FOREWORD

This Service Manual contains maintenance and repair methods for the Mitsubishi Fuso Truck FE, FG Series. Read this manual carefully as an aid in providing correct, efficient maintenance. Please note that the information and specifications contained within this manual may change without notice. This is due to product modifications and contined vehicle improvements that are made throughout the model years. Should you encounter any discrepancy in the information provided, please do not hesitate to contact your nearest Mitsubishi Fuso Dealer or Mitsubishi Fuso Truck of America, Inc.

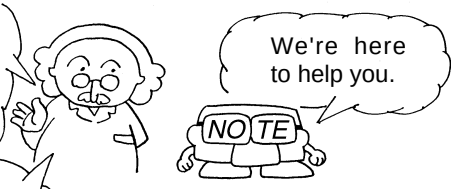
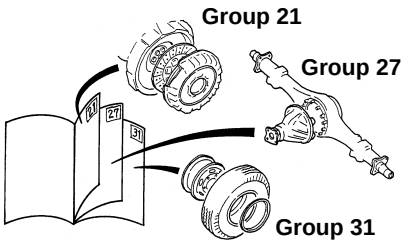
HOW THIS MANUAL IS STRUCTURED

I'm here to explain how to use this manual. To get the most out of your manual, follow along carefully and read all the notes given by my assistant.

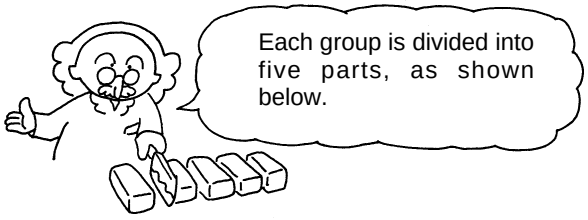


23929

This manual is divided into groups, with one group for each main area of the vehicle.
By way of example, let's look at Group 21, which covers the clutch.



23915



23916

Specifications
Specifications, oil quantities, and other information pertaining to system components.

Structure and Operation
Information on the structure and operation of the overall system and its components.

Troubleshooting
An item-by-item guide to fault symptoms and their probable causes.

On-Vehicle Inspection and Adjustment
Instructions for on-vehicle inspection and adjustment operations.

Service Instructions
(See the next and subsequent pages.)

NOTE
Do not remove the bushing 13 unless it is defective.

● **Assembly sequence**
Reverse the order of disassembly.
Repair kit : Clutch release
Lever kit

● **Post-assembly Inspection and adjustment**
P21 - 44

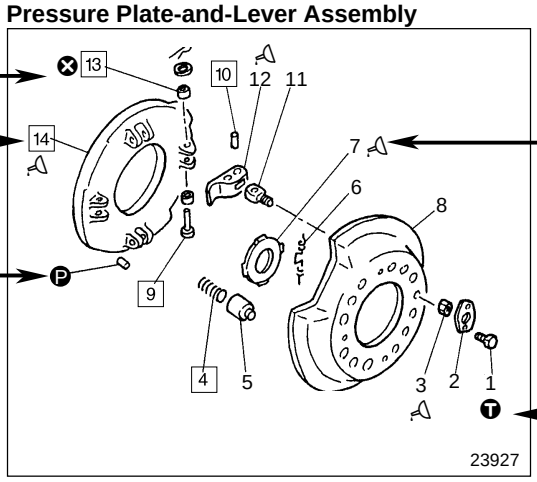
23926

NOTE
This mark indicates a part that cannot be reused.

NOTE
The key number enclosed with a square indicates that the part is mentioned in the service procedure.

NOTE
Ⓟ: Indicates positioning pin.

Pressure Plate-and-Lever Assembly



23927

NOTE
This mark indicates that lubricant or sealant must be applied to the part.

NOTE
This mark indicates that a tightening torque is specified for the part.

So parts without Ⓣ marks don't have specified tightening torques ?

No, they don't. But every bolt and nut must be tightened to a standard torque. A Ⓣ mark shows either that the part must be tightened to a torque other than the standard torque or that the standard torque cannot be determined from the part's shape or markings.
Standard tightening torques are explained at the bottom of the next page.

23928

  Refer to the indicated page of the same group.
- Gr 42
  Refer to the indicated group in another manual.

NOTE
The key numbers show the disassembly sequence.

NOTE
Do not remove bushing 13 unless it is faulty.

● **Assembly sequence**
Follow the disassembly sequence in reverse.
Repair kit : Clutch Release Lever kit

● **Post-assembly inspection and adjustment**
P21 - 44

NOTE
This shows that certain operations must be performed after assembly.

NOTE
The name of the specified repair kit (if any) is given here.

NOTE
The assembly sequence is given here. Assembly is usually performed in the opposite order to disassembly. If the assembly sequence is otherwise specified, it is given in terms of key numbers like this:
● **Assembly sequence**
14→12→10→13→11.....

Now let's look at standard tightening torques. Normally, bolts and nuts have numbers or markings to show their material strength.

Tightening torques for bolts and nuts with such numbers and markings are shown in the Table of Standard Tightening Torques that appears in group 00.

		Strap bolt hole I.D.	10.2 to 10.25 {0.40 to 0.40}	10.5 {0.41}	Replace

NOTE

Number(s) in this column match the key number(s) on the exploded view ①.

③ Tightening torques

Tightening torque

Unit : N·m {ft.lbs, kgf.m}

Location	Parts to be tightened	Tightening torque	Remarks
1	Bolt (Lock plate mounting)	5.9 to 7.8 {4.3 to 5.8, 0.6 to 0.8}	—

NOTE

Number(s) in this column match the key number(s) on the exploded view ①.

NOTE

If oil or grease must be applied to threads before tightening, the word "Wet" appears in this column.

	Remarks
	Wet

④ Lubricants, fluids and/or sealants

Lubricant

Location	Points of application	Specified lubricant	Quantity
3	Threads and spherical surface of support nut	Anti-seizure compound	As required
7, 12	Sliding surfaces of release lever plate and release lever	Molybdenum disulfide grease [NLGI No.2 (Li soap)]	As required
11, 12	Sliding surfaces of support lever and release lever	Molybdenum disulfide grease [NLGI No.2 (Li soap)]	As required
11, 14	Sliding surfaces of support lever and pressure plate	Molybdenum disulfide grease [NLGI No.2 (Li soap)]	As required

NOTE

Number(s) in this column match the key number(s) on the exploded view ①.

NOTE

The specified types/brand are shown here.

⑤ Special tools

Special tools Unit : mm {in.}

Location	Tool name and shape	Part No.	Application
8	Clutch Installer  01277	MH061051	Removal and installation of clutch cover

NOTE
Number(s) in this column match the key number(s) on the exploded view ①.
For any special tool that is not a Mitsubishi genuine part, no illustration is shown; only the part number is given, as shown below.

Special tools

Location	Tool name and shape	Part No.	Application
21	Insertion Tool	*910-24461	Installation of O-ring
32	Retainer	*910-24590	Retention of primary piston

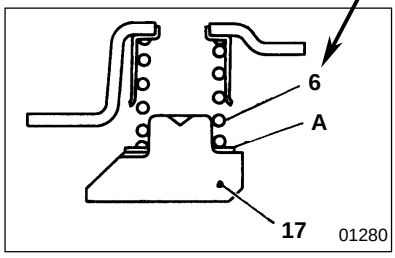
* BOSCH BRAKING SYSTEMS Co. Ltd. product number

⑥ Service procedure

1

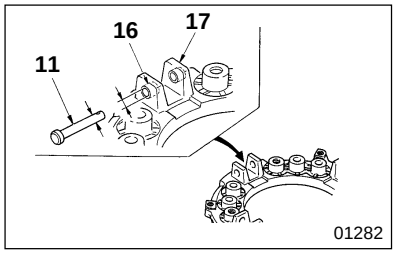
NOTE
Number(s) is this column match the key number(s) exploded view ①.

NOTE
The service procedure gives instructions in order of key numbers.



6 **Installation of pressure spring**
If the pressure plate **17** has been reqround, insert between the pressure plate and pressure spring **6** an adjusting washer **A** whose thickness matches that of the ground off material.

Regrind amount	Thickness and number of washer(s)
Less than 1 mm {0.039 in.}	Not required
1 mm {0.039 in.} (or more) to less than 2 mm {0.079 in.}	1.2 mm {0.047 in.} x 1
2 mm {0.079 in.} (or more) to less than 3 mm {0.12 in.}	1.2 mm {0.047 in.} x 2 or 2.3 mm {0.091 in.} x 1



11 16 **Clearance between release lever pin and bushing**
If the measurement exceeds the specified limit, replace the defective part(s).

NOTE
Perform this check with the bushing 16 press-fitted into the pressure plate 17.

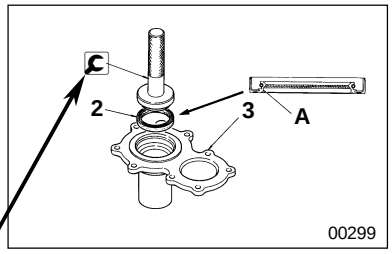
2

Service procedures contain a variety of symbols and other indications. Let's look at some examples.

23931

Key number

[Example 1: Special tools]



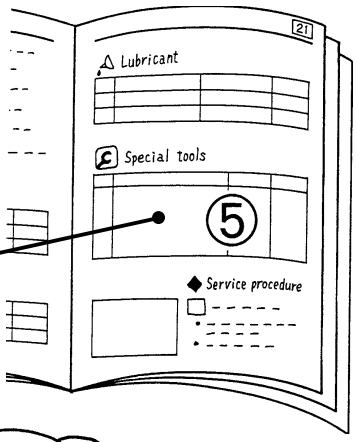
2 Installation of oil seal

- Apply grease to the lip **A** of the oil seal **2**.
- Using the Oil Seal Installer, fit the oil seal **2** into the front bearing retainer **3**. Make sure the oil seal is aligned as illustrated.

Name of special tool

Every special tool is indicated by a symbol. The text of the service procedure also includes the special tool's name. To see the part number and shape of a special tool, find the tool's key number and name in the "Special tools" table ⑤.

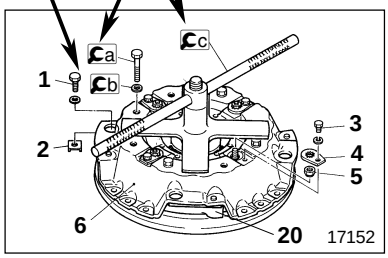
23932



26315

If more than one special tool is used, the symbols are supplemented by letters (for example, a, b and c) to enable cross-referencing between the exploded view and service procedure.

20277



6 Removal and installation of clutch cover

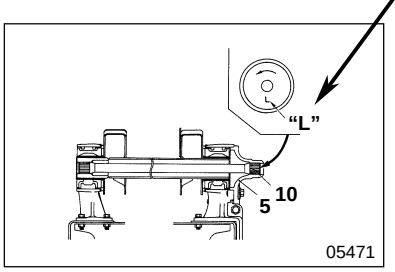
[Removal]

- Compress the pressure spring **8** using the c Clutch Installer, then remove the a Stopper Bolt, b Washer, strap bolt **1**, washer **2**, bolt **3**, lock plate **4** and support nut **5**.
- Gradually loosen the c Clutch Installer until the pressure spring **8** is ineffective, then remove the clutch cover **6**.

3

[Example 2: Identification or mating marks]

NOTE Any mark on an actual part is given in quotation marks " " in the service procedure.

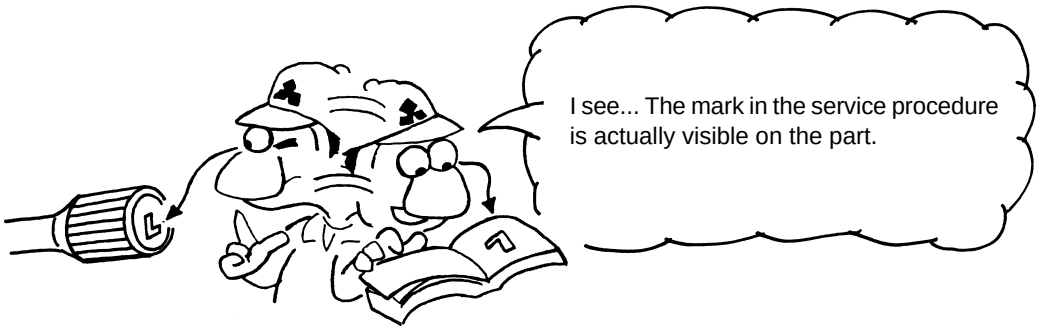


10 Installation of torsion bar

Fit the torsion bar **10** such that the "**L**" identification mark is on the side of the anchor lever **5**.

CAUTION ⚠

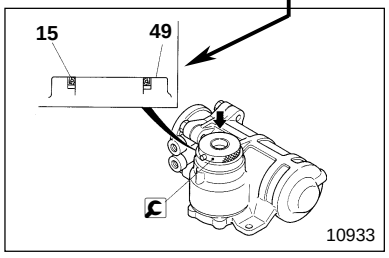
Make sure the torsion bar 10 aligned as specified. If the torsion bar is installed the wrong way around, the torsion direction will be reversed, resulting in damage.



4

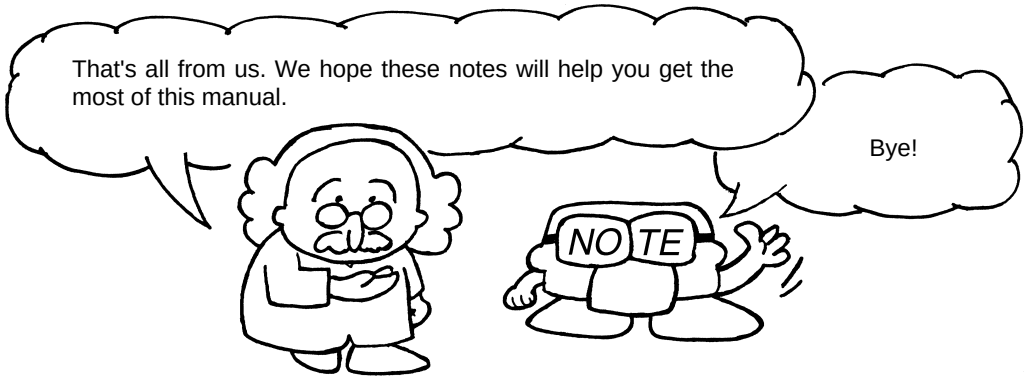
[Example 3 : Alignment of parts]

NOTE All illustrations show the correct alignment/direction of parts relative to each other. Provided the alignment/direction is shown clearly in the exploded view ①, no further explanation is given in the text of the service procedure.

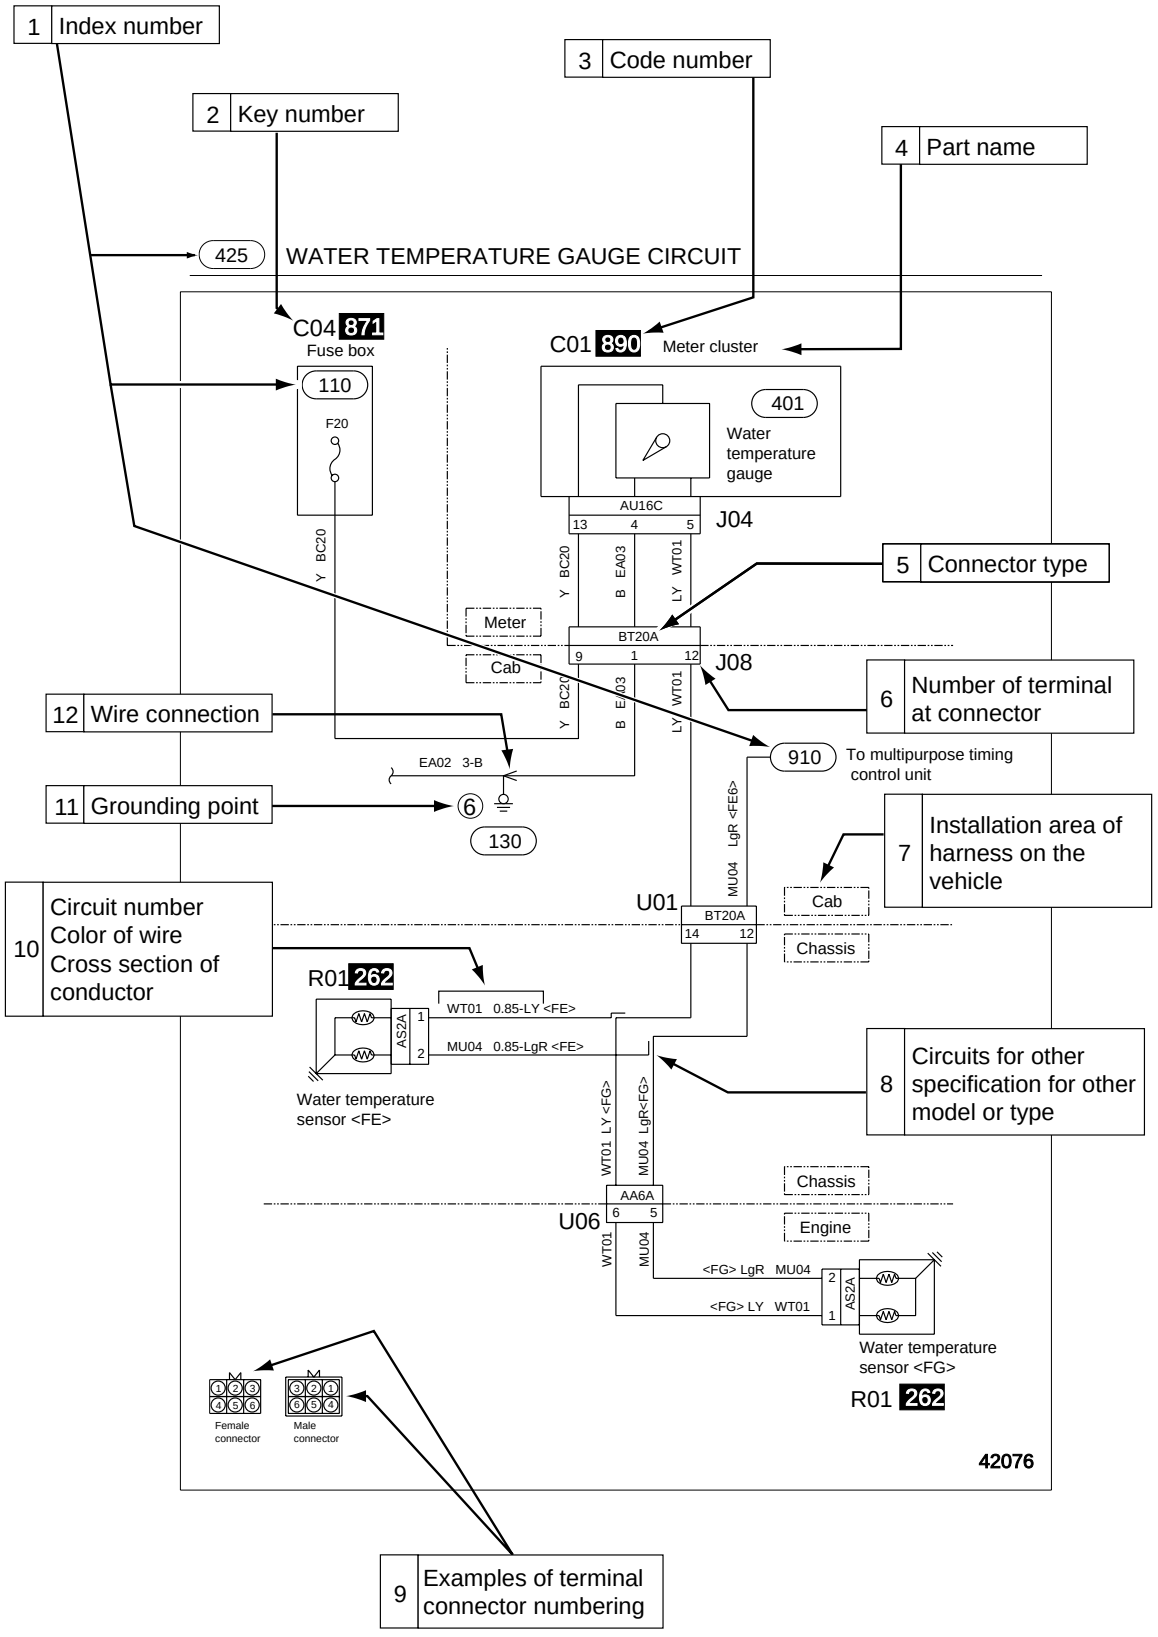


15 Installation of oil seal

Fit the oil seal **15** into the body **49,** making sure it is aligned as illustrated.



HOW TO READ CIRCUITS (GROUP 54)



Ⓟ 43351

1 Index number: (110)

Each circuit has its own Index number respectively and has three digits ((110)).
How to read index number

- By proper using of the index number, it is possible to locate right place immediately since the circuit drawing of this manual book are classified as function by function. (including “Power Circuit” (110) and “Ground Circuit” (130) .)
- How to check the location of circuit drawing in each part
  The circuit drawing which can not be diagramed in one page due to its complicated structure (such as meter cluster and electronic control unit etc.), has its remarked index number to be connected to other circuit drawing. ((401) , (910) , etc.)

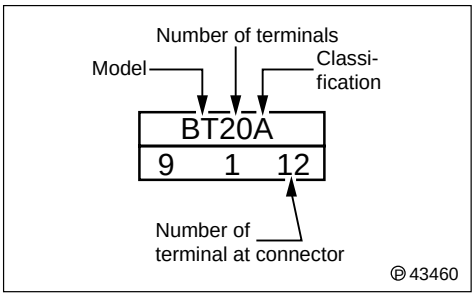
2 Key number: A01~
Key number is the number to indicate the installation position of the parts, and is shown by A01 ~ Z.
The details of the installation position are described in GROUP 10 .

3 Code number: **001** ~
Code number is the number to indicate the one portion of the parts to be checked and has three digits (**001**).
The details of the parts to be checked are described in GROUP 11 .

4 Part name

5 Connector type
Connectors are shown by □ without mentioning Male or Female and in the box it is described model of connector, number of terminals and its classification, etc.
Table of connectors is described in GROUP 14.

6 Number of terminal at connector
Terminal numbers of connector are shown by figures in the box.

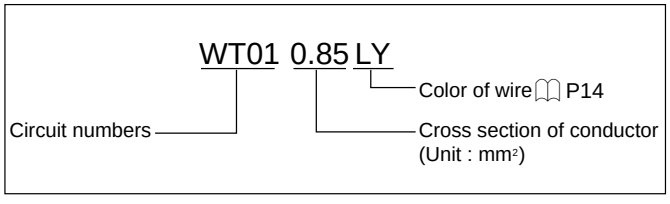


7 Installation area of harness on the vehicle
The location and boundary of the harnesses in the vehicle are shown in the each circuit drawing and it may help to check mounting position of connectors.

8 Circuits for other specification for other model or type

9 Examples of terminal connector numbering
As it is shown, for female connectors, with placing the lock upward then starting to put numbers from the upper left. And when it is male connector, put numbers from the upper right, also with placing the lock upward.

10 Circuit number, color of wire, and cross section of conductor are shown in circuit drawings.



Except for 0.5mm², Wire thickness is described in the circuit drawing. The reason why only wire thickness, 0.5 mm² is not described in the drawings is 0.5mm² is so common and so that the circuit drawing can be seen more easily.
(Examples) 0.5mm²: Y
0.85mm²: 0.85 — LY
3mm²: 3 — B

11 Grounding point
The actual locations of grounding points on the vehicle are shown. Refer to (130) for detailed information.

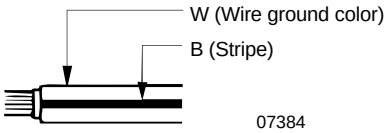
12 Wire connection
When the wires are connected into one point of the harnesses, the circuit drawing shows “Arrow mark”.

CAUTION !
Be careful that direction of the arrow does not show the direction of the electric current flow.

HOW THIS MANUAL IS STRUCTURED

● Wire Colors

Example: WB means a wire whose ground color is white and whose stripe is black.

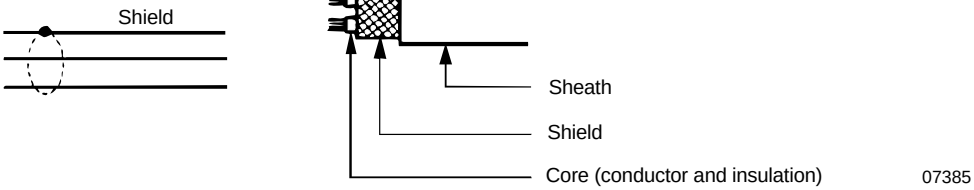


Wire ground color		Wire ground color + Stripe									
W	White	WR	White red	WB	White black	WL	White blue	WG	White green		
B	Black	BW	Black white	BY	Black yellow	BR	Black red				
R	Red	RW	Red white	RB	Red black	RY	Red yellow	RG	Red green	RL	Red blue
Y	Yellow	YR	Yellow red	YB	Yellow black	YG	Yellow green	YL	Yellow blue	YW	Yellow white
G	Green	GW	Green white	GR	Green red	GY	Green yellow	GB	Green black	GL	Green blue
Br	Brown	BrW	Brown white								
L	Blue	LW	Blue white	LR	Blue red	LY	Blue yellow	LB	Blue black	LO	Blue orange
Lg	Yellow green	LgR	Yellow green red	LgY	Yellow green yellow	LgB	Yellow green black	LgW	Yellow green white		
O	Orange										
P	Pink	PB	Pink black								

● Shield Wire

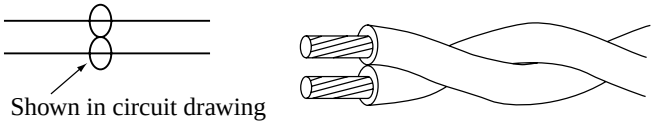
A shield wire is clearly identified as follows:

Example



● Twist wire

Twist wires are made by twisting the core of wires by the constant pitch.
Example:



The terms in this manual are defined as follows.

● This service manual contains important cautionary instructions and supplementary information under the following four headings which identify the nature of the instructions and information:

DANGER⚠ ——— Precautions that should be taken in handling potentially dangerous substances such as battery fluid and coolant additives.

WARNING⚠ ——— Precautionary instructions, which, if not observed, could result in serious injury or death.

CAUTION⚠ ——— Precautionary instructions, which, if not observed, could result in damage to or destruction of equipment or parts.

NOTE Suggestions or supplementary information for more efficient use of equipment or a better understanding.

● **Front and rear**

The terms “front” is the fan side and “rear” the flywheels side of the engine.

● **Left and right**

The terms “right” and “left” shall be used to indicate the side as viewed from the flywheel side of the engine.

● **Terms of service standards**

(1) Standard value

Standard value dimensions in designs indicating: the design dimensions of individual parts, the standard clearance between two parts when assembled, and the standard value for an assembly part, as the case may be.
The figure in [ ] is the basic diameter.

(2) Limit

When the value of a part exceeds this, it is no longer serviceable in respect of performance and strength and must be replaced or repaired.

● **Tightening torque**

Appropriate tightening torque has particular importance in respect of performance. Accordingly, tightening torque is specified in locations that are to be tightened.
Where there is no specified figure for tightening torque, follow the table covering standard tightening torques.
When the item is to be tightened in a “wet” state, wet is indicated. Where there is no indication, read it as dry, and tighten at specified torque.

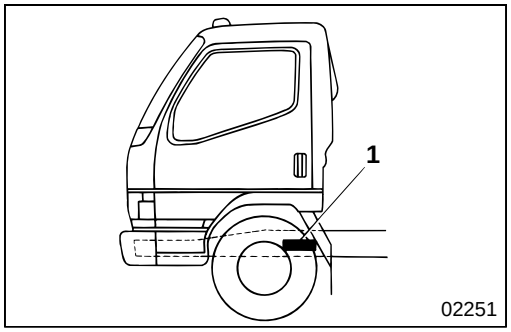
CHASSIS NUMBER AND ENGINE NUMBER/POWER TRAIN LABEL

CHASSIS NUMBER AND ENGINE NUMBER

The serial numbers for chassis and engines are assigned to the respective vehicles and engines in manufacturing sequence: every vehicle and engine has its own numbers. These numbers are required for registration and incidental inspection of the vehicle. Please do not fail to mention these numbers to the dealers when ordering spare parts.

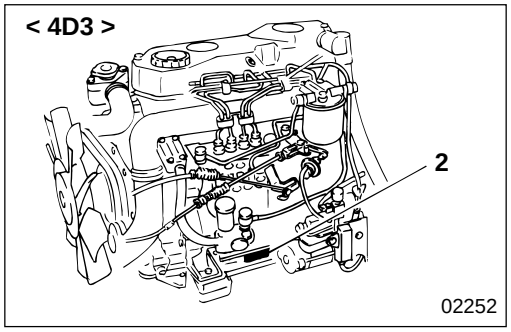


Chassis number

Chassis number **1** is punch-marked on the frame by the left-side front wheel.

Example : FE639C-□□□□□□

- FE639C: Vehicle model
- □□□□□□: Chassis number

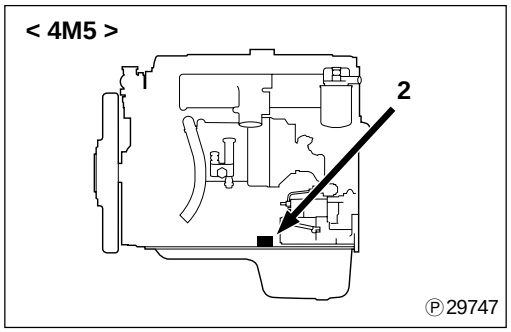


Engine number

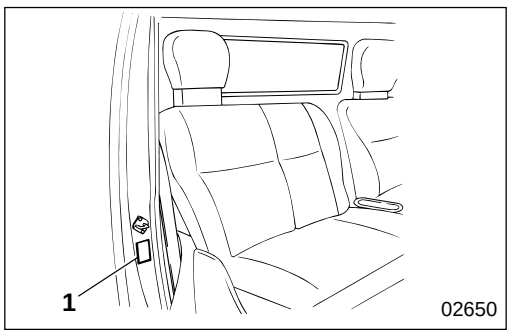
Engine number **2** is punch-marked on the left side of the crankcase.

Example : 4D34-□□□□□□

- 4D34: Engine model
- □□□□□□: Engine number

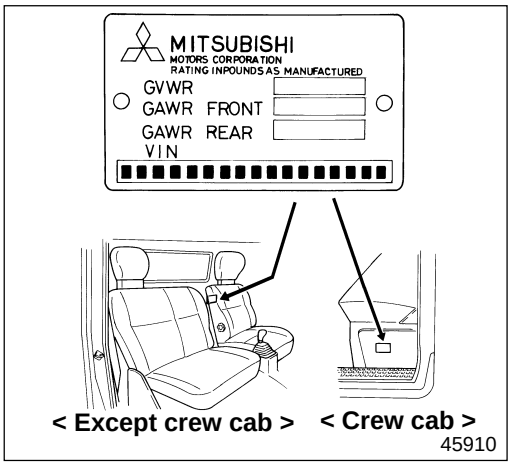


POWER TRAIN LABEL

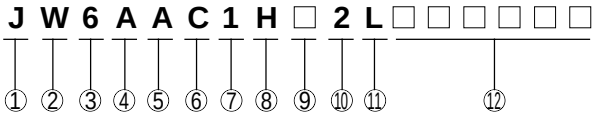


Power train label **1** located in the position illustrated indicates the vehicle model, chassis number and information relevant to the vehicle's power - train components.

VEHICLE IDENTIFICATION NUMBER



The vehicle identification number is punch-marked on the plate, which is attached in the position as illustrated.
The vehicle identification number consists of a 17-digit set of alphanumeric characters. Each digit represents the following specifications.



①	Country	J: Japan
②	Make	W: Mitsubishi Fuso
③	Vehicle type	6: Incomplete Vehicle
		7: Truck
④	Gross vehicle weight/Brake system	A: 10001 to 14000 lbs/Hydraulic

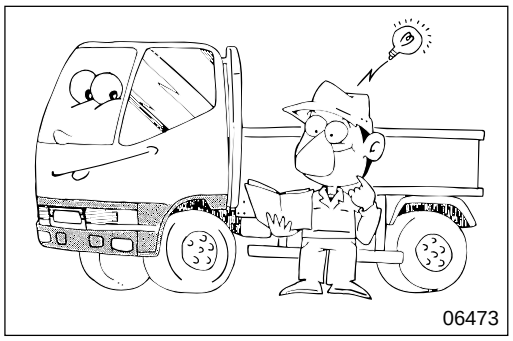
PRECAUTIONS FOR MAINTENANCE OPERATION

DANGER ⚠

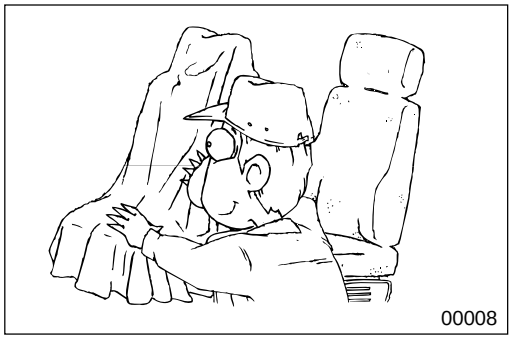
This product contains or emits chemicals known to the State of California to cause cancer and birth defects or other reproductive harm.

In order to determine the condition of the vehicle adequately, keep records of the accumulated mileage, operating condition, what the customer's complaint is, and other information that may be necessary. Prepare steps to be taken to perform efficient maintenance procedures.



06473

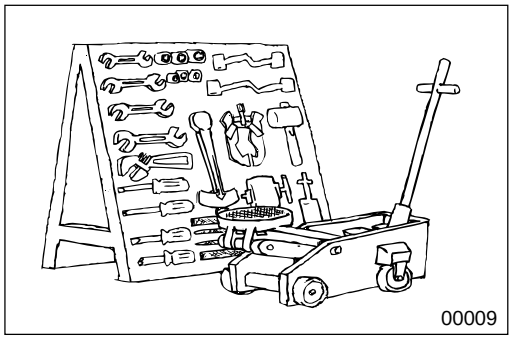
Determine where the fault exists and check for the cause to see whether removal or disassembly of the part is necessary. Then follow the procedure specified by this manual.



00008

Perform maintenance work on level ground.
Prepare the following.

- To prevent the seats, upholstery, floor and bodywork from being spoiled or scratched, cover with workshop sheet cover(s).

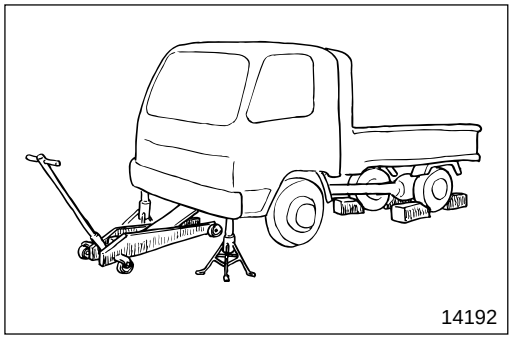


00009

- Prepare general and special tools necessary for the maintenance work.

WARNING ⚠

Do not attempt to use tools other than special tools where use of special tools is specified in this manual. This will avoid injury or damage.



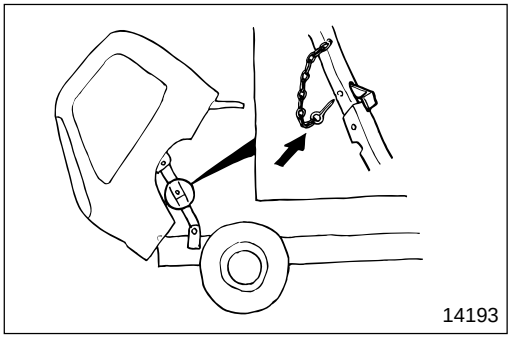
14192

When jacking up the vehicle to work under the vehicle, carry out the following preparatory work:

- Chock the wheels on both sides.
- Jack up the vehicle using a garage jack.
- Support the frame on rigid jack stands.

WARNING ⚠

- **Chock the wheels securely so the vehicle does not move.**
- **Do not remove the chocks until the entire operation is completed.**
- **Supporting a vehicle on a garage jack only is extremely dangerous, so always support the frame on rigid jack stands.**
- **Leave the garage jack and rigid jack stands in place until the entire operation is completed. Never remove them during the operation.**

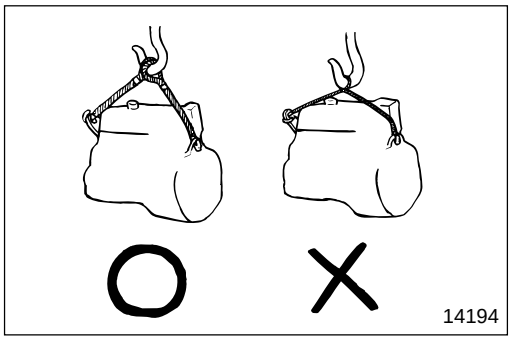


14193

When tilting the cab, be sure to insert the safety pin into the cab stay so that the cab stay remains locked and is not released when the cab is tilted.

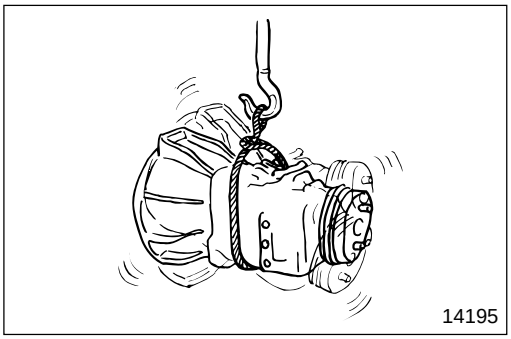
Pay special attention to safety when removing or installing heavy items such as engines, transmissions and axles.

When lifting up heavy items using cables, pay special attention to the following points:



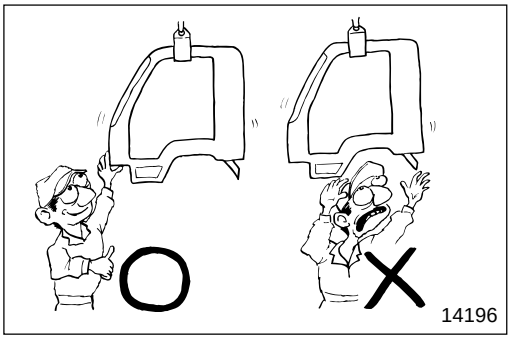
14194

- Check the mass of the item to be lifted and use a cable capable of lifting that mass.



14195

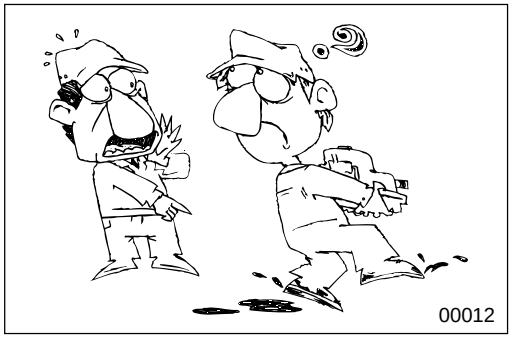
- If you do not have the specified lifting hanger, secure the item using cable taking the point-of-balance of the item into consideration.



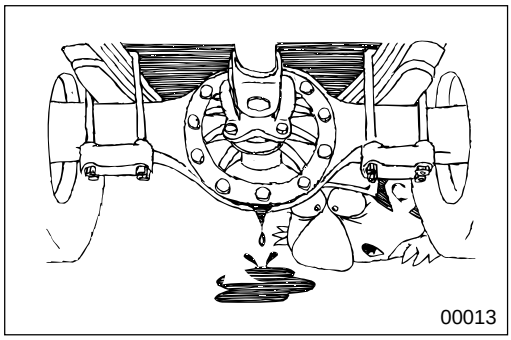
14196

- You must work in a position where you will not be injured even if the cable comes undone and the lifted item falls.

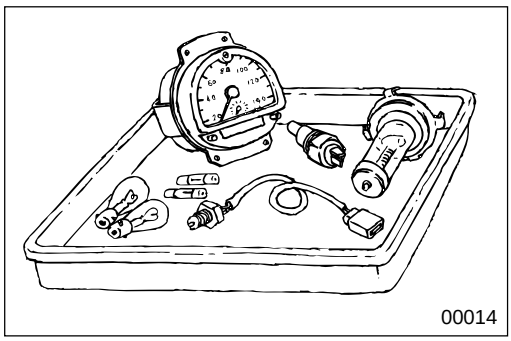
PRECAUTIONS FOR MAINTENANCE OPERATION



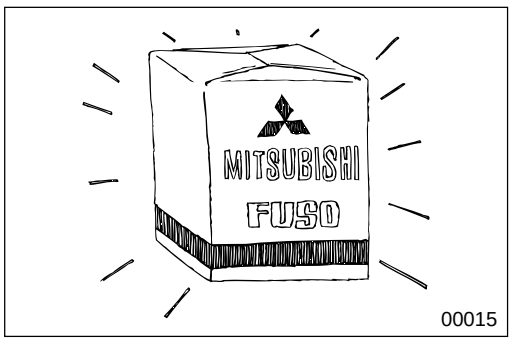
Be particularly careful not to work in shoes that have oily soles and are slippery. When working as a team of two or more, arrange signals in advance and keep confirming safety. Be careful not to accidentally bump switches or levers.



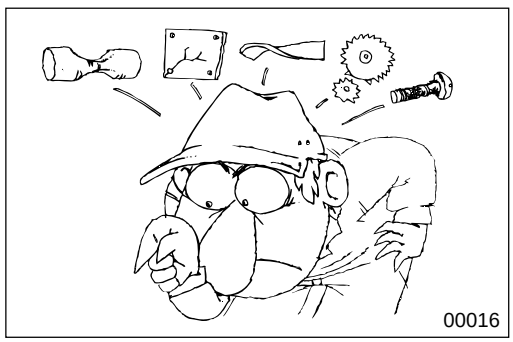
Check for oil leakage before cleaning the area having the fault otherwise you might miss detecting the leakage.



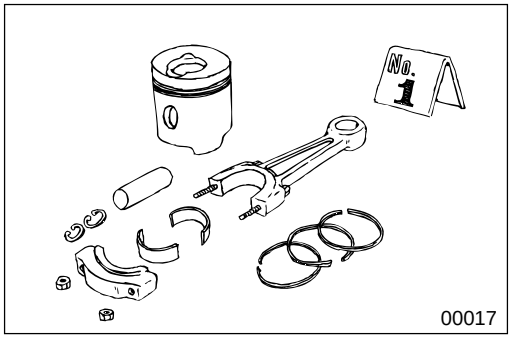
Prepare replacement part(s) beforehand.



Replace oil seals, packing, O-rings and other rubber parts; gaskets and split pins with new parts whenever any of them has been removed. Use only genuine MITSUBISHI replacement parts.



On disassembly, visually inspect all parts for wear and tear, cracks, damage, deformation, degradation, rust, corrosion, smoothness in rotation, fatigue, clogging and any other possible defect.

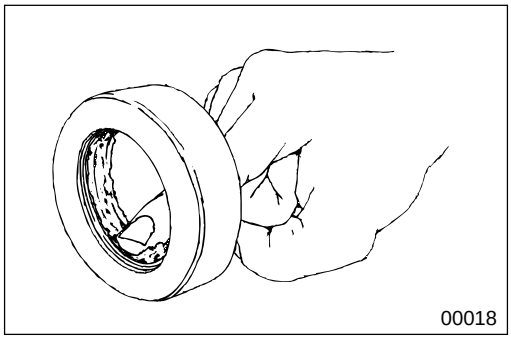


00017

Put alignment marks on part combinations before disassembly and arrange the disassembled parts neatly. This will help avoid mismating of the parts later.
Put the alignment marks, punch marks, etc. where performance and appearance will not be affected.
Cover the area left open after removal of parts to keep it free from dust.

CAUTION⚠

- **Take care to avoid mixing up numerous parts, similar parts, left and right, etc.**
- **Keep new parts for replacement and original (removed) parts separate.**

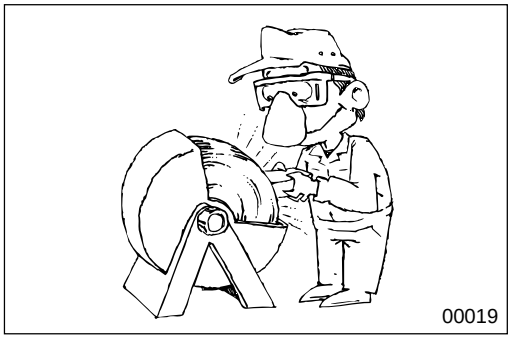


00018

Apply the specified oil or grease to U-packings, oil seals, dust seals and bearings during assembly.
Use only the specified oil, grease, etc. for lubricant, remove the excess immediately after application with a clean rag, etc.

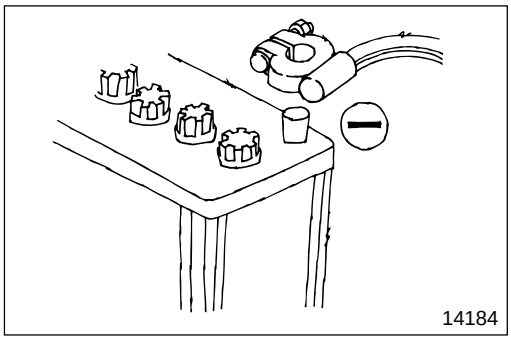
CAUTION⚠

When the specified lubricant, fluid and sealant is not available, you may use an equivalent.



00019

Wear goggles when using a grinder or welder. Pay full attention to safety by wearing gloves when necessary. Watch out for sharp edges, etc. that might injure your hands or fingers.



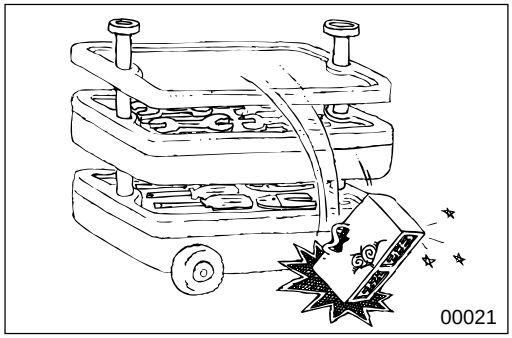
14184

Before carrying out maintenance work on the electric system, disconnect the negative terminal from the batteries to prevent them from short-circuiting.

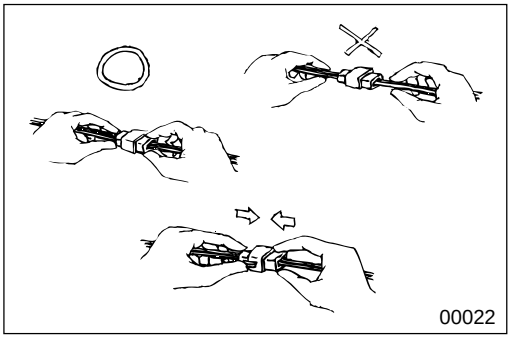
CAUTION⚠

Be sure to turn starter and lighting switches, etc. off before disconnecting or connecting battery terminals, because the semiconductors can become damaged.

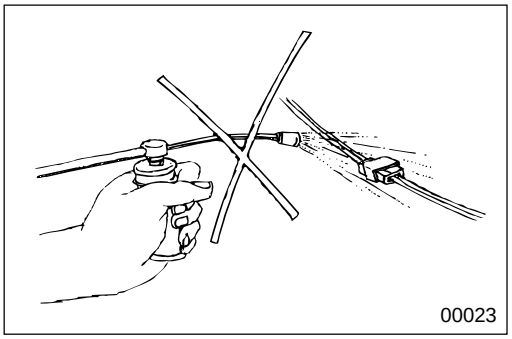
PRECAUTIONS FOR MAINTENANCE OPERATION



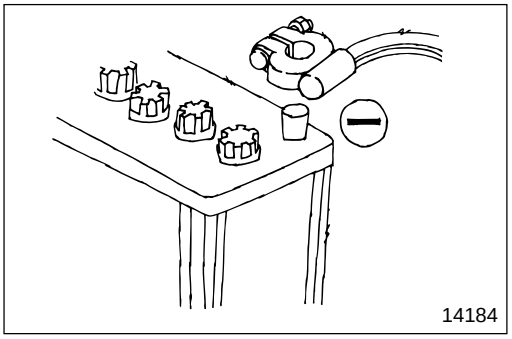
Take care when handling sensors, relays, etc. which are vulnerable to shock and heat. Do not attempt to remove the cover from, or apply paint to, the electronic control unit.



Pull the connector, and not the harness lead, to separate connectors. To separate a lock-type connector, first push toward arrow mark. To reconnect a lock-type connector, press the separated parts until they click together.



When washing the vehicle, cover the electric system parts and instruments with waterproof material beforehand (Cover with vinyl sheet or the like). Keep water away from harness wire connectors and sensors. If any of them should get wet, wipe them off immediately.



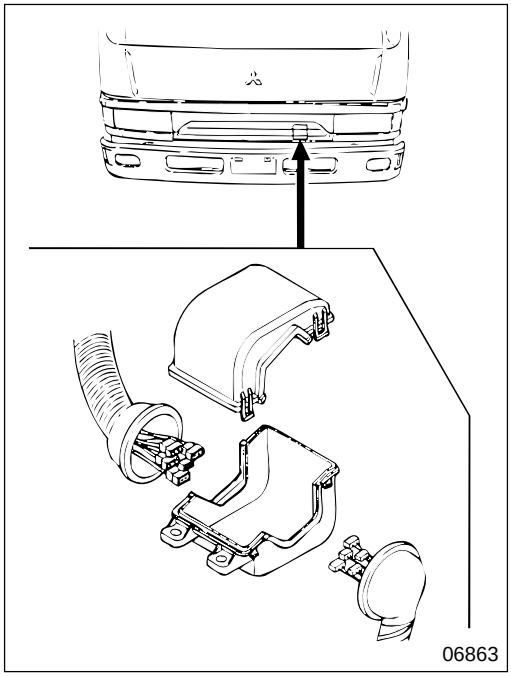
When using an electric welder, such electronic parts that are directly connected to the batteries might be damaged due to the flow of current from the welder that flows through the negative circuit. Parts that have switches might be subject to the same danger if the switches are left on. Therefore, do not fail to observe the following.

A : Welder

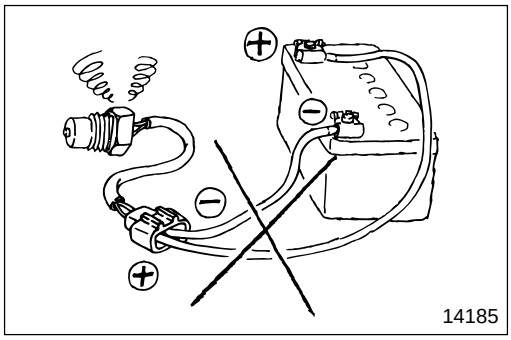
B : Connect the negative terminal of the welder as near as possible to the area that is to be welded.

C : Disconnect the negative cable at the batteries.

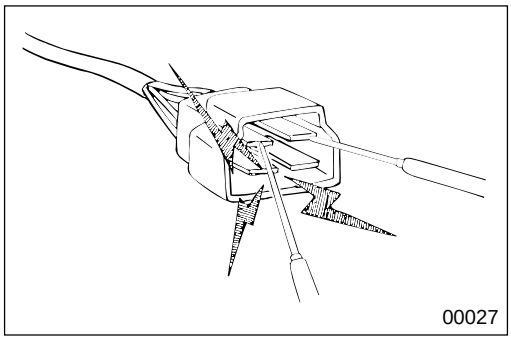
Gr 54 (130)



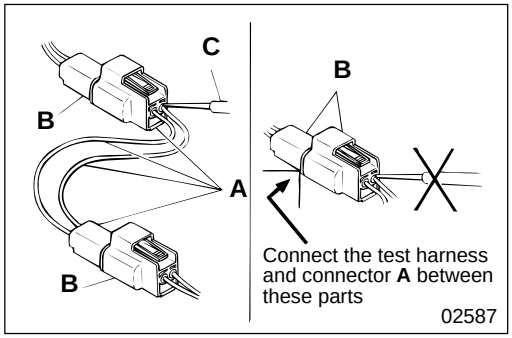
- Disconnect the negative terminals of batteries.
- Disconnect connections between the cab harness wires and the chassis harness wires.



To apply voltage for testing, check that the positive and negative cables are connected properly, then increase voltage gradually from 0 volt. Do not apply voltage higher than the specified value.
In particular, pay close attention to the electronic control unit and sensors, since they are not always fed by battery voltage.



When using testers or the like for continuity tests, be careful not to allow test probes to touch the wrong terminals.



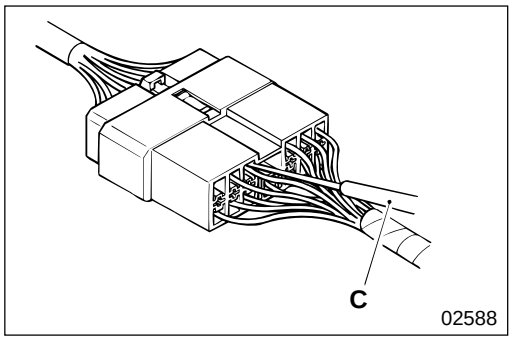
Measurement procedures using connectors

- **Test with connectors engaged (continuity through circuit obtained)**

  < Waterproof connector >

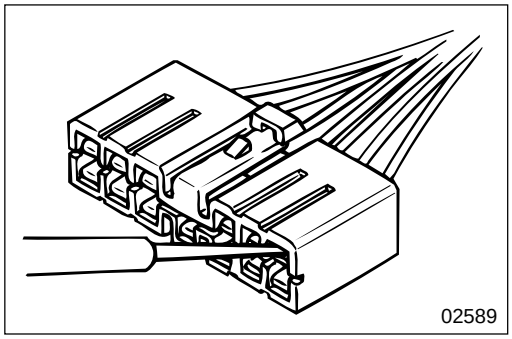
  Prepare a test harness and connectors **A**, then connect if between the two parts of harness **B** that is to be tested. Check the circuit by touching test probe **C** to the test connector.

  Never insert the test probe from the harness side of the waterproof connection, or waterproof performance might be diminished causing corrosion of the connector.



< Non-waterproof connector >

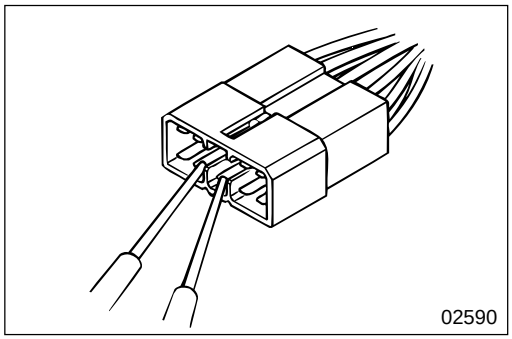
Insert test probe **C** from the harness side of the connector. Where control units, etc. have connectors that are too small to accept the test probe, do not force the test probe into them.



- **Test with connectors disengaged**

  Using female pins

  Insert a test probe into a terminal. However, do not force the probe into the terminal, or it will cause a poor contact.

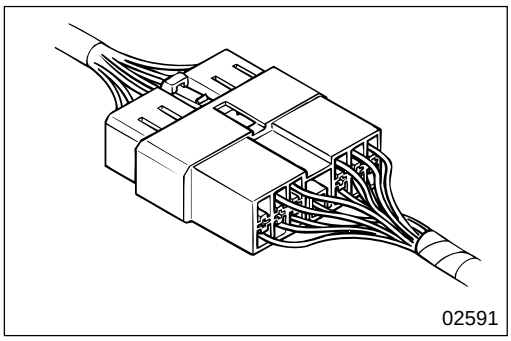


Using male pins

Touch the pins directly using test probes.

CAUTION⚠

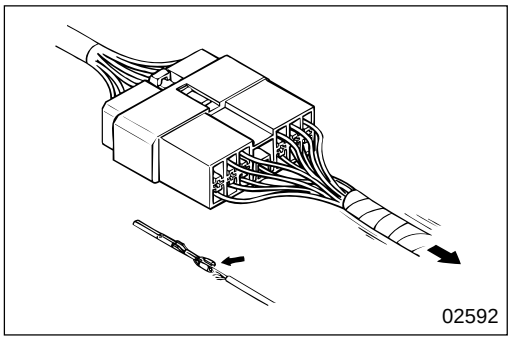
Be sure that you do not short circuit the connector pins when you use the test probe because this could damage the internal circuit of the electronic control unit.



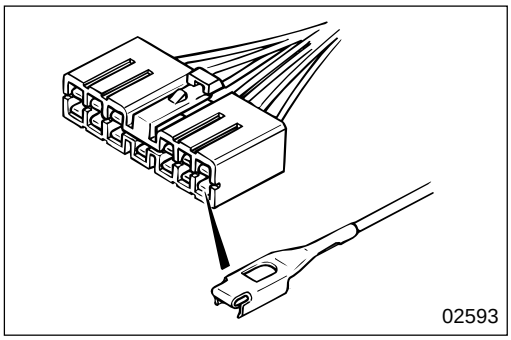
Connector inspection procedures

- **Visual inspection**

  Check for loose connection and poor engagement.

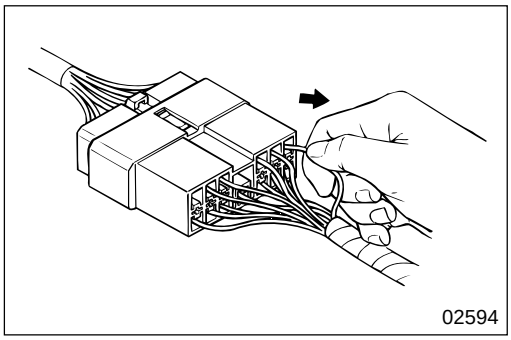


Check if harnesses are broken by pulling gently around the terminals.



Check for a decrease in contact pressure between the male and female terminals.

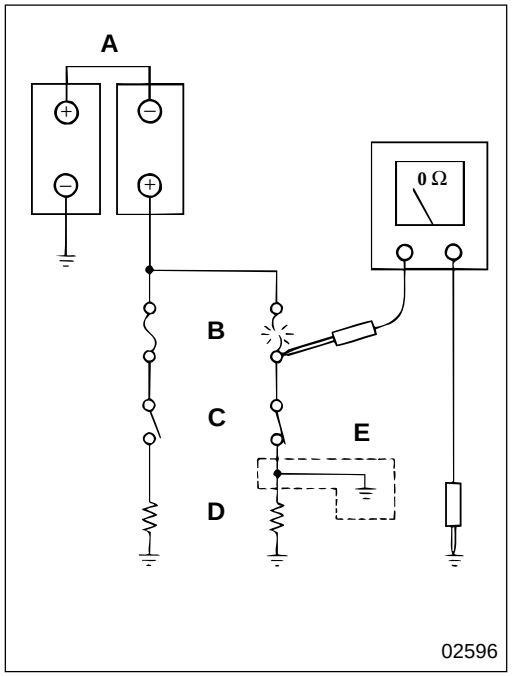
Check for poor contact caused by connector pins having fallen out, rusted terminals or foreign particles.



- **Connector pin fall out inspection**

  Damaged connector pin stoppers can cause poor engagement of the terminals (male and female pins) even if the connector body is secured, and might cause some pins to fall out. Check if the pins have fallen out from the connector by pulling each harness wire gently.

PRECAUTIONS FOR MAINTENANCE OPERATION



Inspection procedures for blown out fuses

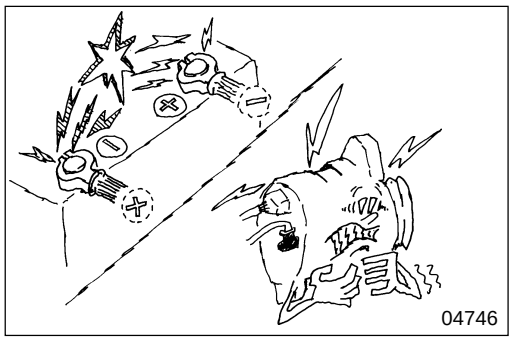
Remove fuse **B** and measure resistance between the loaded side of the fuse and ground.

Turn on all circuit switches (connected to the fuse). If the resistance value reading is approximately 0 Ω, a short has occurred between the switch and the loaded point. A value of other than zero may indicate that the fuse was blown by a temporary short but the short is no longer present.

The major causes of a short circuit are as follows:

- Harness stuck under the vehicle mounted body.
- Harness sheath damaged by friction or heat.
- Water in connectors or circuits.
- Mistakes (accidental short circuits)

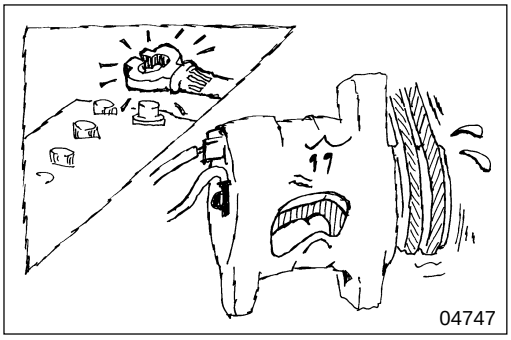
A : Battery
B : Fuse
C : Loaded switch
D : Load
E : Short circuit



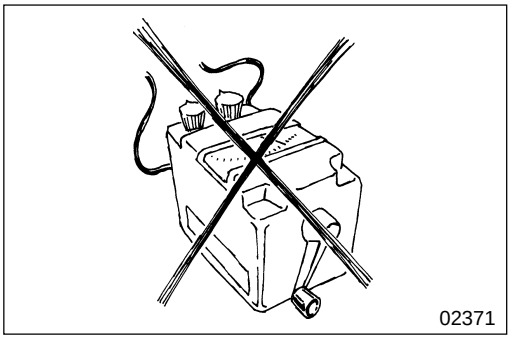
Precautions for handling alternator

When servicing alternators, pay attention to the following :

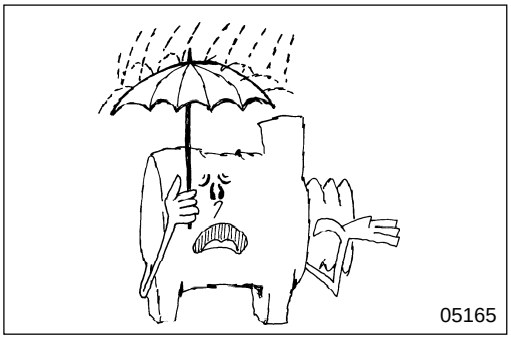
- Do not connect the alternator with battery polarities reversed.
  If the alternator is connected with reversed polarities, a large current flow from the battery to the alternator occurs, and the diode or regulator might be damaged.



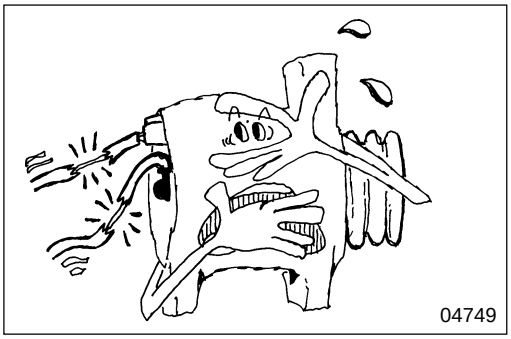
- While the engine is running, do not remove the battery terminals. If the battery terminals are removed at that time, a surge voltage is generated and the diode or regulator might be weakened.



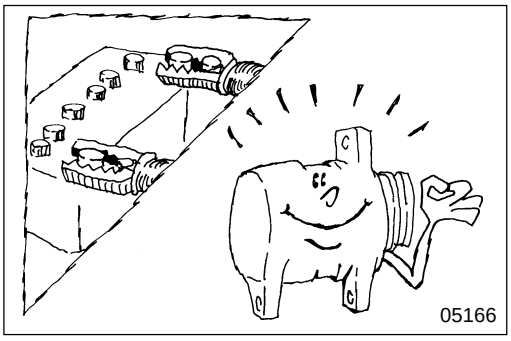
- Do not use a high-voltage tester such as a megger for inspection.
  If a high-voltage tester is used, the diode or regulator might be destroyed.



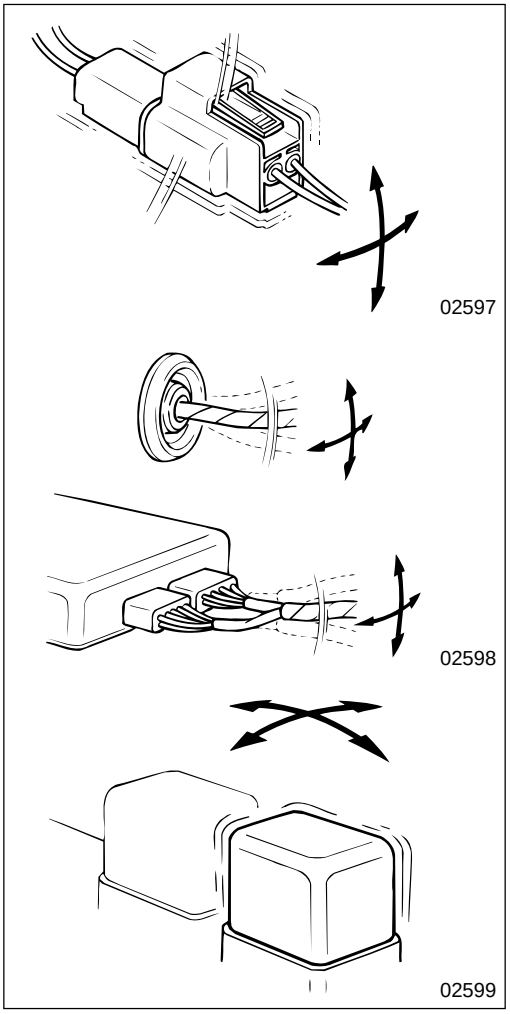
- Do not splash water over the alternator.
  If water is directly splashed over the alternator, individual components will be short-circuited and might be destroyed.



- Do not short-circuit terminal B and terminal L while running the alternator.
  If the terminals are short-circuited while the alternator is running, the diode trio might be destroyed.



- Disconnect the battery terminals before quick-charging the battery. Quick-charging without disconnecting the battery terminals might damage the diode or regulator.



Measures for temporary faults

Temporary faults often occur under certain conditions. So identifying those conditions helps to find possible causes. To find the conditions under which temporary faults occurred, you need to reproduce the faults after interviewing customers in detail about actual driving conditions, weather, frequency of occurence and fault phenomena.
Then determine if the faults were caused by vibration, temperature or other possible elements depending on the actual conditions identified. If vibration is suspected as a possible cause, inspect individual connectors as follows to check if the fault will occur:

- Shake the connector gently in all four directions of the arrows as illustrated.
- Shake the wiring harness gently in all four directions of the arrows as illustrated.
- Wiggle each sensor or piece of equipment by hand.
- Gently shake the wiring harnesses near movable parts such as suspensions.

The inspection subjects include possible causes related to the diagnosis code outputs and faults, as well as the connectors and other parts in the inspection procedure.

TABLE OF STANDARD TIGHTENING TORQUES

- Use specified bolts and nuts and tighten them at specified torques according to the following table, unless otherwise specified.
- Threads and contact seats shall be dry.
- Where there is difference in strength classification between the nut and bolt (or stud bolt), the torque specified for the bolt shall apply.

(1) This column contains the maintenance and inspection items.
(2) The periods between inspection and service are based on the assumption that the vehicle will be driven approximately 60000 kilometers (36000 miles) per year.
Inspections which must be made are indicated by an "×" or by the appropriate period between servicing.
(3) This column provides a simplified explanation of the operational procedures involved for each inspection or maintenance item.
(4) The Gr. No. refers to the "group number" in this Service Manual. For visual checks and simple inspections, see the sections labelled "Working Procedures".

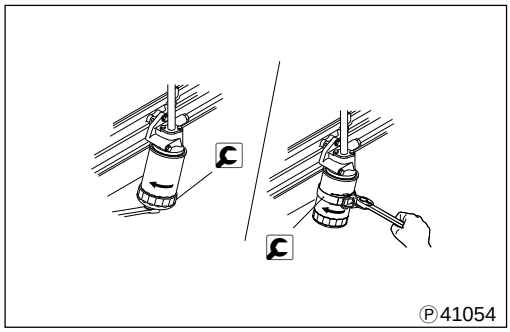
WARNING ⚠

- **Wipe up any spilled engine oil since it may cause a fire or accident.**
- **Do not touch oil when the engine is hot since it can inflict severe burns.**

CAUTION ⚠

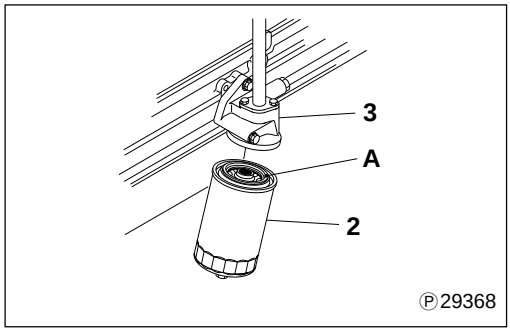
When pouring oil into the engine, take care not to spill any on the V-ribbed belt. Contact with oil could make the V-ribbed belt slip, rendering the cooling system less effective.



Ⓟ41054

Loosen oil filter drain plug **1** to drain the engine oil from inside the filter **2**.
[Removal]

: Oil Filter Element Socket or Filter Wrench



Ⓟ29368

[Installation]

- Clean the surface of oil filter head **3** to which oil filter **2** is fitted.
- Apply a thin coat of engine oil to the gasket **A** of oil filter **2**.
- Screw oil filter **2** into oil filter head **3** by hand until gasket **A** contacts the oil filter head. Then, tighten oil filter **2** further by giving it a 3/4 turn.
- After installing the oil filter, start the engine and check gasket **A** for oil leakage.
- Stop engine, check dipstick to see if the engine oil level is in the specified range.

Special tools

Unit : mm {in.}

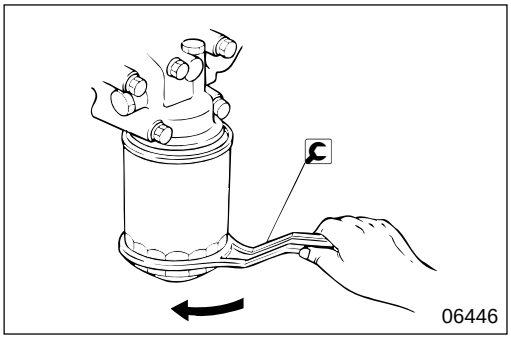
Location	Tool name and shape	Part No.	Application
2	Oil filter wrench  06478	MH061587 (Obtain Locally)	Removal of oil filter

WARNING

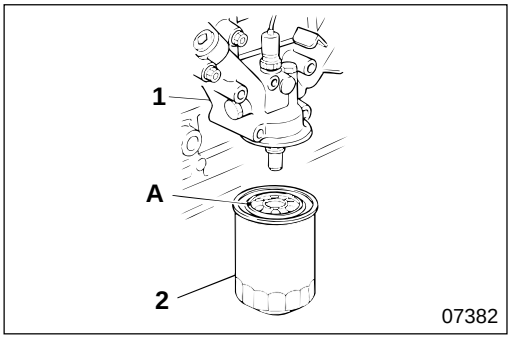
- **Wipe up any spilled engine oil since it may cause a fire or accident.**
- **Do not touch oil when the engine is hot since it can inflict severe burns.**

CAUTION

- **When pouring oil into the engine, take care not to spill any on the V-ribbed belt. Contact with oil could make the V-ribbed belt slip, rendering the cooling system less effective.**



[Removal]

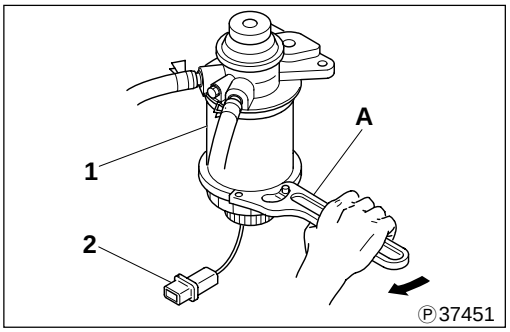


[Installation]

- Clean the surface of oil cooler body **1** that makes contact with oil filter **2**.
- Apply engine oil thinly and evenly to gasket area **A** of oil filter **2**.
- Screw oil filter **2** into oil cooler body **1** until gasket area **A** sits on the body. From this position, tighten further by rotating by 3/4 turn.
- After installation, run the engine and check that there is no oil leakage from gasket area **A**.
- Check the oil making sure it is within the specified range.

Replacement of Fuel Filter
< 4M5 >
Lubricant

Location	Parts to be tightened	Specified lubricant	Quantity
3	Gasket for fuel filter cartridge	Engine oil	As required



[Removal]

A: Filter Wrench
(Commercially available one: For filter diameter of approx. 90 mm {3.54 in.})

WARNING
- **Fuel is highly flammable. Keep it away from flames and sources of heat.**
- **To minimize the risk of fire, wipe up any spilled fuel.**

CAUTION
- **The water level sensor 2 may be reused if it functions properly.**

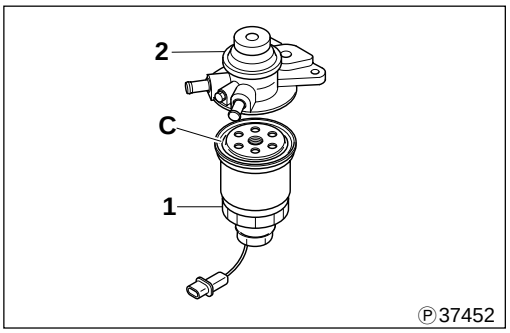
[Installation]

WARNING

Use of an unsuitable fuel filter cartridge 1 can lead to fuel leaks and fires. Be sure to use a genuine filter.

CAUTION

To prevent injection failures, keep dust and dirt out of the fuel filter cartridge 1 and the fuel pipe.



- To fit the fuel filter cartridge **1**, turn it until the gasket **C** touches seal surface of the fuel filter head **2**. Be sure to turn the filter by hand clockwise.
  Then, tighten the filter by 3/4 turn.
- After fitting the filter, start the engine and check that no fuel leakage occurs.
- Bleed all air out of the fuel system. P01-11

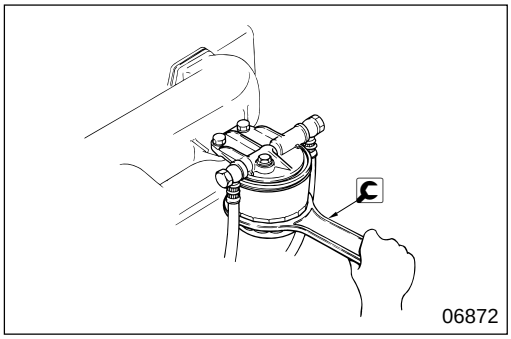
Special tools

Unit : mm {in.}

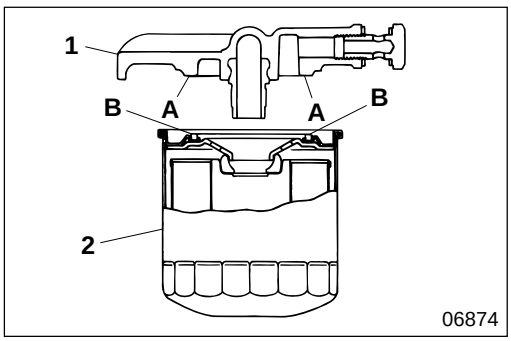
Location	Tool name and shape	Part No.	Application
2	Filter wrench  01882	MH061509 (Obtain Locally)	Removal of fuel filter

WARNING

- **Fuel ignites easily. Do not get it near flame or heat.**
- **Wipe up any diesel fuel that has been spilled because it can cause a fire.**
- **Do not use an unsuitable filter because it can cause a fire.**



[Removal]



[Installation]

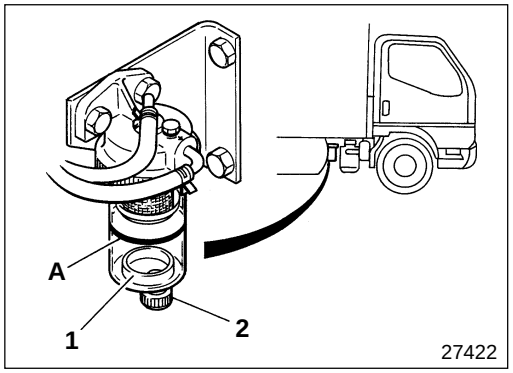
- Install by tightening three quarters to one full turn after contact surface **A** of fuel filter head **1** makes contact with gasket **B** of fuel filter **2**. Be sure to tighten by hand.
- After installation, bleed air from fuel system, run the engine and check for fuel leakage.

Draining of Water Separator Condensation

Tightening torque

Unit : N·m {ft.lbs, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
2	Drain plug	3 to 4 {2.2 to 2.9, 0.3 to 0.4}	—



Visually inspect the water separator before driving.
When level ring **1** reaches red line **A**, drain the condensation as follows:

- Loosen drain plug **2** and drain out the condensation.
- When level ring **1** has dropped to the bottom, tighten drain plug **2**.
- Carefully wipe the water separator and the surrounding area.
- Check for fuel leakage.

Cleaning of Fuel Feed Pump Gauze Filter < 4D3 >

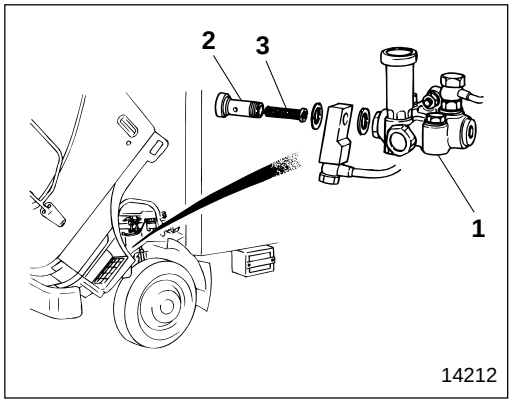
Tightening torque

Unit : N·m {ft.lbs, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
2	Eye bolt	25 to 29 {18 to 22, 2.5 to 3}	—

WARNING⚠

- **Fuel ignites easily. Do not get it near flame or heat.**
- **Wipe up any diesel fuel that has been spilled because it can cause a fire.**



- Remove eye bolt **2** on the inlet side of fuel feed pump **1**.
- Remove gauze filter **3** from eye bolt **2**.
- Clean gauze filter **3** with diesel fuel.
- Follow the removal sequence in reverse and reinstall gauze filter **3**. Install eye bolt **2** in the fuel feed pump.
- Bleed the air from the fuel line.
- Start the engine and check for fuel leakage.

- Loosen the fuel filter air vent plug **2**.
- Operate the priming pump **1** to pump up fuel.
- Continue to pump fuel until no air bubbles are found in the fuel flowing out from the air vent plug **2**.
- After ascertaining that air bubbles have completely disappeared, tighten the air vent plug **2** securely.
- Operate the priming pump **1** further until it feels heavy.
- Wipe up all spilled fuel, then start the engine.
- Check that no fuel leakage occurs.

Adjustment of V-Ribbed Belt or V-Belt Tension

Newly installed V-ribbed belt or V-belts can stretch during their initial running-in period. To prevent this from becoming a problem, run the engine for several minutes after installing the V-ribbed belt or V-belt, then readjust. Perform this cycle several times.

WARNING⚠

You must take special precautions to prevent the engine from rotating while a V-ribbed belt or V-belt is being inspected or adjusted.

CAUTION⚠

- **Make sure that you turn off the engine before attempting to inspect or adjust the V-ribbed belt or V-belts.**
- **Make sure that you fasten all bolts and nuts securely after adjusting the V-ribbed belt or V-belts. Remember that too much tension can damage the V-ribbed belt or V-belts and bearings.**
- **Make sure V-ribbed or V-belts remain clean and free of oil and grease or they may slip which will reduce service life.**

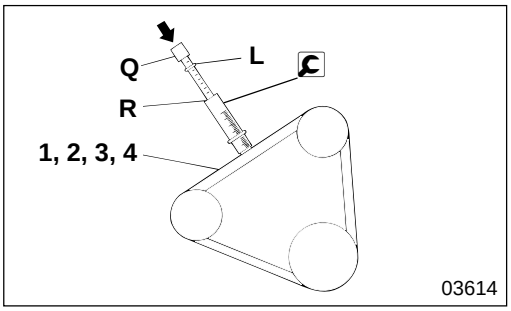
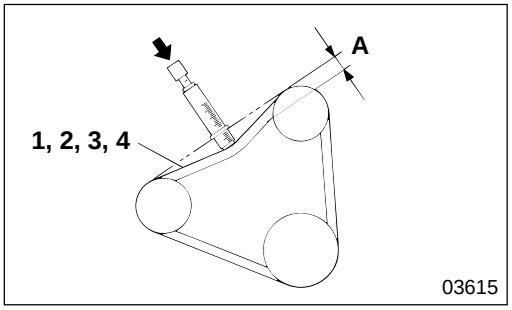
Use of belt tension gauge

- Set the upper O-ring **L** of the Belt Tension Gauge to a push load of 98 N {22 lbf, 10 kgt} on scale **M**.
- Set the lower O-ring **N** of the Belt Tension Gauge to the belt's specified maximum deflection value on scale **P**.
- Refer to Service Standards 🕮 P01-12



03614

- Apply the Belt Tension Gauge to the center of V-ribbed belt **1** or V-belt **2**, **3**, **4** and push **Q** until the upper O-ring **L** reaches the flange **R**.



- Measure the deflection **A** of the V-ribbed belt **1** or V-belt **2**, **3**, **4**. If the measurement does not comply with the standard value, adjust the tension in accordance with the following procedure.

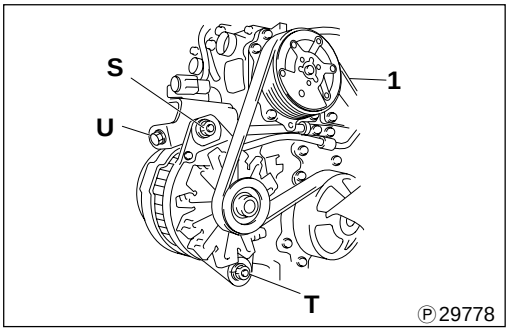
[Adjustment]

CAUTION ⚠

- **Excessive tension in the V-ribbed belt 1 or V-belt 2, 3, 4 may damage the belt and related bearings.**
- **Keep the V-ribbed belt 1 or V-belt 2, 3, 4 free of oil. If the belt becomes oily, it may slip, resulting in overheating of the engine and insufficient charging of the battery.**

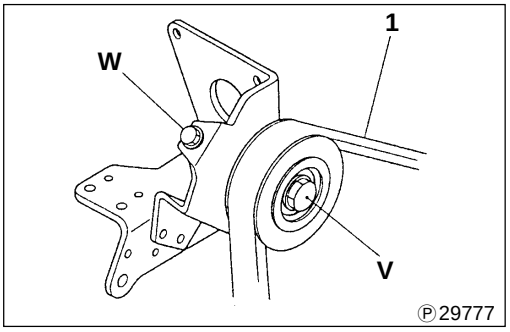
< 4M5 >

(1) V-ribbed belt



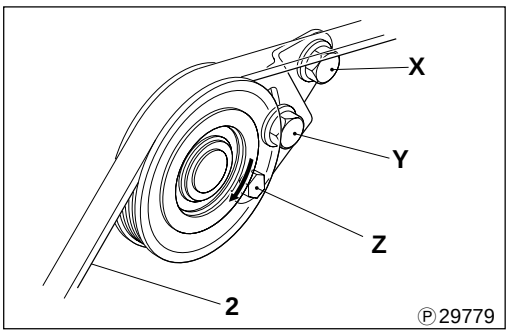
< With air-conditioner >

- Loosen the alternator mounting nuts **S** and **T**, then adjust the tension of the V-ribbed belt **1** using the adjustment bolt **U**.
- When the adjustment is completed, securely tighten the nuts **S** and **T**.



< Without air-conditioner >

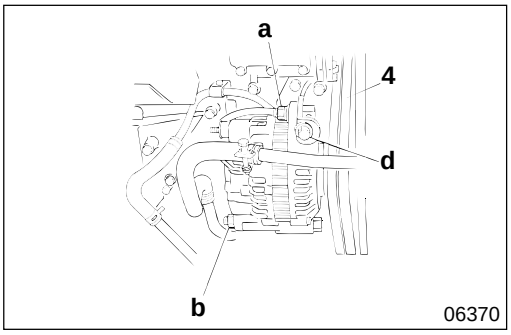
- Loosen the tension pully mounting sleeve **V** and adjust the tension of the V-ribbed belt **1** using the adjusting bolt **W**.
- After the adjustment, tighten the sleeve **V** securely.



(2) V-belt < With refrigerator >

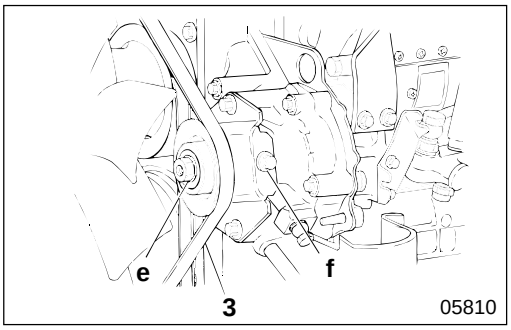
- Loosen bolt **X** first, then loosen bolt **Y**.
- Adjust the tension of V-belt **5** by turning bar **Z** with a closed-end wrench.
- After adjustment, tighten bolt **Y**, then tighten bolt **X** firmly.

< 4D3 >



(1) For fan

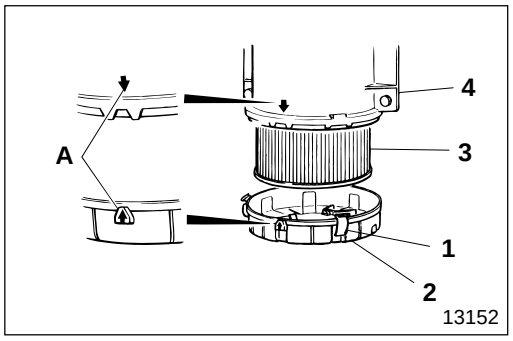
- Loosen the alternator mounting bolts **a** and **b**, then adjust the tension of the V-belt **4** using the adjustment bolt **d**.
- When the adjustment is completed, securely tighten the bolts **a** and **b**.



(2) For air-conditioner

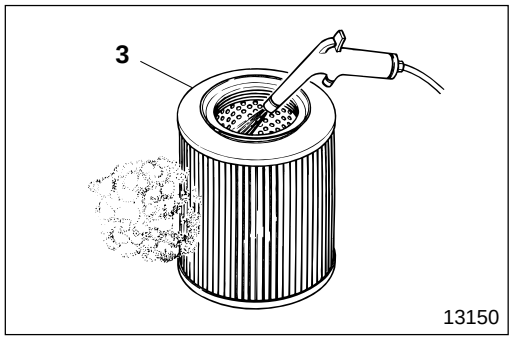
- Loosen the alternator mounting nut **e**, then adjust the tension of V-belt **3** using the adjustment bolt **f**.
- When the adjustment is completed, securely tighten the nut **e**.

Cleaning and Replacement of Air Cleaner Element



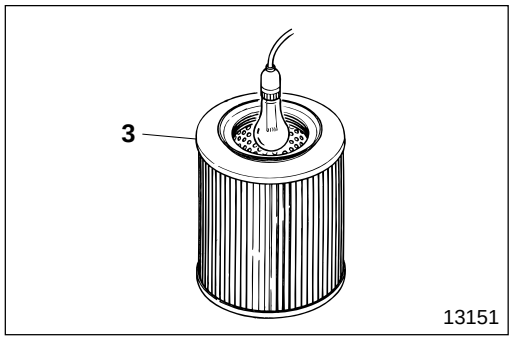
[Removal]
- Unfasten clamp **1** and remove air cleaner cap **2**.
- Remove air cleaner element **3**.

[Installation]
- Install by aligning alignment marks **A** of air cleaner cap case **4** and air cleaner cap **2**.



[Cleaning]
- Blow compressed air of 685 kPa {100 psi, 7 kgf/cm^2} or less through air cleaner element **3** from the inside.
- When using compressed air, move the blower's nozzle up and down along the pleats of air cleaner element **3** evenly.

CAUTION⚠
- **Do not tap or hit air cleaner element 3 to remove dust.**
- **Do not blow compressed air through air cleaner element 3 from the outside.**



[Inspection]
- Illuminate the inside of air cleaner element **3**.
- If parts of the filter paper are torn or thin, or if the sealing area of the upper surface of air cleaner element **3** is damaged, replace the air cleaner element.

NOTE

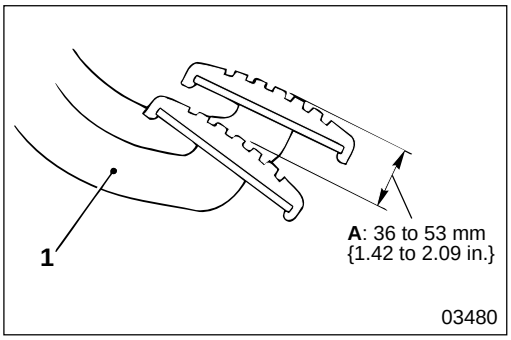
If the dust on air cleaner element 3 is wet due to oil smoke or soot, replace the air cleaner regardless of the scheduled replacement interval.

Inspection of Clutch Pedal Free Play

Service standards

Unit : mm {in.}

Location	Maintenance item	Standard value	Limit	Remedy
1	Clutch pedal free play	36 to 53 {1.42 to 2.09}	—	Adjust or replace



[Inspection]
Push clutch pedal **1** with your hand and measure the amount of movement **A** (free play) until you meet resistance. If the measured value does not conform to the standard value, adjust stroke of clutch power cylinder push rod or replace the clutch disc.

[Clutch operation]
- Check for unusual noises when clutch pedal **1** is pressed while the engine is idling, and also for abnormally hard/stiff clutch operation. Also check to be certain that it is not difficult to shift the vehicle into first and reverse gears.
- Gradually release clutch pedal **1** to set the vehicle in motion.
  Check to be sure there is no slippage, and that the clutch engages smoothly.

GVWR : Gross vehicle weight rating

CAUTION

- **Make certain that there is no difference in the air pressure between the inner and outer rear tires.**
- **Make certain you use valve caps on the air valves.**
- **It is not necessary to increase the air pressure for high-speed driving.**

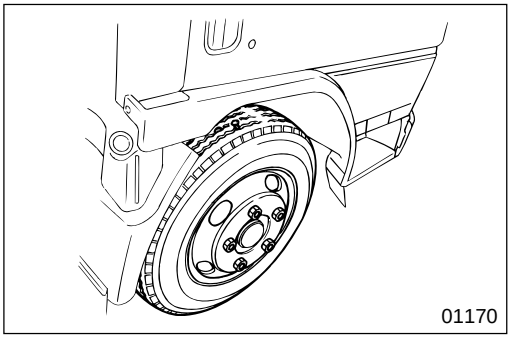
Checking tread depth

- Check all around the tire treads to make sure that the depth of the tread grooves is above the wear limit.
- If the tread grooves are not deep enough, slip sign **A** appears at the position of the ⚠ mark, where the tread groove has worn away.

WARNING

If the depth of the tread grooves is not adequate, the tires will slip on wet roads and present a hazard. Such tires are also extremely dangerous because they are more susceptible to hydroplaning when the vehicle is running at high speeds in the rain. Such tires must be replaced with new ones as soon as possible.



01170

Checking for cracks, damage, and objects embedded in the treads

- Check the tire treads and walls for cracks and damage.
- Check tire treads for uneven wear or other abnormal wear.
- Check if metal objects or nails have penetrated the tires.
- Check for stones embedded between double tires.

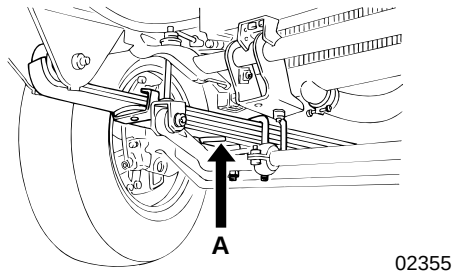
WARNING⚠

Badly damaged or worn tires are extremely dangerous, because they can be punctured more easily when the vehicle is running, they must be replaced with new ones as soon as possible.

Removing tires

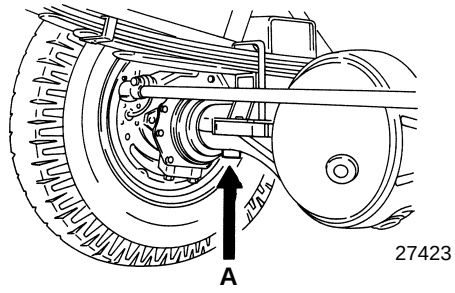
- Jacking up point
  - For FE front wheels : Point **A** under the leaf spring in front of the front axle
  - For FG front wheels : Point **A** under the front axle housing
  - For rear wheels : Point **B** under the rear axle housing

< FE Front wheel >



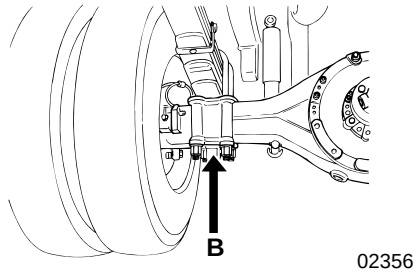
02355

< FG Front wheel >



27423

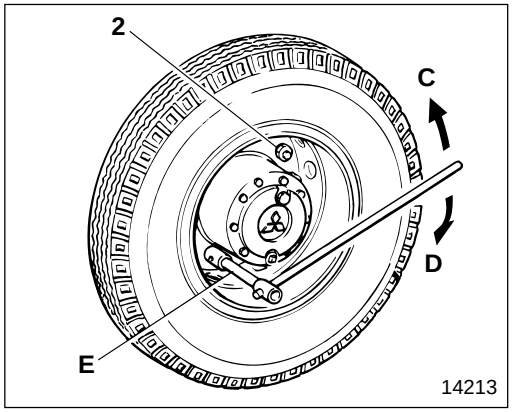
< Rear wheel >



02356

WARNING⚠

- **The jack should be placed on flat, solid ground, and should not be used to raise the vehicle higher than necessary.**
- **Do not use the jack at vehicle locations other than those illustrated.**
- **Keep in mind the danger of a slipping jack. Never crawl under the vehicle while the jack is in use or rock the vehicle. Also, do not start the engine while the vehicle is jacked up.**
- **To increase safety, use rigid racks for the vehicle when it is necessary to leave it jacked up for long periods.**
- **Chock both the tire to be removed and the tire diagonally opposite to it so that they will not rotate when you are removing the tire.**



- Loosen wheel nuts **2** slightly. The wheel nuts for right tires **C** have right-hand threads "**R**", and the wheel nuts for left tires **D** have left-hand threads "**L**".

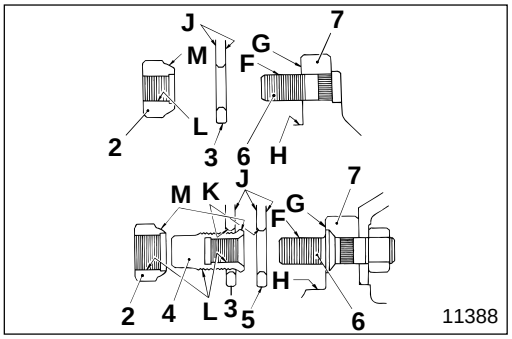
WARNING

Make certain that wheel nut wrench E is fully engaged, all the way to the back of nuts 2. If it is not, it could slip.

CAUTION

Only loosen wheel nuts 2 slightly. Do not remove them.

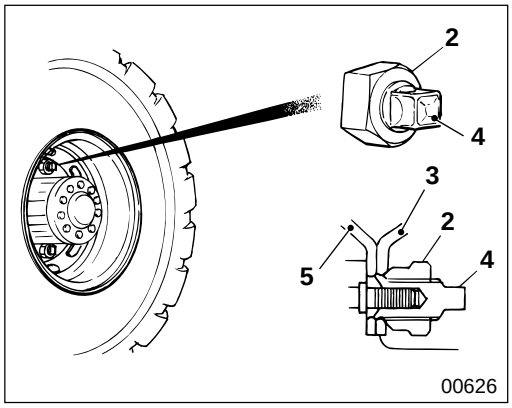
- Jack up the vehicle carefully, until the tire is slightly off the ground. Remove wheel nuts **2**, then remove the tire.
- When working on the double tires at the rear of the vehicle, first remove the outside tire, then lower the vehicle and loosen the nuts on the inside tire. After doing this, jack the vehicle back up and remove the tire.



Mounting tires

To prevent wheel nuts **2**, **4** and hub bolt **6** from becoming loose and to prevent mounted parts (tire assemblies **3**, **5** and hub **7**) from being damaged, remove rust, dust, additional coatings of paint, and foreign particles from the following areas:

F : Hub bolt thread area
G : Wheel mounting surface of hub
H : Wheel alignment area of hub
J : Disc wheel mating surface
K : Disc wheel nut mounting surface
L : Wheel nut thread area
M : Wheel nut spherical area



- Install the dual rear tires as follows:
  - After mounting inner tire **5** and fully tightening inner wheel nuts **4**, jack the vehicle up and mount on outer tire **3**, then tighten outer wheel nuts **2**.
  - Even if only outside tire **3** is to be changed, do not mount it until inner wheel nuts **4** have been fastened at the specified torque.
  - Slide the air valves on the inside and outside tires down when mounting the tires.

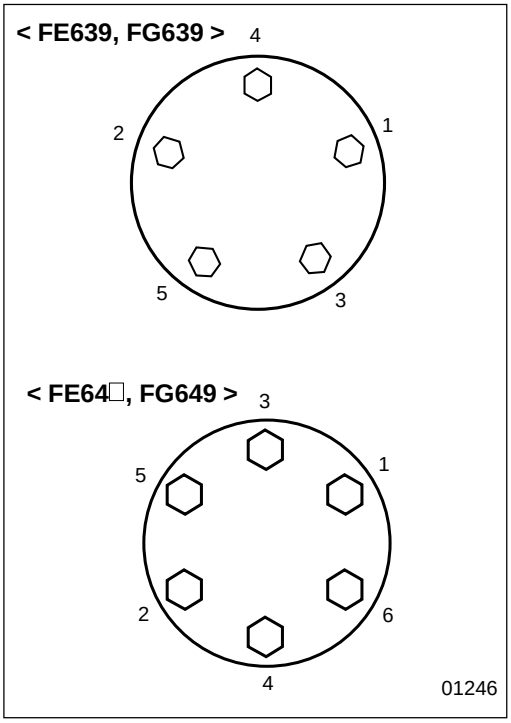
WARNING

If the threads are scored, or the disc wheel is deformed or cracked, change bolts 6, nuts 2, 4 and disc. Driving the truck before correcting such problems can cause the tire in question to come loose, which could be the source of major accidents.

CAUTION

Check hub bolt 6 threads carefully for damage before putting the tire on.

- Place the tapered end of wheel nuts **2**, **4** towards the disc wheel and fasten temporarily. Center so that there is no eccentricity between bolts **6** and the disc wheel bolt holes.
- Lower the vehicle.



- Tighten the nuts in the order as illustrated, tightening each nut two or three times. To finish, tighten each nut at the specified torque.

WARNING

- **Always use the specified torque when tightening the wheel nuts. If the wheel nuts are not tightened properly, the wheels could come loose while the vehicle is being driven, which could result in life threatening accidents or the truck being disabled.**
- **Do not coat the threads with grease when tightening the nuts. This could result in over-tightening force, which could be dangerous.**

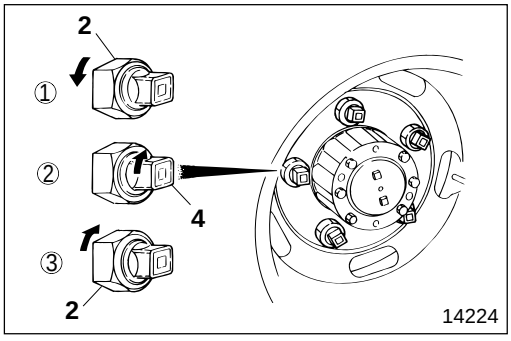
CAUTION

Over-tightening the wheel nuts can damage them.

Checking the wheel nuts for looseness

The wheel nuts should be checked for looseness every 10000 km (6000 miles). All nuts should be tightened at the specified torque.

- Check the double rear tires for looseness as follows:



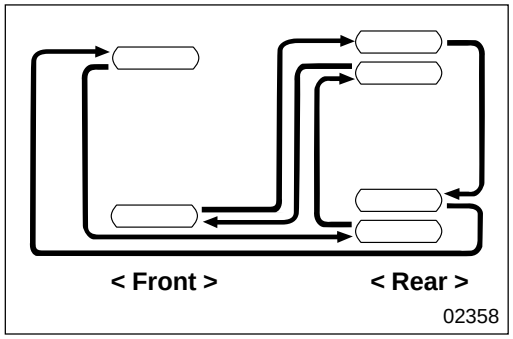
① Loosen outer wheel nuts **2**.
② Tighten inner wheel nuts **4** at specified torque.
③ Tighten outer wheel nuts **2** at specified torque.

CAUTION

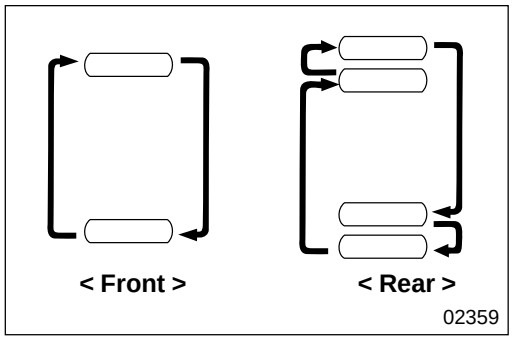
If outer wheel nuts 2 are tightened without first being loosened, it might not be possible to tighten them at the specified torque.

Tire rotation

Tires wear differently, according to the location where they are mounted. To make this wear uniform and prolong the life of your tires, they should be rotated every 10000 km (6000 miles) in the rotation order shown below:



- When the tread patterns for all tires are identical:



- When the tread patterns are different for the front and rear tires:

CAUTION⚠

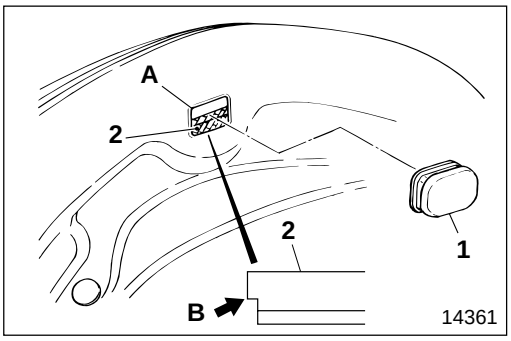
- **Always adjust air pressure after running-in new tires.**
- **When using tires of different tread patterns, use rib-type patterns for the front tires and traction type patterns for the rear tires.**
- **Avoid using both radial and biased tires on the same vehicle.**

Inspection of Brake Lining Thickness < Drum Brake Only >

Service standards

Unit : mm {in.}

Location	Maintenance item	Standard value	Limit	Remedy
2	Thickness of brake lining	—	4 {0.16} (Side shoulder means wear limit)	Replace



NOTE

Be sure to inspect at two points for each wheel per side.

- Remove cover **1** from the packing plate.
- Inspect through check hole **A** whether brake lining **2** is worn to the point of side shoulder **B** of the brake lining (the limit).
- If the measured value is lower than the limit, replace brake lining **2** on the same axle as a unit.
- After inspection, be sure to reinstall cover **1**.

Battery

DANGER⚠

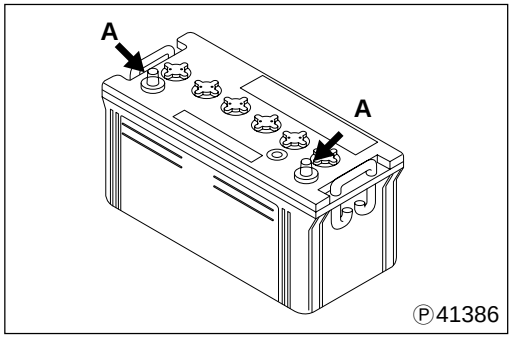
- **Since flammable hydrogen gas is generated by the battery, be sure to obey the following warnings :**
- **Do not short-circuit the ⊕ and ⊖ terminals on the battery.**
- **Keep sparks and lit cigarettes away from the battery.**
- **Do not wear metal objects on your arms and lean over the battery.**
- **Because the battery electrolyte is diluted sulfuric acid and is corrosive, when handling the battery wear safety glasses and rubber gloves to protect the eyes and hands.**
- **Battery posts, terminals and related accessories contain lead and lead compounds. Wash hands after handling.**

WARNING⚠

To prevent a short-circuit be sure that the disconnected battery cables do not accidentally touch the battery terminals.

CAUTION⚠

- **Make sure that you disconnect the battery cable ⊖ first when you disconnect the battery cables.**
- **Make sure that all electrical switches of the vehicle are OFF before connecting the battery cables.**
- **Make sure that you connect the positive battery cables ⊕ before you connect the negative battery cable ⊖.**

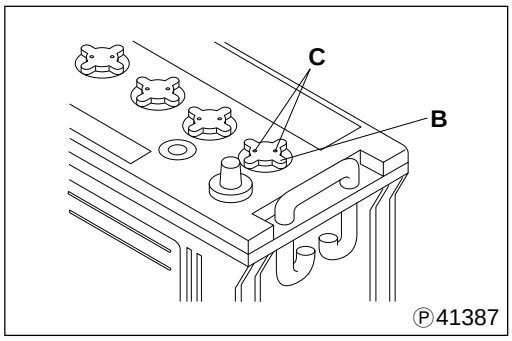


Visual inspection

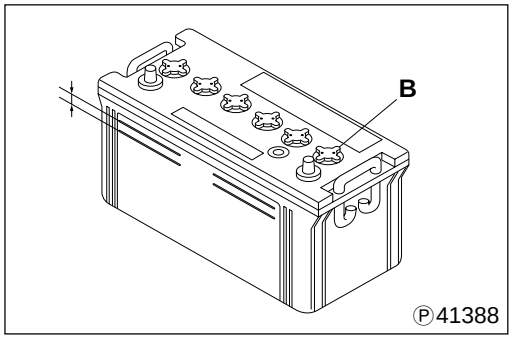
- If terminal **A** is corroded, scrub the corrosion off of it using a wire brush.
- If cracks or defects are found on battery **7**, replace it because the cracks or defects can cause liquid spills.

CAUTION⚠

Be sure to apply grease to the ⊕ side of terminal A because it is easily corroded.

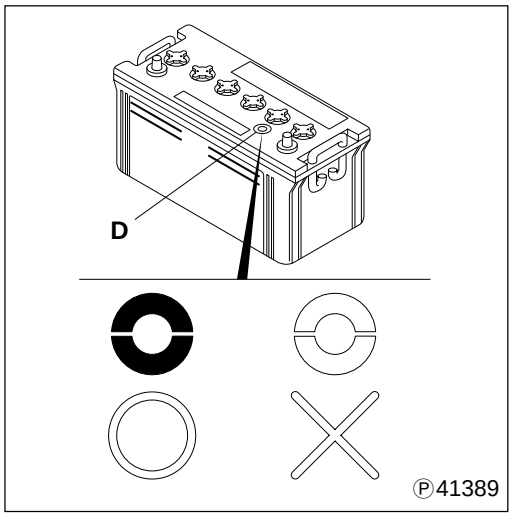


- If the air bleed hole **C** of vent plug **B** is clogged, clean the hole.



Inspection of fluid level

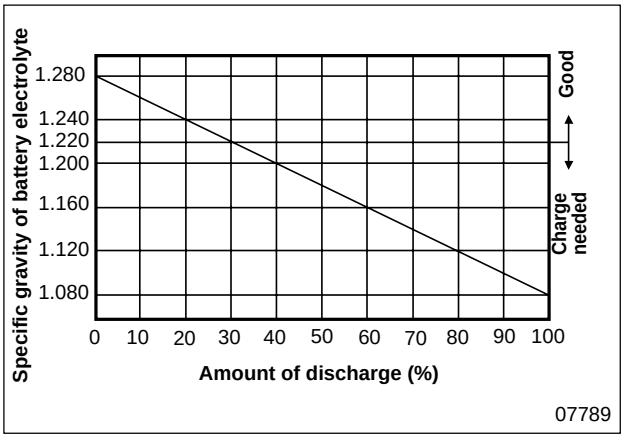
- Confirm that the level of battery electrolyte is between the UPPER and LOWER LEVEL lines.
- If the level is below the LOWER LEVEL line, remove the vent plug **B** and replenish with distilled water or battery fluid to the UPPER LEVEL.



Specific gravity measurement

You can tell the specific gravity of the battery electrolyte by the color shown in indicator **D**.

Blue : Good
White : Charge or replace



Charging

- Although, as a rule, charging of the battery should be done with the battery removed from the vehicle, if you have to charge the battery while it is in the vehicle, make sure that you stop the engine and disconnect the battery cable ⊖.
- Remove vent plug **B** before charging the battery.
- For the recommended charge time and current, see the following table to avoid overcharging.

	Charge current (A)	Charge time (H)	Upper limit of fluid temperature (°C {°F})
Normal charge	Value of 5-hour rating capacity / 10	*Amount of discharge (Ah) / Charge current (A) ×1.2(to 1.5)	45 {113}
Quick charge	Value of 5-hour rating capacity / 1.5	0.5	55 {131}

*Amount of discharge (Ah)=5-hour rating capacity (Ah)× Amount of discharge (%) / 100

- Use the graph shown on the left to calculate the amount of discharge (%).
- If electrolyte level is low add distilled water to raise level.
- The specific gravity of fully-charged battery electrolyte is 1.280 with the temperature at 20°C {68°F}.

DANGER⚠

- **Do not let the battery electrolyte level rise and overflow while charging the battery.**
- **Keep unprotected lights away from the battery while charging it or it might explode.**
- **Be careful not to generate sparks while charging the battery because it may explode.**
- **After charging the battery, tighten vent plug B, wash away sulfuric acid from the battery using water, and dry the surface.**
- **Be sure to check the electrolyte level before charging the battery. Charging with the electrolyte level below the lower limit (LOWER LEVEL) can cause premature deterioration, heat generation and explosion of the battery.**

3 High-current fuse box

CAUTION

- **If a fuse blows, make sure you identify and remedy the cause, then replace the fuse.**
- **Make sure that you replace the fuse with one having the same rating.**
- **Make sure that you remove the ⊖ terminal of the battery cable before removing high-current fuses FH1 to 7.**

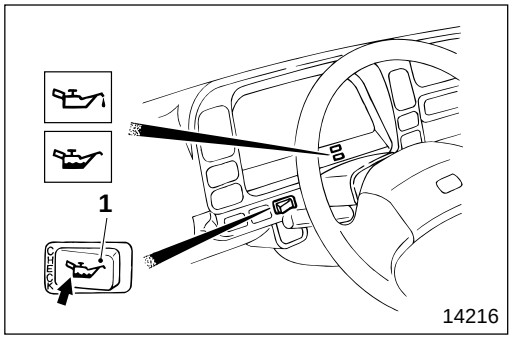
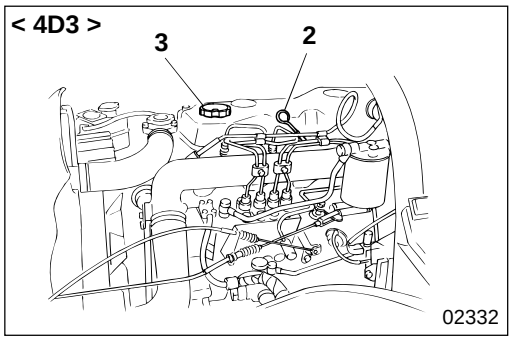
Oil filter		Approximately 1 L {1.1 qts}	4M5

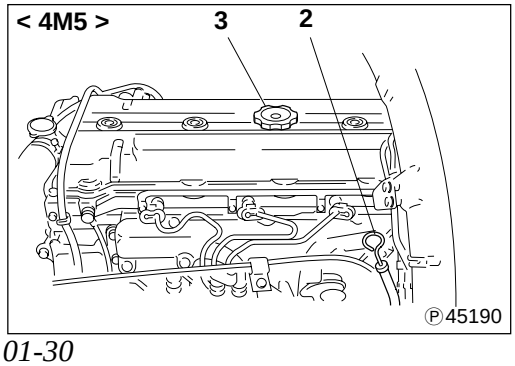


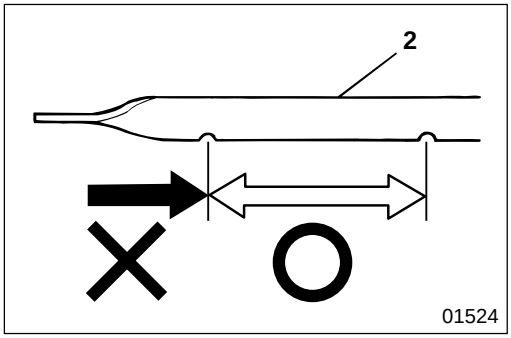
[Inspection]
There are two methods for inspecting the engine oil level; using oil level check switch **1**, and using dipstick **2**. Inspection using the oil level check switch is a simple inspection method. For a more accurate inspection use the dipstick.

- Inspection using oil level check switch **1** (simple inspection)
  - Press oil level check switch **1** before starting the engine. Check the oil level using the illuminated lamp.
    lamp (green) : Correct oil level
    lamp (red) : Low oil level
  - If the level is low, fill to correct level.

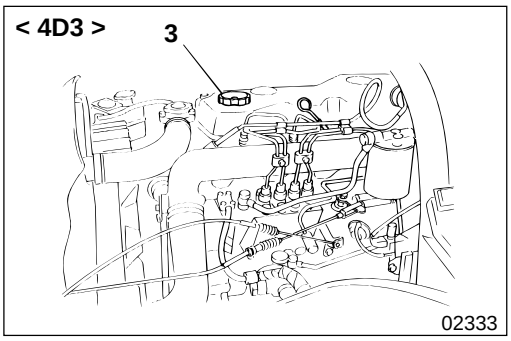


- Inspection using dipstick **2**
  - Tilt the cab.
  - Pull out dipstick **2**, wipe off the oil with a cloth.
  - Reinsert dipstick **2**, then pull it out carefully.
  - Oil level is correct if there is oil sticking to the dipstick between the two notches.
  - If the level is low, fill to correct level.





[Replenishment]
- Clean the area surrounding oil filler cap **3** and prevent dust from entering through the filler.
- Remove oil filler cap **3** and top up with engine oil.
- Wait five minutes before re-checking the oil level.
- Replace filler cap **3**.

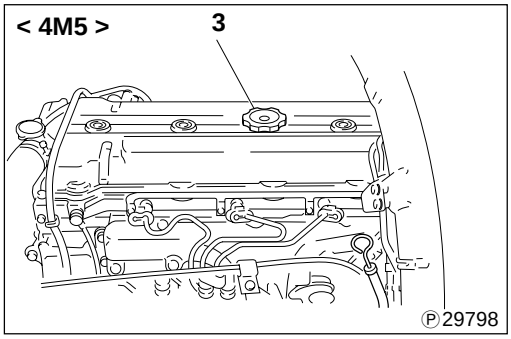


WARNING⚠

Wipe up any spilled engine oil since it can cause a fire.
Do not touch oil when the engine is hot since it can inflict severe burns.

CAUTION⚠

When pouring oil into the engine, take care not to spill any on the V-ribbed belt. Contact with oil could make the V-ribbed belt slip, rendering the cooling system less effective.



[Draining]
- Warm up the engine, then remove oil fill cap **3**.
- Remove oil pan drain plug **4** and oil filter drain plug **5**. Allow engine oil to drain.

[Filling]
Tighten oil pan drain plug **4** and oil filter drain plug **5** to their specified torques. Then, add new engine oil to the specified level.

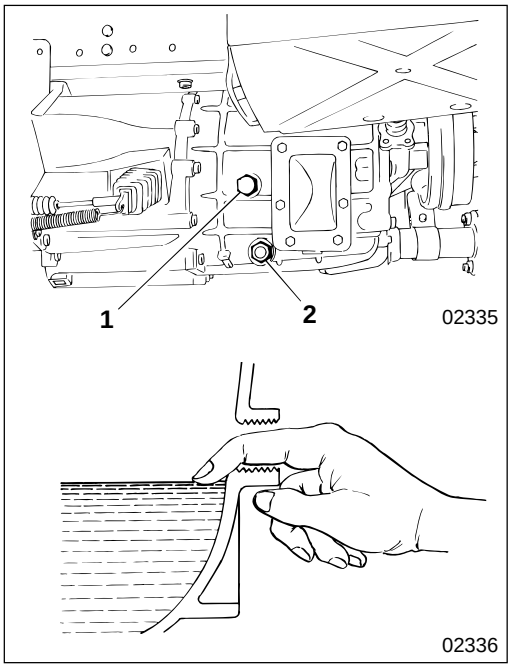
WARNING

The oil temperature is high immediately after the vehicle has stopped, so take care not to scald yourself.



[Inspection and replenishment]

- Remove inspection plug **1** and check whether the oil level is up to the edge of the entrance.
- If the level is low, add oil through the inspection plug hole until the level comes up to the edge of the entrance.

[Replacement]

- Drain the oil after removing inspection plug **1** and drain plug **2**.
- Remove any metal particles sticking to the magnetic part of drain plug **2** before reinstalling the plug.
- Add oil through the inspection plug hole until the level comes up to the edge of the entrance.
- Reinstall inspection plug **1**.

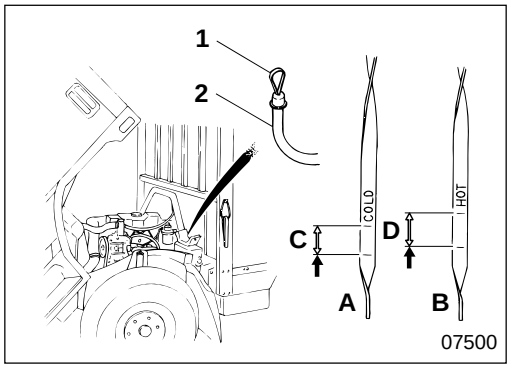
Location	Parts to be tightened	Tightening torque	Remarks
3	Drain plug	29 to 39 {22 to 29, 3 to 4}	—



[Inspection and replenishment]

- Park the vehicle on level ground, make sure that the parking brake is fully activated and chock the wheels to keep them from rolling.
- Start the engine and let it idle. To fill the hydraulic circuit with automatic transmission fluid, slowly shift the range selector lever once through the P to L ranges and finally shift into the N range.
- While the engine is still idling, pull out dipstick **1** and wipe off the fluid sticking to it. Reinsert the dipstick, then pull it out again and check the fluid level.
- If the fluid level is inspected right after the engine is started and the fluid temperature is still low (40±15°C {104±27°F}) the level should be within area **C** marked COLD on dipstick **1** as illustrated in **A**.
- If the fluid level is inspected after the vehicle has been driven and the fluid temperature is high (65±15°C {149±27°F}) the level should be within area **D** marked HOT on dipstick **1** as illustrated in **B**.

WARNING ⚠

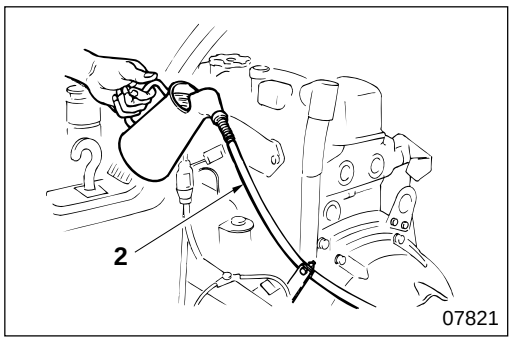
Take care during the inspection because the engine will be running. Take sufficient care to avoid burns or injuries resulting from contact with moving parts.

CAUTION ⚠

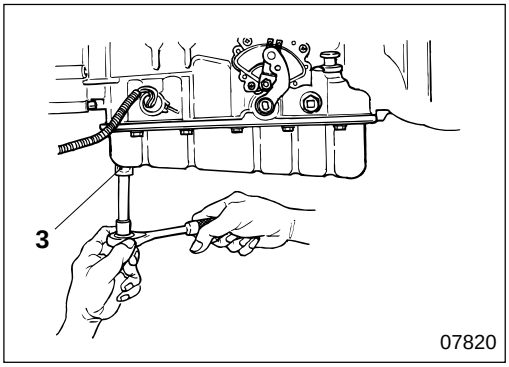
Be sure to wipe off the dust from the safety cap and the upper part of filler tube 2 before you pull out dipstick 1.

NOTE

- **Make sure the vehicle is parked on level ground when you are checking the fluid level.**
- **Make sure the range selector lever is in the N range and the engine is idling when you are checking the fluid level. When the engine is at standstill, the fluid level appears higher than it actually is.**
- **To ensure the fluid is correct, reinspect the fluid level after an actual drive.**



- If the fluid level is low, top it up to the specified level by supplying automatic transmission fluid (DEXRON III type) through filler tube **2**.



[Replacement]

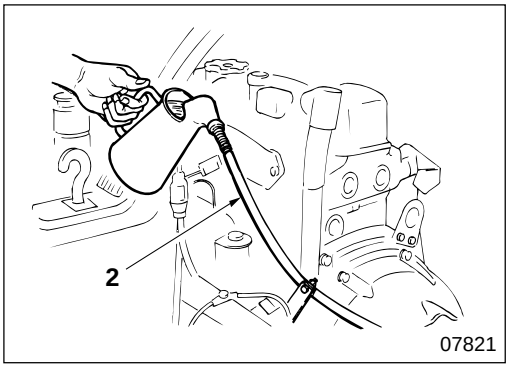
- Place a container under the oil pan, remove drain plug **3** in the front of the oil pan and drain the fluid.

WARNING

Take care because the automatic transmission fluid temperature immediately after the engine has stopped is very high. To avoid scalds, wait until a safe temperature has been reached before draining the fluid.

NOTE

- **The fluid will drain faster if the engine is first run to raise the fluid temperature.**
- **The fluid cannot be drained from the hydraulic circuit, the torque converter or the oil cooler.**



- Reinstall the gasket, and oil pan drain plug **3**.
- Add automatic transmission fluid (DEXRON III type) through filler tube **2**.

CAUTION

Make sure that dirt and foreign particles do not become mixed in with the fluid when it is added.

- Shift the range selector lever into the N range, start the engine and let it idle for at least two minutes.
- After shifting the lever through all ranges once, shift it back into N.

CAUTION

To prevent burning out the interior of the automatic transmission assembly, make sure that the engine is not allowed to race when you do the above.

- Add fluid until the fluid level is at the lower limit of the specified area on dipstick **1**. Next, check the fluid level to make sure it is within the specified limit when engine and transmission reach normal operating temperatures.

NOTE

- **Determining the fluid level immediately after supplying the fluid might be difficult due to the fluid stuck in the inside of the filler tube. Therefore, check the fluid level a few times between intervals.**
- **If the fluid is overfilled, it will overflow and can be mistaken for leakage.**
- **Let the engine idle and, while paying attention to the fluid level, pour in the fluid slowly.**

WARNING

The oil temperature is high immediately after the vehicle has stopped, so take care not to scald yourself.

- Remove inspection plug **1**, check the oil level and make sure it is up to the edge of the entrance.
- If the oil level is low, add oil through the inspection plug hole until the level comes up to the edge of the entrance.
- Insert inspection plug **1**.

[Replacement]

- Drain the oil after removing inspection plug **1** and drain plug **2**.
- Remove any metal particles sticking to the magnetic part of drain plug **2** before reinstalling the plug.
- Supply oil through the inspection plug hole until the level comes up to the edge of the entrance.
- Reinstall inspection plug **1**.

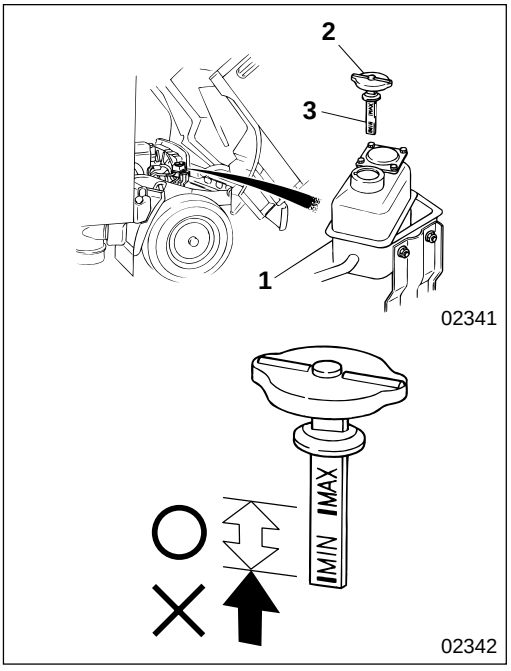
Fluid

Location	Points of application	Specified fluid	Quantity
1	Power steering oil tank	Automatic transmission fluid (DEXRON or DEXRON II type)	Between MIN and MAX on filler cap dipstick



[Inspection and replenishment]

- Straighten the front wheels and stop the engine.
- Tilt the cab.
- Remove filler cap **2** of power steering oil tank **1** by turning the filler cap counterclockwise.
- Wipe off the fluid sticking to dipstick **3** on filler cap **2**. Replace the filler cap.

NOTE

Check the fluid level without screwing on filler cap 2.

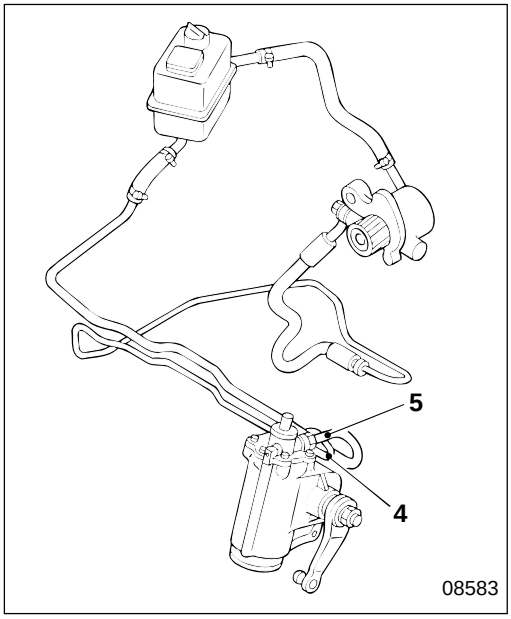
- Carefully lift up filler cap **2** and check the fluid sticking to dipstick **3** to make sure that the fluid is at a point between the “MAX” and “MIN” levels. If the fluid position does not reach the “MIN” level, add fluid.
- After inspection install filler cap **2** by turning it clockwise.

WARNING⚠

Close filler cap 2 firmly; otherwise the fluid may leak and could catch fire. Also wipe up spilled fluid.

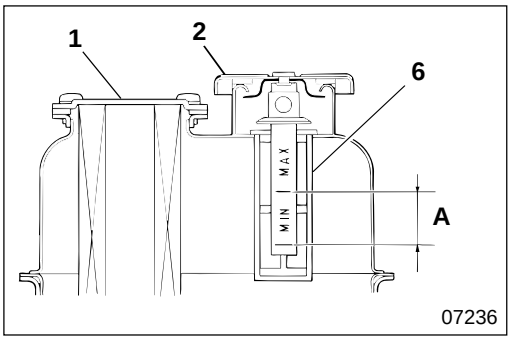
CAUTION⚠

If the fluid level is far below the recommended range, the fluid may be leaking.



[Replacement]

- Drainage
  - Jack up the front wheels.
  - Release pressure tube **4** and return tube **5** connected to the power steering gear box.
  - Turn the steering wheel fully left and right repeatedly, and drain the fluid from the power steering gear box.
  - After draining the fluid, tighten pressure tube **4** and return tube **5** at specified torque.



[Fluid supply]

- Pour fluid into power steering oil tank **1** up to the inner port of strainer **6**.
- With the engine stopped, jack up the front wheels and turn the steering wheel fully left and right repeatedly. When the fluid level has dropped, add fluid to maintain the fluid level within range **A**.

NOTE

Check the fluid level without screwing on filler cap 2.

- Start the engine and letting it idle, turn the steering wheel fully left and right repeatedly. When the fluid level has dropped, add fluid to maintain the fluid level within range **A**. Repeat these steps until the fluid level does not drop.
- If there is an abnormal noise, air is still in the system. Turn the steering wheel several times to raise the fluid temperature to approximately 60 to 80°C {140 to 176°F}, then stop the engine and wait for approximately five minutes.
- Lower the front wheels and turn the steering wheel several times. If there is no noise, bleeding is completed.
- When bleeding is finished, check fluid level of power steering oil tank **1**, and pipe and hose connections for fluid leakage.

07623

WARNING

- **The clutch fluid system and the brake fluid system use the fluid tank in common. Therefore, replacement and air bleeding of the clutch fluid must be carried out simultaneously with that of the brake fluid. Gr 21**
- **You must use new brake fluid (SAE J1703f or FMVSS No. 116 DOT3). Do not add different quality fluid or mineral oil (gas oil, engine oil, gear oil, automatic transmission fluid, etc.) to the clutch system, because this will cause the rubber parts of the clutch system and brake system to swell, resulting in faulty clutch operation, as well as ineffective braking and brake dragging.**
- **Do not allow foreign particles or water to become mixed into the brake fluid when refilling, because this will result in ineffective clutch and brake operations.**
- **If you use a container for adding brake fluid, keep it solely for that purpose.**

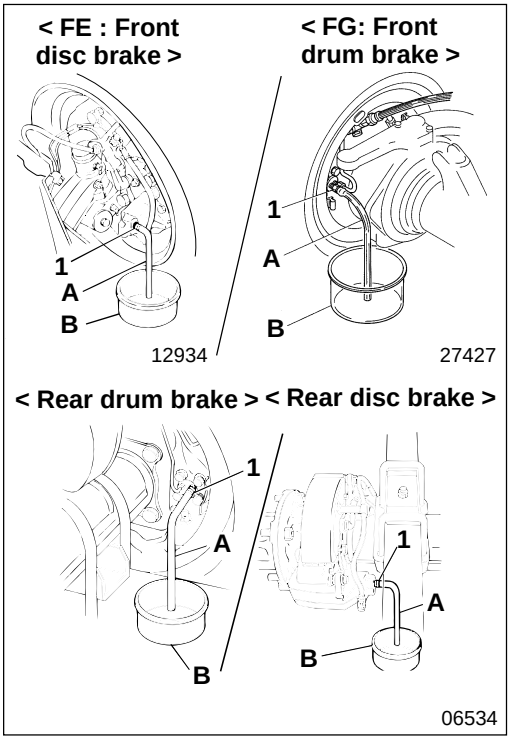
CAUTION

- **Be careful not to splash brake fluid on related parts as this could damage the paintwork.**
- **Be sure to wipe off brake fluid immediately, and wash area, if you splash it on the paintwork.**

NOTE

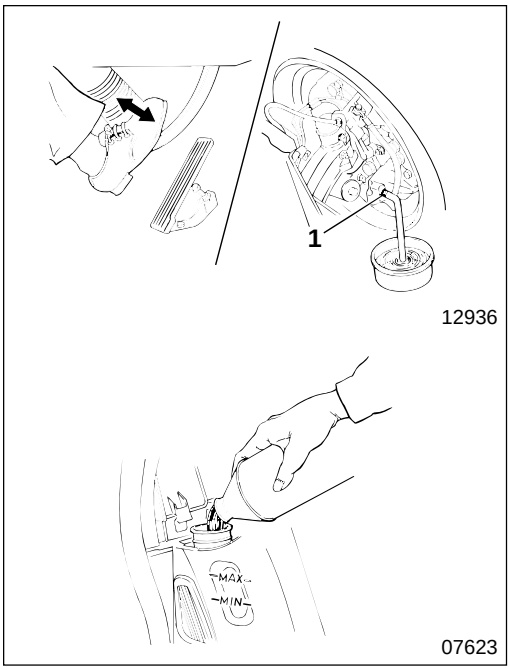
Supply brake fluid to maintain the “MAX” level of the fluid tank always.

[Inspection and replenishment]
Inspect the level of the brake fluid in the fluid tank. It should be between the “MAX” and “MIN” levels. If it is below the “MIN” level, lift up the lid and remove the cap from the fluid tank, then add specified brake fluid until the level reaches the “MAX” level. Do not fill above the “MAX” level.



[Replacement]

- Start the engine and let it idle until you complete brake fluid replacement.
- Attach vinyl pipe **A** to the front disc brake < FE >, the front drum brake < FG >, the rear drum brake < FE639, FG639 >, the rear disc brake < FE64□ >
- Place the free end of vinyl pipe **A** into container **B**.

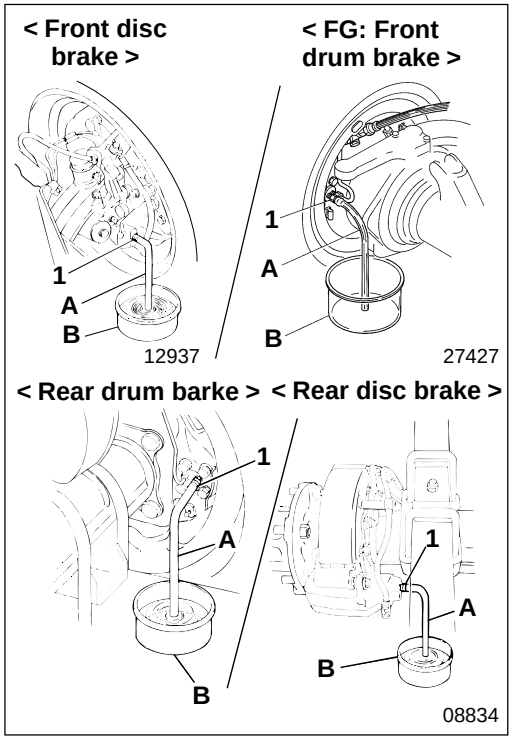


- Loosen air bleeders **1** and depress the brake pedal several times to drain brake fluid completely.
- Maintaining a supply of new brake fluid up to the “MAX” level of the fluid tank, depress the brake pedal repeatedly until the old brake fluid of the brake system is replaced with new fluid. After you complete the work, tighten each air bleeder **1** at specified torque.

NOTE

You can tell when the brake fluid has been completely replaced because the fluid coming out will be a different color.

- Carry out air bleeding of the brake system.



[Air bleeding]

- Start the engine and let it idle until you complete air bleeding of the brake system.
- Attach vinyl pipe **A** to the front disc brake < FE >, the front drum brake < FG >, the rear drum brake < FE639, FG639 >, the rear disc brake < FE64□ >.
- Place the free end of vinyl pipe **A** into container **B**, then bleed air from the brake system as follows:

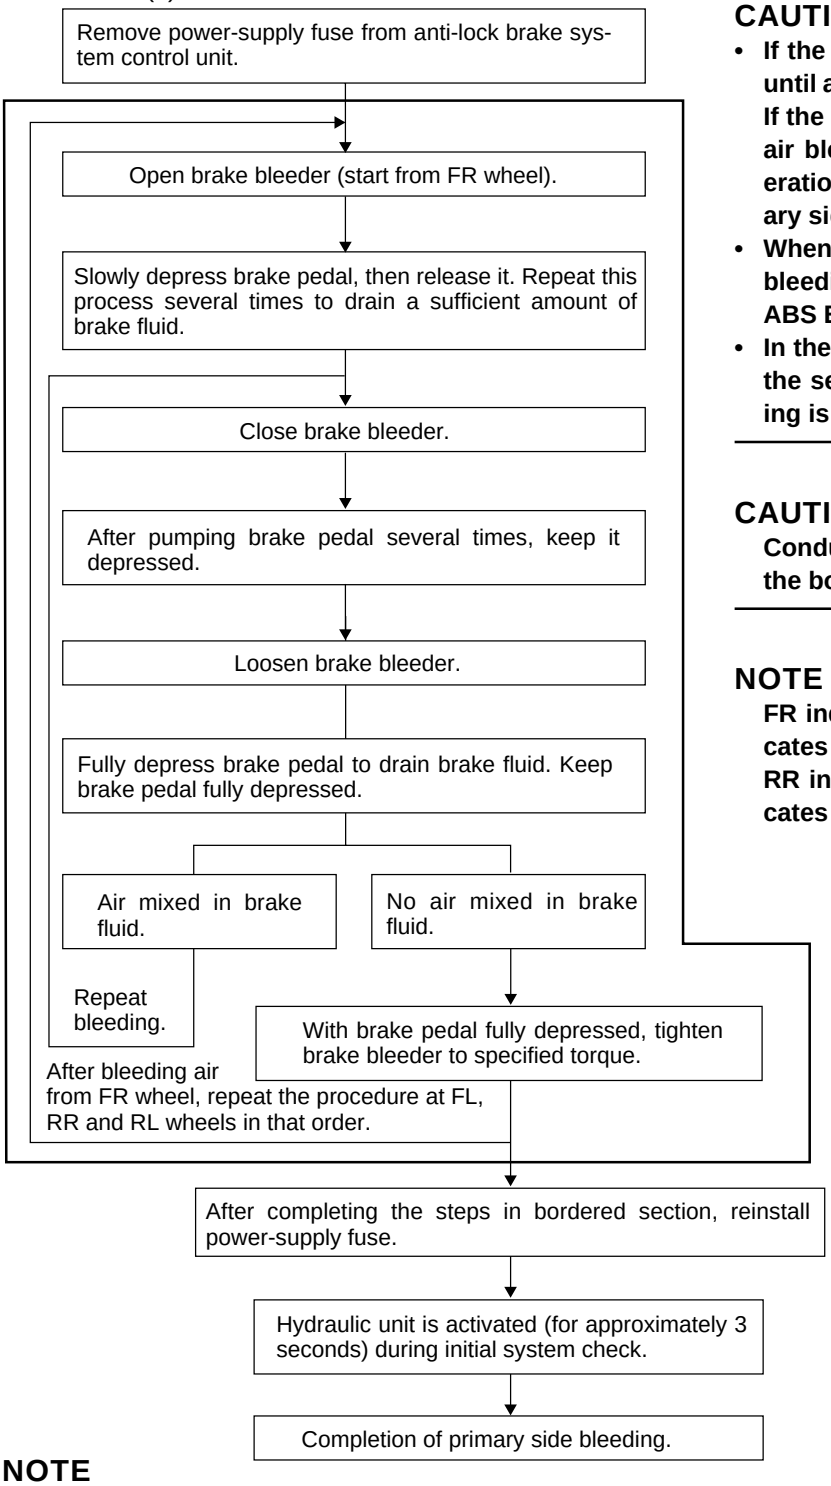
(1) Air bleeding during regular maintenance, and hydraulic unit replacement

When air bleeding is conducted during regular maintenance or when the ABS hydraulic unit is replaced, brake fluid flows into the secondary side (operating circuit) of the ABS hydraulic unit. Therefore, bleed the primary side (normal circuit) by following the procedures below. In the event air enters the secondary side, bleed air by following the procedures described in (2).



CAUTION⚠

- **If the battery is disconnected, do not reconnect until air bleeding of the primary side is complete. If the battery is reconnected before primary side air bleeding is complete, the system check operation is activated and air can enter the secondary side.**
- **When the battery must be connected prior to air bleeding, remove the power-supply fuse for the ABS ECU.**
- **In the event air enters the secondary side, bleed the secondary side after primary side air bleeding is complete.**

CAUTION⚠

Conduct the air bleeding operation described in the bordered section at every wheel.

NOTE

FR indicates front-axle right wheel, and FL indicates front-axle left wheel.
RR indicates rear-axle right wheel, and RL indicates rear-axle left wheel.

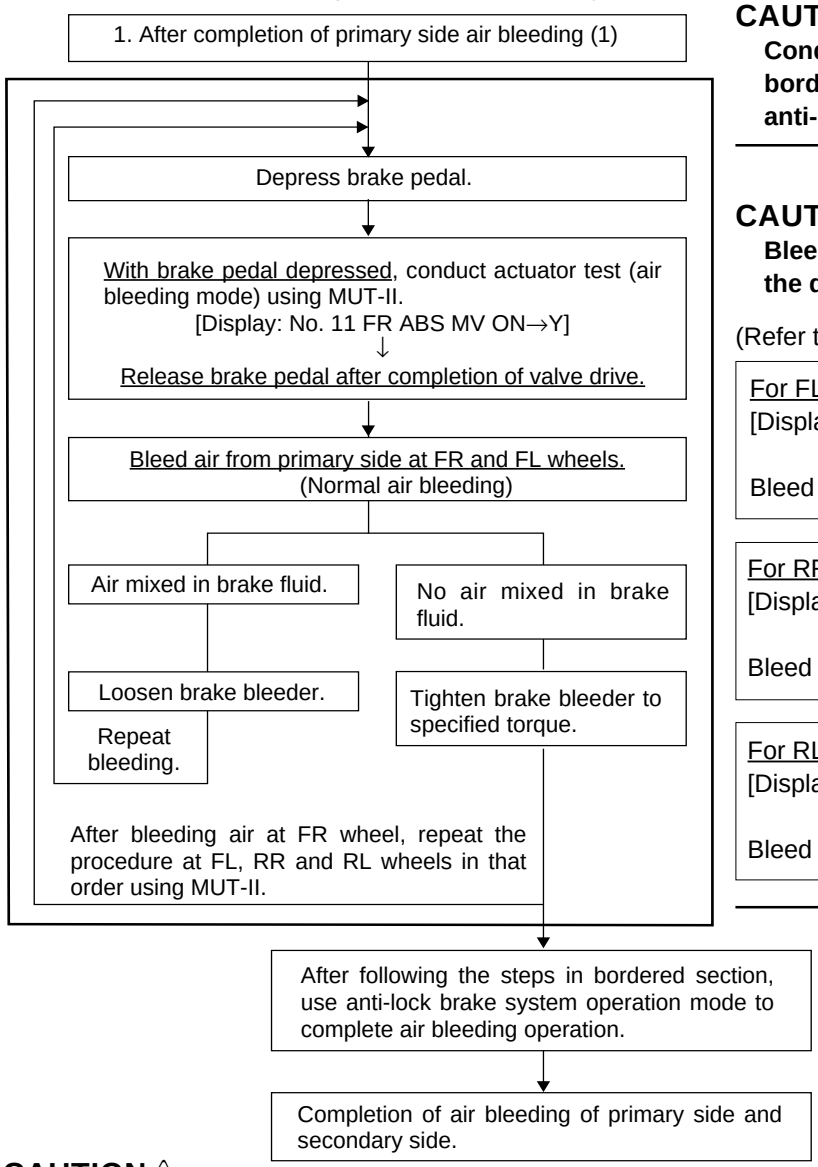
NOTE

- **The primary side (normal circuit) is a hydraulic circuit formed when the system is in non-operation.**
- **The secondary side (operating circuit) is a hydraulic circuit which connects with the primary side only when the system is in operation (when the system is in non-operation, the secondary side is disconnected from the primary side).**

(2) Air bleeding of secondary side

If the system starts operating before air bleeding of the primary side is complete, air can enter the secondary side. In the event the system accidentally starts before the completion of primary side air bleeding, follow the procedures below to bleed air. If air enters the secondary side, air flows into the primary side when the system starts, and this can extend the brake pedal stroke.
During air bleeding, use the MUT-II to conduct an actuator test (anti-lock brake system operation mode) at all wheels.

Use the MUT-II when bleeding air from the secondary side.



CAUTION⚠

Conduct air bleeding operation described in the bordered section at every wheel by using the anti-lock brake system operation mode.

CAUTION⚠

Bleed air from wheels other than FR according to the directions below.

(Refer to NOTE below)

For FL wheel
[Display: No. 12 FL ABS MV ON→Y]
↓
Bleed air from primary side at FR and FL wheels.

For RR wheel
[Display: No. 13 RR ABS MV ON→Y]
↓
Bleed air from primary side at RR and RL wheels.

For RL wheel
[Display: No. 14 RL ABS MV ON→Y]
↓
Bleed air from primary side at RR and RL wheels.

CAUTION⚠

- **Avoid continuous execution of the actuator test (anti-lock brake system drive) using the MUT-II; otherwise, excessive heating of the anti-lock brake system motor, valve and other parts can cause hydraulic unit damage.**
- **Do not conduct the actuator test with the MUT-II while bleeding air from the primary side; otherwise, air can enter the secondary side from the primary side.**
- **When mixing of air was found after air bleeding is conducted to correct an excessive brake pedal stroke, bleed air from the secondary side, too.**

NOTE

- **For the MUT-II operation for the actuator test during air bleeding, refer to section 4.**
- **If a drive operation is conducted for the FR and RL wheels at one time using the MUT-II, subsequent air bleeding of the primary side conducted at each wheel will not remove air from the secondary side.**

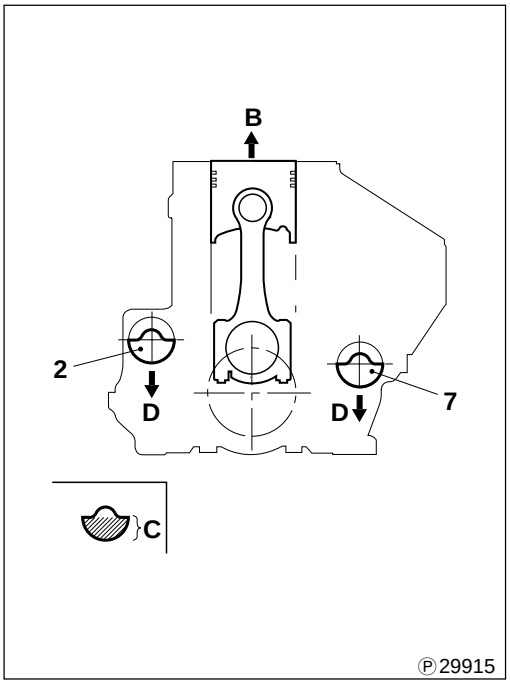
13 Oil pump gear

- The balance shafts RH **2** and LH **7** are mounted in the upper crankcase **4** with the crankshaft **3** sandwiched in between, and serve to reduce the engine vibration caused by rotation of the crankshaft.
- Both balance shafts RH **2** and LH **7** are supported by the three balance shaft bushings **5**, **6** and **8** mounted in upper crankcase **4** and driven by the timing gears (🕮 P11A-8).
- The balance shaft LH **7** is provided with a positioning hole **A** to ensure correct assembly. 🕮 P11A-63



● **Reduction of vertical vibration (Secondary components)**

- The reciprocating motion of the piston produces inertial force **B**, the source of vertical vibration, at the top and bottom dead centers of the piston.
- The balance shafts RH **2** and LH **7** rotate in such a way that at the top and bottom dead centers of the piston, the semi-circular weight portion **C** will always be placed opposite to the piston head in terms of top or bottom position.
- As a result, at the top and bottom dead centers of the piston, both balance shafts RH **2** and LH **7** produce equal centrifugal force **D** to offset inertial force **B** of the piston, thereby reducing vertical vibration.
- In addition, in the medium and high engine speed ranges, the crankshaft rotation moments (secondary components) are also reduced by the balance shafts.

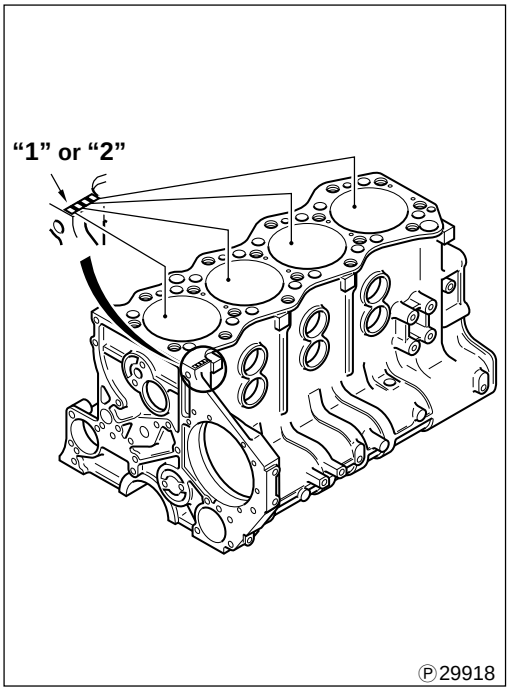
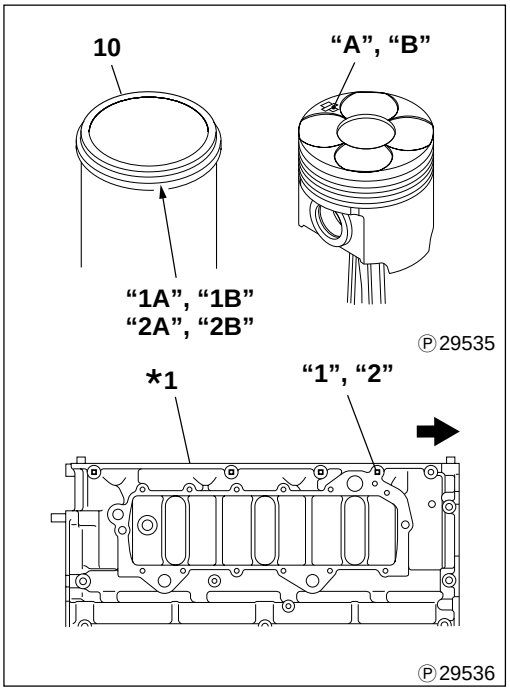
- The crankcase is composed of two parts; upper crankcase **1** and lower crankcase **6**, which are coupled together with crankshaft **8** in between.
- The upper crankcase **1** has four cylinder bores provided into which cylinder liners **10** are fitted.
- Water jacket **A** is provided around the cylinders to cool down the cylinder liners **10**.
- The bolts **4** used to couple the upper crankcase **1** and the lower crankcase **6** and the main cap bolts **5** require the specified procedure to be followed when tightened. P11A-83

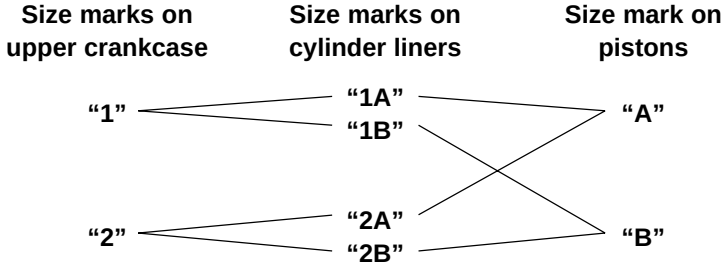


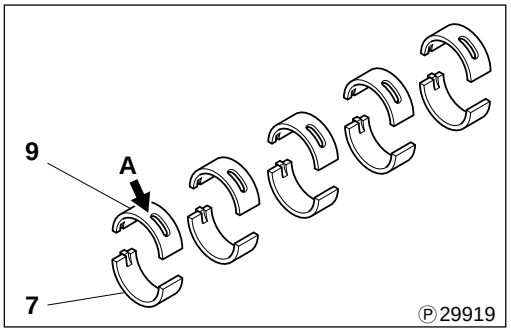
- Size mark "**1**" or "**2**" is stamped on the upper crankcase **1** for selective fitting of pistons in the crankcase.
- The size marks for the four cylinders are collectively stamped at a single location, and indicate the sizes of the respective cylinder liners as illustrated. P11A-7



● **Cylinder liner**

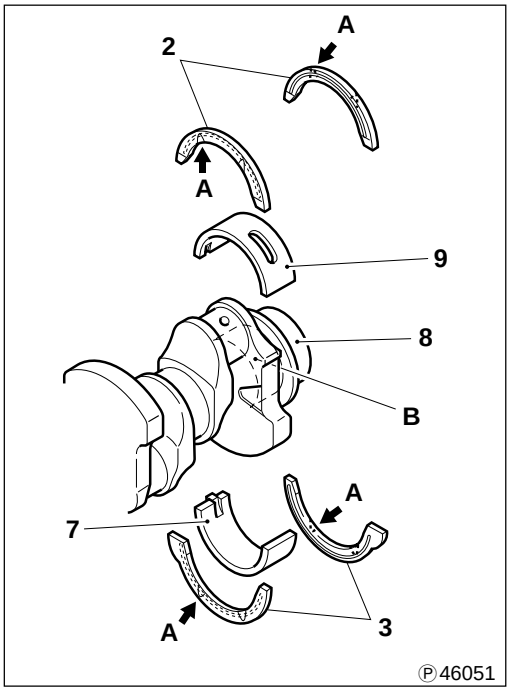
- Select a cylinder liner **10** which has the same size mark as those stamped on the upper crankcase ***1** the piston.
- The size marks on the upper crankcase ***1** are arranged in the order of No. **1**, **2**, **3** and **4** cylinders starting from the engine front **C**.





● **Main bearings**

The upper main bearing **9** has an oil hole **A** through which engine oil is supplied to the journal of the crankshaft **8**.



● **Thrust plates**

- The thrust plates include upper thrust plates **2** and lower thrust plates **3**. They are mounted at both ends of the upper main bearing **9** and the lower main bearing **7** at the rearmost portion of the crankshaft **8**.
- The thrust plates to be used should have a proper thickness suitable to maintain the end play specification of the crankshaft **8**.

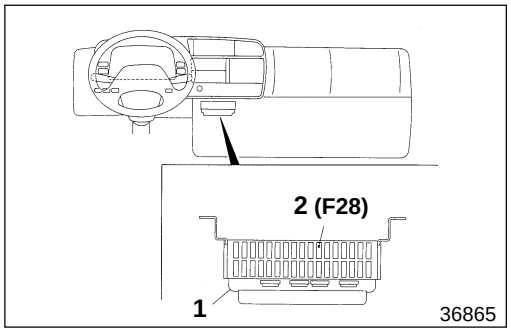
Special tools

Unit: mm {in.}

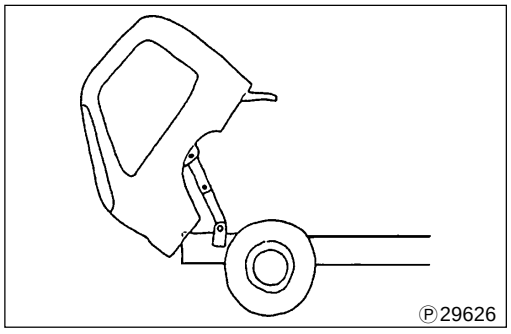
Location	Tool name and shape	Part No.	Application
–	Compression Gauge Adapter 	MH063434	Measuring compression pressure

A drop in compression pressure should be used as a guide in determining a time to overhaul the engine.
Measure the compression pressure at regular intervals, and keep track of its transition which will provide a useful tool for troubleshooting. On a new vehicle, or for a while after replacement of parts with new ones, the compression pressure will be somewhat higher, depending on the break-in condition of piston rings, valve seats, etc., but will return to normal as the parts wear down.

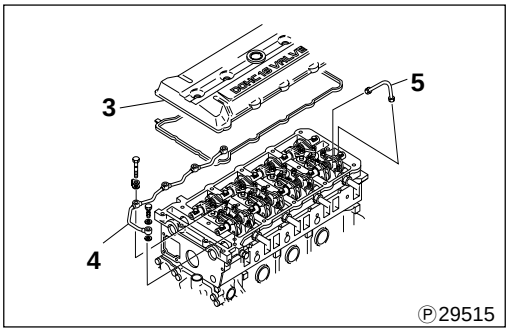
- Prior to an inspection, check to ensure that the engine oil, starter and battery are in normal condition.
- Place the vehicle in the following condition.
  - Warm up the engine until the coolant temperature reaches approx. 75 to 85 °C {167 to 185 °F}.
  - Turn off the lights and auxiliaries.
  - Place the transmission in neutral.
  - Place the steering wheel in the straight-ahead position.



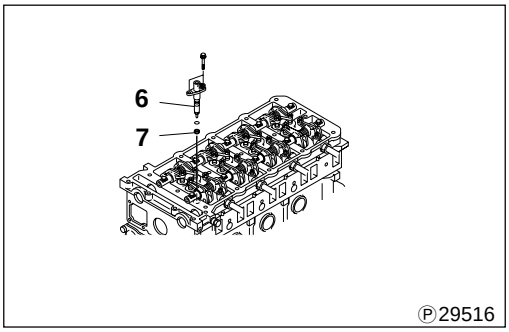
- Remove the fuel cut motor fuse **2** from the fuse box **1** in the cab to make sure that the fuel is not injected when the engine is cranked by the starter.



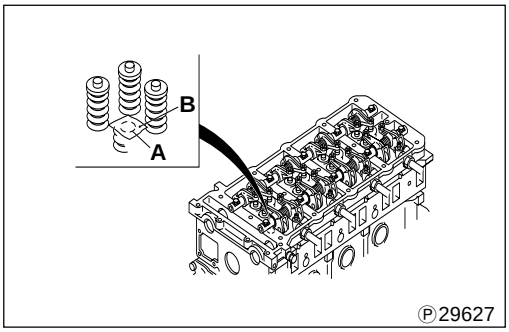
- Tilt the cab.



- Remove the rocker cover **3**, fuel leak-off pipe **4** and injection pipe **5**.
  P11A-24



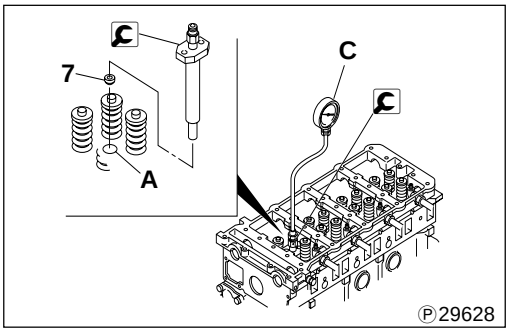
- Remove all glow plugs.
  P11A-38



- Cover the glow plug mounting holes with pieces of waste cloth **B**. After cranking the engine by the starter, check to ensure that no foreign substances are deposited on the waste cloth.

WARNING ⚠

If there is a crack in any of the cylinders, some of the coolant, engine oil, fuel, etc. will enter the cylinder through the crack. If the engine is cranked in such a condition, these substances heated to high temperatures will blow out from glow plug holes A and can be very dangerous. When the engine is cranked, therefore, stay away from the glow plug holes.



- Fit the glow plug adapter for the 🔧 Compression Gauge onto the glow plug mounting hole **A** and mount the compression gauge **C**.
- Crank the engine and measure the compression pressure.
- On all of the cylinders, measure the compression pressure and determine the pressure difference between cylinders.
- If any compression pressure or cylinder-to-cylinder pressure difference is out of the limits, pour in a small amount of engine oil into glow plug mounting hole **A** and check by measuring the compression pressure again.
  - If the compression pressure increases:
    Worn/damaged piston rings and cylinder inner surfaces are suspected.
  - If the compression pressure remains unchanged:
    A seized valve, incorrectly seated valve or defective cylinder head gasket is suspected.

ON-VEHICLE INSPECTION AND ADJUSTMENT

Inspecting and Adjusting Valve Clearances

Service standards

Unit: mm {in.}

Location	Maintenance item		Standard value	Limit	Remedy
–	Valve clearance (when cold)	Inlet	0.4 {0.016}	–	Adjust
		Exhaust	0.5 {0.020}	–	Adjust

Tightening torques

Unit: N·m {ft.lbs, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
2	Lock nut (adjusting screw tightening)	11.2 {8.25, 1.14}	–

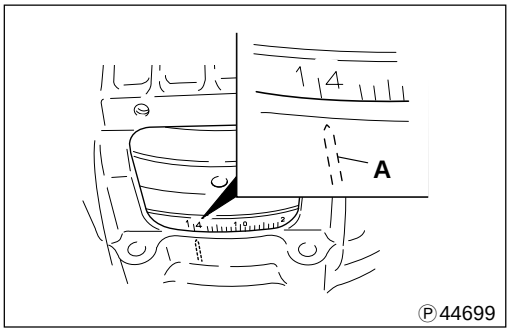
Special tools

Location	Tool name and shape	Part No.	Application
–	Cranking handle Ⓟ45041	MH063568 < without refrigerator > MH063569 < with refrigerator >	Turning fan pulley

Valve clearances should be checked and adjusted as follows while the engine is cold.

[Inspection]

- Tilt the cab.
- Remove the rocker cover. P11A-24
- To place the piston No. 1 or No. 4 at the top dead center on the compression stroke, crank the engine until the pointer **A** in the converter housing (on automatic transmission) inspection window is aligned with the mark between "**1** and **4**" inscribed in the flywheel.

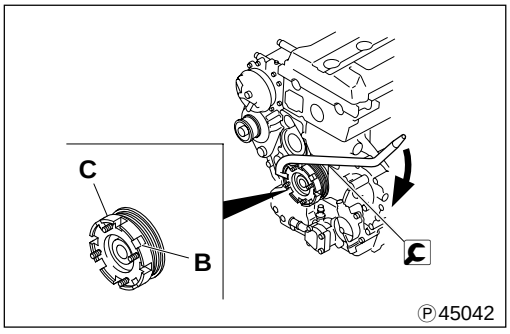


Ⓟ44699

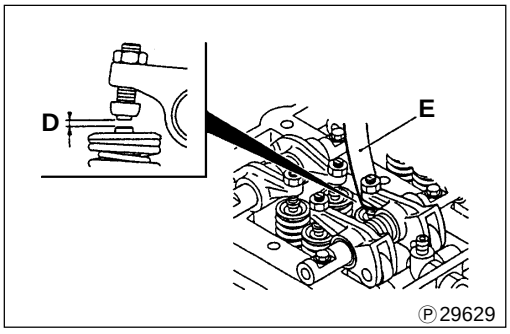
NOTE

Find the cylinder where the rocker arms for both the inlet and exhaust valves can be pushed down. The piston of the cylinder is at the top dead center (TDC) on the compression stroke.

- Use the cranking handle to crank the engine: set it in the groove **B** located on the outer circumference of the fan pulley **C** to turn the crank shaft.



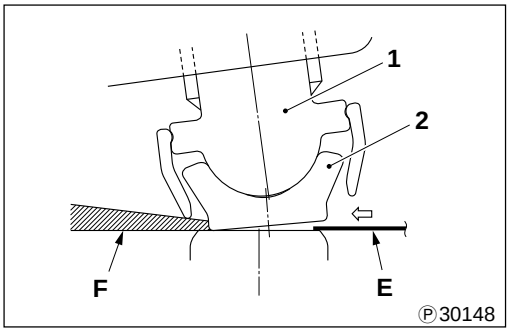
Ⓟ45042



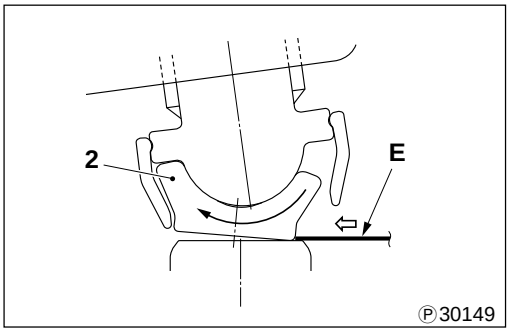
Ⓟ29629

- With the piston No. 1 or No. 4 at the top dead center (TDC) on the compression stroke, measure the valve clearance **D** at the valves marked × in the following table.

Cylinder No.	1		2		3		4	
Valve arrangement	IN	EXH	IN	EXH	IN	EXH	IN	EXH
Piston No. 1 at TDC on compression stroke	×	×	×	–	–	×	–	–
Piston No. 4 at TDC on compression stroke	–	–	–	×	×	–	×	×



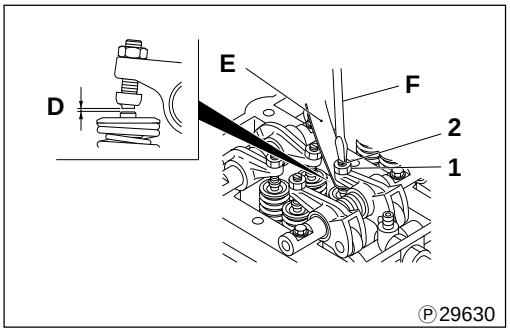
- When measuring the clearances, push the pad **2** of the adjusting screw **1** with the tip of a plain screwdriver **F** or something else from opposite the side where the feeler gauge **E** is to be inserted to open a gap as illustrated, then insert the feeler gauge in the gap.



- If an attempt is made to insert a feeler gauge **E** without opening a gap, the pad will be tilted as illustrated, making it impossible to insert the feeler gauge.

NOTE

- **The feeler gauge E must have a slight drag when taking a measurement.**
- **If the feeler gauge moves without any resistance, the measurement is incorrect (too loose).**

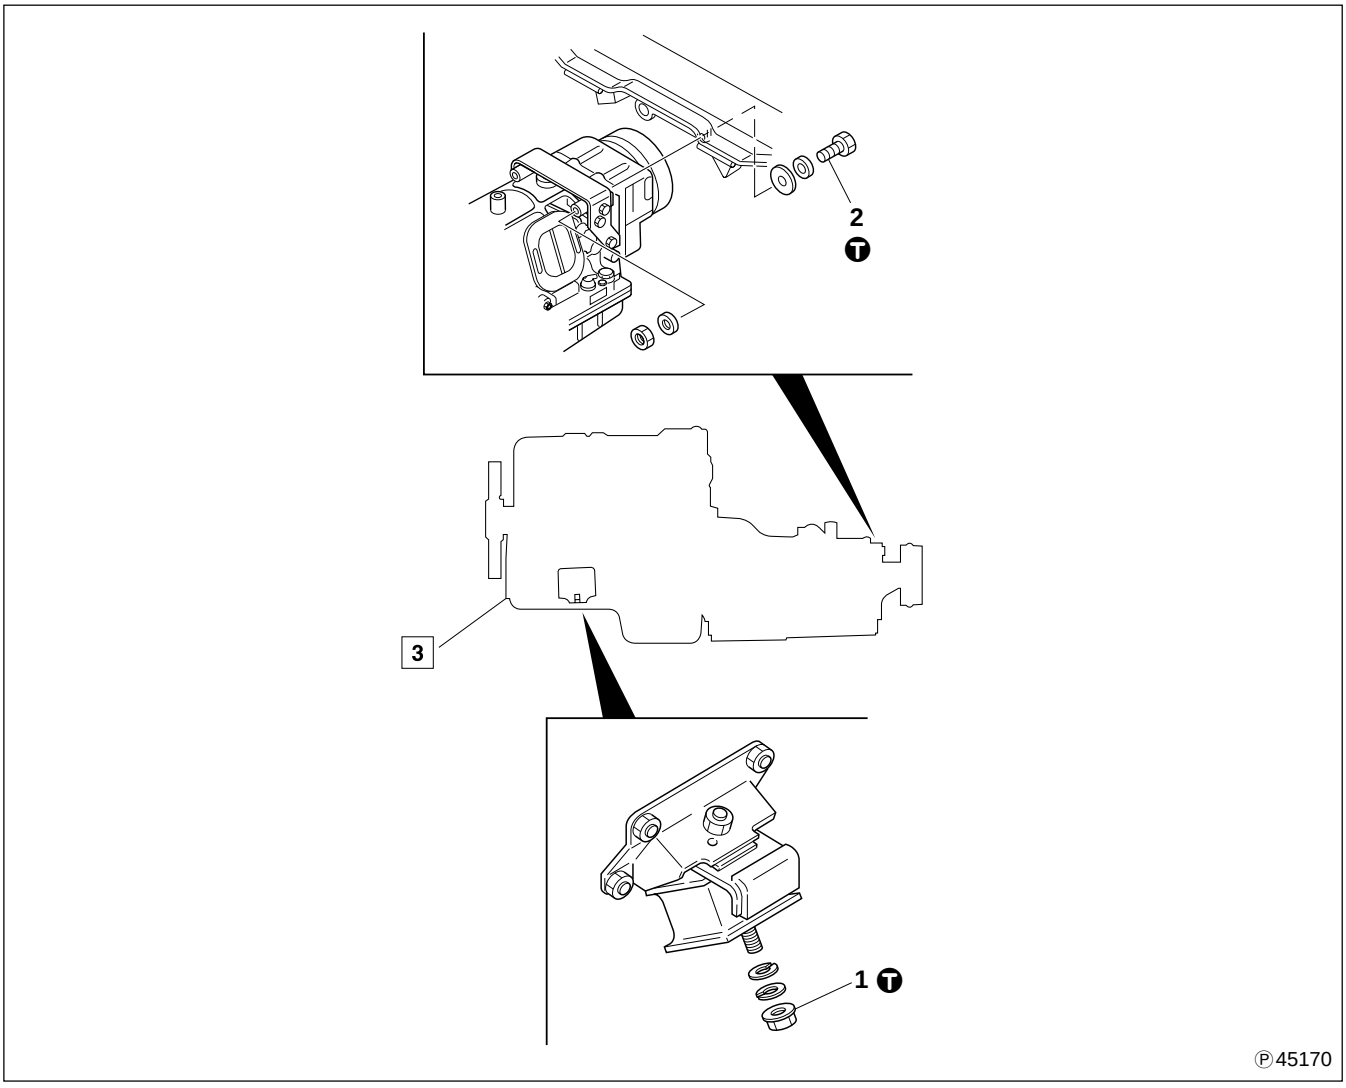


- If the reading is out of specification, adjust by the following procedures.

[Adjustment]

- To adjust the valve clearance **D**, loosen the lock nut **1** and rotate the adjusting screw **2** to adjust the clearance to the extent that the feeler gauge **E** is somewhat hard to move.
- After the adjustment, hold the adjusting screw **2** in position with a screwdriver **F** and tighten the lock nut **1** to the specified torque.
  Thereafter, re-check the valve clearance **D** with the feeler gauge **E**.

REMOVAL AND INSTALLATION OF ENGINE



● **Removal Squence**

1 Nut
2 Bolt
3 Engine and automatic transmission assembly

WARNING ⚠

When lifting the engine and automatic transmission assembly 3, be sure to use a lifting gear or engine hoist capable of lifting an engine of 3.9 to 4.7 kN {880 to 1060 lbs, 400 to 480 kg}

● **Intallation sequence**

Follow the removal sequence in reverse.

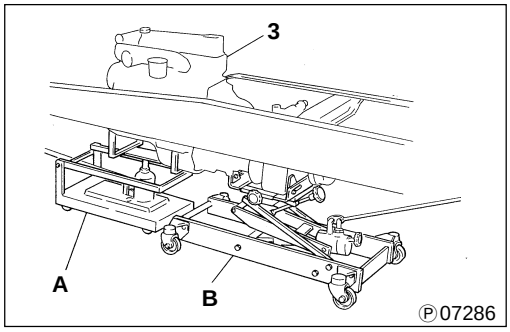
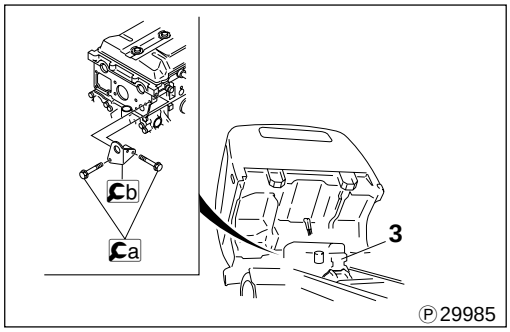
◆ Service procedure



Ⓟ07286

● **Preparatory operation for removal < Fixed cab >**

- Support engine and transmission assembly **3** on engine lifter **A** and transmission jack **B**.
- Make sure that all wiring and hoses are disconnected.



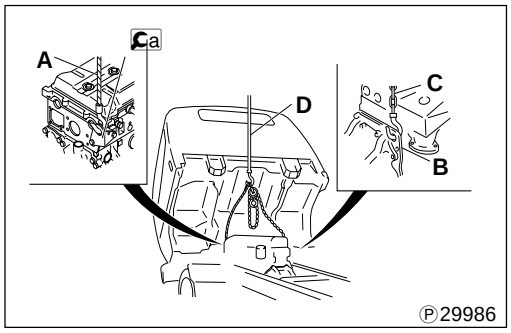
Ⓟ29985

3 **Removal of engine and transmission assembly**

< Tilt cab >

Using a flange bolts, install b engine front hanger to engine and automatic transmission assembly **3**.

REMOVAL AND INSTALLATION OF ENGINE

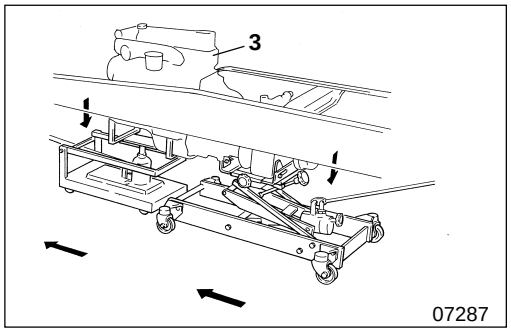


- Attach wire rope **A** to Ca engine front hanger, and chain block **C** to rear plate **B**. Use crane **D** to make the ropes taut.

WARNING ⚠

To lift engine and automatic transmission assembly 3, use hanging hardware suitable for hoisting an engine weighing 3.9 to 4.7 kN {880 to 1060 lbs, 400 to 480 kg}.

- Make sure that all wiring harnesses and pipes are disconnected.
- Slowly lift engine and automatic transmission assembly **3**, making sure that the assembly does not contact the frame or cab.



< Fixed cab >

- Lower engine and transmission assembly **3** to fullest extent keeping it horizontal.
- Lift the vehicle using a jack, and move engine and transmission assembly **3** forward.

● **Pre-disassembly inspection**

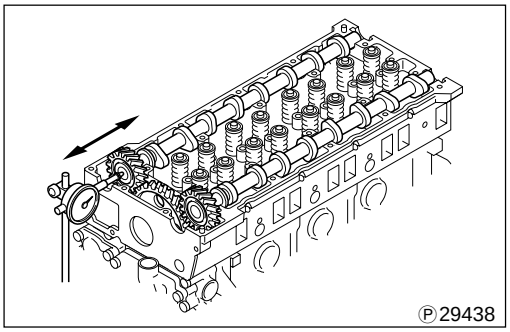
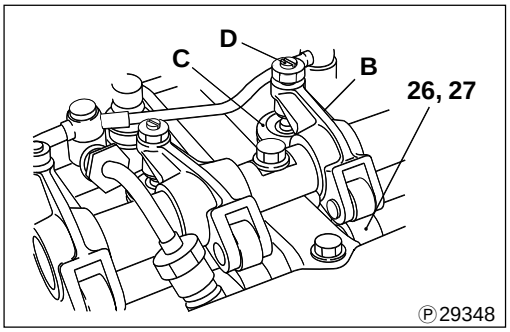
(1) Backlash between head idler gear B and camshaft gear 29 and idler gear assembly C

On a pair of gears, measure backlash at more than three positions. If the reading is more than the limit, replace defective parts.



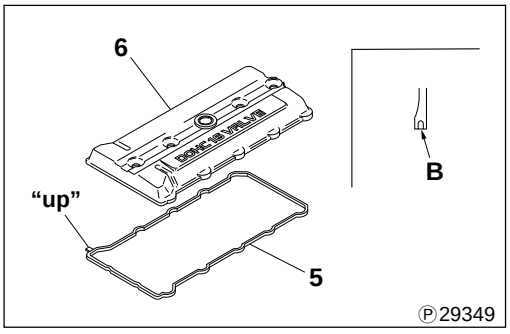
(2) End play of camshaft

If the reading is more than the limit, replace defective parts.



● **Pre-disassembly work**

If the rocker **B** forced up by the camshaft **26** or **27** is pressing the valve spring **C** down, loosen the adjusting screw **D** of the rocker to set the valve spring free.



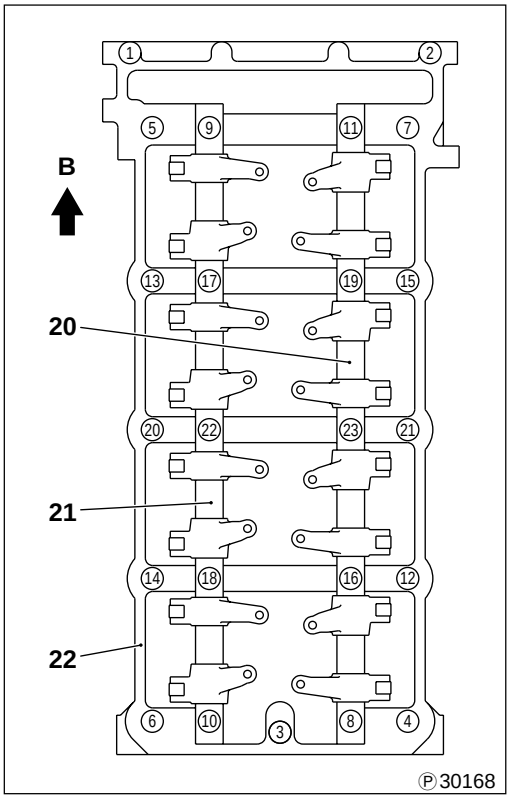
◆ Service procedure

5 **6** **Installation of rocker cover and rocker cover gasket**

- Before installing the rocker cover **6**, remove oil and other deposits thoroughly from the gasket groove **B**.
- Face the rocker cover gasket **5** as illustrated when it is installed on the rocker cover **6**.

CAUTION ⚠

Make sure that the rocker cover gasket 5 is not twisted when installed.

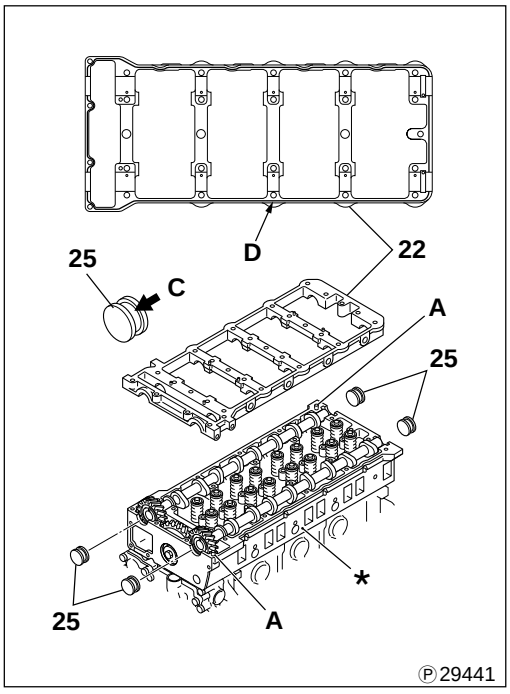


20 to **22** , **25** **Rocker shaft assemblies, camshaft frame and packing**

[Removal]

Loosen the bolts **18** and **19** (① through ㉓) one after another, a small amount at a time, in the numbered sequence shown in the illustration. Then remove the rocker shaft assemblies **20** and **21** and the camshaft frame **22**.

B : Front of engine



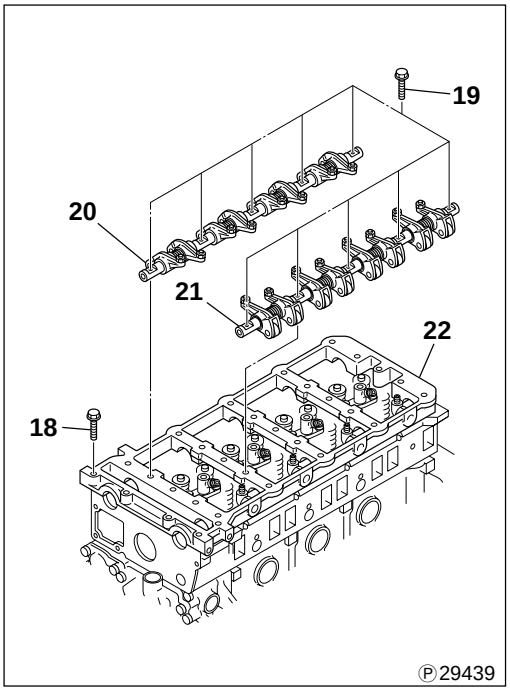
[Installation]

- Apply an even bead of sealant (ϕ 2 ± 1 mm {ϕ 0.079 ± 0.039}) without any break to all around the illustrated portion **C** of the four packings **25**.
- Apply an even bead of sealant (ϕ 1 mm {0.039}) without any break on the circumference **D** of the camshaft frame **22**.
- After the sealant application, install the camshaft frame **22** and the packings **25** on the cylinder head assembly * in less than three minutes.

CAUTION ⚠

- **Check to ensure that the sealant application surfaces C and D are clean and free from any oil or other deposits.**
- **When installing the parts, make sure that the sealant is not forced out of position.**
- **Do not start the engine in less than an hour after installation.**

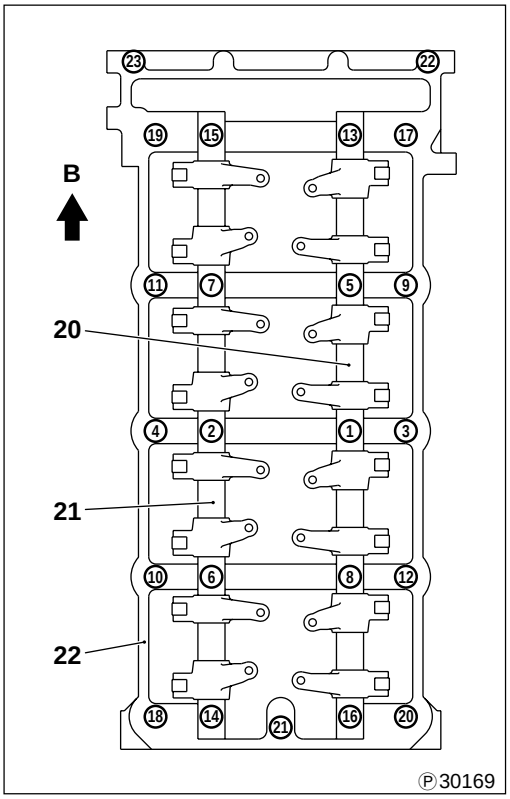
A : Locating pin



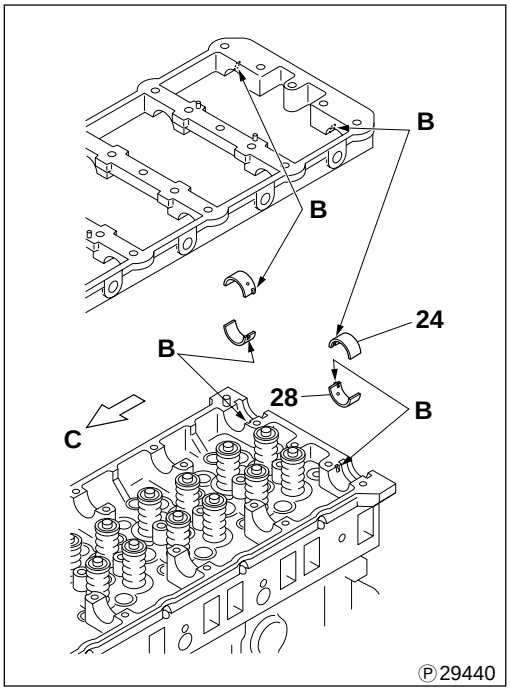
- The bolts **18** (× 13) and **19** (× 10) must be tightened in the following sequence. Therefore, secure the rocker shaft assemblies **20** and **21** together with the camshaft frame **22**.

CAUTION ⚠

When the bolts 18 and 19 were loosened or removed after installation, be sure to re-apply sealant.



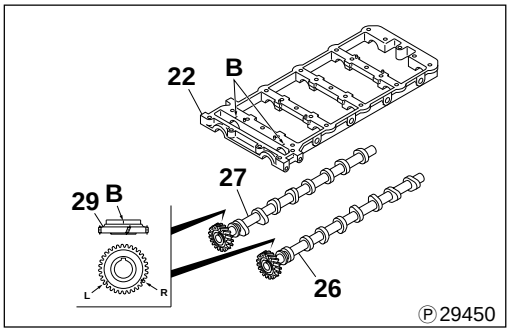
- Tighten the bolts **18** and **19** (① through ㉓) to the specified torque in the numbered sequence shown in the illustration.



24 **28** **Installation of camshaft bearings**

Be sure to fit the lugs **B** of the camshaft bearings **24** and **28** in the mating notches.

C : Front of engine

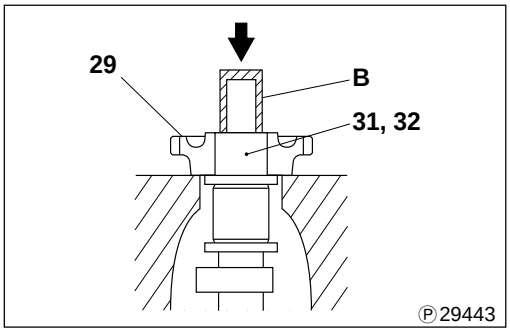


26 **27** **Installation of camshaft assemblies**

- Place the piston of No. 1 cylinder at the top dead center on the compression stroke.
- Install the camshaft assemblies **26** and **27** with the alignment marks **B** on the camshaft gear **29** and on the camshaft frame **22** in alignment.

NOTE

The alignment marks "L" and "R" on the camshaft gear 29 and those on the head idler gears need not always be in alignment, because the alignment mark of the head idler gears, depending on their mounted condition, does not always match that of the camshaft gear.



29 **Camshaft gear**

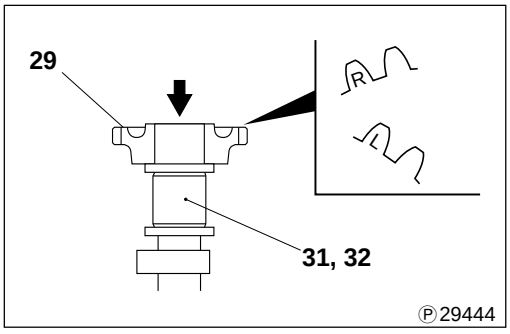
[Removal]

Remove the camshaft gear **29** by pressing the camshaft end with a press.

B : Removal block

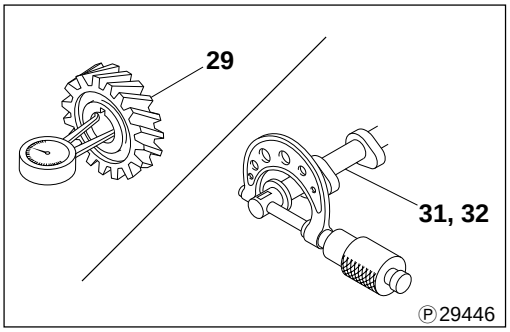
CAUTION ⚠

Never strike the camshaft gear 29 with a hammer to remove it. Be sure to use a press or a similar tool.



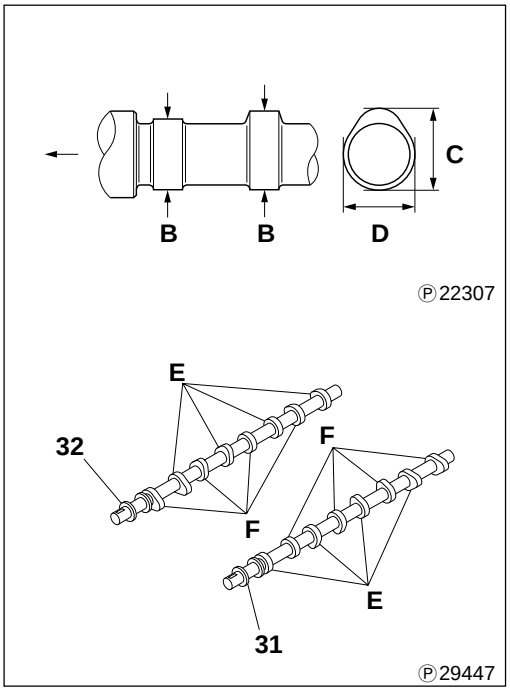
[Installation]

- Heat the camshaft gear **29** to 150 °C {302°F} by a piston heater or a similar tool and install it with the alignment mark "R" or "L" directed as shown.
- Install the camshaft gear **29** such that it is held tightly against the camshaft **31** or **32**.



29 31 32 Camshaft gear and camshaft interference

If the reading is out of the standard values, replace defective parts.



31 32 Inspection of camshafts

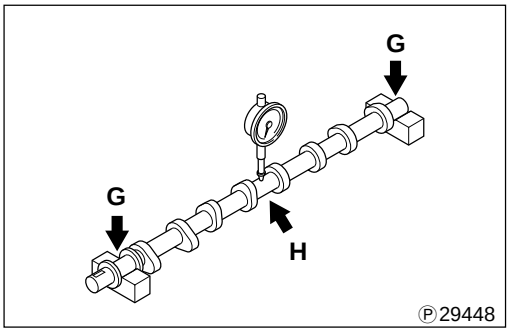
(1) Cam lift (Difference between lobe height and base circle diameter)

If the reading is less than the limit, replace the camshafts **31** and **32**.

B : Measuring position
C : Cam lobe height
D : Base circle diameter
E : Long rocker side cam
F : Short rocker side cam

NOTE

The cam dimensions are different between the long rocker side cams E and the short rocker side cams F.

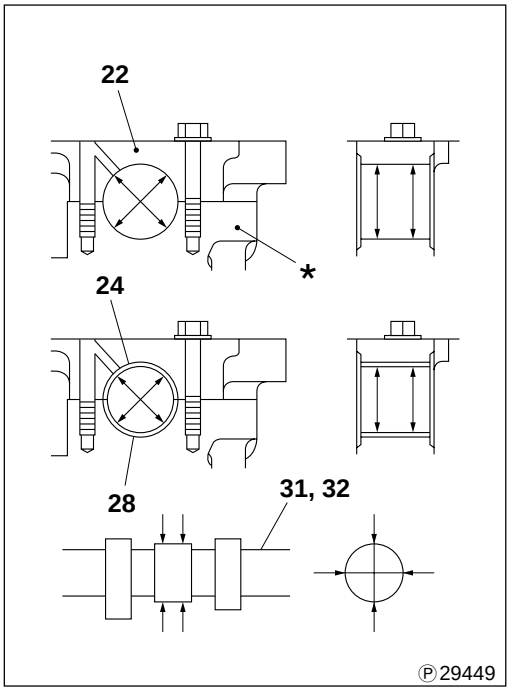


(2) Bend

Measure the bend of the camshafts **31** and **32** at the journal **H** with the journals **G** supported. If the reading is in excess of the limit, replace the camshaft.

NOTE

The bend of the camshafts 31 and 32 is one half of the reading of the dial indicator taken after turning the camshaft through a rotation.



(3) Oil clearance between journals and bearings

Measure the oil clearance. If the reading is in excess of the limit, replace defective parts.

CAUTION ⚠

If a camshaft bearing 24 or 28 is to be replaced, make sure that both upper and lower halves are simultaneously replaced as a pair.

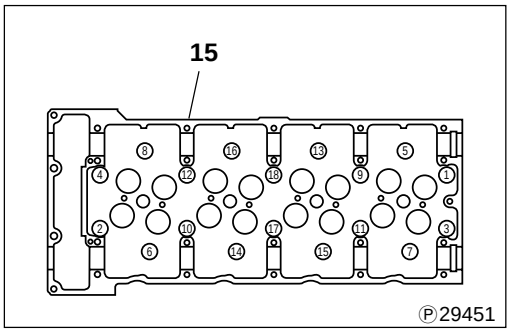
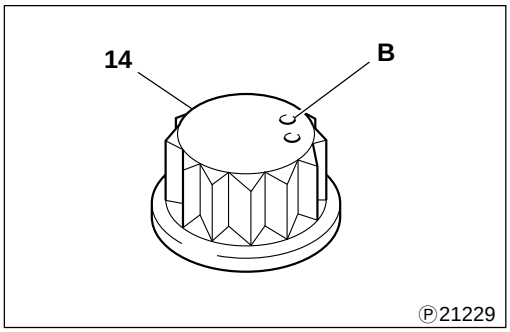
- After press-fitting, measure the clearance again. If the measurement is below the specified limit, ream the head idler gear bushing **11** to the standard value.



15 Cylinder head assembly

[Removal]

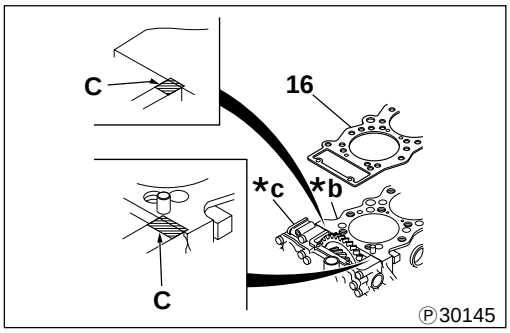
Loosen and remove the cylinder head bolts **14** in the sequence shown (① to ㉒). Each cylinder head bolt should be loosened a little at a time.



[Fitting]

CAUTION ⚠

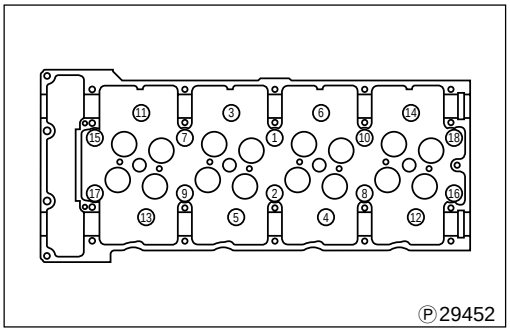
- **Before fitting any cylinder head bolt 14, check the punch marks B on its head. Do not use bolt if there are more than two punch marks.**
- **The punch marks indicate the number of times each bolt has been tightened using the torque-turn tightening method. Any bolt that already has three punch marks must be replaced.**



- Select an appropriate cylinder head gasket **16**. 📖 P11A-42
- Apply a coat of specified sealant to the upper surface **C** of the joint section between the frontcase assembly ***c** and the crankcase assembly ***b**.
- Within 3 minutes after the sealant application, install the cylinder head assembly to the crankcase assembly ***b** together with the cylinder head gasket **16**.

CAUTION ⚠

- **Check to ensure that the sealant application surface C is clean and free of oil and other foreign matter.**
- **During installation of the cylinder head assembly, use care to ensure that the sealant is kept in place.**
- **Do not start the engine for at least 1 hour after the cylinder head assembly is installed.**
- **Whenever the cylinder head bolt 14 is loosened or removed after the cylinder head assembly has been installed, always apply a fresh coat of specified lubricant.**



Ⓟ29452

- Tighten the cylinder head bolts **14** (① through ⑱) to a torque of 145 N·m {110 ft.lbs, 15 kgf·m}(wet) in the sequence shown.
  After tightening,give the bolts an additional 90 degree turn in the sequence of the numbers shown.
- After tightening the cylinder head bolts **14** using the torque-turn tightening method, make a punch mark on the head of each one to indicate the times of use.

CAUTION ⚠

Since the cylinder head bolts utilize the torque-turn tightening method, they must not be tightened further after the angular tightening procedure has been performed.

16 Cylinder head gasket

[Removal]

CAUTION ⚠

Be careful not to scratch cylinder head assembly 15, the crankcase assembly *b and the front case assembly *c when removing cylinder head gasket 16.

[Installation]

Cylinder head gasket **16** installed must be the one which can accommodate the piston projection. Select such a gasket as follows:

- Measure the piston projection at each cylinder. 🕮 P11A-66
- Select a cylinder head gasket **16** appropriate for the piston projection average value from the following table.
- If any of the piston projection measurements is more than 0.05 mm {0.002 in.} larger than the average value, then use the gasket one rank higher than that rank (**A** → **B**, **B** → **C**).

Unit: mm {in.}

Average value of piston projection	Cylinder head gasket	
	Size classification	Thickness when tightening
–0.088 to –0.027 {–0.0034 to 0.0106}	A	0.75 ± 0.03 {0.029 ± 0.0012}

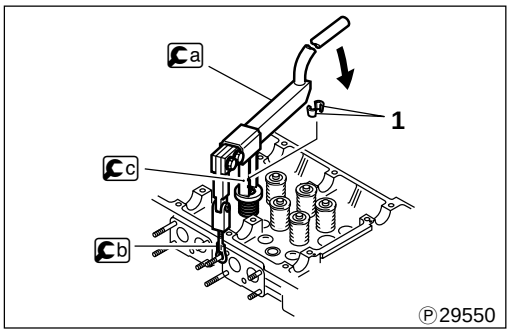
◆ Service procedures



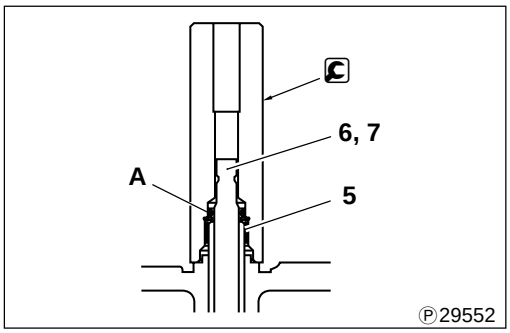
1 Valve keepers

[Removal]

To remove the valve keepers **1**, use the a Valve Lifter, b Valve Lifter Hook and c Valve Lifter Seat to evenly compress the valve springs **3**, **4**.

[Installation]

To install valve keepers, follow the removal instructions in reverse.

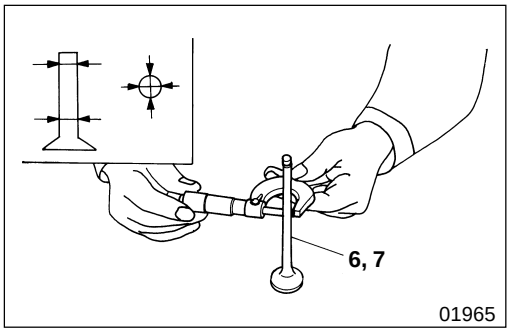


5 Installing valve stem seals

- Apply engine oil to the lip **A** of the valve stem seal **5**.
- Install the valve stem seal **5** using the Valve Stem Seal Installer.
- Strike the Valve Stem Installer until it sits snugly on the cylinder head **18**.

CAUTION ⚠

After installing the valve stem seal 5, check that its spring area is neither deformed nor damaged.



6 7 Inlet and exhaust valves

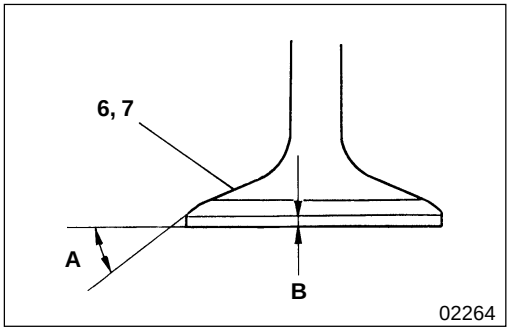
[Inspection]

(1) Valve stem outside diameter

Replace the valve **6**, **7** if its stem's outside diameter is below specification or severely worn.

CAUTION ⚠

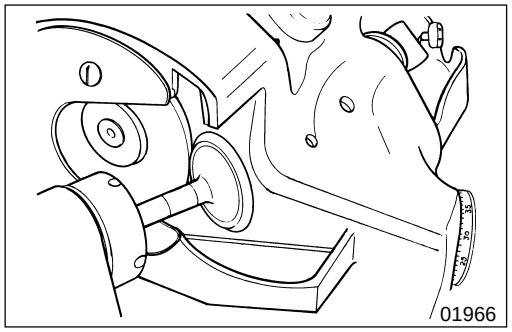
Whenever a valve 6, 7 is replaced, be sure to lap the valve and valve seat 10, 11. P11A-49



(2) Valve seat angle and valve margin

Reface or replace the valve **6**, **7** if the valve seat angle or valve margin exceeds the specified limits.

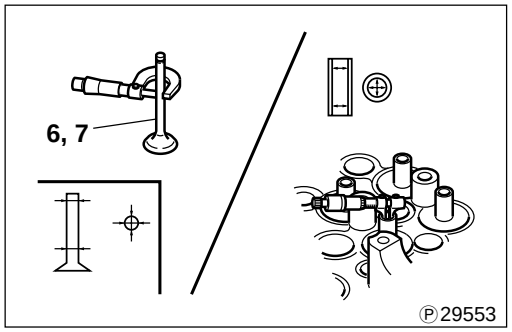
A : Valve seat angle
B : Valve margin



[Refacing]

NOTE

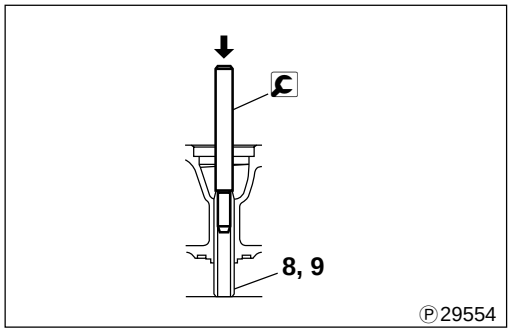
- **Keep grinding to a minimum.**
- **If the valve margin is below specification after grinding, replace the valve 6, 7.**
- **After grinding, be sure to lap the valve 6, 7 and valve seat 10, 11.** **P11A-45**



6 to 9 Valve and valve guides

[Inspection]

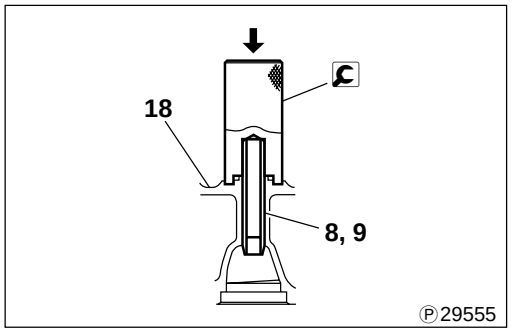
If any clearance exceeds the specified limit, replace the defective part(s).



Valve guides

[Removal]

: Valve Guide Remover

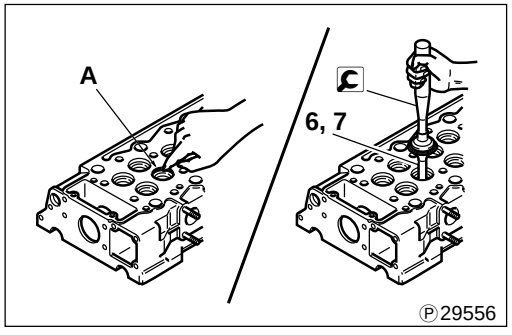


[Installation]

Using the Valve Guide Installer, install the valve guide **8**, **9** until the tool sits snugly on the cylinder head **18**.

CAUTION

- **The valve guides 8, 9 must be pressed in to the specified depth.Be sure to use the Valve Guide Installer for this operation.**
- **Exhaust valve guides 8 are longer than inlet valve guides 9.Be sure to install the correct type of guide in each location.**



6 7 10 11 Valves and valve seats

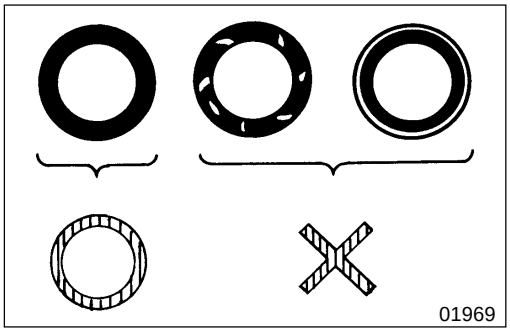
[Inspection]

- Apply an even coat of prussian blue to the valve seat **10**, **11** surface **A** that makes contact with the valve **6**, **7**.
- Strike the valve **6**, **7** against the valve seat **10**, **11** once. Do not rotate the valve during this operation.

: Valve Lapper

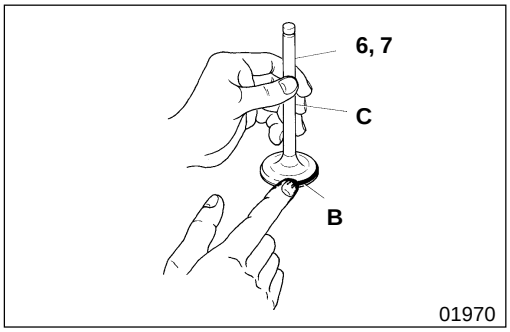
NOTE

Carry out these inspections after inspecting the valves 6, 7 and valve guides 10, 11.



- If the prussian blue deposited on the valve **6**, **7** indicates a poor contact pattern, rectify the contact pattern as follows:

Contact	Corrective action
Minor defect	Lapping
Serious defect	Reface or replace valve and valve seat



[Lapping]

Lap the valve in accordance with the following procedure:

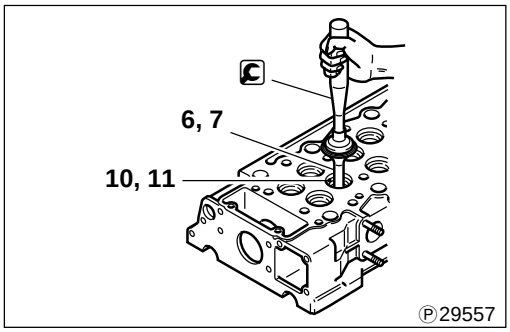
- Apply a thin, even coat of lapping compound to the surface **B** of the valve **6**, **7** that makes contact with valve seat **10**, **11**.

CAUTION ⚠

- **Ensure that no compound adheres to the stem C of the valve 6, 7.**

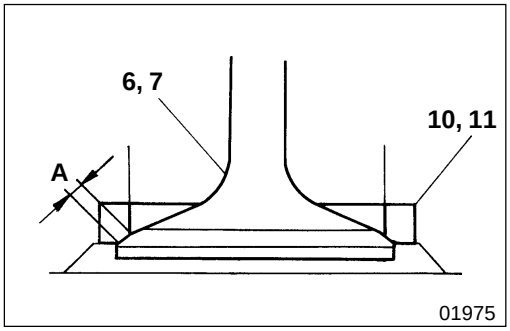
NOTE:

- **Start with intermediate-grit compound (120 to 150 grit) and finish with fine-grit compound (200 grit or more).**
- **The addition of a small amount of engine oil makes lapping compound easier to apply.**



- Strike the valve **6**, **7** against the valve seat **10**, **11** while turning it little by little.

  : Valve Lapper
- Wash away the compound with cleaning fluid.
- Apply engine oil to the contact surfaces of the valve seat **10**, **11** and rub it in so that the contact surfaces are lubricated and mate together snugly.
- Inspect the contact pattern of the valve **6**, **7** and valve seat **10**, **11** once more.
- If the contact pattern is still defective, replace the valve seat **10**, **11**.



10 **11** **Valve seats**

[Inspection]

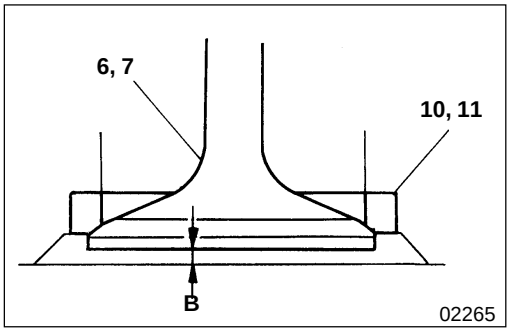
(1) Valve seat width

If the measurement exceeds the specified limit, rectify or replace the valve seat **10**, **11**.

A : Valve seat width

NOTE

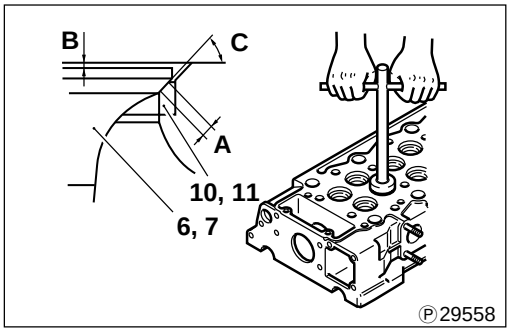
Whenever a valve seat 10, 11 is rectified or replaced, be sure to lap the valve seat and valve 6, 7.



(2) Valve sinkage from cylinder head bottom surface

If any measurement exceeds the specified limit, rectify or replace the defective part(s).

B : Valve sinkage



[Grinding]

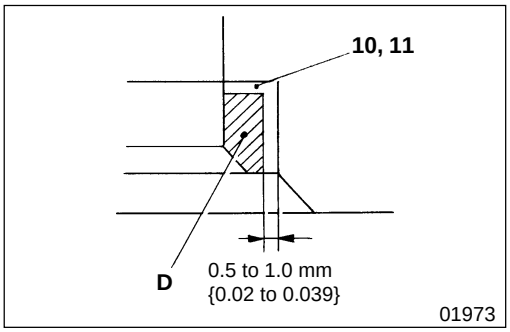
- Grind the valve seat **10**, **11** using a valve seat cutter or valve seat grinder.
- Use a 15° or 75° cutter to achieve the specified valve seat width **A** of the valve **6**, **7**.
- After grinding, put some sandpaper of around #400 grade between the cutter and valve seat and grind the valve seat lightly.

C : Valve seat angle

CAUTION ⚠

Ensure that grinding does not cause the sinkage B of the valve 6, 7 to exceed the specified limit.

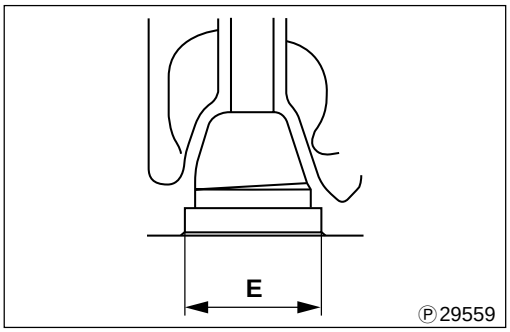
- After grinding, lap the valve **6**, **7** and valve seat **10**, **11**.
🕮 P11A-49



[Removal]

Valve seats **10**, **11** are installed by expansion fitting. To remove a valve seat, grind the inside surface to reduce its thickness, then remove the valve seat at room temperature.

D : Material to be ground

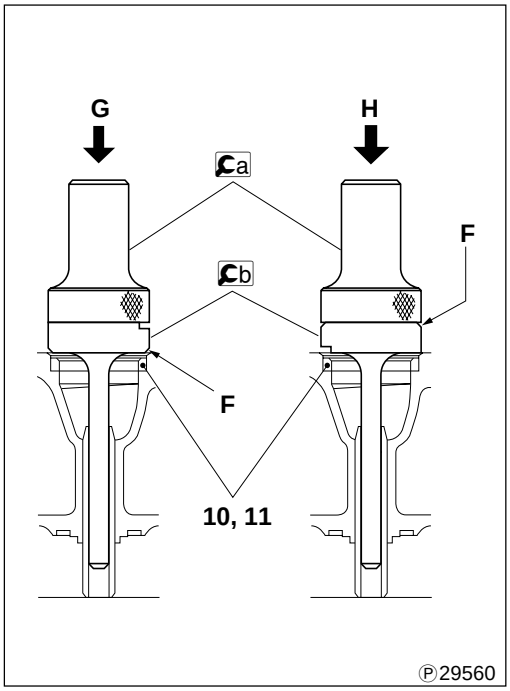


[Installation]

- Check that the valve seat hole diameter **E** in the cylinder head **18** conforms with the value shown below.

Unit: mm {in.}

	Hole diameter
Valve seat hole: **E**	$38\ ^{+0.025}_{0}$ {$1.49\ ^{+0.00098}_{0}$}



- Cool the valve seat **10**, **11** by immersing it in liquid nitrogen.
- Install the valve seat **10**, **11** in the cylinder head **18** using the a Caulking Tool Body and the b Caulking Ring.

CAUTION ⚠

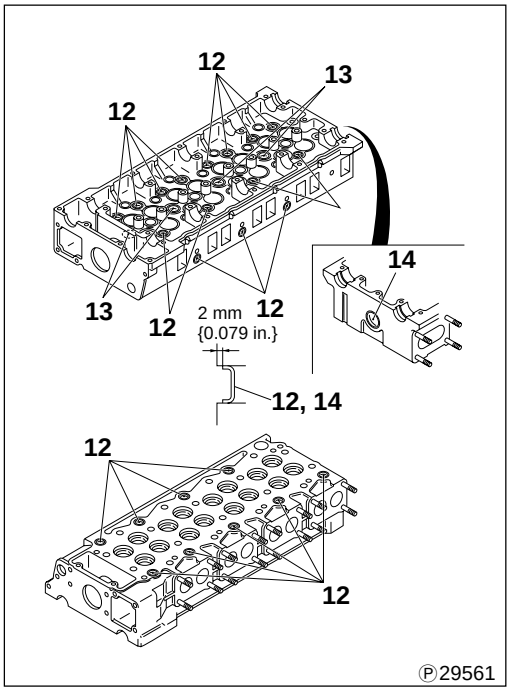
- **For installation, the chamfered side F of the b Caulking Ring must be against the valve seat 10, 11.**

G : Configuration for installation

- Invert the b Caulking Ring such that its chamfered side **F** is against the a Caulking Tool Body, then caulk the valve seat **10**, **11**.

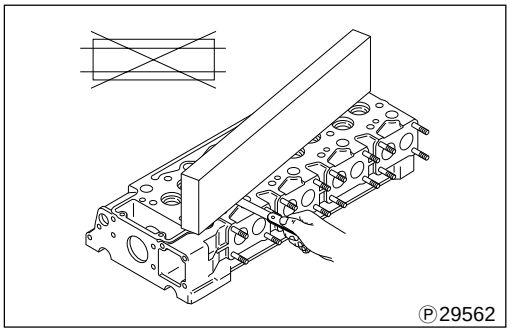
H : Configuration for caulking

- After installing the valve seat **10**, **11**, lap the valve seat and valve **6**, **7**. P11A-49



12 to 14 Installing sealing cup plugs

Drive the sealing cups **12** to **14** in the cylinder head **18** until the specified depth is reached.



18 Inspecting cylinder head

Measure the extent of distortion in the cylinder head **18** bottom surface. If the degree of distortion exceeds the specified limit, rectify the distortion with a surface grinder.

CAUTION ⚠

Ensure that grinding does not cause the cylinder head 18 top surface-to-bottom surface distance to fall below the specified limit.

◆ Service procedure

21 Installation of vacuum pump assembly

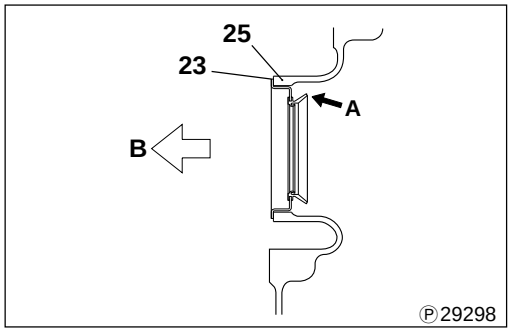
The vacuum pump assembly **21** serves also to position the balance shaft assembly LH ***c**. For this reason, before the assembly is installed, the balance shaft assembly must be kept in the right position by the following procedure.

- Place the piston of cylinder No. 1 at the top dead center on the compression stroke.
- Remove plug **A** from the upper crankcase ***b**.
- Insert a screwdriver into the hole from which the plug **A** was removed until it slightly touches the balance shaft assembly LH ***c**.

CAUTION ⚠

Be sure not to force the screwdriver in, as there is danger of damage to the No. 1 journal of the balance shaft assembly LH *c.

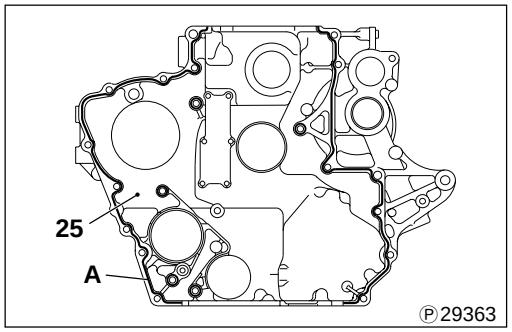
- Slowly rotate the balance shaft assembly LH ***c** to align the tip of the screwdriver with the shaft support hole **B** in the No. 1 journal of the balance shaft.
- Supporting the balance shaft by inserting the screwdriver in the hole, install the vacuum pump assembly **21**.
- After the installation, remove the screwdriver.



23 **Installation of front oil seal**

Install the front oil seal **23** on the front case **25** in the illustrated direction after applying engine oil to the lip **A**.

B : Front of vehicle

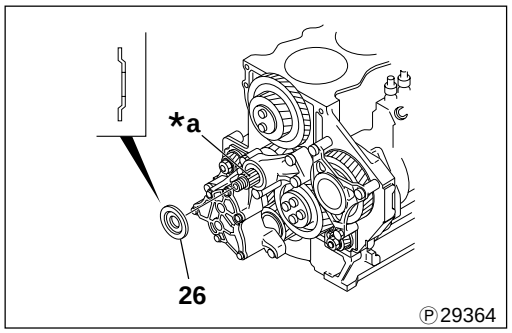


25 **Installation of front case**

- Apply sealant **A** evenly without any break to the mounting surface of the front case **25** as shown. (Approximately ϕ 1 mm {ϕ 0.0393})
- After application of sealant **A**, install the front case **25** in less than three minutes.

CAUTION ⚠

- **Check to ensure that the sealant application surface is clean and free from any oil and other deposits.**
- **When installing the parts, make sure that the sealant is not forced out of position.**
- **Do not start the engine less than an hour after installation.**
- **If the mounting bolts were loosened or removed after installation of the front case 25, be sure to re-apply sealant A.**



26 **Installation of front oil seal slinger**

Install the front oil seal slinger **26** on the fan shaft assembly ***a** in the illustrated direction.

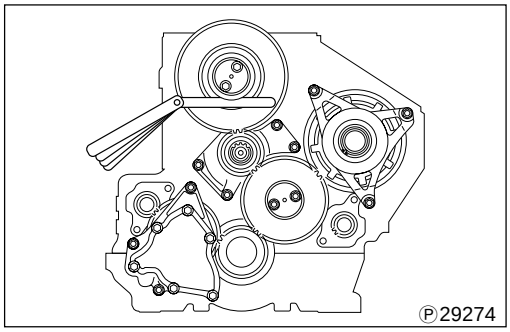
◆ Service procedure

● **Pre-disassembly inspection**

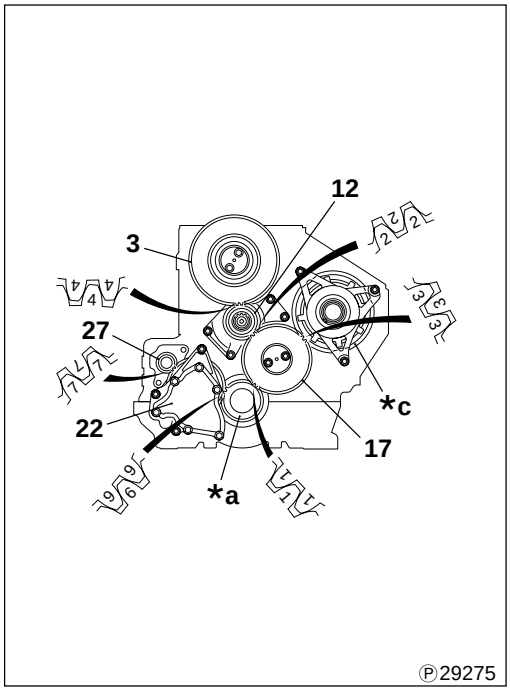
(1) Backlash between gears

On a pair of gears, measure backlash at more than three positions. If the reading is more than the limit, replace defective parts.



(2) End play of each gear and shaft

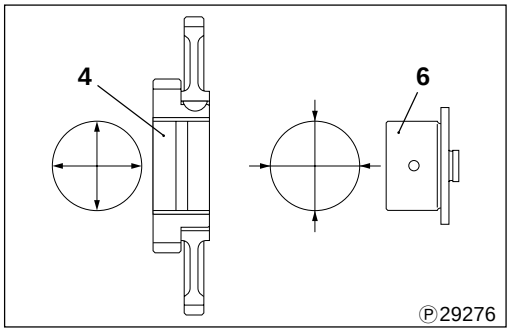
If the reading is more than the limit, replace defective parts.



3 12 17 22 Installation of timing gears

Install the timing gears in the following sequence.

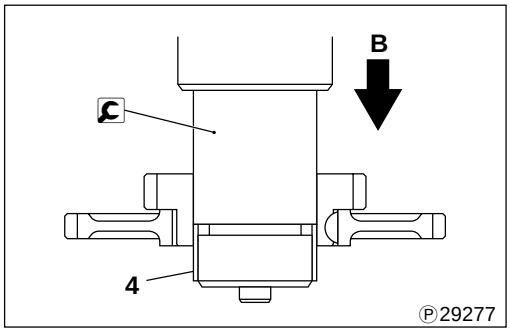
- Place the piston of No. 1 cylinder at the top dead center to position the crankshaft gear ***a**.
- Install the gear of the oil pump assembly **22** while aligning the alignment marks "**6**" and "**7**" with those on the crankshaft gear ***a** and balance shaft gear RH **27**, respectively.
- Install No. 1 idler gear assembly **17** while aligning the alignment marks "**1**" and "**3**" with those on the crankshaft gear ***a** and injection pump gear ***c**, respectively.
- Install the fan shaft assembly **12** while aligning the alignment mark "**2**" with that of No. 1 idler gear assembly **17**.
- Install the idler gear assembly **3** while aligning the alignment mark "**4**" with that of the fan shaft assembly **12**.



4 6 Idler gear bushing and idler shaft

[Inspection]

If the reading is more than the limit, replace defective parts.

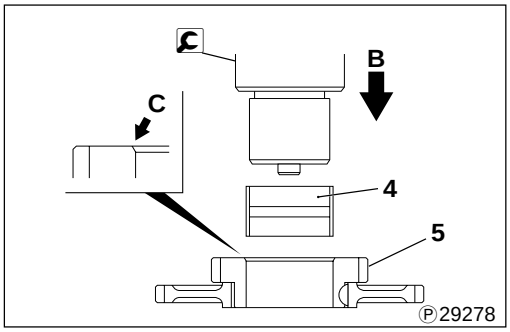


Idler gear bushing

[Removal]

B : Press

**: Idler Gear Bushing Puller

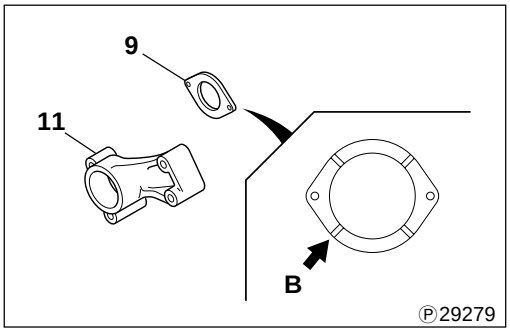


[Installation]

- Face the idler gear **5** in the illustrated direction. Using 🔧 Idler Gear Bushing Puller, press-fit the idler gear bushing **4** into the idler gear up to the chamfered portion **C**.

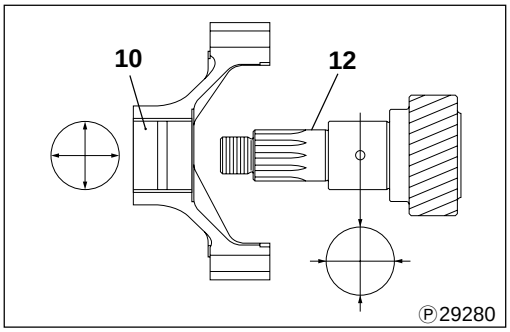
  B : Press

- After press-fitting the bushing, re-measure the clearance. If the reading is less than the standard limits, ream the idler gear bushing **4** until the clearance falls within the standard limits.



9 **Installation of thrust plate**

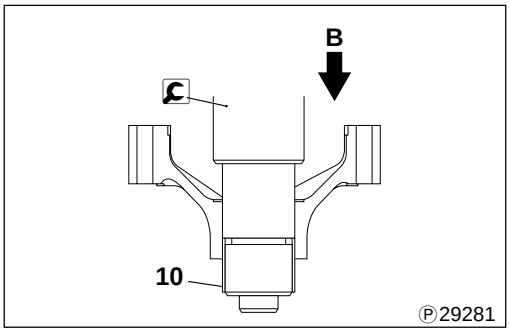
Install the thrust plate **9** with that side which does not have oil grooves **B** toward the fan shaft case **11**.



10 **12** **Fan shaft case bushing and fan shaft assembly**

[Inspection]

If the clearance is more than the limit, replace defective parts.

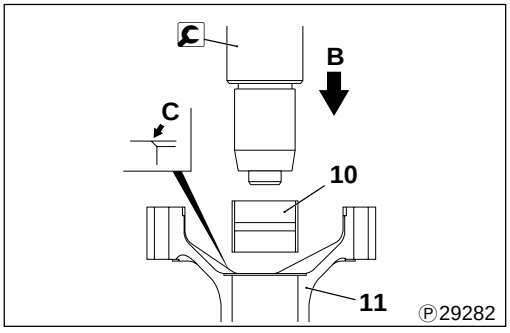


Fan shaft case bushing

[Removal]

B : Press

🔧 **:** Idler Gear Bushing Puller

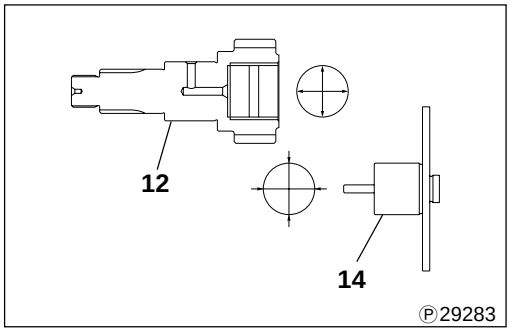


[Installation]

- Face the fan shaft case in the illustrated direction. Using 🔧 Idler Gear Bushing Installer, press-fit the fan shaft case bushing up to the chamfered portion **C** of the fan shaft case.

  B : Press

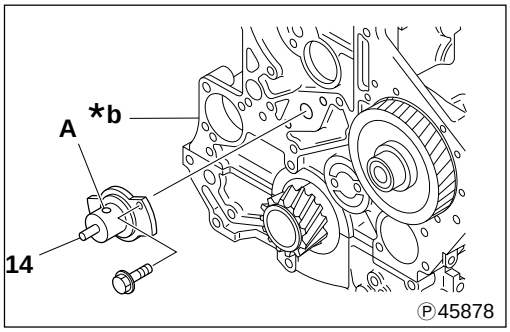
- After press-fitting the bushing, re-measure the clearance. If the reading is less than the standard limits, ream the fan shaft case bushing **10** until the clearance falls within the standard limits.



12 **14** **Fan shaft assembly and fan gear shaft**

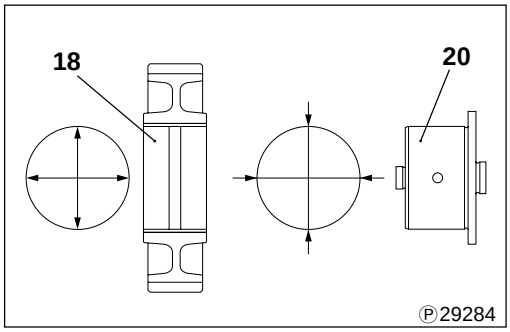
[Inspection]

If the clearance is more than the limit, replace defective parts.



14 **Installation of fan gear shaft**

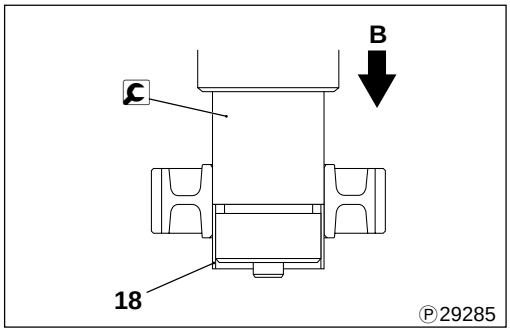
With oil hole **A** in fan gear shaft **14** facing up, install the fan gear shaft to upper crankcase ***b**.



18 **20** **No. 1 idler gear bushing and No. 1 idler shaft**

[Inspection]

If the clearance is more than the limit, replace defective parts.

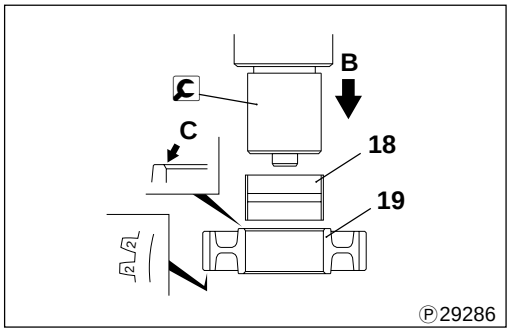


Idler gear bushing

[Removal]

B : Press

: Idler Gear Bushing Installer

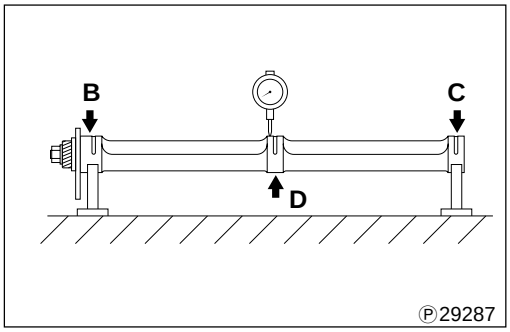


[Installation]

- Face the No. 1 idler gear **19** in the illustrated direction. Using Idler Gear Bushing Installer, press-fit the idler gear bushing up to the chamfered portion **C** of the No. 1 idler gear.

  B : Press

- After press-fitting the bushing, re-measure the clearance. If the reading is less than the standard limits, ream the No. 1 idler gear bushing **18** until the clearance falls within the standard limits.



25 **33** **Balance shaft assembly**

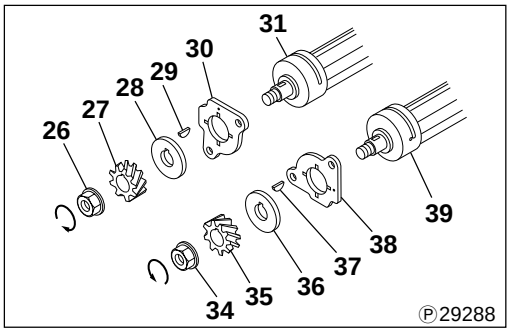
[Inspection]

- Check the balance shaft assemblies RH **25** and LH **33** for bend.
- Measure the balance shaft bend at No. 2 journal **D** while supporting the shaft at No. 1 journal **B** and No. 3 journal **C**.

NOTE

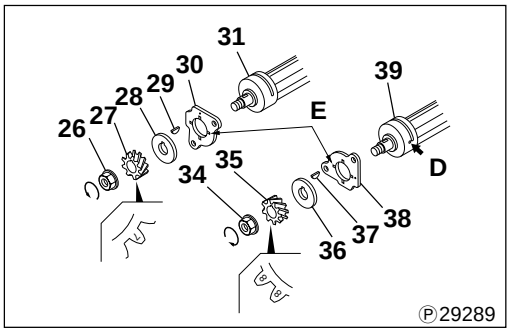
The bend of the balance shaft assemblies RH 25 and LH 33 is one half of the reading of the dial indicator taken after turning the balance shaft assembly through a rotation.

- If the reading exceeds the limit, disassemble the balance shaft assembly RH **25**, LH **33**, and replace the balance shaft RH **31**, LH **39**.



[Disassembly]

- The nut **26** of the balance shaft RH **31** and the nut **34** of the balance shaft LH **39** are different in the thread cutting direction.
- Remove the nut **26** by turning counter-clockwise. Remove the nut **34** by turning clockwise.



[Assembly]

- Of the balance shaft RH **31** and LH **39**, one with a shaft support hole **D** (ϕ 5 mm {ϕ 0.2 in.}) in No. 1 journal is the balance shaft LH **39**.
- Install the thrust plates **30** and **38** in the illustrated direction.

  E : Oil groove
- Install the balance shaft gears RH **27** and LH **35** in the illustrated direction.
- Install the nut **26** by turning clockwise. Install the nut **34** by turning counter-clockwise.

[Installation]

- The installation position of the balance shaft assembly RH **25** is determined by the gears being put in mesh when the oil pump assembly **22** is installed. P11A-60
- The balance shaft assembly LH **33** is not brought in mesh with any gear until when the vacuum pump assembly is installed with the front case attached. Therefore, the following steps must be performed before installation.
  - Remove the plug **G** from the upper crankcase ***b**.
  - Insert a screwdriver in the hole from which the plug **G** was removed and into the shaft support hole **E** (ϕ 5 mm {ϕ 0.2 in.}) provided in the No. 1 journal **B** of the balance shaft assembly LH **33** to support the balance shaft assembly.
  - Align the alignment marks of all the timing gears. P11A-60
  - By so doing, the balance shaft assembly LH **33** can be positioned. Keep it in position until the vacuum pump assembly is installed (P11A-53).

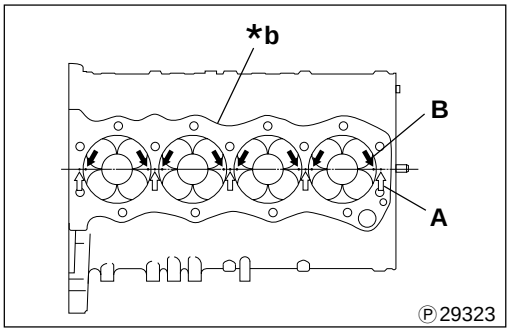
◆ Service procedure

● **Pre-disassembly inspection**

CAUTION ⚠

The cylinder liners 6 may be forced out if the upper crankcase *b is turned over or if the crankshaft assembly *a is rotated with the pistons inserted. Before beginning with inspection procedures, be sure to hold each cylinder liner at its flange section using a washer A or a similar tool.

PISTONS, CONNECTING RODS AND CYLINDER LINERS



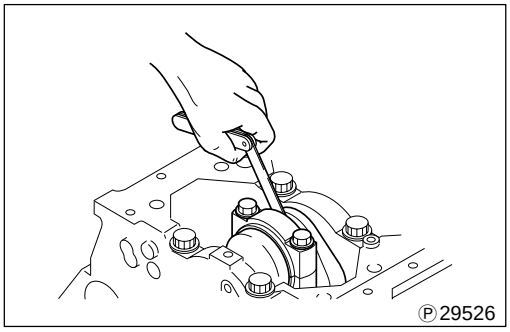
(1) Piston protrusion from crankcase top surface

NOTE

The piston protrusion affects engine performance and must therefore be checked.

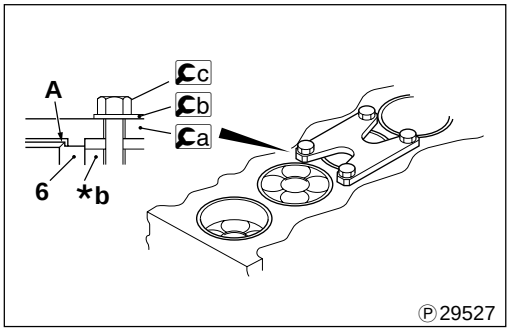
- Set the piston at top dead center.
- Make standard points **A** (five points) on upper crankcase assembly ***b** the 0 (zero) point and measure any protrusion relative to this point.
- Measure at four points on each piston at the nearest standard point from the zero point and produce the average value.

  B : Measurement point (16 points)
- If the average value is out of specification, check the clearances between all relevant parts.



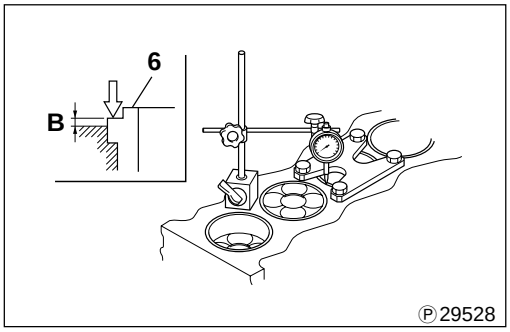
(2) Connecting rod end play

- Measure the end play every connecting rod.
- If any measurement exceeds the specified limit, replace the defective part (s).



(3) Cylinder liner flange protrusion amount and its difference between adjacent cylinders.

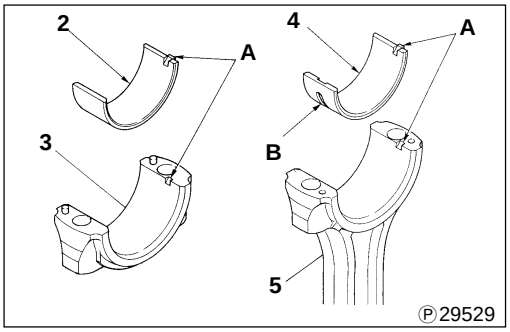
- Install the a Adapter on the upper crankcase in such a way that it may not ride on the flange **A** of the cylinder liner **6** and secure it by tightening the b Washer and c Bolt to a torque of 49 N·m {36 ft.lbs, 5 kgf·m}.



- Measure the protrusion amount **B** of flange of the cylinder liners **6**.
- If the measurement is out of specification, replace the defective part(s).
- Calculate the differences of the protrusion amounts between adjacent cylinders. If any difference is out of specification, check the mounting condition of the liners and replace the defective part(s).

CAUTION ⚠

If the cylinder liner 6 flange protrusion is insufficient, bearing pressure on the cylinder head gasket will be too low in the region of the bore, possibly causing gas to leak.



2 4 Connecting rod bearings

[Installation]

Fit the lower connecting rod bearing **2** into the connecting rod cap **3**, and fit the upper connecting rod bearing **4** into the piston and connecting rod assembly **5.** Make sure the lugs **A** on the bearings are fitted into their respective grooves.

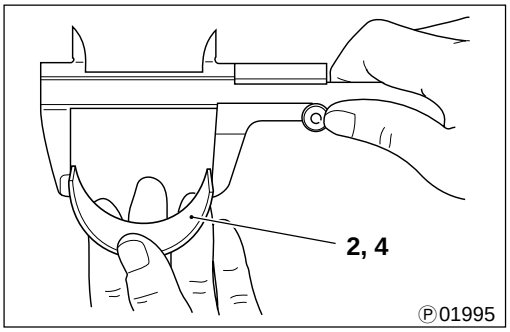
CAUTION ⚠

The upper connecting rod bearing 4 has an oil hole B. The lower connecting rod bearing 2 has no oil hole. Take care not to confuse the upper and lower parts.

[Inspection]

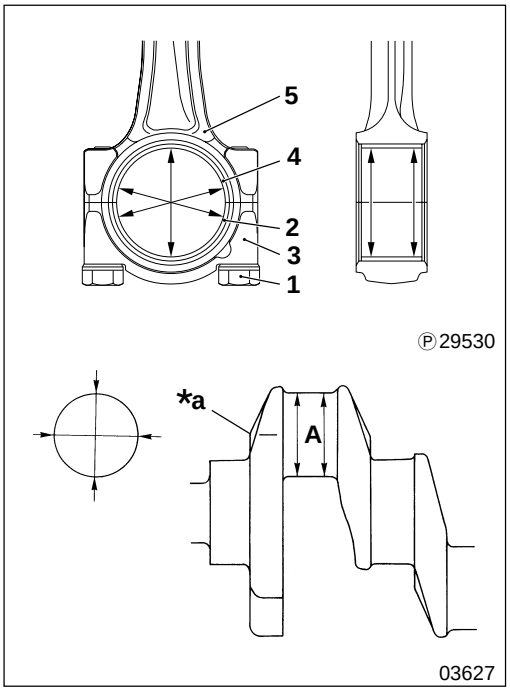
CAUTION ⚠

- **Do not attempt to manually expand a connecting rod bearing 2, 4 if its span is insufficient.**
- **Upper and lower connecting rod bearing 2,4 must be replaced as a set.**



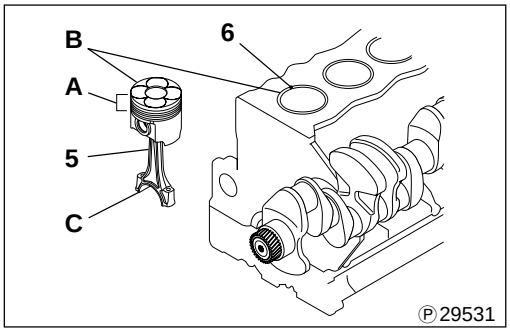
(1) Span when free

If the span is less than the specified requirement, replace the upper and lower connecting rod bearings **2**, **4** as a set.



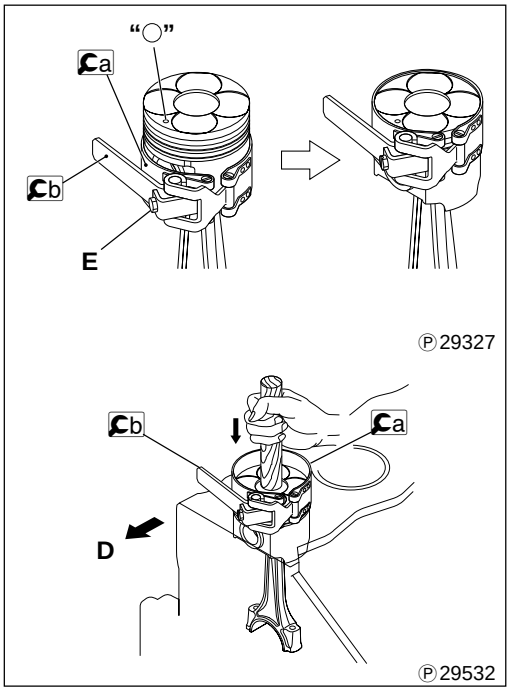
(2) Connecting rod bearing-to-crankshaft pin clearance (oil clearance)

- Fit the lower connecting rod bearing **2** into the connecting rod cap **3**, and fit the upper connecting rod bearing **4** into the piston and connecting rod assembly **5**. Then, tighten the bolts **1** to the specified torque.
- Measure the inside diameter of the connecting rod bearings **2**, **4** and the outside diameter of the crankshaft ***a** pin **A**. If the clearance exceeds the specified limit, replace the defective part(s).
- If the connecting rod bearing **2**, **4** have to be changed to undersized ones, adjust crankshaft ***a** pin outer diameter **A** in accordance with the specified procedure to fit the undersized dimensions. 🕮 P11A-86



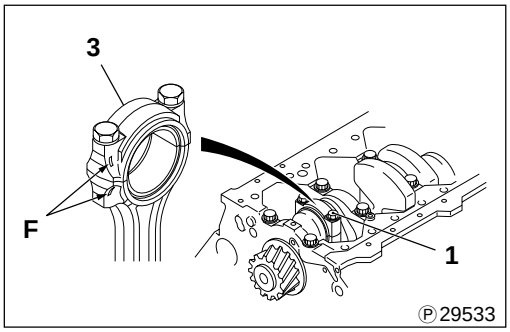
5 Installing piston and connecting rod assembly

- Ensure the gaps of the piston rings **A** remain in their correct positions. 🕮 P11A-74
- Check that the size marks **B** on the piston and cylinder liner are the same. 🕮 P11A-69
- Use care to prevent the connecting rod **C** from damaging the cylinder liner **6** and crankshaft pin.



- With the piston's front mark "○" facing the front of the engine **D**, carefully insert the piston and connecting rod assembly into the cylinder liner.
- Using the bolt **E** of the ⓑb Piston Guide Lever, adjust the inside diameter of the ⓐa Piston Guide Clamp such that it matches the piston's outside diameter.
- After adjustment, remove it from the piston and smear engine oil over the following items**:**
  - Outside of piston
  - Inside of the ⓐa Piston Guide Clamp
  - Inside of the cylinder liner

- Install piston and connecting rod assembly by tapping top of piston with wooden dowel.

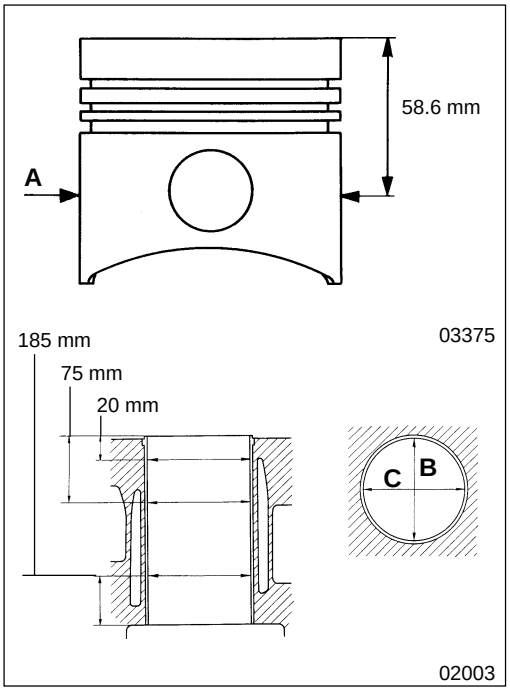


- With the piston installed, align the mating marks **F** on the connecting rod and connecting rod cap **3** and tighten the bolts **1** to the specification.
- Tighten bolts **1** alternately in the following manner.
  - First tighten to a torque of 29 N·m {22 ft.lbs, 3 kgf·m}.
  - Then tighten further 90° ± 5°.

NOTE

After installation of connecting rod cap 3, inspect the following points:

- **End play of the connecting rod: 🕮 P11A-66**
- **Piston Protrusion: 🕮 P11A-66**



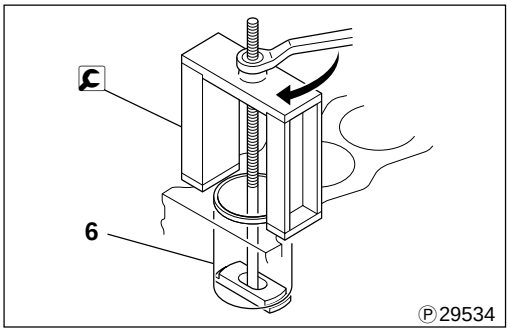
5 **6** **Piston-and-connecting rod assembly and cylinder liners**

[Inspection]

- Take measurements to determine the clearance between the piston and cylinder liner **6**.

  A : Outside diameter measurement position of piston
  B : Direction of crankshaft axis
  C : Perpendicular to crankshaft axis

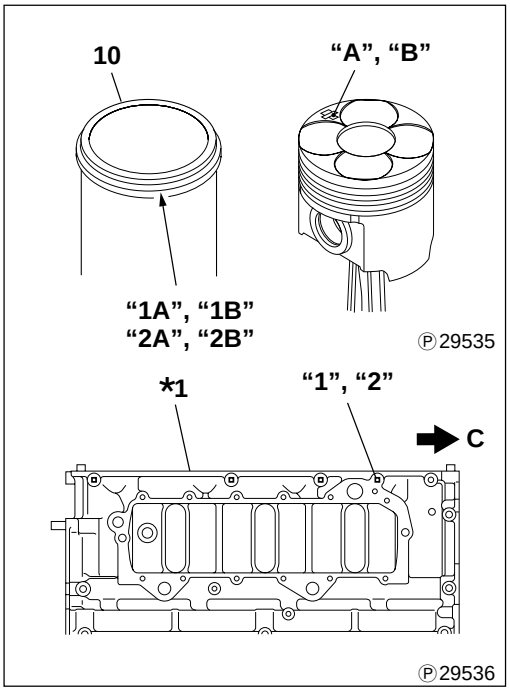
- If the clearance is out of specification, replace the defective part(s).



Cylinder liners

[Removal]

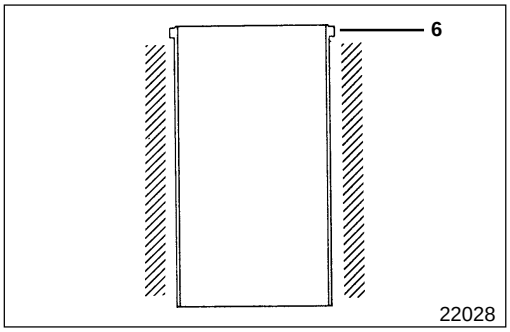
: Cylinder Liner Extractor



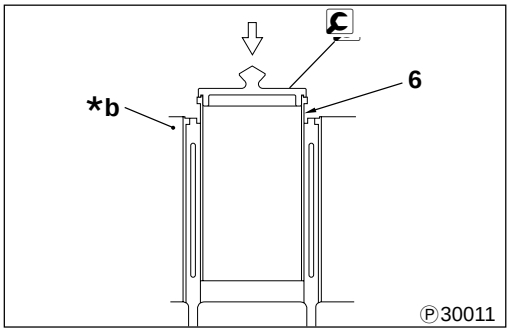
[Installation]

- Select a cylinder liner **6** which has the same size mark as those stamped on the upper crankcase ***b** and the piston.
- The size marks on the upper crankcase ***b** are arranged in the order of No. **1**, **2**, **3** and **4** cylinders starting from the engine front **C**.

Size marks on upper crankcase	Size marks on cylinder liners	Size mark on pistons
"1"	"1A"	"A"
	"1B"	
"2"	"2A"	"B"
	"2B"	



- Apply engine oil to the indicated ▨ parts of the cylinder liner **6**.



- Using the Cylinder Liner Installer, gently tap down the cylinder liner **6** until it is snugly seated on the upper crankcase ***b**.

CAUTION ⚠

The cylinder liner 6 is thin in wall thickness.
Use utmost care when handling it.

Ⓟ02020

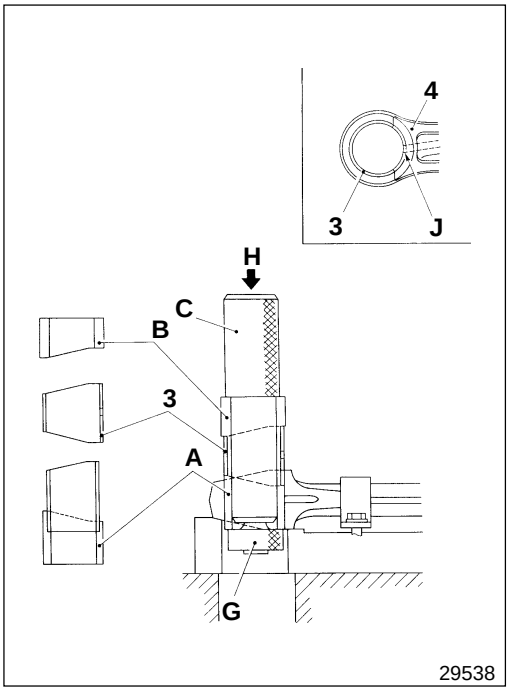
Connecting rod bushing

Replace the connecting rod bushing **3** using the Connecting Rod Bushing Puller Kit.
(Components of the Connecting Rod Bushing Puller Kit)

- **A :** Collar
- **B :** Collar
- **C :** Puller
- **D :** Base
- **E :** Bracket
- **F :** Plate
- **G :** Nut

[Removal]

- Remove the upper bearing (if fitted) from the big end of the connecting rod **4**.
- Mount the connecting rod **4** on the base **D** and lock it in position with the bracket **E** and place **F**.
- Fit the Collar **A** over the Puller **C** in the direction shown. Then, slowly apply pressure of approximately 49 kN (11020 lbf, 5,000 kgf) **H** until the connecting rod bushing **3** is pressed out.

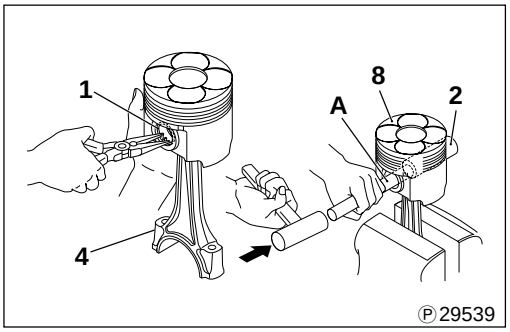


[Installation]

- Apply engine oil to the small end of the connecting rod **4** and to the outer surface of the connecting rod bushing **3**.
- Fit the Collar **B** over the Puller **C**, position the connecting rod bushing **3** and the Collar **A**, and lock this arrangement together with the Nut **G**.
- Align the oil holes **J** in the connecting rod bushing **3** and in the small end of the connecting rod **4**. Then, use a press to slowly apply pressure of approximately 49 kN (11020 lbf, 5,000 kgf) **H** until the bushing is pressed into place.
- After press-fitting the connecting rod bushing **3**, ream it to achieve the specified normal clearance between the bushing and piston pin **2**.

NOTE

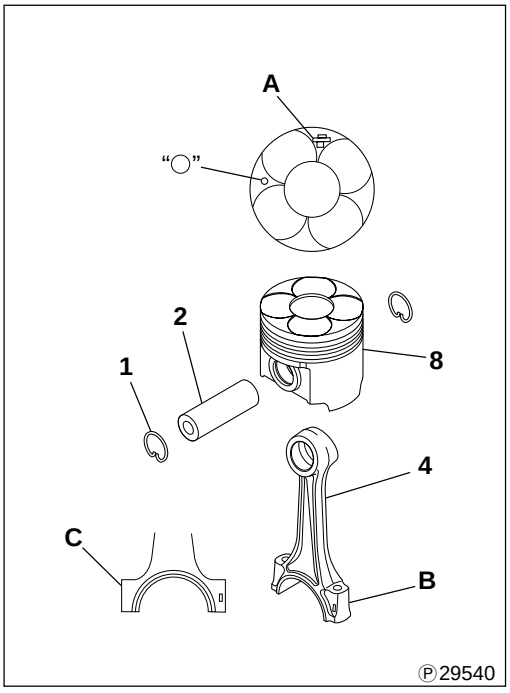
After reaming the connecting rod bushing 3, insert the piston pin 2 and check that it turns smoothly and without play.



2 | 4 | 8 Piston Pin, connecting rod, and piston.

[Removal]

- Removal the snap ring **1** and tap out the piston pin **2** using a rod **A** and hammer.
- If the piston pin **2** is difficult to remove, heat the piston **8** in hot water or using a piston heater.

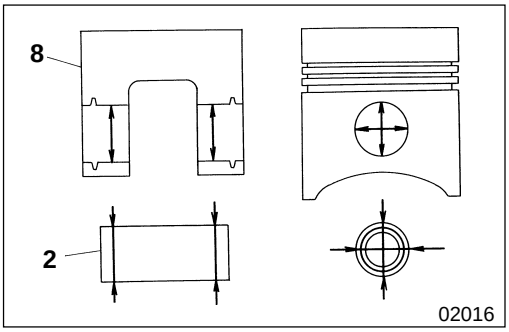


[Installation]

- Apply engine oil to the piston pin **2**. With the connecting rod **4** and piston **8** and aligned as illustrated, insert the piston pin to hold these components together.
  - **A :** Weight mark
  - **B :** Weight mark (**A** through **G**: "**A**" stands for the largest weight)
  - **C :** Alignment mark for connecting rod cap
  - "○"**:** Front mark
- If the piston pin **2** is difficult to insert, heat the piston pin **8** in hot water or use a piston heater.

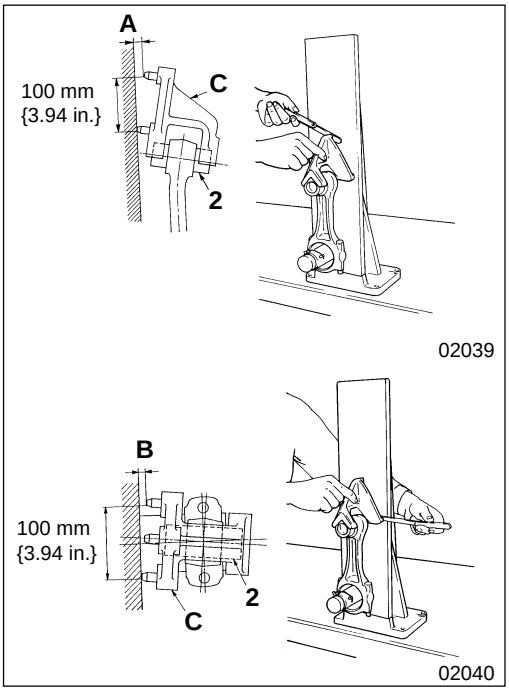
CAUTION ⚠

- **Make sure that all pistons have the same weight mark.**
- **The connecting rods must all have the same weight mark.**
- **After inserting the pin 2, check that it turns smoothly and without play.**



2 **8** **Piston pin-to-piston clearance**

If the clearance exceeds the specified limit, replace the defective part(s).



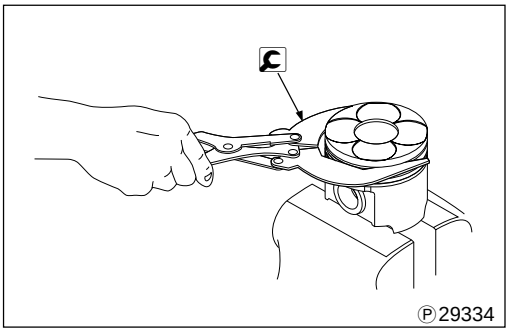
4 **Connecting rod bend and twist**

- Fit the connecting rod bushing **3** and piston pin **2** in their respective positions of the connecting rod **4**.
- Measure the extent of bending **A** and twisting **B** in the connecting rod **4**. If either measurement exceeds the specified limit, replace the connecting rod.

  C : Connecting rod aligner (Measurement device)

NOTE

- **Before mounting the connecting rod 4 on the connecting rod aligner C, install the upper and lower connecting rod bearings in their respective positions.** **P11A-67**
- **Measurements must be made with the connecting rod cap mounting bolts tightened to the specification.** **P11A-67**

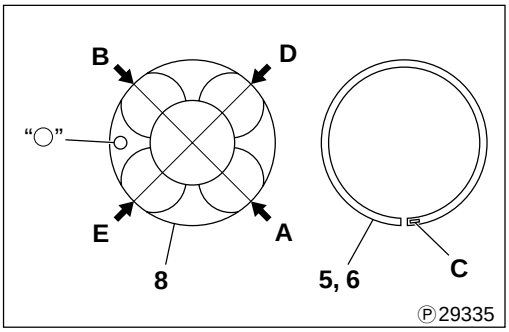


5 **to** **8** **Piston rings and piston**

Piston rings

[Removal]

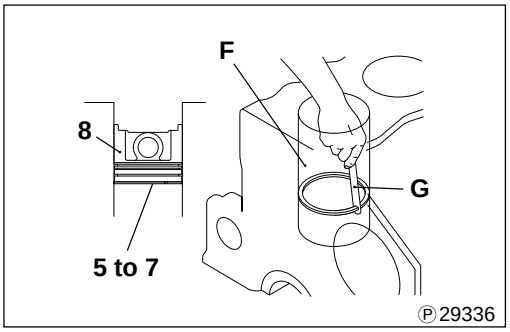
C **:** Piston Ring Tool



[Installation]

- Fit the oil ring onto the piston **8** with its gap **A** and the expander spring end joint **B** in the position illustrated.
- Fit the piston ring **5**, **6** onto the piston **8** such that the manufacturer's marks **C** near the gaps face upward.
- Align the gaps **D**, **E** of the piston ring **5**, **6** as illustrated.

  D **:** 1st compression ring gap
  E **:** 2nd compression ring gap
  "○" **:** Front mark



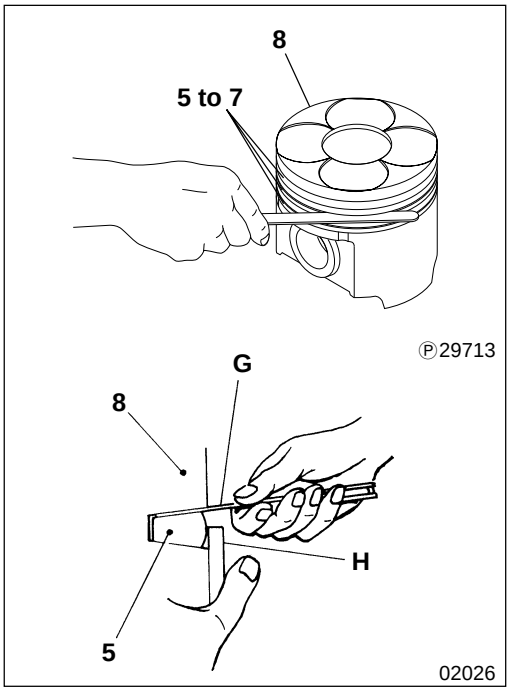
[Inspection]

(1) Piston ring end gap

- Using the crown of a piston **8**, push the piston ring **5**, **6** or **7** horizontally into a cylinder liner **F** in the upper crankcase for measurement.
- Taking care not to move the piston ring **5**, **6** or **7**, measure the end gap using a thickness gauge **G**. Replace all the rings of piston if any gap exceeds the specified limit.

NOTE

- **To keep the piston ring 5, 6 or 7 horizontal, be sure to insert them into the cylinder liner F using a piston 8.**
- **Push the piston ring 5, 6 or 7 down to the bottom of cylinder liner F; the bottom should be less worn than the top.**
- **Piston rings 5, 6 or 7 must be replaced as a set. Never replace piston rings individually.**



(2) Piston ring-to-piston ring groove clearance

- If any measurement exceeds the specified limit, replace the defective part(s).
- Measure the 1st compression ring **5** clearance with a thickness gauge **G** while pressing the ring against the piston **8** with a straight edge **H**.

NOTE

- **Remove any carbon deposits from the ring groove of the piston 8 and measure the clearance around the piston's entire periphery.**
- **Piston ring 5, 6, 7 must be replaced as a set. Never replace piston rings individually.**

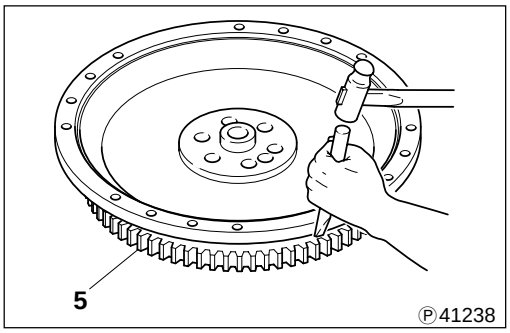
◆ Service procedure

5 Installation of flywheel assembly

- Tighten the bolts **1** to the specified torque (39.0 N·m {29 ft.lbs, 4.0 kgf·m}. After that, turn the bolts further in accordance with the following procedure.
- Turn the holder **C** of the Ca Socket Wrench counterclockwise to the tension the built-in spring.

  D : Socket
  E : Rod
  F : Rod (extension)

- Fit the Cb Magnet Base on the flywheel at a position where it can come in contact with the Rod **F** (for extension) as shown in the illustration.
- Set the rod **F** (for extension) such that it may be pressed against the Cb Magnet Base by the spring force.
- Align any inscribed line **G** on the holder **C** with any inscribed line **H** on the socket **D**. (Use this point as reference 0° position.)
- From the above reference position, turn the socket **D** clockwise by 40° to tighten the bolt to the proper specification.



5 Ring gear

[Inspection]

Inspect ring gear **5** for damage and abnormal wear. If any defect is evident, the ring gear must be replaced.

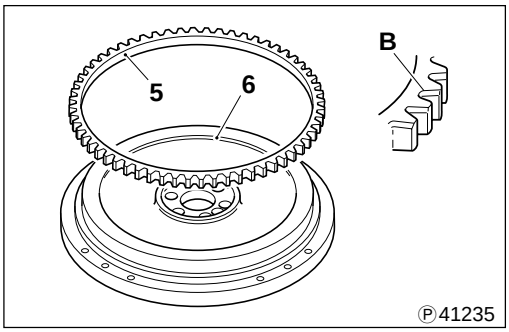
[Removal]

Heat the ring gear **5** evenly with an acetylene torch or the like.

WARNING ⚠

Be careful not to get burned.

- Remove the ring gear **5** from the flywheel by tapping around its entire periphery.



[Installation]

Using an acetylene torch or the like, heat the ring gear **5** to approximately 100 °C {212 °F} for **3** minutes.

WARNING ⚠

Be careful not to get burned.

- Fit the ring gear **5** with the non-chamfered side of its teeth toward the flywheel **6**.

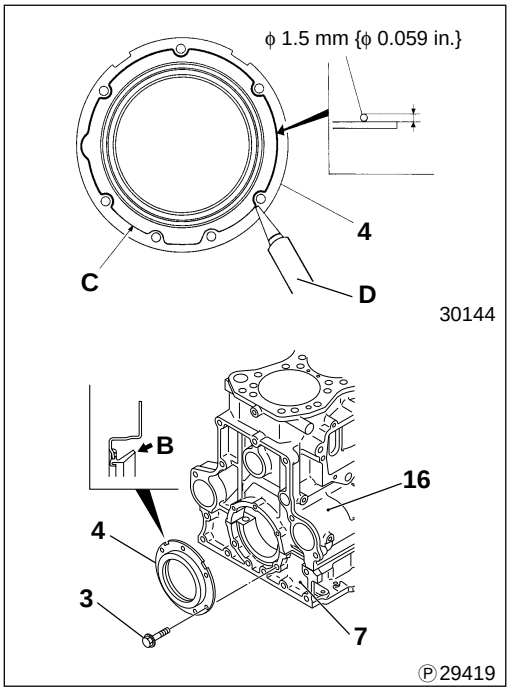
◆ Service procedure

● **Pre-disassembly inspection**
Crankshaft end play

- Before removing the lower crankcase assembly **7**, measure the extent of crankshaft end play.
- If the measurement exceeds the specified limit, replace the thrust plates with oversize ones. P11A-85



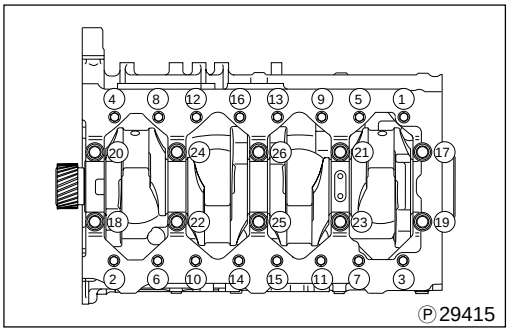
Ⓟ29419

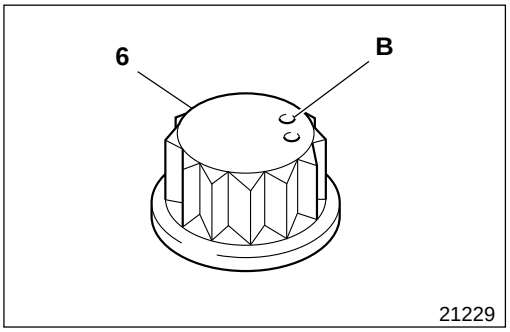
4 **Mounting of rear oil seal**

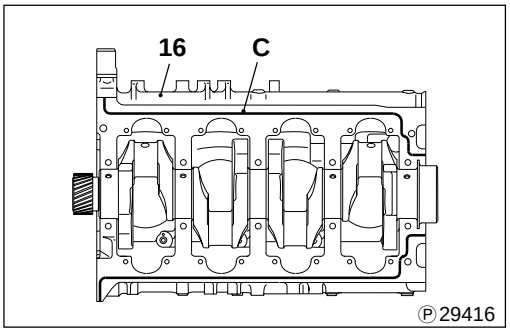
- Apply engine oil to lips **B** of rear oil seal **4**.
- Apply sealant **D** along black line **C** stamped on the rear oil seal **4** evenly without break. (ϕ 1.5 mm {ϕ 0.059 in.})
- After applying sealant **D**, install the rear oil seal **4** between the lower crankcase assembly **7** and upper crankcase assembly **16** within three minutes.

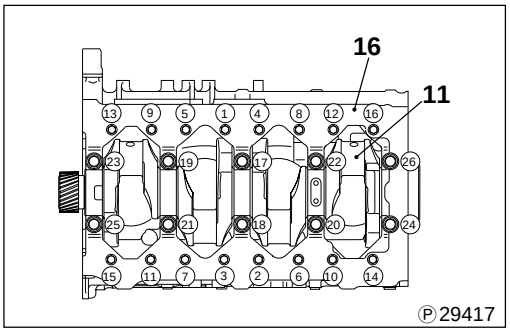
CAUTION ⚠

- **Make sure that the sealant application surfaces are clean and free from grease and oil.**
- **Use care not to let the applied sealant slip out of place during installation.**
- **After fitting rear oil seal, wait at least an hour before starting the engine.**
- **Apply a new bead of sealant D whenever mounting bolts 3 of rear oil seal have been loosened.**









7 Lower crankcase assembly

- ① – ⑯ : Bolt **5**
- ⑰ – ㉖ : Main cap bolt **6**

[Removal]

- Gradually loosen the bolts **5** in the sequence of numbers ① – ⑯ shown in the illustration.
- Then, gradually loosen the main cap bolts **6** in the sequence of numbers ⑰ – ㉖ shown, and remove.

[Installation]

CAUTION ⚠

- **Before installing the lower crankcase assembly check the head of the main cap bolt 6 for punch marks B.**
- **The number of punch marks corresponds to the number of times the bolt has been tightened using torque-turn method (bolts with two or less punch marks are reusable). If there are three, replace the main cap bolt.**

- Apply ϕ 2 mm {ϕ 0.079 in.} thick bead of specified sealant **C** to the fitting surface of the upper crankcase assembly **16** as shown.
- After applying sealant **C**, install the lower crankcase assembly **7** to the upper crankcase assembly **16** within three minutes and secure with the main cap bolts **6** and the bolts **5** as follows:

CAUTION ⚠

- **Make sure that the sealant application surfaces are clean and free from grease and oil.**
- **Use care not to let the applied sealant C slip out of place during installation.**

- Apply a thin coat of engine oil to the threaded part and seating surface of each main cap bolt **6**, then tighten the bolts to a torque of 49 N·m {36 ft.lbs, 5.0 kgf·m} in the sequence of the numbers shown (⑰ – ㉖)
- After tightening, give the bolts an additional 90° turn in the same sequence.
- Following the main cap bolts **6**, tighten the bolts **5** to the specified torque in the sequence of the numbers shown (① – ⑯).

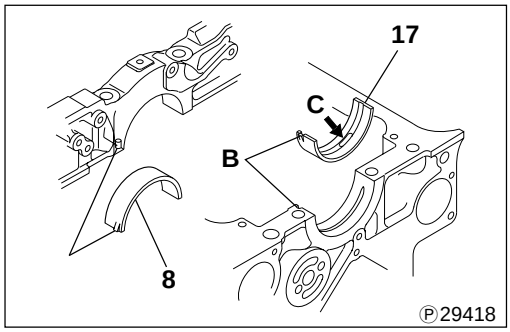
CAUTION ⚠

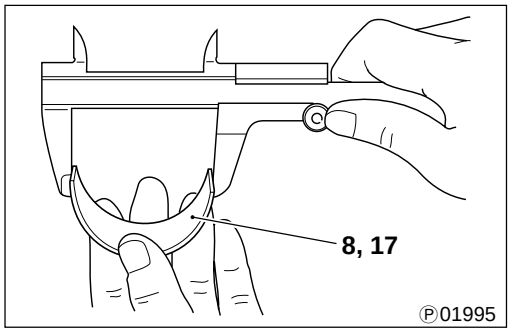
- **After installation, wait at least an hour before starting the engine.**
- **Apply a new bead of sealant C whenever the bolts 5 or the main cap bolts 6 have been loosened.**

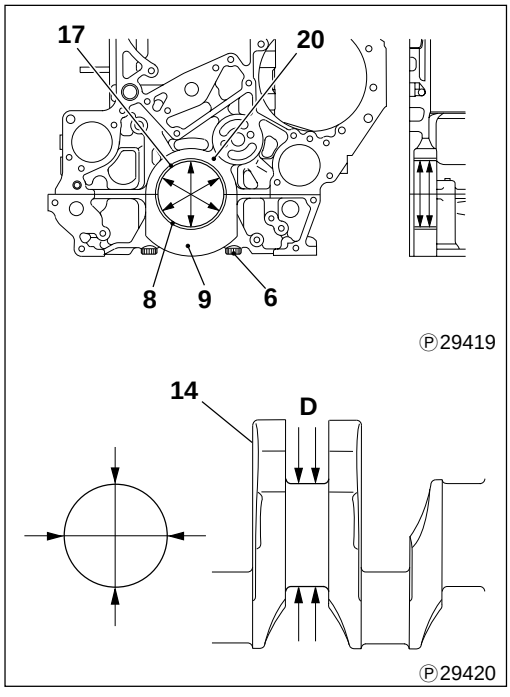
- After tightening the main cap bolts **6** using the torque-turn tightening method, make a punch mark on the head of each one to indicate the number of times used.

NOTE

Since bolts 1 utilize the torque-turn tightening method, they must not be tightened further after this procedure.







- After installing the lower crankcase assembly, check the following:
  - Smooth rotation of crankshaft assembly **11**
  - End play of the crankshaft assembly **11** P11A-82

8 **17** **Main bearings**

[Installation]

Install the main bearings **8**, **17** such that their lugs **B** fit into the corresponding grooves.

CAUTION ⚠

The upper main bearing 17 has an oil hole C. The lower main bearing 8 has no oil hole. Take care not to confuse the upper and lower parts.

[Inspection]

CAUTION ⚠

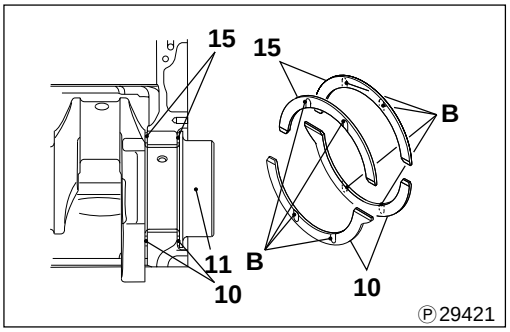
- **Do not attempt to manually expand either bearing 8, 17 if its span is insufficient.**
- **Upper and lower bearings 8, 17 must be replaced as a set.**

(1) Span when free

If either bearing's span when free exceeds the specified limit, the bearings **8**, **17** must be replaced.

(2) Main bearing-to-crankshaft clearance

- Fit the upper main bearing **17** into the upper crankcase **20** and the lower main bearing **8** into the lower crankcase **9**. Then, tighten the main cap bolts **6** to their specified torque (49 N·m {36 ft.lbs, 5.0 kgf·m}).
- Measure the internal diameters of the main bearings **8**, **17** and the journal outside diameter **D** of the crankshaft **14**. If the clearance exceeds the specified limit, replace the defective part(s).

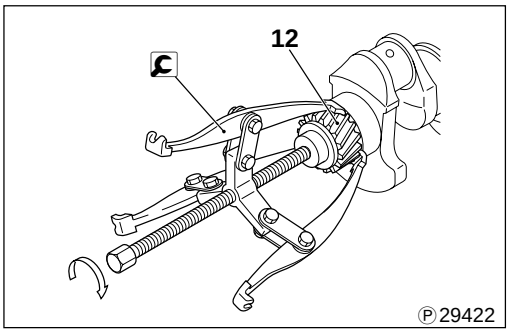


10 **15** **Thrust plate**

Install the thrust plates **10**, **15** to the crankshaft assembly **11** at No. 5 journal only. Install all halves of the thrust plates with the oil groove **B** oriented outward.

NOTE

If any oversize thrust plates are to be used, be sure to use an upper thrust plate 15 and lower thrust plate 10 of the same size at one side. However, using the same size upper (or lower) thrust bearings on both sides is not necessary.
Available oversize: 0.15, 0.30, 0.45 mm {0.0059, 0.012, 0.018 in.}



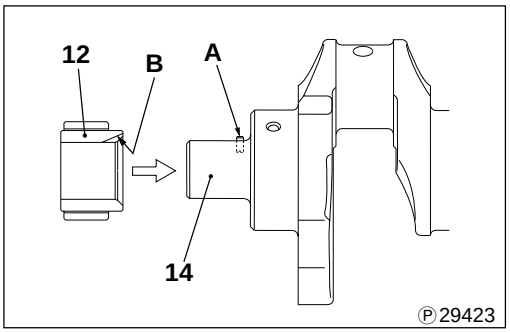
12 **Crankshaft gear**

[Removal]

: Gear Puller

CAUTION ⚠

Do not tap off the crankshaft gear 12 since this could damage it.



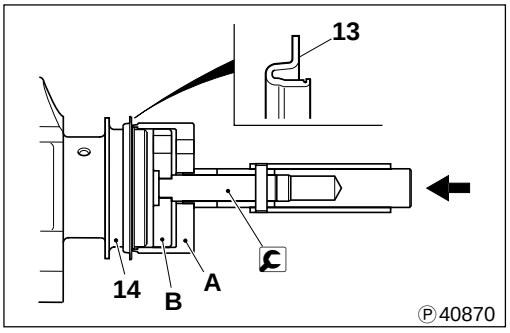
[Installation]

- Using a piston heater or the like, heat the crankshaft gear **12** to a temperature of approximately 150 °C {302 °F}.

WARNING ⚠

Be careful not to get burned.

- Align the location pin **A** on the crankshaft **14** with the notch **B** in the crankshaft gear **12**. Then, drive the gear into position by striking its end face with a plastic mallet.



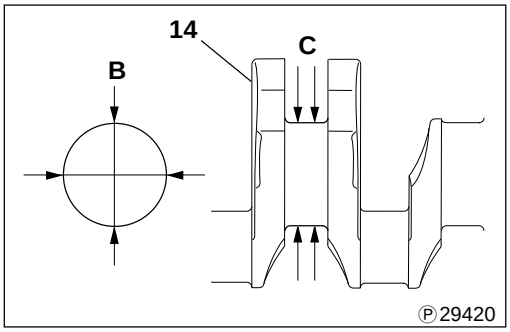
13 **Rear oil seal slinger**

[Removal]

Taking care not to damage the crankshaft **14**, split the oil seal slinger using a chisel or the like.

[Installation]

With the rear oil seal slinger **13** directed as illustrated, drive it onto the crankshaft using the Rear Oil Slinger Installer until the tools end face **A** is pressed firmly against the guide **B**.



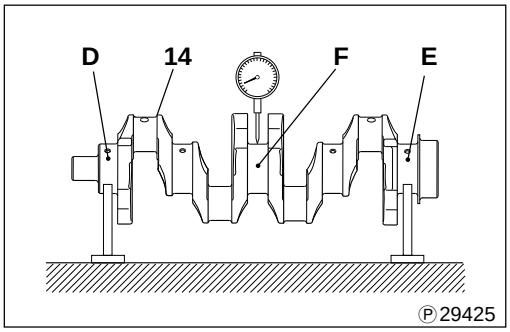
14 Crankshaft

[Inspection]

(1) Roundness and cylindricity of crankshaft journal and pin

If either measurement exceeds the specified limit, grind it to undersize or replace the crankshaft **14**.

B : Roundness
C : Cylindricity

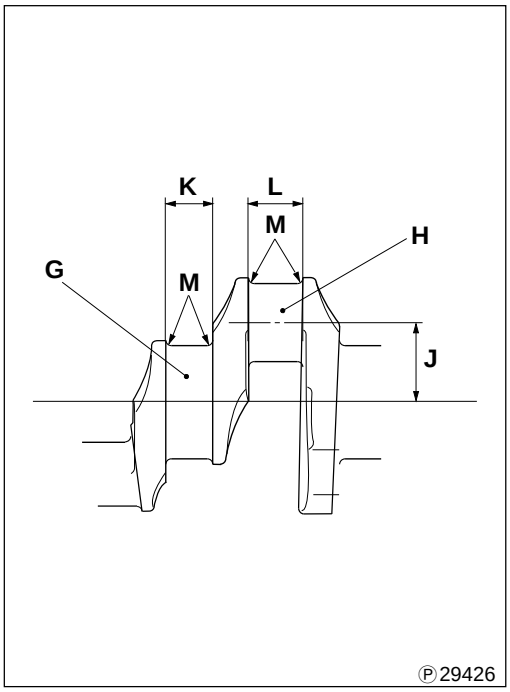


(2) Bend

- Support the crankshaft **14** at its No. 1 journal **D** and No. 5 journal **E**. Measure the extent of bending in the crankshaft at the center of the No. 3 journal **F**.
- If the measurement exceeds the specified limit, replace the crankshaft **14**.

NOTE

Turn the crankshaft 14 through one revolution. One-half of the dial indicator reading represents the extent of bending.



[Rectification]

NOTE

If the crankshaft 14 is rectified by grinding, the main bearings 8, 17 must be replaced with undersized ones.
Available undersizes: 0.25 mm, 0.50 mm 0.75 mm, 1.00 mm {0.0098, 0.02, 0.03, 0.039 in.}

- Grind such that the center-to-center distance **J** between the journal **G** and pin **H** never be changed.

  J : 60 ± 0.05 mm {2.36 ± 0.002 in.}
- Grind such that the journal width **K** and pin width **L** do not change.

  K : 33.5 mm {1.32 in.} (No. 1 journal)
  35 mm {1.38 in.} (No. 2 to No. 4 journals)
  $35^{+0.039}_{0}$ mm {$1.38^{+0.0015}_{0}$ in.} (No. 5 journal)
  L : $41^{+0.2}_{0}$ mm {$1.61^{+0.0079}_{0}$ in.}
- Finish the corner fillet smoothly and to the specified radius M.

  M : 5 mm {0.2 in.}
- Carry out a magnetic inspection to check for cracks caused by grinding. Also, check that the Shore hardness of the surface has not dropped below Hs 75.

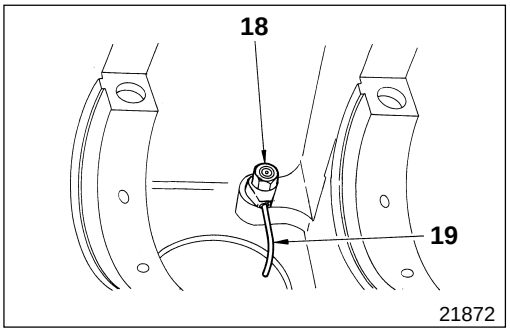
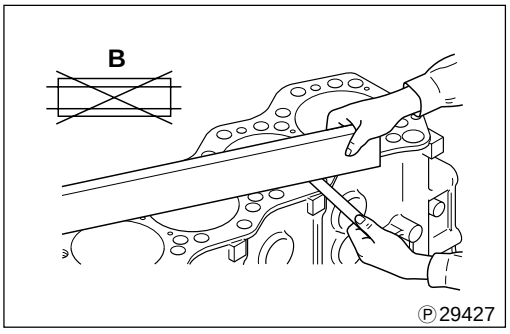
- When grinding **N**, turn the crankshaft **14** counter-clockwise as viewed from its front end. The grinder **P** should rotate in the same direction.
- When finishing **R** the crankshaft **14** with whetstone or sandpaper **Q**, rotate the crankshaft clockwise.



18 **19** **Installation of check valve and oil jet**

CAUTION ⚠

Do not overtighten the check valve 18. If the tightening torque exceeds the specified one, the check valve may malfunction, resulting in seizure of the engine.



20 **Inspecting upper crankshaft**

- Measure the upper surface distortion of the upper crankcase **20**.
- If distortion exceeds the specified limit, correct it with a surface grinder.

B : Measurement positions

CAUTION ⚠

When grinding the crankcase 20, take care that the piston protrusions stay within specification.

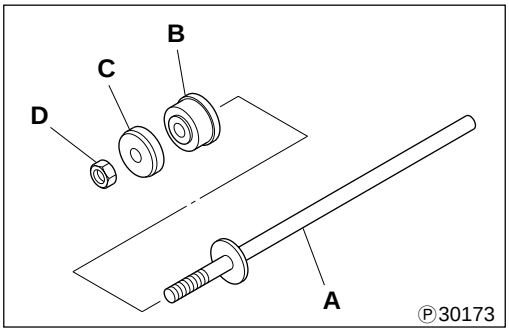
[*b] [1] to [3] Balance shaft and balance shaft bushing

[Inspection]

If the clearance is more than the limit, replace defective parts.

NOTE

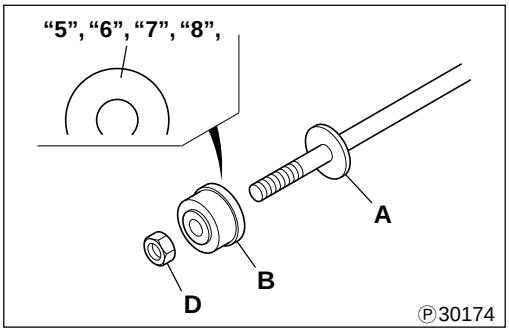
Measure the inner diameter of the balance shaft bushings 1 through 3 with the bushings installed on the upper crankcase *a.



Balance shaft bushing

Use the [C] Balance Shaft Bushing Installer & Extractor to replace the balance shaft bushings **1** through **3**.
(Components of [C] Balance Shaft Bushing Installer & Extractor)

A : Rod
B : Adapter
C : Guide piece
D : Nut



[Removal]

- Drive out the balance shaft bushings **1** to **3** using the [C] Balance Shaft Bushing Installer & Extractor consisting of the adapter **B** appropriate to each bushing secured on rod **A** with nut **D**.

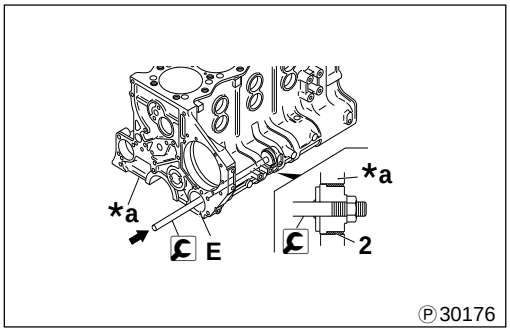
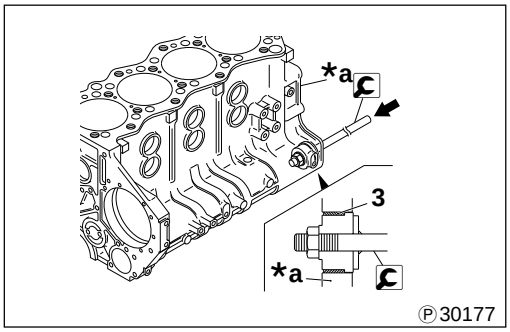
BALANCE SHAFT BUSHINGS

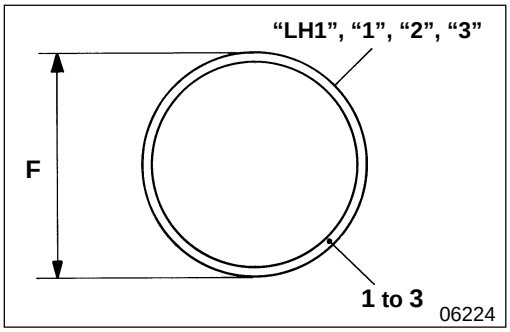


- Remove the No. 2 balance shaft bushing **2** from the upper crankcase ***a** by inserting the 🔧 Balance Shaft Bushing Installer & Extractor through the hole **E** from which the No. 1 balance shaft bushing was removed.



- Remove the No. 3 balance shaft bushing **3** from the rear side of the upper crankcase ***a**.

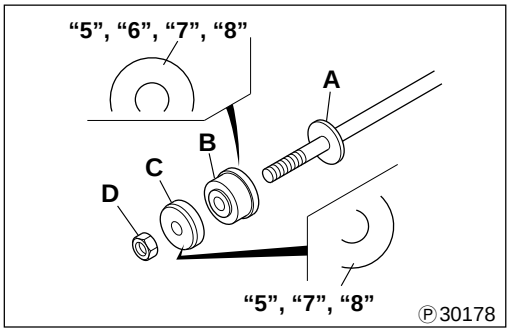
  🔧 **:** Balance Shaft Bushing Installer & Extractor



[Installation]

- Identify balance shaft bushings **1** through **3** by the marks "1", "2", "3" or "LH1" stamped on each bushing.
  If the mark on a bushing is unclear, identify the bushing by measuring the outside diameter **F** of the bushing.

Balance shaft bushing (from front of engine)		Mark	Outside diameter (mm {in.})
No. 1	Left (two oil holes)	LH1	ϕ 55.25 {ϕ 2.175}
	Right (one oil hole)	1	
No. 2		2	ϕ 55 {ϕ 2.165}
No. 3		3	ϕ 54.75 {ϕ 2.155}



- Drive the balance shaft bushings **1** through **3** in position by hammering on the 🔧 Balance Shaft Bushing Installer & Extractor consisting of the adapter **B** and guide piece **C** appropriate to each bushing secured on the rod **A** with nut **D**.

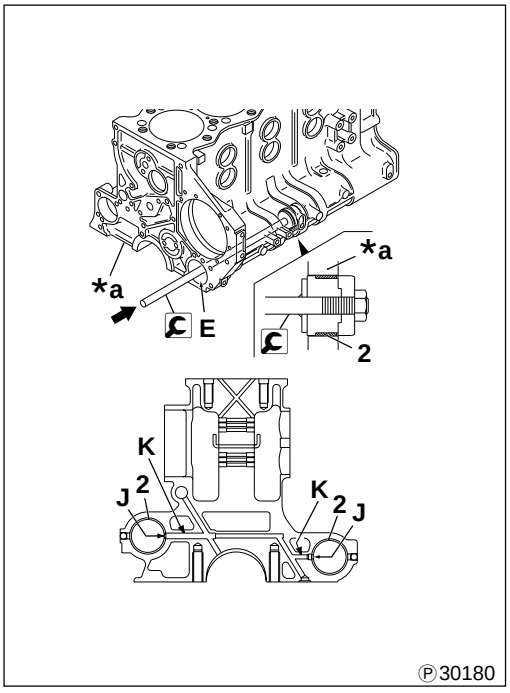
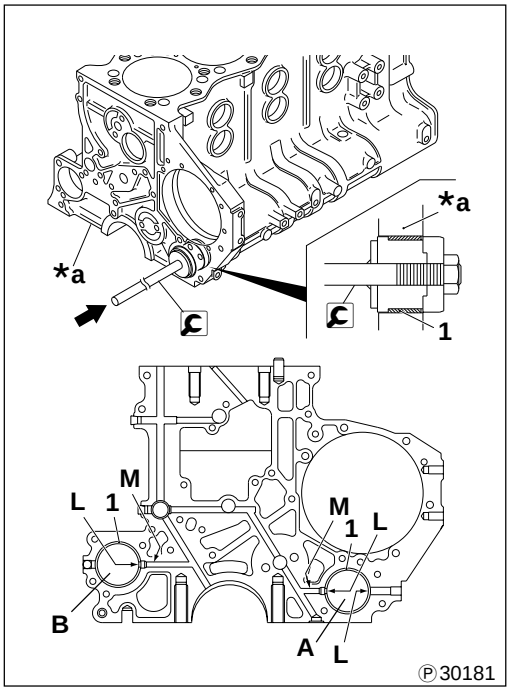
- Install the No. 3 balance shaft bushing **3** from the rear side of the upper crankcase ***a**.
  In this case, make sure that the oil hole **G** in the bushing matches the oil passage **H** in the crankcase.
  : Balance Shaft Bushing Installer & Extractor



- Install the No. 2 balance shaft **2** by inserting the Balance Shaft Bushing Installer & Extractor through the No. 1 balance shaft bushing mounting hole **E** of the upper crankcase ***a**.
  In this case, make sure that the oil hole **J** in the bushing matches the oil passage **K** in the crankcase.
  : Balance Shaft Bushing Installer & Extractor

BALANCE SHAFT BUSHINGS



- Install the No. 1 balance shaft bushing **1** from the front side of the upper crankcase ***a**.
  In this case, make sure that the oil hole **L** in the bushing matches the oil passage **M** in the crankcase.

  : Balance Shaft Bushing Installer & Extractor

CAUTION ⚠

- **The No. 1 balance bushings 1 include the right and left ones which are different from each other. Use care to prevent confusion when installing them.**
  The left one A has two oil holes L, whereas the right one B has one oil hole L.
- **Before installing No. 1 balance bushing 1, check to ensure that No. 2 balance shaft bushing 2 has been installed.**

Inspection of Engine Compression

Service standards

Location	Maintenance item		Standard value	Limit	Remedy
—	Engine Compression	Each cylinder (200 rpm)	2550 kPa {370 psi, 26 kgf/cm^2}	1960 kPa {285 psi, 20 kg/cm^2}	Inspect
		Pressure difference between each cylinder	—	within 390 kPa {57 psi, 4 kgf/cm^2}	Inspect

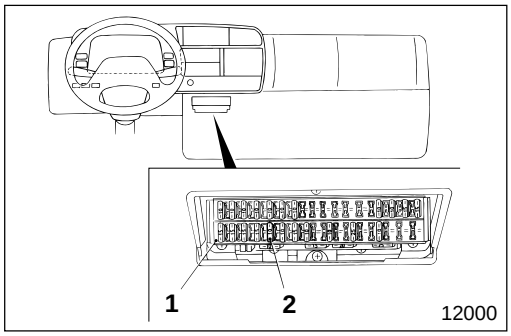
Special tools

Unit : mm {in.}

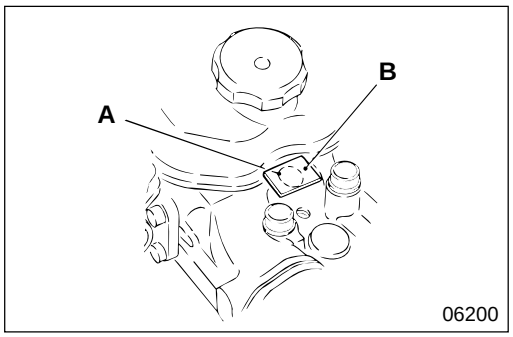
Location	Tool name and shape	Part No.	Application
—	Compression gauge adapter  06197	MH061460	Measurement of engine compression

The decrease of engine compression is a signal that it is time to overhaul the engine. It is strongly recommended that this item is inspected periodically and that you record the history of deterioration in engine performance as this will help you to diagnose causes of future irregularities.
When the vehicle is still new or immediately after installation of new parts, there may be a slight increase in engine compression, but normal performance will be restored soon.

- Before inspection make sure that engine oil, starter and battery are in normal condition.
- Before inspecting the vehicle do the following:
  - Run the engine to bring the temperature of the coolant up to approximately 75 to 85°C {167 to 185°F}.
  - Turn all the lights and accessory equipment OFF.
  - Put transmission in neutral. (P range for automatic transmission)
  - Set the steering wheel at center and straight position.



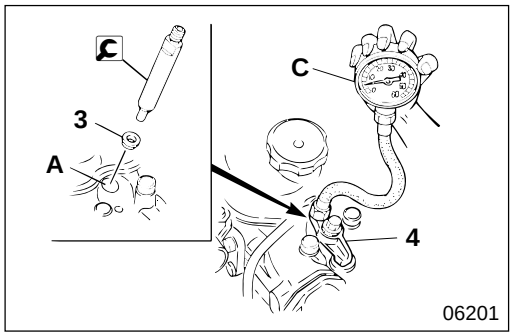
- Remove fuse **2** for the fuel-cut motor/engine ECU from fuse box **1** inside the cab to prevent the fuel from being injected when the engine is cranked by the starter.



- Remove all the injection nozzles. Gr 13B
- Check that no foreign particles are sticking to waste cloth **B** covering injection nozzle mounting hole **A** after cranking the engine.

WARNING

You must stay clear of injection nozzle mounting hole A when you crank the engine during this inspection. Assume that all cylinders have cracked, and that coolant, engine oil, fuel, etc. have seeped into the cylinder chambers. If this is the state when the engine is cranked, there is an extreme danger of these substances being injected out of the injection nozzle mounting hole at high temperature.



- Mount gasket **3** and compression gauge adaptor in injection nozzle mounting hole **A** and fasten them with nozzle bridge **4**, then mount compression gauge **C**.
- Measure engine compression while cranking the engine.
- Measure engine compression of cylinders and calculate the difference among the cylinders.
- If the engine compression and pressure difference between each cylinder deviate from the limit, reinspect by pouring a small amount of engine oil into injection nozzle mounting hole **A**.
  - When pressure is high : It is likely that either wear or damage of the slide-contact area of both the piston ring and the cylinder inner surface has taken place.
  - When pressure is low : It is likely that burning of the valve, faulty contact of valve surfaces and/or faults in the cylinder head gasket have developed.

Inspection and Adjustment of Valve Clearance

Service standards

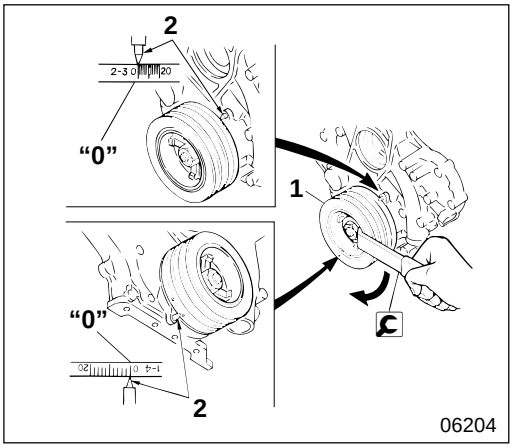
Unit : mm {in.}

Location	Maintenance item	Standard value	Limit	Remedy
—	Valve clearance (When engine is cold)	0.4 {0.016}	—	Adjust

Special tools

Unit : mm {in.}

Location	Tool name and shape	Part No.	Application
—	Cranking handle  05999	MH061289 (Obtain Locally)	Cranking of engine
—	Flat-blade screwdriver  06000	MH060008 (Obtain Locally)	Valve clearance adjustment (Used for an installed engine)



06204

Inspect and adjust the valve clearance while the engine is cold in the following way.

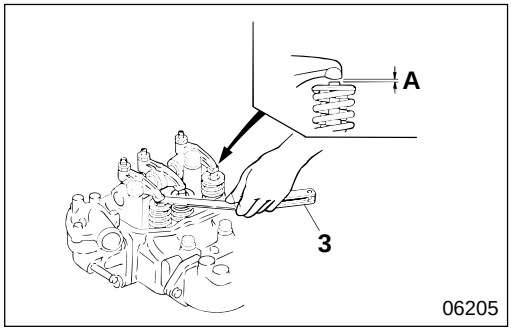
[Inspection]

- Crank the engine to move No.1 or No.4 piston to top dead center. Do this by turning crankshaft pulley **1** clockwise using cranking handle to align stamped mark "**0**" on the crankshaft pulley with pointer **2**.

NOTE

- **The cylinder whose push rod is not pushing up the inlet/outlet rocker is the one whose piston is at top dead center.**
- **There are two pointers 2. Use any one of the two pointers to align the stamped mark of crankshaft pulley 1 in the position as illustrated.**

INSPECTION AND ADJUSTMENT MOUNTED IN VEHICLE



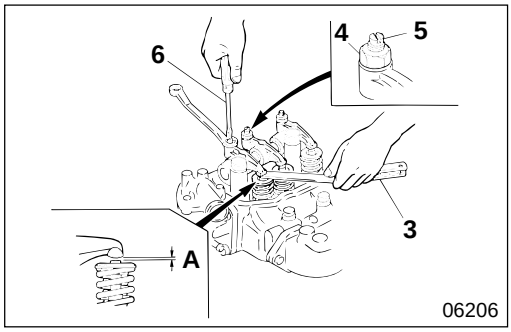
- Measure valve clearance **A** when either No.1 or No.4 piston is at top dead center in accordance with the following tabulated sequence of each valve.

Cylinder No.	1		2		3		4	
Valve arrangement	In-take	Ex-haust	In-take	Ex-haust	In-take	Ex-haust	In-take	Ex-haust
No.1 piston at top dead center	○	○	○	—	—	○	—	—
No.4 piston at top dead center	—	—	—	○	○	—	○	○

NOTE

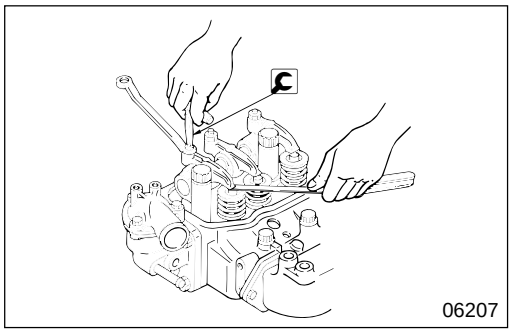
Be sure when taking measurements using feeler gauge 3 that some resistance is felt when inserting the gauge. If the gauge can be inserted freely without any resistance, an accurate measurement has not been obtained.

- If the measured value deviates from the limit, adjust as follows:



[Adjustment]

- Adjust valve clearance **A** so that feeler gauge **3** encounters some resistance when it is inserted. Do this by loosening lock nut **4** and turning adjusting screw **5**.
- After adjusting, hold adjusting screw **5** using screwdriver **6** and tighten lock nut **4**. Reinspect valve clearance **A** using feeler gauge **3**.



- When turning adjusting screw **5** on an engine that is installed, using a flat-blade screwdriver will make the work easier.

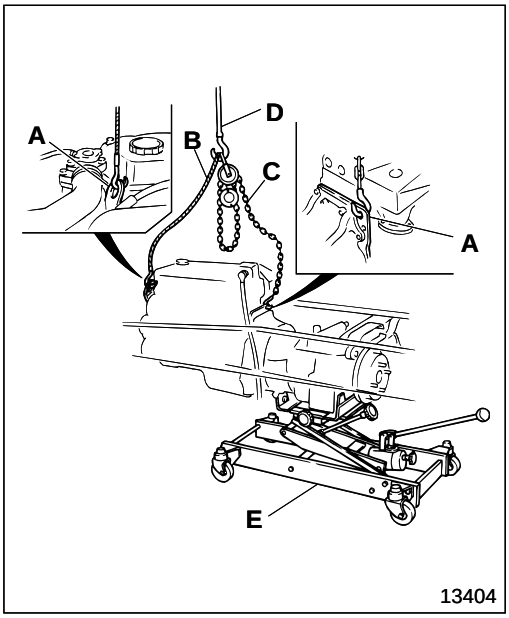
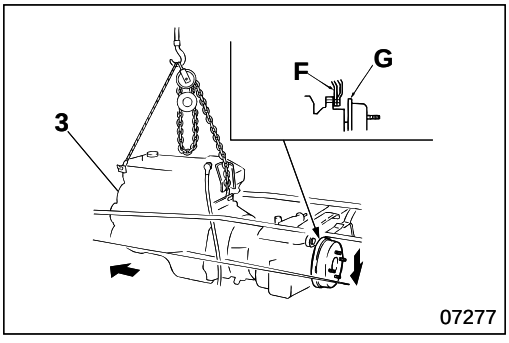
◆ Service procedure

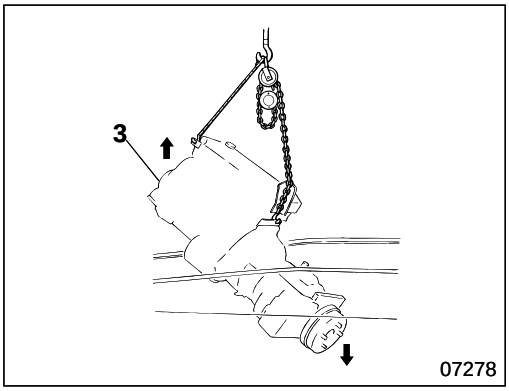


3 Removal of engine and transmission assembly

- Hook cable **B** and chain block **C** to two hangers **A** on the engine and transmission assembly and lift the engine using crane **D** until the lifting gear becomes taut.
- Support the transmission using transmission jack **E**.
- Make sure that wiring and hoses are disconnected.



- Lower the transmission carefully so that transmission back plate **G** does not hit engine rear support **F** then move engine and transmission assembly **3** forward.



- Lift engine and transmission assembly **3** carefully adjusting the lifting angle. As the transmission appears from the front of the rear body turn the transmission 90° clockwise and place it down on the right side carefully so that it does not hit the frame or cab.

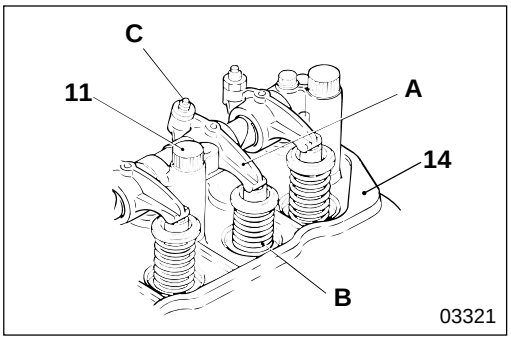
13 **Push rod deflection**

If the measured value is higher than the limit, replace push rod **13**.

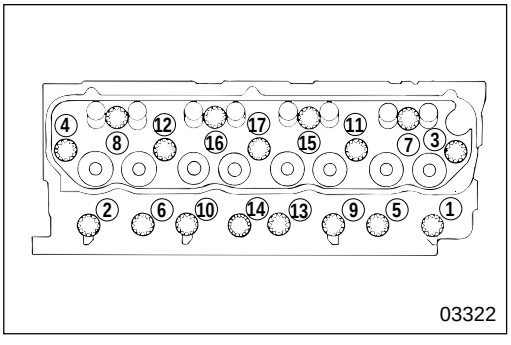


03321

14 **Cylinder head and valve assembly**

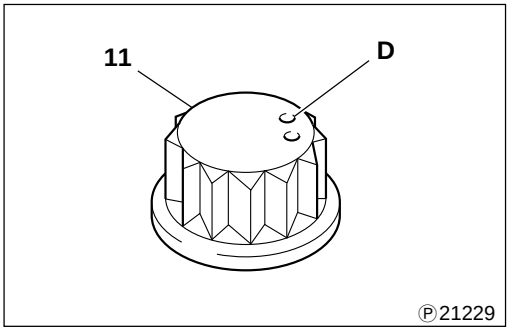
[Removal]

- Before undoing cylinder head bolts **11**, first loosen adjusting screw **C** of rocker **A** that pushes down valve spring **B**.



03322

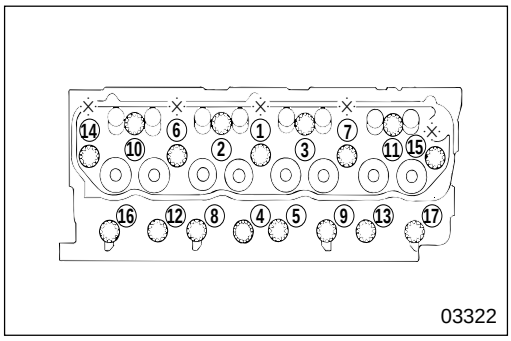
- First loosen cylinder head bolts **11** in the numbered order as illustrated, then remove them.



[Installation]

CAUTION ⚠

- **Before fitting any cylinder head bolt 11, check the punch marks D on its head. Do not use bolt if there are more than two punch marks.**
- **The punch marks indicate the number of times each bolt has been tightened using the torque-turn tightening method. Any bolt that already has three punch marks must be replaced.**

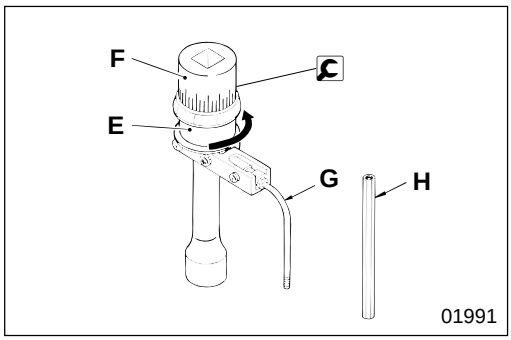


- Center punch the heads of cylinder head bolts **11** before installation.

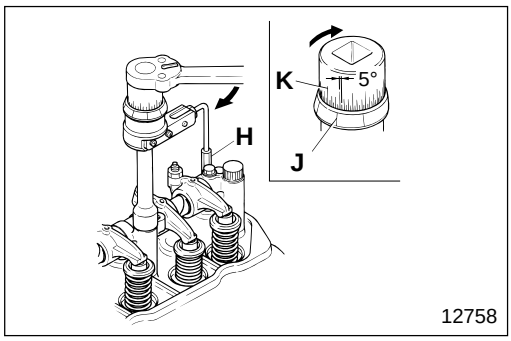
CAUTION ⚠

If there are already three center-punch marks, replace the cylinder head bolt with a new one.

- After tightening cylinder head bolts **11** at specified torque in the numbered order as illustrated, tighten further as follows:
  ·※· : Tightened simultaneously with rocker and bracket assembly



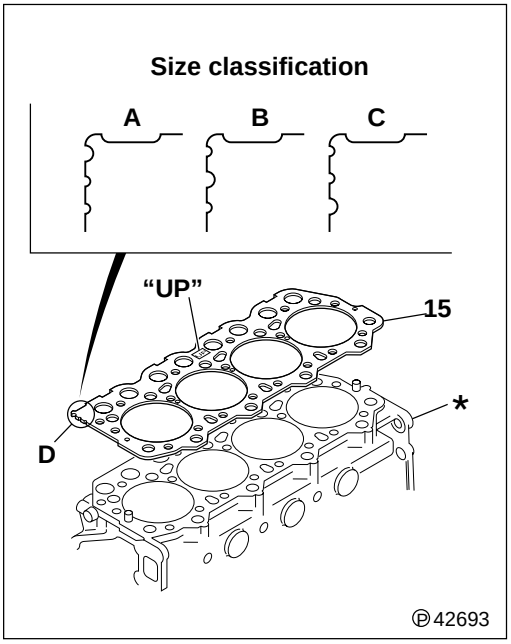
- Turn 🔧 socket wrench holder **E** counterclockwise and keep the spring in the wrench compressed.
  F : Socket
  G : Rod
  H : Rod (for extension)



- Set 🔧 socket wrench holder **E** so that the twisting force of the spring presses rod **H** (for connection) against adjacent parts such as, rocker shaft bracket or the injection pipe.
- Select a scale that is convenient for reading graduation **J** on holder **E**.
- Tighten further by turning socket **F** clockwise by 90° (setting is in 5° increments), referring to graduation **K** on the selected scale.

CAUTION ⚠

Do not retighten after the bolts are tightend to specified torque and angle, since the bolts are provided with a torque-turn tightening system.



15 **Cylinder head gasket**

[Removal]

CAUTION⚠

Be careful not to scratch the cylinder head or crankcase * when removing cylinder head gasket 15.

[Installation]

- Install cylinder head gasket **15** to crankcase * in the direction as shown.
- Measure the piston protrusion value of each cylinder before installing cylinder head gasket. Then, select the cylinder head gasket **15** with thickness corresponding to its average piston protrusion value from the table below.
  Measurement of piston protrusion: 🕮 P11B-42
- If there is any one cylinder which has a piston protrusion value of 0.05mm {0.0020 in.} or more, compared with the average piston protrusion value, use the gasket with one-rank-up thickness (A→B, B→C).

Unit: mm {in.}

Average protrusion value of piston	Size classification of cylinder head gasket
0.466 to 0.526 {0.018 to 0.021}	A
0.526 to 0.588 {0.021 to 0.023}	B
0.588 to 0.648 {0.023 to 0.026}	C

- Identify the kind of cylinder head gasket **15** (engine model and size classification) is based on the notched part **D**.

CAUTION⚠

When changing piston, connecting rod, etc., make sure to measure the protrusion value of piston because it varies.

◆ Service procedure

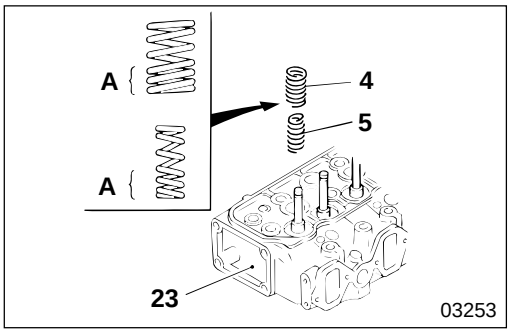
2 **Valve cotter (keepers)**

[Removal]
Remove valve cotter (keepers) **2** making sure that valve springs **4**, **5** are squarely and evenly pressed down by a valve lifter and b valve lifter hook.

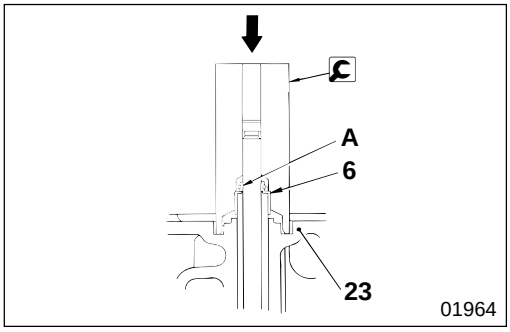
[Installation]
Follow the removal procedure in reverse.

CAUTION
Be sure not to press down on valve springs 4, 5 too hard because this would cause upper retainer 3 to contact valve stem seal 6 and damage it.



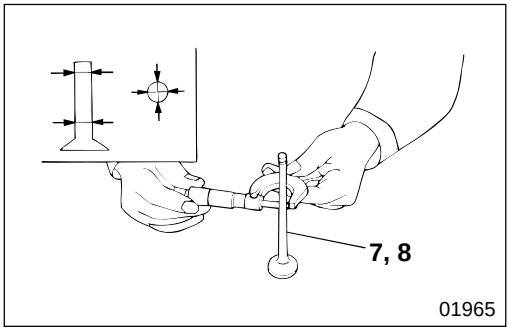
4 **5** **Installation of outer and inner valve springs**

Install outer springs **4** and inner springs **5** in cylinder head **23** in the direction as illustrated.
A : Closely wound area



6 **Installation of valve stem seal**

- Apply engine oil to lip **A** of valve stem seal **6**.
- Tap down valve stem seal installer until it hits cylinder head **23**.



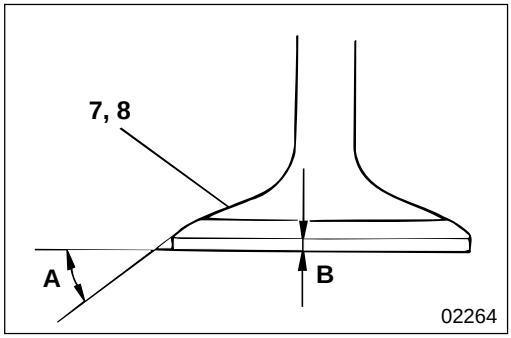
7 **8** **Inlet valve and exhaust valve**

[Inspection]

(1) Inspection of stems

If the measured value is lower than the limit or in the case of excessive wear, replace valves **7**, **8**.

CAUTION
Be sure to lap valve seats 19, 20 when valves 7, 8 are replaced with new ones. **P11B-27**

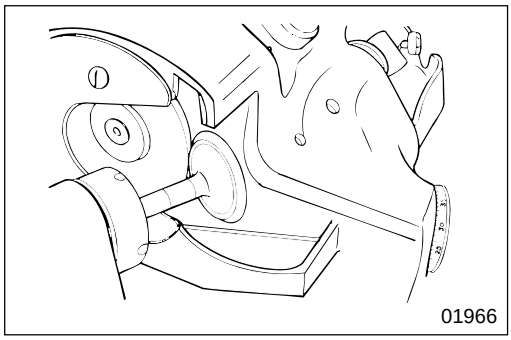


(2) Valve seat angle and valve margin

If the measured value is higher than the limit, replace valves **7**, **8**.

A : Valve seat angle

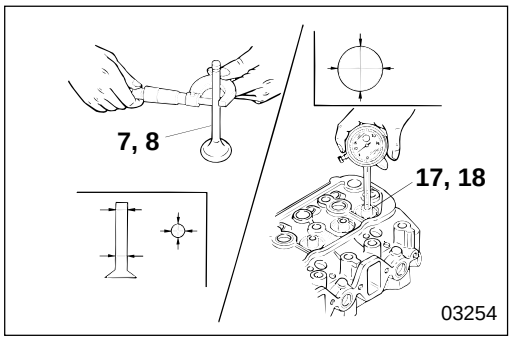
B : Valve margin



[Valve Grinding]

NOTE

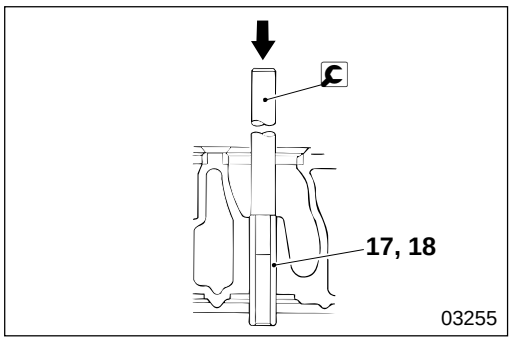
- **Be sure to keep the grinding work as light as possible.**
- **Be sure to replace valves 7, 8 after grinding if valve margin deviates from the limit.**
- **Be sure to lap valve 7, 8 and valve seats 19, 20 after grinding.** **P11-27**



7 **8** **17** **18** **Valve and valve guide**

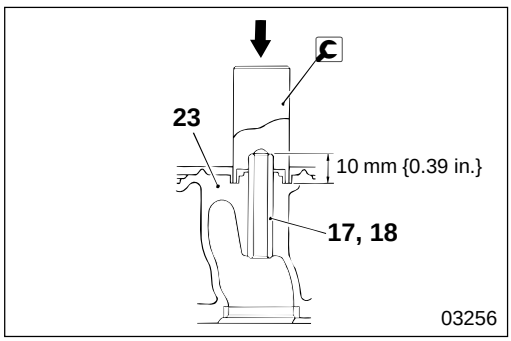
[Inspection]

When the clearance is higher than the limit, replace the faulty parts.



Valve guide

[Removal]

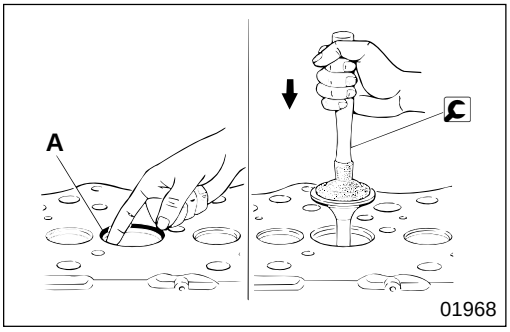


[Installation]

- Tap down valve guides **17**, **18** with 09916-58210 valve guide installer until it hits cylinder head **23**.

CAUTION

- **The length of fit of valve guides 17, 18 is standardized. Be sure to use 09916-58210 valve guide installer.**
- **Be sure to distinguish between valve guides 17, 18. Exhaust valve guide 18 is longer.**



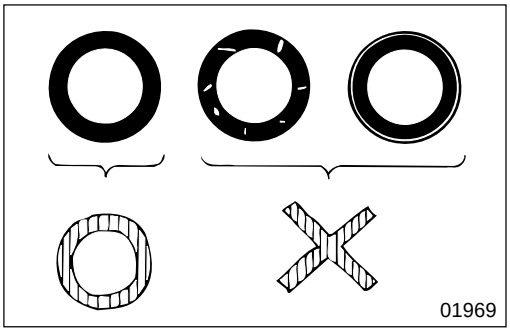
7 **8** **19** **20** **Valve and valve seat**

[Inspection]

- Apply red lead evenly to entire surface **A** of valve seats **19**, **20** that contact valves **7**, **8**.
- Fit valves **7**, **8** to valve seats **19**, **20** and tap once without rotating.

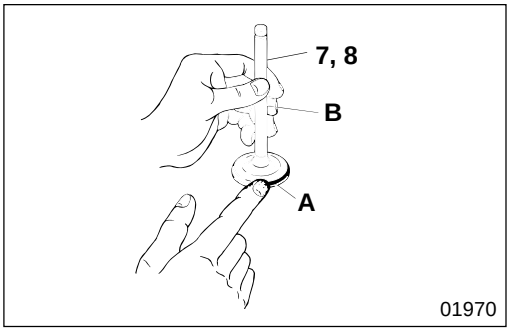
NOTE

Be sure to carry out inspection under the condition that valves 7, 8 and all parts of valve guides 17, 18 are normal.



- Check how much red lead has transferred to valves **7**, **8** to determine the contact of the valve and the seat. According to the degree of abnormality, take proper measures to correct it.

Contact conditions	Correction measures
Minor fault	Valve lapping
Major fault	Repair of valve and seat or replacement of both



[Correction]

Valve lapping is done in the following manner:

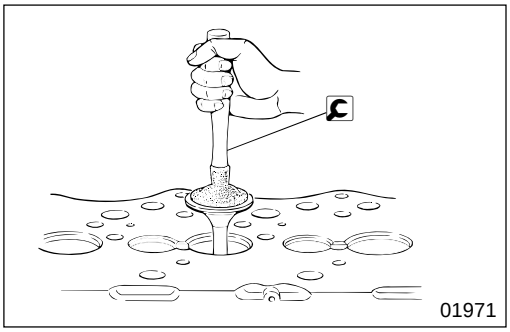
- Apply valve lapping compound thinly to contact surface **A** of valves **7**,**8** with valve seats **19**, **20**.

CAUTION

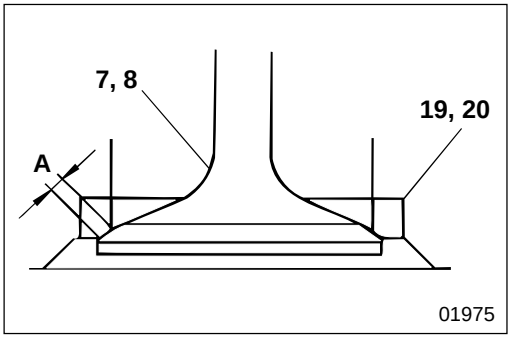
Take care not to smear stems B of valves 7, 8 with the compound.

NOTE

- **Start with medium grit compound (120 to 150 grit) and for finishing up, use finer grit (200 grit or finer).**
- **Mixing with a small amount of engine oil will make the compound consistent and make even application easier.**



- Tap valves **7**, **8** against valve seats **19**, **20** several times while rotating the valves slightly at each strike.
- Clean off the compound with gas oil.
- Apply engine oil to contact surface **A** of valve seats **19**, **20** and smooth the surface.
- Check the contact of valves **7**, **8** and valve seats **19**, **20**.
- If contact does not take place completely around the seat, replace valve seats **19**, **20**.



19 **20** **Valve seat**

[Inspection]

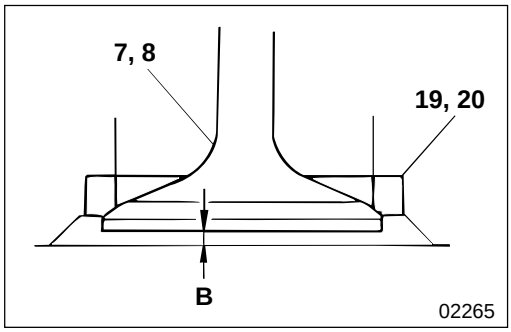
(1) Valve seat width

If the measured value is higher than the limit, replace valve seats **19**, **20**.

A : Valve seat width

NOTE

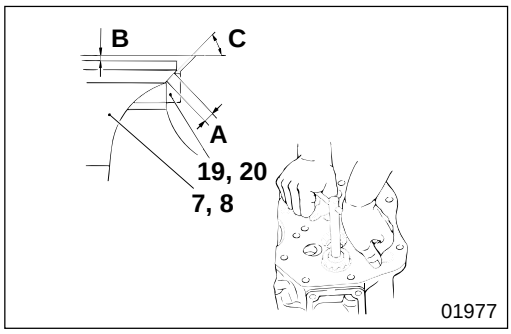
Be sure to lap and fit valves 7, 8 and valve seats 19, 20 after correction or replacement.



(2) Extent of valve recess from the bottom surface of cylinder head

If the measured value is higher than the limit, correct or replace the faulty parts.

B : Extent of valve recess



[Valve Seat Grinding]

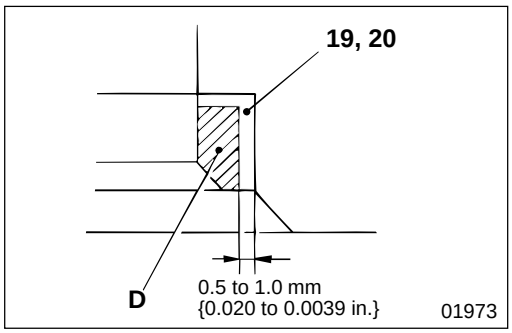
- Grind valve seats **19**, **20** using valve seat cutter or valve seat grinder.
- After grinding, do another light abrasion using 400 grit emery paper placed between the cutter and the seat.
- Adjust the seat width **A** of valves **7**, **8** using 15° or 75° cutter to make seat width conform to the standard value.

C : Valve seat angle

CAUTION ⚠

Be sure that as a result of grinding, recess B of valves 7, 8 does not become higher than the limit.

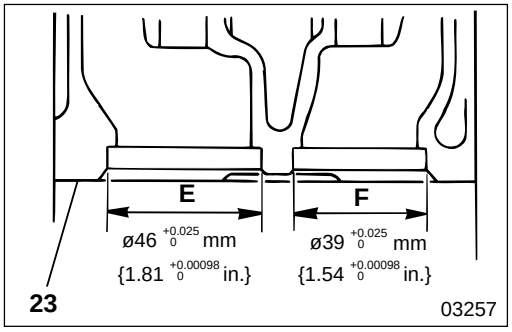
- After valve seat grinding is done, be sure to carry out lapping and fitting of valves **7**, **8** and valve seats **19**, **20**.



[Removal]

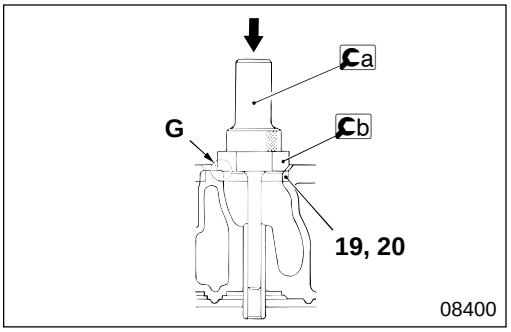
- Valve seats **19**, **20** have been set in by the cooling-off-process, and have to be thinned by grinding off the inner side for removal under normal temperature.

D : Part to be ground



[Installation]

- Make sure that the diameter of valve seat hole of cylinder head **23** conforms to the standard value.
  E : Inlet valve seat hole diameter
  F : Exhaust valve seat hole diameter

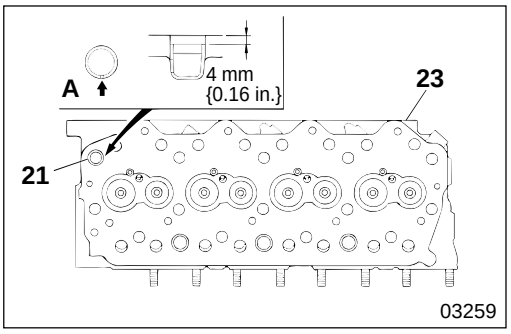


- Immerse valve seats **19**, **20** in liquid nitrogen and cool them substantially. Press-fit into the cylinder head using Ca caulking tool body and Cb caulking rings inlet and exhaust.

CAUTION

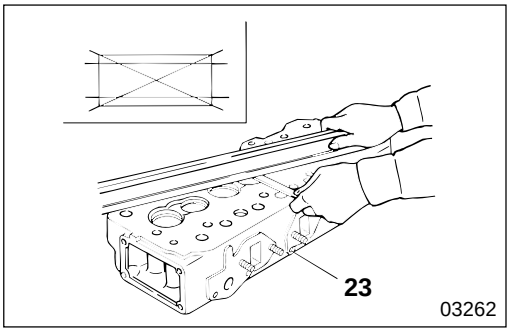
Be sure, when press-fitting, to place the chamfered side G of Cb caulking rings inlet and exhaust against valve seats 19, 20.

- After installation of valve seats **19**, **20**, lapp-in until they contact valves **7**, **8** smoothly.



21 Installation of water director

- With indent **A** set in the direction as illustrated, press-fit water director **21** into cylinder head **23** to the specified depth.



23 Inspection of cylinder head

Measure the extent of distortion of the bottom of cylinder head **23**, and if the measured value is higher than the standard value, grind using a surface grinder.

CAUTION

Be sure to keep the amount of grinding within the limit of the height of cylinder head 23.

● **Inspection before disassembly**

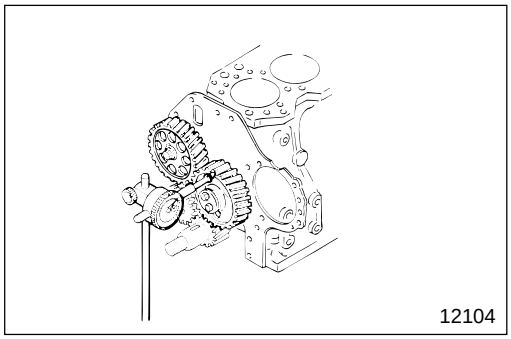
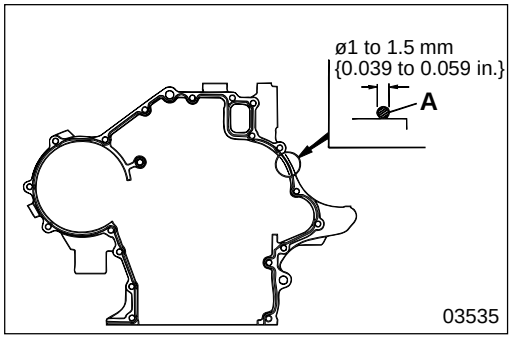
(1) Backlash of each gear

Measure three or more locations on the pairing gears and if the measurements are higher than the limit, replace the faulty parts.



(2) End play of idler gear

If the measured value is higher than the limit, replace the faulty parts.

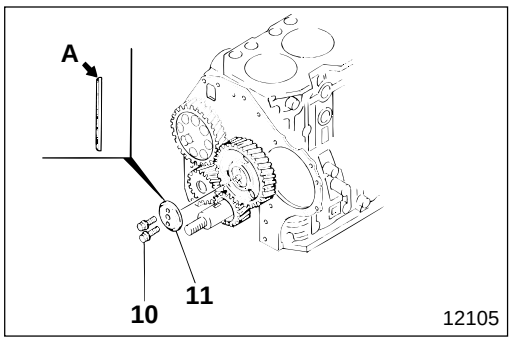


9 Installation of timing gear case

Apply sealant **A** to the mounting surface of timing gear case **9** evenly without break. After applying sealant, within three minutes, mount to the front plate.

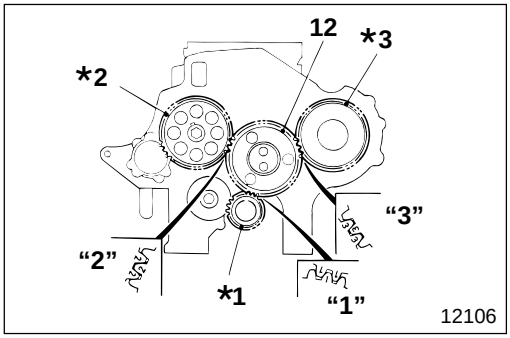
CAUTION ⚠

- **Be sure to clean and wipe off oily substances from the surface where sealant A is to be applied.**
- **Make sure that sealant A is not transferred to other areas while the mounting work is being done.**
- **Be sure to reapply sealant A if the bolts are loosened or removed by any cause whatsoever after mounting.**
- **Do not start the engine within an hour of mounting.**



11 Installation of thrust plate

A : Chamfered side (facing forward)



12 **Installation of idler gear assembly**

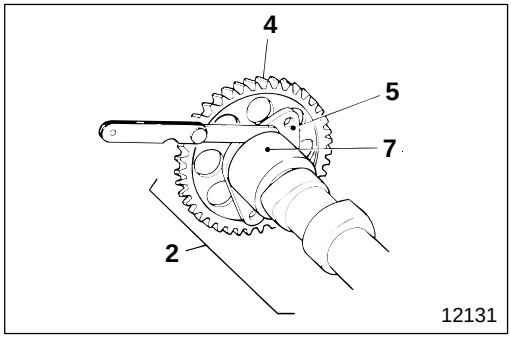
2 **Camshaft assembly**

[Removal]

Remove camshaft assembly **2** by undoing bolts **1** through the holes in camshaft gear **4**.

CAUTION⚠

Be careful not to damage the camshaft bushings when you remove camshaft assembly 2.



[Installation]
- Before installing camshaft assembly **2**, measure the end play between thrust plate **5** and camshaft **7**.
- If the measured value is higher than the limit, replace thrust plate **5**.
- Install the camshaft assembly by matching the alignment mark on camshaft gear **4** with the alignment mark on the idler gear. P11B-33

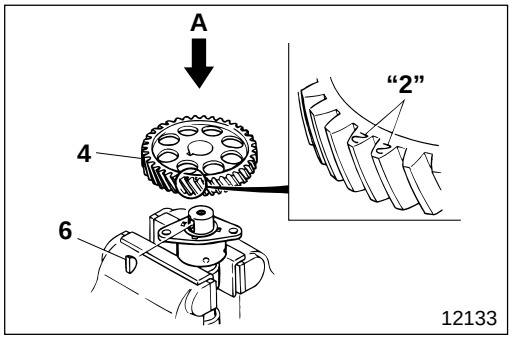
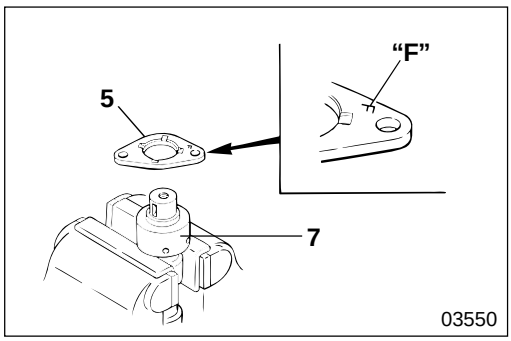
A : Press

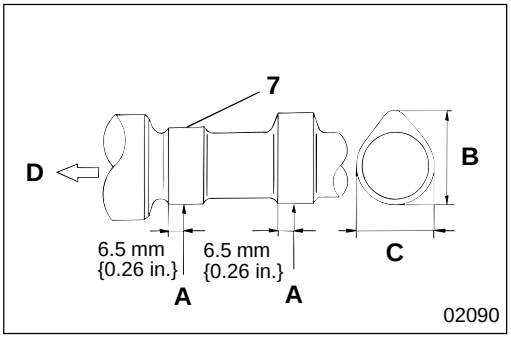


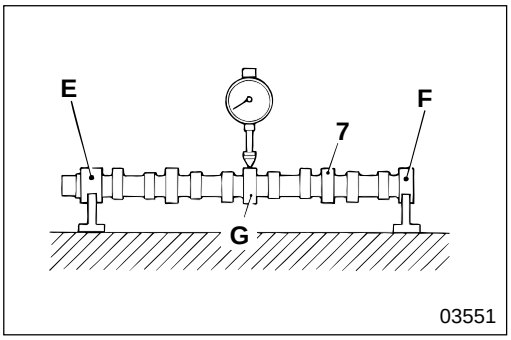
[Installation]
- Install camshaft gear **4** onto camshaft **7** in the direction as illustrated.
  A : Press
- Be sure to install key **6** prior to gear installation.

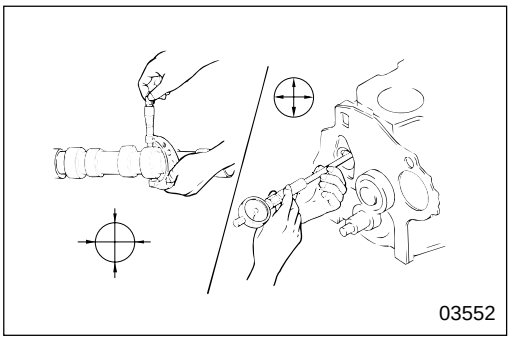


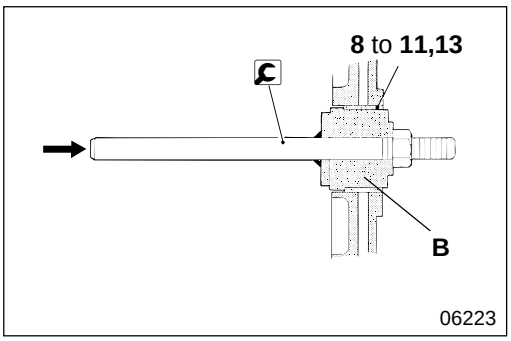
5 **Installation of thrust plate**

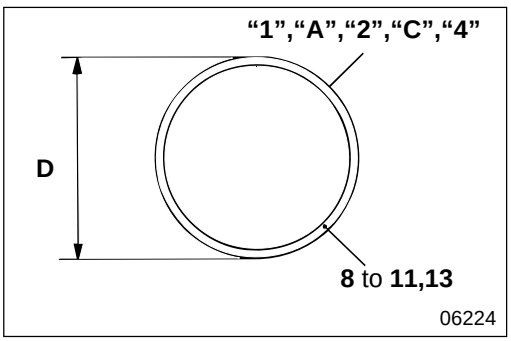
- Install thrust plate **5** onto camshaft **7** in the direction as illustrated.











7 **Inspection of camshaft**

(1) Difference between long diameter and short diameter

If the measured value is lower than the limit, replace camshaft **7**.

NOTE

Measure at point A, as illustrated, because the cam is tapered.

B : Long diameter
C : Short diameter
D : Front of the engine

(2) Degree of bend

To measure bend, support camshaft **7** at area **E** of No.1 journal, and area **F** of No.5 journal. Then, measure the amount of bend at area **G** of No.3 journal. If the measured values are higher than the limit, replace the camshaft.

NOTE

Degree of bend of camshaft 9 is half of the indicated value of the gauge after rotating the shaft 360°.

7 **to** **11** **13** **Camshaft and camshaft bushing**

[Inspection]
If the clearance is greater than the limit, replace the faulty parts.

NOTE

Measure bushings 8 to 11, 13 mounted in the crankcase.

Camshaft bushing

[Removal]
Remove camshaft bushings by using 🔧 camshaft bushing installer and extractor which has adapter **B** set by each bushing No.

NOTE

Remove No.1 to 4 camshaft bushings 8 to 11 from the front of the engine, and No. 5 camshaft bushing 13 from the rear of the engine by pushing 🔧 camshaft bushing installer and extractor.

[Press-fitting]

- Identify, by referring to the table below, No.1 to No.5 camshaft bushings by noting marks **"1"**, **"A"**, **"2"**, **"C"**, **"4"** on camshaft bushings **8** to **11**, **13**. If you cannot identify the mark, measure outer diameter **D** of the bushing and refer to the table below.

◆ Service procedure

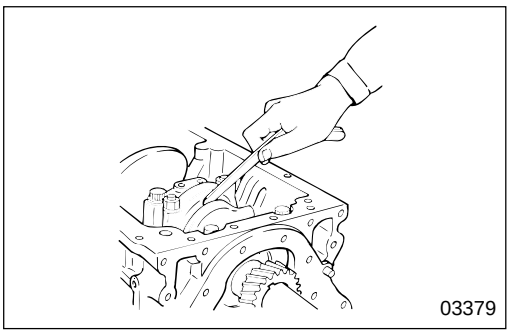
● **Inspection before disassembly**

(1) Extent of piston protrusion from the upper surface of crankcase *2

NOTE

Always inspect the extent of piston protrusion because it affects the engine performance greatly.

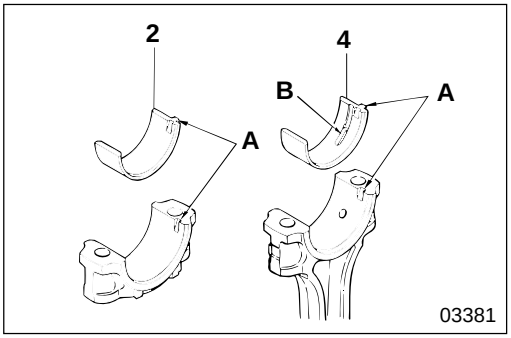
- Measure piston protrusion at two points on the top of the piston, and produce the average value.
  A : Front of the engine
- If the average valve deviates from the limit, inspect clearance of the related parts.



03379

(2) End play of connecting rod

- Measure the end play of each connecting rod.
- If the measured value is higher than the limit, replace the faulty parts.



2 **4** **Connecting rod bearing**

[Installation]
Install connecting rod bearings **2**, **4** by matching lugs **A** to the connecting rods.

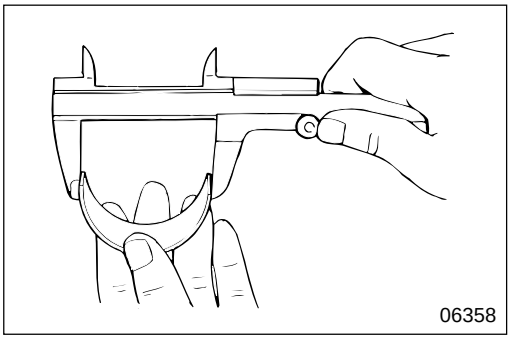
CAUTION

Be sure to distinguish between upper and lower connecting rod bearings 2, 4. The upper bearing has oil opening B while the lower bearing has no oil opening.

[Inspection]

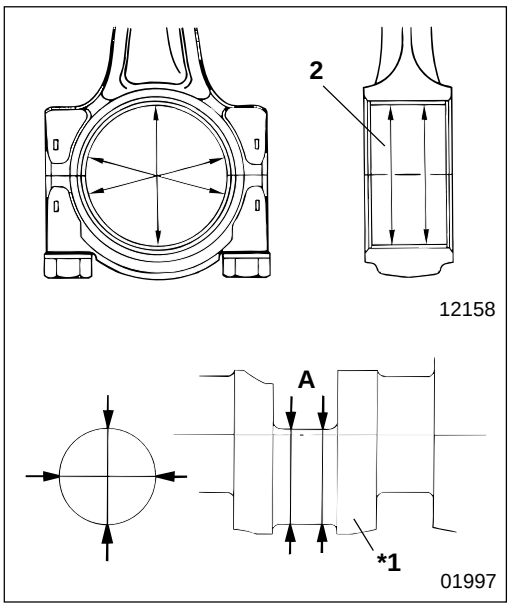
CAUTION

- **Do not forcibly open or expand connecting rod bearings 2, 4.**
- **When either upper or lower connecting rod bearings 2, 4 needs replacing, replace as a set.**



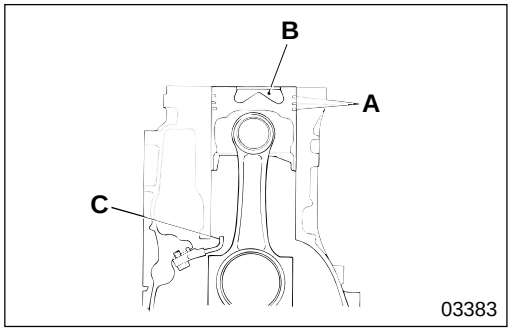
(1) Expansion at free state

If the measured value is lower than the limit, replace connecting rod bearings **2**, **4**.



(2) Clearance between connecting rod bearing and crankshaft (Oil clearance)

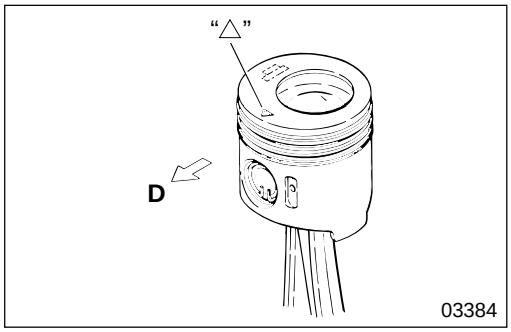
If the measured value is higher than the limit, replace the faulty parts. When replacing connecting rod bearings **2**, **4** with undersized ones, correct pin outer diameter **A** of crankshaft ***1** to the specified undersize. P11B-71



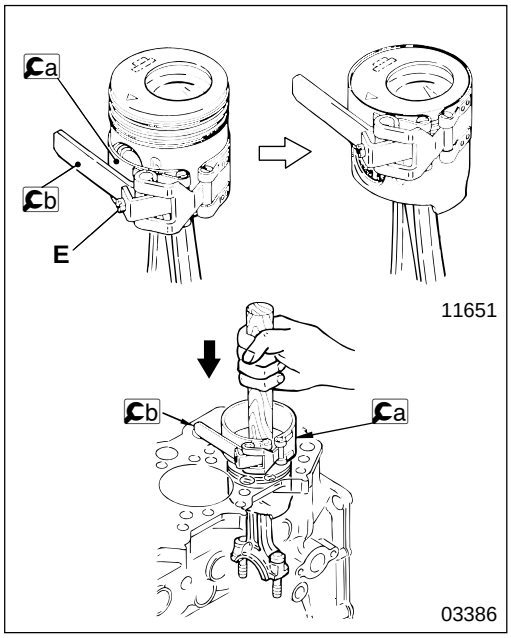
5 **Installation of piston and connecting rod assembly**

CAUTION

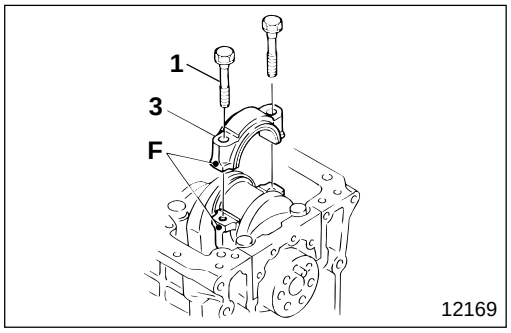
- **Be sure to fit piston ring A in the correct position.**
  P11B-48
- **Be careful not to scratch or damage head B of the piston (a part of the combustion chamber).**
- **Make sure that the connecting rod does not hit oil jet C.**



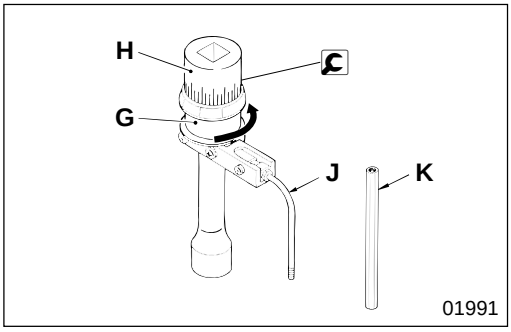
- Install piston front mark "△" directed towards the front of the engine using the following procedure.
  D : Front of the engine



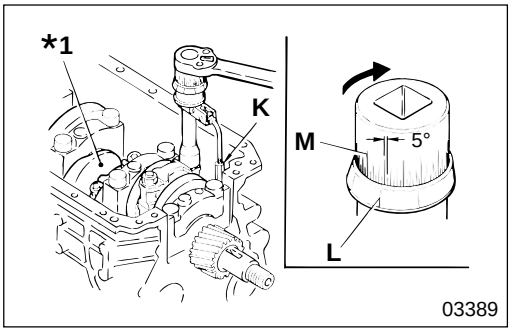
- Match the inner diameter of a piston guide clamp to the outer diameter of the piston skirt by turning adjusting bolt **E** of b piston guide lever.
- After adjusting, set a piston guide clamp and b piston guide lever at the top of the piston so that the clamp is flush with the top of the piston.
- Insert piston into cylinder linner and tap into place using a wooden dowel.



- After the piston is inserted, align alignment marks **F** on the connecting rod with the alignment marks on connecting rod cap **3** and tighten bolt **1** at specified torque. Then tighten the bolt further as follows:



- Turn socket wrench holder **G** counterclockwise and keep the spring in the wrench compressed.
  H : Socket
  J : Rod
  K : Rod (for extension)

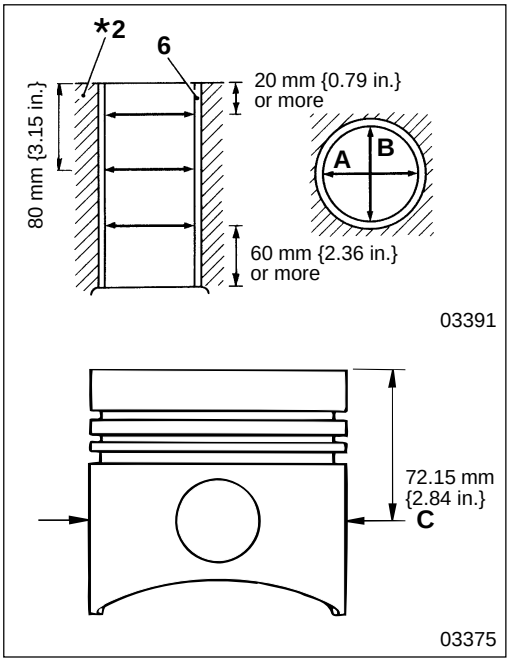


- Set socket wrench holder **G** so that the twisting force of the spring presses rod **K** (for connection) against crankshaft ***1**.
- Select a scale that is convenient for reading graduation **L** on holder **G** side.
- Tighten further by turning socket **H** clockwise by 90° (setting is in 5° increments), referring to graduation **M** on the selected scale.

NOTE

After installation of connecting rod cap 3, inspect the following points :

- **End play of the connecting rod : 🕮 P11B-42**
- **Piston protrusion : 🕮 P11B-42**



5 **6** **Piston and connecting rod assembly and cylinder sleeve**

[Inspection]

- Measure the clearance between the inner diameter of cylinder sleeve **6** and outer diameter of the piston part of piston and connection rod assembly **5**.
  A : Measuring point on the crankcase (in direction of the crankcase axis)
  B : Measuring point on the crankcase (vertical to the crankcase axis)
  C : Measuring point on the piston outer diameter (vertical to the piston pin hole)
- If the measured value is higher than the standard value, correct according to one of the following methods, depending on the condition of the parts.

CAUTION ⚠

Even if only one cylinder is faulty, correct all the cylinders to oversized ones of the same size.

  - Replacing the piston with an oversized one
  - Replacing cylinder sleeve **6**
- After determining the proper method of correction, correct by following one of the procedures described below.

[Correction]

Piston

< When replacing the pistons with an oversized ones >

Amount of oversize : 0.5, 1.0 mm {0.020, 0.039 in.}

- Measure the outer diameter **C** of the oversize piston to be used.
- Bore each cylinders so that the clearance between the piston and the cylinder sleeves conform to the standard value.

CAUTION

To prevent deformation as a result of the rise in temperature during boring, bore the cylinders in the following order.
No. 2 → No. 4 → No. 1→ No. 3

Dimension after boring finish (tolerance ±0.005mm {0.0002 in.})=
oversize piston outer dimension **C** + clearance between piston and cylinder - 0.02 mm {0.0008 in.}
(measured value) (service standards mean value) (honing extent)

- Boring is followed by honing to obtain the proper dimensions (tolerance ±0.005mm {0.0002 in.}).

Dimension after final finish (tolerance ±0.005mm {0.0002 in.})=
oversize piston outer dimension **C** + clearance between piston and cylinder
(measured value) (service standards mean value)

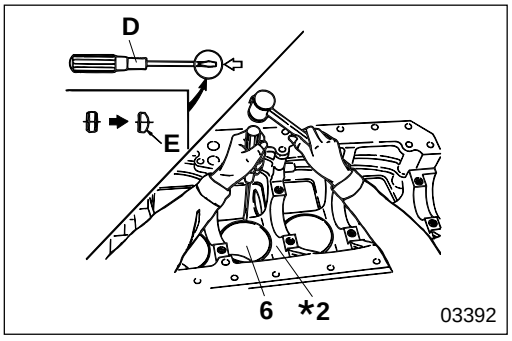
NOTE

- **Honing finished surface coarseness : 3.2 μm {1.26 × 10^{-4} in.} or less**
- **Honing cross-hatching angle : 15 to 25° (half angle)**
- **Cylinder bore squareness : 0.05 mm {0.002 in.}**

- Check the clearance between the piston and the cylinder.

NOTE

Piston rings must be replaced with the corresponding oversized ones.



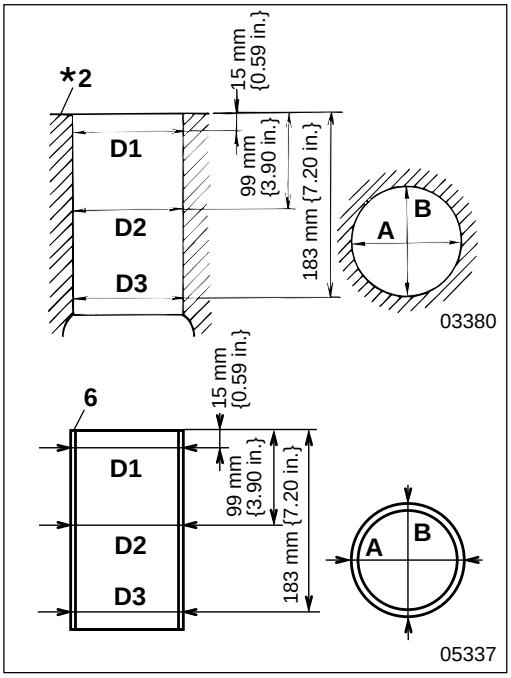
Cylinder sleeve

[Removal]

- Mount a boring machine on crankcase ***2** and center. Centering must be done at the lower part of cylinder sleeve **6** which is less unevenly worn.
- Bore until the thickness of cylinder sleeve **6** is approximately 0.5 mm {0.020 in.}.
- Insert tool **D** (a modified screwdriver) between crankcase ***2** and cylinder sleeve **6**, break the sleeve by tapping it gently, then remove.

CAUTION

Make sure when inserting tool D that round part E is facing crankcase *2.



[Installation]

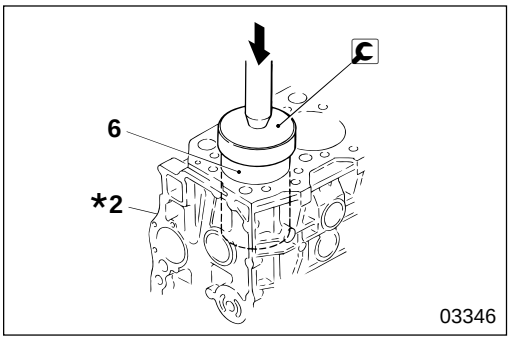
- Inspect sleeve hole of crankcase ***2** before installing cylinder sleeve **6**. If there are irregularities, such as defects or insufficient interference, correct them by boring.

NOTE

- **Pull out cylinder sleeve 6 of all cylinders and bore the sleeve holes perfectly round when you bore the sleeve holes of crankcase *2.**
- **Apply spindle oil (ISO VG 32) when you push cylinder sleeve 6 into the sleeve hole of crankcase *2.**

Inspection of interference must be carried out as follows.

- Measure the inner diameter of the sleeve hole of crankcase ***2** and the outer diameter of cylinder sleeve **6** at the specified positions illustrated.
- Take the average value at the top, middle and bottom (**D1**, **D2**, **D3**) and across the diameter (**A**, **B**). If the interference is lower than the limit, bore the sleeve hole of crankcase ***2** oversize.



< If interference fit is sufficient >

- Press-fit cylinder sleeve **6** into crankcase ***2** from the chamfered end using [C] cylinder sleeve installer.

NOTE

Align the top of cylinder sleeve 6 with the top of crankcase *2 when press-fitting.

- After press-fitting, make the inner diameter of cylinder sleeve **6** conform to the standard value by honing the block surface.

< If interference fit is insufficient >

- Prepare cylinder sleeve **6** which is 0.5 mm {0.020 in.} oversize in diameter.
- Hone crankcase ***2**, making the clearance between the outer diameter of cylinder sleeve **6** and the sleeve hole of crankcase ***2** conform to the standard value.
- Press-fit cylinder sleeve **6** into crankcase ***2** from the chamfered end using [C] cylinder sleeve installer.

NOTE

Align the upper face of cylinder sleeve 6 with the upper face of crankcase *2 when press-fitting.

- After press-fitting, make the inner diameter of cylinder sleeve **6** conform to the standard value by honing, and or boring, the installed sleeve.

PISTON, CONNECTING ROD AND CYLINDER SLEEVE

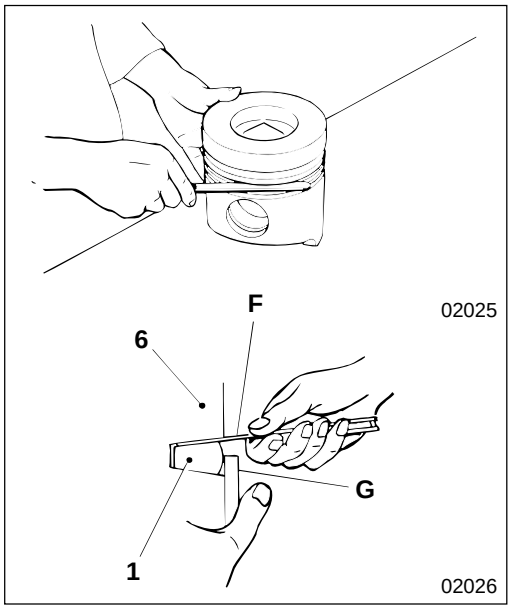
[Inspection]

(1) Clearance of piston ring slit

- Install piston rings **1** to **3** into the crankcase cylinder sleeve using the head of piston **6** to level the piston ring.
- Measure the clearance of the piston ring split while keeping them level and stationary. If the measured value is higher than the limit, replace the piston ring.

NOTE

- **Use piston 6 to ensure that piston rings 1 to 3 are kept level when inserting them into the crankcase cylinder sleeve.**
- **Insert piston rings 1 to 3 into the lower part of the crankcase cylinder sleeve, where the area is less worn, when measuring clearance of piston ring split 1 to 3.**
- **Exchange the whole set of piston rings 1 to 3 as a set if any of the rings is faulty.**

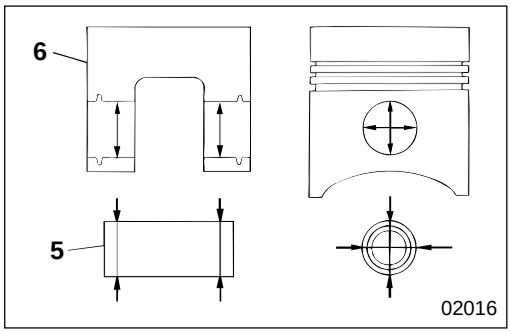


(2) Clearance between piston ring and ring groove

- If the measured value is higher than the limit, replace the faulty parts.
- Measure using feeler gauge **F**, by pressing 1st compression ring **1** against piston **6** with straight edge **G**.

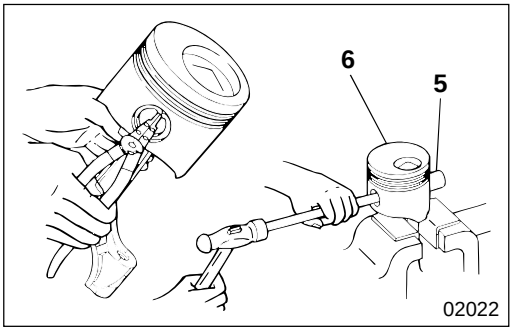
NOTE

- **Measurement has to be conducted around the whole periphery of piston 6 after removing carbon deposits.**
- **Be sure to exchange the whole set of piston rings 1 to 3 as a set if any of the rings is faulty.**



5 6 Clearance between piston pin and piston

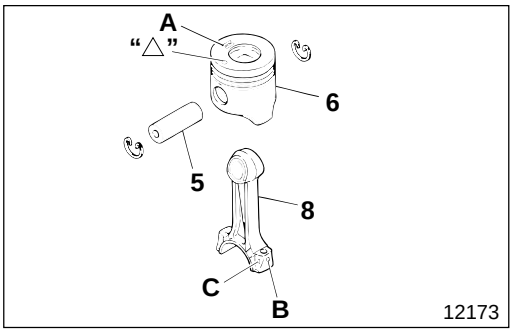
If the clearance is higher than the limit, replace the faulty parts.



5 6 8 Piston pin and connecting rod and piston

[Disassembly]

- Drift out piston pin **5** using a rod.
- When removal of piston pin **5** is difficult, warm piston **6** using a piston heater or hot water.



[Installation]

- Apply engine oil to piston pin **5** and assemble connecting rod **1** and piston **6** in the direction as illustrated.
  A : Piston mass (Mass of piston is marked)
  B : Connecting rod mass mark (Alphabetical: A, B, C, D, E, F, G)
  C : Mounting base of connecting rod cap
  △ : Front mark

- When piston pin **5** insertion is difficult, warm piston **6** using a piston heater or hot water.

CAUTION⚠

- **Make sure that the total mass error of all pistons 6 in one engine is 10 g {0.35 oz.} or less.**
- **Be sure to install connecting rods 8, to be used in one engine, that have identical mass mark B.**
- **Be sure that after inserting piston pin 5 the connecting rod operates smoothly without excessive play.**

Connecting rod bushing

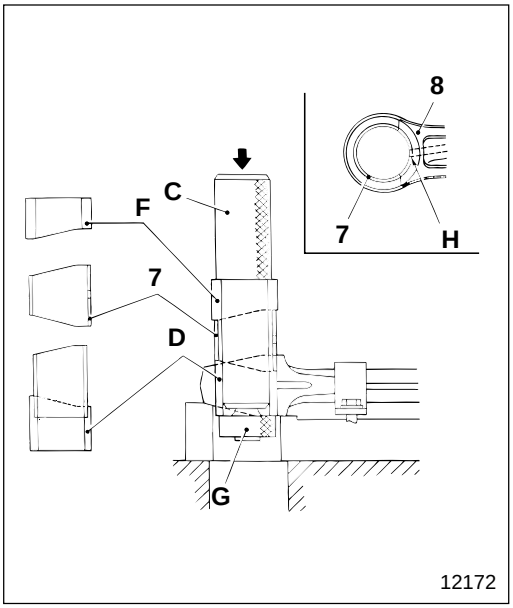
Use 🔧 connecting rod bushing puller kit to replace connecting rod bushing **7**.

(Components of 🔧 connecting rod bushing puller kit)

A : Base **B** : Bracket **C** : Puller **D** : Collar
E : Plate **F** : Collar **G** : Nut

[Pulling-out]

- Remove upper connecting rod bearing from the big end of connecting rod **8**.
- Place connecting rod **8** on base **A** and fix it to the base at two points, bracket **B** and plate **E**.
- Fit collar **D** in puller **C** in the direction as illustrated, and pull out connecting rod bushing **7** with a gradual load of approximately 49 kN {11020 lbf, 5000 kgf}.



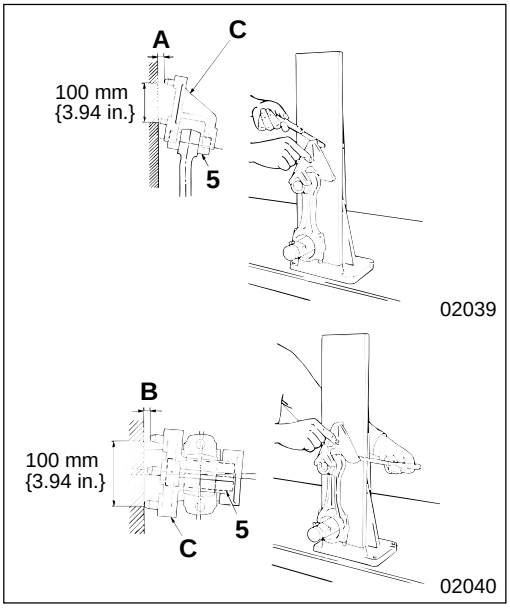
12172

[Press-fitting]

- Apply engine oil to the exterior peripheral area of connecting rod bushing **7** and the inner area of the bushing fitting ring of connecting rod **8**.
- Fit collar **F**, connecting rod bushing **7** and collar **D** in puller **C** in the arrangement and direction as illustrated and mount them with nut **G**.
- Align oiling holes **H** of connecting rod bushing **7** and connecting rod **8**, and gradually press in the bushing with approximately 49 kN {11023 lbf, 5000 kgf} load.
- After press-fitting, ream connecting rod bushing **7** to make its clearance with piston pin **5** conform to the standard value.

NOTE

After press-fitting bushing 7, insert piston pin 5 and make sure that the rod moves smoothly without any excessive play.



8 **Degree of bend or distortion of connecting rod**

- Mount connecting rod bushing **7** and piston pin **5** to connecting rod **8**.
- Measure degree of bend **A** and distortion **B** of connecting rod **8**. If the measured value is higher than the limit, repair or replace the connecting rod.
  C : Connecting rod aligner (Measuring instrument)

NOTE

- **When making measurements by mounting connecting rod 1 to connecting rod aligner C, make sure that the upper connecting rod bearing and the lower connecting rod bearing are mounted on the rod.**
- **Mount the connecting rod cap by tightening the bolt at specified torque.** 🕮 **P11B-44**

4 Flywheel assembly

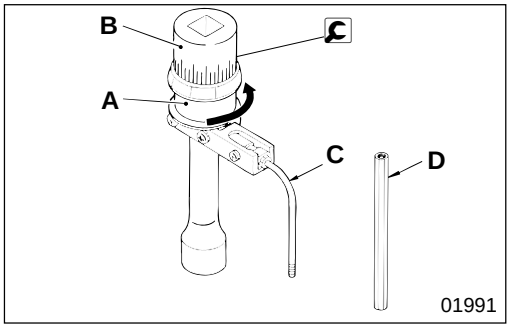
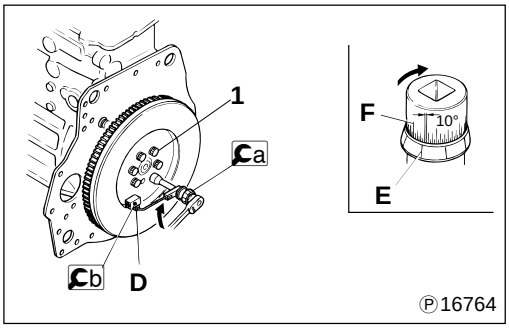
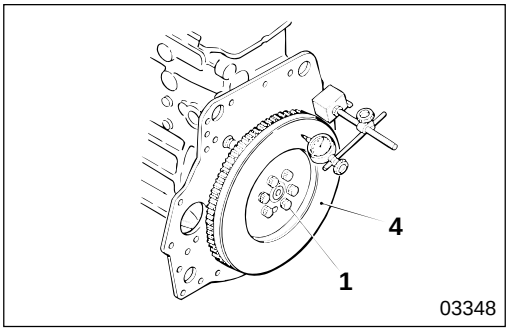
[Installation]

- After tightening bolt **1** at specified torque, tighten further as follows:
- Turn [c] socket wrench holder **A** counterclockwise and keep the spring in the wrench compressed.
  B : Socket
  C : Rod
  D : Rod (for connection)





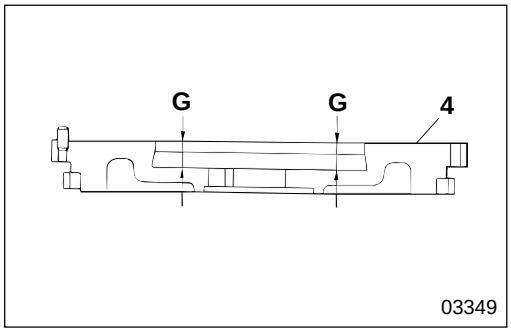
- Set [a] socket wrench holder **A** so that the repercussive force of its spring presses rod **D** (for connection) against [b] magnetic base
- Select a scale that is convenient for reading graduation **E** on holder **A** side.
- Tighten further by turning the socket clockwise by 40° ±5° (setting is in 10° increments) referring to graduation **F** on the selected scale.



[Inspection]
< Manual transmission >

(1) Wobble

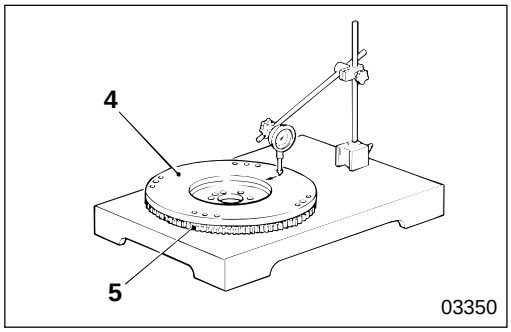
If the measured value is higher than the limit, check the fastening of bolt **1**, the attachment surface of crankshaft assembly, and depending on the condition found, either repair or replace flywheel assembly **4**.



(2) Height of friction surfaces

If the measured value is lower than the limit, repair or replace flywheel assembly **4**.

G : Height from bolt mounting surface to friction surface

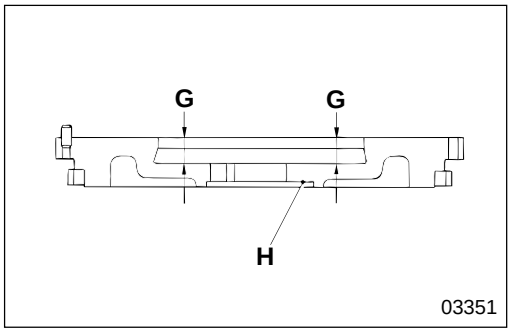


(3) Distortion of friction surface

If the measured value is lower than the limit, repair or replace flywheel assembly **4**.

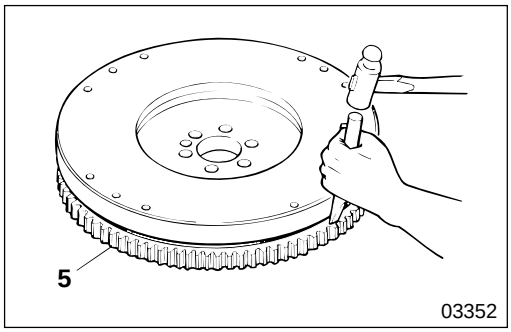
NOTE

If any fault is found in ring gear 5, replace it first, then begin the inspection.



[Correction]

Make sure when grinding the friction surfaces for correction, that height **G** is not lower than the limit while maintaining the degree of parallel with surface **H** within 0.1 mm {0.0039 in.}.



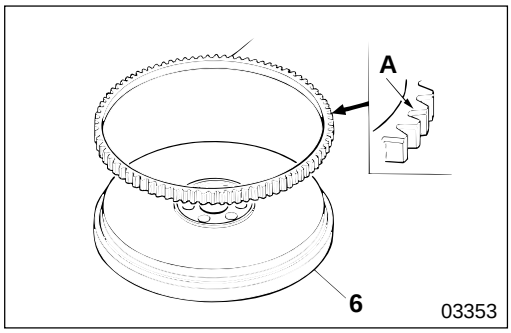
5 Ring gear

[Inspection]

Check and see if there is any damage, wear or other fault, and if any fault is found, replace ring gear **5**.

[Removal]

- Heat up ring gear **5** evenly using an acetylene torch.
- Hammer the outer edge of ring gear **5** evenly until it drops off.



[Installation]

- Heat up ring gear **5** using a piston heater to approximately 100°C {212°F} for three minutes.
- With the side of the chamfered teeth of ring gear **5** facing you, mount it on flywheel **6**.

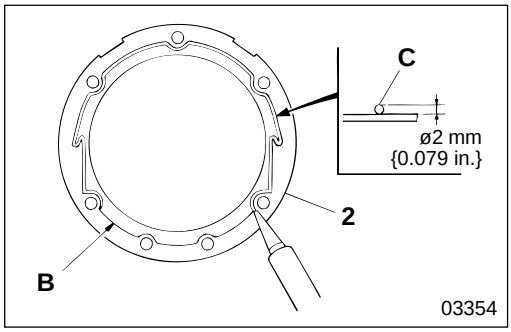
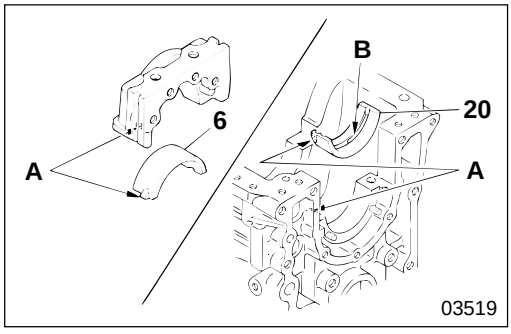
2 **Mounting of rear oil seal**

- Apply engine oil to lip area **A** of rear oil seal **2**.



- Apply sealant **C** along line **B** on rear oil seal **2** evenly without break.
- After applying sealant **C**, within three minutes, mount rear oil seal **2**.

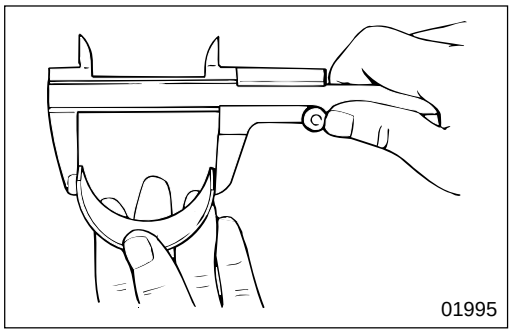
CAUTION⚠
- **Do not start the engine within an hour of mounting rear oil seal 2.**
- **Be sure to reapply sealant C if bolts 1 (for mounting rear oil seal 2) are loosened or removed by any cause whatsoever after mounting.**



6 **20** **Main bearing**

[Installation]
When installing main bearings **6**, **20**, align lugs **A**.

CAUTION⚠
Be sure to distinguish between main bearings 6, 20. The upper bearing has oil opening B while the lower bearing has no oil opening.

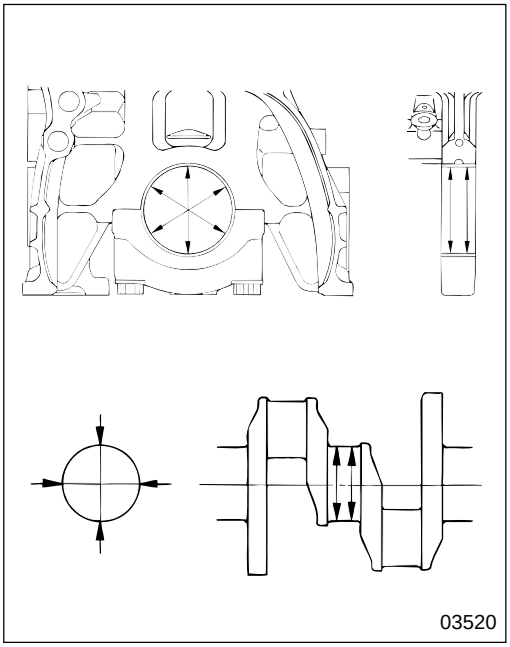


[Inspection]

CAUTION⚠
- **Do not forcibly expand main bearings 6, 20.**
- **Be sure to replace both upper and lower main bearings 6, 20 as a pair when replacement is necessary.**

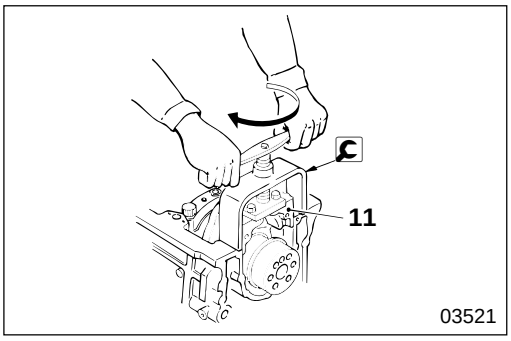
(1) Expansion at free state

If the measured value is lower than the limit, replace main bearings **6**, **20**.



(2) Clearance between main bearing and crankshaft

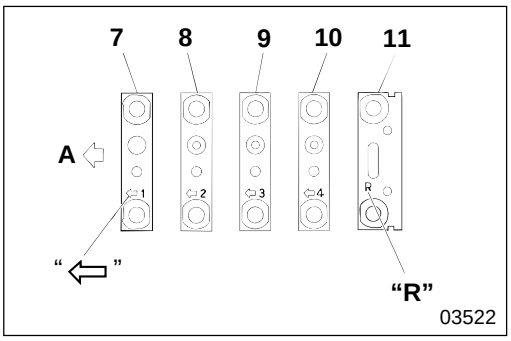
If the measured value is lower than the limit, replace faulty parts.



7 to 11 Main bearing cap

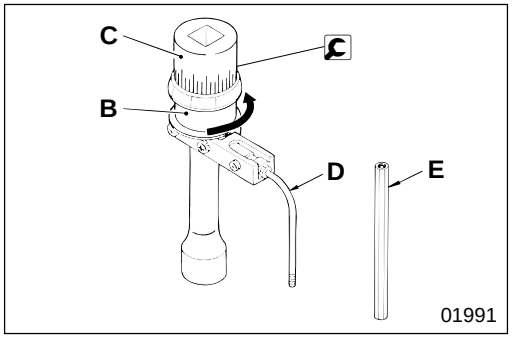
[Removal]

Use C bearing cap extractor to remove rear main bearing cap **11** because side seal **13** is installed between crankcase **23** and the rear main bearing.



[Installation]

- Install main bearing caps **7** to **11** in the direction as illustrated.
  A : Front of engine

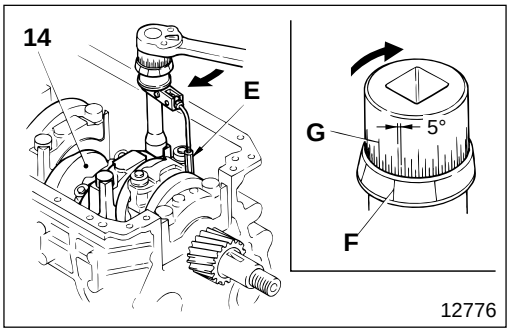


- Center punch the head of bolt **5** before installation.

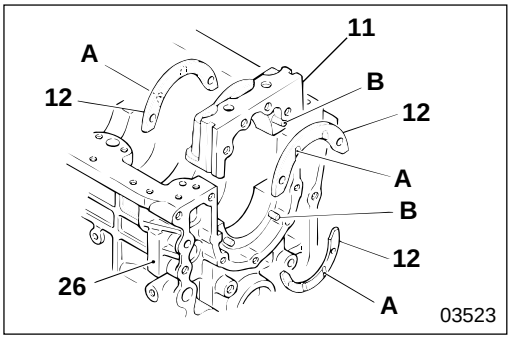
CAUTION⚠

If there are already three center-punch marks, replace the bolt with a new one.

- After tightening main bearing cap bolt **5** at specified torque, tighten further as follows:
- Turn 🔧 socket wrench holder **B** counterclockwise and keep the spring in the wrench compressed.
  C : Socket
  D : Rod
  E : Rod (for connection)



- Set 🔧 socket wrench holder **B** so that the repercussive force of the spring presses rod **E** (for connection) against crankshaft assembly **14**.
- Select a scale that is convenient for reading graduation **F** on holder **B**.
- Tighten further by turning socket **C** clockwise by 90° (setting is in 5° increments), referring to graduation **G** on the selected scale.
- After installation, check the following points :
  - Crankshaft assembly **14** can be rotated easily by hand.
  - The end play of crankshaft assembly **14**. 📖 P11B-69

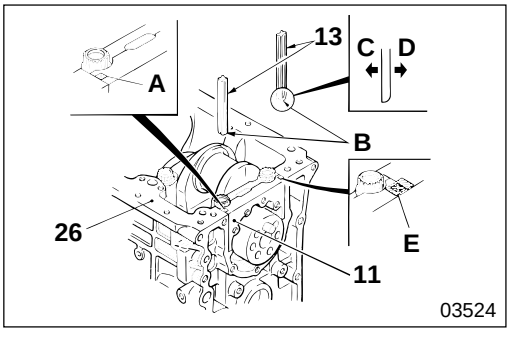


12 Installation of thrust plate

Install thrust plates **12** on both ends of rear main bearing **11** and the rear end of crankcase **26** in the direction as illustrated.
A : Oil groove
B : Positioning pin

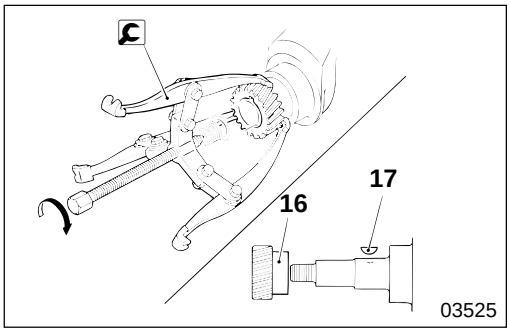
CAUTION⚠

When installing oversized thrust plates 12, mount them on the front and rear of rear main bearing cap 11. It is not necessary that the thrust plates used are all of the same size, but use the same-size-combination of thrust plates for mounting on the rear of crankcase 26 and on the rear of the rear bearing cap.
Available oversize : 0.15, 0.30, 0.45 mm { 0.0059, 0.012, 0.018 in. }



13 Installation of side seal

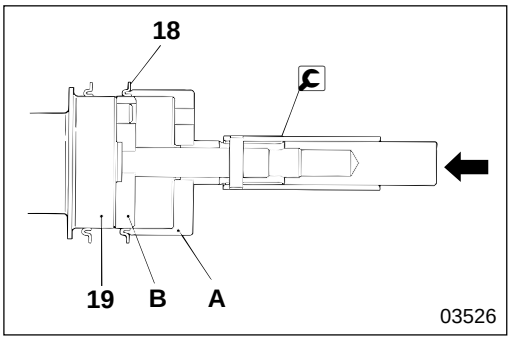
- Supply sealant in side seal mounting groove **A** of rear main bearing cap **11**.
- Apply sealant at end **B** of side seal **13**.
- Press in side seal **13** between rear main bearing cap **11** and crankcase **26** in the direction as illustrated.
  C : Rear main bearing cap side
  D : Crankcase side
- After pressing in, apply sealant to side seal mounting **E** of rear main bearing cap **11**.



16 Crankshaft gear

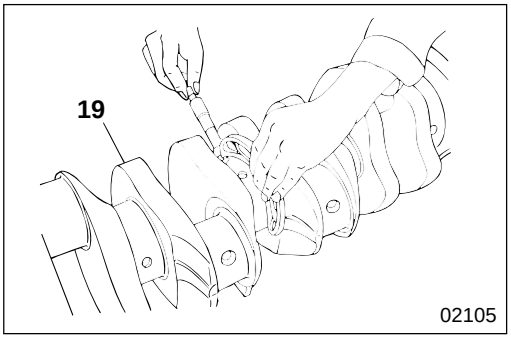
[Removal]
Never remove crankshaft gear **16** by striking, hitting or hammering it.

[Installation]
Before installing heat up crankshaft gear **16** using a piston heater or similar device to approximately 100°C {212°F}.



18 Installation of rear oil seal slinger

Install rear oil seal slinger **18** using oil seal slinger installer. Strike installer **A** until it hits guide **B** positively.

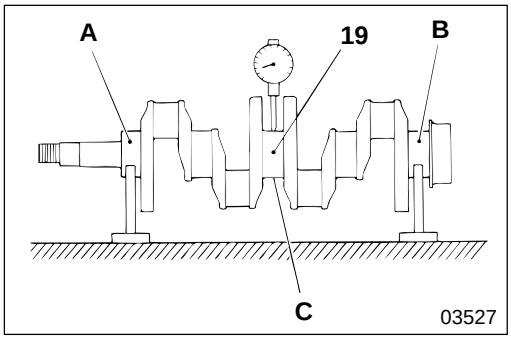


19 Crankshaft

[Inspection]

(1) Cylindrical and circular accuracy of the journal and the pin

If the measured value is higher than the limit, grind and correct crankshaft **19** to convert it to the undersize specifications or replace it.

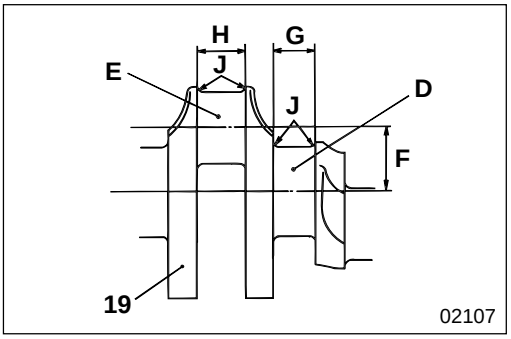


(2) Degree of bend

The degree of bend of crankshaft **19** is measured at No.3 journal **C** by supporting No.1 journal **A** and No.5 journal **B.** If the measured value is higher than the limit, replace the crankshaft.

NOTE

The degree of bend of crankshaft 19 is half of the indicated value of the gauge after rotating the shaft 360°.



[Correction]

NOTE

Be sure to replace main bearings 6, 20 with those that meet the undersize specifications after crankshaft 19 is corrected by grinding.

- Set **F**, distance between the center line of the journal **D** and that of the pin **E**, constant.
  F : 57.5±0.05 mm {2.26±0.0020 in.}
- Set the width of journal **G** and pin **H** so they are constant.
  G : 35 mm {1.38 in.} (32 mm {1.26 in.} for No.1 journal)
  H : $41\ ^{+0.2}_{0}$ mm
  $\{1.61\ ^{+0.0079}_{0}$ in.}

- Finish the fillet **J** smoothly.
  J : R4±0.2 mm {0.0079 in.}
- Check and confirm that there has been no cracking caused by grinding using the magnetic particle inspection method (Magnafluxing). Also make sure the surface hardness has not deteriorated (Shore hardness to be maintained at not less than Hs 75).
- When grinding **K**, set crankshaft **19** and grinder **L** so that they both rotate counterclockwise as viewed from the front of the crankshaft.
- To finish grinding **M** using a grindstone or emery paper **N,** rotate crankshaft **19** clockwise.

26 **Crankcase top surface distortion**

If the measured value is higher than the limit, grind and correct using a surface grinder.

A : Lines to be measured

CAUTION⚠

When grinding crankcase 26 be sure that the extent of piston protrusion does not deviate from the standard value.

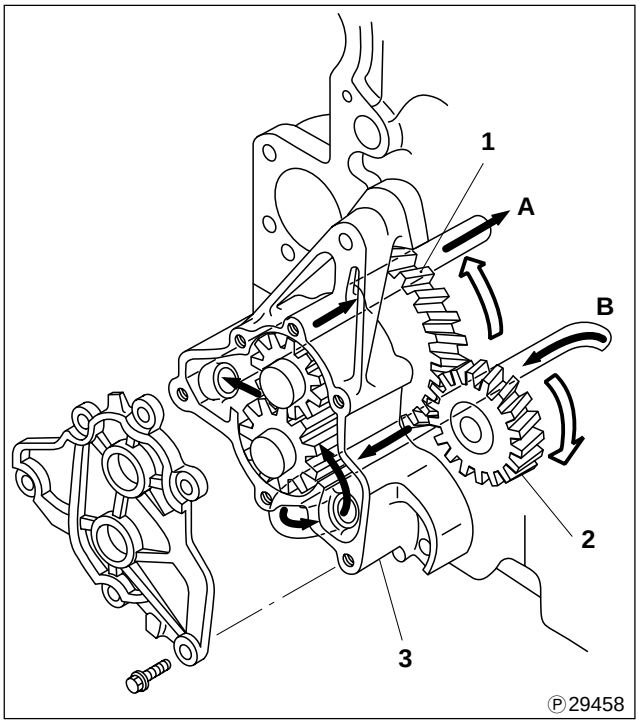
A : Orifice

Oil Pump

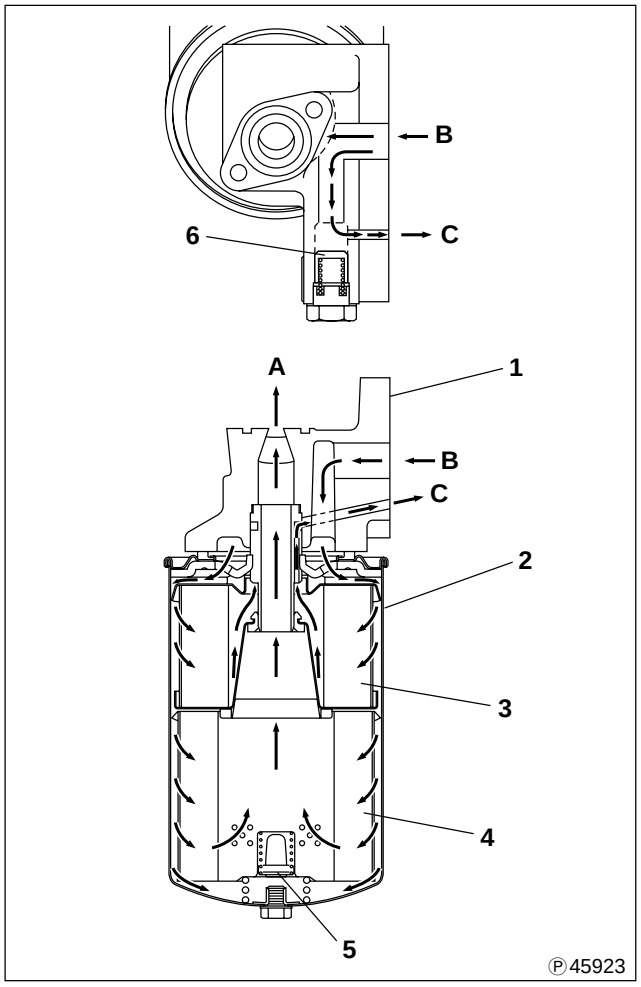


1 Oil pump gear
2 Crankshaft gear
3 Oil pump

A : To oil filter
B : From oil strainer

Oil pump **3** is a gear type. It is driven by rotation of the crankshaft via crankshaft gear **2** and oil pump gear **1**.

Oil Filter

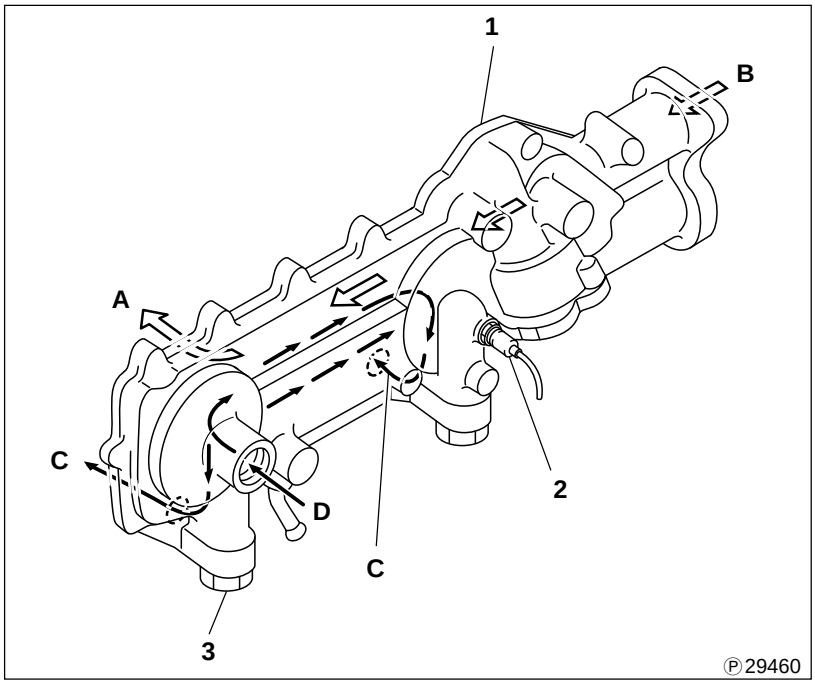


1 Oil filter head
2 Oil filter
3 Bypass filter
4 Full-flow filter
5 Bypass valve
6 Regulator valve

A : To oil cooler
B : From oil pump
C : To oil pan

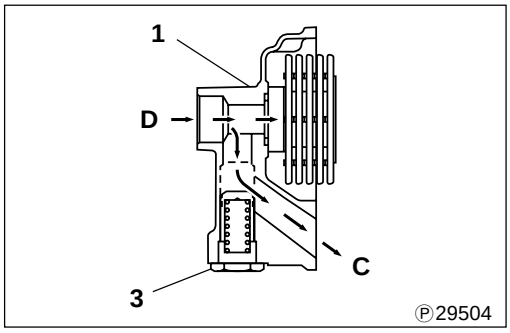
- The oil filter is a spin-on filter-paper type incorporating a bypass filter **3** and a full-flow filter **4**.
  A bypass valve **5** is fitted at the bottom of the filter assembly. If the elements become clogged, the bypass valve opens and allows oil to flow to oil cooler without passing through the elements. This operation prevents seizure of the engine.
- When the pressure of oil going to the main oil gallery exceeds a specified level, regulator valve **6** opens, allowing some of the engine oil to return to the oil pan. The oil pressure is thus constantly regulated.

Oil Cooler



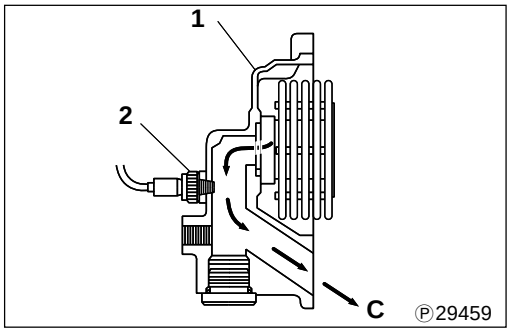
1 Oil cooler
2 Engine oil pressure switch
3 Bypass valve

A : Coolant outlet
B : Coolant inlet
C : To main oil gallery
D : From oil filter



● **Bypass valve**

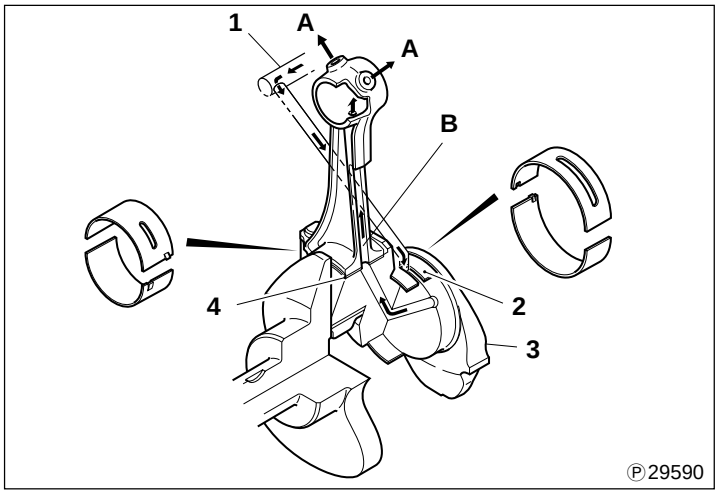
When the oil's viscosity is high at low temperatures or when oil cooler **1** element is clogged and resists the oil's flow, bypass valve **3** opens, thus allowing engine oil to flow to main oil gallery without passing through the cooler.



● **Oil pressure switch**

If the pressure of oil fed to main oil gallery drops below the specified level, electric contacts close inside engine oil pressure switch **2**. As a result, a warning lamp illuminates in the meter cluster to alert the driver.

Lubrication of Related Parts

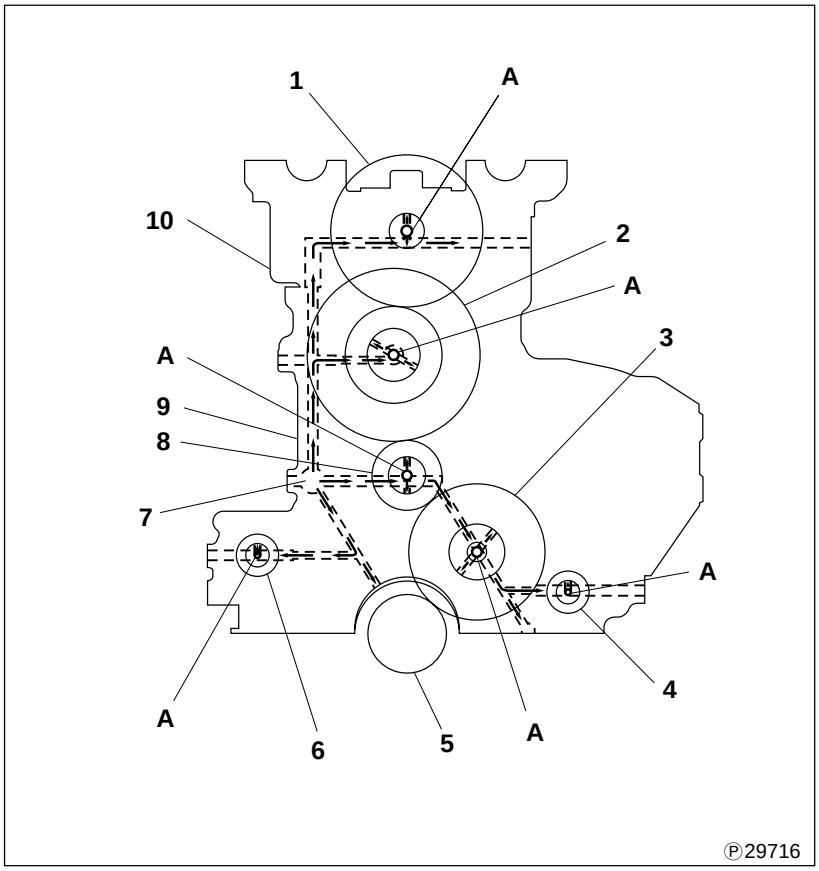


● **Main bearing and connecting rod bearing**

1 Main oil gallery
2 Main bearing
3 Crankshaft
4 Connecting rod bearing

A : Oil jet
B : Connecting rod oil passage

Oil supplied via the oil passage in the crankshaft flows through oil passage **B** in the connecting rod to lubricate the connecting rod's small end. The oil then sprays out from oil jet **A** at the top of the connecting rod to cool the piston.

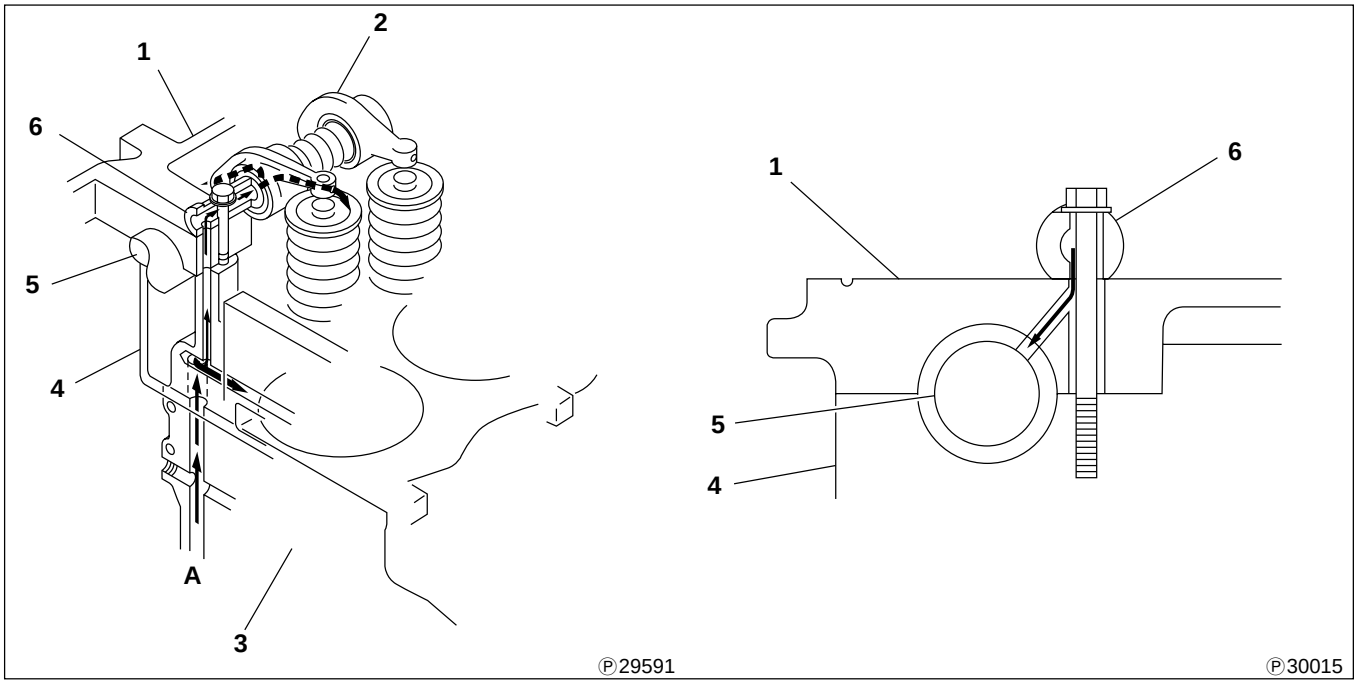


● **Timing gear**

1 Head idler gear
2 Idler gear A, B
3 Idler gear No.1
4 Balanceshaft gear LH
5 Crankshaft gear
6 Balanceshaft gear RH
7 Main oil gallery
8 Fan shaft assembly
9 Upper crankcase
10 Cylinder head

A : Oil hole

Engine oil from main oil gallery **7** passes through upper crankcase **9** and cylinder head **10** to lubricate the journals of the gears. The oil that has lubricated head idler gear **1** sprays out of oil hole in the gear boss and returns to the oil pan through inside the front case while lubricating the gears.

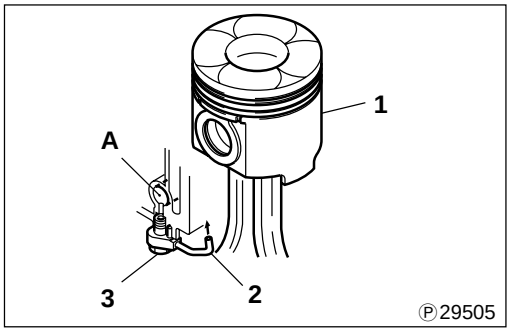


● **Valve mechanism**

1 Camshaft frame
2 Rocker arm
3 Upper crankcase
4 Cylinder head
5 Camshaft
6 Rocker shaft

A : From main oil gallery

Engine oil from main oil gallery **A** passes through upper crankcase **3**, cylinder head **4** and camshaft frame **1** to rocker shaft **6**. Then, the oil flows through the oil passage of rocker shaft and returns to the oil pan while lubricating rocker arm **2** and camshaft **5**.

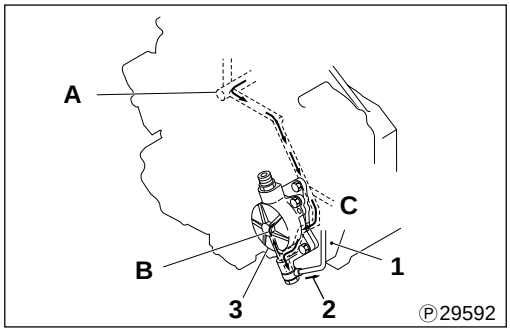


● **Oil jet**

1 Piston
2 Oil jet
3 Check valve

A : Main oil gallery

An oil jet **2** is fitted in the lower part of the main oil gallery **A** for each cylinder. These oil jets cool the pistons **1** by injecting oil into them. Each oil jet is fitted with check valve **3** that opens and closes at specified oil pressure levels. At low engine speeds, these check valves close to maintain the required volume of oil in the lubrication system and prevent reductions in oil pressure.



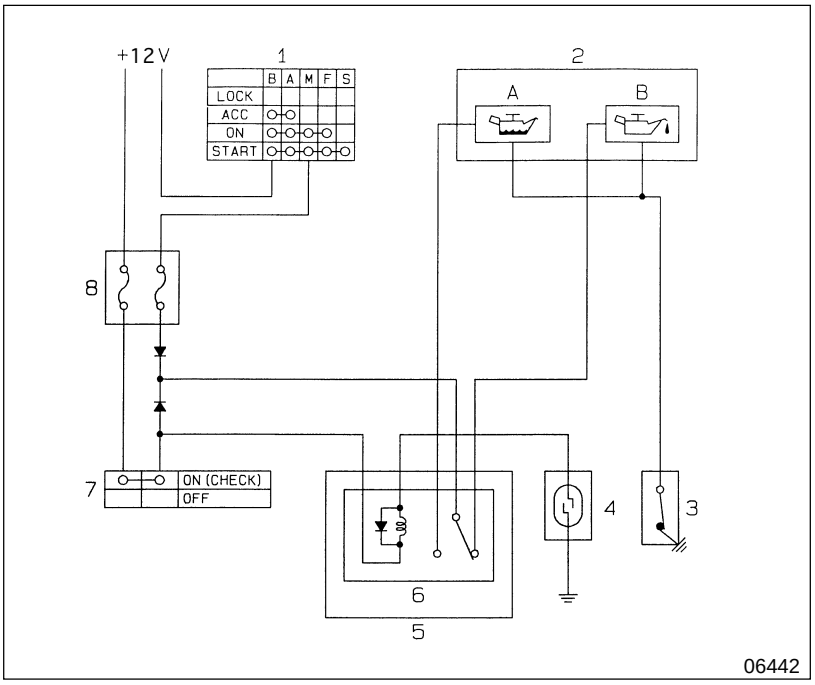
● **Vacuum pump**

1 Front case
2 Oil pipe
3 Vacuum pump

A : Main oil gallery
B : To front case
C : To automatic timer

Engine oil delivered from main oil gallery **A** flows to vacuum pump **3** where it branches into two flows; one is, after lubricating the vanes, discharged into front case **1** from the air vent hole and returns to the oil pan. The other passes through oil pipe **2** to lubricate various parts of the automatic timer and then returns to the oil pan.

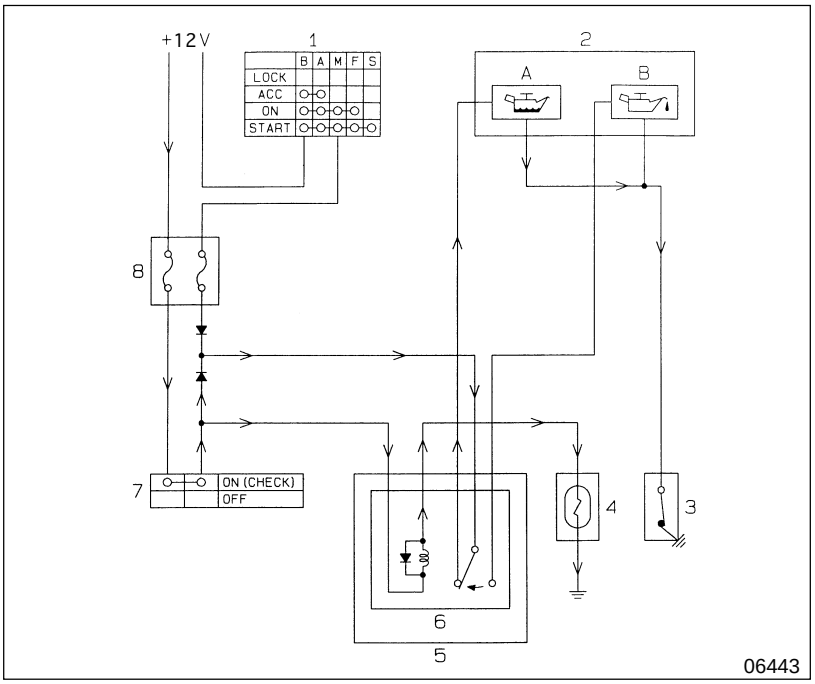
Lubrication System Monitoring Circuit



1 Starter switch
2 Meter cluster
3 Oil pressure switch
4 Oil level sensor
5 Relay box
6 Oil level relay
7 Oil level check switch
8 Fuse box

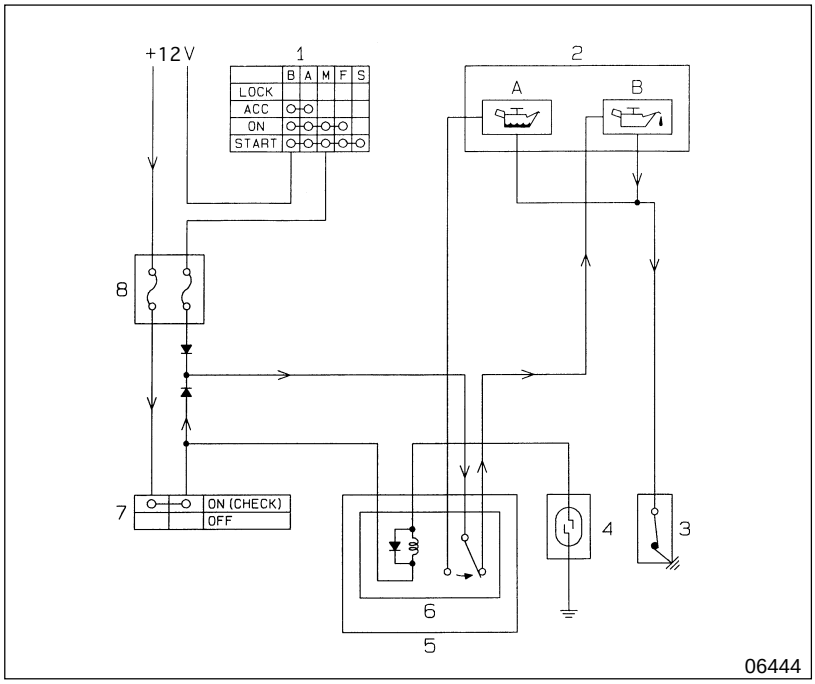
A : Oil level indicator lamp (green)
B : Low oil warning lamp (red)

This circuit monitors the lubrication system by detecting the pressure and level of engine oil.



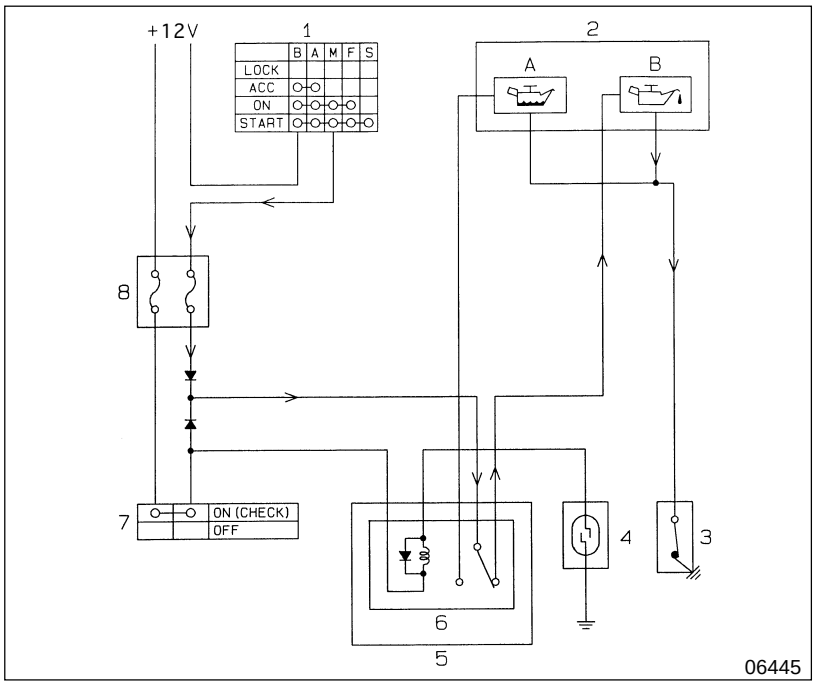
● Oil level normal (oil level sensor ON)
When oil level check switch **7** is turned ON while the engine is not running (oil pressure switch **3** ON), oil level sensor **4** is grounded and therefore oil level relay **6** is energized. This allows current to flow through the route given below and turn on oil level indicator lamp **A**. (green)

Fuse box **8** → oil level check switch **7** → relay box **5**
→ oil level relay **6** → oil level sensor **4** → ground
→ meter cluster **2** → oil level indicator lamp **A**
→ oil pressure switch **3** → ground



● Oil level low (oil level sensor OFF)
Even when oil level check switch **7** is turned ON while the engine is not running (oil pressure switch **3**: ON), oil level relay **6** is not energized because oil level sensor **4** is off. This causes the current to flow through the route given below and turn on oil pressure warning lamp **B**. (red)

Fuse box **8** → oil level switch **7** → Relay box **5** → oil level relay **6** → meter cluster **2** → oil pressure warning lamp **B** → oil pressure switch **3** → ground



● Oil pressure abnormal (oil pressure switch ON)
The oil pressure drops while the engine is running oil pressure switch **3** turns ON. As a result, current flows through the route given below to turn on oil pressure warning lamp **B**. When oil pressure is normal, oil pressure switch **3** remains off and no current flow to illuminate lamp **B.** (red)

Starter switch **1** → fuse box **8** → relay box **5** → oil level relay **6** → meter cluster **2** → oil pressure warning lamp **B** → oil pressure switch **3** → ground

WARNING ⚠

- **Wipe up any spilled engine oil since it may cause a fire.**
- **Do not touch oil when the engine is hot since it can inflict severe burns.**

CAUTION ⚠

When pouring oil into the engine, take care not to spill any on the V-ribbed belt. Contact with oil could make the V-ribbed belt slip, rendering the cooling system less effective.

[Installation]

- Clean the surface of oil filter head **3** to which oil filter **2** is fitted.
- Apply a thin coat of engine oil to the gasket A of oil filter **2**.
- Screw oil filter **2** onto oil filter head **3** by hand until gasket **A** contacts the oil filter head. Then, tighten oil filter **2** further by giving it an additional 3/4 turn.
- After installing the oil filter, start the engine and check gasket **A** for oil leakage.
- Check to see if the engine oil level is in the specified range.

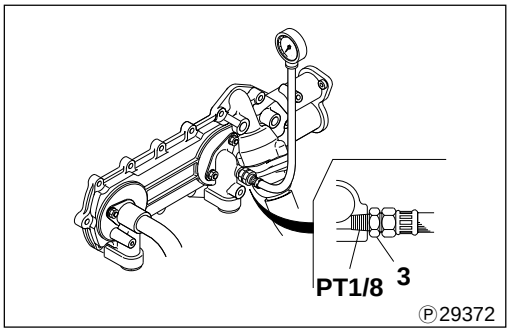
- Remove engine oil pressure switch **2** from oil cooler **1**.



- Fit adapter **3** into the engine oil pressure switch **2** mounting hole, then fit the oil pressure gauge onto the adapter.
- Warm up the engine until the oil temperature reaches 158 to 194°F (70 to 90°C).
- Measure the oil pressure at idle speed and at no-load maximum speed. If the measured values are below the specified standard values, overhaul the lubrication system.
- After taking measurements, install oil pressure switch **2** and tighten it to the specified torque.

CAUTION ⚠

Oil pressure switch 2 must be fitted when the engine is cold.

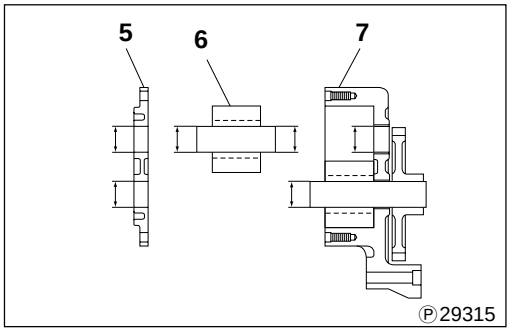
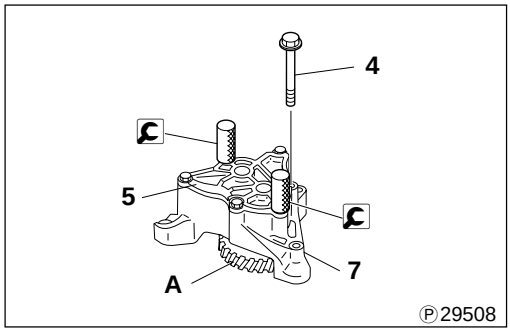
3 Installation of oil pump assembly

- With No. 1 cylinder set at its top dead center, position crankshaft gear ***b**.
- Install oil pump assembly **3** while meshing its gear with crankshaft gear ***b** and balance shaft gear RH ***d** at the match marks "**6**" and "**7**" as shown.



5 to 7 Inspection of oil pump cover, driven gear assembly and oil pump case assembly

Measure the clearance between each gear shaft and oil pump case assembly **7** or cover **5**. Replace the oil pump assembly if any measurement is out of specification.

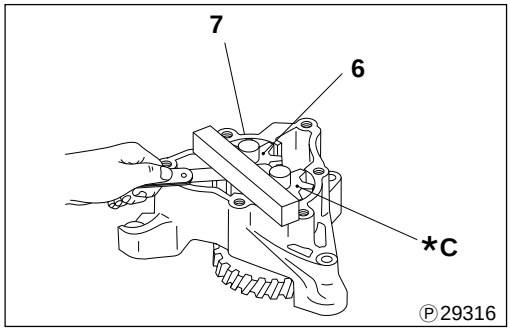


5 **7** **Installation of oil pump cover and oil pump case assembly**

- Position oil pump cover **5** on oil pump case assembly **7** using two 🔧 Pump Cover Pins.
- Fit bolt **4** and tighten it to the specified torque.
- Remove 🔧 Pump Cover Pins, then fit other bolts **4** and tighten them to the specified torque.

CAUTION ⚠

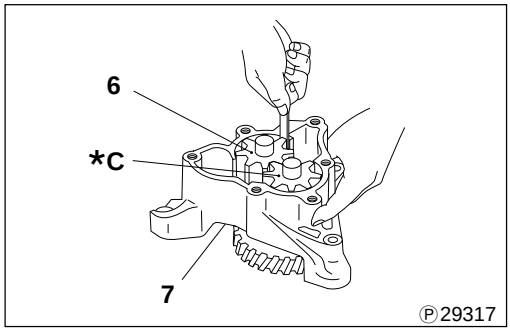
- **Before assembly, apply engine oil to various parts. Pour approximately 5 cm³ {0.3 Cu.in.} of engine oil into the assembly from the oil outlet before installing to the engine.**
- **After assembly, turn the oil pump gear A by hand and check that it rotates smoothly. If the gear does not rotate smoothly, disassemble and reassemble the components.**



6 **7** **Inspection of driven gear assembly and oil pump case assembly**

(1) Differences between gear heights and oil pump case depth

Replace the oil pump assembly if the measurement is out of specification.



(2) Clearance between gear teeth tip and oil pump case

Replace the oil pump assembly if the measurement is out of specification.

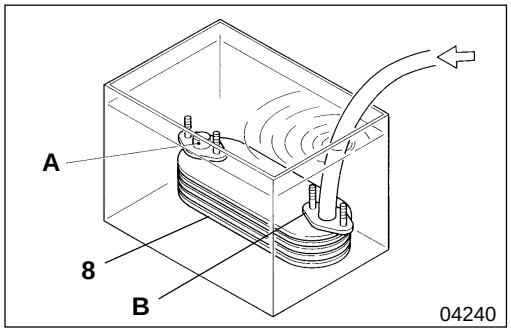
◆ Service procedure

● Cleaning

- Check whether carbon deposits or sludge have accumulated in the oil passage of oil cooler element **8** or in the oil cooler's bypass arrangement. Remove any deposits with cleaning solvent.
- Clean out any water scale or deposits that have accumulated in the oil cooler element **8** or oil cooler body **19**.



8 **Inspection of oil cooler element**

- Plug outlet **A** of oil cooler element **8** and connect a hose to the oil inlet **B**. Then, immerse the oil cooler element in a tank of water.
- Apply an air pressure of 980 kPa {140 psi, 10 kgf/cm^2} via the hose and check that no air leaks from the oil cooler element **8**.
- If any air leaks, replace the oil cooler element **8**.

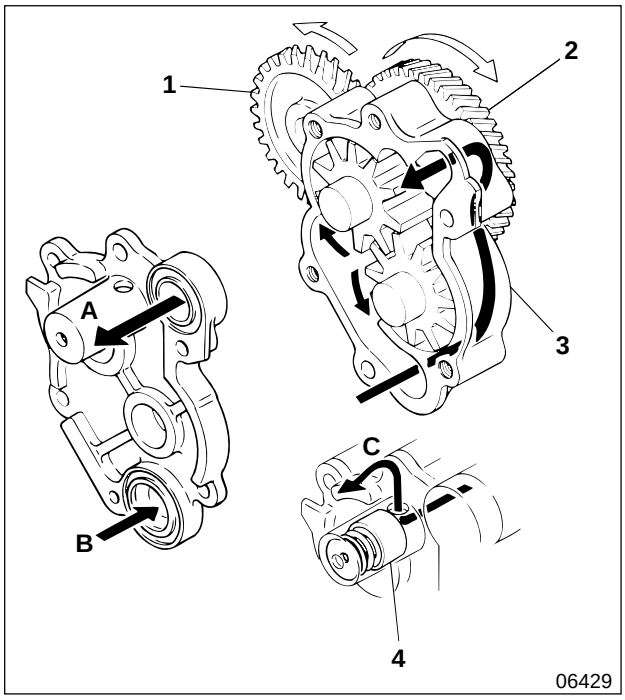
Oil Pump



1 Crankshaft gear
2 Oil pump gear
3 Oil pump
4 Relief valve

A : To oil cooler
B : From oil strainer
C : To oil pan

Oil pump **3** is a gear type, driven by rotation of the crankshaft transmitted by crankshaft gear **1** that engages oil pump gear **2**. Relief valve **4** is installed on the oil pump and when the oil pump discharge pressure becomes higher than the standard pressure level, part of the engine oil is returned to the oil pan by relief action of the valve, protecting the lubricating system from damage caused by excessive oil pressure.

Oil Cooler and Oil Filter

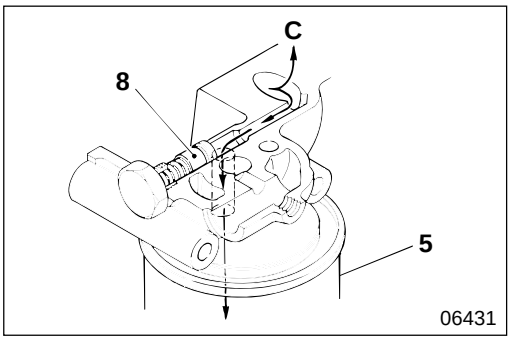
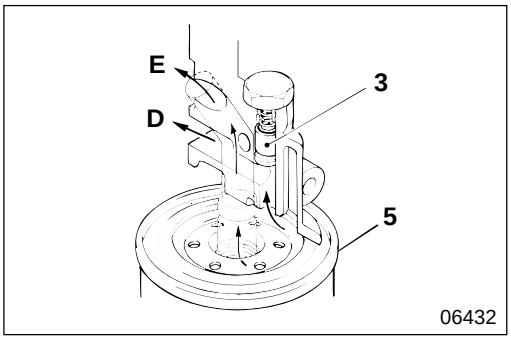
5 Oil filter
6 Full-flow filter element
7 Bypass valve
8 Bypass valve

A : Coolant exit port
B : Coolant entry port
C : To oil cooler
D : To oil pan
E : To main oil gallery



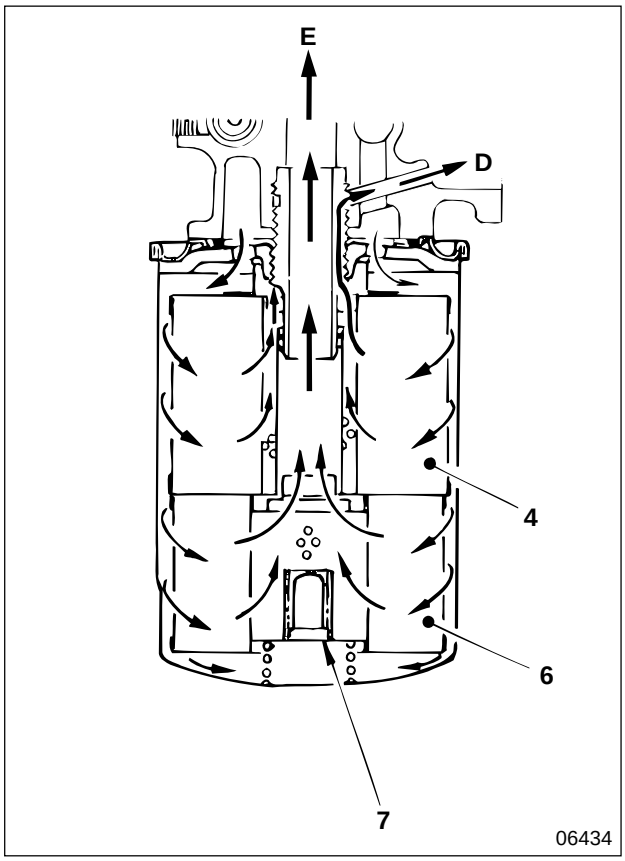
● **Operation of bypass valve**

When the viscosity of the engine oil is high at low temperatures, or when oil cooler **2** element is clogged, flow resistance is high, and if this happens, bypass valve **8** opens to let the engine oil return directly to oil filter **5** without going through the oil cooler.



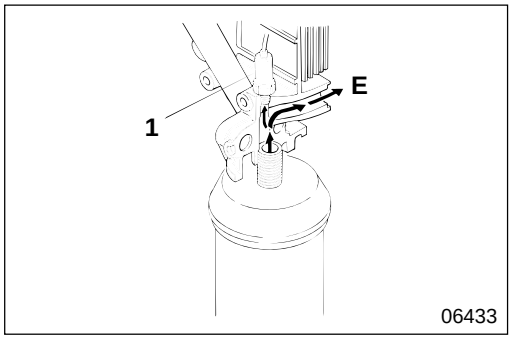
● **Operation of regulator valve**

When the oil pressure in the main oil gallery becomes higher than standard, regulator valve **3** opens to let part of the oil return to oil pan **D**, thereby regulating the oil pressure.



● **Oil filter element**

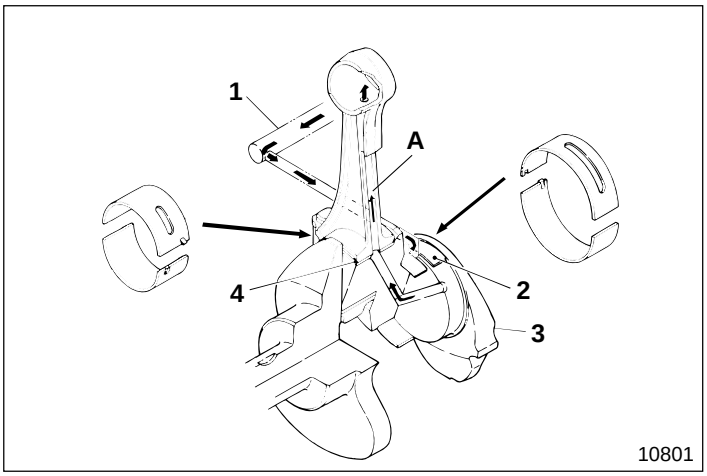
This oil filter uses a spin-on, filter paper type element, that integrates full-flow filter element **6** and bypass filter element **4**. When the filter element is clogged, bypass valve **7**, installed at the base of the filter, opens to let the oil bypass the element and flow directly to main oil gallery **E**, preventing engine seizure.



● **Operation of engine oil pressure switch**

When oil pressure to main oil gallery **E** becomes lower than standard, the built-in electric contact point of engine oil pressure switch **1** closes to light the warning lamp in the meter cluster, warning the driver that the oil pressure is abnormal.

Lubrication of Related Parts



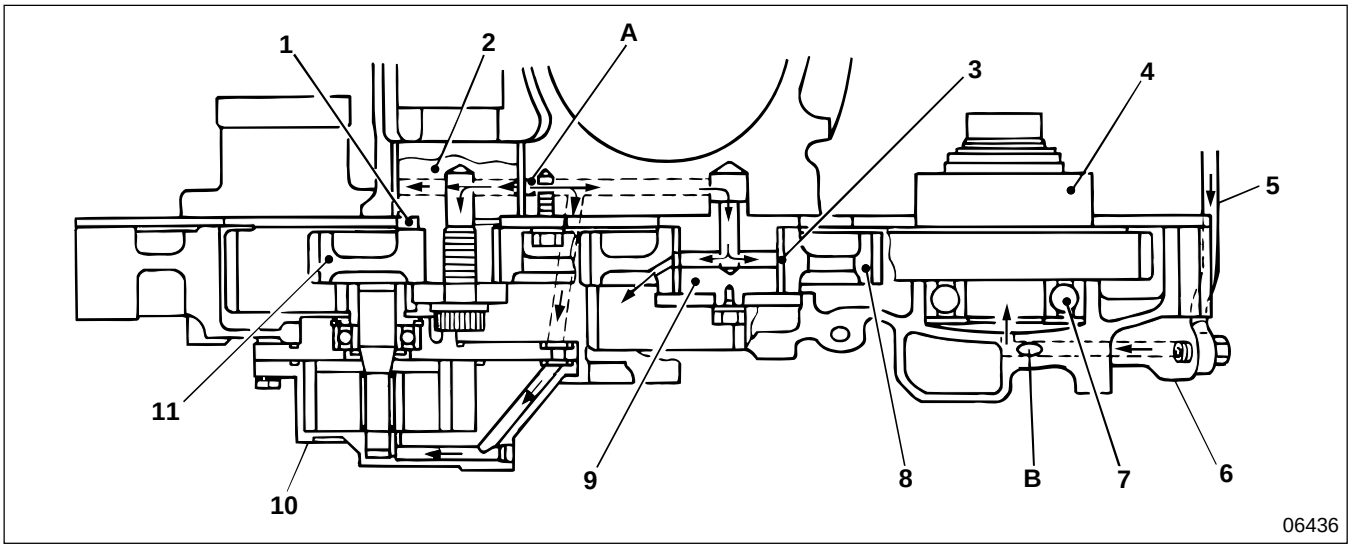
● **Main bearing and connecting rod bearing**

1 Main oil gallery
2 Main bearing
3 Crankshaft
4 Connecting rod bearing

A : Connecting rod oil passage

Engine oil supplied through the oil passage drilled in the crankshaft flows through connecting rod oil passage **A** to lubricate the small end of the connecting rod.

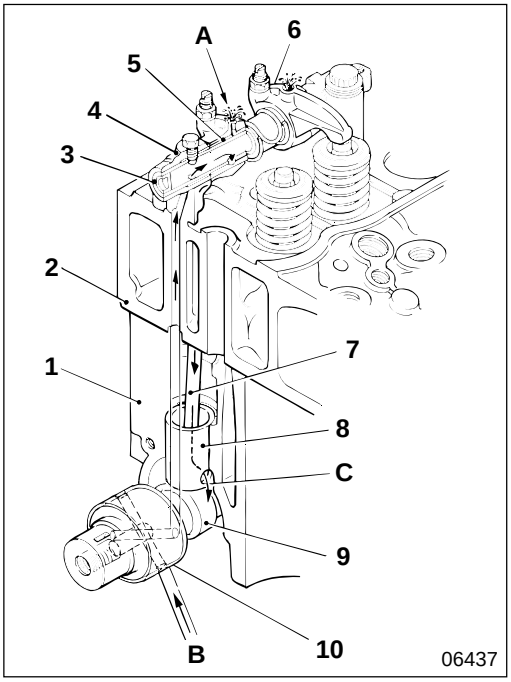
● **Timing gear**



1 Thrust plate
2 Camshaft
3 Idler gear bushing
4 Injection pump gear
5 Oil pipe
6 Timing gear case
7 Bearing
8 Idler gear
9 Idler shaft
10 Vacuum pump
11 Camshaft gear

A : From main oil gallery
B : Oil jet (for forced lubrication of automatic timer)

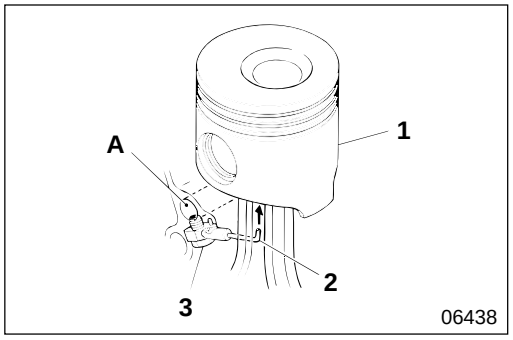
Engine oil from main oil gallery **A** flows through the inside of camshaft **2** and idler shaft **9** and lubricates each gear along the way including vacuum pump **10**.



● **Valve mechanism**

1 Crankcase
2 Cylinder head
3 Rocker shaft
4 Rocker shaft bracket
5 Rocker bushing
6 Rocker
7 Push rod
8 Tappet
9 Camshaft
10 No. 1 camshaft bushing

A : Rocker oil hole
B : From main oil gallery
C : To oil pan

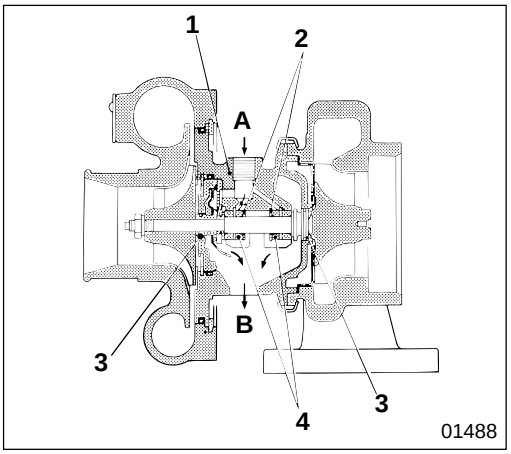


● **Oil jet**

1 Piston
2 Oil jet
3 Check valve

A : Main oil gallery

An oil jet **2** is installed, in the lower part of main oil gallery **A**, for each cylinder and cools piston **1** by injecting engine oil toward the inside of the piston. The oil jet is fitted with check valve 3 which operates at specific oil pressure levels. This check valve remains closed at low engine speed to ensure sufficient oil supply to internal engine parts and to prevent the oil pressure from decreasing.

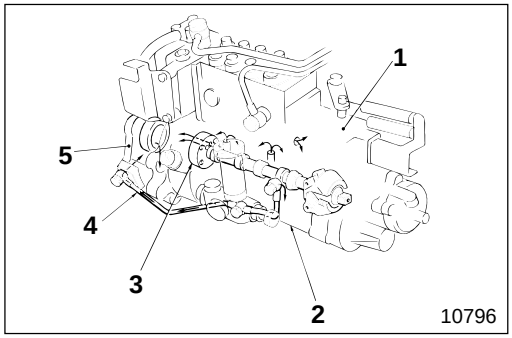


● **Turbocharger**

1 Bearing housing
2 Snap ring
3 Sealing ring
4 Bearing

A : From main oil gallery
B : To oil pan

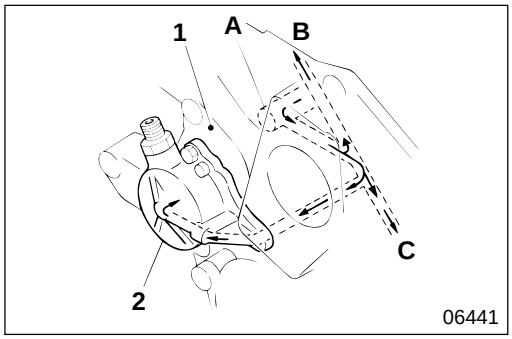
Engine oil is delivered from the main oil gallery to bearing housing **1** through the oil pipe to lubricate bearing **4**. Sealing ring **3** installed at both ends of the turbine wheel shaft works as an oil seal.



● **Injection pump**

1 Governor
2 Injection pump
3 Bearing cover
4 Oil pipe
5 Timing gear case

Engine oil that has lubricated injection pump **2** and governor **1** returns to the oil pan through the oil passage of bearing cover **3**.



● **Vacuum pump**

1 Timing gear case
2 Vacuum pump

A : Main oil gallery
B : To camshaft
C : To crankshaft

Engine oil is delivered from main oil gallery **A** to vacuum pump **2** through the oil passage of timing gear case **1** to lubricate the vanes. Then, the oil is discharged to the timing gear case returning to the oil pan.

Replacement of Oil Filter

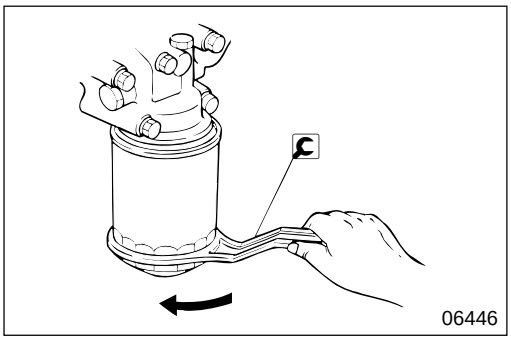
Special tools

Unit : mm {in.}

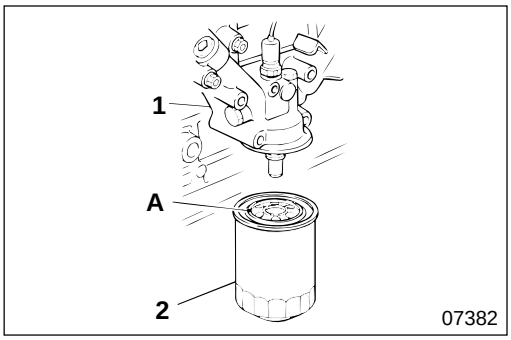
Location	Tool name and shape	Part No.	Application
2	Oil filter wrench  06478	MH061587 (Obtain Locally)	Removal of oil filter

WARNING

- **Wipe up any engine oil that has been spilled because it can cause a fire.**
- **Do not touch the engine while it is hot because it will burn you.**
- **When replacing oil filter 2, take care not to spill oil on the V-belt.**



[Removal]



[Installation]

- Clean the surface of oil cooler body **1** that makes contact with oil filter **2**.
- Apply engine oil thinly and evenly to gasket area **A** of oil filter **2**.
- Screw on oil filter **2** to oil cooler body **1** until gasket area **A** sits on the body. From this position, tighten further by rotating by three quarters of a turn.
- After installation, run the engine and check that there is no oil leakage from gasket area **A**.
- Check the oil level and if it is low, fill to correct level.

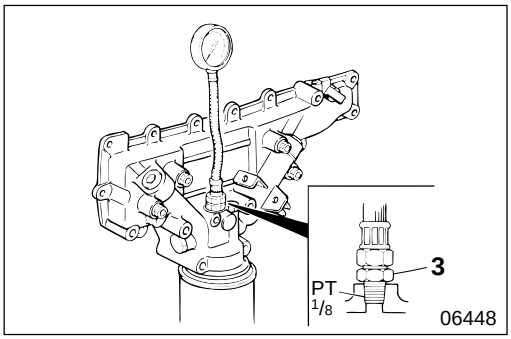
- Remove engine oil pressure switch **2** from oil cooler **1**.
- Mount the oil pressure gauge after installing adaptor **3** onto oil cooler **1**.
- Warm up the engine until the oil temperature reaches 70 to 90°C {158 to 194°F}.
- Measure oil pressure at no-load minimum revolution and at no-load maximum revolution. If the measured values are lower than the limit, overhaul the lubricating system.



- After measurement, install engine oil pressure switch **2** and tighten at specified torque.

CAUTION

Make sure you install engine oil pressure switch 2 when the engine is cold.

6 Fuel filter
7 Fuel suction pipe

10 Fuel hose

- Fuel from the fuel tank **5** is drawn up by the feed pump, which is driven by the V4 injection pump **8**. Then, the fuel is delivered into the V4 injection pump through the fuel filter **6**.
- After filtration, the fuel is fed to the V4 injection pump **8**. From there, it is fed under high pressure to the injection nozzles **1**. The injection nozzles spray the fuel into the combustion chambers.
- Excess fuel from the injection nozzles **1** returns to the fuel tank **5** by way of the fuel leak-off pipe **2**.
- If the fuel pressure in the V4 injection pump **8** exceeds a preset level, the overflow valve **9** opens to allow excess fuel to return from the fuel return pipe **4** to the fuel tank **5**.

4 Lever
5 Emergency engine stop switch
6 Engine control unit
7 Drive Unit
8 Spill valve
9 V4 injection pump assembly

A : Idling position
B : Full-load position
C : Engine stopping position
D : Engine starting position
E : Fuel cut signal
F : Power supply

● **Accelerator position sensor & accelerator switch unit**

The accelerator position sensor & accelerator switch unit **2** consists of an accelerator position sensor and a built-in accelerator switch.

- The accelerator switch responds to the foot pressure acting upon the accelerator pedal **3**.
- The accelerator position sensor detects the movement of the accelerator pedal **3** and outputs an electric signal to the engine control unit **6**. The lever **4** is constantly pulled by the return spring toward the idling position **A**.

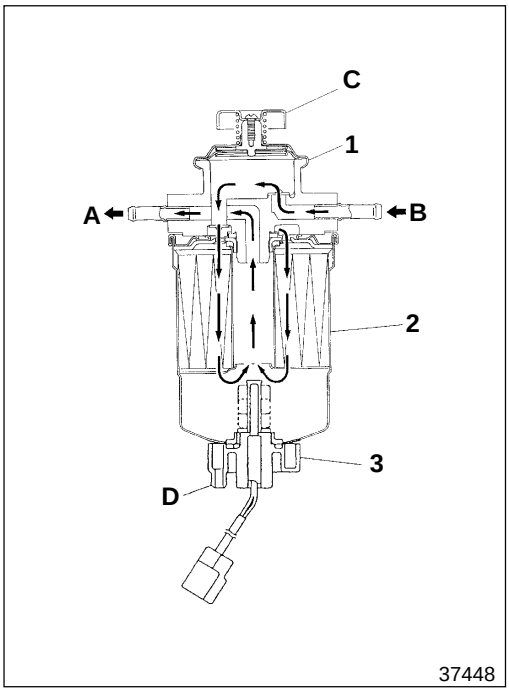
● **Emergency engine stop switch**

The emergency engine stop switch **5** is used to stop the engine when the starter switch **1** placed in the ACC position fails to do it due to a system failure or for some other reason. If the switch is pulled into the engine stopping position **C**, a fuel cut signal **F** is sent to the engine control unit **6**, which in turn terminates power **F** to the spill valve **8** of the V4 injection pump assembly **9** to stop the engine.

CAUTION ⚠

When restarting an engine stopped by means of the emergency engine stop switch 5, set the starter switch 1 to the ACC or LOCK position beforehand to initialize the engine control unit 6.

3. Fuel Filter



1 Fuel filter head
2 Fuel filter cartridge
3 Water level sensor

A : To injection pump
B : From fuel tank
C : Priming pump
D : Drain port

The fuel filter cartridge **2** serves also as a water separator, it separates water from fuel as well as removes impurities. Separated water is collected in the lower part of the filter. The filter is provided with a water level sensor **3**. When water is collected to a certain level, this sensor turns on the warning lamp in the meter cluster.
Collected water can be drained away through the drain port **D** by loosening the water level sensor **3**. The fuel filter head **1** is equipped with a priming pump **C** for bleeding the fuel system.

- Engine coolant temperature: 176 to 203°F {80 to 95°C}
- Lamps and electrical equipment: Off
- A/T: “P” range
- Steering wheel: Neutral position
- Connect a tachometer **A** to the injection nozzle **1** or the injection pipe.

NOTE

Before connecting the tachometer A to the injection pipe, undo all clamps from the pipe.

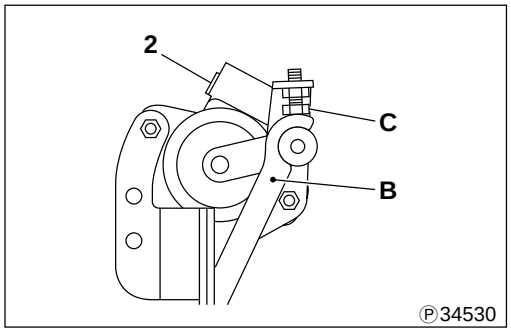
- Check that the minimum speed meets the standard value when the accelerator pedal is free of foot pressure.
- If the reading deviates from the standard value, check the accelerator position sensor & accelerator switch unit **2** for malfunction. Gr 13EA
- If the accelerator position sensor & accelerator switch unit **2** is found normal, check the fuel system diagnosis code, injection pump and ECU. Gr 13EA

● **No-load maximum speed**

- Connect a tachometer **A** to the injection nozzle **1** or the injection pipe.

NOTE

Before connecting the tachometer A to the injection pipe, undo all clamps from the pipe.



- Check that the maximum speed meets the standard value when the lever **B** of the accelerator position sensor & accelerator switch unit **2** is in contact with the full load stopper bolt **C**.
- If the reading deviates from the standard value, check the accelerator position sensor & accelerator switch unit **2** for malfunction. Gr 13EA
- If the accelerator position sensor & accelerator switch unit **2** is found normal, check the fuel system diagnosis code, injection pump and ECU. Gr 13EA

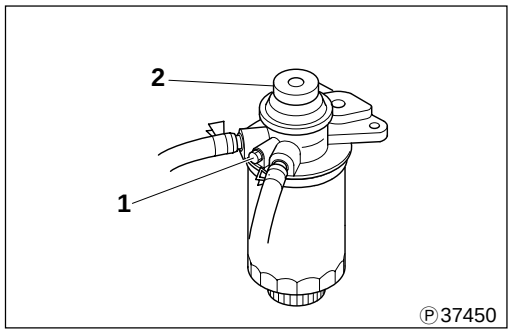
Tightening torque

Unit: N·m {ft.lbs, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
1	Air vent plug	6±1 {4.3±0.7, 0.6±0.1}	–



- Loosen the fuel filter air vent plug **1**.
- Operate the priming pump **2** to pump up fuel.
- Continue to pump fuel until no air bubbles are found in the fuel flowing out from the air vent plug **1**.
- After ascertaining that air bubbles have completely disappeared, tighten the air vent plug **1** securely.
- Operate the priming pump **2** further until it becomes hard to push.
- Wipe up all spilled fuel, then start the engine.
- Check that no fuel leakage occurs.

WARNING ⚠

- **Fuel is highly flammable. Keep it away from flames and sources of heat.**
- **Be sure to wipe up all spilled fuel. Unless it is wiped up, it could catch fire.**

3. Replacing Fuel Filter

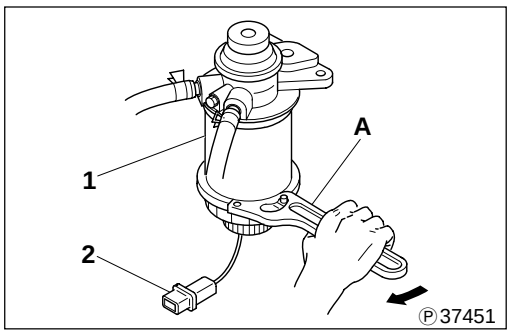
1	Gasket for fuel filter cartridge	Engine oil	As required



[Removal]

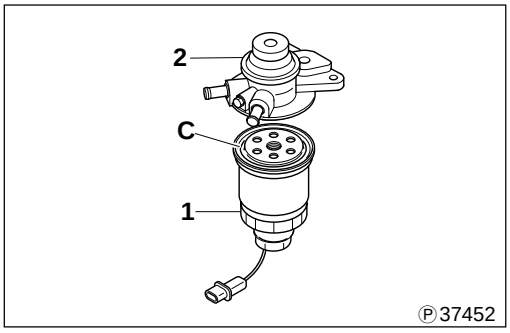
A: Filter Wrench
(Commercially available one: For filter diameter of approx. 90 mm {3.54 in.})

WARNING ⚠

- **Fuel is highly flammable. Keep it away from flames and sources of heat.**
- **To minimize the risk of fire, wipe up any spilled fuel.**

CAUTION ⚠

- **The water level sensor 2 may be reused if it properly functions.**



[Installation]

WARNING ⚠

Use of an unsuitable fuel filter cartridge 1 can lead to fuel leaks and fires. Be sure to use a genuine filter.

CAUTION ⚠

To prevent injection failures, keep dust and dirt out of the fuel filter cartridge 1 and the fuel pipe.

- To install the fuel filter cartridge **1**, turn it until the gasket **C** touches seal surface of the fuel filter head **2**. Be sure to turn the filter by hand clockwise.
  Then, tighten the filter by an additional 3/4 turn.
- Bleed all air out of the fuel system. 🕮 P13A-7
- After fitting the filter, start the engine and check that no fuel leakage occurs.

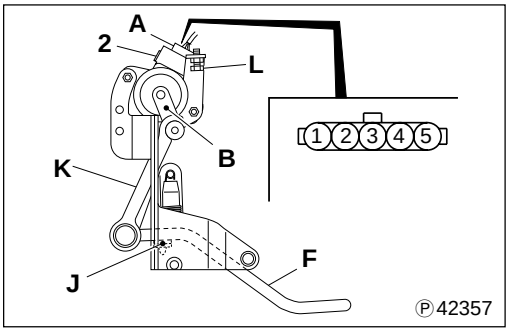
◆ Service procedure

1 **Installation of accelerator pedal assembly**

- Fit the accelerator pedal assembly **1** onto the accelerator pedal position sensor assembly **3**.
- Depress the accelerator pedal **A** until the accelerator control extension **B** touches the stopper bolt **C** of the accelerator pedal position sensor assembly **3**.
- Check that the clearance between the stopper bolt **D** and the stopper bolt contact surface **E** of the accelerator pedal **A** is as shown in the illustration.
- Adjust the stopper bolt **D**, if necessary, to achieve the illustrated clearance. Lock the stopper bolt with the nut **F** after adjustment.



2 **Inspect the accelerator pedal position sensor**

[Inspection]

- Set the starter switch to ON.
- Measure the output voltage of the accelerator position sensor **2** from the back side of harness connector **A** according to the following table.

		Accelerator Position Sensor I		Accelerator Position Sensor II		Accelerator Switch	
		②	①	②	⑤	②	③
Lever **B** position		⊕	⊖	⊕	⊖	⊕	⊖
Standard value	Idling position **C**	0.85±0.1 V		0.85±0.1 V		4V or more	
	Accelerator operating position **D**	1.0±0.24 V		1.0±0.24 V		1V or less	
	Full load position **E**	4.0±0.1 V		4.0±0.1 V			

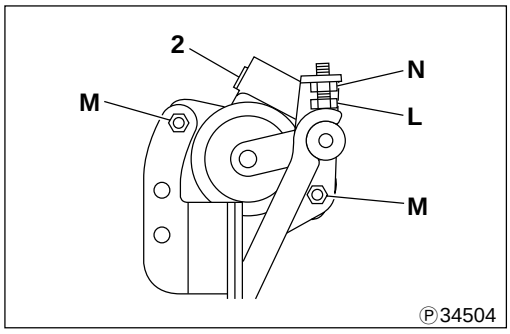
◯——◯ : There must be continuity between the pins.
⊕——⊖ : Polarity when voltage is measured.

C : Where accelerator control arm **F** is in contact with stopper **J**.

D : Where voltage across pins ② and ③ is reduced to 1V or less by slowly depressing the accelerator pedal.

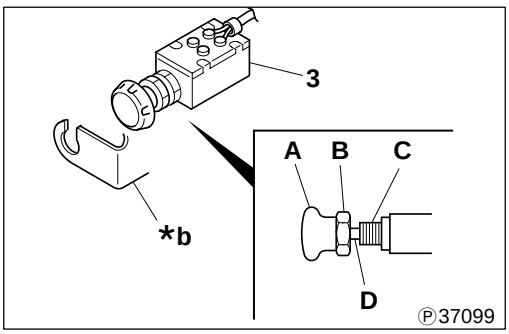
E : Where accelerator control extension **K** is in contact with stopper bolt **L**.

- If the output voltage is out of the standard value range, adjust by the following procedures.



[Adjustment]

- Adjust the output voltage at the idling position **C** by loosening the screws **M** and moving the accelerator position sensor **2**.
  After the adjustment, retighten the screws.
- Adjust the output voltage at the full load position **E** by loosening the nut **N** and adjusting the stopper bolt **L**.
  After the adjustment, lock the bolt with the nut.



3 **Installation of emergency engine stop switch**

- Pull the knob **A** of the emergency engine stop switch **3** into the OFF position. Loosen the nut **B** to remove from the threaded end **C** of the switch.
- Set the shaft **D** in the bracket ***b**.
- Position the shaft **D** properly in the hole of the bracket ***b** and tighten the nut **B**.

◆ Service procedure

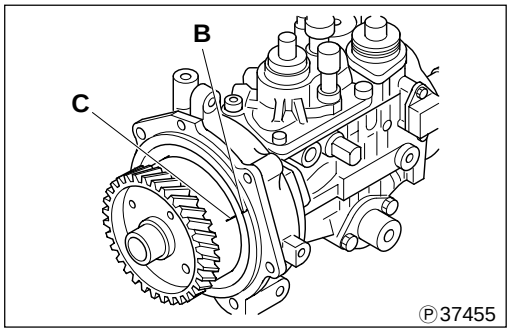
24 Installation of injection pump assembly

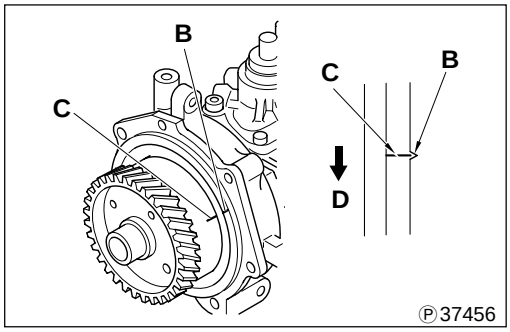
- Crank the engine clockwise to bring the cylinder No. 1 piston to the top dead center of compression stroke; align the pointer **A** in the torque converter housing inspection opening with the inscribed mark between "**1**" and "**4**" on the flywheel.
- Check that the rocker arms of both inlet and exhaust valves of the cylinder No. 1 move.
- If the rocker arms still hold the valves down, give the engine another turn.

NOTE

There are two kinds of marks inscribed in the flywheel, "I" and "IV" and "1" and "4". Do not confuse.



- Align the notch **B** in the flange plate with the inscribed mark **C** on the injection pump gear.



- Ascertaining the alignment between notch **B** and inscribed mark **C**, push in the injection pump assembly to install in position. At this time, the inscribed mark moves in the direction **D**.

- **Under no circumstances change the needle valve 14 and nozzle 15 combination as they are matched.**
- **Dirt particles can seriously detract from engine performance. To prevent ingress of dirt, cover parts to which the injection nozzle assemblies 8 were fitted after removal.**

NOTE

Clean off any carbon deposits before disassembling, reassembling or adjusting the injection nozzle assembly 8. Before disassembly, check the pressure and shape of the spray and inspect the assembly for fuel leads. If no abnormality is apparent, do not commence disassembly.

◆ Service procedure

● Inspection before disassembly

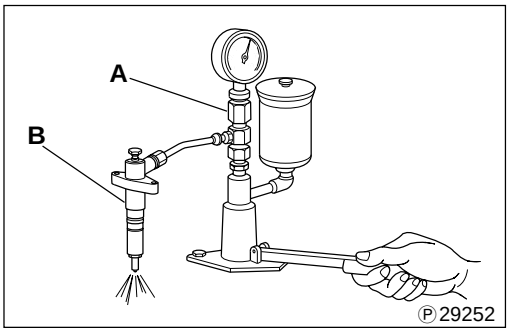
Fit the injection nozzle assembly **8** onto the nozzle tester **A** ready for inspection.

WARNING ⚠

Do not touch the spray that comes out of the nozzle.

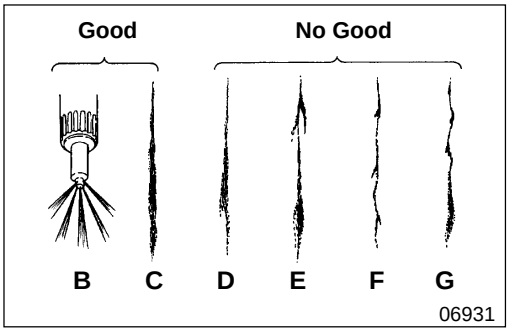
NOTE

Before commencing inspection, operate the lever on the nozzle tester A two or three times to bleed all air out of the arrangement.



(1) Checking valve opening pressure

- Push down the lever on the nozzle tester **A** at a rate of 1 to 2 seconds per stroke. The pressure gauge reading will gradually rise, then the needle will suddenly deflect. Note the pressure when the needle starts to deflect.
- If the measurement is out of specification, disassemble the nozzle, clean it and make adjustments by changing the shims **17**, **21**.
- If the measurement is still out of specification after adjustment, replace the injection nozzle assembly **8**.

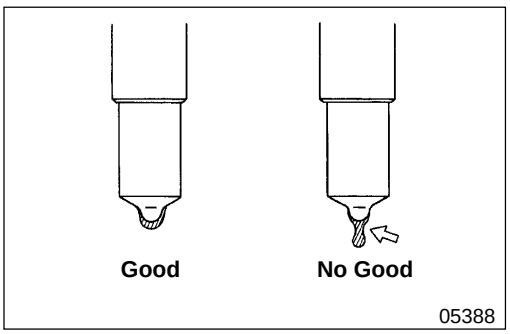


(2) Inspecting spray condition

- Pump the lever on the nozzle tester **A** at a rate of about 1 to 2 strokes per second and maintain a continuous spray.

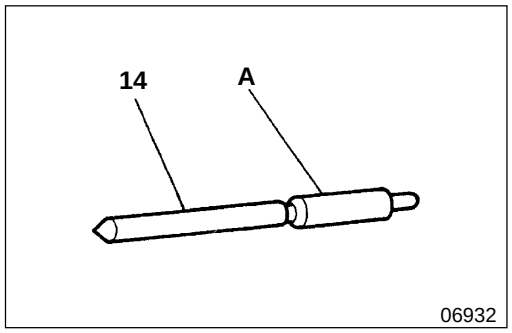
  B : Even spray from all five injection orifices (Good)
  C : Even and symmetrical spray (Good)
  D : Asymmetrical spray (No Good)
  E : Branched spray (No Good)
  F : Thin spray (No Good)
  G : Irregular spray (No Good)

- If the spray is unsatisfactory, disassemble and clean the injection nozzle assembly **8**, then inspect the spray again. If the spray is still unsatisfactory, replace the injection nozzle assembly.
- Check that no fuel drips from the nozzle after the spray is complete.



(3) Inspecting for oil-tightness and leaks

- Slowly increase the nozzle pressure to the pressure below the specified 1st valve opening pressure by 1.96 MPa {285 lbf/in^2, 20 kgf/cm^2}. Maintain this pressure for 10 seconds and check that no fuel drips from the end of the nozzle.
- If the injection nozzle assembly **8** appears defective, disassemble and clean it, then inspect it again. If the injection nozzle assembly still appears defective, it must be replaced.

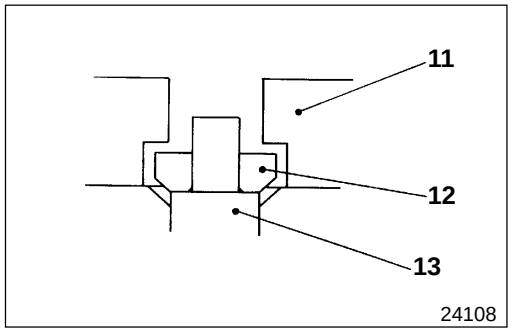


8 **Injection nozzle assembly**

[Disassembly]

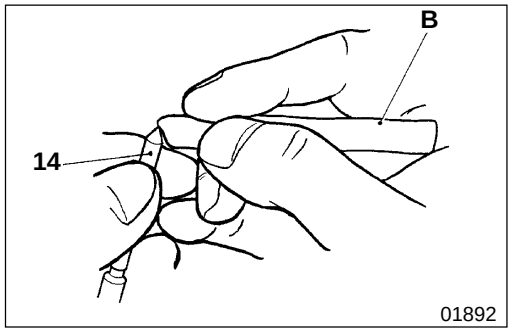
CAUTION ⚠

- **Never touch the sliding part A of the needle valve 14.**
- **Never change the needle valve 14 and nozzle 15 combination as they are a matched set.**



[Assembly]

Assemble the tip packing **11** and the washer **12** (for adjustment of needle valve lift) in the illustrated directions.



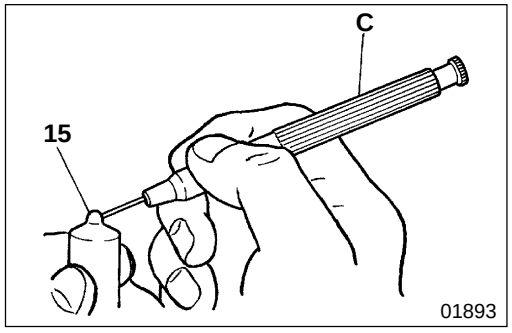
[Cleaning]

Wash the needle valve **14** and nozzle **15** in diesel fuel, then use the Cleaning Tool to remove any carbon deposits in accordance with the following procedure.

- Remove carbon from the end of the needle valve **14** using the Cleaning Bar **B** of the Cleaning Tool.

CAUTION ⚠

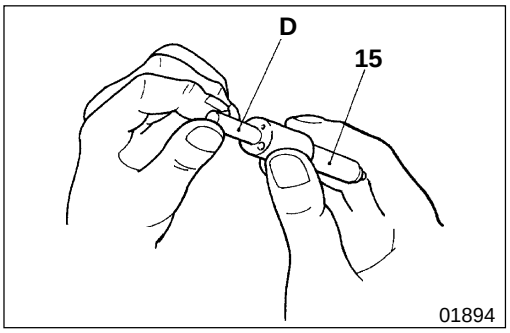
Do not use a wire brush or any hard metallic object for cleaning.

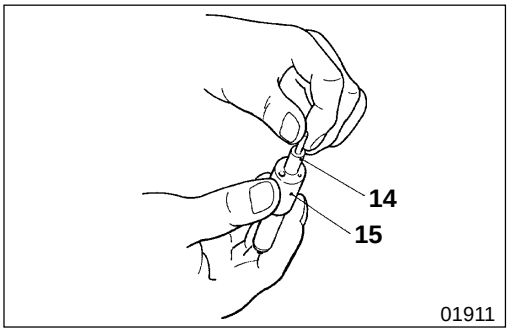


- Remove carbon from the injection orifice of the nozzle **15** using the Cleaning Needle **C** of the Cleaning Tool. Insert the Cleaning Needle and rotate it to remove carbon.

  Cleaning needle diameter: 0.20 mm {0.0079 in.} or smaller

INJECTION NOZZLE





- Clean the seat of the nozzle **15** using the Cleaning Scraper **D** of the Cleaning Tool.
- To remove burned and hardened carbon, use a carbon remover tool.

[Inspection]

- Wash the needle valve **14** and nozzle **15** in diesel fuel, then fit them together.
- Pull up the needle valve **14** by approximately 1/3 of its entire stroke, then check that it drops under its own weight. Repeat this test several times, turning the needle valve each time.
- If the needle valve **14** does not drop as required, wash it in diesel fuel and carry out this test again. If the needle valve is still defective, replace the needle valve and nozzle **15** as a set.

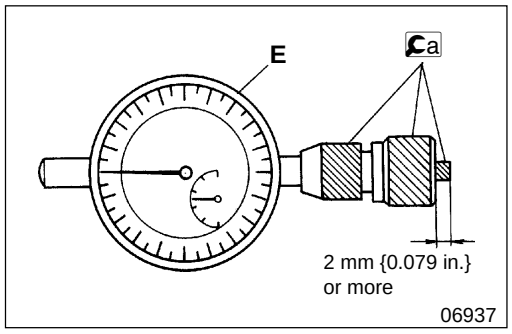
[Adjustment]

During reassembly, make adjustments in the sequence shown below.

CAUTION

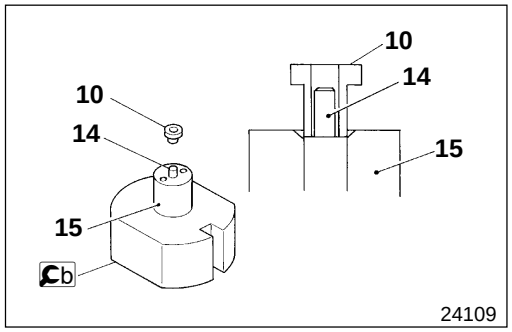
- **Before making adjustments, wash all parts in diesel fuel and ensure that they are free of dirt and other foreign material.**
- **Do not touch the sliding surfaces of the needle valve 14.**

- Check needle valve full lift
- Check prelift
- Adjust 2nd valve opening pressure
- Adjust 1st valve opening pressure

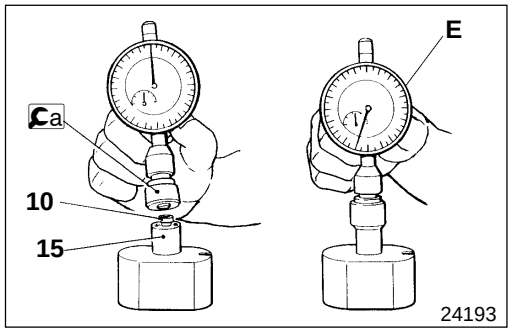


● **Checking needle valve full lift**

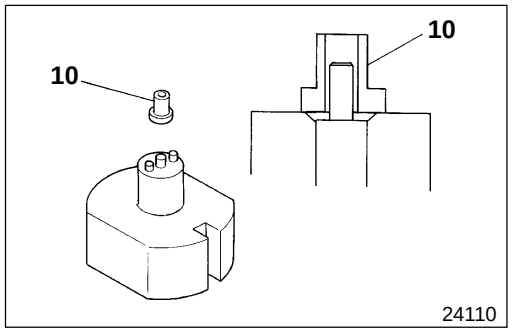
- Set the a Attachment Measure to a dial gauge **E**.



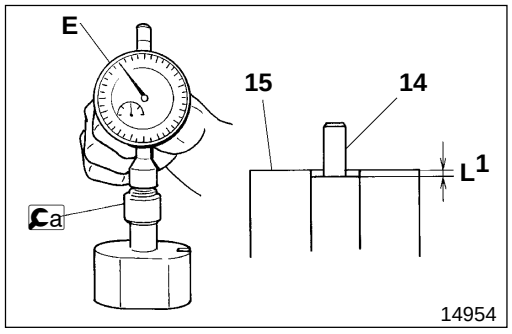
- Mount the nozzle **15** on the b base, with the needle valve **14** and spring seat **10** (for adjustment of pre-lift) fitted to the nozzle in that order.



- Fit the a Attachment Measure onto the nozzle **15**.
- Zero the dial gauge **E**.

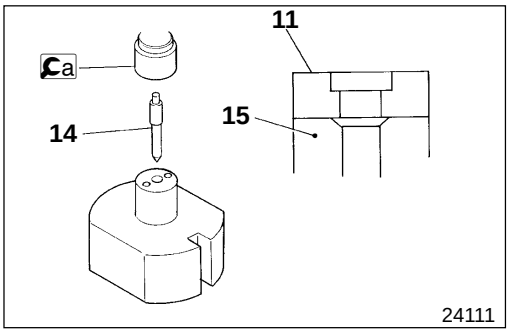


- Remove the a Attachment Measure. Remove the spring seat **10** (for adjustment of pre-lift) and refit it to the nozzle upside down.

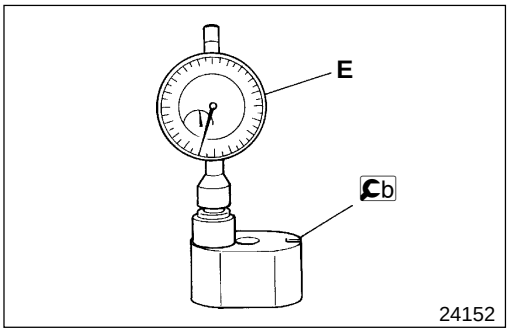


- Fit the a Attachment onto the nozzle **15** again, and read the dial gauge **E**. The reading should be the illustrated dimension L^1.

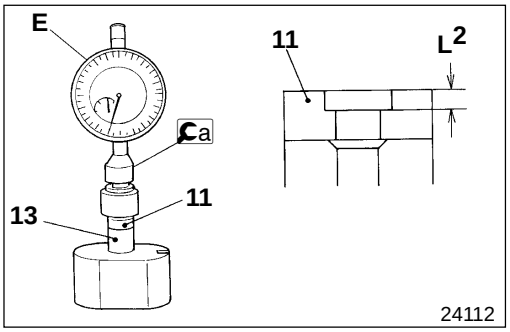
INJECTION NOZZLE



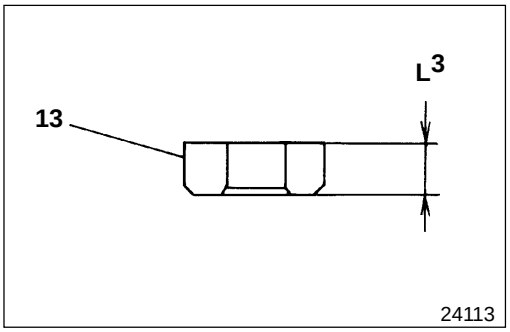
- Remove the a Attachment Measure and the needle valve **14**. Fit the tip packing **11** to the nozzle **15** as shown.



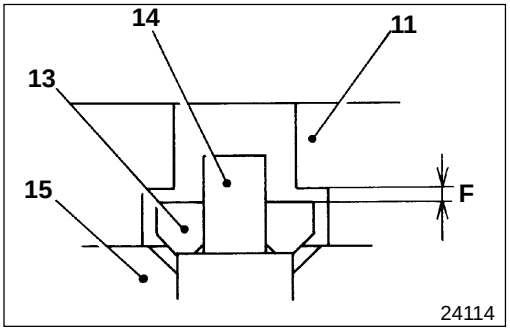
- Zero the dial gauge **E** on the b base.



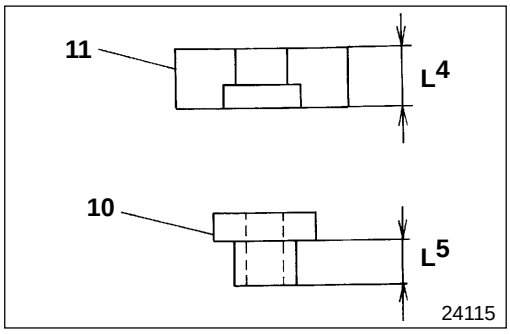
- Fit the a Attachment Measure to the tip packing **11**, and read the dial gauge **E**.
  The reading should be the illustrated dimension L^2.



- Measure the thickness L^3 of the washer **13** (for adjustment of needle valve lift).

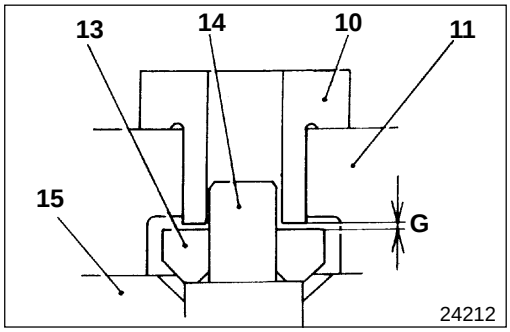


- Calculate the maximum lift **F** of the needle valve **14** from the measurements L^1, L^2 and L^3 as follows.
  Maximum lift **F** = $L^1 + L^2 - L^3$
- If the calculated value is out of specification, make the necessary adjustment by changing the washer **13** (for adjustment of needle valve lift).
  Washers **13** are available in the following thicknesses (L^3):
  2.40, 2.425, 2.45, 2.475, 2.50 mm {0.094, 0.095, 0.096, 0.097, 0.098 in.} (5 sizes)

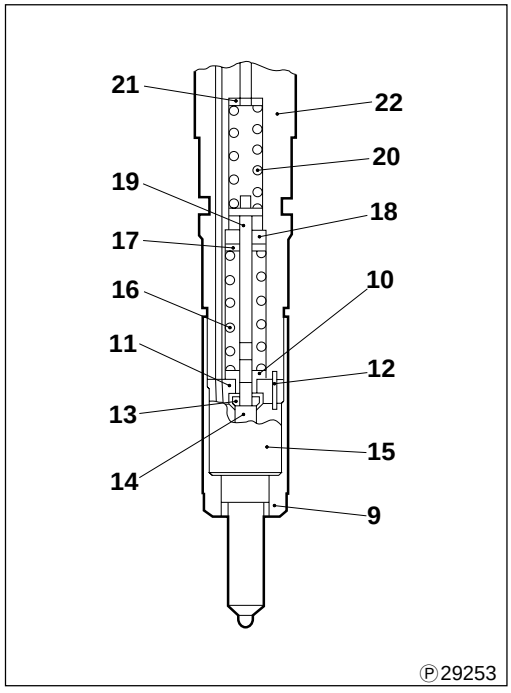


● **Adjusting pre-lift**

- Measure the thickness L^4 of the tip packing **11**.
- Measure the thickness L^5 of the spring seat **10 (**for adjustment of pre-lift).



- Calculate the pre-lift **G** from the measurements L^1, L^3, L^4 and L^5 as follows.
  Pre-lift **G** = $L^4 - L^5 - L^3 + L^1$
- If the calculated value is out of specification, make the necessary adjustment by changing the spring seat **10** (for adjustment of pre-lift).
  Spring seats **10** are available in the following thicknesses (L^5):
  2.59 to 2.80 mm {0.101 to 0.110 in.} (22 sizes at steps of 0.01 mm {0.00039 in.})



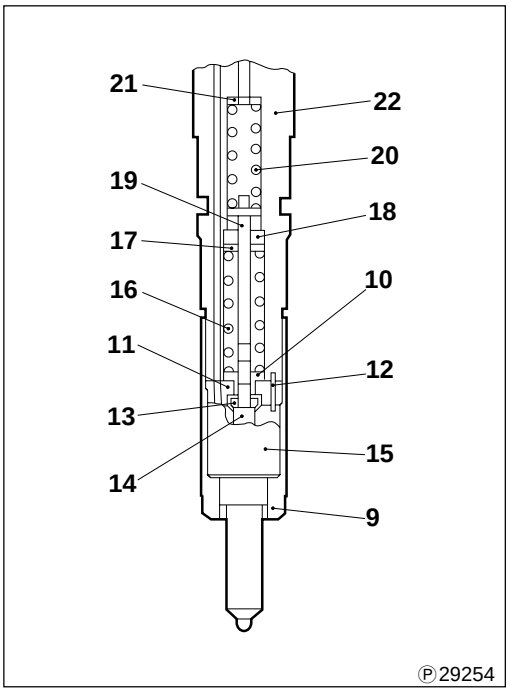
● **Adjusting 2nd valve opening pressure**

- Assemble parts to the nozzle holder **22** as shown. Fit the SC Master Spring Seat in the place of the spring seat **10** (for adjustment of pre-lift).
- Tighten the retaining nut **9** to the specified torque.
- Fit the nozzle assembly onto the nozzle tester and measure the 2nd valve opening pressure.

CAUTION ⚠

Never touch the spray that comes out of the nozzle.

- If the reading is out of specification, make the necessary adjustment by changing the adjusting shim **17** (for adjustment of 2nd valve opening pressure). Adjusting shims **17** are available in the following thicknesses.
  0.70 to 2.15 mm {0.028 to 0.085 in.} (30 sizes at steps of 0.05 mm {0.002 in.})
  0.975 to 1.775 mm {0.038 to 0.070 in.} (17 sizes at steps of 0.05 mm {0.002 in.})
- A difference of 0.025 mm {0.00098 in.} in the thickness of the adjustment shim **17** changes the 2nd valve opening pressure by 345 kPa {50 psi, 3.5 kgf/cm^2}.



● **Adjusting 1st valve opening pressure**

- Assemble parts to the nozzle holder **22** as shown.
- Tighten the retaining nut **9** to the specified torque.
- Fit the nozzle assembly onto the nozzle tester and measure the 1st valve opening pressure.

CAUTION ⚠

Never touch the spray that comes out of the nozzle.

- If the reading is out of specification, make the necessary adjustment by changing the adjusting shim **21** (for adjustment of 1st valve opening pressure).

  Adjusting shims **21** are available in the following thicknesses:
  0.8 to 2.0, 2.05, 2.075 to 2.2 mm {0.031 to 0.079, 0.080, 0.081 to 0.087 in.} (56 sizes at steps of 0.025 mm {0.00098 in.})
  A difference of 0.025 mm {0.00098 in. } in the thickness of the adjusting shim **21** changes the 1st valve opening pressure by 345 kPa {20 psi, 3.5 kgf/cm^2}.

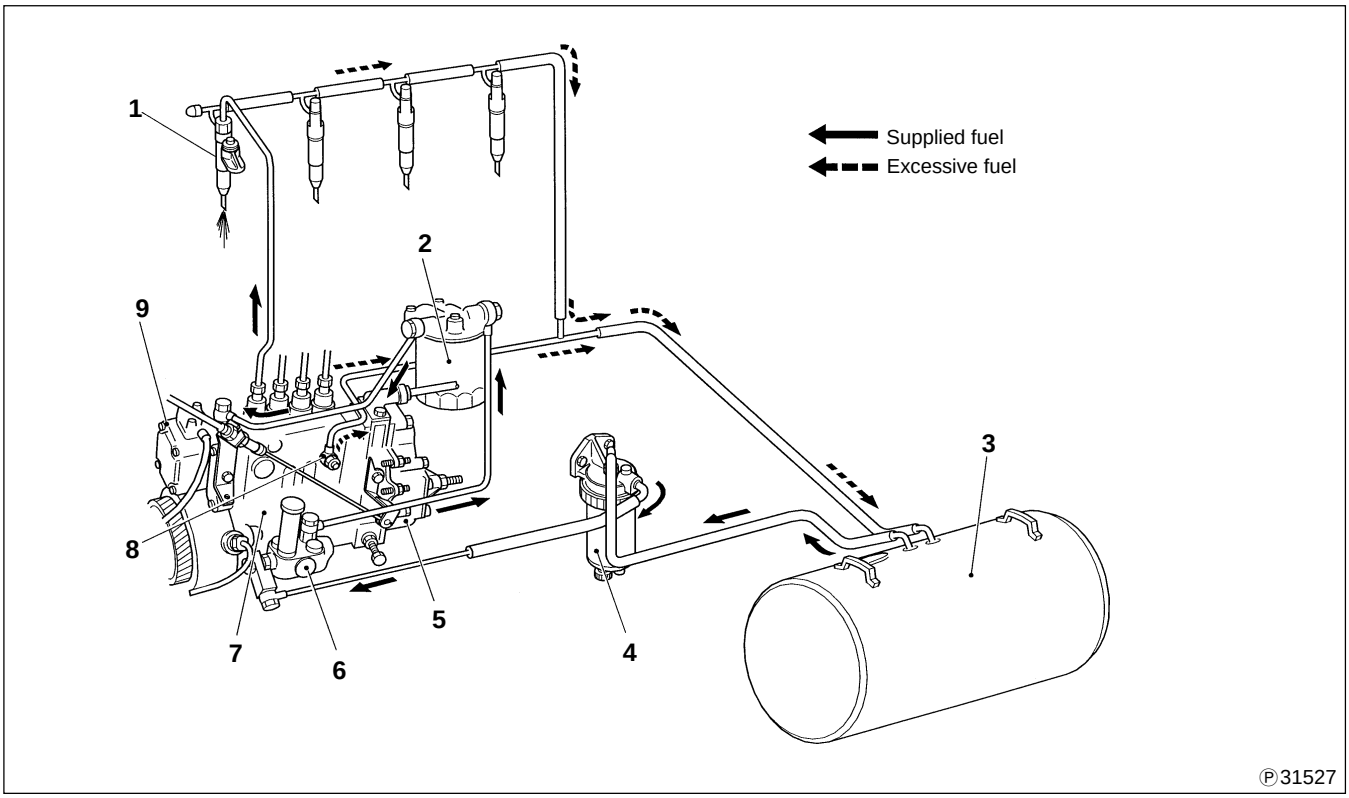
Fuel System (Flow of Fuel)



1 Injection nozzle
2 Fuel filter
3 Fuel tank
4 Water separator
5 Electronic governor
6 Feed pump
7 Injection pump
8 Overflow valve
9 Pre-stroke actuator

Fuel in fuel tank **3** is sucked up by feed pump **6** which is driven by the cam action of injection pump **7** and is filtered through fuel filter **2** which removes dirt and other foreign particles.
Filtered fuel is sent to the injection pump where the fuel pressure is boosted and injected through injection nozzle **1** into the combustion chamber.
When fuel pressure is higher than the specified value, overflow valve **8** opens to let the fuel return to the fuel tank.

Engine Control

3 Engine stop lever
4 Engine stop cable
5 Accelerator pedal assembly
6 Lever
7 Accelerator pedal position sensor

*: Electric governor

A : Engine-stop position
B : Engine start-up position
C : Full-load position
D : Idling position

● **Accelerator switch**

The accelerator switch is integrated in the accelerator pedal position sensor **7**. It detects the pressing of accelerator pedal assembly **5**.

● **Accelerator pedal position sensor**

Accelerator pedal position sensor **7** detects the movement of the accelerator pedal assembly **5,** and sends an electric signal to the electronic governor control unit. Lever **6** of the accelerator pedal position sensor is constantly pulled by the return spring towards idle position **D**.

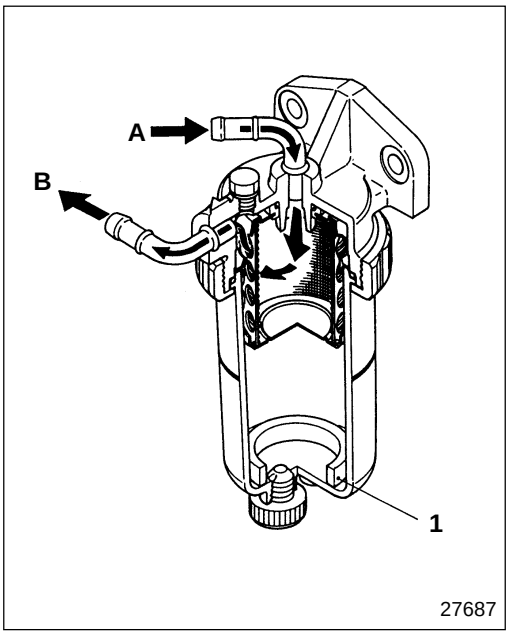
● **Emergency engine stop button**

In normal condition, turn starter switch **2** to the ACC position to electrically shut down the engine operation.
In the case the engine does not stop when the starter switch is turned to the ACC position due to malfunction of the electronic governor system or some other cause, stop the engine by pulling emergency engine stop handle **1** to move stop lever **3** of electronic governor * to engine-stop position **A**.

CAUTION⚠

When the engine is stopped by pulling engine stop handle 1, set starter switch 2 to the ACC or LOCK position to reset the control unit computer.
Restarting the engine without resetting the computer results in unstable engine speed control.

Water Separator

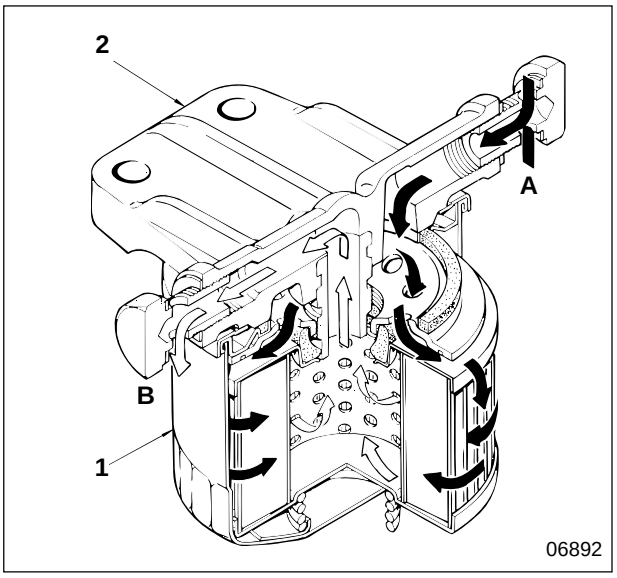


1 Water level ring

A : From fuel tank
B : To feed pump

The water separator is installed between the fuel tank and the feed pump. Any water present in the fuel is separated by the baffle plate and the screen assembly.

Fuel Filter



1 Fuel filter
2 Fuel filter head

A : From feed pump
B : To injection pump

Pressurized fuel is delivered from the feed pump of the injection pump to the fuel filter which separates water from the fuel. Dirt and other foreign particles are removed from the fuel by fuel filter **1**.

Feed Pump

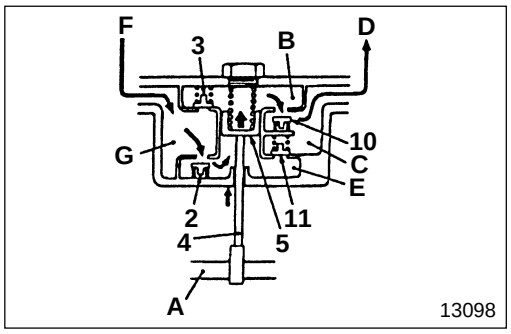
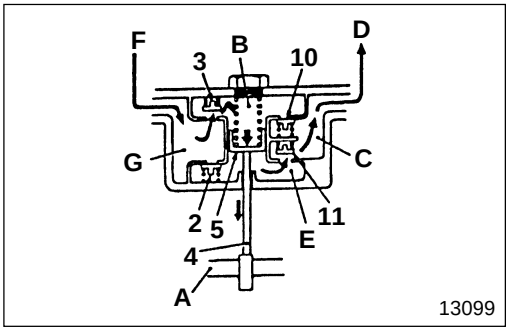
5 Piston
6 Piston spring
7 Eye bolt at fuel inlet
8 Gauze filter
9 Feed pump housing
10 Check valve
11 Check valve
12 Check valve spring
13 Priming pump

- The feed pump is a double-action type pump which, with four check valves operating, sucks and discharges fuel during both strokes of pistons **5**.
- Push rod **4** makes contact with the injection pump camshaft directly, moving piston **5**.
- Priming pump **13** can be manually operated, when the injection pump is not operating, to suck up fuel and thus can be used for air bleeding.
- Gauze filter **8** eliminates large foreign particles from the fuel sucked up from the fuel tank to prevent clogging of the feed pump. This gauze filter must be cleaned with diesel fuel periodically.

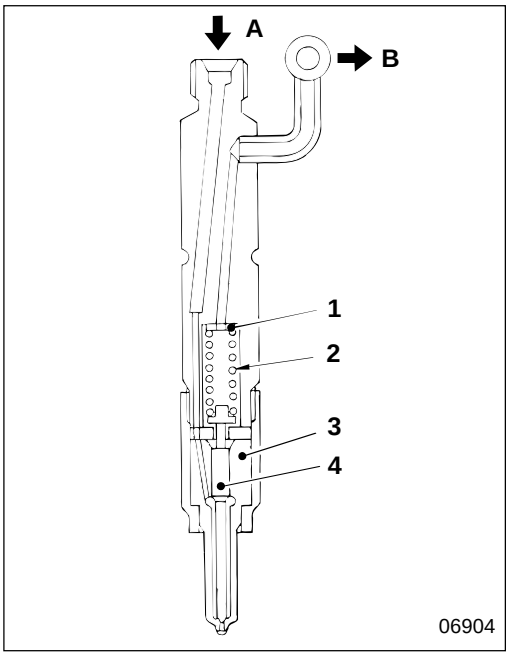


The rotation of injection pump camshaft **A**, pushes up push rod **4** and piston **5**, and the pressure in inner chamber **B** increases. This closes check valve **3**, and check valve **10** opens to let the fuel in inner chamber **B** flow through outer chamber **C** to fuel filter **D**.
When the pressure in inner chamber **E** decreases, check valve **11** closes, and check valve **2** opens to let fuel flow from fuel tank **F** through outer chamber **G** to inner chamber **E**.



When injection pump camshaft **A** rotates further, it pushes down push rod **4** and piston **5**, and the pressure in inner chamber **E** increases. This closes check valve **2**, and check valve **11** opens to let the fuel in inner chamber **E** flow through outer chamber **C** to fuel filter **D**.
When the pressure in inner chamber **B** decreases, check valve **10** closes, and check valve **3** opens to let fuel from fuel tank **F** flow through outer chamber **G** to inner chamber **B**.

Injection Nozzle



1 Washer
2 Spring
3 Nozzle tip
4 Needle valve

A : From injection pump
B : To fuel tank

- As the pressure of the fuel delivered from the injection pump overcomes the repercussive force of spring **2**, needle valve **4** is pushed up to allow the fuel to spray out the opening at the tip of the nozzle.
- Injection pressure can be adjusted by increasing or decreasing the number of washers **1**.

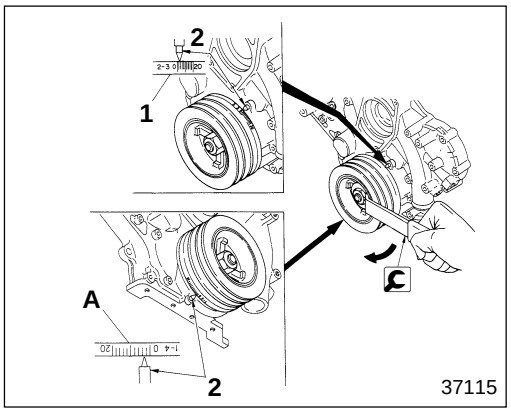
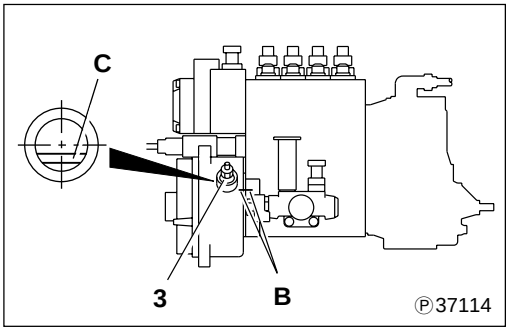
4, 5	Universal extension Width across flats: 14 {0.55}  Ⓟ05163	MH061099 (Obtain Locally)	For inspection and adjustment of fuel injection timing

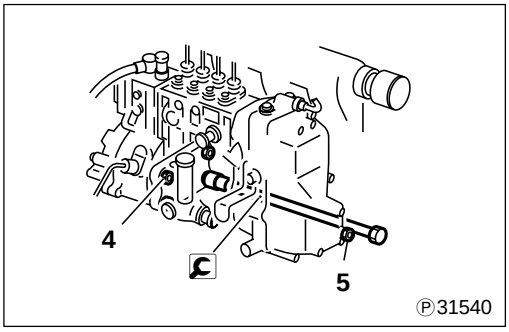


[Inspection]

- Bring the piston in engine cylinder No. 1 to the top dead center in compression stroke by turning crankshaft pulley **1** clockwise with cranking handle and aligning pointer **2** on the timing gear case with the specified fuel injection timing mark on stamped scale **A** on the crankshaft pulley.

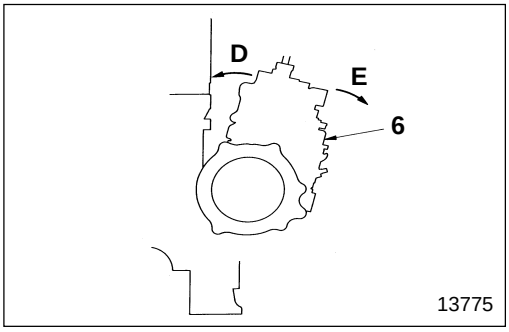


- Make sure that stamped line **B** on the injection pump is aligned with the stamped line on the timer case.
- Remove engine speed sensor **3**.
- Fuel injection timing is normal if internal engine speed pulser protrusion **C** is located at the center of the lower side of the engine speed sensor **3** mounting hole (drilled hole).
- If protrusion **C** is not positioned as described above, follow the procedure below to adjust.



[Adjustment]

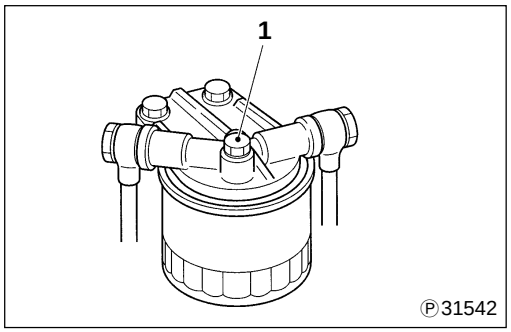
- Loosen injection pump mounting nuts **4** and **5**.
  4 : Nut (4 locations; flange section)
  5 : Nut (1 location)
  : Universal extension



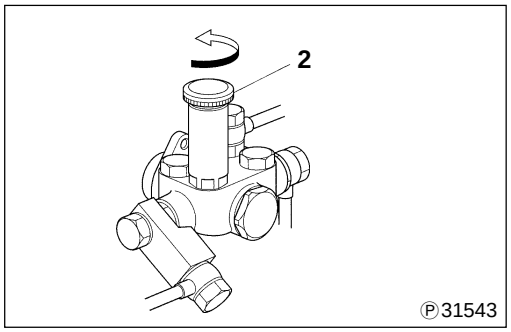
- If the fuel injection timing is retarded, tilt injection pump **6** toward crankcase side **D**.
- If the fuel injection timing is advanced, tilt injection pump **6** toward side **E** opposite to the crankcase.

ON-VEHICLE INSPECTION AND ADJUSTMENT

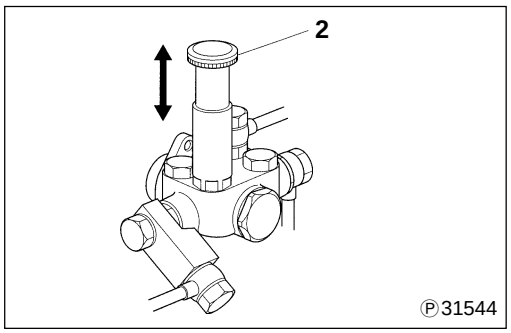
Bleeding Air from Fuel System



- Loosen the fuel filter air plug **1**.



- Turn the priming pump knob **2** counterclockwise until it pops up.
- Move the priming pump knob **2** up and down to feed fuel through the fuel filter.
- When fuel emerging from the fuel filter air plug **1** no longer contains air bubbles, tighten the air plug securely.

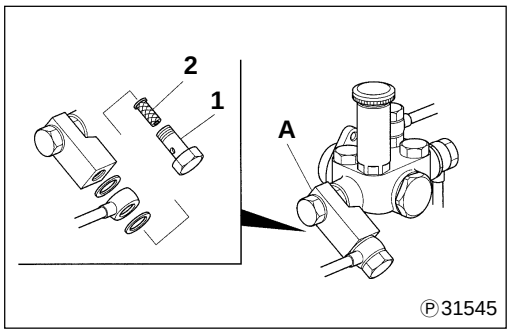


- Move the priming pump knob **2** up and down five or six more times. Then, press the knob down and screw it clockwise to lock it in position.
- Wipe up all spilled fuel, then start the engine.
- Check that no fuel leakage occurs.

WARNING

- **Be sure to wipe up all spilled fuel. Unless it is wiped up, it could catch fire.**
- **Fuel is highly flammable. Keep it away from flames and sources of heat.**

Cleaning Gauze Filter



- Remove the eyebolt **1** from the suction port side **A** of the fuel feed pump.
- Remove the gauze filter **2** from the eyebolt **1**.
- Clean the gauze filter **2** in diesel fuel.
- Refit the gauze filter **2** and eyebolt **1** in the opposite order to that in which they were removed.
- Bleed all air out of the fuel system.
- Start the engine and check that no fuel leakage occurs.

WARNING

- **To minimize the risk of fire, wipe up any spilled fuel.**
- **Fuel is highly flammable. Keep it away from flames and sources of heat.**
- **After refitting the gauze filter, check that no fuel leakage occurs.**

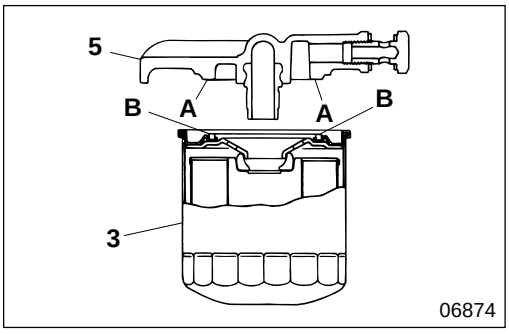
WARNING

- **Fuel is highly flammable. Keep it away from flames and sources of heat.**
- **To minimize the risk of fire, wipe up any spilled fuel.**

[Installation]

WARNING

Use of an unsuitable fuel filter 1 can lead to fuel leaks and fires. Be sure to use a genuine filter.



06874

- To install the fuel filter **3**, turn it until the gasket **B** touches surface **A** of the fuel filter head **5**. Then, tighten the filter by 1 to $1\frac{1}{8}$ turn. Be sure to turn the filter by hand.
- Bleed all air out of the fuel system. P13B-12

WARNING

After fitting the fuel filter 3, start the engine and check that no fuel leakage occurs. Any leaking fuel could cause a fire.

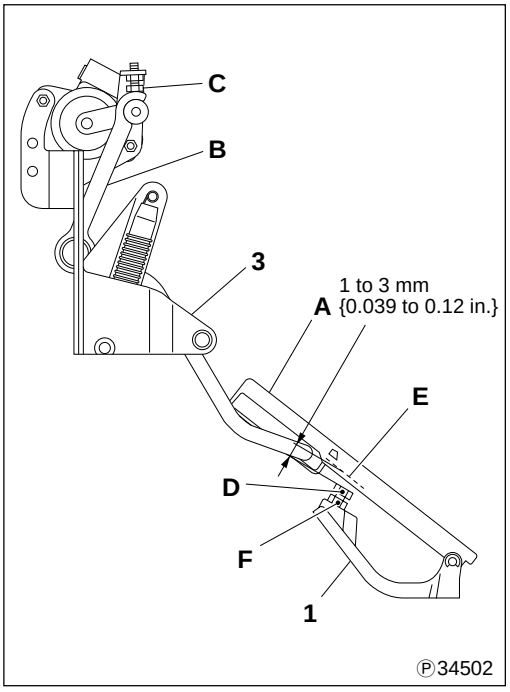
***a :** Lever and bracket assembly
***b :** Injection pump assembly

● **Installation sequence**

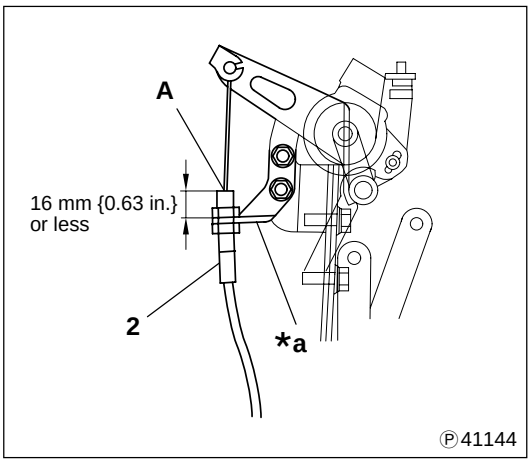
Follow the removal sequence in reverse.

◆ Service procedure



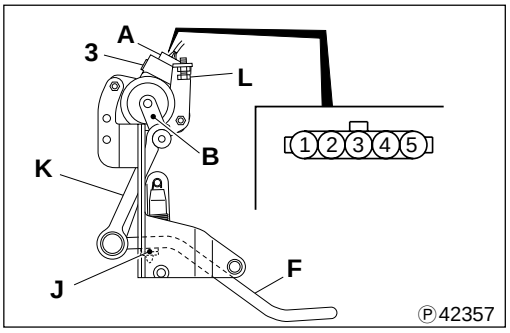
1 Installation of accelerator pedal assembly

- Fit the accelerator pedal assembly **1** onto the accelerator pedal position sensor assembly **3**.
- Depress the accelerator pedal **A** until the accelerator control extension **B** touches the stopper bolt **C** of the accelerator pedal position sensor assembly **3**.
- Check that the clearance between the stopper bolt **D** and the stopper bolt contact surface **E** of the accelerator pedal **A** is as shown in the illustration.
- Adjust the stopper bolt **D**, if necessary, to achieve the illustrated clearance. Lock the stopper bolt with the nut **F** after adjustment.



2 Installation of engine control cable (mixer)

Adjust the threaded section **A** of the engine control cable **2** to the dimension shown in the illustration and connect the cable to the lever & bracket assembly ***a**.



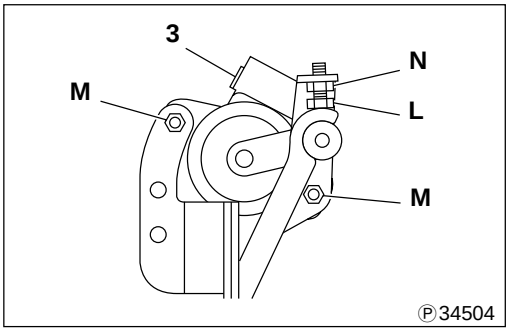
3 **Inspect the accelerator pedal position sensor**

[Inspection]
- Set the starter switch to ON.
- Measure the output voltage of the accelerator position sensor **3** from the back side of harness connector **A** according to the following table.

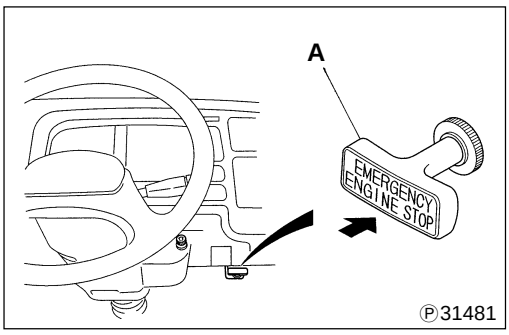
Lever **B** position		Accelerator Position Sensor I		Accelerator Position Sensor II		Accelerator Switch	
		②	①	②	⑤	②	③
		⊕	⊖	⊕	⊖	⊕	⊖
Standard value	Idling position **C**	0.85±0.1 V		0.85±0.1 V		4V or more	
	Accelerator switch operating position **D**	1.0±0.24 V		1.0±0.24 V		1V or less	
	Full load position **E**	4.0±0.1 V		4.0±0.1 V			

○——○ : There must be continuity between the pins.
⊕ , ⊖ : Polarity when voltage is measured
C: Where accelerator control arm **F** is in contact with stopper **J**
D: Where voltage across pins ② and ③ is reduced to 1V or less by slowly depressing the accelerator pedal
E: Where accelerator control extension **K** is in contact with stopper bolt **L**

- If the output voltage is out of the standard value range, adjust by the following procedures.

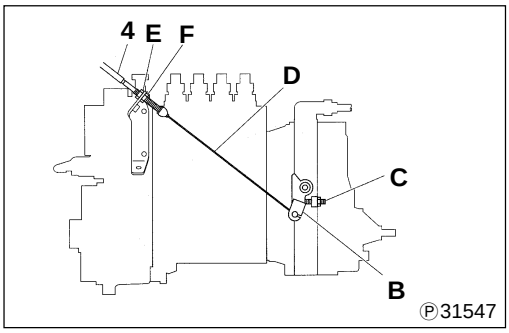


[Adjustment]
- Adjust the output voltage at the idling position **C** by loosening the screw **M** and moving the accelerator position sensor **3**.
  After the adjustment, retighten the screws.
- Adjust the output voltage at the full load position **E** by loosening the nut **N** and adjusting the stopper bolt **L**.
  After the adjustment, lock the bolt with the nut.



4 **Installation of the emergency engine stop cable**

- Mount stop button **A** on emergency engine stop cable **4** and press the button firmly in position.



- With stop lever **B** of the governor contacting stopper bolt **C**, adjust nut **E** so that inner cable **D** of emergency stop cable **4** is taught. Then, tighten nut **F** to secure it in place.
- After installation, start the engine. Pull the stop cable button to make sure that engine stops operating.

◆ Service procedure

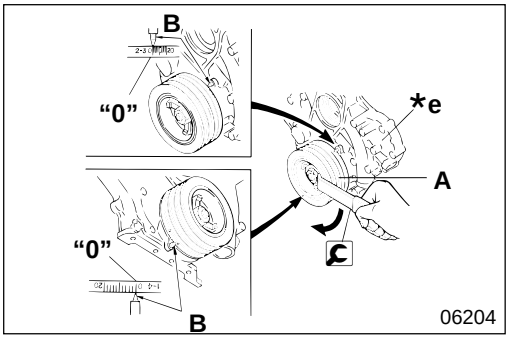
23 **Injection pump assembly**

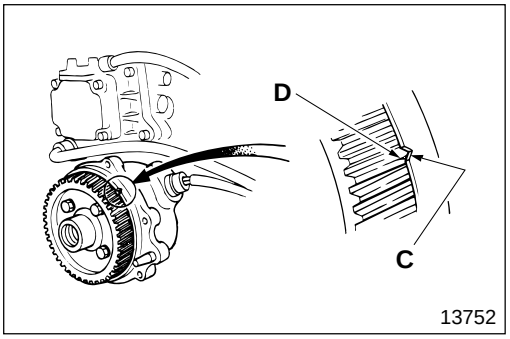
[Removal]

- Refer to Removal sequence on page 13B-62.

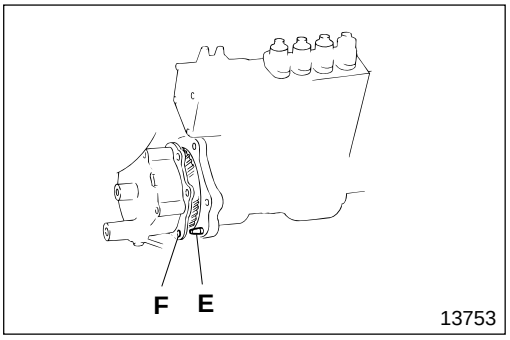


[Installation]

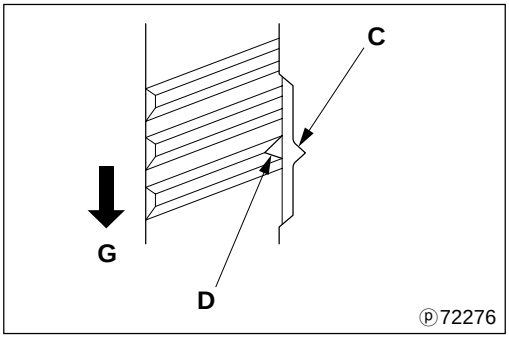
- To bring No. 1 cylinder piston to top dead center in the compression cycle, align pointer **B** of timing gear case ***e** with indent mark "**0**" on crankshaft pulley **A** by turning the crankshaft pulley clockwise using cranking handle. At this point, make sure that the intake and exhaust valves of No.1 cylinder are not depressed by the push rod. If they are depressed, make another full rotation of the crankshaft pulley.



- Align indent **C** on the timer case with indent **D** on the injection pump gear.



- By aligning guide bar **E** of the timer case with guide hole **F** of the front plate, push in the idler gear up to a fraction of an inch short of engaging the injection pump gear.



- Making sure that alignment mark **C** on the timer case aligns with indent **D** on the injection pump gear, push in the injection pump assembly.
  As this installation is taking place, the indent tooth **D** will turn in direction **G**.

WARNING

Wipe up any spilled fuel because it can cause a fire.

CAUTION

- **Be sure not to touch the slide-contact area of needle valve 10 because any scratches or corrosion might spoil the airtightness of nozzle 11. It must be handled with utmost care.**
- **Never change the combination of needle valve 10 and nozzle 11 as they are a matched set.**
- **Be sure to protect all openings by covering them after removal of hoses and pipes because the engine performance is adversely affected if dirt and foreign particles enter injection nozzle assembly 6.**

NOTE

Remove carbon deposits and clean injection nozzle assembly 6 before working on it, then test the injection pressure and jet spray condition, and check for fuel leakage before disassembly. If no fault is found, do not disassemble.

◆ Service procedure

● Inspection before disassembly

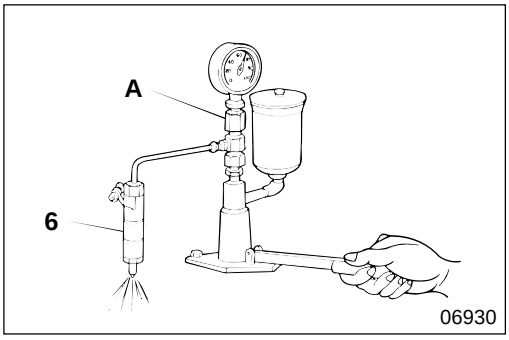
Attach injection nozzle assembly **6** to nozzle tester **A**, and conduct the following inspection.

WARNING⚠

Never touch the spray from nozzle 11 or let your hands get too close to the spray point during the test.

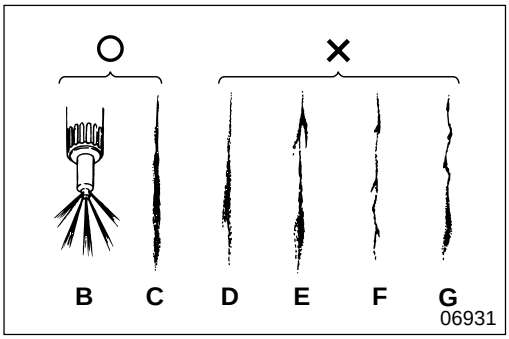
NOTE

Before inspection, bleed the air out in a couple of bursts by pumping nozzle tester A lever.



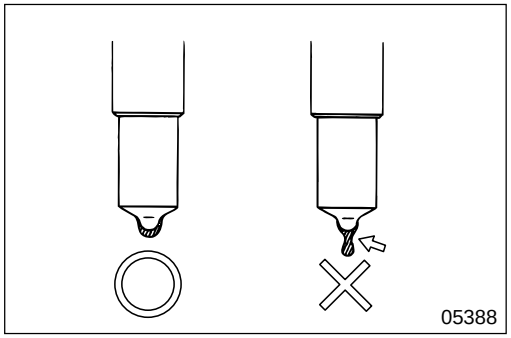
(1) Valve opening pressure

- Raise the pressure of nozzle tester **A** by operating the lever, and measure the pressure that the gauge registers when the pressure is released which will be observed by the sudden movement of the gauge indicator.
- If the measured value deviates from the standard value, disassemble the nozzle and clean, and adjust it using adjusting shims **14**.
- Variation of 0.05 mm {0.0020 in.} thickness in adjusting shims **14** causes a difference of 735 kPa {105 psi, 7.5 kgf/cm^2} of pressure, for example, to alter the pressure for 98 kPa {14 psi, 1 kgf/cm^2}, a thickness of 0.0067 mm {0.00026 in.} is required.
- If the performance cannot reach the standard value even after adjustment, replace injection nozzle assembly **6**.



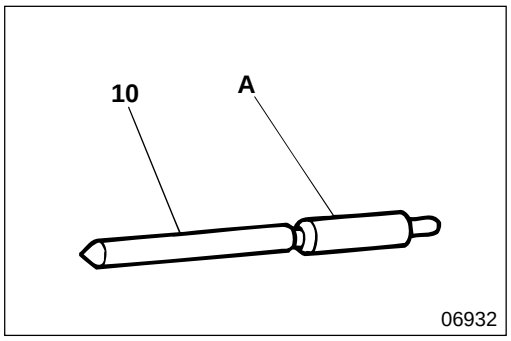
(2) Spray condition

- Test injection spray condition by quick lever actions of nozzle tester **A**, 4 to 6 actions per second.
  - **B** : Even spray from all five orifices (Good)
  - **C** : Even and symmetrical spray (Good)
  - **D** : Asymmetrical spray (Faulty)
  - **E** : Spray direction deviates from the nozzle axis line (Faulty)
  - **F** : Thin and insufficient spray (Faulty)
  - **G** : Irregular spray (Faulty)
- If faulty spray cannot be corrected, disassemble injection nozzle assembly **6** and clean every part and repeat the test.
  If faulty spray still occurs after repeating test, replace the injection nozzle assembly.
- Make sure that there is no post-spray dripping after injection.



(3) Fuel air tightness and leakage at related contact points

- Maintain interior pressure of nozzle at 1960 kPa {285 psi, 20 kgf/cm^2} lower than the valve opening pressure, and check and see if any fuel seeps out of the nozzle tip within 10 seconds.
- If any fault is found, disassemble injection nozzle assembly **6** and clean every part and repeat the test. If any fault is still found, replace the injection nozzle assembly.

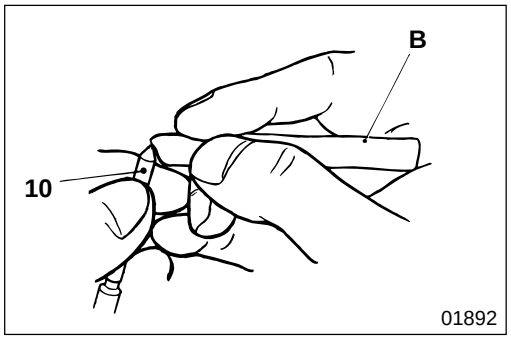


6 Injection nozzle assembly

[Disassembly]

CAUTION

- **Be sure not to touch sliding part A of needle valve 10 with your hands.**
- **Never change the combination of removed needle valve 10 and nozzle 11 as they are a matched set.**



[Cleaning]

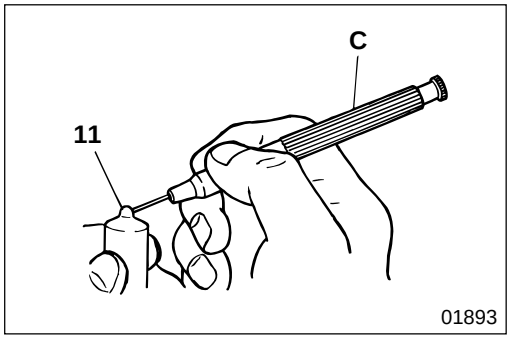
Clean needle valve **10** and nozzle **11** with gas oil (cleaning solvent).

Remove carbon deposits with cleaning tool in the following manner:

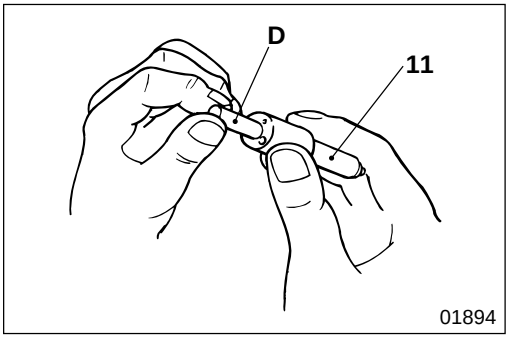
- Clean needle valve **10** by removing carbon deposits from its tip using cleaning bar **B** of cleaning tool.

CAUTION

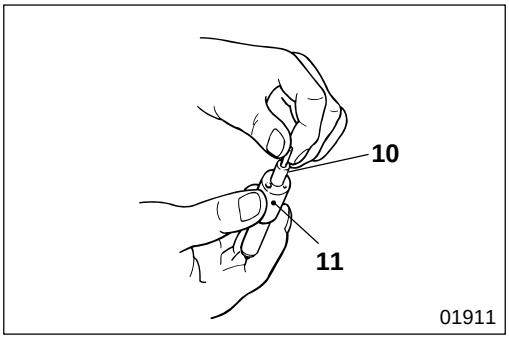
Never use a wire brush or hard steel for cleaning.



- To clean nozzle **11**, remove carbon deposits from the orifices of the nozzle using needle cleaner **C** of cleaning tool, by inserting it into the orifices and turning it.
  Needle cleaner diameter : ø0.25 mm {0.0098 in.} or less



- Clean the seat of nozzle **11** using cleaning needle **D** of [tool] cleaning tool.
- Use a carbon remover tool to remove burnt-on carbon deposits.



[Inspection]

- Immerse needle valve **10** and nozzle **11** in gas oil (cleaning solvent) and clean them thoroughly.
- Check and see if needle value **10** drops by its own weight into the nozzle from the position where a third of its length is pulled out. (Repeat this several times rotating the needle valve.)
- If needle valve **10** does not drop smoothly, repeat cleaning and repeat the test. If any fault is still found, replace both the needle valve and nozzle **11** together as a set.

20 Drive shaft
21 Engine speed sensor

- The feed pump **17** in the injection pump proper **18** pumps up the fuel from the fuel tank **19**, keeping the inside of the injection pump full of the fuel at all times.
- The rotor **12** rotates in the inner cam **15**.
- The electrical drive unit **6** converts the spill valve **5** drive signal delivered from the engine electronic control unit **7** into a high voltage signal to enhance the responsiveness of the spill valve **5**.
- The fuel injection rate is increased or reduced by adjusting the opening time of the spill valve **5**.
- When the spill valve **5** is opened, the inside of the rotor **12** is filled with the fuel.
- After it has been filled, the spill valve **5** closes to confine the fuel in the rotor **12**. In this condition, as the drive shaft **20** rotates, the fuel is pressurized by the inner cam **15** and plunger **16** and fed through the delivery valve **10** to the injection nozzle **8** from which it is injected.
- Then the spill valve **5** opens, and a resultant decline in the fuel pressure in the rotor **12** causes the delivery valve **10** to close, thereby bringing the fuel injection to an end.
- The overflow valve **3** returns the fuel to the fuel tank **19** when the fuel pressure in the injection pump exceeds a predetermined value.
- The fuel injection timing is controlled by the timer control valve **13** which controls the fuel pressure acting on the timer piston **14**.
- The timer control valve **13** is activated by commands from the engine electronic control unit **7**.

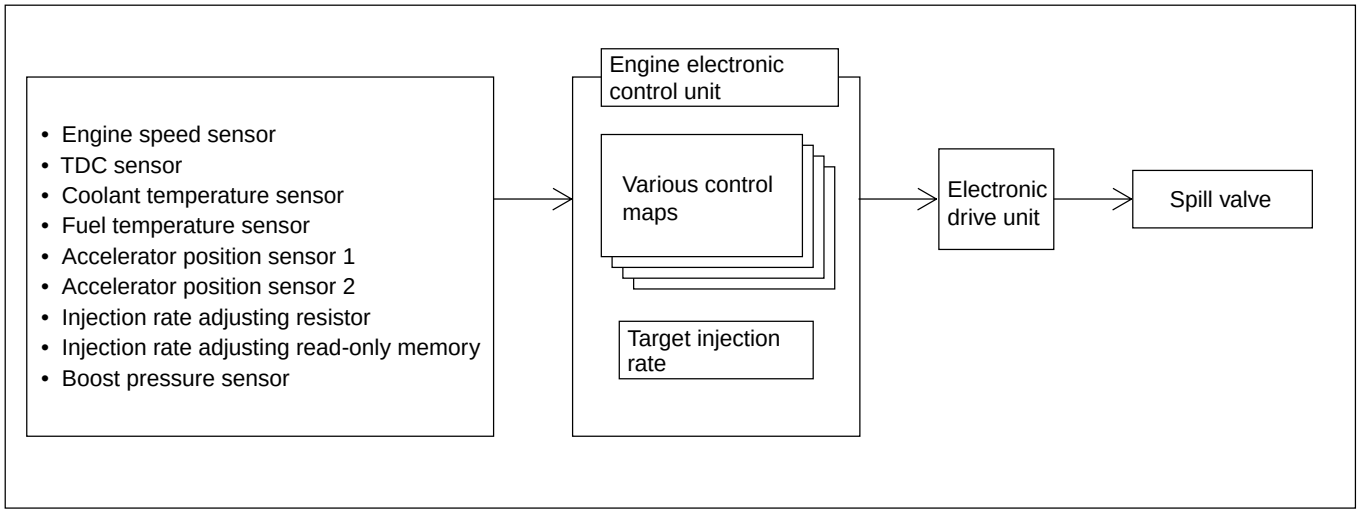
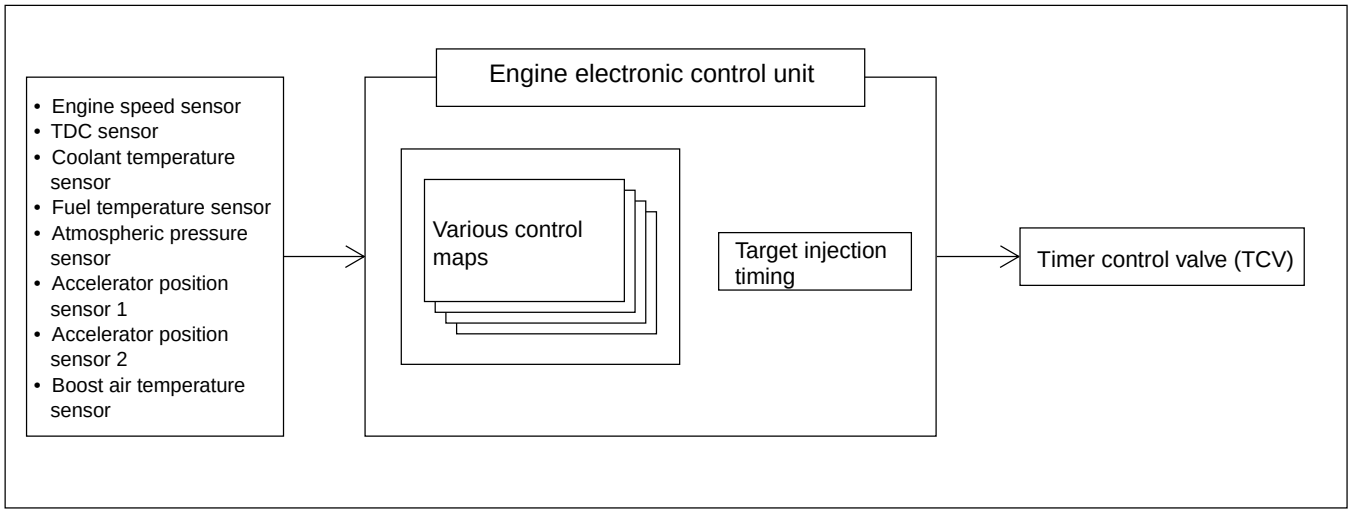
2.2 Fuel Injection Rate Control



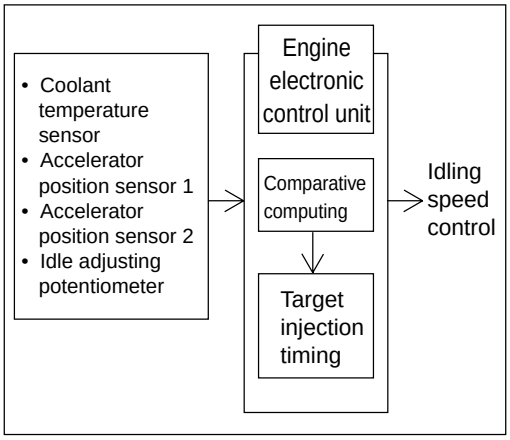
- During operation of the engine, the engine electronic control unit (ECU) processes the individual information signals according to the control maps to select an appropriate injection mode from among the “basic”, “maximum” and “minimum”.
- After selection of the injection mode, the ECU calculates the minimum value to ensure that the maximum injection rate is not exceeded and determines the target injection rate.
- Once the target injection rate has been determined, the engine electronic control unit outputs a signal to drive the spill valve.
- The signal to drive the spill valve is passed through the electronic drive unit so that its responsiveness for high speed driving will be enhanced.
- The electronic drive unit immediately converts the signal voltage delivered from the engine electronic control unit to a high voltage.

2.3 Fuel Injection Timing Control



- During operation of the engine, the engine electronic control unit (ECU) processes the individual information signals according to the control maps to calculate the target injection timing, and drives the timer control valve (TCV) in such a way that the real timing computed on the basis of the engine speed sensor and TDC sensor will match the target timing.
- Controls at the time of an engine start are achieved by the start compensation map contained in each control map.

2.4 Warmup Accelerating Function



The warmup accelerating function varies the idling speed according to the engine coolant temperature to accelerate warmup. The function includes the automatic and manual modes. Either of the modes can be selected by pushing/pulling the idle adjusting potentiometer.

TROUBLESHOOTING

1. INSPECTION PROCEDURES

Diagnostic Function

- Whenever the starter switch is placed at ON, the diagnostic function is activated to check all the sensors, etc. If any of them is found faulty, the warning lamp in the meter cluster is lit to alert the driver. At the same time, the fault location is stored in memory, and the system enters the backup mode.

Warning Lamp Indications

	(Red)	(Amber)
Safety-critical error (Vehicle must not be driven)	ON	OFF
Non-safety-critical error (Vehicle can be driven despite poor control feeling)	OFF	ON

- The stored fault location can be read as a diagnostic trouble code by the Multi-Use Tester II or the diagnosis switch.

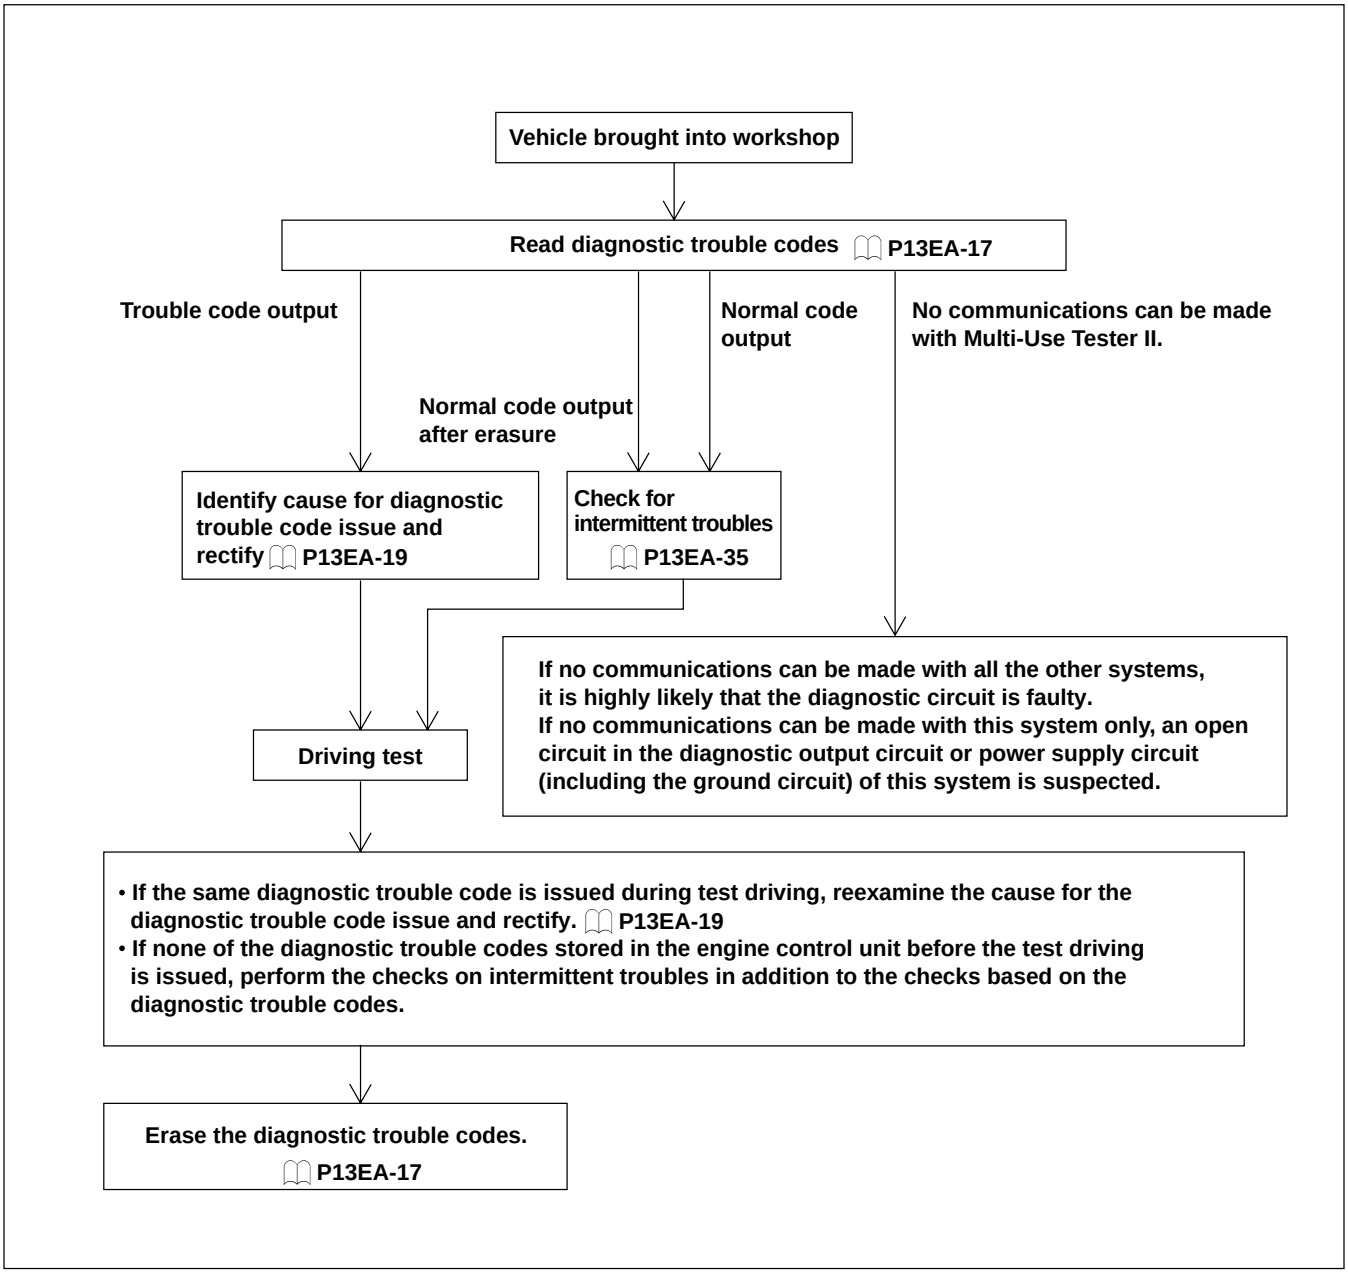
CAUTION ⚠

- **Check to ensure that the battery voltage is within the specified range.**
- **Check all the harness and device connectors for looseness. Always remove a connector at least 20 seconds after placing the starter switch at the LOCK position.**
- **Do not forget to clear the diagnostic trouble code by the Multi-Use Tester II or memory clear switch after a fault has been rectified.**
- **As a rule, inspection operations should be performed with the starter switch at the LOCK position. Some checks, however, may have to be made with the starter switch at the ON position. In such a case, use care to make sure that no short circuit develops between pins of the connectors or with the body.**
- **The resistance value of each component is affected by the temperature and the accuracy of the tester. The reading, therefore, does not always fall within the standard limits. Note that the check values shown in the text are the values obtained at normal temperature (10 to 35°C {58 to 95°F}).**
- **Whether or not the system automatically returns to normal from the backup mode after a fault has been removed depends on the diagnostic trouble code (fault location). When the system returns to normal, the warning lamp will be OFF.**
- **Even when the fault has been removed and the system has been automatically returned to the normal mode, the diagnostic trouble code of the fault remains stored in the engine control unit.**
- **When a fault occurs at a point where the system is not automatically reset, perform the memory clear procedure to let the system exit from the backup mode. 🕮 P13EA-17**

Inspection Flowchart

The system inspection can be performed effectively by use of the Multi-Use Tester II. The types of system inspections may be broadly divided as shown below in accordance with the trouble symptoms and diagnostic trouble code outputs.

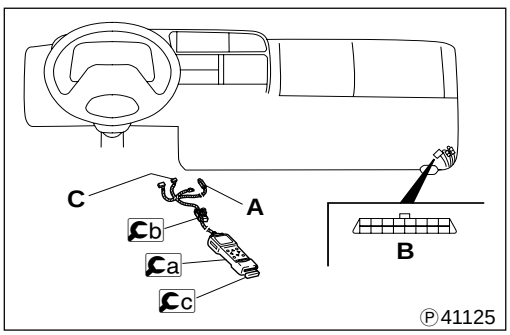
- Inspections based on diagnostic trouble codes stored in the engine electronic control unit
- Inspections of intermittent troubles



2. CONNECTION OF MULTI-USE TESTER II

Special Tools

Location	Name and Shape of Special Tool	Part No.	Application
–	Multi-Use Tester II  19492	MB991496	Inspection of system
–	Multi-Use Tester II harness (for communications)  19141	MK327601	To supply power to Multi-Use Tester II proper and communicate with vehicle side electrical devices
–	Read-only memory pack (MRT-E8.1)  19493	MH063580	Data for inspection and control of engine control unit
–	Memory card (set in Multi-Use Tester II proper)  20538	MB991500	To write data
–	Multi-Use Tester II harness  20536	MB991499	To use Multi-Use Tester II as a circuit tester



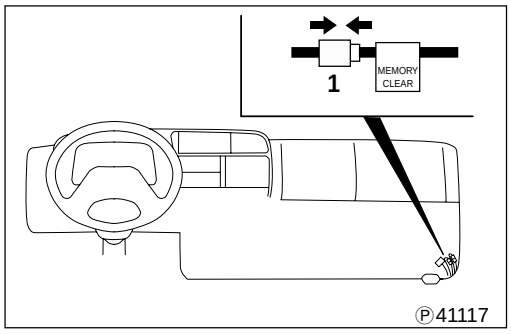
- Place the starter switch at the LOCK position.
- Connect the a Multi-Use Tester II harness to b Multi-Use Tester II and insert the c read-only memory in the tester.
- Connect the connector **A** to the cigar lighter socket.
- Connect the Multi-Use Tester II connector **C** (16 pins) to the data link connector **B** (16 pins).

NOTE

For the operating procedures for the Multi-Use Tester II, refer to the instruction manual for the Multi-Use Tester II.

3. READING AND ERASING DIAGNOSTIC TROUBLE CODES

Two types of methods are available for reading or erasing a diagnostic trouble code; one using the Multi-Use Tester II and one using the vehicle side diagnostic functions.

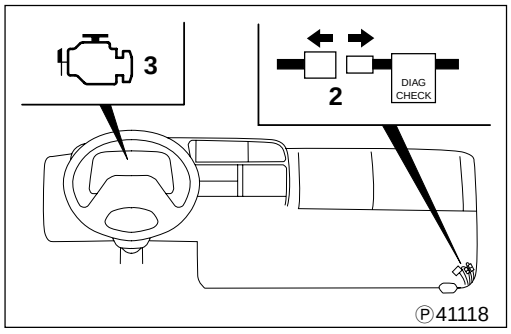


(1) Method using Multi-Use Tester II

● **Current Diagnostic Trouble Code**
- Check to see that the memory clear switch **1** is connected.
- Set the starter switch to ON.
- Operate the Multi-Use Tester II to read the current diagnostic trouble code and determine the fault location.

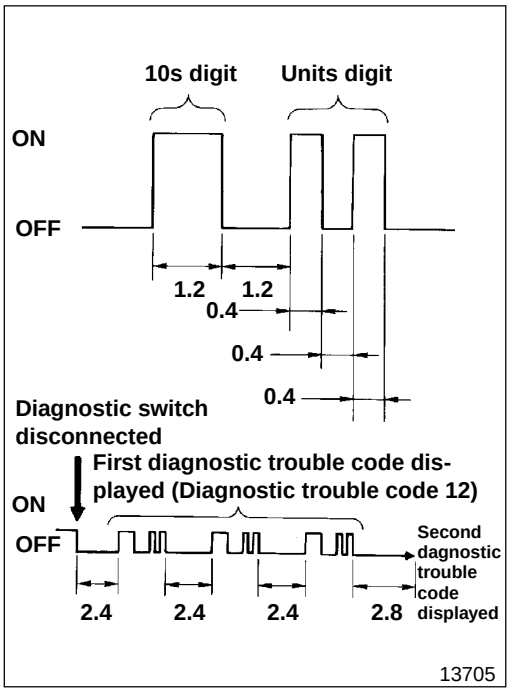
● **Past Diagnostic Trouble Code**
- Set the starter switch to ON.
- Disconnect the memory clear switch **1**.
- Operate the Multi-Use Tester II to read the past registered diagnostic trouble codes and determine the fault location.

● **Erasing Diagnostic Trouble Codes**
- Set the starter switch to ON.
- Operate the Multi-Use Tester II to erase all of the diagnostic trouble codes stored in the engine electronic control unit.



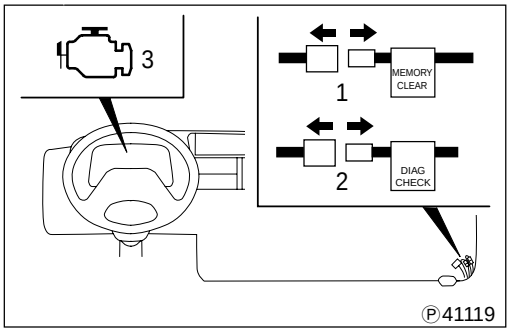
(2) Method Not Using Multi-Use Tester II (Method Using Diagnostic Switch and Memory Clear Switch)

● **Current Diagnostic Trouble Code**
- Set the starter switch to ON.
- Disconnect the diagnostic switch **2**.
- The diagnostic trouble code is displayed by flashes of the warning lamp **3**.



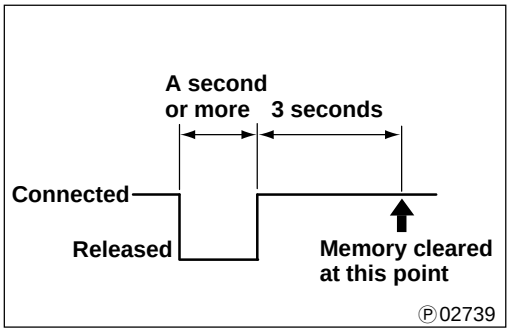
● **Reading Diagnostic Trouble Code**

- Diagnostic trouble codes are indicated by the number of times the warning lamp **3** flashes and their duration.
  - The flashing intervals also differ between the 10s digit and units digit.
  - 10s digit: 1.2 second interval
  - Units digit: 0.4 second interval
  - Each diagnostic trouble code is displayed from the 10s digit followed by the units digit. As for a code which has no 10s digit, units digit only is displayed.
- Each diagnostic trouble code is displayed three times in succession.
- If there is no more code stored, the sequence is then repeated from the beginning with each code indicated three times.
- When the diagnostic switch **2** is connected, the engine electronic control unit will immediately stop displaying codes.



● **Past Diagnostic Trouble Codes**

- After reading the current diagnostic trouble codes (with the diagnostic switch **2** disconnected), disconnect the memory clear switch **1**. Then the warning lamp **3** will restart flashing.
- This time, the warning lamp displays the past diagnostic trouble codes. Determine the fault locations based on the indicated codes.



● **Erasing Diagnostic Trouble Codes**

Disconnect the memory clear switch **1** and the diagnostic switch **2** then reconnect them. Then all the diagnostic trouble codes stored in the engine electronic control unit will be cleared.

CAUTION ⚠

- **If the contents of memory are not to be cleared after display of the stored codes, set the starter switch to OFF with the memory clear switch 1 disconnected. Thereafter, connect the memory clear switch.**
- **When you change the combination of the injection pump and engine electronic control unit, you must rewrite the pump data stored in the engine electronic control unit. For this purpose, be sure to perform the diagnostic trouble code erasing procedure.**
- **Whenever the engine electronic control unit has been replaced with a new one, be sure to erase the diagnostic trouble codes by disconnecting the memory clear switch 1 and diagnostic switch 2 after connecting all the connectors. Upon completing the procedure, confirm that no diagnostic trouble codes is stored.**

4.2 Diagnostic Trouble Code Issued Conditions and Check Items

Perform service procedures taking the diagnostic trouble code issued conditions and the probable causes into consideration.

06 EDU/SPV		
Code issued condition [Reset condition]	Diagnostic trouble code **06** is intended for checking the electronic drive unit and spill valve for anything abnormal. The code is issued when the FAIL signal is not input the specified number of consecutive times from the electronic drive unit to the electronic control unit despite the fact that the battery voltage is normal, the engine is running at a speed higher than the idling speed, and the electrical drive unit is outputting the spill valve drive signal. [Starter switch OFF]	
Action taken by electronic control unit	Engine stopped	
Warning lamp illuminated	(Red)	
Probable cause and check item	• Open or short circuit between electronic control unit and electronic drive unit,or between electronic drive unit and spill valve • Faulty electronic drive unit • Faulty spill valve	• Check on the basis of the service data of the Multi-Use Tester II. 🕮 P13EA-28 No. 83: Spill valve operation check • Test the actuator by the Multi-Use Tester II. 🕮 P13EA-30 No. 9B: Spill valve operation check • Check the electronic drive unit (Ask your DENSO service station to do the job.) • Check the spill valve. 🕮 P13EA-36: Inspection of Electrical Devices **536** • Check the circuit between the electronic control unit and electronic drive unit or the circuit between the electronic drive unit and spill valve. 🕮 P13EA-49: Electrical wiring Diagram

07 OVER REV		
Code issued condition [Reset condition]	Diagnostic trouble code **07** is intended for checking whether the engine speed has reached an overspeed. When the engine speed reaches an overspeed, the code is issued. (When the engine speed decreases to fall within the normal range, a reset is made.)	
Action taken by electronic control unit	Spill valve operation stopped	
Warning lamp illuminated	None	
Probable cause and check item	• Faulty spill valve of injection pump assembly • Overrevved engine during driving downhill • Faulty electronic control unit	Check the injection pump assembly (Ask your DENSO service station to do the job.)

14 TDC SNSR		
Code issued condition [Reset condition]	Diagnostic trouble code **14** is intended for checking the TDC sensor operation. It is issued when the TDC sensor signal is not input to the electronic control unit the specified number of consecutive times while the engine is running. [When normal TDC sensor signal input is restored, the system is reset.]	
Action taken by electronic control unit	Injection timing feedback control stopped and open-loop control executed	
Warning lamp illuminated	(Amber)	
Probable cause and check item	• Open or short circuit between control unit and TDC sensor • Faulty TDC sensor • Faulty electronic control unit	• Perform checks at electronic control unit connector. 🕮P13EA-32 **01**: Measure resistance of TDC sensor. • Check TDC sensor. 🕮 P13EA-36: Inspection of Electronic Devices **316** • Check circuit between electronic control unit and TDC sensor. 🕮 P13EA-49: Electrical Writing Diagram

15 NE SNSR		
Code issued condition [Reset condition]	Diagnostic trouble code **15** is issued when the signal from the engine speed sensor is not input the specified number of times to the electronic control unit while the engine is in operation. [When the signal from the engine speed sensor returns to normal, a reset is made.]	
Action taken by electronic control unit	Synchronous control of spill valve with timer control valve interrupted	
Warning lamp illuminated	(Red)	
Probable cause and check item	• Open or short circuit in harness between electronic control unit and engine speed sensor • Faulty engine speed sensor • Gap of engine speed sensor maladjusted • Faulty electronic control unit	• Perform checks on the basis of the service data of the Multi-Use Tester II. 🕮P13EA-28 No. 01: Measure engine speed. • Perform checks at control electronic unit connector. 🕮P13EA-32 **02**: Measure resistance of engine speed sensor. • Check engine speed sensor. 🕮 P13EA-36: Inspection of Electrical Devices **263** • Check circuit between electronic control unit and engine speed sensor. 🕮P13EA-49: Electrical Wiring Diagram

16 ACCEL SNSR-2		
Code issued condition [Reset condition]	Diagnostic trouble code **16** is intended for checking the accelerator position sensor 2 for an abnormal voltage. The code is issued when the voltage of the accelerator position sensor 2 is out of the specified limits. When diagnostic trouble code **24** is also registered, the portion between the accelerator position sensors is faulty. [When the voltage of the accelerator position sensor 2 falls within the specified limits, a reset is made.]	
Action taken by electronic control unit	①: Ordinary controls are made by using only accelerator position sensor 1 ②: When accelerator position sensor 1 is also faulty, controls are made on the assumption that the pedal is depressed 30% when accelerator switch is OFF and 0% when accelerator switch is ON.	
Warning lamp illuminated	①: None ②: (Amber)	
Probable cause and check item	• Open or short circuit in harness between electronic control unit and accelerator position sensor 2 Faulty accelerator position sensor 2 • Faulty electronic control unit	• Perform checks on the basis of the service data of the Multi-Use Tester II. 🕮 P13EA-28 No. 0B: Accelerator pedal opening measurement. No. 0C: Measurement of accelerator position sensor output voltage. • Perform checks at electronic control unit connector. 🕮 P13EA-32 **03**: Measurement of accelerator position sensor 2 output voltage • Check accelerator position sensor 2. 🕮 P13EA-36: Inspection of Electrical Devices **324** • Check circuit between electronic control unit and accelerator position sensor 2. 🕮 P13EA-49: Electrical Wiring Diagram

19 AIR PRES SNSR		
Code issued condition [Reset condition]	Diagnostic trouble code **19** is intended for checking the atmospheric pressure sensor (built into the electronic control unit) for anything abnormal. The code is issued when a voltage signal from the atmospheric pressure sensor is out of the specified limits. [When the output voltage of the atmospheric pressure sensor falls within the specified range, a reset is made.]	
Action taken by electronic control unit	Controls achieved on the assumption that atmospheric pressure is 100 kPa {29.9 in. Hg, 760 mmHg}.	
Warning lamp illuminated	None	–
Probable cause and check item	• Faulty atmospheric pressure sensor (built into control unit) Faulty electronic control unit	Perform checks on the basis of the service data of the Multi-Use Tester II. 🕮 P13EA-28 No. 14: Atmospheric pressure measurement.

21 WTR TEMP SNSR		
Code issued condition [Reset condition]	Diagnostic trouble code **21** is intended for checking for open or short circuit in the harness of the coolant temperature sensor or anything abnormal in coolant temperature sensor. The code is issued when the output voltage from the coolant temperature sensor is out of the specified limits. [When the output voltage of the coolant temperature sensor falls within the specified range, a reset is made.]	
Action taken by electronic control unit	Controls achieved on the assumption that the coolant temperature is 80°C {178°F}	
Warning lamp illuminated	None	–
Probable cause and check item	• Open or short circuit in harness between electronic control unit and coolant temperature sensor • Faulty coolant temperature sensor • Faulty electronic control unit	• Perform checks on the basis of the service data of the Multi-Use Tester II. 🕮 P13EA-28 No. 10: Engine coolant temperature measurement • Check coolant temperature sensor. 🕮 P13EA-36: Inspection of Electrical Devices **262** • Check circuit between electronic control unit and coolant temperature sensor. 🕮 P13EA-49: Electrical Wiring Diagram

23 TCV		
Code issued condition [Reset condition]	Diagnostic trouble code **23** is intended for checking the harness of the timer control valve for open or short circuit and checking the timer control valve for anomalies. The code is issued when the real advance angle position of the timer continues to be out of the specified limits under the condition that fuel injection timing feedback control is in progress after completion of engine warmup. [When the advance angle re-enters the specified range with the engine at a speed of less than 1200 rpm, a reset is made.]	
Action taken by electronic control unit	Controls are made on the assumption that the coolant temperature is 20°C {-4°F} when the engine is started, and 120°C {248°F} during operation.	
Warning lamp illuminated	None	–
Probable cause and check item	• Open or short circuit in harness between electronic control unit and timer control valve • Faulty timer control valve • Faulty electronic control unit	• Perform checks on the basis of the service data of the Multi-Use Tester II. 🕮 P13EA-28 No. 09: Timer advance angle measurement • Check timer control valve. 🕮 P13EA-36: Inspection of Electrical Devices **584** • Check circuit between electronic control unit and timer control valve. 🕮 P13EA-49: Electrical Wiring Diagram

24 ACCEL SNSR-1		
Code issued condition [Reset condition]	Diagnostic trouble code **24** is intended for checking the accelerator position sensor 1 for abnormal voltage. The code is issued when the output voltage of the accelerator position sensor 1 is out of the specified limits. When diagnostic trouble code 16 is also registered, the portion between the accelerator position sensors is faulty. [When the output voltage of the accelerator position sensor 1 re-enters the specified range, a reset is made.]	
Action taken by electronic control unit	①: Ordinary controls are continued by using only the accelerator position sensor 2. ②: When accelerator position sensor 2 is also faulty, controls are made on the assumption that the pedal is depressed 30% when accelerator switch is OFF and 0% when accelerator switch is ON.	
Warning lamp illuminated	①: None ②: (Amber)	
Probable cause and check item	• Open or short circuit in harness between electronic control unit and accelerator position sensor 1 • Faulty accelerator position sensor 1 • Faulty electronic control unit	• Perform checks on the basis of the service data of the Multi-Use Tester II. 🕮 P13EA-28 No. 0B: Accelerator pedal opening measurement No. 0C: Measurement of accelerator position sensor output voltage. • Perform checks at electronic control unit connector. 🕮 P13EA-32 **04**: Measurement of accelerator position sensor 1 output voltage • Check accelerator position sensor 1. 🕮 P13EA-36: Inspection of Electrical Devices **324** • Check circuit between electronic control unit and accelerator position sensor 1. 🕮 P13EA-49: Electrical Wiring Diagram

25 SPEED SNSR		
Code issued condition [Reset condition]	Diagnostic trouble code **25** is intended for checking the harness of the vehicle speed sensor for open/short circuit and checking the vehicle speed sensor for abnormalities. The code is issued when there are no pulse inputs from the vehicle speed sensor to the electronic control unit in the specified time duration. [When a pulse is input, a reset is made.]	
Action taken by electronic control unit	ISC (Idle Speed Control) disabled	
Warning lamp illuminated	None	
Probable cause and check item	• Open or short circuit in harness between electronic control unit and vehicle speed sensor • Faulty vehicle speed sensor • Faulty electronic control unit	• Perform checks on the basis of the service data of the Multi-Use Tester II. 🕮 P13EA-28 No. 0D: Vehicle speed measurement. • Perform checks at electronic control unit connector. 🕮P13EA-32 **05**: Measurement of vehicle speed signal voltage. • Check vehicle speed sensor. 🕮P13EA-36: Inspection of Electrical Devices **265** • Check circuit between electronic control unit and vehicle speed sensor. 🕮P13EA-49: Electrical Wiring Deagram

26 PUMP ROM		
Code issued condition [Reset condition]	Diagnostic trouble code **26** is intended for checking for an error in the loaded pump read-only memory data necessary for control of the injection rate. The code is issued when any of the following situations occurs. Loaded read-only memory has unmatched data. • Read-only memory data cannot be read. • Loaded data exceeds the upper limit of correction. • There is a mismatch between control unit backup data and loaded data. [No automatic reset takes place.]	
Action taken by electronic control unit	Initial values used	
Warning lamp illuminated	None –	
Probable cause and check item	• Open or short circuit in harmess between electronic control unit and injection rate and adjusting read-only memory • Faulty injection rate adjusting read-only memory • Faulty electronic control unit	• Check injection rate adjusting read-only memory. Checking Procedures

CAUTION ⚠

Each item is checked by one of two methods; one by disconnecting the connectors and one by leaving the connectors connected.

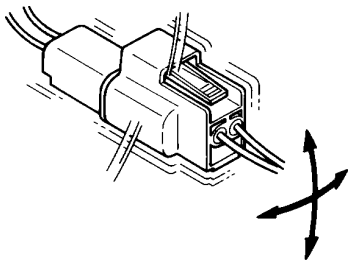
Pay heed to the following points.

- **Be sure not to touch any other pin than the one to be checked.**
  Especially, use utmost care that a short circuit is never produced between pins by the tester.
- **All the illustrations of the connectors in the table show the connectors on the electronic control unit side. Be careful not to confuse the pins with those to be checked.**

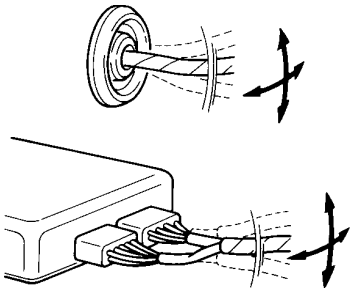
Check Item	Checking Procedure
01 Resistance of TDC sensor	[Conditions] • Starter switch OFF • Disconnect connector and make checks at vehicle side harness connector (25°C {77°F}). [Judging Criteria] Between pins: C⑤ – C⑪ 1.5 ± 0.2 kΩ
02 Resistance of engine speed sensor	[Conditions] • Starter switch OFF • Disconnect connector and make checks at vehicle side harness connector. [Judging Criteria] Between pins: C⑥ – C⑫ 230 ± 25 Ω
03 Output voltage of accelerator position sensor 2	[Conditions] • Starter switch OFF • Leave vehicle side harness connected (make checks from back side of connector). [Judging Criteria] Between pins (⊕ — ⊖): B⑬ – B⑧ • When accelerator pedal is released: 0.85V • When accelerator pedal is depressed: 4.15V
04 Output voltage of accelerator position sensor 1	[Conditions] • Starter switch OFF • Leave vehicle side harness connected (make checks from back side of connector). [Judging Criteria] Between pins (⊕ — ⊖): B⑪ – B⑥ • When accelerator pedal is released: 0.85V • When accelerator pedal is depressed: 4.15V
05 Signal voltage of vehicle speed sensor	[Conditions] • Starter switch ON • Leave vehicle side harness connected (make checks from back side of vehicle side connector). • Using chassis dynamometer or something else, slowly rotate wheels. [Judging Criteria] Between pins (⊕ — ⊖): A ⑰ – A ⑬ • Hi: Approx. 8V • Lo: 0.5V or less

Check Item	Checking Procedure
06 Output voltage of idle adjusting potentiometer	[Conditions] • Starter switch ON • Leave vehicle side harness connected (make checks from back side of connector). [Judging Criteria] Between pins (⊕ — ⊖): C⑤ – C⑩ • When knob is pulled: Approx. 1 to 3V • When knob is pushed all the way: Approx. 3.6 to 4.3V
09 Voltage of accelerator switch	[Conditions] • Starter switch ON • Leave vehicle side harness connected (make checks from back side of connector). [Judging Criteria] Between pins (⊕ — ⊖): D⑩ – B⑧ • When accelerator pedal is depressed: 0V • When accelerator pedal is released: 5V
11 Voltage of emergency engine stop switch	[Conditions] • Starter switch ON • Leave vehicle side harness connected (make checks from back side of connector). [Judging Criteria] Between pins (⊕ — ⊖): D⑫ – D⑯ • Switch at stop position: 0V • Switch at normal position: 12V
12 Resistance of fuel temperature sensor	[Conditions] • Starter switch OFF • Leave vehicle side harness connected (make checks from back side of connector). [Judging Criteria] Between pins: B⑫ – B⑯ 2.5 ± 1.0 kΩ
13 Voltage of starter switch (starter signal)	[Conditions] • Leave vehicle side harness connected (make checks from back side of connector). • Starter switch (S position) [Judging Criteria] Between pins (⊕ — ⊖): D② – D⑪ 12V

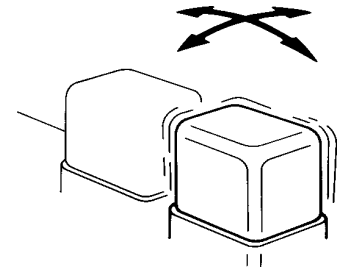
8. CHECKS ON INTERMITTENT TROUBLES



02597



02598



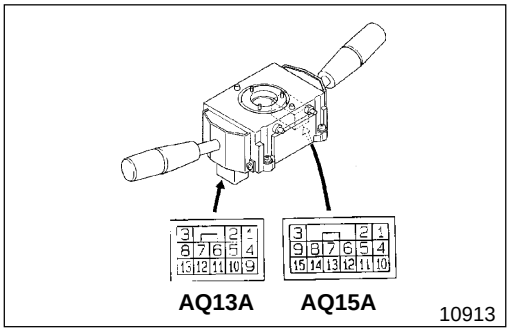
02599

A intermittent trouble often occurs in a specific condition. Therefore, pinpointing the condition will make it easy to estimate the cause. To pinpoint the condition for a intermittent trouble, ask the customer in detail about the driving condition when the trouble occurs, weather, occurrence frequency and symptoms, and reproduce the symptoms of the trouble.
Depending on the condition where the trouble occurs, determine whether the cause of the trouble is vibration, temperature or any other factor.
If the probable cause is vibration, perform the following checks on the relevant connectors harnesses, etc. and check whether the symptoms of the trouble are reproduced.

- Lightly move the connector up and down and to the right and left.
- Lightly move the harness up and down and to the right and left.
- Lightly shake the sensors and other devices by hand.
- Lightly shake the wiring harness located in the moving components such as the suspension.

The connectors and other parts to be checked are identifiable from the descriptions in the Probable Causes or the Checking Procedures for the displayed diagnostic trouble code.

INSPECTION OF ELECTRICAL EQUIPMENT



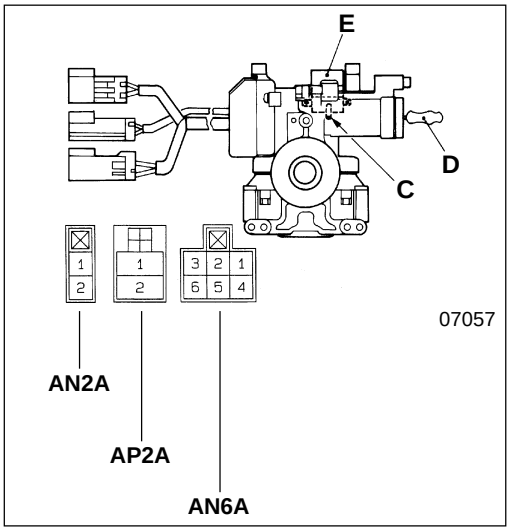
001 Checking Combination Switch

- Perform continuity checks according to the following table.
  AQ15A Connector Connection Table

		⑤	⑥
Exhaust brake switch	OFF		
	ON	○——○	

○——○ : There must be continuity between the pins.

- If there is anything wrong, replace the switch.



002 Checking Starter Switch

- Perform continuity checks according to the following table.
- If there is anything wrong, replace the starter switch. Gr 37

(1) Continuity Check

		AP2A		AN6A				
		②	①	③	④	②	⑥	⑤
LOCK	Key not in position							
	Key in position						○——○

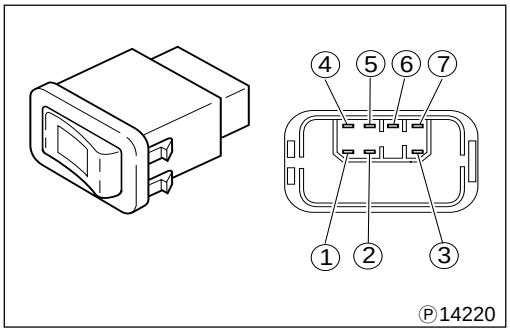
ON		○——○		○——○			○——○	
START		○——○		○——○		○	○——○	
		B	M	A	F/M	S	K1	K2

○——○ : There must be continuity between the pins.

(2) Checking Key Interlock Solenoid

	AN2A		LOCK	ACC	ON	START	Remarks
	①	②					
Rotating range of key **D**	⊕——⊖			←——		——→	Plunger **C** is locked and key **D** cannot be removed.
			←——			——→	Plunger **C** is free and key **D** can be removed.

⊕——⊖ : Apply voltage across these pins.
DC 12V
E: Key interlock solenoid



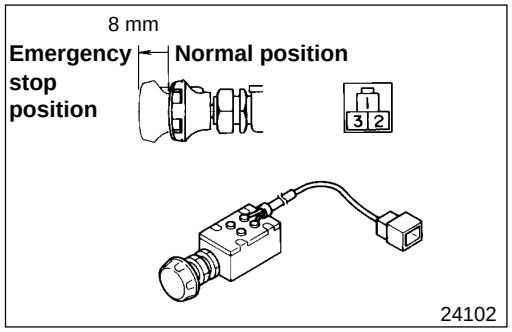
014 Checking Cold Start Switch

- Perform continuity checks according to the following table.

	①	⑤
ON	○——○	
OFF		

○——○ : There must be continuity between the pins.

- If there is anything wrong, replace the switch.



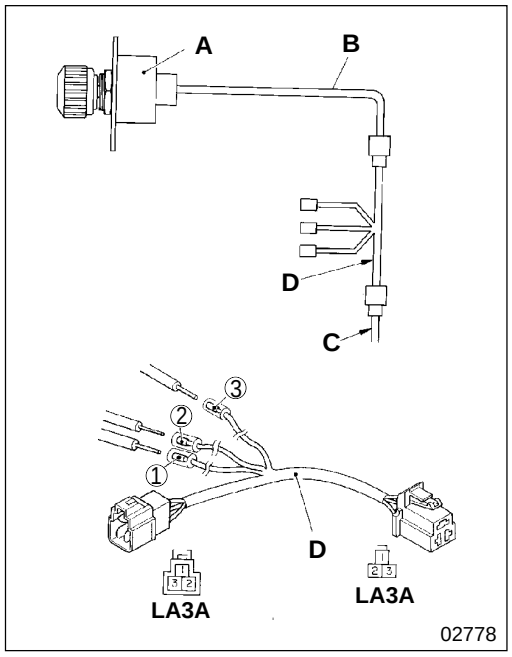
156 Checking Emergency Engine Stop Switch

- Perform continuity checks according to the following table.

	①	②	③
Normal position	○—○		
Emergency stop position	○		○

○—○ : There must be continuity between the pins.

- If there is anything wrong, replace the switch.
  Gr 13A



157 Checking Idle Adjusting Potentiometer

- Disconnect the harness **B** of the idle adjusting variable resistor **A** from the vehicle side harness **C**, and connect the inspection harness **D** between them.
- Set starter switch to ON.
- Measure the output voltage of the idle adjusting variable resistor **A** according to the following table.

	②	③		
Standard value	⊖	⊕	Output voltage PULL (Knob in pulled position)	1 to 3 V
			Output voltage PUSH (Knob in pushed position)	3.6 to 4.3 V

- If the reading is out of the standard value range, replace the idle adjusting potentiometer **A**.

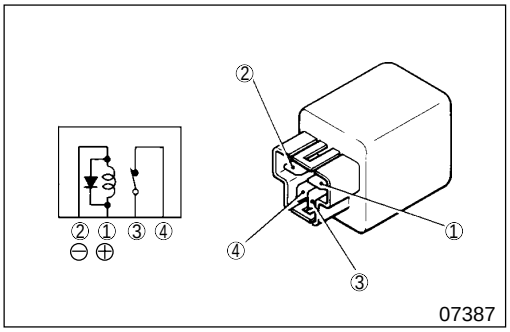
INSPECTION OF ELECTRICAL EQUIPMENT



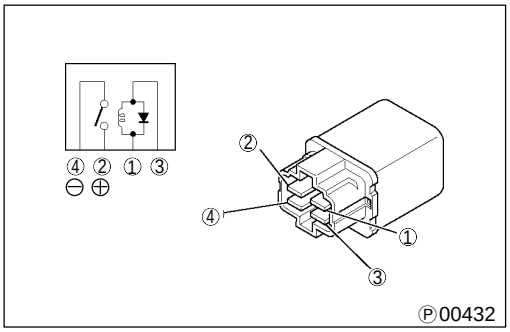
180 Checking Relay (Normally closed type 4-pin)

- Perform continuity and operation checks according to the following table.

	①	②	③	④
When not energized	○	○	○	○
When energized	⊕	⊖	◌	◌

○——○ : There must be continuity between the pins.
⊕——⊖ : Apply a voltage of 12 V DC across these pins.
◌·····◌ : Continuity between these pins must be lost.

- If there is anything wrong, replace the relay.



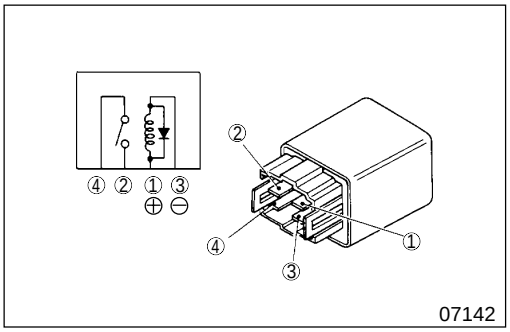
181 Checking Relay (Normally open type 4-pin)

- Perform continuity and operation checks according to the following table.

	①	②	③	④
When not energized	○		○	
When energized	⊕	○	⊖	○

○——○ : There must be continuity between the pins.
⊕——⊖ : Apply a voltage of 12V DC across these pins.

- If there is anything wrong, replace the relay.



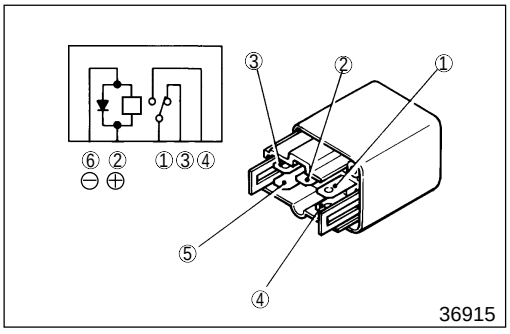
185 Checking Relay (Normally open type 4-pin)

- Perform continuity and operation checks according to the following table.

	①	②	③	④
When not energized	○		○	
When energized	⊕	○	⊖	○

○——○ : There must be continuity between the pins.
⊕——⊖ : Apply a voltage of 12V DC across these pins.

- If there is anything wrong, replace the relay.



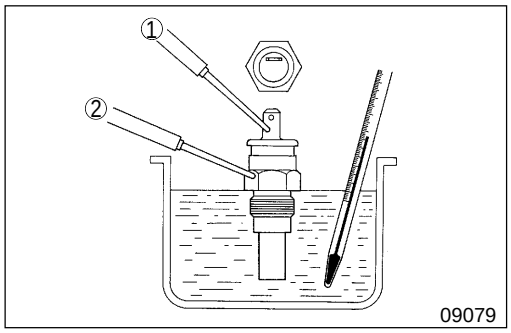
228 Checking Relay (Normally open type 6-pin)

- Perform continuity and operation checks according to the following table.

	①	②	③	④	⑥
When not energized	○	○	○		○
When energized	○	⊕		○	⊖

○——○ : There must be continuity between the pins.
⊕——⊖ : Apply a voltage of 12 V DC across these pins.

- If there is anything wrong, replace the relay.



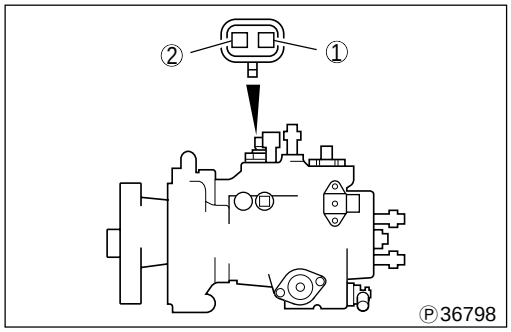
262 **Checking Coolant Temperature Sensor**

- Put the coolant temperature sensor in a container filled with engine oil.
- Heat the engine oil to various specified temperatures while stirring the engine oil.
- Measure the resistance value between pins ① and ② (body).

Standard value	0°C {32°F}	(8.62 kΩ)
	20°C {68°F}	(3.25 kΩ)
	40°C {104°F}	(1.5 kΩ)
	60°C {140°F}	620 ± 62 Ω

Reference value in parentheses

- If the reading is out of the standard value, replace the coolant temperature sensor. Gr14A

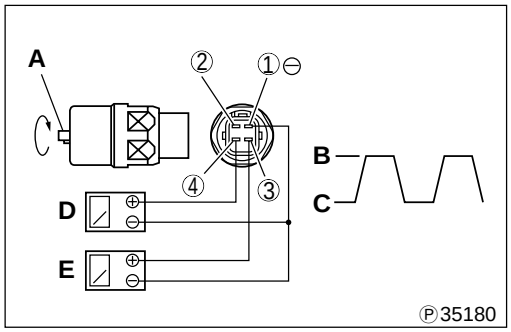


263 **Checking Engine Speed Sensor**

- Measure the resistance value between pins ① and ②.

Standard value (at 20°C {68°F})	230 ± 25 Ω

- If the reading is out of the standard value range, replace the engine speed sensor. Ask your DENSO service station to replace it.



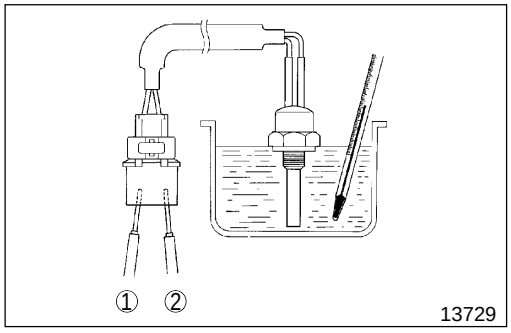
265 **Checking Vehicle Speed Sensor**

- Slowly rotate portion **A** of the vehicle speed sensor with a voltage of 12V DC applied across pins ① and ③.
- Measure the maximum value (high pulse voltage **B**) and minimum value (low pulse voltage **C**) of the voltage generated across the pins ① and ②.

D: Tester (to check 25 pulses)

Standard value	Low pulse	0.5 V or less
	High pulse	8 ± 1 V

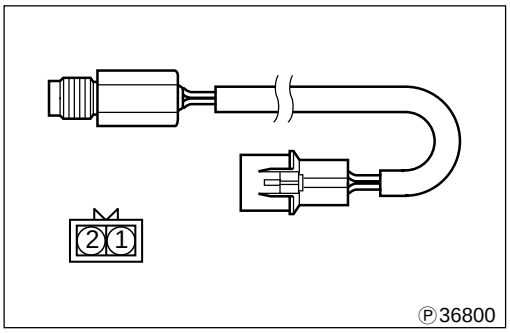
- If the reading is out of the standard value, replace the vehicle speed sensor.



304 **Checking Boost Air Temperature Sensor**

- Place the boost air temperature sensor in a container of water.
- Raise the water temperature to the specified values and stir.
- Measure the resistance between pins ① and ②.
- If the measured value deviates from the standard value, replace the boost air temperature sensor. Gr 15A

Standard value	0°C {32°F}	5880 ± 588 Ω
	20°C {68°F}	2450 ± 245 Ω
	80°C {176°F}	322 ± 48 Ω



316 Checking TDC Sensor

- Measure the resistance between pins ① and ②.

Standard value (at 25°C {77°F})	1.5 ± 0.2 kΩ

- If the reading is out of the standard value, replace the TDC sensor.

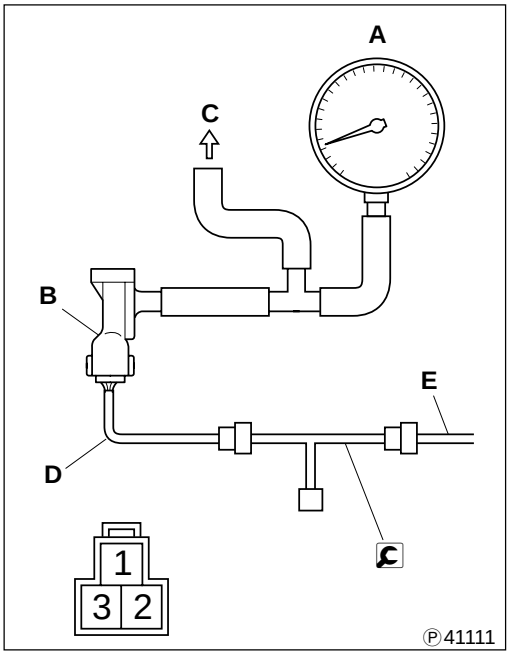
318 Checking Boost Pressure Sensor

< Checking by use of Multi-Use Tester II >

P13EA-28

NOTE

The boost pressure checking conditions differ between when the boost pressure is checked by use of the Multi-Use Tester II and when it is checked without use of the Multi- Use Tester II. So the standard values also differ.



< Checking without use of Multi-Use Tester II >

- Disconnect the harness **D** of the boost pressure sensor from the chassis side harness **E** and connect the C inspection harness between them.

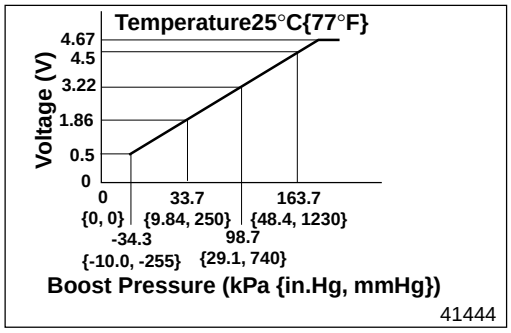
Too Name and Shape	Part No.
Inspection Harness  02806	MC854336 (Obtain Locally)

- Mount pressure gauge **A** for measurement of the boost pressure.
  C: To inlet manifold
- Set the starter switch to ON.
- Measure the output voltage of the boost pressure sensor **B** according to the following table.

Item	Connector Pin		
	① Power (+)	② GND (-)	③ Output (+)
Power voltage	○	○	
* Output voltage (Refer to the output characteristics shown.)		○	○

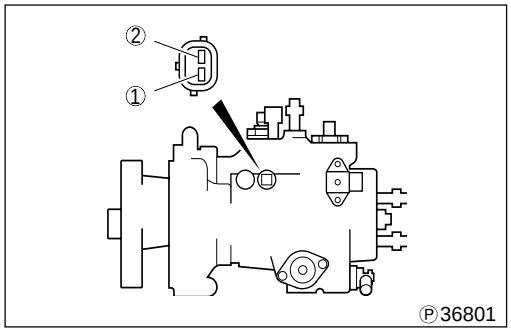
*: Start the engine before measurement.

Output Characteristics



Standard Value	② - ③	5 V
	① - ②	0.5 V/–34.3 kPa {–10.0 in. Hg, –255 mmHg}
		1.86 V/33.7 kPa {9.84 in. Hg, 250 mmHg}
		3.22 V/98.7 kPa {29.1 in. Hg, 740 mmHg}
		4.5 V/163.7 kPa {48.4 in. Hg, 1230 mmHg}

- If the results of the above mentioned checks show any deviation from the standard values, replace the boost pressure sensor **B**.

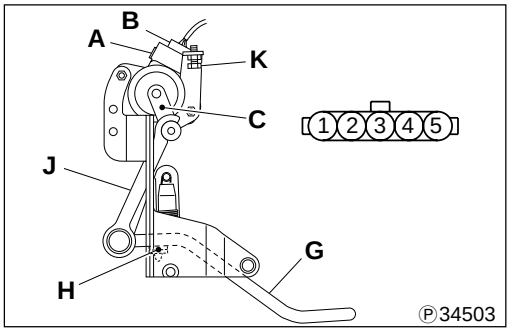


323 Checking Fuel Temperature Sensor

- Measure the resistance between pins ① and ②

Standard value (at 20°C {68°F})	2.5 ± 1.0 kΩ

- If the reading is out of the standard value range, replace the fuel temperature sensor. Ask your DENSO service station to replace it.



324 Checking Accelerator Position Sensor

[Inspection]

- Set the starter switch to ON.
- Measure the output voltage of the accelerator position sensor **A** from the back side of harness connector **B** according to the following table.

Lever **C** position		Accelerator Position Sensor 1		Accelerator Position Sensor 2		Accelerator Switch	
		②	①	②	⑤	②	③
		⊕	⊖	⊕	⊖	⊕	⊖
Standard value	Idling position **D**	0.85 ± 0.1 V		0.85 ± 0.1 V		4V or more	
	Accelerator switch operating position **E**	1.0 ± 0.24 V		1.0 ± 0.24 V		1V or less	
	Full load position **F**	4.0 ± 0.1 V		4.0 ± 0.1 V			

○——○ : There must be continuity between the pins.

⊕ , ⊖ : Polarity when voltage is measured

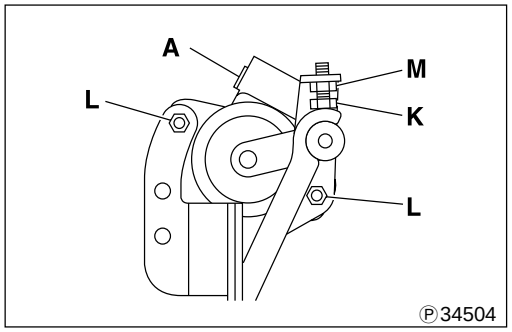
D: Where accelerator control arm **G** is in contact with stopper **H**

E: Where voltage across pins ② and ③ is reduced to 1V or less by slowly depressing the accelerator pedal

F: Where accelerator control extension **J** is in contact with stopper bolt **K** (fully depressed).

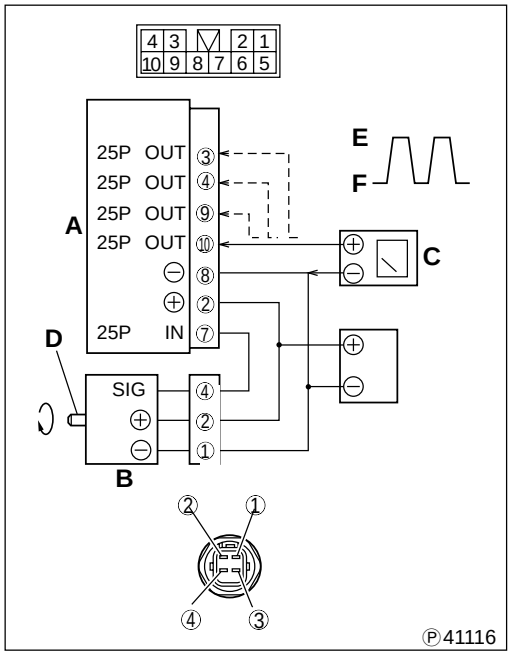
- If the output voltage is out of the standard value range, adjust by the following procedures.

INSPECTION OF ELECTRICAL EQUIPMENT



[Adjustment]

- Adjust the output voltage at the idling position **D** by loosening the screw **L** and moving the accelerator position sensor **A**.
  After the adjustment, retighten the screw.
- Adjust the output voltage at the full load position **F** by loosening the nut **M** and adjusting the stopper bolt **K**.
  After the adjustment, lock the bolt with the nut.

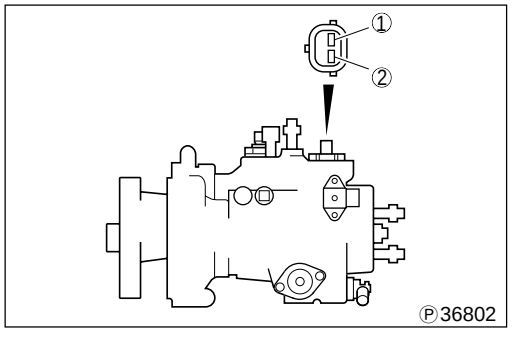


351 Checking Pulse Divider

- Wire the pulse divider **A** as shown.
  B: Vehicle speed sensor (Use 25-pulse pins.)
  C: Tester
- Slowly rotate the shaft **D** of the vehicle speed sensor **B** by hand and measure the maximum value (high pulse voltage **E**) and the minimum value (low pulse voltage **F**) of the voltage generated across each of the output pins (③, ④, ⑨, ⑩) and pin ⑧ of the pulse divider **A**.

Standard value	Low pulse voltage **F**	0.5V or less
	High pulse voltage **E**	8 ± 1 V

- If the reading is out of the standard value, replace the pulse divider **A**.

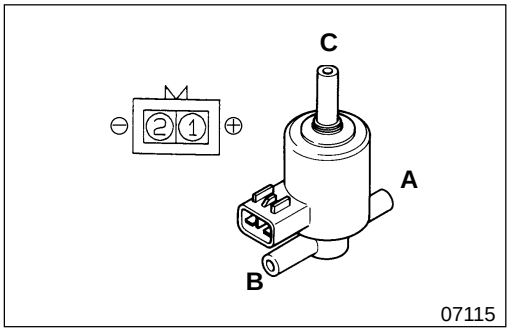


536 Checking Spill Valve

- Measure the resistance between pins ① and ②.

Standard value (at 20°C {68°F})	1.5 ± 0.5 Ω

- If the reading is out of the standard value range, replace the spill valve. Ask your DENSO service station to replace it.



565 Checking 3-Way Magnet Valve

Perform the following checks. If there is anything wrong, replace the 3-way magnet valve.

(1) Operation Check

- Apply DC voltage across pins ① and ② and slowly increase, beginning at 0V.
- Measure the voltage at the time when the 3-way magnet valve is operated.
  (Determine whether the magnet valve is ON or OFF on the basis of its operating sound.)

Standard value (Lowest operating voltage)	11 V or more

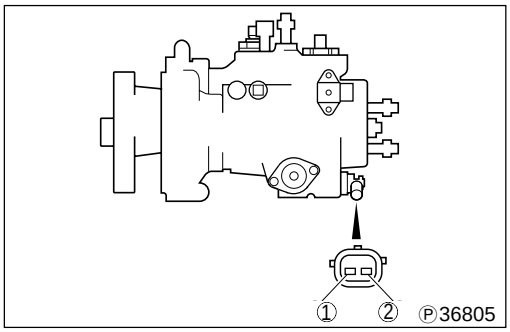
(2) Continuity and Air Tightness Checks

Perform continuity checks according to the following table.

	Input Port **A**	Output Port **B**	Exhaust Port **C**
ON	○———	——○	
OFF		○———	——○

○——○ : There must be continuity between the pins.

Negative pressure at the time of check: 100 kPa {30 in.Hg, 750 mmHg}



584 Checking Timer Control Valve

- Measure the resistance between pins ① and ②.

Standard value (at 20°C {68°F})	11.3 ± 3 Ω

- If the reading is out of the standard value range, replace the timer control valve. Ask your DENSO service station to replace it.

- The electronic governor and pre-stroke control injection pump system combines an electronic governor **10** with an injection pump **6** that has an electronically controlled pre-stroke adjustment feature.
- The injection pump's plunger lift speed varies in accordance with the engine speed, causing concomitant variations in the injection pipe pressure.
- Variations in the injection pipe pressure make it difficult to achieve an optimum spray from the injection nozzles and the optimum air/fuel mixture.
- To compensate for changes in the injection pipe pressure, the injection pump plunger pre-stroke is increased at low and mid- range speeds, thus ensuring that fuel injection takes place late in the cam lift, when plunger movement is relatively fast.
- At high speeds, the plunger pre-stroke is decreased, thus ensuring that fuel injection takes place in early in the cam lift, when plunger movement is relatively slow. Excessive increases in injection pipe pressure are thus prevented.
- By adjusting the plunger pre-stroke in this manner, the pre-stroke control injection pump **6** ensures that the spray and air/ fuel mixture are always optimally suited to combustion.
- The overall benefits are higher engine torque and cleaner exhaust emissions than are possible with a conventional injection pump.
- Control operations are performed by the engine control unit **35**, which receives data from sensors on the engine and other vehicle components, processes them, and issues appropriate drive signals to the pre-stroke actuator **5** (located at the rear of the injection pump) and to the linear DC motor **9** (located inside the electronic governor).

The system's control functions (including auxiliary functions) are shown in the following table.

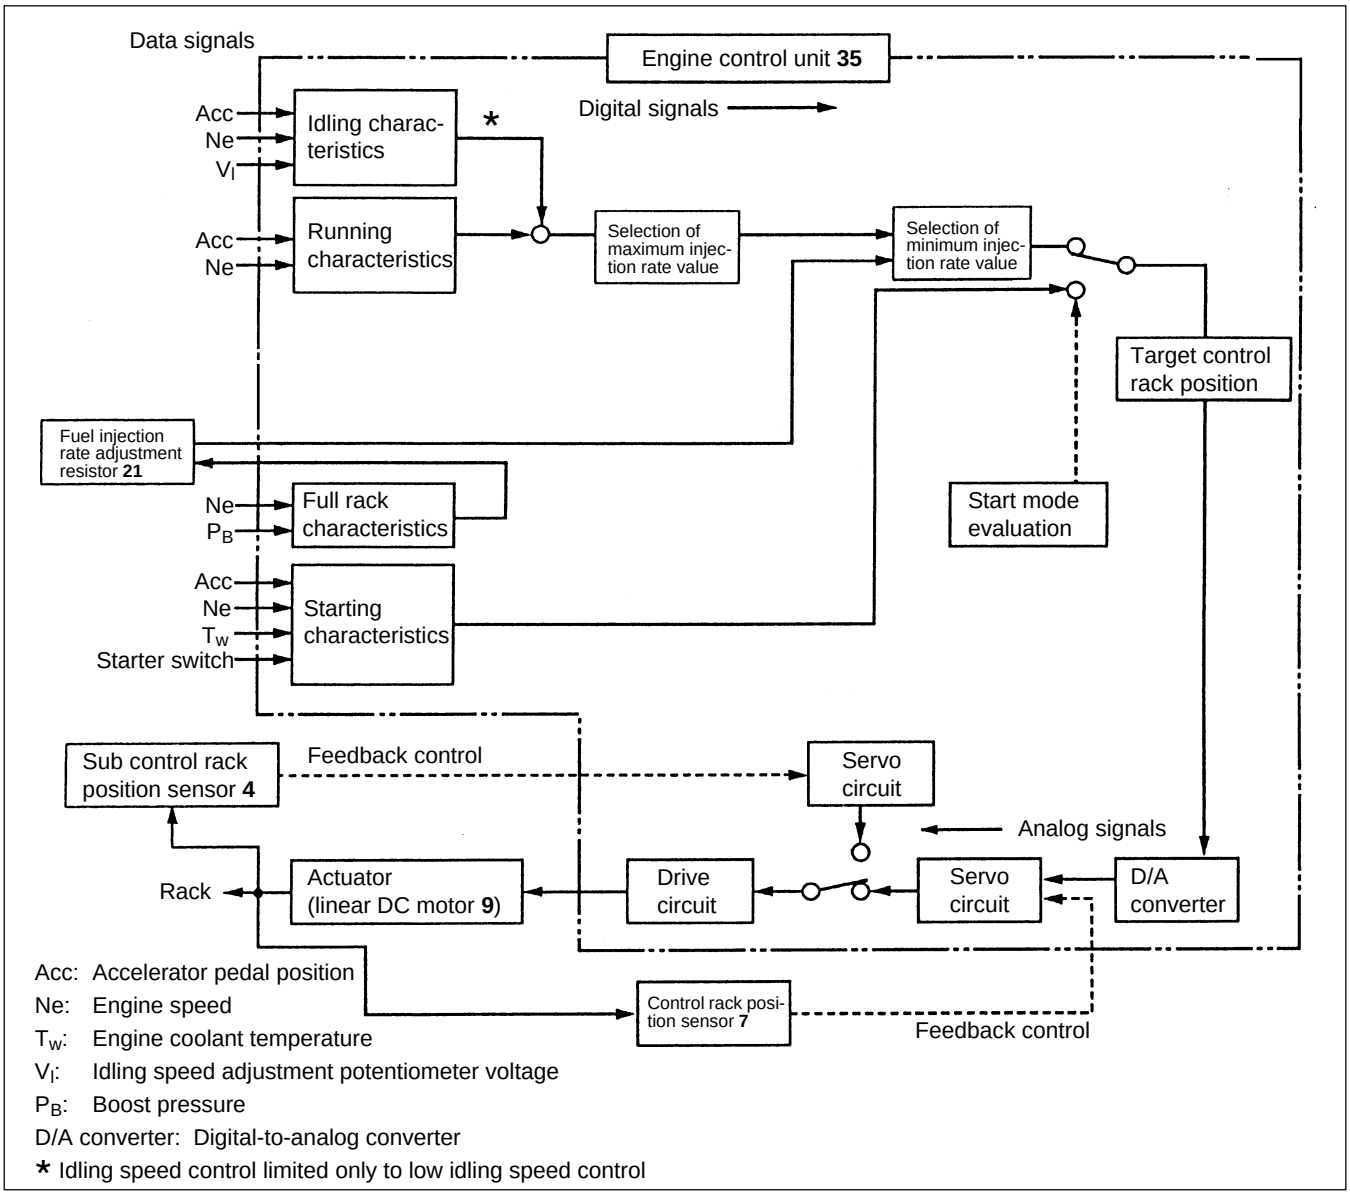
● Fuel Injection Rate Control



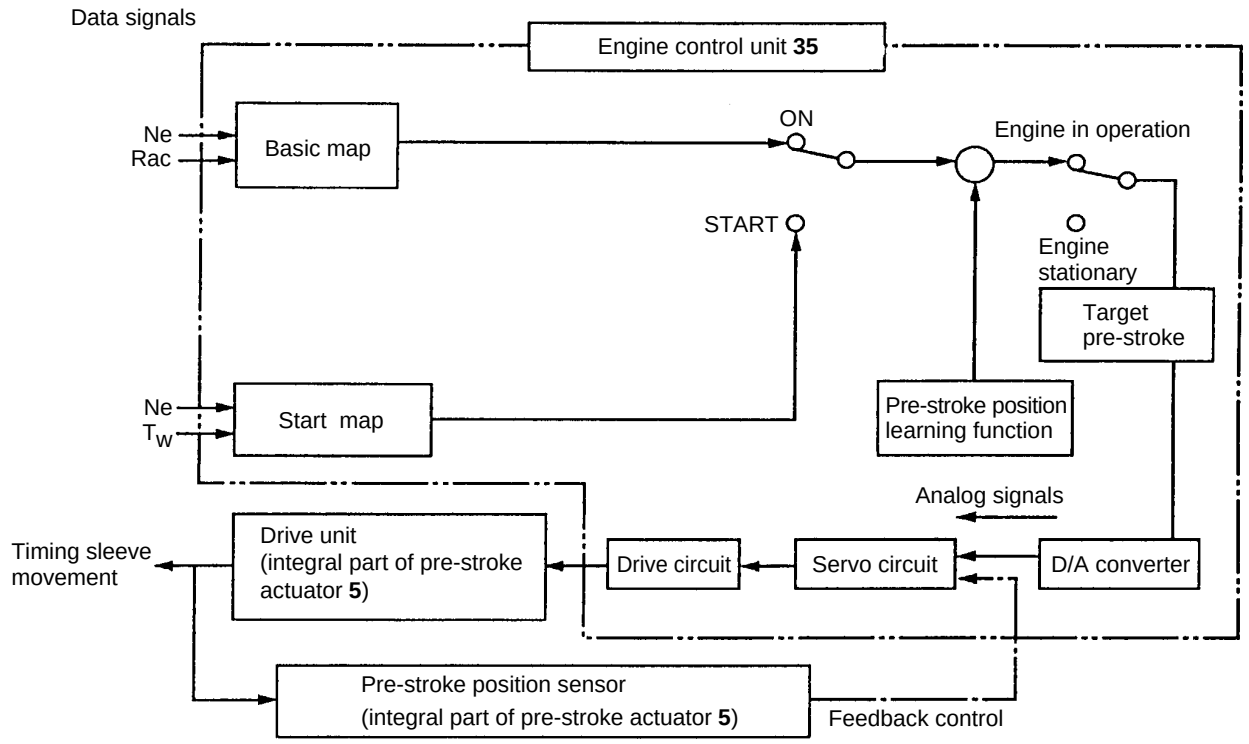
Operation of engine control unit 35

- During engine operation, control is effected in accordance with the idling characteristics and running characteristics. The maximum fuel injection rate value is selected in accordance with the output signals.
- After this selection, the control unit calculates and determines the minimum injection rate to prevent the injection rate selected in accordance with the full rack characteristics from exceeding the maximum injection rate. The target control rack position is thus determined. (During engine startup, control is effected in accordance with the starting characteristics, with the target rack position determined directly in accordance with the data signals.)
- The determined control rack position signal is converted into a continuous analog signal. By way of the servo circuit and drive circuit, the signal is applied to the linear DC motor **9**, which moves the rack.

Operation of control rack position sensor 7

- The control rack position sensor **7** monitors the operation of the linear DC motor **9**. In accordance with the position of the control rack, the sensor determines whether the linear DC motor is operating in accordance with the target, and it transmits feedback signals to the engine control unit **35**.
- In accordance with the feedback signals, the engine control unit **35** calculates the actual control rack position. If the actual position differs from the target, the control unit issues a correction command.
- Through repetition of this process, the system ensures that the control rack position complies with the target at all times.

● Pre-stroke control



Rac: Control rack position
Ne: Engine speed
T_W: Engine coolant temperature
D/A converter: Digital-to-analog converter

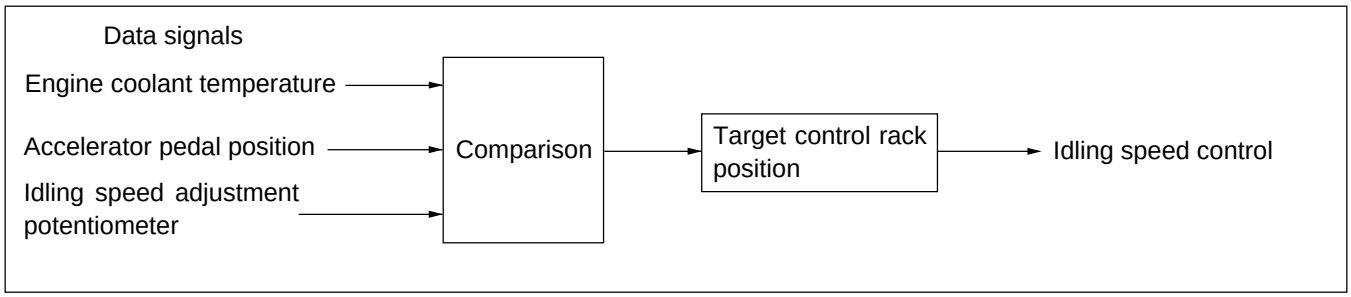
Operation of engine control unit 35

- During engine operation, control is effected in accordance with the basic map.
- The pre-stroke position learning function compensates for pre-stroke position sensor adjustment errors and other injection pump errors using the pre-stroke position sensor output voltage, thereby enabling determination of the target pre-stroke.
- The determined target pre-stroke value is converted into a continuous analog signal. By way of the servo circuit and drive circuit, the signal is applied to the drive unit. The drive unit moves the timing sleeve to alter the pre-stroke.
- During engine startup, control is effected in accordance with the start map.

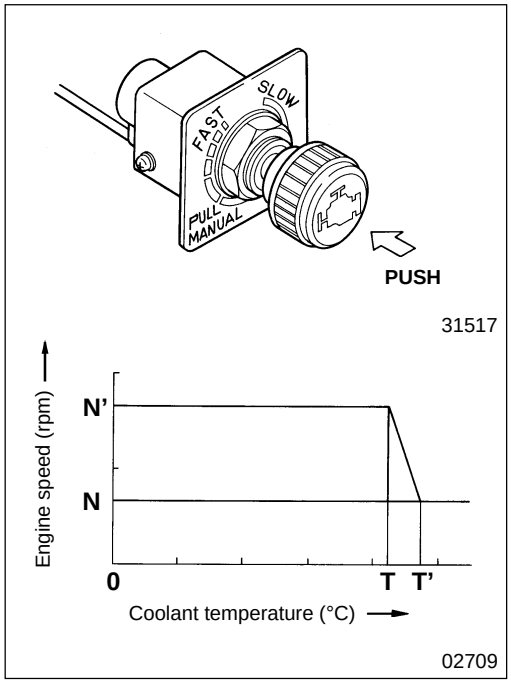
Operation of pre-stroke position sensor (integral part of pre-stroke actuator 5)

- The pre-stroke position sensor monitors the operation of the drive unit. In accordance with the position of the timing sleeve, the sensor determines whether pre-stroke control is being performed in accordance with the target, and it transmits feedback signals to the engine control unit **35**.
- In accordance with the feedback signals, the engine control unit **35** calculates the actual timing sleeve position. If the actual position differs from the target, the control unit issues a correction command.
- Through repetition of this process, the system ensures that the timing sleeve position complies with the target at all times. The appropriate pre-stroke is achieved as a result.

● Warmup time shortening function

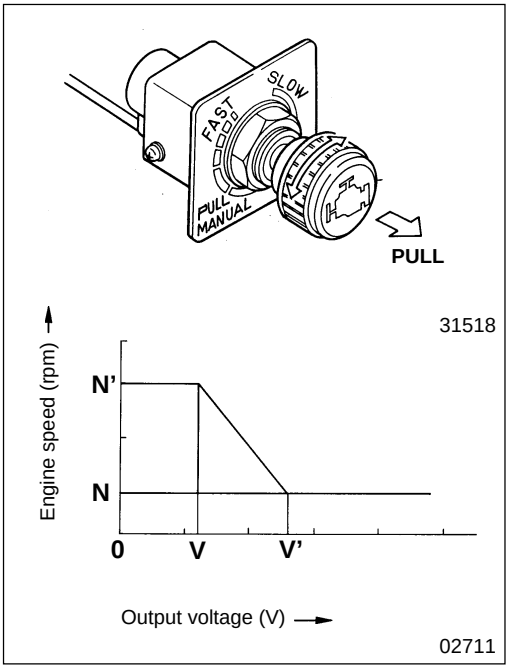


The warmup time shortening function increases the engine's idling speed in accordance with the coolant temperature, thereby shortening the time required for the engine to warm up. Control is effected automatically or manually in accordance with the position of the idling speed adjustment potentiometer **20**. Automatic control is selected by pushing the potentiometer, and manual control is selected by pulling it.



Automatic control (Potentiometer pushed)

- Automatic control is selected when the idling speed adjustment potentiometer **20** is pushed.
- When the coolant temperature is low, the engine's idling speed is automatically increased to shorten the time required for warmup.
- If the coolant temperature increases from **T** to **T'** (see the graph), the engine speed is decreased from **N'** to **N**, thus returning to its standard idling level.



Manual control (Potentiometer pulled)

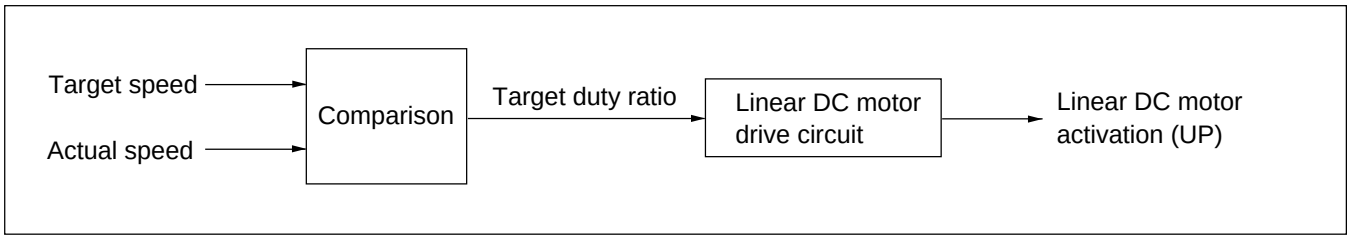
- When the idling speed adjustment potentiometer **20** is pulled, the automatic mechanism is deselected. The driver can then adjust the idling speed as desired by rotating the potentiometer. (Rotation of the potentiometer causes the potentiometer's output voltage to change accordingly.)
- With the output voltage between **0** and **V**, the engine speed stays at the **N** to **N'** level.
- If the output voltage is increased from **V** to **V'** (see the graph), the engine speed decreases from **N'** until it reaches its standard idling level **N**.

● Emergency vehicle operation function (Used in event of control rack position sensor fault)

Fault in Control rack position sensor 7

In the event of a fault in the control rack position sensor **7**, detection of the control rack position is performed using the sub control rack position sensor **4**. This enables more-or-less normal vehicle operation.

Fault in control rack position sensor 7 and sub control rack position sensor 4



In the event of faults in both the control rack position sensor **7** and sub control rack position sensor **4**, the position of the rack, which is controlled by the linear DC motor **9**, cannot be sensed directly. The fuel injection rate cannot be controlled normally with the engine in this condition. As an emergency measure, therefore, control operations are performed in accordance with engine speed data signals only. For this function, target engine speeds for given degrees of accelerator pedal depression are pre-programmed into the engine control unit **35**. Control is effected as follows:

- The target engine speed is compared with the actual engine speed (this is indicated by the engine speed sensor **3**).
- The target duty ratio is determined in accordance with the result of the comparison. In accordance with the target duty ratio, a drive signal is transmitted to the UP-side (speed increasing side) circuit to effect control over the engine speed. If the target engine speed exceeds the actual engine speed or vice versa, the UP-side circuit's ON time period is altered such that the target engine speed is maintained.

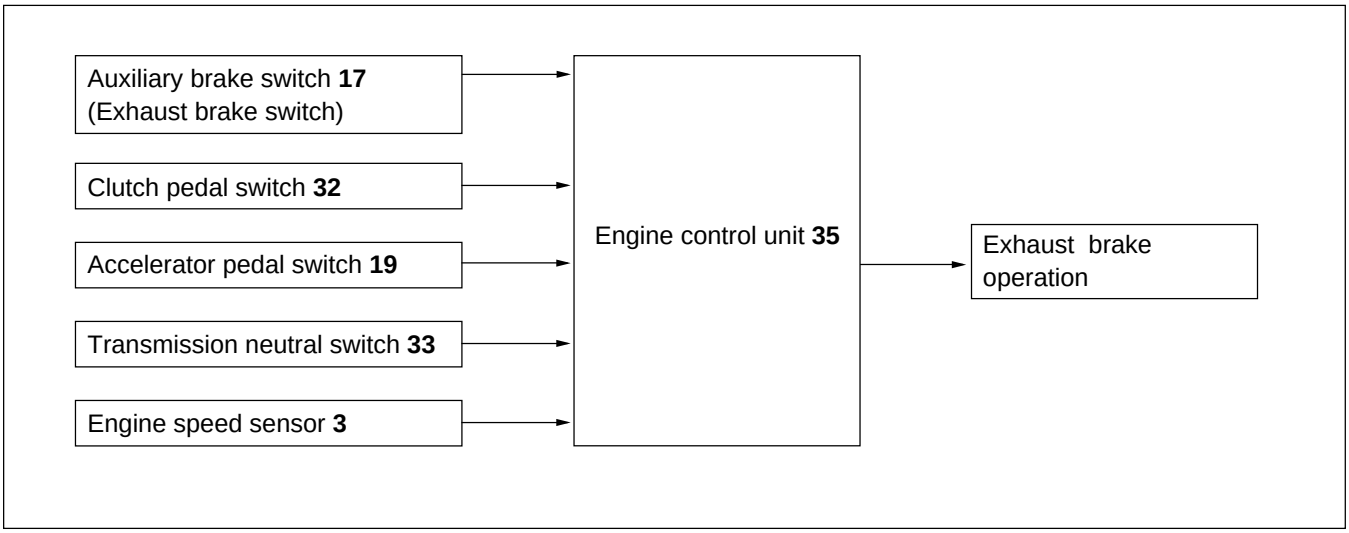
The target duty ratio is the ratio of the time periods during which the linear DC motor's UP-side and DOWN-side (speed decreasing side) circuits are energized. It is calculated as follows:

$$\text{Duty ratio} = \frac{\text{UP-side circuit ON time period}}{\text{UP-side circuit ON time period + DOWN-side circuit ON time period}} \times 100\%$$

CAUTION ⚠

When this function is activated, the warning lamp 14, 15 flashes to indicate that the engine must be inspected immediately. 🕮 **P13EB-20**

● Auxiliary brake control function



The auxiliary brake control function acts upon the auxiliary braking devices, i.e., the exhaust brake, when the following conditions are satisfied:

- Clutch pedal switch **32**: OFF (clutch pedal released)
- Accelerator pedal switch **19**: ON (accelerator pedal released)
- Transmission neutral switch **33**: ON (transmission not in neutral)

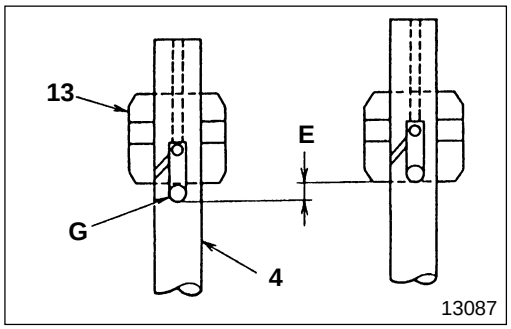
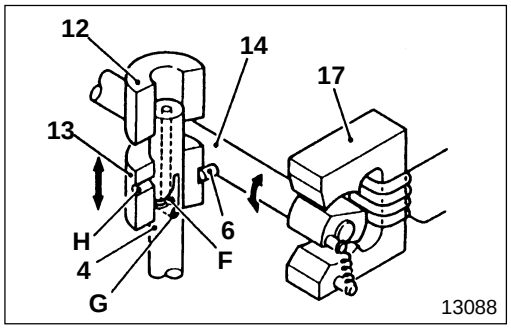
C : Mechanical timer
D : Electronic governor

- The injection pump is provided with a mechanism that enables variation of the plunger pre-stroke.
- Variation of the plunger pre-stroke enables the creation of air/fuel mixture and spray conditions that are optimally suited to combustion. The overall benefits are higher engine torque and cleaner exhaust emissions than are possible with a conventional injection pump.



Pre-stroke

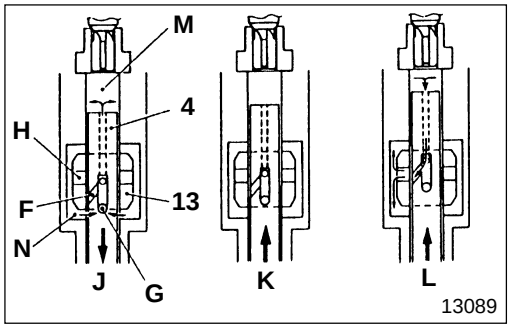
The term “pre-stroke” refers to the stroke dimension **E** of a plunger **4** from the plunger’s bottom dead center position to the point at which its fuel inlet hole **G** is closed by the timing sleeve **13** and fuel feed begins. This stroke dimension is constant in a conventional injection pump.



Variable pre-stroke mechanism

F : Lead
G : Inlet hole
H : Outlet hole

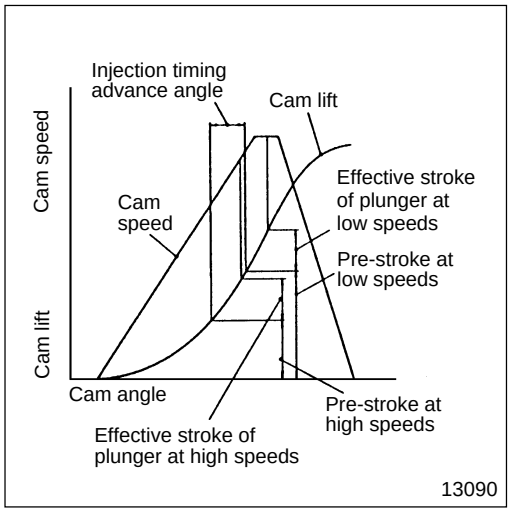
- In contrast to the fixed plunger barrel arrangement of a conventional injection pump, each plunger barrel **12** in the pre-stroke control type injection pump incorporates a vertically moveable timing sleeve **13**.
- Movement of the timing sleeve is effected by the timing rod **14**, pin **6**, and drive unit **17**.
- When the drive unit **17** rotates the timing rod **14**, the pin **6** moves the timing sleeve **13** up or down accordingly.
- Since the timing sleeve **13** incorporates a fuel outlet hole **H**, the pre-stroke changes in accordance with the movement of the timing sleeve.



Fuel feed action

J : Fuel intake
K : Start of pressurization
L : End of pressure feed

- As the plunger **4**, moves downward from its top dead center position and its inlet hole **G** opens, fuel flows into the pressure chamber **M** owing to the vacuum created by the plunger’s downward movement and the fuel pressure produced by the feed pump.
- When the plunger **4** moves upward but its lift dimension is still small, the fuel in the pressure chamber **M** escapes into the sump **N** through the inlet hole **G** in the plunger. Thus, the pressure in the pressure chamber does not increase.
- As the plunger **4** moves further upward and the inlet hole **G** is closed by the timing sleeve **13**, the fuel starts to be pressurized. The pressure increases as the plunger moves upward, and the injection pump starts to feed the pressurized fuel to each injector.
- When the lead **F** in the plunger **4** becomes aligned with the outlet hole **H** in the timing sleeve **13**, the fuel in the pressure chamber **M** returns to the sump **N**, thus completing the pressure feed cycle.
- Adjustment of the injected fuel volume is achieved by rotation of the plunger **4**, which alters the position of the outlet hole **H** in the timing sleeve **13** relative to the lead **F** at the plunger.



Fuel injection timing and fuel injection characteristics

- Changes in the position of the timing sleeve **13** cause multiple changes in the pre-stroke, which in turn alter the fuel injection timing.
- A decrease in the pre-stroke causes the fuel inlet hole **G** in the plunger **4** to close earlier such that the fuel injection timing is advanced.
- This arrangement provides highly responsive control over the injection timing and thus enhances the engine's cold startability.

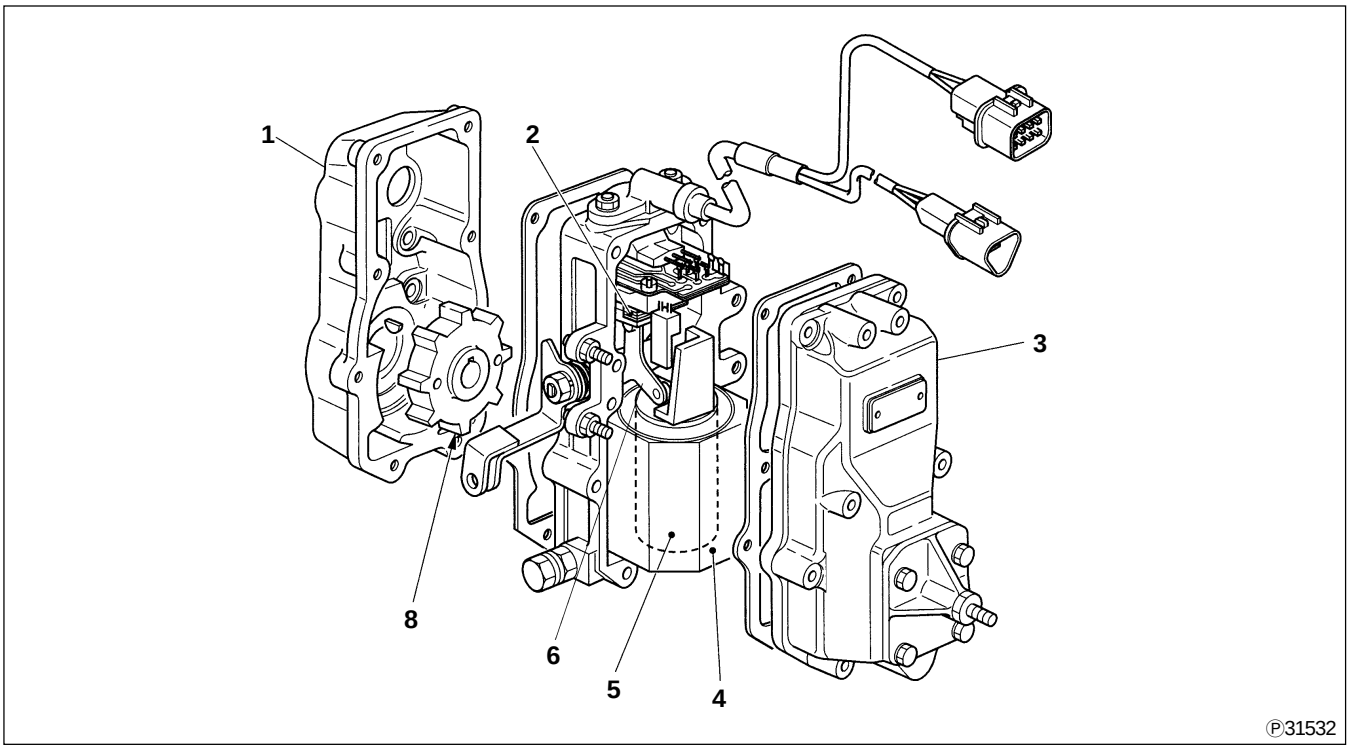
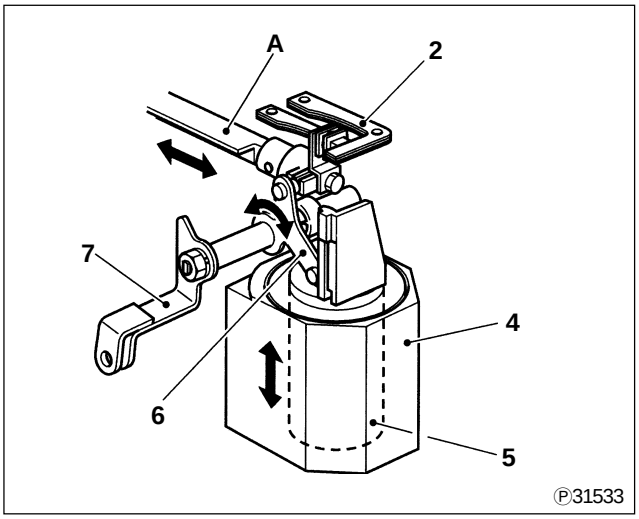
P : Start of pressure feed
Q : End of pressure feed

- The delivery valve **10** keeps constant the residual pressure **R** in the injection pipe at all engine speeds. This operation prevents the generation of bubbles in the fuel (this is known as "cavitation") and thus enables fuel injection at a high pressure.
- When the plunger **4** moves upward and the pressure of the fuel pushed by the plunger overcomes the residual pressure **R** in the injection pipe and the preset force of the delivery valve spring **7**, the delivery valve is pushed upward and delivery of the pressurized fuel begins.
- As soon as fuel delivery is complete, the fuel in the injection pipe rapidly returns to the plunger side and the delivery valve closes.
- Surplus fuel slowly returns through the orifice **S**, thus reducing the pressure in the injection pipe.
- When the preset force of the spring **9** in the delivery valve **10** is exactly offset by the pressure in the injection pipe, the ball **8** closes the orifice **S**, thus ensuring that the residual pressure **R** in the injection pipe remains constant.

Electronic Governor



1 Housing
2 Control rack position sensor
3 Cover
4 Coil assembly
5 Linear DC motor
6 Link
7 Emergency engine stop lever
8 Sensing gear



● Linear DC motor

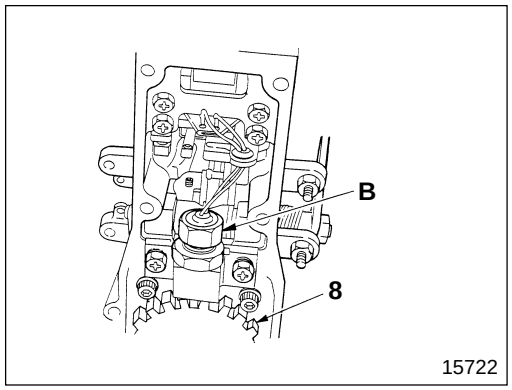
The linear DC motor **5** moves the coil assembly **4** vertically in accordance with signals from the electronic governor control unit. Via the link **6**, this movement is transmitted to the control rack **A**, which moves longitudinally to increase and decrease the fuel quantity.

● Control rack position sensor

The control rack position sensor **2** senses whether the control rack **A** is moved to the correct position by the linear DC motor **5**. In the event of a discrepancy between the actual control rack position and the target control rack position (this is determined by the electronic governor control unit), the control unit instructs the linear DC motor to perform a corrective movement.

● **Emergency engine stop lever**

The emergency engine stop lever **7** is connected to the link **6**. Via a cable, it enables the link to be moved from the driver's seat. In the event of a system fault that prevents the engine from being stopped normally, operation of the emergency engine stop lever forces the control rack **A** to move to the position at which fuel injection is terminated. This operation takes place irrespective of the position of the linear DC motor **5**.



● **Backup engine speed sensor**

The backup engine speed sensor **B** is fitted inside the governor. It converts the rotation speed of the sensing gear **8** into electric signals and feeds the signals to the electronic governor control unit to provide an indication of the engine speed.

TROUBLESHOOTING

1. INSPECTION PROCEDURES

Diagnostic Function

- Whenever the starter switch is placed at ON, the diagnostic function is activated to check all the sensors, etc. If any of them is found faulty, the warning lamp in the meter cluster is lit to alert the driver. At the same time, the fault location is stored in memory, and the system enters the backup mode.

Warning Lamp Indications

	(Red)	(Amber)
Safety-critical error (Vehicle must not be driven)	ON	OFF
Non-safety-critical error (Vehicle can be driven despite poor control feeling)	OFF	ON

- The stored fault location can be read as a diagnostic trouble code by the Multi-Use Tester II or the diagnosis switch.

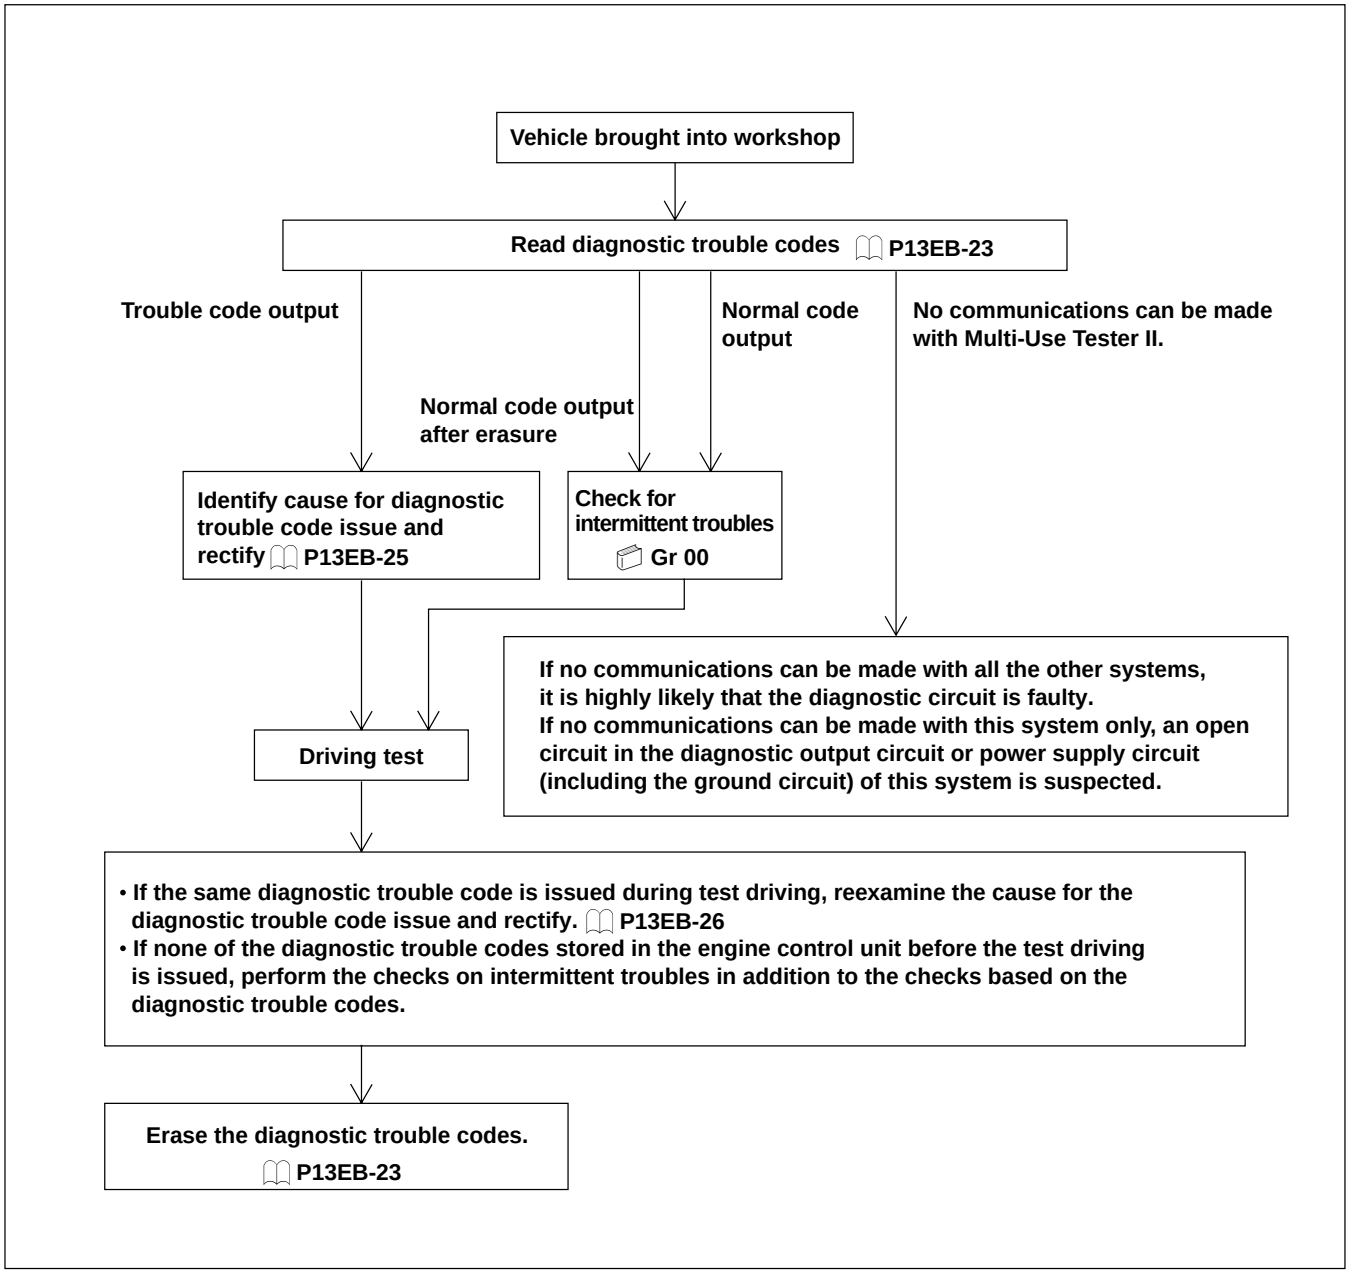
CAUTION ⚠

- **Check to ensure that the battery voltage is within the specified range.**
- **Check all the harness and device connectors for looseness. Always remove a connector at least 20 seconds after placing the starter switch at the LOCK position.**
- **Do not forget to clear the diagnostic trouble code by the Multi-Use Tester II or memory clear switch after a fault has been rectified.**
- **As a rule, inspection operations should be performed with the starter switch at the LOCK position. Some checks, however, may have to be made with the starter switch at the ON position. In such a case, use care to make sure that no short circuit develops between pins of the connectors or with the body.**
- **The resistance value of each component is affected by the temperature and the accuracy of the tester. The reading, therefore, does not always fall within the standard limits. Note that the check values shown in the text are the values obtained at normal temperature (10 to 35°C {58 to 95°F}).**
- **Whether or not the system automatically returns to normal from the backup mode after a fault has been removed depends on the diagnostic trouble code (fault location). When the system returns to normal, the warning lamp will be OFF.**
- **Even when the fault has been removed and the system has been automatically returned to the normal mode, the diagnostic trouble code of the fault remains stored in the engine control unit.**
- **When a fault occurs at a point where the system is not automatically reset, perform the memory clear procedure to let the system exit from the backup mode. 🕮 P13EB-25**

Inspection Flowchart

The system inspection can be performed effectively by use of the Multi-Use Tester II. The types of system inspections may be broadly divided as shown below in accordance with the trouble symptoms and diagnostic trouble code outputs.

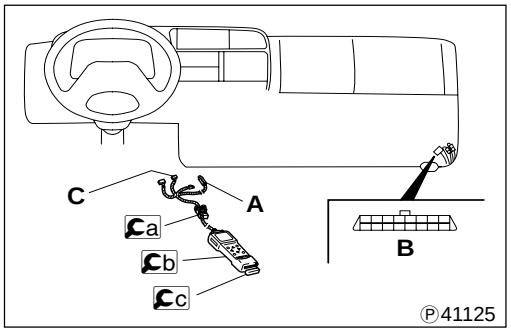
- Inspections based on diagnostic trouble codes stored in the engine control unit
- Inspections of intermittent troubles



2. CONNECTION OF MULTI-USE TESTER II

Special Tools

Location	Name and Shape of Special Tool	Part No.	Application
–	Multi-Use Tester II  19492	MB991496	Inspection of system
–	Multi-Use Tester II harness (for communications)  19141	MK327601	To supply power to Multi-Use Tester II proper and communicate with vehicle side electrical devices
–	Read-only memory pack (MRT-E8.1)  19493	MH063580	Data for inspection and control of engine control unit
–	Memory card (set in Multi-Use Tester II proper)  20538	MB991500	To write data
–	Multi-Use Tester II harness  20536	MB991499	To use Multi-Use Tester II as a circuit tester



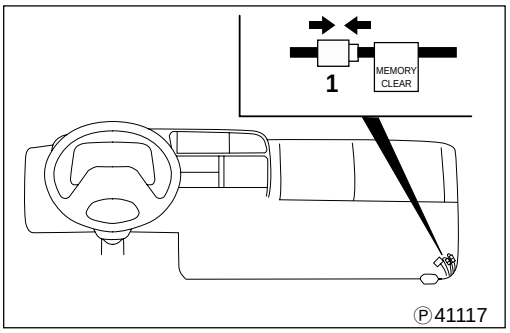
- Place the starter switch at the LOCK position.
- Connect the a Multi-Use Tester II harness to b Multi-Use Tester II and insert the c read-only memory in the tester.
- Connect the connector **A** to the cigar lighter socket.
- Connect the Multi-Use Tester II connector **C** (16 pins) to the data link connector **B** (16 pins).

NOTE

For the operating procedures for the Multi-Use Tester II, refer to the instruction manual for the Multi-Use Tester II.

3. READING AND ERASING DIAGNOSTIC TROUBLE CODES

Two types of methods are available for reading or erasing a diagnostic trouble code; one using the Multi-Use Tester II and one using the vehicle side diagnostic functions.

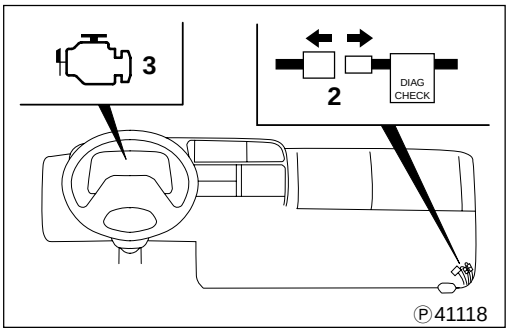


(1) Method using Multi-Use Tester II

● **Current Diagnostic Trouble Code**
- Check to see that the memory clear switch **1** is connected.
- Set the starter switch to ON.
- Operate the Multi-Use Tester II to read the current diagnostic trouble code and determine the fault location.

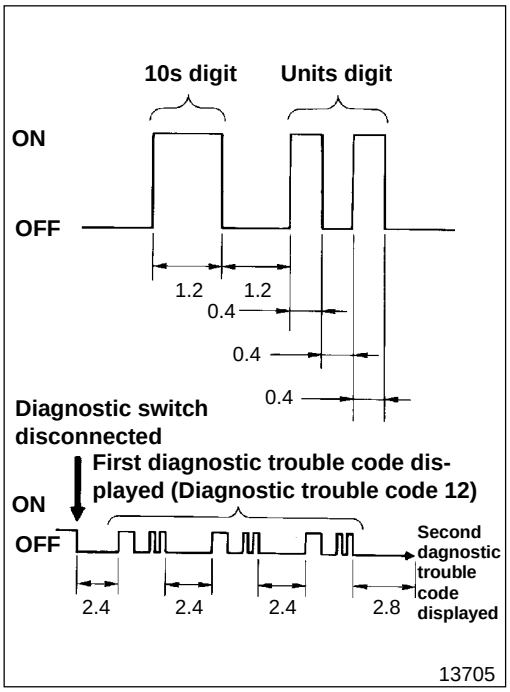
● **Past Diagnostic Trouble Code**
- Set the starter switch to ON.
- Disconnect the memory clear switch **1**.
- Operate the Multi-Use Tester II to read the past registered diagnostic trouble codes and determine the fault location.

● **Erasing Diagnostic Trouble Codes**
- Set the starter switch to ON.
- Operate the Multi-Use Tester II to erase all of the diagnostic trouble codes stored in the engine control unit.



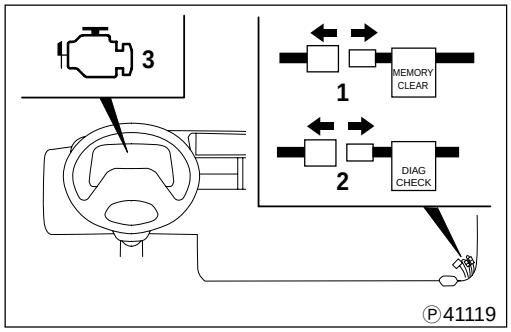
(2) Method Not Using Multi-Use Tester II (Method Using Diagnostic Switch and Memory Clear Switch)

● **Current Diagnostic Trouble Code**
- Set the starter switch to ON.
- Disconnect the diagnostic switch **2**.
- The diagnostic trouble code is displayed by flashes of the red warning lamp **3**.



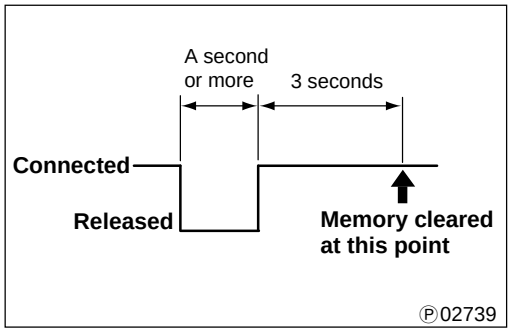
● **Reading Diagnostic Trouble Code**

- Diagnostic trouble codes are indicated by the number of times the red warning lamp **3** flashes and their duration.
  - The flashing intervals also differ between the 10s digit and the units digit.
  - 10s digit: 1.2 second interval
  - Units digit: 0.4 second interval
  - Each diagnostic trouble code is displayed from the 10s digit followed by the units digit. As for a code which has no 10s digit, the units digit only is displayed.
- Each diagnostic trouble code is displayed three times in succession.
- If there is no additional codes stored, the sequence is then repeated from the beginning with each code indicated three times.
- When the diagnostic switch **2** is connected, the engine control unit will immediately stop displaying codes.



● **Past Diagnostic Trouble Codes**

- After reading the current diagnostic trouble codes (with the diagnostic switch **2** disconnected), disconnect the memory clear switch **1**. Then the warning lamp **3** will restart flashing.
- This time, the warning lamp displays the past diagnostic trouble codes. Determine the fault locations based on the indicated codes.



● **Erasing Diagnostic Trouble Codes**

Disconnect the memory clear switch **1** and the diagnostic switch **2** then reconnect them. Then all the diagnostic trouble codes stored in the engine control unit will be cleared.

CAUTION ⚠

- **If the contents of memory are not to be cleared after display of the stored codes, set the starter switch to OFF with the memory clear switch 1 disconnected. Thereafter, connect the memory clear switch.**
- **When you change the combination of the injection pump and engine control unit, you must rewrite the pump data stored in the engine control unit. For this purpose, be sure to perform the diagnostic trouble code erasing procedure.**
- **Whenever the engine control unit has been replaced with a new one, be sure to erase the diagnostic trouble codes by disconnecting the memory clear switch 1 and diagnostic switch 2 after connecting all the connectors. Upon completing the procedure, confirm that no diagnostic trouble codes is stored.**

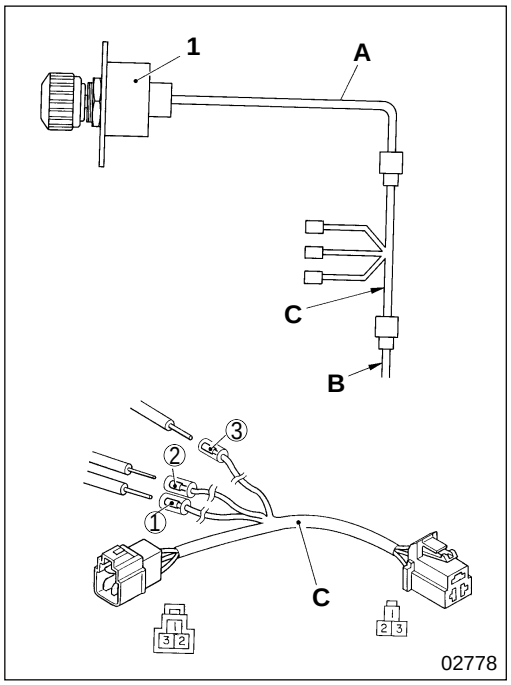
◆ Service procedure

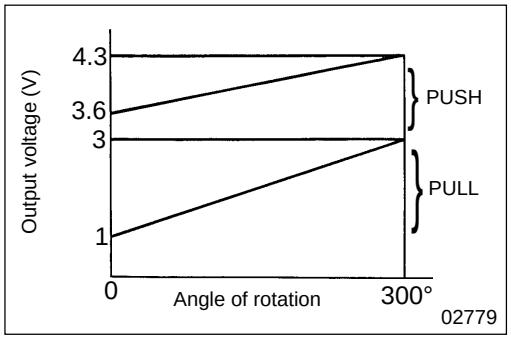


1 **Inspection of idling speed adjustment potentiometer**

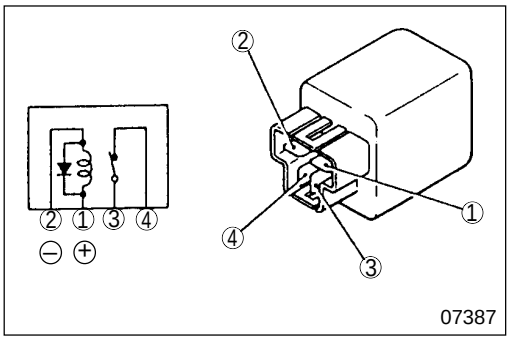
- Disconnect the harness **A** of the idling speed adjustment potentiometer **1** from the cab-side harness **B**. Then, connect an inspection harness **C** between harnesses **A** and **B**. (The inspection harness must be made specially for this procedure.)
- Turn the starter switch to the ON position.
- Check the output voltages of the idling speed adjustment potentiometer **1** in accordance with the following table.

Item	Connector terminal		
	Accelerator pedal position sensor inspection harness		
	①: Power supply (+)	②: GND (–)	③: Output(+)
Output voltage with knob pulled	1.0 - 3.0	⊖	⊕
Output voltage with knob pushed	3.6 - 4.3		

Output characteristics



- If the output voltages are out of specification, replace the idling speed adjustment potentiometer **1.**



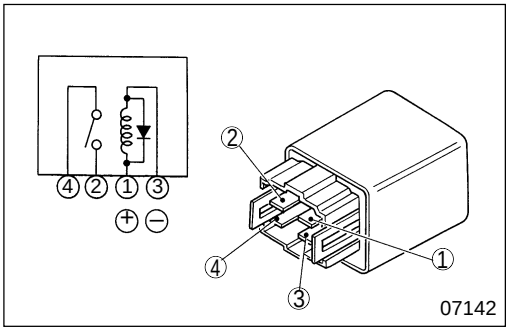
3 **4** **Inspection of pre-stroke cut relay and exhaust brake cut relay (normally-closed type with 4-pin connector)**

- Perform continuity checks in accordance with the following table.

	①	②	③	④
Not energized	○——○		○——○	
Energized	⊕——⊖		〔⊢ - - - - ⊣〕	

○——○ : Continuity exists between terminals.
⊕——⊖ : Terminals across which 12 V DC is applied.
〔⊢ - - - ⊣〕 : Continuity no longer exists between terminals.

- Replace the relay if any abnormality is evident.



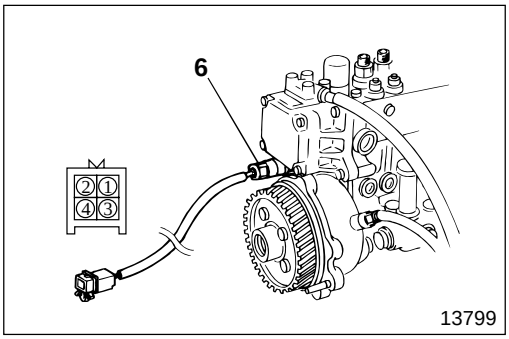
5 Inspection of exhaust brake relay (Open type 4 pin)

- Follow the table below to inspect continuity :

	①	②	③	④
No current	○		○	
Current	⊕		⊖	○

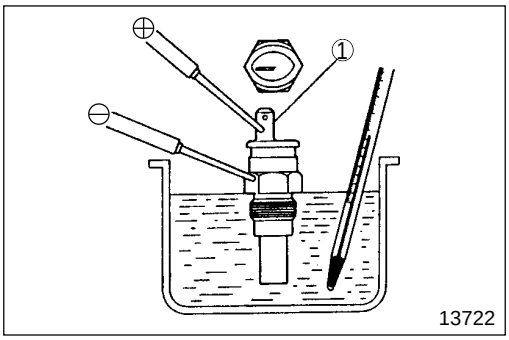
○—○ : There is continuity between terminal ○ and ○.
⊕—⊖ : Indicates that **12** volts DC is applied to the line between the terminals.

- If any fault is found, replace the relay.



6 Inspection of sub control rack position sensor

- Measure the resistances between the following terminals : ① and ④ ; ① and ③ ; ③ and ④.
- If any resistance is out of specification, replace the sub control rack position sensor **6**.
- Have replacement performed by the nearest MFTA Dealer.



7 Inspection of engine water temperature sensor

- Put the engine water temperature sensor **7** in a container of engine oil.
- Heat the oil to each of the specified temperatures. Stir the oil to ensure that it heats up evenly.
- At each of the specified temperatures, measure the resistance between the terminal ① and body of the engine water temperature sensor **7**.
- If the measurements are out of specification, replace the engine water temperature sensor.

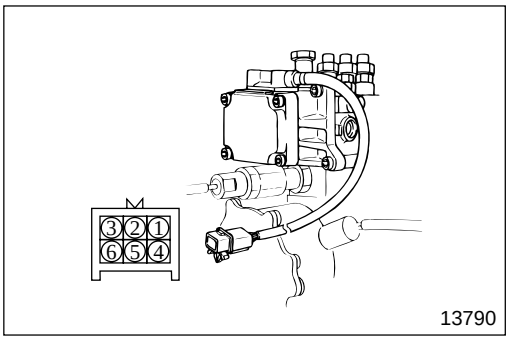
Item			Standard value (reference values)	Limit	Remedy
Engine coolant temperature sensor	Between Terminal and body	20°C {68°F}	(3.25 k) ohms	—	Replace
		40°C {104°F}	(1.5k) ohms	—	
		60°C {140°F}	(650±62k) ohms	—	

8 Inspection of pre-stroke actuator

Perform the following inspections. If any abnormality is evident, have inspection and repair performed by the nearest MFTA Dealer.

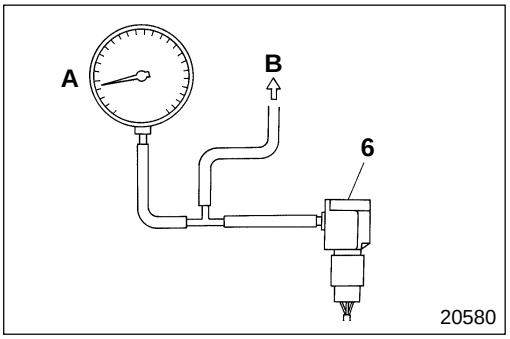
CAUTION ⚠

The pre-stroke actuator 8 must be inspected when the engine is cold.



(1) Measurements on connectors

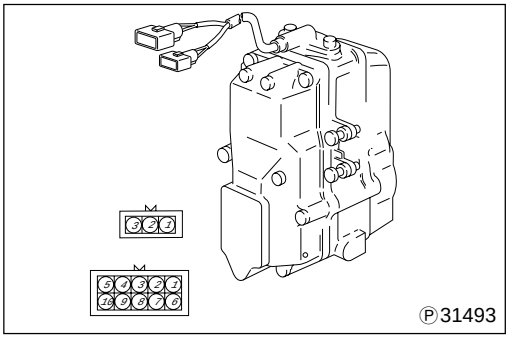
Measure the resistance between terminals ② and ③; ① and ③; ① and ②; ④ and ⑤.



9 Inspection of boost pressure sensor

- Mount pressure gauge **A** for boost pressure measurement as shown in the diagram.
- Connect the Multi-Use Tester-II . 📖 P13EB-22.
- Set the Multi-Use Tester-II for boost pressure measurement
- Start the engine. Compare the value displayed on the Multi-Use Tester-II and the value indicated by pressure gauge **A**. If the values are different, replace boost pressure sensor **9**.

  B : To inlet manifold.

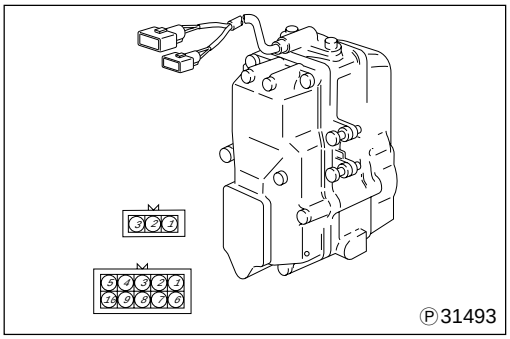


10 Inspection of control rack position sensor

Perform the following inspections. If any abnormality is evident, have inspection and repair performed by the nearest MFTA.

● **Measurements on connectors**

Measure resistances between terminals as specified in the standard table.

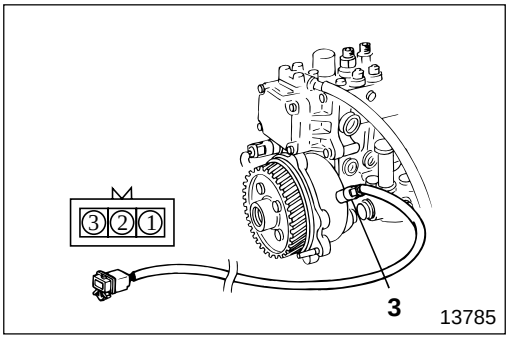


12 Inspection of linear DC motor

Perform the following inspections. If any abnormality is evident, have inspection and repair performed by the nearest MFTA Dealer.

(1) Measurements on connectors

Measure resistances between terminals as specified in the standard table.



13 Engine speed sensor

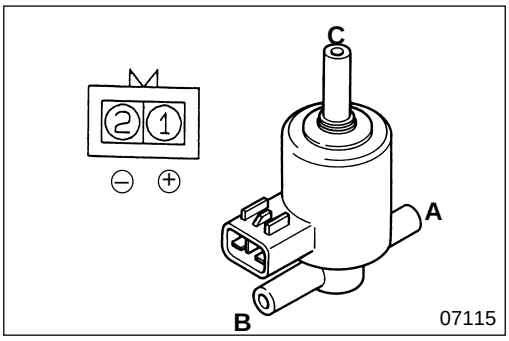
[Inspection]

(1) Main unit

- Measure the resistance between terminals ① and ②.
- If the measured value deviates from the standard value, replace engine speed sensor **13**.

CAUTION

Be sure to check the tightening torque of engine speed sensor 13. If the tightening torque is insufficient, the sensor may not output a signal.



14 Inspection of 3-way magnetic valve

Carry out the following inspection. If any fault is found, replace 3-way magnetic valves **14** :

Air circuit table (There is air continuity between terminals ○ and ○.)

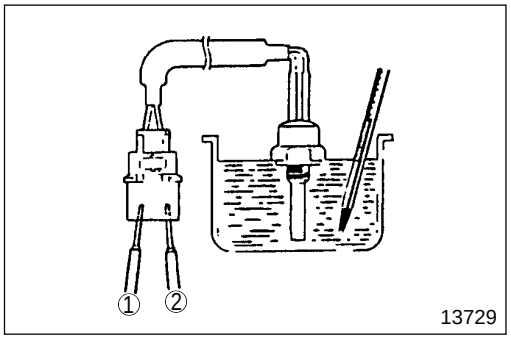
	Input port A	Output port B	Exhaust port C
ON	○	○	
OFF		○	○

(1) Operation inspection

- Apply voltage between terminals ① and ②, increasing gradually from 0 volt.
- Measure voltage (minimum operating voltage) when magnetic valves **14** starts operating. (You can tell if the magnetic valves are ON or OFF by listening for an operating sound.)

(2) Airtightness inspection

- When magnetic valve is ON :
  - Close output port **B.**
  - Apply 12 volts DC between terminals ① and ②.
  - Make sure that there is no air suction from exhaust port **C** when negative pressure (–100 kPa {–30 in.Hg, –750 mmHg}) is applied to input port **A**.
- When magnetic valve is OFF :
  - Close exhaust port **C**.
  - Make sure that there is no air suction from output port **B** when negative pressure (–100 kPa {–30 in.Hg, –750 mmHg}) is applied to input port **A**.



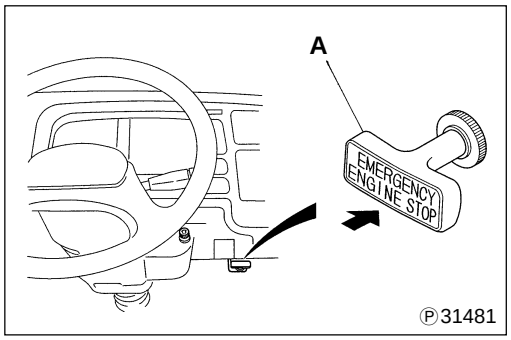
16 Inspection of boost temperature sensor

- Place boost temperature sensor **16** in a container of water.
- Raise the water temperature to the specified values and stir.
- Measure the resistance between terminals ① and ②.

Item	Standard value	Limit	Remedy
0°C {32°F}	5880±588 ohms	—	
20°C {68°F}	2455±245 ohms	—	Replace
80°C {176°F}	322±32 ohms	—	

- If the measured value deviates from the standard value, replace boost temperature sensor. Gr 15A, B

INSPECTION OF ELECTRICAL EQUIPMENT

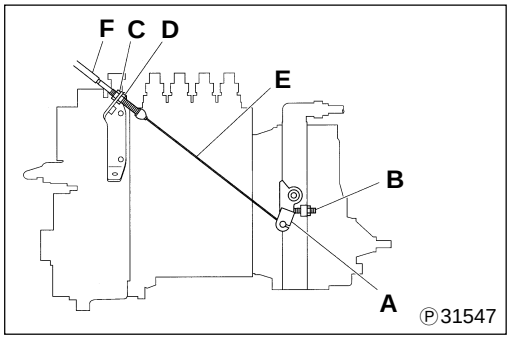


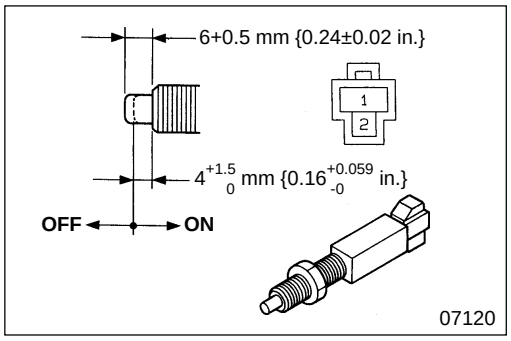
17 **Inspection of emergency engine stop button**

- Push emergency engine stop button **17** in all the way.
- In this step, make sure that stop lever **A** of the governor is in contact with stopper bolt **B**.
- If the stop lever does not contact the stopper bolt, turn nut **C** until they contact, and tighten nut **D** to secure it in place.
- Inner wire **E** of stop cable **F** should be taut. If not, make adjustment.

CAUTION ⚠

Be careful not to make the tension of inner wire E too high, since excess tension prevents stop lever A from fully contacting stopper bolt B.





18 **Inspection of clutch switch**

- Follow the table below to inspect continuity:

	①	②
OFF		
ON	○	○

○——○ : There is continuity between terminals ○ and ○.

- If any fault is found, replace clutch switch **18**. Gr 21

A : From radiator
B : From cylinder head
C : To water pump
D : With high coolant temperature
E : With low coolant temperature

Thermostat **2** is a bottom bypass type that uses wax-charged pellets as its regulating element. As the wax changes from solid to liquid in with temperature increases, the total wax volume changes. As a result, the position of the valve, changed by the coolant temperature, regulates the flow of coolant from the radiator and cylinder head (by-pass side) before entering the engine to control the coolant temperature (inlet control type).

T Tightening torque

Unit: N·m {ft.lbs, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
2	Drain cock	2 {14.5, 0.2}	—
3	Water drain plug	24.5±4.9 {18.1±3.6, 2.5±0.5}	—

Using the radiator for extended periods without cleaning the cooling system will cause overheating since rust and scale will accumulate. The cooling system must be cleaned periodically.

● **Draining the coolant**

Before draining the coolant, loosen the pressure cap **1** to reduce the pressure in the cooling system.

WARNING ⚠

- **To avoid being scalded, make sure the coolant has cooled sufficiently before loosening the pressure cap 1.**
- **Unless care is taken, opening the pressure cap 1 when the coolant is hot can cause the coolant to spray out. Cover the pressure cap with a cloth, and loosen the cap slowly to bleed off the pressure before opening it fully.**

● **Cleaning procedure**

- Run the engine and keep the coolant at a temperature of approximately 90°C {194°F} such that the thermostat valves remain open and the coolant circulates continuously in the radiator.
- To increase the coolant temperature quickly, cover the front of the radiator with cardboard or a similar material.
- If cleaning is carried out after a large amount of rust has accumulated, the radiator may start to leak. Carefully examine the radiator for leaks after cleaning the cooling system.
- Soft water to be used should have the following properties.

CAUTION ⚠

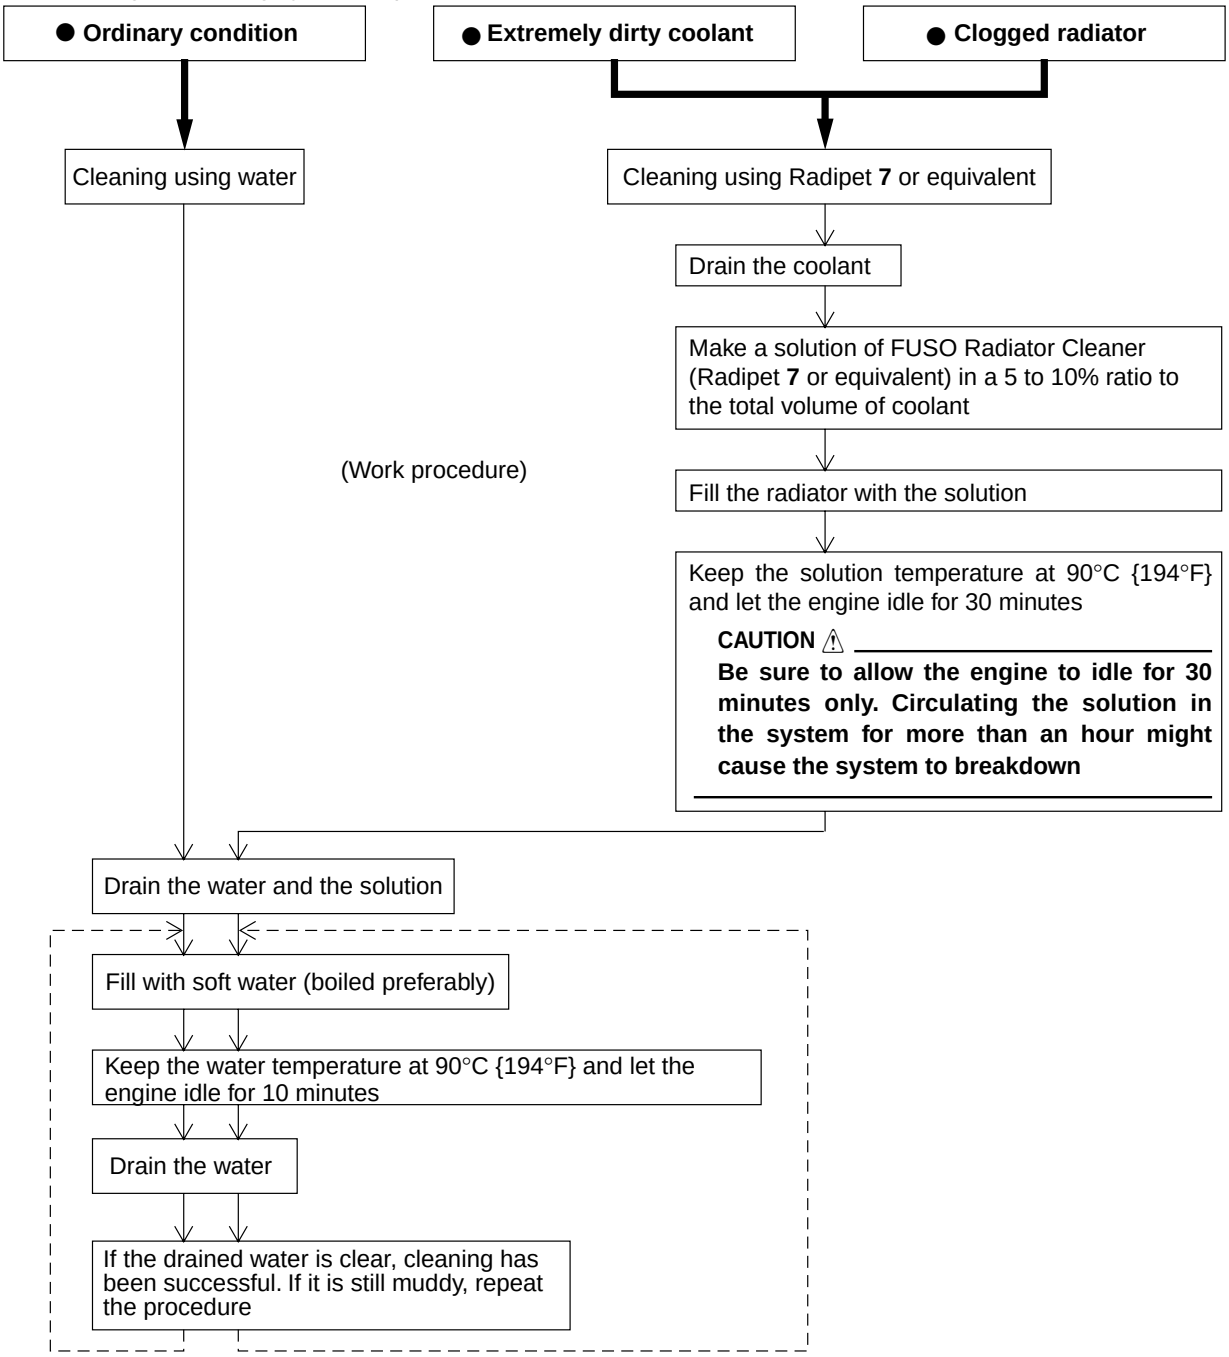
Do not use hard water as it causes scale and rust.

Required properties of soft water

Total hardness	300 ppm or less
Sulfate SO_4^-	100 ppm or less
Chloride Cl^-	100 ppm or less

Total dissolved solids	500 ppm or less
pH	6 to 8

Method of cleaning the cooling system depends on its condition.



DANGER ⚠

If FUSO DIESEL LONG LIFE COOLANT solution gets in your eyes accidentally, you must immediately rinse your eyes with large amounts of water, and be sure to consult a doctor.

WARNING ⚠

FUSO DIESEL LONG LIFE COOLANT is inflammable. Do not put it near unprotected lights.

NOTE

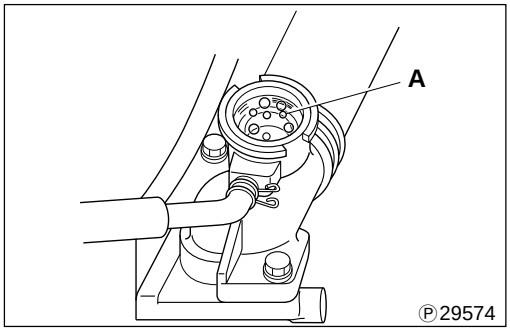
- **After cleaning with solution, fill with coolant as quickly as possible.**
- **To prevent freezing of the coolant and corrosion of the cooling system, use specified coolant solution of FUSO DIESEL LONG LIFE COOLANT. (See the Owner's Handbook for use of these materials.)**

Air Bleeding of Cooling System

- Remove the pressure cap. Then, introduce cooling water little by little up to the water outlet pipe neck. Do not pour water up to the outlet port brim, otherwise water would overflow out of the outlet port after the engine is started as water will expand due to temperature rise.
- With the pressure cap removed, run the engine at idle. While keeping temperature at 90°C {194°F}, bleed the cooling system completely.
- After bleeding the cooling system of air, add coolant to the water outlet pipe and reservoir tank as required.

Gas Leak Testing

The presence of air or exhaust gas in the coolant increases corrosion and rust in the cooling system. Check for air or exhaust gas in the coolant using the following procedure.



- Open the pressure cap.

WARNING ⚠

Make sure the coolant is cool before loosening the pressure cap. If the coolant is hot, it may spray out.

- Run the engine and let the coolant temperature reach approximately 90°C {194°F}.
- If bubbles **A** appear continuously, there is air or exhaust gas in the coolant.
- If the coolant contains air, the cylinder head bolts, water pump mounting bolt, or hose connections may be loose. Alternatively, the hoses may be damaged.
- If the coolant contains exhaust gas, it is possible that the cylinder head gasket is damaged or that the cylinder head is cracked.

◆ Service procedure

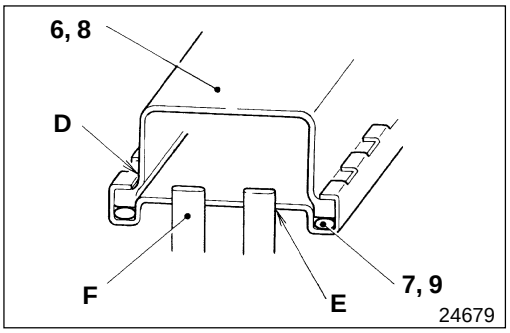
3 Radiator inspection

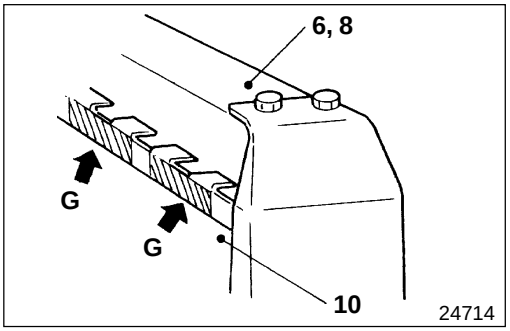
- Fit a hose **A**, and radiator cap tester **B** onto the radiator upper tank **6**.
- Fit a plug **C** onto the radiator lower tank **8**, then immerse the radiator in a tank of water.
- Using the radiator cap tester **B**, apply the specified air pressure of 150 kPa {21 psi, 1.5 kgf/cm^2}, and check for air leakage.
- If air leakage is apparent, repair or replace the radiator assembly **3**.



- Replace the following parts according to the leaking locations.

Leaking location	Part to replace
Tank root **D**	O-ring **7** or **9**
Tank **6**	Tank **6**, O-ring **7**
Tank **8**	Tank **8**, O-ring **9**
Tube fitted area **E**	Core **10**, O-ring **7**, **9**
	* Tube **F** (TIG welded), O-ring **7**, **9**
Tube **F**	Core **10**, O-ring **7**, **9**

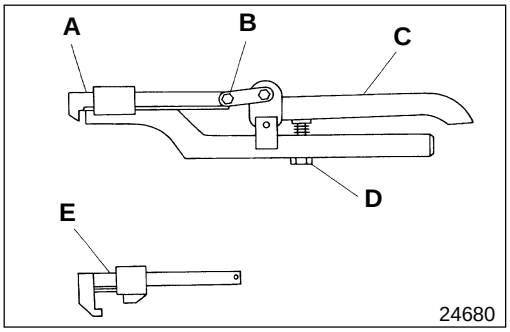
*: When repaired



CAUTION ⚠

Replace the core 10 if its clinching tabs that hold the upper tank 6 or lower tank 8 have two paint marks G, evidence of the tabs having been bent back twice.

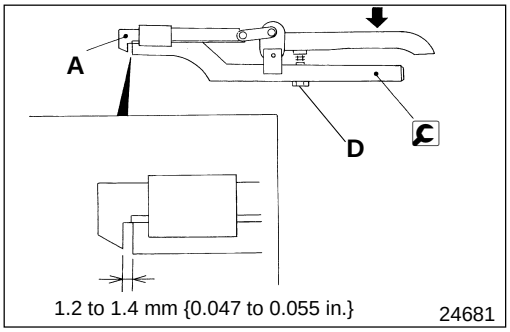
The tabs are provided with one paint mark each time they are bent back. Count the paint marks on each of upper and lower tabs separately.



6 **8** **Upper tank and lower tank**

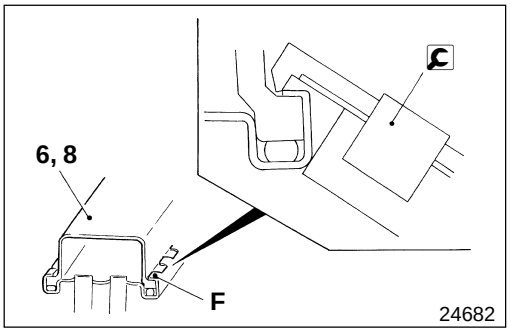
Remove and reinstall the tanks using the Lock and Break Tool.

A : Attachment (for tank removal)
B : Attachment locking bolt
C : Slide handle
D : Stopper/adjuster bolt
E : Attachment (for tank installation)

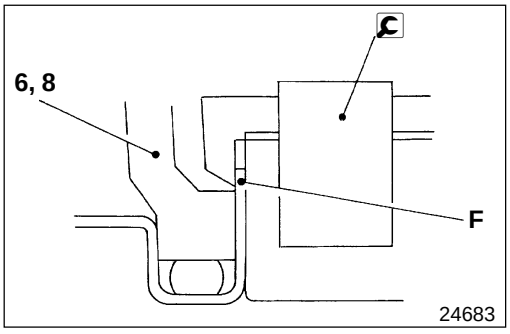


[Removal]

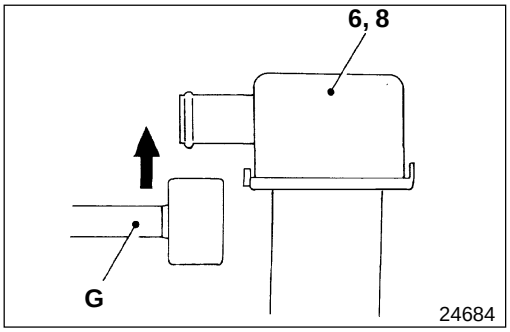
- Fit attachment **A** onto the end of the Lock and Break Tool, set it to the illustrated dimension and lock it in position with the stopper/adjuster bolt **D**.



- Using the Lock and Break Tool, bend up the tabs **F** of the core **10** that hold the tank **6**, **8**.
- Straighten the tabs **F** completely as shown by gripping the Lock and Break Tool.

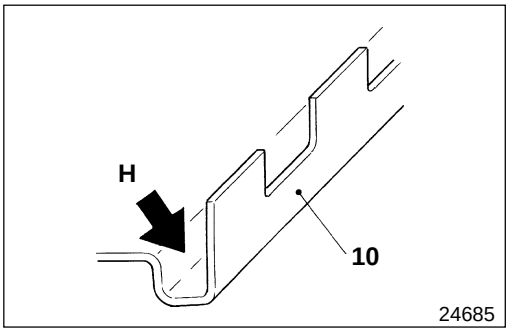


- After straightening all the tabs **F**, grasp the inlet or outlet pipe and remove the tank **6**, **8**.
- If the tank **6**, **8** is difficult to remove, tap it with a rubber or plastic hammer **G**.



CAUTION ⚠

The tanks 6 and 8 are made of plastic and may crack if subjected to undue shock. Handle them with care.

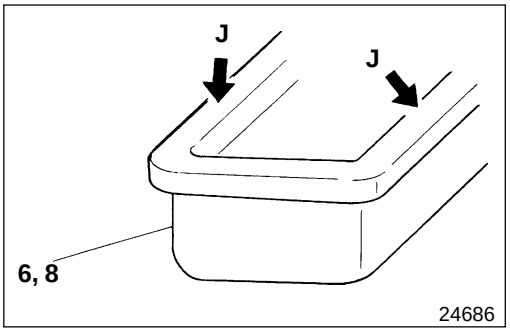


[Inspection]

- Check the tank mounting channels **H** of the core **10** for foreign matters.
- If foreign matter is stuck inside the mounting channels, rub them away with sandpaper (approximately #1000) or blow them out with compressed air.

CAUTION ⚠

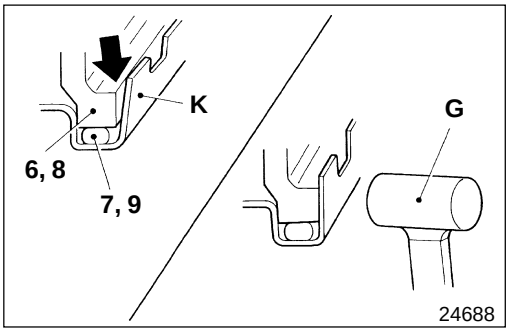
If any foreign matter (even a single hair) remains when the O-ring 7, 9 and tank 6, 8 are fitted, leakage can occur. Carefully inspect and clean each tank mounting channel H entirely.



- Clean the core contacting surface **J** of the tank **6**, **8** and inspect it for damage. Replace the tank if any defect is evident.

CAUTION ⚠

Perform procedure with bare hands to prevent foreign matter from sticking to the surface J.

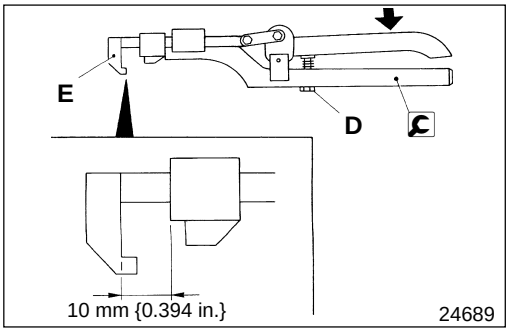


[Installation]

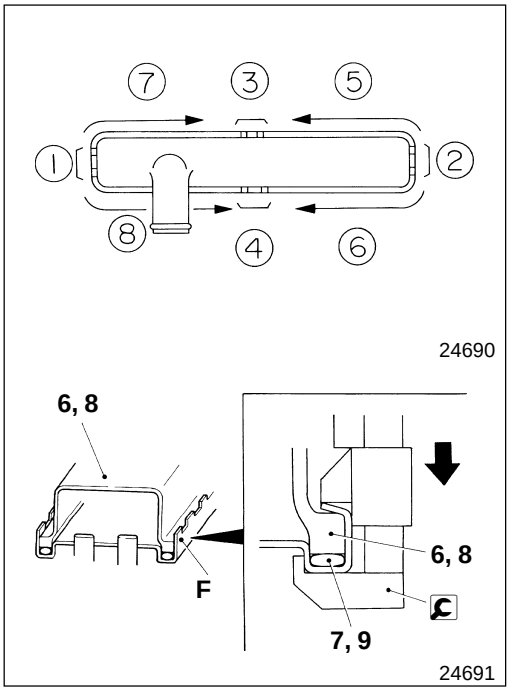
- Install the tank **6**, **8** in position. Check that the sub-plate **K** of the core is in close contact with the tank. If there is any space, tap the sub-plate lightly with a rubber or plastic hammer to eliminate space.

CAUTION ⚠

Handle the parts with bare hands to prevent foreign matter from sticking to the O-ring 7, 9 and tank 6, 8.



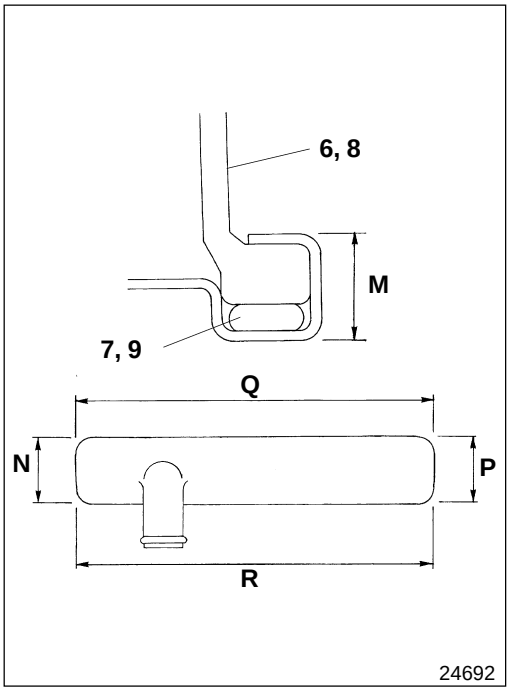
- Fit attachment **E** onto the end of the Lock and Break Tool, set it to the illustrated dimension and lock it in position with the stopper/adjuster bolt **D**.



- Clinch the tabs **F** of the core **10** to hold the tank **6**, **8** in the illustrated order.
  ① to ④ : Two center tabs on each side
  ⑤ to ⑧ : Remaining tabs in illustrated sequence
  : Lock and Break Tool (with attachment **E**)

NOTE

The sides ① and ② do not allow the Lock and Break Tool to be used for clinching. Clinch these sides using a pair of pliers with tape wrapped around its jaws.

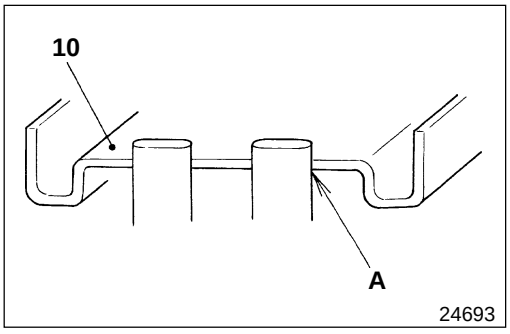


- Check that the tabs have been clinched to the following dimensions.
  M : 14.65 to 15.05 mm {0.576 to 0.592 in.} (Sides **N** and **P**)
  10.05 to 10.45 mm {0.395 to 0.411 in.} (Sides **Q** and **R**)

- Check for leaks. P14A-13
- Provide a paint mark to the sub-plate **K** of the core **10** to indicate that the tabs have been bent up and then down.

NOTE

Provide one paint mark after each removal of the tank.



11 Core

If water leaks from the tube fitted area **A**, replace the core **10** or repair it by the following method.

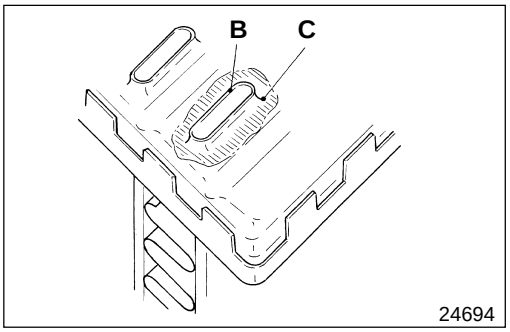
[Repair]

NOTE

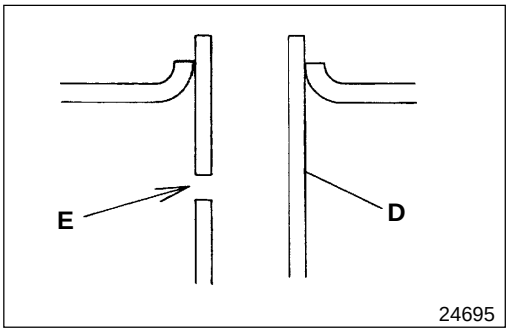
Repair is carried out by tungsten inert gas arc (TIG) welding, which requires the skill of a trained welder.

WARNING ⚠

To avoid danger, dry the core 10 completely before welding.



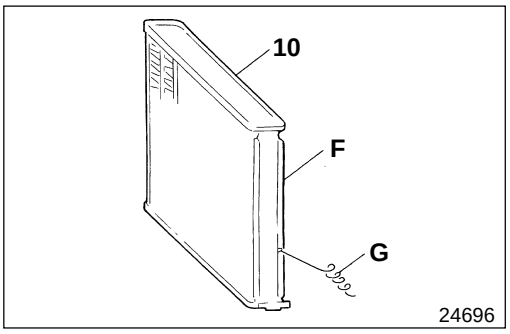
- Clean both edges **B** of the leaky tube and their surroundings **C** using a stainless steel wire brush. Scrub the surface until it glistens with exposed aluminum.



- Since both ends of the tube are covered with weld metal, make a small hole **E** in the tube **D** to allow air venting.

NOTE

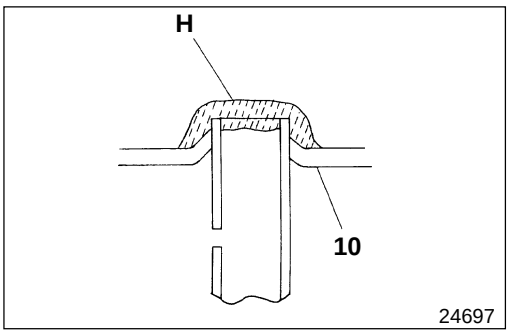
Absence of the small hole E causes escaping air to produce small pin holes in the weld.



- Connect a grounding wire **G** from the support **F** of the core **10** to an appropriate object.

CAUTION ⚠

Improper connection of the grounding wire G causes a short circuit during welding work and the core could be fused at the welded portion.



- Cover both ends of the tube with welding metal.
  H : Tungsten inert gas arc weld (TIG)
  Welding conditions:
  Welding rod: A4043 (approximately ϕ 2 mm {ϕ 0.0079 in.} in diameter)
  Welding current: 80A AC
- After welding, check for the following defects. Rectify the weld or replace the core **10** if any of the defects is evident.
  - Undercut
  - Bead crack
  - Crack in base metal

CAUTION ⚠

Weld with sufficient care. Poor welding may cause leakage to reoccur.

◆ Service Procedure

4 Automatic cooling fan coupling

[Inspection]

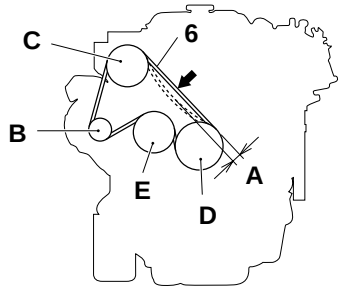
Inspect the automatic cooling fan coupling **4** in accordance with the following procedure. If any defect is apparent, replace the unit.

- Check for leakage of oil from the coupling body.
- Rotate the automatic cooling fan coupling **4** by hand and check for irregular movement or abnormal noise caused by a defect in the bearing.
- Check for excessive axial play in the automatic cooling fan coupling **4** when the engine is cool.

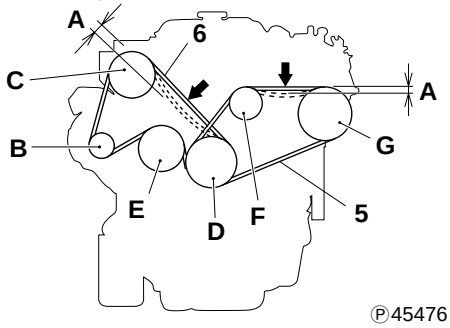
[Cleaning]

If any foreign particles have adhered to the bimetal **A**, brush them off gently.

< Without refrigerator >



< With refrigerator >



5 **6** **V-belt and V-ribbed belt tension**

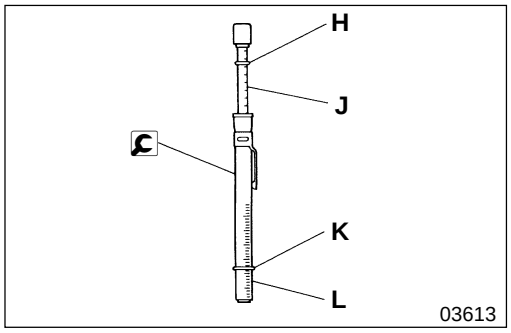
[Inspection]

NOTE

Before checking for tension, crank the engine one turn or more clockwise.

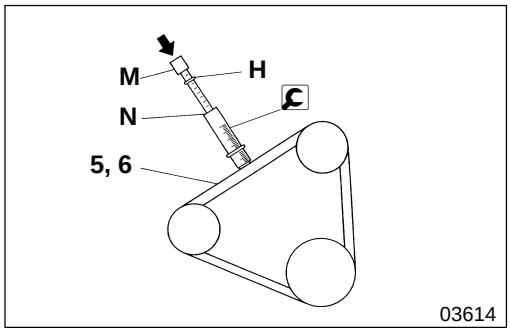
Apply force of approximately 98 N {22 lbf, 10 kgf} to the span center of the V-belt **5** and V-ribbed belt **6**, and measure the extent of belt deflection **A**.

B : Alternator pulley
C : Air conditioner compressor pulley or tention pulley
D : Fan pulley
E : Water pump pulley
F : Tension pulley < Refrigerator-equipped unit >
G : Compressor pulley < Refrigerator-equipped unit >

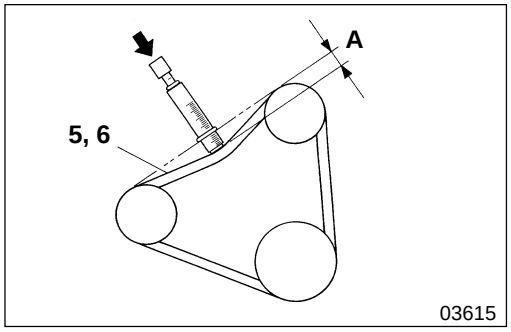


● **Use of belt tension gauge**

- Set the upper O-ring **H** of the 🔧 Belt Tension Gauge to a push load of 98 N {22 lbf, 10 kgf} on scale **J**.
- Set the lower O-RING **K** of the 🔧 Belt Tension Gauge to the belt's specified maximum deflection value on scale **L**.



- Apply the 🔧 Belt Tension Gauge to the center of the V-belt **5** and V-ribbed belt **6** and push **M** until the upper O-ring **H** reaches the flange **N**.

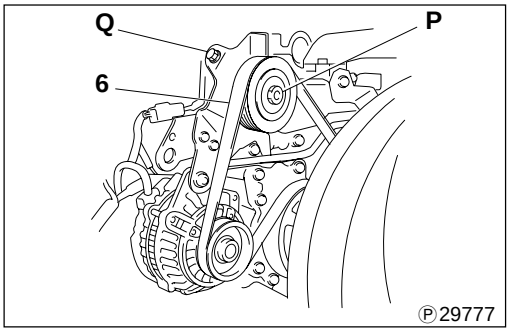


- Measure the deflection **A** of the V-belt **5** and V-ribbed belt **6**. If the measurement does not comply with the standard value, adjust the tension in accordance with the following procedure.

[Adjustment]

CAUTION ⚠

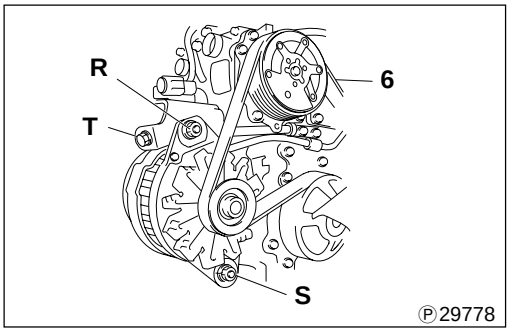
- **Excessive tension in the V-belt 5 or V-ribbed belt 6 may damage the belt and related bearings.**
- **Keep the V-belt 5 or V-ribbed belt 6 free of oil. If the belt becomes oily, it may slip, resulting in overheating of the engine and insufficient charging of the battery.**



(1) V-ribbed belt

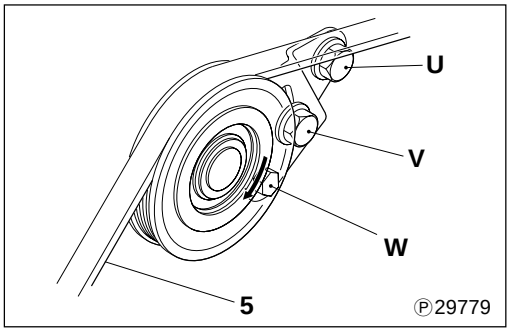
< Without air-conditioner >

- Loosen the tensioner pulley mounting sleeve **P**, then adjust the tension of the V-ribbed belt **6** using the adjustment bolt **Q**.
- When the adjustment is completed, securely tighten the sleeve **P**.



< With air-conditioner >

- Loosen the alternator mounting nuts **R** and **S**, then adjust the tension of the V-ribbed belt **6** using the adjustment bolt **T**.
- When the adjustment is completed, securely tighten the nuts **R** and **S**.



(2) V-belt < With refrigerator >

- Loosen bolt **U** before loosening bolt **V**.
- Using a box-end wrench on bar **W**, adjust the tension of the V-ribbed belt **5**.
- After adjustment, tighten bolt **V**, then tighten bolt **U** firmly.

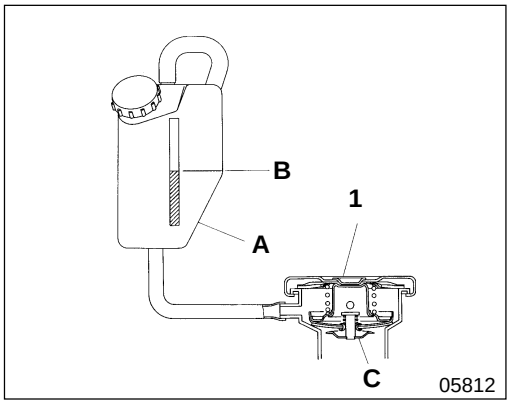
◆ Service procedure

1 Pressure cap inspection

(1) Pressure valve opening pressure

If the gauge reading deviates from the standard value, replace the pressure cap **1**.



(2) Vent valve inspection

- Observe the water level **B** in the reservoir tank **A**.
- Run the engine at a high speed. Stop the engine when a small amount of coolant has overflowed into the reservoir tank **A**.
- Wait for a while in this condition. When the coolant returns to the ambient temperature, check to see if the water level in the reservoir tank **A** has returned to the level at which it was observed before the engine was started.
- If the water level has not dropped, the vent valve **C** is faulty. Replace the pressure cap **1**.

NOTE

If the pressure cap 1 is removed before the coolant temperature drops to the ambient temperature, the vacuum in the radiator is lost, preventing the coolant from returning to the radiator.

6 Thermostat

[Inspection]

Place the thermostat in a container of water. Then, carry out the following inspection procedure while stirring the water with a rod **A** to ensure that it is heated evenly. If the measurements do not comply with the standard values, replace the thermostat **6**.

(1) Valve opening temperature

- Support the thermostat **6** with wire **E** to keep it away from the heat source **D**.
- Gradually heat the water until it reaches the valve opening temperature.
- Maintain this temperature for approx five minutes and check that the valve **B** is open.
- When the water temperature drops below 65 °C {149 °F}, check the the valve **B** is completely closed.

C: Thermometer

(2) Valve lift

Heat the water to slightly higher than the valve opening temperature. With the valve **B** fully open, maintain this water temperature for five minutes. Measure the extent of valve lift **F**.

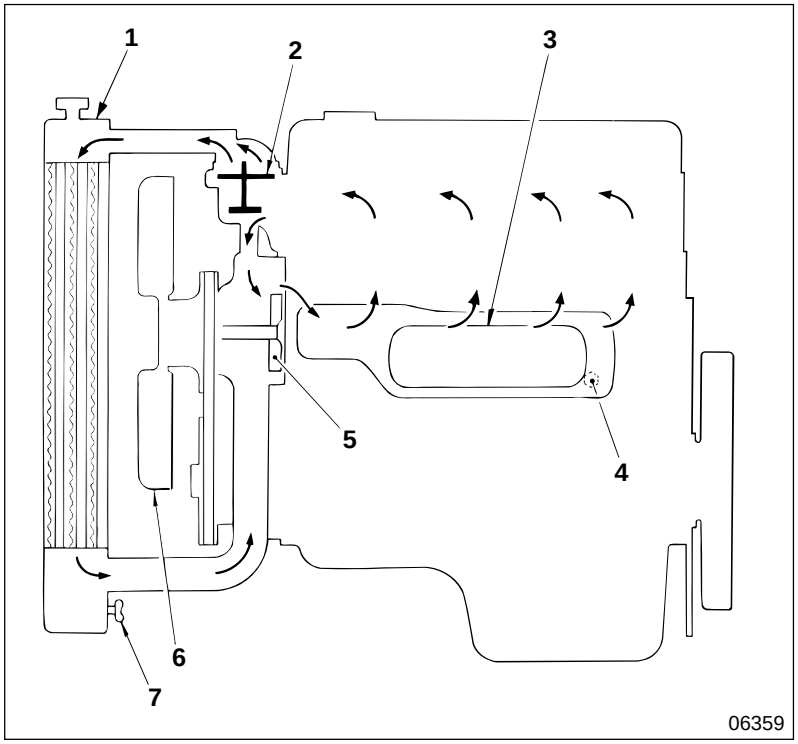
SPECIFICATIONS

Item	Specifications
Kind of cooling system	Forced water circulation system
Water pump type	Belt-driven involute type
Thermostat type	Wax-pellet, bottom bypass type (with jiggling valve)
Automatic cooling fan coupling type	Continuous control type
Radiator type	Tube and corrugated fin type
Coolant capacity L {qts}	13 {14}

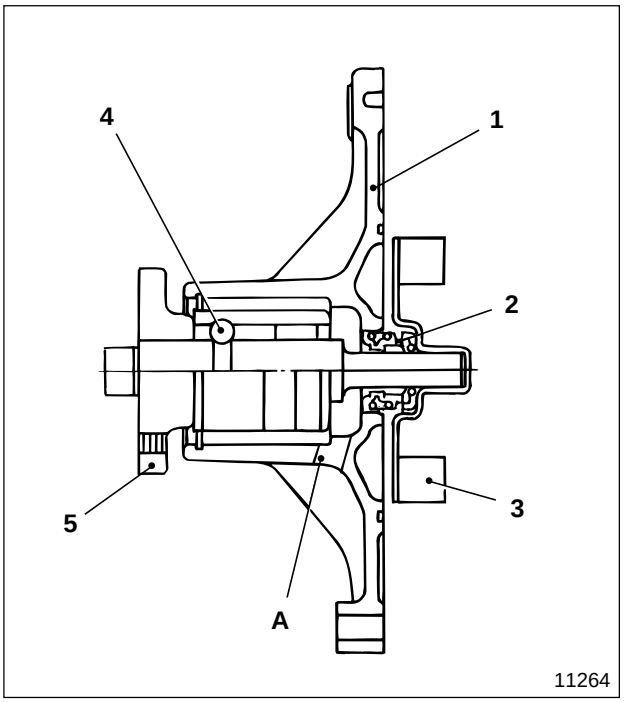
STRUCTURE AND OPERATION

Cooling System (Flow of Coolant)



1 Radiator
2 Thermostat
3 Oil cooler
4 Crankcase drain plug
5 Water pump
6 Cooling fan
7 Radiator drain cock

Water Pump

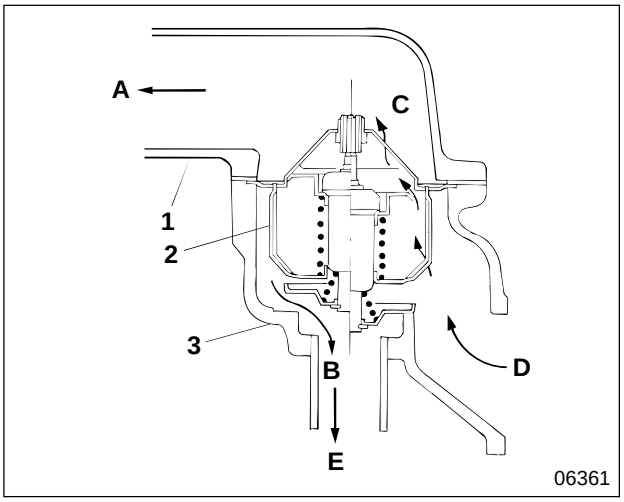


1 Case
2 Unit seal
3 Impeller
4 Ball bearing
5 Flange

A : Drain hole

The water pump is provided with a drain hole **A** to prevent the ingress of coolant to the ball bearing **4** when the unit seal **2** is damaged.

Thermostat



1 Thermostat cover
2 Thermostat
3 Thermostat case

A : To radiator
B : When low coolant temperature
C : When high coolant temperature
D : From cylinder head
E : To water pump

Thermostat **2** is a bottom bypass type that uses wax pellets as its regulating element. As the wax changes its form from solid to liquid according to changes in temperature, the volume of the wax changes. Therefore, the position of the valve, changed by the coolant temperature, regulates the flow of the coolant to the radiator and water pump (bypass side) and controls the coolant temperature.

Using the radiator for a long period of time without cleaning it will cause overheating because rust and scale deposits will accumulate inside the cooling system. Periodical cleaning is recommended.

● **Draining coolant**

First loosen pressure cap **1,** to lower the pressure in the cooling system, before draining coolant.

WARNING

- **You must make sure that the engine coolant is cold before draining it so as not to scald yourself.**
- **It is dangerous to open pressure cap 1, when the coolant temperature is high, without taking due care because the hot water would spray out. Be sure to cover the pressure cap with a cloth and loosen slowly to bleed the pressure before opening fully.**

● **Cleaning procedure**

- Keep the coolant temperature at approximately 90°C {194°F} so that the thermostat valve remains open and the coolant continues to circulate in the radiator.
- For the sake of convenience you can raise the coolant temperature quickly by covering the front of the radiator with corrugated cardboard or something similar.
- Soft water to be used should have the following properties.

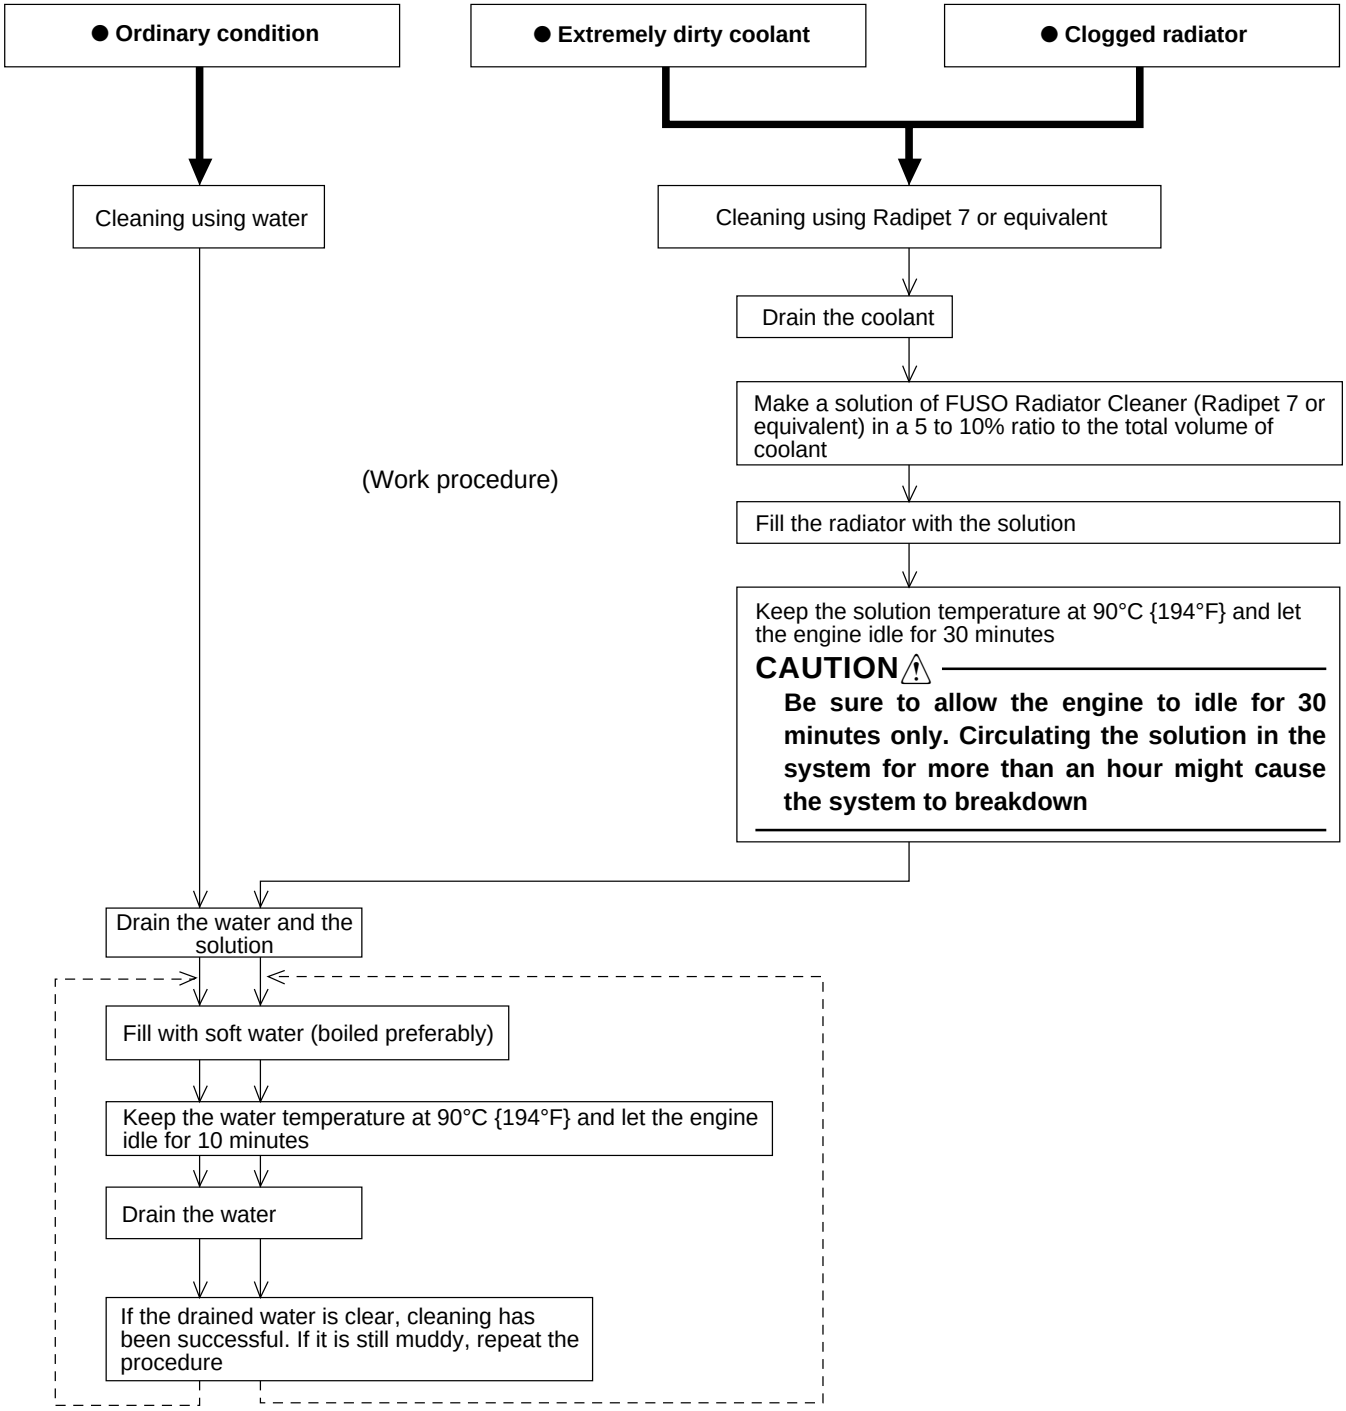
CAUTION

Do not use hard water as it causes scale and rust.

Required properties of soft water

Total hardness	300 ppm or less	Total dissolved solids	500 ppm or less
Sulfate SO_4^-	100 ppm or less	pH	6 to 8
Chloride Cl^-	100 ppm or less		

Method of cleaning the cooling system depends on its condition.



DANGER

If FUSO DIESEL LONG LIFE COOLANT solution gets in your eyes accidentally, you must immediately rinse your eyes with copious amounts of water, and be sure to consult a doctor.

WARNING

FUSO DIESEL LONG LIFE COOLANT is inflammable. Do not put it near naked lights.

NOTE

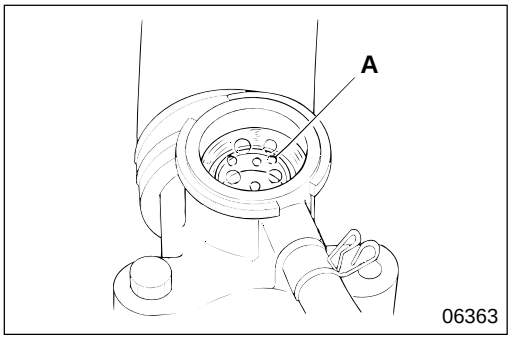
- **After cleaning with solution, fill with coolant as quickly as possible.**
- **To prevent freezing of the coolant and corrosion of the cooling system, use specified coolant solution of FUSO DIESEL LONG LIFE COOLANT. (See the Owner's Handbook for use of these materials.)**

INSPECTION AND ADJUSTMENT MOUNTED IN VEHICLE

Air Bleeding of Cooling System

- Remove the pressure cap and keep the coolant temperature at 90°C {194°F} while letting the engine idle and bleed the air out completely. Keep the temperature adjusting lever of the heater controller at maximum so that the coolant can circulate freely in the heater piping area.
- After completing adequate air bleeding of the cooling system, refill coolant sufficiently enough for the radiator and the reservoir tank.

Gas Leakage Test



Air or exhaust gas in the coolant increases corrosion and rusting in the system. Therefore, carry out the following test:

- Remove the pressure cap.

WARNING⚠

Be sure that the coolant temperature is low enough so that hot coolant does not spout out when you loosen the pressure cap.

- Run the engine to bring the coolant temperature to approximately 90°C {194°F}.
- If air bubbles **A** continuously rise from the coolant, it is an indication that air or exhaust gas has gotten into the coolant.
- If it is air, it is possible that the cylinder head bolts, the water pump mounting bolts or the hose connections are loose, or that the hose is damaged.
- If it is exhaust gas, it is possible that the cylinder head gaskets are damaged, or that the cylinder head is cracked.

◆ Service procedure

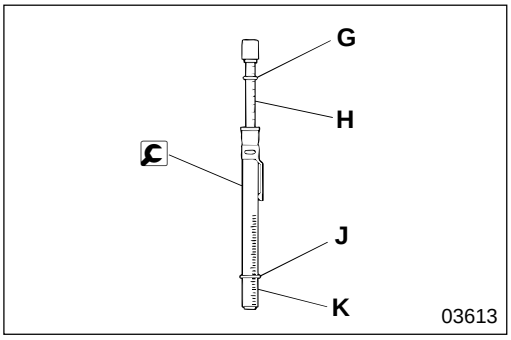
1 **2** **V-belt**

[Inspection]

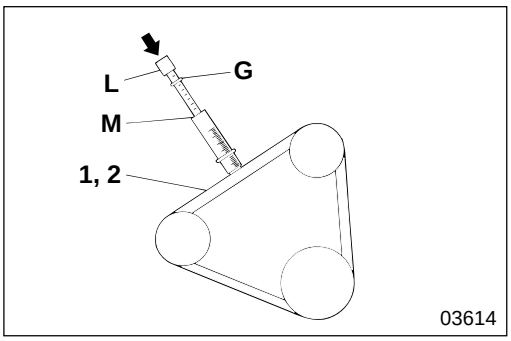
Measure the extent of flex **A** when the center of V-belts **1**, **2** as illustrated is depressed with a force of 98 N {72 lbf, 10 kgf}.

B : Alternator pulley
C : Water pump pulley
D : Cooler compressor pulley (Air-conditioner)
E : Tension pulley
F : Crankshaft pulley

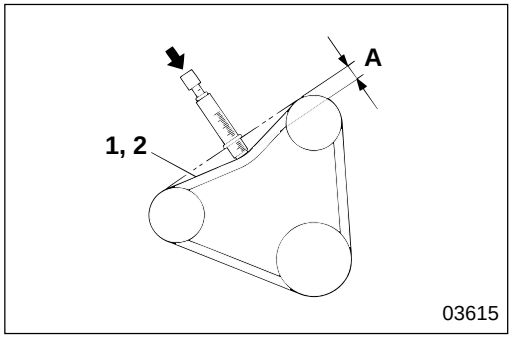


● **Use of special tool belt tension gauge**

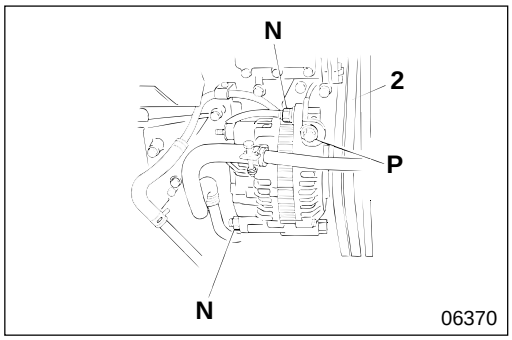
- Set upper O-ring G of belt tension gauge to 98 N {72 lbf, 10 kgf} (push load) on graduation **H**.
- Set lower O-ring **J** of belt tension gauge to graduation **K** (maximum flex of belt).



- Place belt tension gauge at the center of V-belts **1**, **2** perpendicularly as illustrated and push top **L** all the way down until upper O-ring **G** hits upper edge **M**.



- Measure the extent of flex **A** of V-belts **1**, **2** at this point, and if the measured value deviates from the standard value, adjust as follows.



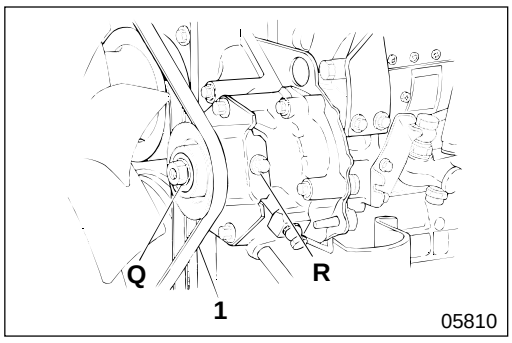
[Adjustment]

(1) Adjustment of V-belt tension for fan

- Loosen alternator mounting bolts **N** (two places), and adjust the tension of V-belts **2** by moving adjusting bolt **P**.
- After adjustment, tighten the bolts and nuts securely.

CAUTION⚠

- **Bear in mind that excessive tension of V-belts 2 might damage the belts and bearings that engage with the V-belts.**
- **Be sure to replace V-belts 2 as a matched set to maintain even tension between them.**
- **Be careful not to let oil stick to V-belts 2, if oil gets onto the belts, it causes slipping, resulting in overheating and insufficient battery charging.**

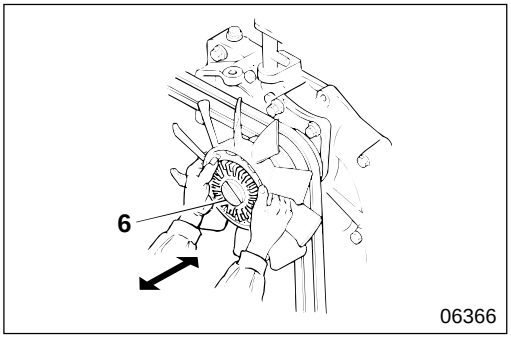


(2) Adjustment of V-belt tension for air-conditioner

- Loosen tension pulley mounting nut **Q**, and adjust the tension of V-belt **1** by adjusting bolt **R**.
- After adjustment, tighten the bolts and nuts securely.

CAUTION⚠

- **Bear in mind that excessive tension of V-belt 1 might damage the belt and bearings that engage with the V-belt.**
- **Be careful not to let oil stick to V-belt 1, if oil gets onto the belt, it causes slipping, resulting in poor performance of the air-conditioner.**

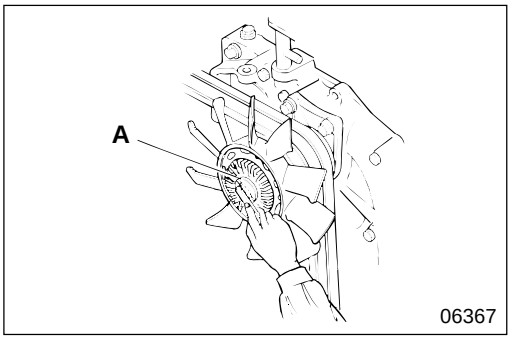


6 Automatic cooling fan coupling

[Inspection]

Carry out the following inspection of automatic cooling fan coupling **6** and if any fault is found, replace the unit.

- Check for any leakage of lubricating oil sealed in the coupling body.
- Rotate automatic cooling fan coupling **6** by hand, and check for any irregularity in rotation related to the coupling bearing or any abnormal noise.
- Check for any excessive play of automatic cooling fan coupling **6** in the axial direction when the engine is cool.



[Cleaning]

- If there are any foreign particles sticking to bimetal **A**, remove them by brushing lightly.

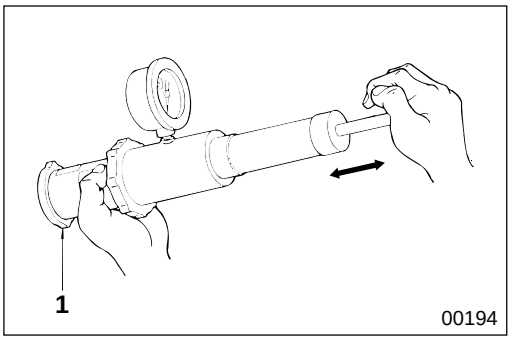
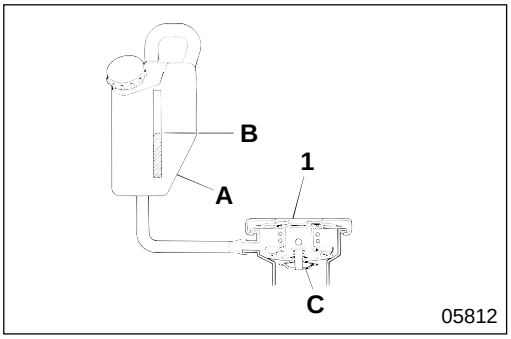
◆ Service procedure



1 Inspection of pressure cap

(1) Pressure valve opening pressure

If the measured value deviates from the standard value, replace pressure cap **1**.

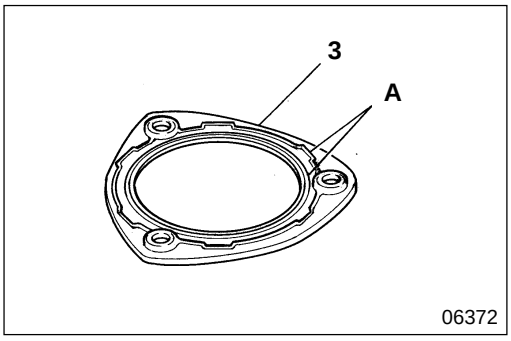


(2) Inspection of vent valve

- Take note of the liquid level **B** of reservoir tank **A** beforehand.
- Run the engine at a high revolution and before the overflow reaches the capacity of tank **A** stop the engine.
- Leave things for a while. Check the time it takes for the coolant temperature to return to the ambient temperature, and check whether the coolant level in tank **A** is the same as before running the engine.
- If the coolant level has not returned to the level before running the engine, it means vent valve **C** is faulty, therefore replace pressure cap **1**.

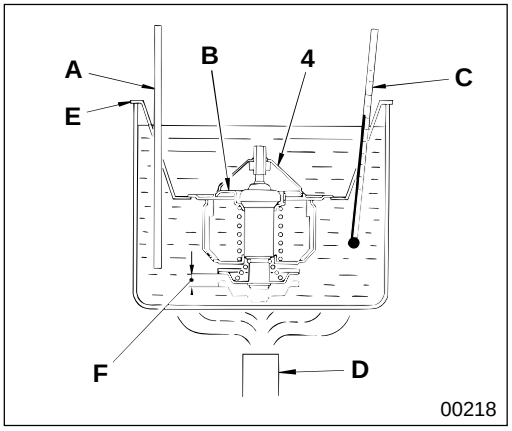
NOTE

Do not remove pressure cap 1 before the coolant temperature falls to the atmospheric temperature. If you do that the coolant will not return to radiator because negative pressure in the radiator is lost.



3 Mounting of thermostat cover gasket

When mounting thermostat cover gasket **3,** face sealant applied surface **A** to thermostat case **5** and mout it to the case.



4 Thermostat

[Inspection]
Stir the water using stick **A** to maintain an even water temperature in the container, then carry out the following tests. If the measured value deviates from the standard value, replace thermostat **4**.

(1) Valve opening temperature

- Hold thermostat **4** with wire **E** so as not to get the thermostat too close to heat **D**.
- Heat the water gradually to raise the temperature to the valve opening temperature.
- Maintain this temperature for five minutes and make sure that valve **B** has opened.
- Make sure that valve **B** has closed when the water temperature has dropped to 65°C {149°F}.

C : Water thermometer

(2) Extent of valve lift

Measure valve lift **F**, while maintaining the water temperature a little higher than the valve opening temperature, with valve **B** fully open for five minutes.

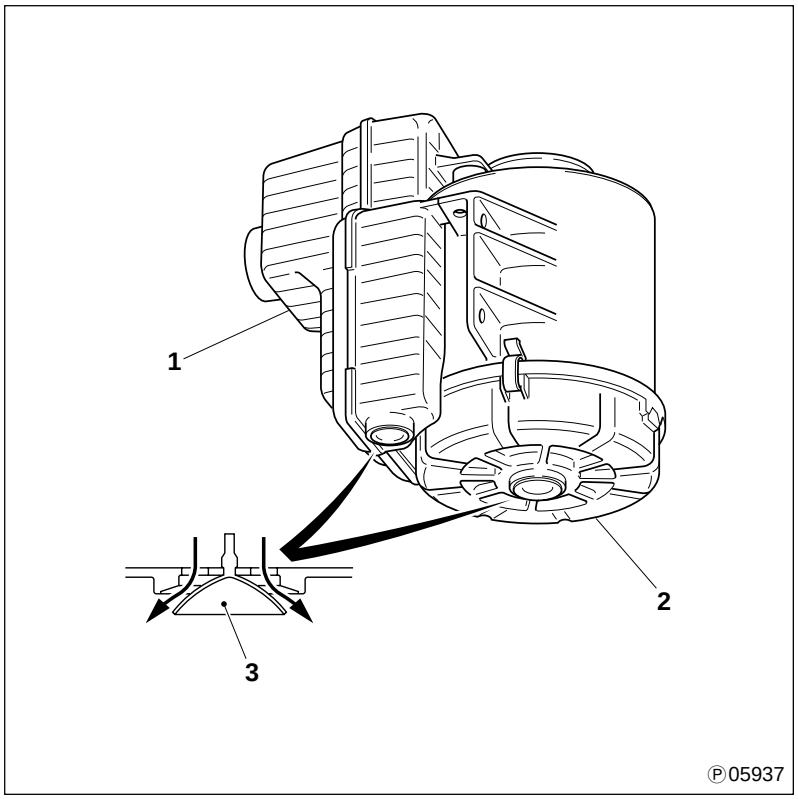
Turbocharger	Model	TD05
	Manufacturer	Mitsubishi Heavy Industries
Intercooler type		Tube and corrugated fin (air cooled)

STRUCTURE AND OPERATION

1. Air Cleaner



1 Air box
2 Air cleaner assembly
3 Unloader valve

- The air cleaner assembly **2** utilizes a single element.
- The air box **1** and the air cleaner assembly **2** incorporate an unloader valve **3**.
- The unloader valve vibrates due to a vacuum fluctuation when the engine speed drops below a predetermined level, automatically discharging accumulated water and dust.

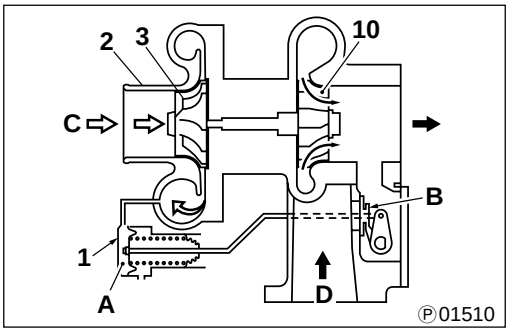
14 Insert

● **Waste gate mechanism**

- The waste gate mechanism has an actuator assembly **1** to let extra exhaust gas escape. By so doing, the boost pressure is properly controlled to prevent the turbine wheel from overrunning and prevent an excessive pressure in the intake manifold.
- The boost pressure is led from compressor cover **2** through a rubber hose to chamber **A** of actuator assembly **1**. When the boost pressure **C** that acts on chamber **A** is below the setting, the actuator assembly does not operate, and the waste gate valve remains closed, and exhaust gas **D** is blown against turbine wheel **10**.



- When the boost pressure that acts on chamber **A** exceeds the setting, the waste gate valve is opened. As a result, the amount of exhaust gas blown against turbine wheel **10** decreases, the rotating speed of compressor wheel **3** also decreases, and the boost pressure falls.

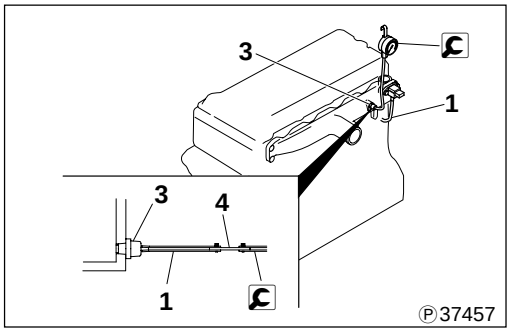
1. Measurement of Turbocharger Boost Pressure

Service standards

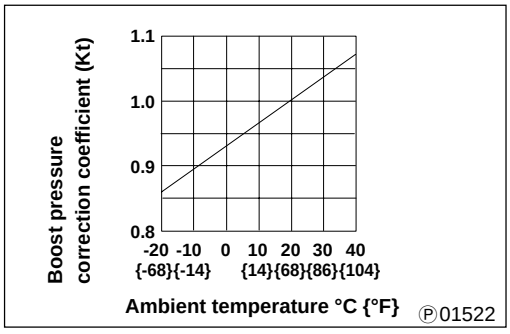
Location	Maintenance item	Standard value	Limit	Remedy
–	Boost pressure (at ambient temperature of 20°C {68°F} and atmospheric pressure of 100 kPa {29.9 in.Hg, 760 mmHg})	–	34.7 kPa {10.2 in.Hg, 260 mmHg}/ 3750 rpm 136 kPa {10.2+29.9 in.Hg, 260+760 mmHg} when measured by MUT	Inspect/ adjust

Special tool

Location	Tool name and shape	Part No.	Application
—	Boost pressure gauge Ⓟ01524	MH061366	Measurement of boost pressure



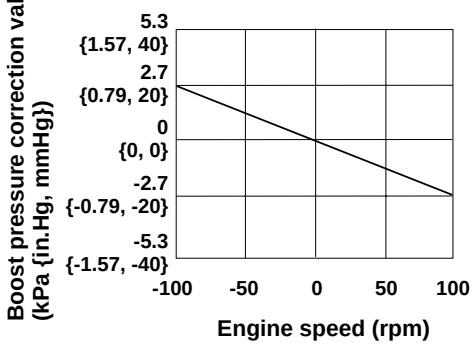
- Before measuring the boost pressure, clean or replace the air cleaner element.
- Disconnect the vacuum hose **1** at the boost pressure sensor **2** side.
- Connect the pipe **4** (MH062049 [component part of MH062047]) between the vacuum hose **1** fitted to the gas filter assembly **3** and the Boost Pressure Gauge.
- Warm up the engine, then measure the boost pressure at the engine's maximum speed. At the same time, measure the engine speed and ambient temperature.



- Correct the measurement to determine the boost pressure under standard conditions. (The boost pressure varies in accordance with the ambient temperature and engine speed.)

  [Correction for ambient temperature]

  From the graph, determine the boost pressure correction coefficient Kt for the ambient temperature.



(Differece between the median of the no-load maximum engine speed and the actual engine speed used for boost pressure measurement)

Ⓟ06165

[Correction for engine speed]

From the engine speed during boost pressure measurement, subtract the median of the maximum idling speed. From the result, determine the boost pressure correction value (**Pa**) in accordance with the graph.

Median**:** 3,750 rpm

[Calculation of corrected boost pressure]

If the measured boost pressure is **P**, the corrected boost pressure **Pb** is determined as follows**:**

Pb = KtP + Pa

Pb : Corrected boost pressure
P : Measured boost pressure
Kt : Boost pressure correction coefficient for ambient temperature
Pa : Boost pressure correction value

If **Pb** is out of specification, the turbocharger must be inspected and adjusted.

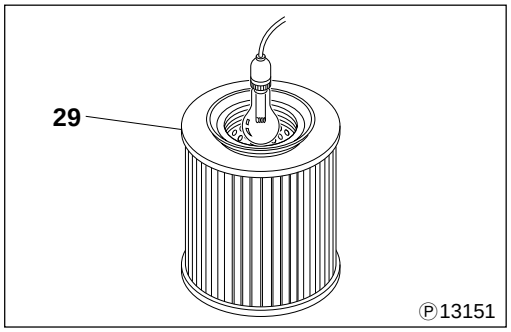
- When using compressed air, move the blower’s nozzle up and down along the pleats of air cleaner element **29** evenly.

CAUTION ⚠

- **Do not tap or hit air cleaner element 29 to remove dust.**
- **Do not blow compressed air through air cleaner element 29 from the outside.**



[Inspection]

- Illuminate the inside of air cleaner element **29**.
- If parts of the filter paper are torn or thin, or if the packing of the upper surface of air cleaner element **29** is damaged, replace the air cleaner element.

NOTE

If the dust on air cleaner element 29 is wet due to oil smoke or soot, replace the air cleaner regardless of the scheduled replacement interval.

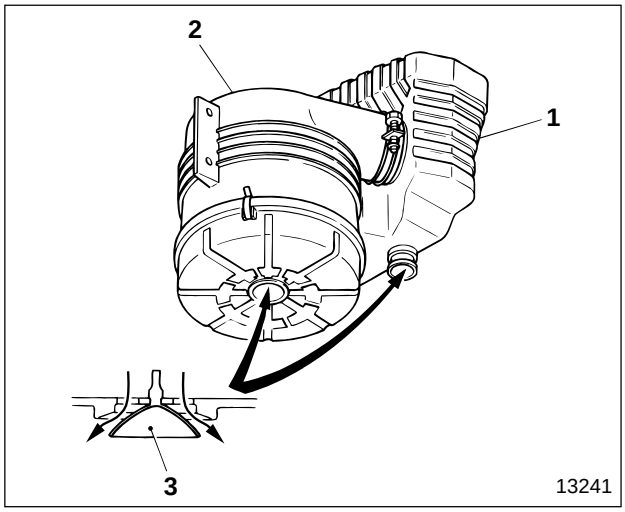
SPECIFICATIONS/STRUCTURE AND OPERATION

SPECIFICATIONS

Items		Specifications
Air cleaner element		Cyclone paper filter type
Turbocharger	Model	TD05
	Manufacturer	MITSUBISHI HEAVY INDUSTRIES
Intercooler type		Air-cooled, tube and corrugated fin type

STRUCTURE AND OPERATION

Air Cleaner



1 Air box
2 Air cleaner assembly
3 Unloader valve

- Air cleaner assembly **2** uses a single element.
- Air box **1** and air cleaner assembly **2** are fitted with unloader valve **3**. Water, dust and dirt that collect in the unit are automatically vented by vibration caused by the change of negative pressure when the engine revolution falls below the specified revolution.

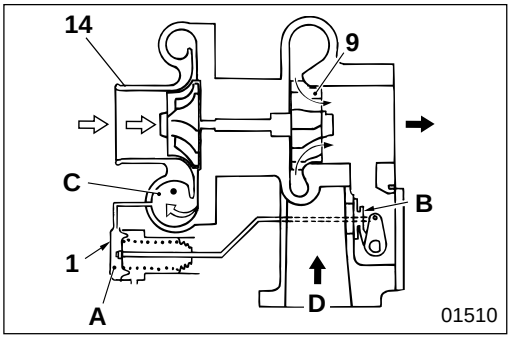
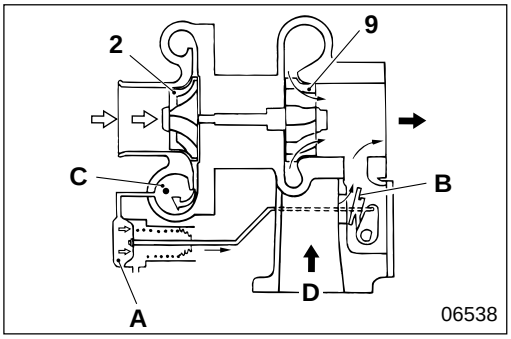
2 to **13** : Cartridge assembly

Waste gate mechanism

- The waste gate mechanism relieves the boost pressure of excess exhaust gas using actuator **1**. This controls the boost pressure appropriately and prevents the turbocharger from overrunning, and prevents excessive pressure in the intake manifold.
- The boost pressure is fed into chamber **A** of actuator **1** from compressor cover **14** via a rubber hose. When boost pressure **C**, acting on the chamber, is lower than the preset value, the actuator does not operate and waste gate valve **B** remains closed, therefore exhaust gas **D** is blown against shaft and turbine wheel **9**.

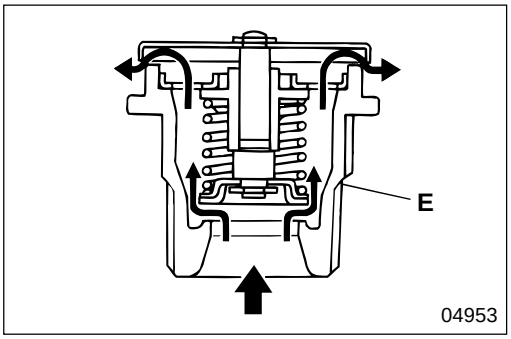




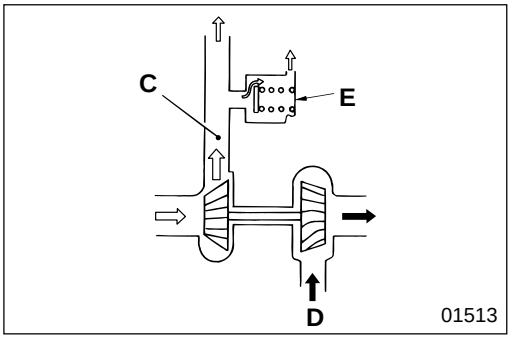
- As the boost pressure acting on chamber **A** increases to become higher than the preset value, waste gate valve **B** is opened and the exhaust gas blown against shaft and turbine wheel **9** decreases. Therefore the rotation of compressor wheel **2** decreases, causing the boost pressure to decrease.

Operation of over-boost valve

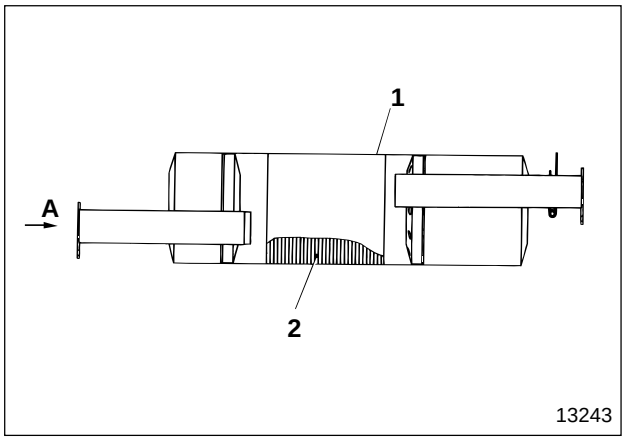
- Over-boost valve **E** operates when the boost pressure increases abnormally because of faulty operation of the waste gate mechanism.



- If boost pressure **C** of over-boost valve **E** increases to become higher than the preset value, the excessive boost pressure is discharged into the atmosphere, protecting the engine from excessive boost pressure. When the valve is operating, a pipe-blowing sound is generated.



Muffler



1 Muffler
2 Catalytic converter

A : Exhaust gas intake

Converter **2** is built into muffler **1** to decrease the amount of particulate matter (PM) in the exhaust gas.

INSPECTION AND ADJUSTMENT MOUNTED IN VEHICLE

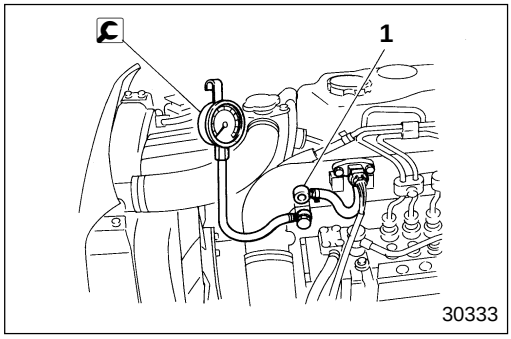
Measurement of Turbo Boost Pressure

Service standards

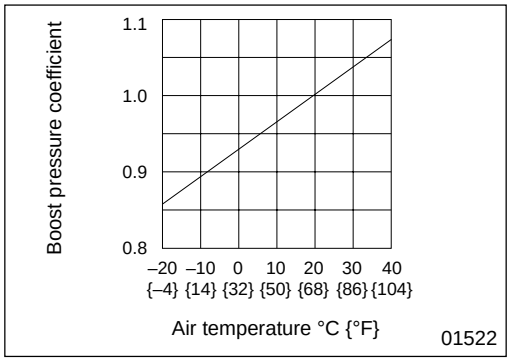
Location	Maintenance item	Standard value	Limit	Remedy
—	Boost pressure (Air temperature 20°C {68°F}, Atmospheric pressure 100 kPa {29.9 in. Hg, 760 mmHg})	—	36 kPa {10.6 in. Hg, 270 mmHg}/ 3700 rpm	Inspect and adjust

Special tools

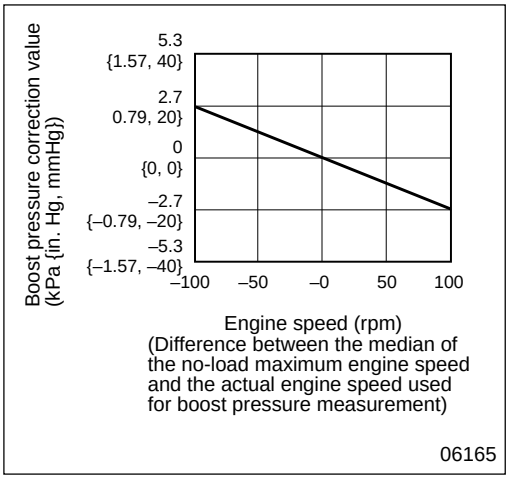
Location	Tool name and shape	Part No.	Application
—	Boost pressure gauge  01524	MH061366	Measurement of turbo boost pressure



- Before measuring the turbo boost pressure, clean or replace the air cleaner element.
- Remove boost pressure sensor hose **1** and attach boost pressure gauge.
- After warming up the engine, measure the boost pressure at the no-load maximum engine speed. Also measure the engine speed and the air temperature.



- Correct the boost pressure at standard conditions. (Since the boost pressure varies depending on the air temperature and engine speed.)
  [Correction for air temperature]
  Identify boost pressure coefficient depending on the air temperature from the graph.



[Correction for engine speed]
Subtract the engine speed actually used for measuring the boost pressure from the median of the no-load maximum engine speed. Identify the boost pressure correction value (**Pa**) according to the graph.
Median value : 3700 rpm

[Calculation of corrected boost pressure]
Given the measured boost pressure to be **P**, corrected boost pressure **Pb** can be calculated from the following equation:

Pb = ktP + Pa

- **Pb** : Corrected boost pressure
- **P** : Measured boost pressure
- **kt** : Boost pressure correcting coefficient depending on air temperature
- **Pa** : Boost pressure correction value

If **Pb** is lower than the limit, the turbocharger must be inspected and adjusted.

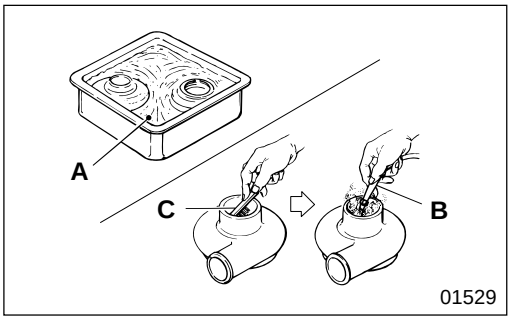
5 Removal of turbine housing

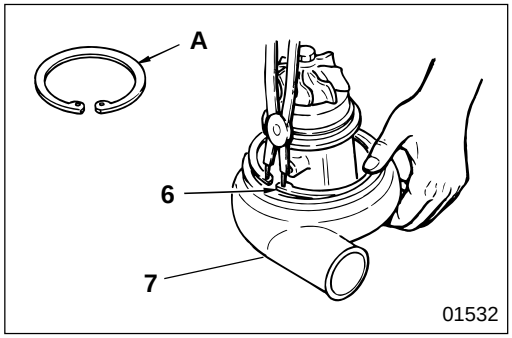
CAUTION ⚠

- **When removing turbine housing 5, tap all around the circumference lightly using rubber-headed hammer A so as not to damage the turbine housing.**
- **Do not hit the turbine wheel near turbine housing 5, since the blade of the turbine wheel can be easily bent.**



5 7 Cleaning of turbine housing and compressor cover

- Visually inspect related parts before cleaning to check if there are any burns or scratches as these would not be seen after cleaning. If any fault is found, replace the faulty parts.
- Remove any foreign particles before cleaning by scraping them off using plastic scraper or bristle-headed brush **C**. Immerse the disassembled parts in nonflammable solvent **A** (DAIDO KAGAKU KOGYO DAICLEANER T-30), then take them out and blow compressed air **B** on them.



6 **Installation of snap ring**

Install snap ring **6** into compressor cover **7** with taper surface **A** upward.

WARNING

STRUCTURE AND OPERATION

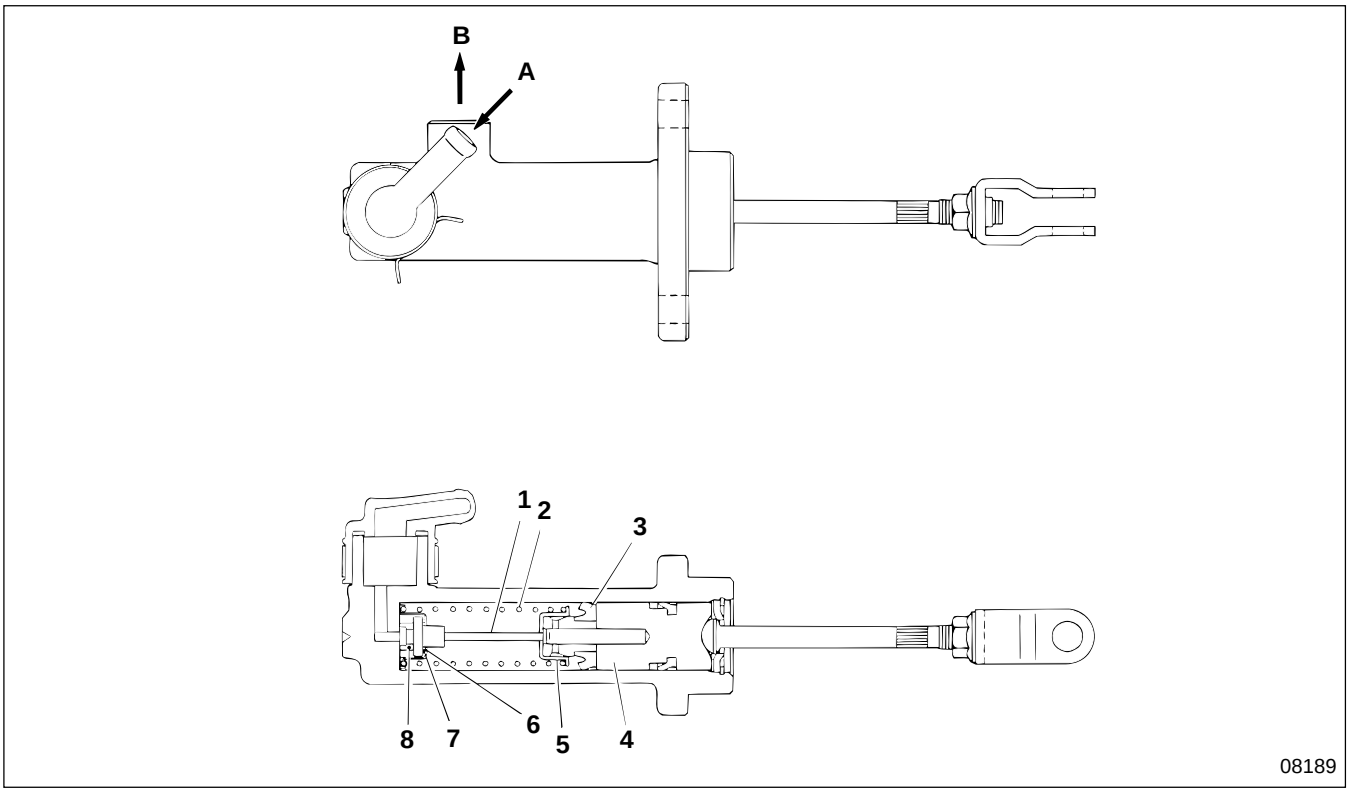
6 Clutch cover assembly
7 Push rod
8 Clutch power cylinder

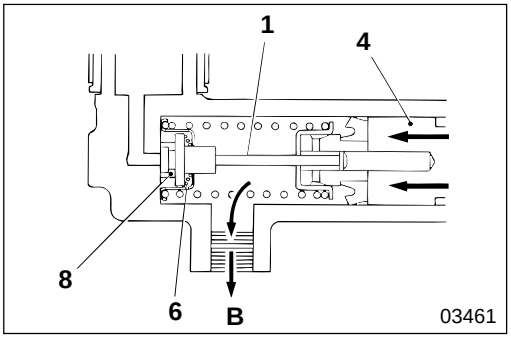
A : Hydraulic pressure

Clutch Master Cylinder



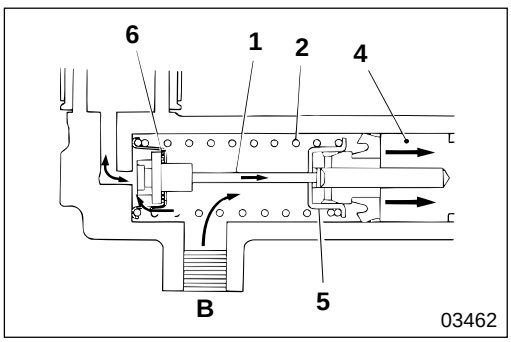
1 Valve stem
2 Return spring
3 Pressure cup
4 Piston
5 Spring seat
6 Valve spring
7 Valve case
8 Valve seal

A : From fluid tank
B : To clutch power cylinder (hydraulic pressure)



When clutch pedal is depressed

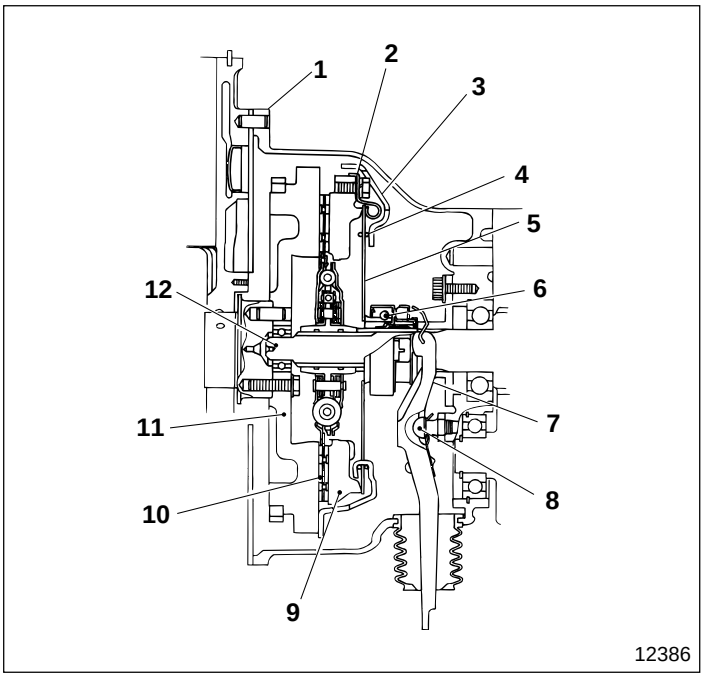
- As piston **4** is pressed in the direction as illustrated, valve spring **6** of valve stem **1** forces down valve seal **8** to close the fluid tank port.
- Then, the hydraulic pressure in the master cylinder increases to transmit hydraulic pressure **B** to the power cylinder.



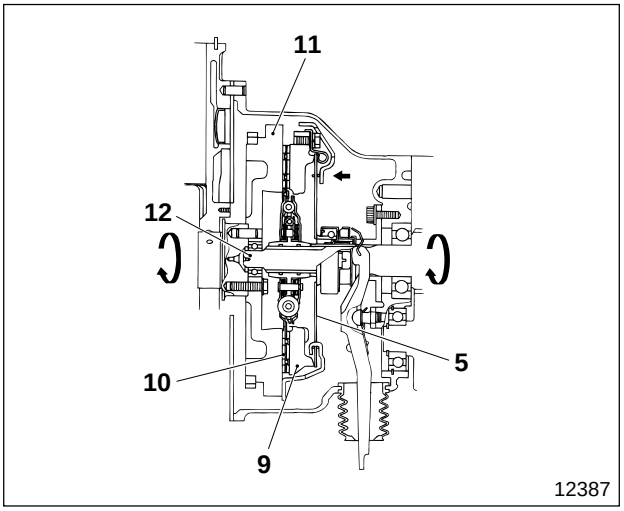
When clutch pedal is released

- As the clutch pedal is released, hydraulic pressure **B** from the power cylinder and return spring **2** push back piston **4**.
- At the same time, valve stem **1** is retracted by spring seat **5** and compresses valve spring **6** to open the fluid tank port.
- Thus released, hydraulic pressure **B** in the master cylinder returns piston **4** to its original position.

Clutch Body

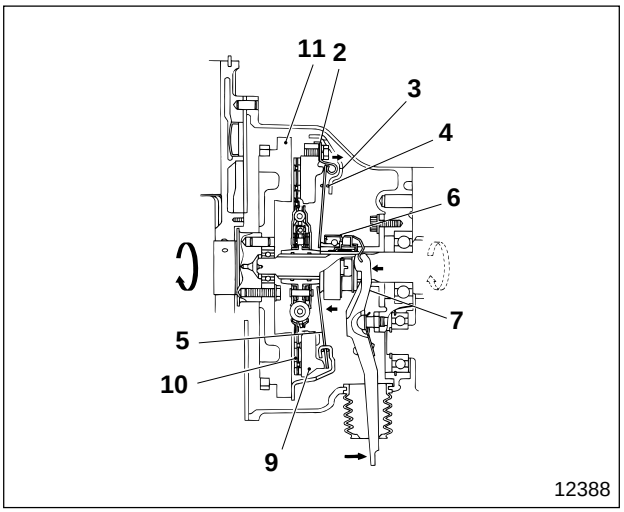


1 Clutch housing
2 Strap plate
3 Clutch cover
4 Pivot ring
5 Diaphragm spring
6 Clutch release bearing
7 Clutch release rocker arm
8 Rocker arm pivot
9 Pressure plate
10 Clutch disc
11 Flywheel
12 Drive pinion



When clutch pedal is released

- Pressure plate **9**, activated by diaphragm spring **5**, forces clutch disc **10** against flywheel **11**.
- Clutch disc **10** forced against flywheel **11** runs together with the flywheel and transmits power from the engine to transmission drive pinion **12**.



When clutch pedal is depressed

- Hydraulic pressure generated within the clutch master cylinder activates the power cylinder. This pushes out clutch release bearing **6** via clutch release rocker arm **7** to compress diaphragm spring **5**. The diaphragm spring supported by pivot ring **4** retracts pressure plate **9**, which is connected to clutch cover **3** via the strap plate **2**. The resulting clearance between clutch disc **10** and flywheel **11** cuts off the transmission of engine power.

Clutch Fluid (Brake Fluid) Replacement and Air Bleeding

Tightening torque

Unit : N·m {ft.lbs, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
1	Bleeder screw	10.8 to 14.7 {8 to 11, 1.1 to 1.5}	—

Fluid

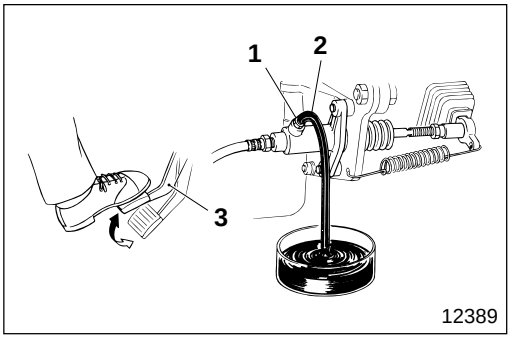
Location	Points of application	Kinds	Quantity
3	Fluid tank	Brake fluid (SAE J1703f or FMVSS No.116 DOT3)	As required

WARNING

- **The clutch fluid system and the brake fluid system use the fluid tank in common. Therefore, replacement the clutch fluid must be carried out simultaneously with that of the brake fluid. Gr 35A**
- **You must use new brake fluid (SAE J1703f or FMVSS No. 116 DOT3). Do not add different quality fluid or mineral oil (gas oil, engine oil, gear oil, automatic transmission fluid, etc.) to the clutch system, because this will cause the rubber parts of the clutch system and brake system to swell, resulting in faulty clutch operation, as well as ineffective braking and brake dragging.**
- **Do not allow foreign particles or water to become mixed into the brake fluid when refilling, because this will result in faulty clutch and brake operations.**
- **If you use a mug for adding brake fluid, keep it solely for that purpose to prevent contamination from different quality fluids or mineral oils.**

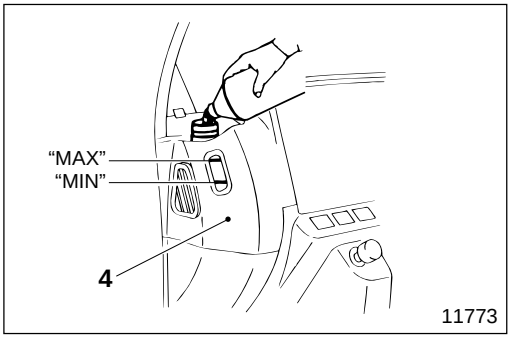
CAUTION

- **Be careful not to splash brake fluid on related parts as this could damage the paintwork.**
- **Be sure to wipe off brake fluid immediately if you splash it on the paintwork.**

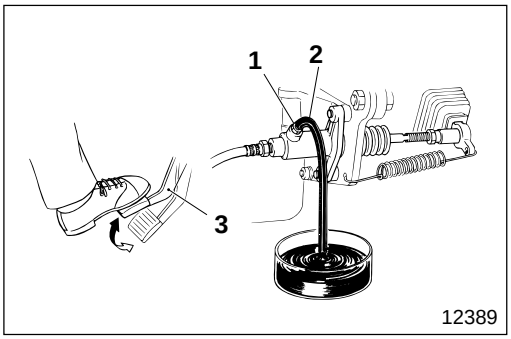


(1) Replacement of brake fluid

- Attach vinyl pipe **2** to bleeder screw **1** of the clutch power cylinder.
- Loosen bleeder screw **1** and depress clutch pedal **3** several times to drain brake fluid completely.



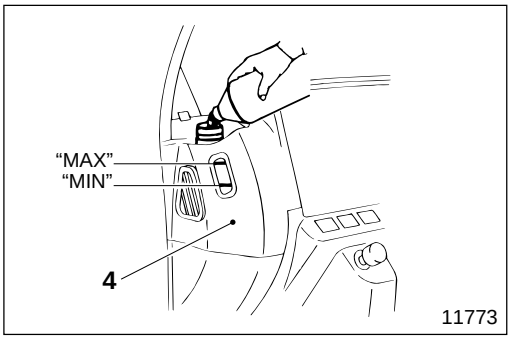
- Supply new brake fluid to the "MAX" level of fluid tank **4**. Depress clutch pedal **3** repeatedly until the old brake fluid discharged from vinyl pipe **2** is replaced by the new brake fluid.



(2) Air bleeding of clutch system

NOTE

Carry out this operation maintaining the brake fluid level in fluid tank 4 between "MAX" and "MIN".



- Attach vinyl pipe **2** to bleeder screw **1** of the clutch power cylinder as in the replacement procedure.
- Fill fluid tank **4** with brake fluid, and loosen bleeder screw **1** of the clutch power cylinder, then depress clutch pedal **3** continuously.
- Keep depressing clutch pedal **3**, and tighten bleeder screw **1** when air is bled completely.
- Depress clutch pedal **3** several times again, then keep it depressed at its fullest extent.
- With the clutch pedal depressed, loosen bleeder screw **1** to drain brake fluid containing air. Release the pedal after tightening the bleeder screw.
- Repeat this operation until air is no longer present in the fluid being drained.
- When this operation is completed, tighten bleeder screw **1** at specified torque.
- Check that brake fluid is at the "MAX" level of fluid tank **4**, and supply new brake fluid if necessary.
- Check for brake fluid leakage from each of the parts with clutch pedal **3** depressed.

INSPECTION AND ADJUSTMENT MOUNTED IN VEHICLE

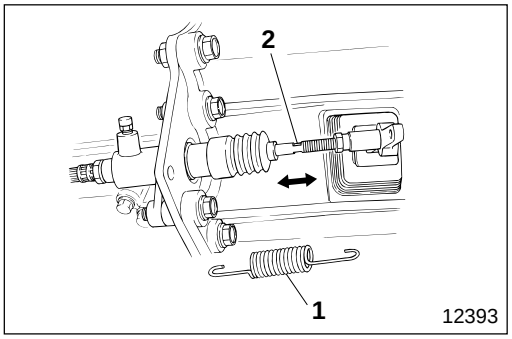
Clutch Pedal Free Play

Service standards

Unit : mm {in.}

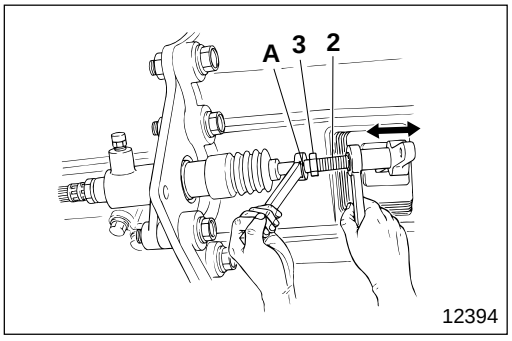
Location	Maintenance item	Standard value	Limit	Remedy
2	Push rod stroke	4 {0.16}	—	Adjust or replace
6	Clutch pedal free play	36 to 53 {1.42 to 2.09}	—	Adjust or replace

Inspect and adjust the free play of the clutch pedal, by noting the stroke of the clutch power cylinder push rod, after the clutch pedal has been correctly adjusted.



[Inspection]

- Bleed air from the clutch system P21-7
- Adjust the clutch pedal P21-11
- Disconnect return spring **1** and check the free play of push rod **2** by hand. If the measured value deviates from the standard value, adjust as follows:

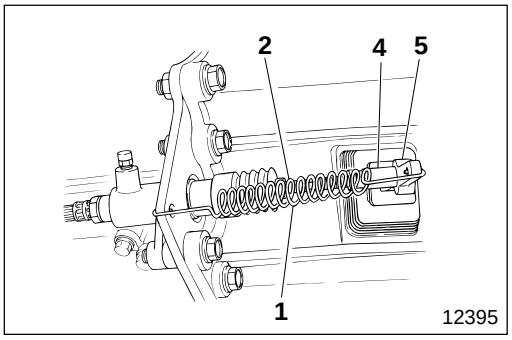


[Adjustment]

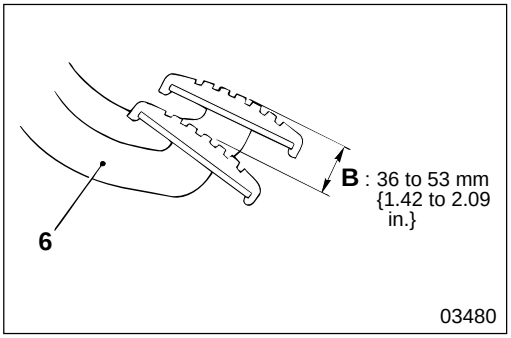
- Loosen nut **3** and turn flat parts **A** of push rod **2** to extend push rod until it stops.
- Then, return flat parts **A** of push rod **2** by the following value and retighten nut **3**.

  Amount of return : Approximately three and one fifth of a turn

- If push rod **2** cannot be returned by the above amount, the clutch disc is worn beyond the limit and needs replacing.



- Install return spring **1**, and check that there is no space between push rod cap **4** and clutch release rocker arm **5** by moving push rod **2**.



[Confirmation]
Push clutch pedal **6** with your hand until you feel a resistance and measure free play **B**.
If the measured value deviates from the standard value, readjust or replace the clutch disc.

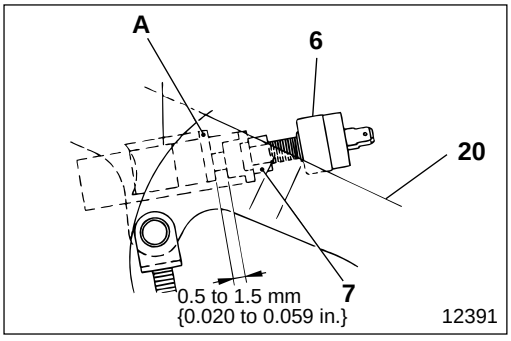
- Remove fluid hose **2** from clutch master cylinder **5** after removing pipe **B** from the cab, then fit stopper **C** to pipe **B**.
- After installation, bleed the system. 🕮 P21-7



6 **Installation of clutch switch**

After adjusting clutch pedal **20**, adjust the clearance between the thread end of clutch switch **6** and pedal stopper **A** so that it is within the standard value, and tighten lock nut **7**.

CAUTION⚠

Do not allow the thread end of clutch switch 6 to come into contact with pedal stopper A of clutch pedal 20 because this will cause the clutch to slip.

WARNING⚠

- **Since the parking brake will be removed, naturally it cannot be used. Therefore, you must chock the wheels securely so the vehicle does not move.**
- **Do not remove the chocks until the entire operation is completed.**
- **Supporting a vehicle on a garage jack only is extremely dangerous, so always support the frame on rigid jack stands.**
- **Leave the garage jack and rigid jack stands in place until the entire operation is completed. Never remove them during the operation.**

CAUTION⚠

Keep the transmission in neutral throughout the operation.

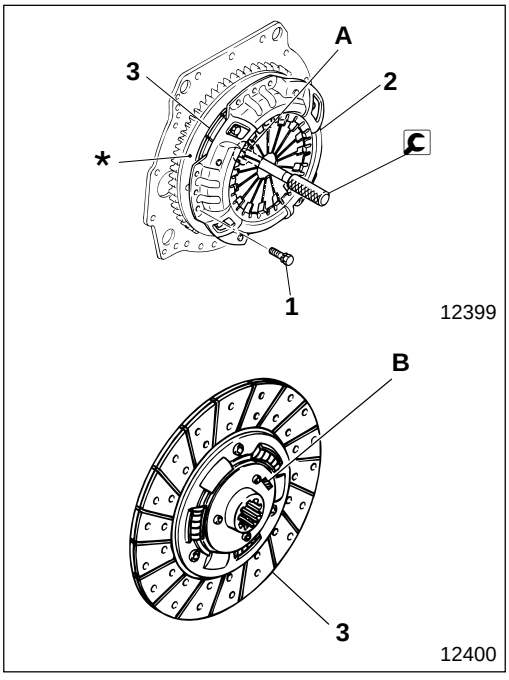
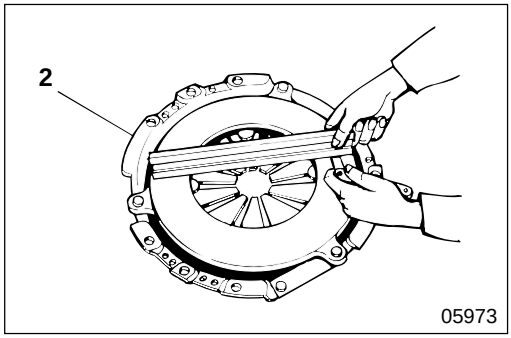
◆ Service procedure



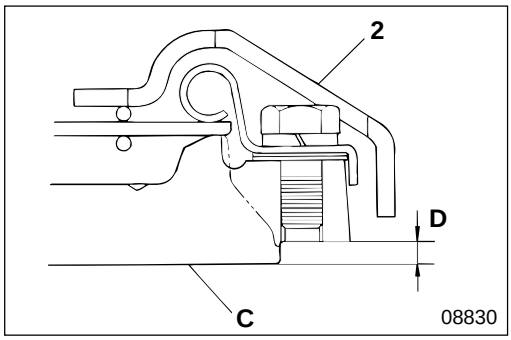
2 Clutch cover assembly

[Removal]

- Insert clutch alignment arbor into pilot bearing **A** on flywheel * to hold clutch disc **3**, and remove clutch cover assembly **2**.
- For installation, follow the removal sequence in reverse.
- Install clutch disc **3** so that part No. B is visible.
- Tighten bolts **1** gradually, in diagonal order, to specified torque.

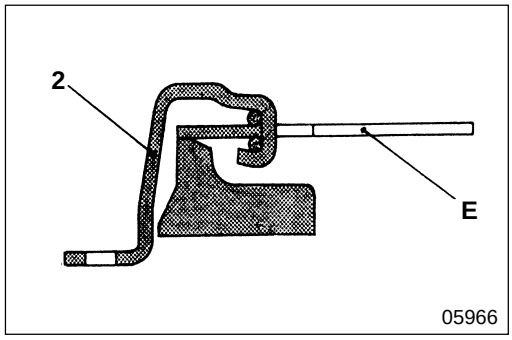


[Flatness of pressure plate]
If the measured value is higher than the limit, replace clutch cover assembly **2**.

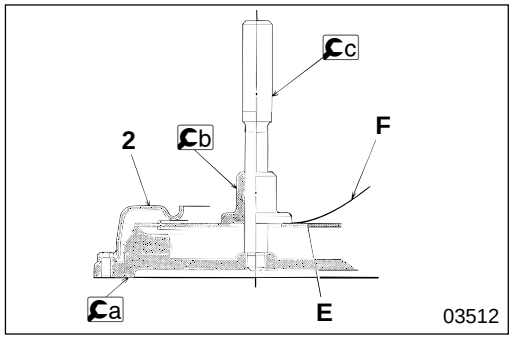


[Friction surface of pressure plate]
Measure pressure plate friction surface **C** at specified position **D** (measuring position of friction surface must be within the maximum and minimum diameters), and if the measured value is lower than the limit, replace clutch cover assembly **2**.

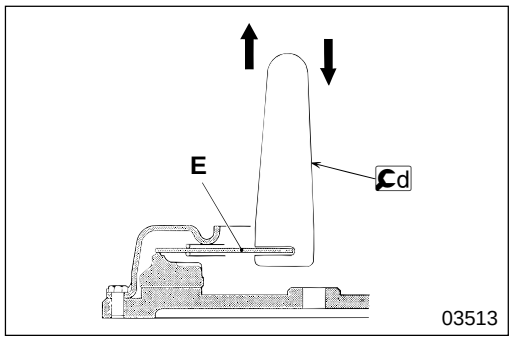
Maximum diameter	298 mm {11.7 in.}
Minimum diameter	192 mm {7.56 in.}



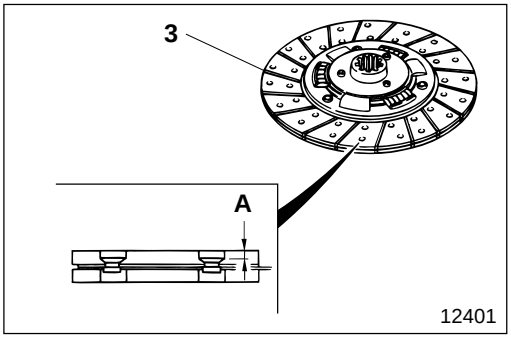
[Inspection]
- Check for play in diaphragm spring **E**.
- If there is play, replace clutch cover assembly **2**.



[Inspection of installation height]
- Place a plate on a surface plate and install clutch cover assembly **2**.
- Install b sleeve and c clutch alignment arbor, measure finger heights of diaphragm spring **E** to see if they are uneven, using feeler gauge **F**. If the measured value is higher than the limit, correct the heights.



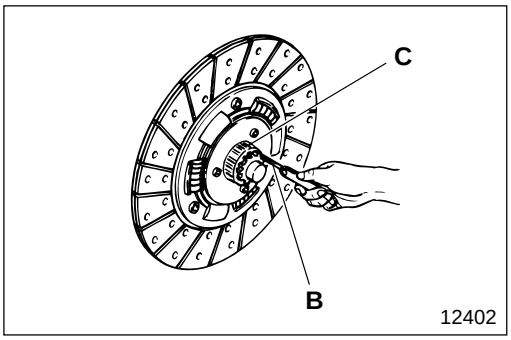
[Correction]
- Correct uneven finger heights of diaphragm spring **E** using d adjusting wrench.



3 Clutch disc

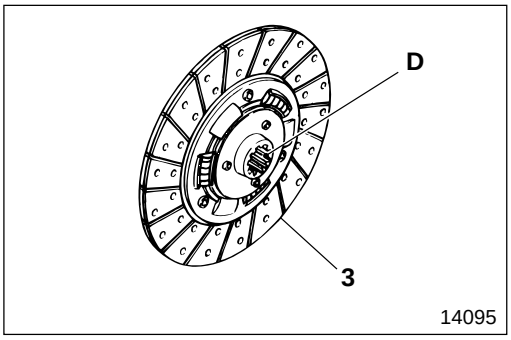
(1) Height of facing

Measure dimension **A** of clutch disc **3**. If the measured value is lower than the limit, replace the clutch disc.



(2) Play in direction of revolution

- Reshape feeler gauge **B** for insertion into drive pinion spline **C**, and measure play. If the measured value is higher than the limit, replace clutch disc **3** or the drive pinion.
- Carry out the same measurement on new clutch disc **3**. If the measured value is higher than the limit, replace the drive pinion.



(3) Applying grease

Apply grease evenly to spline **D** entire tooth surface of clutch disc **3**. Apply grease to the grease groove of the spline up to its large diameter.

CAUTION ⚠

Be careful not to apply too much grease because excessive grease causes grease leakage from spline D and can cause the clutch to slip.

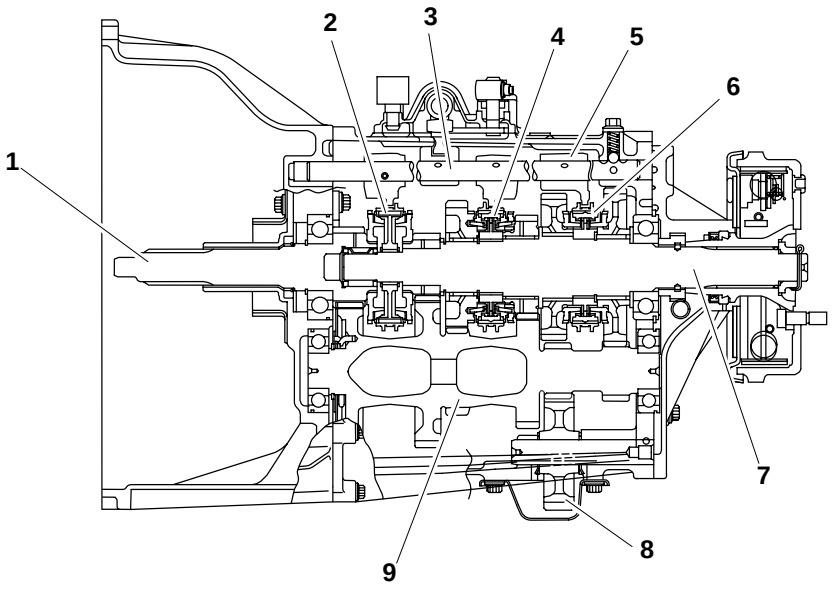
Transmission Assembly

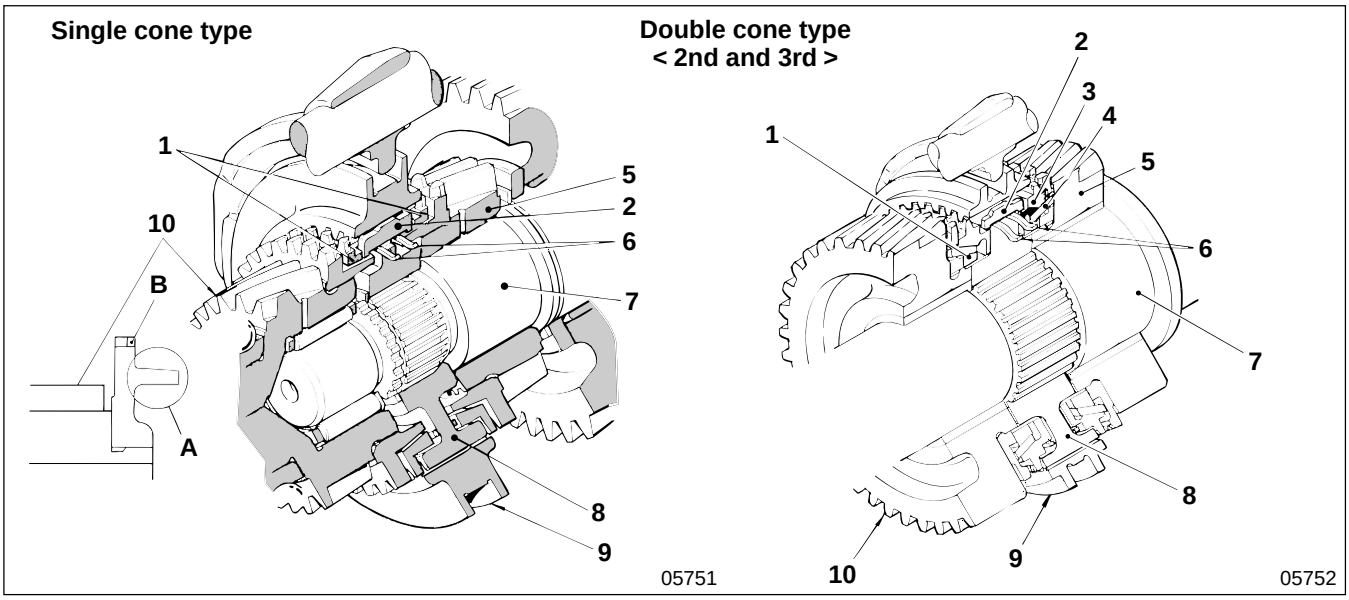


Ⓟ45171

1 Drive pinion
2 4th and 5th synchronizer assembly
3 Shift rail
4 2nd and 3rd synchronizer assembly
5 Shift fork
6 1st and reverse constant-mesh assembly
7 Main shaft
8 Reverse idler gear
9 Countershaft

The transmission changes revolution and torque generated by the engine into those that match the vehicle's power requirement (driving force). Revolution and torque are increased or decreased by making a selection from several sets of engaged gears. The transmission uses an interlock mechanism to avoid double engagement and the non-backlash mechanism reduces the idling noise of the transmission when the engine is idling.

Synchromesh Mechanism



1 Synchronizer ring (Single cone type)
Inner synchronizer ring (Double cone type)
2 Shifting key
3 Outer synchronizer ring (Double cone type)
4 Center cone (Double cone type)
5 Overdrive gear (Single cone type)
3rd gear (Double cone type)
6 Shifting key spring
7 Mainshaft
8 Synchronizer hub
9 Synchronizer sleeve
10 Drive pinion (Single cone type)
2nd gear (Double cone type)

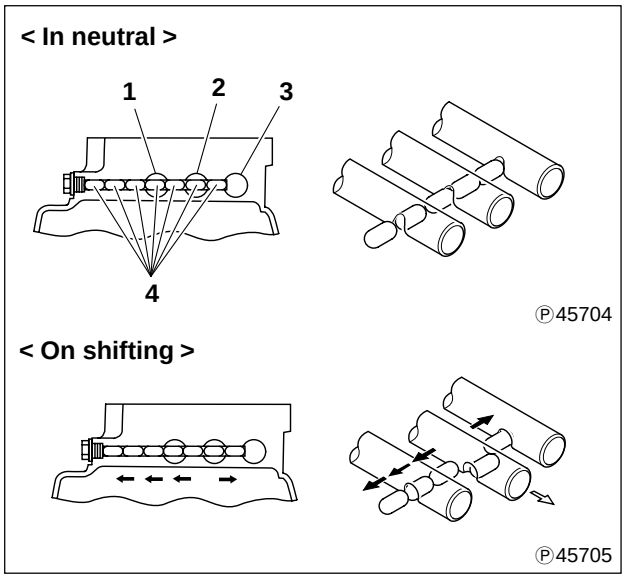
A : Taper cone
B : Dog clutch

The synchromesh mechanism synchronizes the rotating speed of mainshaft **7** and associated synchronizer hub **8** with the rotating speed of the gears to be selected when shifting gear.

Single cone type
In this cone type, gear taper cone **A** acts as a cone clutch for synchronization with synchronizer ring **1**. So the rotating speed of the gear to be synchronized with synchronizer hub **8** gradually changes to the matching speed. When synchronizer sleeve **9** moves into the appropriate position efficiently through this process and engages with the synchronizer hub and dog clutch **B** of the gear to be selected, gear shift is completed.

Double cone type < only for 2nd and 3rd gear >
In this cone type, unlike the single cone type, inner synchronizer ring **1**, center cone **4** and outer synchronizer ring **3** are used instead of just the synchronizer ring. The center cone is between the inner synchronizer ring and the outer synchronizer ring and reduces synchronizing time through more efficient operation of the cone clutch.

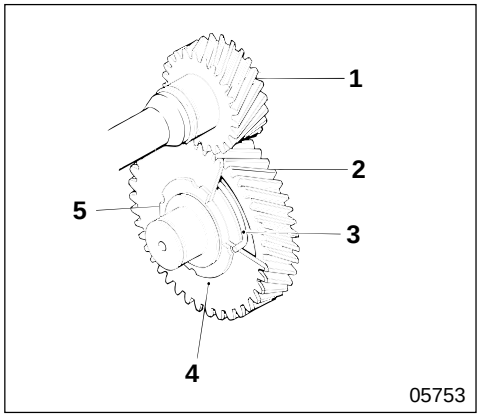
Interlock Mechanism



1 4th and 5th shift rail
2 2nd and 3rd shift rail
3 1st and reverse shift rail
4 Interlock pin

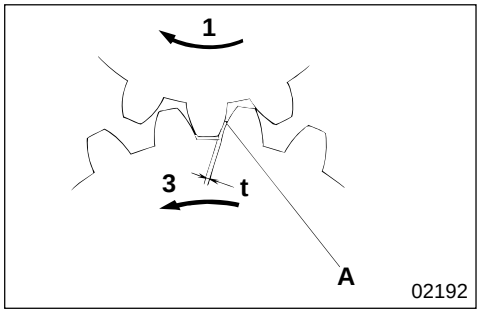
The interlock mechanism is designed to avoid double engagement of gears. When 2nd and 3rd shift rail **2** is shifted, interlock pins other than interlock pin **4** in the 2nd and 3rd shift rail are pushed by the 2nd and 3rd shift rail to lock other shift rails.

* Non-Backlash Mechanism

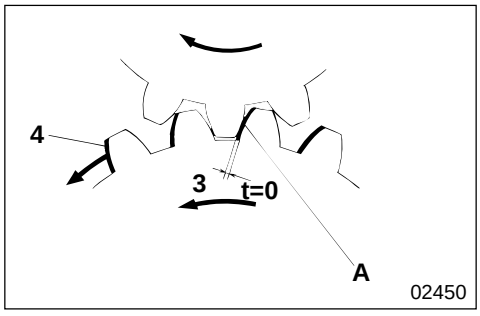


1 Drive pinion
2 Countershaft constant mesh gear
*** 3** Sub-gear spring
*** 4** Sub-gear
*** 5** Sub-gear plate

Sub-gear spring **3** is between sub-gear **4** and countershaft constant mesh gear **2**. The sub-gear is engaged with drive pinion **1** together with countershaft constant mesh gear, being turned in the contracting direction of the sub-gear spring.



The revolution of drive pinion **1** varies in accordance to the engine revolution when idling.
Without a non-backlash mechanism, backlash **t** at point **A** would vary between zero to the maximum, causing a gear grinding noise.



With a non-backlash mechanism, sub-gear **4** maintains backlash **t** at zero at point **A** regardless of change in revolution caused by the engine, eliminating gear grinding noise, resulting in a reduction of idling noise.

*** NOTE: Not used on products for U.S.A.**

● **Work sequence before removal**

1 Place wheel chocks.
2 Disconnect negative battery cable. Gr 54
3 Jack up the front axle on a garage jack.
4 Support the front frame on rigid stands.

WARNING⚠

- **Since the parking brake will be removed, naturally it cannot be used. Therefore, you must chock the wheels securely so the vehicle does not move.**
- **Do not remove the chocks until the entire operation is completed.**
- **Supporting a vehicle on a garage jack only is extremely dangerous, so always support the frame on rigid stands.**
- **Leave the garage jack and rigid stands in place until the entire operation is completed. Never remove them during the operation.**

CAUTION⚠

Keep the transmission in neutral throughout the operation.

● **Work sequence after installation**

Follow the work sequence before removal in reverse.

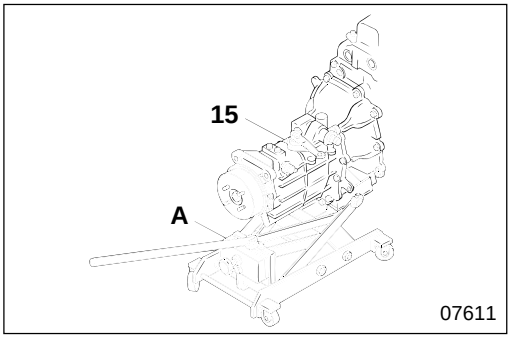
◆ Service procedure

● **Replacement of oil**

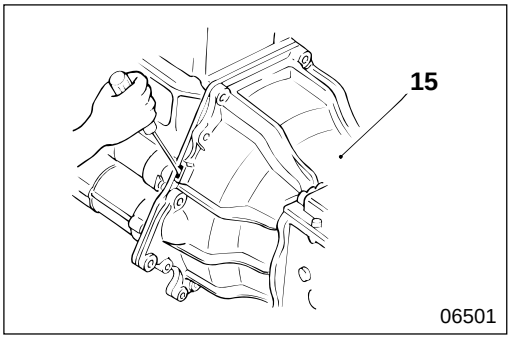
[Draining]
- When draining oil, check the quantity and quality of oil, especially for small pieces of metal and metal dust.
- Clean drain plug **10** before reinstalling it because it is magnetic.

[Filling]
- Check that drain plug **10** is tightened in the transmission case at specified torque.
- Pour in gear oil until the oil overflows from the inspection hole. (For oil quantity, see specifications.)



15 **Transmission assembly**

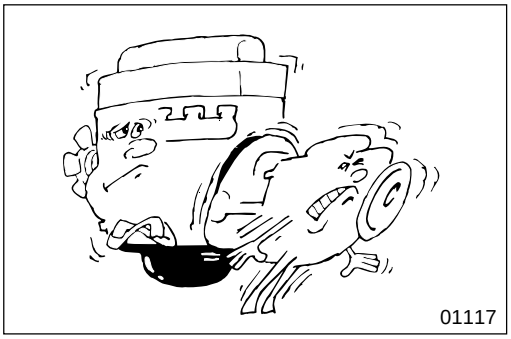
[Supporting transmission]
Support transmission assembly **15** on transmission jack **A**.



[Removal]
- Insert a screwdriver into the three removal grooves to remove transmission assembly **15** from the engine.

CAUTION

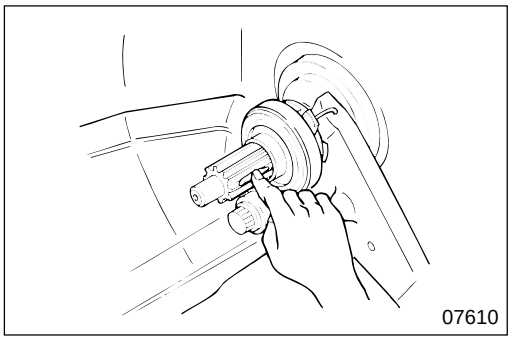
Make sure that you remove hoses and cables correctly during service operations.



- Move transmission assembly **15** backward until the spline of the drive pinion is detached from the clutch.

CAUTION

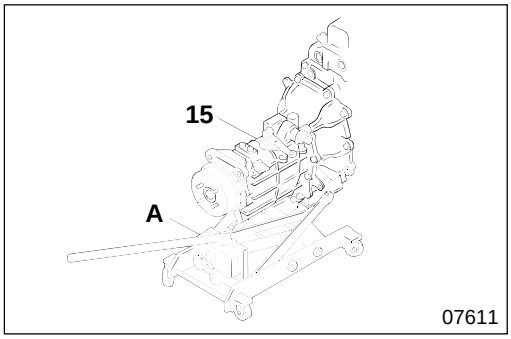
Make sure that you pull transmission assembly 15 out in a straight line. If you seesaw the transmission assembly violently, you will damage the spline that connects the drive pinion and the clutch.



[Installation]
- Check the spline of the drive pinion for rust. If rust is found, remove it using a wire brush.
- Rub grease onto the friction surfaces of the drive pinion using your hand.

CAUTION

Make sure that you apply only the necessary amount of grease because too much grease could drip and cause clutch slippage.



- Support transmission assembly **15** on transmission jack **A**, and insert the transmission assembly into the pilot bearing of the flywheel paying attention to the drive pinion spline.
- Tighten bolt **14** at specified torque to mount transmission assembly **15** to the engine.

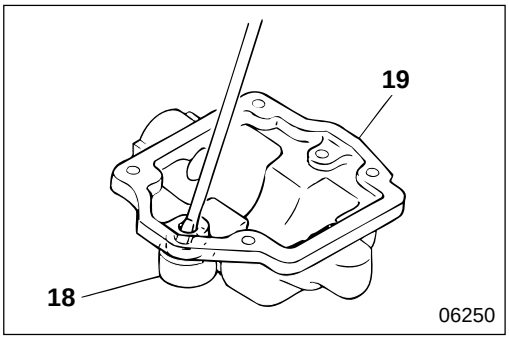
Apply grease to lip area **A** of oil seal **17** with bushing **18** press-fitted onto selector lever case **19**, and press-fit evenly in the direction as illustrated.

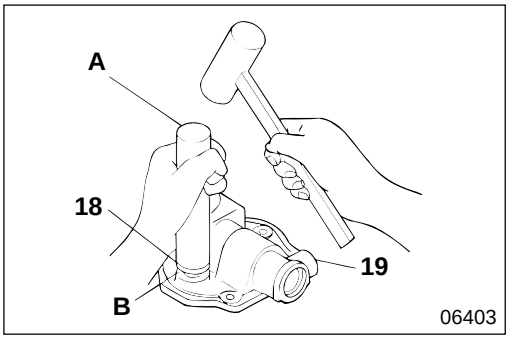


18 **Bushing**

[Removal]
Bushing **18** is press-fitted onto selector lever case **19**. For replacement, remove using a screwdriver.

CAUTION

Be careful not to damage selector lever case 19.



[Press-fitting]
Clean the inner surface of selector lever case **19**, and drive bushing **18** evenly into the case using bar **A** (approximately ø30 mm {1.18 in.}) taking care not to damage the case.
After press-fitting, apply sealant to bushing outer side **B**.

CAUTION

Make sure that you prevent sealant from sticking to the inner surface of bushing 18.

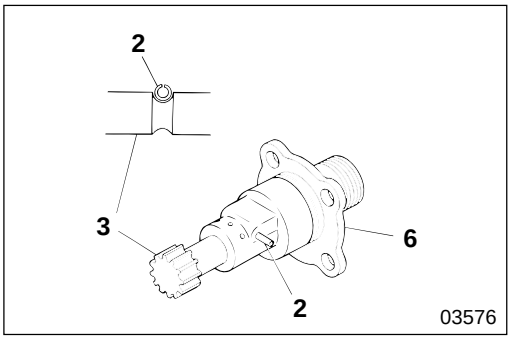
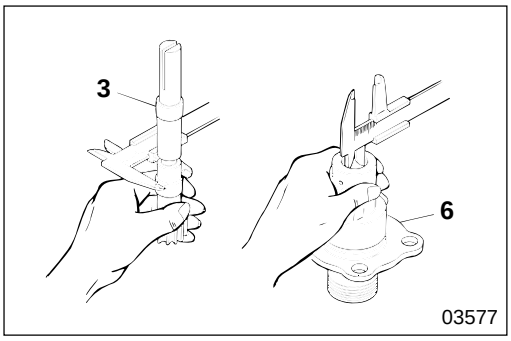
◆ Service procedure



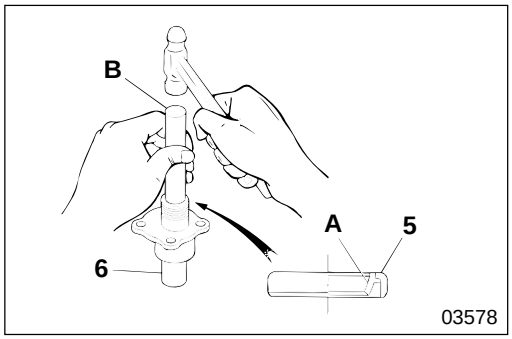
2 **Driving-in spring pin**

Drive spring pin **2** into speedometer gear bushing **6** with the opening in the opposite direction to speedometer gear **3**, as illustrated.



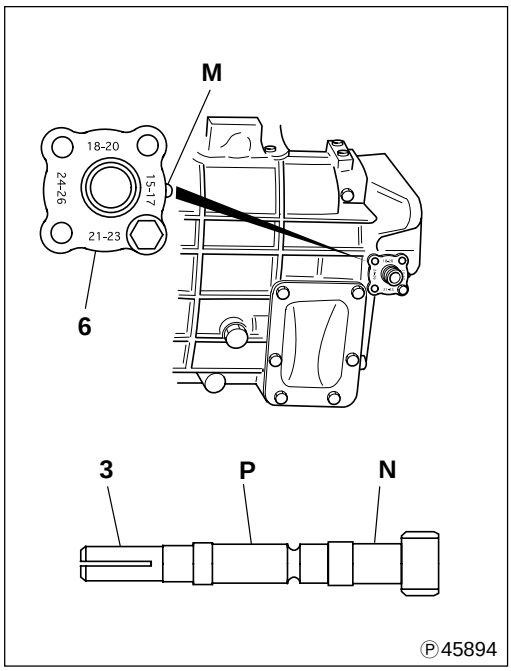
3 **6** **Clearance between speedometer gear and speedometer gear bushing**

If the clearance is higher than the limit, replace faulty parts.



5 **Installation of oil seal**

Apply grease to lip area **A** of oil seal **5**, and drive oil seal evenly into speedometer gear bushing **6** in the direction as illustrated using bar **B** (approximately ø14 mm {0.55 in.}).



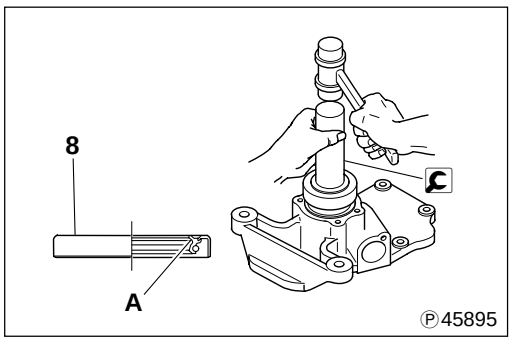
6 **Installation of speedometer gear bushing**

Due to its eccentric center arrangement, speedometer gear bushing **6** allows replacement of speedometer gear **3** with gears having a different number of teeth by changing only the installation direction, the worm gear does not have to be changed.

When installing the bushing, align stamped number, identical to the number of speedometer gear teeth, with alignment mark **M**.

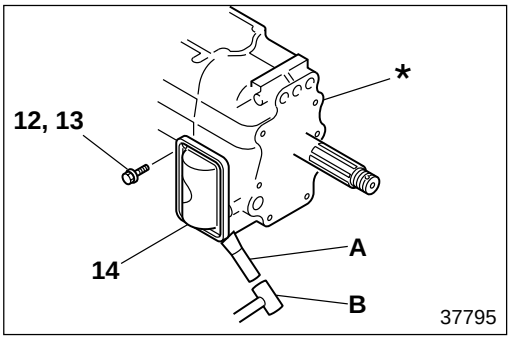
The identification mark is stamped on points **N** or **P**. The following table shows the relationship between the identification marks and the number of speedometer gear teeth:

Identification mark	A	B	C	D	E	F	G	H	I	J	K	L
Number of teeth	15	16	17	18	19	20	21	22	23	24	25	26
Gear ratio	3.0	3.2	3.4	3.6	3.8	4.0	4.2	4.4	4.6	4.8	5.0	5.2



8 **Installation of oil seal**

Apply grease to lip area **A** of oil seal **8**, and press-fit it.



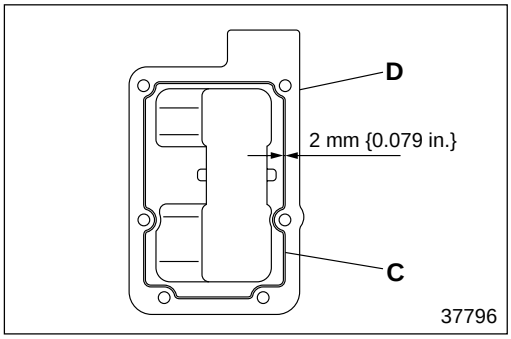
13 **Reverse idler gear cover**

[Removal]

- After removing bolt **12**, **13** insert scraper **A** between transmission body * from the lower right or left of reverse idler gear cover **14**. Use a plastic hammer **B**, if necessary.

- With the scraper **A** inserted, push forward the scraper clockwise and counterclockwise to the upper part of reverse idler gear cover **14** along the flange of the cover, then removing the cover.

- Be sure to get rid of all the sealant adhered to reverse idler gear cover **14** and the flange surface of the transmission body *, by using the scraper **A**.



[Installation]

- Apply the sealant **C** on the installation surface **D** of reverse idler gear cover **14** (either transmission body or cover) smoothly and continuously by using a special nozzle (nozzle diameter ø2 mm {0.079}).

- After applying the sealant **C**, assemble reverse idler gear cover **14** within five minutes, and tighten it with the specified torque using bolts.

CAUTION⚠

- **Clean all the parts beforehand when applying sealant C.**
- **When using the sealant C, do not apply it uniformly and flatly to whole surface since it will become hard to remove due to its strong bonding power.**
- **Wait at least thirty (30) minutes after assembling for sealant to dry prior to adding oil.**

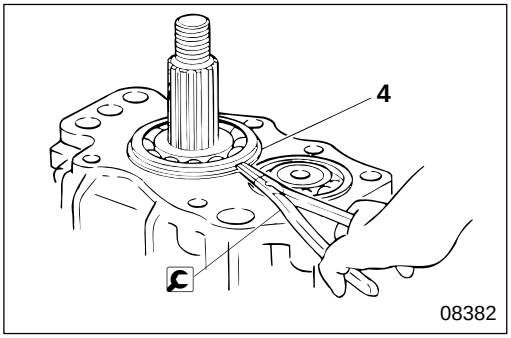
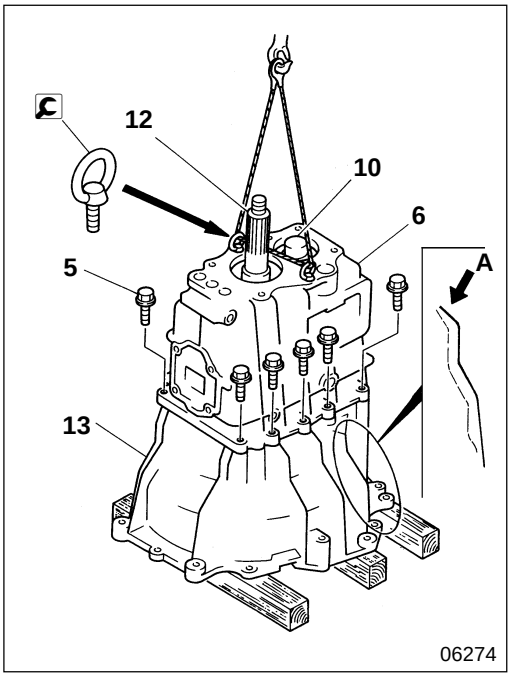
3 **Installation of front bearing retainer**

Install oil seal guide onto drive pinion **11** to protect oil seal **2** installed on front bearing retainer **3**. Then install the front bearing retainer.



4 Removal and installation of snap ring

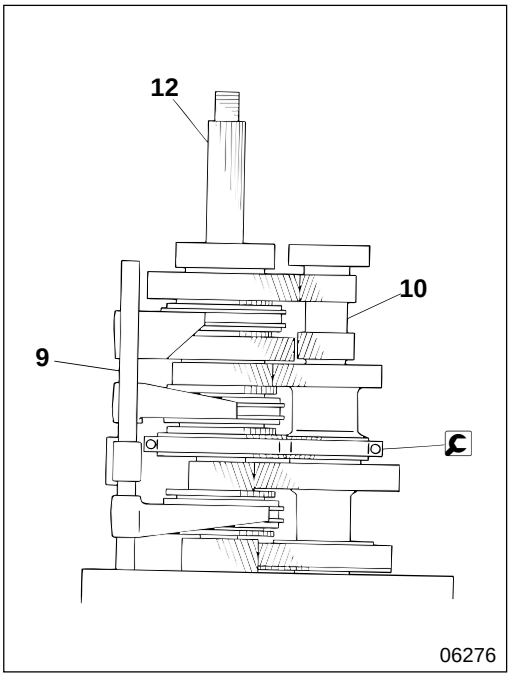


6 Removal of transmission case

- Remove the main shaft and countershaft rear bearings. P22-36
- Install eye bolts to transmission case **6**, and attach wires to prepare for lifting by a crane.
- Remove bolts **5**. Then lift transmission case **6** with a crane, while using a wooden or plastic hammer to tap rear rib section **A** on clutch housing **13**, main shaft assembly **12**, and the rear section of counter shaft assembly **10**.

CAUTION

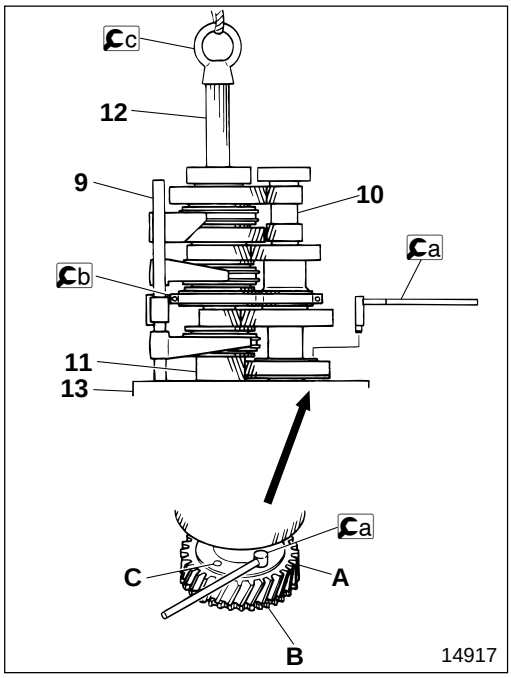
Be sure to tap the clutch housing only at rib section A, as indicated in the diagram. Tapping other parts with a hammer can damage the clutch housing.



- After removing transmission case **6**, fit the 2nd gear using steel lifting band to ensure safety.

CAUTION

Be sure to tighten steel lifting band adequately enough to prevent it from coming undone, but not excessively, because excessive tightening could damage the gears, etc.



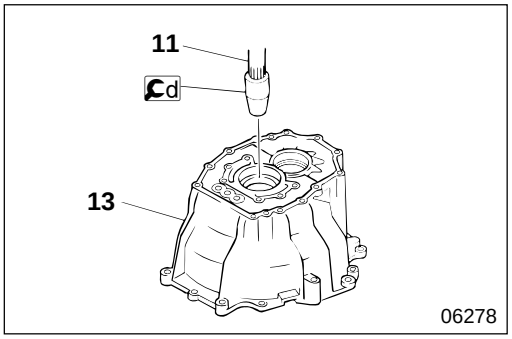
9 to 12 Removal and installation of shift rail and shift fork, countershaft assembly, drive pinion assembly and mainshaft assembly

[Removal]

- When removing or installing shift rail and shift fork **9**, countershaft assembly **10**, drive pinion assembly **11** and mainshaft assembly **12**, handle them as a group.
- After removing the case, install c eye bolt on mainshaft assembly **12** with b steel lifting band fitted so that the whole assembly can be lifted up.
- Fix shift rail and shift fork **9** to mainshaft assembly **12** using rubber bands.
- Remove the bearing retainer bolts **8** and retainer **7**.
- Attach wooden blocks to clutch housing **13**. Then lift the whole assembly (with drive pinion assembly **11**) up with a crane to remove them. During hoisting, hit the assembly using a mallet.

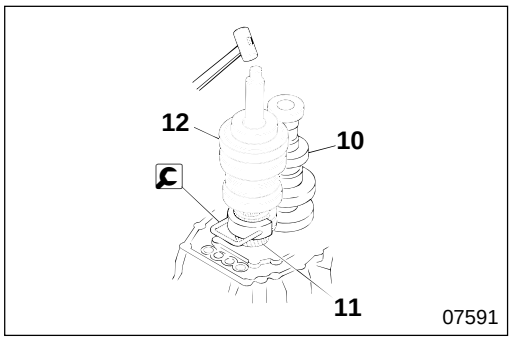
CAUTION

- **Be sure to tighten b steel lifting band adequately enough to prevent it from coming undone, but not excessively, because excessive tightening would damage the gears, etc.**
- **Be sure that you support mainshaft assembly 12, etc. with your hand when lifting them because if the mainshaft assembly and countershaft assembly 10 become detached, drive pinion assembly 11 would fall.**



[Installation]

- Follow the removal sequence in reverse.
- Before installing parts, install d oil seal guide onto drive pinion **11** to prevent damage to oil seal **2** of front bearing retainer **3**.



- To drive-in drive pinion **11**, mainshaft assembly **12** and countershaft assembly **10**, attach synchro guard which prevents the drive pinion and the mainshaft synchronizer sticking during installation.

NOTE

Remember to remove all special tools after use.

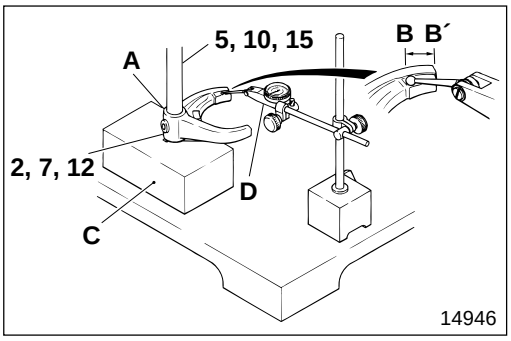
For installation of spring pins **1**, **3**, **6**, **8**, **11**, **13**, position the openings in the direction of the shift rail axes.

CAUTION

- **Be careful when driving in spring pins 1, 3, 6, 8, 11, 13, that you do not subject shift rails 5, 10, 15 to excessive strain, because this would cause faults such as bent shift rails.**
- **Make sure you do not drive in spring pins 1, 3, 6, 8, 11, 13 fully, leave 0 to 0.5 mm {0 to 0.020 in.} outside to prevent them from slipping out.**



2 **7** **12** **Tilt of shift fork claw**

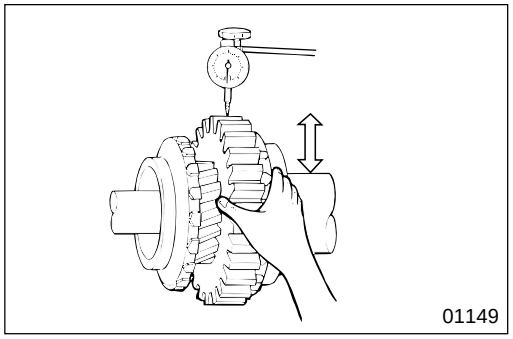
● Work before disassembly

[Inspection]

(1) End play of gears

A : 1st gear
B : Reverse gear
C : 2nd gear
D : 3rd gear
E : 5th gear

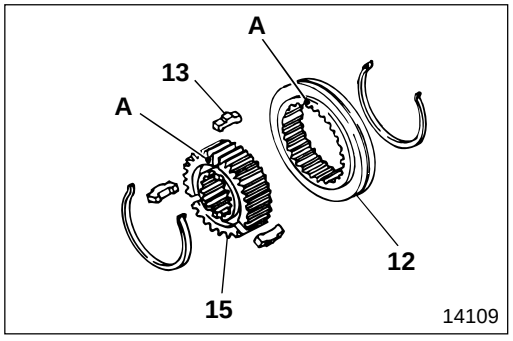
If the measured value is higher than the limit, replace faulty parts.



01149

(2) Play of gears in the diameter direction

If the measured value is higher than the limit, replace faulty parts.

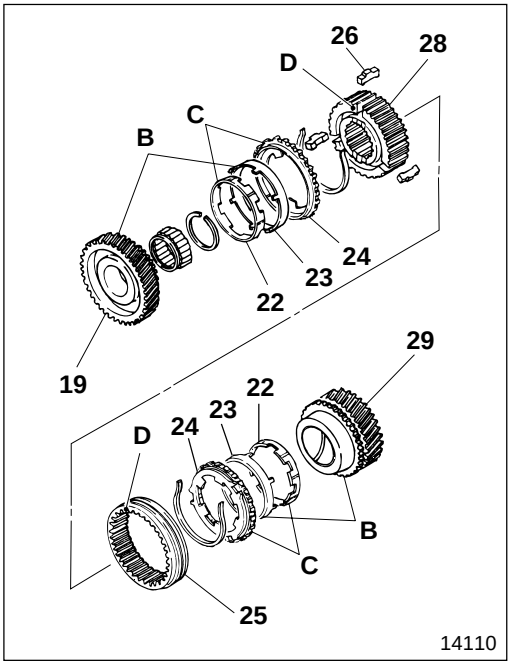


14109

[Alignment marks]

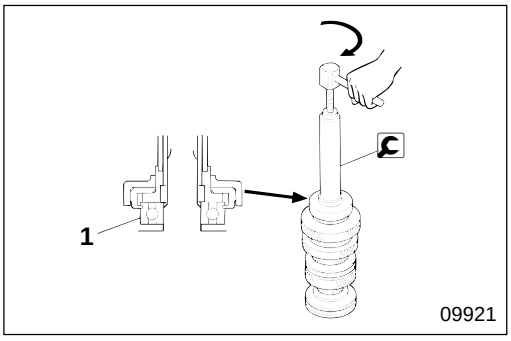
(1) Single cone synchromesh

Before disassembling synchronizer sleeve **12** and synchronizer hub **15**, put alignment marks **A** on the places where shifting keys **13** are installed. When reusing parts, align the alignment marks to reassemble.



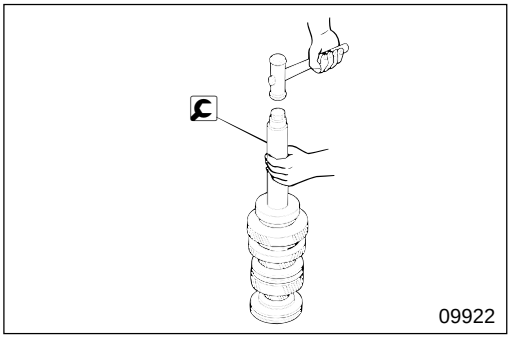
(2) Double cone synchromesh

- Before disassembling synchronizer center cone **23**, 2nd gear assembly **19**, and 3rd gear assembly **29**, put alignment marks **B** on them. Similarly, put alignment marks **C** on synchronizer inner ring **22**, and synchronizer outer ring **24**. When reusing parts, align the alignment marks to reassemble.
- Before disassembling synchronizer sleeve **25** and synchronizer hub **28**, put alignment marks **D** on the places where shifting keys **26** are installed. When reusing parts, align the alignment marks to reassemble.

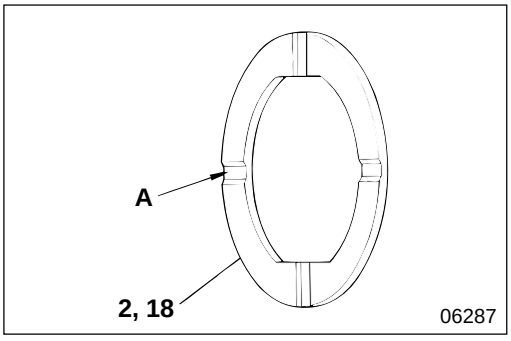


1 Bearing

[Removal]



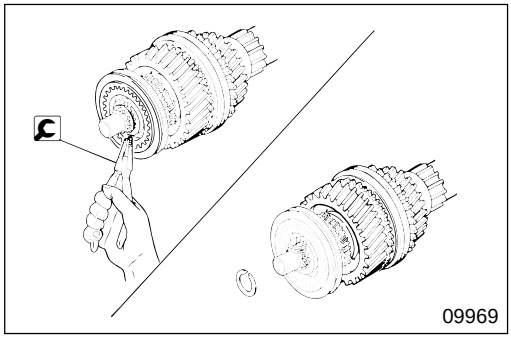
[Installation]
Press-fit bearing **1** with its snap ring groove facing the rear.



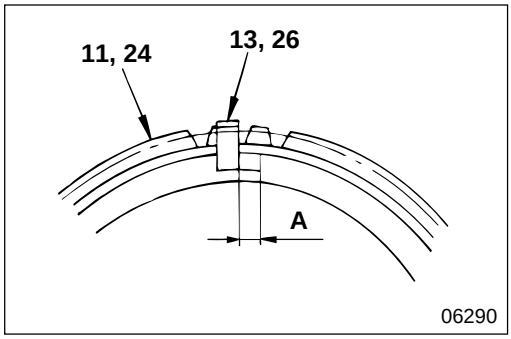
2 18 Installation of thrust washer

Install thrust washer with oil groove **A** facing gear side.

MAINSHAFT ASSEMBLY

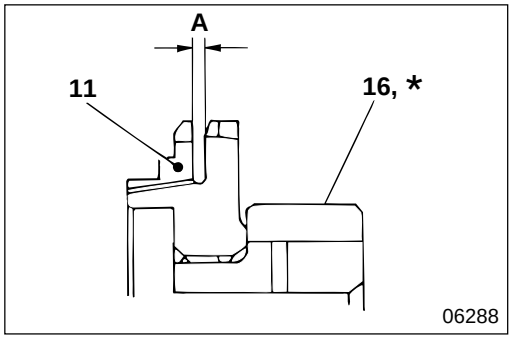


5 10 17 21 Removal and installation of snap ring



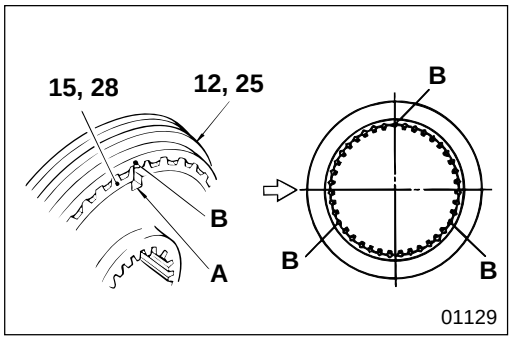
11 13 24 26 Clearance between synchronizer ring or synchronizer outer ring and shifting key

If the measured value for clearance **A** is higher than the limit, replace faulty parts.



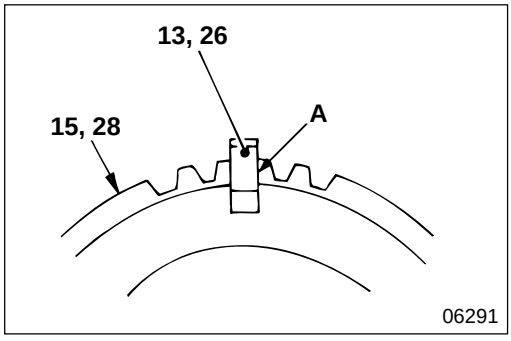
11 16 * Clearance between synchronizer ring and gear assemblies

- Press in synchronizer ring **11** evenly, and measure all circumferences.
- If the measured value for clearance **A** is lower than the limit, replace faulty parts.



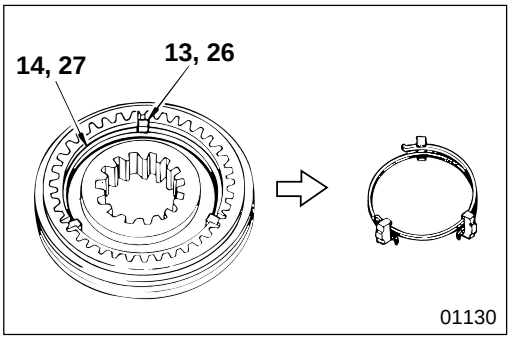
12 25 Installation of synchronizer sleeve

- To install synchronizer sleeves **12**, **25**, align three keyways **A** of synchronizer hubs **15**, **28** with the three stub teeth **B** of synchronizer sleeves.
- Before assembling synchronizer hubs **15**, **28** and synchronizer sleeves **12**, **25**, align the alignment marks (made before disassembly).



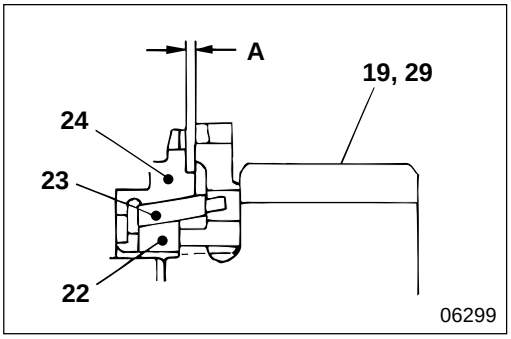
13 15 26 28 Clearance between shifting key and synchronizer hub

If the measured value for clearance **A** is higher than the limit, replace faulty parts.



14 **27** **Installation of shifting key spring**

- Place shifting keys **13**, **26** into keyways of synchronizer hubs **15**, **28**, and install shifting key springs **14**, **27** taking care to locate the openings away from the shifting key positions.
- Two openings of shifting key springs **14**, **27** should not align with each other.



19 **24** **29** **Clearance between 2nd, 3rd gear assembly and synchronizer outer ring**

- Press in synchronizer inner ring **22**, synchronizer center cone **23** and synchronizer outer ring **24** evenly, and measure all circumferences.
- If the measured value for clearance **A** is lower than the limit, replace faulty parts.

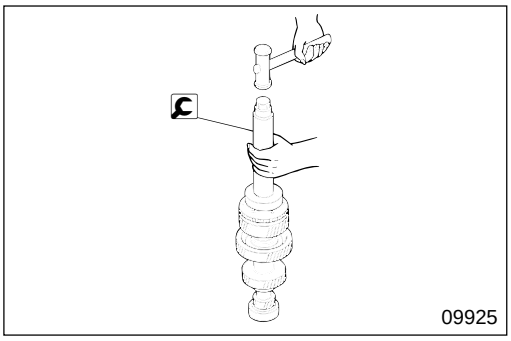
1 **Countershaft front bearing**

[Removal]



[Installation]
Press-fit countershaft front bearing **1** with its snap ring groove facing the gear side.

● **Positioning of sub-gear**

Turn sub-gear **4** to the right using ⚿a jig assembly, and insert ⚿b set pin into alignment hole **A**, in the direction as illustrated to secure the sub-gear, with all parts assembled except for snap ring **2** and countershaft front bearing **1**.

The automatic transmission is comprised of a torque converter with a lock-up mechanism and a fully automatic 4-speed gear system.

● **Torque converter**

The torque converter is driven by the engine crankshaft, and functions as the input device for the transmission. The torque converter is a fluid coupling device that magnifies torque produced by the engine and absorbs shock that generates when the vehicle accelerates from a standstill or when the transmission shifts. At a cruising speed, the lock-up mechanism prevents slippage for improved power transmitting efficiency.

● **Transmission gear section**

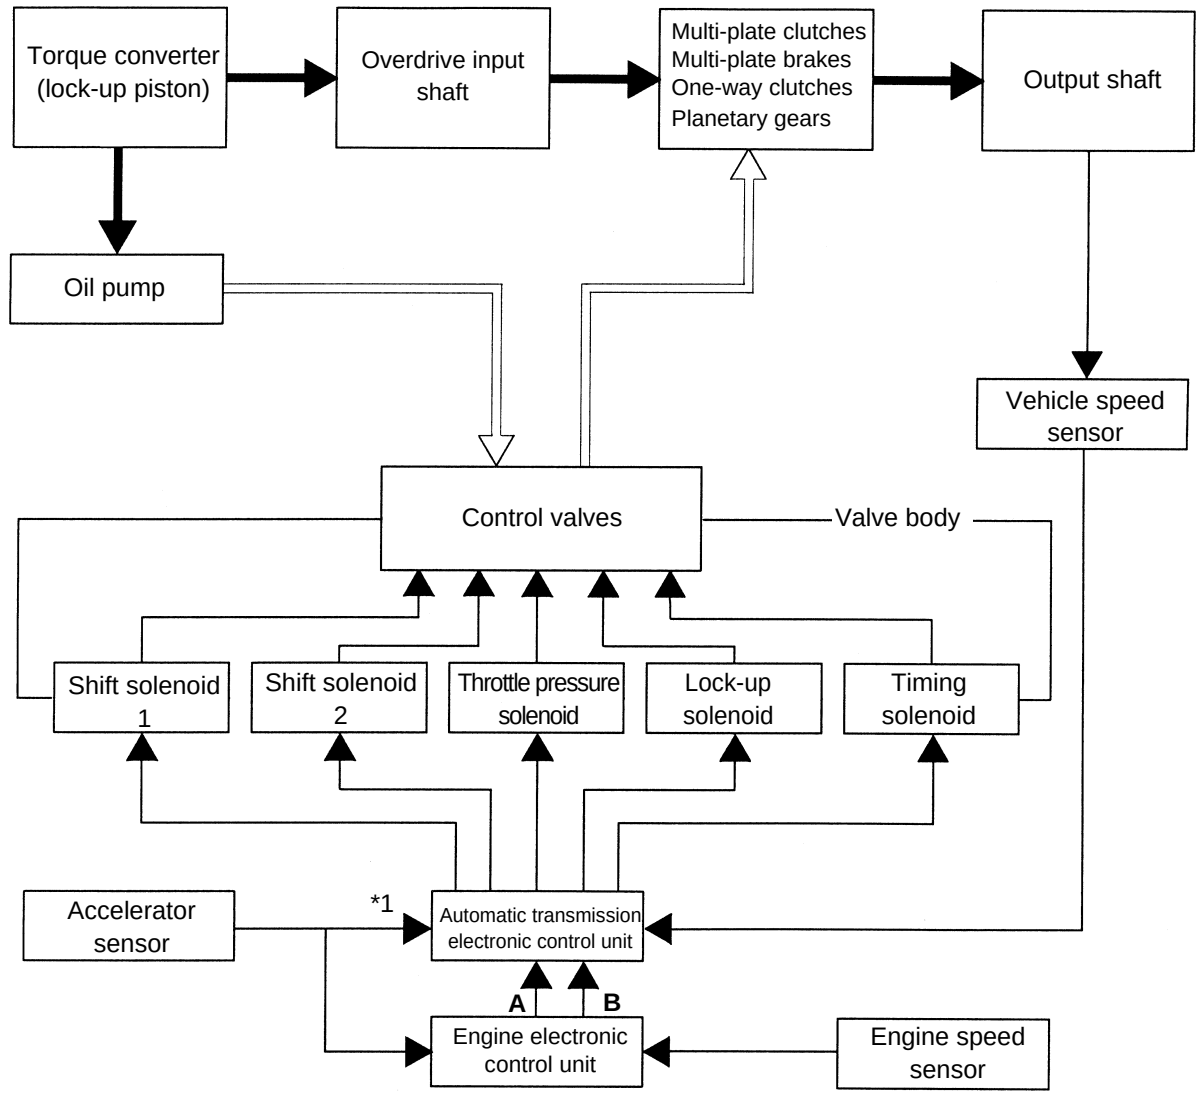
The gear system provides four forward speeds and one reverse speed. The gear section contains two one-way clutches, three sets of planetary gears, each comprised of a sun gear, pinion gears and a ring gear, three sets of hydraulic wet-type multi-plate clutches; and three sets of wet-type multi-plate brakes.

● **Hydraulic control section**

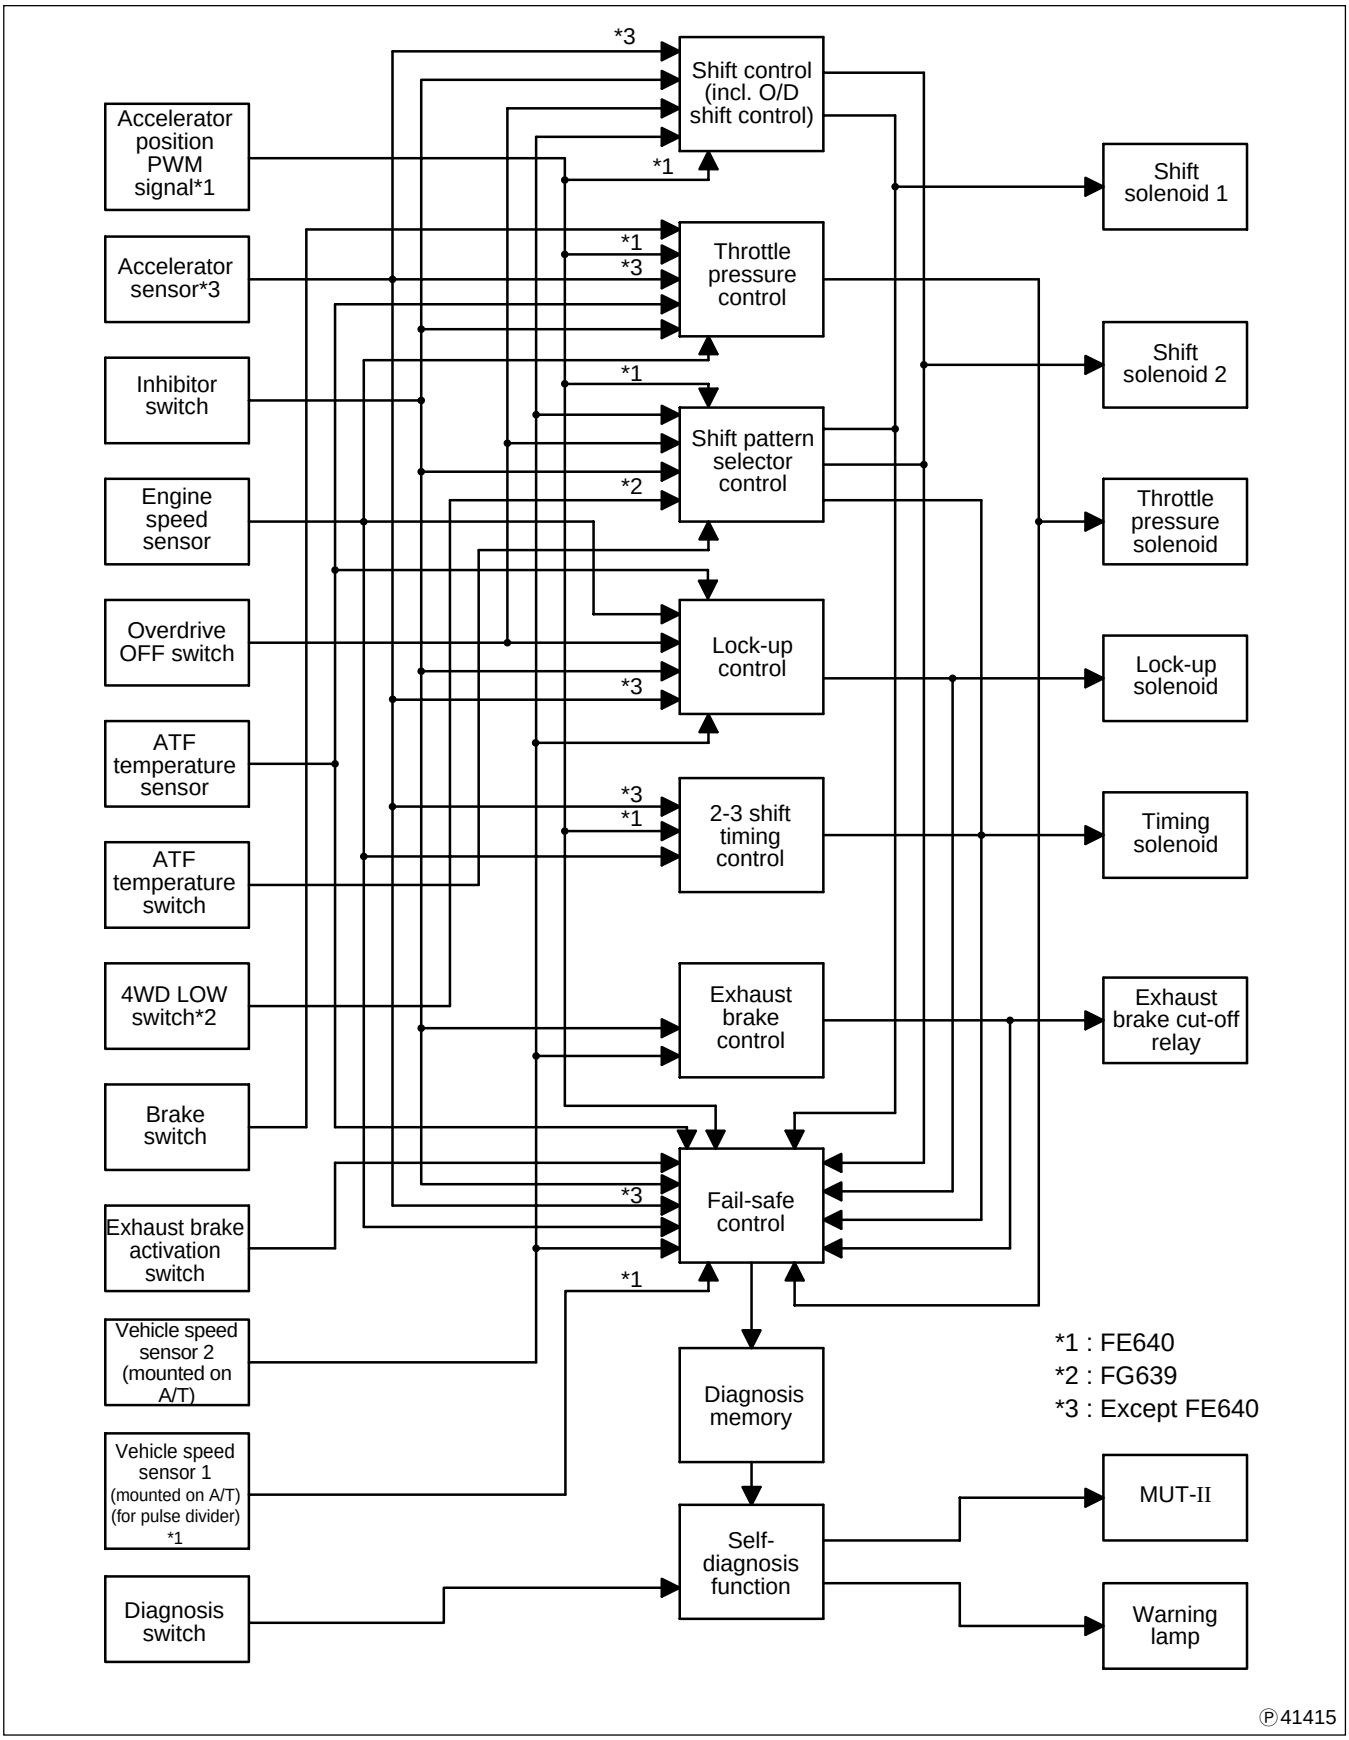
The electronic control system uses a microcomputer to regulate the mechanism operations for precise shifting.

Control Mechanisms

Control system



Control block diagram



STRUCTURE AND OPERATION

The control functions can be roughly divided into shift control, lock-up control and 2-3 shift control. The electronic control unit electronically controls these functions precisely in accordance with driving conditions.

● **Shift control**

Based on the accelerator operation signal transmitted from the accelerator sensor and the signal from the vehicle speed sensor, the automatic transmission electronic control unit outputs signals according to the predetermined shift curve. These signals are sent to shift solenoid 1, shift solenoid 2 and the timing solenoid mounted on the valve body, and automatically shift to the optimum gear.

● **Throttle pressure control**

The accelerator sensor detects the degree of throttle operation. This data is used to control the throttle pressure solenoid, and the hydraulic pressure supplied from the reducing valve is maintained at the optimum level (throttle pressure) according to the vehicle's operating condition.

● **2-3 shift control**

Based on the signal from the throttle sensor and the signal from the engine speed sensor, the automatic transmission electronic control unit outputs a signal to the timing solenoid mounted on the valve body, and controls the discharge timing of automatic transmission fluid to reduce shift shock.

● **Lock-up control**

The lock-up mechanism eliminates slippage of the torque converter for improved power transmitting efficiency. Based on the accelerator operation signal transmitted from the accelerator sensor and the signal from the vehicle speed sensor, the automatic transmission electronic control unit outputs a signal according to the predetermined shift curve. This signal is sent to the lock-up solenoid mounted on the valve body, and engages or disengages the lock-up mechanism.

● **Fail-safe control**

The fail-safe functions minimize adverse effects to the vehicle operation caused by malfunctioning of the vehicle speed sensor, engine speed sensor, accelerator sensor, inhibitor switch or solenoids.

• Accelerator sensor

This sensor prohibits lock-up control change and 2-3 shift timing control by determining the shift-point vehicle speed at closed throttle position and the line pressure at maximum pressure, thus allowing vehicle operation.

• Inhibitor switch

If the inhibitor switch malfunctions in a stationary or moving vehicle and there is no signal input to the automatic transmission electronic control unit, the automatic transmission electronic control unit determines the transmission position setting as the D range and prohibits shifting from 3rd to 4th gear. If the automatic transmission electronic control unit receives two or more signals, the automatic transmission electronic control unit operates according to the following priority order for the range selector position and enables vehicle operation: L > R > 2 > D > N >P. Since the manual valve changes the hydraulic circuit in the valve body according to the range selector position, the vehicle operates as follows.

Range selector lever position	Inhibitor switch input signal	Vehicle operating condition
P	P and other selector signals	P
R	R and other selector signals	R
N	N and other selector signals	N

• Engine speed sensor

The 2-3 shift timing control becomes inactive to ensure proper vehicle operation.

• Shift solenoid 1 and shift solenoid 2

If a solenoid malfunction occurs when the transmission is in the D, 2 or L range, the operating conditions of the solenoids change as shown in the following table. The automatic transmission electronic control unit also deactivates the lock-up solenoid and timing solenoid to allow vehicle operation.

• Throttle pressure solenoid

The malfunctioning solenoid is deactivated to bring the line pressure to a maximum level, thus allowing vehicle operation.

• Timing solenoid and lock-up solenoid

The malfunctioning solenoid is deactivated to allow vehicle operation.

● **Self-diagnosis function**

The warning lamp lights when an abnormality occurs during vehicle operation.

- The warning lamp does not light if the abnormality causes minimum effect to vehicle operation.
- The warning lamp lights when the following parts are malfunctioning to indicate the abnormal condition since these malfunctions significantly reduce vehicle performance.
  - Vehicle speed sensor < except FE640 >
  - Vehicle speed sensor 1 < FE640 >
  - Throttle position PWM signal < except FE640 >
  - Vehicle speed sensors 1 and 2 < FE640 >
  - Shift solenoid 1
  - Shift solenoid 2
  - Accelerator sensor
  - Timing solenoid
  - Inhibitor switch
  - Throttle pressure solenoid

CAUTION ⚠

The warning lamp lights only when the malfunction prevents proper vehicle operation.

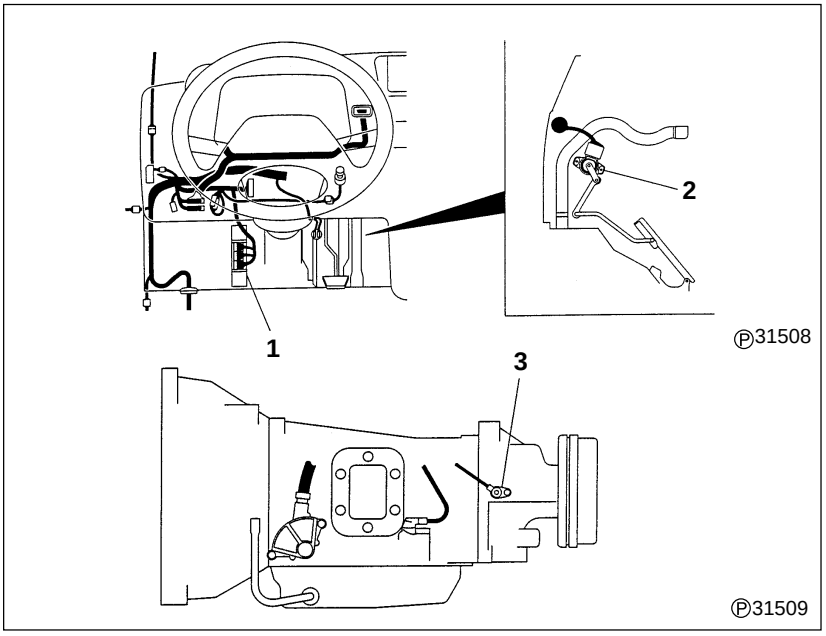
The indicator lamp provides self-diagnosis information.

- To facilitate the discovery of malfunctions that may not reproduce themselves frequently, the automatic transmission electronic control unit stores in the memory information of malfunctions that occur during vehicle operation.
- An input of a self-diagnosis start signal produces the output of the data from the memory, and causes the automatic transmission warning lamp to flash according to the data.

CAUTION ⚠

The automatic transmission electronic control unit stores information of all malfunctions that occur after the previous self-diagnosis operation.

Electronic Control Devices

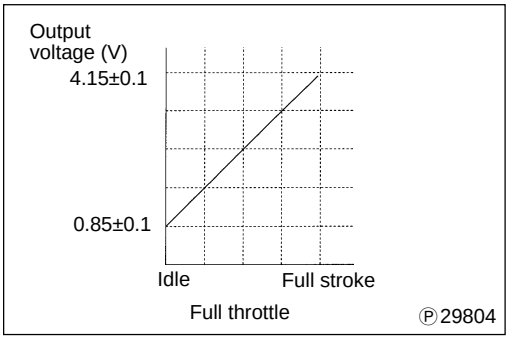


1 Automatic transmission electronic control unit
2 Accelerator sensor
3 Vehicle speed sensor

● **Automatic transmission electronic control unit**

The automatic transmission electronic control unit is mounted near the brake booster on the driver's seat side. It determines the vehicle operating conditions based on signals sent from sensors, and outputs signals to solenoids to regulate shift control, lock-up control and other automatic transmission functions.

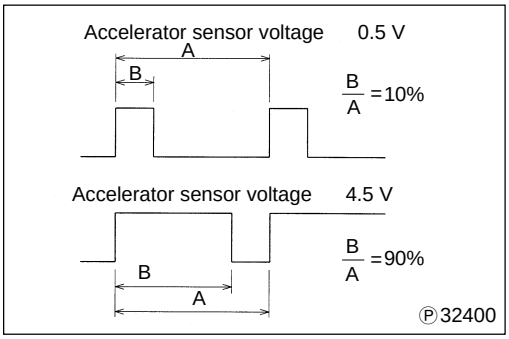
The automatic transmission electronic control unit is also equipped with a self-diagnosis function for the detection of malfunctions of main sensors and solenoids.



● **Accelerator sensor < Except FE640 >**

The accelerator sensor is mounted on the accelerator lever. It converts the accelerator pedal operation to voltage and sends it to the automatic transmission electronic control unit.

The output characteristic of the electric signal produced by the sensor is shown in the graph on the left. This output signal is used to determine the accelerator pedal angle and pressing speed.



● **Throttle position PWM signal < FE640 >**

The accelerator sensor voltage detected by the electronic governor control unit is converted to a PWM signal and output to the automatic transmission electronic control unit. The PWM signal is a chopping wave with a duty ratio shown in the diagram at the left.

● **Vehicle speed sensor**

< Except FE640 >

This sensor is mounted on the extension housing of the transmission, and converts the vehicle speed to a pulse signal by means of the parking lock gear and sends it to the automatic transmission electronic control unit.

< FE640 >

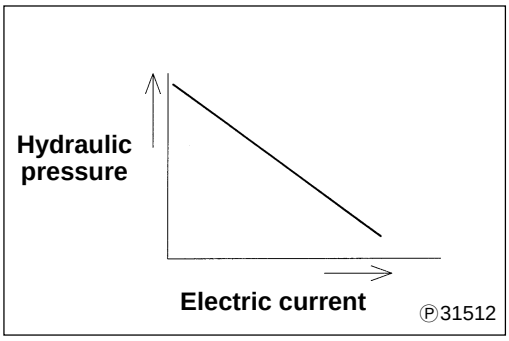
The vehicle speed monitoring system is composed of two sensor circuits; vehicle speed sensor **2** (output shaft rotation sensor) and vehicle speed sensor **1**. Accordingly, the normal driving mode is not disabled even when one of the vehicle speed sensor circuits is faulty.

● **Shift solenoids 1 and 2**

These solenoids are mounted on the valve body, and control shifting by turning ON and OFF in accordance with the signals sent from the automatic transmission electronic control unit.

The ON and OFF conditions of the two solenoids result in the following gear positions.

Shift solenoid 1	ON	ON	OFF	OFF
Shift solenoid 2	OFF	ON	ON	OFF
Gear position	1st gear	2nd gear	3rd gear	4th gear



● **Throttle pressure solenoid**

The throttle pressure solenoid is mounted on the valve body. It adjusts the throttle pressure based on the throttle opening signal sent from the automatic transmission electronic control unit. The throttle pressure adjustment characteristics are shown in the diagram.

● **Timing solenoid**

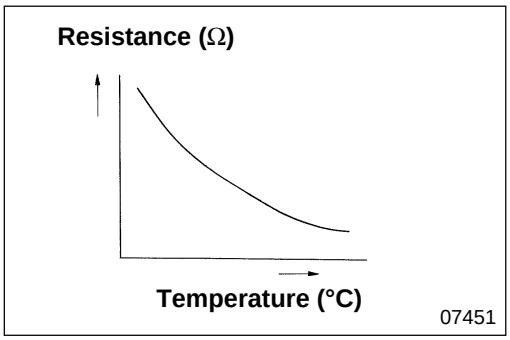
This solenoid is mounted on the valve body, and regulates the 2-3 shift timing control by turning ON and OFF in accordance with the signal sent from the automatic transmission electronic control unit.

● **Lock-up solenoid**

The lock-up solenoid is mounted on the valve body. According to the signal sent from the automatic transmission electronic control unit, the solenoid repeats ON and OFF operations, thereby opening and closing the drain circuit to control the hydraulic pressure at a predetermined level. The lock-up solenoid is a duty-cycle type that can control the ON and OFF time ratio in each cycle between 0 and 100%.

● **Automatic transmission fluid temperature switch**

This switch is mounted on the oil cooler outlet section of the transmission case. It detects abnormal temperatures of the automatic transmission fluid and turns on the warning lamp located on the meter cluster to indicate the abnormal condition.

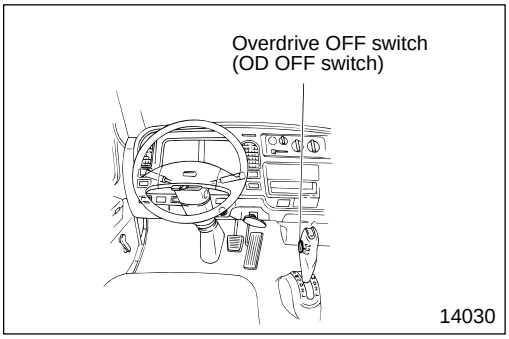


● **Automatic transmission fluid temperature sensor**

This sensor is mounted on the control valve in the transmission. It coverts temperature changes into continuous electric signals and sends them to the automatic transmission electronic control unit. The characteristics of the sensor's electric output signal are shown at the left. Based on this output signal, the automatic transmission electronic control unit prohibits overdrive shifting and lock-up operation and also performs partial correction of line pressure control.

● **Engine speed sensor**

The sensor converts the engine revolution speed to a pulse signal, and outputs to the electronic governor control unit. This signal is then transmitted from the electronic governor control unit to the automatic transmission control unit.



● **Overdrive OFF switch**

This switch is mounted on the range selector lever. It is operated by the driver, and it allows switching between the 3-speed and 4-speed modes.

OFF : Transmission shifts to 4th gear for improved fuel efficiency.

ON : Transmission does not shift to 4th gear, thus increasing the engine brake effect and improving driveability on an up grade incline.

● Valve Functions

- **Upper valve body**

No.	Valve name	Description of function
1	2-3 Shift valve	Switches between 2nd and 3rd gears
2	Reverse inhibitor valve	When range selector is shifted to R range while vehicle is moving forward at moderate or high speed, this valve, operated by solenoid output, prevents shifting to reverse.
3	Modulator valve	Adjusts line pressure and supplies hydraulic pressure to lock-up signal valve and orifice control valve
4	Throttle valve	Adjusts signal pressure (throttle pressure) that is used to provide optimum line pressure in accordance with operating conditions
5	Secondary regulator valve	Controls pressure of automatic transmission fluid supplied from primary regulator valve to torque converter as well as lubricating oil pressure
6	Reducing valve	Reduces line pressure and feeds to throttle valve
7	Lock-up signal valve	Engages and disengages lock-up mechanism
8	Accumulator control valve	Lowers accumulator back pressure when throttle opening becomes smaller, and obtains accumulator control pressure from line pressure that is used to reduce shift shock
9	Low coast modulator valve	Lowers line pressure to reduce shift shock when range selector is shifted to L range
10	Orifice control valve	Switches orifices to reduce shock
11	Low inhibitor valve	When range selector is shifted to L range at high vehicle speed, this valve, operated by timing solenoid output, shifts to 3rd gear
12	Check valve	Switches fluid passage to rear clutch (C2) in D range and R ranges

A : Operating pressure

< Active condition >

The control valve supplies operating pressure **A** to overdrive direct clutch piston **3**, coupling clutch discs **8** and clutch plates **7**. This interlocks overdrive planetary sun gear **11** with overdrive planetary carrier **12**.
As a result, the entire overdrive planetary gear acts as a single unit to transmit the engine's driving power from overdrive input shaft **13** to input shaft **14**.

< Inactivate condition >

Since operating pressure **A** is not supplied, the force of overdrive clutch return springs **5** presses against overdrive direct clutch piston **3**.
As a result, clutch plates **7** are separated from clutch discs **8**, and the engine power is not transmitted.

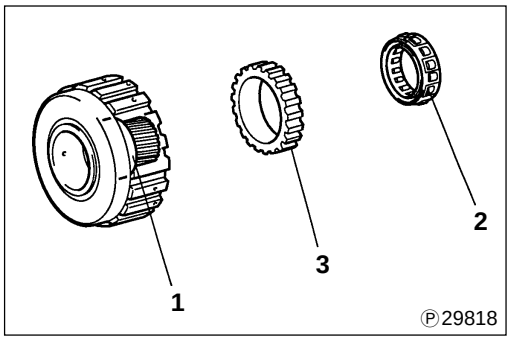
- Three sets of Simpson-type planetary gears provide a total of five gear ratios: four forward speeds and one reverse speed.
- Each planetary gear set consists of a sun gear **3** at the center and pinion gears **1** that revolve around the sun gear and on their axes. This set of gears are contained in a ring gear **2**. The pinion gears are attached to a planetary carrier **4**, so that all pinion gears rotate in the same direction and at the same rate. Gear shifting occurs when these four elements — sun gear, pinion gears, ring gear and planetary carrier — are provided with certain conditions. Clutches and brakes provide operating conditions to the planetary gears in accordance with shifting.

● Overdrive One-Way Clutch



1 Overdrive direct clutch drum and overdrive one-way clutch inner race

3 Overdrive one-way clutch outer race

- During acceleration in the 1st, 2nd and 3rd gears, the overdrive one-way clutch **2** engages and becomes interlocked with the overdrive sun gear and overdrive planetary carrier.
- In the 4th gear, the overdrive one-way clutch **2** rotates freely.

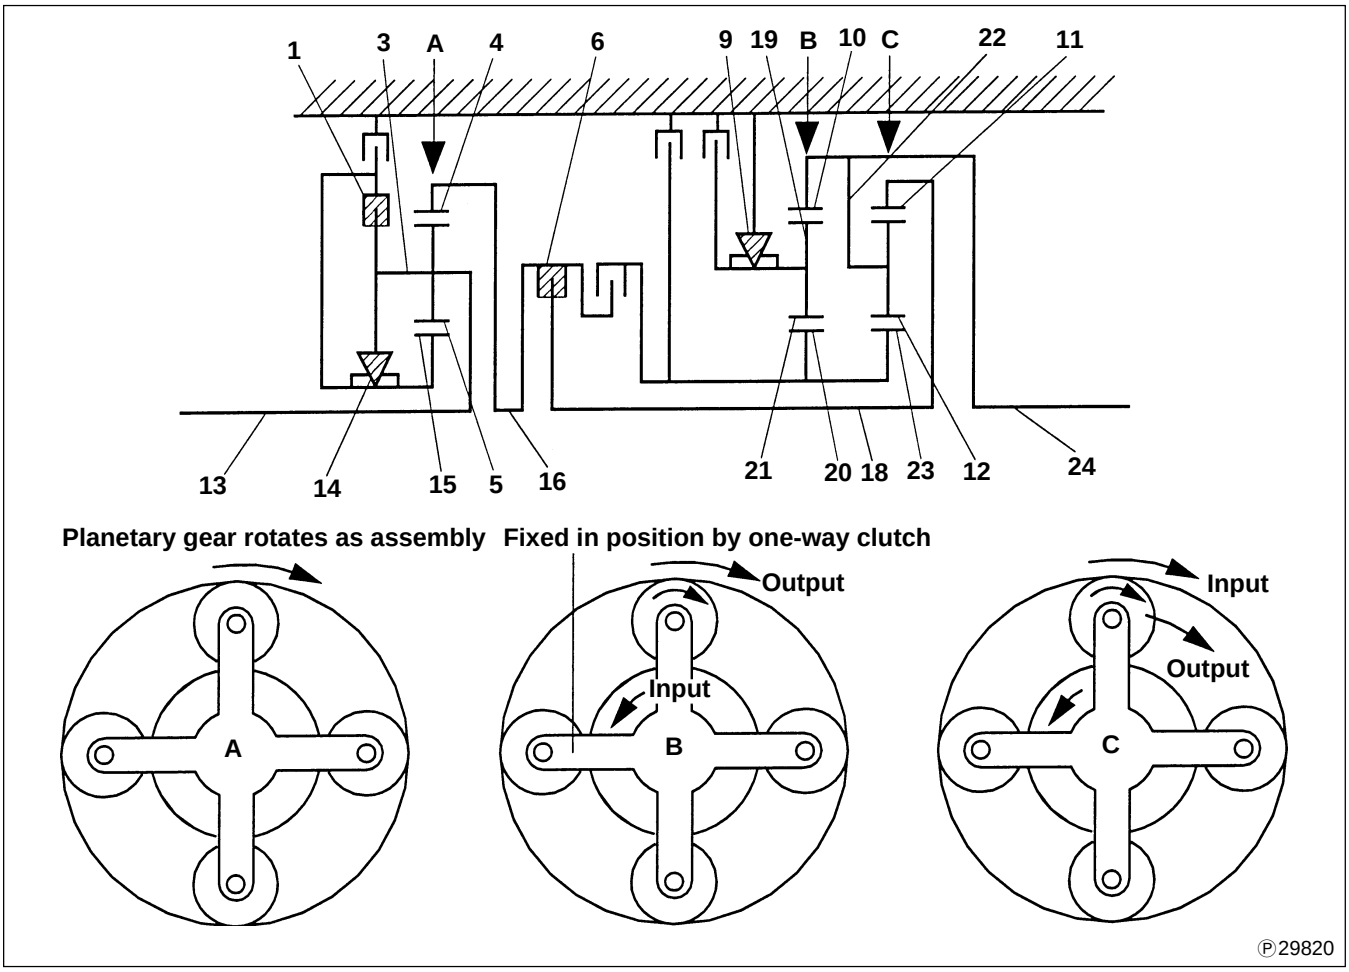
● D, and 2 Ranges (1st Gear)



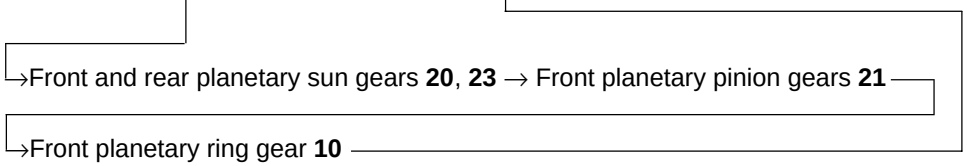
Overdrive direct clutch **1**, front clutch **6**, overdrive one-way clutch **14** and No. 2 one-way clutch **9** activate to provide the 1st gear. At overdrive planetary gear **A**, overdrive direct clutch **1** operates to interlock overdrive planetary carrier **3** (overdrive input shaft **13**) with overdrive planetary sun gear **15**. This disables overdrive planetary pinion gears **5** from rotating on their axes, and overdrive planetary carrier **3** becomes locked (direct coupling) in position with overdrive planetary ring gear **4**, thus transmitting driving force to input shaft **16**. Clockwise rotation of overdrive planetary carrier **3** results in a force that attempts to turn overdrive pinion gears **5** in a counterclockwise direction, producing clockwise rotating force for overdrive planetary sun gear **15**. However, since overdrive planetary sun gear **15** rotates faster than overdrive planetary carrier **3**, overdrive one-way clutch **14** activates, interlocking overdrive planetary carrier **3** with overdrive planetary sun gear **15**. This disallows overdrive planetary pinion gears **5** from rotating on their axes, in the same way as when overdrive direct clutch **1** activates. Therefore, overdrive planetary carrier **3** becomes locked (direct coupling) in position with overdrive planetary ring gear **4**, thus transmitting the driving force to input shaft **16**.

These two power transmitting systems reduce the load on overdrive direct clutch **1**.

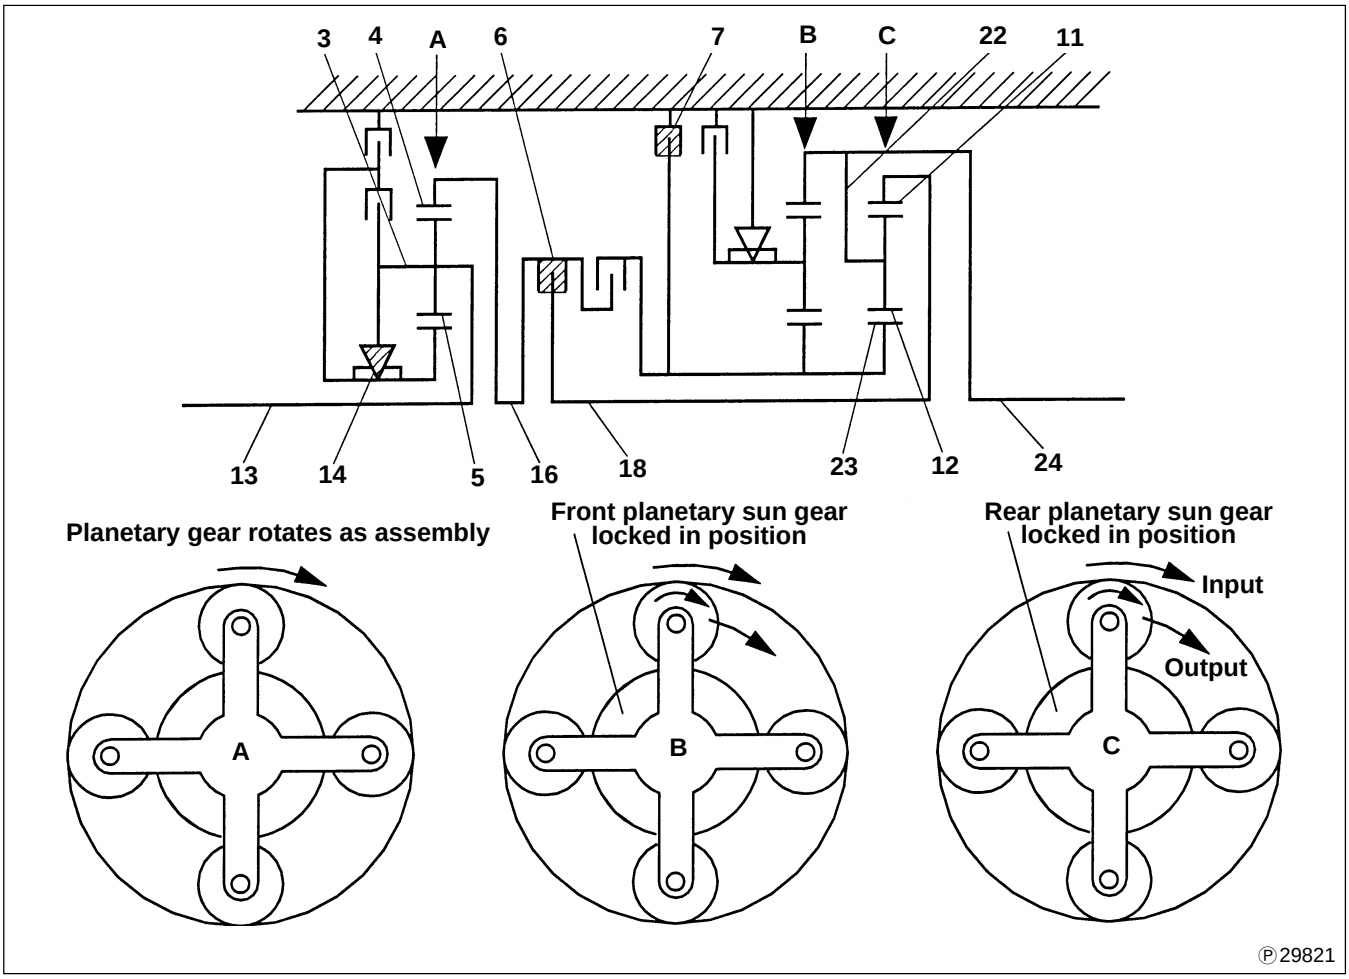
The clockwise rotating force of input shaft **16** is transmitted to intermediate shaft **18** by the action of front clutch **6**, then turns rear planetary pinion gears **12** clockwise by means of rear planetary ring gear **11**. In this process, rear planetary carrier **22** is stationary due to vehicle weight. Therefore, rear planetary sun gear **23** receives counterclockwise rotating force and transmits this force to front planetary pinion gears **21**, exerting force to rotate front planetary carrier **19** in a counterclockwise direction. However, since No. 2 one-way clutch **9** prevents front planetary carrier **19** from rotating in a counterclockwise direction, pinion gears **12**, **21** cause front planetary ring gear **10** and rear planetary carrier **22** to rotate in a clockwise direction, thereby transmitting the rotating force to output shaft **24**. (Rotational directions are described as viewed from the torque converter side.)

Power transmitting process

Overdrive input shaft **13** → Overdrive planetary carrier **3** → Overdrive planetary pinion gears **5** → Overdrive planetary ring gear **4** → Input shaft **16** → Front clutch **6** → Intermediate shaft **18** → Rear planetary ring gear **11** → Rear planetary pinion gears **12** → Rear planetary carrier **22** → Output shaft **24**



● D Range (2nd Gear)

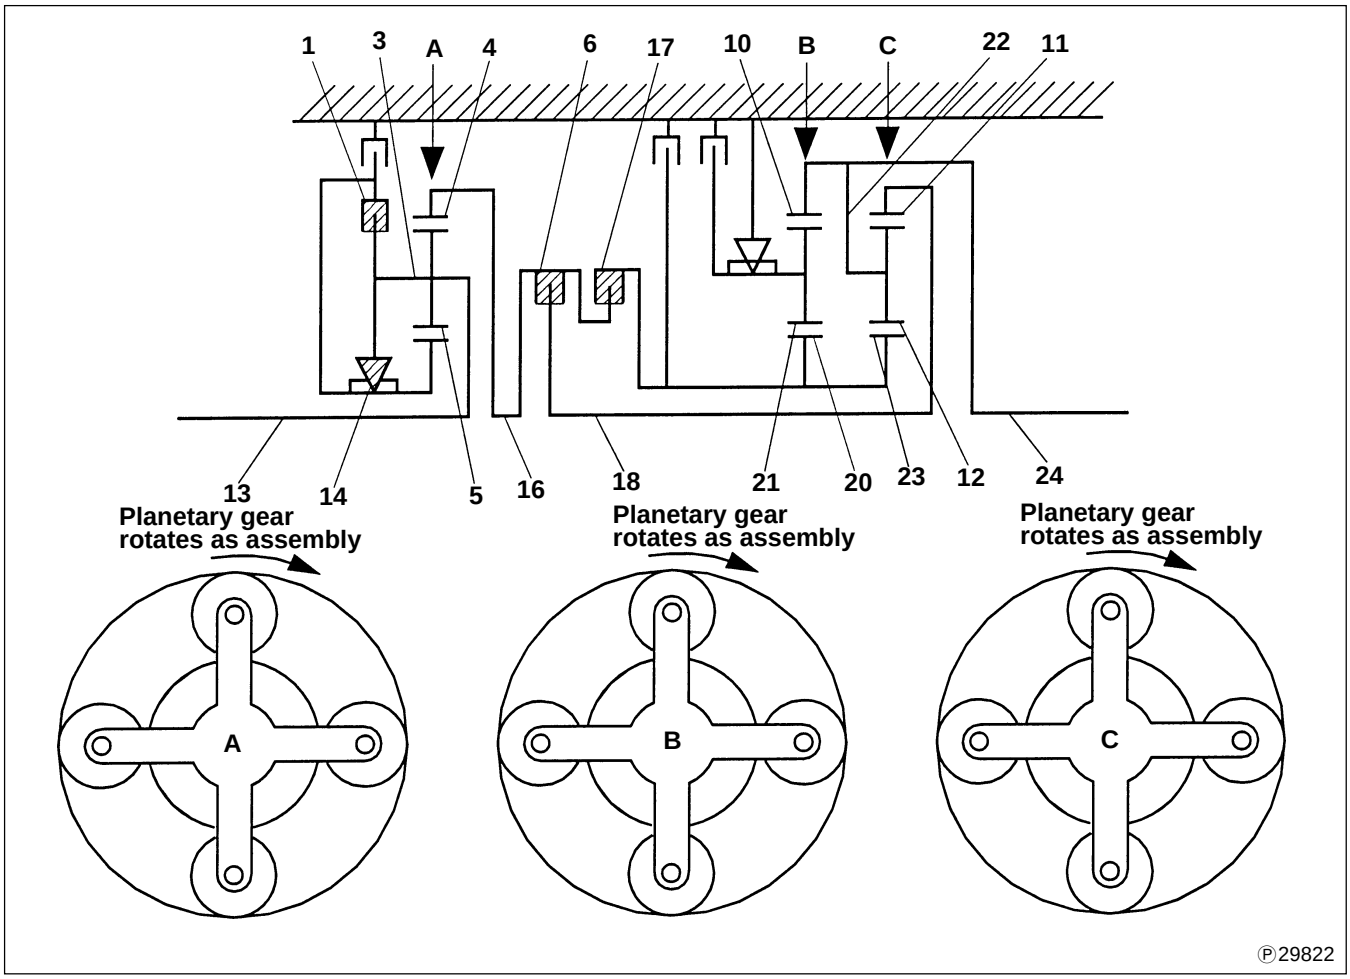


Front clutch **6**, 2nd brake **7** and overdrive one-way clutch **14** activate to provide the 2nd gear. In this gear, overdrive one-way clutch **14** transmits the rotating force of input shaft **16** to rear planetary pinion gears **12** by means of intermediate shaft **18** and rear planetary ring gear **11**. Although rear planetary sun gear **23**, which is meshed with pinion gears **12**, receives a counterclockwise rotating force, 2nd brake **7** prevents its rotation, disabling the transfer of the rotating force to front planetary gear **B**. As a result, the rotating force transmits to rear planetary carrier **22** via rear planetary pinion gears **12**, then to output shaft **24**.

Power transmitting process

Overdrive input shaft **13** → Overdrive planetary carrier **3** → Overdrive planetary pinion gears **5** → Overdrive planetary ring gear **4** → Input shaft **16** → Front clutch **6** → Intermediate shaft **18** → Rear planetary ring gear **11** → Rear planetary pinion gears **12** → Rear planetary carrier **22** → Output shaft **24**

● D, 2 and L Ranges (3rd Gear)



Overdrive direct clutch **1**, front clutch **6**, rear clutch **17** and Overdrive one-way clutch **14** activate to provide the 3rd gear. In this gear, front clutch **6** and rear clutch **17** cause intermediate shaft **18** and front and rear sun gears **20**, **23** to rotate in the same direction. Therefore, front and rear planetary pinion gears **12**, **21** become locked in position, thus the entire assemblies of planetary gears **A**, **B**, **C** rotate together to transmit the rotating force of input shaft **16** to output shaft **24** without reducing the rate of rotating speed.

Power transmitting process

Overdrive input shaft **13** → Overdrive planetary carrier **3** → Overdrive planetary pinion gears **5** → Overdrive planetary ring gear **4** → Input shaft **16** →Front clutch **6** → Intermediate shaft **18**

→Rear planetary ring gear **11** → Rear planetary pinion gears **12**

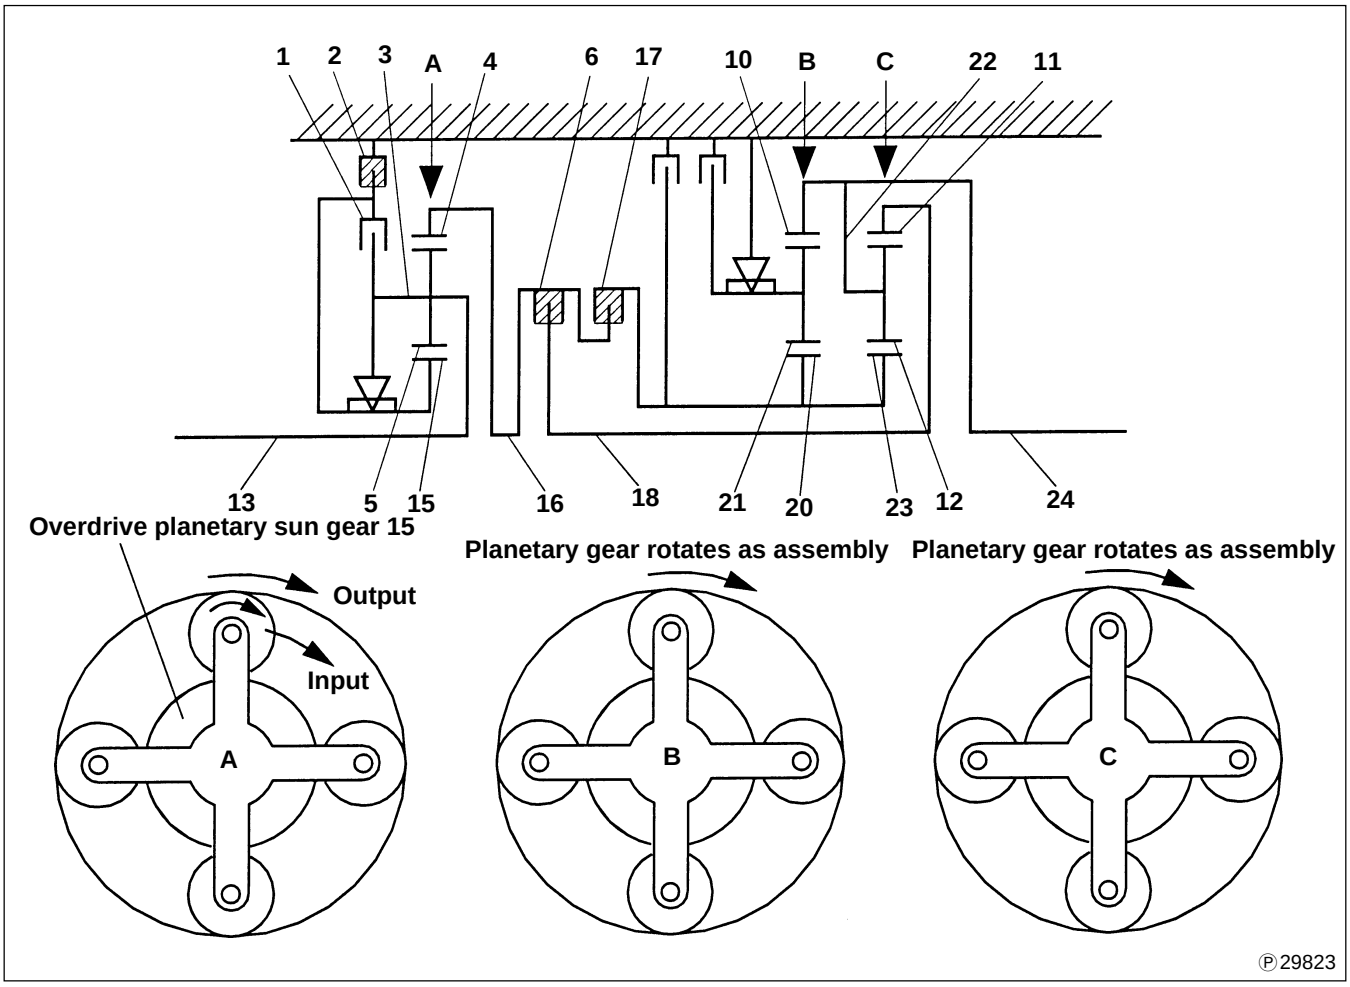
→Rear clutch **17**

→Rear planetary carrier **22** →Output shaft **24**

→Rear planetary sun gear **23** → Rear planetary pinion gears **12**

→Front planetary sun gear **20** → Front planetary pinion gears **21** → Front planetary ring gear **10**

● D Range (4th Gear)



If the overdrive conditions (see the table below) are fulfilled when the transmission is in 3rd gear, overdrive direct clutch **1** disengages, and overdrive brake **2** activates at the same time to provide the overdrive gear ratio. In the overdrive gear, overdrive brake **2** is in operation, thus locking overdrive planetary sun gear **15** in position. Therefore, the rotating force transmitted from overdrive input shaft **13** to overdrive planetary carrier **3** causes overdrive planetary pinion gears **5** to revolve around the sun gear and on their own axes, which results in an increased rotating speed of overdrive planetary ring gear **4** (input shaft **16**). The rotating force of input shaft **16** is transmitted to output shaft **24**, in the same way as in the 3rd gear.

Overdrive conditions

Overdrive OFF SW	OFF

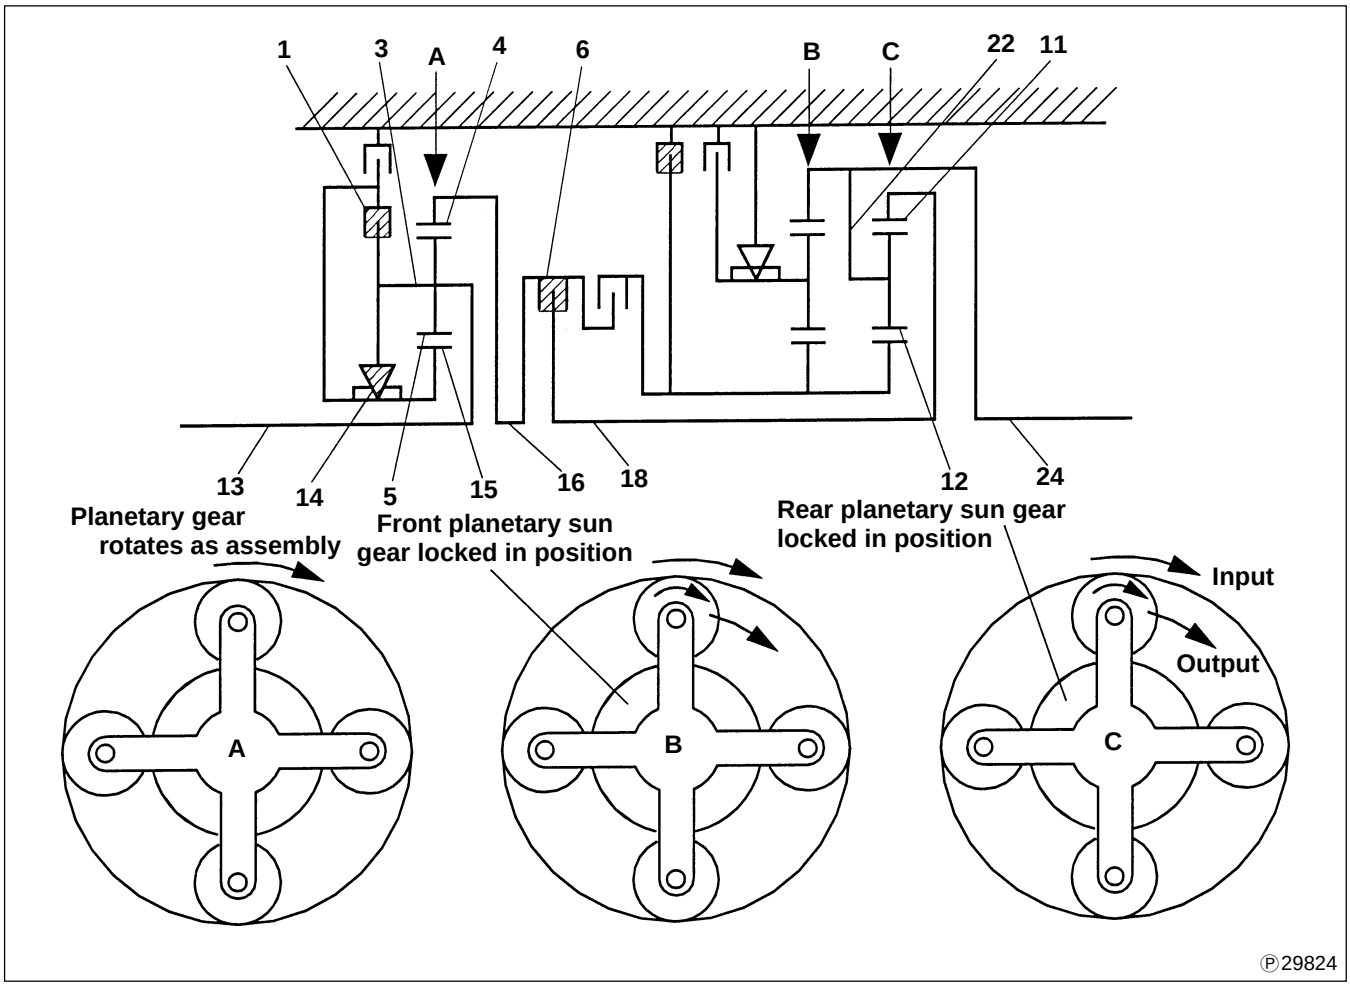
→ Rear clutch **17** → Rear planetary carrier **22** → Output shaft **24**

→ Rear planetary sun gear **23** → Rear planetary pinion gears **12**

→ Front planetary sun gear **20** → Front planetary pinion gears **21** → Front planetary ring gear **10**

● 2 Range (2nd Gear)

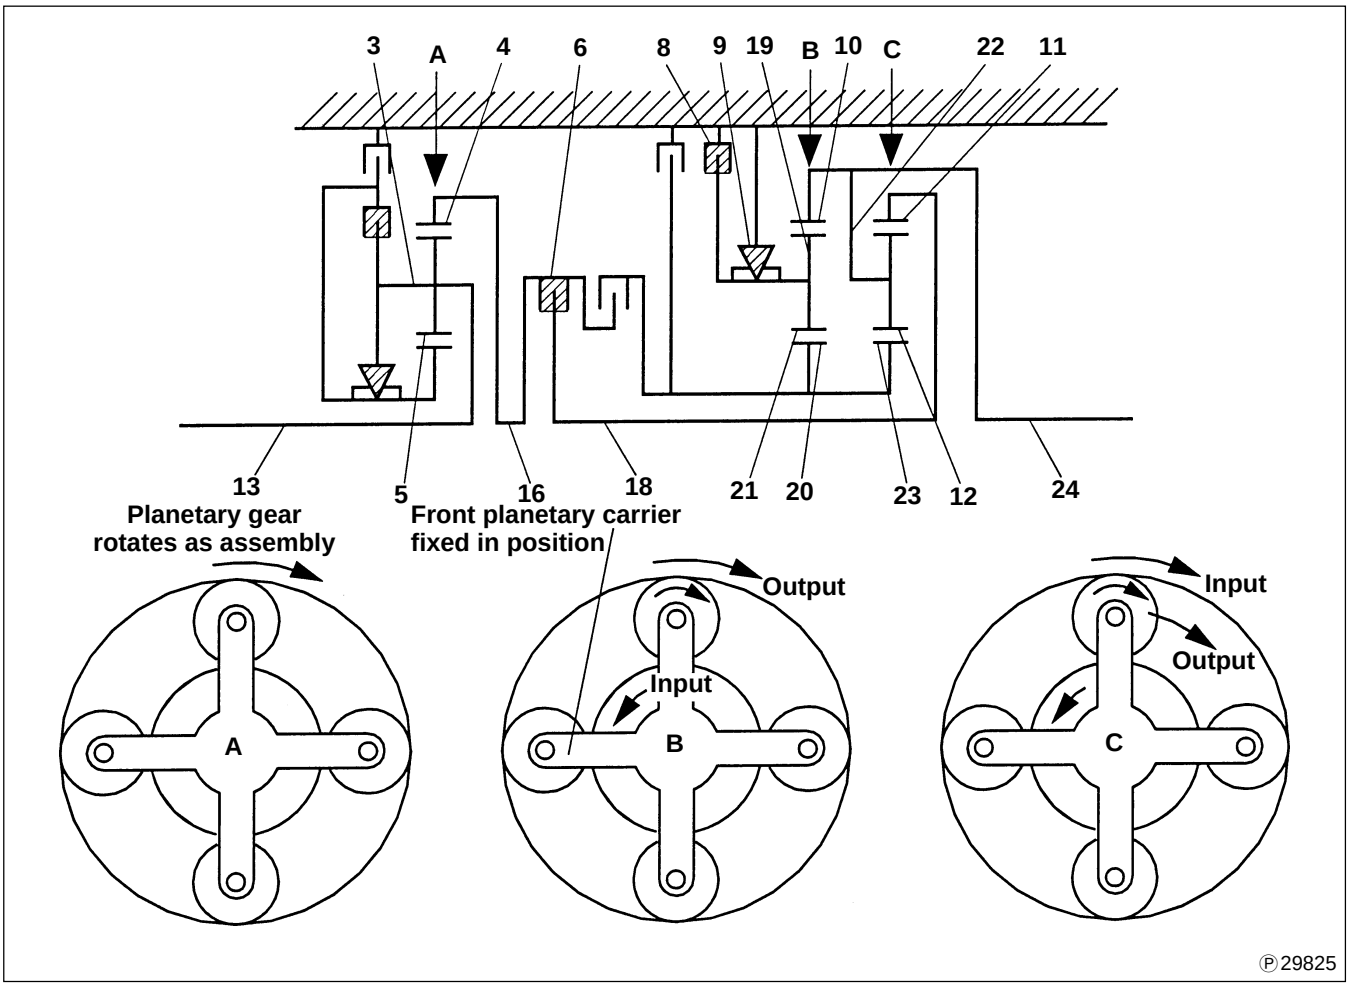


The rotating power is transmitted in the same way as in the previously described 2nd gear in the D range. However, when engine brake is applied, overdrive direct clutch **1** activates and prevents overdrive planetary sun gear **15** from rotating clockwise. In other words, when the transmission is in 2nd gear with the range selector in the D range, overdrive one-way clutch **14** transmits the rotating power to input shaft **16**. When the engine brake is applied, however, the counterclockwise rotating force of overdrive planetary sun gear **15** inactivates overdrive one-way clutch **14** and causes overdrive planetary sun gear **15** to spin freely. This disallows the transmission of the engine brake force. To properly transmit the engine brake force in the 2 range, overdrive direct clutch **1** is activated to interlock overdrive planetary sun gear **15** with overdrive planetary carrier **3**.

Power transmitting process

Overdrive input shaft **13** → Overdrive planetary carrier **3** → Overdrive planetary pinion gears **5** → Overdrive planetary ring gear **4** → Input shaft**16** → Front clutch **6** → Intermediate shaft **18** → Rear planetary ring gear **11** → Rear planetary pinion gears **12** → Rear planetary carrier **22** → Output shaft **24**

● L Range (1st Gear)



The rotating power is transmitted in the same way as in the previously described 1st gear in the D and L ranges. However, when the engine brake is applied, 1st and reverse brake **8** activates and prevents front planetary carrier **19** from rotating clockwise. In other words, when the transmission is in 1st gear with the range selector in the D or 2 range, No. 2 one-way clutch **9** prevents a counterclockwise rotation of front planetary carrier **19** and transmits the rotating power to output shaft **24**. When the engine brake is applied, however, a rotating force in the reverse direction is generated, inactivating No. 2 one-way clutch **9** and allowing front planetary carrier **19** to spin freely. This disallows the transmission of the engine brake force. To properly transmit the engine brake force in the L range, 1st and reverse brake **8** is activated to lock front planetary carrier **19** in position.

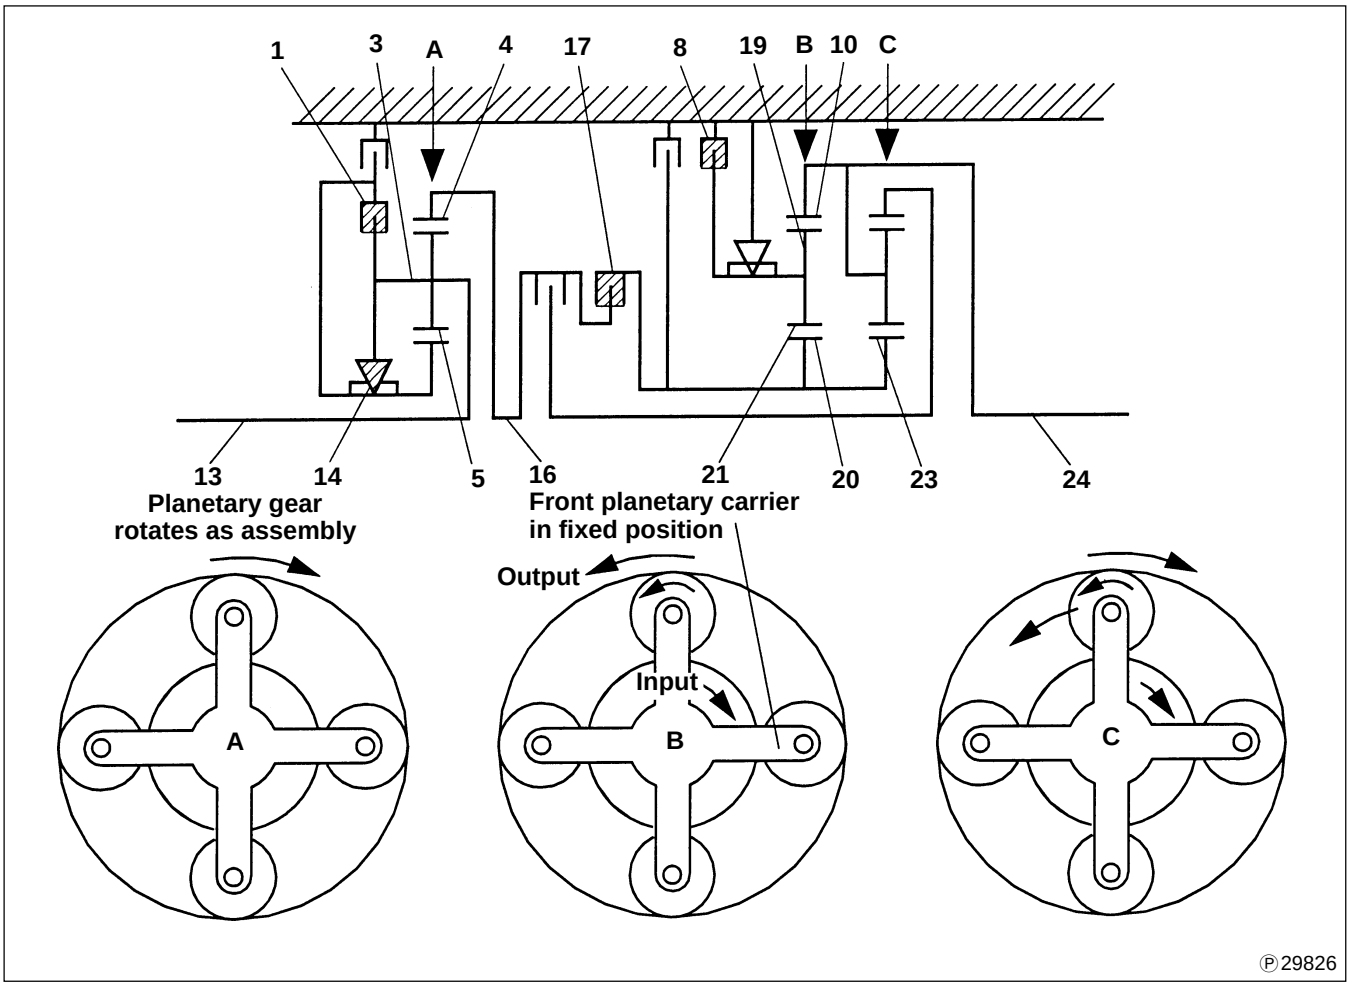
→Front planetary ring gear **10**

● R Range

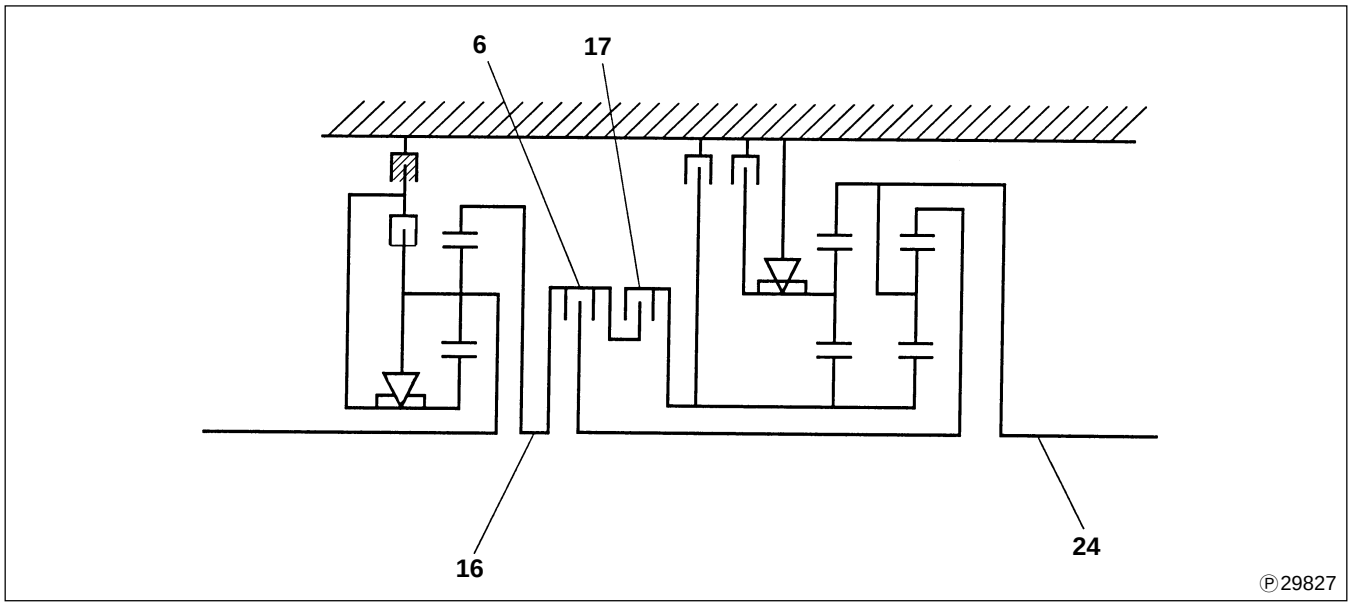


In the R range, overdrive direct clutch **1**, overdrive one-way clutch **14**, rear clutch **17** and 1st and reverse brake **8** activate to provide reverse gear. The rotating force of overdrive input shaft **13** is transmitted to input shaft **16** via direct coupling, in the same way as in the 1st gear in the D and 2 ranges. Since rear clutch **17** is in operation, the rotating force of input shaft **16** is transmitted to pinion gears **21** of front planetary gear **B** by means of the sun gear. However, because front planetary carrier **19** is locked in position by 1st and reverse brake **8**, the rotating force of front planetary sun gear **20** is transmitted to the ring gear by means of front planetary pinion gears **21**, thus providing a counterclockwise rotating force to output shaft **24**.

Power transmitting process

Overdrive input shaft **13** → Overdrive planetary carrier **3** → Overdrive planetary pinion gears **5** → Overdrive planetary ring gear **4** → Input shaft **16** → Rear clutch **17** → Front planetary sun gear **20** → Front planetary pinion gears **12** → Front planetary ring gear **10** → Output shaft **24**

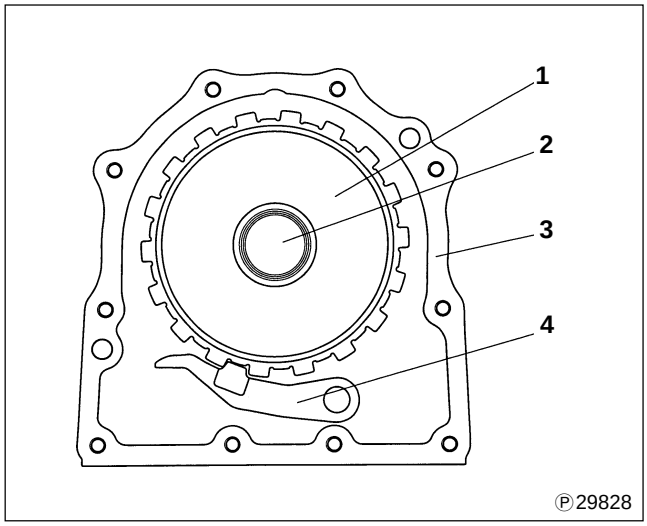
● N Range



- **N range**

  Since front clutch **6** and rear clutch **17** are disengaged, the driving force of input shaft **16** is not transmitted to output shaft **24**.

● P Range

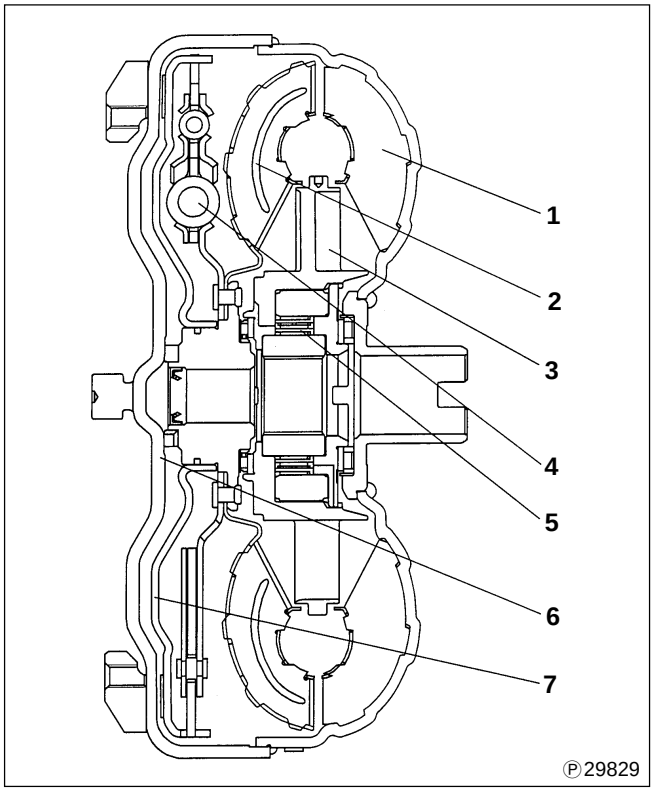


1 Parking lock gear
2 Output shaft
3 Transmission case
4 Parking lock pawl

- **P range**

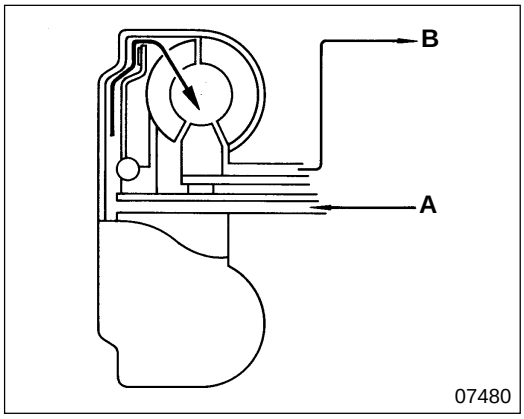
  In the same way as in the N range, the driving force of the input shaft is not transmitted to output shaft **2**. Parking lock pawl **4**, which is linked with the range selector lever, meshes with parking lock gear **1** which is directly connected to the output shaft, thus disallowing vehicle movement.

● Torque Converter



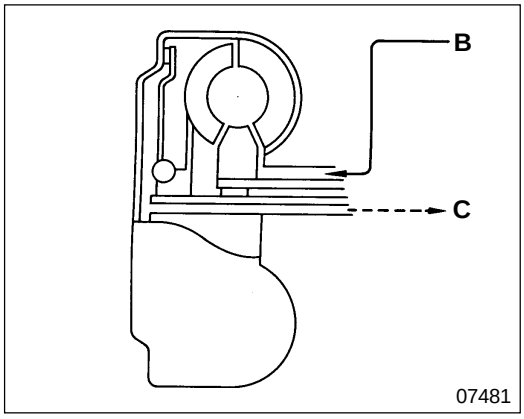
1 Pump impeller
2 Turbine liner
3 Stator
4 Lock-up damper
5 One-way clutch
6 Front converter cover
7 Lock-up piston

- The torque converter transfers engine torque to the transmission. It transmits engine torque by means of oil when it is not in a lock-up condition, and it transfers power via the lock-up piston when it is in a lock-up condition.
- The torque converter is a 3-element, 1-stage, 2-phase type.
- "1-stage" indicates that the torque converter has one turbine liner, which is an output element. "2-phase" means that it provides a torque converter function when the turbine liner speed is relatively slow as compared to the pump impeller speed, and acts as a fluid coupler when the turbine liner speed is high.



< Lock-up mechanism in inactive condition >

The lock-up control valve supplies the torque converter operating pressure through oil passage **A** to the space between the front converter cover and lock-up piston. This oil pressure separates the clutch facing of the lock-up piston from the front converter cover. As a result, the torque converter operating pressure supplied through oil passage **A** is released from oil passage **B**, and enters the oil cooler.



< Lock-up mechanism in active condition >

The lock-up control valve switches the operating oil passage. The torque converter operating pressure is supplied through oil passage **B** to the pump impeller, turbine liner and stator.
As a result, the oil pressure applied to the lock-up piston causes the clutch facing of the lock-up piston to engage with the front converter cover for improved power transmitting efficiency.

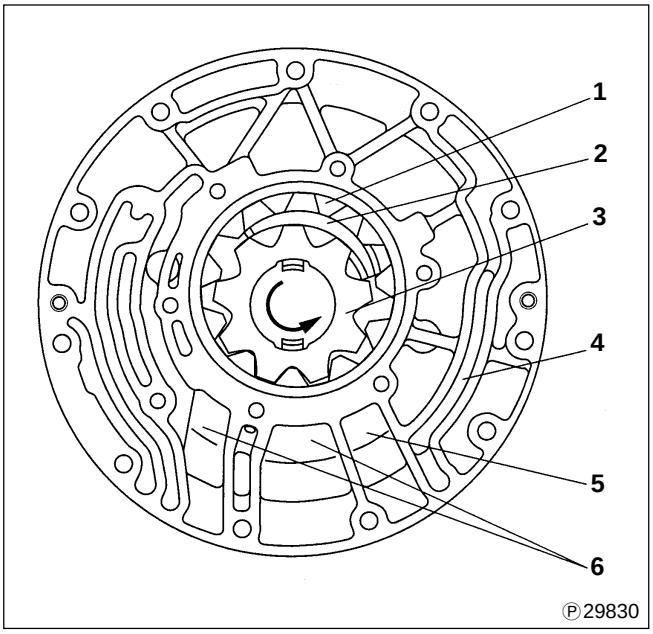
● Oil Pump



1 Driven gear
2 Crescent
3 Drive gear
4 Oil pump body
5 Outlet port
6 Inlet ports

- Feature ..... The oil pump gears have a small number of gear teeth and features a special high-performance tooth profile.
- Operation ··· The drive gear is fitted to the extension sleeve of the torque converter, and rotates in the same direction (in the direction of the arrow) as the engine to compress and discharge the intake oil.

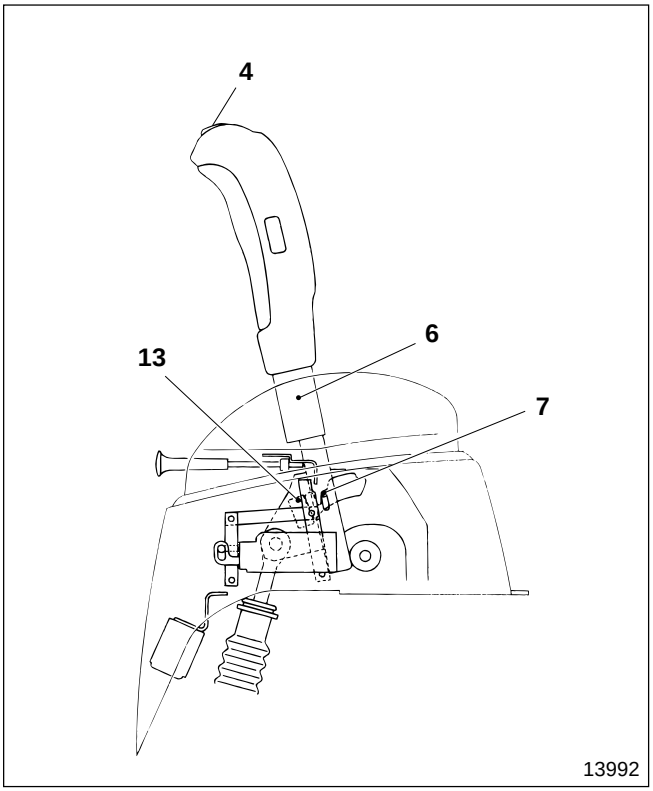
● **Parking Shift Lock Device with Key Interlock**

The key interlock device prevents the removal of the key unless selector lever **6** is in the P (Parking) range. The shift lock device disallows the selector lever from moving from the P range position unless brake pedal **14** is pressed, thereby preventing accidental vehicle movement caused by an unintended selector lever operation.



Key interlock device

< Lock condition >

Condition: When selector lever **6** is in a position other than the P range or when shift button **4** is pressed with the selector lever in the P range, pin **7** is not in contact with P range switch **13** (switch is set free). Therefore, the switch is ON.

↓

An electric current flows from key interlock electronic control unit **18** to key interlock solenoid **1** to activate the key interlock solenoid.

↓

Key interlock solenoid **1** turns ON to prevent starter switch **2** from being turned to the LOCK position, thus disabling the removal of the key.

< Unlock condition >

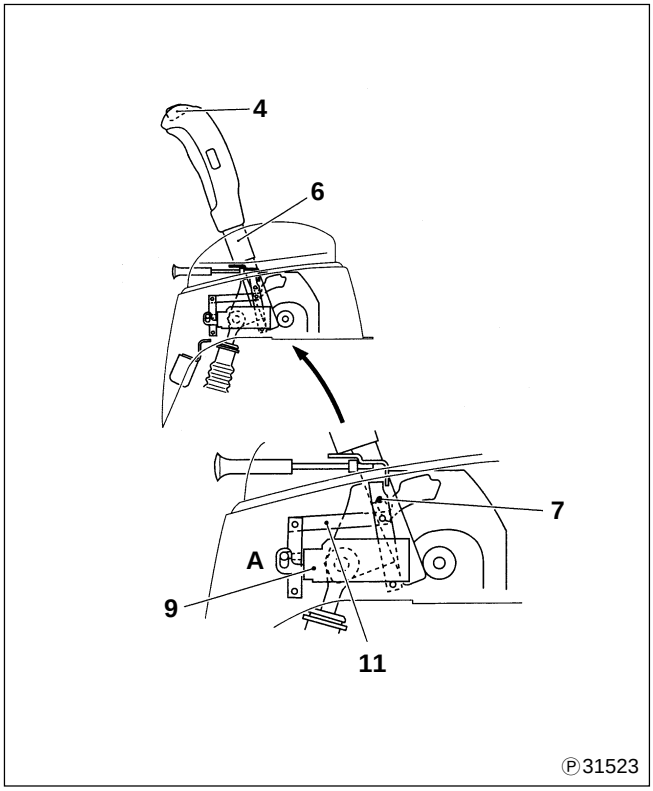
Condition: When selector lever **6** is in the P range and shift button **4** is not pressed, pin **7** presses against P range switch **13** (switch is activated). Therefore, the switch is OFF.

↓

No electric current flows from key interlock electronic control unit **18** to key interlock solenoid **1**. Therefore, the key interlock solenoid is OFF.

↓

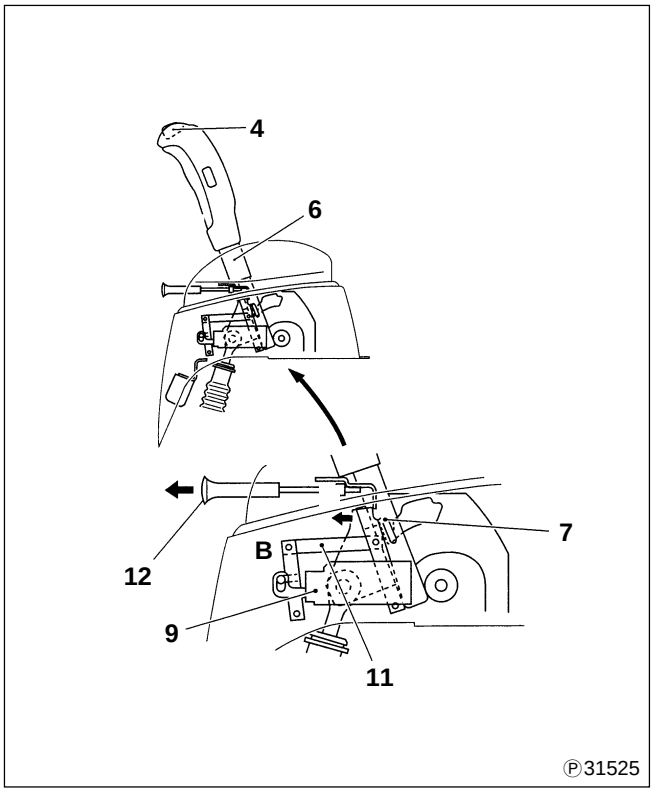
Key interlock solenoid **1** does not turn ON, thereby disengaging starter switch **2** and allowing the switch to turn to the LOCK position for the removal of the key.



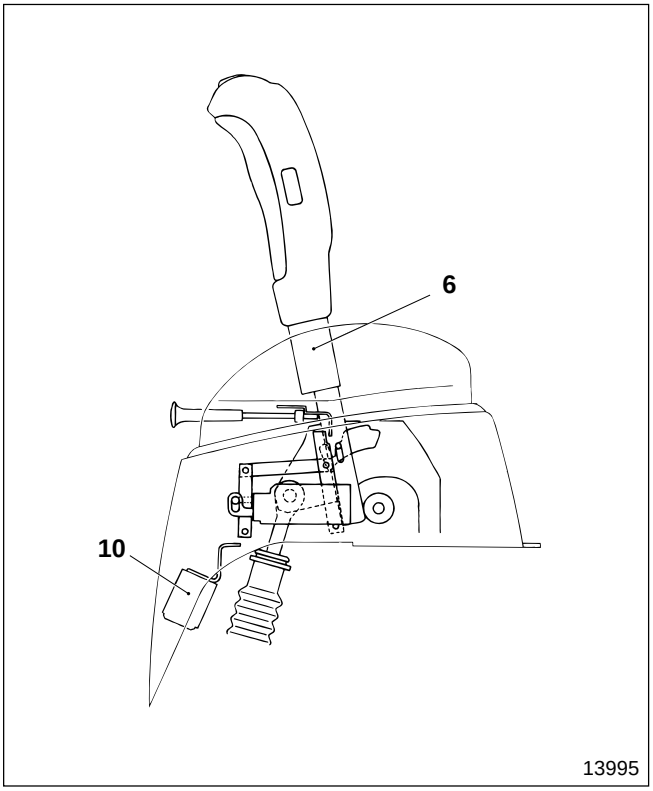
P shift lock device

- With selector lever **6** in the P range, when the electric current (see the table below) supplied to shift lock actuator **9** sets the shift lock actuator in lock position **A**, pin **7** is restrained by shift lock link **11** and disallows pressing of shift button **4**. Therefore, the selector lever cannot be moved from the P range.

Power supply		Switch		Operation mode	
IGN	+B	Brake	P range	Unlock	Lock
○	○	○	○	○←	
○	○		○		→○
○	○	○		○	
○	○			○	
	○	○	○		→○
	○		○		→○
	○	○		○	
	○			○	



- With selector lever **6** in the P range, when the electric current (see the above table) supplied to shift lock actuator **9** sets the shift lock actuator in unlock position **B**, shift lock link **11** is in the forward position to set pin **7** free, thus allowing pressing of shift button **4**. Therefore, the selector lever can be moved from the P range to another range position.
- Should an electrical problem occur and hinder proper operation, pulling of shift lock release knob **12** overrides the P shift lock.



● **Selector lever reverse position warning device**

When starter switch **2** is ON, moving selector lever **6** to the R (reverse) range activates the reverse position detecting switch (inhibitor switch: built into automatic transmission) and turns on automatic transmission reverse buzzer **10** to warn the driver that the selector lever is in the reverse position.

TROUBLESHOOTING PROCEDURES

Automatic transmission problems can be caused by the following malfunctions.

- Engine malfunction
- Improperly adjusted parts
- Faulty hydraulic system
- Faulty mechanical functions
- Faulty electrical system

When diagnosing the above abnormalities, be sure to inspect the following basic items.

- Engine condition
- Automatic transmission fluid level and condition: 🕮 P23-58
- Range selector cable adjustment

In addition to the inspection of the above items, use the self-diagnosis function to locate the cause of the problem and take necessary measures.

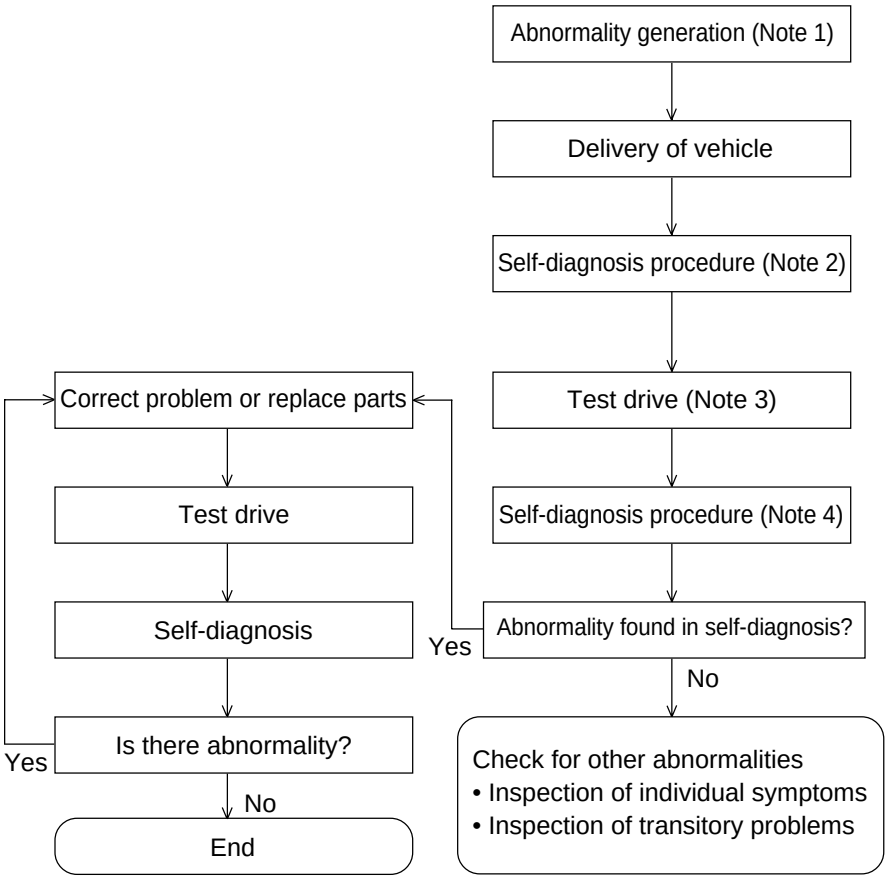
After repair is complete, test-drive the vehicle to determine whether the problem is corrected or further inspection is necessary.

If the cause of the problem cannot be located, or if repair work does not correct the problem, conduct a line pressure test and a stall test. 🕮 P23-52, 54

It should be noted that special knowledge and tools are required to repair the automatic transmission unit or replace parts. Therefore, conduct an inspection for the purpose of evaluating the operating condition of the transmission. For maintenance or repair of the automatic transmission, contact your nearest authorized Mitsubishi dealer or distributor.

Use of the MUT-II allows efficient inspection of the automatic transmission system.

Self-diagnosis process



Note 1 : The following abnormalities significantly lower driving performance. In the case that these abnormalities generate during operation, the automatic transmission warning lamp lights.
- Faulty operation of vehicle speed sensors
- Faulty operation of solenoid other than lock-up solenoid
- Faulty operation of accelerator sensor
- Faulty operation of inhibitor switch
- Faulty throttle position PWM signal

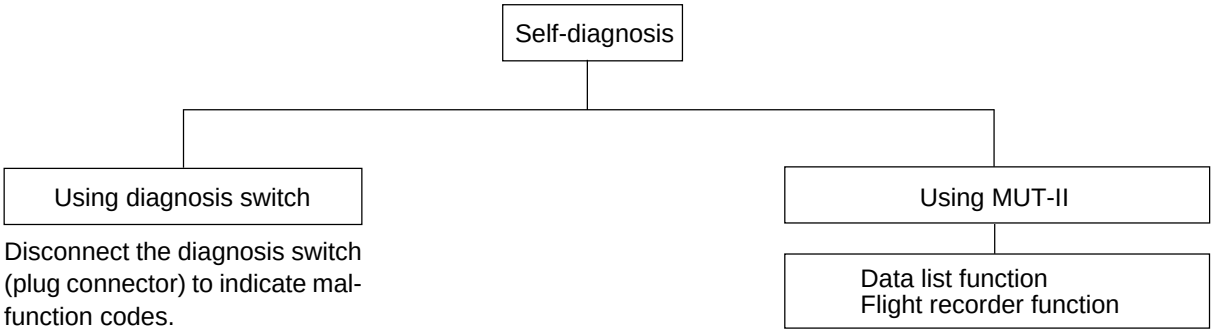
Note 2 : Inspect for malfunctions that occurred during user operation. Record inspection results.

Note 3 :
- Check abnormal conditions.
- In a test drive, operate the accelerator pedal in full range (from the released position to full throttle) with a vehicle speed of up to approximately 50 km/h {31.1 mph}.

Note 4 : Inspect problems that generate during a test drive. Record inspection results.

Types of Self-Diagnosis

The following two types of self-diagnosis function can be selected.



Disconnect the diagnosis switch (plug connector) to indicate malfunction codes.
Data of malfunctions stored in the memory can be deleted with the memory clear switch.

Connect the MUT-II to the automatic transmission electronic control unit via the data plug connector to download and display malfunction codes.
In addition to the self-diagnosis function, the MUT-II is equipped with a data list function that indicates sensor and switch values and a flight recorder function that records those data for a certain length of time before and after the triggering. These functions are useful in analyzing malfunctions.
(Refer to the MUT-II operation manual.)

Using diagnosis switch to recall diagnosis codes and using memory clear switch to delete diagnosis codes

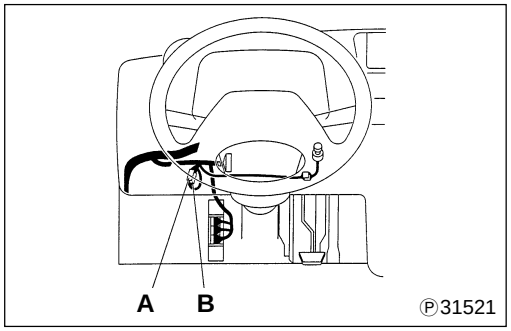
The diagnosis switch is used for the analysis of malfunction, and the memory clear switch allows deletion of stored diagnosis codes.

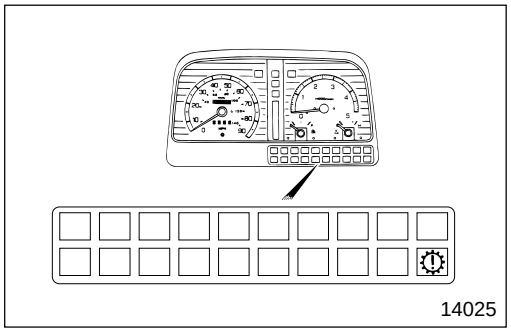
● **Recalling diagnosis code** 📖 P23-42

- Pull out the diagnosis switch to recall the diagnosis code of the current problem from the electronic control unit's memory.
- Pull out the diagnosis switch and memory clear switch to recall the diagnosis codes of the current and past problems from the electronic control unit's memory.

● **Deleting diagnosis codes** 📖 P23-43

Pull out and reinsert the memory clear switch to delete the diagnosis codes stored in the electronic control unit's memory.





● **Procedure for recalling diagnosis codes**

[Current diagnosis code]

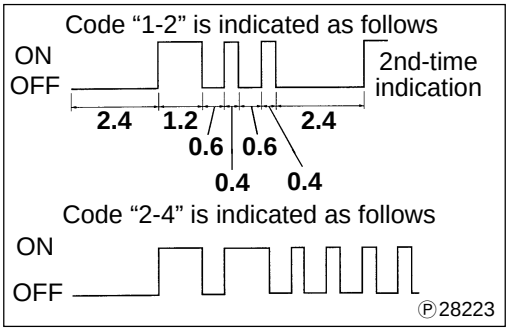
- Turn on the starter switch.
- Remove diagnosis switch **A** (plug connector). The warning lamp begins flashing. The flashing pattern indicates a diagnosis code. Check the code list to locate the problem location. 📖 P23-44

[Current and past diagnosis codes]

- Turn on the starter switch.
- Remove diagnosis switch **A** (plug connector) and memory clear switch **B** (1-pin connector). The warning lamp begins flashing to indicate diagnosis codes.
- The warning lamp indicates the diagnosis codes of past malfunctions and the diagnosis code of the current problem, if any.

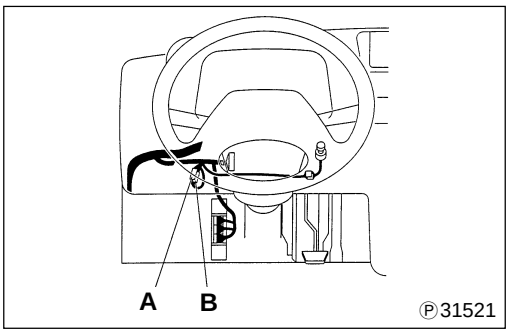
CAUTION ⚠

If diagnosis switch A is connected first, diagnosis codes in the electronic control unit's memory are deleted, and a "01" (normal) code is indicated.



● **Procedure for reading diagnosis codes**

- The automatic transmission electronic control unit’s memory is stored with the data of all malfunctions that occurred after the previous self-diagnosis operation.
- The warning lamp turns off for 2.4 seconds after the self-diagnosis operation starts, then indicates a code.
  - The tens digit is indicated by 1.2-second ON operation and 0.6-second OFF operation.
  - The ones digit is indicated by 0.4-second ON operation and 0.6-second OFF operation.
  - The lamp remains OFF for 2.4 seconds between codes.
- If there are two or more malfunction codes in the memory, they are output in an order from the smallest code number. Each malfunction code is indicated three times before the following code is output.
- After all malfunction codes in the memory are output, the indication process repeats from the beginning.



● **Procedure for deleting diagnosis codes**

- Keep diagnosis switch **A** (plug connector) connected.
- Turn on the starter switch.
- Disconnect memory clear switch **B** (1-pin connector). After more than one second, connect the memory clear switch. When the memory clear switch remains connected for more than three seconds, diagnosis codes in the electronic control unit are deleted.

● **Diagnosis Code Chart**

Diagnosis code	Problem location	Judgement criterion	Fail-safe measure
01	Normal		
11	Power supply voltage	Power supply voltage remains below 7.5 V for 1 second or longer with range selector in a position other than P or N range.	
12 < FE640 >	Vehicle speed sensor 1	• Vehicle speed sensor 1 indicates sudden speed decrease.	• Maintains the gear selected immediately before malfunction. • Turns off shift solenoids 1, 2 when engine speed sensor detects a value or less than 1000 rpm.
13	Oil temperature sensor	When oil temperature of more than 135°C {275°F} or lower than -50°C{-58°F} is detected. Note that MUT display is fixed at “40°C {104°F}” after fail-safe judgement result.	Maximum oil temperature
15	Engine speed sensor	Engine speed sensor detects a value of less than 300 rpm when range selector is in a position other than P or N range and when output shaft rotating speed is 1000 rpm or higher.	Prohibits 2-3 shift timing control.
24 < Except FE640 >	Accelerator sensor	• When accelerator sensor voltage is less than 0.4 V, or 4.6 V or higher	• Shift-point is set at 0% throttle opening. • Prohibits throttle learning function. • Prohibits 2-3 shift timing control. • Line pressure at maximum • Lock-up control change
24 FE640		• When accelerator sensor signal input to engine ECU is faulty	• Shift-point is set at 0% throttle opening. • Prohibits 2-3 shift timing control. • Executes controls assuming that throttle pressure is at maximum. • Prohibits lock-up control (lock-up solenoid OFF) except during driving at high speeds.
25	Vehicle speed sensor 2	• Vehicle speed sensor 2 indicates sudden speed decrease.	• Maintains the gear selected immediately before malfunction detection. • Turns off shift solenoids 1, 2 when engine speed sensor detects a value of less than 1000 rpm.
31	Shift solenoid 1	• When solenoid output short-circuit occurs while solenoid is receiving current. • When solenoid output disconnection occurs while solenoid is not receiving current.	• Turns off malfunctioning shift solenoid. • Turns off lock-up solenoid and timing solenoid. • Refer to the chart on P23-54 for gear selection.
32	Shift solenoid 2	• When solenoid output short-circuit occurs while solenoid is receiving current. • When solenoid output disconnection occurs while solenoid is not receiving current.	• Turns off malfunctioning shift solenoid. • Turns off lock-up solenoid and timing solenoid. • Refer to the chart on P23-54 for gear selection.
34	Line pressure solenoid	When wire breakage or short-circuit occurs.	Turns off line pressure solenoid.
35	Lock-up solenoid	• When solenoid output short-circuit occurs while solenoid is receiving current. • When solenoid output disconnection occurs while solenoid is not receiving current.	Turns off lock-up solenoid.

● **Diagnosis Code Chart**

Diagnosis code	Problem location	Judgement criterion	Fail-safe measure
43	Inhibitor switch	• No signal	Operates as D range and prohibits shifting to 4th gear.
		• Two or more signals	• Control function activates based on priority order of L > R > 2 > D > N (P). • Refer to pages 23 through 54 for actual vehicle operation conditions.
50	PTO solenoid	When solenoid output short-circuit occurs while solenoid is receiving current.	Turns off PTO solenoid.
		When solenoid output is cut off while solenoid is not receiving current.	
51	Timing solenoid	• When solenoid output short-circuit occurs while solenoid is receiving current.	Turns off timing solenoid.
		• When solenoid output disconnection occurs while solenoid is not receiving current.	
54	Exhaust brake cut-off signal	Exhaust brake activates when exhaust brake cut-off signal is generated.	• Prohibits exhaust brake cut-off control • Allows lock-up only at high cruising speed.
58 < Except FE640 >	PWM signal	Malfunction of engine electronic control unit (PWM signal fixed at 1 V or lower)	Shift-point is set at 0% throttle opening. Prohibits 2-3 shift timing control. Line pressure at maximum Prohibits throttle position learning function.
		Wire breakage or short-circuit	Prohibits throttle position learning function.

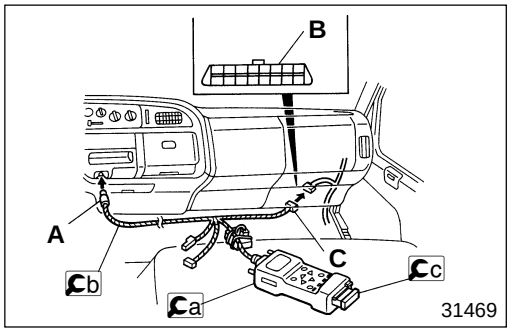
—	MUT-II harness  19141	MK327601	
—	ROM pack (MRT-E8.1)  19493	MH063580	



● **Connecting the MUT-II**

- Turn the starter switch to the LOCK position.
- Connect the b MUT Communication Harness to the a MUT-II, and insert the c ROM Pack.
- Plug connector **A** into the cigarette lighter socket.
- Fit connector **C** into Mut connector **B** (16-pin).

NOTE

Instructions for operation of the MUT-II are given in the separate MUT-II Reference Manual.

● **Inspection using MUT-II**

①The MUT-II indicates diagnosis codes that provide information of malfunctioning items (devices that require inspection).

②The MUT-II indicates sensor signal conditions with numerical values (service data). Comparison of the service data with judgement criteria allows evaluation of the transmission operation. Diagnosis codes and service data codes can be effectively used for troubleshooting.

Stall Test

● **Purpose**

To check wearing of gears, slippage of one-way clutches, operation of torque converter and overall performance of the engine.

● **Measuring procedure**

Before the test, inspect the engine coolant, engine oil and automatic transmission fluid. Run the engine until the engine coolant temperature reaches an appropriate level. Also conduct a warm-up operation for the automatic transmission and bring the automatic transmission fluid temperature to an appropriate level.

- Place wheel chocks in front and back of all wheels, and apply the parking brake. When operating the accelerator pedal, be sure to press down firmly on the foot brake pedal.
- Shift the range selector lever to the D range.
- Press down on the accelerator pedal gradually to full throttle. When the engine speed stabilizes, quickly read the engine rpm (stall speed) and remove foot from the accelerator pedal.

CAUTION ⚠

- **Limit each measuring operation to five seconds. Extended testing causes automatic transmission fluid degradation and adverse effects to the internal parts.**
- **If the engine speed does not stabilize but continues to increase or suddenly jumps, stop the test immediately.**

- Shift the range selector lever to the N range, and let the engine run at approximately 1200 rpm for one minute or longer for cooling.
- Conduct tests in the same way with the range selector lever in each of the 2, L and R ranges.
- Stall speed

FE 639	1810±150 rpm
FE 649, FG 639	1890±150 rpm
FE 640	2070±150 rpm

● **Diagnosis of test result**

Measuring result	Suspected abnormality
Lower than standard value in all ranges	Insufficient engine output power
	Faulty operation of one-way clutch in torque converter
Higher than standard value in D range	Slippage of front clutch
	Faulty operation of No. 2 one-way clutch
	Low line pressure
Higher than standard value in R range	Slippage of rear clutch
	Slippage of 1st and reverse brake
	Low line pressure
Higher than standard value in all range	Low line pressure
	Inappropriate automatic transmission fluid level
	Slippage of overdrive direct clutch
	Faulty operation of overdrive one-way clutch

Time Lag Test

● **Purpose**

To check the conditions of overdrive direct clutch, front clutch, rear clutch and 1st and reverse brake.

● **Measuring procedure**

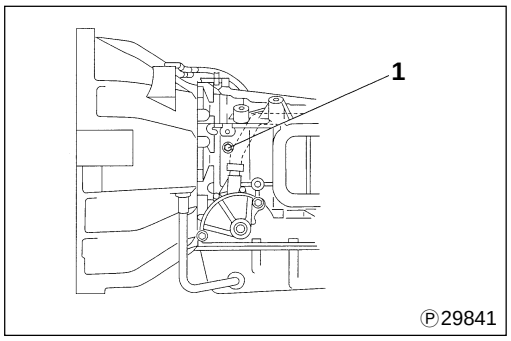
- Bring the oil temperature to normal operating level of between 50 and 80°C {122 and 176°F}.
- Start the engine and check the idle speed.
- Shift the range selector lever from the N range to the D range and use a stopwatch to measure the time it takes for shock to be felt.
- In the same way, measure the time lag by shifting the range selector lever from the N range to the R range.

	Standard value
N→D shifting	0.7 sec or less
N→R shifting	1.2 sec or less

● **Diagnosis of test result**

Measuring result	Suspected abnormality
Large time lag in N→D shift	Low line pressure
	Slippage of front clutch
	Faulty operation of overdrive one-way clutch
Large time lag in N→R shift	Low line pressure
	Slippage of rear clutch
	Slippage of 1st and reverse brake
	Faulty operation of overdrive one-way clutch

Line Pressure Test



● **Purpose**

To check the oil pump capacity, control valve functions and leaks in hydraulic circuit.

● **Measuring procedure**

CAUTION ⚠

The line pressure test requires two persons. One person must observe tire movement and wheel chocks from outside the vehicle, while the other person conducts the test.

- Apply the parking brake firmly.
- Place wheel chocks.
- Remove pressure detecting plug **1**, and mount the oil pressure gauge.
- Start the engine, and operate it until the automatic transmission fluid temperature reaches between 50 and 80°C {122 and 176°F}. Then, check the idle speed.
- While pressing the brake pedal firmly with the left foot, shift the range selector lever to the D range and measure the oil pressure while the engine is idling.
- Press the accelerator pedal all the way, and quickly measure the oil pressure at stall speed.

CAUTION ⚠

If the engine RPM's do not reach stall speed and the rear wheels start rotating, release the accelerator pedal and stop the test.

- Measure the oil pressure with the range selector lever in the R range by following the above procedure.
- After the measurement, re-install pressure detecting plug **1** and tighten to the specified torque.

Pressure detecting plug	Bolt size	1/2-20UNF
	Tightening torque	7.5 N·m {5.5 ft.lbs, 0.76 kgf·m}

● **Line pressure** kPa {psi, kgf/cm^2}

	R range	1401 to 2107 {205 to 305, 14.3 to 21.5}

● **Diagnosis of test result**

Measuring result	Suspected abnormality
Higher than standard value in all ranges	Faulty adjustment of throttle cable
	Sticking of regulator valve
	Sticking of throttle valve
Lower than standard value in all ranges	Faulty adjustment of throttle cable
	Sticking of regulator valve
	Sticking of throttle valve
	Excessive wear of oil pump
	Faulty overdrive direct clutch
Lower than standard value only in D range	Oil leak in D range system
	Faulty front clutch
Lower than standard value only in R range	Oil leak in R range system
	Faulty rear clutch
	Faulty 1st and reverse brake

Road Test

● **Measuring procedure**

Before the road test, check the level and condition of the automatic transmission fluid. Also make sure that the range selector cable and the accelerator control cable are properly adjusted.
Operate the automatic transmission in every range position during the road test and check slippage and other operating conditions during shifting of gears.
Check to see if the shift feels too tight or too loose.
Check the shift points of up-shifting and downshifting.
Check shift-point vehicle speeds under various driving conditions.

- 5.285 differential gear ratio, 0.374 m tire radius (215/85R16) < FE640 >
- 5.714 differential gear ratio, 0.374 m tire radius (215/85R16) < FG639 >

If the differential gear ratio and/or the tire radius are different from the above, proper standard values must be calculated based on the ratios of the differences and the above figures.

Inspection of Automatic Transmission Fluid (ATF)

If the automatic transmission has insufficient ATF, the pump draws air together with ATF. Air bubbles mixed in the ATF cause a “sponge” effect and lower the pressure. This can cause slipping of internal clutches.
On the other hand, if the ATF level is too high, excess air bubbles also result when rotating parts agitate the ATF, thus causing the same effect as when the ATF level is low.
In both cases, excess air bubbles lead to overheat, oxidation of oil and varnish generation, thereby hindering proper operation of the valves and clutches.
Excess air bubbles in the ATF also cause ATF to overflow from the vent hole and filler tube, which may be mistakenly diagnosed as an ATF leak.
To prevent these problems, read the ATF level accurately by following the procedure described below.

(1) Inspection of ATF condition

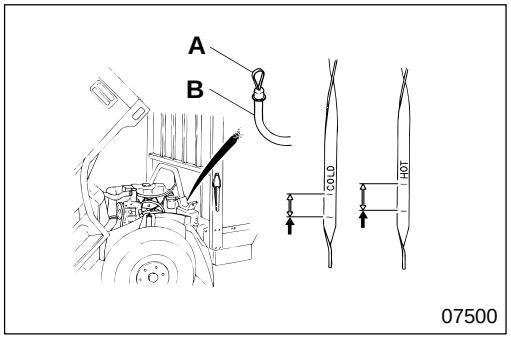
If ATF has a burned odor and contains metal shavings or particles, the automatic transmission needs an overhaul. Closely inspect the ATF adhered on level gauge **A**.
If ATF is suspected to be in poor condition, take out a sample and inspect closely.

(2) Inspection of ATF level

CAUTION ⚠

- **Inspection is conducted while the engine is running. Be careful of moving parts and hot areas to prevent personal injuries and burns.**
- **Before inspection, check the idle speed.**
- **Place the vehicle on level ground.**
- **Bring the transmission to normal operating temperature (70 to 80°C {158 to 176°F}) before inspection.**
- **Before pulling out level gauge A, clean the protective cap and the upper part of the filler tube B.**

- Apply the parking brake firmly, and place wheel chocks.
- With the engine idling, press down on the brake pedal and shift the range selector lever slowly from the P range to the L range, stopping at each position in between. Then return the range selector lever to the P range.
- With the engine idling, pull out level gauge **A**. Wipe the ATF from the level gauge and blow compressed air to remove lint and other particles. Insert the level gauge, and pull it out. Check to make sure that the ATF level is in the range marked “HOT.”

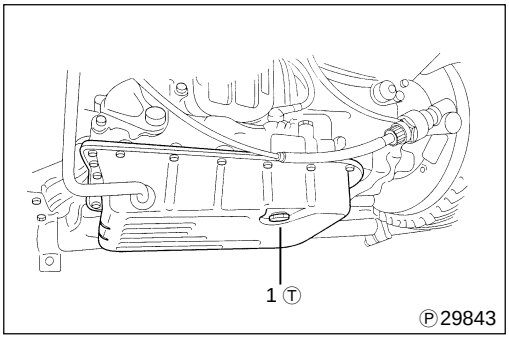


CAUTION ⚠

- **If the ATF temperature is low (20 to 30°C {68 to 86°F}), such as after an ATF change, bring the ATF level to the area on the level gauge marked “COLD.” Then, after the transmission temperature rises to normal operating level (70 to 80°C {158 to 176°F}), check to make sure that the ATF level is in the area on the level gauge marked “HOT.”**
- **If the markings on the front and back sides of the level gauge show different level indications, use the line that indicates the lower ATF level.**

- If the ATF level is low, add ATF from the filler tube **B** to the specified level on level gauge **A**.

Changing Automatic Transmission Fluid (ATF)



(1) Drain

- Place an ATF receiving tray under the automatic transmission oil pan. Remove the drain plug located at the back side of the pan to drain ATF.
  Tightening torque: 27 N·m {20 ft.lbs, 2.8 kgf·m}

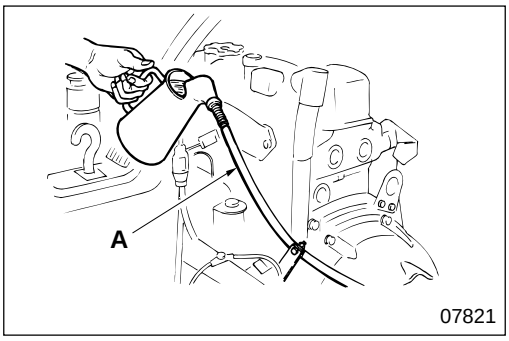
CAUTION ⚠

- **ATF is very hot immediately after the engine is turned off. Wait until the ATF temperature lowers sufficiently.**
- **For faster ATF drainage, warm up the engine.**
- **ATF in the hydraulic circuit, torque converter and oil cooler cannot be drained in the above process.**
- **Inspect the drained ATF for dirtiness and contamination such as metal shavings and particles.**

- After the above process, approximately 1 L {1.1 qts} of ATF remains in the oil pan. If you wish to drain this remaining ATF, remove the oil pan. 🕮 P23-80

Amount of drained ATF

ATF drained by removing oil pan : Approximately 4.5 L {4.8 qts}
ATF drained by removing drain plug : Approximately 3.5 L {3.7 qts}



(2) Adding ATF

- Prepare new ATF.
- Re-install the oil pan drain plug and gasket.
- At filler tube **A**, add the same amount of ATF as drained.

CAUTION ⚠

Be careful not to let dust and other particles mix with ATF.

- Start the engine and let it idle for at least two minutes.
- Shift the range selector lever into every position, then back to the P range.

CAUTION ⚠

Do not rev up the engine in the above process.

- Check the ATF level. 🕮 P23-58

(3) ATF leaks

- Torque converter housing of the automatic transmission unit
- Check for leaking locations
  Since the torque converter and the surrounding area can be soiled with oil that leaks from the engine, inspect those areas carefully.
  ATF is red, so that it can be easily distinguished from engine oil.
- Before dismounting the automatic transmission, carefully examine if ATF leaks from the torque converter or the automatic transmission unit (oil seal of oil pump housing or connection of oil pump housing and case).

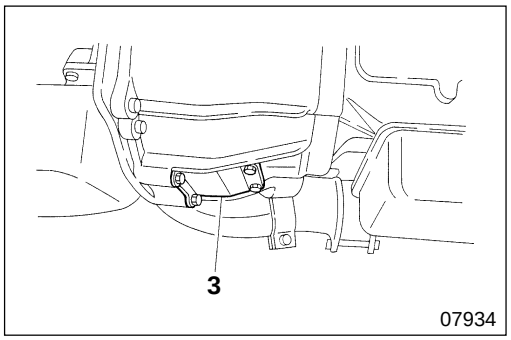
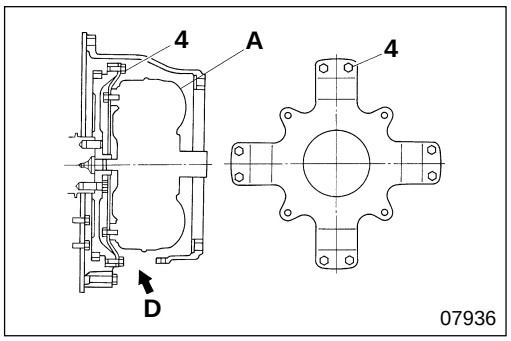
◆ Service procedure

9 Automatic transmission assembly

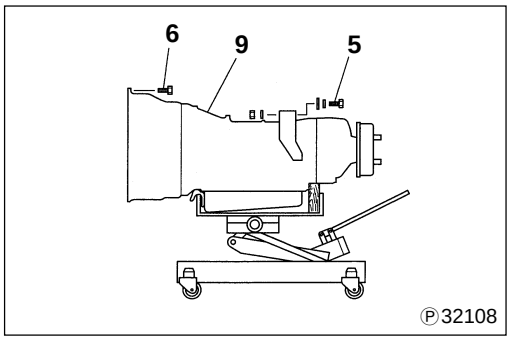


[Removal]

- Remove dust cover **3**.



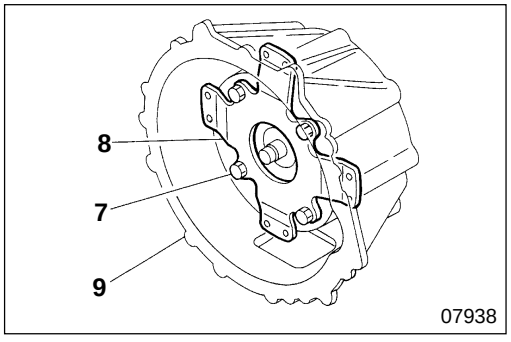
- Turn the engine so that bolt **4** is positioned at service window **D**.
- Remove eight bolts **4**. Remove two bolts at each of the four locations by turning the engine and stopping at the proper position.



- Support automatic transmission assembly **9** with a jack, then remove automatic transmission assembly mounting bolts **5**, **6**.
- Remove automatic transmission assembly **9** by pulling away from the back of the engine.

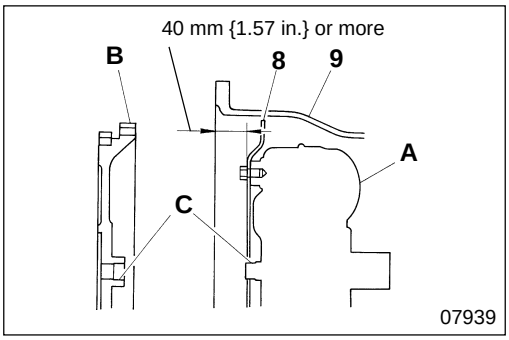
CAUTION ⚠

- **Do not support the automatic transmission by the oil pan, since it causes shape deformation of the oil pan and oil pan gasket.**
- **Since torque converter A can easily separate from the automatic transmission assembly, be careful not to drop the torque converter.**
- **Mounting bolts 6 are different in length. Record the length of each bolt when removing, so that bolts can be re-installed in the original locations.**

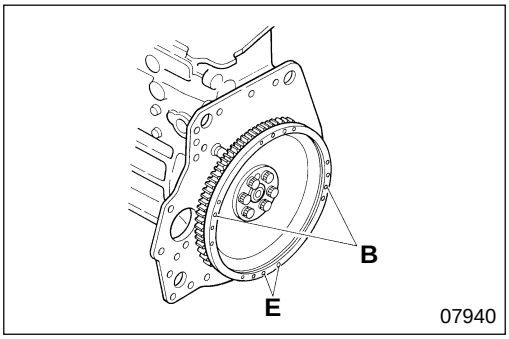


[Installation]

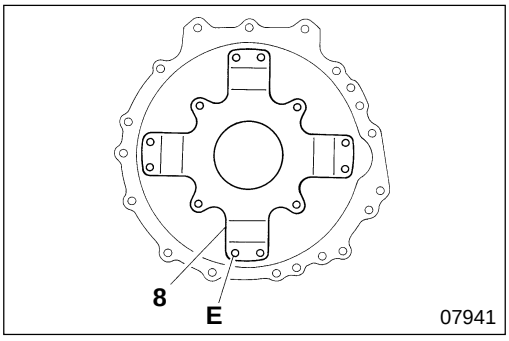
- Install drive plate **8** to torque converter **A** before installing the torque converter into automatic transmission assembly **9**.
  Tighten bolts **7** to the specified torque.



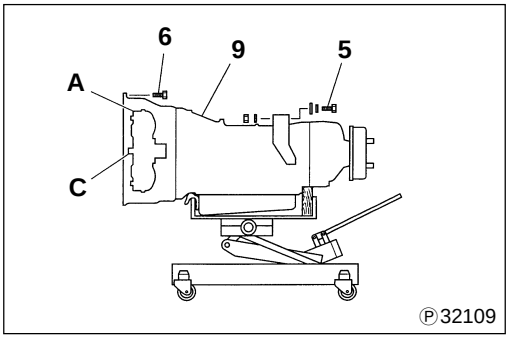
- Check to make sure that torque converter **A** is properly mounted in automatic transmission assembly **9**.
  When the torque converter is properly installed, the distance between the surface of drive plate **8** and the case mounting surface is as indicated in the diagram.
- Apply grease on pilot sections **C** of flywheel **B** and torque converter **A**.



- Turn flywheel **B** so that one of the bolt holes **E** on the flywheel is located at the lowest position. Bolt holes are used to connect the drive plate **8** to the flywheel.



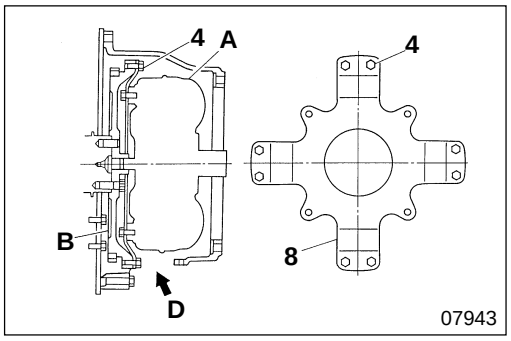
- Turn drive plate **8** so that one of the bolt holes **E** is located at the lowest position.



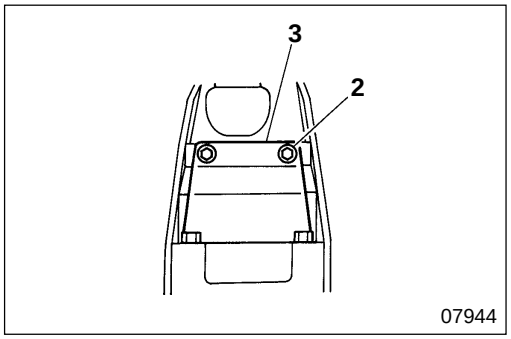
- Install automatic transmission assembly **9** into position slowly and carefully while aligning pilot section **C** and the dowel pin of the rear plate.
- Tighten several mounting bolts **6** on automatic transmission assembly **9** for temporary holding. Tighten bolts **5** to the specified torque to mount the automatic transmission assembly to the rear support.

CAUTION ⚠

- **Torque converter A can easily separate from the automatic transmission assembly 9. To keep the torque converter in place, set the back side of automatic transmission assembly slightly lower than the front part.**
- **Before mounting the automatic transmission assembly 9, wipe oil adhered on the internal wall of the torque converter housing.**



- Align the bolt holes of drive plate **8** and flywheel **B** by looking through service hole **D**, and mount bolts **4**.
- Temporarily tighten all eight bolts, two bolts at each of the four locations, by turning the engine and stopping at the proper position. Then, repeat the same process, and tighten the bolts to the specified torque.



- Tighten all automatic transmission assembly mounting bolts **6** to the specified torque.
- Tighten bolts **2** to the specified torque to secure dust cover **3** in place.

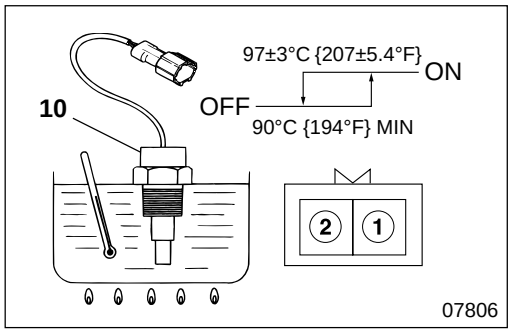
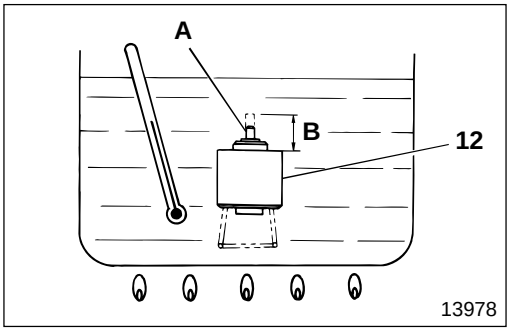
◆ Service procedure



10 **Inspection of automatic transmission fluid thermostat switch**

Carry out the following inspection and replace automatic transmission fluid thermostat switch **10** if there are any faults.

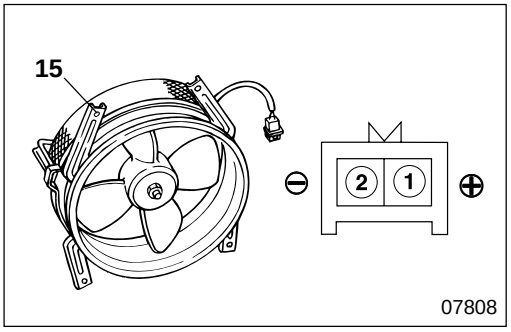
- Check that there is no continuity between terminals ① and ② at ambient temperature of 20±5°C {68±9°F}.
- Place automatic transmission fluid thermostat switch **10** in a container filled with automatic transmission fluid, and raise the temperature while stirring well.
  Measure the temperature when continuity has been achieved between terminals ① and ②, and check that the measured value conforms to the standard value.
- Lower and measure the temperature when continuity is lost between terminals ① and ②, and check that the measured value conforms to the standard value.



12 **Inspection of thermostat valve**

Carry out the following inspection. If any fault is found, replace thermostat valve **12**.

- Place thermostat valve **12** in a container filled with automatic transmission fluid and raise the fluid temperature while stirring the fluid.
  Make sure that end **A** starts stroking at a temperature of 76.5±3°C {170±5.4°F}.
- Raise the fluid temperature further and make sure that end **A** expands by 4.5 mm {1.18 in.} and dimension **B** in the illustration is 13.4 mm {0.53 in.} at a temperature of 83±2°C {181±3.6°F}.



15 **Inspection of blower assembly**

Check blower assembly **15** and make sure it operates when battery voltage is loaded between terminals ① and ②. If any fault is found, replace the blower assembly.

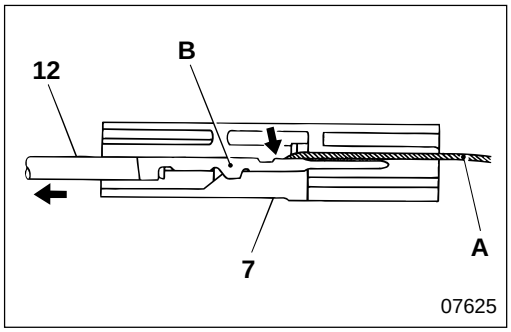
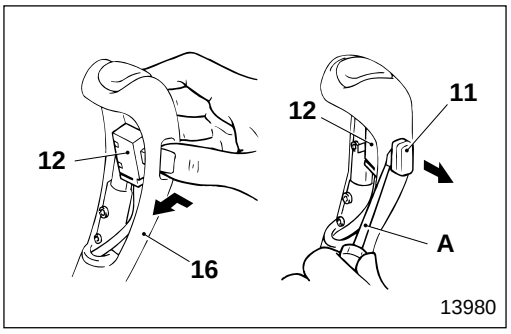
◆ Service procedure



7 **Removal of connector**

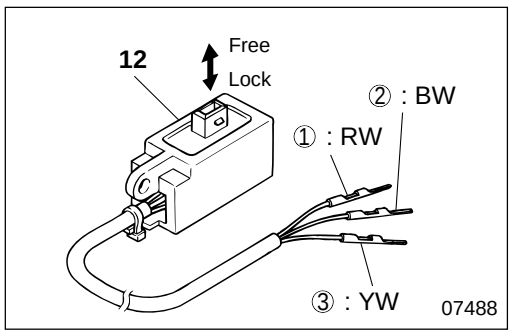
Using screwdriver **A**, pull out terminal **B** of overdrive OFF switch **12** from the inside of connector **7** and remove the connector.



11 **12** **Switch button, overdrive OFF switch**

[Removal]

- Using screwdriver **A**, remove switch button **11** from overdrive OFF switch **12**.
- Remove overdrive OFF switch **12** from automatic transmission knob **16** by pushing the switch out.

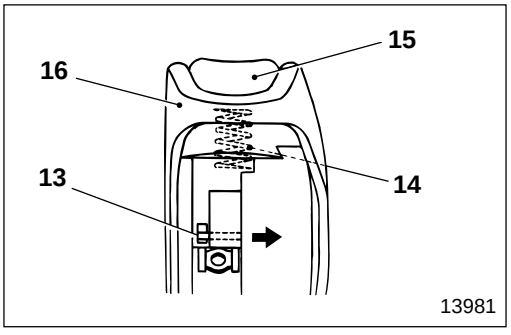


[Inspection of overdrive OFF switch **12**]

	① : RW	② : BW	③ : YW
Free	○		○
Lock	○	○	

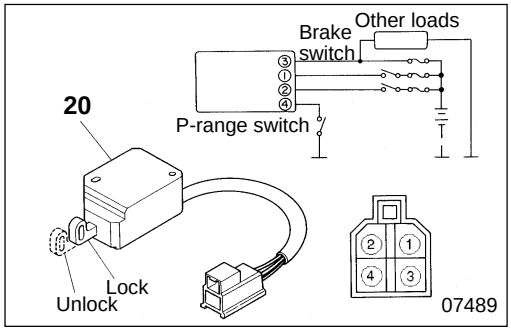
○——○ : There is continuity between terminals ○ and ○.

Replace overdrive OFF switch **12** if it is faulty.



13 **Removal of pin**

While keeping shift button **15** and spring **14** pressed down, remove pin **13** towards the inside (arrow direction) of automatic transmission knob **16**.



20 **Inspection of shift lock actuator**

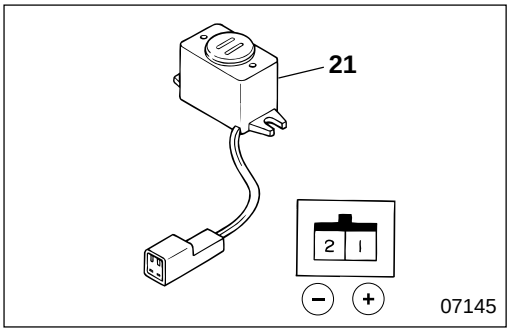
	○			○	

Check to make sure that shift lock actuator **20** is in operating mode under the above power supply and switch position.
Replace the shift lock actuator if it is faulty.

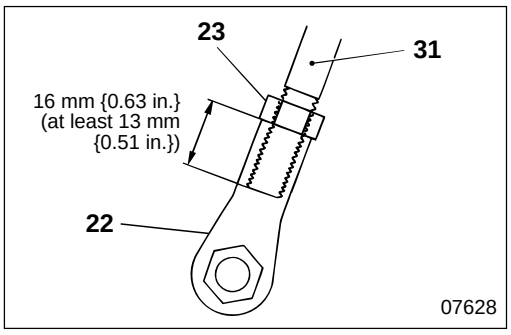


21 **Inspection of automatic transmission reverse buzzer**

- Check to make sure that the automatic transmission reverse buzzer sounds when 12 volts DC is loaded between terminals ① and ②.
- Replace automatic transmission reverse buzzer **21** if it is faulty.

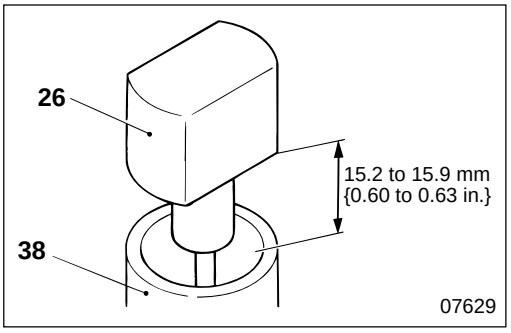
NOTE

- **Automatic transmission reverse buzzer 21 sounds continuously when you apply voltage.**
- **If you want to make automatic transmission reverse buzzer 21 sound intermittently, use the automatic transmission reverse buzzer and the back buzzer in combination.**



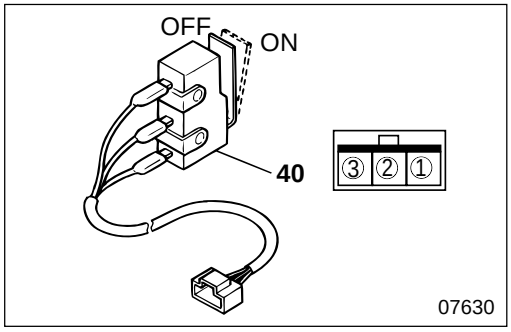
22 **Installation of ball joint**

Using ball joint **22** adjust rod **31** so that its thread ridge conforms to the dimensions as illustrated, then tighten with lock nut **23**.



26 **Installation of sleeve**

Shift range selector lever **38** to the P range. Install sleeve **26** by rotating it so that the dimension between the sleeve and the upper part of the lever conforms to the value as illustrated.



40 **P-range switch**

5 **Selection of spacer**

- Select the spacer so that when nut **4** is tightened at specified torque the clearance between lever bracket **9** and spacer **5** conforms to the dimensions as illustrated.
  There are two spacer thicknesses available : 0.3, 0.5 mm {0.012, 0.020 in.}
- After installation make sure lever **7** can be operated smoothly.

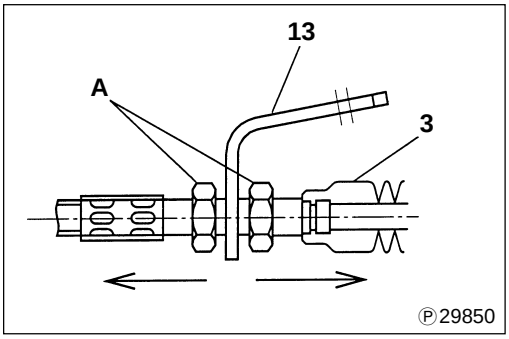
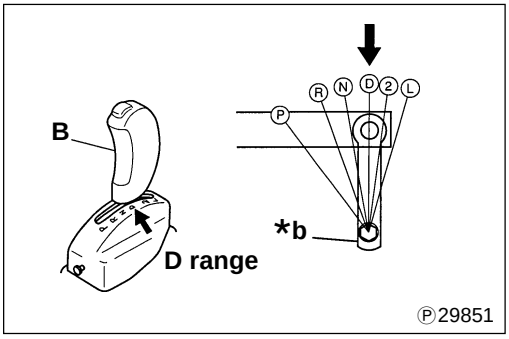
◆ Service procedure

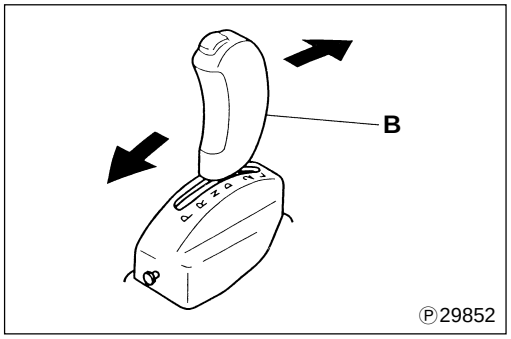


3 **Selector cable**

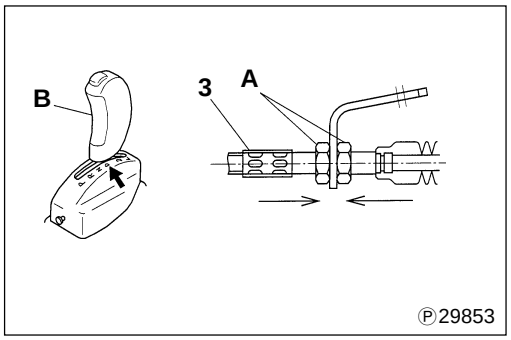
- Loosen nuts **A** on the selector cable **3** all the way to the ridges.



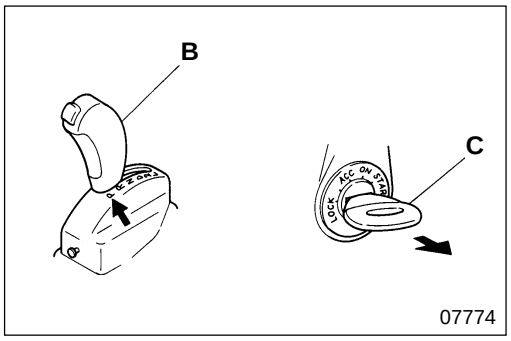
- Set automatic transmission lever knob **B** (located inside the cabin) and transmission control lever ***b** to the D range position.



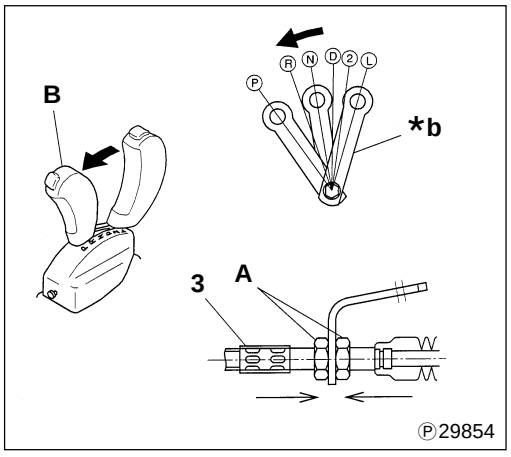
- Shake automatic transmission lever knob **B** back and forth.



- Check to make sure that automatic transmission lever knob **B** is in the D range, and tighten nuts **A** on selector cable **3** to the specified torque.



- Make sure that starter key **C** can be removed with automatic transmission lever knob **B** in the P range.



[Adjustment]

Adjust nuts **A** on selector cable **3** so that transmission control lever ***b** moves smoothly in the entire range when automatic transmission lever knob **B** is moved from the L range to P range.

CAUTION ⚠

If the adjustment of nuts A is improper, automatic transmission lever knob B produces resistance when it is moved to the L or P range. In some cases, the starter key cannot be removed with the automatic transmission lever knob in the P range.

REPLACEMENT OF AUTOMATIC TRANSMISSION PARTS

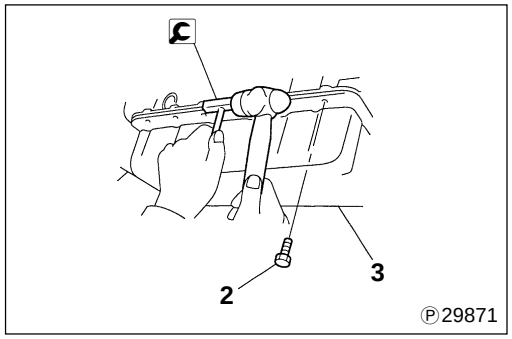
Special tools

Location	Tool name and shape	Part No.	Application
25	Oil seal installer  Ⓟ29857	MH063608	Installation of oil seal

◆ Service procedure



Ⓟ29871

3 Oil pan

[Removal]

- Remove bolts **2**.

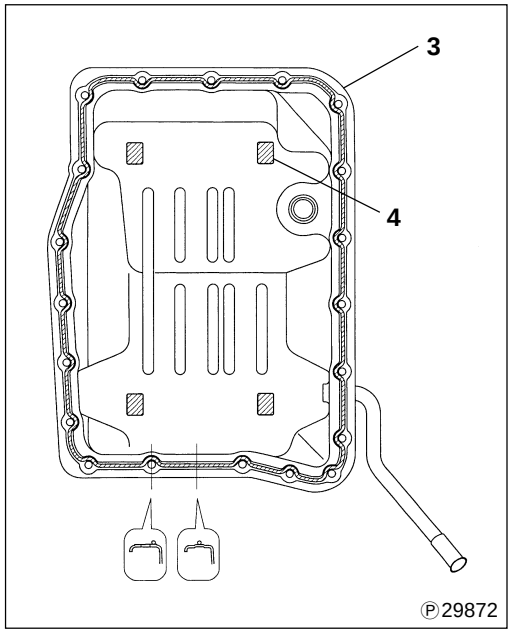
CAUTION

To prevent oil pan 3 from dropping when separating the sealant from the oil pan, keep several bolts (not tightened) mounted at intervals of three bolt holes.

- Insert oil pan remover at a corner of oil pan **3**, and separate the oil pan from the automatic transmission unit.

CAUTION

- **Be careful not to deform the shape of oil pan 3 when inserting oil pan remover.**
- **Do not tilt the oil pan during removal since the oil pan 3 contains oil.**



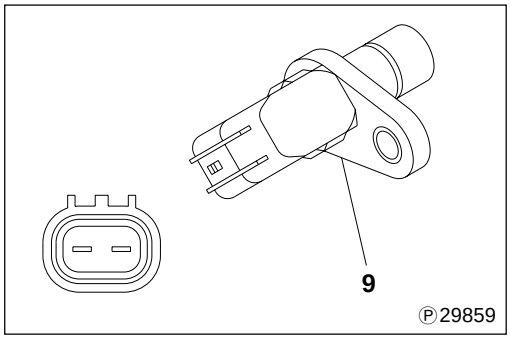
Ⓟ29872

[Installation]

- Remove the sealant from the mounting surfaces of the automatic transmission unit and oil pan **3**.
- Clean oil cleaner magnets **4**, and mount them in the oil pan.
- Apply sealant on oil pan **3**, and mount the oil pan on the automatic transmission unit.
- Tighten bolts **2** to the specified torque.

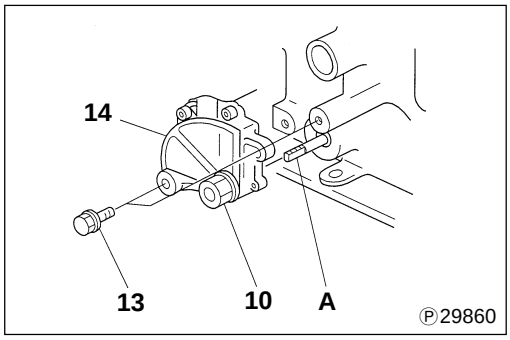
CAUTION

- **Do not allow automatic transmission fluid on the contact surfaces of oil pan 3 and the automatic transmission unit.**
- **Apply sealant continuously with a diameter of 2 or 3 mm {0.079 to 0.12 in.}, as shown in the diagram.**
- **Install the oil pan within 10 minutes after the application of the sealant.**
- **Tighten bolts 2 evenly by conducting the tightening operation for each bolt several times.**



9 Inspection of speed sensor

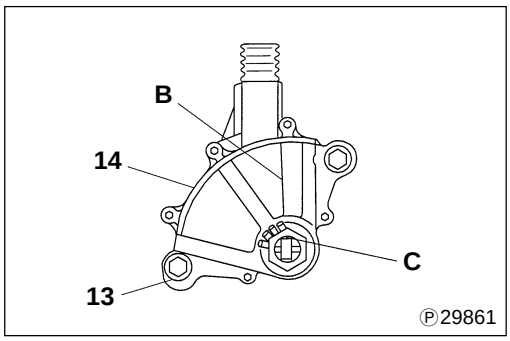
- Measure the resistance between the connector terminals shown in the diagram. If the measured value deviates from the standard value, the connector is defective.
- Standard resistance between terminals: 560 to 680 Ω (at normal temperature)



14 Inhibitor switch

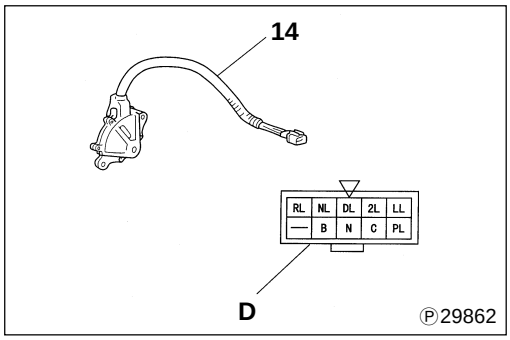
[Installation]

- Set control shaft **A** to the N position.
- Mount inhibitor switch **14** on control shaft **A**.
- Tighten two bolts **13**.
- Tighten nut **10**.



[Adjusting]

- Loosen two bolts **13**, and position inhibitor switch **14** so that reference line **B** on the inhibitor switch aligns with groove **C**.
- While holding inhibitor switch **14** with one hand, tighten two bolts **13** to the specified torque with the other hand.
- Bend the two lock tabs on the nut of inhibitor switch **14**.



[Inspection]

Check the electric conduction at wire connector **D** of inhibitor switch **14** using a tester.

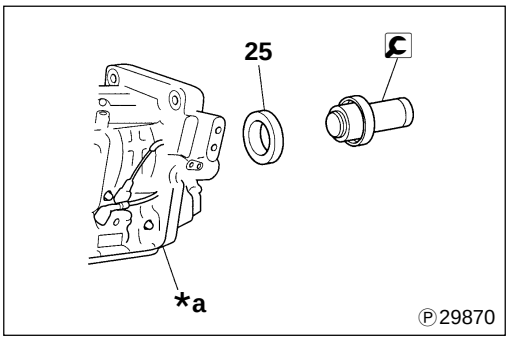
19 **Oil temperature switch**

Place oil temperature switch assembly **19** in a container filled with water. Vary the temperature of the water, and check to make sure that the switch operates (ON and OFF) at the specified temperatures.



25 **Installation of oil seal**

< FE >

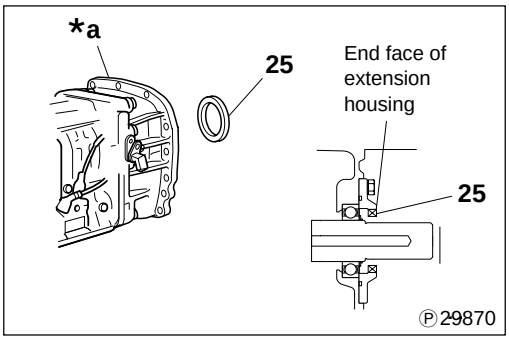
CAUTION

After the oil seal 25 is removed, clean the surface of the extension housing of automatic transmission unit *a to which oil seal is mounted.

- Apply grease on the lip section of oil seal **25**.
- Use oil seal installer to insert oil seal **25** all the way into the extension housing of automatic transmission unit ***a**.

CAUTION

- **Insert oil seal 25 evenly.**
- **Do not damage or deform the shape of oil seal 25.**



< FG >

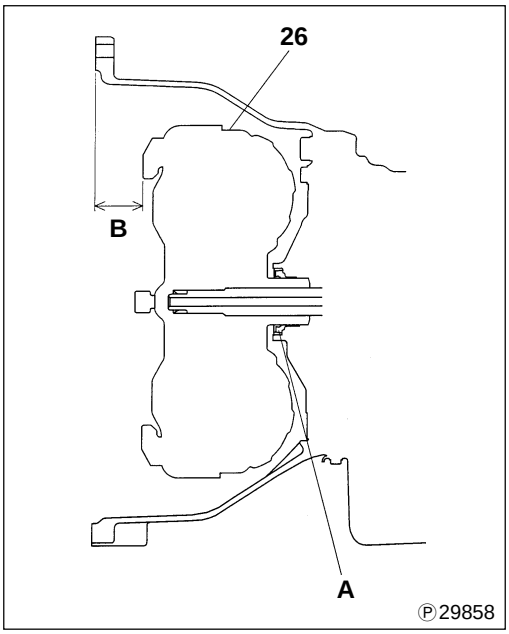
CAUTION

After the oil seal 25 is removed, clean the surface of the extension housing of automatic transmission unit *a to which oil seal is mounted.

- Apply grease on the lip section of oil seal **25**.
- Drive the oil seal **25** into the automatic transmission unit ***a** until its end face becomes flush with the end face of the extension housing.

CAUTION

- **Be sure to apply the installation force evenly on the entire periphery.**
- **Do not damage or deform the shape of oil seal 25.**



26 **Installation of torque converter**

- Pour new automatic transmission fluid into torque converter **26** when the torque converter to be installed is new.
  Automatic transmission fluid quantity : Approximately 2 L {2.1 qts}
- Apply automatic transmission fluid on front oil seal **A**, and mount torque converter **26** on the oil pump.

CAUTION

Be careful not to damage oil seal A when mounting torque converter 26.

- Measure dimension **B** between the torque converter housing and the set back of torque converter **26** to make sure that the torque converter is inserted into the proper depth.
  Dimension **B** : 44 mm {1.73 in.} or more

2 Accelerator sensor

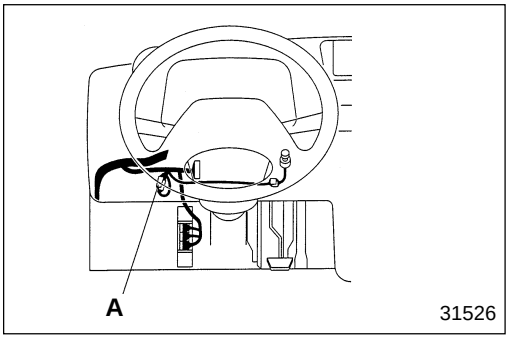
< Except FE640 >

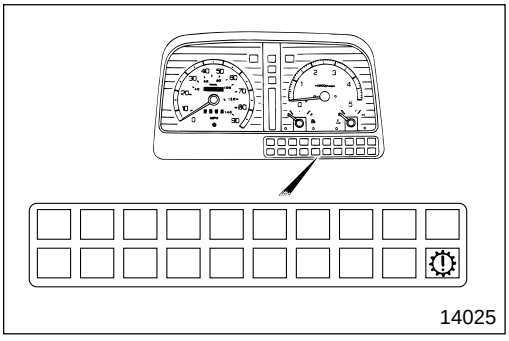
(1) Initial voltage data storage

When accelerator sensor **2** is dismounted or replaced, it is necessary to save the initial voltage value (full throttle) in the automatic transmission electronic control unit memory.

Check items

- Idle adjustment knob is appropriate.
- Accelerator sensor **2** are properly mounted. Gr 13B
- Make sure to apply the parking brake firmly.





Initial full-throttle voltage data storage

- Turn the starter switch to the ON position.
- Delete the data in the automatic transmission electronic control unit memory by keeping the following conditions for five seconds.
  Turn the starter switch to the ON position.
  Stop the vehicle (engine OFF).
  Shift the range selector lever to the L range.
  Turn off the overdrive OFF switch. (Overdrive OFF)
  Disconnect diagnosis switch (plug connector) **A**.
  Press on the brake pedal.
  Press on the accelerator pedal to full throttle.
  When data deletion is complete, the warning lamp flashes.
- Remove feet from the accelerator and brake pedals, and shift the range selector lever to the P range and connect diagnosis switch **A**.
- Hold the accelerator pedal at full throttle, and press down on the brake pedal for more than three seconds.
  During this process, the warning lamp lights for three seconds. After the full throttle position data is stored in the electronic control unit, the warning lamp turns off.
- After confirming that the warning lamp has turned off, remove feet from the brake and accelerator pedals. Then turn off the starter switch.
- If the warning lamp does not light, repeat the procedure from the beginning.

The transfer functions as both the distributer for four-wheel drive and as the sub-transmission with a reduction device. This transfer is a three-shaft constant-mesh type.
HIGH/LOW changeover and front drive ON/OFF are controlled by a transfer control lever in the cab.

◆ Service procedure

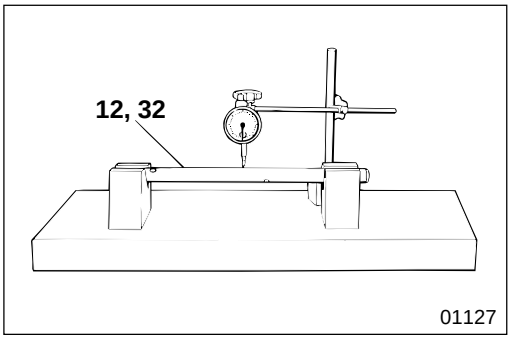
11 **25** **Removal and installation of set bolt**

Tighten shift fork mounting set bolt **11, 25** at specified torque, and stake the thread area at three points using a punch.

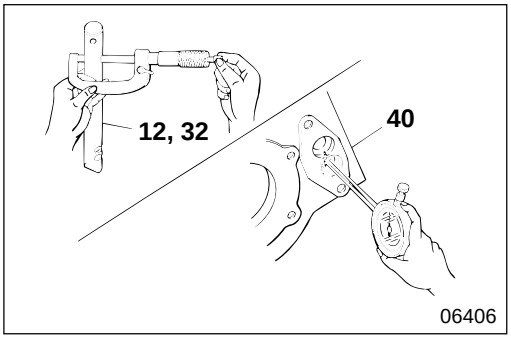


12 **32** **Inspection of shift rail**

If the measured value is higher than the limit, correct or replace shift rails **12**, **32**.

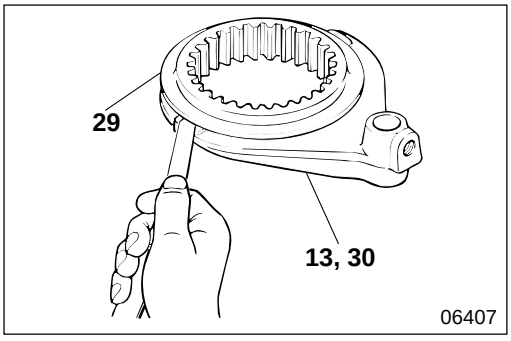
NOTE

To measure the deflection of shift rails 12, 32, turn them one full revolution and read the dial gauge indicator. The deflection is one half of the indicated value.



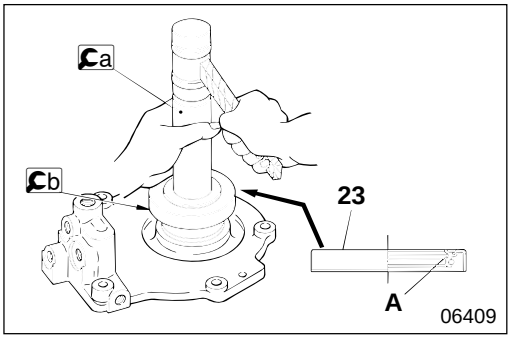
12 **32** **40** **Clearance between shift rail and transfer assembly rail hole**

Measure the outer diameter of shift rail **12**, **32** and the inner diameter of transfer assembly hole **40**. If the clearance is higher than the limit, replace faulty parts.



13 **29** **30** **Clearance between shift fork and synchronizer sleeve**

If the measured value is higher than the limit, replace faulty parts.



23 **Installation of oil seal**

Apply grease to lip area **A** of oil seal **23**, and press-fit it.

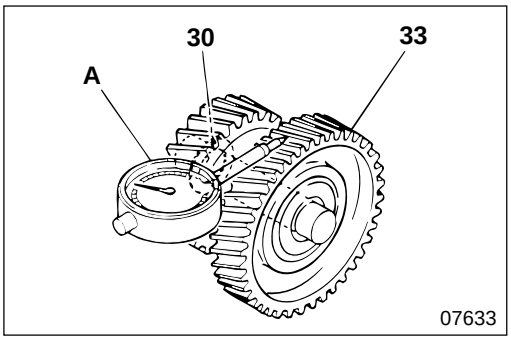
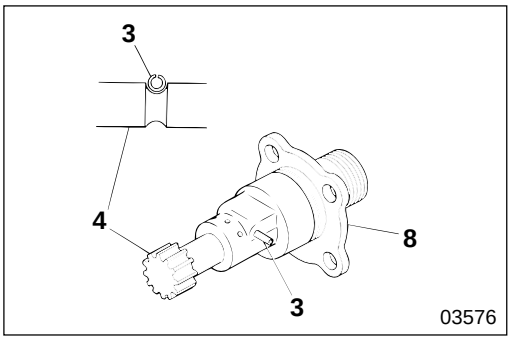
◆ Service procedure

Inspection before service



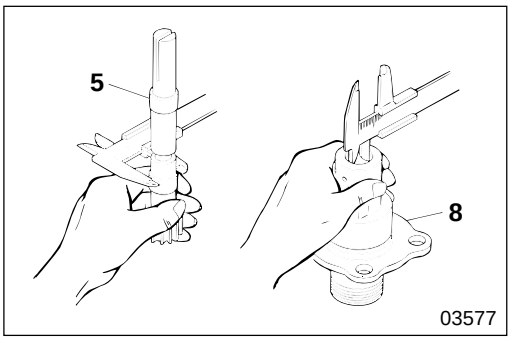
● **Starting torque of transfer idler gear**

- Disassemble parts, and measure the torque with push gauge **A** leaving only transfer idler gear **33** in transfer case.
  If the value deviates from the standard value, adjust it using shim **30**.
- On assembly, also check that starting torque is within the standard value range using the same method.
- Shim **30** is available in four thicknesses : 0.01 mm {0.00039 in.}, 0.02 mm {0.00079 in.}, 0.03 mm {0.0012 in.}, 0.06 mm {0.0024 in.}.



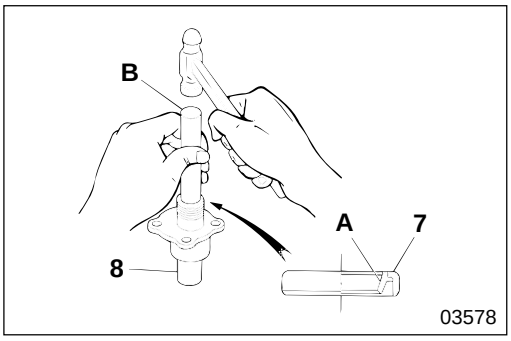
4 **Driving-in spring pin**

Drive spring pin **4** into speedometer gear bushing **8** with the opening in the opposite direction to speedometer gear **5**.



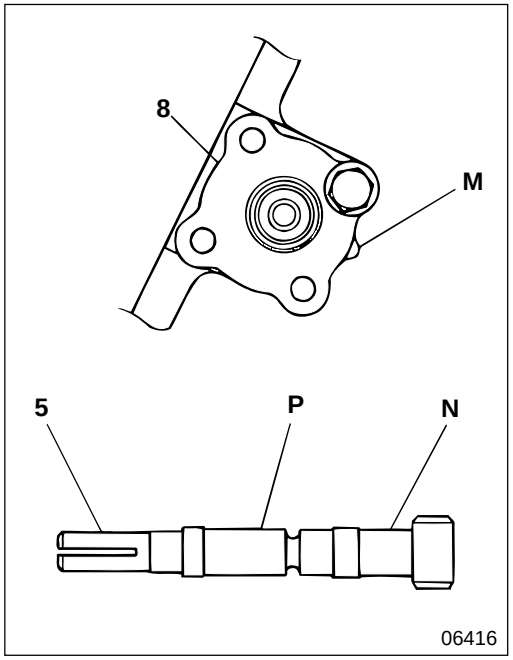
5 **8** **Clearance between speedometer gear and speedometer gear bushing**

If the clearance is higher than the limit, replace the faulty parts.



7 **Installation of oil seal**

Apply grease to lip area **A** of the inner rim of the oil seal, **7** and press-fit oil seal evenly into speedometer gear bushing **8** in the direction as illustrated using bar **B** (approximately ø15 mm {0.59 in.}).

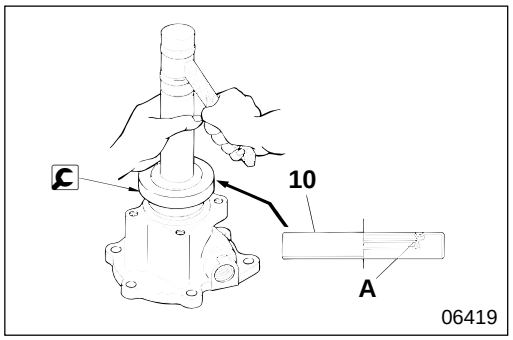


8 **Installation of speedometer gear bushing**

Due to its eccentric center arrangement, speedometer gear bushing **8** allows replacement of speedometer gear **5** with gears having a different number of teeth by changing only the installation direction, the worm gear does not have to be changed.
When installing the bushing, align the stamped number, identical to the number of speedometer gear teeth, with alignment mark **M** of output rear cover **11**.
The number of speedometer gear teeth can be identified by the identification marks stamped on **N** or **P**.

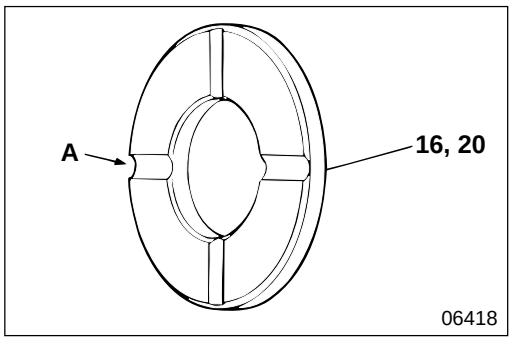
Identification mark and number of speedometer gear teeth

Identification mark	A	B	C	D	E	F	G	H	I	J	K	L
Number of teeth	15	16	17	18	19	20	21	22	23	24	25	26
Gear ratio	3.0	3.2	3.4	3.6	3.8	4.0	4.2	4.4	4.6	4.8	5.0	5.2



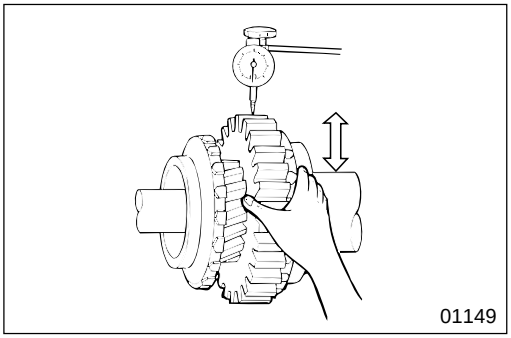
10 **Installation of oil seal**

Apply grease to lip area **A** of oil seal **10** and press-fit it into output rear cover **11**.



16 **20** **Installation of thrust washer**

Install thrust washer **16**, **20** with oil groove **A** facing gear side.



17 **20** **22** **25** **26** **Play of rear drive shaft gear in diameter direction after assembly**

If the measured value is higher than the limit, replace faulty parts.

NOTE

When replacing needle bearing 22, 26, use bearings from the same color package.

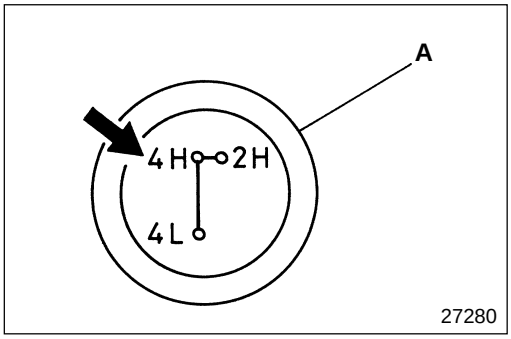
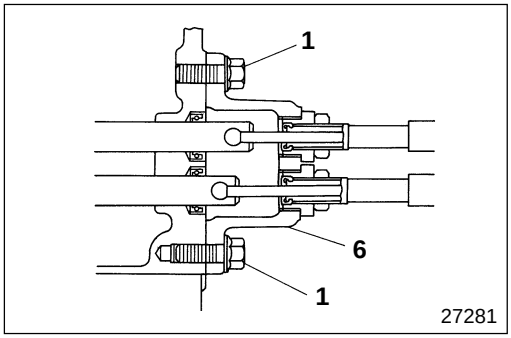
◆ Service procedure



● **Work before removal**

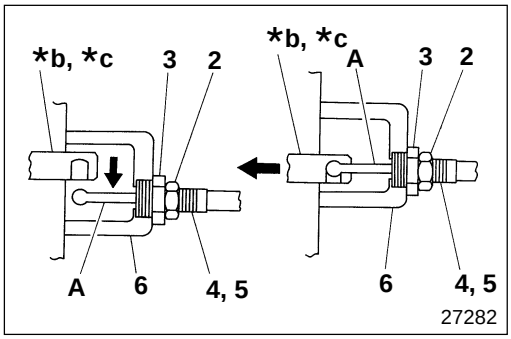
When removing, move shift lever knob **A** of the transfer control bar to the position of 4H.



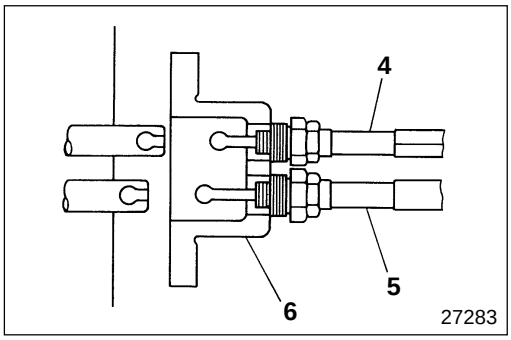
4 **5** **HIGH/LOW, 2H/4H Control Cable**

[Removal]

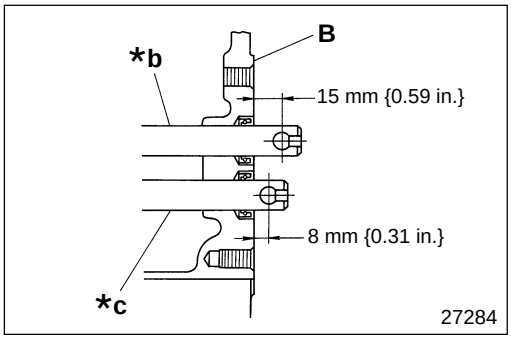
- Remove bolt **1** securing shift rail cover **6**.



- Remove shift rail cover **6**, and then remove inner cable **A** of HIGH/LOW and 2H/4H control cables **4** and **5**, from HIGH/LOW shift rail ***b**, and front drive shift rail ***c**. Loosen nuts **2** and **3** to the end of their threads.

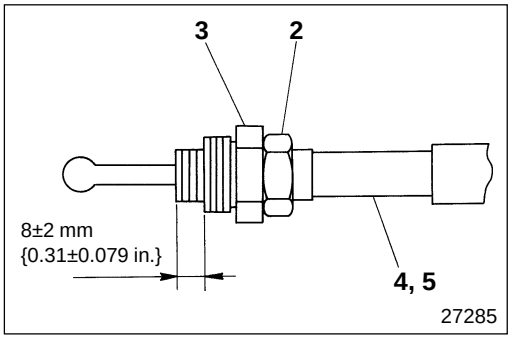


- Remove HIGH/LOW and 2H/4H control cables **4** and **5** from shift rail cover **6**.

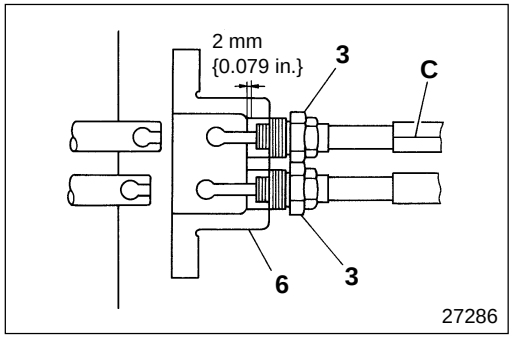


[Installation]

- Position HIGH/LOW shift rail ***b** and front drive shift rail ***c** as shown.
  B : Transfer end face



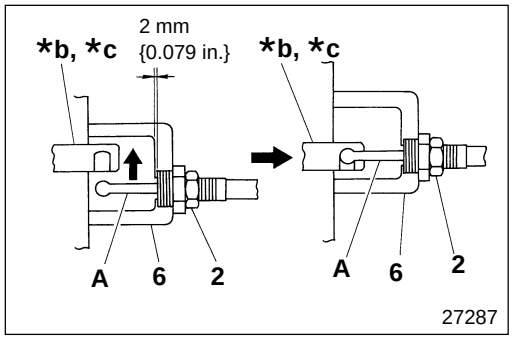
- Adjust nuts **2** and **3** to the end of the thread to align the end of HIGH/LOW and 2H/4H control cables **4** and **5** as shown.



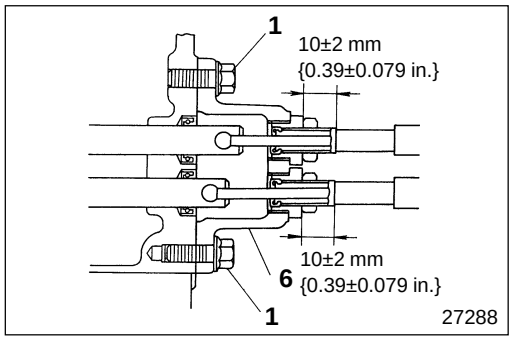
- Screw nut **3** into shift rail cover **6** and tighten it to the specified torque.

CAUTION⚠

- **Ensure that the HIGH/LOW and four-wheel / two-wheel drive control cables are not positioned incorrectly. The cable with the white line C is for HIGH/LOW.**
- **After installation, the end of nut 3 should be located 2 mm {0.079 in.} from the front face of shift rail cover 6.**



- Tighten the nut with its specified torque and lock it with nut **3**. Then slide the shift rail cover **6** and install the inner cable **A** to HIGH/LOW shift rail ***b** and front drive shift rail ***c**.



- Tighten shift rail cover **6** installation bolt **1** at the specified torque.

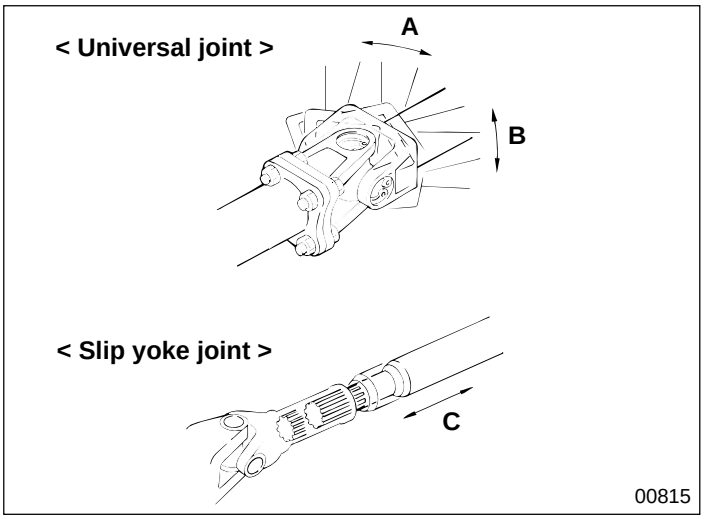
Swing of Propeller Shaft



A : Lateral swing
B : Longitudinal swing
C : Fore-and-aft movement

Relative positions of transmission, transfer, rear axle and front axle vary depending on the undulation of the road surface, and the vibration and load carried when operating the vehicle.
The universal joint and the slip yoke joint are provided to absorb these influences.

● Inspection before disassembly

Clearance in axial direction for spider

Press needle bearing **2** downward firmly, and measure clearance **A** between snap ring **1** and flange yoke **3**, slip yoke joint **9**, and rear propeller shaft **10**. If the measured value is higher than the standard value, adjust it by changing the thickness of the snap ring.

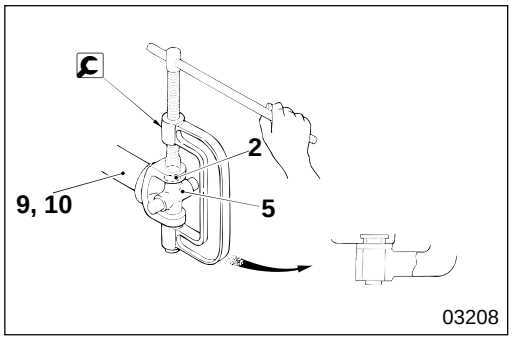
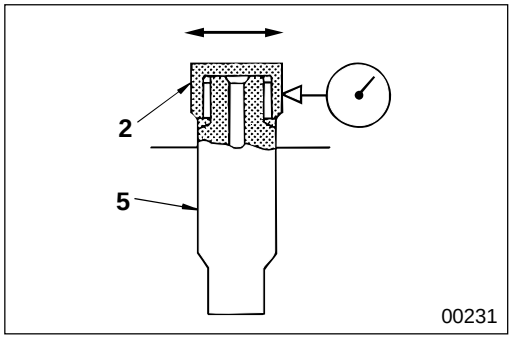
2 Needle bearing

[Removal]

- Put alignment marks on needle bearing **2** and spider **5**.
- Put alignment marks on flange yoke **3** and slip yoke joint **9** and propeller shaft **10**.

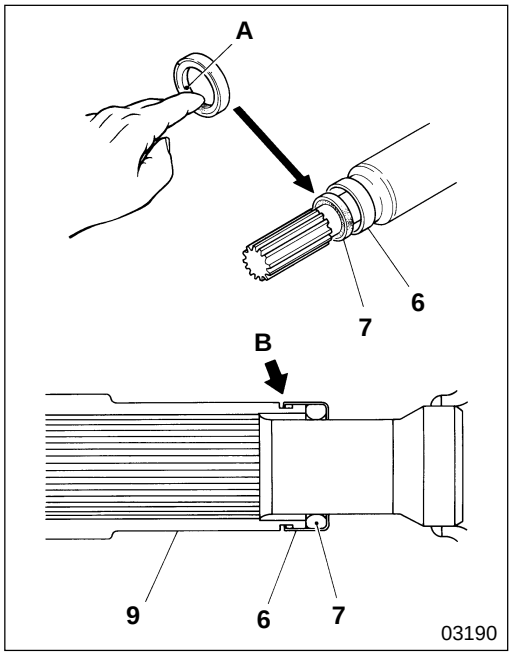


[Press-fitting]



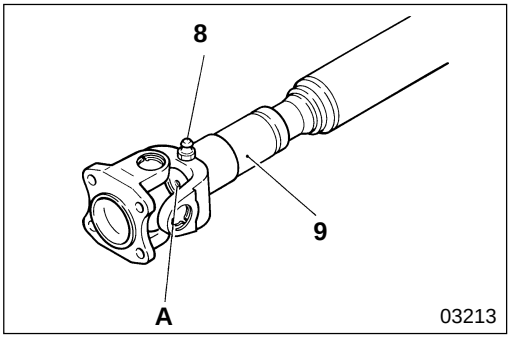
2 5 Clearance between needle bearing and spider

Measure the play towards the diameter direction between needle bearing **2** and spider **5**. If the measured value is higher than the limit, replace with universal joint spider kit.



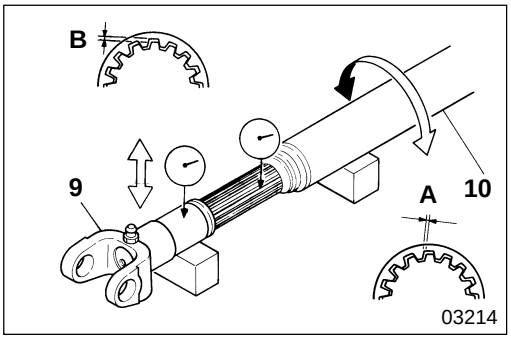
6 7 Installation of retainer packing and sealed packing

- Apply grease to inner periphery **A** of sealed packing **7** and install as illustrated.
- Press retainer packing **6** onto slip yoke joint **9**, and caulk claw **B** at eight points.



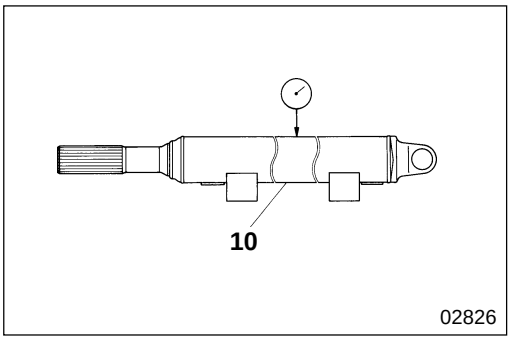
8 **Supply of grease via grease nipple**

Pack grease via grease nipple **8** until grease starts overflowing from dust plug **A** of slip yoke joint **9**.



9 **10** **Play between slip yoke joint and rear propeller shaft spline**

- Measure play **A** in the rotation direction between slip yoke joint **9** and rear propeller shaft **10** at the spline area. If the measured value is higher than the limit, replace the faulty parts.
- Measure play **B** in the rotation direction between slip yoke joint **9** and rear propeller shaft **10** at the spline area. If the measured value is higher than the limit, replace the faulty parts.



10 **Deflection of rear propeller shaft**

Measure the deflection of rear propeller shaft **10** at the center. If the measured value is higher than the limit, correct or replace it.

CAUTION

Be sure to check for cracks at the welded area after straightening has been done by means of a press.

NOTE

To measure the deflection of rear propeller shaft 10, turn it one full revolution and read the dial gauge indicator. The deflection is one half of the indicated value.

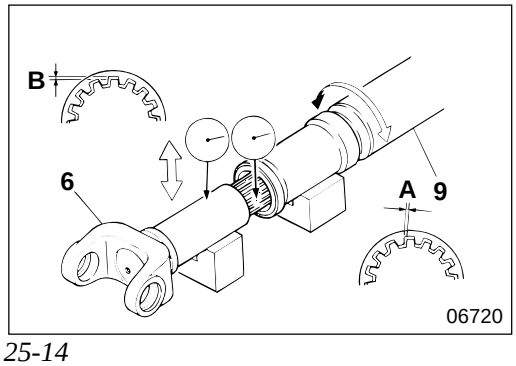
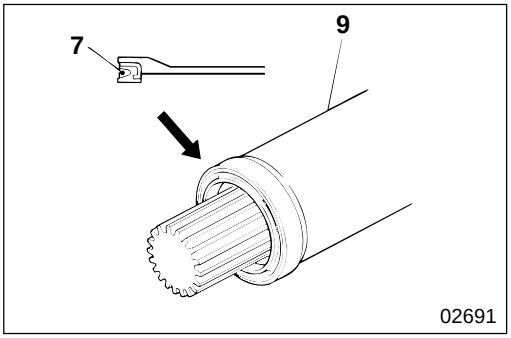
2 **5** **Clearance between needle bearing and spider**

Measure the play towards the diameter direction between needle bearing **2** and spider **5**. If the measured value is higher than the limit, replace with universal joint spider kit.



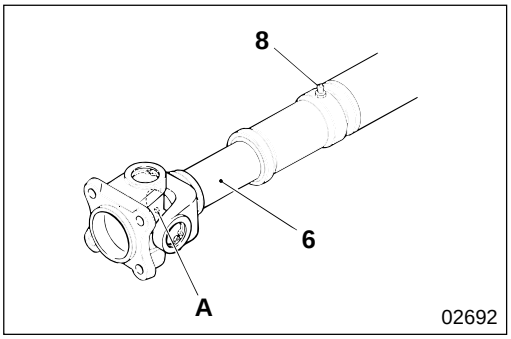
6 **9** **Play between slip yoke joint and rear propeller shaft spline**

- Measure play **A** in the rotation direction between slip yoke joint **6** and rear propeller shaft **9** at the spline area. If the measured value is higher than the limit, replace the faulty parts.
- Measure play **B** in the diameter direction between slip yoke joint **6** and rear propeller shaft **9** at the spline area. If the measured value is higher than the limit, replace the faulty parts.



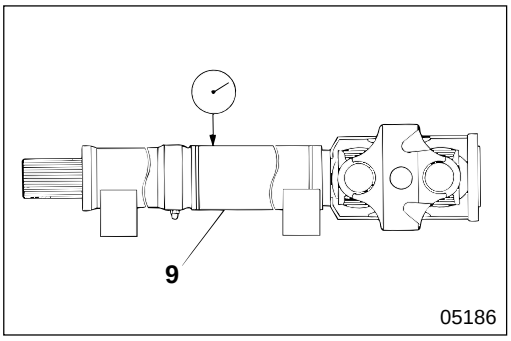
7 **Installation of sealed packing**

Install sealed packing **7** onto propeller shaft **9** in the direction illustrated until it is flush with the propeller shaft.



8 **Supply of grease via grease nipple**

Pack grease via grease nipple **8** until grease starts overflowing from dust plug **A** of slip yoke joint **6**.



9 **Deflection of rear propeller shaft**

Measure the deflection of rear propeller shaft **9** at the center. If the measured value is higher than the limit, correct or replace it.

CAUTION

Be sure to check for cracks at the welded area after straightening has been done by means of a press.

NOTE

To measure the deflection of rear propeller shaft 9, turn it one full revolution and read the dial gauge indicator. The deflection is one half of the indicated value.

Special tools

Unit : mm {in.}

Location	Tool name and shape	Part No.	Application
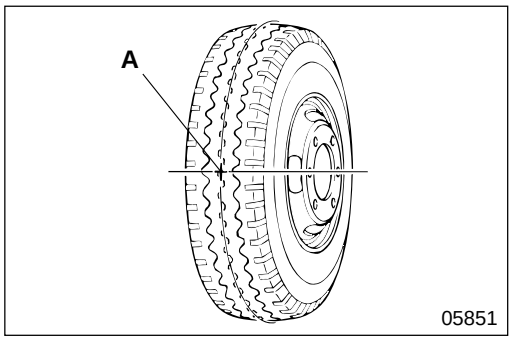
—	Alignment gauge adapter 	MH063428 (Obtain Locally)	Measurement of camber and caster angles, and kingpin inclination angle: with free-wheel hub only

NOTE

- **Measure the wheel alignment when the vehicle is empty and level.**
- **Be sure that each part of the front axle has been serviced and is within specification before adjusting the wheel alignment.**

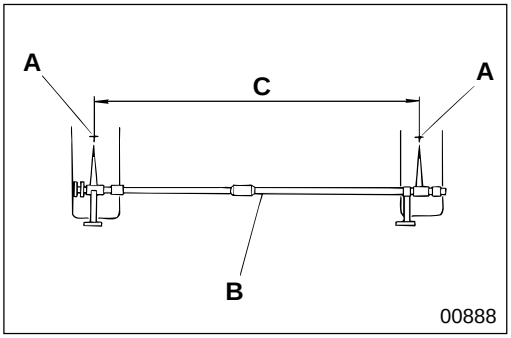
Before adjusting the wheel alignment, check for the following faults:

- Play in front wheel hub
- Play or looseness in kingpin
- Play or looseness in the joint between the tie rod and the knuckle arm
- Looseness of any fasteners
- Fatigued or damaged leaf springs
- Incorrect tire pressure
- Incorrect power steering booster backlash

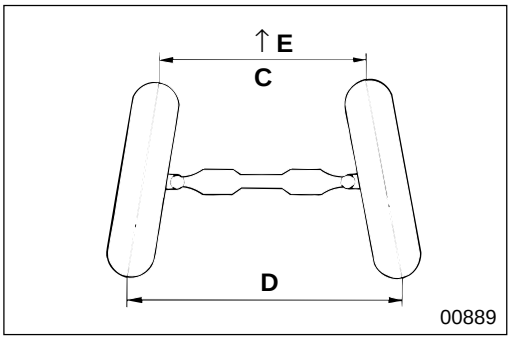


(1) Measurement and adjustment of toe-in

- Point the front wheels exactly forward.
- Put mark **A** on the left and right front tires at the height of front wheel axis and in the middle of the tire width.

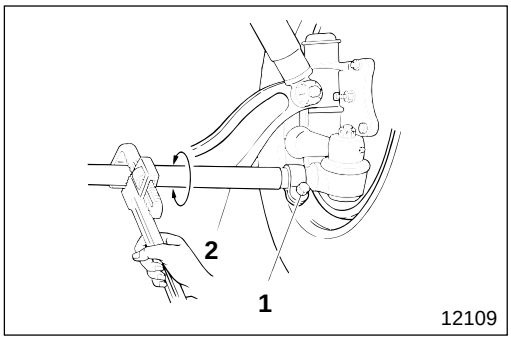


- Align the two points of toe-in gauge **B** to the respective marks **A** on the front tires. Measure the distance **C** between the marks at the front of the vehicle.

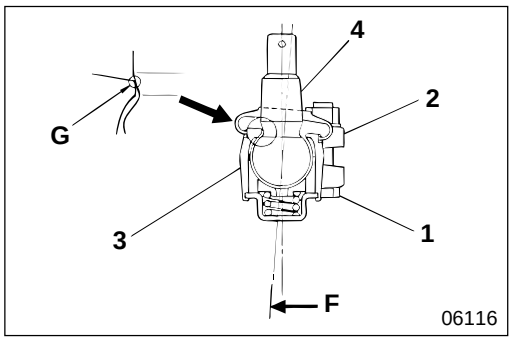


- Rotate the tires 180° and measure the distance **D** between the marks at the rear of the vehicle with the tires on the ground.
- Check if the difference between distances **C** and **D** is within the standard value.

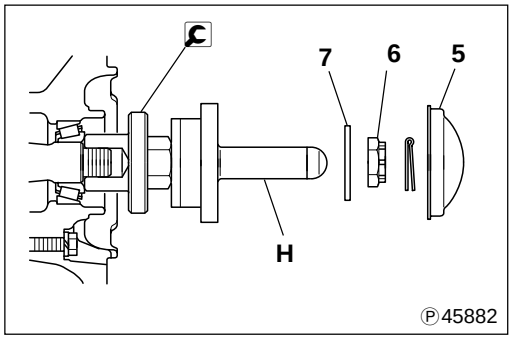
E : Front of the vehicle



- If the measured value deviates from the standard value, with the tires pointed forward, loosen left and right clamp bolts **1** and adjust the toe-in to the standard value by turning tie rod **2** with a pipe wrench.

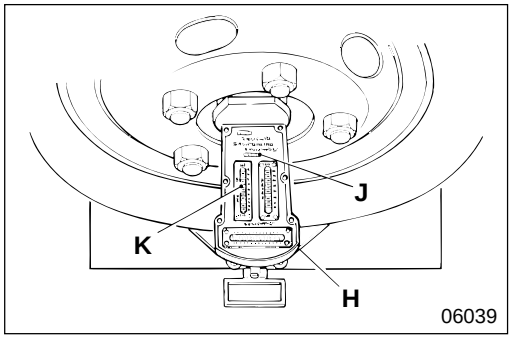


- Move the vehicle forward and turn tie rod **2** towards the front, with the tires pointed forward (**F** as illustrated). Make sure when adjusting toe-in to the standard value, that both left and right tie rod ends **3** are in contact with ball stud **4** (**G** as illustrated) at the same time. After adjustment, tighten clamp bolt **1** to secure the tie rod.

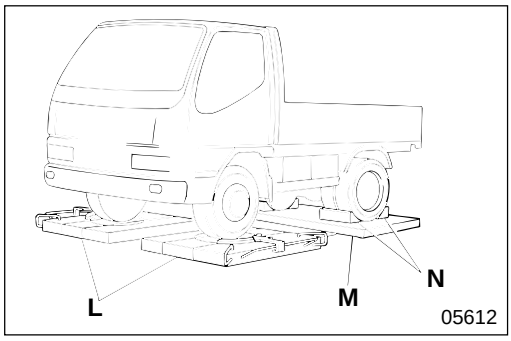


(2) Measurement of camber

- Point the front wheels exactly forward.
- Remove the hub cap **5**, lock nut **6** and lock washer **7**. Attach 🔧 alignment gauge adapter and mount camber/caster/kingpin gauge **H**.



- While keeping the bubble in level **J** centered, measure the camber angle by reading the scale mark at the center of the bubble on camber scale **K**. Follow this procedure to measure the camber angles on the left and right sides.

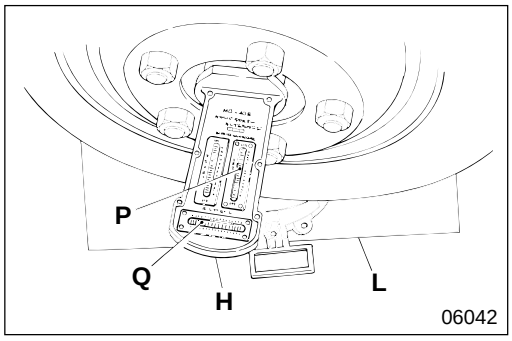


(3) Measurement of caster and kingpin inclination angle

- Align turning radius gauges **L**. Prepare a platform **M** having the same height as the turning radius gauges and place the platform under the rear wheels so that the vehicle is kept level.
- Keep turning radius gauges **L** locked.
- Jack up the vehicle and set the left and right front wheels so that the ground contact area of both front tires and the turntables of turning radius gauge **L** meet at their respective centers.

WARNING⚠

- **After jacking up the vehicle, chock the rear wheels securely with chocks N.**
- **Do not remove chocks N until the entire operation is completed.**



- Unlock turning radius gauge **L**, and set the scale to 0°.
- As in measuring camber explained previously, attach camber/caster kingpin gauge **H** tightly to the front wheel hub and keep the bubble centered.
- Apply the brake to the front wheels and turn the steering wheel slowly from the 0° point on the scale of turning radius gauge **L**, until direction changes 20° to the left for the left front wheel and 20° to the right for the right front wheel.

NOTE

It is not possible to obtain an exact reading of camber unless the brake is applied to the front wheels because the tires might rotate slightly.

- At the 20° point, align the bubbles in caster scale **P** and kingpin scale **Q** to 0° by turning the adjuster.

NOTE

Kingpin scale Q has scales for left and right; use the left scale when adjusting the left wheel, and the right scale when adjusting the right wheel.

- Turn the steering wheel slowly until the left front wheel changes its direction 20° to the right, or until the right front wheel changes its direction 20° to the left, past the 0° point of turning radius gauge **L** scale. At this point read the scale marks at the center of the bubbles on caster scale **P** and kingpin scale **Q**. The scale marks indicate the caster and kingpin inclination angles.

Adjustment of Steering Angle

Service standards

Location	Maintenance item		Standard value	Limit	Remedy
—	Steering angle	Inside (Outside : reference)	42° (33°)	—	Adjust

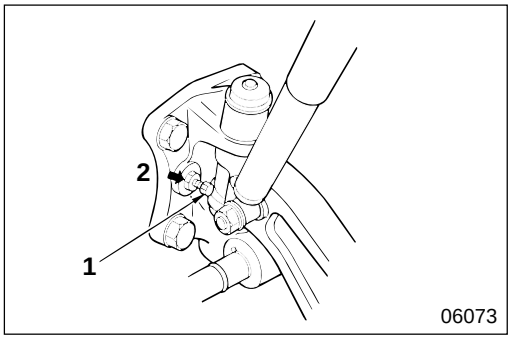
Tightening torque

Unit : N·m {ft.lbs, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
2	Lock nut (Knuckle stopper bolt fastening)	46.5±7 {34±5.4, 4.75±0.75}	—

NOTE

Be sure that wheel alignment is adjusted perfectly before adjusting the steering angle.



- To adjust the steering angle, set the turning radius gauges and platform in the same way as for caster and kingpin inclination angle measurement.
- Turn the steering wheel to the left or right completely, and from the position where the turning radius gauge is aligned to 0°, adjust knuckle stopper bolt **1**. Adjust so that the steering angle is within the standard inside steering angle value, to the left for the left front wheel, and to the right for the right front wheel. Then, tighten lock nut **2** at specified torque.

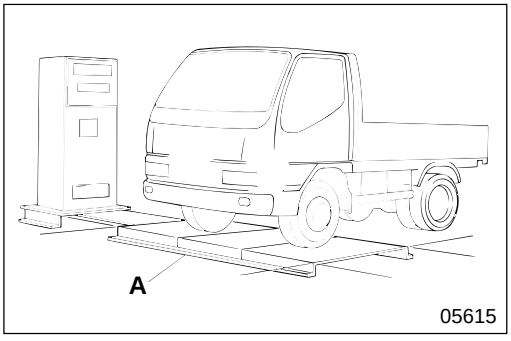
NOTE

Be sure when working on the vehicle, to adjust both stopper bolts 1 at the front and back of the knuckle arm side.

Measurement of Side Slip

NOTE

Be sure that wheel alignment is adjusted fully before measuring side slip.



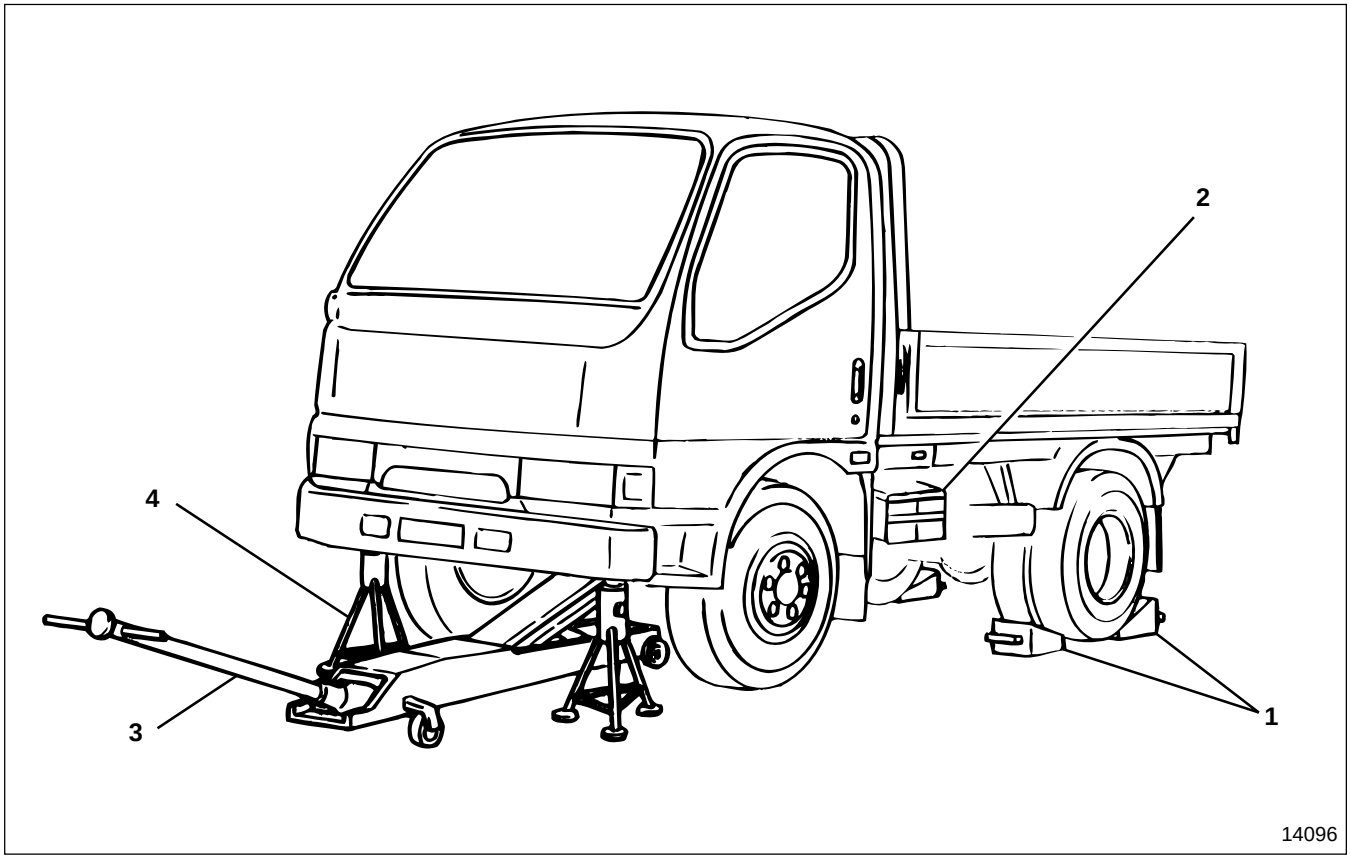
- Point the front wheels exactly forward.
- Maintain this position and slowly move vehicle forward, over side slip tester **A**, as slowly as possible.

NOTE

Make sure, when measuring side slip, that the wheels point exactly forward when the vehicle passes over side slip tester A. Do not allow the wheels to veer from side-to-side.

- The side slip is indicated by side slip tester **A** after the vehicle has passed through the tester. Readjust wheel alignment if slippage is 3 mm {0.12 in.} or more per meter {3.28 ft.}.

WORK BEFORE REMOVAL AND INSTALLATION OF FRONT AXLE



● **Work sequence before removal**

1 Place wheel chocks.
2 Disconnect the negative battery cable. Gr 54
3 Jack up the front axle with a garage jack.
4 Support the front frame on jack stands.

WARNING

- **Chock the wheels securely so the vehicle does not move.**
- **Do not remove the chocks until the entire operation is completed.**
- **Supporting a vehicle on a garage jack only is extremely dangerous, so always support the frame on jack stands.**
- **Leave the garage jack and stands in place until the entire operation is completed. Never remove them during the operation.**

CAUTION

- **Before removing disc brake assembly 12, secure the disc brake assembly to the frame using wires, and do not disconnect the brake hose. Never allow the weight of the disk brake caliper assembly to hang from the hydraulic brake hose. Be sure to remove the harness clips to prevent damaging the pad wear indicator harness during the removal process.**
- **Be sure to protect brake hoses 3, 10 from dust by fitting blanking plugs after removal.**

NOTE

Do not disassemble disc rotor 25 and wheel hub 27 except for replacement.

● **Assembly sequence**

Follow the disassembly sequence inreverse.

WARNING⚠

- **Do not allow oil or grease to adhere on the pad surface of disc brake assembly 12 or the rotor surface of wheel hub and rotor assembly 17 or rotors 25.**
- **You must bleed air from the brake system after installing the brake hose, failure to do so would cause the brake to malfunction. Gr 35A**

CAUTION⚠

Be careful not to damage rotor 18 or oil seal 19 when installing wheel hub and rotor assembly 17 onto knuckle *.

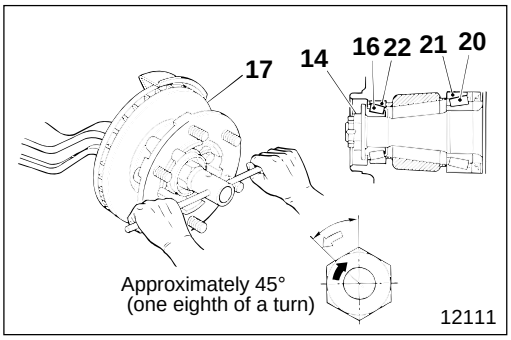
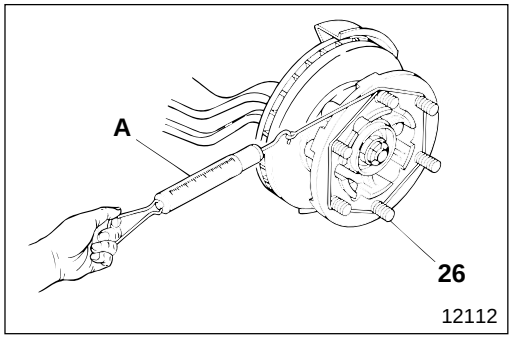
◆ Service procedure



● Starting torque of wheel hub bearing

[Adjustment]

- Tighten lock nut **14** at specified torque (primary tightening) while turning wheel hub and rotor assembly **17**. Then, slacken off.
- Turn wheel hub and rotor assembly **17** several times to smooth operation of outer bearings **16** and **22**, and inner bearings **20** and **21**, and retighten lock nut **14** at specified torque (secondary tightening).
- Slacken off lock nut **14** by approximately 45° (one eighth of a turn), and lock it with a split pin. If the split pin and the pin hole do not align, slacken off the lock nut slightly, making sure that there is no play in the axial direction.

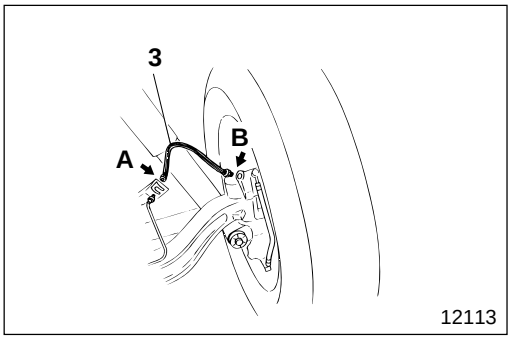


[Measurement]

- Fasten spring balance **A** to hub bolt **26** and measure the tangential force.
- If the measured tangential force is the standard value, the starting torque conforms to the standard value.
- Make sure that the starting torque is smaller than the tangential force.
- If the tangential force deviates from the specified value, adjust the starting torque again.
- If the measured value deviates from the standard value, adjust the starting torque of the wheel hub bearing according to the procedure described above.
- If any fault is found after adjustment, replace outer and inner bearings **16**, **20** to **22**.

NOTE

- **Measure the starting torque when oil seal 19 has been installed.**

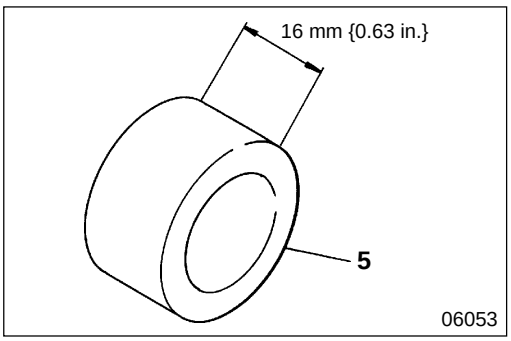


3 Removal and installation of brake hose

First remove brake hose **3** from bracket **A** (on the frame), then remove the brake hose from wheel brake **B**. For installation, follow this procedure in reverse.

CAUTION⚠

Make sure that brake hose 3 is not twisted when you install it.

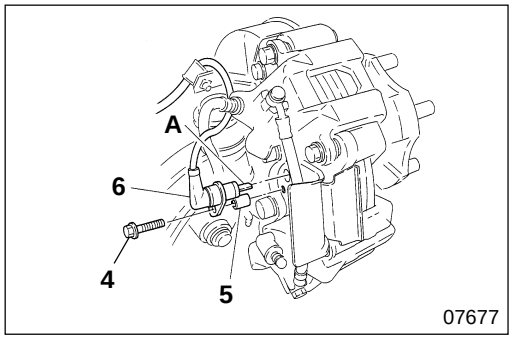


5 Installation of spacer

Check the thickness of spacer **5** before installation.

CAUTION⚠

Installation of spacer 5 with an improper thickness results in inaccurate wheel speed detection, thus causing faulty ABS operation.

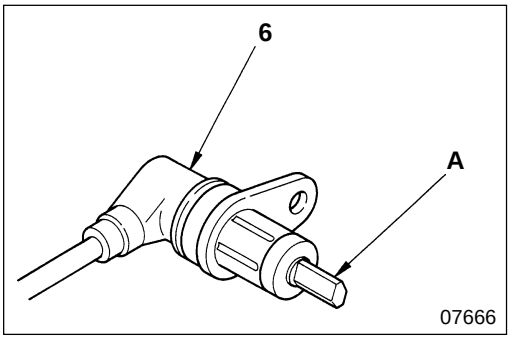


6 **Wheel speed sensor**

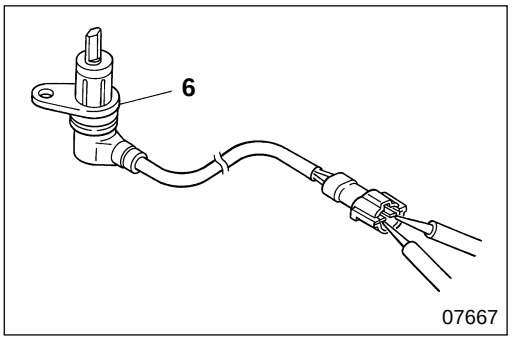
[Removal]
To prevent damaging pole piece **A** in wheel speed sensor **6**, remove the wheel speed sensor before removing wheel hub and rotor assembly **17**.

[Installation]
The connector of wheel speed sensor **6** is color-coded. Install the wheel speed sensors to the proper wheels according to the following table.

Installation of location	Connector
Left wheel	Gray
Right wheel	Black

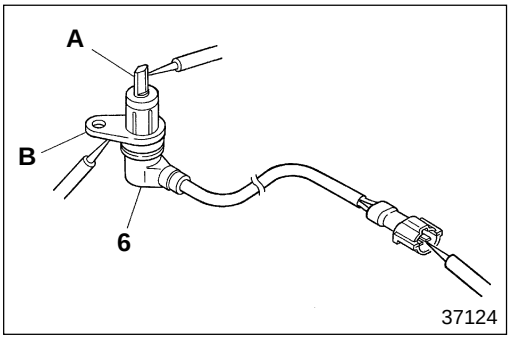


[Inspection]
Pole piece **A** in wheel speed sensor **6** is magnetized by a built-in magnet and attracts metals. Do not allow metal particles to stick to the pole piece.



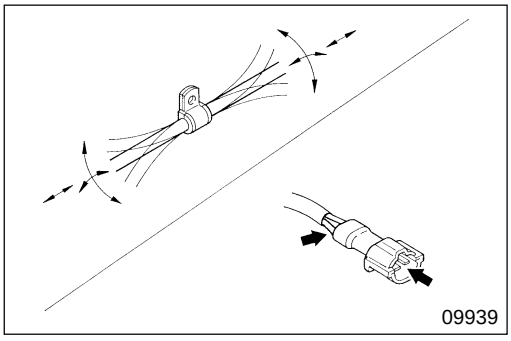
● **Measurement of resistance between terminals**

Measure resistance between the terminals of wheel speed sensor **6**.
If the measured value deviates from the standard value, replace the wheel speed sensor.



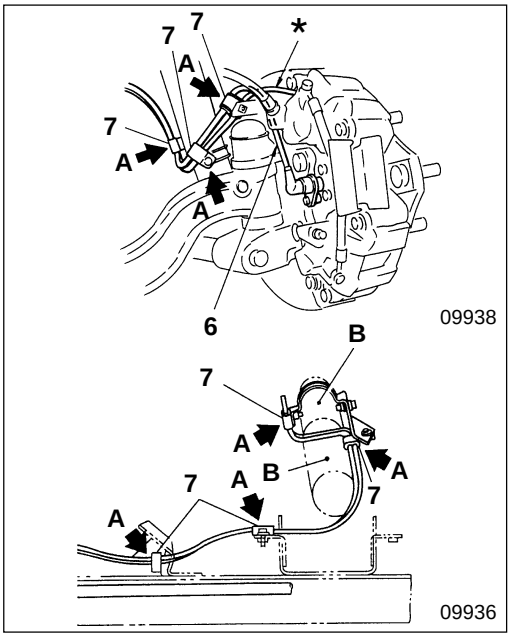
● **Measurement of insulation resistance**

Measure resistance between pole piece **A**, bracket **B** and each terminal of wheel speed sensor **6**.
If the measured value deviates from the standard value, replace the wheel speed sensor.



● **Inspection of open circuit in harness**

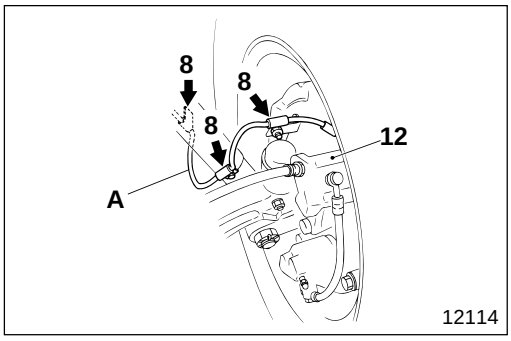
To check the harness for an open circuit, disconnect the harness clamp from the vehicle side, then bend and pull harness at the clamp to checkk if a momentary open circuit results. Also inspect the terminal contact conditions in the connector.
If an abnormality is found, replace wheel speed sensor **6**.



6 **7** **Installation of wheel speed sensor harness and clips**

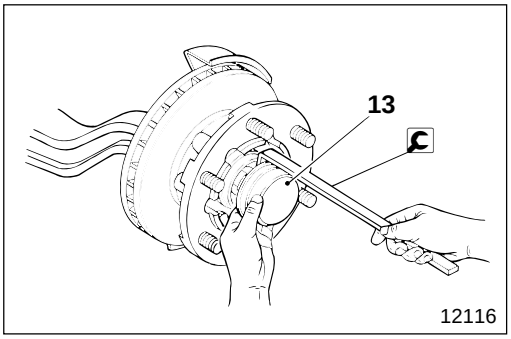
Starting from the wheel brake side, secure the harness of wheel speed sensor **6** in place at white tape sections **A** using clips **7**, while making sure that there is no interference, twisting or excessive sagging of the harness.

B : Shock absorber
***** : Pad wear indicator harness

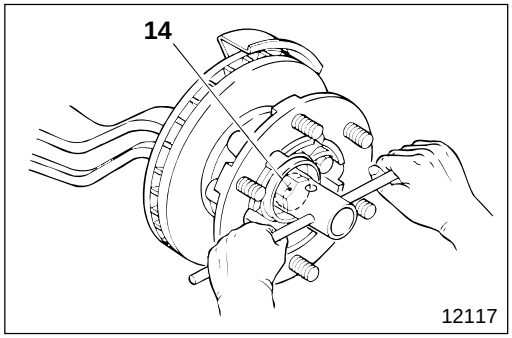


12 **Installation of brake pad wear indicator harness of disc brake assembly**

Fix the taping position for brake pad wear indicator harness **A** on disc brake assembly **12** using clip **8**.

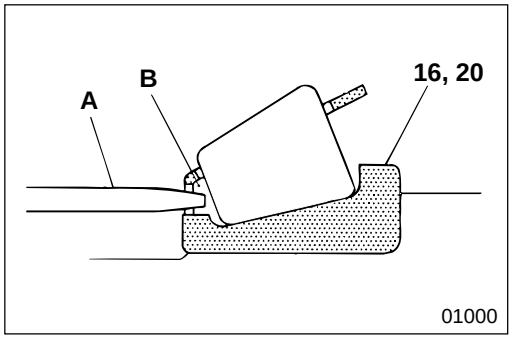


13 **Removal of hub cap**



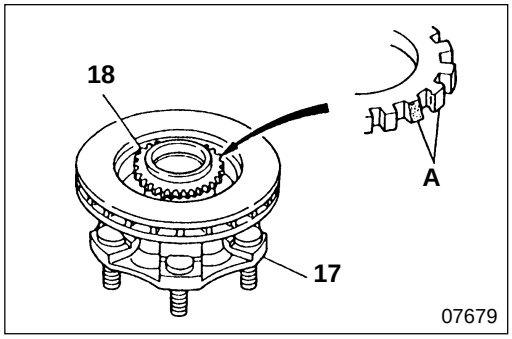
14 **Removal and installation of lock nut**

Refer to adjustment of the starting torque of the wheel hub bearing.
P26A-13



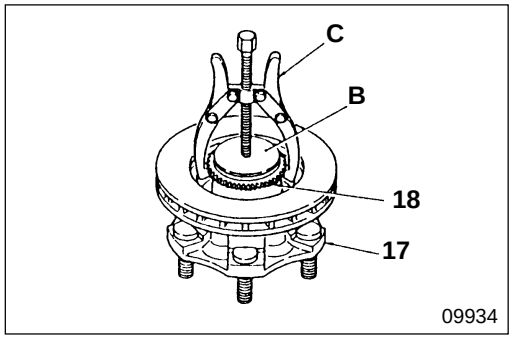
16 **20** **Packing grease in outer bearing inner race and inner bearing inner race**

A : Grease pump nozzle
B : Between rollers



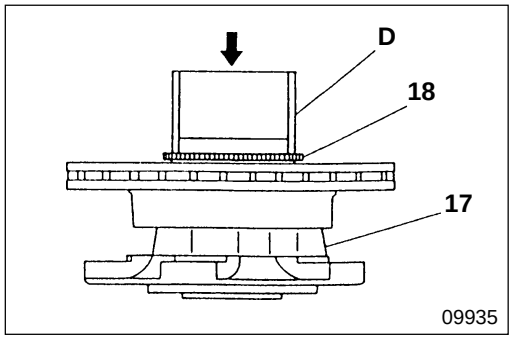
18 **Rotor**

[Inspection]
Check rotor **18** for chipped or crushed teeth (see section **A** in the diagram).
If an abnormality is found, replace the rotor.

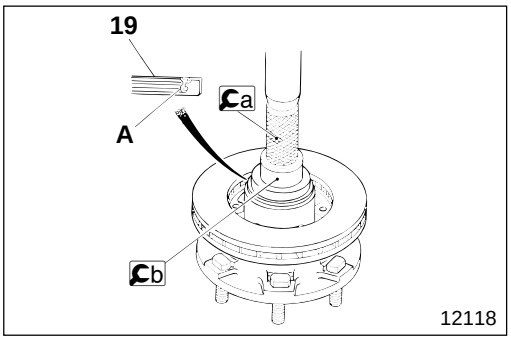


[Removal]

B : Iron plate
C : Gear puller

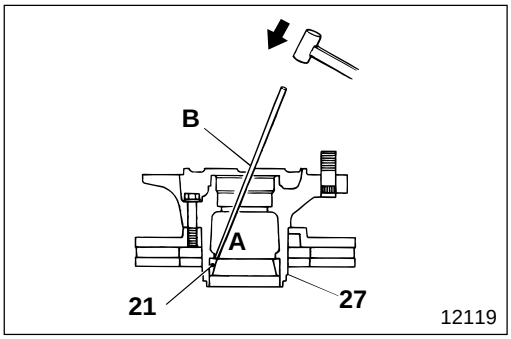


[Installation]
Before installing rotor **18** to wheel hub and rotor assembly **17**, heat the rotor to approximately 150°C {302°F}. Using pipe **D**, install the rotor to the wheel hub and rotor assembly by applying uniform pressure to prevent the rotor from tilting.



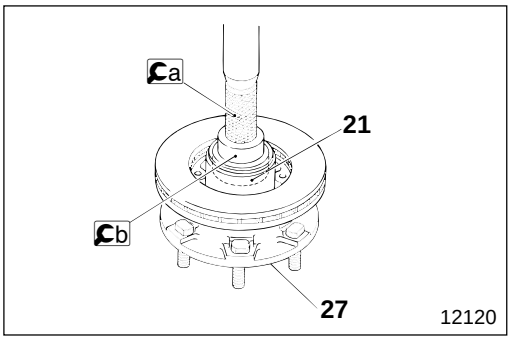
19 **Installation of oil seal**

Apply grease to lip area **A** of oil seal **19** and press-fit it.

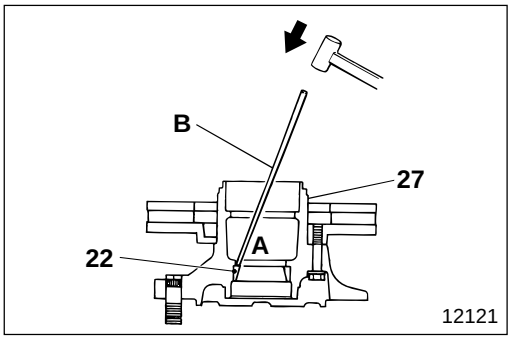


21 **Inner bearing outer race**

[Removal]
Drive out inner bearing outer race **21** from the two indented parts **A** in wheel hub **27**.
B : Pin-punch

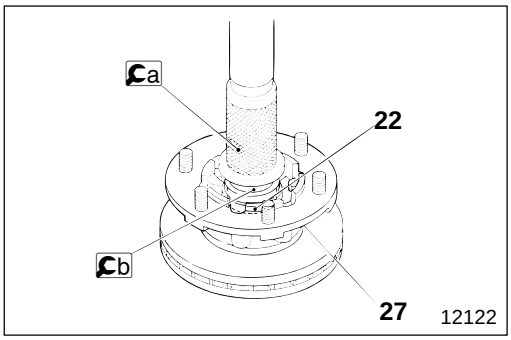


[Installation]

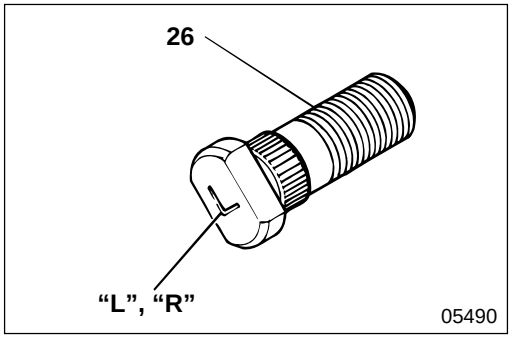


22 **Outer bearing outer race**

[Removal]
Drive out outer bearing outer race **22** from the two indented parts **A** in wheel hub **27**.
B : Pin-punch



[Installation]



26 **Installation of hub bolt**

Hub bolt **26** is marked with "**L**" (left) or "**R**" (right) to indicate the side it is to be installed on. Check this symbol before installing the bolt.

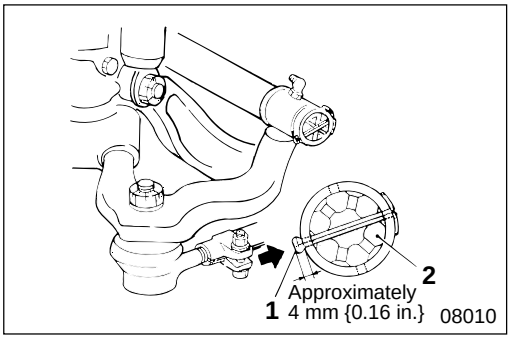
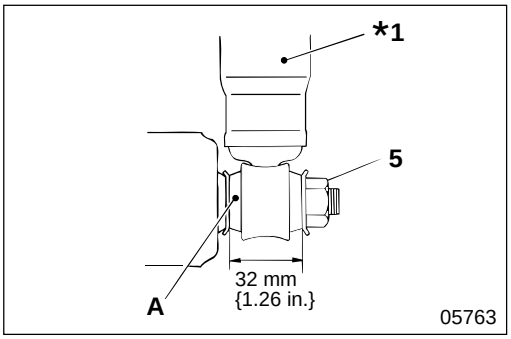
◆ Service procedure



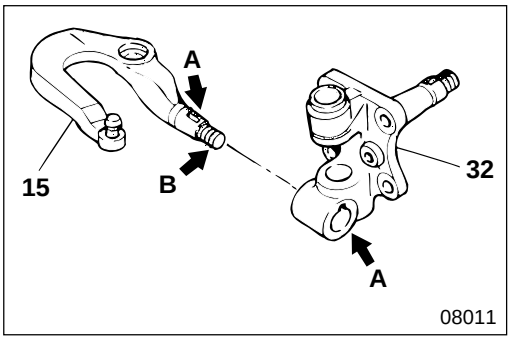
1 **2** **Mounting of split pin and end plug**

- Tighten end plug **2** fully and slacken off by one half of a turn, then turn the plug so that the head of split pin **1** faces the outside of the body.
- Caulk the head of split pin **1** until it is approximately 4 mm {0.16 in.} thick.



5 **Mounting of nut**

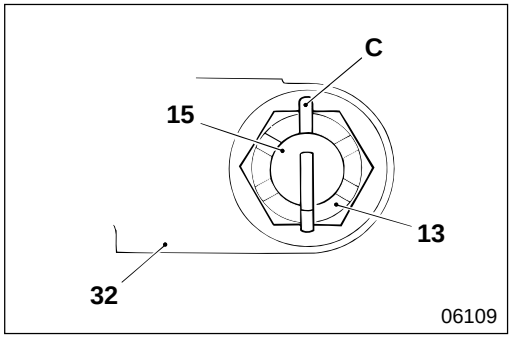
Mount and tighten nut **5** so that the dimensions of rubber bushing **A** of shock absorber ***1** are as illustrated.



15 **32** **Installation of knuckle arm and knuckle**

(1) Reassembly of existing knuckle arm 15 and/or knuckle 32

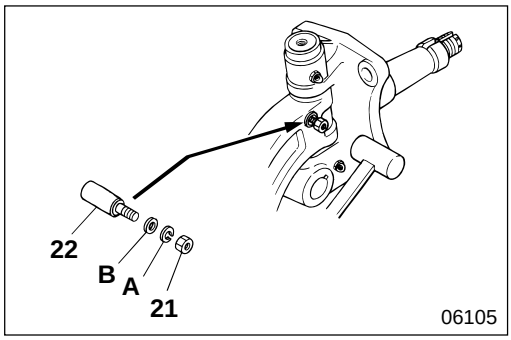
- Polish taper surfaces **A** of knuckle arm **15** and knuckle **32** with emery paper (120 grit or finer) uniformly, until abrasion traces left by the emery paper are only just visible. For new parts, polishing is not required.
- Clean taper surfaces **A** of knuckle arm **15** and knuckle **32**, and thread area **B** of the knuckle arm. (Use a cleaning solvent for acetone color checking or other solvent.)



- Install knuckle arm **15** after applying grease to thread area **B**. (Do not grease the taper surface of knuckle arm and knuckle **32**.)
- Tighten new nut **13** at specified torque. Without loosening the nut, insert split pin **C** into the pin hole to lock the nut.

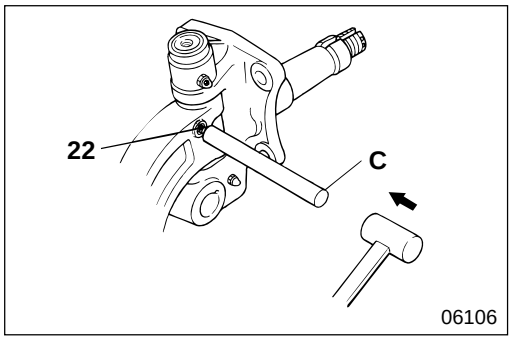
(2) Installation of new knuckle arm 15 and new knuckle 32

- Clean taper surfaces **A**, or thread area **B**, of knuckle arm **15** and knuckle **32**, and install them without greasing.
- Tighten new nut **13** at specified torque. Without loosening the nut, insert split pin **C** into the pin hole to lock the nut.

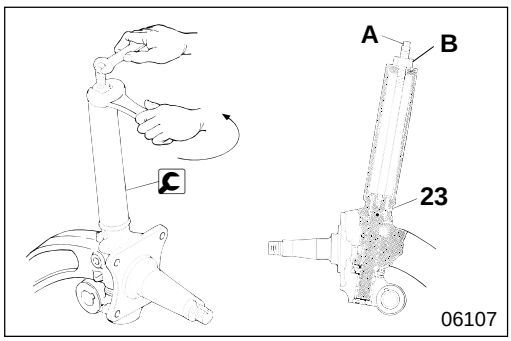


22 Removal of lock pin

- Remove nut **21**, spring washer **A**, and washer **B**. Screw the nut off lock pin **22** again until they are almost level with each other. Then, tap the nut lightly to loosen the lock pin.

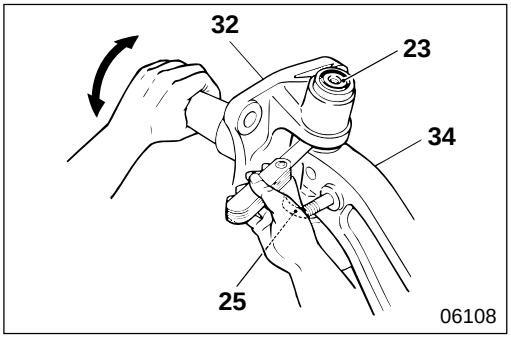


- Remove nut **21**. While holding drift **C** against lock pin **22**, tap the lock pin lightly to extract it.



23 Removal of kingpin

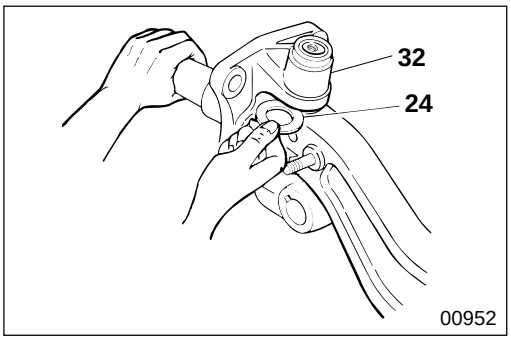
- Screw bolt **A** of the kingpin puller into the thread area of kingpin **23**.
- Fasten bolt **A** with nut **B**, and remove kingpin **23**.



24 **32** **34** **Kingpin shim, knuckle, and front axle**

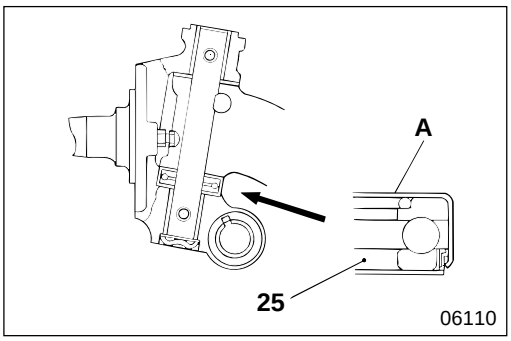
[Inspection]

- Assemble kingpin **23** and thrust bearing **25** temporarily, and turn knuckle **32** a couple of times to smooth its operation.
- Measure the clearance between the upper surface of front axle **34** and the lower part of knuckle **32**.
- If the measured value is higher than the limit, adjust the clearance.



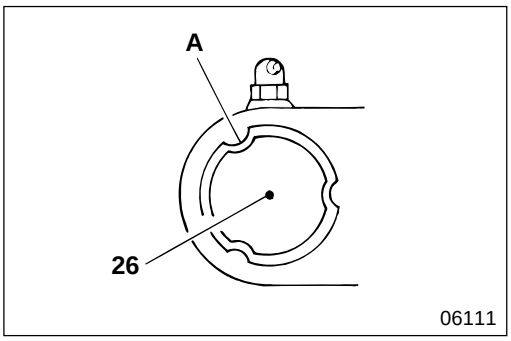
[Adjustment]

- Adjusting kingpin shim **24** is available in four thickness: 0.10 mm {0.0039 in.}, 0.15mm {0.0059 in.} 0.20 mm {0.0079 in.} and 0.30 mm {0.012 in.}
- Be sure to minimize the clearance by selecting appropriate kingpin shim **24**.
- Make sure that knuckle **32** turns smoothly after assembly.



25 **Installation of thrust bearing**

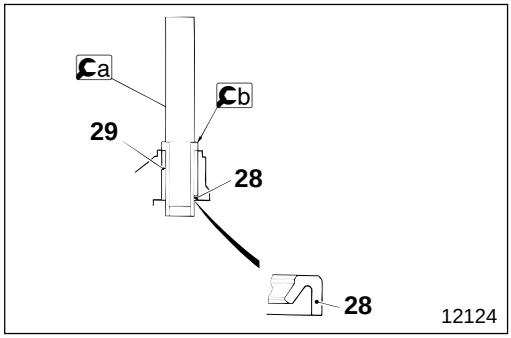
Install thrust bearing **25** with case **A** facing upwards.



26 **Mounting of plug**

Drift in plug **26**, and caulk it securely at three equidistant points around the circumference.

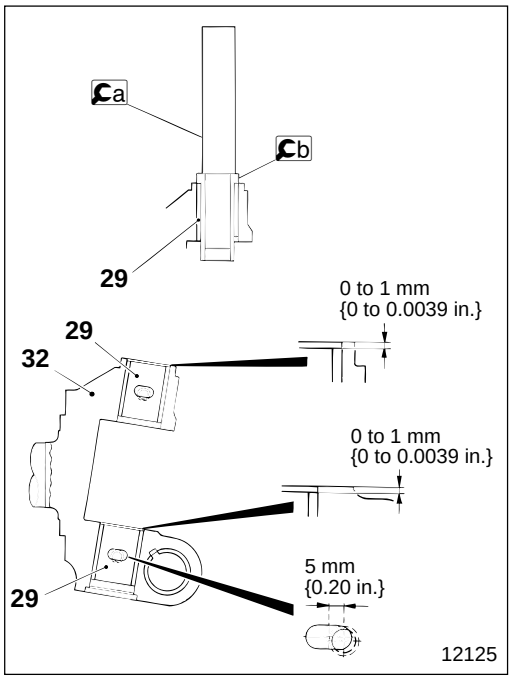
A : When caulked



28 **29** **Dust seal and kingpin bushing**

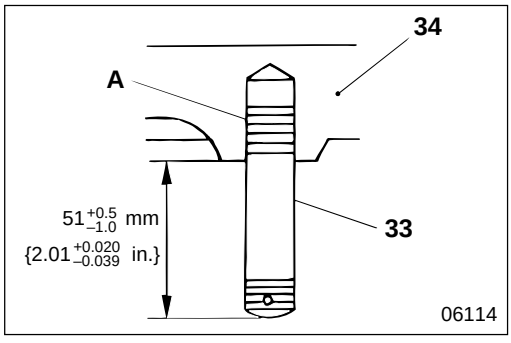
[Removal]

When removing the upper part of kingpin bushing **29**, remove dust seal **28** at the same time.



[Installation]

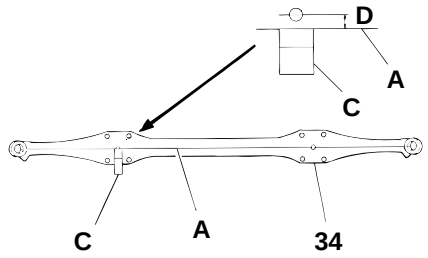
- Press-fit kingpin bushing **29** so that gap **A** between kingpin bushing **29** and knuckle **32** is within 0 to 1 mm {0 to 0.039 in.}.
- Oil hole of kingpin bushing **29** and tapped hole of knuckle **32** should not deviate from each other by more than 5 mm {0.20 in.}.
- Apply grease to lip area **C** of dust seal **28** and press-fit in the direction as illustrated in the upper figure.



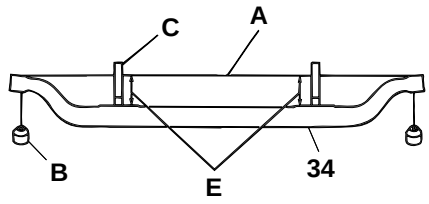
33 **34** **Stud bolt and front axle**

- Coat thread area **A** of stud bolt **33** in front axle **34** with lock tite.
- Mount stud bolt **33** maintaining a mounting dimension within $51^{+0.5}_{-1.0}$ mm {$2.01^{+0.020}_{-0.039}$ in.}.

< Longitudinal >



< Vertical >

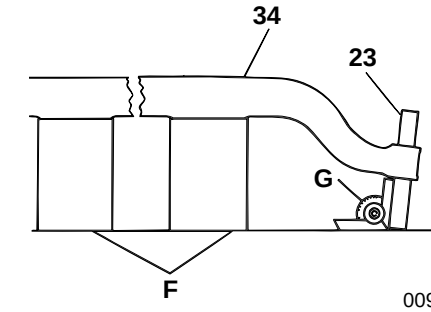


00954

34 Inspection of front axle

(1) Measurement of bend in front axle in longitudinal and vertical directions

- Pass a piece of thread **A** through the kingpin hole of front axle **34** and hang weights **B** on both ends.
- Use square **C** to find the degree of bend in both the longitudinal direction **D** and the vertical direction **E**.
- If the measured value is higher than the limit, replace front axle **34**.



00955

(2) Measurement of kingpin inclination angle

Mount kingpin **23** in front axle **34** as illustrated, and measure the kingpin inclination angle. If the measured value is higher the limit, replace the front axle.

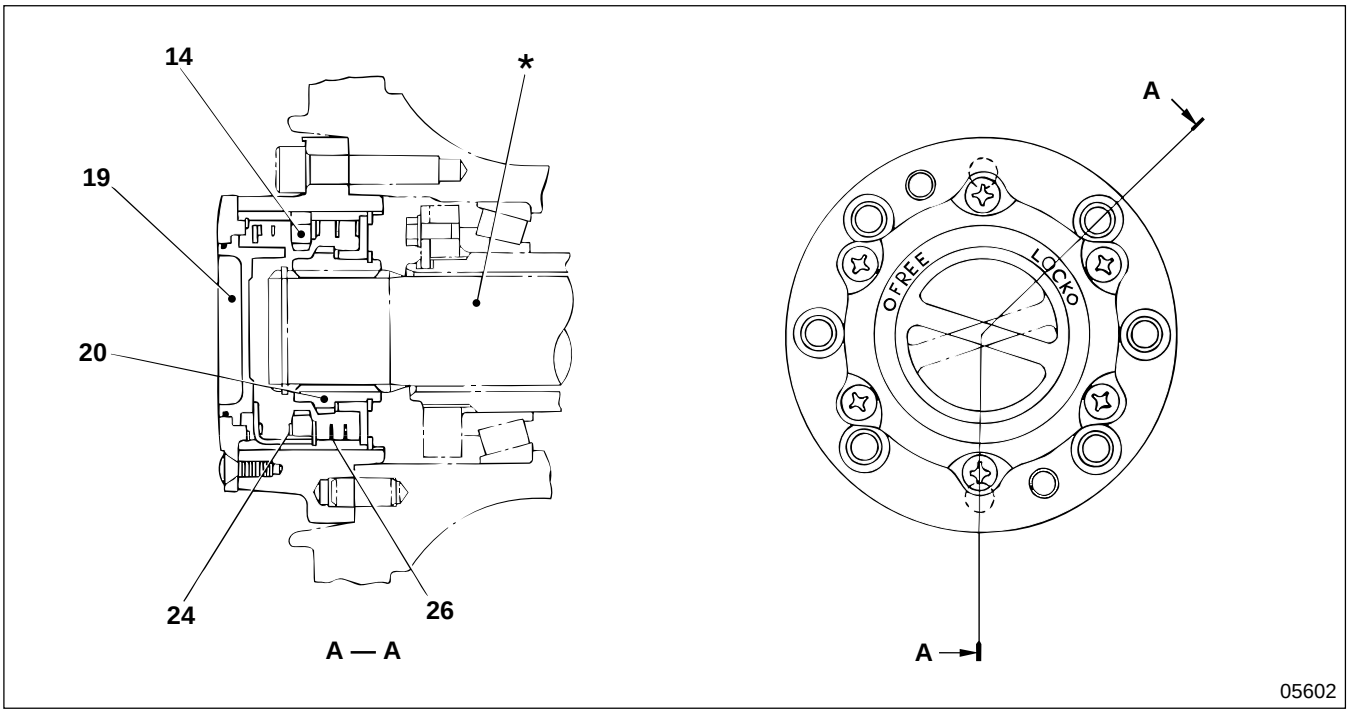
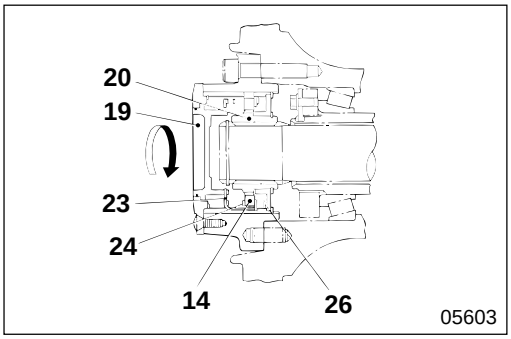
Free-wheel Hub



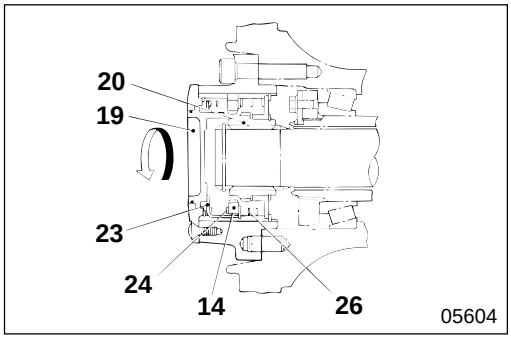
- In the case of a four-wheel drive vehicle, even when it is running in rear-wheel drive only, the drive shaft *, differential, propeller shaft, and driving parts of the transfer front drive shaft continue to run due to transmission of rotation from the wheels. This subjects the vehicle drive to a load, and it causes loss of driving power.
  Now, with a free-wheel hub, transmission of rotation from the front wheels to the drive shaft * is cut, reducing driving loss when running in rear-wheel drive only. This improves fuel efficiency and reduces vibration and noise.
- With a free-wheel hub, FREE (cutting of driving power) ↔ LOCK (transmission of driving power) is made easily by manual operation.



Operating mechanism

● **From FREE to LOCK**

When knob **19** is turned to LOCK, retainer **23** shifts to the inside along with the shape of the knob, pressing return spring **26**. At this instance, driven gear **14**, being pressed by shift spring **24**, engages with drive gear **20** at the spline, and transmits the driving power.



● **From LOCK to FREE**

When knob **19** is turned to FREE, the action is the reverse of FREE to LOCK, and the driving power is disengaged.

Axle shaft assembly **16** should transmit power in response to the variations in rotation speed that occur due to variations in steering angle, etc. when steering the vehicle.
To support this function, Birfield joint assembly area **A** in axle shaft assembly **16** uses a constant speed joint that transmits power evenly, eliminating variations in rotation speed between the driving shaft and the driven shaft.

Special tools

Unit : mm {in.}

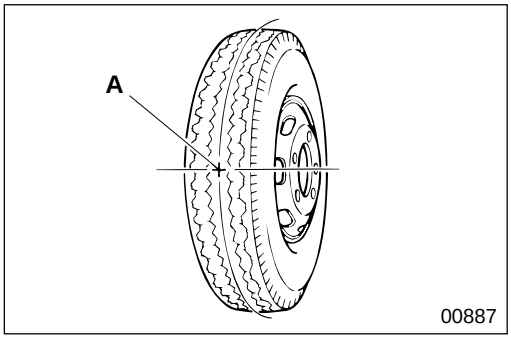
Location	Tool name and shape	Part No.	Application
—	Alignment gauge adapter 	MH061994 (Obtain Locally)	Measurement of camber and caster angles, and kingpin inclination angle: with free-wheel hub only

NOTE

- **Measure the wheel alignment when the vehicle is empty and level.**
- **Be sure that each part of the front axle has been serviced perfectly before adjusting the wheel alignment.**

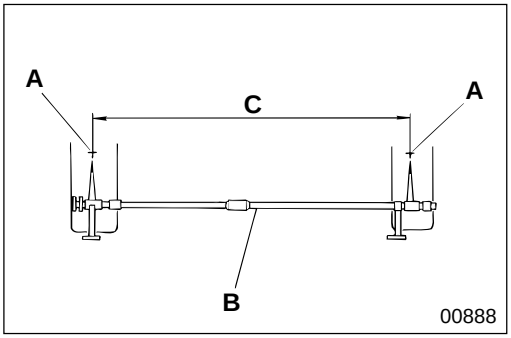
Before adjusting the wheel alignment, check for the following faults :

- Play in front wheel hub
- Play or looseness in kingpin
- Play or looseness in the joint between the tie rod and the knuckle arm
- Looseness of any fasteners
- Fatigued or damaged leaf springs
- Incorrect tire pressure
- Incorrect steering gear backlash

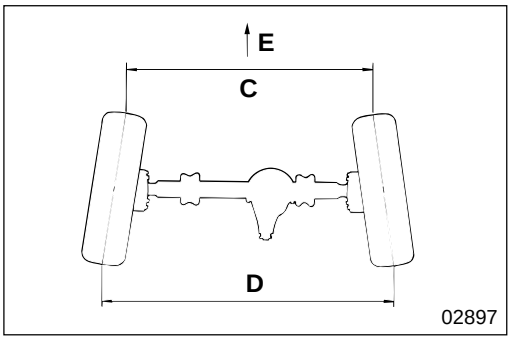


(1) Measurement and adjustment of toe-in

- Point the front wheels exactly forward.
- Put mark **A** on the left and right front tires at the height of front wheel axis and in the middle of the tire width.

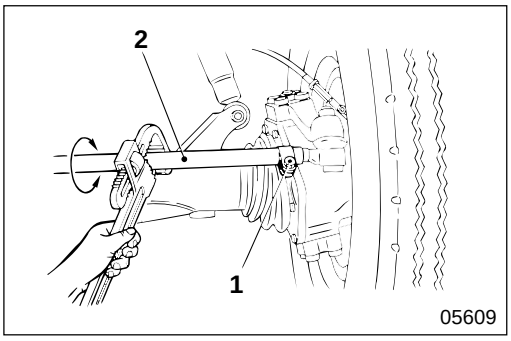


- Align the two points of toe-in gauge **B** to the respective marks **A** on the front tires. Measure the distance **C** between the marks at the front of the vehicle.

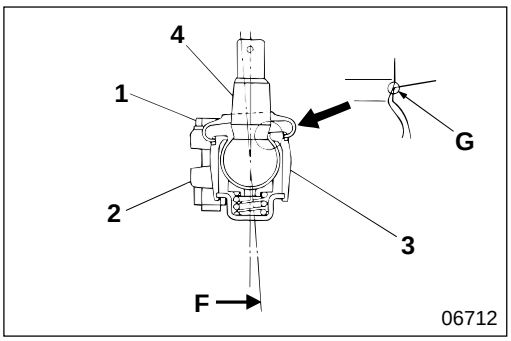


- Rotate the tires 180° and measure the distance **D** between the marks at the rear of the vehicle with the tires on the ground.
- Check if the difference between distances **C** and **D** is within the standard value.

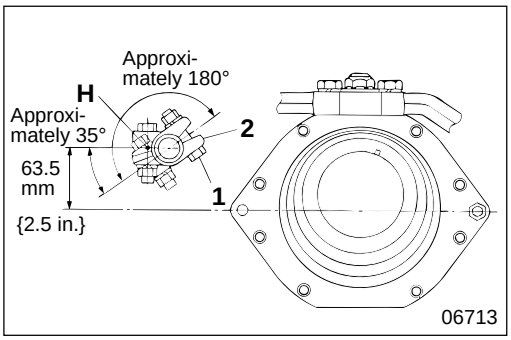
E : Front of the vehicle

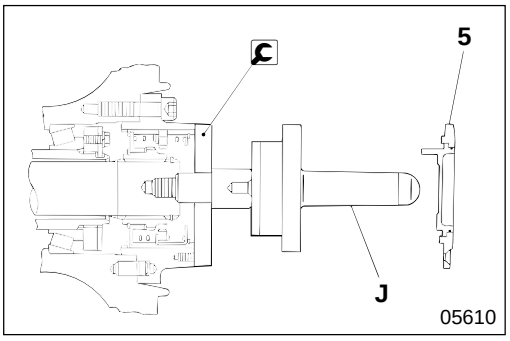


- If the measured value deviates from the standard value, with the tires pointed forward, loosen left and right clamp bolts **1** and adjust the toe-in to the standard value by turning tie rod **2** with a pipe wrench.



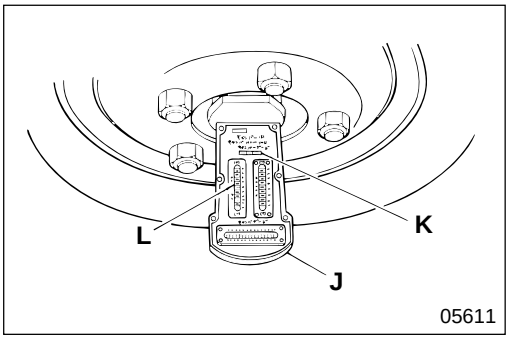
- Move the vehicle forward and turn tie rod **2** towards the front, with the tires pointed forward (**F** as illustated). Make sure when adjusting toe-in to the standard value, that both left and right tie rod ends **3** are in contact with ball stud **4** (**G** as illustrated) at the same time.
  After adjustment, tighten clamp bolt **1** to secure the tie rod.
- In order to keep the end of clamp bolts **1** away from the vehicle, mount tie rod **2** so that clamp center **H** is placed in the range as illustrated.



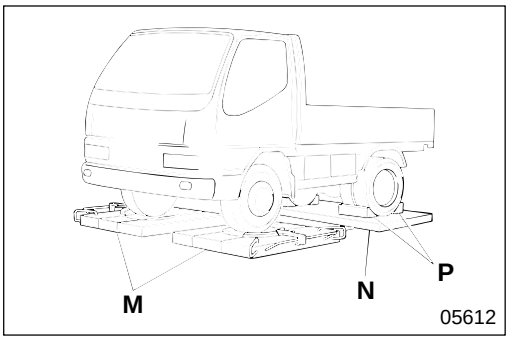


(2) Measurement of camber

- Point the front wheels exactly forward.
- Remove cover assembly **5** and attach 🔧 alignment gauge adapter. Then, attach camber/caster kingpin gauge **J**.



- While keeping the bubble in level **K** centered, measure the camber angle by reading the scale mark at the center of the bubble on camber scale **L**. Follow this procedure to measure the camber angles on the left and right sides.

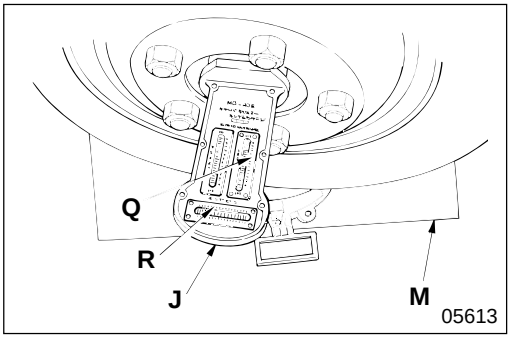


(3) Measurement of caster and kingpin inclination angle

- Align turning radius gauges **M**. Prepare a platform **N** having the same height as the turning radius gauges and place the platform under the rear wheels so that the vehicle is kept level.
- Keep turning radius gauges **M** locked.
- Jack up the vehicle and set the left and right front wheels so that the ground contact area of both front tires and the turntables of turning radius gauges **M** meet at their respective centers.

WARNING⚠

- **After jacking up the vehicle, chock the rear wheels securely with chocks P.**
- **Do not remove chocks P until the entire operation is completed.**



- Unlock turning radius gauges **M**, and set the scale at 0°.
- As in measuring camber explained previously, attach camber/caster kingpin gauge **J** tightly to the front wheel hub and keep the bubble centered.
- Apply the brake to the front wheels and turn the steering wheel slowly from the 0° point on the scale of turning radius gauges **M**, until direction changes 20° to the left for the left front wheel and 20° to the right for the right front wheel.

NOTE

It is not possible to obtain an exact reading of camber unless the brake is applied to the front wheels because the tires might rotate slightly.

- At the 20° point, align the bubbles in caster scale **Q** and kingpin scale **R** to 0° by turning the adjuster.

NOTE

Kingpin scale R has scales for left and right; use the left scale when adjusting the left wheel, and the right scale when adjusting the right wheel.

- Turn the steering wheel slowly until the left front wheel changes its direction 20° to the right, or until the right front wheel changes its direction 20° to the left, past the 0° point of turning radius gauge **M** scale. At this point read the scale marks at the center of the bubbles on caster scale **Q** and kingpin scale **R**. The scale marks indicate the caster and kingpin inclination angles.

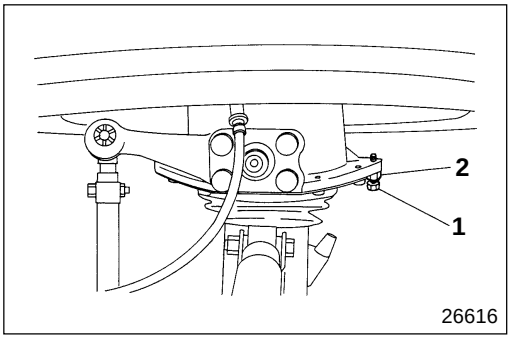
Location	Parts to be tightened	Tightening torque	Remarks
2	Lock nut (Knuckle stopper bolt tightening)	96±12 {71±9, 9.75±1.25}	—



NOTE

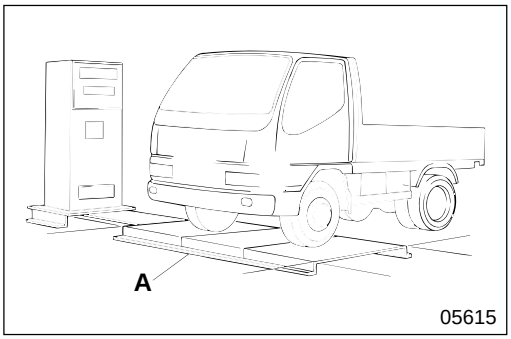
Be sure that wheel alignment is adjusted correctly before adjusting the steering angle.

- To adjust the steering angle, set the turning radius gauges and platform in the same way as for caster and kingpin inclination angle measurement.
- Turn the steering wheel to the left or right completely, and from the position where the turning radius gauge is aligned to 0°, adjust knuckle stopper bolt **1**. Adjust so that the steering angle is within the standard inside steering angle value, to the left for the left front wheel, and to the right for the right front wheel. Then, tighten lock nut **2** at specified torque.

NOTE

Be sure when working on the vehicle, to adjust both stopper bolts 1 at the front and back of the knuckle arm side.

Measurement of Side Slip



NOTE

Be sure that wheel alignment is adjusted correctly before measuring side slip.

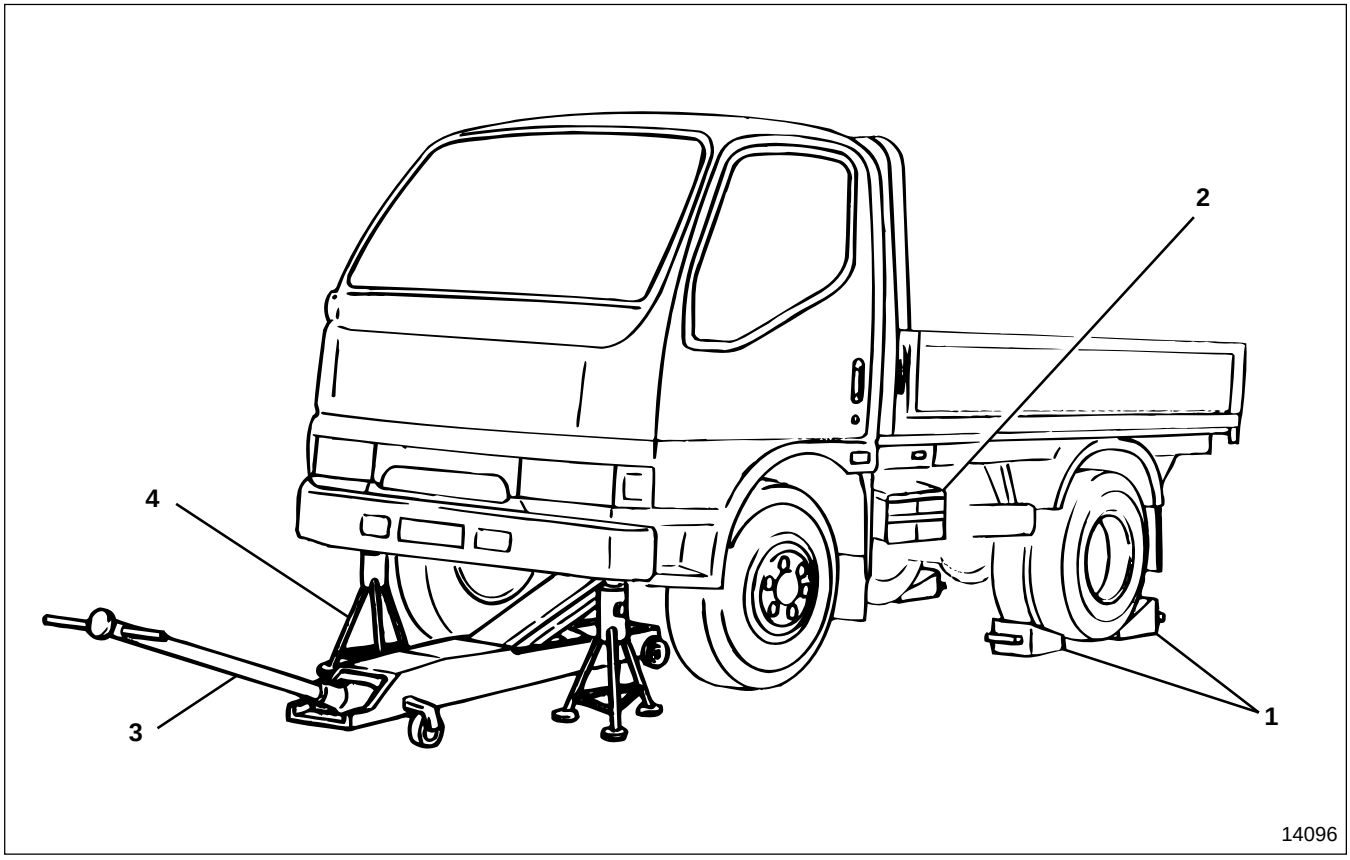
- Point the front wheels exactly forward.
- Maintain this position and slowly move vehicle forward, over side slip tester **A**, as slowly as possible.

NOTE

Make sure, when measuring side slip, that the wheels point exactly forward when the vehicle passes over side slip tester A. Do not allow the wheels to veer from side-to-side.

- The side slip is indicated by side slip tester **A** after the vehicle has passed through the tester. Readjust wheel alignment if slippage is 3 mm {0.12 in.} or more per meter {3.28 ft.}.

WORK BEFORE REMOVAL AND INSTALLATION OF FRONT AXLE



● **Work sequence before removal**

1 Place wheel chocks.
2 Disconnect the negative battery cable. Gr 54
3 Jack up the front axle with a garage jack.
4 Support the front frame on jack stands.

WARNING

- **Chock the wheels securely so the vehicle does not move.**
- **Do not remove the chocks until the entire operation is completed.**
- **Supporting a vehicle on a garage jack only is extremely dangerous, so always support the frame on jack stands.**
- **Leave the garage jack stands in place until the entire operation is completed. Never remove them during the operation.**

● **Work sequence after installation**

Follow the work sequence before removal in reverse.

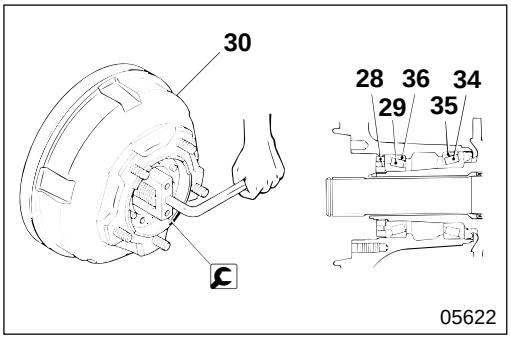
◆ Service procedure

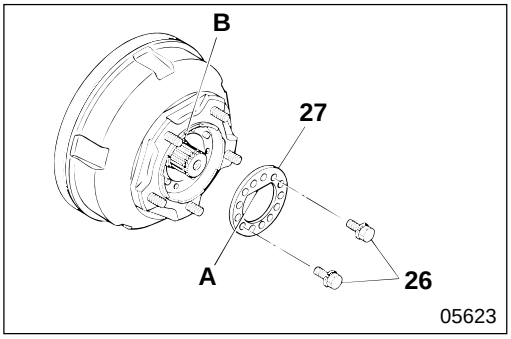


● Starting torque of wheel hub bearing

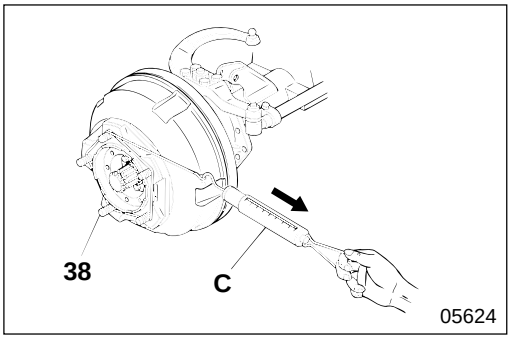
[Adjustment]

- Tighten lock nut **28** at specified torque (primary tightening) while turning wheel hub and brake drum assembly **30**, then slacken off.
- Turn wheel hub and brake drum assembly **30** several times to smooth operation of outer bearings **29**, **36**, and inner bearings **34**, **35** and retighten lock nut **28** at specified torque (secondary tightening).
- After adjustment, make sure that there is no play in the axial direction.

: Lock nut adjustment tool



- Insert lock washer **27** so that flat area **A** fits onto notch **B** of the knuckle spindle. Mount two bolts **26** (diagonally opposite each other) to lock nut **28**, and tighten them at specified torque.
- If lock nut **28** and the hole of lock washer **27** do not align, slacken off the lock nut slightly.



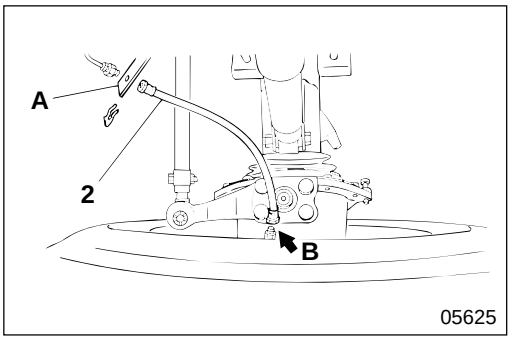
[Measurement]

- Fasten spring balance **C** to hub bolt **38** and measure the tangential force.
- If the measured tangential force is the standard value, the starting torque conforms to the standard value.
- If the measured value deviates from the standard value, adjust the starting torque of the wheel hub bearing according to the procedure described above.

  If any fault is found after adjustment, replace outer bearings **29**, **34**, or inner bearings **34**, **35**.

NOTE

- **Make sure that there is no drag in the brake lining and brake drum 40 before you measure the tangential force.**
- **Make sure that you install oil seal 33.**
- **Do not install free-wheel hub assembly 25.**

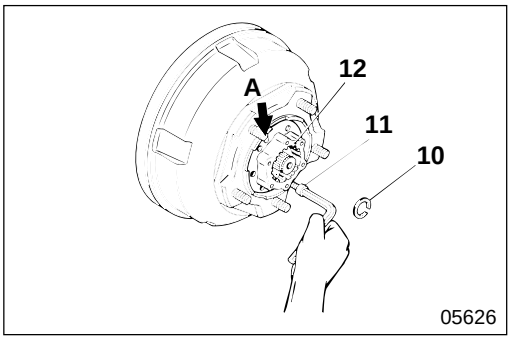


2 **Removal and installation of brake hose**

First remove brake hose **2** from bracket **A** (on the frame), then remove the brake hose from wheel brake **B**. For installation, follow this procedure in reverse.

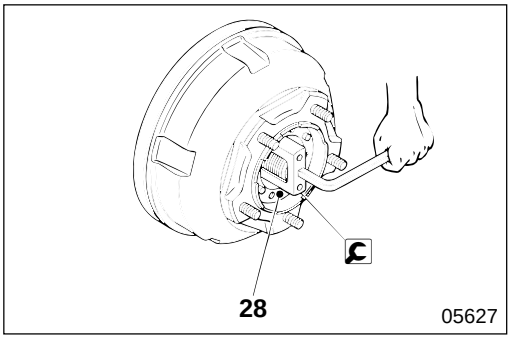
CAUTION

Make sure that brake hose 2 is not twisted when you install it.



12 **Removal of housing assembly**

Remove snap ring **10**, and insert bolts **11** (to the same depth) into two tapped holes **A** provided for disassembly. Then, remove housing assembly **12**.



28 **Removal and installation of lock nut**

When mounting lock nut **28** see P26B-19 : adjustment procedure for starting torque of the wheel hub bearing.

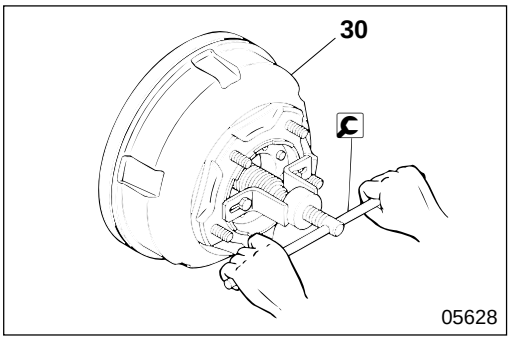
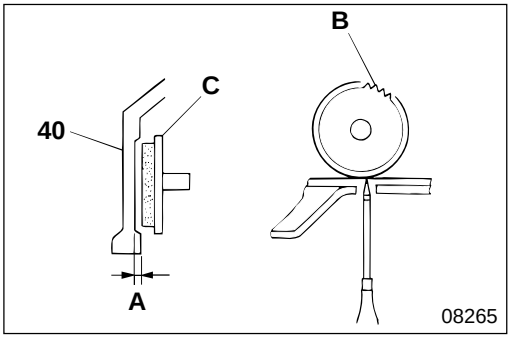
A : Grease pump nozzle
B : Between roller



30 **Wheel hub and brake drum assembly**

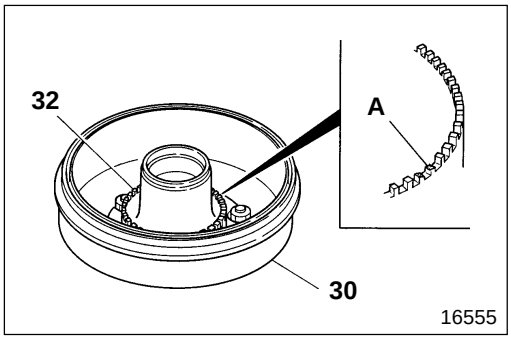
[Removal]

: Hub puller



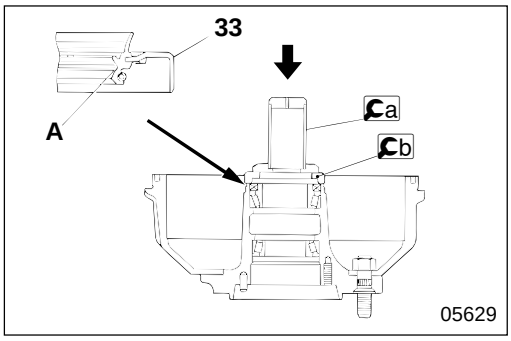
- If wheel hub and brake drum assembly **30** cannot be removed because of stepped wear **A** in brake drum **40**, remove the backing plate cover. Turn adjuster **B** in the opposite direction to the arrow on the backing plate to increase the clearance between the brake drum and brake shoe assembly **C**. Then, remove the wheel hub and brake drum assembly.
- Correct brake drum **40** if any fault is found. Gr 35A

[Installation]
After installing wheel hub and brake drum assembly **30**, adjust the clearance between brake drum **40** and brake shoe assembly **C**. Gr 35A



32 Rotor

[Inspection]
Check rotor **32** for chipped or crushed teeth (see section **A** in the diagram).
If an abnormality is found, replace the rotor.



33 Installation of oil seal

Apply grease to lip area **A** of oil seal **33** and press-fit it.

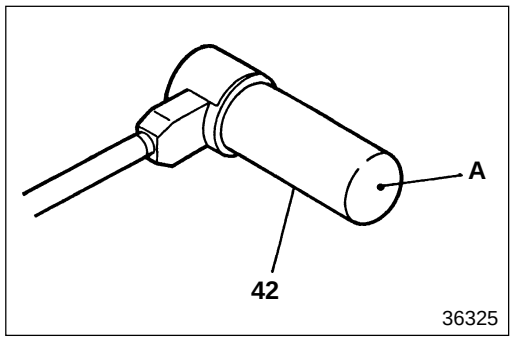
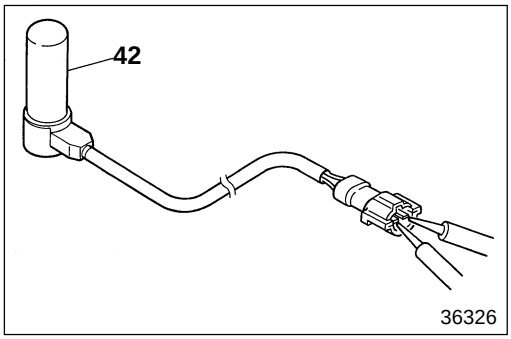
37 **38** **Installation of nut and hub bolt**

- Hub bolt **38** is marked with **"L"** (left) or **"R"** (right) to indicate the side it is to be mounted on. Check this symbol before mounting the bolt.
- Screw nut **37** onto hub bolt **38** and tighten at specified torque. Then, caulk the hub bolt to keep it from turning.



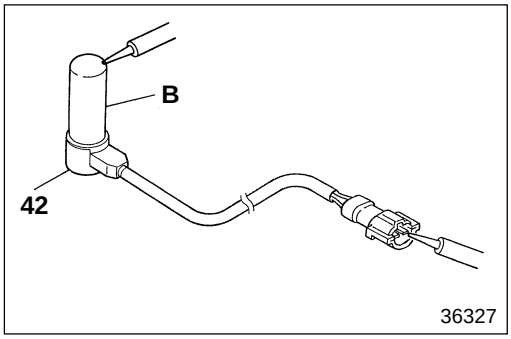
42 **Wheel speed sensor**

[Inspection]
Pole piece **A** in wheel speed sensor **42** is magnetized by a built-in magnet and attracts metals. Do not allow metal particles to stick to the pole piece.



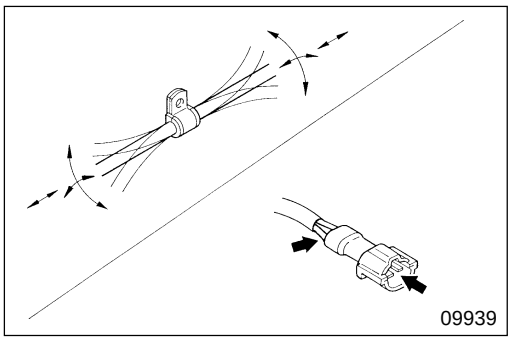
● **Measurement of resistance between terminals**

Measure resistance between the terminals of wheel speed sensor **42**. If the measured value deviates from the standard value, replace the wheel speed sensor.



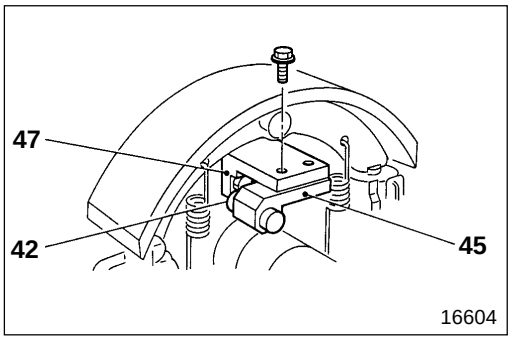
● **Measurement of insulation resistance**

Measure resistance between body **B** and each terminal of wheel speed sensor **42**.
If the measured value is lower than the standard value, replace the wheel speed sensor.



● **Inspection of open circuit in harness**

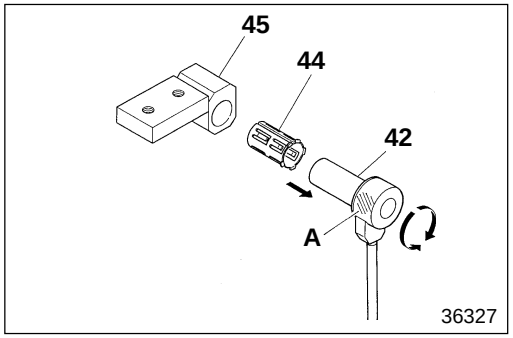
To check the harness for an open circuit, disconnect the harness clamp from the vehicle side, then bend and pull harness at the clamp to check if a momentary open circuit results. Also inspect the terminal contact conditions in the connector.
If an abnormality is found, replace wheel speed sensor **42**.



42 **44** **Wheel speed sensor and spring spacer**

The illustration shows the front-axle left wheel. The right wheel is symmetrical to the one shown in the diagram.
[Removal]

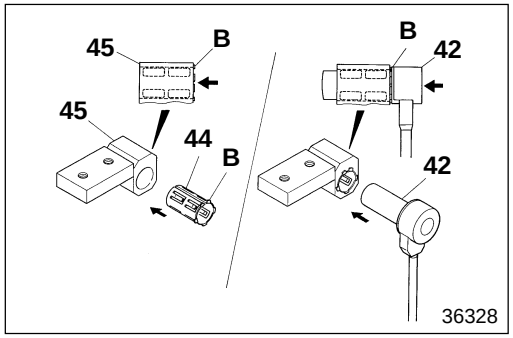
- Remove wheel speed sensor **42** and sensor holder **45** as an assembly.



- Using pliers, hold wheel speed sensor **42** at shaded section **A** in the diagram, and remove it by turning it slightly.

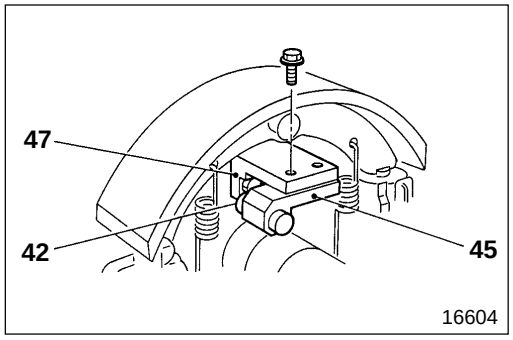
CAUTION ⚠

- **Do not hold wheel speed sensor 42 with pliers at positions other than shaded section A shown in the diagram.**
- **Do not apply excessive force to remove wheel speed sensor 42, such as by striking with a hammer, prying with a screwdriver, and pulling the harness. Excessive force can break wires in the wheel speed sensor.**
- **If only slight force is necessary to remove wheel speed sensor 42, replace spring spacer 44.**

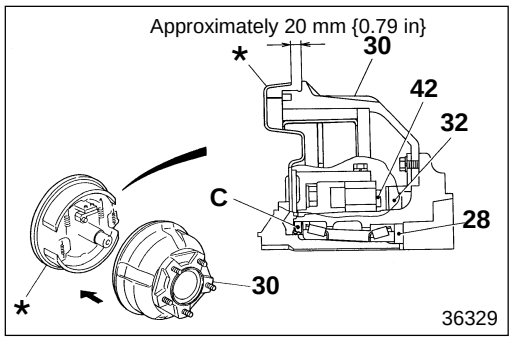


[Installation]

- Insert spring spacer **44** into sensor holder **45** until section **B** of the spring spacer contacts the sensor holder.
- Insert wheel speed sensor **42** until it contacts section **B**.



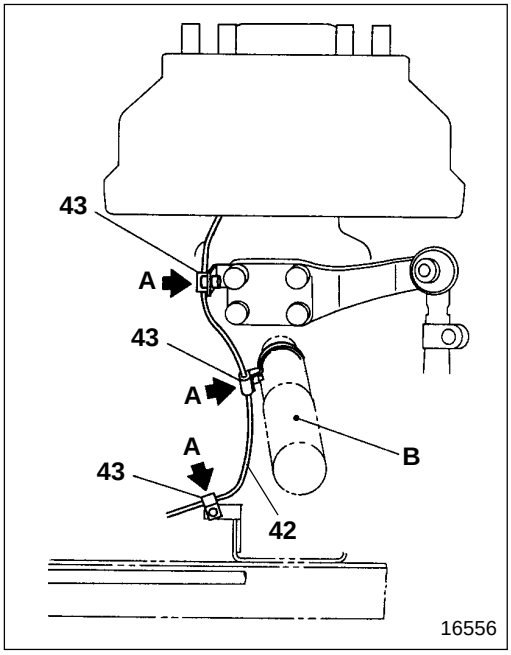
- Install wheel speed sensor **42** and sensor holder **45** as an assembly.



- Carefully install wheel hub & brake drum assembly **30** to avoid damaging oil seal **C**. Position the wheel hub & brake drum assembly at the location where the distance indicated in the illustration is approximately 20 mm {0.79in} (to prevent wheel speed sensor **42** from contacting rotor **32**).
- Slowly tighten lock nut **28** to the specified torque (primary tightening). Adjust and measure the starting torque of the wheel hub bearing.
  P26B-19

CAUTION ⚠

Do not apply excessive force to install wheel speed sensor 42, such as by striking with a hammer, prying with a screwdriver, and pulling the harness. Excessive force can break wires in the wheel speed sensor.



42 **43** **Installation of wheel speed sensor harness and clips**

Starting from the wheel brake side, secure the harness of wheel speed sensor **42** in place at white tape sections **A** using clips **43**, while making sure that there is no interference, twisting or excessive sagging of the harness.

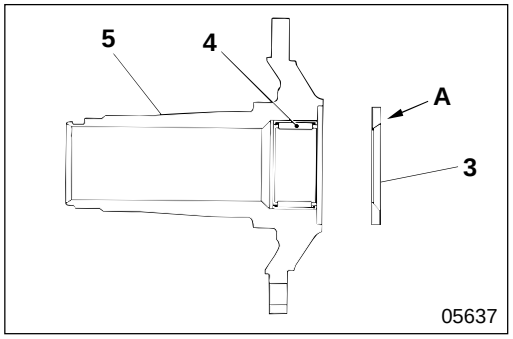
◆ Service procedure

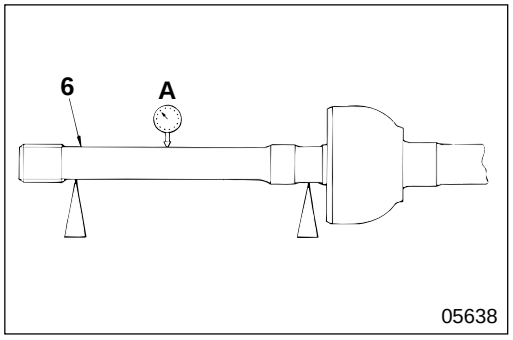


3 **4** **Installation of spacer and needle bearing**

- Pack the space between rollers of needle bearing **4** with grease and press-fit the needle bearing until it is level with the end of knuckle spindle **5**.
- Install spacer **3** on knuckle spindle **5** as illustrated.
- After installing spacer **3**, coat the chamfered side **A** of the inner diameter of the spacer with grease.

CAUTION

Take care not to use too much force when installing needle bearing 4.



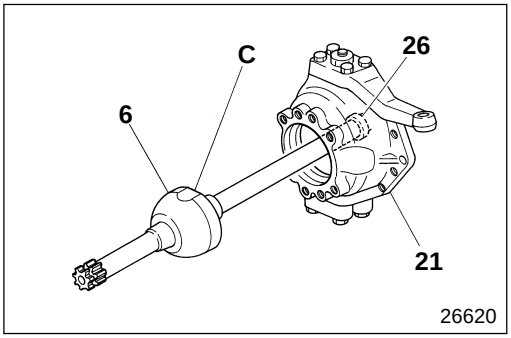
6 **Drive shaft assembly**

[Inspection]

Measure deflection **A** of drive shaft assembly **6** at the center of the inner shaft. If the measured value is higher than the limit, replace the drive shaft assembly.

NOTE

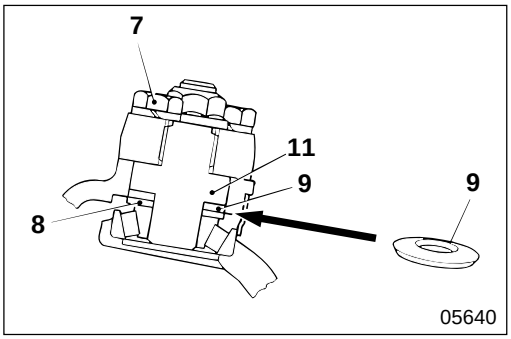
To measure the deflection of drive shaft assembly 6, turn it one full revolution and read the dial gauge indicator. The deflection is one half of the indicated value.



[Installation]
Insert drive shaft assembly **6** into steering knuckle **21** with flat part **C** of the Birfield joint facing upwards.

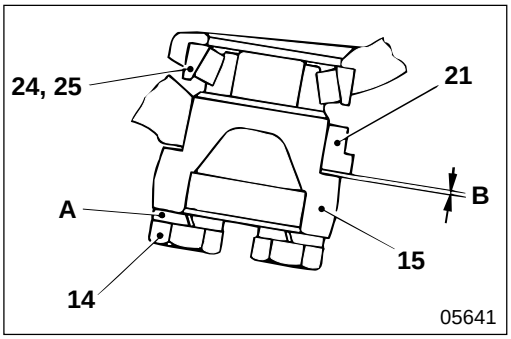
CAUTION

Be careful not to damage oil seal 26, when installing drive shaft assembly 6.



8 **9** **Spacer and conical spring**

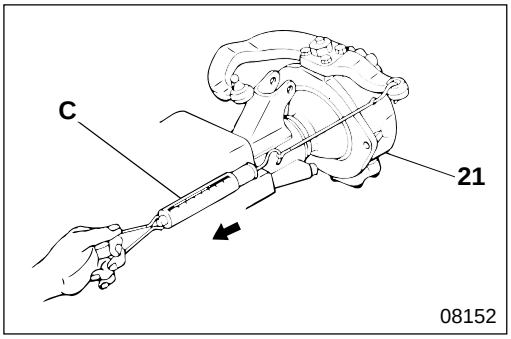
[Adjustment of pre-pressure in trunnion bearing]
Assemble conical spring **9** and spacer **8** (thickness=3.2 mm {0.13 in.}) and temporarily tighten kingpin, upper **11** with assembly bolt **7** as illustrated.



- Install kingpin, lower **15** into steering knuckle **21**. Screw bolt **14** into spring washer **A**, and tighten sufficiently but without applying tension to the spring washer.
- Tighten kingpin, lower **15** until it fits snugly into trunnion bearings **24**, **25** in the lower part.
- Measure clearance **B** between steering knuckle **21** and kingpin, lower **15**. Select spacer **8** based on the measured clearance.

Clearance B	Thickness of spacer
0.6 mm {0.024 in.} or more	3.2 mm {0.13 in.}
Less than 0.6 mm {0.024 in.}	3.6 mm {0.14 in.}

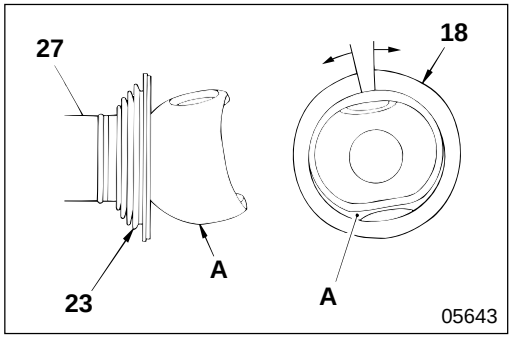
- If clearance **B** is 0.6 mm {0.024 in.} or more, tighten bolt **14** at specified torque.
  If clearance **B** is less than 0.6 mm {0.024 in.}, replace with spacer **8** (thickness=3.6 mm {0.14 in.}) and remeasure the clearance.



[Starting torque of steering knuckle]
- Fasten spring balancer **C** to steering knuckle **21** and measure whether the starting torque of the steering knuckle conforms to the standard value.
- If the measured value deviates from the standard value, adjust the starting torque of the steering knuckle according to the procedure described above. If any fault is found after adjustment, replace trunnion bearings **24**, **25**.

NOTE

Be sure to measure the starting torque before installing dust seal 18 and dust boot 23.

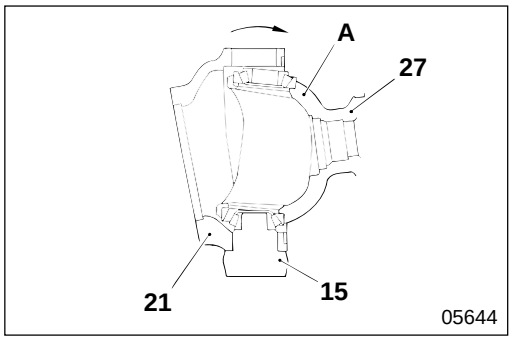


18 **23** **Installation of dust seal and dust boot**

Install dust boot **23** on kingpin ball yoke area **A** in axle housing **27**. Then, mount dust seal **18** while widening its end part.

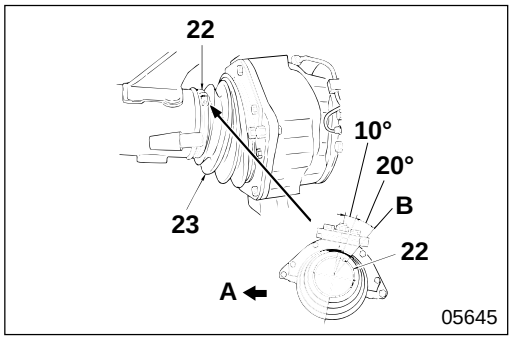
CAUTION

Do not widen dust seal 18 too much.



21 **Assembly of steering knuckle**

Install kingpin, lower **15** into steering knuckle **21**.
While turning the steering knuckle, install it into kingpin ball yoke area **A** in axle housing **27**.



22 **Tightening of boot band**

Install boot band **22** at an angle within 20° as illustrated. Then, tighten and caulk it.
A : Front of the vehicle

CAUTION

Be careful not to overtighten dust boot 23, and make sure that the rubber does not protrude too much from the joint surface.

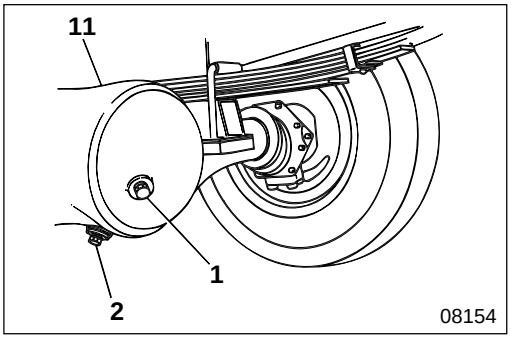
◆ Service procedure

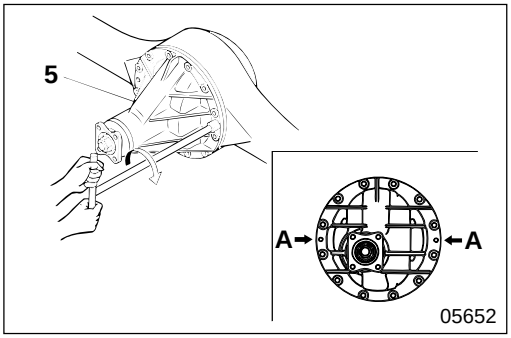


● Service operations before removal and after installation

(1) Before removing any part, remove inspection plug **1** and drain plug **2** and drain the gear oil from axle housing **11**.

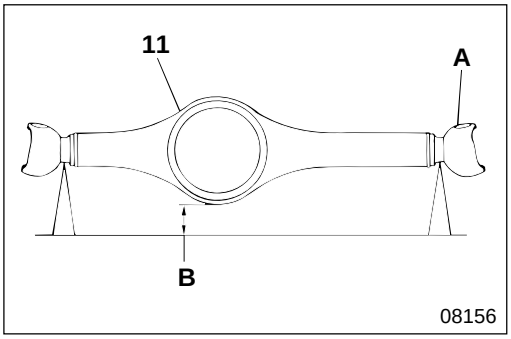
(2) After installing all parts, fill axle housing **11** with the specified amount of gear oil.

(3) Tighten drain plug **2** and inspection plug **1** at specified torque.



5 **Removal of reduction and differential assembly**

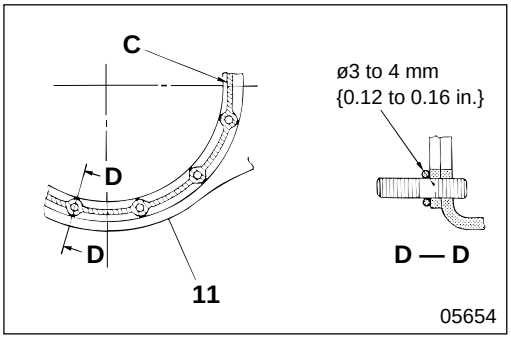
Tighten M10×1.25 mm bolts evenly into two screw holes **A** provided for removing reduction and differential assembly **5**.



11 **Axle housing**

[Inspection for deflection]

- Support both ends of kingpin ball yoke part **A** of axle housing **11** horizontally and measure axle housing height **B**.
- Turn axle housing **11** through 180° to measure height **B**.
- If the height difference is higher than the limit, replace axle housing **11**.



[Applying sealant]

- Apply sealant to reduction and differential assembly **5** mounting surface of axle housing **11**.
- Apply sealant linearly for part **C** and for the position that is symmetrical to an imaginary center line.

CAUTION ⚠

Make sure that sealant does not ooze from the mating surface after installing reduction and differential assembly 5.

Follow the disassembly sequence in reverse.

● **Inspection and adjustment after assembly** P26B-38

CAUTION⚠

Be sure when replacing any of the following parts, to replace both it and its associated parts as a set :

- **For bolt 4, bearing cap 5 or differential carrier 29, replace the carrier assembly.**
- **For final drive gear 10 or final drive pinion 23, replace the gear set.**
- **Make sure you keep left and right side bearings 6, 7 separate after removal, and be careful not to mix then up when installing them.**

NOTE

Write down the thickness of front bearing shim 19, pinion spacer 20 and rear bearing shim 22 when disassembling to use it as reference when reassembling.

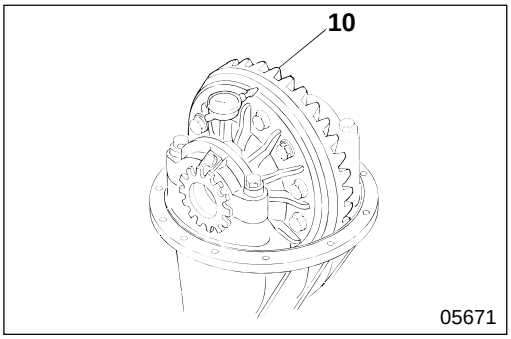
● **Work before disassembly**

Mount differential carrier **29** on c differential working base assembly.

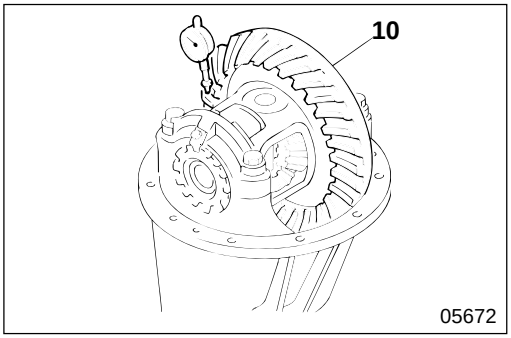
- a : Attachment
- b : Holder
- c : Holder
- d : Working base



● **Inspection before disassembly**

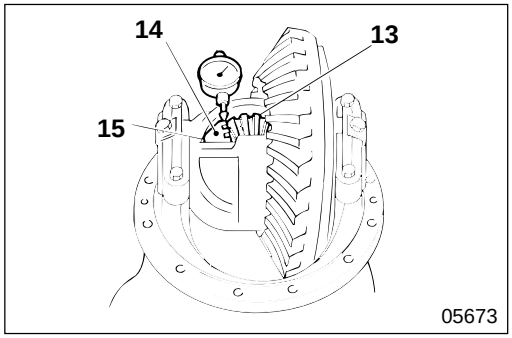
(1) Deflection of rear surface of final drive gear

Measure at the point of maximum diameter of final drive gear **10**.



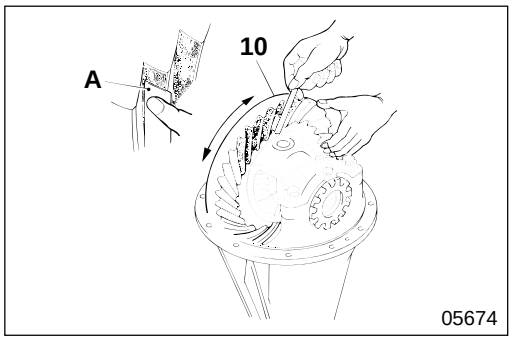
(2) Backlash between final drive gear and final drive pinion

Measure at three points on the circumference of final drive gear **10**.



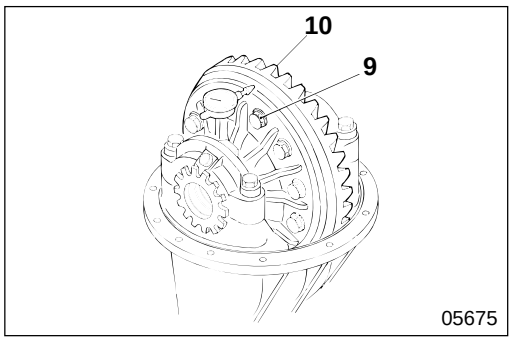
(3) Backlash between differential pinion and differential gear

Measure backlash between differential pinion **13** and differential gear **14**.



(4) Tooth contact of final drive gear

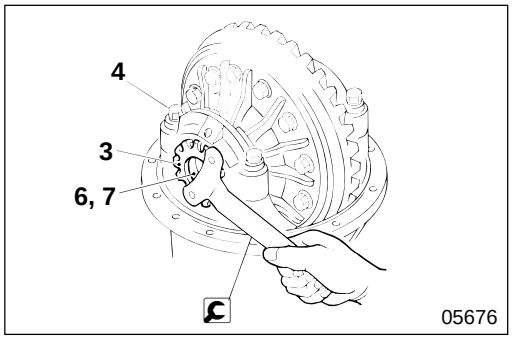
Apply red lead primer to the surfaces of three or four teeth of final drive gear **10**, examine tooth contact by turning the gears a few times.
A : Examine tooth contact using paper.



● **Inspection and adjustment after assembly**

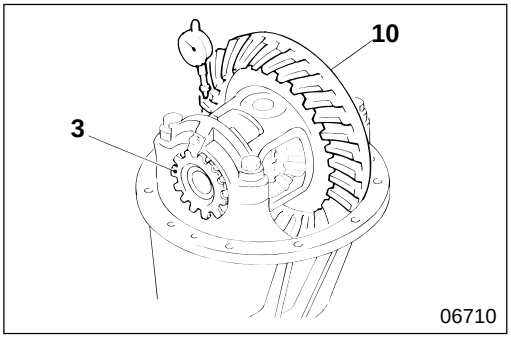
(1) Deflection of rear surface of final drive gear

- Measure at the point of maximum diameter of final drive gear **10**.
- If the measured value deviates from the standard value, check tightening torque of bolt **9** or replace along with the gear set.



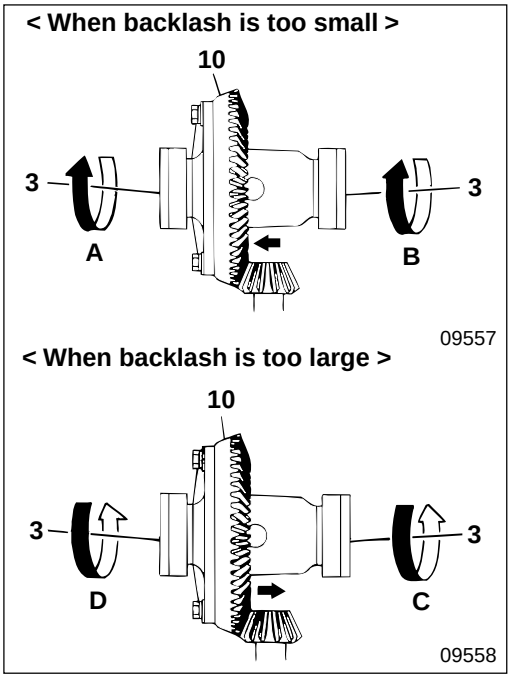
(2) Backlash of final drive gear

[Adjustment]
Before adjusting, tighten bolt **4** temporarily. Then, tighten side bearing nut **3** using 🔧 differential side bearing adjustment tool until just before pre-pressure is exerted on side bearings **6**, **7**.



[Measurement]

- Measure final drive gear **10** backlash at three points on the circumference of the final drive gear.



- If backlash deviates from the standard value, rotate left and right side bearing nuts **3** and move final drive gear **10** as illustrated using 🔧 side bearing adjusting tool to adjust backlash.

  < When backlash is too small >

  Adjust in order of **A** to **B**.

  A : Loosen

  B : Tighten

  < When backlash is too great >

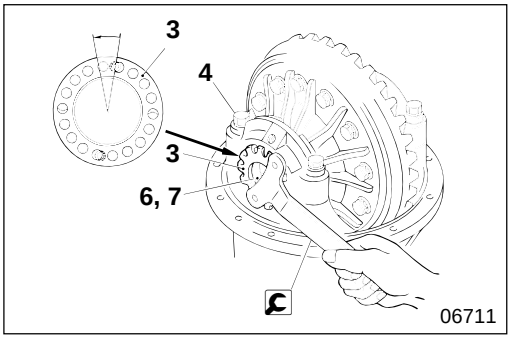
  Adjust in order of **C** to **D**.

  C : Loosen

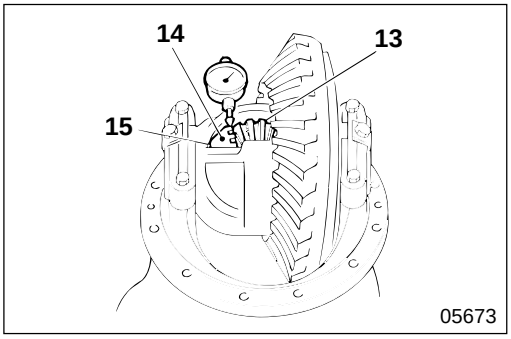
  D : Tighten

CAUTION ⚠

Be sure, when side bearing nut 3 on one side is loosened, to tighten the other side by the same amount.



- Tighten right and left side bearing nuts **3**, by half the pitch between the centers of adjacent holes, using 🔧 differential side bearing adjustment tool to add pre-pressure to side bearings **6**, **7**.
- Tighten bolt **4** at specified torque.



(3) Backlash between differential pinion and differential gear

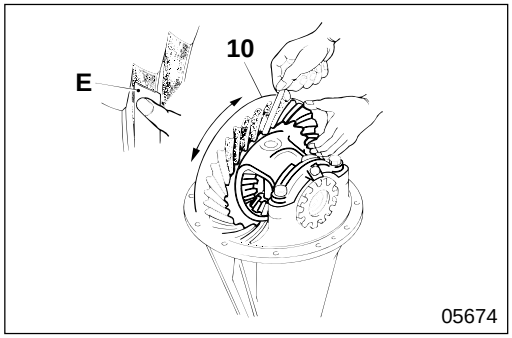
Measure backlash between differential pinion **13** and differential gear **14**. If the measured value deviates from the standard value, adjust with spacer **15**.

CAUTION ⚠

Make sure that the thickness of right spacer 15 is identical to that of the left spacer.

Spacer thicknesses :

1.4 to 1.6 mm {0.055 to 0.063 in.} (three thicknesses available in 0.1 mm {0.0039 in.} increments)



(4) Tooth contact of final drive gear

[Inspection]
Apply red lead primer to the surfaces of three or four teeth of final drive gear **10**, examine tooth contact by turning the gears a few times.
E : Examine tooth contact using paper.

[Adjustment]
If tooth contact deviates excessively from the standard value, adjust by increasing or decreasing backlash and rear bearing shim **22**.

CAUTION

Be sure when replacing the gear because of abnormally worn teeth to replace the gear set of final drive gear 10 and final drive pinion 23 together.

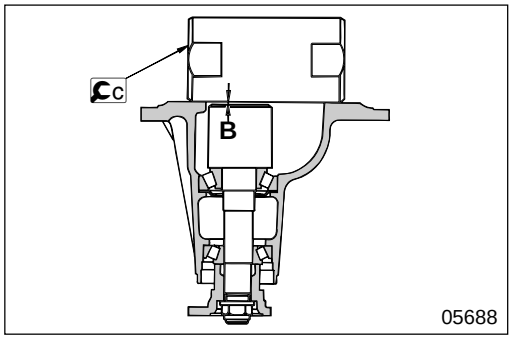
[Selection of rear bearing shim]

- Install Ca pinion gauge temporarily in differential carrier **29** together with the parts illustrated.
- Tighten lock nut **17** using Cb socket to adjust starting torque **A** of the pinion gauge to the standard value.

CAUTION

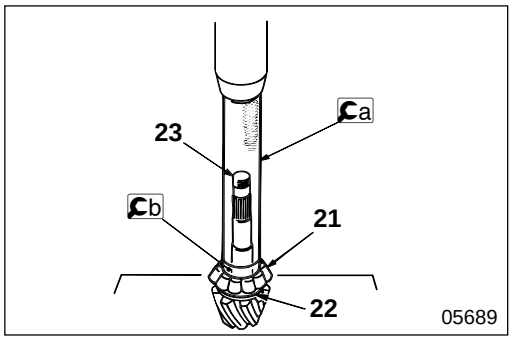
Do not assemble parts other than those illustrated.



- Set Cc cylinder gauge to standard starting torque to measure gap **B** as illustrated.
  Select rear bearing shim **22** using the calculation given below.
  < Calculation of rear bearing shim thickness C >
  C=B–1.5 mm {0.059 in.}
  Rear bearing shim thicknesses :
  0.3 mm {0.012 in.} and 1.38 to 1.65 mm {0.054 to 0.065 in.}
  (10 thicknesses available in 0.03 {0.0012 in.} mm increments)

CAUTION

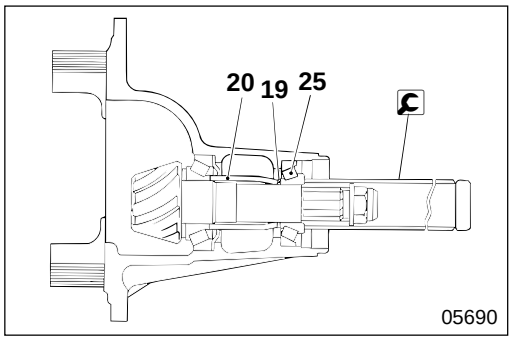
Be sure to keep the number of rear bearing shims 22 to the minimum and keep them as close to the standard value as possible.



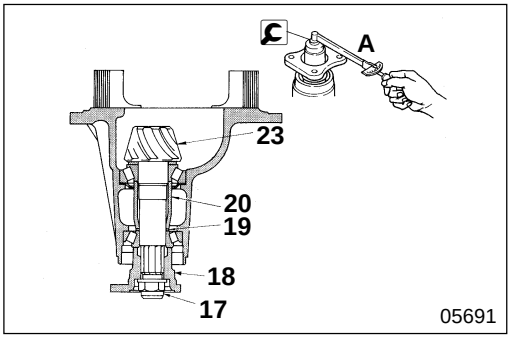
[Installation of rear bearing shim]
Install selected rear bearing shim **22** onto final drive pinion **23** and press-fit rear bearing inner race **21** using Ca Cb bearing installer.

CAUTION

Be sure, when installing rear bearing shim 22 comprised of a 0.3 mm {0.012 in.} shim and another shim, that the 0.3 mm {0.012 in.} shim is installed next to the bearing.



[Press-fitting of front bearing inner race]
Assemble pinion spacer **20** and front bearing shim **19** for press-fitting of front bearing inner race **25** using C bearing installer.



[Measurement of starting torque]

- After installing companion flange assembly **18**, tighten lock nut **17** at specified torque.
  Measure starting torque **A** of final drive pinion **23** using [E] socket.
- If the measured value deviates from the standard value, select pinion spacer **20** and front bearing shim **19** to adjust the starting torque to the standard value.

CAUTION

- **Do not install the oil seal before measuring the starting torque.**
- **Be sure to keep the number of shims to the minimum when selecting pinion spacers 20.**

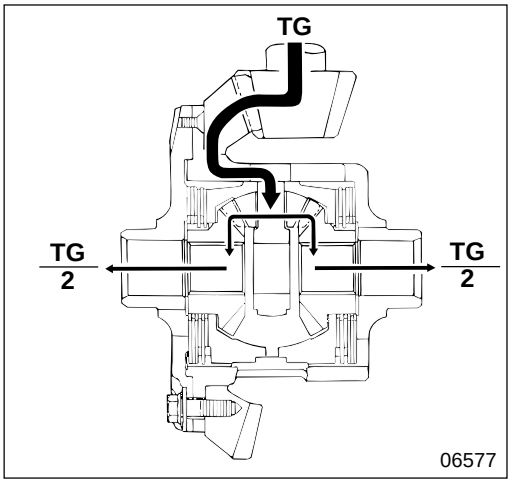
Friction disc **5** and friction plate **6** engage side gear **3** and differential case RH **4**, respectively. These parts are pressed against pressure ring **9** by spring plate **7**. The pressure ring mates with the groove in the differential case RH and always turns at the same speed.

Operation mechanism

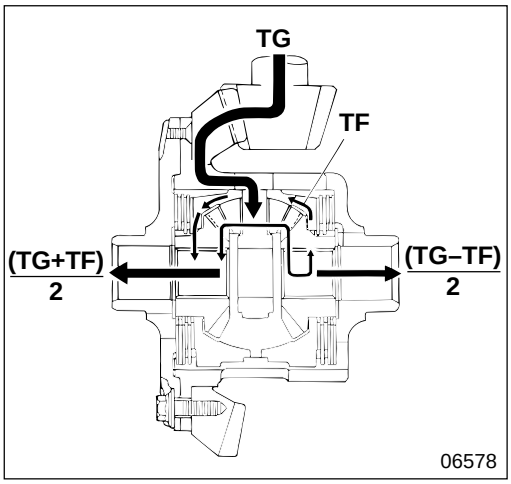
When the wheel of one side starts spinning, a rotational difference between side gear **3** and differential cases, LH **2** and RH **4** occurs. Then, friction disc **5** and friction plate **6** start rotating with a relative difference in revolution speed. This causes friction torque between the disc and plate.



● **Operation in straight movement**

In the case of straight movement, as the revolution speed of the left axle shaft and that of the right axle shaft are equal, no friction torque occurs.

TG : Torque input



● **Operation when there is a difference in revolution speed between left and right wheel**

When a difference in the resistance the wheels receive from the road surface occurs, such as when the wheel of one side encounters mud, the differential function comes into play, transmitting friction torque **TF**. This exertion of friction torque reduces the revolution speed causing the high-revolution speed axle to reduce its speed and the low-revolution speed axle to increase its speed.

Therefore, when the wheel of one side starts spinning, when caught in mud for example, a big difference in revolution speed occurs, causing a large amount of friction torque to come into action. The differential functions in such a manner that a smaller ratio of the torque is transmitted to the axle of the wheel which is spinning while the axle of the wheel on the other side receives a greater ratio of the torque. This makes it easier for the vehicle to get out of the mud.

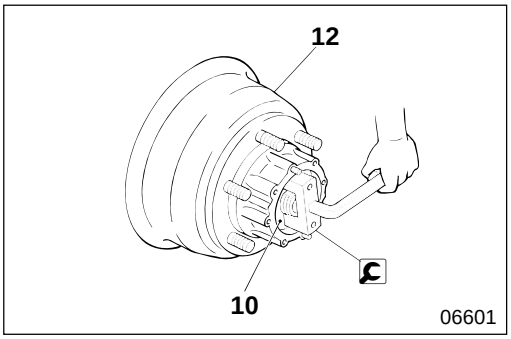
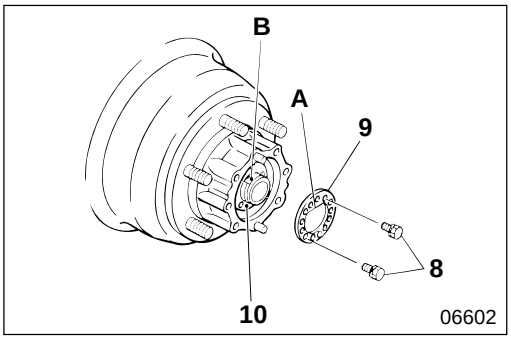
◆ Service procedure



● Starting torque of wheel hub bearing

[Adjustment]

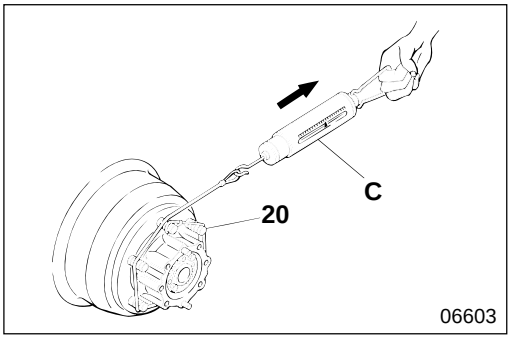
- Tighten lock nut **10** at specified torque for primary tightening, while turning wheel hub and brake drum assembly **12**.
- Slacken off lock nut **10** completely.
- Turn wheel hub and brake drum assembly **12** several times to smooth operation of outer bearings **11**, **17** and inner bearings **15**, **16.**
- Retighten lock nut **10** at specified torque for secondary tightening.



- Align flat area **A** with notch **B** to install lock washer **9**.
- Make sure that the mounting holes of lock washer **9** and lock nut **10** align. If they do not, slacken off the lock nut and align them.
- Install bolts **8** at the position as illustrated, aligning lock nut **10**.
- Tighten bolts **8** at specified torque.

CAUTION

After adjustment, make sure that there is no play in the axial direction of wheel hub and brake drum assembly 12.



[Measurement]

- Install spring balance **C** on hub bolt **20**.
- Measure the tangential force.
- If the measured tangential force is within the specified value, the starting torque conforms to the standard value.
- Do not allow the starting torque to become higher than the tangential force.
- If the measured value deviates from the specified value, readjust.
- If any fault is found after readjustment, replace outer bearings **11**, **17** and inner bearings **15**, **16**.

NOTE

- **Measure the starting torque with inner oil seal 14 installed.**
- **Measure the starting torque with rear axle shaft 6 and outer oil seal 7 removed.**

2 Wheel speed sensor

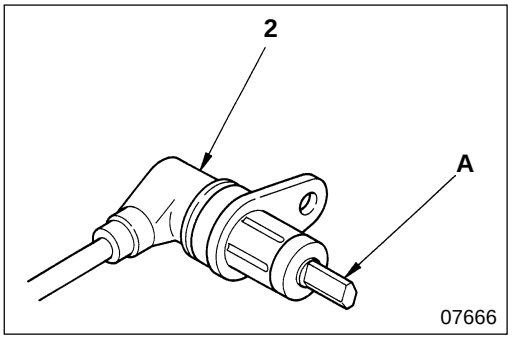
[Removal]

To prevent damaging pole piece **A** of wheel speed sensor **2**, remove the wheel speed sensor before removing wheel hub and drum assembly **12**.

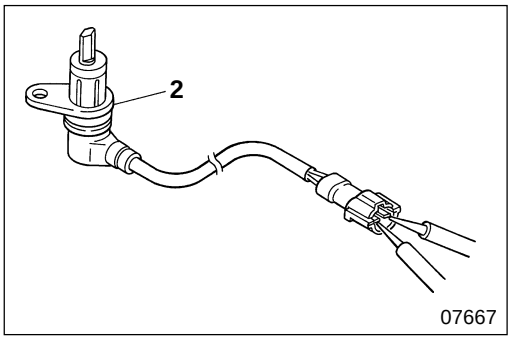
[Installation]

The connector of wheel speed sensor **2** is color-coded. Install the wheel speed sensors to the proper wheels according to the following table.

Installation location	Connector color	Connector shape	Right/left identification tape
Left wheel	Gray	Female	Yellow
Right wheel	Black	Male	None

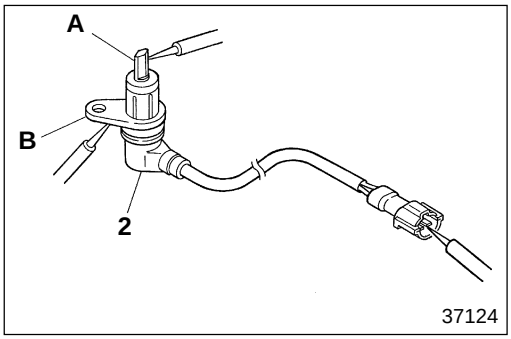


[Inspection]
Pole piece **A** in wheel speed sensor **2** is magnetized by a built-in magnet and attracts metals. Do not allow metal particles to stick to the pole piece.



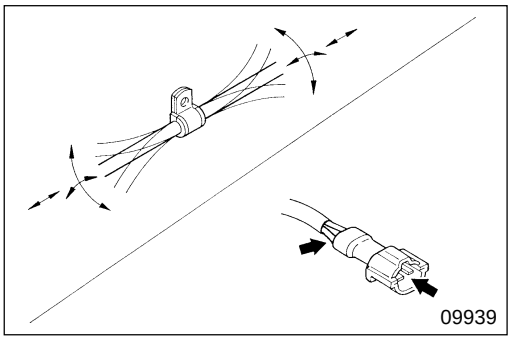
● **Measurement of resistance between terminals**

Measure resistance between the terminals of wheel speed sensor **2**.
If the measured value deviates from the standard value, replace the wheel speed sensor.



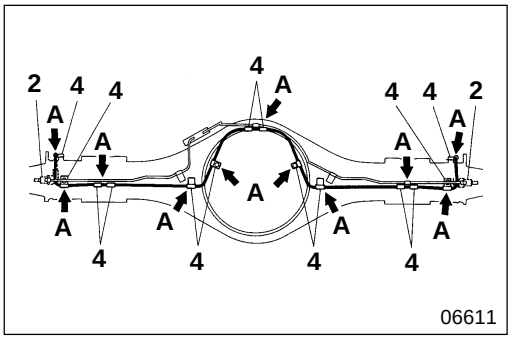
● **Measurement of insulation resistance**

Measure resistance between pole piece **A**, bracket **B** and each terminal of wheel speed sensor **2**.
If the measured value is lower than the standard value, replace the wheel speed sensor.



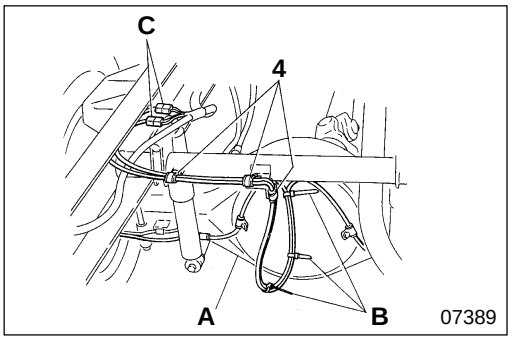
● **Inspection of open circuit in harness**

To check the harness for an open circuit, disconnect the harness clamp from the vehicle side, then bend and pull harness at the clamp to check if a momentary open circuit results. Also inspect the terminal contact conditions in the connector.
If an abnormality is found, replace wheel speed sensor **2**.

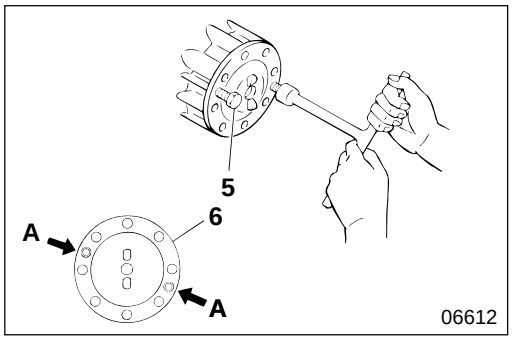


2 **4** **Installation of wheel speed sensor harness and clips**

Starting from the wheel brake side, secure the harness of wheel speed sensor **2** in place at tape sections **A** using clips **4**, while making sure that there is no interference, twisting or excessive sagging of the harness.

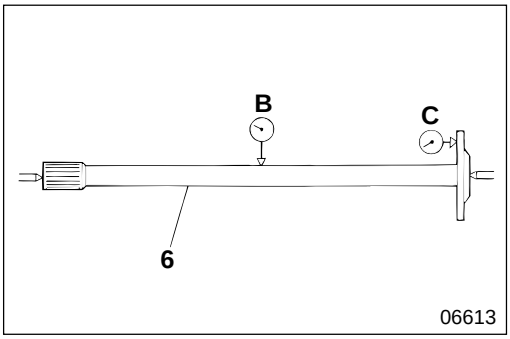


- As shown in the diagram, position the harness of wheel speed sensor **2**, starting from rear axle housing section **A** and moving toward the frame, making sure that there is no twisting or unnecessary slack in the harness. Use clips **4** and cable ties **B** to secure the harness in place, then connect connectors **C**.



6 **Axle shaft**

[Removal]
Insert two mounting bolts **5** of axle shaft **6** into two screw holes **A**, provided for disassembly, of the flange. Then, remove the rear shaft.

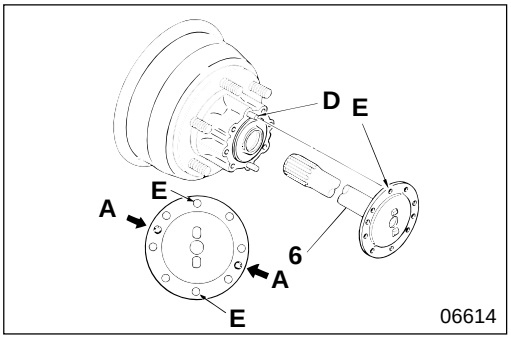


[Inspection]
B : Bend at the shaft center

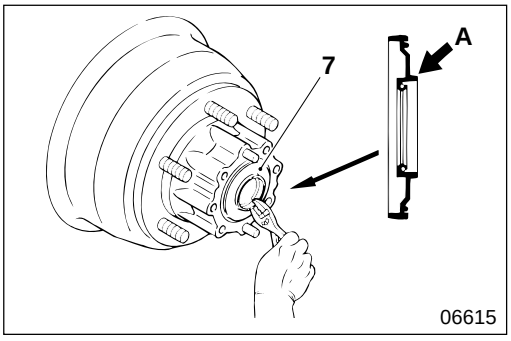
NOTE

To measure the bend of axle shaft 6, turn it one full revolution and read the dial gauge indicator. The bend is one half of the indicated value.

C : Bend of flange surface

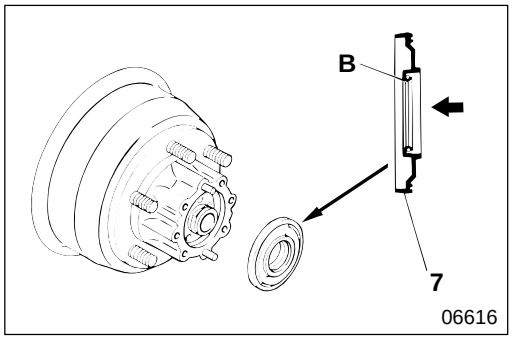


[Installation]
- Knock pin hole **E** of axle shaft **6** is the second hole clockwise from disassembly screw hole **A**.
- To mount axle shaft **6**, align knock pin **D** with knock pin hole **E**.

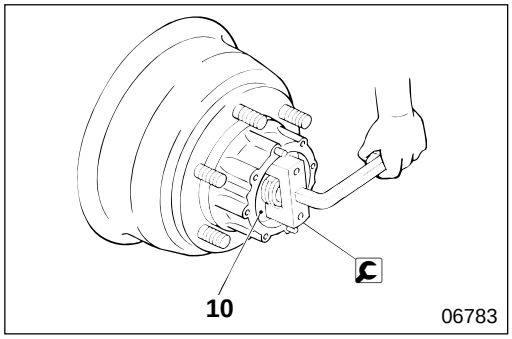


7 **Outer oil seal**

[Removal]
To remove outer oil seal **7**, use a pair of pliers and pull protrusion **A** of the outer oil seal circumference evenly.

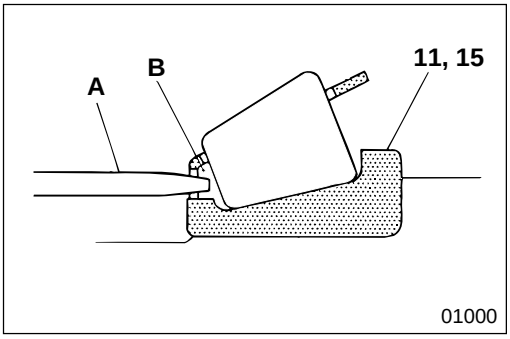


[Installation]
Apply grease to lip area **B** of outer oil seal **7** and press-fit the outer oil seal in the direction as illustrated.



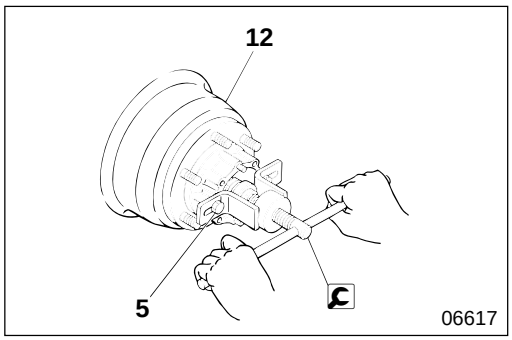
10 **Removal and installation of lock nut**

Adjust and measure the starting torque of wheel hub bearing during installation. P27-13



11 **15** **Packing grease in outer bearing inner race and inner bearing inner race**

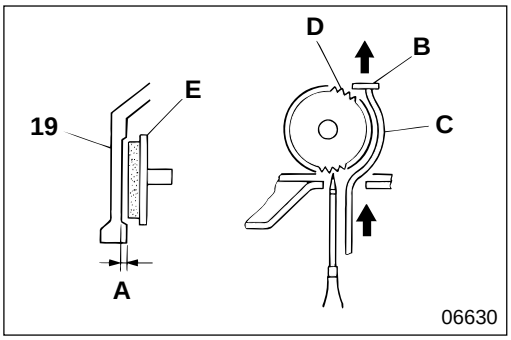
A : Grease pump nozzle
B : Space between rollers



12 **Wheel hub and brake drum assembly**

[Removal]
- Remove wheel hub and brake drum assembly **12** using mounting bolt **5** of axle shaft **6**.

CAUTION
Make sure you remove wheel hub and brake drum assembly 12 in a straight line to prevent damage to oil seal 14.

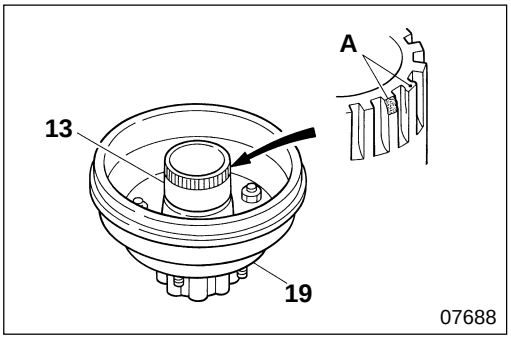


- If wheel hub and brake drum assembly **12** cannot be removed because of stepped wear **A** in brake drum **19**, do the following:
- Remove the backing plate cover.
- Lift lever **B**.
  C : Wire approximately ø2 mm {0.079 in.}
- Turn adjuster **D** in the opposite direction to the arrow on the backing plate to retract brake shoe assembly **E**.
- Remove wheel hub and brake drum assembly **12**.

CAUTION⚠

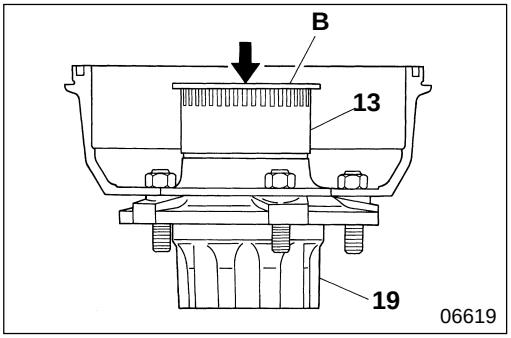
Correct brake drum 19 if any fault is found. 📦 **Gr 35A**

[Installation]
After installing wheel hub and brake drum assembly **12**, adjust the brake shoe clearance. 📦 Gr 35A

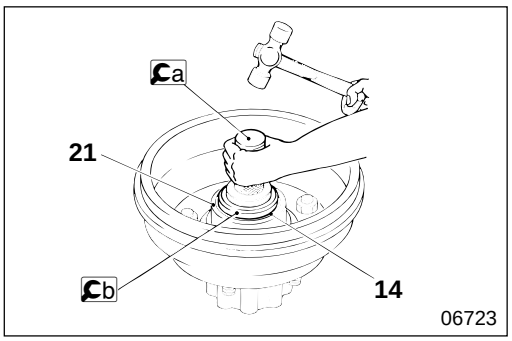


13 **Rotor**

[Inspection]
Check rotor **13** for chipped or crushed teeth (see section **A** in the diagram).
If an abnormality is found, replace the rotor.

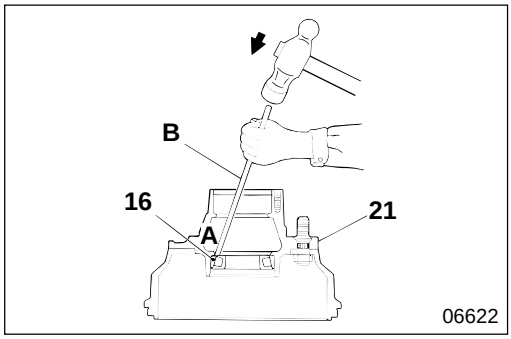


[Installation]
Before installing rotor **13** to brake drum **19**, heat the rotor to approximately 150°C {302°F}. Using iron plate **B**, install the rotor to the brake drum by applying uniform pressure, making sure that there is no gap between the rotor and the brake drum.



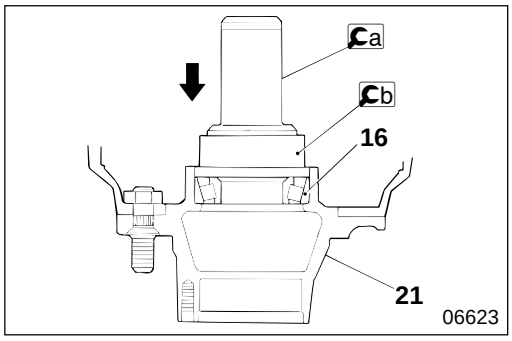
14 **Installation of inner oil seal**

Press-fit inner oil seal **14** until it is flush with the end of wheel hub **21**.

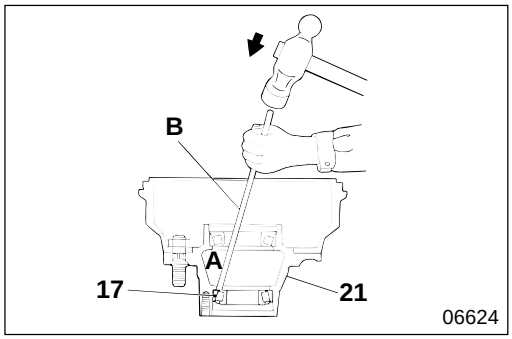


16 **Inner bearing outer race**

[Removal]
Drive out inner bearing outer race **16** evenly from three indented parts **A** in wheel hub **21**.
B : Pin-punch

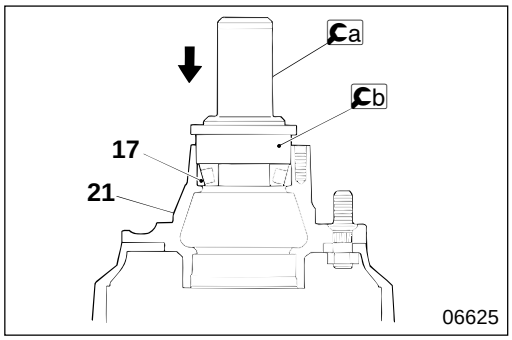


[Installation]

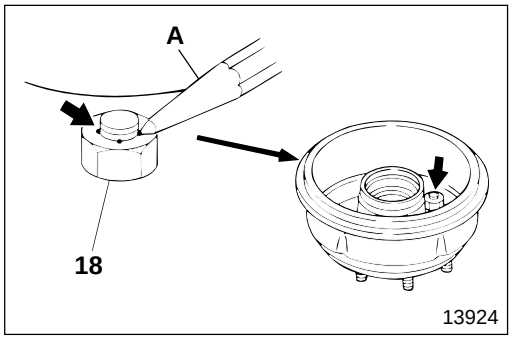


17 **Outer bearing outer race**

[Removal]
Drive out outer bearing outer race **17** evenly from three indented parts **A** in wheel hub **21**.
B : Pin-punch

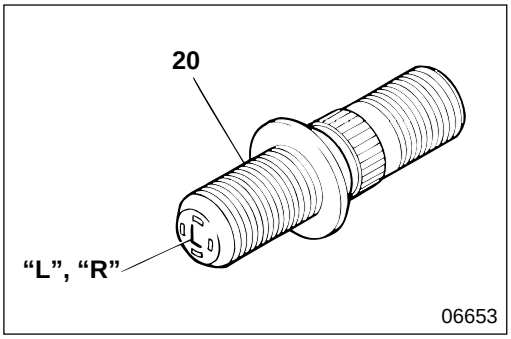


[Installation]



18 **Installation of nut**

Tighten nut **18** at specified torque, then caulk the nut to keep it from turning.
A : Punch



20 **Installation of hub bolt**

Hub bolt **20** is marked with **L** (left) or **R** (right) to indicate the side it is to be mounted on. Check this symbol before press-fitting the bolt.

CAUTION

- **Before removing disc brake assembly 15 secure the disc brake assembly to the frame using wires, and do not disconnect the brake hose. Never allow the weight of the disk brake caliper assembly to hang from the hydraulic brake hose. Be sure to remove the harness clips to prevent damaging the pad wear indicator harness during the removal process.**
- **Be sure to protect brake pipe 1 and brake hoses 3, 11 from dust by fitting blanking plugs after removal.**

NOTE

Do not disassemble wheel hub 33 and disc rotor 34 unless they are faulty.

● **Assembly sequence**

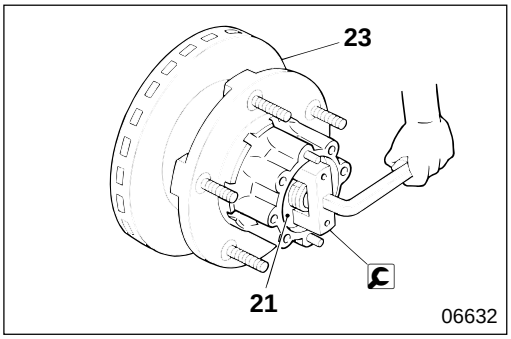
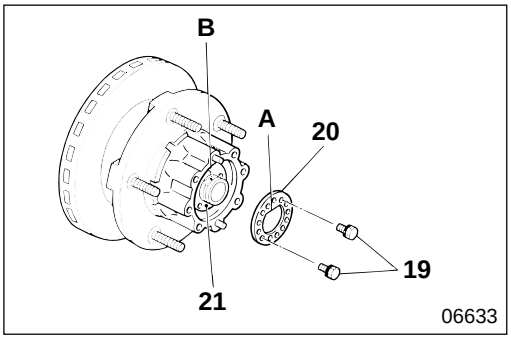
◆ Service procedure



● Starting torque of wheel hub bearing

[Adjustment]

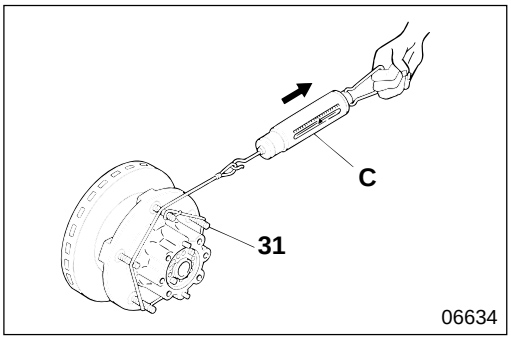
- Tighten lock nut **21** at specified torque for primary tightening, while turning wheel hub and rotor assembly **23**.
- Slacken off lock nut **21**completely.
- Turn wheel hub and rotor assembly **23** several times to smooth operation of outer bearings **22**, **29** and inner bearings **27, 28**.
- Tighten lock nut **21** at specified torque for secondary tightening.



- Insert lock washer **20** so that flat area **A** fits onto notch **B**.
- Make sure that the mounting holes of lock washer **20** and lock nut **21** align. If they do not, slacken off the lock nut and align them.
- Install bolts **19** at the positions as illustrated, aligning lock nut **21**.
- Tighten bolts **19** at specified torque.

CAUTION

After adjustment, make sure that there is no play in the axial direction of wheel hub and rotor assembly 23.

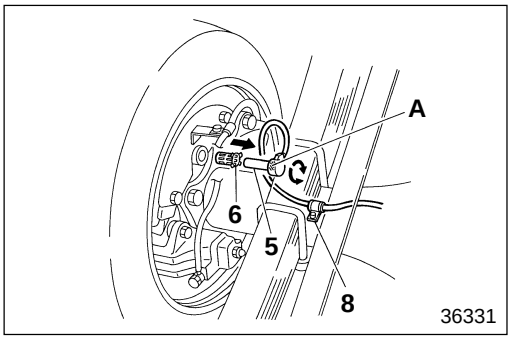


[Measurement]

- Install spring balance **C** on hub bolt **31**.
- Measure the tangential force.
- If the measured tangential force is within the specified value, the starting torque conforms to the standard value.
- Do not allow the starting torque to become higher than the tangential force.
- If the measured value deviates from the specified value, readjust.
- If any fault is found after readjustment, replace outer bearings **22, 29** and inner bearings **27, 28**.

NOTE

- **Measure the starting torque with inner oil seal 26 installed.**
- **Measure the starting torque with disc brake assembly 15, outer oil seal 18 and axle shaft 17 removed.**



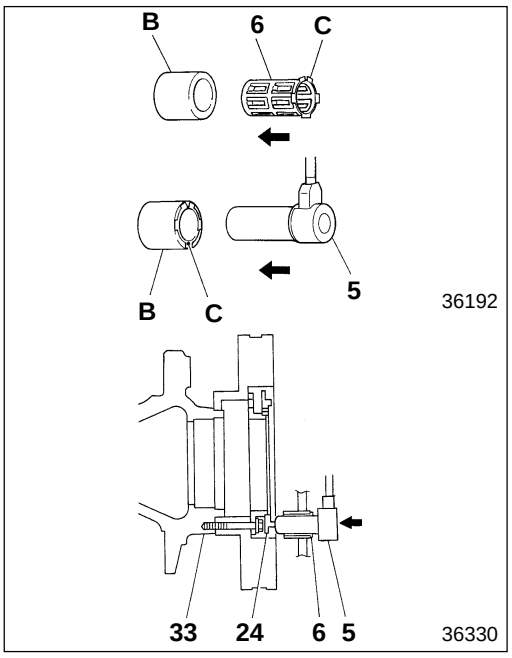
5 **6** **Wheel speed sensor and spacer**

[Removal]

Using pliers, hold wheel speed sensor **5** at shaded section **A** in the diagram, and remove it by turning it slightly.

CAUTION

- **Do not hold wheel speed sensor 5 with pliers at positions other than shaded section A shown in the diagram.**
- **Do not apply excessive force to remove wheel speed sensor 5, such as by striking with a hammer, prying with a screwdriver, and pulling the harness. Excessive force can break wires in the wheel speed sensor.**
- **If only slight force is necessary to remove wheel speed sensor 5, replace spring spacer 6.**



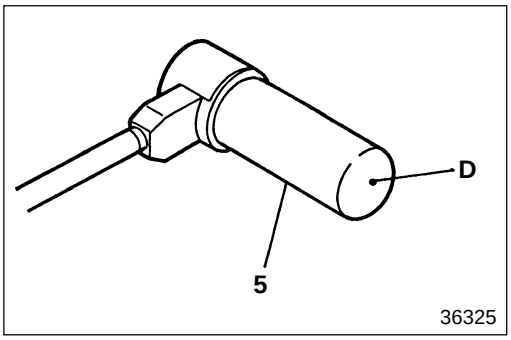
[Installation]
The connector of wheel speed sensor **5** is color-coded. Install the wheel speed sensors to the proper wheels according to the following table.

Installation location	Connector color	Connector shape	Right/left identification tape
Left wheel	Gray	Female	Yellow
Right wheel	Black	Male	None

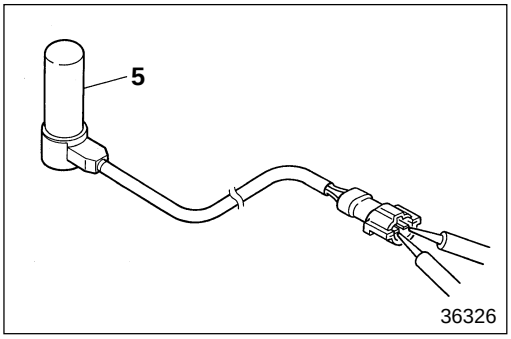
- Insert spring spacer **6** into holder section **B** of the backplate until stopper section **C** contacts the holder section.
- Insert wheel speed sensor **5** until it firmly contacts rotor **24**.
- Slowly rotate wheel hub **33** two or three turns (1 rotation per 2 seconds) to make sure it rotates smoothly.

CAUTION

Do not apply excessive force to install wheel speed sensor 5, such as by striking with a hammer, prying with a screwdriver, and pulling the harness. Excessive force can break wires in the wheel speed sensor.

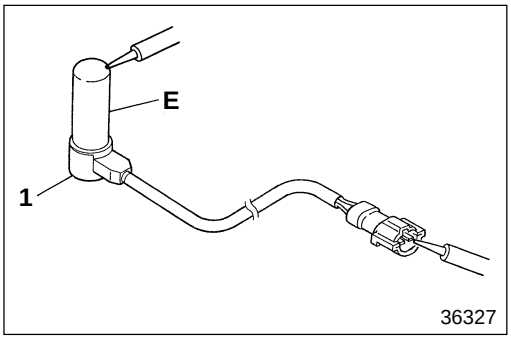


[Inspection]
Pole piece **D** in wheel speed sensor **5** is magnetized by a built-in magnet and attracts metals. Do not allow metal particles to stick to the pole piece.



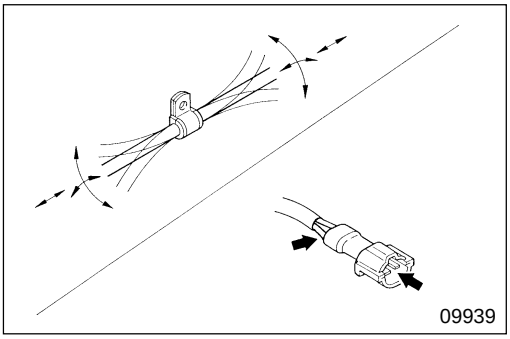
● **Measurement of resistance between terminals**

Measure resistance between the terminals of wheel speed sensor **5**.
If the measured value deviates from the standard value, replace the wheel speed sensor.



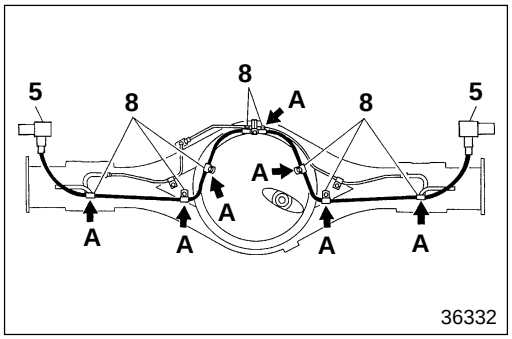
● **Measurement of insulation resistance**

Measure resistance between body **E** and each terminal of wheel speed sensor **5**.
If the measured value is lower than the standard value, replace the wheel speed sensor.



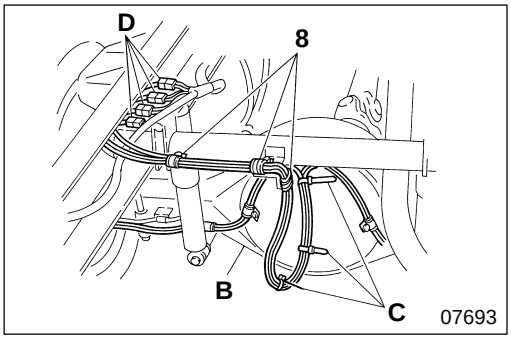
● **Inspection of open circuit in harness**

To check the harness for an open circuit, disconnect the harness clamp from the vehicle side, then bend and pull harness at the clamp to check if a momentary open circuit results. Also inspect the terminal contact conditions in the connector.
If an abnormality is found, replace wheel speed sensor **1**.

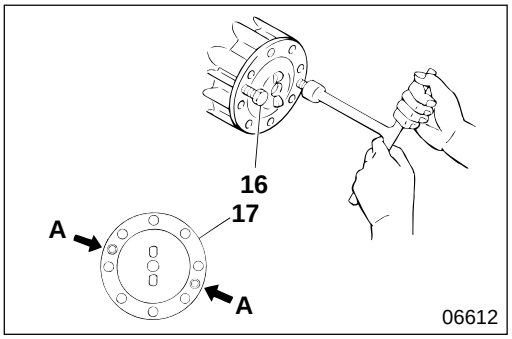


5 **8** **Installation of wheel speed sensor harness and clips**

- Starting from the wheel brake side, secure the harness of wheel speed sensor **5** and the pad wear indicator harness in place at tape sections **A** using clips **8**, while making sure that there is no interference, twisting or excessive sagging of the harnesses.

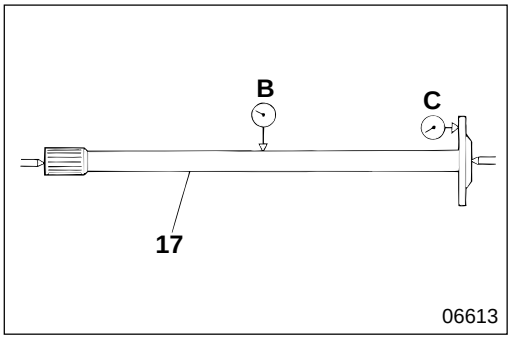


- As shown in the diagram, position the harness of speed sensor **5** and the pad wear indicator harness, starting from housing section **B** and moving toward the frame, making sure that there is no twisting or excessive sagging of the harnesses. Use clips **8** and cable ties **C** to secure the harnesses in place, then connect connectors **D**.



17 **Axle shaft**

[Removal]
Insert bolts **16** into screw holes **A** of axle shaft **17**. Then, remove the axle shaft.

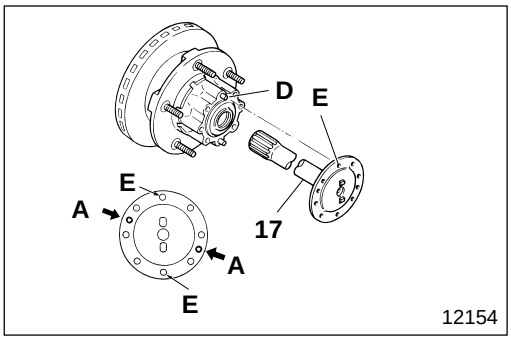


[Inspection]
B : Bend of shaft center

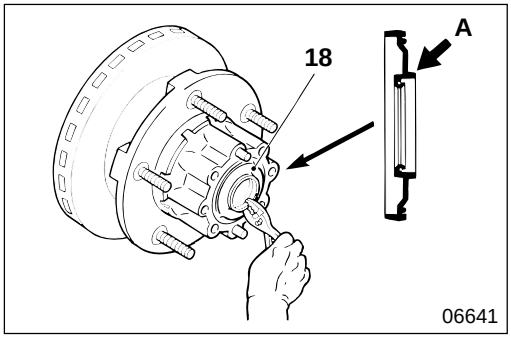
NOTE

To measure the bend of axle shaft 17, turn it one full revolution and read the dial gauge indicator. The bend is one half of the indicated value.

C : Wobble of flange face

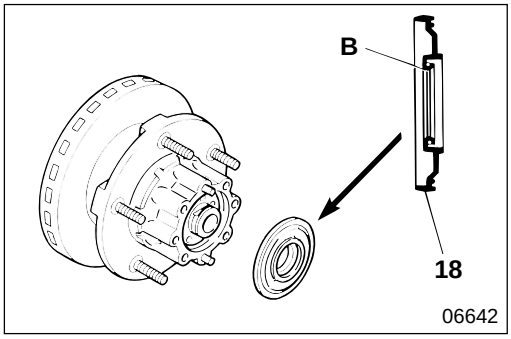


[Installation]
- Knock pin hole **E** of axle shaft **17** is the second hole clockwise from disassembly screw hole **A**.
- To mount axle shaft **17**, align knock pin **D** with knock pin hole **E**.

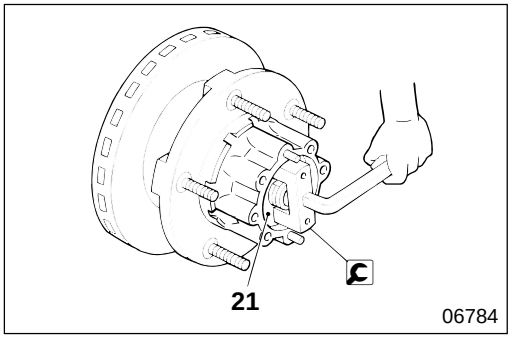


18 **Outer oil seal**

[Removal]
To remove outer oil seal **18**, use pliers and pull protrusion **A** of the outer oil seal circumference evenly.



[Installation]
- Apply grease to lip area **B** of outer oil seal **18**.
- Press-fit outer oil seal **18** in the direction as illustrated.



21 **Removal and installation of lock nut**

Adjust starting torque of wheel hub bearing during installation.

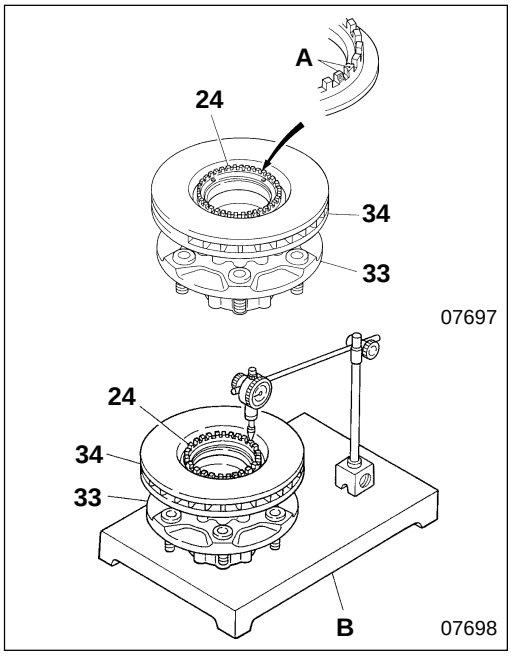
23 **Removal of wheel hub and rotor assembly**

Remove wheel hub and rotor assembly **23** using mounting bolt **16** of axle shaft **17**.

CAUTION

Make sure you remove wheel hub and rotor assembly 23 in a straight line to prevent damage to inner oil seal 26.



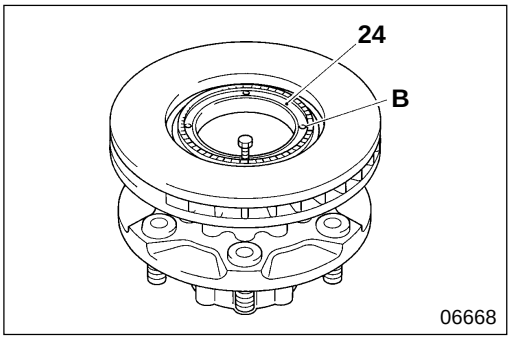
24 **Rotor**

[Inspection]

- Check rotor **24** for chipped or crushed teeth (see section **A** in the diagram).
  If an abnormality is found, replace the rotor.

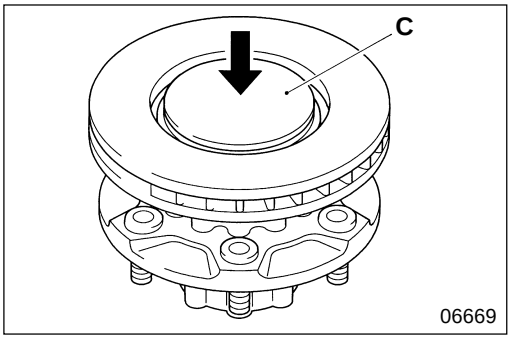
- If the amount of runout of rotor **24** deviates from the standard value, repeat the disassembly and reassembly procedures. If the amount of runout still deviates from the standard value after the reassembly, replace faulty parts.

  B : Platform



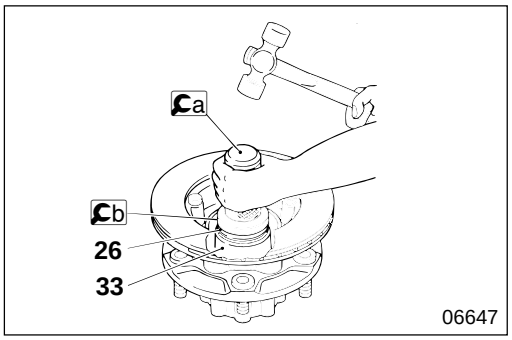
[Removal]

Install bolts (M6 × 1.0) in threaded holes **B** (holes for rotor removal) on rotor **24**, and tighten them evenly to remove the rotor.



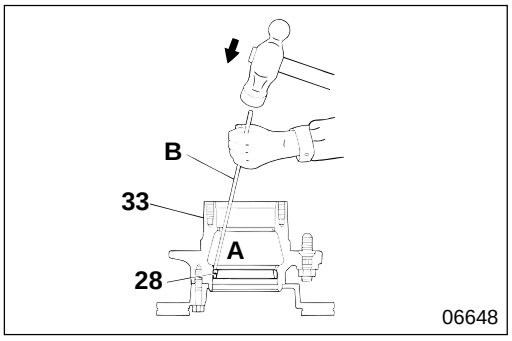
[Installation]

Before installing rotor **24** to rotor flange **25**, heat the rotor to approximately 150°C {302°F}. Using iron plate **C**, press-fit the rotor into the rotor flange by applying uniform pressure, making sure that there is no gap between the rotor and the rotor flange.



26 **Installation of inner oil seal**

Press-fit inner oil seal **26** so that it is flush with the end of wheel hub **33**.



28 **Inner bearing outer race**

[Removal]
Drive out inner bearing outer race **28** evenly from three indented parts **A** in wheel hub **33**.

[Installation]

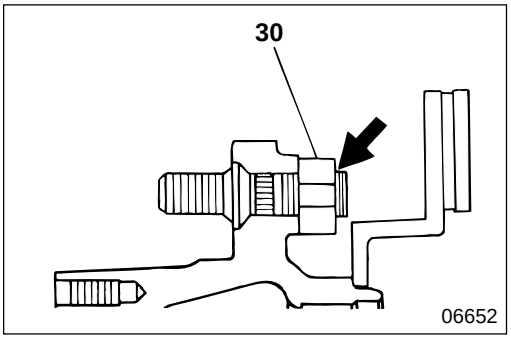
30 **31** **Installation of nut, hub bolt**

- Hub bolt **31** is marked with **L** (left) or **R** (right) to indicate the side it is to be mounted on. Check this symbol before press-fitting the bolt.



- Tighten nut **30** at specified torque.
- Drive nut **30** in using a punch to lock the nut.

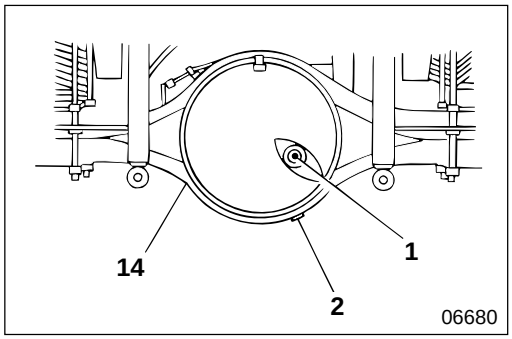
◆ Service procedure



● **Work before disassembly**

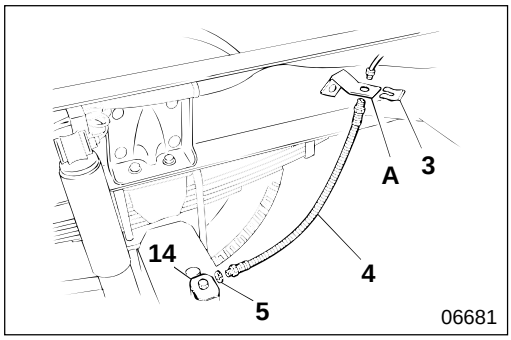
Remove inspection plug **1** and drain plug **2**, then drain the gear oil from axle housing **14**.

WARNING⚠

The oil temperature is high immediately after the vehicle has stopped, so take care not to scald yourself.

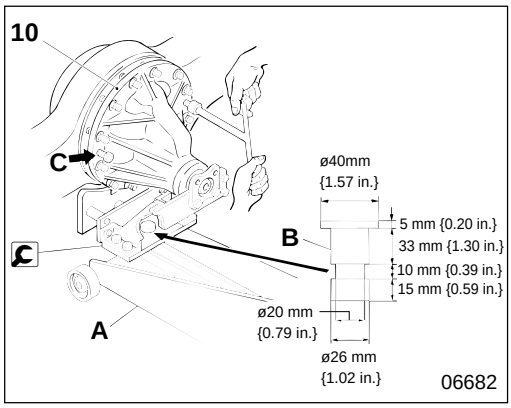
● **Work after assembly**

Fill axle housing **14** with the specified amount of gear oil via inspection plug **1**.



4 **Removal and installation of brake hose**

Remove brake hose **4** from bracket **A** (on the frame) first, then remove the brake hose from axle housing **14**. To assemble the brake hose follow the disassembly sequence in reverse.

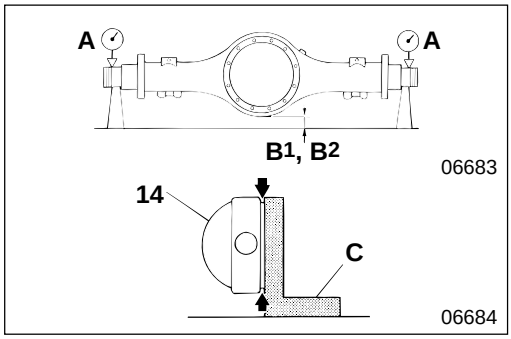


10 **Removal and installation of reduction and differential assembly**

- Remove the lift pad from garage jack **A** and mount differential carrier base, after turning pin **B** to the dimensions as illustrated insert it and secure it with the bolt which secured the lift pad.
- Tighten two bolts in screw holes **C** used for removing reduction and differential assembly **10** evenly, and remove the reduction and differential assembly.
  Bolt size : M12×1.25 mm

NOTE

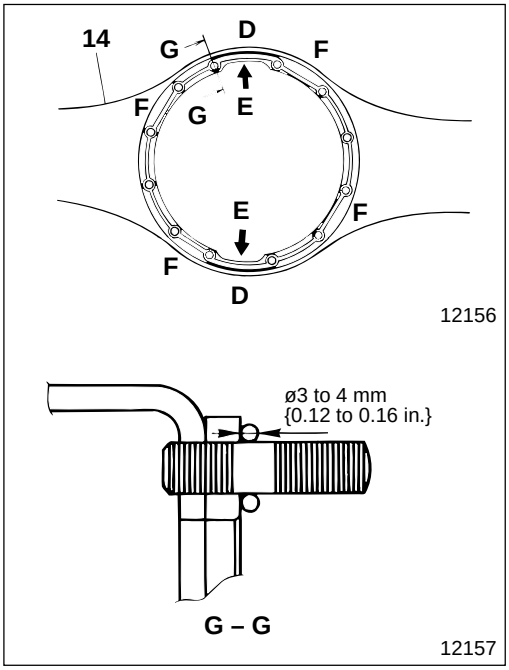
Be sure to completely remove adhered sealant from the mounting surface of the axle housing and carrier.



14 **Axle housing**

[Inspection]

- Support the inner bearing mating parts at both ends of the housing spindle of axle housing **14** horizontally.
- Set the dial gauge against outer bearing mating part **A** and turn it 360° to measure bend.
- Set axle housing **14** vertical using square **C**. After measuring B_1, turn the axle housing 180° and measure B_2 to find the difference.
- If the measured value is higher than the limit, replace axle housing **14**.



[Application of sealant]

- Apply sealant to reduction and differential assembly **10** mounting surface of axle housing **14**.
- Apply sealant around the periphery of indented area **E** for part **D**.
- Apply sealant linearly to part **F**.

NOTE

Make sure that sealant does not ooze from the mounting surface after installing reduction and differential assembly 10.

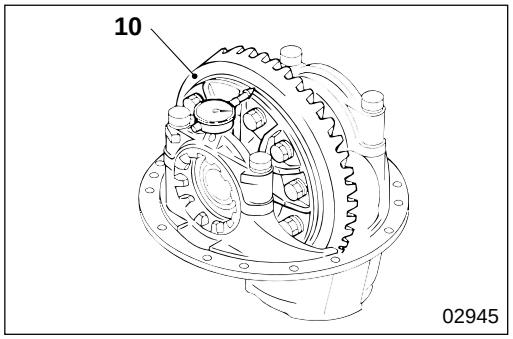
◆ Service procedure

● **Work before disassembly**

Mount differential carrier **35** on a differential working base assembly.

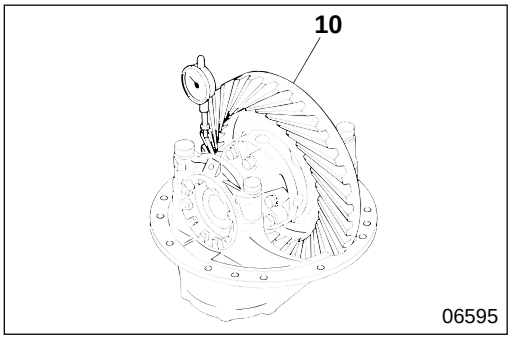


● **Inspection before disassembly**

Inspect for faulty parts before disassembly.

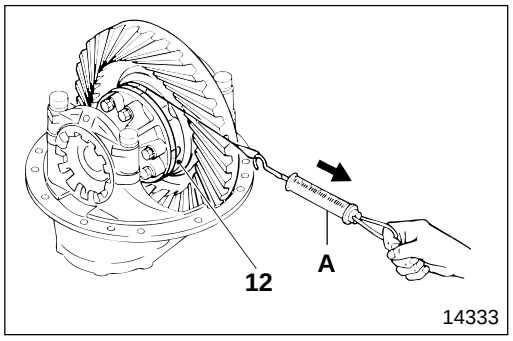
(1) Wobble of rear face of final drive gear

Measure wobble at a point 132 mm {5.20 in.} (on the radius) from the center of final drive gear **10**.



(2) Backlash of final drive gear and final drive pinion

Measure at three points on the circumference of final drive gear **10**.

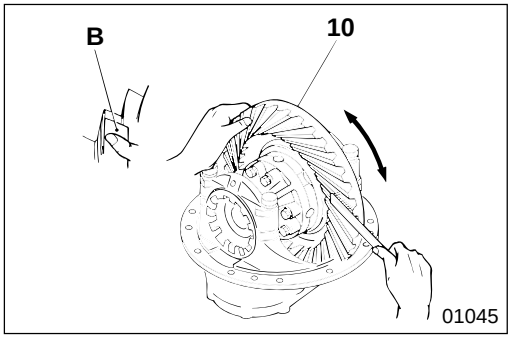


(3) Starting torque of side bearing

- Install spring balance **A** at 152 mm {5.98 in.} outer periphery point of differential case LH **12**.
- Measure the tangential force.
- If the measured tangential force is within the specified value, the starting torque conforms to the standard value.

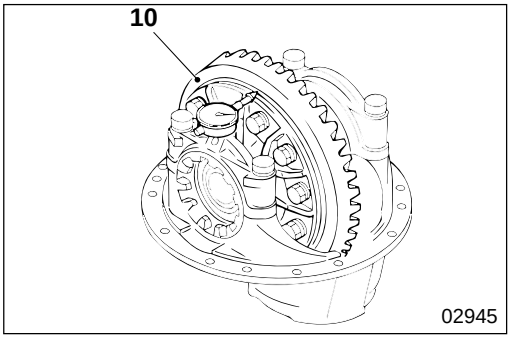
NOTE

Measure the starting torque within final drive gear 10 and final drive pinion 28 backlash range.



(4) Tooth contact of final drive gear

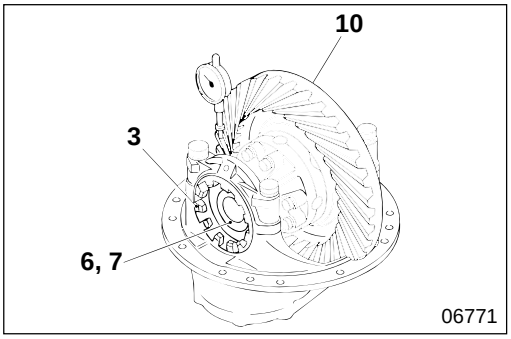
Apply red lead to three or four teeth of final drive gear **10**, examine tooth contact by turning the gears a few times.
B : Examine tooth contact using paper.



● **Inspection and adjustment after assembly**

(1) Inspection of wobble of back face of final drive gear

Measure wobble at a point 132 mm {5.20 in.} (on the radius) from the center of final drive gear **10**.



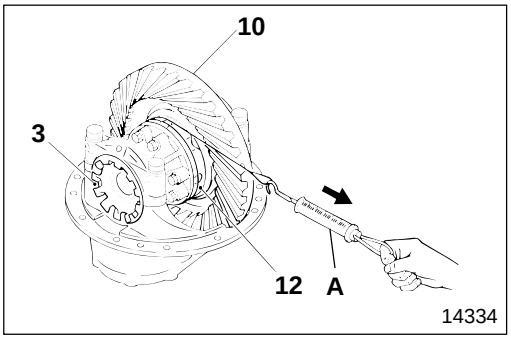
(2) Backlash of final drive gear and final drive pinion

[Adjustment]

- Adjust backlash using left and right adjusting screws **3** with the adjusted starting torques of side bearings **6**, **7** unchanged.
- Measure backlash at three points around the circumference of final drive gear **10**.

CAUTION

Make sure when you loosen one adjusting screw 3 that you tighten the other adjusting screw by the same amount, because the starting torque of the side bearings 6, 7 changes.



(3) Starting torque of side bearing

[Inspection]

- Install spring balance **A** at 152 mm {5.98 in.} outer periphery point of differential case LH **12**.
- Measure the tangential force.
- If the measured tangential force is within the specified value, the starting torque conforms to the standard value.
- If the measured value deviates from the specified value, adjust.

[Adjustment]

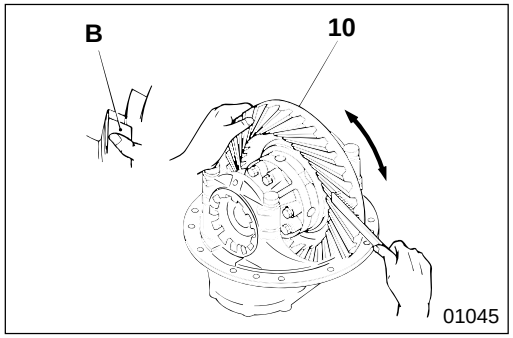
If the measured value deviates from the specified value, adjust it using left and right adjusting screws **3**.

CAUTION

Be sure to tighten left and right adjusting screws 3 by the same amount of pitch.

NOTE

Adjust the backlash to within the standard backlash of final drive gear 10 and final drive pinion 28.



(4) Tooth contact of final drive gear

[Inspection]

Apply red lead to three or four teeth of final drive gear **10**, examine tooth contact by turning the gears a few times.

B : Examine tooth contact using paper.

[Adjustment]

If tooth contact has deteriorated, adjust by increasing or decreasing backlash and shim **34**.

CAUTION

Be sure when replacing the gear because of abnormally worn teeth to replace the reduction gear set of final drive gear 10 and final drive pinion 28.

Maintenance item			Assembly standards
At no load	Tooth contact position	Lengthwise direction of tooth	From center towards edge
		Vertical direction	From center towards top of tooth for final drive gear and center for final drive pinion
	Tooth contact shape	Length	Approximately 50 to 70% of tooth width
		Width	Approximately 50 to 70% of tooth depth
	Degree of tooth contact		It becomes weaker as it nears tooth root or tooth tip

NOTE

When tooth contact is near the toe at no load it becomes middle area contact at load.

Adjustment of tooth contact

	Method of adjustment	Moving direction
Adjustment by adding or reducing shims	Advance final drive pinion to final drive gear (Shims are reduced) 	 Tooth contact moves towards tooth root
	Retard final drive pinion from final drive gear (Shims are added) 	 Tooth contact moves towards tooth tip
Adjustment using adjusting screw	Advance final drive gear to final drive pinion center (Less backlash) 	 Tooth contact moves in lengthwise direction of tooth Leading edge : Nearer to toe and slightly nearer to root of tooth Trailing edge : Nearer to heel and slightly nearer to top of tooth
	Retard final drive gear from final drive pinion center (More backlash) 	 Tooth contact moves in lengthwise direction of tooth Leading edge : Nearer to heel and slightly nearer to top of tooth Trailing edge : Nearer to toe and slightly nearer to root of tooth

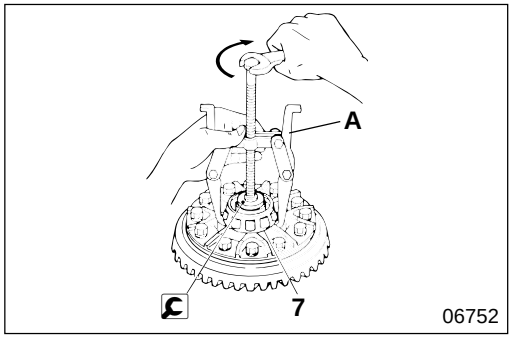
5 Removal of bearing cap

Put alignment marks **A** on bearing cap **5** and differential carrier **35** to distinguish left and right.



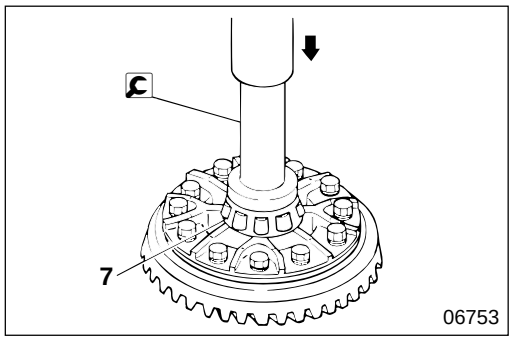
7 **Side bearing inner race**

[Removal]

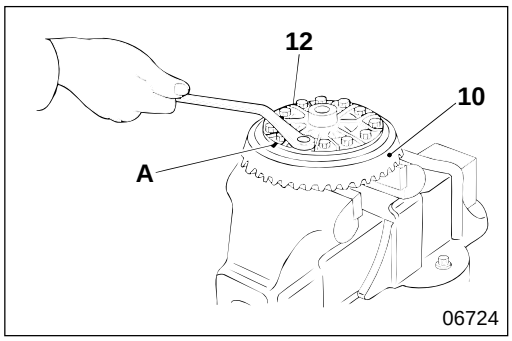
A : Gear puller (General tool)

NOTE

Make sure you keep left and right side bearings 6, 7 separate after removal, and be careful not to mix them up when installing them.



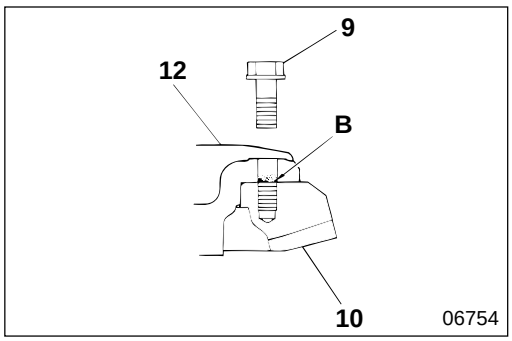
[Installation]



10 **12** **Final drive gear and differential case LH**

[Removal]

Put alignment marks **A** on final drive gear **10** and differential case LH **12**.

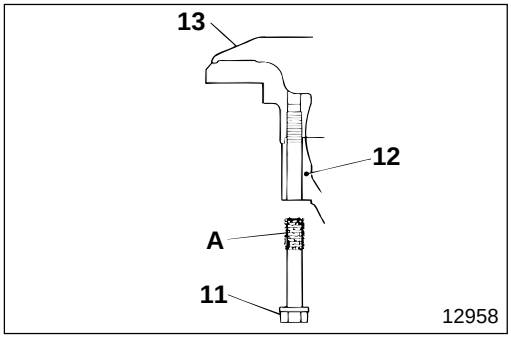


[Installation]

- Apply rust preventive to the entire surface of bolts **9**.
- Apply lock paint to the threads of all bolt holes **B** of final drive gear **10**.
- Tighten bolts **9** at specified torque.

CAUTION

- **Be sure to apply rust preventive because of the need to tighten bolt 9 at specified torque.**
- **Be sure not to operate the vehicle for at least one hour after installation in order to let the lock paint harden.**
- **Be sure not to operate the vehicle at full torque for at least four hours after installation in order to let the lock paint harden.**

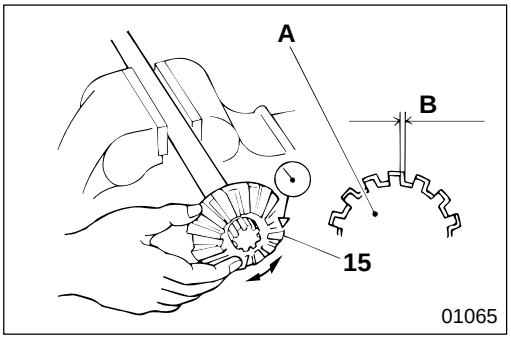


12 **13** **Installation of differential case RH and differential case LH**

- Apply rust preventive to the entire surface of bolts **11**.
- Apply lock paint to thread area **A** of bolts **11**.
- Tighten bolts **11** at specified torque.

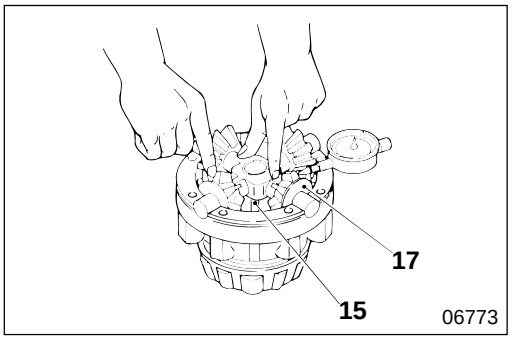
CAUTION

- **Be sure to apply rust preventive because of the need to tighten bolts 11 at specified torque.**
- **Be sure not to operate the vehicle for at least one hour after installation in order to let the lock paint harden.**
- **Be sure not to operate the vehicle at full torque for at least four hours after installation in order to let the lock paint harden.**

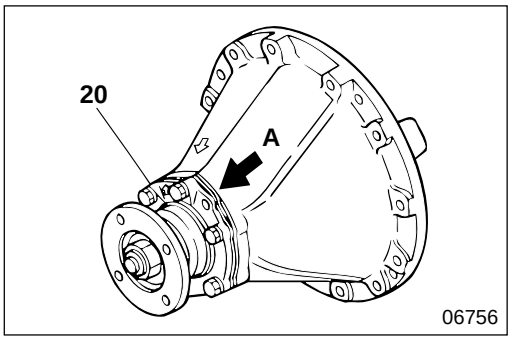


15 **Play between differential gear and axle shaft spline area in the rotating direction**

If the measured value is higher than the limit, replace the faulty parts.
A : Axle shaft
B : Play

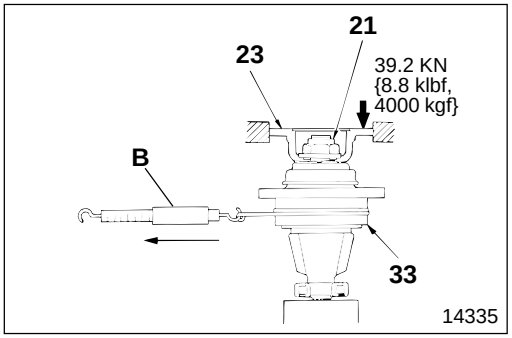


15 **17** **Backlash between differential gear and differential pinion**



20 **Pinion assembly**

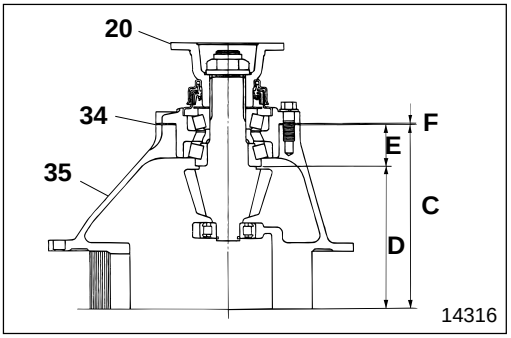
[Removal]
Screw M12×1.25 mm bolts into two holes **A** provided for removing pinion assembly **20**, then tighten bolts uniformly until the pinion assembly is removed.



[Inspection of starting torque after installation]
- Apply load of approximately 39.2 kN {8.8 klbf, 4000 kgf} to companion flange **23** or tighten lock nut **21** at specified torque.
- Install spring balance **B** at 114 mm {4.49 in.} outer periphery point of bearing retainer **33**.
- Measure the tangential force.
- If the measured tangential force is within the specified value, the starting torque conforms to the standard value.
- If the measured value deviates from the specified value, adjust.

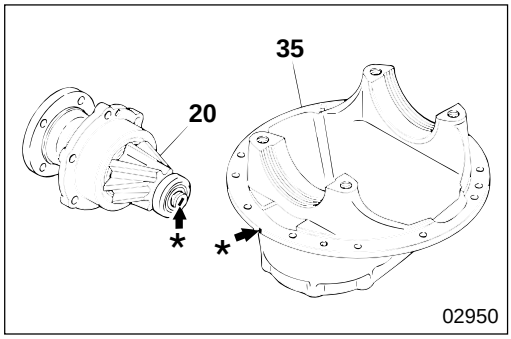
NOTE
- **Be sure to secure companion flange 23 before measurement.**
- **Be sure to remove oil seal 29 before measurement.**

[Adjustment of starting torque]
If the measured value deviates from the specified value, replace collar **24** so that the tangential force conforms to the standard value.
Collar thicknesses :
15.600 to 16.200 mm {0.61 to 0.64 in.} (25 thicknesses available in 0.025 mm {0.00098 in.} increments)



[Adjustment when installing]
- Carry out the following procedure so that **C**, **D** and **E** conform to the standard dimension.
- Calculate shim thickness **F** according to the following formula based upon the machining error data stamped on pinion assembly **20** and differential carrier **35**.
  Formula for calculation:
  F = 0.5 {0.020}–b+c+d

  c : Deviation from basic dimension **C**
  d : Deviation from basic dimension **D**
  e : Deviation from basic dimension **E**



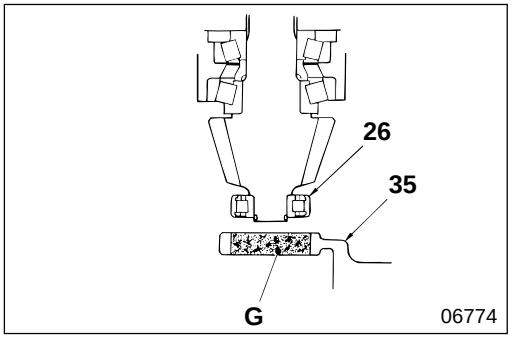
Unit : mm {in.}

Location	Standard dimension	How to calculate deviation
Shim thickness	0.5 {0.020}	—
C	203 {7.99}	The basic dimension, multiplied by 100, is stamped on the periphery of differential carrier **35** flange
D	157 {0.18}	The basic dimension is stamped on the top of pinion assembly **20**
E	46.5 {1.8}	Measure the deviation from **E** using a dial gauge. However, if it is difficult to measure the actual deviation, assume a value from 0 to 0.2 {0 to 0.0079}

***** : Stamped number position

NOTE
Thickness is stamped in millimeters.

- Select shim **34** from shim thickness **F**.
  Available thicknesses of shim **34** : 0.1 mm {0.0039 in.} and 0.2 mm {0.0079 in.}

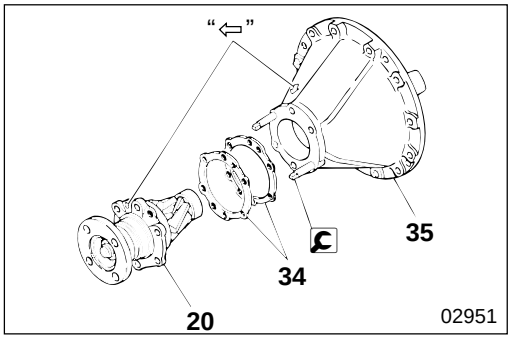


[Installation]

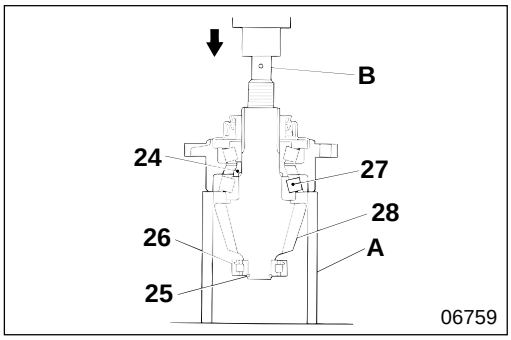
- Apply lock paint to entire mounting surface **G** of pinion pilot bearing **26** of differential carrier **35**.

CAUTION

- **Be sure to let the lock paint harden undisturbed for 30 minutes to two hours after installation.**
- **Be sure to wait at least three hours before running the vehicle, and if possible wait 24 hours to let the lock paint harden.**

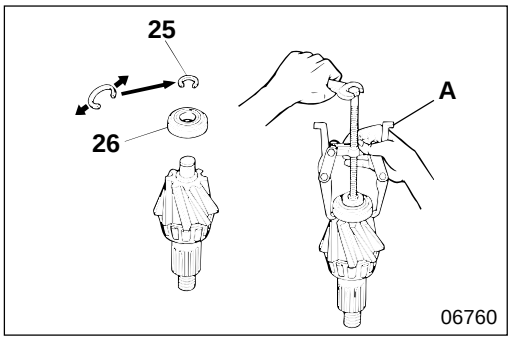


- Assemble differential carrier **35** and pinion assembly **20** with their alignment marks "⇦" aligned.



20 **Removal of pinion assembly**

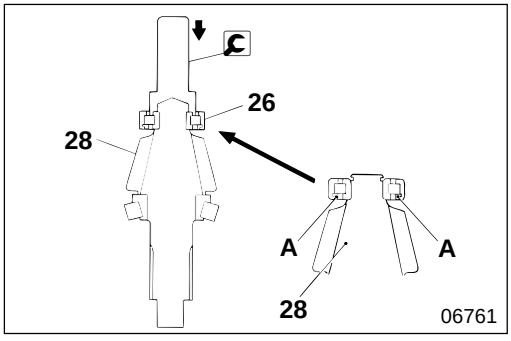
Using an appropriate cylinder **A** and press **B**, remove collar **24**, lock ring **25**, pinion pilot bearing **26**, rear bearing inner race **27**, and final drive pinion **28** together.



25 **26** **Lock ring and pinion pilot bearing**

[Removal]

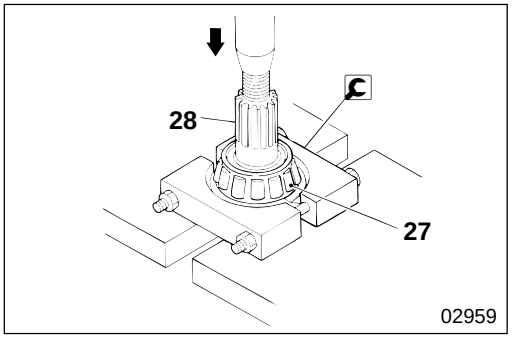
A : Gear puller (General tool)



[Installation]

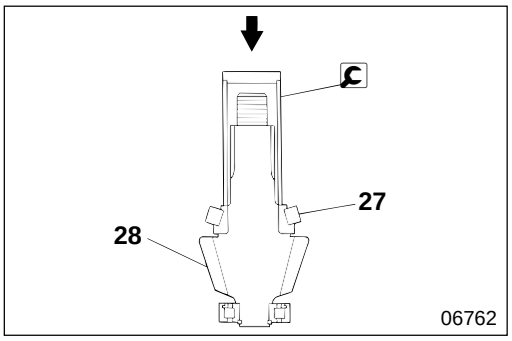
Press-fit pinion pilot bearing **26** in the direction as illustrated.

A : Lock ring

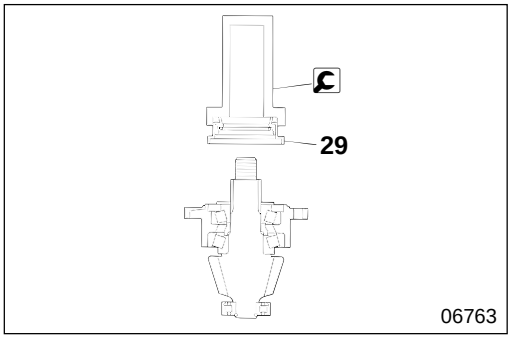


27 **Rear bearing inner race**

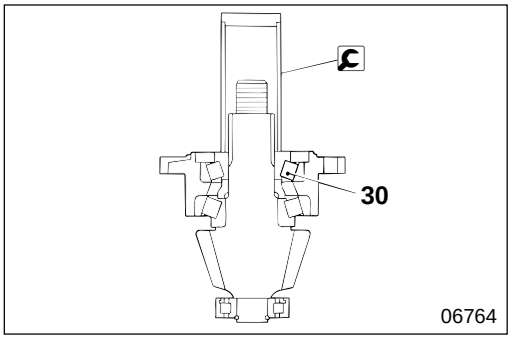
[Removal]



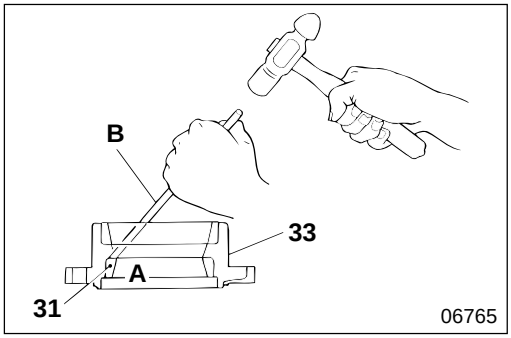
[Installation]



29 **Installation of oil seal**



30 **Installation of front bearing inner race**



31 **Front bearing outer race**

[Removal]
Drive out front bearing outer race **31** evenly from three indented parts **A** in bearing retainer **33**.

MULTIPLATE LIMITED SLIP DIFFERENTIAL ASSEMBLY

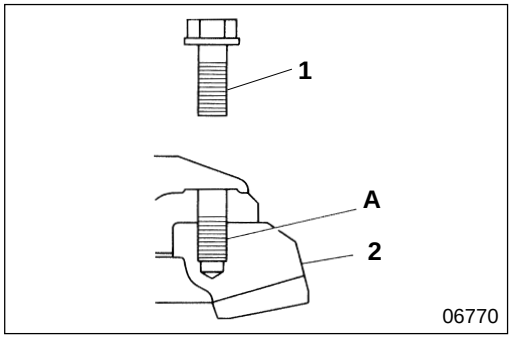
◆ Service procedure

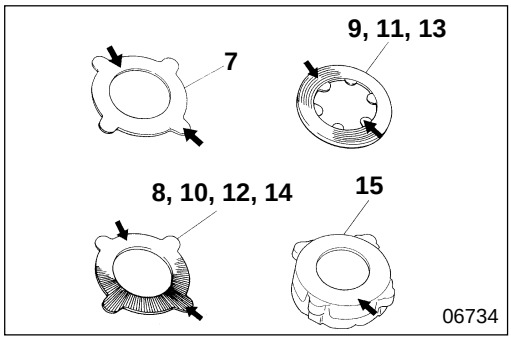


2 Final drive gear

Apply LOCKTITE to thread area **A** of all the bolt holes of final drive gear **2**.

CAUTION⚠

- **Be sure to let bolts 1 harden for at least an hour, after installation, before driving.**
- **Furthermore, be sure to let bolts 1 harden for at least four hours before running at full torque.**



3 Multiplate limited slip differential assembly

[Inspection of contact and sliding surfaces]

- Inspect spring plates **7**, friction plates **8**, **10**, **12**, **14** and friction discs **9**, **11**, **13** and replace if the friction surface or sliding surface shows extreme wear or heat discoloration.

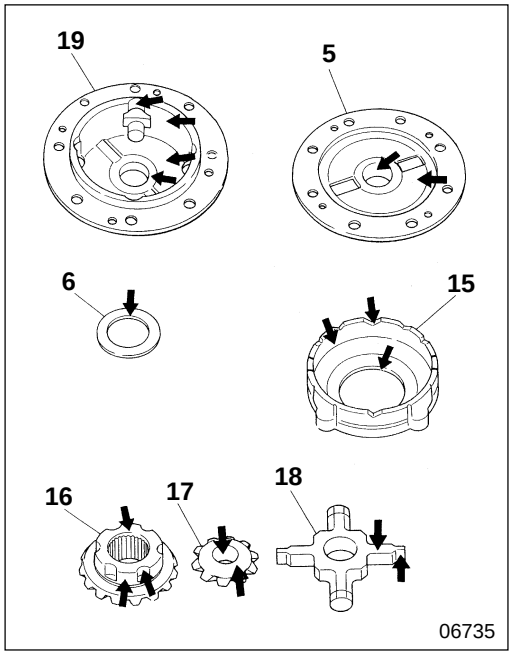
NOTE

The hardened area on the inner periphery of the friction surfaces of plates and discs 7 to 14 is due to the force exerted by the springs and should not be mistaken for abnormal wear.

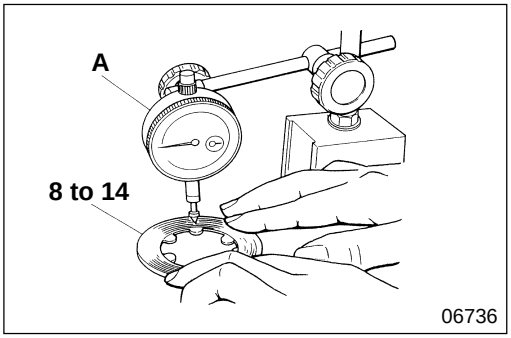
- Replace spring plates, friction discs and friction plates **7** to **14** if their protruding areas have cracks or are damaged.
- If there are nicks or marred areas on the friction and sliding surfaces of pressure rings **15** and friction plates **14** remove using an oil stone, then fit and correct on the base using compound.

NOTE

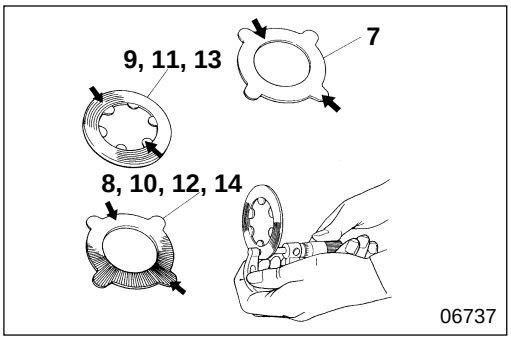
The hardened area on the inner periphery of the friction surfaces of plates and discs 7 to 14 is due to the force exerted by springs and should not be mistaken for abnormal wear.



- Inspect the contact and sliding parts (⬅) of differential case LH **5**, thrust washer **6**, pressure ring **15**, side gear **16**, differential pinion **17**, pinion shaft **18**, and differential case RH **19**. If there are nicks or marred areas remove using an oil stone.



[Inspection for deformation]
Check friction plates **8**, **10**, **12**, **14** and friction discs **9**, **11**, **13** for deformation by mounting dial gauge **A** on a base and rotating the plate or disc and measuring its flatness.

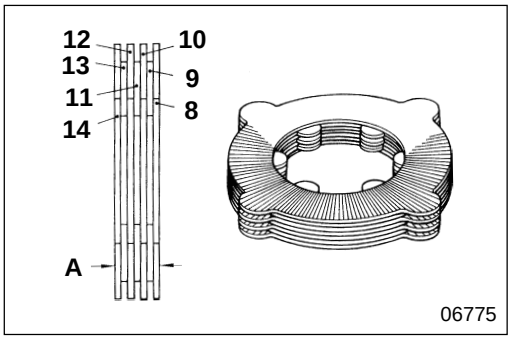


[Measurement of thickness]
Measure the thickness of the friction surfaces and the protruding parts (⬅) of spring plates **7**, friction plates **8**, **10**, **12**, **14** and friction discs **9**, **11**, **13**. If the measured values deviate from the limit, replace the faulty parts.

NOTE

Measure several locations on each part.

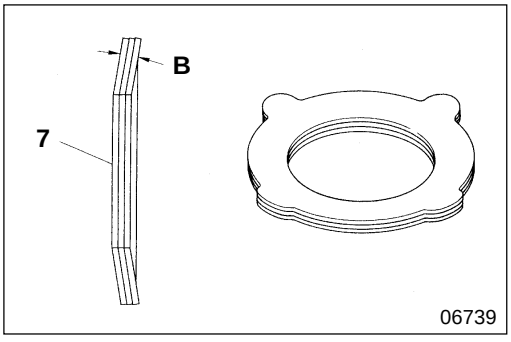
[Work before assembly]
In order to adjust the tolerance in the axial direction when the internal parts of differential cases LH **5** and RH **19** are inserted (clutch plates **7** to **14** friction force) and the tolerance in the axial direction of side gear **16** follow the procedure below.



- Put friction plates **8**, **10**, **12**, **14** and friction discs **9**, **11**, **13** one on top of the other as illustrated. Using a micrometer measure thickness **A**, and by selecting the right combination of plates and discs for each set, make sure the difference in thickness between the left and right sets conforms to the standard value.

NOTE

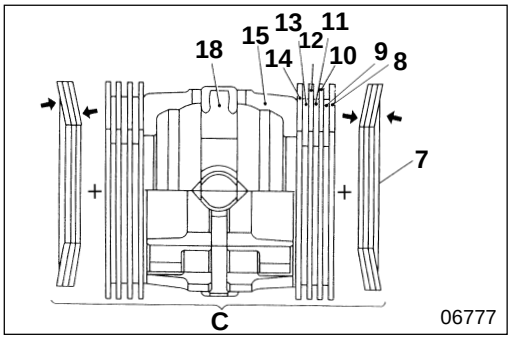
When using new parts, keep in mind that friction plates 8, 10, 12, 14 come in one size, 2.0 mm {0.0079 in.} and friction discs 9, 11, 13 in three sizes, 1.9 mm {0.075 in.}, 2.0 mm {0.079 in.} and 2.1 mm {0.083 in.}.



- Put spring plates **7** one on top of the other as illustrated. Using a micrometer measure thickness **B** and by selecting the right combination of plates for each set, make sure the difference in thickness between the left and right sets is minimal.

NOTE

When replacing spring plates 7 with new ones, the plate thickness is 2.0 mm {0.079 in.}.

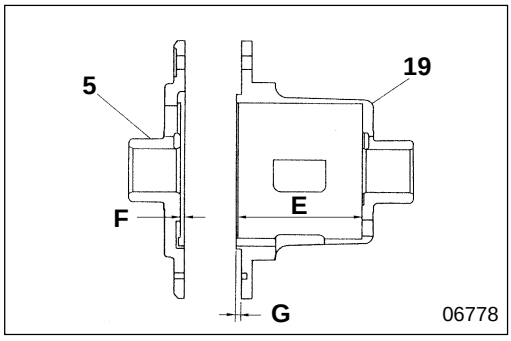


- Assemble pressure rings **15**, pinion shaft **18**, the friction discs, the friction plates and spring plates **7** to **14** and measure total width **C** using a micrometer.

NOTE

When measuring, press down both ends of pressure ring 15 to make sure its V-shaped groove is properly mated with pinion shaft 18.

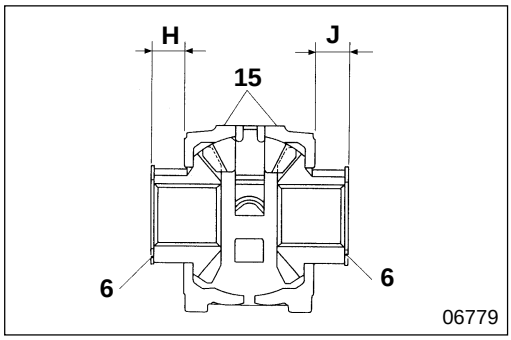
MULTIPLATE LIMITED SLIP DIFFERENTIAL ASSEMBLY



- Calculate dimension **D** between the surfaces of differential cases LH **5** and RH **19** which come in contact with spring plate **7** when the two cases are assembled.
  D = E + F – G
- If the above mentioned total width **C** and clearance **(D – C)** between differential cases LH **5** and RH **19** deviate from the standard value, adjust by changing friction discs **9**, **11**, **13**.

NOTE

When using new friction discs 9, 11, 13, keep in mind that there are three different sizes, 1.9 mm {0.075 in.}, 2.0 mm {0.079 in.} and 2.1 mm {0.083 in.}.



- Install thrust washers **6** as illustrated. Make sure the difference between dimensions **H** and **J** from the back face of pressure ring **15** to the end face of thrust washer on either side conforms to the standard value.

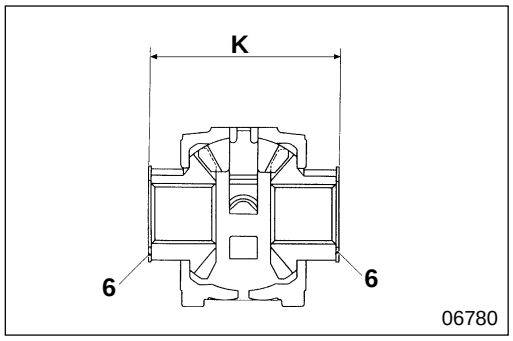
NOTE

When measuring press down both ends of pressure ring 15 to make sure its V-shaped groove is in full contact with pinion shaft 18.

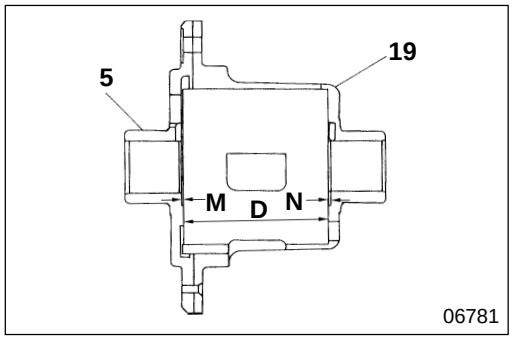
- If the variation of tolerance deviates from the standard value, adjust by changing thrust washers **6**.

NOTE

When using new thrust washers 6 keep in mind that there are three different sizes, 1.50 mm {0.059 in.}, 1.60 mm {0.063 in.} and 1.70 mm {0.067 in.}.



- Measure total width **K**.



- Calculate dimension **L** between the surfaces of differential cases LH **5** and RH **19** that come in contact with thrust washers **6** when the two cases are assembled.
  L = D + M + N

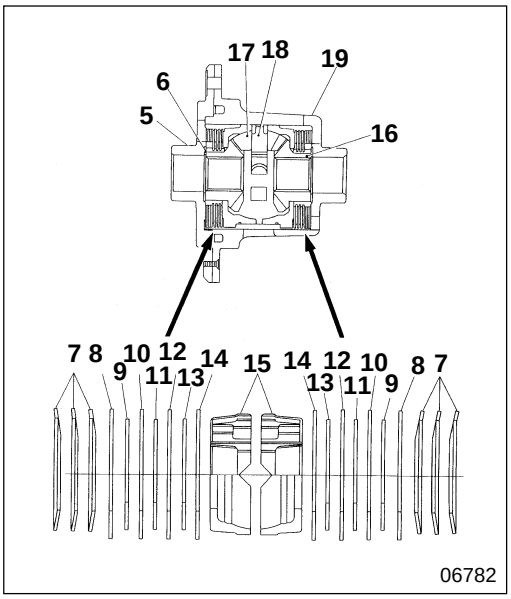
NOTE

Dimension D is the dimension between the surfaces of differential cases LH 5 and RH 19 that come in contact with spring plate 7 when the two cases are assembled and was calculated above.

- Make sure that side gear **16** clearance in the axial direction **(L – K)** conforms to the standard value. If the measured value deviates from the standard value, adjust by replacing thrust washers **6**.

NOTE

- **Select thrust washers 6 so that the difference in dimension between the left and right sides from the back face of pressure ring 15 to the end face of thrust washers conforms to the standard value.**
- **When using new thrust washers keep in mind that there are three sizes, 1.50 mm {0.059 in.}, 1.60 mm {0.063 in.} and 1.70 mm {0.067 in.}.**

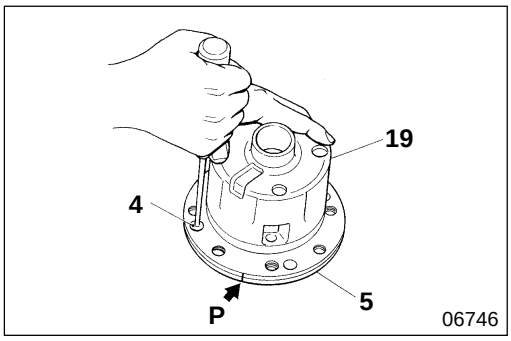


[Assembly]

Assemble the different parts in differential case RH **19** in the direction as illustrated.

CAUTION

- **Make sure that friction plates 8, 10, 12, 14 and friction discs 9, 11, 13 are installed in the correct order and that spring plate 7 is assembled in the correct direction.**
- **Apply the specified gear oil to each of the parts before assembly. Special attention should be given to applying oil to the contact and sliding surfaces.**

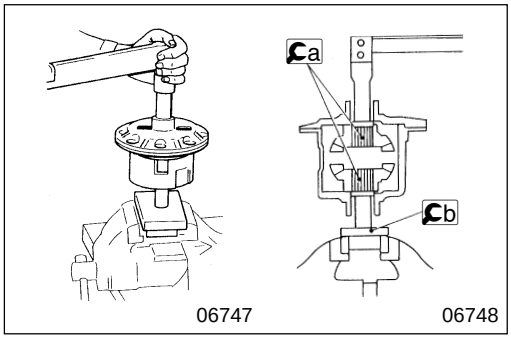


[Tightening of screws]

Align alignment marks **P** (identical Arabian numerals) on differential cases LH **5** and RH **19** and gradually tighten screws **4** evenly in diagonal order.

CAUTION

If differential cases LH 5 and RH 19 are not joined firmly even when screws 4 have been tightened, it may be because thrust washers 6 or spring plates 7 are not properly assembled and they should be reassembled.



[Measurement of rotational torque]

In order to verify the friction force of clutch plates **7** to **14** after assembly, use a side gear holding tool and b side gear holding base to measure the rotation torque and make sure it conforms to the standard value.

NOTE

When measuring the rotation torque, rotate the gear and measure after the rotation has reached a sufficiently steady pace.

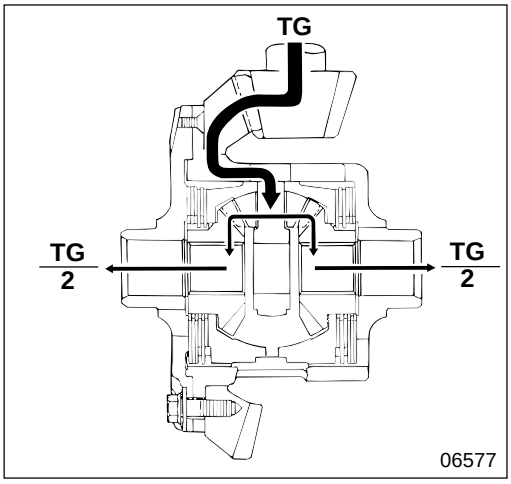
Friction disc **5** and friction plate **6** engage side gear **3** and differential case RH **4**, respectively. These parts are pressed against pressure ring **9** by spring plate **7**. The pressure ring mates with the groove in the differential case RH and always turns at the same speed.

Operation mechanism

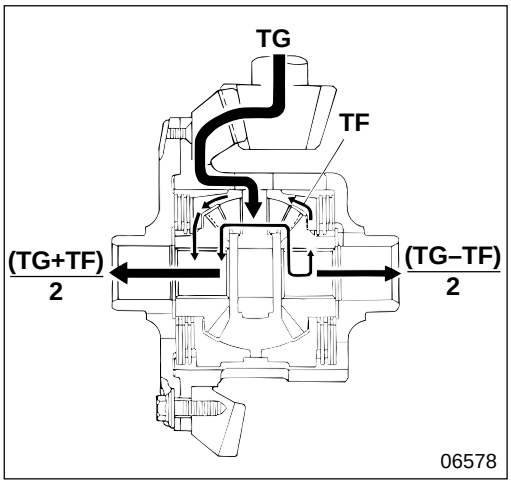
When the wheel of one side starts spinning, a rotational difference between side gear **3** and differential cases, LH **2** and RH **4** occurs. Then, friction disc **5** and friction plate **6** start rotating with a relative difference in revolution speed. This causes friction torque between the disc and plate.



● **Operation in straight movement**

In the case of straight movement, as the revolution speed of the left axle shaft and that of the right axle shaft are equal, no friction torque occurs.

TG : Torque input



● **Operation when there is a difference in revolution speed between left and right wheel**

When a difference in the resistance the wheels receive from the road surface occurs, such as when the wheel of one side encounters mud, the differential function comes into play, transmitting friction torque **TF**. This exertion of friction torque reduces the revolution speed causing the high-revolution speed axle to reduce its speed and the low-revolution speed axle to increase its speed.

Therefore, when the wheel of one side starts spinning, when caught in mud for example, a large amount of friction torque to come into action. The differential functions in such a manner that a smaller ratio of the torque is transmitted to the axle of the wheel which is spinning while the axle of the wheel on the other side receives a greater ratio of the torque. This makes it easier for the vehicle to get out of the mud.

$\frac{(TG-TF)}{2}$ High rotation side (spin side)

$\frac{(TG+TF)}{2}$ Low rotation side

● **Work sequence before removal**

1 Place wheel chocks.
2 Disconnect the negative terminal of the battery cable. Gr 54
3 Jack up the rear axle using a garage jack.
4 Support the rear frame on rigid racks.

WARNING

- **Chock the wheels securely so the vehicle does not move.**
- **Do not remove the chocks until the entire operation is completed.**
- **Supporting a vehicle on a garage jack only is extremely dangerous, so always support the frame on rigid racks.**
- **Leave the garage jack and rigid racks in place until the entire operation is completed. Never remove them during the operation.**

● **Work sequence after installation**

Follow the work sequence before removal in reverse.

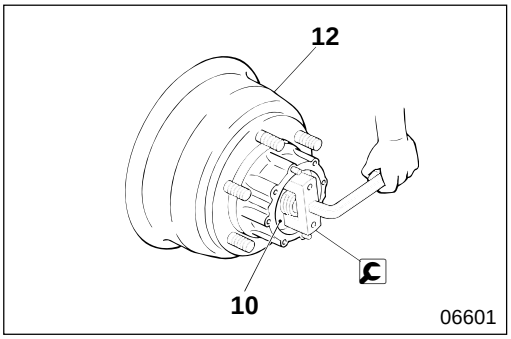
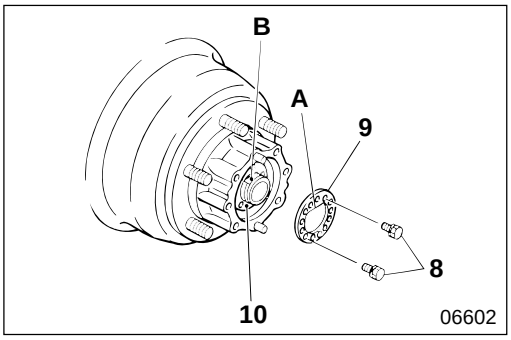
◆ Service procedure



● Starting torque of wheel hub bearing

[Adjustment]

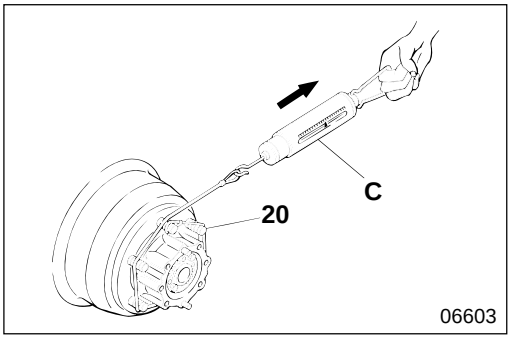
- Tighten lock nut **10** at specified torque for primary tightening, while turning wheel hub and brake drum assembly **12**.
- Slacken off lock nut **10** completely.
- Turn wheel hub and brake drum assembly **12** several times to smooth operation of outer bearings **11**, **17** and inner bearings **15**, **16.**
- Retighten lock nut **10** at specified torque for secondary tightening.



- Align flat area **A** with notch **B** to install lock washer **9**.
- Make sure that the mounting holes of lock washer **9** and lock nut **10** align. If they do not, slacken off the lock nut and align them.
- Install bolts **8** at the position as illustrated, aligning lock nut **10**.
- Tighten bolts **8** at specified torque.

CAUTION

After adjustment, make sure that there is no play in the axial direction of wheel hub and brake drum assembly 12.

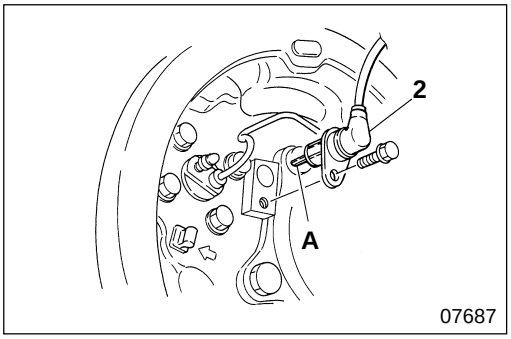


[Measurement]

- Install spring balance **C** on hub bolt **20**.
- Measure the tangential force.
- If the measured tangential force is within the specified value, the starting torque conforms to the standard value.
- Do not allow the starting torque to become higher than the tangential force.
- If the measured value deviates from the specified value, readjust.
- If any fault is found after readjustment, replace outer bearings **11**, **17** and inner bearings **15**, **16**.

NOTE

- **Measure the starting torque with inner oil seal 14 installed.**
- **Measure the starting torque with rear axle shaft 6 and outer oil seal 7 removed.**
- **Make sure that there is no drag in brake lining and brake drum 19 before you measure the tangential force.**



2 Wheel speed sensor

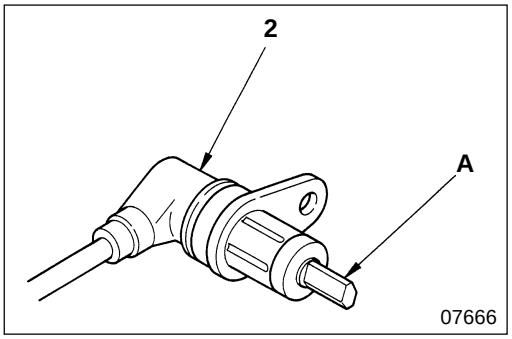
[Removal]

To prevent damaging pole piece **A** of wheel speed sensor **2**, remove the wheel speed sensor before removing wheel hub and drum assembly **12**.

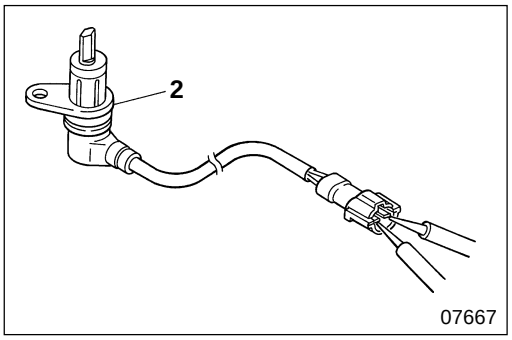
[Installation]

The connector of wheel speed sensor **2** is color-coded. Install the wheel speed sensors to the proper wheels according to the following table.

Installation location	Connector color	Connector shape	Right/left identification tape
Left wheel	Gray	Female	Yellow
Right wheel	Black	Male	None

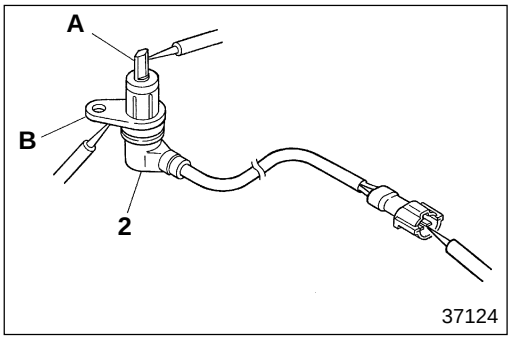


[Inspection]
Pole piece **A** in wheel speed sensor **2** is magnetized by a built-in magnet and attracts metals. Do not allow metal particles to stick to the pole piece.



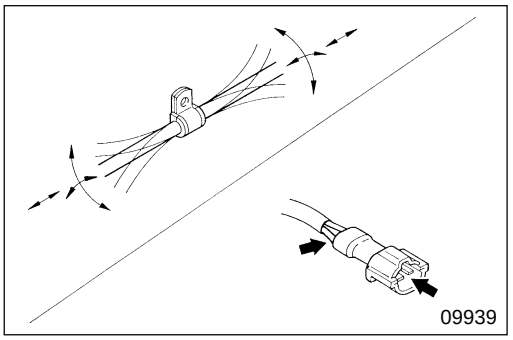
● **Measurement of resistance between terminals**

Measure resistance between the terminals of wheel speed sensor **2**.
If the measured value deviates from the standard value, replace the wheel speed sensor.



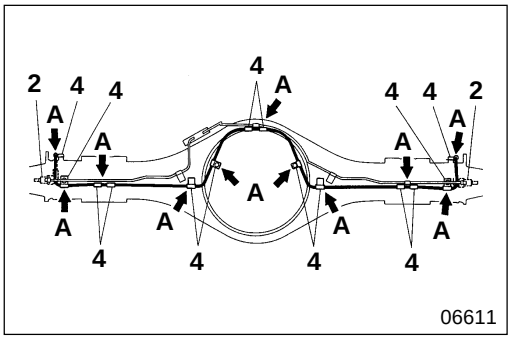
● **Measurement of insulation resistance**

Measure resistance between pole piece **A**, bracket **B** and each terminal of wheel speed sensor **2**.
If the measured value is lower than the standard value, replace the wheel speed sensor.



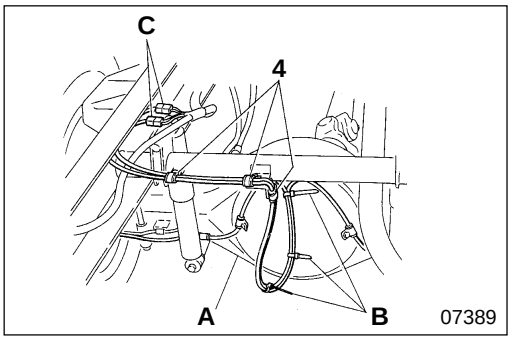
● **Inspection of open circuit in harness**

To check the harness for an open circuit, disconnect the harness clamp from the vehicle side, then bend and pull harness at the clamp to check if a momentary open circuit results. Also inspect the terminal contact conditions in the connector.
If an abnormality is found, replace wheel speed sensor **2**.

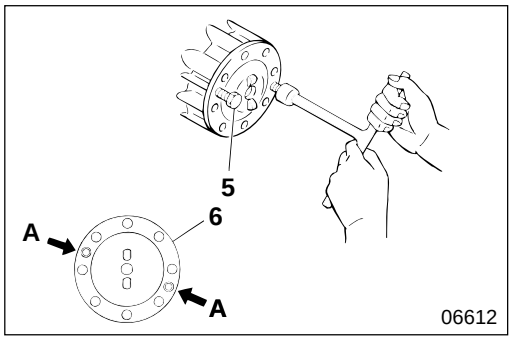


2 **4** **Installation of wheel speed sensor harness and clips**

Starting from the wheel brake side, secure the harness of wheel speed sensor **2** in place at tape sections **A** using clips **4**, while making sure that there is no interference, twisting or excessive sagging of the harness.

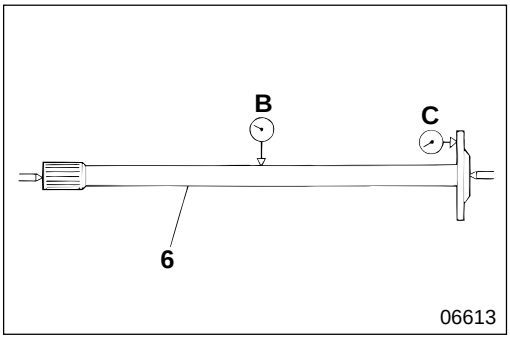


- As shown in the diagram, position the harness of wheel speed sensor **2**, starting from rear axle housing section **A** and moving toward the frame, making sure that there is no twisting or unnecessary slack in the harness. Use clips **4** and cable ties **B** to secure the harness in place, then connect connectors **C**.



5 **Axle shaft**

[Removal]
Insert two mounting bolts **5** of axle shaft **6** into two screw holes **A**, provided for disassembly, of the flange. Then, remove the rear shaft.

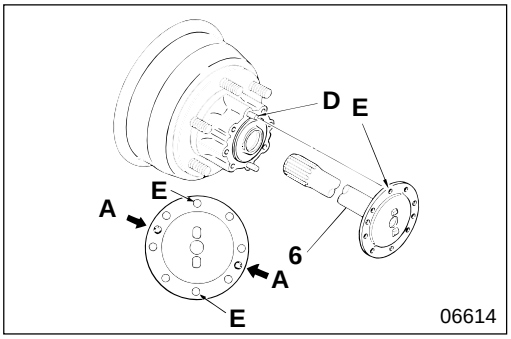


[Inspection]
B : Bend at the shaft center

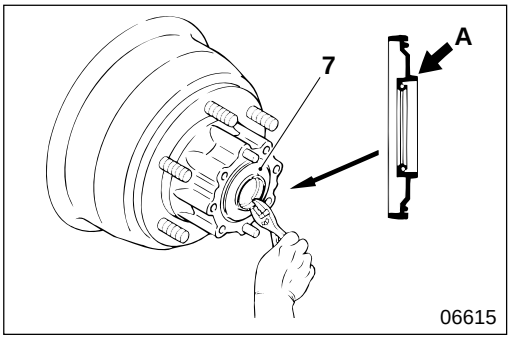
NOTE

To measure the bend of axle shaft 6, turn it one full revolution and read the dial gauge indicator. The bend is one half of the indicated value.

C : Bend of flange surface

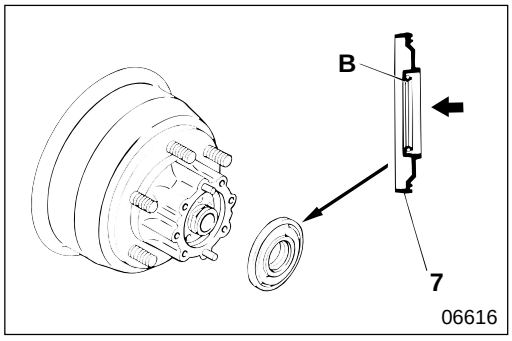


[Installation]
- Knock pin hole **E** of axle shaft **6** is the second hole clockwise from disassembly screw hole **A**.
- To mount axle shaft **6**, align knock pin **D** with knock pin hole **E**.

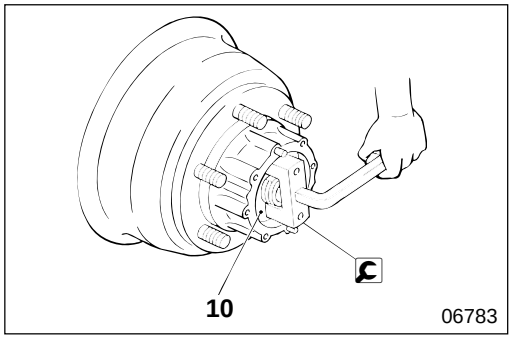


7 **Outer oil seal**

[Removal]
To remove outer oil seal **7**, use a pair of pliers and pull protrusion **A** of the outer oil seal circumference evenly.

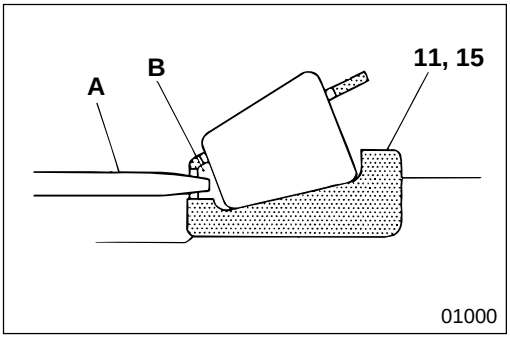


[Installation]
Apply grease to lip area **B** of outer oil seal **7** and press-fit the outer oil seal in the direction as illustrated.



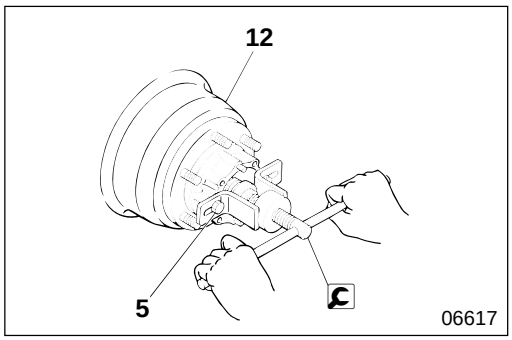
10 **Removal and installation of lock nut**

Adjust and measure the starting torque of wheel hub bearing during installation. P27-13



11 **15** **Packing grease in outer bearing inner race and inner bearing inner race**

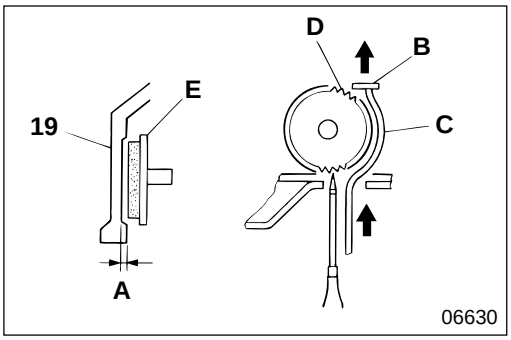
A : Grease pump nozzle
B : Space between rollers



12 **Wheel hub and brake drum assembly**

[Removal]
- Remove wheel hub and brake drum assembly **12** using mounting bolt **5** of axle shaft **6**.

CAUTION
Make sure you remove wheel hub and brake drum assembly 12 in a straight line to prevent damage to oil seal 14.

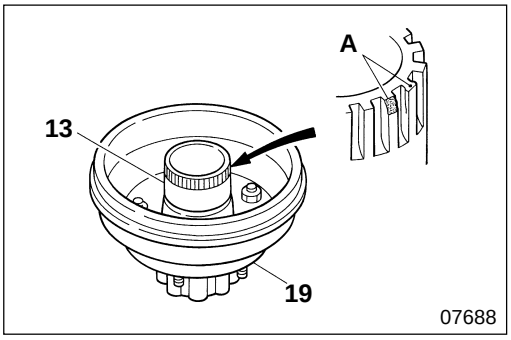


- If wheel hub and brake drum assembly **12** cannot be removed because of stepped wear **A** in brake drum **19**, do the following:
- Remove the backing plate cover.
- Lift lever **B**.
  C : Wire approximately ø2 mm {0.079 in.}
- Turn adjuster **D** in the opposite direction to the arrow on the backing plate to retract brake shoe assembly **E**.
- Remove wheel hub and brake drum assembly **12**.

CAUTION⚠

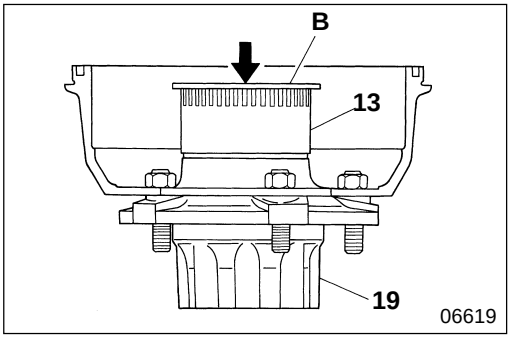
Correct brake drum 19 if any fault is found. 📦 **Gr 35A**

[Installation]
After installing wheel hub and brake drum assembly **12**, adjust the brake shoe clearance. 📦 Gr 35A

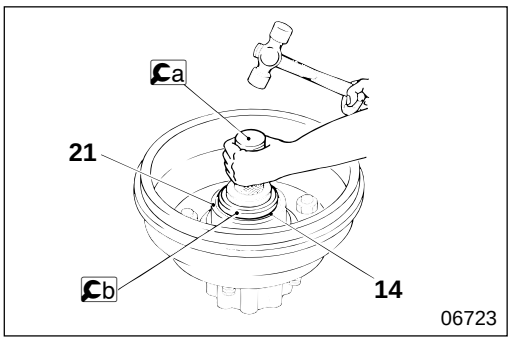


13 **Rotor**

[Inspection]
Check rotor **13** for chipped or crushed teeth (see section **A** in the diagram).
If an abnormality is found, replace the rotor.

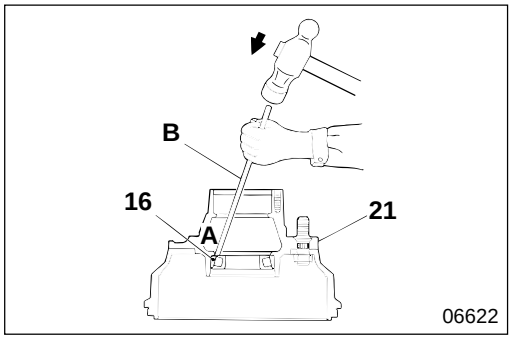


[Installation]
Before installing rotor **13** to brake drum **19**, heat the rotor to approximately 150°C {302°F}. Using iron plate **B**, install the rotor to the brake drum by applying uniform pressure, making sure that there is no gap between the rotor and the brake drum.



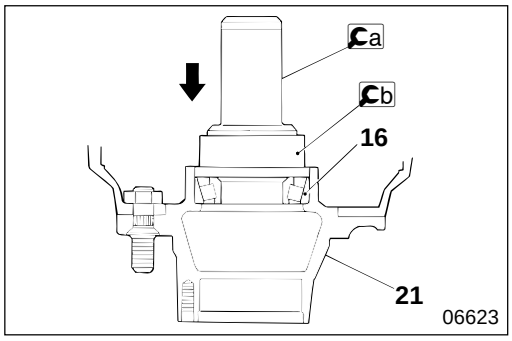
14 **Installation of inner oil seal**

Press-fit inner oil seal **14** until it is flush with the end of wheel hub **21**.

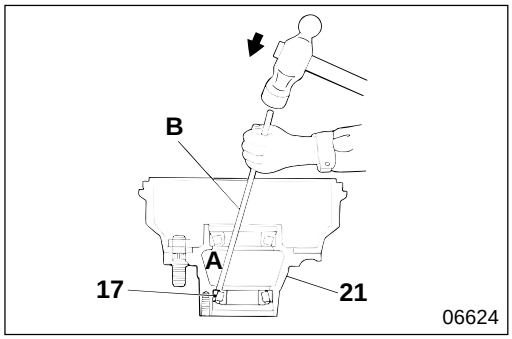


16 **Inner bearing outer race**

[Removal]
Drive out inner bearing outer race **16** evenly from three indented parts **A** in wheel hub **21**.
B : Pin-punch

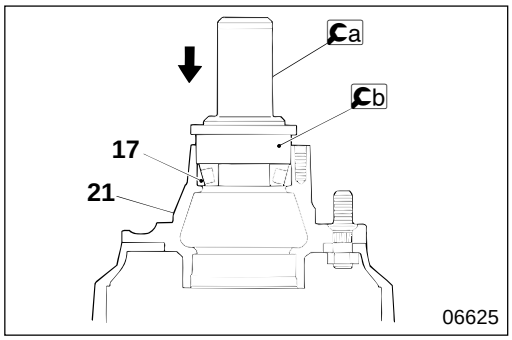


[Installation]

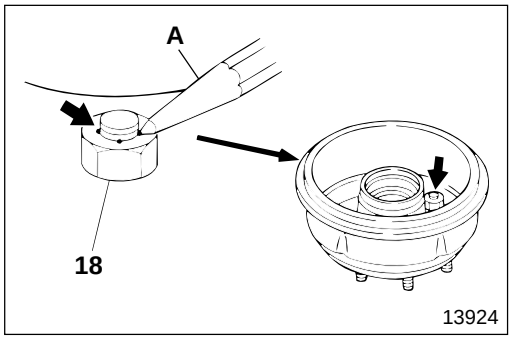


17 **Outer bearing outer race**

[Removal]
Drive out outer bearing outer race **17** evenly from three indented parts **A** in wheel hub **21**.
B : Pin-punch

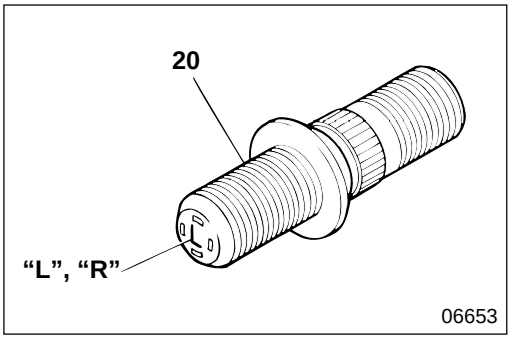


[Installation]



18 **Installation of nut**

Tighten nut **18** at specified torque, then caulk the nut to keep it from turning.
A : Punch



20 **Installation of hub bolt**

Hub bolt **20** is marked with **L** (left) or **R** (right) to indicate the side it is to be mounted on. Check this symbol before press-fitting the bolt.

CAUTION

- **Before removing disc brake assembly 15 secure the disc brake assembly to the frame using wires, and do not disconnect the brake hose. Never allow the weight of the disk brake caliper assembly to hang from the hydraulic brake hose. Be sure to remove the harness clips to prevent damaging the pad wear indicator harness during the removal process.**
- **Be sure to protect brake pipe 1 and brake hoses 3, 11 from dust by fitting blanking plugs after removal.**

NOTE

Do not disassemble wheel hub 33 and disc rotor 34 unless they are faulty.

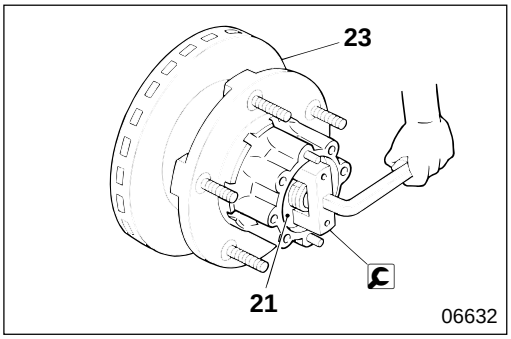
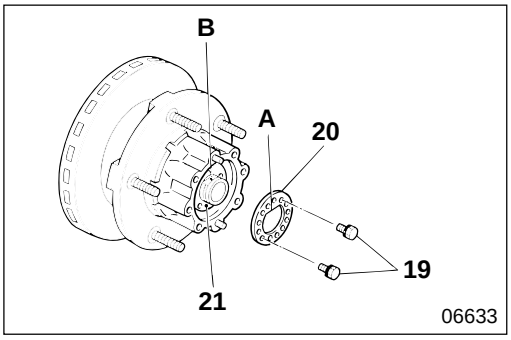
◆ Service procedure



● Starting torque of wheel hub bearing

[Adjustment]

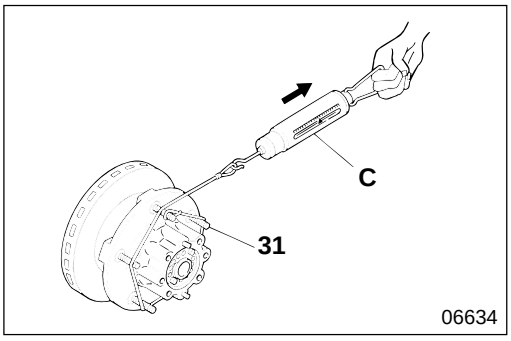
- Tighten lock nut **21** at specified torque for primary tightening, while turning wheel hub and rotor assembly **23**.
- Slacken off lock nut **21**completely.
- Turn wheel hub and rotor assembly **23** several times to smooth operation of outer bearings **22**, **29** and inner bearings **27, 28**.
- Tighten lock nut **21** at specified torque for secondary tightening.



- Insert lock washer **20** so that flat area **A** fits onto notch **B**.
- Make sure that the mounting holes of lock washer **20** and lock nut **21** align. If they do not, slacken off the lock nut and align them.
- Install bolts **19** at the positions as illustrated, aligning lock nut **21**.
- Tighten bolts **19** at specified torque.

CAUTION

After adjustment, make sure that there is no play in the axial direction of wheel hub and rotor assembly 23.

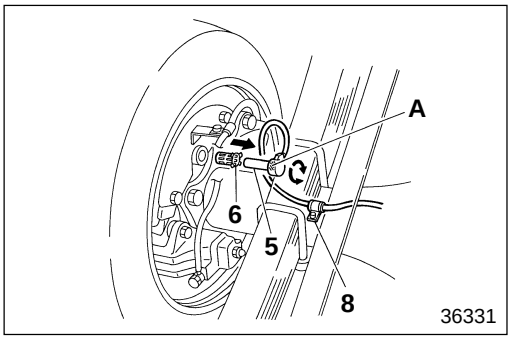


[Measurement]

- Install spring balance **C** on hub bolt **31**.
- Measure the tangential force.
- If the measured tangential force is within the specified value, the starting torque conforms to the standard value.
- Do not allow the starting torque to become higher than the tangential force.
- If the measured value deviates from the specified value, readjust.
- If any fault is found after readjustment, replace outer bearings **22, 29** and inner bearings **27, 28**.

NOTE

- **Measure the starting torque with inner oil seal 26 installed.**
- **Measure the starting torque with disc brake assembly 15, outer oil seal 18 and axle shaft 17 removed.**



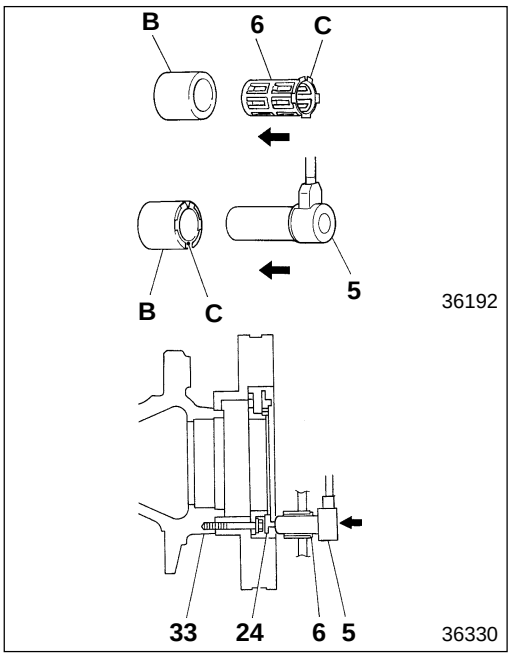
5 **6** **Wheel speed sensor and spacer**

[Removal]

Using pliers, hold wheel speed sensor **5** at shaded section **A** in the diagram, and remove it by turning it slightly.

CAUTION

- **Do not hold wheel speed sensor 5 with pliers at positions other than shaded section A shown in the diagram.**
- **Do not apply excessive force to remove wheel speed sensor 5, such as by striking with a hammer, prying with a screwdriver, and pulling the harness. Excessive force can break wires in the wheel speed sensor.**
- **If only slight force is necessary to remove wheel speed sensor 5, replace spring spacer 6.**



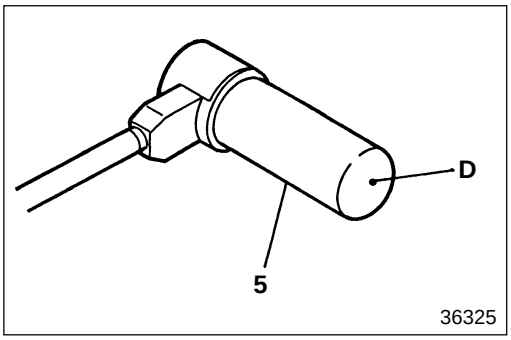
[Installation]
The connector of wheel speed sensor **5** is color-coded. Install the wheel speed sensors to the proper wheels according to the following table.

Installation location	Connector color	Connector shape	Right/left identification tape
Left wheel	Gray	Female	Yellow
Right wheel	Black	Male	None

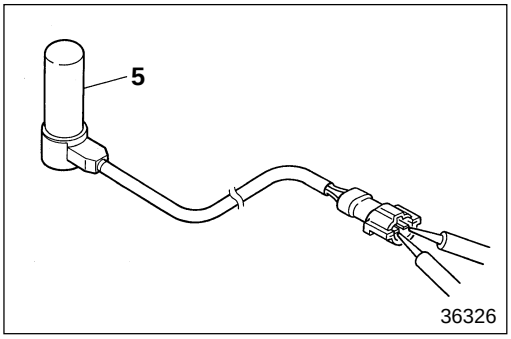
- Insert spring spacer **6** into holder section **B** of the backplate until stopper section **C** contacts the holder section.
- Insert wheel speed sensor **5** until it firmly contacts rotor **24**.
- Slowly rotate wheel hub **33** two or three turns (1 rotation per 2 seconds) to make sure it rotates smoothly.

CAUTION ⚠

Do not apply excessive force to install wheel speed sensor 5, such as by striking with a hammer, prying with a screwdriver, and pulling the harness. Excessive force can break wires in the wheel speed sensor.

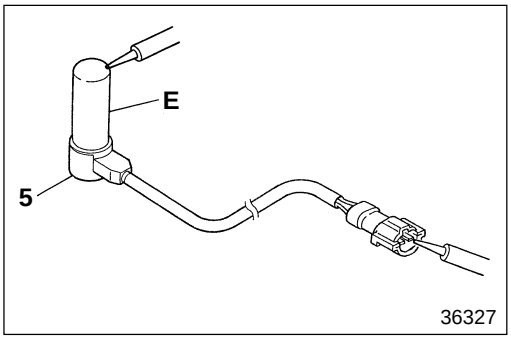


[Inspection]
Pole piece **D** in wheel speed sensor **5** is magnetized by a built-in magnet and attracts metals. Do not allow metal particles to stick to the pole piece.



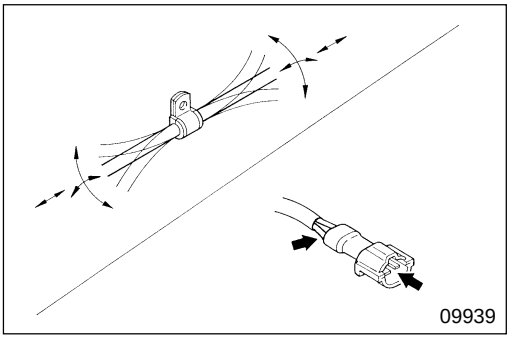
● **Measurement of resistance between terminals**

Measure resistance between the terminals of wheel speed sensor **5**.
If the measured value deviates from the standard value, replace the wheel speed sensor.



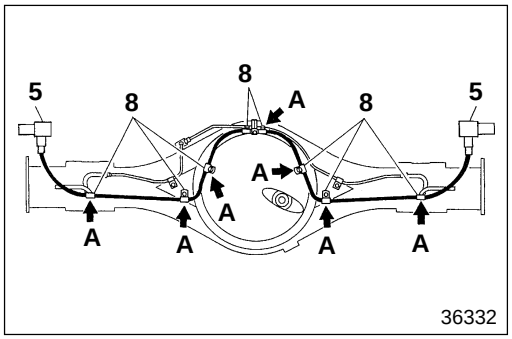
● **Measurement of insulation resistance**

Measure resistance between body **E** and each terminal of wheel speed sensor **5**.
If the measured value is lower than the standard value, replace the wheel speed sensor.



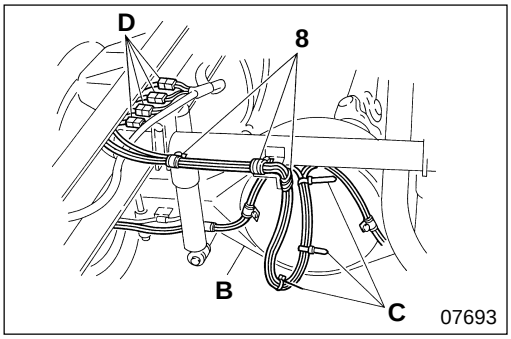
● **Inspection of open circuit in harness**

To check the harness for an open circuit, disconnect the harness clamp from the vehicle side, then bend and pull harness at the clamp to check if a momentary open circuit results. Also inspect the terminal contact conditions in the connector.
If an abnormality is found, replace wheel speed sensor **5**.

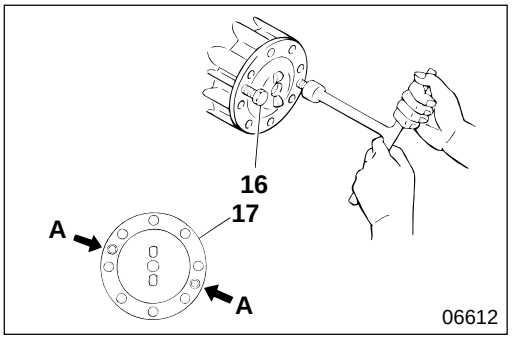


5 **8** **Installation of wheel speed sensor harness and clips**

- Starting from the wheel brake side, secure the harness of wheel speed sensor **5** and the pad wear indicator harness in place at tape sections **A** using clips **8**, while making sure that there is no interference, twisting or excessive sagging of the harnesses.



- As shown in the diagram, position the harness of speed sensor **5** and the pad wear indicator harness, starting from housing section **B** and moving toward the frame, making sure that there is no twisting or excessive sagging of the harnesses. Use clips **8** and cable ties **C** to secure the harnesses in place, then connect connectors **D**.



17 **Axle shaft**

[Removal]
Insert bolts **16** into screw holes **A** of axle shaft **17**. Then, remove the axle shaft.

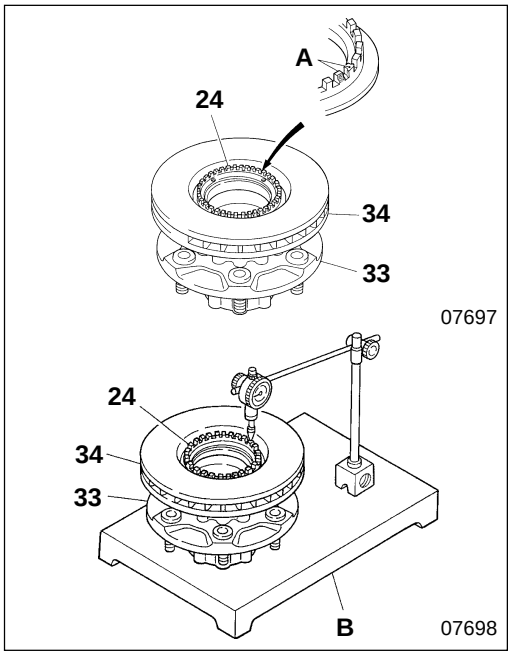
Remove wheel hub and rotor assembly **23** using mounting bolt **16** of axle shaft **17**.

CAUTION

Make sure you remove wheel hub and rotor assembly 23 in a straight line to prevent damage to inner oil seal 26.



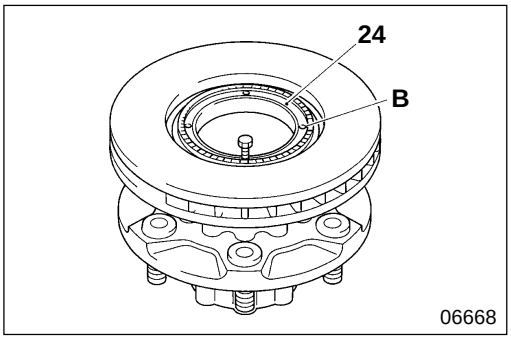
24 **Rotor**

[Inspection]

- Check rotor **24** for chipped or crushed teeth (see section **A** in the diagram).
  If an abnormality is found, replace the rotor.

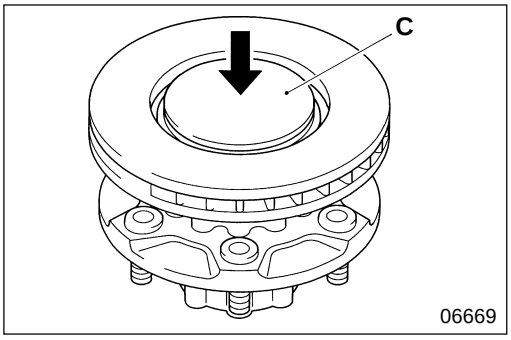
- If the amount of runout of rotor **24** deviates from the standard value, repeat the disassembly and reassembly procedures. If the amount of runout still deviates from the standard value after the reassembly, replace faulty parts.

  B : Platform



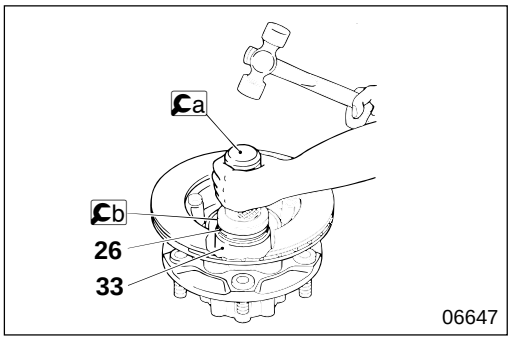
[Removal]

Install bolts (M6 × 1.0) in threaded holes **B** (holes for rotor removal) on rotor **24**, and tighten them evenly to remove the rotor.



[Installation]

Before installing rotor **24** to rotor flange **25**, heat the rotor to approximately 150°C {302°F}. Using iron plate **C**, press-fit the rotor into the rotor flange by applying uniform pressure, making sure that there is no gap between the rotor and the rotor flange.



26 **Installation of inner oil seal**

Press-fit inner oil seal **26** so that it is flush with the end of wheel hub **33**.

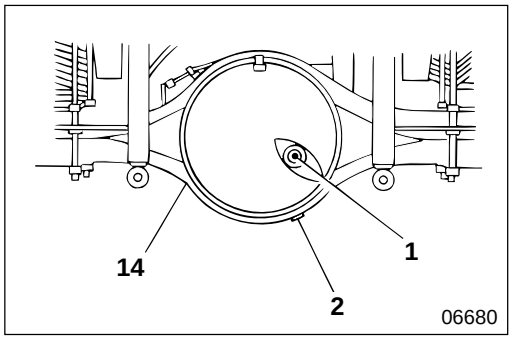
◆ Service procedure



● **Work before disassembly**

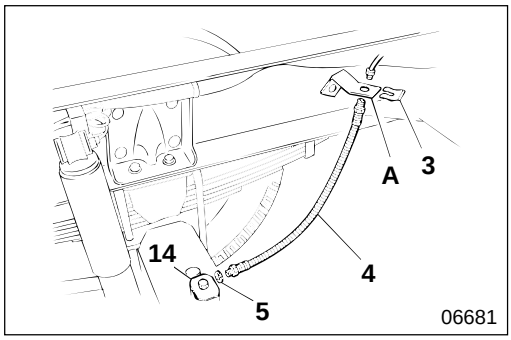
Remove inspection plug **1** and drain plug **2**, then drain the gear oil from axle housing **14**.

WARNING⚠

The oil temperature is high immediately after the vehicle has stopped, so take care not to scald yourself.

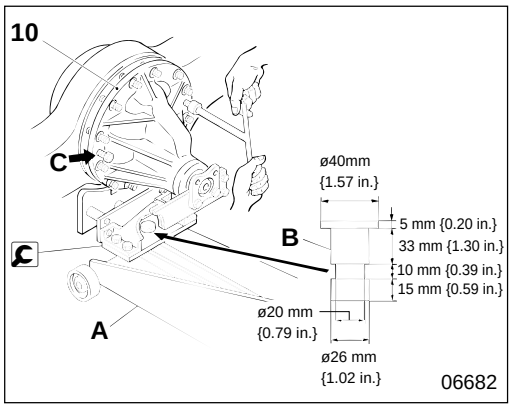
● **Work after assembly**

Fill axle housing **14** with the specified amount of gear oil via inspection plug **1**.



4 **Removal and installation of brake hose**

Remove brake hose **4** from bracket **A** (on the frame) first, then remove the brake hose from axle housing **14**. To assemble the brake hose follow the disassembly sequence in reverse.

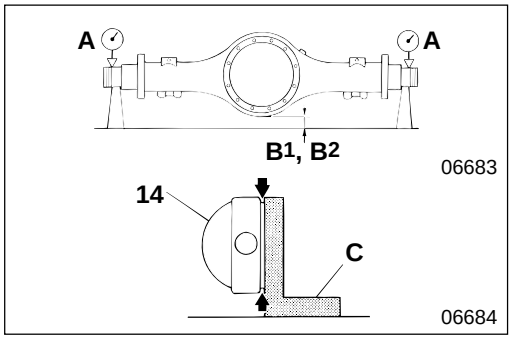


10 **Removal and installation of reduction and differential assembly**

- Remove the lift pad from garage jack **A** and mount differential carrier base, after turning pin **B** to the dimensions as illustrated insert it and secure it with the bolt which secured the lift pad.
- Tighten two bolts in screw holes **C** used for removing reduction and differential assembly **10** evenly, and remove the reduction and differential assembly.
  Bolt size : M12×1.25 mm

NOTE

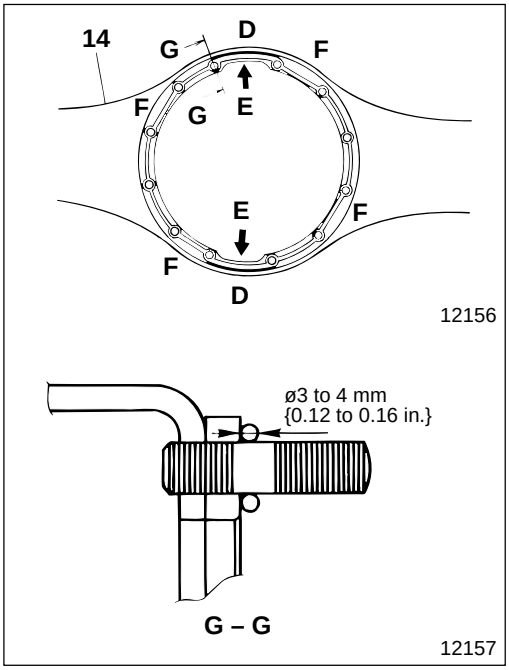
Be sure to completely remove adhered sealant from the mounting surface of the axle housing and carrier.



14 **Axle housing**

[Inspection]

- Support the inner bearing mating parts at both ends of the housing spindle of axle housing **14** horizontally.
- Set the dial gauge against outer bearing mating part **A** and turn it 360° to measure bend.
- Set axle housing **14** vertical using square **C**. After measuring B_1, turn the axle housing 180° and measure B_2 to find the difference.
- If the measured value is higher than the limit, replace axle housing **14**.



[Application of sealant]

- Apply sealant to reduction and differential assembly **10** mounting surface of axle housing **14**.
- Apply sealant around the periphery of indented area **E** for part **D**.
- Apply sealant linearly to part **F**.

NOTE

Make sure that sealant does not ooze from the mounting surface after installing reduction and differential assembly 10.

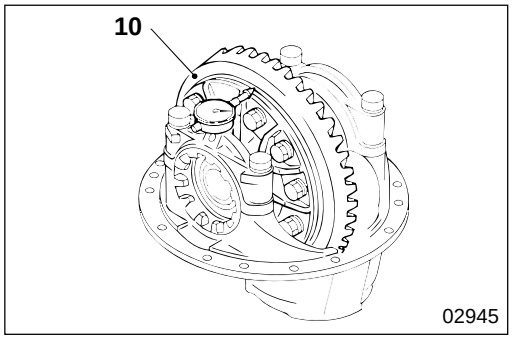
◆ Service procedure

● **Work before disassembly**

Mount differential carrier **35** on a differential working base assembly.

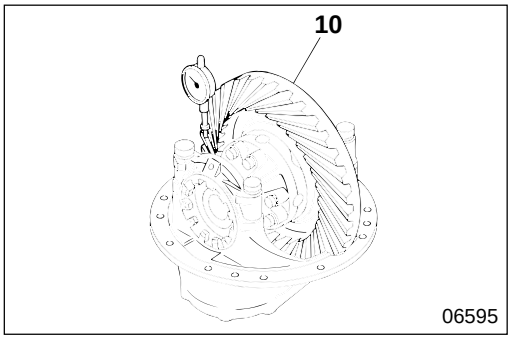


● **Inspection before disassembly**

Inspect for faulty parts before disassembly.

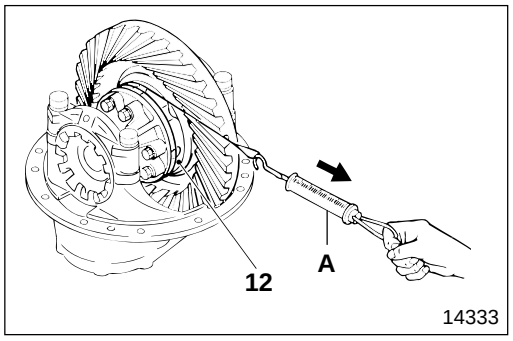
(1) Wobble of rear face of final drive gear

Measure wobble at a point 132 mm {5.20 in.} (on the radius) from the center of final drive gear **10**.



(2) Backlash of final drive gear and final drive pinion

Measure at three points on the circumference of final drive gear **10**.

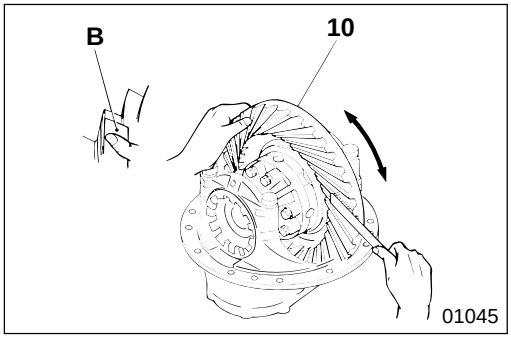


(3) Starting torque of side bearing

- Install spring balance **A** at 152 mm {5.98 in.} outer periphery point of differential case LH **12**.
- Measure the tangential force.
- If the measured tangential force is within the specified value, the starting torque conforms to the standard value.

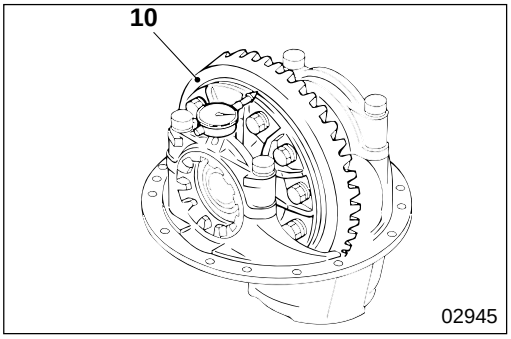
NOTE

Measure the starting torque within final drive gear 10 and final drive pinion 28 backlash range.



(4) Tooth contact of final drive gear

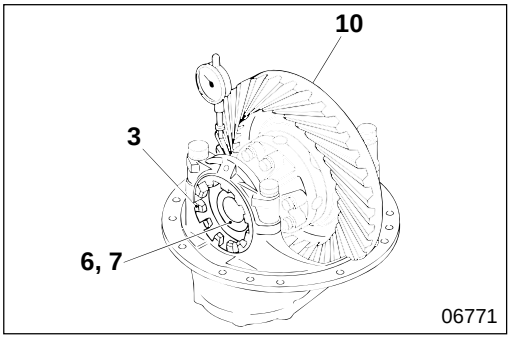
Apply red lead to three or four teeth of final drive gear **10**, examine tooth contact by turning the gears a few times.
B : Examine tooth contact using paper.



● **Inspection and adjustment after assembly**

(1) Inspection of wobble of back face of final drive gear

Measure wobble at a point 132 mm {5.20 in.} (on the radius) from the center of final drive gear **10**.



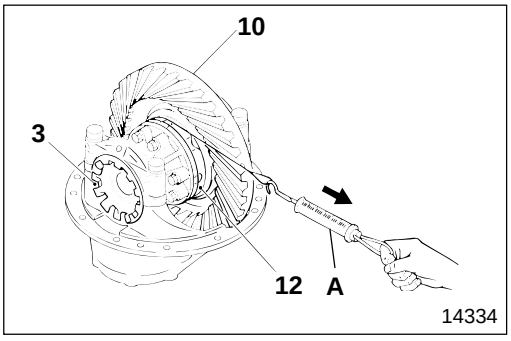
(2) Backlash of final drive gear and final drive pinion

[Adjustment]

- Adjust backlash using left and right adjusting screws **3** with the adjusted starting torques of side bearings **6**, **7** unchanged.
- Measure backlash at three points around the circumference of final drive gear **10**.

CAUTION

Make sure when you loosen one adjusting screw 3 that you tighten the other adjusting screw by the same amount, because the starting torque of the side bearings 6, 7 changes.



(3) Starting torque of side bearing

[Inspection]

- Install spring balance **A** at 152 mm {5.98 in.} outer periphery point of differential case LH **12**.
- Measure the tangential force.
- If the measured tangential force is within the specified value, the starting torque conforms to the standard value.
- If the measured value deviates from the specified value, adjust.

[Adjustment]

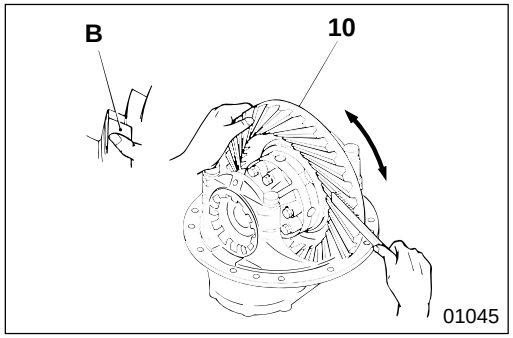
If the measured value deviates from the specified value, adjust it using left and right adjusting screws **3**.

CAUTION

Be sure to tighten left and right adjusting screws 3 by the same amount of pitch.

NOTE

Adjust the backlash to within the standard backlash of final drive gear 10 and final drive pinion 28.



(4) Tooth contact of final drive gear

[Inspection]

Apply red lead to three or four teeth of final drive gear **10**, examine tooth contact by turning the gears a few times.

B : Examine tooth contact using paper.

[Adjustment]

If tooth contact has deteriorated, adjust by increasing or decreasing backlash and shim **34**.

CAUTION

Be sure when replacing the gear because of abnormally worn teeth to replace the reduction gear set of final drive gear 10 and final drive pinion 28.

Maintenance item			Assembly standards
At no load	Tooth contact position	Lengthwise direction of tooth	From center towards edge
		Vertical direction	From center towards top of tooth for final drive gear and center for final drive pinion
	Tooth contact shape	Length	Approximately 50 to 70% of tooth width
		Width	Approximately 50 to 70% of tooth depth
	Degree of tooth contact		It becomes weaker as it nears tooth root or tooth tip

NOTE

When tooth contact is near the toe at no load it becomes middle area contact at load.

Adjustment of tooth contact

	Method of adjustment	Moving direction
Adjustment by adding or reducing shims	Advance final drive pinion to final drive gear (Shims are reduced) 	 Tooth contact moves towards tooth root
	Retard final drive pinion from final drive gear (Shims are added) 	 Tooth contact moves towards tooth tip
Adjustment using adjusting screw	Advance final drive gear to final drive pinion center (Less backlash) 	 Tooth contact moves in lengthwise direction of tooth Leading edge : Nearer to toe and slightly nearer to root of tooth Trailing edge : Nearer to heel and slightly nearer to top of tooth
	Retard final drive gear from final drive pinion center (More backlash) 	 Tooth contact moves in lengthwise direction of tooth Leading edge : Nearer to heel and slightly nearer to top of tooth Trailing edge : Nearer to toe and slightly nearer to root of tooth

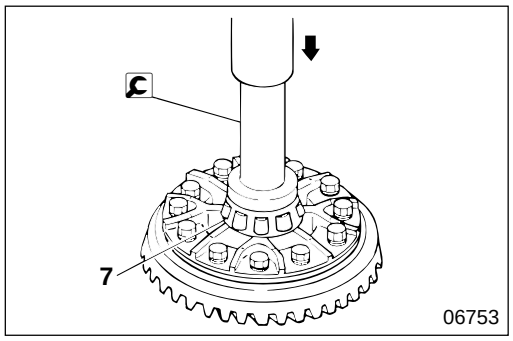
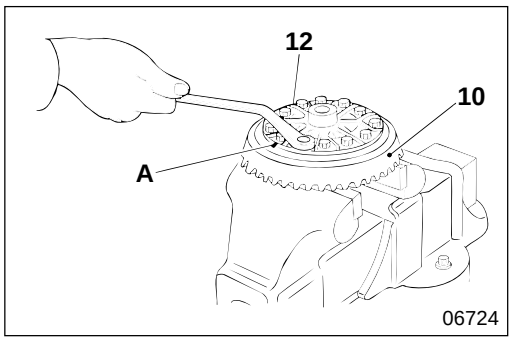
NOTE

Make sure you keep left and right side bearings 6, 7 separate after removal, and be careful not to mix them up when installing them.



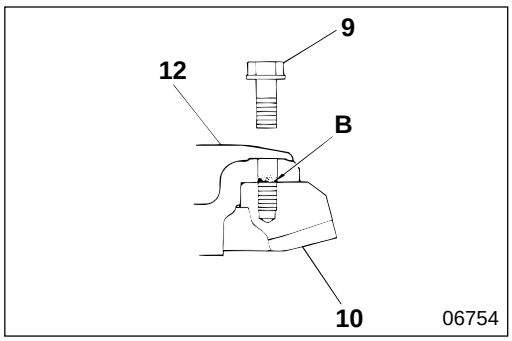
[Installation]



10 **12** **Final drive gear and differential case LH**

[Removal]

Put alignment marks **A** on final drive gear **10** and differential case LH **12**.

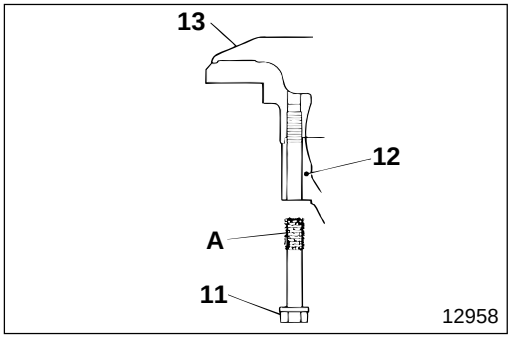


[Installation]

- Apply rust preventive to the entire surface of bolts **9**.
- Apply lock paint to the threads of all bolt holes **B** of final drive gear **10**.
- Tighten bolts **9** at specified torque.

CAUTION

- **Be sure to apply rust preventive because of the need to tighten bolt 9 at specified torque.**
- **Be sure not to operate the vehicle for at least one hour after installation in order to let the lock paint harden.**
- **Be sure not to operate the vehicle at full torque for at least four hours after installation in order to let the lock paint harden.**

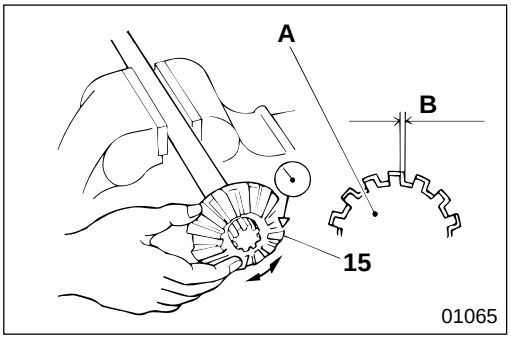


12 **13** **Installation of differential case RH and differential case LH**

- Apply rust preventive to the entire surface of bolts **11**.
- Apply lock paint to thread area **A** of bolts **11**.
- Tighten bolts **11** at specified torque.

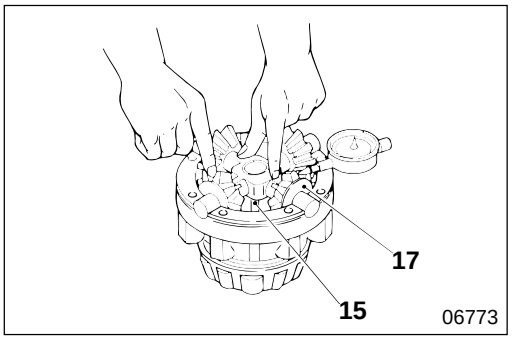
CAUTION

- **Be sure to apply rust preventive because of the need to tighten bolts 11 at specified torque.**
- **Be sure not to operate the vehicle for at least one hour after installation in order to let the lock paint harden.**
- **Be sure not to operate the vehicle at full torque for at least four hours after installation in order to let the lock paint harden.**

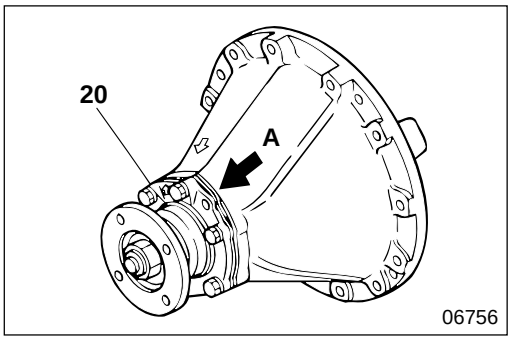


15 **Play between differential gear and axle shaft spline area in the rotating direction**

If the measured value is higher than the limit, replace the faulty parts.
A : Axle shaft
B : Play

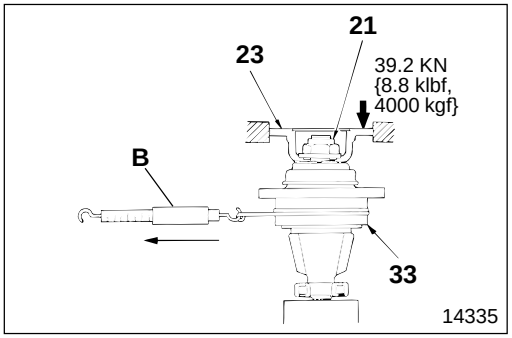


15 **17** **Backlash between differential gear and differential pinion**



20 **Pinion assembly**

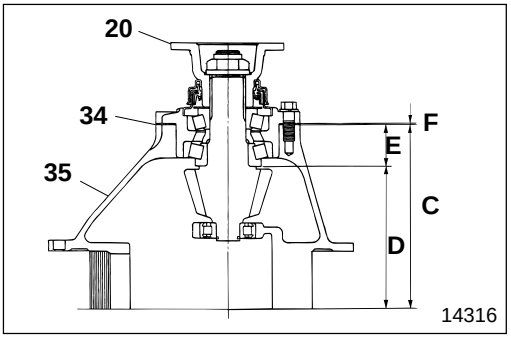
[Removal]
Screw M12×1.25 mm bolts into two holes **A** provided for removing pinion assembly **20**, then tighten bolts uniformly until the pinion assembly is removed.



[Inspection of starting torque after installation]
- Apply load of approximately 39.2 kN {8.8 klbf, 4000 kgf} to companion flange **23** or tighten lock nut **21** at specified torque.
- Install spring balance **B** at 114 mm {4.49 in.} outer periphery point of bearing retainer **33**.
- Measure the tangential force.
- If the measured tangential force is within the specified value, the starting torque conforms to the standard value.
- If the measured value deviates from the specified value, adjust.

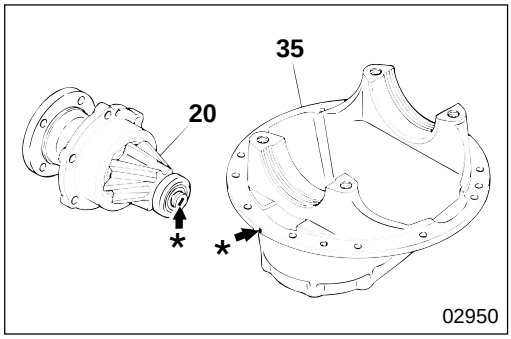
NOTE
- **Be sure to secure companion flange 23 before measurement.**
- **Be sure to remove oil seal 29 before measurement.**

[Adjustment of starting torque]
If the measured value deviates from the specified value, replace collar **24** so that the tangential force conforms to the standard value.
Collar thicknesses :
15.600 to 16.200 mm {0.61 to 0.64 in.} (25 thicknesses available in 0.025 mm {0.00098 in.} increments)



[Adjustment when installing]
- Carry out the following procedure so that **C**, **D** and **E** conform to the standard dimension.
- Calculate shim thickness **F** according to the following formula based upon the machining error data stamped on pinion assembly **20** and differential carrier **35**.
  Formula for calculation:
  F = 0.5 {0.020}–b+c+d

  c : Deviation from basic dimension **C**
  d : Deviation from basic dimension **D**
  e : Deviation from basic dimension **E**



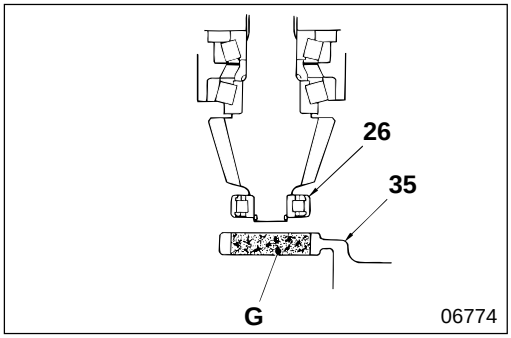
Unit : mm {in.}

Location	Standard dimension	How to calculate deviation
Shim thickness	0.5 {0.020}	—
C	203 {7.99}	The basic dimension, multiplied by 100, is stamped on the periphery of differential carrier **35** flange
D	157 {0.18}	The basic dimension is stamped on the top of pinion assembly **20**
E	46.5 {1.8}	Measure the deviation from **E** using a dial gauge. However, if it is difficult to measure the actual deviation, assume a value from 0 to 0.2 {0 to 0.0079}

***** : Stamped number position

NOTE
Thickness is stamped in millimeters.

- Select shim **34** from shim thickness **F**.
  Available thicknesses of shim **34** : 0.1 mm {0.0039 in.} and 0.2 mm {0.0079 in.}

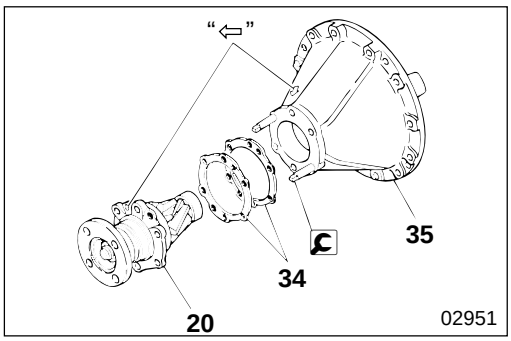


[Installation]

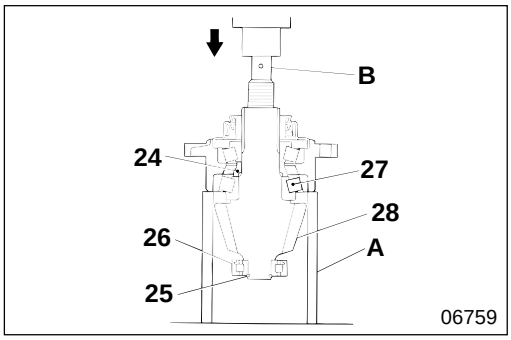
- Apply lock paint to entire mounting surface **G** of pinion pilot bearing **26** of differential carrier **35**.

CAUTION

- **Be sure to let the lock paint harden undisturbed for 30 minutes to two hours after installation.**
- **Be sure to wait at least three hours before running the vehicle, and if possible wait 24 hours to let the lock paint harden.**

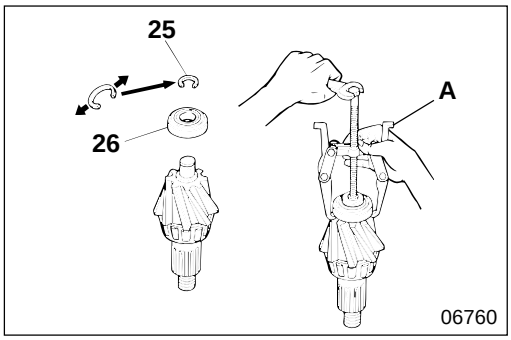


- Assemble differential carrier **35** and pinion assembly **20** with their alignment marks "⇦" aligned.



20 **Removal of pinion assembly**

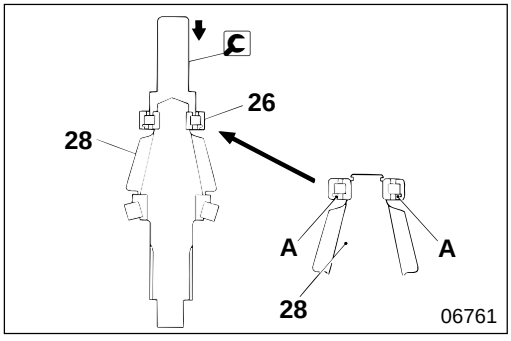
Using an appropriate cylinder **A** and press **B**, remove collar **24**, lock ring **25**, pinion pilot bearing **26**, rear bearing inner race **27**, and final drive pinion **28** together.



25 **26** **Lock ring and pinion pilot bearing**

[Removal]

A : Gear puller (General tool)



[Installation]

Press-fit pinion pilot bearing **26** in the direction as illustrated.

MULTIPLATE LIMITED SLIP DIFFERENTIAL ASSEMBLY

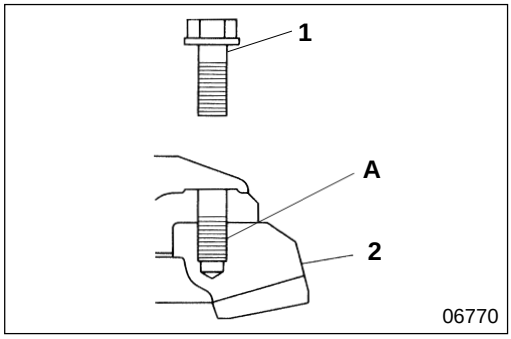
◆ Service procedure

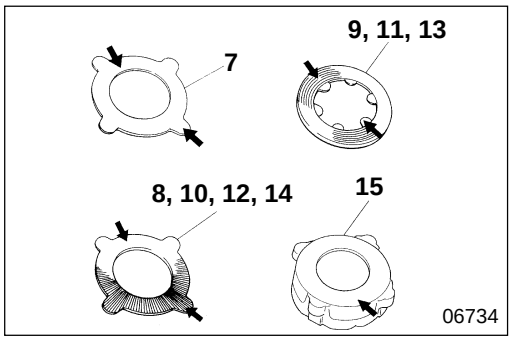


2 Installation of final drive gear

- Apply rust preventive to the entire surface of bolts **1**.
- Apply lock paint to the threads area **A** of all the bolt holes of final drive gear **2**.
- Tighten boltes **1** at specified torque.

CAUTION

- **Be sure to let bolts 1 harden for at least an hour, after installation, before driving.**
- **Furthermore, be sure to let bolts 1 harden for at least four hours before running at full torque.**



3 Multiplate limited slip differential assembly

[Inspection of contact and sliding surfaces]

- Inspect spring plates **7**, friction plates **8**, **10**, **12**, **14** and friction discs **9**, **11**, **13** and replace if the friction surface or sliding surface shows extreme wear or heat discoloration.

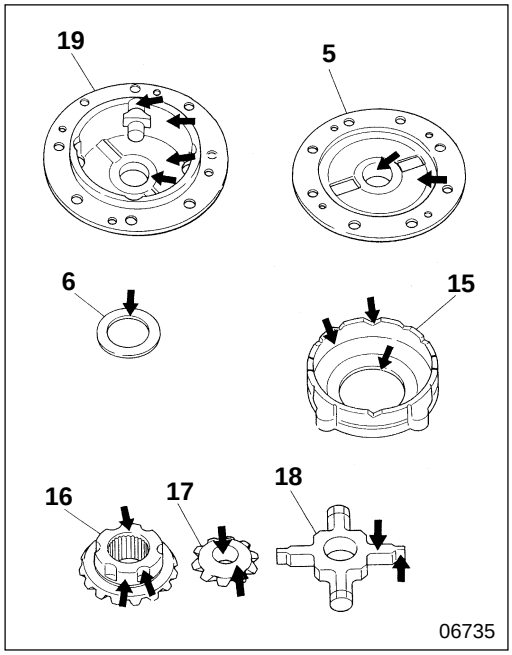
NOTE

The hardened area on the inner periphery of the friction surfaces of plates and discs 7 to 14 is due to the force exerted by the springs and should not be mistaken for abnormal wear.

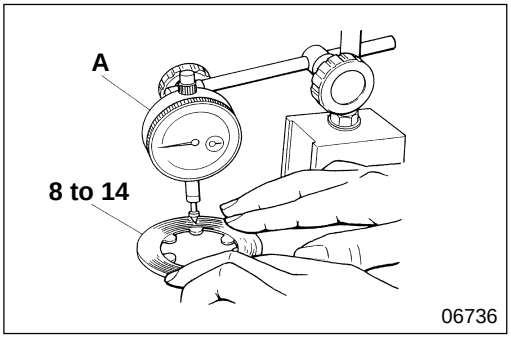
- Replace spring plates, friction discs and friction plates **7** to **14** if their protruding areas have cracks or are damaged.
- If there are nicks or marred areas on the friction and sliding surfaces of pressure rings **15** and friction plates **14**, remove using an oil stone and then fit and correct on the base using compound.

NOTE

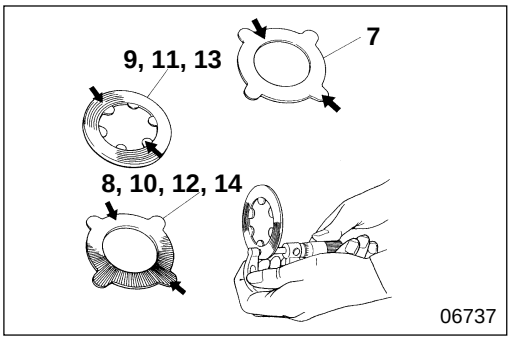
The hardened area on the inner periphery of the friction surfaces of plates and discs 7 to 14 is due to the force exerted by springs and should not be mistaken for abnormal wear.



- Inspect the contact and sliding parts (⬅) of differential case LH **5**, thrust washer **6**, pressure ring **15**, side gear **16**, differential pinion **17**, pinion shaft **18**, and differential case RH **19**. If there are nicks or marred areas, remove using an oil stone.



[Inspection for deformation]
Check friction plates **8**, **10**, **12**, **14** and friction discs **9**, **11**, **13** for deformation by mounting dial gauge **A** on a base and rotating the plate or disc and measuring its flatness.

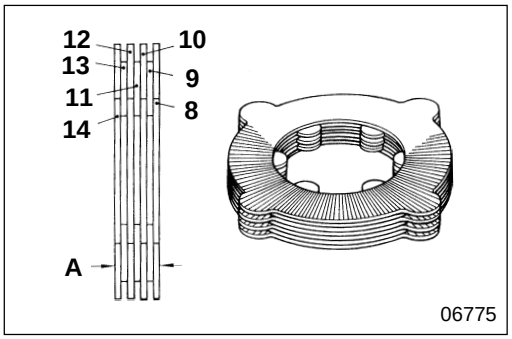


[Measurement of thickness]
Measure the thickness of the friction surfaces and the protruding parts (⬅) of spring plates **7**, friction plates **8**, **10**, **12**, **14** and friction discs **9**, **11**, **13**. If the measured values deviate from the limit, replace the faulty parts.

NOTE

Measure several locations on each part.

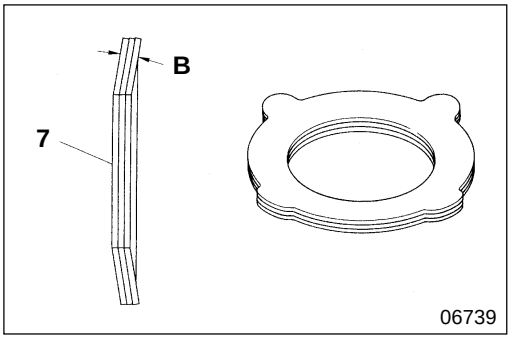
[Work before assembly]
In order to adjust the tolerance in the axial direction when the internal parts of differential cases LH **5** and RH **19** are inserted (clutch plates **7** to **14** friction force) and the tolerance in the axial direction of side gear **16** follow the procedure below.



- Put friction plates **8**, **10**, **12**, **14** and friction discs **9**, **11**, **13** one on top of the other as illustrated. Using a micrometer measure thickness **A**, and by selecting the right combination of plates and discs for each set, make sure the difference in thickness between the left and right sets conforms to the standard value.

NOTE

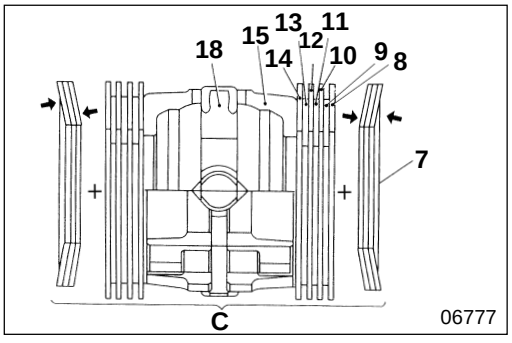
When using new parts, keep in mind that friction plates 8, 10, 12, 14 come in one size, 2.0 mm {0.0079 in.} and friction discs 9, 11, 13 in three sizes, 1.9 mm {0.075 in.}, 2.0 mm {0.079 in.} and 2.1 mm {0.083 in.}.



- Put spring plates **7** one on top of the other as illustrated. Using a micrometer measure thickness **B** and by selecting the right combination of plates for each set, make sure the difference in thickness between the left and right sets is minimal.

NOTE

When replacing spring plates 7 with new ones, the plate thickness is 2.0 mm {0.079 in.}.

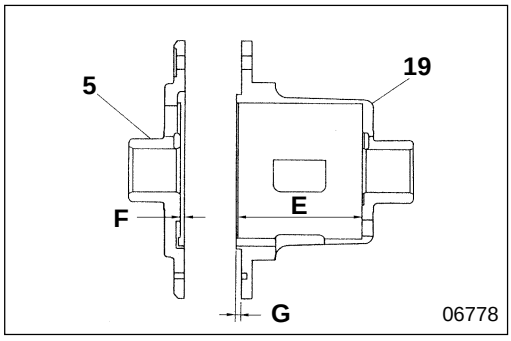


- Assemble pressure rings **15**, pinion shaft **18**, the friction discs, the friction plates and spring plates **7** to **14** and measure total width **C** using a micrometer.

NOTE

When measuring, press down both ends of pressure ring 15 to make sure its V-shaped groove is properly mated with pinion shaft 18.

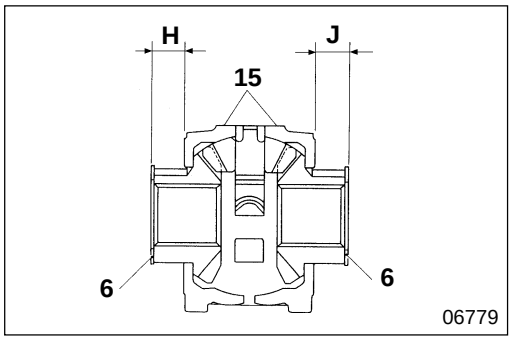
MULTIPLATE LIMITED SLIP DIFFERENTIAL ASSEMBLY



- Calculate dimension **D** between the surfaces of differential cases LH **5** and RH **19** which come in contact with spring plate **7** when the two cases are assembled.
  D = E + F – G
- If the above mentioned total width **C** and clearance **(D – C)** between differential cases LH **5** and RH **19** deviate from the standard value, adjust by changing friction discs **9**, **11**, **13**.

NOTE

When using new friction discs 9, 11, 13, keep in mind that there are three different sizes, 1.9 mm {0.075 in.}, 2.0 mm {0.079 in.} and 2.1 mm {0.083 in.}.



- Install thrust washers **6** as illustrated. Make sure the difference between dimensions **H** and **J** from the back face of pressure ring **15** to the end face of thrust washer on either side conforms to the standard value.

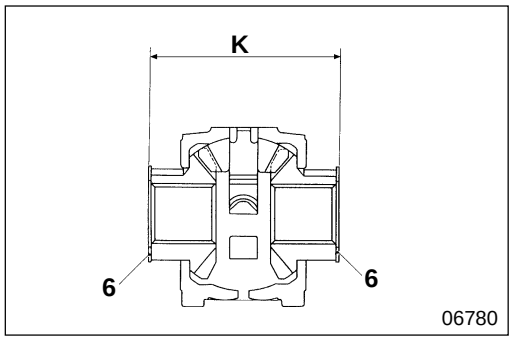
NOTE

When measuring press down both ends of pressure ring 15 to make sure its V-shaped groove is in full contact with pinion shaft 18.

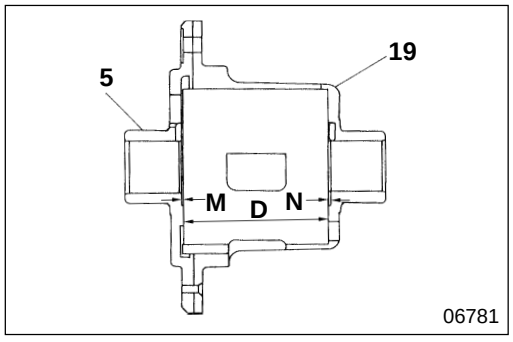
- If the variation of tolerance deviates from the standard value, adjust by changing thrust washers **6**.

NOTE

When using new thrust washers 6 keep in mind that there are three different sizes, 1.50 mm {0.059 in.}, 1.60 mm {0.063 in.} and 1.70 mm {0.067 in.}.



- Measure total width **K**.



- Calculate dimension **L** between the surfaces of differential cases LH **5** and RH **19** that come in contact with thrust washers **6** when the two cases are assembled.
  L = D + M + N

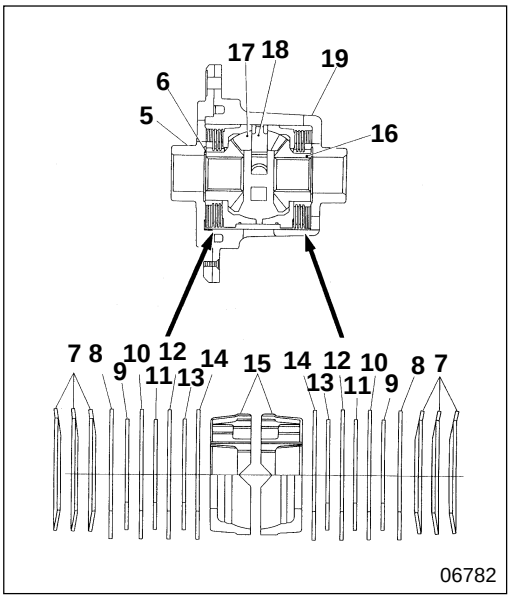
NOTE

Dimension D is the dimension between the surfaces of differential cases LH 5 and RH 19 that come in contact with spring plate 7 when the two cases are assembled and was calculated above.

- Make sure that side gear **16** clearance in the axial direction **(L – K)** conforms to the standard value. If the measured value deviates from the standard value, adjust by replacing thrust washers **6**.

NOTE

- **Select thrust washers 6 so that the difference in dimension between the left and right sides from the back face of pressure ring 15 to the end face of thrust washers conforms to the standard value.**
- **When using new thrust washers keep in mind that there are three sizes, 1.50 mm {0.059 in.}, 1.60 mm {0.063 in.} and 1.70 mm {0.067 in.}.**

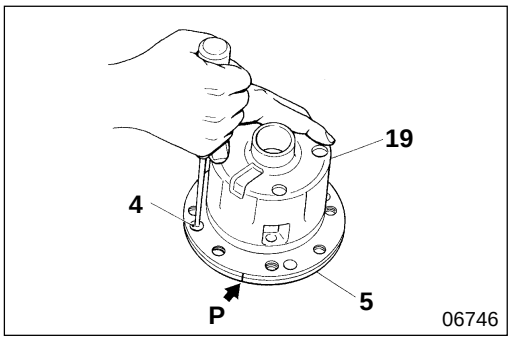


[Assembly]

Assemble the different parts in differential case RH **19** in the direction as illustrated.

CAUTION

- **Make sure that friction plates 8, 10, 12, 14 and friction discs 9, 11, 13 are installed in the correct order and that spring plate 7 is assembled in the correct direction.**
- **Apply the specified gear oil to each of the parts before assembly. Special attention should be given to applying oil to the contact and sliding surfaces.**

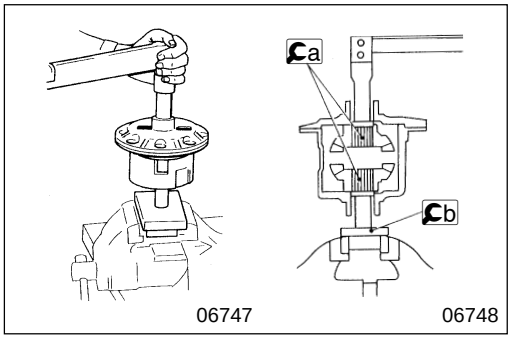


[Tightening of screws]

Align alignment marks **P** (identical Arabian numerals) on differential cases LH **5** and RH **19** and gradually tighten screws **4** evenly in diagonal order.

CAUTION

If differential cases LH 5 and RH 19 are not joined firmly even when screws 4 have been tightened, it may be because thrust washers 6 or spring plates 7 are not properly assembled and they should be reassembled.



[Measurement of rotational torque]

In order to verify the friction force of clutch plates **7** to **14** after assembly, use a side gear holding tool and b side gear holding base to measure the rotation torque and make sure it conforms to the standard value.

NOTE

When measuring the rotation torque, rotate the gear and measure after the rotation has reached a sufficiently steady pace.

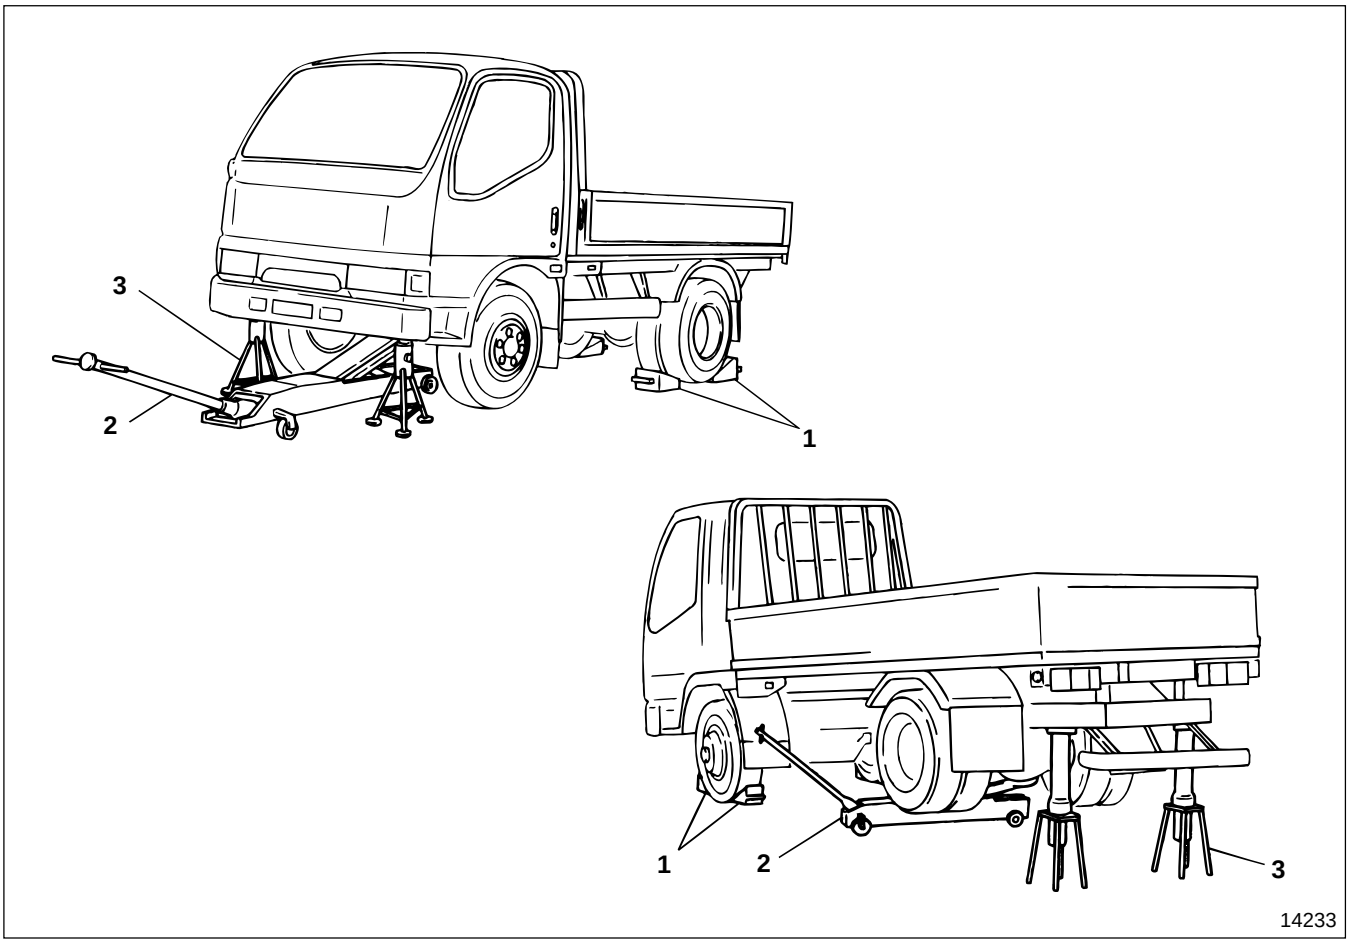
Work for Removal and Installation of Wheel and Tire



● **Work sequence**

1 Place wheel chocks.
2 Jack up the front or rear axle using a garage jack placed under the center of the axle.
3 Support the frame on jack stands.

WARNING⚠

- **Chock the wheels securely so the vehicle does not move.**
- **Do not remove the chocks until the entire operation is completed.**
- **Supporting a vehicle on a garage jack only is extremely dangerous, so always support the frame on jack stands.**
- **Leave the garage jack and stands in place until the entire operation is completed. Never remove them during the operation.**

● **Work sequence after removal and installation**

Follow the work sequence in reverse.

NOTE

Use right-hand threaded wheel nuts marked “R” for right side wheel and left-hand threaded wheel nuts marked “L” for left side wheel.

		Horizontal deflection	1.5 {0.059} or less	—	—
		Vertical deflection	1.5 {0.059} or less	—	—

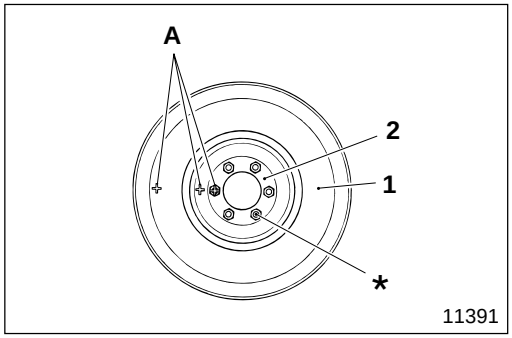
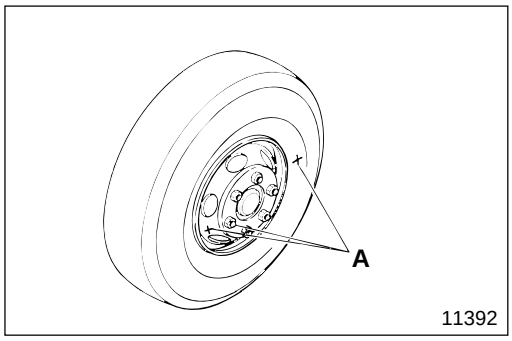
◆ Service procedure

1 **Deflection of tire**

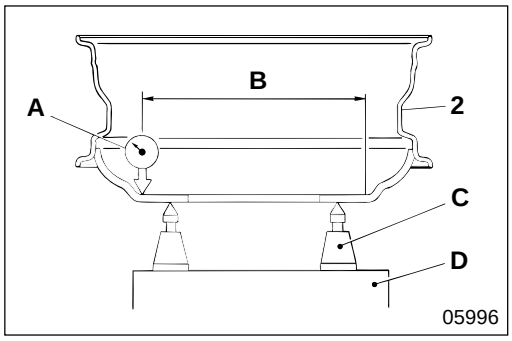
[Inspection]
If the measured value is higher than the limit, make corrections as follows.



[Correction]
- Put chalk marks on tire **1**, disc wheel **2**, and hub bolt * (positions **A** as illustrated).
- Remove tire **1** from disc wheel **2**.



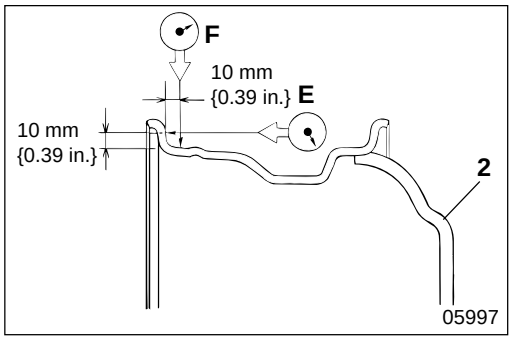
- Measure deflection of disc wheel **2**. If the most deflective position is near the chalk mark, reinstall tire **1** rotating it half a turn from the chalk mark and tighten nuts.
- Remeasure deflection of tire **1**.
- If the measured value is still higher than the limit, replace tire **1** and disc wheel **2** together as an assembly.



2 Inspection of disc wheel

(1) Flatness

- Measure flatness at specified position **B** from the center of disc wheel **2**.
  Measure flatness at five equidistant points (wheel with 5 studs) or six equidistant points (wheel with 6 studs) on the wheel.
  A : Dial gauge
  B : ø165 to 250 mm {6.50 to 9.84 in.}
  (wheel with 5 studs)
  ø170 to 270 mm {6.69 to 10.6 in.}
  (wheel with 6 studs)
  C : Portable screw jacks (x 4)
  D : Surface plate
- Replace disc wheel **2** if the measured value is higher than the limit.



(2) Deflection

Replace disc wheel **2** if the measured value is higher than the limit.
E : Horizontal deflection measuring point
F : Vertical deflection measuring point

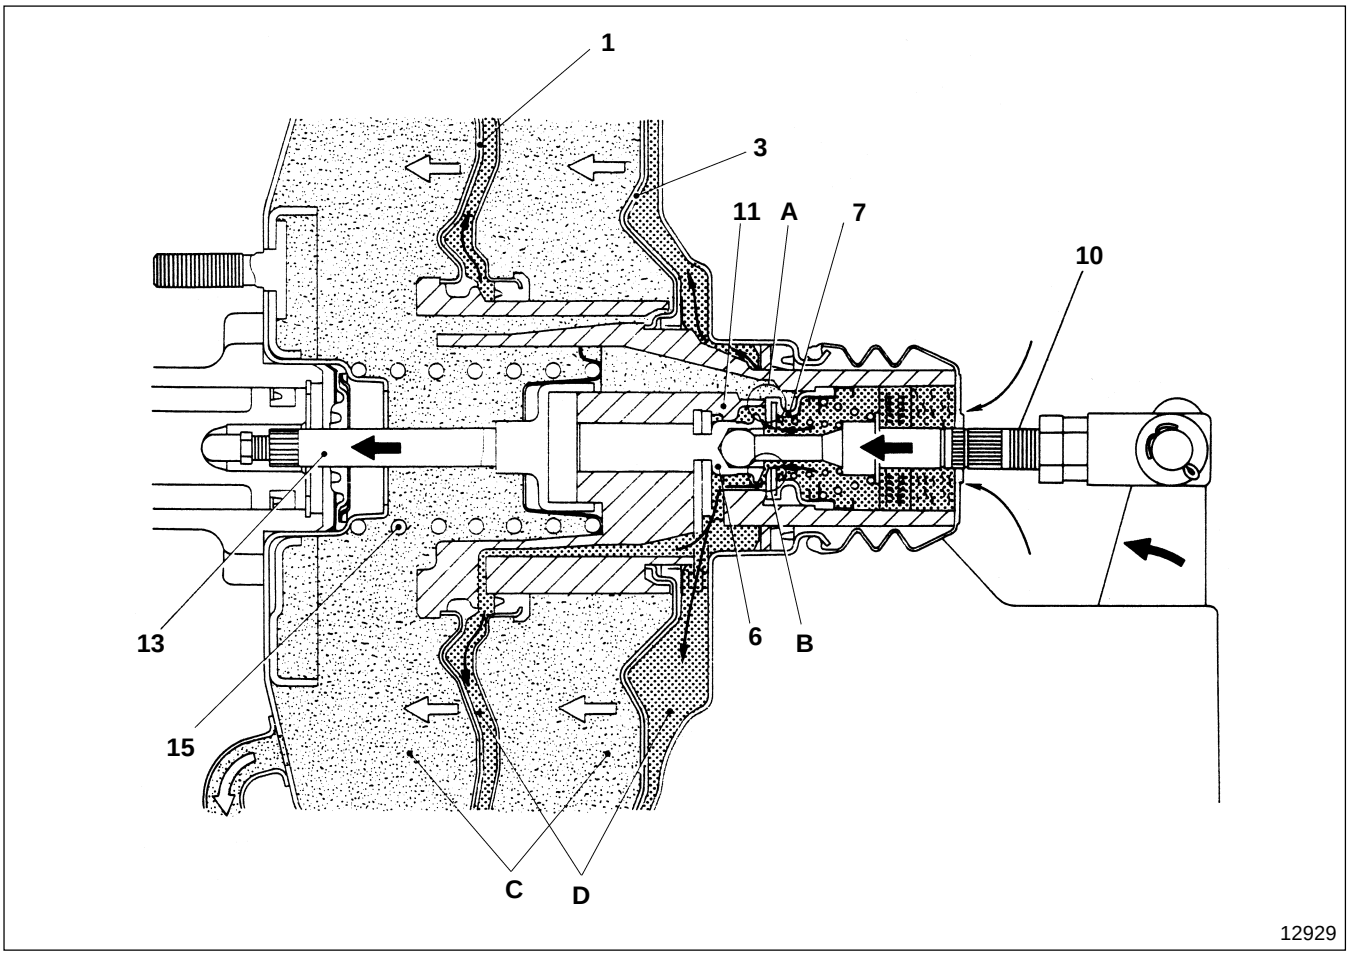
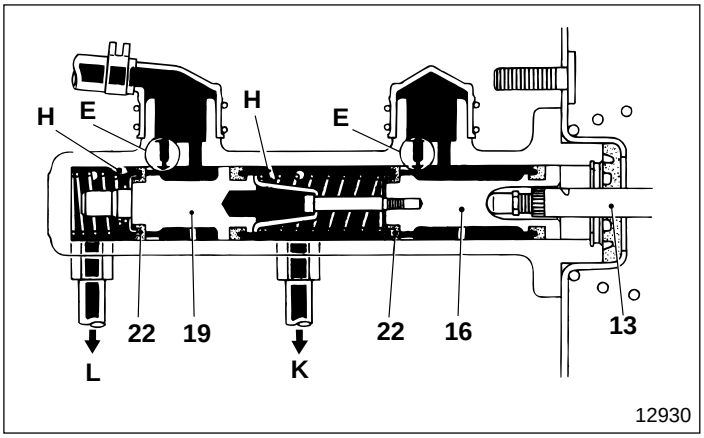
- **17** Primary piston return spring
- **18** Retainer
- **19** Secondary piston
- **20** Secondary piston return spring
- **21** Cylinder body
- **22** Packing cup

● **When depressing brake pedal**



Action of brake booster (master vac)

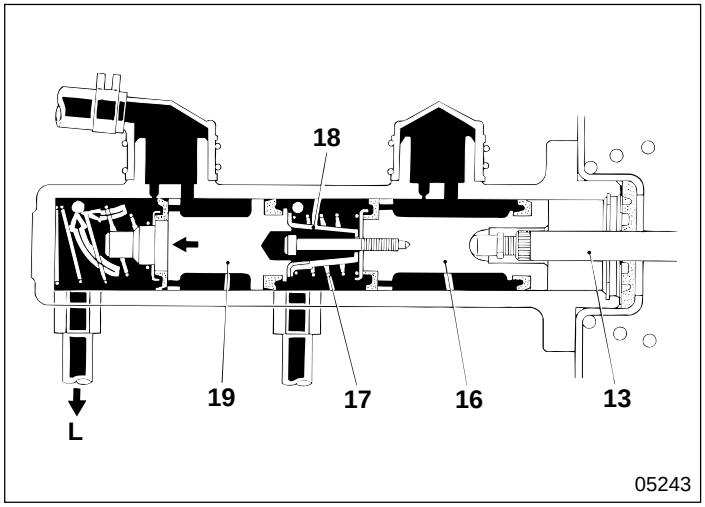
- When the brake pedal is released, chambers **C** and **D** are subjected to the vacuum created by the vacuum pump.
- Depressing the brake pedal activates operating rod **10**, placing poppet **7** in tight contact with the seat of valve body **11**. This action closes vacuum valve **A**, cutting off the vacuum to chamber **D**.
- Depressing the brake pedal further separates valve plunger **6** from poppet **7**, opening breather valve **B** permitting atmospheric pressure to flow into chamber **D**, producing a pressure difference between chambers **C** and **D**.
- This pressure difference between chambers **C** and **D** presses front diaphragm **1** and rear diaphragm **3**, boosting the depressing force.
- This boosted pedal depression force overcomes the repercussive force of diaphragm plate spring **15**, presses push rod **13**, and actuates the brake master cylinder.



Action of brake master cylinder

- Push rod **13** pushes in primary piston **16** and secondary piston **19**, and packing cup **22** passes return port **E**, generating hydraulic pressure in chamber **H**, feeding the fluid to the respective brake systems.

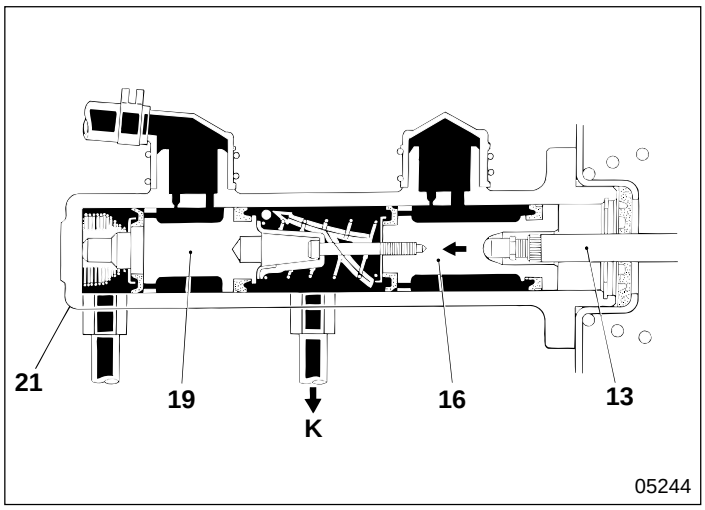
  K : To the front brake system
  L : To the rear brake system



● **Fluid leakage in the front brake system**

- Depressing the brake pedal makes push rod **13** push in primary piston **16**. However, if the brake fluid in the front brake system leaks, hydraulic pressure is not generated in the front brake system.
- Depressing the brake pedal further makes primary piston **16** compress primary piston return spring **17**, causing retainer **18** to push secondary piston **19**, thus generating hydraulic pressure only in the rear brake system.

L : To the rear brake system

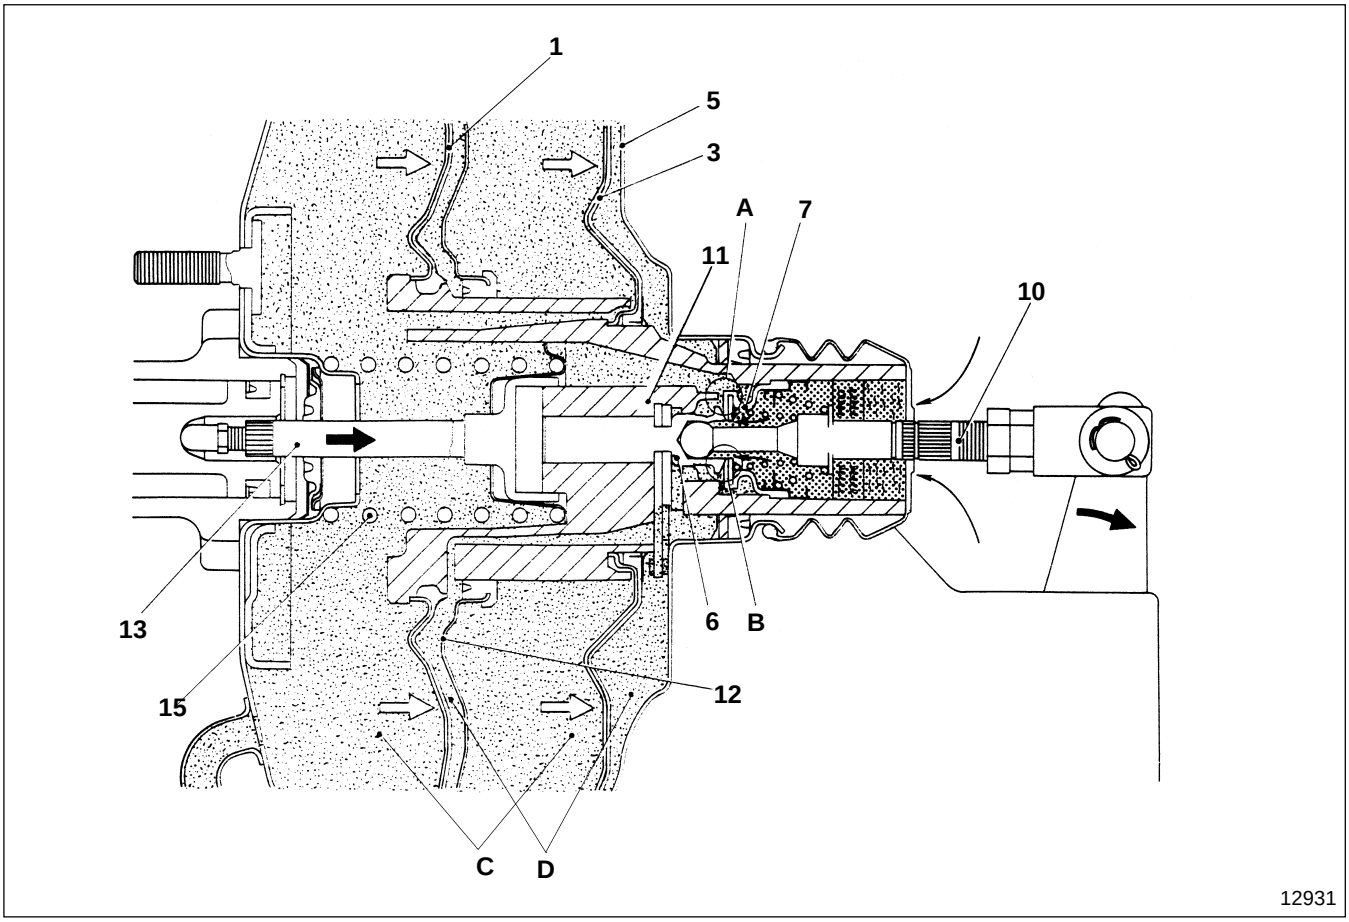


● **Fluid leakage in the rear brake system**

- Depressing the brake pedal makes push rod **13** push in primary piston **16** and secondary piston **19**. However, if the brake fluid in the rear brake system leaks, hydraulic pressure is not generated in the rear brake system.
- Depressing the brake pedal further makes the end of secondary piston **19** contact cylinder body **21**, pushing primary piston **16**, thus generating hydraulic pressure only in the front brake system.

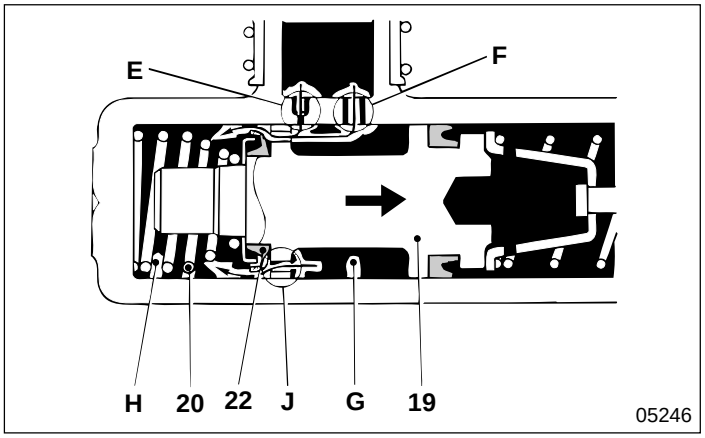
K : To the front wheel brake system

● **When releasing brake pedal**



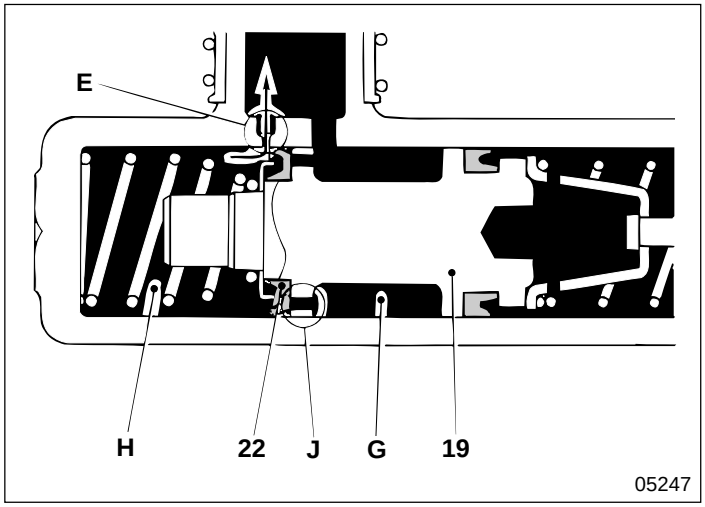
Action of brake booster (master vac)

- When the brake pedal is depressed, atmospheric air flows into chamber **D** as chamber **C** is subjected to negative pressure generated by the vacuum pump.
- When the brake pedal is released, since the pressing force acting on the operating rod **10** also is released, valve plunger **6** contacts poppet **7** tightly, closing breather valve **B** to cut off the flow of atmospheric air into chamber **D**. In addition, valve plunger separates from valve body **11** to open vacuum valve **A**. Then, the negative pressure generated by the vacuum pump creates a vacuum in chamber **D**, and the pressure difference between chambers **C** and **D** diminishes.
- This absence of a pressure difference between chambers **C** and **D**, allows rear diaphragm **3** to be pushed against the rear shell **5** by the repercussive force of diaphragm plate return spring **15**, and push rod **13** returns to its original position.



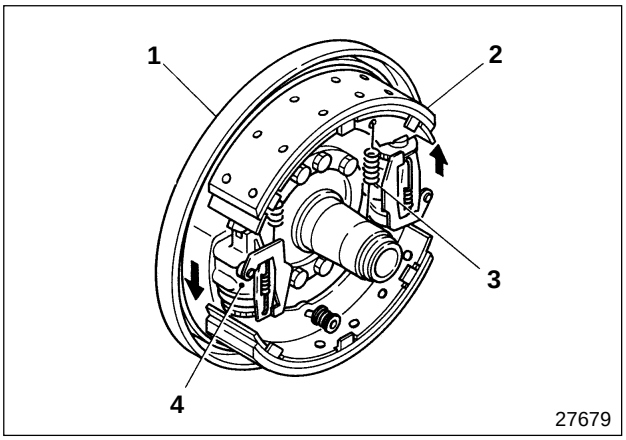
Action of brake master cylinder

- When push rod **13** returns to its original position, the repercussive force of the secondary piston return spring **20** immediately begins to return secondary piston **19**. However, the brake fluid delivered from the brake master cylinder cannot return quickly due to the absence of a pressure difference between chambers **H** and **G**.
- As secondary piston **19** begins to return, the pressure in chamber **H** becomes lower than that in chamber **G**, and this pressure difference deforms packing cup **22** to open a small passage **J**. Then, the brake fluid in chamber **G** is drawn into chamber **H**.



- When secondary piston **19** returns to its original position, the pressure difference between chambers **G** and **H** is diminished, and packing cup **22** closes the small passage **J**. The hydraulic oil in the brake pipe flows from chamber **H** to the fluid tank via return port **E**.
- The same operation takes place also on the primary side.

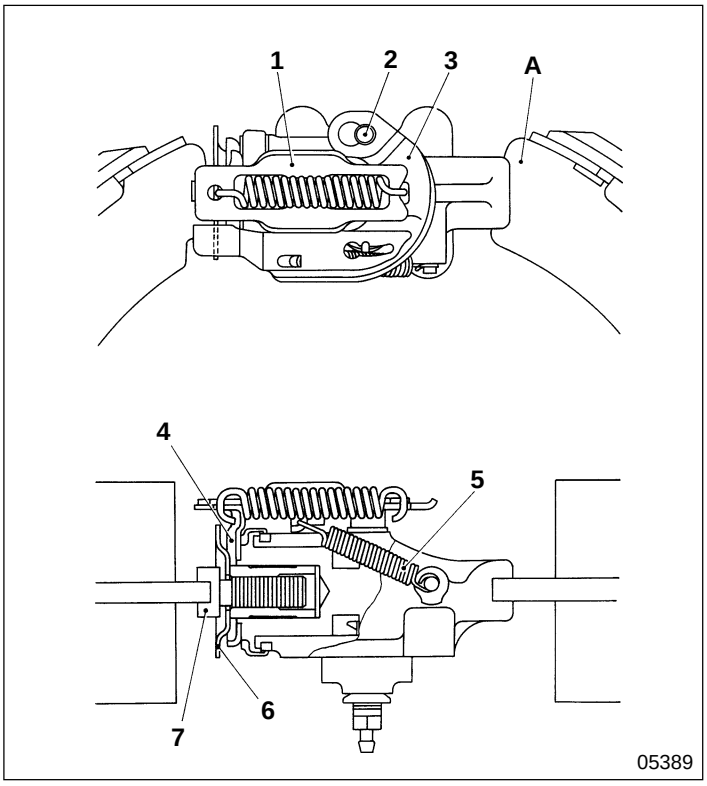
Front Drum Brake Assembly



1 Back plate
2 Brake shoe assembly
3 Return spring
4 Wheel cylinder assembly

The front drum brake assembly has two-leading brakes installed, and with single action wheel cylinder assembly **4**, the action coming from leading shoes when brake shoe assembly **2** is forward provides increased braking force through its independent double action.

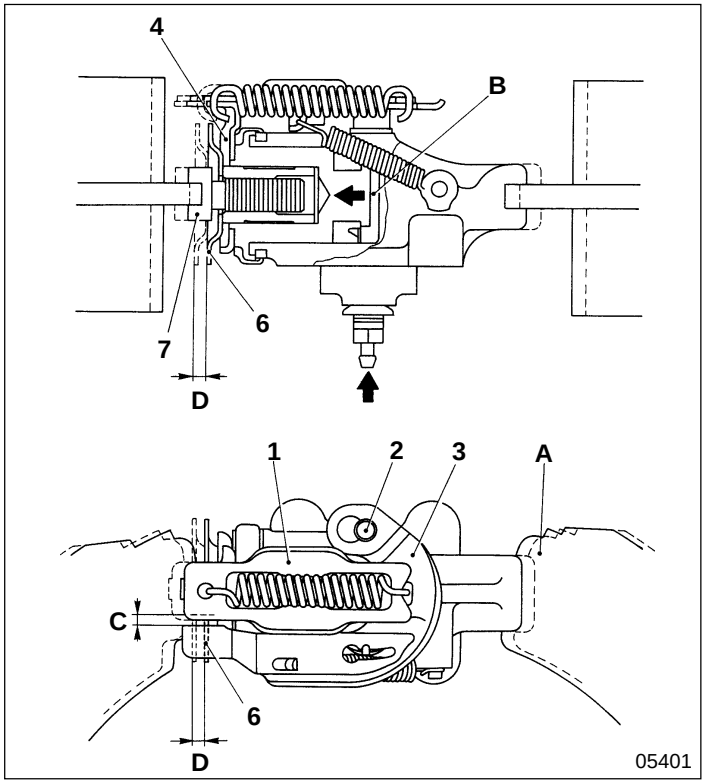
● **Wheel cylinder assembly**



1 Spring and fitting
2 Pin
3 Lever
4 Piston assembly
5 Set spring
6 Adjuster assembly
7 Adjusting screw

A : Brake shoe assembly

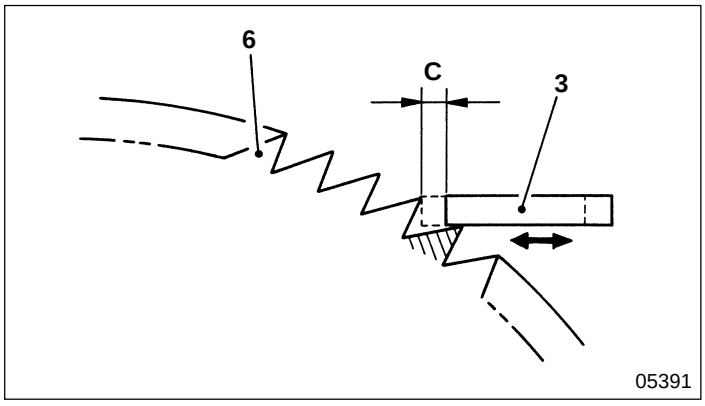
The wheel cylinder assembly is equipped with an auto adjusting mechanism to adjust the gap resulting from wear between the brake lining and brake drum, each time the brakes are applied.



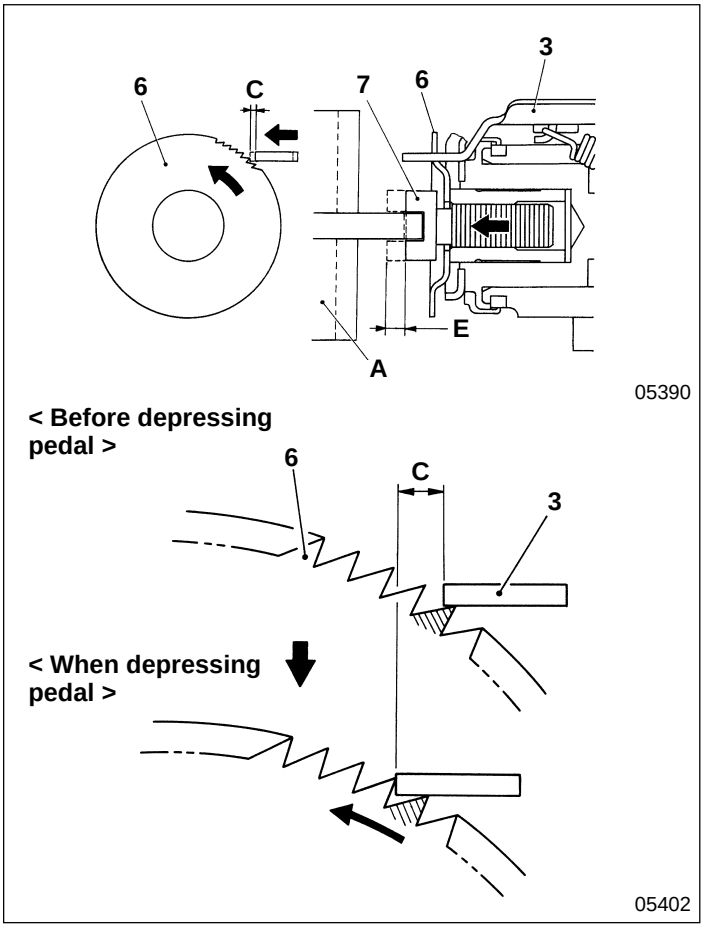
● **Automatic adjustment mechanism**

Operation

- When the brake pedal is pushed, hydraulic pressure from the brake master cylinder enters chamber **B**, driving out piston assembly **4** and pulling spring and fitting **1**. Lever **3** interlocks with spring and fitting **1**, rotating on pin **2**.
  C : Level travel
  D : Protrusion of piston assembly

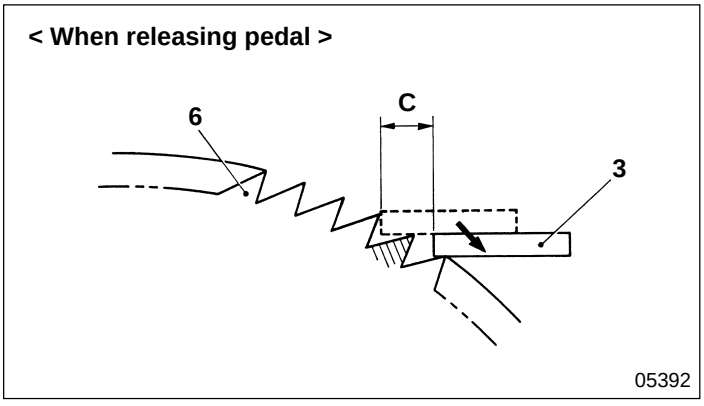


- When the clearance between the brake drum and brake lining is correct, adjuster assembly **6** does not rotate even when brakes are applied, as there is no action from lever **3**.
  C : Lever travel



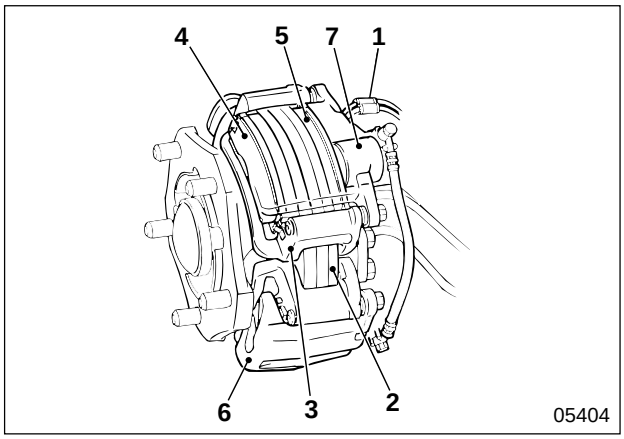
- When the clearance between the brake drum and brake lining increases, movement of piston assembly **4** and lever **3** increase.
  C : Lever travel
  E : portrusion of adjustor screw

- The force of lever **3** increases the rotation of adjuster assembly **6** and the force of screw of adjuster assembly ejects adjusting screw **7**, and brake shoe assembly **A** expands.



- By depressing brake pedal adjuster assembly **6** keep its rotated position while lever **3** goes back to the position deviated one step, and adjust the gap between the brake drum and brake lining correctly.
  C : Lever travel

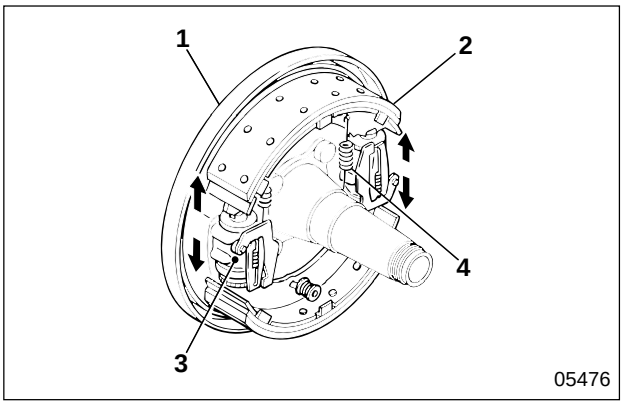
Front Disc Brake



1 Brake pad wear indicator
2 Disc rotor
3 Torque member
4 Outer pad
5 Inner pad
6 Caliper
7 Piston

Inner pad **5** is fitted with brake pad wear indicator **1** that gives warning when it is time to replace outer pad **4** and the inner pads.

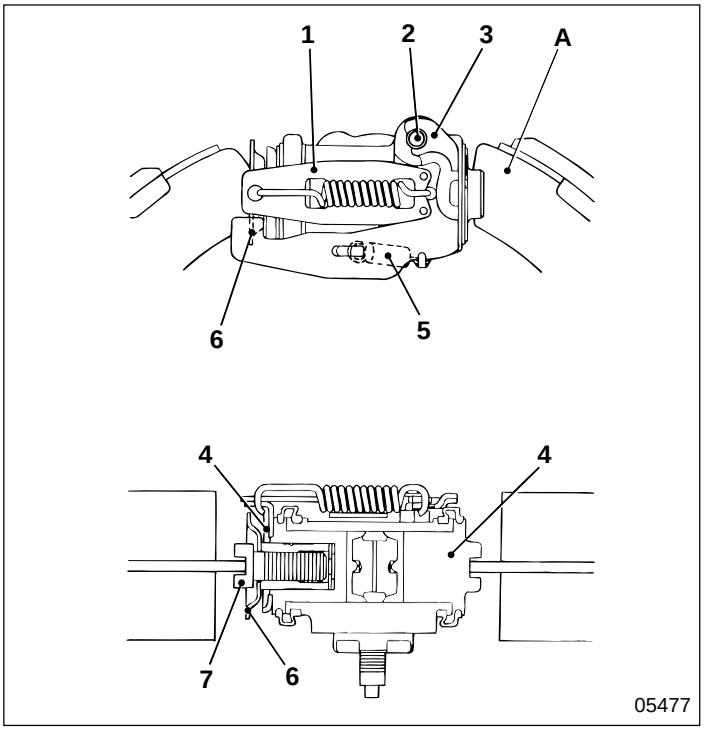
Rear Drum Brake Assembly



1 Backing plate
2 Brake shoe assembly
3 Wheel cylinder assembly
4 Return spring

The rear drum brake assembly is a dual 2-leading type brake and is fitted with wheel cylinder assembly **3**, the self-servo action of which produces a great braking force by using brake shoe assembly **2** as the leading shoe when the vehicle is travelling forwards.

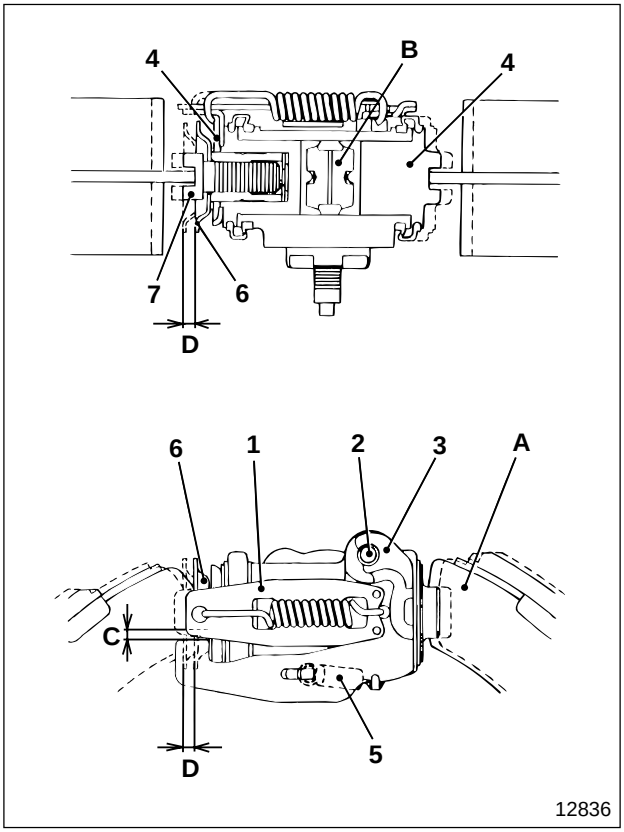
● **Wheel cylinder assembly**



1 Spring and fitting
2 Pin
3 Lever
4 Piston assembly
5 Set spring
6 Adjuster assembly
7 Adjusting screw

A : Brake shoe assembly

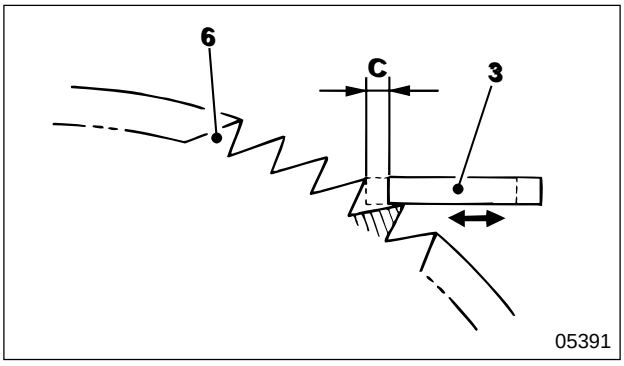
The wheel cylinder assembly has an automatic adjuster that corrects the increase in clearance that occurs between the brake lining and the brake drum, an increase caused by the wear of the brake lining. This increase occurs whenever the brake pedal is depressed.



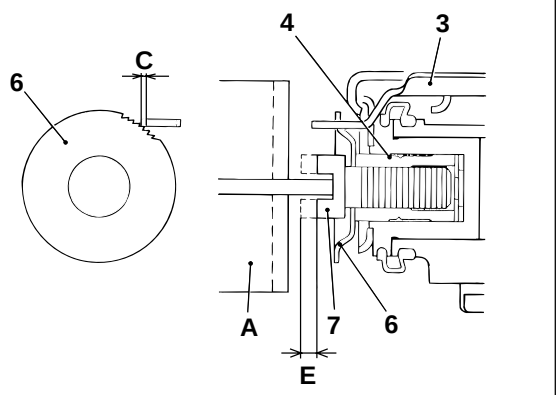
● **Automatic adjustment mechanism**

Operation

- When the brake pedal is pushed, hydraulic pressure from the brake master cylinder enters chamber **B**, driving out piston assembly **4** and pulling spring and fitting **1**. Lever **3** interlocks with spring and fitting **1**, rotating on pin **2**.
  C : Level travel
  D : Protrusion of piston assembly

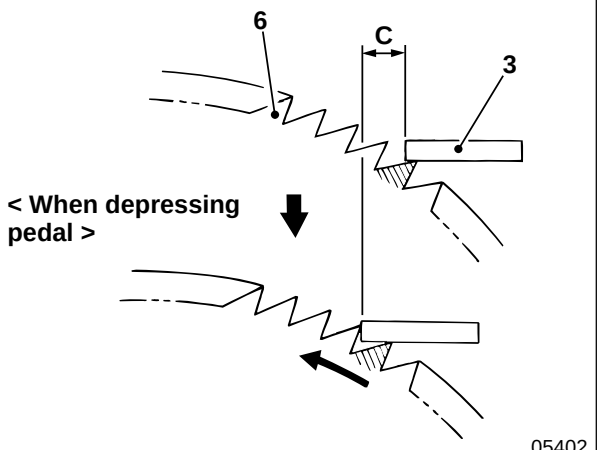


- When the clearance between the brake drum and brake lining is correct, adjuster assembly **6** does not rotate even when brakes are applied, as there is no action from lever **3**.
  C : Lever travel



12837

< Before depressing pedal >

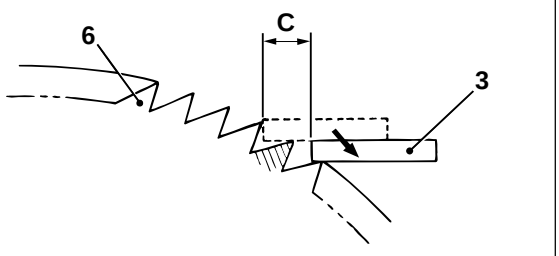


05402

- As the clearance between the brake drum and the brake lining increases, the amount of protrusion of piston assembly **4** also increases, as does the amount of travel of lever **3**.
  C : Lever travel
  E : Protrusion of adjuster screw

- The action of lever **3** increases the rotation of adjuster assembly **6**, the screw action pushes out adjuster screw **7**, expanding brake shoe assembly **A**.

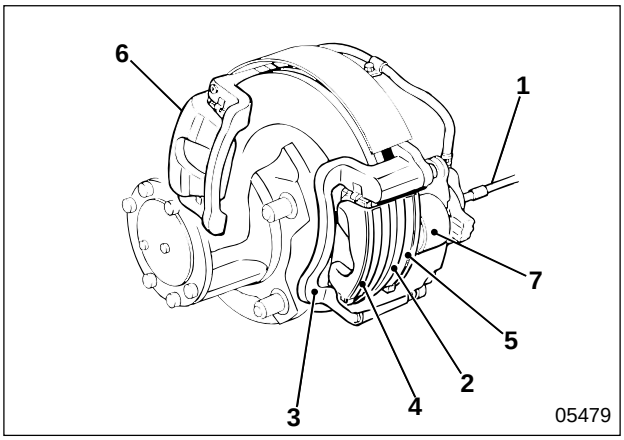
< When releasing pedal >



05392

- When the brake pedal is released, since adjuster assembly **6** remains in its new position after turning, returned lever **3** enters the next position, moved by one notch. This assures correct clearance between the brake drum and the brake lining.
  C : Lever travel

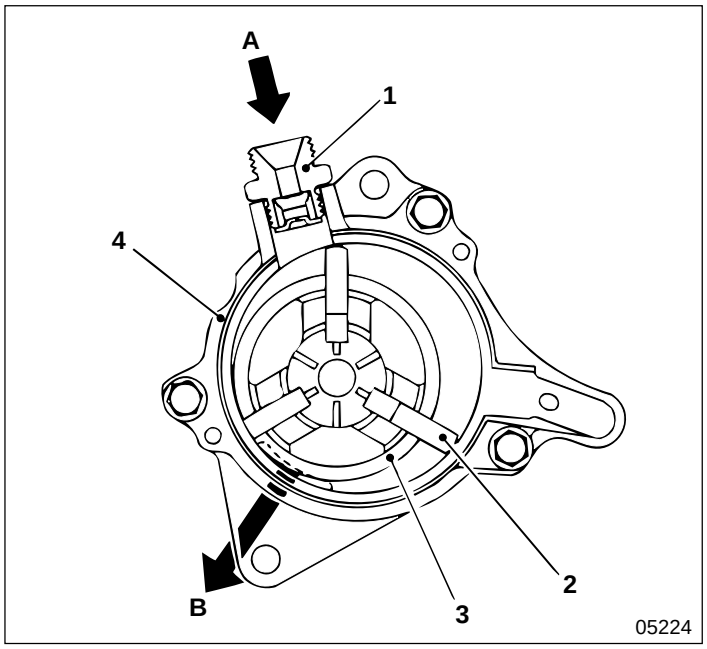
Rear Disc Brake



1 Brake pad wear indicator
2 Disc rotor
3 Torque member
4 Outer pad
5 Inner pad
6 Caliper
7 Piston

Inner pad **5** is fitted with brake pad wear indicator **1** that gives warning when it is time to replace outer pad **4** and the inner pads.

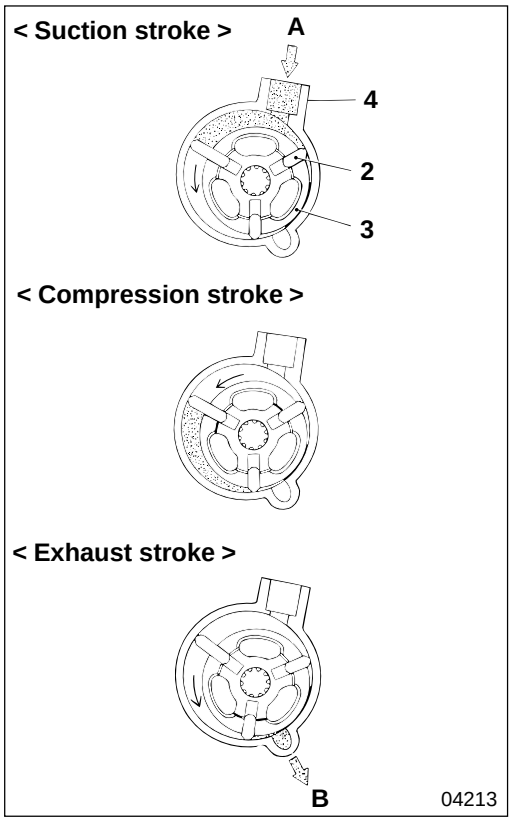
Vacuum Pump



1 Check valve assembly
2 Vane
3 Rotor
4 Housing

A : Inlet
B : Outlet

- The vacuum pump is installed on the timing gear case and is rotated by the injection pump gear or camshaft gear.
- Check valve assembly **1** is fitted to prevent the atmospheric pressure and the lubricating oil from flowing in reverse from the vacuum pump to the vacuum tank when the engine is stopped.



● **Operation**

- Inside cylindrical housing **4**, rotor **3** equipped with three vanes (movable blades) **2** rotates, pressing the vanes against the inside surface of the housing by centrifugal force.
- Since rotor **3** is eccentric with respect to housing **4**, as the rotor rotates, the atmospheric pressure of the vacuum tank is drawn in from inlet **A** and discharges from outlet **B** by the gradual compression of the air. This repetition of the suction, compression and exhaust strokes generates a vacuum, realizing a near-vacuum in the vacuum tank.
- The engine oil that lubricates and cools the inside of housing **4** is returned, along with air pressure, through outlet **B** to the oil pan.

A : From starter switch

- The exhaust brake uses pressure to push and return the piston in the exhaust stroke. This pressure is generated when the exhaust pipe is shut and the pressure in the exhaust pipe increases.
- A butterfly valve type exhaust brake unit **8** is fitted as an auxiliary brake to assist the foot brake. Intake shutter **9** is fitted to reduce the suction noise generated when the exhaust brake is operated.
- When the exhaust brake switch **16** is turned ON, excitation of the coil of exhaust brake 3-way magnetic valve **6** closes the atmospheric valve and opens the vacuum valve. This makes the vacuum in the vacuum tank act on the exhaust brake unit **8** which closes butterfly valve **10**, activating the exhaust brake.

Electrical System

< Automatic transmission >

When exhaust brake switch **16** is turned ON, exhaust brake indicator lamp **3** within meter cluster **2** lights up and the exhaust brake 3-way magnetic valve **6** operates.
At this time, depressing the clutch pedal (clutch switch **12** OFF) or the accelerator pedal (accelerator switch **17** OFF) temporarily releases the exhaust brake. When the transmission is in neutral (neutral switch **11** or inhibiter switch **13** ON) because the vehicle is stopped or for some other reason, exhaust brake cut relay **15** operates, releasing the exhaust brake after approximately 10 seconds.
If the accelerator pedal is depressed and released after the exhaust brake is released by the exhaust brake cut relay, the exhaust brake operates again, and after approximately 10 seconds is released.

3 Brake fluid level switch

***a** : For brakes

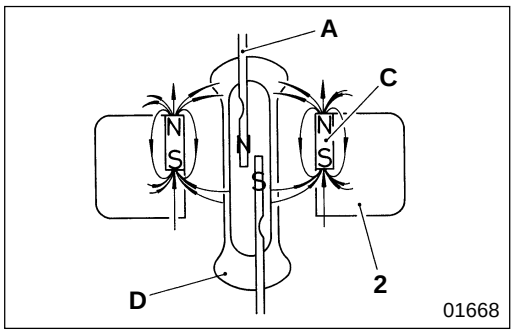
- Brake fluid level switch **3**, installed on fluid tank **1**, monitors the brake fluid level in the fluid tank. If the brake fluid level drops below the specified level, float **2** moves and lights up the warning lamp within the meter cluster to alert the driver.



- If the brake fluid level in fluid tank **1** drops and float **2** drops lower than level **L**, magnetic force **B** that passes through the contact point (ferromagnetic body **A**), increases generating north and south poles at the ends of the contact points. Therefore, the contact points pull each other and overcome the repercussive force of the springs of the contact points, forming an electric circuit.

Fluid

Location	Points of application	Specified fluid	Quantity
—	Fluid tank	Brake fluid (SAE J1703f or FMVSS No. 116 DOT3)	As required

WARNING

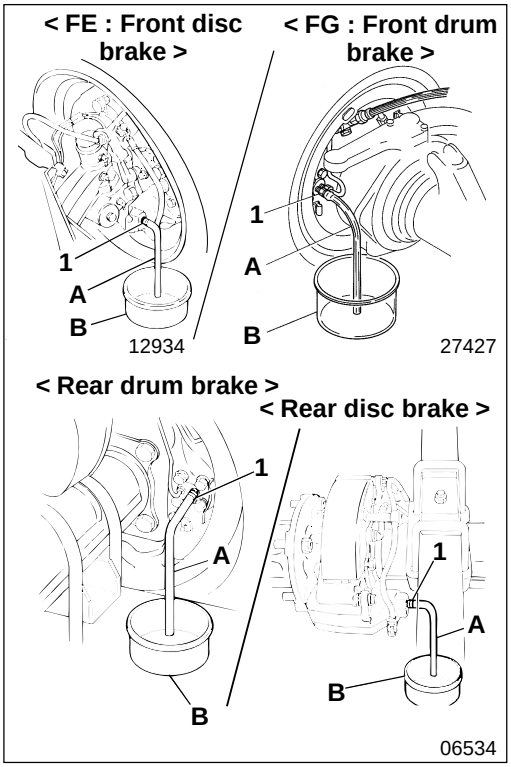
- **The clutch fluid system and the brake fluid system use the fluid tank in common. Therefore, replacement and air bleeding of the clutch fluid must be carried out simultaneously with that of the brake fluid. Gr 21**
- **You must use new brake fluid (SAE J1703f or FMVSS No. 116 DOT3). Do not add different quality fluid or mineral oil (gas oil, engine oil, gear oil, automatic transmission fluid, etc.) to the clutch system, because this will cause the rubber parts of the clutch system and brake system to swell, resulting in faulty clutch operation, as well as ineffective braking and brake dragging.**
- **Do not allow foreign particles or water to become mixed into the brake fluid when refilling, because this will result in ineffective clutch and brake operations.**
- **If you use a container for adding brake fluid, keep it solely for that purpose.**

CAUTION

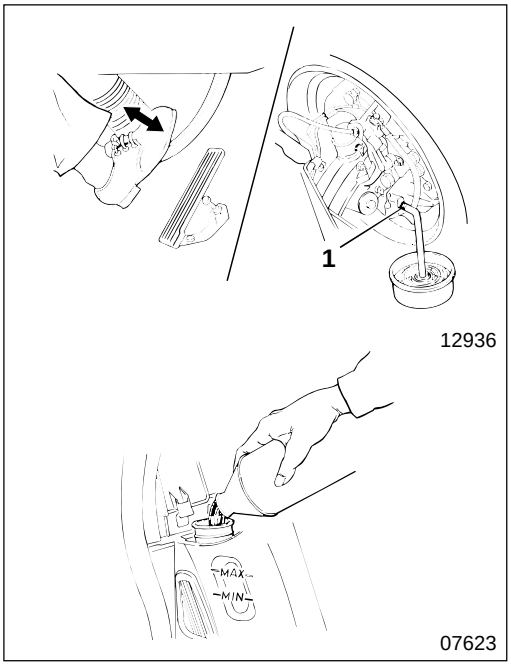
- **Be careful not to splash brake fluid on related parts as this could damage the paintwork.**
- **Be sure to wipe off brake fluid immediately if you splash it on the paintwork.**

NOTE

Supply and maintain the brake fluid level to the “MAX” level of the fluid tank.



- Start the engine and let it idle until you complete brake fluid replacement.
- Connect vinyl pipes **A** : one to the front disc brake < FE >, the front drum brake < FG > one to the rear drum brake < FE639 (except FE639□6, FG > or the rear disc brake < FE639□6, FE64□ >.
- Put the free ends of vinyl pipes **A** into containers **B**.



- Loosen air bleeders **1** and depress the brake pedal several times to drain brake fluid completely.
- Maintaining a supply of new brake fluid up to the “MAX” level of the fluid tank, depress the brake pedal repeatedly until the old brake fluid of the brake system is replaced with new fluid, and after you complete the work, tighten each air bleeder **1** at specified torque.

- Bleed air from the brake system.

ON-VEHICLE INSPECTION AND ADJUSTMENT

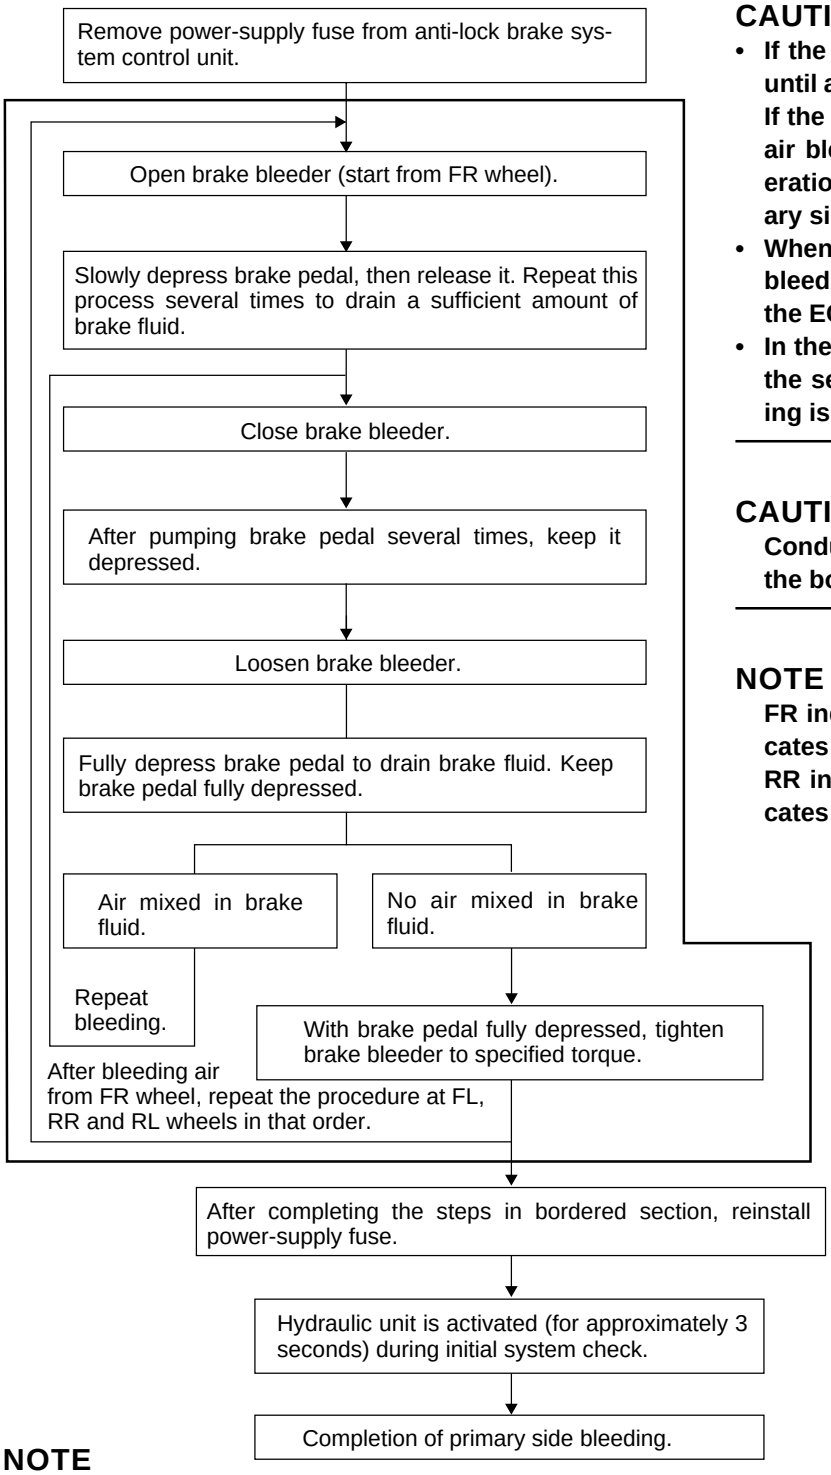
(1) Air bleeding during regular maintenance, and hydraulic unit replacement

When air bleeding is conducted during regular maintenance or when the hydraulic unit is replaced, brake fluid flows into the secondary side (operating circuit) of the hydraulic unit. Therefore, bleed the primary side (normal circuit) by following the procedures below. In the event air enters the secondary side, bleed air by following the procedures described in (2).



CAUTION

- **If the battery is disconnected, do not reconnect until air bleeding of the primary side is complete. If the battery is reconnected before primary side air bleeding is complete, the system check operation is activated and air can enter the secondary side.**
- **When the battery must be connected prior to air bleeding, remove the power-supply fuse from the ECU.**
- **In the event air enters the secondary side, bleed the secondary side after primary side air bleeding is complete.**

CAUTION

Conduct the air bleeding operation described in the bordered section at every wheel.

NOTE

FR indicates front-axle right wheel, and FL indicates front-axle left wheel.
RR indicates rear-axle right wheel, and RL indicates rear-axle left wheel.

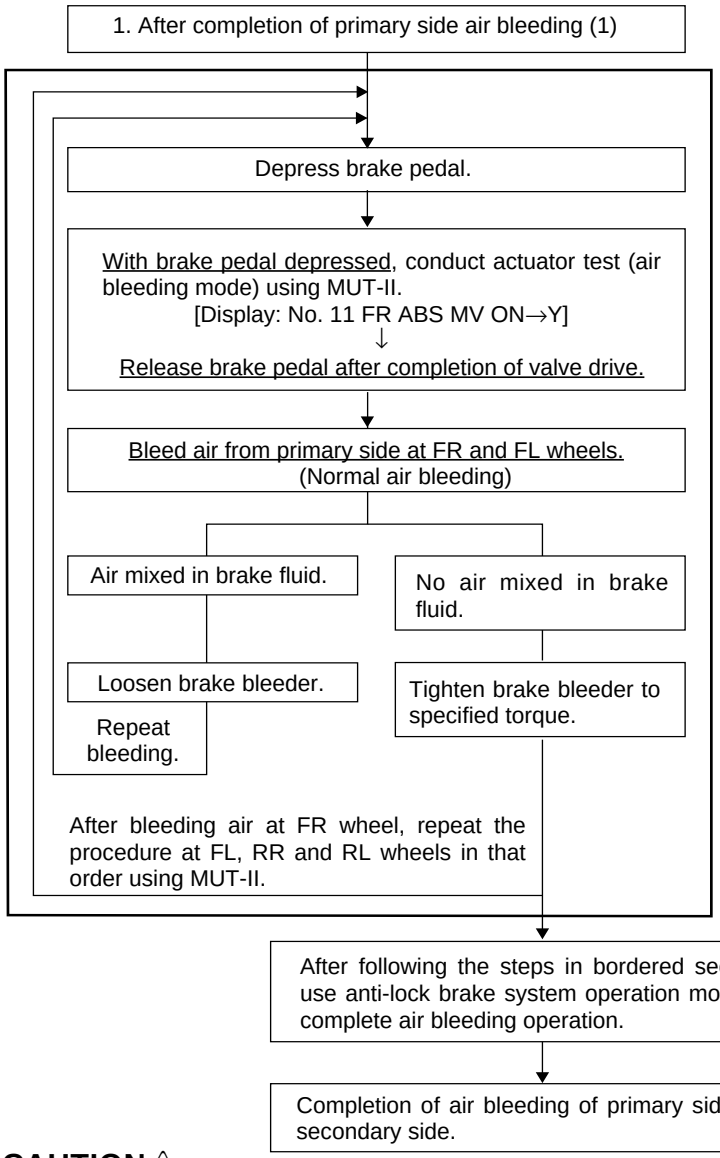
NOTE

- **The primary side (normal circuit) is a hydraulic circuit formed when the system is in non-operation.**
- **The secondary side (operating circuit) is a hydraulic circuit which connects with the primary side only when the system is in operation (when the system is in non-operation, the secondary side is disconnected from the primary side).**

(2) Air bleeding of secondary side

If the system starts operating before air bleeding of the primary side is complete, air can enter the secondary side. In the event the system accidentally starts before the completion of primary side air bleeding, follow the procedures below to bleed air. If air enters the secondary side, air flows into the primary side when the system starts, and this can extend the brake pedal stroke.
During air bleeding, use the MUT-II to conduct an actuator test (anti-lock brake system operation mode) at all wheels.

Use the MUT-II when bleeding air from the secondary side.



CAUTION⚠

Conduct air bleeding operation described in the bordered section at every wheel by using the anti-lock brake system operation mode.

CAUTION⚠

Bleed air from wheels other than FR according to the directions below.

(Refer to NOTE below)

For FL wheel
[Display: No. 12 FL ABS MV ON→Y]
↓
Bleed air from primary side at FR and FL wheels.

For RR wheel
[Display: No. 13 RR ABS MV ON→Y]
↓
Bleed air from primary side at RR and RL wheels.

For RL wheel
[Display: No. 14 RL ABS MV ON→Y]
↓
Bleed air from primary side at RR and RL wheels.

CAUTION⚠

- **Avoid continuous execution of the actuator test (anti-lock brake system drive) using the MUT-II; otherwise, excessive heating of the anti-lock brake system motor, valve and other parts can cause hydraulic unit damage.**
- **Do not conduct the actuator test with the MUT-II while bleeding air from the primary side; otherwise, air can enter the secondary side from the primary side.**
- **When mixing of air was found after air bleeding is conducted to correct an excessive brake pedal stroke, bleed air from the secondary side, too.**

NOTE

- **For the MUT-II operation for the actuator test during air bleeding, refer to section 4.**
- **If a drive operation is conducted for the FR and RL wheels at one time using the MUT-II, subsequent air bleeding of the primary side conducted at each wheel will not remove air from the secondary side.**

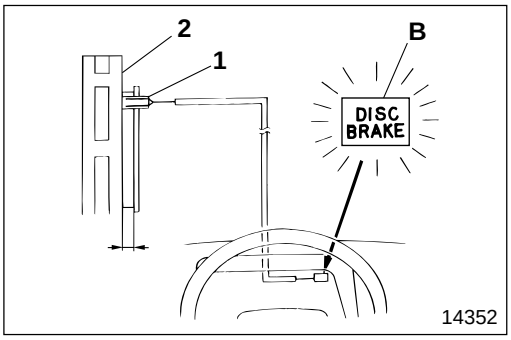
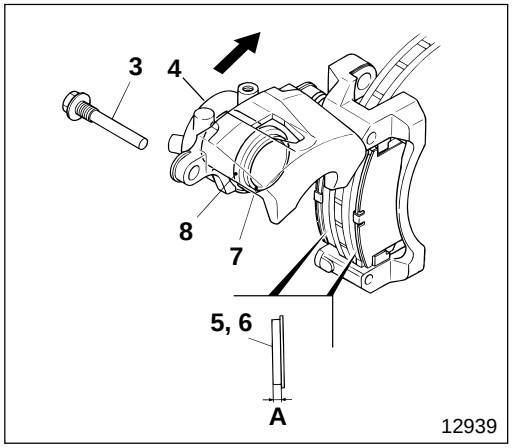
—	Piston expander 	MB990520	Pushing back of piston when replacing brake pad



[Inspection]

- When brake pad thickness **A** decreases to approximately 4 mm {0.16 in.}, brake pad wear indicator **1** makes contact with disc rotor **2** and is disconnected. This lights up brake warning lamp **B** within the meter cluster, indicating that the brake pad should be replaced.

ON-VEHICLE INSPECTION AND ADJUSTMENT

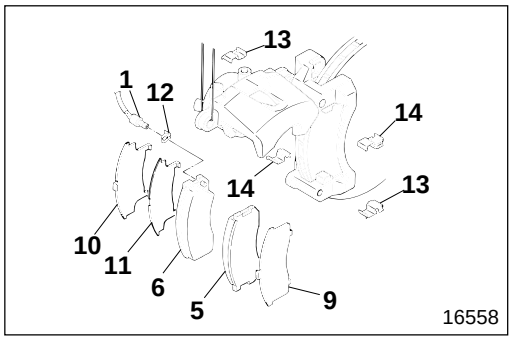


- Remove lower slide pin bolt **3**.
- Turn caliper **4** upward and secure it using wire.

CAUTION

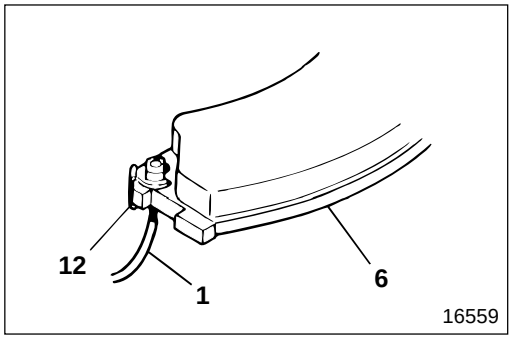
- **Make sure that you do not smear, or get dust on, the grease applied to slide pin bolt 3.**
- **Be careful when you secure caliper 4 that you do not use excessive force on the brake hose or brake pad wear indicator 1.**
- **Make sure that you secure caliper 4 securely.**

- Check thickness **A** of outer pad **5** and inner pad **6** and if the thickness is lower than the limit, replace the pads on the same axle as a unit.
- Check if any fluid is leaking from piston **7**, and check if piston boot **8** is damaged. If any fault is found, replace the faulty parts.

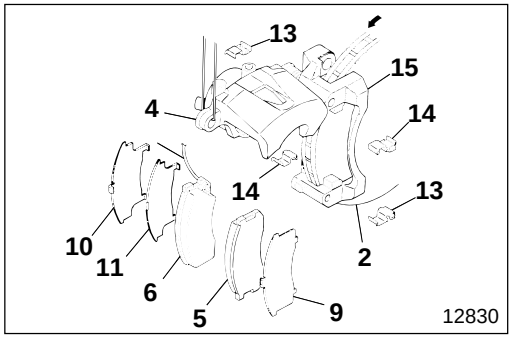


[Replacement]

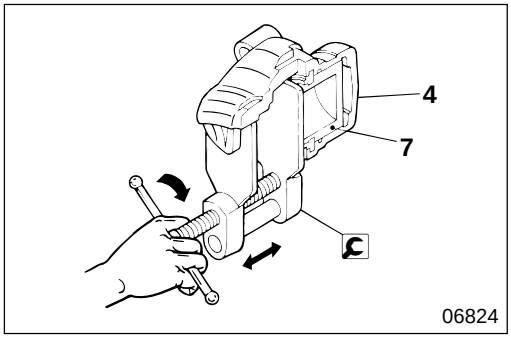
- Remove the following parts:
  - **9** Outer shim
  - **5** Outer pad
  - **10** Inner shim A
  - **11** Inner shim B
  - **12** Clip
  - **1** Brake pad wear indicator
  - **6** Inner pad
  - **13** Pad liner A
  - **14** Pad liner B



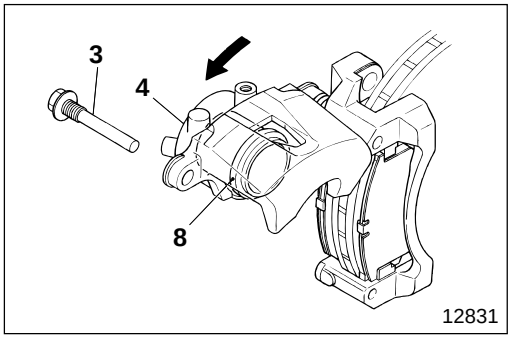
Install brake pad wear indicator **1** on inner pad **6** in the pad kit using clip **12**.



- Clean torque member **15**.
- Install the kit parts onto torque member **15** in the following order:
  - Install pad liner A **13** and pad liner B **14** on torque member **15**.
  - Install outer shim **9** on outer pad **5**.
  - Install inner shims **10**, **11** on inner pad **6**.
  - Install outer pad **5** on torque member **15**.
  - Install inner pad **6** on torque member **15**.
  - Install inner pad **6** so that brake pad wear indicator **1** faces the entrance side (when the vehicle is moving forwards) of disc rotor **2** of caliper **4**.



- Push piston **7** until it makes contact with the bottom of caliper **4**.
  : Piston expander



- Slacken off caliper **4**, taking care not to damage piston boot **8**.
- Bleed the bushing.
- Apply rubber grease thinly to the outer periphery of slide pin **3**. Apply brake fluid thinly to the thread area of slide pin bolt.
- Tighten slide pin bolt **3** at specified torque.
- Wire up the harness of brake pad wear indicator **1**. Gr 26A, 27
- Inspect drag torque. P35A-52, 56, 74
- Depress the brake pedal several times.

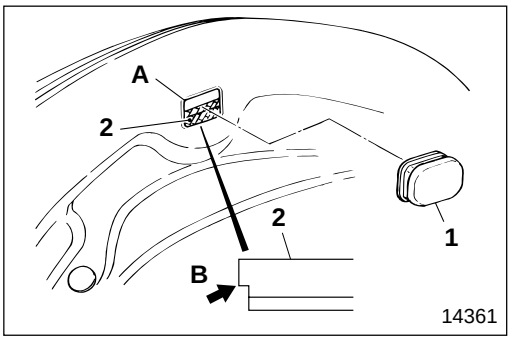
Drum Brake Lining Thickness Inspection and Replacement

Service standards

Unit : mm {in.}

Location	Maintenance item	Standard value	Limit	Remedy
—	Thickness of brake lining	—	4 {0.16} (Side shoulder means wear limit)	Replace



[Inspection]

NOTE

Be sure to inspect at two points for each wheel per side.

- Remove cover **1** from the backing plate.
- Inspect through check hole **A** whether brake lining **2** is worn to the point of side shoulder **B** of the brake lining (the limit).
- If the measured value is lower than the limit, replace brake lining **2** on the same axle as a unit.
- After inspection, be sure to reinstall cover **1**.

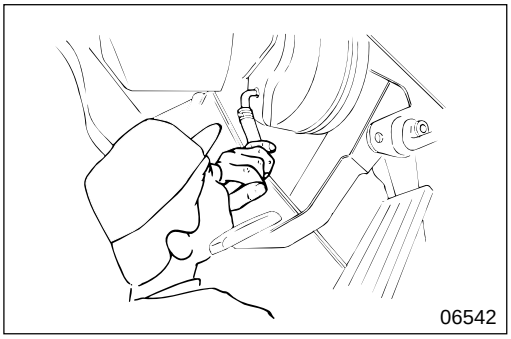
			1470 kPa {215 psi, 15 kgf/cm^2} (295 N {66 lbf, 30 kgf})		

[Inspection]
Two types of inspection are used to inspect the brake booster (master vac) operation, inspection without a tester and inspection with a simple tester. Make sure that there is no fluid leak or damage at the joints of the brake pipes and hoses before inspection.



06542

(1) Inspection of check valve operation

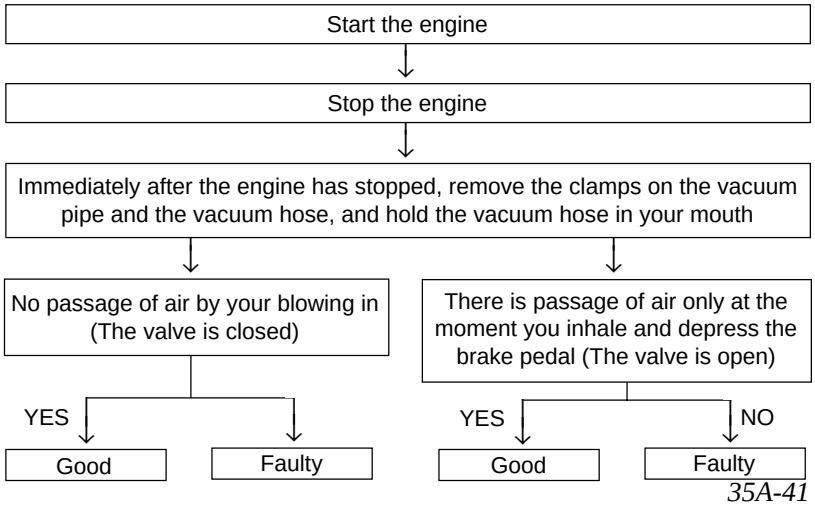
Be sure to inspect the check valve both when opened and when closed.

CAUTION

Make sure that your saliva does not enter the check valve when blowing air through the vacuum hose as this would cause the check valve to malfunction.

NOTE

The check valve fitted to the vacuum hose cannot be removed.



(2) Inspection of brake booster (master vac) operation

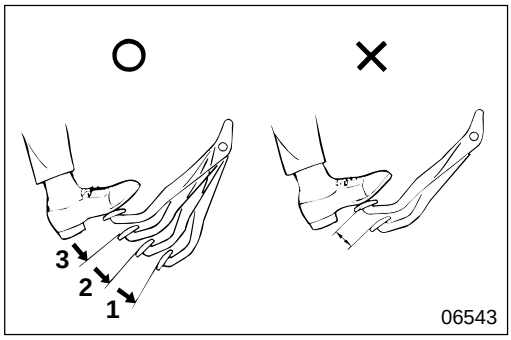
NOTE

If the brake booster (master vac) is faulty, determine the quality of the brake booster (master vac) as an independent device by means of a bench test specified by the maker's service station. This is because the above inspection of the brake booster (master vac) operation is merely a simplified inspection. If any fault is found, hand the device over to the service station without disassembling it, and replace the whole assembly. 📖 **P35A-48**

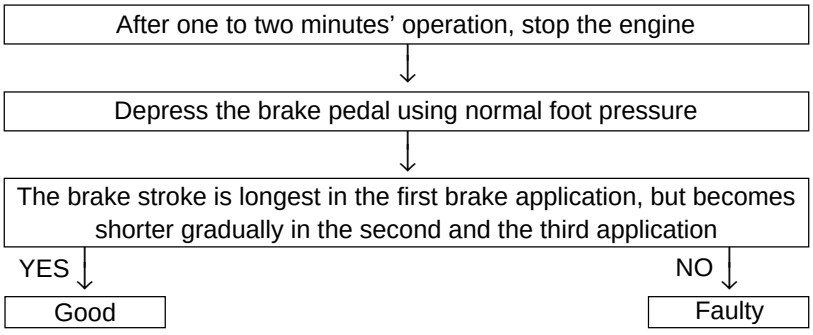
● **Inspection method without a tester**

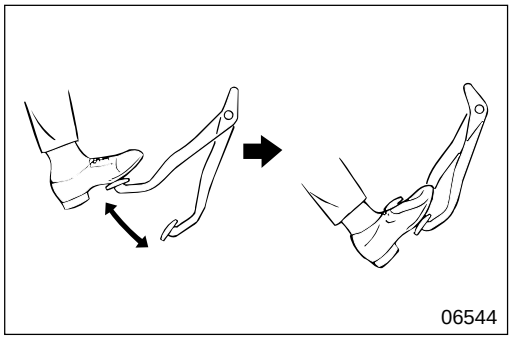
If the brake booster (master vac) is determined to be good by inspections 1 to 3 below, its operation is normal. If any fault is detected in any of the three inspections, the following parts are likely to be faulty.

- Check valve
- Vacuum hose
- Brake booster (master vac)
- Vacuum pump

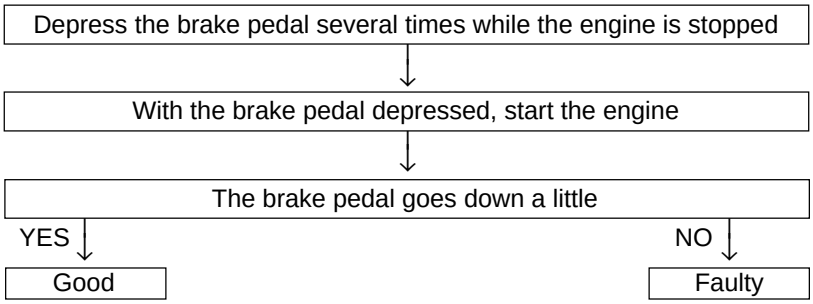


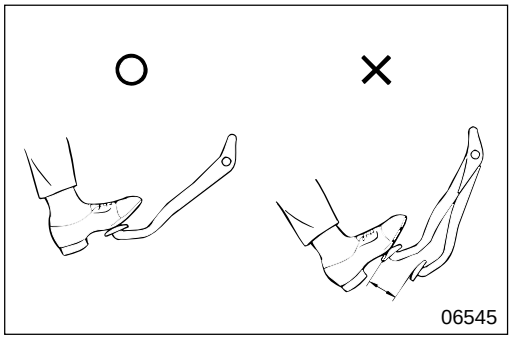
[Inspection 1]



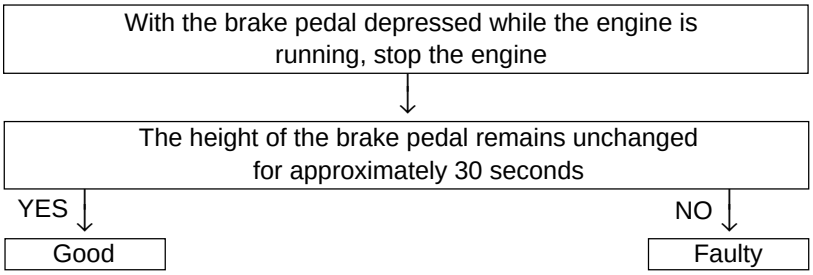


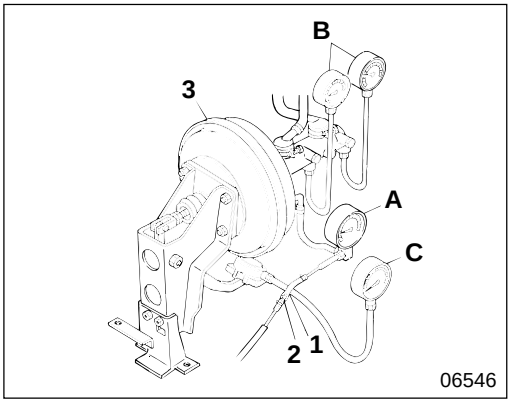
[Inspection 2]





[Inspection 3]



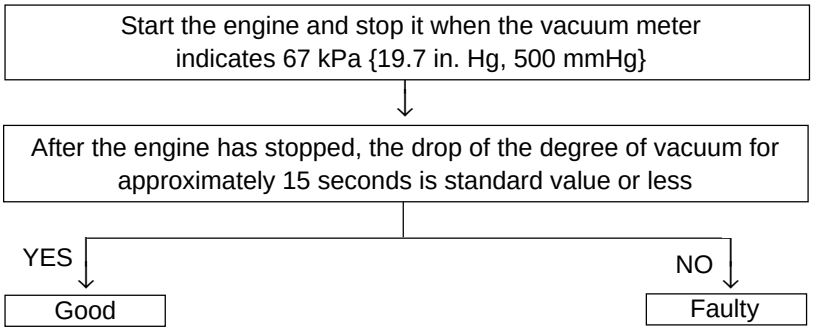


● Inspection with a simplified tester

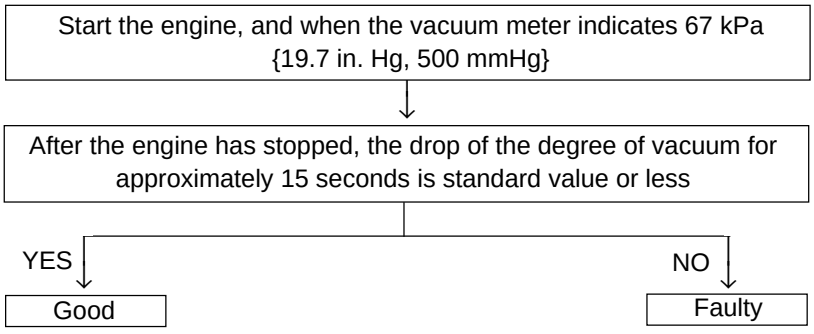
● Airtightness inspection

- Before inspection, observe the operation of check valve **2** fitted to vacuum hose **1**. P35A-41
- Remove vacuum hose **1** from brake booster (master vac) **3**, place the end without the white ○ mark on the brake booster (master vac) and connect it to vacuum meter **A**. Connect another vacuum hose (without a built-in check valve) between the vacuum meter and the brake booster (master vac).
  Connect pressure gauges **B** and foot pressure meter **C** as illustrated, and bleed the air from the pressure gauges.
- If the results of the following two airtightness inspections are satisfactory, the operation is normal. If any fault is found in any of the two inspections, the following parts are likely to be faulty.
  - Vacuum hose
  - Brake booster (master vac)

[No-load airtightness inspection]



[At load airtightness inspection]

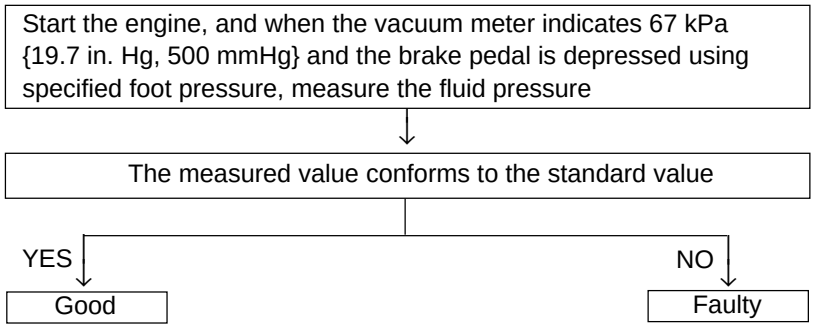


- Be sure when you attach vacuum hose **1** to brake booster (master vac) **3** after the inspection, that the end without the white ○ mark faces brake booster (master vac) **3**.

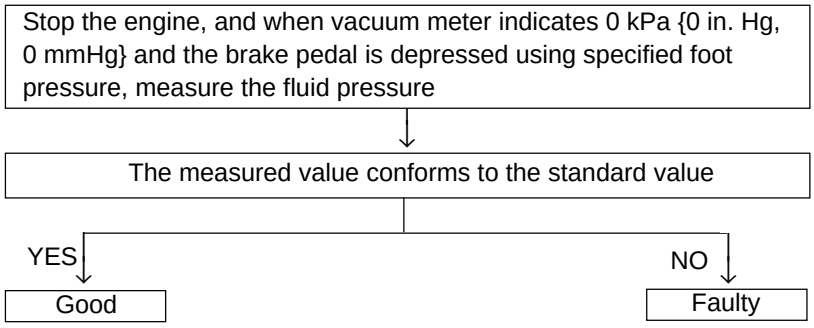
● **Inspection of characteristics**

- Inspect characteristics after the airtightness inspection is finished.
- If the results of the following two inspections are good, the operation is normal. If any fault is found in any of the two inspections, the following parts are likely to be faulty.
  - Vacuum hose
  - Brake booster (master vac)

[Boosting action inspection]



[No boosting action inspection]



Be sure when you attach vacuum hose **1** to brake booster (master vac) **3** after the inspection, that the end without the white ○ mark faces brake booster (master vac) **3**.

***** : Brake pedal and brake booster assembly 🕮 P35A-48

WARNING⚠

Be sure not to damage the inner surface of cylinder body 7, since it will cause air to get mixed in or will result in brake fluid leakage during the removal and installation of primary piston assembly 2 and secondary piston assembly 4.

● **Assembly sequence**

Follow the disassembly sequence in reverse.

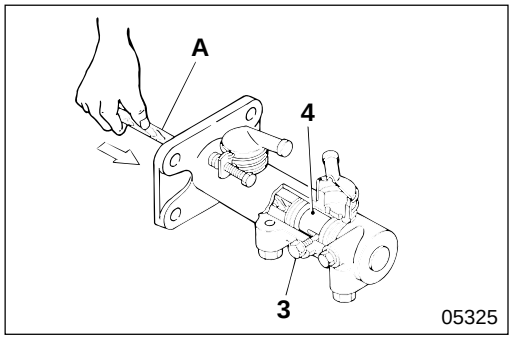
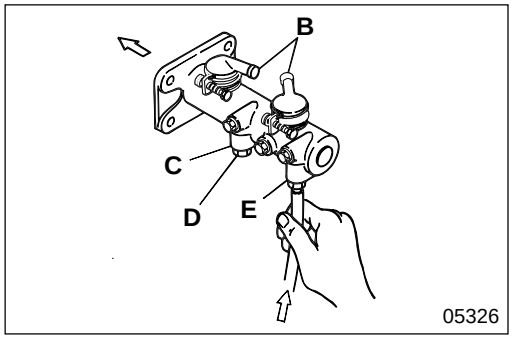
◆ Service procedure

4 Secondary piston assembly



[Removal]

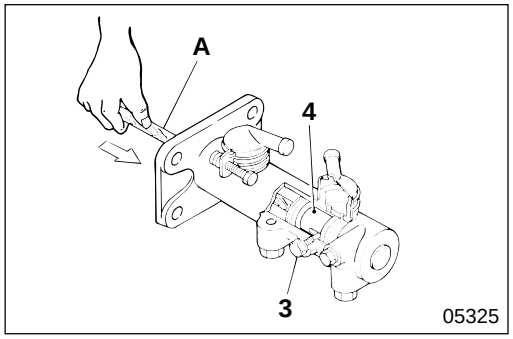
- Using rod **A**, push in secondary piston assembly **4**, then loosen set bolt **3**.



- Put plugs **D** into brake fluid filling port **B** and discharge port **C** that leads to the rear wheel brakes, then feed compressed air via discharge port **E** to the front wheel brakes to extract the secondary piston assembly.

WARNING⚠

You must apply compressed air gradually when you remove secondary piston assembly 4. If you applied compressed air strongly at one time, the secondary piston assembly would be violently ejected.



[Installation]

Using rod **A**, push in secondary piston assembly **4**, then tighten set bolt **3** at specified torque.

◆ Service procedure

● Adjustment after assembly

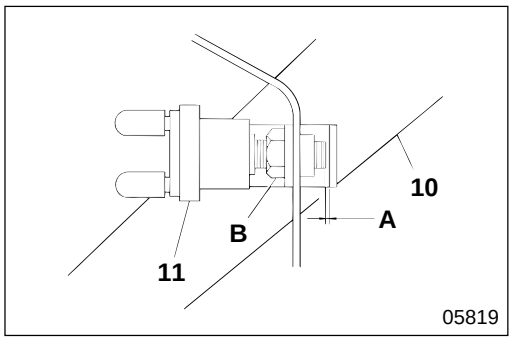
- Adjustment of brake pedal installation height
  By turning operating rod **C** of brake booster (master vac) **1**, adjust height **B** from the center of pedal pad **9** to the underside of instrument panel **A** to the standard value, then secure in place using nut **D**.

WARNING⚠

Make sure, when brake pedal 10 is depressed fully, that operating rod C of brake booster (master vac) 1 functions as the stopper and the pedal does not come to a stop by hitting against the floor panel, since this will reduce brake effectiveness.

- Inspection of brake pedal full stroke
  Make sure that full stroke **E** when brake pedal **10** is depressed fully conforms to the standard value.
  If there is any fault, adjust the installation height of the brake pedal.

- Inspection of play towards brake pedal 🕮 P35A-36



11 **Adjustment of stop lamp switch**

Turn stop lamp switch **11** to adjust clearance **A** between the top of the thread area of the stop lamp switch and the stopper of brake pedal **10** to the standard value, and fasten with lock nut **B**.

WARNING⚠

Make sure, when brake pedal 10 is released, that stop lamp switch 11 does not stop the pedal, since this will cause the brake to drag.

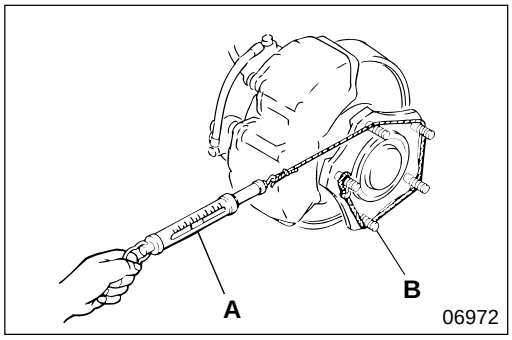
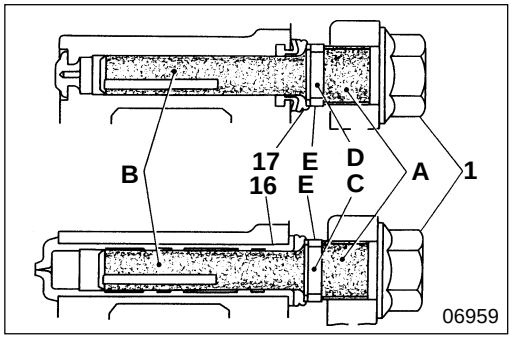
◆ Service procedure



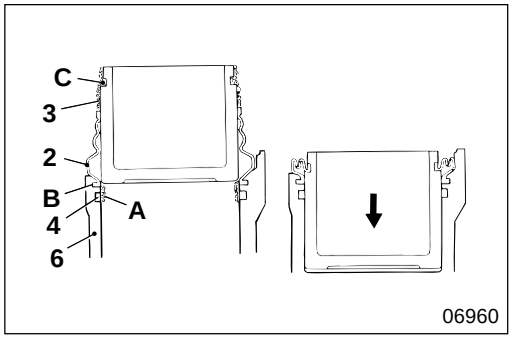
● Measurement of dragging torque

- Fasten spring balance **A** to hub bolt **B** and measure the tangential force.
- If the measured value is the specified value, the torque conforms to the standard value.
- If the measured value deviates from the specified value, inspect the friction surface between piston seal **4** and piston **3**.



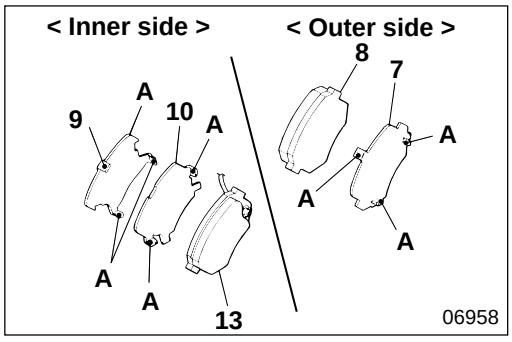
1 **Installation of slide pin bolt**

- Apply brake fluid to thread area **A** lightly, and apply grease to slide outer periphery **B**, bushing groove **C** or connecting surface **D** of pin boot **17**, then tighten slide pin bolt **1** at specified torque.
- Bleed bushing **16** or pin boot **17**.
- Check that seal **E** of bushing **16** or pin boot **17** is installed in bushing groove **C** of slide pin bolt **1** or connecting surface **D** of the pin boot.



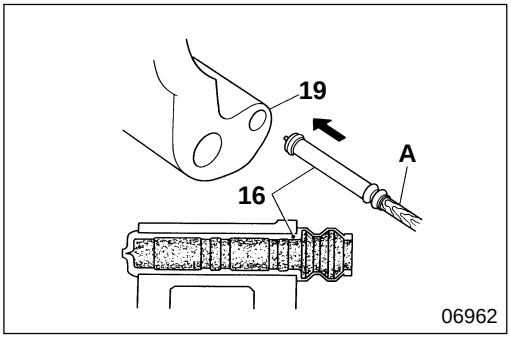
2 **to** **4** **Installation of piston boot, piston and piston seal**

- Apply brake fluid to the periphery of piston **3** to insert piston boot **2**.
- Spread the grease applied to piston seal **4** evenly and install it into the seal groove of caliper **6**.
- Apply grease to cylinder lip area **A** of caliper **6** evenly.
- Install the caliper side seal of piston boot **2** to the boot groove **B** of caliper **6**, then press in piston **3** slowly.
- Make sure that the piston side seal of piston boot **2** is installed in the boot groove **C** of piston **3**.



7 **to** **10** **13** **Installation of pad and shim**

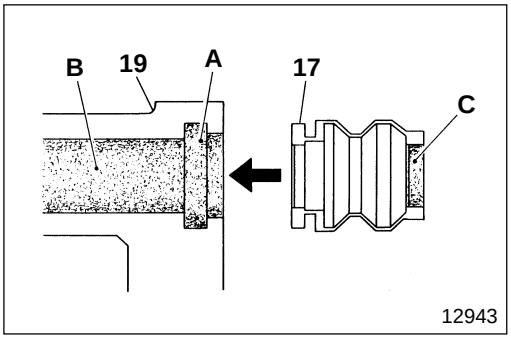
Make sure that you install the shims with pawls **A** facing the correct way.



16 **Installation of bushing**

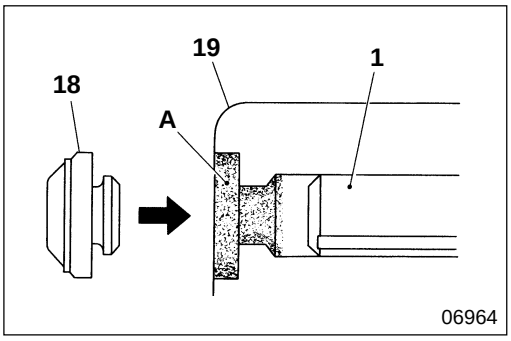
A : Push bar approximately ø8 mm {0.31 in.} long

After installation, apply grease to the whole inner periphery of bushing **16** and its contact surface with slide pin bolt **1**.



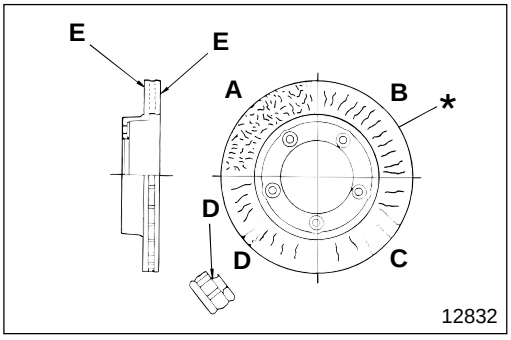
17 **Installation of pin boot**

- Apply grease to pin boot groove **A** of torque member **19**, the whole surface of guide hole **B**, and contact surface **C** between slide pin bolt **1** and pin boot **17**.
- Install pin boot **17**.



18 **Installation of cap**

- Apply grease to cap seat surface **A**.
- Install cap **18**.



***** **Inspection of disc rotor**

- Inspect the friction surface **E** of disc rotor * visually.
- If any cracks are found, correct or replace disc rotor *.
  - **A** : Net pattern cracks (Correct or replace)
  - **B** : Radial cracks that do not reach the outer periphery (Correct or replace)

◆ Service procedure

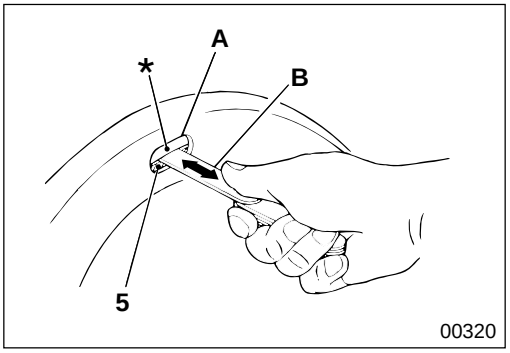
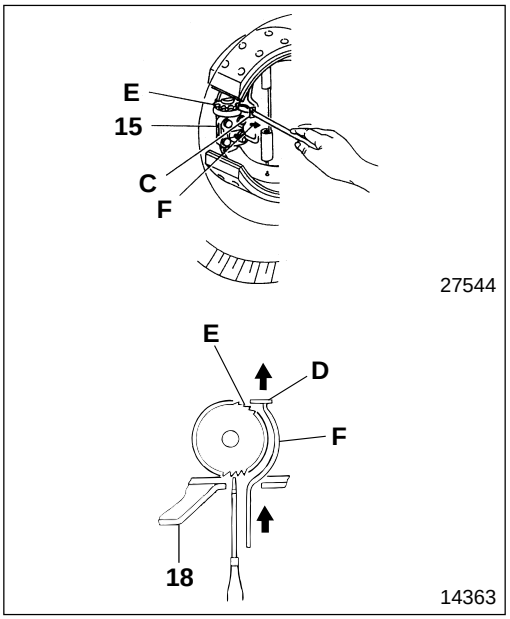
● **Initial adjustment of brake shoe clearance after installation**

Turning the adjuster of wheel cylinder assembly **15** in arrow direction expands brake shoe assembly **5**, narrowing the clearance between brake drum * and brake lining **7**.

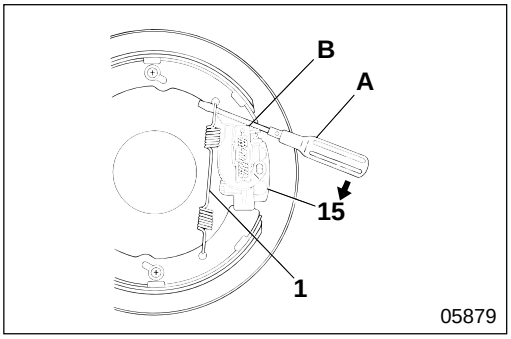
- Jack up the vehicle to make sure that the wheel hub bearing has no play. If there is any play, correct it. Gr 26B
- Remove covers **16** and **17**.



- Adjust the brake shoe clearance as follows, so that 0.3 mm {0.012 in.} feeler gauge **B** can be inserted or extracted through check hole **A**, between brake drum * and brake lining **7** with a little resistance.

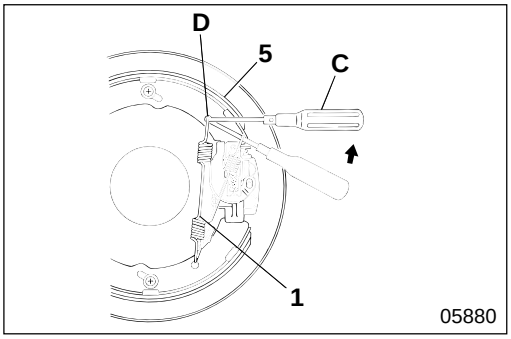


- To increase brake shoe clearance
  - Insert a wire (approximately ø2 mm {0.079 in.}) into the adjusting hole **C** and lift adjusting lever **D** of wheel cylinder assembly **15**.
  - Turn adjuster **E** of wheel cylinder assembly **15**, through adjusting hole **C**, in the opposite direction to arrow **F** on backing plate **15**.
- To decrease brake shoe clearance
  Turn adjuster **E** in the arrow **F** direction marked on backing plate **18** through adjusting hole **C**.
- Extract the feeler gauge and depress the brake pedal two or three times fully, then the specified value brake shoe clearance can be obtained.
- Insert a 0.2 mm {0.0079 in.} feeler gauge through check hole **A** and make sure that it can be inserted or extracted with a little resistance. If there is any fault, disassemble and inspect wheel cylinder assembly **15**. P35A-63

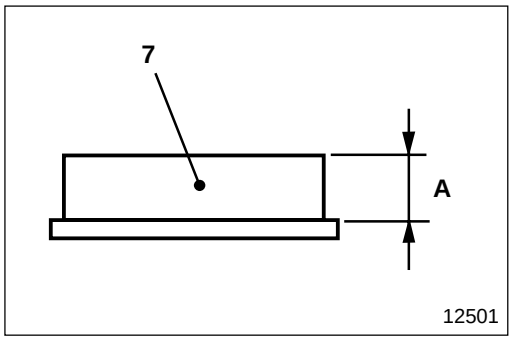


1 **Return spring**

[Removal]
To remove return spring **1**, place screwdriver **A** into the hook of the return spring, then pry and remove the return spring making use of wheel cylinder assembly **15** adjusting screw **B** as a fulcrum.

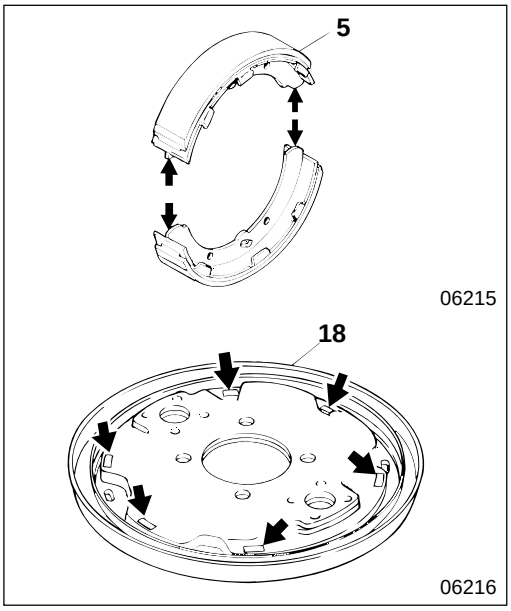


[Installation]
Insert a small Phillips screwdriver **C** into the hook of return spring **1**, insert the tip of the screwdriver into return spring installation hole **D** of brake shoe assembly **5** to pry on the return spring.



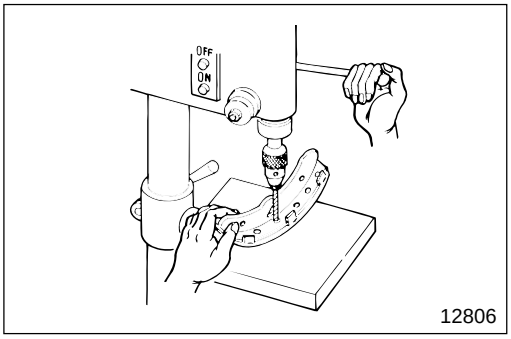
5 **Inspection of brake shoe assembly**

If thickness **A** of brake lining **7** is lower than the limit, replace the brake lining on the same axle as a unit.



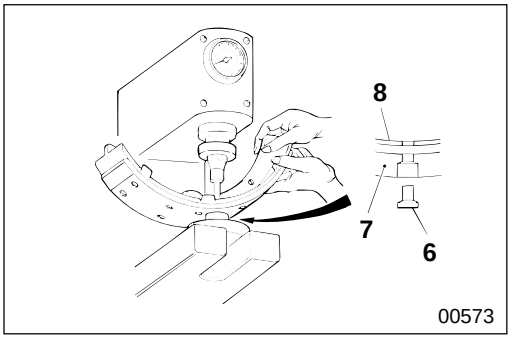
5 **18** **Installation of brake shoe assembly and backing plate**

Apply grease to the points as illustrated, and install brake shoe assembly **5** and backing plate **18**.



7 **Brake lining**

[Removal]



[Installation]

- Clean the mounting surfaces of brake lining **7** and brake shoe **8** with cleaning fluid and dry them.
- Insert rivets **6** from brake lining **7** side, and caulk the rivets at the specified load so that there is no clearance between brake shoe **8** and the brake lining.

  Staking load for rivets : 21±1 kN {4630±220 lbf, 2100±100 kgf}

- Make sure that you inspect contact with the inner surface of brake drum * after you replace brake linings **7**. If contact is incorrect, correct with the brake assembled.

WARNING⚠

Do not leave lubricant on the surface of brake lining 7 because this reduces braking performance.

CAUTION⚠

Make sure that the type of brake linings 7 you fit are suitable for the intended use of the vehicle. Make sure that you fit identical size and color coated linings on the left and right sides of one axle.

*** Correction of brake drum**

If the cylindrical accuracy of brake drum * is higher than the limit, or there are grooves, correct by machining to the correction limit. Machining of the brake drum should be done with the wheel hub attached as an integral part.

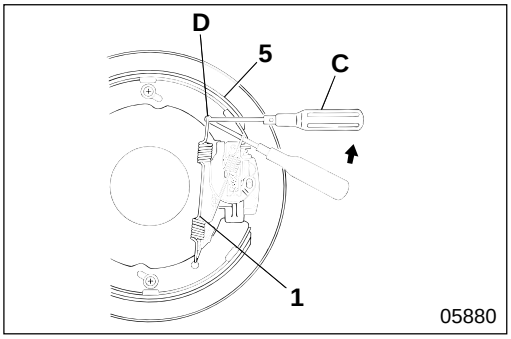
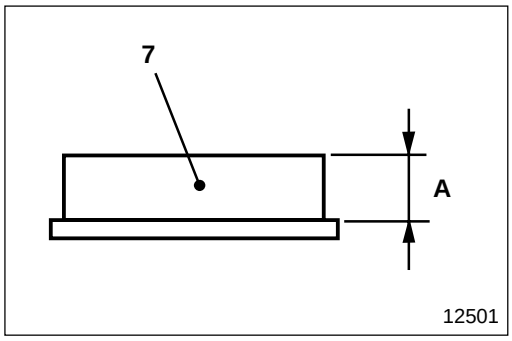
1 **Return spring**

[Removal]
To remove return spring **1**, place screwdriver **A** into the hook of the return spring, then pry and remove the return spring making use of wheel cylinder assembly **12** adjusting screw **B** as a fulcrum.

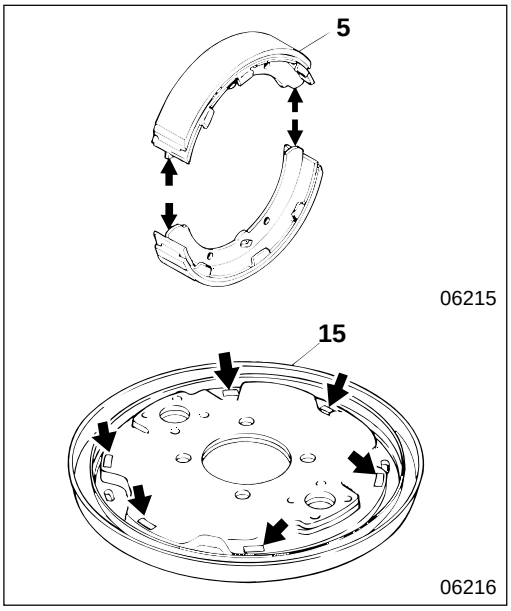


[Installation]
Insert a small Phillips screwdriver **C** into the hook of return spring **1**, insert the tip of the screwdriver into return spring installation hole **D** of brake shoe assembly **5** to pry on the return spring.



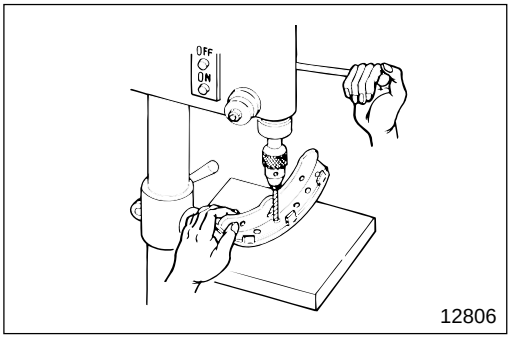
5 **Inspection of brake shoe assembly**

If thickness **A** of brake lining **7** is lower than the limit, replace the brake lining on the same axle as a unit.



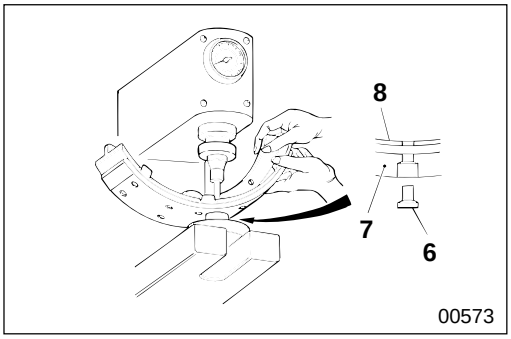
5 **15** **Installation of brake shoe assembly and backing plate**

Apply grease to the points as illustrated, and install brake shoe assembly **5** and backing plate **15**.



7 **Brake lining**

[Removal]



[Installation]

- Clean the mounting surfaces of brake lining **7** and brake shoe **8** with cleaning fluid and dry them.
- Insert rivets **6** from brake lining **7** side, and stake the rivets at the specified load so that there is no clearance between brake shoe **8** and the brake lining.

  Staking load for rivets : 21±1 kN {4630±220 lbf, 2100±100 kgf}

- Make sure that you inspect contact with the inner surface of brake drum * after you replace brake linings **7**. If contact is incorrect, correct with the brake assembled.

WARNING⚠

Do not leave lubricant on the surface of brake lining 7 because this reduces braking performance.

CAUTION⚠

Make sure that the type of brake linings 7 you fit are suitable for the intended use of the vehicle. Make sure that you fit identical size and color coated linings on the left and right sides of one axle.

*** Correction of brake drum**

If the cylindrical accuracy of brake drum * is higher than the limit, or there are grooves, correct by machining to the correction limit. Machining of the brake drum should be done with the wheel hub attached as an integral part.

◆ Service procedure

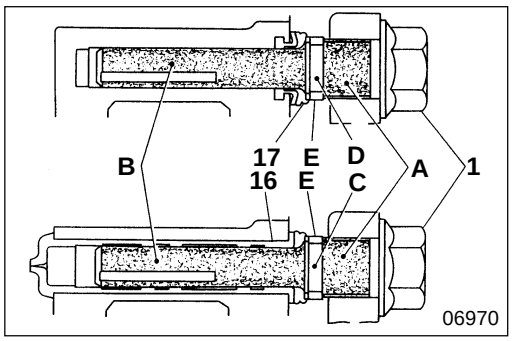
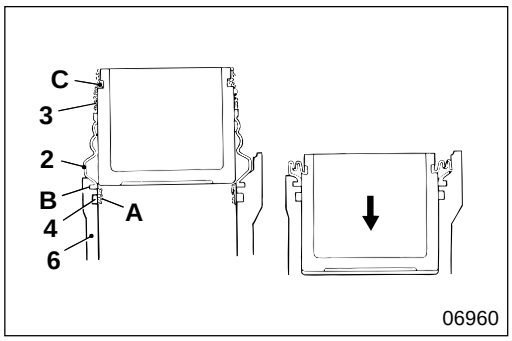
● Measurement of dragging torque

- Fasten spring balance **A** to hub bolt **B** and measure the tangential force.
- If the measured value is the specified value, the torque conforms to the standard value.
- If the measured value deviates from the specified value, inspect the friction surface between piston seal **4** and piston **3**.



1 Installation of slide pin bolt

- Apply brake fluid to thread area **A** lightly, and apply grease to slide outer periphery **B**, bushing groove **C** or connecting surface **D** of pin boot **17**, then tighten slide pin bolt 1 at specified torque.
- Bleed bushing **16** or pin boot **17**.
- Check that seal **E** of bushing **16** or pin boot **17** is installed in bushing groove **C** of slide pin bolt **1** or connecting surface **D** of the pin boot.



2 to 4 Installation of piston boot, piston and piston seal

- Apply brake fluid to the periphery of piston **3** to insert piston boot **2**.
- Spread the grease applied on piston seal **4** evenly to install it into the seal groove of caliper **6**.
- Apply grease to cylinder lip area **A** of caliper **6** evenly.
- Install the caliper side seal of piston boot **2** to the boot groove **B** of caliper **6**, then press in piston **3** slowly.
- Make sure that the piston side seal of piston boot **2** is installed in the boot groove **C** of piston **3**.

STRUCTURE AND OPERATION
Anti-lock Brake System (ABS)

The anti-lock brake system (ABS) prevents tire slippage due to wheel lockup caused by sudden braking and braking on slippery road surfaces. The anti-lock brake system provides a driver with vehicle controllability and directional stability in braking.

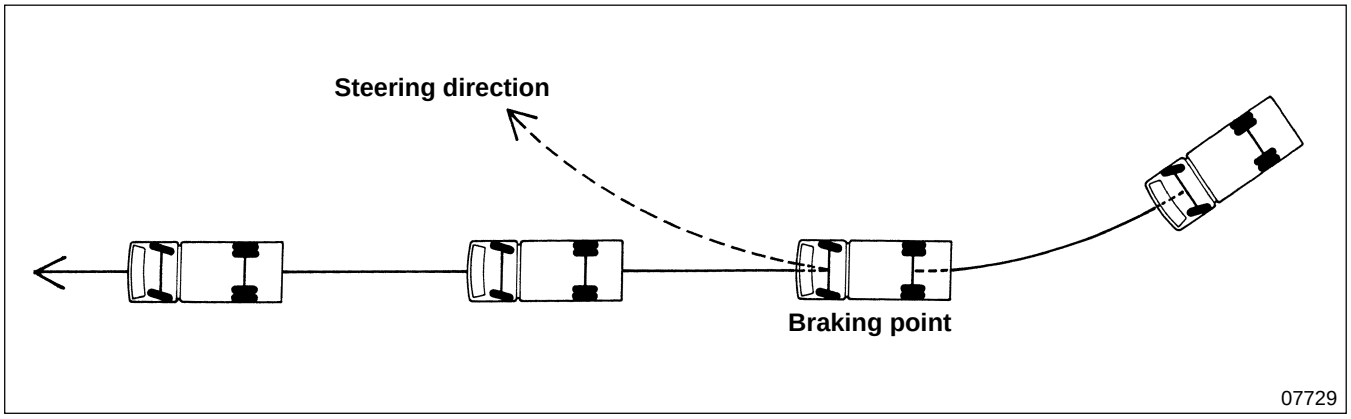
● Wheel lockup

Rotating tires of a moving vehicle have a tendency to continue traveling in the direction of tire rotation. Because of this characteristic, a driver can control the vehicle's traveling direction by moving the front wheels to a desired direction using the steering wheel.

In a vehicle not equipped with an anti-lock brake system, when a driver depresses the brake pedal with full force, the wheels can lock up under certain conditions. Tires in a wheel lockup condition lose the tendency to maintain directional characteristic, and the vehicle starts sliding in a direction of an externally applied force regardless of the tire direction. In other words, when wheel lockup occurs, the vehicle loses its directional stability, disallowing the driver to control the vehicle's movement.

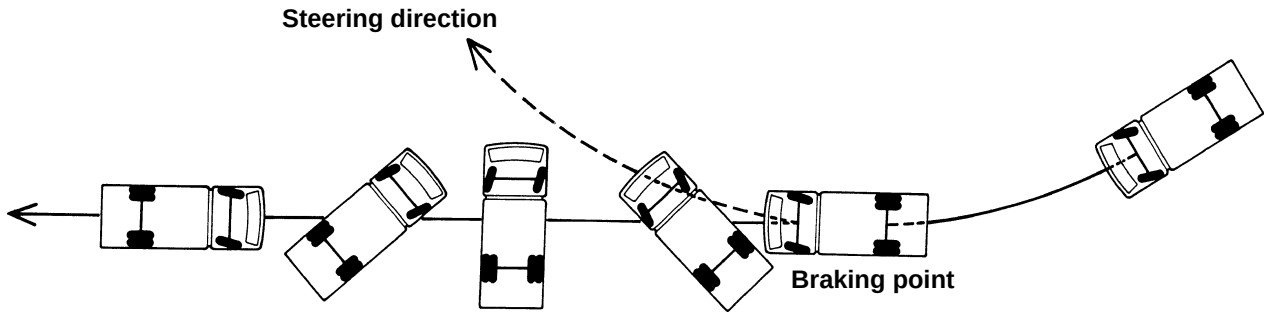
The following shows how a vehicle without anti-lock brake system loses its directional stability when different tires lock up on slippery road surfaces.

● Front wheel lockup (both front tires)



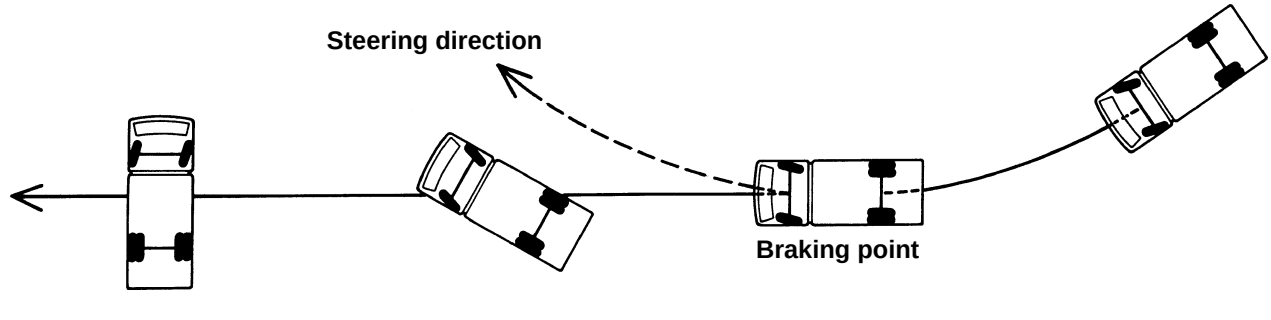
The front tires lose directional stability, but the rear tires try to travel in the direction of rotation since they are not locked up. Because of the front wheel lockup, a steering wheel operation does not change the vehicle's moving direction.

● **Rear wheel lockup (both rear tires)**



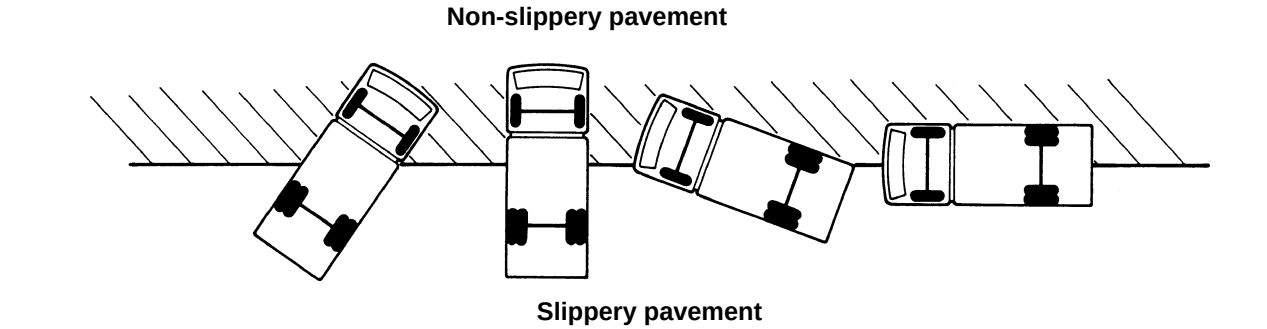
When the steering wheel is operated with the rear wheels in a lockup condition, the front tires try to change the vehicle's traveling direction, but the rear tires slide sideways, causing the vehicle to spin. If wheel lockup occurs in a vehicle traveling in a straight direction, the force of inertia continues to push the vehicle straight ahead from the back of the vehicle due to the lack of stopping force in the rear tires, and the vehicle can spin.

● **All wheel lock up (front and rear tires)**



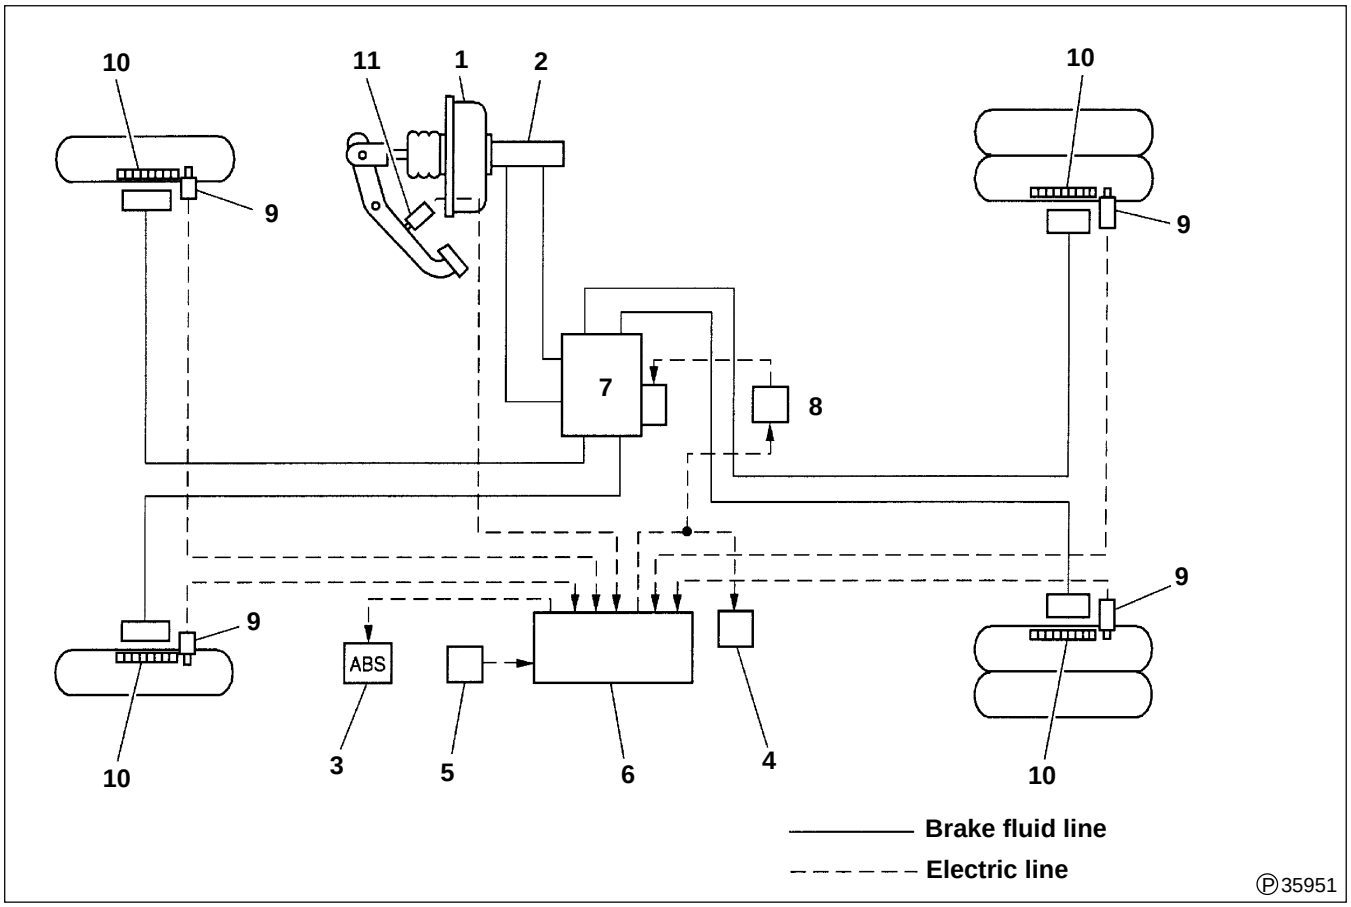
When wheel lockup occurs in both front and rear tires, all four tires lose directional stability. Therefore, the vehicle slips in the direction of inertia regardless of the steering direction.

● **Wheel lockup on surfaces with split μ factors (road surface with different friction coefficients for right and left tires)**



The tires on a surface with a lower friction coefficient lock up first. The tires in a lockup condition start sliding, thus failing to provide effective stopping force. Due to this imbalance in the stopping power between the right and left tires, one side of the vehicle slows down while the other side continues traveling, thus resulting in the loss of directional stability. When this happens during sudden braking, the vehicle spins.

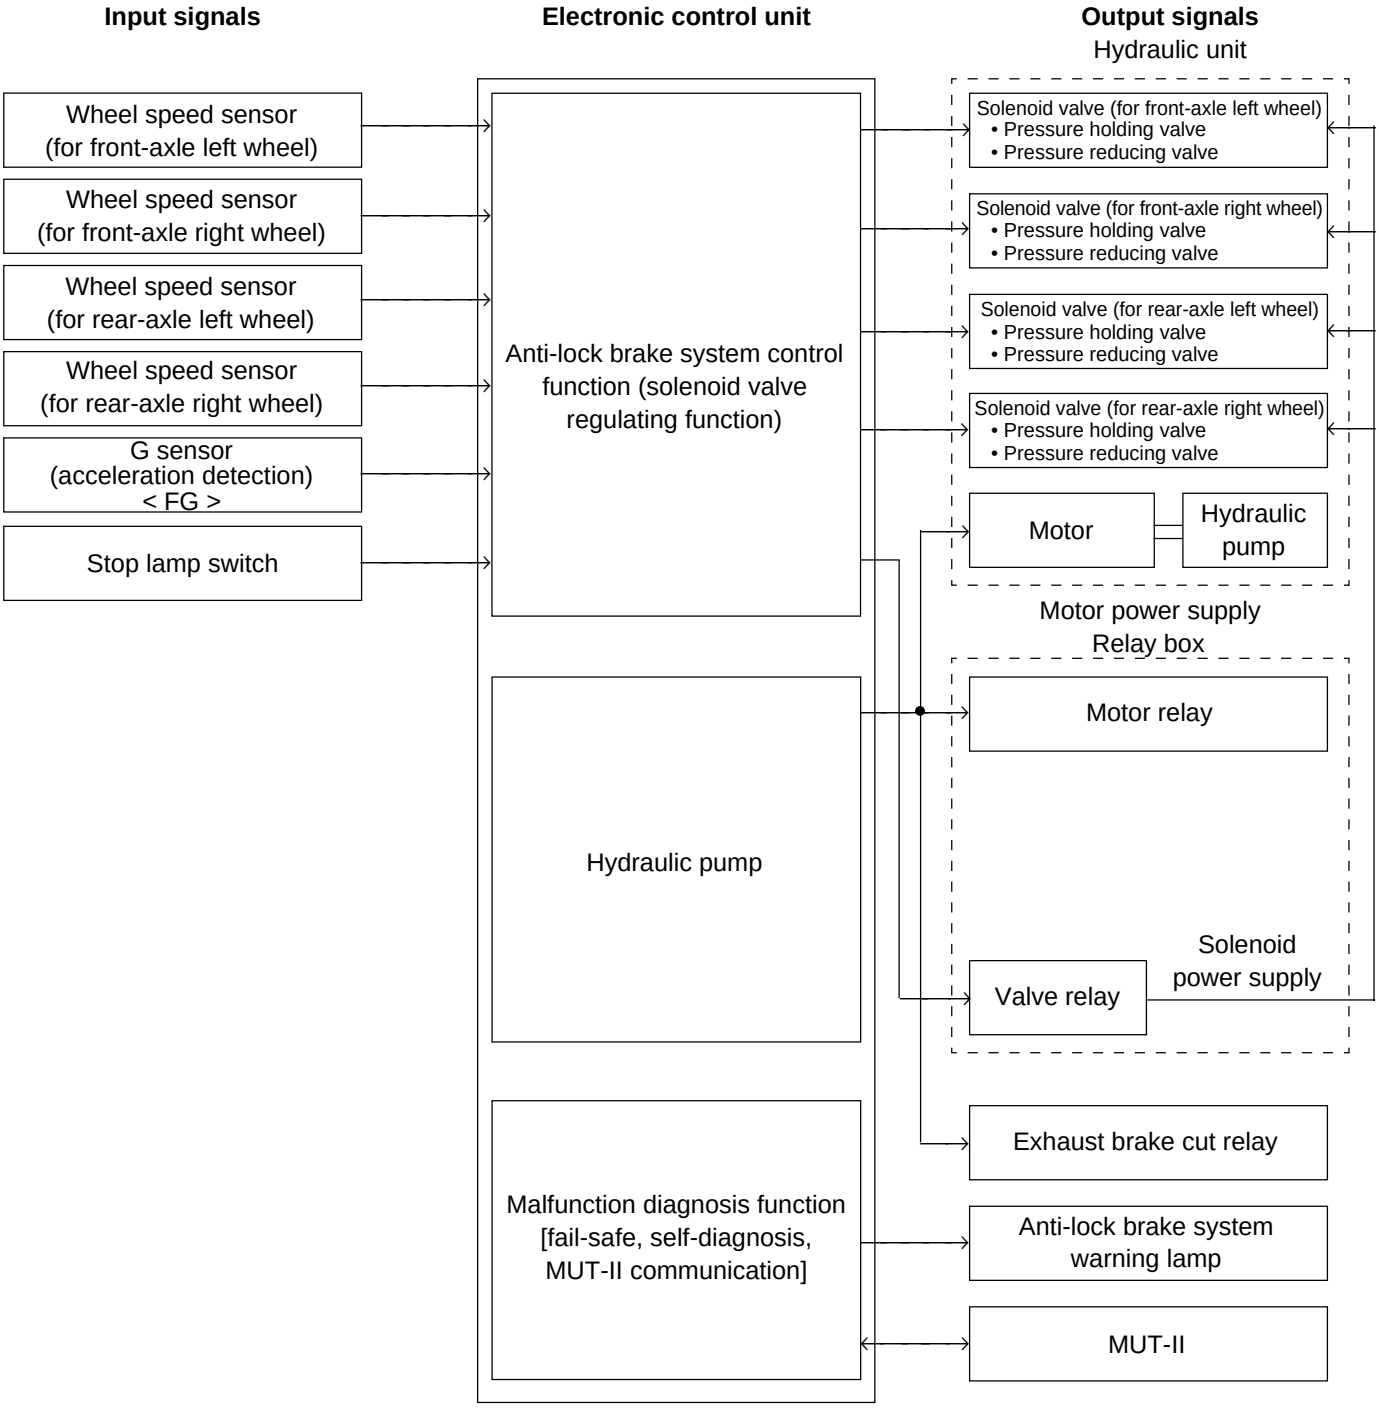
Structure of anti-lock brake system

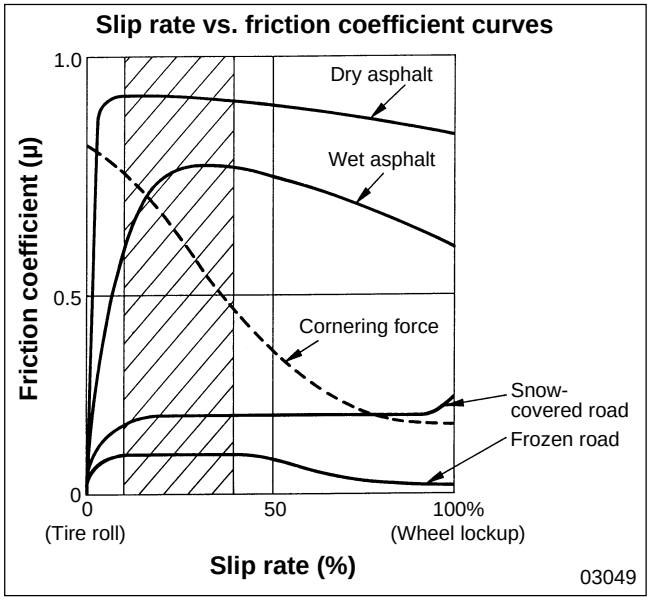


1 Brake booster (Mastervac)
2 Brake master cylinder
3 Anti-lock brake system warning lamp
4 Exhaust brake cut relay
5 G sensor < FG >
6 Electronic control unit
7 Hydraulic unit
8 Relay box
9 Wheel speed sensor
10 Rotor
11 Stop lamp switch

The ABS uses wheel speed sensors **9** and electronic control unit **6** to monitor the rotating speed of each wheel. The FG models are also equipped with G sensor **5** for the detection of the degree of vehicle's forward and backward acceleration. When the wheel speed exceeds the preset deceleration speed or slip rate during braking, the electronic control unit detects it as a tendency leading to wheel lockup, and sends control signals to hydraulic unit **7** and relay box **8**. The signals activate the solenoid valves to reduce the brake fluid pressure in the wheel brakes and ease the braking force to prevent wheel lockup. Then, when the wheel speed increases, wheel speed sensors **9** send signals to the solenoid valves in hydraulic unit **7** by way of electronic control unit **6** to increase the brake fluid pressure in the wheel brakes to augment the braking force. This control cycle is repeated to prevent wheel lockup on slippery pavements and ensure the vehicle's directional stability during braking. The 4-sensor 4-channel anti-lock brake system uses four wheel speed sensors **9**, which are located at the front and rear wheels, to control each of the four wheels.

● **Anti-lock brake system function**





● **Anti-lock brake system control function**

To provide optimum stopping power, the ABS controls the braking force based on the slip rate determined by the relationship between the wheel speed and the vehicle speed. When the brake is applied, the resulting force slows down the wheel rotation, thus reducing the vehicle speed. However, inertia acts on the vehicle and tries to maintain the vehicle's forward movement despite the stopping force applied by the tires. When there is a difference between the wheel speed and vehicle speed, slipping occurs. The degree of slippage is expressed by a slip rate.

$$\text{Slip rate (\%)} = \frac{\text{Vehicle speed} - \text{Wheel speed}}{\text{Vehicle speed}} \times 100$$

When the slip rate is 0%, there is no slippage between the tires and pavement. The slip rate of 100% refers to a wheel lockup condition.

The graph shows the time-based changes in the friction coefficient of a rolling tire during the process of wheel lockup. When the brake is applied gradually while the tires are rotating on pavement, the tires begin to slip while in rotation.

When the brake is applied harder, the tires stop rotating and start to slide on the pavement. This condition is called wheel lockup.

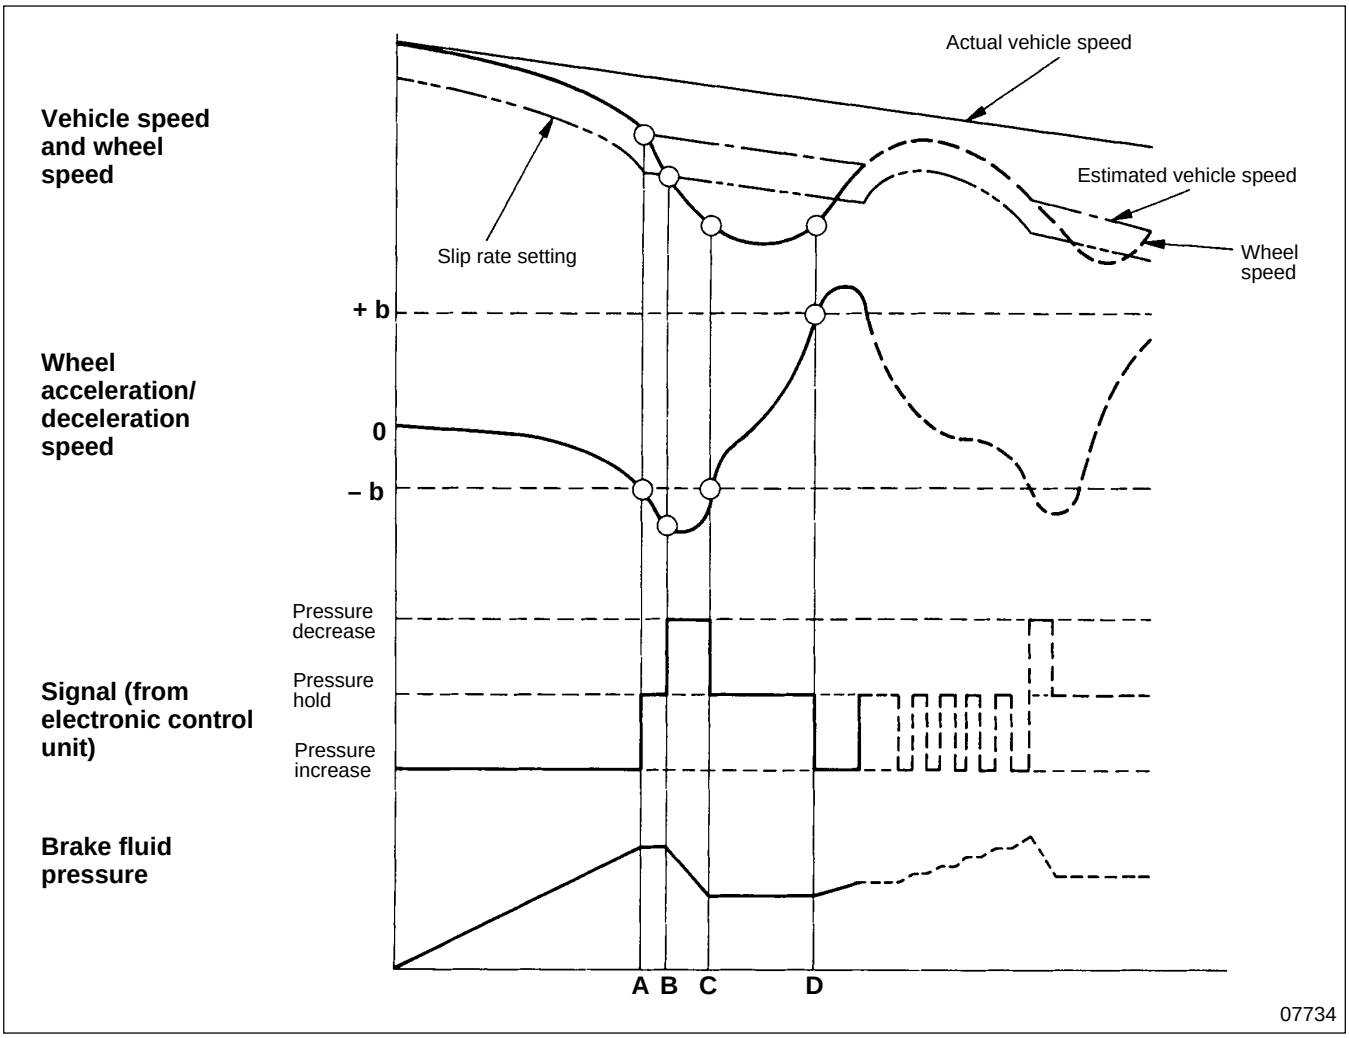
The friction coefficient is highest when the slip rate is within the shaded area on the graph.

In other words, tires provide maximum friction when the braking force is appropriately controlled to maintain the slip rate in the range indicated by the shaded area on the graph, rather than when the brake is applied at full force.

In a vehicle equipped with anti-lock brake system, the electronic control unit and hydraulic unit adjust the braking force and maintain it within the shaded area on the graph where the friction coefficient is high, thus preventing tire slippage and ensuring braking stability.

Anti-lock brake system operation

● **Anti-lock brake system control characteristic curve**



The above anti-lock brake system control characteristic graph shows the time-based changes in vehicle speed, wheel acceleration/deceleration speed and brake fluid pressure level during braking.

- When the wheel deceleration speed exceeds the speed setting **– b** at point **A**, the electronic control unit sends a signal to maintain the brake fluid pressure at the same level.
  At the same time, the electronic control unit estimates the vehicle speed according to a programmed calculation method.
- When the vehicle speed decreases further and the slip rate exceeds the setting at point **B**, the electronic control unit detects it as a tendency leading to wheel lockup, and sends a signal to reduce the brake fluid pressure.
- When the wheel speed increases because of the reduced brake fluid pressure and the wheel speed exceeds the setting **– b** at point **C**, the electronic control unit sends a signal to maintain the brake fluid pressure at the same level.
- When the wheel speed increases further and the wheel speed exceeds the setting **+ b** at point **D**, the electronic control unit determines that there is no risk of wheel lockup and sends a signal to increase the brake fluid pressure.

By repeating the above control cycle, the anti-lock brake system prevents wheel lockup and provides maximum friction between the tires and pavement to ensure high stability during braking.

● **Anti-lock brake system and exhaust brake system**

On slippery road surfaces, activation of the exhaust brake system can result in wheel lockup. If the exhaust brake activates during an anti-lock brake system braking operation, proper braking function cannot be provided by the anti-lock brake system.
To prevent this, the exhaust brake system is deactivated during anti-lock brake system operation even when the exhaust brake switch is turned ON. When the anti-lock brake system stops providing its function, the exhaust brake system becomes operable if the exhaust brake switch is ON.

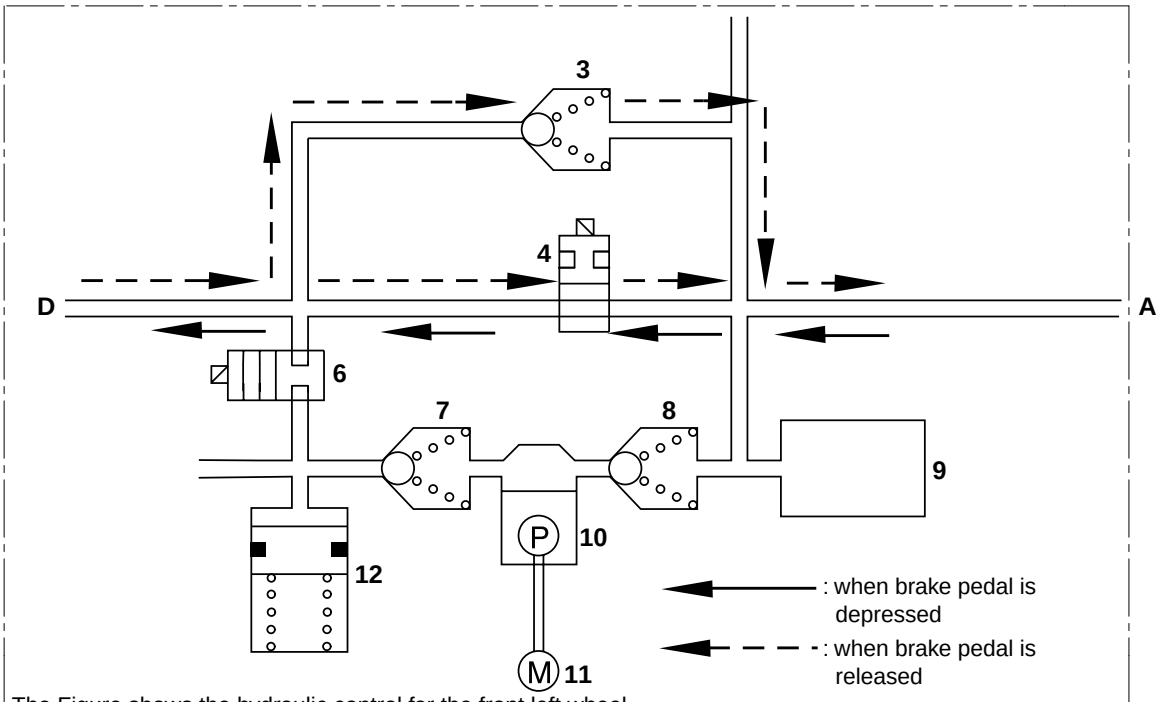
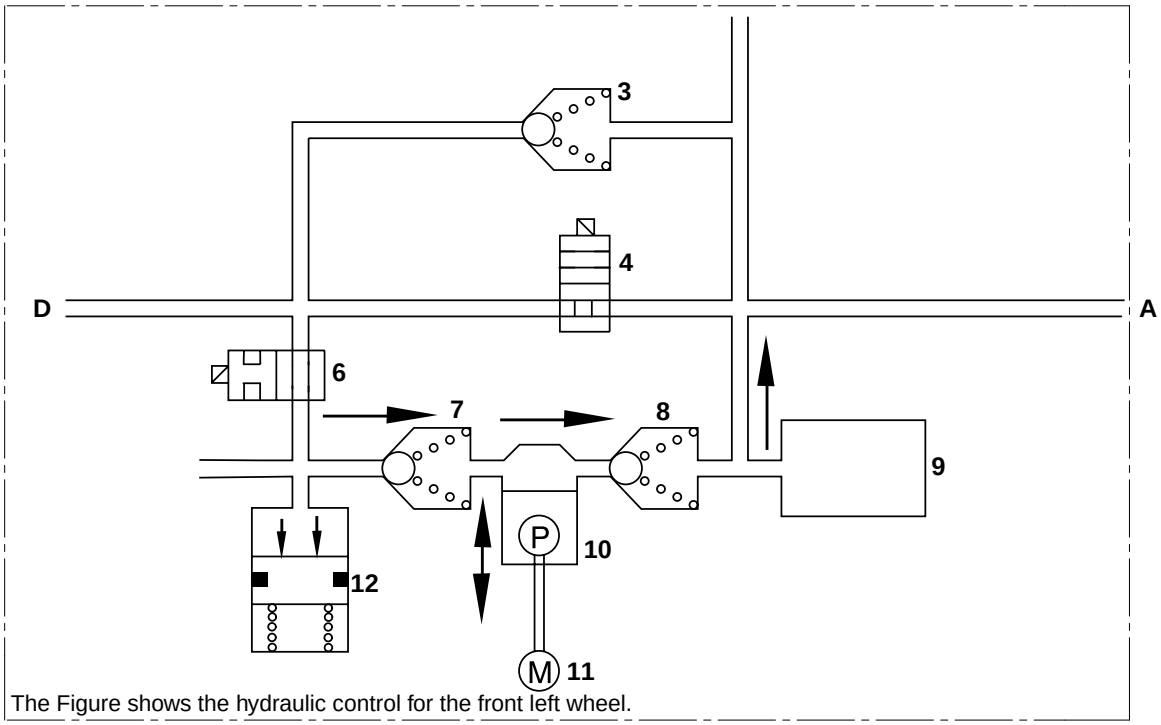
(2) Braking in normal conditions (anti-lock brake system not activated)



Ⓟ36688

- In the conditions where the brake pedal is depressed but ABS is not activated, no control signals are sent to the solenoid valve **6** (reducing pressure for front left wheel) and the solenoid valve **4** (holding pressure for front left wheel) in the hydraulic unit. Therefore, the solenoid valve **4** (holding pressure for front left wheel) is open and the solenoid valve **6** (reducing pressure for front left wheel) is closed.
- The brake fluid pressure **A** from the brake master cylinder is then fed to the wheel brake **D** through the solenoid valve **4** (holding pressure for front left wheel) without any modulation, braking the wheel.
- At that time, the brake fluid pressure is also applied to the damper **9** (front system), which is not activated with a normal brake fluid pressure.
- When the brake pedal is released, the brake fluid pressure **A** from the brake master cylinder is reduced. Therefore, the brake fluid pressure in the wheel brake **D** returns to the brake master cylinder through the solenoid valve **4** (holding pressure for front left wheel) and through the check valve **3** (front left wheel) whose ball is pressed off the seat by the pressure.

(3) When anti-lock brake system is activated (for reducing pressure)

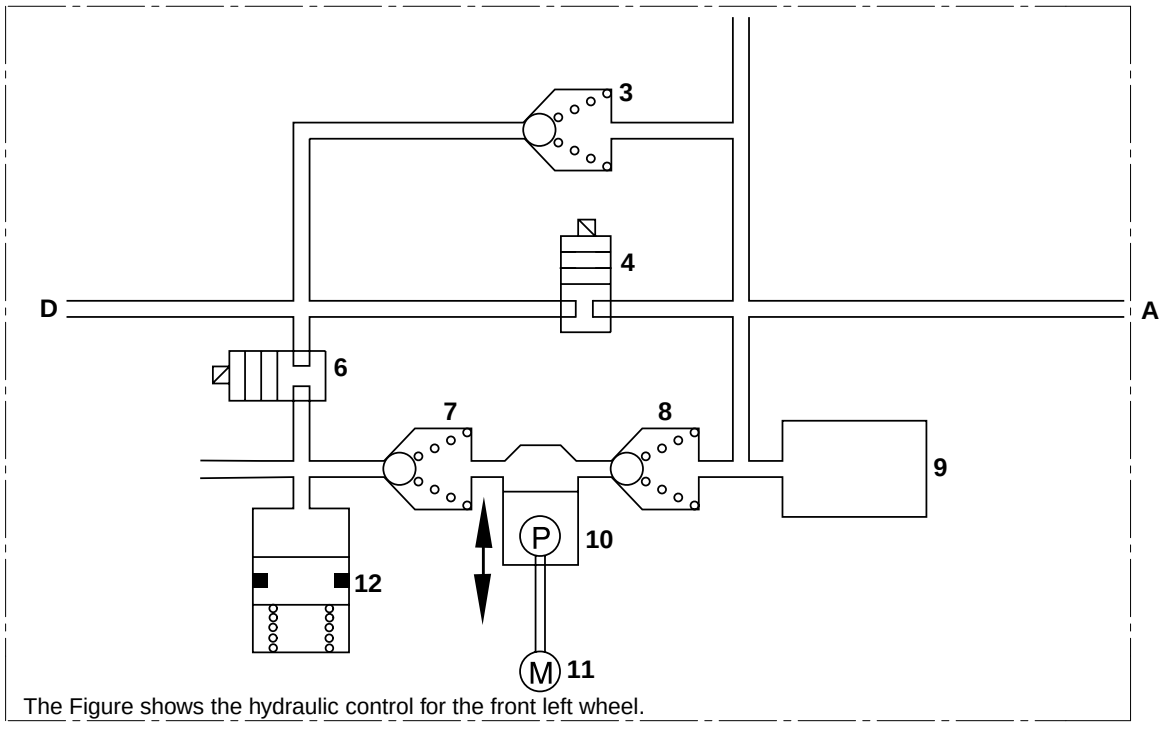


The Figure shows the hydraulic control for the front left wheel.

Ⓟ36689

- If the front left wheel shows signs of locking when the brake pedal is depressed, the electronic control unit sends the control signals to the solenoid valve **6** (reducing pressure for front left wheel) and the solenoid valve **4** (holding pressure for front left wheel). Then, the solenoid valve **6** (reducing pressure for front left wheel) opens and the solenoid valve **4** (holding pressure for front left wheel) closes.
- The brake fluid pressure in the wheel brake **D** is fed back into the reservoir **12** (front system) through the solenoid valve **6** (reducing pressure for front left wheel) and thereby it is reduced.
- Simultaneously with the control signals to the solenoid valve **6** (reducing pressure for front left wheel) and solenoid valve **4** (holding pressure for front left wheel), the electronic control unit also sends a control signal to the motor **11**, which operates the plunger pump **10** (front system). This causes the brake pressure in the reservoir to flow through the inlet valve **7** (front system) and outlet valve **8** (front system) into the damper **9** (front system).
- At this time, the check valve **3** (front left wheel) is closed by the brake fluid pressure **A** from the brake master cylinder. Accordingly, the brake fluid pressure is not fed from the brake master cylinder to the wheel brake.

(4) When anti-lock brake system is activated (for holding pressure)

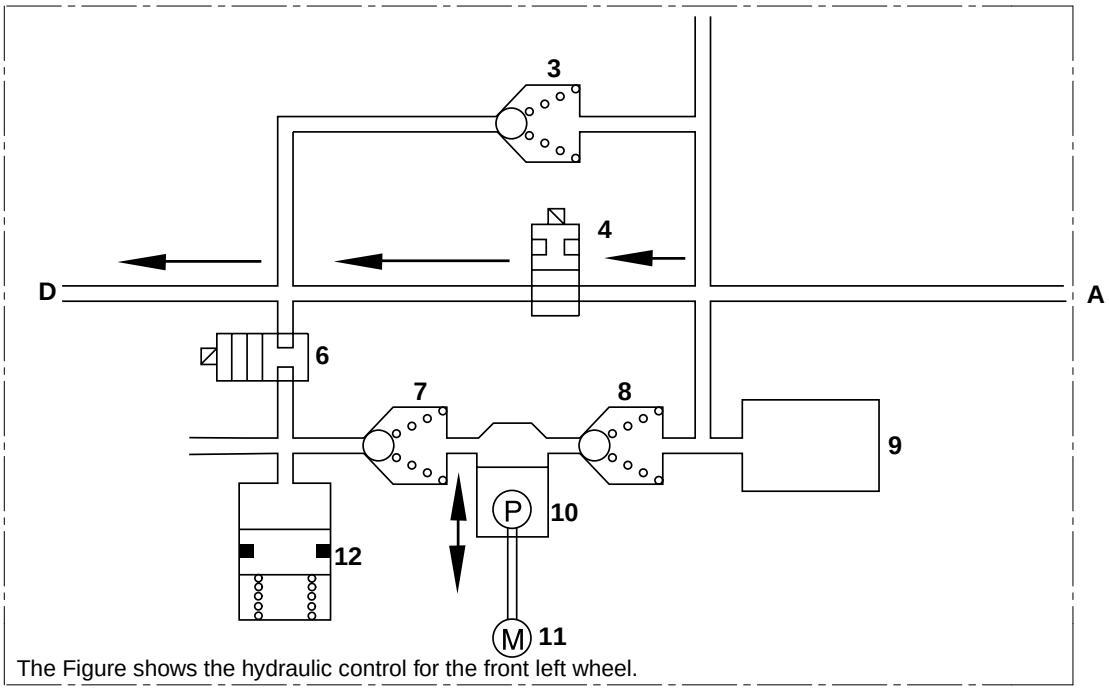


The Figure shows the hydraulic control for the front left wheel.

Ⓟ36690

If the brake fluid pressure **D** in the wheel brake should be maintained for sustained anti-lock brake system control, the electronic control unit sends the pressure holding signal to the solenoid valve **4** (holding pressure for front left wheel) and stops control signal to the solenoid valve **6** (reducing pressure for front left wheel). This causes both solenoid valve **4** (holding pressure for front left wheel) and solenoid valve **6** (reducing pressure for front left wheel) to close, thereby the brake fluid pressure being maintained.

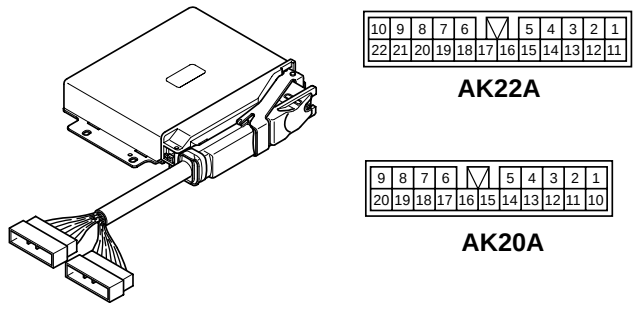
(5) When anti-lock brake system is activated (for increasing pressure)



The Figure shows the hydraulic control for the front left wheel.

Ⓟ36691

- If the brake fluid pressure **D** in the wheel brake should be increased, the electronic control unit stops sending control signals to the solenoid valve **4** (holding pressure for front left wheel) and solenoid valve **6** (reducing pressure for front left wheel) in the hydraulic unit.
- Then, the solenoid valve **4** (holding pressure for front left wheel) opens and the solenoid valve **6** (reducing pressure for front left wheel) closes. Namely, the same condition as where no anti-lock brake system control is provided brings about.
- At this time, the check valve **3** (front left wheel) is kept closed by the brake fluid pressure **A** from the brake master cylinder. Therefore, the brake fluid pressure **D** increased by the damper **9** (front system) is applied to the wheel brake irrespective of the brake fluid pressure in the brake master cylinder.



Ⓟ36208

● Electronic Control Unit

This component calculates the wheel speed and estimates the vehicle speed based on signals sent from the wheel speed sensors. Based on the calculation results, it determines the degree of wheel lockup tendency, and sends brake fluid pressure control signals to the solenoid valves of the hydraulic unit to regulate brake fluid pressure accordingly.

The electronic control unit is equipped with a self-diagnosis function. Should an abnormality occur, the electronic control unit turns on the warning lamp on the instrument panel to indicate the system malfunction and deactivates the anti-lock brake system control to set the brake system in normal condition (without anti-lock brake system control).

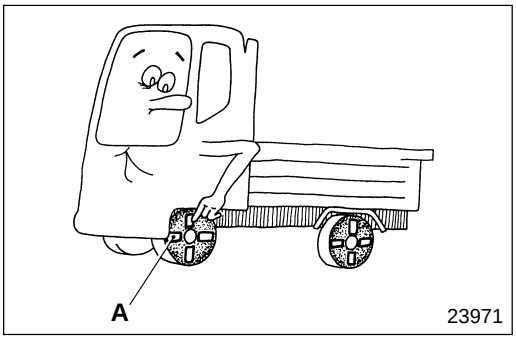
Periodic Inspection Procedures

(1) Periodic inspection of Anti-lock brake system

- Inspect the vehicle's Anti-lock brake system following the procedure below.
- If an abnormality is found in this inspection, further inspect the Anti-lock brake system using MUT-II (multi-use tester-II) by referring to TROUBLESHOOTING section.
  P35E-19



- Inspection procedure
  ① With the vehicle stationary, press the brake pedal and inspect the hydraulic unit for fluid leaks.
  If fluid leaks from the hydraulic unit, replace the unit. If fluid leaks from the fluid pipe or connector, tighten the joint.
  ② Inspection using brake tester
  Check the braking force at each wheel with a brake tester by following the inspection procedure for ordinary vehicles.
  If an abnormality is found, inspect the wheel brake units, service brake system and hydraulic unit.
  ③ Drive the vehicle and check the operation of the Anti-lock brake system.
  - Conduct a test drive at an open area to ensure safety.
  - Conduct a test drive without cargo.

  Attach white tape **A** on the sides of tires, so that it is easy to observe the rotation of the front and rear wheels.
  - Turn the starter switch from the OFF position to the ON position, and make sure that the ABS warning lamp lights.
    Then, check that the ABS warning lamp turns off approximately two seconds after the starter switch is turned on.
  - Drive the vehicle at a speed of 20 to 30 km/h {12 to 19 mph}, and apply a sudden brake. Make sure that wheel lockup does not occur in any of the tires.

Inspection of Wheel Speed Sensor Signal Waveform Using Oscilloscope

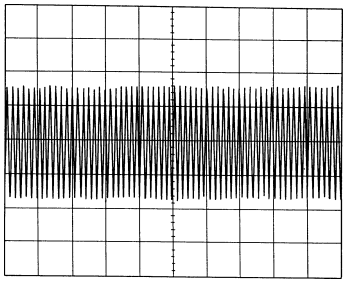
Inspect the rotor for dents using an oscilloscope, since the tester cannot be used for dent detection.

NOTE

Use an oscilloscope with a waveform recording function.

- Lift the wheel to be tested off the ground, and disconnect the connector at the wheel speed sensor.
- Connect the terminal of the oscilloscope to the terminal of the disconnected connector. Rotate the wheel at a constant speed. Check the waveform shown on the oscilloscope to check for dents on the rotor.

Normal waveform (no dent on rotor)



03122

- Rotor dents are often made by the rotor press-fit on the hub end contacting the axle during installation of the hub and brake drum assembly on the axle. When installing the hub & brake drum assembly, pay close attention to prevent the rotor from contacting other parts.
- If the wave is noticeably narrower in width than other observed waves, the rotor may be chipped. Visually inspect the rotor.

Hydraulic Unit Operation Check

Operation check using MUT-II

- Lift the vehicle using a jack and support it with jack stands, or position the tires on brake tester rollers.

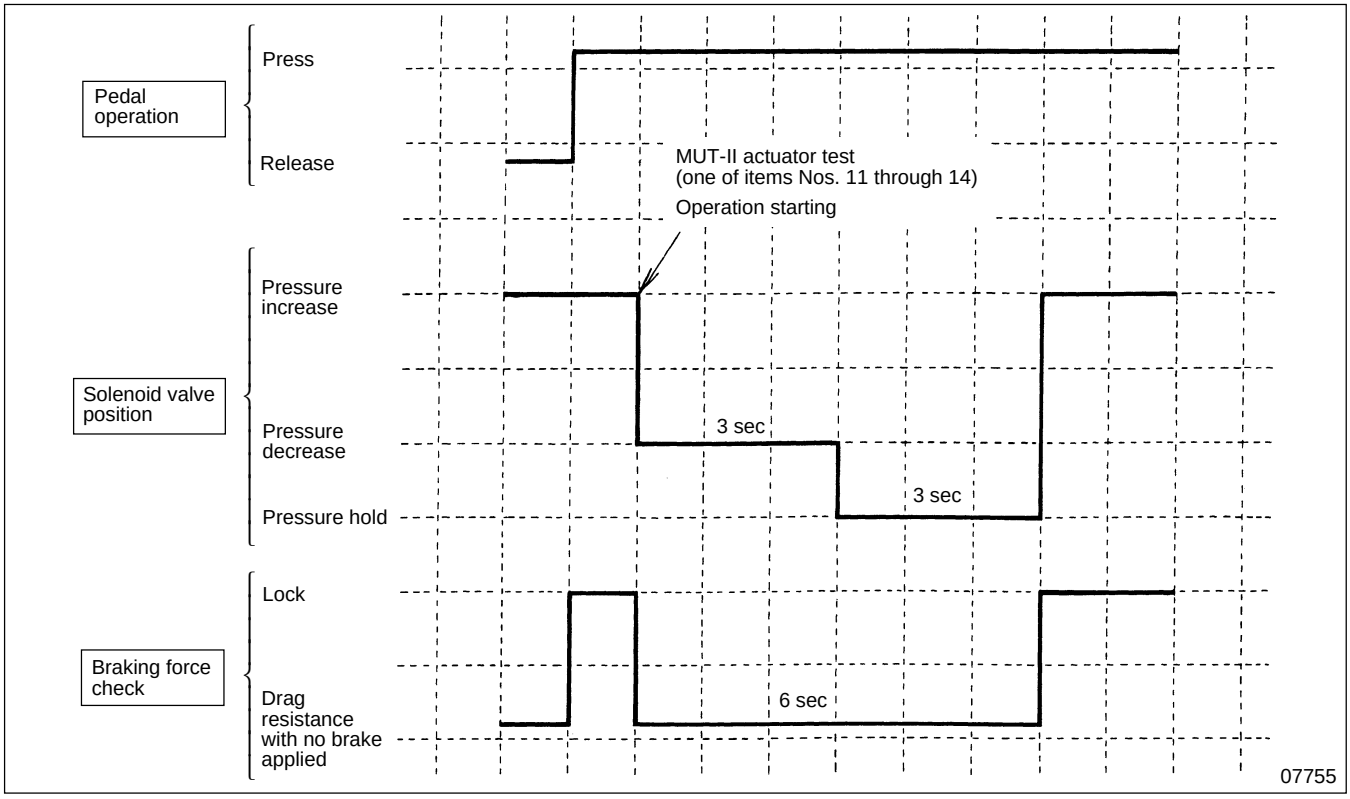
WARNING⚠

- **The brake tester rollers and tires must be dry during inspection.**
- **To test the front brakes, apply the parking brake. To test the rear brakes, place wheel chocks at the front tires to secure them in position.**

- Disengage the parking brake, and feel the drag resistance of the brake on each wheel.
  When using a brake tester, record the indicated drag resistance of the brake.
- Set the starter switch to the OFF position, then connect the MUT-II.
- Set the testing equipment and system on the MUT-II.
- After making sure that the transmission is in the neutral position, start the engine.

NOTE

- **When the engine is turned on, the anti-lock brake system switches to the MUT-II mode and the anti-lock brake system warning lamp flashes.**
- **When the anti-lock brake system function is deactivated due to the electronic control unit's fail-safe function, the actuator test cannot be performed with the MUT-II.**



- If an abnormality is found during the inspection, take appropriate measures described in the following operating condition evaluation chart.

Operating condition evaluation chart

Item No.	MUT-II indication	Operation	Judgment		Cause	Remedy
			Normal	Malfunction		
11	FR ABS MV ON	(1) Depress the brake pedal to lock wheels. (2) On the MUT-II, select the wheel to be tested and forcibly drive the actuator. (3) Rotate the selected wheel using the brake tester or by hand, and check the change in braking power.	Braking force eases for 6 seconds from locked condition.	Wheel does not lock when brake pedal is depressed.	Clogging in brake line other than HU	Inspect and clean brake lines.
12	FL ABS MV ON				Clogging in hydraulic line inside HU	Replace HU assembly.
13	RR ABS MV ON			Braking force does not ease.	Erroneous HU brake tube connection	Correct tube connection.
14	RL ABS MV ON				Faulty HU solenoid valve	Replace HU assembly.

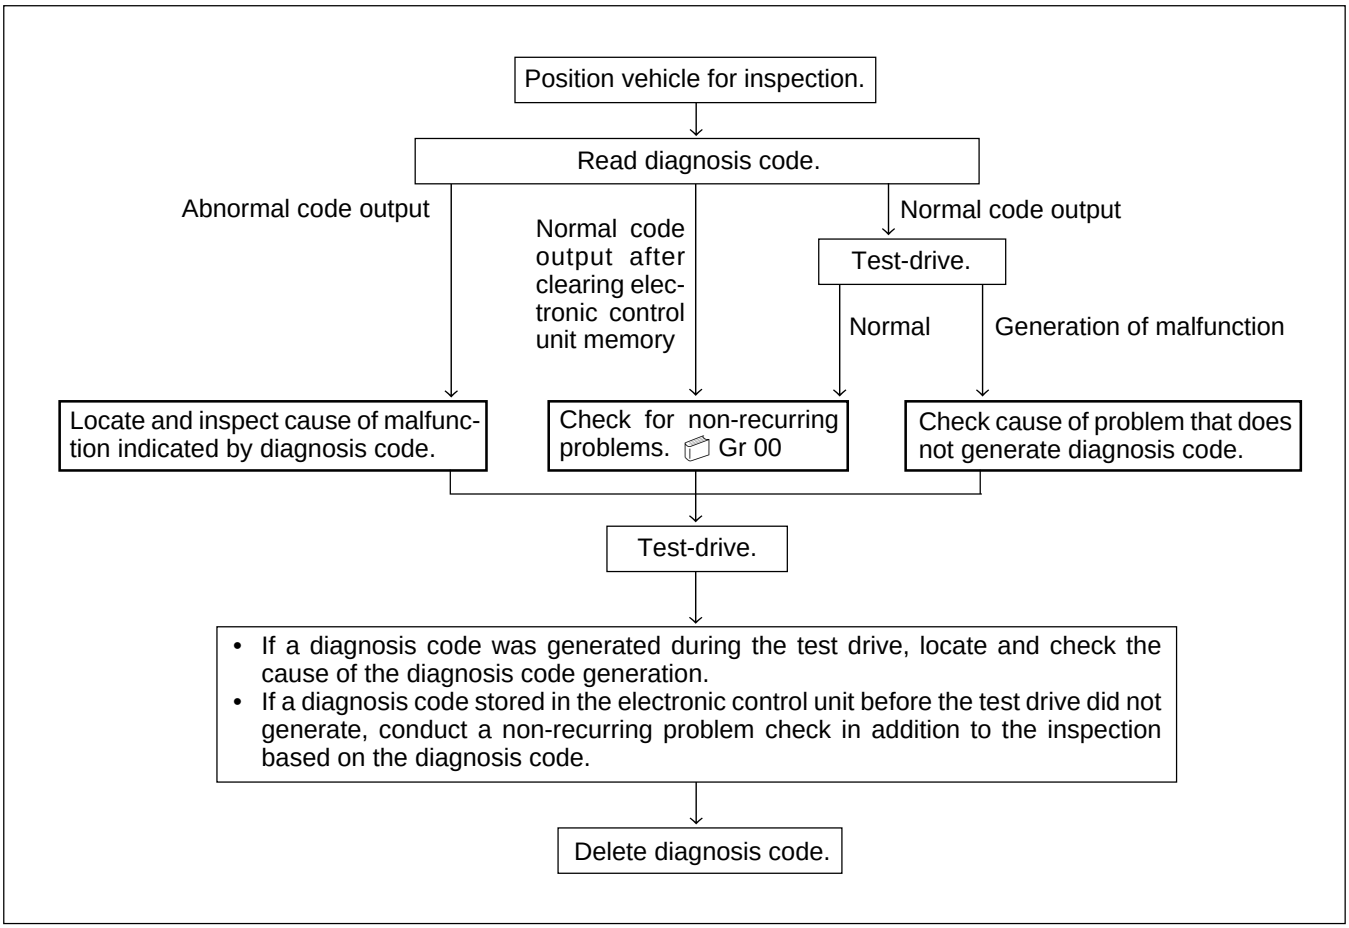
HU: Hydraulic unit • After inspection, set the starter switch to OFF before disconnecting the MUT-II.

Troubleshooting Procedures

Inspection flow chart

The MUT-II allows efficient inspection of the anti-lock brake system.
The types of system inspections can be roughly divided according to the malfunction condition and diagnosis code, as shown below.

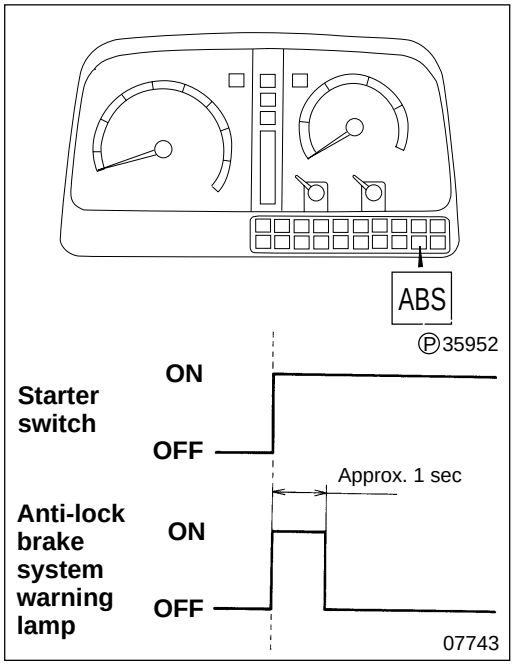
- Inspection based on individual malfunction diagnosis codes stored in the electronic control unit
- Inspection based on symptoms not indicated by diagnosis codes
- Correcting non-recurring problems



Cautions in malfunction diagnosis

- The anti-lock brake system uses electronic control to regulate the braking system. The following phenomena may occur during normal anti-lock brake system operation, but they do not denote a malfunction.

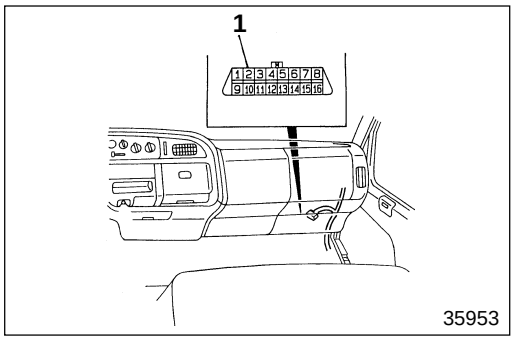
Phenomenon	Description
System checking sound	When the engine starts, a slight clunking sound may be generated in the left side of the frame near the cargo bed. This sound is produced by the system conducting an operation check, and does not denote a malfunction.
Anti-lock brake system operating sound	• Motor noise from the hydraulic unit (humming sound) • Noise generated as the brake pedal feel changes (grinding sound) • Noise from the chassis produced by repeated ON and OFF operations of the anti-lock brake system (wheels: short squeak, suspension: slight thud)
Anti-lock brake system operation effect (longer stopping distance)	On snow-covered surfaces and gravel roads, a vehicle equipped with anti-lock brake system may require a longer distance to come to a complete stop. Therefore, when driving on such road surfaces, reduce the speed sufficiently and drive carefully to minimize the use of brakes.



● Inspection of anti-lock brake system warning lamp

Check the anti-lock brake system warning lamp to make sure that the following operation turns on the lamp.

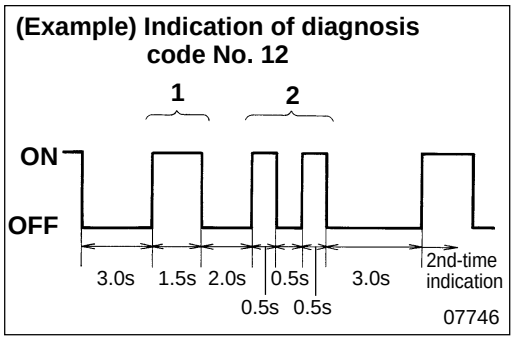
- Set the starter switch to the ON position, and check that the anti-lock brake system warning lamp lights for about 1 second and turns off.
- If the lamp does not light as described above, check diagnosis codes stored in the electronic control unit.



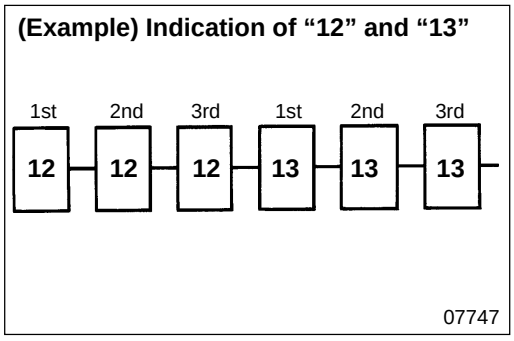
Diagnosis Code Indication

• Without MUT-II

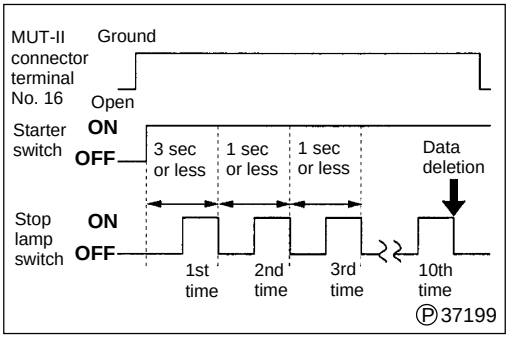
- With the vehicle stationary, ground terminal No. 16 of MUT-II connector **1**, then turn the starter switch to the ON position. The anti-lock brake system warning lamp will flash to indicate a diagnosis code.
- The anti-lock brake system warning lamp starts flashing 3.0 seconds after the starter switch is turned ON. The flashing pattern of the warning lamp indicates a diagnosis code.



- A diagnosis code is indicated in the following manner.
  - To indicate the tens digit (left digit), the lamp remains ON for 1.5 seconds, then remains OFF for 0.5 seconds. To indicate the ones digit (right digit), the lamp remains ON for 0.5 second, then remains OFF for 0.5 second.
  - Each diagnosis code is indicated three consecutive times. When there is no other diagnosis code to indicate, the lamp repeats the diagnosis code indication from the beginning.
  - When there is no diagnosis code stored in the memory (normal condition), the anti-lock brake system warning lamp repeats On/Off in 0.25-second intervals.



- When two or more diagnosis codes are stored in the electronic control unit.



● **Deletion of diagnosis codes**

Connect terminal No. 16 of the MUT-II connector to the chassis for grounding. While depressing the brake pedal, turn the starter switch on and off ten times in intervals of 1 second or less. Turn the key off, disconnect the ground wire. This erases diagnosis codes from the memory.

● **Completion of diagnosis code check**

The diagnosis code check completes when diagnosis codes are erased from the electronic control unit of terminal No. 16 of the MUT-II connector is disconnected.

NOTE

The diagnosis code check also ends when the vehicle moves from a stationary condition during the diagnosis code check.

Connecting the MUT-II
- Turn the starter switch to the LOCK position.
- Connect the b MUT Communication Harness to the a MUT-II, and insert the c ROM Pack.
- Plug connector **A** into the cigarette lighter socket.
- Fit connector **C** onto MUT connector **B** (16 pin) in the relay box.

NOTE

Instructions for operation of the MUT-II are given in the separate MUT-II Reference Manual.

Current diagnosis codes
- Turn the starter switch to the ON position.
- Determine the fault location(s) in accordance with the MUT-II diagnosis code(s).

Past diagnosis codes
- Turn the starter switch to the ON position.
- Determine the fault location(s) in accordance with the past MUT-II diagnosis code(s).

Diagnosis code erasure
- Turn the starter switch to the ON position.
- Using the MUT-II, erase all diagnosis codes stored in the electronic control unit.

- Pulling the parking brake ratchet bar pulls the parking brake cable, which in turn pulls parking brake lever **1** installed in the parking brake body, operating shoe and lining assembly **5**.
- Activation of parking lever **1** expands one shoe and lining assembly **5** via strut **2**, the parking lever itself expands the other shoe and lining assembly. Therefore, both shoe and lining assemblies function as leading shoes.
- When the ratchet bar (parking lever) is returned, the repercussive force of shoe return spring **3** releases the brake.

Adjustment of Parking Brake Shoe Clearance and Ratchet Bar Pulling Stroke

Service standards

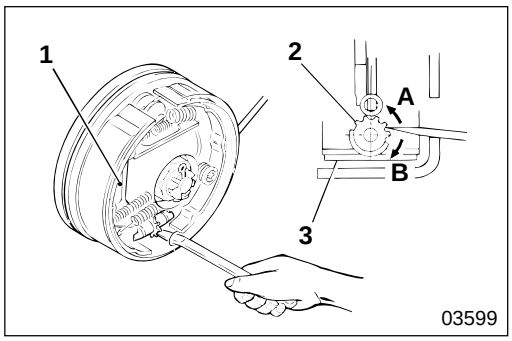
Unit : mm {in.}

Location	Maintenance item	Standard value	Limit	Remedy
—	Brake shoe clearance	0.2 to 0.25 {0.0079 to 0.0098}	—	Adjust
4	Ratchet bar pulling stroke (Operating force : 295 N {66 lbf, 30 kgf})	80 to 120 {3.15 to 4.72}	—	Adjust

Ⓣ Tightening torque

Unit : N·m {ft.lbs, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
6	Lock nut	19 to 27 {14 to 20, 1.9 to 2.8}	—

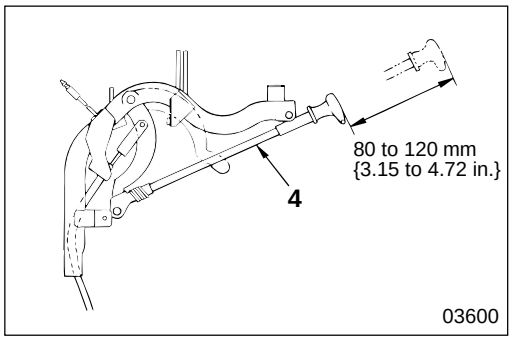


(1) Shoe clearance

When parking lever **1** is released, turn adjuster **2** in the expansion direction, using a screwdriver inserted through the shoe adjusting hole of the parking brake drum, and return 8 to 10 notches from the position where shoe **3** is in close contact with the drum. Then, the shoe clearance will be the standard value.

A : Contraction

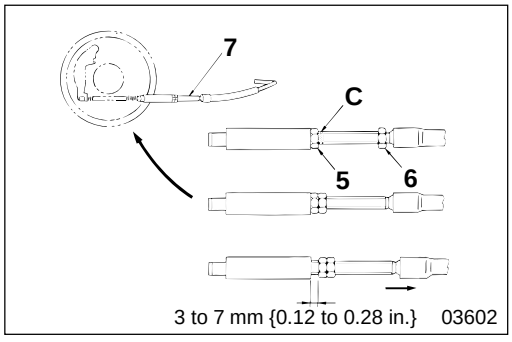
B : Expansion



(2) Ratchet bar pulling stroke

Adjust the adjusting nut of the parking brake cable so that the ratchet bar pulling stroke is the standard value when parking brake ratchet bar **4** is pulled from the released position by an operating force of 295 N {66 lbf, 30 kgf}.

Operate ratchet bar two or three times after adjusting to verify the pulling stroke, to make sure that the parking brake is operating properly and that the parking brake drum does not drag when the parking brake is released.



[Adjustment]

- Tighten adjusting nut **5** until mark **C** can be seen.
- Tighten lock nut **6** to the position of adjusting nut **5**.
- Tighten lock nut **6** at specified torque.
- Check clearance when the outer cable of parking brake cable **7** is pulled by an operating force of 59 to 98 N {13 to 22 ft.lbs, 6 to 10 kgf·m}.

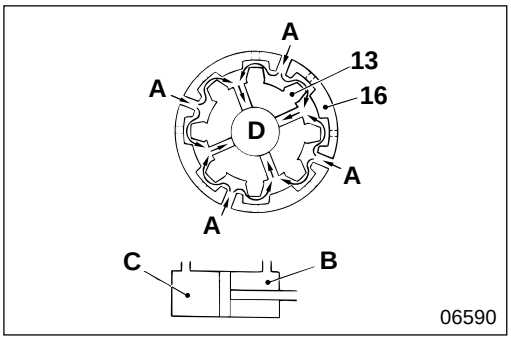
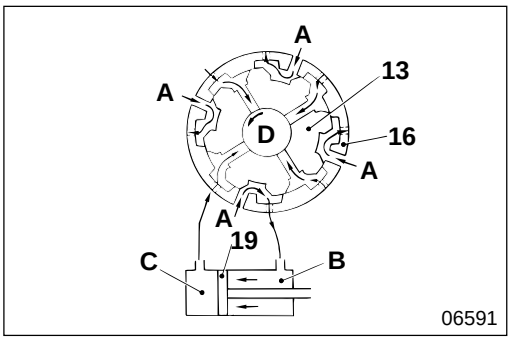
Rotary valve **16** is the central part of the power steering booster. Torsion bar **9** allows the steering reaction force and valve return to operate lightly and smoothly at low speed, and ensures stable steering feel even at high speed.



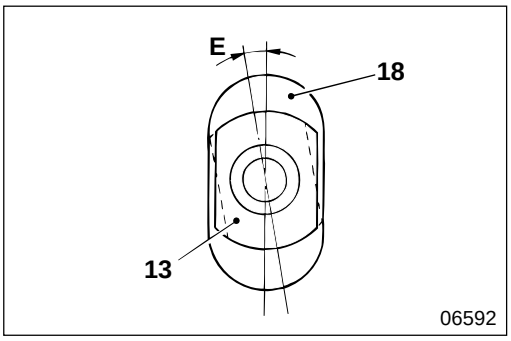
● **Straight-ahead drive operation**

When steering torque is not applied by the steering wheel, input shaft **13** is not activated and remains in neutral. At this time, pressurized fluid from the oil pump flows through the input shaft and the hole of rotary valve **16**, and returns to the oil tank without flowing into cylinder chambers **B**, **C**.
A : From the oil pump
D : To the oil tank



● **Steering operation**

Turning the steering wheel rotates input shaft **13**, causing rotary valve **16** to close the fluid feed passage to cylinder chamber **C**. This produces a pressure difference between cylinder chambers **B**, **C**, which causes rack piston **19** to move, and facilitates rotation of main shaft **18**.
The illustration shows right-turn steering, and should be reversed for left-turn steering.



● **Operation when hydraulic circuit is faulty**

The safety structure means that when the fluid circuit is faulty, the stopper of input shaft **13** directly contacts the groove at the large end of main shaft **18** to transmit steering force, enabling manual operation.

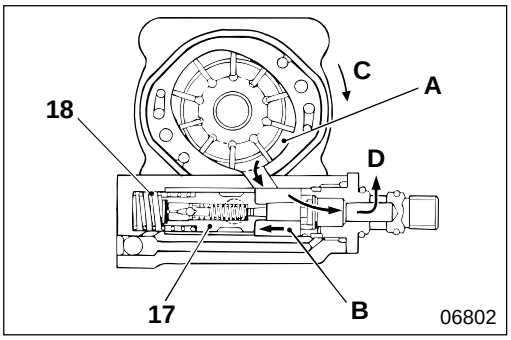
Relief Valve Assembly



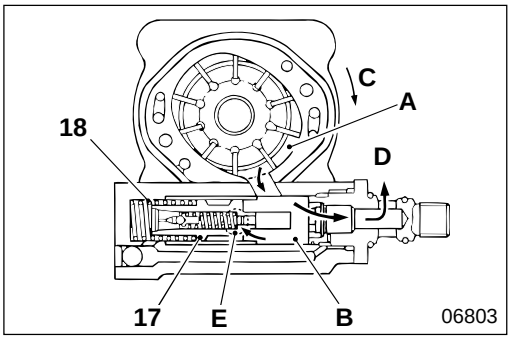
● **Operation of flow control valve**

(1) When not operating (Oil pump rotating at low speed)

Since pressure generated from pressure chamber **A** is low when the oil pump is rotating at low speed, fluid pressure in chamber **B** is also low. Therefore, relief valve assembly **17**, which is pressed by the repercussive force of flow control spring **18** is not activated.

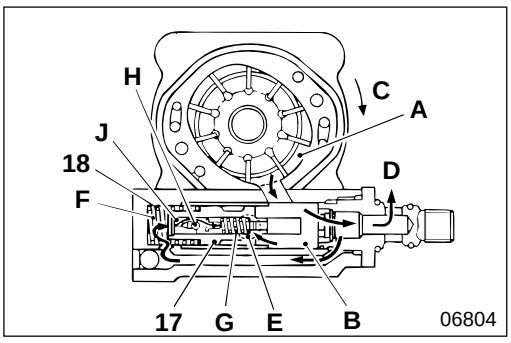
C : Direction of rotation

D : To the power steering booster



(2) When operating (Oil pump rotating at middle or high speed)

Since pressure generated from pressure chamber **A** is high when the oil pump is rotating at middle or high speed, fluid pressure in chamber **B** is also high. This will activate relief valve assembly **17**, overcoming the repercussive force of flow control spring **18**, and open port **E**, making excess fluid return to the inlet port to adequately regulate the flow of fluid to power steering booster **D**.



● **Operation of relief valve**

When the steering is lock-to-lock, pressure in chambers **B** and **F** increases and overcomes the repercussive force of relief spring **G** opening relief valve **J**, which was closed by steel ball **H**, causing the fluid to be returned to the inlet port through port **E**. Thus, if pressure in chamber **F** decreases, the relief valve closes again.

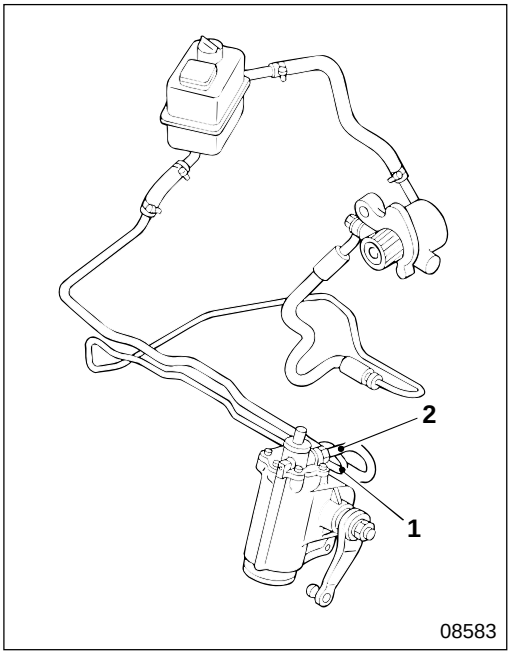
2	Return tube	39 to 49 {29 to 36, 4 to 5}	—



[Draining]

- Jack up the front wheels.
- Release pressure tube **1** and return tube **2** connected to the power steering booster.
- Turn the steering wheel fully left and right repeatedly, and drain the fluid from the power steering booster.
- After draining the fluid, tighten pressure tube **1** and return tube **2** at specified torque.

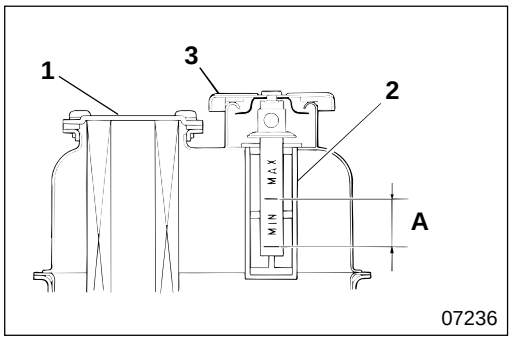
Bleeding of Power Steering System

Fluid

Location	Points of application	Kinds	Quantity
1	Power steering oil tank	Automatic transmission fluid (DEXRON or DEXRON II type)	Filler cap dipstick between MIN and MAX



CAUTION

Do not keep the steering wheel turned fully to the left or right for more than fifteen seconds when the engine is running, as this can cause the power steering oil pump to seize up.

- Pour fluid into power steering oil tank **1** up to the inner port of strainer **2**.
- With the engine stopped, jack up the front wheels and support with jack stands. Turn the steering wheel fully left and right repeatedly. When the fluid level has dropped, add fluid to maintain the fluid level within range **A**.

NOTE

Check the fluid level without screwing on filler cap 3.

- Start the engine and letting it idle, turn the steering wheel fully left and right repeatedly. When the fluid level has dropped, add the fluid to maintain the fluid level within range **A**. Repeat these steps until the fluid level does not drop.
- If there is an abnormal noise, air is still in the system. Turn the steering wheel several times to raise fluid temperature to approximately 60 to 80°C {140 to 176°F}, then stop the engine and wait for approximately five minutes.
- Lower the front wheels and turn the steering wheel several times. If there is no noise, bleeding is completed.
- When bleeding is finished, check fluid level of power steering oil tank **1**, and pipe and hose connections for fluid leaks.

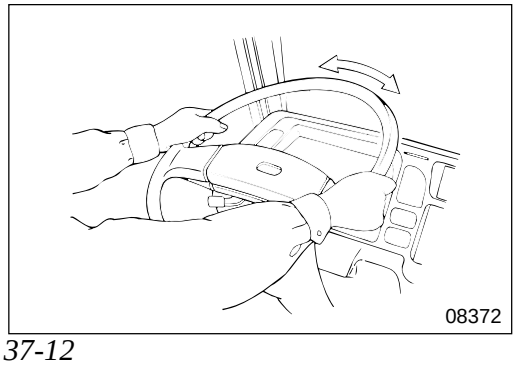
Service standards

Unit : mm {in.}

Location	Maintenance item	Standard value	Limit	Remedy
—	Steering wheel play (Measure at the outer circumference of steering wheel)	0 to 50 {0 to 1.97}	—	Adjust



Point the wheels directly forward, start the engine and gently turn the steering wheel left and right to measure play at the outer circumference. If the play deviates from the standard value, adjust tightening points and power steering booster backlash. P37-26, 33

Verify that the power steering booster and the power steering oil pump are operating properly by testing the following items.

CAUTION

Do not keep the steering wheel turned fully to the left or right for more than fifteen seconds when the engine is running, as this can cause the power steering oil pump to seize up.

NOTE

If the fluid pressure is higher than 490 kPa {71 psi, 5 kgf/cm^2} with engine idling and the steering wheel free, inspect power steering booster 1 and fluid circuit for restriction.

Test item	Test procedure	Assembly standards
Verification of smooth operation	Jack up the front wheels and support with stands. Turn steering wheel fully left and right	Smooth operation throughout test
Measurement conditions	• Install oil pressure gauge **A** capable of measuring above 10.8 MPa {1560 lbf/in^2, 110 kgf/cm^2} and stop valve **B**, then bleed air • With engine idling, turn steering wheel left and right several times to raise fluid temperature to 50 to 60°C {122 to 140°F} • With the engine idling, open stop valve **B**	
Measurement of fluid pressure	• Measure fluid pressure with hands off steering wheel	490 kPa {71 psi, 5 kgf/cm^2}
Measurement of relief pressure	• Gradually increase engine speed and maintain it at 1000 to 1500 rpm, and close stop valve **B** to measure maximum fluid pressure	Relief set pressure 9.3 MPa {1350 lbf/in^2, 95 kgf/cm^2} < FE >, 10.3 MPa {1490 lbf/in^2, 105 kgf/cm^2} < FG >

Lubricant

Location	Points of application	Specified lubricant	Quantity

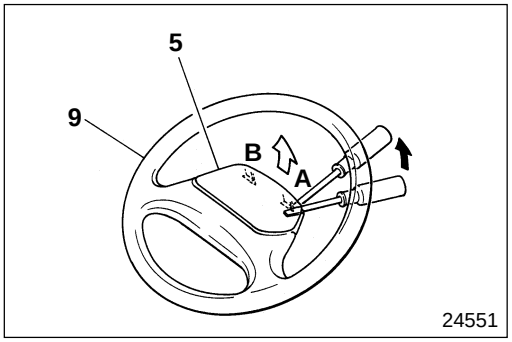
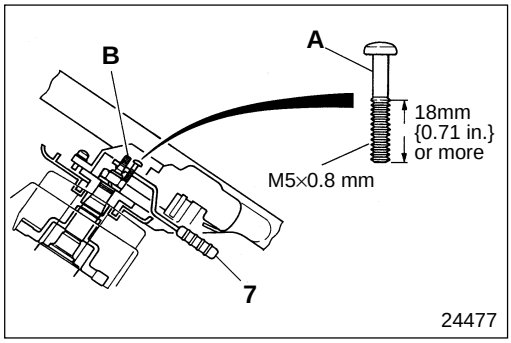
◆ Service procedure



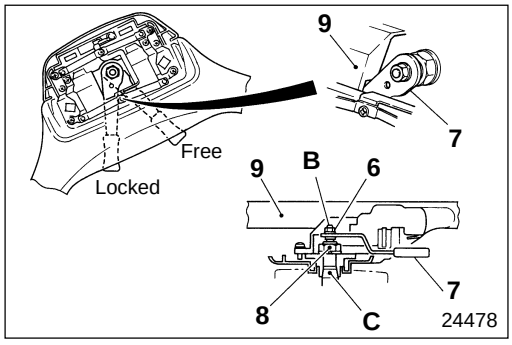
5 Removal of horn pad

- Insert a flat-tip screwdriver into the space between steering wheel assembly **9** and shoulder sections **A**, **B** of horn pad **5**, and disengage the latch by prying open the horn pad with the screwdriver until a clicking sound is produced.
- Insert fingers into the space behind lifted horn pad **5** and remove the horn pad.



7 Telescopic lever

[Removal]
Secure screw **A** (M5×0.8 mm) in tapped hole in telescopic lever **7** and remove telescopic lever from telescopic shaft **B**.



[Installation]
Make adjustment so that telescopic lever **7** positioned at the designated location applies the specified torque on telescopic shaft **B**.

CAUTION⚠

Be careful not to damage the threads on the tip of telescopic shaft B.

C : Telescopic shaft assembly

Start procedure

Install steering wheel assembly **9**. Using a long socket wrench, tighten nut **8** at specified torque 39 to 49 N·m {29 to 36 ft.lbs, 4 to 5 kgf·m}

Looseness found

Rotate telescopic shaft **B** counterclockwise with your fingers and check for looseness

No looseness

Using a flat-blade screwdriver turn telescopic shaft **B** clockwise and drive it in until it hits lightly with a "clunk", but do not turn it any further

CAUTION

Be careful not to over tighten or you will crush the end of the telescopic shaft, requiring replacement of telescopic shaft assembly C

Install telescopic lever **7** at a location that allows easy tightening, then tighten nut **6** until the telescopic lever will not slip

Tighten telescopic shaft **B** at operating torque 6.9 to 7.8 N·m {5.1 to 5.8 ft.lbs, 0.7 to 0.8 kgf·m}. (Tighten telescopic bar **7** at torque 69 to 78 N {15 to 18 lbf, 7 to 8 kgf} at 100 mm {3.94 in.} from the center of steering wheel assembly **9**)

To maintain lock, hold telescopic lever **7** clockwise, then loosen and remove lock nut **6**

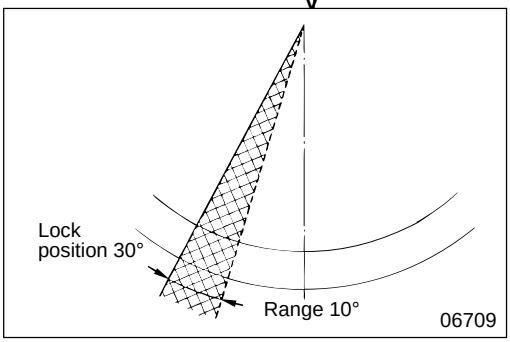
Remove telescopic lever **7**

NOTE

Remove telescopic lever 7 following the description under [Removal], taking care not to loosen telescopic shaft B.

Set telescopic lever **7** to specified lock position (within 10° before the position at which telescopic lever contacts steering wheel assembly **9**).

Tighten nut **6** at specified torque 8.8 to 9.8 N·m {6.5 to 7.2 ft.lbs, 0.9 to 1.0 kgf·m}



When telescopic lever **7** is released, and telescopic shaft **B** is retightened at operating torque 6.9 to 7.8 N·m {5.1 to 5.8 ft.lbs, 0.7 to 0.8 kgf·m}, the telescopic lever should lock in the 10° range this side of specified lock position 30°

Out of the range

Within the range

Jiggle steering wheel assembly **9** up and down and check for looseness

Looseness found

No looseness

Remove nut **6**

Procedure is completed

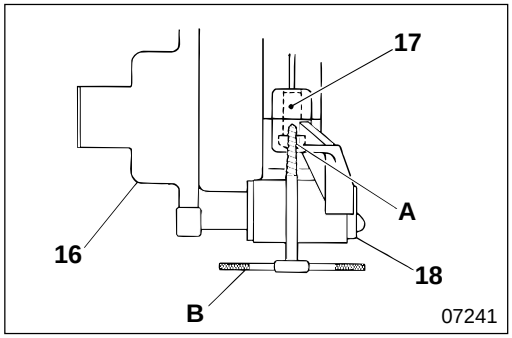
Remove telescopic lever **7**

CAUTION

Be sure not to operate telescopic shaft B while steering wheel assembly 9 is removed.

NOTE

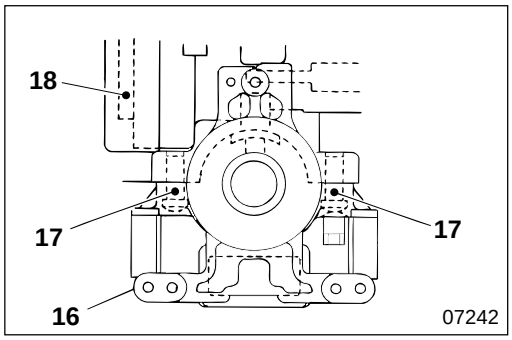
Be sure to assemble telescopic lever 7 only after steering wheel assembly 9 has been installed.



17 **18** **Head cutting bolt, starter switch**

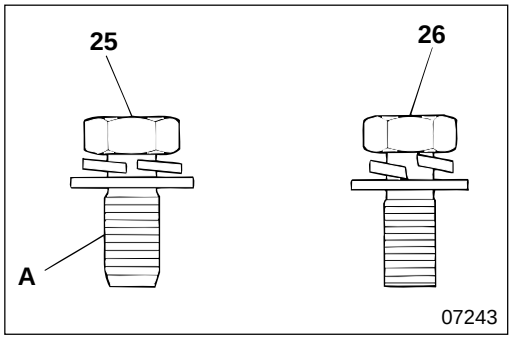
[Removal]

- After removing bracket **16**, drill a ø5.5 to 6.0 mm {0.22 to 0.24 in.} hole 10 to 15 mm {0.39 to 0.59 in.} deep on cutting face **A** of head cutting bolt **17** for mounting starter switch **18**.
- Screw in screw extractor **B** counterclockwise, then pull out head cutting bolt **17**.



[Installation]

- With new head cutting bolt **17**, tighten starter switch **18** at specified torque to cut the head off the bolt.
- After installing bracket **16**, verify operation of the steering lock function of starter switch **18**.

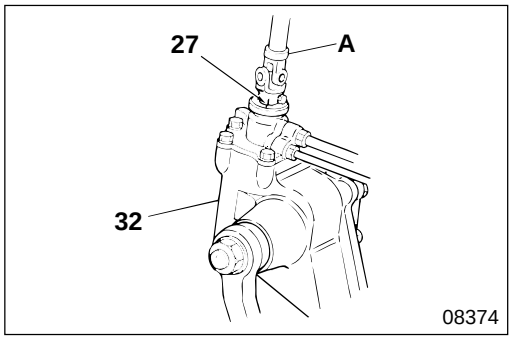


25 **26** **Installation of bolt**

Bolts **25** and **26**, differ in shape. Do not mix them up when installing.

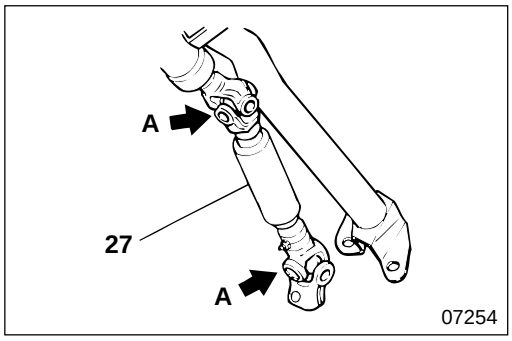
NOTE

Thread area A of bolt 25 is elliptical to facilitate grounding of the horn circuit.



27 **32** **Removal and installation of steering column subassembly and power steering booster**

Before removing steering column subassembly **27**, power streering booster **32**, be sure to make alignment mark **A**.



27 **Steering column subassembly**

When the spline of steering column subassembly **27** is disconnected, align the yokes to the same direction **A**.

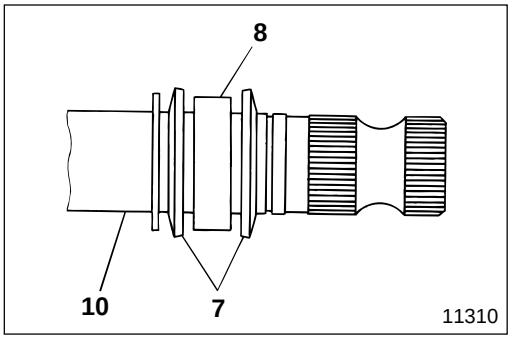
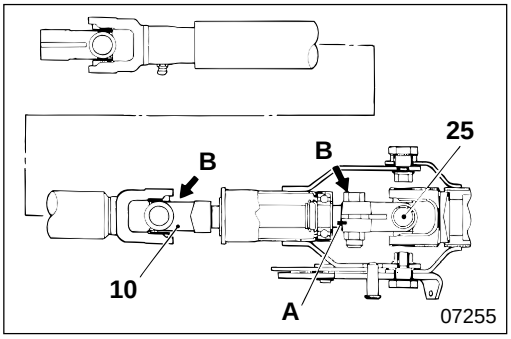
◆ Service procedure



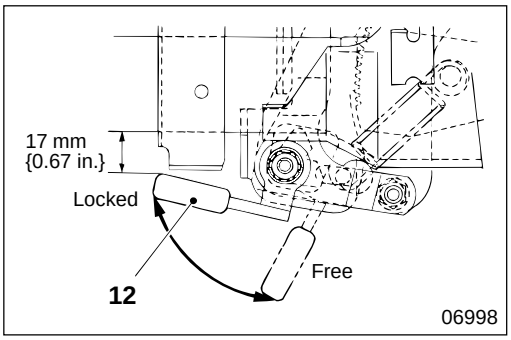
7 **Installation of stopper**

Install stoppers **7** on steering shaft assembly **10** in the direction as illustrated so that they straddle bearing spacer **8**.



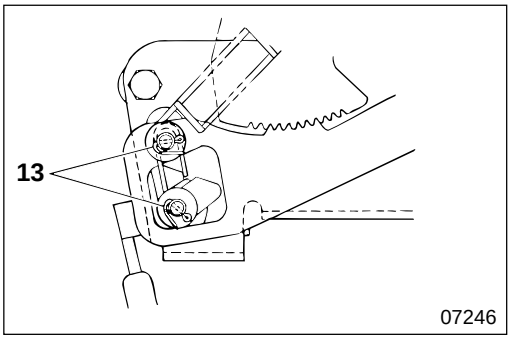
10 **Steering shaft assembly**

- Before removing steering shaft assembly **10**, be sure to make alignment mark **A**.
- Install the steering shaft with direction **B** of the telescopic shaft assembly **25** yoke and steering shaft assembly **10** yoke aligned or at phase angle of 90°.



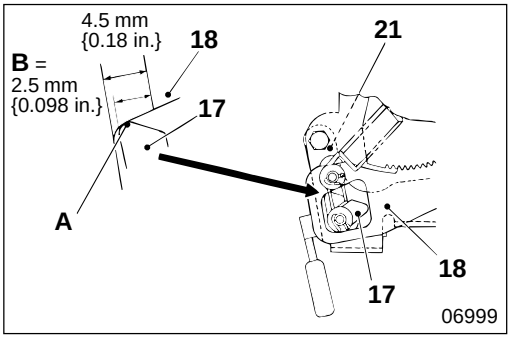
12 **Installation of lock lever**

- Install lock lever **12** so it is within the working angle when locked.
- After installing lock lever **12**, make sure that the lever operates smoothly (operating force less than 49 N {11 lbf, 5 kgf}). With the lever free, make sure that high tilt operates smoothly.



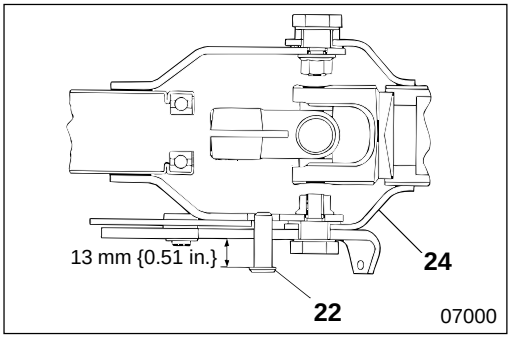
13 **Installation of split pin**

Bend split pin **13** to face outwards as illustrated.



17 **Installation of cam**

Adjust lever support **21** so that the top surface **A** of cam **17** is within dimension **B** of lock plate **18** to install the cam.



22 **Installation of clevis pin**

Drive clevis pin **22** into column support upper **24** so that the drive dimension is obtained.

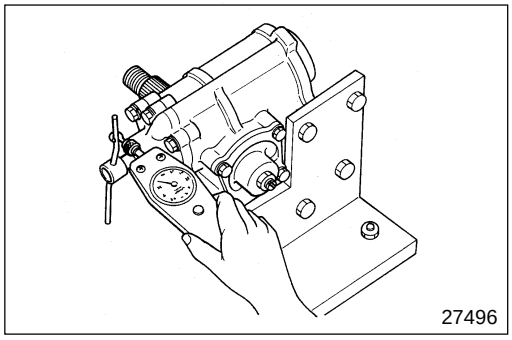
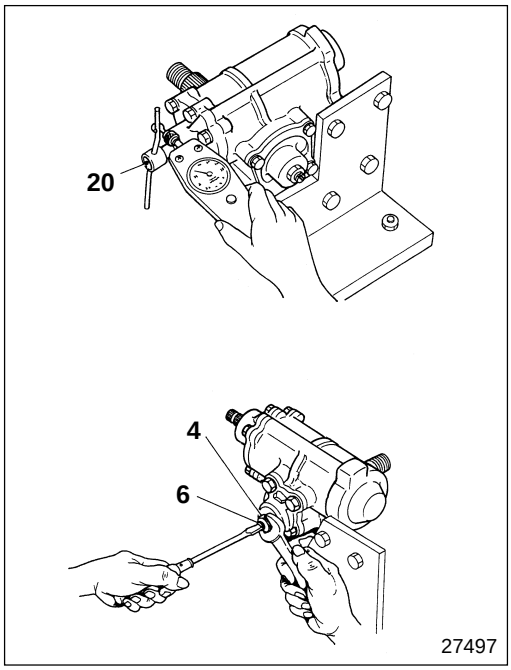
◆ Service procedure



● **Inspection before disassembly**

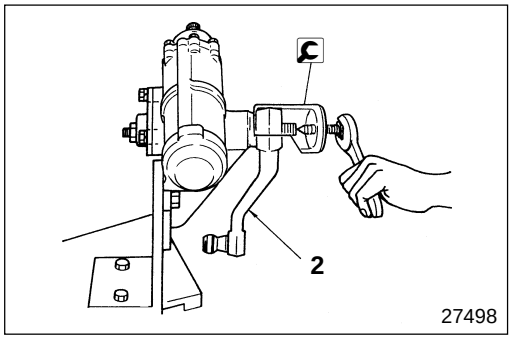
[Measurement of total starting torque]
Before disassembly, measure the total starting torque for a reference during assembly.



● **Inspection after assembly**

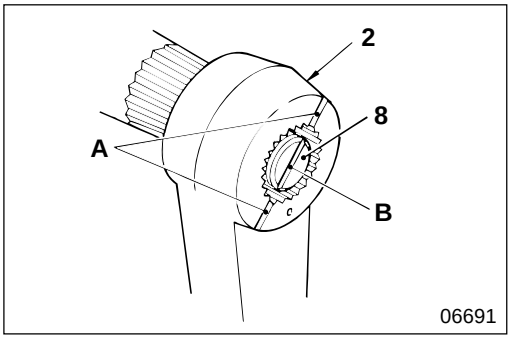
[Measurement of total starting torque]

- While turning ball screw set shaft **20**, one quarter of a turn left and right from the neutral position using a torque meter, drive adjusting bolt **6** in, then adjust so that the total starting torque or the engagement torque is within the standard value.
- After adjustment, tighten nut **4** at specified torque.

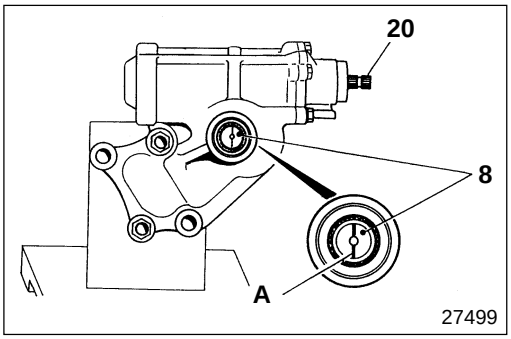


2 **Pitman arm**

[Removal]
: Pitman arm puller



[Installation]
Align slit **B** of the V-groove of sector shaft **8** on the same line as slit **A** of the V-groove of pitman arm **2** when installing it.



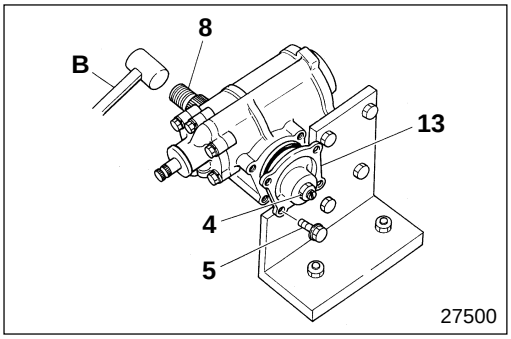
8 **13** **Sector shaft and side cover**

[Removal]

- Turn ball screw set shaft **20** counterclockwise to the lock position, then turn it clockwise approximately 2.6 turns, so that slit **A** of the V-groove at the end of sector shaft **8** is in the neutral position as illustrated.

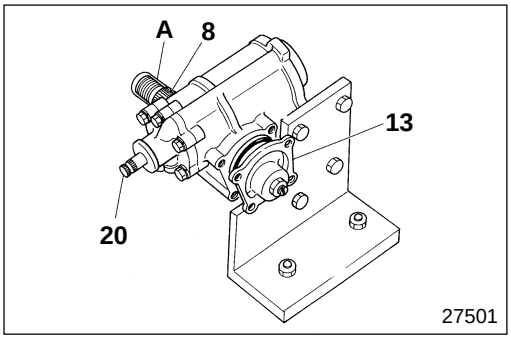
NOTE

At this time, make sure that slit A of the V-groove at the end of sector shaft 8 is at right angles to the axial line of ball screw set shaft 20.



- Loosen nut **4** and remove bolt **5**. After making sure that sector shaft **8** is in the neutral position, tap the end of the sector shaft, and pull out side cover **13** together with the sector shaft.

  B : Plastic-headed mallet



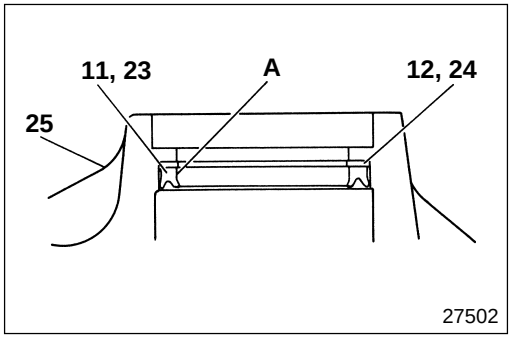
[Installation]
With ball screw set shaft **20** in the neutral position, insert sector shaft **8** and side cover **13**.

CAUTION ⚠

Insert sector shaft 8 with the thread area of the shaft end and serration area protected by cover A to prevent damage to the oil seal.

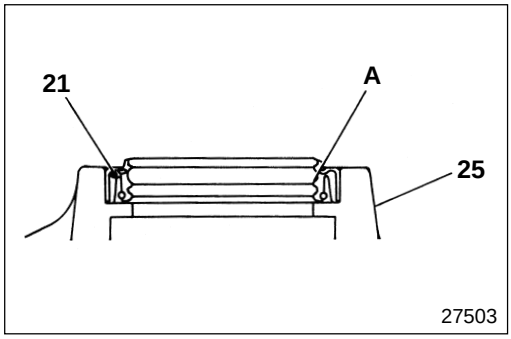
NOTE

- **Turn ball screw set shaft 20, and make sure that the shaft rotates approximately five turns lock-to-lock.**
- **If the number of turns is less, inspect engagement of ball screw set shaft 20 and sector shaft 8.**



11 **23** **Installation of U-packing**

Apply grease to lip area **A** of U-packing **11, 23** and install into gear box **25** as illustrated.



21 **Installation of oil seal**

Apply grease to lip area **A** of oil seal **21** and install into gear box **25** as illustrated.

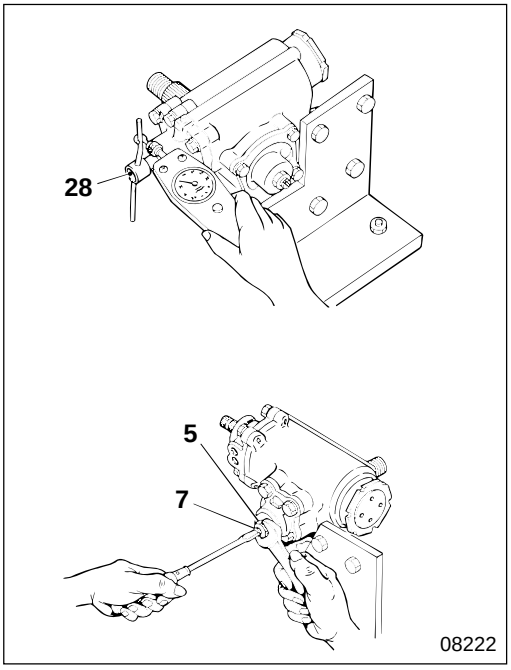
◆ Service procedure

● **Inspection before disassembly**

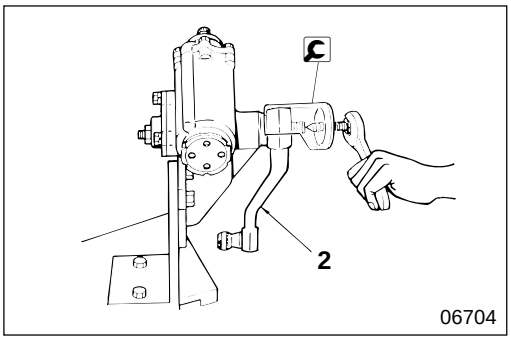
[Measurement of total starting torque]
Before disassembly, measure the total starting torque for a reference during assembly.



● **Inspection after assembly**

[Measurement of total starting torque]

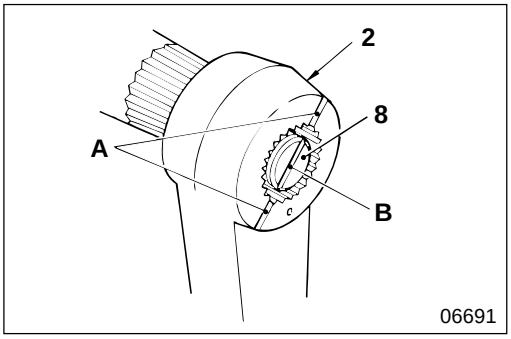
- While turning ball screw set shaft **28**, one quarter of a turn left and right from the neutral position using a torque meter, drive adjusting bolt **7** in, then adjust so that the total starting torque or the engagement torque is within the standard value.
- After adjustment, tighten nut **5** at specified torque.



2 **Pitman arm**

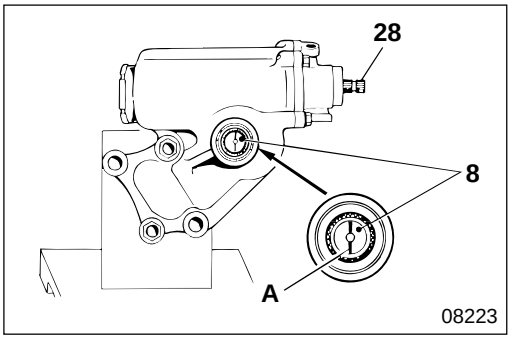
[Removal]

: Pitman arm puller



[Installation]

Align slit **B** of the V-groove of sector shaft **8** on the same line as slit **A** of the V-groove of pitman arm **2** when installing it.



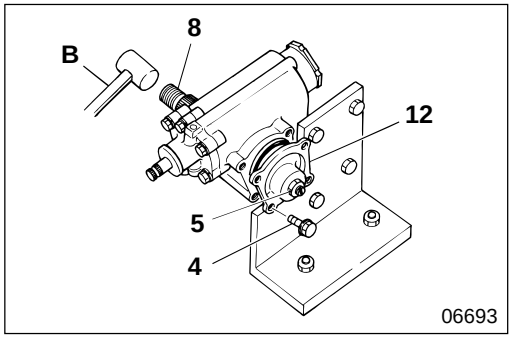
8 **12** **Sector shaft and side cover**

[Removal]

- Turn ball screw set shaft **28** counterclockwise to the lock position, then turn it clockwise approximately 2.6 turns, so that slit **A** of the V-groove at the end of sector shaft **8** is in the neutral position as illustrated.

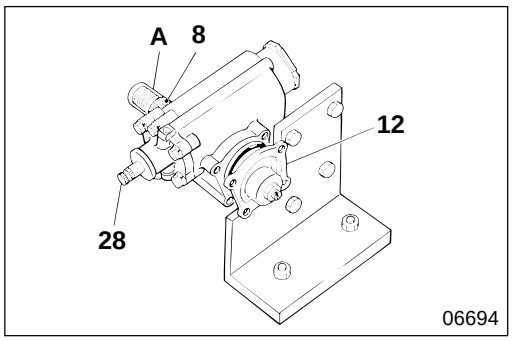
NOTE

At this time, make sure that slit A of the V-groove at the end of sector shaft 8 is at right angles to the axial line of ball screw set shaft 28.



- Loosen nut **5** and remove bolt **4**. After making sure that sector shaft **8** is in the neutral position, tap the end of the sector shaft, and pull out side cover **12** together with the sector shaft.

  B : Plastic-headed mallet



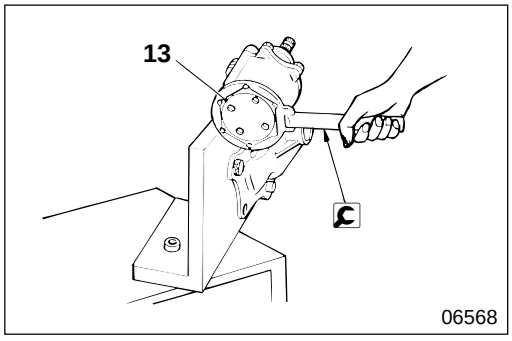
[Installation]
With ball screw set shaft **28** in the neutral position, insert sector shaft **8** and side cover **12**.

CAUTION

Insert sector shaft 8 with the thread area of the shaft end and serration area protected by cover A to prevent damage to the oil seal.

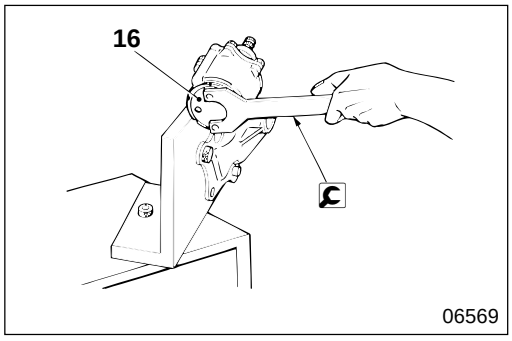
NOTE

- **Turn ball screw set shaft 28, and make sure that the shaft rotates approximately five turns lock-to-lock.**
- **If the number of turns is less, inspect engagement of ball screw set shaft 28 and sector shaft 8.**



13 Removal and installation of special nut

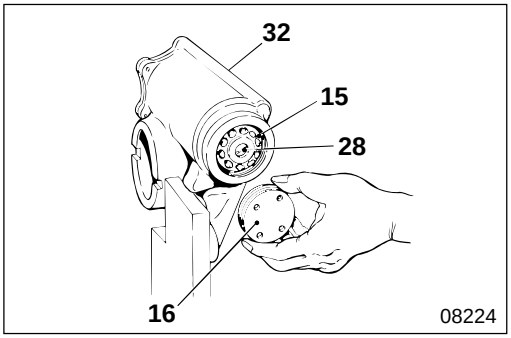
: Special nut wrench



16 End cover

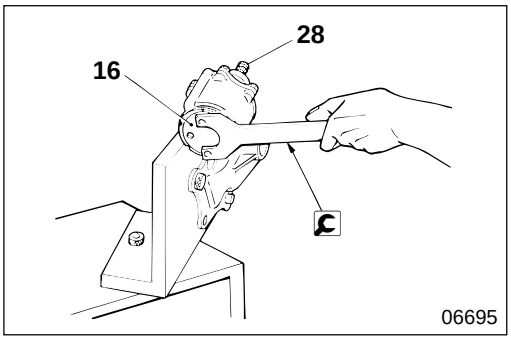
[Removal]

: End cover wrench

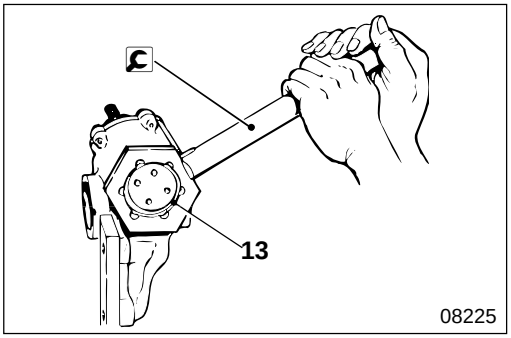


[Installation]

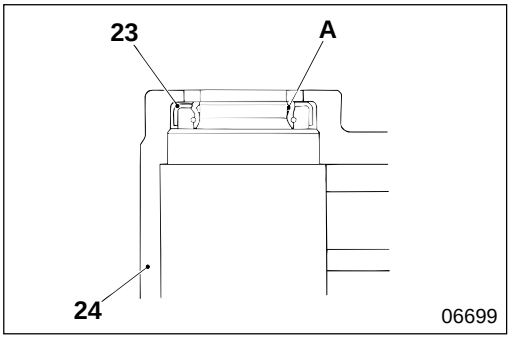
- Install inner race of bearing **15** onto the end of ball screw set shaft **28**, then install the outer race of the bearing onto end cover **16** and screw into gear box **32**.



- Making sure that the rotation torque of ball screw set shaft 28 is not uneven, thread end cover **16**, using 🔧 end cover wrench, until the rotation torque is within the standard value.

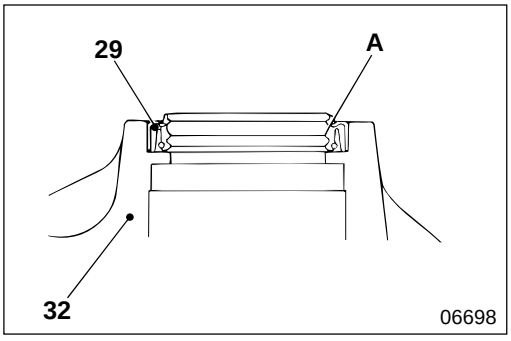


- At the point where the rotation torque is fixed, tighten special nut **13** at specified torque, using 🔧 special nut wrench.



23 **Installation of oil seal**

Apply grease to lip area **A** of oil seal **23** and install into valve housing **24** as illustrated.



29 **Installation of oil seal**

Apply grease to lip area **A** of oil seal **29** and install into gear box **32** as illustrated.

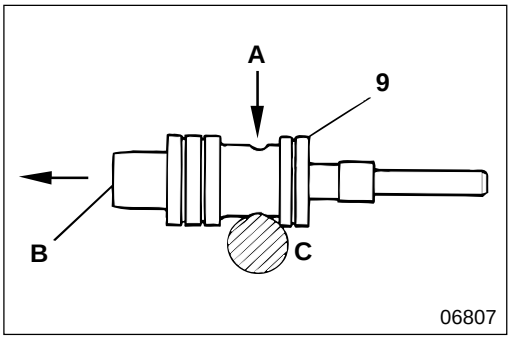
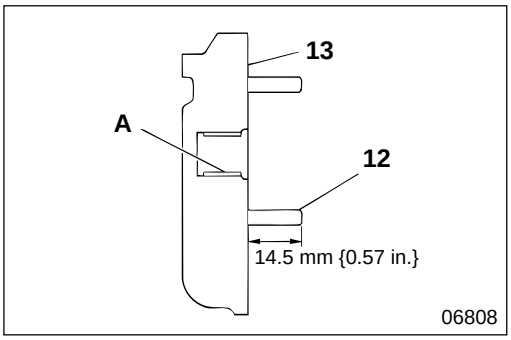
◆ Service procedure



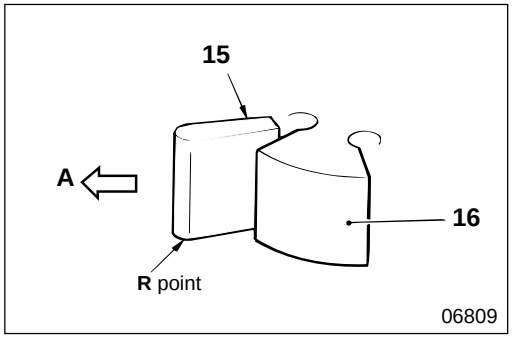
9 **Inspection of relief valve assembly**

Block one side of the hole of relief valve assembly **9**, with your finger **C**, then when air pressure **A** of 390 to 490 kPa {57 to 71 psi, 4 to 5 kgf/cm²} is applied from the other side, check whether air is released from small hole **B** at the rear. If air is not released, it is normal.



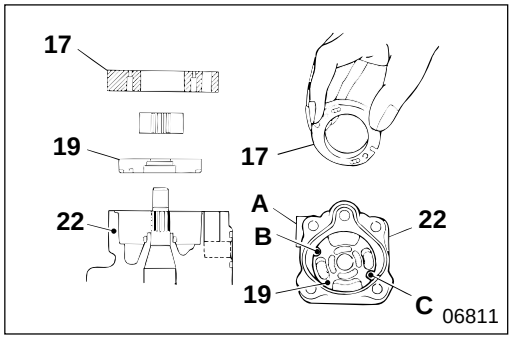
12 **13** **Installation of pin and cover**

- Press-fit pin **12** into cover **13**, to the press-fitting height.
- Apply hydraulic oil to bushing area **A** of the cover.



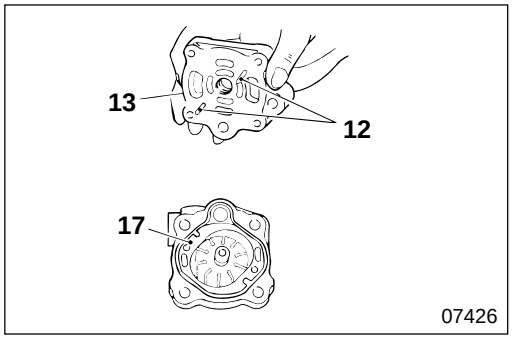
15 **Installation of vane**

With **R** point of vane **15** facing outside **A**, install it on rotor **16** and make sure that the vane moves smoothly. If it is faulty, replace cartridge **14**.



17 **19** **Installation of cam ring and side plate**

- Since the mounting direction of side plate **19** is determined, mount the side plate, so that relief valve side **A** is aligned with round hole **B** (standard pin side) and slotted hole **C** is located on a diagonal.



- Align cam ring **17** with pin **12** of cover **13**, then install the cam ring.

◆ Service procedure

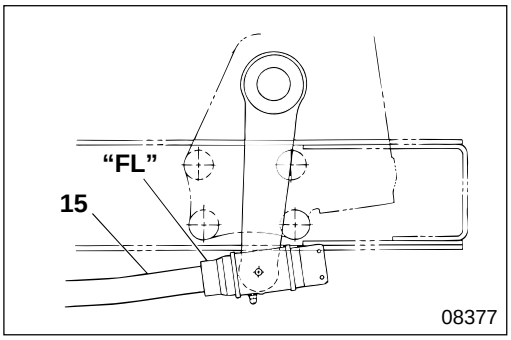
1 **2** **8** **9** **Installation of split pin and end plug**

- Tighten end plug **2, 9** fully, then slacken it off by one half of a turn.
- Place split pins **1**, **8** so that the heads face the outside of the vehicle.
- Stake the heads of split pins **1**, **8** until they are approximately 4 mm {0.16 in.} thick.



15 **Installation of drag link**

Install drag link **15** with front mark **"FL"** facing the front of the vehicle.

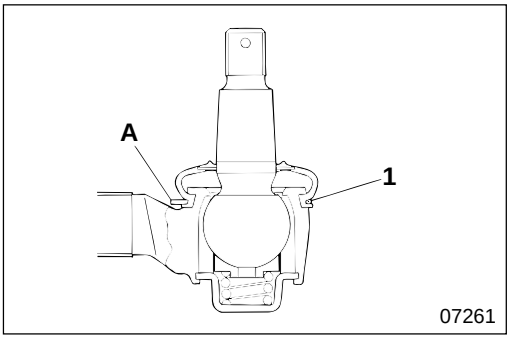
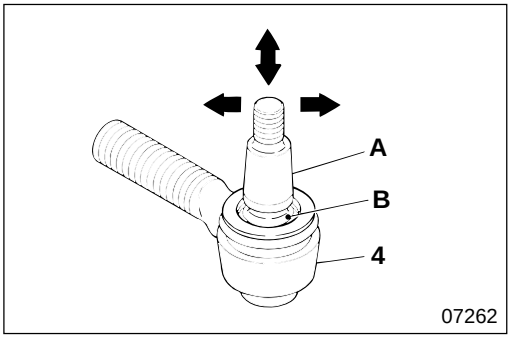
◆ Service procedure



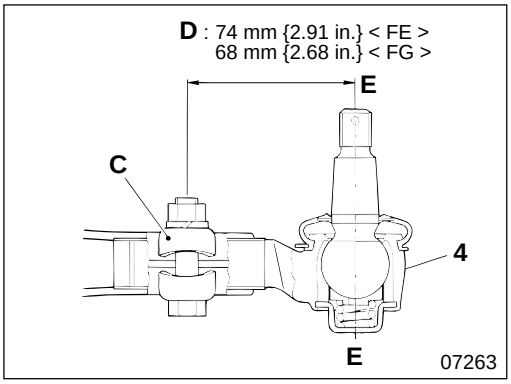
1 **Installation of clip**

Install clip **1** with alignment port **A** in the direction as illustrated.



4 **Tie rod end**

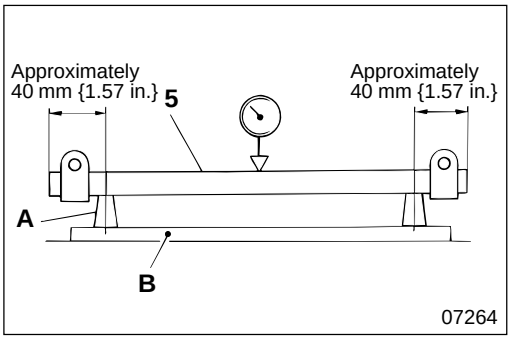
[Inspection]
Move ball stud area **A** vertically and horizontally to inspect for looseness. Ensure that ball **B** rotates evenly.



[Installation]
- Screw in tie rod end **4** so that dimension **D** of the tie rod end and clamp **C** differs by 1.5 mm {0.059 in.} or less between left and right.
- Secure axis **E – E** so that it is parallel both left and right.

NOTE

Deviation of the left and right screw-in amount of tie rod end 4 should be within one turn.



5 **Bending of tie rod**

Measure the bend of tie rod **5** at the center point. If the measured value exceeds the limit, correct or replace the tie rod.

NOTE

To measure the deflection of tie rod 5, turn it one full rotation and read the dial gauge indicator. The deflection is one half of the indicated value.

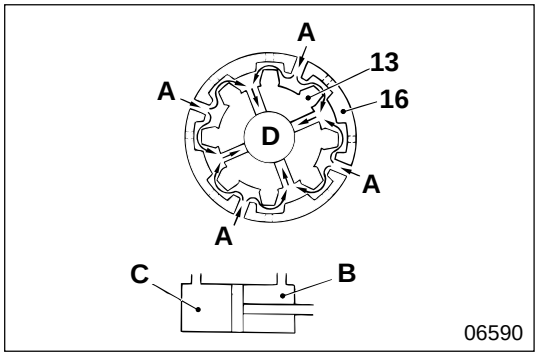
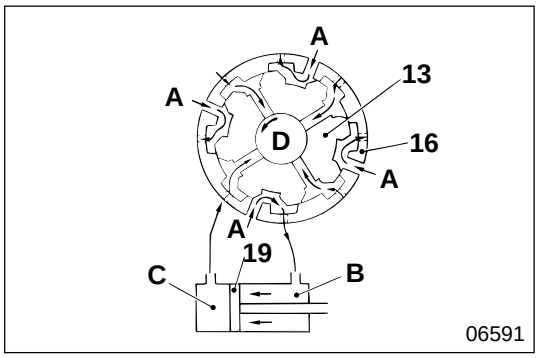
Rotary valve **16** is the central part of the power steering booster. Torsion bar **9** allows the steering reaction force and valve return to operate lightly and smoothly at low speed, and ensures stable steering feel even at high speed.



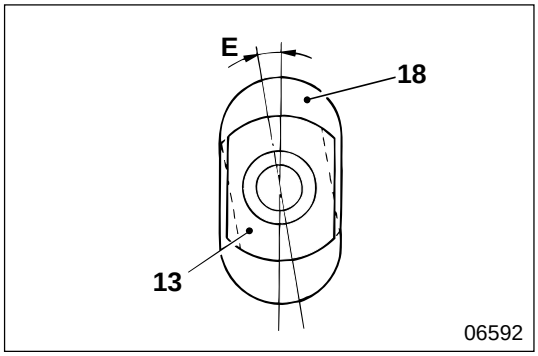
● **Straight-ahead drive operation**

When steering torque is not applied by the steering wheel, input shaft **13** is not activated and remains in neutral. At this time, pressurized fluid from the oil pump flows through the input shaft and the hole of rotary valve **16**, and returns to the oil tank without flowing into cylinder chambers **B**, **C**.
A : From the oil pump
D : To the oil tank



● **Steering operation**

Turning the steering wheel rotates input shaft **13**, causing rotary valve **16** to close the fluid feed passage to cylinder chamber **C**. This produces a pressure difference between cylinder chambers **B**, **C**, which causes rack piston **19** to move, and facilitates rotation of main shaft **18**.
The illustration shows right-turn steering, and should be reversed for left-turn steering.



● **Operation when hydraulic circuit is faulty**

The safety structure means that when the fluid circuit is faulty, the stopper of input shaft **13** directly contacts the groove at the large end of main shaft **18** to transmit steering force, enabling manual operation.
