
  E : Branched spray (No Good)
  F : Thin spray (No Good)
  G : Irregular spray (No Good)

- If the spray is unsatisfactory, disassemble and clean the injection nozzle assembly **8**, then inspect the spray again. If the spray is still unsatisfactory, replace the injection nozzle assembly.
- Check that no fuel drips from the nozzle after the spray is complete.



(3) Inspecting for oil-tightness and leaks

- Slowly increase the nozzle pressure to the pressure below the specified 1st valve opening pressure by 1.96 MPa {285 lbf/in^2, 20 kgf/cm^2}. Maintain this pressure for 10 seconds and check that no fuel drips from the end of the nozzle.
- If the injection nozzle assembly **8** appears defective, disassemble and clean it, then inspect it again. If the injection nozzle assembly still appears defective, it must be replaced.

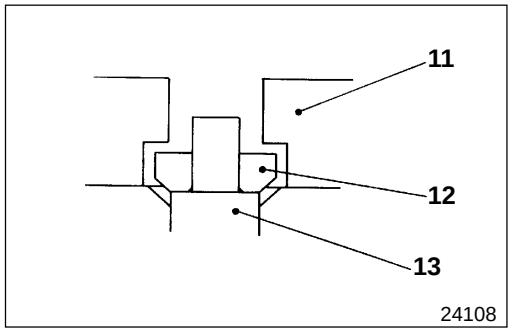


8 **Injection nozzle assembly**

[Disassembly]

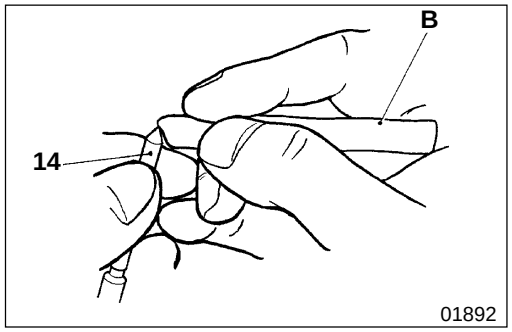
CAUTION ⚠

- **Never touch the sliding part A of the needle valve 14.**
- **Never change the needle valve 14 and nozzle 15 combination on each cylinder.**



[Assembly]

Assemble the tip packing **11** and the washer **12** (for adjustment of needle valve lift) in the illustrated directions.



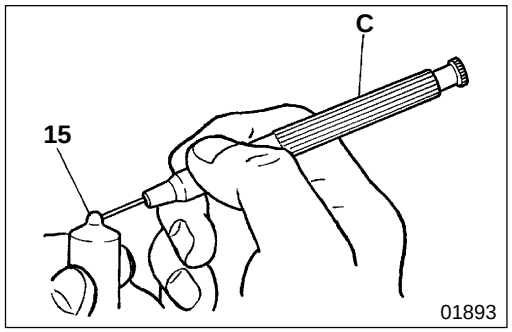
[Cleaning]

Wash the needle valve **14** and nozzle **15** in diesel fuel, then use the Cleaning Tool to remove any carbon deposits in accordance with the following procedure.

- Remove carbon from the end of the needle valve **14** using the Cleaning Bar **B** of the Cleaning Tool.

CAUTION ⚠

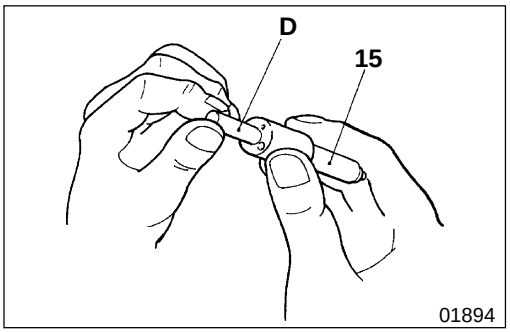
Do not use a wire brush or any hard metallic object for cleaning.

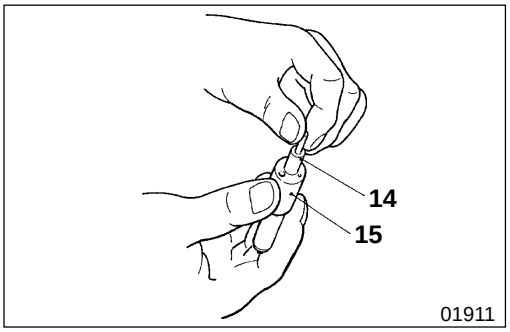


- Remove carbon from the injection orifice of the nozzle **15** using the Cleaning Needle **C** of the Cleaning Tool. Insert the Cleaning Needle and rotate it to remove carbon.

  Cleaning needle diameter: 0.20 mm {0.0079 in.} or smaller

INJECTION NOZZLE





- Clean the seat of the nozzle **15** using the Cleaning Scraper **D** of the Cleaning Tool.
- To remove burned and hardened carbon, use FUSO Carbon Remover.

[Inspection]

- Wash the needle valve **14** and nozzle **15** in diesel fuel, then fit them together.
- Pull up the needle valve **14** by approximately 1/3 of its entire stroke, then check that it drops under its own weight. Repeat this test several times, turning the needle valve each time.
- If the needle valve **14** does not drop as required, wash it in diesel fuel and carry out this test again. If the needle valve is still defective, replace the needle valve and nozzle **15** as a set.

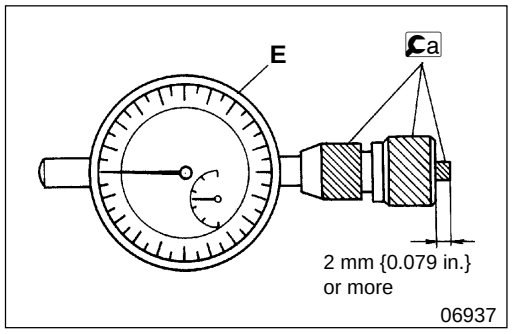
[Adjustment]

During reassembly, make adjustments in the sequence shown below.

CAUTION

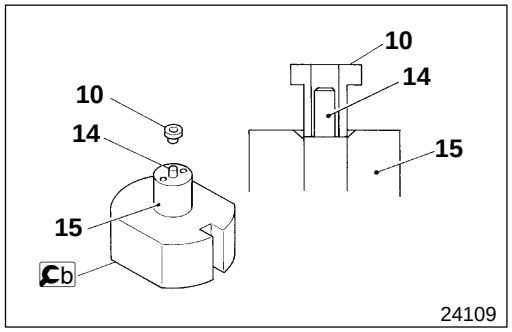
- **Before making adjustments, wash all parts in diesel fuel and ensure that they are free of dirt and other foreign material.**
- **Do not touch the sliding surfaces of the needle valve 14.**

- Check needle valve full lift
- Check prelift
- Adjust 2nd valve opening pressure
- Adjust 1st valve opening pressure

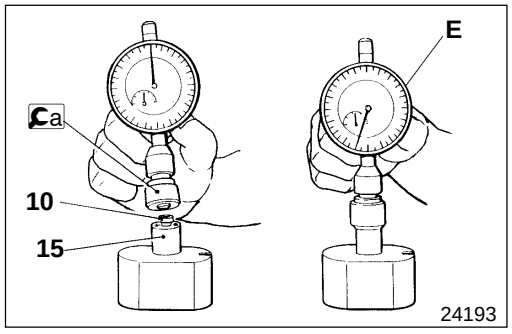


● **Checking needle valve full lift**

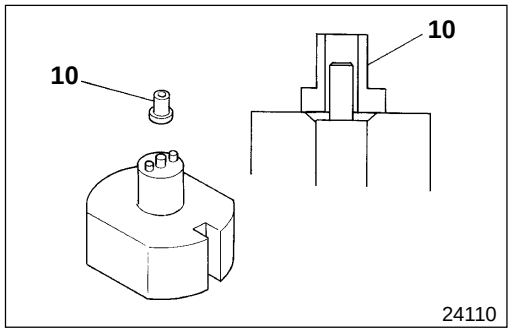
- Set the a Attachment Measure to a dial gauge **E**.



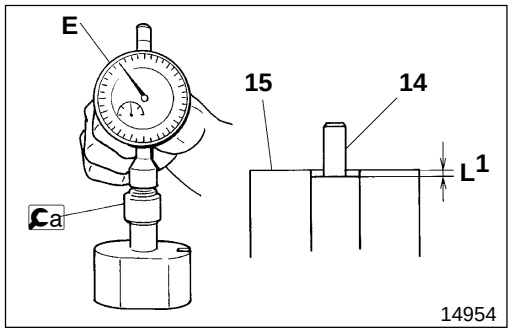
- Mount the nozzle **15** on the b base, with the needle valve **14** and spring seat **10** (for adjustment of pre-lift) fitted to the nozzle in that order.



- Fit the a Attachment Measure onto the nozzle **15**.
- Zero the dial gauge **E**.

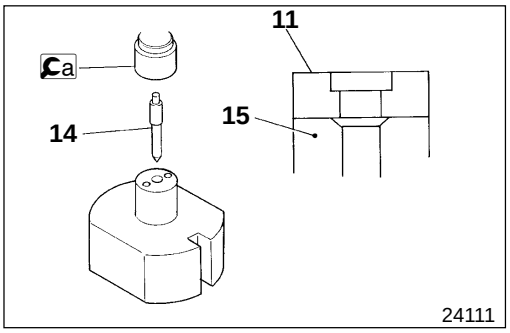


- Remove the a Attachment Measure. Remove the spring seat **10** (for adjustment of pre-lift) and refit it to the nozzle upside down.

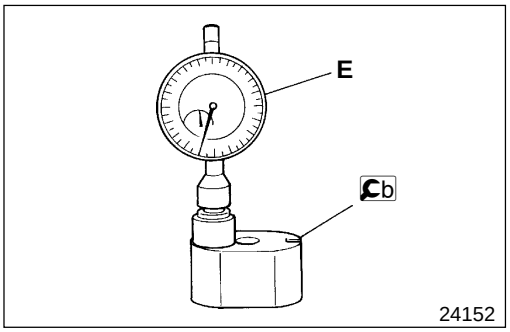


- Fit the a Attachment onto the nozzle **15** again, and read the dial gauge **E**. The reading should be the illustrated dimension L^1.

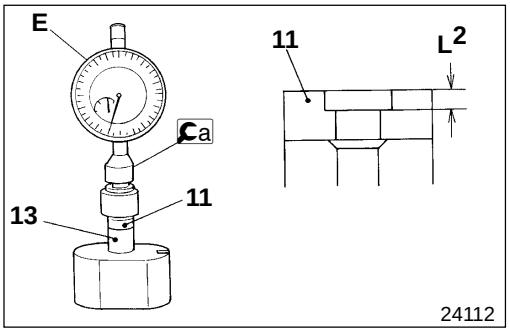
INJECTION NOZZLE



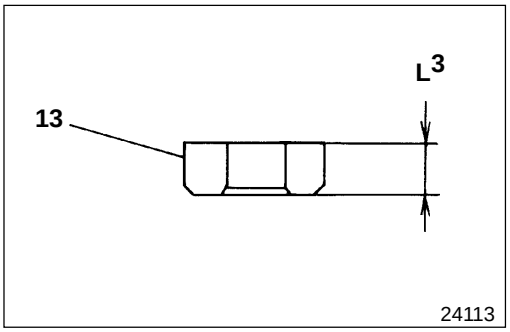
- Remove the a Attachment Measure and the needle valve **14**. Fit the tip packing **11** to the nozzle **15** as shown.



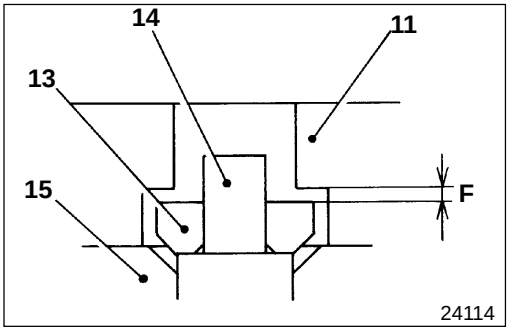
- Zero the dial gauge **E** on the b base.



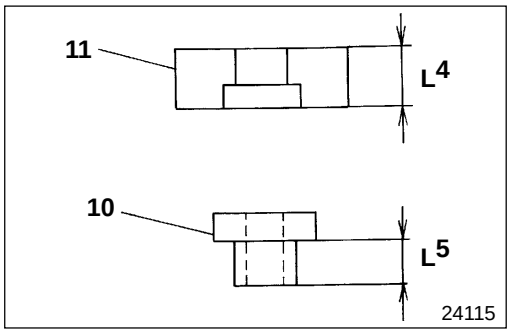
- Fit the a Attachment Measure to the tip packing **11**, and read the dial gauge **E**.
  The reading should be the illustrated dimension L^2.



- Measure the thickness L^3 of the washer **13** (for adjustment of needle valve lift).

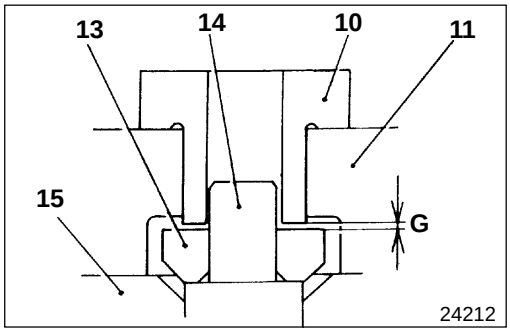


- Calculate the maximum lift **F** of the needle valve **14** from the measurements L^1, L^2 and L^3 as follows.
  Maximum lift **F** = $L^1 + L^2 - L^3$
- If the calculated value is out of specification, make the necessary adjustment by changing the washer **13** (for adjustment of needle valve lift).
  Washers **13** are available in the following thicknesses (L^3):
  2.40, 2.425, 2.45, 2.475, 2.50 mm {0.094, 0.095, 0.096, 0.097, 0.098 in.} (5 sizes)

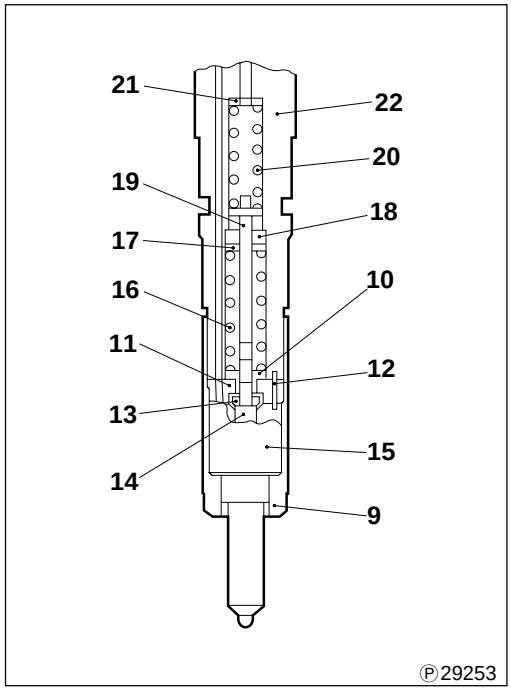


● **Adjusting pre-lift**

- Measure the thickness L^4 of the tip packing **11**.
- Measure the thickness L^5 of the spring seat **10 (**for adjustment of pre-lift).



- Calculate the pre-lift **G** from the measurements L^1, L^3, L^4 and L^5 as follows.
  Pre-lift **G** = $L^4 - L^5 - L^3 + L^1$
- If the calculated value is out of specification, make the necessary adjustment by changing the spring seat **10** (for adjustment of pre-lift).
  Spring seats **10** are available in the following thicknesses (L^5):
  2.59 to 2.80 mm {0.101 to 0.110 in.} (22 sizes at steps of 0.01 mm {0.00039 in.})



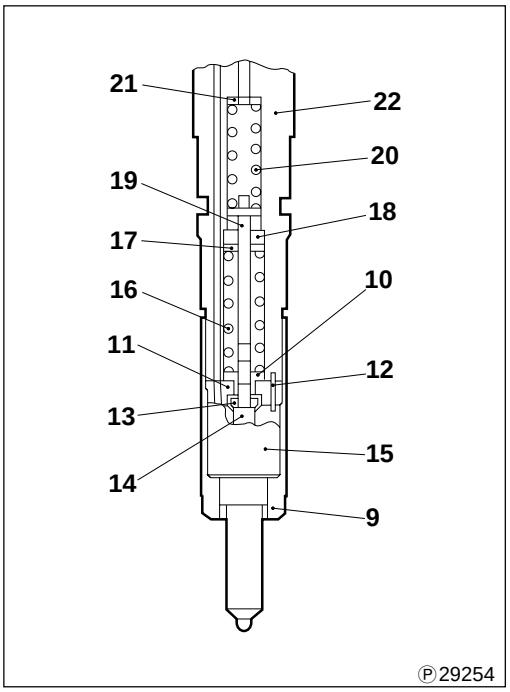
● **Adjusting 2nd valve opening pressure**

- Assemble parts to the nozzle holder **22** as shown. Fit the SC Master Spring Seat in the place of the spring seat **10** (for adjustment of pre-lift).
- Tighten the retaining nut **9** to the specified torque.
- Fit the nozzle assembly onto the nozzle tester and measure the 2nd valve opening pressure.

CAUTION ⚠

Never touch the spray that comes out of the nozzle.

- If the reading is out of specification, make the necessary adjustment by changing the adjusting shim **17** (for adjustment of 2nd valve opening pressure). Adjusting shims **17** are available in the following thicknesses.
  0.70 to 2.15 mm {0.028 to 0.085 in.} (30 sizes at steps of 0.05 mm {0.002 in.})
  0.975 to 1.775 mm {0.038 to 0.070 in.} (17 sizes at steps of 0.05 mm {0.002 in.})
- A difference of 0.025 mm {0.00098 in.} in the thickness of the adjustment shim **17** changes the 2nd valve opening pressure by 345 kPa {50 psi, 3.5 kgf/cm^2}.



● **Adjusting 1st valve opening pressure**

- Assemble parts to the nozzle holder **22** as shown.
- Tighten the retaining nut **9** to the specified torque.
- Fit the nozzle assembly onto the nozzle tester and measure the 1st valve opening pressure.

CAUTION ⚠

Never touch the spray that comes out of the nozzle.

- If the reading is out of specification, make the necessary adjustment by changing the adjusting shim **21** (for adjustment of 1st valve opening pressure).

  Adjusting shims **21** are available in the following thicknesses:
  0.8 to 2.0, 2.05, 2.075 to 2.2 mm {0.031 to 0.079, 0.080, 0.081 to 0.087 in.} (56 sizes at steps of 0.025 mm {0.00098 in.})
  A difference of 0.025 mm {0.00098 in. } in the thickness of the adjusting shim **21** changes the 1st valve opening pressure by 345 kPa {20 psi, 3.5 kgf/cm^2}.

SPECIFICATIONS

Injection Pump

Item	Specifications
Manufacturer	BOSCH AUTOMOTIVE SYSTEMS
Body model	MD-TICS (Pre-stroke control type)
Governor type	RED-III electronically controlled governor
Feed pump model	KD
Automatic timer model	SPG mechanical type

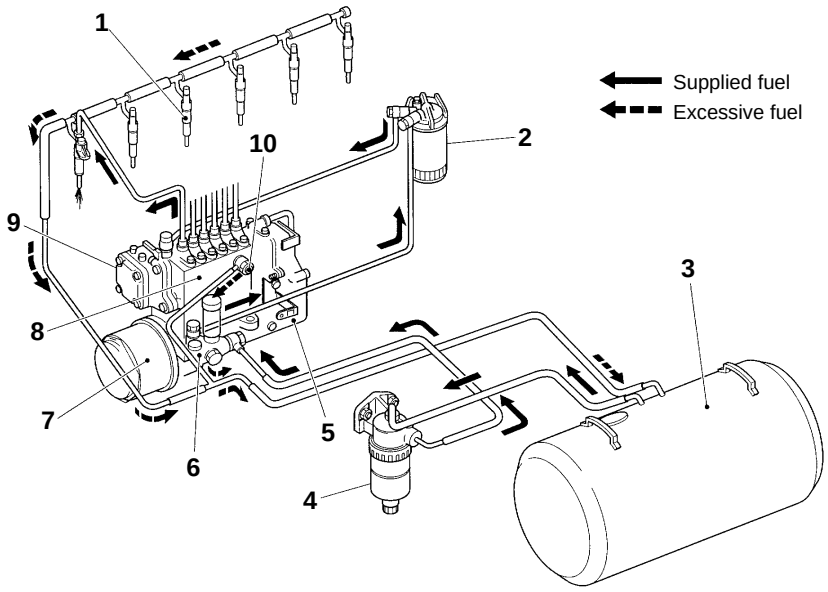
Injection Nozzle

Item	Specifications
Manufacturer	BOSCH AUTOMOTIVE SYSTEMS
Model and type	DLLA hole type 1-spring nozzle
Nozzle orifice quantity	5
Orifice diameter mm {in.}	ø0.23 {0.0091}

Fuel Filter

Item	Specifications
Filter type	Spin-on type

Fuel System (Flow of Fuel)

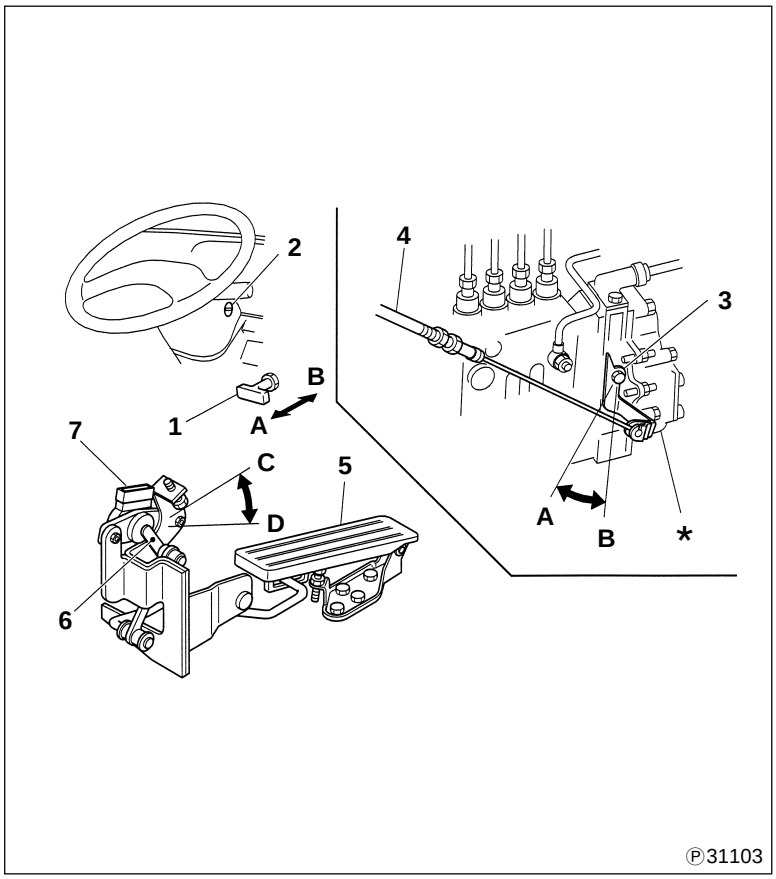


Ⓟ31102

1 Injection nozzle
2 Fuel filter
3 Fuel tank
4 Water separator
5 Governor
6 Feed pump
7 Automatic timer
8 Injection pump
9 Pre-stroke actuator
10 Overflow valve

Fuel in fuel tank **3** is sucked up by feed pump **6** which is driven by the cam action of injection pump **8** and is filtered through fuel filter **2** which removes dirt and other foreign particles.
Filtered fuel is sent to the injection pump where the fuel pressure is boosted and injected through injection nozzle **1** into the combustion chamber.
When fuel pressure is higher than the specified value, overflow valve **10** opens to let the fuel return to the fuel tank.

Engine Control



1 Emergency engine stop button
2 Starter switch
3 Engine stop lever
4 Engine stop cable
5 Accelerator pedal assembly
6 Lever
7 Accelerator pedal position sensor

***** : Electronic governor

A : Engine-stop position
B : Engine start-up position
C : Full-load position
D : Idling position

● **Accelerator switch**

The accelerator switch is integrated in the accelerator pedal position sensor **7**. It detects the pressing of accelerator pedal assembly **5**.

● **Accelerator pedal position sensor**

Accelerator pedal position sensor **7** detects the movement of accelerator pedal assembly **5**, and sends an electric signal to the engine electronic control unit. Lever **6** of the accelerator pedal position sensor is constantly pulled by the return spring towards idle position **D**.

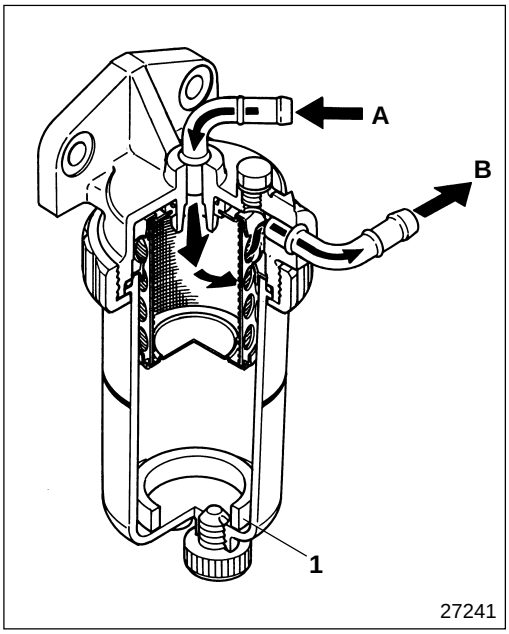
● **Emergency engine stop button**

In normal condition, turn starter switch **2** to the ACC position to electrically shut down the engine operation.
In the case the engine does not stop when the starter switch is turned to the ACC position due to malfunction of the electronic governor system or other cause, stop the engine by pulling emergency engine stop button **1** to move stop lever **3** of electronic governor ***** to engine stop position **A**.

CAUTION ⚠

When the engine is stopped by pulling engine stop button 1, set starter switch 2 to the ACC or LOCK position to reset the control unit computer.
Restarting the engine without resetting the computer results in unstable engine speed control.

Water Separator

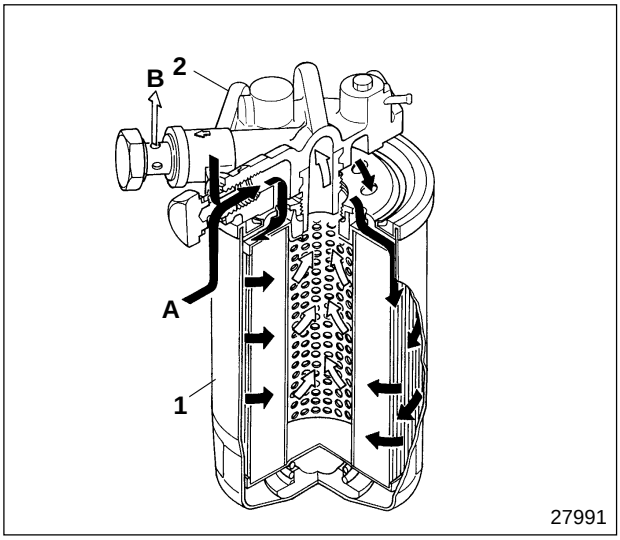


1 Water level ring

A : From fuel tank
B : To feed pump

The water separator is installed between the fuel tank and the feed pump. Any water present in the fuel is separated by the baffle plate and the screen assembly.

Fuel Filter

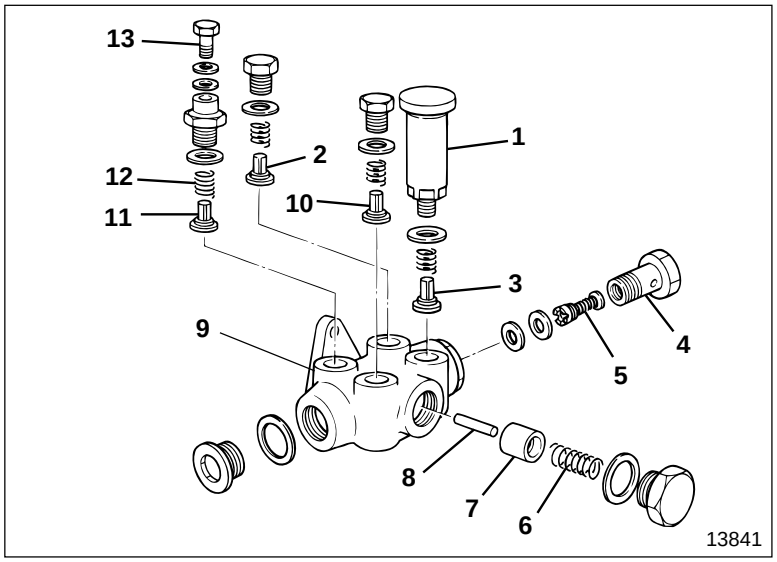


1 Fuel filter
2 Fuel filter head

A : From feed pump
B : To injection pump

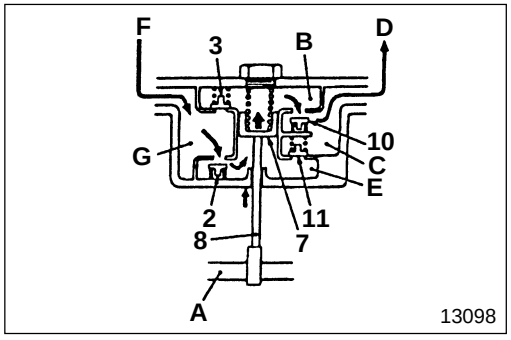
Pressurized fuel is delivered from the feed pump of the injection pump to the fuel filter which separates water from the fuel. Dirt and other foreign particles are removed from the fuel by fuel filter **1**.

Feed Pump

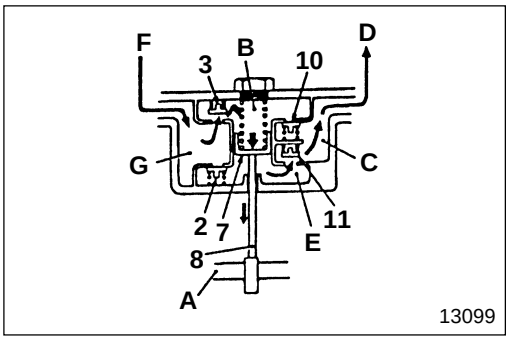


1 Priming pump
2 Check valve
3 Check valve
4 Eye bolt on fuel inlet side
5 Gauze filter
6 Piston spring
7 Piston
8 Push rod
9 Feed pump housing
10 Check valve
11 Check valve
12 Check valve spring
13 Eye bolt on fuel outlet side

- The feed pump is a double-action type pump which, with four check valves operating, sucks and discharges fuel during both strokes of pistons **7**.
- Push rod **8** makes contact with the injection pump camshaft directly, moving piston **7**.
- Priming pump **1** can be manually operated, when the injection pump is not operating, to suck up fuel and thus can be used for air bleeding.
- Gauze filter **5** eliminates large foreign particles from the fuel sucked up from the fuel tank to prevent clogging of the feed pump. This gauze filter must be cleaned with diesel fuel periodically.

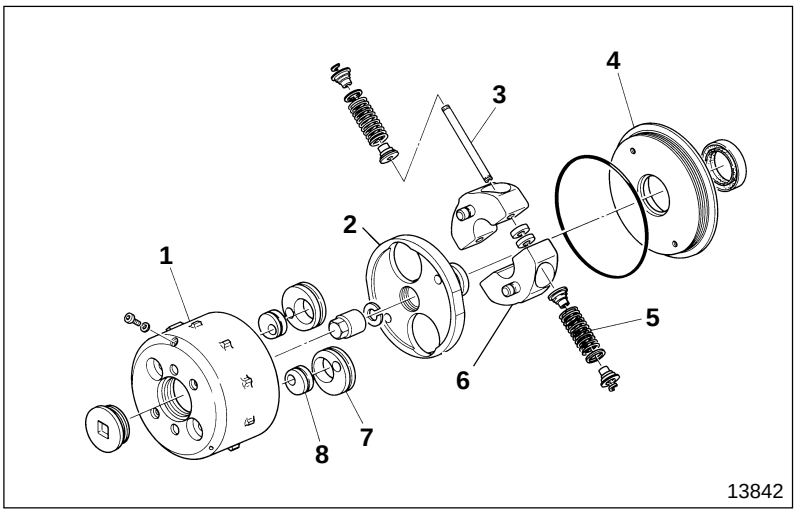


The rotation of injection pump camshaft **A**, pushes up push rod **8** and piston **7**, and the pressure in inner chamber **B** increases. This closes check valve **3**, and check valve **10** opens to let the fuel in inner chamber **B** flow through outer chamber **C** to fuel filter **D**.
When the pressure in inner chamber **E** decreases, check valve **11** closes, and check valve **2** opens to let fuel flow from fuel tank **F** through outer chamber **G** to inner chamber **E**.



When injection pump camshaft **A** rotates further, it pushes down push rod **8** and piston **7**, and the pressure in inner chamber **E** increases. This closes check valve **2**, and check valve **11** opens to let the fuel in inner chamber **E** flow through outer chamber **C** to fuel filter **D**.
When the pressure in inner chamber **B** decreases, check valve **10** closes, and check valve **3** opens to let fuel from fuel tank **F** flow through outer chamber **G** to inner chamber **B**.

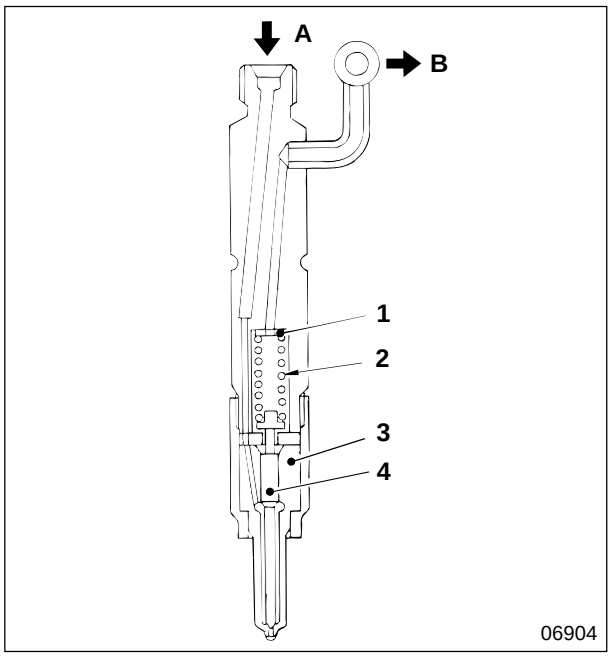
Automatic Timer



1 Timer housing
2 Timer holder
3 Pilot pin
4 Cover
5 Timer spring
6 Flyweight
7 Eccentric cam (Large)
8 Eccentric cam (Small)

- The mechanical type automatic timer changes fuel injection timing automatically when the engine revolution reaches the specified rate.
- The automatic timer controls the retard of fuel injection timing. The pre-stroke control unit controls the advance of fuel injection timing.

Injection Nozzle



1 Washer
2 Spring
3 Nozzle tip
4 Needle valve

A : From injection pump
B : To fuel tank

- As the pressure of the fuel delivered from the injection pump overcomes the repercussive force of spring **2**, needle valve **4** is pushed up to allow the fuel to spray out the opening at the tip of the nozzle.

- Injection pressure can be adjusted by increasing or decreasing the number of washers **1**.

ON-VEHICLE INSPECTION AND ADJUSTMENT

Checking and Adjusting Injection Timing

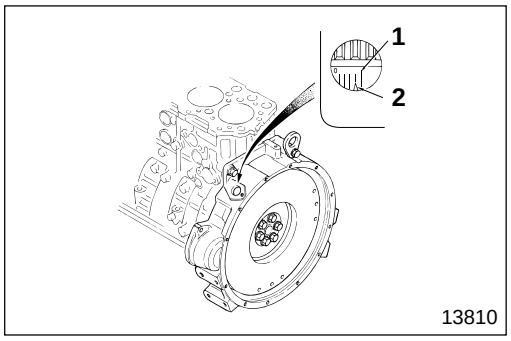
Service standards

Location	Maintenance item	Standard value	Limit	Remedy
—	Fuel injection timing (BTDC)	3°±0.5°	—	Adjust

Tightening torque

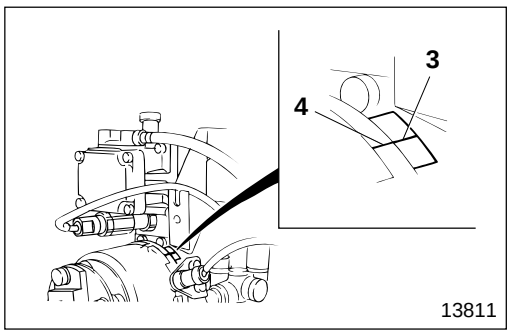
Unit : N·m {ft.lbs, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
5	Adjusting bolt	59 to 64 {43 to 47, 6 to 6.5}	—

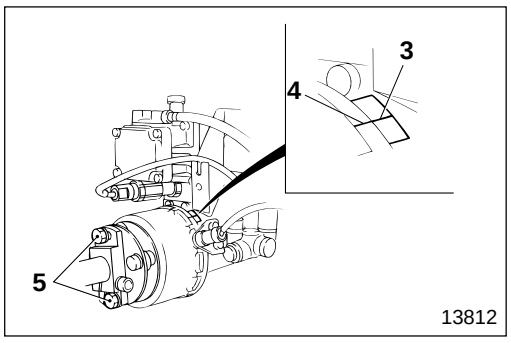


[Inspection]

- Turn the crankshaft more than 180° in the direction of engine rotation. Check if notch **1** on the flywheel and pointer **2** on the flywheel housing show the standard fuel injection timing.



- When pointer **3** on the injection pump and notch **4** on the automatic timer align, the fuel injection timing is standard.
- If the fuel injection timing is not standard, adjust as follows.



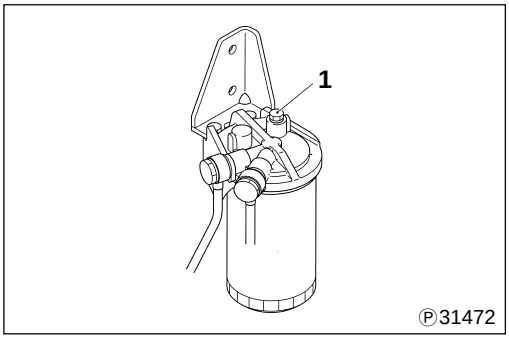
[Adjustment]

- Loosen adjusting bolts **5** and turn the automatic timer to align pointer **3** and notch **4**.
- Tighten adjusting bolts **5** at specified torque.
- Reinspect the fuel injection timing.

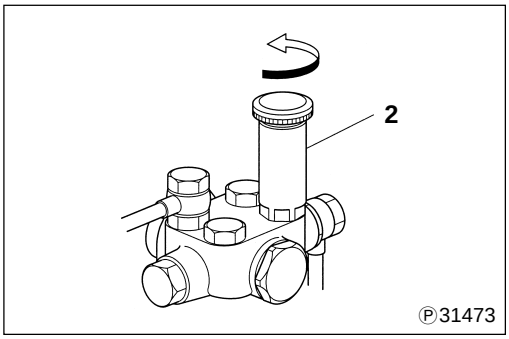
CAUTION ⚠

Do not loosen any bolts other than adjusting bolts 5.

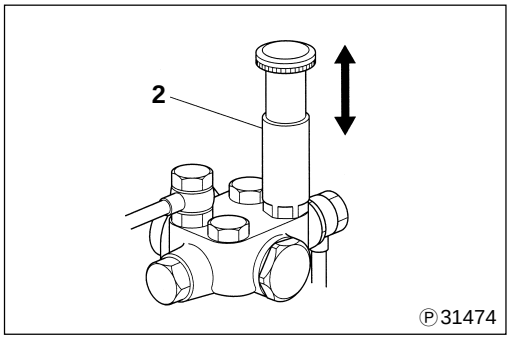
Bleeding Air from Fuel System



- Loosen the fuel filter air plug **1**.



- Turn the priming pump knob **2** counterclockwise until it pops up.
- Move the priming pump knob **2** up and down to feed fuel through the fuel filter.
- When fuel emerging from the fuel filter air plug **1** no longer contains air bubbles, tighten the air plug securely.

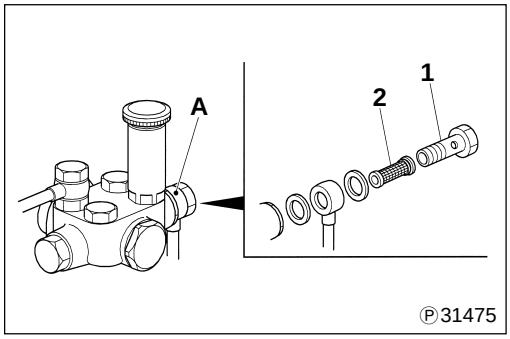


- Move the priming pump knob **2** up and down five or six more times. Then, press the knob down and screw it clockwise to lock it in position.
- Wipe up all spilled fuel, then start the engine.
- Check that no fuel leakage occurs.

WARNING⚠

- **Be sure to wipe up all spilled fuel. Unless it is wiped up, it could catch fire.**
- **Fuel is highly flammable. Keep it away from flames and sources of heat.**

Cleaning Gauze Filter



- Remove the eyebolt **1** from the suction port side **A** of the fuel feed pump.
- Remove the gauze filter **2** from the eyebolt **1**.
- Clean the gauze filter **2** in diesel fuel.
- Refit the gauze filter **2** and eyebolt **1** in the opposite order to that in which they were removed.
- Bleed all air out of the fuel system. 🕮 P13B-13
- Start the engine and check that no fuel leakage occurs.

WARNING⚠

- **To minimize the risk of fire, wipe up any spilled fuel.**
- **Fuel is highly flammable. Keep it away from flames and sources of heat.**
- **After refitting the gauze filter, check that no fuel leakage occurs.**

Replacing Fuel Filter

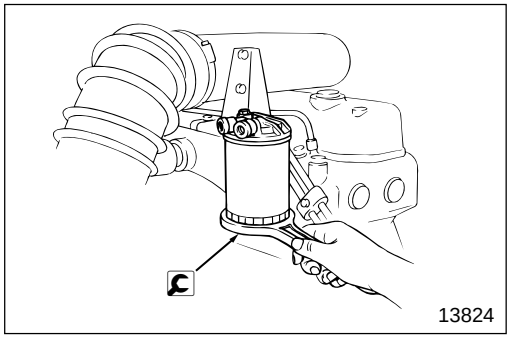
Lubricant

Location	Points of application	Specified lubricant	Quantity
1	Gasket between fuel filter and fuel filter head	Engine oil	As required

Special tool

Unit : mm {in.}

Location	Tool name and shape	Part No.	Application
1	Filter wrench  01882	MH061572	Fuel filter removal



13824

[Removal]

: Filter Wrench

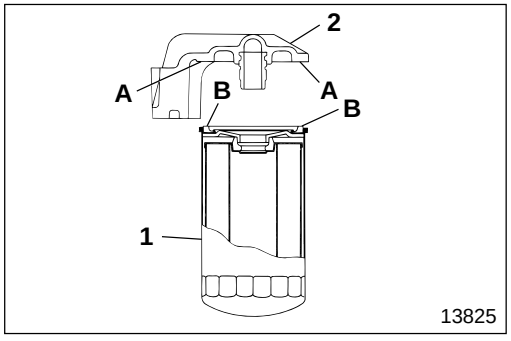
WARNING

- **Fuel is highly flammable. Keep it away from flames and sources of heat.**
- **To minimize the risk of fire, wipe up any spilled fuel.**

[Installation]

WARNING

Use of an unsuitable fuel filter 1 can lead to fuel leaks and fires. Be sure to use a genuine filter.



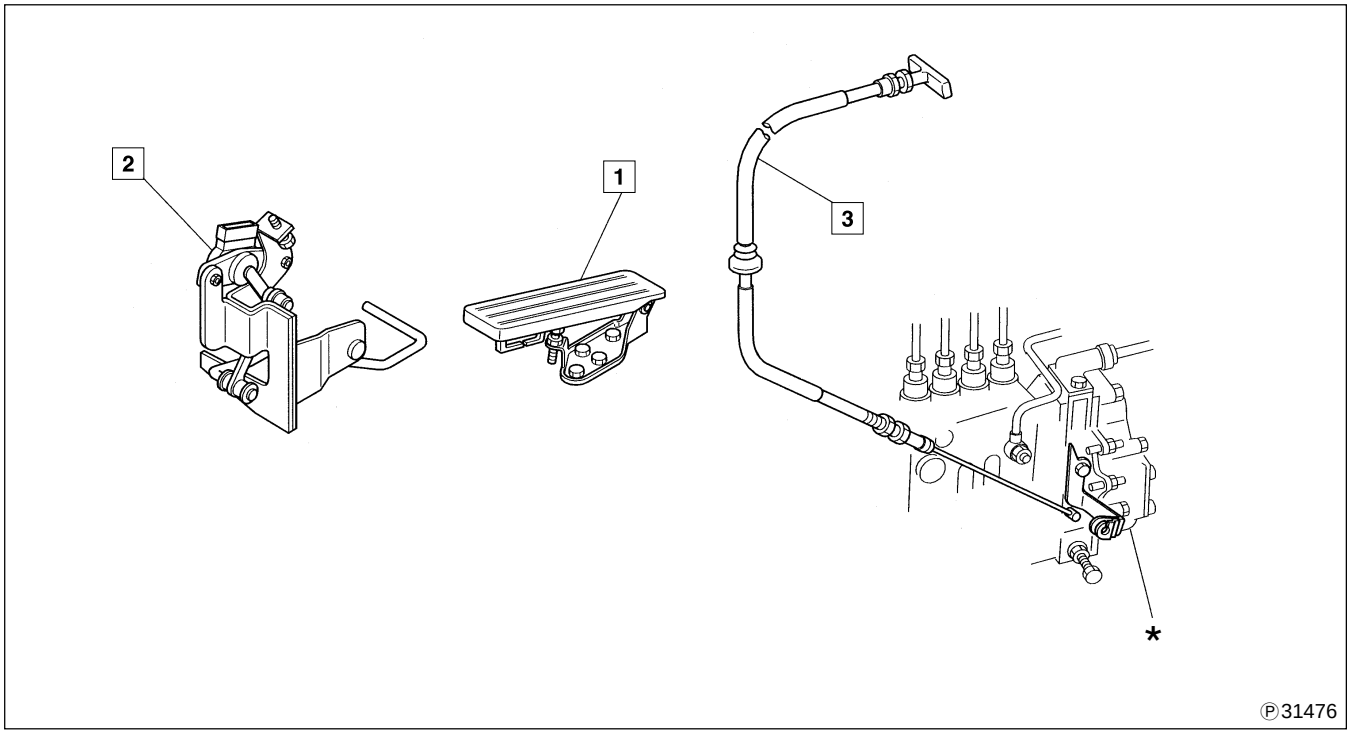
13825

- To fit the fuel filter **1**, turn it until the gasket **B** touches surface **A** of the fuel filter head **2**. Then, tighten the filter by 1 to $1\frac{1}{8}$ turn. Be sure to turn the filter by hand.
- Bleed all air out of the fuel system. P13B-13

WARNING

After fitting the fuel filter 1, start the engine and check that no fuel leakage occurs. Any leaking fuel could cause a fire.

M E M O



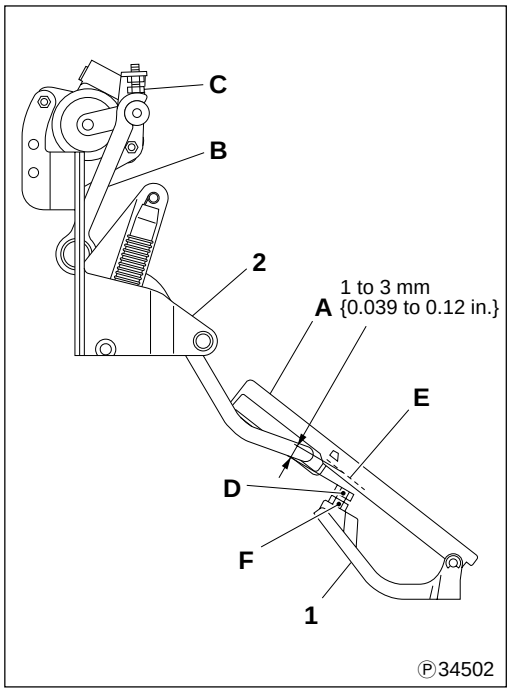
● **Removal sequence**

1 Accelerator pedal assembly
2 Accelerator pedal position sensor assembly
3 Emergency engine stop cable

***** : Injection pump assembly

● **Installation sequence**

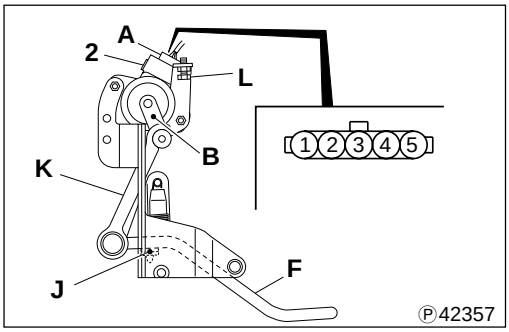
Follow the removal sequence in reverse.



◆ Service procedure

1 **Installation of accelerator pedal assembly**

- Fit the accelerator pedal assembly **1** onto the accelerator pedal position sensor assembly **2**.
- Depress the accelerator pedal **A** until the accelerator control extension **B** touches the stopper bolt **C** of the accelerator pedal position sensor assembly **2**.
- Check that the clearance between the stopper bolt **D** and the stopper bolt contact surface **E** of the accelerator pedal **A** is as shown in the illustration.
- Adjust the stopper bolt **D**, if necessary, to achieve the illustrated clearance. Lock the stopper bolt with the nut **F** after adjustment.



2 **Inspect the accelerator pedal position sensor**

[Inspection]

- Set the starter switch to ON.
- Measure the output voltage of the accelerator position sensor **2** from the back side of harness connector **A** according to the following table.

Lever **B** position		Accelerator Position Sensor I		Accelerator Position Sensor II		Accelerator Switch	
		②	①	②	⑤	②	③
		⊕	⊖	⊕	⊖	⊕	⊖
Standard value	Idling position **C**	0.85±0.1 V		0.85±0.1 V		4V or more	
	Accelerator switch operating position **D**	1.0±0.24 V		1.0±0.24 V		1V or less	
	Full load position **E**	4.15±0.1 V		4.15±0.1 V			

○——○ : There must be continuity between the pins.

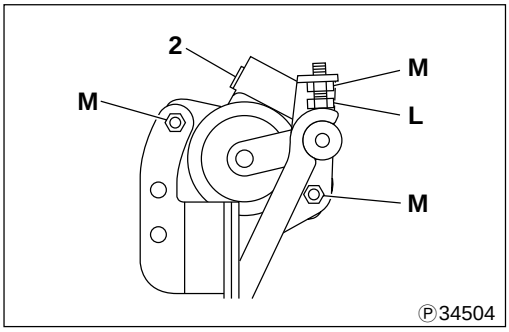
⊕ , ⊖ : Polarity when voltage is measured

C: Where accelerator control arm **F** is in contact with stopper **J**

D: Where voltage across pins ② and ③ is reduced to 1V or less by slowly depressing the accelerator pedal

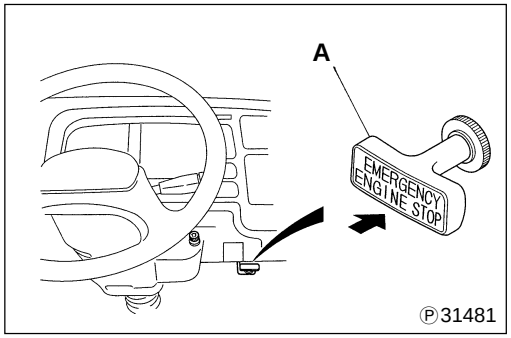
E: Where accelerator control extension **K** is in contact with stopper bolt **L**

- If the output voltage is out of the standard value range, adjust by the following procedures.



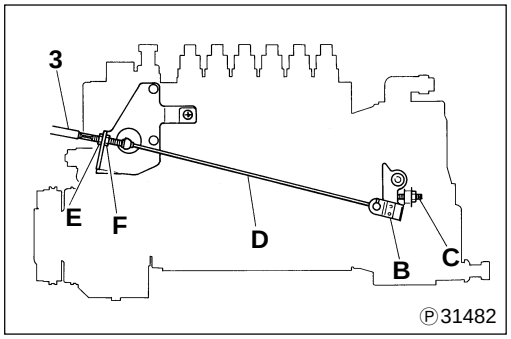
[Adjustment]

- Adjust the output voltage at the idling position **C** by loosening the screw **M** and moving the accelerator position sensor **2**.
  After the adjustment, retighten the screw.
- Adjust the output voltage at the full load position **E** by loosening the nut **M** and adjusting the stopper bolt **L**.
  After the adjustment, lock the bolt with the nut.



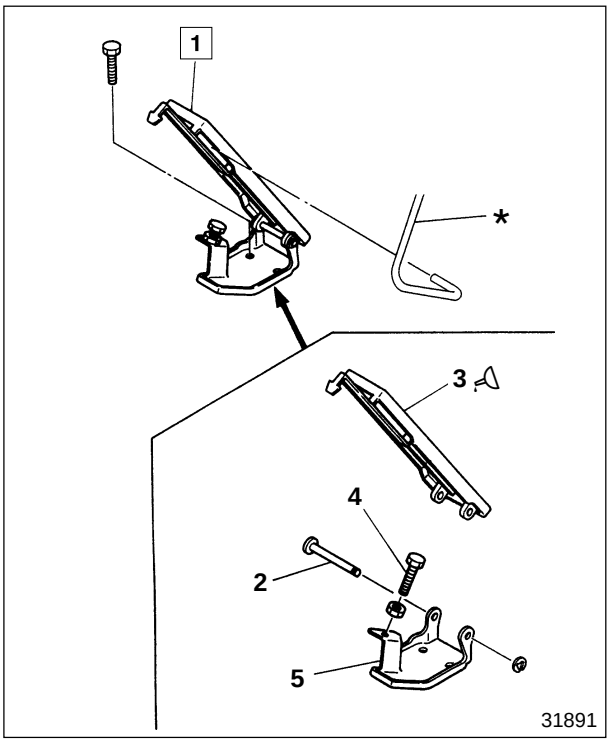
3 **Installation of emergency engine stop cable**

- Mount stop button **A** on emergency engine stop cable **3** and press the button firmly in position.



- With stop lever **B** of the governor contacting stopper bolt **C**, adjust nut **E** so that inner cable **D** of emergency stop cable **3** is taut. Then, tighten nut **F** to secure it in place.
- After installation, start the engine. Pull the stop button to make sure that the engine stops operating.

Accelerator Pedal Assembly



● **Disassembly sequence**

1 Accelerator pedal assembly
2 Clevis pin
3 Accelerator pedal
4 Stopper bolt
5 Accelerator pedal bracket

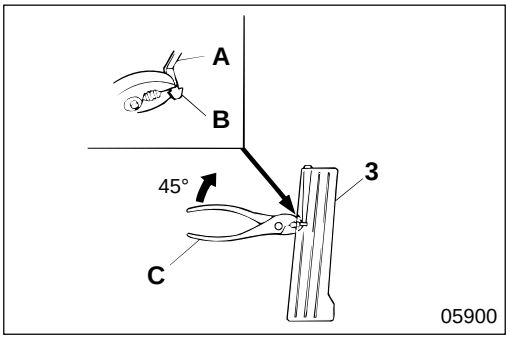
***** : Accelerator pedal position sensor assembly 🕮 P13B-20

● **Assembly sequence**

Follow the disassembly sequence in reverse.

Lubricant

Location	Points of application	Specified lubricant	Quantity
3	Slide-contacting surfaces of accelerator pedal and bracket	Chassis grease [NLGI No.1 (Ca soap)]	As required



◆ Service procedure

1 **Removal of accelerator pedal assembly**

Pinch hook **B** of stopper **A** of accelerator pedal **3** using pliers **C** and rotating approximately 45° pull out the stopper towards the front of the vehicle.

CAUTION ⚠

Take care not to damage stopper A itself during removal, do not pull it out too forcibly.

WARNING ⚠

- **Fuel ignites easily. Do not get it near flame or heat.**
- **Wipe up any spilled fuel because it can cause a fire.**

CAUTION ⚠

- **Be sure to protect all openings by covering them after removal of hoses and pipes because the engine performance is adversely affected if dirt and foreign particles enter injection pump assembly 26.**
- **Do not hold the control lever when lifting injection pump assembly 26. Also, do not remove the control lever because removal of the lever might cause poor performance of the pump.**
- **Do not remove injection pump bracket 28 unless it is faulty.**
- **Make sure you connect fuel hose *g at a high position because fuel in the fuel tank would leak out if the end of the fuel hose were at a position lower than the tank.**

● **Installation sequence**

Follow the removal sequence in reverse.

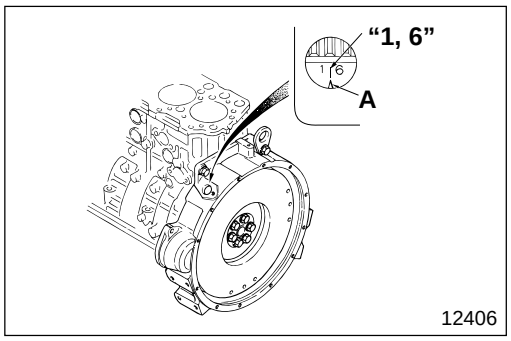
Special tools

Unit : mm {in.}

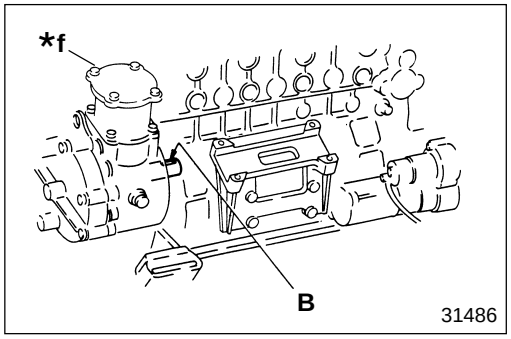
Location	Tool name and shape	Part No.	Application
28	Injection pump centering tool  14311	MH063336	Positioning of injection pump bracket

◆ Service procedure

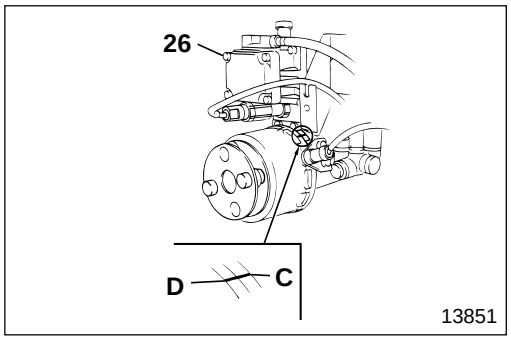


26 **Installation of injection pump assembly**

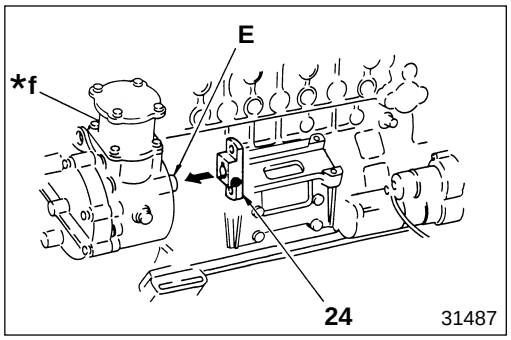
- Turn the engine to bring No.1 cylinder piston to top dead center in the compression cycle, and align mark "**1, 6**" of the flywheel with pointer **A** on the flywheel housing.



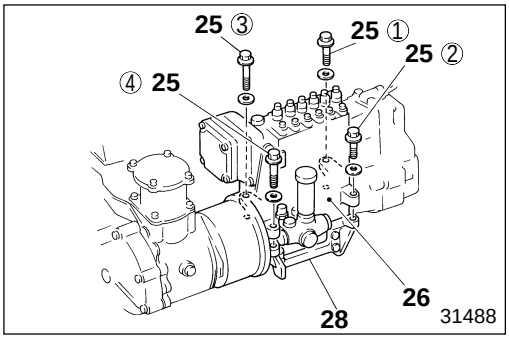
- In this state, make sure that keyway **B** in the crankshaft of injection pump drive case ***f** faces upward.
- If keyway **B** is not facing upward, turn the engine crankshaft by one turn.



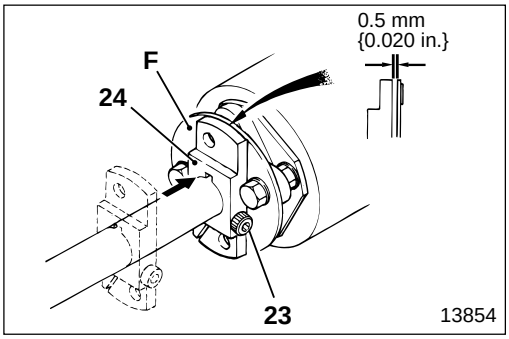
- Align pointer **C** on injection pump assembly **26** with notch **D** on the automatic timer.



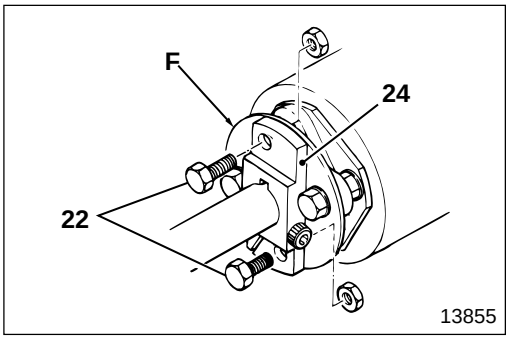
- Install driving coupling **24** to crankshaft **E** of injection pump drive case ***f** and place the driving coupling on the air compressor side.
- Install injection pump assembly **26** on the injection pump bracket.



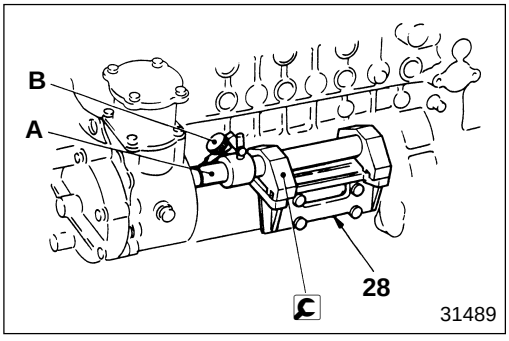
- Install injection pump assembly **26** on injection pump bracket **28**.
- Tighten bolts **25** in the order as illustrated at specified torque for primary tightening.
- Retighten bolts **25** in the order as illustrated at specified torque for secondary tightening.



- Move driving coupling **24** to adjust the clearance between the driving coupling and coupling plate **F** as illustrated, then tighten cotter bolt **23** at specified torque.



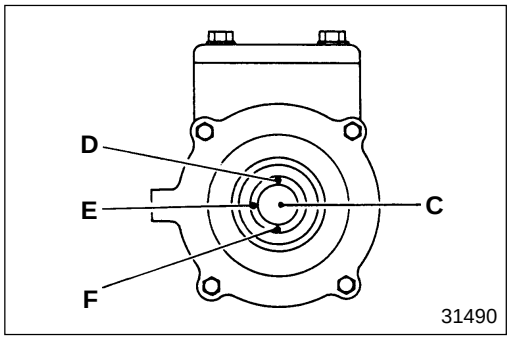
- Attach driving coupling **24** and coupling plate **F** using bolts **22** and tighten the bolts temporarily.
- In this state, adjust the fuel injection timing.
  Adjustment of fuel injection timing : P13B-12
  After adjusting the fuel injection timing, tighten bolts **22** at specified torque.



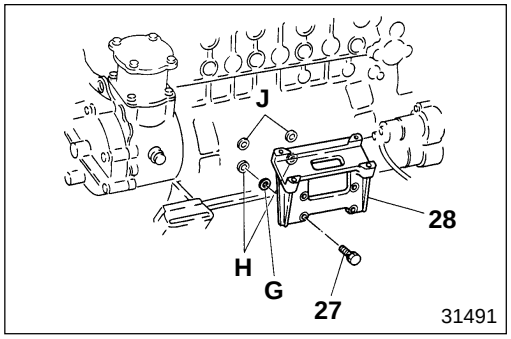
28 **Injection pump bracket**

[Inspection]

- Attach dial gauge **B** to arbor **A** of injection pump centering tool and adjust to gauge to zero setting.



- Slide dial gauge **B** toward injection pump drive case ***f** and measure the eccentricity of crankshaft **C** against arbor **A** at points **D**, **E** and **F**.
- If the measured value is higher than the standard value, adjust as follows.



[Adjustment]

- When the measured value at point **E** is higher than the standard value:
  Insert shims **G** into four points equally.
- When the measured value at point **D** is higher than the standard value:
  Insert shims **G** into lower side **H**.
- When the measured value at point **F** is higher than the standard value:
  Insert shims **G** into upper side **J**.

CAUTION ⚠

Insert shims G observing the following conditions:

- **Number of shims per point is three or less.**
- **The same number of shims should be used for the front and the rear.**
- **The difference in number of shims used for bottom and top is none or one.**

- Tighten bolt **27** at specified torque, then reinspect.

● **Assembly sequence**

Follow the disassembly sequence in reverse.

WARNING ⚠

Wipe up any spilled fuel because it can cause a fire.

CAUTION ⚠

- **Be sure not to touch slide-contact area of needle valve 10 because any scratches or corrosion might spoil the airtightness of nozzle 11. It must be handled with utmost care.**
- **Never change the combination of needle valve 10 and nozzle 11 for each cylinder.**
  Be sure to protect all openings by covering them after removal of hoses and pipes because the engine performance is adversely affected if dirt and foreign particles enter injection nozzle assembly 6.

NOTE

Remove carbon deposits and clean injection nozzle assembly 6 before working on it, then test the injection pressure and jet spray condition, and check for fuel leakage before disassembly. If no fault is found, do not disassemble.

◆ Service procedure

● Inspection before disassembly

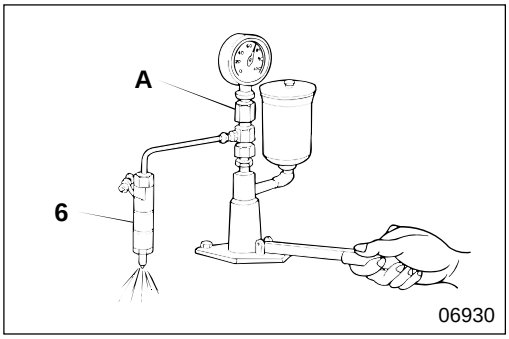
Attach injection nozzle assembly **6** to nozzle tester **A**, and conduct the following inspection.

WARNING ⚠

Never touch the spray from nozzle 11 or let your hands get too close to the spray point during the test.

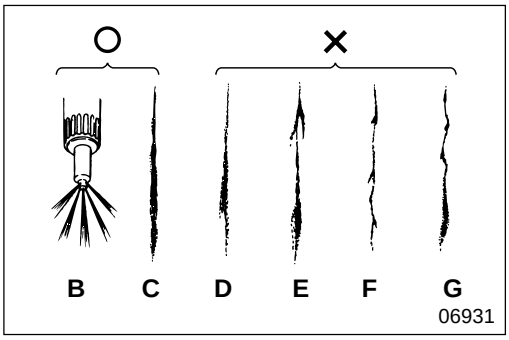
NOTE

Before inspection, bleed the air out in a couple of bursts by pressing nozzle tester A lever.



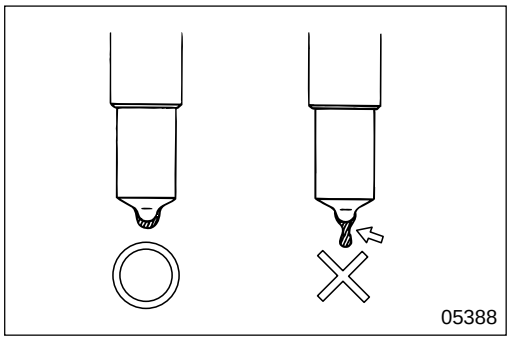
(1) Valve opening pressure

- Raise the pressure of nozzle tester **A** by operating the lever, and measure the pressure that the gauge registers when the pressure is released which will be observed by the sudden movement of the gauge indicator.
- If the measured value deviates from the standard value, disassemble the nozzle and clean, and adjust it using adjusting shims **14**.
- Variation of 0.05 mm {0.0020 in.} thickness in adjusting shims **14** causes a difference of 735 kPa {105 lbf/in^2, 7.5 kgf/cm^2} of pressure, for example, to alter the pressure for 98 kPa {14 lbf/in^2, 1 kgf/cm^2}, a thickness of 0.0067 mm {0.00026 in.} is required.
- If the performance cannot reach the standard value even after adjustment, replace injection nozzle assembly **6**.



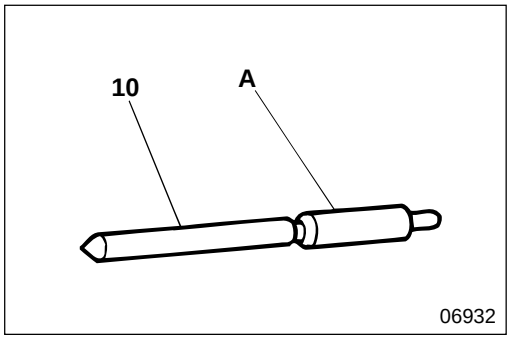
(2) Spray condition

- Test injection spray condition by quick lever actions of nozzle tester **A**, 4 to 6 actions per second.
  - **B** : Even spray from all five orifices (Good)
  - **C** : Even and symmetrical spray (Good)
  - **D** : Asymmetrical spray (Faulty)
  - **E** : Spray direction deviates from the nozzle axis line (Faulty)
  - **F** : Thin and insufficient spray (Faulty)
  - **G** : Irregular spray (Faulty)
- If faulty spray cannot be corrected, disassemble injection nozzle assembly **6** and clean every part and repeat the test.
  If faulty spray still occurs after repeating test, replace the injection nozzle assembly.
- Make sure that there is no post-spray dripping after injection.



(3) Fuel air tightness and leakage at related contact points

- Maintain interior pressure of nozzle at 1960 kPa {285 lbf/in^2, 20 kgf/cm^2} lower than the valve opening pressure, and check and see if any fuel seeps out of the nozzle tip within 10 seconds.
- If any fault is found, disassemble injection nozzle assembly **6** and clean every part and repeat the test. If any fault is still found, replace the injection nozzle assembly.

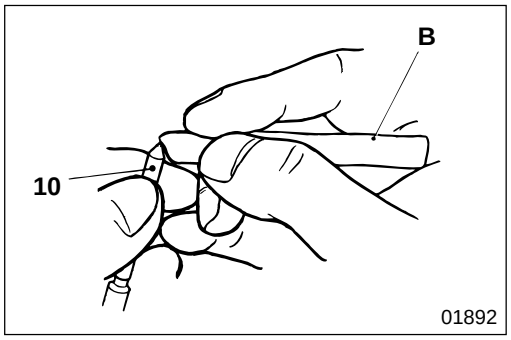


6 Injection nozzle assembly

[Disassembly]

CAUTION

- **Be sure not to touch sliding part A of needle valve 10 with your hands.**
- **Never change the combination of removed needle valve 10 and nozzle 11 for each cylinder.**



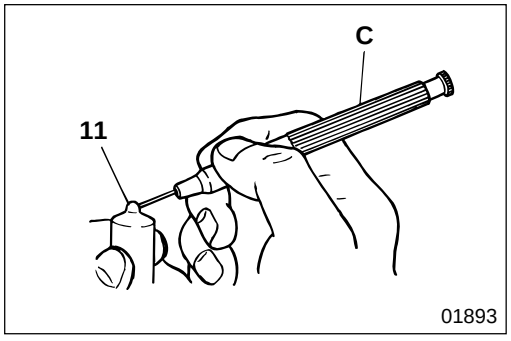
[Cleaning]

Clean needle valve **10** and nozzle **11** with diesel fuel (cleaning solvent). Remove carbon deposits with cleaning tool in the following manner:

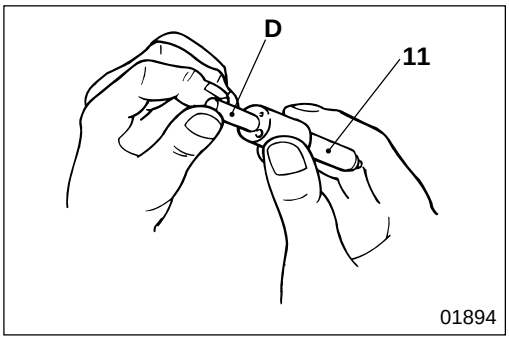
- Clean needle valve **10** by removing carbon deposits from its tip using cleaning bar **B** of cleaning tool.

CAUTION

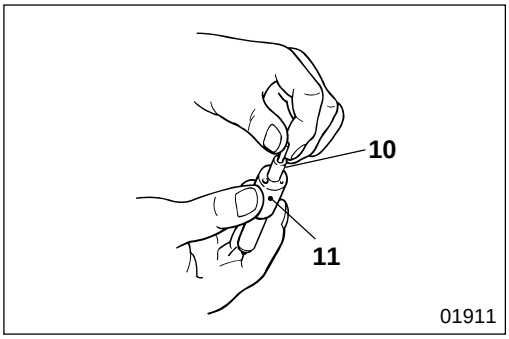
Never use a wire brush or hard steel for cleaning.



- To clean nozzle **11**, remove carbon deposits from the orifices of the nozzle using needle cleaner **C** of cleaning tool, by inserting it into the orifices and turning it.
  Needle cleaner diameter : ø0.25 mm {0.0098 in.} or less



- Clean the seat of nozzle **11** using cleaning needle **D** of [C] cleaning tool.
- Use FUSO carbon remover to remove hard-to-remove, burnt-on carbon deposits.



[Inspection]

- Immerse needle valve **10** and nozzle **11** in diesel fuel (cleaning solvent) and clean them thoroughly.
- Check and see if needle value **10** drops by its own weight into the nozzle from the position where a third of its length is pulled out. (Repeat this several times rotating the needle valve.)
- If needle valve **10** does not drop smoothly, repeat cleaning and repeat the test. If any fault is still found, replace both the needle valve and nozzle **11** together as a set.

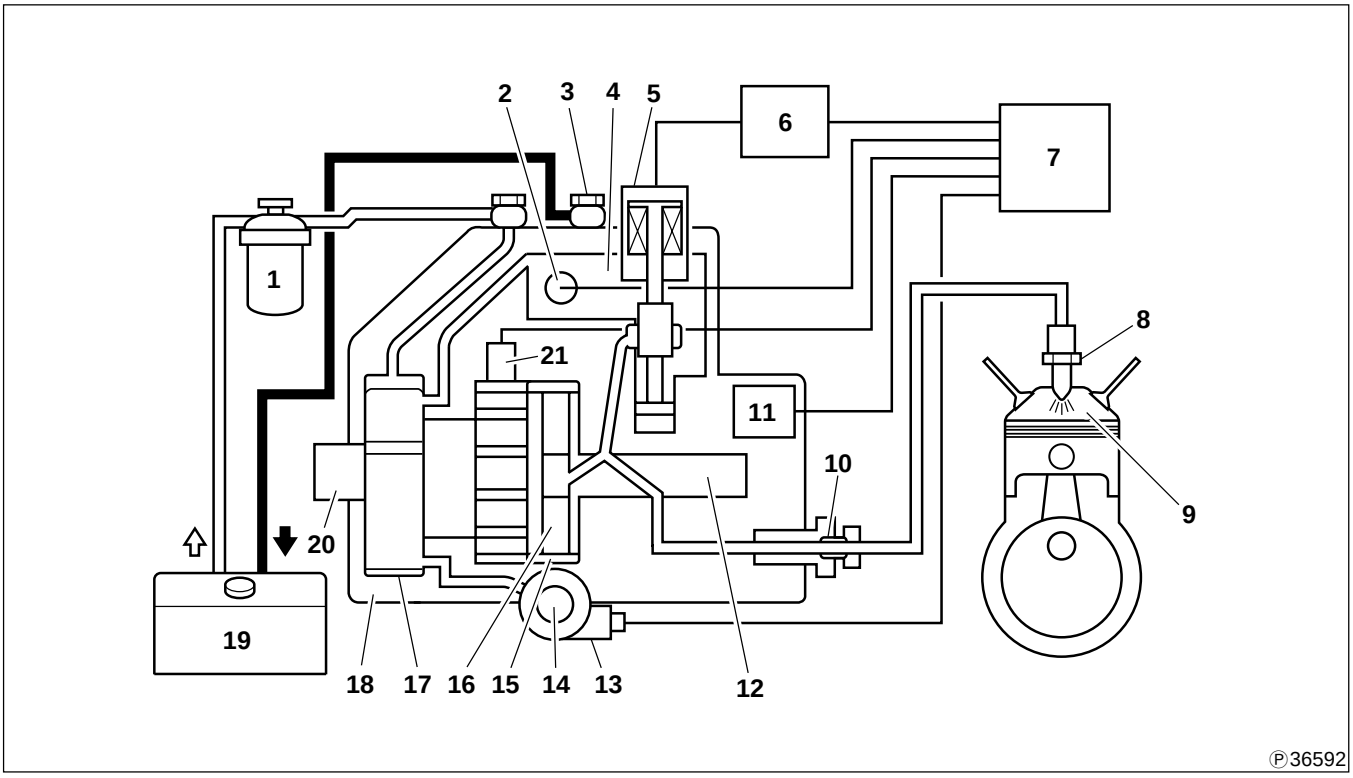
	Spill valve (Solenoid valve)		Electronically controlled type
	Timer	Control scheme	High pressure chamber control
		Drive method	Timer control valve (TCV)
	Overflow valve	Valve opening pressure kPa (psi, kgf/cm^2)	343 {49.8, 3.5}
	Feed pump	Type	Vane type
		Theoretical delivery rate cc {cu.in.}	6.4 {0.39} (per rotation)
	Fuel temperature sensor		Provided
	Engine speed sensor		Provided
Engine control unit	Manufacturer		DENSO
	Rated voltage V		12
Electrical drive unit	Manufacturer		DENSO
	Rated voltage V		12

1. GENERAL

The V4 system adopts a distribution type injection pump, which features small size and light weight and yet high speed, as well as an electronic control unit which controls the fuel injection rate, fuel injection timing, etc., thereby operating the engine in an optimum condition.

Theory of Operation



1 Fuel filter
2 Fuel temperature sensor
3 Overflow valve
4 Pump chamber
5 Spill valve
6 Electronic drive unit
7 Engine electronic control unit
8 Injection nozzle
9 Fuel chamber
10 Delivery valve
11 Injection rate adjusting read-only memory
12 Rotor
13 Timer control valve
14 Timer piston
15 Inner cam
16 Plunger
17 Feed pump
18 Injection pump proper
19 Fuel tank
20 Drive shaft
21 Engine speed sensor

- The feed pump **17** in the injection pump proper **18** pumps up the fuel from the fuel tank **19**, keeping the inside of the injection pump full of the fuel at all times.
- The rotor **12** rotates in the inner cam **15**.
- The electronic drive unit **6** converts the spill valve **5** drive signal delivered from the engine electronic control unit **7** into a high voltage signal to enhance the responsiveness of the spill valve.
- The fuel injection rate is increased or reduced by adjusting the opening time of the spill valve **5**.
- When the spill valve **5** is opened, the inside of the rotor **12** is filled with the fuel.
- After it has been filled, the spill valve **5** closes to confine the fuel in the rotor **12**. In this condition, as the drive shaft **20** rotates, the fuel is pressurized by the inner cam **15** and plunger **16** and fed through the delivery valve **10** to the injection nozzle **8** from which it is injected.
- Then the spill valve **5** opens, and a resultant decline in the fuel pressure in the rotor **12** causes the delivery valve **10** to close, thereby bringing the fuel injection to an end.
- The overflow valve **3** returns the fuel to the fuel tank **19** when the fuel pressure in the injection pump exceeds a predetermined value.
- The fuel injection timing is controlled by the timer control valve **13** which controls the fuel pressure acting on the timer piston **14**.
- The timer control valve **13** is activated by commands from the engine electronic control unit **7**.

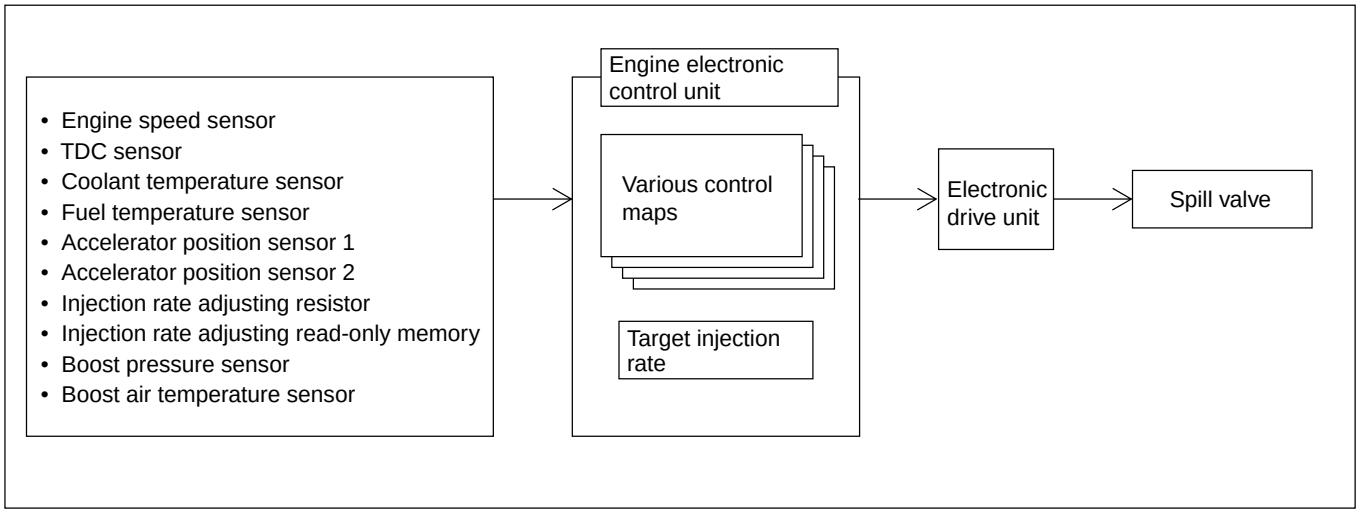
2. ELECTRONIC CONTROL SYSTEM

2.1 System Block Diagram

	Information Signal	Part Names	Major Function or Operation
1	Engine speed signal	Engine speed sensor	Detection of engine speed
2	Fuel temperature signal	Fuel temperature sensor	Detection of fuel temperature
3	Coolant temperature signal	Coolant temperature sensor	Detection of coolant temperature
4	Crank angle signal	TDC sensor	Detection of crank angle signal
5	Boost pressure signal	Boost pressure sensor	Detection of boost pressure
6	Boost air temperature signal	Boost air temperature sensor	Detection of boost air temperature
7	Engine start signal	Starter switch	Recognition of engine start when starter switch is placed at START position
8	Accelerator depressed signal	Accelerator position sensor	Detection of amount that accelerator pedal has been depressed
		Accelerator switch	Detection of released/depressed accelerator pedal
9	Warmup accelerating signal	Idle control variable resistor	Acceleration of warmup
		Warming switch	
10	Fuel injection amount adjustment signal	Injection amount adjusting ROM	Adjustment of fuel injection amount
11	Auxiliary brake signal	Exhaust brake switch	Control of auxiliary brake
		Exhaust brake cut relay	
12	Vehicle speed signal	Vehicle speed sensor	Detection of vehicle speed

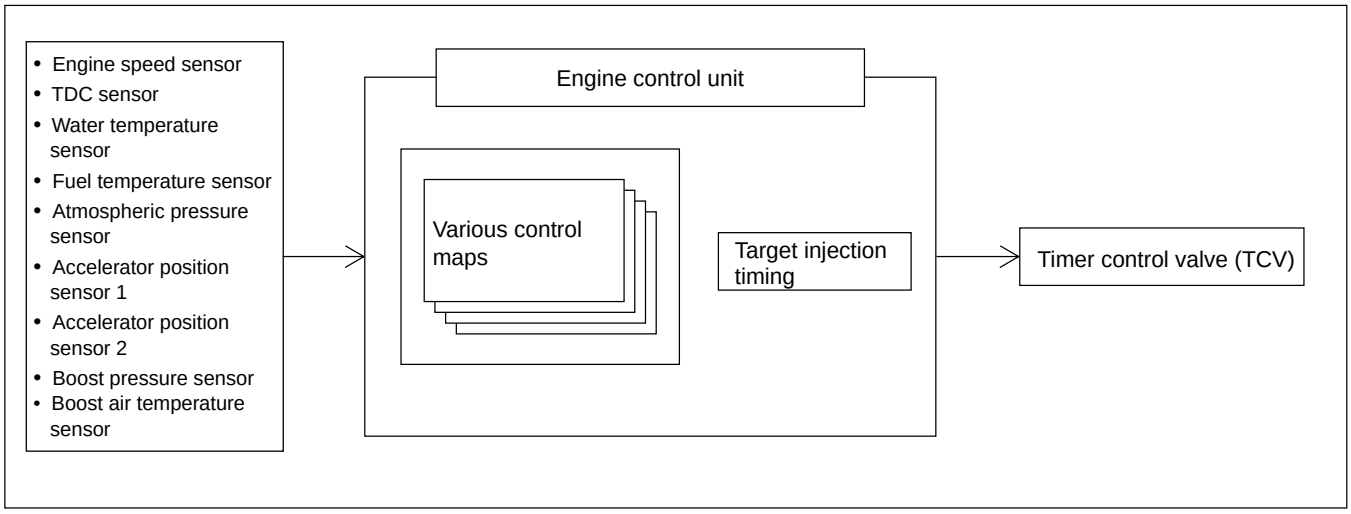
	Information Signal	Part Names	Major Function or Operation
13	Diagnostic signal	Diagnosis switch	Transmission of diagnosis signal
		Memory clear switch	Erasure of diagnostic trouble code Transmission of past diagnostic trouble code
14	Engine emergency stop signal	Emergency engine stop switch	Emergency shutdown of engine
15	–	Electronic drive unit	Assurance of high voltage for high speed drive of spill valve
16	–	Spill valve	Control of fuel injection amount and injection rate
17	Timer control valve operation signal	Timer control valve	Operation of timer piston
18	–	Intake shutter 3-way magnet valve	Operation of intake shutter 3-way magnet valve

2.2 Fuel Injection Rate Control



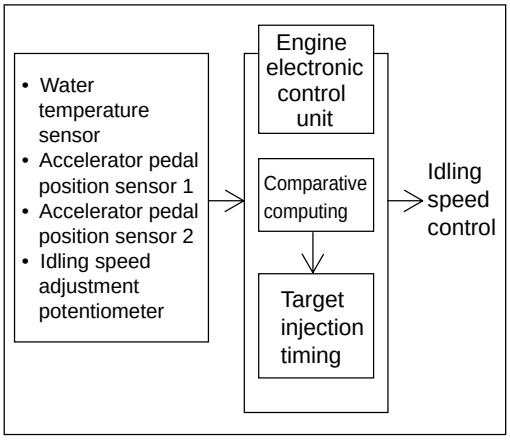
- During operation of the engine, the engine electronic control unit processes the individual information signals according to the control maps to select an appropriate injection mode from among the “basic”, “maximum” and “minimum”.
- After selection of the injection mode, the electronic control unit calculates the minimum value to ensure that the maximum injection rate is not exceeded and determines the target injection rate.
- Once the target injection rate has been determined, the engine electronic control unit outputs a signal to drive the spill valve.
- The signal to drive the spill valve is passed through the electronic drive unit so that its responsiveness for high speed driving will be enhanced.
- The electronic drive unit immediately converts the signal voltage delivered from the engine electronic control unit to a high voltage.

2.3 Fuel Injection Timing Control



- During operation of the engine, the engine electronic control unit processes the individual information signals according to the control maps to calculate the target injection timing, and drives the timer control valve (TCV) in such a way that the real timing computed on the basis of the engine speed sensor and top dead center sensor will match the target timing.
- Controls at the time of an engine start are achieved by the start compensation map contained in each control map.

2.4 Warmup Accelerating Function



The warmup accelerating function varies the idling speed according to the engine coolant temperature to accelerate warmup. The function includes the automatic and manual modes. Either of the modes can be selected by pushing/pulling the idling speed adjustment potentiometer.

TROUBLESHOOTING

1. INSPECTION PROCEDURES

Diagnostic Function

- Whenever the starter switch is placed at ON, the diagnostic function is activated to check all the sensors, etc. If any of them is found faulty, the warning lamp in the meter cluster is lit to alert the driver. At the same time, the fault location is stored in memory, and the system enters the backup mode.

Warning Lamp Indications

	(Red)	(Amber)
Safety-critical error (Vehicle must not be driven)	ON	OFF
Non-safety-critical error (Vehicle can be driven despite poor control feeling)	OFF	ON

- The stored fault location can be read as a diagnostic trouble code by the Multi-Use Tester II or the diagnosis switch.

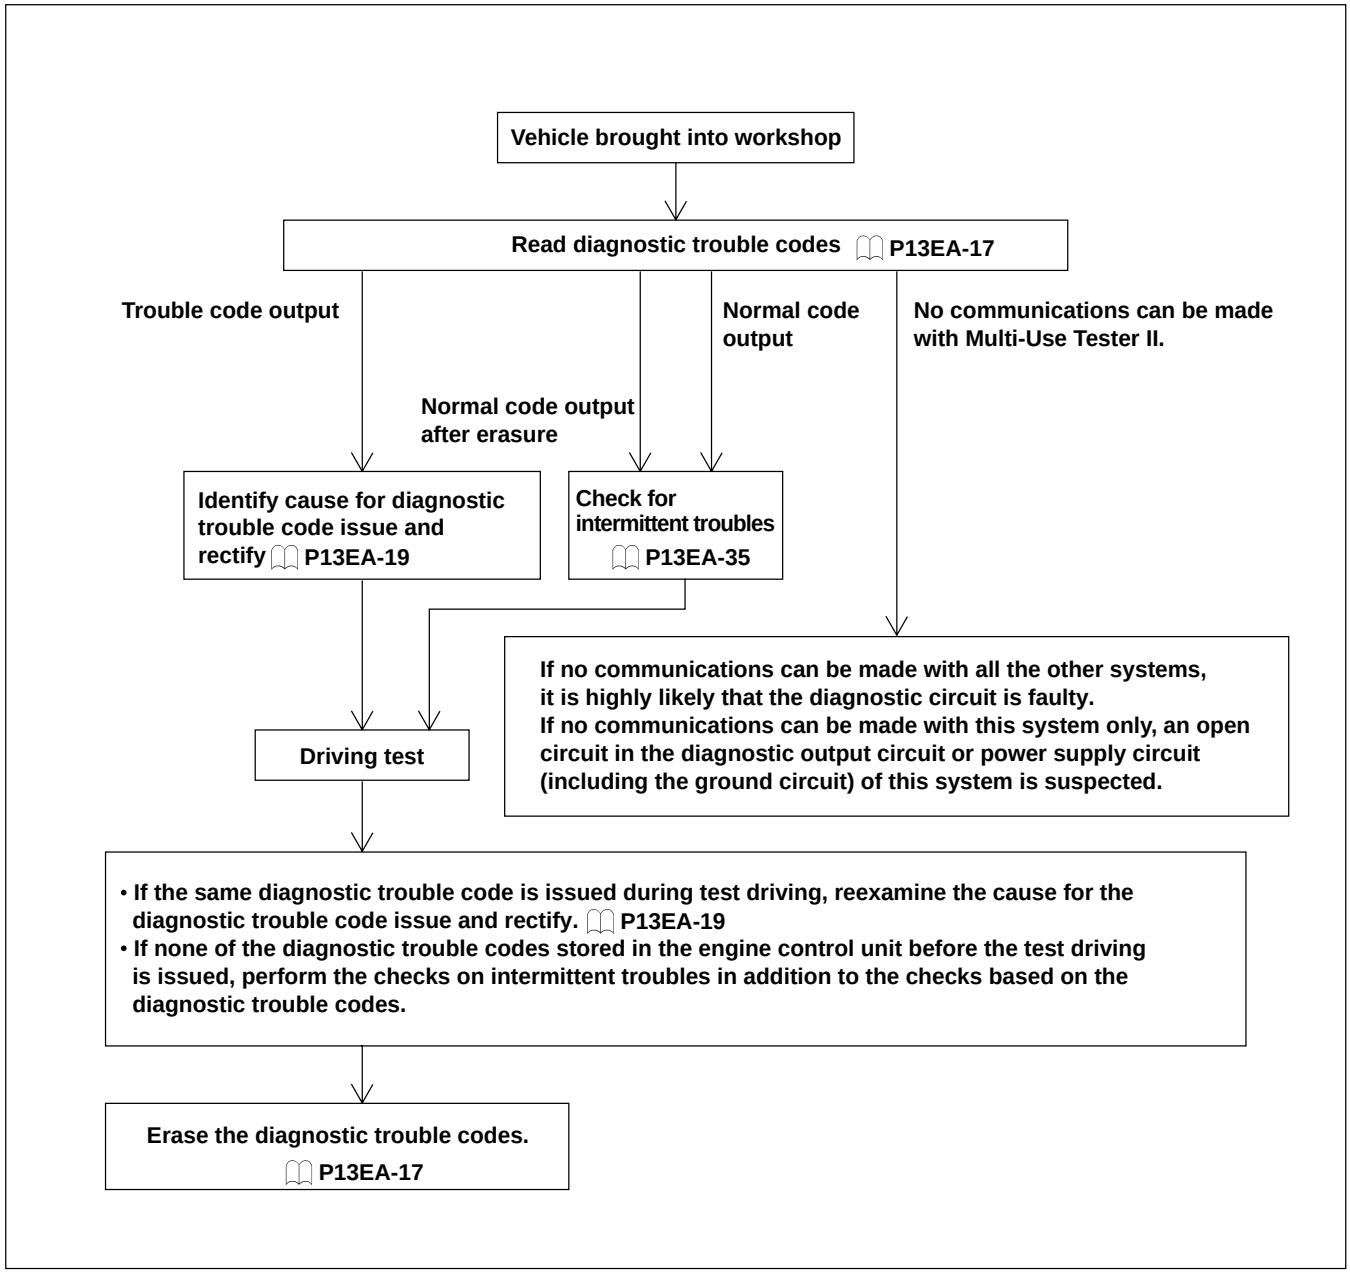
CAUTION ⚠

- **Check to ensure that the battery voltage is within the specified range.**
- **Check all the harness and device connectors for looseness. Always remove a connector at least 20 seconds after placing the starter switch at the LOCK position.**
- **Do not forget to clear the diagnostic trouble code by the Multi-Use Tester II or memory clear switch after a fault has been rectified.**
- **As a rule, inspection operations should be performed with the starter switch at the LOCK position. Some checks, however, may have to be made with the starter switch at the ON position. In such a case, use care to make sure that no short circuit develops between pins of the connectors or with the body.**
- **The resistance value of each component is affected by the temperature and the accuracy of the tester. The reading, therefore, does not always fall within the standard limits. Note that the check values shown in the text are the values obtained at normal temperature (10 to 35°C {58 to 95°F}).**
- **Whether or not the system automatically returns to normal from the backup mode after a fault has been removed depends on the diagnostic trouble code (fault location). When the system returns to normal, the warning lamp will be OFF.**
- **Even when the fault has been removed and the system has been automatically returned to the normal mode, the diagnostic trouble code of the fault remains stored in the engine control unit.**
- **When a fault occurs at a point where the system is not automatically reset, perform the memory clear procedure to let the system exit from the backup mode. 🕮 P13EA-17**

Inspection Flowchart

The system inspection can be performed effectively by use of the Multi-Use Tester II. The types of system inspections may be broadly divided as shown below in accordance with the trouble symptoms and diagnostic trouble code outputs.

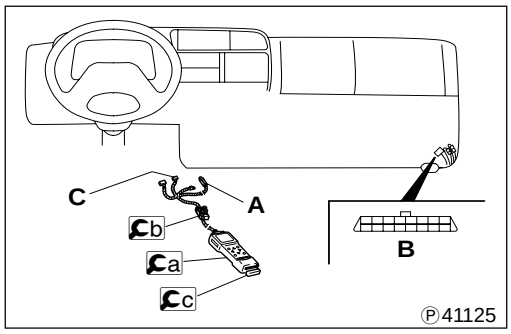
- Inspections based on diagnostic trouble codes stored in the engine electronic control unit
- Inspections of intermittent troubles



2. CONNECTION OF MULTI-USE TESTER II

Special Tools

Location	Name and Shape of Special Tool	Part No.	Application
—	Multi-Use Tester II  19492	MB991496	Inspection of system
—	Multi-Use Tester II harness (for communications)  19141	MK327601	To supply power to Multi-Use Tester II proper and communicate with vehicle side electrical devices
—	Read-only memory pack (MRT-E10)  19493	MH062867	Data for inspection and control of engine control unit
—	Memory card (set in Multi-Use Tester II proper)  20538	MB991500	To write data
—	Multi-Use Tester II harness  20536	MB991499	To use Multi-Use Tester II as a circuit tester



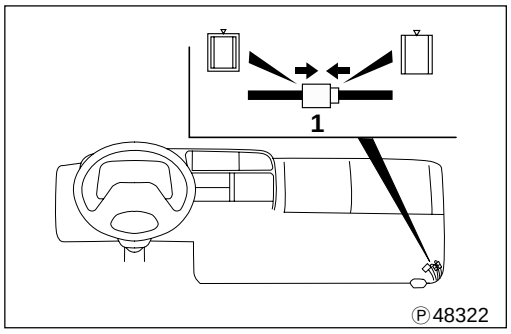
- Place the starter switch at the LOCK position.
- Connect the b Multi-Use Tester II harness to a Multi-Use Tester II and insert the c read-only memory in the tester.
- Connect the connector **A** to the cigar lighter socket.
- Connect the Multi-Use Tester II connector **C** (16 pins) to the data link connector **B** (16 pins).

NOTE

For the operating procedures for the Multi-Use Tester II, refer to the instruction manual for the Multi-Use Tester II.

3. READING AND ERASING DIAGNOSTIC TROUBLE CODES

Two types of methods are available for reading or erasing a diagnostic trouble code; one using the Multi-Use Tester II and one using the vehicle side diagnostic functions.

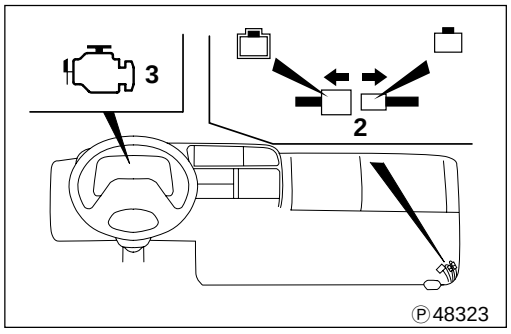


(1) Method using Multi-Use Tester II

● **Current Diagnostic Trouble Code**
- Check to see that the memory clear switch **1** is connected.
- Set the starter switch to ON.
- Operate the Multi-Use Tester II to read the current diagnostic trouble code and determine the fault location.

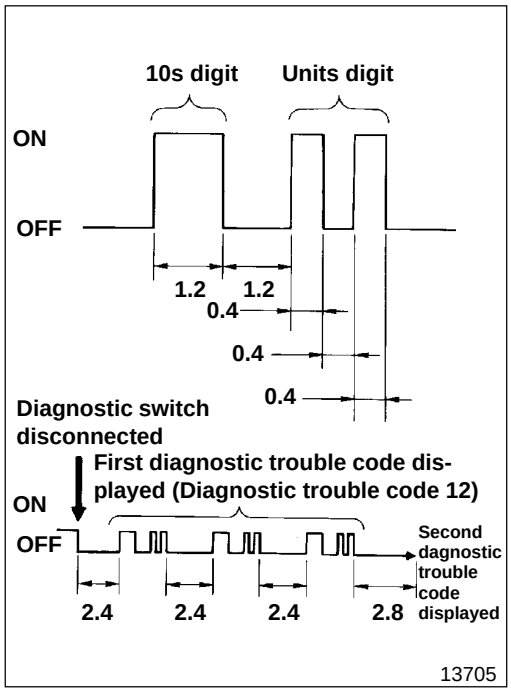
● **Past Diagnostic Trouble Code**
- Set the starter switch to ON.
- Disconnect the memory clear switch **1**.
- Operate the Multi-Use Tester II to read the past registered diagnostic trouble codes and determine the fault location.

● **Erasing Diagnostic Trouble Codes**
- Set the starter switch to ON.
- Operate the Multi-Use Tester II to erase all of the diagnostic trouble codes stored in the engine electronic control unit.



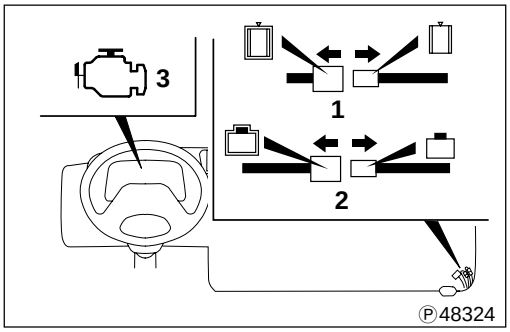
(2) Method Not Using Multi-Use Tester II (Method Using Diagnostic Switch and Memory Clear Switch)

● **Current Diagnostic Trouble Code**
- Set the starter switch to ON.
- Disconnect the diagnostic switch **2**.
- The diagnostic trouble code is displayed by flashes of the warning lamp **3**.



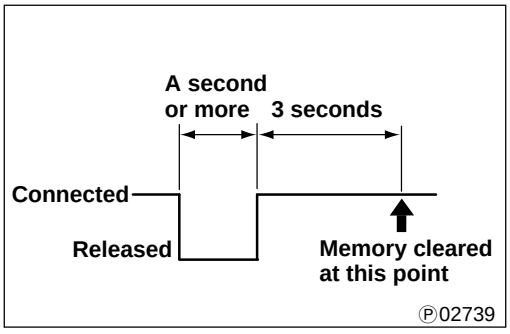
● **Reading Diagnostic Trouble Code**

- Diagnostic trouble codes are indicated by the number of times the warning lamp **3** flashes and their duration.
  - The flashing intervals also differ between the 10s digit and units digit.
  - 10s digit: 1.2 second interval
  - Units digit: 0.4 second interval
  - Each diagnostic trouble code is displayed from the 10s digit followed by the units digit. As for a code which has no 10s digit, units digit only is displayed.
- Each diagnostic trouble code is displayed three times in succession.
- If there is no more code stored, the sequence is then repeated from the beginning with each code indicated three times.
- When the diagnostic switch **2** is connected, the engine electronic control unit will immediately stop displaying codes.



● **Past Diagnostic Trouble Codes**

- After reading the current diagnostic trouble codes (with the diagnostic switch **2** disconnected), disconnect the memory clear switch **1**. Then the warning lamp **3** will restart flashing.
- This time, the warning lamp displays the past diagnostic trouble codes. Determine the fault locations based on the indicated codes.



● **Erasing Diagnostic Trouble Codes**

Disconnect the memory clear switch **1** and the diagnostic switch **2** then reconnect them. Then all the diagnostic trouble codes stored in the engine electronic control unit will be cleared.

CAUTION ⚠

- **If the contents of memory are not to be cleared after display of the stored codes, set the starter switch to OFF with the memory clear switch 1 disconnected. Thereafter, connect the memory clear switch.**
- **When you change the combination of the injection pump and engine electronic control unit, you must rewrite the pump data stored in the engine electronic control unit. For this purpose, be sure to perform the diagnostic trouble code erasing procedure.**
- **Whenever the engine electronic control unit has been replaced with a new one, be sure to erase the diagnostic trouble codes by disconnecting the memory clear switch 1 and diagnostic switch 2 after connecting all the connectors. Upon completing the procedure, confirm that no diagnostic trouble codes is stored.**

4.2 Diagnostic Trouble Code Issued Conditions and Check Items

Perform service procedures taking the diagnostic trouble code issued conditions and the probable causes into consideration.

06 EDU/SPV		
Code issued condition [Reset condition]	Diagnostic trouble code **06** is intended for checking the electronic drive unit and spill valve for anything abnormal. The code is issued when the FAIL signal is not input the specified number of consecutive times from the electronic drive unit to the electronic control unit despite the fact that the battery voltage is normal, the engine is running at a speed higher than the idling speed, and the electrical drive unit is outputting the spill valve drive signal. [Starter switch OFF]	
Action taken by electronic control unit	Engine stopped	
Warning lamp illuminated	(Red)	
Probable cause and check item	• Open or short circuit between electronic control unit and electronic drive unit,or between electronic drive unit and spill valve • Faulty electronic drive unit • Faulty spill valve	• Check on the basis of the service data of the Multi-Use Tester II. 🕮 P13EA-28 No. 83: Spill valve operation check • Test the actuator by the Multi-Use Tester II. 🕮 P13EA-30 No. 9B: Spill valve operation check • Check the electronic drive unit (Ask your DENSO service station to do the job.) • Check the spill valve. 🕮 P13EA-36: Inspection of Electrical Devices **536** • Check the circuit between the electronic control unit and electronic drive unit or the circuit between the electronic drive unit and spill valve. 🕮 P13EA-49: Electrical wiring Diagram

07 OVER REV		
Code issued condition [Reset condition]	Diagnostic trouble code **07** is intended for checking whether the engine speed has reached an overspeed. When the engine speed reaches an overspeed, the code is issued. (When the engine speed decreases to fall within the normal range, a reset is made.)	
Action taken by electronic control unit	Spill valve operation stopped	
Warning lamp illuminated	None	
Probable cause and check item	• Faulty spill valve of injection pump assembly • Overrevved engine during driving downhill • Faulty electronic control unit	Check the injection pump assembly (Ask your DENSO service station to do the job.)

14 TDC SNSR		
Code issued condition [Reset condition]	Diagnostic trouble code **14** is intended for checking the TDC sensor operation. It is issued when the TDC sensor signal is not input to the electronic control unit the specified number of consecutive times while the engine is running. [When normal TDC sensor signal input is restored, the system is reset.]	
Action taken by electronic control unit	Injection timing feedback control stopped and open-loop control executed	
Warning lamp illuminated	(Amber)	
Probable cause and check item	• Open or short circuit between control unit and TDC sensor • Faulty TDC sensor • Faulty electronic control unit	• Perform checks at electronic control unit connector. 📖P13EA-32 **01**: Measure resistance of TDC sensor. • Check TDC sensor. 📖 P13EA-36: Inspection of Electronic Devices **316** • Check circuit between electronic control unit and TDC sensor. 📖 P13EA-49: Electrical Writing Diagram

15 NE SNSR		
Code issued condition [Reset condition]	Diagnostic trouble code **15** is issued when the signal from the engine speed sensor is not input the specified number of times to the electronic control unit while the engine is in operation. [When the signal from the engine speed sensor returns to normal, a reset is made.]	
Action taken by electronic control unit	Synchronous control of spill valve with timer control valve interrupted	
Warning lamp illuminated	(Red)	
Probable cause and check item	• Open or short circuit in harness between electronic control unit and engine speed sensor • Faulty engine speed sensor • Gap of engine speed sensor maladjusted • Faulty electronic control unit	• Perform checks on the basis of the service data of the Multi-Use Tester II. 📖P13EA-28 No. 01: Measure engine speed. • Perform checks at control electronic unit connector. 📖P13EA-32 **02**: Measure resistance of engine speed sensor. • Check engine speed sensor. 📖 P13EA-36: Inspection of Electrical Devices **263** • Check circuit between electronic control unit and engine speed sensor. 📖P13EA-49: Electrical Wiring Diagram

16 ACCEL SNSR-2		
Code issued condition [Reset condition]	Diagnostic trouble code **16** is intended for checking the accelerator pedal position sensor 2 for an abnormal voltage. The code is issued when the voltage of the accelerator pedal position sensor 2 is out of the specified limits. When diagnostic trouble code **24** is also registered, the portion between the accelerator pedal position sensor is faulty. [When the voltage of the accelerator pedal position sensor 2 falls within the specified limits, a reset is made.]	
Action taken by electronic control unit	①: Ordinary controls are made by using only accelerator pedal position sensor 1 ②: When accelerator pedal position sensor 1 is also faulty, controls are made on the assumption that the pedal is depressed 30% when accelerator switch is OFF and 0% when accelerator switch is ON.	
Warning lamp illuminated	①: None ②: (Amber)	
Probable cause and check item	• Open or short circuit in harness between electronic control unit and accelerator pedal position sensor 2 • Faulty accelerator pedal position sensor 2 • Faulty electronic control unit	• Perform checks on the basis of the service data of the Multi-Use Tester II. 📖 P13EA-28 No. 0B: Accelerator pedal opening measurement. No. 0C: Measurement of accelerator pedal position sensor output voltage. • Perform checks at electronic control unit connector. 📖 P13EA-32 **03**: Measurement of accelerator pedal position sensor 2 output voltage • Check accelerator pedal position sensor 2. 📖 P13EA-36: Inspection of Electrical Devices **324** • Check circuit between electronic control unit and accelerator pedal position sensor 2. 📖 P13EA-49: Electrical Wiring Diagram

19 AIR PRES SNSR		
Code issued condition [Reset condition]	Diagnostic trouble code **19** is intended for checking the atmospheric pressure sensor (built into the electronic control unit) for anything abnormal. The code is issued when a voltage signal from the atmospheric pressure sensor is out of the specified limits. [When the output voltage of the atmospheric pressure sensor falls within the specified range, a reset is made.]	
Action taken by electronic control unit	Controls achieved on the assumption that atmospheric pressure is 100 kPa {29.9 in. Hg, 760 mmHg}.	
Warning lamp illuminated	None	–
Probable cause and check item	• Faulty atmospheric pressure sensor (built into control unit) • Faulty electronic control unit	Perform checks on the basis of the service data of the Multi-Use Tester II. 📖 P13EA-28 No. 14: Atmospheric pressure measurement.

21 WTR TEMP SNSR		
Code issued condition [Reset condition]	Diagnostic trouble code **21** is intended for checking for open or short circuit in the harness of the water temperature sensor or anything abnormal in water temperature sensor. The code is issued when the output voltage from the water temperature sensor is out of the specified limits. [When the output voltage of the water temperature sensor falls within the specified range, a reset is made.]	
Action taken by electronic control unit	Controls achieved on the assumption that the water temperature is 80°C {178°F}	
Warning lamp illuminated	None	–
Probable cause and check item	• Open or short circuit in harness between electronic control unit and water temperature sensor • Faulty water temperature sensor • Faulty electronic control unit	• Perform checks on the basis of the service data of the Multi-Use Tester II. 📖 P13EA-28 No. 10: Engine water temperature measurement • Check water temperature sensor. 📖 P13EA-36: Inspection of Electrical Devices **262** • Check circuit between electronic control unit and water temperature sensor. 📖 P13EA-48: Electrical Wiring Diagram

23 TCV		
Code issued condition [Reset condition]	Diagnostic trouble code **23** is intended for checking the harness of the timer control valve for open or short circuit and checking the timer control valve for anomalies. The code is issued when the real advance angle position of the timer continues to be out of the specified limits under the condition that fuel injection timing feedback control is in progress after completion of engine warmup. [When the advance angle re-enters the specified range with the engine at a speed of less than 1200 rpm, a reset is made.]	
Action taken by electronic control unit	Controls are made on the assumption that the coolant temperature is 20°C {-4°F} when the engine is started, and 120°C {248°F} during operation.	
Warning lamp illuminated	None	–
Probable cause and check item	• Open or short circuit in harness between electronic control unit and timer control valve • Faulty timer control valve • Faulty electronic control unit	• Perform checks on the basis of the service data of the Multi-Use Tester II. 🕮 P13EA-28 No. 09: Timer advance angle measurement • Check timer control valve. 🕮 P13EA-36: Inspection of Electrical Devices **584** • Check circuit between electronic control unit and timer control valve. 🕮 P13EA-49: Electrical Wiring Diagram

24 ACCEL SNSR-1		
Code issued condition [Reset condition]	Diagnostic trouble code **24** is intended for checking the accelerator pedal position sensor 1 for abnormal voltage. The code is issued when the output voltage of the accelerator pedal position sensor 1 is out of the specified limits. When diagnostic trouble code 16 is also registered, the portion between the accelerator pedal position sensors is faulty. [When the output voltage of the accelerator pedal position sensor 1 re-enters the specified range, a reset is made.]	
Action taken by electronic control unit	①: Ordinary controls are continued by using only the accelerator pedal position sensor 2. ②: When accelerator pedal position sensor 2 is also faulty, controls are made on the assumption that the pedal is depressed 30% when accelerator switch is OFF and 0% when accelerator switch is ON.	
Warning lamp illuminated	①: None ②: (Amber)	
Probable cause and check item	• Open or short circuit in harness between electronic control unit and accelerator pedal position sensor 1 • Faulty accelerator pedal position sensor 1 • Faulty electronic control unit	• Perform checks on the basis of the service data of the Multi-Use Tester II. 🕮 P13EA-28 No. 0B: Accelerator pedal opening measurement No. 0C: Measurement of accelerator pedal position sensor output voltage • Perform checks at electronic control unit connector. 🕮 P13EA-32 **04**: Measurement of accelerator pedal position sensor 1 output voltage • Check accelerator pedal position sensor 1. 🕮 P13EA-36: Inspection of Electrical Devices **324** • Check circuit between electronic control unit and accelerator pedal position sensor 1. 🕮 P13EA-49: Electrical Wiring Diagram

25 SPEED SNSR		
Code issued condition [Reset condition]	Diagnostic trouble code **25** is intended for checking the harness of the vehicle speed sensor for open/short circuit and checking the vehicle speed sensor for abnormalities. The code is issued when there are no pulse inputs from the vehicle speed sensor to the electronic control unit in the specified time duration. [When a pulse is input, a reset is made.]	
Action taken by electronic control unit	ISC (Idle Speed Control) disabled	
Warning lamp illuminated	None	
Probable cause and check item	• Open or short circuit in harness between electronic control unit and vehicle speed sensor • Faulty vehicle speed sensor • Faulty electronic control unit	• Perform checks on the basis of the service data of the Multi-Use Tester II. 📖 P13EA-28 No. 0D: Vehicle speed measurement. • Perform checks at electronic control unit connector. 📖P13EA-32 **05**: Measurement of vehicle speed signal voltage. • Check vehicle speed sensor. 📖P13EA-36: Inspection of Electrical Devices **265** • Check circuit between electronic control unit and vehicle speed sensor. 📖P13EA-49: Electrical Wiring Deagram

26 PUMP ROM		
Code issued condition [Reset condition]	Diagnostic trouble code **26** is intended for checking for an error in the loaded pump read-only memory data necessary for control of the injection rate. The code is issued when any of the following situations occurs. Loaded read-only memory has unmatched data. • Read-only memory data cannot be read. • Loaded data exceeds the upper limit of correction. • There is a mismatch between control unit backup data and loaded data. [No automatic reset takes place.]	
Action taken by electronic control unit	Initial values used	
Warning lamp illuminated	None	–
Probable cause and check item	• Open or short circuit in harmess between electronic control unit and injection rate and adjusting read-only memory • Faulty injection rate adjusting read-only memory • Faulty electronic control unit	• Check injection rate adjusting read-only memory. (Ask your DENSO service station to do the job.) • Check circuit between electronic control unit and injection rate adjusting read-only memory. 📖P13EA-49: Electrical Wiring Diagram

27 SILENCER M/V		
Code issued condition [Reset condition]	Diagnostic trouble code **27** is intended for checking the harness of the intake silencer 3-way magnet valve for open/short circuit. [No automatic reset takes place.]	
Action taken by electronic control unit	Intake silencer control disabled	
Warning lamp illuminated	(Amber)	
Probable cause and check item	• Open or short circuit in harmess between electronic control unit and injection rate and adjusting read-only memory • Faulty intake silencer 3-way magnet valve • Faulty electronic control unit	• Check intake silencer 3-way magnet valve. P13EA-36: Inspection of Electrical Devices **565** • Check circuit between electronic control unit and intake silencer 3-way magnet valve. P13EA-49: Electrical Wiring Diagram

31 IDL VOLUME		
Code issued condition [Reset condition]	Diagnostic trouble code **31** is intended for checking the harness of the idling speed adjustment potentiometer for open or short circuit and checking the idling speed adjustment potentiometer for abnormalities. The code is issued when the voltage of the idling speed adjustment potentiometer continues to be out of the specified limits for the predetermined period of time. [When the voltage of the idling speed adjustment potentiometer re-enters the specified range, a reset is made.]	
Action taken by electronic control unit	Operation mode fixed to auto idle	
Warning lamp illuminated	None	–
Probable cause and check item	• Open or short circuit in harness between electronic control unit and idling speed adjustment potentiometer • Faulty idling speed adjustment potentiometer • Faulty electronic control unit	• Perform checks on the basis of the service data of the Multi-Use Tester II. 🕮 P13EA-28 No. 0E: Measurement of idling speed adjustment potentiometer voltage. • Perform checks at electronic control unit connector. 🕮P13EA-32 **06**: Measurement of idling speed adjustment potentiometer output voltage. • Check idling speed adjustment potentiometer. 🕮 P13EA-36: Inspection of Electrical Devices **157** • Check circuit between electronic control unit and idling speed adjustment potentiometer. 🕮 P13EA-48: Electrical Wiring Diagram

32 BOOST PRES		
Code issued condition [Reset condition]	Diagnostic trouble code **32** is intended for checking the harness of the boost pressure sensor for open or short circuit and checking the boost pressure sensor for abnormalities. The code is issued when the output voltage of the boost pressure sensor continues to be out of the specified limits for the predetermined period of time. [When the voltage of the boost pressure sensor re-enters the specified range, a reset is made.]	
Action taken by electronic control unit	Controls are made on the assumption that the boost pressure is 100 kPa {29.9 in. Hg, 760 mmHg}	
Warning lamp illuminated	None	–
Probable cause and check item	• Open or short circuit in harmess between electronic control unit and boost pressure sensor • Faulty boost pressure sensor • Faulty electronic control unit	• Perform checks on the basis of the service data of the Multi-Use Tester II. 🕮P13EA-28 No. 15: Boost pressure measurement • Check boost pressure sensor. 🕮 P13EA-36: Inspection of Electrical Devices **318** • Check circuit between electronic control unit and boost pressure sensor. 🕮P13EA-49: Electrical Wiring Diagram

33 ECU SYSTEM		
Code issued condition [Reset condition]	Diagnostic trouble code **33** is issued in the following cases. ①: Analog/Digital converter out of order [When Analog/Digital converter returns to normal, a reset is made.] ②: Mutual monitoring error, interruption processing error [When starter switch is turned OFF, a reset is made.]	
Action taken by electronic control unit	①: All Fail Safe functions against a faulty Analog/Digital input are activated. ②: Engine stopped	
Warning lamp illuminated	①: None ②: (Amber)	
Probable cause and check item	Faulty electronic control unit	—

34 Q RESISTOR		
Code issued condition [Reset condition]	Diagnostic trouble code **34** is intended for checking the harness of the injection rate adjustment resistor for open or short circuit and checking the injection rate adjustment resistor for abnormalities. The code is issued when the output voltage of the injection rate adjustment resistor continues to be out of the specified limits for the predetermined period of time. [When the voltage of the injection rate adjustment resistor re-enters the specified range, a reset is made.]	
Action taken by electronic control unit	The injection rate correction value is fixed to No. 1 value.	
Warning lamp illuminated	None	–
Probable cause and check item	• Open or short circuit in harness between electronic control unit and injection rate adjustment resistor • Faulty injection rate adjustment resistor • Faulty electronic control unit	• Perform checks on the basis of the service data of the Multi-Use Tester II. 🕮 P13EA-28 No. 13: Resistor No. check of injection rate adjustment resistor. • Check circuit between electronic control unit and injection rate adjustment resistor. 🕮 P13EA-49: Electrical Wiring Diagram

41 FUEL TEMP		
Code issued condition [Reset condition]	Diagnostic trouble code **41** is intended for checking the harness of the fuel temperature sensor for open or short circuit and checking fuel temperature sensor for abnormalities. The code is issued when the output voltage of the fuel temperature sensor continues to be out of the specified limits for the predetermined period of time. [When the voltage of the fuel temperature sensor re-enters the specified range, a reset is made.]	
Action taken by electronic control unit	Control is made on the assumption that fuel temperature is 40°C {104°F}	
Warning lamp illuminated	None	–
Probable cause and check item	• Open or short circuit in harmess between electronic control unit and fuel temperature sensor • Faulty fuel temperature sensor • Faulty electronic control unit	• Perform checks on the basis of the service data of the Multi-Use Tester II. 🕮 P13EA-28 No. 11: Fuel temperature measure. • Perform checks at electronic control unit connector. 🕮 P13EA-32 **12** : Measurement of fuel temperature sensor resistance. • Check fuel temperature sensor. 🕮 P13EA-36: Inspection of Electrical Devices **323** • Check circuit between electronic control unit and fuel temperature sensor. 🕮 P13EA-49: Electrical Wiring Diagram

44 BOOST TEMP		
Code issued condition [Reset condition]	Diagnostic trouble code **44** is intended for checking the harness of the boost air temperature sensor for open or short circuit and checking the boost air temperature sensor for abnormalities. [When the voltage of the boost air temperature sensor re-enters the specified range, a reset is made.]	
Action taken by electronic control unit	Control is made on the assumption that boost air temperature is 80°C {176°F}	
Warning lamp illunimated	None	–
Probable cause and check item	• Open or short circuit in harmess between electronic control unit and boost air temperature sensor • Faulty boost air temperature sensor • Faulty electronic control unit	• Check boost air temperature sensor. 🕮 P13EA-36 **304** : Inspection of Electrical Devices • Check circuit between electronic control unit and boost air temperature sensor. 🕮 P13EA-49: Electrical Wiring Diagram

45 FUEL CUT SW		
Code issued condition [Reset condition]	Diagnostic trouble code **45** is intended for checking the harness of the emergency engine stop switch for open or short circuit and checking the emergency engine stop switch for abnormalities. The code is issued when a fault is detected in the circuit with both emergency engine stop switch and starter switch at the ON position (without starting the engine). [When the emergency engine stop switch is set to OFF, a reset is made.]	
Action taken by electronic control unit	Engine start inhibited	
Warning lamp illuminated	(Red)	–
Probable cause and check item	• Open or short circuit in harmess between electronic control unit and emergency engine stop switch • Faulty emergency engine stop switch • Faulty electronic control unit	• Perform checks on the basis of the service data of the Multi-Use Tester II. 📖 P13EA-28 No. 42: Operation check of emergency engine stop switch. • Perform checks at electronic control unit connector. 📖 P13EA-32 **11**: Measurement of emergency engine stop switch operating voltage. • Check emergency engine stop switch. 📖 P13EA-36: Inspection of Electrical Devices **156** • Check circuit between electronic control unit and emergency engine stop switch. 📖 P13EA-49: Electrical Wiring Diagram

46 EDU RELAY		
Code issued condition [Reset condition]	Diagnostic trouble code **46** is issued in the following cases. ①: Electronic driveunit relay is not ON with electronic drive unit relay ON command issued. [When the electronic drive unit relay is not ON by the electronic drive unit relay ON command, and the voltage exceeds 16V, a reset is made.] ②: Electronic drive unit relay is not OFF with electronic drive unit relay OFF command issued. [Electronic drive unit relay is turned OFF by the electronic drive unit relay OFF command, and the voltage exceeds 16V, a reset is made.]	
Action taken by electronic control unit	①: Electronic drive unit relay OFF ②: Ordinary controls continued	
Warning lamp illuminated	①: (Amber) ②: None	
Probable cause and check item	• Open or short circuit in harmess between electronic control unit and electronic drive unit. • Faulty electronic drive unit relay	• Check electronic drive unit relay. 📖 P13EA-36: Inspection of Electrical Devices **228** • Check circuit between electronic control unit and electronic drive unit relay. 📖 P13EA-49: Electrical Wiring Diagram

65 ACCEL SW		
Code issued condition [Reset condition]	Diagnostic trouble code **65** is intended for checking the harness of the accelerator switch for open or short circuit and checking the accelerator switch for abnormalities. The code is issued when the accelerator pedal position sensor 1 or 2 shows an opening of more than 20% with the accelerator switch ON. [If the accelerator switch turns OFF when the accelerator pedal position sensor shows an opening of more than 20%, a reset is made.]	
Action taken by electronic control unit	Ordinary controls continued	
Warning lamp illuminated	None	–
Probable cause and check item	• Open or short circuit in harmess between electronic control unit and accelerator switch • Faulty accelerator switch • Faulty electronic control unit	• Perform checks on the basis of the service data of the Multi-Use Tester II. 🕮 P13EA-28 No. 43: Check of accelerator switch operating signal. Perform checks at electronic control unit connector. 🕮P13EA-32 **09**: Measurement of accelerator switch operating voltage. Check accelerator switch. 🕮P13EA-36: Inspection of Electrical Devices **324** Check circuit between electronic control unit and accelerator switch. 🕮P13EA-49: Electrical Wiring Diagram

66 STARTER SW (S)		
Code issued condition [Reset condition]	Diagnostic trouble code **66** is intended for checking the harness of the starter switch for open or short circuit and checking the starter switch for abnormalities. The code is issued when a start signal is input with the engine running at a speed higher than the specified speed. [When the start signal is no longer input, a reset is made.]	
Action taken by electronic control unit	Ordinary controls continued	
Warning lamp illuminated	None	–
Probable cause and check item	• Open or short circuit in harmess between electronic control unit and starter switch • Faulty starter switch • Faulty electronic control unit	• Perform checks on the basis of the service data of the Multi-Use Tester II. 🕮P13EA-28 No. 41: Start signal ON/OFF check. • Perform checks at electronic control unit connector. 🕮P13EA-32 **13**: Measurement of starter switch signal voltage. • Check starter switch. 🕮P13EA-36: Inspection of Electrical Devices **002** • Check circuit between electronic control unit and starter switch. 🕮P13EA-49: Electrical Wiring Diagram

5. SERVICE DATA OF MULTI-USE TESTER II

Screen Display of Multi-Use Tester II			Condition When Checking	Judging Criteria
No.	Item Name	Data		
01	ENGINE SPEED	■■■■. rpm	Racing (Engine running)	Synchronized with tachometer
03	INJ VOL	■■■. ■ %	Starter switch ON	0 %
09	TCV ANG DIFF	■■■. ■ deg	Warm engine running at idle	0 deg
0B	ACCEL (%)	■■■. ■ %	Accelerator pedal released	0 %
			Slowly depressed	Slowly increased
			Accelerator pedal fully depressed	100 %
0C	ACCEL (V)	■. ■■■ V	Accelerator pedal slowly depressed from released position	0.85 to 4.15 V

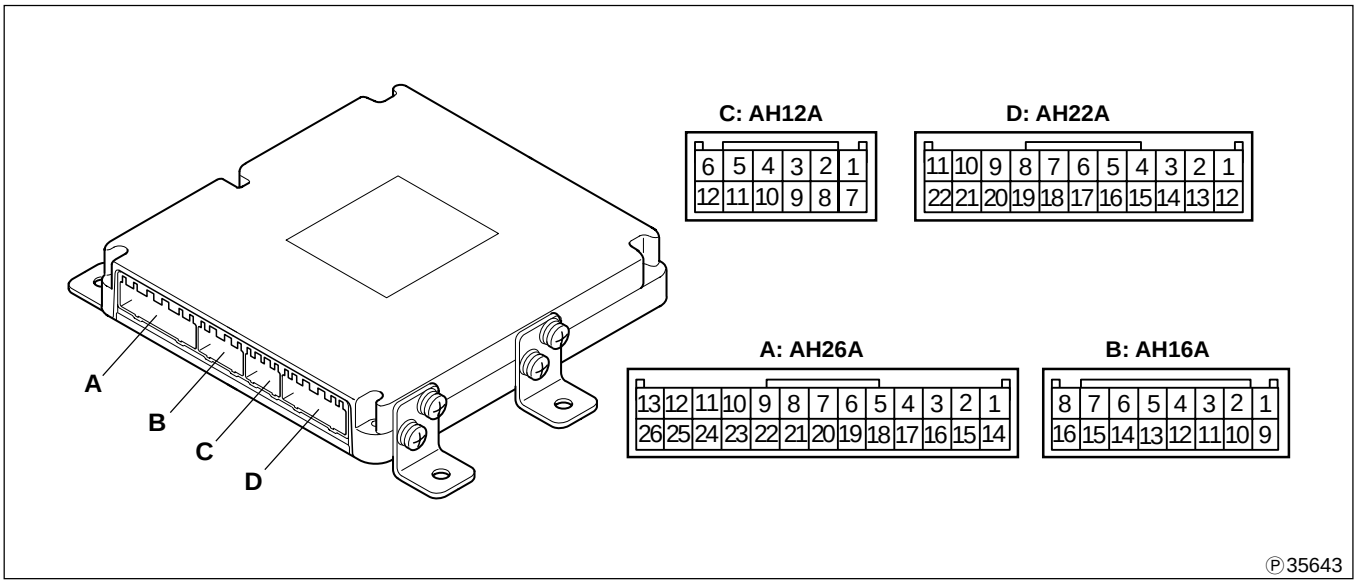
99	A/C SIG	High idling speed
9A	IDL-UP CNCL	Low idling speed

MEMO

7. CHECKS AT CONNECTOR OF ELECTRONIC CONTROL UNIT

This method of checks is useful for checking whether all the signals of the electronic control unit are transmitted without any error through the vehicle side harness and connector.
The numbers in the table correspond to the call numbers used in “4. DIAGNOSTIC TROUBLE CODES AND CHECK ITEMS” for referencing this section.

Pin Configuration of Electronic Control Unit



No.	Item	Reference Page
01	Resistance of TDC (Top dead center) sensor	P13EA-33
02	Resistance of engine speed sensor	
03	Output voltage of accelerator position sensor 1	
04	Output voltage of accelerator position sensor 2	
05	Signal voltage of vehicle speed sensor	
06	Output voltage of idling speed adjustment potentiometer	P13EA-34
09	Voltage of accelerator switch	
11	Voltage of emergency engine stop switch	
12	Resistance of fuel temperature sensor	
13	Voltage of starter switch (start signal)	

Checking Procedures

CAUTION ⚠

Each item is checked by one of two methods; one by disconnecting the connectors and one by leaving the connectors connected.

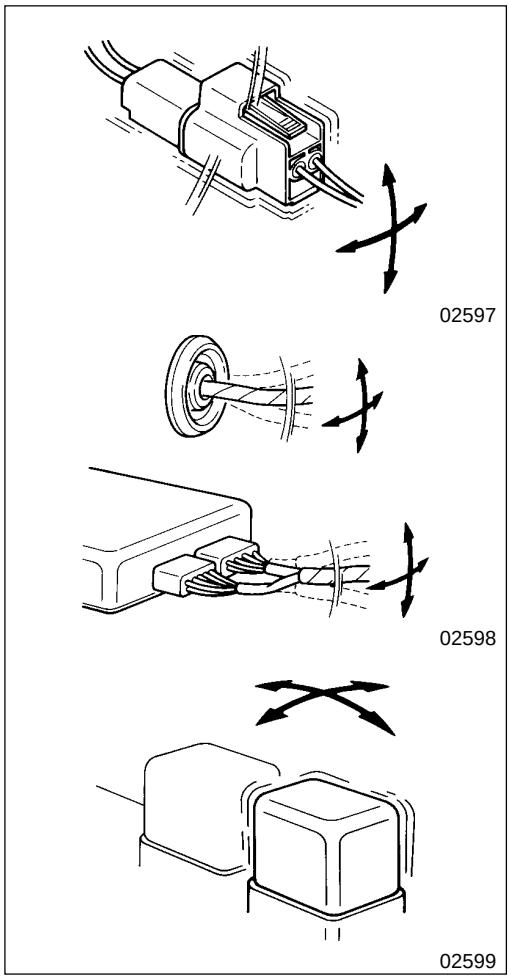
Pay heed to the following points.

- **Be sure not to touch any other pin than the one to be checked.**
  Especially, use utmost care that a short circuit is never produced between pins by the tester.
- **All the illustrations of the connectors in the table show the connectors on the electronic control unit side. Be careful not to confuse the pins with those to be checked.**

Check Item	Checking Procedure
01 Resistance of TDC (Top dead center) sensor	[Conditions] • Starter switch OFF • Disconnect connector and make checks at vehicle side harness connector (25°C {77°F}). [Judging Criteria] Between pins: C⑤ – C⑪ 1.5 ± 0.2 kΩ
02 Resistance of engine speed sensor	[Conditions] • Starter switch OFF • Disconnect connector and make checks at vehicle side harness connector. [Judging Criteria] Between pins: C⑥ – C⑫ 230 ± 25 Ω
03 Output voltage of accelerator pedal position sensor 2	[Conditions] • Starter switch ON • Leave vehicle side harness connected (make checks from back side of connector). [Judging Criteria] Between pins (⊕ — ⊖): B⑬ – B⑧ • When accelerator pedal is released: 0.85V • When accelerator pedal is depressed: 4.15V
04 Output voltage of accelerator pedal position sensor 1	[Conditions] • Starter switch ON • Leave vehicle side harness connected (make checks from back side of connector). [Judging Criteria] Between pins (⊕ — ⊖): B⑪ – B⑥ • When accelerator pedal is released: 0.85V • When accelerator pedal is depressed: 4.15V
05 Signal voltage of vehicle speed sensor	[Conditions] • Starter switch ON • Leave vehicle side harness connected (make checks from back side of vehicle side connector). • Using chassis dynamometer or something else, slowly rotate wheels. [Judging Criteria] Between pins (⊕ — ⊖): A⑦ – A⑬ • High: Approx. 8V • Low : 0.5V or less

Check Item	Checking Procedure
06 Output voltage of idling speed adjustment potentiometer	[Conditions] • Starter switch ON • Leave vehicle side harness connected (make checks from back side of connector). [Judging Criteria] Between pins (⊕ — ⊖): B⑤ – B⑩ • When knob is pulled: Approx. 1 to 3V • When knob is pushed all the way: Approx. 3.6 to 4.3V
09 Voltage of accelerator switch	[Conditions] • Starter switch ON • Leave vehicle side harness connected (make checks from back side of connector). [Judging Criteria] Between pins (⊕ — ⊖): D⑩ – B⑧ • When accelerator pedal is depressed: 0V • When accelerator pedal is released: 5V
11 Voltage of emergency engine stop switch	[Conditions] • Starter switch ON • Leave vehicle side harness connected (make checks from back side of connector). [Judging Criteria] Between pins (⊕ — ⊖): D㉒ – D⑯ • Switch at stop position: 0V • Switch at normal position: 12V
12 Resistance of fuel temperature sensor	[Conditions] • Starter switch OFF • Leave vehicle side harness connected (make checks from back side of connector). [Judging Criteria] Between pins: B⑫ – B⑯ 2.5 ± 1.0 kΩ
13 Voltage of starter switch (starter signal)	[Conditions] • Leave vehicle side harness connected (make checks from back side of connector). • Starter switch (S position) [Judging Criteria] Between pins (⊕ — ⊖): D② – D⑪ 12V

8. CHECKS ON INTERMITTENT TROUBLES

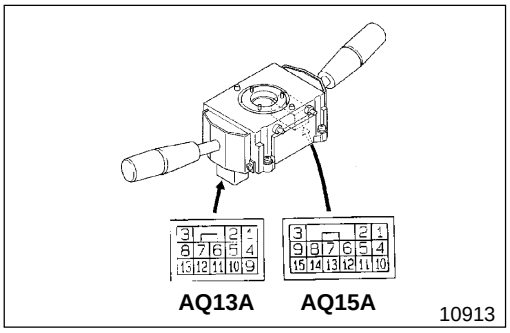


A intermittent trouble often occurs in a specific condition. Therefore, pinpointing the condition will make it easy to estimate the cause. To pinpoint the condition for a intermittent trouble, ask the customer in detail about the driving condition when the trouble occurs, weather, occurrence frequency and symptoms, and reproduce the symptoms of the trouble.
Depending on the condition where the trouble occurs, determine whether the cause of the trouble is vibration, temperature or any other factor.
If the probable cause is vibration, perform the following checks on the relevant connectors harnesses, etc. and check whether the symptoms of the trouble are reproduced.

- Lightly move the connector up and down and to the right and left.
- Lightly move the harness up and down and to the right and left.
- Lightly shake the sensors and other devices by hand.
- Lightly shake the wiring harness located in the moving components such as the suspension.

The connectors and other parts to be checked are identifiable from the descriptions in the Probable Causes or the Checking Procedures for the displayed diagnostic trouble code.

INSPECTION OF ELECTRICAL EQUIPMENT



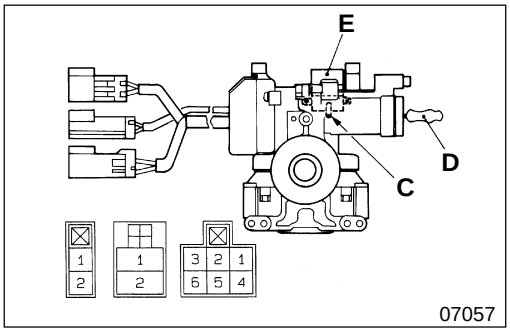
001 Checking Combination Switch

- Perform continuity checks according to the following table.
  AQ15A Connector Connection Table

		⑤	⑥
Exhaust brake switch	OFF		
	ON	○——○	

○——○ : There must be continuity between the pins.

- If there is anything wrong, replace the switch.



002 Checking Starter Switch

- Perform continuity checks according to the following table.
- If there is anything wrong, replace the starter switch. Gr 37

(1) Continuity Check

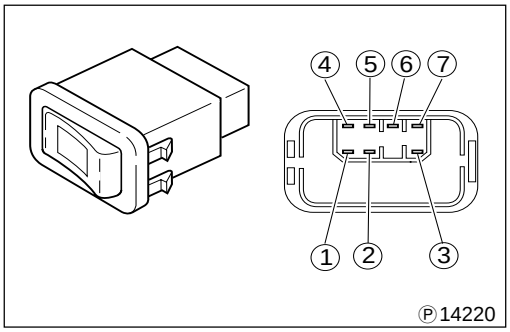
		AP2A		AN6A				
		②	①	③	④	②	⑥	⑤
LOCK	Key not in position							
	Key in position						○——○	
• (OFF)							○——○	
ACC		○———		○			○——○	
ON		○——○		○——○			○——○	
START		○——○		○——○		○	○——○	
		B	M	A	F/M	S	K1	K2

○——○ : There must be continuity between the pins.

(2) Checking Key Interlock Solenoid

	AN2A		LOCK	ACC	ON	START	Remarks
	①	②					
Rotating range of key **D**	⊕——⊖			←———		———→	Plunger **C** is locked and key **D** cannot be removed.
			←———			———→	Plunger **C** is free and key **D** can be removed.

⊕——⊖ : Apply voltage across these pins.
DC 12V
E: Key interlock solenoid



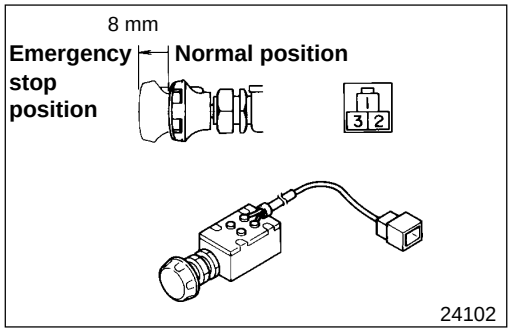
014 Checking Warming Switch

- Perform continuity checks according to the following table.

	①	⑤
ON	○——○	
OFF		

○——○ : There must be continuity between the pins.

- If there is anything wrong, replace the switch.



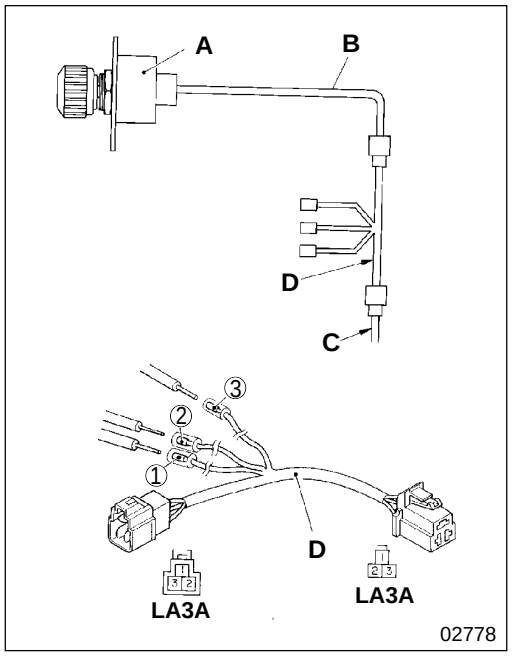
156 Checking Emergency Engine Stop Switch

- Perform continuity checks according to the following table.

	①	②	③
Normal position	○——○		
Emergency stop position	○		○

○——○ : There must be continuity between the pins.

- If there is anything wrong, replace the switch.
  Gr 13A

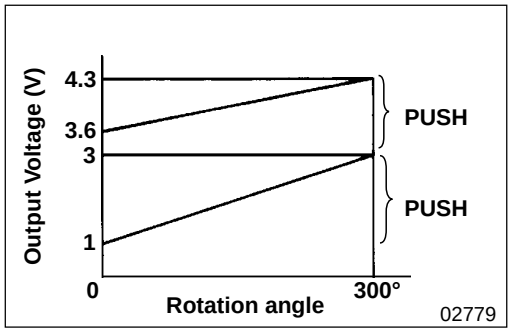


157 Checking Idling Speed Adjustment Potentiometer

- Disconnect the harness **B** of the idling speed adjustment potentiometer **A** from the vehicle side harness **C**, and connect the inspection harness **D** between them.
- Set starter switch to ON.
- Measure the output voltage of the idling speed adjustment potentiometer **A** according to the following table.

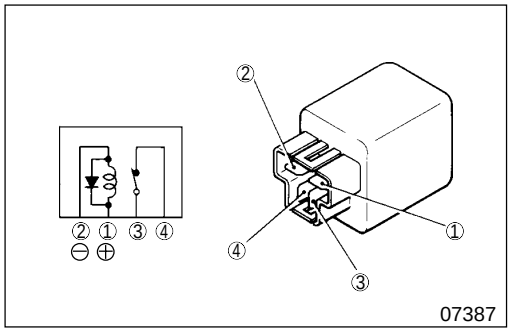
	②	③		
Standard value	⊖	⊕	Output voltage PULL (Knob in pulled position)	1 to 3 V
			Output voltage PUSH (Knob in pushed position)	3.6 to 4.3 V

- If the reading is out of the standard value range, replace the idling speed adjustment potentiometer **A**.



Output Characteristics

INSPECTION OF ELECTRICAL EQUIPMENT



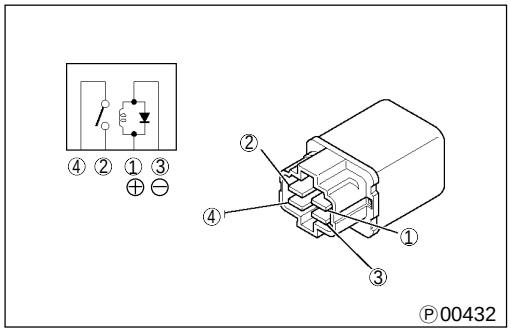
180 Checking Relay (Normally closed type 4-pin)

- Perform continuity and operation checks according to the following table.

	①	②	③	④
When not energized	○	○	○	○
When energized	⊕	⊖	◌	◌

○——○ : There must be continuity between the pins.
⊕——⊖ : Apply a voltage of 12 V DC across these pins.
◌·····◌ : Continuity between these pins must be lost.

- If there is anything wrong, replace the relay.



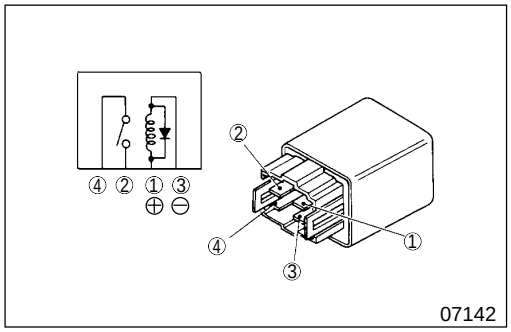
181 Checking Relay (Normally open type 4-pin)

- Perform continuity and operation checks according to the following table.

	①	②	③	④
When not energized	○		○	
When energized	⊕		⊖	○

○——○ : There must be continuity between the pins.
⊕——⊖ : Apply a voltage of 12V DC across these pins.

- If there is anything wrong, replace the relay.



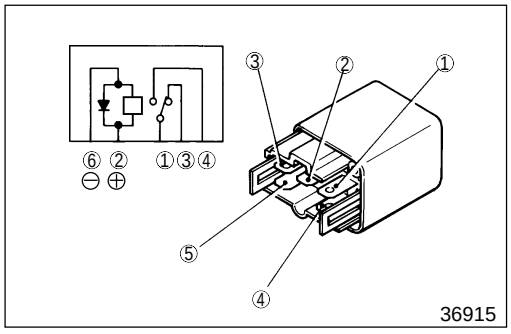
185 Checking Relay (Normally open type 4-pin)

- Perform continuity and operation checks according to the following table.

	①	②	③	④
When not energized	○		○	
When energized	⊕		⊖	○

○——○ : There must be continuity between the pins.
⊕——⊖ : Apply a voltage of 12V DC across these pins.

- If there is anything wrong, replace the relay.



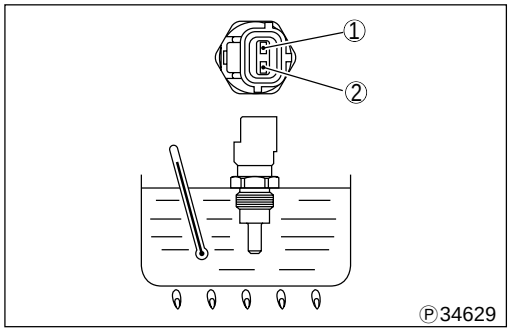
228 Checking Relay (Normally open type 6-pin)

- Perform continuity and operation checks according to the following table.

	①	②	③	④	⑥
When not energized	○		○		
		○			○
When energized	○			○	
		⊕			⊖

○——○ : There must be continuity between the pins.
⊕——⊖ : Apply a voltage of 12 V DC across these pins.

- If there is anything wrong, replace the relay.



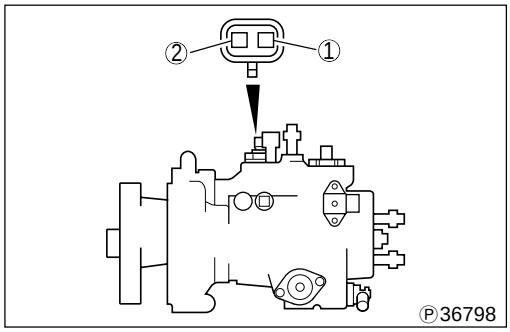
262 **Checking Water Temperature Sensor**

- Put the water temperature sensor in a container filled with engine oil.
- Heat the engine oil to various specified temperatures while stirring the engine oil.
- Measure the resistance value between pins ① and ② (body).

Standard value	20°C {68°F}	2.3 to 2.6 kΩ
	80°C {176°F}	0.30 to 0.34 kΩ

Reference value in parentheses

- If the reading is out of the standard value, replace the water temperature sensor. Gr14A

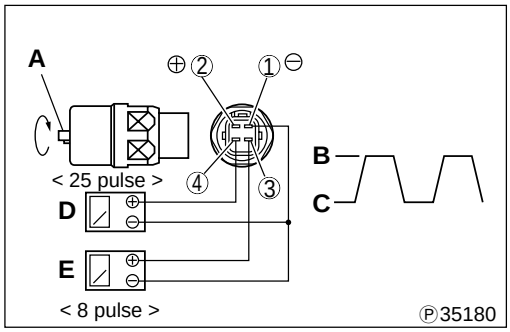


Checking Engine Speed Sensor

263 asure the resistance value between pins ① and ②.

Standard value (at 20°C {68°F})	230 ± 25 Ω

- If the reading is out of the standard value range, replace the engine speed sensor. Ask your DENSO service station to replace it.



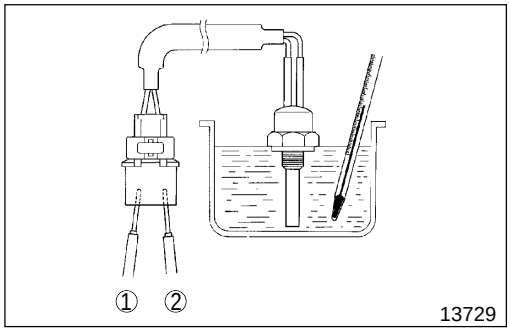
265 **Checking Vehicle Speed Sensor**

- Slowly rotate portion **A** of the vehicle speed sensor with a voltage of 12V DC applied across pins ① and ②.
- Measure the maximum value (high pulse voltage **B**) and minimum value (low pulse voltage **C**) of the voltage generated across following pins.

D: Tester

Standard value	Between pins ① and ③ of 8-pulse output	Low pulse	1.5 V or less
		High pulse	12 V — (0.5 V or less)
	Between pins ① and ④ of 25-pulse output	Low pulse	0.5 V or less
		High pulse	8 ± 1 V

- If the reading is out of the standard value, replace the vehicle speed sensor.

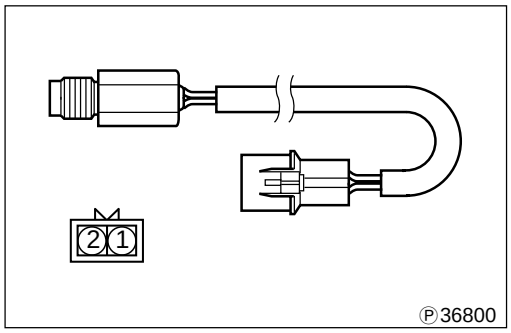


304 **Checking Boost Air Temperature Sensor**

- Place the boost air temperature sensor in glycerin in a container.
- Raise the glycerin temperature to the specified values and stir the glycerin.
- Measure the resistance between pins ① and ②.
- If the measured value deviates from the standard value, replace the boost air temperature sensor. Gr 15A

Standard value	0°C {32°F}	5880 ± 588 Ω
	20°C {68°F}	2450 ± 245 Ω
	80°C {176°F}	322 ± 48 Ω

INSPECTION OF ELECTRICAL EQUIPMENT

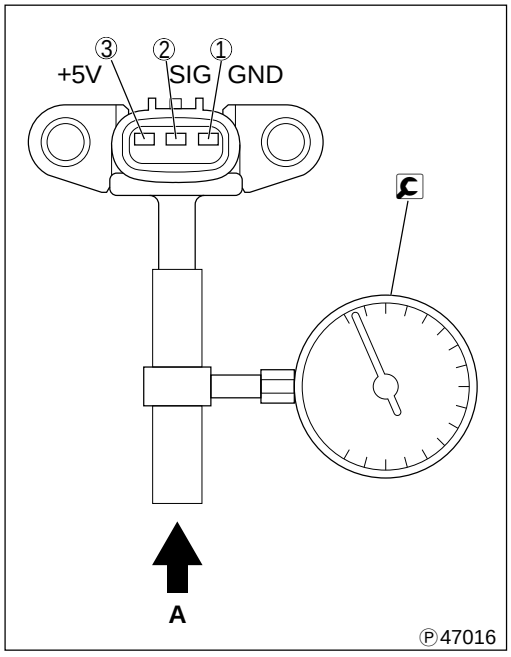


316 Checking TDC (Top dead center) Sensor

- Measure the resistance between pins ① and ②.

Standard value (at 25°C {77°F})	1.4 ± 0.2 kΩ

- If the reading is out of the standard value, replace the TDC (Top dead center) sensor.



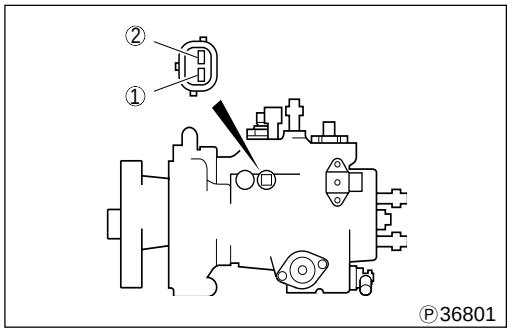
318 Checking Boost Pressure Sensor

- Apply 5V DC between terminals ① and ③.
- Increase air pressure A gradually and measure the voltage between terminals ② and ③.
  : Boost Pressure Gauge

Tool Name and Shape	Part No.
01524	MC061366

	Air pressure	Voltage
Standard value	99 kPa {740 mmHg, 1 kg/cm^2)	2.5V
	232 kPa {1738 mmHg, 2.4 kg/cm^2)	4.5V

- If the measurement deviates from the standard values, replace the boost pressure sensor.

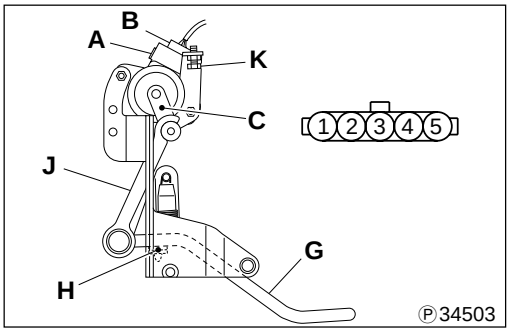


323 Checking Fuel Temperature Sensor

- Measure the resistance between pins ① and ②

Standard value (at 20°C {68°F})	2.5 ± 1.0 kΩ

- If the reading is out of the standard value range, replace the fuel temperature sensor. Ask your DENSO service station to replace it.



324 Checking Accelerator Position Sensor

[Inspection]

- Set the starter switch to ON.
- Measure the output voltage of the accelerator position sensor **A** from the back side of harness connector **B** according to the following table.

Lever **C** position		Accelerator Position Sensor 1		Accelerator Position Sensor 2		Accelerator Switch	
		②	①	②	⑤	②	③
		⊕	⊖	⊕	⊖	⊕	⊖
Standard value	Idling position **D**	0.85 ± 0.1 V		0.85 ± 0.1 V		4V or more	
	Accelerator switch operating position **E**	1.0 ± 0.24 V		1.0 ± 0.24 V		1V or less	
	Full load position **F**	4.15 ± 0.1 V		4.15 ± 0.1 V			

○——○ : There must be continuity between the pins.

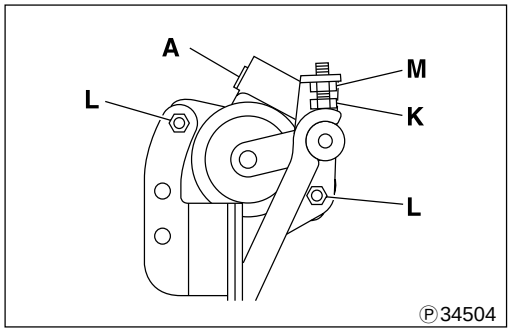
⊕ , ⊖ : Polarity when voltage is measured

D: Where accelerator control arm **G** is in contact with stopper **H**

E: Where voltage across pins ② and ③ is reduced to 1V or less by slowly depressing the accelerator pedal

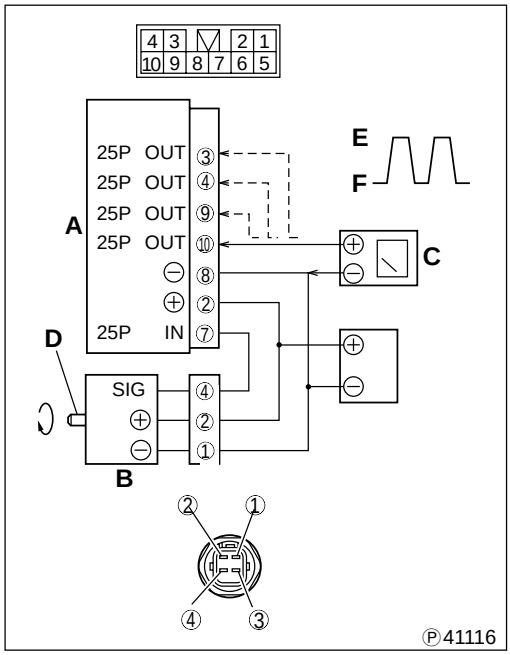
F: Where accelerator control extension **J** is in contact with stopper bolt **K**

- If the output voltage is out of the standard value range, adjust by the following procedures.



[Adjustment]

- Adjust the output voltage at the idling position **D** by loosening the screw **L** and moving the accelerator position sensor **A**.
  After the adjustment, retighten the screw.
- Adjust the output voltage at the full load position **F** by loosening the nut **M** and adjusting the stopper bolt **K**.
  After the adjustment, lock the bolt with the nut.

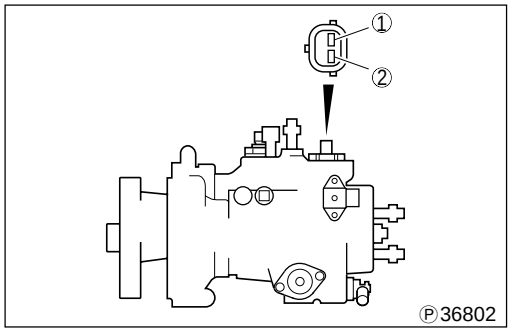


351 Checking Pulse Divider

- Wire the pulse divider **A** as shown.
  B: Vehicle speed sensor (Use 25-pulse pins.)
  C: Tester
- Slowly rotate the shaft **D** of the vehicle speed sensor **B** by hand and measure the maximum value (high pulse voltage **E**) and the minimum value (low pulse voltage **F**) of the voltage generated across each of the output pins (③, ④, ⑨, ⑩) and pin ⑧ of the pulse divider **A**.

Standard value	Low pulse voltage **F**	0.5V or less
	High pulse voltage **E**	8 ± 1 V

- If the reading is out of the standard value, replace the pulse divider **A**.

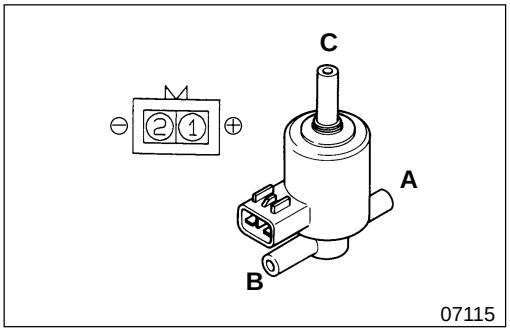


536 Checking Spill Valve

- Measure the resistance between pins ① and ②.

Standard value (at 20°C {68°F})	1.5 ± 0.5 Ω

- If the reading is out of the standard value range, replace the spill valve. Ask your DENSO service station to replace it.



565 Checking 3-Way Magnet Valve

Perform the following checks. If there is anything wrong, replace the 3-way magnet valve.

(1) Operation Check

- Apply DC voltage across pins ① and ② and slowly increase, beginning at 0V.
- Measure the voltage at the time when the 3-way magnet valve is operated.
  (Determine whether the magnet valve is ON or OFF on the basis of its operating sound.)

Standard value (Lowest operating voltage)	11 V or less

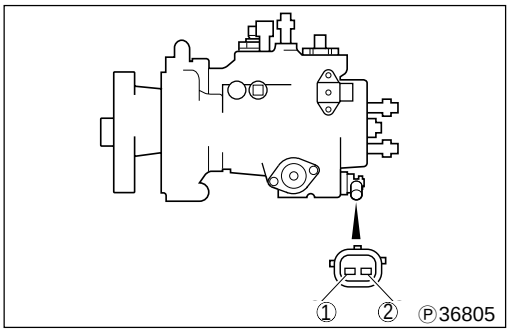
(2) Continuity and Air Tightness Checks

Perform continuity checks according to the following table.

	Input Port **A**	Output Port **B**	Exhaust Port **C**
ON	○———	———○	
OFF		○———	———○

○——○ : There must be continuity between the pins.

Negative pressure at the time of check: 100 kPa {30 in.Hg, 750 mmHg}



584 Checking Timer Control Valve

- Measure the resistance between pins ① and ②.

Standard value (at 20°C {68°F})	11.3 ± 3 Ω

- If the reading is out of the standard value range, replace the timer control valve. Ask your DENSO service station to replace it.

- The electronic governor and pre-stroke control injection pump system combines an electronic governor **10** with an injection pump **6** that has an electronically controlled pre-stroke adjustment feature.
- The injection pump's plunger lift speed varies in accordance with the engine speed, causing concomitant variations in the injection pipe pressure.
- Variations in the injection pipe pressure make it difficult to achieve an optimum spray from the injection nozzles and the optimum air/fuel mixture.
- To compensate for changes in the injection pipe pressure, the injection pump plunger pre-stroke is increased at low and mid- range speeds, thus ensuring that fuel injection takes place late in the cam lift, when plunger movement is relatively fast.
- At high speeds, the plunger pre-stroke is decreased, thus ensuring that fuel injection takes place in early in the cam lift, when plunger movement is relatively slow. Excessive increases in injection pipe pressure are thus prevented.
- By adjusting the plunger pre-stroke in this manner, the pre-stroke control injection pump **6** ensures that the spray and air/ fuel mixture are always optimally suited to combustion.
- The overall benefits are higher engine torque and cleaner exhaust emissions than are possible with a conventional injection pump.
- Control operations are performed by the engine electronic control unit **35**, which receives data from sensors on the engine and other vehicle components, processes them, and issues appropriate drive signals to the pre-stroke actuator **5** (located at the rear of the injection pump) and to the linear DC motor **9** (located inside the electronic governor).

The system's control functions (including auxiliary functions) are shown in the following table.

Item	Operation	Data source	
		Sensor(s)	Data signal(s)
Fuel injection rate control	The fuel injection rate is optimized to match engine operating conditions. P13EB-6	3, 7, 18, 19, 21, 31	Ⓓ , Ⓖ , Ⓠ , Ⓡ , Ⓣ , ⓐ
Pre-stroke control	The timing sleeve position is altered, thereby changing the pre-stroke and advancing the fuel injection timing. P13EB-7	3, 5, 7, 18, 32	Ⓓ , Ⓐ , Ⓑ , Ⓖ , Ⓠ , ⓑ
* Control rack preliminary operation	In cold weather and other conditions that are unfavorable for engine startup, the control rod is caused to move slightly in the fuel increase direction, thus enhancing startability. This operation takes place when the starter switch is turned ON.	1, 18, 19, 32	ⓔ , Ⓠ , Ⓡ , ⓑ

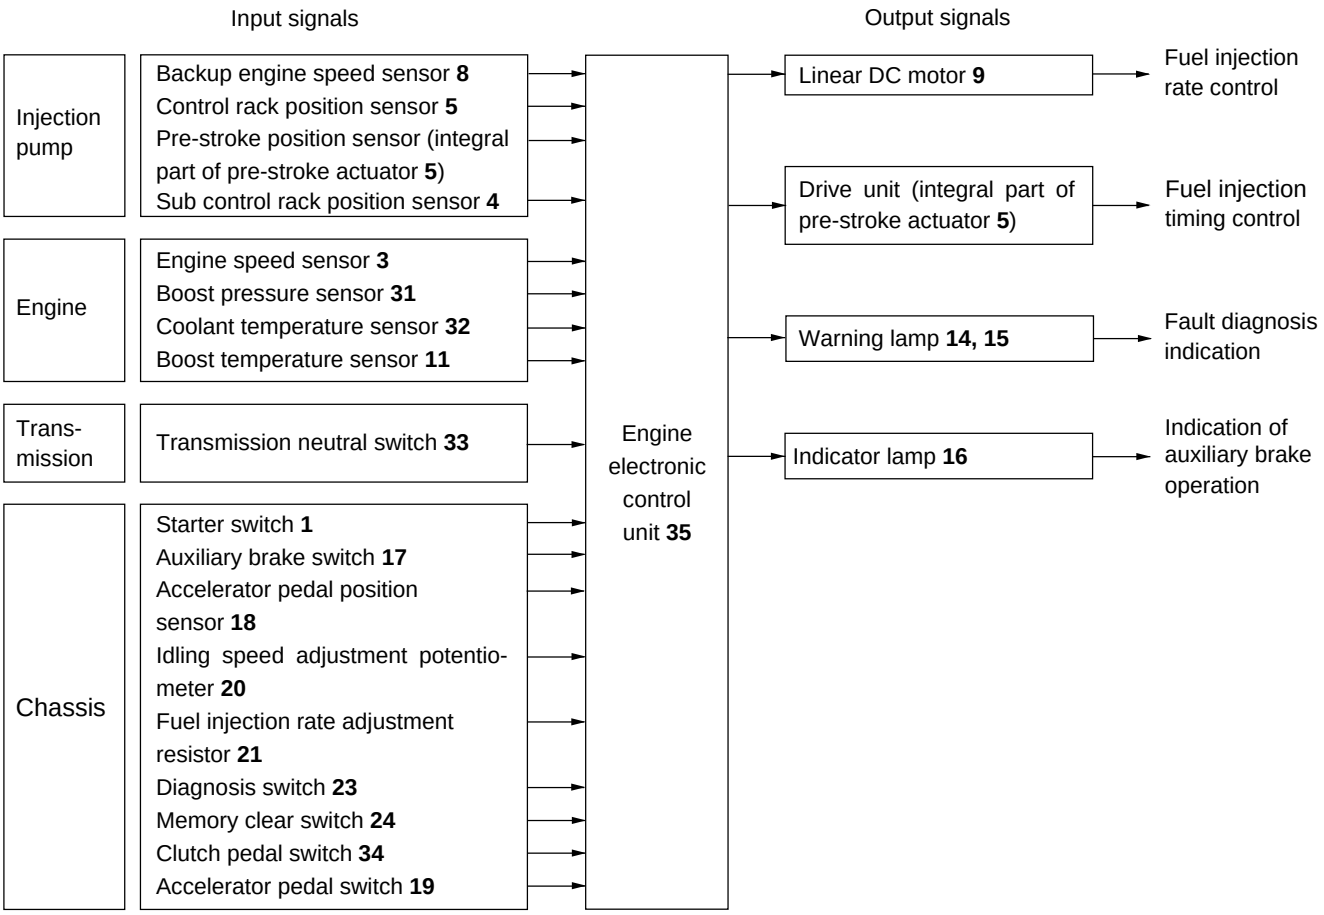
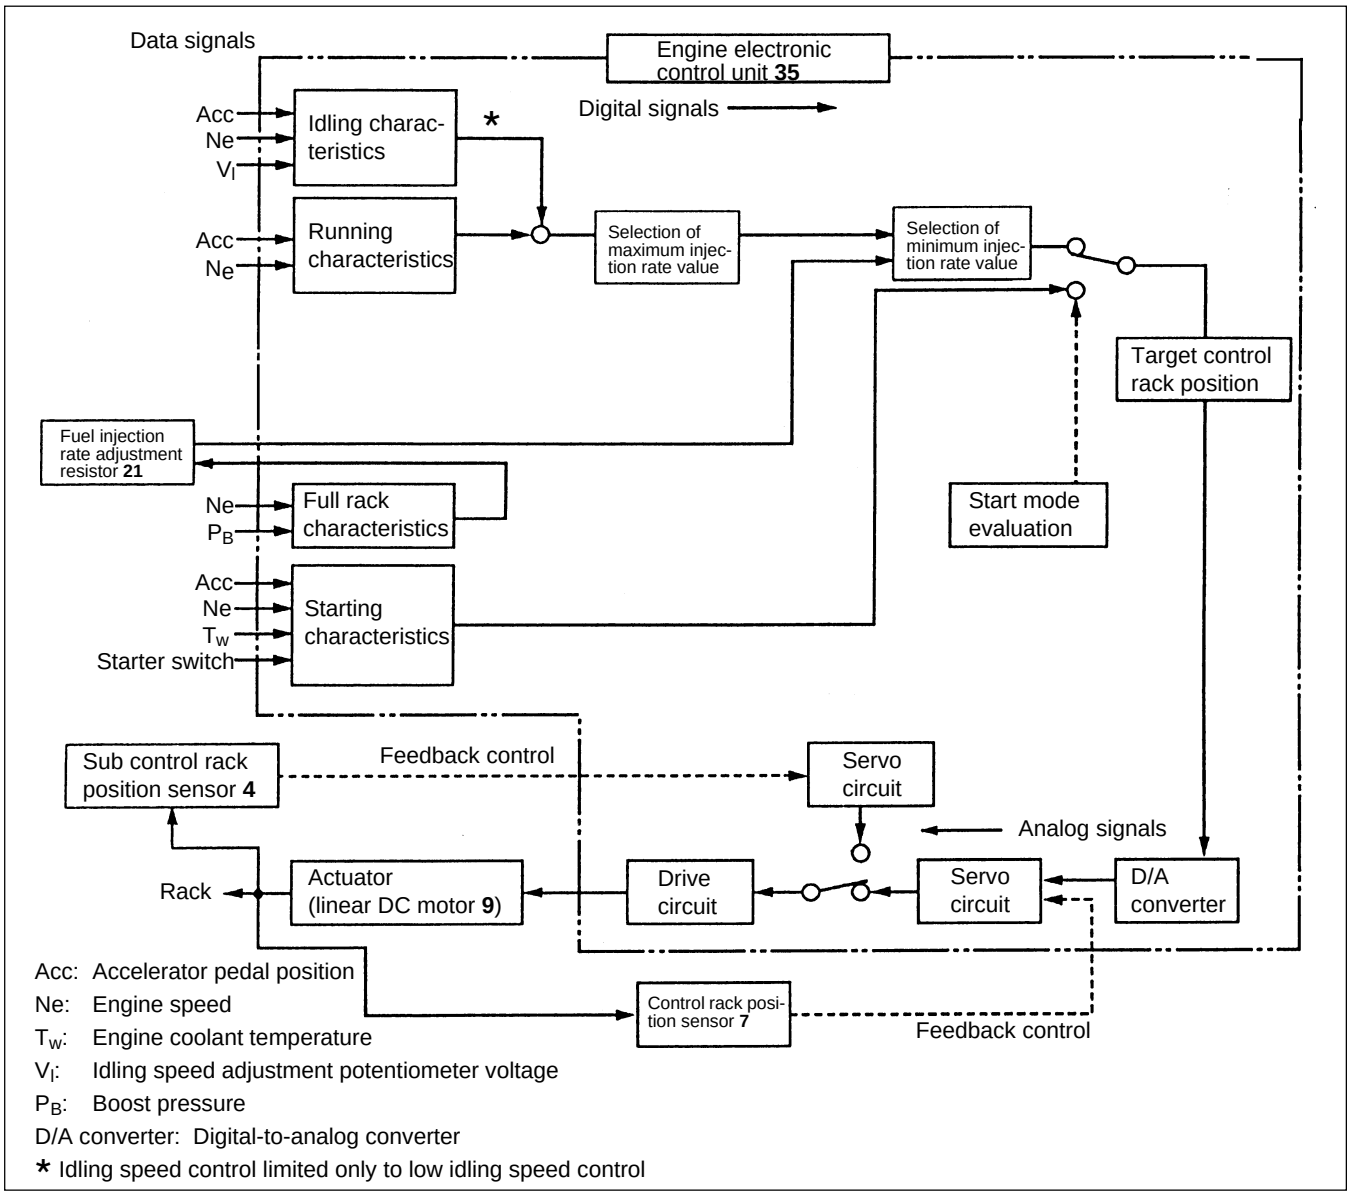
System Block Diagram



● Fuel Injection Rate Control



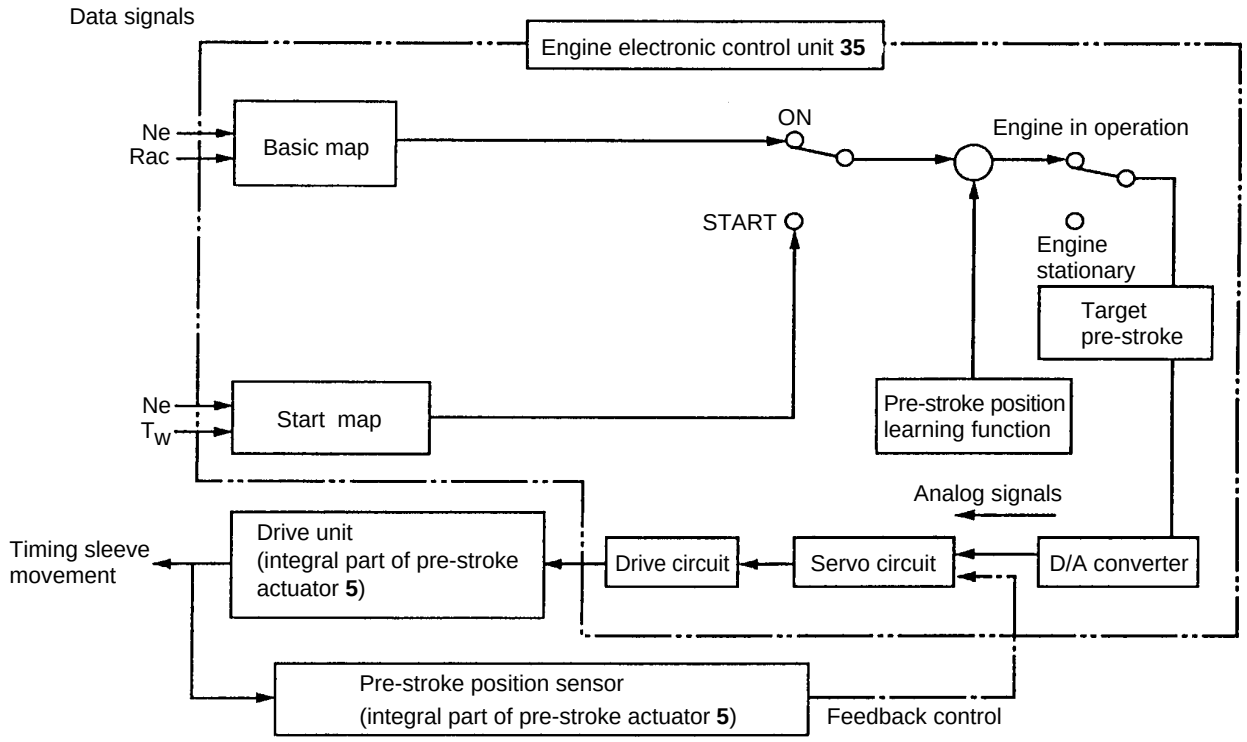
Operation of engine electronic control unit 35

- During engine operation, control is effected in accordance with the idling characteristics and running characteristics. The maximum fuel injection rate value is selected in accordance with the output signals.
- After this selection, the control unit calculates and determines the minimum injection rate to prevent the injection rate selected in accordance with the full rack characteristics from exceeding the maximum injection rate. The target control rack position is thus determined. (During engine startup, control is effected in accordance with the starting characteristics with the target rack position determined directly in accordance with the data signals.)
- The determined control rack position signal is converted into a continuous analog signal. By way of the servo circuit and drive circuit, the signal is applied to the linear DC motor **9**, which moves the rack.

Operation of control rack position sensor 7

- The control rack position sensor **7** monitors the operation of the linear DC motor **9**. In accordance with the position of the control rack, the sensor determines whether the linear DC motor is operating in accordance with the target, and it transmits feedback signals to the engine electronic control unit **35**.
- In accordance with the feedback signals, the engine electronic control unit **35** calculates the actual control rack position. If the actual position differs from the target, the control unit issues a correction command.
- Through repetition of this process, the system ensures that the control rack position complies with the target at all times.

● Pre-stroke control



Rac: Control rack position
Ne: Engine speed
T_W: Engine coolant temperature
D/A converter: Digital-to-analog converter

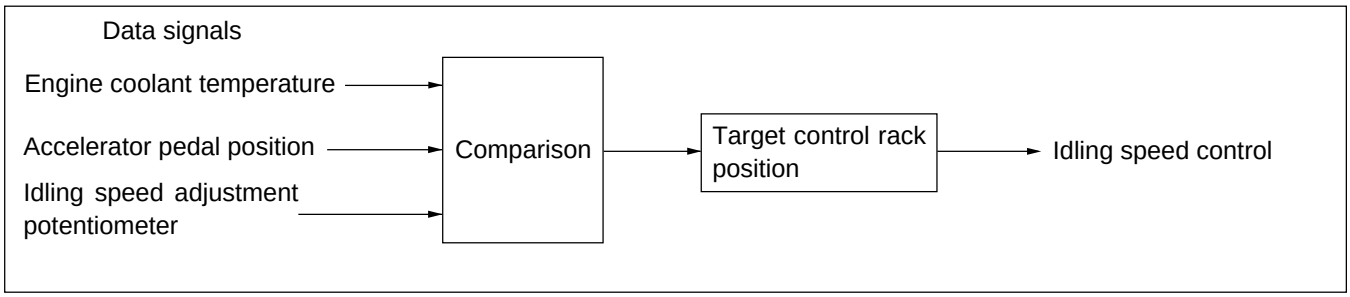
Operation of engine electronic control unit 35

- During engine operation, control is effected in accordance with the basic map.
- The pre-stroke position learning function compensates for pre-stroke position sensor adjustment errors and other injection pump errors using the pre-stroke position sensor output voltage, thereby enabling determination of the target pre-stroke.
- The determined target pre-stroke value is converted into a continuous analog signal. By way of the servo circuit and drive circuit, the signal is applied to the drive unit. The drive unit moves the timing sleeve to alter the pre-stroke.
- During engine startup, control is effected in accordance with the start map.

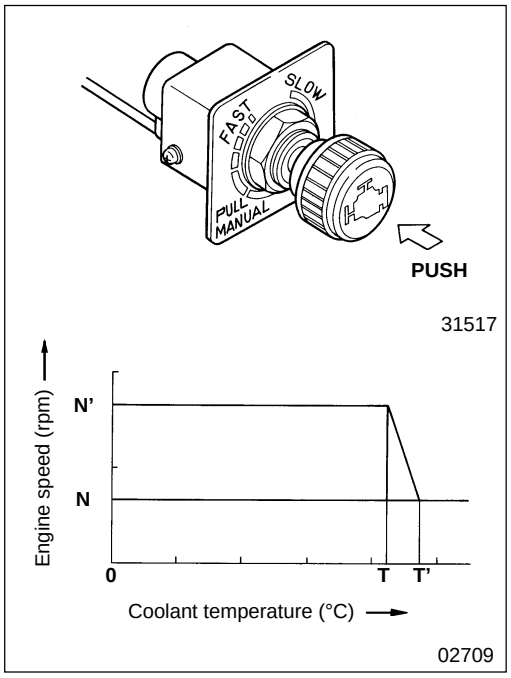
Operation of pre-stroke position sensor (integral part of pre-stroke actuator 5)

- The pre-stroke position sensor monitors the operation of the drive unit. In accordance with the position of the timing sleeve, the sensor determines whether pre-stroke control is being performed in accordance with the target, and it transmits feedback signals to the engine electronic control unit **35**.
- In accordance with the feedback signals, the engine electronic control unit **35** calculates the actual timing sleeve position. If the actual position differs from the target, the control unit issues a correction command.
- Through repetition of this process, the system ensures that the timing sleeve position complies with the target at all times. The appropriate pre-stroke is achieved as a result.

● Warmup time shortening function

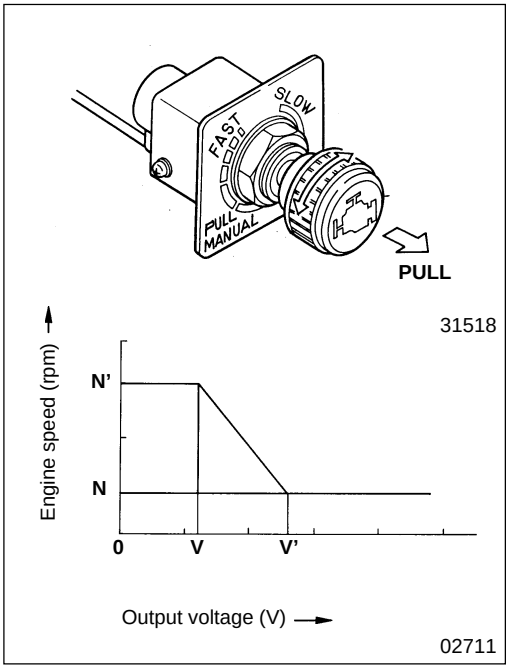


The warmup time shortening function increases the engine's idling speed in accordance with the coolant temperature, thereby shortening the time required for the engine to warm up. Control is effected automatically or manually in accordance with the position of the idling speed adjustment potentiometer **20**. Automatic control is selected by pushing the potentiometer, and manual control is selected by pulling it.



Automatic control (Potentiometer pushed)

- Automatic control is selected when the idling speed adjustment potentiometer **20** is pushed.
- When the coolant temperature is low, the engine's idling speed is automatically increased to shorten the time required for warmup.
- If the coolant temperature increases from **T** to **T'** (see the graph), the engine speed is decreased from **N'** to **N**, thus returning to its standard idling level.



Manual control (Potentiometer pulled)

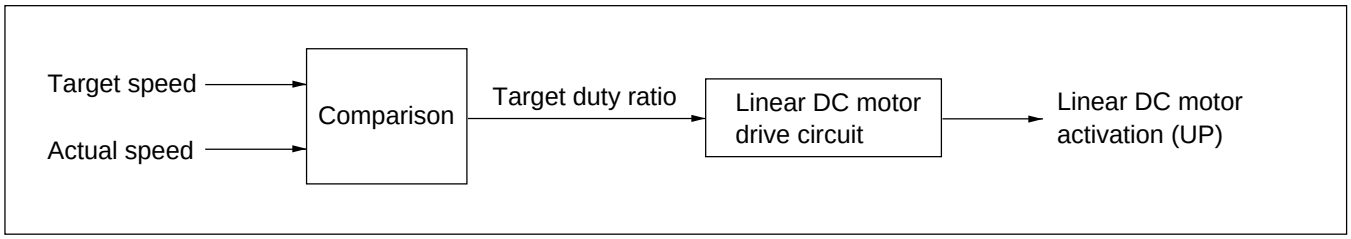
- When the idling speed adjustment potentiometer **20** is pulled, the automatic mechanism is deselected. The driver can then adjust the idling speed as desired by rotating the potentiometer. (Rotation of the potentiometer causes the potentiometer's output voltage to change accordingly.)
- With the output voltage between **0** and **V**, the engine speed stays at the **N** to **N'** level.
- If the output voltage is increased from **V** to **V'** (see the graph), the engine speed decreases from **N'** until it reaches its standard idling level **N**.

● Emergency vehicle operation function (Used of event in control rack position sensor fault)

Fault in Control rack position sensor 7

In the event of a fault in the control rack position sensor **7**, detection of the control rack position is performed using the sub control rack position sensor **4**. This enables more-or-less normal vehicle operation.

Fault in control rack position sensor 7 and sub control rack position sensor 4



In the event of faults in both the control rack position sensor **7** and sub control rack position sensor **4**, the position of the rack, which is controlled by the linear DC motor **9**, cannot be sensed directly. The fuel injection rate cannot be controlled normally with the engine in this condition. As an emergency measure, therefore, control operations are performed in accordance with engine speed data signals only. For this function, target engine speeds for given degrees of accelerator pedal depression are pre-programmed into the engine electronic control unit **35**. Control is effected as follows:

- The target engine speed is compared with the actual engine speed (this is indicated by the engine speed sensor **3**).
- The target duty ratio is determined in accordance with the result of the comparison. In accordance with the target duty ratio, a drive signal is transmitted to the UP-side (speed increasing side) circuit to effect control over the engine speed. If the target engine speed exceeds the actual engine speed or vice versa, the UP-side circuit's ON time period is altered such that the target engine speed is maintained.

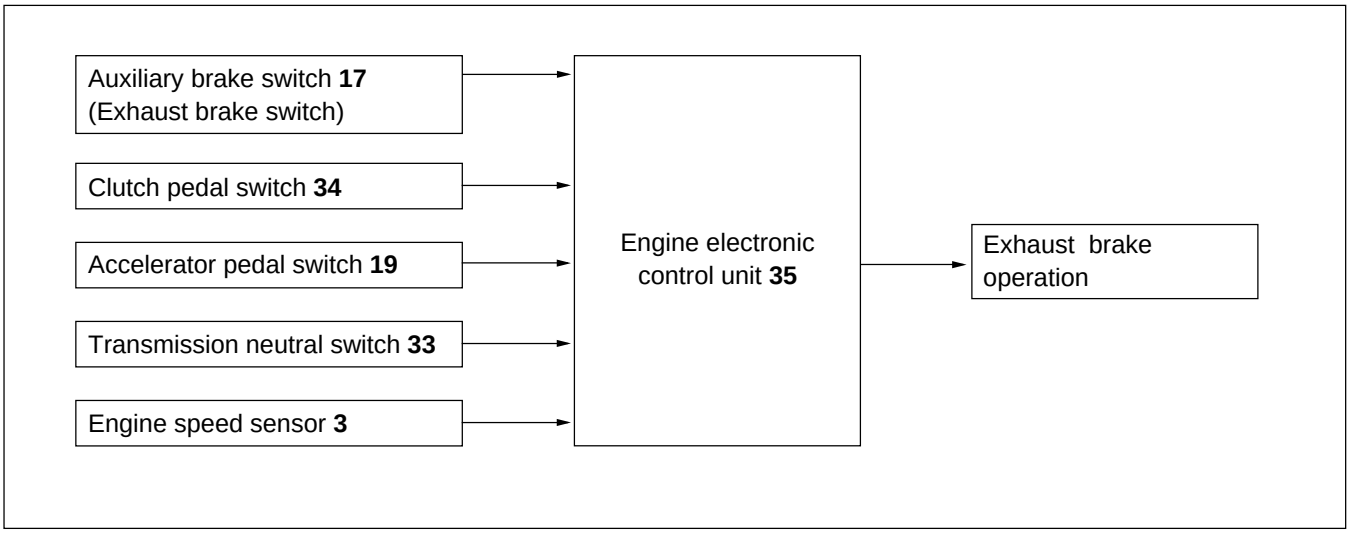
The target duty ratio is the ratio of the time periods during which the linear DC motor's UP-side and DOWN-side (speed decreasing side) circuits are energized. It is calculated as follows:

$$\text{Duty ratio} = \frac{\text{UP-side circuit ON time period}}{\text{UP-side circuit ON time period + DOWN-side circuit ON time period}} \times 100\%$$

CAUTION ⚠

When this function is activated, the warning lamp 14, 15 flashes to indicate that the engine must be inspected immediately. 🕮 **P13EB-20**

● Auxiliary brake control function



The auxiliary brake control function acts upon the auxiliary braking devices, i.e., the exhaust brake, when the following conditions are satisfied:

- Clutch pedal switch **34**: OFF (clutch pedal released)
- Accelerator pedal switch **19**: ON (accelerator pedal released)
- Transmission neutral switch **33**: ON (transmission not in neutral)

Engine electronic control unit

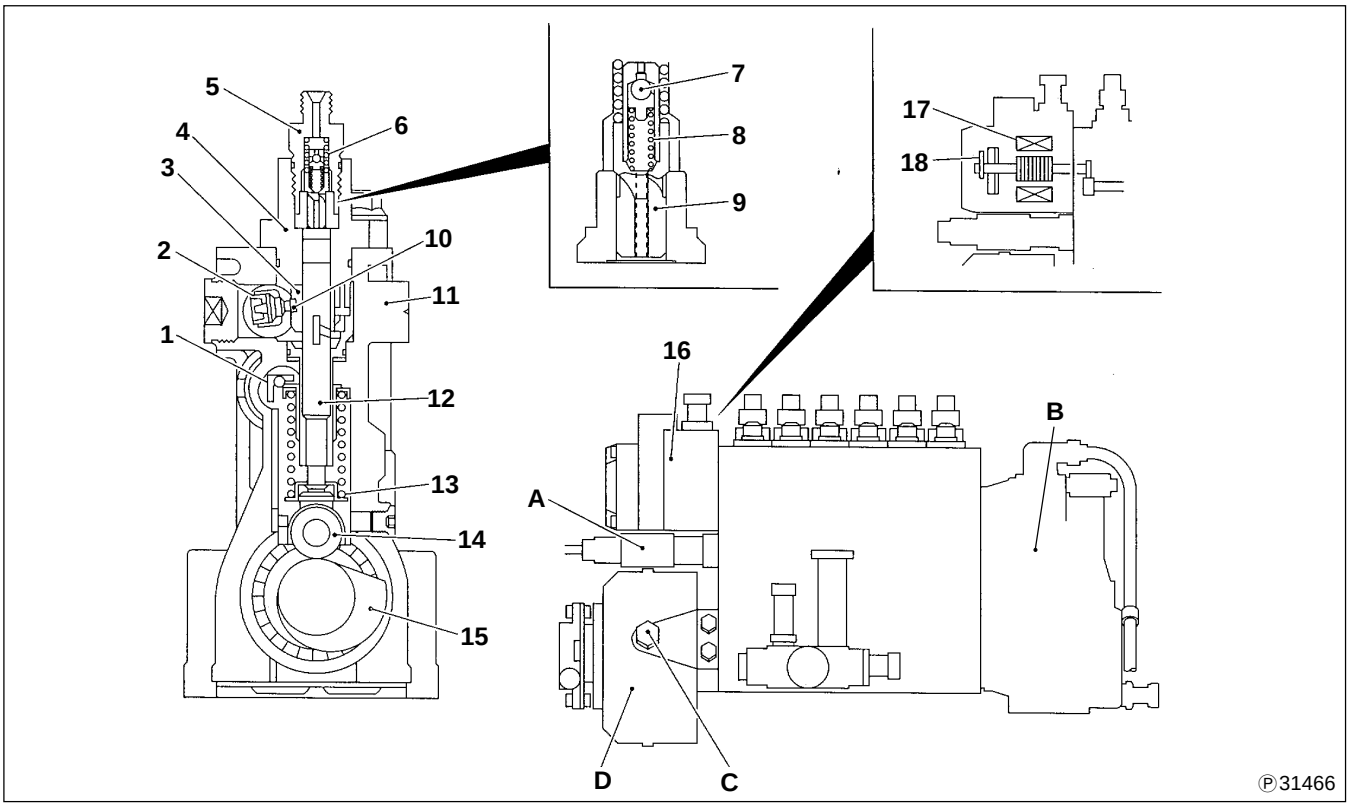
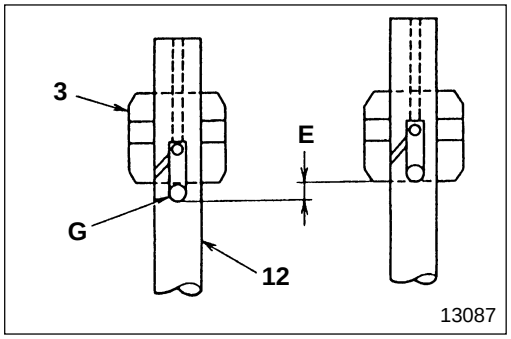
Pre-stroke Control Injection Pump Unit



1 Control rod
2 Timing rod
3 Timing sleeve
4 Plunger barrel
5 Delivery valve holder
6 Delivery valve spring
7 Ball
8 Spring
9 Delivery valve
10 Pin
11 Pump housing
12 Plunger
13 Plunger spring
14 Tappet
15 Camshaft
16 Pre-stroke actuator
17 Drive unit
18 Pre-stroke position sensor

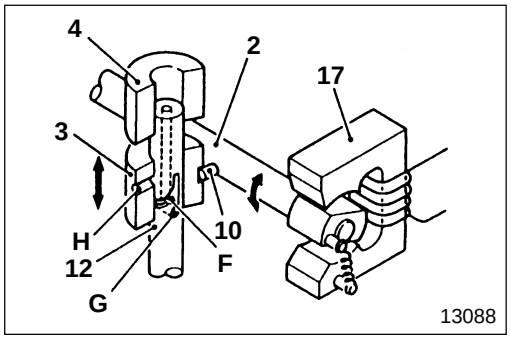
A : Sub-control rod position sensor
B : Electronic governor
C : Engine speed sensor
D : Mechanical timer

- The injection pump is provided with a mechanism that enables variation of the plunger pre-stroke.
- Variation of the plunger pre-stroke enables the creation of air/fuel mixture and spray conditions that are optimally suited to combustion. The overall benefits are higher engine torque and cleaner exhaust emissions than are possible with a conventional injection pump.



Pre-stroke

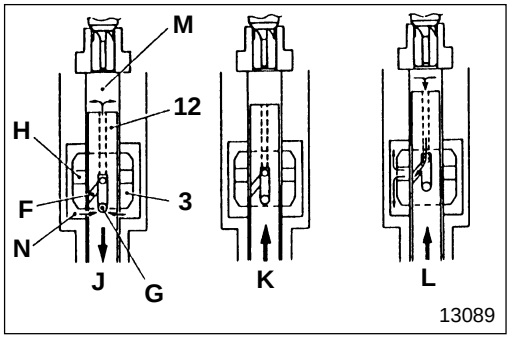
The term “pre-stroke” refers to the stroke dimension **E** of a plunger **12** from the plunger’s bottom dead center position to the point at which its fuel inlet hole **G** is closed by the timing sleeve **3** and fuel feed begins. This stroke dimension is constant in a conventional injection pump.



Variable pre-stroke mechanism

F : Lead
G : Inlet hole
H : Outlet hole

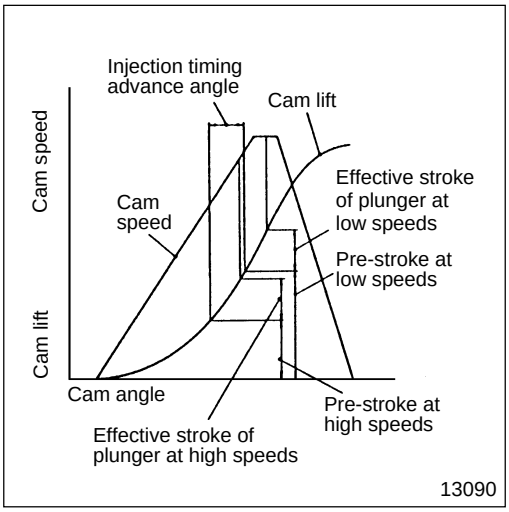
- In contrast to the fixed plunger barrel arrangement of a conventional injection pump, each plunger barrel **4** in the pre-stroke control type injection pump incorporates a vertically moveable timing sleeve **3**.
- Movement of the timing sleeve is effected by the timing rod **2**, pin **10**, and drive unit **17**.
- When the drive unit **17** rotates the timing rod **2**, the pin **10** moves the timing sleeve **3** up or down accordingly.
- Since the timing sleeve **3** incorporates a fuel outlet hole **H**, the pre-stroke changes in accordance with the movement of the timing sleeve.



Fuel feed action

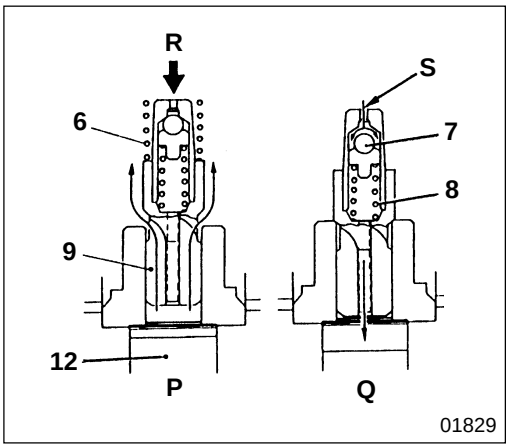
J : Fuel intake
K : Start of pressurization
L : End of pressure feed

- As the plunger **12** moves downward from its top dead center position and its inlet hole **G** opens, fuel flows into the pressure chamber **M** owing to the vacuum pressure created by the plunger’s downward movement and the fuel pressure produced by the feed pump.
- When the plunger **12** moves upward but its lift dimension is still small, the fuel in the pressure chamber **M** escapes into the sump **N** through the inlet hole **G** in the plunger. Thus, the pressure in the pressure chamber does not increase.
- As the plunger **12** moves further upward and the inlet hole **G** is closed by the timing sleeve **3**, the fuel starts to be pressurized. The pressure increases as the plunger moves upward, and the injection pump starts to feed the pressurized fuel to each injector.
- When the lead **F** in the plunger **12** becomes aligned with the outlet hole **H** in the timing sleeve **3**, the fuel in the pressure chamber **M** returns to the sump **N**, thus completing the pressure feed cycle.
- Adjustment of the injected fuel volume is achieved by rotation of the plunger **12**, which alters the position of the outlet hole **H** in the timing sleeve **3** relative to the lead **F** in the plunger.



Fuel injection timing and fuel injection characteristics

- Changes in the position of the timing sleeve **3** cause concomitant changes in the pre-stroke, which in turn alter the fuel injection timing.
- A decrease in the pre-stroke causes the fuel inlet hole **G** in the plunger **12** to close earlier such that the fuel injection timing is advanced.
- This arrangement provides highly responsive control over the injection timing and thus enhances the engine's cold startability.

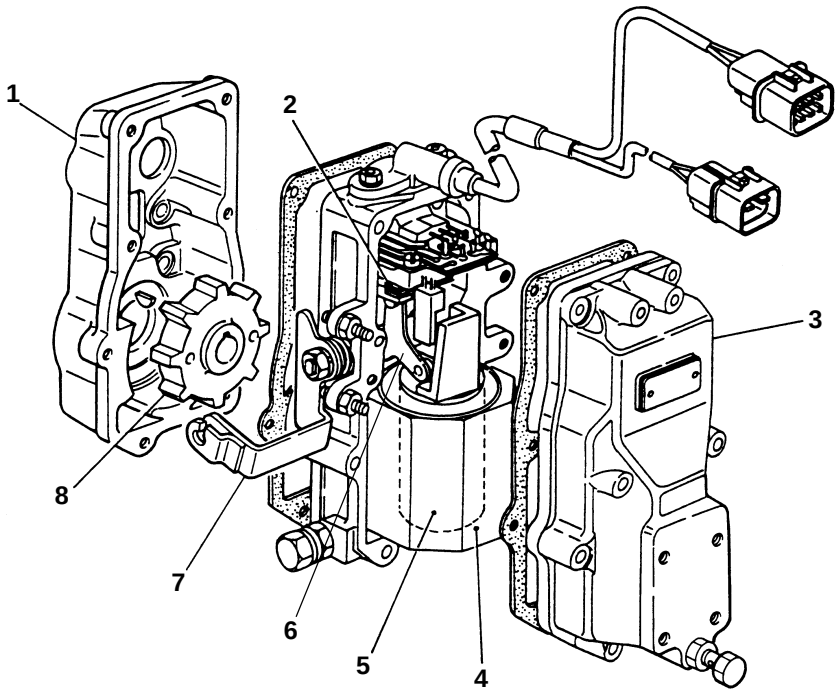


Delivery valve

P : Start of pressure feed
Q : End of pressure feed

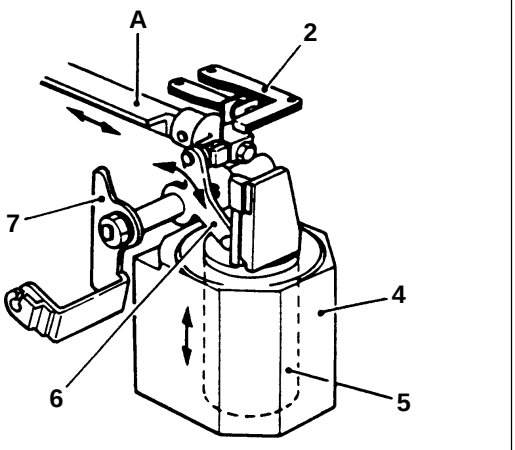
- The delivery valve **9** keeps constant the residual pressure **R** in the injection pipe at all engine speeds. This operation prevents the generation of bubbles in the fuel (this is known as "cavitation") and thus enables fuel injection at a high pressure.
- When the plunger **12** moves upward and the pressure of the fuel pushed by the plunger overcomes the residual pressure **R** in the injection pipe and the preset force of the delivery valve spring **2**, the delivery valve is pushed upward and delivery of the pressurized fuel begins.
- As soon as fuel delivery is complete, the fuel in the injection pipe rapidly returns to the plunger side and the delivery valve closes.
- Surplus fuel slowly returns through the orifice **S**, thus reducing the pressure in the injection pipe.
- When the preset force of the spring **8** in the delivery valve **9** is exactly offset by the pressure in the injection pipe, the ball **7** closes the orifice **S**, thus ensuring that the residual pressure **R** in the injection pipe remains constant.

Electronic Governor



31467

1 Housing
2 Control rack position sensor
3 Cover
4 Coil assembly
5 Linear DC motor
6 Link
7 Emergency engine stop lever
8 Sensing gear



31468

● Linear DC motor

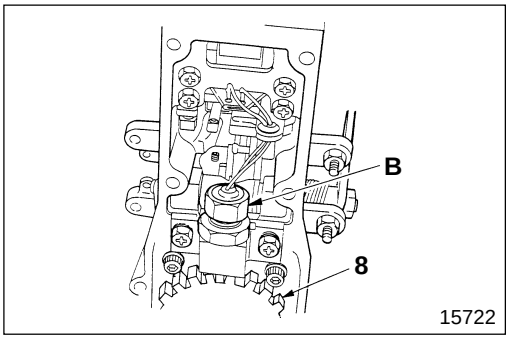
The linear DC motor **5** moves the coil assembly **4** vertically in accordance with signals from the engine electronic control unit. Via the link **6**, this movement is transmitted to the control rack **A**, which moves longitudinally to increase and decrease the fuel quantity.

● Control rack position sensor

The control rack position sensor **2** senses whether the control rack **A** is moved to the correct position by the linear DC motor **5**. In the event of a discrepancy between the actual control rack position and the target control rack position (this is determined by the engine electronic control unit), the control unit instructs the linear DC motor to perform a corrective movement.

● **Emergency engine stop lever**

The emergency engine stop lever **7** is connected to the link **6**. Via a cable, it enables the link to be moved from the driver's seat. In the event of a system fault that prevents the engine from being stopped normally, operation of the emergency engine stop lever forces the control rack **A** to move to the position at which fuel injection is terminated. This operation takes place irrespective of the position of the linear DC motor **5**.



● **Backup engine speed sensor**

The backup engine speed sensor **B** is fitted inside the governor. It converts the rotation speed of the sensing gear **8** into electric signals and feeds the signals to the engine electronic control unit to provide an indication of the engine speed.

TROUBLESHOOTING

1. INSPECTION PROCEDURES

Diagnostic Function

- Whenever the starter switch is placed at ON, the diagnostic function is activated to check all the sensors, etc. If any of them is found faulty, the warning lamp in the meter cluster is lit to alert the driver. At the same time, the fault location is stored in memory, and the system enters the backup mode.

Warning Lamp Indications

	(Red)	(Amber)
Safety-critical error (Vehicle must not be driven)	ON	OFF
Non-safety-critical error (Vehicle can be driven despite poor control feeling)	OFF	ON

- The stored fault location can be read as a diagnostic trouble code by the Multi-Use Tester II or the diagnosis switch.

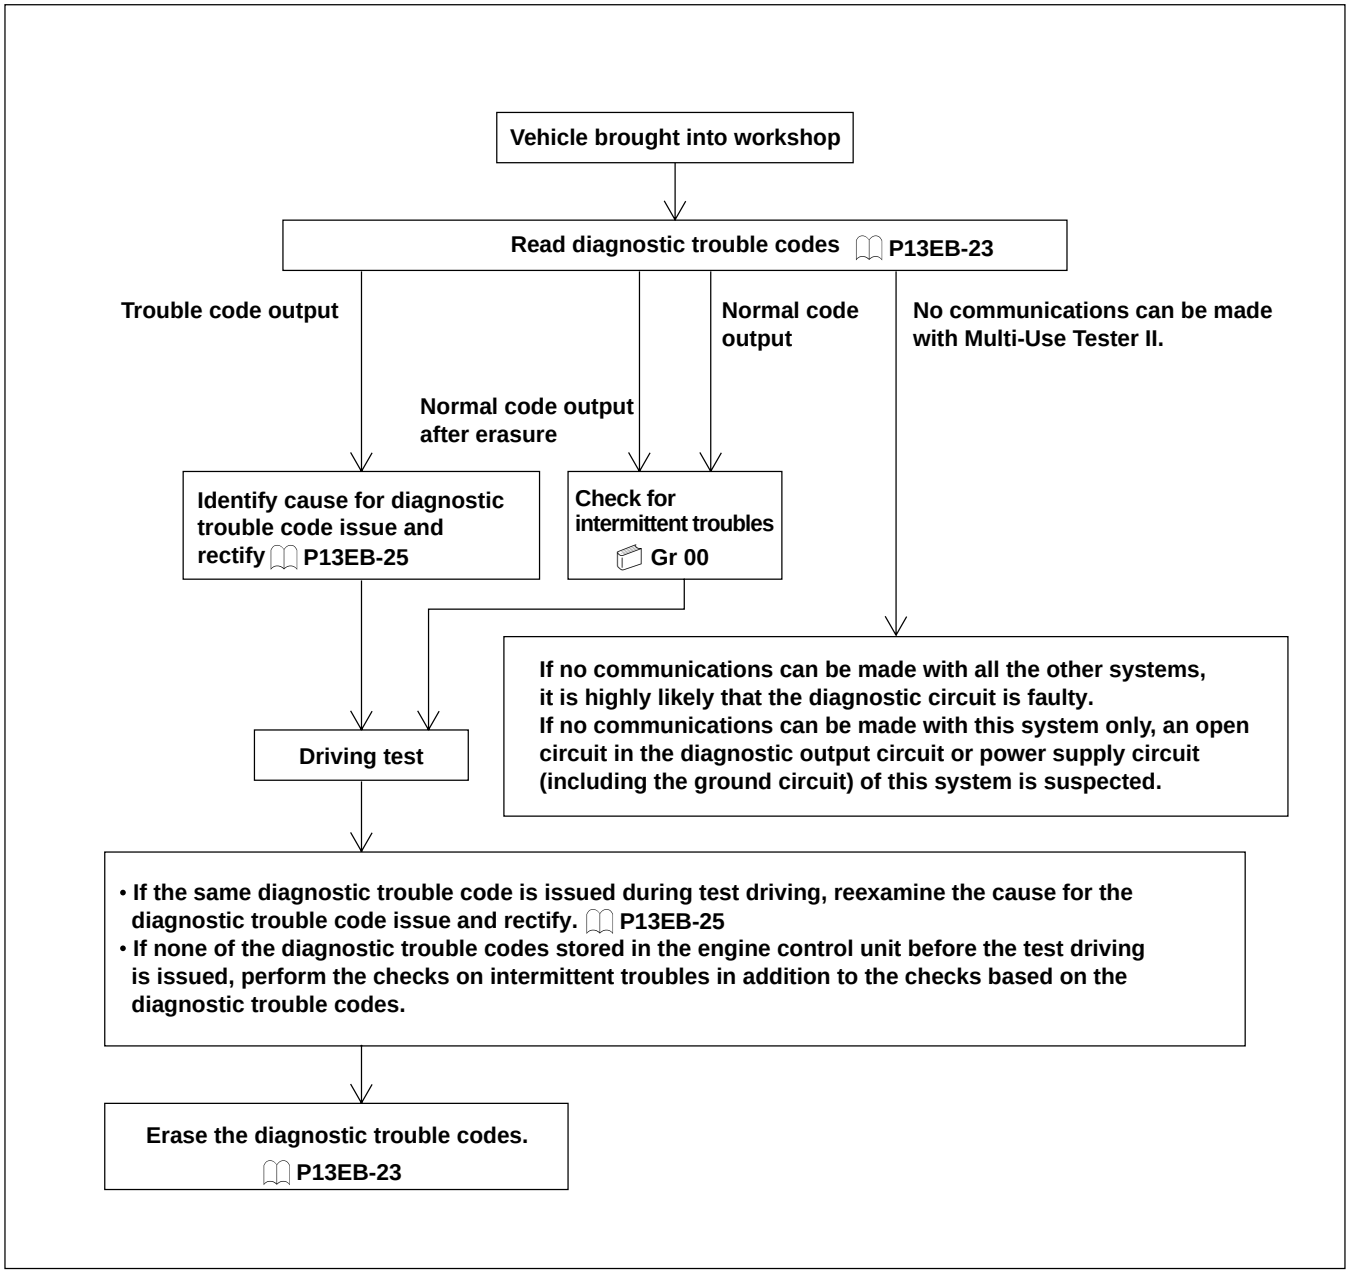
CAUTION ⚠

- **Check to ensure that the battery voltage is within the specified range.**
- **Check all the harness and device connectors for looseness. Always remove a connector at least 20 seconds after placing the starter switch at the LOCK position.**
- **Do not forget to clear the diagnostic trouble code by the Multi-Use Tester II or memory clear switch after a fault has been rectified.**
- **As a rule, inspection operations should be performed with the starter switch at the LOCK position. Some checks, however, may have to be made with the starter switch at the ON position. In such a case, use care to make sure that no short circuit develops between pins of the connectors or with the body.**
- **The resistance value of each component is affected by the temperature and the accuracy of the tester. The reading, therefore, does not always fall within the standard limits. Note that the check values shown in the text are the values obtained at normal temperature (10 to 35°C {58 to 95°F}).**
- **Whether or not the system automatically returns to normal from the backup mode after a fault has been removed depends on the diagnostic trouble code (fault location). When the system returns to normal, the warning lamp will be OFF.**
- **Even when the fault has been removed and the system has been automatically returned to the normal mode, the diagnostic trouble code of the fault remains stored in the engine control unit.**
- **When a fault occurs at a point where the system is not automatically reset, perform the memory clear procedure to let the system exit from the backup mode. 🕮 P13EB-25**

Inspection Flowchart

The system inspection can be performed effectively by use of the Multi-Use Tester II. The types of system inspections may be broadly divided as shown below in accordance with the trouble symptoms and diagnostic trouble code outputs.

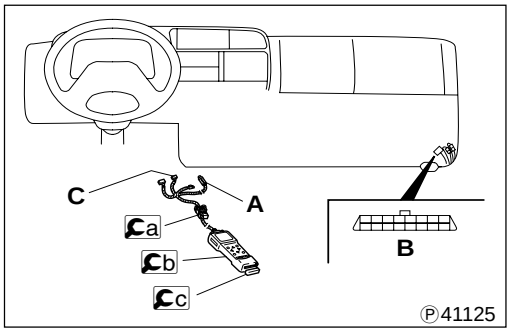
- Inspections based on diagnostic trouble codes stored in the engine control unit
- Inspections of intermittent troubles



2. CONNECTION OF MULTI-USE TESTER II

Special Tools

Location	Name and Shape of Special Tool	Part No.	Application
–	Multi-Use Tester II  19492	MB991496	Inspection of system
–	Multi-Use Tester II harness (for communications)  19141	MK327601	To supply power to Multi-Use Tester II proper and communicate with vehicle side electrical devices
–	Read-only memory pack (MRT-E9)  19493	MH062821	Data for inspection and control of engine control unit
–	Memory card (set in Multi-Use Tester II proper)  20538	MB991500	To write data
–	Multi-Use Tester II harness  20536	MB991499	To use Multi-Use Tester II as a circuit tester



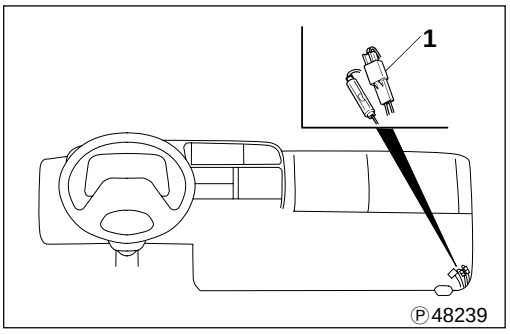
- Place the starter switch at the LOCK position.
- Connect the a Multi-Use Tester II harness to b Multi-Use Tester II and insert the c read-only memory in the tester.
- Connect the connector **A** to the cigar lighter socket.
- Connect the Multi-Use Tester II connector **C** (16 pins) to the data link connector **B** (16 pins).

NOTE

For the operating procedures for the Multi-Use Tester II, refer to the instruction manual for the Multi-Use Tester II.

3. READING AND ERASING DIAGNOSTIC TROUBLE CODES

Two types of methods are available for reading or erasing a diagnostic trouble code; one using the Multi-Use Tester II and one using the vehicle side diagnostic functions.

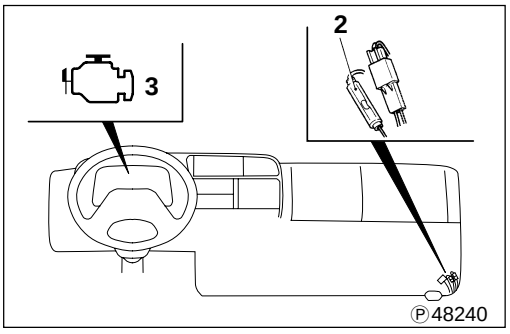


(1) Method using Multi-Use Tester II

● **Current Diagnostic Trouble Code**
- Check to see that the memory clear switch **1** is connected.
- Set the starter switch to ON.
- Operate the Multi-Use Tester II to read the current diagnostic trouble code and determine the fault location.

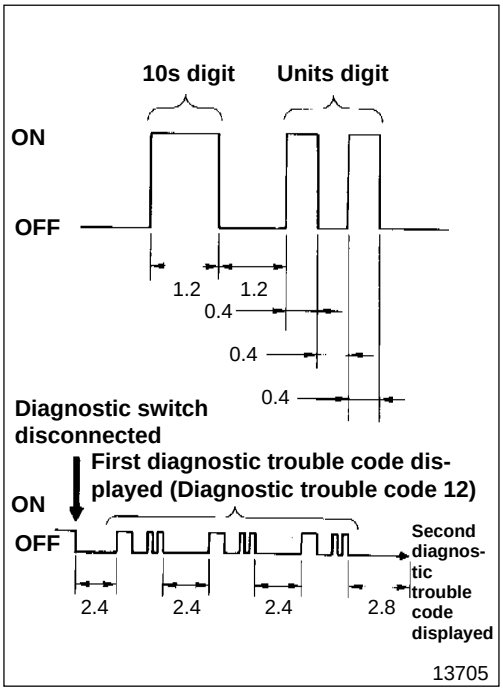
● **Past Diagnostic Trouble Code**
- Set the starter switch to ON.
- Disconnect the memory clear switch **1**.
- Operate the Multi-Use Tester II to read the past registered diagnostic trouble codes and determine the fault location.

● **Erasing Diagnostic Trouble Codes**
- Set the starter switch to ON.
- Operate the Multi-Use Tester II to erase all of the diagnostic trouble codes stored in the engine control unit.



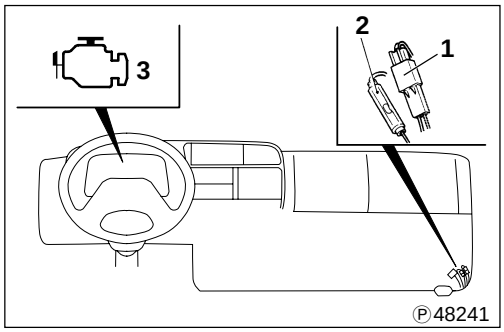
(2) Method Not Using Multi-Use Tester II (Method Using Diagnostic Switch and Memory Clear Switch)

● **Current Diagnostic Trouble Code**
- Set the starter switch to ON.
- Disconnect the diagnostic switch **2**.
- The diagnostic trouble code is displayed by flashes of the warning lamp **3**.



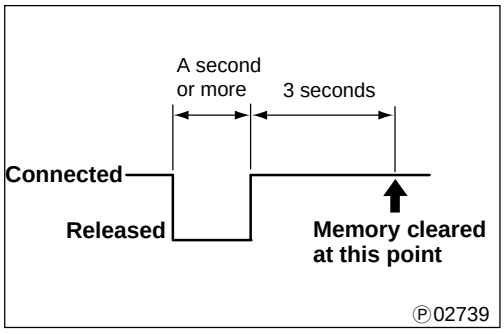
● **Reading Diagnostic Trouble Code**

- Diagnostic trouble codes are indicated by the number of times the warning lamp **3** flashes and their duration.
  - The flashing intervals also differ between the 10s digit and units digit.
  - 10s digit: 1.2 second interval
  - Units digit: 0.4 second interval
  - Each diagnostic trouble code is displayed from the 10s digit followed by the units digit. As for a code which has no 10s digit, units digit only is displayed.
- Each diagnostic trouble code is displayed three times in succession.
- If there is no more code stored, the sequence is then repeated from the beginning with each code indicated three times.
- When the diagnostic switch **2** is connected, the engine control unit will immediately stop displaying codes.



● **Past Diagnostic Trouble Codes**

- After reading the current diagnostic trouble codes (with the diagnostic switch **2** disconnected), disconnect the memory clear switch **1**. Then the warning lamp **3** will restart flashing.
- This time, the warning lamp displays the past diagnostic trouble codes. Determine the fault locations based on the indicated codes.



● **Erasing Diagnostic Trouble Codes**

Disconnect the memory clear switch **1** and the diagnostic switch **2** then reconnect them. Then all the diagnostic trouble codes stored in the engine control unit will be cleared.

CAUTION ⚠

- **If the contents of memory are not to be cleared after display of the stored codes, set the starter switch to OFF with the memory clear switch 1 disconnected. Thereafter, connect the memory clear switch.**
- **When you change the combination of the injection pump and engine control unit, you must rewrite the pump data stored in the engine control unit. For this purpose, be sure to perform the diagnostic trouble code erasing procedure.**
- **Whenever the engine control unit has been replaced with a new one, be sure to erase the diagnostic trouble codes by disconnecting the memory clear switch 1 and diagnostic switch 2 after connecting all the connectors. Upon completing the procedure, confirm that no diagnostic trouble codes is stored.**

4. DIAGNOSTIC TROUBLE CODES AND CHECK ITEMS

4.1 Diagnostic Trouble Code List

Diagnosis code	Fault location	Warning lamp	Electronic control unit countermeasure(s) in the case of failure (back-up mode)	Drive ability
01	Normal	—	—	○
03	Pre-stroke actuator learning function	Orange	Provides control with “0” as correction value.	○
06	Sub-control rack position sensor	Orange	Normal control using the main control rack position sensor	○
11	Governor servo	Red	*1 Engine stopped by the pull-down function.	×
12	Pre-stroke servo	Orange	Pre-stroke control stop engine revolution speed limit (approximately 1800 rpm)	△
13	Pre-stroke sensor	Orange	Pre-stroke control stop engine revolution speed limit (approximately 1800 rpm)	△
14	Back-up engine speed sensor	Orange	Control using the main engine speed sensor	○
15	Engine speed sensor	Orange	Calculate the engine revolution speed from the pulse count of the back-up engine speed sensor.	○
14+15	Both the back-up engine sensor and the main engine speed sensors are faulty upon start-up.	Red	Do not start the engine.	×
16	Accelerator pedal position sensor II	Orange	Control using the accelerator pedal sensor I	○
21	Water temperature sensor	Orange	Set the water temperature to 80 °C {176°F}.	○
22	Control rack position sensor	Orange	Switch to the sub-control rack position sensor control.	△
24	Accelerator pedal position sensor I	Orange	Control using the accelerator pedal position sensor II.	○
24+16	Both accelerator pedal position sensor I and accelerator pedal position sensor II are faulty	Red	Set the maximum accelerator depression angle to 30 degrees even if the accelerator pedal is depressed.	△
31	Idling adjustment volume	Orange	Set to auto idling.	○
32	Boost pressure sensor	Orange	Set the boost pressure to 0 kpa {0 mmHg, 0 in. Hg}.	△*2
33	RAM (ECU internal memory circuit)	Red	Do not start the engine.	×
41	Boost temperature sensor	Orange	Normal control assuming the boost temperature is 80 °C {176 °F}.	○
45	Reverse engine operation	Orange	*1 Engine stopped by the pull-down function.	×*2
65	Accelerator switch	Orange	Limited accelerator depressing angle (Approximately 30%)	○

*1 : The pull-down function indicates the rack pull-back action. In the event of an engine over-run or severe accident, the rack is pulled back immediately to the no-injection direction in order to protect the engine.

*2 : Driveable if the starter switch is turned OFF once and then restarted again.

○ : Driveable
△ : Back-up mode driving possible
× : Undriveable

4.2 Diagnostic Trouble Code Issued Conditions and Check Items

Perform service procedures taking the diagnostic trouble code issued conditions and the probable causes into consideration.

Diagnosis code	Diagnosis code display condition (s)	Cause	Remedy
03	Indicated that pre-stroke learning function has not been executed.	Faulty timing rod, timing sleeve or other parts in the injection pump assembly.	Repair or replace the injection pump assembly. *
		Faulty adjusment or pre-stroke position sensor	Repair or replace the injection pump.*
		Faulty engine electronic control unit	Replace the engine electronic control unit
06	Displayed if the output voltage of the control rack position sensor is less than 0.06 V or more than 3.5 V.	Open or short in harness wire or poor connector contact between the sub-control rack position sensor and the engine electronic control unit	Inspect the harness and the connector 🕮 P13EB-43
		Open, short, or poor connector contact in the sub-control rack position sensor	Inspect the sub-control rack position sensor 🕮 P13EB-32
		Faulty engine electronic control unit	Replace the engine electronic control unit
11	Displayed if the difference between the target control rackposition and the actual control rack position is ±1mm {0.039 in.}.	Open or short in harness wire or poor connector contact between the linear DC motor and the engine electronic control unit	Inspect the harness and the connector 🕮 P13EB-43
		Open or shorted wire in the linear DC motor connector	Inspect the linear DC motor 🕮 P13EB-32
		Poor adjustment of the emergency engine stop cable (The lever is pulled in the stop direction)	Inspect the emergency engine stop button 🕮 P13EB-32
		Faulty injection pump assembly rack movement or poor governor actuator link	Repair or replace the injection pump assembly. *

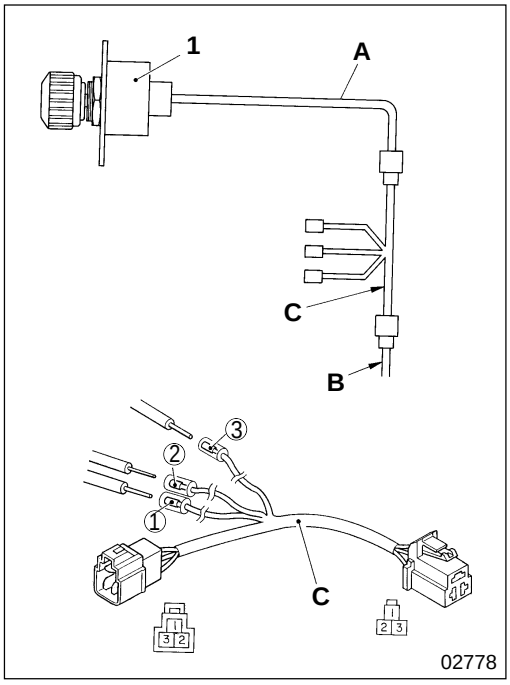
Tightening torque

Unit : N·m {ft.lbs, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
8	Coolant temperature sensor	34±6.9 {25±5, 3.5±0.7}	—
14	Engine speed sensor lock nut	24 to 35 {17 to 26, 2.4 to 3.6}	—

◆ Service procedure

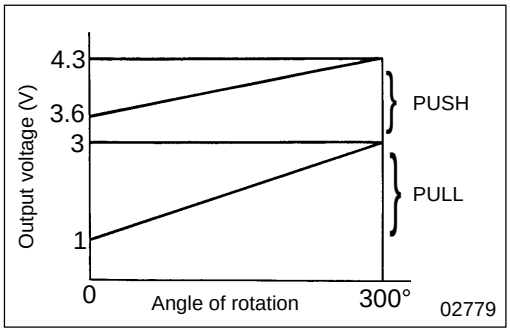


1 **Inspection of idling speed adjustment potentiometer**

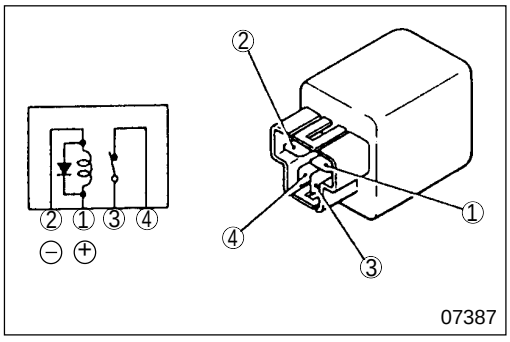
- Disconnect the harness **A** of the idling speed adjustment potentiometer **1** from the cab-side harness **B**. Then, connect an inspection harness **C** between harnesses **A** and **B.** (The inspection harness must be made specially for this procedure.)
- Turn the starter switch to the ON position.
- Check the output voltages of the idling speed adjustment potentiometer **1** in accordance with the following table.

Item	Connector terminal		
	Accelerator pedal position sensor inspection harness		
	①: Power supply (+)	②: GND (–)	③: Output (+)
Output voltage with knob pulled		⊖	⊕
Output voltage with knob pushed			

Output characteristics



- If the output voltages are out of specification, replace the idling speed adjustment potentiometer **1**.



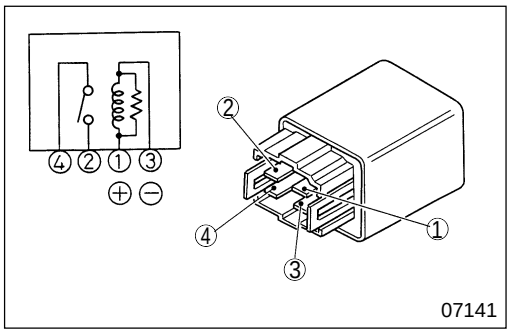
2 **3** **Inspection of pre-stroke cut relay and transmission neutral relay (normally-closed type with 4 pin connector)**

- Perform continuity checks in accordance with the following table.

	①	②	③	④
Not energized	○——○		○——○	
Energized	⊕——⊖		〔⊢ - - - - ⊣〕	

○——○ : Continuity exists between terminals.
⊕——⊖ : Terminals across which 12 V DC is applied
〔⊢ - - - ⊣〕 : Continuity no longer exists between terminals

- Replace the relay if any abnormality is evident.



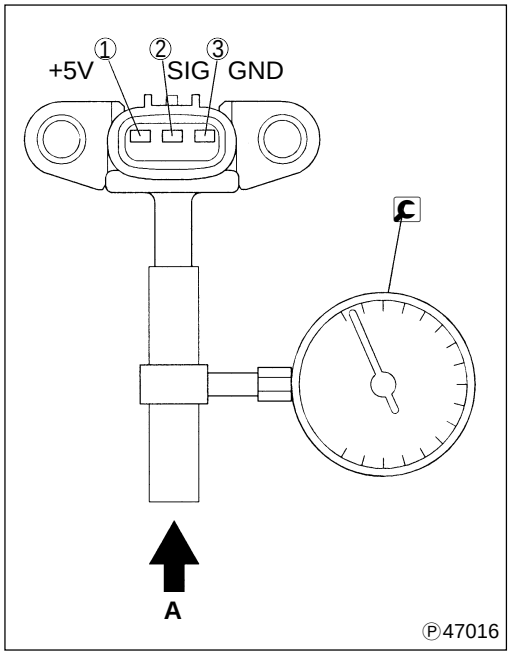
4 **15** **Inspection of exhaust brake relay and accelerator relay**

- Check the electrical conduction and operation according to the table below.

	①	②	③	④
Electric current not supplied	○		○	
Electric current supplied	⊕	○	⊖	○

○—○ Electric conduction between terminals.
⊕—⊖ Terminals applied with 12 VDC.

- If an abnormality is found, replace the relay.



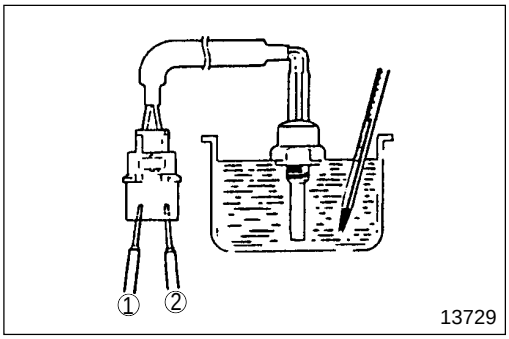
6 **Inspection of boost pressure sensor**

- Apply 5V DC between terminals ① and ③.
- Increase air pressure **A** gradually and measure the voltage between terminals ② and ③.
  : Boost Pressure Gauge

Tool Name and Shape	Part No.
 01524	MH061366

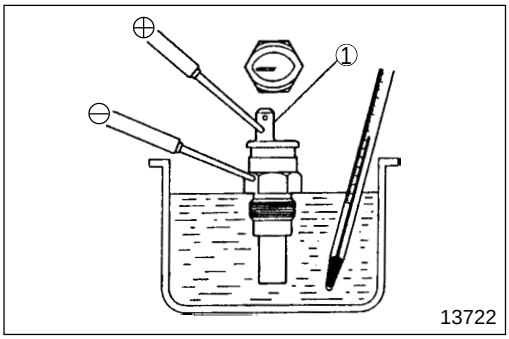
Standard value	Air pressure	Voltage
	99 kPa {740 mmHg, 1 kg/cm²}	2.5V
	232 kPa {1738 mmHg, 2.4 kg/cm²}	4.5V

- If the measurements deviate from the standard values, replace the boost pressure sensor.



7 Inspection of boost temperature sensor

- Place boost temperature sensor **7** in glycerin in a container.
- Raise the glycerin temperature to the specified values and stir the glycerin.
- Measure the resistance between terminals ① and ②.
- If the measured value deviates from the standard value, replace boost temperature sensor **7**. Gr 15B

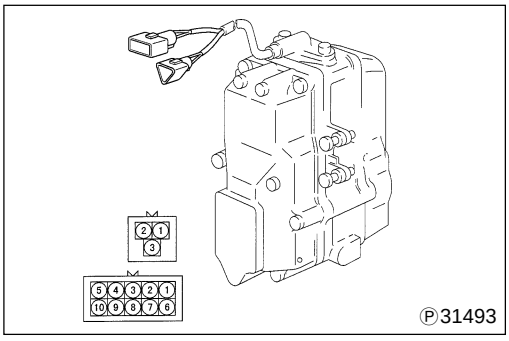


8 Inspection of engine coolant temperature sensor

- Put the engine coolant temperature sensor **8** in a container of engine oil.
- Heat the oil to each of the specified temperatures. Stir the oil to ensure that it heats up evenly.
- At each of the specified temperatures, measure the resistance between the terminal ① and body of the engine coolant temperature sensor **8**.
- If the measurements are out of specification, replace the engine coolant temperature sensor **8**.

9 Inspection of control rack position sensor

Perform the following inspections. If any abnormality is evident, have inspection and repair performed by the nearest MFTA.

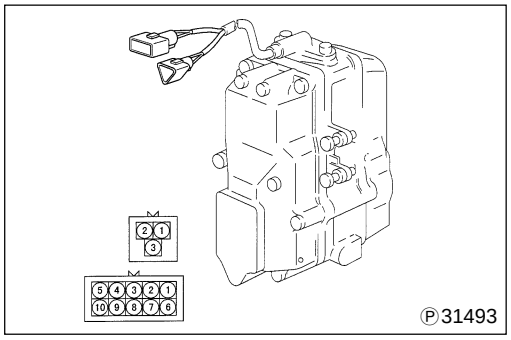


● **Measurements on connectors**

Measure the resistances between the following terminals: 3 pin connector's ③ and 10 pin connector's ④; 10 pin connector's ③ and ⑨; ④ and ⑨.

11 Inspection of linear DC motor

Perform the following inspections. If any abnormality is evident, have inspection and repair performed by the nearest MFTA.



(1) Measurements on connectors

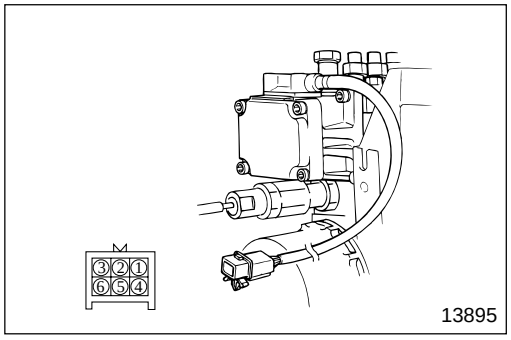
Measure the resistance between terminals ① and ② on each connector.

12 Inspection of pre-stroke actuator

Perform the following inspections. If any abnormality is evident, have inspection and repair performed by the nearest MFTA.

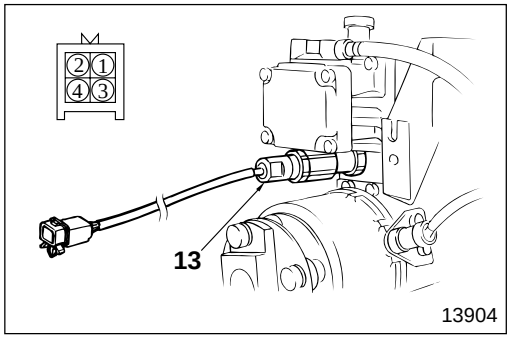
CAUTION ⚠

The pre-stroke actuator 12 must be inspected when the engine is cold.



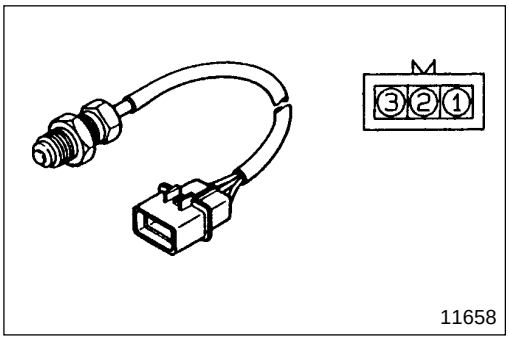
(1) Measurements on connectors

Measure the resistance between terminals ② and ③; ① and ③; ① and ②; ④ and ⑤.



13 Inspection of sub control rack position sensor

- Measure the resistances between the following terminals: ① and ④; ① and ③; ③ and ④.
- If any resistance is out of specification, replace the sub control rack position sensor **13**.
- Have replacement performed by the nearest MFTA.



14 Engine speed sensor

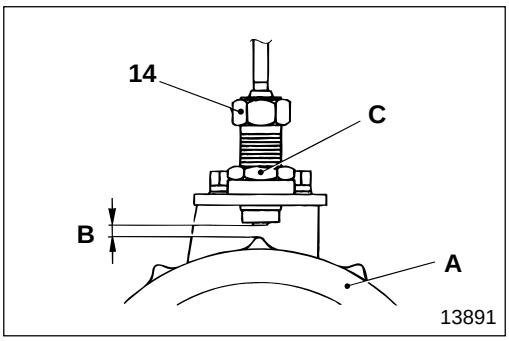
[Inspection]

(1) Main Unit

- Measure the resistance between terminals ① and ②.
- If the measured value deviates from the standard value, replace engine speed sensor **14**.

CAUTION

Be sure to check the tightening torque of engine speed sensor 14. If the tightening torque is insufficient, the sensor may not output a signal.



(2) Clearance between protrusions

If the clearance between engine speed sensor **14** and timer housing protrusion **A** deviates from the standard value, adjust by following the procedure below.

[Adjustment]

- Loosen lock nut **C**, and rotate engine speed sensor **14** to adjust the clearance.
- After adjustment, tighten lock nut **C** to the specified torque.

CAUTION

If clearance B between engine speed sensor 14 and timer housing protrusion A is too large, the sensor may not output a signal. If the clearance is too small, the sensor may contact the protrusions.

THERMOSTAT 14A-25

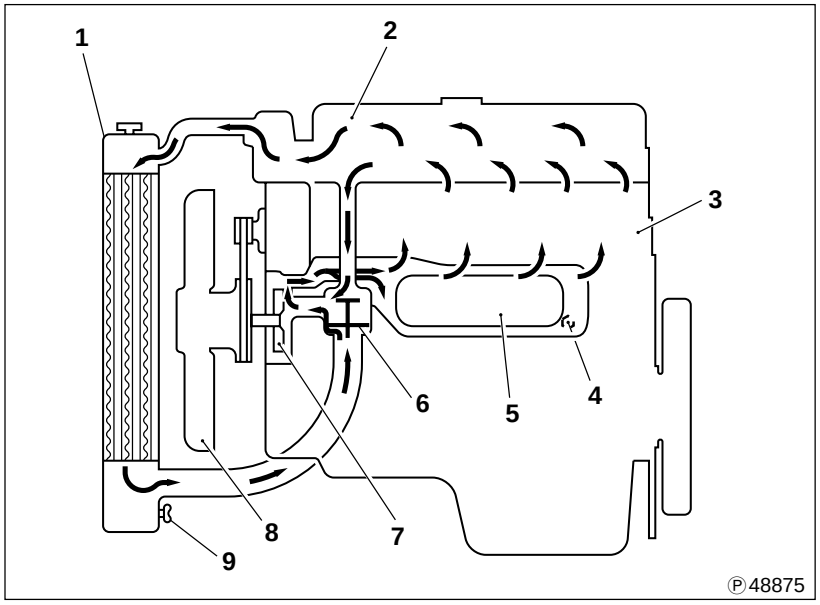
SPECIFICATIONS/STRUCTURE AND OPERATION

SPECIFICATIONS

Item	Specifications
Kind of cooling system	Forced water circulation system
Water pump type	Belt-driven involute type
Thermostat type	Wax-pellet, bottom bypass type (with jiggling valve)
Automatic cooling fan coupling type	Continuous control type
Radiator type	Tube and corrugated fin type
Coolant capacity L {qts}	15 {15}

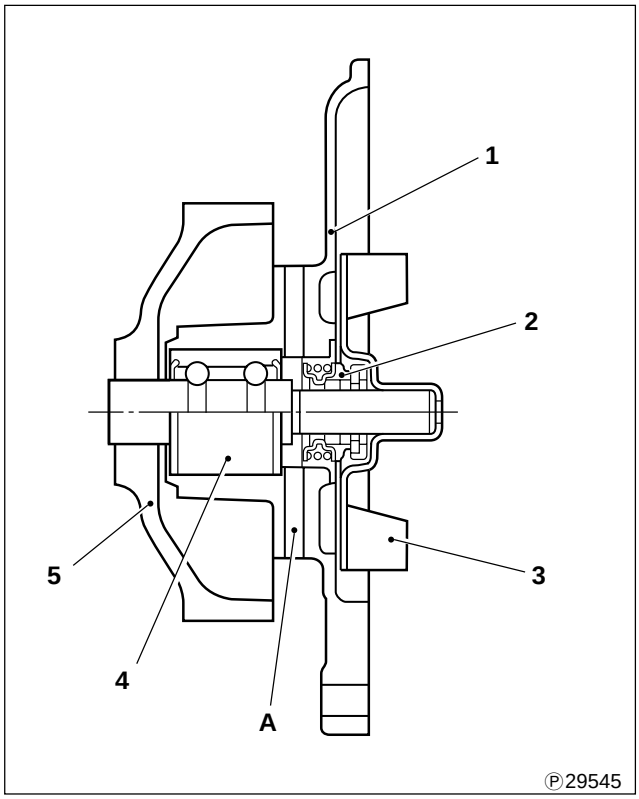
STRUCTURE AND OPERATION

Cooling System (Flow to Coolant)



1 Radiator
2 Cylinder head
3 Crankcase
4 Crankcase drain cock
5 Oil cooler
6 Thermostat
7 Water pump
8 Cooling fan
9 Radiator drain cock

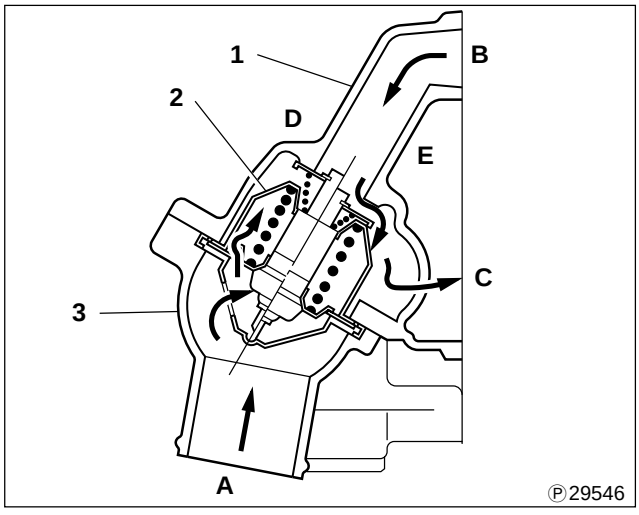
Water Pump



1 Case
2 Unit seal
3 Impeller
4 Unit bearing
5 Pulley

A : Drain hole

Thermostat



1 Oil cooler
2 Thermostat
3 Thermostat cover

A : From radiator
B : From cylinder head
C : To water pump
D : With high coolant temperature
E : With low coolant temperature

Thermostat **2** is a bottom bypass type that uses wax-charged pellets as its regulating element. As the wax changes from solid to liquid in with temperature increases, the total wax volume changes. As a result, the position of the valve, changed by the coolant temperature, regulates the flow of coolant from the radiator and cylinder head (by-pass side) before entering the engine to control the coolant temperature (inlet control type).

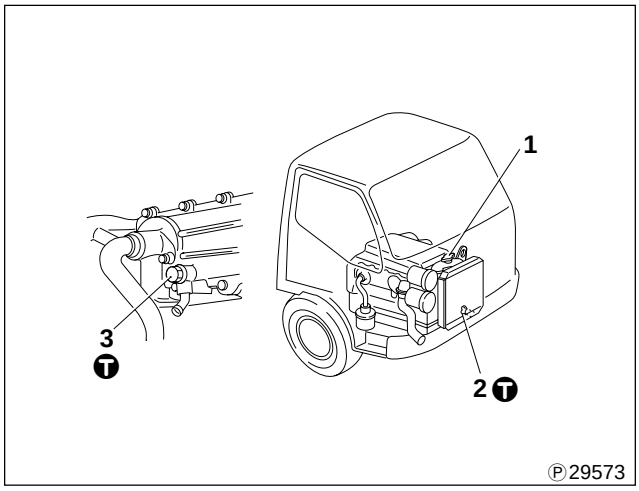
TROUBLESHOOTING

Possible causes \ Symptoms		Overheating (insufficient cooling)	Overcooling	Abnormal noise	Excessive coolant loss	Remarks
V-ribbed belt	Loose or damaged	○		○		
	Excessive tension			○		
	Oil on belt	○				
Water pump	Water pump fitted poorly	○		○	○	
	Unit bearing defective	○		○		
	Impeller defective	○		○		
	Unit seal defective	○			○	
	Loose fit between unit bearing and flange and/or impeller	○		○		
Thermostat	Case fitted poorly	○			○	
	Valve opening temperature too high; valve remains closed	○				
	Valve opening temperature too low; valve remains open		○			
Radiator	Space between core and fins clogged	○				
	Core cracked and/or soldered joints separated	○			○	
Cooling fan	Fan shroud fitted poorly	○		○		
Automatic cooling fan coupling	Bearing defective	○		○		
	Bimetal damaged	○				
	Bimetal contaminated with foreign particles	○	○			
	Silicone oil leaking	○		○		
Oil cooler	Oil cooler fitted poorly	○			○	Gr 12A
	Gasket defective	○			○	
Cylinder head	Cylinder head fitted poorly	○			○	Gr 11A
	Gasket defective	○			○	
Coolant quantity insufficient		○				
Coolant passages dirty and/or clogged		○				
Hoses fitted poorly		○			○	
Ambient temperature extremely low			○			

M E M O

ON-VEHICLE INSPECTION AND ADJUSTMENT

Replacing Coolant and Cleaning Cooling System



1 Pressure cap
2 Drain cock
3 Water drain plug

T Tightening torque

Unit: N·m {ft.lbs, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
2	Drain cock	2 {14.5, 0.2}	—
3	Water drain plug	24.5±4.9 {18.1±3.6, 2.5±0.5}	—

Using the radiator for extended periods without cleaning the cooling system will cause overheating since rust and scale will accumulate. The cooling system must be cleaned periodically.

● **Draining the coolant**

Before draining the coolant, loosen the pressure cap **1** to reduce the pressure in the cooling system.

WARNING ⚠

- **To avoid being scalded, make sure the coolant has cooled sufficiently before loosening the pressure cap 1.**
- **Unless care is taken, opening the pressure cap 1 when the coolant is hot can cause the coolant to spray out. Cover the pressure cap with a cloth, and loosen the cap slowly to bleed off the pressure before opening it fully.**

● **Cleaning procedure**

- Run the engine and keep the coolant at a temperature of approximately 90°C {194°F} such that the thermostat valves remain open and the coolant circulates continuously in the radiator.
- To increase the coolant temperature quickly, cover the front of the radiator with cardboard or a similar material.
- If cleaning is carried out after a large amount of rust has accumulated, the radiator may start to leak. Carefully examine the radiator for leaks after cleaning the cooling system.
- Soft water to be used should have the following properties.

CAUTION ⚠

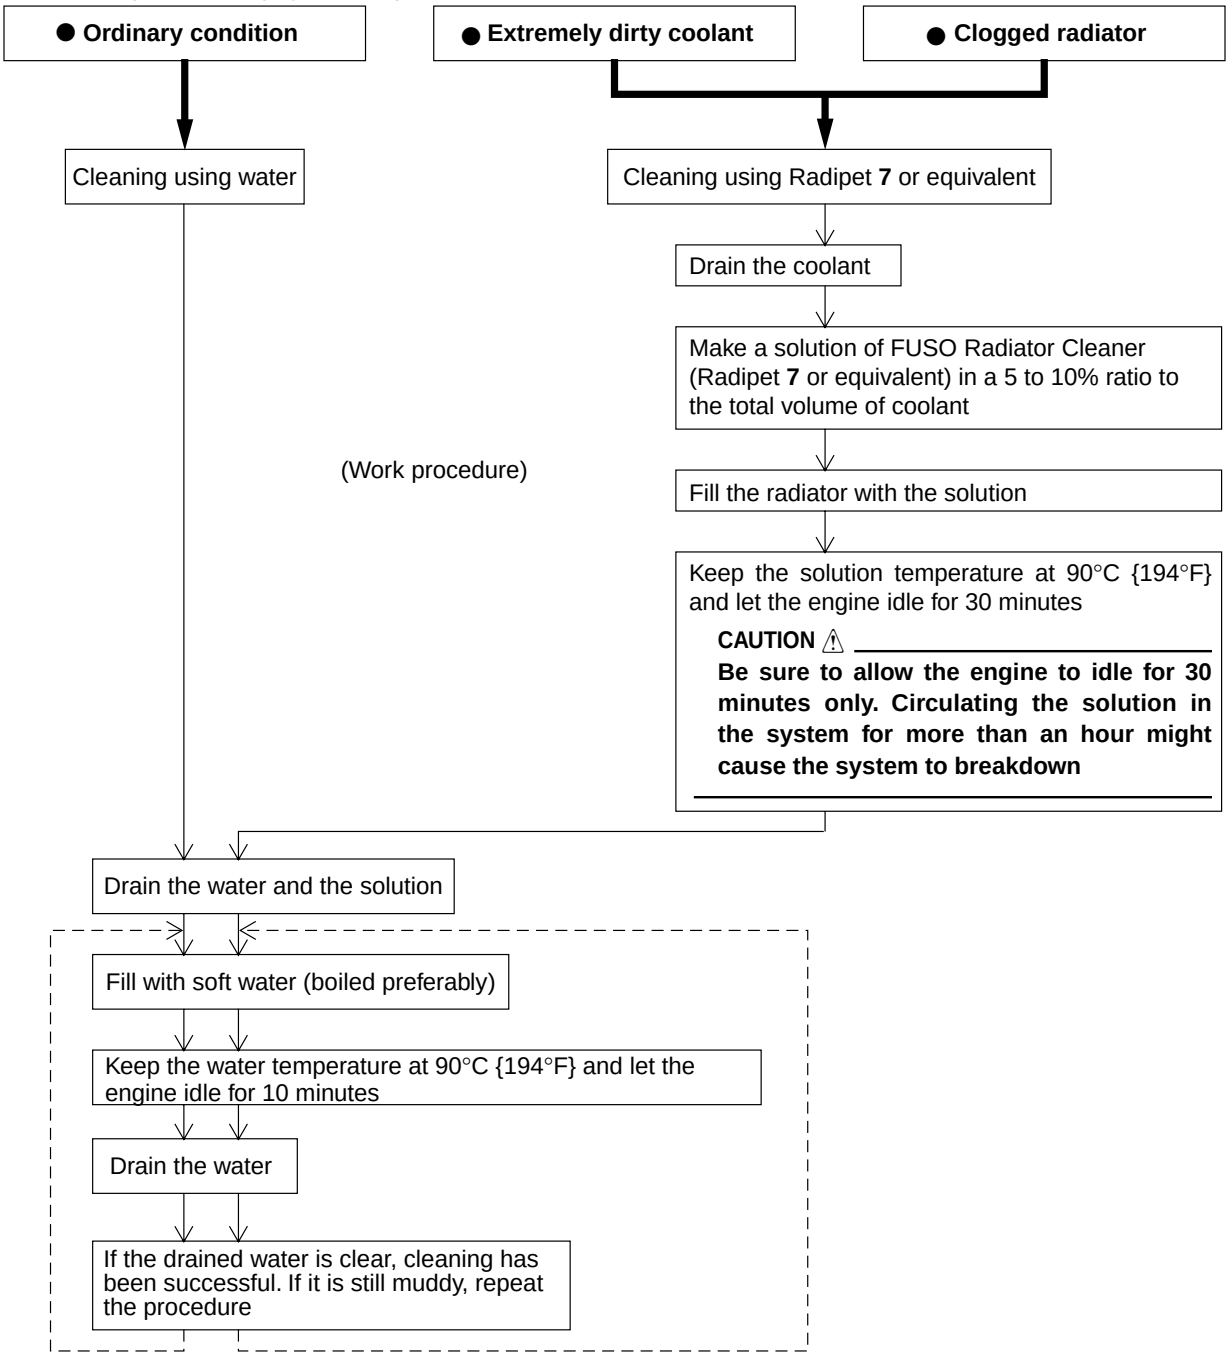
Do not use hard water as it causes scale and rust.

Required properties of soft water

Total hardness	300 ppm or less
Sulfate SO_4^-	100 ppm or less
Chloride Cl^-	100 ppm or less

Total dissolved solids	500 ppm or less
pH	6 to 8

Method of cleaning the cooling system depends on its condition.



DANGER ⚠

If FUSO DIESEL LONG LIFE COOLANT solution gets in your eyes accidentally, you must immediately rinse your eyes with copious amounts of water, and be sure to consult a doctor.

WARNING ⚠

FUSO DIESEL LONG LIFE COOLANT is inflammable. Do not put it near unprotected lights.

NOTE

- **After cleaning with solution, fill with coolant as quickly as possible.**
- **To prevent freezing of the coolant and corrosion of the cooling system, use specified coolant solution of FUSO DIESEL LONG LIFE COOLANT. (See the Owner's Handbook for use of these materials.)**

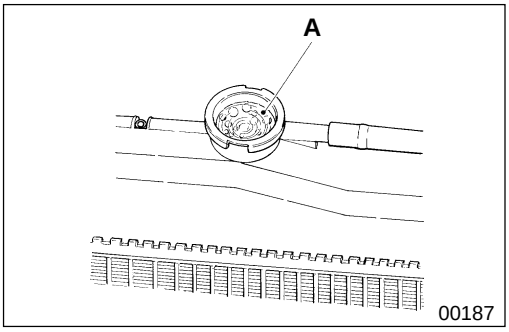
ON-VEHICLE INSPECTION AND ADJUSTMENT

Air Bleeding of Cooling System

- Remove the pressure cap. Then, introduce cooling water little by little up to the water outlet pipe neck. Do not pour water up to the outlet port brim, otherwise water would overflow out of the outlet port after the engine is started as water will expand due to temperature rise.
- With the pressure cap removed, run the engine at idle. While keeping temperature at 90°C {194°F}, bleed the cooling system completely.
- After bleeding the cooling system of air, add coolant to the water outlet pipe and reservoir tank as required.

Gas Leak Testing

The presence of air or exhaust gas in the coolant increases corrosion and rust in the cooling system. Check for air or exhaust gas in the coolant using the following procedure.



- Open the pressure cap.

WARNING ⚠

Make sure the coolant is cool before loosening the pressure cap. If the coolant is hot, it may spray out.

- Run the engine and let the coolant temperature reach approximately 90°C {194°F}.
- If bubbles **A** appear continuously, there is air or exhaust gas in the coolant.
- If the coolant contains air, the cylinder head bolts, water pump mounting bolt, or hose connections may be loose. Alternatively, the hoses may be damaged.
- If the coolant contains exhaust gas, it is possible that the cylinder head gasket is damaged or that the cylinder head is cracked.

Special tools

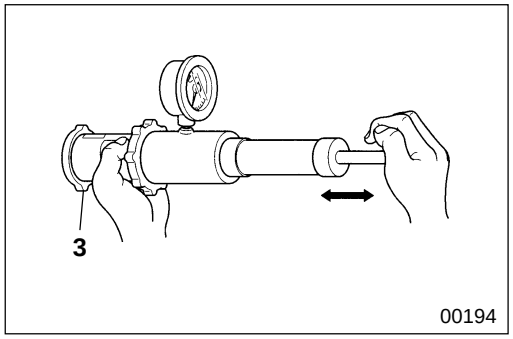
Unit : mm {in.}

Location	Tool name and shape	Part No.	Application
9, 11	Lock & Break Tool	Obtain locally or use sublet repair	Upper tank, lower tank removal

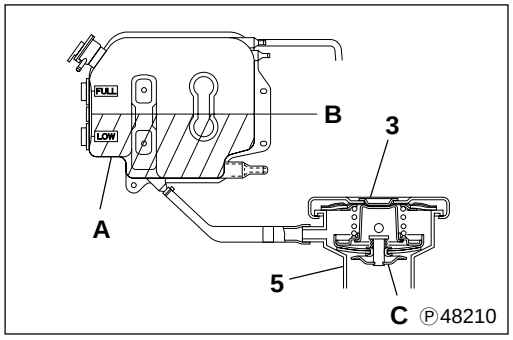
◆ Service procedure



3 **Pressure cap inspection**

(1) Pressure valve opening pressure

If the measurement does not comply with the standard value, replace the pressure cap **3**.

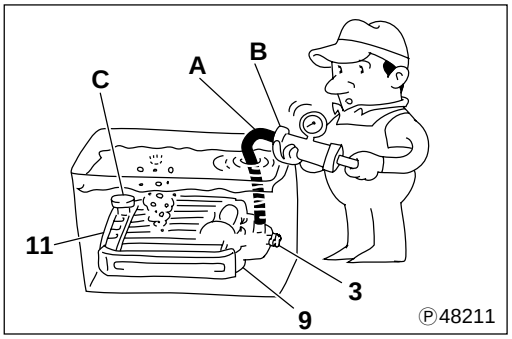


(2) Vent valve inspection

- Obeserve the water level **B** in the resorvoir tank **A**.
- Run the engine at a high speed. Stop then engine when a small amount of coolant has overflowed into the reservoir tank **A**.
- Wait for a while in this condition. When the coolant returns to the ambient temperature, check to see if the water level **B** in the reservoir tank **A** has returned to the level at which it was observed before the engine was started.
- If the water level **B** has not dropped, the vent valve **C** is defective; replace the pressure cap **3**.

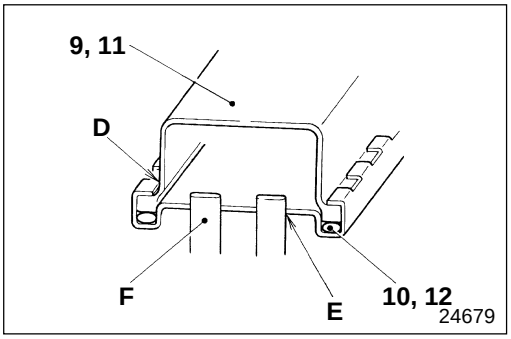
NOTE

If the pressure cap 3 is removed before the coolant has cooled down to the ambient temperature, the vacuum in the radiator 4 will be lost, preventing the coolant from returning to the reservoir tank A.



5 **Radiator inspection**

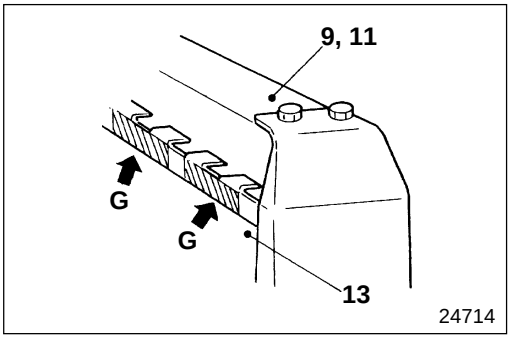
- Fit pressure cap **3**, hose **A**, and radiator cap tester **B** onto the radiator upper tank **9**.
- Fit a plug **C** onto the radiator lower tank **11**, then immerse the radiator in a tank of water.
- Using the radiator cap tester **B**, apply the specified air pressure of 150 kPa {21 psi, 1.5 kgf/cm^2}, and check for air leakage.
- If air leakage is apparent, repair or replace the radiator assembly **5**.



- Replace the following parts according to the leaking locations.

Leaking location	Part to replace
Tank root **D**	O-ring **10** or **12**
Tank **9**	Tank **9**, O-ring **10**
Tank **11**	Tank **11**, O-ring **12**
Tube fitted area **E**	Core **13**, O-ring **10**, **12**
	* Tube **F** (TIG welded), O-ring **10**, **12**
Tube **F**	Core **13**, O-ring **10**, **12**

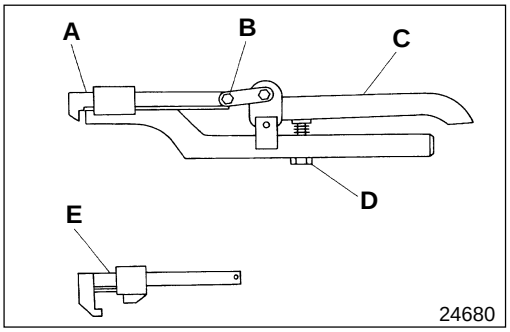
* : When repaired



CAUTION ⚠

Replace the core 13 if its clinching tabs that hold the upper tank 9 or lower tank 11 have two paint marks G, evidence of the tabs having been back twice.

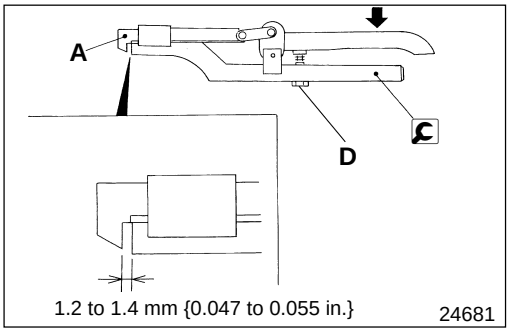
The tabs are provided with one paint mark each time they are bent back. Count the paint marks on each of upper and lower tabs separately.



9 **11** **Upper tank and lower tank**

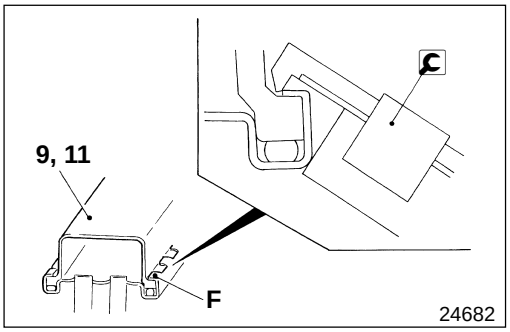
Remove and reinstall the tanks using the Lock and Break Tool.

A : Attachment (for tank removal)
B : Attachment locking bolt
C : Slide handle
D : Stopper/adjuster bolt
E : Attachment (for tank installation)

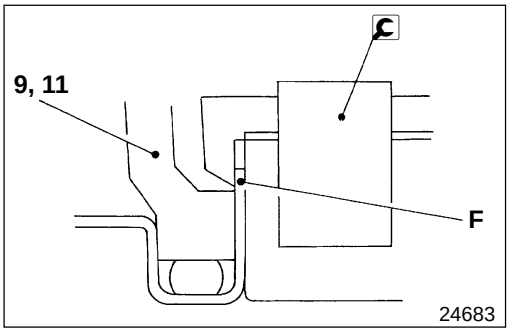


[Removal]

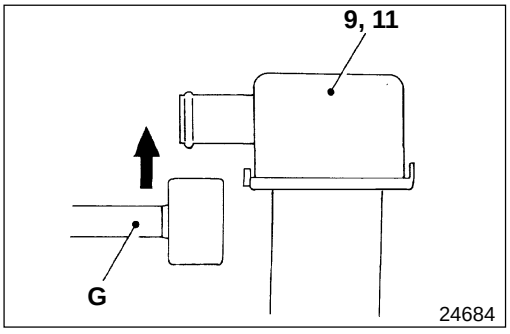
- Fit attachment **A** onto the end of the Lock and Break Tool, set it to the illustrated dimension and lock it in position with the stopper/adjuster bolt **D**.



- Using the Lock and Break Tool, bend up the tabs **F** of the core **13** that hold the tank **9, 11**.
- Straighten the tabs **F** completely as shown by gripping the Lock and Break Tool.

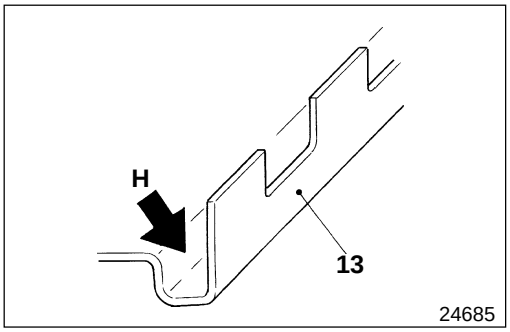


- After straightening all the tabs **F**, grasp the inlet or outlet pipe and remove the tank **9, 11**.
- If the tank **9, 11** is difficult to remove, tap it with a rubber or plastic hammer **G**.



CAUTION ⚠

The tanks 9 and 11 are made of plastic and may crack if subjected to undue shock. Handle them with care.

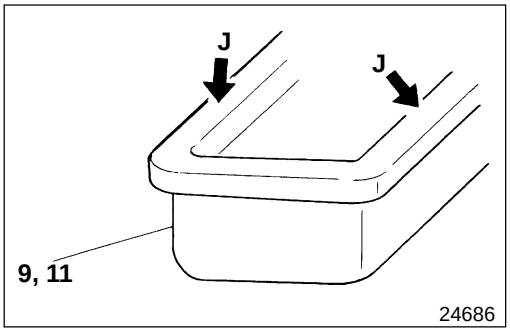


[Inspection]

- Check the tank mounting channels **H** of the core **13** for foreign matters.
- If foreign matter is stuck inside the mounting channels, rub them away with sandpaper (approximately #1000) or blow them out with compressed air.

CAUTION ⚠

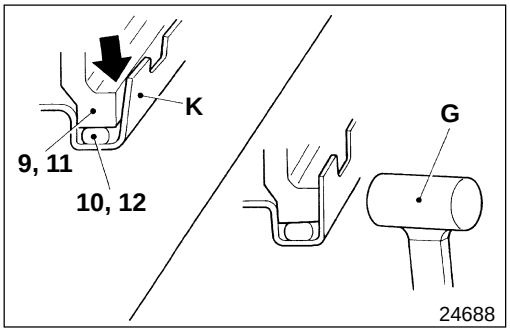
If any foreign matter (even a single hair) remains when the O-ring 10, 12 and tank 9, 11 are fitted, leakage can occur. Carefully inspect and clean each tank mounting channel H entirely.



- Clean the core contacting surface **J** of the tank **9, 11** and inspect it for damage. Replace the tank if any defect is evident.

CAUTION ⚠

Perform procedure with bare hands to prevent foreign matter from sticking to the surface J.

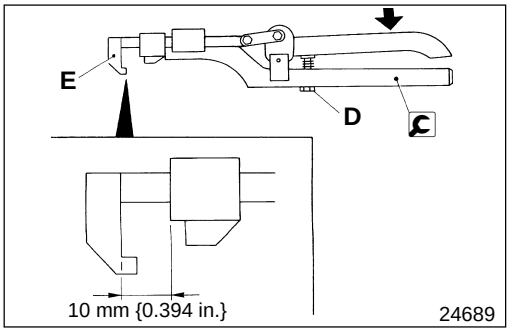


[Installation]

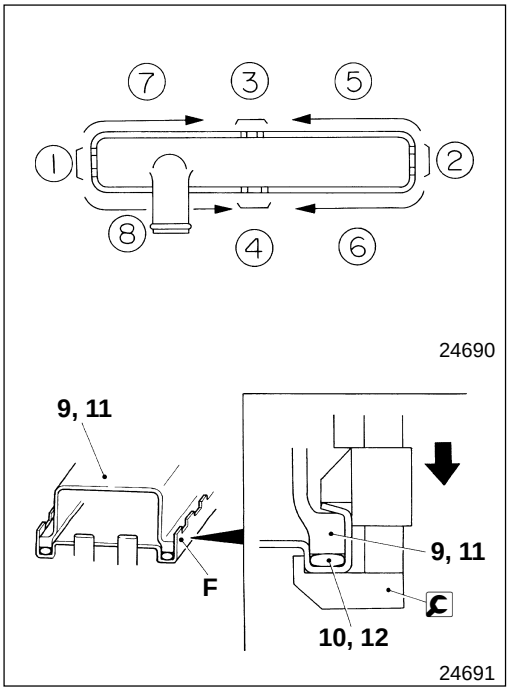
- Install the tank **9, 11** in position. Check that the sub-plate **K** of the core is in close contact with the tank. If there is any space, tap the sub-plate lightly with a rubber or plastic hammer to eliminate space.

CAUTION ⚠

Handle the parts with bare hands to prevent foreign matter from sticking to the O-ring 10, 12 and tank 9, 11.



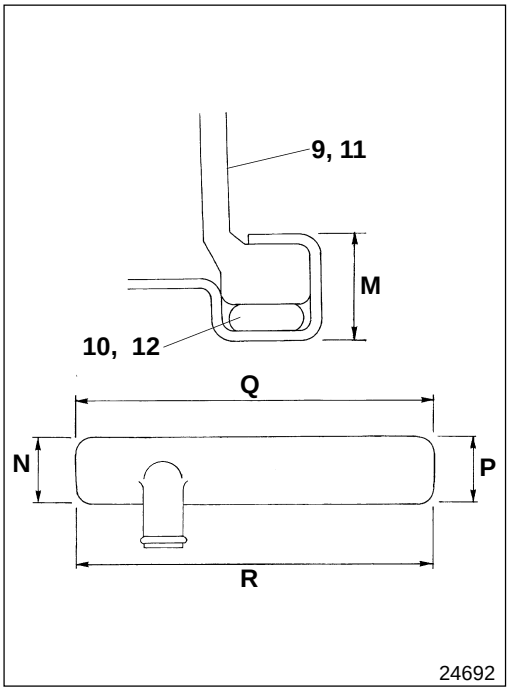
- Fit attachment **E** onto the end of the Lock and Break Tool, set it to the illustrated dimension and lock it in position with the stopper/adjuster bolt **D**.



- Clinch the tabs **F** of the core **13** to hold the tank **9, 11** in the illustrated order.
  ① to ④ : Two center tabs on each side
  ⑤ to ⑧ : Remaining tabs in illustrated sequence
  : Lock and Break Tool (with attachment **E**)

NOTE

The sides ① and ② do not allow the Lock and Break Tool to be used for clinching. Clinch these sides using a pair of pliers with tape wrapped around its jaws.

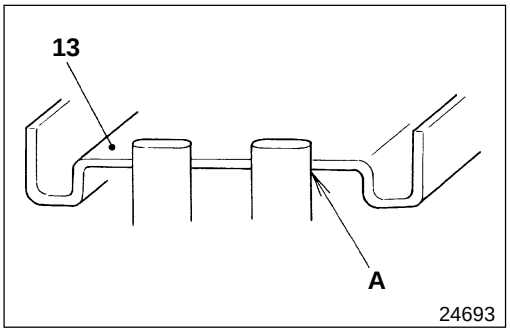


- Check that the tabs has been clinched to the following dimensions.
  M : 14.65 to 15.05 mm {0.576 to 0.592 in.} (Sides **N** and **P**)
  10.05 to 10.45 mm {0.395 to 0.411 in.} (Sides **Q** and **R**)

- Check for leaks. P14A-14
- Provide a paint mark to the sub-plate **K** of the core **13** to indicate that the tabs have been bent up and then down.

NOTE

Provide one paint mark after each removal of the tank.



13 Core

If water leaks from the tube fitted area **A**, replace the core **13** or repair it by the following method.

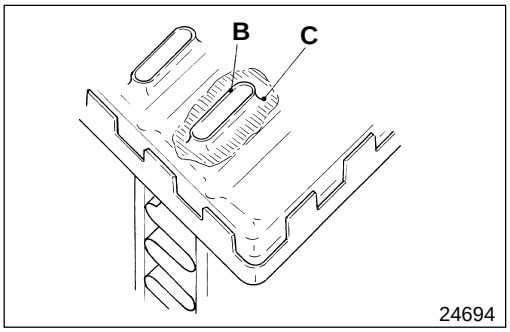
[Repair]

NOTE

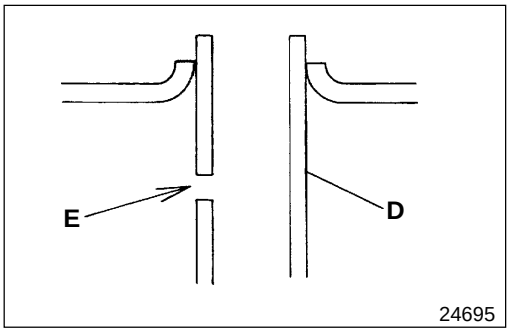
Repair is carried out by tungsten inert gas arc (TIG) welding, which requires the skill of a trained welder.

WARNING ⚠

To avoid danger, dry the core 13 completely before welding.



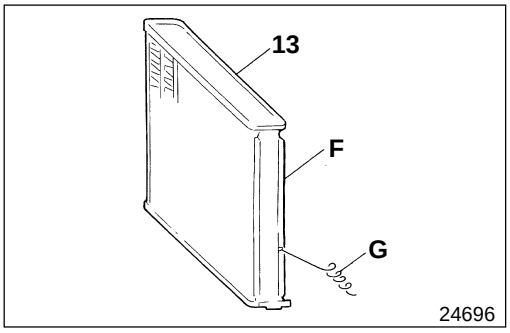
- Clean both edges **B** of the leaky tube and their surroundings **C** using a stainless steel wire brush. Scrub the surface until it glistens with exposed aluminum.



- Since both ends of the tube are covered with weld metal, make a small hole **E** in the tube **D** to allow air venting.

NOTE

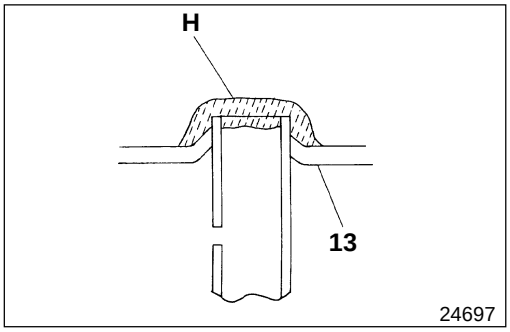
Absence of the small hole E causes escaping air to produce small pin holes in the weld.



- Connect a grounding wire **G** from the support **F** of the core **13** to an appropriate object.

CAUTION ⚠

Improper connection of the grounding wire G causes a short circuit during welding work and the core could be fused at the welded portion.



- Cover both ends of the tube with welding metal.
  H : Tungsten inert gas arc weld (TIG)
  Welding conditions:
  Welding rod: A4043 (approximately ϕ 2 mm {ϕ 0.0079 in.} in diameter)
  Welding current: 80A AC
- After welding, check for the following defects. Rectify the weld or replace the core **13** if any of the defects is evident.
  - Undercut
  - Bead crack
  - Crack in base metal

CAUTION ⚠

Weld with sufficient care. Poor welding may cause leakage to recur.

***c :** Front case Gr 11A
⊗ **:** Non-reusable part

● **Assembly sequence**

Follow the disassembly sequence in reverse.

Service standard

Unit: mm {in.}

Location	Maintenance item		Standard Value	Limit	Remedy
5	V-ribbed belt tension (for water pump)	When belt is new	9 to 11 {0.35 to 0.43}	—	Adjust
		When belt in use is re-tensioned	11 to 13 {0.43 to 0.51}	—	

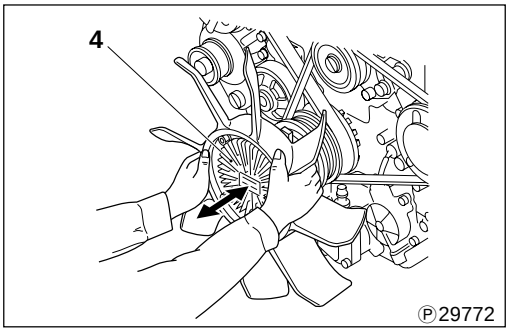
Tightening torque

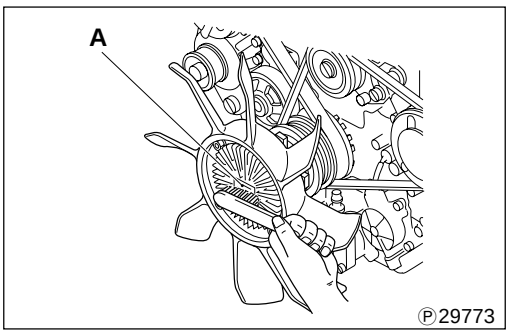
Unit: N·m {ft.lbs, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
1	Nut (cooling fan mounting)	4.9 {3.6, 0.5}	—
3	Nut (for automatic cool fan coupling mounting)	12.7 {9.4, 1.3}	—
6	Bolt (for water pump assembly mounting)	23.5 {17.4, 2.4}	—
9	Nut (for fan pulley mounting)	196.1 {145, 20}	—

Special tools

Location	Tool name and shape	Part No.	Application
5	Belt Tension Gauge 03612	Obtain Locally	V-belt and V-ribbed belt tension measurement





◆ Service Procedure

4 Automatic cooling fan coupling

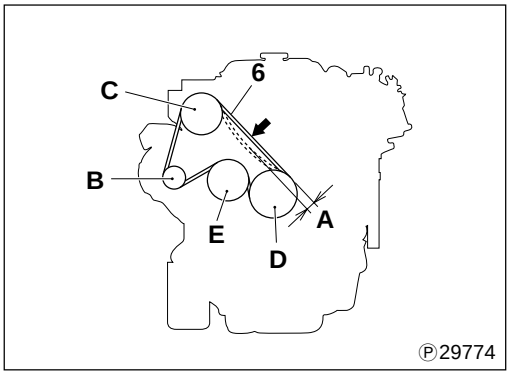
[Inspection]

Inspect the automatic cooling fan coupling **4** in accordance with the following procedure. If any defect is apparent, replace the unit.

- Check for leakage of oil from the coupling body.
- Rotate the automatic cooling fan coupling **4** by hand and check for irregular movement or abnormal noise caused by a defect in the bearing.
- Check for excessive axial play in the automatic cooling fan coupling **4** when the engine is cool.

[Cleaning]

If any foreign particles have adhered to the bimetal **A**, brush them off gently.



5 V-belt and V-ribbed belt tension

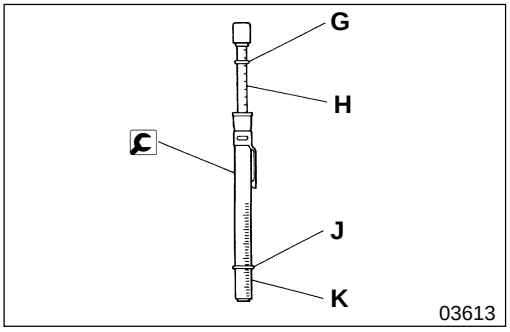
[Inspection]

NOTE

Before checking for tension, crank the engine one turn or more clockwise.

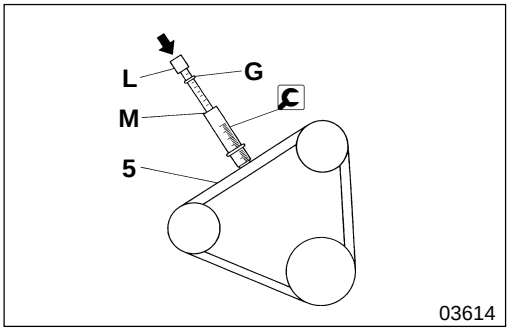
Apply force of approximately 98 N {22 lbf, 10 kgf} to the span center of the V-ribbed belt **5**, and measure the extent of belt deflection **A**.

B : Alternator pulley
C : Air conditioner compressor pulley or tention pulley
D : Fan pulley
E : Water pump pulley
F : Tension pulley

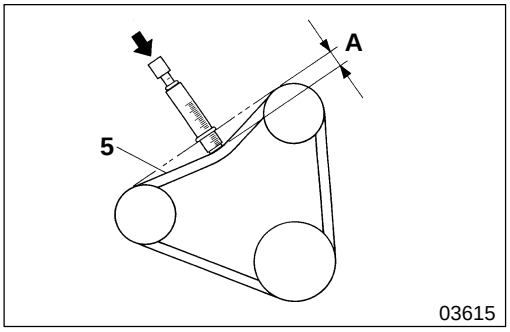


● **Use of belt tension gauge**

- Set the upper O-ring **G** of the 🔧 Belt Tension Gauge to a push load of 98 N {22 lbf, 10 kgf} on scale **H**.
- Set the lower O-RING **J** of the 🔧 Belt Tension Gauge to the belt's specified maximum deflection value on scale **K**.



- Apply the 🔧 Belt Tension Gauge to the center of the V-ribbed belt **5** and push **L** until the upper O-ring **G** reaches the flange **M**.

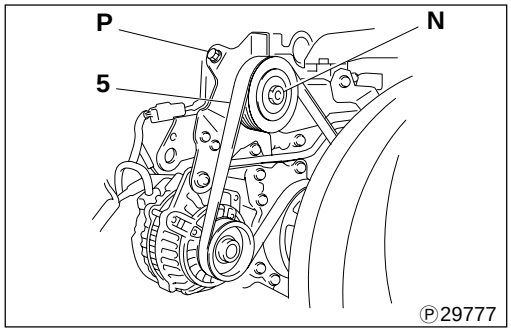


- Measure the deflection **A** of the V-ribbed belt **6**. If the measurement does not comply with the standard value, adjust the tension in accordance with the following procedure.

[Adjustment]

CAUTION ⚠

- **Excessive tension in the V-ribbed belt 5 may damage the belt and related bearings.**
- **Keep the V-ribbed belt 5 free of oil. If the belt becomes oily, it may slip, resulting in overheating of the engine and insufficient charging of the battery.**



- Loosen the tensioner pulley mounting sleeve **N**, then adjust the tension of the V-ribbed belt **5** using the adjustment bolt **P**.
- When the adjustment is completed, securely tighten the sleeve **N**.

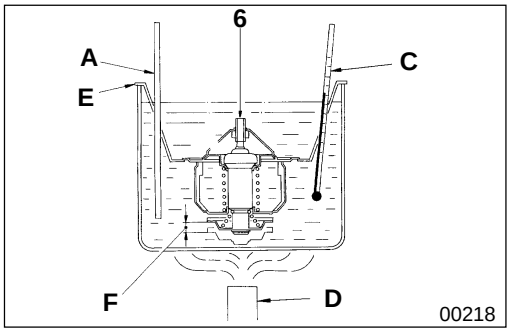
4	Bolt (for thermostat cover mounting)	23.5 {17.4, 2.4}	—
7	Water temperature sensor	22.6 {16.6, 2.3}	—



◆ Service procedure

6 Thermostat

[Inspection]

Place the thermostat in a container of water. Then, carry out the following inspection procedure while stirring the water with a rod **A** to ensure that it is heated evenly. If the measurements do not comply with the standard values, replace the thermostat **6**.

(1) Valve opening temperature

- Support the thermostat **6** with wire **E** to keep it away from the heat source **D**.
- Gradually heat the water until it reaches the valve opening temperature.
- Maintain this temperature for approx five minutes and check that the valve **B** is open.
- When the water temperature drops below 65°C {149°F}, check the the valve **B** is completely closed.
  C : Thermometer

(2) Valve lift

Heat the water to slightly higher than the valve opening temperature. With the valve **B** fully open, maintain this water temperature for five minutes. Measure the extent of valve lift **F**.

THERMOSTAT 14B-26

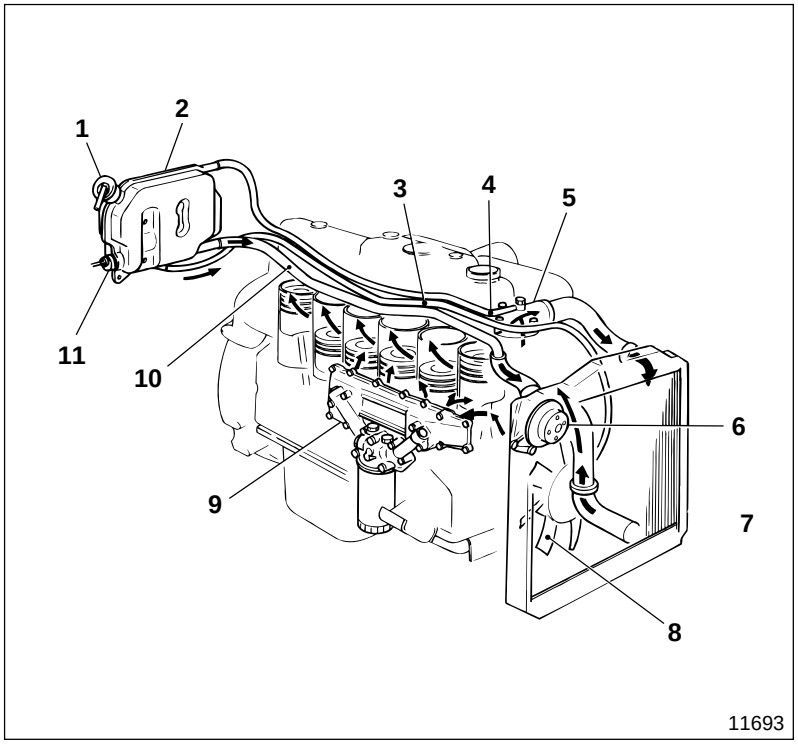
SPECIFICATIONS/STRUCTURE AND OPERATION

SPECIFICATIONS

Item	Specifications
Kind of cooling system	Forced water circulation system
Water pump type	Belt-driven involute type
Thermostat type	Wax-pellet, bottom bypass type (with jiggling valve)
Automatic cooling fan coupling type	Continuous control type
Radiator type	Tube and corrugated fin type
Coolant capacity L {qts}	21 {22}

STRUCTURE AND OPERATION

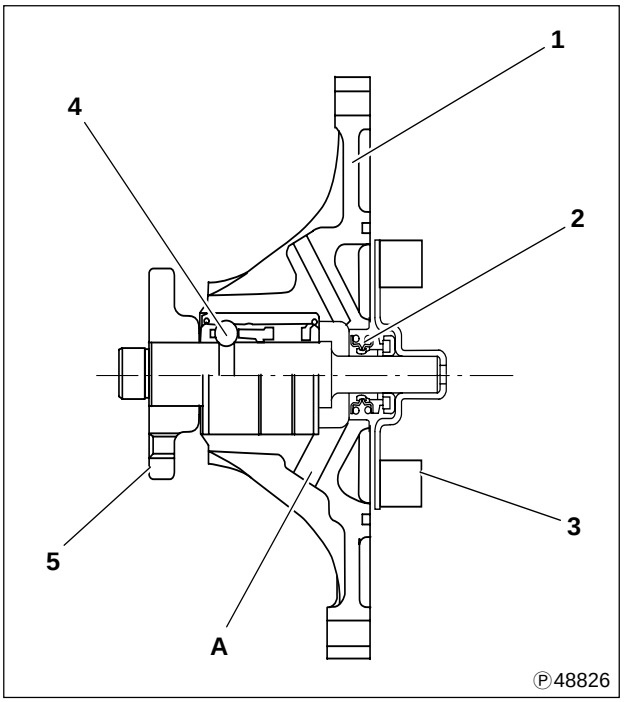
Cooling System (Flow of Coolant)



1 Pressure cap
2 Surge tank
3 Suction pipe
4 Air pipe
5 Thermostat
6 Water pump
7 Radiator
8 Cooling fan
9 Oil cooler
10 Water inlet pipe
11 Water level sensor

Surge tank **2** is installed at a higher position than radiator **7** and automatically adds coolant when the coolant level in the radiator drops.

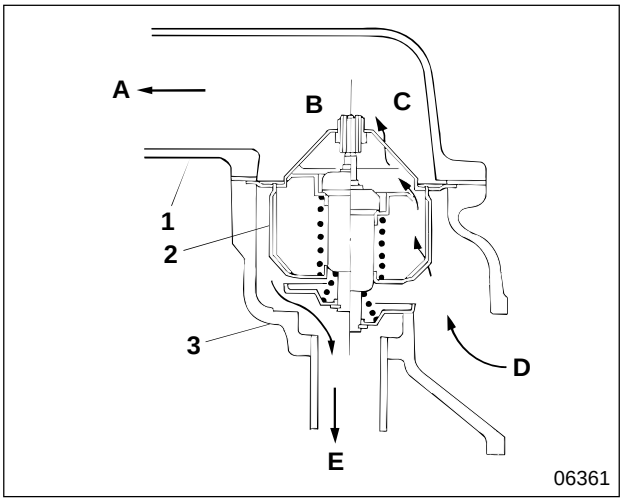
Water Pump



1 Case
2 Unit seal
3 Impeller
4 Ball bearing
5 Flange

A : Drain hole

Thermostat



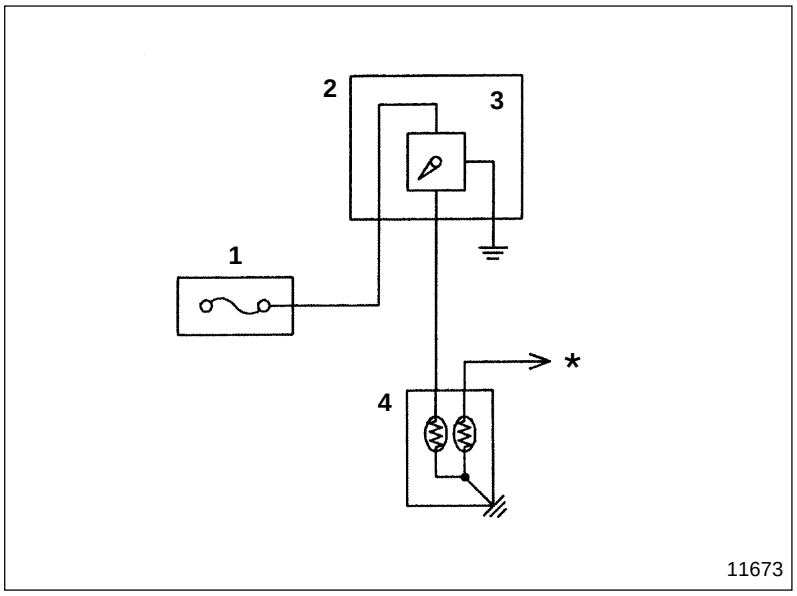
1 Thermostat cover
2 Thermostat
3 Thermostat case

A : To radiator
B : When low coolant temperature
C : When high coolant temperature
D : From cylinder head
E : To water pump

Thermostat **2** is a bottom bypass type that uses wax pellets as its regulating element. As the wax changes its form from solid to liquid according to changes in temperature, the volume of the wax changes. Therefore, the position of the valve, changed by the coolant temperature, regulates the flow of the coolant to the radiator and water pump (bypass side) and controls the coolant temperature.

Cooling System Electric Circuit

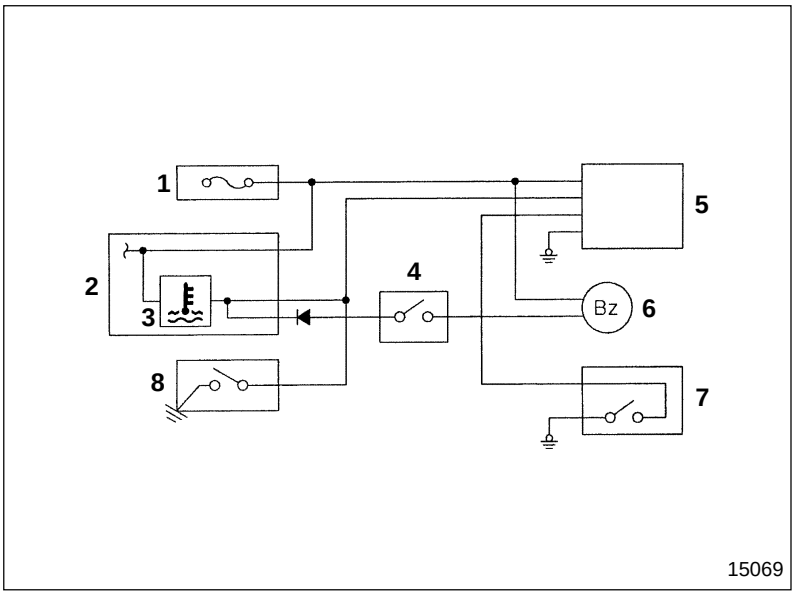
● Water temperature gauge circuit



1 Fuse box
2 Meter cluster
3 Water temperature gauge
4 Water temperature sensor

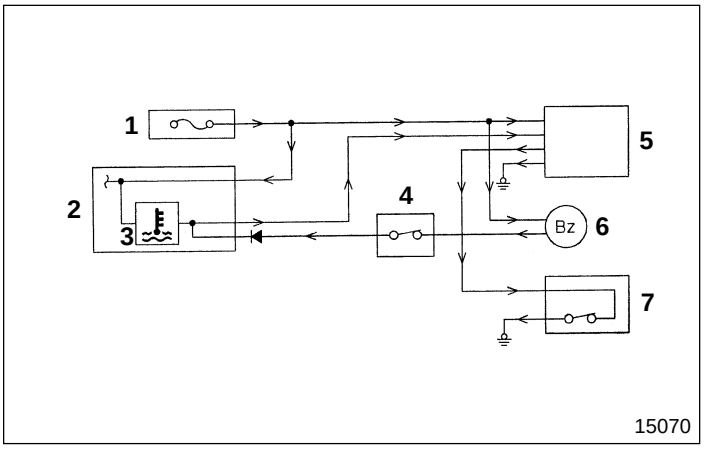
***** : To cold start switch

● Water level sensor and overheating circuit



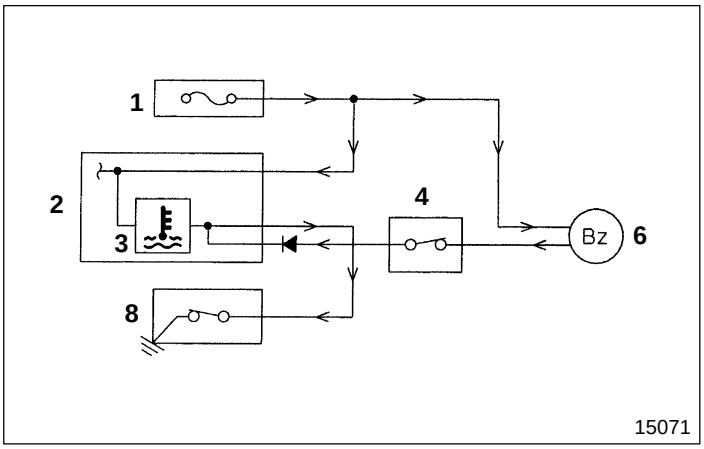
1 Fuse box
2 Meter cluster
3 Water level warning lamp
4 Parking brake switch
5 Water level control unit
6 Buzzer
(Buzzer does not work when the parking brake is engaged.)
7 Water level sensor
8 Overheating switch

When this circuit detects insufficient coolant or extremely high coolant temperature, it lights water level warning lamp **3** and sounds buzzer **6** to warn the driver of the abnormal conditions.



When water level sensor is activated

- **1**→**5**→**7**→Ground
- Water level control unit **5** detects insufficient coolant.
- **1** → **3** → **5** → Ground; **1** → **6** → **5** → Ground
- When the sensor is activated, water level warning lamp **3** lights up and buzzer **6** sounds.



When overheating switch is activated

- **1** → **3** → **8** → Ground; **1** → **6** → **8** → Ground
- When the switch is activated, water level warning lamp **3** lights up and buzzer **6** sounds.

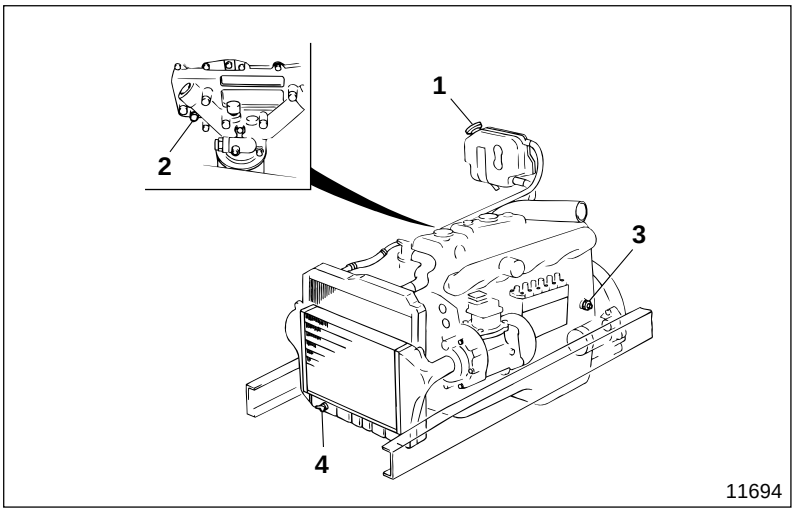
M E M O

Replacing Coolant and Cleaning Cooling System



1 Pressure cap
2 Oil cooler drain plug
3 Crankcase drain plug
4 Radiator drain plug

Tightening torque

Unit : N·m {ft.lbs, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
2	Oil cooler drain plug	34 to 39 {25 to 29, 3.5 to 4.0}	—
3	Crankcase drain plug	98 {12, 10}	—

Using the radiator for a long period of time without cleaning it will cause overheating because rust and scale deposits will accumulate inside the cooling system. Periodical cleaning is recommended.

● **Draining coolant**

First loosen pressure cap **1,** to lower the pressure in the cooling system, before draining coolant.

WARNING

- **You must make sure that the engine coolant is cold before draining it so as not to scald yourself.**
- **It is dangerous to open pressure cap 1, when the coolant temperature is high, without taking due care because the hot water would spray out. Be sure to cover the pressure cap with a cloth and loosen slowly to bleed the pressure before opening fully.**

● **Cleaning procedure**

- Keep the coolant temperature at approximately 90°C {194°F} so that the thermostat valve remains open and the coolant continues to circulate in the radiator.
- For the sake of convenience you can raise the coolant temperature quickly by covering the front of the radiator with corrugated cardboard or something similar.
- Set the temperature adjusting lever of the heater controller at maximum so that the coolant can circulate freely in the heater piping area.
- In cases where a great amount of rust has accumulated it often happens that as a result of cleaning the radiator starts leaking. Conduct a thorough check for leakage after cleaning.
- Soft water to be used should have the following properties.

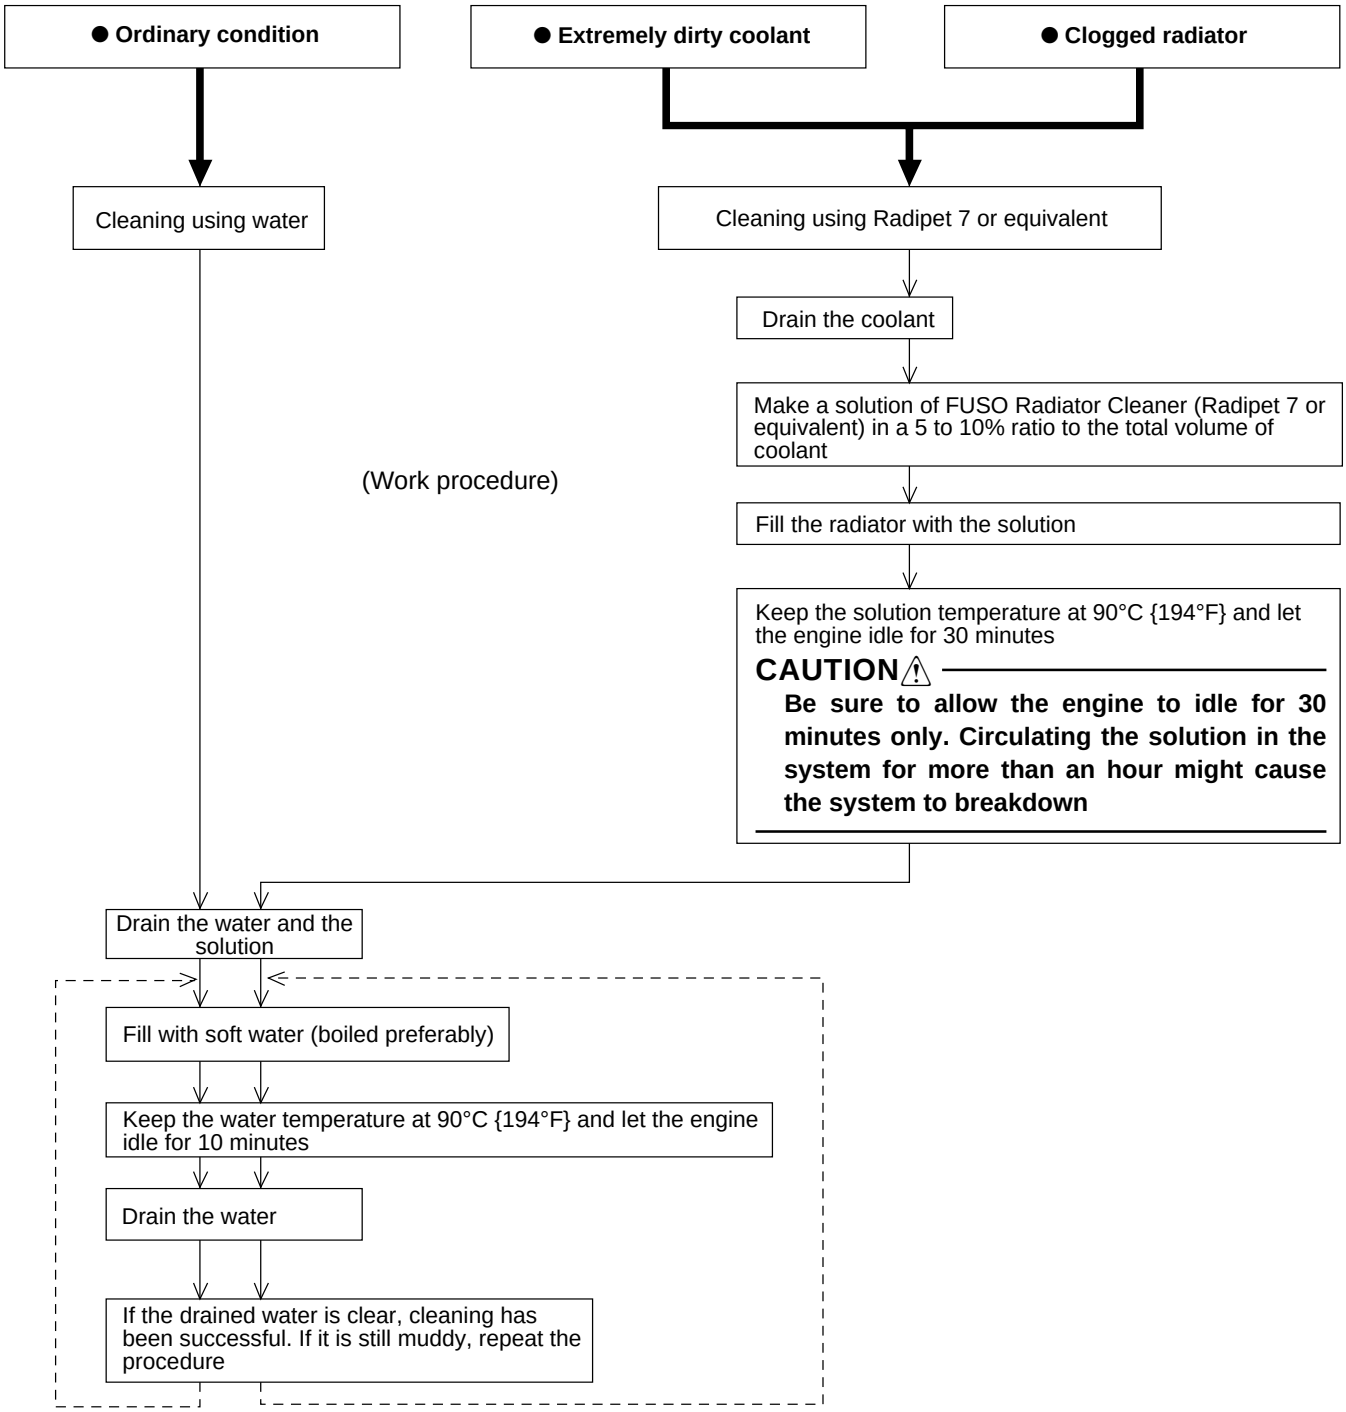
CAUTION

Do not use hard water as it causes scale and rust.

Required properties of soft water

Total hardness	300 ppm or less	Total dissolved solids	500 ppm or less
Sulfate SO_4^-	100 ppm or less	pH	6 to 8
Chloride Cl^-	100 ppm or less		

Method of cleaning the cooling system depends on its condition.



DANGER

If FUSO DIESEL LONG LIFE COOLANT solution gets in your eyes accidentally, you must immediately rinse your eyes with copious amounts of water, and be sure to consult a doctor.

WARNING

FUSO DIESEL LONG LIFE COOLANT is inflammable. Do not put it near naked lights.

NOTE

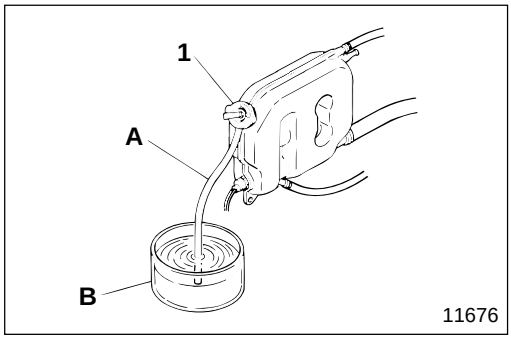
- **After cleaning with solution, fill with coolant as quickly as possible.**
- **To prevent freezing of the coolant and corrosion of the cooling system, use specified coolant solution of FUSO DIESEL LONG LIFE COOLANT. (See the Owner's Handbook for use of these materials.)**

ON-VEHICLE INSPECTION AND ADJUSTMENT

Air Bleeding of Cooling System

- Remove the pressure cap and keep the coolant temperature at 90°C {194°F} while letting the engine idle and bleed the air out completely. Keep the temperature adjusting lever of the heater controller at maximum so that the coolant can circulate freely in the heater piping area.
- After completing adequate air bleeding of the cooling system, refill coolant sufficiently enough for the surge tank.

Gas Leakage Test

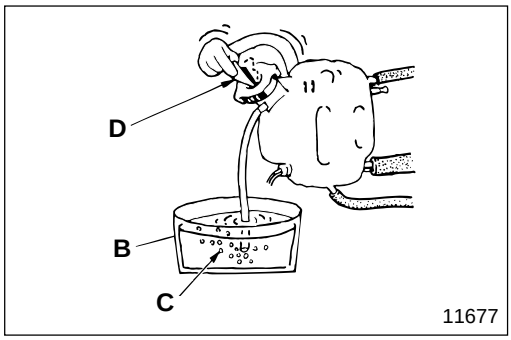


Air or exhaust gas in the coolant increases corrosion and rusting in the system. Therefore, carry out the following test:

- Remove surge tank pressure cap **1** and check if the coolant level comes up to the lip of the tank.
- Put the end of overflow pipe **A** into water tank **B**.

WARNING⚠

Be sure that the coolant temperature is low enough so that hot coolant does not spout out when you loosen pressure cap 1.



- Run the engine to bring the coolant temperature to approximately 90°C {194°F}.
- Lift lever **D** of pressure cap **1**.
- If air bubbles **C** continuously rise in water tank **B**, it is an indication that air or exhaust gas has gotten into the coolant.
- If it is air, it is possible that the cylinder head bolts, the water pump mounting bolts or the hose connections are loose, or that the hose is damaged.
- If it is exhaust gas, it is possible that the cylinder head gaskets are damaged, or that the cylinder head is cracked.

Tightening torque

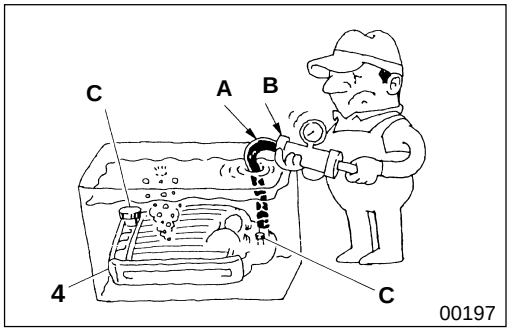
Unit: N·m {ft.lbs, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
3	Drain cock	2 {1.4, 0.2}	—
5	Bolt (side member mounting)	13 {9, 1.3}	—

Special tool

Location	Tool name and shape	Part No.	Application
7, 9	Lock & break tool	Obtain locally or use sublet repair	Upper tank, lower tank removal

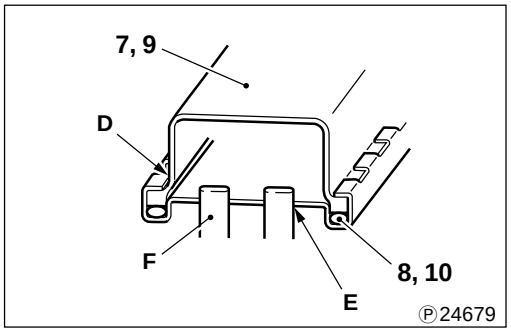
The part number given is Toyo Radiator's one.



Service procedure

4 Radiator inspection

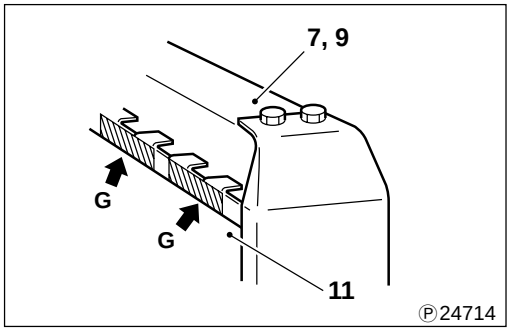
- Fit a hose **A**, radiator cap tester **B** and plug **C** onto the radiator upper tank **7**.
- Fit a plug **C** onto the radiator lower tank **9**, then immerse the radiator in a tank of water.
- Using the radiator cap tester **B**, apply the specified air pressure of 150 kPa {21 psi, 1.5 kgf/cm^2}, and check for air leakage.
- If air leakage is apparent, repair or replace the radiator assembly **4**.



- Replace the following parts according to the leaking locations.

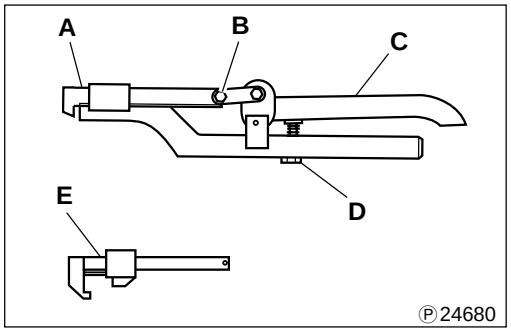
Leaking location	Part to replace
Tank root **D**	O-ring **8** or **10**
Tank **7**	Tank **7**, O-ring **8**
Tank **9**	Tank **9**, O-ring **10**
Tube fitted area **E**	Core **11**, O-ring **8**, **10**
	* Tube **F** (TIG welded), O-ring **8**, **10**
Tube **F**	Core **11**, O-ring **8**, **10**

* : When repaired



CAUTION ⚠

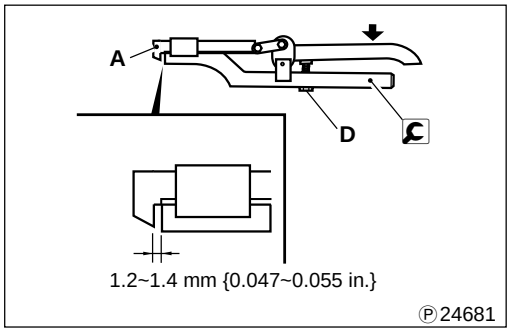
- **Replace the core 11 if its clinching tabs that hold the upper tank 7 or lower tank 9 have two paint marks G, evidence of the tabs having been bent back twice.**
- **The tabs are provided with one paint mark each time they are bent back. Count the paint marks on each of upper and lower tabs separately.**



7 **9** **Upper tank and lower tank**

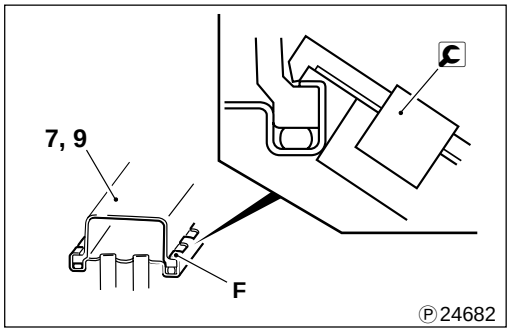
Remove and reinstall the tanks using the Lock and Break Tool.

- **A**: Attachment (for tank removal)
- **B**: Attachment locking bolt
- **C**: Slide handle
- **D**: Stopper/adjuster bolt
- **E**: Attachment (for tank installation)

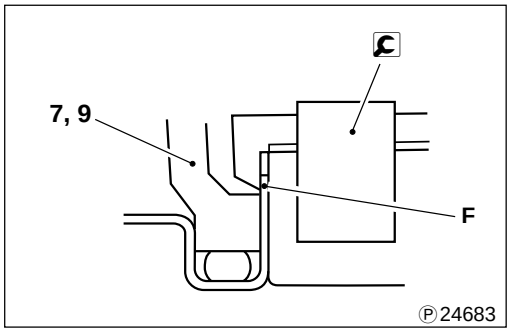


[Removal]

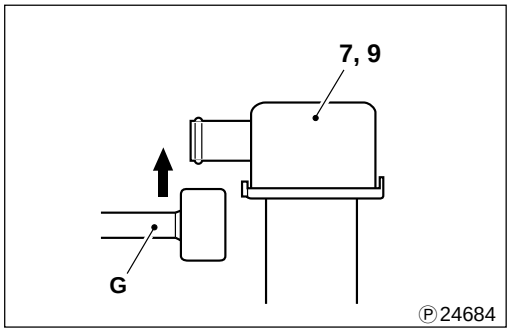
- Fit attachment **A** onto the end of the Lock and Break Tool, set it to the illustrated dimension and lock it in position with the stopper/adjuster bolt **D**.



- Using the Lock and Break Tool, bend up the tabs **F** of the core **11** that hold the tank **7**, **9**.



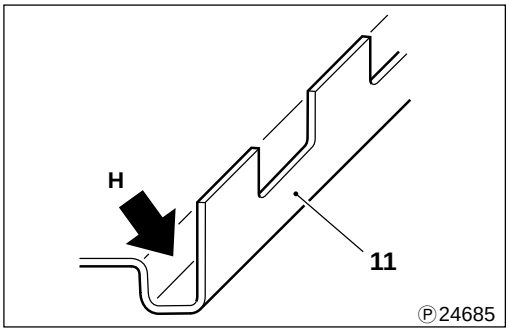
- Straighten the tabs **F** completely as shown by gripping the Lock and Break Tool.
- After straightening all the tabs **F**, grasp the inlet or outlet pipe and remove the tank **7**, **9**.



- If the tank **7**, **9** is difficult to remove, tap it with a rubber or plastic hammer **G**.

CAUTION ⚠

The tanks 7 and 9 are made of plastic and may crack if subjected to undue shock. Handle them with care.

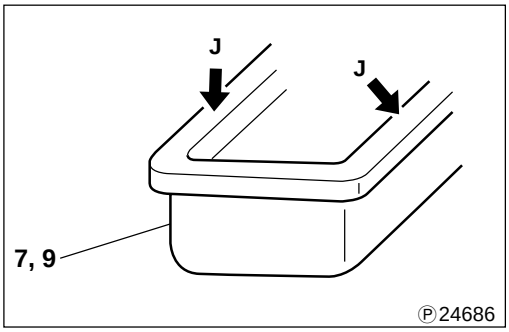


[Inspection]

- Check the tank mounting channels **H** of the core **11** for foreign matter.
- If foreign matter is stuck inside the mounting channels, rub it away with sandpaper (approx. #1000) or blow it out with compressed air.

CAUTION ⚠

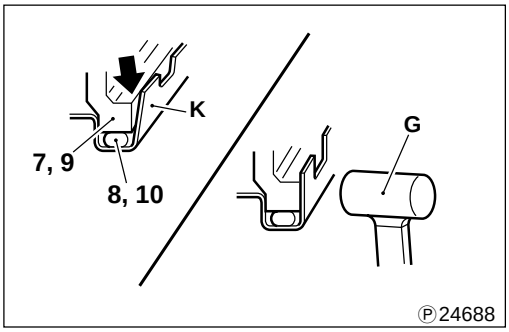
If any foreign matter (even a single hair) remains when the O-ring 8, 10 and tank 7, 9 are fitted, leakage can occur. Carefully inspect and clean each tank mounting channel H entirely.



- Clean the core contacting surface **J** of the tank **7**, **9** and inspect it for damage. Replace the tank if any defect is evident.

CAUTION ⚠

Perform works with bare hands to prevent foreign matter from sticking to the surface J.

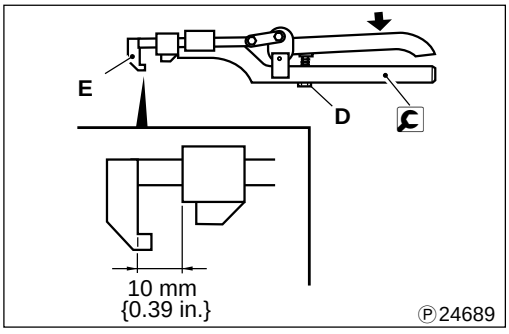


[Installation]

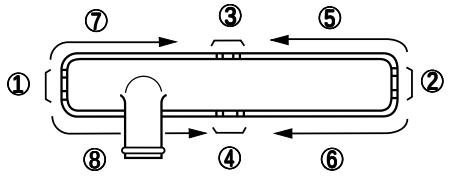
- Install the tank **7**, **9** in position. Check that the sub-plate **K** of the core is in close contact with the tank. If there is any space, tap the sub-plate lightly with a rubber or plastic hammer to eliminate space.

CAUTION ⚠

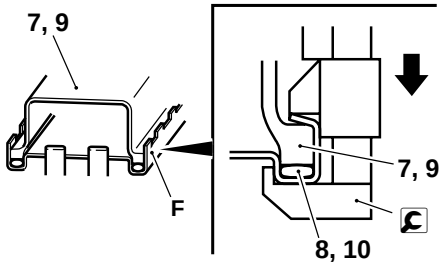
Handle the parts with bare hands to prevent foreign matter from sticking to the O-ring 8, 10 and tank 7, 9.



- Fit attachment **E** onto the end of the Lock and Break Tool, set it to the illustrated dimension and lock it in position with the stopper/adjuster bolt **D**.



Ⓟ24690



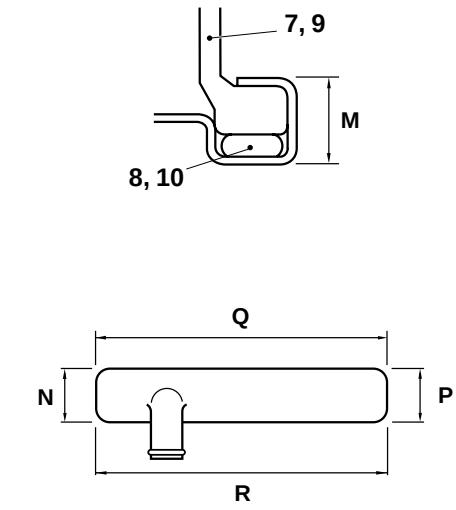
Ⓟ24691

- Clinch the tabs **F** of the core **11** to hold the tank **7**, **9** in the illustrated order.

  ①~④ :Two center tabs on each side
  ⑤~⑧ : Remaining tabs in illustrated sequence
  : Lock and Break Tool (with attachment **E**)

CAUTION ⚠

The sides ① and ② do not allow the Lock and Break Tool to be used for clinching. Clinch these sides using a pair of pliers with tape wrapped around its jaws.



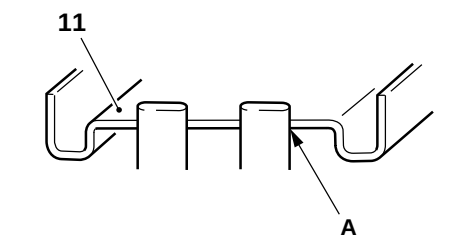
Ⓟ24692

- Check that the tabs have been clinched to the following dimensions.

  M : 14.65 ~ 15.05 mm {0.576 ~ 0.592 in.} (Sides **N** and **P**)
  10.05 ~ 10.45 mm {0.395 ~ 0.411 in.} (Sides **Q** and **R**)
- Check for leaks. 🕮 P14B-15
- Provide a paint mark to the sub-plate **K** of the core **11** to indicate that the tabs have been bent up and then down. 🕮 P14B-15

CAUTION ⚠

Provide one paint mark after each removal of the tank.



Ⓟ24693

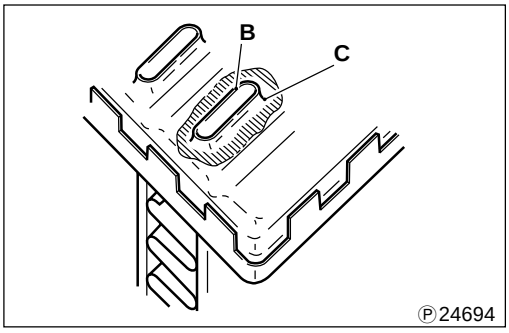
11 Core

If water leaks from the tube fitted area **A**, replace the core **11** or repair it by the following method.

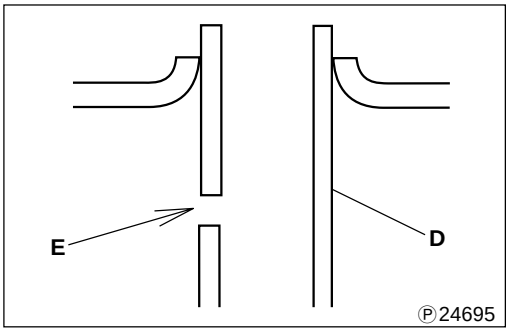
[Repair]

WARNING ⚠

- **Repair is carried out by tungsten inert gas arc (TIG) welding, which requires the skill of a trained welder.**
- **To avoid danger, dry the core 11 completely before welding.**



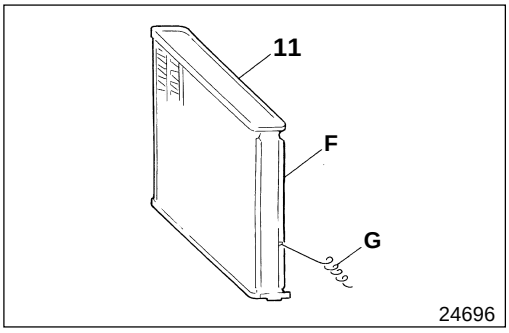
- Clean both edges **B** of the leaky tube and their surroundings **C** using a stainless steel wire brush. Scrub the surface until it glistens with exposed aluminum.



- Since both ends of the tube are covered with weld metal, make a small hole **E** in the tube **D** to allow air venting.

CAUTION ⚠

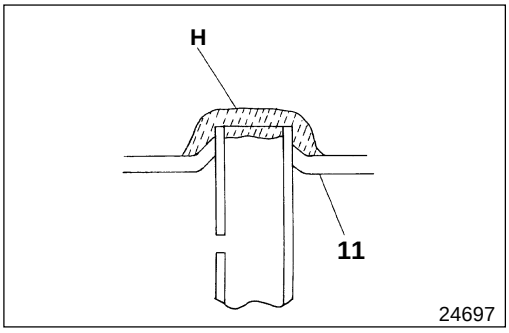
Absence of the small hole E causes escaping air to produce small pin holes in the weld.



- Connect a grounding wire **G** from the support **F** of the core **11** to an appropriate object.

CAUTION ⚠

Improper connection of the grounding wire G causes a short circuit during welding work and the core could be fused at the welded portion.

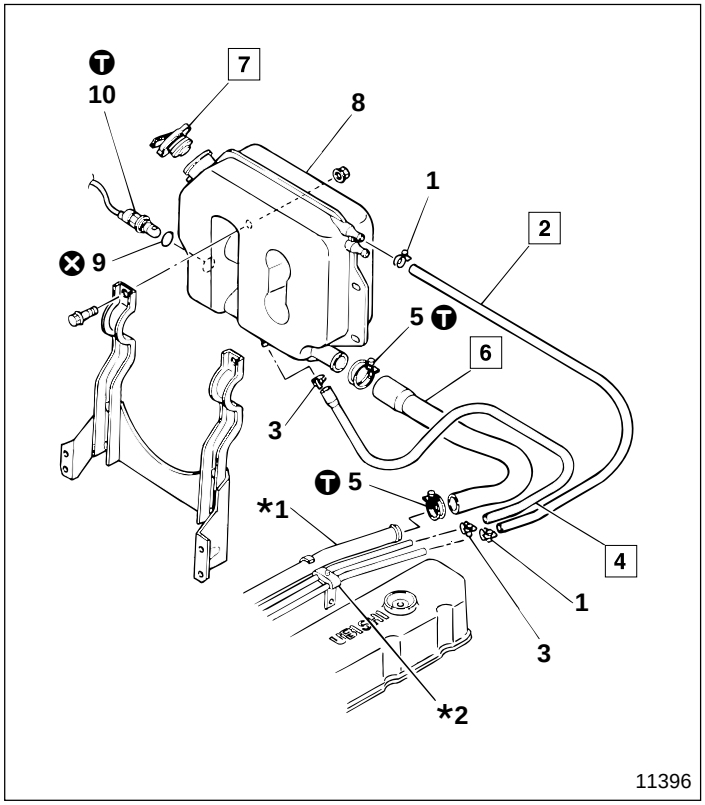


- Cover both ends of the tube with welding metal.
  H : Tungsten inert gas arc weld (TIG)
  Welding conditions:
  Welding rod: A4043 (approx. 2 mm {0.0079 in.} in diameter)
  Welding current: 80A AC
- After welding, check for the following defects. Rectify the weld or replace the core **11** if any of the defects is evident.
  - Undercut
  - Bead crack
  - Crack in base metal

CAUTION ⚠

Weld with sufficient care. Poor welding may cause leakage to reoccur.

SURGE TANK



11396

● **Disassembly sequence**

1 Clamp
2 Air hose
3 Clamp
4 Water hose
5 Clamp
6 Supply hose
7 Pressure cap
8 Surge tank
9 O-ring
10 Water level sensor Gr 54

***1** : Water inlet pipe
***2** : Air and water suction pipe
⊗ : Non-reusable parts

● **Assembly sequence**

Follow the disassembly sequence in reverse.

Service standards

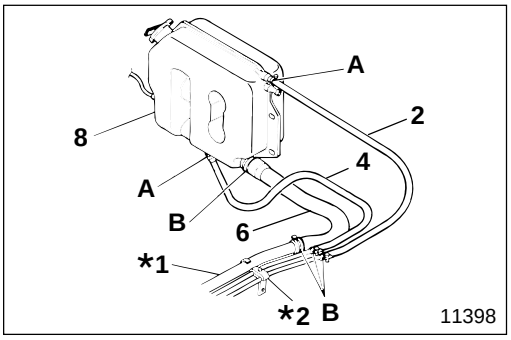
Location	Maintenance item	Standard value	Limit	Remedy
7	Pressure cap valve opening pressure	69±15 kPa {10±2.1 psi, 0.7±0.15 kgf/cm^2}	—	Replace

Ⓣ Tightening torque

Unit : N·m {ft.lbs, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
5	Clamp	3.9 {2.9, 0.4}	—
10	Water level sensor	2.9 to 3.9 {2.2 to 2.9, 0.3 to 0.4}	—

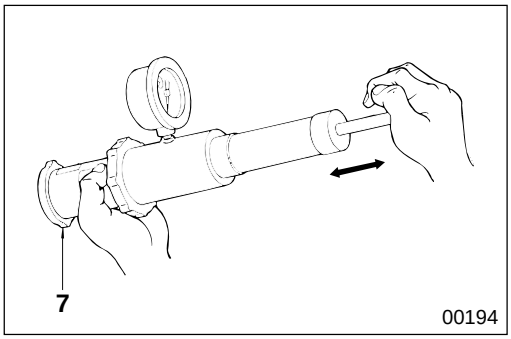
◆ Service procedure



2 4 6 Installation of hose

The depth of hose installation is as follows.

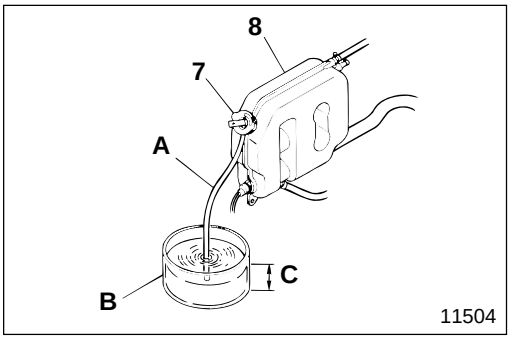
A : 15 mm {0.59 in.}
B : 30 mm {1.18 in.}



7 Inspection of pressure cap

(1) Pressure valve opening pressure

If the measured value deviates from the standard value, replace pressure cap **7**.



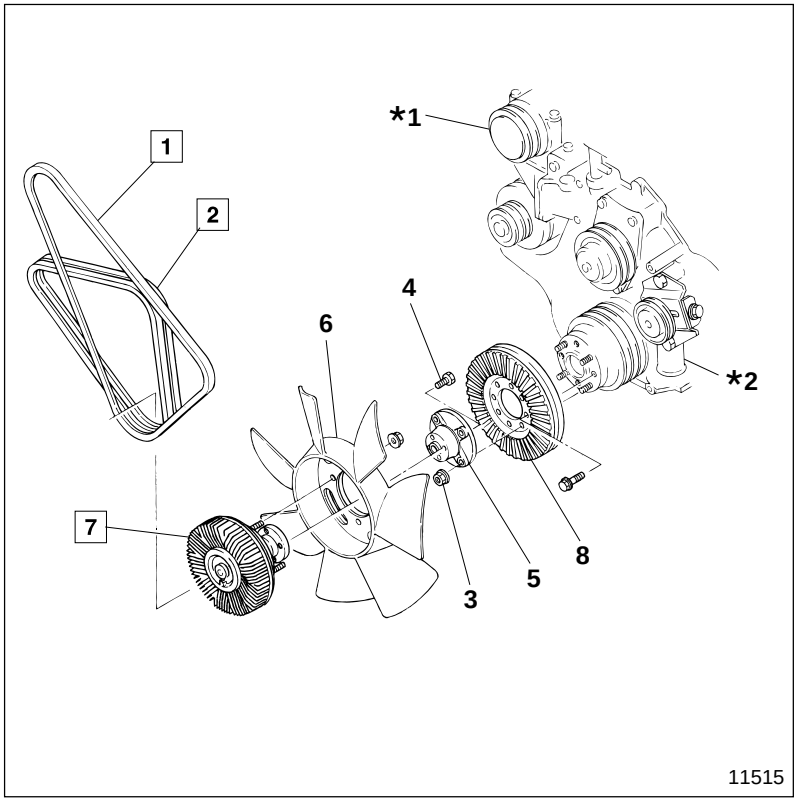
(2) Inspection of vent valve

- Check that the coolant level comes up to the lip of surge tank **8**. If the level is low, add coolant.
- Tighten pressure cap **7**.
- Put the end of overflow hose **A** into water tank **B**.
- Check coolant level **C** of water tank **B**.
- Run the engine at a high revolution to increase the coolant temperature.
- Stop the engine when some of the coolant in surge tank **8** has overflown into water tank **B**.
- Leave things for a while.
- Check the time it takes for the coolant temperature to return to the ambient temperature, and check whether coolant level **C** in the tank is the same as before running the engine.
- If the coolant level has not returned to that before running engine, replace pressure cap **7**.

NOTE

Do not remove pressure cap 7 before the coolant temperature decreases to the ambient temperature. If you do the coolant will not return to reservoir tank A because negative pressure in the radiator is lost.

COOLING FAN AND V-BELT



● **Removal sequence**

1 V-belt (Air-conditioner)
2 V-belt (Fan)
3 Nut
4 Bolt
5 Fan spacer
6 Cooling fan
7 Automatic cooling fan coupling
8 Torsional damper

***1** : Cooler compressor
***2** : Tension pulley

● **Installation sequence**

Follow the removal sequence in reverse.

CAUTION⚠

- **Be sure to replace automatic cooling fan coupling 7 as an assembly if it is faulty because it is a unit construction.**
- **Be sure to replace V-belts 2 as a set to maintain even tension between them.**

Service standards

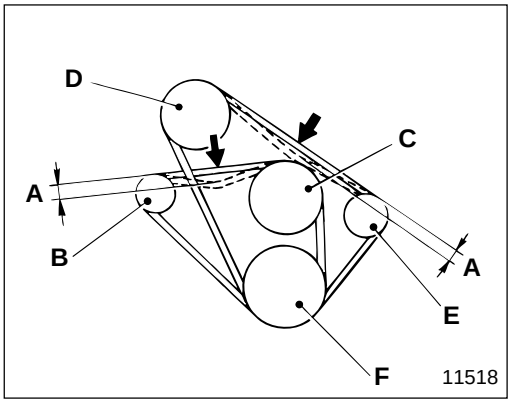
Unit : mm {in.}

Location	Maintenance item	Standard value	Limit	Remedy
1	V-belt tension (Air-conditioner)	16 to 20 {0.63 to 0.79}	—	Adjust
2	V-belt tension (Fan)	12 to 16 {0.47 to 0.63}	—	Adjust

Special tools

Location	Tool name and shape	Part No.	Application
1, 2	Belt tension gauge 03612	MH062345	Measurement of tension of V-belt

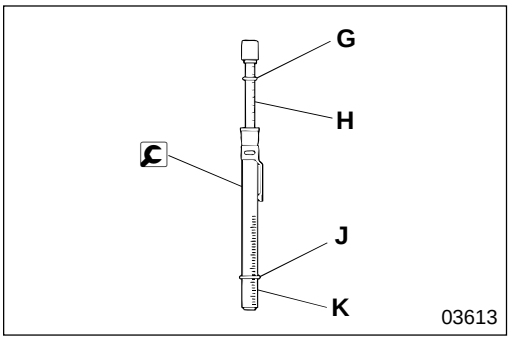
◆ Service procedure



1 **2** **V-belt**

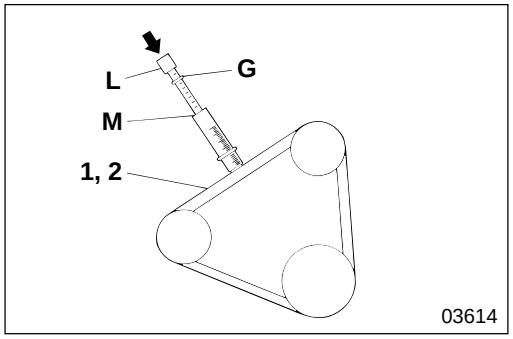
[Inspection]
Measure the extent of flex **A** when the center of V-belts **1**, **2** as illustrated is depressed with a force of approximately 98 N {72 lbf, 10 kgf}.

B : Alternator pulley
C : Water pump pulley
D : Cooler compressor pulley (Air-conditioner)
E : Tension pulley
F : Crankshaft pulley

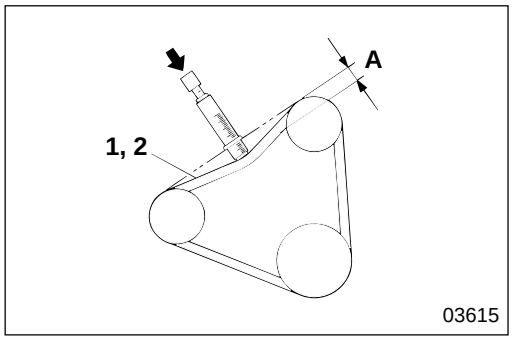


● **Use of special tool belt tension gauge**

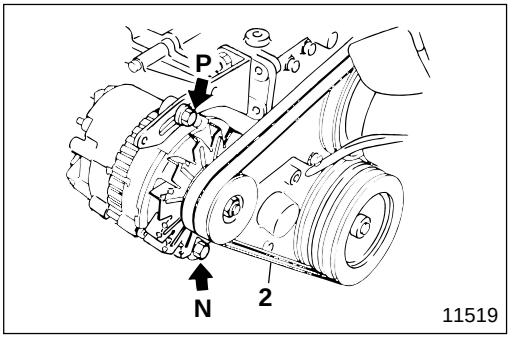
- Set upper O-ring **G** of belt tension gauge to 98 N {72 lbf, 10 kgf} (push load) on graduation **H**.
- Set lower O-ring **J** of belt tension gauge to graduation **K** (maximum flex of belt).



- Place belt tension gauge at the center of V-belts **1**, **2** perpendicularly as illustrated and push top **L** all the way down until upper O-ring **G** hits upper edge **M**.



- Measure the extent of flex **A** of V-belts **1**, **2** at this point, and if the measured value deviates from the standard value, adjust as follows.



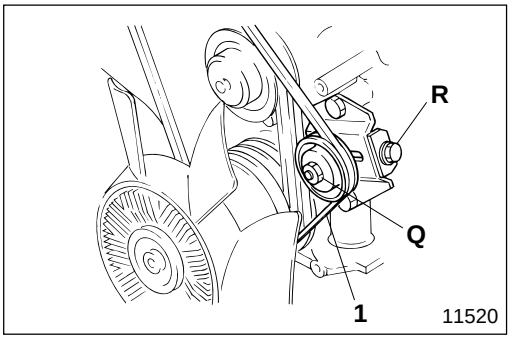
[Adjustment]

(1) Adjustment of V-belt tension for fan

- Loosen alternator mounting bolts **N** (two places), and adjust the tension of V-belts **2** using adjusting bolt **P**.
- After adjustment, tighten the bolts and nuts securely.

CAUTION

- **Bear in mind that excessive tension of V-belts 2 might damage the belts and bearings that engage with the V-belts.**
- **Be sure to replace V-belts 2 as a set to maintain even tension between them.**
- **Be careful not to let oil stick to V-belts 2, if oil gets onto the belts, it causes slipping, resulting in overheating and insufficient battery charging.**

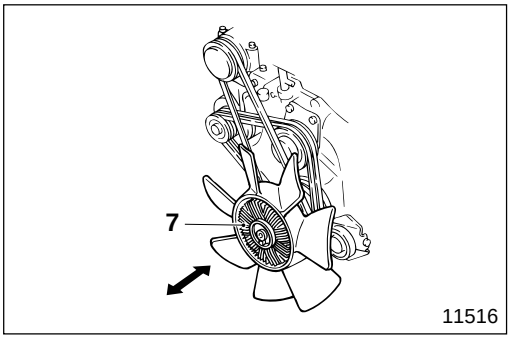


(2) Adjustment V-belt tension for air-conditioner

- Loosen tension pulley mounting nut **Q**, and adjust the tension of V-belt **1** using adjusting bolt **R**.
- After adjustment, tighten the bolt **R** and nut **Q** securely.

CAUTION

- **Bear in mind that excessive tension of V-belt 1 might damage the belt and bearings that engage with the V-belt.**
- **Be careful not to let oil stick to V-belt 1, if oil gets onto the belt, it causes slipping, resulting in poor performance of the air conditioner.**

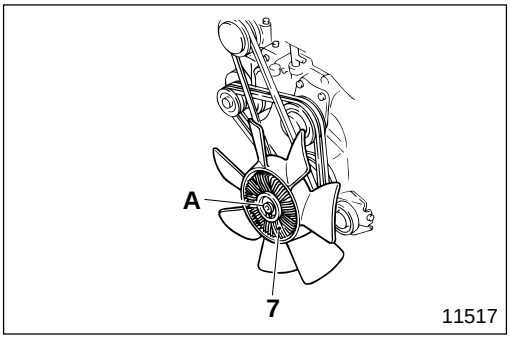


7 Automatic cooling fan coupling

[Inspection]

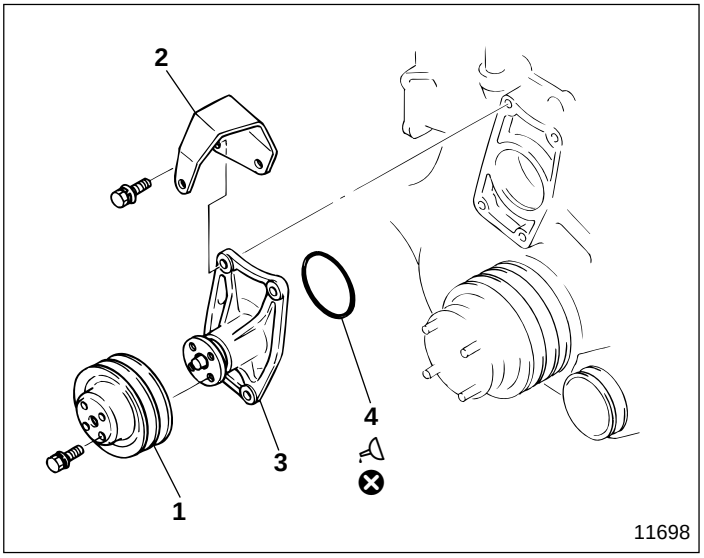
Carry out the following inspection of automatic cooling fan coupling **7** and if any fault is found, replace the unit.

- Check for any leakage of lubricating oil sealed in the coupling body.
- Rotate automatic cooling fan coupling **7** by hand, and check for any irregularity in rotation related to the coupling bearing or any abnormal noise.
- Check for any excessive play of automatic cooling fan coupling **7** in the axial direction when the engine is cool.



[Cleaning]

- If there are any foreign particles sticking to bimetal **A**, remove them by brushing lightly.



● **Removal sequence**

1 Water pump pulley
2 Upper shroud stay
3 Water pump
4 O-ring

⊗ : Non-reusable parts

● **Installation sequence**

Follow the removal sequence in reverse.

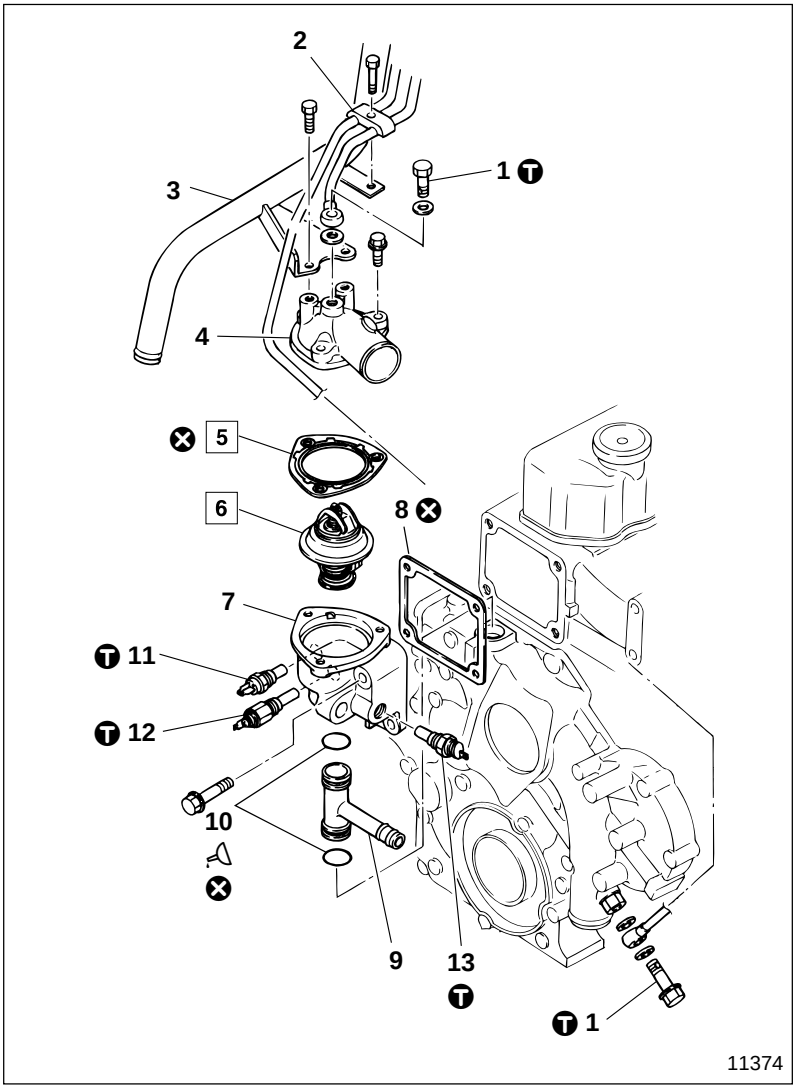
CAUTION

- **Be sure to replace water pump 3 as an assembly if it is faulty because it is a unit construction.**
- **Never apply engine oil to the O-ring because it will cause the O-ring to swell.**

Lubricant

Location	Points of application	Kinds	Quantity
4	Periphery of O-ring	Soapy water	As required

THERMOSTAT



● **Disassembly sequence**

1 Eye bolt
2 Air and water suction pipe
3 Water inlet pipe
4 Thermostat cover
5 Thermostat cover gasket
6 Thermostat
7 Thermostat case
8 Thermostat case gasket
9 Bypass pipe
10 O-ring
11 Water temperature sensor (Water temperature gauge and multi-purpose timing control unit) Gr 54
12 Overheating switch Gr 54
13 Water temperature sensor (Pre-stroke control type injection pump) Gr 54

⊗ : Non-reusable parts

● **Assembly sequence**

Follow the disassembly sequence in reverse.

CAUTION

Never apply engine oil to O-ring 10 because it will cause the O-ring to swell.

Service standards

Unit : mm {in.}

Location	Maintenance item		Standard value	Limit	Remedy
6	Thermostat	Valve opening temperature	82±2°C {180±3.6°F}	—	Replace
		Extent of valve lift (95°C {203°F})	10 {0.39} or more	—	Replace

T Tightening torque

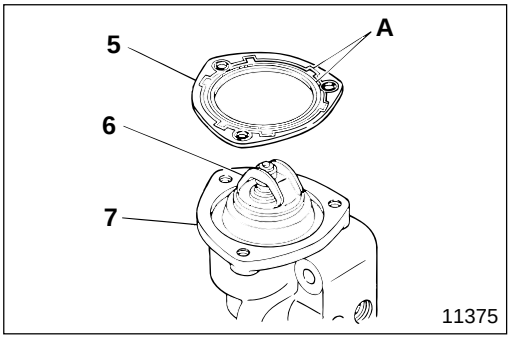
Unit : N·m {ft.lbs, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
1	Eye bolt	25 {19, 2.6}	—
11	Water temperature sensor	34±6.9 {25±5.1, 3.5±0.7}	—
12	Overheating switch	27 to 41 {20 to 30, 2.8 to 4.2}	—
13	Water temperature sensor	34±6.9 {25±5.1, 3.5±0.7}	—

Lubricant

Location	Points of application	Kinds	Quantity
10	O-ring	Soapy water	As required

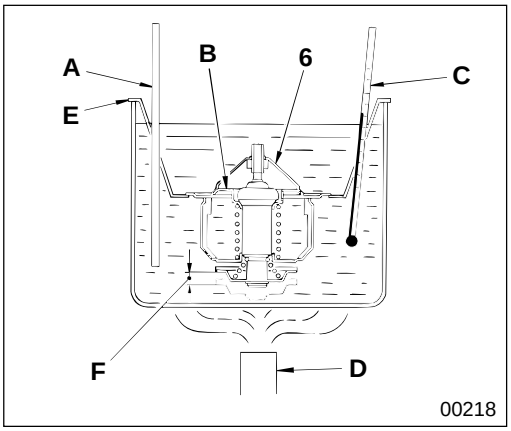
◆ Service procedure



5 **Mounting of thermostat cover gasket**

Mount thermostat cover gasket **5** on thermostat case **7** in the direction as illustrated.

A : Sealant application surface



6 **Thermostat**

[Inspection]

Stir the water using stick **A** to maintain an even water temperature in the container, then carry out the following tests. If the measured value deviates from the standard value, replace thermostat **6**.

(1) Valve opening temperature

- Hold thermostat **6** with wire **E** so as not to get the thermostat too close to heat **D**.
- Heat the water gradually to raise the temperature to the valve opening temperature.
- Maintain this temperature for five minutes and make sure that valve **B** has opened.
- Make sure that valve **B** has closed when the water temperature has dropped to 65°C {149°F}.

  C : Water temperature gauge

(2) Extent of valve lift

Measure valve lift **F**, while maintaining the water temperature a little higher than the valve opening temperature, with valve **B** fully open for five minutes.

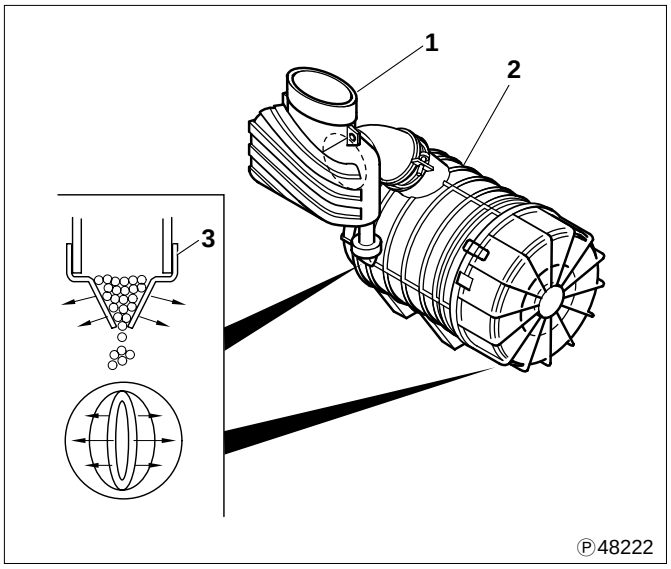
SPECIFICATIONS / STRUCTURE AND OPERATION

SPECIFICATIONS

Item		Specifications
Air cleaner element		Cyclone paper filter type
Dust indicator type		Mechanical
Turbocharger	Model	TD05
	Manufacturer	Mitusubishi Heavy Industries
Intercooler type		Tube and corrugated fin (air cooled)

STRUCTURE AND OPERATION

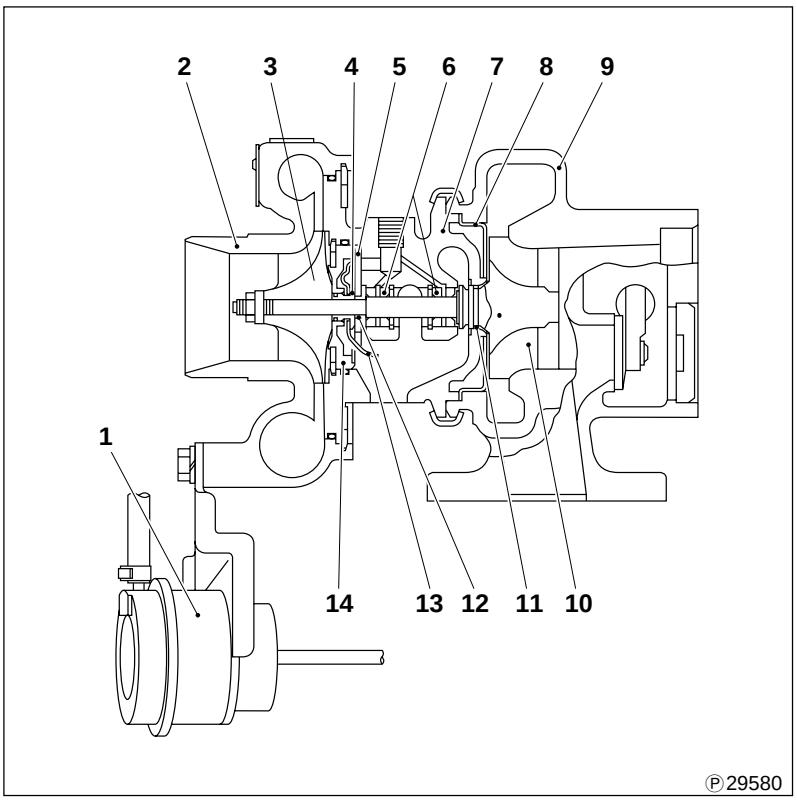
1. Air Cleaner



1 Air lower duct
2 Air cleaner assembly
3 Vacuator valve

- Air cleaner assembly **2** uses a single element.
- Vacuator valves **3** are fitted with air lower duct **1** and air cleaner assembly **2**.
- Vacuator valves **3** automatically vent dust and dirt by the repercussive force of the rubber of the valve that overcomes the inner negative pressure when the engine revolution falls below the specified revolution.

2. Turbocharger Assembly

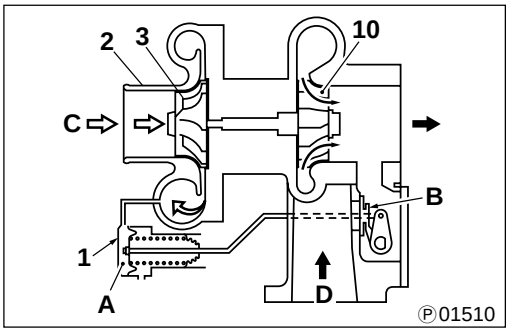


1 Actuator
2 Compressor cover
3 Compressor wheel
4 Thrust sleeve
5 Thrust bearing
6 Bearing
7 Bearing housing
8 Turbine back plate
9 Turbine housing
10 Shaft and turbine wheel
11 Piston ring
12 Thrust ring
13 Oil deflector
14 Insert

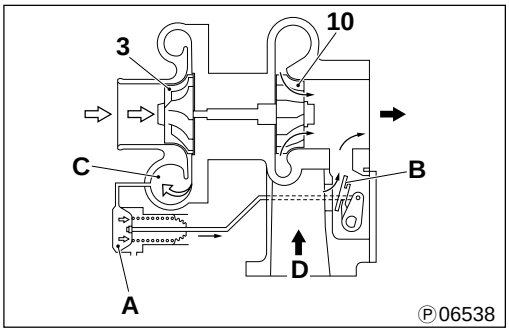
3 to 14: Cartridge assembly

● **Waste gate mechanism**

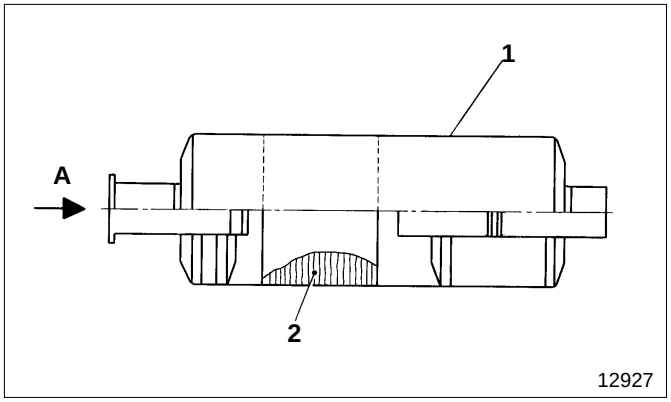
- The waste gate mechanism has actuator assembly **1** to let extra exhaust gas escape. By so doing, the boost pressure is properly controlled to prevent the turbine wheel from overrunning and prevent an excessive pressure in the intake manifold.
- The boost pressure is led from compressor cover **2** through a rubber hose to chamber **A** of actuator assembly **1**. When the boost pressure **C** that acts on chamber **A** is below the setting, the actuator assembly does not operate, and the waste gate valve remains closed, and exhaust gas **D** is blown against turbine wheel **10**.



- When the boost pressure that acts on chamber **A** exceeds the setting, the waste gate valve is opened. As a result, the amout of exhaust gas blown against turbine wheel **10** decreases, the rotating speed of compressor wheel **3** also decreases, and the boost pressure falls.



3. Muffler



1 Muffler
2 Catalytic converter

A : Exhaust gas intake

Converter **2** is built into muffler **1** to decrease the amount of particulate matter (PM) in the exhaust gas.

Possible causes \ Symptoms			Engine hard to start	Black exhaust gas	White exhaust gas	Insufficient engine output	Excessive oil consumption	Strange sound or vibration in intake and exhaust system	Remarks

ON-VEHICLE INSPECTION AND ADJUSTMENT

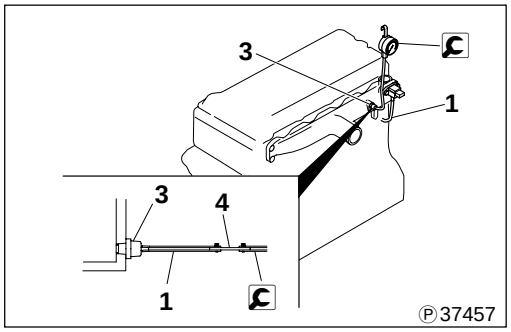
Measurement of Turbocharger Boost Pressure

Service standards

Location	Maintenance item	Standard value	Limit	Remedy
–	Boost pressure (at ambient temperature of 20°C {68°F} and atmospheric pressure of 100 kPa {29.9 in.Hg, 760 mmHg})	–	34.7 kPa {10.2 in.Hg, 260 mmHg}/ 3750 rpm 136 kPa {10.2+29.9 in.Hg, 260+760 mmHg} when measured by MUT	Inspect/ adjust

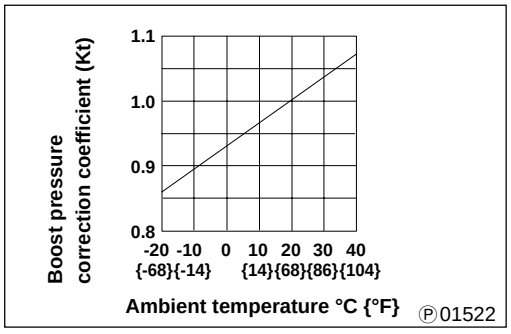
Special tool

Location	Tool name and shape	Part No.	Application
—	Boost pressure gauge Ⓟ01524	MH061366	Measurement of boost pressure



Ⓟ37457

- Before measuring the boost pressure, clean or replace the air cleaner element.
- Disconnect the vacuum hose **1** at the boost pressure sensor **2** side.
- Connect the pipe **4** (MH062049 [component part of MH062047]) between the vacuum hose **1** fitted to the gas filter assembly **3** and the Boost Pressure Gauge.
- Warm up the engine, then measure the boost pressure at the engine's maximum idling speed. At the same time, measure the engine speed and ambient temperature.

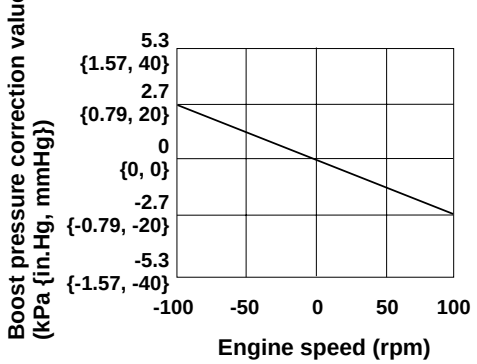


Ⓟ01522

- Correct the measurement to determine the boost pressure under standard conditions. (The boost pressure varies in accordance with the ambient temperature and engine speed.)

  [Correction for ambient temperature]

  From the graph, determine the boost pressure correction coefficient Kt for the ambient temperature.



(Difference between the median of the no-load maximum engine speed and the actual engine speed used for boost pressure measurement)

Ⓟ06165

[Correction for engine speed]

From the engine speed during boost pressure measurement, subtract the median of the maximum idling speed. From the result, determine the boost pressure correction value (**Pa**) in accordance with the graph.

Median**:** 3,750 rpm

[Calculation of corrected boost pressure]

If the measured boost pressure is **P**, the corrected boost pressure **Pb** is determined as follows**:**

Pb = KtP + Pa

Pb : Corrected boost pressure
P : Measured boost pressure
Kt : Boost pressure correction coefficient for ambient temperature
Pa : Boost pressure correction value

If **Pb** is out of specification, the turbocharger must be inspected and adjusted.

AIR DUCT AND AIR CLEANER

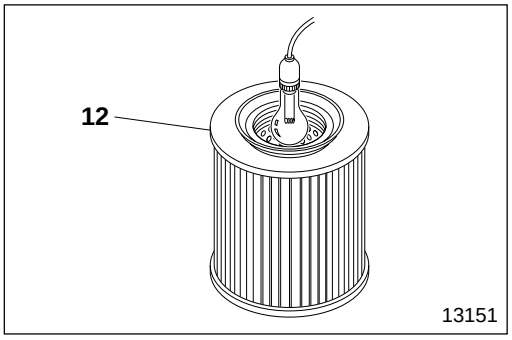
12 **Element**

[Cleaning]

- Blow compressed air of 685 kPa {100 psi, 7 kgf/cm^2} or less through air cleaner element **12** from the inside.
- When using compressed air, move the blower's nozzle up and down along the pleats of air cleaner element **12** evenly.

CAUTION

- **Do not tap or hit air cleaner element 12 to remove dust.**
- **Do not blow compressed air through air cleaner element 12 from the outside.**

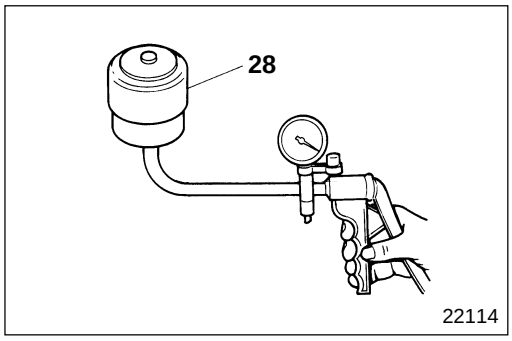


[Inspection]

- Illuminate the inside of air cleaner element **12**.
- If parts of the filter paper are torn or thin, or if the packing of the upper surface of air cleaner element **12** is damaged, replace the air cleaner element.

NOTE

If the dust on air cleaner element 12 is wet due to oil smoke or soot, replace the air cleaner regardless of the scheduled replacement interval.



28 **Inspection of dust indicator**

- Apply the specified vacuum pressure (7.5±0.6 kPa {2.20±0.17 in.Hg, 56±4.3 mmHg}) on the dust indicator **28** and check that the red signal appears in the window,

◆ Service procedure

● **Operation before disassembly**

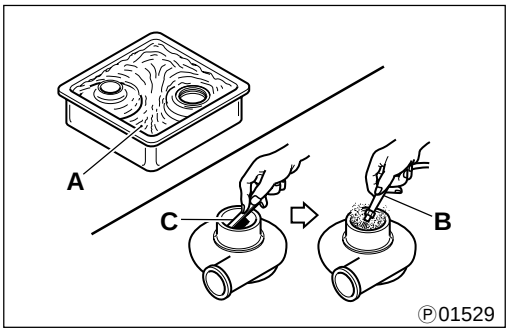
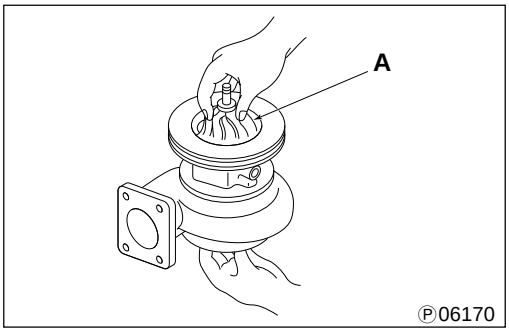
Make alignment marks **A** on the coupling **4**, turbine housing **5**, compressor cover **7**, and cartridge assembly **9**.



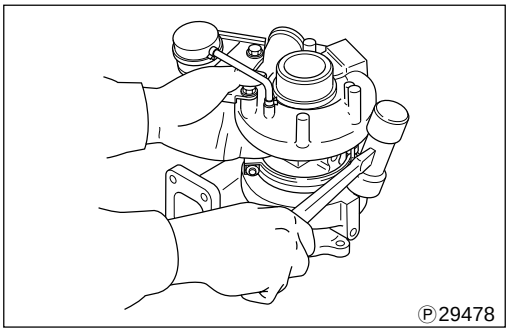
● **Cleaning after disassembly**

- Visually check the disassembled parts for scorches, abrasion, and other marks that may be difficult to see after cleaning. Replace any part that appears defective.
- Immerse the disassembled parts in a non-flammable solvent **A** and remove the parts from the solvent and blow them dry with compressed air **B**. Before this procedure, remove adhering matter if any using a plastic scraper on a wire brush **C**.
- Immerse the parts in the solvent **A** again.
- Blow the parts dry with compressed air **B**.



● **Inspection after assembly**

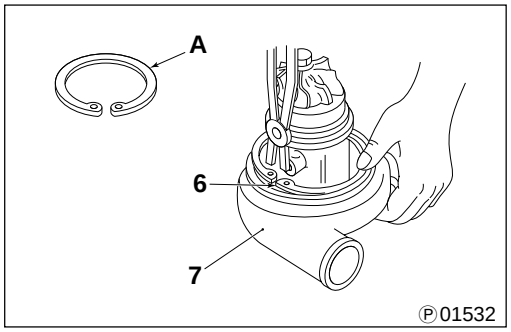
Manually rotate the wheel **A** of the cartridge assembly **9** to check that it turns smoothly.



5 **Removal of turbine housing**

CAUTION ⚠

- **While using care to prevent damage to the turbine housing, lightly strike its entire circumference with a rubber hammer or similar tool.**
- **Since the blades of the turbine wheel are easily bent, use care to make sure that they do not hit turbine housing 5.**

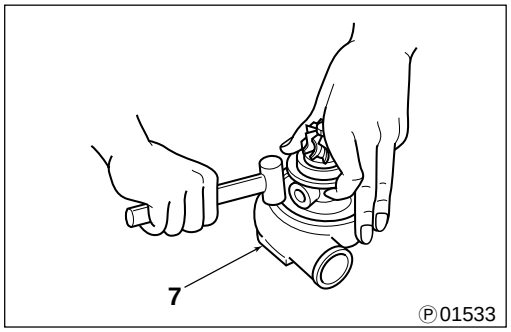


6 **Installing snap ring**

- Fit snap ring **6** onto compressor cover **7** with its tapered surface **A** facing upward.

WARNING ⚠

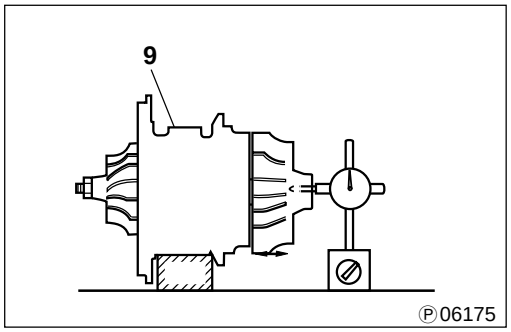
When fitting snap ring 6, hold it down to prevent it from flying off.



7 **Removal of compressor cover**

CAUTION ⚠

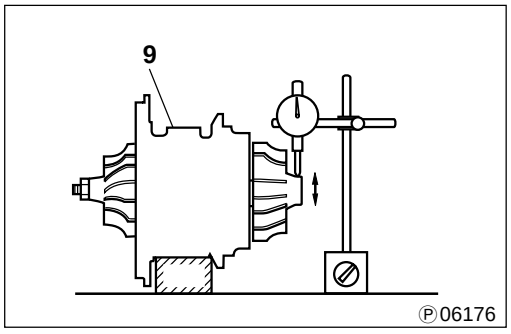
- **While using care to prevent damage to compressor cover 7, lightly strike its entire circumference with a rubber hammer or similar tool.**
- **Since the blades of the compressor wheel are easily bent, use care to make sure that they do not hit the compressor cover.**



9 **Inspection of cartridge assembly**

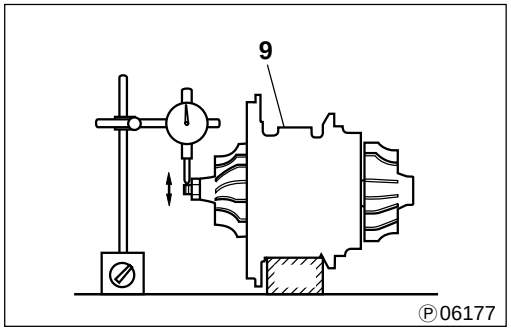
(1) Axial play in shaft and turbine wheel assembly

If the measurement exceeds the specified limit, replace cartridge assembly **9**.



(2) Play at right angle to shaft direction in shaft and turbine wheel assembly

- Play on turbine wheel side
  If the measurement exceeds the specified limit, replace cartridge assembly **9**.



- Play on compressor wheel side
  If the measurement exceeds the specified limit, replace cartridge assembly **9**.

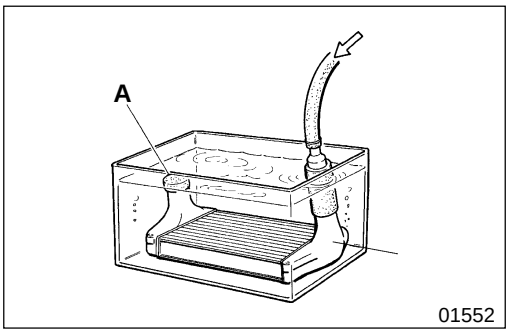
15	Boost air temperature sensor	14.7±2 {11±1.4, 1.5±0.2}	–



◆ Service procedure

16 Inspection of intercooler

Fit a cap over one of the air ports **A** on the intercooler **16**, connect a hose to the other port, and immerse the intercooler in a tank of water. Then, apply the specified air pressure (150 kPa {21 psi, 1.5 kgf/cm²}) via the hose and check for air leakage.
If leakage is apparent, replace the intercooler **16**.

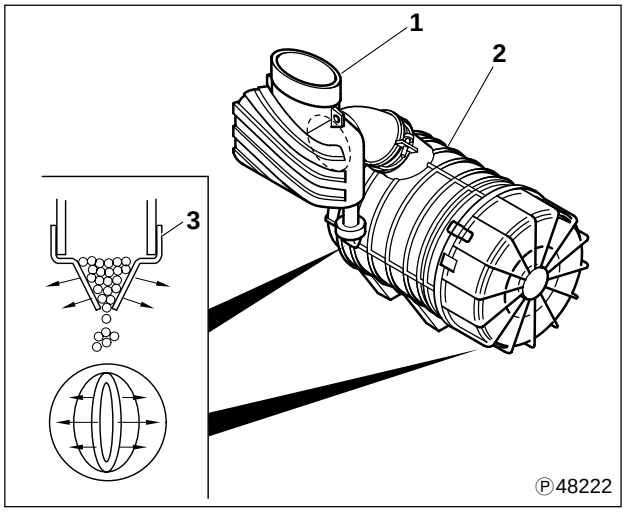
SPECIFICATIONS/STRUCTURE AND OPERATION

SPECIFICATIONS

Items		Specifications
Air cleaner element		Cyclone paper filter type
Dust indicator type		Mechanical
Turbocharger	Model	TD06
	Manufacturer	MITSUBISHI HEAVY INDUSTRIES
Intercooler type		Tube and corrugated fin (air cooled)

STRUCTURE AND OPERATION

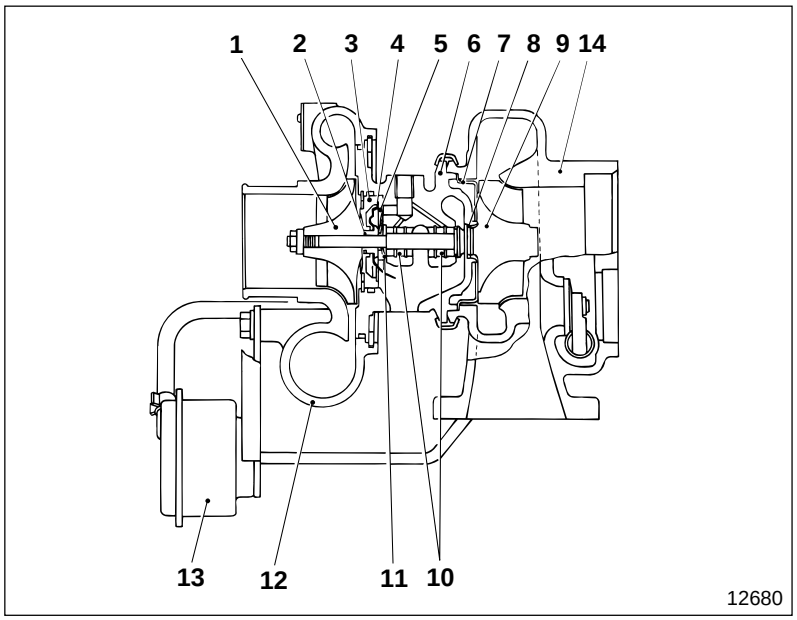
Air Cleaner



1 Air lower duct
2 Air cleaner assembly
3 Vacuator valve

- Air cleaner assembly **2** uses a single element.
- Vacuator valves **3** are fitted with air lower duct **1** and air cleaner assembly **2**.
- Vacuator valves **3** automatically vent dust and dirt by the repercussive force of the rubber of the valve that overcomes the inner negative pressure when the engine revolution falls below the specified revolution.

Turbocharger

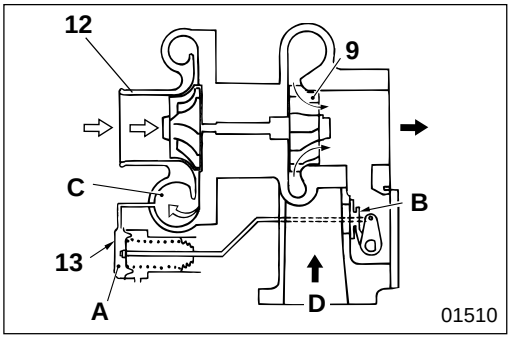


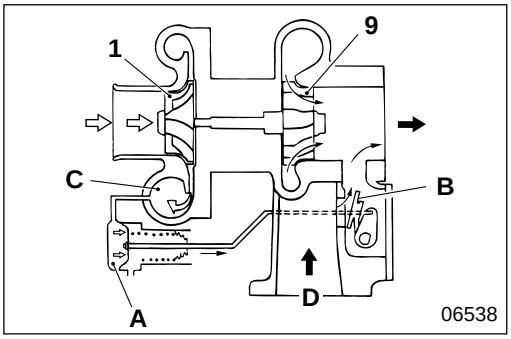
1 Compressor wheel
2 Thrust sleeve
3 Insert
4 Oil deflector
5 Thrust bearing
6 Bearing housing
7 Turbine backplate
8 Piston ring
9 Shaft and turbine wheel
10 Bearing
11 Thrust bearing
12 Compressor cover
13 Actuator
14 Turbine housing assembly

1 to **11** : Cartridge assembly

Waste gate mechanism

- The waste gate mechanism relieves the boost pressure of excess exhaust gas using actuator **13**. This controls the boost pressure appropriately and prevents the turbocharger from overrunning, and prevents excessive pressure in the intake manifold.
- The boost pressure is fed into chamber **A** of actuator **13** from compressor cover **12** via a rubber hose. When boost pressure **C**, acting on the chamber, is lower than the preset value, the actuator does not operate and waste gate valve **B** remains closed, therefore exhaust gas **D** is blown against shaft and turbine wheel **9**.

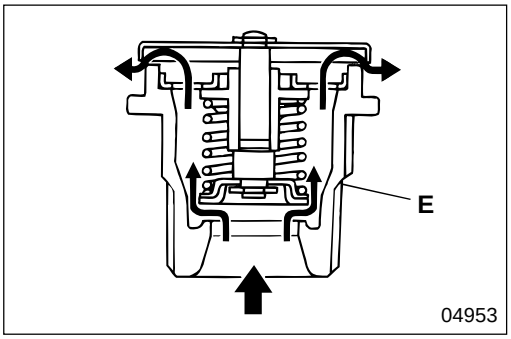


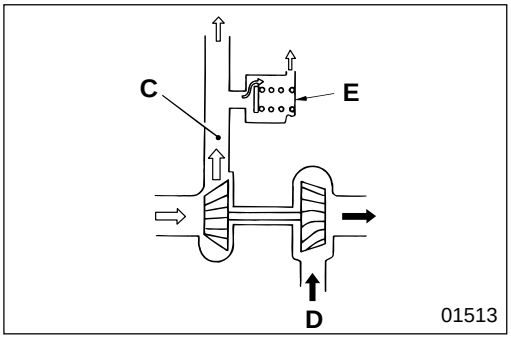


- As the boost pressure acting on chamber **A** increases to become higher than the preset value, waste gate valve **B** is opened and the exhaust gas blown against shaft and turbine wheel **9** decreases. Therefore the rotation of compressor wheel **1** decreases, causing the boost pressure to decrease.

Operation of over-boost valve

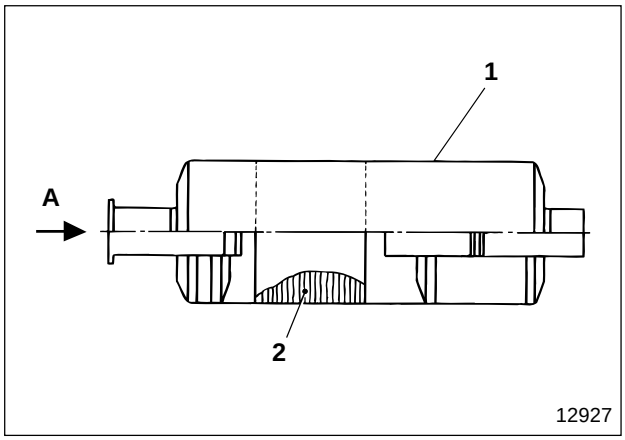
- Over-boost valve **E** operates when the boost pressure increases abnormally because of faulty operation of the waste gate mechanism.





- If boost pressure **C** of over-boost valve **E** increases to become higher than the preset value, the excessive boost pressure is discharged into the atmosphere, protecting the engine from excessive boost pressure. When the valve is operating, a pipe-blowing sound is generated.

Muffler



1 Muffler
2 Catalytic converter

A : Exhaust gas intake

Converter **2** is built into muffler **1** to decrease the amount of particulate matter (PM) in the exhaust gas.

Possible causes \ Symptoms			Engine hard to start	Exhaust gas dark	Exhaust gas whitish	Engine output insufficient	Oil consumption excessive	Noise and vibration in intake/exhaust systems	Remarks

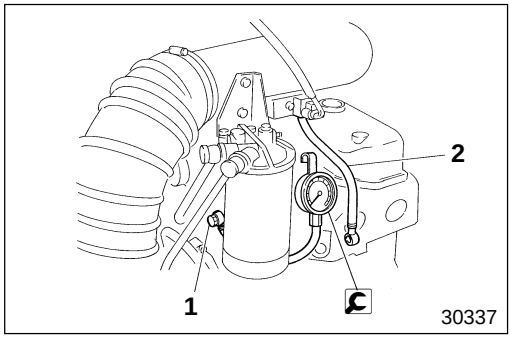
Measurement of Turbo Boost Pressure

Service standards

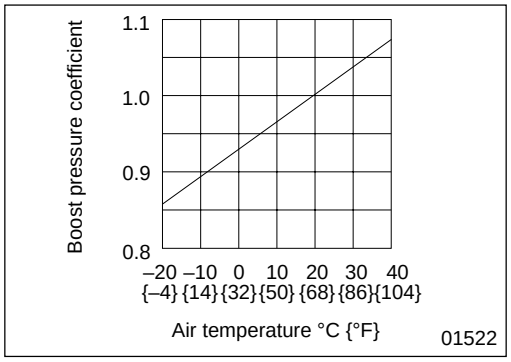
Location	Maintenance item	Standard value	Limit	Remedy
—	Boost pressure (Air temperature 20°C {68°F}, Atmospheric pressure 100 kPa {29.9 in. Hg, 760 mmHg})	—	32 kPa {9.45 in. Hg, 240 mmHg}/ 3700 rpm	Inspect and adjust

Special tools

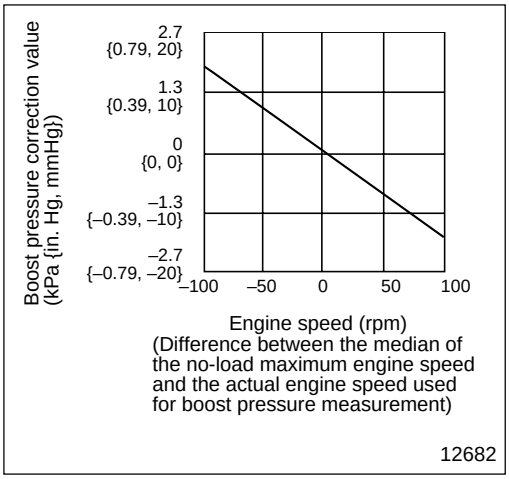
Location	Tool name and shape	Part No.	Application
—	Boost pressure gauge  01524	MH061366	Measurement of turbo boost pressure



- Before measuring the turbo boost pressure, clean or replace the air cleaner element.
- Slacken off eye bolt **1** of boost compensator and remove boost compensator pipe **2**, then attach boost pressure gauge.
- After warming up the engine, measure the boost pressure at the no-load maximum engine speed. Also, measure the engine speed and the air temperature.



- Correct the boost pressure at standard conditions. (Since the boost pressure varies depending on the air temperature and engine speed.)
  [Correction for air temperature]
  Identify boost pressure coefficient depending on the air temperature from the graph.



[Correction for engine speed]
Subtract the engine speed actually used for measuring the boost pressure from the median of the no-load maximum engine speed. Identify the boost pressure correction value (**Pa**) according to the graph.
Median value : 3700 rpm

[Calculation of corrected boost pressure]
Given the measured boost pressure to be **P**, corrected boost pressure **Pb** can be calculated from the following equation:

Pb = ktP + Pa

- **Pb** : Corrected boost pressure
- **P** : Measured boost pressure
- **kt** : Boost pressure correcting coefficient depending on air temperature
- **Pa** : Boost pressure correction value

If **Pb** is lower than the limit, the turbocharger must be inspected and adjusted.

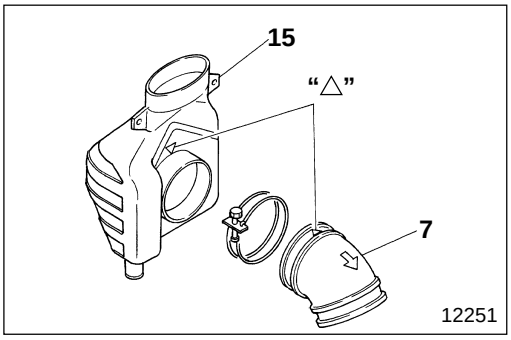
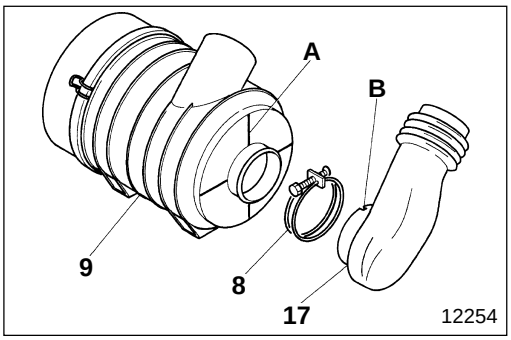
2	Apply sealant to the connecting part of grommet to the resonator	ThreeBond 1207C	As required
3	Apply sealant to grommet groove area	ThreeBond 1207C	As required

◆ Service procedure



7 **Installation of air intake hose**

△ : Alignment mark

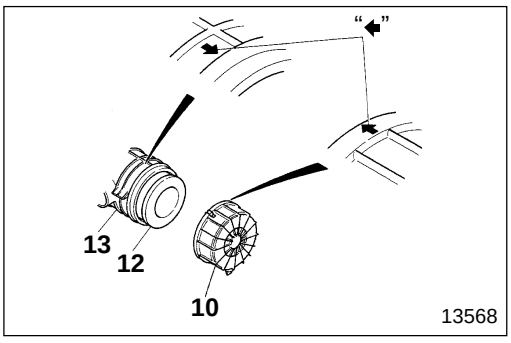


17 **Installation of air dust**

Install air duct **13** in the direction as illustrated to the air cleaner assembly **9**.

A : Protrusion

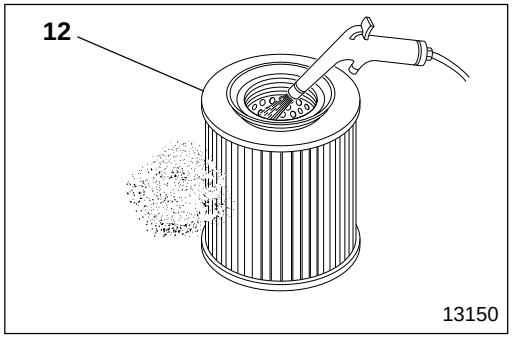
B : Indent



10 **Installation of cover**

➧ **:** Alignment mark

AIR DUCT AND AIR CLEANER



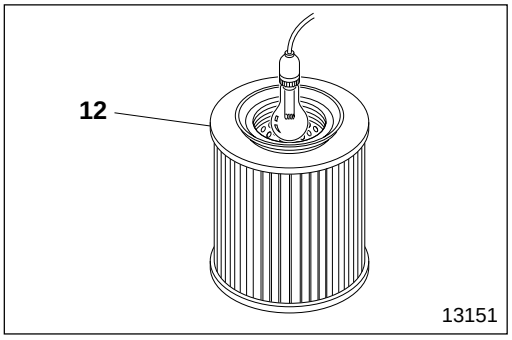
12 **Element**

[Cleaning]

- Blow compressed air of 685 kPa {100 psi, 7 kgf/cm^2} or less through air cleaner element **12** from the inside.
- When using compressed air, move the blower's nozzle up and down along the pleats of air cleaner element **12** evenly.

CAUTION ⚠

- **Do not tap or hit air cleaner element 12 to remove dust.**
- **Do not blow compressed air through air cleaner element 12 from the outside.**

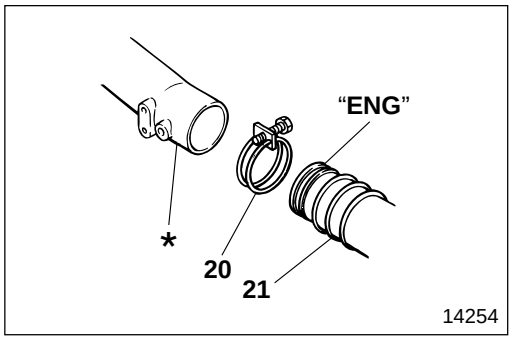


[Inspection]

- Illuminate the inside of air cleaner element **12**.
- If parts of the filter paper are torn or thin, or if the packing of the upper surface of air cleaner element **12** is damaged, replace the air cleaner element.

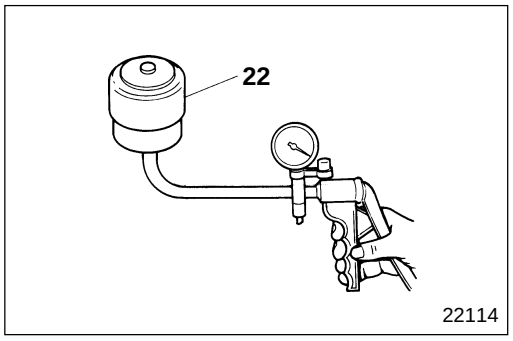
NOTE

If the dust on air cleaner element 12 is wet due to oil smoke or soot, replace the air cleaner regardless of the scheduled replacement interval.



21 **Installation of air intake hose**

ENG : Alignment mark



22 **Inspection of dust indicator**

- Check to verify that when a specified vacuum pressure of 7.5±0.6 kPa {2.20±0.17 in.Hg, 56±4.3 mmHg} is applied to the dust indicator **28**, a red signal appears in its window area.

Lubricant

Location	Points of application	Kinds	Quantity
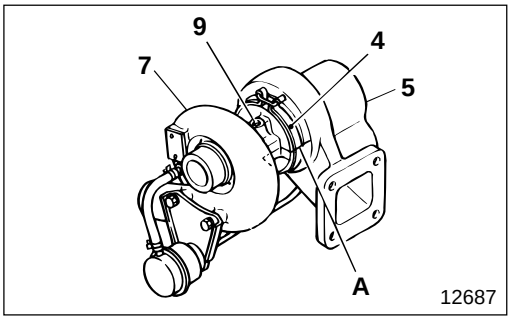
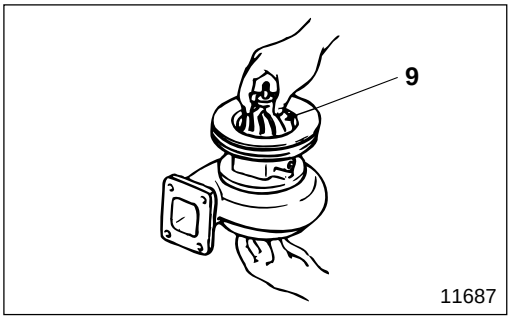
3	Thread area of bolt	Molybdenum disulfide grease	As required
8	Periphery of O-ring	Engine oil	As required

◆ Service procedure



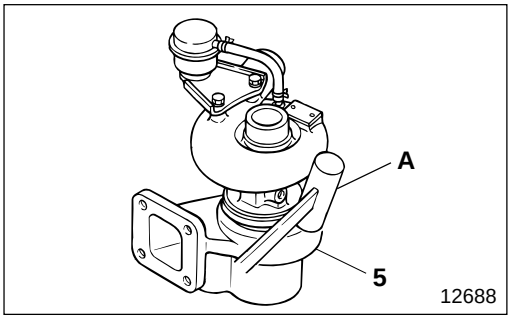
● Work before disassembly

Put alignment marks **A** on coupling **4**, turbine housing **5**, compressor cover **7** and cartridge assembly **9**.



● Inspection after assembly

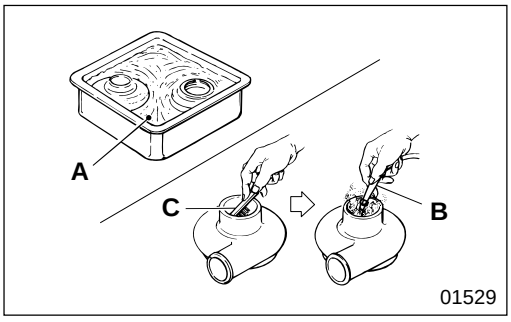
Turn the turbine wheel and the compressor wheel of cartridge assembly **9** to make sure that they turn smoothly.



5 Removal of turbine housing

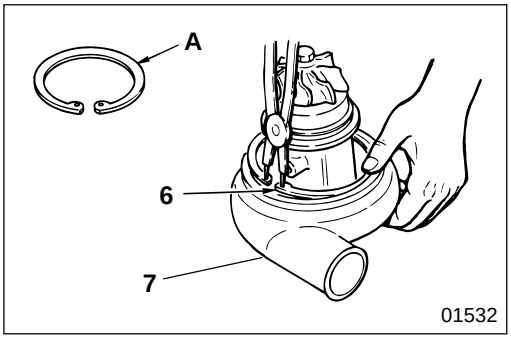
CAUTION

- **When removing turbine housing 5, tap all around the circumference lightly using rubber-headed hammer A so as not to damage the turbine housing.**
- **Do not hit the turbine wheel near turbine housing 5, since the blade of the turbine wheel can be easily bent.**



5 7 Cleaning of turbine housing and compressor cover

- Visually inspect related parts before cleaning to check if there are any burns or scratches as these would not be seen after cleaning. If any fault is found, replace the faulty parts.
- Remove any foreign particles before cleaning by scraping them off using plastic scraper or bristle-headed brush **C**. Immerse the disassembled parts in nonflammable solvent **A** (DAIDO KAGAKU KOGYO DAICLEANER T-30), then take them out and blow compressed air **B** on them.

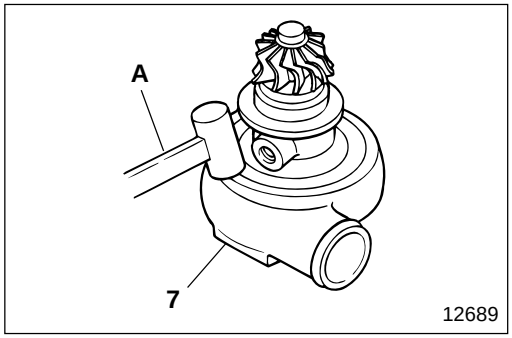


6 Installation of snap ring

Install snap ring **6** into compressor cover **7** with taper surface **A** upward.

WARNING

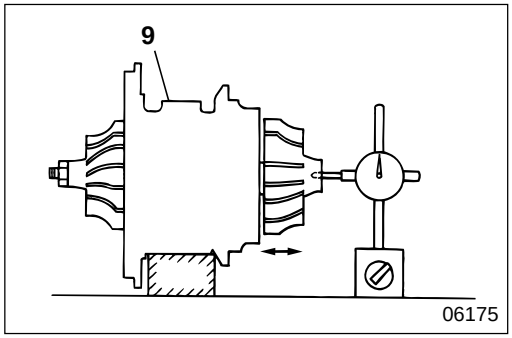
Use your hand to hold snap ring 6 in place to prevent it from springing out.



7 **Removal of compressor cover**

CAUTION

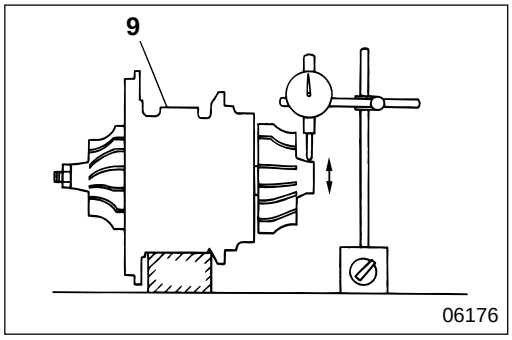
- **When removing compressor cover 7, tap all around the circumference lightly so as not to damage the compressor cover.**
- **Avoid hitting the compressor wheel near compressor cover 7, since the blade of the compressor wheel can be easily bent.**



9 **Inspection of cartridge assembly**

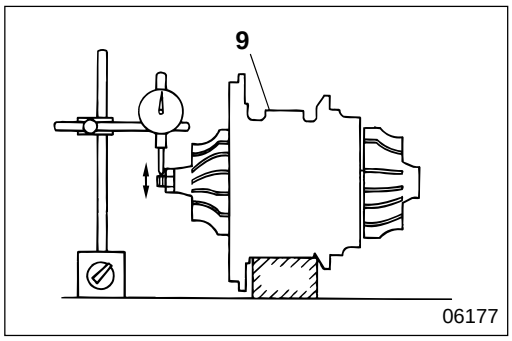
(1) Play in the shaft direction of the shaft and turbine wheel assembly

If the measured value deviates from the standard value, replace cartridge assembly **9**.



(2) Play at right angles to the shaft of the shaft and turbine wheel assembly

- Play on turbine wheel side
  If the measured value is higher than the limit, replace cartridge assembly **9**.



- Play on compressor wheel side
  If measured value is higher than the limit, replace cartridge assembly **9**.

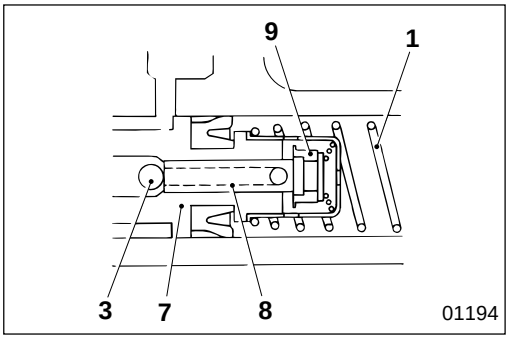
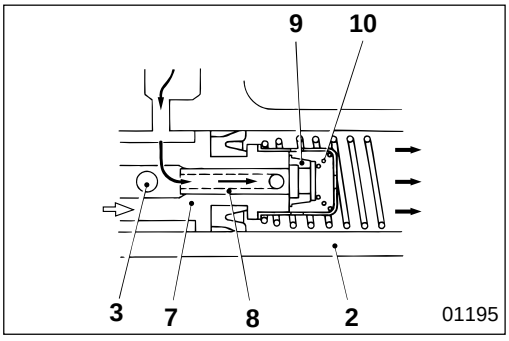
4 Primary cup
5 Secondary cup
6 Push rod
7 Piston
8 Supply valve rod
9 Supply valve
10 Supply valve spring

A : To clutch power cylinder
B : From fluid tank



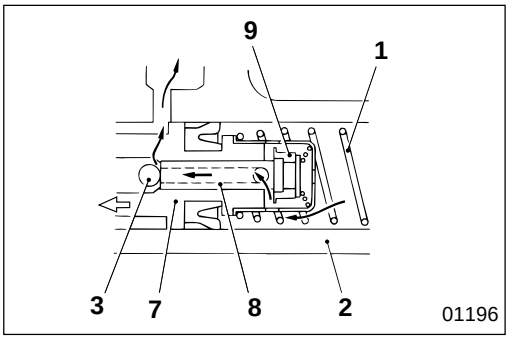
Before clutch pedal is depressed

- As piston **7** is pressed towards the push rod side by return spring **1**, supply valve rod **8** rests against supply valve stopper **3**, and supply valve **9** remains open.
- Thus, the passage between the fluid tank and the clutch is open.



When clutch pedal is depressed

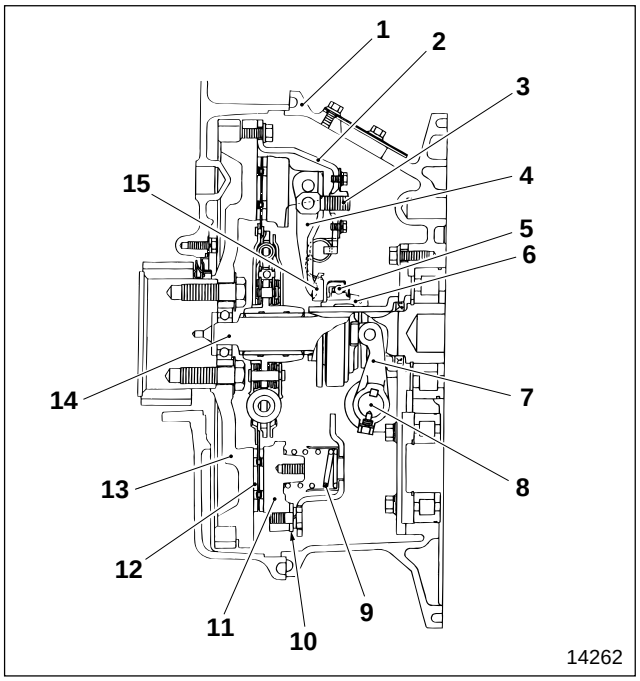
- As push rod **6** pushes piston **7**, supply valve rod **8** moves away from supply valve stopper **3**, and supply valve **9** is closed by the repercussive force of supply valve spring **10**.
- As piston **7** is pressed further, the hydraulic pressure generated within cylinder **2** actuates the clutch power cylinder.
- This results in fluid being supplied in direct proportion to the movement of piston **7**.



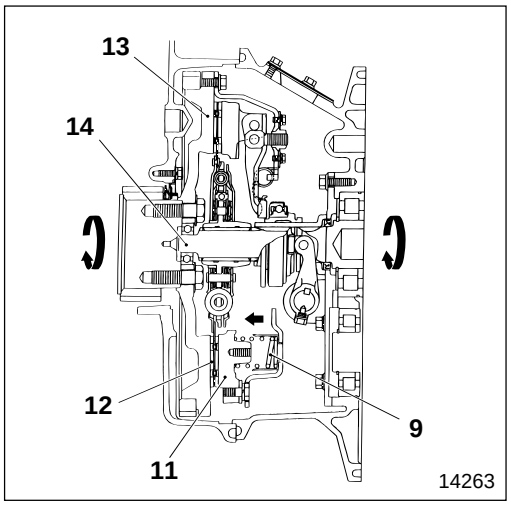
When clutch pedal is released

- As piston **7** is pushed back by the hydraulic pressure from cylinder **2** and the repercussive force of return spring **1**, supply valve rod **8** hits valve stopper **3** and supply valve **9** opens.
- Thus, the fluid in the clutch power cylinder side returns to the fluid tank and the hydraulic pressure drops to zero.

Clutch

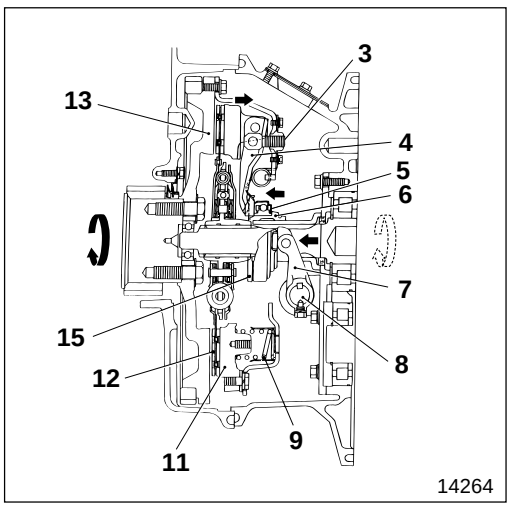


1 Clutch housing
2 Clutch cover
3 Support lever
4 Release lever
5 Release bearing
6 Clutch shifter
7 Release fork
8 Release fork shaft
9 Pressure spring
10 Strap plate
11 Pressure plate
12 Clutch disc
13 Flywheel
14 Drive pinion
15 Release lever plate



When clutch pedal is released

- Pressure plate **11**, activated by pressure spring **9**, presses clutch disc **12** firmly against flywheel **13**.
- Clutch disc **12** forced against flywheel **13** runs together with the flywheel and transmits power from the engine to transmission drive pinion **14**.



When clutch pedal is depressed

- Hydraulic pressure generated within the clutch master cylinder activates the clutch power cylinder. Thus, release fork shaft **8** actuates release fork **7**, pushing forward release bearing **5** and clutch shifter **6**, which in turn push release lever plate **15** and release lever **4**.
- Release lever **4**, using support lever **3** as a fulcrum, compresses pressure spring **9** and retracts pressure plate **11**, creating a clearance between clutch disc **12** and flywheel **13**, cutting off the transmission of engine power.

ON-VEHICLE INSPECTION AND ADJUSTMENT

Clutch Fluid (Brake Fluid) Replacement and Air Bleeding

Tightening torque

Unit : N·m {ft.lbs, kgf·m}

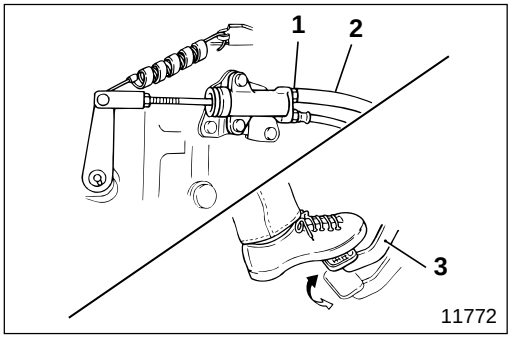
Location	Parts to be tightened	Tightening torque	Remarks
1	Air bleeder	25 to 34 {18 to 25, 2.5 to 3.5}	—

Fluid

Location	Points of application	Kinds	Quantity
4	Fluid tank	Brake fluid (SAE J1703f or FMVSS No.116 DOT3)	As required

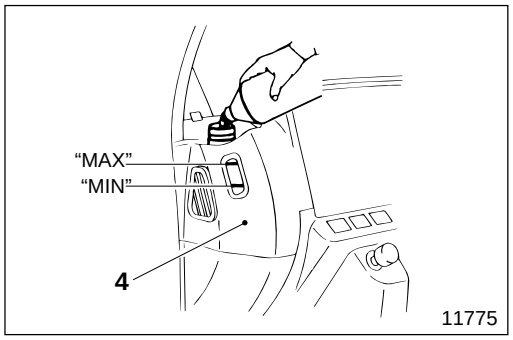
CAUTION

- **Be careful not to splash brake fluid on related parts as this could damage the paintwork.**
- **Be sure to wipe off brake fluid immediately if you splash it on the paintwork.**
- **You must use new brake fluid (SAE J1703f or FMVSS No. 116 DOT3). Do not add different quality fluid or mineral oil (gas oil, engine oil, gear oil, automatic transmission fluid, etc.) to the clutch system, because this will cause the rubber parts of the clutch system to swell, resulting in faulty clutch operation.**
- **Do not allow foreign particles or water to become mixed into the brake fluid when refilling, because this will cause faulty clutch operation.**
- **If you use a mug for adding brake fluid, keep it solely for that purpose to prevent contamination from different quality fluids or mineral oils.**

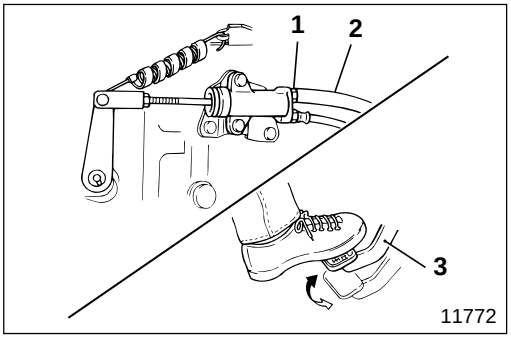


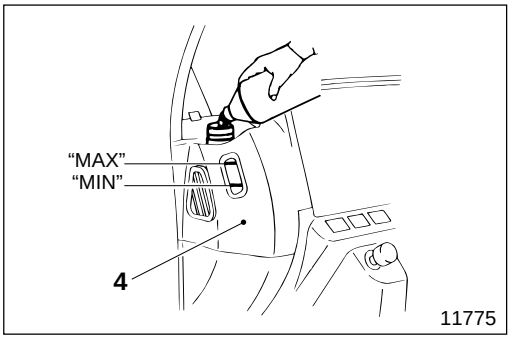
(1) Replacement of brake fluid

- Attach vinyl pipe **2** to air bleeder **1** of the clutch power cylinder.
- Loosen air bleeder **1** and depress clutch pedal **3** several times to drain brake fluid completely.



- Supply new brake fluid to the "MAX" level of fluid tank **4**. Depress clutch pedal **3** repeatedly until the old brake fluid discharged from vinyl pipe **2** is replaced by the new brake fluid.





(2) Air bleeding of clutch system

NOTE

Carry out this operation maintaining the brake fluid level in fluid tank 4 between "MAX" and "MIN".

- Attach vinyl pipe **2** to air bleeder **1** of the clutch power cylinder as in the replacement procedure.
- Fill fluid tank **4** with brake fluid, and loosen air bleeder **1** of the clutch power cylinder, then depress clutch pedal **3** continuously.
- Keep depressing clutch pedal **3**, and tighten air bleeder **1** when air is bled completely.
- Depress clutch pedal **3** several times again, then keep it depressed at its fullest extent.
- With the clutch pedal depressed, loosen air bleeder **1** to drain brake fluid containing air. Release the pedal after tightening the air bleeder.
- Repeat this operation until air is no longer present in the fluid being drained.
- When this operation is completed, tighten air bleeder **1** at specified torque.
- Check that brake fluid is at the "MAX" level of fluid tank **4**, and supply new brake fluid if necessary.
- Check for brake fluid leakage from each of the parts with clutch pedal **3** depressed.

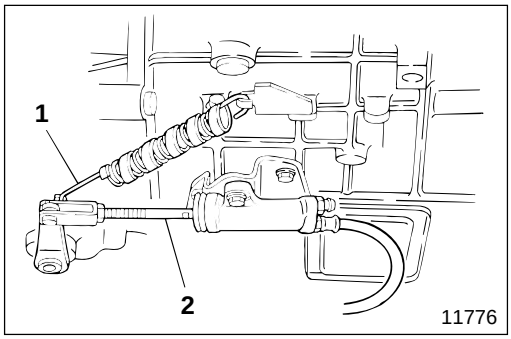
Clutch Pedal Free Play

Service standards

Unit : mm {in.}

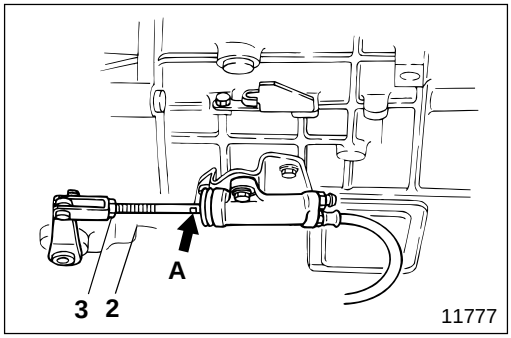
Location	Maintenance item	Standard value	Limit	Remedy
2	Push rod stroke	3.6 {0.14}	—	Adjust or replace
4	Clutch pedal free play	37 to 52 {1.46 to 2.05}	—	Adjust or replace

Inspect and adjust the free play of the clutch pedal, by noting the stroke of the clutch power cylinder push rod, after the clutch pedal has been correctly adjusted.



[Inspection]

- Bleed air from the clutch system. P21-7
- Adjust the clutch pedal. P21-11
- Disconnect return spring **1** and check the free play of push rod **2** by hand. If the measured value deviates from the standard value, adjust as follows:

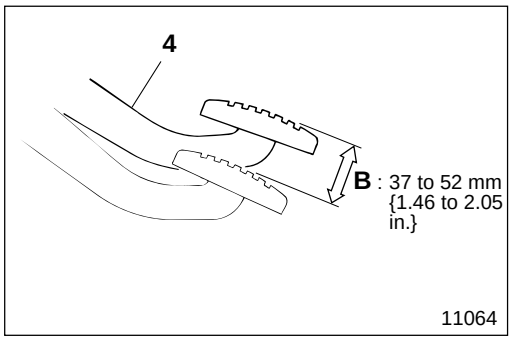


[Adjustment]

- Loosen nut **3** and turn head **A** of push rod **2** to extend the push rod until it stops.
- Then, slacken off head **A** of push rod **2** by the following value and retighten nut **3**.

  Amount of slackening off : Approximately three turns

- If push rod **2** does not return by the above amount, replace the clutch disc because it is worn beyond the limit.



[Confirmation]

Push clutch pedal **4** with your hand until you feel a resistance and measure free play **B**.

If the measured value deviates from the standard value, readjust or replace the clutch disc.

Lubricant

Location	Points of application	Kinds	Quantity
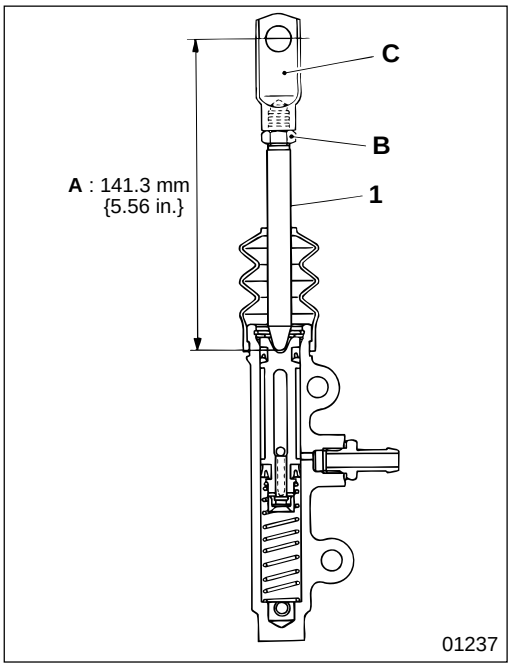
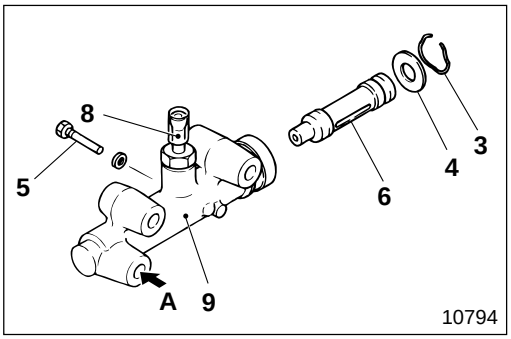
6, 9	Friction surfaces of piston assembly and cylinder body	Rubber grease	As required

◆ Service procedure



1 Adjustment of push rod length

If dimension **A**, as illustrated, deviates from the standard value, loosen lock nut **B** of push rod **1**, and adjust the length by turning head **C**.
After adjustment, tighten the lock nut at specified torque.



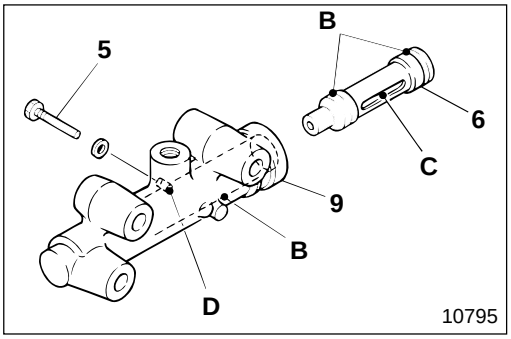
6 Piston assembly

[Removal]

- Remove piston stop ring **3**, piston stop plate **4** and supply valve stopper **5**.
- Block nipple **8** of cylinder **9**, and apply compressed air from **A** as illustrated to remove piston assembly **6**.

WARNING⚠

You must apply compressed air gradually when you remove piston assembly 6. If you applied compressed air strongly at one time, the piston assembly would be violently ejected.



[Installation]

- Before installing the assembly, apply rubber grease to friction surface **B** of piston assembly **6** and cylinder **9**.
- To install the piston, align groove **C** of piston assembly **6** with hole **D** of cylinder **9**, then insert valve stopper **5** to hold the piston in place.

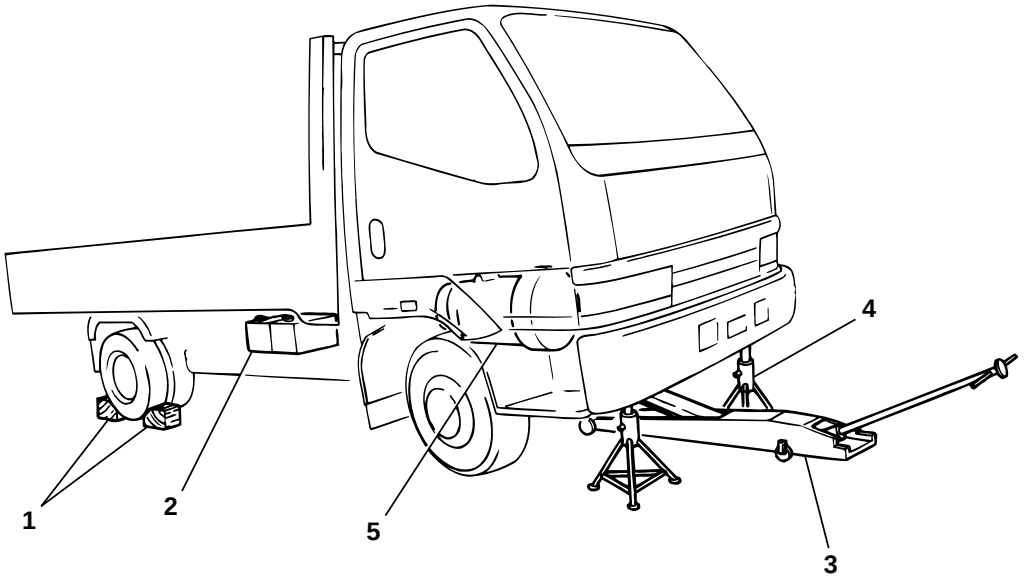
WORK BEFORE REMOVAL AND INSTALLATION OF CLUTCH BODY



14118

● **Work sequence before removal**

1 Place wheel chocks.
2 Disconnect the negative battery cable. Gr 54
3 Jack up the front axle using a garage jack.
4 Support the front frame on rigid racks.
5 Remove the transmission. Gr 22

WARNING

- **Since the parking brake will be removed, naturally it cannot be used. Therefore, you must chock the wheels securely so the vehicle does not move.**
- **Do not remove the chocks until the entire operation is completed.**
- **Supporting a vehicle on a garage jack only is extremely dangerous, so always support the frame on rigid racks.**
- **Leave the garage jack and rigid racks in place until the entire operation is completed. Never remove them during the operation.**

CAUTION

Keep the transmission in neutral throughout the operation.

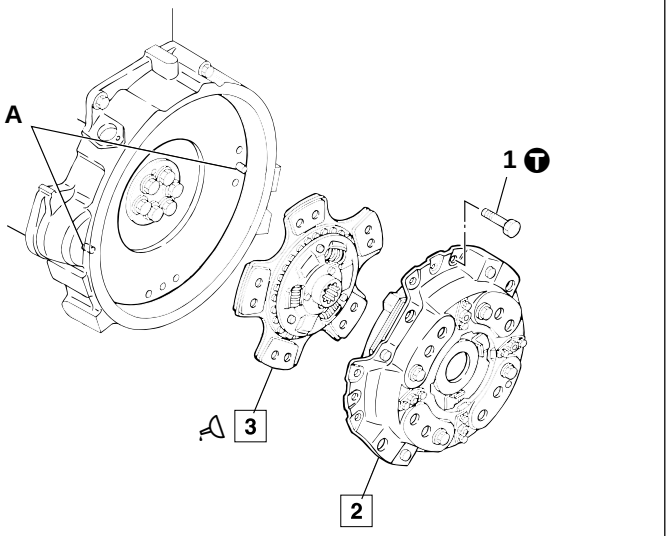
● **Work sequence after installation**

Follow the work sequence before removal in reverse.

M E M O

CLUTCH BODY

Clutch Disc



● **Removal sequence**

1 Bolt
2 Pressure plate and lever assembly
P21-24
3 Clutch disc

A : Positioning pins (two points)

WARNING

Be careful when you handle pressure plate and lever assembly 2 because it is rather heavy.

● **Installation sequence**

Follow the removal sequence in reverse.

CAUTION

Be careful not to get oily substances on clutch disc 3 surfaces because this will cause the clutch to slip.

Service standards

Unit : mm {in.}

Location	Maintenance item		Standard value	Limit	Remedy
3	Clutch disc	Lateral runout	1.2 {0.047} or less	—	Replace
		Vertical runout	1.2 {0.047} or less	1.8 {0.071}	Replace
		Play in revolving direction at spline	0.06 to 0.21 {0.0024 to 0.0083}	0.5 {0.02}	Replace
		Depth from facing surface to cup	0.79 to 1.43 {0.031 to 0.056}	0.2 {0.0079}	Replace

Tightening torque

Unit : N·m {ft.lbs, kgf·m}

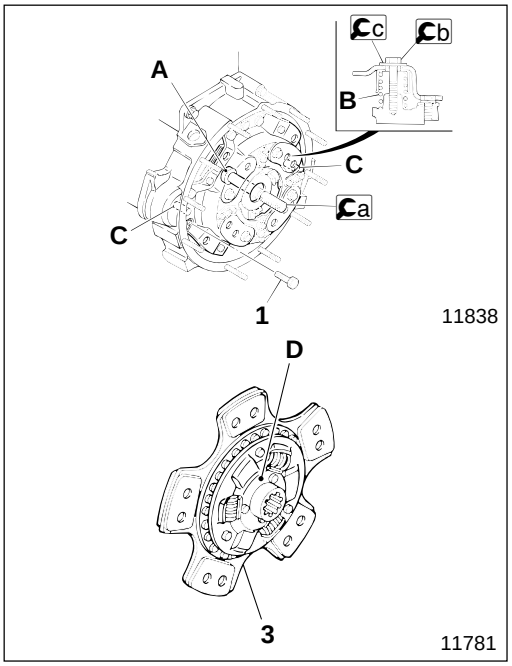
Lubricant

Location	Points of application	Kinds	Quantity
3	Spline of clutch disc	Molybdenum disulfide grease [NLGI No.2 (Li soap)]	3.2 to 4.2 g {0.11 to 0.15 oz}

Special tools

Unit : mm {in.}

Location	Tool name and shape	Part No.	Application
2	Stopper bolt Washer  02378	ME521425 < Stopper bolt > ME521426 < Washer >	Removal and installation of pressure plate and lever assembly
3	Clutch alignment arbor  01270	MH061986	Holding of clutch disc



◆ Service procedure

2 Removal and installation of pressure plate and lever assembly

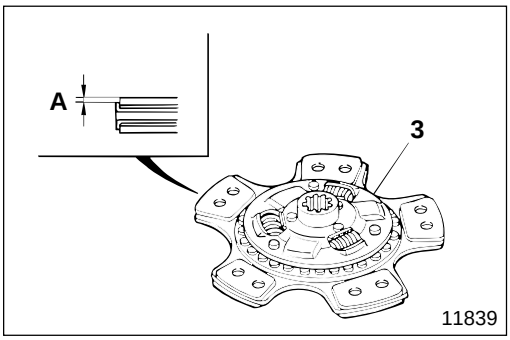
- Insert a clutch alignment arbor into flywheel pilot bearing **A** to hold clutch disc **3**.
- Compress pressure springs **B** using b stopper bolt and c washer, then remove bolt **1**.
- For installation, follow the removal sequence in reverse.
- Install clutch disc **3** so that part No. **D** is visible.
- Tighten bolts **1** gradually, in diagonal order, to specified torque.

CAUTION

- **Make sure you use b stopper bolts and c washers (four points) when you remove bolt 1. If you do not, pressure springs B might force up pressure plate and lever assembly 2, damaging the strap plate, and separate and fall off knock pin C.**
- **Remember to remove b stopper bolts and c washers after installation (four points). If the stopper bolts and washers are left on, the clutch will not engage.**

NOTE

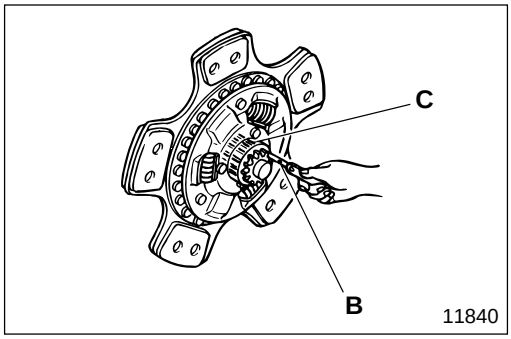
Clean flywheel contact surface of clutch disc 3 before installing pressure plate and lever assembly 12.



3 Clutch disc

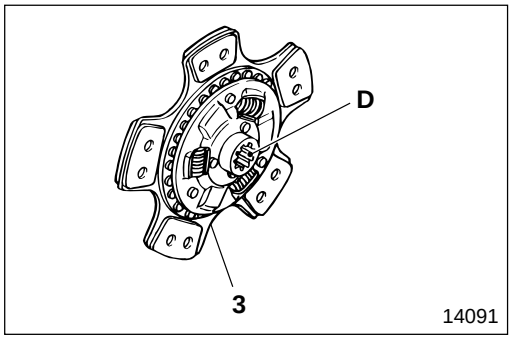
(1) Height of facing

Measure illustrated dimension **A** of clutch disc **3**. If the measured value is lower than the limit, replace the clutch disc.



(2) Play in direction of revolution

- First, reshape feeler gauge **B** for insertion into drive pinion spline **C**, and measure play at the spline.
- If the measured value is higher than the limit, replace clutch disc **3** or the drive pinion.
- Carry out the same measurement on new clutch disc **3**. If the measured value is higher than the limit, replace the drive pinion.



(3) Applying grease

Apply grease evenly to spline **D** and the entire tooth surface of clutch disc **3**. Apply grease to the grease groove of spline up to its large diameter.

CAUTION

Be careful not to apply too much grease because excessive grease causes grease leakage from the spline D and makes the clutch slippery.

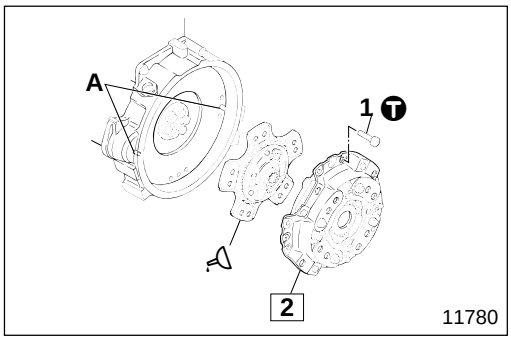
Special tools

Unit : mm {in.}

Location	Tool name and shape	Part No.	Application
—	Stopper bolt Washer  02378	(Obtain Locally) ME521425 < Stopper bolt > ME521426 < Washer >	Disassembly and assembly of pressure plate and lever assembly
9	Clutch release Lever aligner 	315560 (chrome)	Adjust release lever heights
	Clutch alignment arbor  01270	MH061986	Holding of clutch disc
10	Clutch installer  01277	N/A MH061051	Removal and installation of clutch cover

◆ Service procedure



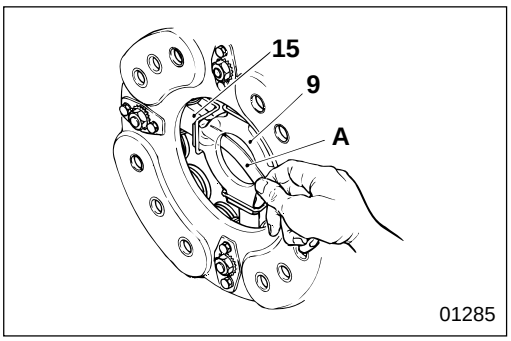
● **Work before disassembly**

Put alignment marks on all parts before disassembly.

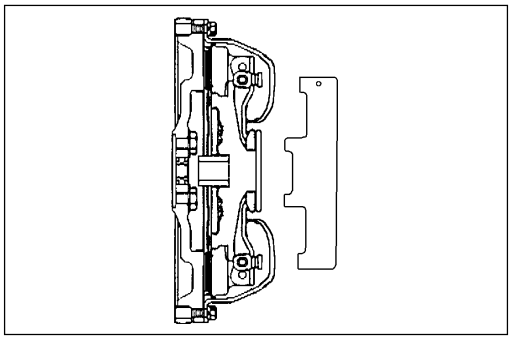
● **Inspection and adjustment after assembly**

(1) Measurement of release lever height

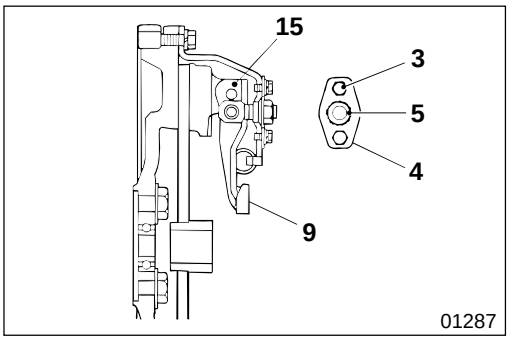
- Install the pressure plate assembly and clutch disc.



- Make certain that the clearance between release lever **15** and release lever plate **9** is such that a 0.05 mm {0.0020 in.} feeler gauge **A** cannot be inserted between them.
  If there is excessive clearance, press in strongly using your fingers, and return slowly to lessen the clearance.

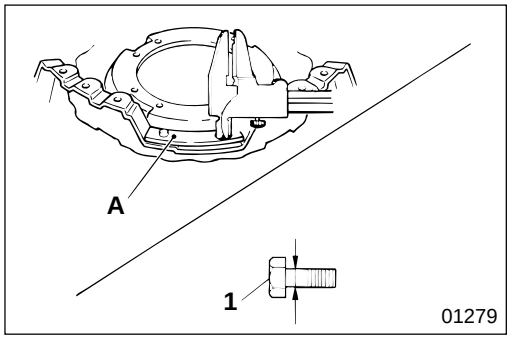


- Check clutch release lever height by using 09 clutch release lever aligner to upper surface of release lever plate **9** (at four points).
  If the measured value does not conform to the gauge, adjust as explained below. Note that even if the measured value is within the standard value, adjustment is necessary if the difference between any two points is higher than 0.5 mm {0.020 in.}.



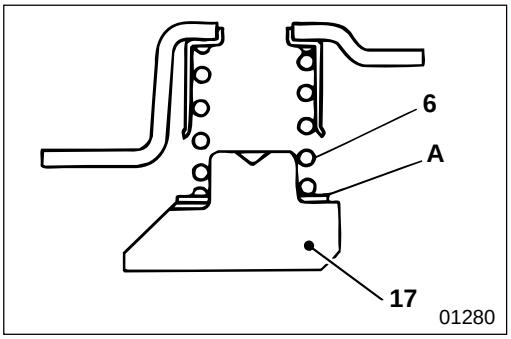
(2) Adjustment of release lever height

Remove bolt **3** and lock plate **4**, then turn support nut **5** to adjust.
After adjustment, install lock plate **4**, then lock support nut **5**, and check the height of release lever plate **9**.



1 **A** **Clearance between strap bolt and strap plate**

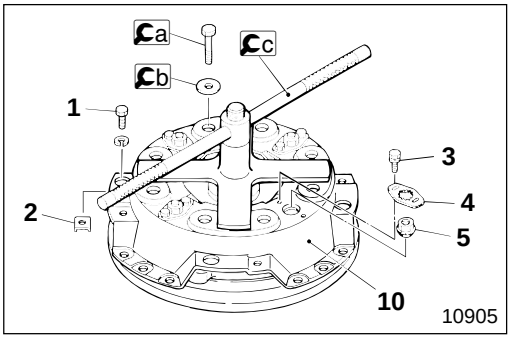
If the measured value is higher than the limit, replace the faulty parts.
A : Strap plate



6 **Installation of pressure spring**

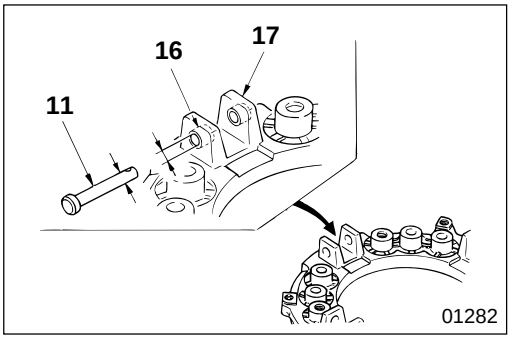
When pressure plate **17** has been corrected by grinding, place adjusting washer **A** equivalent to the correction depth between the plate and pressure spring **6**.

Amount of correction made	Thickness of washers and quantity
Less than 1 mm {0.039 in.}	Not required
1 to 2 mm {0.039 to 0.079 in.}	1×1.2 mm {0.047 in.}
2 to 3 mm {0.079 to 0.12 in.}	2×1.2 mm {0.047 in.}, or 1×2.3 mm {0.091 in.}



10 **Removal and installation of clutch cover**

- Compress pressure spring **6** using Cc clutch installer, and remove Ca stopper bolt, Cb washer, strap bolt **1**, washer **2**, bolt **3**, lock plate **4** and support nut **5**.
- Gradually loosen Cc clutch installer until pressure spring **6** is fully extended, then remove clutch cover **10**.
- For installation, follow the removal procedure in reverse.

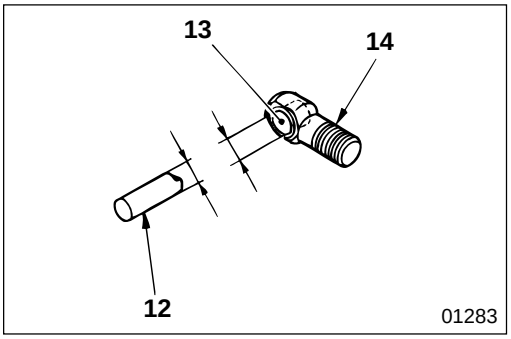


11 **16** **Clearance between release lever pin and bushing**

If the measured value is higher than the limit, replace the faulty parts.

NOTE

Measure the bore of bushing 16 as press-fitted in pressure plate 17.

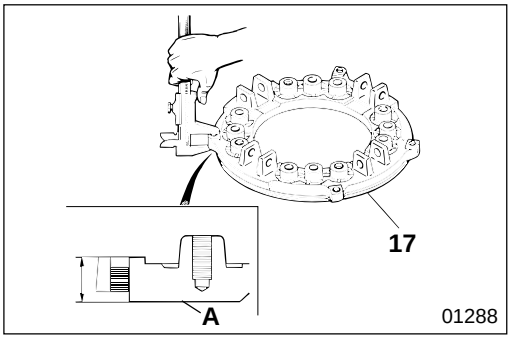


12 **13** **Clearance between support lever pin and bushing**

If the measured value is higher than the limit, replace the faulty parts.

NOTE

Measure the bore of bushing 13 as press-fitted in support lever 14.

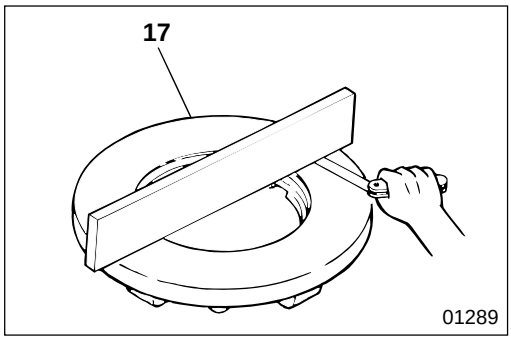


17 **Pressure plate**

(1) Thickness

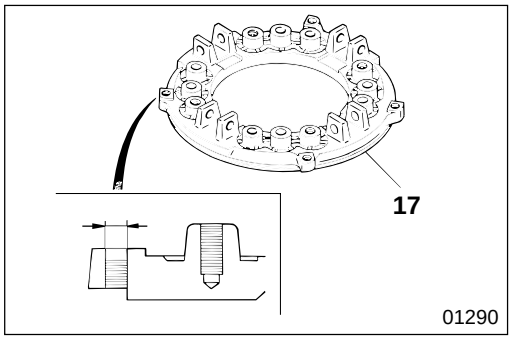
Measure friction surface **A** of pressure plate **17** (measuring position must be within the maximum and minimum diameters), and if the measured value is lower than the limit, replace the pressure plate.

Maximum diameter	320 mm {12.6 in.}
Minimum diameter	220 mm {8.66 in.}



(2) Flatness

If the measured value is higher than the limit, replace pressure plate **17**.



(3) Strap bolt fitting hole inner diameter

If the measured value is higher than the limit, replace pressure plate **17**.

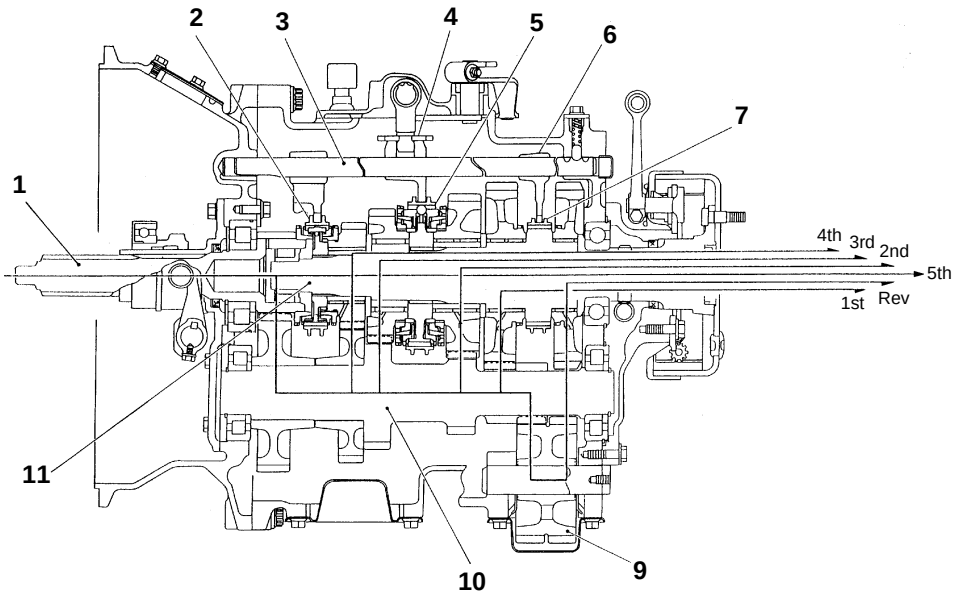
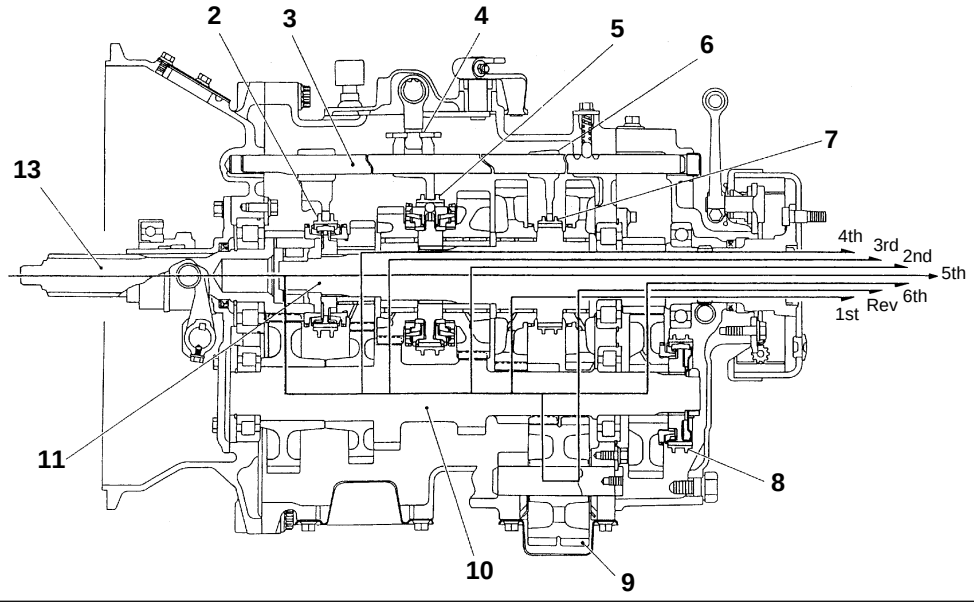
Transmission

< S5 >



37122

< S6 >



36021

1 Drive pinion
2 4th and 5th synchronizer assembly
3 Shift rail
4 Interlock mechanism
5 2nd and 3rd synchronizer assembly
6 Shift fork
7 1st and reverse constant mesh assembly
8 6th synchronizer assembly < S6 >
9 Reverse idler gear
10 Countershaft
11 Mainshaft

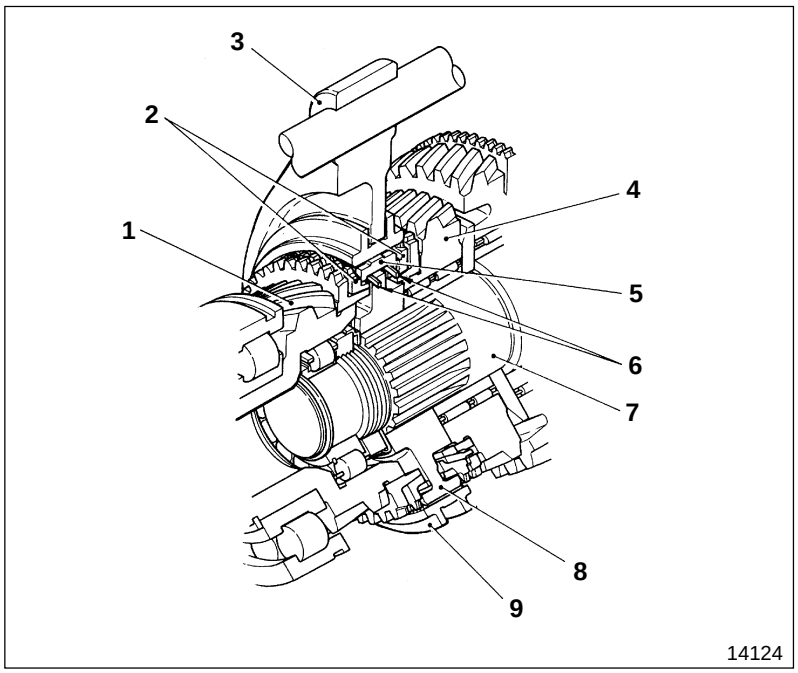
The transmission changes revolution and torque generated by the engine into those that match the vehicle's power requirement (driving force). Revolution and torque are increased or decreased by making a selection from several sets of engaged gears. The transmission uses an interlock mechanism to avoid double engagement.

Synchromesh Mechanism

This vehicle has two synchromesh mechanisms, a single cone type, and a double cone type, and uses the key system. The single or double cone type is used depending on the gear positions as shown below:

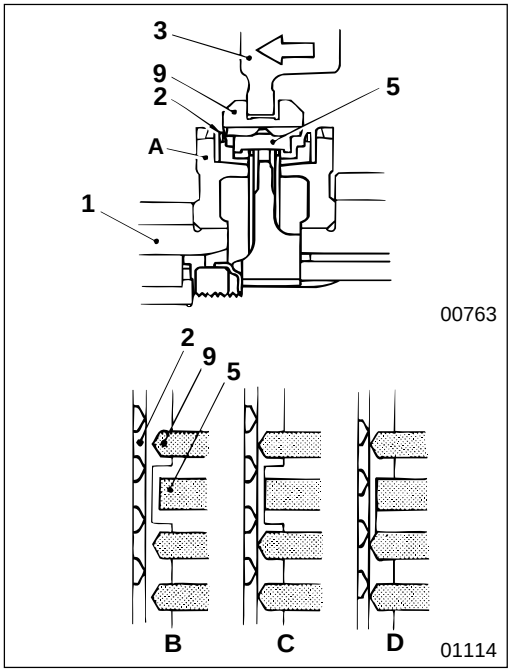
Synchromesh type	Parts used
Single cone type	4th, 5th, 6th
Double cone type	2nd and 3rd

Single Cone Type

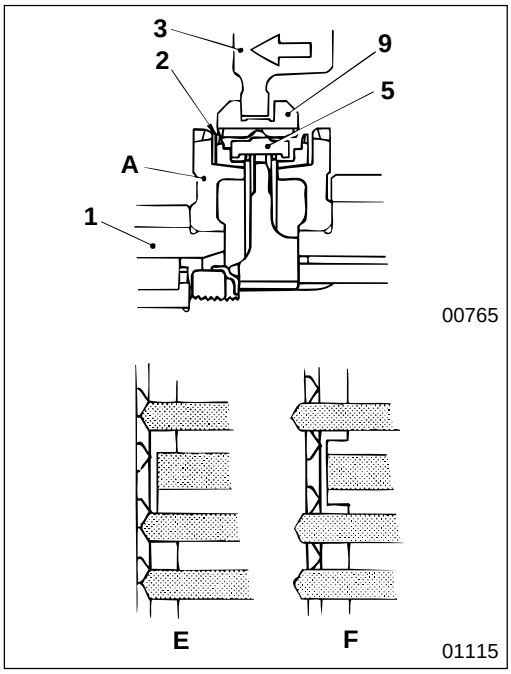


1 Drive pinion
2 Synchronizer ring
3 4th and 5th shift fork
4 4th gear
5 Shifting key
6 Shifting key spring
7 Mainshaft
8 Synchronizer hub
9 Synchronizer sleeve

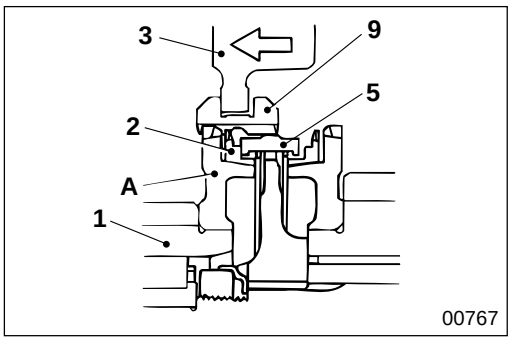
- The following descriptions are for 4th and 5th gear
  The inside of synchronizer hub **8** engages the spline of mainshaft **7** and rotates with it. The outside of the synchronizer hub has a spline that engages synchronizer sleeve **9** and three keyways.
- Shifting keys **5** are inserted into these keyways. When the gear shift is in neutral, a protrusion in the center of each shifting key engages a groove inside the synchronizer sleeve and the shifting keys are pressed against the inside of the synchronizer sleeve by shifting key springs **6**.
- Synchronizer rings **2** are inserted into drive pinions **1** in the front and rear of synchronizer hub **8**, and the taper cone of 4th gear **4**.
- The internal tapers of synchronizer rings **2** have fine threads, and the outer splines engage synchronizer sleeve **9**. On the hub side of the synchronizer rings are three keyways in which the ends of shifting keys **5** are inserted. These keyways are wider than the width of the shifting keys.
- Synchronizer rings **2** rotate relative to synchronizer sleeve **9** by the amount of play of the keyways.



- When the gear shift is in neutral (Figure **B**), moving shift fork **3** in the direction of the arrow as illustrated, moves synchronizer sleeve **9** slightly to the left. At the same time, shifting key **5**, the central protrusion of which engages the synchronizer sleeve, moves to the left and presses synchronizer rings **2** against taper cone **A** of drive pinion **1**. (Figure **C**)
- When the taper surfaces of synchronizer rings **2** make contact with the taper cone of the drive pinion, the taper surfaces of the synchronizer rings act as cone clutches. This frictional torque rotates the synchronizer rings in the rotating direction of the drive pinion by the amount of play between shifting key **5** and the synchronizer rings. The spline chamfers of the synchronizer rings and the spline chamfer of synchronizer sleeve **9** are offset from each other. (Figure **D**)
- The disengagement direction of synchronizer rings **2** is defined by the speed of rotation of the synchronizer—sleeve **9**, and the synchronized—drive pinion **1**. When increasing the vehicle speed by shifting up, disengagement is made in the opposite direction to rotation, and when decreasing the vehicle speed by shifting down, disengagement is made in the rotating direction.

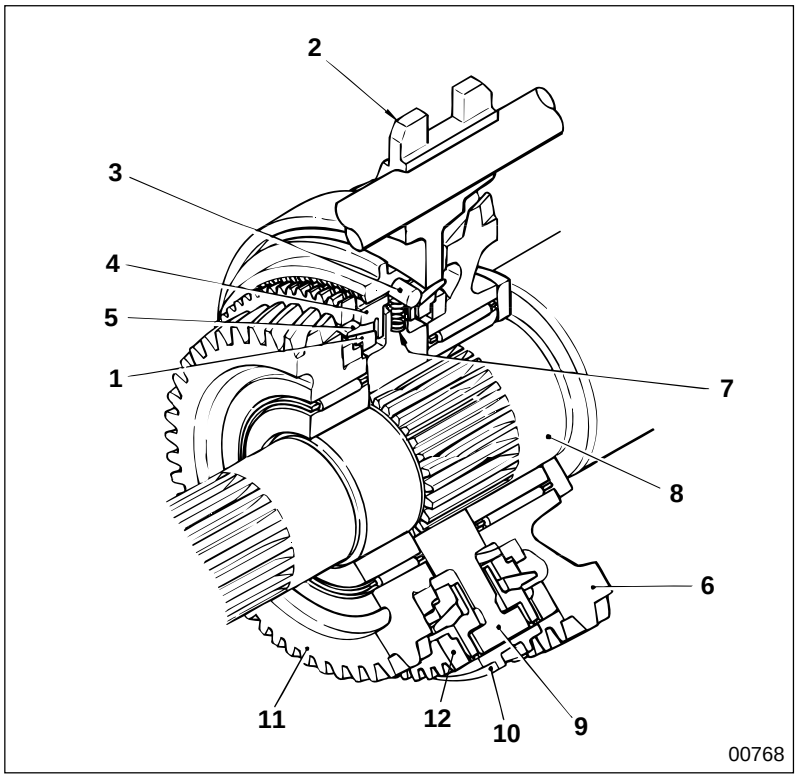


- When synchronizer sleeve **9** moves further to the left, synchronizer rings **2** prevent shifting key **5** from moving, and the synchronizer sleeve disengages from the protrusion of the shifting key.
- Since synchronizer rings **2** remain disengaged, the spline chamfer of synchronizer sleeve **9** presses the spline chamfers of the synchronizer rings, which in turn press the synchronizer rings against taper cone **A** of drive pinion **1**.
- As the frictional torque increases on the taper surfaces, the relative speed of the synchronizer and the synchronized gradually decreases.
  E : In synchronization
  F : After synchronization



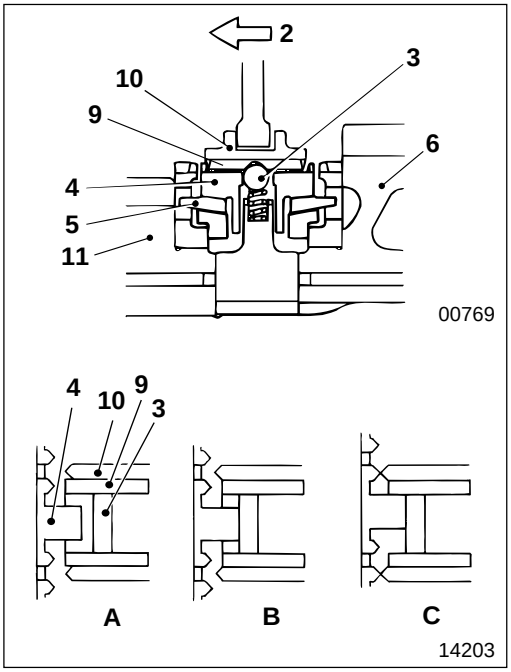
- When synchronizer sleeve **9** and drive pinion **1** rotate at the same speed, synchronizer rings **2** no longer prevent the synchronizer sleeve from moving, and the synchronizer sleeve moves further to the left and smoothly engages the spline of taper cone **A** of drive pinion **1**, transmitting the driving force.

Double Cone Type

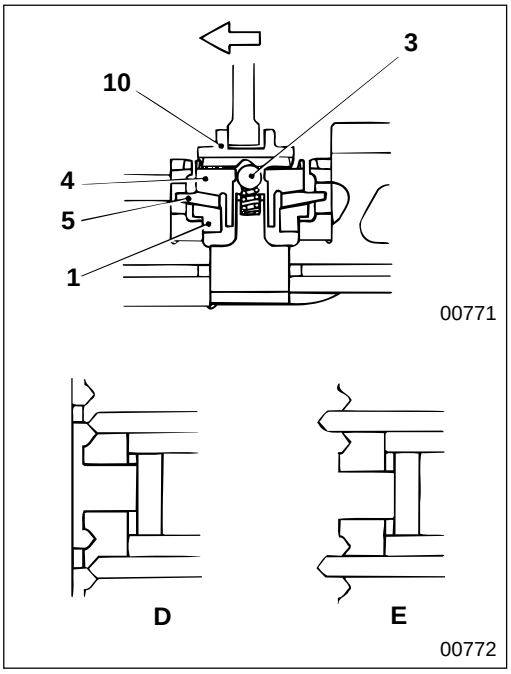


1 Synchronizer inner ring
2 2nd and 3rd shift fork
3 Shifting key
4 Synchronizer outer ring
5 Synchronizer center cone
6 2nd gear
7 Shifting key spring
8 Mainshaft
9 Synchronizer hub
10 Synchronizer sleeve
11 3rd gear
12 Dog clutch

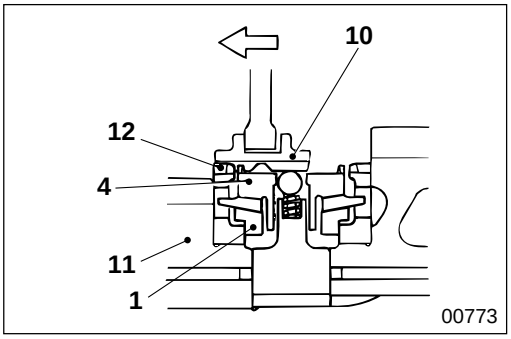
- The following descriptions are for 2nd and 3rd gear
  The synchromesh structure and operation of the double cone type are basically the same as for the single cone type.
- Synchronizer center cone **5** is a taper cone independent of 2nd gear **6** and 3rd gear **11**, (both the inside and outside surfaces are tapered). The synchronizer center cone is between synchronizer inner ring **1** and synchronizer outer ring **4** to increase the synchronization capacity.
- Six protrusions on the outside of center cone **5** fit into corresponding gear holes, in the same manner as the taper cone of the single cone type. The center cone and the gear are installed as if integrated.
  Shifting key **3** is a cylinder installed so that the lengthwise direction of the cylinder is at right angles to the diameter direction of synchronizer hub **9**. Shifting key spring **7** is a coil spring inserted in a hole in the synchronizer hub, this spring presses the shifting key against the inside of synchronizer sleeve **10**.



- When the gear shift is in neutral (Figure **A**), moving shift fork **2** in the direction of the arrow as illustrated, moves synchronizer sleeve **10** slightly to the left. At the same time, shifting key **3**, the central protrusion of which engages the synchronizer sleeve, moves to the left and presses synchronizer outer ring **4** against synchronizer center cone **5**. (Figure **B**)
- When the taper surface of synchronizer outer ring **4** makes contact with the taper cone of synchronizer center cone **5**, the taper surface of the synchronizer outer ring acts as a cone clutch. This frictional torque rotates the synchronizer outer ring in the rotating direction of 3rd gear **11** by the amount of play between the synchronizer outer ring and synchronizer hub **9**. The spline chamfer of the synchronizer outer ring and the spline chamfer of synchronizer sleeve **10** are offset from each other. (Figure **C**)
- The disengagement direction of synchronizer outer ring **4** is defined by the speed of rotation of the synchronizer—the sleeve, and the synchronized—3rd gear **11**. When increasing the vehicle speed by shifting up, disengagement is made in the opposite direction to rotation, and when decreasing the vehicle speed by shifting down, disengagement is made in the rotating direction.

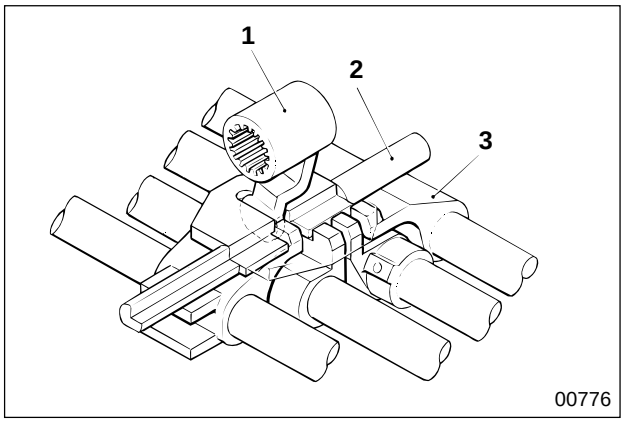


- When synchronizer sleeve **10** moves further to the left, synchronizer outer ring **4** prevents shifting key **3** from moving, and the synchronizer sleeve disengages from the protrusion of the shifting key.
- Since synchronizer outer ring **4** remains disengaged, the spline chamfer of synchronizer sleeve **10** presses the spline chamfer of the synchronizer outer ring, which in turn presses the synchronizer outer ring against the taper cone of synchronizer center cone **5**, and the frictional torque acts on the taper surface.
- As the frictional torque increases on the taper surface of synchronizer inner ring **1**, the relative speed of the synchronizer and the synchronized gradually decreases. The frictional torque acts on both sides of the synchronizer center cone. The double cone type has greater capacity for synchronization than the single cone type.
  D : In synchronization
  E : After synchronization



- When synchronizer sleeve **10** and 3rd gear **11** rotate at the same speed, synchronizer outer ring **4** no longer prevents the synchronizer sleeve from moving and the synchronizer sleeve moves further to the left and smoothly engages the spline of dog clutch **12** of the 3rd gear, transmitting the driving force.

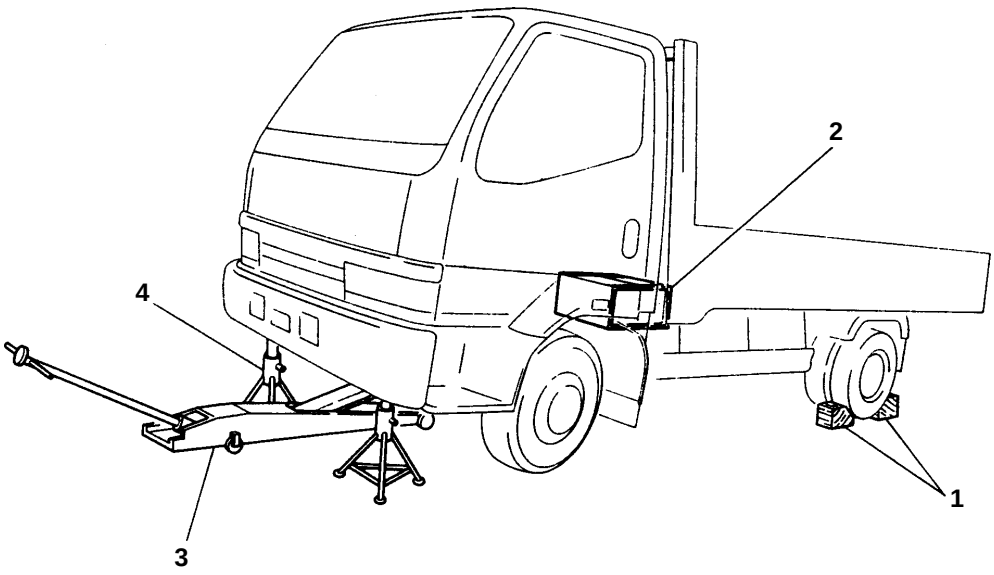
Interlock Mechanism



In the interlock mechanism, the rail beneath interlock plate **2** locks jaws **3**, (apart from the jaws shifted by gear shift slide lever **1**), preventing double engagement of gears.

Possible causes \ Symptoms		Gears slip out of engagement	Gears hard to engage	Noise when engine is idling	Noise while cruising	Noise when changing gear
Transmission body faulty	Mainshaft rear lock nut loose	○	○			
	Mainshaft thrust washer worn	○	○			
	Mainshaft bearing worn or damaged	○	○			
	Synchronizer ring and synchronizer sleeve spline worn	○				
	Synchronizer ring and gears taper cone area worn		○			
	Mainshaft pilot bearing worn or damaged			○	○	
	Drive pinion bearing worn or damaged			○		
	Countershaft bearing worn or damaged			○		
	Needle bearings of gears worn or damaged			○	○	
	Mainshaft and countershaft bearings worn or damaged				○	
	Mainshaft and countershaft gears backlash excessive				○	
	Spline of gears worn					○
	Gears damaged				○	
	Gear oil insufficient				○	
Control mechanisms faulty	Control cable joint play	○	○			
	Set board assembly bushings worn	○				
	Shift rail steel ball and groove worn	○				
	Shift rail poppet spring fatigued or damaged	○				
	Shift rail sliding movement faulty		○			
	Shift fork jaws worn		○			
	Shift fork bent		○			
Clutch faulty	Clutch disengagement faulty		○			○
	Clutch pedal play faulty (Gr 21)		○			
Synchronizer faulty	Contacting surfaces of synchronizer ring and gear taper cone worn					○
	Shifting key worn					○
	Shifting key spring deteriorated or damaged					○
	Synchronizer sleeve worn or damaged				○	○

WORK BEFORE REMOVAL AND INSTALLATION OF TRANSMISSION ASSEMBLY



14340

● **Work sequence before removal**

1 Place wheel chocks.
2 Disconnect negative battery cable. Gr 54
3 Jack up the front axle on a garage jack.
4 Support the front frame on rigid racks.

WARNING

- **Since the parking brake will be removed, naturally it cannot be used. Therefore, you must chock the wheels securely so the vehicle does not move.**
- **Do not remove the chocks until the entire operation is completed.**
- **Supporting a vehicle on a garage jack only is extremely dangerous, so always support the frame on rigid racks.**
- **Leave the garage jack and rigid racks in place until the entire operation is completed. Never remove them during the operation.**

CAUTION

Keep the transmission in neutral throughout the operation.

● **Work sequence after installation**

Follow the work sequence before removal in reverse.

Follow the disassembly sequence in reverse.

Ⓣ Tightening torque

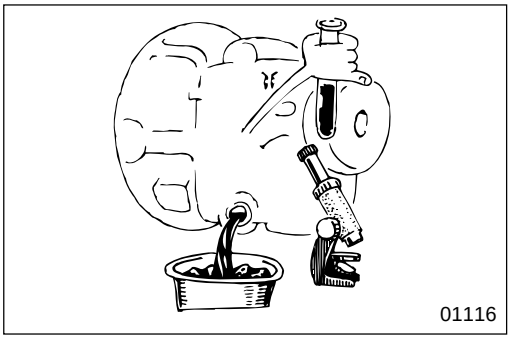
Unit : N·m {ft.lbs, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
8	Power shift hose connector	20 {14.8, 2}	—
9	Inspection plug	69±15 {51±11, 7±1.5}	—
10, 11	Drain plug	69±15 {51±11, 7±1.5}	—
12	Nut or bolt (Transmission mounting)	40 {30, 4.1}	—

Lubricant and sealant

Location	Points of application	Kinds	Quantity
9	Thread area of inspection plug	THREEBOND 1105D	As required
10, 11	Thread area of drain plug	THREEBOND 1105D	As required
13	Spline of drive pinion	Molybdenum disulfide grease [NLGI No.2 (Li soap)]	As required

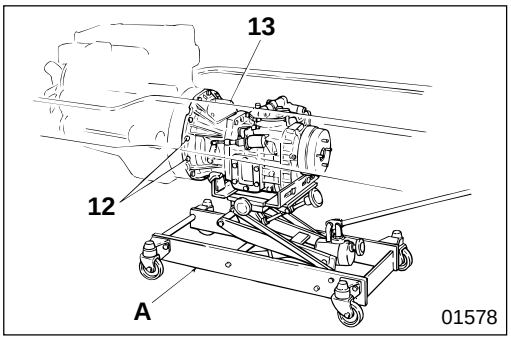
◆ Service procedure



● Oil change

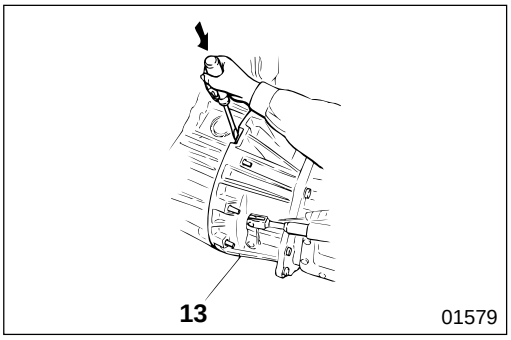
[Draining]
- When draining oil, check the quantity and quality of oil, especially for small pieces of metal and metal dust.
- Clean drain plug **9** before reinstalling it because it is magnetic.

[Filling]
- Check that drain plugs **10**, **11** are tightened at specified torque.
- Pour in gear oil until the oil overflows from the inspection hole. (For oil quantity, see specifications.)



12 Removal of transmission mounting nut or bolt

- Support transmission assembly **13** on transmission jack **A**.
- Tighten transmission mounting nuts or bolts **12**.

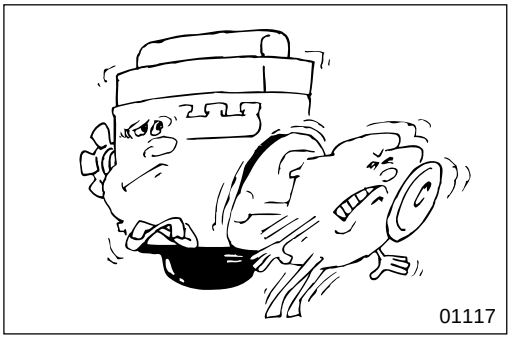


13 Transmission assembly

[Removal]
- Insert a screwdriver into the three removal grooves and pry transmission assembly **13** from the engine.

CAUTION⚠

Make sure that you remove hoses and cables before starting service operations.

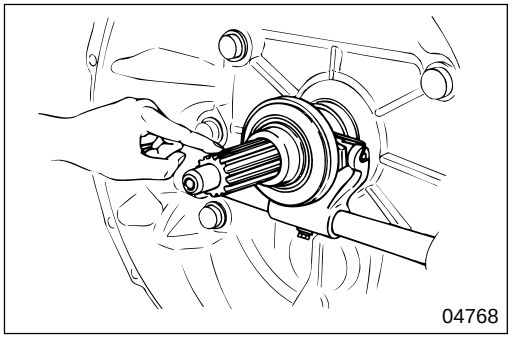


- Move transmission assembly **13** backward until the spline of the drive pinion is detached from the clutch.

CAUTION⚠

Make sure that you pull transmission assembly 13 out in a straight line. If you seesaw the transmission assembly violently, you will damage the spline that connects the drive pinion and the clutch.

REMOVAL AND INSTALLATION OF TRANSMISSION ASSEMBLY

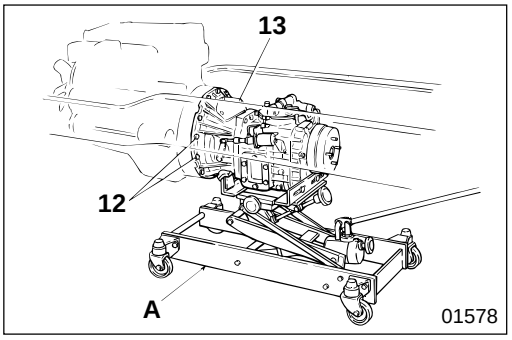


[Installation]

- Check the spline of the drive pinion for rust.
- If rust is found, remove it using a wire brush.
- Rub grease onto the clutch disc sliding surfaces of the drive pinion using your hand.

CAUTION

Make sure that you apply only the necessary amount of grease because too much grease would drip and cause clutch slip.



- Support transmission assembly **13** on transmission jack **A**, and insert the transmission assembly into the pilot bearing of the flywheel paying attention to the drive pinion spline.
- Tighten transmission mounting nuts or bolts **12** at specified torque.

GEAR SHIFTER UPPER AND INTERLOCK PLATE

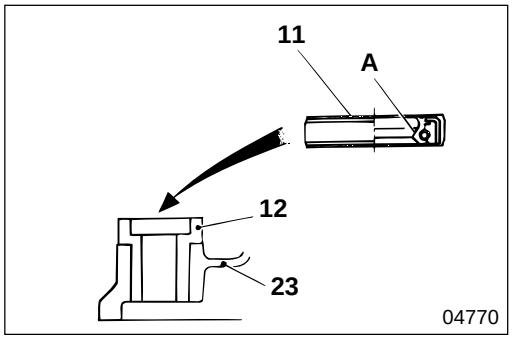
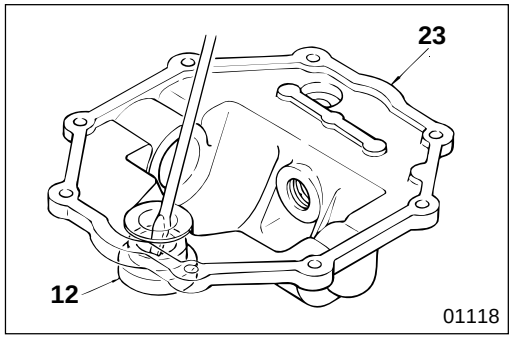
◆ Service procedure



11 Installation of oil seal

- Apply grease to lip area **A** of oil seal **11**.
- Press-fit oil seal **11** into bushing **12** in the direction as illustrated.



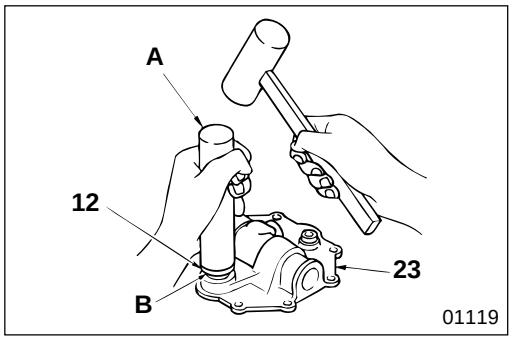
12 Bushing

[Removal]

Remove bushing **12** from selector lever case **23** using a screwdriver.

CAUTION

Be careful not to damage selector lever case 23.

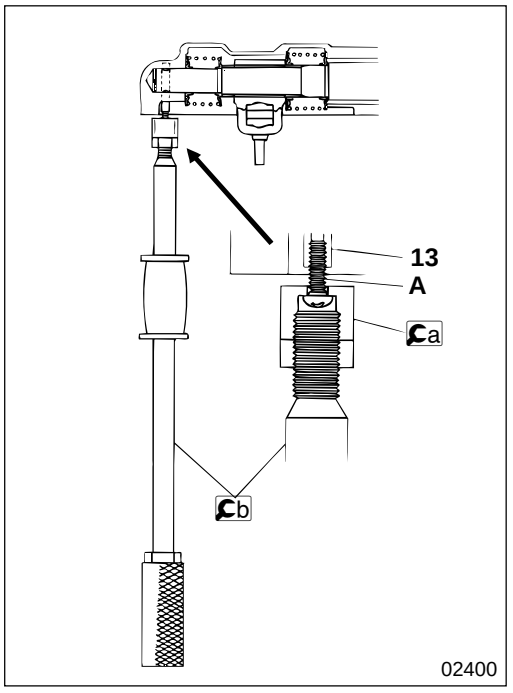


[Installation]

- Clean the inner surface of selector lever case **23**.
- Press-fit bushing **12** into selector lever case **23** using bar **A** (approximately ø40 mm {1.57 in.}).
- When press-fitting bushing **12**, take care not to damage selector lever case **23**.
- After press-fitting, apply sealant to press-fitted side **B** of bushing **12**.

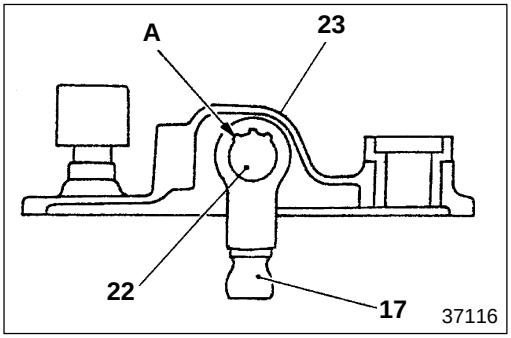
CAUTION

Prevent sealant from sticking to the inner surface of bushing 12.



13 Removal of spring pin

- Tap spring pin **13** using an M4 tap.
- Insert Ca spring pin puller with an M4 thread **A** of appropriate length into spring pin **13**.
- Position Cb reverse shaft puller on Ca spring pin puller.
- Remove spring pin **13** from selector lever case **23** using Ca spring pin puller and Cb reverse shaft puller.



17 **Installation of gear shift slide lever**

When you install gear shift slide lever **17** in gear shift lever **22**, position spline **A** is as illustrated.

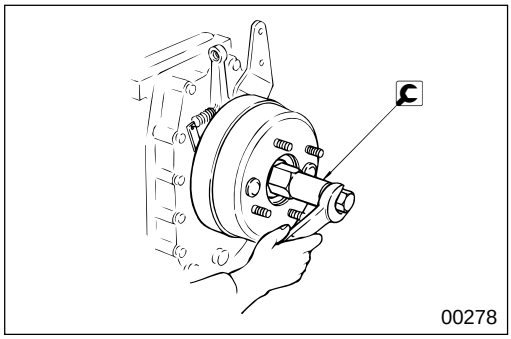
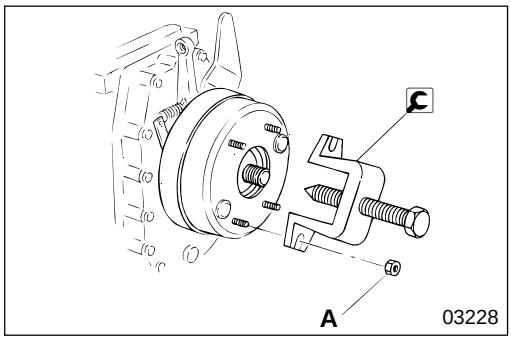
◆ Service procedure



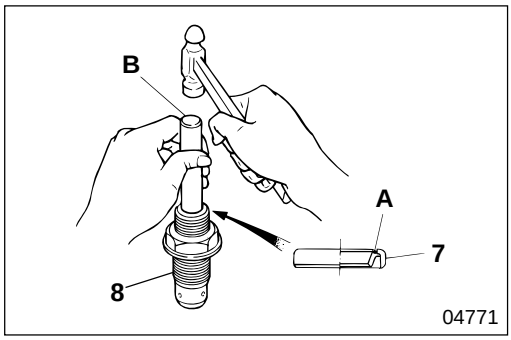
1 **Removal and installation of lock nut**

: Socket wrench



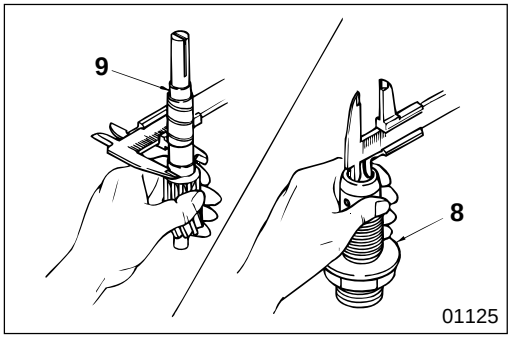
4 **Removal of companion flange**

A : Propeller shaft mounting nut
: Flange puller



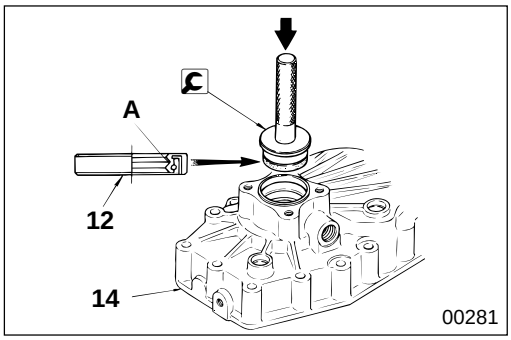
7 **Press-fitting of oil seal**

- Apply grease to inside of oil seal **7** packing **A**.
- Press-fit oil seal **7** into speedometer gear bushing **8** in the direction as illustrated using bar **B** (approximately ø15 mm {0.59 in.}).



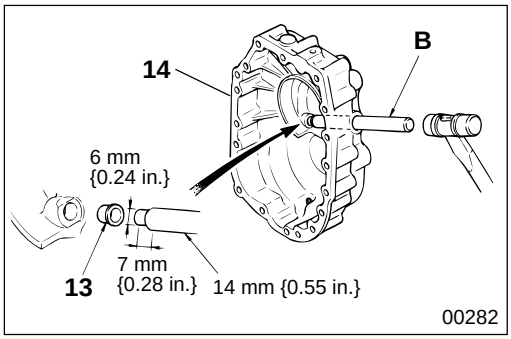
8 **9** **Clearance between speedometer gear bushing and speedometer gear**

If the clearance is higher than the limit, replace the faulty parts.



12 **Installation of oil seal**

- Apply grease to lip area **A** of oil seal **12**.
- Press-fit oil seal **12** into extension housing or rear cover **14** in the direction as illustrated using oil seal installer.



13 **Installation of speedometer gear bushing A**

Press-fit speedometer gear bushing A **13** into extension housing or rear cover **14** using bar **B**, turned to the dimensions as illustrated.

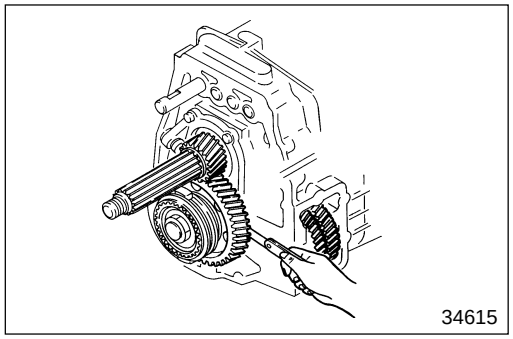
◆ Service procedure

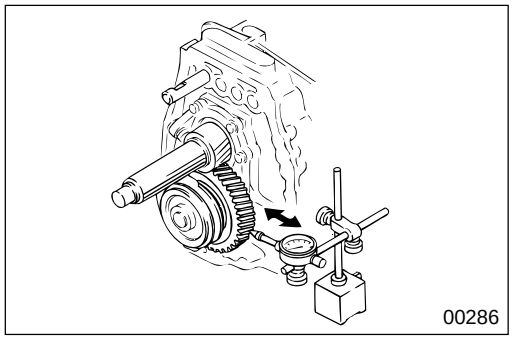


34615

● Inspection before disassembly

(1) End play of various gears < S6 >

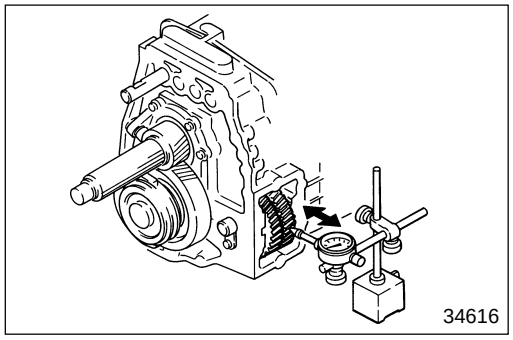
- If the measured value is higher than the limit, replace the faulty parts.
- Reinspect play after assembly to check that the measured value is within the limit.



00286

(2) Play of countershaft O/D gear in the diameter direction < S6 >

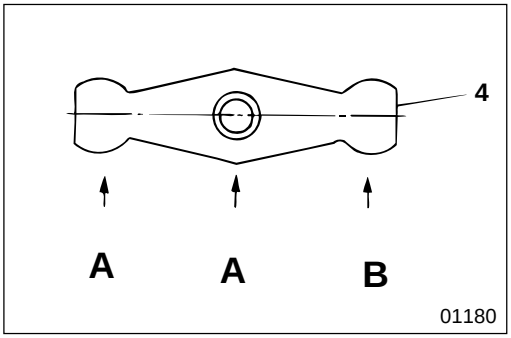
- If the measured value is higher than the limit, replace the faulty parts.
- Reinspect play after assembly to check that the measured value is within the limit.



34616

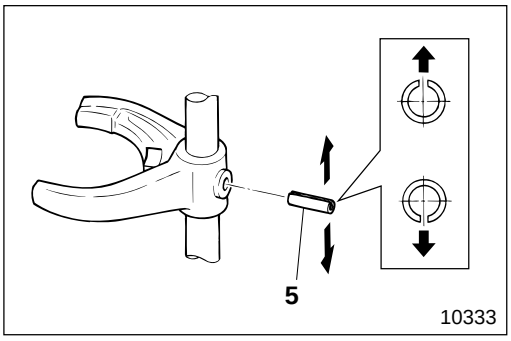
(3) Play of reverse ilder gear in the diameter direction

- If the measured value is higher than the limit, replace the faulty parts.
- Reinspect play after assembly to check that the measured value is within the limit.



4 **Bend of O/D shift lever**

If bend **B** exeeds the limit on the basis of illustrated **A - A**, replace O/D shift lever **4**.

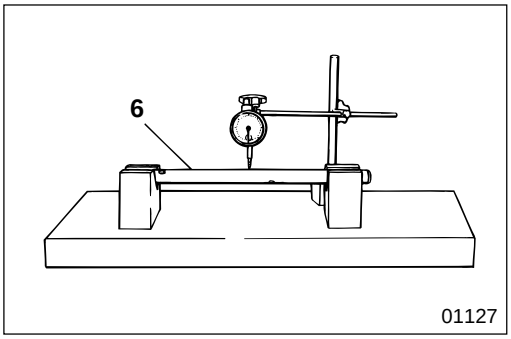


5 **Installation of spring pin**

Install spring pin **5** in O/D gear shift fork **7** in the direction as illustrated.

CAUTION

Make sure you do not drive in spring pin 5 fully, leave 0 to 0.5 mm {0 to 0.020 in.} outside to prevent them from slipping out.

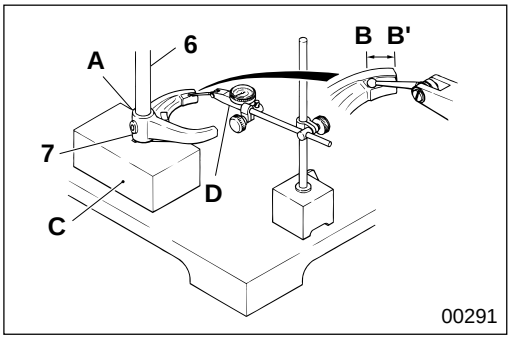


6 **Bend of O/D shift rail C**

If the measured value is higher than the limit, correct or replace O/D shift rail **C6**.

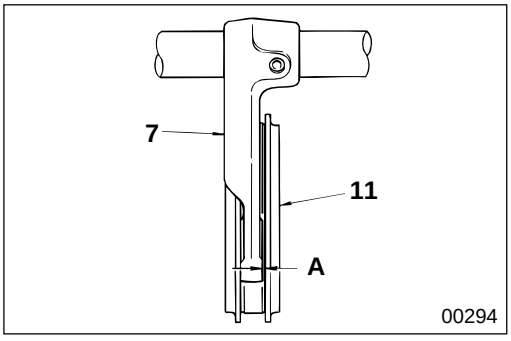
NOTE

Read the dial gauge after turning O/D shift rail C6 one full revolution. The bend is one half of the indicated value.



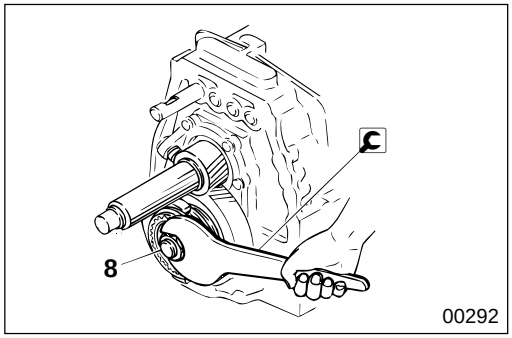
7 **Tilt of O/D gear shift fork claw**

- Measure the tilt (difference between **B** and **B'**) of claw **B-B'** against hole **A** of O/D shift rail C**6** of O/D gear shift fork **7** with the shift rail upright.
- If the measured value is higher than the limit, replace gear shift fork **7**.
  C: V-block
  D: Dial gauge



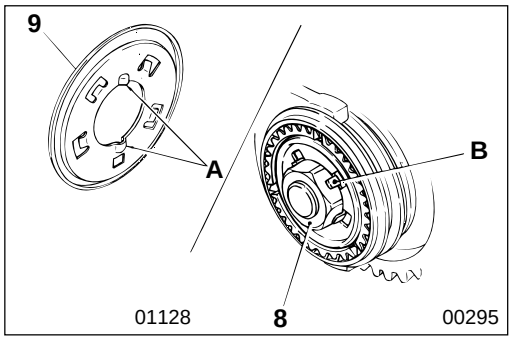
7 **11** **Clearance between O/D gear shift fork and synchronizer sleeve**

- Measure clearance **A** between O/D gear shift fork **7** and synchronizer sleeve **11**.
- If the measured value is higher than the limit, replace the faulty parts.



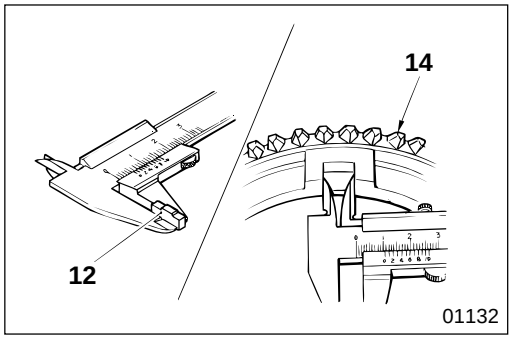
8 **Removal and installation of countershaft rear lock nut**

Have transmissions engaged in double to lock countershaft for this work.
: Single spanner



9 **Installation of shifting key retainer**

- Install so that shifting key retainer **9** protrusions **A** (at 2 places) rest in recessions provided on synchronizer hub.
- After tightening of lock nut, caulk the areas with slits **B** at 4 places of shifting retainer, toward lock nut **8**.

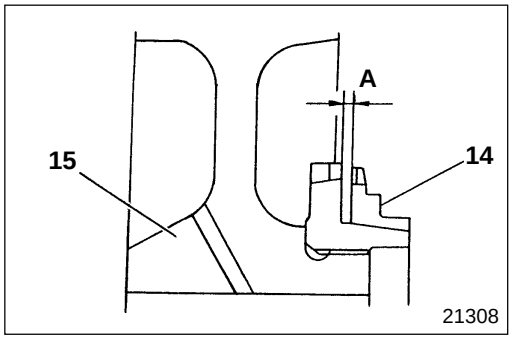


10 **to** **15** **Synchromesh mechanism and countershaft O/D gear assembly**

[Inspection]

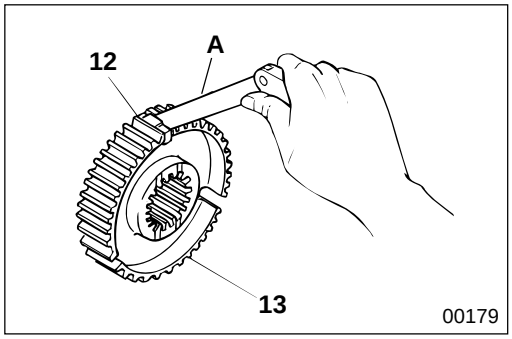
(1) Clearance between synchronizer ring 14 and shifting key 12.

If the measured value is higher than the limit, replace the faulty parts.



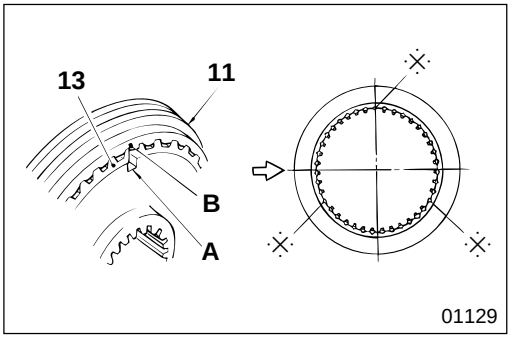
(2) Clearance between synchronizer ring 14 and countershaft O/D gear assembly 15

- Measure clearance **A** between synchronizer ring **14** and the gear cone of countershaft O/D gear assembly **15**.
- When measuring this value, press synchronizer ring **14** evenly, and measure all around the circumference.
- If the measured value is lower than the limit, replace the faulty parts.



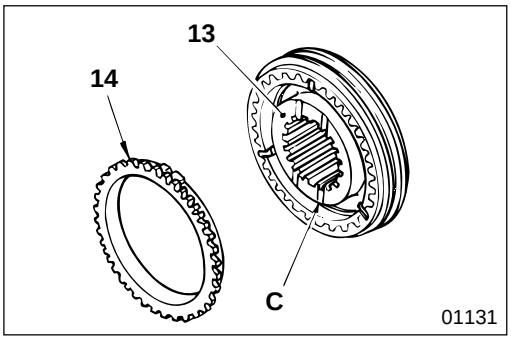
(3) Clearance between shifting key 12 and synchronizer hub 13

If the measured value is higher than the limit, replace the faulty parts.
A : Feeler gauge

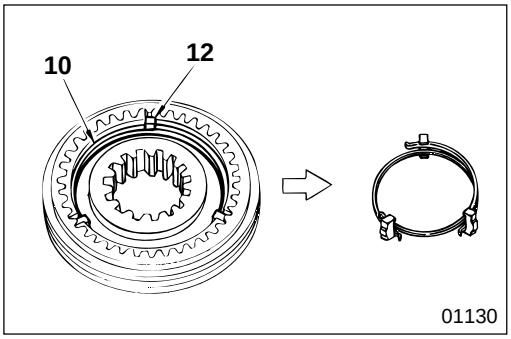


[Installation]

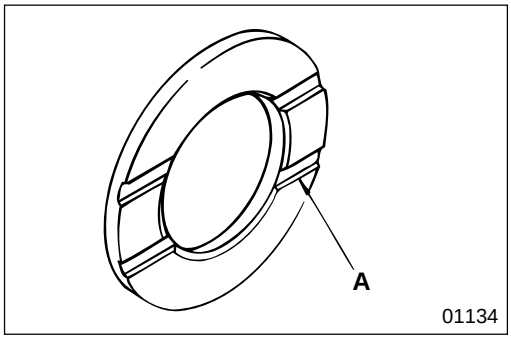
- Align the three keyways **A** of synchronizer hub **13** with the three stub teeth **B** (illustrated by ⋇ mark) of synchronizer sleeve **11** to install the synchronizer hub.
- To reassemble synchronizer hub **13** and synchronizer sleeve **11**, align the alignment marks made during disassembly.



- Assemble synchronizer ring **14** on synchronizer hub **13** with the keyway aligned to the side where oil groove **C** is located.

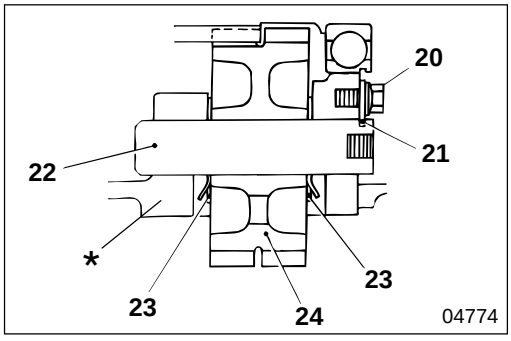


- Insert shifting **12** into the keyway.
- Install shifting key spring **10** so that its opening is offset from the one of the shifting key.
- Make sure that the openings of shifting key springs do not align with each other.



17 Installation of thrust washer

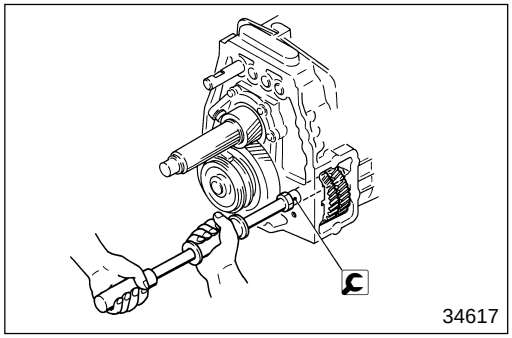
Install with the side having oil grooves **A** facing the side of gear.



20 to 24 Assembly of reverse idler gear

- Install reverse shaft gear side washer **23** and reverse idler gear **24** in trasmission body *****.
- Install reverse ilder shaft **22** in transmission body ***** using a plastic-headed mallet.
- Install reverse shaft lock piece **21** in transmission body ***** with mounting bolt **20**.

6TH GEAR < S6 > AND REVERSE IDLER GEAR



22 **Removal of reverse ilder shaft.**

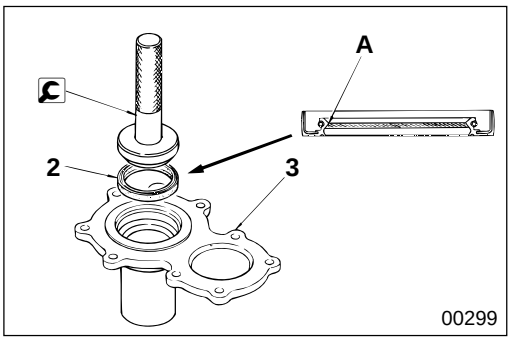
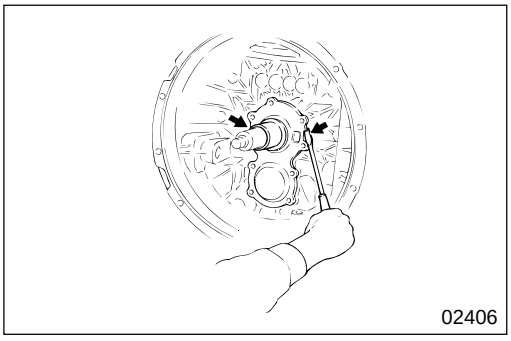
◆ Service procedure



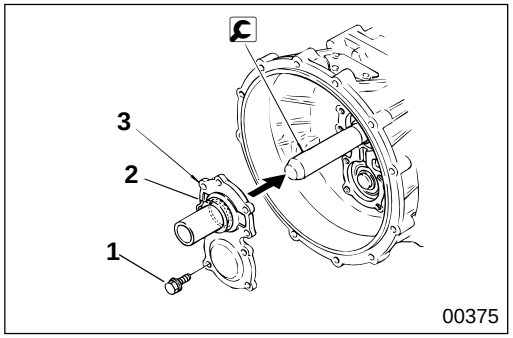
2 Installation of oil seal

- Apply grease to lip area **A** of oil seal **2**.
- Press-fit oil seal **2** into front bearing retainer **3** in the direction as illustrated using oil seal installer.



3 Front bearing retainer

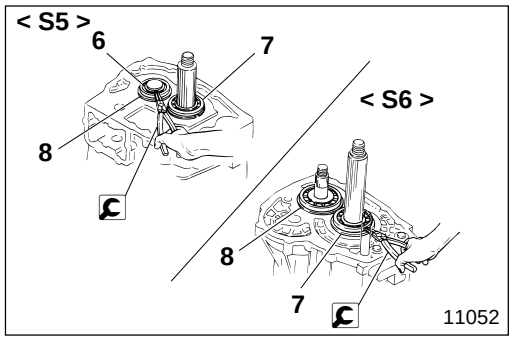
[Removal]



[Installation]
Press-fit front bearing retainer **3** into clutch housing assembly **19** using oil seal front guide.

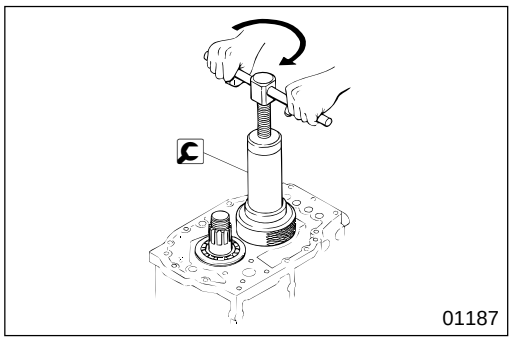
CAUTION

Be careful when installing front bearing retainer 3, that you do not damage oil seal 2 installed on the front bearing retainer.



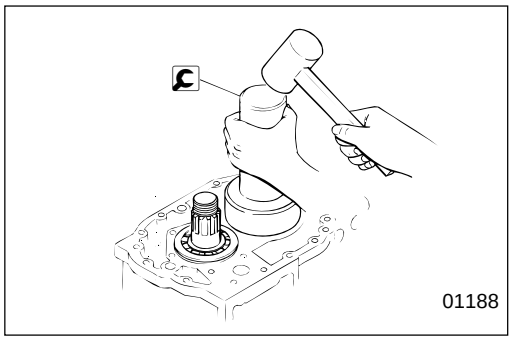
6 to 8 Removal and installation of snap ring

: Snap ring expander

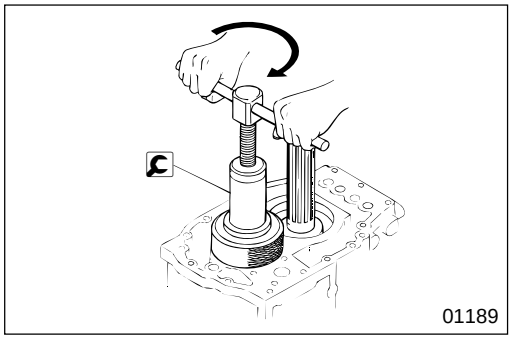


9 Mainshaft rear bearing

[Removal]
: Mainshaft bearing puller

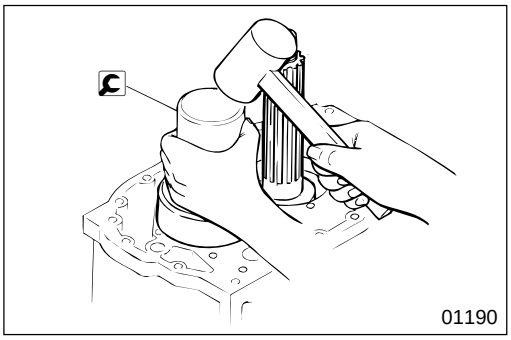


[Installation]
: Mainshaft bearing installer



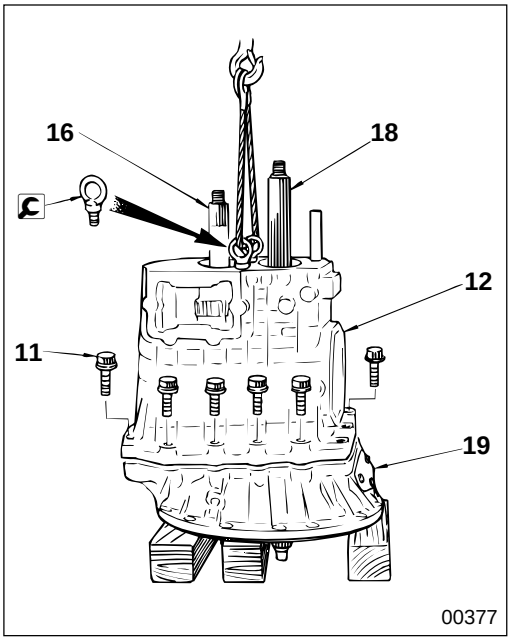
10 Countershaft rear bearing

[Removal]
: Countershaft bearing puller



[Installation]

: Countershaft bearing installer



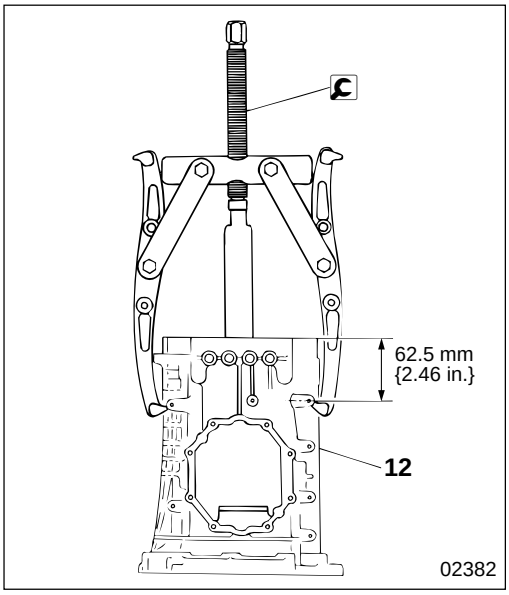
12 Removal and installation of transmission case

[Removal]

● **Remove transmission case 12.**

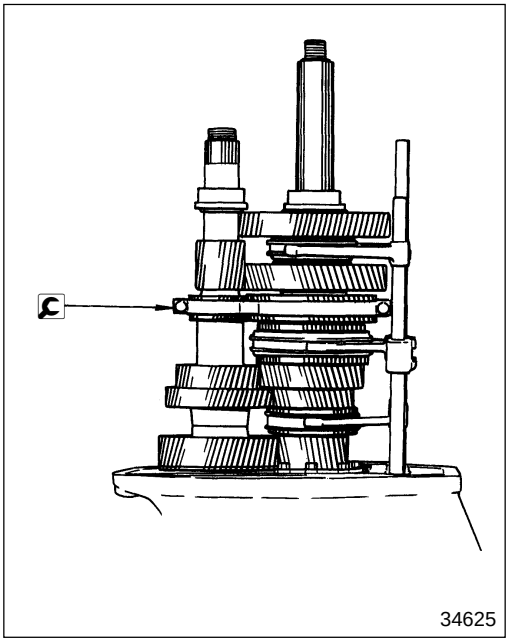
Method 1

- When lifting up with a crane, install eye bolts on transmission case **12** and pass a steel sling through them.
- After removing bolts **11**, lift transmission case **12** up with a crane and keep hitting the rear ends of clutch housing assembly **19**, mainshaft assembly **18** and countershaft assembly **16**. Use a plastic-headed or copper-headed mallet to remove the transmission case.



Method 2

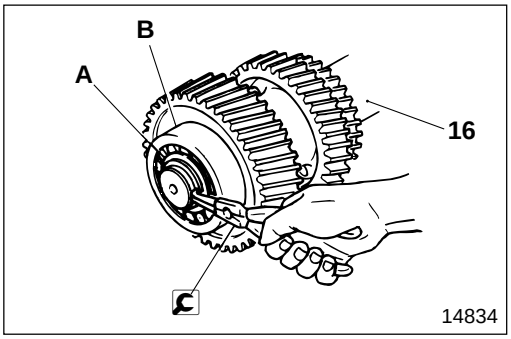
- A gear puller can be used instead of a crane.
  Puller installation position



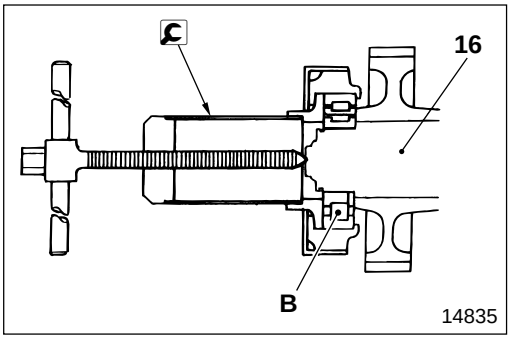
- After removing transmission case **12**, fit the 2nd gear unit using 🔧 steel lifting band to ensure safety.

CAUTION ⚠

Be sure to tighten 🔧 steel lifting band adequately enough to prevent it from coming undone, but not excessively, because excessive tightening would damage the gears, etc.



- Remove snap ring **A** from countershaft assembly **16**.
  B : Countershaft front bearing
  🔧 : Snap ring expander

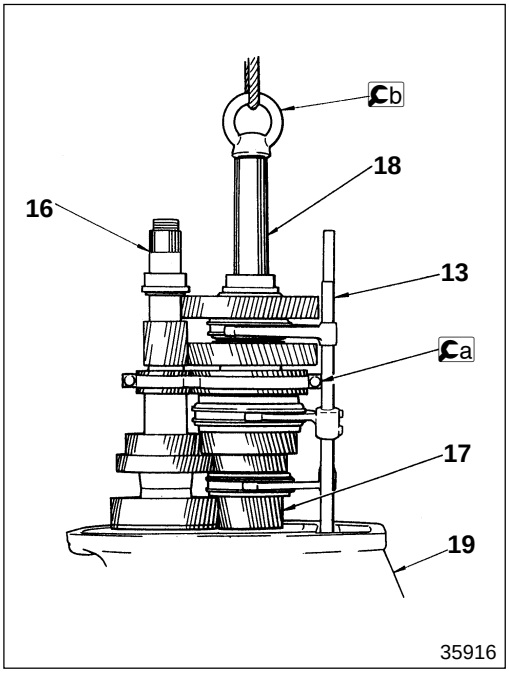


- Remove countershaft bearing **B** from countershaft assembly **16**.
  🔧 : Countershaft bearing puller

[Installation]
Follow the removal sequence in reverse.

CAUTION ⚠

Be careful not to damage mainshaft assembly 18, or rear bearings 9, 10 of countershaft assembly 16 during installation.



13 **16** **to** **18** **Shift rail and shift fork, countershaft assembly, drive pinion assembly, and mainshaft assembly**

[Removal]
Remove or install shift rail and shift fork **13**, countershaft assembly **16**, drive pinion assembly **17**, and mainshaft assembly **18** as a group.

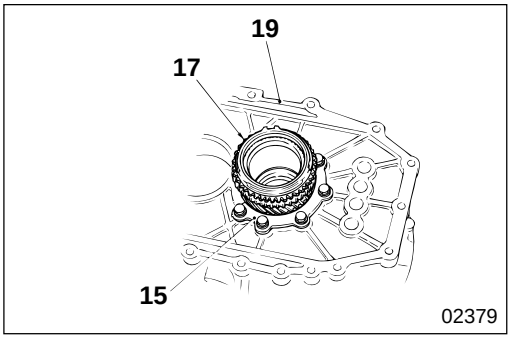
- Before lifting, after removing the case, install b eye nut at the end of mainshaft **18**, fitted with a steel lifting band.
- Fix shift rail and shift fork **13** to mainshaft assembly **18** with a rubber band.
- Fix a piece of wood to clutch housing assembly **19**, and use a crane to lift the clutch housing together with drive pinion assembly **17** up, at the same time hitting them with a plastic-headed mallet to remove them.

CAUTION

- **Be sure to tighten a steel lifting band adequately enough to prevent it from coming undone, but not excessively, because excessive tightening would damage the gears, etc.**
- **Make sure, when lifting mainshaft assembly 18 or other parts, that you support drive pinion assembly 17 with your hand in order to prevent it from falling when the mainshaft assembly and countershaft assembly 16 come apart.**

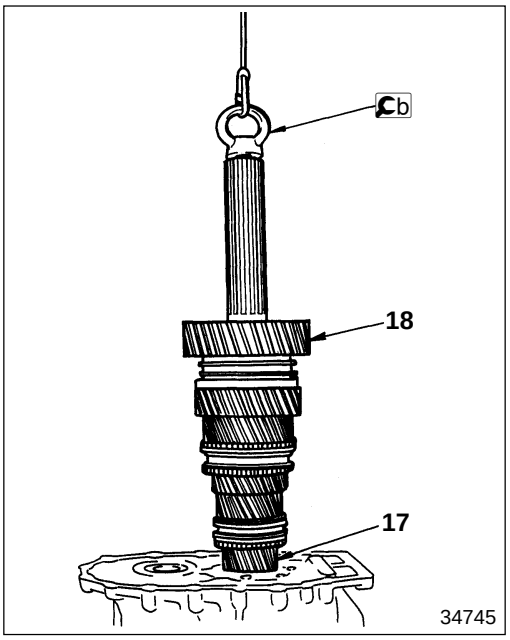
[Installation]
Method 1

- Follow the removal sequence in reverse.



Method 2

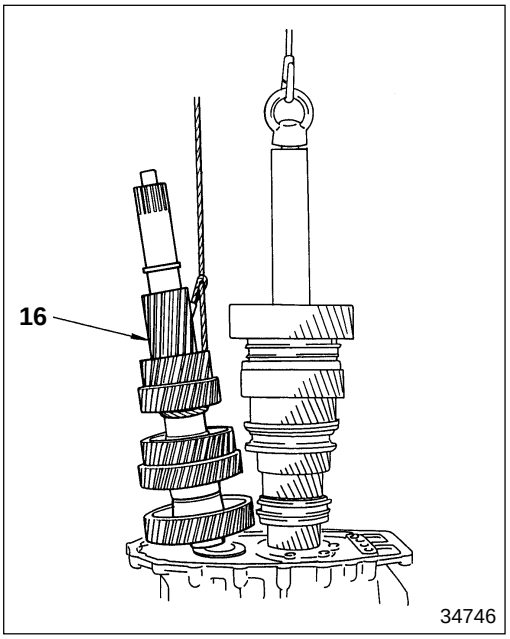
- After installing drive pinion assembly **17** in clutch housing assembly **19**, install drive pinion bearing retainer **15**.



- Install b eye nut at the end of mainshaft assembly **18**.
- Lift mainshaft assembly **18** up using a crane and install the mainshaft assembly on drive pinion assembly **17**.

CAUTION

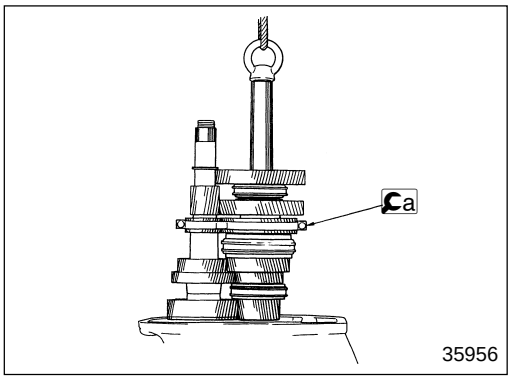
To prevent mainshaft assembly 18 from falling, support it using a crane.



- Install countershaft assembly **16** in clutch housing assembly **19**.

CAUTION

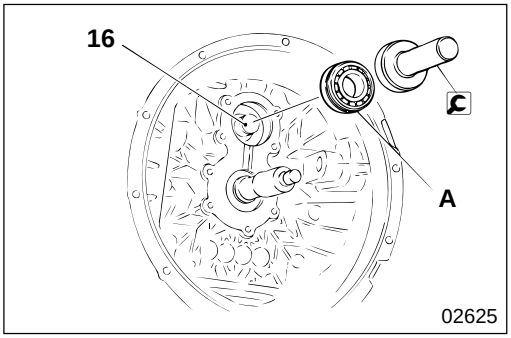
If you use this method of installation, first remove the countershaft front bearing. P22-56



- Fit the 2nd gear unit using a steel lifting band to ensure safety.

CAUTION

Be sure to tighten a steel lifting band adequately enough to prevent it from coming undone, but not excessively, because excessive tightening would damage the gears, etc.

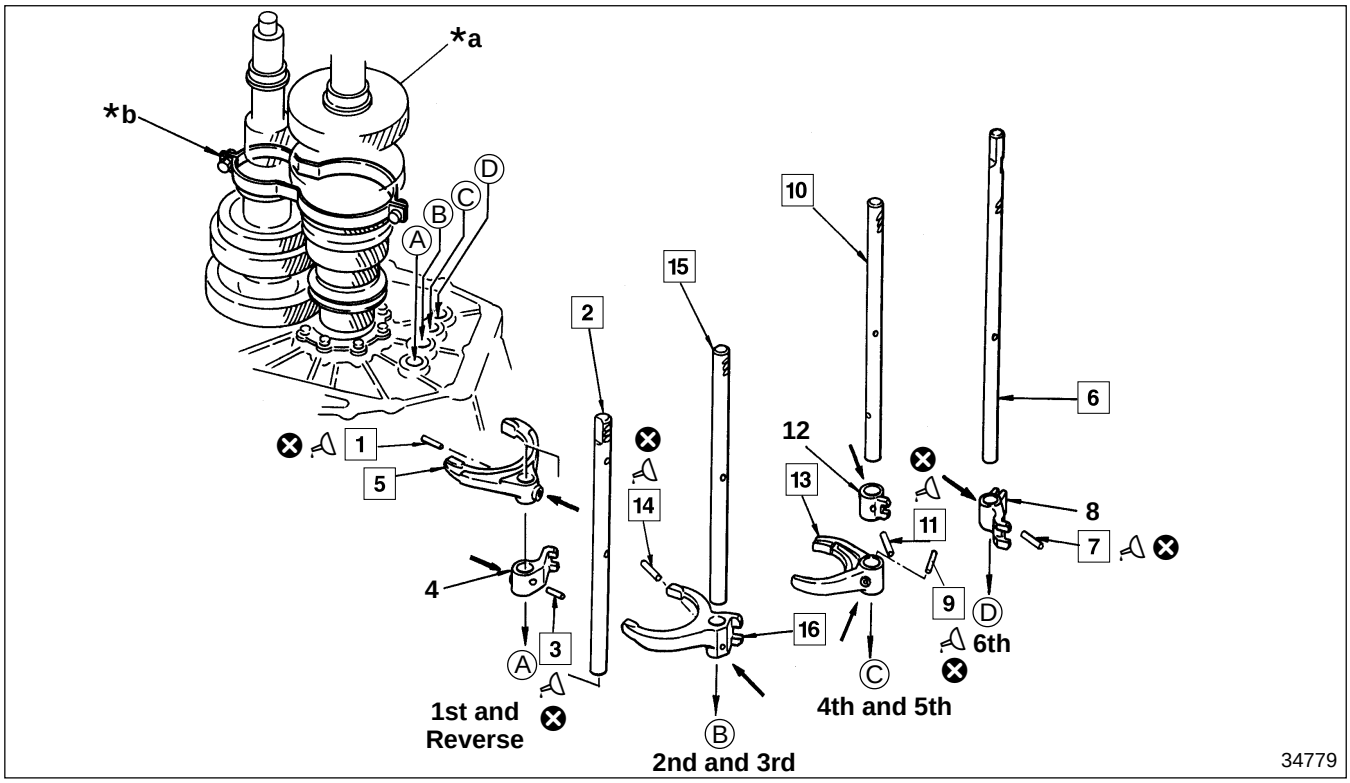


- Install shift rail and shift fork **13** and transmission case **12** in clutch housing assembly **19**.
- Place cluch housing assembly **19** horizontally so that countershaft assembly **16** is uppermost.
- Install the countershaft front bearing **A** into clutch housing assembly **19** using countershaft bearing installer.

CAUTION

Be sure to install the snap ring of the countershaft front bearing.

Shift Rail and Shift Fork



Arrow mark : Removal and installation direction for spring pin

● **Disassembly sequence** (When the mainshaft assembly is not removed or installed and only the shift rail and shift fork is disassembled)

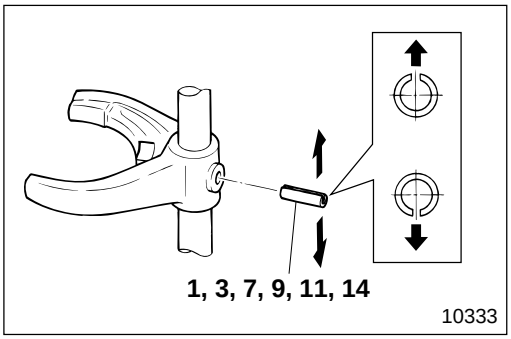
Sealant

Location	Points of application	Specified sealant	Quantity
1, 3, 7, 9, 11, 14	Spring pin	LOCTITE 601	As required

◆ Service procedure

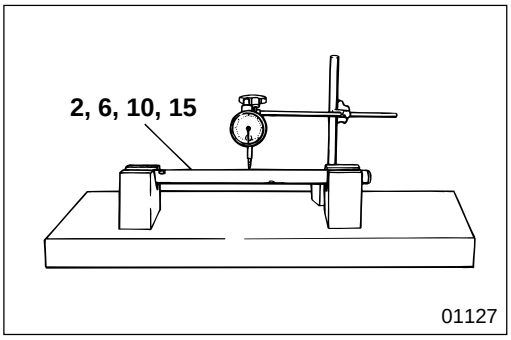


1 **3** **7** **9** **11** **14** **Installation of spring pin**

Install spring pins **1**, **3**, **7**, **9**, **11, 14** in the direction as illustrated.

CAUTION

- **Make sure you do not drive in spring pins 1, 3, 7, 9, 11, 14 fully, leave 0 to 0.5 mm {0 to 0.020 in.} outside to prevent them from slipping out.**
- **Do not remove spring pin 9 for 4th and 5th shift fork 13 (made of aluminum), except when replacing shift fork 13 or shift rail 10.**
- **Note that the length of spring pin 9 differs from that of spring pins 1, 3, 7, 11, 14.**
- **Be careful when driving in spring pins 1, 3, 7, 9, 11, 14 that you do not subject shift rails 2, 6, 10, 15 to excessive strain, because this would cause faults such as bent shift rails.**

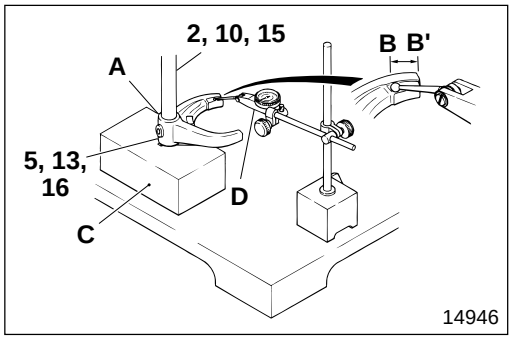


2 **6** **10** **15** **Bend of shift rail**

If the measured value is higher than the limit, correct or replace shift rail **2**, **6**, **10** or **15**.

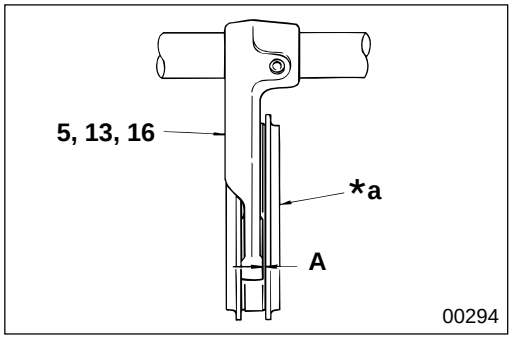
NOTE

Read the dial gauge after turning shift rails 2, 6, 10, 15 one full revolution. The bend is one half of the indicated value.



5 13 16 Tilt of shift fork claws

- Measure the tilt (difference between **B** and **B'**) of claw **B**–**B'** against hole **A** of shift rails **2, 10, 15** of shift forks **5, 13, 16** with the shift rails upright.
- If the measured value is higher than the limit, replace shift fork **5**, **13**, or **16**.
  C : V-block
  D : Dial gauge



5 13 16 *a Clearance between gear shift fork and synchronizer sleeve of mainshaft

If clearance **A** is higher than the limit, replace the faulty parts.
***a** : Synchronizer ring of mainshaft assembly

◆ Service procedure

● Work before disassembly

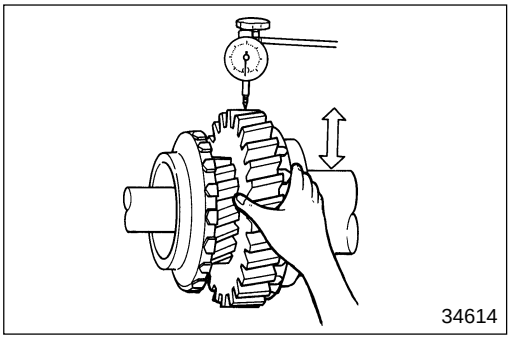
[Inspection]

(1) End play of gears

A : Reverse gear
B : 2nd gear
C : 3rd gear
D : 4th gear
E : 1st gear

If the measured value is higher than the limit, replace the faulty parts.

Also inspect this item after assembly and make sure that the measured value is within the limit.

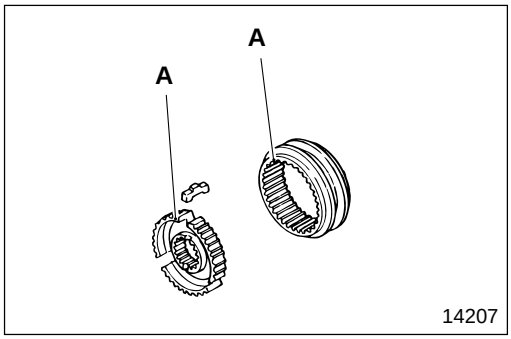


(2) Play of gears in diameter direction

If the measured value is higher than the limit, replace the faulty parts. Also inspect this item after assembly and make sure that the measured value is within the limit.

CAUTION⚠

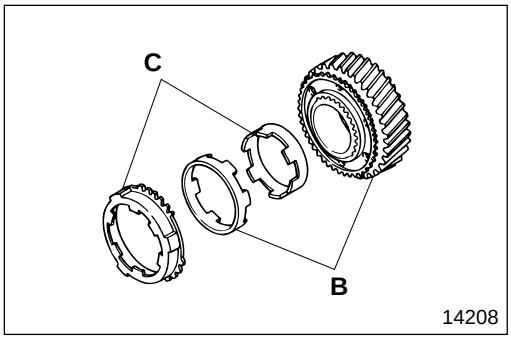
Be sure when you replace the two needle bearings of a gear, that both needle bearings are from the same color package.



[Alignment marks]

(1) Synchronizer sleeve and synchronizer hub

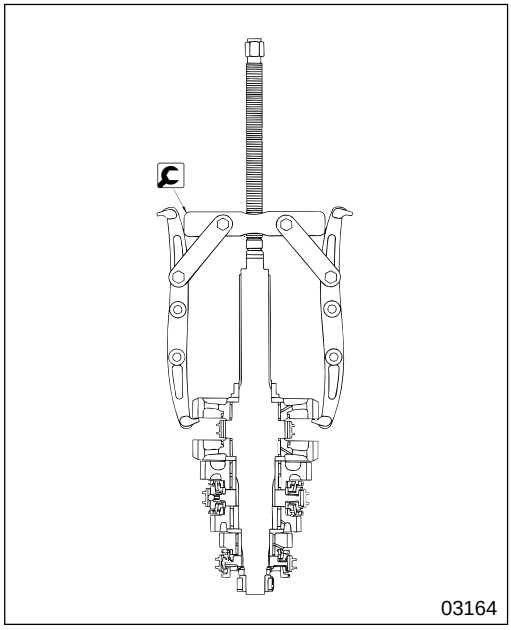
Before disassembling the synchronizer sleeve and the synchronizer hub, put alignment marks **A** on the places where the shifting keys are installed. When reusing parts, align the alignment marks to assemble.



(2) Ring, cone and gear assembly of double cone synchronizer

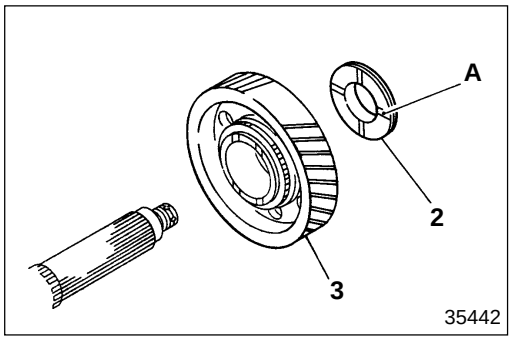
Before disassembling synchronizer center cone and gear assembly (**B**), and synchronizer center ring and synchronizer outer ring (**C**), put alignment marks on them. When reusing parts, align the alignment marks to assemble.

MAINSHAFT ASSEMBLY



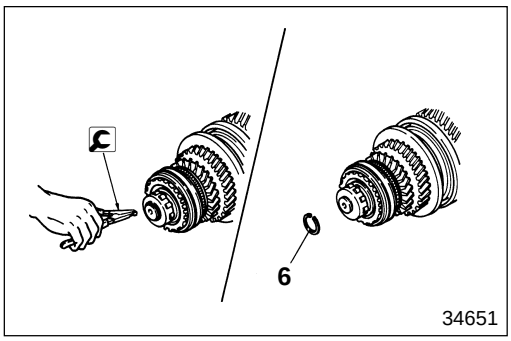
1 **Removal of mainshaft rear bearing inner race < S6 >**

: Gear puller



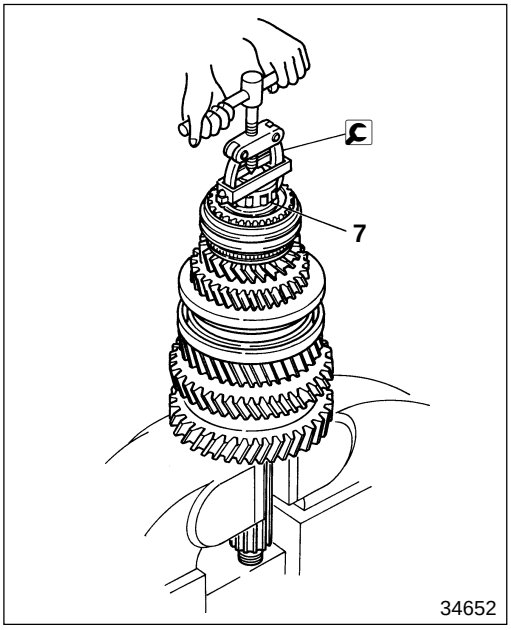
2 **Installation of reverse gear thrust washer**

A : Oil groove



6 **Removal and installation of snap ring**

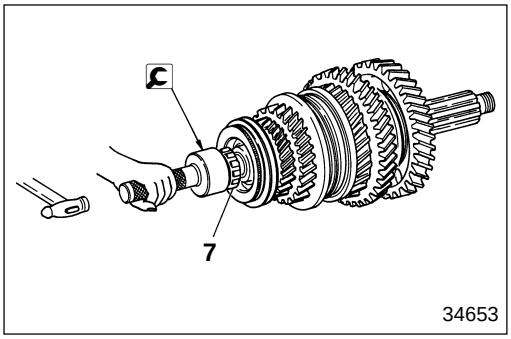
: Snap ring expander



7 **Pilot bearing**

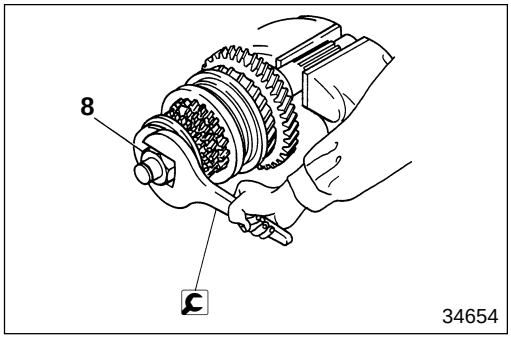
[Removal]

: Pilot bearing puller



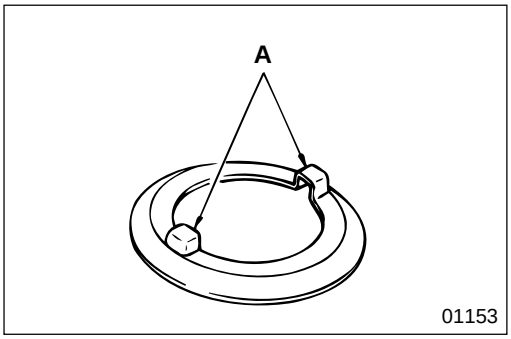
[Installation]

: Pilot bearing installer



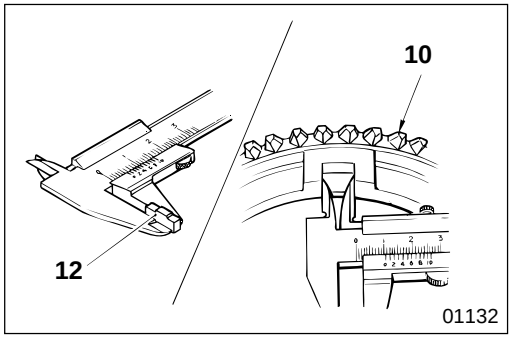
8 **Removal and installation of lock nut**

: Single spanner



9 **Installation of lock washer**

Install so that protrusions **A** (two points as illustrated) fit into the grooves of synchronizer hub **14**.

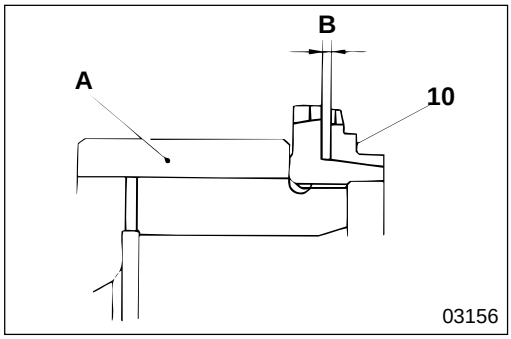


10 to **15** **Synchromesh mechanism and 4th gear**

[Inspection]

(1) Clearance between synchronizer ring 10 and shifting key 12

If the measured value is higher than the limit, replace the faulty parts.

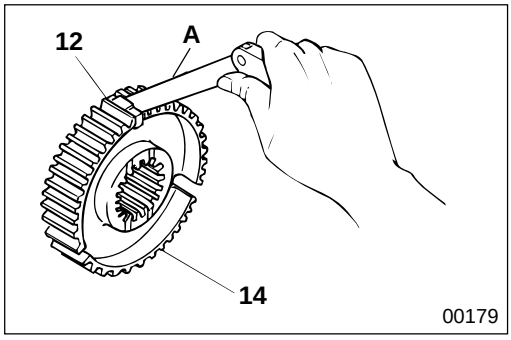


(2) Clearance between synchronizer ring 10 and drive pinion

- Measure clearance **B** between synchronizer ring **10** and the gear cone of drive pinon **A**.
- When measuring this value, press synchronizer ring **10** evenly, and measure all around the circumference.
- If the measured value is lower than the limit, replace the faulty parts.

(3) Clearance between synchronizer ring and 4th gear

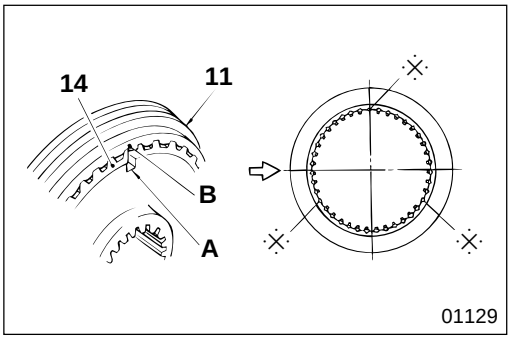
- According to the procedure described in (2), measure clearance between synchronizer ring **10** and the gear cone of 4th gear **15**.



(4) Clearance between shifting key 12 and synchronizer hub 14

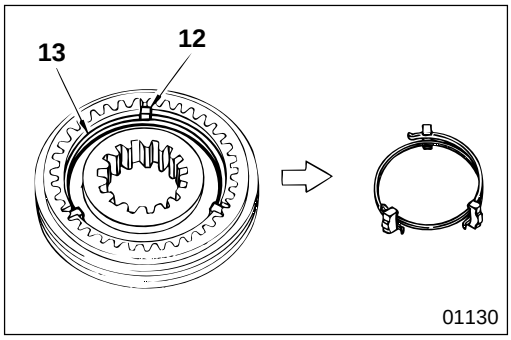
If the measured value is higher than the limit, replace the faulty parts.

A : Feeler gauge

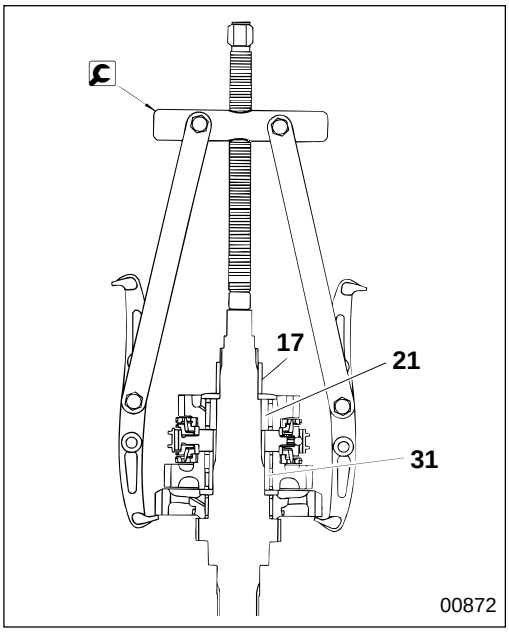


[Installation]

- Align the three keyways **A** of synchronizer hub **14** with the three stub teeth **B** (illustrated by ·⁜· mark) of synchronizer sleeve **11** to install the synchronizer hub.
- To reassemble synchronizer hub **14** and synchronizer sleeve **11**, align the alignment marks made during diassembly.

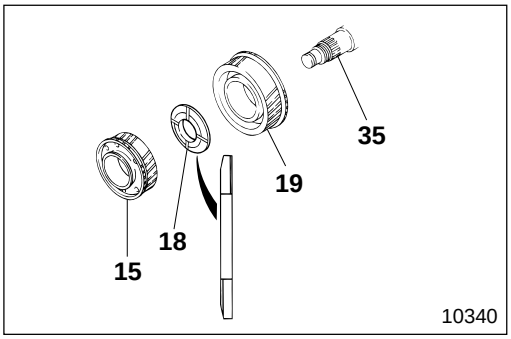


- Insert shifting key **12** into the keyway.
- Install shifting key spring **13** so that its opening is offset from the one of the shifting key.
- Make sure that the openings of shifting key springs do not align with each other.

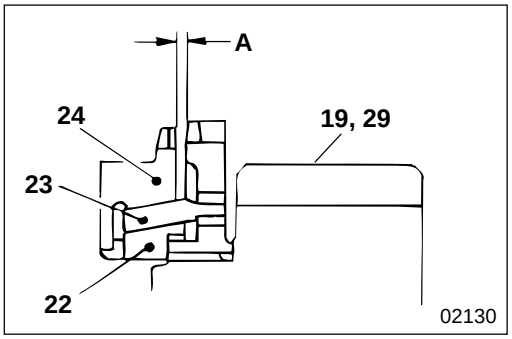


17 **21** **31** **Removal of 4th, 3rd, 2nd gear bearing sleeves**

: Gear puller



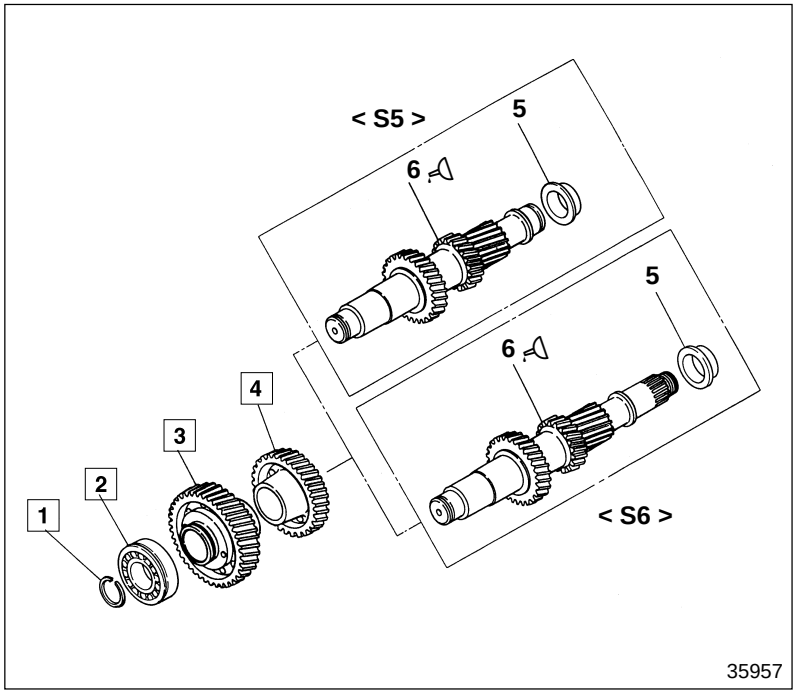
18 **Installation of 3rd and 4th gear thrust washer**



19 **24** **29** **Clearance between synchronizer outer ring and 3rd gear assembly or 2nd gear assembly**

- Measure clearance **A** between synchronizer outer ring **24** and the cone of 3rd gear assembly **19** or 2nd gear assembly **29**.
- When measuring this value, press synchronizer inner ring **22**, synchronizer outer ring **24** and synchronizer center ring **23** evenly and measure all around the circumference.
- If the measured value is higher than the limit, replace the faulty parts.

COUNTERSHAFT ASSEMBLY



● **Disassembly sequence**

1 Snap ring
2 Countershaft front bearing
3 Countershaft constant mesh gear
4 Countershaft 4th gear
5 Countershaft rear bearing inner race
6 Countershaft

● **Assembly sequence**

Follow the disassembly sequence in reverse.

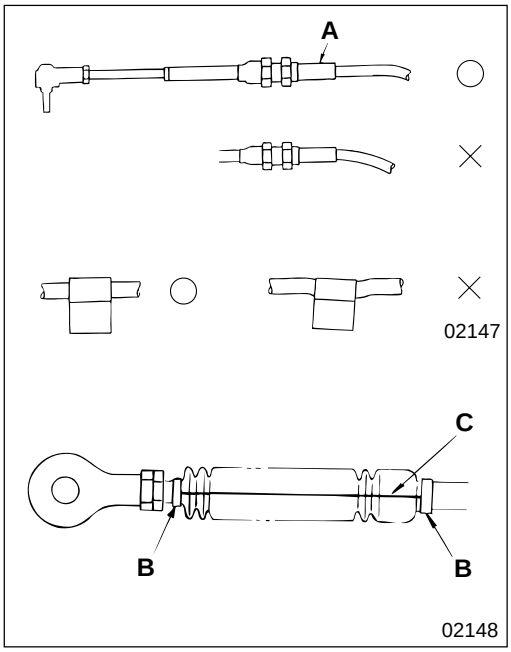
Ⓣ Tightening torque

Unit : N·m {ft.lbs, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
1 to 4	Nut (Ball joint or rubber damper mounting)	19 to 24 {14 to 17, 1.9 to 2.4}	—
5, 6	Cable lock nut tightening	59 to 83 {43 to 61, 6 to 8.5}	—

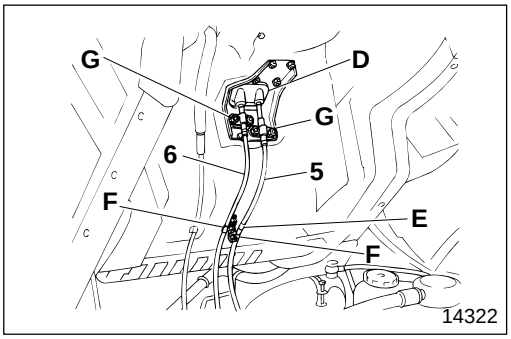
◆ Service procedure



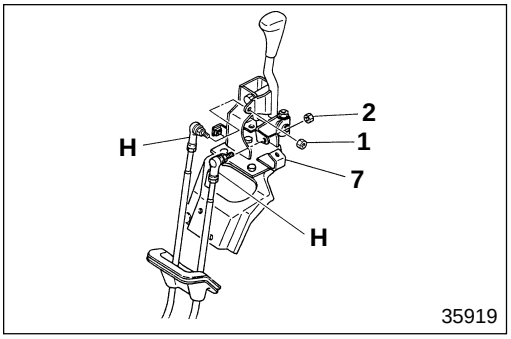
5 **6** **Installation of shift cable and selector cable**

CAUTION

- **Be sure to install casing cap A lengthwise.**
- **Make sure the radius of the bend is 200 mm {7.87 in.} or more.**
- **Make sure the cable operates smoothly.**
- **Be sure to install the clamps vertically against the cable.**
- **Make sure you do not twist clamps B at both ends of the boot. Make sure that white line C on the boot is aligned.**
- **Make sure the identification marks on the cable, the ball joint and the rubber damper point in the right direction when you install the cables. Installing the cables with the identification marks in the wrong direction can remarkably reduce the durability of the cables.**



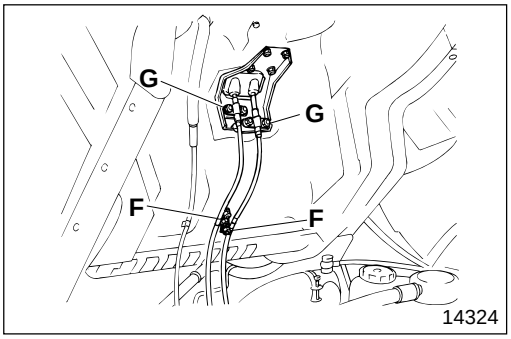
- Install shift cable **5** and selector cable **6** to the frame after having temporarily installed all the clamps.
- Insert shift cable **5** and selector cable **6** through grommet **D** of the cab floor into the inside of the cab, then install clip **F** and clip **G** temporarily by making identification mark **E** on the shift cable come to clip **F** position. (The selector cable has no identification mark.)



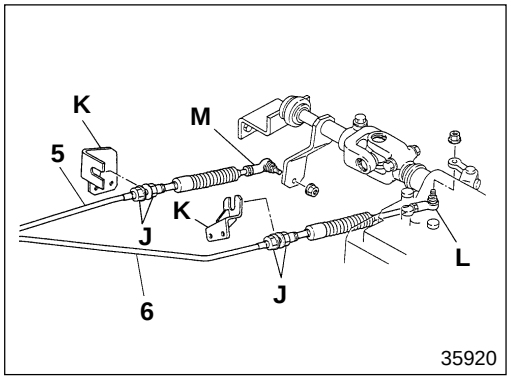
- Lower the cab.
- Install ball joint **H** of the cable to the shift lever and selector lever of transmission control lever assembly **7**.

CAUTION

Make sure that ball joint H faces the correct direction.



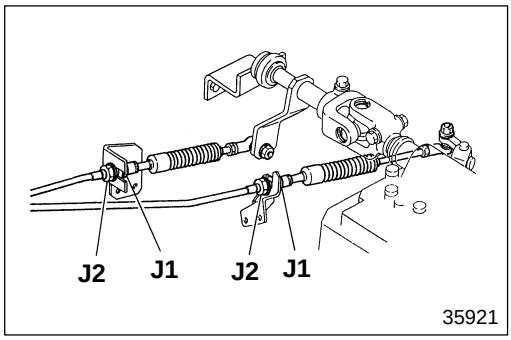
- Tilt the cab up and tighten clip **F** and clip **G** permanently without applying force to the cables.



- Install lock nut **J** to bracket **K** temporarily and connect ball joint **L** or rubber damper **M** to the shift lever and selector lever.
- Tighten lock nut **J** permanently without applying force to the cables.

CAUTION ⚠

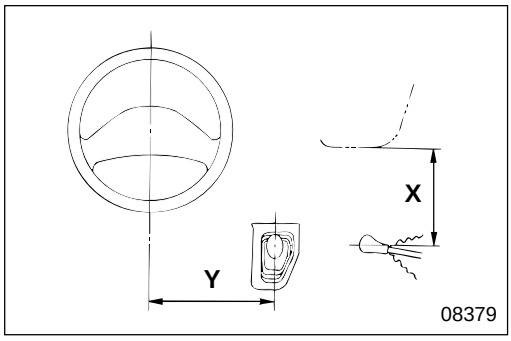
Make sure that ball joint L and rubber damper M face the correct direction.



CAUTION ⚠

Make sure not to move lock nut J1 of the transmission side when tightening lock nut J. Tighten lock nut J2.

- Check when you operate the gear shift lever that it shifts and selects each position smoothly.



- If the gear shift lever leans to the front or rear, or to the left or right, excessively, adjust the length of the cable.
- When adjusting the gear shift lever, use the distance from the center of the steering wheel or from the instrument panel as the reference distance.

Unit : mm {in.}

Front and rear direction X (Distance from the instrument panel)	Left and right direction Y (Distance from the steering wheel center)
309 {12.17}	350 {13.78} (4th and 5th gear position)

	Shift cable **5**	Selector cable **6**
To front	Shorten	—
To rear	Lengthen	—
To right	—	Lengthen
To left	—	Shorten

The automatic transmission is comprised of a torque converter with a lock-up mechanism and a fully automatic 4-speed gear system.

● **Torque converter**

The torque converter is driven by the engine crankshaft, and functions as the input device for the transmission. The torque converter is a fluid coupling device that magnifies torque produced by the engine and absorbs shock that generates when the vehicle accelerates from a standstill or when the transmission shifts. At a cruising speed, the lock-up mechanism prevents slippage for improved power transmitting efficiency.

● **Transmission gear section**

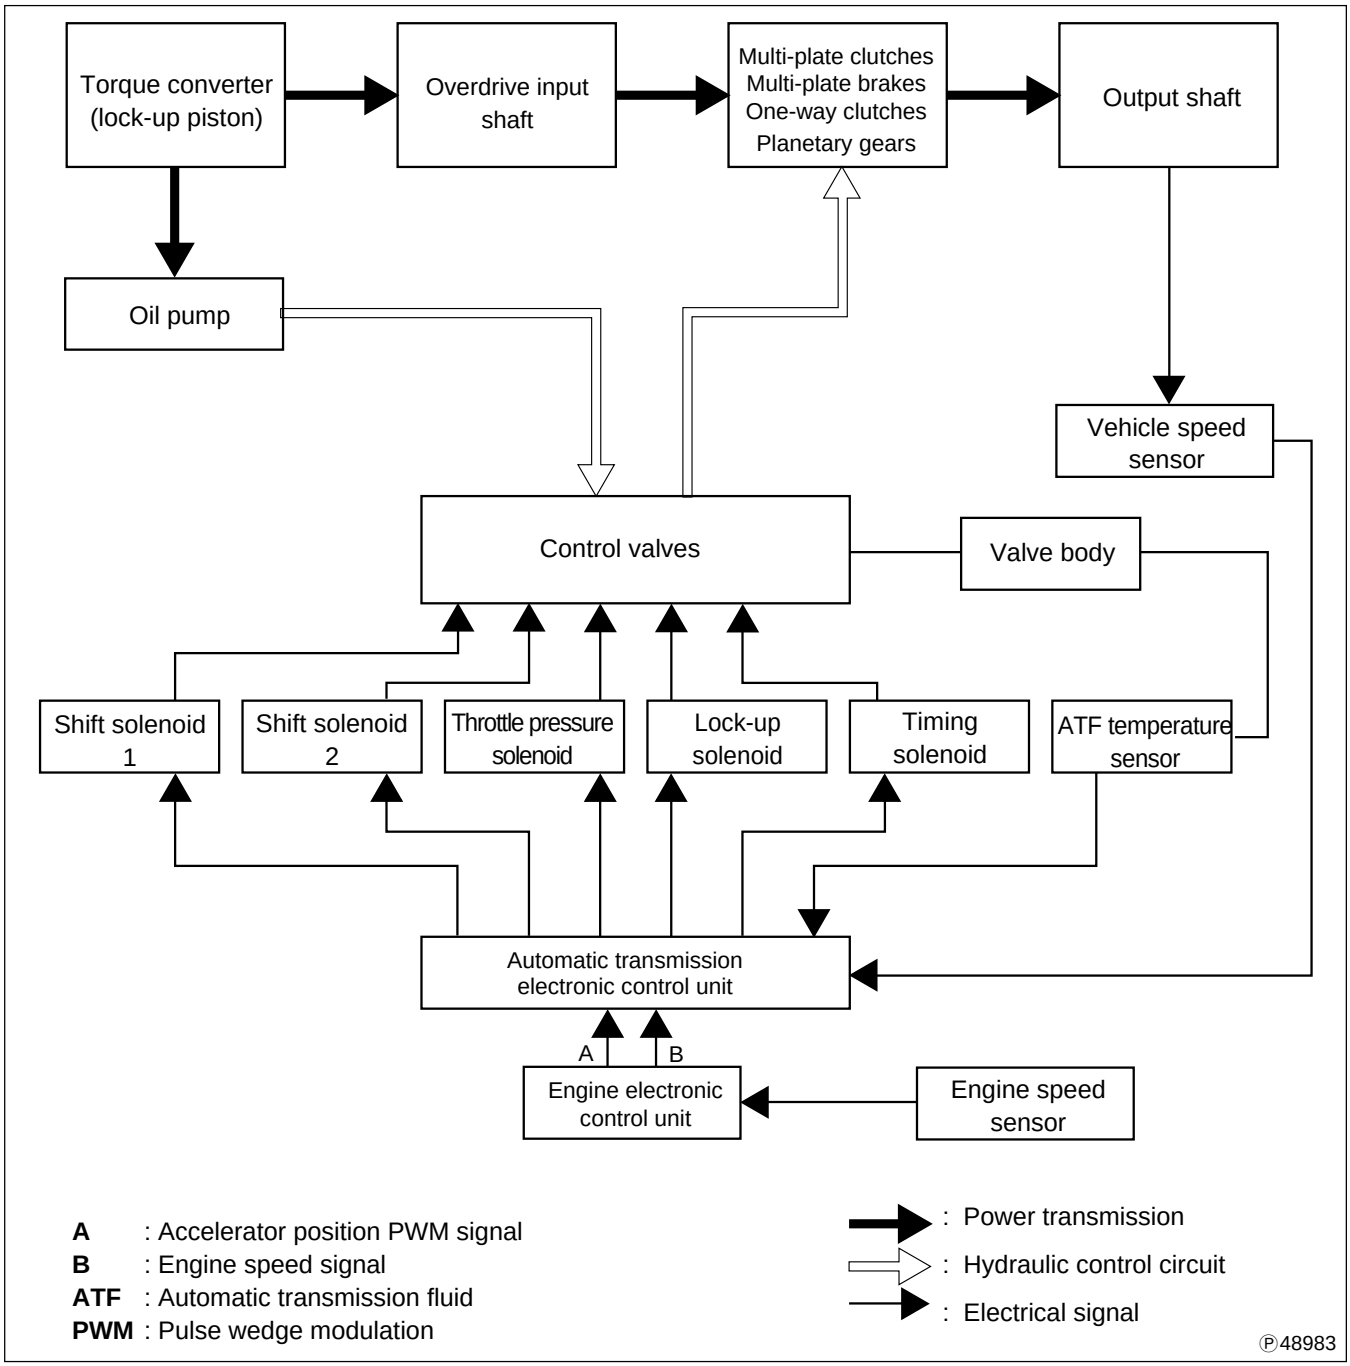
The gear system provides four forward speeds and one reverse speed. The gear section contains two one-way clutches, three sets of planetary gears, each comprised of a sun gear, pinion gears and a ring gear, three sets of hydraulic wet-type multi-plate clutches; and three sets of wet-type multi-plate brakes.

● **Hydraulic control section**

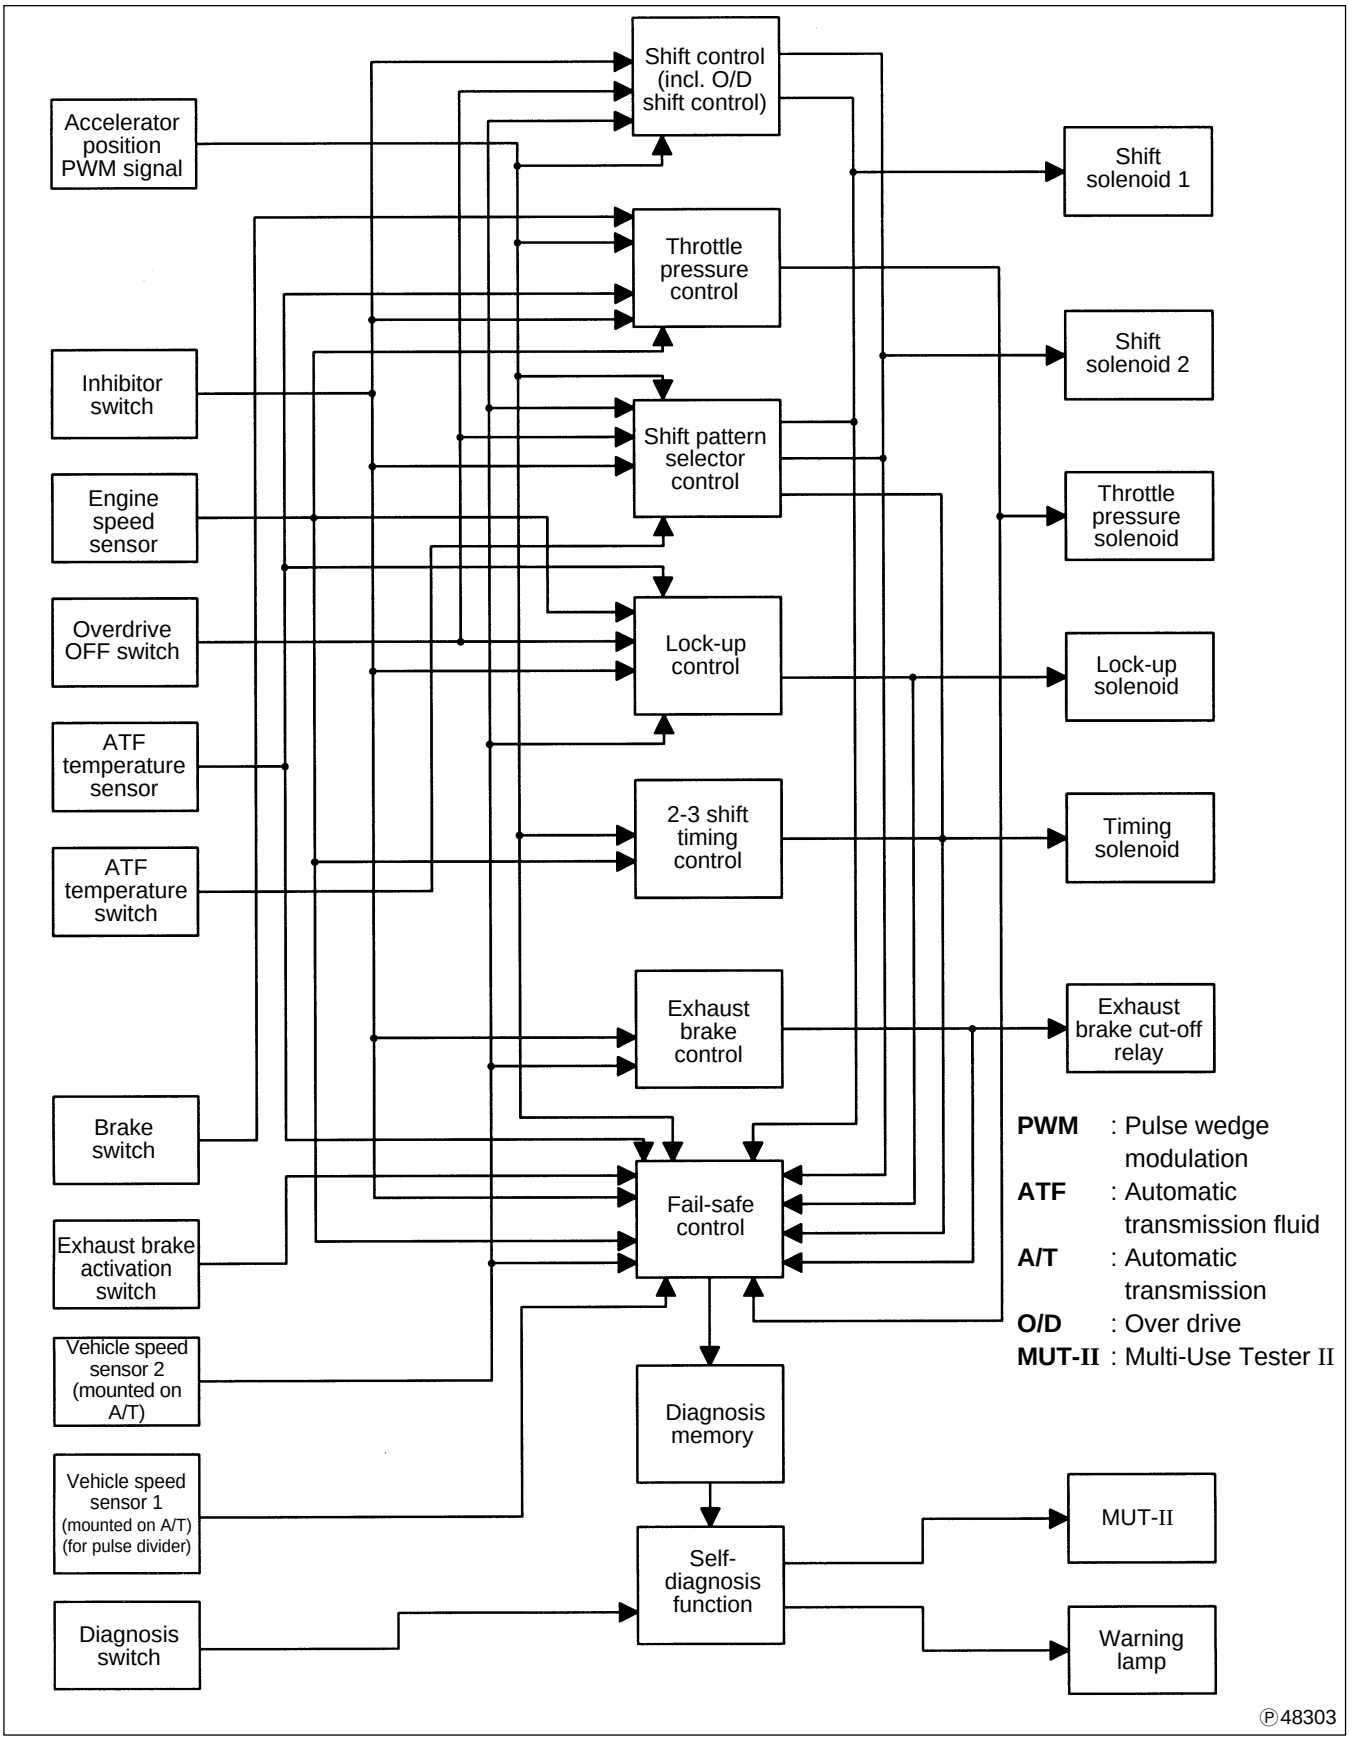
The electronic control system uses a microcomputer to regulate the mechanism operations for precise shifting.

Control Mechanisms

Control system



Control block diagram



The control functions can be roughly divided into shift control, lock-up control and 2-3 shift control. The electronic control unit electronically controls these functions precisely in accordance with driving conditions.

Chart of control items, inputs and outputs

Item \ Control item			Shift control (incl. overdrive control)	Shift pattern selector control	Throttle pressure control	Lock-up control	2-3 shift control	Exhaust brake control	Fail-safe control	Self-diagnosis control

Note 1 : The automatic transmission electronic control unit activates fail-safe functions when there is an abnormality in the input/output signals.
Note 2 : The self-diagnosis function actiates.
Note 3 : Backup for vehicle speed sensor 2 (mounted on transmission)
PWM : Pulse wedge modulation

● **Shift control**

Based on the accelerator operation signal transmitted from the throttle position PWM signal and the signal from the vehicle speed sensor, the automatic transmission electronic control unit outputs signals according to the predetermined shift curve. These signals are sent to shift solenoid 1, shift solenoid 2 and the timing solenoid mounted on the valve body, and automatically shift to the optimum gear.

● **Throttle pressure control**

The throttle position PWM signal detects the degree of throttle operation. This data is used to control the throttle pressure solenoid, and the hydraulic pressure supplied from the reducing valve is maintained at the optimum level (throttle pressure) according to the vehicle's operating condition.

● **2-3 shift control**

Based on the signal from the throttle position PWM signal and the signal from the engine speed sensor, the automatic transmission electronic control unit outputs a signal to the timing solenoid mounted on the valve body, and controls the discharge timing of automatic transmission fluid to reduce shift shock.

● **Lock-up control**

The lock-up mechanism eliminates slippage of the torque converter for improved power transmitting efficiency. Based on the accelerator operation signal transmitted from the throttle position PWM signal and the signal from the vehicle speed sensor, the automatic transmission electronic control unit outputs a signal according to the predetermined shift curve. This signal is sent to the lock-up solenoid mounted on the valve body, and engages or disengages the lock-up mechanism.

● **Fail-safe control**

The fail-safe functions minimize adverse effects to the vehicle operation caused by malfunctioning of the vehicle speed sensor, engine speed sensor, throttle position PWM signal, inhibitor switch or solenoids.

• Throttle position PWM signal

This sensor prohibits lock-up control change and 2-3 shift timing control by determining the shift-point vehicle speed at closed throttle position and the line pressure at maximum pressure, thus allowing vehicle operation.

• Inhibitor switch

If the inhibitor switch malfunctions in a stationary or moving vehicle and there is no signal input to the automatic transmission electronic control unit, the automatic transmission electronic control unit determines the transmission position setting as the D range and prohibits shifting from 3rd to 4th gear. If the automatic transmission electronic control unit receives two or more signals, the automatic transmission electronic control unit operates according to the following priority order for the range selector position and enables vehicle operation: L > R > 2 > D > N >P. Since the manual valve changes the hydraulic circuit in the valve body according to the range selector position, the vehicle operates as follows.

Range selector lever position	Inhibitor switch input signal	Vehicle operating condition
P	P and other selector signals	P
R	R and other selector signals	R
N	N and other selector signals	N
D	D and other selector signals (excludes R, L and 2 range signals)	$D_1 \leftrightarrow D_2 \leftrightarrow D_3 \leftrightarrow D_4$
↑	D and L range signals	$D_1 \leftrightarrow D_2 \leftarrow D_3$
↑	D and R range signals	D_4
↑	D and 2 range signals	$D_1 \leftrightarrow D_2 \leftrightarrow D_3$
2	2 and other selector signals (excludes R and L signals)	$2_1 \leftrightarrow 2_2 \leftarrow 2_3$
↑	2 and L range signals	$2_1 \leftrightarrow 2_2 \leftarrow 2_3$
↑	2 and R range signals	2_3
L	L and other selector signals	$L_1 \leftrightarrow L_2 \leftarrow L_3$

• Engine speed sensor

The 2-3 shift timing control becomes inactive to ensure proper vehicle operation.

• Shift solenoid 1 and shift solenoid 2

If a solenoid malfunction occurs when the transmission is in the D, 2 or L range, the operating conditions of the solenoids change as shown in the following table. The automatic transmission electronic control unit also deactivates the lock-up solenoid and timing solenoid to allow vehicle operation.

Range selector position	Normal				Malfunctioning of S1			Malfunctioning of S2			Malfunctioning of S1 and S2		
	S1	S2	ST	Gear	S1	S2	Gear	S1	S2	Gear	S1	S2	Gear
D range	○	×	×	1st	–	×→○	3rd	○	–	1st	–	–	4th
	○	○	×	2nd	–	○	3rd	○→×	–	4th	–	–	4th
	×	○	×	3rd	–	○	3rd	×	–	4th	–	–	4th
	×	×	×	4th	–	×	4th	×	–	4th	–	–	4th
2 range	○	×	×	1st–		×→○	3rd	○	–	1st	–	–	3rd
	○	○	×	2nd	–	○	3rd	○→×	–	3rd	–	–	3rd
	×	○	×	3rd	–	○	3rd	×	–	3rd	–	–	3rd
L range	○	×	×	1st	–	×	1st	○	–	1st	–	–	1st
	○	○	×	2nd	–	○	2nd	○	–	1st	–	–	1st
	×	○	○	3rd	–	○	2nd	×	–	1st	–	–	1st

○ : Electric current supplied ×: Electric current not supplied – : Malfunctioning → : Fail-safe function
S1 : Shift solenoid 1 S2 : Shift solenoid 2 ST : Timing solenoid

• Throttle pressure solenoid

The malfunctioning solenoid is deactivated to bring the line pressure to a maximum level, thus allowing vehicle operation.

• Timing solenoid and lock-up solenoid

The malfunctioning solenoid is deactivated to allow vehicle operation.

● Self-diagnosis function

The warning lamp lights when an abnormality occurs during vehicle operation.

- The warning lamp does not light if the abnormality causes minimum effect to vehicle operation.
- The warning lamp lights when the following parts are malfunctioning to indicate the abnormal condition since these malfunctions significantly reduce vehicle performance.
  - Vehicle speed sensor 1
  - Vehicle speed sensors 1 and 2
  - Shift solenoid 1
  - Shift solenoid 2
  - Accelerator sensor
  - Timing solenoid
  - Inhibitor switch
  - Throttle pressure solenoid

CAUTION ⚠

The warning lamp lights only when the malfunction prevents proper vehicle operation.

The indicator lamp provides self-diagnosis information.

- To facilitate the discovery of malfunctions that may not reproduce themselves frequently, the automatic transmission electronic control unit stores in the memory information of malfunctions that occur during vehicle operation.
- An input of a self-diagnosis start signal produces the output of the data from the memory, and causes the automatic transmission warning lamp to flash according to the data.

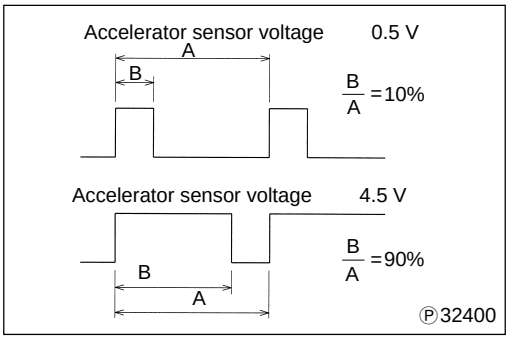
CAUTION ⚠

The automatic transmission electronic control unit stores information of all malfunctions that occur after the previous self-diagnosis operation.

Electronic Control Devices

● **Automatic transmission electronic control unit**

The automatic transmission electronic control unit is mounted near the brake booster on the driver's seat side. It determines the vehicle operating conditions based on signals sent from sensors, and outputs signals to solenoids to regulate shift control, lock-up control and other automatic transmission functions.
The automatic transmission electronic control unit is also equipped with a self-diagnosis function for the detection of malfunctions of main sensors and solenoids.



● **Throttle position PWM signal**

The accelerator sensor voltage detected by the electronic governor control unit is converted to a PWM signal and output to the automatic transmission electronic control unit. The PWM signal is a chopping wave with a duty ratio shown in the diagram at the left.

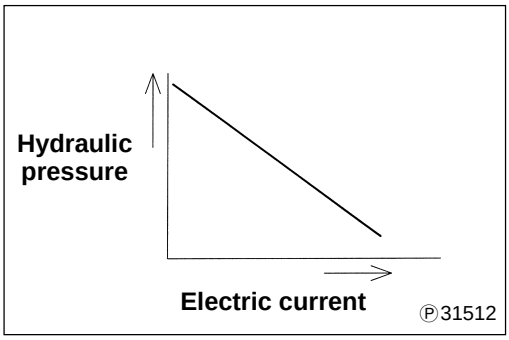
● **Vehicle speed sensor**

The vehicle speed monitoring system is composed of two sensor circuits; vehicle speed sensor **2** (output shaft rotation sensor) and vehicle speed sensor **1**. Accordingly, the normal driving mode is not disabled even when one of the vehicle speed sensor circuits is faulty.

● **Shift solenoids 1 and 2**

These solenoids are mounted on the valve body, and control shifting by turning ON and OFF in accordance with the signals sent from the automatic transmission electronic control unit.
The ON and OFF conditions of the two solenoids result in the following gear positions.

Shift solenoid 1	ON	ON	OFF	OFF
Shift solenoid 2	OFF	ON	ON	OFF
Gear position	1st gear	2nd gear	3rd gear	4th gear



● **Throttle pressure solenoid**

The throttle pressure solenoid is mounted on the valve body. It adjusts the throttle pressure based on the throttle opening signal sent from the automatic transmission electronic control unit. The throttle pressure adjustment characteristics are shown in the diagram.

● **Timing solenoid**

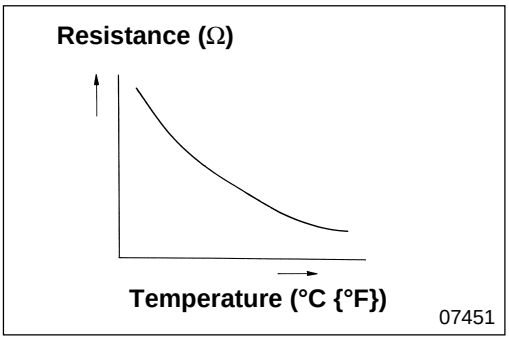
This solenoid is mounted on the valve body, and regulates the 2-3 shift timing control by turning ON and OFF in accordance with the signal sent from the automatic transmission electronic control unit.

● **Lock-up solenoid**

The lock-up solenoid is mounted on the valve body. According to the signal sent from the automatic transmission electronic control unit, the solenoid repeats ON and OFF operations, thereby opening and closing the drain circuit to control the hydraulic pressure at a predetermined level. The lock-up solenoid is a duty-cycle type that can control the ON and OFF time ratio in each cycle between 0 and 100%.

● **Automatic transmission fluid temperature switch**

This switch is mounted on the oil cooler outlet section of the transmission case. It detects abnormal temperatures of the automatic transmission fluid and turns on the warning lamp located on the meter cluster to indicate the abnormal condition.

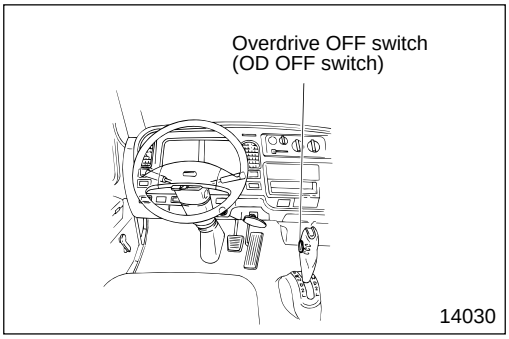


● **Automatic transmission fluid temperature sensor**

This sensor is mounted on the control valve in the transmission. It coverts temperature changes into continuous electric signals and sends to the automatic transmission electronic control unit. The characteristics of the sensor's electric output signal are shown at the left. Based on this output signal, the automatic transmission electronic control unit prohibits overdrive shifting and lock-up operation and also performs partial correction of line pressure control.

● **Engine speed sensor**

The sensor converts the engine revolution speed to a pulse signal, and outputs to the electronic governor control unit. This signal is then transmitted from the electronic governor control unit to the automatic transmission control unit.



● **Overdrive OFF switch**

This switch is mounted on the range selector lever. It is operated by the driver, and it allows switching between the 3-speed and 4-speed modes.

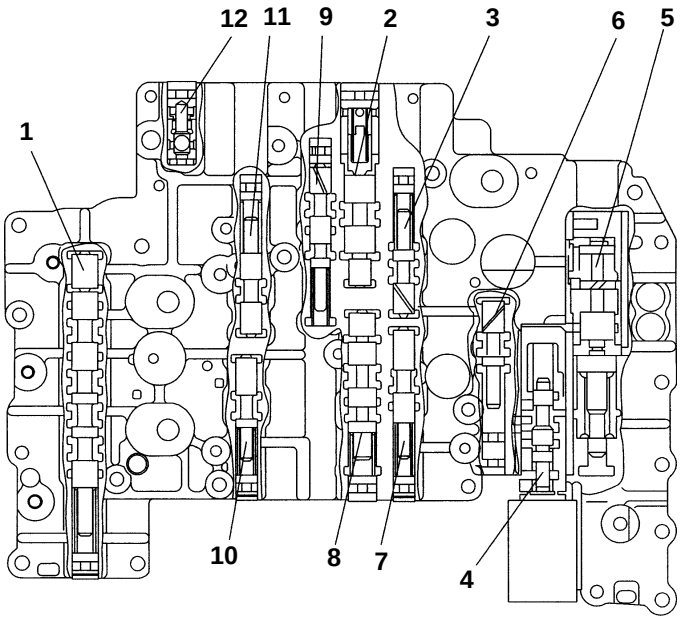
OFF : Transmission shifts to 4th gear for improved fuel efficiency.

ON : Transmission does not shift to 4th gear, thus increasing the engine brake effect and improving driveability on an up grade incline.

Hydraulic Control Devices

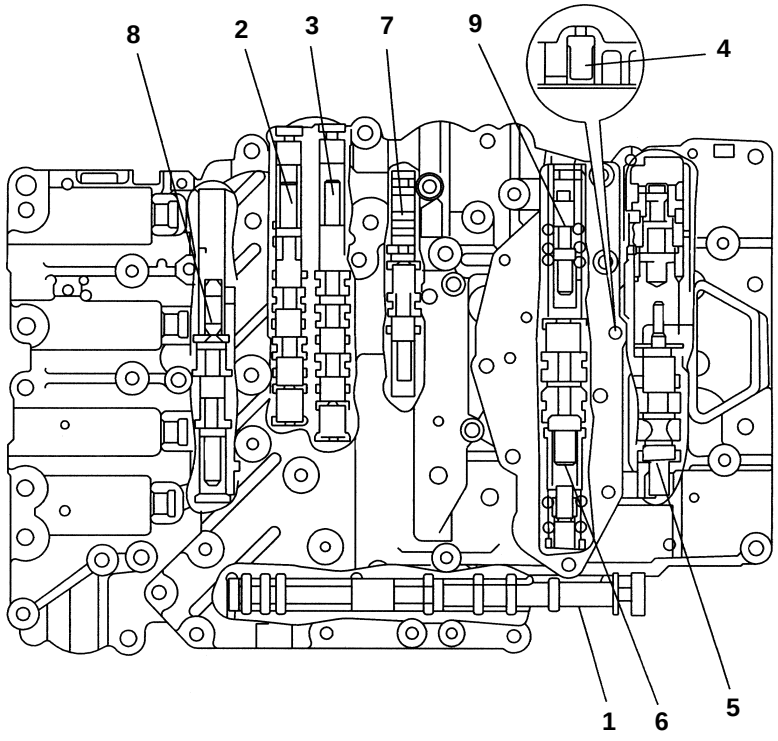
● **Valve Layout Diagram**

• **Upper valve body**



Ⓟ31513

• **Lower valve body**



Ⓟ31514

● Valve Functions

- **Upper valve body**

No.	Valve name	Description of function
1	2-3 Shift valve	Switches between 2nd and 3rd gears
2	Reverse inhibitor valve	When range selector is shifted to R range while vehicle is moving forward at moderate or high speed, this valve, operated by solenoid output, prevents shifting to reverse.
3	Modulator valve	Adjusts line pressure and supplies hydraulic pressure to lock-up signal valve and orifice control valve
4	Throttle valve	Adjusts signal pressure (throttle pressure) that is used to provide optimum line pressure in accordance with operating conditions
5	Secondary regulator valve	Controls pressure of automatic transmission fluid supplied from primary regulator valve to torque converter as well as lubricating oil pressure
6	Reducing valve	Reduces line pressure and feeds to throttle valve
7	Lock-up signal valve	Engages and disengages lock-up mechanism
8	Accumulator control valve	Lowers accumulator back pressure when throttle opening becomes smaller, and obtains accumulator control pressure from line pressure that is used to reduce shift shock
9	Low coast modulator valve	Lowers line pressure to reduce shift shock when range selector is shifted to L range
10	Orifice control valve	Switches orifices to reduce shock
11	Low inhibitor valve	When range selector is shifted to L range at high vehicle speed, this valve, operated by timing solenoid output, shifts to 3rd gear
12	Check valve	Switches fluid passage to rear clutch (C2) in D range and R ranges

- **Lower valve body**

No.	Valve name	Description of function
1	Manual valve	Switches fluid passage according to the position (P, R, N, D, 2, L) of range selector lever
2	1-2 Shift valve	Switches between 1st and 2nd gears
3	3-4 Shift valve	Switches between 3rd and overdrive gears
4	Pressure relief valve	Maintains pressure supplied to cooler at low level
5	Primary regulator valve	Regulates hydraulic pressure (line pressure) to devices
6	Lock-up control valve	Adjust flow rate of automatic transmission fluid to torque converter
7	C0 exhaust valve	Reduces shock in 3rd-to-2nd shifting
8	2-3 Timing valve	Adjusts hydraulic pressure switching timing in 3rd-to-2nd shifting to reduce shock
9	Cutback valve	Applies cutback pressure to throttle valve to reduce line pressure

A : Operating pressure

< Active condition >

The control valve supplies operating pressure **A** to overdrive direct clutch piston **3**, coupling clutch discs **8** and clutch plates **7**. This interlocks overdrive planetary sun gear **11** with overdrive planetary carrier **12**.
As a result, the entire overdrive planetary gear acts as a single unit to transmit the engine's driving power from overdrive input shaft **13** to input shaft **14**.

< Inactivate condition >

Since operating pressure **A** is not supplied, the force of overdrive clutch return springs **5** presses against overdrive direct clutch piston **3**.
As a result, clutch plates **7** are separated from clutch discs **8**, and the engine power is not transmitted.

11 Input shaft
12 Front and rear planetary sun gears
13 Rear clutch hub

A : Operating pressure

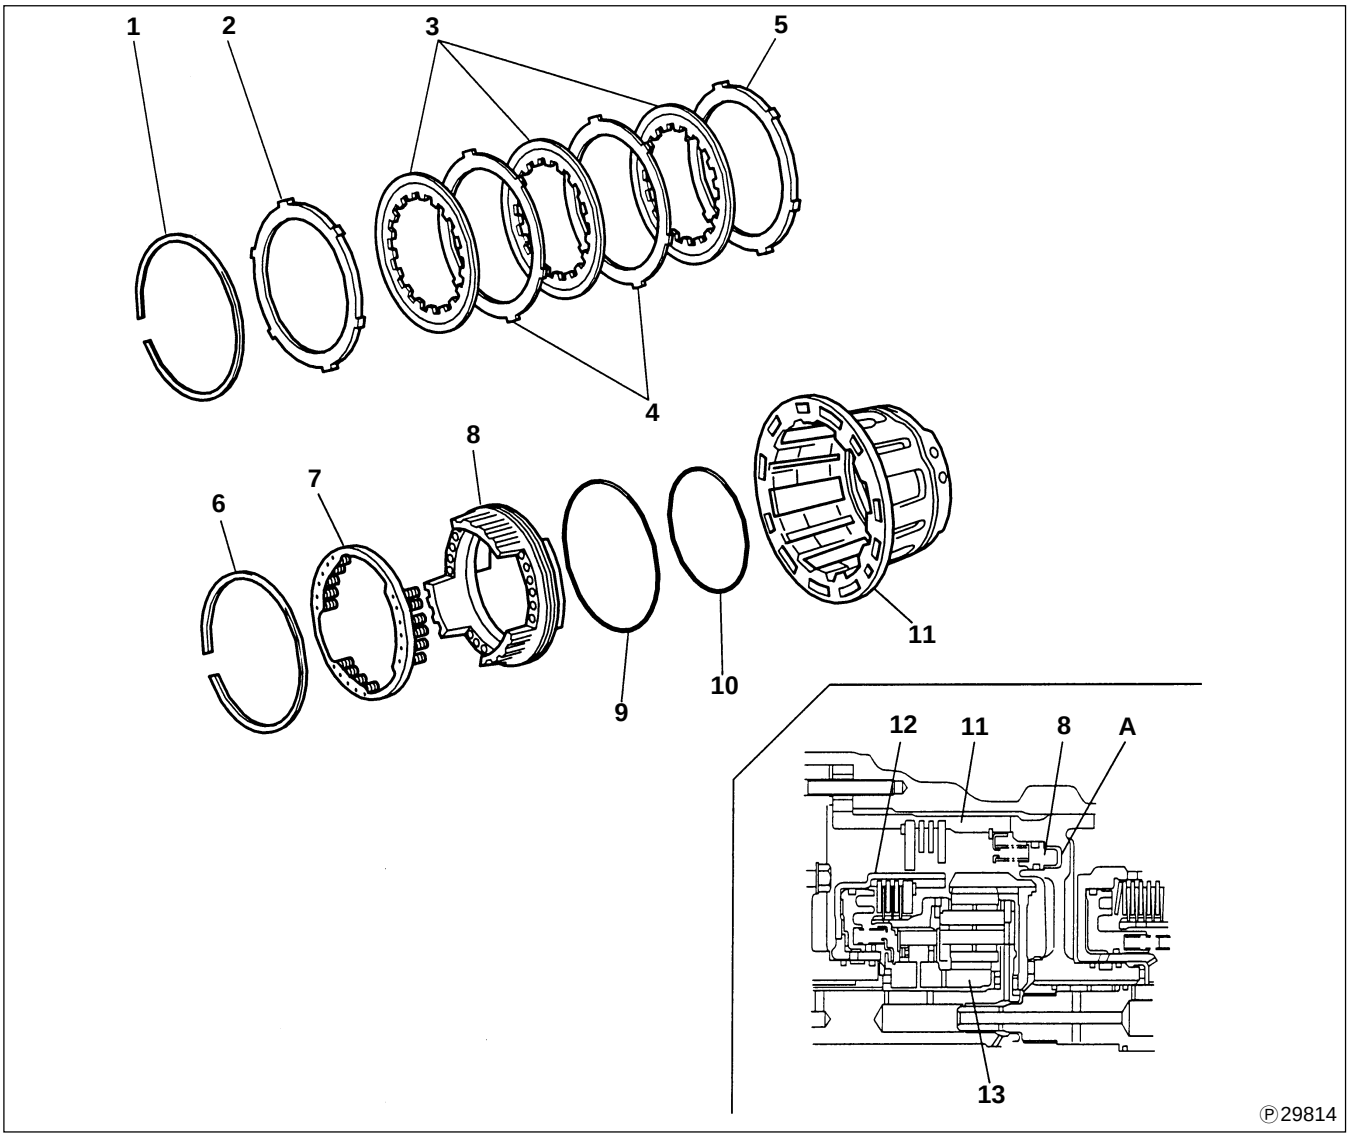
< Active condition >

The control valve supplies operating pressure **A** to rear clutch piston **7**, which causes the coupling of clutch discs **3** and clutch plates **4**, thus transmitting the engine's driving power from input shaft **11** and rear clutch hub **13** to rear clutch drum **10** and front and rear planetary sun gears **12**.

< Inactivate condition >

Since operating pressure **A** is not supplied, the force of rear clutch piston return springs **6** presses against rear clutch piston **7**.
As a result, clutch plates **4** are separated from clutch discs **3**, and the engine power is not transmitted.

● Overdrive Brake (B0)



1	Snap ring	**6**	Snap ring	**11**	Overdrive case
2	Brake flange	**7**	Overdrive brake return springs	**12**	Overdrive direct clutch

4	Brake plates	**9**	O-ring		
5	Brake plates	**10**	O-ring	**A**	: Operating pressure

< Active condition >

The control valve supplies operating pressure **A** to overdrive brake piston **8**, which causes the coupling of clutch discs **3** and brake plates **4**, **5**, thus interlocking overdrive direct clutch **12** with overdrive case **11**. This sets overdrive planetary sun gear **13** in locked condition.

< Inactivate condition >

Since operating pressure **A** is not supplied, the force of overdrive brake return springs **7** presses against overdrive brake piston **8**.

As a result, brake plates **4**, **5** are separated from clutch discs **3**, and the engine power is not transmitted.

● 2nd Brake (B1)

2 Brake flange
3 Clutch discs
4 Brake plates
5 Snap ring
6 2nd brake return springs
7 Brake piston No. 1
8 O-ring
9 O-ring
10 Center support
11 Rear clutch
12 Front and rear planetary sun gears

A : Operating pressure

< Active condition >

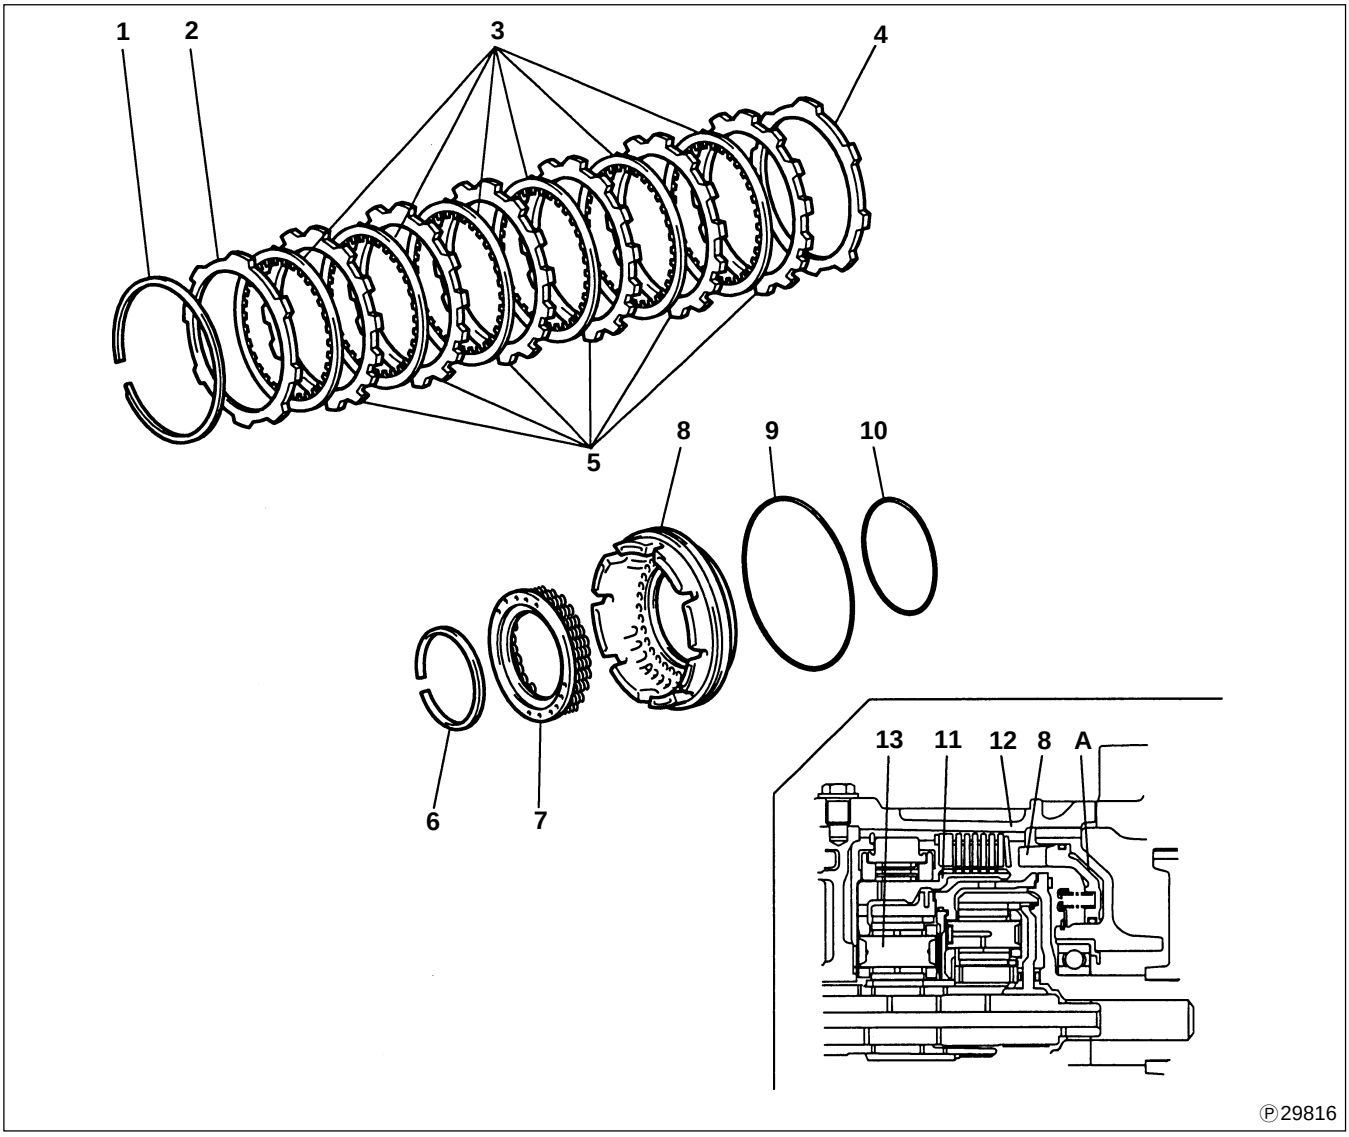
The control valve supplies operating pressure **A** to brake piston No.1 **7**, which causes the coupling of clutch discs **3** and brake plates **4**, thus interlocking rear clutch **11** with center support **10**. This sets front and rear planetary sun gears **12** in locked condition.

< Inactivate condition >

Since operating pressure **A** is not supplied, the force of 2nd brake return springs **6** presses against brake piston No.1 **7**.

As a result, brake plates **4** are separated from clutch discs **3**, and the engine power is not transmitted.

● 1st and Reverse Brake (B2)



1 Snap ring
2 Brake flange
3 Clutch discs
4 Brake cushion plate

10 O-ring
11 1st and reverse brake hub
12 Transmission case
13 Front planetary carrier

A : Operating pressure

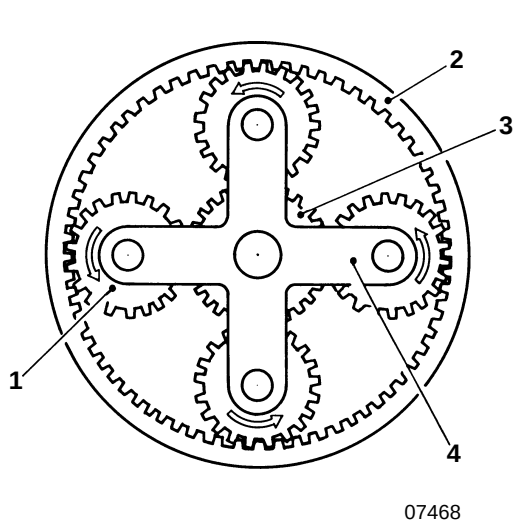
< Active condition >

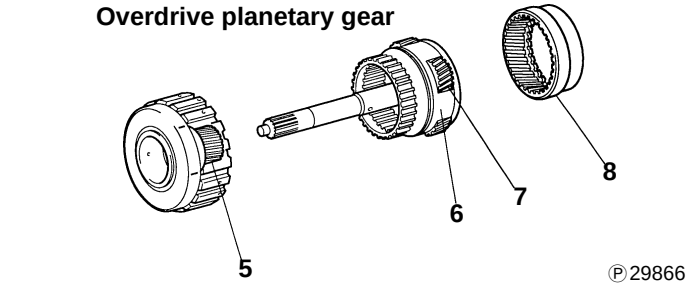
The control valve supplies operating pressure **A** to 1st and reverse brake piston **8**, which causes the coupling of clutch discs **3** and brake plates **5**, thus interlocking 1st and reverse brake hub **11** with transmission case **12**. This sets front planetary carrier **13** in locked condition.

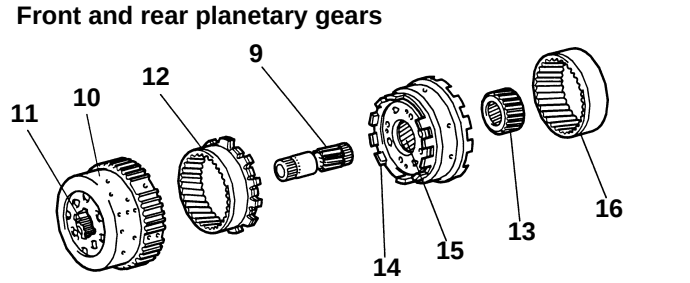
< Inactivate condition >

Since operating pressure **A** is not supplied, the force of 1st and reverse brake return springs **7** presses against 1st and reverse brake piston **8**.
As a result, brake plates **5** are separated from clutch discs **3**, and the engine power is not transmitted.

● Planetary Gears



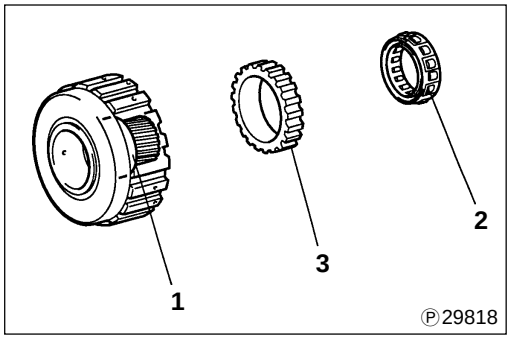




1 Pinion gear
2 Ring gear
3 Sun gear
4 Planetary carrier
5 Overdrive sun gear
6 Overdrive planetary carrier
7 Overdrive pinion gears
8 Overdrive ring gear
9 Front sun gear
10 Front planetary carrier
11 Front pinion gears
12 Front ring gear
13 Rear sun gear
14 Rear planetary carrier
15 Rear pinion gears
16 Rear ring gear

- Three sets of Simpson-type planetary gears provide a total of five gear ratios: four forward speeds and one reverse speed.
- Each planetary gear set consists of a sun gear **3** at the center and pinion gears **1** that revolve around the sun gear and on their axes. This set of gears are contained in a ring gear **2**. The pinion gears are attached to a planetary carrier **4**, so that all pinion gears rotate in the same direction and at the same rate. Gear shifting occurs when these four elements — sun gear, pinion gears, ring gear and planetary carrier — are provided with certain conditions. Clutches and brakes provide operating conditions to the planetary gears in accordance with shifting.

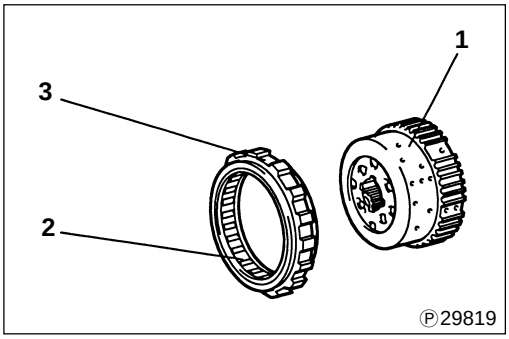
● Overdrive One-Way Clutch



1 Overdrive direct clutch drum and overdrive one-way clutch inner race
2 Overdrive one-way clutch
3 Overdrive one-way clutch outer race

- During acceleration in the 1st, 2nd and 3rd gears, the overdrive one-way clutch **2** engages and becomes interlocked with the overdrive sun gear and overdrive planetary carrier.
- In the 4th gear, the overdrive one-way clutch **2** rotates freely.

● No. 2 One-Way Clutch



1 Front planetary carrier and No. 2 one-way clutch inner race
2 No. 2 one-way clutch
3 No. 2 one-way clutch outer race

- During acceleration in the 1st gear, the No. 2 one-way clutch **2** engages and becomes interlocked with the front planetary carrier.
- In the 1st, 2nd and 3rd gears, the No. 2 one-way clutch **2** rotates freely.

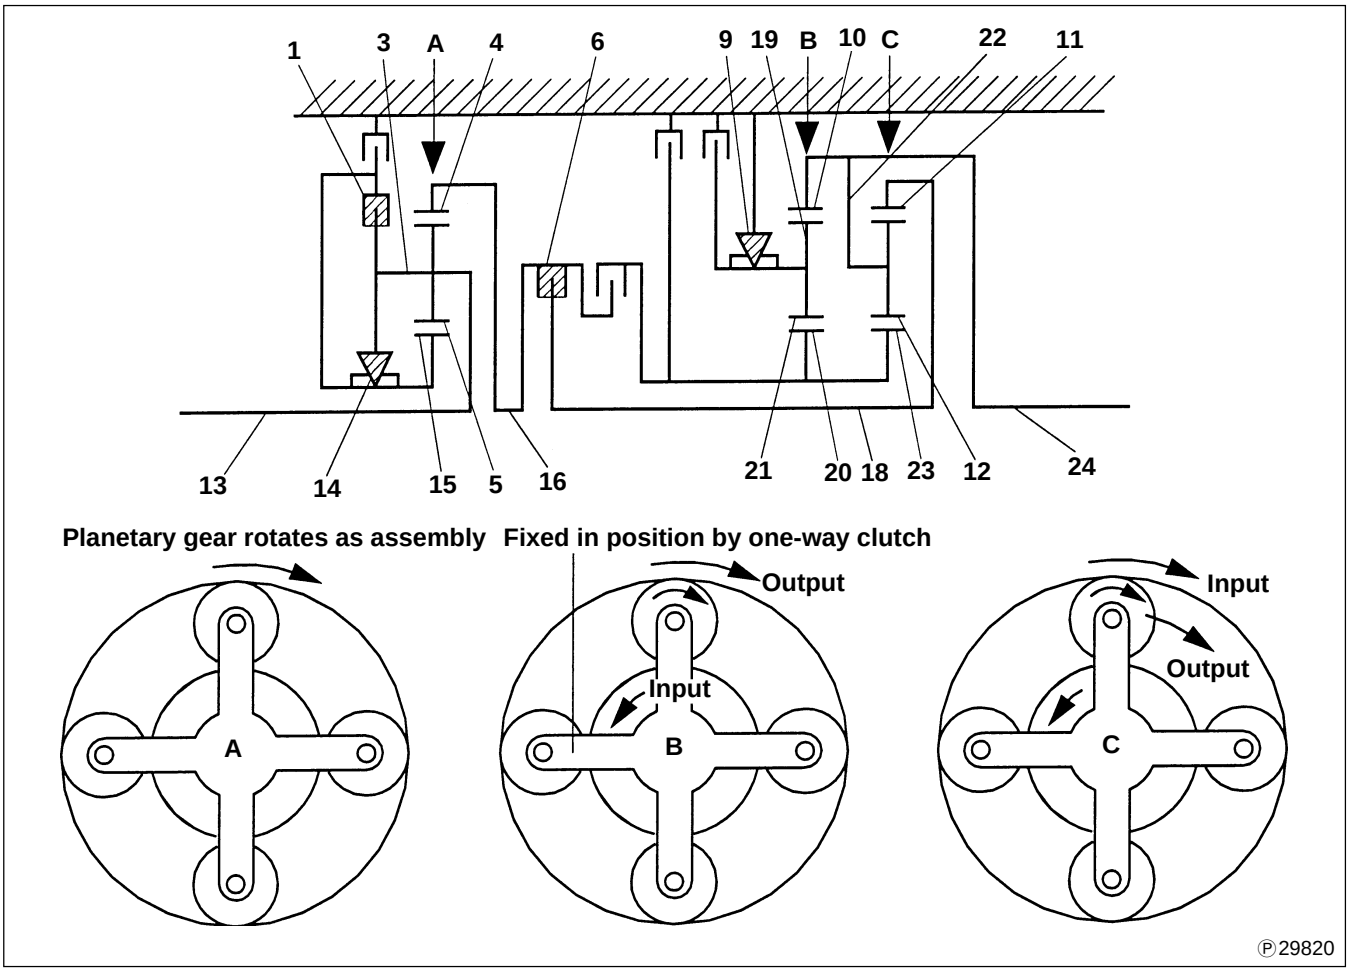
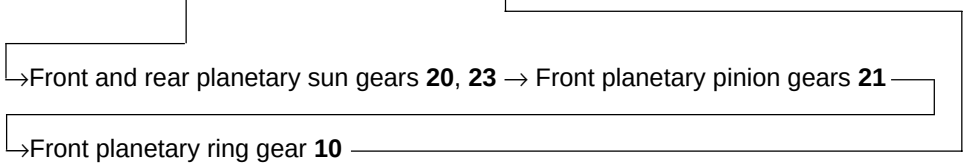
● D, and 2 Ranges (1st Gear)



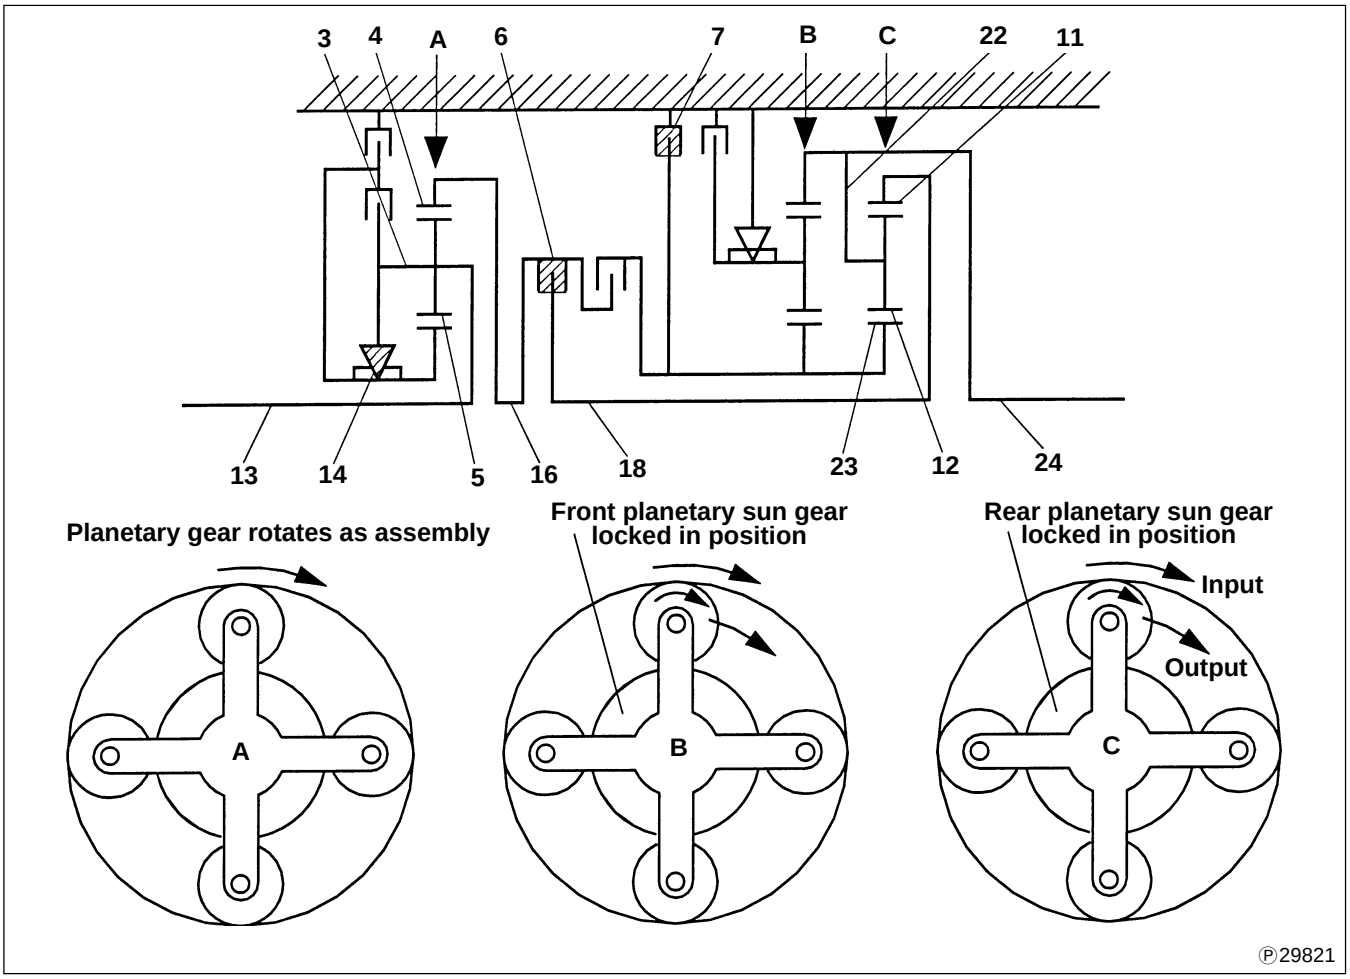
Overdrive direct clutch **1**, front clutch **6**, overdrive one-way clutch **14** and No. 2 one-way clutch **9** activate to provide the 1st gear. At overdrive planetary gear **A**, overdrive direct clutch **1** operates to interlock overdrive planetary carrier **3** (overdrive input shaft **13**) with overdrive planetary sun gear **15**. This disables overdrive planetary pinion gears **5** from rotating on their axes, and overdrive planetary carrier **3** becomes locked (direct coupling) in position with overdrive planetary ring gear **4**, thus transmitting driving force to input shaft **16**. Clockwise rotation of overdrive planetary carrier **3** results in a force that attempts to turn overdrive pinion gears **5** in a counterclockwise direction, producing clockwise rotating force for overdrive planetary sun gear **15**. However, since overdrive planetary sun gear **15** rotates faster than overdrive planetary carrier **3**, overdrive one-way clutch **14** activates, interlocking overdrive planetary carrier **3** with overdrive planetary sun gear **15**. This disallows overdrive planetary pinion gears **5** from rotating on their axes, in the same way as when overdrive direct clutch **1** activates. Therefore, overdrive planetary carrier **3** becomes locked (direct coupling) in position with overdrive planetary ring gear **4**, thus transmitting the driving force to input shaft **16**.
These two power transmitting systems reduce the load on overdrive direct clutch **1**.
The clockwise rotating force of input shaft **16** is transmitted to intermediate shaft **18** by the action of front clutch **6**, then turns rear planetary pinion gears **12** clockwise by means of rear planetary ring gear **11**. In this process, rear planetary carrier **22** is stationary due to vehicle weight. Therefore, rear planetary sun gear **23** receives counterclockwise rotating force and transmits this force to front planetary pinion gears **21**, exerting force to rotate front planetary carrier **19** in a counterclockwise direction. However, since No. 2 one-way clutch **9** prevents front planetary carrier **19** from rotating in a counterclockwise direction, pinion gears **12**, **21** cause front planetary ring gear **10** and rear planetary carrier **22** to rotate in a clockwise direction, thereby transmitting the rotating force to output shaft **24**. (Rotational directions are described as viewed from the torque converter side.)

Power transmitting process

Overdrive input shaft **13** → Overdrive planetary carrier **3** → Overdrive planetary pinion gears **5** → Overdrive planetary ring gear **4** → Input shaft **16** → Front clutch **6** → Intermediate shaft **18** → Rear planetary ring gear **11** → Rear planetary pinion gears **12** → Rear planetary carrier **22** → Output shaft **24**



● D Range (2nd Gear)

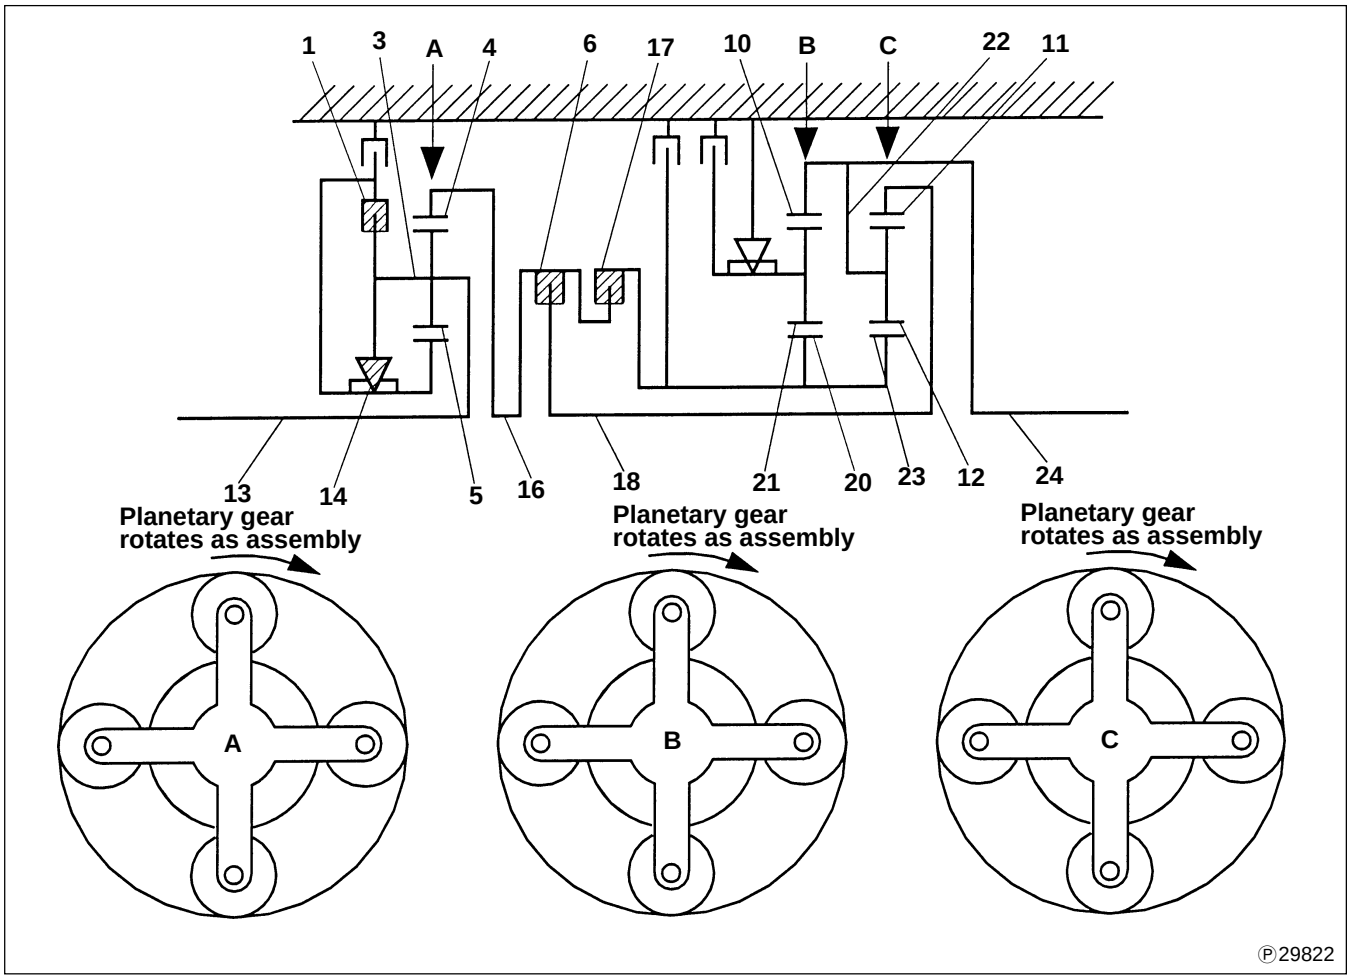


Front clutch **6**, 2nd brake **7** and overdrive one-way clutch **14** activate to provide the 2nd gear. In this gear, overdrive one-way clutch **14** transmits the rotating force of input shaft **16** to rear planetary pinion gears **12** by means of intermediate shaft **18** and rear planetary ring gear **11**. Although rear planetary sun gear **23**, which is meshed with pinion gears **12**, receives a counterclockwise rotating force, 2nd brake **7** prevents its rotation, disabling the transfer of the rotating force to front planetary gear **B**. As a result, the rotating force transmits to rear planetary carrier **22** via rear planetary pinion gears **12**, then to output shaft **24**.

Power transmitting process

Overdrive input shaft **13** → Overdrive planetary carrier **3** → Overdrive planetary pinion gears **5** → Overdrive planetary ring gear **4** → Input shaft **16** → Front clutch **6** → Intermediate shaft **18** → Rear planetary ring gear **11** → Rear planetary pinion gears **12** → Rear planetary carrier **22** → Output shaft **24**

● D, 2 and L Ranges (3rd Gear)



Overdrive direct clutch **1**, front clutch **6**, rear clutch **17** and Overdrive one-way clutch **14** activate to provide the 3rd gear. In this gear, front clutch **6** and rear clutch **17** cause intermediate shaft **18** and front and rear sun gears **20**, **23** to rotate in the same direction. Therefore, front and rear planetary pinion gears **12**, **21** become locked in position, thus the entire assemblies of planetary gears **A**, **B**, **C** rotate together to transmit the rotating force of input shaft **16** to output shaft **24** without reducing the rate of rotating speed.

Power transmitting process

Overdrive input shaft **13** → Overdrive planetary carrier **3** → Overdrive planetary pinion gears **5** → Overdrive planetary ring gear **4** → Input shaft **16** →Front clutch **6** → Intermediate shaft **18**

→Rear planetary ring gear **11** → Rear planetary pinion gears **12**

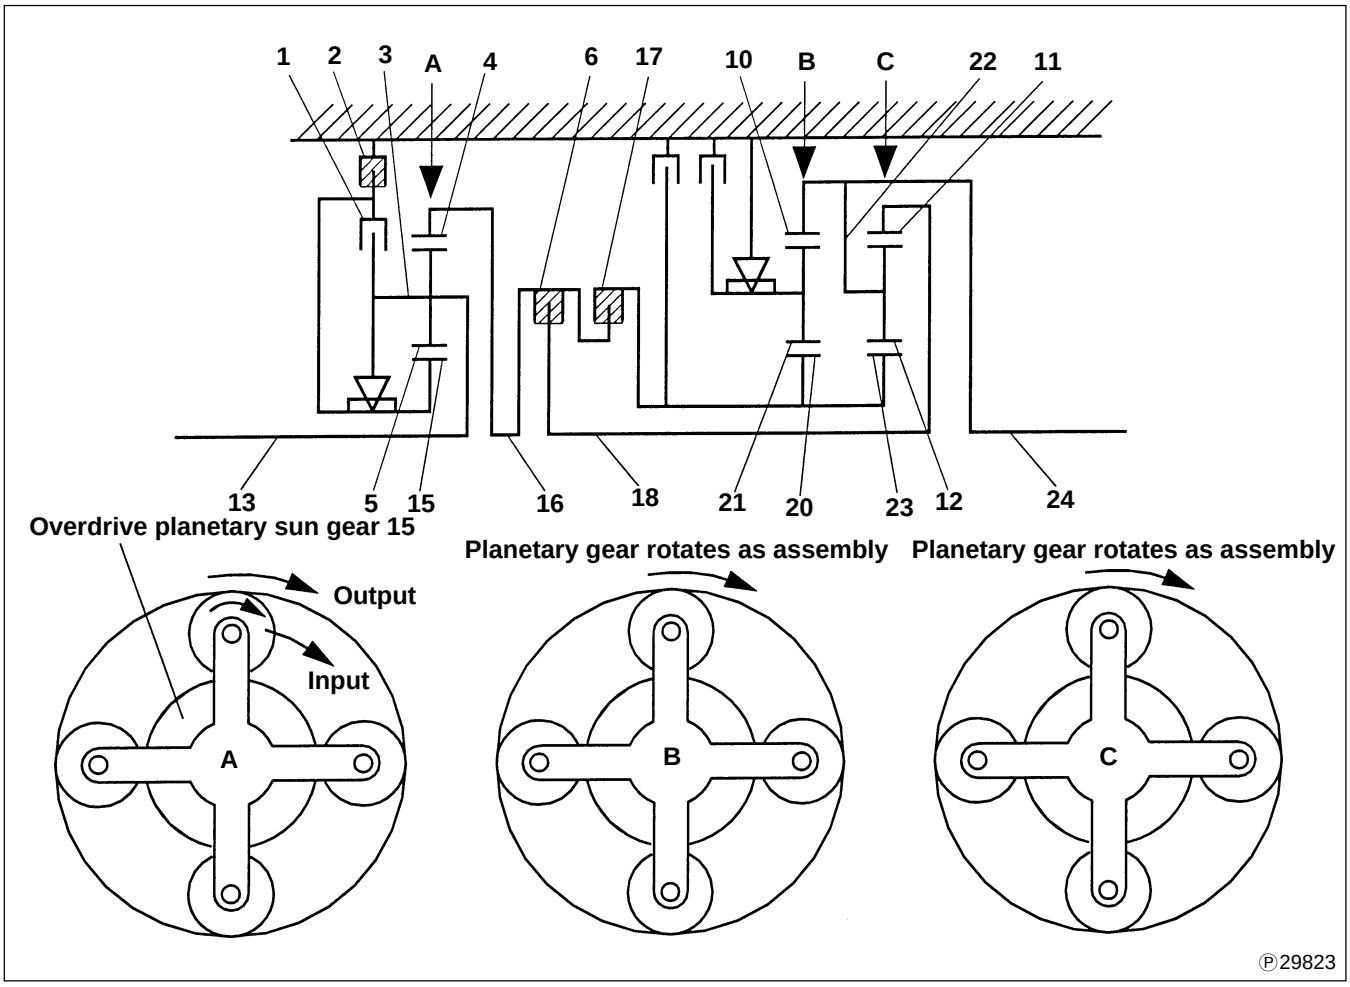
→Rear clutch **17**

→Rear planetary carrier **22** →Output shaft **24**

→Rear planetary sun gear **23** → Rear planetary pinion gears **12**

→Front planetary sun gear **20** → Front planetary pinion gears **21** → Front planetary ring gear **10**

● D Range (4th Gear)



If the overdrive conditions (see the table below) are fulfilled when the transmission is in 3rd gear, overdrive direct clutch **1** disengages, and overdrive brake **2** activates at the same time to provide the overdrive gear ratio. In the overdrive gear, overdrive brake **2** is in operation, thus locking overdrive planetary sun gear **15** in position. Therefore, the rotating force transmitted from overdrive input shaft **13** to overdrive planetary carrier **3** causes overdrive planetary pinion gears **5** to revolve around the sun gear and on their own axes, which results in an increased rotating speed of overdrive planetary ring gear **4** (input shaft **16**). The rotating force of input shaft **16** is transmitted to output shaft **24**, in the same way as in the 3rd gear.

Overdrive conditions

Shift position	D
Overdrive OFF SW	OFF
Temperature of oil in oil pan	Approximately 0°C {32°F} or higher

Power transmitting process

Overdrive input shaft **13** → Overdrive planetary carrier **3** → Overdrive planetary pinion gears **5** → Overdrive planetary ring gear **4** → Input shaft **16** → Front clutch **6** → Intermediate shaft **18**

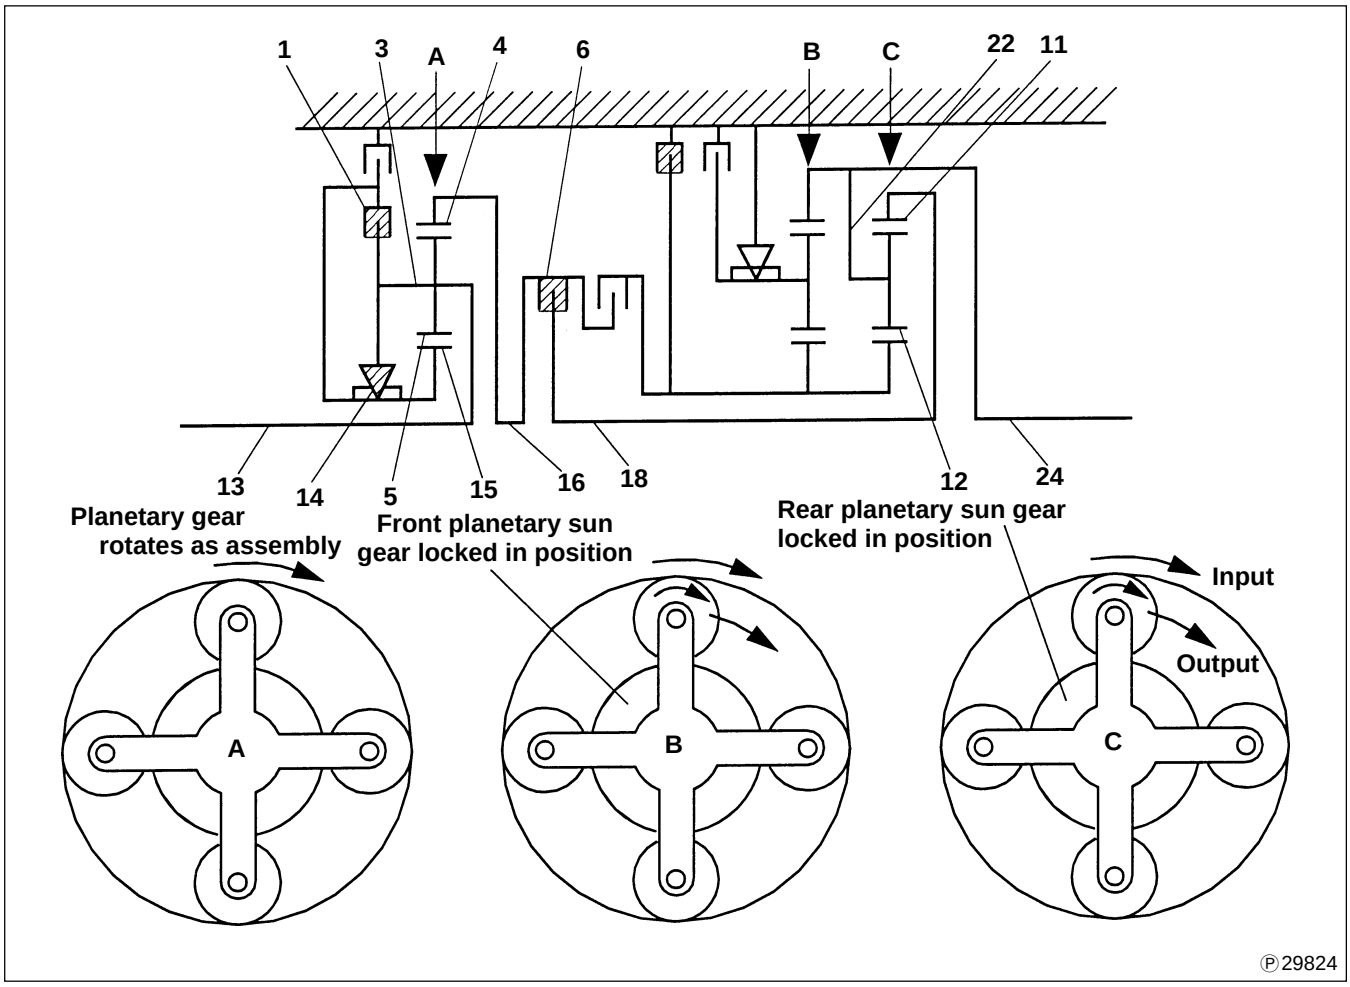
→ Rear planetary ring gear **11** → Rear planetary pinion gears **12**

→ Rear clutch **17** → Rear planetary carrier **22** → Output shaft **24**

→ Rear planetary sun gear **23** → Rear planetary pinion gears **12**

→ Front planetary sun gear **20** → Front planetary pinion gears **21** → Front planetary ring gear **10**

● 2 Range (2nd Gear)

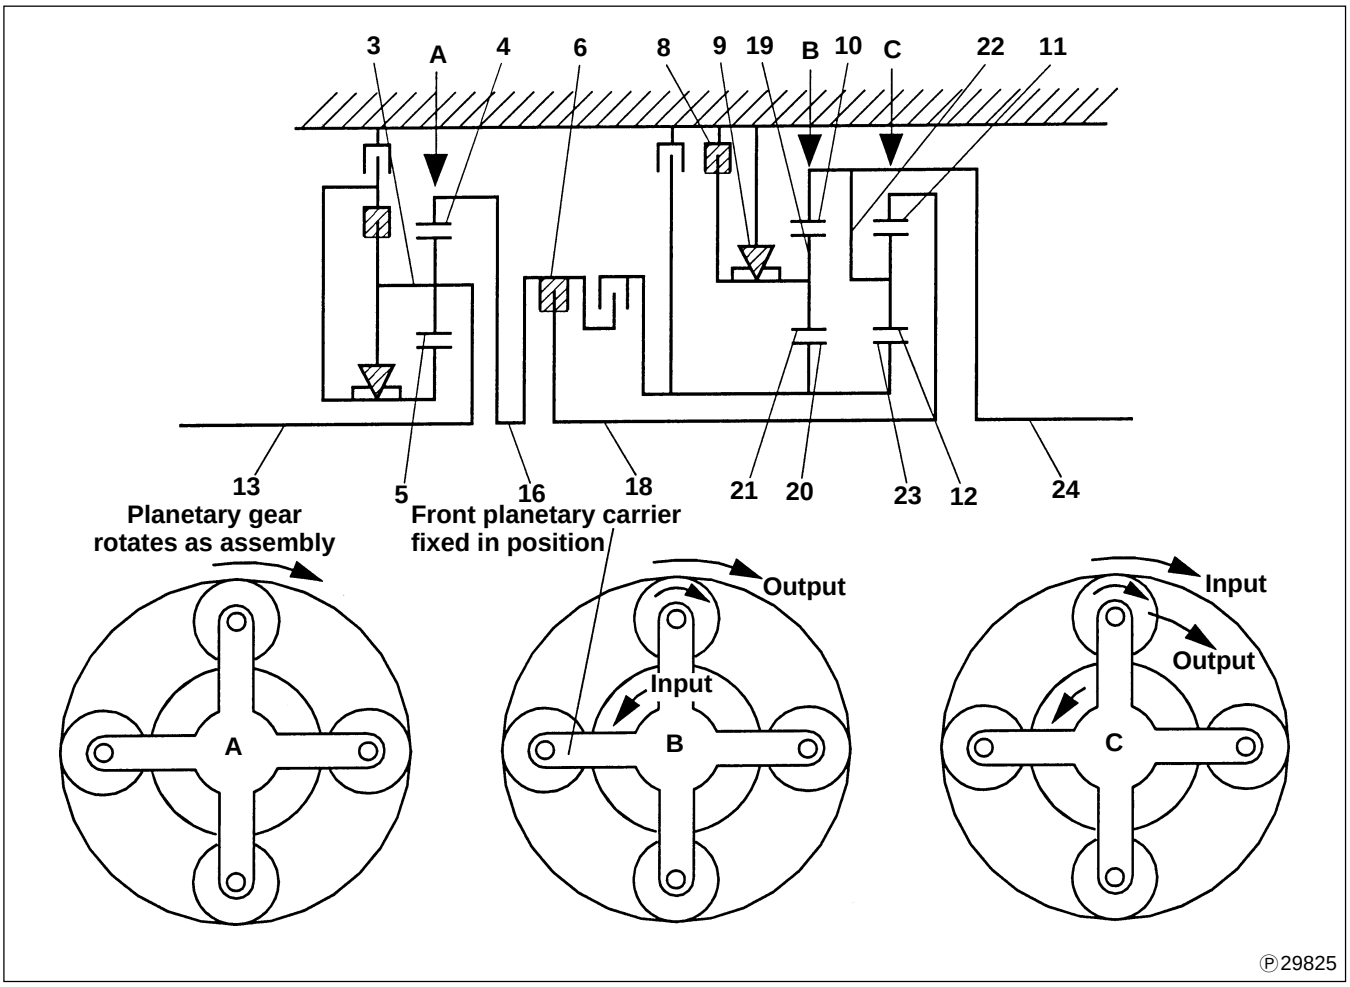


The rotating power is transmitted in the same way as in the previously described 2nd gear in the D range. However, when engine brake is applied, overdrive direct clutch **1** activates and prevents overdrive planetary sun gear **15** from rotating clockwise. In other words, when the transmission is in 2nd gear with the range selector in the D range, overdrive one-way clutch **14** transmits the rotating power to input shaft **16**. When the engine brake is applied, however, the counterclockwise rotating force of overdrive planetary sun gear **15** inactivates overdrive one-way clutch **14** and causes overdrive planetary sun gear **15** to spin freely. This disallows the transmission of the engine brake force. To properly transmit the engine brake force in the 2 range, overdrive direct clutch **1** is activated to interlock overdrive planetary sun gear **15** with overdrive planetary carrier **3**.

Power transmitting process

Overdrive input shaft **13** → Overdrive planetary carrier **3** → Overdrive planetary pinion gears **5** → Overdrive planetary ring gear **4** → Input shaft**16** → Front clutch **6** → Intermediate shaft **18** → Rear planetary ring gear **11** → Rear planetary pinion gears **12** → Rear planetary carrier **22** → Output shaft **24**

● L Range (1st Gear)



The rotating power is transmitted in the same way as in the previously described 1st gear in the D and L ranges. However, when the engine brake is applied, 1st and reverse brake **8** activates and prevents front planetary carrier **19** from rotating clockwise. In other words, when the transmission is in 1st gear with the range selector in the D or 2 range, No. 2 one-way clutch **9** prevents a counterclockwise rotation of front planetary carrier **19** and transmits the rotating power to output shaft **24**. When the engine brake is applied, however, a rotating force in the reverse direction is generated, inactivating No. 2 one-way clutch **9** and allowing front planetary carrier **19** to spin freely. This disallows the transmission of the engine brake force. To properly transmit the engine brake force in the L range, 1st and reverse brake **8** is activated to lock front planetary carrier **19** in position.

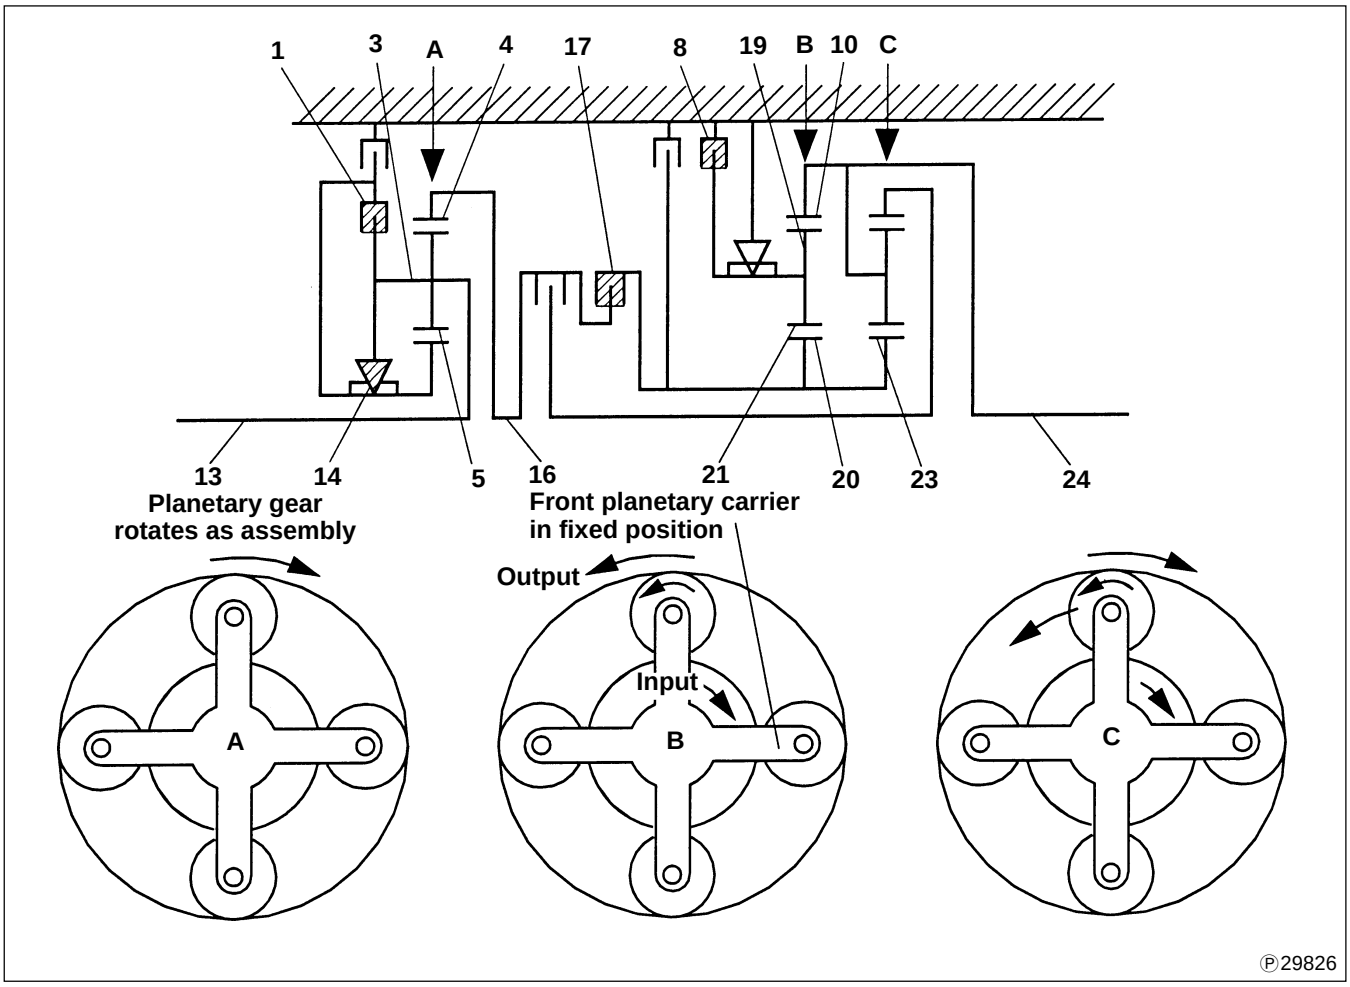
Power transmitting process

Overdrive input shaft **13** → Overdrive planetary carrier **3** → Overdrive planetary pinion gears **5** → Overdrive planetary ring gear **4** → Input shaft **16** → Front clutch **6** → Intermediate shaft **18** → Rear planetary ring gear **11** → Rear planetary pinion gears **12** → Rear planetary carrier **22** → Output shaft **24**

→Front and rear planetary sun gears **20**, **23** → Front planetary pinion gears **21**

→Front planetary ring gear **10**

● R Range

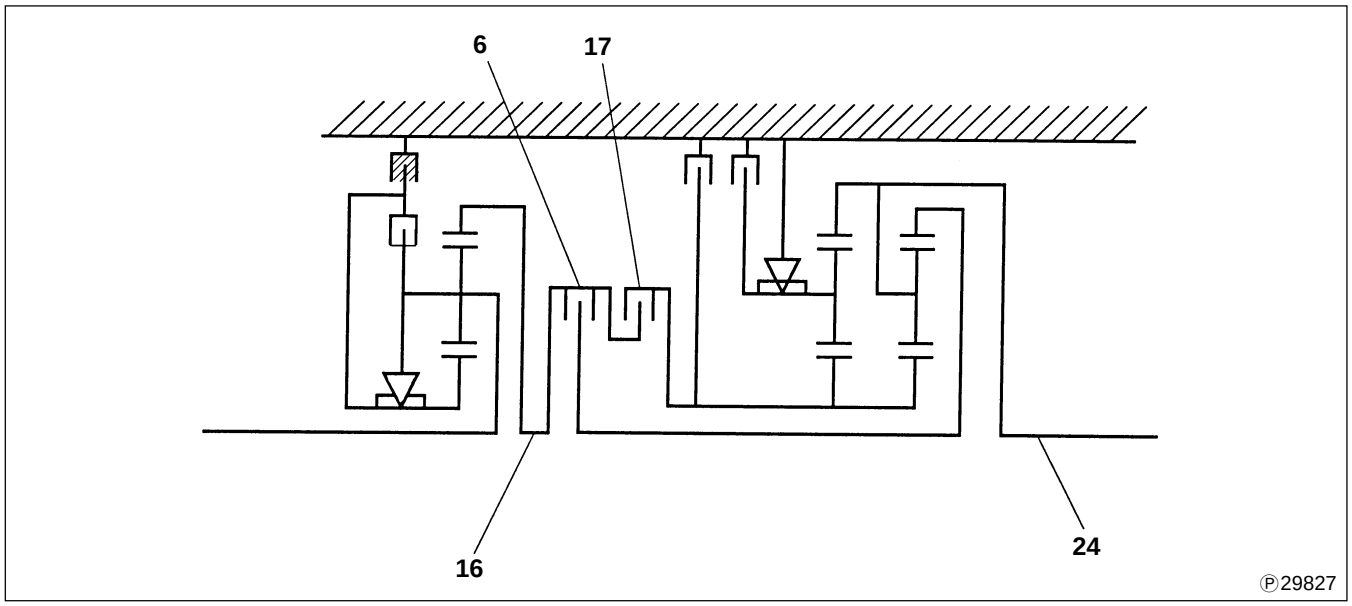


In the R range, overdrive direct clutch **1**, overdrive one-way clutch **14**, rear clutch **17** and 1st and reverse brake **8** activate to provide reverse gear. The rotating force of overdrive input shaft **13** is transmitted to input shaft **16** via direct coupling, in the same way as in the 1st gear in the D and 2 ranges. Since rear clutch **17** in operation, the rotating force of input shaft **16** is transmitted to pinion gears **21** of front planetary gear **B** by means of the sun gear. However, because front planetary carrier **19** is locked in position by 1st and reverse brake **8**, the rotating force of front planetary sun gear **20** is transmitted to the ring gear by means of front planetary pinion gears **21**, thus providing a counterclockwise rotating force to output shaft **24**.

Power transmitting process

Overdrive input shaft **13** → Overdrive planetary carrier **3** → Overdrive planetary pinion gears **5** → Overdrive planetary ring gear **4** → Input shaft **16** → Rear clutch **17** → Front planetary sun gear **20** → Front planetary pinion gears **12** → Front planetary ring gear **10** → Output shaft **24**

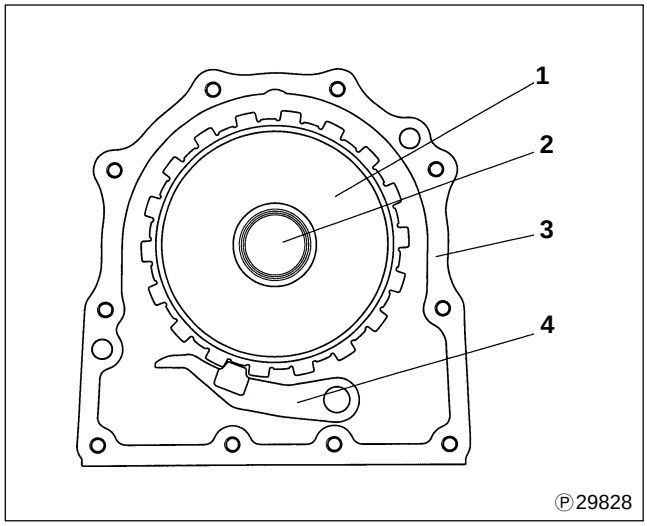
● N Range



- **N range**

  Since front clutch **6** and rear clutch **17** are disengaged, the driving force of input shaft **16** is not transmitted to output shaft **24**.

● P Range

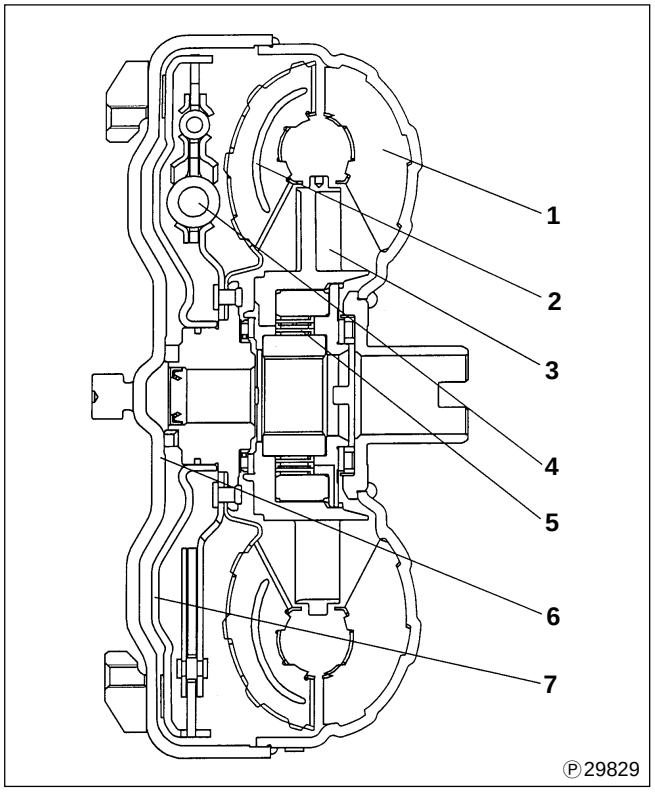


1 Parking lock gear
2 Output shaft
3 Transmission case
4 Parking lock pawl

- **P range**

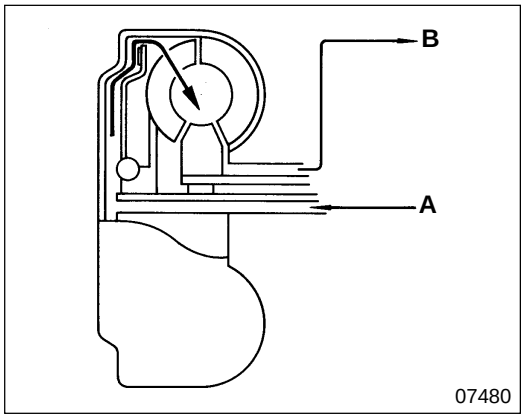
  In the same way as in the N range, the driving force of the input shaft is not transmitted to output shaft **2**. Parking lock pawl **4**, which is linked with the range selector lever, meshes with parking lock gear **1** which is directly connected to the output shaft, thus disallowing vehicle movement.

● Torque Converter



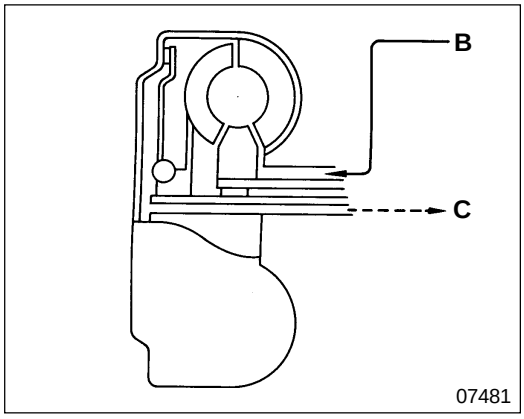
1 Pump impeller
2 Turbine liner
3 Stator
4 Lock-up damper
5 One-way clutch
6 Front converter cover
7 Lock-up piston

- The torque converter transfers engine torque to the transmission. It transmits engine torque by means of oil when it is not in a lock-up condition, and it transfers power via the lock-up piston when it is in a lock-up condition.
- The torque converter is a 3-element, 1-stage, 2-phase type.
- "1-stage" indicates that the torque converter has one turbine liner, which is an output element. "2-phase" means that it provides a torque converter function when the turbine liner speed is relatively slow as compared to the pump impeller speed, and acts as a fluid coupler when the turbine liner speed is high.



< Lock-up mechanism in inactive condition >

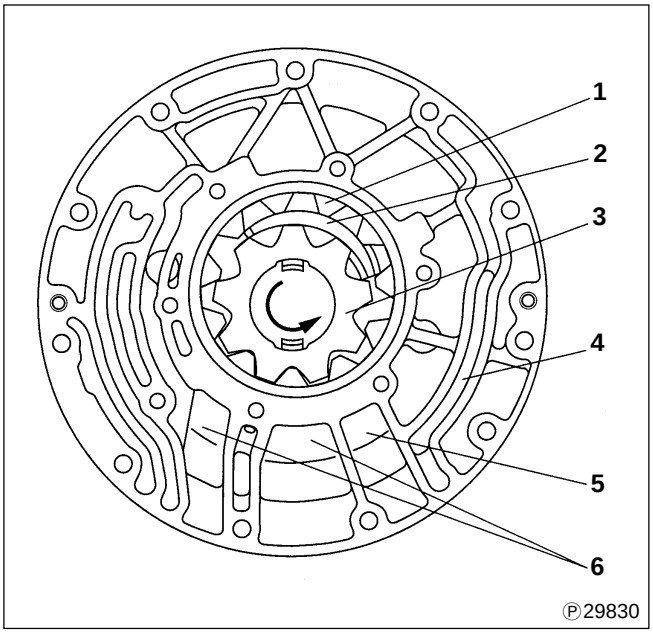
The lock-up control valve supplies the torque converter operating pressure through oil passage **A** to the space between the front converter cover and lock-up piston. This oil pressure separates the clutch facing of the lock-up piston from the front converter cover. As a result, the torque converter operating pressure supplied through oil passage **A** is released from oil passage **B**, and enters the oil cooler.



< Lock-up mechanism in active condition >

The lock-up control valve switches the operating oil passage. The torque converter operating pressure is supplied through oil passage **B** to the pump impeller, turbine liner and stator.
As a result, the oil pressure applied to the lock-up piston causes the clutch facing of the lock-up piston to engage with the front converter cover for improved power transmitting efficiency.
C : Drain

● Oil Pump



1 Driven gear
2 Crescent
3 Drive gear
4 Oil pump body
5 Outlet port
6 Inlet port

- Feature ..... The oil pump gears have a small number of gear teeth and features a special high-performance tooth profile.
- Operation ··· The drive gear is fitted to the extension sleeve of the torque converter, and rotates in the same direction (in the direction of the arrow) as the engine to compress and discharge the intake oil.

Operation Error Protection Device

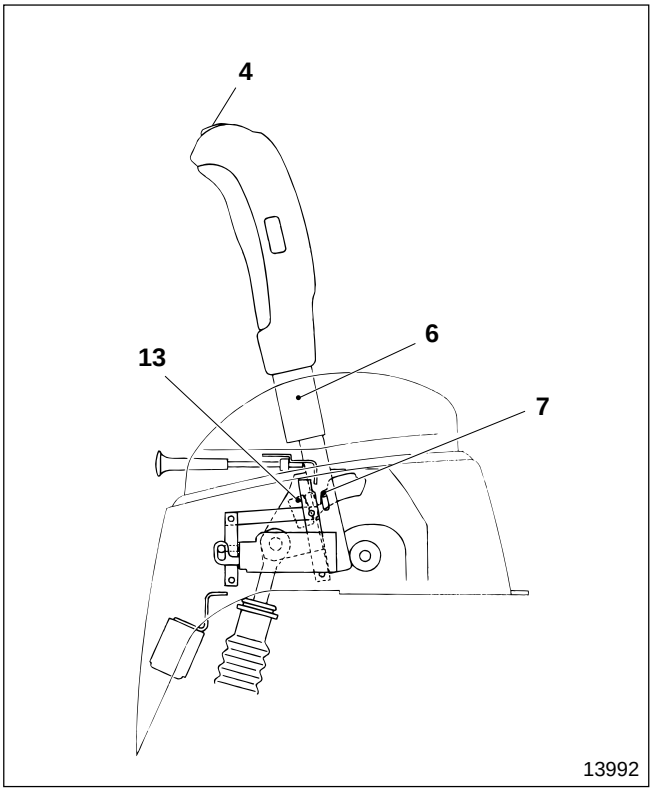
B : To backup buzzer

● **Parking Shift Lock Device with Key Interlock**

The key interlock device prevents the removal of the key unless selector lever **6** is in the P (Parking) range. The shift lock device disallows the selector lever from moving from the P range position unless brake pedal **15** is pressed, thereby preventing accidental vehicle movement caused by an unintended selector lever operation.



Key interlock device

< Lock condition >

Condition: When selector lever **6** is in a position other than the P range or when shift button **4** is pressed with the selector lever in the P range, pin **7** is not in contact with P range switch **13** (switch is set free). Therefore, the switch is ON.

↓

An electric current flows from key interlock electronic control unit **18** to key interlock solenoid **1** to activate the key interlock solenoid.

↓

Key interlock solenoid **1** turns ON to prevent starter switch **2** from being turned to the LOCK position, thus disabling the removal of the key.

< Unlock condition >

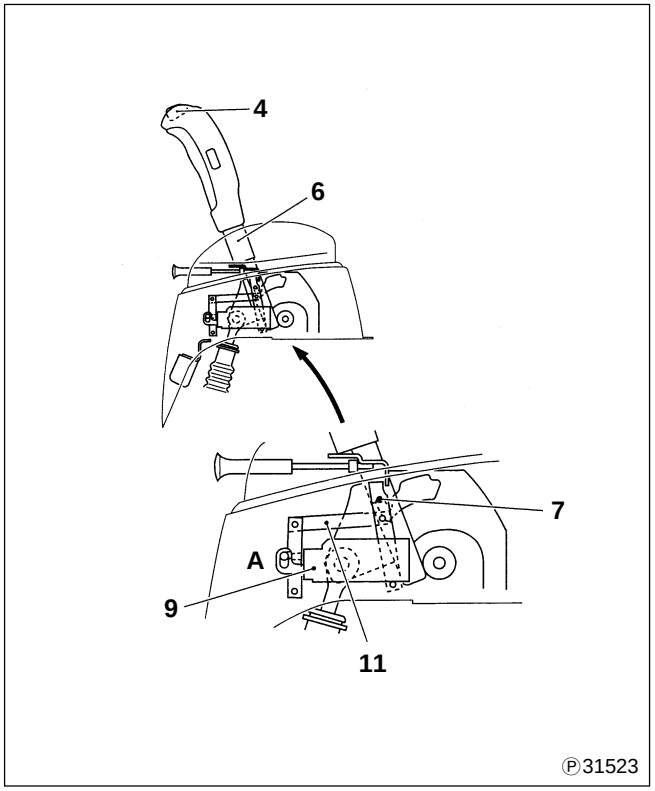
Condition: When selector lever **6** is in the P range and shift button **4** is not pressed, pin **7** presses again P range switch **13** (switch is activated). Therefore, the switch is OFF.

↓

No electric current flows from key interlock electronic control unit **18** to key interlock solenoid **1**. Therefore, the key interlock solenoid is OFF.

↓

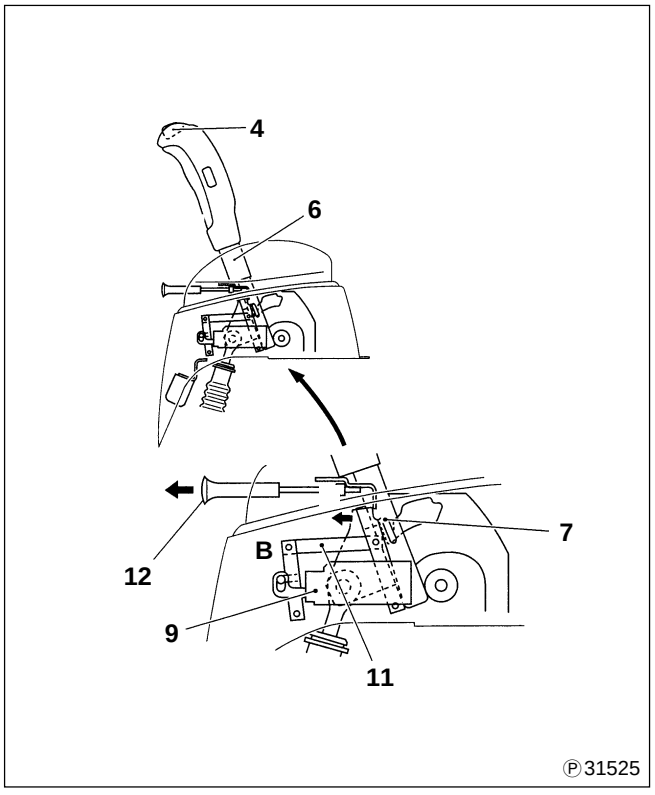
Key interlock solenoid **1** does not turn ON, thereby disengaging starter switch **2** and allowing the switch to turn to the LOCK position for the removal of the key.



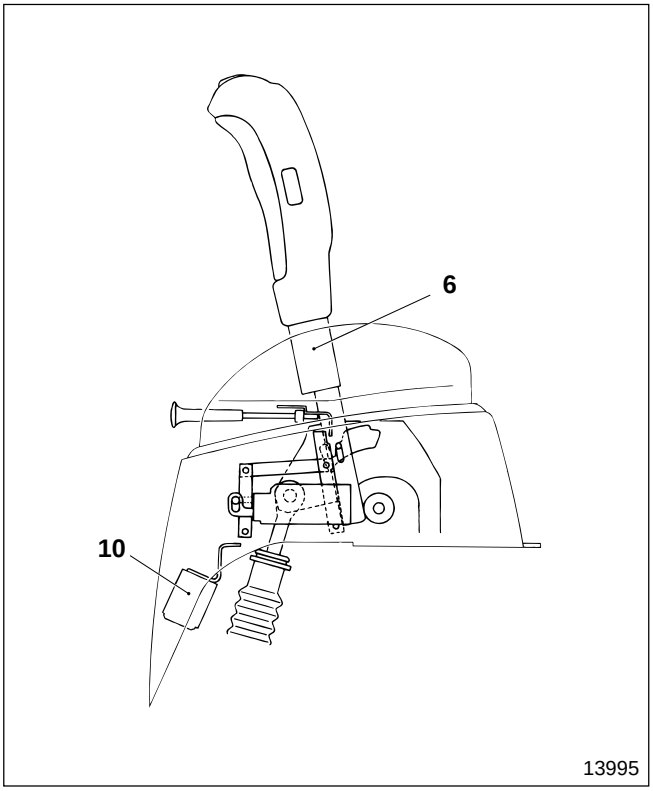
P shift lock device

- With selector lever **6** in the P range, when the electric current (see the table below) supplied to shift lock actuator **9** sets the shift lock actuator in lock position **A**, pin **7** is restrained by shift lock link **11** and disallows pressing of shift button **4**. Therefore, the selector lever cannot be moved from the P range.

Power supply		Switch		Operation mode	
IG	+B	Brake	P range	Unlock	Lock
○	○	○	○	○←	
○	○		○		→○
○	○	○		○	
○	○			○	
	○	○	○		→○
	○		○		→○
	○	○		○	
	○			○	



- With selector lever **6** in the P range, when the electric current (see the above table) supplied to shift lock actuator **9** sets the shift lock actuator in unlock position **B**, shift lock link **11** is in the forward position to set pin **7** free, thus allowing pressing of shift button **4**. Therefore, the selector lever can be moved from the P range to another range position.
- Should an electrical problem occur and hinder proper operation, pulling of shift lock release knob **12** deactivates the P shift lock.



● **Selector lever reverse position warning device**

When starter switch **2** is ON, moving selector lever **6** to the R (reverse) range activates the reverse position detecting switch (inhibitor switch: built into automatic transmission) and turns on automatic transmission reverse buzzer **10** to warn the driver that the selector lever is in the reverse position.

TROUBLESHOOTING PROCEDURES

Automatic transmission problems can be caused by the following malfunctions.

- Engine malfunction
- Improperly adjusted parts
- Faulty hydraulic system
- Faulty mechanical functions
- Faulty electrical system

When diagnosing the above abnormalities, be sure to inspect the following basic items.

- Engine condition
- Automatic transmission fluid level and condition: 🕮 P23A-57
- Range selector cable adjustment

In addition to the inspection of the above items, use the self-diagnosis function to locate the cause of the problem and take necessary measures.

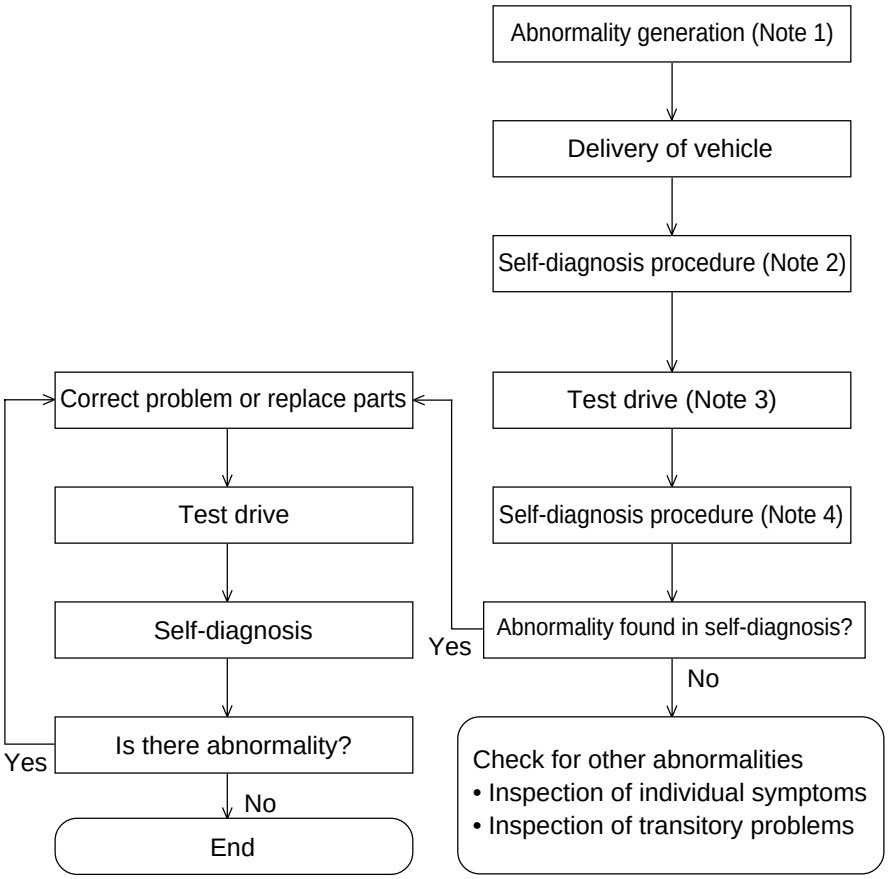
After repair is complete, test-drive the vehicle to determine whether the problem is corrected or further inspection is necessary.

If the cause of the problem cannot be located, or if repair work does not correct the problem, conduct a line pressure test and a stall test. 🕮 P23A-52, 54

It should be noted that special knowledge and tools are required to repair the automatic transmission unit or replace parts. Therefore, conduct an inspection for the purpose of evaluating the operating condition of the transmission. For maintenance or repair of the automatic transmission, contact your nearest authorized Mitsubishi dealer or distributor.

Use of the MUT-II allows efficient inspection of the automatic transmission system.

Self-diagnosis process



Note 1 : The following abnormalities significantly lower driving performance. In the case that these abnormalities generate during operation, the automatic transmission warning lamp lights.
- Faulty operation of vehicle speed sensors
- Faulty operation of solenoid other than lock-up solenoid
- Faulty operation of accelerator sensor
- Faulty operation of inhibitor switch
- Faulty throttle position PWM signal

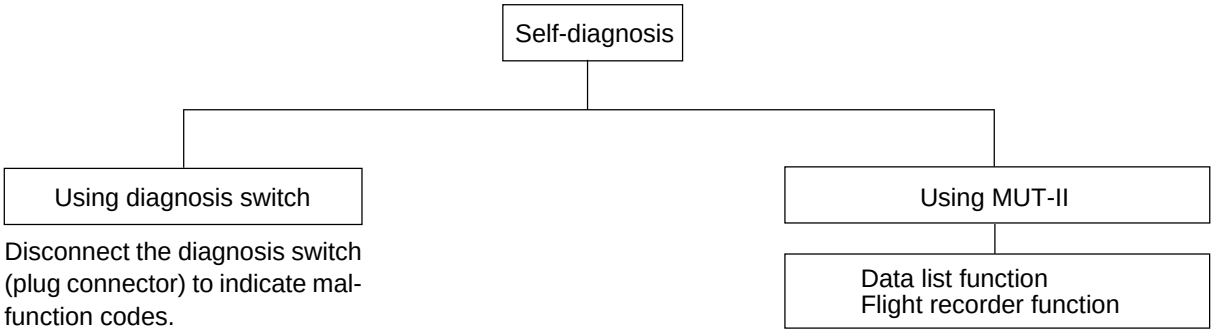
Note 2 : Inspect for malfunctions that occurred during user operation. Record inspection results.

Note 3 :
- Check abnormal conditions.
- In a test drive, operate the accelerator pedal in full range (from the released position to full throttle) with a vehicle speed of up to approximately 50 km/h {31.1 mph}.

Note 4 : Inspect problems that generate during a test drive. Record inspection results.

Types of Self-Diagnosis

The following two types of self-diagnosis function can be selected.



Disconnect the diagnosis switch (plug connector) to indicate malfunction codes.
Data of malfunctions stored in the memory can be deleted with the memory clear switch.

Connect the MUT-II to the automatic transmission electronic control unit with a test harness to download and display malfunction codes.
In addition to the self-diagnosis function, the MUT-II is equipped with a data list function that indicates sensor and switch values and a flight recorder function that records those data for a certain length of time before and after the triggering. These functions are useful in analyzing malfunctions.
(Refer to the MUT-II operation manual.)

Features of the two self-diagnosis methods

Item \ Self-diagnosis method	Use of diagnosis switch	Use of MUT-II
Convenience	○	◎
Number of self-diagnosis items	◎	◎
Data reading ease	○	◎
Data application range	×	◎

◎ : Good
○ : Fair
× : Bad

Using diagnosis switch to recall diagnosis codes and using memory clear switch to delete diagnosis codes

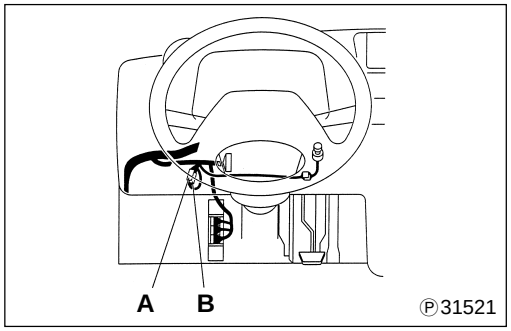
The diagnosis switch is used for the analysis of malfunction, and the memory clear switch allows deletion of stored diagnosis codes.

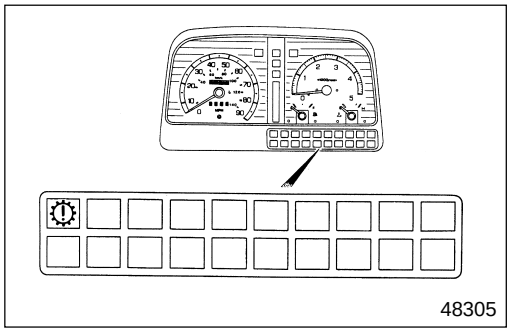
● **Recalling diagnosis code** 🕮 P23A-42

- Pull out the diagnosis switch to recall the diagnosis code of the current problem from the electronic control unit's memory.
- Pull out the diagnosis switch and memory clear switch to recall the diagnosis codes of the current and past problems from the electronic control unit's memory.

● **Deleting diagnosis codes** 🕮 P23A-43

Pull out and reinsert the memory clear switch to delete the diagnosis codes stored in the electronic control unit's memory.





● **Procedure for recalling diagnosis codes**

[Current diagnosis code]

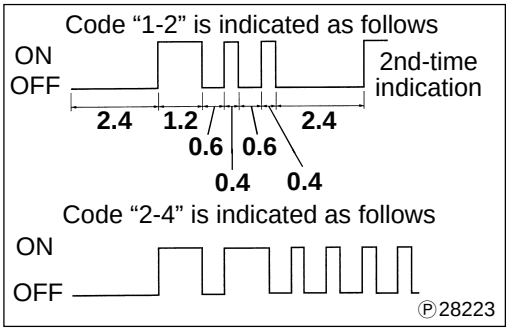
- Turn on the starter switch.
- Remove diagnosis switch **A** (plug connector). The warning lamp begins flashing. The flashing pattern indicates a diagnosis code. Check the code list to locate the problem location. 🕮 P23A-44

[Current and past diagnosis codes]

- Turn on the starter switch.
- Remove diagnosis switch **A** (plug connector) and memory clear switch **B** (1-pin connector). The warning lamp begins flashing to indicate diagnosis codes.
- The warning lamp indicates the diagnosis codes of past malfunctions and the diagnosis code of the current problem, if any.

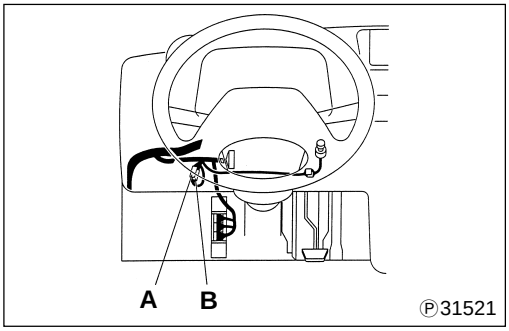
CAUTION ⚠

If diagnosis switch A is connected first, diagnosis codes in the electronic control unit's memory are deleted, and a "01" (normal) code is indicated.



● **Procedure for reading diagnosis codes**

- The automatic transmission electronic control unit’s memory is stored with the data of all malfunctions that occurred after the previous self-diagnosis operation.
- The warning lamp turns off for 2.4 seconds after the self-diagnosis operation starts, then indicates a code.
  - The tens digit is indicated by 1.2-second ON operation and 0.6-second OFF operation.
  - The ones digit is indicated by 0.4-second ON operation and 0.6-second OFF operation.
  - The lamp remains OFF for 2.4 seconds between codes.
- If there are two or more malfunction codes in the memory, they are output in an order from the smallest code number. Each malfunction code is indicated three times before the following code is output.
- After all malfunction codes in the memory are output, the indication process repeats from the beginning.



● **Procedure for deleting diagnosis codes**

- Keep diagnosis switch **A** (plug connector) connected.
- Turn on the starter switch.
- Disconnect memory clear switch **B** (1-pin connector). After more than one second, connect the memory clear switch. When the memory clear switch remains connected for more than three seconds, diagnosis codes in the electronic control unit are deleted.

● **Diagnosis Code Chart**

Diagnosis code	Problem location	Judgement criterion	Fail-safe measure
1	Normal		
11	Power supply voltage	Power supply voltage remains below 7.5 V for 1 second or longer with range selector in a position other than P or N range.	
12	Vehicle speed sensor 1	• Vehicle speed sensor 1 indicates sudden speed decrease.	• Maintains the gear selected immediately before malfunction. • Turns off shift solenoids 1, 2 when engine speed sensor detects a value or less than 1000 rpm.
13	Oil temperature sensor	When oil temperature of more than 135°C {275°F} or lower than -50°C{-58°F} is detected. Note that Multi-Use Tester II display is fixed at "40°C {104°F}" after fail-safe judgement result.	Maximum oil temperature
15	Engine speed sensor	Engine speed sensor detects a value of less than 300 rpm when range selector is in a position other than P or N range and when output shaft rotating speed is 1000 rpm or higher.	Prohibits 2-3 shift timing control.
24	Accelerator sensor	• When accelerator sensor signal input to engine Electronic Control Unit is faulty	• Shift-point is set at 0% throttle opening. • Prohibits 2-3 shift timing control. • Executes controls assuming that throttle pressure is at maximum. • Prohibits lock-up control (lock-up solenoid OFF) except during driving at high speeds.
25	Vehicle speed sensor 2	• Vehicle speed sensor 2 indicates sudden speed decrease.	• Maintains the gear selected immediately before malfunction detection. • Turns off shift solenoids 1, 2 when engine speed sensor detects a value of less than 1000 rpm.
31	Shift solenoid 1	• When solenoid output short-circuit occurs while solenoid is receiving current. • When solenoid output disconnection occurs while solenoid is not receiving current.	• Turns off malfunctioning shift solenoid. • Turns off lock-up solenoid and timing solenoid. • Refer to the chart on P23A-54 for gear selection.
32	Shift solenoid 2	• When solenoid output short-circuit occurs while solenoid is receiving current. • When solenoid output disconnection occurs while solenoid is not receiving current.	• Turns off malfunctioning shift solenoid. • Turns off lock-up solenoid and timing solenoid. • Refer to the chart on P23A-54 for gear selection.
34	Line pressure solenoid	When wire breakage or short-circuit occurs.	Turns off line pressure solenoid.
35	Lock-up solenoid	• When solenoid output short-circuit occurs while solenoid is receiving current. • When solenoid output disconnection occurs while solenoid is not receiving current.	Turns off lock-up solenoid.

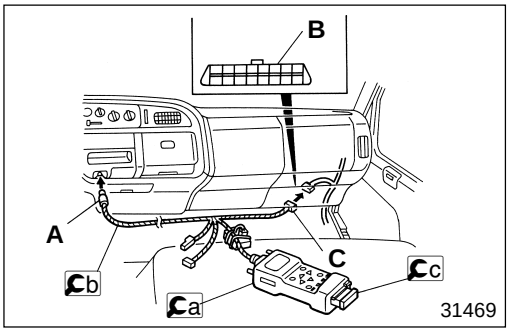
● **Diagnosis Code Chart**

Diagnosis code	Problem location	Judgement criterion	Fail-safe measure
43	Inhibitor switch	• No signal	Operates as D range and prohibits shifting to 4th gear.
		• Two or more signals	• Control function activates based on priority order of L > R > 2 > D > N (P). • Refer to P23A-54 for actual vehicle operation conditions.
50	PTO solenoid	When solenoid output short-circuit occurs while solenoid is receiving current.	Turns off PTO solenoid.
		When solenoid output is cut off while solenoid is not receiving current.	
51	Timing solenoid	• When solenoid output short-circuit occurs while solenoid is receiving current.	Turns off timing solenoid.
		• When solenoid output disconnection occurs while solenoid is not receiving current.	
54	Exhaust brake cut-off signal	Exhaust brake activates when exhaust brake cut-off signal is generated.	• Prohibits exhaust brake cut-off control • Allows lock-up only at high cruising speed.

Procedure for servicing with Multi-Use Tester II (MUT-II)

Special tools

Location	Tool name and shape	Part No.	Application
—	Multi-Use Tester II (MUT-II)  19492	MB991496	System inspection
—	Multi-Use Tester II (MUT-II) harness  19141	MK327601	
—	ROM (Read only memory) pack (MRT-E10)  19493	MH062867	



● **Connecting the MUT-II**

- Turn the starter switch to the LOCK position.
- Connect the b MUT-II Communication Harness to the a MUT-II, and insert the c ROM Pack.
- Plug connector **A** into the cigarette lighter socket.
- Fit connector **C** onto MUT-II connector **B** (16-pin) in the relay box.

NOTE

Instructions for operation of the MUT-II are given in the separate MUT-II Reference Manual.

● **Inspection using MUT-II**

①The MUT-II indicates diagnosis codes that provide information of malfunctioning items (devices that require inspection).

②The MUT-II indicates sensor signal conditions with numerical values (service data). Comparison of the service data with judgement criteria allows evaluation of the transmission operation. Diagnosis codes and service data codes can be effectively used for troubleshooting.

Stall Test

● **Purpose**

To check wearing of gears, slippage of one-way clutches, operation of torque converter and overall performance of the engine.

● **Measuring procedure**

Before the test, inspect the engine coolant, engine oil and automatic transmission fluid. Run the engine until the engine coolant temperature reaches an appropriate level. Also conduct a warm-up operation for the automatic transmission and bring the automatic transmission fluid temperature to an appropriate level.

- Place wheel chocks in front and back of all wheels, and apply the parking brake. When operating the accelerator pedal, be sure to press down firmly on the foot brake pedal.
- Shift the range selector lever to the D range.
- Press down on the accelerator pedal gradually to full throttle. When the engine speed stabilizes, quickly read the engine rpm (stall speed) and remove foot from the accelerator pedal.

CAUTION ⚠

- **Limit each measuring operation to five seconds. Extended testing causes automatic transmission fluid degradation and adverse effects to the internal parts.**
- **If the engine speed does not stabilize but continues to increase or suddenly jumps, stop the test immediately.**

- Shift the range selector lever to the N range, and let the engine run at approximately 1200 rpm for one minute or longer for cooling.
- Conduct tests in the same way with the range selector lever in each of the 2, L and R ranges.
- Stall speed : 2070±150 rpm

● **Diagnosis of test result**

Measuring result	Suspected abnormality
Lower than standard value in all ranges	Insufficient engine output power
	Faulty operation of one-way clutch in torque converter
Higher than standard value in D range	Slippage of front clutch
	Faulty operation of No. 2 one-way clutch
	Low line pressure
Higher than standard value in R range	Slippage of rear clutch
	Slippage of 1st and reverse brake
	Low line pressure
Higher than standard value in all range	Low line pressure
	Inappropriate automatic transmission fluid level
	Slippage of overdrive direct clutch
	Faulty operation of overdrive one-way clutch

Time Lag Test

● **Purpose**

To check the conditions of overdrive direct clutch, front clutch, rear clutch and 1st and reverse brake.

● **Measuring procedure**

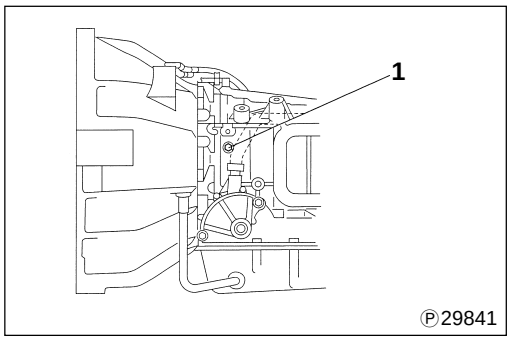
- Bring the oil temperature to normal operating level of between 50 and 80°C {122 and 176°F}.
- Start the engine and check the idle speed.
- Shift the range selector lever from the N range to the D range and use a stopwatch to measure the time it takes for shock to be felt.
- In the same way, measure the time lag by shifting the range selector lever from the N range to the R range.

	Standard value
N→D shifting	0.7 sec or less
N→R shifting	1.2 sec or less

● **Diagnosis of test result**

Measuring result	Suspected abnormality
Large time lag in N→D shift	Low line pressure
	Slippage of front clutch
	Faulty operation of overdrive one-way clutch
Large time lag in N→R shift	Low line pressure
	Slippage of rear clutch
	Slippage of 1st and reverse brake
	Faulty operation of overdrive one-way clutch

Line Pressure Test



● **Purpose**

To check the oil pump capacity, control valve functions and leaks in hydraulic circuit.

● **Measuring procedure**

CAUTION ⚠

The line pressure test requires two persons. One person must observe tire movement and wheel chocks from outside the vehicle, while the other person conducts the test.

- Apply the parking brake firmly.
- Place wheel chocks.
- Remove pressure detecting plug **1**, and mount the oil pressure gauge.
- Start the engine, and operate it until the automatic transmission fluid temperature reaches between 50 and 80°C {122 and 176°F}. Then, check the idle speed.
- While pressing the brake pedal firmly with the left foot, shift the range selector lever to the D range and measure the oil pressure while the engine is idling.
- Press the accelerator pedal all the way, and quickly measure the oil pressure at stall speed.

CAUTION ⚠

If the engine RPM do not reach stall speed and the rear wheels start rotating, release the accelerator pedal and stop the test.

- Measure the oil pressure with the range selector lever in the R range by following the above procedure.
- After the measurement, re-install pressure detecting plug **1** and tighten to the specified torque.

Pressure detecting plug	Bolt size	1/2-20UNF
	Tightening torque	7.5 N·m {5.5 ft.lbs, 0.76 kgf·m}

● **Line pressure** kPa {psi, kgf/cm^2}

Idle oil pressure	D range	529 to 784 {77 to 115, 5.4 to 8.0}
	R range	755 to 1127 {110 to 165, 7.7 to 11.5}
Stall oil pressure	D range	990 to 1480 {145 to 215, 10.1 to 15.1}
	R range	1401 to 2107 {205 to 305, 14.3 to 21.5}

● **Diagnosis of test result**

Measuring result	Suspected abnormality
Higher than standard value in all ranges	Faulty adjustment of throttle cable
	Sticking of regulator valve
	Sticking of throttle valve
Lower than standard value in all ranges	Faulty adjustment of throttle cable
	Sticking of regulator valve
	Sticking of throttle valve
	Excessive wear of oil pump
	Faulty overdrive direct clutch
Lower than standard value only in D range	Oil leak in D range system
	Faulty front clutch
Lower than standard value only in R range	Oil leak in R range system
	Faulty rear clutch
	Faulty 1st and reverse brake

ON-VEHICLE INSPECTION AND ADJUSTMENT

Road Test

● **Measuring procedure**

Before the road test, check the level and condition of the automatic transmission fluid. Also make sure that the range selector cable and the accelerator control cable are properly adjusted.
Operate the automatic transmission in every range position during the road test and check slippage and other operating conditions during shifting of gears.
Check to see if the shift feels too tight or too loose.
Check the shift points of up-shifting and downshifting.
Check shift-point vehicle speeds under various driving conditions.

● **Shift-point vehicle speeds**

Unit : km/h {mph}

Throttle opening	Shifting	Vehicle speed
Half throttle	D1→D2	6.8 to 9.3 {4.2 to 5.8}
	D2→D3	20.1 to 22.7 {12.5 to 14.1}
	D3→D4	37.4 to 39.9 {23.2 to 24.8}
Full throttle	D1→D2	19.4 to 21.9 {12.0 to 13.6}
	D2→D3	41.5 to 44.1 {25.8 to 27.4}
	D3→D4	73.0 to 78.0 {45.4 to 48.5}
Closed throttle	D1→D2	5.0 to 7.6 {3.1 to 4.7}
	D2→D3	5.0 to 7.6 {3.1 to 4.7}
	D3→D4	27.2 to 29.7 {16.9 to 18.5}

● **Lock-up vehicle speeds**

Unit : km/h {mph}

Throttle opening	Shifting	Vehicle speed
Half throttle	2nd gear ON	34.0 to 36.5 {21.1 to 22.7}
	3rd gear ON	45.1 to 47.6 {28.0 to 29.6}
	4th gear ON	54.5 to 57.0 {33.9 to 35.4}
Full throttle	2nd gear ON	44.1 to 46.6 {27.4 to 28.9}
	3rd gear ON	45.1 to 47.6 {28.0 to 29.6}
	4th gear ON	73.0 to 78.0 {45.4 to 48.5}
Closed throttle	2nd gear OFF	34.0 to 36.5 {21.1 to 22.7}
	3rd gear OFF	44.1 to 46.6 {27.4 to 28.9}
	4th gear OFF	45.6 to 48.1 {28.3 to 29.9}

The above standard values are based on the following conditions.
- 5.571 differential gear ratio, 0.372 m {1.22 ft.} tire radius (215/75R17.5)

If the differential gear ratio and/or the tire radius are different from the above, proper standard values must be calculated based on the ratios of the differences and the above figures.

Inspection of Automatic Transmission Fluid (ATF)

If the automatic transmission has insufficient ATF, the pump draws air together with ATF. Air bubbles mixed in the ATF cause a “sponge” effect and lower the pressure. This can cause slipping of internal clutches.
On the other hand, if the ATF level is too high, excess air bubbles also result when rotating parts agitate the ATF, thus causing the same effect as when the ATF level is low.
In both cases, excess air bubbles lead to overheat, oxidation of oil and varnish generation, thereby hindering proper operation of the valves and clutches.
Excess air bubbles in the ATF also cause ATF to overflow from the vent hole and filler tube, which may be mistakenly diagnosed as an ATF leak.
To prevent these problems, read the ATF level accurately by following the procedure described below.

(1) Inspection of ATF condition

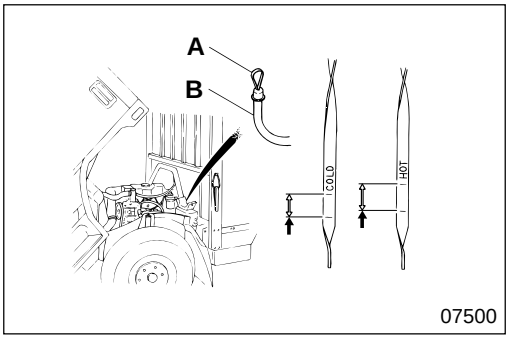
If ATF has a burned odor and contains metal shavings or particles, the automatic transmission needs an overhaul. Closely inspect the ATF adhered on level gauge **A**.
If ATF is suspected to be in poor condition, take out a sample and inspect closely.

(2) Inspection of ATF level

CAUTION

- **Inspection is conducted while the engine is running. Be careful of moving parts and hot areas to prevent personal injuries and burns.**
- **Before inspection, check the idle speed.**
- **Place the vehicle on level ground.**
- **Bring the transmission to normal operating temperature (70 to 80°C {158 to 176°F}) before inspection.**
- **Before pulling out level gauge A, clean the protective cap and the upper part of the filler tube B.**

- Apply the parking brake firmly, and place wheel chocks.
- With the engine idling, press down on the brake pedal and shift the range selector lever slowly from the P range to the L range, stopping at each position in between. Then return the range selector lever to the P range.
- With the engine idling, pull out level gauge **A**. Wipe the ATF from the level gauge and blow compressed air to remove lint and other particles. Insert the level gauge, and pull it out. Check to make sure that the ATF level is in the range marked “HOT.”

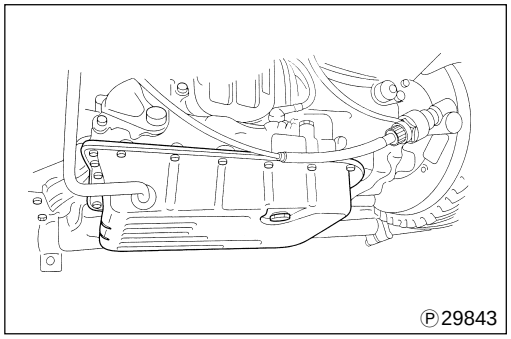


CAUTION

- **If the ATF temperature is low (20 to 30°C {68 to 86°F}), such as after an ATF change, bring the ATF level to the area on the level gauge marked “COLD.” Then, after the transmission temperature rises to normal operating level (70 to 80°C {158 to 176°F}), check to make sure that the ATF level is in the area on the level gauge marked “HOT.”**
- **If the markings on the front and back sides of the level gauge show different level indications, use the line that indicates the lower ATF level.**

- If the ATF level is low, add ATF from the filler tube **B** to the specified level on level gauge **A**.

Changing Automatic Transmission Fluid (ATF)



(1) Drain

- Place an ATF receiving tray under the automatic transmission oil pan. Remove the drain plug located at the back side of the pan to drain ATF.
  Tightening torque: 27 N·m {20 ft.lbs, 2.8 kgf·m}

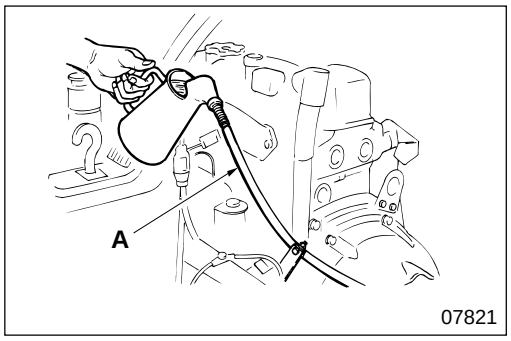
CAUTION ⚠

- **ATF is very hot immediately after the engine is turned off. Wait until the ATF temperature lowers sufficiently.**
- **For faster ATF drainage, warm up the engine.**
- **ATF in the hydraulic circuit, torque converter and oil cooler cannot be drained in the above process.**
- **Inspect the drained ATF for dirtiness and contamination such as metal shavings and particles.**

- After the above process, approximately 1 L {1.1 qts} of ATF remains in the oil pan. If you wish to drain this remaining ATF, remove the oil pan. 🕮 P23A-80

Amount of drained ATF

ATF drained by removing oil pan : Approximately 4.5 L {4.8 qts}
ATF drained by removing drain plug : Approximately 3.5 L {3.7 qts}



(2) Adding ATF

- Prepare new ATF.
- Re-install the oil pan drain plug and gasket.
- From filler tube **A**, add the same amount of ATF as drained.

CAUTION ⚠

Be careful not to let dust and other particles mix with ATF.

- Start the engine and let it idle for at least two minutes.
- Shift the range selector lever into every position, then back to the P range.

CAUTION ⚠

Do not rev up the engine in the above process.

- Check the ATF level. 🕮 P23A-57

(3) ATF leaks

- Torque converter housing of the automatic transmission unit
- Check for leaking locations
  Since the torque converter and the surrounding area can be soiled with oil that leaks from the engine, inspect those areas carefully.
  ATF is red, so that it can be easily distinguished from engine oil.
- Before dismounting the automatic transmission, carefully examine if ATF leaks from the torque converter or the automatic transmission unit (oil seal of oil pump housing or connection of oil pump housing and case).

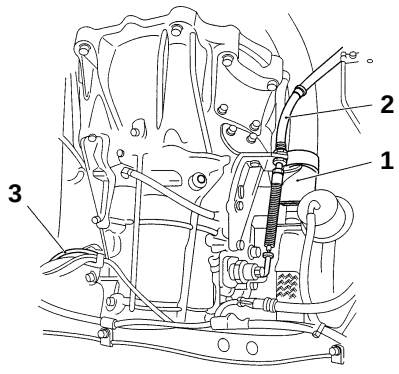
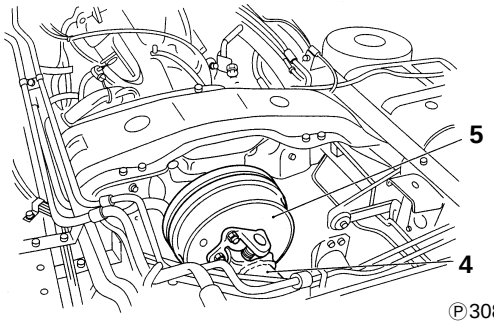
REMOVAL AND INSTALLATION OF AUTOMATIC TRANSMISSION ASSEMBLY

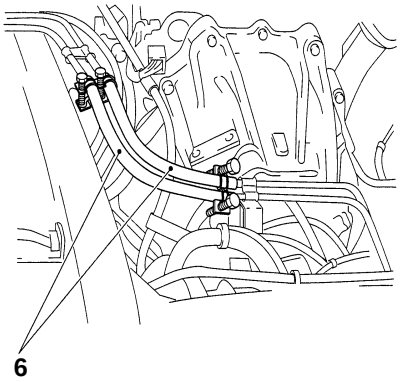
Preparation



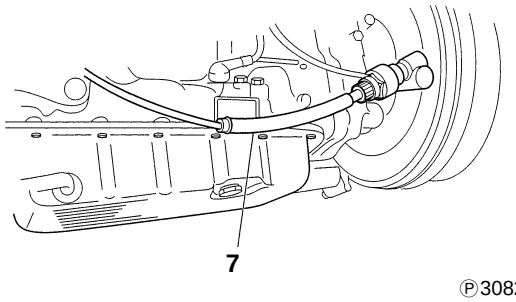
Ⓟ31515



Ⓟ30821



Ⓟ30920



Ⓟ30822

● **Removal sequence**

1 Exhaust pipe Gr 15A
2 Selector cable P23A-75
3 Electrical harness
4 Propeller shaft Gr 25
5 Parking brake Gr 36
6 Oil cooler hose P23A-66
7 Speedometer cable

CAUTION

After removing propeller shaft 5, suspend the shaft at the same height as the installation position by securing it to the frame with a rope.

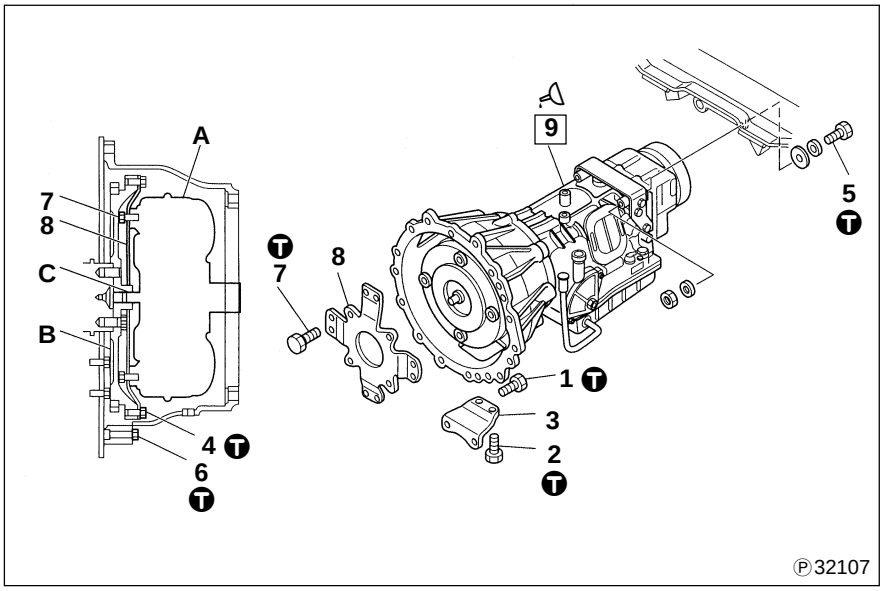
● **Installation sequence**

Follow the removal sequence in reverse.

CAUTION

If the automatic transmission unit is replaced due to a malfunction and if the automatic transmission fluid contains a large amount of impurities, conduct flushing of the oil cooler system. P23A-66

Removal



● **Removal sequence**

1 Bolt
2 Bolt
3 Dust cover
4 Bolt (8)
5 Bolt
6 Bolt
7 Bolt (4)
8 Drive plate
9 Automatic transmission assembly

A: Torque converter
B: Flywheel
C: Pilot section

● **Installation sequence**

Follow the removal sequence in reverse.

CAUTION ⚠

Remove the automatic transmission assembly with drive plate 8 attached to torque converter A.

Ⓣ Tightening torque

Unit : N·m {ft.lbs, kgf·m}

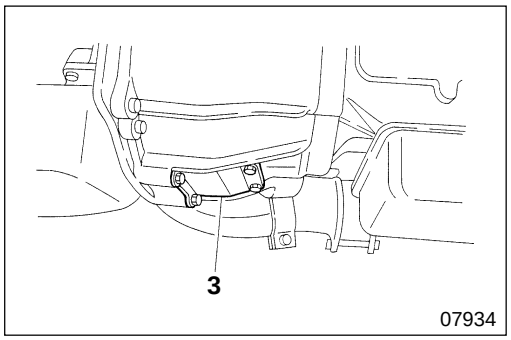
Location	Parts to be tightened	Tightening torque	Remarks
1	Bolt (Automatic transmission assembly mounting and dust cover mounting)	47 {35, 4.8}	—
2	Bolt (Dust cover mounting)	13 {9.4, 1.3}	—
4	Bolt (Flywheel and drive plate coupling)	32 {24, 3.3}	—
5	Bolt (Rear mounting)	83 to 105 {61 to 80, 8.5 to 11}	—
6	Bolt (Automatic transmission assembly mounting)	82 {61, 8.4}	M12
		47 {35, 4.8}	M10
	Bolt (Bracket mounting)	40 {30, 4.1}	—
7	Bolt (Drive plate mounting)	79±12 {59±8.7, 8.1±1.2}	—

Lubricant

Location	Points of application	Specified lubricant	Quantity
9	Pilot section C on torque converter A in automatic transmission assembly	Molybdenum disultide grease [NLGI No.2 (Li soap)]	As required

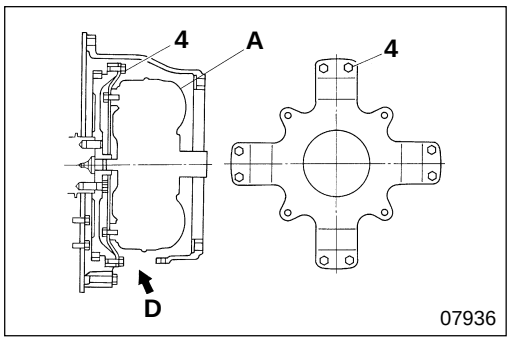
◆ Service procedure

9 Automatic transmission assembly

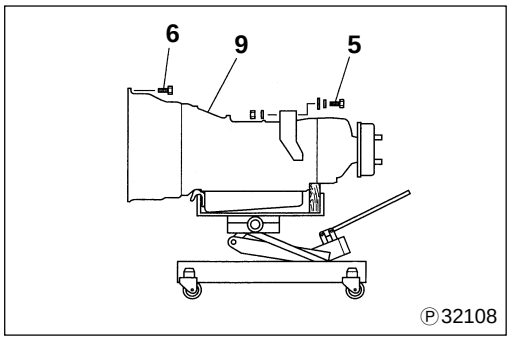


[Removal]

- Remove dust cover **3**.



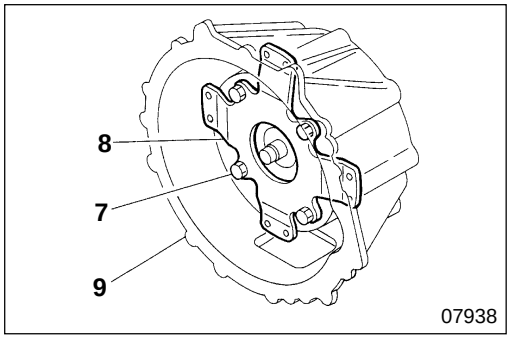
- Turn the engine so that bolt **4** is positioned at service window **D**.
- Remove eight bolts **4**. Remove two bolts at each of the four locations by turning the engine and stopping at the proper position.



- Support automatic transmission assembly **9** with a jack, then remove automatic transmission assembly mounting bolts **5**, **6**.
- Remove automatic transmission assembly **9** by pulling towards the back of the vehicle.

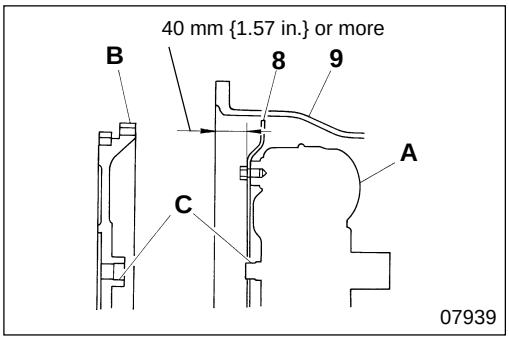
CAUTION ⚠

- **Do not support the automatic transmission by the oil pan, since it causes shape deformation of the oil pan and oil pan gasket.**
- **Since torque converter A can easily separate from the automatic transmission assembly, be careful not to drop the torque converter.**
- **Mounting bolts 6 are different in length. Record the length of each bolt when removing, so that bolts can be re-installed in the original locations.**

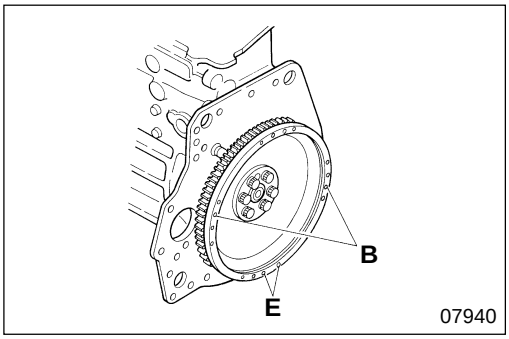


[Installation]

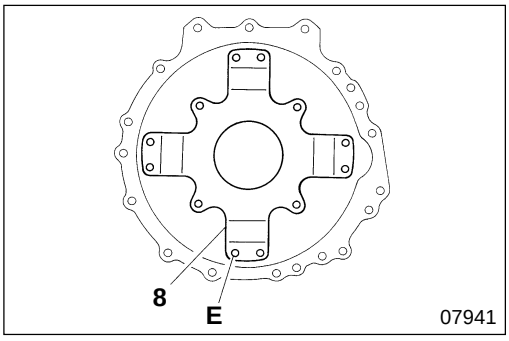
- Install drive plate **8** to torque converter **A** before installing the torque converter into automatic transmission assembly **9**.
  Tighten bolts **7** to the specified torque.



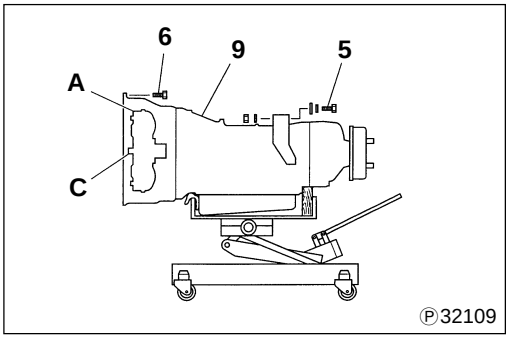
- Check to make sure that torque converter **A** is properly mounted in automatic transmission assembly **9**.
  When the torque converter is properly installed, the distance between the surface of drive plate **8** and the case mounting surface is as indicated in the diagram.
- Apply grease on pilot sections **C** of flywheel **B** and torque converter **A**.



- Turn flywheel **B** so that one of bolt holes **E** on the flywheel is located at the lowest position. Bolt holes are used to connect drive plate **8** to the flywheel.



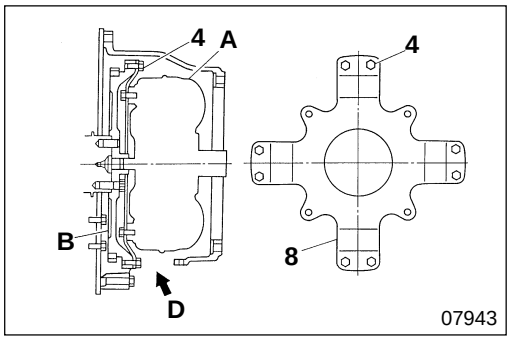
- Turn drive plate **8** so that one of bolt holes **E** is located at the lowest position.



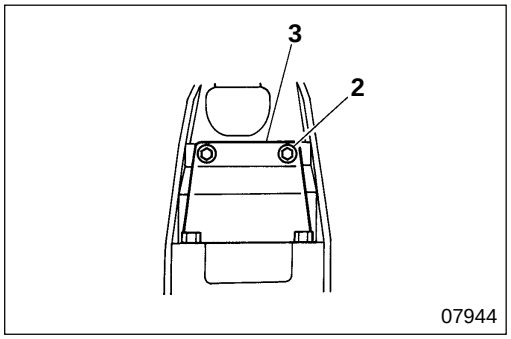
- Install automatic transmission assembly **9** into position slowly and carefully while aligning pilot section **C** and the dowel pin of the rear plate.
- Tighten several mounting bolts **6** on automatic transmission assembly **9** for temporary holding. Tighten bolts **5** to the specified torque to mount the automatic transmission assembly to the rear support.

CAUTION ⚠

- **Torque converter A can easily separate from the automatic transmission assembly 9. To keep the torque converter in place, set the back side of automatic transmission assembly slightly lower than the front part.**
- **Before mounting the automatic transmission assembly 9, wipe oil adhered on the internal wall of the torque converter housing.**



- Align the bolt holes of drive plate **8** and flywheel **B** by looking through service hole **D**, and mount bolts **4**.
- Temporarily tighten all eight bolts, two bolts at each of the four locations, by turning the engine and stopping at the proper position. Then, repeat the same process, and tighten the bolts to the specified torque.



- Tighten all automatic transmission assembly mounting bolts **6** to the specified torque.
- Tighten bolts **2** to the specified torque to secure dust cover **3** in place.

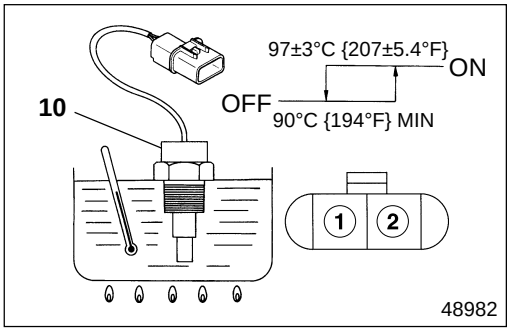
Sealant

Location	Points of application	Specified sealant	Quantity
10	Automatic transmission fluid thermostat switch	THREEBOND 1110B	As required
11	Thread area of plug	THREEBOND 1110B	As required

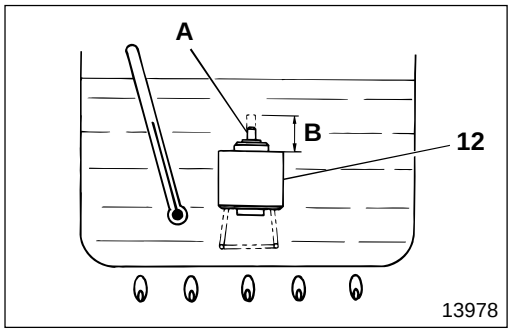
◆ Service procedure



10 **Inspection of automatic transmission fluid thermostat switch**

Carry out the following inspection and replace automatic transmission fluid thermostat switch **10** if there are any faults.

- Check that there is no continuity between terminals ① and ② at ambient temperature of 20±5°C {68±9°F}.
- Place automatic transmission fluid thermostat switch **10** in a container filled with automatic transmission fluid, and raise the temperature while stirring well.
  Measure the temperature when continuity has been achieved between terminals ① and ②, and check that the measured value conforms to the standard value.
- Lower and measure the temperature when continuity is lost between terminals ① and ②, and check that the measured value conforms to the standard value.



12 **Inspection of thermostat valve**

Carry out the following inspection. If any fault is found, replace thermostat valve **12**.

- Place thermostat valve **12** in a container filled with automatic transmission fluid and raise the fluid temperature while stirring the fluid.
  Make sure that end **A** starts stroking at a temperature of 76.5±3°C {170±5.4°F}.
- Raise the fluid temperature further and make sure that end **A** expands by 4.5 mm {1.18 in.} and dimension **B** in the illustration is 13.4 mm {0.53 in.} at a temperature of 83±2°C {181±3.6°F}.

Tightening torque

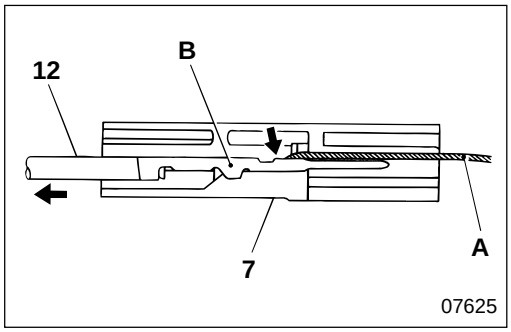
Unit : N·m {ft.lbs, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
1	Nut (Lever assembly mounting)	17 to 22 {12 to 16, 1.7 to 2.2}	—
4	Screw (Range selector lever cover mounting)	3.9 to 5.9 {2.9 to 4.3, 0.4 to 0.6}	—
5	Screw (Range selector lever cover mounting)	3.9 to 5.9 {2.9 to 4.3, 0.4 to 0.6}	—
8	Screw (Cover mounting)	2.0 {1.4, 0.2}	—
10	Screw (Automatic transmission knob mounting)	2.0 {1.4, 0.2}	—
17	Screw (Indicator panel mounting)	1 to 2 {0.7 to 1.4, 0.1 to 0.2}	—
19	Bolt (Lever bracket mounting)	9.8 to 15.0 {7.2 to 11.0, 1.0 to 1.5}	—
23	Lock nut (Ball joint mounting)	16 to 24 {12 to 17, 1.6 to 2.4}	—
29	Nut (Lever mounting)	9.8 to 14.0 {7.2 to 10.0, 1.0 to 1.4}	—
39	Screw (P-range switch mounting)	0.2 to 0.3 {0.1 to 0.2, 0.02 to 0.03}	—
48	Bolt (Base plate mounting)	9.8 to 15.0 {7.2 to 11.0, 1.0 to 1.5}	—

Lubricant

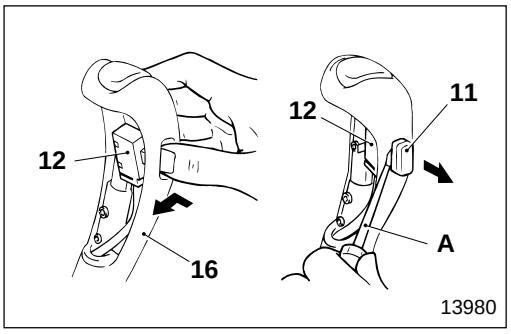
Location	Points of application	Specified lubricant	Quantity
14	Outside surface of spring	Multipurpose grease [NLGI No.2 (Li soap)]	As required
15	Sliding area of shift button	Multipurpose grease [NLGI No.2 (Li soap)]	As required
26	Sliding area of sleeve	Wheel bearing grease [NLGI No.2 (Li soap)]	As required
33	Interior of bushing	Chassis grease [NLGI No.1 (Ca soap)]	As required
36	Sliding area of ball support	Chassis grease [NLGI No.1 (Ca soap)]	As required
38	Sliding area of selector lever	Wheel bearing grease [NLGI No.2 (Li soap)]	As required
42, 45	Sliding area of clevis pin	Chassis grease [NLGI No.1 (Ca soap)]	As required
47	Sliding area of lever bracket	Chassis grease [NLGI No.1 (Ca soap)]	As required

◆ Service procedure



7 **Removal of connector**

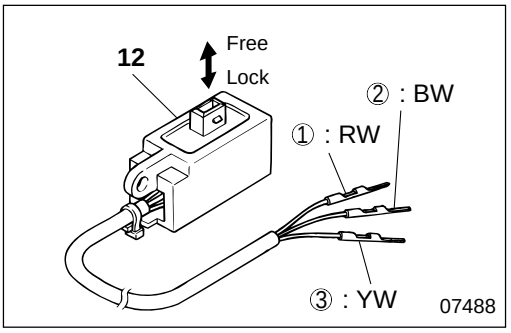
Using screwdriver **A**, pull out terminal **B** of overdrive OFF switch **12** from the inside of connector **7** and remove the connector.



11 **12** **Switch button, overdrive OFF switch**

[Removal]

- Using screwdriver **A**, remove switch button **11** from overdrive OFF switch **12**.
- Remove overdrive OFF switch **12** from automatic transmission knob **16** by pushing the switch out.

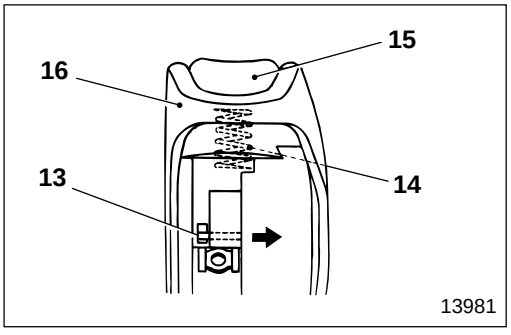


[Inspection of overdrive OFF switch **12**]

	① : RW	② : BW	③ : YW
Free	○——○		○
Lock	○	——○	

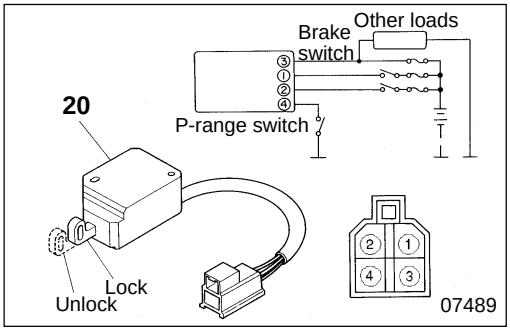
○——○ : There is continuity between terminals ○ and ○.

Replace overdrive OFF switch **12** if it is faulty.



13 **Removal of pin**

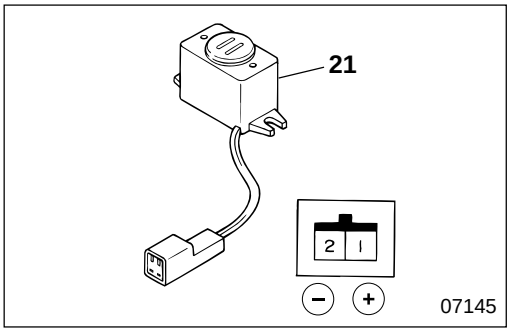
While keeping shift button **15** and spring **14** pressed down, remove pin **13** towards the inside (arrow direction) of automatic transmission knob **16**.



20 **Inspection of shift lock actuator**

Power supply		Switch		Operating mode	
IG	+B	Brake	P range	Unlock	Lock
○	○	○	○	○←	
○	○		○		→○
○	○	○		○	
○	○			○	
	○	○	○		→○
	○		○		→○
	○	○		○	
	○			○	

Check to make sure that shift lock actuator **20** is in operating mode under the above power supply and switch position.
Replace the shift lock actuator if it is faulty.

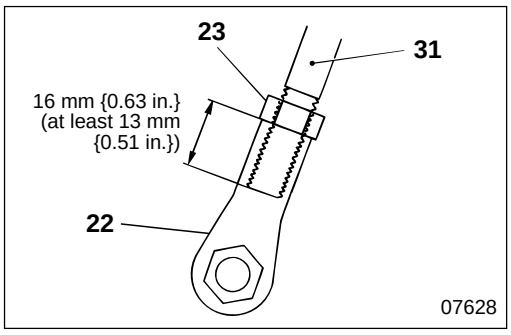


21 **Inspection of automatic transmission reverse buzzer**

- Check to make sure that the automatic transmission reverse buzzer sounds when 12 volts DC is loaded between terminals ① and ②.
- Replace automatic transmission reverse buzzer **21** if it is faulty.

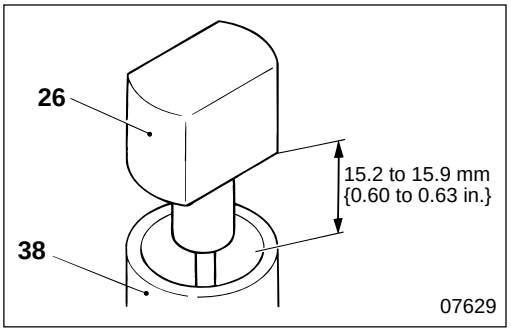
NOTE

- **Automatic transmission reverse buzzer 21 sounds continuously when you apply voltage.**
- **If you want to make automatic transmission reverse buzzer 21 sound intermittently, use the automatic transmission reverse buzzer and the back buzzer in combination.**



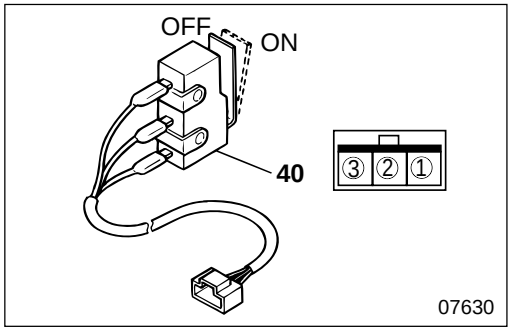
22 **Installation of ball joint**

Using ball joint **22** adjust rod **31** so that its thread ridge conforms to the dimensions as illustrated, then tighten with lock nut **23**.



26 **Installation of sleeve**

Shift range selector lever **38** to the P range. Install sleeve **26** by rotating it so that the dimension between the sleeve and the upper part of the lever conforms to the value as illustrated.



40 **P-range switch**

[Inspection]

	①	②	③
ON	○———		———○
OFF		○———	———○

○——○: There is continuity between terminals ○ and ○.
Replace P-range switch **40** if it is faulty.

[Installation]
Install P-range switch **40** so that it is OFF when the range selector lever is in the P range.

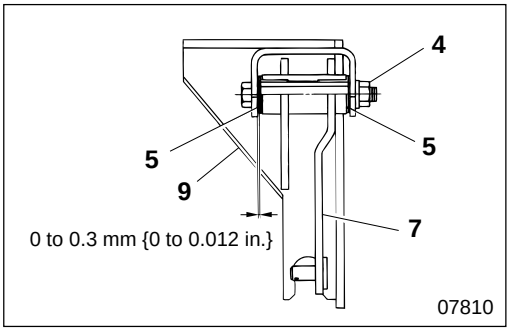
Tightening torque

Unit : N·m {ft.lbs, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
1	Nut (Range selector lever mounting)	17 to 22 {12 to 16, 1.7 to 2.2}	—
3	Nut (Bracket mounting)	9.8 to 15.0 {7.2 to 11.0, 1.0 to 1.5}	—
4	Nut (Lever mounting)	17 to 22 {12 to 16, 1.7 to 2.2}	—

Lubricant

Location	Points of application	Specified lubricant	Quantity
8	Outside surface of collar	Chassis grease [NLGI No.1 (Ca soap)]	As required



◆ Service procedure

5 **Selection of spacer**

- Select the spacer so that when nut **4** is tightened at specified torque the clearance between lever bracket **9** and spacer **5** conforms to the dimensions as illustrated.
  There are two spacer thicknesses available : 0.3, 0.5 mm {0.012, 0.020 in.}
- After installation make sure lever **7** can be operated smoothly.

Ⓣ Tightening torque

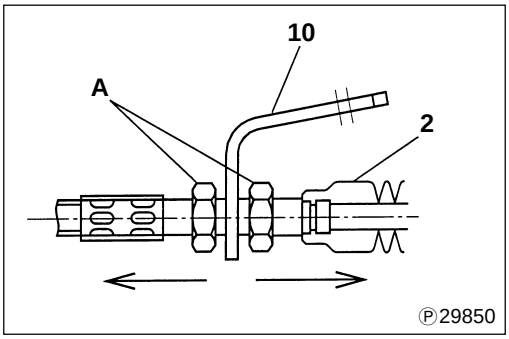
Unit : N·m {ft.lbs, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
1	Nut (Selector cable mounting)	3.9 to 5.9 {2.9 to 4.3, 0.4 to 0.6}	—
2	Selector cable (For mounting on bracket)	60 to 85 {43.4 to 61.5, 6.0 to 8.5}	—
3	Nut (Rod mounting)	9.8 to 15 {7.2 to 11, 1.0 to 1.5}	—
5	Nut (Lever mounting)	28 to 34 {20.3 to 25.3, 2.8 to 3.5}	—
8	Bolt (Bracket mounting)	69 to 93 {50.6 to 65, 7.0 to 7.5}	—

Lubricant

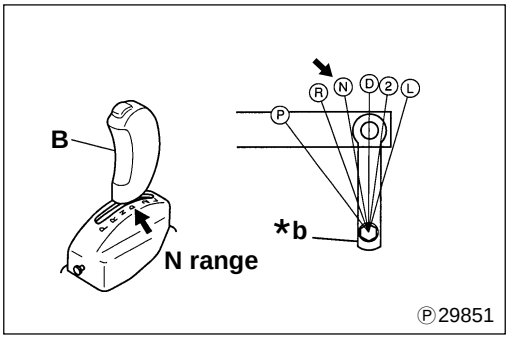
Location	Points of application	Specified lubricant	Quantity
6	Inside bushings	Chassis grease [NLGI No.1 (Ca soap)]	As required

◆ Service procedure

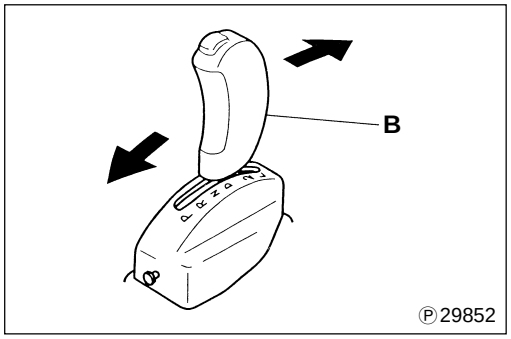


2 **Selector cable**

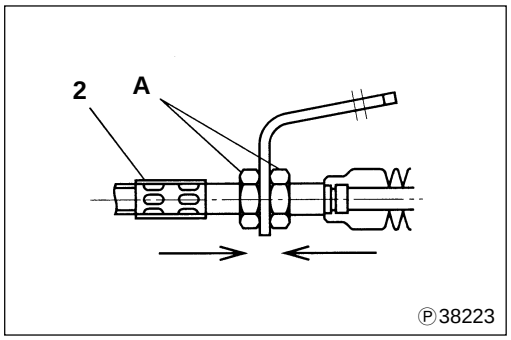
- Loosen nuts **A** on the selector cable **2** all the way to the ridges.



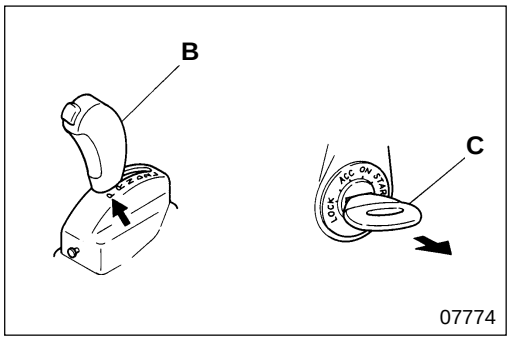
- Set automatic transmission lever knob **B** (located inside the cabin) and transmission control lever ***b** to the N range position.



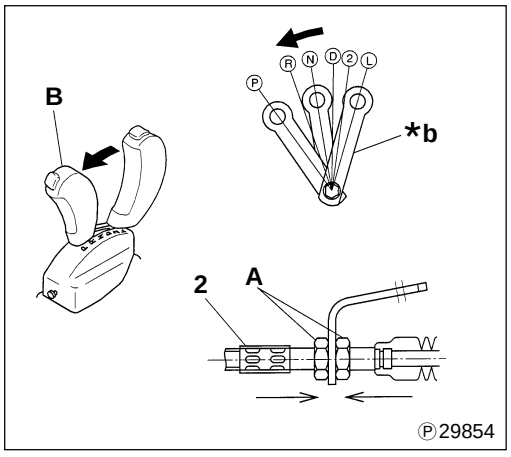
- Shake automatic transmission lever knob **B** back and forth.



- While ligthly pressing transmission control shift lever ***b** to R range position, tighten nut **A** of selector cable **2** to the specified torque.



- Make sure that starter key **C** can be removed with automatic transmission lever knob **B** in the P range.



[Adjustment]

Adjust nuts **A** on selector cable **2** so that transmission control lever ***b** moves smoothly in the entire range when automatic transmission lever knob **B** is moved from the L range to P range.

CAUTION ⚠

If the adjustment of nuts A is improper, automatic transmission lever knob B produces resistance when it is moved to the L or P range. In some cases, the starter key cannot be removed with the automatic transmission lever knob in the P range.

REPLACEMENT OF AUTOMATIC TRANSMISSION PARTS

Special tools

Location	Tool name and shape	Part No.	Application
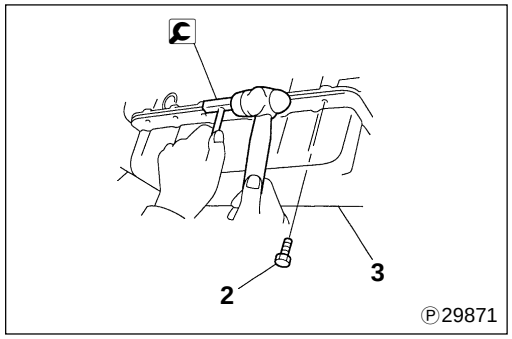
25	Oil seal installer  Ⓟ29857	MH063608	Installation of oil seal

◆ Service procedure



Ⓟ29871

3 Oil pan

[Removal]

- Remove bolts **2**.

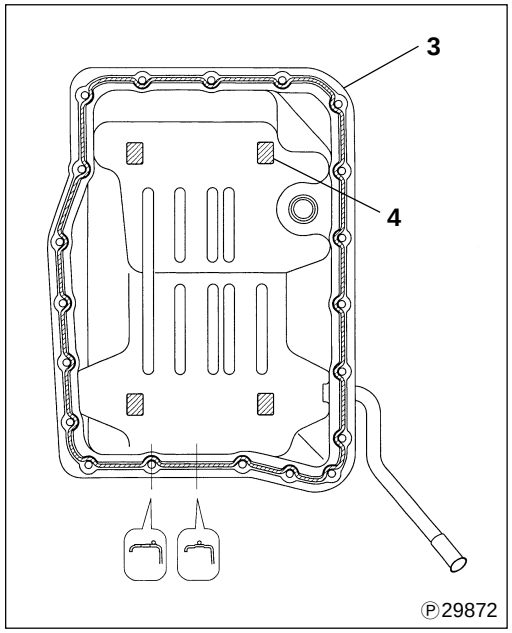
CAUTION

To prevent oil pan 3 from dropping when separating the sealant from the oil pan, keep several bolts (not tightened) mounted at intervals of three bolt holes.

- Insert oil pan remover at a corner of oil pan **3**, and separate the oil pan from the automatic transmission unit.

CAUTION

- **Be careful not to deform the shape of oil pan 3 when inserting oil pan remover.**
- **Do not tilt the oil pan during removal since the oil pan 3 contains oil.**



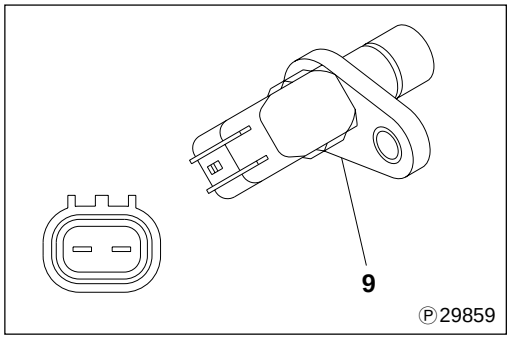
Ⓟ29872

[Installation]

- Remove the sealant from the mounting surfaces of the automatic transmission unit and oil pan **3**.
- Clean oil cleaner magnets **4**, and mount them in the oil pan.
- Apply sealant on oil pan **3**, and mount the oil pan on the automatic transmission unit.
- Tighten bolts **2** to the specified torque.

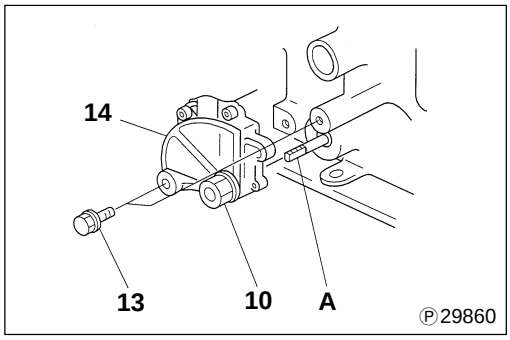
CAUTION

- **Do not allow automatic transmission fluid on the contact surfaces of oil pan 3 and the automatic transmission unit.**
- **Apply sealant continuously with a diameter of 2 or 3 mm {0.079 to 0.12 in.}, as shown in the diagram.**
- **Install the oil pan within 10 minutes after the application of the sealant.**
- **Tighten bolts 2 evenly by conducting the tightening operation for each bolt several times.**



9 Inspection of speed sensor

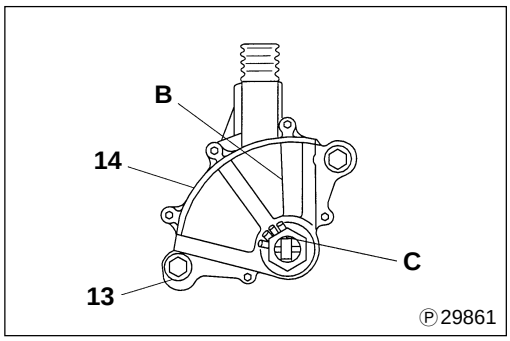
- Measure the resistance between the connector terminals shown in the diagram. If the measured value deviates from the standard value, the connector is defective.
- Standard resistance between terminals: 560 to 680 Ω (at normal temperature)



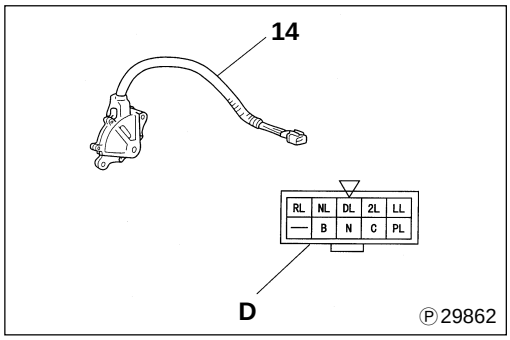
14 Inhibitor switch

[Installation]

- Set control shaft **A** to the N position.
- Mount inhibitor switch **14** on control shaft **A**.
- Tighten two bolts **13**.
- Tighten nut **10**.



- Loosen two bolts **13**, and position inhibitor switch **14** so that reference line **B** on the inhibitor switch aligns with groove **C**.
- While holding inhibitor switch **14** with one hand, tighten two bolts **13** to the specified torque with the other hand.
- Bend the two lock tabs on the nut of inhibitor switch **14**.



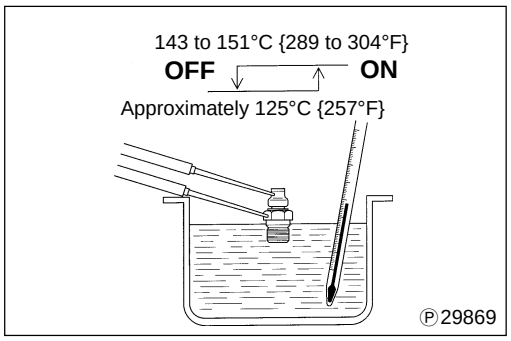
[Inspection]

Check the electric conduction at wire connector **D** of inhibitor switch **14** using a tester.

< Connection chart >

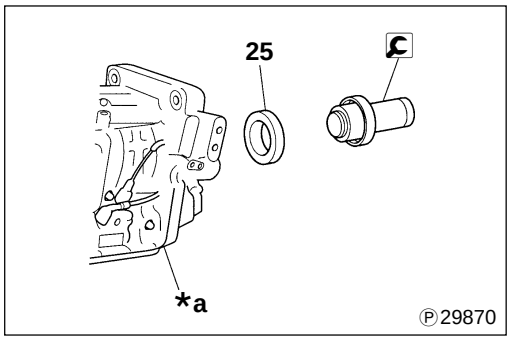
	B	N	C	PL	RL	NL	DL	2L	LL
P	○	○	○	○					
R			○		○				
N	○	○	○			○			
D			○				○		
2			○					○	
L			○						○

○——○ : Electric conduction between terminals



19 **Oil temperature switch**

Place oil temperature switch assembly **19** in a container filled with glycerin. Vary the temperature of the oil, and check to make sure that the switch operates (ON and OFF) at the specified temperatures.



25 **Installation of oil seal**

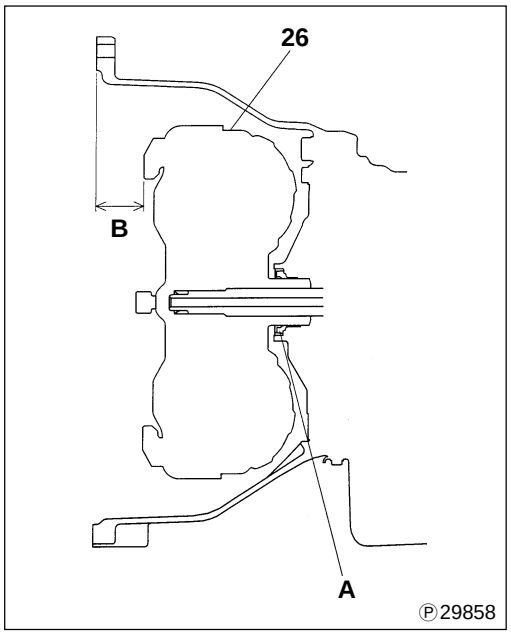
CAUTION

After the oil seal 25 is removed, clean the surface of the extension housing of automatic transmission unit *a to which oil seal is mounted.

- Apply grease on the lip section of oil seal **25**.
- Use oil seal installer to insert oil seal **25** all the way into the extension housing of automatic transmission unit ***a**.

CAUTION

- **Insert oil seal 25 evenly.**
- **Do not damage or deform the shape of oil seal 25.**



26 **Installation of torque converter**

- Pour new automatic transmission fluid into torque converter **26** when the torque converter to be installed is new.
  Automatic transmission fluid quantity : Approximately 2 L {2.1 qts}
- Apply automatic transmission fluid on front oil seal **A**, and mount torque converter **26** on the oil pump.

CAUTION

Be careful not to damage oil seal A when mounting torque converter 26.

- Measure dimension **B** between the torque converter housing and the set block of torque converter **26** to make sure that the torque converter is inserted into the proper position.
  Dimension **B** : 44 mm {1.73 in.} or more

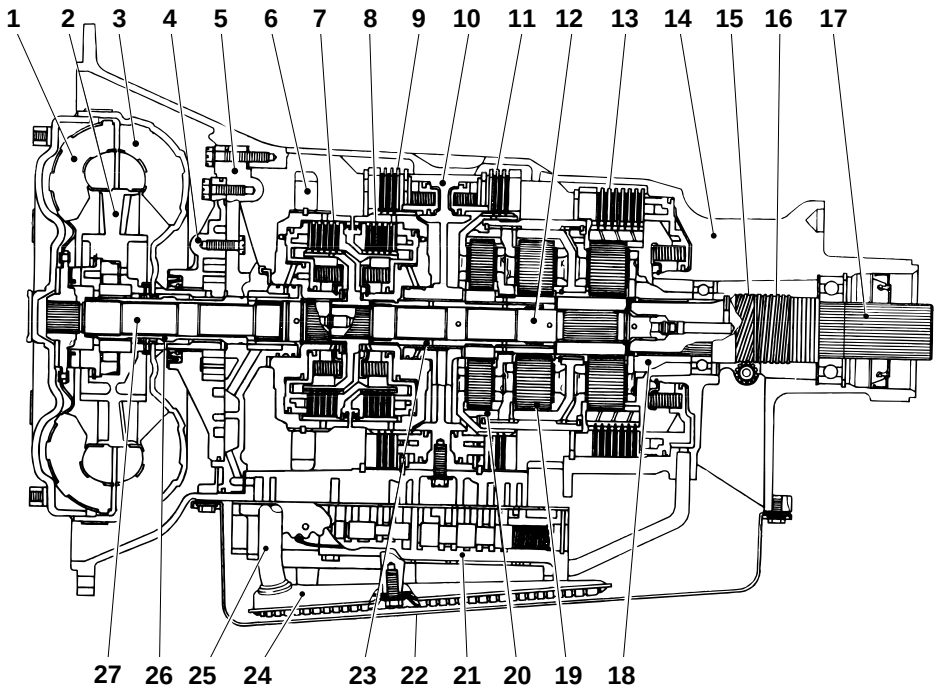
Automatic Transmission Assembly



1	Turbine	**10**	Center support	**19**	Center planetary gear set
2	Stator	**11**	2nd clutch	**20**	Front planetary gear set
3	Impeller	**12**	Mainshaft	**21**	Control valve assembly
4	Oil pump assembly	**13**	1st and reverse clutch	**22**	Oil pan
5	Front support	**14**	Transmission case	**23**	Sun gear shaft
6	Power take-off drive gear	**15**	Governor drive gear	**24**	Oil filter
7	Forward clutch	**16**	Speedometer sensor drive gear	**25**	Intake pipe
8	4th clutch	**17**	Output shaft	**26**	Stator shaft
9	3rd clutch	**18**	Rear planetary gear set	**27**	Turbine shaft

The automatic transmission consists of a torque converter and a fully automatic 4-speed gear system.

● **Torque converter**

The torque converter is driven by the engine crankshaft, and functions as the input device for the transmission. The torque converter also acts as the fluid coupling, absorbing shock during engine start up and gear shifting.

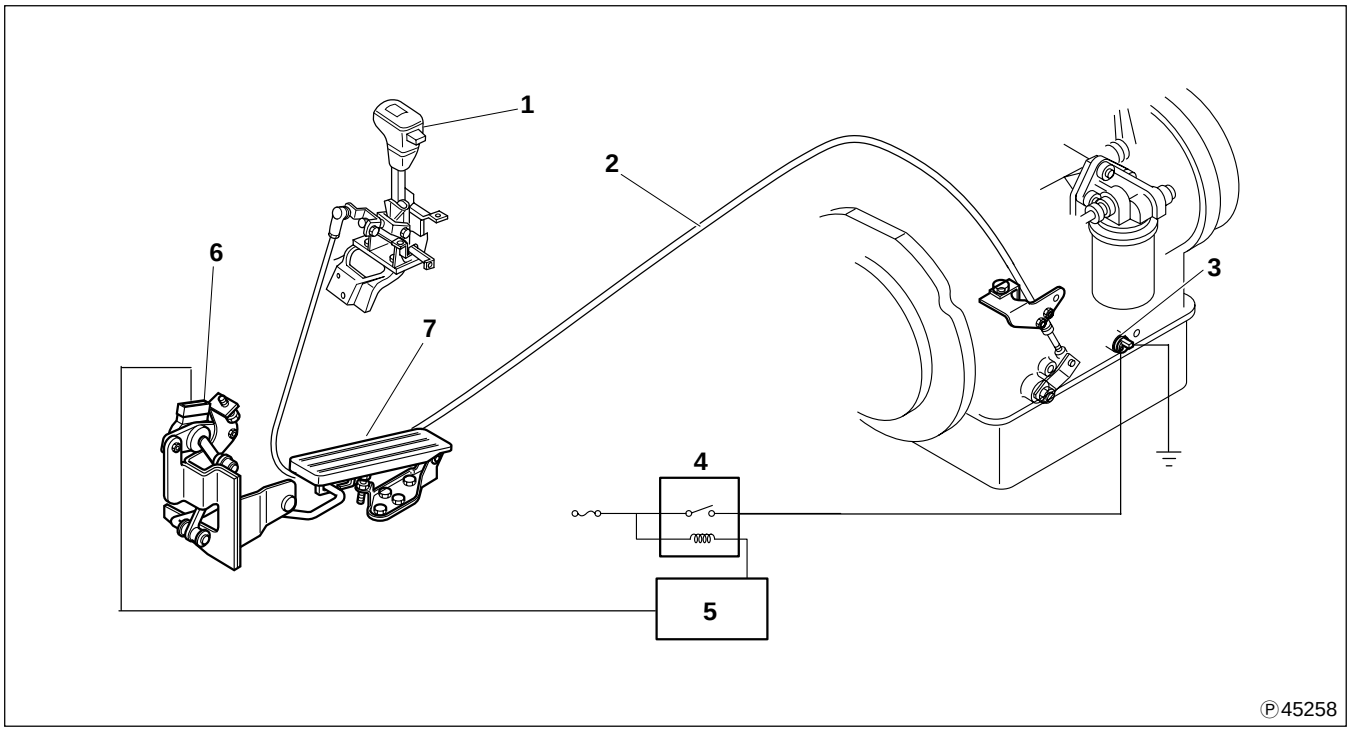
● **Transmission (4 forward speeds, 1 reverse speed)**

The transmission is accomplished by three sets of planetary gears **18**, **19**, **20** and five sets of oil pressure-operated, wet-type multiple disc clutches **7**, **8**, **9**, **11**, **13**. These oil-cooled clutch discs are self-adjusting to compensates for wear.

● **Oil pressure control area**

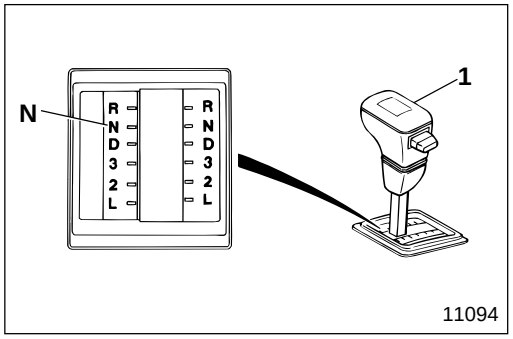
This oil pressure control area consists of oil pump **4**, control valve assembly **21** that controls the changeover between clutches **7**, **8**, **9**, **11**, and **13**, the modulator that monitors the amount the accelerator pedal is depressed, and the governor that monitors the vehicle speed. Gear shift is made automatically and depends on how much the accelerator pedal is depressed and how fast the vehicle is travelling.

Automatic Transmission Control



1 Range selector lever
2 Selector cable
3 Modulator
4 Relay
5 Engine control unit
6 Accelerator pedal position sensor
7 Accelerator pedal

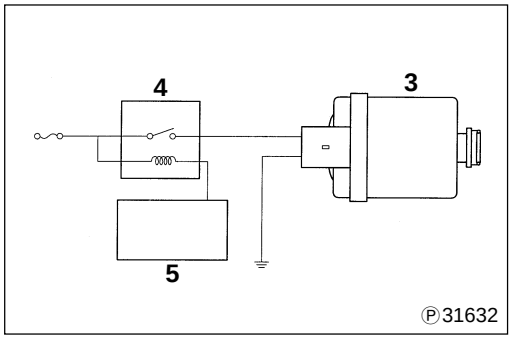
Selector Lever



Range selector lever **1** selects the most suitable range for the operating conditions, ensuring optimum service from the automatic transmission. Safety features are incorporated that make sure that the engine cannot be started when the range selector lever is in any position other than neutral (N).

N : Neutral

Modulator

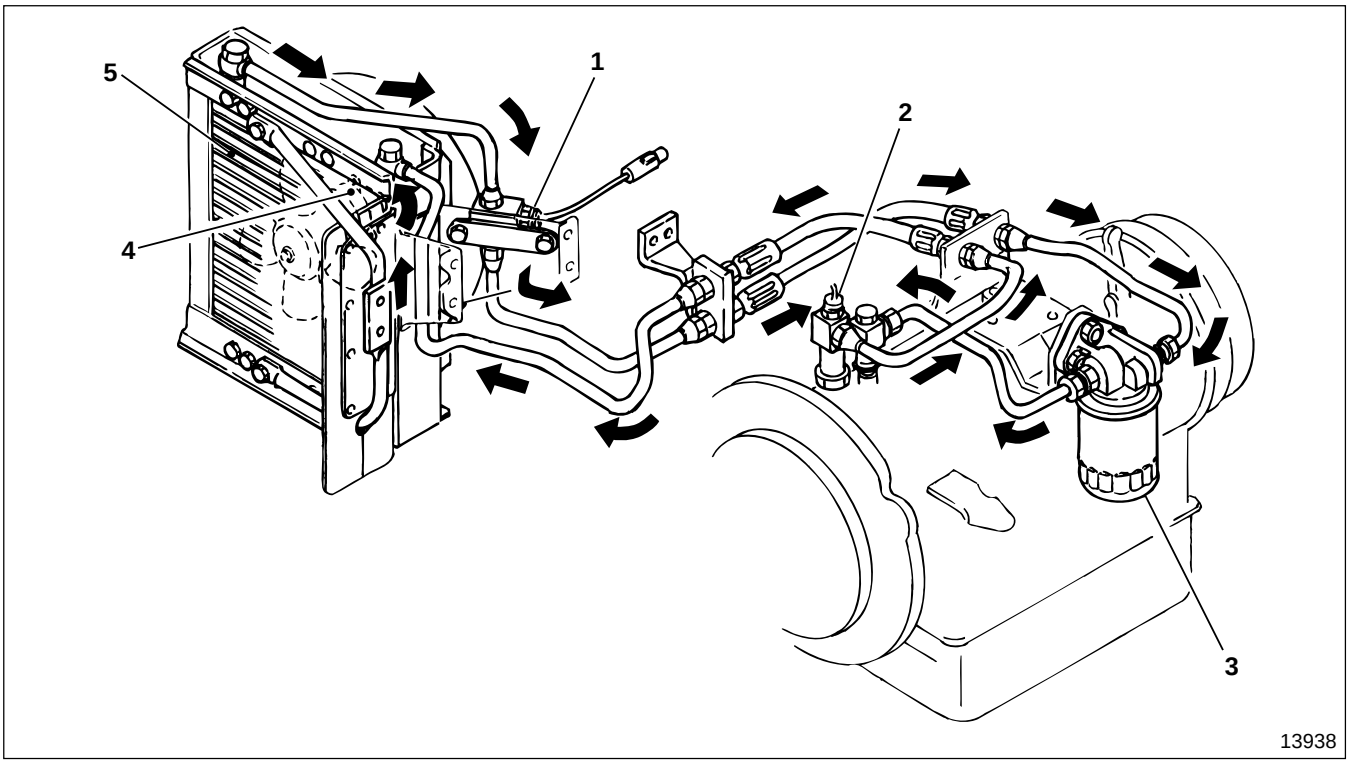


Modulator **3** converts the amount the accelerator pedal is depressed into hydraulic pressure.

- Outline of operating system
  Engine control unit **5** sends a signal via relay to modulator **3** for switching between closed-throttle shift and full-throttle shift.

- Operating conditions
  Throttle opening of 80% or more : ON (Full-throttle shift)
  Throttle opening of 65% or less after ON : OFF (Closed-throttle shift)

Oil Cooler



1 Automatic transmission fluid thermostat switch (Oil cooler fan)
2 Automatic transmission fluid temperature switch (Warning lamp)
3 Oil filter
4 Blower assembly
5 Oil cooler

Oil Temperature Warning System

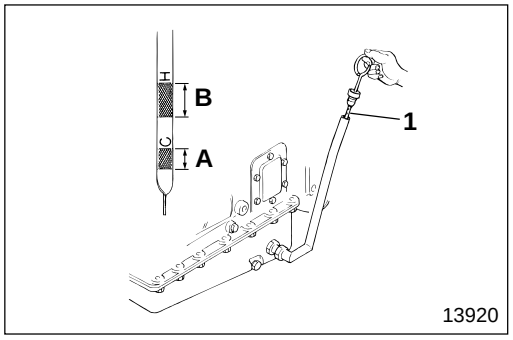
ON-VEHICLE INSPECTION AND ADJUSTMENT

Inspection of Automatic Transmission Fluid

(1) Inspection of characteristics

If the automatic transmission fluid smells burnt or if it contains metal particles or sludge as a result of internal friction and wear of metal or other material, the transmission assembly must be completely overhauled. Make sure you carefully examine the automatic transmission fluid on the dipstick. If you find the quality questionable, take a sample and examine it more closely.



(2) Inspection of automatic transmission fluid level

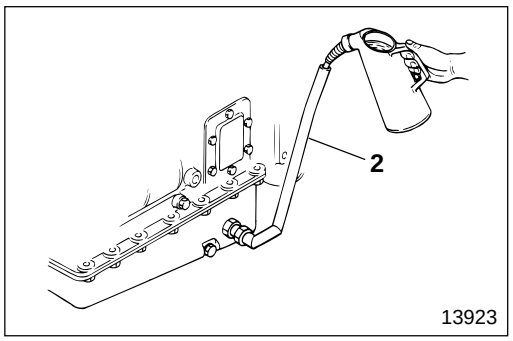
- Park the vehicle on level ground, make sure that the parking brake is fully activated and chock the wheels to keep them from rolling.
- Start the engine and let it idle. To fill the hydraulic circuit with automatic transmission fluid, shift the range selector lever from N → R → N → D → 2 → D → N. Repeat this process five times, finally shifting to N.
- While the engine is still idling, pull out dipstick **1** and wipe off the fluid sticking to it. Reinsert the dipstick, then pull it out again and check the fluid level.
- If the fluid level is inspected right after the engine is started and the fluid temperature is still low (approximately 15 to 49°C {60 to 120°F}), the level should be within area **A** marked COLD on the dipstick.
- If the fluid level is inspected after the vehicle has been driven and the fluid temperature is high (approximately 71 to 93°C {160 to 200°F}), the level should be within area **B** marked HOT on dipstick **1**.

WARNING⚠

Take care during the inspection because the engine will be running. Take sufficient care to avoid burns or injuries resulting from contact with moving parts.

NOTE

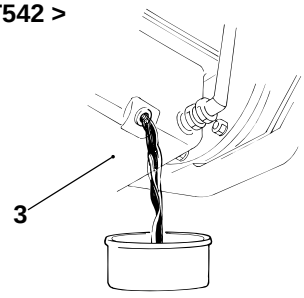
- **Make sure the vehicle is parked on level ground when you are checking the fluid level.**
- **Make sure the range selector lever is in the N position and the engine is idling when you are checking the fluid level. When the engine is stopped, the fluid level appears higher than it actually is.**
- **Be sure to wipe off the dust from the safety cap and the upper part of dipstick guide 2 before you pull out dipstick 1.**
- **To ensure the fluid is correct, reinspect the fluid level after an actual drive.**



- If the fluid level is low, add automatic transmission fluid (DEXRON or DEXRON II type) through dipstick guide **2** until the correct level on dipstick **1** is reached.

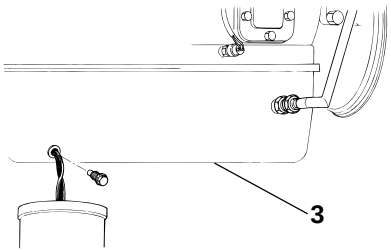
Replacement of Automatic Transmission Fluid

< AT542 >

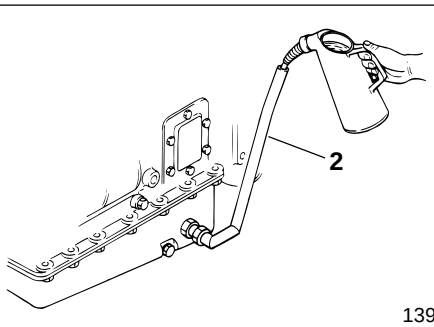


13921

< AT545 >



13922



13923

(1) Draining

- Park the vehicle on level ground, chock the wheels and shift the range selector lever to the **N** position.
- Place a container under oil pan **3**, remove the drain plug and drain the fluid.
- Clean oil pan **3** and the drain plug. Replace the oil filter. P23B-19
- Replace the outer oil filter. P23B-26

WARNING

Take care because the fluid temperature immediately after the engine has stopped is very high. To avoid scalds, wait until a safe temperature has been reached before draining the fluid.

NOTE

- **The fluid will drain faster if the engine is first run to raise the fluid temperature.**
- **The fluid cannot be drained from the hydraulic circuit, the torque converter or the oil cooler.**
- **Check the drained fluid for dirt, metal particles and metal fragments.**

(2) Supply

- Install oil filter, oil pan **3** and drain plug. P23B-19
- Add automatic transmission fluid (DEXRON or DEXRON II type) through dipstick guide **2**.
  AT542 : 8.5 L {9.0 qts}
  AT545 : 15 L {16 qts}

CAUTION

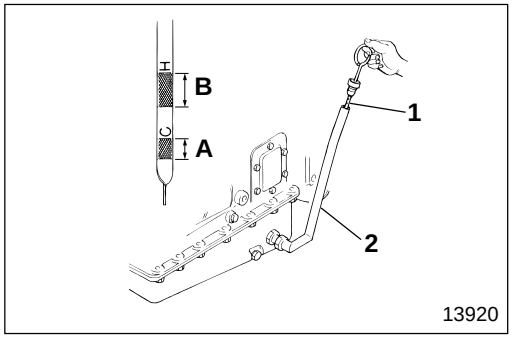
Make sure that dirt and foreign particles do not become mixed in with the fluid when it is added.

- Shift the range selector lever to the N position, start the engine and let it idle for about one minute.
- After shifting the lever through all positions once, shift it back to N position.

CAUTION

To prevent burning out the interior of the automatic transmission assembly, make sure that the engine is not allowed to race when you do the above.

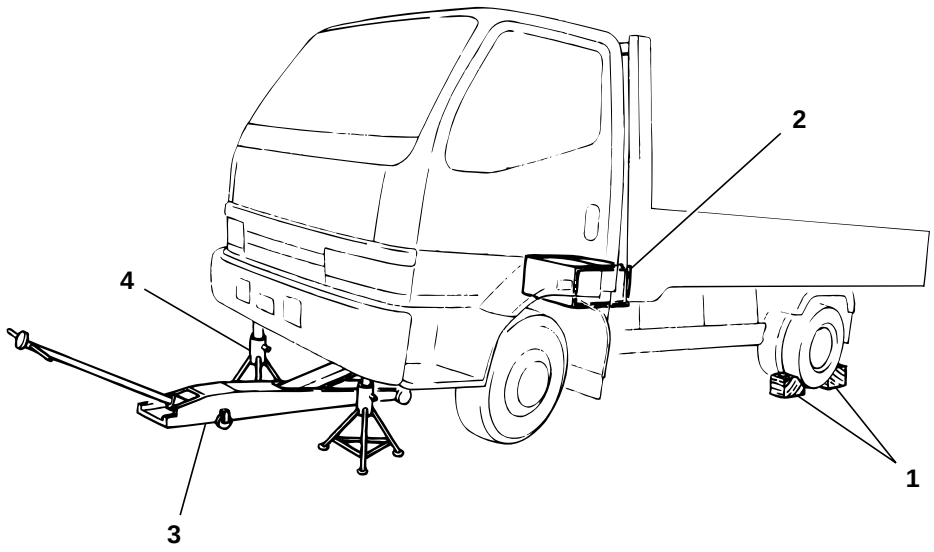
ON-VEHICLE INSPECTION AND ADJUSTMENT



- Check and adjust so that the fluid level is within the specified area on dipstick **1**.

NOTE

- **As the temperature of the fluid rises, so does the fluid level. If you add fluid while the temperature is still low (approximately 15 to 49°C {60 to 120°F}), make sure that the level stays within area A, marked COLD on dipstick 1.**
- **Let the engine idle and, while paying attention to the fluid level, pour in the fluid slowly.**
- **It is sometimes hard to check the fluid level, immediately after supplying fluid, because of the fluid adhering to the interior of dipstick guide 2. If this is the case, check the fluid level several times at intervals.**
- **Be careful not to supply too much fluid because you might mistake the fluid that overflows from the air breather for fluid leakage.**



14340

● **Work sequence before removal**

1 Place wheel chocks.
2 Disconnect the negative battery cable Gr 54
3 Jack up the front axle with a garage jack.
4 Support the front frame on rigid racks.

WARNING⚠

- **The parking brake will be removed so naturally it cannot be used. Chock the wheels securely so the vehicle does not move.**
- **Do not remove the chocks until the entire operation is completed.**
- **Supporting a vehicle on a garage jack only is extremely dangerous, so always support the frame on rigid racks.**
- **Leave the garage jack and rigid racks in place until the entire operation is completed. Never remove them during the operation.**

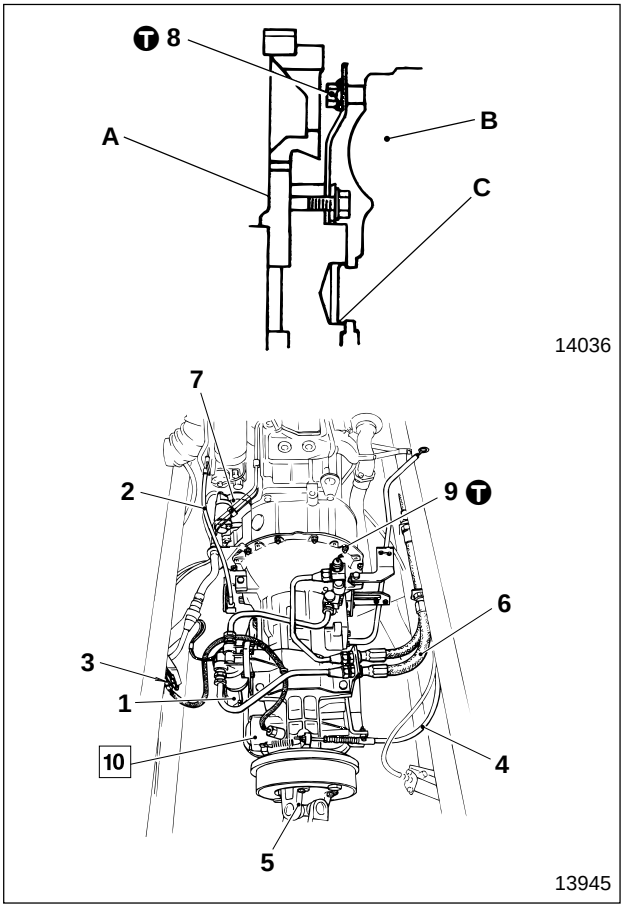
CAUTION⚠

Be sure to keep the automatic transmission in neutral throughout the operation.

● **Work sequence after installation**

Follow the work sequence before removal in reverse.

REMOVAL AND INSTALLATION OF AUTOMATIC TRANSMISSION ASSEMBLY



● **Removal Sequence**

1 Chassis harness (Modulator)
2 Selector cable
3 Harness connector
4 Parking brake cable Gr 36
5 Propeller shaft Gr 25
6 Oil cooler hose
7 Starter Gr 54
8 Bolt

B : Torque converter
C : Torque converter pilot area

● **Installation sequence**

Follow the removal sequence in reverse.

Tightening torque

Unit : N·m {ft.lbs, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
8	Bolt (Torque converter and flywheel mounting)	51 to 61 {38 to 45, 5.20 to 6.22}	—
9	Nut (Automatic transmission assembly mounting)	39 to 58 {28 to 43, 3.9 to 6.0}	—

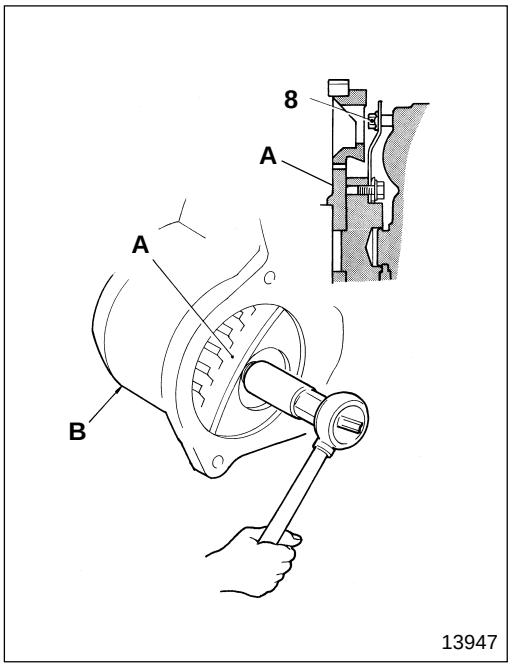
Lubricant

Location	Points of application	Kinds	Quantity
10	Torque converter pilot area (area C)	Molybdenum disulfide grease [NLGI No.2 (Li soap)]	As required

Special tools

Location	Tool name and shape	Part No.	Application
10	Converter installer  03726	ME633437	Automatic transmission assembly installation guide

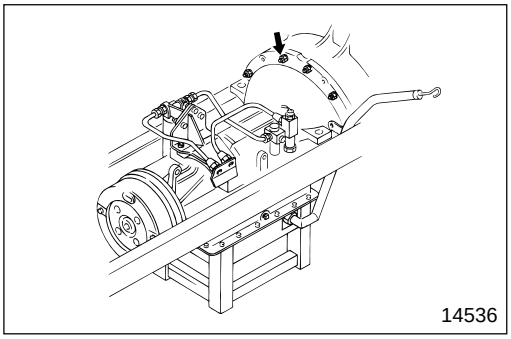
◆ Service procedure



10 **Automatic transmission assembly**

[Removal]

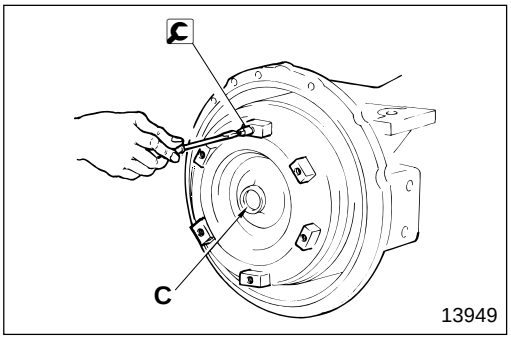
- Rotate flywheel **A** and remove bolts **8** in sequence.
  B : Starter housing



- Use a square bar or a similar object to support the oil pan of automatic transmission assembly **10**, then remove it by pulling it out backward.

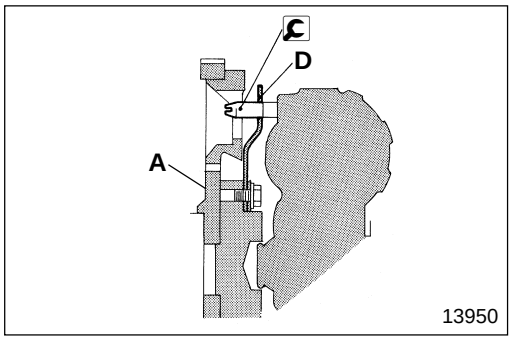
CAUTION

- **Be careful not to apply force unevenly to any of the oil pan parts.**
- **Be careful not to let the torque converter fall from the transmission body because as a single unit the torque converter can come loose easily.**

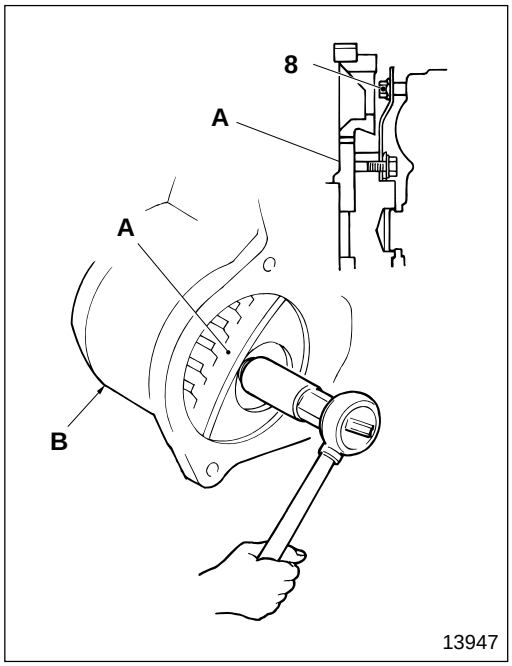


[Installation]

- Apply molybdenum disulfide grease to torque converter pilot area **C**.
- Mount torque converter installer in the tapped hole on the torque converter periphery.



- Install the automatic transmission assembly to the engine flywheel housing, by aligning torque converter installer with the hole in flexplate **D** of flywheel **A**.



- Rotate flywheel **A** and tighten bolts **8**, in sequence, through the working hole of starter housing **B** (6 points).
- Remove the converter installer and replace it with bolt **8**.
- First tighten all six bolts **8** temporarily, then tighten at specified torque.

NOTE

Be careful not to drop bolts 8 into the gap between flywheel A and the torque converter.

OIL SEAL AND SPEEDOMETER WORM

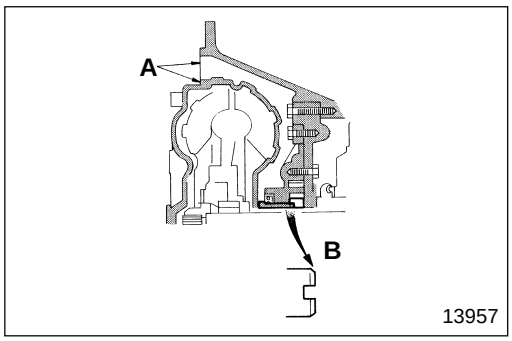
◆ Service procedure

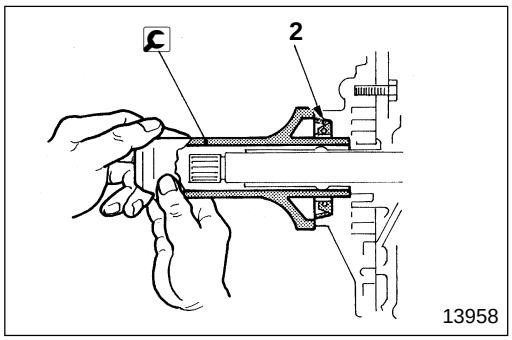


1 **Installation of torque converter**

Align the hub groove of torque converter **1** with the claw of the oil pump, then insert until the welded part on the converter periphery and the housing flange almost coincide.

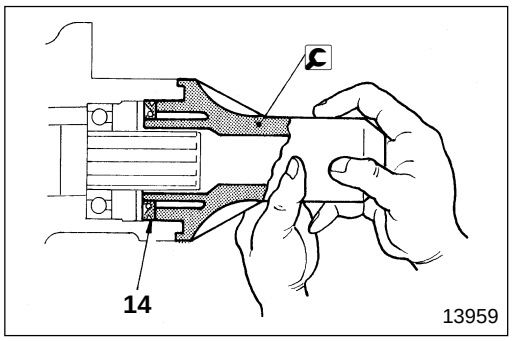
CAUTION
Be careful not to scratch the oil seal.

A : Guide to insertion position (Align faces)
B : Align claw position



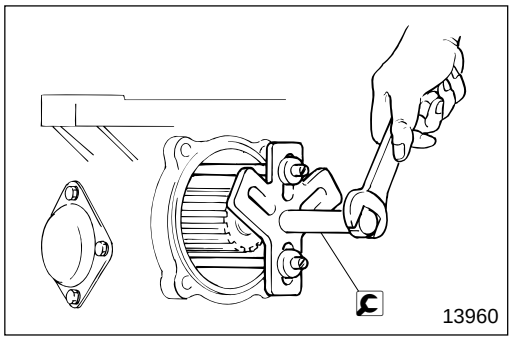
2 **Installation of oil seal**

- Apply grease to the lip area, and apply sealant to the periphery of oil seal **2**.
- Use 🔧 pump seal installer and install oil seal **2**.



14 **Installation of oil seal**

- Apply grease to the lip area, and apply sealant to the periphery of oil seal **14**.
- Use 🔧 rear oil seal installer and install oil seal **14**.



16 **Bearing**

[Removal]

- Insert the claw on the tip of 🔧 bearing remover set rod between the bearing race of bearing **16**.
- Insert the bolt of 🔧 bearing remover set into the automatic transmission output shaft, then remove bearing **16** by tightening the bearing remover.

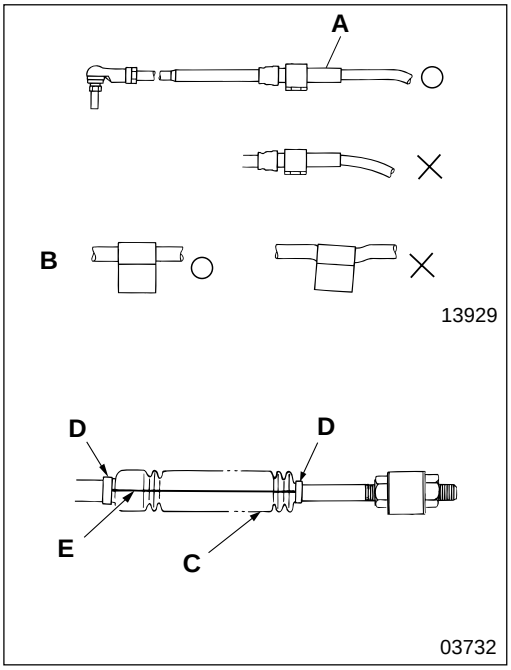
7	Nut (Selector lever mounting)	23.5±3.4 {17±2.5, 2.4±0.35}	—

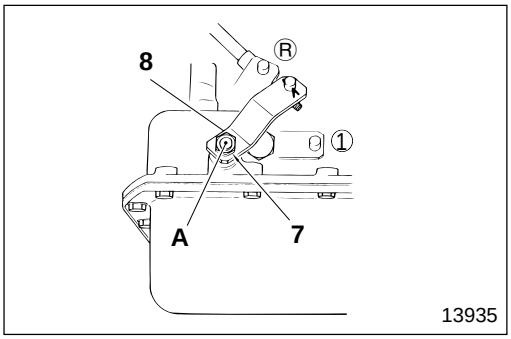
◆ Service procedure



6 Installation of selector cable

NOTE

- **Make sure casing cap A is installed in a straight line.**
- **Cable bend radius must be 20 cm {7.87 in.} or more.**
- **Make sure the cable is straight.**
- **Install the clamp at right angles to the cable. (Figure B)**
- **Do not twist clamps D at the ends of boot C. Install so that white line E on the boot is a straight line. (Figure E)**



8 Installation of selector lever

If selector lever **8** has been removed, rotate selector shaft **A** and move it to an intermediate position between, but other than, ① and Ⓡ, then tighten nut **7**.

CAUTION ⚠

Be careful not to overtighten nut 7, it might cause the internal lever to malfunction.

● Inspection after installation

- Make sure that when the range selector lever * on the driver's side is operated, the detent positions of selector lever **8** on the automatic transmission side agree with the corresponding positions of the range selector lever on the driver's side. Also make sure that the range selector lever on the driver's side and the selector lever on the automatic transmission side are both operating smoothly.
- Make sure the modulator cable moves smoothly.
- Make sure the starter switch can be operated only in the neutral position, and is disabled for all other positions.
- Make sure the backup lamps light when the selector is in the reverse (R) position.
  (The lamps do not light when the engine is stopped.)

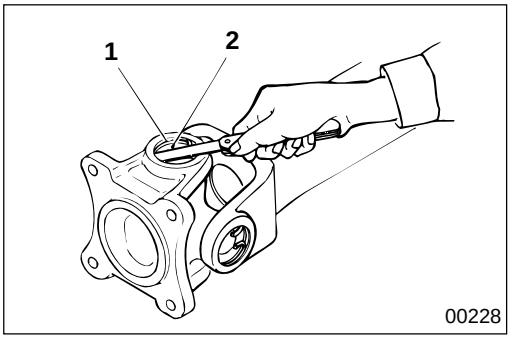
9	Inner surface of cork seal	Wheel bearing grease [NLGI No. 2 (Li soap)]	As required
10	Supply via grease nipple	Wheel bearing grease [NLGI No. 2 (Li soap)]	Pack until grease overflows from dust plug hole

Special tools

Location	Tool name and shape	Part No.	Application
1	Snap ring repressor  00227	MH061001	Removal and installation of snap ring



00228

◆ Service procedure

● **Inspection before disassembly**

Clearance in axial direction for spider

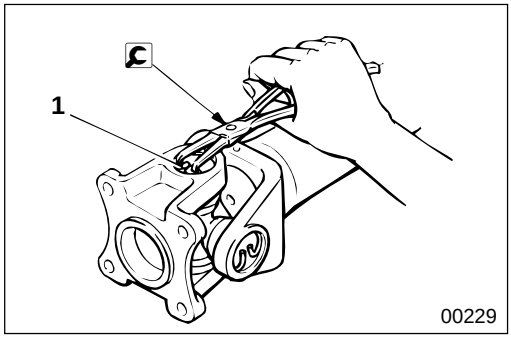
Press needle bearing **2** downward firmly, and measure the clearance between snap ring **1** and the needle bearing. If the measured value is higher than the standard value, adjust it by changing the thickness of the snap ring.

- Available snap ring thicknesses

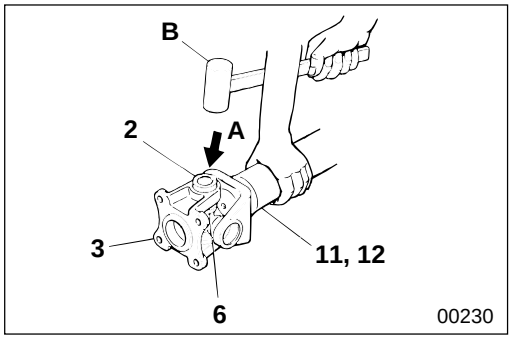
Part name	Thickness	Identification color
Snap ring A	2.5 mm {0.098 in.}	Green
Snap ring B	2.6 mm {0.10 in.}	Red

NOTE

For snap ring 1, it is recommended that you use rings with the same thickness on both ends to ensure balanced revolution.

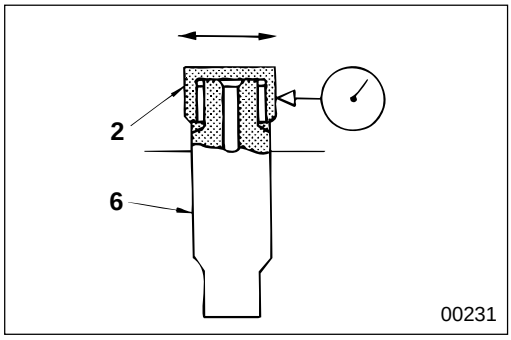


1 **Removal and installation of snap ring**



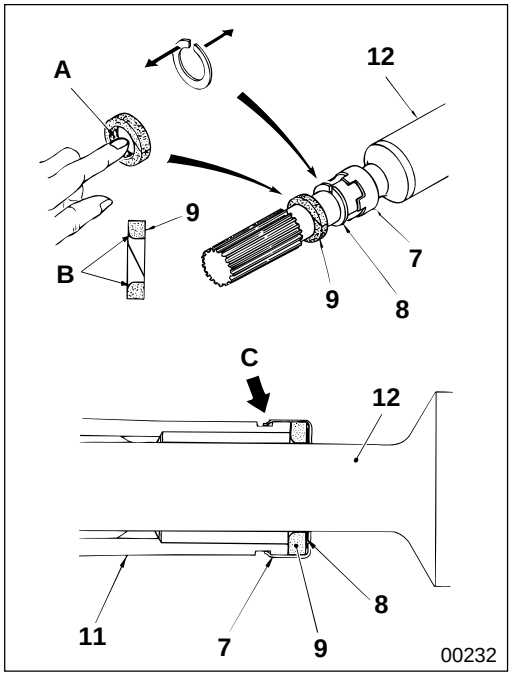
2 **Removal of needle bearing**

- Make alignment marks on needle bearing **2** and spider **6**.
- Make alignment marks across flange yoke **3**, slip yoke joint **11** and rear propeller shaft **12**.
- Hit the yoke lightly at shoulder area **A** so that needle bearing **2** bounces out due to reaction.
  B : Mallet



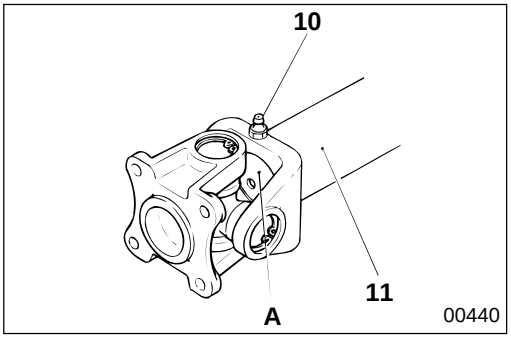
2 **6** **Clearance between needle bearing and spider**

Measure the play towards the diameter direction between needle bearing **2** and spider **6**. If the measured value is higher than the limit, replace with universal joint spider kit.



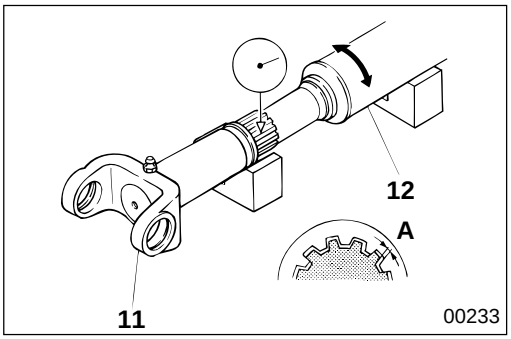
7 **to** **9** **Assembly of dust cap, retainer and cork seal**

- Insert dust cap **7** into rear propeller shaft **12** and expand retainer **8** carefully to mount it on the propeller shaft. Then, release the retainer and allow it to return to its original shape.
- Apply grease to inner surface **A** of cork seal **9**, face its chamfered side **B** towards the spline and mount in the same way as retainer **8**.
- Press cork seal **9**, compressing it by 1 to 2 mm {0.039 to 0.079 in.}, against slip yoke joint **11**, then caulk pawl area **C**.



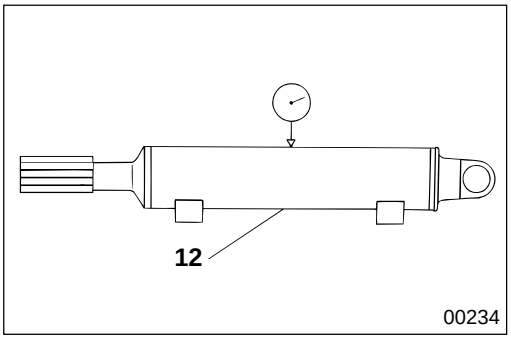
10 **Supply of grease via grease nipple**

Pack grease via grease nipple **10** until grease starts overflowing from the hole in dust plug **A** of slip yoke joint **11**.



11 **12** **Play between slip yoke joint and rear propeller shaft spline in rotaring direction**

Measure play **A** between slip yoke joint **11** and rear propeller shaft **12** at the spline area. If the measured value is higher than the limit, replace the faulty parts.



12 **Bend of rear propeller shaft**

Measure bend of rear propeller shaft **12** at its center. If the measured value is higher than the limit, correct or replace it.

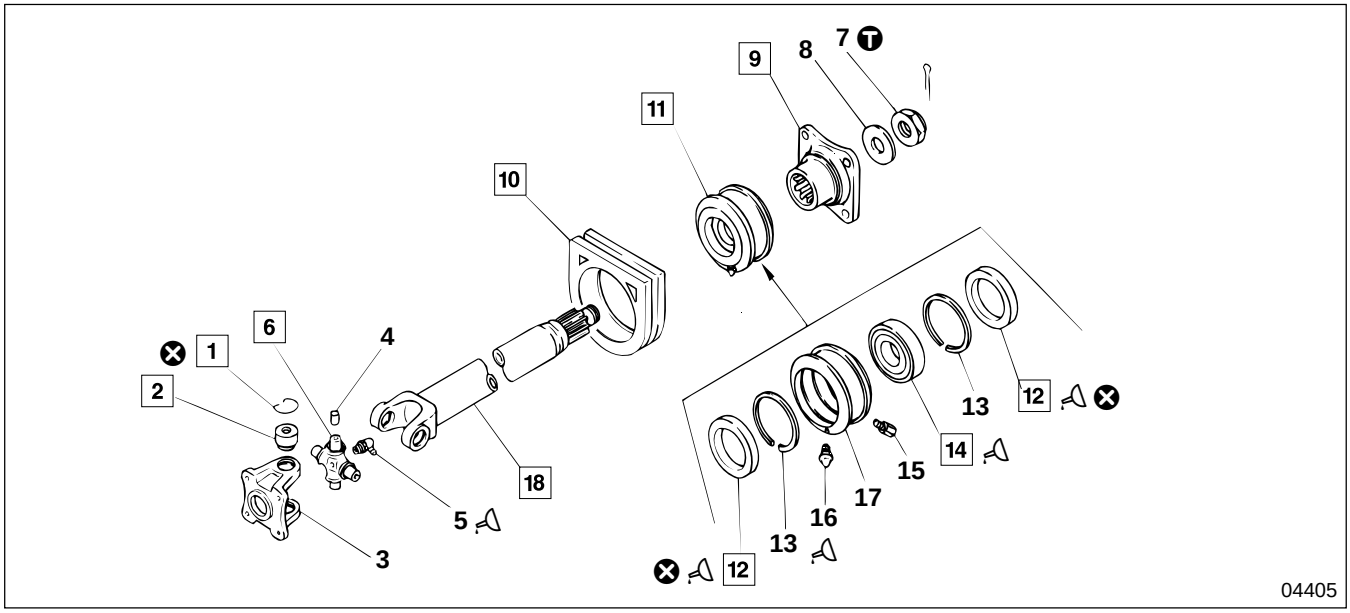
CAUTION

Be sure to check for cracks at the welded area after straightening has been done by means of a press.

NOTE

To measure the bend of rear propeller shaft 12, turn it one full revolution and read the dial gauge indicator. The bend is one half of the indicated value.

FRONT PROPELLER SHAFT



● **Inspection before disassembly**

13 Snap ring
14 Center bearing
15 Relief valve
16 Grease nipple
17 Center bearing case
18 Front propeller shaft

⊗ : Non-reusable parts

● **Assembly sequence**

Follow the disassembly sequence in reverse.

Repair kit : Universal joint spider kit

Service standards

Unit : mm {in.}

Location	Maintenance item	Standard value (Basic diameter in [ ])	Limit	Remedy
1 to 6	Clearance of spider is axial direction	0 to 0.25 {0 to 0.0098}	—	Adjust
2, 6	Clearance between needle bearing and spider	[26.7] 0.02 to 0.07 {[1.05] 0.00079 to 0.0028}	0.2 {0.0079}	Replace
18	Bend of front propeller shaft (Center)	—	0.6 {0.024}	Correct or replace

Ⓣ Tightening torque

Unit : N·m {ft.lbs, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
7	Nut (Companion flange mounting)	200 to 340 {145 to 255, 20 to 35}	—

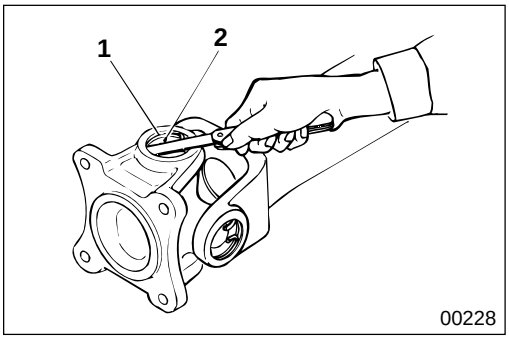
Lubricant

Location	Points of application	Kinds	Quantity
5	Supply via grease nipple	Wheel bearing grease [NLGI No. 2 (Li soap)]	Pack until grease overflows from spider dust cover
12	Lip area of oil seal	Wheel bearing grease [NLGI No. 2 (Li soap)]	As required
14	Pack area of center bearing assembly that houses ball bearings	Wheel bearing grease [NLGI No. 2 (Li soap)]	As required
16	Supply via grease nipple	Wheel bearing grease [NLGI No. 2 (Li soap)]	Pack until grease overflows from relief valve

Special tools

Unit : mm {in.}

Location	Tool name and shape	Part No.	Application
1	Snap ring expander  00227	MH061001	Removal and installation of snap ring
9	Flange puller  00552	MC881524	Removal of companion flange
17	Gear puller  00553	MH061102	Removal of center bearing



00228

◆ Service procedure

● **Inspection before disassembly**

Clearance in axial direction for spider

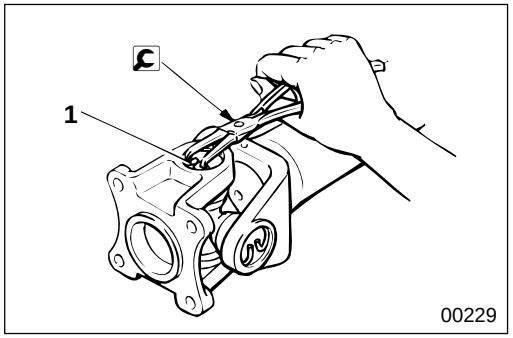
Press needle bearing **2** downward firmly, and measure the clearance between snap ring **1** and the needle bearing. If the measured value is higher than the standard value, adjust it by changing the thickness of the snap ring.

- Available snap ring thicknesses

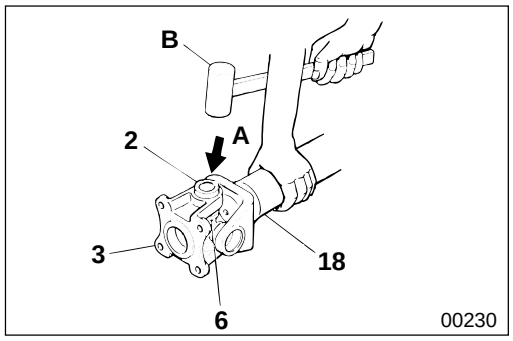
Part name	Thickness	Identification color
Snap ring A	2.5mm {0.098 in.}	Green
Snap ring B	2.6mm {0.10 in.}	Red

NOTE

For snap ring 1, it is recommended that you use rings with the same thickness on both ends to ensure balanced revolution.

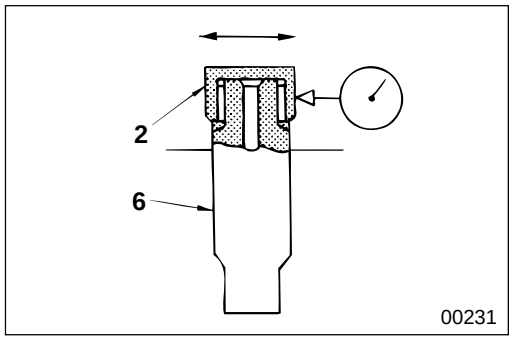


1 **Removal and installation of snap ring**



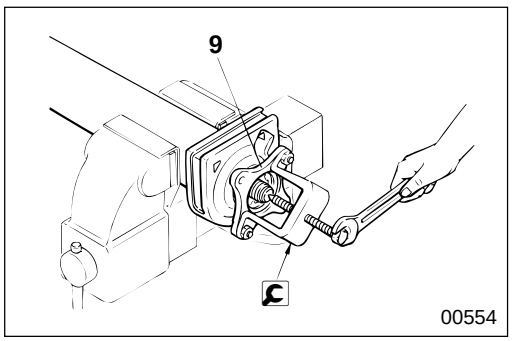
2 **Removal of needle bearing**

- Make alignment marks on needle bearing **2** and spider **6**.
- Make alignment marks across flange yoke **3** and front propeller shaft **18**.
- Hit the yoke lightly at shoulder area **A** so that needle bearing **2** bounces out due to reaction.
  B : Mallet

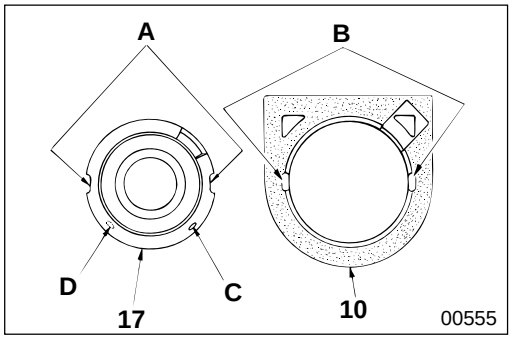


2 **6** **Clearance between needle bearing and spider**

Measure the play towards the diameter direction between needle bearing **2** and spider **6**. If the measured value is higher than the limit, replace with universal joint spider kit.



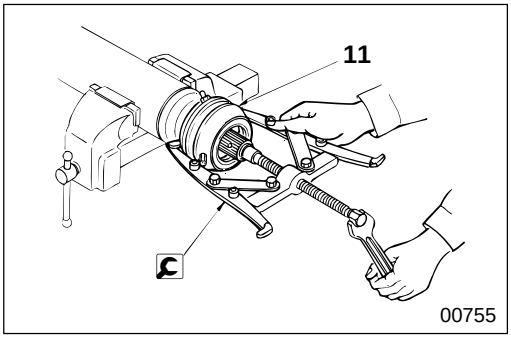
9 **Removal of companion flange**



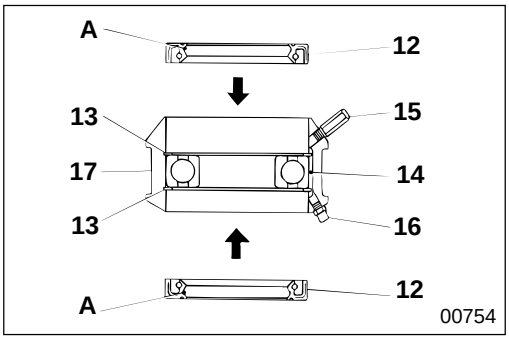
10 **Installation of cushion rubber**

- Align part **A** of center bearing case **17** to part **B** of cushion rubber **10**, and fit them together. When it is hard to fit them together, apply some soapy water to facilitate the fitting work.
- Assemble center bearing case **17** so that grease nipple mounting hole **D** faces downward.

C : Relief valve mounting hole
D : Grease nipple mounting hole

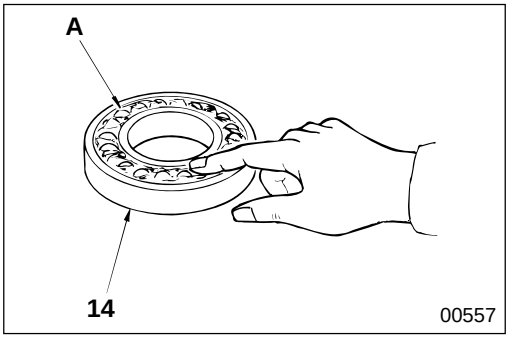


11 **Removal of center bearing assembly**



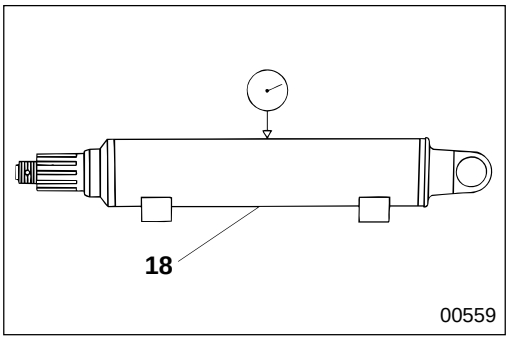
12 **Installation of oil seal**

- Apply grease to oil seal **12** lip area **A** and install to the direction as illustrated.
- Install oil seal **12** flush with center bearing case **17** end surface.



14 **Packing grease in center bearing**

Pack grease into the area that houses ball bearings **A** of center bearing **14**.



18 **Bend of front propeller shaft**

Measure bend of front propeller shaft **18** at its center. If the measured value is higher than the limit, connect or replace it.

CAUTION

Be sure to check for cracks at the welded area after straightening has been done by means of a press.

NOTE

To measure the bend of front propeller shaft 18, turn it one full revolution and read the dial gauge indicator. The bend is one half of the indicated value.

BALANCING PROPELLER SHAFT

Adjustment after Assembly

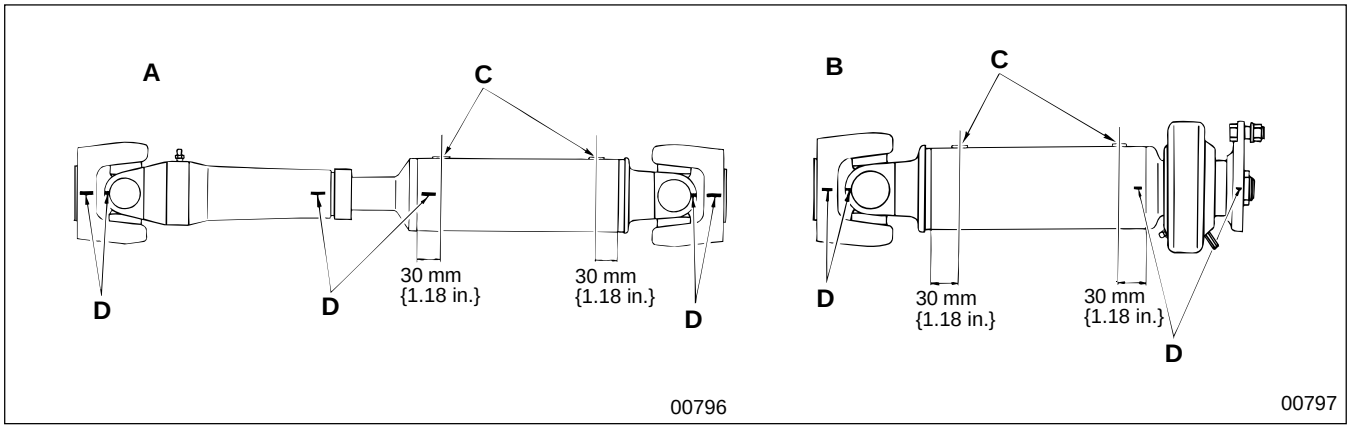
(1) After correction of propeller shaft deflection, or replacement of flange yoke and universal joint, adjust the amount of balance of the completed propeller shaft assembly on a balancing machine, and adjust by adding balance piece(s) so that the amount comes within the permissible limit.

(2) For correction of dynamic balance, use the polar coordination method.

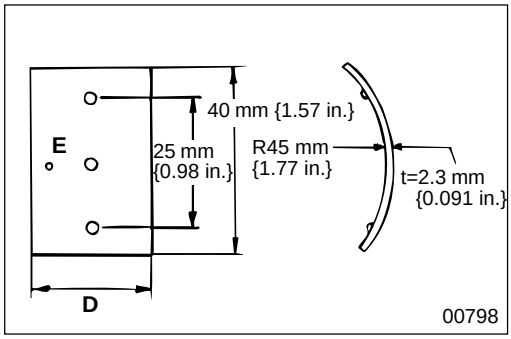
(3) Permissible amount of unbalance
0.49 N·cm {0.0036 ft.lbs, 50 gf·cm}/1600 rpm (Pipe outer periphery)

(4) Method of correction by way of the polar coordination method

• Balance piece attachment point



A : Rear propeller shaft
B : Front propeller shaft
C : Balance piece attachment point
D : Alignment mark



• Balance pieces available

Part name	Mass {oz}	Dimension D mm {in.}
Balance piece G	10 {0.35}	14 {0.55}
Balance piece A	20 {0.71}	28 {1.1}
Balance piece B	40 {1.41}	55.7 {2.19}
Balance piece C	60 {2.36}	83.5 {3.29}
Balance piece H	30 {1.06}	42 {1.65}

E : Mass punch mark

NOTE

- **Maximum balance piece allowed for one point is 120 g {4.23 oz}.**
- **Use a combination that keeps balance pieces to the minimum.**

ON-VEHICLE INSPECTION AND ADJUSTMENT

Adjustment of Wheel Alignment

Service standards

Unit : mm {in.}

Location	Maintenance item		Standard value	Limit	Remedy
—	Wheel alignment	Toe-in (With tires on the ground)	0±1 {0±0.039}	—	Adjust
		Camber	1°30'±1°00'	—	—
		Caster	2°30' $^{+1°30'}_{-1°00'}$	—	Adjust
		Kingpin inclination angle	7°00'	7°00'±30'	Replace

Tightening torque

Unit : N·m {ft.lbs, kgf·m}

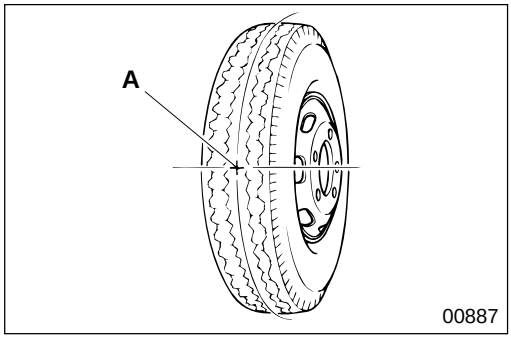
Location	Parts to be tightened	Tightening torque	Remarks
1	Nut (Tie rod end clamp fastening)	78 {58, 8}	Wet

NOTE

- **Measure the wheel alignment when the vehicle is empty and level.**
- **Be sure that each part of the front axle has been serviced perfectly before adjusting the wheel alignment.**

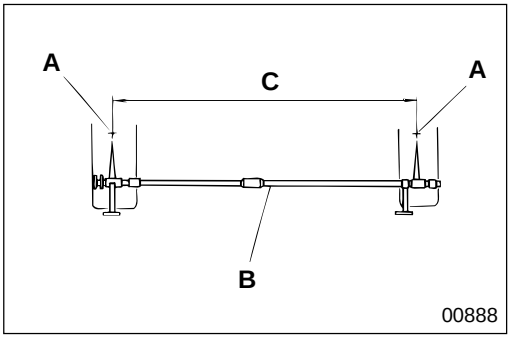
Before adjusting the wheel alignment, check for the following faults:

- Play in front wheel hub
- Play or looseness in kingpin
- Play or looseness in the joint between the tie rod and the knuckle arm
- Looseness of any fasteners
- Permanently set or damaged leaf springs
- Incorrect tire pressure
- Power steering booster backlash adjustment incorrect

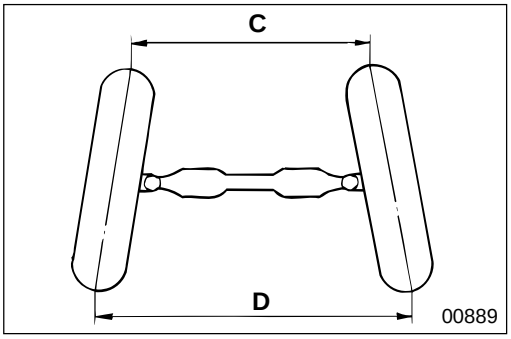


(1) Measurement and adjustment of toe-in

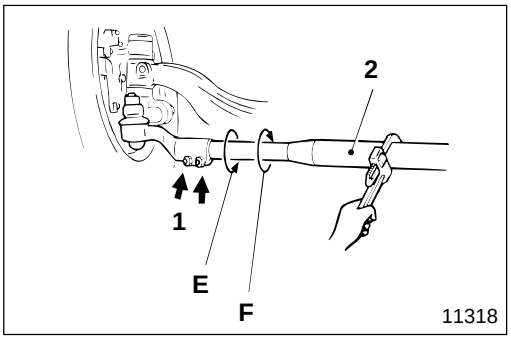
- Point the front wheels forward exactly in running order.
- Put mark **A** on the left and right front tires at the height of front wheel axis and in the middle of the tire width.



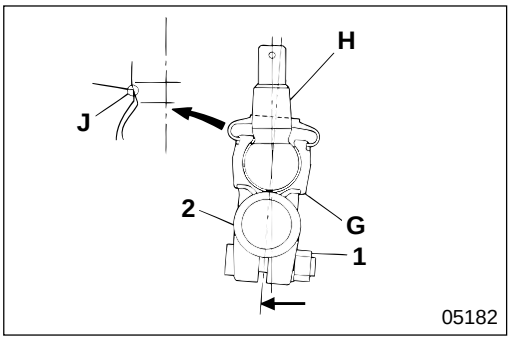
- Align the two points of toe-in gauge **B** to the respective marks **A** on the front tires. Measure the distance **C** between the marks at the front of the vehicle.



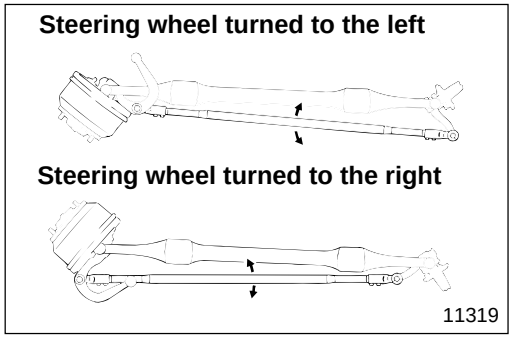
- Rotate the tires 180° and measure distance **D** between the marks at the rear of the vehicle with the tires on the ground.
- Check if the difference between distances **C** and **D** is within the standard value.



- If the measured value deviates from the standard value, with the tires pointed forward, loosen the left and right pairs of nuts **1**. (Total four nuts)
- Adjust the toe-in to the standard value by turning tie rod **2** with a pipe wrench.
  E : To adjust toe-in outward.
  F : To adjust toe-in inward.
  (★ : If tie rod **2** does not swing after the adjustment on 🕮 P26-6, redo from this item.)



- When tightening nuts **1**, push down and hold tie rod **2** backward or forward in the longitudinal direction of the vehicle so that left and right tie rod ends **G** are in contact (**J** as illustrated) with ball studs **H** at the same time.
- Tighten nuts **1** without allowing tie rod ends **G** to move backward or forward in the longitudinal direction of the vehicle.
- If you have to do the above work on your own; after you tighten nuts on one side of tie rod end **G**, when you tighten the nuts on the other end of the tie rod, make sure you keep the tie rod pushed down in the same direction.

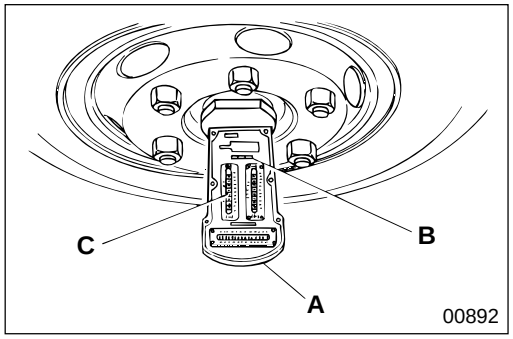


- After adjustment, turn the steering wheel to the left (until the knuckle stopper bolt is contacted), then shake tie rod **2** backward and forward in the longitudinal direction of the vehicle and see if the tie rod moves. Do the same with the steering wheel turned to the right.
  (If the tie rod can be moved, it means that tie rod end **G** and ball stud **H** are in simultaneous contact.)

WARNING⚠

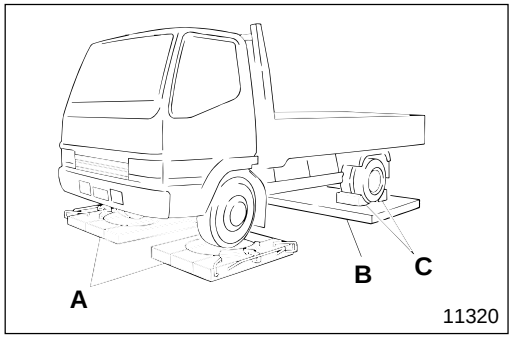
You must be careful not to catch your hand when turning the steering wheel to the left or right, since the tie rod moves.

- If tie rod **2** does not swing, redo the procedure from the item marked ★. 🕮 P26-5



(2) Measurement of camber

- Point the front wheels exactly forward.
- Remove the hub caps.
- Wipe off grease from the knuckle end, and attach camber/caster/kingpin gauge **A** to the knuckle.
- While keeping the bubble in level **B** centered, measure the camber angle by reading the scale mark at the center of the bubble on camber scale **C**.
  Follow this procedure to measure the camber angles on the left and right sides.

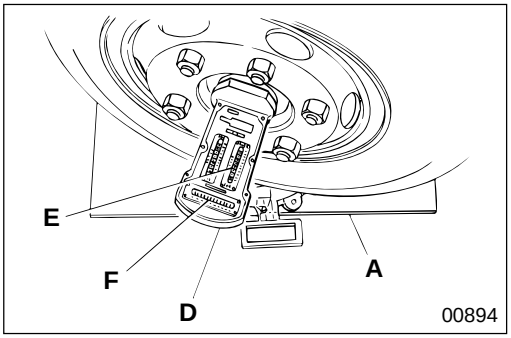


(3) Measurement of caster and kingpin inclination angle

- Prepare a platform **B** having the same height as turning radius gauges **A** and place the platform under the rear wheels so that the vehicle is kept level.
- Keep the turning radius gauges **A** locked.
- Jack up the vehicle and set the left and right wheels so that the ground contact area of both front tires and the turntables of turning radius gauges **A** meet at their respective centers.

WARNING⚠

- **After jacking up the vehicle, chock the rear wheels securely with chocks C.**
- **Do not remove chocks C until the entire operation is completed.**



- Unlock turning radius gauge **A**, and set the scale to 0°.
- As in measuring camber explained previously, attach camber/caster/kingpin gauge **D** tightly to the front wheel hub and keep the bubble centered.
- Apply the brake to the front wheels and turn the steering wheel slowly from the 0° point on the scale of turning radius gauge **A**, until direction changes 20° to the left for the left front wheel and 20° to the right for the right front wheel.

NOTE

It is not possible to obtain an exact reading of camber unless the brake is applied to the front wheels because the tires might rotate slightly.

- At the 20° point, align the bubbles in caster scale **E** and kingpin scale **F** to 0° by turning the adjuster.

NOTE

Kingpin scale F has scales for left and right; use the left scale when adjusting the left wheel, and the right scale when adjusting the right wheel.

- Turn the steering wheel slowly until the left front wheel changes its direction 20° to the right, or until the right front wheel changes its direction 20° to the left, past the 0° point of turning radius gauge **A** scale. At this point read the scale marks at the center of the bubbles on caster scale **E** and kingpin scale **F**. The scale marks indicate the caster and kingpin inclination angles.

Adjustment of Steering Angle

Service standards

Location	Maintenance item		Standard value	Limit	Remedy
—	Steering angle	Inside (Outside: reference)	54° (38°52´)	—	Adjust

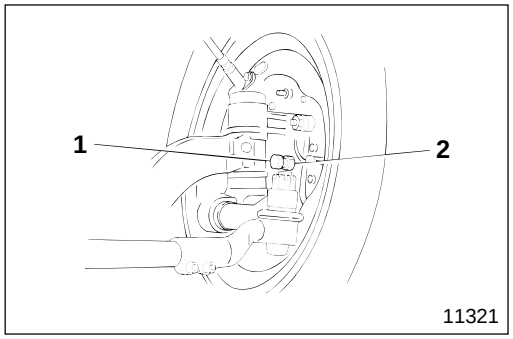
Tightening torque

Unit : N·m {ft.lbs, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
2	Lock nut (Knuckle stopper bolt fastening)	71±12 {52±9, 7.25±1.25}	—

NOTE

Be sure that wheel alignment is adjusted perfectly before adjusting the steering angle.

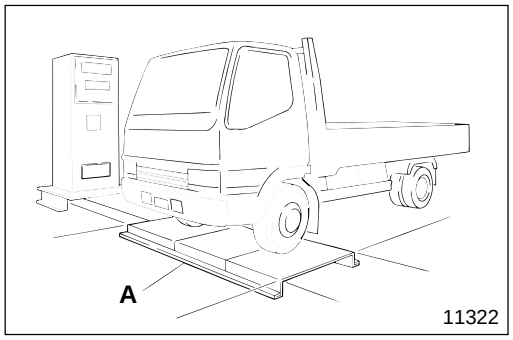


- To adjust the steering angle, set the turning radius gauges and platform in the same way as for caster and kingpin inclination angle measurement.
- Turn the steering wheel to the left or right completely, and from the position where the turning radius gauge is aligned to 0°, adjust knuckle stopper bolt **1**. Adjust so that the steering angle is within the standard inside steering angle value, to the left for the left front wheel, and to the right for the right front wheel. Then, tighten lock nut **2** at specified torque.

Measurement of Side Slip

NOTE

Be sure that wheel alignment is adjusted fully before measuring side slip.

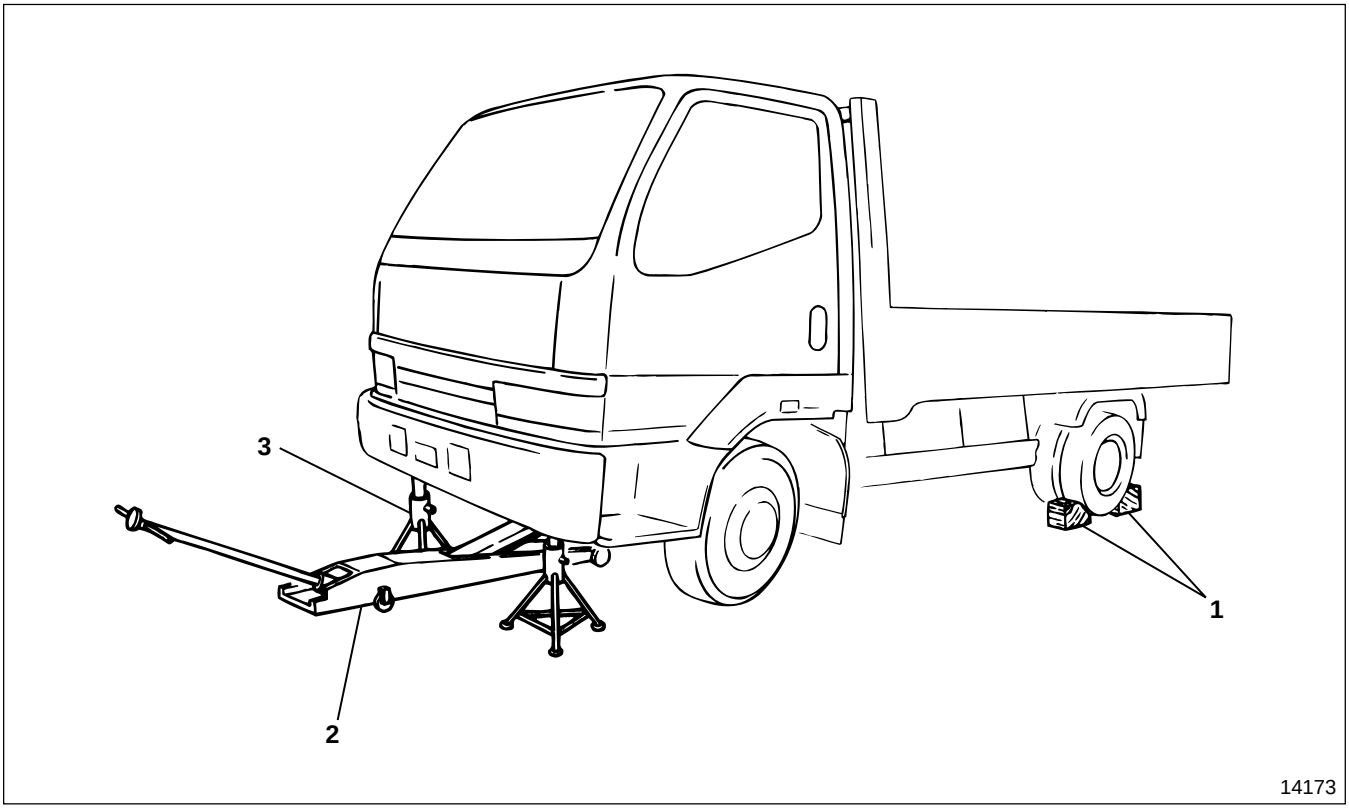


- Point the front wheels exactly forward.
- Maintain this position and slowly move vehicle forward, over side slip tester **A**, as slowly as possible.

NOTE

Make sure, when measuring side slip, that the wheels point exactly forward when the vehicle passes over side slip tester A. Do not allow the wheels to veer from side-to-side.

- The side slip is indicated by side slip tester **A** after the vehicle has passed through the tester. Readjust wheel alignment if slippage is 3 mm {0.12 in.} or more per meter {3.28 ft.}.



● **Work sequence before removal**

1 Place wheel chocks.
2 Jack up the front axle with a garage jack.
3 Support the front frame on rigid racks.

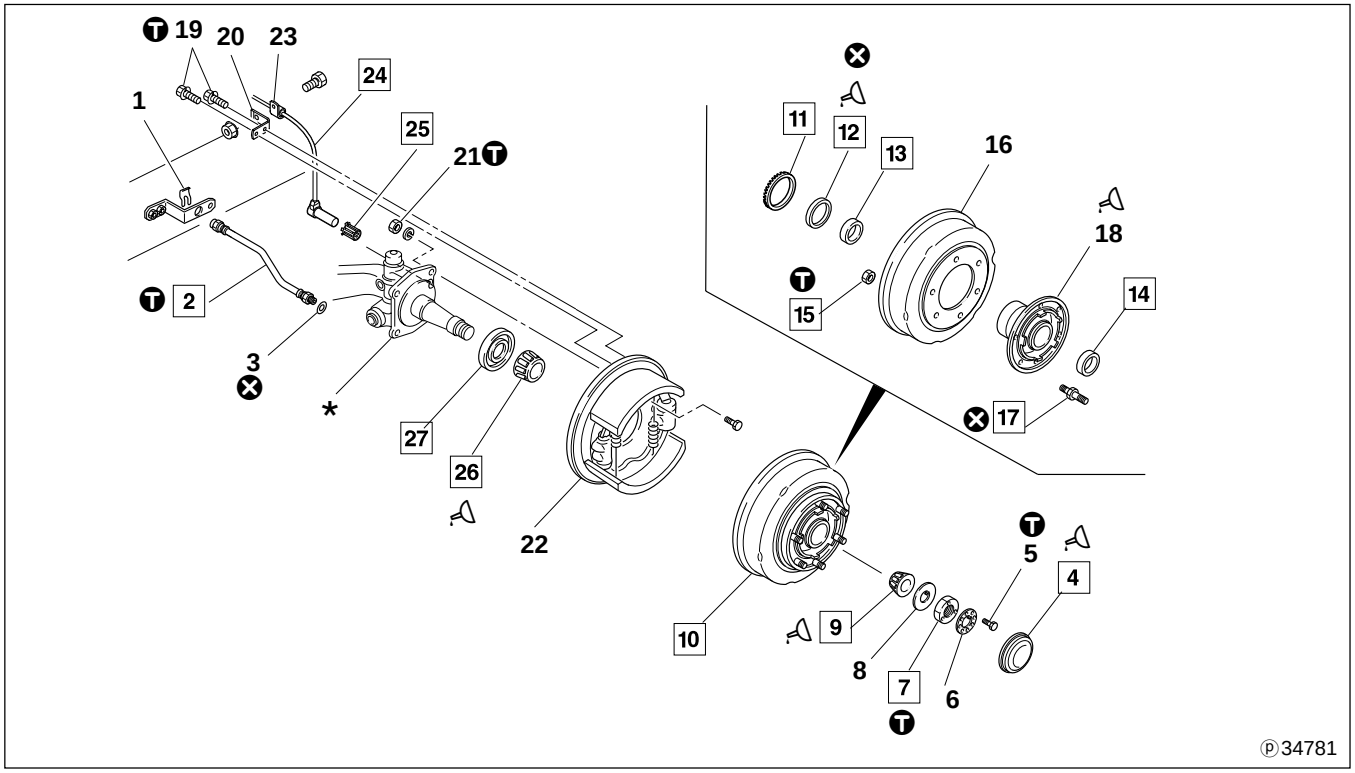
WARNING⚠

- **Chock the wheels securely so the vehicle does not move.**
- **Do not remove the chocks until the entire operation is completed.**
- **Supporting a vehicle on a garage jack only is extremely dangerous, so always support the frame on rigid racks.**
- **Leave the garage jack and rigid racks in place until the entire operation is completed. Never remove them during the operation.**

● **Work sequence after installation**

Follow the work sequence before removal in reverse.

WHEEL HUB AND BRAKE DRUM



● **Disassembly sequence**

1 Clip
2 Brake hose
3 Gasket
4 Wheel hub cap
5 Bolt
6 Lock plate
7 Lock nut

21 Nut
22 Brake assembly Gr 35A
23 Clip
24 Wheel speed sensor
25 Spring spacer
26 Inner bearing inner race
27 Oil seal retainer

* : Knuckle P26-22
⊗ : Non-reusable parts

CAUTION⚠

Be sure to protect brake hose 2 from dust by fitting blanking plugs after removal.

NOTE

Do not disassemble brake drum 16 and wheel hub 18 except for replacement.

● **Assembly sequence**

Follow the disassembly sequence in reverse.

WARNING⚠

You must bleed air from the brake system after installing the brake hose, failure to do so would cause the brake to malfunction. Gr 35A

CAUTION⚠

- **Keep oil and grease off lining surface of front brake assembly * and the inner surface of brake drum 16.**
- **Be careful not to damage oil seal 12 and rotor 11 when installing wheel hub and brake drum assembly 10 onto knuckle *.**

Service standards

Location	Maintenance item		Standard value	Limit	Remedy
9, 13, 14, 26	Starting torque of wheel hub bearing		1 to 4 N·m {0.72 to 2.89 ft.lbs, 0.1 to 0.4 kgf·m}	—	Tangential force at wheel hub bearing 9 to 35 N {1.98 to 7.94 lbf, 0.9 to 3.6 kgf}
11	Wobbling of rotor		0.1 {0.0039}	—	Replace
25	Wheel speed sensor	Resistance between terminals	950 to 1450Ω	—	Replace

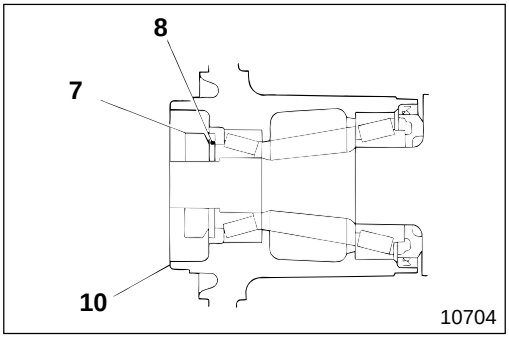
	Inner bearing installer 	MH061475	Press-fitting of inner bearing inner race and oil seal

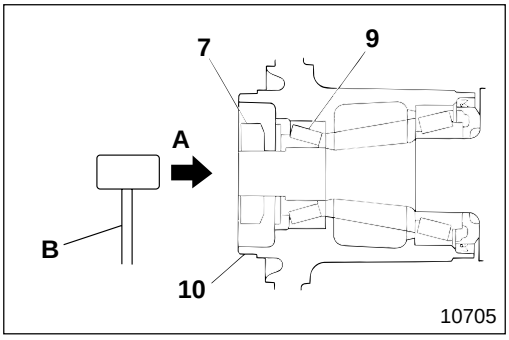


◆ Service procedure

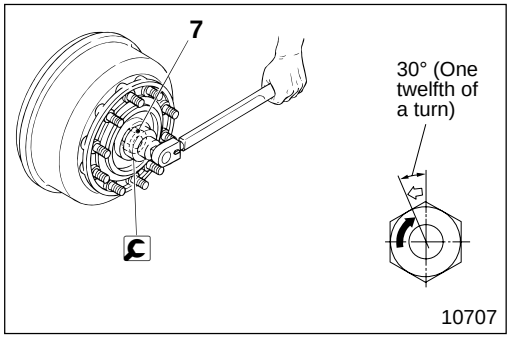
● Starting torque of wheel hub drum

[Adjustment]

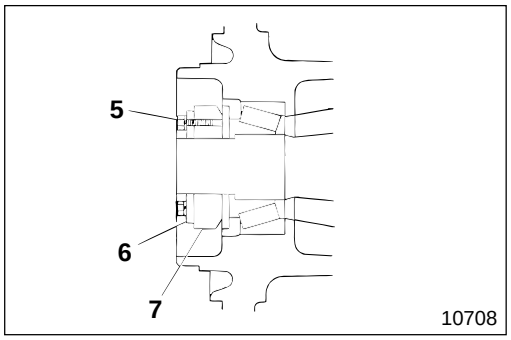
- Install lock washer **8** and lock nut **7**, then tighten the lock nut at specified torque while turning wheel hub and brake drum assembly **10** several times.
- Next, slacken off the lock nut fully until a clearance is obtained between lock nut **7** and lock washer **8**.



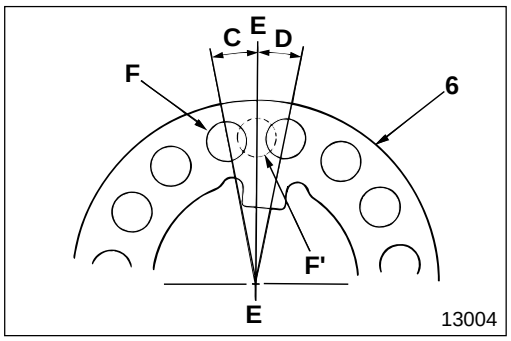
- Return outer bearing **9** toward lock nut **7** by hitting illustrated part **A**, while turning wheel hub and brake drum assembly **10** again.
  B : Copper-headed mallet



★ • After retightening lock nut **7** at specified torque, slacken it off by 30° (one twelfth of a turn)
(★ : If there is any deviation found when you measure the tangential force, carried out following the procedure on 🕮 P26-15, repeat the work.)

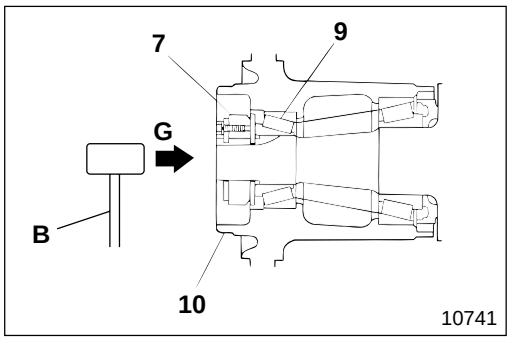


- Install lock plate **6**.
- Make sure that the bolt mounting holes of lock plate **6** and lock nuts **7** align.
- Tighten mounting bolts **5** at specified torque.



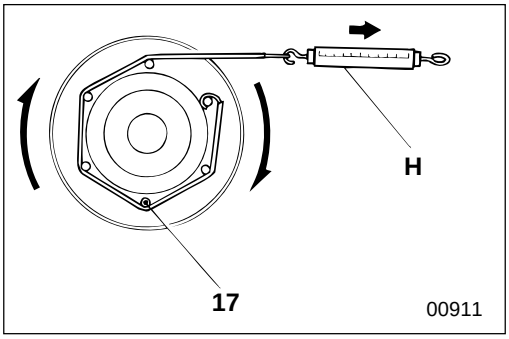
- If the mounting holes of lock plate **6** and lock nuts **7** do not align, align as follows:

Hole position of lock nut	How to align hole of lock plate
Within range **C**	Loosen lock nuts to align holes
Within range **D**	Turn over lock plate and loosen lock nut to align holes
On **E**–**E** line	Turn over the lock plate to align the holes (Lock nut hole position changes from **F'** to **F**)



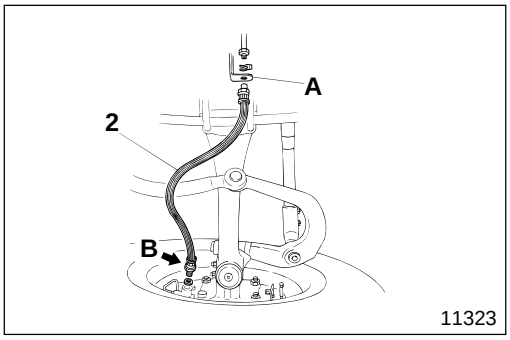
- To slide outer bearing **9** towards lock nut **7**, hit end **G** two or three times with a copper-headed mallet, while turning wheel hub and brake drum assembly **10**.
B : Copper-headed mallet

- Once again, hit one end of the knuckle two or three times with a soft-faced mallet while turning the hub and drum assembly so that the outer bearing fits tightly to the lock nut.



[Measurement]
- Fasten spring balance **H** to hub bolt **17** and measure the tangential force.
- If the measured tangential force is the standard value, the starting torque conforms to the standard value.
- Make sure that the starting torque is smaller than the tangential force.
- If the tangential force deviates from the specified value, adjust the starting torque again.
- If the measured value deviates from the specified value, redo the procedure from the item marked ★. 📖 P26-14
- If any fault is found after adjustment, replace outer bearings **9**, **14** and inner bearings **13**, **26**.

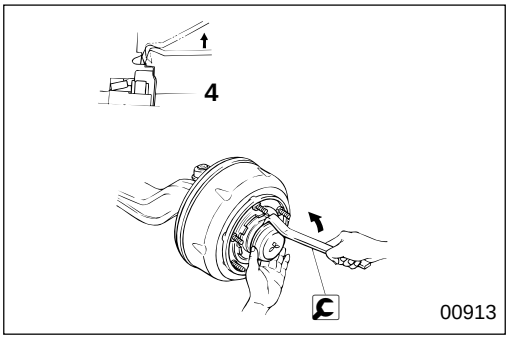
NOTE
- **Measure the starting torque when oil seal 12 has been installed.**
- **Make sure that the brake lining and brake drum 16 do not drag before measurement.**



2 Removal and installation of brake hose

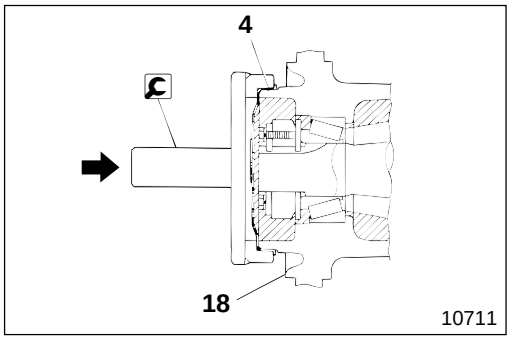
Remove the brake hose from frame side **A** first, then disconnect from wheel brake side **B**. For installation, connect the hose in a reverse order.

CAUTION ⚠
Make sure that brake hose 2 is not twisted when you install it.



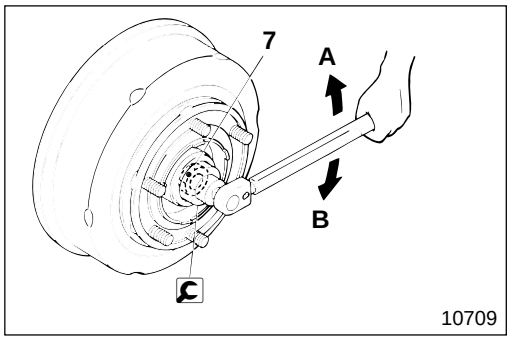
4 Wheel hub cap

[Removal]



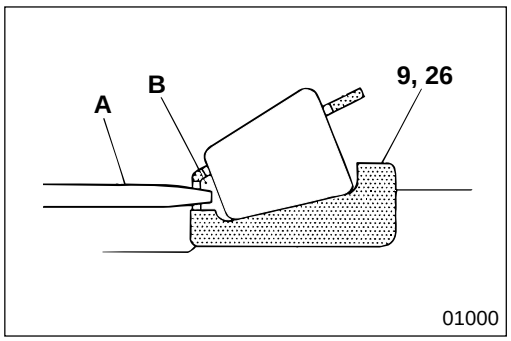
[nstallation]
Pack wheel hub cap **4** with grease, apply sealant to contact surfaces of wheel hub **18**, and press-fit it.

CAUTION
Do not use a hammer, etc. when you install wheel hub cap 4, or you might deform the mating surface, destroying watertightness.



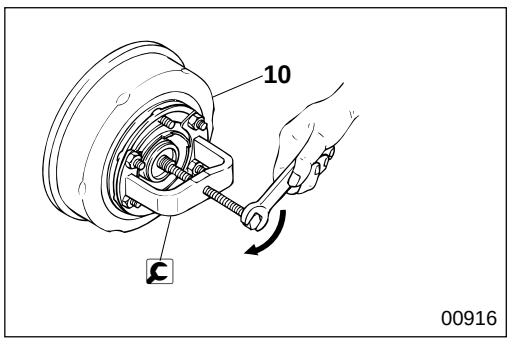
7 **Removal and installation of lock nut**

See adjustment of wheel hub bearing starting torque. P26-14
A : Removal
B : Installation



9 **26** **Packing grease in outer bearing inner race and inner bearing inner race**

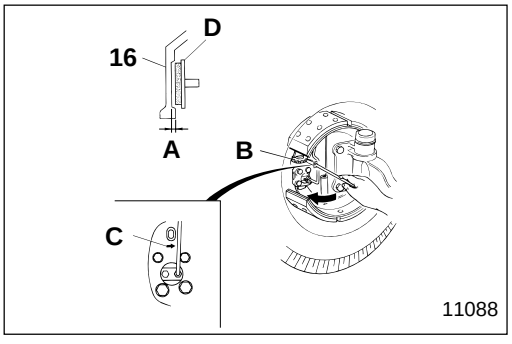
A : Grease pump nozzle
B : Between rollers



10 **Wheel hub and brake assembly**

[Removal]

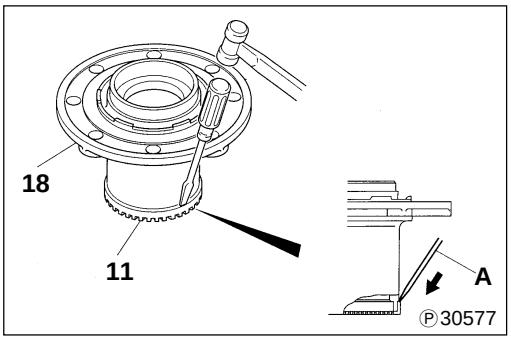
CAUTION
Make sure you remove wheel hub and brake drum assembly 10 in a straight line to prevent damage to oil seal 12.



- If it is hard to remove wheel hub and brake drum assembly **10** because brake drum **16** has stepped wear **A**, remove the wheel hub and brake drum assembly as follows:
- Turn adjuster **B** in the opposite direction to arrow **C** on the backing plate, and expand the clearance between brake drum **16** and brake shoe **D**. Then remove the brake drum.

CAUTION
If brake drum 16 is faulty, correct it. **Gr 35A**

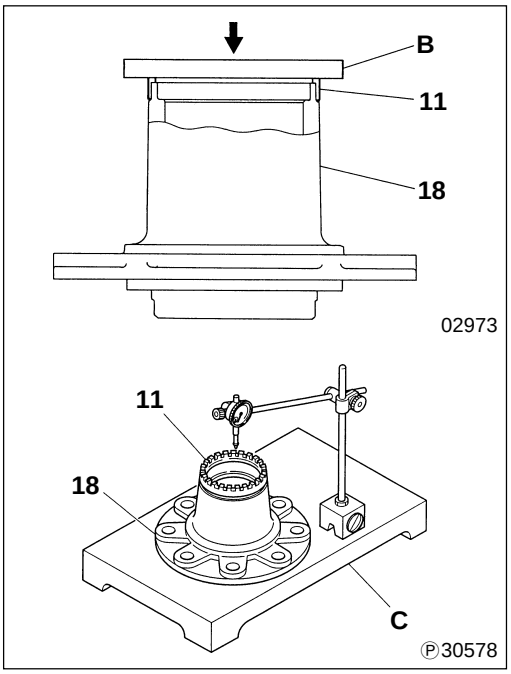
[Installation]
After installing wheel hub and brake drum assembly **10**, adjust the brake shoe clearnace.
Gr 35A



11 Rotor

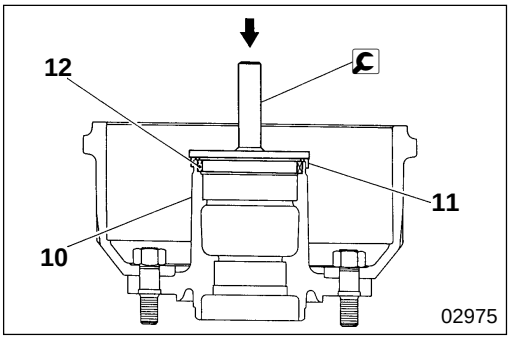
[Removal]
Strike the outer edge of rotor **11** evenly with flat-tip screwdriver **A** to remove the rotor from the wheel hub.

CAUTION ⚠
Be careful not to damage wheel hub 18.



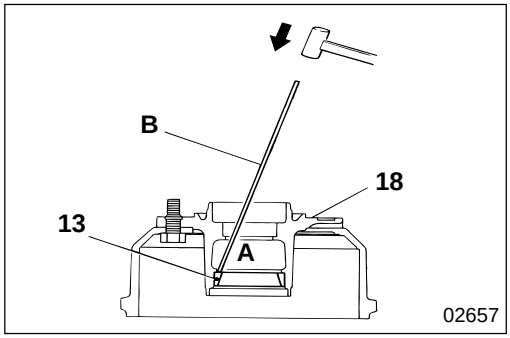
[Installation]
Heat rotor **11** to approximately 150°C {302°F}. Press the rotor evenly with iron plate **B** to press-fit the rotor to wheel hub **18**. Make sure there is no space between the rotor and wheel hub.

[Inspection]
- If the amount of wobbling exceeds the standard value, repeat the assembly procedure from the beginning.
- If the amount of wobbling exceeds the standard value after reassembly, replace defective parts.
  C : Base



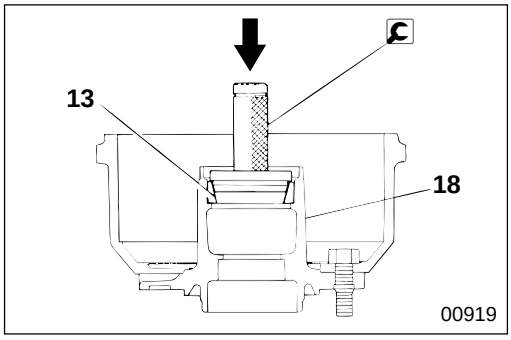
12 Installation of oil seal

CAUTION ⚠
When hub and brake drum assembly 10 is removed for a service operation and if rotor 11 is still mounted on the wheel hub, use 0 ABS oil seal installer to press-fit oil seal 12.

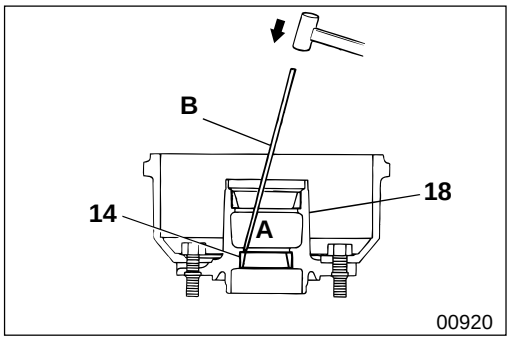


13 **Inner bearing outer race**

[Removal]
Drive out inner bearing outer race **13** evenly from two indented parts **A** in wheel hub **18**.
B : Pin-punch

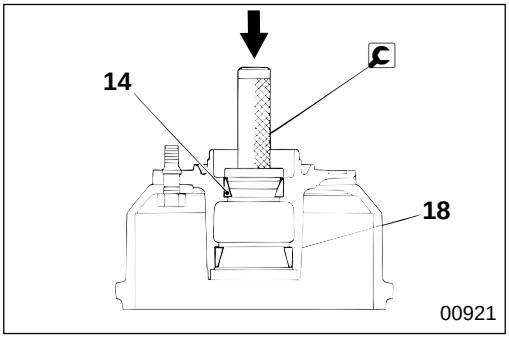


[Installation]

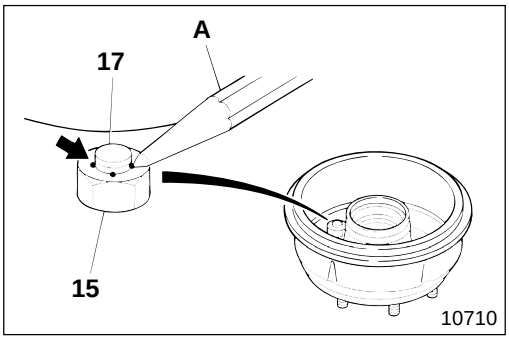


14 **Outer bearing outer race**

[Removal]
Drive out outer bearing outer race **14** evenly from two indented parts **A** in wheel hub **18**.
B : Pin-punch

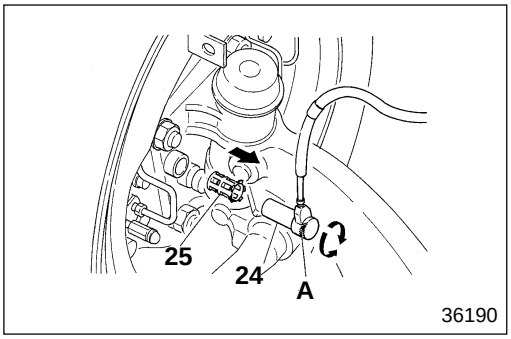


[Installation]



15 **17** **Installation of nut and hub bolts**

Tighten nut **15** at specified torque, then caulk hub bolt **17** evenly at four points.
A :Punch

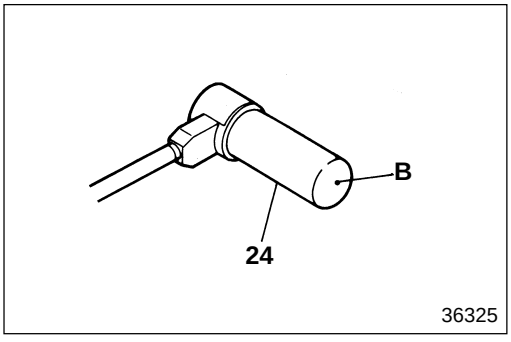


24 **Wheel speed sensor**

[Removal]
Hold shaded section **A** of wheel speed sensor **24** with pliers, and remove the sensor by twisting it slightly in left and right directions.

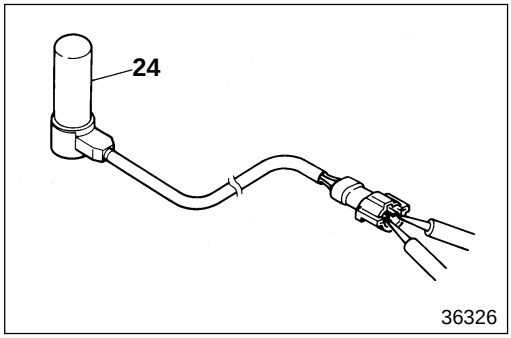
CAUTION

- **When holding wheel speed sensor 24 with pliers, do not grip any section other than shaded area A in the diagram.**
- **When removing wheel speed sensor 24, do not apply force on the sensor, such as by hitting with a hammer, prying with a screwdriver or pulling the harness, since these actions can result in wire breakage.**
- **If wheel speed sensor 24 dismounts easily, replace spring spacer 25.**

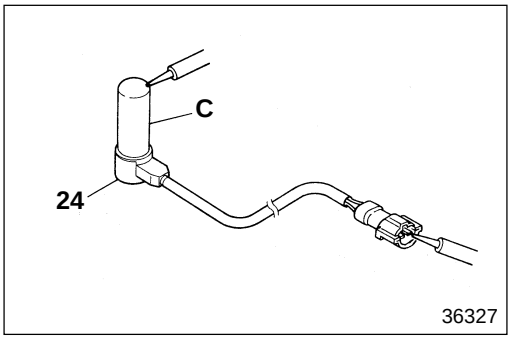


[Inspection]

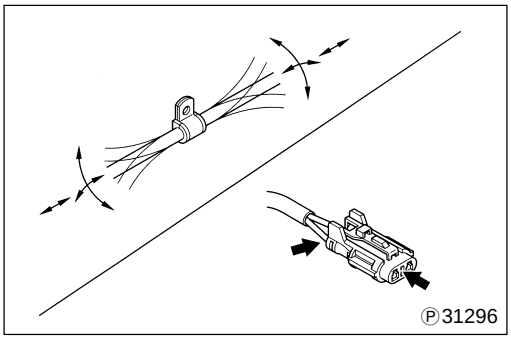
- Since pole piece section **B** is magnetized by the magnet inside wheel speed sensor **24**, it attracts metals. Do not allow the pole piece to collect metallic objects.



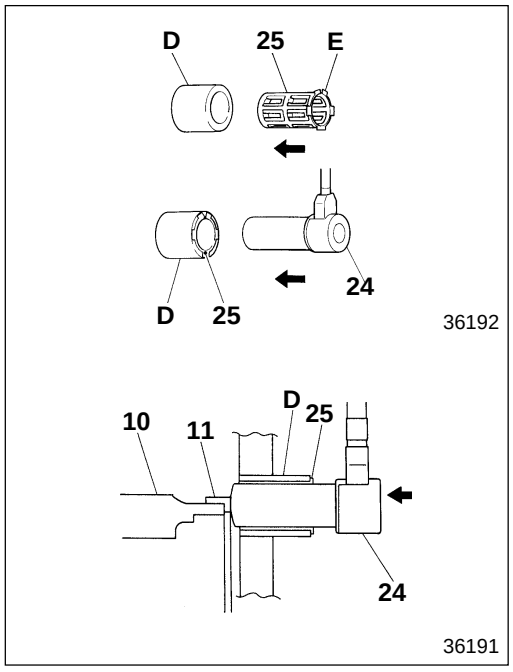
- Measure the resistance between the terminals of wheel speed sensor **24**.
  If the measured value deviates from the standard value, replace the wheel speed sensor.



- Measure the insulation resistance between body **C** of wheel speed sensor **24** and each terminal.
  If the measured values deviate from the standard value, replace the wheel speed sensor.



- To check for broken wires, remove the harness clamp section from the vehicle. Bend and extend the harness to check if there is any broken wire in the harness. Also, inspect the connector for proper contact.
  If a defect is found, replace wheel speed sensor **24**.

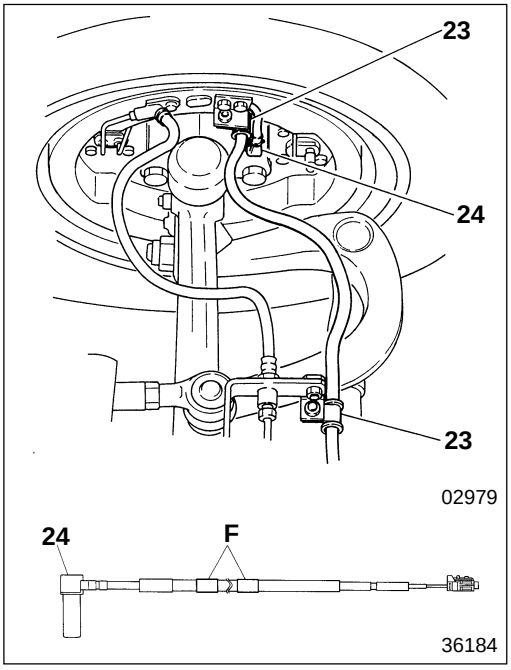


[Installation]

- Insert spring spacer **25** into holder section **D** of the knuckle, and press until stopper section **E** contacts the holder.
- Insert wheel speed sensor **24**, and press until it contacts rotor **11**.
- Rotate hub and brake drum assembly **10** slowly for two or three turns (2 seconds per turn) to make sure it rotates smoothly.

CAUTION⚠

When installing wheel speed sensor 24, do not apply force on the sensor, such as by hitting with a hammer, prying with a screwdriver or pulling the harness, since these actions can result in wire breakage.



- Secure white tape section **F** of the harness of wheel speed sensor **24** in place using clip **23** on the wheel brake side and clip **23** on the frame side.

CAUTION⚠

Be sure to clamp the harness of wheel speed sensor 24 at two white tape sections F. Make sure the harness does not interfere with other parts and there is no twist or slack in the harness.

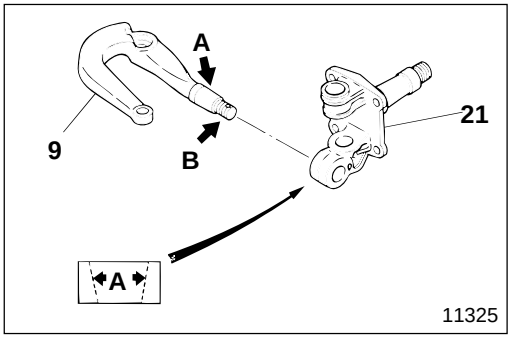
◆ Service procedure

● Work after assembly

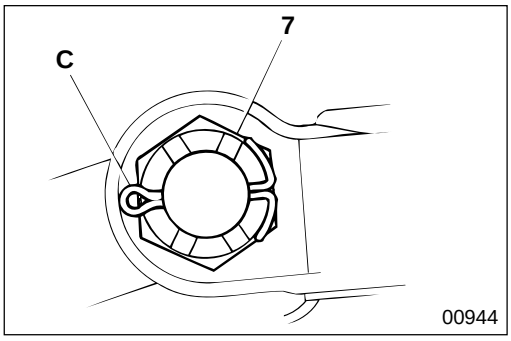
Pack knuckle **21** with grease via grease nipple **20**. Pack until grease starts overflowing from the dust cap of upper cap **12**, thrust washer **16**, and the press side of bearing **17**.



9 **21** **Installation of knuckle arm and knuckle**

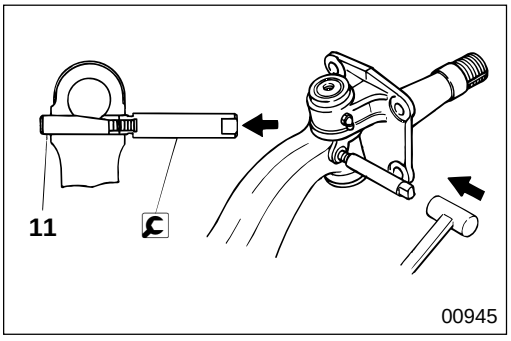
(1) Reassembly of existing knuckle arm 9 and/or knuckle 21

- Polish taper surfaces **A** of knuckle arm **9** and knuckle **21** with emery paper (120 grit or finer) uniformly, until abrasion traces left by the emery paper are only just visible. For new parts, polishing is not necessary.
- Clean taper surfaces **A** of knuckle arm **9** and knuckle **21**, and thread **B** of the knuckle arm. (Use a cleaning solvent for acetone color checking or other solvent.)
- Install knuckle arm **9** after applying grease to thread **B**. (Do not grease the taper surface of the knuckle arm and knuckle **21**.)
- Tighten new nut **7** at specified torque. Make sure you align the pin hole by turning in the tightening direction when you insert and fix split pin **C**.

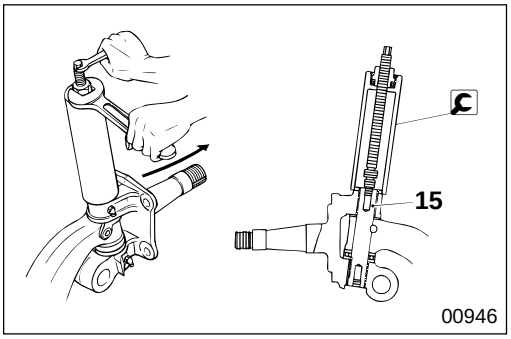


(2) Installation of new knuckle arm 9 and knuckle 21

- Clean taper surfaces **A** of knuckle arm **9**, knuckle **21**, and thread **B** of the knuckle arm, and install them without greasing.
- Tighten new nut **7** at specified torque. Make sure you align the pin hole by turning in the tightening direction when you insert and fix split pin **C**.

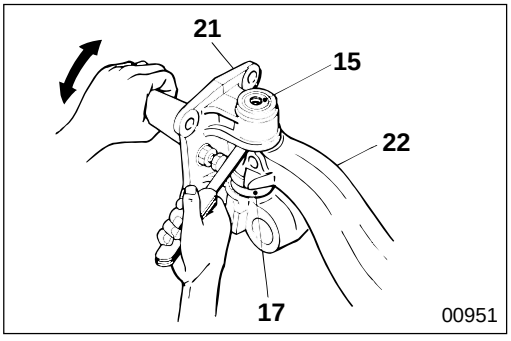


11 **Removal of set bolt**



15 **Removal of kingpin**

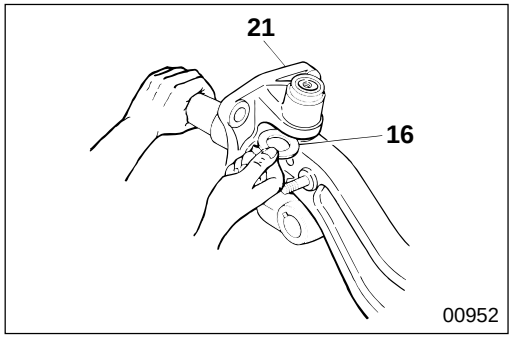
- Remove the kingpin cap; tighten kingpin puller bolt into the thread of kingpin **15** to remove the kingpin.



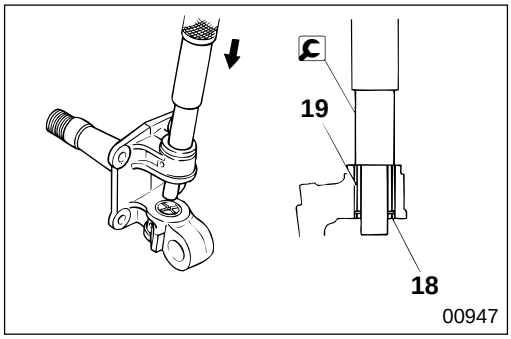
16 **21** **22** **Thrust washer, knuckle and front axle**

[Inspection]

- Assemble kingpin **15** and bearing **17** temporarily, and turn knuckle **21** a few times to smooth its operation.
- Measure the clearance between the upper surface of front axle **22** and the lower part of knuckle **21**.
- If the measured value is higher than the limit, adjust the clearance with thrust washer **16**.

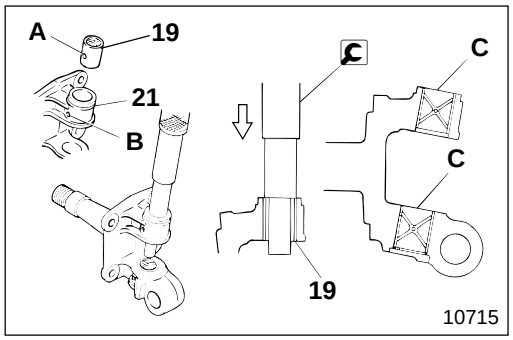


[Adjustment]
- Available adjusting thrust washer **16** thicknesses: 2.1 to 2.8 mm {0.083 to 0.11 in.} (8 thicknesses are available in 0.1 mm {0.0039 in.} increments.)
- Minimize the clearance by selecting appropriate thrust washer **16**.
- Check that knuckle **21** turns smoothly after assembly.

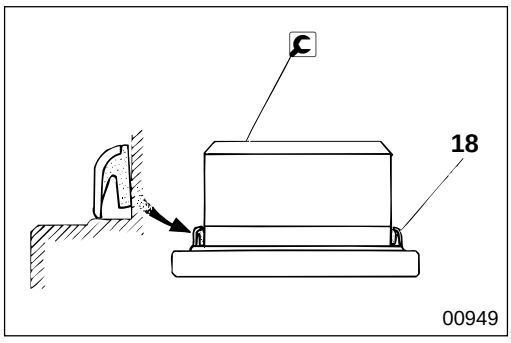


18 **19** **Oil seal and bushing**

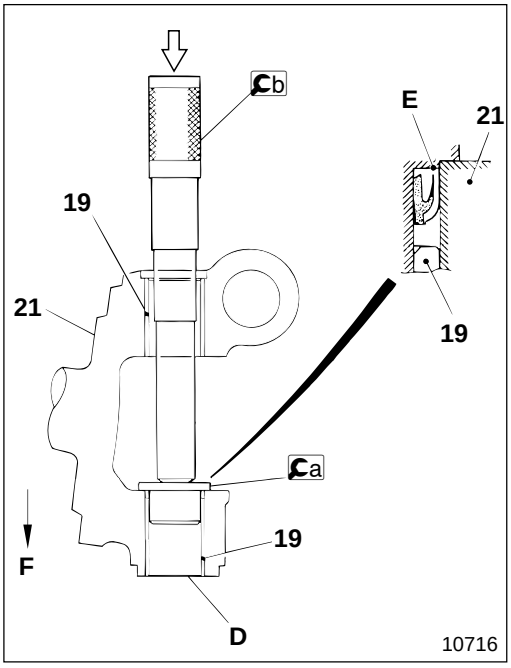
[Removal]



[Installation]
- Install bushing **19** so that the direction of oil hole **A** is aligned with oil hole **B** of knuckle **21** and the bushing end is set in the same plane with end **C**.

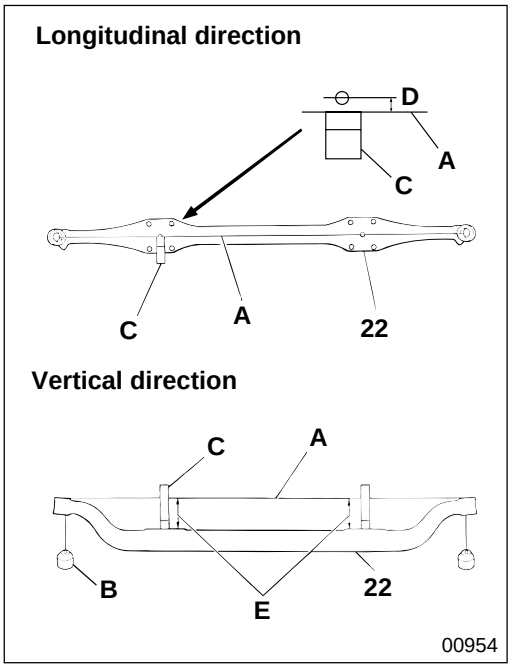


- Apply grease to the lip area of oil seal **18** and install it on oil seal installer.



- Next, install a oil seal installer on knuckle **21** in the direction as illustrated.
- Pass b kingpin bushing remover through kingpin hole until it makes contact with a oil seal installer.
- Drive the head of b kingpin bushing remover using a mallet until a oil seal installer makes contact with knuckle **21**.
- Check that end **D** of bushing **19** is aligned with knuckle **21**.
- Make sure that oil seal end **E** does not protrude from knuckle **21**.

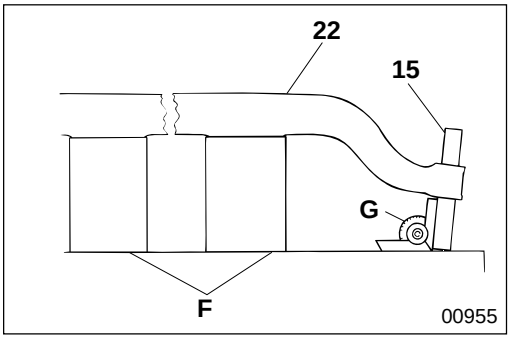
  F : Top of vehicle



22 Inspection of front axle

(1) Measurement of bend in front axle 22 in longitudinal and vertical directions

- Pass a piece of thread **A** through the kingpin hole of front axle **22** and hang weights **B** on both ends.
- Use square **C** to find the degree of bend in both the longitudinal direction **D** and the vertical direction **E**.
- If the measured value is higher than the limit, replace front axle **22**.



(2) Measurement of kingpin inclination angle

Mount kingpin **15** in front axle **22** as illustrated, and measure the kingpin inclination angle. If the measured value is higher the limit, replace the front axle.

F : Block gauge

G : Angle gauge

SPECIFICATIONS/STRUCTURE AND OPERATION

SPECIFICATIONS

Item		Specifications
Rear axle	Model	R040T
	Type	Banjo type, full floating
Reduction	Model	D040H
	Type	Single-reduction
	Tooth shape	Hypoid gear
	Speed reduction ratio	4.111, 4.625, 5.571
Differential	Tooth shape	Straight bevel gear
Gear oil	Grade	* Normal : Maximum air temperature during operation below 40°C {104°F} API GL-5 SAE 90 Hot areas : Maximum air temperature during operation above 40°C {104°F} API GL-5 SAE 140
	Quantity L {qts}	4.5 {4.8}
Mass kg {lb}		Approximately 285 {630}

* : When used under heavily-loaded, severe conditions such as continuous driving on uphill grades, it is recommended that you use gear oil with a SAE viscosity grade of 140. However, the air temperature must be above 10°C {50°F}.

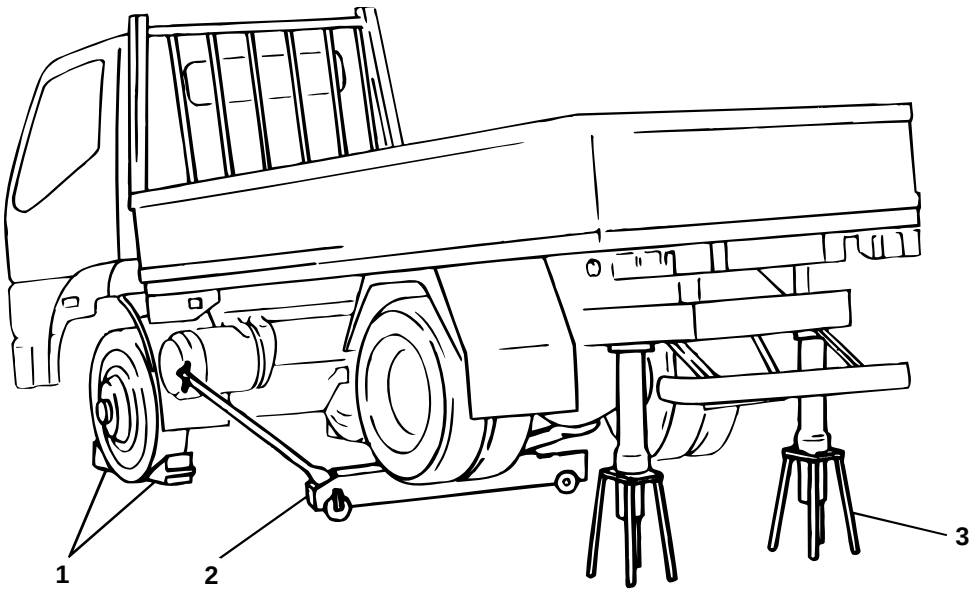
WORK BEFORE REMOVAL AND INSTALLATION OF REAR AXLE



14186

● **Work sequence before removal**

1 Place wheel chocks.
2 Jack up the rear axle using a garage jack.
3 Support the rear frame on rigid racks.

WARNING⚠

- **Chock the wheels securely so the vehicle does not move.**
- **Do not remove the chocks until the entire operation is completed.**
- **Supporting a vehicle on a garage jack only is extremely dangerous, so always support the frame on rigid racks.**
- **Leave the garage jack and rigid racks in place until the entire operation is completed. Never remove them during the operation.**

● **Work sequence after installation**

Follow the work sequence before removal in reverse.

Gr 35A

* : Axle housing P27-22

⊗ : Non-reusable parts

CAUTION

Be sure to protect brake pipe 1, from dust by fitting blanking plugs after removal.

NOTE

Do not disassemble brake drum 16 and wheel hub 19 unless they are faulty.

● **Assembly sequence**

Follow the disassembly sequence in reverse.

WARNING

You must bleed air from the brake system after assembly, failure to do so would cause the brake to malfunction. Gr 35A

CAUTION⚠

- **When removing or installing wheel hub and brake drum assembly 11, handle rotor 18 with care to prevent damage. Also, do not damage oil seal 12 during assembly.**
- **Keep oil and grease off lining surface of brake assembly 28 and the inner surface of brake drum 17.**

Service standards

Unit : mm {in.}

Location	Maintenance item		Standard value	Limit	Remedy

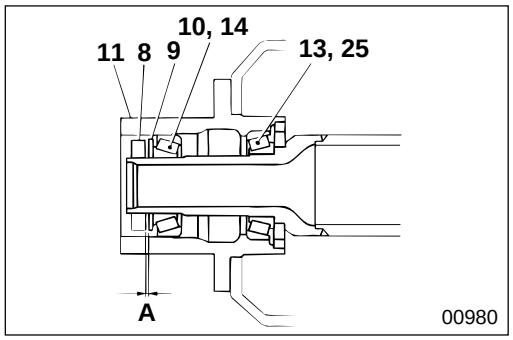
	Oil seal retainer installer 	MH061008	Press-fitting of oil seal retainer

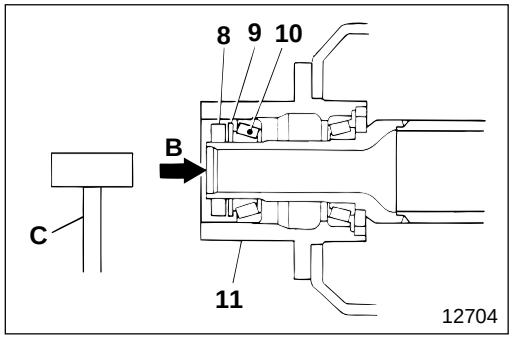
◆ Service procedure

● Starting torque of wheel hub bearing

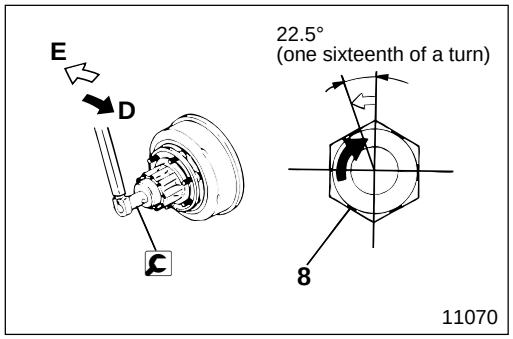


[Adjustment]

- Install lock washer **9** and lock nut **8**.
- Turn wheel hub and brake drum assembly **11** several times to smooth operation of outer bearings **10**, **14** and inner bearings **13**, **25**.
- Tighten lock nut **8** at specified torque.
- Slacken off lock nut **8** to obtain clearance **A** between the lock nut and lock washer **9**.



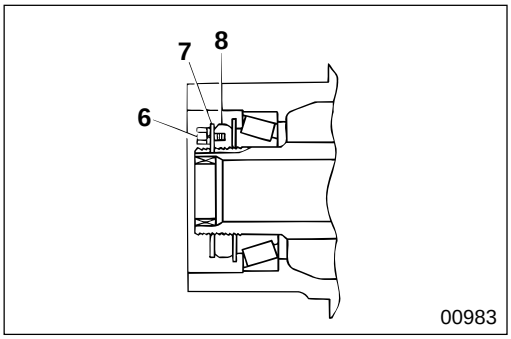
- To slide outer bearing inner race **10** towards lock nut **8**, hit end **B** of the axle tube two or three times with a mallet, while turning wheel hub and brake drum assembly **11**.
  C : Copper-headed mallet



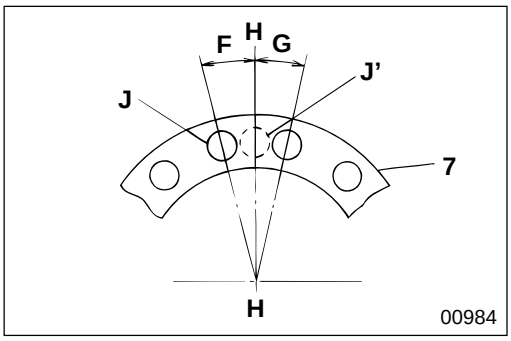
★ • Tighten lock nut **8** at specified torque.
  D : Tightening direction

- Slacken off lock nut **8** by 22.5° (one sixteenth of a turn).
  E : Slackening off direction

(★ : If any fault is found when measuring tangential force, redo from this item.)

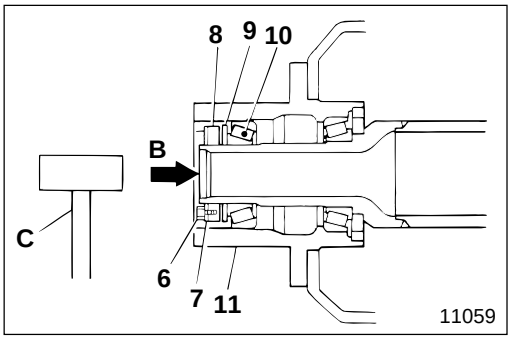


- Install lock plate **7**.
- Make sure that bolt **6** mounting holes of lock nut **8** and lock plate **7** align.
- Tighten bolt **6** at specified torque.

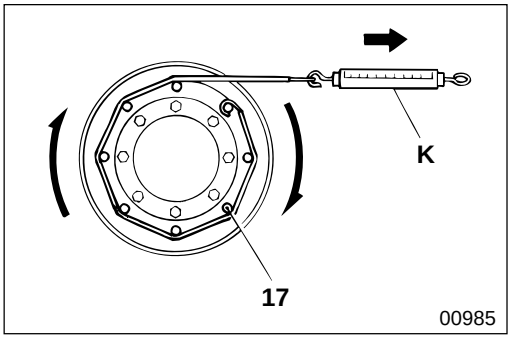


- If mounting holes of lock plate **7** and lock nut **8** do not align, align as follows:

Hole position of lock nut	How to align hole of lock plate
Within range **F**	Loosen lock nut to align holes
Within range **G**	Turn over lock plate and loosen lock nut to align holes
On line **H-H**	Turn over lock plate to align holes (Hole position **J'** changes to **J**)



- To slide outer bearing inner race **10** towards lock nut **8**, hit end **B** of the axle tube two or three times with a mallet, while turning wheel hub and brake drum assembly **11**.
  C : Copper-headed mallet

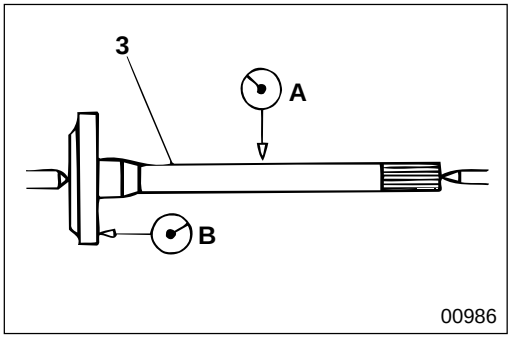


[Measurement]

- Install spring balance **K** on hub bolt **17**.
- Measure the tangential force.
- If the measured tangential force is within the specified value, the starting torque conforms to the standard value.
- Do not allow the tangential force to become higher than the upper limit of the specified value.
- If the measured value deviates from the specified value, repeat from step ★. 📖 P27-12
- If the result is still not satisfactory, replace outer bearings **10, 14** and inner bearings **13, 25**.

NOTE

- **Make sure that there is no drag in brake lining and brake drum 16 before you measure the tangential force.**
- **Measure the starting torque when oil seal 12 has been installed.**



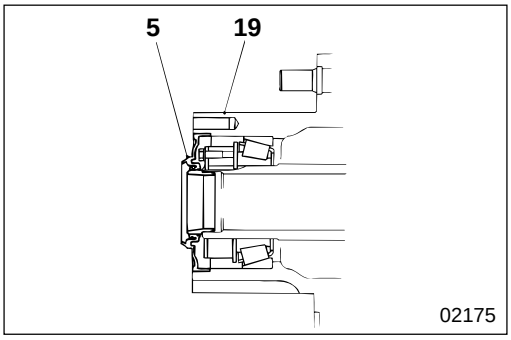
3 **Inspection of axle shaft**

A : Bend of shaft center

NOTE

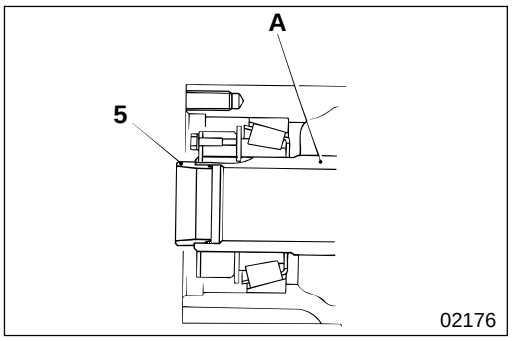
To measure the bend of axle shaft 3, turn it one full revolution and read the dial gauge indicator. The bend is one half of the indicated value.

B : Wobble of flange face



4 **Installation of oil seal**

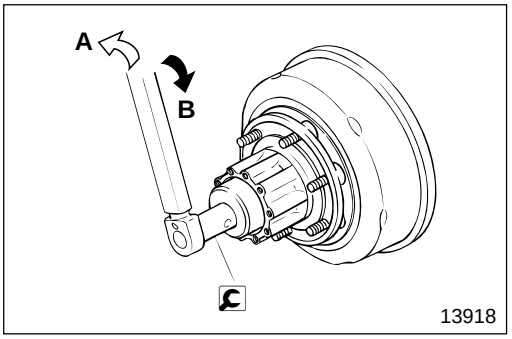
Press-fit oil seal **4** until it is flush with the end of wheel hub **19**.



5 **Oil seal retainer**

[Removal]
It is not necessary to remove oil seal retainer **5** other than for replacement of oil seal **4**.

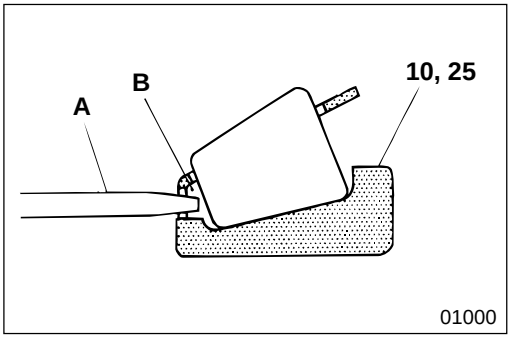
[Installation]
Press-fit oil seal retainer **5** until it is flush with the end of axle tube **A**.



8 **Removal and installation of lock nut**

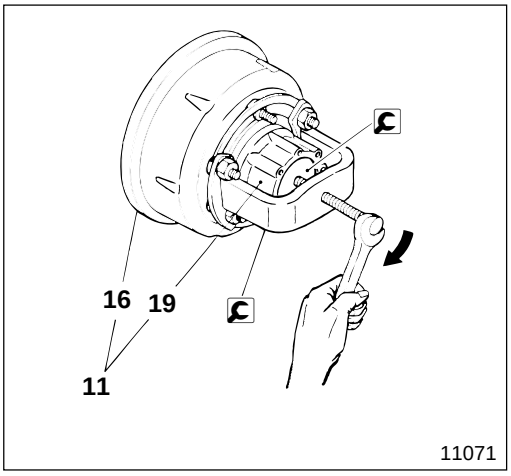
After installation, adjust the starting torque of the wheel hub bearing. See P27-12

A : Removal
B : Installation



10 **25** **Packing grease in outer bearing inner race and inner bearing inner race**

A : Grease pump nozzle
B : Space between rollers

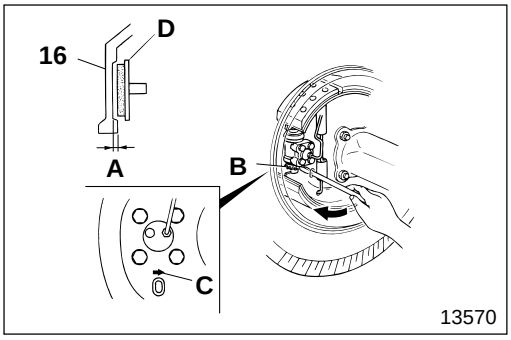


11 **Wheel hub and brake drum assembly**

[Removal]

CAUTION

Make sure you remove wheel hub and brake drum assembly 11 in a straight line to prevent damage to oil seal 12.



- If wheel hub and brake drum assembly **11** cannot be removed because of stepped wear **A** in brake drum **16**, carry out the following:
- Turn adjuster **B** in the opposite direction to arrow **C** on the packing plate, and expand the clearance between brake drum **16** and brake shoe assembly **D**. Then remove wheel hub and brake drum assembly **11**.

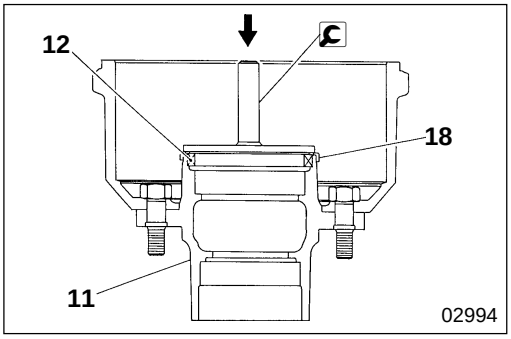
CAUTION

If brake drum 16 is faulty, correct it. Gr 35A

[Installation]

After installing wheel hub and brake drum assembly **11**, adjust the brake shoe clearance.

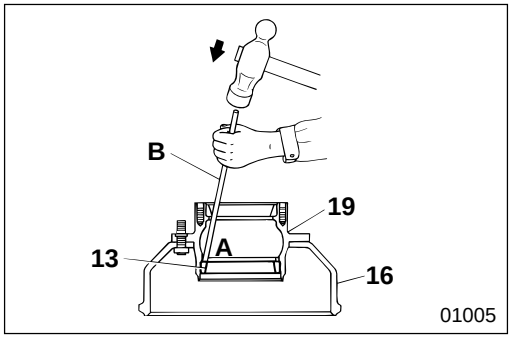
Gr 35A



12 **Installation of oil seal**

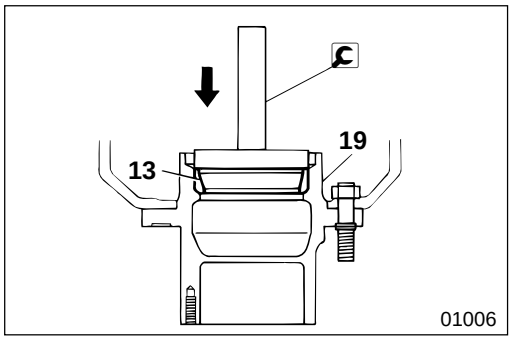
NOTE

When hub and brake drum assembly 11 is removed for a service operation and if rotor 18 is still mounted on the wheel hub, use Anti-lock brake system oil seal installer to press-fit oil seal 12.

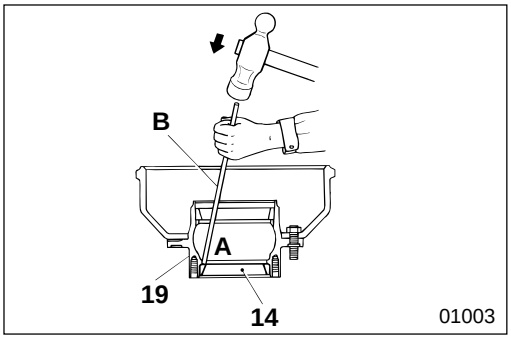


13 **Inner bearing outer race**

[Removal]
Drive out inner bearing outer race **13** evenly from four indented parts **A** in wheel hub **19**.
B : Pin-punch

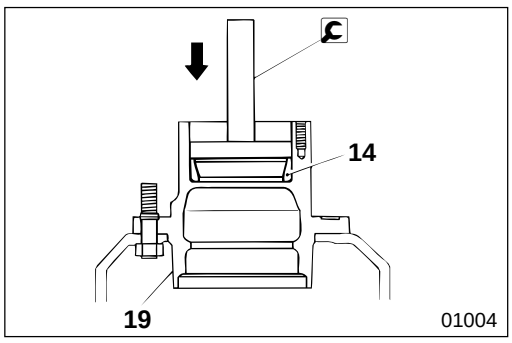


[Installation]

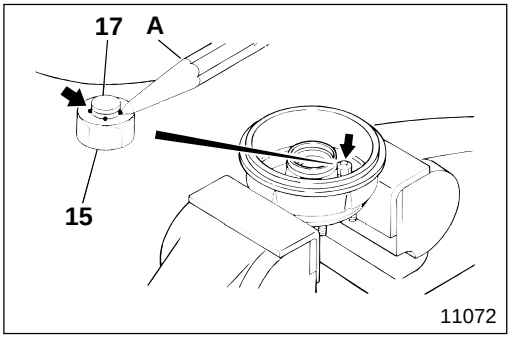


14 **Outer bearing outer race**

[Removal]
Drive out outer bearing outer race **14** evenly from four indented parts **A** in wheel hub **19**.
B : Pin-punch

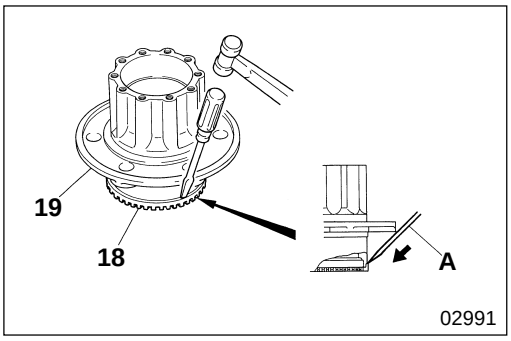


[Installation]



15 **17** **Installation of hub bolt and nut**

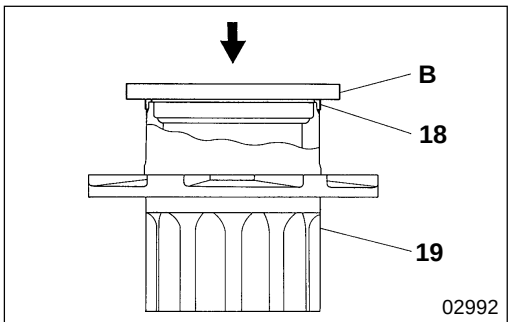
- Install hub bolt **17**.
- Tighten nut **15** at specified torque.
- Caulk nut **15** evenly at four points to keep it from turning.
  A : Pin-punch



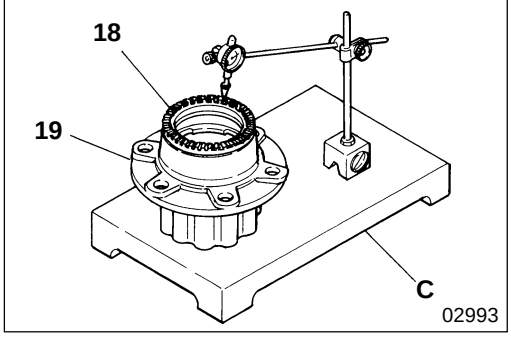
18 **Rotor**

[Removal]
Strike the outer edge of rotor **18** evenly with flat-tip screwdriver **A** to remove the rotor from the wheel hub.

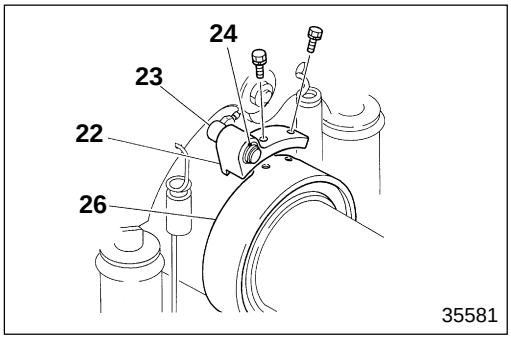
CAUTION
Be careful not to damage wheel hub 19.



[Installation]
Heat rotor **18** to approximately 150°C {302°F}. Press the rotor evenly with iron plate **B** to press-fit the rotor to wheel hub **19**. Make sure there is no space between the rotor and wheel hub.

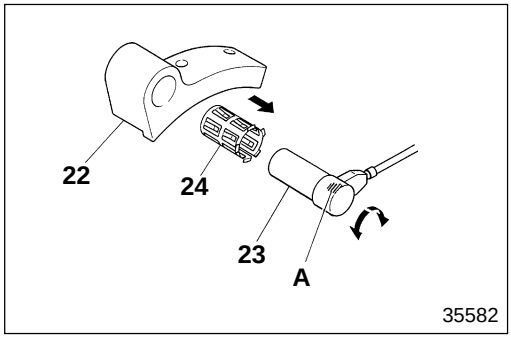


[Inspection]
- If the amount of wobbling exceeds the standard value, repeat the assembly procedure from the beginning.
- If the amount of wobbling exceeds the standard value after reassembly, replace defective parts.
  C : Base



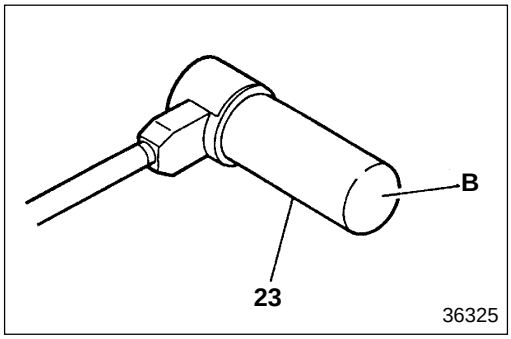
23 **Wheel speed sensor**

[Removal]
- With wheel speed sensor **23** and spring spacer **24** installed in sensor holder **22**, remove the sensor holder from oil seal retainer **26**.

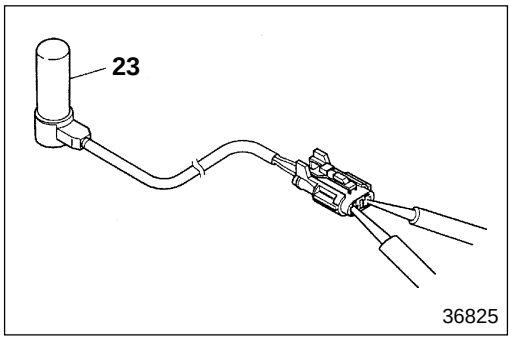


- Hold shaded section **A** of wheel speed sensor **23** with pliers, and remove the sensor by twisting it slightly in left and right directions.

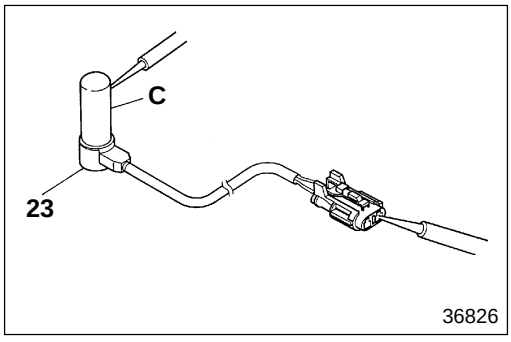
CAUTION
- **When holding wheel speed sensor 23 with pliers, do not grip any section other than shaded area A in the diagram.**
- **When removing wheel speed sensor 23, do not apply force on the sensor, such as by hitting with a hammer, prying with a screwdriver or pulling the harness, since these actions can result in wire breakage.**
- **If wheel speed sensor 23 dismounts easily, replace spring spacer 24.**



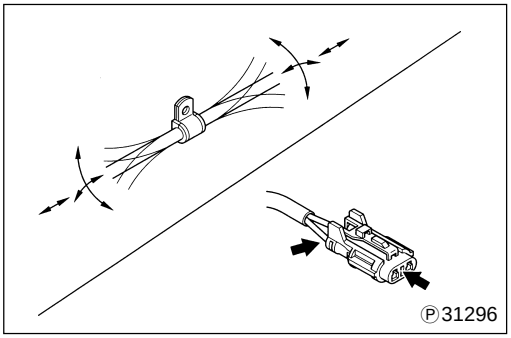
[Inspection]
- Since pole piece section **B** is magnetized by the magnet inside wheel speed sensor **23**, it attracts metals. Do not allow the pole piece to collect metallic objects.



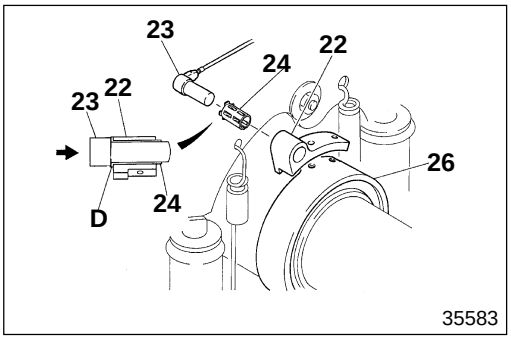
- Measure the resistance between the terminals of wheel speed sensor **23**.
  If the measured value deviates from the standard value, replace the wheel speed sensor.



- Measure the insulation resistance between body **C** of wheel speed sensor **23** and each terminal.
  If the measured values deviate from the standard value, replace the wheel speed sensor.



- To check for broken wires, remove the harness clamp section from the vehicle. Bend and extend the harness to check if there is any broken wire in the harness. Also, inspect the connector for proper contact.
  If a defect is found, replace wheel speed sensor **23**.



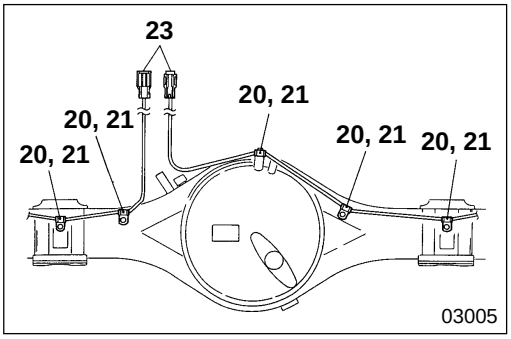
[Installation]

- Insert wheel speed sensor **23** from the back plate, and press until spring spacer **24** and stopper section **D** of the wheel speed sensor contacts sensor holder **22**.
- With wheel speed sensor **23** and spring spacer **24** installed in sensor holder **22**, mount the sensor holder on oil seal retainer **26**.

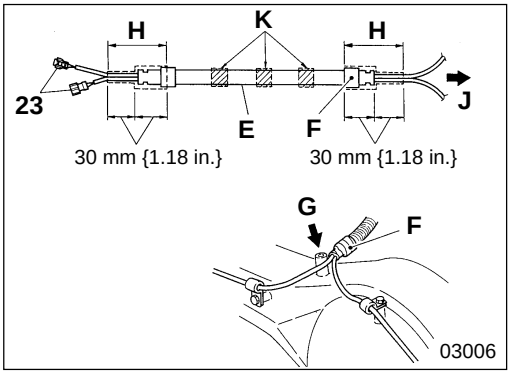
CAUTION⚠

- **When installing wheel speed sensor 23, do not apply force on the sensor, such as by hitting with a hammer, prying with a screwdriver or pulling the harness, since these actions can result in wire breakage.**
- **Note that wheel speed sensor 23 is different for left and right wheels.**

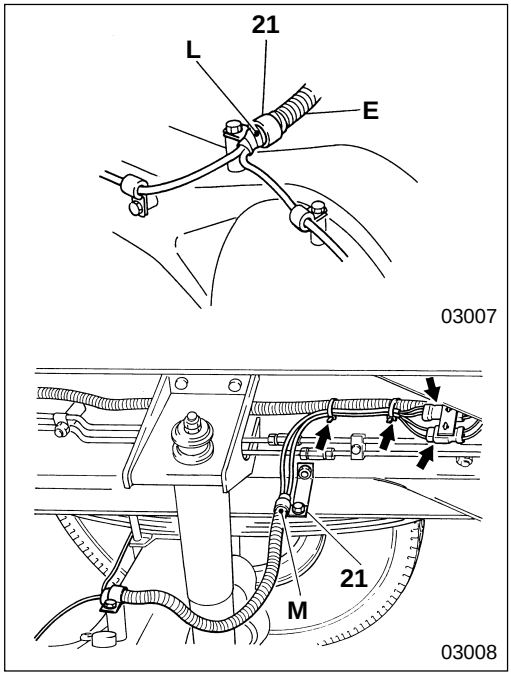
Location	Harness connector color	Harness connector shape
Left wheel	Gray	Male
Right wheel	Black	Female



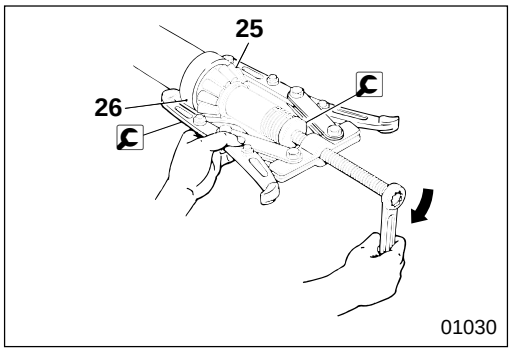
- Rear axle housing section
  Starting from the wheel brake side, secure the harness of wheel speed sensor **23** in place with clip **21** and bolt **20**. Make sure the harness does not interfere with other parts and there is no twist or slack in the harness.



- Binding of harness
  - Gather the harnesses of left and right wheel speed sensors **23**, and bind with corrugated tube **E**.
  - Adjust the position of the corrugated tube **E** so that white tape section **F** is located at clip position **G** on the rear axle housing. Then, turn the corrugated tube so that the slit faces down. Wrap black tape (electric harness tape) on both ends **H** of the corrugated tube. The tape should be placed over the tube end and harness.
    J: Rear axle housing side
  - Wrap tape on the harnesses of wheel speed sensors **23** at sections **K** (three locations at equal intervals).

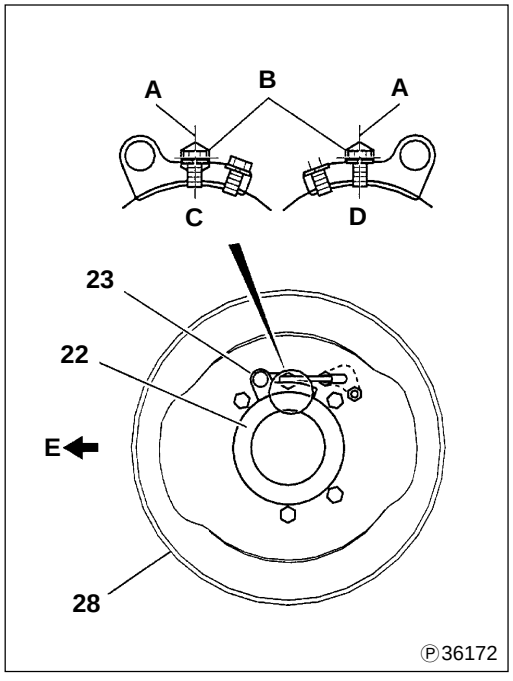


- Clamping of harness
  - Secure section **L** of corrugated tube **E** to the rear axle housing using clip **21**, and attach section **M** of the corrugated tube to the frame using clip **21**.
  - Connect the wheel speed sensor connector to the harness connector on the chassis side, and secure the connectors in place using the bracket.



25 **26** **Inner bearing inner race and oil seal retainer**

[Removal]



[Installation]

When installing oil seal retainer **26**, align mounting bolt center **A** of sensor holder **22** with the center line of mounting bolt **B** of brake assembly **28**.

C : For left wheel
D : For right wheel
E : Front of vehicle

NOTE

The brake assembly diagram shows a left wheel.

Be sure to protect brake hose 4 from dust by fitting blanking plugs after removal.

NOTE

Do not remove axle housing 12 unless it is faulty.

● **Installation sequence**

Follow the removal sequence in reverse.

CAUTION

Make sure that brake hose 4 is not twisted when you install it.

NOTE

Do not let sealant ooze from the mounting surfaces of reduction and differential assembly 8 and axle housing 12.

● **Work after installation** P27-23

Service standards

Unit : mm {in.}

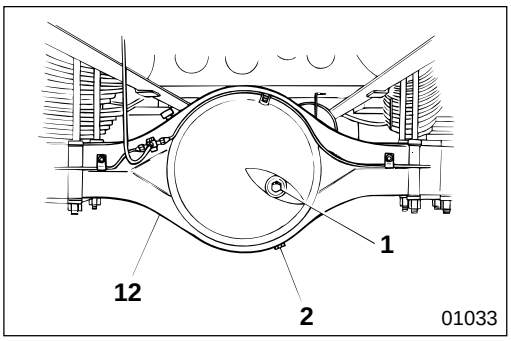
Special tools

Unit : mm {in.}

Location	Tool name and shape	Part No.	Application
12	Measuring bar 	MH061003	Measures bend of axle housing : Two required



◆ Service procedure

● **Work before removal**

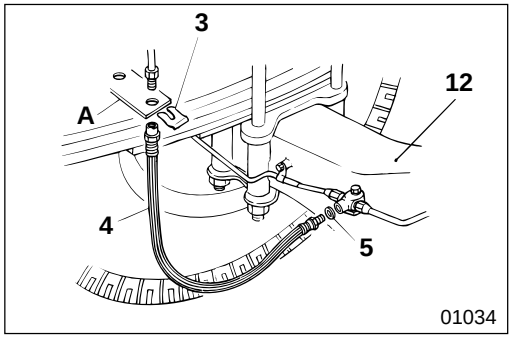
Remove drain plug **2** and drain the gear oil.

WARNING⚠

The oil temperature is high immediately after the vehicle has stopped, so take care not to scald yourself.

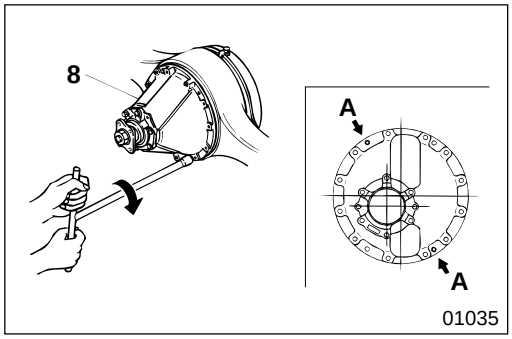
● **Work after installation**

Fill with the specified amount of gear oil via inspection plug **1**.



4 Removal and installation of brake hose

- Remove brake hose **4** from frame **A** side first, then from axle housing **12** side.
- For installation, follow the removal sequence in reverse.

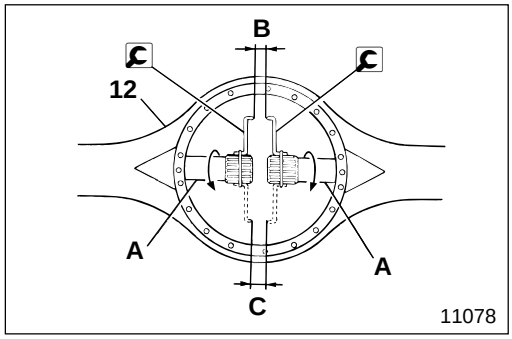


8 Removal of reduction and differential assembly

To remove reduction and differential assembly **8**, screw two M12×1.25 mm bolts evenly into two screw holes **A**.

NOTE

Completely remove adhered sealant from the mounting surfaces of reduction and differential assembly 8 and axle housing 12.



12 Bend of axle housing

- Leave axle shaft **A** installed in axle housing **12**.
- Install measuring bar on axle shaft **A**, and measure clearance **B**.
- Turn axle shaft **A** 180°, and measure clearance **C**.
- The difference between **B** and **C** is the amount of bend of axle housing **12**.
- If the bend of axle housing **12** is higher than the limit, replace the axle housing.

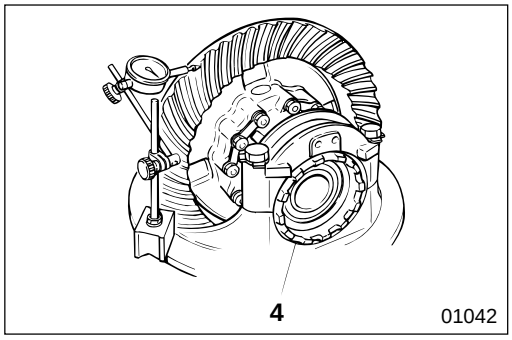
Special tools

Unit : mm {in.}

Location	Tool name and shape	Part No.	Application
9	Side bearing installer 	MH061748	Press-fitting of side bearing inner race
12	Bearing retainer guide pin 	MH061745	Installation of pinion assembly : Two required

◆ Service procedure

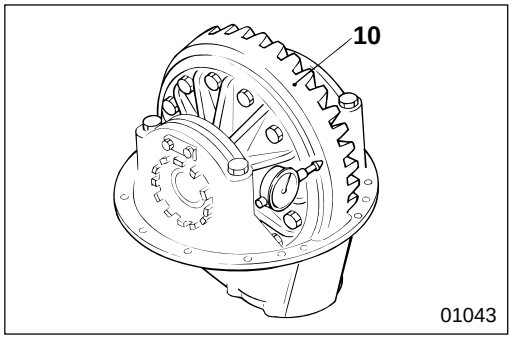


● Inspection before disassembly

Inspect for faulty parts before disassembly.

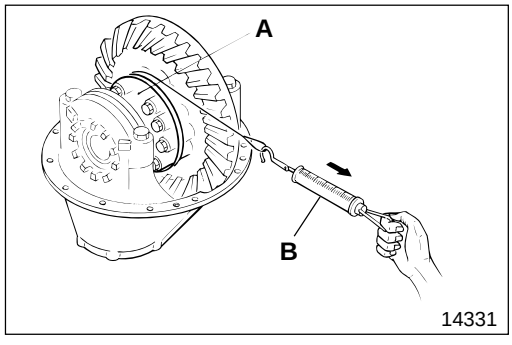
(1) Backlash of reduction gear and reduction pinion

If there is any fault, it is considered to be because of the amount adjusting screw **4** was tightened.



(2) Wobble of back face of reduction gear

Measure wobble at a point 145 mm {5.71 in.} (on the radius) from the center of the reduction gear, turning differential assembly **10** one full revolution.

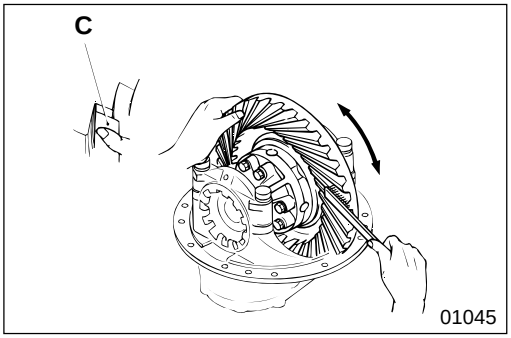


(3) Starting torque of side bearing

- Install spring balance **B** at 170 mm {6.69 in.} outer periphery point of differential case **A**.
- Measure the tangential force.
- If the measured tangential force is within the specified value, the starting torque conforms to the standard value.

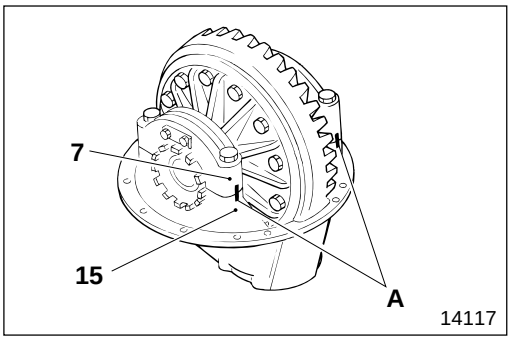
NOTE

Measure the starting torque within reduction gear and reduction pinion backlash range.



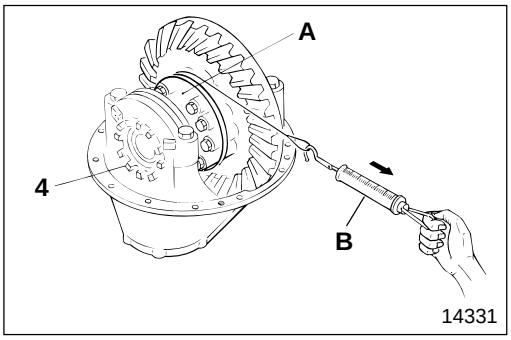
(4) Tooth contact of reduction gear

Apply red lead to three or four gear teeth, turn the gear a few times, and examine tooth contact with a piece of paper **C**.



● **Work before disassembly**

Put alignment marks **A** on bearing cap **7** and differential carrier **15** to identify left and right.



● **Inspection and adjustment after assembly**

(1) Starting torque of side bearing

[Inspection]

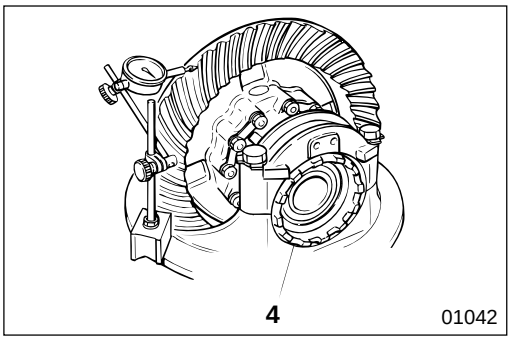
- Install spring balance **B** at 170 mm {6.69 in.} outer periphery point of differential case **A**.
- Measure the tangential force.
- If the measured tangential force is within the specified value, the starting torque conforms to the standard value.
- If the measured value deviates from the specified value, adjust.

[Adjustment]

If the measured value does not meet the specified value, adjust using left and right adjusting screws **4**.

CAUTION

- **Tighten left and right adjusting screws 4 the same amount.**
- **Adjust the starting torque within the reduction gear and reduction pinion backlash range.**

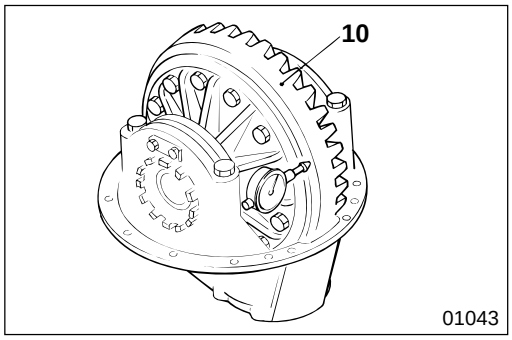


(2) Adjustment of backlash between reduction gear and reduction pinion

Adjust the starting torque of the side bearings using left and right adjusting screws **4**, taking care not to change the starting torque.

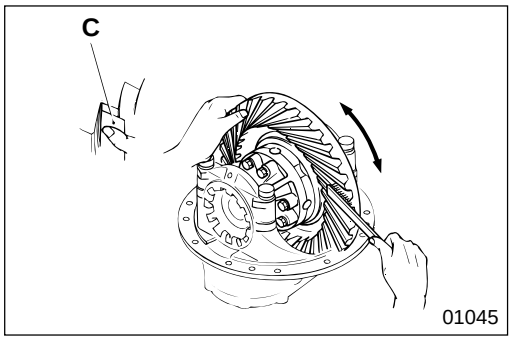
CAUTION

Make sure when you loosen one adjusting screw 4 that you tighten the other adjusting screw by the same amount, because the starting torque of the side bearing changes.



(3) Inspection of wobble of back face of reduction gear

Measure wobble at a point 145 mm {5.71 in.} (on the radius), from the center of the reduction gear, turning differential assembly **10** one full revolution.



(4) Tooth contact of reduction gear

[Inspection]

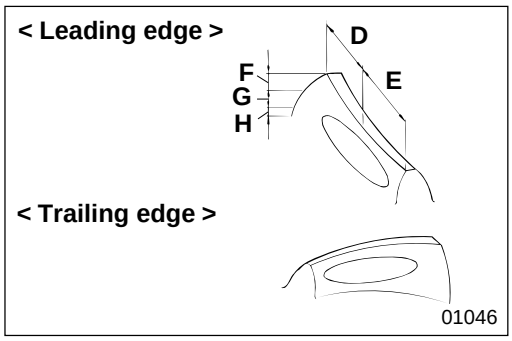
Apply red lead to three or four gear teeth, turn the gear a few times, and examine tooth contact with a piece of paper **C**.

[Adjustment]

If contact area is remarkably offset, adjust with reduction pinion mounting adjusting shims **14** to increase or decrease the backlash.

CAUTION ⚠

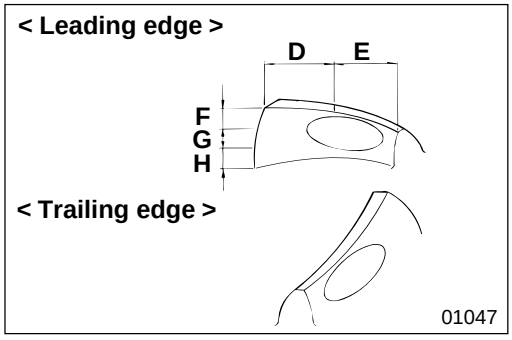
- **Make sure you replace as a reduction gear set (reduction gear and reduction pinion), when you replace the gear because of excessive teeth wear.**
- **When good tooth contact adjustment has been obtained, but backlash does not meet the standard value, tooth contact has priority. It is not necessary to adjust backlash to the standard value if it is less than 0.15 mm {0.0059 in.} out.**



● **Normal tooth contact at no load**

< Reduction gear >

D : Heel
E : Toe
F : Face
G : Flank
H : Clearance



< Reduction pinion >

D : Heel
E : Toe
F : Face
G : Flank
H : Clearance

Maintenance item			Assembly standards
At no load	Tooth contact position	Lengthwise direction of tooth	From center toward toe
		Vertical direction	From center toward top of tooth for reduction gear and center of tooth for pinion
	Tooth contact shape	Length	About 50 to 70% of tooth width
		Width	About 50 to 70% of tooth depth
	Degree of tooth contact		Degree of tooth contact becomes weaker as it comes nearer to root or top

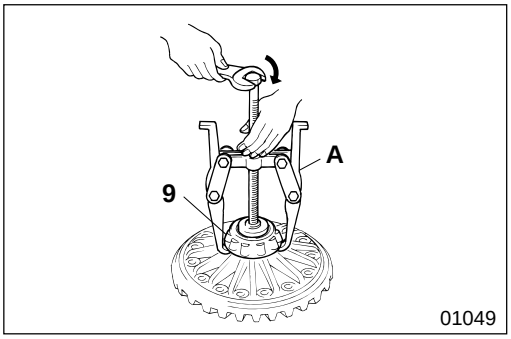
NOTE

When tooth contact area is nearer to toe at no load, it becomes middle area contact under load.

Adjustment of Tooth Contact

	Mode of adjustment	Moving direction
Adjustment by adding or reducing shims	Advances reduction pinion to reduction gear (Shims are reduced) 	< Leading edge > < Trailing edge > Tooth contact moves toward root of tooth
	Retards reduction pinion from reduction gear (Shims are added) 	 Tooth contact moves toward top of tooth
Adjustment using adjusting screw	Advance reduction gear to reduction pinion axis (Less backlash) 	Tooth contact moves in lengthwise direction of tooth Leading edge: Nearer to toe and slightly nearer to root of tooth Trailing edge: Nearer to heel and slightly nearer to top of tooth
	Retard reduction gear from reduction pinion axis (More backlash) 	Tooth contact moves in lengthwise direction of tooth Leading edge: Nearer to heel and slightly nearer to top of tooth Trailing edge: Nearer to toe and slightly nearer to root of tooth

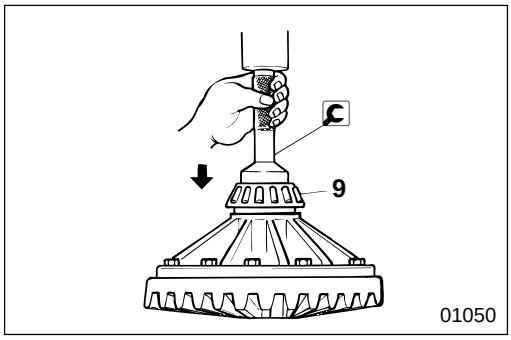
◆ Service procedure



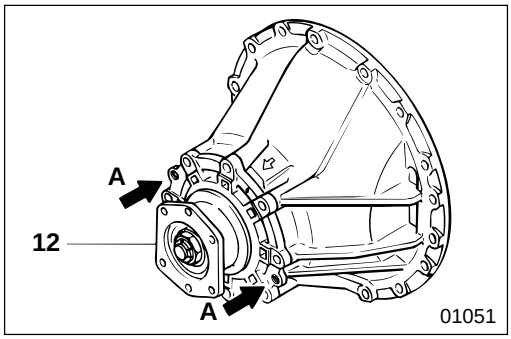
9 **Side bearing inner race**

[Removal]

A : Gear puller (General tool)



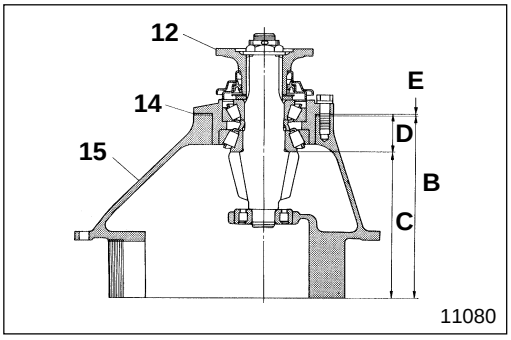
[Installation]



12 **Pinion assembly**

[Removal]

To remove pinion assembly **12**, screw two M12×1.25 mm bolts evenly into the two pinion assembly removal screw holes **A**.



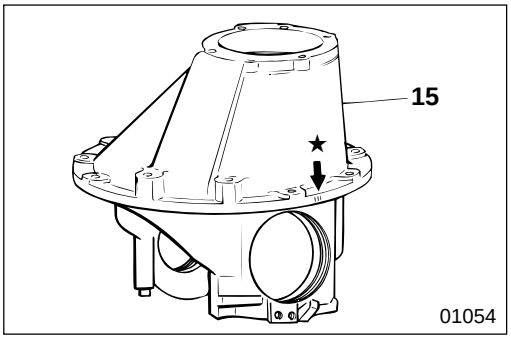
[Adjustment]

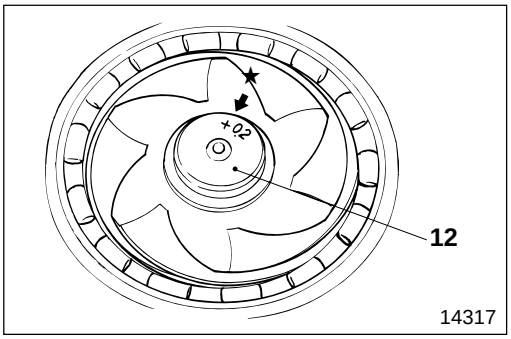
- Carry out the following procedure so that **B**, **C** and **D** conform to the standard dimension.
- Calculate shim thickness **E** according to the following formula based upon the machining error data stamped on pinion assembly **12** and differential carrier **15**.

Formula for calculation:

E = 0.5 {0.020}–b+c+d

b : Deviation from basic dimension **B**
c : Deviation from basic dimension **C**
d : Deviation from basic dimension **D**





Unit : mm {in.}

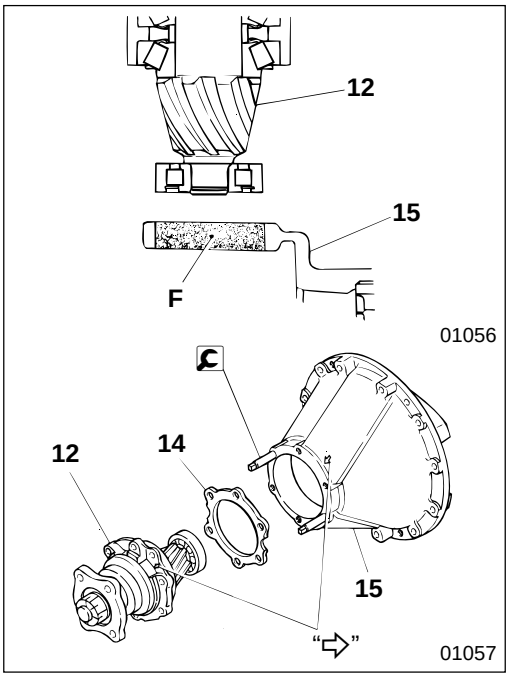
Location	Standard dimension	How to calculate deviation
Shim thickness	0.5 {0.020}	—
B	227 {8.94}	The basic dimension, multiplied by 100, is stamped on the periphery of differential carrier **15** flange
C	175 {6.89}	The basic dimension is stamped on the top of pinion assembly **12**
D	52 {2.05}	Measure the deviation from **D** using a dial gauge. However, If it is difficult to measure the actual deviation, assume a value from 0 to 0.2 {0 to 0.0079}

★ : Stamped number position

NOTE

Thickness is stamped in millimeters.

- Select shim **14** from shim thickness **E**.
  Available thicknesses of shim **14** : 0.1 mm {0.0039 in.} and 0.2 mm {0.0079 in.}



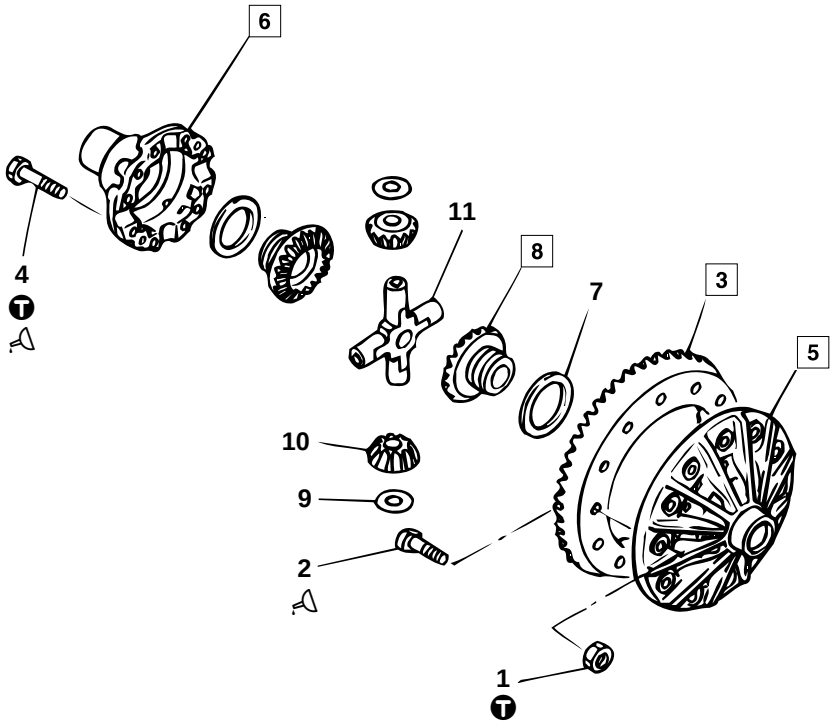
[Installation]

- Apply lock paint to pinion pilot bearing mounting surface **F** of differential carrier **15**.
- Install pinion assembly **12**.

CAUTION

- **Be sure to let the lock paint harden undisturbed for 30 minutes to two hours after installation.**
- **Be sure to wait at least three hours before running the vehicle, and if possible wait 24 hours to let the lock paint harden.**

Differential Assembly



● **Disassembly sequence**

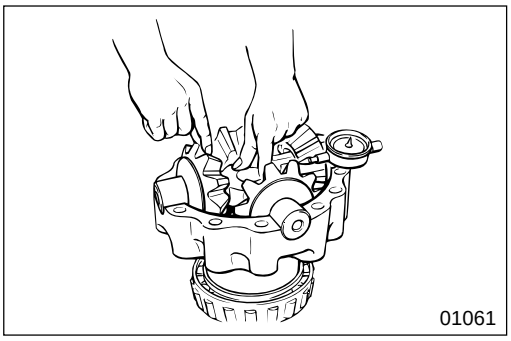
Lubricant and sealant

Location	Points of application	Kinds	Quantity
2, 4	Entire bolt	Rust preventive	As required
	Thread area of bolt	LOCTITE 271	As required

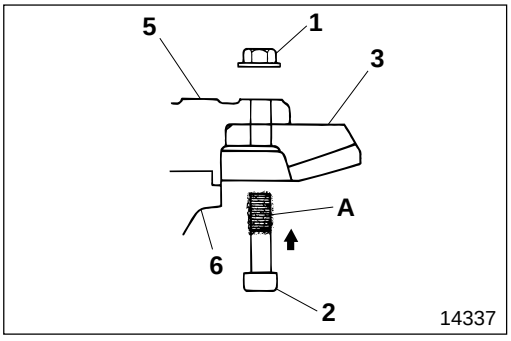


◆ Service procedure

● **Adjustment after assembly**

Backlash between differential gear and differential pinion

If the measured value deviates from the standard value, replace differential gear washer **7**.

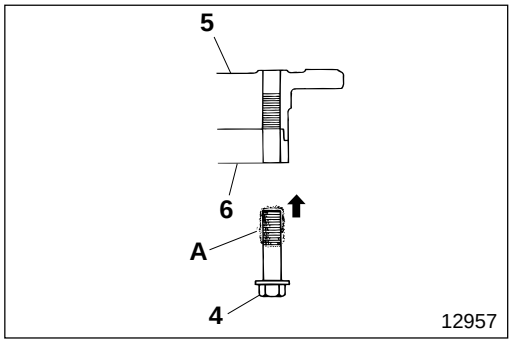


3 **5** **Installation of differential case LH and reduction gear**

- Apply rust preventive to entire surface of bolt **2**.
- Apply lock paint to thread area **A** of bolt **2**.
- Tighten nut **1** at specified torque.

CAUTION

- **Be sure to apply rust preventive to nut 1 because of the need to tighten it at specified torque.**
- **Be sure not to operate the vehicle for at least one hour after installation in order to let the lock paint harden.**
- **Be sure not to operate the vehicle at full torque for at least four hours after installation in order to let the lock paint harden.**

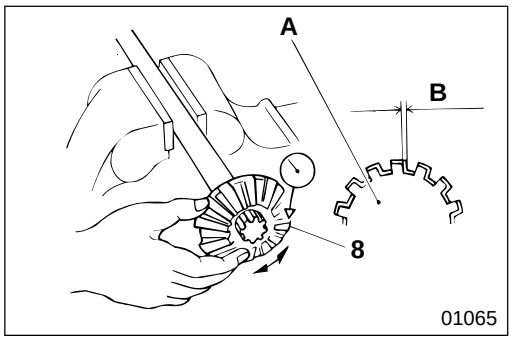


5 **6** **Installation of differential case LH and differential case RH**

- Apply rust preventive to entire surface of bolt **4**.
- Apply lock paint to thread area **A** of bolt **4**.
- Tighten bolt **4** at specified torque.

CAUTION

- **Be sure to apply rust preventive to bolt 4 because of the need to tighten it at specified torque.**
- **Be sure not to operate the vehicle for at least one hour after installation in order to let the lock paint harden.**
- **Be sure no to operate the vehicle at full torque for at least four hours after installation in order to let the lock paint harden.**



8 **Play between differential gear and axle shaft at the spline**

A : Axle shaft
B : Play

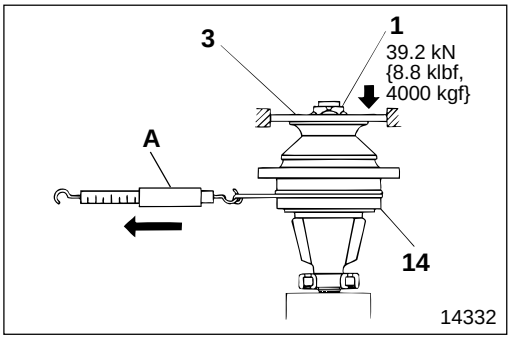
13	Pinion inner bearing installer 	MH061006	Press-fitting of inner bearing outer race



◆ Service procedure

● Inspection and adjustment after assembly

Starting torque of pinion bearing

[Inspection]

- Apply load of approximately 39.2 kN {8.8 klbf, 4000 kgf} to companion flange **3** or tighten lock nut **1** at specified torque.
- Install spring balance **A** at 134 mm {5.28 in.} outer periphery point of bearing retainer **14**.
- Measure the tangential force.
- If the measured tangential force is within the specified value, the starting torque conforms to the standard value.
- If the measured value deviates from the specified value, adjust.

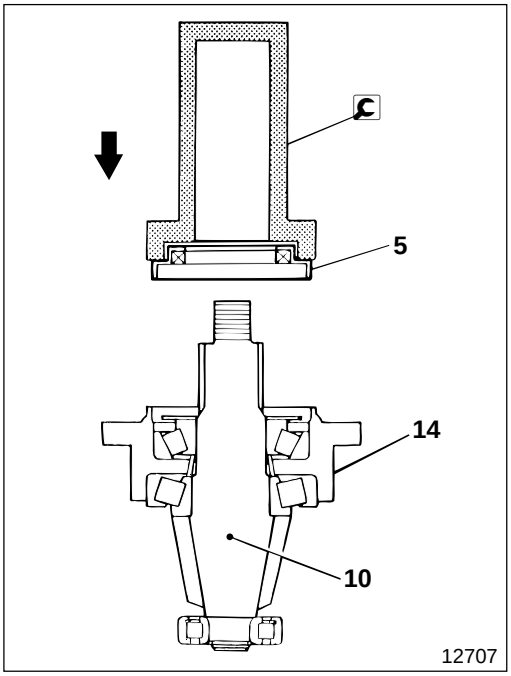
NOTE

- **Tighten companion flange 3 before measuring.**
- **Measure with oil seal 5 removed.**

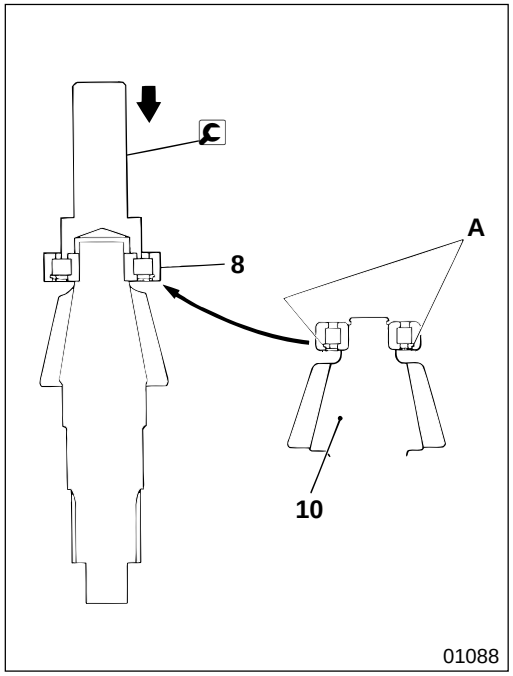
[Adjustment]

If the measured value does not conform to the specified value, adjust with collar **6** to obtain specified tangential force. Choose an appropriate collar by referring to the table below.

Thickness of collar : 15.875 to 16.475 mm {0.62 to 0.65 in.} (25 thicknesses in 0.025 mm {0.00098 in.} increments)



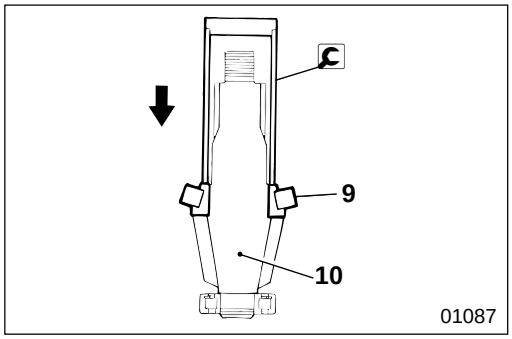
5 **Installation of oil seal**



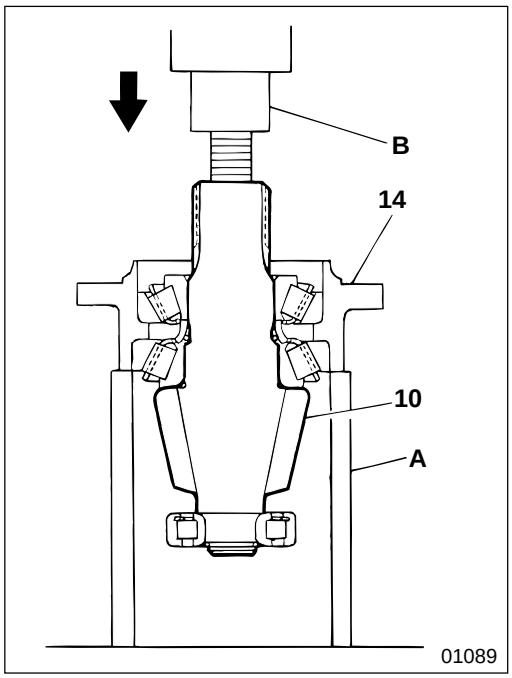
8 **Installation of pinion pilot bearing**

Press-fit pinion pilot bearing **8** in the direction as illustrated.

A : Lock ring



9 **Installation of inner bearing inner race**



10 **Removal of reduction pinion**

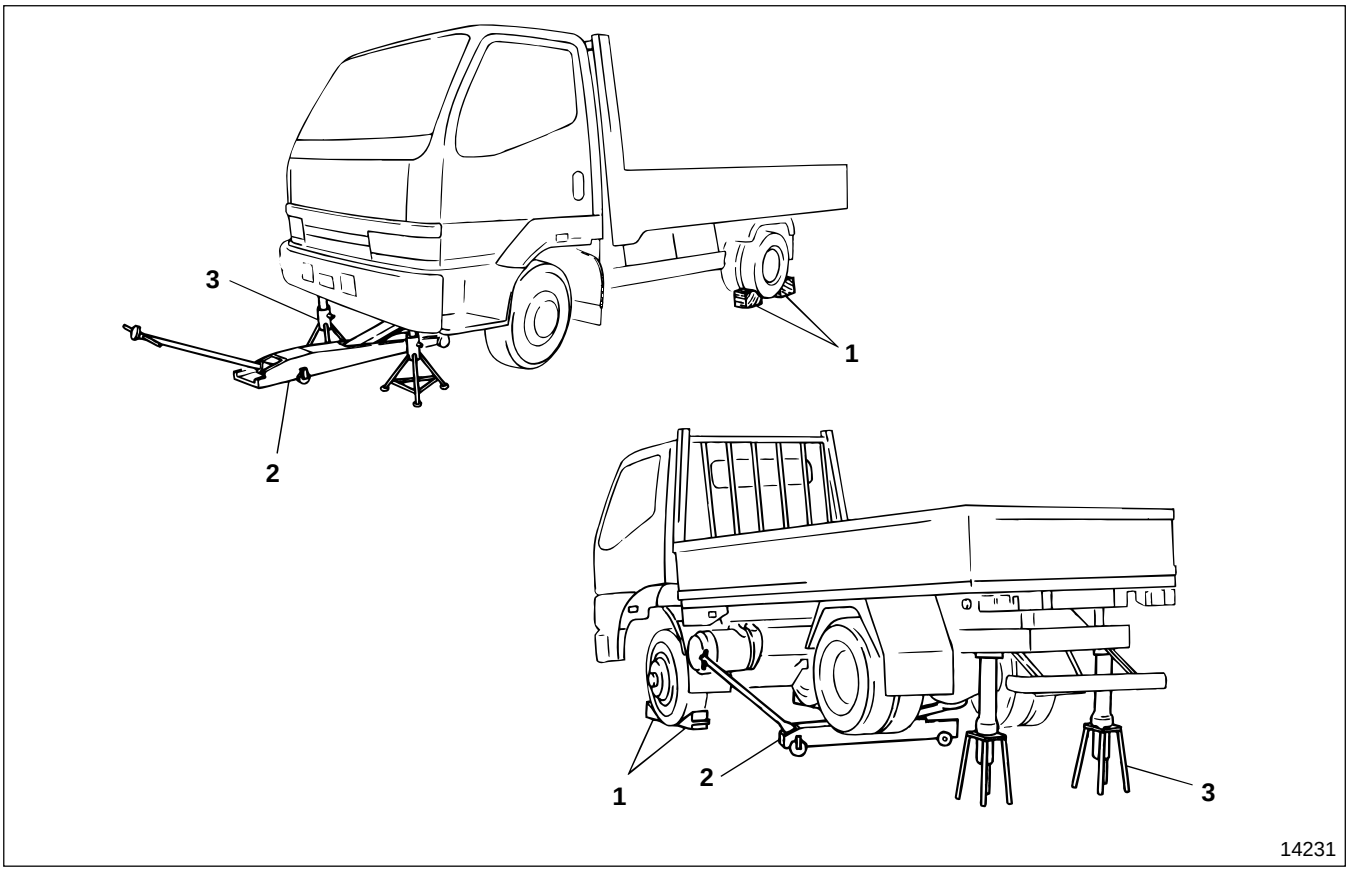
Work for Removal and Installation of Wheel and Tire



● **Work sequence**

1 Place wheel chocks.
2 Jack up the front or rear axle using a garage jack placed under the center of the axle.
3 Support the frame on rigid racks.

WARNING⚠

- **Chock the wheels securely so the vehicle does not move.**
- **Do not remove the chocks until the entire operation is completed.**
- **Supporting a vehicle on a garage jack only is extremely dangerous, so always support the frame on rigid racks.**
- **Leave the garage jack and rigid racks in place until the entire operation is completed. Never remove them during the operation.**

● **Work sequence after removal and installation**

Follow the work sequence in reverse.

WHEEL AND TIRE

NOTE

Use right-hand threaded wheel nuts marked “R” for right side wheel and left-hand threaded wheel nuts marked “L” for left side wheel.

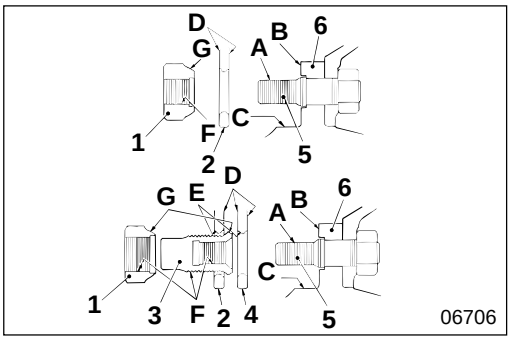
Tightening torque

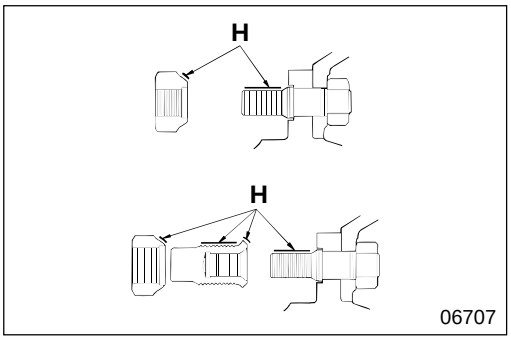
Unit : N·m {ft.lbs, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
1, 3	Wheel nut	370 to 410 {275 to 305, 38 to 42}	Wet

Lubricant

Location	Points of application	Kinds	Quantity
1	Wheel nut spherical area	Chassis grease [NLGI No. 1 (Ca soap)] or Wheel bearing grease [NLGI No. 2 (Li soap)]	As required
3	Thread and spherical areas of wheel nut (inner)	Chassis grease [NLGI No. 1 (Ca soap)] or Wheel bearing grease [NLGI No. 2 (Li soap)]	As required
5	Thread area of hub bolt	Chassis grease [NLGI No. 1 (Ca soap)] or Wheel bearing grease [NLGI No. 2 (Li soap)]	As required





◆ Service procedure

● Cleaning and applying grease before installation

[Cleaning]

To prevent wheel nuts **1** and **3** and hub bolt **5** from becoming loose and to prevent mounting parts (tire assemblies **2** and **4** and hub **6**) from being damaged, remove rust, dust, additional coatings of paint, and foreign particles from the following areas:

A : Hub bolt thread area
B : Wheel mounting surface of hub
C : Wheel alignment area of hub
D : Disc wheel mating surface
E : Disc wheel nut mounting surface
F : Wheel nut thread area
G : Wheel nut spherical area

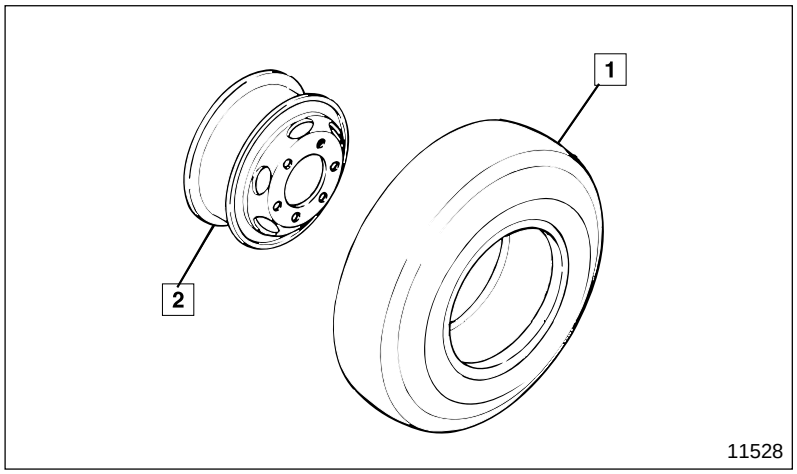
[Applying grease]

H : Grease application location

WARNING⚠

Never use grease containing molybdenum disulfide, since it can cause loosening of fitted screws.

Tire Assembly



● **Disassembly sequence**

1 Tire
2 Disc wheel

● **Assembly sequence**

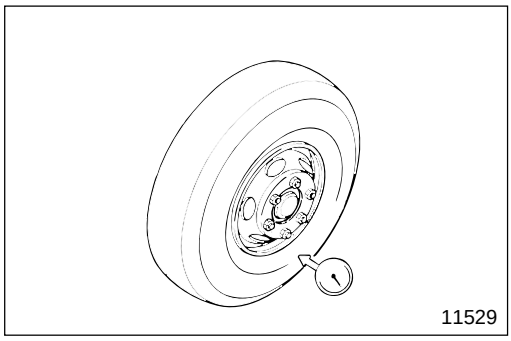
Follow the disassembly sequence in reverse.

Service standards

Unit : mm {in.}

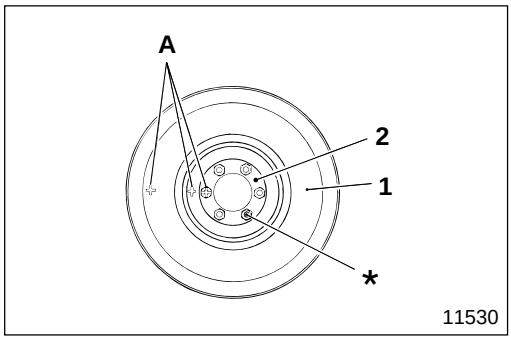
Location	Maintenance item		Standard value	Limit	Remedy
1	Horizontal deflection of tire (When assembled)		3.5 {0.14} or less	—	—
2	Disc wheel	Flatness	0.2 {0.0079} or less	—	—
		Horizontal deflection	1.5 {0.059} or less	—	—
		Vertical deflection	1.5 {0.059} or less	—	—

◆ Service procedure



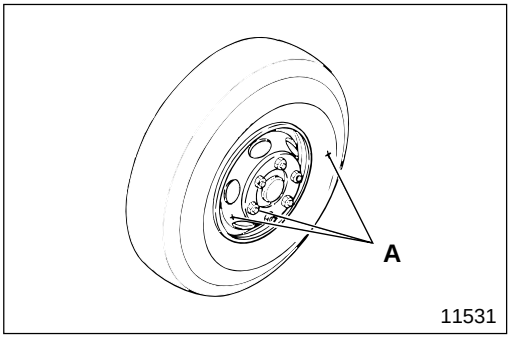
1 **Deflection of tire**

[Inspection]
If the measured value is higher than the limit, make corrections as follows.

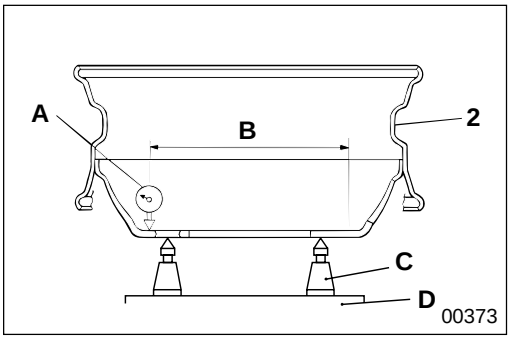


[Correction]

- Put chalk marks on tire **1**, disc wheel **2**, and hub bolt * (positions **A** as illustrated).
- Remove tire **1** from disc wheel **2**.



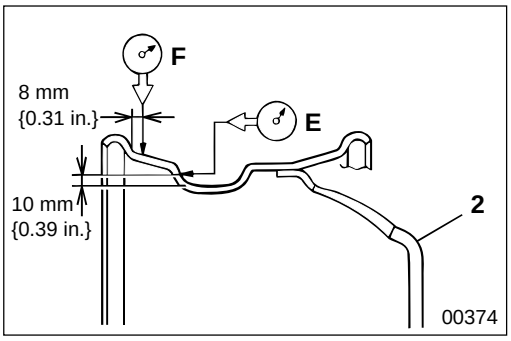
- Measure deflection of disc wheel **2**. If the most deflective position is near the chalk mark, reinstall tire **1** rotating it half a turn from the chalk mark and tighten nuts.
- Remeasure deflection of tire **1**.
- If the measured value is still higher than the limit, replace tire **1** and disc wheel **2** together as an assembly.



2 Inspection of disc wheel

(1) Flatness

- Measure flatness at specified position **B** from the center of disc wheel **2**.
  Measure flatness at six equidistant points (wheel with 6 studs) on the wheel.
  A : Dial gauge
  B : ø170 to 270 mm {6.69 to 10.6 in.}
  C : Portable screw jacks (× 4)
  D : Surface plate
- Replace disc wheel **2** if the measured value is higher than the limit.



(2) Deflection

Replace disc wheel **2** if the measured value is higher than the limit.
E : Horizontal deflection measuring point
F : Vertical deflection measuring point

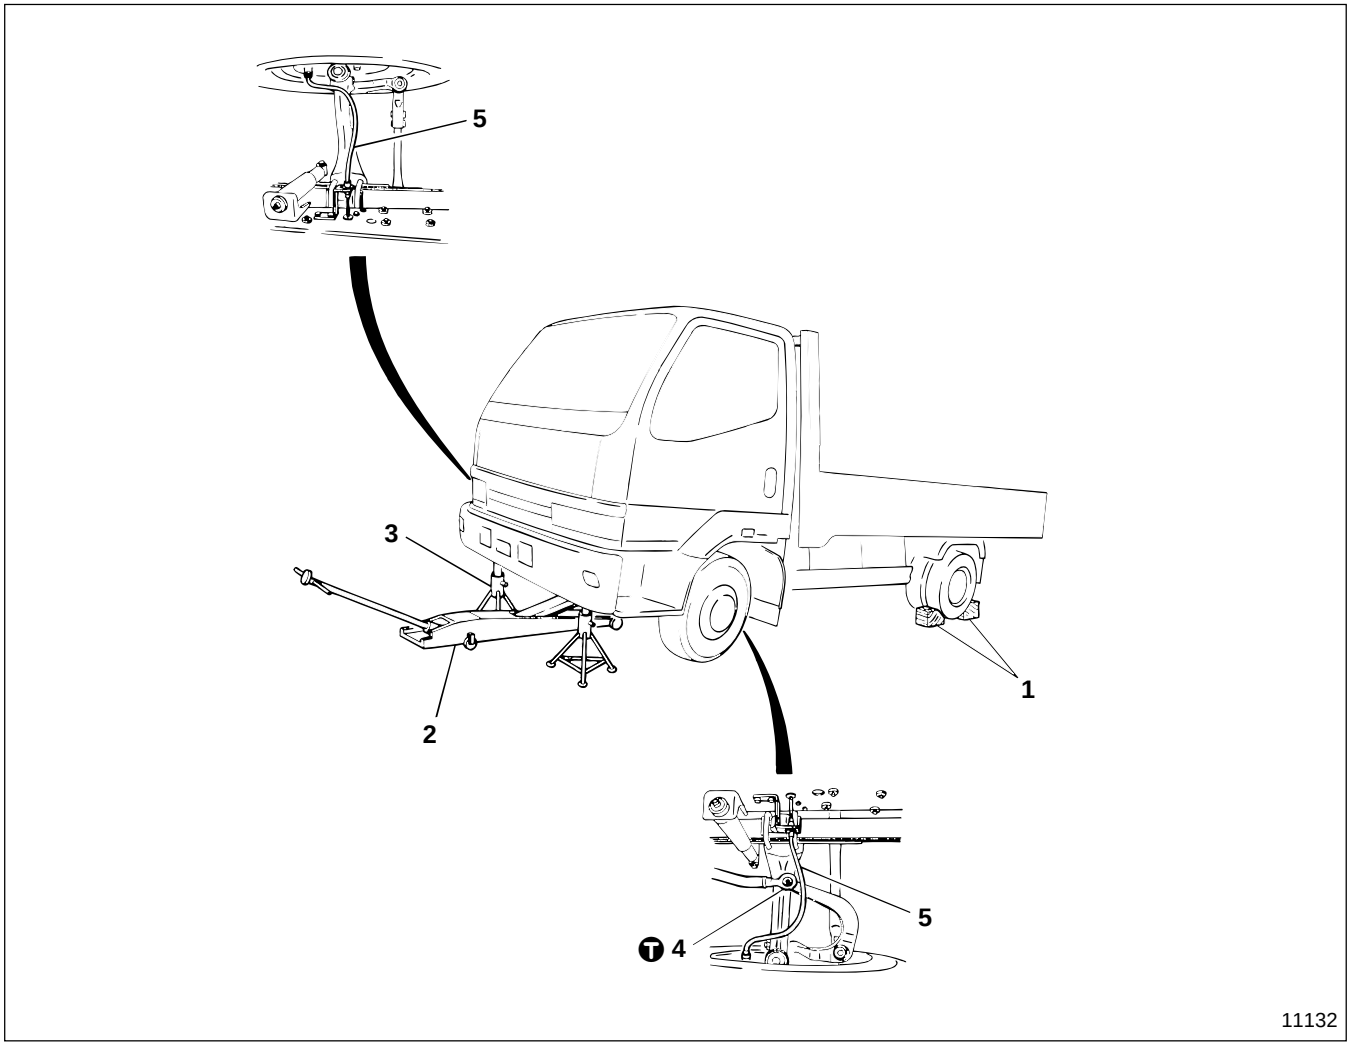
WORK BEFORE REMOVAL AND INSTALLATION OF FRONT SUSPENSION



● **Removal sequence**

1 Place wheel chocks.
2 Jack up the front axle with a garage jack.
3 Support the front frame on rigid racks.
4 Remove the nut (that connect the knuckle arm and the drag link).
5 Disconnect the brake hose (on the frame side).

WARNING⚠

- **Chock the wheels securely so the vehicle does not move.**
- **Do not remove the chocks until the entire operation is completed.**
- **Supporting a vehicle on a garage jack only is extremely dangerous, so always support the frame with rigid racks.**
- **Leave the garage jack and rigid racks in place until the entire operation is completed. Never remove them during the operation.**

CAUTION⚠

Be sure to protect the brake hose from dust by fitting blanking plugs.

● **Installation sequence**

Follow the removal sequence in reverse.

WARNING⚠

You must bleed air from the brake system after connecting the brake hose, failure to do so would cause the brakes to malfunction. Gr 35A

CAUTION⚠

Be sure that the brake hose is not twisted when you connect it.

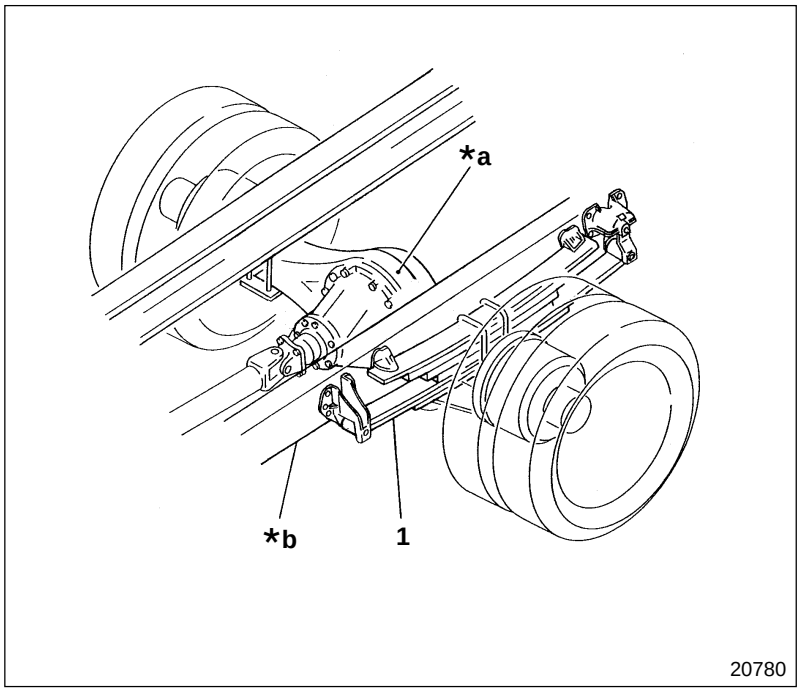
REMOVAL AND INSTALLATION OF LEAF SPRING ASSEMBLY 34- 6

LEAF SPRING ASSEMBLY 34-12



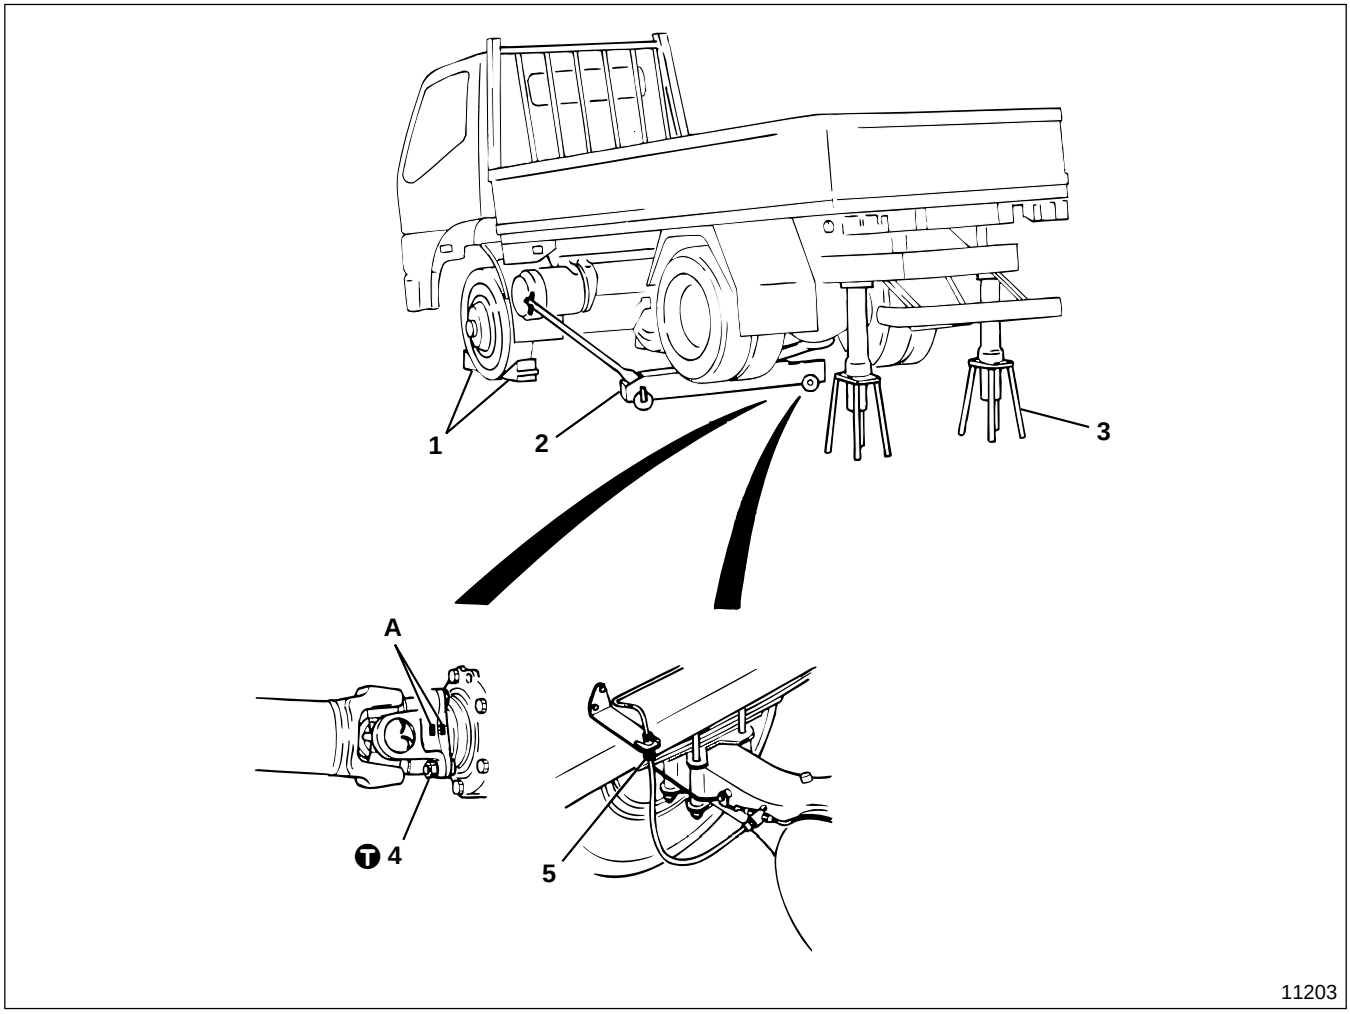
1 Leaf spring assembly

***a** : Rear axle
***b** : Frame

Leaf spring assembly **1** installed between frame ***b** and rear axle ***a** to support the vehicle body mass and absorb vibration and shock from the road surface to prevent them from being directly transmitted to the vehicle body thereby protecting the crew, the vehicle body, and the cargo. In addition, irregular vibration from the wheels is restrained, ensuring driving stability.

Possible causes \ Symptoms		Noise generated when vehicle is unloaded	Impact transmitted from uneven road surface	Noise generated when vehicle is loaded	Periodic jolts caused by the road surface	Remarks
Leaf spring	Cracked or damaged		○			
	Damaged	○				
	Spring bracket broken			○		
	U-bolts loose			○		
	Spring bushing worn	○				
Shackle pins thrust play excessive		○				
Helper stopper damaged or broken				○		
Tire	Tires worn unevenly				○	
	Tires and wheels unbalanced				○	Gr 31
	Air pressure excessive		○			

WORK BEFORE REMOVAL AND INSTALLATION OF REAR SUSPENSION



● **Removal sequence**

1 Place wheel chocks.
2 Jack up the rear axle with a garage jack.
3 Support the rear frame on a rigid rack.
4 Put alignment marks **A** on the rear axle companion flange and the propeller shaft flange yoke, then remove the nuts (on the joint between the rear axle and the propeller shaft).
5 Remove the brake hose joint (on the frame).

WARNING ⚠

- **Chock the wheels securely so the vehicle does not move.**
- **Do not remove the chocks until the entire operation is completed.**
- **Supporting a vehicle on a garage jack only is extremely dangerous, so always support the frame on rigid racks.**
- **Leave the garage jack and rigid racks in place until the entire operation is completed. Never remove them during the operation.**

CAUTION ⚠

Be sure to protect the brake hose from dust by fitting blanking plugs.

● **Installation sequence**

Follow the removal sequence in reverse.

WARNING⚠

You must bleed air from the brake system after installing the brake hose, failure to do so would cause the brake to malfunction. Gr 35A

CAUTION⚠

Be sure that the brake hose is not twisted when you install it.

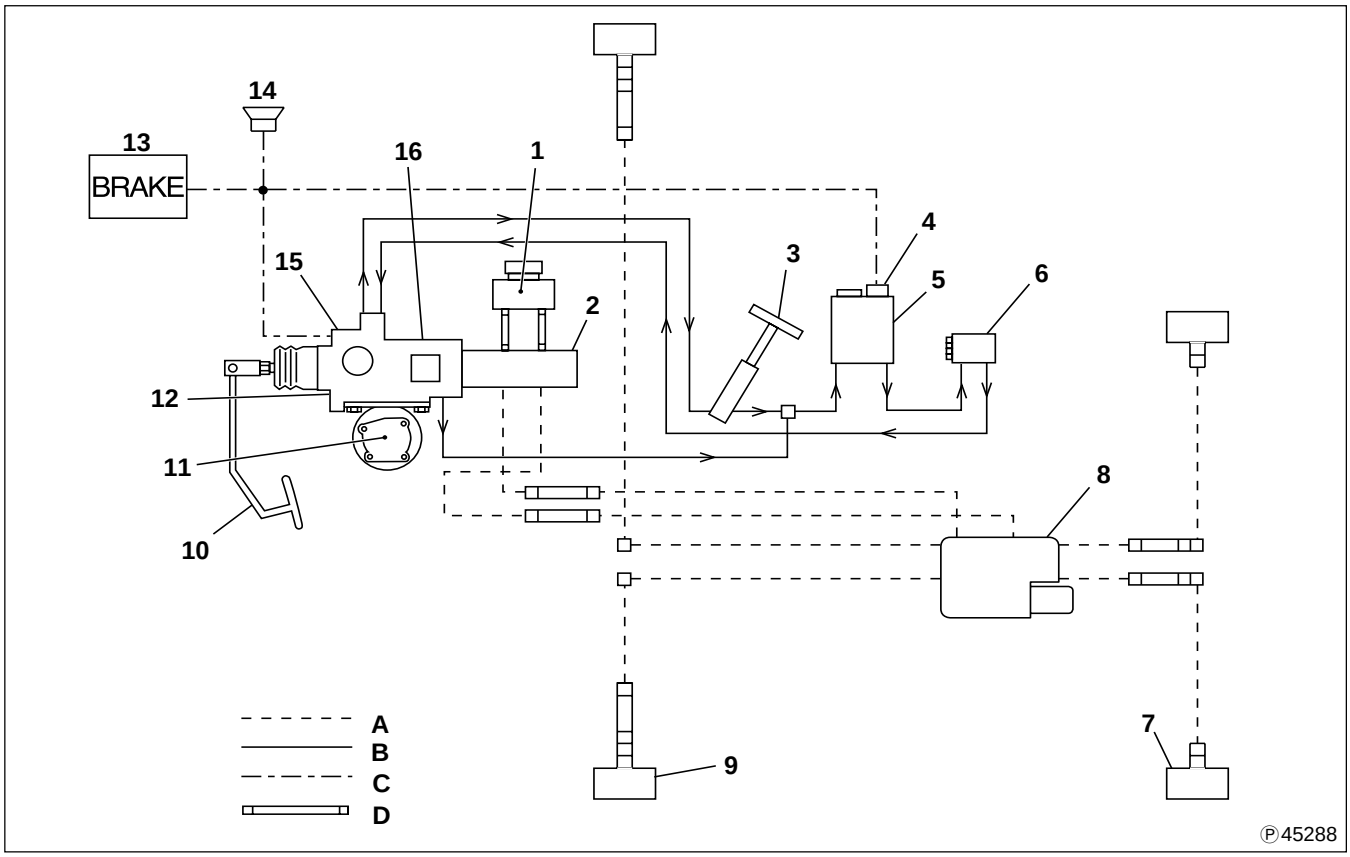
Hydraulic booster brake system



1 Brake fluid tank
2 Brake master cylinder
3 Power steering booster
4 Power steering fluid level sensor
5 Power steering oil tank
6 Power steering oil pump
7 Rear wheel cylinder
8 Hydraulic unit
9 Front wheel cylinder
10 Brake pedal
11 Emergency pump motor
12 Brake booster (Hydraulic booster)
13 Brake warning lamp
14 Warning buzzer
15 Flow switch
16 Motor relay

A : Brake fluid line
B : Power steering fluid line
C : Electric line
D : Hose

- The brake system is a hydraulic booster brake type, all-wheel braking type consisting of separate front and rear systems.
- The servo system is fitted with brake booster (hydraulic booster) **12**.
- The hydraulic booster brake type uses the fluid pressure from power steering oil pump **6** to boost brake pedal **10** operating force.
- If fluid pressure stops being generated because of engine stoppage, power steering oil pump **6** failure, or fluid leakage from the power steering piping, it is detected by flow switch **15**. To ensure proper fluid pressure in an emergency, the emergency pump motor **11** rotates by the action of operating currents from motor relay **16**.

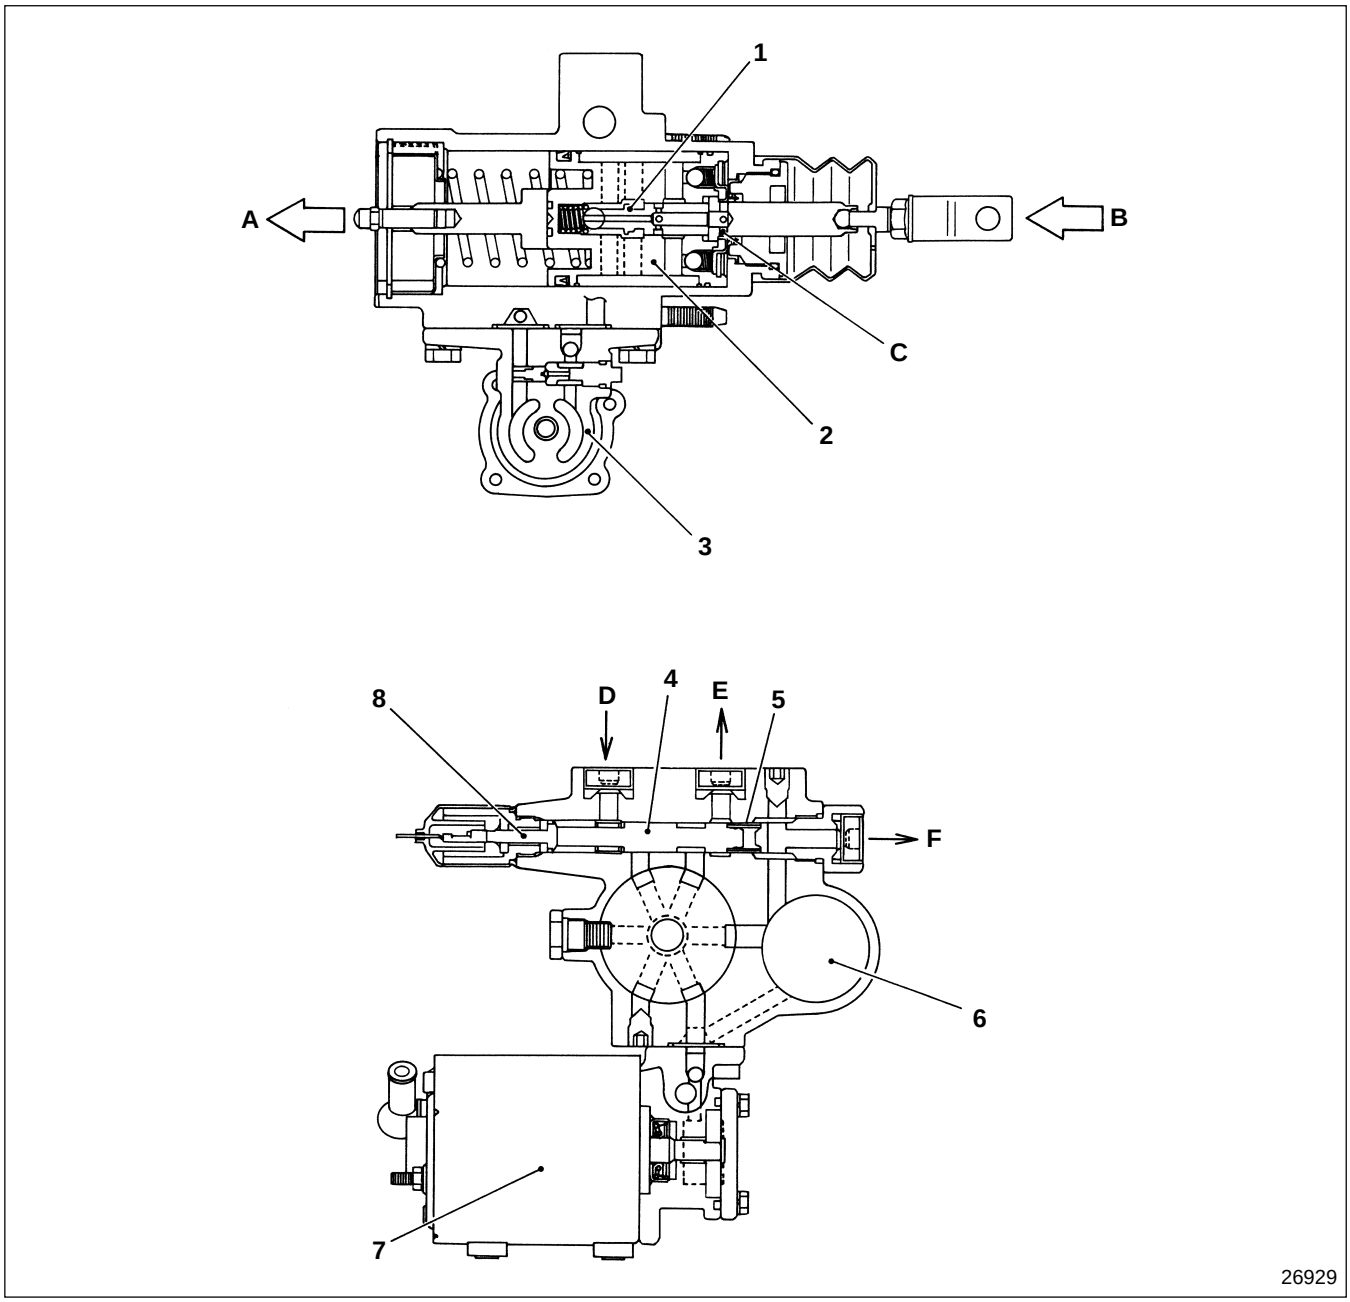
- Emergency pump **10** operates only when brake pedal **9** is depressed.
  Operation conditions details are as follows.

Starter switch	Engine	Parking brake switch	Alarms		Power steering fluid pressure	*1 Emergency pump motor	Vehicle condition
			Brake warning lamp ○ ··· Lit × ··· Not lit	Warning buzzer ○ ··· Sounding × ··· Silent		○ ··· Running × ··· Stopped	
ON	Running	ON (Pulled)	×	×	Present	×	When normal
			○	○	Absent	○	*2 Power steering piping fluid leakage
		OFF (Returned)	×	×	Present	×	When normal
			○	○		○	*2 Power steering piping fluid leakage
	ON (Pulled)	ON (Pulled)	○	○		○	When engine is started
						○	When engine stalls during take-off on a slope
		OFF (Returned)	○	○	Absent	○	When engine stalls
Stopped OFF			×	×		○	When vehicle starts moving right after being parked (when parking brake force is insufficient)
		OFF (Returned)	×	×		○	When engine is cut off right before the vehicle comes to a stop
ON	—	—	○	○	—	—	When fluid level in power steering oil tank is below “MIN” or above “MAX”
OFF	—	—	×	×	—	—	

*1 : The emergency pump motor operates when the brake pedal is depressed.

*2 : Fluid pressure is obtained by the action of the brake booster (hydraulic booster) fail-safe system which cuts off the flow of fluid to the power steering piping. 🕮 P35A-6

Brake Booster (Hydraulic Booster)



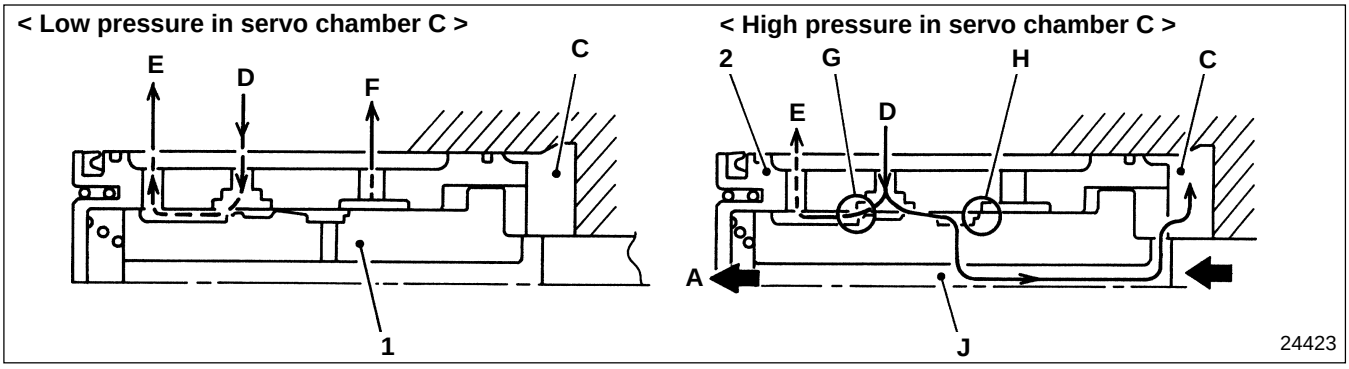
1 Spool valve
2 Hydraulic piston
3 Emergency pump
4 Piston
5 Spring
6 Reservoir
(Brake booster built-in)
7 Emergency pump motor
8 Flow switch

A : Brake master cylinder
B : Brake pedal
C : Servo chamber
D : Power steering oil pump
E : Power steering booster
F : Drain

- Spool valve **1** is an adjusting valve linked to brake pedal **B** that generates fluid pressure in accordance with the pedal operating force.
- Hydraulic piston **2** is linked to brake master cylinder **A**, by storing the fluid supplied via spool valve **1** in servo chamber **C** its force is boosted.

- In case there is fluid leaking from the power steering piping and fluid pressure is lost, piston **4** is depressed by the action of spring **5** and moves to the left, shutting off the flow of fluid to power steering oil pump **D** and power steering booster **E**. As a result fluid hydraulic circuit is created only inside the brake booster.
- When piston **4** moves to the left, flow switch **8** is turned ON and emergency pump motor **7** starts operating. By the action of emergency pump **3**, fluid pressure is generated within the fluid hydraulic circuit inside the brake booster.

● Spool valve



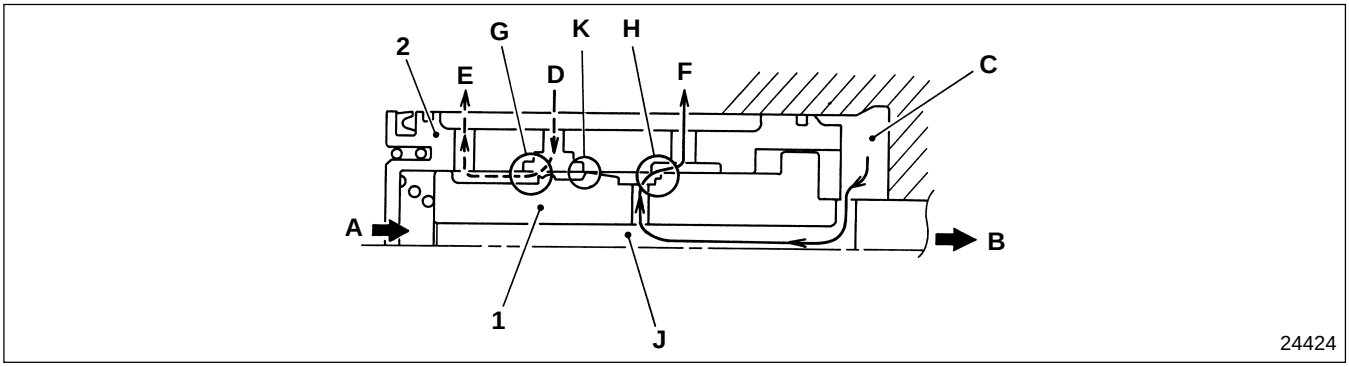
At operation

Through the action of brake pedal **B** spool valve **1** moves to the left, narrowing down land **G*** and closing off land **H** → Pressure of fluid coming from power steering oil pump **D** rises → High pressure fluid flows into servo chamber **C** via fluid groove **J**

↓

Hydraulic piston **2** is pushed to the left → Piston of brake master cylinder **A** is pushed and the brake is operated

***** : When the brake is operating, land **G** is not completely shut, therefore the power steering booster is not affected.



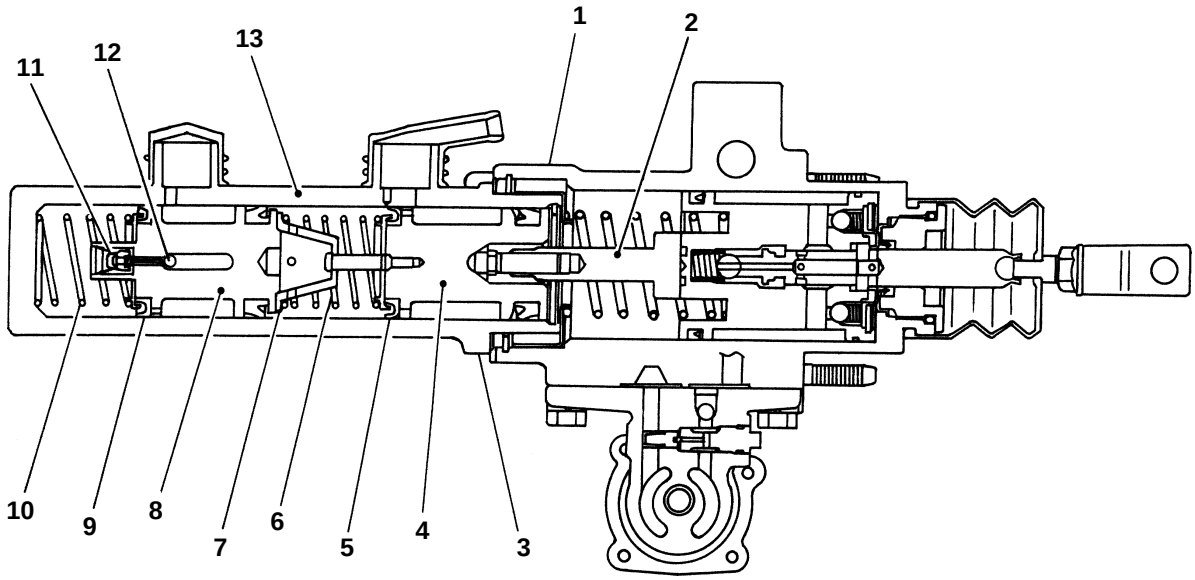
When released

Through the action of brake pedal **B** spool valve **1** moves to the right, opening lands **G** and **H** and closing fluid groove **K** → Pressure of fluid from power steering oil pump **D** falls → Fluid from servo chamber **C** flows into reservoir **4** and drain **F**

↓

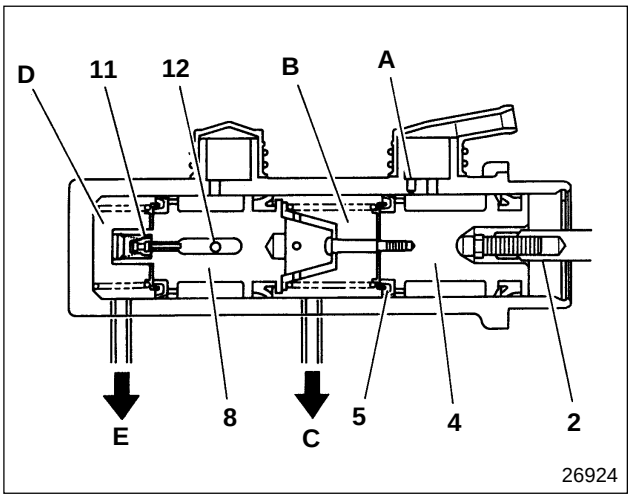
Hydraulic piston **2** moves to its original position → Brake master cylinder **A** piston is released

Brake Master Cylinder



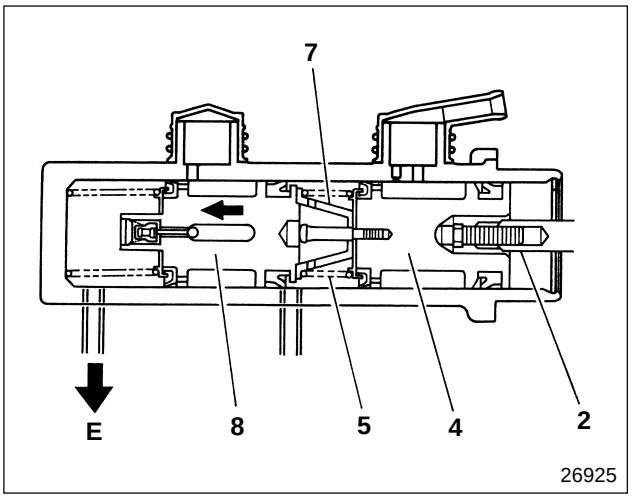
1 Brake booster (Hydraulic booster)
2 Hydraulic piston
3 Brake master cylinder
4 Primary piston
5 Packing cup
6 Primary piston return spring
7 Retainer
8 Secondary piston
9 Packing cup
10 Secondary piston return spring
11 Supply valve
12 Supply valve stopper
13 Cylinder

- Brake master cylinder **3** consists of separate and independent front and rear hydraulic systems. Therefore, if by chance there should be leakage in either the front or the rear hydraulic systems, the safety mechanism ensures that the other unaffected system can operate the brakes.



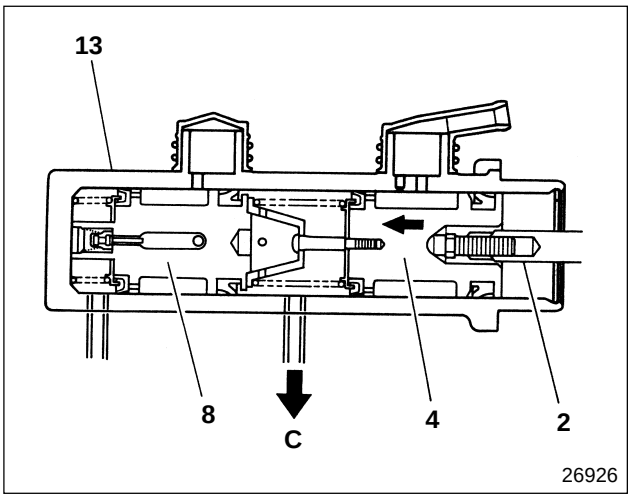
● **When brake pedal is depressed**

- Depressing the brake pedal makes brake booster (hydraulic booster) hydraulic piston **2** push in primary piston **4** and secondary piston **8**, packing cup **5** passes return port **A**, generates hydraulic pressure in chamber **B**, and feeds fluid to front brake system **C**.
- Supply valve **11** separates from supply valve stopper **12**, generates hydraulic pressure in chamber **D**, and feeds fluid to rear brake system **E**.



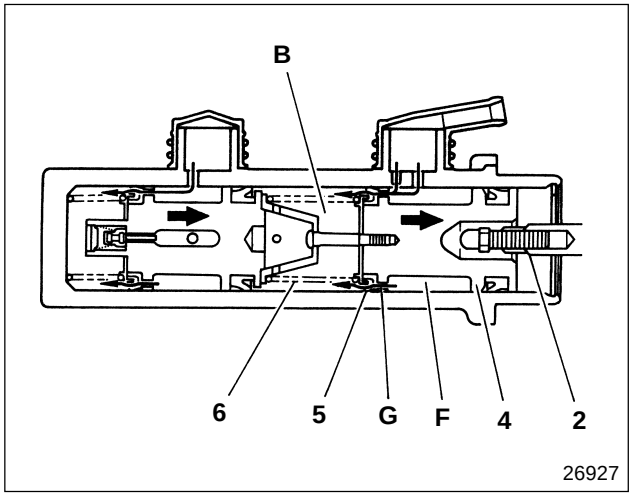
● **When there is fluid leakage in the front brake system**

- Depressing the brake pedal makes hydraulic piston **2** push in primary piston **4**. However, if the brake fluid in the front brake system leaks, hydraulic pressure is not generated in the front brake system.
- Depressing the brake pedal further makes primary piston **4** compress primary piston return spring **6** causing retainer **7** to push in secondary piston **8**, thus generating hydraulic pressure only in the rear brake system **E**.



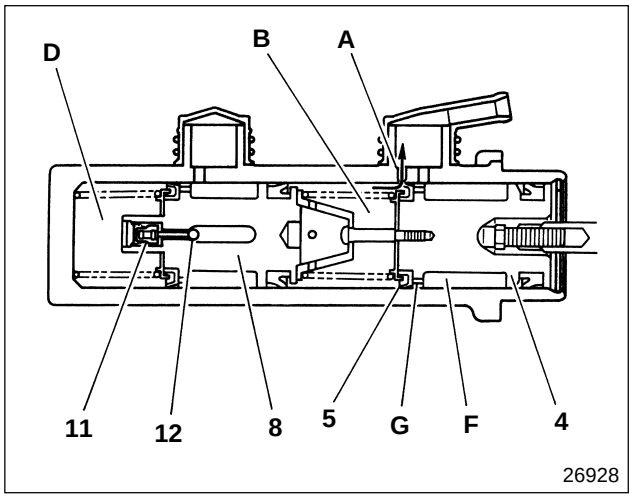
● **When there is fluid leakage in the rear brake system**

- Depressing the brake pedal makes hydraulic piston **2** push in primary piston **4** and secondary piston **8**. However, if the brake fluid in the rear brake system leaks, hydraulic pressure is not generated in the rear brake system.
- Depressing the brake pedal further makes the end of secondary piston **8** hit against cylinder **13**, pushing primary piston **4** and generating hydraulic pressure only in the front brake system **C**.



● **When the brake pedal is released**

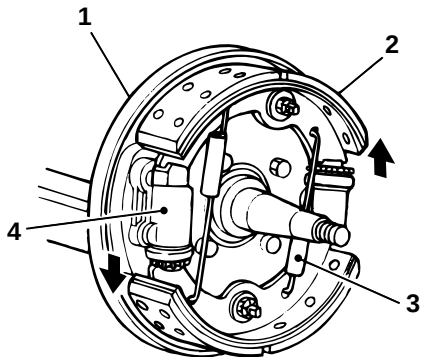
- When hydraulic piston **2** returns to its original position, as a result of the repercussive force of primary piston return spring **6**, primary piston **4** begins to return immediately. However, because of a lack of a pressure difference between chambers **B** and **F** brake fluid delivered from the brake master cylinder cannot return quickly.
- When primary piston **4** begins to return, hydraulic pressure in chamber **B** becomes lower than that in chamber **F**, the pressure difference causes packing cup **5** to deform opening up passage **G**. This causes brake fluid from chamber **F** to flow into chamber **B**.



- When primary piston **4** moves further and returns to its original position, the pressure in chambers **B** and **F** become the same, and packing cup **5** closes passage **G**. The hydraulic fluid in the brake pipe returns from chamber **B** to the reservoir tank via return port **A**.
- The same action also takes place in the secondary side. However, when secondary piston **8** is pushed back, supply valve **11** hits against supply valve stopper **12** and the supply valve opens.
- Therefore the hydraulic fluid in the brake pipe returns from chamber **D** to the reservoir tank via supply valve **11**.

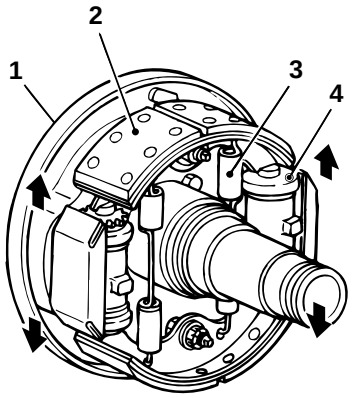
Wheel Brake

< Front >



12964

< Rear >

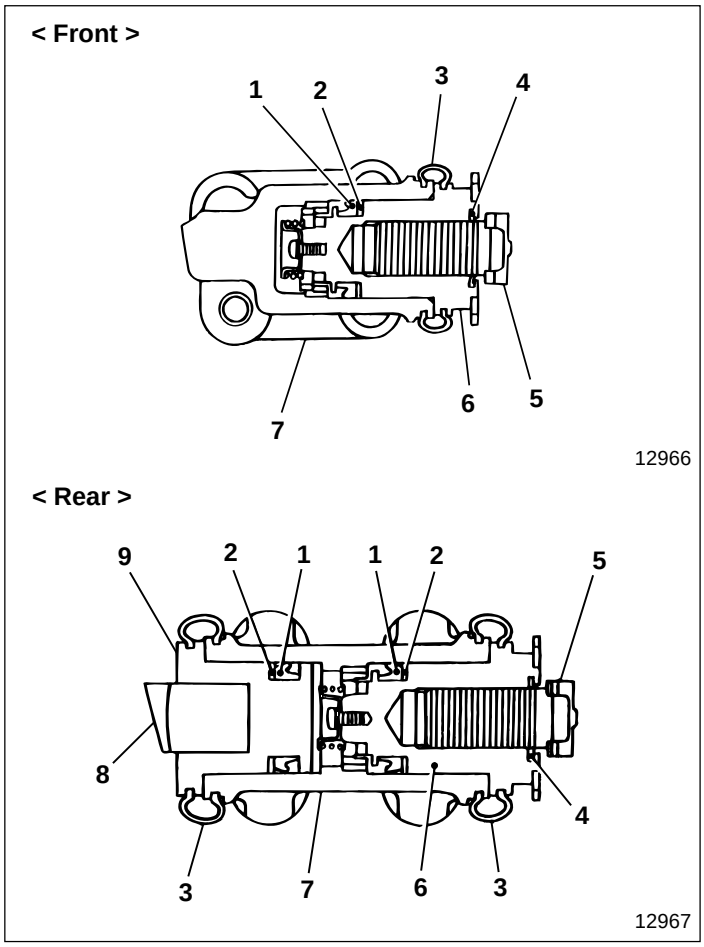


12965

1 Backing plate
2 Brake shoe assembly
3 Return spring
4 Wheel cylinder assembly

- The front wheel brake is an internal expanding 2-leading brake type.
- The rear wheel brake is an internal expanding dual 2-leading brake type.
- Front and rear wheel cylinder assemblies **4** have shoe clearance automatic adjusting mechanisms to adjust shoe clearance within a specific range.

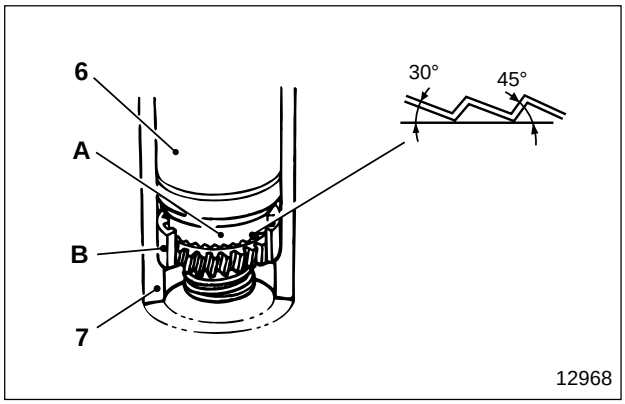
● Wheel cylinder assembly



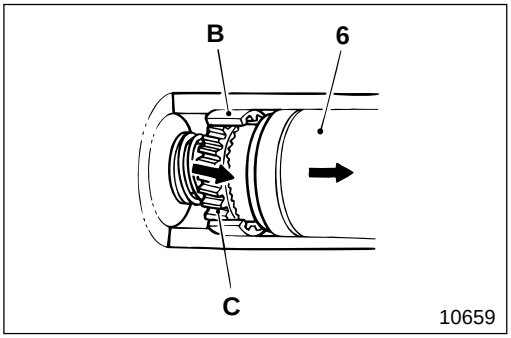
1 Piston cup
2 Backup ring
3 Boot
4 Seal
5 Screw
6 Piston
7 Cylinder body
8 Anchor piece < Rear >
9 Piston < Rear >

Even if the brake lining has worn to the extent that the brake shoe clearance is higher than the specified value, the brake shoe clearance automatic adjusting mechanism automatically adjusts the brake shoe clearance to maintain the appropriate brake shoe clearance when the vehicle is braked when moving forward.

● Operation of automatic shoe clearance adjusting mechanism (one-way clutch)

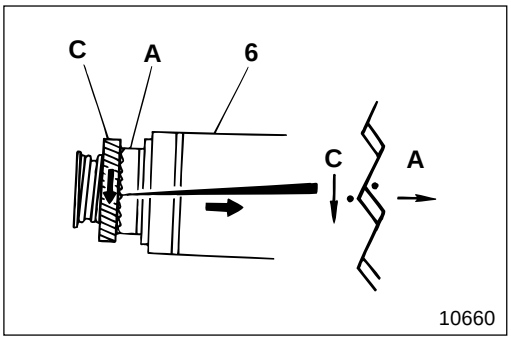


30° : When piston **6** appears, the double helical gear slides out easily.
45° : When turning piston **6**, the double helical gear receives and maintains the rotational force.
A : Clutch
B : Guide

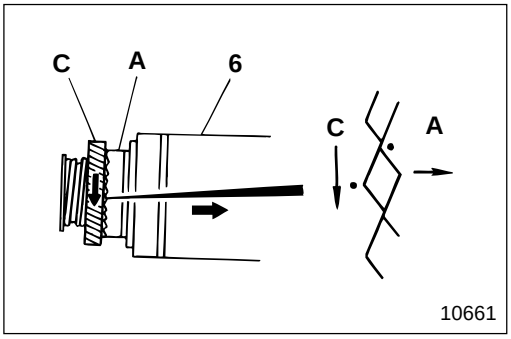


● **When braking starts**

- When hydraulic braking pressure acts on the wheel cylinder, it pushes piston **6** forward.
- Idler **C** of extended piston **6** is engaged with the diagonal gears cut in guide **B** of the cylinder body, so the idler advances while turning, in accordance with the travel of the piston.



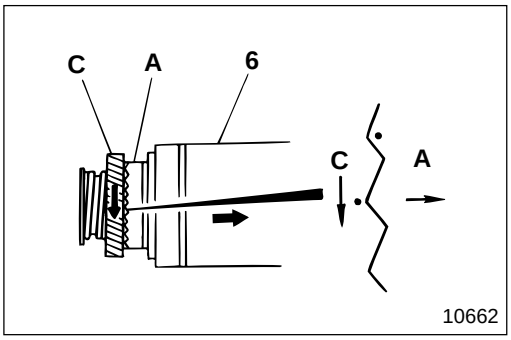
- The rotation of idler **C** slides out the double helical gear of clutch **A**.



● **When depressing brake pedal**

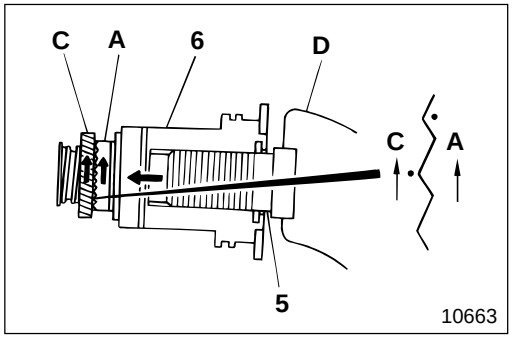
When the brake shoe clearance conforms to the specified value

- The amount of travel of idler **C** is proportional to the amount of travel of piston **6**. The amount of travel is not enough to make the double helical gear of clutch **A** climb over the opposite double helical gear when the brake shoe clearance is within the specified value.



When the brake shoe clearance is higher than the specified value

- When the brake shoe clearance is higher than the specified value, the amount of travel of idler **C** increases enough to make the double helical gear of clutch **A** climb over the opposite double helical gear.



● **When releasing brake pedal**

- As the brake fluid pressure decreases and piston **6** returns, idler **C** also returns, turning in the opposite direction along guide **B** of the cylinder body.
- When the brake shoe clearance is within the specified value, piston **6** returns to its original position without turning, because the double helical gear of clutch **A** has not climbed over the opposite double helical gear.
- When the brake shoe clearance is higher than the specified value, piston **6** returns while turning by one gear tooth, since the double helical gear of clutch **A** has climbed over the opposite gear. This lowers the brake shoe clearance to the specified value, because screw **5** of the piston is fixed by brake shoe **D** and does not turn.
