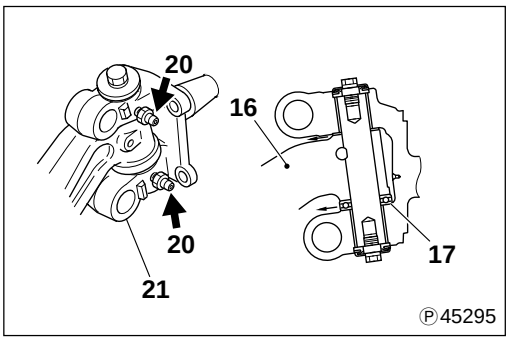
20	Supply via knuckle grease nipple	Wheel bearing grease [NLGI No.2 (Li soap)]	As required

Special tools

Unit : mm {in.}

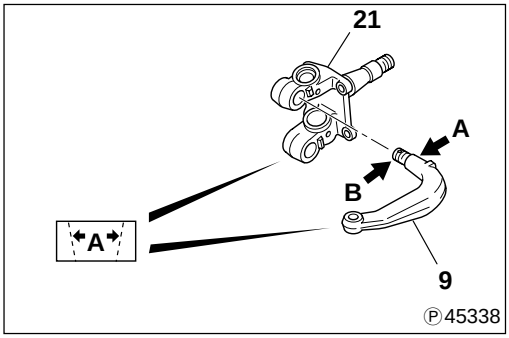
Location	Tool name and shape	Part No.	Application
11	Kingpin set bolt remover  00938	MH061688	Removal of kingpin set bolt
15	Kingpin puller  00939	MH061684	Removal of kingpin
18	Oil seal installer  00940	MH062202	Press-fitting of oil seal
19	Kingpin bushing remover  00941	MH061792 (MH061037)	Removal and installation of kingpin bushing. Tool No. in ( ) is used for press-fitting oil seal installer



◆ Service procedure

● Work after assembly

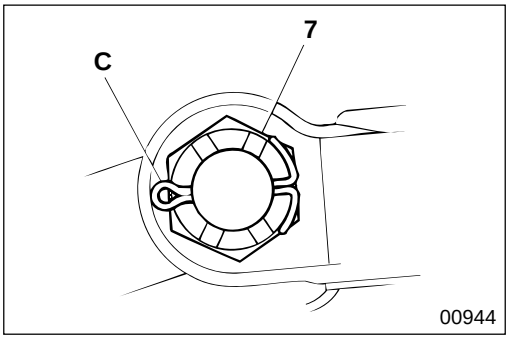
Supply grease via grease nipple **20** of knuckle **21**. Supply grease until it overflows from thrust washer **16** and the press side of ball bearing **17**.



9 **21** **Installation of knuckle arm and knuckle**

(1) Reassembly of existing knuckle arm 9 and/or knuckle 21

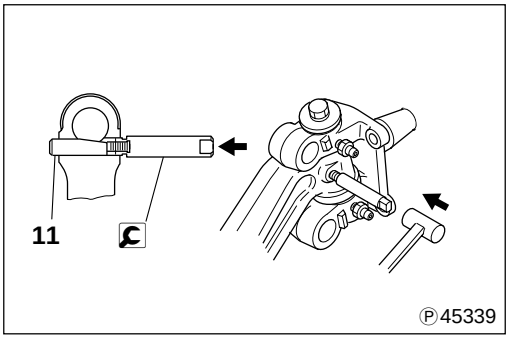
- Evenly polish taper surfaces **A** of knuckle arm **9** and knuckle **21** using emery paper (120 grit or finer), until abrasion traces left by the emery paper are only just visible. For new parts, polishing is not required.
- Clean taper surfaces **A** of knuckle arm **9** and knuckle **21** and thread area **B** of the knuckle arm. (Use a cleaning solvent for acetone color checking or other solvent.)
- Install knuckle arm **9** after applying grease to thread area **B**. (Do not grease the taper surfaces of the knuckle arm and the knuckle.)



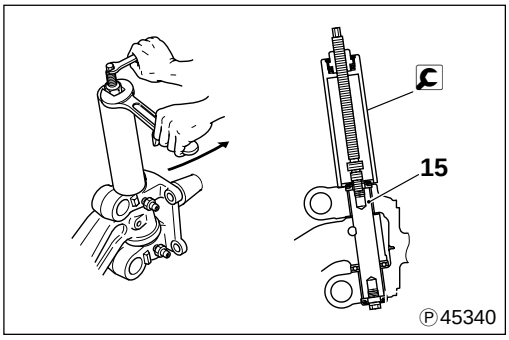
- Tighten new nut **7** at specified torque. Without loosening the nut, insert split pin **C** into the pin hole to lock the nut.

(2) Installation of new knuckle arm 9 and knuckle 21

- Clean taper surfaces **A**, or thread area **B**, of knuckle arm **9** and knuckle **21**, and install them without greasing.
- Tighten new nut **7** at specified torque. Without loosening the nut, insert split pin **C** into the pin hole to lock the nut.

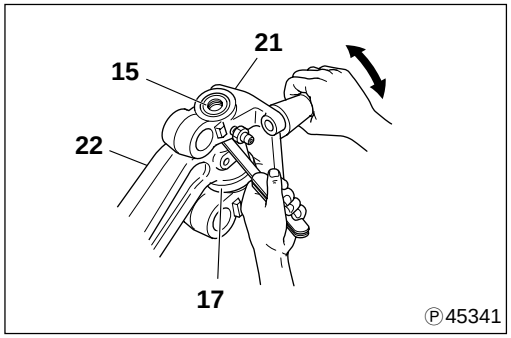


11 **Removal of set bolt**



15 **Removal of kingpin**

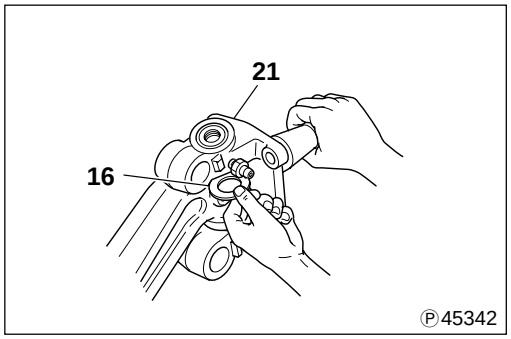
Remove the kingpin cover and dust seal. Screw the bolt of kingpin puller into the threads of kingpin **15**, and remove the kingpin.



16 **21** **22** **Thrust washer, knuckle, and front axle**

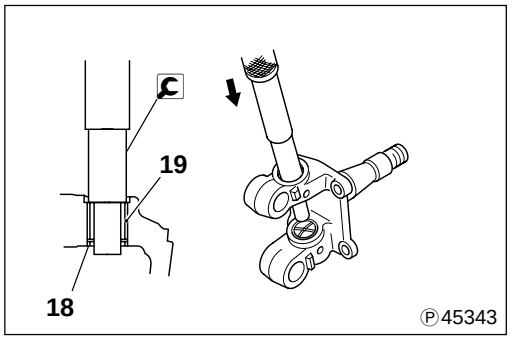
[Inspection]

- Assemble kingpin **15** and bearing **17** temporarily, and turn knuckle **21** a couple of times to smooth its operation.
- Measure the clearance between the upper surface of front axle **22** and the lower part of knuckle **21**.
- If the measured value is higher than the limit, adjust with thrust washer **16**.



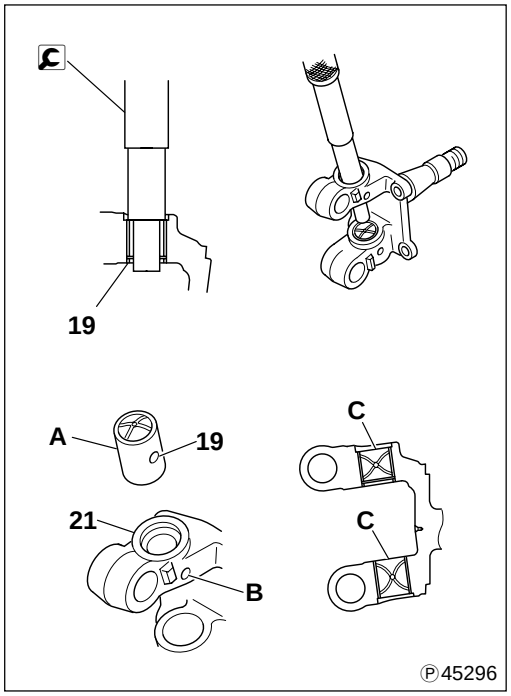
[Adjustment]

- Adjusting thrust washers **16** are available in the following sizes:2.9 to 3.6 mm {0.11 to 0.14 in.} (eight thicknesses in 0.1 mm {0.0039 in.} increments)
- Be sure to minimize the clearance by selecting appropriate thrust washer **16**.
- Make sure that knuckle **21** moves smoothly after assembly



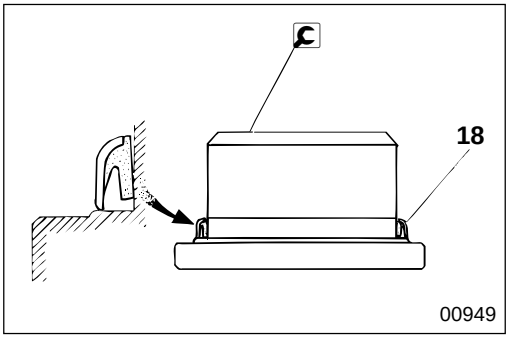
18 **19** **Oil seal and bushing**

[Removal]

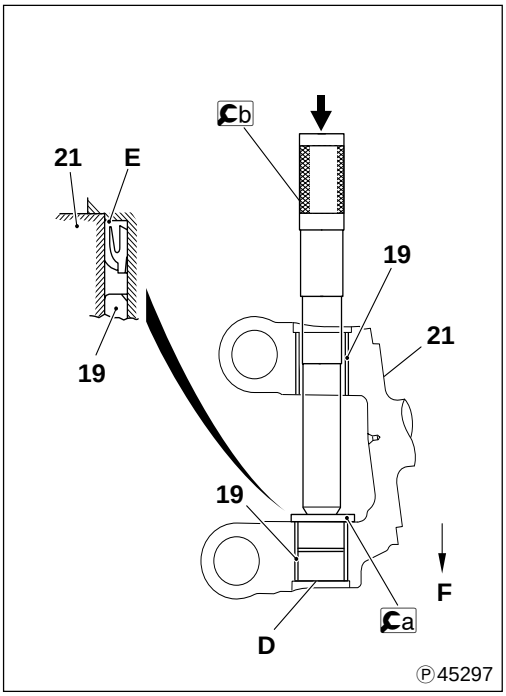


[Installation]

- Press bushing **19** in, with its oil hole **A** aligned to oil hole **B** of knuckle **21**, until end **C** is flush with the knuckle end.

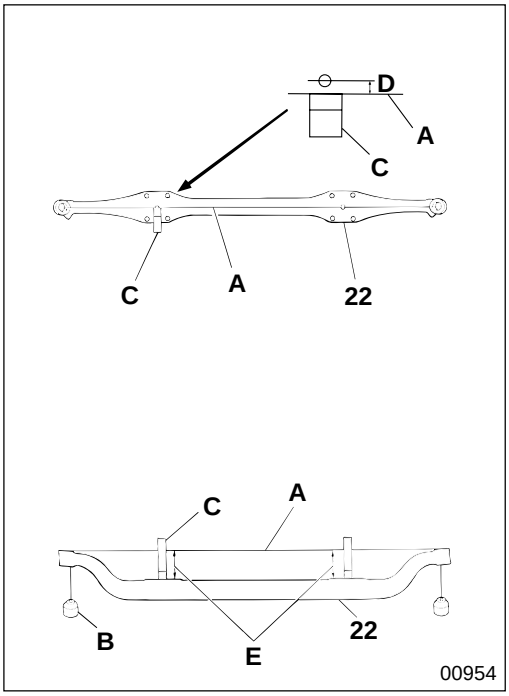


- Apply grease to lip area of oil seal **18**, and position the oil seal on oil seal installer.



- Next, install oil seal installer on knuckle **21** in the direction as illustrated.
- Pass kingpin bushing remover through the kingpin hole and position it on oil seal installer.
- Hit the head of kingpin bushing remover until oil seal installer makes contact with knuckle **21**.
- Make sure that end **D** of bushing **19** makes contact with knuckle **21** on the same level.
- Make sure that oil seal end **E** does not protrude from knuckle **21**.

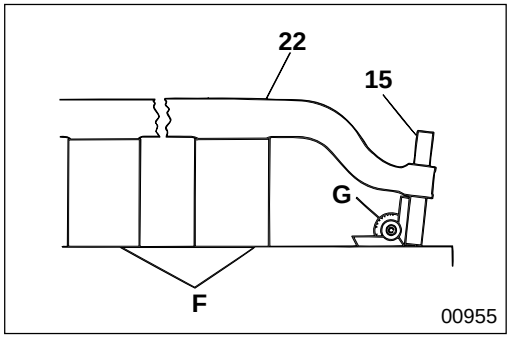
F : Upper side of vehicle



22 Inspection of front axle

(1) Measurement of bend in front axle 22 in longitudinal and vertical directions

- Pass a piece of thread **A** through the kingpin hole of front axle **22** and hang weights **B** on both ends.
- Use square **C** to find the degree of bend in both the longitudinal direction **D** and the vertical direction **E**.
- If the measured value is higher than the limit, replace front axle **22**.



(2) Measurement of kingpin inclination angle

Mount kingpin **15** in front axle **22** as illustrated, and measure the kingpin inclination angle. If the measured value is higher than the limit, replace the front axle.

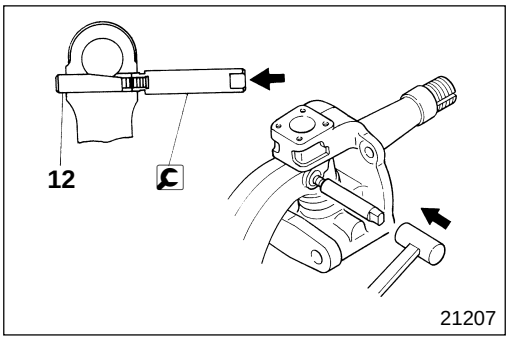
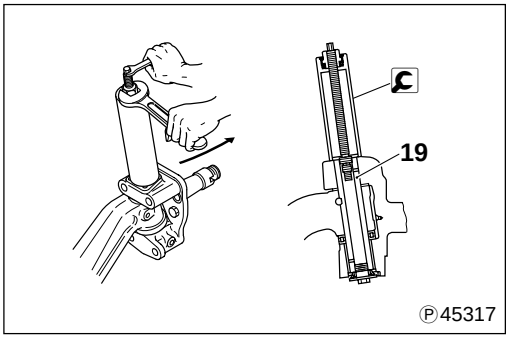
◆ Service procedure

● Work after assembly

Supply grease via grease nipple **13** of knuckle **26**. Supply grease until it overflows from thrust washer **20** and the press side of ball bearing **21**.

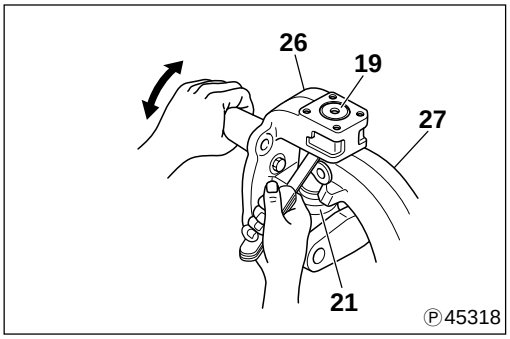


12 **Removal of set bolt**



19 **Removal of kingpin**

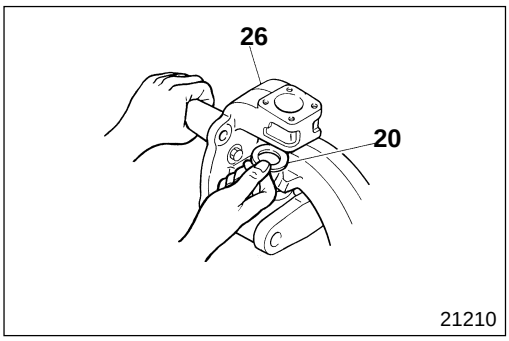
Screw the bolt of kingpin puller into the threads of kingpin **15**, and remove the kingpin.



20 **21** **26** **27** **Thrust washer, bearing, knuckle, and front axle**

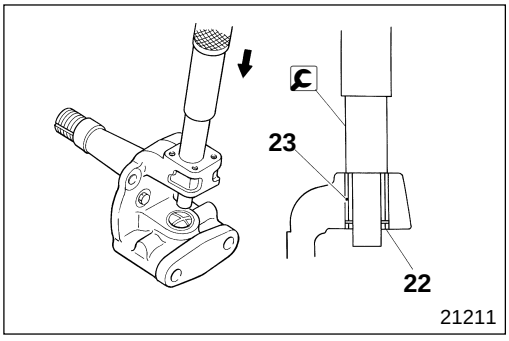
[Inspection]

- Assemble kingpin **19** and bearing **21** temporarily, and turn knuckle **26** a couple of times to smooth its operation.
- Measure the clearance between the upper surface of front axle **27** and the lower part of knuckle **26**.
- If the measured value is higher than the limit, adjust with thrust washer **20**.



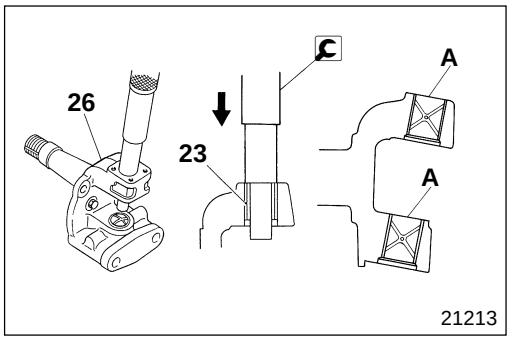
[Adjustment]

- Adjusting thrust washers **20** are available in the following sizes:2.9 to 3.6 mm {0.11 to 0.14 in.} (eight thicknesses in 0.1 mm {0.0039 in.} increments)
- Be sure to minimize the clearance by selecting appropriate thrust washer **20**.
- Make sure that knuckle **26** moves smoothly after assembly



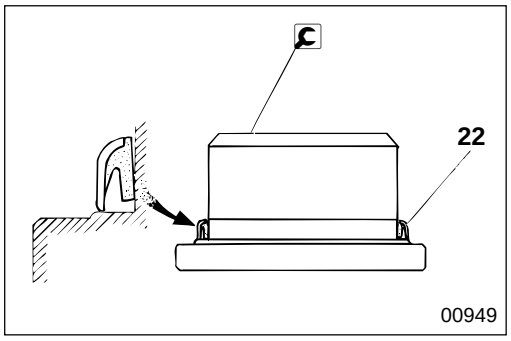
22 **23** **Oil seal and bushing**

[Removal]

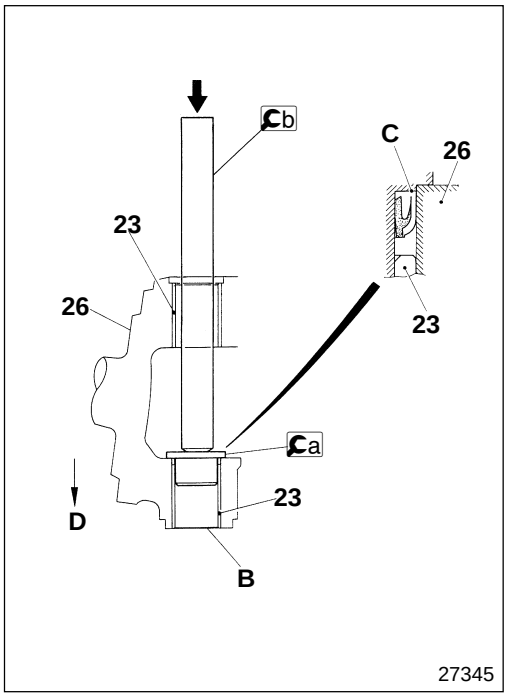


[Installation]

- Install bushing **23**, making sure that its surface is flush with the end face **A** on knuck **26**.



- Apply grease to lip area of oil seal **22**, and position the oil seal on oil seal installer.



- Next, install a oil seal installer on knuckle **26** in the direction as illustrated.
- Pass b kingpin bushing remover through the kingpin hole and position it on a oil seal installer.
- Hit the head of b kingpin bushing remover until a oil seal installer makes contact with knuckle **26**.
- Make sure that end **B** of bushing **23** makes contact with knuckle **26** on the same level.
- Make sure that oil seal end **C** does not protrude from knuckle **26**.

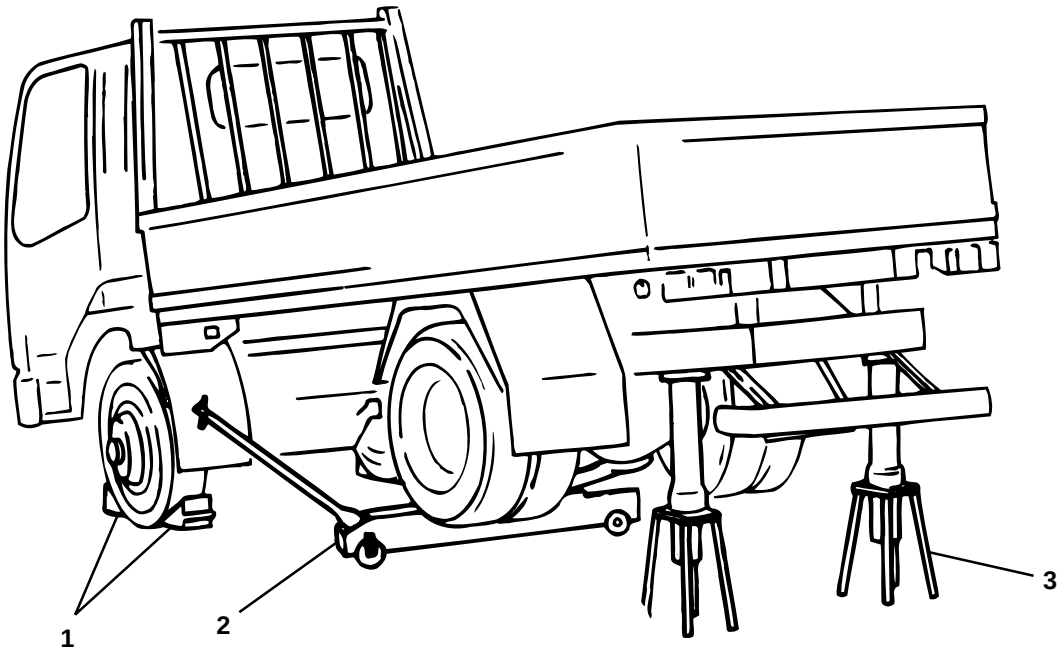
WORK BEFORE REMOVAL AND INSTALLATION OF REAR AXLE



14176

● **Work sequence before removal**

1 Place wheel chocks.
2 Jack up the rear axle using a garage jack.
3 Support the rear frame on rigid racks.

WARNING⚠

- **Chock the wheels securely so the vehicle does not move.**
- **Do not remove the chocks until the entire operation is completed.**
- **Supporting a vehicle on a garage jack only is extremely dangerous, so always support the frame on rigid racks.**
- **Leave the garage jack and rigid racks in place until the entire operation is completed. Never remove them during the operation.**

● **Work sequence after installation**

Follow the work sequence before removal in reverse.

⊗ : Non-reusable parts

CAUTION

Be sure to protect brake pipe 1, from dust by fitting blanking plugs after removal.

NOTE

Do not disassemble brake drum 16 and wheel hub 19 unless they are faulty.

● **Assembly sequence**

Follow the disassembly sequence in reverse.

WARNING

You must bleed air from the brake system after assembly, failure to do so would cause the brake to malfunction. Gr 35A

CAUTION⚠

- **When removing or installing wheel hub and brake drum assembly 11, handle rotor 18 with care to prevent damage. Also, do not damage oil seal 12 during assembly.**
- **Keep oil and grease off lining surface of brake assembly 29 and the inner surface of brake drum 17.**

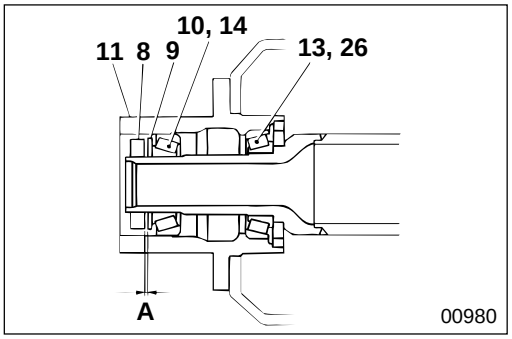
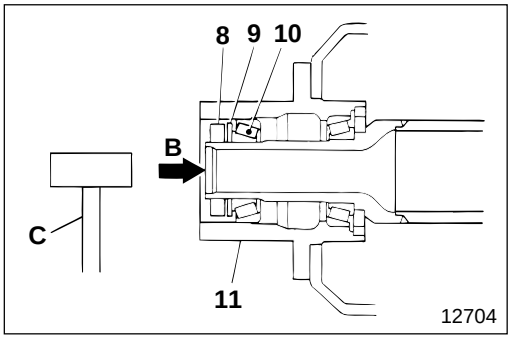
◆ Service procedure

● Starting torque of wheel hub bearing

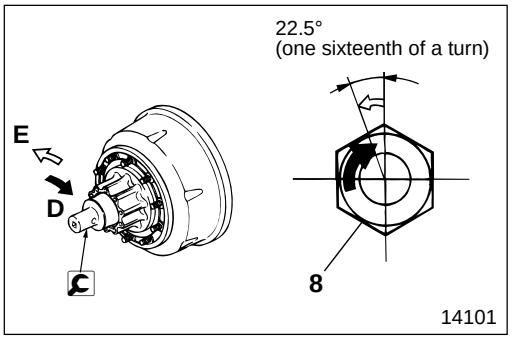


[Adjustment]

- Install lock washer **9** and lock nut **8**.
- Turn wheel hub and brake drum assembly **11** several times to smooth operation of outer bearings **10**, **14** and inner bearings **13**, **26**.
- Tighten lock nut **9** at specified torque.
- Slacken off lock nut **8** to obtain clearance **A** between the lock nut and lock washer **9**.



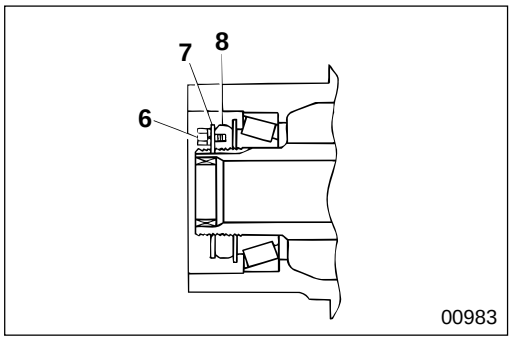
- To slide outer bearing inner race **10** towards lock nut **8**, hit end **B** of the axle tube two or three times with a mallet, while turning wheel hub and brake drum assembly **11**.
  C : Copper-headed mallet



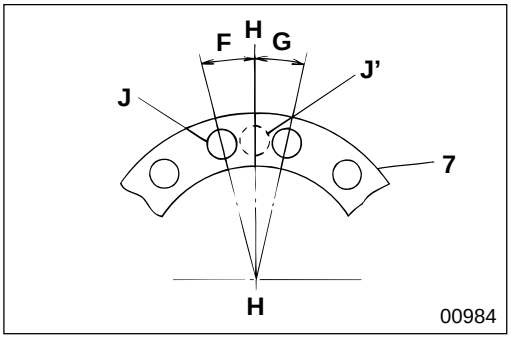
★ • Tighten lock nut **8** at specified torque.
  D : Tightening direction

- Slacken off lock nut **8** by 22.5° (one sixteenth of a turn).
  E : Slackening off direction

(★ : If any fault is found when measuring tangential force, redo from this item.)

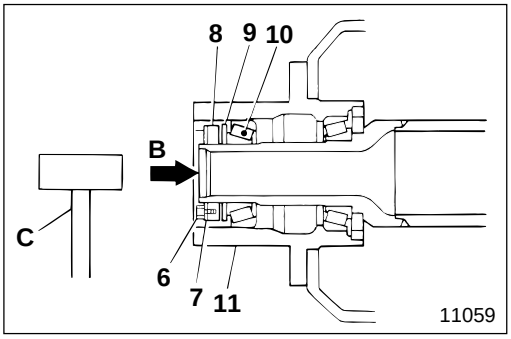


- Install lock plate **7**.
- Make sure that bolt **6** mounting holes of lock nut **8** and lock plate **7** align.
- Tighten bolt **6** at specified torque.

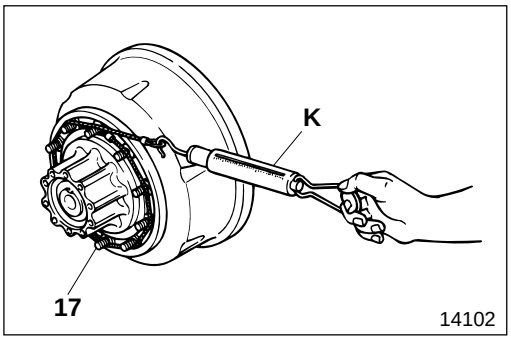


- If mounting holes of lock plate **7** and lock nut **8** do not align, align as follows:

Hole position of lock nut	How to align hole of lock plate
Within range **F**	Loosen lock nut to align holes
Within range **G**	Turn over lock plate and loosen lock nut to align holes
On line **H-H**	Turn over lock plate to align holes (Hole position **J'** changes to **J**)



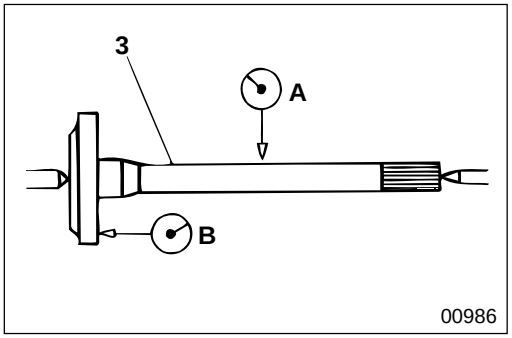
- To slide outer bearing inner race **10** towards lock nut **8**, hit end **B** of the axle tube two or three times with a mallet, while turning wheel hub and brake drum assembly **11**.
  C : Copper-headed mallet



[Measurement]
- Install spring balance **K** on hub bolt **17**.
- Measure the tangential force.
- If the measured tangential force is within the specified value, the starting torque conforms to the standard value.
- Do not allow the tangential force to become higher than the upper limit of the specified value.
- If the measured value deviates from the specified value, repeat from step ★. 📖 P27-14
- If the result is still not satisfactory, replace outer bearings **10, 14** and inner bearings **13, 26**.

NOTE

- **Make sure that there is no drag in brake lining and brake drum 16 before you measure the tangential force.**
- **Measure the starting torque when oil seal 12 has been installed.**



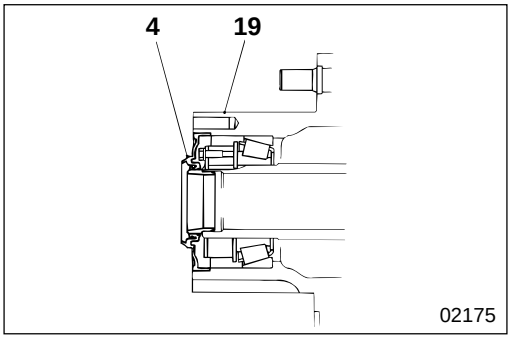
3 **Inspection of axle shaft**

A : Bend of shaft center

NOTE

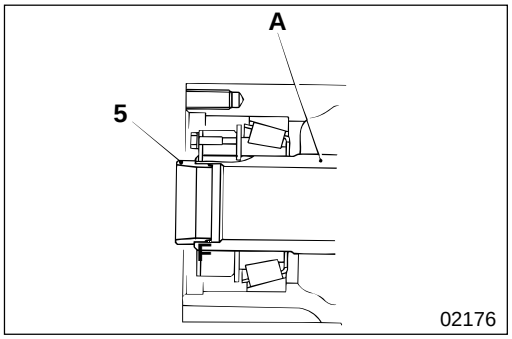
To measure the bend of axle shaft 3, turn it one full revolution and read the dial gauge indicator. The bend is one half of the indicated value.

B : Wobble of flange face



4 **Installation of oil seal**

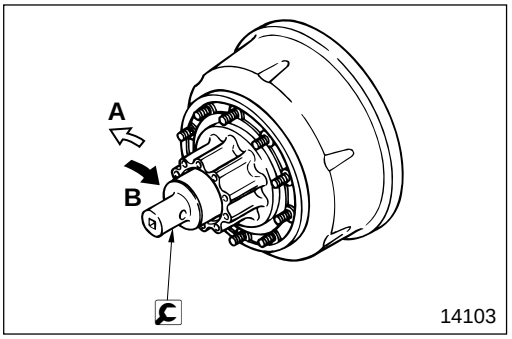
Press-fit oil seal **4** until it is flush with the end of wheel hub **19**.



5 **Oil seal retainer**

[Removal]
It is not necessary to remove oil seal retainer **5** other than for replacement of oil seal **4**.

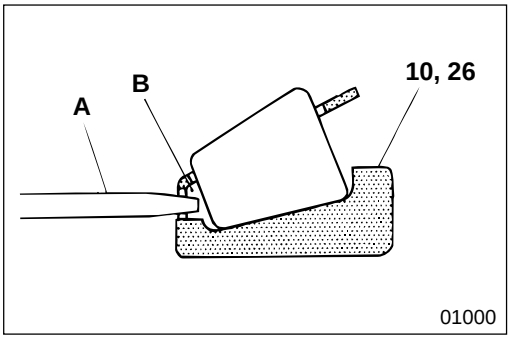
[Installation]
Press-fit oil seal retainer **5** until it is flush with the end of axle tube **A**.



8 **Removal and installation of lock nut**

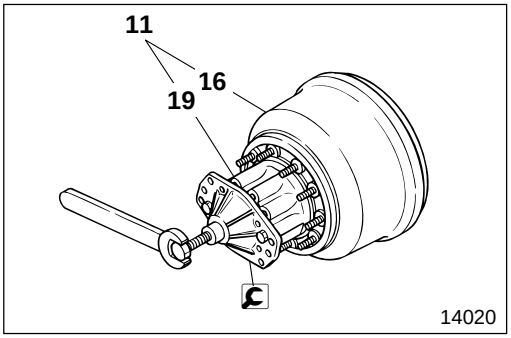
After installation, adjust the starting torque of the wheel hub bearing. See P27-14

A : Removal
B : Installation



10 **26** **Packing grease in outer bearing inner race and inner bearing inner race**

A : Grease pump nozzle
B : Space between rollers

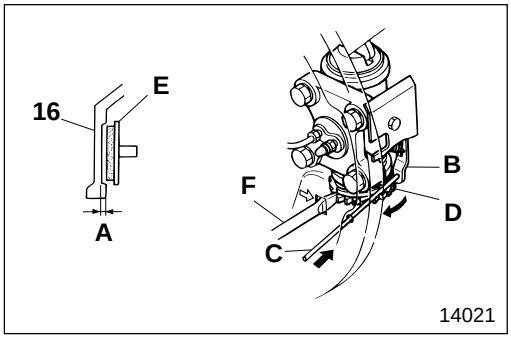


11 Wheel hub and brake drum assembly

[Removal]

CAUTION

Make sure you remove wheel hub and brake drum assembly 11 in a straight line to prevent damage to oil seal 12.



If wheel hub and brake drum assembly **11** cannot be removed because of stepped wear **A** in brake drum **16**, carry out the following:

- Remove the packing plate cover.
- Lift lever **B**.
  C : Wire approximately ø5 mm {0.020 in.}
- Turn adjuster **D** in the opposite direction to the arrow on the packing plate, and expand the clearance between brake drum **17** and brake shoe assembly **E**.
  F : Screwdriver
- Remover wheel hub and brake drum assembly **11**.

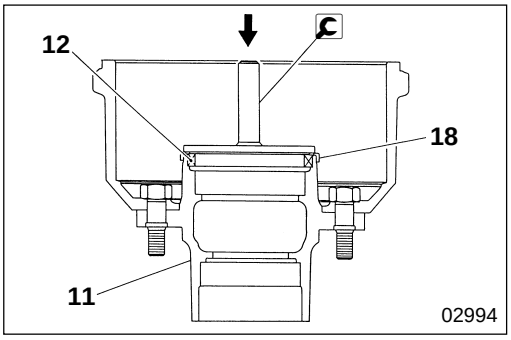
CAUTION

If brake drum 17 is faulty, correct it. Gr 35A, B

[Installation]

After installing wheel hub and brake drum assembly **11**, adjust the brake shoe clearance.

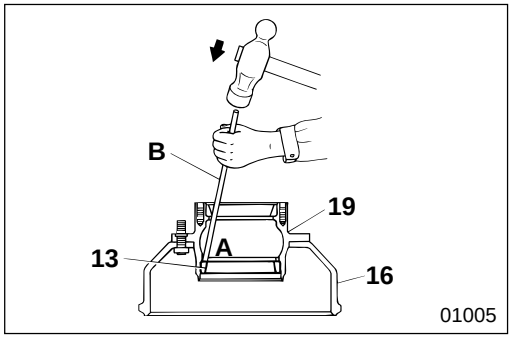
Gr 35A



12 Installation of oil seal

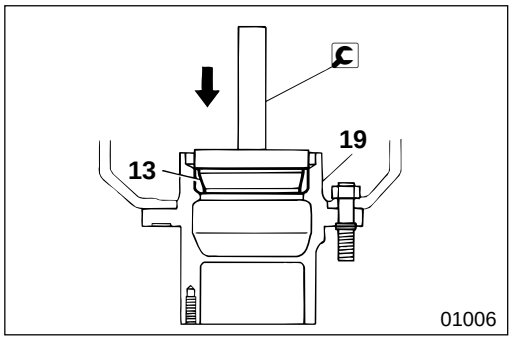
NOTE

When hub and brake drum assembly 11 is removed for a service operation and if rotor 18 is still mounted on the wheel hub, use Anti-lock brake system oil seal installer to press-fit oil seal 12.

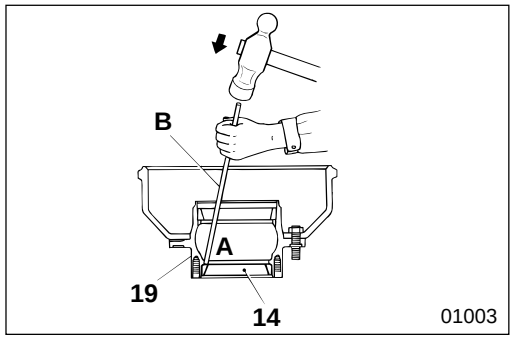


13 **Inner bearing outer race**

[Removal]
Drive out inner bearing outer race **13** evenly from four indented parts **A** in wheel hub **19**.
B : Pin-punch

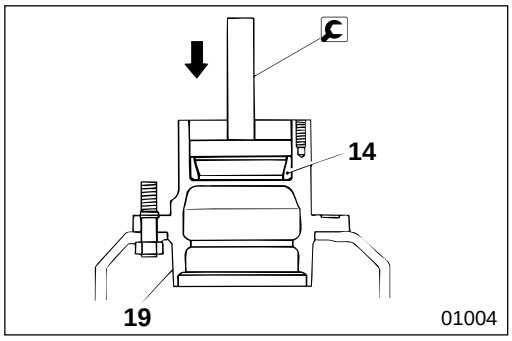


[Installation]

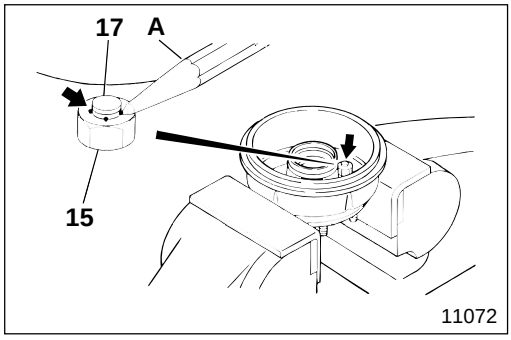


14 **Outer bearing outer race**

[Removal]
Drive out outer bearing outer race **14** evenly from four indented parts **A** in wheel hub **19**.
B : Pin-punch

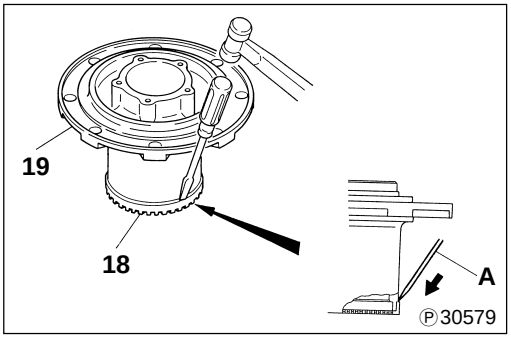


[Installation]



15 **17** **Installation of hub bolt and nut**

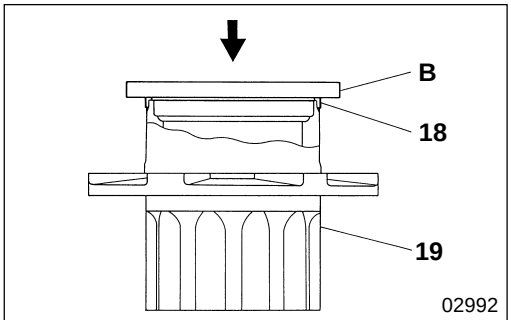
- Install hub bolt **17**.
- Tighten nut **15** at specified torque.
- Caulk nut **15** evenly at four points to keep it from turning.
  A : Pin-punch



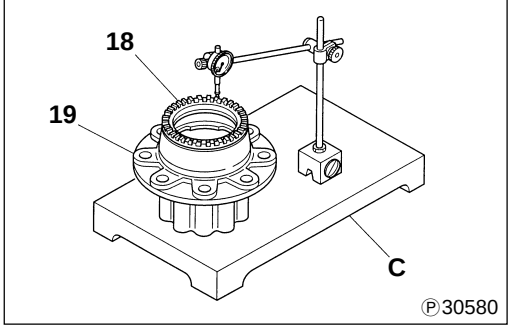
18 **Rotor**

[Removal]
Strike the outer edge of rotor **18** evenly with flat-tip screwdriver **A** to remove the rotor from the wheel hub.

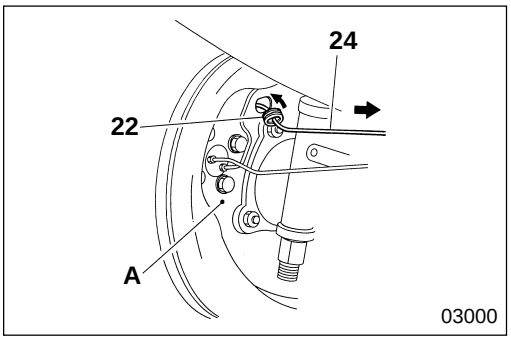
CAUTION ⚠
Be careful not to damage wheel hub 19.



[Installation]
Heat rotor **18** to approximately 150°C {302°F}. Press the rotor evenly with iron plate **B** to press-fit the rotor to wheel hub **19**. Make sure there is no space between the rotor and wheel hub.

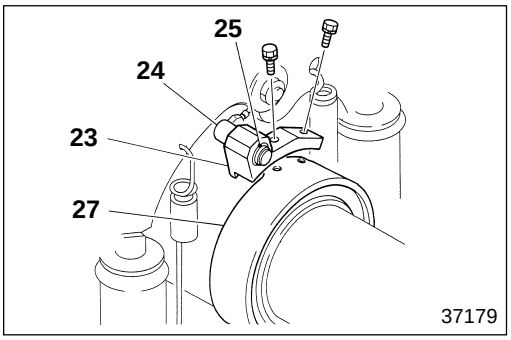


[Inspection]
- If the amount of wobbling exceeds the standard value, repeat the assembly procedure from the beginning.
- If the amount of wobbling exceeds the standard value after reassembly, replace defective parts.
  C : Base



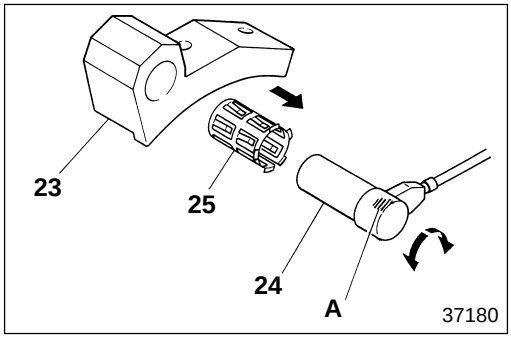
22 **Installation of grommet**

Mount grommet **22** on back plate **A**, and pull the harness of wheel speed sensor **24** to make sure there is no slack inside the wheel brake.



24 **Wheel speed sensor**

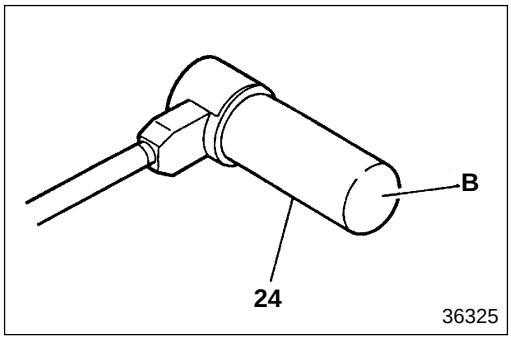
[Removal]
- With wheel speed sensor **24** and spring spacer **25** installed in sensor holder **23**, remove the sensor holder from oil seal retainer **27**.



- Hold shaded section **A** of wheel speed sensor **24** with pliers, and remove the sensor by twisting it slightly in left and right directions.

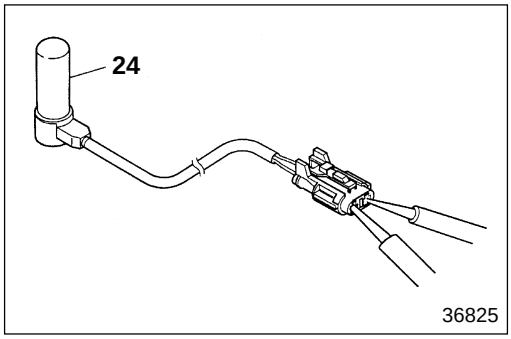
CAUTION

- **When holding wheel speed sensor 24 with pliers, do not grip any section other than shaded area A in the diagram.**
- **When removing wheel speed sensor 24, do not apply force on the sensor, such as by hitting with a hammer, prying with a screwdriver or pulling the harness, since these actions can result in wire breakage.**
- **If wheel speed sensor 24 dismounts easily, replace spring spacer 25.**

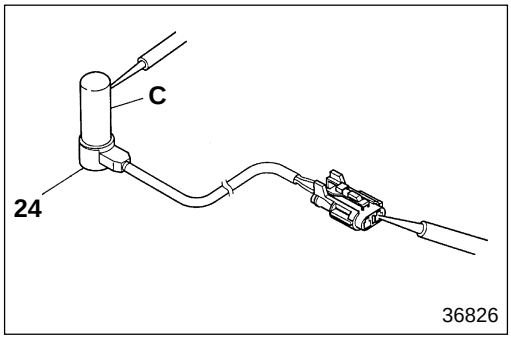


[Inspection]

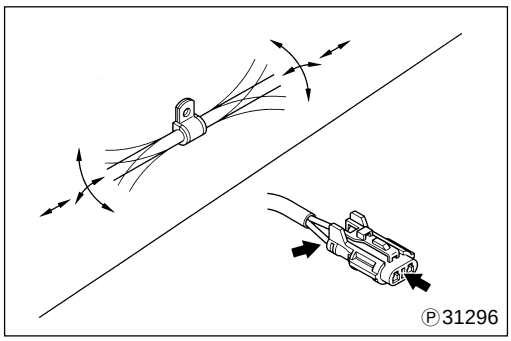
- Since pole piece section **B** is magnetized by the magnet inside wheel speed sensor **24**, it attracts metals. Do not allow the pole piece to collect metallic objects.



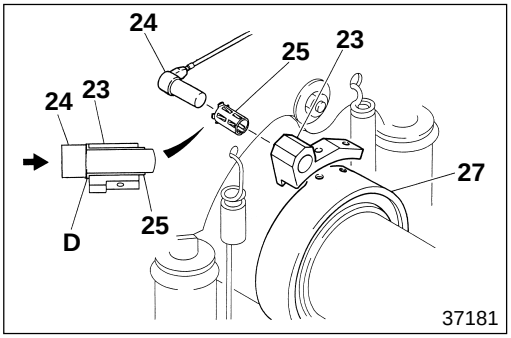
- Measure the resistance between the terminals of wheel speed sensor **24**.
  If the measured value deviates from the standard value, replace the wheel speed sensor.



- Measure the insulation resistance between body **C** of wheel speed sensor **24** and each terminal.
  If the measured values deviate from the standard value, replace the wheel speed sensor.



- To check for broken wires, remove the harness clamp section from the vehicle. Bend and extend the harness to check if there is any broken wire in the harness. Also, inspect the connector for proper contact.
  If a defect is found, replace wheel speed sensor **24**.



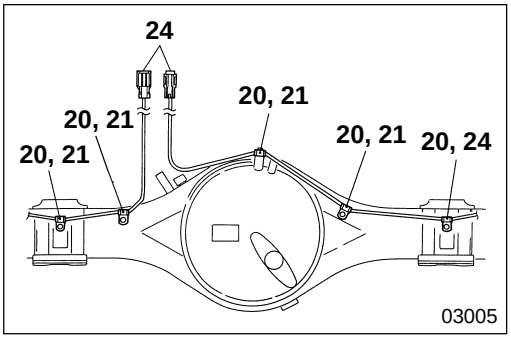
[Installation]

- Insert wheel speed sensor **24** from the back plate, and press until spring spacer **25** and stopper section **D** of the wheel speed sensor contacts sensor holder **23**.
- With wheel speed sensor **24** and spring spacer **25** installed in sensor holder **23**, mount the sensor holder on oil seal retainer **27**.

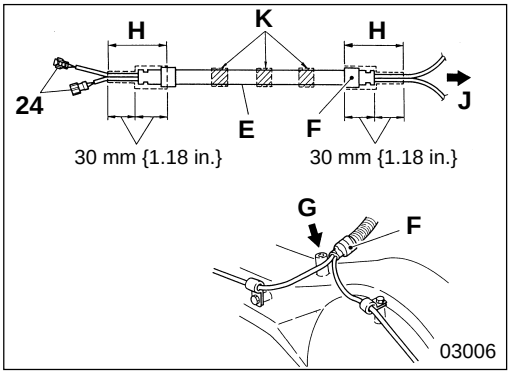
CAUTION

- **When installing wheel speed sensor 24, do not apply force on the sensor, such as by hitting with a hammer, prying with a screwdriver or pulling the harness, since these actions can result in wire breakage.**
- **Note that wheel speed sensor 24 is different for left and right wheels.**

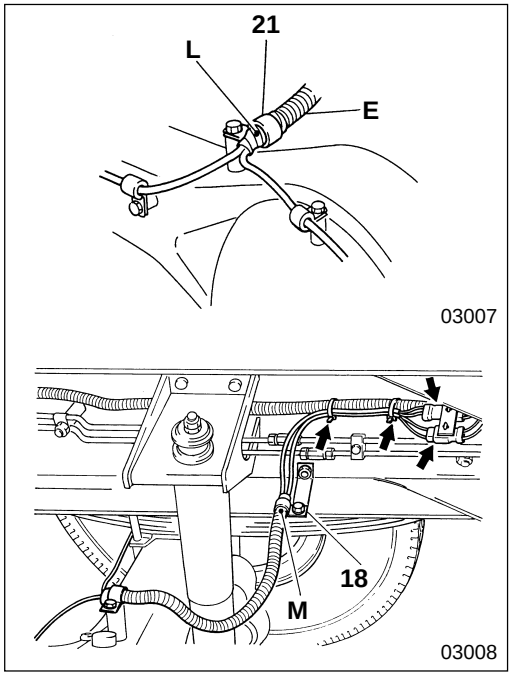
Location	Harness connector color	Harness connector shape
Left wheel	Gray	Male
Right wheel	Black	Female



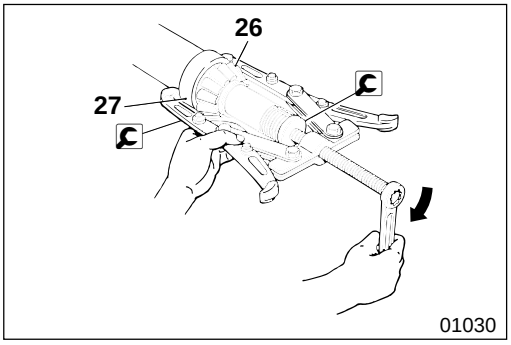
- Rear axle housing section
  Starting from the wheel brake side, secure the harness of wheel speed sensor **24** in place with clip **21** and bolt **20**. Make sure the harness does not interfere with other parts and there is no twist or slack in the harness.



- Binding of harness
  - Gather the harnesses of left and right wheel speed sensors **24**, and bind with corrugated tube **E**.
  - Adjust the position of the corrugated tube **E** so that white tape section **F** is located at clip position **G** on the rear axle housing. Then, turn the corrugated tube so that the slit faces down. Wrap black tape (electric harness tape) on both ends **H** of the corrugated tube. The tape should be placed over the tube end and harness.
    J: Rear axle housing side
  - Wrap tape on the harnesses of wheel speed sensors **24** at sections **K** (three locations at equal intervals).

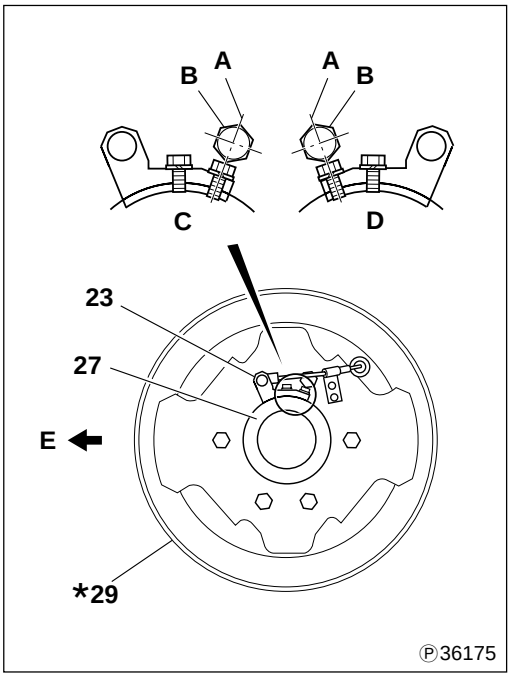


- Clamping of harness
  - Secure section **L** of corrugated tube **E** to the rear axle housing using clip **21**, and attach section **M** of the corrugated tube to the frame using clip **21**.
  - Connect the wheel speed sensor connector to the harness connector on the chassis side, and secure the connectors in place using the bracket.



26 **27** **Inner bearing inner race and oil seal retainer**

[Removal]



[Installation]

When installing oil seal retainer **27**, align mounting bolt center **A** of sensor holder **23** with the center line of mounting bolt **B** of brake assembly **29**.

C : For left wheel
D : For right wheel
E : Front of vehicle

NOTE

The brake assembly diagram shows a left wheel.

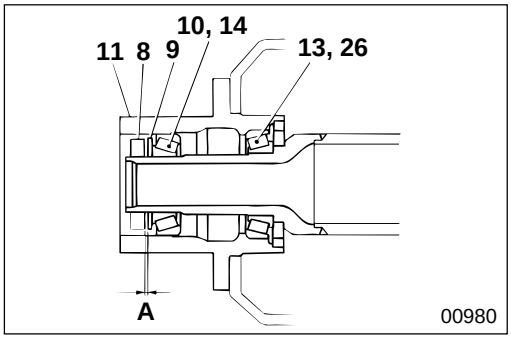
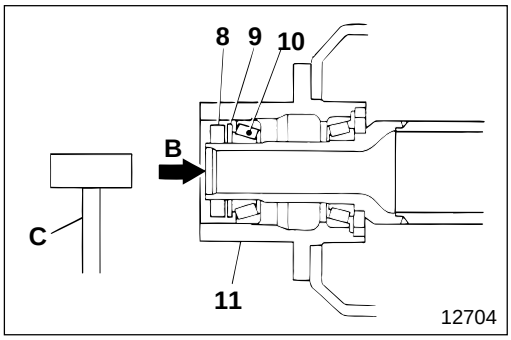
◆ Service procedure

● Starting torque of wheel hub bearing

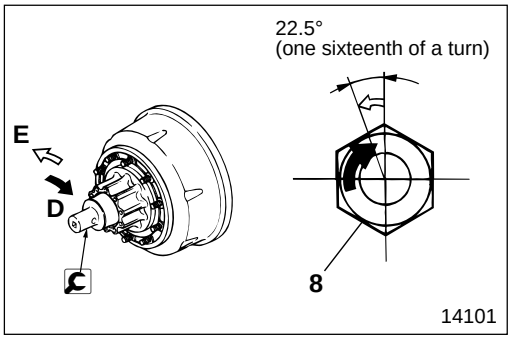


[Adjustment]

- Install lock washer **9** and lock nut **8**.
- Turn wheel hub and brake drum assembly **11** several times to smooth operation of outer bearings **10**, **14** and inner bearings **13**, **26**.
- Tighten lock nut **9** at specified torque.
- Slacken off lock nut **8** to obtain clearance **A** between the lock nut and lock washer **9**.



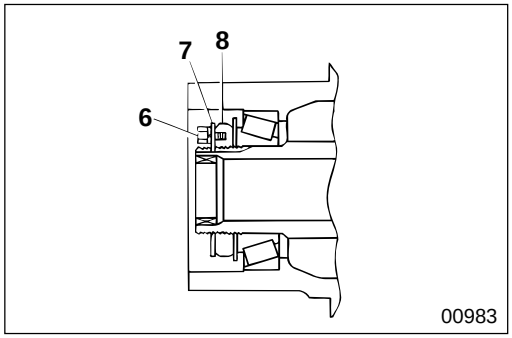
- To slide outer bearing inner race **10** towards lock nut **8**, hit end **B** of the axle tube two or three times with a mallet, while turning wheel hub and brake drum assembly **11**.
  C : Copper-headed mallet



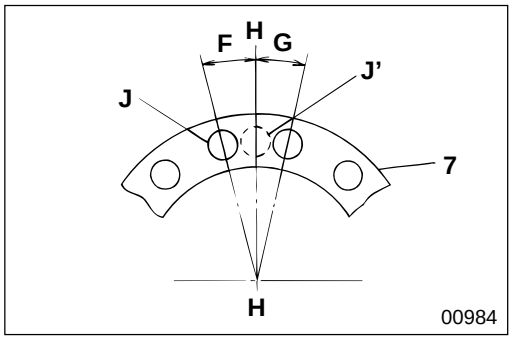
★ • Tighten lock nut **8** at specified torque.
  D : Tightening direction

- Slacken off lock nut **8** by 22.5° (one sixteenth of a turn).
  E : Slackening off direction

(★ : If any fault is found when measuring tangential force, redo from this item.)

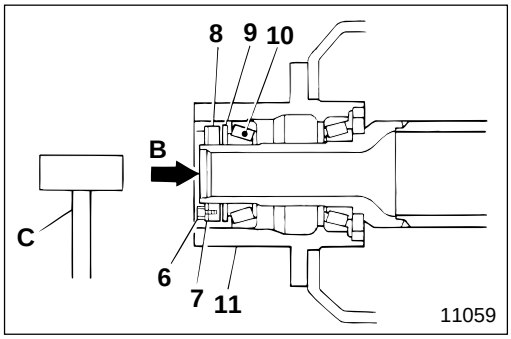


- Install lock plate **7**.
- Make sure that bolt **6** mounting holes of lock nut **8** and lock plate **7** align.
- Tighten bolt **6** at specified torque.

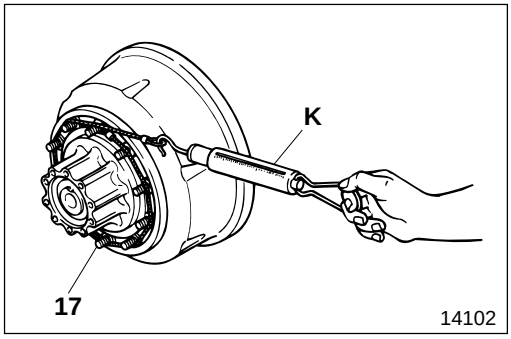


- If mounting holes of lock plate **7** and lock nut **9** do not align, align as follows:

Hole position of lock nut	How to align hole of lock plate
Within range **F**	Loosen lock nut to align holes
Within range **G**	Turn over lock plate and loosen lock nut to align holes
On line **H-H**	Turn over lock plate to align holes (Hole position **J'** changes to **J**)

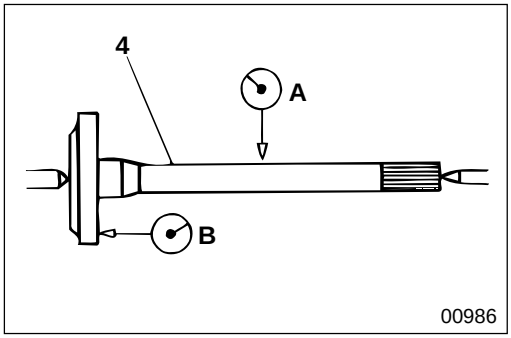


- To slide outer bearing inner race **10** towards lock nut **8**, hit end **B** of the axle tube two or three times with a mallet, while turning wheel hub and brake drum assembly **11**.
  C : Copper-headed mallet



[Measurement]
- Install spring balance **K** on hub bolt **17**.
- Measure the tangential force.
- If the measured tangential force is within the specified value, the starting torque conforms to the standard value.
- Do not allow the tangential force to become higher than the upper limit of the specified value.
- If the measured value deviates from the specified value, repeat from step ★. 📖 P27-29
- If the result is still not satisfactory, replace outer bearings **10, 14** and inner bearings **13, 26**.

NOTE
- **Make sure that there is no drag in brake lining and brake drum 16 before you measure the tangential force.**
- **Measure the starting torque when oil seal 12 has been installed.**



4 **Axle shaft**

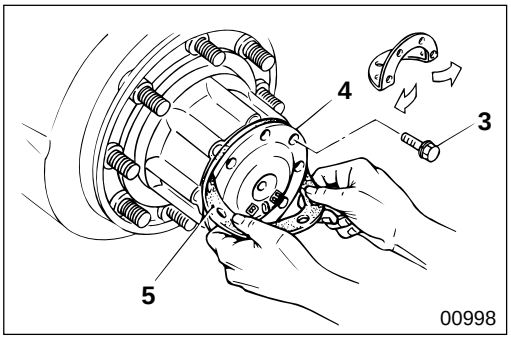
[Inspection]

A : Bend of shaft center

NOTE

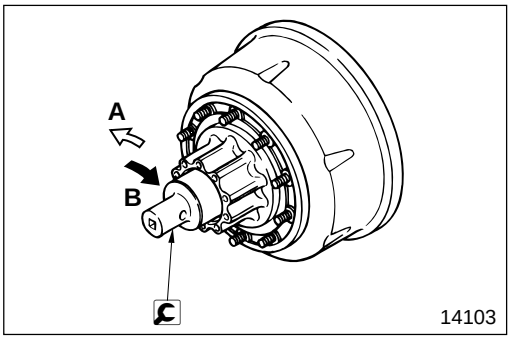
To measure the bend of axle shaft 4, turn it one full revolution and read the dial gauge indicator. The bend is one half of the indicated value.

B : Wobble of flange face



[Installation]

Install gasket **5** on axle shaft **4**, and tighten bolt **3** at specified torque.

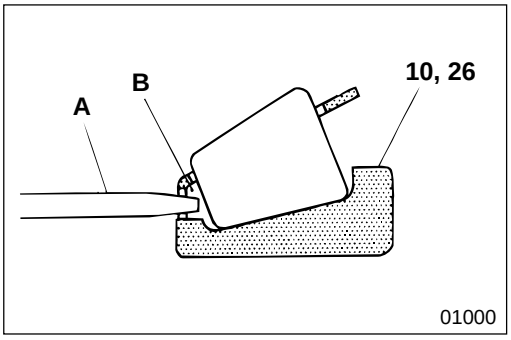


8 **Removal and installation of lock nut**

After installation, adjust the starting torque of the wheel hub bearing. See P27-29

A : Removal

B : Installation

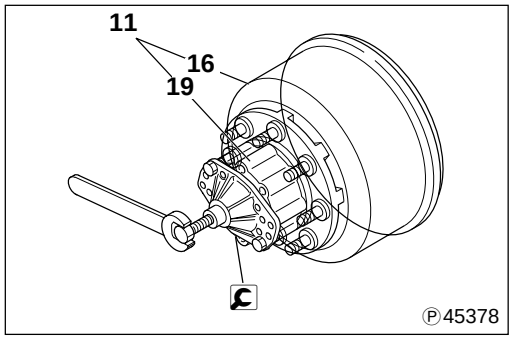


10 **26** **Packing grease in outer bearing inner race and inner bearing inner race**

A : Grease pump nozzle

B : Space between rollers

WHEEL HUB AND BRAKE DRUM < FM >



11 **Wheel hub and brake drum assembly**

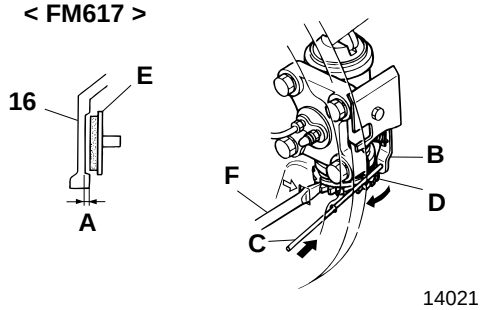
[Removal]

CAUTION

Make sure you remove wheel hub and brake drum assembly 11 in a straight line to prevent damage to oil seal 12.

If wheel hub and brake drum assembly **11** cannot be removed because of stepped wear **A** in brake drum **16**, carry out the following:

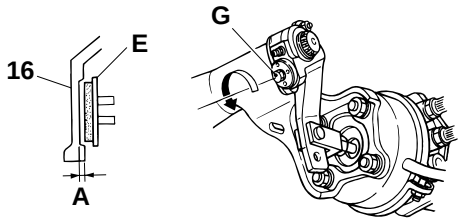
< FM617 >



< FM617 >

- Remove the packing plate cover.
- Lift lever **B**.
  C : Wire approximately ø5 mm {0.020 in.}
- Turn adjuster **D** in the opposite direction to the arrow on the packing plate, and expand the clearance between brake drum **16** and brake shoe assembly **E**.
  F : Screwdriver
- Remover wheel hub and brake drum assembly **11**.

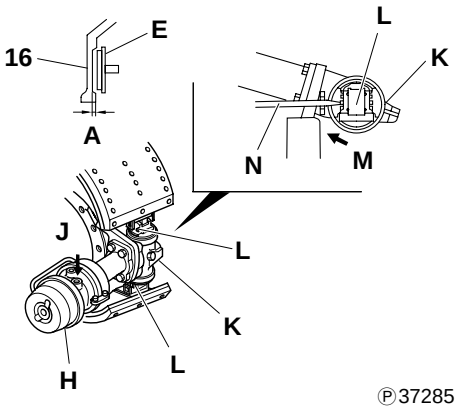
< FM657 (Type 1) >



< FM657 (Type 1) >

- Turn worm shaft **G** of the automatic slack adjuster counterclockwise, and expand the clearance between brake drum **16** and brake shoe assembly **E**.
- Remover wheel hub and brake drum assembly **11**.

< FM657 (Type 2) >



< FM657 (Type 2) >

- Remove the dust cover from the back side of the anchor bracket.
- Supply compressed air at pressure of 640 kpa {92 psi, 6.5 kgf/cm^2} to spring brake air inlet **J** of brake chamber assembly **H** to release the spring brake.
- Turn adjuster **L** on expander assembly **K** in direction **M**, and widen the gap between brake drum **16** and brake shoe **E**.
- Reinstall the dust cover on the back side of the anchor bracket.

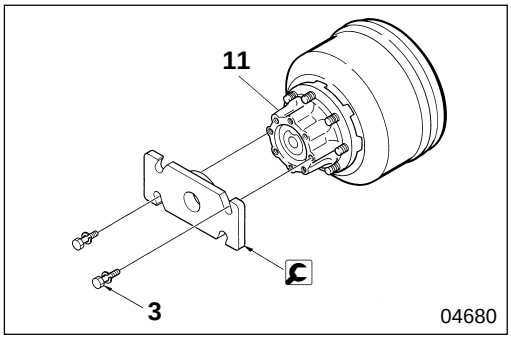
CAUTION

- **Be careful not to damage the boot of expander assembly K when inserting flat-tip screwdriver N.**
- **If brake drum 16 is faulty, correct it.** **Gr 35A, B**

[Installation]

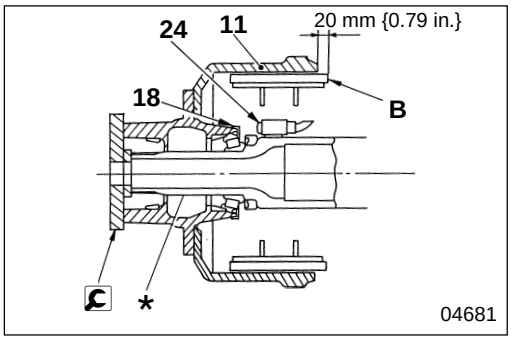
After installing wheel hub and brake drum assembly **11**, adjust the brake shoe clearance.

Gr 35A < FM617 >
Gr 35B < FM657 >



[Installation]

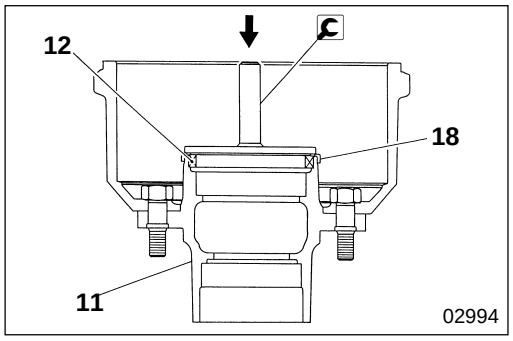
- Using two bolts **3**, mount Anti-lock brake system hub stopper on wheel hub and brake drum assembly **11**.



- Mount wheel hub and brake drum assembly **11** on axle housing * and press until Anti-lock brake system hub stopper contacts the end surface of the axle housing.
- Remove Anti-lock brake system hub stopper, and mount outer bearing inner lace **10**, lock washer **9** and lock nut **8**. Tighten the lock nut slowly.

CAUTION

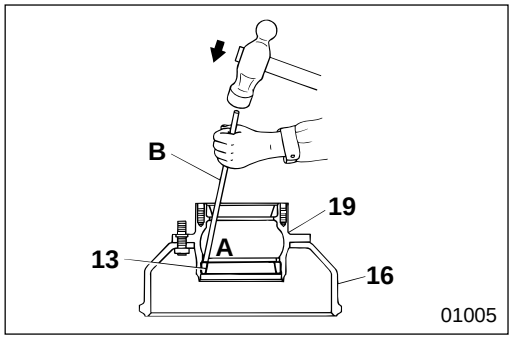
When installing wheel hub and brake drum assembly 11 without using Anti-lock brake system hub stopper, mount the assembly without jiggling until brake lining B extends approximately 20 mm {0.79 in.} from the edge of brake drum. Then, tighten lock nut 8 slowly.



12 Installation of oil seal

NOTE

When hub and brake drum assembly 11 is removed for a service operation and if rotor 18 is still mounted on the wheel hub, use Anti-lock brake system oil seal installer to press-fit oil seal 12.

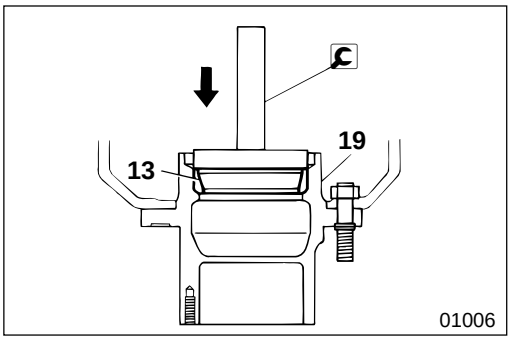


13 Inner bearing outer race

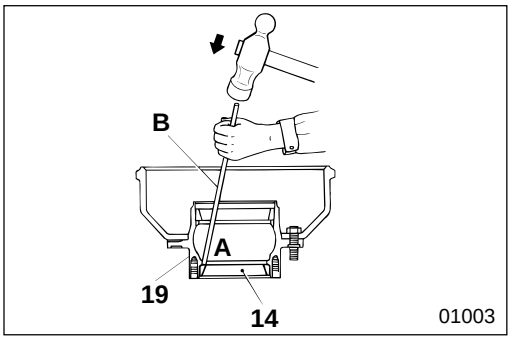
[Removal]

Drive out inner bearing outer race **13** evenly from four indented parts **A** in wheel hub **19**.

B : Pin-punch

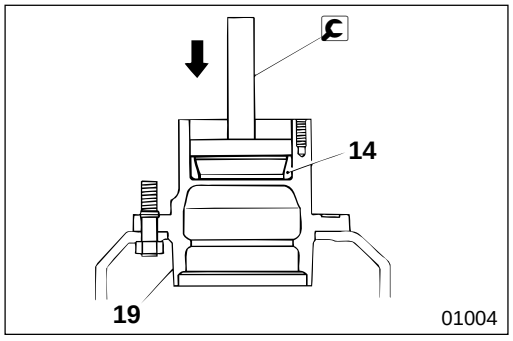


[Installation]

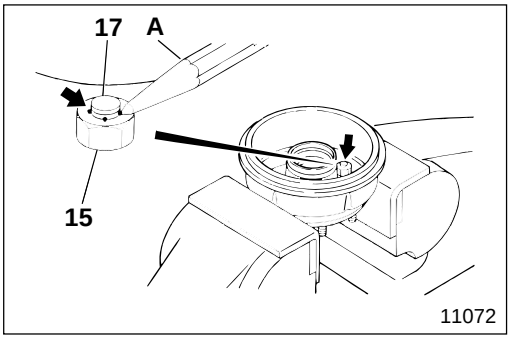


14 **Outer bearing outer race**

[Removal]
Drive out outer bearing outer race **14** evenly from four indented parts **A** in wheel hub **19**.
B : Pin-punch

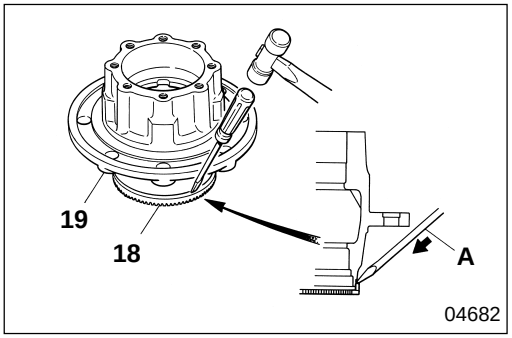


[Installation]



15 **17** **Installation of hub bolt and nut**

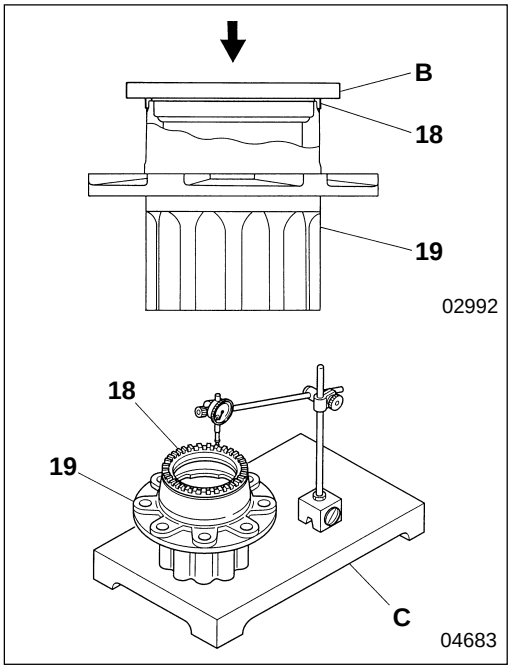
- Install hub bolt **17**.
- Tighten nut **15** at specified torque.
- Caulk nut **15** evenly at four points to keep it from turning.
  A : Pin-punch



18 **Rotor**

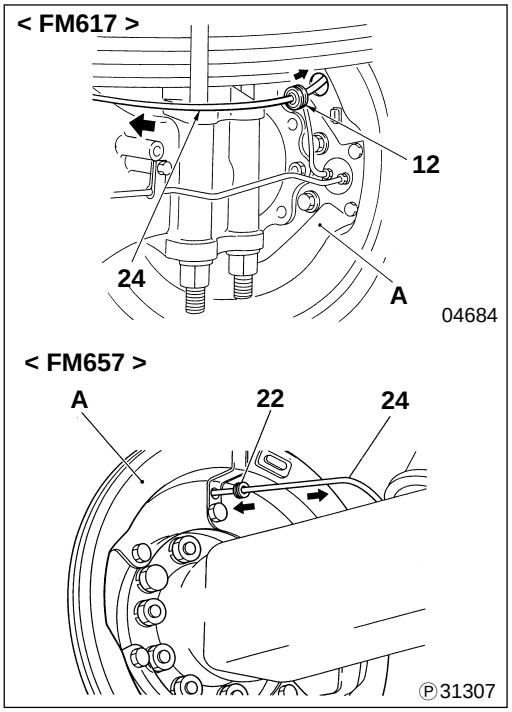
[Removal]
Strike the outer edge of rotor **18** evenly with flat-tip screwdriver **A** to remove the rotor from the wheel hub **19**.

CAUTION
Be careful not to damage wheel hub 19.



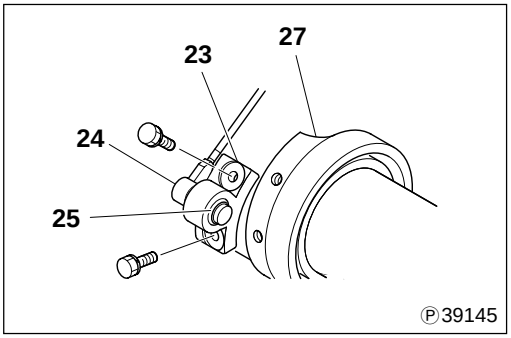
[Installation]
Heat rotor **18** to approximately 150°C {302°F}. Press the rotor evenly with iron plate **B** to press-fit the rotor to wheel hub **19**. Make sure there is no space between the rotor and wheel hub.

[Inspection]
- If the amount of wobbling exceeds the standard value, repeat the assembly procedure from the beginning.
- If the amount of wobbling exceeds the standard value after reassembly, replace defective parts.
  C: Base



22 **Installation of grommet**

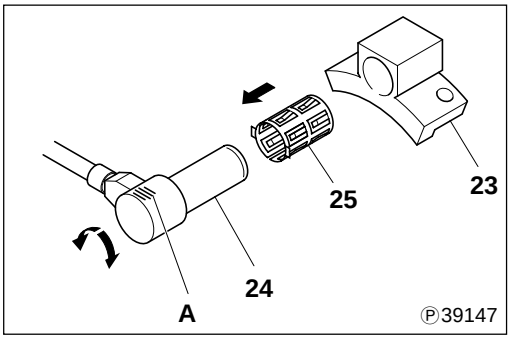
Mount grommet **22** on back plate **A**, < FM617 > or dust cover **A** < FM657 > and pull the harness of wheel speed sensor **24** to make sure there is no slack inside the wheel brake.



24 **Wheel speed sensor**

[Removal]

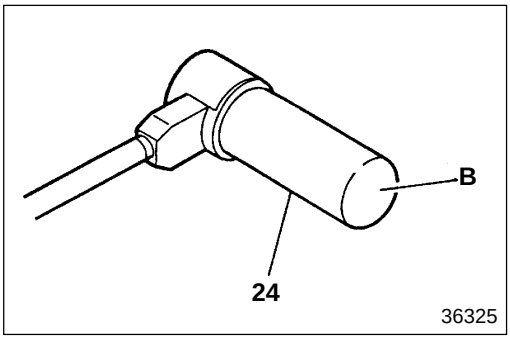
- With wheel speed sensor **24** and spring space **25** installed in sensor holder **23**, remove the sensor holder from oil seal retainer **27**.



- Hold shaded section **A** of wheel speed sensor **24** with pliers, and remove the sensor by twisting it slightly in left and right directions.

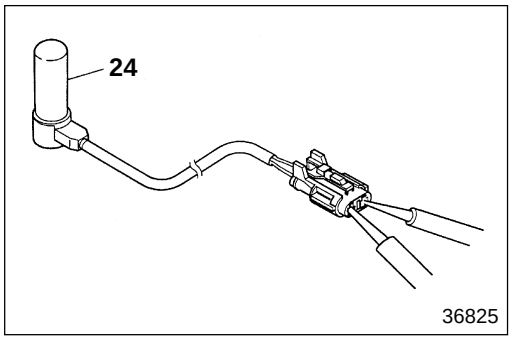
CAUTION

- **When holding wheel speed sensor 24 with pliers, do not grip any section other than shaded area A in the diagram.**
- **When removing wheel speed sensor 24, do not apply force on the sensor, such as by hitting with a hammer, prying with a screwdriver or pulling the harness, since these actions can result in wire breakage.**
- **If wheel speed sensor 24 dismounts easily, replace spring spacer 25.**

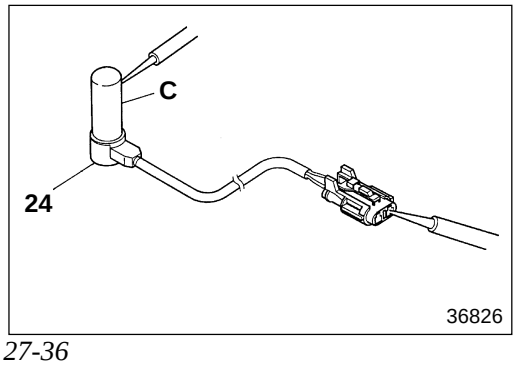


[Inspection]

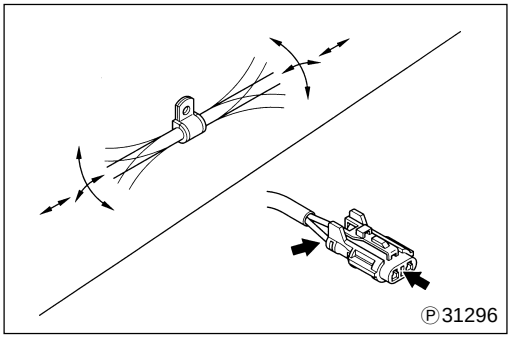
Since pole piece section **B** is magnetized by the magnet inside wheel speed sensor **24**, it attracts metals. Do not allow the pole piece to collect metallic objects.



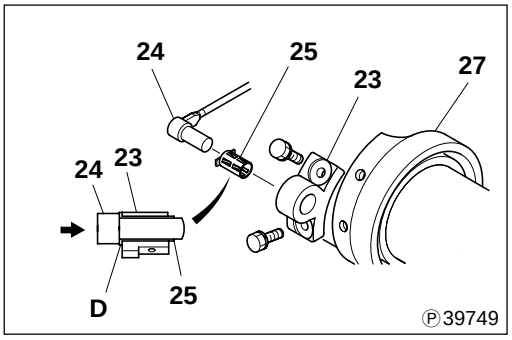
- Measure the resistance between the terminals of wheel speed sensor **24**.
  If the measured value deviates from the standard value, replace the wheel speed sensor.



- Measure the insulation resistance between body **C** of wheel speed sensor **24** and each terminal.
  If the measured values deviate from the standard value, replace the wheel speed sensor.



- To check for broken wires, remove the harness clamp section from the vehicle. Bend and extend the harness to check if there is any broken wire in the harness. Also, inspect the connector for proper contact.
  If a defect is found, replace wheel speed sensor **24**.



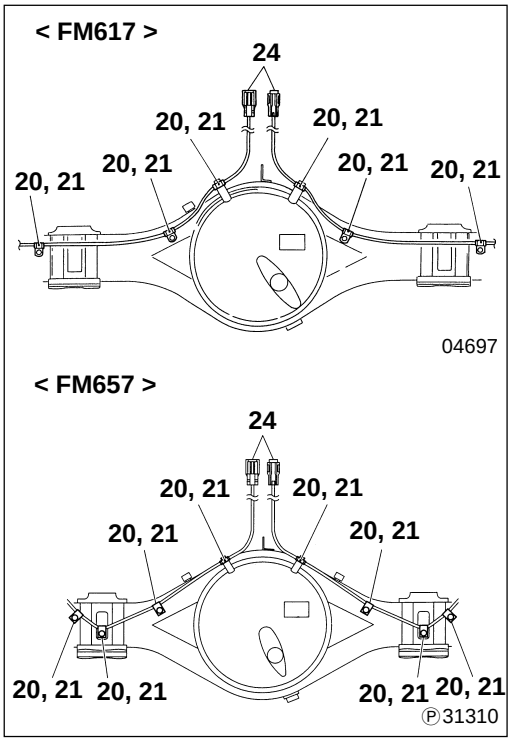
[Installation]

- Insert wheel speed sensor **24** from the back plate, and press until spring spacer **25** and stopper section **D** of the wheel speed sensor contacts sensor holder **23**.
- With wheel speed sensor **24** and spring spacer **25** installed in sensor holder **23**, mount the sensor holder on oil seal retainer **27**.

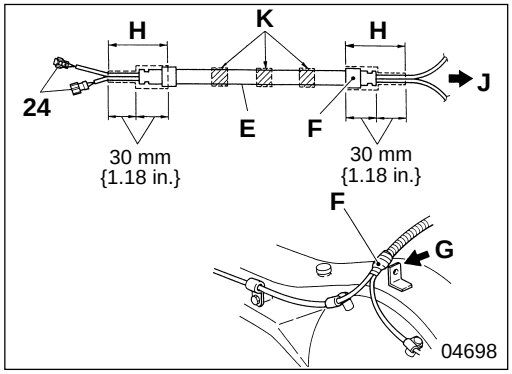
CAUTION

- **When installing wheel speed sensor 24, do not apply force on the sensor, such as by hitting with a hammer, prying with a screwdriver or pulling the harness, since these actions can result in wire breakage.**
- **Note that wheel speed sensor 24 is different for left and right wheels.**

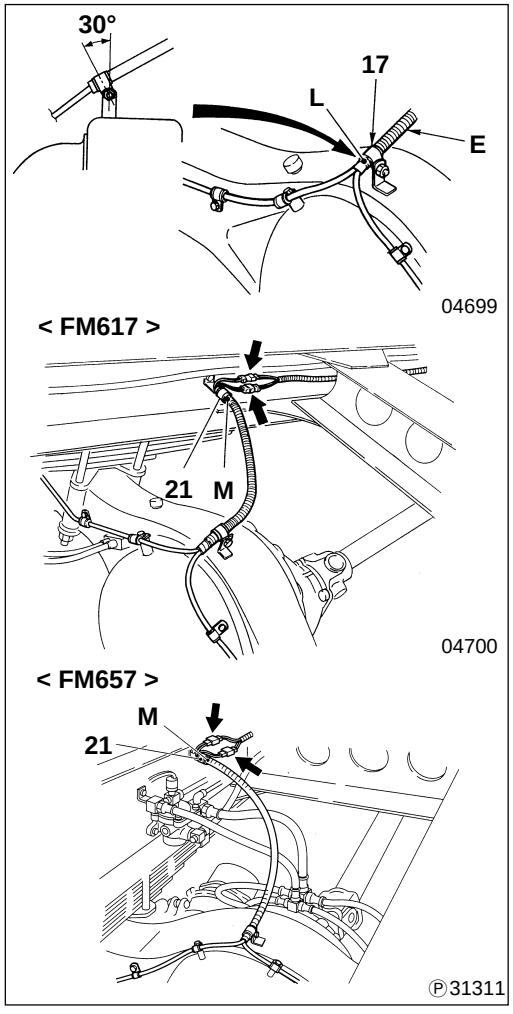
Location	Harness connector color	Harness connector shape
Left wheel	Gray	Male
Right wheel	Black	Female



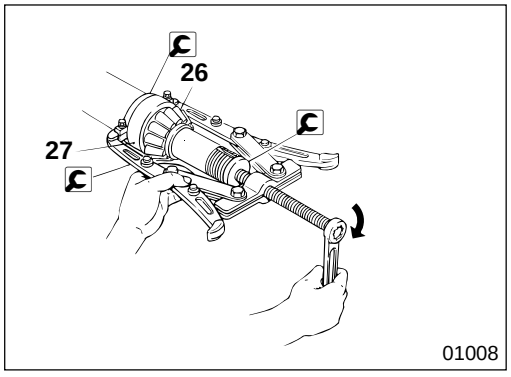
- Rear axle housing section
  Starting from the wheel brake side, secure the harness of wheel speed sensor **24** in place with clip **21** and bolt **20**. Make sure the harness does not interfere with other parts and there is no twist or slack in the harness.



- Binding of harness
  - Gather the harnesses of left and right wheel speed sensors **24**, and bind with corrugated tube **E**.
  - Adjust the position of the corrugated tube **E** so that white tape section **F** is located at clip position **G** on the rear axle housing. Then, turn the corrugated tube so that the slit faces down. Wrap black tape (electric harness tape) on both ends **H** of the corrugated tube. The tape should be placed over the tube end and harness.
    J : Rear axle housing side
  - Wrap tape on the harnesses of wheel speed sensors **24** at sections **K** (three locations at equal intervals).

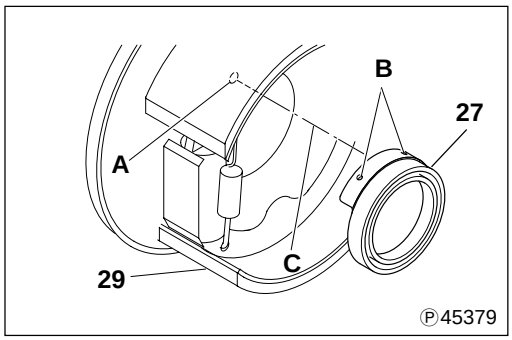


- Clamping of harness
  - Position section **L** of corrugated tube **E** so that it forms a 30° angle with clip **21**, then secure it to the rear axle housing.
  - Secure section **M** of the corrugated tube to the frame using the clip.
  - Connect the wheel speed sensor connector to the harness connector on the chassis side.



26 **27** **Inner bearing inner race and oil seal retainer**

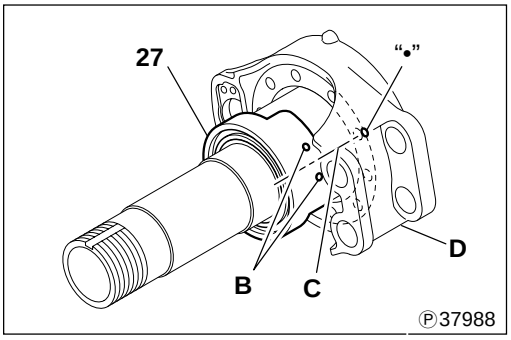
[Removal]



[Installation]

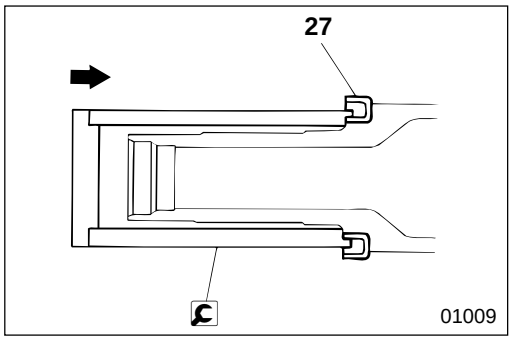
< FM617 >

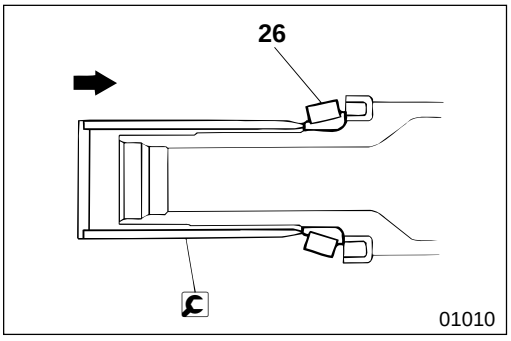
Install oil retainer **27** by aligning mounting hole **A** in brake assembly **29** with center line **C** between two center holder mounting holes **B** in oil seal retainer **27**.

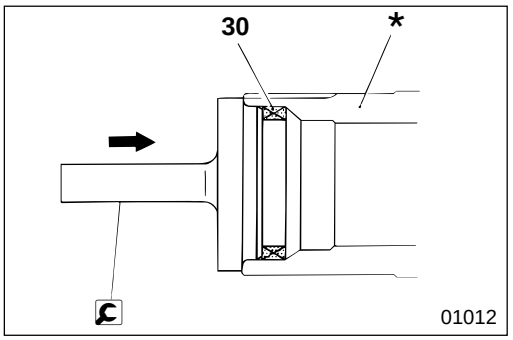


< FM657 >

- Make sure there is an alignment mark "•" on anchor bracket **D** at the location shown in the diagram.
- Install oil seal retainer **27** by aligning center line **C** between sensor holder mounting holes **B** in oil seal retainer **27** with the alignment mark "•" on anchor bracket D.







30 **Installation of oil seal**

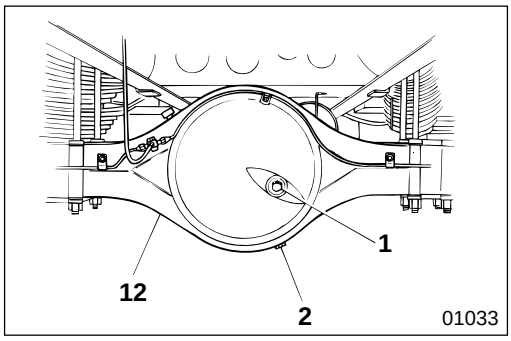
◆ Service procedure



● **Work before removal**

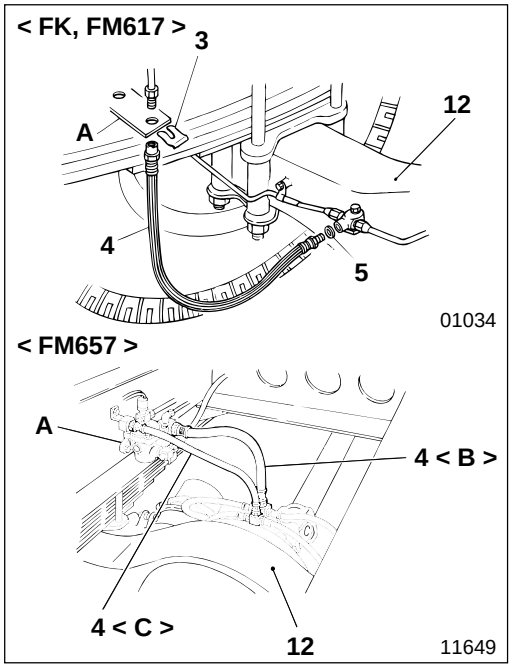
Remove drain plug **2** and drain the gear oil.

WARNING⚠

The oil temperature is high immediately after the vehicle has stopped, so take care not to scald yourself.

● **Work after installation**

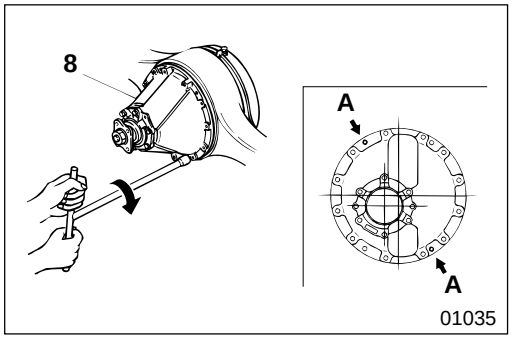
Fill with the specified amount of gear oil via inspection plug **1**.



4 **Removal and installation of brake hose**

- Remove brake hose **4** from frame **A** side first, then from axle housing **12** side.
- For installation, follow the removal sequence in reverse.

B : Service brake hose
C : Spring brake hose

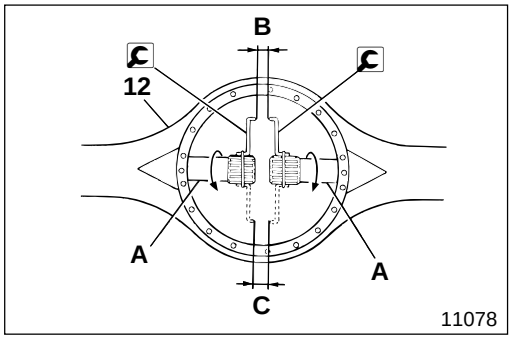


8 **Removal of reduction and differential assembly**

To remove reduction and differential assembly **8**, screw two M12×1.25 mm bolts evenly into two screw holes **A**.

NOTE

Completely remove adhered sealant from the mounting surfaces of reduction differential assembly 8 and axle housing 12.



12 **Bend of axle housing**

- Leave axle shaft **A** installed in axle housing **12**.
- Install measuring bar on axle shaft **A**, and measure clearance **B**.
- Turn axle shaft **A** 180°, and measure clearance **C**.
- The difference between **B** and **C** is the amount of bend of axle housing **12**.
- If the bend of axle housing **12** is higher than the limit, replace the axle housing.

Location	Points of application	Kinds	Quantity
16	Mounting surface of pinion pilot bearing	LOCTITE 601	As required

Special tools

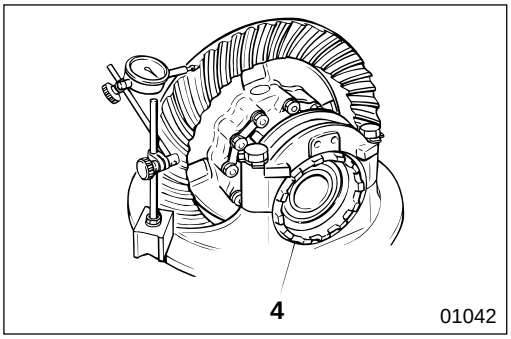
Unit : mm {in.}

Location	Tool name and shape	Part No.	Application
9	Side bearing installer  	< D050H > MH061748 < D8H > 03723-25000	Press-fitting of side bearing inner race
13	Bearing retainer remover  	< D8H > MH062172	Removal of pinion assembly : Two required
	Bearing retainer guide pin  	< D050H > MH061745 < D8H > MH061746	Installation of pinion assembly : Two required

	A	B
D050H	ø80 {3.15}	ø70 {2.76}
D8H	ø95 {3.74}	ø85.5 {3.37}

	C	D	E
D050H	85 {3.35}	18 {0.71}	M12×1.25
D8H	95 {3.74}	23 {0.91}	M14×1.5

◆ Service procedure

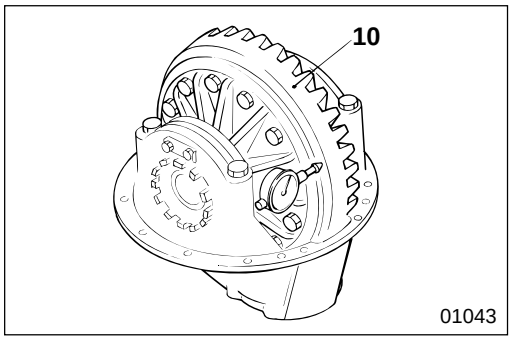


● Inspection before disassembly

Inspect for faulty parts before disassembly.

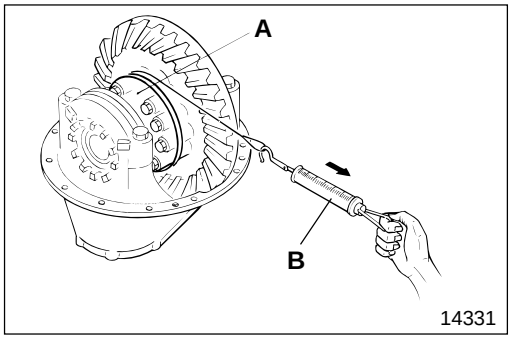
(1) Backlash of reduction gear and reduction pinion

If there is any fault, it is considered to be because of the amount adjusting screw **4** was tightened.



(2) Wobble of back face of reduction gear

Measure wobble at a point 145 mm {5.71 in.} (on the radius) for < D050H >, 185 mm {7.28 in.} for < D8H >, from the center of the reduction gear, turning differential assembly **10** one full revolution.

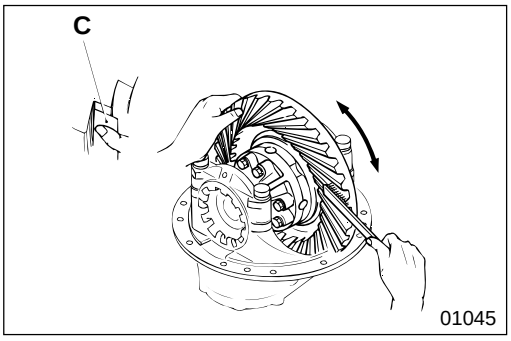


(3) Starting torque of side bearing

- Install spring balance **B** at 170 mm {6.69 in.} for < D050H >, 213 mm {8.39 in.} for < D8H >, outer periphery point of differential case **A**.
- Measure the tangential force.
- If the measured tangential force is within the specified value, the starting torque conforms to the standard value.

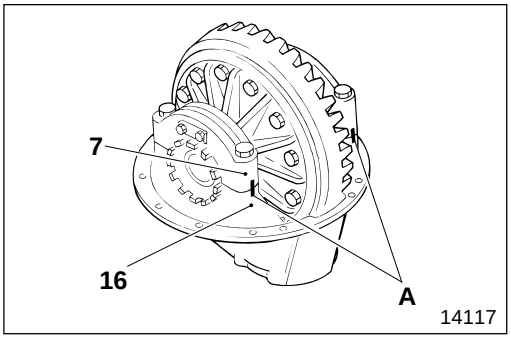
NOTE

Measure the starting torque within reduction gear and reduction pinion backlash range.



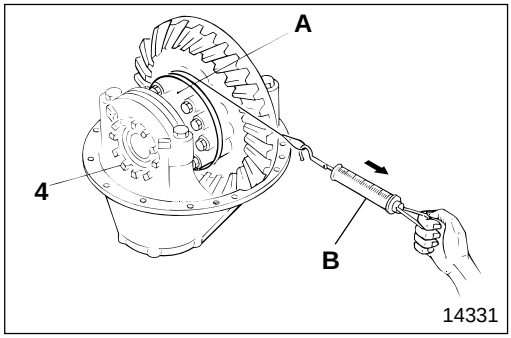
(4) Tooth contact of reduction gear

Apply red lead to three or four gear teeth, turn the gear a few times, and examine tooth contact with a piece of paper **C**.



● Work before disassembly

Put alignment marks **A** on bearing cap **7** and differential carrier **16** to identify left and right.



● **Inspection and adjustment after assembly**

(1) Starting torque of side bearing

[Inspection]

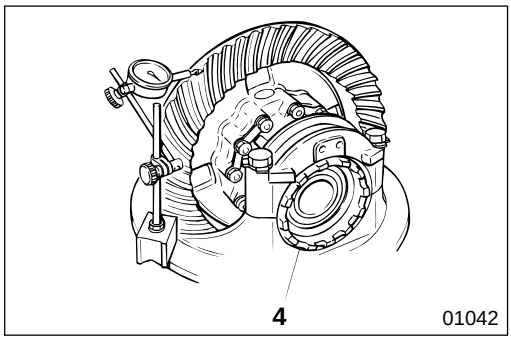
- Install spring balance **B** at 170 mm {6.69 in.} for < D050H >, 213 mm {8.39 in.} for < D8H >, outer periphery point of differential case **A**.
- Measure the tangential force.
- If the measured tangential force is within the specified value, the starting torque conforms to the standard value.
- If the measured value deviates from the specified value, adjust.

[Adjustment]

If the measured value does not meet the standard value, adjust using left and right adjusting screws **4**.

CAUTION

- **Tighten left and right adjusting screws 4 the same amount.**
- **Adjust the starting torque within the reduction gear and reduction pinion backlash range.**

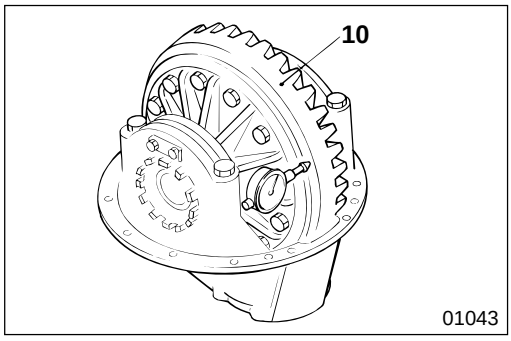


(2) Adjustment of backlash between reduction gear and reduction pinion

Adjust the starting torque of the side bearings using left and right adjusting screws **4**, taking care not to change the starting torque.

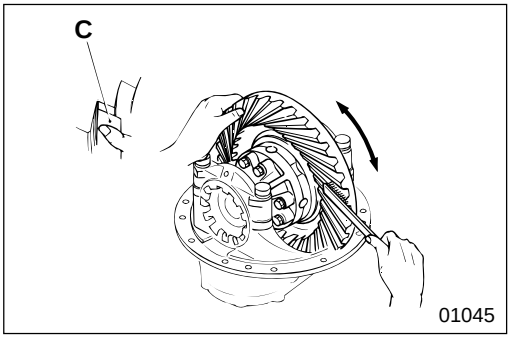
CAUTION

Make sure when you loosen one adjusting screw 4 that you tighten the other adjusting screw by the same amount, because the starting torque of the side bearing changes.



(3) Inspection of wobble of back face of reduction gear

Measure wobble at a point 145 mm {5.71 in.} (on the radius) for < D050H >, 185 mm {7.28 in.} for < D8H >, from the center of the reduction gear, turning differential assembly **10** one full revolution.



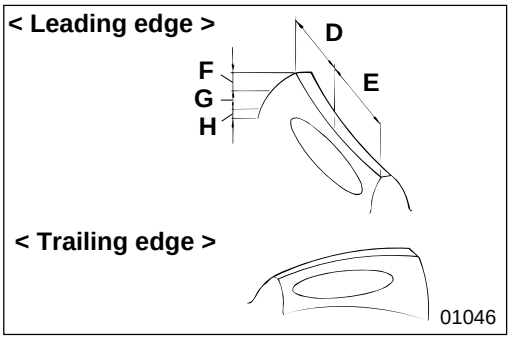
(4) Tooth contact of reduction gear

[Inspection]
Apply red lead to three or four gear teeth, turn the gear a few times, and examine tooth contact with a piece of paper **C**.

[Adjustment]
If contact area is remarkably offset, adjust with reduction pinion mounting adjusting shims to increase or decrease the backlash.

CAUTION

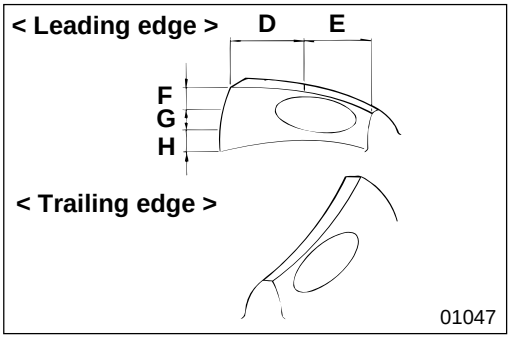
- **Make sure you replace as a reduction gear set (reduction gear and reduction pinion), when you replace the gear because of excessive teeth wear.**
- **When good tooth contact adjustment has been obtained, but backlash does not meet the standard value, tooth contact has priority. It is not necessary to adjust backlash to the standard value if it is less than 0.15 mm {0.0059 in.} out.**



● **Normal tooth contact at no load**

< Reduction gear >

D : Heel
E : Toe
F : Face
G : Flank
H : Clearance



< Reduction pinion >

D : Heel
E : Toe
F : Face
G : Flank
H : Clearance

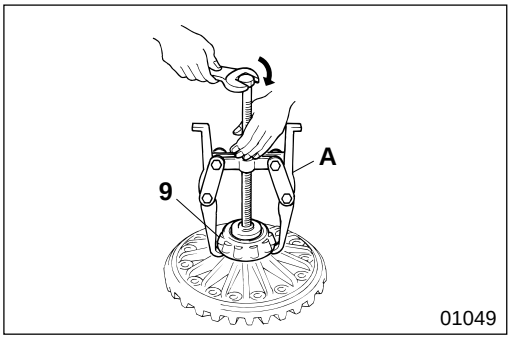
Maintenance item			Assembly standards
At no load	Tooth contact position	Lengthwise direction of tooth	From center toward toe
		Vertical direction	From center toward top of tooth for reduction gear and center of tooth for pinion
	Tooth contact shape	Length	About 50 to 70% of tooth width
		Width	About 50 to 70% of tooth depth
	Degree of tooth contact		Degree of tooth contact becomes weaker as it comes nearer to root or top

NOTE

When tooth contact area is nearer to toe at no load, it becomes middle area contact under load.

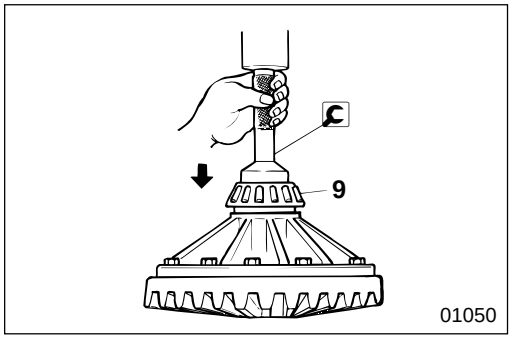
Adjustment of Tooth Contact

	Mode of adjustment	Moving direction
Adjustment by adding or reducing shims	Advances reduction pinion to reduction gear (Shims are reduced) 	< Leading edge >  < Trailing edge > Tooth contact moves toward root of tooth
	Retards reduction pinion from reduction gear (Shims are added) 	 Tooth contact moves toward top of tooth
Adjustment by controlling adjusting screw	Advance reduction gear to reduction pinion axis (Less backlash) 	Tooth contact moves in lengthwise direction of tooth Leading edge: Nearer to toe and slightly nearer to root of tooth Trailing edge: Nearer to heel and slightly nearer to top of tooth
	Retard reduction gear from reduction pinion axis (More backlash) 	Tooth contact moves in lengthwise direction of tooth Leading edge: Nearer to heel and slightly nearer to top of tooth Trailing edge: Nearer to toe and slightly nearer to root of tooth

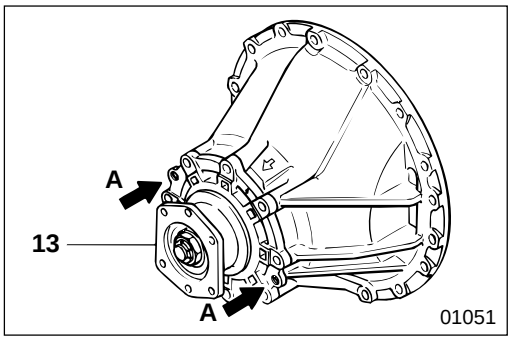


9 **Side bearing inner race**

[Removal]
A : Gear puller (General tool)

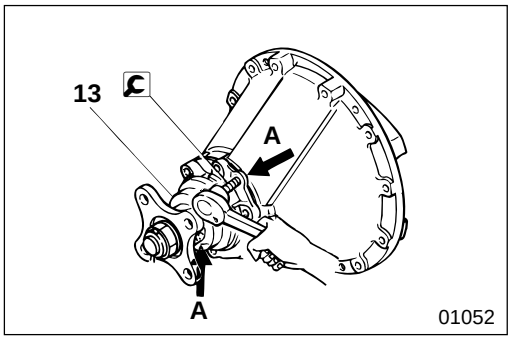


[Installation]

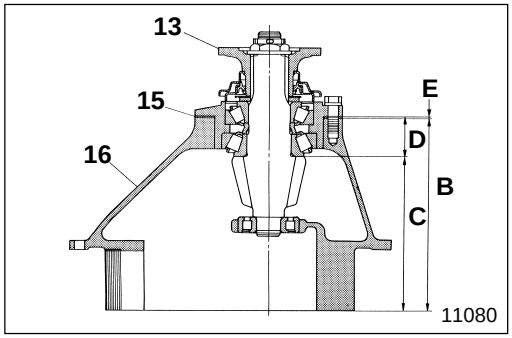


13 **Pinion assembly**

[Removal]
< D050H >
To remove pinion assembly **13**, screw two M12×1.25 mm bolts evenly into the two pinion assembly removal screw holes **A**.



< D8H >
To remove pinion assembly **13**, screw two bearing retainer removers into the two pinion assembly removal screw holes **A**.



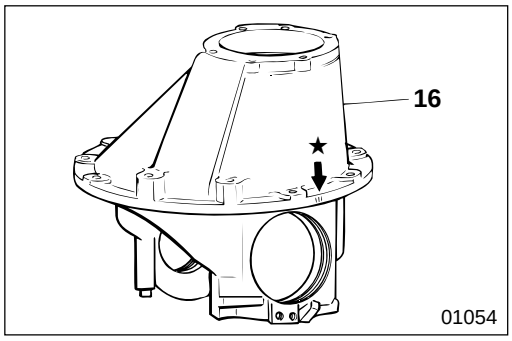
[Adjustment]

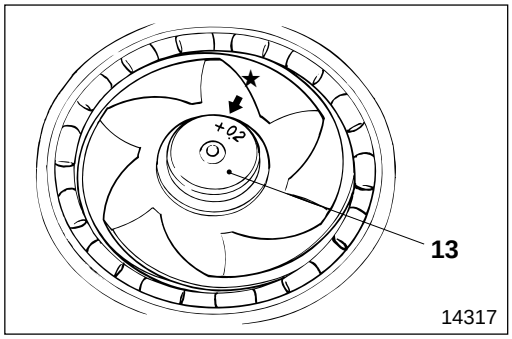
- Carry out the following procedure so that **B**, **C** and **D** conform to the standard dimension.
- Calculate shim thickness **E** according to the following formula based upon the machining error data stamped on pinion assembly **13** and differential carrier **16**.

Formula for calculation

E = 0.5 {0.020}–b+c+d

b : Deviation from basic dimension **B**
c : Deviation from basic dimension **C**
d : Deviation from basic dimension **D**





NOTE

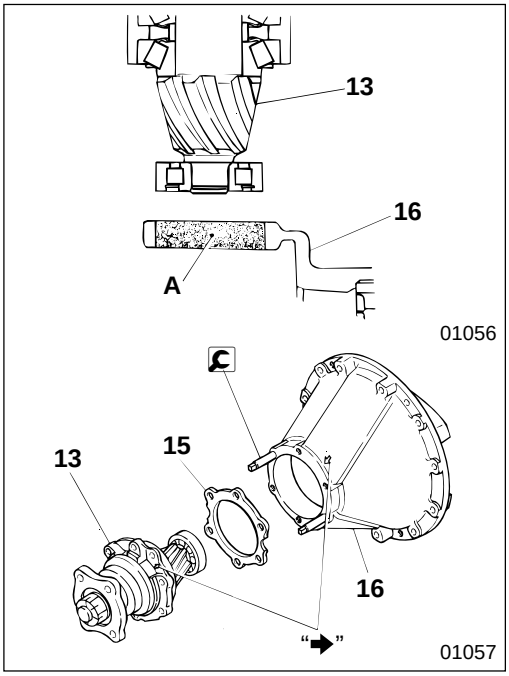
Thickness is stamped in millimeters.

Unit : mm {in.}

Location	Standard dimension		How to calculate deviation
	D050H	D8H	
Shim thickness	0.5 {0.020}		—
B	232 {9.13}	261 {10.3}	The basic dimension, multiplied by 100, is stamped on the periphery of differential carrier **16** flange
C	180 {7.09}	208 {8.19}	The basic dimension is stamped on the top of pinion assembly **13**
D	52 {2.05}	53.5 {2.11}	Measure the deviation from **D** using a dial gauge. However, If it is difficult to measure the actual deviation, assume a value from 0 to 0.2 {0 to 0.0079}

★ : Stamped number position

- Select shim **15** from shim thickness **E**.
  Available thicknesses of shim **15** : 0.1 mm {0.0039 in.} and 0.2 mm {0.0079 in.}



[Installation]

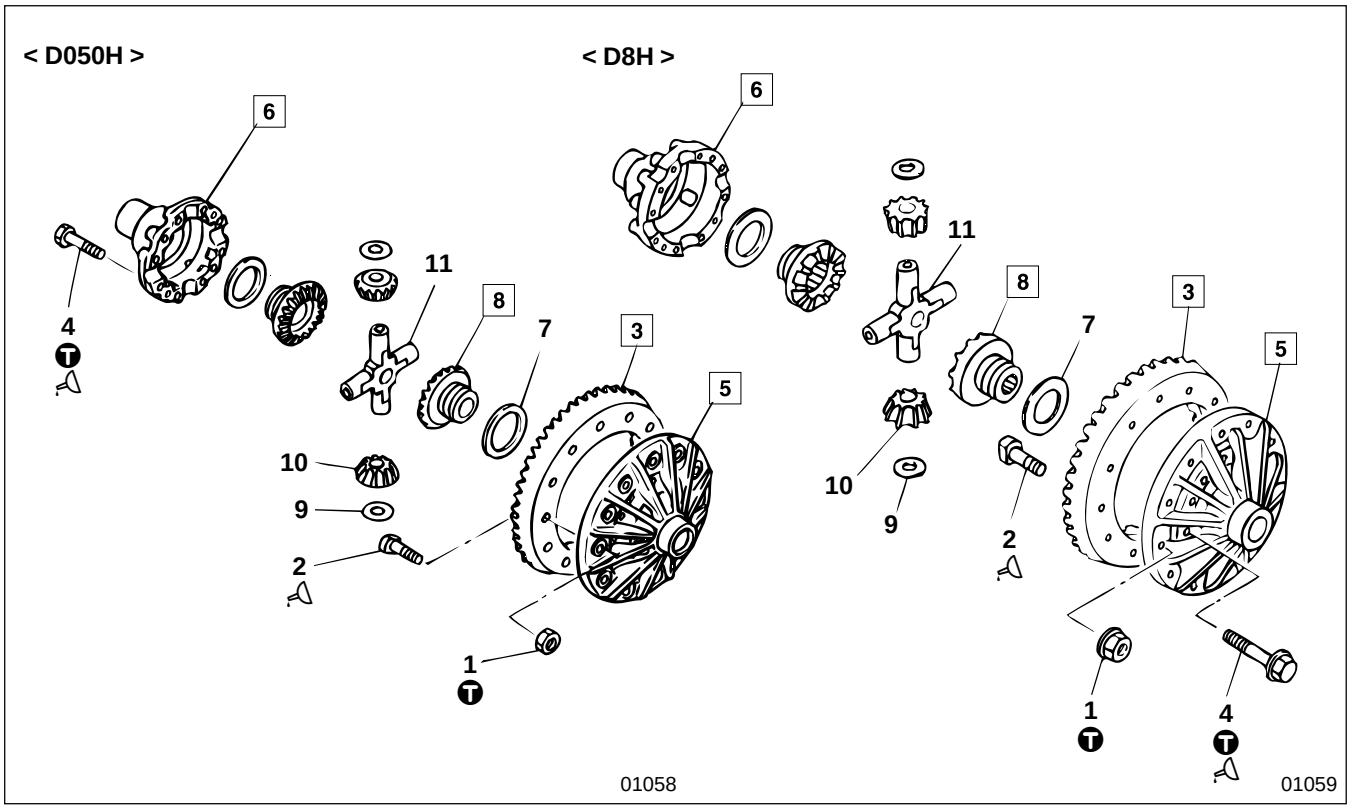
- Apply lock paint to pinion pilot bearing mounting surface **A** of differential carrier **16**.
- Install pinion assembly **13**.

CAUTION⚠

- **Be sure to let the lock paint harden undisturbed for 30 minutes to two hours after installation.**
- **Be sure to wait at least three hours before running the vehicle, and if possible wait 24 hours to let the lock paint harden.**

REDUCTION AND DIFFERENTIAL

Differential Assembly



● **Disassembly sequence**

1 Nut
2 Bolt
3 Reduction gear
4 Bolt
5 Differential case , LH
6 Differential case, RH
7 Differential gear washer
8 Differential gear
9 Differential pinion washer
10 Differential pinion
11 Pinion spider

CAUTION

Make sure you replace differential case LH 5 and differential case RH 6 as a differential case set.

● **Assembly sequence**

Follow the disassembly sequence in reverse.

● **Adjustment after assembly** **P27-55**

Service standards

Unit : mm {in.}

Location	Maintenance item		Standard value (Basic diameter in [ ])	Limit	Remedy
8	Play between differential gear and axle shaft spline	D050H	0.10 to 0.18 {0.0039 to 0.0071}	0.5 {0.020}	Replace
		D8H	0.07 to 0.22 {0.0028 to 0.0082}	0.5 {0.020}	Replace

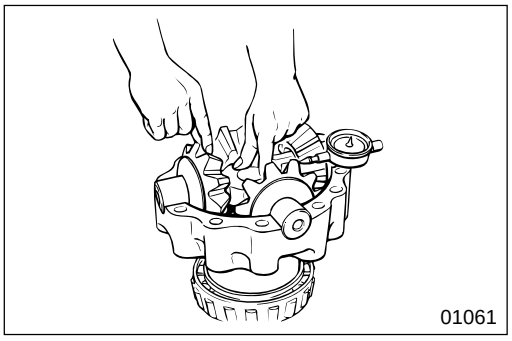
Lubricant and sealant

Location	Points of application	Kinds	Quantity
2, 4	Entire bolt	Rust preventive	As required
	Thread area of bolt	LOCTITE 271	As required

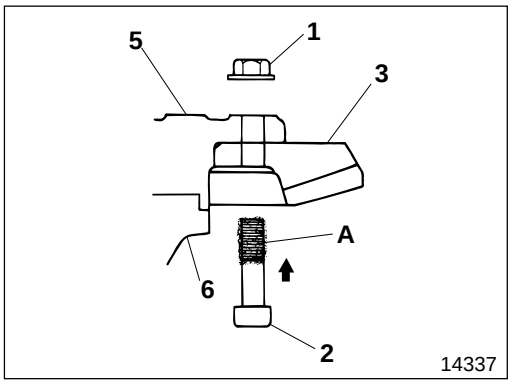


◆ Service procedure

● **Adjustment after assembly**

Backlash between differential gear and differential pinion

If the measured value deviates from the standard value, replace differential gear washer **7**.

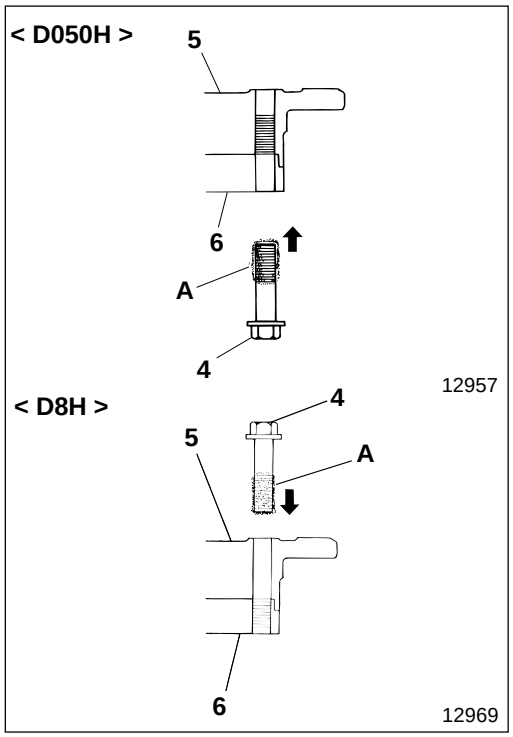


3 **5** **Installation of differential case LH and reduction gear**

- Apply rust preventive to entire surface of bolt **2**.
- Apply lock paint to thread area **A** of bolt **2**.
- Tighten nut **1** at specified torque.

CAUTION

- **Be sure to apply rust preventive to nut 1 because of the need to tighten it at specified torque.**
- **Be sure not to operate the vehicle for at least one hour after installation in order to let the lock paint harden.**
- **Be sure not to operate the vehicle at full torque for at least four hours after installation in order to let the lock paint harden.**



5 **6** **Installation of differential case LH and differential case RH**

- Apply rust preventive to entire surface of bolt **4**.
- Apply lock paint to thread area **A** of bolt **4**.
- Tighten bolt **4** at specified torque.

CAUTION

- **Be sure to apply rust preventive to bolt 4 because of the need to tighten it at specified torque.**
- **Be sure not to operate the vehicle for at least one hour after installation in order to let the lock paint harden.**
- **Be sure not to operate the vehicle at full torque for at least four hours after installation in order to let the lock paint harden.**

◆ Service procedure

● Inspection and adjustment after assembly

Starting torque of pinion bearing

[Inspection]

- Apply load **A** to companion flange **3** or tighten lock nut **1** at specified torque.
  A : Approximately 39.2 kN {8.8 klbf, 4000 kgf} < D050H >
  Approximately 49 kN {11 klbf, 5000 kgf} < D8H >

- Install spring balance **B** at 170 mm {6.69 in.} for < D050H >, 160 mm {6.30 in.} for < D8H >, outer periphery point of differential case **A**.
- Measure the tangential force.
- If the measured tangential force is within the specified value, the starting torque conforms to the standard value.
- If the measured value deviates from the specified value, adjust.

NOTE

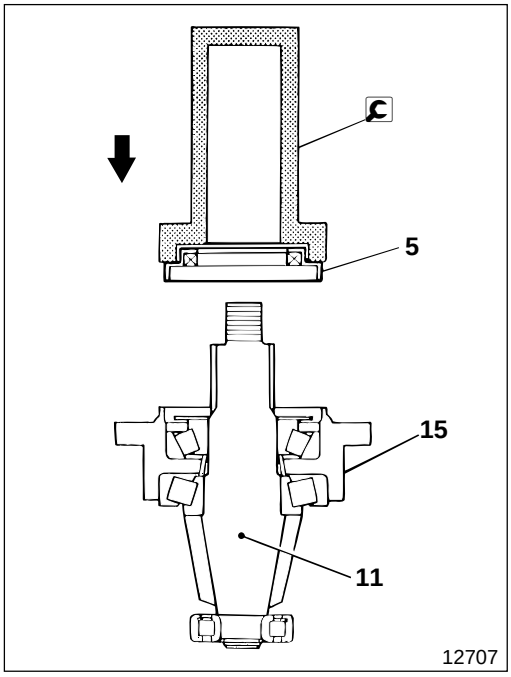
- **Tighten companion flange 3 before measuring.**
- **Oil separator 6 must be installed when you measure. < D8H >**
- **Measure with oil seal 5 removed.**

[Adjustment]

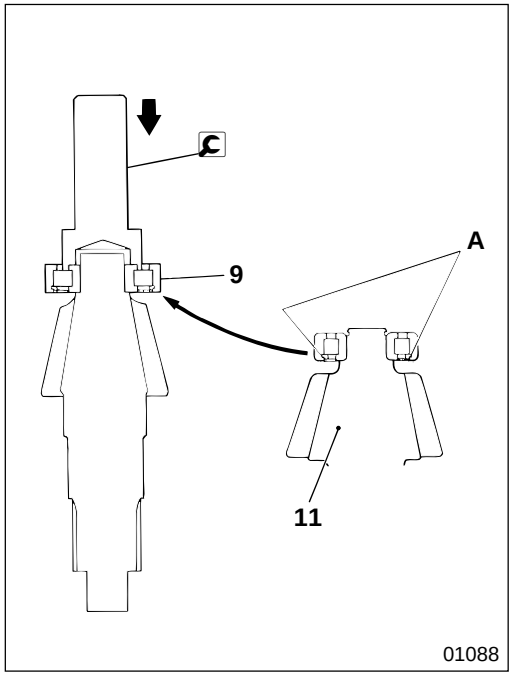
If the measured value does not conform to the specified value, adjust with collar **7** to obtain specified tangential force. Choose an appropriate collar by referring to the table below.

Unit : mm {in.}

Applicable model	Thickness of collar
D050H	13.875 to 14.475 {0.55 to 0.57} (25 thicknesses in 0.025 {0.00098} increments)
D8H	14.975 to 15.575 {0.59 to 0.61} (25 thicknesses in 0.025 {0.00098} increments)



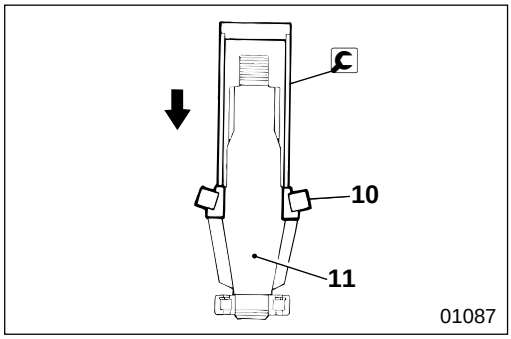
5 **Installation of oil seal**



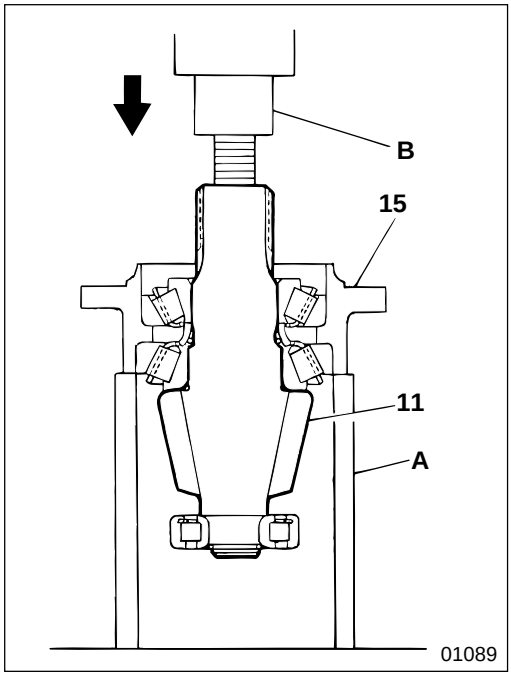
9 **Installation of pinion pilot bearing**

Press-fit pinion pilot bearing **9** in the direction as illustrated.

A : Lock ring



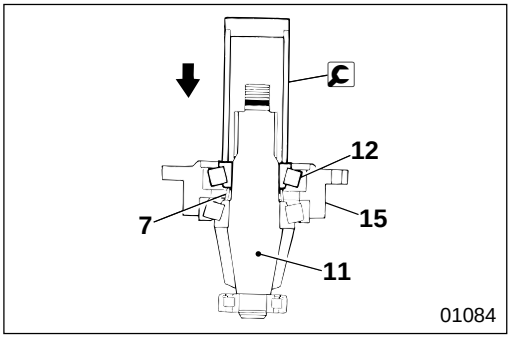
10 **Installation of inner bearing inner race**



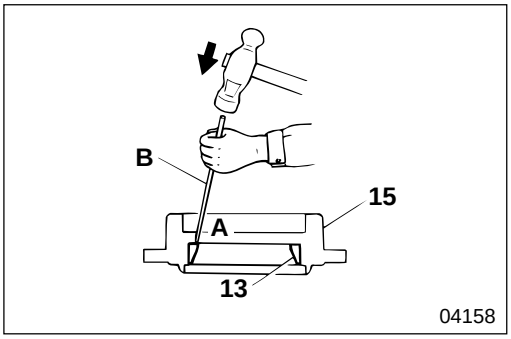
11 **Removal of reduction pinion**

A : Cylindrical guide

B : Press

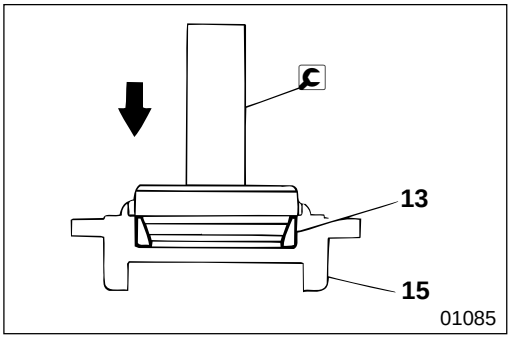


12 **Installation of outer bearing inner race**

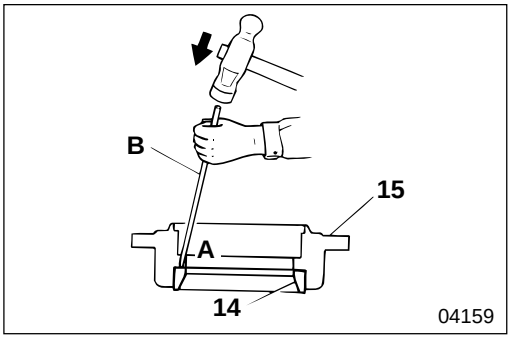


13 **Outer bearing outer race**

[Removal]
Drive out outer bearing outer race **13** evenly from three indented parts **A** in bearing retainer **15**.
B : Pin-punch



[Installation]



14 **Inner bearing outer race**

[Removal]
Drive out inner bearing outer race **14** evenly from three indented parts **A** in bearing retainer **15**.
B : Pin-punch

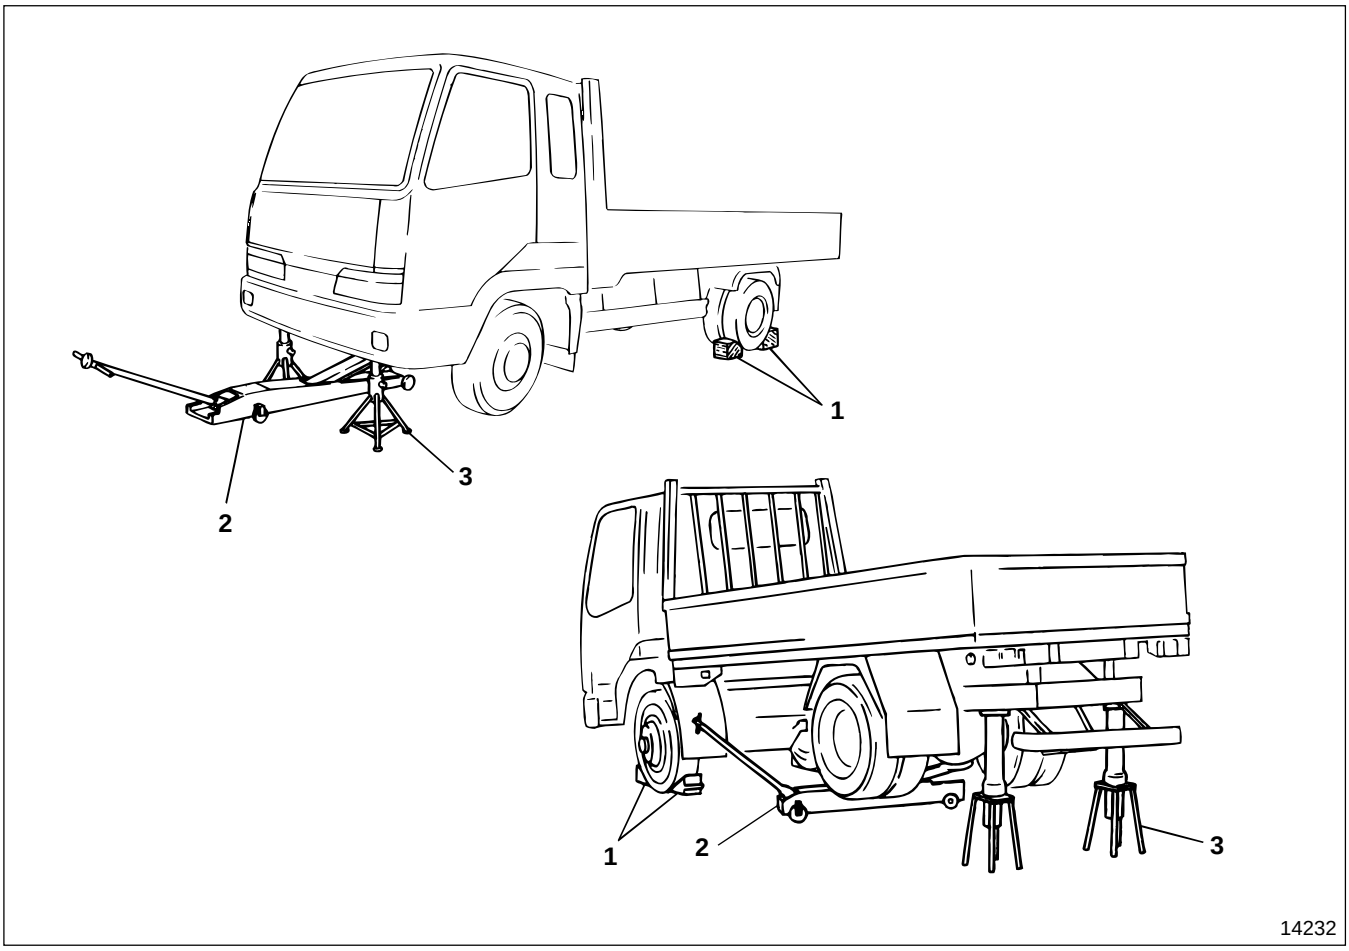
Work for Removal and Installation of Wheel and Tire



● **Work sequence**

1 Place wheel chocks.
2 Jack up the front or rear axle using a garage jack placed under the center of the axle.
3 Support the frame on rigid racks.

WARNING⚠

- **Chock the wheels securely so the vehicle does not move.**
- **Do not remove the chocks until the entire operation is completed.**
- **Supporting a vehicle on a garage jack only is extremely dangerous, so always support the frame on rigid racks.**
- **Leave the garage jack and rigid racks in place until the entire operation is completed. Never remove them during the operation.**

● **Work sequence after removal and installation**

Follow the work sequence in reverse.

WHEEL AND TIRE

NOTE

Use right-hand threaded wheel nuts marked “R” for right side wheel and left-hand threaded wheel nuts marked “L” for left side wheel.

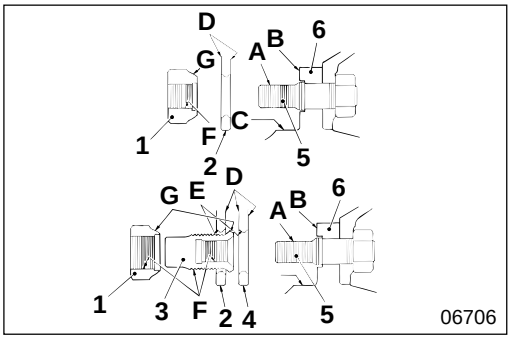
Tightening torque

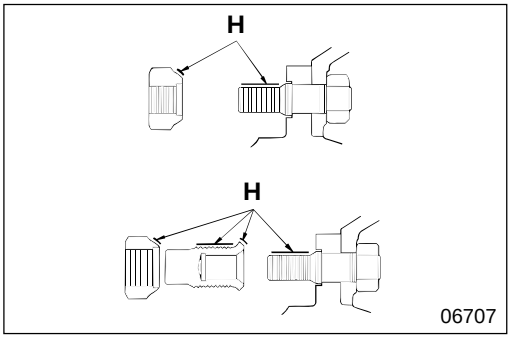
Unit : N·m {ft.lbs, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
1, 3	Wheel nut	400 to 440 {295 to 325, 41 to 45}	Wet

Lubricant

Location	Points of application	Kinds	Quantity
1	Wheel nut spherical area	Chassis grease [NLGI No. 1 (Ca soap)] or Wheel bearing grease [NLGI No. 2 (Li soap)]	As required
3	Thread and spherical areas of wheel nut (inner)	Chassis grease [NLGI No. 1 (Ca soap)] or Wheel bearing grease [NLGI No. 2 (Li soap)]	As required
5	Thread area of hub bolt	Chassis grease [NLGI No. 1 (Ca soap)] or Wheel bearing grease [NLGI No. 2 (Li soap)]	As required





◆ Service procedure

● Cleaning and applying grease before installation

[Cleaning]

To prevent wheel nuts **1** and **3** and hub bolt **5** from becoming loose and to prevent mounting parts (tire assemblies **2** and **4** and hub **6**) from being damaged, remove rust, dust, additional coatings of paint, and foreign particles from the following areas:

A : Hub bolt thread area
B : Wheel mounting surface of hub
C : Wheel alignment area of hub
D : Disc wheel mating surface
E : Disc wheel nut mounting surface
F : Wheel nut thread area
G : Wheel nut spherical area

[Applying grease]

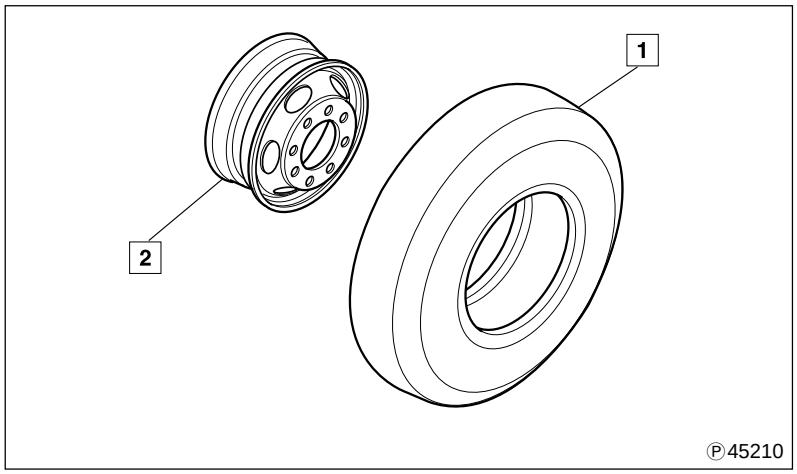
H : Grease application location

WARNING⚠

Never use grease containing molybdenum disulfide, since it can cause loosening of fitted screws.

WHEEL AND TIRE

Tire Assembly



● **Disassembly sequence**

1 Tire
2 Disc wheel

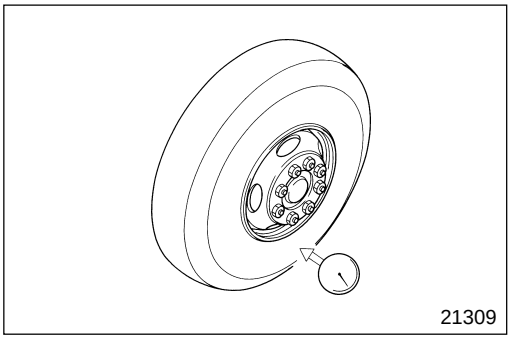
● **Assembly sequence**

Follow the disassembly sequence in reverse.

Service standards

Unit : mm {in.}

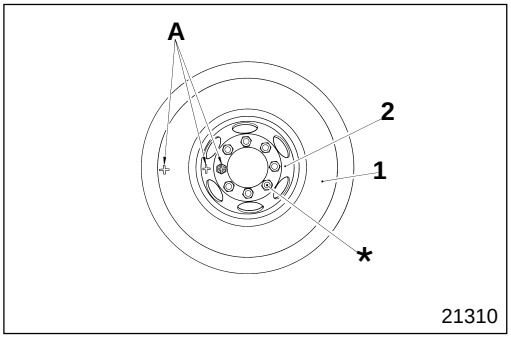
Location	Maintenance item		Standard value	Limit	Remedy
1	Horizontal deflection of tire (When assembled)		3.5 {0.14} or less	—	—
2	Disc wheel < 22.5×6.75-152-12 >	Flatness	0.2 {0.0079} or less	—	—
		Horizontal deflection	2.0 {0.079} or less	—	—
		Vertical deflection	1.8 {0.071} or less	—	—
	Disc wheel < 22.5×7.50-162-13 >	Flatness	0.2 {0.0079} or less	—	—
		Horizontal deflection	2.0 {0.079} or less	—	—
		Vertical deflection	1.8 {0.071} or less	—	—



◆ Service procedure

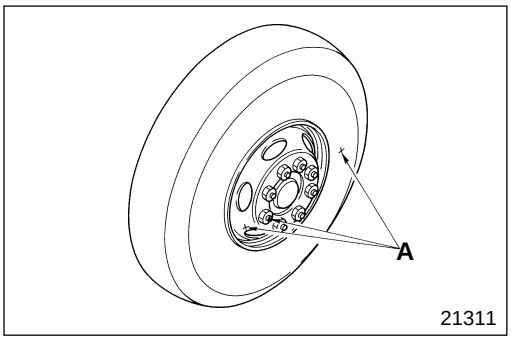
1 **Deflection of tire**

[Inspection]
If the measured value is higher than the limit, make corrections as follows.

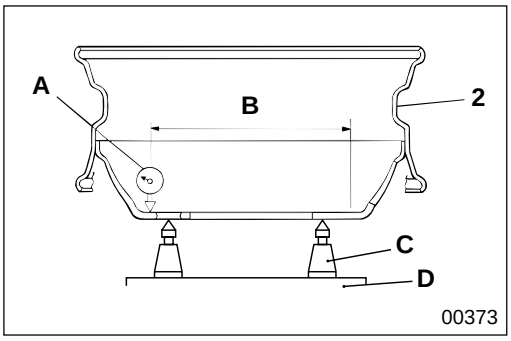


[Correction]

- Put chalk marks on tire **1**, disc wheel **2**, and hub bolt * (positions **A** as illustrated).
- Remove tire **1** from disc wheel **2**.



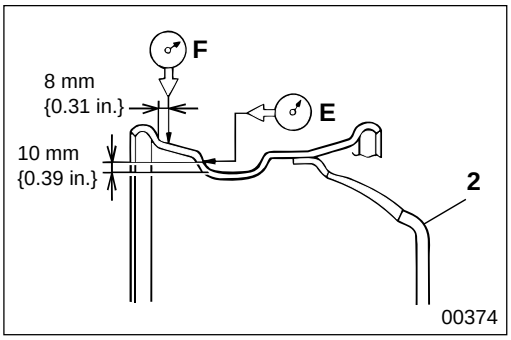
- Measure deflection of disc wheel **2**. If the most deflective position is near the chalk mark, reinstall tire **1** rotating it half a turn from the chalk mark and tighten nuts.
- Remeasure deflection of tire **1**.
- If the measured value is still higher than the limit, replace tire **1** and disc wheel **2** together as an assembly.



2 Inspection of disc wheel

(1) Flatness

- Measure flatness at specified position **B** from the center of disc wheel **2**.
  Measure flatness at ten equidistant points on the wheel.
  A : Dial gauge
  B : ø235 to 340 mm {9.25 to 13.4 in.}
  C : Portable screw jacks (x 4)
  D : Surface plate
- Replace disc wheel **2** if the measured value is higher than the limit.



(2) Deflection

Replace disc wheel **2** if the measured value is higher than the limit.
E : Horizontal deflection measuring point
F : Vertical deflection measuring point

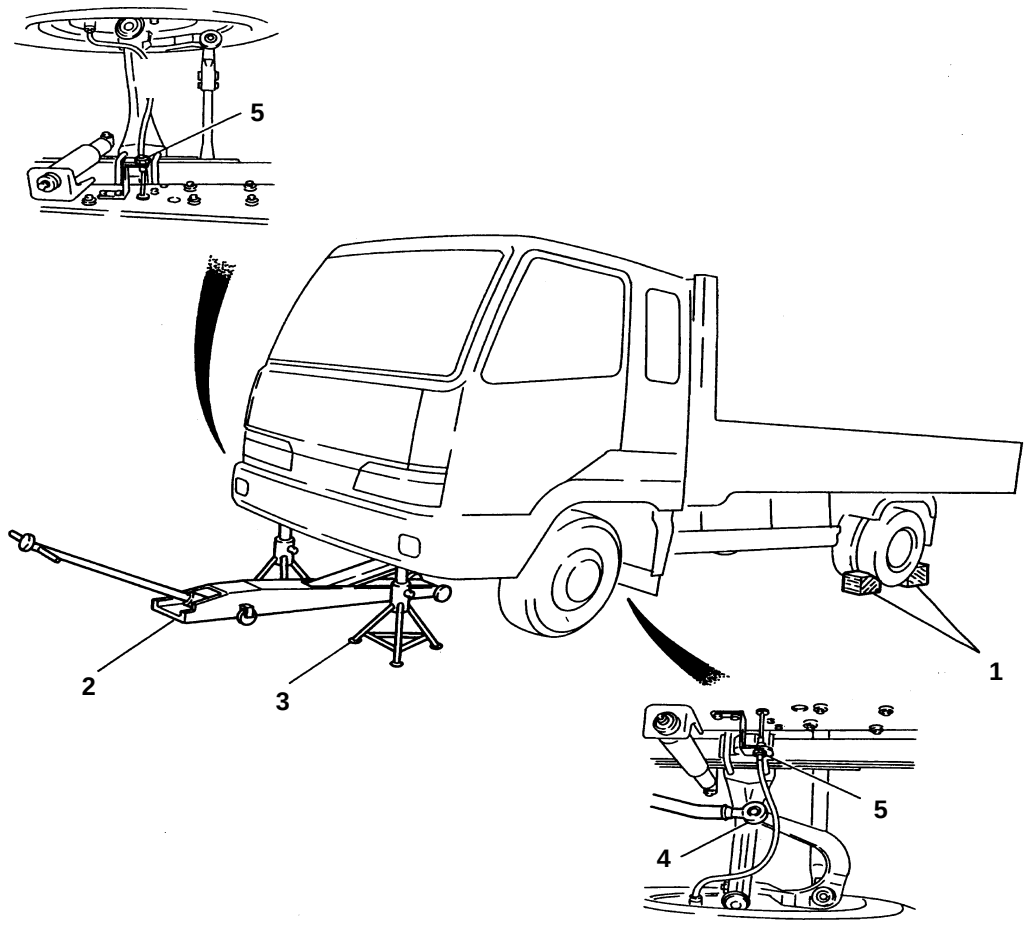
	Tires and wheels unbalanced						○	Gr 31
	Air pressure excessive			○				

WORK BEFORE REMOVAL AND INSTALLATION OF FRONT SUSPENSION



● **Removal sequence**

1 Place wheel chocks.
2 Jack up the front axle with a garage jack.
3 Support the front frame on rigid racks.
4 Remove the nut (on the joint between the knuckle arm and the drag link). Gr 37
5 Remove the brake hose joint and wheel speed sensor (on the frame). Gr 26

WARNING

- **Chock the wheels securely so the vehicle does not move.**
- **Do not remove the chocks until the entire operation is completed.**
- **Supporting a vehicle on a garage jack only is extremely dangerous, so always support the frame with rigid racks.**
- **Leave the garage jack and rigid racks in place until the entire operation is completed. Never remove them during the operation.**

CAUTION

Be sure to protect the brake hose from dust by fitting blanking plugs.

● **Installation sequence**

Follow the removal sequence in reverse.

WARNING⚠

You must bleed air from the brake system after connecting the brake hose, failure to do so would cause the brakes to malfunction. Gr 35A

CAUTION⚠

Be sure that the brake hose is not twisted when you install it.

REMOVAL AND INSTALLATION OF LEAF SPRING ASSEMBLY

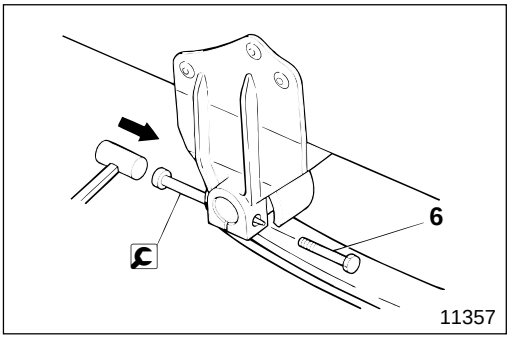
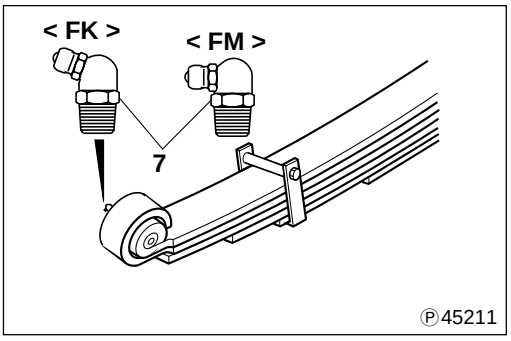
◆ Service procedure

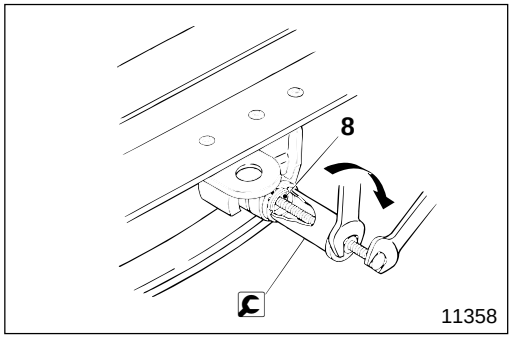


6 **Removal of bolt**



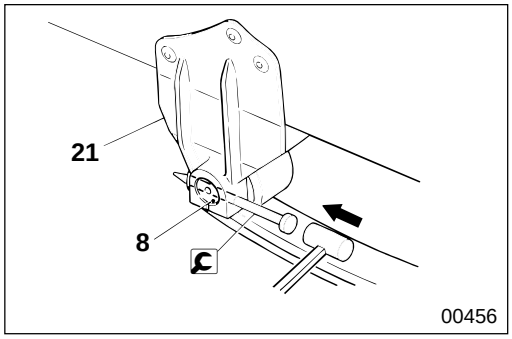
7 **Grease nipple < FK >**

- Install grease nipple **7**, on the driver's side, so that it can be easily accessed for grease supply. This is the only nipple that is installed on • the inner side of the vehicle. Grease nipples, **11**, **16** are straight types and are installed on the outer side of the vehicle.
- Grease nipple **7** at the forward side of the assistant driver's seat is a straight type, and it is installed on the outer side of the vehicle.

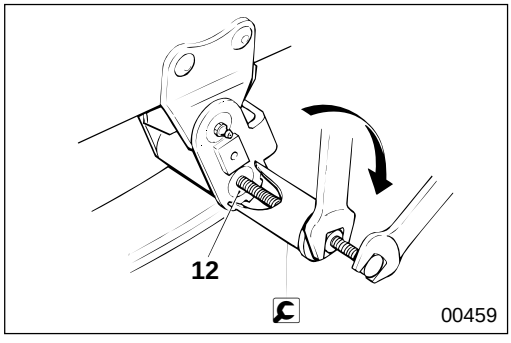


8 **Shackle pin**

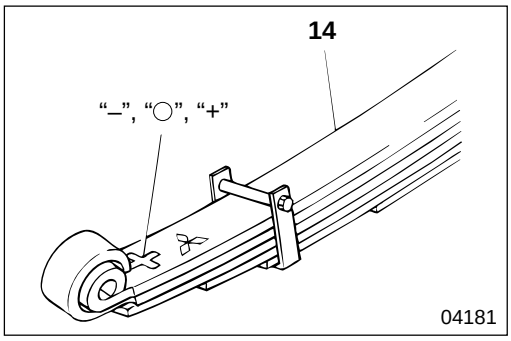
[Removal]



[Installation]
Align the bolt hole of front spring front bracket **21** with the bolt groove of shackle pin **8** using ⊏ shackle pin setting bar.



12 **Removal of shackle pin**



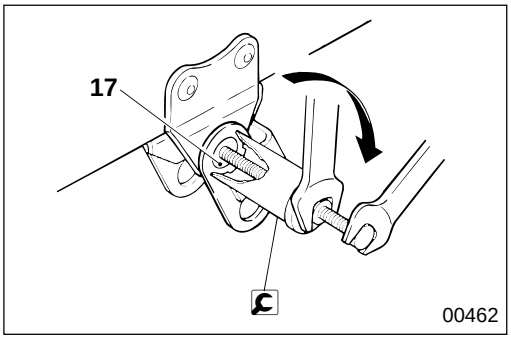
14 **Leaf spring assembly left/right height combinations**

When replacing leaf spring assembly **14**, select the members so that the left and right height marks "+", "○" and "–" are combined as shown below.

Item	Combination				
	1	2	3	4	5
Right leaf spring assembly, passenger's side	–	–	○	○	+
Left leaf spring assembly, driver's side	–	○	○	+	+

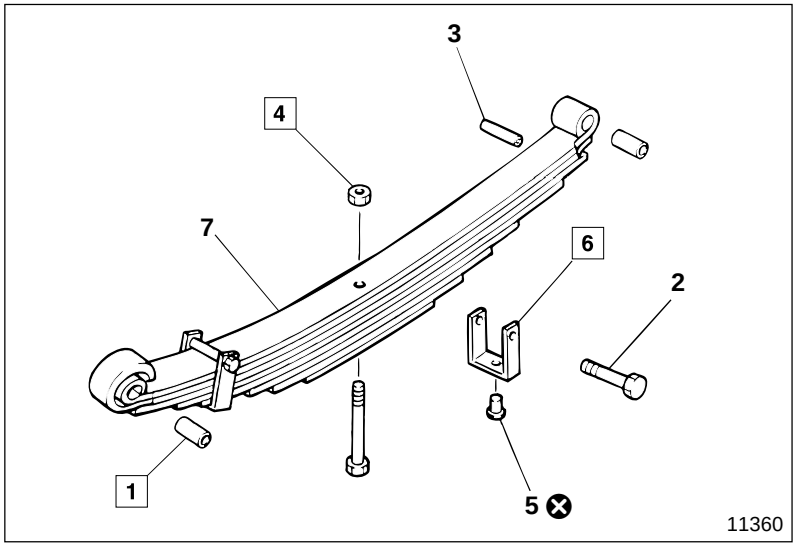
CAUTION⚠

Passenger's side leaf spring assembly 14 differs from the driver's side leaf spring assembly in camber (arch). Do not mix them up when mounting, or this would cause vehicle tilt.



17 **Removal of shackle pin**

LEAF SPRING ASSEMBLY



● **Disassembly sequence**

1 Spring bushing
2 Clip bolt
3 Pipe < FM >
4 Rivet
5 Clip
6 Leaf spring

⊗ : Non-reusable parts

● **Assembly sequence**

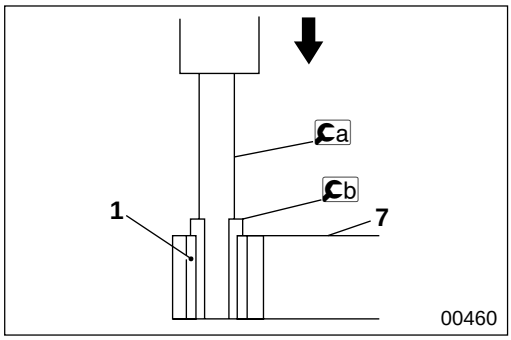
Follow the disassembly sequence in reverse.

Special tools

Unit : mm {in.}

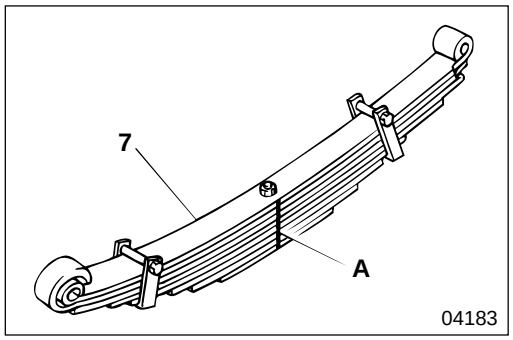
Location	Tool name and shape	Part No.	Application
1	Bushing installer set **A** : Bushing installer A **B** : Bushing installer B 	MB999066 **A** : MB999067 **B** : MB999068	Removal and press-fitting of spring bushing

◆ Service procedure



1 **Removal of spring bushing**

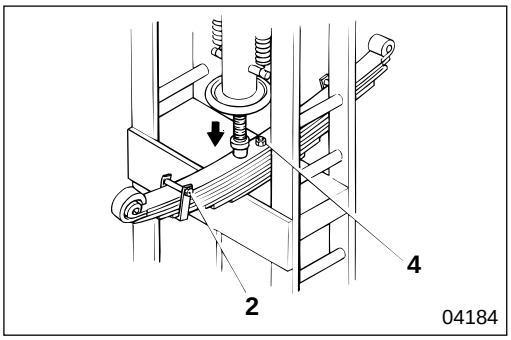
Remove the spring bushing from leaf spring **7** using a bushing installer **A** and b bushing installer **B**. For installation, follow the removal sequence in reverse.



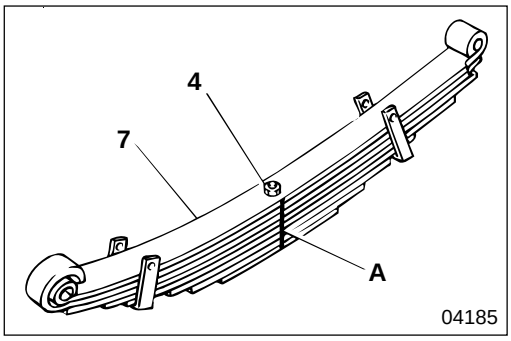
4 **Center nut**

[Removal]

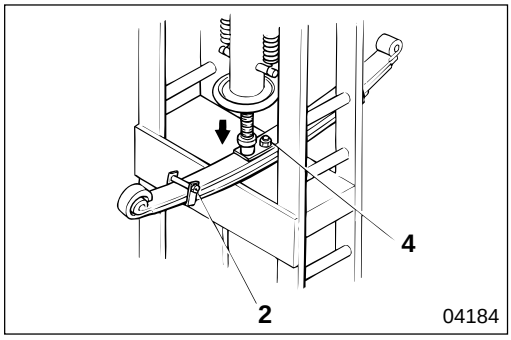
- Put aligning marks **A** across leaves of leaf spring **7**.



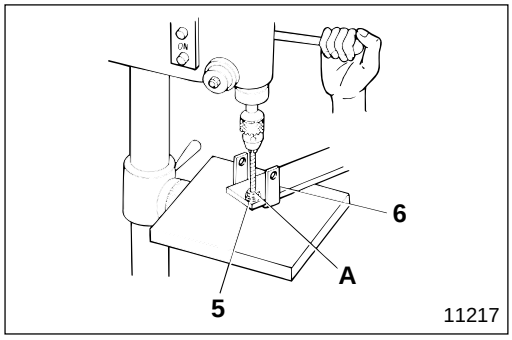
- Compress the leaf springs using a press to remove clip bolt **2** and center nut **4**.



[Installation]
- Align alignment marks **A** on leaf springs **7** and assemble.
- Tighten center nut **4** temporarily.

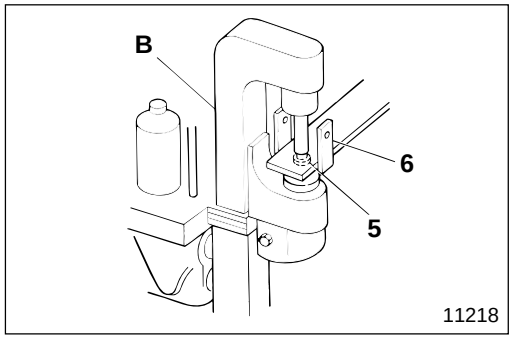


- Compress leaf spring **7** using a press, then install center nut **4**.
- Tighten clip bolt **2**.



6 Clip

[Removal]
Drill out caulked ends **A** of rivet **5** on a drill press to remove clip **6**.



[Installation]
Using riveting machine **B**, install clip **6** by caulking rivet **5**.

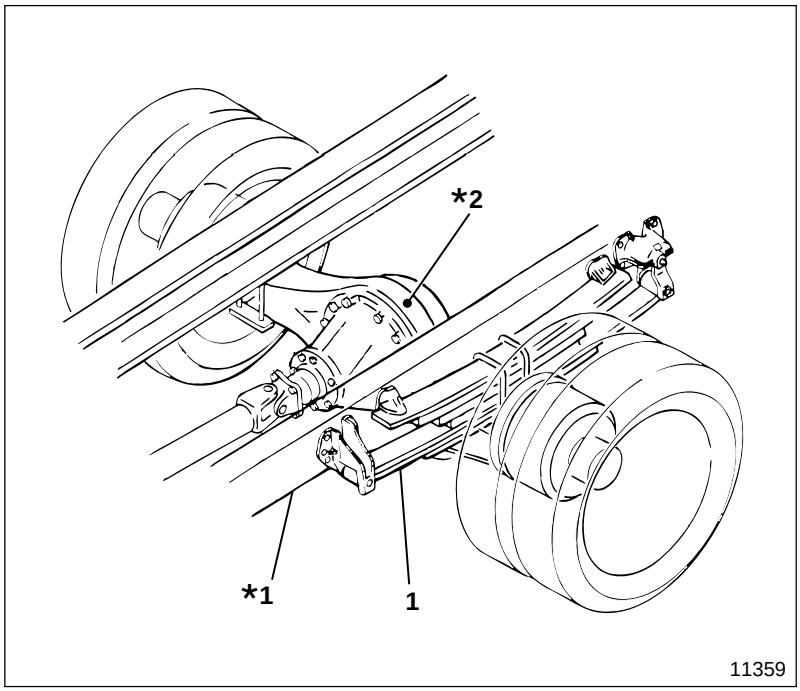
REMOVAL AND INSTALLATION OF LEAF SPRING ASSEMBLY 34- 6

LEAF SPRING ASSEMBLY 34-12



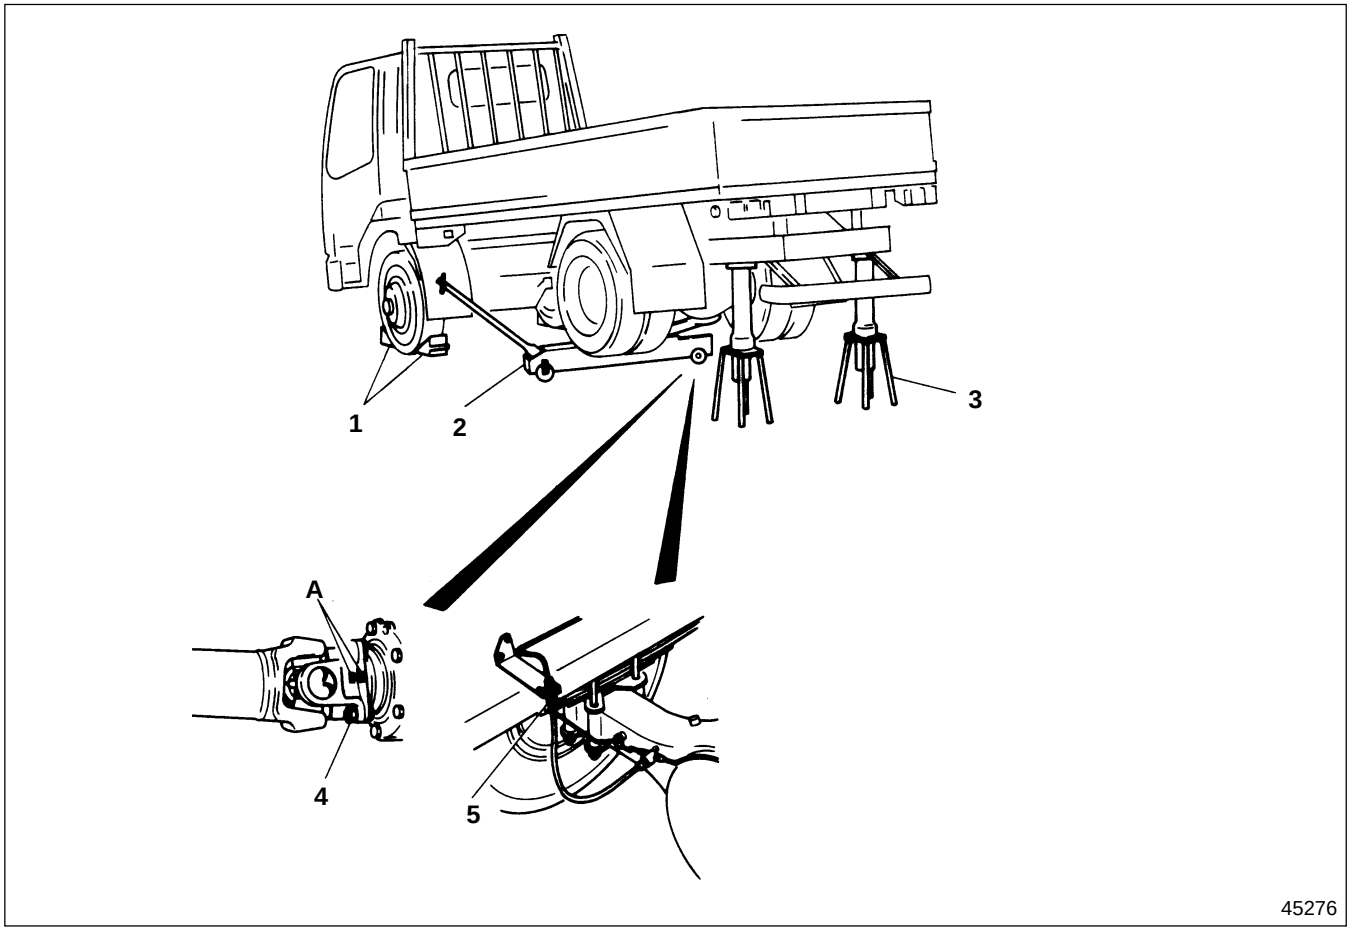
1 Leaf spring assembly

***1** : Frame
***2** : Rear axle

Leaf spring assembly **1** is installed between frame ***1** and rear axle ***2** to support the vehicle body mass and absorb vibration and shock from the road surface to prevent them from being directly transmitted to the vehicle body thereby protecting the crew, the vehicle body, and the cargo. In addition, irregular vibration from the wheels is restrained, ensuring driving stability.

Possible causes \ Symptoms		Ride spongy	Noise generated when vehicle is unloaded	Impact transmitted from uneven road surface	Noise generated when vehicle is loaded	Excessive rolling while cruising	Periodic jolts caused by the road surface	Remarks
Leaf spring	Cracked or damaged			○				
	Damaged		○					
	Spring bracket broken				○			
	U-bolts loose				○			
	Spring bushing worn		○					
Shackle pins thrust play excessive			○					
Sliding seat < FM > or helper stopper damaged or broken					○			
Tire	Tires worn unevenly						○	
	Tires and wheels unbalanced						○	Gr 31
	Air pressure excessive			○				

WORK BEFORE REMOVAL AND INSTALLATION OF REAR SUSPENSION



● **Removal sequence**

1 Place wheel chocks.
2 Jack up the rear axle with a garage jack.
3 Support the rear frame on rigid racks.
4 Put alignment marks **A** on the rear axle companion flange and the propeller shaft flange yoke, then remove the nuts (on the joint between the rear axle and the propeller shaft). Gr 25
5 Remove the brake hose joint and wheel speed sensor (on the frame). Gr 27

WARNING

- **Chock the wheels securely so the vehicle does not move.**
- **Do not remove the chocks until the entire operation is completed.**
- **Supporting a vehicle on a garage jack only is extremely dangerous, so always support the frame on rigid racks.**
- **Leave the garage jack and rigid racks in place until the entire operation is completed. Never remove them during the operation.**

CAUTION

Be sure to protect the brake hose from dust by fitting blanking plugs.

● **Installation sequence**

Follow the removal sequence in reverse.

WARNING⚠

You must bleed air from the brake system after installing the brake hose, failure to do so would cause the brake to malfunction. Gr 35A

CAUTION⚠

Be sure that the brake hose is not twisted when you install it.

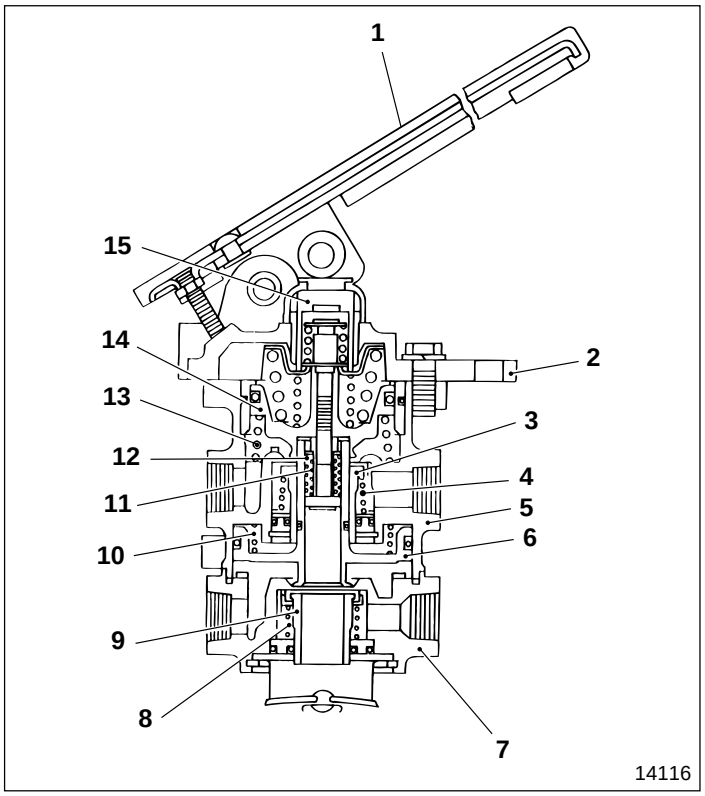
Y : Yellow tape
***a**: With exhaust brake
***b**: Without exhaust brake

- The brake system is an air over hydraulic, all wheel brake type consisting of separate front and rear systems.
- The servo system is fitted with brake boosters.
- An exhaust brake system of the exhaust pipe opening and closing valve type, is fitted as a sub-brake system.

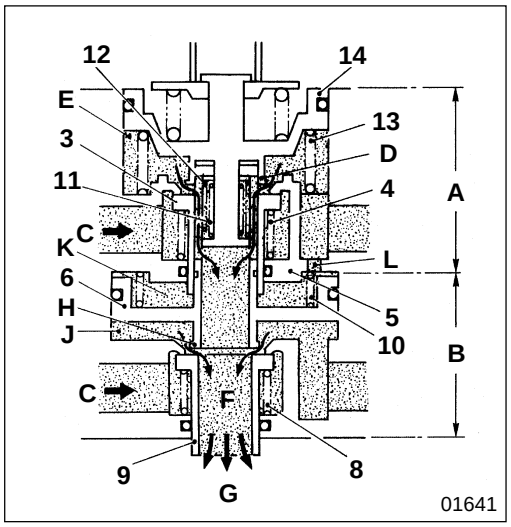
Dual Brake Valve



1 Brake pedal
2 Plate assembly
3 Primary inlet valve
4 Primary valve spring
5 Body
6 Relay piston
7 Cover
8 Secondary valve spring
9 Secondary inlet valve
10 Relay piston spring
11 Inner spring
12 Outer spring
13 Primary piston spring
14 Primary piston
15 Plunger

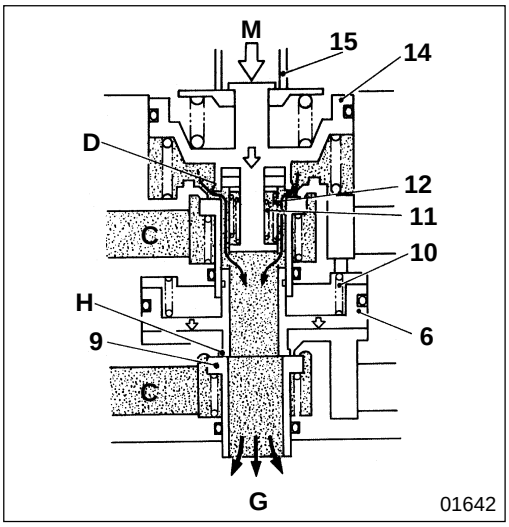
The dual brake valve controls the braking force of the vehicle by feeding pressurized air to the airmaster in accordance with the brake pedal depression angle of brake pedal **1**.

● When brake not operating



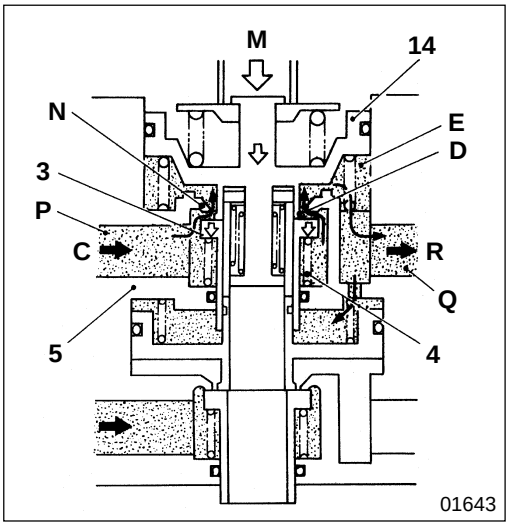
- The repercussive forces of primary valve springs **4**, secondary valve spring **8** seat primary inlet valve **3** at primary side **A**, and inlet valve **9** at secondary side **B**, on their respective seats. This shuts off air **C** from the air tank to maintain airtightness.
- The repercussive force of primary piston spring **13** raises primary piston **14** to its upper position. Exhaust valve seat **D** opens and chamber **E** is open to atmosphere **G** via chamber **F**.
- Since the repercussive forces of inner spring **11** and outer spring **12** is stronger than the repercussive force of relay piston spring **10**, relay piston **6** is raised to its upper position and exhaust valve seat **H** is opened. This opens chamber **J** to atmosphere **G** via chamber **F**.
  Chamber **E** at the primary side and chamber **K** at the upper part of relay piston **6** at the secondary side are connected via passage port **L** of body **5**.

● When depressing brake pedal (before braking pressure is generated)



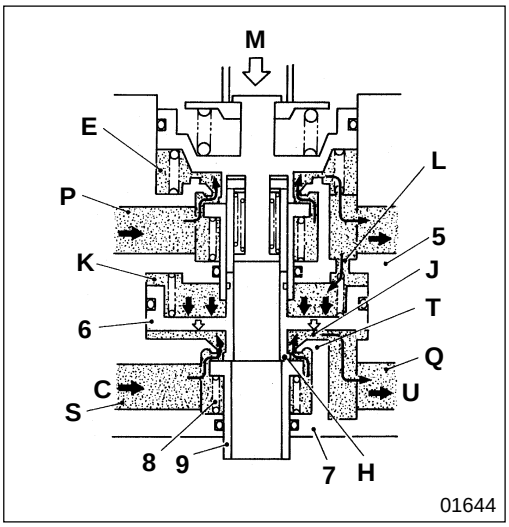
- Depressing the brake pedal (illustrated as pedal action **M**), forces down primary piston **14** via plunger **15**.
- Forcing down primary piston **14** changes the balance between the repercussive forces of inner spring **11** and outer spring **12**, and the repercussive force of relay piston spring **10**, forcing down relay piston **6**. This seats the relay piston on secondary inlet valve **9** and closes exhaust valve seat **H**.
- This closes the secondary side exhaust passage; however, primary side exhaust valve seat **D** remains open. No braking pressure is generated at either primary or secondary sides.

● When depressing brake pedal (braking pressure is generated)



Primary side

- As the brake pedal is depressed further (illustrated as brake pedal action **M**), primary piston **14** is forced down until it is seated on primary inlet valve **3**, closing exhaust valve seat **D**.
- Primary inlet valve **3** is forced down, compressing primary valve spring **4**, and supply valve seat **N** of body **5** separates from the primary inlet valve. The air in chamber **P** flows into chamber **E** and is fed to rear brake system **R** via discharge port **Q** as braking pressure.

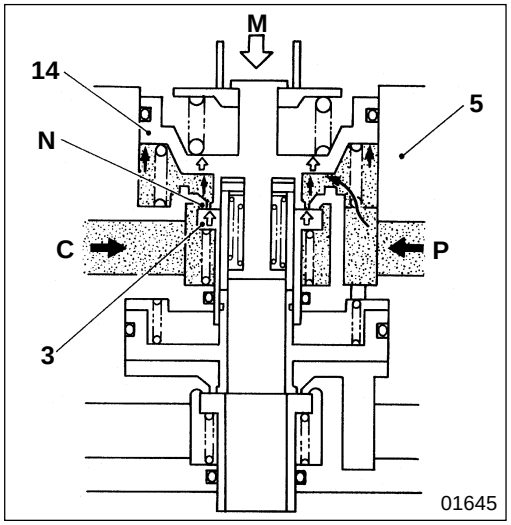


Secondary side

- The air at the primary side flows into chamber **K** via passage port **L** of body **5**.
- The air fed into chamber **K** acts on the upper part of relay piston **6** to force down the relay piston and compress secondary valve spring **8**, forcing down secondary inlet valve **9**.
- This separates supply valve seat **T** and secondary inlet valve **9** of cover **7**.
- The air in supply port chamber **S** flows into chamber **J** and is fed to front brake system **U** via discharge port **Q** as braking pressure.

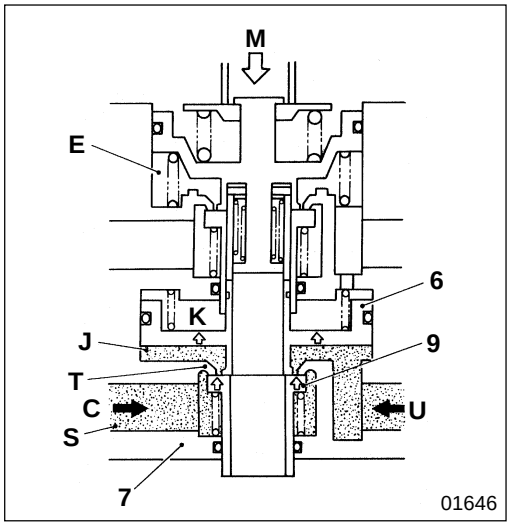
● Stabilization of braking pressure

When the brake pedal remains depressed at the specified depression angle, the braking air pressure stabilizes at the pressure corresponding to the brake pedal depression angle.



Primary side

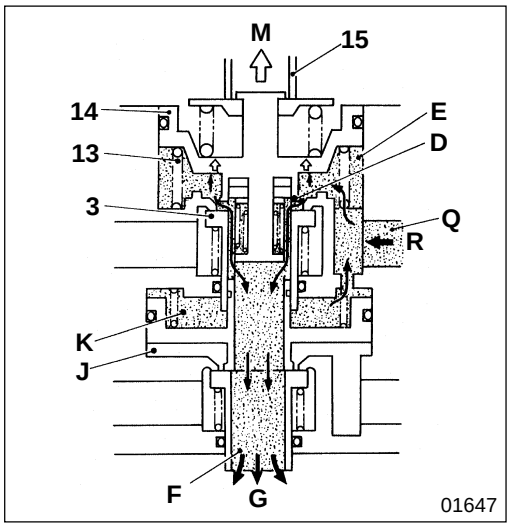
- The braking air pressure fed under the bottom of primary piston **14** raises the primary piston and primary inlet valve **3** together in tandem.
- Primary inlet valve **3** makes contact with supply valve seat **N** of body **5**, then the supply of air **C** from the air tank ceases and the increases in the braking air pressure stops. This stabilizes braking pressure **R** for the rear brake system.



Secondary side

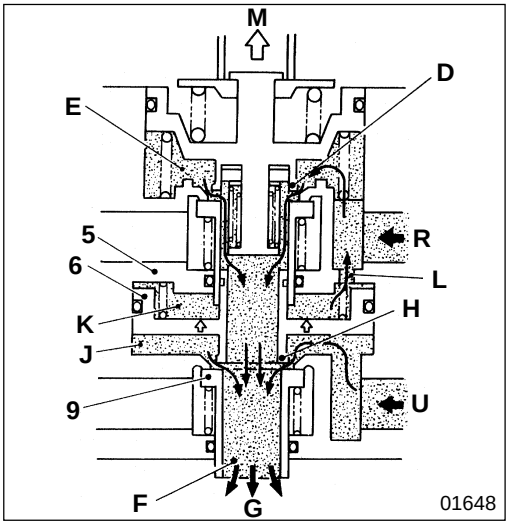
- As the braking pressure (pressure in chamber **J**) for the front brake system balances the pressures in chambers **E** and **K**, the force raising relay piston **6** disappears, and the relay piston rises in tandem with secondary inlet valve **9**.
- Secondary inlet valve **9** makes contact with supply valve seat **T** of cover **7**, then the supply of air from supply port chamber **S** to chamber **J** ceases. This stabilizes brake pressure **U** for the front system.

● Release of brake pressure



Primary side

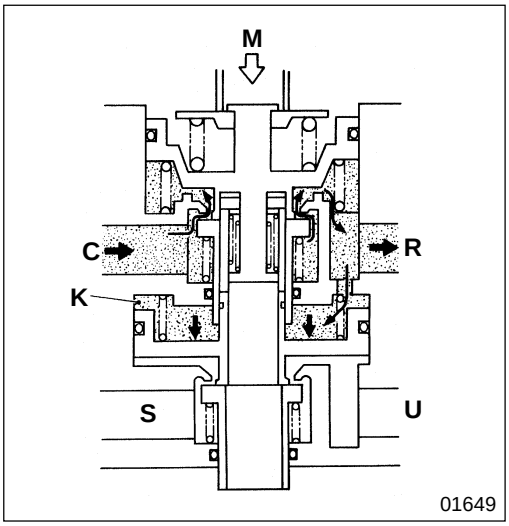
When the brake pedal is released (illustrated as brake pedal action **M**), primary piston spring **13** and air pressure **R** at discharge port **Q** (pressure in chamber **E**) raise plunger **15** and primary piston **14**. Then, exhaust valve seat **D** at the lower end of the primary piston separates from primary inlet valve **3**. The air pressure of the rear brake system flows through chamber **E** to be discharged from exhaust passage chamber **F** into atmosphere **G**.



Secondary side

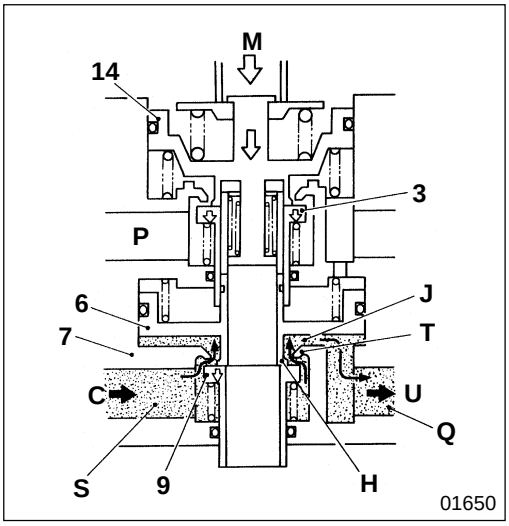
- As the air pressure in the rear brake system drops, the air pressure in chamber **K** is discharged via passage port **L** of body **5**, and chambers **E**, **F** into atmosphere **G**.
- This changes the air pressure balance between chambers **K** and **J**. The air pressure in chamber **J** raises relay piston **6**, and exhaust valve seat **H** at the lower end of the relay piston separates from secondary inlet valve **9**. Air pressure **U** in the front brake system is discharged from exhaust passage chamber **F** into atmosphere **G**.

● When abnormality occurs



Operation when the air pipe of the front brake system fails

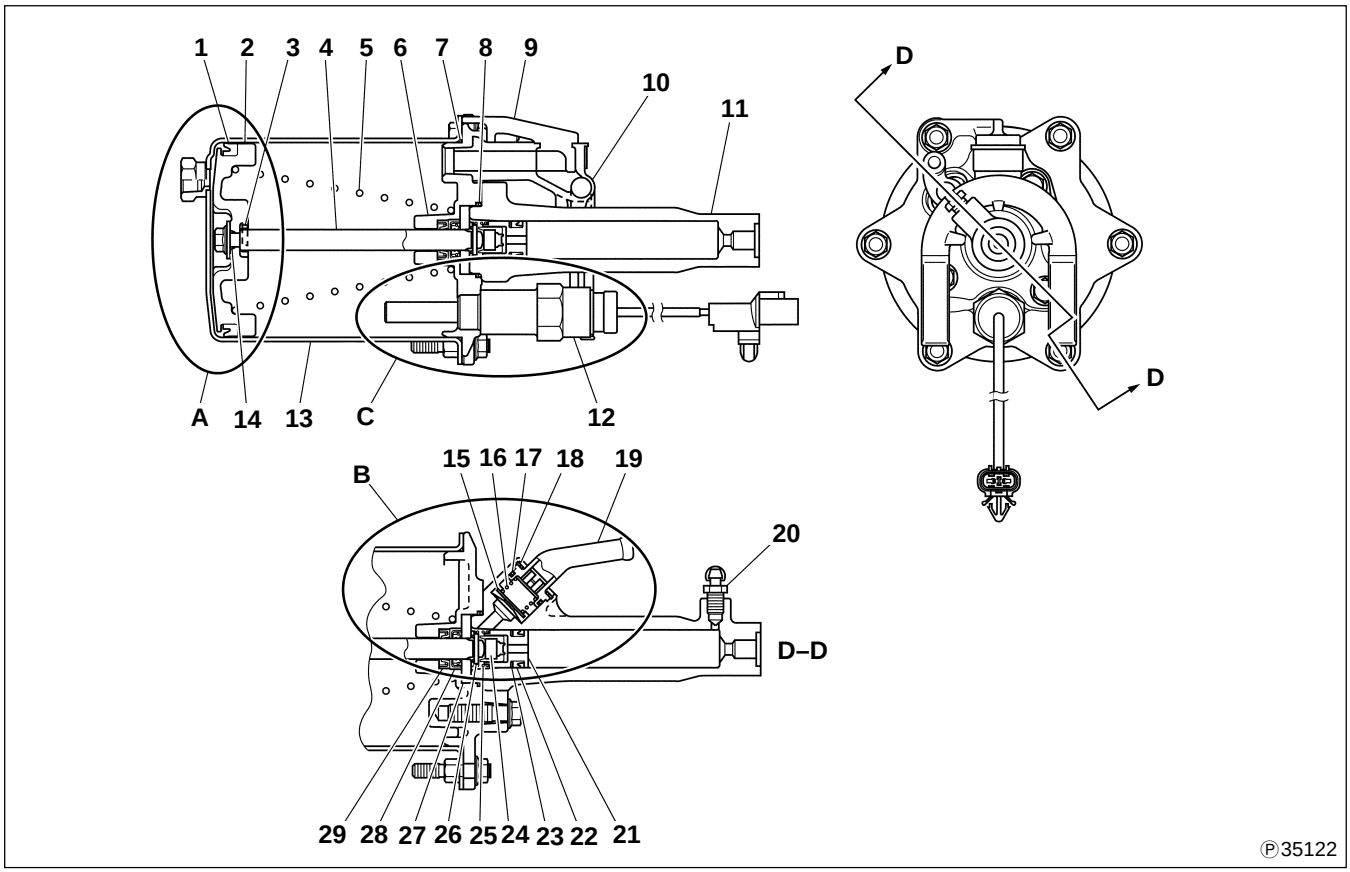
- The primary side operates the same as normal, generating braking pressure in rear brake system **R**.
- At the secondary side, even if the primary side generates air pressure in chamber **K**, braking pressure is not generated in front brake system **U**, since no air pressure is generated in supply port **S**.



Operation when the air pipe of the rear brake system fails

- In the rear brake system, air pressure is not generated up to supply port **P**. Therefore, even if the brake pedal is depressed (causing primary piston **14** to force down primary inlet valve **3**), braking pressure is not generated.
- If the brake pedal is depressed further (illustrated as brake pedal action **M**), primary piston **14** makes contact with relay piston **6** and they force down secondary inlet valve **9**.
- This action separates supply valve seat **T** of cover **7** from secondary inlet valve **9**. The air pressure flows into chamber **J** from chamber **S** and is fed to front brake system **U** via discharge port **Q** as braking pressure.

Brake Booster



1 Cup packing

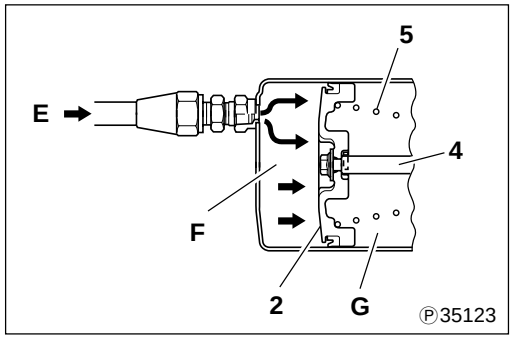
25 Spring
26 Straight pin
27 Washer
28 Oil seal
29 Oil seal

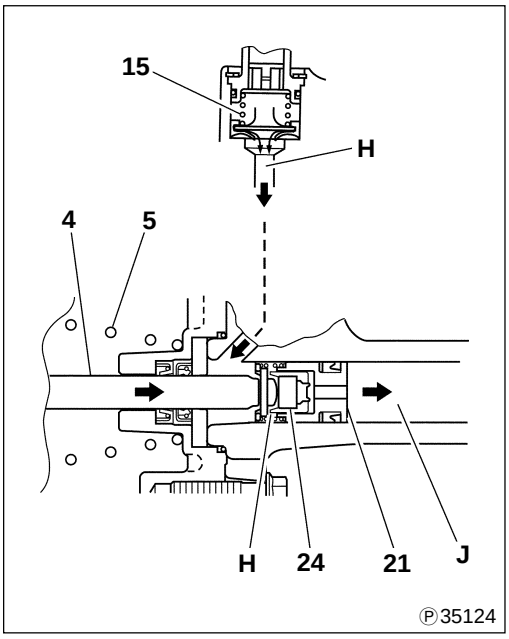
A : Power cylinder section
B : Hydraulic piston section
C : Brake booster stroke switch section

● Power cylinder section



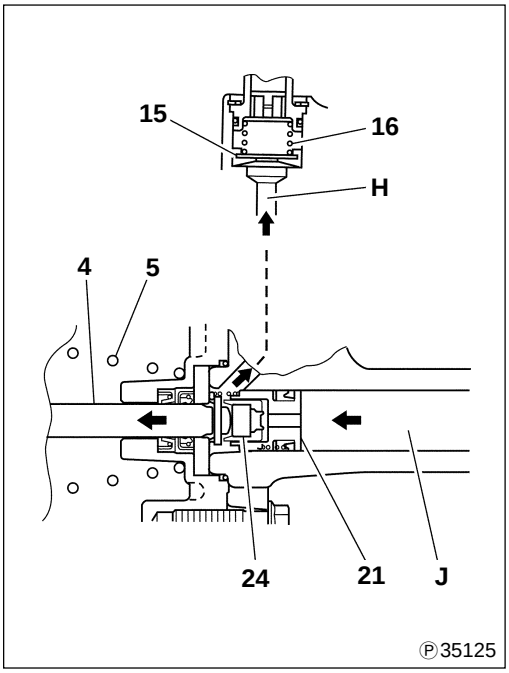
- The action of the dual-brake valve sends compressed air **E** into chamber **F**, which applies pressure to piston plate **2**. Since chamber **G** is open to the atmosphere, an internal pressure difference is created between chambers **F** and **G**. When the force of the pressure difference exceeds the force of return spring **5**, the piston plate moves toward the right.
- Piston plate **2** is attached to push rod **4**. The piston plate transmits the force applied by compressed air to the hydraulic piston section.

● **Hydraulic piston section**



When brake is applied

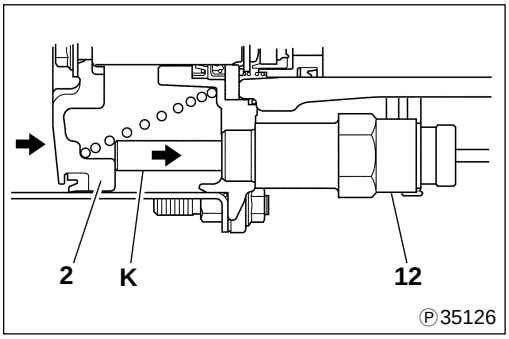
- The movement of piston plate **2** compresses return spring **5**, pushes push rod **4**, and moves hydraulic piston **21** to the right.
- Valve seal assembly **24** contacts the seat surface of hydraulic piston **21**. As a result, the passage between chamber **H** on the fluid tank side and chamber **J** on the wheel cylinder side closes, and applies pressure to the brake fluid inside chamber **J**. This pressure force is transmitted to the wheel cylinder.
- The movement of hydraulic piston **21** increases the volume of chamber **H** and causes negative pressure in the chamber. As a result, the valve in valve assembly **15** opens, and allows brake fluid to flow from the fluid tank into the valve assembly.



When brake is released

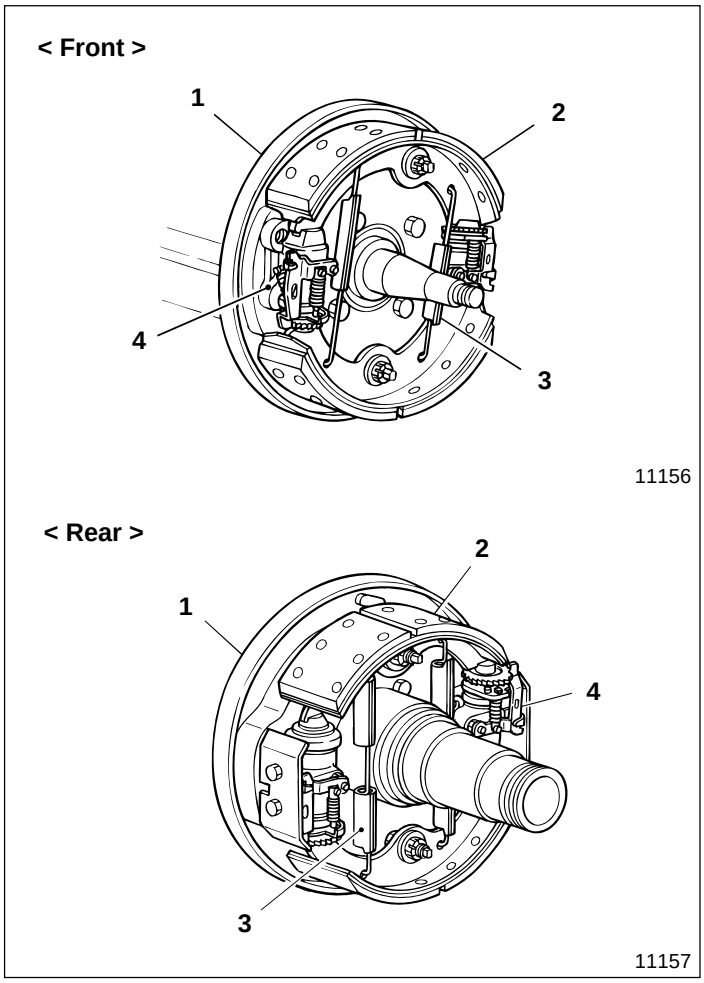
- When the brake pedal is released, compressed air behind piston plate **2** is released to the atmosphere. Hydraulic piston **21** is forced back to the original position by return spring **5** on push rod **4** and the pressure of the brake fluid in chamber **J**. When valve seal assembly **24** contacts push rod **4**, the passage between chambers **H** and **J** opens.
- Brake fluid passes through chamber **H**, compresses spring **16** in valve assembly **15** < not provided in disk brake system >, then flows around the valve assembly and return to the fluid tank.
- Valve assembly **15** remains at a position where the brake fluid pressure is in balance with the force of spring **16**.

● **Brake booster stroke switch section**



- If the brake lining is worn or brake fluid leaks due to damaged brake pipe, the stroke of piston plate **2** increases and causes the piston plate to contact the tip of rod **K**, thus moving the rod to the right.
- When the rod moves to the right, it activates brake booster stroke switch **12**, which in turn lights the warning lamp on the meter cluster to warn the driver.

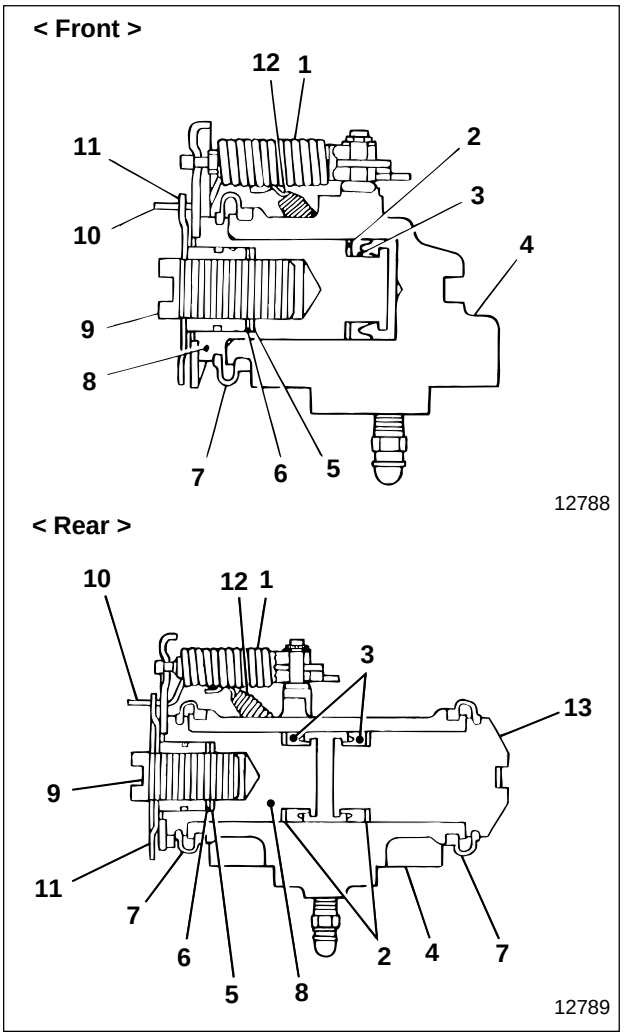
Wheel Brake



1 Backing plate
2 Brake shoe assembly
3 Return spring
4 Wheel cylinder assembly

- The front wheel brake is an internal expanding 2-leading brake type.
- The rear wheel brake is an internal expanding dual 2-leading brake type.
- Front and rear wheel cylinder assemblies **4** have shoe clearance automatic adjusting mechanisms to maintain the shoe clearance within a specific range.

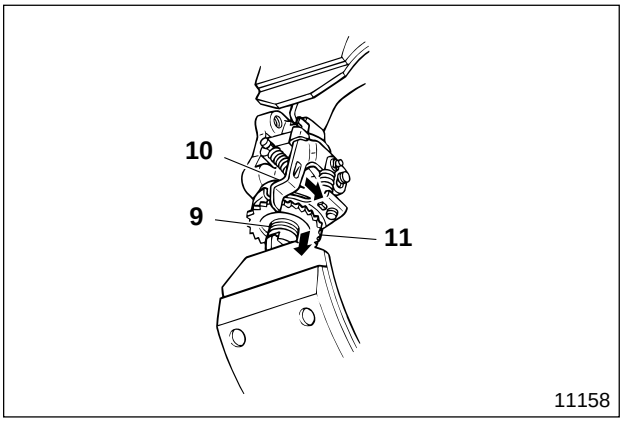
Wheel Cylinder Assembly



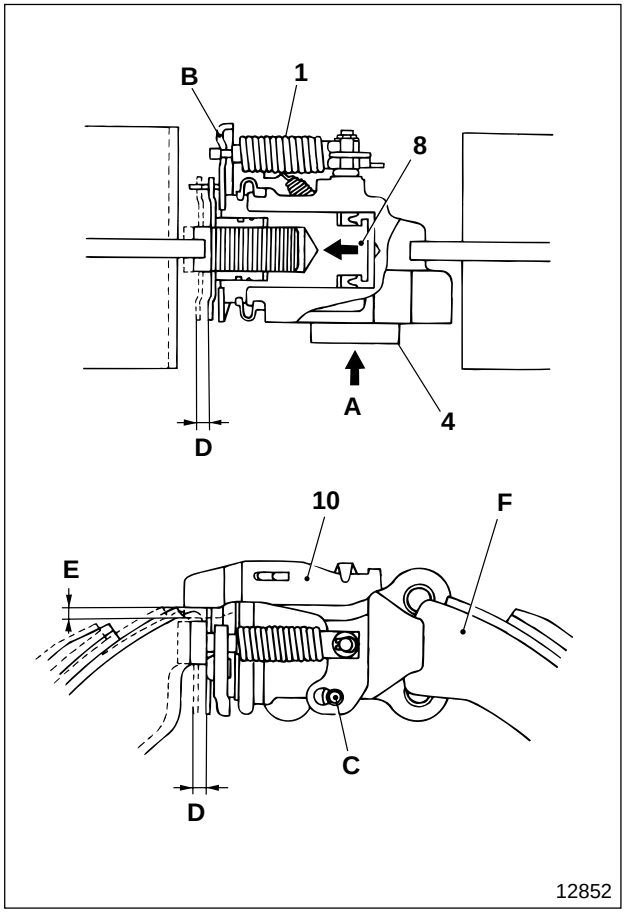
1 Spring
2 Backup ring
3 Piston cup
4 Cylinder body
5 Washer (Thick)
6 Washer (Thin)
7 Boot
8 Piston
9 Screw
10 Adjusting lever
11 Adjuster
12 Set spring
13 Piston < Rear wheel cylinder >

The automatic shoe clearance adjuster automatically adjusts the brake shoe clearance as the lining wears and the brake shoe clearance becomes higher than the specified value.

● **Operation of automatic shoe clearance adjusting mechanism**

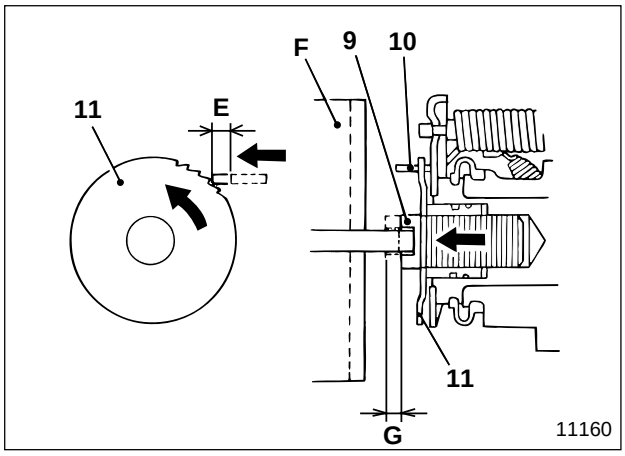


Adjusting lever **10** turns adjuster **11** to push out screw **9**, maintaining correct shoe clearance.



When depressing brake pedal

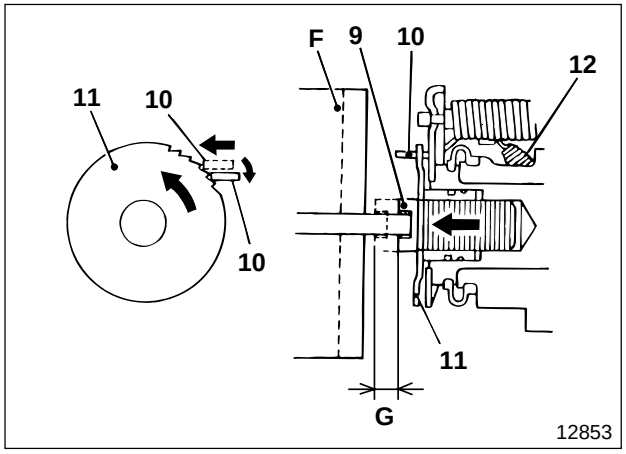
- Hydraulic pressure **A** acts on cylinder body **4** to push piston **8** forward.
- As spring hanger **B** of piston **8** is pushed forward, spring **1** which is connected to the spring hanger is pulled, and adjuster lever **10** turns around pin **C**.
  D : Travel of piston **8**
  E : Travel of adjusting lever **10**
  F : Brake shoe assembly



When the brake shoe clearance conforms to the specified value

- When the brake shoe clearance conforms to the specified value, the amount of travel of piston **8** is small. Therefore, the amount adjusting lever **10** turns is less than a one-tooth pitch of adjuster **11** and the adjuster does not turn, so no adjustment is made.
  E : Travel of adjusting lever **10**
  F : Brake shoe assembly
  G : Travel of screw **9**

- When the brake pedal is released, adjusting lever **10** does not climb one tooth of adjuster **11**, so the original engagement is maintained.



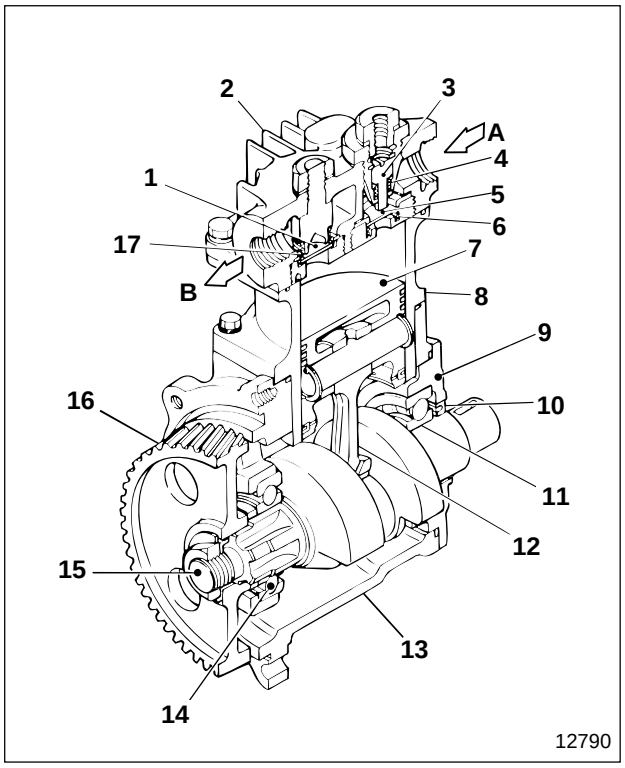
When the brake shoe clearance is higher than the specified value

- When the brake shoe clearance is higher than the specified value, the amount of travel of piston **8** is large. Therefore, adjusting lever **10** and adjuster **11** turn by a greater amount.
- The further adjuster **11** turns, the further screw **9** is pushed out. This regulates the brake shoe clearance to an amount within the specified value.
- When the brake pedal is released, adjuster **11** maintains the position after turning. Adjusting lever **10** climbs one tooth of the adjuster due to the action of set spring **12** to change the engagement, and is returned to the original position.

  F : Brake shoe assembly

  G : Travel of screw **9**

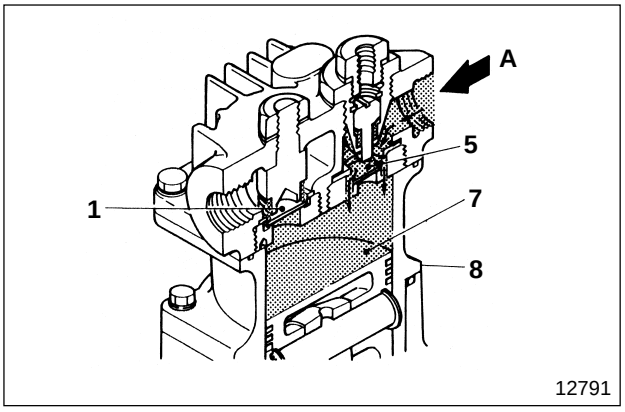
Air Compressor



1 Delivery valve
2 Cylinder head
3 Unloader valve
4 Unloader valve spring
5 Suction valve
6 Suction valve spring
7 Piston
8 Cylinder liner
9 Bearing holder
10 Oil seal
11 Bearing
12 Connecting rod
13 Crankcase
14 Bearing
15 Crankshaft
16 Drive gear
17 Delivery valve spring

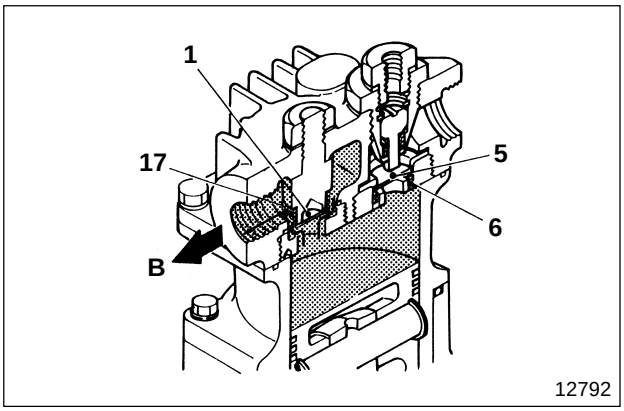
A : Air delivery port (From air cleaner)
B : Air discharge port (To air dryer)

● **During suction**



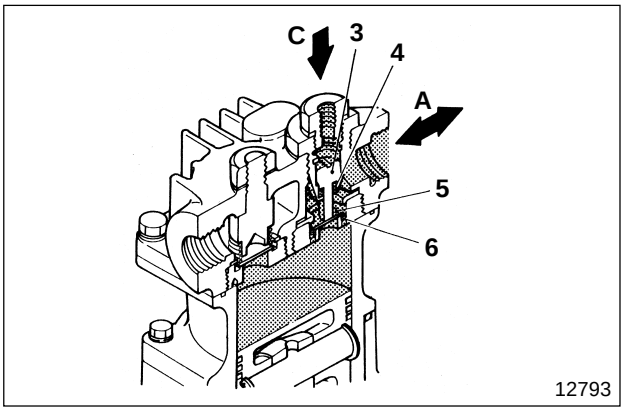
- When drive gear **16** is driven, crankshaft **15** engaged with the drive gear turns to force down piston **7**.
- The negative pressure generated at this time opens suction valve **5**, sucking air **A** into cylinder liner **8**.

● **During pressurized delivery**



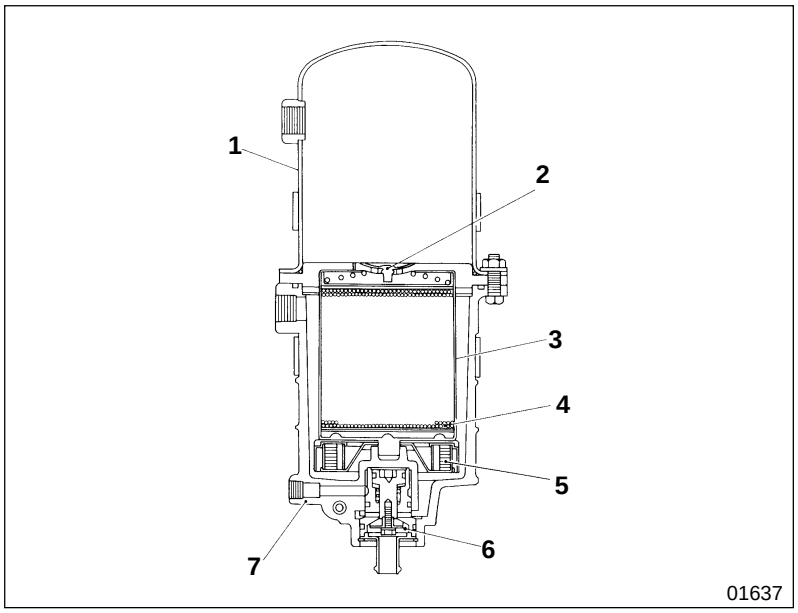
- As piston **7** rises and enters into the compression stroke, suction valve spring **6** closes suction valve **5**.
- The pressure of the compressed air overcomes the repercussive force of delivery valve spring **17** and opens delivery valve **1** to compress and deliver air **B** to the air dryer.

● **When unloader valve operates**



- When the air pressure in the air tank raises higher than the specified value, the air pressure governor operates to feed pressured air **C** to unloader valve **3**. This forces down the unloader valve and holds suction valve **5** open at the same time. Therefore, air **A** is not compressed and the air compressor idles.
- When the air pressure in the air tank drops lower than the specified value, the air pressure governor operates again to discharge pressured air from the upper side of unloader valve **3**. So, unloader spring **4** returns the unloader valve to its original position and the air compressor operates under a load.

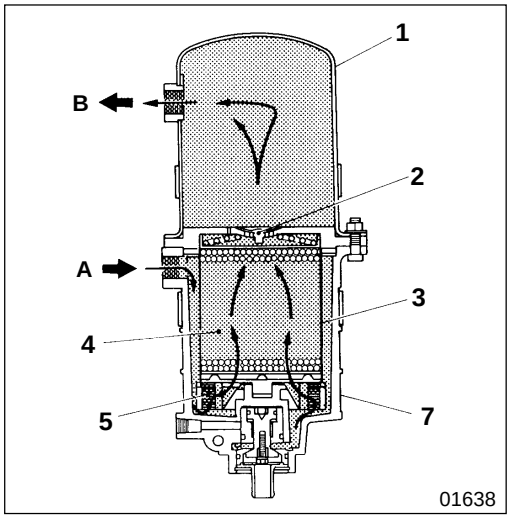
Air Dryer



1 Purge chamber
2 Check valve
3 Case
4 Desiccant
5 Oil filter
6 Valve
7 Body

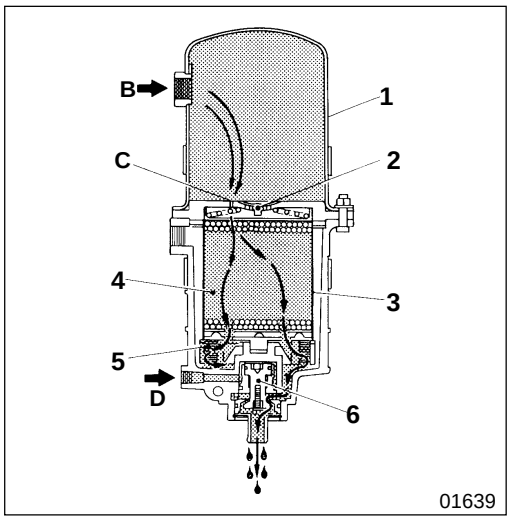
The air dryer removes moisture and oil from the air compressed by the air compressor, protecting the brake system.

● Dehumidification



- The pressurized air from the air compressor enters the air dryer through delivery port **A**. First, it flows in body **7** where moisture and oil are separated from the air and collected in the bottom. Then, the air passes through oil filter **5** where oil mist and dust are removed. Next, it is delivered into case **3** where moisture contained in the air is removed by desiccant **4**.
- As the air travels from the bottom to the top of case **3**, it comes into contact with more dried desiccant **4**. This removes residual moisture from the air, drying the air as it reaches the top of the case. The air passes through check valve **2** and purge chamber **1**, and is delivered to the air tank through exhaust port **B**.

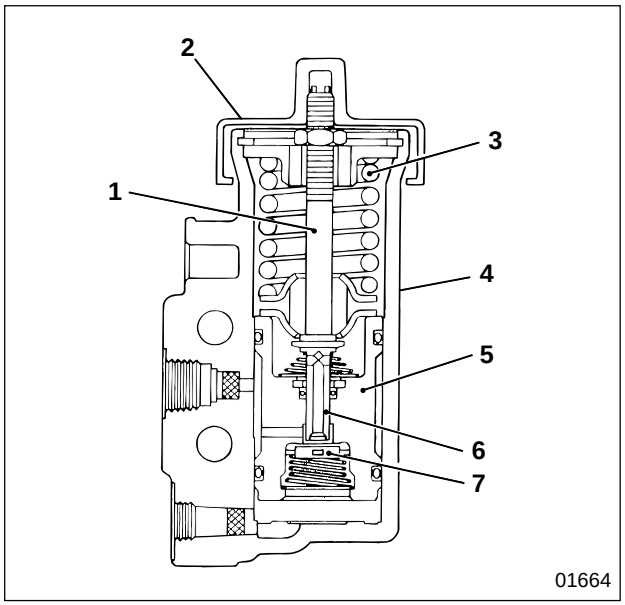
● Regeneration of desiccant



- When the supply of air from the air compressor stops, command pressure **D** from the air pressure governor opens valve **6** of the control port of the air dryer. This allows the pressure in case **3** to clean oil filter **5** and release the condensed water and oil into the atmosphere.
- Because of quick pressure reduction in the case, the dry air in purge chamber **1** flows through orifice **C** in the case **3** where the air expands under the reduced pressure, becoming super dry air. This air flows back through case **3** while removing the moisture from desiccant **4**, and is discharged together with moisture into the atmosphere, thereby recycling the desiccant.

M E M O

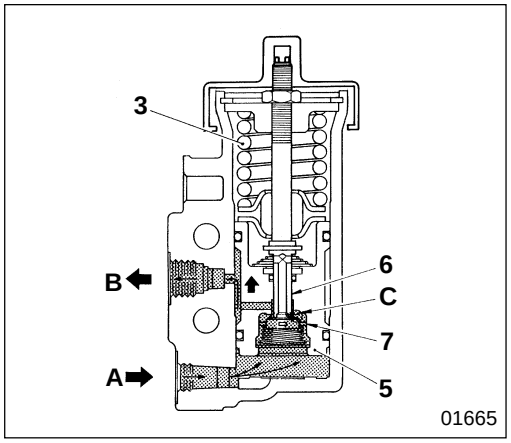
Air Pressure Governor



1 Adjusting screw
2 Cover
3 Spring
4 Body
5 Piston
6 Exhaust stem
7 Valve

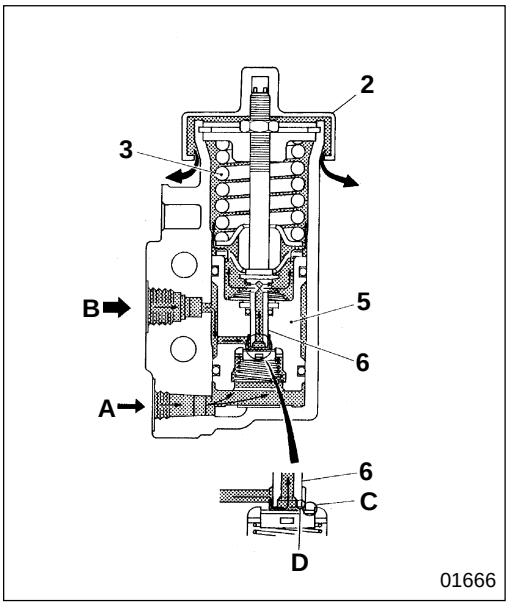
The air pressure governor keeps the air pressure in the air tank at the specified pressure, by operating the air compressor with or without load in accordance with the air pressure in the air tank.

● High specified-pressure



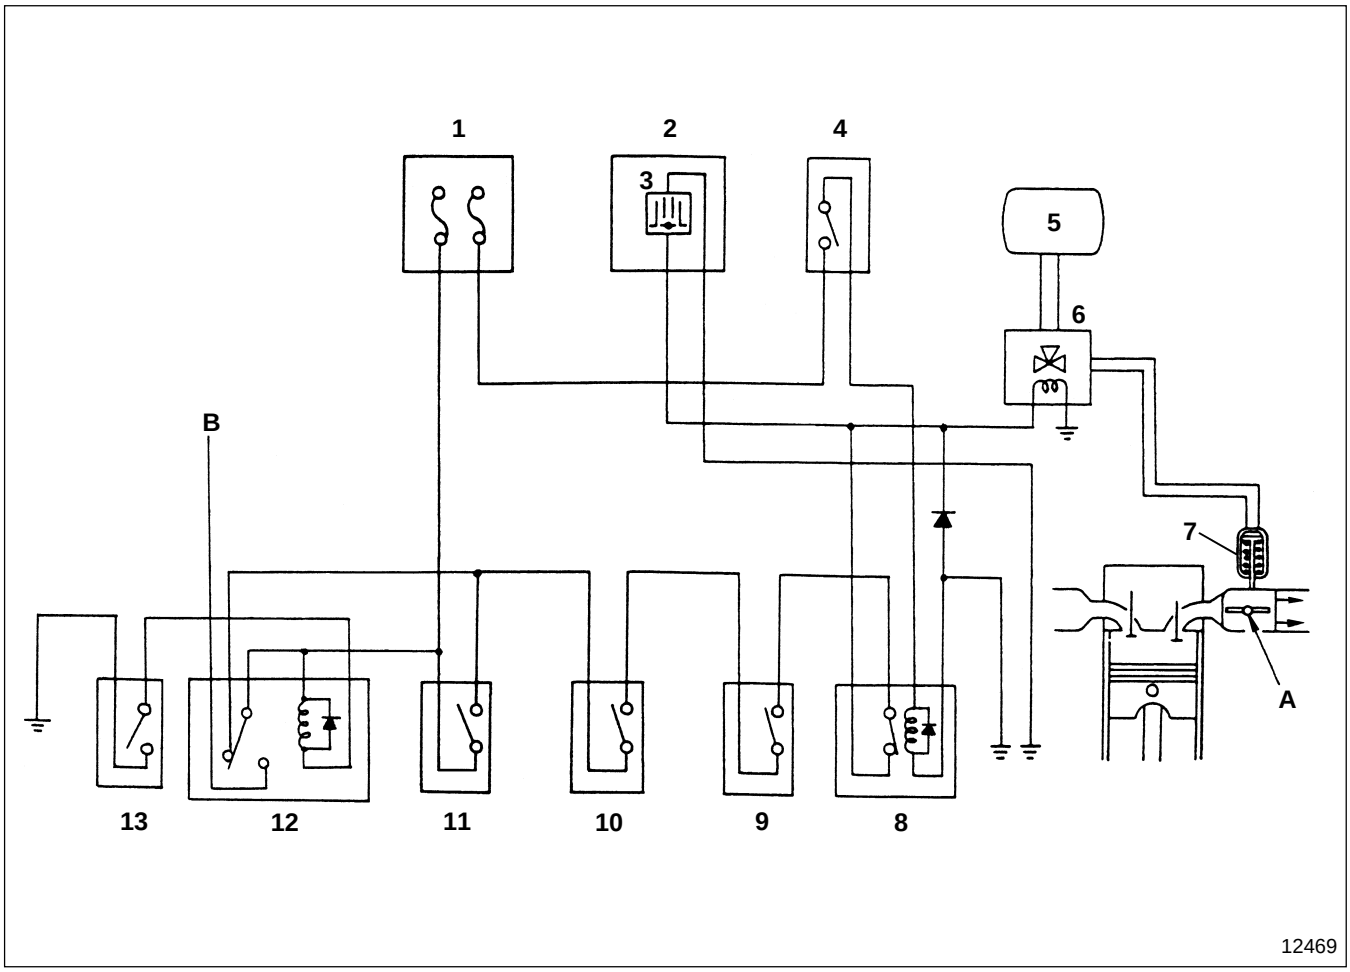
- Pressurized air **A** from the air tank acts constantly on piston **5**. As the pressure in the air tank rises to overcome the repercussive force of spring **3**, the piston rises and valve **7** closes.
- As air pressure **A** from the air tank rises further to become higher than the high specified-pressure, piston **5** rises further. Therefore, exhaust stem **6** opens inlet valve **C** and the air pressure in the air tank flows from unloader port **B** to the unloader valve of the air compressor via the inlet valve. Then the air compressor enters unloaded operation. Pressure also reaches the air dryer to recycle the desiccant

● Low specified-pressure



When pressurized air **A** from the air tank gradually drops below the specified-pressure, spring **3** forces down piston **5**. This closes inlet valve **C** and opens exhaust valve seat **D** so pressurized air **B**, up to the unloader valve of the air compressor, is discharged through the opening of cover **2** via exhaust stem **6**, operating the air compressor at load. The pressurized air up to the air dryer is also discharged into the atmosphere.

Exhaust Brake System

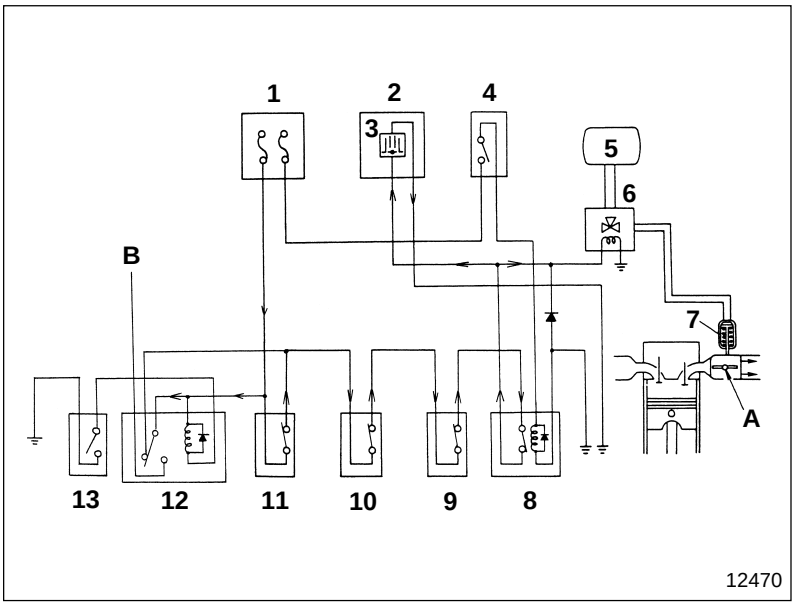


1 Relay and fuse box
2 Meter cluster
3 Exhaust brake indicator lamp
4 Transmission neutral switch
5 Air tank
6 3-way magnetic valve
7 Exhaust brake unit
8 Exhaust brake cut relay
9 Accelerator switch
10 Exhaust brake switch
11 Clutch switch < without power take-off >
12 Power take-off relay < with power take-off >
13 Clutch switch < with power take-off >

A : Butterfly valve
B : To power take-off switch

- Excitation of 3-way magnetic valve **6** causes the air pressure in air tank **5** to act on exhaust brake unit **7** to close butterfly valve **A**, activating the exhaust brake.
- If the exhaust brake is activated while the vehicle is stationary, the coolant temperature can rise excessively, overheating the engine. To avoid this, when the transmission is in neutral, transmission neutral switch **4** turns ON, cutting the exhaust brake system.

● When exhaust brake system is activated

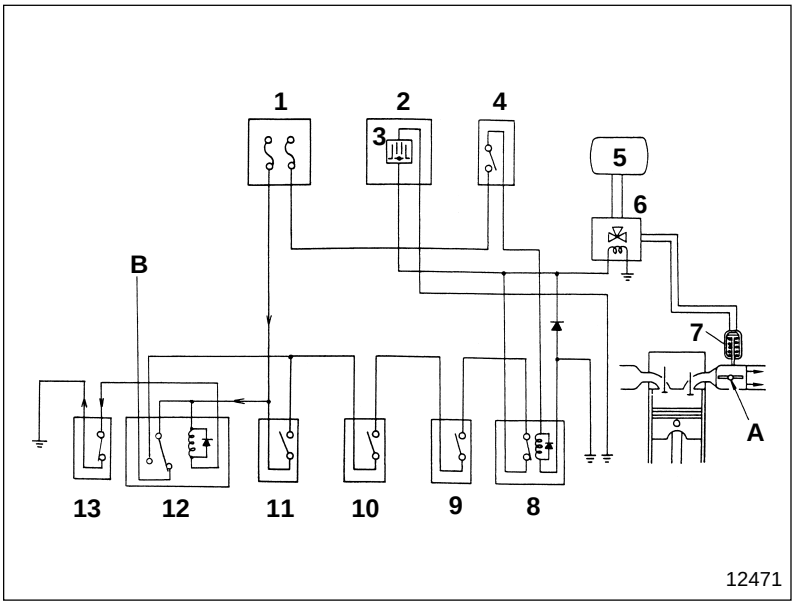


When exhaust brake switch **10** is turned on, the current flows as illustrated to activate the exhaust brake.

Fuse **1** → Power take-off relay **12** → Clutch switch **11** → Exhaust brake switch **10** → Accelerator switch **9** → Exhaust brake cut relay **8** → 3-way magnetic valve **6** → Ground

Fuse **1** → Exhaust brake indicator lamp **3** (ON) → Ground

● When the exhaust brake system is released



When the accelerator pedal or clutch pedal is depressed while the exhaust brake is working, all switches **9**, **11** turn off, shutting off the current, releasing the exhaust brake.

● When clutch pedal is depressed

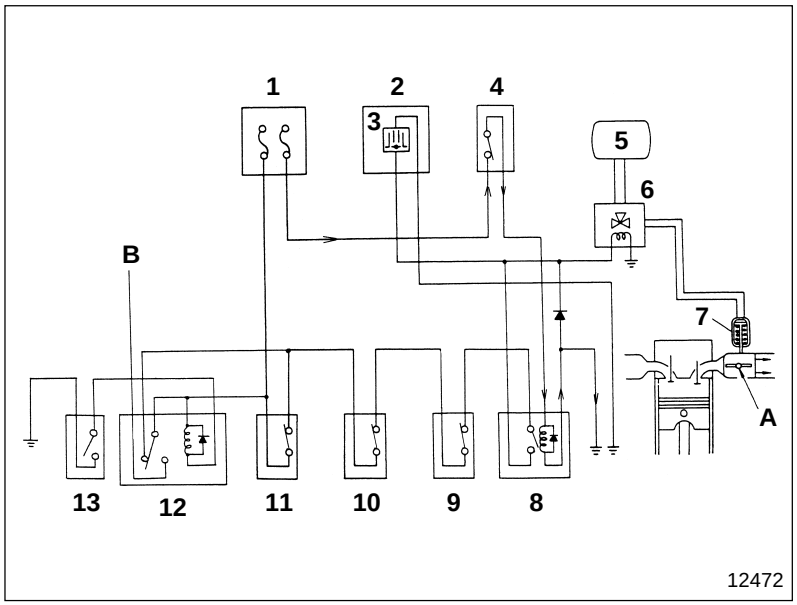
Fuse **1** → Clutch switch **11** (OFF) → Since no current flows, the circuit turns off and the exhaust brake is released.

Fuse **1** → Power take-off relay **12** excitation → Clutch switch **13** (ON) → Ground

● When accelerator pedal is depressed

Fuse **1** → Power take-off relay **12** → Clutch switch **11** → Exhaust brake switch **10** → Accelerator switch **9** (OFF) → Since there is no grounding, current does not flow, so the exhaust brake is released.

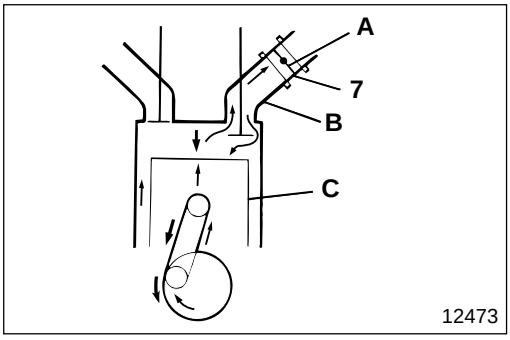
● Releasing exhaust brake system by placing transmission in neutral



When the transmission is placed in neutral, the current flows as illustrated and the exhaust brake is released.

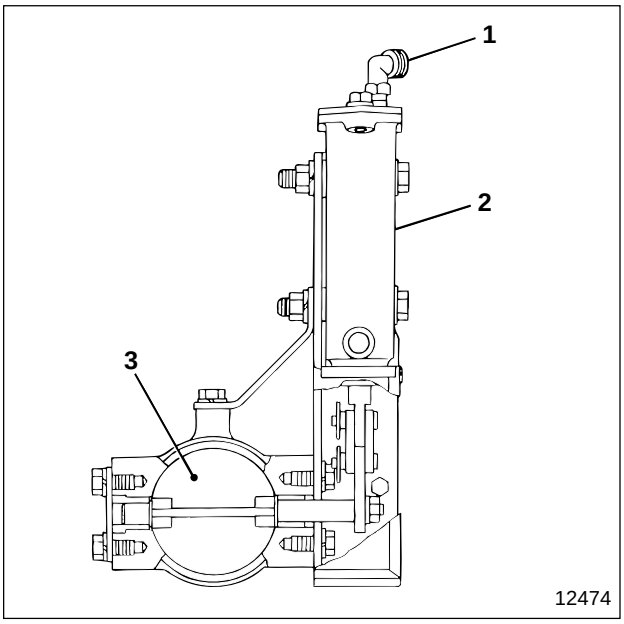
Fuse **1**⟶Transmission neutral switch **4**→Exhaust brake cut relay **8** excitation →Ground
Fuse **1**⟶Clutch switch **11**⟶ Exhaust brake switch **10**→Accelerator switch **9**→Exhaust brake cut relay **8** (OFF)
→Power take-off relay **12**
→Beyond this, current does not flow so the exhaust brake is released.

● Working principle of exhaust brake



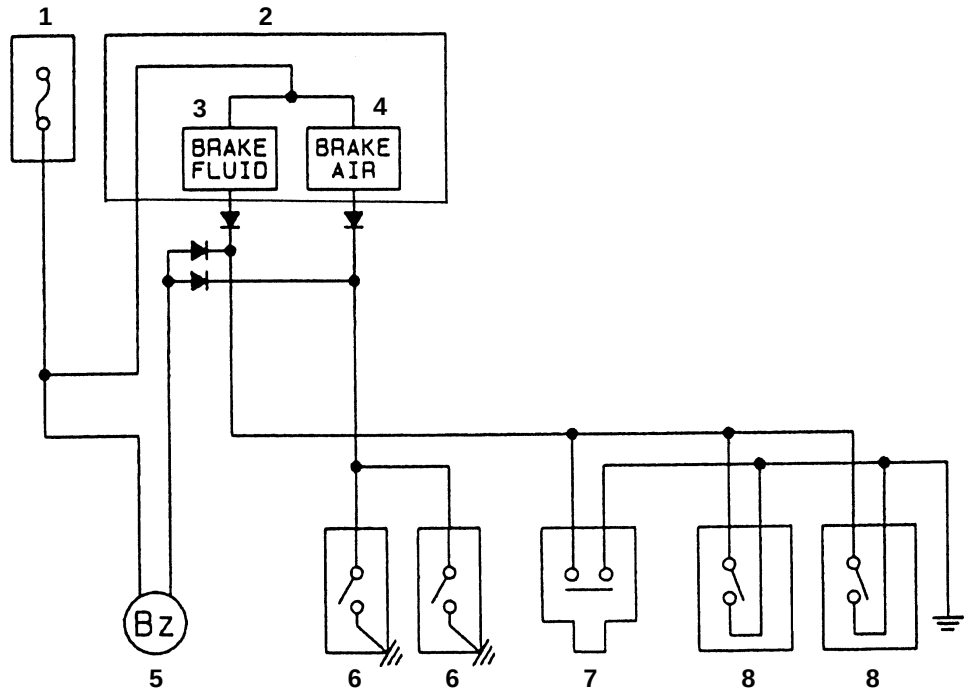
When butterfly valve **A** of exhaust brake unit **7**, in exhaust pipe **B**, is closed, the pressure in the exhaust pipe rises. The pressure rises further in the exhaust stroke, generating a force that pushes back piston **C**, the exhaust braking force.

● Exhaust brake unit



1 Connector
2 Control cylinder
3 Butterfly valve

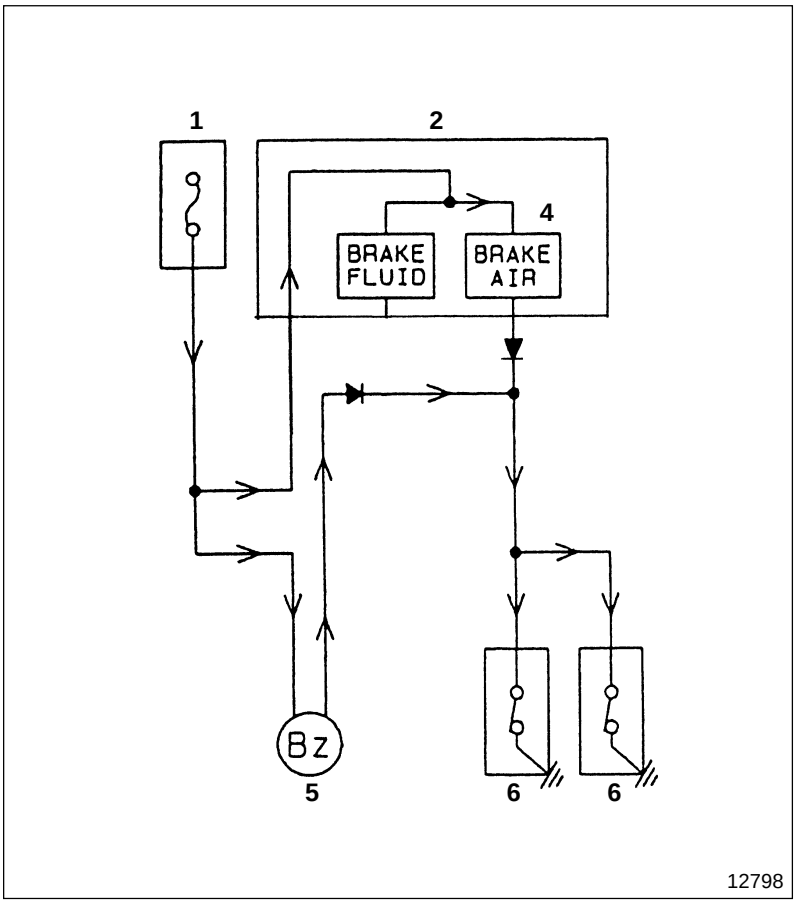
Brake Warning System



1 Fuse and relay box
2 Meter cluster
3 Brake fluid warning lamp
4 Air warning lamp
5 Warning buzzer
6 Low air pressure switch
7 Brake fluid level switch (installed on fluid tank)
8 Stroke switch (installed on airmaster)

The brake warning system consists of two circuits: the air pressure warning circuit and the brake fluid warning circuit. The first detects decrease of air pressure in the air tank, the second detects decrease in brake fluid in the fluid tank and brake fluid leakage in the brake fluid system. Both circuits light warning lamps and at the same time sound a buzzer to alert the driver.

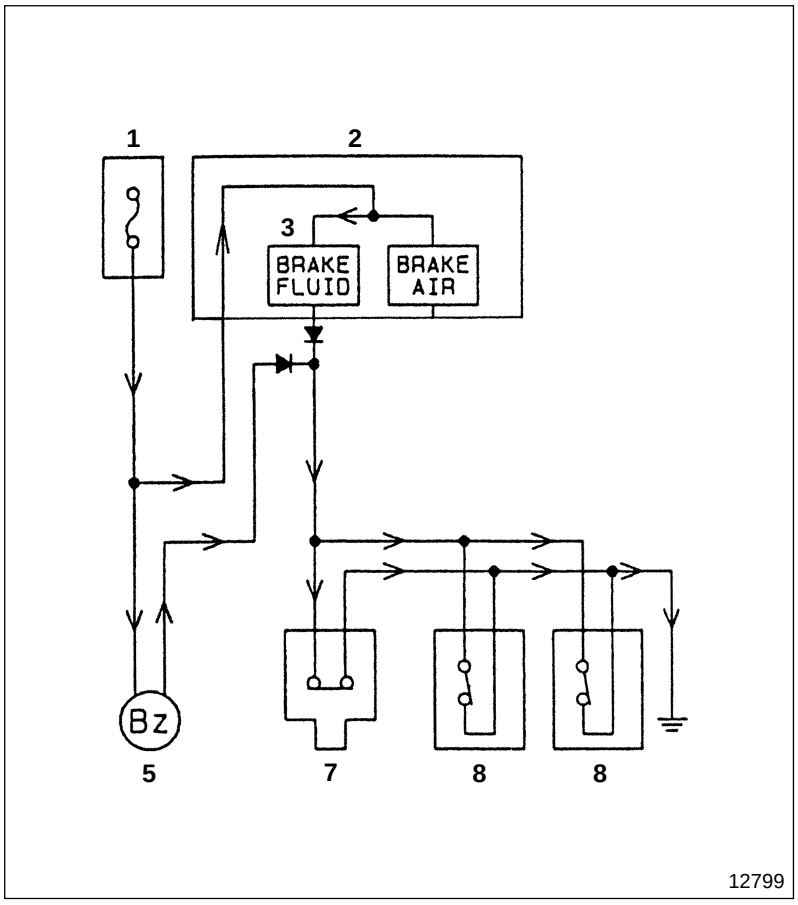
● Air pressure warning circuit



When the air pressure in the air tank drops below the specified value, low air pressure switch **6** turns on to light air warning lamp **4** and sound warning buzzer **5**. The current flows as follows:

Fuse **1**→Air warning lamp **4**→Low air pressure switch **6**→Ground
Fuse **1**→Warning buzzer **5**→Low air pressure switch **6**→Ground

● Brake fluid warning circuit



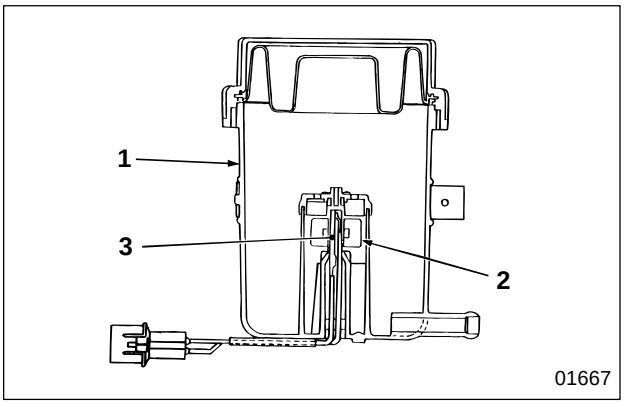
- When the brake fluid in the fluid tank drops below the specified level, brake fluid level switch **7** in the fluid tank turns on, brake fluid warning lamp **3** lights and warning buzzer **5** sounds. At this time, current flows as follows:

  Fuse **1** → Brake fluid warning lamp **3** → Brake fluid level switch **7** → Ground
  Fuse **1** → Warning buzzer **5** → Brake fluid level switch **7** → Ground

- If brake fluid leaks from the brake fluid system, stroke switch **8** of the airmaster turns on, brake fluid warning lamp **3** lights and warning buzzer **5** sounds. At this time, current flows as follows:

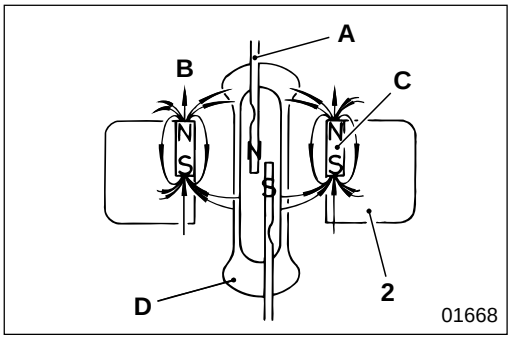
  Fuse **1** → Brake fluid warning lamp **3** → Stroke switch **8** → Ground
  Fuse **1** → Warning buzzer **5** → Stroke switch **8** → Ground

● Brake fluid level switch



1 Fluid tank
2 Float
3 Brake fluid level switch

- Brake fluid level switch **3**, installed on fluid tank **1**, detects the brake fluid level in the fluid tank. If the brake fluid level drops below the specified level, float **2** moves to turn on the brake fluid level switch and light up the brake fluid warning lamp to alert the driver.



- If the brake fluid level in fluid tank **1** drops and float **2** drops lower than level **L**, magnetic force **B** that passes through the contact points (ferromagnetic material **A**) increase, generating north and south poles at the ends of the contact points. Therefore, the contact points pull each other and overcome the repercussive force of the springs of the contact points, forming an electric circuit.
  C : Permanent magnet
  D : Glass

● Wheel Brake

Symptoms / Possible causes		Wheel brake does not work effectively: Air leakage when brake pedal depressed	Wheel brake does not work effectively: Air leakage when brake pedal released	Wheel brake does not work effectively: No air leakage but brake works ineffectively	Wheel brake does not work effectively: Air pressure low	Brake drum over-heating: Brake shoe self-return poor after releasing brake pedal (Wheel drags)	Noise when brake pedal depressed	One-sided braking	Wheel brake works suddenly	Brake fluid warning lamp lights

ON-VEHICLE INSPECTION AND ADJUSTMENT

Replacement of Brake Fluid

Fluid

Location	Points of application	Kinds	Quantity
—	Fluid tank	Brake fluid (SAE J1703f or FMVSS No.116, DOT3)	As required

Special tools

Unit : mm {in.}

Location	Tool name and shape	Part No.	Application
1	Vinyl hose 	MH033102	Air bleeding

WARNING

- **You must use new brake fluid (SAE J1703f or FMVSS No. 116, DOT3).**
- **Do not add different quality fluid or mineral oil (gas oil, engine oil, gear oil, automatic transmission fluid, etc.) to the brake system, because this will cause the rubber parts of the brake system to swell, resulting in brake dragging or ineffective braking.**
- **Do not allow foreign particles or water to get mixed in with the brake fluid when you add it.**
- **If you use a mug for adding brake fluid, keep it solely for that purpose to prevent contamination from different quality fluids or mineral oil.**

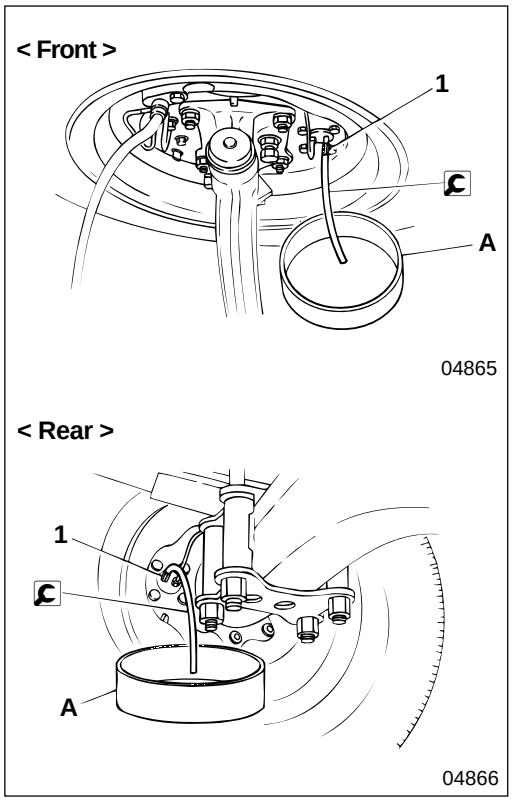
CAUTION

- **Be careful not to splash brake fluid on related parts as this could damage the paintwork.**
- **Be sure to wipe off brake fluid immediately if you splash it on the paintwork.**

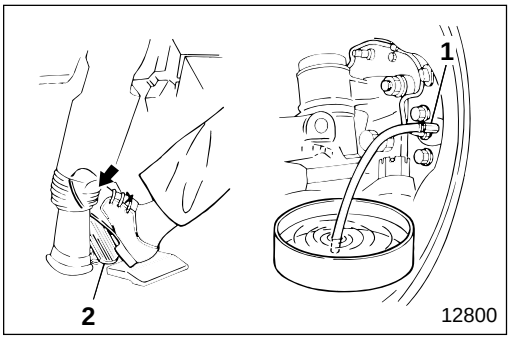
NOTE

Supply and maintain brake fluid to the “H” level of the fluid tank.

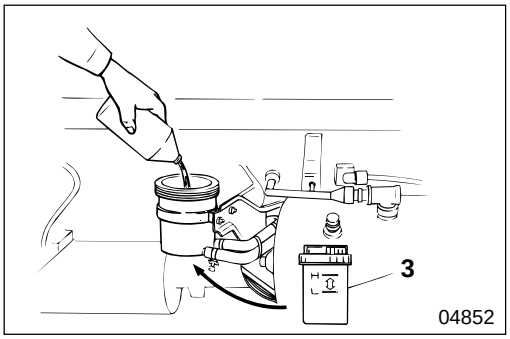
- Start engine and let it idle until brake fluid replacement is completed.



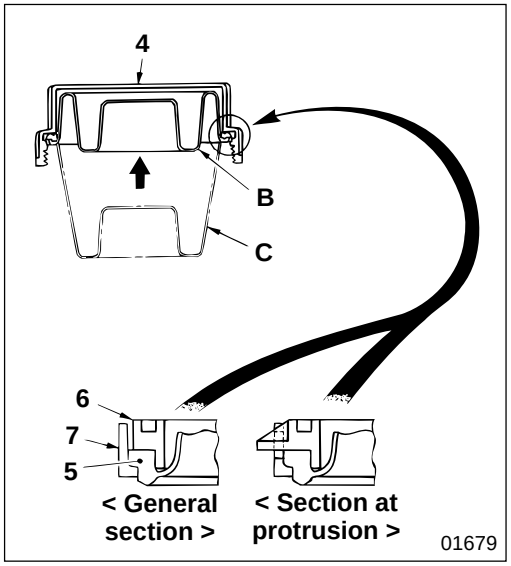
- Attach one end of vinyl hose to air bleeder **1** and place the other end in container **A**.



- Loosen air bleeder **1** and depress brake pedal **2** to drain brake fluid completely.



- Maintain a supply of new brake fluid up to the "**H**" level of fluid tank **3**, depress the brake pedal repeatedly until the old brake fluid of the brake system is replaced with new fluid.



- If diaphragm **5** is not in its normal posture when the brake fluid is supplied, correct it to its normal posture, and install cap **4**. If brake fluid leaks from the cap area after you have supplied brake fluid, check whether the diaphragm is assembled as illustrated.

  6 : Slide ring
  7 : Ring cover
  B : Correct condition of diaphragm when brake fluid is being supplied
  C : Condition when diaphragm is extended when brake fluid has decreased

- Air bleeding of brake system. P35A-36

Air Bleeding of Brake System

Tightening torque

Unit : N·m {ft.lbs, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
—	Air bleeder (Airmaster)	6.9 to 12.7 {5.1 to 9.4, 0.7 to 1.3}	—
—	Air bleeder (Wheel brake)	7.8 to 12 {5.8 to 8.5, 0.8 to 1.2}	—

Fluid

Location	Points of application	Kinds	Quantity
—	Fluid tank	Brake fluid (SAE J1703f or FMVSS No.116, DOT3)	As required

Special tools

Unit : mm {in.}

Location	Tool name and shape	Part No.	Application
2	Vinyl hose 	MH033102	Air bleeding

WARNING⚠

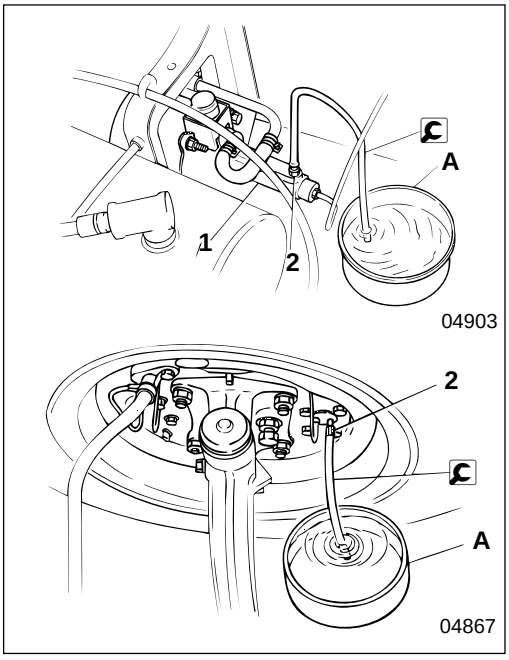
- **You must use new brake fluid (SAE J1703f or FMVSS No. 116, DOT3).**
- **Do not add different quality fluid or mineral oil (gas oil, engine oil, gear oil, automatic transmission fluid, etc.) to the brake system, because this will cause the rubber parts of the brake system to swell, resulting in brake dragging or ineffective braking.**
- **Do not allow foreign particles or water to get mixed in with the brake fluid when you add it.**
- **If you use a mug for adding brake fluid, keep it solely for that purpose to prevent contamination from different quality fluids or mineral oil.**

CAUTION⚠

- **Be careful not to splash brake fluid on related parts as this could damage the paintwork.**
- **Be sure to wipe off brake fluid immediately if you splash it on the paintwork.**

NOTE

- **Supply and maintain brake fluid to the "H" level of the fluid tank.**
- **Make sure you maintain brake fluid at the "H" level of the fluid tank since the brake fluid level drops during air bleeding.**



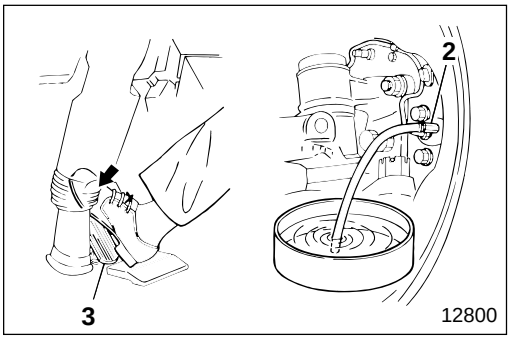
- Start engine and let it idle until brake fluid replacement is completed.
- Attach one end of vinyl hose to front or rear airmaster **1**. Then, attach one end of another vinyl hose to air bleeder **2** of the wheel brake. Finally, place both free ends in container **A** filled with brake fluid.
- Carry out air bleeding in the following sequence:

Front brake system

Airmaster for front
↓
Right-hand side wheel brake
↓
Left-hand side wheel brake

Rear brake system

< Right-hand side >	< Left-hand side >
Airmaster for rear (Right-hand side)	Airmaster for rear (left-hand side)
↓	↓
right-hand side wheel brake	Left-hand side wheel brake



- Depress brake pedal **3** slowly a few times, and with the brake pedal depressed, loosen air bleeder **2** to drain brake fluid containing air.

- Tighten air bleeder **2**, and release brake pedal **3**.
- Repeat this service procedure until air is no longer present in the fluid being drained.
- Tighten air bleeder **2** at specified torque as soon as brake fluid flowing out is free of air bubbles.

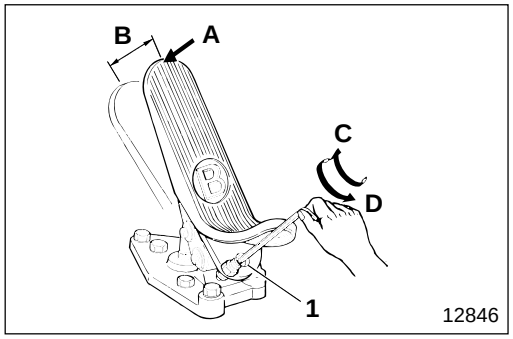
- Adjust brake shoe clearance when you have finished air bleeding. P35A-62
- Check that brake fluid comes up to level "**H**" of fluid tank. If it does not, refill with new brake fluid.
- Depress brake pedal **3** a few times and check for any leakage of brake fluid, then test the brakes.
- When you test the brakes, if the brake fluid warning lamp within the meter cluster lights, it means that air has not been bled completely. Redo air bleeding.

Inspection and Adjustment of Brake Pedal Free Play

Service standards

Unit : mm {in.}

Location	Maintenance item		Standard value	Limit	Remedy
—	Free play of pedal	Pedal toe	$12^{+3.0}_{-1.5}\{0.47^{+0.12}_{-0.059}\}$	—	Adjust using set screw
		Depression angle	$3.5°^{+1.0°}_{-0.5°}$	—	



Press pedal toe **A** with your hand and measure free play **B**. If the measured value deviates from the standard value, adjust it by turning set screw **1**.

C : Turning clockwise decreases the free play (For a small angle)

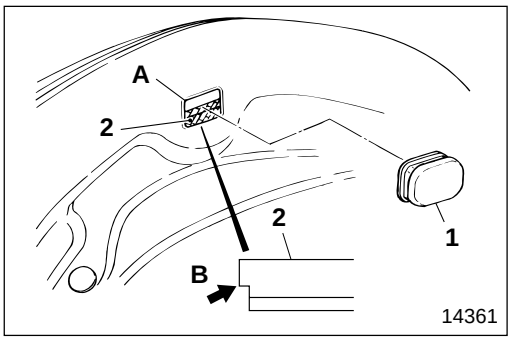
D : Turning counterclockwise increases the free play (For a large angle)

Thickness Inspection and Replacement of Brake Lining

Service standards

Unit : mm {in.}

Location	Maintenance item	Standard value	Limit	Remedy
2	Thickness of brake lining	—	5.5 {0.22} (Side shoulder means wear limit)	Replace



[Inspection]

NOTE

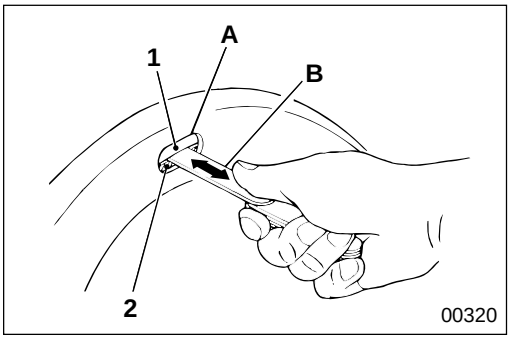
Be sure to inspect at two points for each wheel per side.

- Remove inspection hole plug **1** from the backing plate.
- Inspect through check hole **A** whether brake lining **2** is worn to the point of side shoulder **B** of the brake lining (the limit).
- If the measured value is lower than the limit, replace brake lining **2** on the same axle as a unit.
- After inspection, be sure to reinstall check hole plug **1**.

[Replacement]

P35A-60

Inspection of Brake Shoe Clearance



NOTE

When the vehicle is jacked up and the wheel is being turned, make sure that there is no dragging.

- Remove the inspection hole plug from the backing plate.
  A : Check hole
- Try to insert a 1 mm {0.039 in.} feeler gauge **B** between brake drum **1** and brake lining **2**. Check that the clearance is too small to allow feeler gauge to be inserted.
  If feeler gauge **A** can be inserted, disassemble the wheel cylinder and inspect.
  P35A-60

ON-VEHICLE INSPECTION AND ADJUSTMENT

Inspection and Maintenance of Air Dryer

Carry out inspection and maintenance according to the following interval or vehicle milage.

(1) Every 10000 km (6000 miles)

- To check that the air dryer operates correctly, open the drain cock of the tank and see if any drainage comes out.
- If a little drainage comes out, remove the indicator from the unit and check the indicator assembly for color change. If its color has changed to pink, replace with a new cartridge assembly and indicator assembly.
  P35A-88

NOTE

In an operational environment, where the decrease of the ambient temperature in the air tank is higher than 16°C {29°F}, a little moisture might collect.

- Carefully inspect the drainage from the exhaust port of the air dryer body.

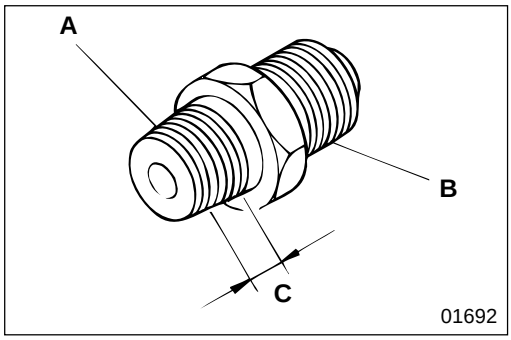
(2) Every year or every 60000 km {36000 miles}

Disassemble the air dryer body and replace the cartridge assembly, the indicator assembly and all rubber parts.
P35A-88

M E M O

HANDLING OF CONNECTOR AND NYLON TUBE PIPING

Connector

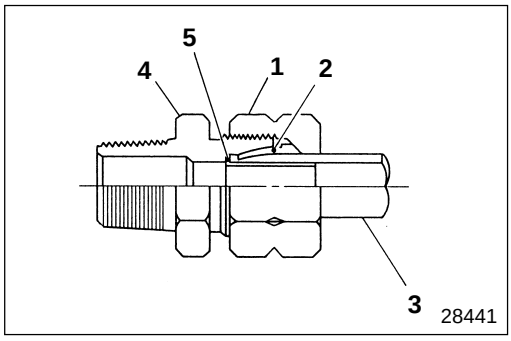


(1) Installation of connector

- When reusing a air system connector, remove remainder of sealer, oil, and water sufficiently, apply THREEBOND TB1110B to threads leaving 1 or 2 threads on top blank, and then screw in.
  Where alignment is required, stop at aligning point in additional tightening process.

A : Taper screw area
B : Parallel screw area (Do not apply sealer)
C : Area where sealer shall be applied

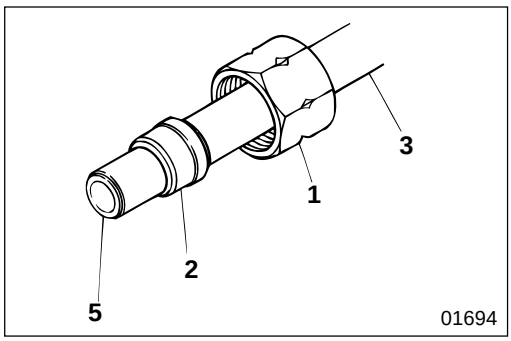
Nylon Tube



Follow the following process where nylon tube is employed.

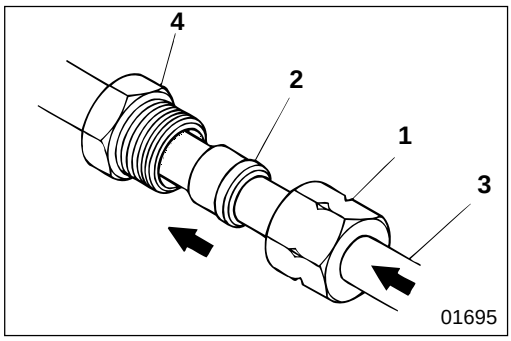
- Nylon tube is designed so that as nut **1** is tightened, sleeve **2** advances gripping to tube **3** while itself is being deformed in the process, thus keeping air tightness to prevent leakage. Accordingly, do not re-use: do not fail to replace with new one.

4 : Connector
5 : Insert



(2) Installation of nylon tube

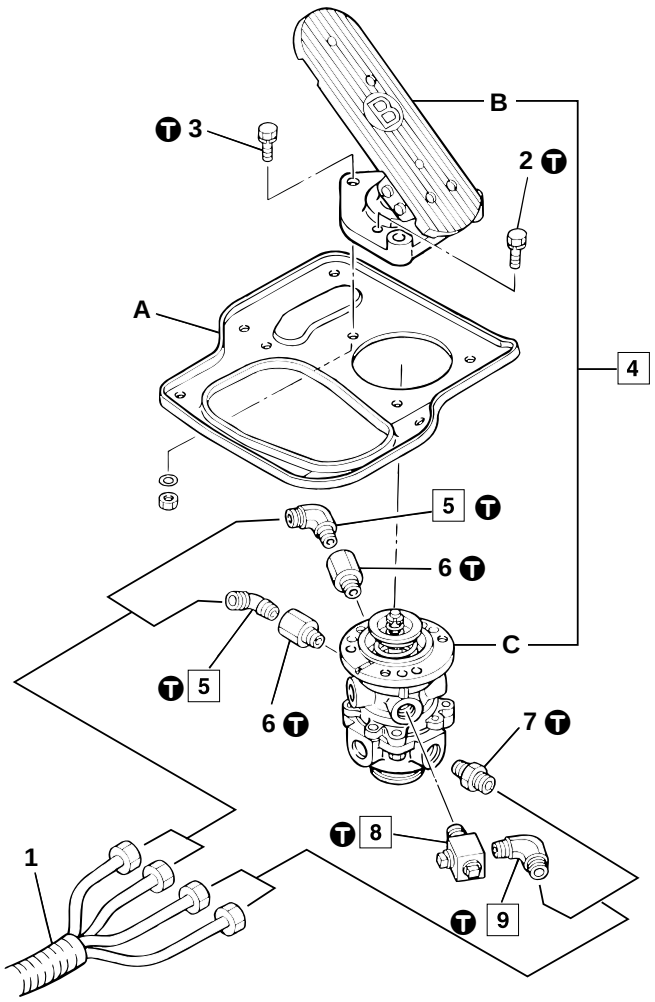
- Make sure that insert **5**, sleeve **2**, nut **1**, and tube **3** are assembled as illustrated.



- Insert tube **3** into connector **4**, push sleeve **2** into connector **4**, and provisionally tighten nut **1** by hand.
- After this, pull tube **3** to make sure that it does not have leakage, and it does not come apart.

M E M O

BRAKE PEDAL



Remove pedal assembly **B** upward from valve board **A**, and valve assembly **C** downward from the valve board to separate dual brake valve **4** (pedal assembly and valve assembly). Do this without removing the valve board from the vehicle.

● **Removal sequence**

1 Nylon tube
2 Bolt
3 Bolt
4 Dual brake valve P35A-46
5 Connector
6 Connector
7 Connector
8 Connector
9 Connector

● **Assembly sequence**

Follow the removal sequence in reverse.

Tightening torque

Unit : N·m {ft.lbs, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks

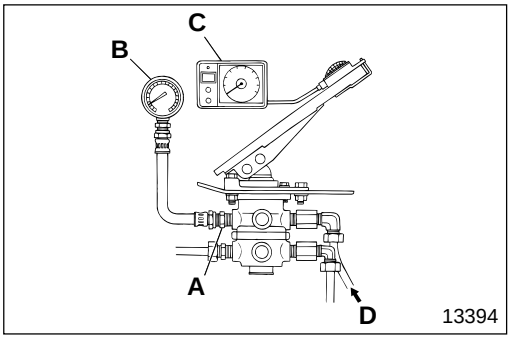
32	Retainer	*910-24590	Holding of primary piston

* : BOSCH BRAKING SYSTEMS part No.

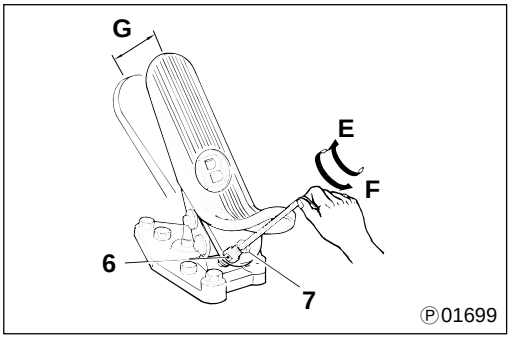
◆ Service procedure



● Inspection of function after assembly

Check that the output air pressure, corresponding to the pedal depression angle, conforms to the specified value.

- Mount pressure gauge **B**, capable of measuring 980 kPa {142 psi, 10 kgf/cm^2} or more, on primary output side port **A**.
- Mount depression gauge **C** on the brake pedal.
- Apply air pressure of 685 kPa {100 psi, 7 kgf/cm^2} to primary input side port **D** and inspect related parts for air leakage.
- If air leakage is found, do the following:
  - Tighten connectors.
  - Disassemble the dual brake valve and inspect the O-ring assemblies of all parts.

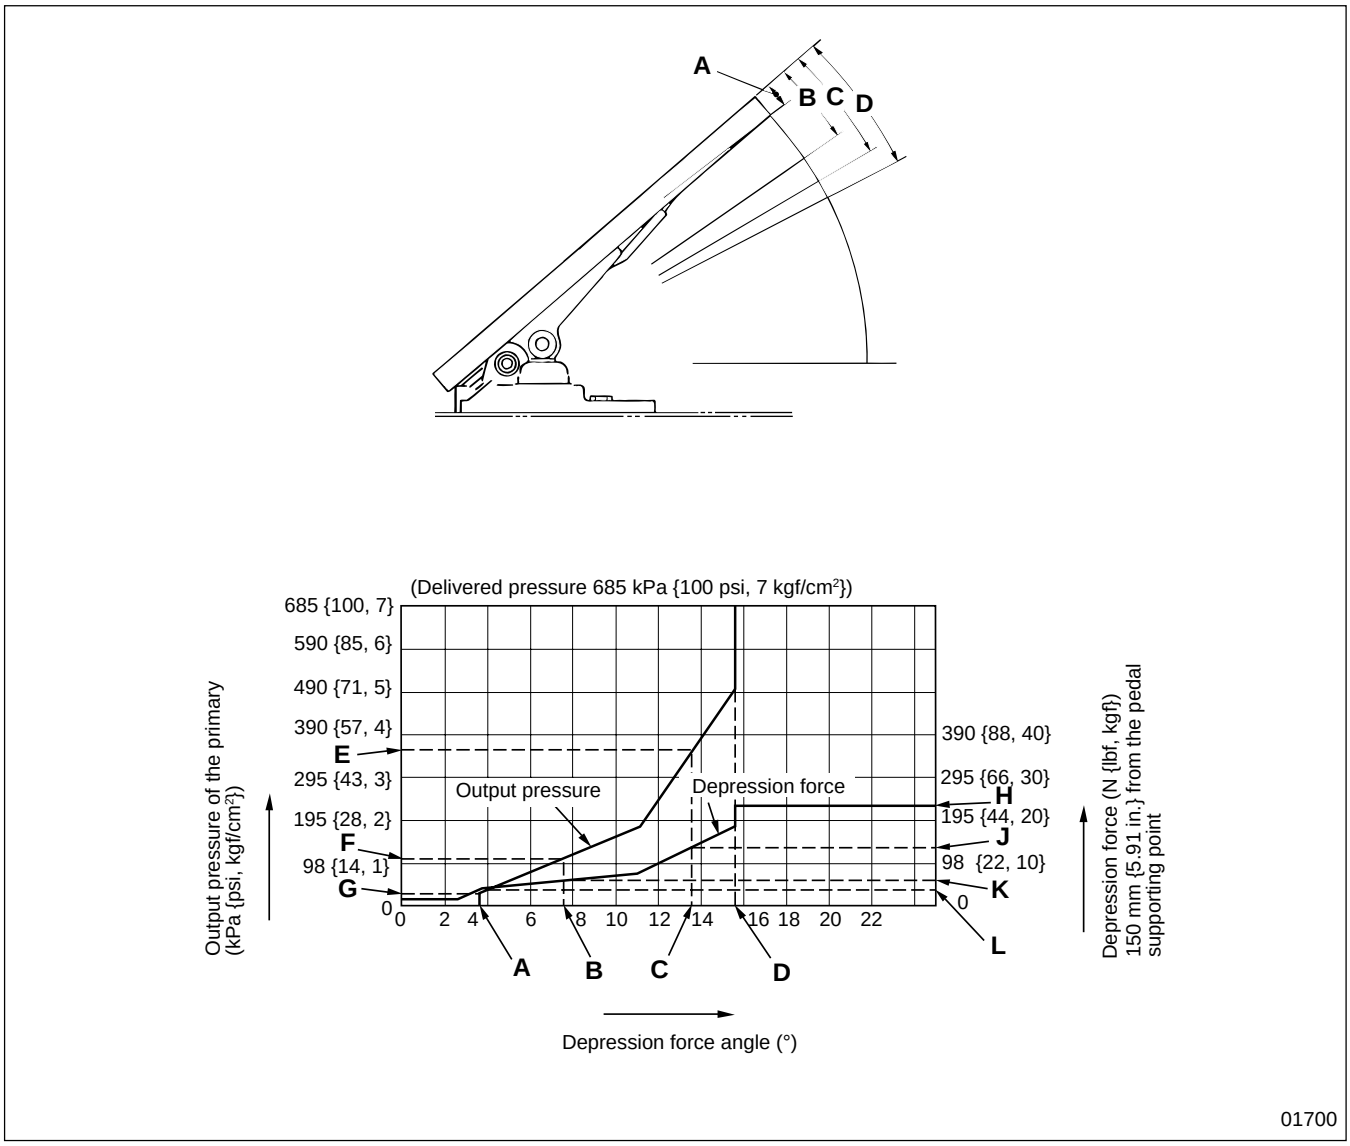


- Turn set screw **7** and adjust brake pedal play **G** to the standard value.
- Tighten lock nut **6** at specified torque to lock set screw **7**.
- Read pressure gauge **B** and make sure that the primary output pressure and brake pedal depression force angle, corresponding to the brake pedal depression angle, conform to the standard values shown in the input/output characteristic curve diagram overleaf.
- If the output air pressure is lower than the standard value, replace the following springs:
  - Spring **15**
  - Outer spring **29**
  - Inner spring **30**

E : Turning clockwise decreases the play (To decrease brake pedal depression angle)

F : Turning counterclockwise increases the play (To increase brake pedal depression angle)

Input/Output Characteristic Curve Diagram



A : Play 3.5° $^{+1.0°}_{-0.5°}$(12 $^{+3.0}_{-1.5}$ mm {0.47 $^{+0.12}_{-0.059}$ in.})
B : Pressure stroke 7.5° (25.5 mm {1.0 in.})
C : Pressure stroke 13.5° (45.5 mm {1.8 in.})
D : Pressure stroke 15.5° $^{+2.5°}_{-0.5°}$(52 $^{+8.5}_{-0.5}$ mm {2.0 $^{+0.33}_{-0.020}$ in.})
E : 355$^{+39}_{-98}$ kPa {52$^{+5.7}_{-1.4}$ psi, 3.65$^{+0.4}_{-1.0}$ kgf/cm²}
F : 105$^{+25}_{-54}$ kPa {16$^{+3.6}_{-7.8}$ psi, 1.1$^{+0.25}_{-0.55}$ kgf/cm²}
G : 29 kPa {4.3 psi, 0.3 kgf/cm²} or less
H : 230.5±20 N {52±4.4 lbf, 23.5±2 kgf}

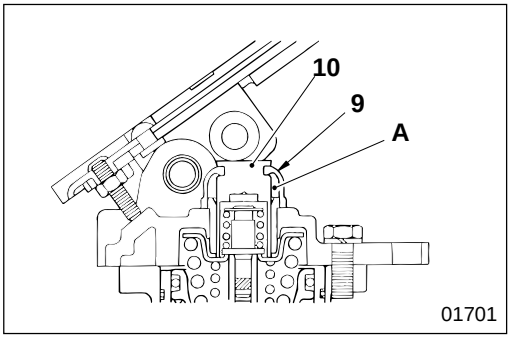
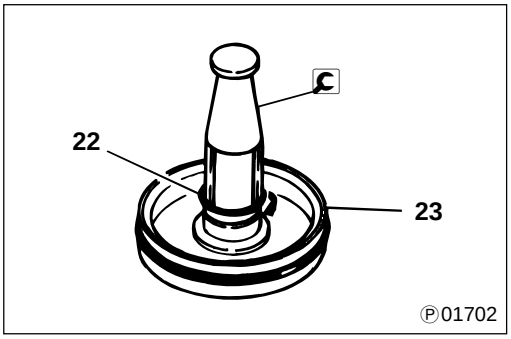
K : 59±25 N {13±5.5 lbf, 6±2.5 kgf}
L : 39±10 N {8.8±2.2 lbf, 4±1 kgf}

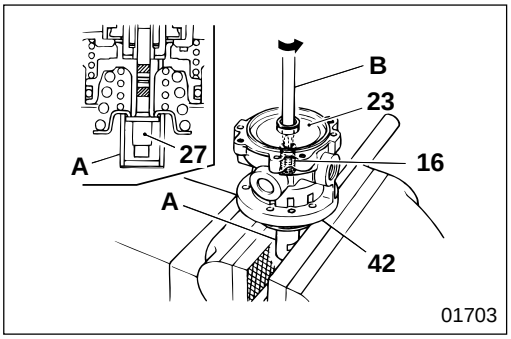


9 **10** **Packing grease between boot and plunger**

Pack area A with **1** cm^3 {0.061 cu in.} of grease.



22 **Installation of O-ring**



23 **Removal of relay piston**

- Grip (14 mm {0.55 in.}) socket wrench **A** in a vise.
- Insert the head of self-locking bolt **27** into socket wrench **A** to tighten body **42**.

WARNING ⚠

You must be careful when you loosen screw 16, because the spring in body 42 can forcibly eject relay piston 23. To avoid this hazard, press down on the relay piston with your hand when you carry out the above work.

- Loosen screw **16** gradually to remove relay piston **23**.

–	Portable Tester	*916-00021	Function check after assembly

* BOSCH BRAKING SYSTEMS part No.

◆ Service procedure

● Inspection of function after assembly

(1) Install the brake booster on the vehicle, and conduct the performance test using Portable Tester.

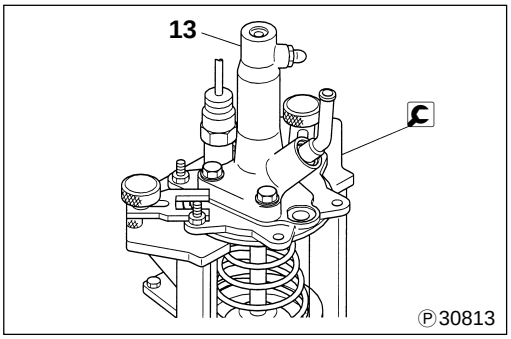
- Setting up of pressure gauge
  - Connect a pressure gauge (PG4) for measuring the command pressure to the air supply port of the power cylinder.
  - Remove air bleeder **10** from the hydraulic cylinder and connect an oil pressure gauge (PG2). Then bleed air from the inside of the tester.
- Raise the air pressure in the air tank to 590 kPa {85 psi, 6 kgf/cm^2), then inspect the functions given in the following table with the engine stopped.

Test item	Test condition	Standard value in assembled condition	Limit	Remedy
Air-tightness at full load	Air pressure decrease after keeping brake pedal fully depressed for 15 seconds	–	Air pressure gauge (PG4) reading less than 59 kPa {8.5 psi,0.6 kgf/cm^2}	Replace O-ring **15** and/or cup packing **19**
Operation at full load	Confirm that command air pressure (PG4) is 590 kPa {85 psi, 6 kgf/cm^2} with the brake pedal fully depressed	Oil pressure gauge (PG2) reading 14.0 to 15.4 MPa {2030 to 2230 psi, 143 to 157 kgf/cm^2}	Oil pressure gauge (PG2) reading 13.7 to 15.7 Mpa {1990 to 2280 psi, 140 to 160 kgf/cm^2}	Replace hydraulic piston **26** and/or cup packing **27**
Brake booster operation starting pressure	Depress brake pedal grad ually and read the com-mand pressure when oil pressure gauge (PG2) starts rising	Air pressure gauge (PG4) reading 14 to 33 kPa {2.0 to 4.8 psi, 0.14 to 0.34 kgf/cm^2}	Air pressure gauge (PG4) reading 43 kPa {6.3 psi, 0.44 kgf/cm^2}	Replace valve seal assembly **26**, cup packing **19** and/or cup packing **27**
Residual pressure	When brake pedal is released after depressed	Oil pressure gauge (PG2) reading 78 to 125 kPa {11 to 18 psi, 0.8 to 1.3 kgf/cm^2}	Oil pressure gauge (PG2) reading 59 to 155 kPa {8.5 to 23.0 psi, 0.6 to 1.6 kgf/cm^2}	Replace valve assembly **9** and/or spring **8**

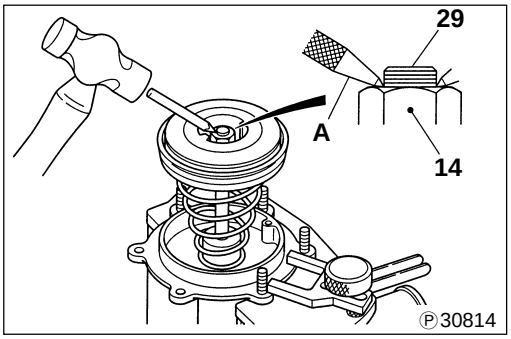
(2) After completion of the above tests, conduct the function test of stroke switch **4**. Loosen the air bleeder so as to allow fluid to leak out. Depress the brake pedal to let the power piston move full stroke so that stroke switch **4** may be operated. Then confirm that the brake warning lamp on the meter cluster comes on.

(3) Always bleed the brake system and pour brake fluid to the "**H**" line of the brake fluid tank after performing the brake booster function check.

◆ Service procedure



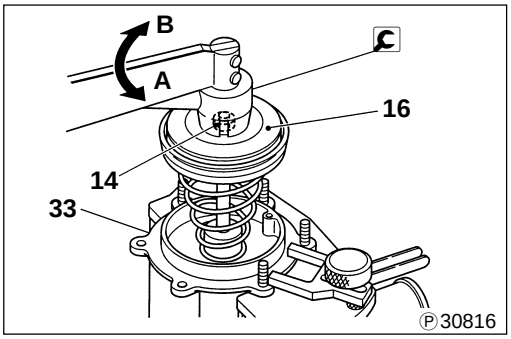
13 **Installation of body assembly**



14 **Installation of nut**

After tightening nut **14** at specified torque, stake the nut and push rod **29** thread area.

A : Center punch

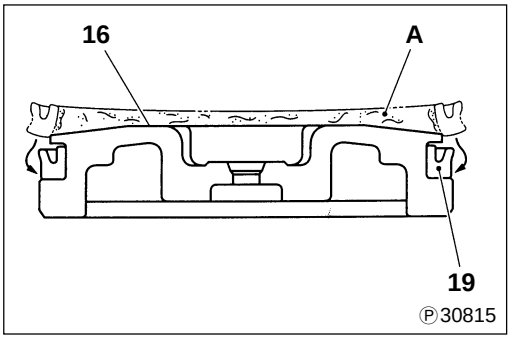


16 **Removal and installation of piston plate**

A : Removal
B : Installation

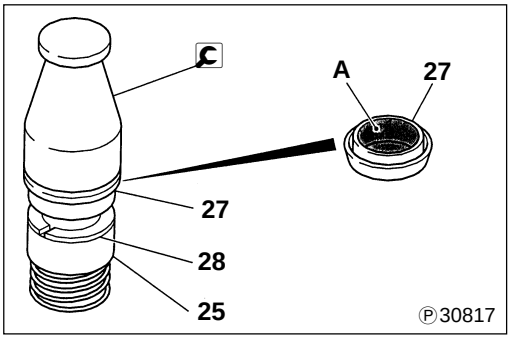
NOTE

To install, while pressing piston plate 16 to end plate 33 with sufficient force, tighten nut 14 to specified torque.



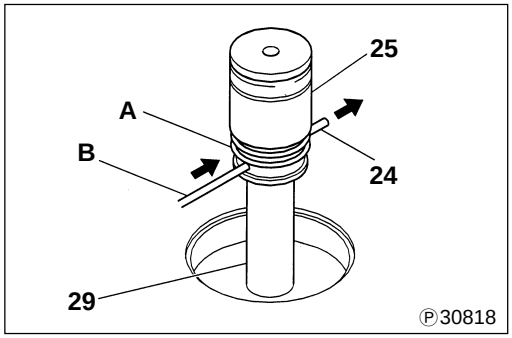
19 **Installation of cup packing**

A : Grease



27 **Installation of cup packing**

A : Brake fluid

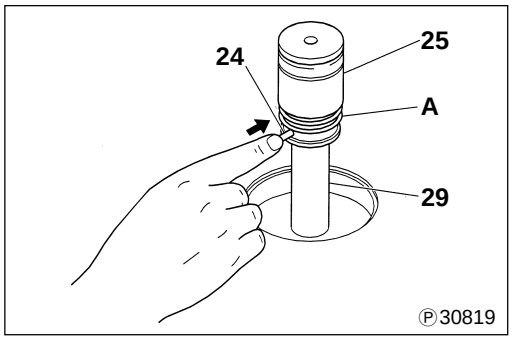


25 **Hydraulic piston**

[Removal]

A : Spring

B : Needle



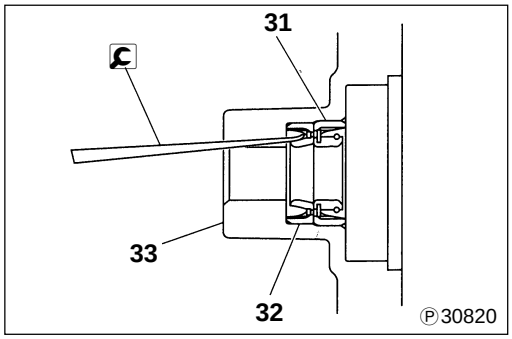
[Installation]

Align the holes of hydraulic piston **25**, valve seal assembly **26** and push rod **29**, and insert straight pin **24**.

A : Spring

NOTE

After inserting straight pin 24, make sure that the hydraulic piston spring is hanging over the straight pin and working as a stopper.

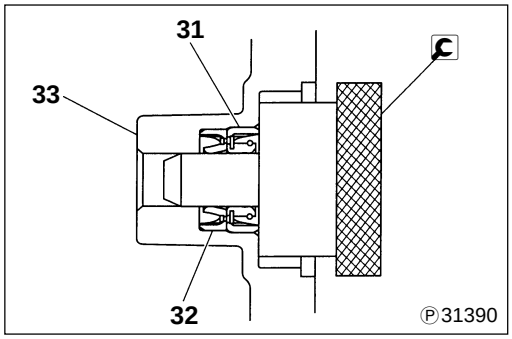


31 **32** **Oil seals**

[Removal]

CAUTION ⚠

Remove oil seals 31, 32 by tapping evenly. Be careful not to scratch inner surface of end plate 33.



[Installation]

Install oil seals on end plate **33** in the direction shown in the diagram.

		Cylindrical accuracy	0.025 {0.00098}		0.2 {0.0079}	Correct

* : Indicates correction limit.

Tightening torque

Unit : N·m {ft.lbs, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
1	Brake pipe flare nut	12.75 to 17.65 {9.4 to 13, 1.3 to 1.8}	—
2	Bolt (Joint mounting)	37.27 to 49.03 {27 to 36, 3.8 to 5.0}	—
12	Bolt (Wheel cylinder assembly mounting)	37.27 to 49.03 {27 to 36, 3.8 to 5.0}	M10
		122.58 to 166.7 {90 to 120, 12.5 to 17.0}	M12

Lubricant

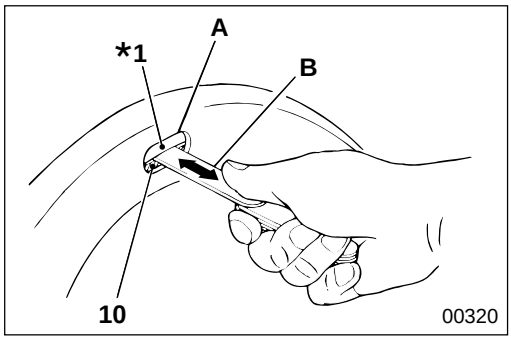
Location	Points of application	Kinds	Quantity
7	Brake shoe assembly contact surface of nut	Brake grease	As required
13	Wheel cylinder assembly anchor and screw groove contact area with brake shoe	Brake grease	As required

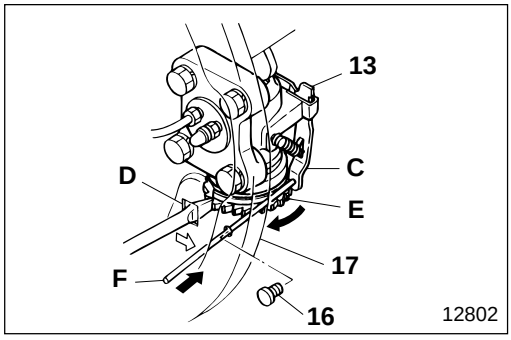
◆ Service procedure

● Initial adjustment of brake shoe clearance after installation

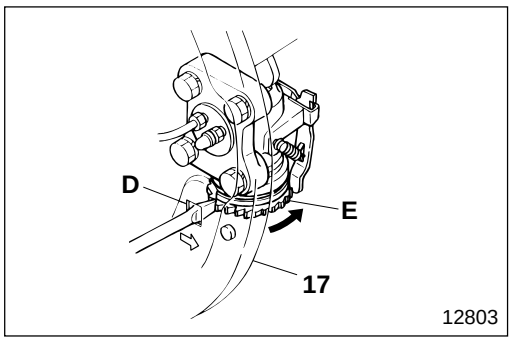
Turning the adjuster of wheel cylinder assembly **13** in arrow ⇨ direction expands brake shoe assembly **8**, narrowing the clearance between brake drum ***1** and brake lining **10**.

- Jack up the vehicle to make sure that the wheel hub bearing has no play. If there is any play, correct it. Gr 26
- Remove adjusting hole plug **15** and check hole plug **14**.
- Adjust the brake shoe clearance as follows, so that 0.3 mm {0.012 in.} feeler gauge **B** can be inserted or extracted through check hole **A**, between brake drum ***1** and brake lining **10** with a little resistance.



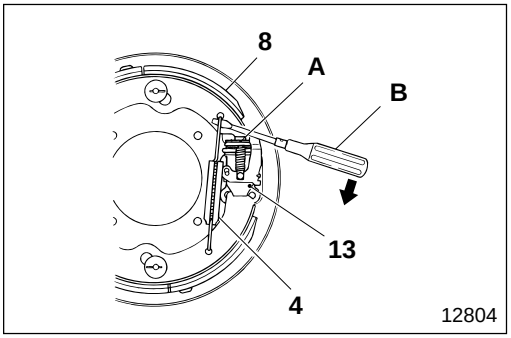


- To increase brake shoe clearance
  - Remove cover **16** on the rear of backing plate **17**.
  - Insert a wire (approximately ø5 mm {0.20 in.}) into the hole of cover **16** and lift adjusting lever **C** of wheel cylinder **13**.
  - Turn adjuster **E** of wheel cylinder **13**, through adjusting hole **D**, in the opposite direction to arrow ⇨ on backing plate **17**.



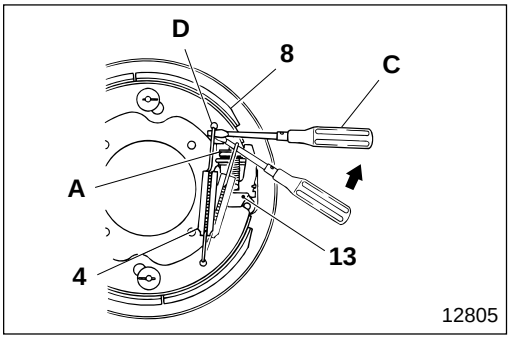
- To decrease brake shoe clearance
  Turn adjuster **E** in the arrow ⇨ direction marked on backing plate **17** through adjusting hole **D**.

- Extract the feeler gauge and depress the brake pedal two or three times fully, then the specified value brake shoe clearance can be obtained.
- Insert a 0.2 mm {0.0079 in.} feeler gauge through check hole **A** and make sure that it can be inserted or extracted with a little resistance.
  If there is any fault, disassemble and inspect wheel cylinder **13**.
  P35A-66

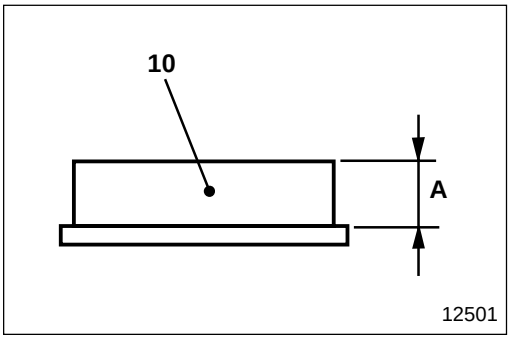


4 Return spring

[Removal]
To remove the return spring, place screwdriver **B** on the hook of the return spring, then pry and remove the return spring making use of wheel cylinder **13** adjusting screw **A** as a fulcrum.

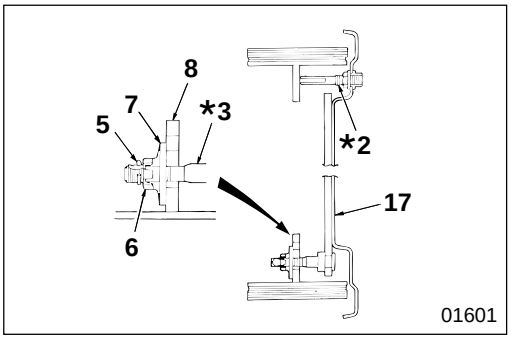


[Installation]
- Install the shorter hook of return spring **4** on brake shoe assembly **8**.
- Insert a small Phillips screwdriver **C** into the hook of return spring **4**, insert the tip of the screwdriver into return spring installation hole **D** of brake shoe assembly **8** to pry on the return spring.

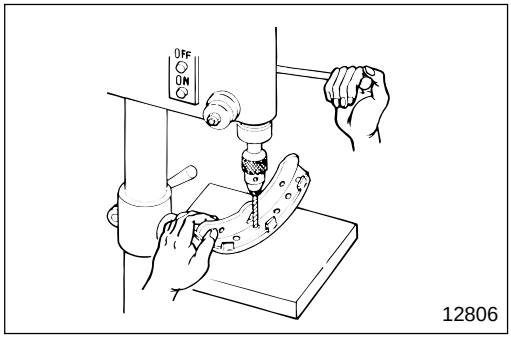


8 Brake shoe assembly

[Inspection]
If thickness **A** of brake lining **10** is lower than the limit replace the brake lining on the same axle as a unit.

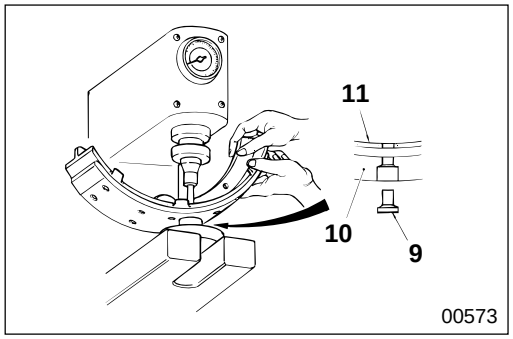


[Installation]
- Install brake shoe assembly **8**.
- Tighten nut **7**. When brake shoe assembly **8** makes contact with bolt ***2** of backing plate **17**, slacken off the nut by one third of a turn.
- Slacken off nut **7** until the holes of stud pin ***3** and lock plate **6** align with each other.
- Install cotter pin **5** and bend it.



10 **Brake lining**

[Removal]



[Installation]

- Clean the mounting surfaces of brake lining **10** and brake shoe **11** with cleaning fluid and dry them.
- Insert rivets **9** from brake lining **10** side, and caulk the rivets at the specified load so that there is no clearance between brake shoe **11** and the brake lining.

  Caulking load for rivets : 17 to 19 kN {3750 to 4190 lbf, 1700 to 1900 kgf}

- Make sure that you inspect contact with the inner surface of brake drum ***1** after you replace brake linings **10**. If contact is incorrect, correct with the brake assembled.

WARNING

Do not leave lubricant on the surface of brake lining 10 because this reduces braking performance.

CAUTION

Make sure that the type of brake linings 10 you fit are suitable for the intended use of the vehicle. Make sure that you fit identical size and color coated linings on the left and right sides of one shaft.

***1** **Correction of brake drum**

If the cylindrical accuracy of brake drum ***1** is higher than the limit, or there are seams, correct by machining to the correction limit. Machining of the brake drum should be done with the wheel hub attached as an integral part.

***3** : Stud pin

WARNING ⚠

Do not leave grease or oil on the surface of brake lining 8 or inner surface of brake drum *1 because this reduces braking performance.

CAUTION⚠

- **If you are replacing only brake lining 8, clean the adjuster and screw thread area of wheel cylinder assembly 13 and apply rubber grease to the thread area.**
- **Do not turn or remove bolt *2 that is fitted to keep brake shoe assembly 6 at 90°.**

● **Assembly sequence**

Follow the disassembly sequence in reverse.
Repair kit : Brake lining kit

● **Adjustment of initial brake shoe clearance after installation**

🕮 P35A-72

Service standards

Unit : mm {in.}

Location	Maintenance item		Standard value		Limit	Remedy
2	Return spring load (Installed length 266.5 {10.5})		420 N {95 lbf, 43 kgf}		Clearance between coils or coil and cover	Replace
6	Thickness of Brake lining		15 {0.59}		5.5 {0.22} (Side shoulder means wear limit)	Replace brake lining
***1**	Brake drum	Inner diameter	400 {15.75}	*401 {15.79}	402 {15.83}	Correct or replace
		Cylinder accuracy	0.025 {0.00098}		0.2 {0.0079}	Correct

* : Indicates correction limit

Tightening torque

Unit : N·m {ft.lbs, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
1	Brake pipe flare nut	12.75 to 17.65 {9.4 to 13, 1.3 to 1.8}	—
10	Bolt (Wheel cylinder assembly cover mounting)	7.85 to 11.77 {5.8 to 8.7, 0.8 to 1.2}	—
12	Bolt (Wheel cylinder assembly mounting)	122.58 to 166.7 {90 to 120, 12.5 to 17.0}	—

Lubricant

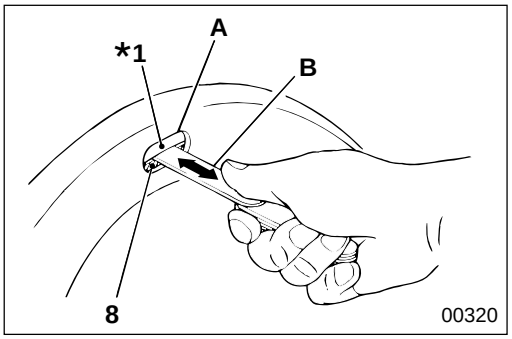
Location	Points of application	Kinds	Quantity
5	Brake shoe assembly contact surface of nut	Brake grease	As required
13	Wheel cylinder assembly anchor and screw groove contact areas with brake shoe	Brake grease	As required

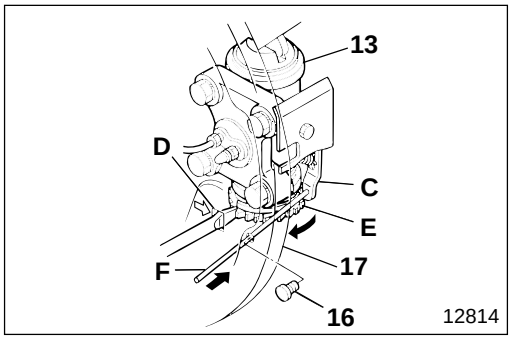
◆ Service procedure

● **Adjustment of initial brake shoe clearance after installation**

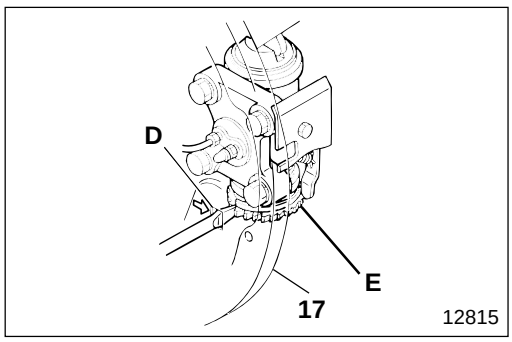
Turning the adjuster of wheel cylinder **13** in arrow ⇨ direction expands brake shoe assembly **6**, narrowing the clearance between brake drum ***1** and brake lining **8**.

- Jack up the vehicle to make sure that the wheel hub bearing has no play. If there is any play, correct it. Gr 27
- Remove adjusting hole plug **15** and check hole plug **14**.
- Adjust the brake shoe clearance as follows, so that 0.3 mm {0.012 in.} feeler gauge **B** can be inserted or extracted through inspection hole **A**, between brake drum ***1** and brake lining **8** with a little resistance.



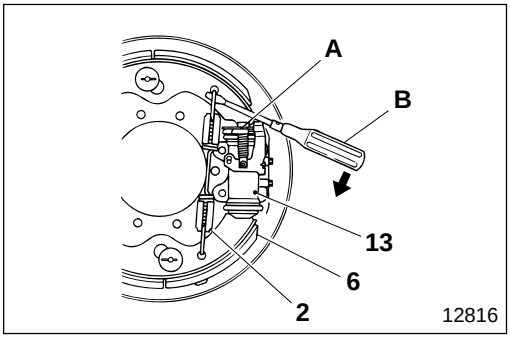


- To increase brake shoe clearance
  - Remove cover **16** on the rear of backing plate **17**.
  - Insert a wire (approximately ø5 mm {0.20 in.}) into the hole of cover **16** and lift adjusting lever **C** of wheel cylinder **13**.
  - Turn adjuster **E** of wheel cylinder **13**, through adjusting hole **D**, in the opposite direction to arrow ⇨ on backing plate **17**.



- To decrease brake shoe clearance
  Turn adjuster **E** in the arrow ⇨ direction marked on backing plate **17** through adjusting hole **D**.

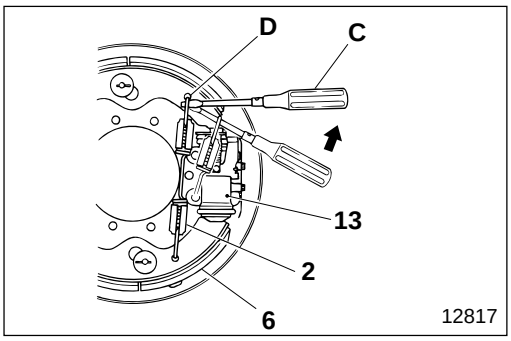
- Extract the feeler gauge and depress the brake pedal two or three times fully, then the specified value brake shoe clearance can be obtained.
- Insert a 0.2 mm {0.0079 in.} feeler gauge through check hole **A** and make sure that it can be inserted or extracted with a little resistance.
  If there is any fault, disassemble and inspect wheel cylinder **13**. P35A-76



2 **Return spring**

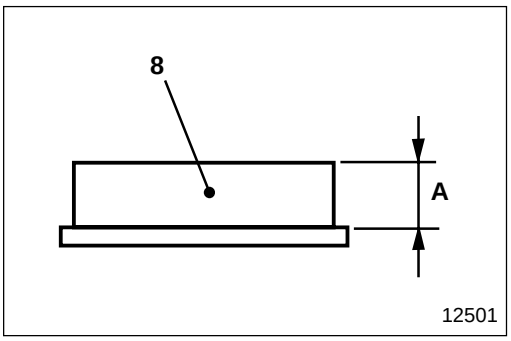
[Removal]

To remove the return spring, place screwdriver **B** on the hook of the return spring, then pry and remove the return spring making use of wheel cylinder assembly **13** adjusting screw **A** as a fulcrum.



[Installation]

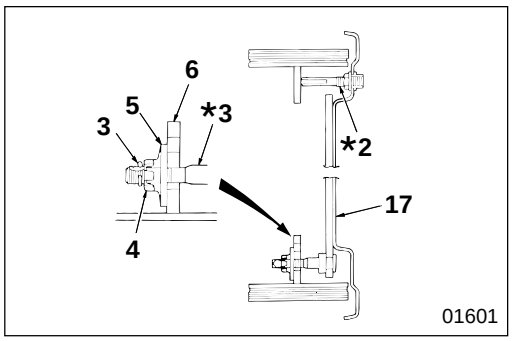
- Install the shorter hook of return spring **2** on brake shoe assembly **6**.
- Insert a small Phillips screwdriver **C** into the hook of return spring **2**, insert the tip of the screwdriver into return spring installation hole **D** of brake shoe assembly **6** to pry on the return spring.



6 **Brake shoe assembly**

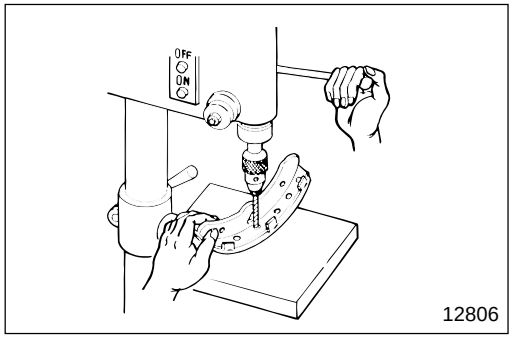
[Inspection]

If thickness **A** of brake lining **8** is lower than the limit replace the brake lining on the same axle as a unit.



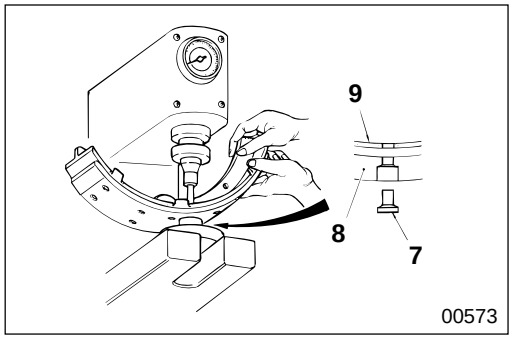
[Installation]

- Install brake shoe assembly **6**.
- Tighten nut **5**. When brake shoe assembly **6** makes contact with bolt ***2** of backing plate **17**, slacken off the nut by one third of a turn.
- Slacken off nut **5** until the holes of stud pin ***3** and lock plate **4** align with each other.
- Install cotter pin **3** and bend it.



8 **Brake lining**

[Removal]



[Installation]

- Clean the mounting surfaces of brake lining **8** and brake shoe **9** with cleaning fluid and dry them.
- Insert rivets **7** from brake lining **8** side, and caulk the rivets at the specified load so that there is no clearance between brake shoe **9** and the brake lining.

  Caulking load for rivets : 17 to 19 kN {3750 to 4190 lbf, 1700 to 1900 kgf}

- Make sure that you inspect contact with the inner surface of brake drum ***1** after you replace brake linings **8**. If contact is incorrect, correct with the brake assembled.

WARNING

Do not leave lubricant on the surface of brake lining 8 because this reduces braking performance.

CAUTION

Make sure that the type of brake linings 8 you fit are suitable for the intended use of the vehicle. Make sure that you fit identical size and color coated linings on the left and right sides of one shaft.

***1** **Correction of brake drum**

If the cylindrical accuracy of brake drum ***1** is higher than the limit, or there are seams, correct by machining to the correction limit. Machining of the brake drum should be done with the wheel hub attached as an integral part.

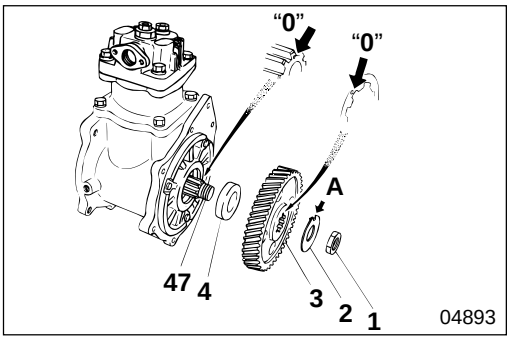
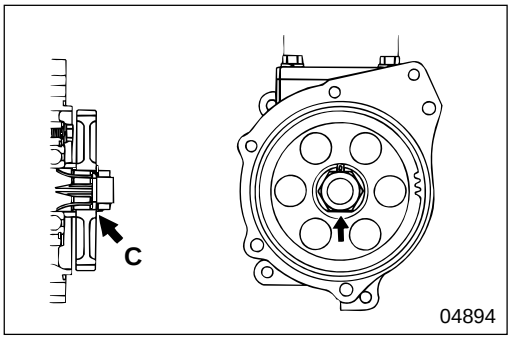
32 to 35	Piston ring tool  01732	MH060014	Removal and installation of piston ring (Compression ring, oil ring)

◆ Service procedure

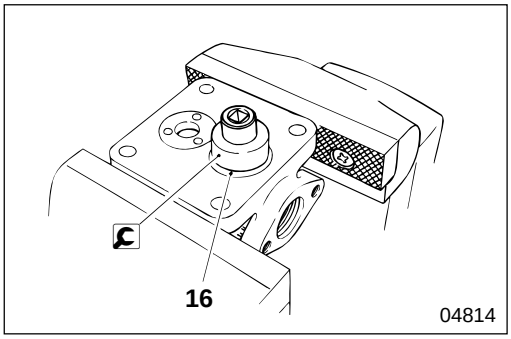


1 **to** **3** **Installation of drive gear**

- To install, align mark "**0**" of crankshaft **47** with alignment mark "**0**" of drive gear **3**.
  Assemble by aligning the alignment mark of the drive gear with indent **A** of lock washer **2**, then tighten nut **1** at specified torque.

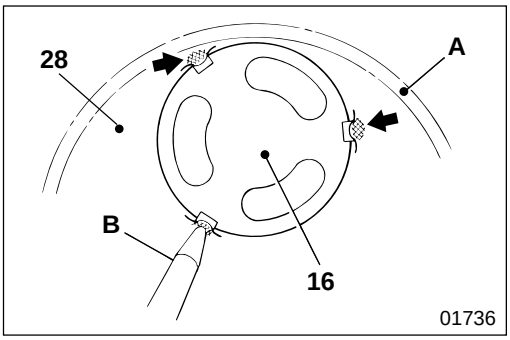


- Bend the lock washer toward nut **C** after assembly.

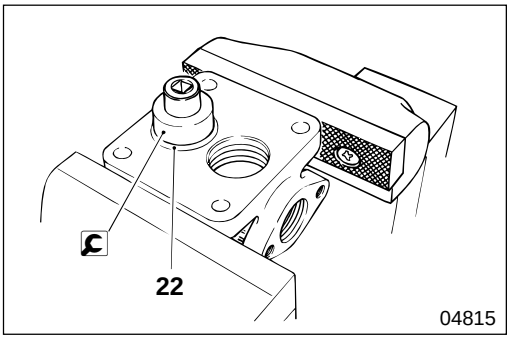


16 **Suction valve holder**

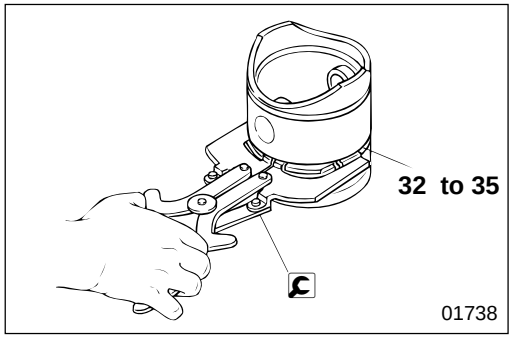
[Removal and installation]



[Caulking]
Caulk cylinder head **28** taking care not to damage seal surface **A** of the O-ring.
B : Center punch

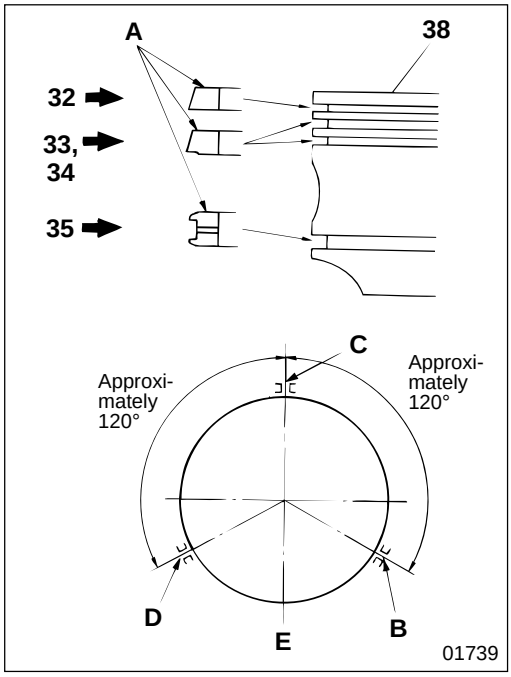


22 **Removal and installation of delivery valve holder**



32 to **35** **Piston ring (Compression ring and oil ring)**

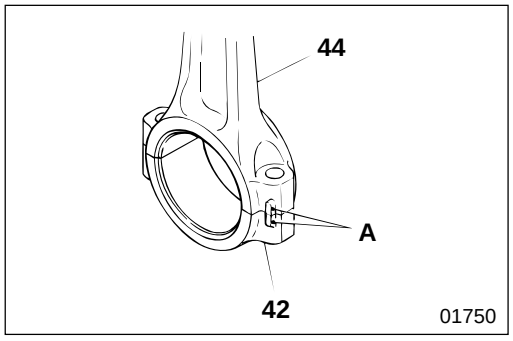
[Removal and installation]



[Mounting position]

- Pay attention to the mounting positions of compression rings **32** to **34** and oil ring **35**. Assemble the piston rings so that lettered side **A** faces toward the top of piston **38**.
- Arrange the piston rings so that each split, **B** to **D**, of the compression rings is offset by 120° from the preceding split.

  B : 1st compression ring split
  C : 2nd compression ring split
  D : 3rd compression ring split
- Position oil ring split **E** so that it comes midway between the splits of the two compression rings.



42 **44** **Installation of connecting rod and connecting rod cap**

Assemble connecting rod **44** and connecting rod cap **42** with alignment marks **A** aligned.

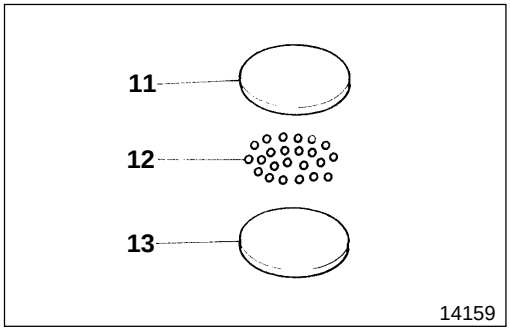
◆ Service procedure

● Inspection after assembly

Inspection for air leakage

- Plug the air outlet port of the air dryer completely, and apply pressures of 49 kPa {7.1 psi, 0.5 kgf/cm^2} and 880 kPa {130 psi, 9 kgf/cm^2} from the air inlet port. Check to ensure that each section except valve assembly **30** is free from any air leaks. As for the valve assembly, a small amount of air leaks not exceeding 20 cm^3 {1.22 cu. in.}/min is permissible.
- Check to ensure that there are no air leaks in the air dryer body when an air pressure of 880 kPa {130 psi, 9 kgf/cm^2} is applied from the command pressure port of the air dryer.



11 **13** **Installation of filter**

Install filters **11** and **13** with their softer layer facing desiccant **12**.

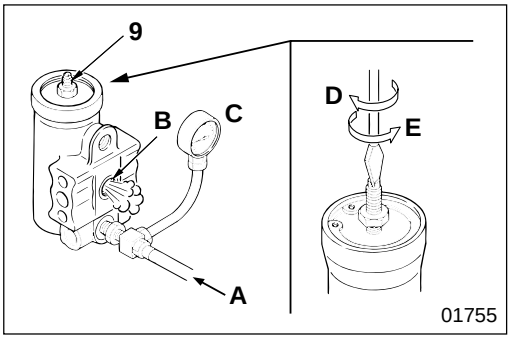
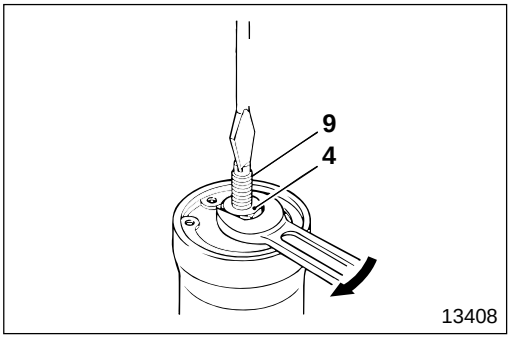
18	Interior of body	Multipurpose grease [NLGI No. 2 (Li soap)]	As required

◆ Service procedure

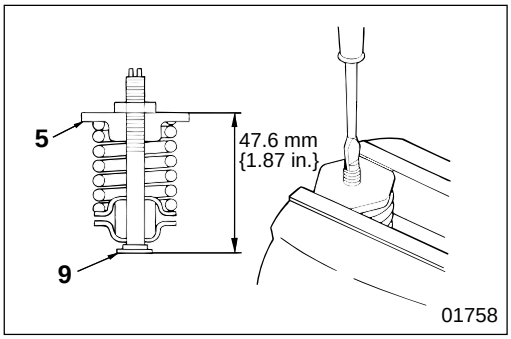
● Inspection of function after assembly



- Increase air pressure **A** gradually and read the value on air pressure gauge **C** when air is discharged from **B**. Adjust by turning adjusting screw **9** so that the reading conforms to the standard value (high specified-pressure).
  D : Turning clockwise decreases the pressure
  E : Turning counterclockwise increases the pressure
- Lower air pressure **A** to 685 kPa {100 psi, 7 kgf/cm²} or less, then raise the air pressure gradually. Read air pressure gauge **C** when it stops and check that the value conforms to the standard value (high specified-pressure). If the value deviates from the standard value, readjust.
- Lower air pressure **A** gradually. When the discharge of air from **B** ceases, read air pressure gauge **C** to check that the valve conforms to the standard value (high specified-pressure). If the value deviates from the standard value, replace the air pressure governor assembly.



- After adjusting, tighten lock nut **4** to prevent adjusting screw **9** being turned accidentally.



3 **Preliminary adjustment of adjusting screw assembly**

It is recommended that you adjust the distance from the upper level of upper spring seat **5** to the lower level of adjusting screw **9** to 47.6 mm {1.87 in.} by turning the adjusting screw, because this makes adjustment to the specified value easier.

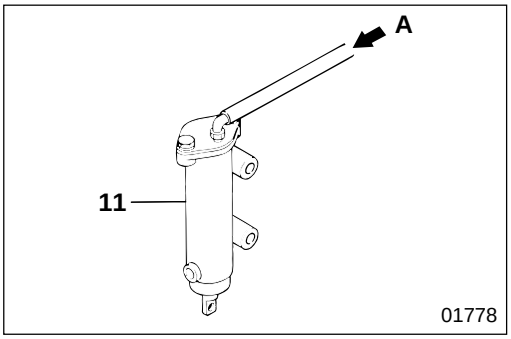
Lubricant and sealant

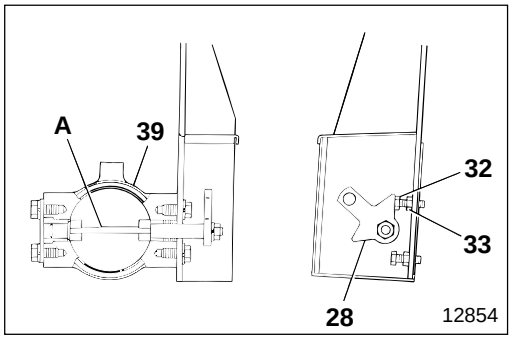
Location	Points of application	Kinds	Quantity
10	Thread area of connector	THREEBOND No.1211 or No.1213	As required
17	Surface of packing	Molybdenum disulfide bearing grease [NLGI No.2 (Li soap)]	As required
19, 20	Mounting areas of plate and shaft	Sealant [Hermetic GA (SANNOW KOGYO)]	As required
20	Shaft at ø12 {0.47}	Molybdenum disulfide bearing grease [NLGI No.2 (Li soap)]	As required
25	Interior of cylinder	Molybdenum disulfide bearing grease [NLGI No.2 (Li soap)]	2 cm³ {0.12 cu. in.}



◆ Service procedure

11 **Inspection on airtightness of control cylinder**

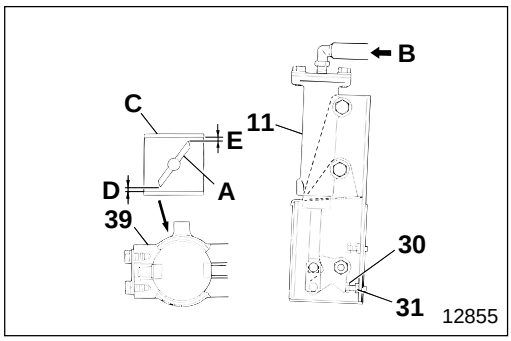
Make sure that there is no air leakage when air pressure of 980 kPa {140 psi, 10 kgf/cm²} is applied to control cylinder **11**. If any air leakage is found, replace the control cylinder assembly.



28 **30** **to** **33** **39** **Lever, adjusting bolt, lock nut, and valve assembly**

[Butterfly valve **A** fully-opened adjustment]

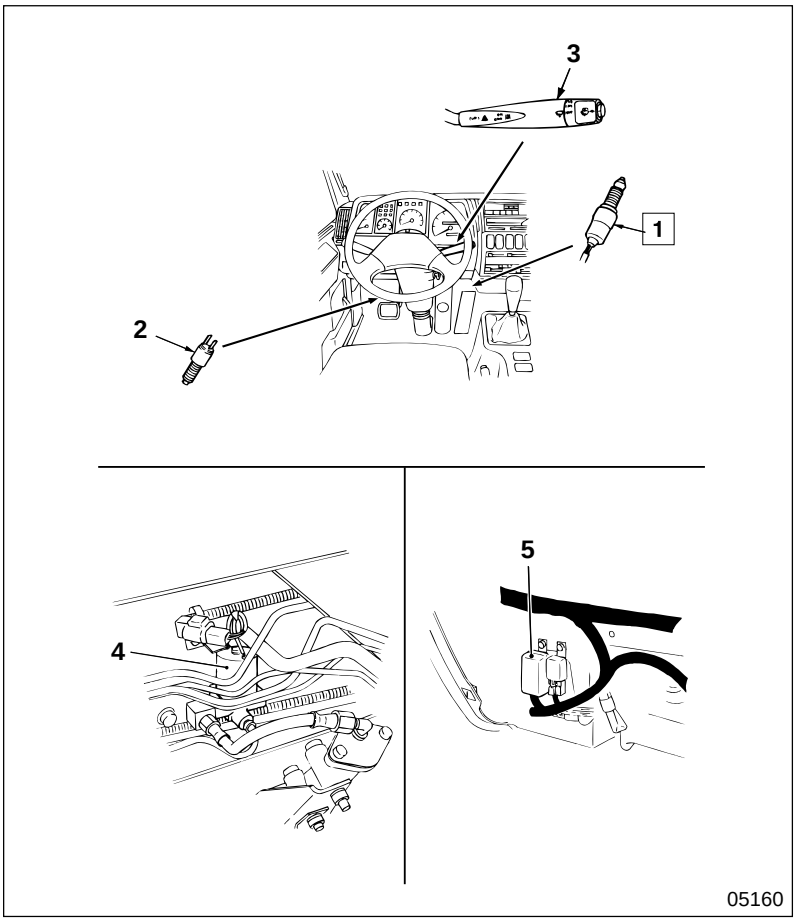
- Turn the adjusting bolt so that lever **28** and the head of adjusting bolt **32** make contact horizontally.
- Tighten lock nut **33** at specified torque.



[Butterfly valve **A** fully-closed adjustment]

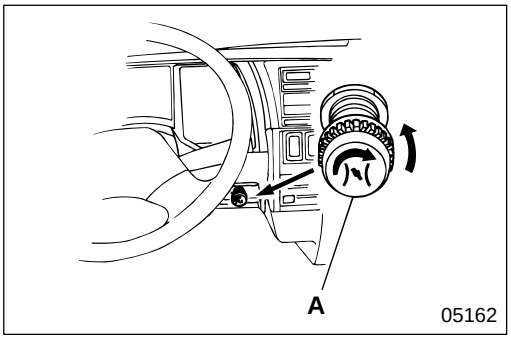
- Apply air pressure **B** of 685±49 kPa {100±7.1 psi, 7±0.5 kgf/cm^2} to control cylnder **11**.
- Turn adjusting bolt **30** so that the average value of clearances **D**, **E** between butterfly valve **A** and body **C** conforms to the standard value.
- Calculate the average of clearances **D**, **E** by (**D**+**E**)/2.
- Tighten lock nut **31** at specified torque.

Exhaust Brake Electric Equipment



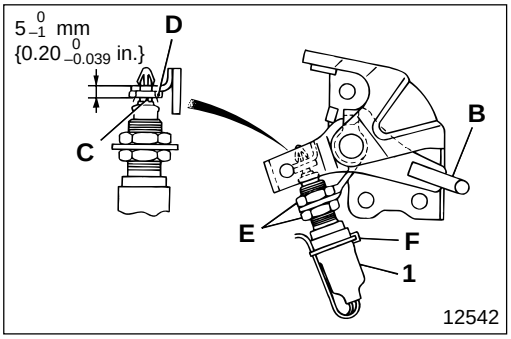
1 Accelerator switch
Gr 54
2 Clutch switch
Gr 21, 54
3 Exhaust brake switch
Gr 37, 54
4 3-way magnetic valve
Gr 54
5 Exhaust brake cut relay
Gr 54

◆ Service procedure



1 **Installation of accelerator switch**

- Turn idling control knob **A** in direction ⇨ (counterclockwise) to free the accelerator pedal.



- Screw in accelerator switch **1**, holding accelerator control lever **B** still, until push rod **C** makes contact with stopper **D**. Then screw in by a further 5 0 -1 mm {0.20 0 -0.039 in.} and tighten lock nut **E**.
- Secure accelerator switch **1** harness using band **F**.

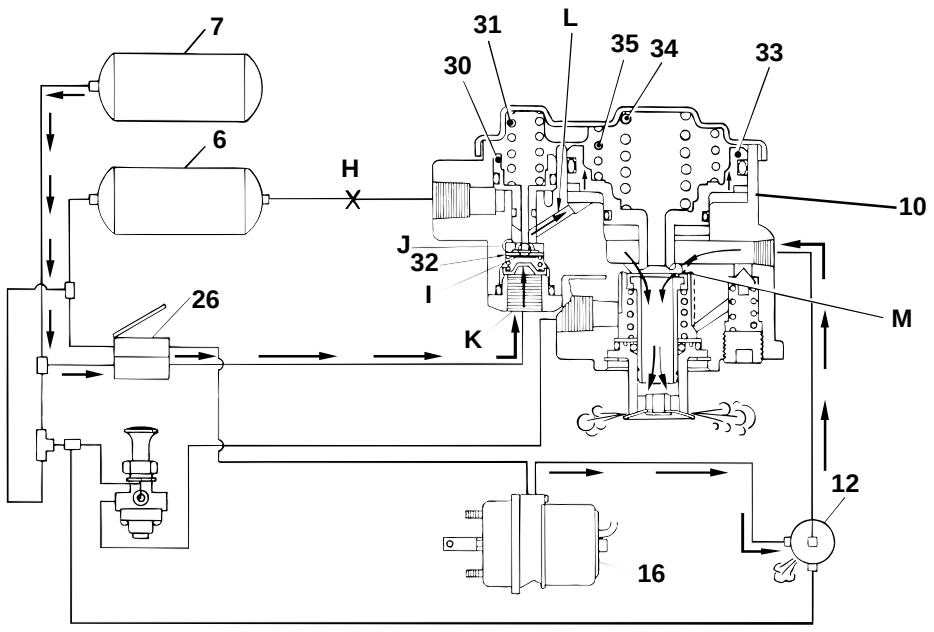
W : White tape

- The brake system is a full-air, all wheel brake type consisting of separate front and rear systems.
- Parking brake control valve **27** is fitted as a safety mechanism. It provides normal braking action on the spring brake of rear brake chamber **16** even if the rear brake system air line fails.
- An exhaust brake system, of the exhaust pipe opening and closing valve type, is fitted as a sub-brake system.

● Safety mechanism for rear brake system failure (Spring brake)

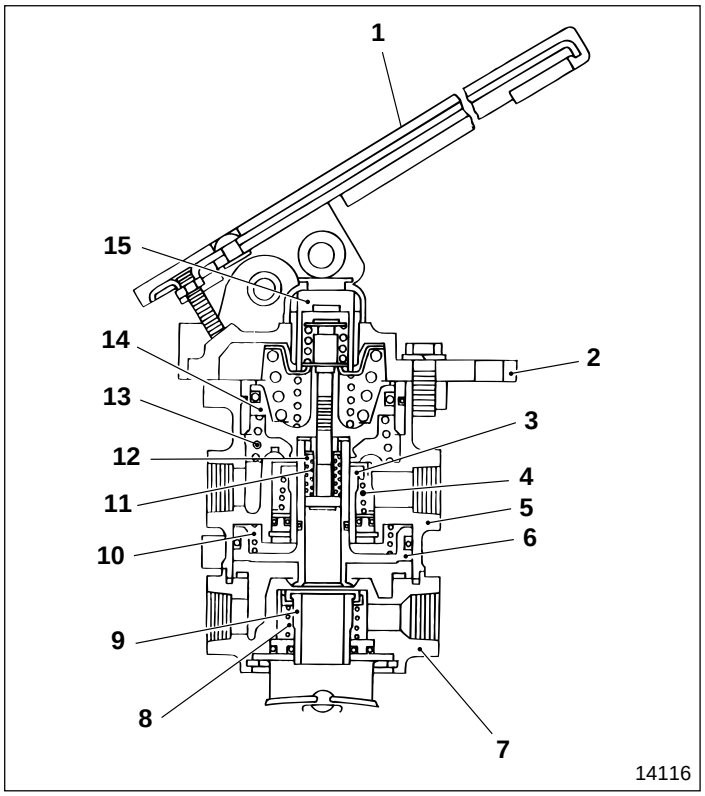


- If any part of the rear brake system fails and the air pressure in air tank **6** (for the rear brake system) drops below the specified pressure, the air pressure under piston **30** of spring brake valve **10** is overcome by the repercussive force of spring **31** and the piston is forced down.
- When forced down, piston **30** makes contact with valve **32** to close exhaust port **I** and open inlet port **J**.
- When brake pedal **26** is depressed, the air pressure in the air tank (for the front brake system) is fed to control port **K** of spring brake valve **10**, and is then fed under piston **33** via inlet port **J** and passage **L**.
- The air pressure under piston **33** overcomes the repercussive force of springs **34**, **35** to raise the piston and open exhaust valve **M**.
- When exhaust valve **M** opens, the pressurized air that flowed from spring brake valve **10** to relay valve **12** is discharged through the exhaust port in accordance with brake pedal **26** depression force.
- Since relay valve **12** opens the exhaust valve when air pressure is lost, and discharges the air in the spring brake of rear brake chamber **16**, the spring brake works to generate braking force.

H : Failure

M E M O

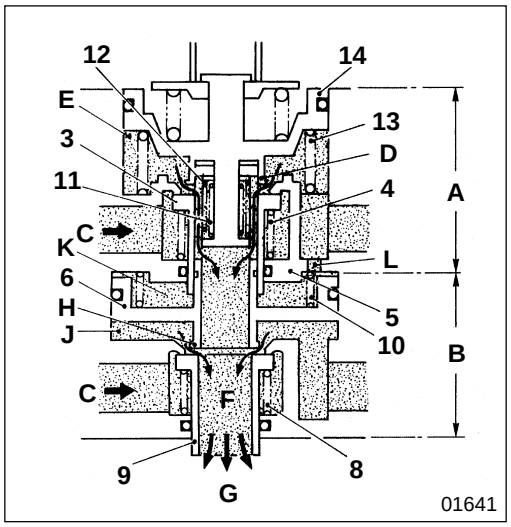
Dual Brake Valve



1 Brake pedal
2 Plate assembly
3 Primary inlet valve
4 Primary valve spring
5 Body
6 Relay piston
7 Cover
8 Secondary valve spring
9 Secondary inlet valve
10 Relay piston spring
11 Inner spring
12 Outer spring
13 Primary piston spring
14 Primary piston
15 Plunger

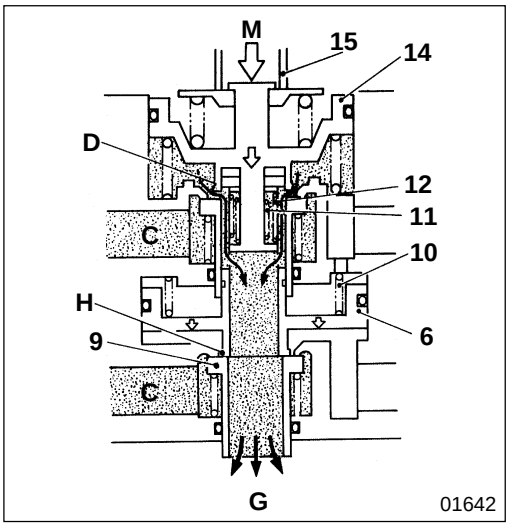
The dual brake valve controls the braking force of the vehicle by feeding pressurized air to the air master in accordance with the brake pedal depression angle of brake pedal **1**.

● When brake not operating



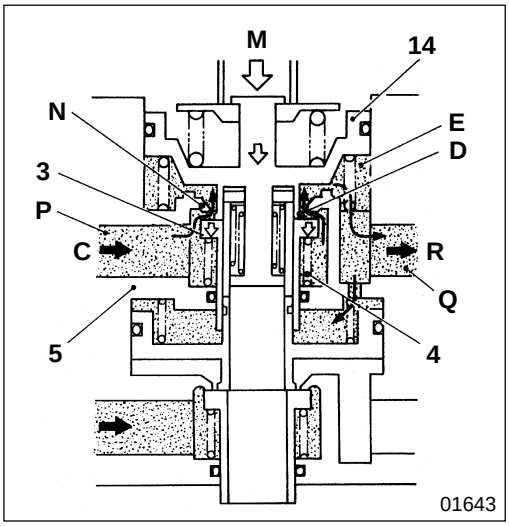
- The repercussive forces of primary valve springs **4**, secondary valve spring **8** seat primary inlet valve **3** at primary side **A**, and inlet valve **9** at secondary side **B**, on their respective seats. This shuts off air **C** from the air tank to maintain airtightness.
- The repercussive force of primary piston spring **13** raises primary piston **14** to its upper position. Exhaust valve seat **D** opens and chamber **E** is open to atmosphere **G** via chamber **F**.
- Since the repercussive forces of inner spring **11** and outer spring **12** is stronger than the repercussive force of relay piston spring **10**, relay piston **6** is raised to its upper position and exhaust valve seat **H** is opened. This opens chamber **J** to atmosphere **G** via chamber **F**.
  Chamber **E** at the primary side and chamber **K** at the upper part of relay piston **6** at the secondary side are connected via passage port **L** of body **5**.

● When depressing brake pedal (before braking pressure is generated)



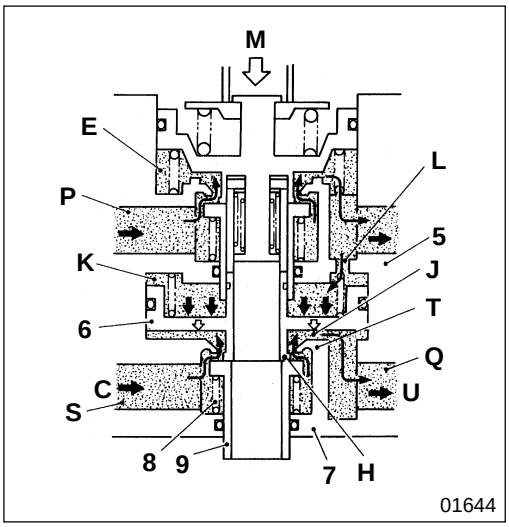
- Depressing the brake pedal (illustrated as pedal action **M**), forces down primary piston **14** via plunger **15**.
- Forcing down primary piston **14** changes the balance between the repercussive forces of inner spring **11** and outer spring **12**, and the repercussive force of relay piston spring **10**, forcing down relay piston **6**. This seats the relay piston on secondary inlet valve **9** and closes exhaust valve seat **H**.
- This closes the secondary side exhaust passage; however, primary side exhaust valve seat **D** remains open. No braking pressure is generated at either primary or secondary sides.

● When depressing brake pedal (braking pressure is generated)



Primary side

- As the brake pedal is depressed further (illustrated as brake pedal action **M**), primary piston **14** is forced down until it is seated on primary inlet valve **3**, closing exhaust valve seat **D**.
- Primary inlet valve **3** is forced down, compressing primary valve spring **4**, and supply valve seat **N** of body **5** separates from the primary inlet valve. The air in chamber **P** flows into chamber **E** and is fed to rear brake system **R** via discharge port **Q** as braking pressure.

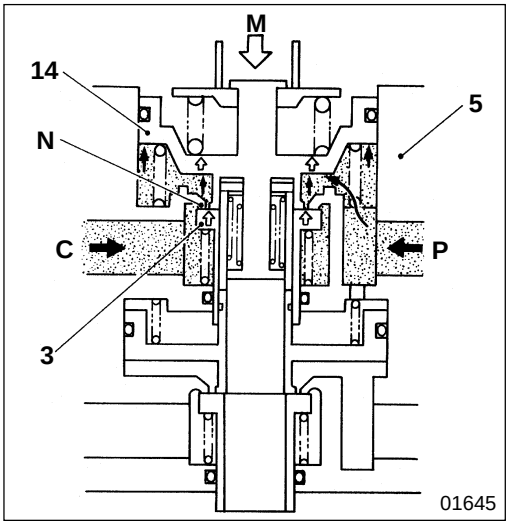


Secondary side

- The air at the primary side flows into chamber **K** via passage port **L** of body **5**.
- The air fed into chamber **K** acts on the upper part of relay piston **6** to force down the relay piston and compress secondary valve spring **8**, forcing down secondary inlet valve **9**.
- This separates supply valve seat **T** and secondary inlet valve **9** of cover **7**.
- The air in supply port chamber **S** flows into chamber **J** and is fed to front brake system **U** via discharge port **Q** as braking pressure.

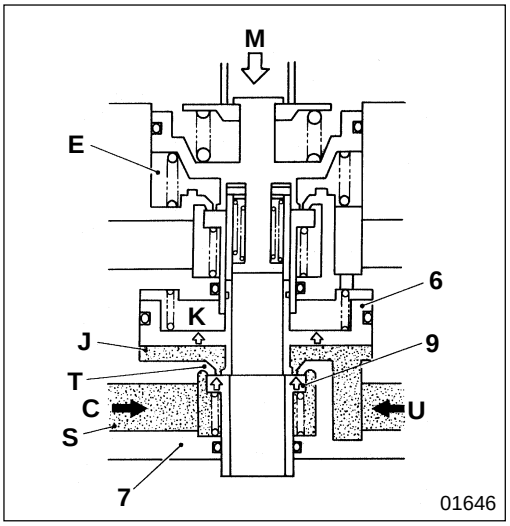
● Stabilization of braking pressure

When the brake pedal remains depressed at the specified depression angle, the braking air pressure stabilizes at the pressure corresponding to the brake pedal depression angle.



Primary side

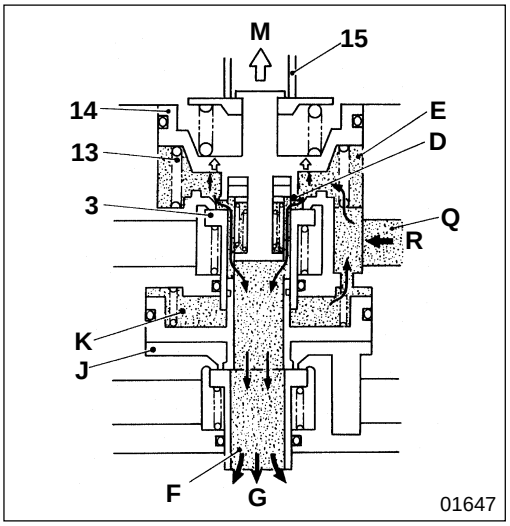
- The braking air pressure fed under the bottom of primary piston **14** raises the primary piston and primary inlet valve **3** together in tandem.
- Primary inlet valve **3** makes contact with supply valve seat **N** of body **5**, then the supply of air **C** from the air tank ceases and the increases in the braking air pressure stops. This stabilizes braking pressure **R** for the rear brake system.



Secondary side

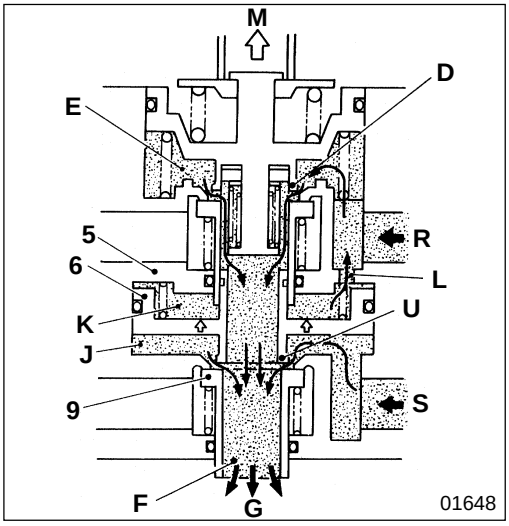
- As the braking pressure (pressure in chamber **J**) for the front brake system balances the pressures in chambers **E** and **K**, the force raising relay piston **6** disappears, and the relay piston rises in tandem with secondary inlet valve **9**.
- Secondary inlet valve 9 makes contact with supply valve seat **T** of cover **7**, then the supply of air from supply port chamber **S** to chamber **J** ceases. This stabilizes brake pressure **U** for the front system.

● Release of brake pressure



Primary side

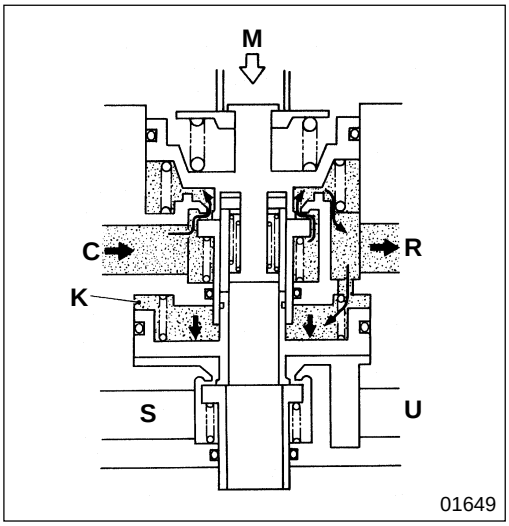
When the brake pedal is released (illustrated as brake pedal action **M**), primary piston spring **13** and air pressure **R** at discharge port **Q** (pressure in chamber **E**) raise plunger **15** and primary piston **14**. Then, exhaust valve seat **D** at the lower end of the primary piston separates from primary inlet valve **3**. The air pressure of the rear brake system flows through chamber **E** to be discharged from exhaust passage chamber **F** into atmosphere **G**.



Secondary side

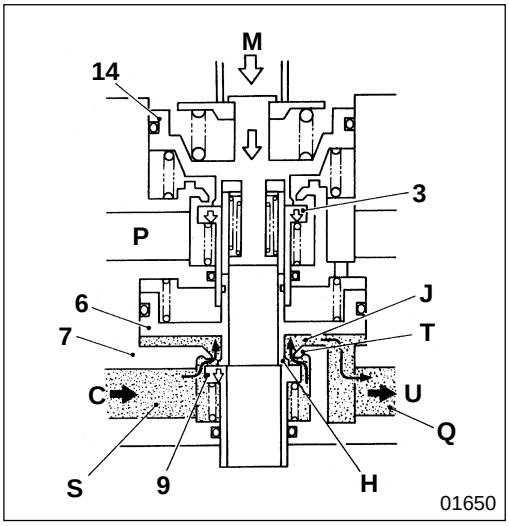
- As the air pressure in the rear brake system drops, the air pressure in chamber **K** is discharged via passage port **L** of body **5**, and chambers **E**, **F** into atmosphere **G**.
- This changes the air pressure balance between chambers **K** and **J**. The air pressure in chamber **J** raises relay piston **6**, and exhaust valve seat **H** at the lower end of the relay piston separates from secondary inlet valve **9**. Air pressure **U** in the front brake system is discharged from exhaust passage chamber **F** into atmosphere **G**.

● When abnormality occurs



Operation when the air pipe of the front brake system fails

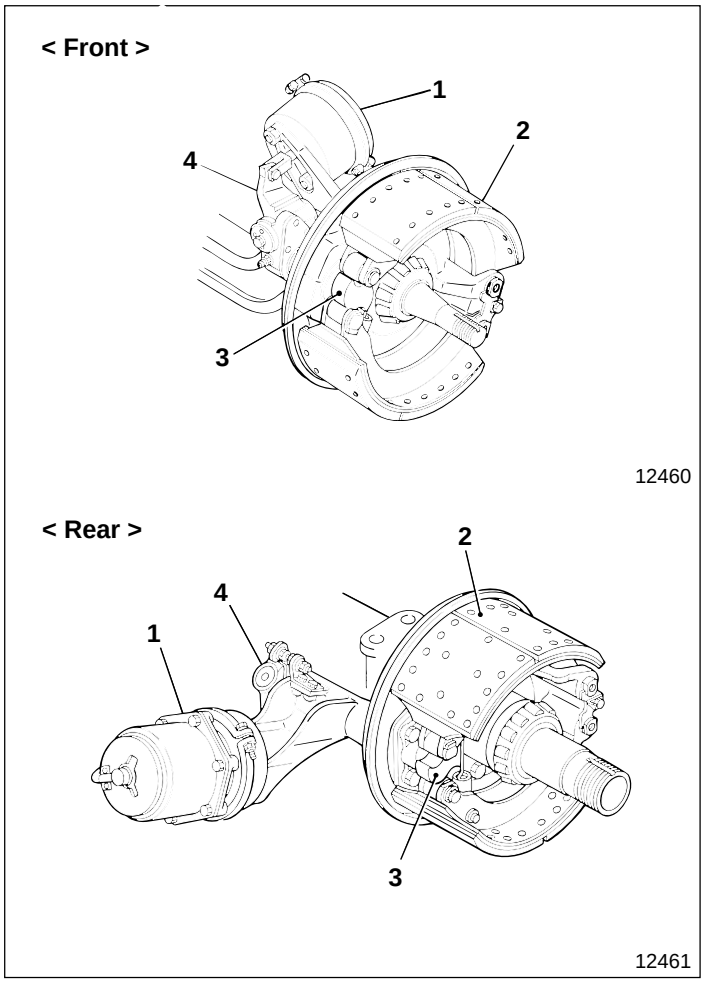
- The primary side operates the same as normal, generating braking pressure in rear brake system **R**.
- At the secondary side, even if the primary side generates air pressure in chamber **K**, braking pressure is not generated in front brake system **U**, since no air pressure is generated in supply port **S**.



Operation when the air pipe of the rear brake system fails

- In the rear brake system, air pressure is not generated up to supply port **P**. Therefore, even if the brake pedal is depressed (causing primary piston **14** to force down primary inlet valve **3**), braking pressure is not generated.
- If the brake pedal is depressed further (illustrated as brake pedal action **M**), primary piston **14** makes contact with relay piston **6** and they force down secondary inlet valve **9**.
- This action separates supply valve seat **T** of cover **7** from secondary inlet valve **9**. The air pressure flows into chamber **J** from chamber **S** and is fed to front brake system **U** via discharge port **Q** as braking pressure.

Wheel Brake < MANUAL TRANSMISSION >

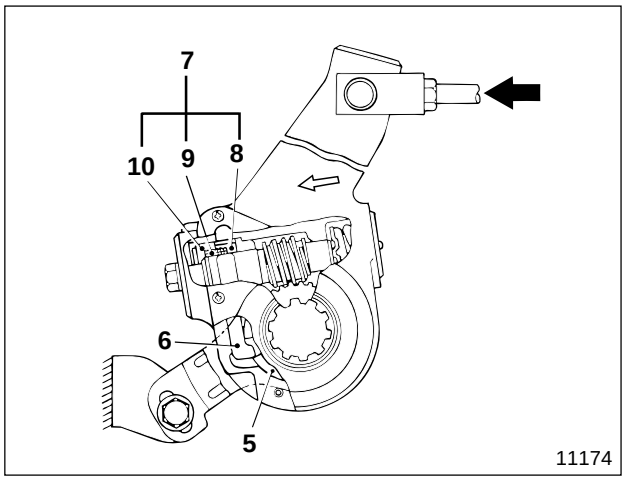


1 Brake chamber
2 Brake shoe assembly
3 Camshaft
4 Automatic slack adjuster

- The wheel brake is an internal expanding leading trailing brake type. Brake chamber **1** turns camshaft **3** to extend and press brake shoe assembly **2** against the brake drum, creating the braking force.
- Automatic slack adjuster **4** automatically adjusts the brake shoe clearance as the lining wears and the brake shoe clearance becomes higher than the specified value.

Automatic Slack Adjuster

● **When brake is operating**

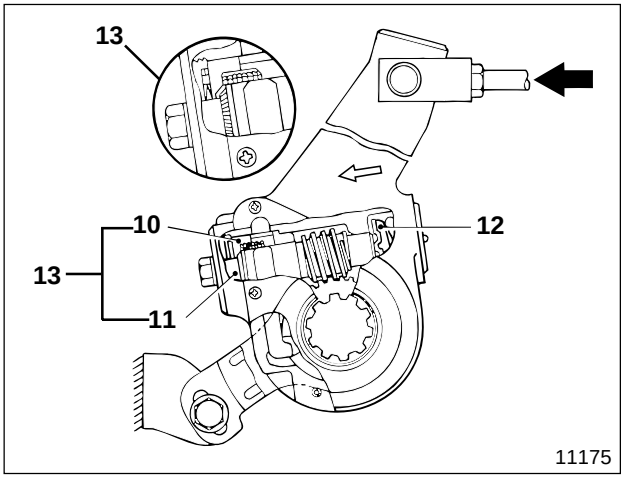


- Control disc **5** raises rack **6** in accordance with the lining wear.
- Rack **6** turns gear wheel **8** of one-way clutch **7**, but the gear wheel runs idle.

NOTE

One-way clutch 7 — **Gear wheel 8**, **Clutch spring 9**, **Clutch ring 10**

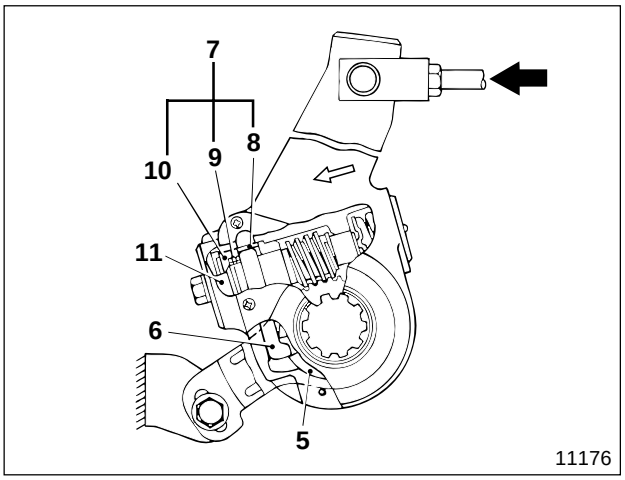
- As automatic slack adjuster **4** turns further and the force of the lining that pushes against the brake drum gradually increases, the torque of camshaft **3** of the wheel brake increases.



- As the torque of camshaft **3** of the wheel brake increases, worm screw **11** compresses spring **12** and moves in the axial direction to separate cone clutch **13**.

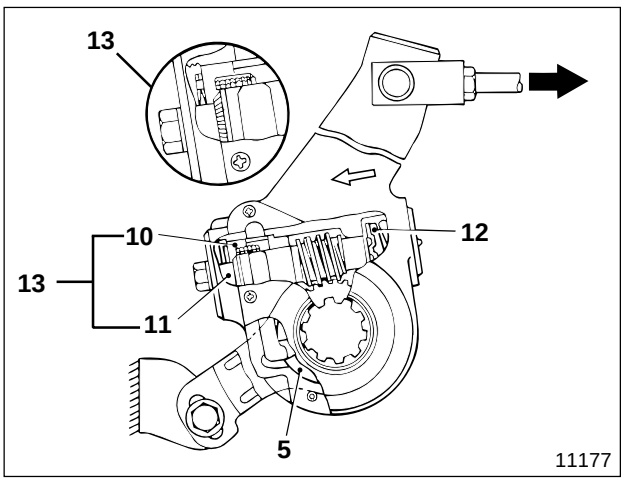
NOTE

Cone clutch 13 — **Clutch ring 10**, **Worm screw 11**

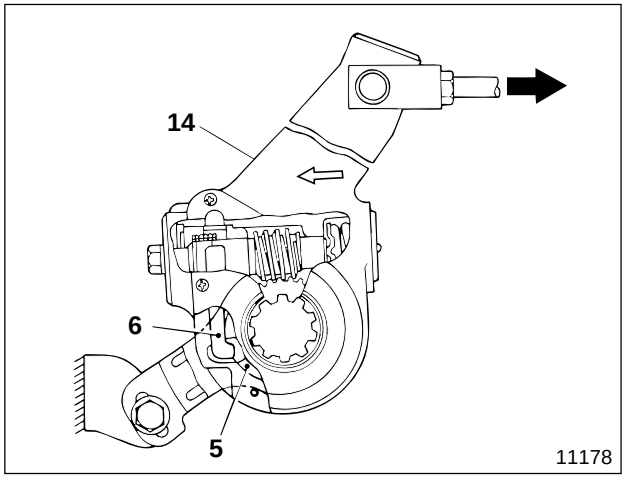


- Although control disc **5** pushes rack **6** further upward, the rack lets one-way clutch **7** idle, since cone clutch **13** is not engaged.

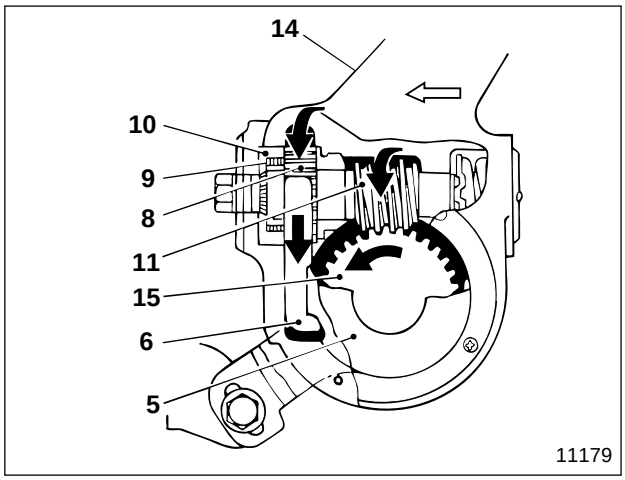
● **When releasing brake pedal**



- When the brake pedal is released, the torque from camshaft **3** of the wheel brake disappears, and the repercussive force of spring **12** pushes back worm screw **11**, engaging cone clutch **13**.

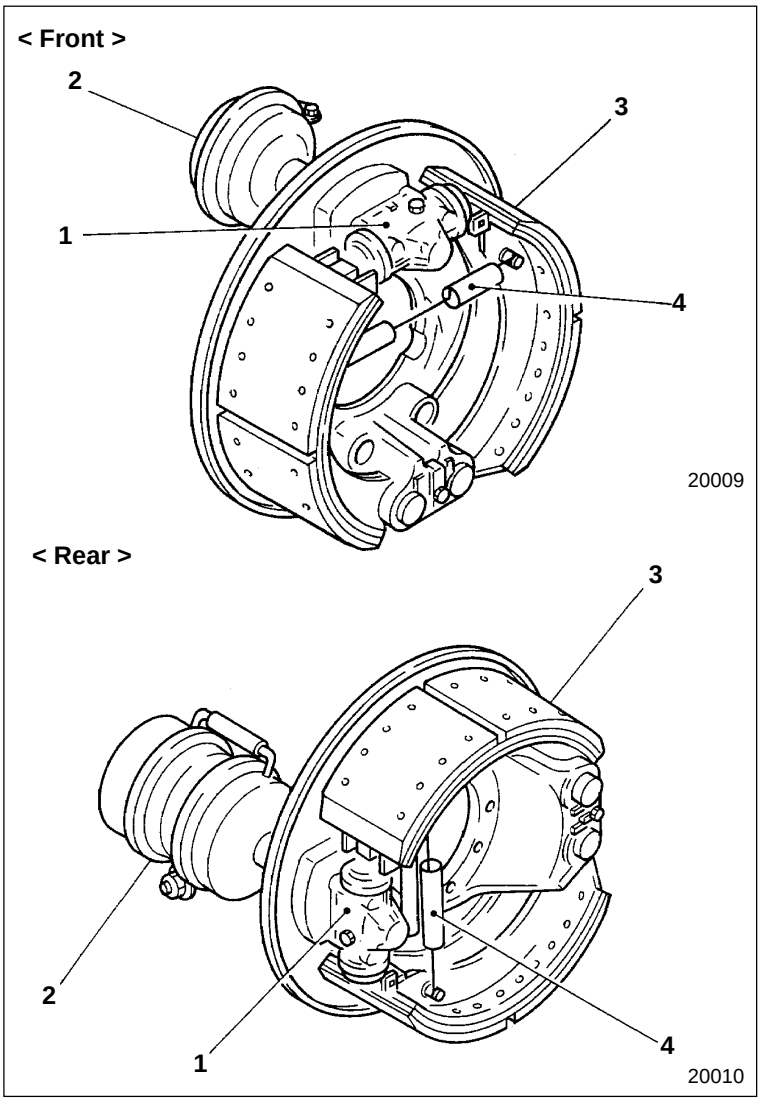


- Rack **6** is to be pushed down by the spring; however, gear wheel **8** engaged with the rack cannot turn because cone clutch **13** is engaged with the gear wheel.
- Therefore, rack **6** turns together with housing **14** until the rack makes contact with control disc **5**.



- When rack **6** makes contact with control disc **5**, the control disc is pushed down to the bottom of the rack under housing **14**.
- When rack **6** is pushed down, since cone clutch **13** is engaged with the rack, it turns worm wheel **15** and worm screw **11**.
- Therefore, since worm screw **11** turns camshaft **3** of the wheel brake in accordance with lining wear, constant brake shoe clearance is maintained.

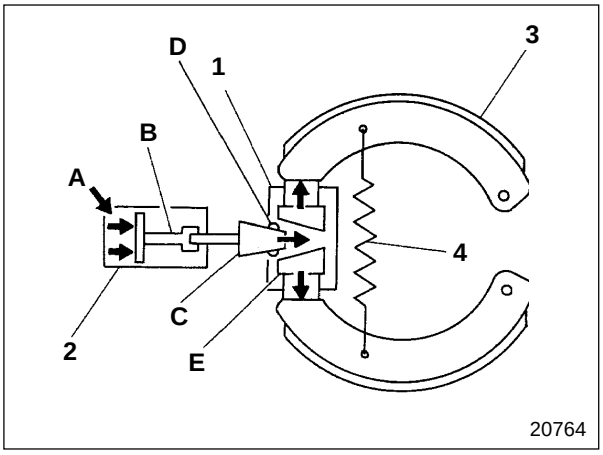
Wheel Brake < AUTOMATIC TRANSMISSION >



1 Expander
2 Brake chamber
3 Brake shoe
4 Return spring

- Drum brake expands brake shoe **3** by a wedge mechanism.
- Expander **1** incorporates an auto adjustment mechanism that automatically adjusts the brake shoe clearance.

● Wedge mechanism

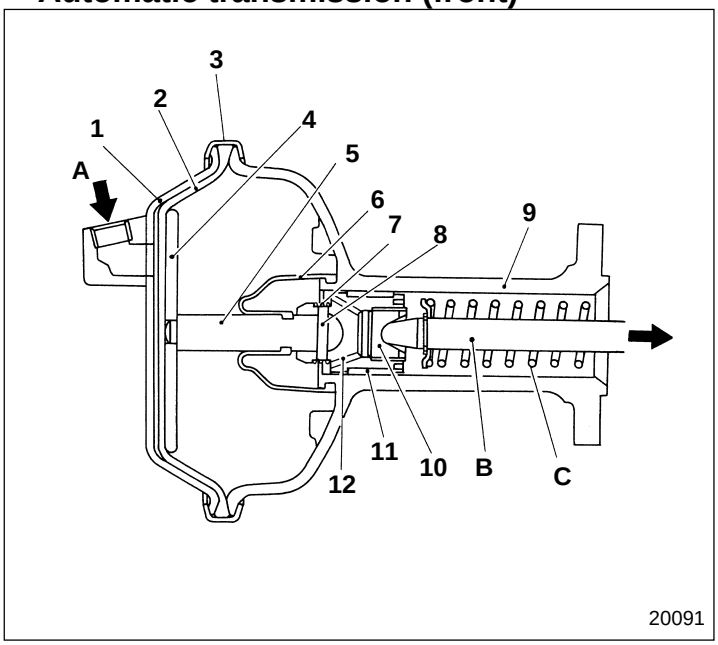


- When applying air pressure **A** on brake chamber **2**, the push rod **B** pushes wedge **C**.
- The wedge **C** pushes the sleeve **E** of expander **1** through roller **D** to expand brake shoe **3**.

STRUCTURE AND OPERATION

Brake Chamber

< Automatic transmission (front) >

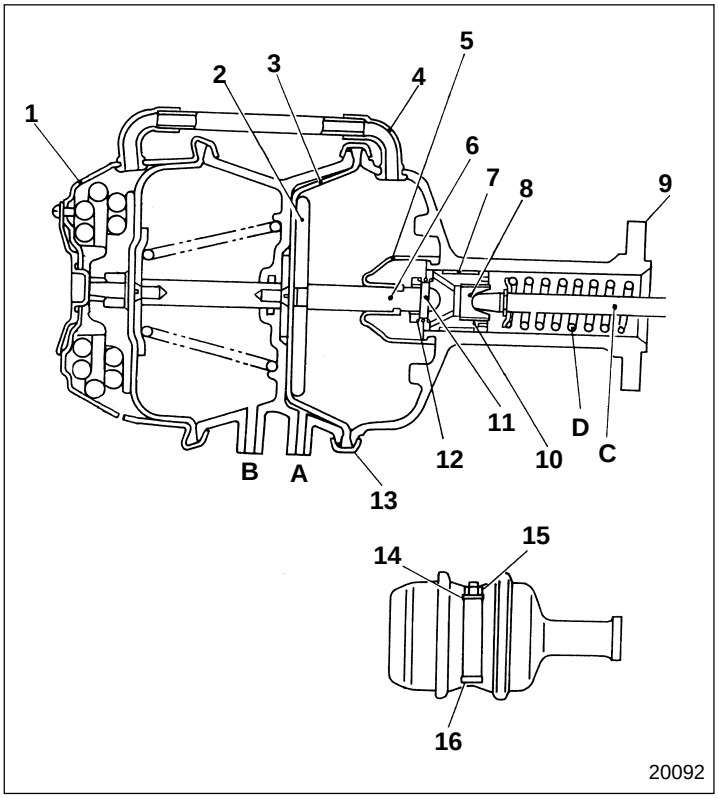


1 Pressure plate
2 Diaphragm
3 Clamp ring
4 Push plate
5 Push rod
6 Dust cover
7 Ring
8 Pin
9 Base
10 Guide head
11 Bush
12 Push rod guide

A : Air pressure
B : Wedge (expander)
C : Spring (expander)

- When applying air pressure **A** on the brake chamber < front >, the push rod **5** and wedge **B** are pushed through diaphragm **2**.
- When releasing air pressure **A**, wedge **B** and push rod **5** are returned by spring force of spring **C**.

< Automatic transmission (rear) >

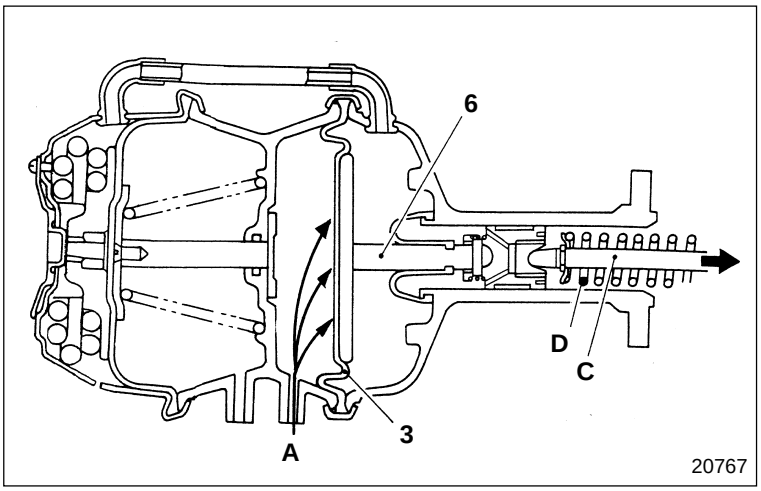


1 Piggyback
2 Push plate
3 Diaphragm
4 Elbow
5 Dust cover
6 Push rod
7 Bush
8 Guide head
9 Base
10 Push rod guide
11 Pin
12 Ring
13 Clamp ring
14 Washer
15 Release nut
16 Release bolt

A : Service brake port
B : Spring brake port
C : Wedge (expander)
D : Spring (expander)

- The brake chamber < rear > has a spring brake mechanism other than the service brake.
- The washer **14**, release nut **15**, and release bolt **16** are used when releasing the spring brake by a mechanical release.

● Service brake



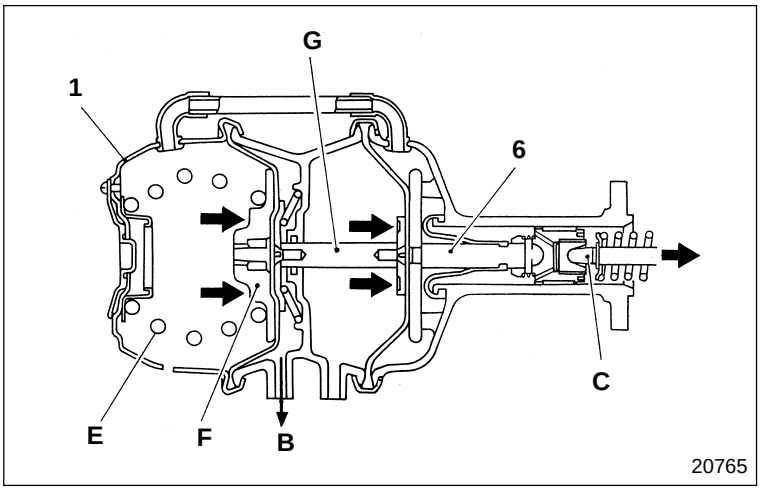
Operation

When applying air pressure on service brake port **A**, the push rod **6** and wedge **C** are pushed through diaphragm **3**.

Release

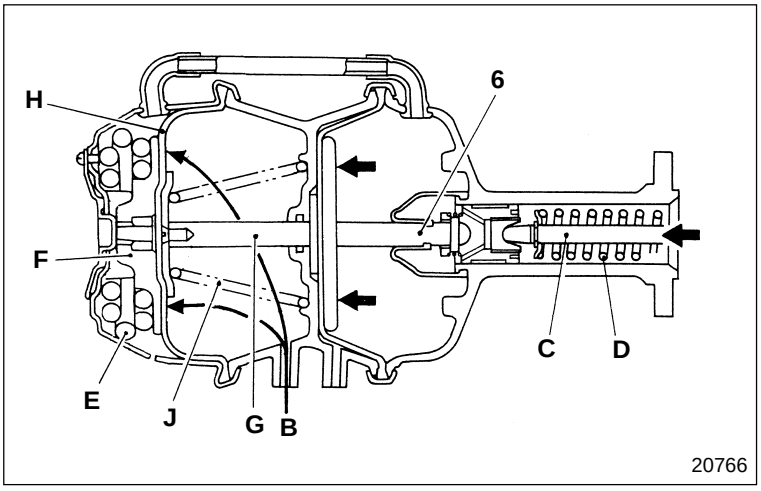
When releasing the air pressure of the service brake port **A**, wedge **C** and push rod **6** are returned by spring force of spring **D**.

● Spring brake



Operation

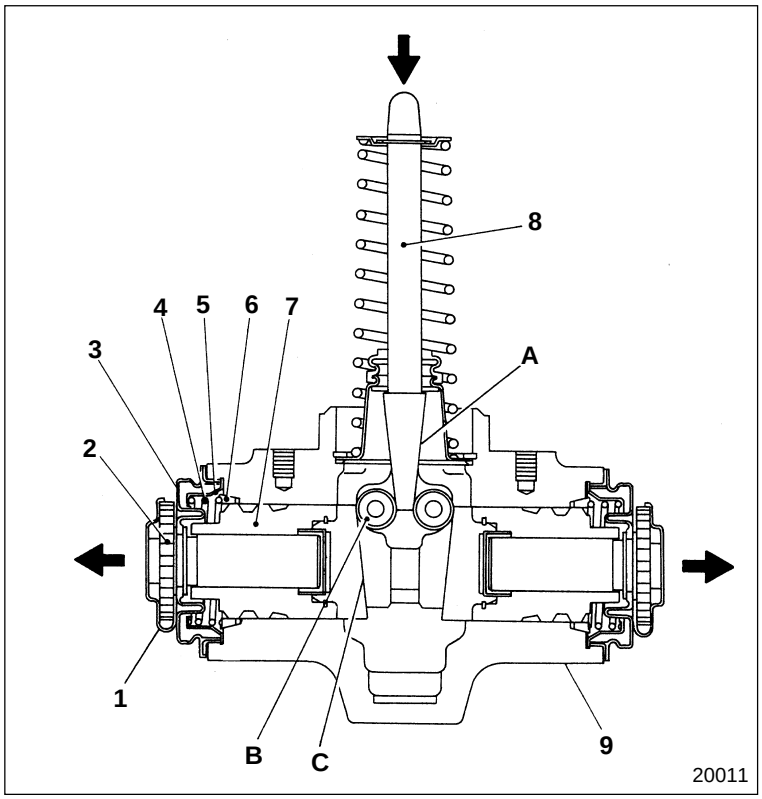
When releasing the air pressure of spring brake port **B**, piston **F**, push rod **G**, **6**, and wedge **C** are pushed by spring force of spring **E** of piggyback **1**.



Release

- When applying air pressure on spring brake port **B**, piston **F** is pushed back through diaphragm **H**, and thereby spring **E** is compressed.
- Push rod **G** is returned by spring force of spring **J**.
- Wedge **C** and push rod **6** are returned by spring force of spring **D**.

Expander

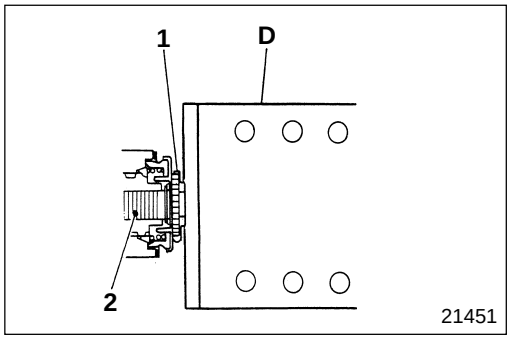


1 Clip
2 Adjusting screw
3 Boot
4 Spring
5 Cage
6 Drive ring
7 Sleeve assembly
8 Wedge
9 Body

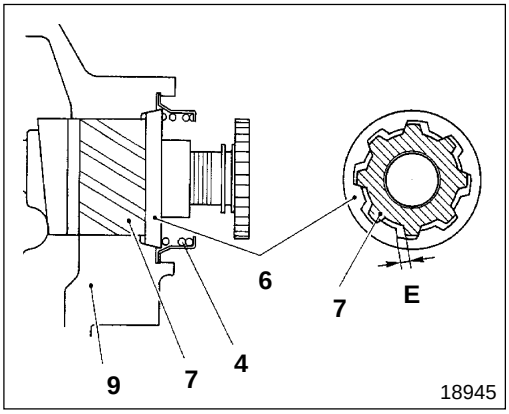
A : Inclination part (wedge)
B : Roller
C : Inclination part (sleeve assembly)

- When wedge **8** being pushed, roller **B** is spread out along inclination part **A** of the wedge.
- Roller **B** pushes out sleeve assembly **7** and adjusting screw **2** along inclination part **C** of sleeve assembly **7**.
- Body **9** of the expander incorporates an auto adjustment mechanism.

● Auto adjustment mechanism

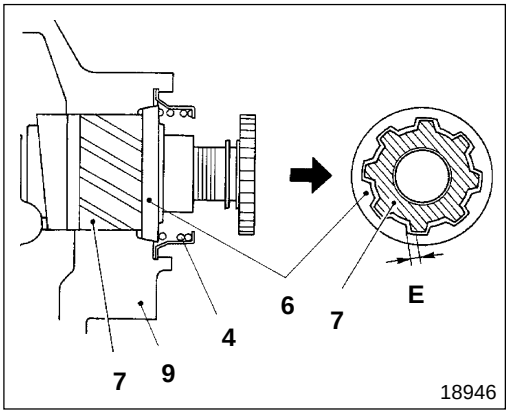


- The rotation direction of adjusting screw **2** is fixed by clip **1**.
- The rotation direction of clip **1** is fixed by brake shoe **D**.

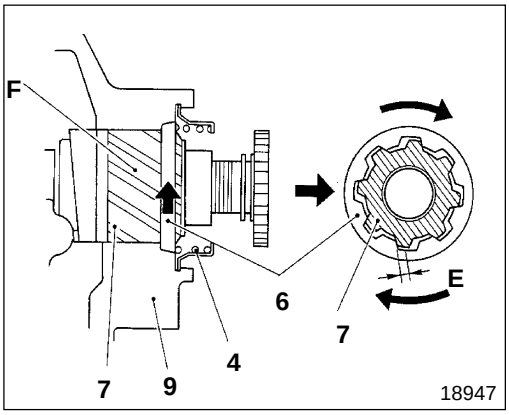


When brake shoe clearance is the standard value

- Before applying the brake, a low part of sleeve assembly **7** strikes body **9**.
- Drive ring **6** is pushed by spring **4**, strikes body **9**, and fixed.
  E : Backlash

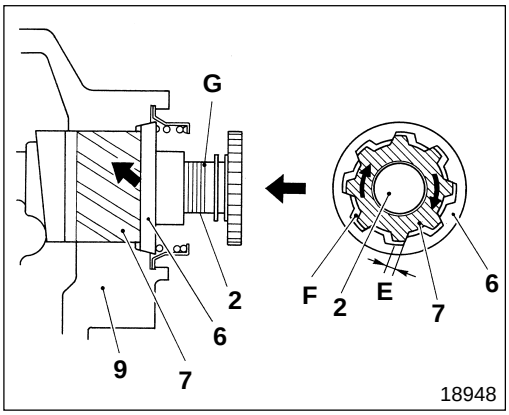


- If applying the brake, sleeve assembly **7** moves within a range of backlash **E**.



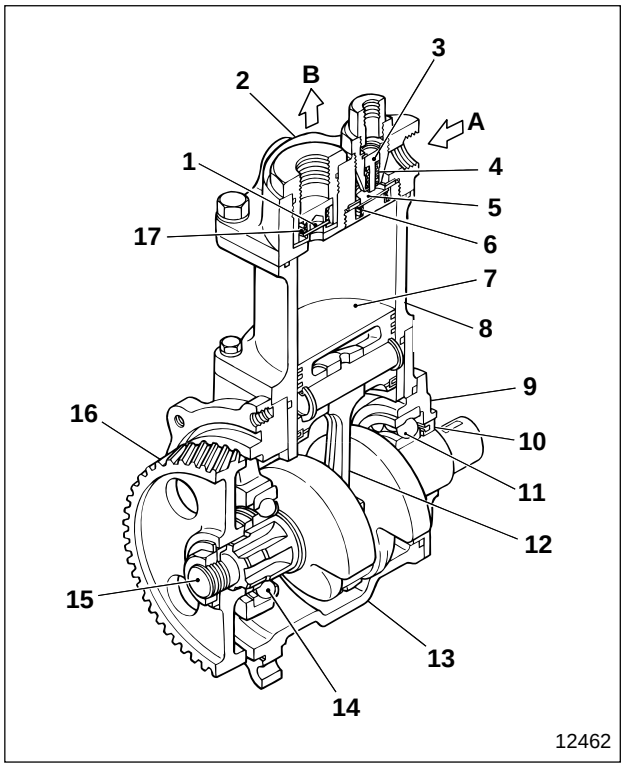
When brake shoe clearance exceeds the standard value

- If applying the brake, sleeve assembly **7** moves over backlash **E**, and rotates along screw lead face **F** of the sleeve assembly since drive ring **6** is pushed by spring **4**.
- Drive ring **6** remains to strike body **9** with being pushed to spring **4**.



- If releasing the brake, a low part of sleeve assembly **7** moves until it strikes body **9**.
  Thereby the sleeve assembly moves just to the extent of backlash **E** without any rotation; after that, it rotates along the screw lead face **F** of drive ring **6**; it pushes out the adjusting screw **2** by the action of screw **G**; and it adjusts the brake shoe clearance to the standard value.

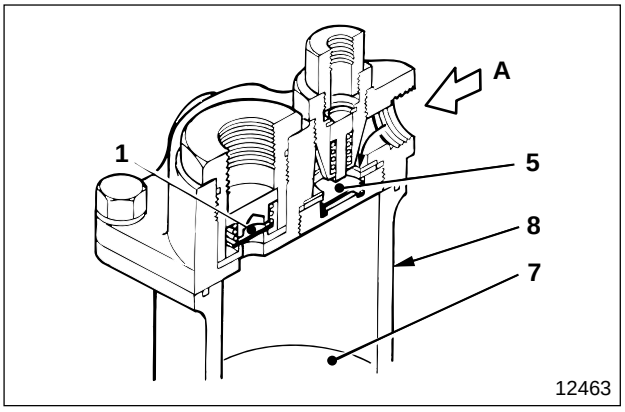
Air Compressor



1 Delivery valve
2 Cylinder head
3 Unloader valve
4 Unloader valve spring
5 Suction valve
6 Suction valve spring
7 Piston
8 Cylinder liner
9 Bearing holder
10 Oil seal
11 Bearing
12 Connecting rod
13 Crankcase
14 Bearing
15 Crankshaft
16 Drive gear
17 Delivery valve spring

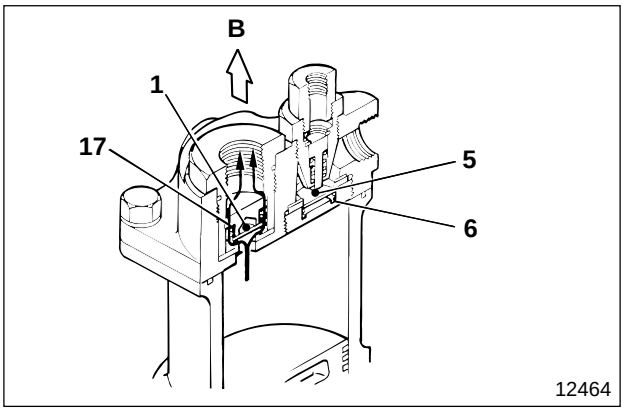
A : Air delivery port (From air cleaner)
B : Air discharge port (To air dryer)

● During suction



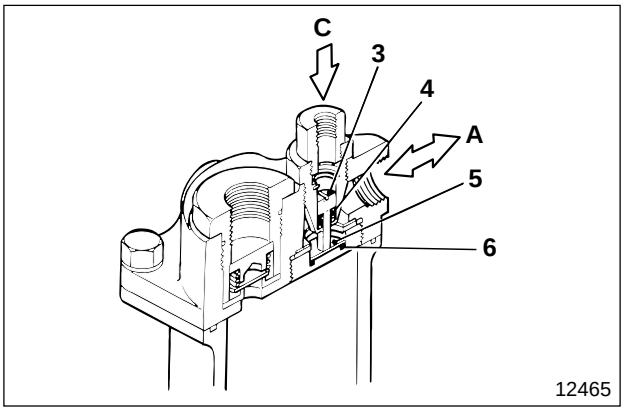
- When drive gear **16** is driven, crankshaft **15** engaged with the drive gear turns to force down piston **7**.
- The negative pressure generated at this time opens suction valve **5**, sucking air **A** into cylinder liner **8**.

● During pressurized delivery



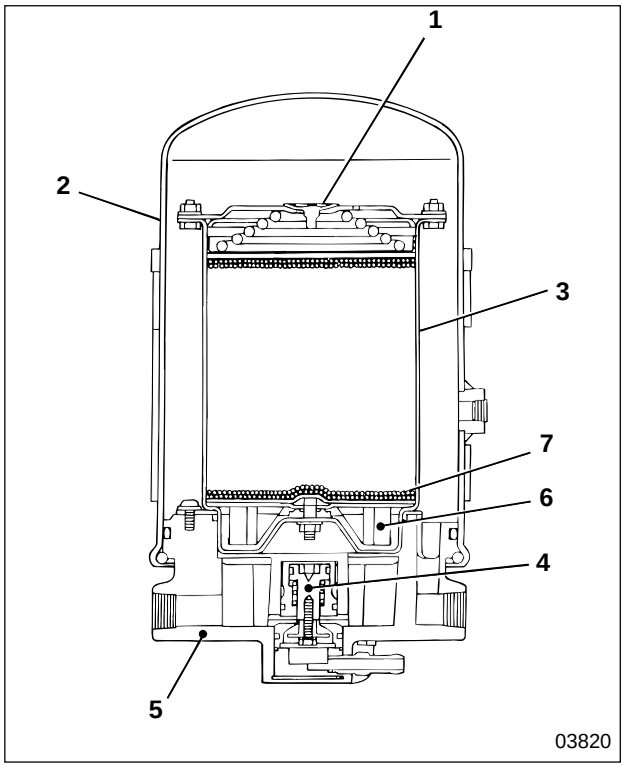
- As piston **7** rises and enters into the compression stroke, suction valve spring **6** closes suction valve **5**.
- The pressure of the compressed air overcomes the repercussive force of delivery valve spring **17** and opens delivery valve **1** to compress and deliver air **B** to the air dryer.

● When unloader valve operates



- When the air pressure in the air tank raises higher than the specified value, the air pressure governor operates to feed pressured air **C** to unloader valve **3**. This forces down the unloader valve and holds suction valve **5** open at the same time. Therefore, air **A** is not compressed and the air compressor idles.
- When the air pressure in the air tank drops lower than the specified value, the air pressure governor operates again to discharge pressured air from the upper side of unloader valve **3**. So, unloader spring **4** returns the unloader valve to its original position and the air compressor operates under a load.

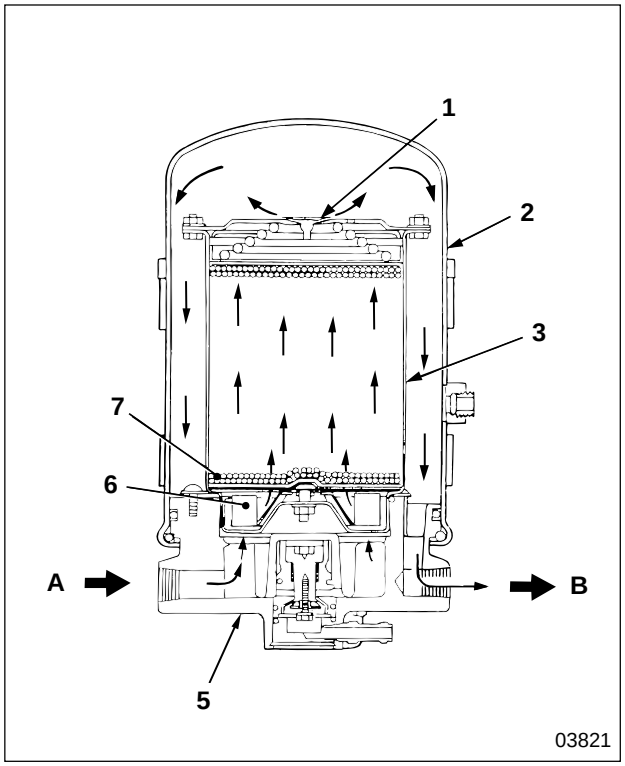
Air Dryer



1 Check valve
2 Case
3 Desiccant
4 Oil filter
5 Valve
6 Body
7 Purge chamber

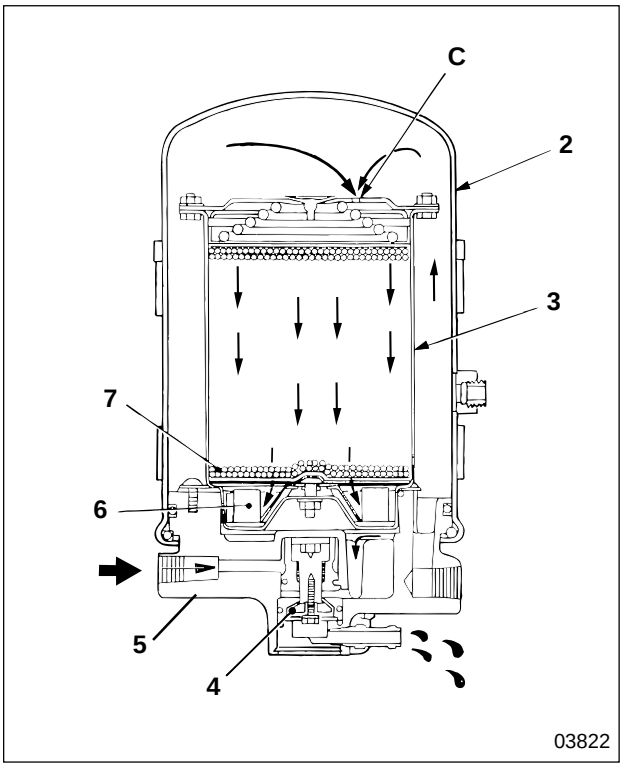
The air dryer removes moisture and oil in the air compressed by the air compressor and protects the brake assembly from rust or faulty operation.

● Dehumidification



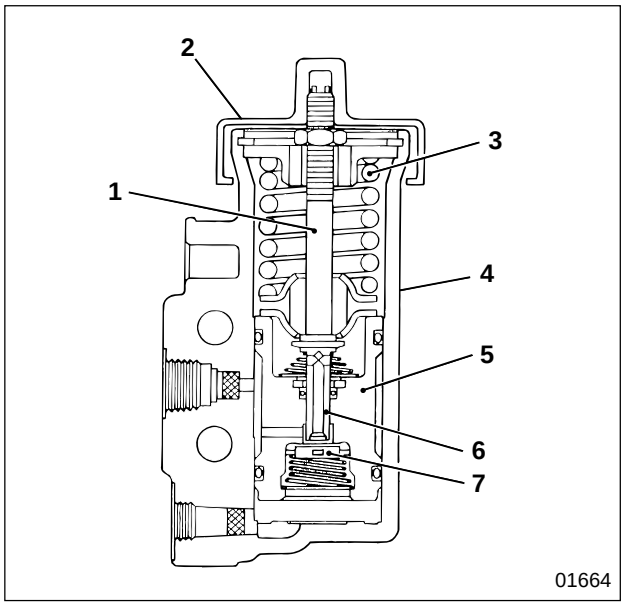
- The air from the air compressor enters delivery side **A** of the air dryer. Once in body **6**, moisture and oil are separated from the air and collected in the bottom. Then, the air passes through oil filter **4**, where small oil droplets and dust are removed. Next, the air is delivered into case **2**, where moisture is removed by desiccant **3**.
- As the air travels from the bottom to the top of case **2**, it comes into contact with more dried desiccant. This removes residual moisture from the air, drying the air as it reaches the top of the case. the air passes through check valve **1** and purge chamber **7**, and is delivered to the air tank through exhaust side **B**.

● Regeneration of desiccant



- When the supply of air from the air compressor stops, the pressure from the air pressure governor opens valve **5** of the control port of the air dryer. The pressure in case **2** cleans oil filter **4**, releasing the condensed water and oil into the atmosphere.
- After being quickly decompressed, the dry air in purge chamber **7** passes through hole **C**, where the air expands under the reduced pressure, becoming super dry air. This air flows back through case **2** and collects the moisture in desiccant **3**, releasing this moisture into the atmosphere, thereby recycling the desiccant.

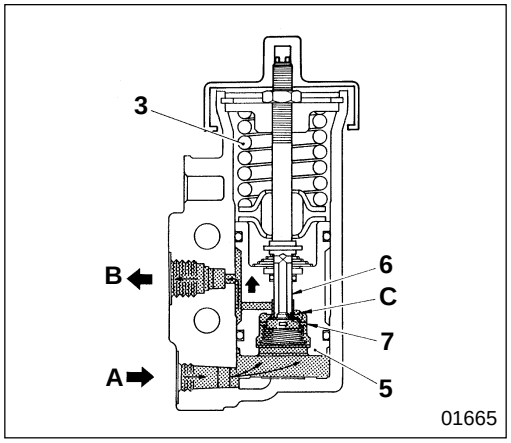
Air Pressure Governor



1 Adjusting screw
2 Cover
3 Spring
4 Body
5 Piston
6 Exhaust stem
7 Valve

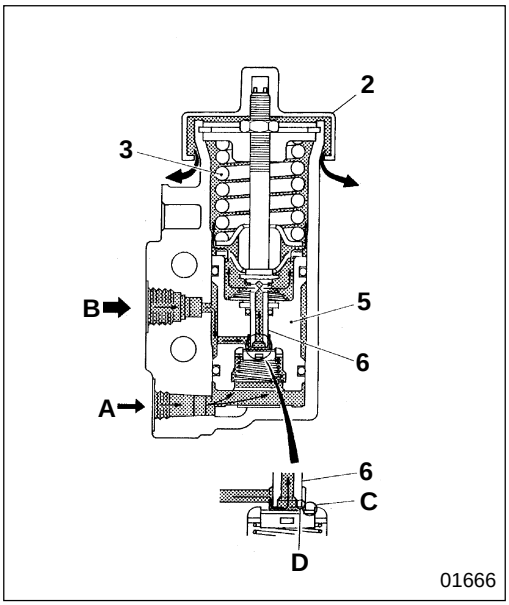
The air pressure governor keeps the air pressure in the air tank at the specified pressure, by operating the air compressor with or without load in accordance with the air pressure in the air tank.

● High specified-pressure



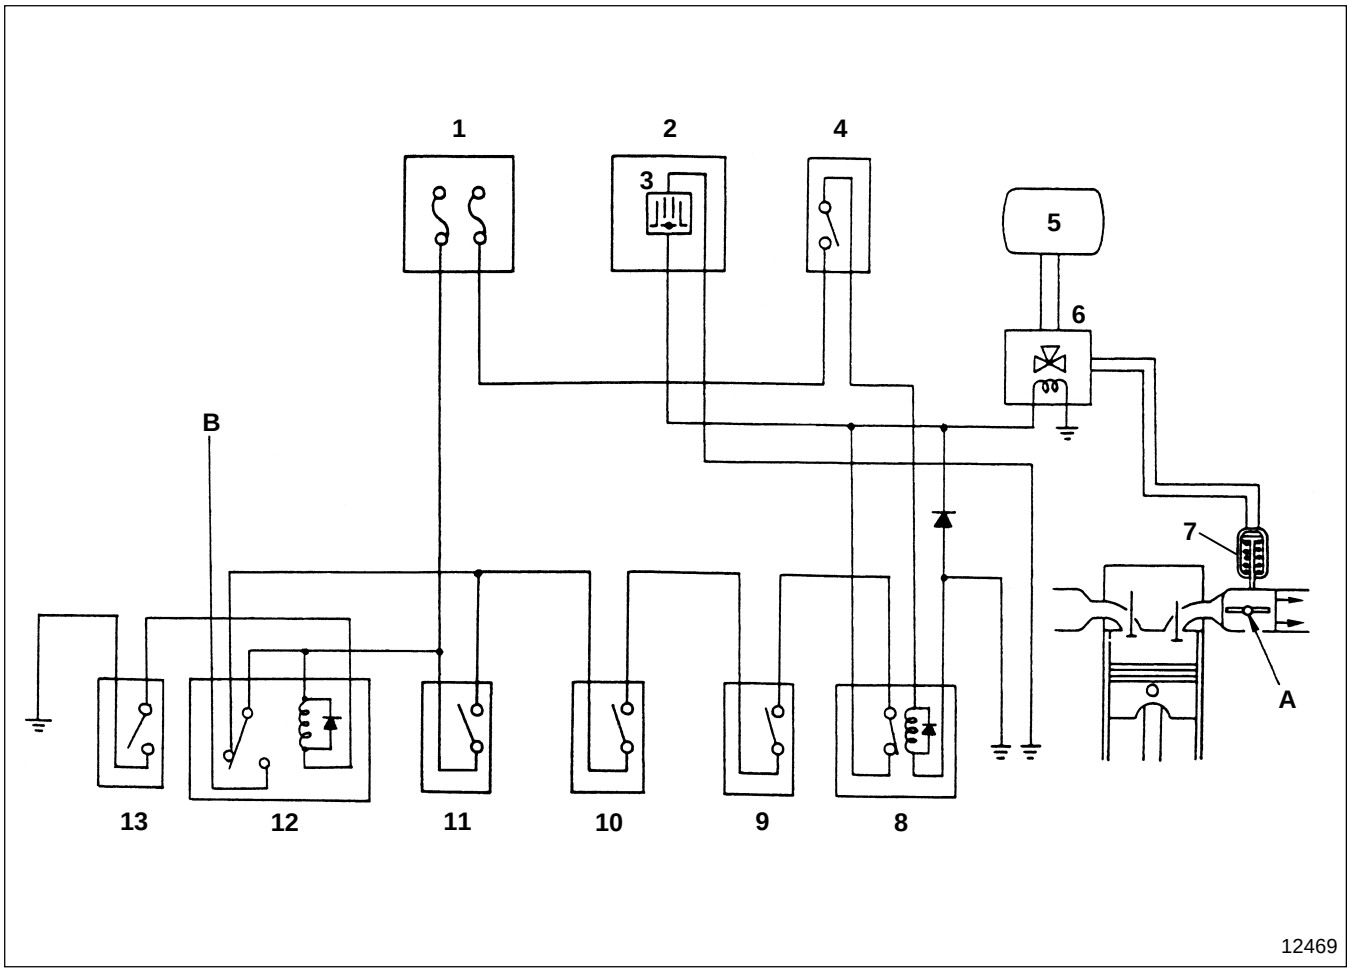
- Pressurized air **A** from the air tank acts constantly on piston **5**. As the pressure in the air tank rises to overcome the repercussive force of spring **3**, the piston rises and valve **7** closes.
- As air pressure **A** from the air tank rises further to become higher than the high specified-pressure, piston **5** rises further. Therefore, exhaust stem **6** opens inlet valve **C** and the air pressure in the air tank flows from unloader port **B** to the unloader valve of the air compressor via the inlet valve. Then the air compressor enters in unloaded operation. Pressure also reaches the air dryer to recycle the desiccant.

● Low specified-pressure



When pressurized air **A** from the air tank gradually drops below the specified-pressure, spring **3** forces down piston **5**. This closes inlet valve **C** and opens exhaust valve seat **D** so pressurized air **B**, up to the unloader valve of the air compressor, is discharged through the opening of cover **2** via exhaust stem **6**, operating the air compressor at load. The pressurized air up to the air dryer is also discharged into the atmosphere.

Exhaust Brake System

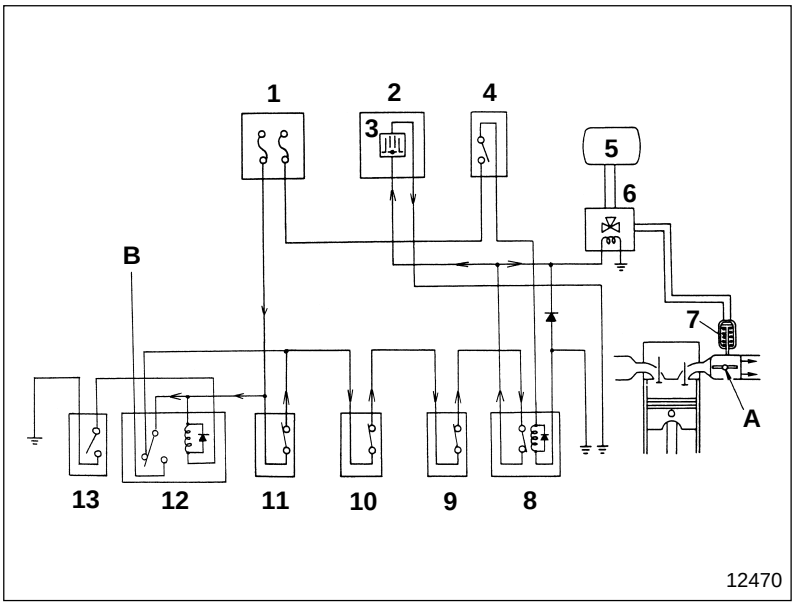


1 Relay and fuse box
2 Meter cluster
3 Exhaust brake indicator lamp
4 Transmission neutral switch
5 Air tank
6 3-way magnetic valve
7 Exhaust brake unit
8 Exhaust brake cut relay
9 Accelerator switch
10 Exhaust brake switch
11 Clutch switch < without power take-off >
12 Power take-off relay < with power take-off >
13 Clutch switch < with power take-off >

A : Butterfly valve
B : To power take-off switch

- Excitation of 3-way magnetic valve **6** causes the air pressure in air tank **5** to act on exhaust brake unit **7** to close butterfly valve **A**, activating the exhaust brake.
- If the exhaust brake is activated while the vehicle is stationary, the coolant temperature can rise excessively, overheating the engine. To avoid this, when the transmission is in neutral, transmission neutral switch **4** turns ON, cutting the exhaust brake system.

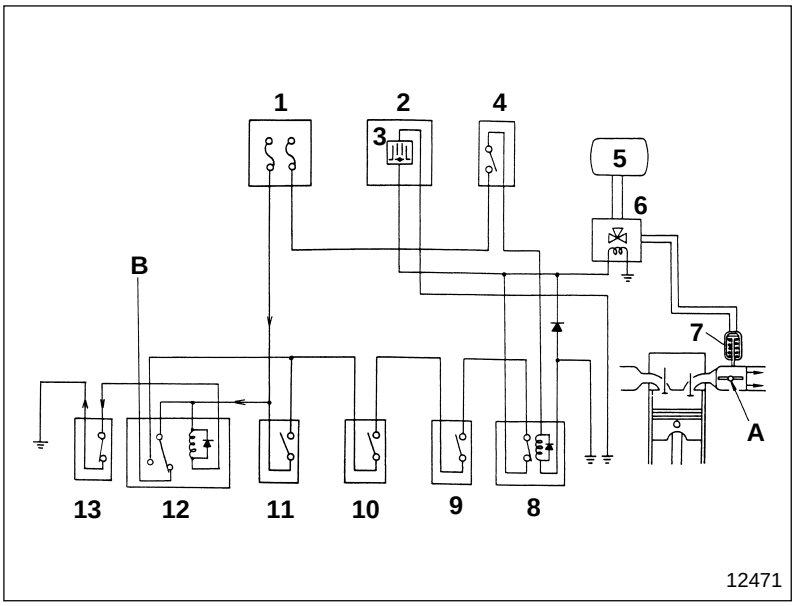
● When exhaust brake system is activated



When exhaust brake switch **10** is turned on, the current flows as illustrated to activate the exhaust brake.

Fuse **1**→Power take-off relay **12**→Clutch switch **11**→Exhaust brake switch **10**→Accelerator switch **9**→Exhaust brake cut relay **8**
→ 3-way magnetic valve **6**→Ground
→Exhaust brake indicator lamp **3** (ON)→Ground

● When the exhaust brake system is released



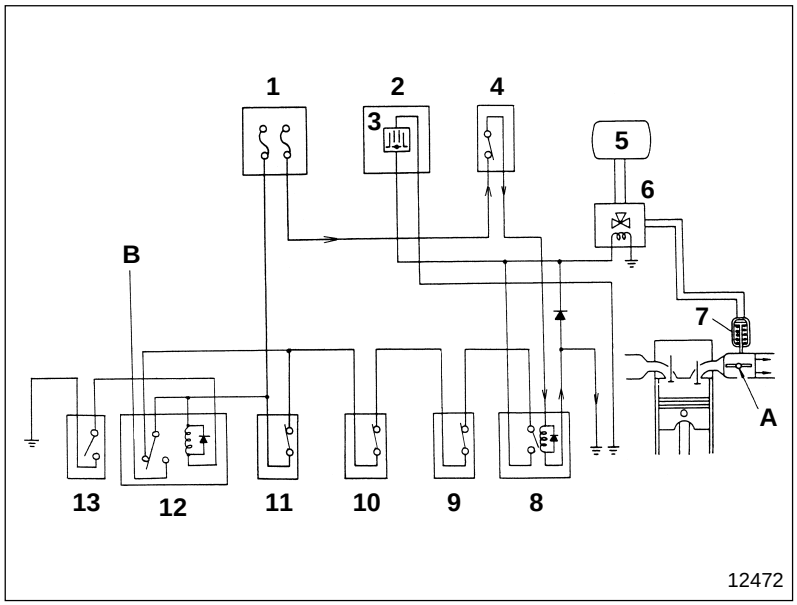
When the accelerator pedal or clutch pedal is depressed while the exhaust brake is working, all switches **9**, **11** turn off, shutting off the current, releasing the exhaust brake.

● When clutch pedal is depressed

Fuse **1**→Clutch switch **11** (OFF)→Since no current flows, the circuit turns off and the exhaust brake is released.
→Power take-off relay **12** excitation→Clutch switch **13** (ON)→Ground

Fuse **1**→Power take-off relay **12**→Clutch switch **11**→Exhaust brake switch **10**→Accelerator switch **9** (OFF)→Since there is no grounding, current does not flow, so the exhaust brake is released.

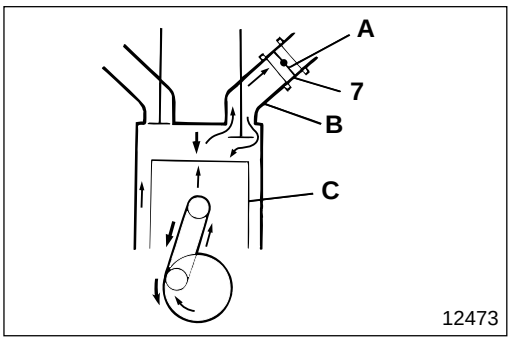
● Releasing exhaust brake system by placing transmission in neutral



Fuse **1**⟶Transmission neutral switch **4**→Exhaust brake cut relay **8** excitation →Ground
Fuse **1**⟶Clutch switch **11**⟶ Exhaust brake switch **10**→Accelerator switch **9**→Exhaust brake cut relay **8** (OFF)
└→Power take-off relay **12**

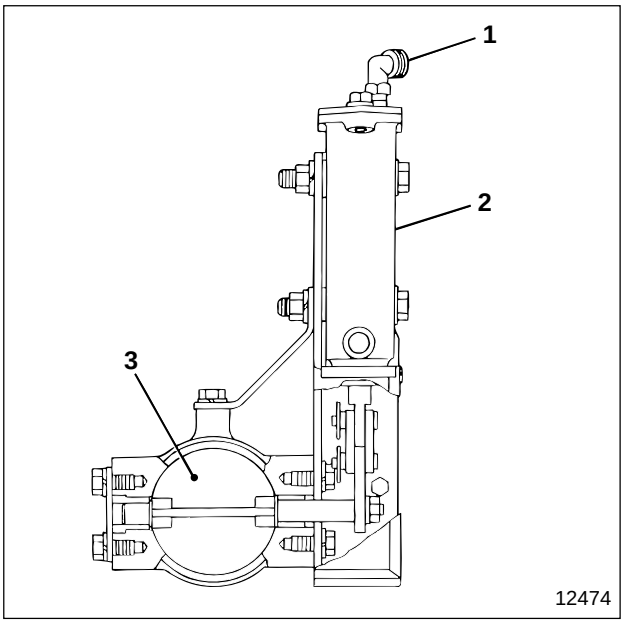
└→Beyond this, current does not flow so the exhaust brake is released.

● Working principle of exhaust brake



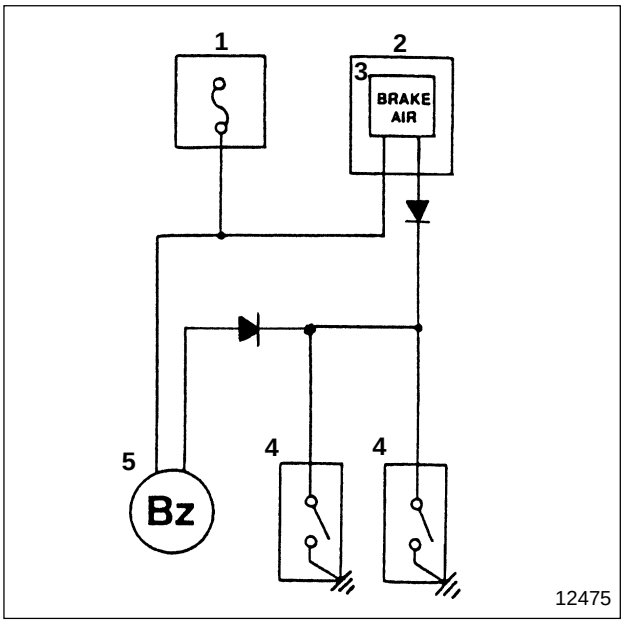
When butterfly valve **A** of exhaust brake unit **7**, in exhaust pipe **B**, is closed, the pressure in the exhaust pipe rises. The pressure rises further in the exhaust stroke, generating a force that pushes back piston **C**, the exhaust braking force.

● Exhaust brake unit

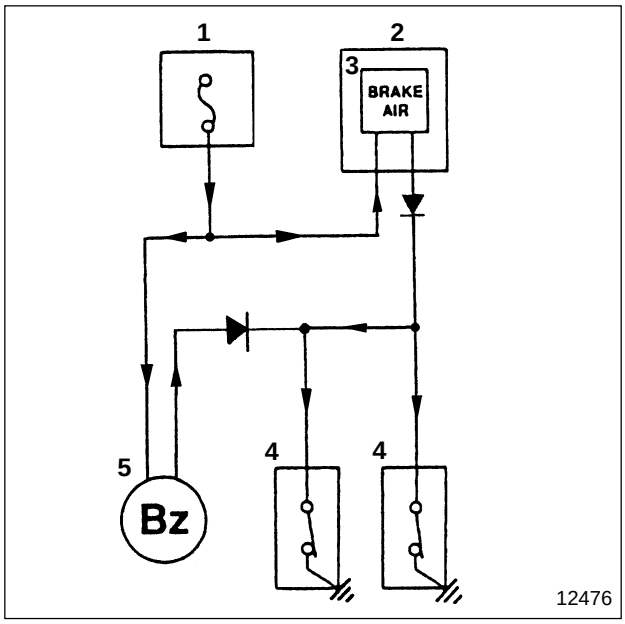


1 Connector
2 Control cylinder
3 Butterfly valve

Air pressure Warning Circuit



1 Relay and fuse box
2 Meter cluster
3 Air warning lamp
4 Low air pressure switch
5 Warning buzzer



When the air pressure in the air tank drops below the specified value, low air pressure switch **4** turns ON to light air warning lamp **3** and sound warning buzzer **5**. The warning buzzer continues sounding until the starter switch is turned OFF, or until the air pressure in the air tank becomes higher than the specified value and the low air pressure switch is turned OFF.

Fuse **1**→Air warning lamp **3**→Low air pressure switch **4**→Ground
Fuse **1**→Warning buzzer **5**→Low air pressure switch **4**→Ground

Wheel Brake

	Improper contact of brake linings							○		
	Insufficient brake shoe clearance					○		○	○	
	Air pressure fed to brake chambers unequally							○		
	Air pressure in brake chamber not released					○				
	Wheel parking brake working 🗀 Gr 36B					○				

TROUBLESHOOTING

Possible causes	Symptoms	Wheel brake does not work efficiently				Brake drum overheating			
		Air leakage when brake pedal depressed	Air leakage when brake pedal released	Air pressure low	No air leakage but brake works inefficiently	Brake shoe self-return poor after releasing brake pedal (Wheel drags)	Noise when brake pedal is depressed	One-sided braking	Wheel brake works suddenly
Air compressor	Malfunctioning			○					
Dual brake valve	Primary and secondary valves airtightness faulty	○	○						
	Primary and secondary valves return faulty					○			
	O-ring damaged	○							
	Exhaust port clogged with foreign particles					○			
Air pressure governor	Specified pressure set incorrectly			○					
Air piping	Air leakage in air piping	○	○	○					
Tire	Left and right air pressure different Gr 31							○	
Suspension	U-bolt loose Gr 33, 34							○	

Air Dryer

Possible causes / Symptoms		Drainage from air reservoir drain cock	Drainage not drawn off from exhaust port	Air dryer interior frozen	Air leakage from exhaust port	Air pressure in air reservoir drops extraordinarily	Engine oil coming out exhaust port	Remarks
Air dryer	Desiccant deteriorated	○						
	Heater not working and air dryer interior frozen		○					
	No warming because heater wiring broken			○				
	Heater or thermostat wiring disconnected			○				
	Heater not working because thermostat faulty			○				
	Temperature extremely low because of snow or ice sticking to air dryer body			○				
	Valves clogged with foreign particles		○					
	Valve seat clogged with foreign particles				○			
Check valve	Air returning from air tank because air tank side check valve malfunctioning during air compressor unloading cycle					○		
Air compressor	Air compressor oiling-up						○	

Exhaust Brake

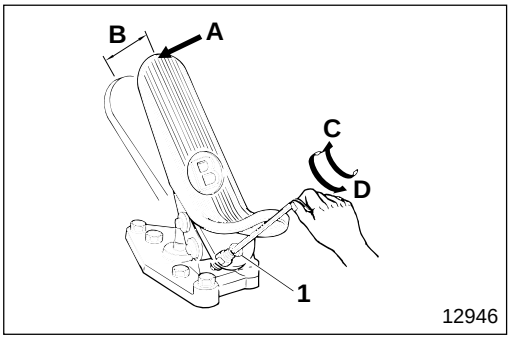
Symptoms / Possible causes	Exhaust brake does not work	Exhaust brake cannot be released	Remarks
Air pressure low	○		
Electrical system faulty	○	○	
Air pipe crushed	○		
3-way magnetic valve does not work	○	○	
Exhaust brake unit does not work	○	○	
Exhaust brake unit shaft stuck	○	○	
Control cylinder does not work	○		

Inspection and Adjustment of Brake Pedal Free Play

Service standards

Unit : mm {in.}

Location	Maintenance item		Standard value	Limit	Remedy
—	Pedal play	Pedal toe	$12^{+3.0}_{-1.5}$ $\{0.47^{+0.12}_{-0.059}\}$	—	Adjust using set screw
		Depression angle	$3.5°^{+1.0°}_{-0.5°}$	—	



Press pedal toe **A** with your hand and measure free play **B**. If the measured value deviates from the standard value, adjust it by turning set screw **1**.

C : Turning clockwise decreases the free play (For a small angle)

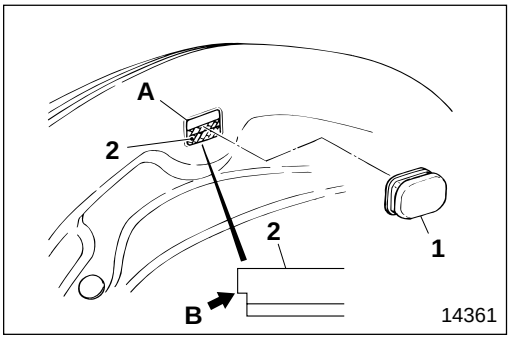
D : Turning counterclockwise increases the free play (For a large angle)

Thickness Inspection and Replacement of Brake Lining

Service standards

Unit : mm {in.}

Location	Maintenance item	Standard value	Limit	Remedy
2	Thickness of brake lining	16 {0.63}	6{0.24}	Replace



[Inspection]

NOTE

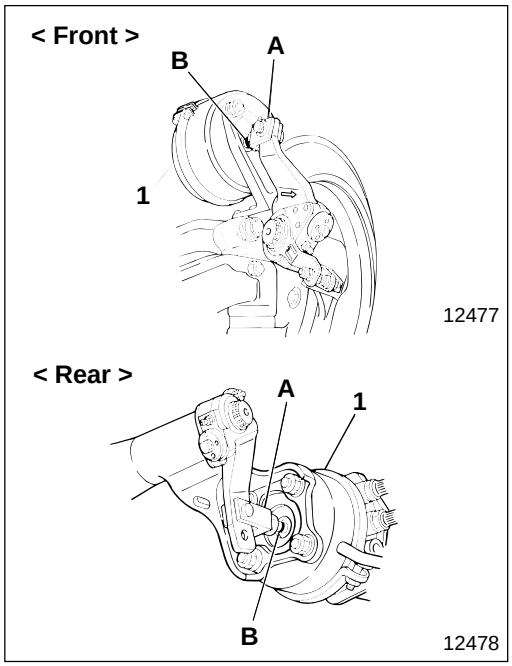
Be sure to inspect at two points for each wheel per side.

- Remove inspection hole plug **1** from the backing plate.
- Inspect through inspection hole **A** whether brake lining **2** is worn to the point of side shoulder **B** of the brake lining (the limit).
- If the measured value is lower than the limit, replace brake lining **2** on the same axle as a unit.
- After inspection, be sure to reinstall inspection hole plug **1**.

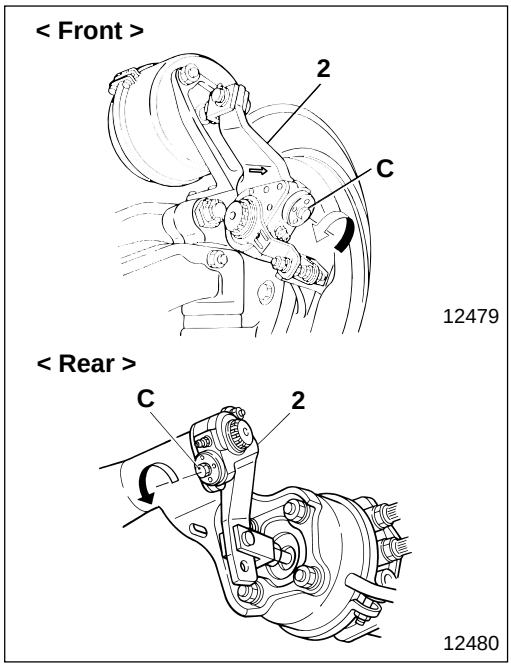
[Replacement]

P35B-54, 64, 74, 88

Inspection of Automatic Slack Adjuster Function



If red painted area **B** of push rod **A** of brake chamber **1** can be seen when the brake pedal is depressed fully, or if any abnormality is sensed in braking, inspect as follows:



- Increase the air pressure in the air tank to approximately 685 kPa {100 psi, 7 kgf/cm^2}.
- Turn worm shaft **C** of automatic slack adjuster **2** in direction ➡ (counterclockwise) to compress the brake shoe assembly and increase the brake shoe clearance to approximately 1.5 mm {0.059 in.}.

NOTE

A large force is required to turn worm shaft A.

- Put a spanner on worm shaft **C** of automatic slack adjuster **2** and inspect operation by watching how far the spanner moves.

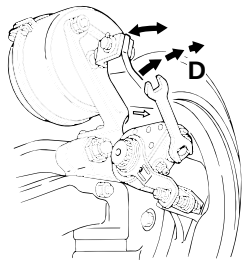
NOTE

Hold the spanner so that it does not fall off.

- Depress the brake pedal fully to work the brake, then release it.
- Check that worm shaft **C** of automatic slack adjuster **2** turns clockwise when the brake is released, and check if the turning stroke decreases every time the brake is depressed and released. If the automatic slack adjuster is faulty, replace it.

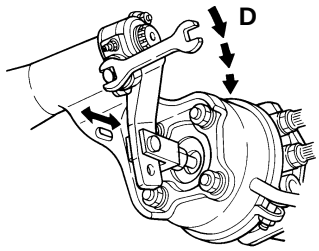
  D : Stroke

< Front >



11155

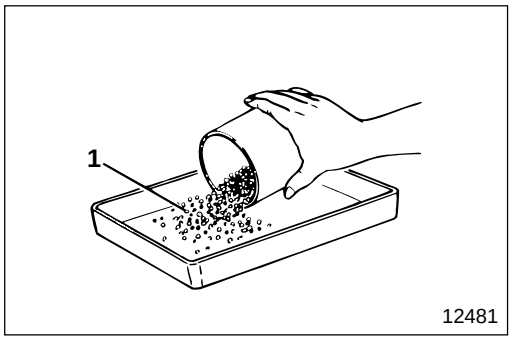
< Rear >



13014

Inspection and Maintenance of Air Dryer

Carry out inspection and maintenance according to the following interval or vehicle milage.

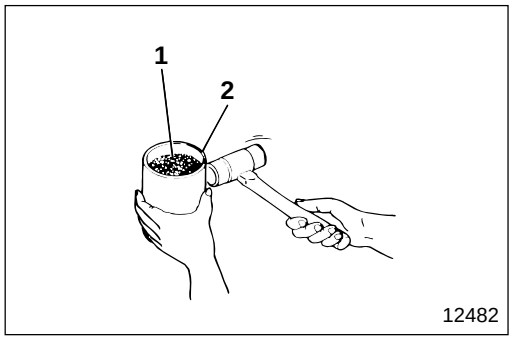


(1) Every 10000 km {6000 miles}

- To check that the air dryer operates correctly, open the drain cock of the air tank and see if any drainage comes out.
- If a little drainage comes out, check if the desiccant **1** is discolored. If more than one fifth of the desiccant has changed color from white to brown, renew desiccant.

NOTE

In an operational environment where the decrease of the ambient temperature in the air tank is higher than 16°C {29°F}, a little moisture might collect.



- Pour desiccant **1** into case **2**, tap around the container lightly to settle the desiccant.
- Carefully inspect the drainage from the exhaust port of the air dryer body. Inspect the air compressor and take appropriate action for abnormal oil consumption.
  P35B-112

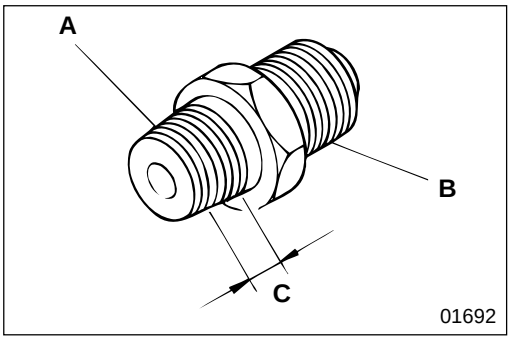
NOTE

Appropriate action means to inspect the clearance between the oil ring and the cylinder liner.

(2) Every year or every 60000 km {36000 miles}

Disassemble the air dryer body. Replace the oil filter, filter and all the rubber parts together with a repair kit.
P35B-112

Connector

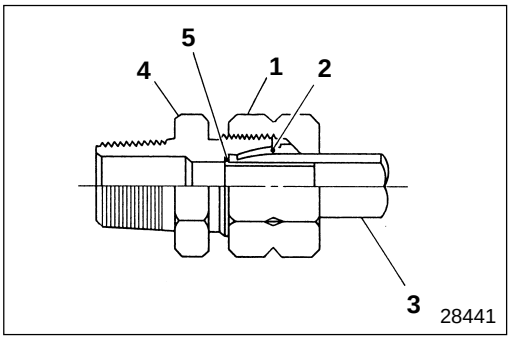


(1) Installation of connector

- When reusing air system connector, remove remainder of sealer, oil, and water sufficiently, apply THREEBOND TB1110B to threads leaving 1 or 2 threads on top blank, and then screw in.
  Where alignment is required, stop at aligning point in additional tightening process.

  A : Taper screw area
  B : Parallel screw area (Do not apply sealer)
  C : Area where sealer shall be applied

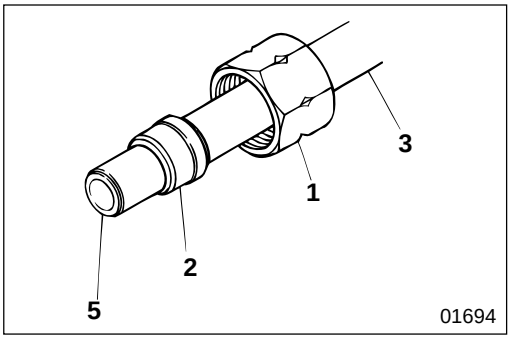
Nylon Tube



Follow the following process where nylon tube is employed.

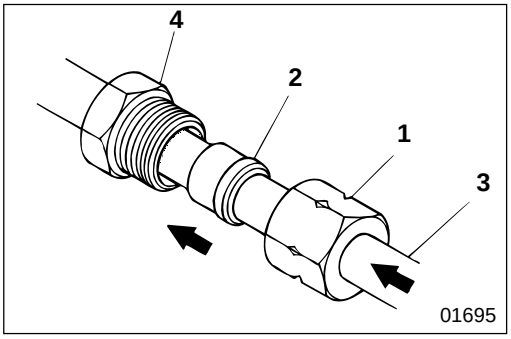
- Nylon tube is designed so that as nut **1** is tightened, sleeve **2** advances gripping to tube **3** while itself is being deformed in the process, thus keeping air tightness to prevent leakage. Accordingly, do not reuse: do not fail to replace with new one.

  4 : Connector
  5 : Insert



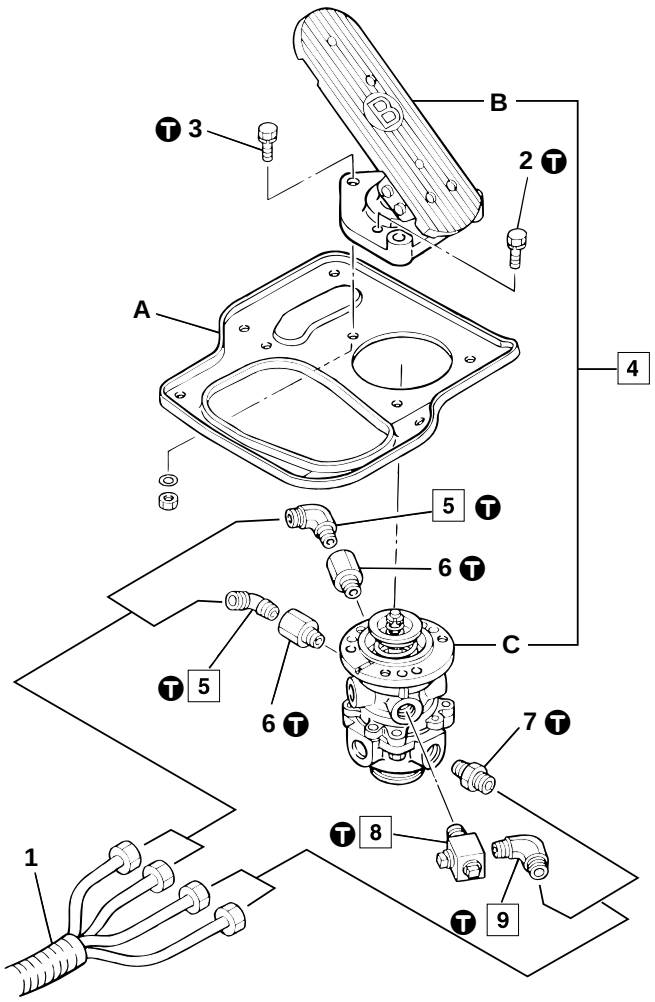
(2) Installation of nylon tube

- Make sure that insert **5**, sleeve **2**, nut **1**, and tube **3** are assembled as illustrated.



- Insert tube **3** into connector **4**, push sleeve **2** into connector **4**, and provisionally tighten nut **1** by hand.
- After this, pull tube **3** to make sure that it does not have leakage, and it does not come apart.

BRAKE PEDAL



Remove pedal assembly **B** upward from valve board **A**, and valve assembly **C** downward from the valve board to separate dual brake valve **4** (pedal assembly and valve assembly). Do this without removing the valve board from the vehicle.

◆ Service procedure

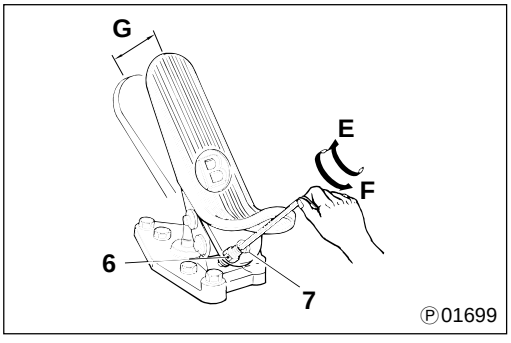
● Inspection of function after assembly

Check that the output air pressure, corresponding to the pedal depression angle, conforms to the specified value.

- Mount pressure gauge **B**, capable of measuring 980 kPa {142 psi, 10 kgf/cm^2} or more, on primary output side port **A**.
- Mount depression gauge **C** on the brake pedal.
- Apply air pressure of 685 kPa {100 psi, 7 kgf/cm^2} to primary input side port **D** and inspect related parts for air leakage.
- If air leakage is found, do the following:
  - Tighten connectors.
  - Disassemble the dual brake valve and inspect the O-ring assemblies of all parts.

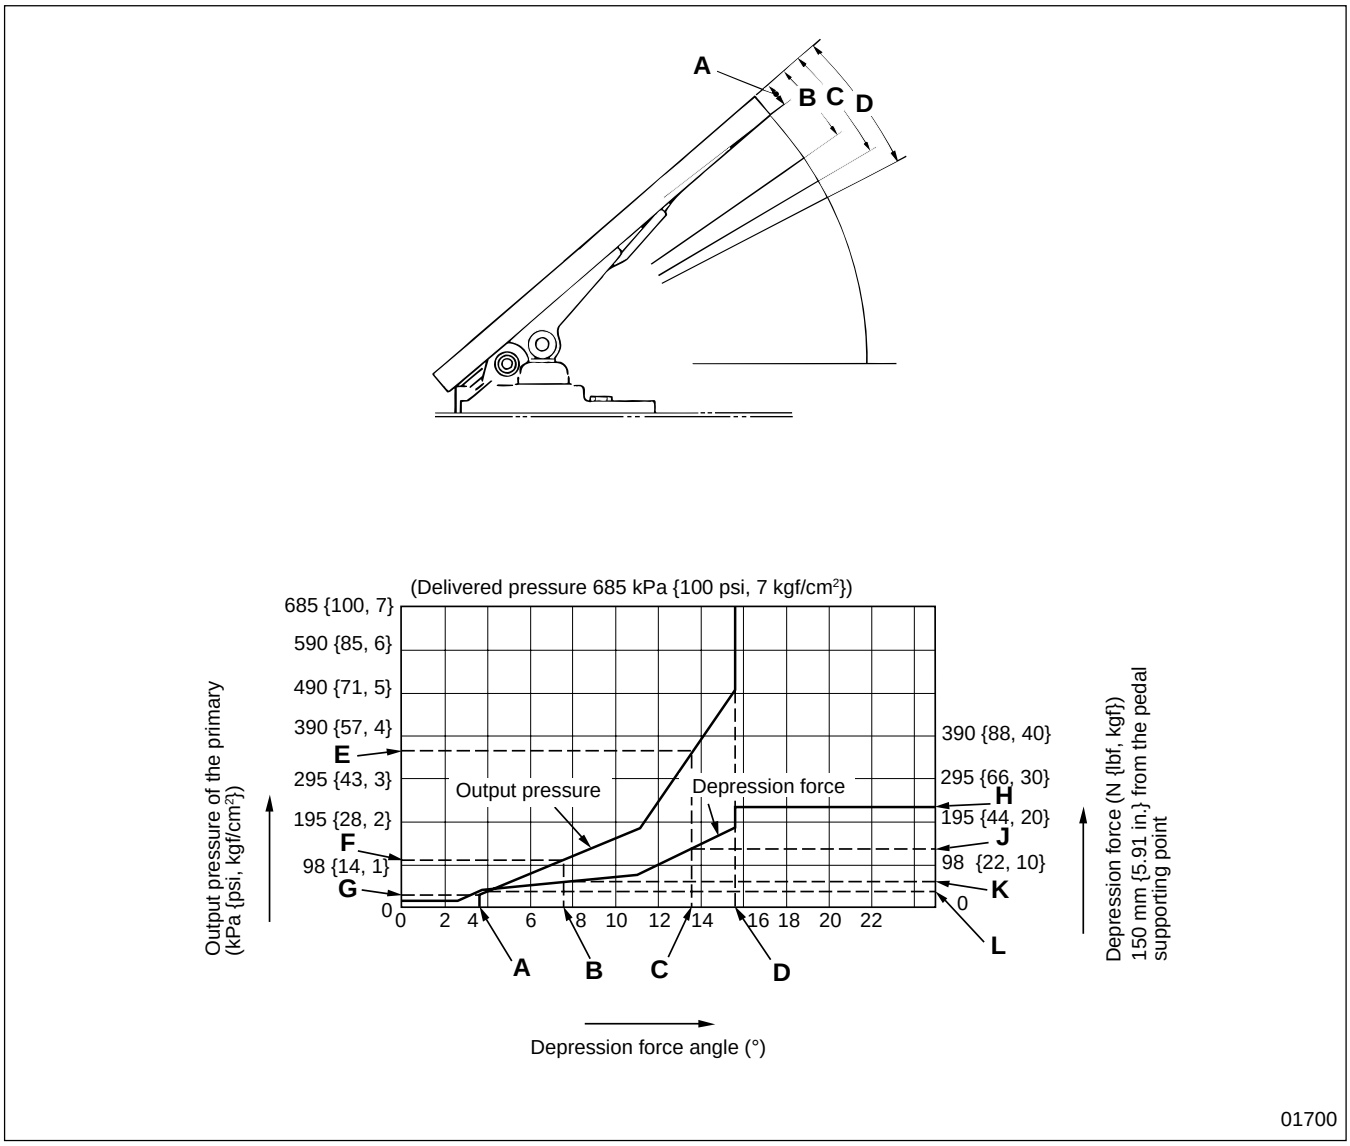


- Turn set screw **7** and adjust brake pedal play **G** to the standard value.
- Tighten lock nut **6** at specified torque to lock set screw **7**.
- Read pressure gauge **B** and make sure that the primary output pressure and brake pedal depression force angle, corresponding to the brake pedal depression angle, conform to the standard values shown in the Input/Output characteristic curve diagram overleaf.
- If the output air pressure is lower than the standard value, replace the following springs:
  - Spring **15**
  - Outer spring **29**
  - Inner spring **30**

  E : Turning clockwise decreases the play (To decrease brake pedal depression angle)

  F : Turning counterclockwise increases the play (To increase brake pedal depression angle)

Input/Output Characteristic Curve Diagram



A : Play 3.5° $^{+1.0^\circ}_{-0.5^\circ}$(12 $^{+3.0}_{-1.5}$ mm {0.47 $^{+0.12}_{-0.059}$ in.})
B : Pressure stroke 7.5° (25.5 mm {1.0 in.})
C : Pressure stroke 13.5° (45.5 mm {1.8 in.})
D : Pressure stroke 15.5° $^{+2.5^\circ}_{-0.5^\circ}$ (52 $^{+8.5}_{-0.5}$ mm {2.0 $^{+0.33}_{-0.020}$ in.})
E : 355 $^{+39}_{-98}$ kPa {52 $^{+5.7}_{-1.4}$ psi, 3.65 $^{+0.4}_{-0.1}$ kgf/cm²}
F : 105 $^{+25}_{-54}$ kPa {16 $^{+3.6}_{-7.8}$ psi, 1.1 $^{+0.25}_{-0.55}$ kgf/cm²}
G : 29 kPa {4.3 psi, 0.3 kgf/cm²} or less
H : 230.5±20 N {52±4.4 lbf, 23.5±2 kgf}

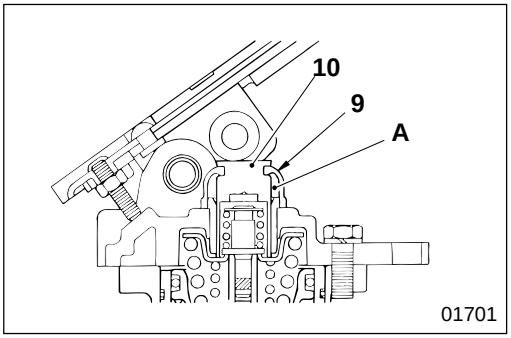
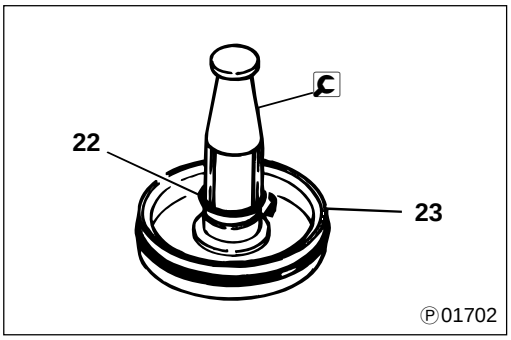
K : 59±25 N {13±5.5 lbf, 6±2.5 kgf}
L : 39±10 N {8.8±2.2 lbf, 4±1 kgf}

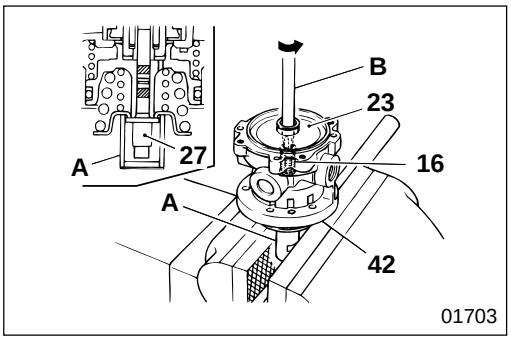


9 **10** **Packing grease between boot and plunger**

Pack area **A** with 1 cm^3 {0.061 cu. in.} of grease.



22 **Installation of O-ring**



23 **Removal of relay piston**

- Grip (14 mm {0.55 in.}) socket wrench **A** in a vise.
- Insert the head of self-locking bolt **27** into socket wrench **A** to tighten body **42**.

WARNING ⚠

You must be careful when you loosen screw 16, because the spring in body 42 can forcibly eject relay piston 23. To avoid this hazard, press down on the relay piston with your hand when you carry out the above work.

- Loosen screw **16** gradually to remove relay piston **23**.

◆ Service procedure

● **Inspection of operation after assembly**

- Increase the air pressure in the air tank to approximately 685 kPa {100 psi, 7 kgf/cm^2}.
- Turn worm shaft **A** of automatic slack adjuster **24** in direction ➡ (counterclockwise) to compress brake shoe assembly **6** and increase the brake shoe clearance to approximately 1.5 mm {0.059 in}.

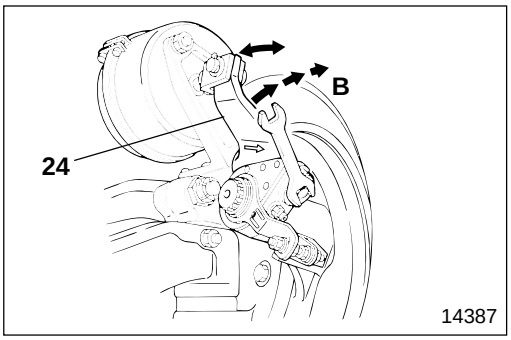
NOTE

A large force is required to turn worm shaft A.

- Put a spanner on worm shaft **A** of automatic slack adjuster **24** and inspect operation by watching how far the spanner moves.

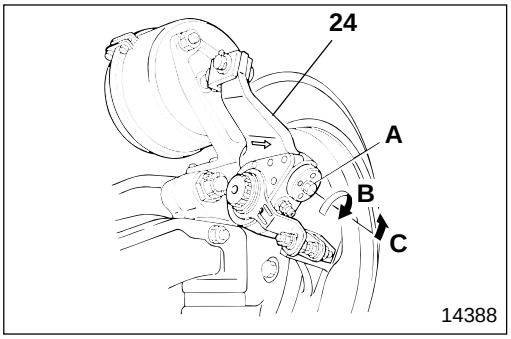
NOTE

Hold the spanner so that it does not fall off.



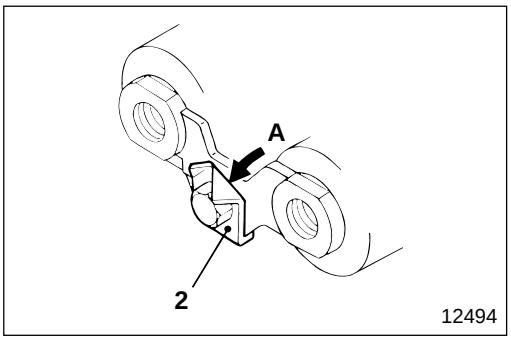
- Depress the brake pedal fully to work the brake, then release it.
- Check that worm shaft **A** of automatic slack adjuster **24** turns clockwise when the brake is released, and if the turning stroke decreases every time the brake is depressed and released. If the automatic slack adjuster is faulty, replace it.

  B : Stroke



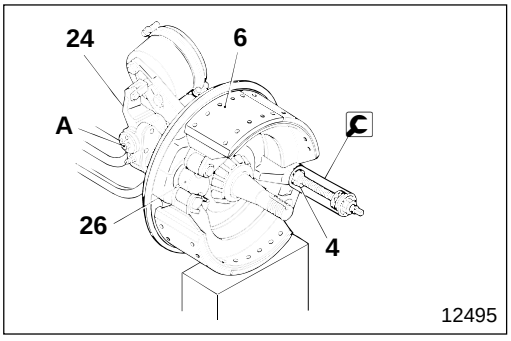
● **Adjustment of initial brake shoe clearance after installation**

- Turn worm shaft **A** of automatic slack adjuster **24** clockwise to open brake shoe assembly **6** until the brake shoe clearance is 0 mm {0 in.}.
- Slacken off worm shaft **A** counterclockwise by one quarter of a turn.
  B : Turn clockwise fully.
  C : Slacken off counterclockwise by one quarter of a turn.



2 **Bending up lock washer**

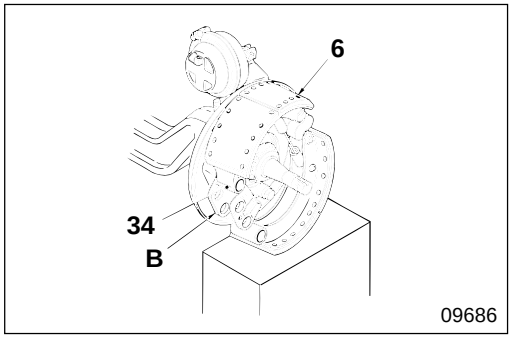
A : Bend



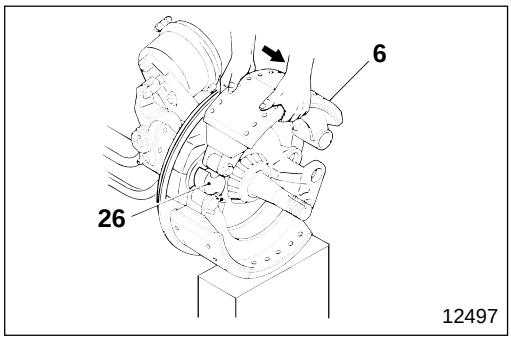
6 **Brake shoe assembly**

[Removal]

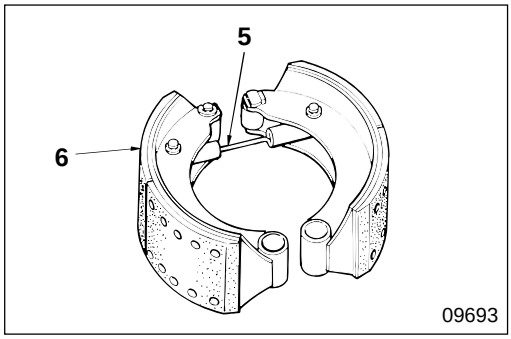
- Turn worm shaft **A** of automatic slack adjuster **24** so that camshaft **26** does not open brake shoe assembly **6**.
- Remove anchor pin **4** using [C] anchor pin puller.



- Remove heel part **B** of lower brake shoe assembly **6** from anchor bracket **34**.
- Remove heel part **B** of upper brake shoe assembly **6** from anchor bracket **34**.

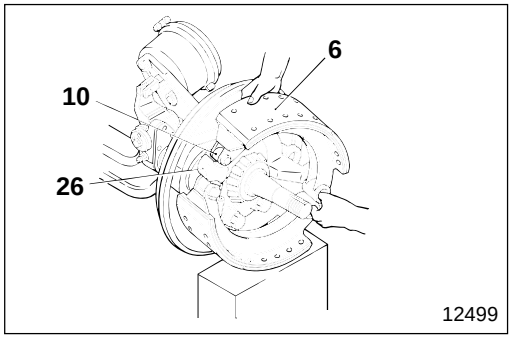


- Hold upper brake shoe assembly **6**, and remove it from camshaft **26** by sliding horizontally.

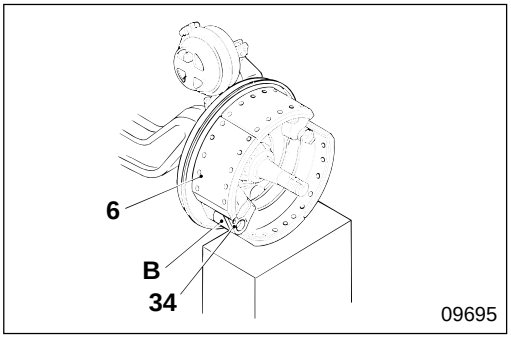


[Installation]

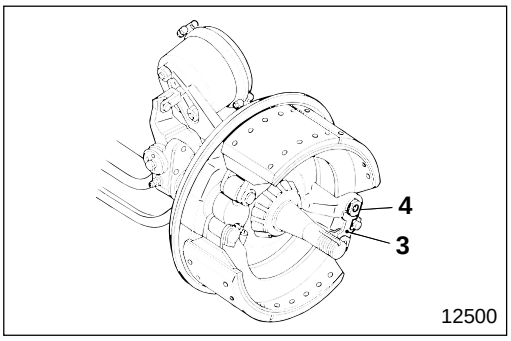
- Install return spring **5** in both brake shoe assemblies **6**.



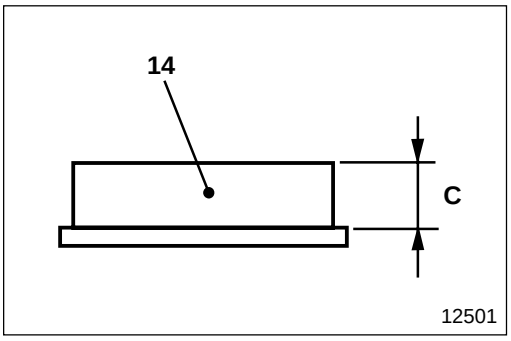
- Insert your thumb and forefinger into the anchor pin hole of both brake shoe assemblies **6**, and lift the upper brake shoe assembly with your other hand.
- Place and slide roller **10** of brake shoe assembly **6** onto camshaft **26**.



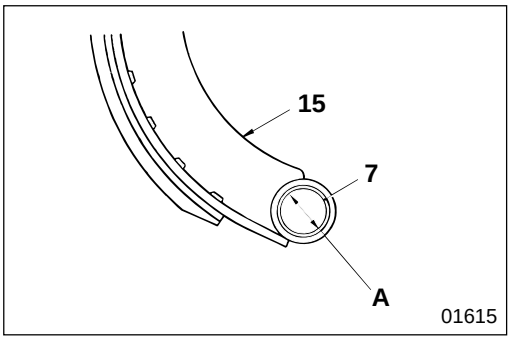
- Install heel part **B** of upper brake shoe assembly **6** in anchor bracket **34**.
- Install heel part **B** of lower brake shoe assembly **6** in anchor bracket **34**.



- Drive in anchor pin **4** and fix it with lock plate **3**.



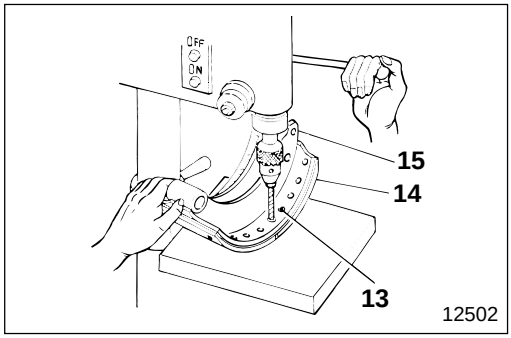
[Inspection]
If thickness **C** of brake lining **14** is lower than the limit replace the brake lining on both sides of the axle.



7 **Inner diameter of bushing**

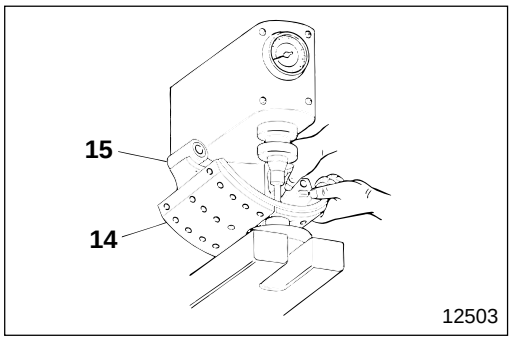
- After installing bushing **7** in brake shoe **15**, measure inner diameter **A** of the bushing.
- If the inner diameter deviates from dimension A ream the diameter to the standard value.

Dimension **A** : $35\ ^{+0.05}_{0}$ mm {$1.4\ ^{+0.0020}_{0}$ in.}



14 **Rivet, brake lining and brake shoe**

[Removal]



[Installation]

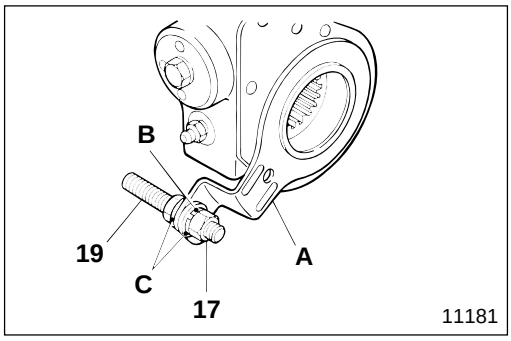
- Clean the mounting surfaces of brake lining **14** and brake shoe **15** with cleaning fluid and dry them.
- Insert rivets **13** from brake lining **14** side, and caulk the rivets at the specified load so that there is no clearance between brake shoe **15** and the brake lining.
  Caulking load for rivets : 17 to 19 kN {3750 to 4190 lbf, 1700 to 1900 kgf}

WARNING⚠

Do not leave lubricant on the surface of brake lining 14 because this reduces braking performance.

CAUTION⚠

- **Make sure that the type of brake linings 14 you fit are suitable for the intended use of the vehicle. Make sure that you fit identical size and color coated linings on the left and right sides of one shaft.**
- **Make sure that you inspect contact with the inner surface of brake drum *1 after you replace brake linings 14. If contact is incorrect, correct with the brake assembled.**

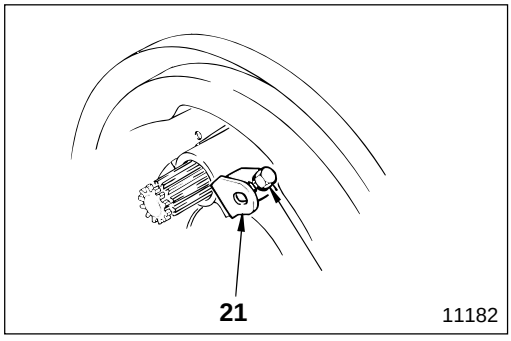


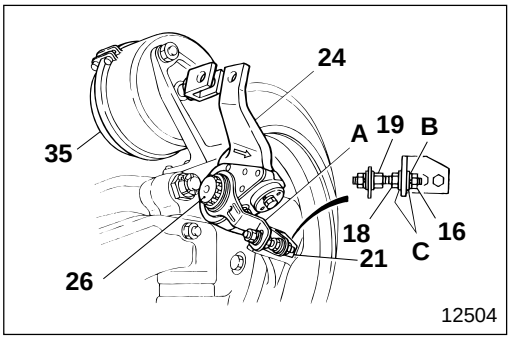
24 **Automatic slack adjuster**

[Installation]

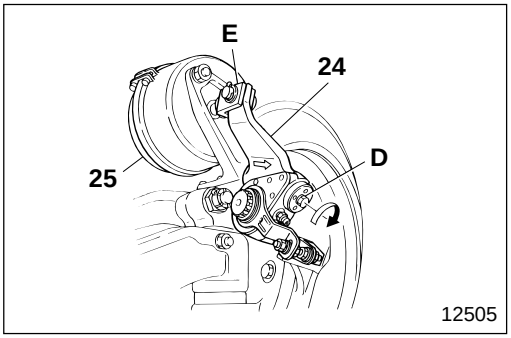
- Install stopper pin **19** in control arm **A** of automatic slack adjuster **24** temporarily.

  B : Spring washer
  C : Plain washer

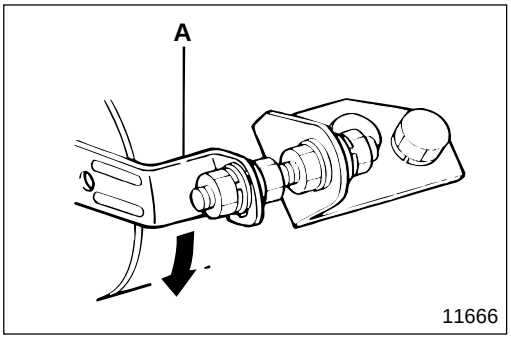




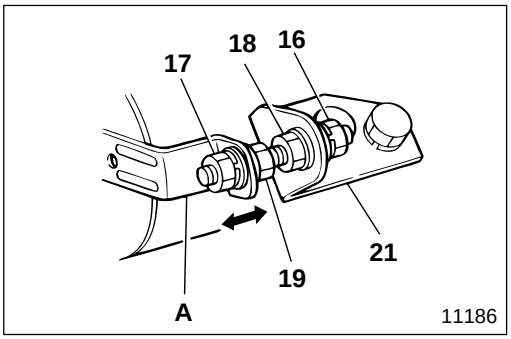
★ • Fit nuts **16**, **18**, spring washer **B** and plain washer **C** on stopper pin **19** that is installed in automatic slack adjuster **24**.
• Position control arm **A** so that stopper pin **19** can be fitted into the hole of stopper pin bracket **21**.
• Install automatic slack adjuster **24** on camshaft **26** of the wheel brake so that mark "⇨" on the arm of the automatic slack adjuster points away from brake chamber **35** as illustrated.



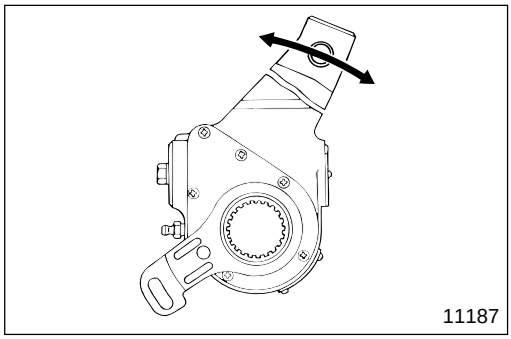
• Turn and align worm shaft **D** of automatic slack adjuster **24** clockwise in the direction of mark "➡" as illustrated, and install push rod **E** of brake chamber **35** in the arm.



• Push control arm **A** of automatic slack adjuster **24** in direction ➡ as illustrated, and confirm that the arm does not move due to contact with the inner stopper.
If the control arm does move, repeat the operation from step ★.

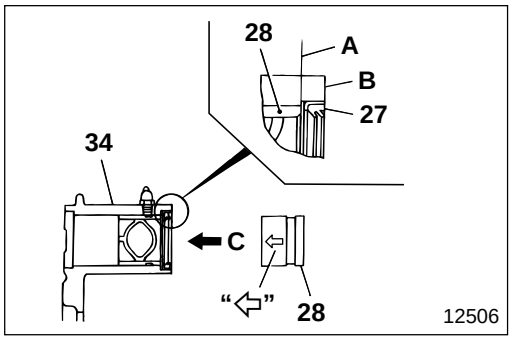


• First install stopper pin **19** in control arm **A**, then in stopper pin bracket **21**, tighten nuts **16**, **17**, **18** at specified torque. Check that the control arm does not move. When tightening the nuts at specified torque, do not apply force to the control arm in arrow mark direction ⟷ as illustrated.



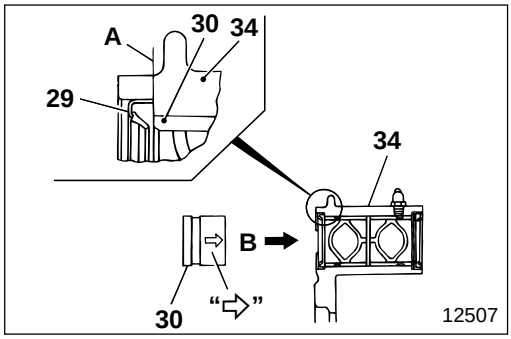
[Inspection of play]

- Inspect automatic slack adjuster **24** when it is disconnected from brake chamber **35**.
- To inspect play, move automatic slack adjuster **24** in direction ⟷ as illustrated. If play is higher than the limit, replace the automatic slack adjuster.
  Limit : 4 mm {0.16 in.} or less



27 **28** **Press-fitting of dust seal and bushing**

A : Press-fit bushing **28** to this level
B : Press-fit dust seal **27** to this level
C : Press-fitting direction for bushing **28**



29 **30** **Press-fitting of oil seal and bushing**

A : Press-fit oil seal **29** and bushing **30** to this level
B : Press-fitting direction for bushing **30**

***1** **Correction of brake drum**

If the cylindrical accuracy of brake drum ***1** is higher than the limit, or there are seams, correct by machining to the correction limit. Machining of the brake drum should be done with the wheel hub attached as an integral part.

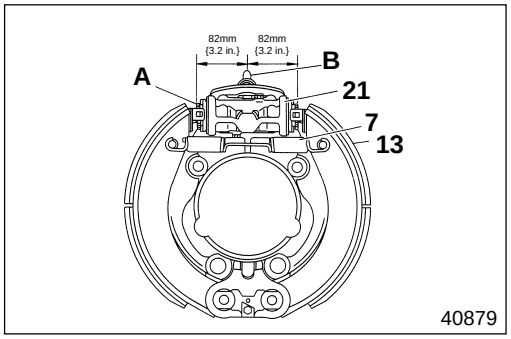
7	Return spring setter 	MC809749	Remove return spring
11	Anchor pin puller 	03727-60000	Remove anchor



♦Service procedure

● **Work after assembly**

(1) Release of spring brake

Follow the work sequence before disassembly in reverse to release the mechanical release of spring brake. 🕮 P35B-90

NOTE

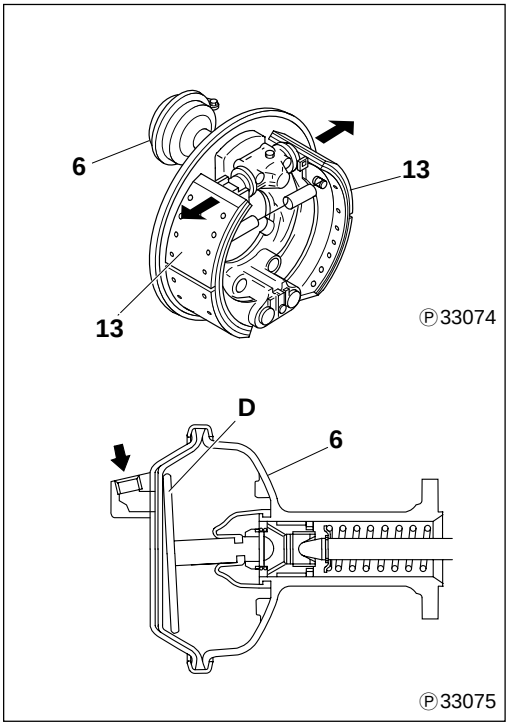
- **Confirm that end cap A is surely installed.**
- **Confirm that there is no damage in bleeder pipe B. Also, confirm that the bleeder pipe is surely installed.**

(2) Confirmation of operation

- Confirm that the installation dimension of expander assembly **24** is 82 mm {3.2 in.}.
  If it is incorrect, adjust it according to the following procedure.
- Set the part indicated in diagram to 82 mm {3.2 in.} by adjusting the adjusting screw **A**.
- Expand the brake shoe assembly **14** under a full stroke by pushing push rod **B**.
- Confirm that expander assembly **24** returns to 82 mm {3.2 in.} when returning the push rod **B**.
- If it operates incorrectly, inspect the spring force of return spring **8**, inactivation of brake shoe assembly **14**, and expander assembly **24** again.

WARNING⚠

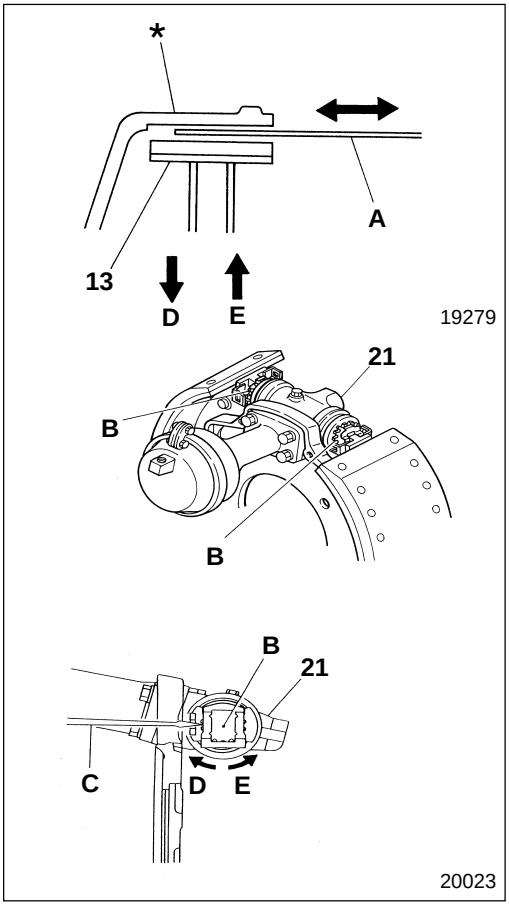
The auto adjustment mechanism might not operate normally if the assembly work is not surely executed.



- When disassembling brake chamber assembly **6**, inspect the following.

< When disassembling brake chamber assembly 6 >

- Confirm whether brake shoe assembly **13** does not move with the adjusting screw **C** of expander assembly **21** when pulling the brake shoe assembly **13** with a force of 20 to 30 N {4.4 to 6.6 lbf, 2 to 3 kgf}.
- If brake shoe assembly **13** moves, bush rod and pressure plate **D** of brake chamber assembly **6** are diagonally installed; therefore, correct the bush rod and the pressure plate to a regular position by depressing brake pedal 2 to 3 times with not installing brake drum.



(2) Initial adjustment of brake shoe clearance after assembly

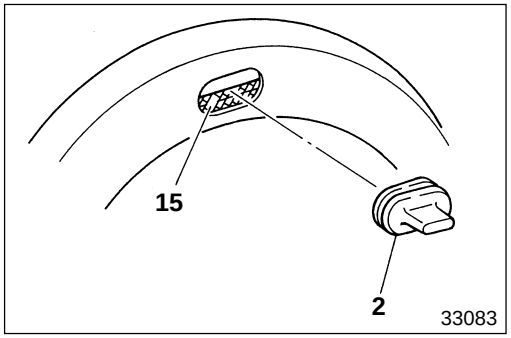
< When not replacing brake lining 15 with the new one >

- Remove dust cover **3**.
- Turn adjusting screw **B** of expander assembly **21** to the extent that the thickness gauge **A** of 0.3 to 0.5 mm {0.012 to 0.02 in.} can be easily pulled in and out at the inspection hole of the 2-points/per wheel.
  C : Flat screw driver
  D : Increasing brake shoe clearance
  E : Decreasing brake shoe clearance

- Install dust cover **3**

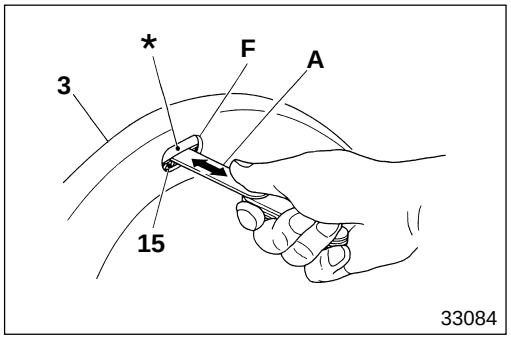
CAUTION⚠

Do not damage the boot of expander assembly 21 when inserting minus driver C.

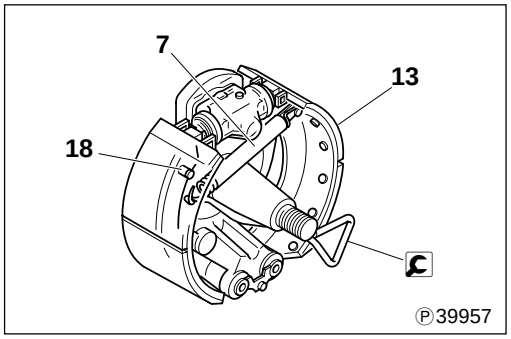


< When replacing brake lining 15 with the new one >

- Adjust expander assembly **21**.
  P35B-69
- Start the engine after having assembled brake drum *, and confirm whether brake air pressure is sufficient.
- Operate auto adjuster by fully depressing brake pedal ten times.
- Remove inspection hole plug **2**.



- Insert thickness gauge **A** into the inspection hole **F** of dust cover **3**, and confirm whether brake shoe clearance is 0.4 to 1.0 mm {0.016 to 0.039 in.}, as well as 0.3 mm {0.012 in.} or less in the right and left difference.
- If the clearance is not 0.4 to 1.0 mm {0.016 to 0.039 in.}, adjust it as required.



7 Return spring

[Removal]

Remove the return spring with hanging the return spring setter on the hook of return spring **7**.

WARNING

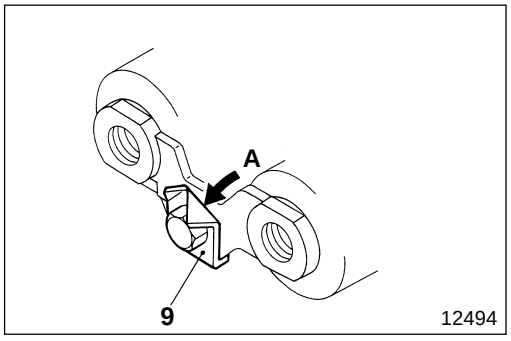
Do not hang return spring setter on the sliding area of oil seal.

[Installation]

- Hang one hook of return spring **7** on the pin **18** of brake shoe assembly **13**.
- Hang another hook on return spring setter, and install it while pressing against pin **18**.

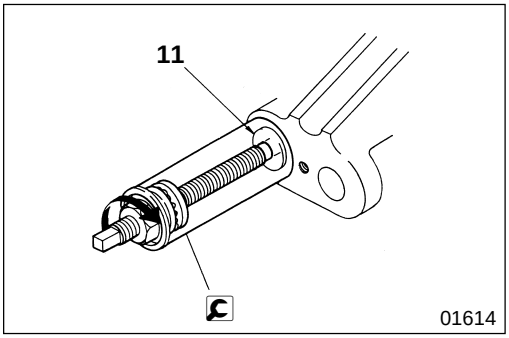
WARNING

Do not hang return spring setter on the sliding area of oil seal.



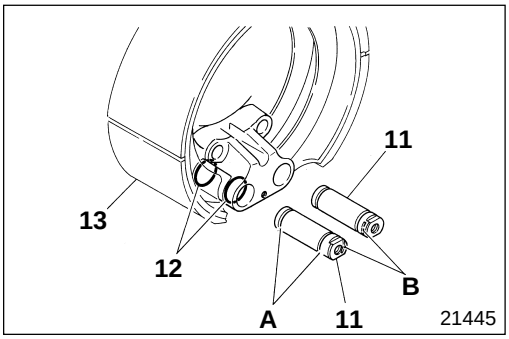
9 Installation of lock washer

A : Bend



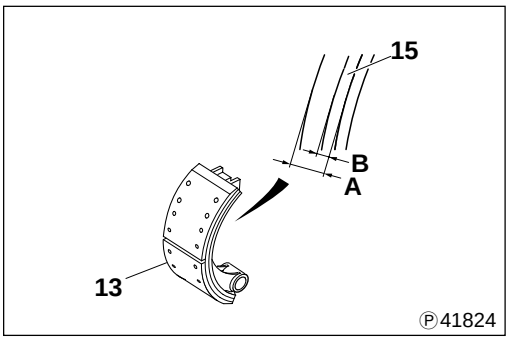
11 **Anchor pin**

[Removal]
: Anchor pin puller



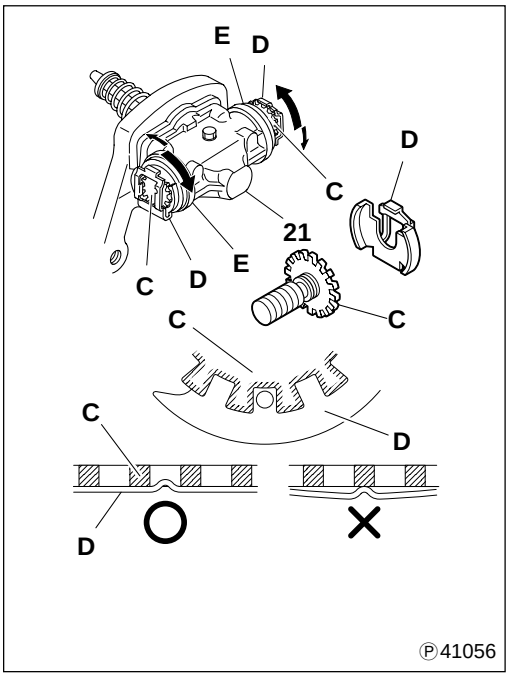
[Installation]
- Apply grease on the grease groove **A** of anchor pin **11**.
- Install anchor pin **11** in the direction shown in Figure.
  B : Groove installing lock plate

CAUTION
If anchor pin 11 is installed in the wrong direction of the anchor pin, O-ring 12 will be damaged; therefore, be sure to mount it as required.



13 **Brake shoe assembly**

[Inspection]
If the thickness **A** of brake lining **15** reaches below the limit **B**, replace the brake lining on both sides of the axle.

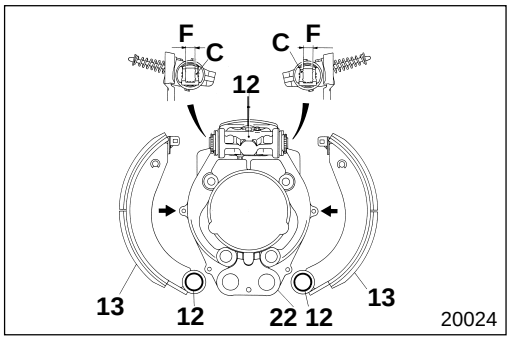


[Installation]
- Turn adjusting screw **C** of expander assembly **21** fully clockwise by hand.
  (Back off to align clip **D**)
- Confirm whether the open part of clip **D** is in the drum side; if it is not in the drum side, turn adjusting screw **C** further clockwise to match the position. (This is due to the rotation of sleeve assembly)

WARNING
- **Be sure to apply grease appropriately on the contact part of adjusting screw C in boot E; otherwise auto adjuster may be caused the malfunctioning due to breakage of boot.**

CAUTION
- **Turn it slowly so that boot E may not be jammed.**
- **Be sure to keep the convex part of clip D between teeth of adjusting screw C (2 points).**

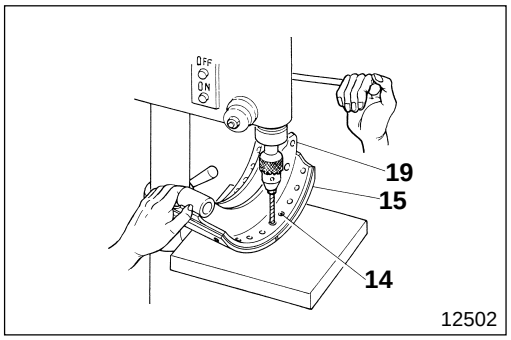
- Take care whether clip **D** is misaligned, and rotate adjusting screw **C** anticlockwise by two revolutions. (Only if the lining is replaced.)



- Install brake shoe assembly **13** so that it securely enters into the slot **F** of clip **C**.

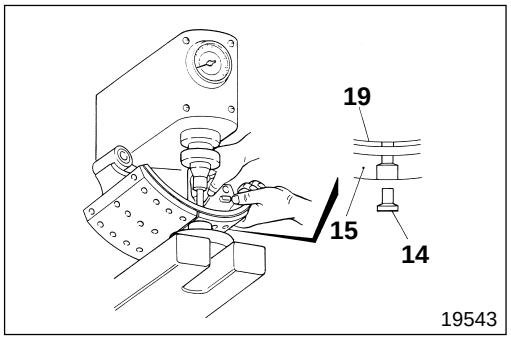
CAUTION

When installing brake shoe assembly 13, do not damage clip C and O-ring 12.



15 **Brake lining**

[Removal]



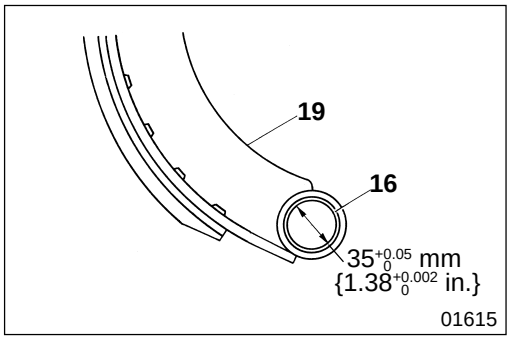
[Installation]

- Clean and dry brake lining **15** and brake shoe **19**.
- Insert rivet **14** from brake lining **15**, and stake the rivet in sequence from the center to both ends.
- Put a staking load of rivet **14** as 19.61±0.98 kN {4410±2200 lbf, 2000±1000 kgf}.
- Inspect how brake drum ***** and brake lining **15** touches: correct any faulty points if they are found. Such correction must be performed in a state that the brake has been assembled.

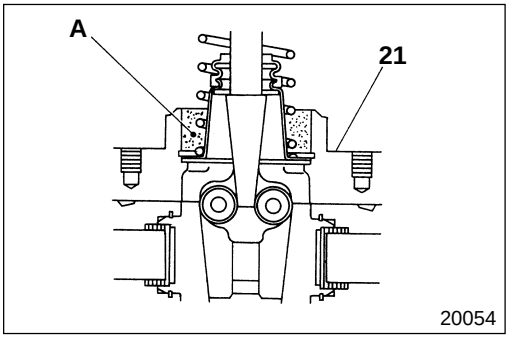
WARNING

- **Be sure to replace brake lining 15 on both sides of an axle since the lining may cause pulling under braking.**
- **Do not adhere oil and grease to the brake lining 15, which may cause the malfunctioning of braking.**

16 **Installation of bushing**

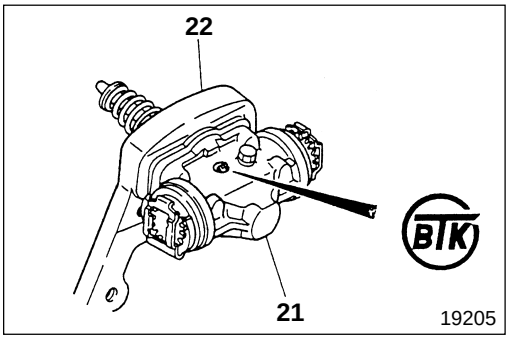


- Install bushing **16** on brake shoe **19**.
- Measure the inside diameter of bush 1**6**.
- If the inside diameter is not $35^{+0.05}_{0}$ mm {$1.38^{+0.002}_{0}$ in.}; align it with the same required dimensions, or $35^{+0.05}_{0}$ mm {$1.38^{+0.002}_{0}$ in.} by drilling it with reamer.



21 **Installation of expander assembly**

- Fill the grease of the specified amount in **A** part of expander assembly **21**.



- Install expander assembly **21** on anchor bracket **22** in the direction shown in diagram.

***** **Correction of brake drum**

If the cylindrical degree of brake drum ***** exceeds the limit, or has heat checks; renew the wear surface with drum and hub assembled.

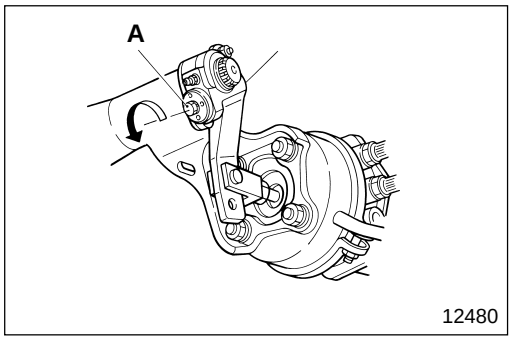
◆ Service procedure



● Inspection of operation after installation

- Increase the air pressure in the air tank to approximately 685 kPa {100 psi, 7 kgf/cm^2}.
- Turn worm shaft **A** of automatic slack adjuster **25** in direction ➡ (counterclockwise) to compress the brake assembly and increase the brake shoe clearance to approximately 1.5 mm {0.059 in}.

NOTE

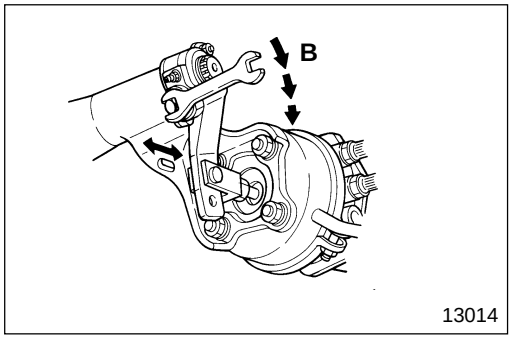
A large force is required to turn worm shaft A.

- Put a spanner on worm shaft **A** of automatic slack adjuster **25** and inspect its operation by watching how far the spanner moves.

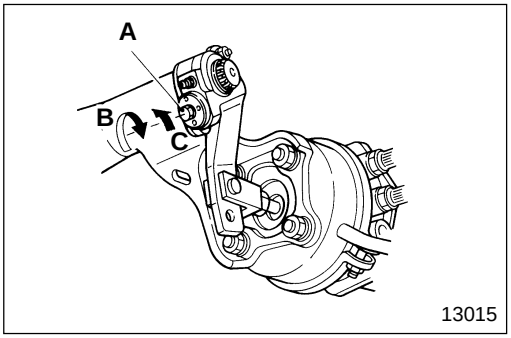
NOTE

Hold the spanner so that it does not fall off.

- Depress the brake pedal fully to work the brake, then release it.

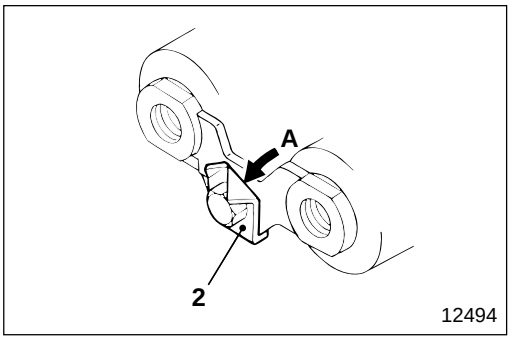


- Check that worm shaft **A** of automatic slack adjuster **25** turns clockwise when the brake is released, and if the turning stroke decreases every time the brake is depressed and released. If the automatic slack adjuster is faulty, replace it.
  B : Stroke



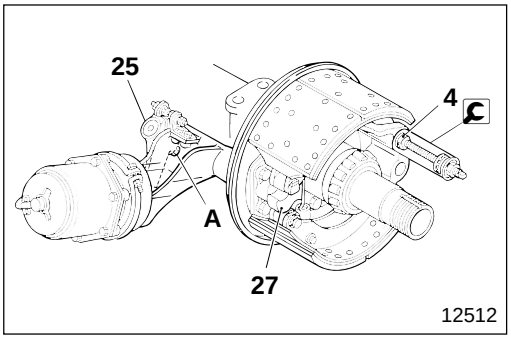
● **Adjustment of initial brake shoe clearance after installation**

- Turn worm shaft **A** of automatic slack adjuster **25** clockwise to open brake shoe assembly **6** until the brake shoe clearance is 0 mm {0 in.}.
- Slacken off worm shaft **A** counterclockwise by one quarter of a turn.
  B : Turn clockwise fully.
  C : Slacken off counterclockwise by one quarter of a turn.



2 **Bending up lock washer**

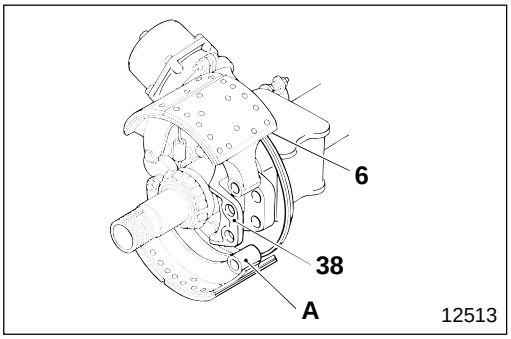
A : Bend



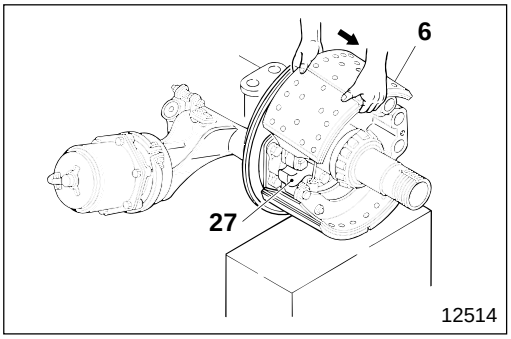
6 **Brake shoe assembly**

[Removal]

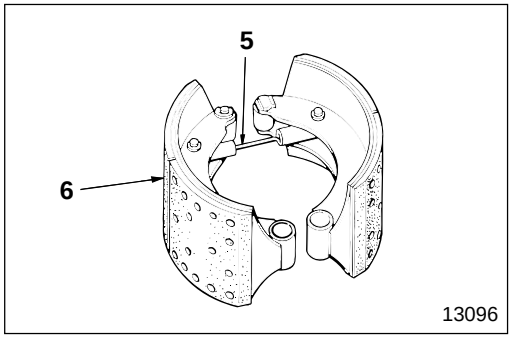
- Turn worm shaft **A** of automatic slack adjuster **25** so that camshaft **27** does not open brake shoe assembly **6**.
- Remove anchor pin **4** using 🔧 anchor pin puller.



- Remove heel part **A** of lower brake shoe assembly **6** from anchor bracket **38**.
- Remove heel part **A** of upper brake shoe assembly **6** from anchor bracket **38**.

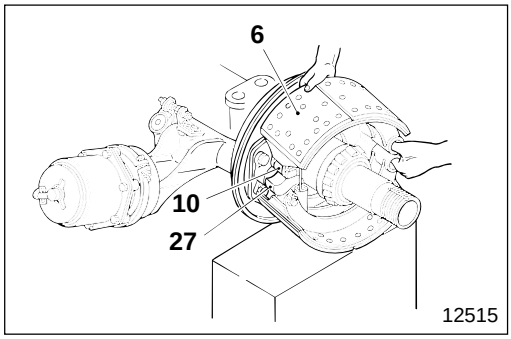


- Hold upper brake shoe assembly **6**, and remove it from camshaft **27** by sliding horizontally.

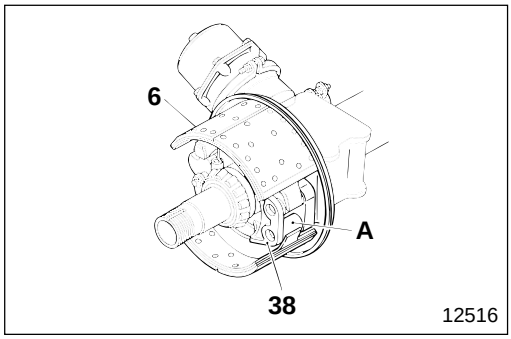


[Installation]

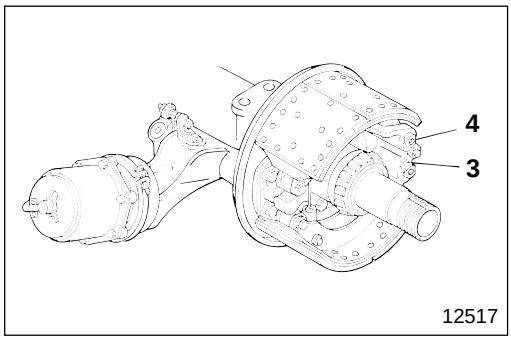
- Install return spring **5** in both brake shoe assemblies **6**.



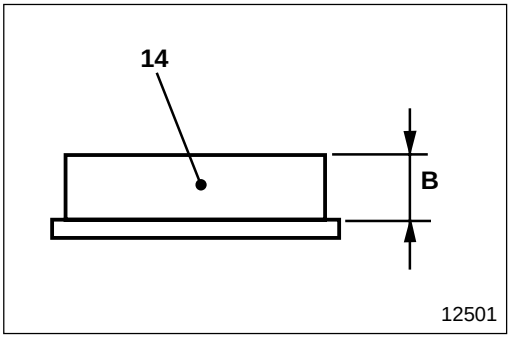
- Insert your thumb and forefinger into the anchor pin hole of both brake shoe assemblies **6**, and lift the upper brake shoe assembly with your other hand.
- Place and slide roller **10** of brake shoe assembly **6** onto camshaft **27**.



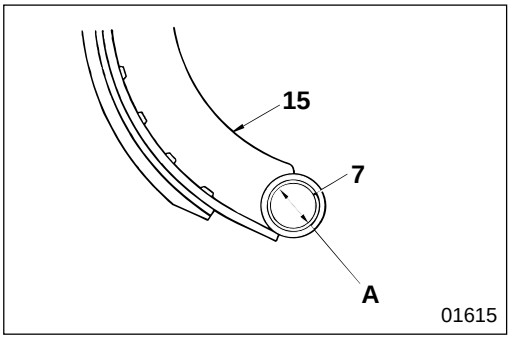
- Install heel part **A** of upper brake shoe assembly **6** in anchor bracket **38**.
- Install heel part **A** of lower brake shoe assembly **6** in anchor bracket **38**.



- Drive in anchor pin **4** and fix it with lock plate **3**.



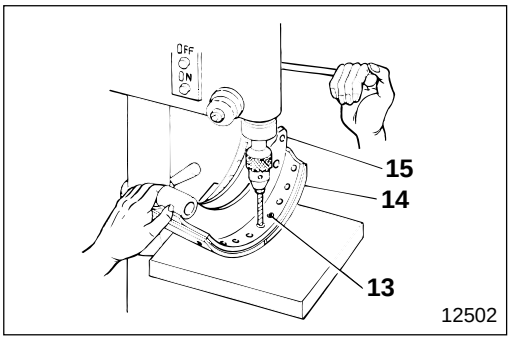
[Inspection]
If thickness **B** of brake lining **14** is lower than the limit replace the brake lining on both sides of the axle.



7 **Inner diameter of bushing**

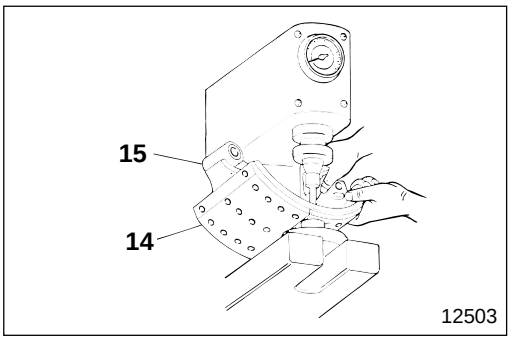
- After installing bushing **7** in brake shoe **15**, measure inner diameter **A** of the bushing.
- If the inner diameter deviates from dimension **A** ream the diameter to the standard value.

  Dimension **A** : $35\ ^{+0.05}_{0}$ mm {$1.4\ ^{+0.0020}_{0}$ in.}



14 **Brake lining**

[Removal]



[Installation]

- Clean the mounting surfaces of brake lining **14** and brake shoe **15** with cleaning fluid and dry them.
- Insert rivets **13** from brake lining **14** side, and caulk the rivets at the specified load so that there is no clearance between brake shoe **15** and the brake lining.

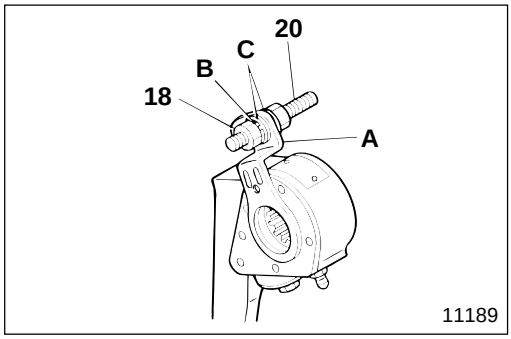
  Caulking load for rivets : 17 to 19 kN {3750 to 4190 lbf, 1700 to 1900 kgf}

WARNING

Do not leave lubricant on the surface of brake lining 14 because this reduces braking performance.

CAUTION

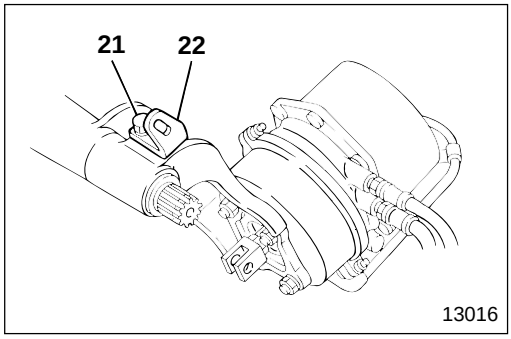
- **Make sure that the type of brake linings 14 you fit are suitable for the intended use of the vehicle. Make sure that you fit identical size and color coated linings on the left and right sides of one shaft.**
- **Make sure that you inspect contact with the inner surface of brake drum *1 after you replace brake linings 14. If contact is incorrect, correct with the brake assembled.**

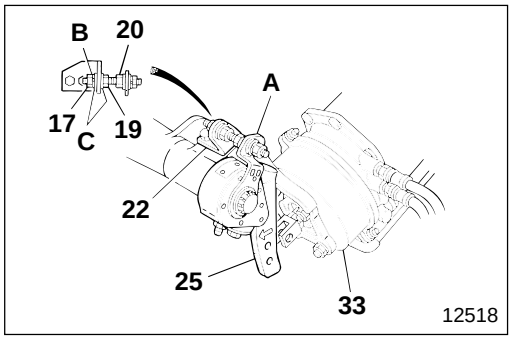


25 Automatic slack adjuster

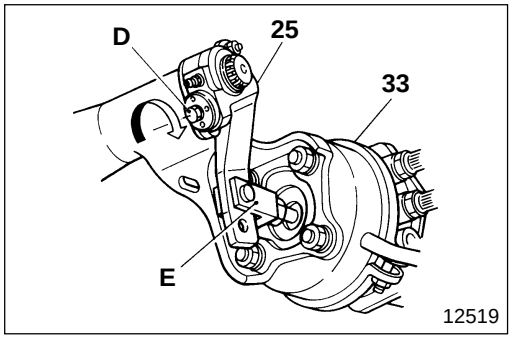
[Installation]

- Install stopper pin **20** in control arm **A** of automatic slack adjuster **25** temporarily.
  B : Spring washer
  C : Plain washer

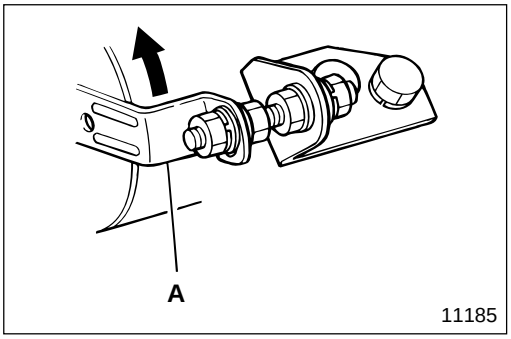




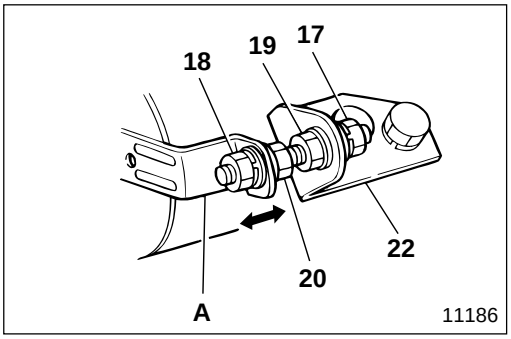
★ • Fit nuts **17**, **19**, spring washer **B** and plain washer **C** on stopper pin **20** that is installed in automatic slack adjuster **25**.
- Position control arm **A** so that stopper pin **20** can be fitted into the hole of stopper pin bracket **22**.
- Install automatic slack adjuster **25** on camshaft **27** of the wheel brake so that mark "⇨" on the arm of the automatic slack adjuster points away from brake chamber **33** as illustrated.



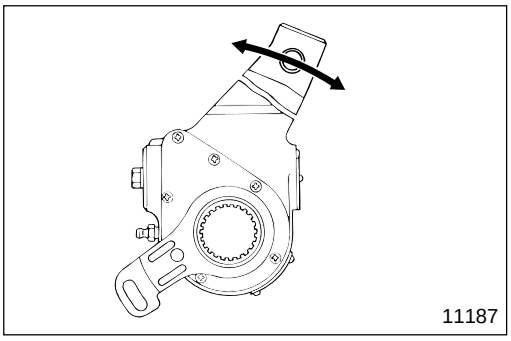
- Turn and align worm shaft **D** of automatic slack adjuster **25** clockwise in the direction of mark "➡" as illustrated, and install push rod **E** of brake chamber **33** in the arm.



- Push control arm **A** of automatic slack adjuster **25** in direction ➡ as illustrated, and confirm that the arm does not move due to contact with the inner stopper.
  If the control arm does moves, repeat the operation from step ★.

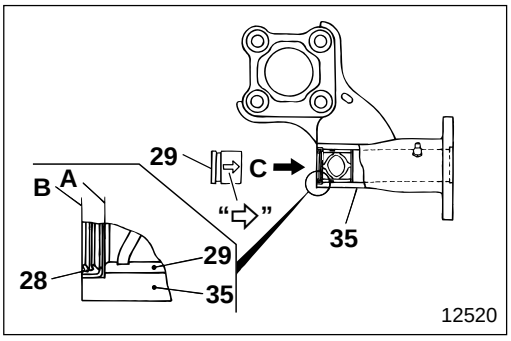


- First install stopper pin **20** in control arm **A**, then in stopper pin bracket **22**, tighten nuts **17**, **18**, **19** at specified torque. Check that the control arm does not move. When tightening the nuts at specified torque, do not apply force to the control arm in arrow mark direction ⟷ as illustrated.



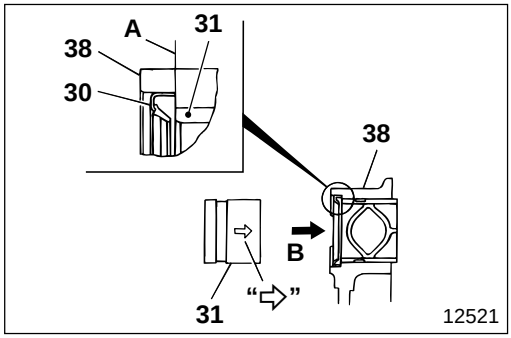
[Inspection of play]

- Inspect automatic slack adjuster **25** when it is disconnected from brake chamber **33**.
- To inspect play, move automatic slack adjuster **25** in direction ⟷ as illustrated. If play is higher than the limit, replace the automatic slack adjuster.
  Limit : 4 mm {0.16 in.} or less



28 **29** **Press-fitting of dust seal and bushing**

A : Press-fit bushing **29** to this level
B : Press and fit dust seal **28** to this level
C : Press-fitting direction for bushing **29**



30 **31** **Press-fitting of oil seal and bushing**

A : Press-fit oil seal **30** and bushing **31** to this level
B : Press-fitting direction for the bushing

***1** **Correction of brake drum**

If the cylindrical accuracy of brake drum ***1** is higher than the limit, or there are heat checks, correct by machining to the correction limit. Machining of the brake drum should be done with the wheel hub assembled.

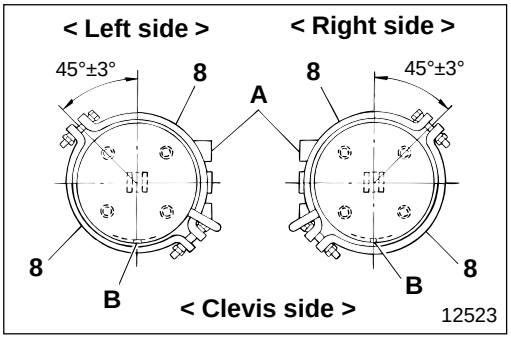
Tightening torque

Unit : N·m {ft.lbs, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
1	Screw (Holder mounting)	1.2±0.2 {0.9±0.18, 0.125±0.025}	—
6	Nut (Clevis fixing)	44±5 {33±3.6, 4.5±0.5}	—
7	Nut (Clamp tightening)	29.4±2.9 {22±2.2, 3.0±0.3}	—
17	Lock nut (Release bolt fixing)	41.7±2.5 {31±1.8, 4.25±0.25}	—
18	Bolt (Cylinder and bulkhead mounting)	13.7±3.9 {10±2.9, 1.4±0.4}	—
31	Follower	44±5 {33±3.6, 4.5±0.5}	—

Lubricant and sealant

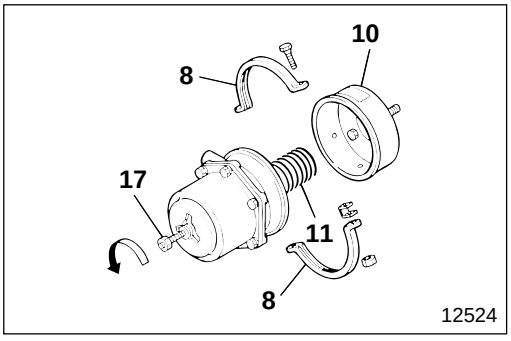
Location	Points of application	Kinds	Quantity
20	Interior of cylinder	Silicon grease	As required
24	Outer periphery of piston	Silicon grease	As required
27	Thread area of release bolt	Multipurpose grease [NLGI No.2 (Li soap)]	As required
31	Thread area of follower	LOCTITE 242	As required



◆ Service procedure

8 **Points of clamp installation**

A : Service port
B : Drain port

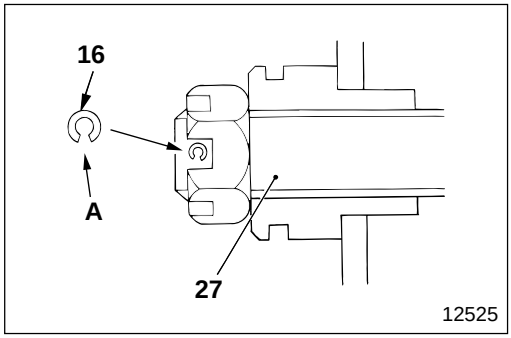


10 **Removal of chamber**

- Turn lock nut **17** in direction ➔ (counterclockwise) fully to compress spring **21**.
- Remove clamp **8** and chamber **10**.

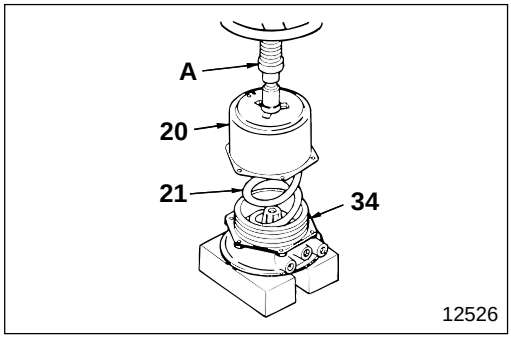
WARNING

You must be careful when you remove the clamp, because spring 11 in chamber 10 can be forcibly ejected. To avoid this hazard, press down the chamber with your hand when you carry out the above work.



16 **Installation of spring pin**

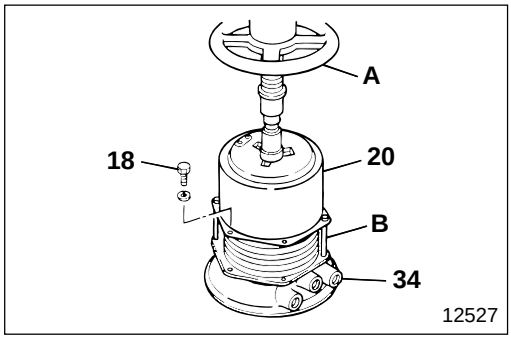
Drive in spring pin **16** so that slit **A** faces release bolt **27** at a right angle.



20 **Cylinder**

[Removal]

When you remove cylinder **20**, spring **21** might spring out. To prevent this, press down the cylinder using press **A** during removal.



[Installation]

- Arrange bolt **B** (M8×1.25) as a guide.
- Install bolt **B** as a guide, pressing down cylinder **20** using press **A**.
- Align the bolt holes of cylinder **20** and bulk head **34**, and press down using press **A**. Tighten bolt **18** at specified torque.

8	Return spring setter 	Obtain locally	Remove return spring
12	Anchor pin puller 	03727-60000	Remove anchor pin

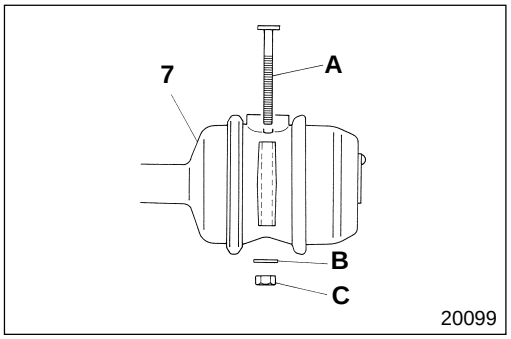
♦ Service procedure

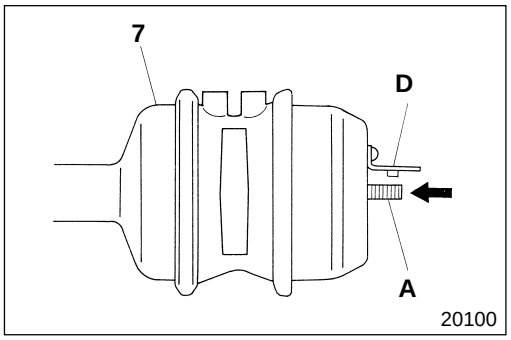
● **Work before disassembly**

Release of spring brake

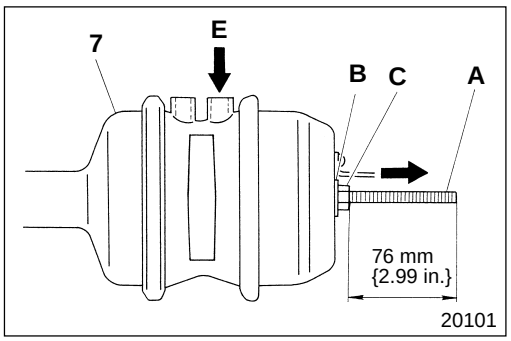
Release the spring brake by mechanical release.

- Remove the release bolt **A**, the washer **B**, and the release nut **C** from brake chamber assembly **7**.





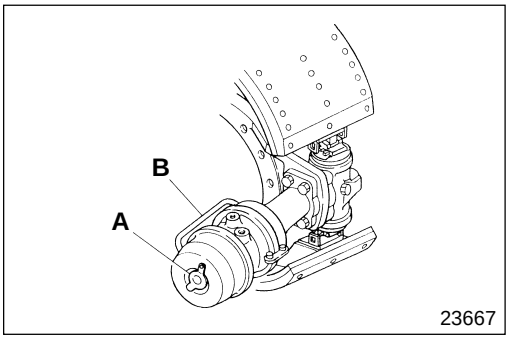
- Remove end cap **D**.
- Insert the release bolt **A** into the inner part, and turn it one quarter (1/4) turn.
- Pull up the release bolt **A**, and confirm that the release bolt does not come off.
- In case the release bolt **A** comes off, insert the release bolt again into the inner part, and turn it one quarter (1/4) turn.



- Install the washer **B** and the release Nut **C**.
- Turn the release nut **C**, and draw out the screw of release bolt **A** by 76 mm {2.99 in.}, while applying air pressure of 640 kPa {92 psi, 6.5 kgf/cm^2} to spring brake port **E**, while setting the hand control valve to the release position.

CAUTION

- **Do not turn the release nut C by a strong torque; (68.6 N·m {51 ft.lbs, 7 kgf·m} or more): because brake chamber assembly 6 may be damaged if turning it by such a strong torque.**
- **Use air pressure E so that the release nut C may be easily turned.**



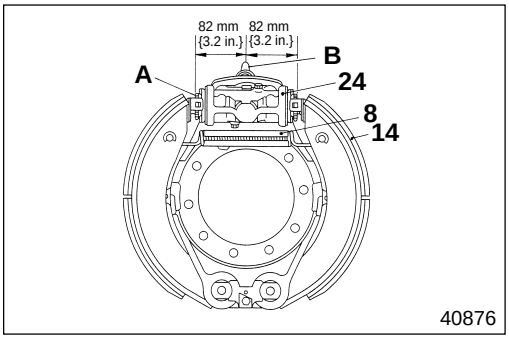
● **Work after assembly**

(1) Release of spring brake

Follow the work sequence before disassembly in reverse to release the mechanical release of spring brake. 🕮 P35B-90

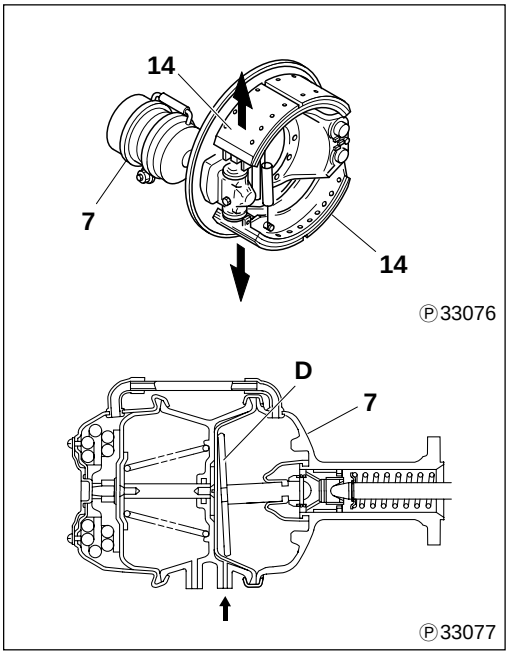
NOTE

- **Confirm that end cap A is surely installed.**
- **Confirm that there is no damage in bleeder pipe B. Also, confirm that the bleeder pipe is surely installed.**



(2) Confirmation of operation

- Confirm that the installation dimension of expander assembly **24** is 82 mm {3.2 in.}.
  If it is incorrect, adjust it according to the following procedure.
- Set the part indicated in diagram to 82 mm {3.2 in.} by adjusting the adjusting screw **A**.
- Expand the brake shoe assembly **14** under a full stroke by pushing push rod **B**.
- Confirm that expander assembly **24** returns to 82 mm {3.2 in.} when returning the push rod **B**.
- If it operates incorrectly, inspect the spring force of return spring **8**, inactivation of brake shoe assembly **14**, and expander assembly **24** again.



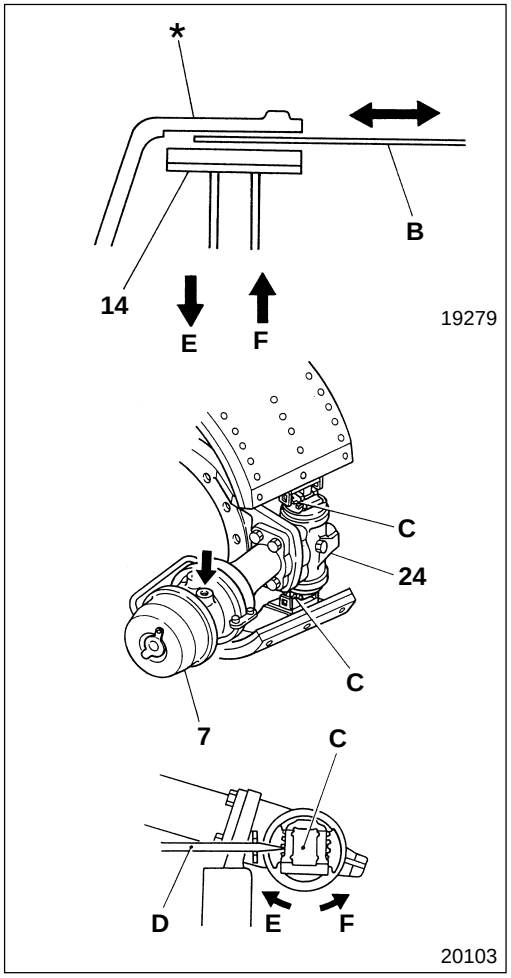
WARNING⚠

The auto adjustment mechanism might not operate normally if the assembly work is not surely executed.

- When disassembling brake chamber assembly **7**, inspect the following.

< When disassembling brake chamber assembly 7 >

- Confirm that brake shoe assembly **14** does not move with the adjusting screw **C** of expander assembly **24** when pulling the brake shoe assembly with a force of 20 to 30 N {4.4 to 6.6 lbf, 2 to 3 kgf}.
- If brake shoe assembly **14** moves, push rod and pressure plate **D** of brake chamber assembly **7** are diagonally installed; therefore, correct the push rod and the pressure plate to a regular position by depressing brake pedal 2 to 3 times with not installing brake drum ***.

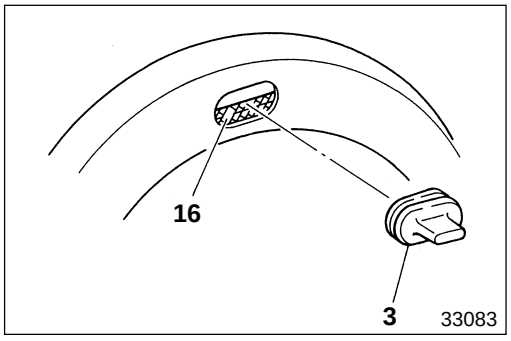


(2) Initial adjustment of brake shoe clearance
< When not replacing brake lining 16 with the new one >

- Remove dust cover **4**.
- Apply air pressure of 640 kPa {92 psi, 6.5kgf/cm^2}) on the spring brake air supply port **A** of brake chamber assembly **7** (thereby putting the hand control valve to the release position), and then release the spring brake.
- Turn adjusting screw **C** of expander assembly **24** until a feeler gauge **B** of 0.4 mm {0.016 in.} can be easily pulled in and out at the inspection hole of each shoe.
  D : Screw driver
  E : Increasing brake shoe clearance
  F : Decreasing brake shoe clearance

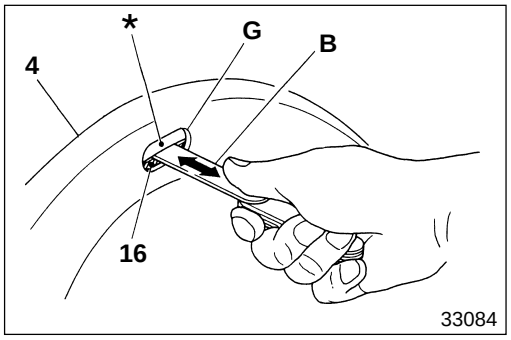
- Install dust cover **4**.

CAUTION
Do not damage the boot of expander assembly 24 when inserting screw driver D.

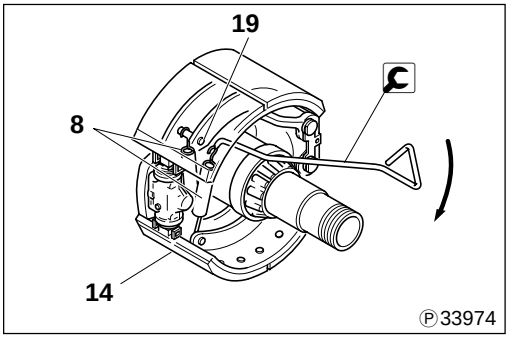


< When replacing brake lining 16 with the new one >

- Adjust expander assembly **24**. P35B-94
- Start the engine after having assembled brake drum *, and confirm whether brake air pressure is sufficient.
- Operate auto adjuster by fully depressing brake pedal ten times.
- Remove inspection hole plug **3**.



- Insert feeler gauge **B** into inspection hole **G** of dust cover **4**, and confirm whether brake shoe clearance is 0.4 to 1.0 mm {0.016 to 0.039 in.}, as well as 0.3 mm {0.012 in.} or less in the right and left difference.
- If the clearance is not 0.4 to 1.0 mm {0.016 to 0.039 in.}, adjust it again.



8 **Return spring**

[Removal]

Remove the return spring with the return spring setter as shown.

WARNING

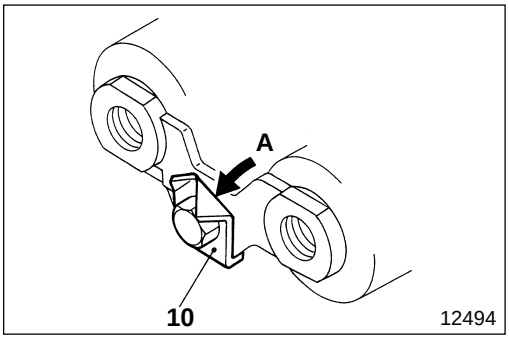
Do not allow the return spring setter to contact the mating surface of oil seal.

[Installation]

- Attach one hook of return spring **8** on the pin **19** of brake shoe assembly **14**.
- Attach the other hook on the return spring setter, and install it while pressing against pin **19**.

WARNING

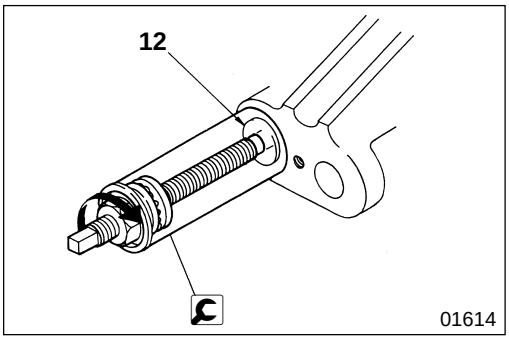
Do not hang the return spring setter on the sliding area of oil seal.



10 **Installation of lock washer**

A : Bend

- After installing the lock washer, bend the tab over the bolt head as shown in the figure on the left.

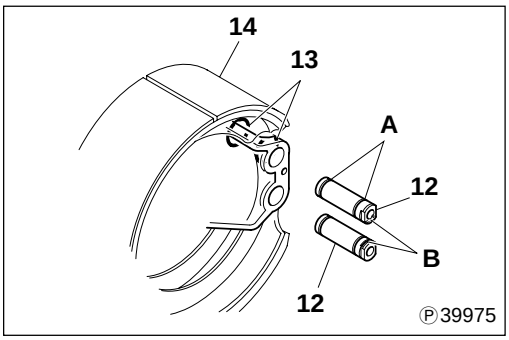


12 **Anchor pin**

[Removal]

: Anchor pin puller

- Remove the anchor pin using anchor pin puller as shown in the figure on the left.



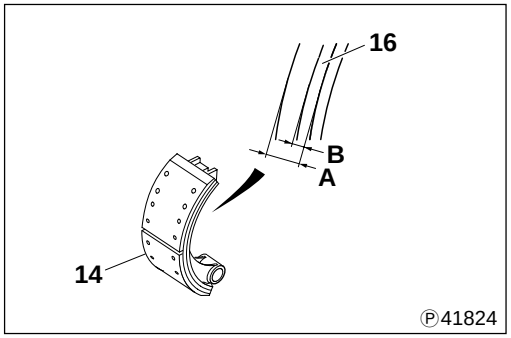
[Installation]

- Apply grease in the grease grooves **A** of anchor pin **12**.
- Install anchor pin **12** in the direction shown in Figure.

B : Groove installing lock plate

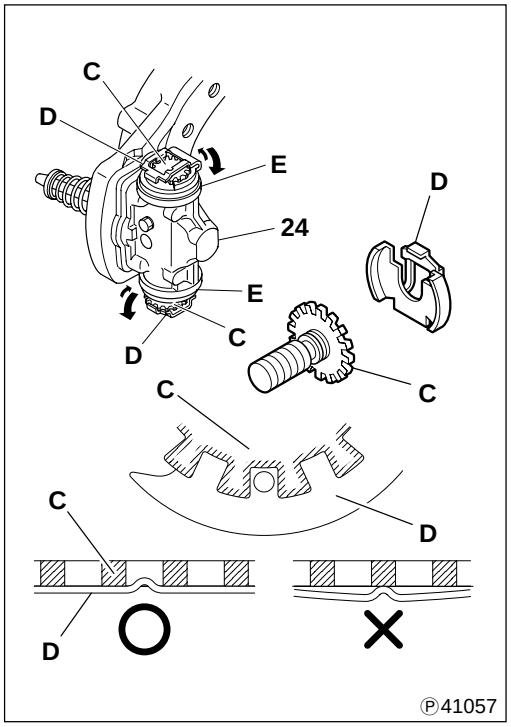
CAUTION

If anchor pin 12 is installed in the wrong direction of the anchor pin, O-ring 13 will be damaged; therefore, be sure to install it as required.



14 Brake shoe assembly

[Inspection]
If the thickness **A** of brake lining **16** reaches below the limit **B**, replace the brake lining by every one axis.

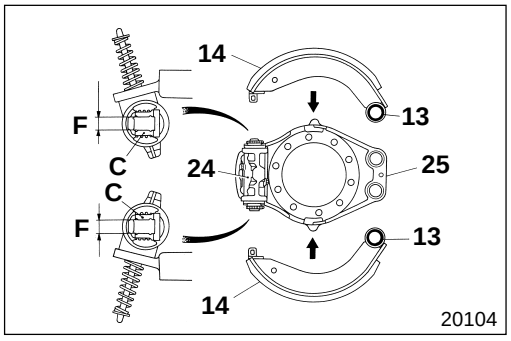


[Installation]
- Turn adjusting screw **C** of expander assembly **24** fully clockwise by hand.
- Install clip **D** with the open side facing the drum. Turn adjusting screw **C** further clockwise to match the position if alignment is incorrect.

WARNING
Be sure to apply grease as required on the contact part of adjusting screw C in boot E; otherwise the auto adjuster may malfunction due to breakage of boot.

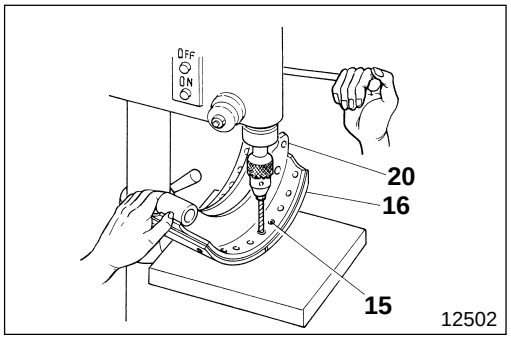
CAUTION
- **Turn it slowly so that boot E is not jammed.**
- **Be sure to keep the convex part of clip D between teeth of adjusting screw C (2 points).**

- If clip **D** is misaligned, rotate adjusting screw **C** counterclockwise by two revolutions to center of clip.



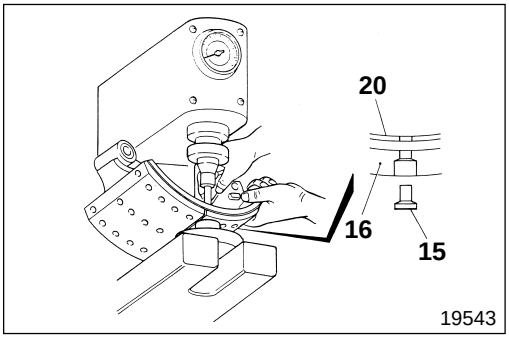
- Install brake shoe assembly **14** so that it securely enters into the slot **F** of clip **C**.

CAUTION
When installing brake shoe assembly 14, do not damage clip C and O-ring 13.



16 Brake lining

[Removal]
- Remove the rivets **15** by drilling, taking care not to damage the brake shoe **20**. Then, remove the brake lining **16**.

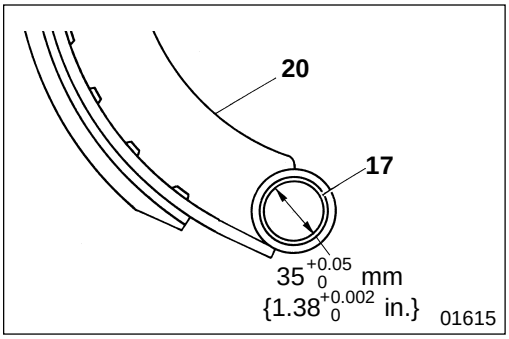


[Installation]

- Clean the surface of the brake lining **16** and brake shoe **20**.
- Insert rivet **15** through brake lining **16**, and stake the rivet in sequence from the center to both ends.
- Stake the rivet **15** with a load of 19.61±0.98 kN {4410±220 lbf, 2000±100 kgf}.
- Inspect brake drum * to brake lining **16** contact: correct any faulty points if they are found. Such correction must be performed in a state that the brake has been assembled.

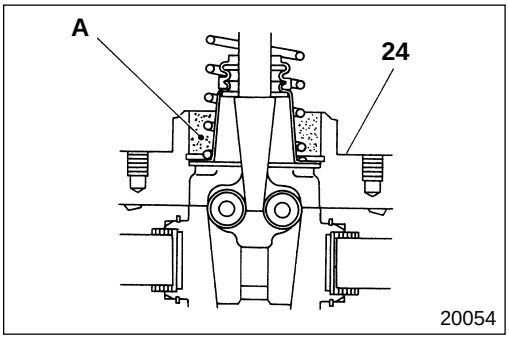
WARNING

- **Be sure to replace brake lining 16 to prevent uneven braking.**
- **Do not apply oil or grease to the brake lining 16, which may cause the malfunctioning of braking system.**



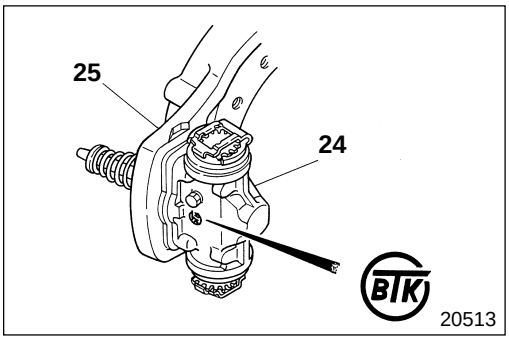
17 Installation of bushing

- Install bushing **17** on brake shoe **20**.
- Measure the inside diameter of bushing **17**.
- If the inside diameter is not $35^{+0.05}_{0}$ mm {$1.38^{+0.002}_{0}$ in.}; correct by reaming to specification.



24 Installation of expander assembly

- Fill the grease of the specified amount in **A** part of expander assembly **24**.



- Install expander assembly **24** on anchor bracket **25** in the direction shown in Figure.

*** Correction of brake drum**

If the taper of brake drum * exceeds the limit, or has deep grooves, cut them to the specified limit.

Brake Chamber Assembly

13 Push rod complete
14 Base

⊗ : Non-reusable parts

WARNING

Make sure not to disassemble emergency brake chamber 5 since its built-in spring with a very strong spring force may cause a very dangerous result.

CAUTION

When removing clamp ring 3, do not damage emergency brake chamber 5 and the seat surface of diaphragm 6 of base 14, which may cause air leakage.

● **Assembly sequence**

Follow the disassembly sequence in reverse.

Repair kit: chamber kit

WARNING

Do not apply oil and grease to diaphragm 6 so that the diaphragm may not come off.

Tightening torque

Unit : mm {in.}

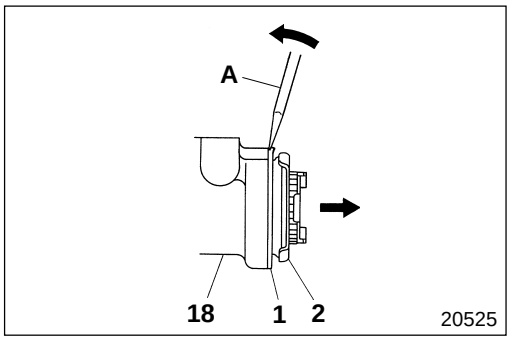
Location	Tool name and shape	Part No.	Application
1	Boot setterr  19000	Use a locally obtained equivalent	Install boot
2, 9	Clip adaptor  19111	Use a locally obtained equivalent	Measure holding torque of clip and rotating torque of sleeve assembly
12	Spring holder  18999	Use a locally obtained equivalent	Remove spring

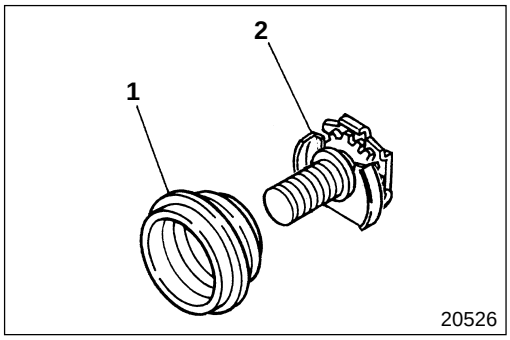


20525

◆ Service procedure

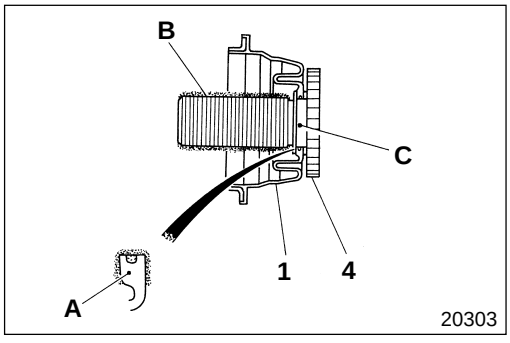
1 2 Removal of boot and adjusting screw assembly

- Remove the boot **1** from the body **18** with screw driver **A**.
- Remove adjusting screw assembly **2** and boot **1** by turning the adjusting screw assembly counterclockwise.



20526

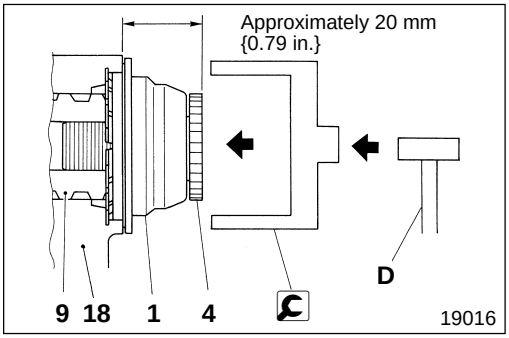
- Remove boot **1** from adjusting screw assembly **2**.



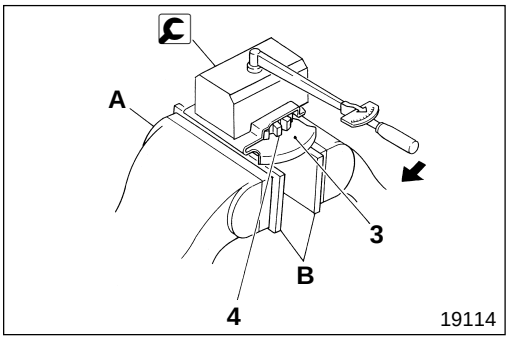
20303

1 4 Installation of boot and adjusting screw

- Apply grease on the contact part **A** of adjusting screw **4** of boot **1** and the threads **B** of the adjusting screw.
- Install boot **1** in groove **C** of adjusting screw **4**.



- Thread adjusting screw **4** into the sleeve assembly **9** until the adjusting screw reaches a distance of approximately 20 mm {0.79 in.} from the body **18**.
- Confirm that sleeve assembly **9** slides by pulling adjusting screw **4** lightly.
- Press boot **1** fit with 🔧 boot installer.
  D : Plastic hammer



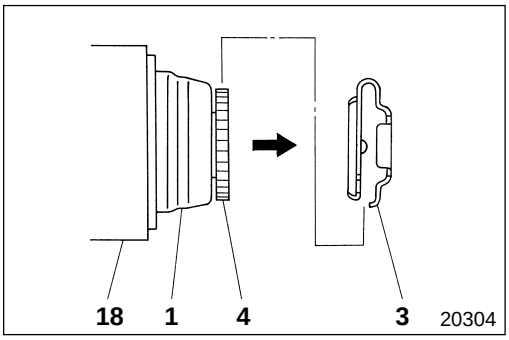
2 Inspection of clip-holding torque of adjusting screw assembly

- Fix adjusting screw **4** with vise **A**.
  B : Buffer (jaw protectors.)

CAUTION ⚠

Use buffer B such as jaw protectors so as not to give damage to adjusting screw 4.
Also, the auto adjustment mechanism will not operate when the threaded part of the adjusting screw is damaged.

- Install 🔧 clip adaptor
- The holding torque is a value indicated when clip **3** has began to turn.
- Replace clip **3** if the measurement value comes off from the standard value.

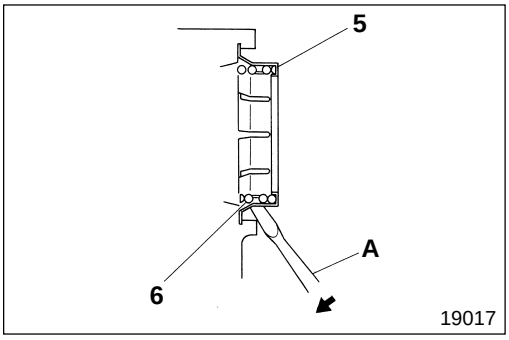


3 Installation of clip

- To install the clip **3** on adjusting screw **4**, extend the adjusting screw out to the extent that it does not come in contact with boot **1**.
- Install clip **3**.

CAUTION ⚠

Do not damage boot 1 when installing clip 3.

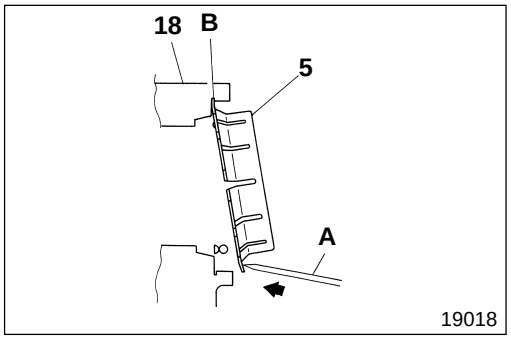


5 Spring cage

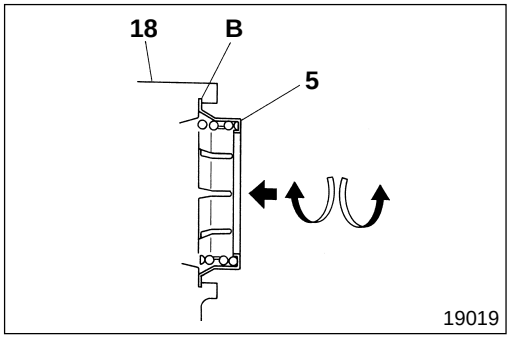
[Removal]
Remove spring cage **5** with holding it by hand so that spring **6** may not pop out.
A : Screw driver

WARNING ⚠

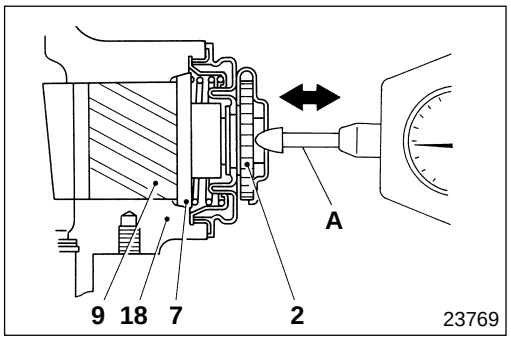
Take care that spring 6 may pop out.



[Installation]
- Fit the one side of spring cage **5** into groove **B** of body **18**.
- Push the other side of spring cage **5** with screw driver **A**.



- To check the spring cage **5** for proper installation into the groove of body **18**, push in on the spring cage while rotating the cage. It should rotate smoothly.

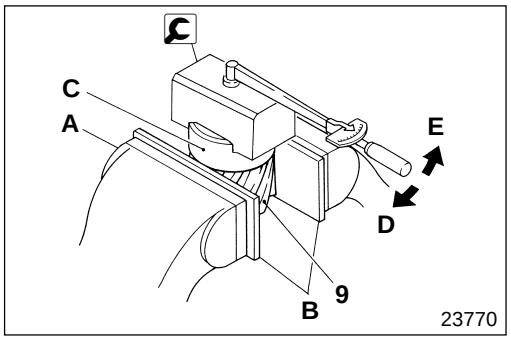


7 **9** **Inspection of backlash between drive ring and sleeve assembly**

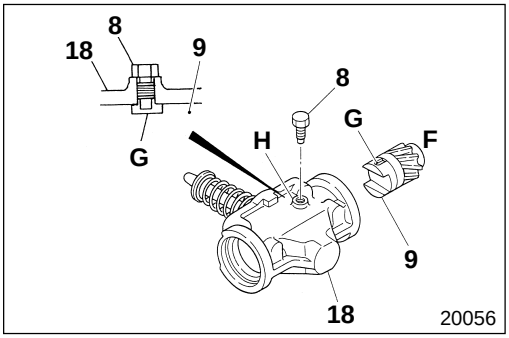
- Measure the backlash between drive ring **7** and sleeve assembly **9** with a dial indicator **A** while moving the adjusting screw assembly **2** in the direction of the arrow.
- If the measured value is out of specification, replace drive ring **7** and sleeve assembly **9**.

CAUTION

Measure the backlash with care so that drive ring 7 may not separate from body 18 with being pushed by sleeve assembly 9.



[Inspection]
- Fix sleeve assembly **9** with vise **A**.
  B : Buffer (jaw protectors)
- Install clip adaptor.
- Measure the torque at the time when tappet **C** begins to rotate.
  D : Clockwise
  E : Counterclockwise
- If the measured value is out of specification, replace sleeve assembly **9**.



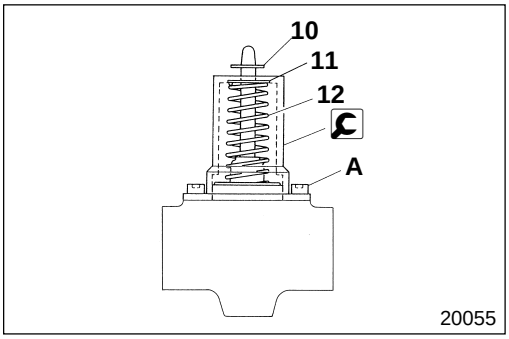
9 Sleeve assembly

[Installation]

- Install sleeve assembly **9** by aligning the identification groove **F** in the tip of the sleeve assembly with the threaded hole **H** of the body **18**.
- Apply grease on the outer, the screw part and the roller contact part of sleeve assembly **9**.
- Install screw **8** after groove **G** is aligned.
- Tighten the sleeve assembly with the specified torque after applying the sealing compound on the screw of screw **8**.
- Confirm whether sleeve assembly **9** does not come off.

NOTE

Recheck that the sleeve assembly 9 does not pull out of the housing.



12 Spring

[Removal]

- spring holder with bolt **A**, and compress spring **12**.
- Remove snap ring **10**.
- Remove bolt **A** and spring holder.

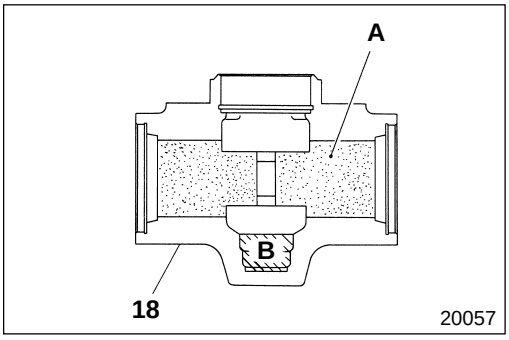
CAUTION

When removing bolt A, use caution as the spring 12 may pop out.

- Remove retainer **11** and spring **12**.

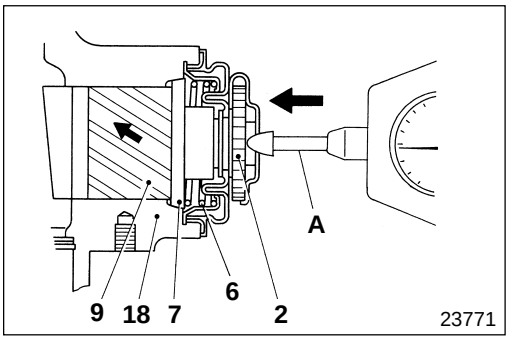
[Installation]

- Follow the removal sequence in reverse.



18 Applying and filling grease on body

- Apply grease on the inside surface **A** of body **18**.
- Fill grease in the **B** part.



– Inspection of auto adjustment mechanism operation of expander assembly

- Pull the adjusting screw assembly **2** as far out as possible by hand.
- Push the adjusting screw assembly **2** back slightly until you feel the resistance change.
- Place the push-pull gauge **A** on the adjusting screw assembly **2**, then push the gauge **A** in the direction of the arrow as shown in the figure on the left, and measure the maximum moving resistance of the adjusting screw assembly **2**.
- If the measured value is out of specification, replace sleeve assembly **9**.

AIR COMPRESSOR

Tightening torque

Unit : N·m {ft.lbs, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
1	Bolt (Cylinder head assembly mounting)	25 to 29 {18 to 22, 2.5 to 3.0}	—
3	Connector	29 to 34 {22 to 25, 3.0 to 3.5}	—
5	Unloader valve assembly	98 to 115 {72 to 87, 10 to 12}	—
8	Delivery valve holder	98 to 115 {72 to 87, 10 to 12}	—
15	Suction valve holder	98 to 115 {72 to 87, 10 to 12}	—
21	Bolt (Cylinder liner mounting)	25 to 29 {18 to 22, 2.5 to 3.0}	—
30	Nut (Connecting rod and connecting rod cap mounting)	23 to 25 {17 to 19, 2.3 to 2.6}	—
36	Nut (Drive gear mounting)	165 to 210 {120 to 155, 17 to 21.5}	—
40	Bolt (Bearing holder mounting)	14 to 18 {10 to 13, 1.4 to 1.8}	—

Lubricant and sealant

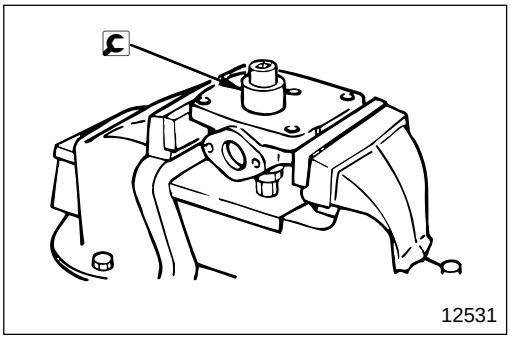
Location	Points of application	Kinds	Quantity
8	Thread area of delivery valve holder	THREEBOND 1323B	As required
41	Oil seal lip	Engine oil	As required

Special tools

Unit : mm {in.}

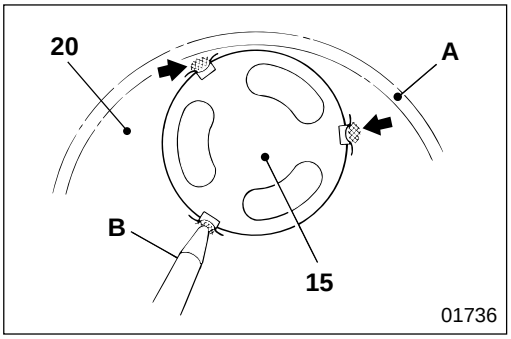
Location	Tool name and shape	Part No.	Application
15	Suction valve tool  01730	MH061263 (Obtain Locally)	Removal and installation of suction valve holder
25 to 28	Piston ring tool  01732	MH060014 (Obtain Locally)	Removal and installation of piston ring (compression ring and oil ring)

◆ Service procedure



15 **Suction valve holder**

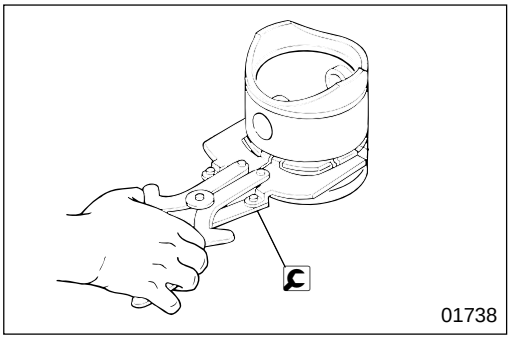
[Removal and installation]



[Caulking]

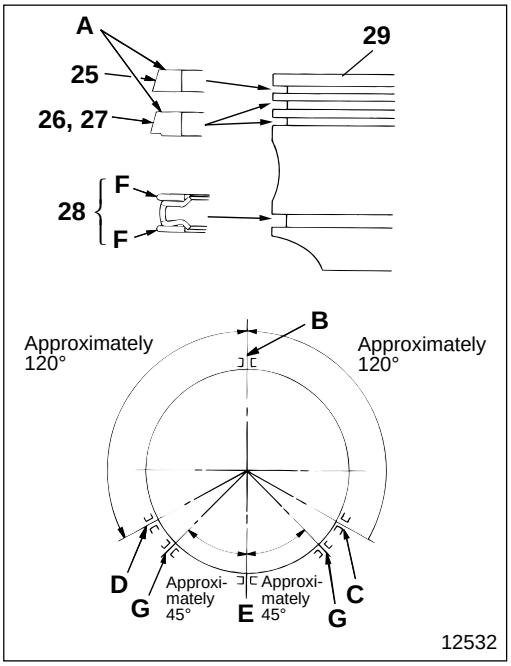
Caulk cylinder head **20** taking care not to damage seal surface **A** of the O-ring.

B : Center punch



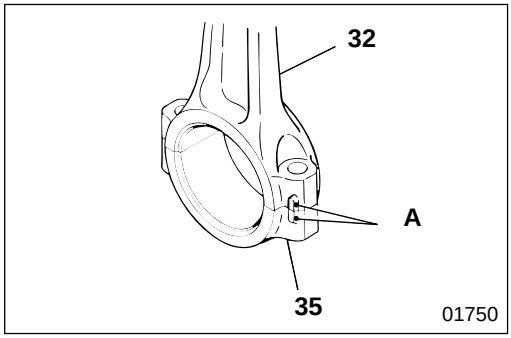
25 **to** **28** **Piston ring (compression ring and oil ring)**

[Removal and installation]



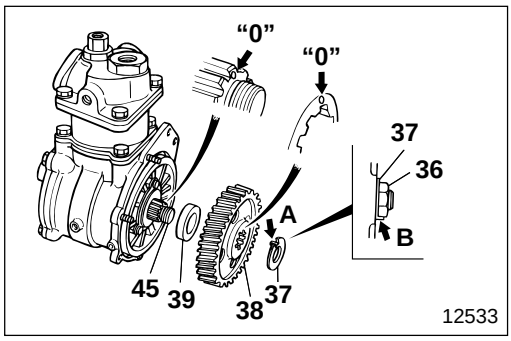
[Point of installation]

- Install compression rings **25** to **27** with punched marks **A** pointing toward the top of piston **29**.
- Stagger the splits of compression rings **25** to **27** at approximately 120°.
  B : No.1 compression ring split
  C : No.2 compression ring split
  D : No.3 compression ring split
- Arrange split **E** of oil ring **28** so that it is at the center of two compression ring splits, and install side rails **F** in position **G** staggered by approximately a further 45° to the right and left from the split of the oil ring.



32 **35** **Installation of connecting rod and connecting cap**

A : Alignment marks



37 **38** **Installation of lock washer and drive gear**

- Align alignment marks "**0**" of crankshaft **45** and drive gear **38** and install.
- Align indent **A** of lock washer **37** and alignment mark "**0**" of drive gear **38** and install.
- Make bend **B** on lock washer **37**, against one side of nut **36**, to act as a stopper.

39	Friction surface of piston	Multipurpose grease [NLGI No. 2 {Li soap)]	As required
—	Surface of O-ring	Multipurpose grease [NLGI No. 2 {Li soap)]	As required

● **Inspection after installation**

- Start the engine.
- Make sure that air is exhausted from the port of exhaust body **33** when the air pressure reaches the specified level and the air compressor is switched to idling.

NOTE

If high air pressure is exhausted first and approximately three seconds later, you cannot hear an exhausting sound, do not worry, it is normal.

- Make sure that there is no air leakage from any piping connection.

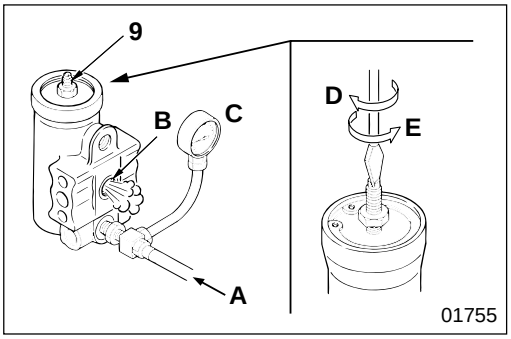
18	Interior of body	Multipurpose grease [NLGI No. 2 (Li soap)]	As required

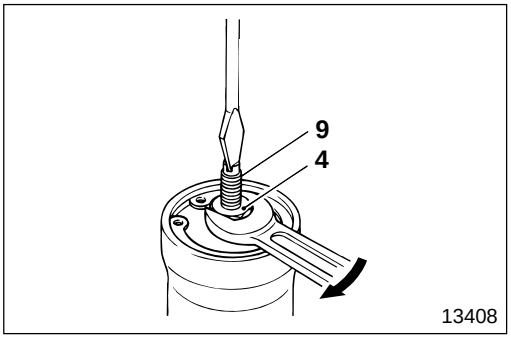
◆ Service procedure

● Inspection of function after assembly

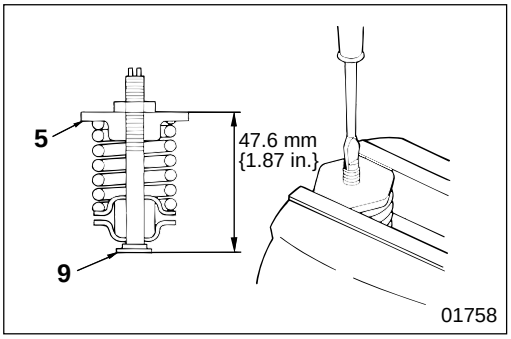


- Increase air pressure **A** gradually and read the value on air pressure gauge **C** when air is discharged from **B**. Adjust by turning adjusting screw **9** so that the reading conforms to the standard value (high specified-pressure).
  D : Turning clockwise decreases the pressure
  E : Turning counterclockwise increases the pressure
- Lower air pressure **A** to 685 kPa {100 psi, 7 kgf/cm²} or less, then raise the air pressure gradually. Read air pressure gauge **C** when it stops and check that the value conforms to the standard value (high specified-pressure). If the value deviates from the standard value, readjust.

- Lower air pressure **A** gradually. When the discharge of air from **B** ceases, read air pressure gauge **C** to check that the valve conforms to the standard value (high specified-pressure). If the value deviates from the standard value, replace the air pressure governor assembly.



- After adjusting, tighten lock nut **4** to prevent adjusting screw **9** being turned accidentally.



3 **Preliminary adjustment of adjusting screw assembly**

It is recommended that you adjust the distance from the upper level of upper spring seat **5** to the lower level of adjusting screw **9** to 47.6 mm {1.87 in.} by turning the adjusting screw, because this makes adjustment to the specified value easier.

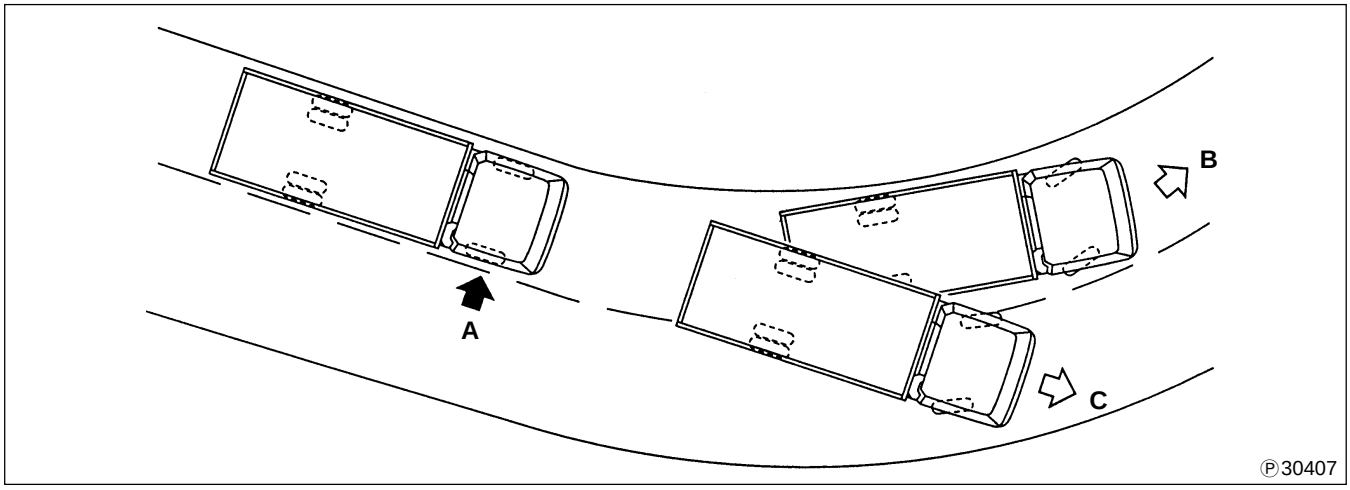
12 Air tank (for front brake system)
13 Air tank (for rear brake system)

Anti-lock brake system prevents the slippage of tires resulting from wheel lockup that occurs during sudden braking on slippery pavement, thus helping maintain controllability and directional stability of the vehicle.
The following section explains how wheel lockup affects the vehicle's movement and directional stability.

Wheel lockup

Rotating tires of a moving vehicle have a tendency to travel in the direction of tire rotation. Therefore, a driver can control the vehicle's movement by turning the steering wheel to move the front tires to a desired direction. In a vehicle not equipped with Anti-lock brake system, when a driver presses the brake pedal all the way, wheel lockup occurs and tires stop rotating while the vehicle is still moving. Tires in this condition lose the tendency to maintain the direction of travel and slip in a direction of an externally applied force regardless of the tires' rotating direction. In other words, when wheels lock, the vehicle loses its directional stability, disallowing the driver to control the vehicle's movement. Anti-lock brake system eases the braking force on wheels before wheel lockup occurs, thus maintaining controllability and directional stability.

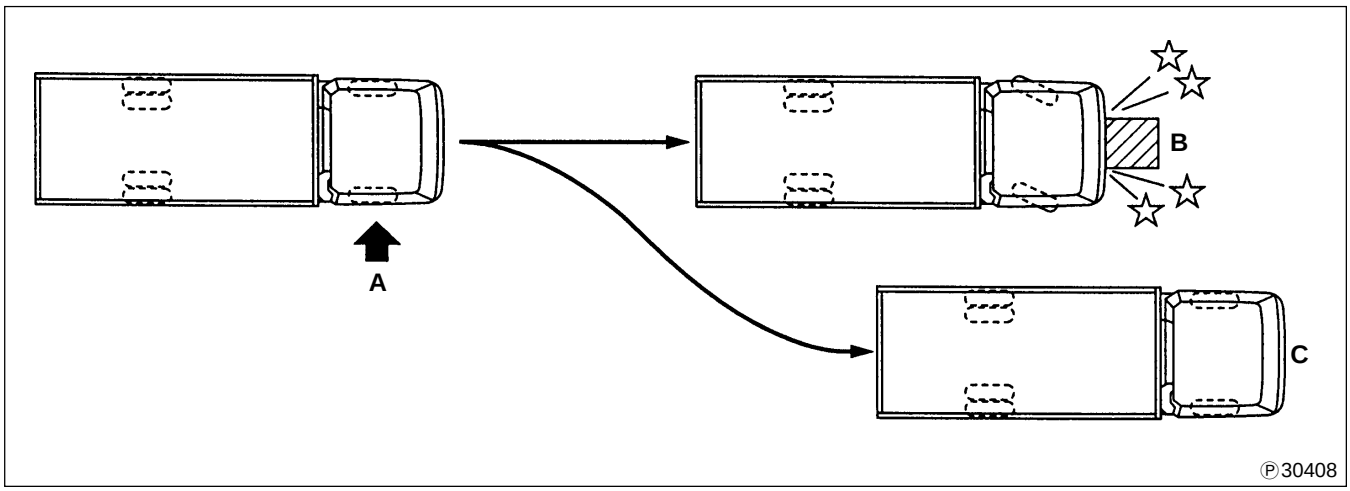
(1) Wheel lockup during cornering on slippery road



When wheel lockup occurs during braking at a curve on slippery pavement, the vehicle loses its directional stability and does not move in the steered direction.

A : Braking point (wheel lockup)
B : Steered direction
C : Vehicle continues to travel straight

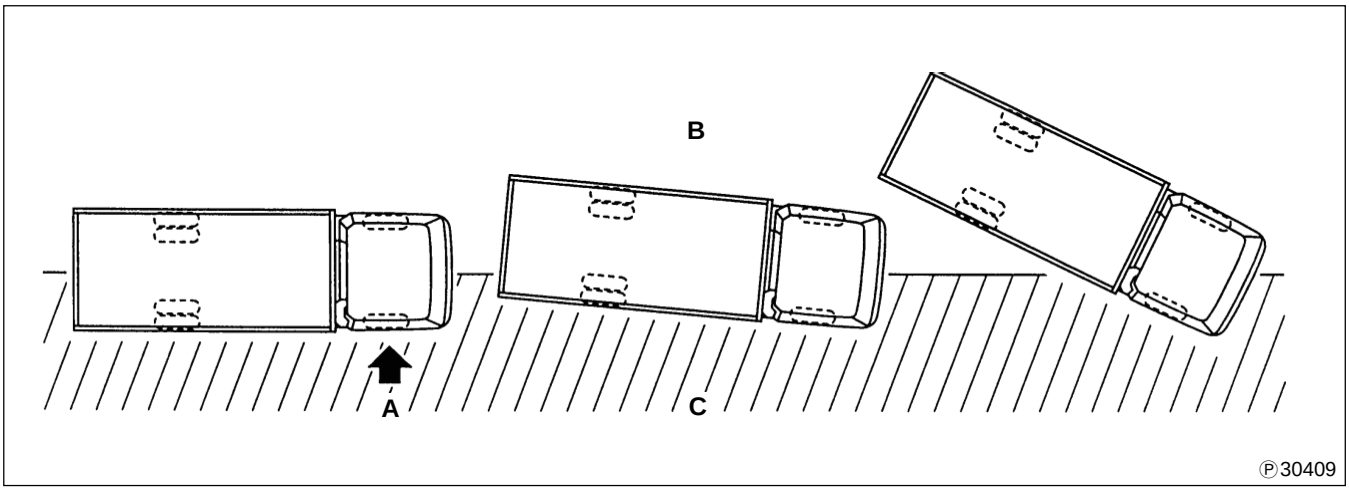
(2) Wheel lockup on straightway on slippery pavement



When wheel lockup occurs as a driver applies sudden braking on a straightway to avoid an obstacle ahead, the vehicle loses its directional stability and controllability. When this happens, the driver cannot control the vehicle's movement to avoid hitting the obstacle.

A : Braking point (wheel lockup)
B : Obstacle
C : Intended direction of vehicle movement

(3) Wheel lockup on surfaces with split μ factors (road surface with different friction coefficients for left and right wheels)



If the brake is applied hard when the friction coefficient of a road surface is different for the left and right tires, the tires which are on a surface with a lower friction coefficient lock up first and start sliding. Since the sliding of the tires on one side of the vehicle causes an imbalance in the stopping power between the left and right tires, one side of the vehicle slows down while the other side continues traveling at the same speed, resulting in the loss of directional stability. In this condition, the driver cannot maneuver the vehicle properly. When this happens during sudden braking, the vehicle spins.

A : Braking point (wheel lockup)
B : Slippery pavement
C : Non-slippery pavement

To prevent the above mentioned conditions, Anti-lock brake system controls the braking force to provide optimum stopping power to each wheel and prevents wheel lockup. Therefore, the vehicle maintains controllability and directional stability during hard braking without slipping or sliding.

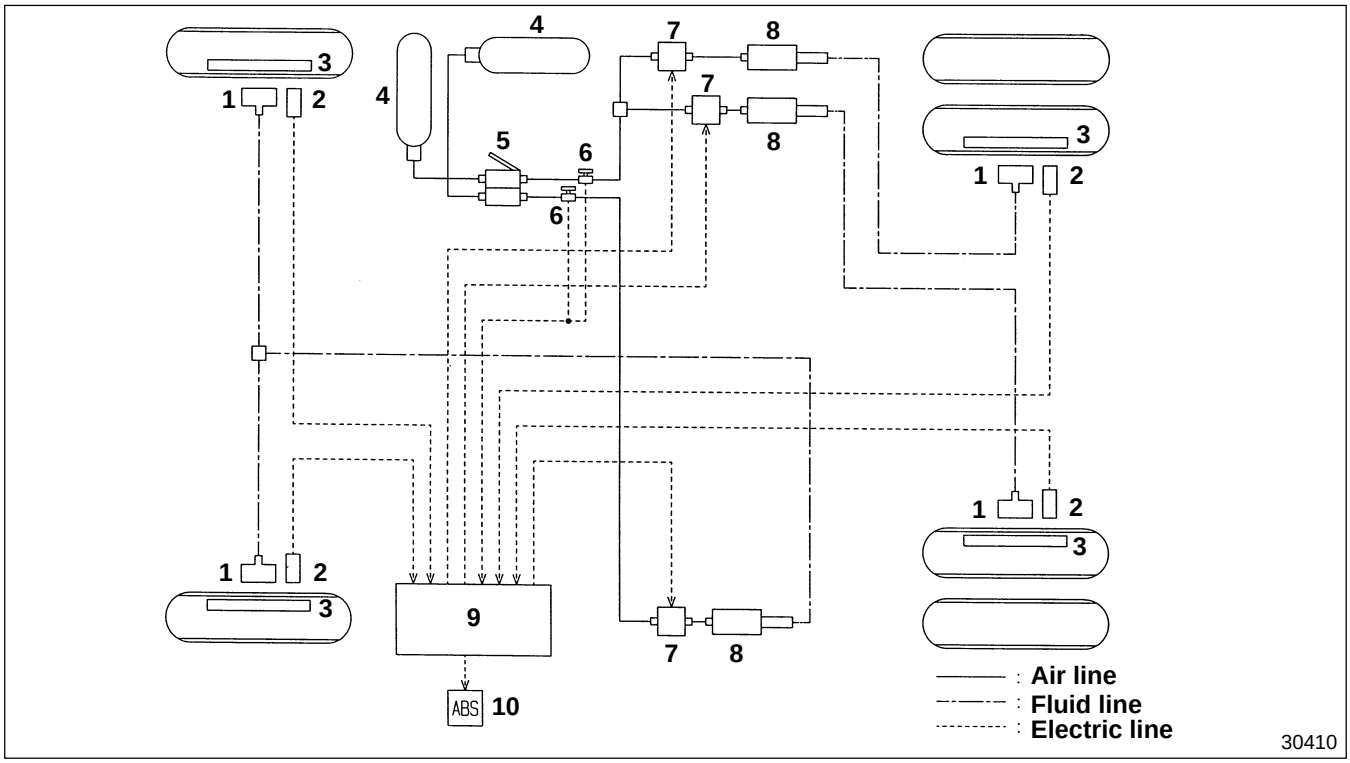
● Anti-lock brake system structure

Anti-lock brake system consists of wheel speed sensors **2** that detect wheel speed, control unit **9** that detects wheel lockup tendencies based on wheel speed data and outputs signals to control the braking force, control valves **7** that physically regulate the braking force, and Anti-lock brake system warning lamp **10** that indicates system abnormalities.

The following shows the Anti-lock brake system control process in a wheel lockup condition.

Schematic system diagram

< Air-over hydraulic brake >

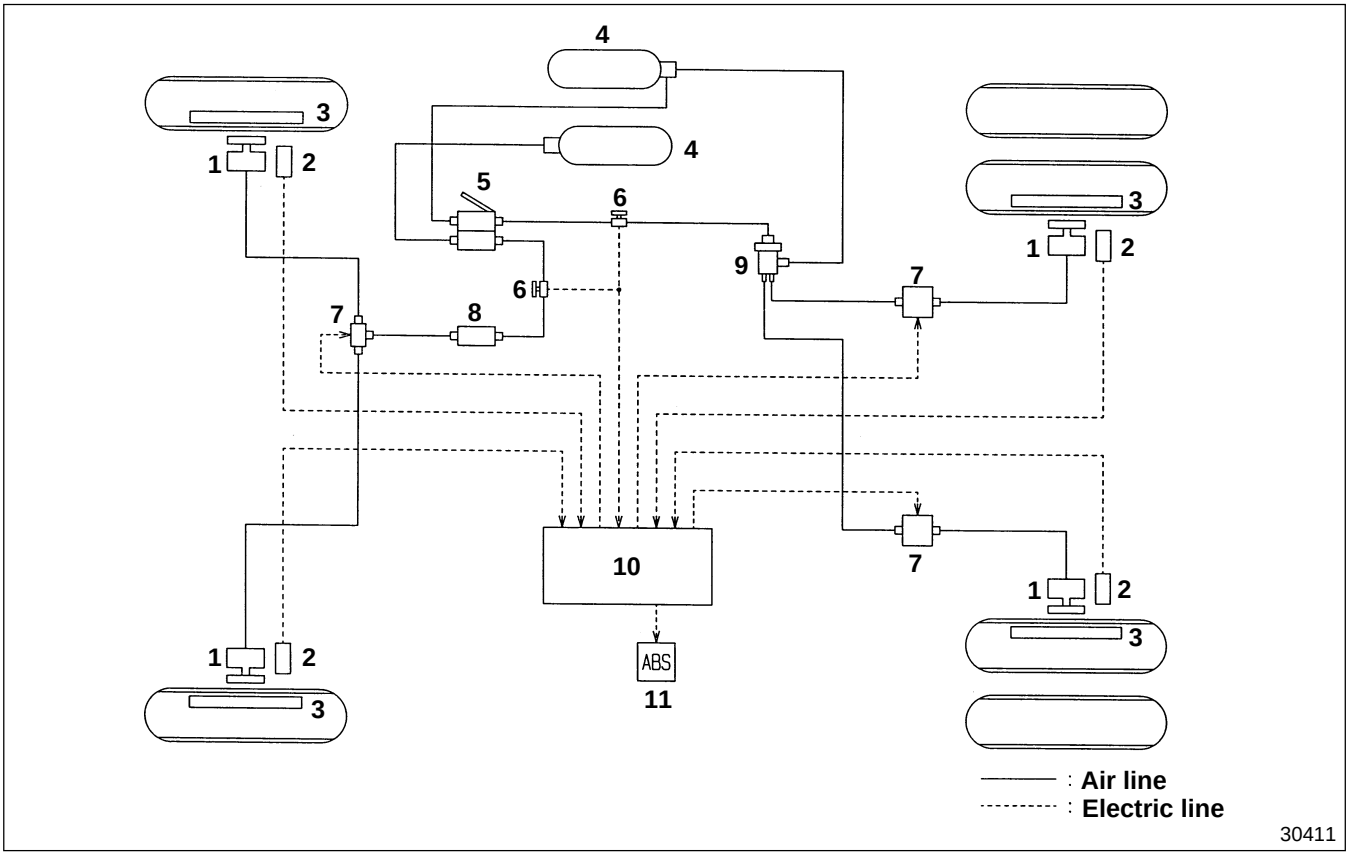


1 Wheel brake
2 Wheel speed sensor
3 Rotor
4 Air tank
5 Dual brake valve
6 Stop lamp switch
7 Control valve
8 Brake booster
9 Electronic control unit
10 Anti-lock brake system warning lamp

- Anti-lock brake system uses wheel speed sensors **2** and Electronic control unit **9** to monitor the rotating speed of wheels. When the wheel speed exceeds the preset deceleration speed or slip rate, the Electronic control unit detects it as the tendency leading to wheel lockup and activates control valves **7** to reduce air pressure inside brake boosters **8**. This decreases the braking force and prevents wheel lockup. Then, when the wheel speed increases, the wheel speed sensors send signals to the control valves by way of the Electronic control unit to increase air pressure in the brake boosters to augment the braking force.
- This control cycle is repeated to prevent wheel lockup on slippery pavements and ensure the vehicle's directional stability during braking. The 4-sensor 3-channel Anti-lock brake system uses four wheel speed sensors **2**, which are located at the front and rear wheels, to control each of the four wheels. For the front wheels, the control function is integrated for the left and right wheels.

Schematic system diagram

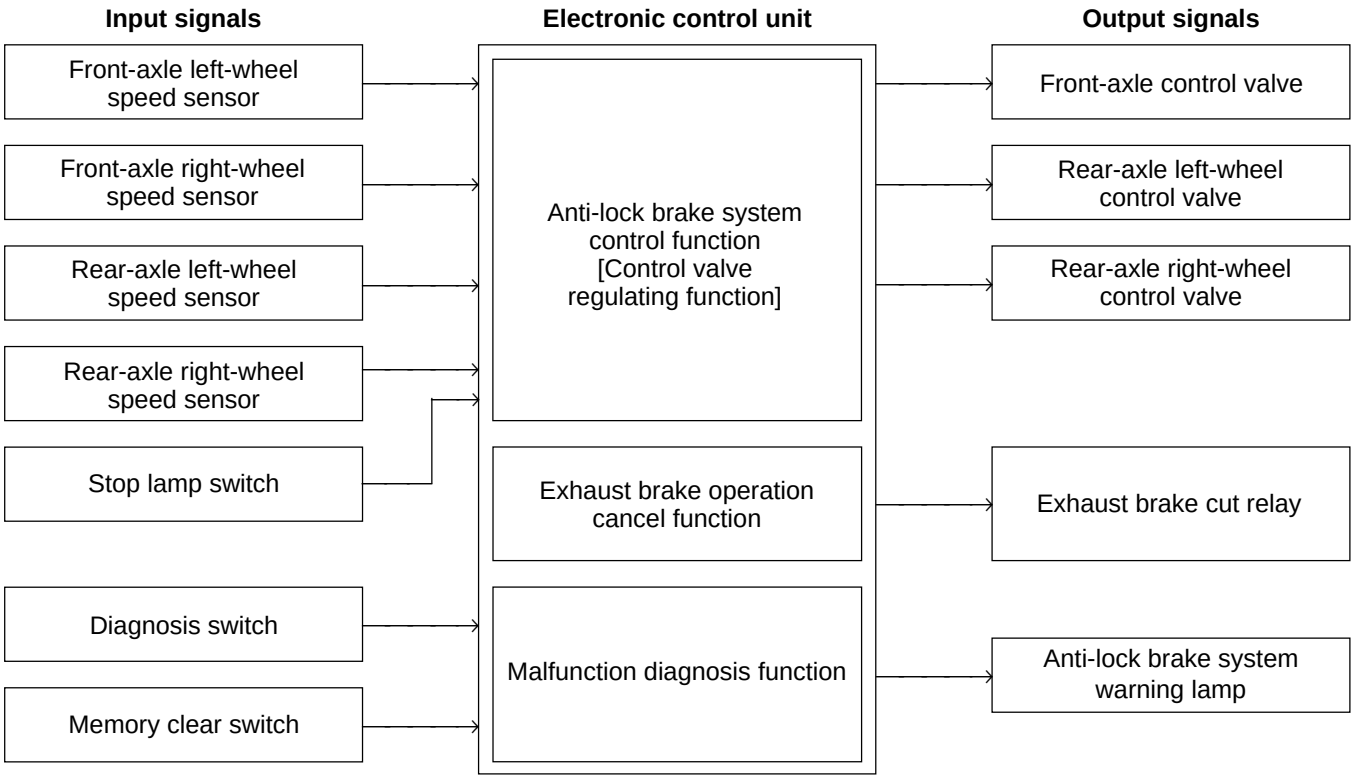
< Full-air brake >



1 Brake chamber
2 Wheel speed sensor
3 Rotor
4 Air tank
5 Dual brake valve
6 Stop lamp switch
7 Control valve
8 Quick release valve
9 Relay valve
10 Electronic control unit
11 Anti-lock brake system warning lamp

- Anti-lock brake system uses wheel speed sensors **2** and Electronic control unit **10** to monitor the rotating speed of wheels. When the wheel speed exceeds the preset deceleration speed or slip rate, the Electronic control unit detects it as a wheel lockup tendency and activates control valves **7** to reduce air pressure inside brake chambers **1**. This decreases the braking force and prevents wheel lockup. Then, when the wheel speed increases, the wheel speed sensors send signals to the control valves by way of the Electronic control unit to increase air pressure in the brake chambers to augment the braking force.
- This control cycle is repeated to prevent wheel lockup on slippery pavements and ensure the vehicle's directional stability during braking. The 4-sensor 3-channel Anti-lock brake system uses four wheel speed sensors **2**, which are located at the front and rear wheels, to control each of the four wheels. For the front wheels, the control function is integrated for the left and right wheels.

Anti-lock brake system function



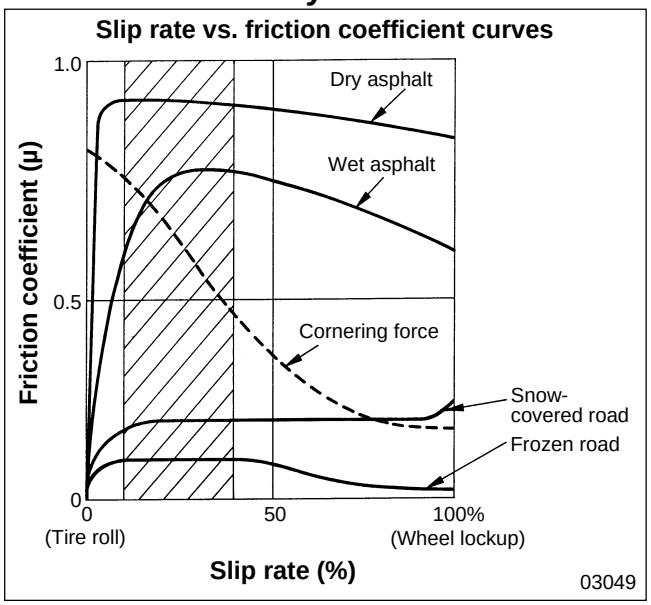
Anti-lock brake system malfunction diagnosis function

When the Electronic control unit detects malfunction of the following components, it turns on the Anti-lock brake system warning lamp to indicate the system abnormality.

- Broken wire, short-circuit or output abnormality in wheel speed sensors
- Broken wire or short-circuit in outlet and holding valves of control valves
- Broken wire, short-circuit or power supply voltage abnormality in power relays
- Abnormal detection of Electronic control unit

M E M O

● Anti-lock brake system control



To provide optimum stopping power, Anti-lock brake system controls the braking force based on the slip rate determined by the relationship between the wheel speed and vehicle speed. When the brake is applied, the resulting force creates resistance which slows down the wheel rotation, thus reducing the speed of the vehicle. However, inertia acts on the vehicle and maintains the vehicle's forward movement despite the stopping force applied by the tires. When there is a difference between the wheel speed and vehicle speed, slipping occurs. The degree of slippage is expressed by a slip rate.

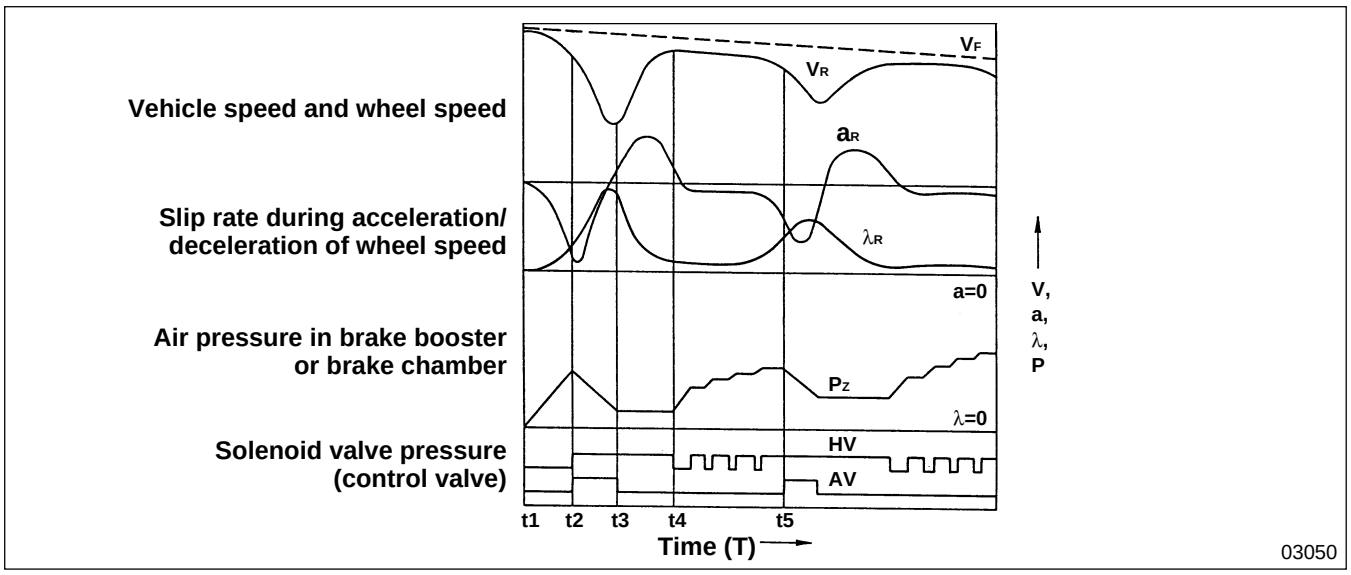
$$\text{Slip rate (\%)} = \frac{\text{Vehicle speed} - \text{Wheel speed}}{\text{Vehicle speed}} \times 100$$

When the slip rate is 0%, there is no slippage between the tires and pavement. The slip rate of 100% refers to a wheel lockup condition.

The graph shows the relationship between the slip rate and the friction coefficient of tire and pavement. In a vehicle equipped with Anti-lock brake system, the Electronic control unit and control valves adjust the braking force and maintains it within the shaded area on the graph where the friction coefficient is high, thus preventing tire slippage and maintaining stability during stopping.

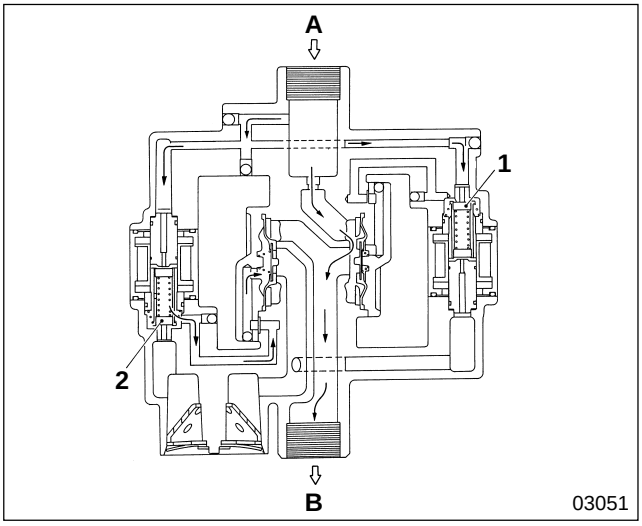
● Anti-lock brake system operation

Characteristic curve



The above Anti-lock brake system characteristic graph shows the time-based changes in vehicle speed, wheel speed of individual tires, and brake pressure levels during braking. The Electronic control unit calculates the wheel speed and estimates the vehicle speed based on signals sent from wheel speed sensors, and continuously monitors the slip rate and deceleration speed. When the Electronic control unit detects a tendency toward wheel lockup, it sends a signal to the solenoid valves of the control valves. The following shows the control system.

- **V_F** : Vehicle speed
- **V_R** : Wheel speed
- **a_R** : Acceleration/deceleration of wheel speed
- **λ_R** : Slip rate
- **P_Z** : Airpressure inside brake booster < air-over hydraulic brake > or brake chamber < full-air brake >
- **HV** : Solenoid valve (Pressure holding valve of control valve)
- **AV** : Solenoid valve (Outlet valve of control valve)

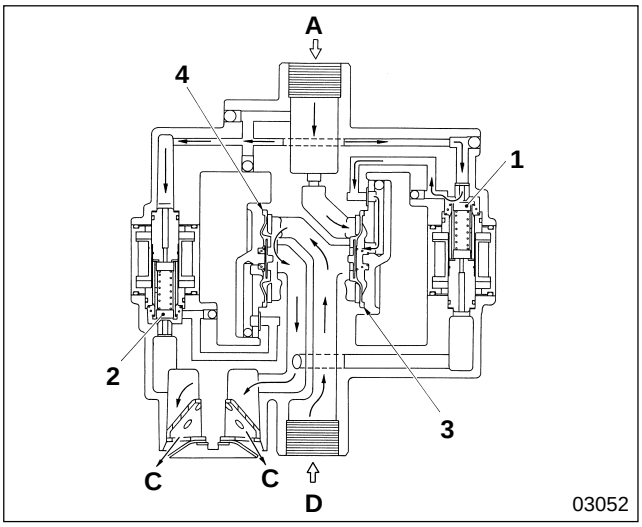


During normal braking

When there is no tendency toward wheel lockup under normal braking, solenoid valves **1**, **2** do not activate, thus air pressure is fed from the dual brake valve to the air master.

A : From dual brake valve < air-over hydraulic brake > From quick release valve (front) and relay valve (rear) < full-air brake >

B : To brake booster < air-over hydraulic brake > To brake chamber < full-air brake >



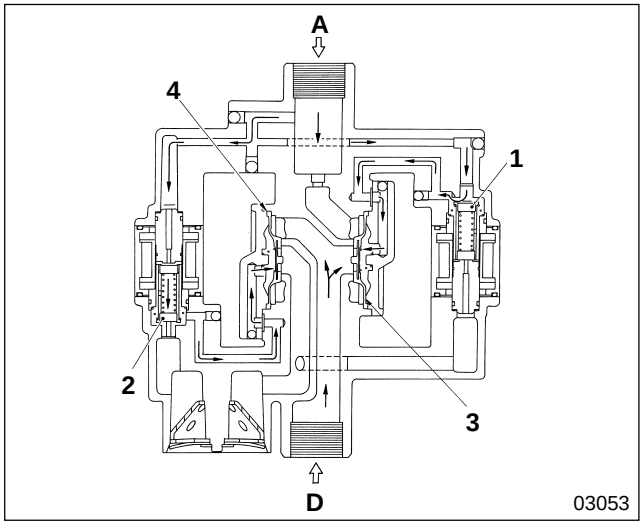
During depressurizing

- When the brake is applied at t_1 on the previous Anti-lock brake system characteristic graph, the air pressure inside the brake boosters or brake chambers increases, and the vehicle speed and wheel speed start decreasing. When the wheels show a tendency toward wheel lockup at t_2 on the graph, the Electronic control unit outputs a control signal to turn ON solenoid valve (holding valve) **1** and solenoid valve (outlet valve) **2**.
- Pressure holding valve **3** closes, and outlet valve **4** opens, discharging the air from the brake booster or brake chamber to minimize the wheel lockup tendency. ($t_2 \rightarrow t_3$)

A : From dual brake valve < air-over hydraulic brake > From quick release valve (front) and relay valve (rear) < full-air brake >

C : Pressure discharge

D : From brake booster < air-over hydraulic brake > From brake chamber < full-air brake >



During pressure holding

- At t_3 on the previous Anti-lock brake system characteristic graph, solenoid valve (outlet valve) **2** turns OFF and closes outlet valve **4**. Therefore, the air pressure inside the brake booster or brake chamber is retained. This makes the slip rate closer to ($\lambda = 0$) and the wheel speed increases.
- At t_4, solenoid valve (holding valve) **1** repeats ON and OFF operations until t_5. Momentary opening and closing of pressure holding valve **3** increase the pressure in steps. This operation reduces the wheel speed. The above control cycle ($t_2 \rightarrow t_5$) is repeated until the vehicle comes to a complete stop.

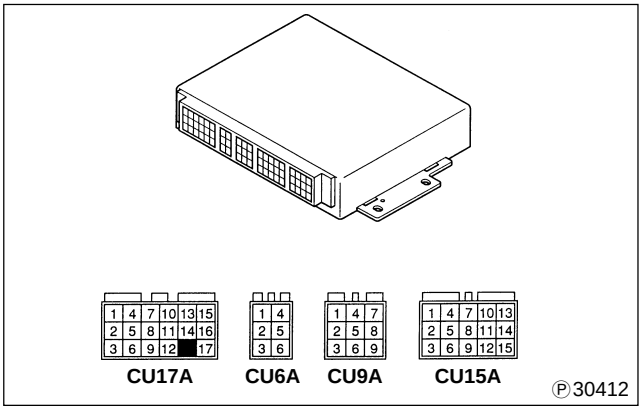
  A : From dual brake valve < air-over hydraulic brake > From quick release valve (front) and relay valve (rear) < full-air brake >

  D : From brake booster < air-over hydraulic brake > From brake chamber < full-air brake >

Anti-lock brake system and exhaust brake

On slippery pavement, the use of the exhaust brake can result in a condition similar to wheel lockup. Therefore, if the exhaust brake is activated while the Anti-lock brake system control is in operation, it hinders the Anti-lock brake system from providing proper brake control. To prevent this, when the Anti-lock brake system is in operation, the exhaust brake is deactivated even when the exhaust brake switch is turned ON.

When the Anti-lock brake system deactivates, the exhaust brake provides its normal function when the exhaust brake switch is ON.



● Anti-lock brake system components

Electronic control unit

This component calculates the wheel speed and estimates the vehicle speed based on a signal sent from the wheel speed sensors. Based on the calculation results, it determines a tendency for wheel lockup, and sends a brake pressure control signal to the solenoid valves of the control valves to regulate air pressure accordingly.
The Electronic control unit is equipped with a self-diagnosis function. If an abnormality occurs, the Electronic control unit turns on the warning lamp to indicates the system malfunction and deactivates the Anti-lock brake system control to set the brake system in the normal condition (without Anti-lock brake system control).

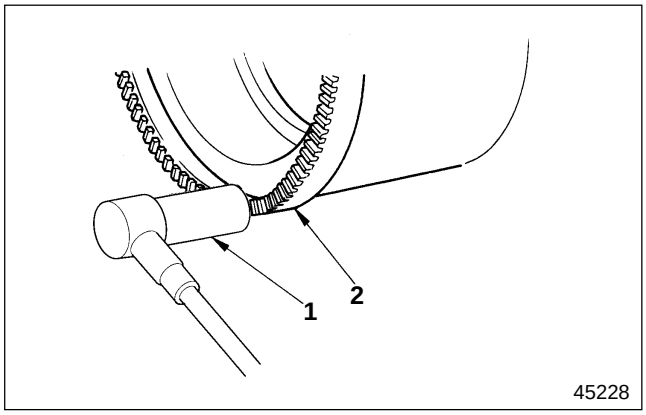
Control valve

The valve is comprised of solenoid valves **3** that receive a signal from the Electronic control unit and controls air pressure supplied from the dual brake valve, and diaphragm valves **4**.

The two solenoid valves operate in different combinations to increase, maintain and decrease air pressure.

A : Inlet port 1 (From dual brake valve < air-over hydraulic brake > or quick release valve (front), and relay valve (rear) < full-air brake >)

B : Outlet port 2 (To brake booster < air-over hydraulic brake > or brake chamber < full-air brake >)



Wheel speed sensor

Wheel speed sensor **1** detects the rotating speed of the wheel and sends a signal to the Electronic control unit. The sensor unit houses an electromagnetic pickup with a permanent magnet core placed inside the coil.

Rotor **2** is connected to the wheel hub. The rotor has a ring gear, and the evenly spaced tooth ridges are positioned perpendicular to the sensor. When the wheel rotates and the rotor teeth cross the magnetic flux of the sensor, the electric potential difference generated by the coil results in an alternate-current voltage that is directly proportional to the rotating speed. The resulting signal is then sent to the Electronic control unit.

ON-VEHICLE INSPECTION AND ADJUSTMENT

Periodic Inspection Procedures

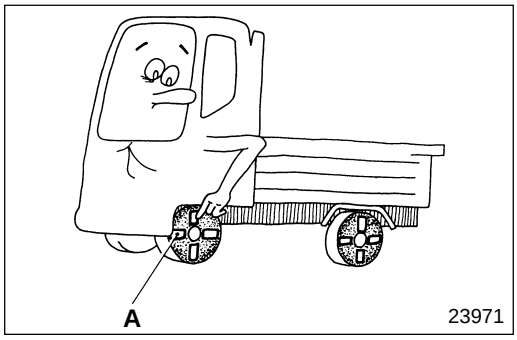
(1) Periodic inspection of Anti-lock brake system

- Inspect the vehicle's Anti-lock brake system following the procedure below.
- If an abnormality is found in this inspection, further inspect the Anti-lock brake system using Multi-Use Tester II or the diagnosis switch by referring to TROUBLESHOOTING section.
  P35E-21

- Inspection procedure

① With the vehicle stationary, press the brake pedal and inspect the control valves for air leaks.
If air leaks from the control valve unit, replace it. If air leaks from the air pipe or connector, tighten the joint.
Then, release the brake pedal and inspect the air discharge condition of the control valve. If there is no air discharging operation, replace the control valve.
Conduct the above inspection for each control valve.

② Inspection using brake tester
Check the braking force at each wheel with a brake tester by following the inspection procedure for ordinary vehicles.
If an abnormality is found, inspect the wheel brake units, service brake system and control valves.



③ Drive the vehicle and check the operation of the Anti-lock brake system.
- Conduct a test drive at an open area to ensure safety.
- Conduct a test drive without cargo.

Attach white tape **A** on the sides of tires, so that it is easy to observe the rotation of the front and rear wheels.
- Turn the starter switch from the OFF position to the ON position, and make sure that the ABS warning lamp lights.
  Then, check that the ABS warning lamp turns off approximately two seconds after the starter switch is turned on.
- Drive the vehicle at a speed of 20 to 30 km/h {12 to 19 mph}, and apply a sudden brake. Make sure that wheel lockup does not occur in any of the tires.

(2) Operating conditions resulting from Anti-lock brake system malfunction

Lamp condition	Possible causes		Fail-safe functions (operation in the case of malfunction)
ABS warning lamp ABS Warning lamp does not turn off two seconds after starter switch is turned on. ① ABS warning lamp lights when starter switch is turned to ON position, does not turn off two seconds after starter switch is turned on. ② ABS warning lamp lights during driving. ③ ABS warning lamp lights after 30 to 60 minutes regardless of whether vehicle is driven or stationary.	Power supply system (Lamp condition: ①, ②)	Faulty relay (for power supply) inside Electronic control unit	Anti-lock brake system control becomes inactive for all systems, and all wheels operate under normal brake system.
		Blown fuse	
		Broken wire in harness, short-circuit or disconnected connector, faulty contact or faulty grounding	
		Low battery voltage	
	Wheel speed sensor system	Excessive clearance between wheel speed sensor and rotor (Lamp condition: ②)	¥When malfunction occurs in one front wheel Properly operating front wheel speed sensor of the other front wheel is used for Anti-lock brake system control of the wheel with malfunctioning sensor. ¥When malfunction occurs in both front wheels Anti-lock brake system control is deactivated for front wheels. ¥When malfunction occurs in one rear wheel Anti-lock brake system control is provided only to the rear wheel with properly operating sensor.
		Defective wheel speed sensor (Lamp condition: ①, ②)	
		Broken wire, short-circuit or disconnected connector or faulty contact in wheel speed sensor harness (Lamp condition: ①, ②)	
	Control valve system (Lamp condition: ①, ②)	Short-circuit in coil or power-supply side of harness	Anti-lock brake system control becomes inactive for all systems, and all wheels operate under normal brake system.
		Defective relay (for power supply) inside Electronic control unit	
	Control valve	Broken wire or short-circuit in coil or harness	Only the properly operating control valves are used for Anti-lock brake system control.
	Electronic control unit (Lamp condition: ①, ③)	Electronic control unit internal malfunction or disconnected connector	Anti-lock brake system control becomes inactive for all systems, and all wheels operate under normal brake system.
	ABS warning lamp system (Lamp condition: ①, ②)	Short-circuit in harness	Anti-lock brake system control operates normally.

Adjustment of Wheel Speed Sensor Clearance

Tightening torque

Unit : N·m {ft.lbs, kgf·m}

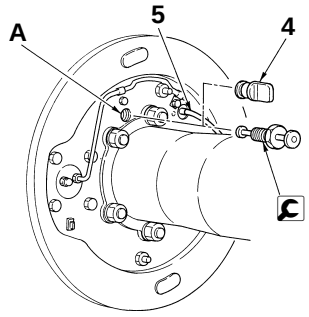
Location	Parts to be tightened	Tightening torque	Remarks
7	Bolt (Anchor bracket mounting)	135 {100, 13.8}	—

Special tools

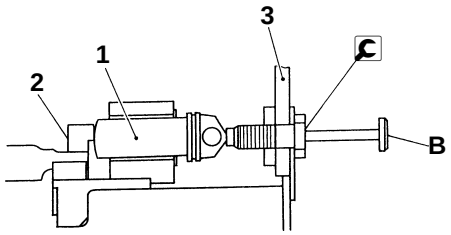
Unit : mm {in.}

Location	Tool name and shape	Part No.	Application
1	Adjuster  14912	MH062080	Adjustment of wheel speed sensor clearance

< Air-over hydraulic brake >



14913



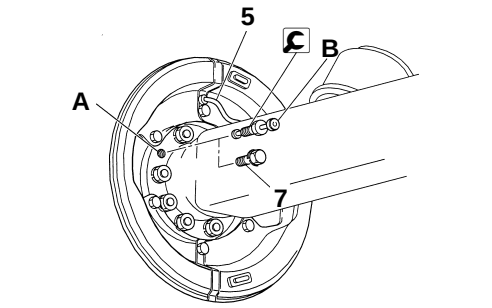
23974

Tighten adjuster to extend wheel speed sensor **1**, and adjust clearance between the sensor and rotor **2**.

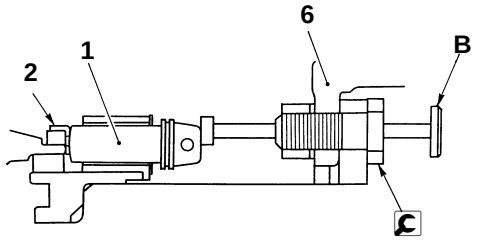
- Remove plug **4** located on the back side of back plate **3**.
- Mount adjuster in adjustment hole **A**, and tighten the adjuster.
- Wheel speed sensor **1** contacts the rotor before adjuster is completely tightened. Therefore, do not press shaft **B**, and tighten the adjuster until resistance is felt.
- Be sure to reinstall plug **4** after adjustment.

5 : Wheel speed sensor harness

< Full-air brake >



Ⓟ30555



23976

Tighten 🔧 adjuster to extend wheel speed sensor **1**, and adjust clearance between the sensor and rotor **2**.

- Remove bolt **7** located on the back side of anchor bracket **6**.
- Mount 🔧 adjuster in adjustment hole **A**, and tighten the adjuster.
- Wheel speed sensor **1** contacts the rotor before 🔧 adjuster is completely tightened. Therefore, do not press shaft **B**, and tighten the adjuster until resistance is felt.
- After adjustment, tighten bolt **7** to the specified torque.

5 : Wheel speed sensor harness

Inspection of Wheel Speed Sensor Signal Waveform Using Oscilloscope

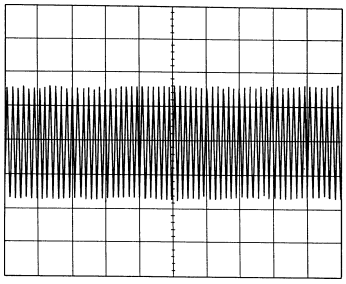
Inspect the rotor for dents using an oscilloscope, since the tester cannot be used for dent detection.

NOTE

Use an oscilloscope with a waveform recording function.

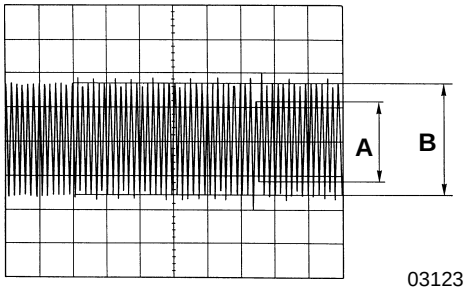
- Lift the wheel to be tested off the ground, and disconnect the connector at the wheel speed sensor.
- Connect the terminal of the oscilloscope to the terminal of the disconnected connector. Rotate the wheel at a constant speed. Check the waveform shown on the oscilloscope to check for dents on the rotor.

Normal waveform (no dent on rotor)



03122

Abnormal waveform (with dents on rotor)



03123

- Rotor dents are often made by the rotor press-fit on the hub end contacting the axle during installation of the hub and brake drum assembly on the axle. When installing the hub & brake drum assembly, pay close attention to prevent the rotor from contacting other parts.

A : Vmin (Minimum peak)

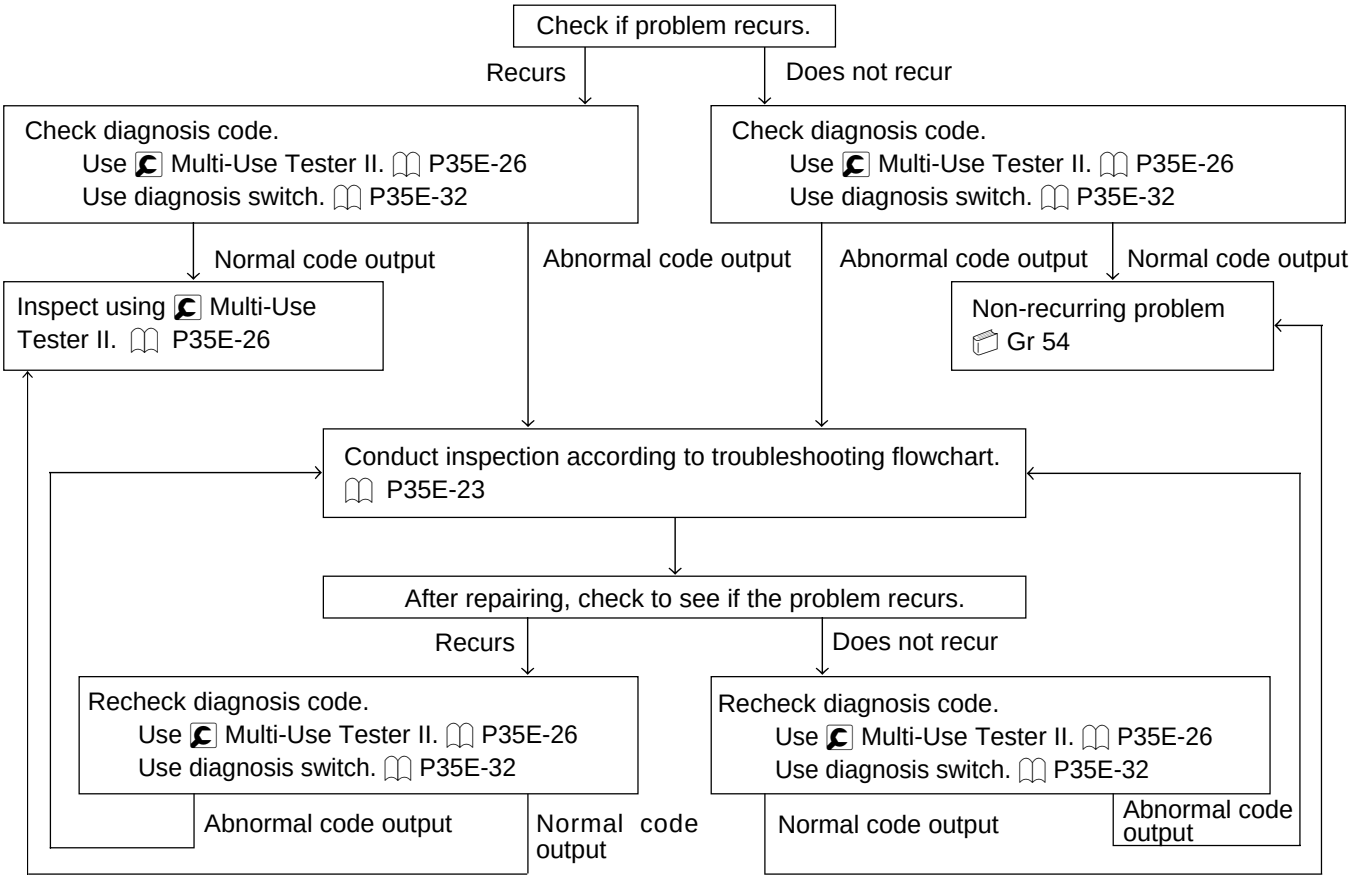
B : Vmean (Average of maximum peaks)

$$\frac{\text{Vmean} - \text{Vmin}}{\text{Vmean}} = 0.2(20\% \text{ or lower})$$

If more than 20%, replace the rotor.

Troubleshooting Procedures

Inspection the following components when the ABS warning lamp lights.
When the above warning lamp lights, conduct an inspection according to the following flowchart.



TROUBLESHOOTING

Troubleshooting Flowchart

- The Electronic control unit is equipped with a diagnosis function that monitors system operations. If the diagnosis function detects an abnormality, it turns on the ABS warning lamp on the meter cluster and stores the problem location data.
- The stored problem location data can be recalled by using Multi-Use Tester II or the diagnosis switch.
- Follow the instruction below to recall diagnosis codes.

(1) Multi-Use Tester II
Multi-Use Tester II displays diagnosis codes that indicate problem locations. The Multi-Use Tester II can also be used to check service data and actuator operations. P35E-26

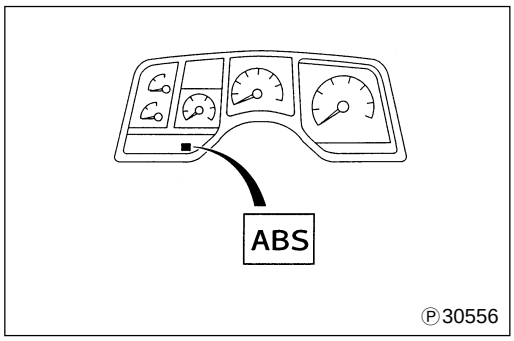
(2) Diagnosis switch
The diagnosis switch allows the indication of diagnosis codes and problem locations. When the diagnosis switch is operated, the ABS warning lamp on the meter cluster flashes. The number of lamp flashing operations indicates the code of problem location stored in the Electronic control unit. P35E-32

(3) Deletion of diagnosis code data
The method of erasing diagnosis code data from the Electronic control unit memory differs from model to model. Follow the procedure below.
- Multi-Use Tester II P35E-27
- Memory clear switch P35E-33

- Check the following items before conducting the troubleshooting described on the following page.

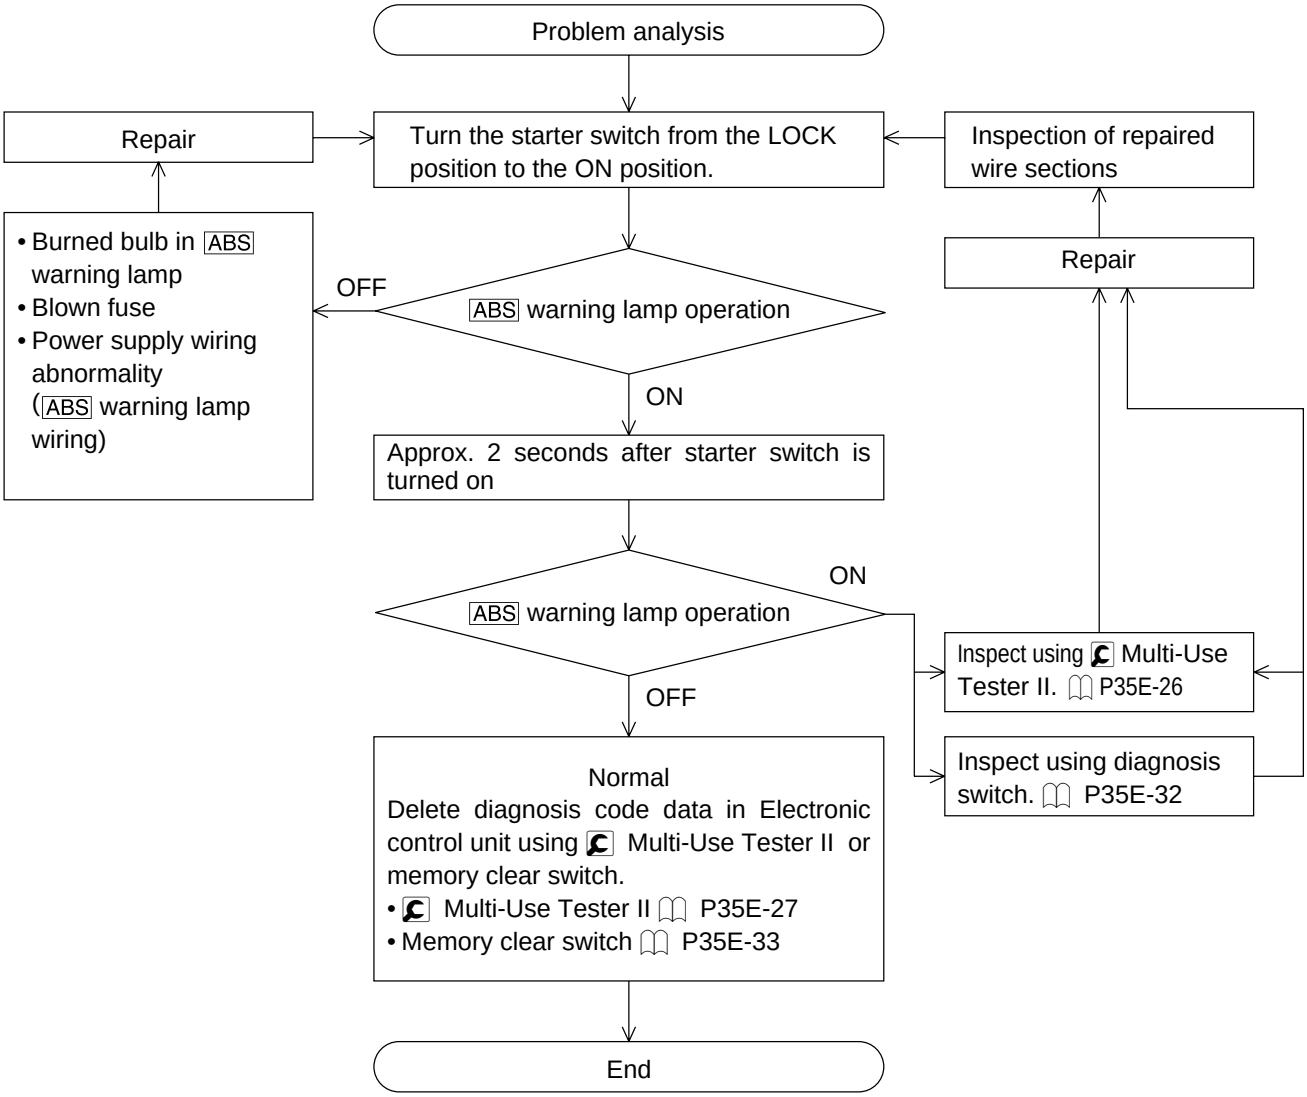
(1) Check to make sure that air pressure in the air tank is 685 kPa {100 psi, 7 kgf/cm^2} or higher.
(2) Check to make sure that the battery voltage is 12 V or higher.
(3) Check harness and connectors for secure connection. Before disconnecting connectors, turn starter switch to the LOCK position and wait for 20 seconds or longer.

- To inspect the ABS warning lamp, follow the procedure below.



- Check to see that the ABS warning lamp turns on and off in the following manner.
- Turn the starter switch to the ON position and check to see that the ABS warning lamp lights.
- The ABS warning lamp turns off approximately two seconds after the starter switch is turned on.
- If the warning lamp does not turn on and off in the above manner, check the diagnosis code. P35E-26, 32

< Troubleshooting Flowchart >



TROUBLESHOOTING

Tester

To inspect Anti-lock brake system, use Multi-Use Tester II.

(1) The Multi-Use Tester II displays inspection items on its LCD for easy data reading. It also enables detection of connection errors after rear wheel sensor connectors are repaired.

(2) The following items can be checked by the tester.

Inspection item
Diagnosis code
Service data
Actuator operation
Electronic control unit power supply voltage
Control valve power supply voltage
Stop lamp switch
Exhaust brake cut relay
ABS warning lamp
Control valve function
Wheel speed sensor function
Diagnosis switch

For details of tester inspection items, see the following pages. P35E-26

Special tools

Unit : mm {in.}

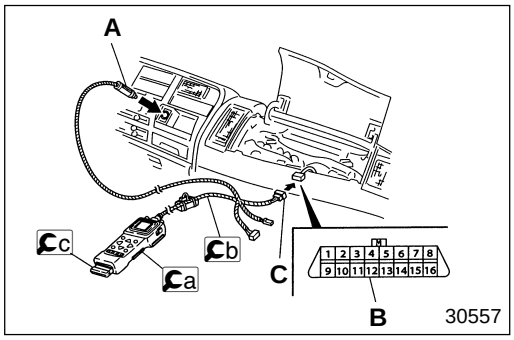
Tool name and shape	Part No.	Application
Multi-Use Tester II PLUS  19492	MB991496	Inspection of Anti-lock brake system
Multi-Use Tester II harness (for data communication)  19141	MK327601	
ROM pack (MRT-E8.1)  19493	MH063580	
Multi-Use Tester II harness (for circuit tester)  20536	MB991499	
Memory card (for Multi-Use Tester II)  20538	MB991500	

Procedure of Inspection Using Multi-Use Tester II

Use the Multi-Use Tester II to conduct necessary service operations listed below.

Test the operations of actuators related to the problem locations indicated by diagnosis codes, and inspect data list.

- Recall of diagnosis codes P35E-27
  Use the self-diagnosis function to recall the diagnosis codes stored in the Electronic control unit.
  Diagnosis codes of both current and previous malfunctions are indicated.
  The diagnosis code of the current malfunction is indicated when the starter switch remains in the ON position after abnormality generation.
  When the starter switch is turned from the ON position to the ACC or LOCK position after abnormality generation, diagnosis codes of previous malfunctions stored in the Electronic control unit are indicated. Diagnosis codes of non-recurring problem malfunctions that generated during vehicle operation but did not reproduce after the starter switch is turned from the ON position to the ACC or LOCK position are also stored as previous malfunctions.
- Deletion of diagnosis codes P35E-27
  Use the diagnosis code delete function in the special test mode to erase diagnosis codes stored in the Electronic control unit.
- Forced drive of devices P35E-31
  Use the actuator test function to forcibly turn devices on and off to check faulty device operations.
- Service data check and switch on/off check P35E-30
  Use the data list function to check the data of voltage and vehicle speed. When each switch is turned on and off in the data list mode using the tester, the Multi-Use Tester II displays the ON and OFF switch status, thus allowing inspection of switches for proper function after repair or replacement is performed.
- Use the above Multi-Use Tester II functions to locate causes of malfunctions.
- The following shows how to connect and use the Multi-Use Tester II. For other Multi-Use Tester II functions and further details, refer to the Multi-Use Tester II operation manual.



Connection of Multi-Use Tester II

- Turn the starter switch to the LOCK position.
- Connect ca Multi-Use Tester II and cb Multi-Use Tester II harness, and insert cc ROM pack.
- Insert connector **A** into the cigarette lighter socket.
  Connect connector **C** (16-pin) to Multi-Use Tester II connector **B** (16-pin) located inside the relay and fuse box.

NOTE

Regarding the operating procedure, refer to the Multi-Use Tester II operation manual.

Diagnosis code of current malfunction

- Turn the starter switch to the ON position.
- Check the diagnosis code using the self-diagnosis function of Ca Multi-Use Tester II to obtain data of the problem location.
  P35E-28

Diagnosis codes of previous malfunctions

- Turn the starter switch to the ON position.
- With the diagnosis switch disconnected, disengage the memory clear switch to set the Electronic control unit to the previous malfunction indication mode. P35E-33
- Check the diagnosis codes of previous malfunctions using the self-diagnosis function of Ca Multi-Use Tester II, and obtain data of problem locations. P35E-33
- After checking diagnosis codes, connect the diagnosis switch and memory clear switch in that order.

Deletion of diagnosis codes

- Turn the starter switch to the ON position.
- Delete all diagnosis codes stored in the Electronic control unit by using Ca Multi-Use Tester II.

CAUTION⚠

- **Before erasing diagnosis codes, test-drive the vehicle after the malfunction is repaired (when system is in normal condition), and make sure the ABS warning lamp is not lit.**
- **If diagnosis codes are deleted when some of the connectors are not connected or the system is still malfunctioning, the Electronic control unit becomes damaged.**

20	ABS LANP OFF	ABS warning lamp: OFF

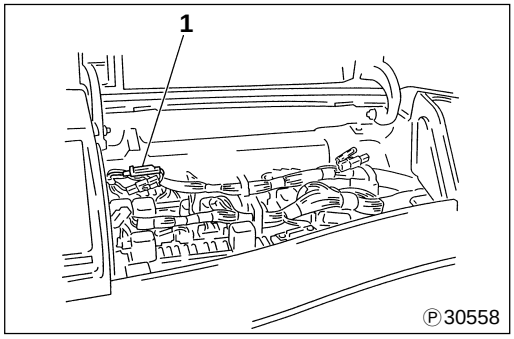
Item Nos. 15 and 16 are for vehicles equipped with an exhaust brake system.

Procedure of Inspection Using Diagnosis Switch

- When the ABS warning lamp lights, analyze the problem by following the procedure below.
- Diagnosis codes are used for the analysis of malfunctions. Diagnosis codes of both current and previous malfunctions are indicated.
- The diagnosis code of the current malfunction is indicated when the starter switch remains in the ON position after abnormality generation.
- When the starter switch is turned from the ON position to the ACC or LOCK position after abnormality generation, diagnosis codes of previous malfunctions stored in the Electronic control unit are indicated. Diagnosis codes of non-recurring malfunctions that generated during vehicle operation but did not reproduce after the starter switch is turned from the ON position to the ACC or LOCK position are also stored as previous malfunctions.

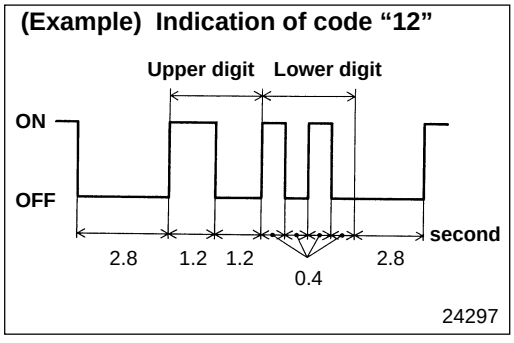
Diagnosis code indications and operations

Diagnosis switch	Memory clear switch		Current malfunction			
			Normal	Malfunction	Normal	Malfunction
			Previous malfunctions			
			Normal	Normal	Malfunction	Malfunction
Connect	Connect	ABS warning lamp	OFF	ON	OFF	ON
Disconnect	Connect		Lamp flashes to indicate diagnosis code for normal condition.	Lamp flashes to indicate diagnosis code of current malfunction.	Lamp flashes to indicate diagnosis code for normal condition.	Lamp flashes to indicate diagnosis code of current malfunction.
Disconnect	Disconnect		Lamp flashes to indicate diagnosis code for normal condition.	Lamp flashes to indicate diagnosis code of current malfunction.	Lamp flashes to indicate diagnosis codes of previous malfunctions.	Lamp flashes to indicate diagnosis codes of current and previous malfunctions.
Connect	Disconnect		OFF	ON	OFF	ON



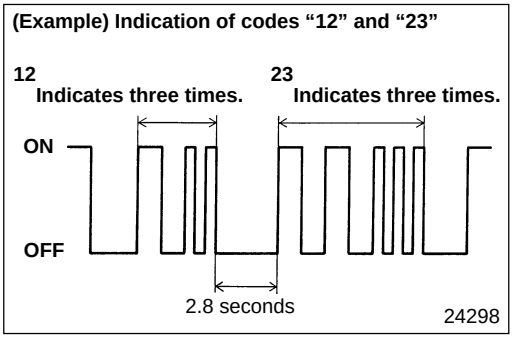
Diagnosis code indication

- Turn the starter switch to the ON position.
- Disconnect diagnosis switch **1** (white BN1A connector). The ABS warning lamp on the meter cluster begins flashing.
  The flashing pattern of the warning lamp indicates a diagnosis code. Check the code list to locate the problem location. P35E-34

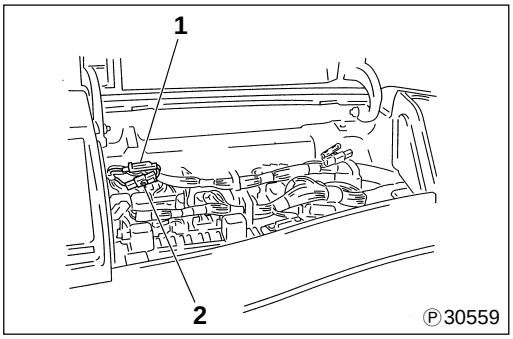


Reading diagnosis code of current malfunction

- After the Electronic control unit completes the self-diagnosis operation, the ABS warning lamp turns off in approximately 2.4 seconds, then starts indicating a diagnosis code.
  Each diagnosis code consists of two digits. The two digits are indicated in the following manner.
  - Tens digit indication
    The lamp remains ON for 1.2 seconds, then remains OFF for 1.2 seconds.
  - Ones digit indication
    The lamp remains ON for 0.4 second, then remains OFF for 0.4 second.
- Each malfunction code is indicated three consecutive times.



- If there are two or more malfunction codes in the memory, the lamp indicates the first malfunction code three times, turns off for 2.8 seconds, then indicates the next code three times.
  The lamp continues indicating all malfunction codes stored in the memory even if diagnosis switch **1** (white BN1A connector) is disconnected in the middle of code indication.



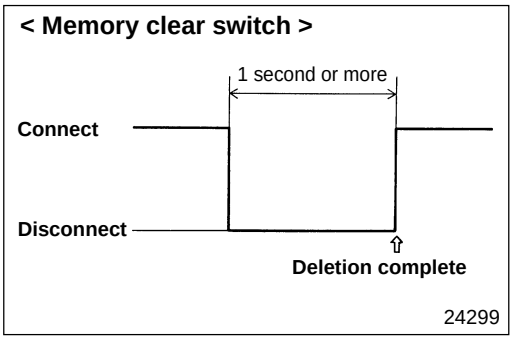
Reading diagnosis codes of previous malfunctions

- After reading the diagnosis code of the current malfunction, read the diagnosis codes of previous malfunctions.

CAUTION⚠

- **Note that connecting memory clear switch 2 (brown AL1A connector) erases diagnosis codes of current and previous malfunctions from the Electronic control unit memory.**
- **If diagnosis codes are deleted when some of the connectors are not connected or the system is still malfunctioning, the Electronic control unit becomes damaged.**

- To indicate diagnosis codes of previous malfunctions, with diagnosis switch **1** (white BN1A connector) disconnected, disengage memory clear switch **2** (brown AL1A connector). The ABS warning lamp starts flashing to indicate a diagnosis code.



Deleting diagnosis codes

CAUTION⚠

- **Before erasing diagnosis codes, test-drive the vehicle after the malfunction is repaired (when system is in normal condition), and make sure the ABS warning lamp is not lit.**
- **If diagnosis codes are deleted when some of the connectors are not connected or the system is still malfunctioning, the Electronic control unit becomes damaged.**

- Leave the starter switch in the ON position.
- After connecting diagnosis switch **1** (white BN1A connector), keep memory clear switch **2** (brown AL1A connector) disconnected for two seconds or more, then reconnect the memory clear switch.

Diagnosis Code Chart

Diagnosis code	Possible cause
11	Normal
21	Front-axle left-wheel speed sensor: Improper clearance
22	Excessive wobbling of front-axle left rotor
23	Damaged front-axle left rotor
24	Front-axle left-wheel speed sensor: Prolonged period of unstable output
25	Front-axle left-wheel speed sensor: Abnormally fast speed drop
26	Front-axle left-wheel speed sensor: Short-circuit to positive (+) wire, short-circuit to grounding wire, broken wire
27	Front-axle left-wheel speed sensor: Electronic control unit internal damage
31	Front-axle left-wheel speed sensor: Improper clearance
32	Excessive wobbling of front-axle right rotor
33	Damaged front-axle right rotor
34	Front-axle right-wheel speed sensor: Prolonged period of unstable output
35	Front-axle right-wheel speed sensor: Abnormally fast speed drop
36	Front-axle right-wheel speed sensor: Short-circuit to positive (+) wire, short-circuit to grounding wire, broken wire
37	Front-axle right-wheel speed sensor: Electronic control unit internal damage
41	Rear-axle right-wheel speed sensor: Improper clearance
42	Excessive wobbling of rear-axle left rotor
43	Damaged rear-axle left rotor
44	Rear-axle left-wheel speed sensor: Prolonged period of unstable output
45	Rear-axle left-wheel speed sensor: Abnormally fast speed drop
46	Rear-axle left-wheel speed sensor: Short-circuit to positive (+) wire, short-circuit to grounding wire, broken wire
47	Rear-axle left-wheel speed sensor: Electronic control unit internal damage
51	Rear-axle right-wheel speed sensor: Improper clearance
52	Excessive wobbling of rear-axle right rotor
53	Damaged rear-axle right rotor
54	Rear-axle right-wheel speed sensor: Prolonged period of unstable output
55	Rear-axle right-wheel speed sensor: Abnormally fast speed drop
56	Rear-axle right-wheel speed sensor: Short-circuit to positive (+) wire, short-circuit to grounding wire, broken wire
57	Rear-axle right-wheel speed sensor: Electronic control unit internal damage
61	Front-axle control valve: Short-circuit of outlet valve to positive (+) wire
62	Front-axle control valve: Short-circuit of outlet valve to grounding wire
63	Front-axle control valve: Broken wire in outlet valve
64	Front-axle control valve: Broken grounding wire
68	Front-axle control valve: Configuration error (*1)
75	Front-axle control valve: Short-circuit of holding valve to positive (+) wire
76	Front-axle control valve: Short-circuit of holding valve to grounding wire
77	Front-axle control valve: Broken wire in holding valve
78	Front-axle control valve: Configuration error (*1)
81	Rear-axle left-wheel control valve: Short-circuit of outlet valve to positive (+) wire
82	Rear-axle left-wheel control valve: Short-circuit of outlet valve to grounding wire
83	Rear-axle left-wheel control valve: Broken wire in outlet valve
85	Rear-axle left-wheel control valve: Short-circuit of holding valve to positive (+) wire
86	Rear-axle left-wheel control valve: Short-circuit of holding valve to grounding wire
87	Rear-axle left-wheel control valve: Broken wire in holding valve
89	Control valve grounding 2: Short-circuit to positive (+) wire
8A	Control valve grounding 2: Short-circuit to negative (-) wire

Diagnosis code	Possible cause
91	Rear-axle right-wheel control valve: Short-circuit of outlet valve to positive (+) wire
92	Rear-axle right-wheel control valve: Short-circuit of outlet valve to grounding wire
93	Rear-axle right-wheel control valve: Broken wire in outlet valve
94	Rear-axle right-wheel control valve: Broken grounding wire
95	Rear-axle right-wheel control valve: Short-circuit of holding valve to positive (+) wire
96	Rear-axle right-wheel control valve: Short-circuit of holding valve to grounding wire
97	Rear-axle right-wheel control valve: Broken wire in holding valve
99	Control valve grounding 1: Short-circuit to positive (+) wire
9A	Control valve grounding 1: Short-circuit to negative (-) wire
D1	Electronic control unit internal damage
D2	Electronic control unit internal damage
D3	Electronic control unit internal damage
D4	Electronic control unit internal damage
D5	Electronic control unit internal damage
E1	Control valve power supply voltage 1: Overvoltage
E2	Control valve power supply voltage 1: Low voltage
E3	Control valve power supply voltage 1: Broken wire
E4	Control valve grounding 1: Broken wire
E5	Control valve power supply voltage 2: Overvoltage
E6	Control valve power supply voltage 2: Low voltage
E7	Control valve power supply voltage 2: Broken wire
E8	Rear-axle left-wheel control valve: Broken grounding wire
E9	Electronic control unit power supply voltage: Overvoltage
EA	Electronic control unit power supply voltage: Low voltage
EB	Excessive voltage difference between control valve power supply voltages 1 and 2
F1	Exhaust brake cut relay: Short-circuit to positive (+) wire, broken wire
F2	Exhaust brake cut relay: Short-circuit to grounding wire
F5	Wheel arrangement error: Excessive wheel speed difference between front and rear wheels
F6	Wheel arrangement error: Wheel speed difference between front and rear wheels exceeding allowed range
FC	Wheel speed sensor abnormality generated previously. (*2)

*1 : Configuration error (mismatch between vehicle system and Electronic control unit system)

*2 : When a wheel speed sensor abnormality is generated in the previous driving operation, this diagnosis code is output. When this diagnosis code is generated, the ABS warning lamp does not turn off two seconds after the starter switch is turned on. However, if the wheel speed sensor is restored to its proper condition, the ABS warning lamp turns off and this diagnosis code is reset when the vehicle is operated at a speed of 10 km/h {6.2 mph} or faster.

NOTE

Alphabetic letters in the diagnosis codes indicate the following lighting cycles. A: 10, B:11, C: 12, D: 13, E: 14, F: 15

(Example) Diagnosis code: 8 A

Number of ones

Number of tens

Diagnosis code 8A indicates that the indication lights eight times first, then 10 times.

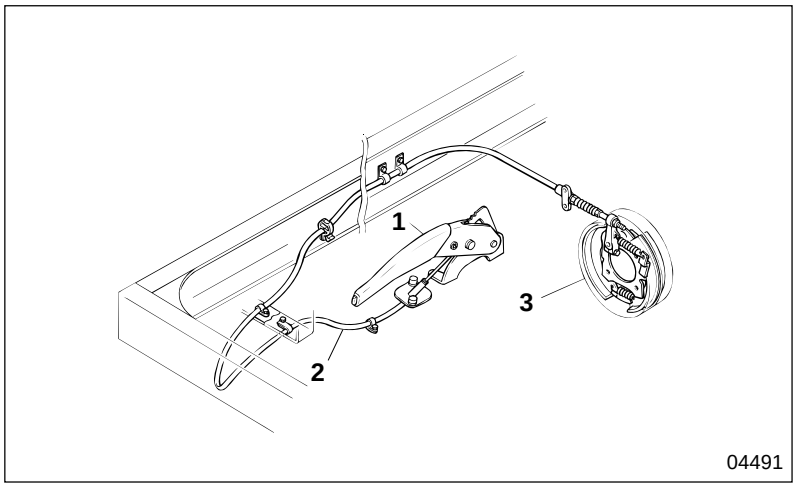
SPECIFICATIONS/STRUCTURE AND OPERATION

SPECIFICATIONS

Item \ Vehicle model		FK617, FM617
Brake	Type	Propeller shaft internal expanding type brake
	Operation type	Mechanical cable type
Parking brake assembly	Type	Duo-servo type
	Inner diameter of drum mm {in.}	ø254 {10}
	Lining width×Thickness mm {in.}	60×5.8 {2.36×0.23}

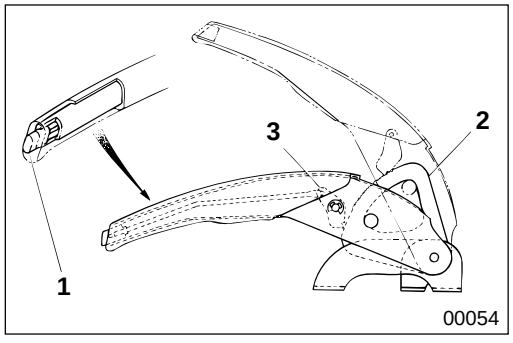
STRUCTURE AND OPERATION

Parking Brake Control



1 Parking brake lever
2 Parking brake cable
3 Parking brake assembly

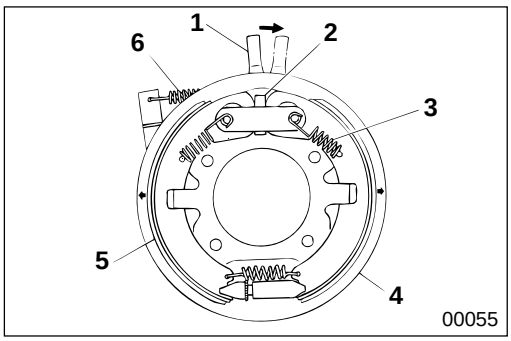
Parking Brake Lever



1 Release rod knob
2 Lever bracket
3 Locking latch

The parking brake has a built-in locking mechanism that prevents inadvertent release of the brake.
To release locking, push release rod knob **1** which will disengage from the serration of lever bracket **2** and the tooth of locking latch **3** freeing the parking brake lever and allowing it to return.

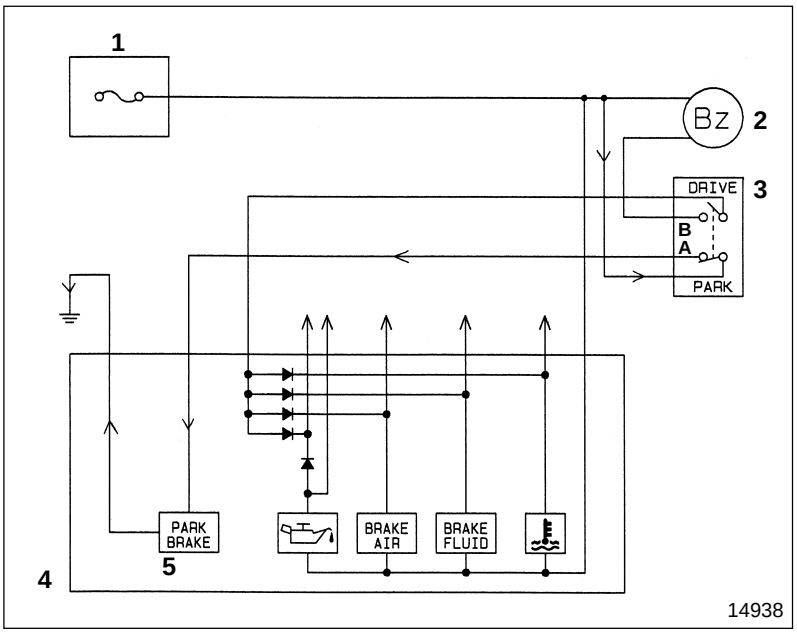
Parking Brake Assembly < Dual-servo Type >



1 Camshaft lever
2 Camshaft
3 Shoe return spring
4 Brake drum
5 Shoe and lining assembly
6 Camshaft lever return spring

Pulling the parking brake lever pulls the parking brake cable, which in turn pulls camshaft lever **1**. At the same time, camshaft **2** rotates in conjunction with the camshaft lever, and expands shoe and lining assembly **5** making it press against brake drum **4**. This frictional force locks the propeller shaft that is connected to the drum. When the brake lever is released, the repercussive force of shoe return spring **3** releases the brake.

Parking Brake System Electric Circuit



1 Relay and fuse box
2 Buzzer
3 Parking brake switch
4 Meter cluster
5 Parking brake indicator lamp

- The parking brake system electrical circuit is provided for indicating, its detecting and indicating function is activated by pulling the parking brake lever.
- When the parking brake lever is pulled, contact point **A** of parking brake switch **3** closes (ON), and parking brake indicator lamp **5** is lit, indicating that the parking brake is operating.
  The current flows as below:
  Fuse **1** → Parking brake switch **3** → Parking brake indicator lamp **5** → Ground
- Buzzer **2** sounds and gives a warning when any fault is detected in the engine oil pressure system, brake system or cooling system. Pulling the parking brake lever opens (OFF) contact point **B** of parking brake switch **3** to stop the buzzer from sounding.

TROUBLESHOOTING

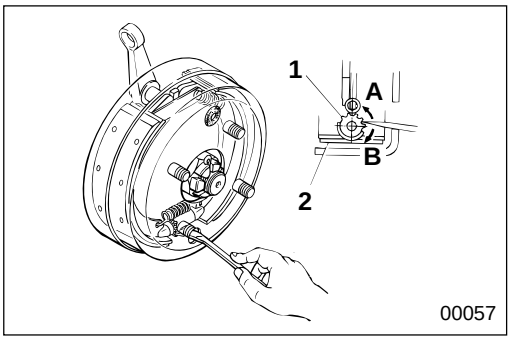
Possible causes / Symptoms		Parking brake does not work	Parking brake does not release smoothly (dragging)	Remarks
Parking brake cable	Inner cable stretched or damaged	○	○	
	Inner cable rusted		○	
Parking brake lever	Locking ratchet and lever bracket serration engagement faulty	○		
	Pulling stroke insufficient	○	○	
	Pulling stroke excessive	○		
Parking brake assembly	Shoe clearance insufficient		○	
	Shoe clearance excessive	○		
	Parking brake drum inner surface deformed or distorted	○		
	Parking brake drum inner surface greasy or oily	○		
	Linings worn unevenly	○		
	Lining surface greasy or oily	○		
	Camshaft lever return spring permanently set or fractured		○	
	Shoe return spring fatigued or fractured		○	

Adjustment of Parking Brake Shoe Clearance and Lever Stroke

Service standards

Unit : mm {in.}

Location	Maintenance item	Standard value	Limit	Remedy
—	Brake shoe clearance	0.1 to 0.25 {0.0039 to 0.0098}	—	Adjust
3	Brake lever pulling stroke (at operation force of 490 N {110 lbf, 50 kgf})	7 to 10 notches	—	Adjust

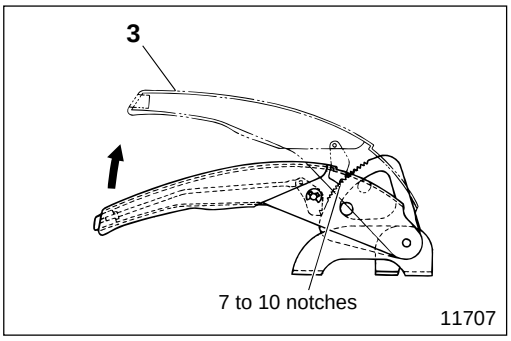


(1) Shoe clearance

When the camshaft lever is released, turn adjusting screw **1** in the expansion direction, using a screwdriver inserted through the shoe adjusting hole of the brake drum, and return 8 notches from the position where shoe **2** contacts the drum. Then, the shoe clearance will be the standard value.

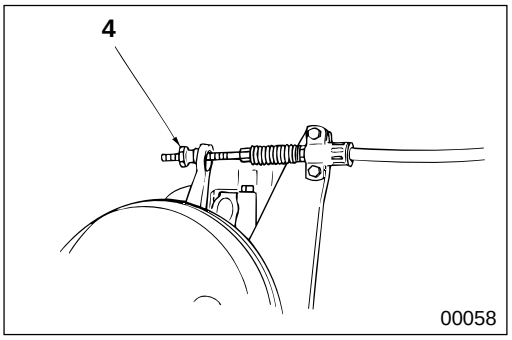
A : Expansion

B : Contraction

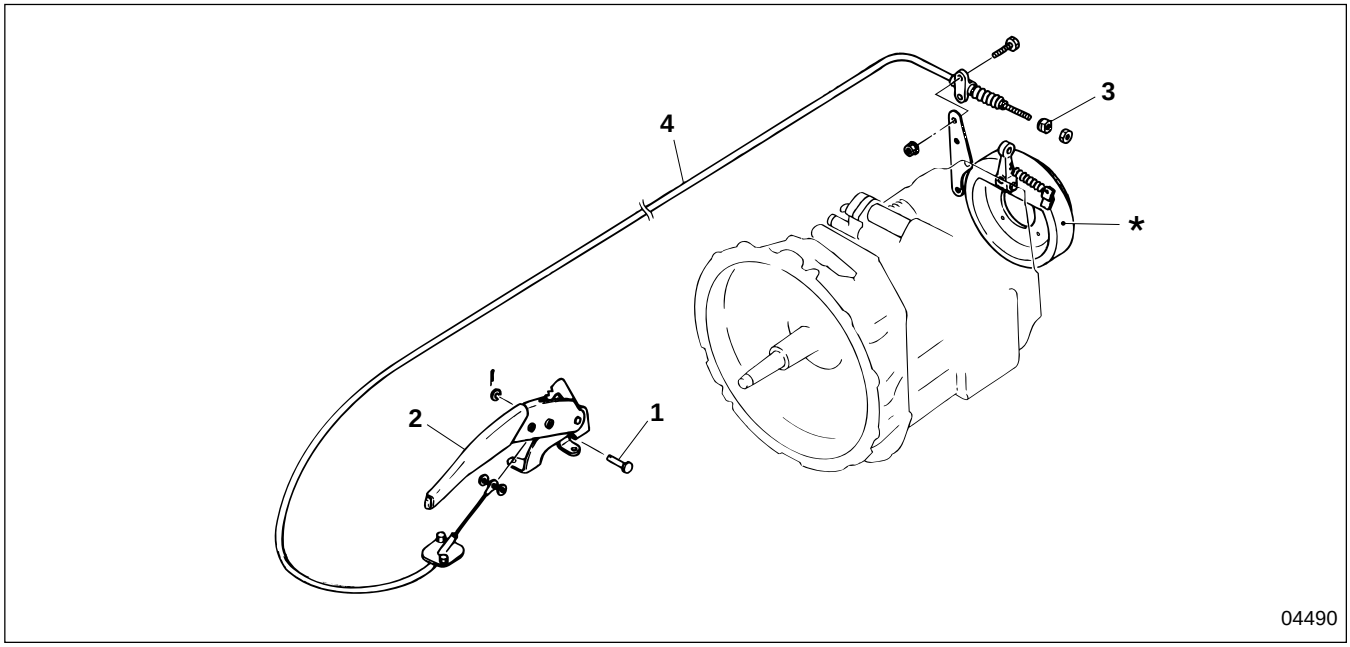


(2) Lever pulling stroke

Adjust camshaft lever lock nut **4** so that the number of notches (clicks heard) is the standard value when parking brake lever **3** is pulled from the released position by an operating force of 490 N {110 lbf, 50 kgf}. Operate the parking brake lever two or three times after adjusting to verify the pulling stroke, to make sure that the parking brake is operating properly and that the parking brake drum does not drag when the parking brake is released.



PARKING BRAKE CONTROL



● **Removal sequence**

1 Clevis pin
2 Parking brake lever assembly 🕮 P36A-7

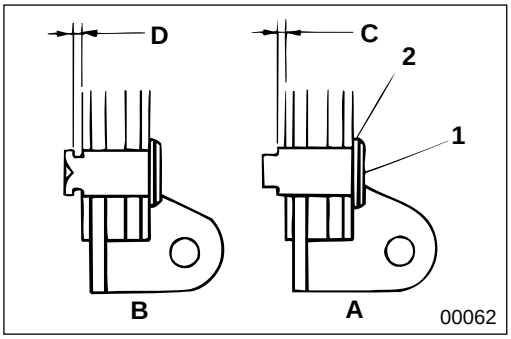
Lubricant and sealant

Location	Points of application	Kinds	Quantity
1, 3	Rotating area and friction surface of pins	Chassis grease [NLGI No.1 (Ca soap)]	As required
6	Thread area of release rod	Cemedine 1500	As required

◆ Service procedure

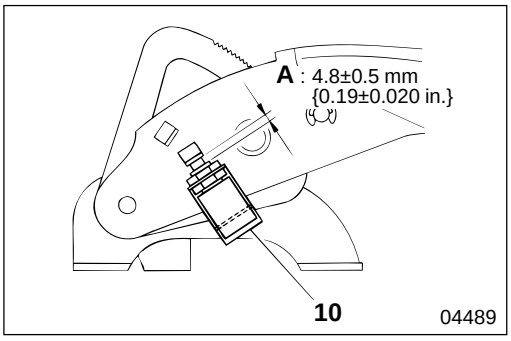


1 **Installation of pin**

A : Before caulking
B : After caulking

When clearance **C** before caulking is less than 0.6 mm {0.024 in.}, do not use spacer **2**.
Also, use spacer to adjust if it is 0.6 to 0.96 mm {0.024 to 0.038 in.}.

	Without spacer	With spacer
Dimension **D**	0.06 to 0.6 mm {0.0024 to 0.024 in.}	0 to 0.36 mm {0 to 0.014 in.}



10 **Installation of parking brake switch**

Install parking brake switch **10** so that the stroke equals **A**.

19 Support plate and cover assembly

● **Assembly sequence**

Follow the disassembly sequence in reverse.

WARNING ⚠

Do not leave grease or oil on the surface of lining 9 because this reduces braking performance.

NOTE

If lining 9 has been replaced with a new part, check correctness of contact with the parking brake drum.

Service standards

Unit : mm {in.}

Location	Maintenance item	Standard value	Limit	Remedy
1	Installed load of shoe return spring (Installed length 75 {2.95})	180±18 N {41±4.0 lbf, 18.5±1.8 kgf}	145 N {33 lbf, 15 kgf}	Replace
3	Installed load of wheel return spring (Installed length 85 {3.35})	105±11 N {24±2.4 lbf, 11±1.1 kgf}	86 N {19 lbf, 8.8 kgf}	Replace
6	Installed load of shoe hold-down spring (Installed length 14 {0.55})	145±15 N {33±3.3 lbf, 15±1.5 kgf}	115 N {26 lbf, 12 kgf}	Replace
9	Lining thickness	5.8 {0.23}	3.5 {0.14}	Replace
14	Installed load of camshaft lever return spring (Installed length 85 {3.35})	62±5.9 N {14±1.3 lbf, 6.3±0.6 kgf}	49 N {11 lbf, 5 kgf}	Replace

Ⓣ Tightening torque

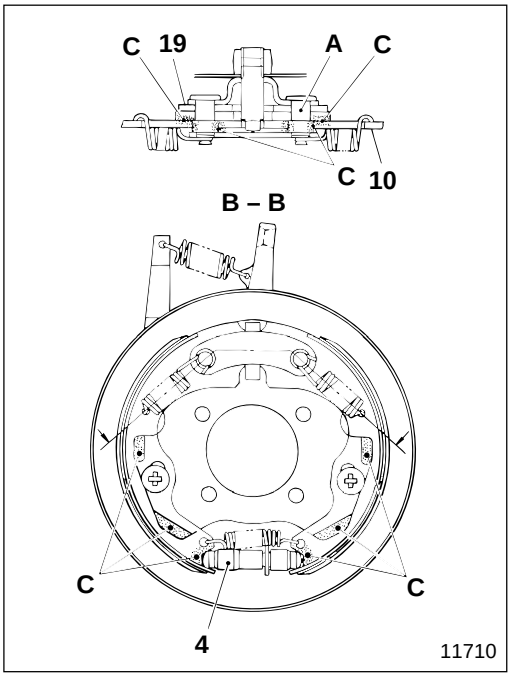
Unit : N·m {ft.lbs, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
15	Nut (Camshaft lever mounting)	13.72 to 22.56 {10 to 17, 1.4 to 2.3}	—

Lubricant

Location	Points of application	Kinds	Quantity
4, 10	Apply to both ends of adjusting screw which makes contact with brake shoe	Brake grease (AKB 100)	As required
10, 19	Apply to support plate and cover assembly at the place which makes contact with brake shoe	Brake grease (AKB 100)	As required
	Apply to anchor pin area of support plate and cover assembly at the place which makes contact with brake shoe	Brake grease (AKB 100)	As required

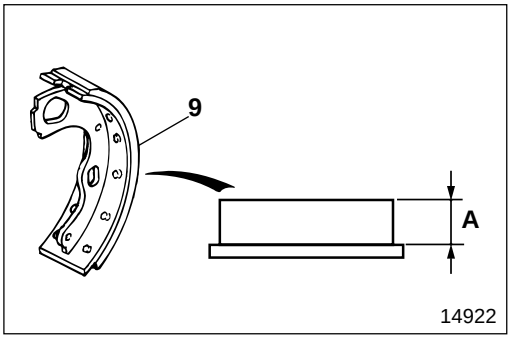
◆ Service procedure



4 **10** **19** **Applying grease to adjusting screw, brake shoe, and support plate and cover assembly**

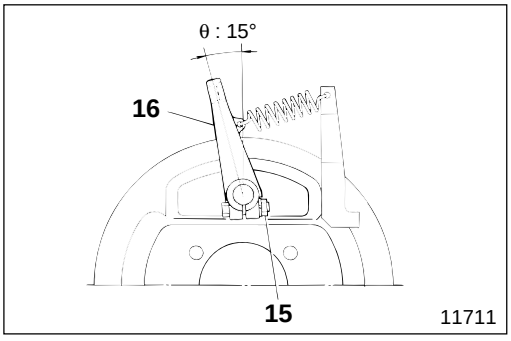
Apply grease to area **C**.

A : Anchor pin area



9 **Inspection of lining**

Measure thickness **A** of lining **9**. If the measured value is lower than the limit, replace the lining.



16 **Installation of camshaft lever**

Align camshaft lever **16** to lever mounting angle θ, and tighten nut **15** at specified torque.

INDEX

STRUCTURE AND OPERATION 36B- 2

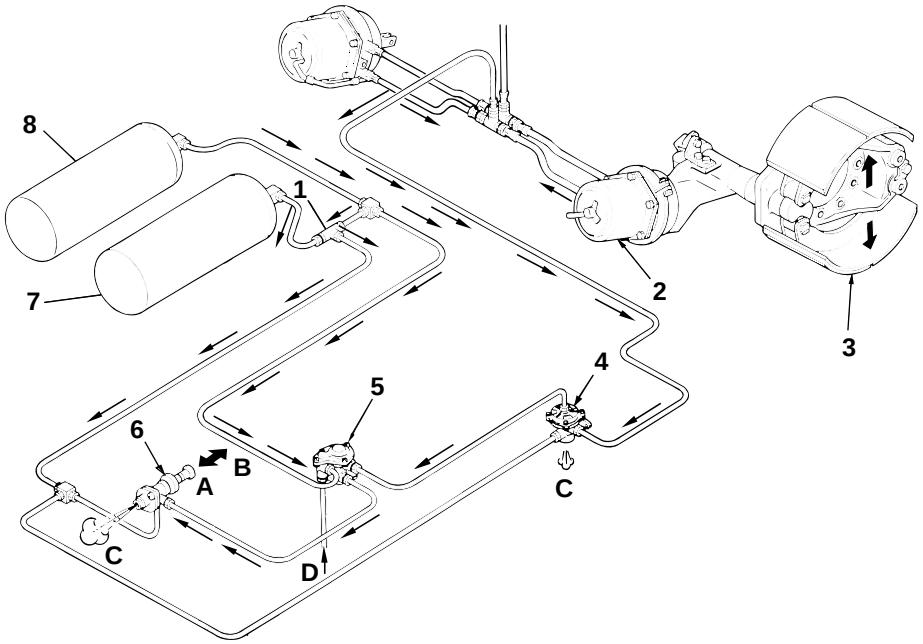
TROUBLESHOOTING 36B- 7

PARKING BRAKE CONTROL VALVE 36B- 8

SPRING BRAKE VALVE 36B-10

DOUBLE CHECK VALVE 36B-13

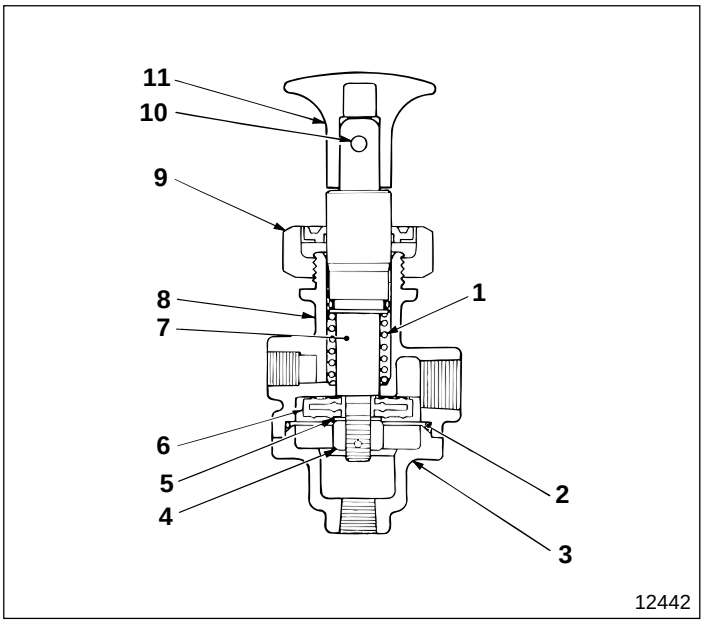
Parking Brake System



1	Double check valve	**5**	Spring brake valve	**A** :	RELEASE position
2	Rear brake chamber	**6**	Parking brake control valve	**B** :	PARK position
3	Rear wheel brake	**7**	Front brake air tank	**C** :	Pressurized air
4	Relay valve	**8**	Rear brake air tank	**D** :	From front brake system

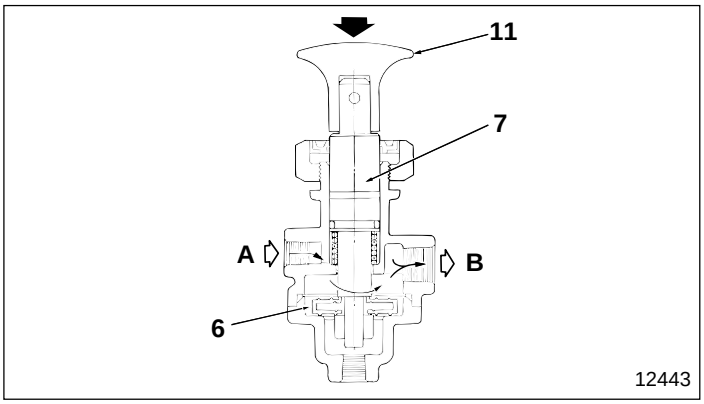
- In the wheel parking brake system, operating parking brake control valve **6** causes rear brake chamber **2**, which contains a spring brake, to apply rear wheel brake **3**, generating braking force.
- Pulling out the knob of parking brake control valve **6** to the PARK position, feeds pressurized air **C** from the parking brake control valve and spring brake valve **5** to relay valve **4**. This exhausts pressurized air **C** in the spring brake in rear brake chamber **2** through the exhaust port of the relay valve, causing the spring brake to generate braking force.
- Pushing in the knob of parking brake control valve **6** to the RELEASE position, feeds pressurized air from rear brake air tank **8** to relay valve **4** via the parking brake control valve.
  Consequently in the separate air system, pressurized air from the rear brake air tank is fed to the spring brake of rear brake chamber **2** via the relay valve, releasing the wheel parking brake.

Parking Brake Control Valve



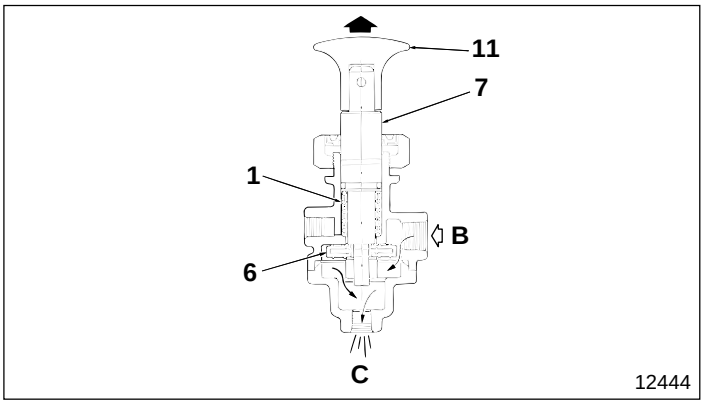
1 Plunger spring
2 Seal ring
3 Cover
4 Nut
5 Washer
6 Valve
7 Plunger
8 Body
9 Seal nut
10 Spring pin
11 Knob

● Feed action (RELEASE)



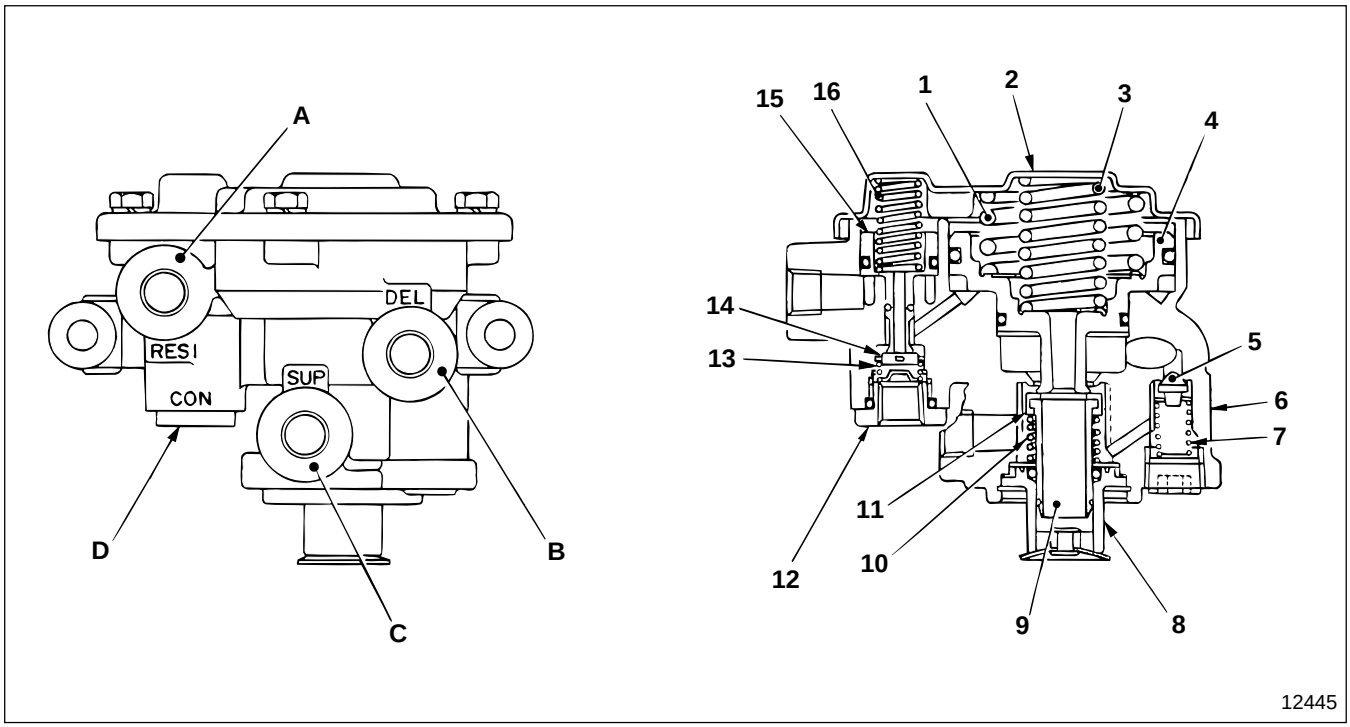
When the air pressure at feed port **A** reaches 420 kPa {61 psi, 4.3 kgf/cm^2} or higher, pushing in knob **11** causes valve **6** at the top of plunger **7** to close the exhaust port, feeding pressurized air to exit port **B**.

● Exhaust action (PARK)



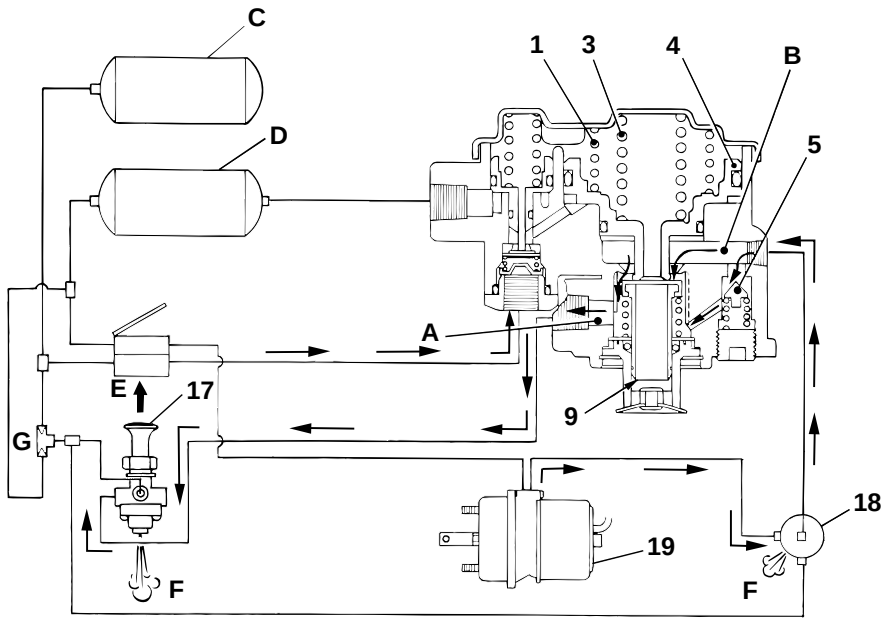
- Pulling out knob **11** causes valve **6** at the top of plunger **7** to open exhaust port **C**, and remains in that position, closing the supply port. This exhausts the air returned from exit port **B** through the air exhaust port.
- When the air pressure at the supply port drops to 275 kPa {40 psi, 2.8 kgf/cm^2} or lower, the repercussive force of plunger spring **1** overcomes the air pressure acting on valve **6** pushing out knob **11** automatically. This exhausts the air through exit port **B**.

Spring Brake Valve



1 Piston spring
2 Cover
3 Spring
4 Piston
5 Check valve
6 Body
7 Spring
8 Exhaust cover
9 Inlet and exhaust valve
10 Valve spring
11 Valve retainer
12 Cap nut
13 Valve spring
14 Valve
15 Piston
16 Piston spring
A : From rear brake air tank
B : To spring brake
C : From parking brake control valve
D : From front brake system

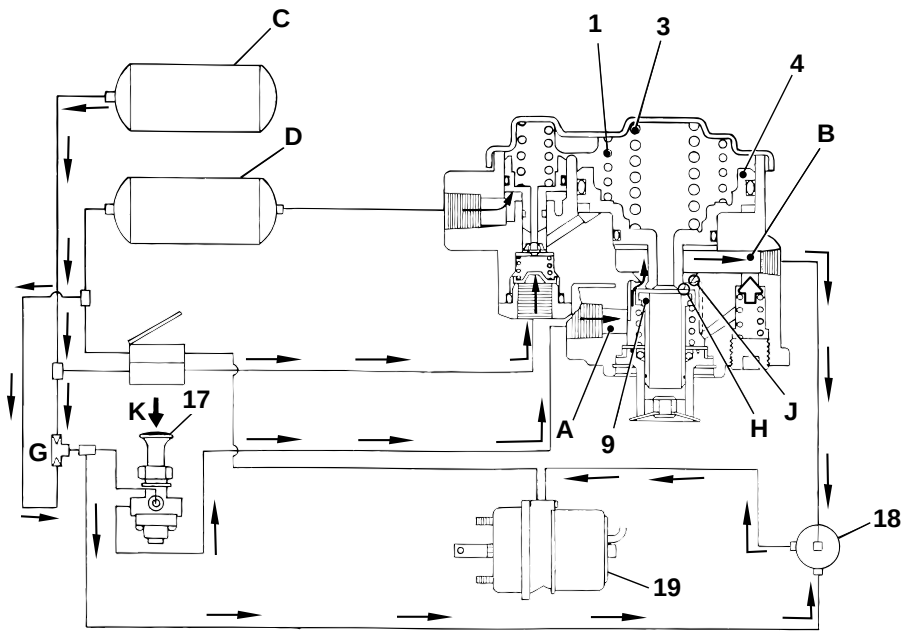
● When parking brake is operated



- Pulling out the knob of parking brake control valve **17** to PARK position **E**, exhausts the pressurized air in chamber **A** of the spring brake valve through the parking brake control valve. Then, the pressurized air in chamber **B** of the spring brake valve forces down check valve **5**, passes through chamber **A**, and is exhausted through the parking brake control valve.
- When the air pressure in chamber **B** of the spring brake valve drops sufficiently, springs **1**, **3** at the top of piston **4** force the piston down, opening inlet and exhaust valve **9**. This exhausts the pressurized air, which is fed to relay valve **18**, from the spring brake valve.
- Relay valve **18** exhausts the pressurized air from the spring brake in rear brake chamber **19** through the exhaust port.
- The spring brake of rear brake chamber **19** operates to generate braking force.

  C : Front brake air tank
  D : Rear brake air tank
  E : PARK position
  F : Pressurized air
  G : Double check valve

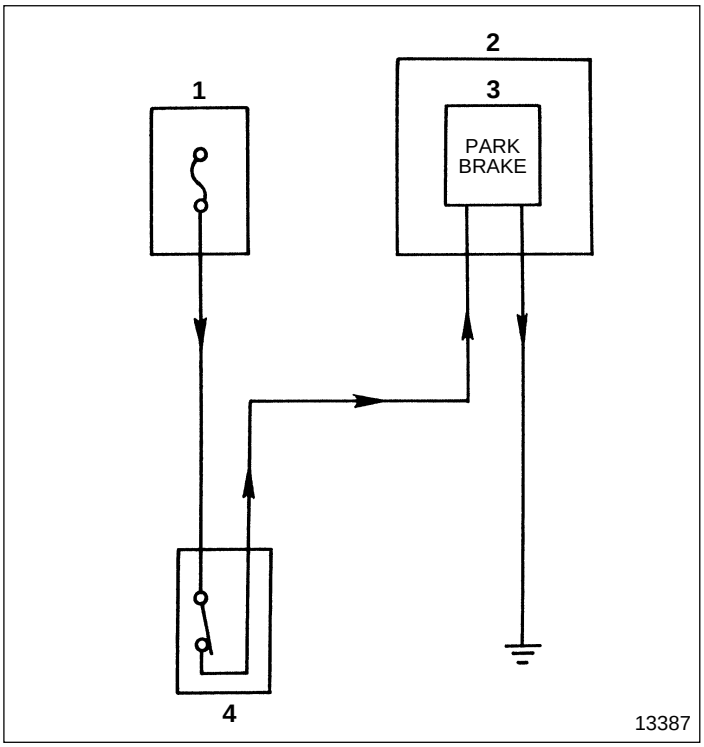
● When parking brake is released



- Pushing in the knob of parking brake control valve **17** to RELEASE position **K**, causes the pressurized air to flow through chamber **A** of the spring brake valve to chamber **B**, then the pressurized air is fed to relay valve **18** as air pressure.
- As the air pressure in chamber **B** rises further, the rising force of piston **4** overcomes the repercussive force of springs **1**, **3**. This closes exhaust valve **H** of inlet and exhaust valve **9**, and at the same time lifts the piston and the inlet and exhaust valve together.
- As piston **4** and inlet and exhaust valve **9** rise further, the inlet and exhaust valve closes inlet valve **J**, isolating chambers **A** and **B** from each other, stopping the air flow between them.
- When it receives pressurized air, relay valve **18** feeds pressurized air in the separate air system to the spring brake, releasing the wheel parking brake.

  C : Front brake air tank
  D : Rear brake air tank
  G : Double check valve
  K : RELEASE position

Parking Brake System Electric Circuit



1 Fuse
2 Meter cluster
3 Parking brake indicator lamp
4 Parking brake switch

Operating the parking brake turns on parking brake switch **4** and lights parking brake indicator lamp **3**.
The current flows as below:

Fuse **1** → Parking brake switch **4** → Parking brake indicator lamp **3** → Ground

TROUBLESHOOTING

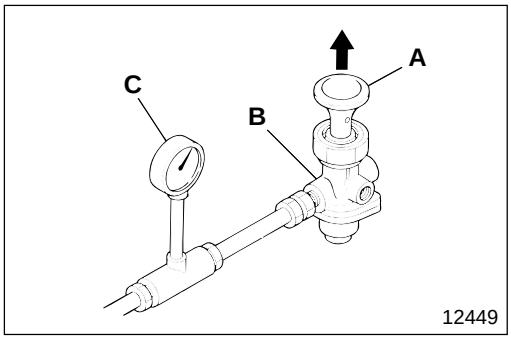
8	Friction surface and O-ring groove of plunger	Multipurpose grease [NLGI No.2 (Li soap)]	As required
9	Periphery of O-ring	Multipurpose grease [NLGI No.2 (Li soap)]	As required
11	Friction surfaces of body and plunger	Multipurpose grease [NLGI No.2 (Li soap)]	As required



◆ Service procedure

● **Inspection after assembly**

- While pushing in knob **A**, feed air pressure of 685 kPa {100 psi, 7 kgf/cm^2} via air supply port **B**.
- Gradually decrease the air pressure and confirm that the air pressure required to push out the knob from its pushed-in position is the standard value.
  C : Air gauge

Tightening torque

Unit : N·m {ft.lbs, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
1	Plug	15 to 20 {11 to 14, 1.5 to 2.0}	—
11	Cap nut	11 to 14 {8.0 to 10, 1.1 to 1.4}	—
16	Bolt (Cover mounting)	5.9 to 8.8 {4.3 to 6.5, 0.6 to 0.9}	—

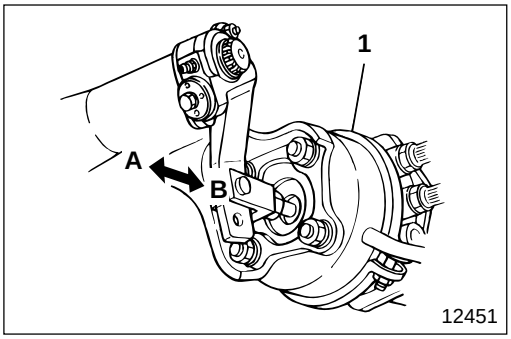
Lubricant

Location	Points of application	Kinds	Quantity
5	Friction surfaces of exhaust cover and inlet and exhaust valve	Silicon grease	As required
20, 24	O-ring groove and outer periphery of piston	Silicon grease	As required
27	Friction surfaces of body and piston	Silicon grease	As required
—	Periphery of O-ring	Silicon grease	As required

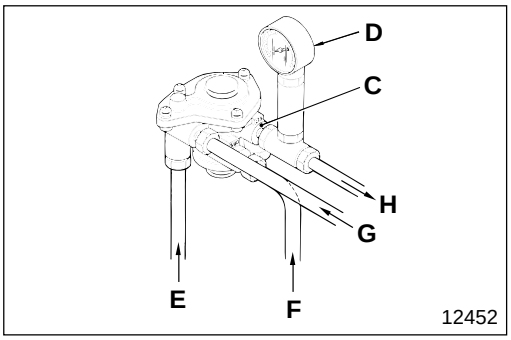
◆ Service procedure

● Inspection of operation after assembly

- Place wheel chocks at the rear wheels to prevent the vehicle from moving.
- Start the engine to raise the air pressure until the air pressure gauge reads 805^{+29}_{-20} kPa {$115^{+4.3}_{-2.8}$ psi, $8.2^{+0.3}_{-0.2}$ kgf/cm^2}.

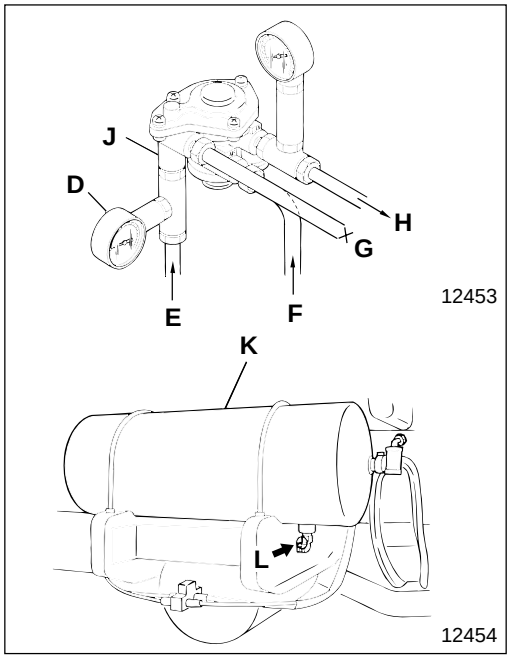


- Confirm that when the knob of the parking brake control valve is pulled out to the PARK position, rear brake chamber **1** operates immediately, applying the wheel parking brake .
- Confirm that when the knob of the parking brake control valve is pushed in to the RELEASE position, rear brake chamber **1** operates, releasing the wheel parking brake.
  A : Applied
  B : Released

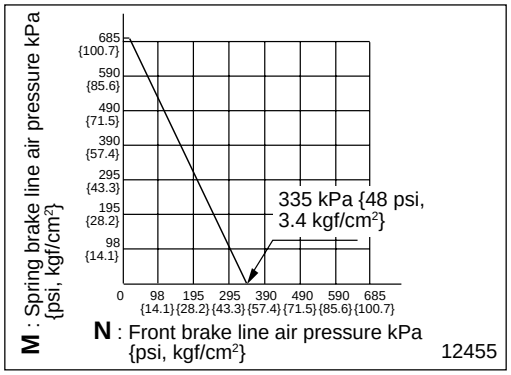


- Mount air pressure gauge **D** on delivery port **C** of the spring brake valve.
- Read air pressure gauge **D** when the knob of the parking brake control valve is pushed to the RELEASE position.
  Specified value: 650 kPa {95 psi, 6.62 kgf/cm^2}
  E : From front brake system
  F : From parking brake control valve
  G : From rear brake air tank
  H : To spring brake of rear brake chamber

- Confirm that when the knob of the parking brake control valve is pulled out to the PARK position, the reading of air pressure gauge **B** drops immediately to 0 kPa {0 psi, 0 kgf/cm^2}. If the air pressure gauge indicator needle drops slowly, replace check valve **3**, since it is probably faulty.



- Mount air pressure gauge **D** on control port **J**.
- Push in the knob of the parking brake control valve to the RELEASE position and pull drain cock **L** to completely bleed tank **K** of the rear brake system.
  E : From front brake system
  F : From parking brake control valve
  G : No pressurized air from rear brake air tank
  H : To spring brake of rear brake chamber



- Have the brake pedal depressed several times and read the drop in the air pressure on both air pressure gauges **D** every time the brake is pressed to confirm that each value conforms to the specified value indicated on the performance curve diagram.
- Press the brake pedal several times to compress the air until rear brake chamber **1** operates on the wheel parking brake locking the rear wheels completely.

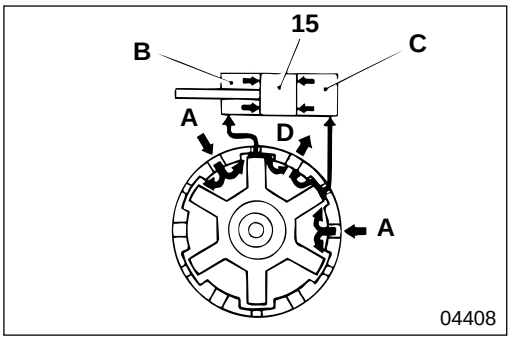
42 O-ring

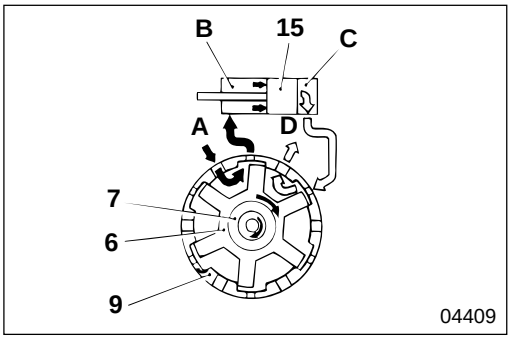
The rotary valve is the central part of the power steering booster. The torsion bar allows the steering reaction force and valve return to operate lightly and smoothly at low speed, and ensures stable steering feel even at high speed.



Straight-ahead operation

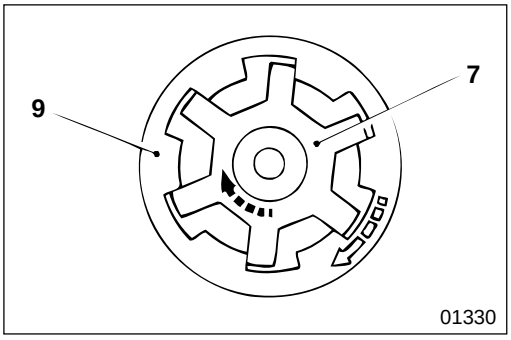
Piston **15** is in the neutral position as chambers **B** and **C** of the piston are under equal pressure.

A : From oil pump
D : To oil tank



Steering operation

Turning the steering wheel rotates stub shaft **7**, causing rotor **6** to close the fluid feed passage to cylinder chamber **C**. This produces a pressure difference between cylinder chambers **B**, **C**, which causes piston **15** to move, and facilitates rotation of worm shaft **9**.



If the hydraulic circuit fails

The safety mechanism allows the vehicle to be steered manually, when the rotating force of stub shaft **7** alone directly turns worm shaft **9**, transmitting the steering force.

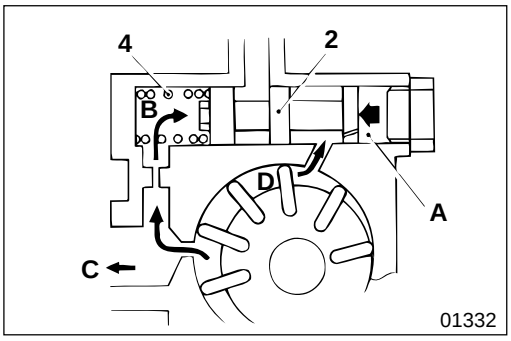
Flow Control Valve Assembly

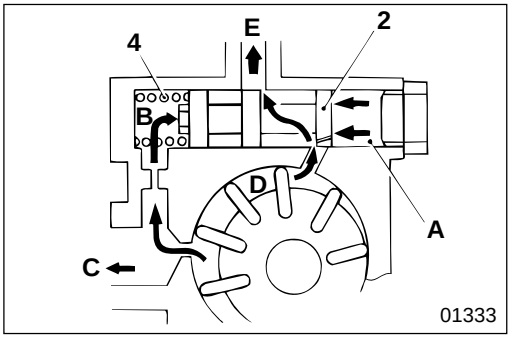


● **Operation of flow control valve**

(1) When not operating (When oil pump rotating at low speed)

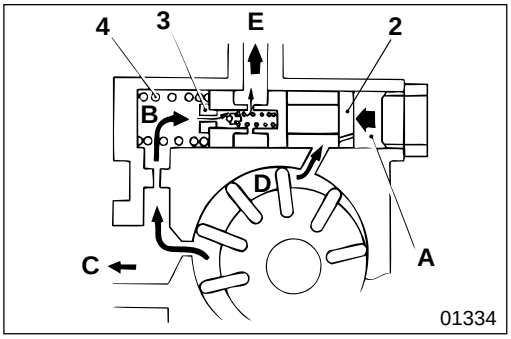
The fluid pressure from chamber **A** does not move flow control valve assembly **2** because the fluid pressure is lower than the combined force of the fluid pressure from chamber **B** and the repercussive force of flow control spring **4**.

C : To power steering booster
D : Pressure chamber



(2) When operating (When oil pump rotating at middle or high speed)

The fluid pressure from chamber **A** moves flow control valve assembly **2** because the fluid pressure is higher than the combined force of the fluid pressure from chamber **B** and the repercussive force of flow control spring **4**. Then, port **E** opens to release the fluid, maintaining the level of flow in chamber **A**.



● **Operation of relief valve**

The combined force of the fluid pressure from chamber **B** and the repercussive force of flow control spring **4** moves flow control valve assembly **2** because the fluid pressure is higher than the fluid pressure from chamber **A**. The fluid pressure in chamber **B** rises further to open relief valve **3** and port **E**, stabilizing the fluid pressure in chamber **B**.

Possible causes \ Symptoms		Steering wheel operation heavy	Steering wheel play excessive and unstable	Steering wheel pulls to one side	Steering wheel vibration	Steering wheel self-return poor	Steering wheel does not turn	Steering angle insufficient or difference between right and left	Fluid leaking	Oil pump fluid pressure abnormal	Oil pump gurgles	Oil pump squeaks	Oil pump growls	Remarks

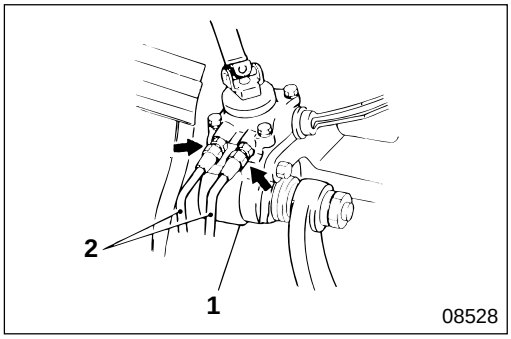
Change of Power Steering Fluid

Tightening torque

Unit : N·m {ft.lbs, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
2	Oil pipe	66.69±12.75 {49±9.4, 6.8±1.3}	—



[Draining]
- Jack up the front wheels.
- Loosen oil pipe **2** connected to power steering booster **1**.
- Turn the steering wheel fully left and right repeatedly, and drain the fluid from power steering booster **1**.
- After draining the fluid, tighten oil pipe **2** at specified torque.

[Filling]
P37-13

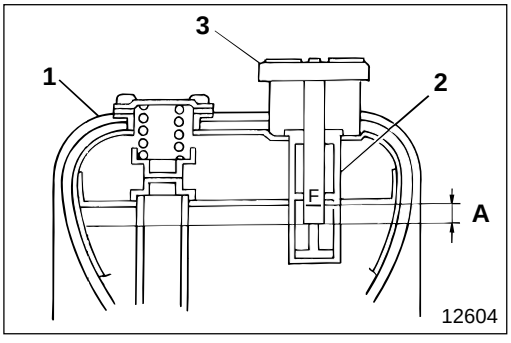
Bleeding of Power Steering System

Fluid

Location	Points of application	Kinds	Quantity
1	Power steering oil tank	Automatic transmission fluid (DEXRON or DEXRON II type)	Filler cap dipstick between end and F

CAUTION

Do not keep the steering wheel turned fully to the left or right for more than fifteen seconds when the engine is running, as this can cause the power steering oil pump to seize up.



- Pour fluid into power steering oil tank **1** up to the inner port of strainer **2**.
- With the engine stopped, jack up the front wheels and turn the steering wheel fully left and right repeatedly. When the fluid level has dropped, add fluid to maintain the fluid level within range **A**.

NOTE

Check the fluid level without screwing on filler cap 3.

- Start the engine and letting it idle, turn the steering wheel fully left and right repeatedly. When the fluid level has dropped, add fluid to maintain the fluid level within range **A**. Repeat these steps until the fluid level does not drop.
- If there is an abnormal noise, air is still in the system. Turn the steering wheel several times to raise the fluid temperature to approximately 60 to 80°C {140 to 176°F}, then stop the engine and wait for approximately five minutes.
- Lower the front wheels and turn the steering wheel several times. If there is no noise, bleeding is completed.
- When bleeding is finished, check fluid level of power steering oil tank **1**, and pipe and hose connections for fluid leaks.

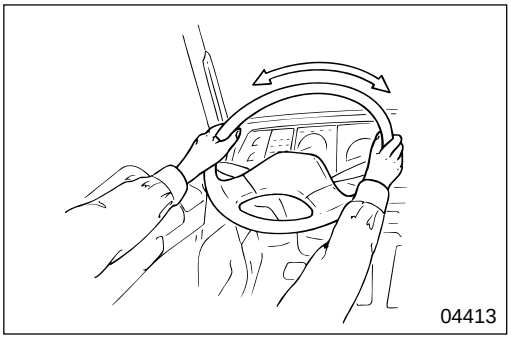
ON-VEHICLE INSPECTION AND ADJUSTMENT

Steering Wheel Play

Service standards

Unit : mm {in.}

Location	Maintenance item	Standard value	Limit	Remedy
—	Steering wheel play (Measure at the outer circumference of steering wheel)	10 to 40 {0.39 to 1.57}	—	Adjust

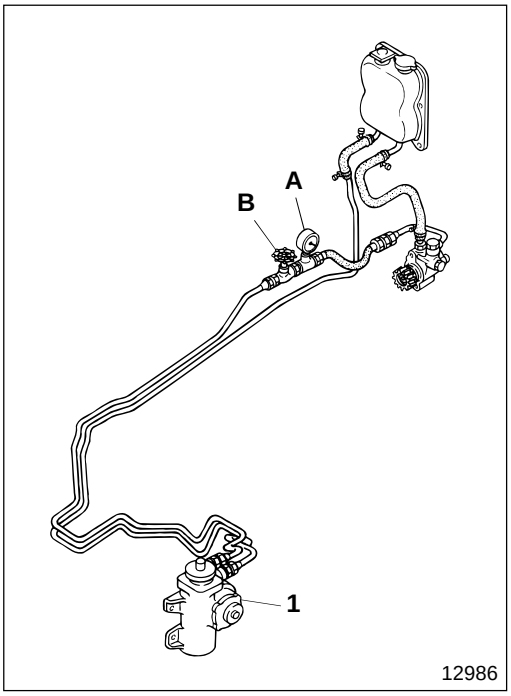


Point the wheels directly forward and gently turn the steering wheel left and right and measure the outer circumference play. If the play deviates from the standard value, adjust tightening points and power steering booster backlash. P37-27

Performance Verification Test of Power Steering System

Service standards

Location	Maintenance item	Standard value	Limit	Remedy
—	Steering system fluid pressure (With hands off steering wheel)	490 kPa {71 psi, 5 kgf/cm²}	—	Repair
—	Relief set pressure (Measure with engine speed at 1000 to 1500 rpm and stop valve closed)	< FK617, FM617 >: 13.2 MPa {1914 psi, 135 kgf/cm²}, < FM657 >: 12.3 MPa {1780 psi, 125 kgf/cm²},	Maximum +785 KPa {115 psi, 8 kgf/cm²} Minimum –1180 KPa {170 psi, 12 kgf/cm²}	Adjust or replace



Verify that the power steering booster and the power steering oil pump are operating properly by testing the following items.

CAUTION

Do not keep stop valve B closed for more than fifteen seconds as this can cause the power steering oil pump to seize up.

NOTE

If the fluid pressure is higher than 490 kPa {71 psi, 5 kgf/cm²} with engine idling and the steering wheel free, inspect power steering booster 1 and fluid circuit for clogging.

Test item	Test procedure	Assembly standards
Verification of smooth operation	Jack up the front wheels and turn steering wheel fully left and right	Smooth operation throughout test
Measurement conditions	• Install oil pressure gauge **A** capable of measuring above 14.7 MPa {2130 psi, 150 kgf/cm²} and stop valve **B**, then bleed air • With engine idling, turn steering wheel left and right several times to raise fluid temperature to 50 to 60°C {122 to 140°F} • With the engine idling, open stop valve **B**	
Measurement of fluid pressure	Measure fluid pressure with hands off steering wheel	490 kPa {71 psi, 5 kgf/cm²}
Measurement of relief pressure	• Gradually increase engine speed and maintain it at 1000 to 1500 rpm, and close stop valve **B** to measure maximum fluid pressure • Do not keep stop valve **B** closed for more than fifteen seconds	Relief set pressure < FK617, FM617 >: 13.2 MPa {1920 psi, 135 kgf/cm²}, < FM657 >: 12.3 MPa {1780 psi, 125 kgf/cm²}

Lubricant

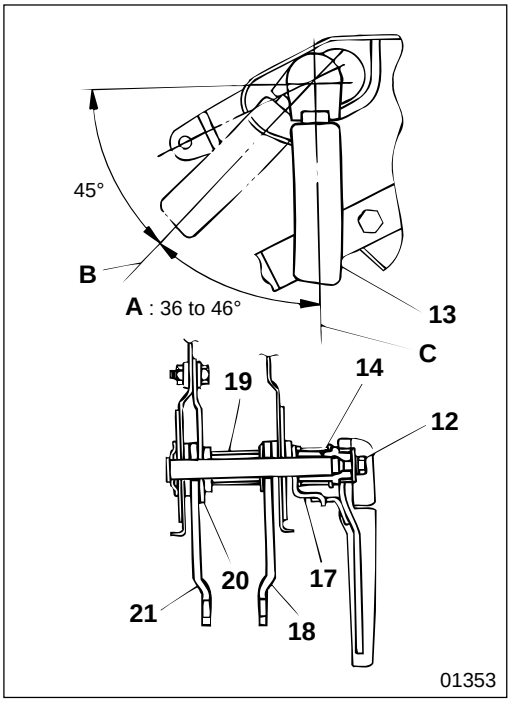
Location	Points of application	Kinds	Quantity
13	Serration area on lock lever	Chassis grease [NLGI No.1 (Ca soap)]	As required
17	Friction surfaces of stopper and steering column bracket	Chassis grease [NLGI No.1 (Ca soap)]	As required
22	Friction surfaces of adjusting bolt and steering column bracket	Chassis grease [NLGI No.1 (Ca soap)]	As required
	Adjusting bolt thread area	Chassis grease [NLGI No.1 (Ca soap)]	As required



◆ Service procedure

13 **Installation of lock lever**

- Tighten nut **14** at specified torque.
- Install lock lever **13** at position **B** so it is within standard working angle **A** from where the lock lever hits stopper **17**.
- Pull up lock lever **13** to position **B**, and make sure that upper levers **18**, **21** moves vertically, as well as horizontally, smoothly.
- Pull down lock lever **13** to position **C**, and make sure that upper levers **18**, **21** are securely locked.

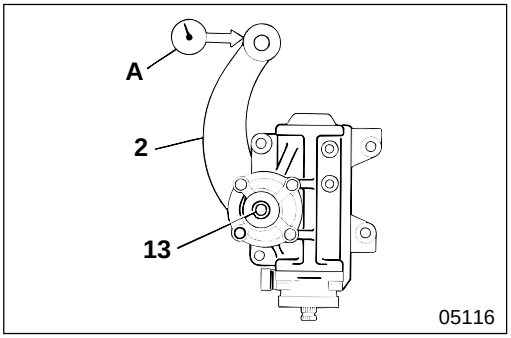
◆ Service procedure

● **Work before disassembly**

Move pitman arm **2**, and align slit **A** of the V-groove of sector shaft **14** to the center of body **50** so that the gears are in neutral position.

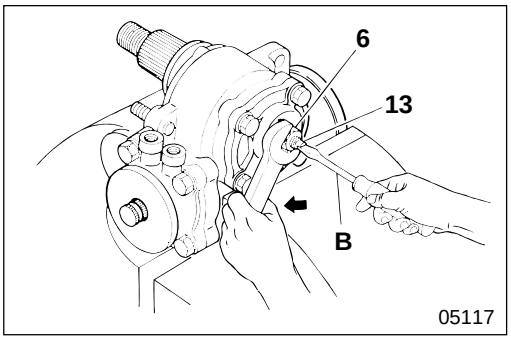


● **Adjustment after assembly**

Adjustment of backlash

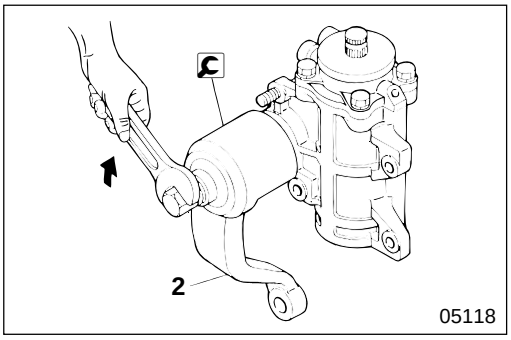
- (Carry out this work with the gears in neutral position.)
  Measure play at the end of pitman arm **2** with dial gauge **A**, and adjust adjusting screw **13** so that reading meets the standard value.

  Measuring load : < FK617, FM617 > ±15 N {3.3 lbf, 1.5 kgf}
  < FM657 > ±20 N {4.4 lbf, 2 kgf}



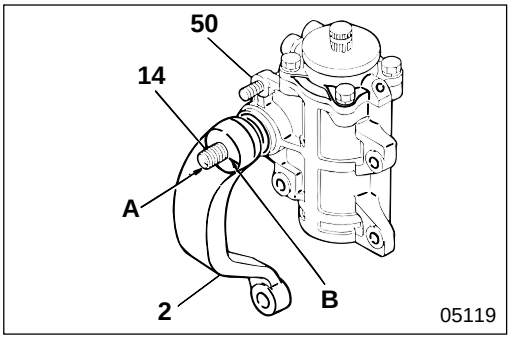
Tightening nut

- After adjusting backlash, apply sealer to thread area of adjusting screw **13**. Hold it in place with screwdriver **B** and tighten nut **6** at specified torque.



2 Pitman arm

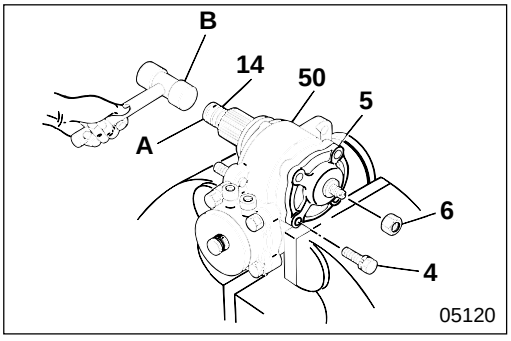
[Removal]



[Installation]
Align slit **A** of the V-groove of sector shaft **14** to the center of body **50**, and align slit **B** of the V-groove of pitman arm **2** on the same line.

NOTE

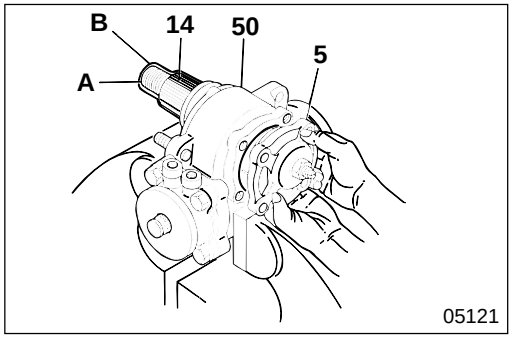
Have pitman arm 2 make a full stroke of the piston to make sure that the piston moves smoothly.



5 Sector shaft assembly and side cover assembly

[Removal]

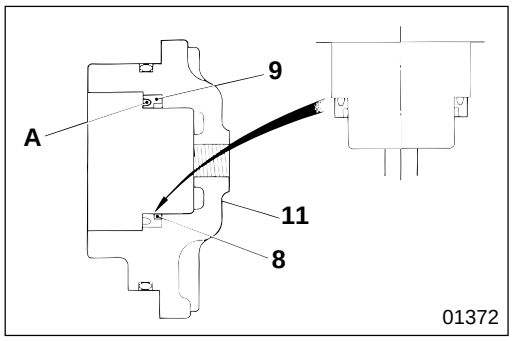
- Make sure that the piston is in the neutral position (slit **A** of the V-groove at one end of sector shaft **14** is aligned with the center of body **50**).
- Tap the end of sector shaft **14** and pull out sector shaft assembly and side cover assembly **5**.
  B : Plastic-headed mallet



[Installation]
Position sector shaft **14** of sector shaft assembly and side cover assembly **5** so that slit **A** of its V-groove is aligned with the center of body **50**, and the piston gear and sector shaft gear engage at their centers.

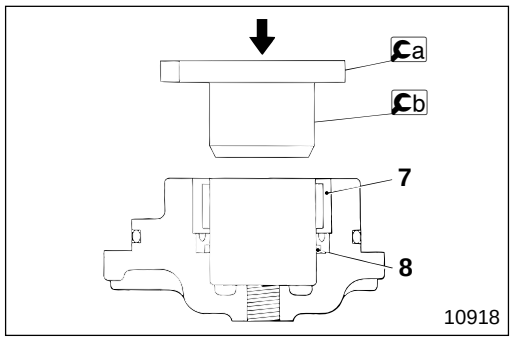
CAUTION⚠

Before installation, apply tape B to the Y-packing to prevent it being damaged by the threads of sector shaft 14.

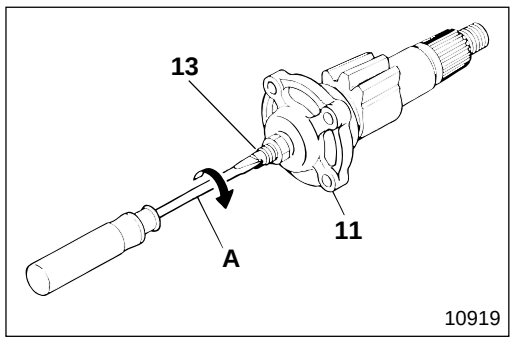


8 **9** **Backup ring, Y-packing**

[Installation]
- Install Y-packing **9** into side cover **11** in the direction as illustrated.
- After installing backup ring **8**, pack groove **A** of Y-packing **9** with grease.



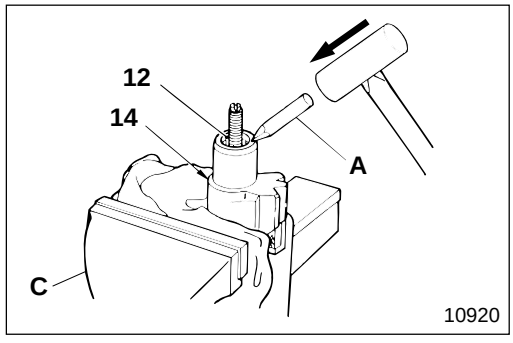
- After installing needle bearing **7** into backup ring **8**, form the bent up part of the backup ring using a insert tool assembly and b insert tool.



11 **Removal of side cover**

Screw in adjusting screw **13** and remove side cover **11.**

A : Screwdriver



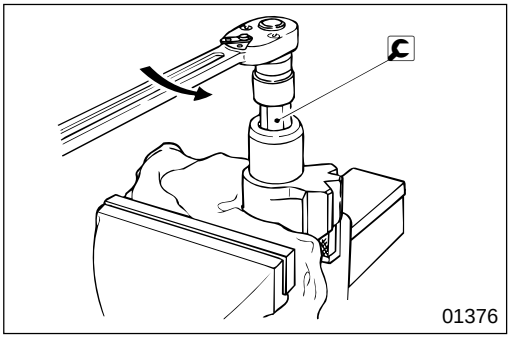
12 **Retainer**

Disassemble sector shaft **14**, as follows, only if it is faulty :
[Removal]
- Pry up (2 points) of retainer **12**.

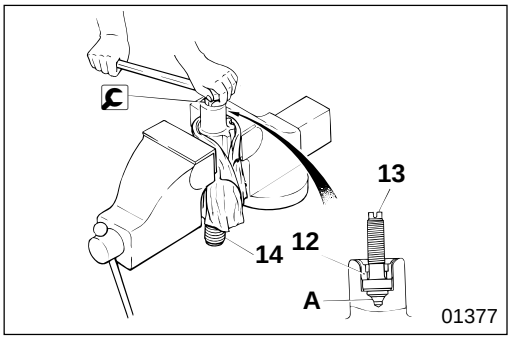
A : Chisel

CAUTION⚠

Make sure you use a cloth when you grip sector shaft 14 in vise C to prevent damage.

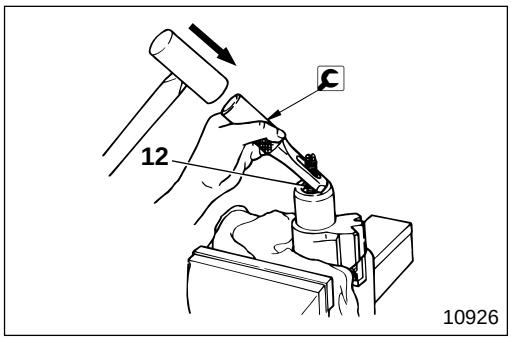


- Remove retainer **12** using [C] bar.

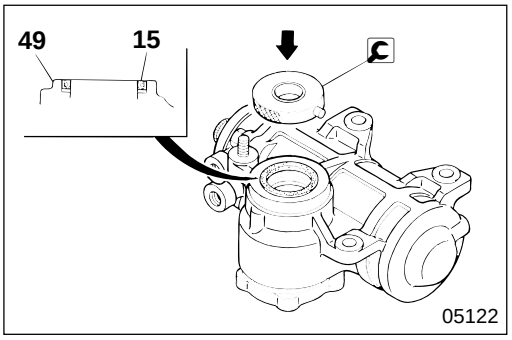


[Installation]

- Pack adjusting screw **13** mounting hole **A** of sector shaft **14** with grease.
- Install adjusting screw **13** into sector shaft **14**.
- Install retainer **12** into sector shaft **14** using [C] bar.
- After installation, slacken off by 180°, retighten at 39 N·m {29 ft.lbs, 4 kgf·m}, then slacken off by 20°.
- Make sure that adjusting screw **13** turns smoothly.

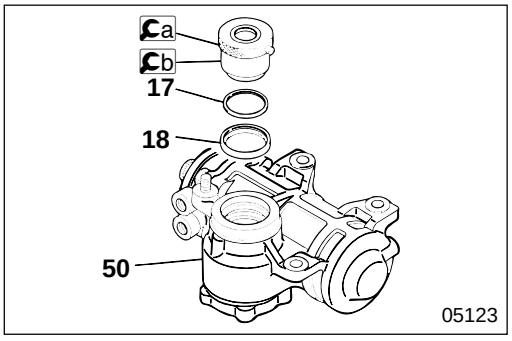


- After installing retainer **12**, caulk the retainer (2 points) using [C] squeeze tool.



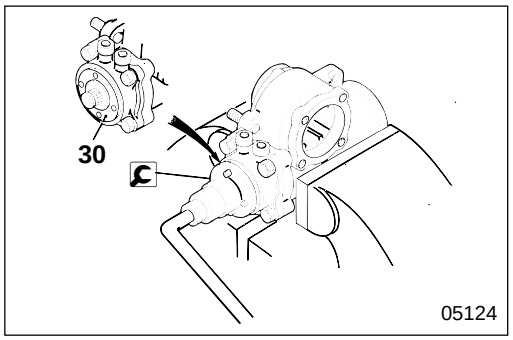
15 Installation of oil seal

Install oil seal **15** into body **50** in the direction as illustrated.



17 18 Installation of backup ring and Y-packing

- Install Y-packing **18** and backup ring **17** to body **50**.
- Pack the groove of Y-packing **18** with grease.
- Form the shape of backup ring **17** using [Ca] insert tool assembly and [Cb] insert tool.



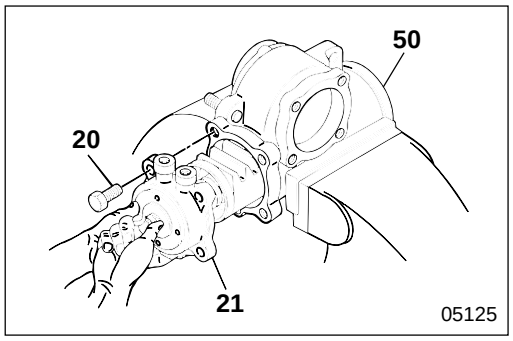
21 **Ball screw assembly**

[Removal]

- Loosen adjusting plug assembly **30** by approximately 180° using wrench assembly.

CAUTION

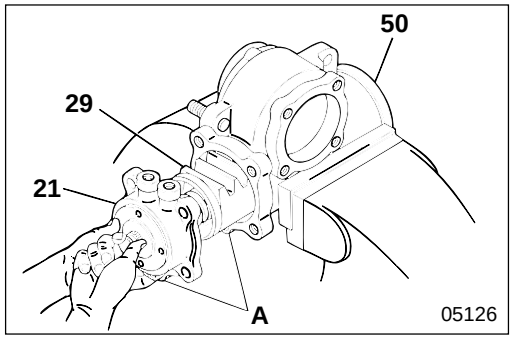
Make sure you only loosen adjusting plug assembly 30, do not undo it completely because the bearing inside the valve housing might spring out.



- Loosen bolt **20** and remove ball screw assembly **21** from body **50**.

CAUTION

- **Make sure that the balls of the ball screw do not spring out.**
- **Be careful not to damage the piston or the interior of body 50.**



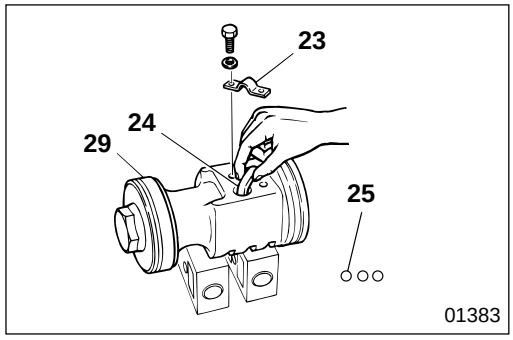
[Installation]

- Install ball screw assembly **21** into body **50**, holding piston **29** so it will not turn.

CAUTION

Be careful not to damage the piston seal ring or the interior of body 50.

- Align oil passage ports **A** of ball screw assembly **21** and body **50**, then tighten.

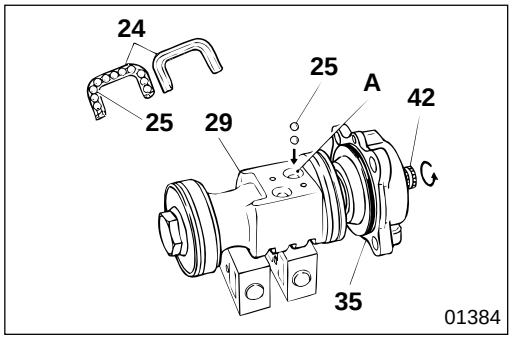


24 **25** **Ball tube and steel ball**

First remove steel balls **25** from piston **29** and place them in the receiving tray, remove ball clip **23**, grip ball tube **24** with your fingers and pull it out gently.

CAUTION

Be careful not to loose any steel balls 25.
< FK617, FM617 (×30) >
< FM657 (×32) >

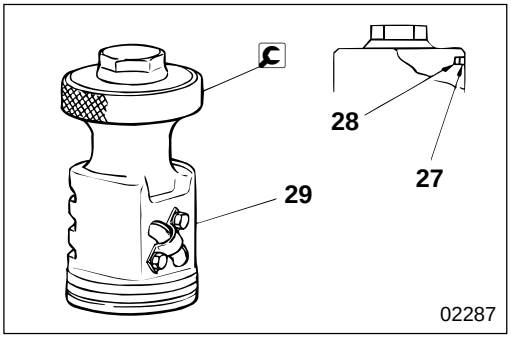


[Installation]

- Pack the interior of ball tube **24** with grease, lay 10 or 11 steel balls **25** in place, then mount the other side of the ball tube.
- Place piston **29** on a level surface, align assembled worm shaft assembly and valve housing assembly **35** and the piston ball race, then drop steel balls **25** through ball tube hole **A** while turning stub shaft **42**.

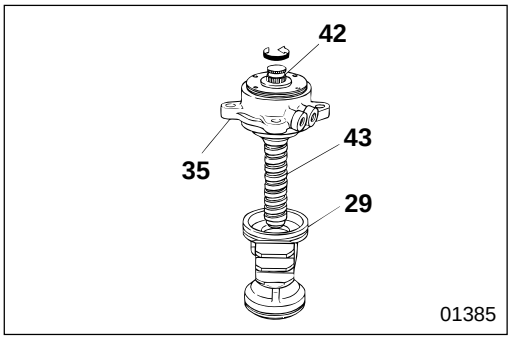
CAUTION

Make sure that you do not pull out worm shaft assembly and valve housing assembly 35 too far, or steel balls 25 will drop out of the ball race.



27 **28** **Installation of O-ring and seal-ring**

Install O-ring **28** and seal ring **27** in the outside grooves of piston **29**, then form the shape of the seal ring with 🔧 inserting tool.

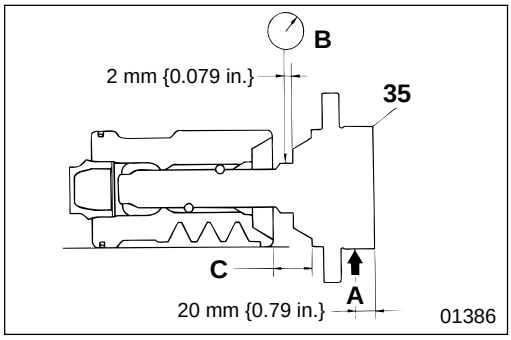


29 **Piston**

[Removal]
Holding worm shaft assembly and valve housing assembly **35** so that piston **29** is at the bottom, turn stub shaft **42** and remove the piston.

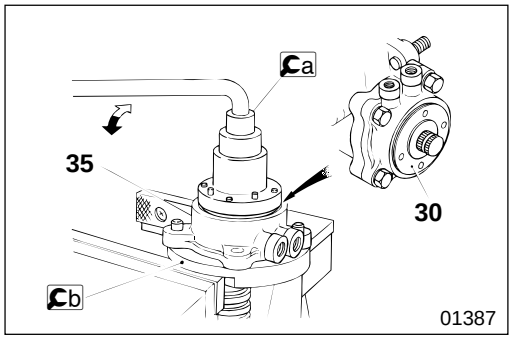
CAUTION ⚠

Be careful not to tilt piston 29 when you do this, otherwise steel balls 25 in the races of the piston and worm shaft 43, will drop into the piston.



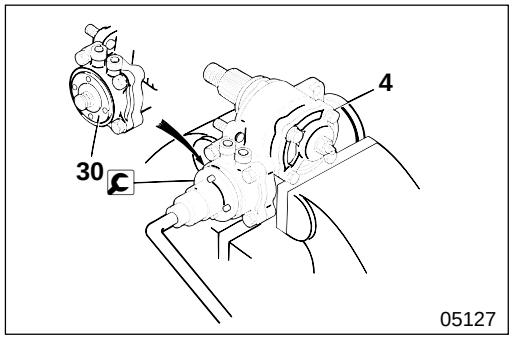
[Inspection]
Measure side play (play in axial direction) **B** of worm shaft assembly and valve housing assembly **35** when 49 N {11 lbf, 5 kgf} is applied to **A** as illustrated.

C :	< FK617 >	30.45 mm {1.20 in.}
	< FM617 >	30.24 mm {1.19 in.}
	< FM657 >	42.8 mm {1.69 in.}

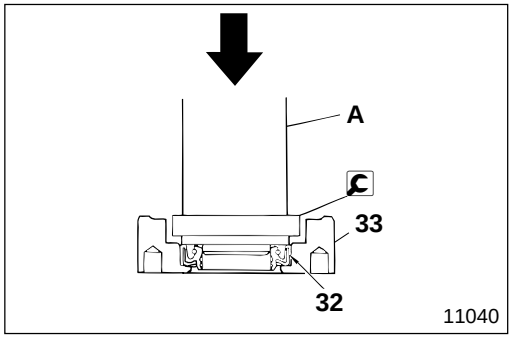


30 **Installation of adjusting plug assembly**

- After tightening adjusting plug assembly **30** of worm shaft assembly and valve housing assembly **35** at specified torque, slacken off by approximately 180°.

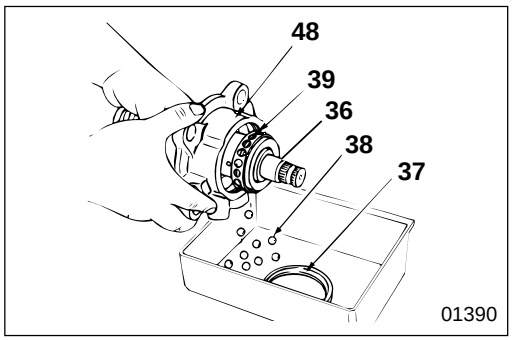


- Tighten bolt **4** at specified torque, then retighten adjusting plug assembly **30** at specified torque using 🔧 wrench assembly.



32 **Installation of oil seal**

Install oil seal **32** into adjusting plug **33** in the direction as illustrated.
A : Hand press



36 **Worm shaft assembly**

[Removal]
Push out worm shaft assembly **36** from valve housing **48** by pushing out the side of the worm shaft assembly where the piston is assembled.

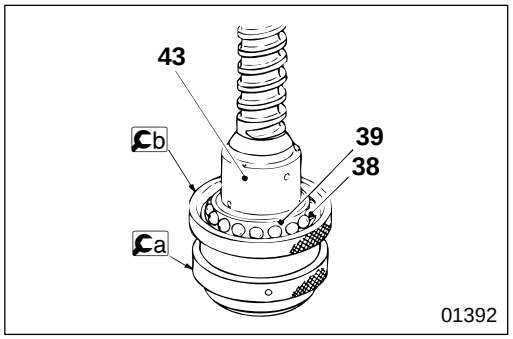
NOTE

Have a tray or box ready to catch side race 37, steel balls 38, and bearing cage 39 as these items separate on removal.

[Installation]

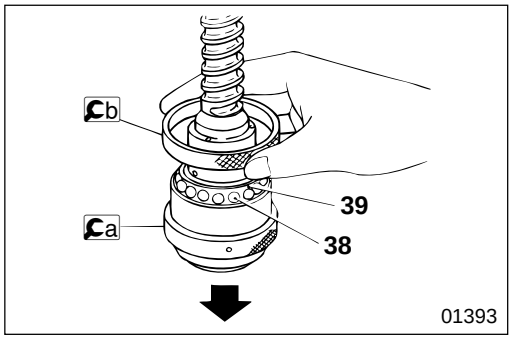
CAUTION

Be careful that worm shaft assembly 36 ball race does not damage seal ring 44.

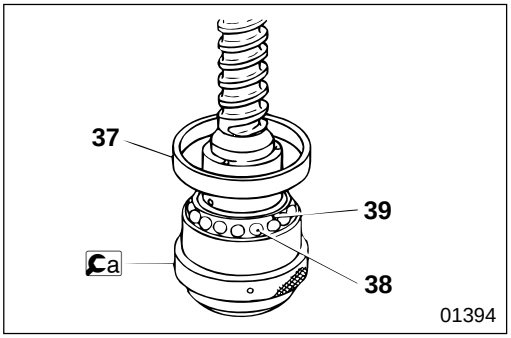


37 **to** **39** **Installation of side race, steel ball, and bearing cage**

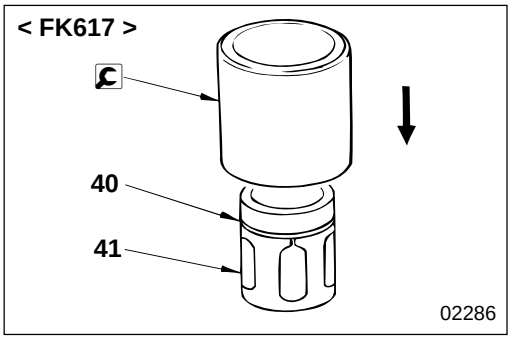
- Install b guide assembly on a tool assembly, and insert worm shaft **43** in the direction as illustrated.
- Assemble bearing cage **39** and steel balls **38** on worm shaft **43**.



- Hold down b with your hand and slide a downward, so that you can position steel balls **38** as specified.

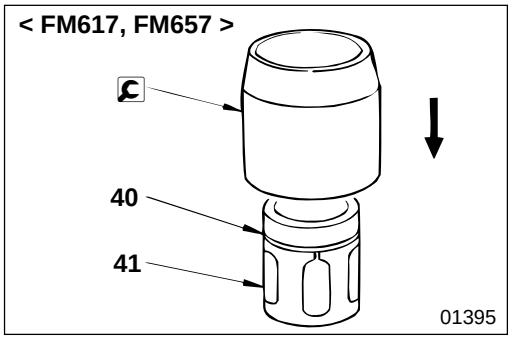


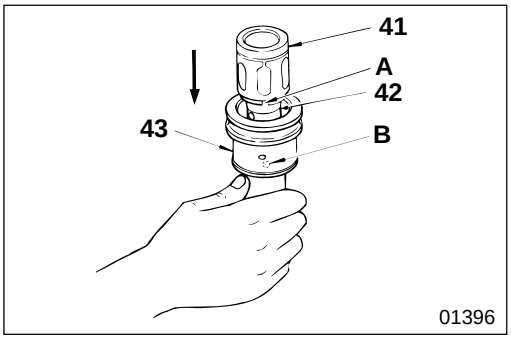
- Install side race **37** on top of steel balls **38** and bearing cage **39**.



40 **Installation of seal ring**

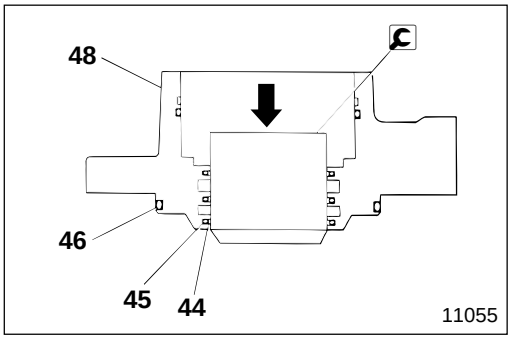
- Install seal ring **40** onto rotor **41**.
- Form seal ring **40** using insert tool.





41 **Installation of rotor**

Install rotor **41** between stub shaft **42** and worm shaft **43** so that indent **A** of the rotor fits positioning pin **B** of the worm shaft.



44 **to** **46** **Installation of seal ring and O-ring**

- Install seal ring **44** and O-rings **45**, **46** into valve housing **48**.
- Form seal ring **44** using insert tool.

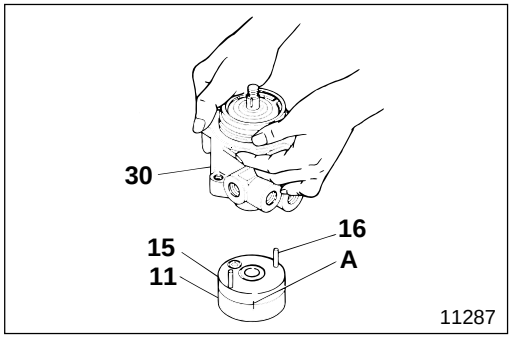
◆ Service procedure

5 Adjustment of flow control valve assembly

When you reassemble flow control valve assembly **5**, adjust the assembly so that the relief pressure conforms to the standard value. Do this with shim **A**. The thick shim lowers pressure, and the thin shim increases pressure.
After adjustment, tighten relief valve **B** at specified torque.

Shim thickness	Pressure variation
0.5mm {0.020 in.}	Approximately 1310 kPa {190 psi, 13.4 kgf/cm^2}
0.2mm {0.0079 in.}	Approximately 520 kPa {75 psi, 5.3 kgf/cm^2}

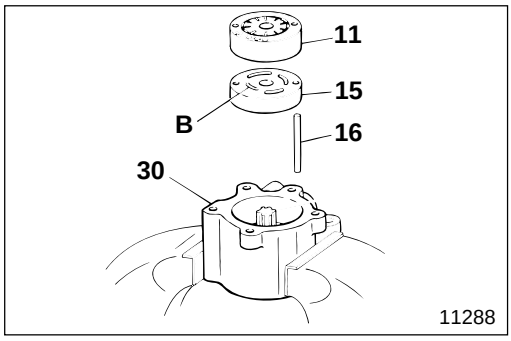
P37-15



11 Removal and installation of cartridge assembly

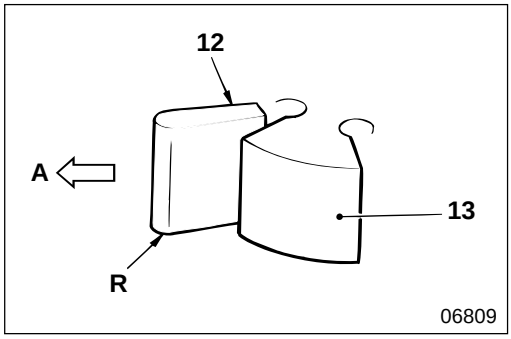
[Removal]

- Remove cartridge assembly **11**, pressure plate **15** and straight pin **16** together from front body **30**.
- Put alignment marks **A** around the outer circumferences of cartridge assembly **11** and pressure plate **15**.



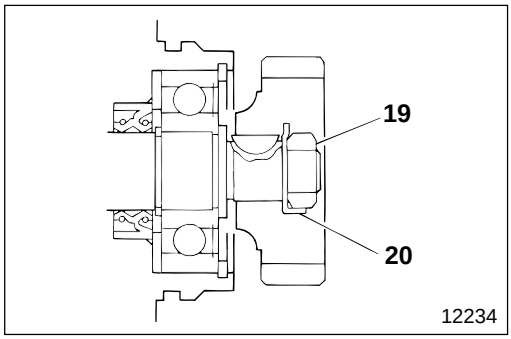
[Installation]

- Install straight pin **16** into front body **30**.
- Install pressure plate **15** onto front body **30**, so that groove **B** of the pressure plate faces the direction as illustrated.
- Align cartridge assembly **11** with straight pin **16**, then install the cartridge assembly.



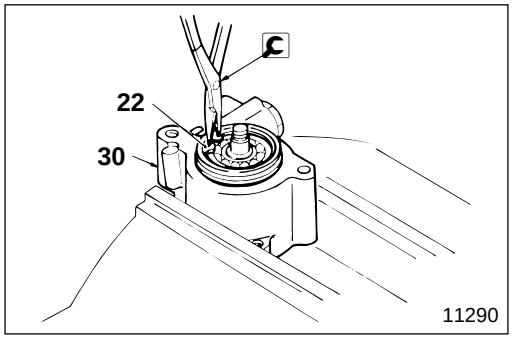
12 Installation of vane

With point **R** of vane **12** facing outside **A**, install it into rotor **13** and make sure that the vane moves smoothly. If it is faulty, replace the cartridge assembly.



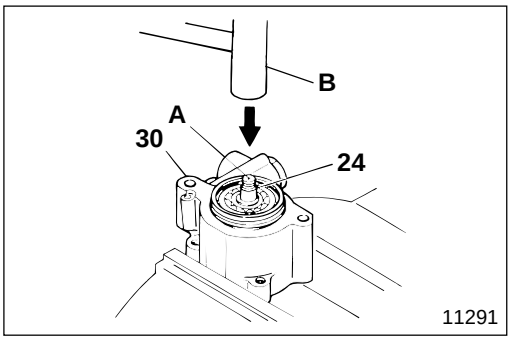
20 Installation of lock washer

After installing nut **19**, bend up one lug on the circumference of lock washer **20**.



22 Removal of retaining ring

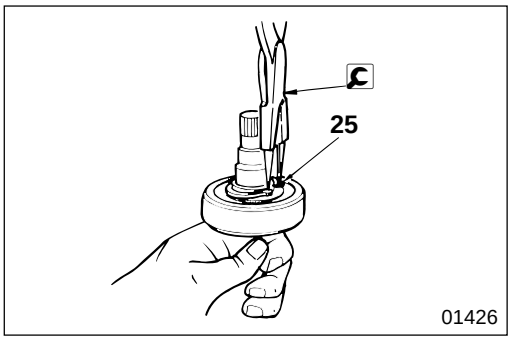
Remove retaining ring **22** using pliers.



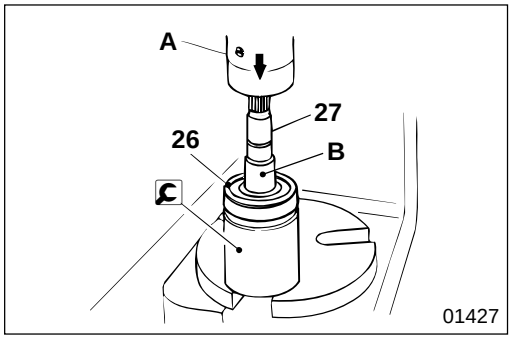
24 **Installation of drive shaft assembly**

If it is hard to install drive shaft assembly **24** in the correct position of front body **20** by hand, tap the shaft to install it.

B : Plastic-headed mallet



25 **Removal of retaining ring**



26 **Removal and installation of ball bearing**

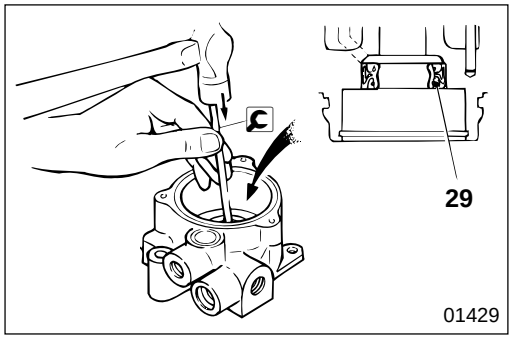
Remove ball bearing **26** from shaft **27** using 🔧 press-fitting tool.

A : Hand press

For installation, follow the removal sequence in reverse.

CAUTION ⚠

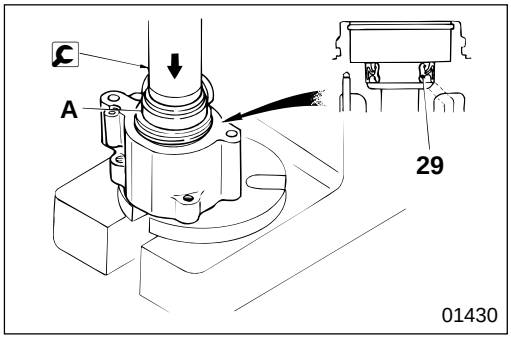
Be careful not to damage oil seal contact surface B.



29 **Oil seal**

[Removal]

Remove oil seal **29** using 🔧 stick.



[Installation]

Install oil seal **29** in the direction as illustrated using 🔧 press-fitting tool.

A : Hand press

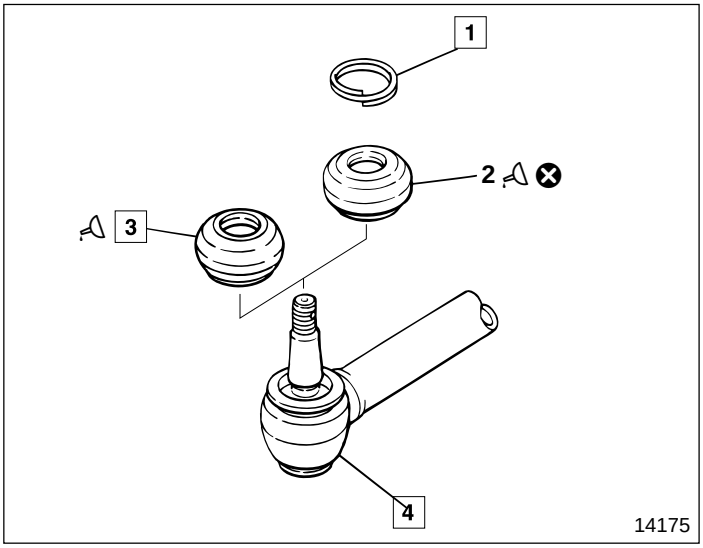
DRAG LINK



● **Disassembly sequence**

1 Clip < FK617 >
2 Dust cover < FK617 >
3 Dust cover < FM617, FM657 >
4 Drag link

⊗ : Non-reusable parts

NOTE

- **Do not remove clip 1 and dust covers 2, 3 unless they are faulty.**
- **Do not disassemble drag link 4 because it is a unit construction.**

● **Assembly sequence**

Follow the disassembly sequence in reverse.

Lubricant

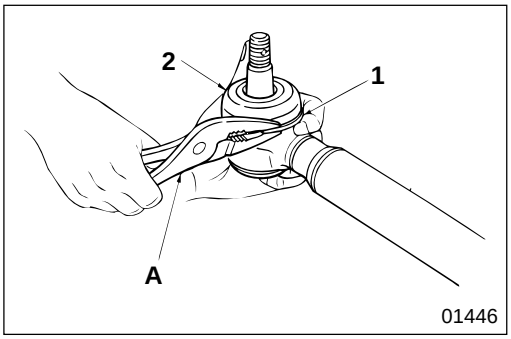
Location	Points of application		Kinds	Quantity
2, 3	Lip area of dust cover		Molybdenum disulfide grease [NLGI No.2 (Li soap)]	As required
2	Pack interior of dust cover	FK617	Molybdenum disulfide grease [NLGI No.2 (Li soap)]	11 g {0.39 oz}
3	Pack interior of dust cover	FM617	Molybdenum disulfide grease [NLGI No.2 (Li soap)]	13 to 14 g {0.46 to 0.49 oz}
		FM657	Molybdenum disulfide grease [NLGI No.2 (Li soap)]	19 to 20 g {0.67 to 0.71 oz}

Special tools

Unit : mm {in.}

Location	Tool name and shape	Part No.	Application
1	Clip guide 	< FK617 > MH061831	Installation of clip
3	Dust cover installer | | A | B | C | | MH061828 | ø60.3 {2.37} | ø45 {1.77} | 80 {3.15} | | MH061827 | ø65 {2.56} | ø51 {2.01} | ø100 {3.94} | 	< FM617 > MH061828 < FM657 > MH061827	Installation of dust cover
	End holder | | A | B | | MH061830 | ø60 {2.36} | ø50.5 {1.99} | | MH061829 | ø64 {2.56} | ø55.7 {2.19} | 	< FM617 > MH061830 < FM657 > MH061829	

◆ Service procedure



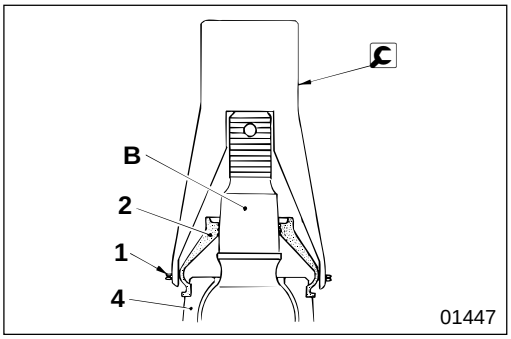
1 Clip < FK617 >

A : Long nose pliers

[Removal]

CAUTION

- **Be careful not to damage clip 1 or dust cover 2 when you remove the clip.**
- **If clip 1 is deformed, do not reuse it.**

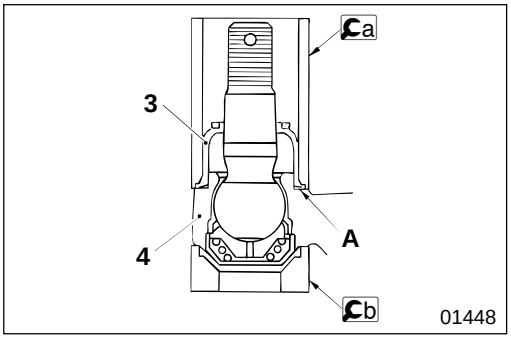


[Installation]

- Position the assembly so ball stud **B** is vertical.
- Place [C] clip guide on drag link **4**.
- Install clip **1** into the groove of dust cover **2**.

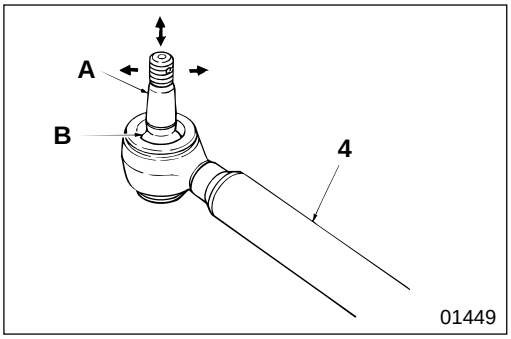
CAUTION

- **Be careful that [C] clip guide end does not dig into dust cover 2.**
- **Be especially careful that clip 1 end does not damage dust cover 2.**



3 Installation of dust cover < FM617, FM657 >

- Place dust cover **3** on drag link **4**.
- Hold drag link **4** between [Ca] dust cover installer and [Cb] end cover.
- Using a vise, press-fit dust cover **3** onto drag link **4** so as the dust cover is perpendicular to the drag link, and reinforcing ring **A** is in close contact with the drag link.



4 Inspection of drag link

Move ball stud area **A** of drag link **4** vertically and horizontally to make sure that there is no play. Also, check that ball section **B** moves evenly. If any fault is found, replace the tie rod assembly.

TIE ROD ASSEMBLY

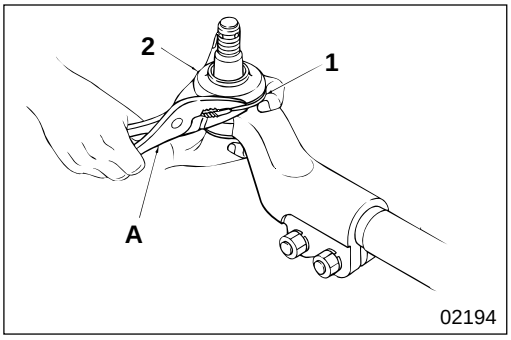
◆ Service procedure



02194

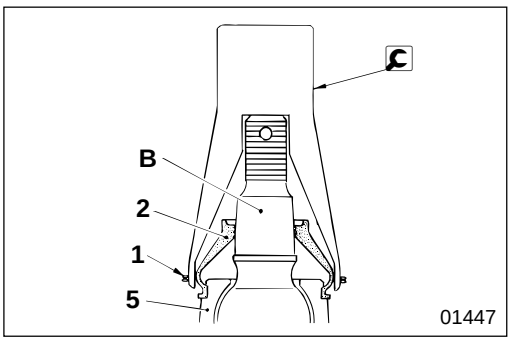
1 Clip < FK617 >

[Removal]

A : Long nose pliers

CAUTION

- **Be careful not to damage clip 1 or dust cover 2 when you remove the clip.**
- **If clip 1 is deformed, do not reuse it.**



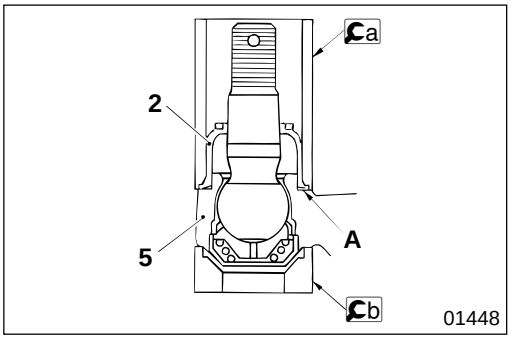
01447

[Installation]

- Position the assembly so ball stud **B** is vertical.
- Place clip guide on tie rod end assembly **5**.
- Install clip 1 into the groove of dust cover **2**.

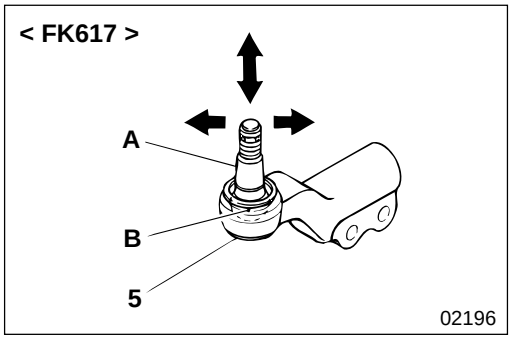
CAUTION

- **Be careful that clip guide end does not dig into dust cover 2.**
- **Be especially careful that clip 1 end does not damage dust cover 2.**



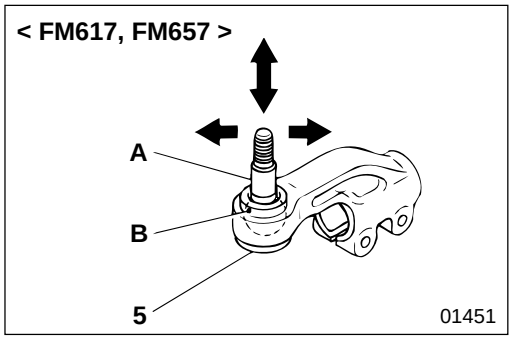
2 **Installation of dust cover < FM617, FM657 >**

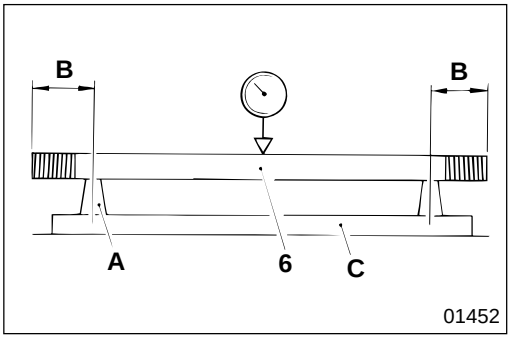
- Place dust cover **2** on tie rod end assembly **5**.
- Hold tie rod end assembly **5** between a dust cover installer and b end cover.
- Using a vise, press-fit dust cover **2** onto tie rod end assembly **5** so as the dust cover is perpendicular to the tie rod end assembly, and reinforcing ring **A** is in close contact with the tie rod end assembly.



5 **Inspection of tie rod end assembly**

Move ball stud area **A** of tie rod end assembly **5** vertically and horizontally to make sure that there is no play. Also, check that ball section **B** moves evenly. If any fault is found, replace the tie rod end assembly.





6 **Bend of tie rod**

Measure the bend of tie rod **6** at the center point. If the measured value exceeds the limit, correct or replace the tie rod.

NOTE

To measure the deflection of tie rod 6, turn it one full rotation and read the dial gauge indicator. The deflection is one half of the indicated value.

A : V-block
B : Approximately 300 mm {11.8 in.} < FK617 >
Approximately 250 mm {9.84 in.} < FM617, FM657 >
C : Surface plate

◆ Service procedure

● Cleaning of frame

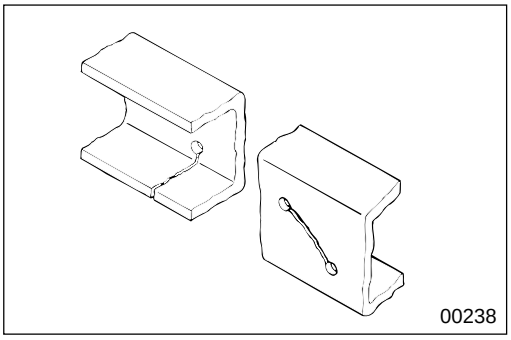
Carefully remove mud, grease, rust, etc. that is stuck to the outer and inner surfaces of the frame.

● Inspection for frame deformation

If any fault such as deformation is found, repair the frame.

● Inspection for cracks in frame

- Remove paint from any areas that are seemingly faulty and carefully inspect.
- If visual inspection is difficult, inspect using color contrast penetrant examination or other methods.
  If a crack is found, repair as follows.

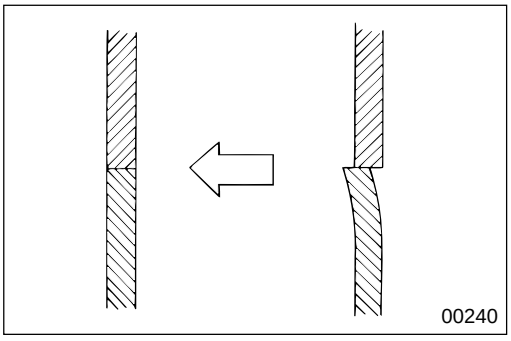


● Repair of crack in frame

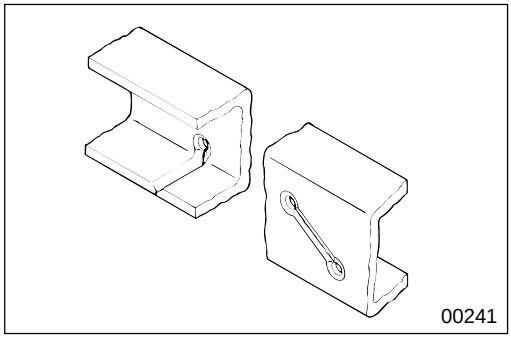
- With the vehicle unloaded, level the frame.
- Drill a hole, about twice the thickness of the frame, 10 mm {0.39 in.} from the end of the crack.

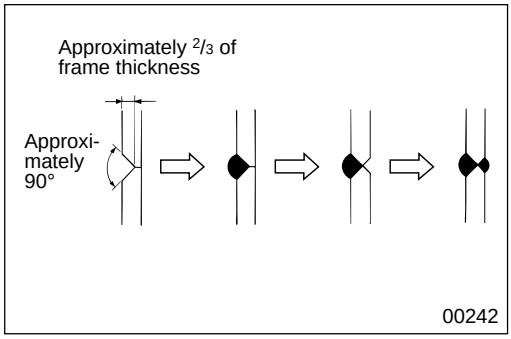
NOTE

If a crack is found inside the frame, drill holes at both ends of the crack.



- If the edges of the crack are not flush, make them flush with each other.





- Using a grinder, etc., grind a 90° V-section channel, two-thirds of the frame thickness, then weld.

WARNING

You must cover any inflammable materials, such as pipelines, wiring harnesses, rubber parts, and the fuel tank, that are near the welding site.

CAUTION

- **Do not use gas welding because the high temperature produced alters the material properties and weakens the welded area. Be sure, therefore, to use electric welding.**
- **Be sure to remove the negative terminal of the battery, then ground the welder near the area to be welded to prevent reversed flow of current from the welder which might burn out electrical components.**
- **Be sure to protect mountings such as main sills that can be damaged by heat, by using heat insulators, etc.**

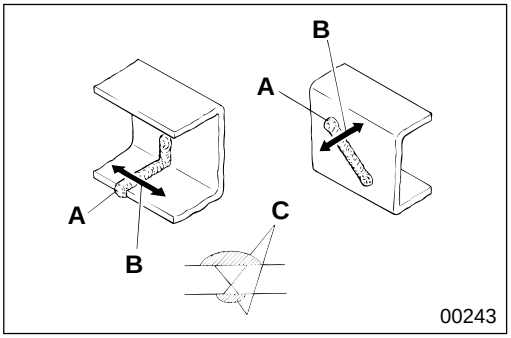
NOTE

- **Use low-hydrogen type coated CO_2 and arc welding electrodes for welding to prevent harmful defects such as undercutting, blow holes, etc.**
- **Preheat the area to be welded to approximately 50 to 350°C {122 to 662°F} before welding when the workshop temperature is below 0°C {32°F}.**

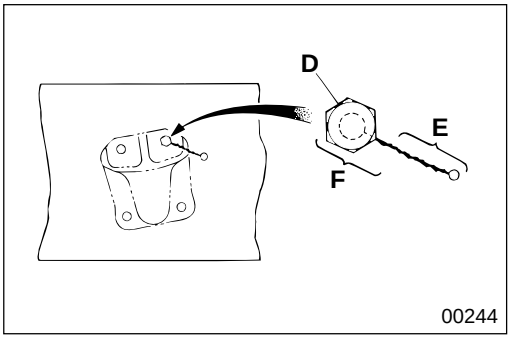
- Next, grind a V-section channel, as described above, on the opposite side of the weld and weld. At the same time, fill the holes at both ends of the crack by welding.

NOTE

In cold districts, heat the welded area to approximately 200°C {392°F} after welding.

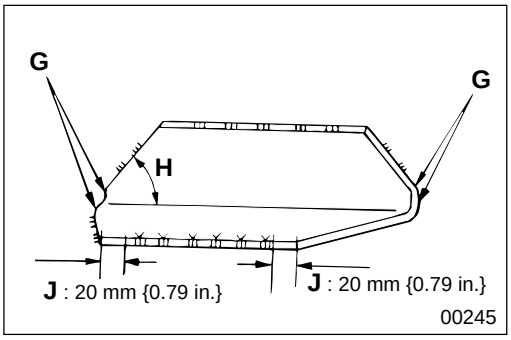


- After welding, grind bead **A** at right angles **B** to remove shaded area **C** as illustrated and grind the area flat.
- Finish the surface so that the frame thickness is identical to the original thickness.



[Repairing cracks caused by rivets or bolt holes]

- To make the edges of the holes flush at the cracked area, temporarily tighten bolt **D** in the hole.
- Weld cracked point **E** at least 20 mm {0.79 in.} from the center of the bolt.
  For welding method refer to the above-mentioned procedures for repairing cracks. P41-3.
- After removing the bolt and making the edges flush, weld remaining area **F** and fill the hole.
- After drilling a hole in the filled area, install a rivet or bolt.

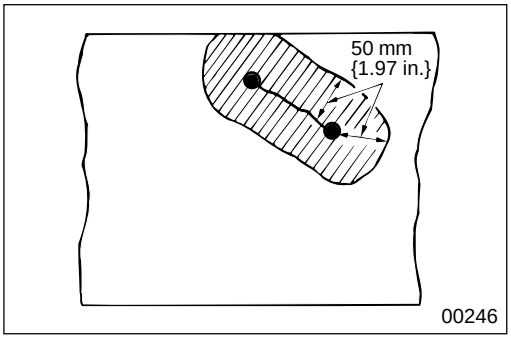


[Repairing using reinforcement plate]

- To prevent concentrated stress being produced at ends **G** of the reinforcement plate, weld the plate with angle **H** at both ends opened 30° or less.
  Do not weld area **J**.
- The reinforcement plate must have enough strength for the cracked area.

NOTE

- **Thickness of reinforcement plate : same as frame thickness**
- **Reinforcement plate material : HTP540 (high tensile strength steel) or equivalent strength.**

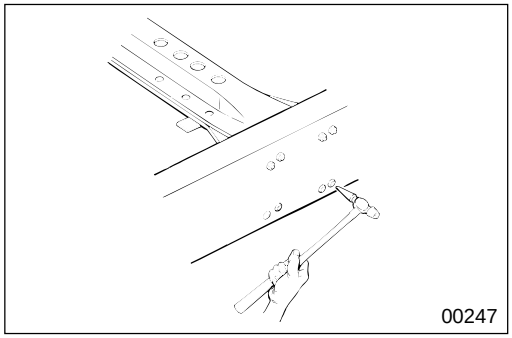


- After welding, heat the shaded area to 600 to 700°C {1112 to 1292°F}.

CAUTION

Be sure to protect mountings such as main sills that can be damaged by heat, by using heat insulators, etc.

INSPECTION AND REPAIR OF FRAMES

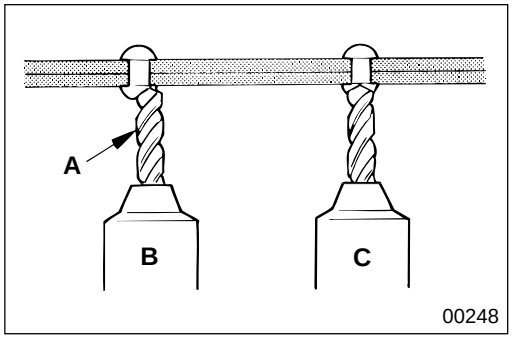


● **Inspection for loose rivets**

- Gently tap the rivet head using an inspection hammer and judge the condition by checking the vibration using the tip of your finger, or by listening to the sound.
- Rust between rivet and frame indicates that the rivet is loose.

CAUTION

Be sure to replace loose rivets because they can break or cause cracking of the frame in the area around the rivet hole, causing accidents.

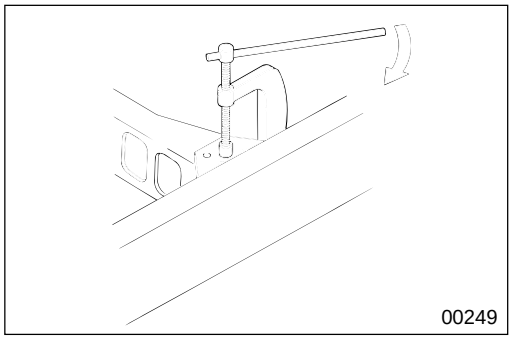


● **Repair of rivet**

- When removing rivets, use a center punch to make an indent in the center of the rivet head; then, drill out using drill **A** or grind.
  B : Incorrect
  C : Correct

CAUTION

Make sure that you do not damage the rivet hole.



- When rivetting, first clamp both plates tightly near the rivet hole using a clamp to eliminate gaps between plates.

- Using a rivetting machine, insert the rivet (cold rivet).
- If rivetting is impossible, ream the rivet hole, drive in a reamer bolt, fully tightening the nut, then weld it in place.
  A flange bolt and flange nut should be used for the reamer bolt and nut.

● **Inspection for loose bolts and nuts**

- Inspect the mounting bolts of the cross member, the helper stopper < FK > and the rear spring bracket < FM > for looseness. Loosened bolts should be tightened at specified torque. P41-2, Gr 34

NOTE

Tighten the nut side when working on the helper stopper < FK > and the rear spring bracket < FM > mounting bolts.

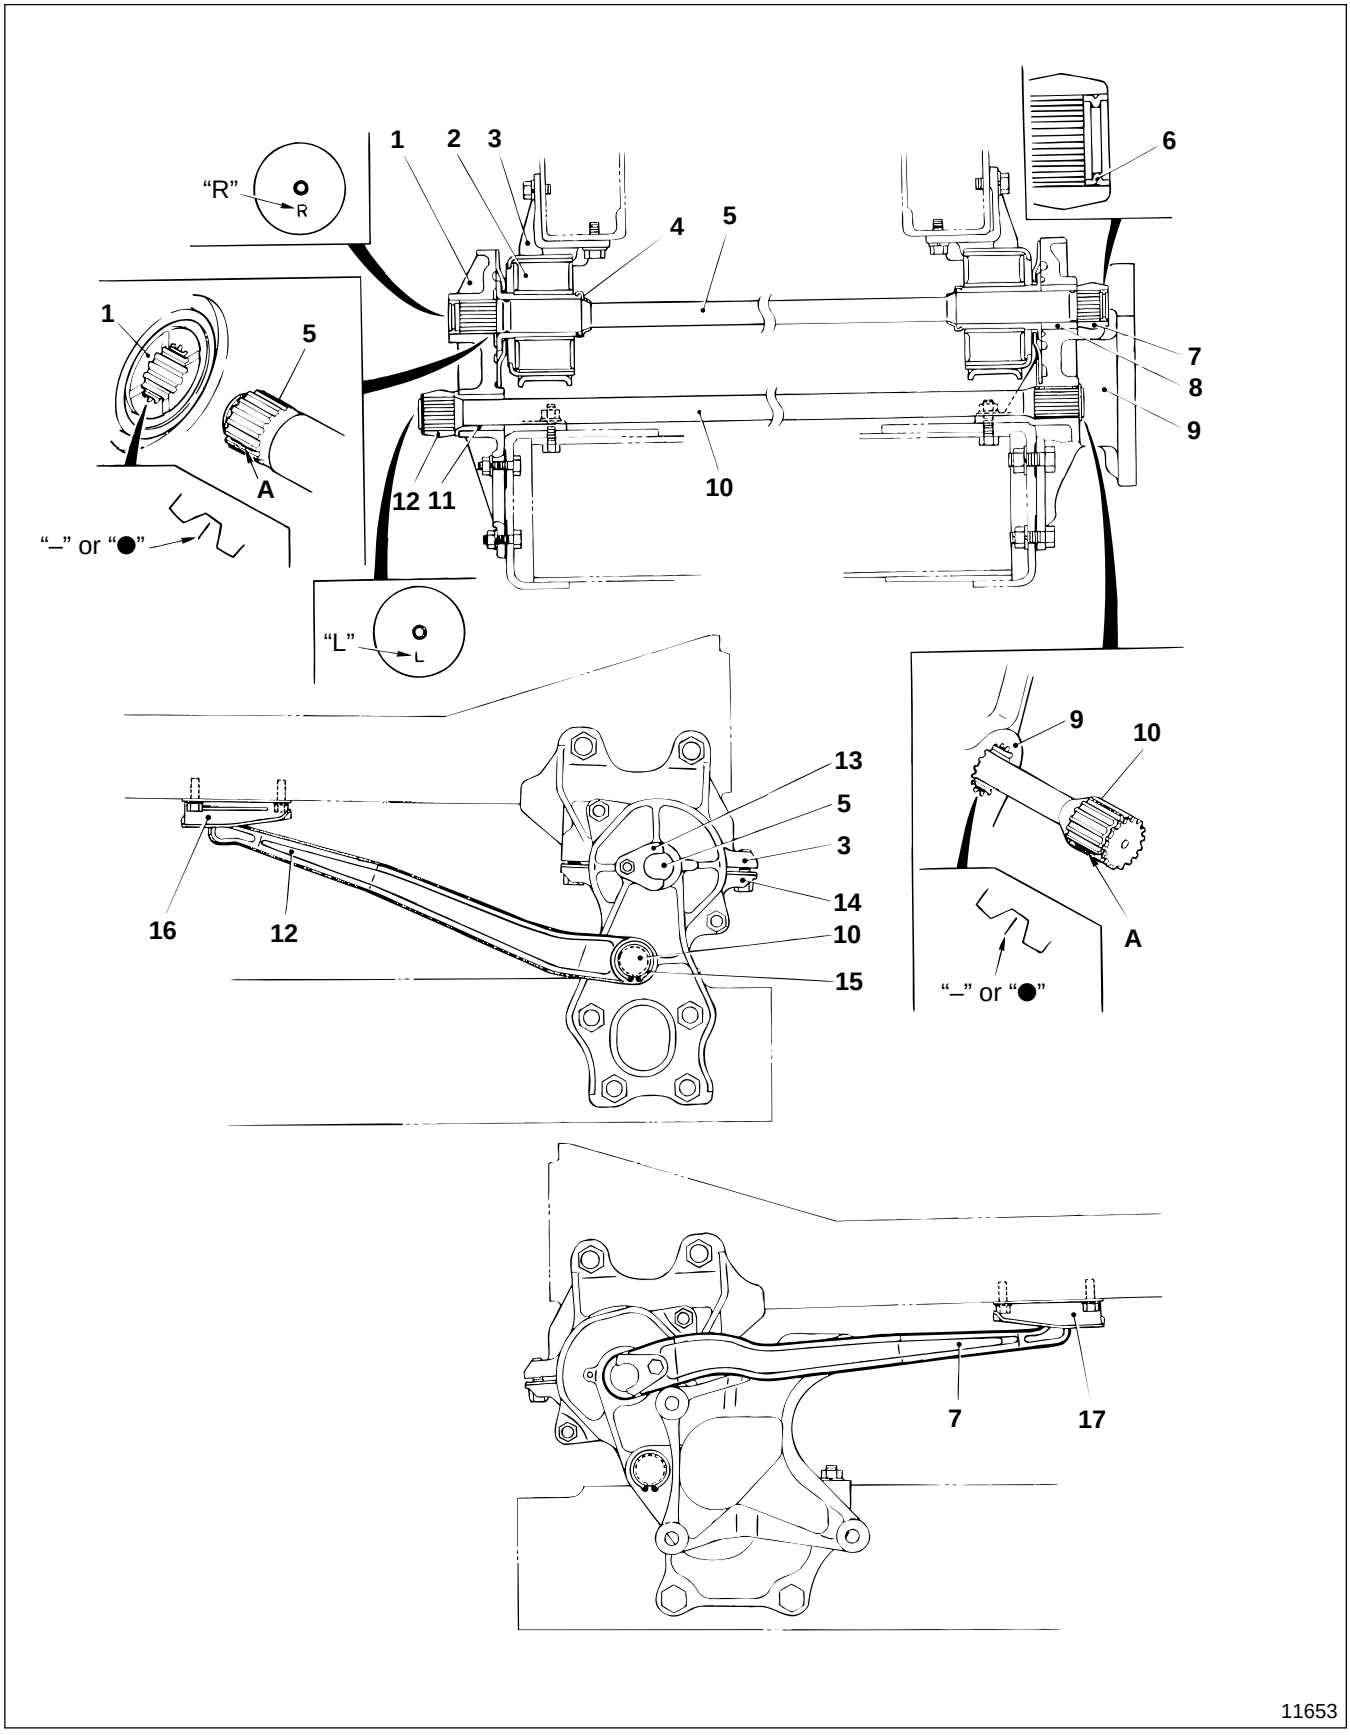
Glass other than windshield		Tempered glass
Door glass opening and closing mechanism		Manual control type (Cable driven)

M E M O

Front Cab Mounting



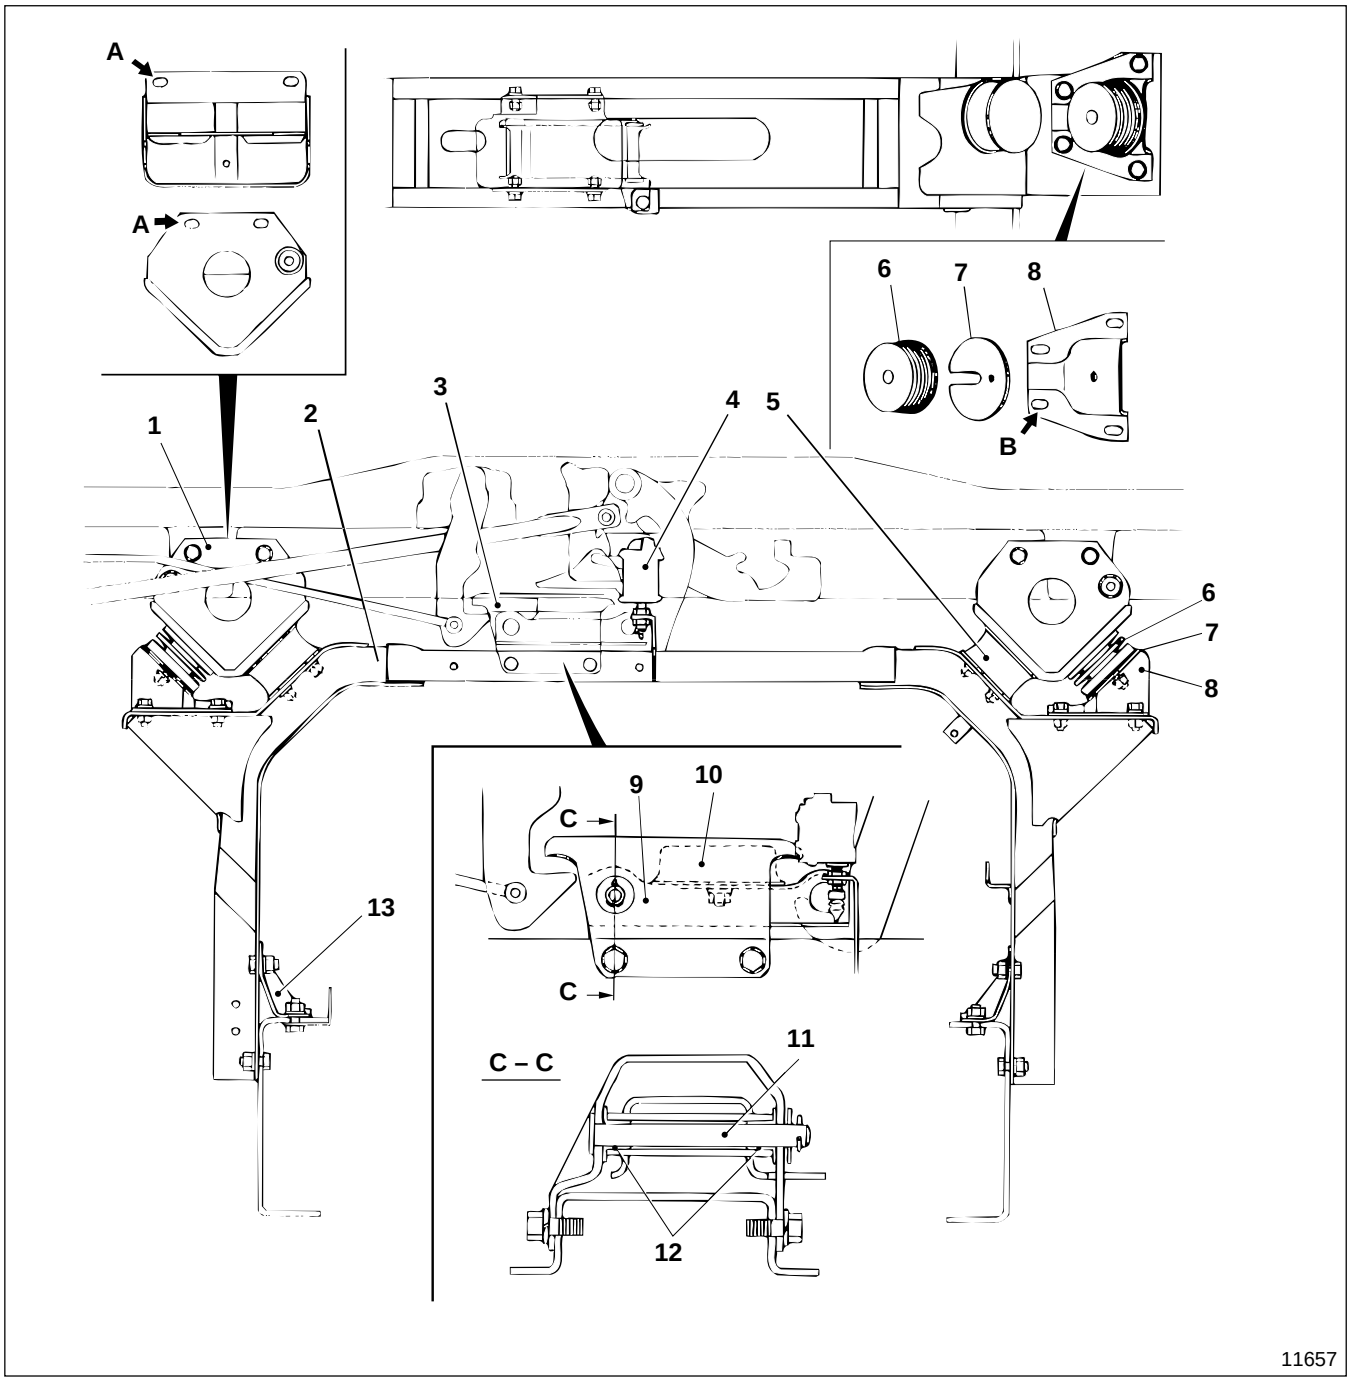
11653

1 Cab hinge bracket
2 Cab hinge cushion
3 Cab hinge upper bracket
4 Dust cover
5 Upper torsion bar
6 Dust cover
7 Torsion bar arm, LH
8 Bushing
9 Gear box bracket
10 Lower torsion bar
11 Bushing
12 Torsion bar arm, RH
13 Stopper plate
14 Cab hinge cap
15 Snap ring
16 Torsion bar support, RH
17 Torsion bar support, LH

A : White paint

- Since upper torsion bar **5** and lower torsion bar **10** have torsional directions, they are marked "**L**" and "**R**" on their right ends, preventing mistaken installation.
- Upper torsion bar **5** and cab hinge bracket **1** have alignment marks to aid alignment. The torsion bar is marked with white paint **A**, and the cab hinge bracket is marked with "–" or "●".
- Lower torsion bar **10** and gear box bracket **9** have alignment marks to aid alignment. The torsion bar is marked with white paint **A**, and the gear box bracket is marked with "–" or "●" .

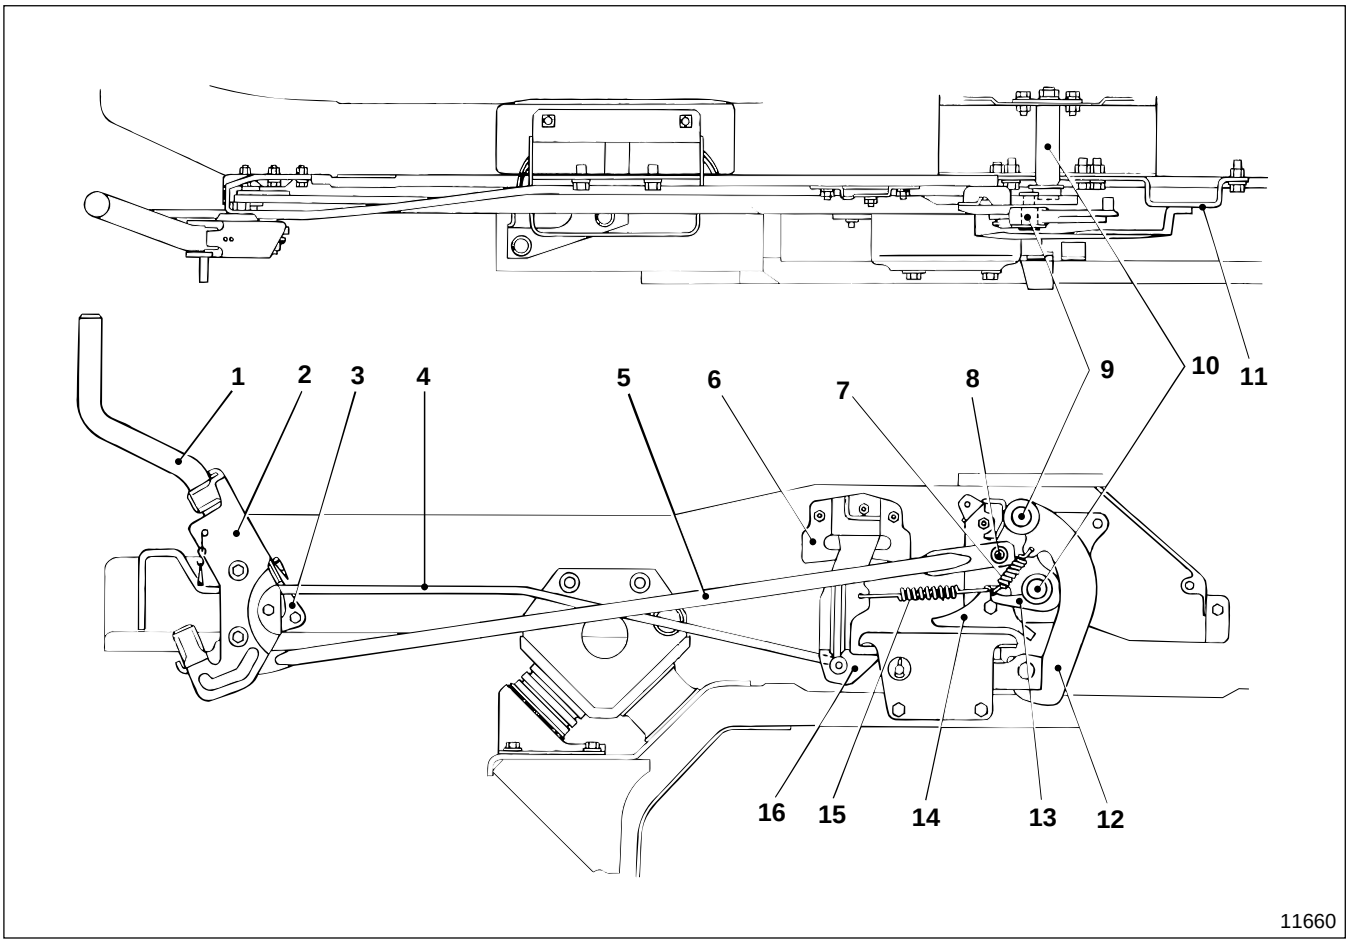
Rear Cab Mounting



1	Bottom bracket	**5**	Side cushion	**9**	Hook pin bracket	**13**	Cab bridge stiffener
2	Cab bridge	**6**	Compression cushion	**10**	Rebound cushion		
3	Hook hinge bracket	**7**	Shim	**11**	Clevis pin		
4	Cab tilt lock switch	**8**	Mounting bracket	**12**	Bushing		

- Mounting holes **A** of bottom bracket **1** are oval to allow adjustment of contact with side cushion **5**.
- Mounting bracket **8** and shim **7** allow you to adjust the position of bottom bracket **1** and compression cushion **6**.
  - Mounting holes **B** of mounting bracket **8** are oval to allow horizontal adjustment of compression cushion **6**.
  - Shim **7** allows vertical adjustment of compression cushion **6**.

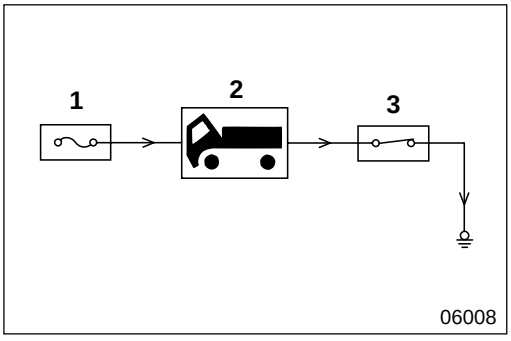
Cab Tilt Link



1 Control lever hook
2 Control lever hook bracket
3 Hinge bracket
4 L-lever rod
5 Control rod
6 L-lever bracket
7 Return spring
8 Lock pin
9 Main hook pin
10 Main hook shaft
11 Main hook bracket
12 Main hook
13 Main hook arm
14 Lock lever
15 Return spring
16 L-lever

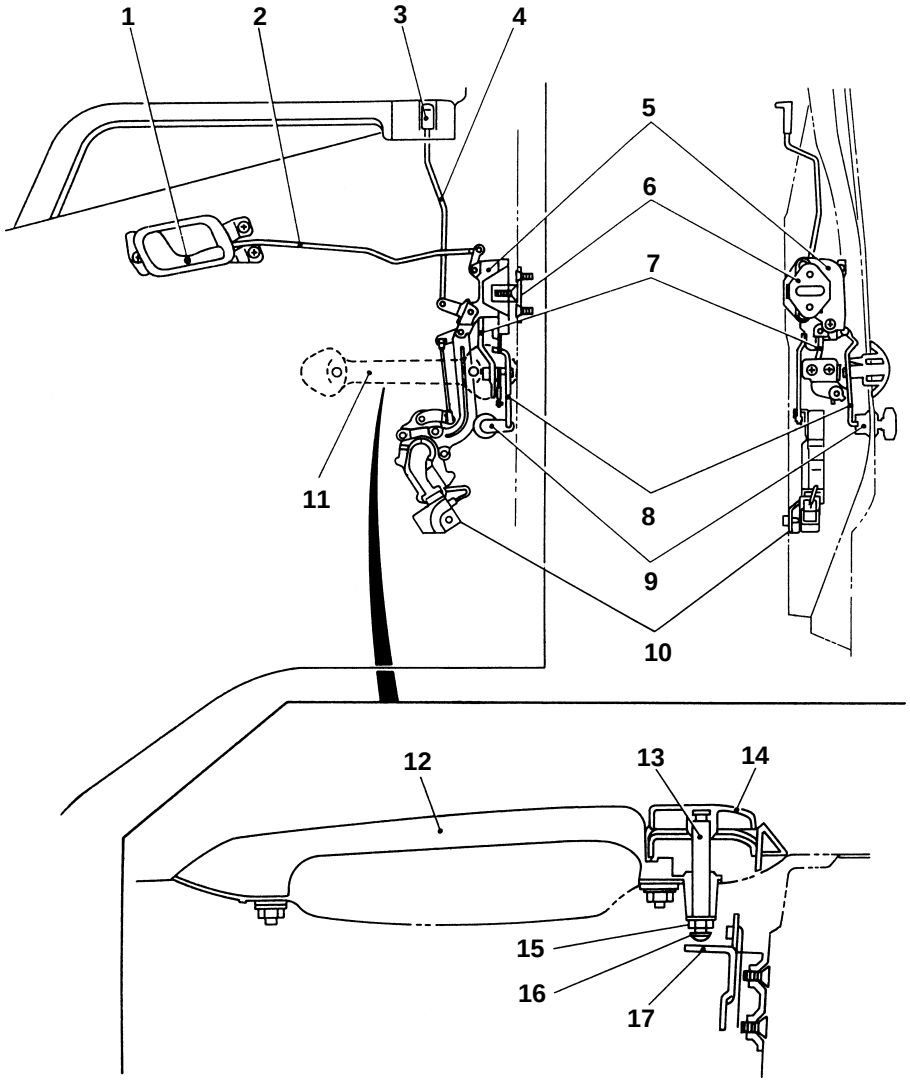
The heads of lock pin **8**, main-hook pin **9** and main-hook shaft **10** were caulked after installation. Therefore, set parts **5**, and **8** to **13** constitute the main hook assembly and they must be handled together. They must not be disassembled.

Cab Tilt Warning Electric Circuit



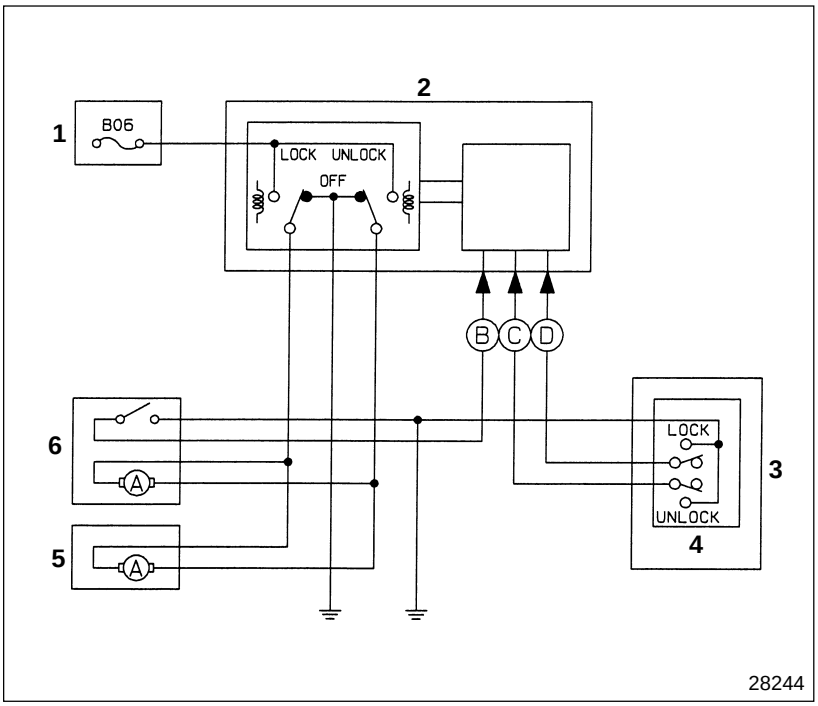
1 Relay and fuse box
2 Cab tilt warning lamp
3 Cab tilt lock switch

Door Locking System



1 Inside handle
2 Door opening rod
3 Door lock knob
4 Door lock rod
5 Door latch
6 Striker
7 Door opening rod
8 Door lock cylinder rod
9 Door lock cylinder
10 Door lock actuator
11 Outside handle
12 Handle
13 Shaft
14 Push button
15 Nut
16 Screw
17 Stay

- Push button **14** stroke of outside handle **11** can be adjusted to optimize opening and closing of the door .
- To adjust the stroke, turn screw **16** on shaft **13**.
- The head of screw **16** pushes stay **17**, and this moves door opening rod **7**, releasing door latch **5**.



● **Auto door lock system electric circuit**

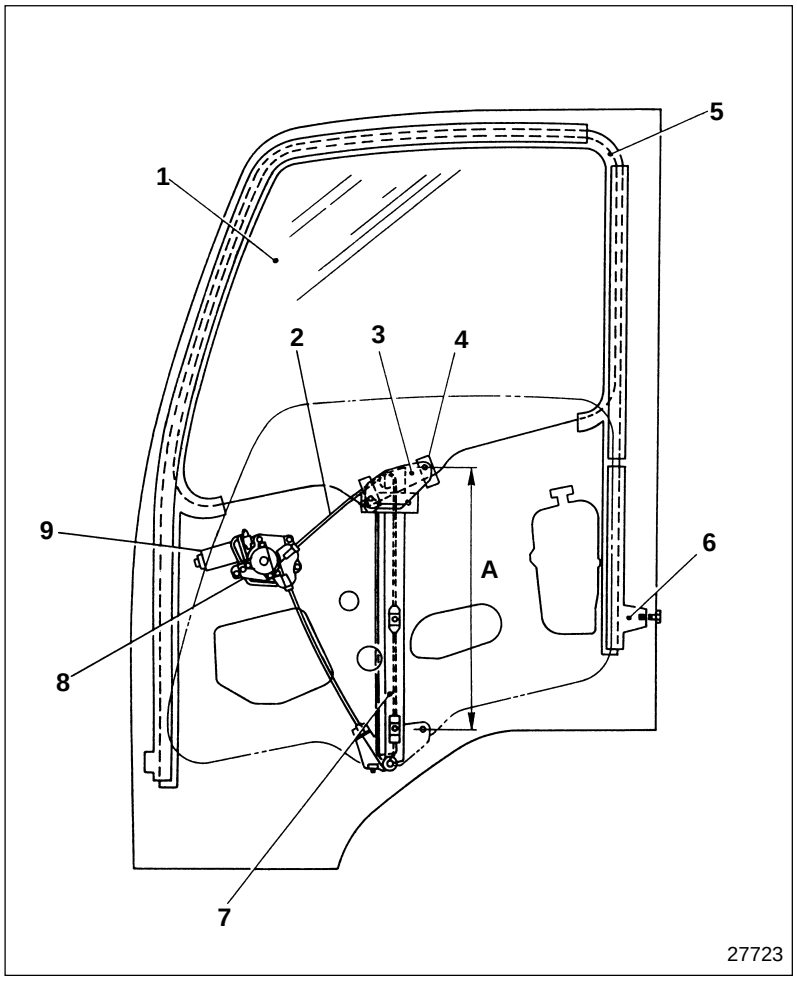
1 Fuse box
2 Power window electronic control unit
3 Power window switch and automatic door lock switch assembly
4 Automatic door lock switch
5 Assistant driver's seat side door lock actuator
6 Driver's seat side door lock actuator

A : Actuator

Ⓑ: Door lock and unlock signal by driver's seat side door lock actuator
Ⓒ: Door lock signal by automatic door lock switch
Ⓓ: Door unlock signal by automatic door lock switch

At the driver's seat side, the doors can be locked and unlocked by automatic door lock switch **4**. In addition, the doors can be locked and unlocked by procedures at door lock actuator **6**.

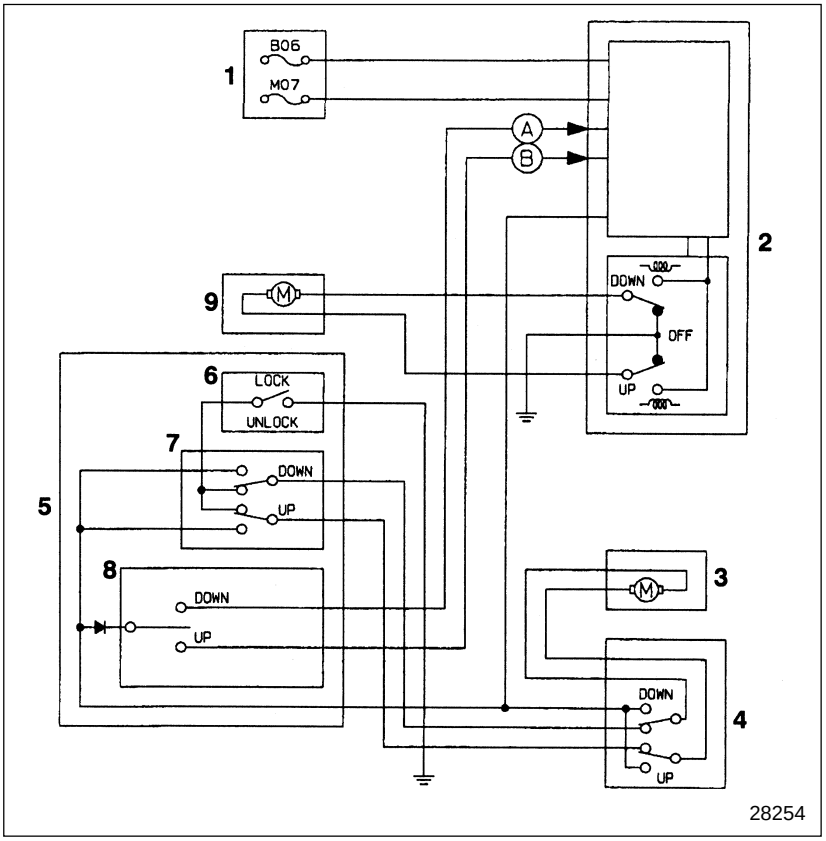
Door Glass Opening System



1 Door glass
2 Wire
3 Carrier plate
4 Glass holder
5 Run channel
6 Lower sash
7 Rail
8 Regulator
9 Power window motor

A : Carrier plate moving range

- Regulator **8** is so constructed that it is interlocked with power window motor **9** and carrier plate **3** through wire **2**.
- When power window motor **9** is rotated, carrier plate **3** is wound up or down by wire **2** to raise or lower door glass **1**.



● **Door glass opening system electric circuit**

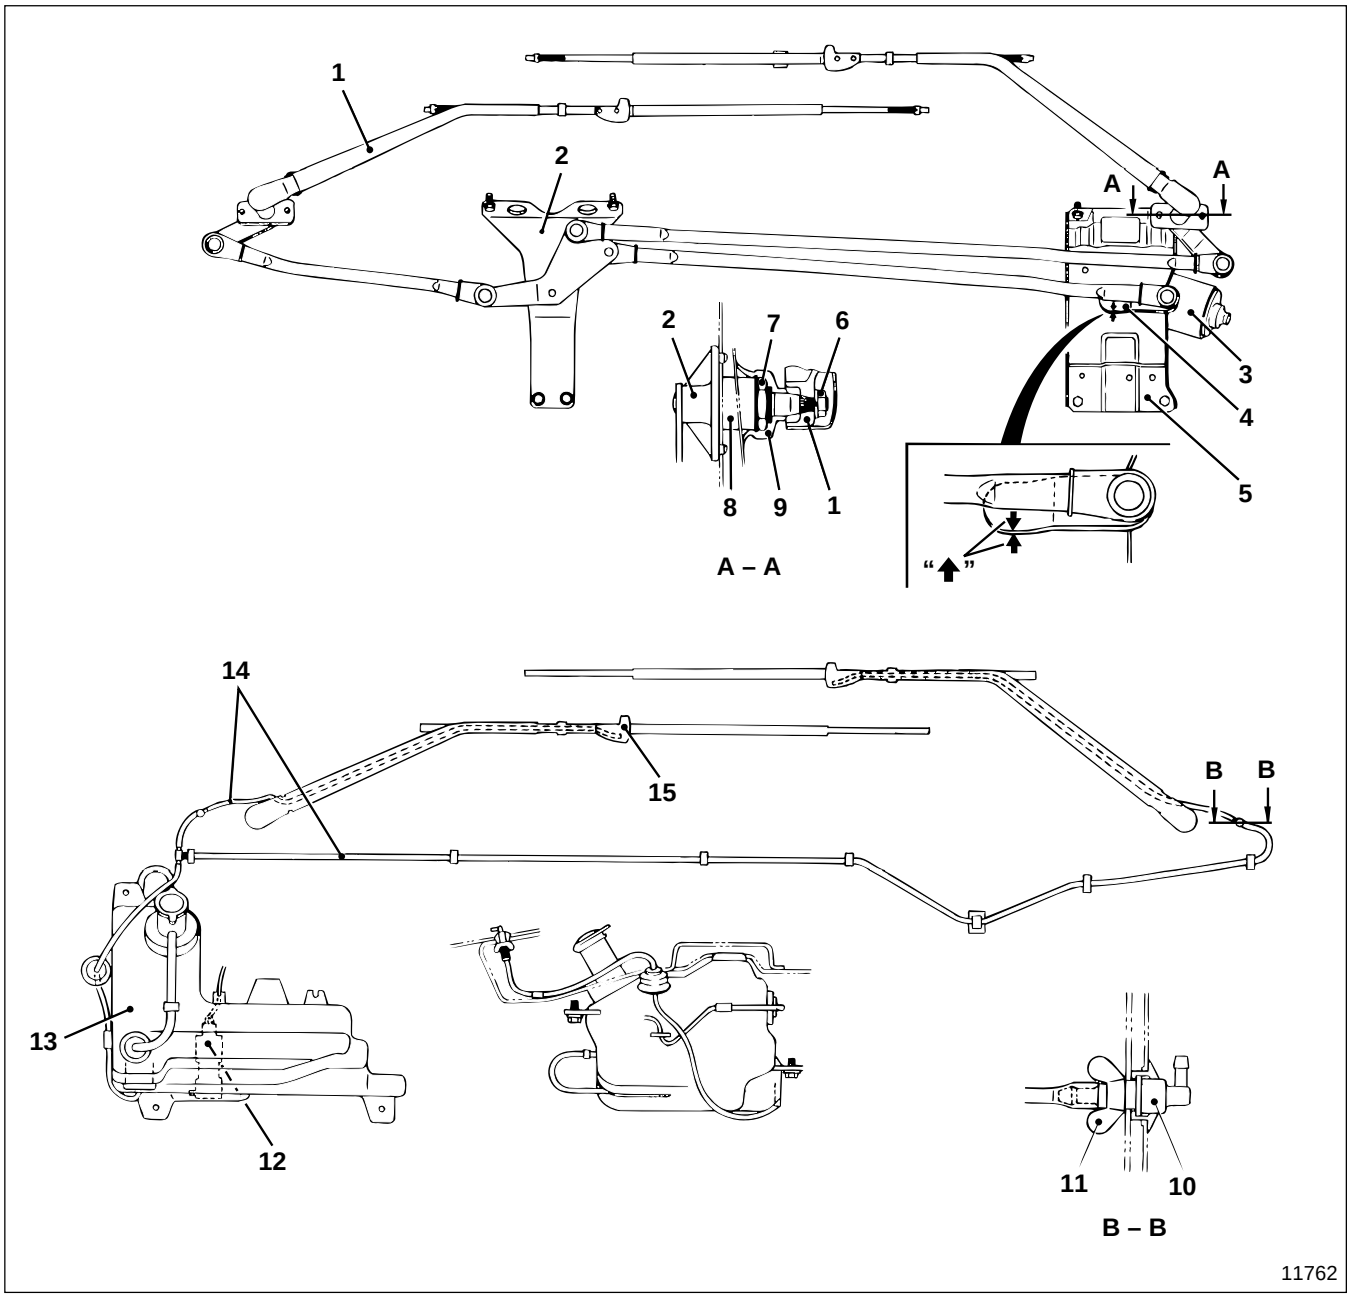
1 Fuse box
2 Door and mirror electric circuit unit
3 Assistant driver's seat side power window motor
4 Assistant driver's seat side power window switch
5 Power window switch assembly (driver's seat side)
6 Power window lock switch
7 Power window switch (to open and close assistant driver's side door glass from driver's seat)
8 Power window switch (driver's seat side)
9 Driver's seat side power window motor

M : Motor

Ⓐ: DOWN (MANUAL) signal from driver's seat side power window switch
Ⓑ: UP (MANUAL) signal from driver's seat side power window switch

- Driver's seat side power switch assembly **5** consists of power window lock switch **6**, power window switches **7** and **8**, and the automatic door lock switch put together as a unit.
- When power window lock switch **6** is placed at the LOCK position, the assistant driver's seat side door glass cannot be opened and closed even if the power window switches **4** and **7** are operated.

Wiper and Washer



1	Wiper and blade assembly	**6**	Nut	**11**	Nut
2	Link assembly	**7**	Nut	**12**	Washer motor

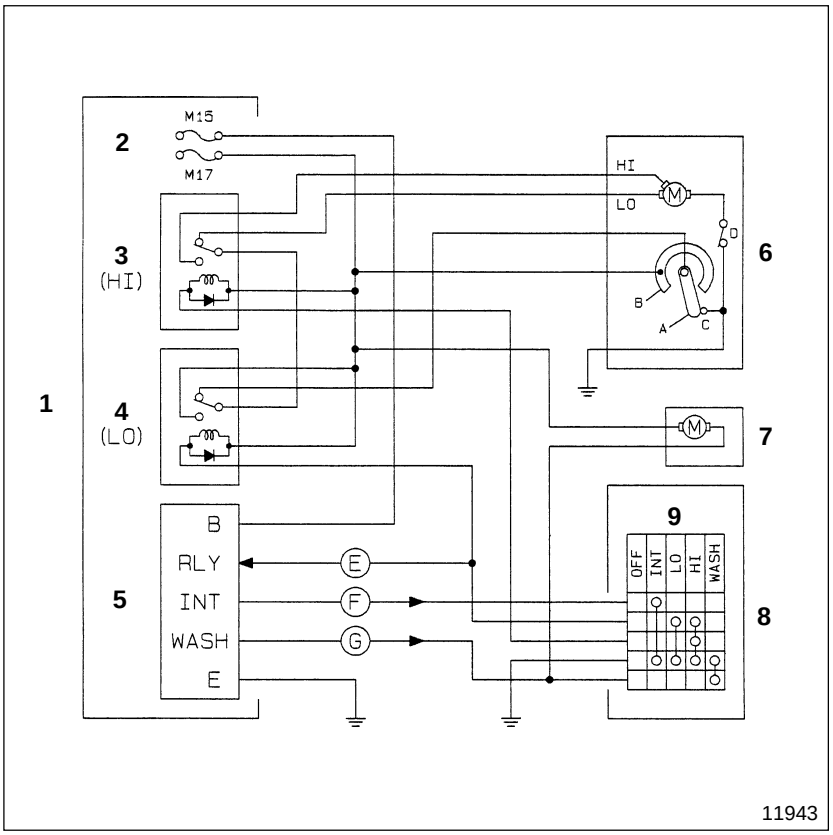
5	Wiper motor bracket	**10**	Hose joint	**15**	Washer nozzle

Crank arm **4** and wiper motor bracket **5** have alignment marks "⬆" that align when wiper and blade assembly **1** stop at the specified position.

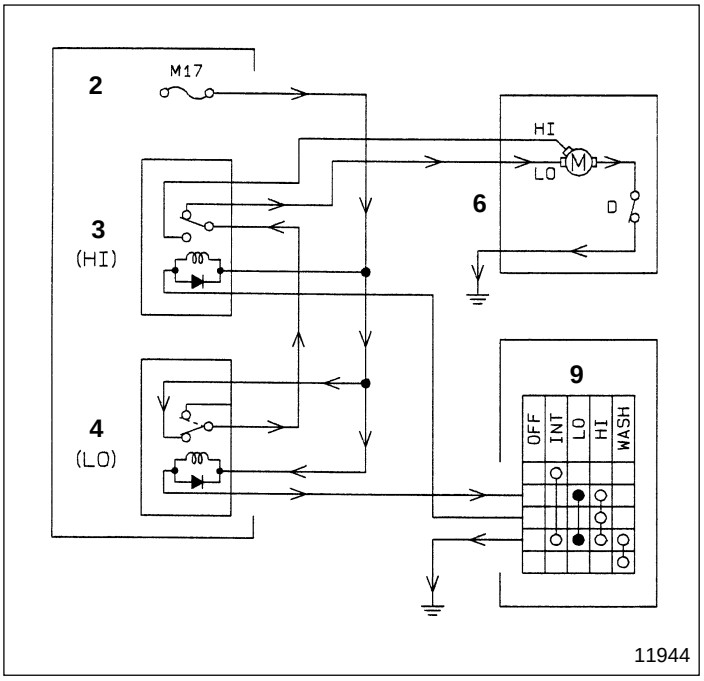
Wiper and Washer Electric Circuit



1 Fuse and realy box
2 Fuse
3 Wiper relay (HIGH)
4 Wiper relay (LOW)
5 Multipurpose timing control unit
6 Wiper motor
7 Washer motor
8 Combination switch
9 Wiper and washer switch

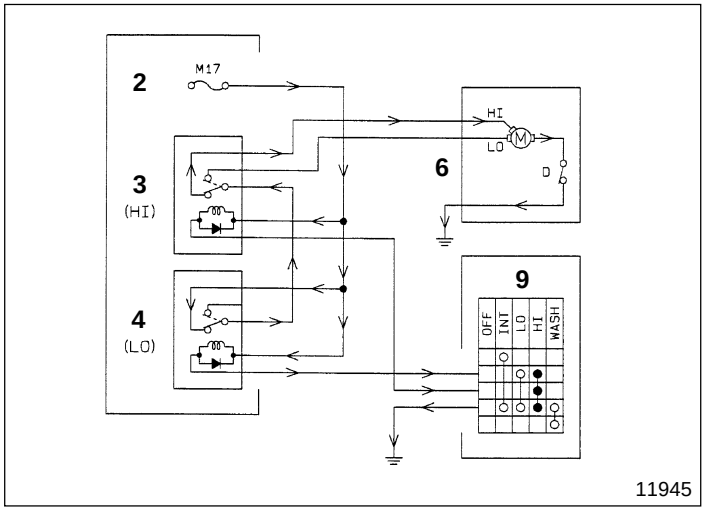
Wiper motor **6** section
A : Cam
B : Plate
C : Contact point
D : Circuit breaker

Ⓔ : Wiper motor driving signal (when wiper operating intermittently)
Ⓕ : Intermittent switch signal (when wiper operating intermittently)
Ⓖ : Washer switch signal



When wiper operating at LOW speed

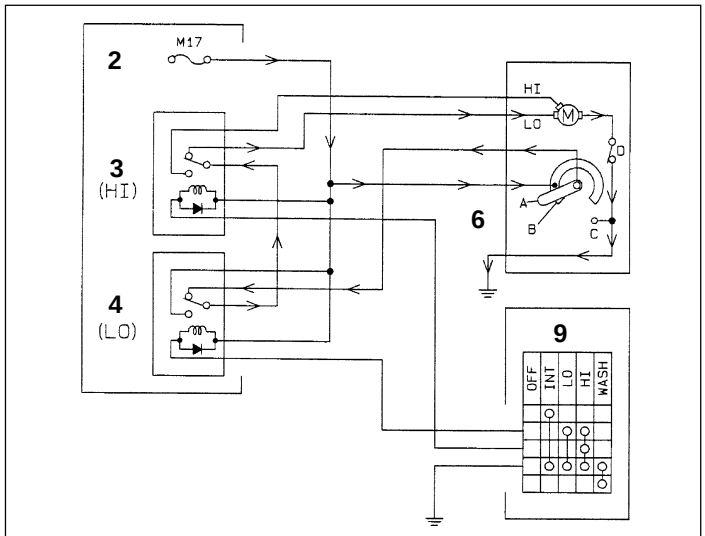
Position of wiper and washer switch **9** : LO
- **2** (M17) → **4** (coil) → **9** (LO) → Ground
- **2** (M17) → **4** (contact point) → **3** (contact point) → **6** (LO) → **6** (D) → Ground
  Wiper motor **6** rotates at low speed.



When wiper operating at HIGH speed

Position of wiper and washer switch **9** : HI

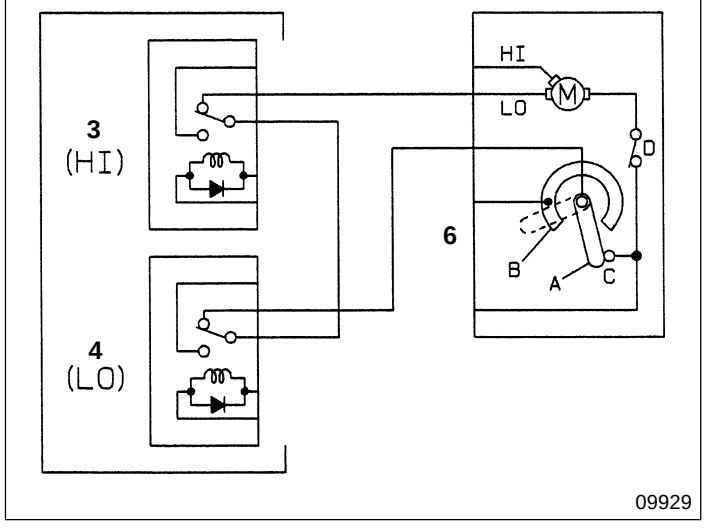
- **2** (M17) → **3** (coil) → **9** (HI) → Ground
  → **4** (coil) → **9** (HI) → Ground
- **2** (M17) → **4** (contact point) → **3** (contact point) → **6** (HI) → **6** (D) → Ground
  Wiper motor **6** rotates at high speed.



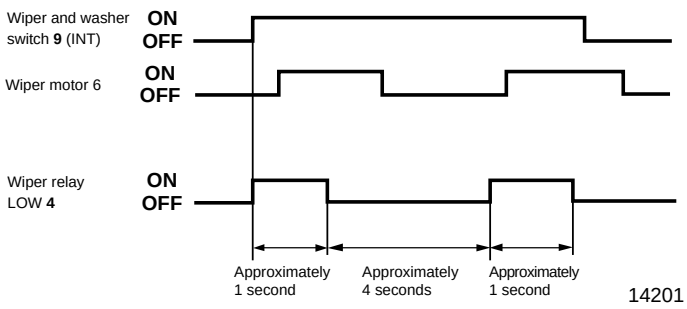
When wiper stops

Position of wiper and washer switch **9** : OFF

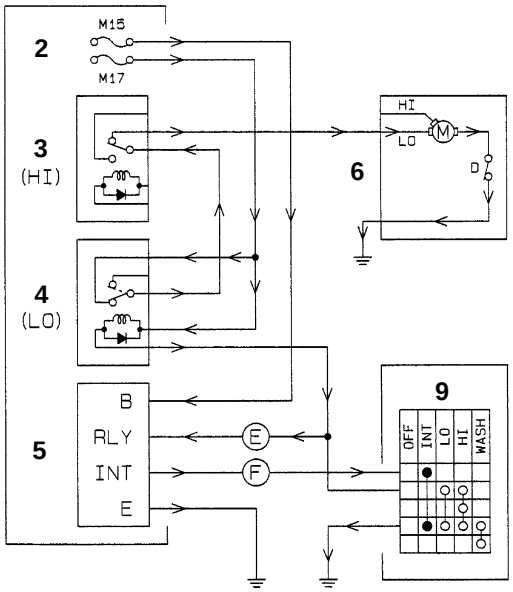
- **2** (M17) → **6** (B) → **6** (A) → **4** (contact point) → **3** (contact point) → **6** (LO) → **6** (D) → Ground
  Wiper motor **6** continues to rotate at low speed.



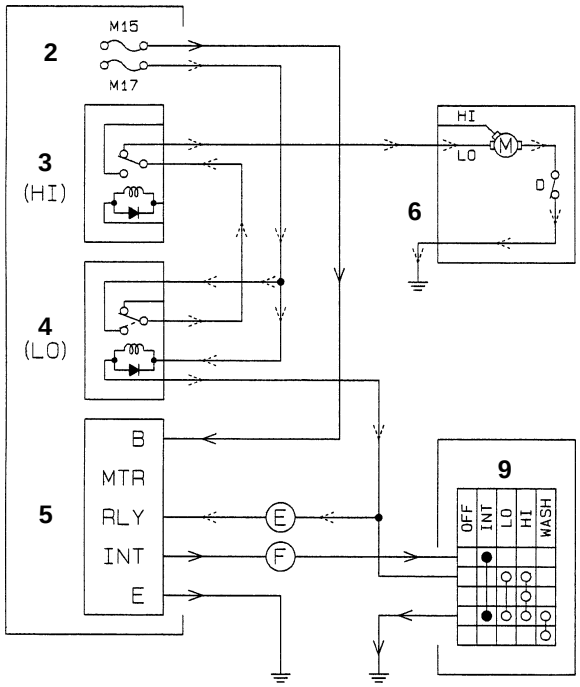
- When cam **A** is separated from plate **B** by rotation of wiper motor **6**, the current to the motor is cut off.
- Wiper motor **6** continues to rotate due to the inertia force of the motor and the wiper link.
- When cam **A** of wiper motor **6** makes contact with contact point **C**, the following ungrounded circuit is formed.
  → **6** (LO) → **6** (D) → **6** (C) → **3** (contact point) ← **4** (contact point) ← **6** (A) ←
- Wiper motor **6** stops by dynamic (electric) braking because of this circuit.



14201



11947



11948

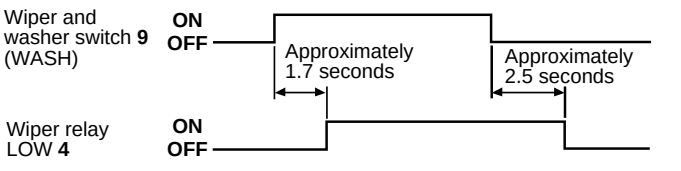
When wiper operating intermittently

Operation mode with multipurpose timing control unit **5**

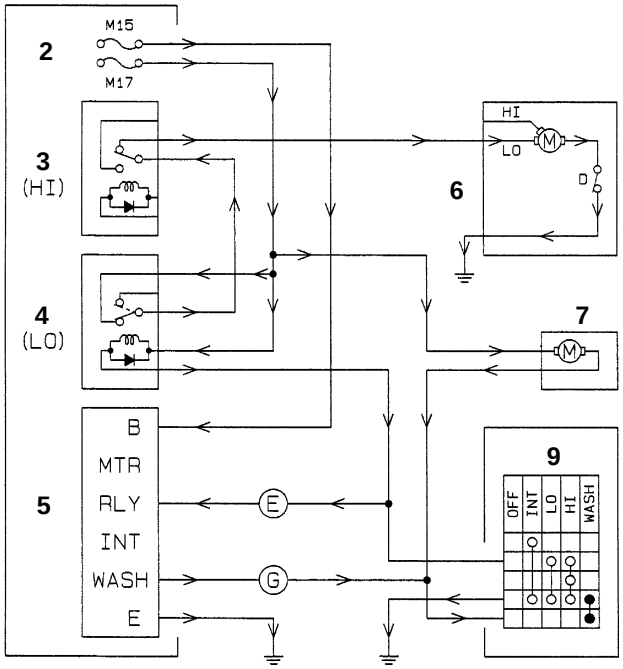
Position of wiper and washer switch **9** : INT

- **2** (M15) → **5** (B) → Ground
- **5** (INT) —Ⓕ→ **9** (INT) → Ground
- Multipurpose timing control unit **5** sends wiper motor driving signal Ⓔ when it receives intermittent switch signal Ⓕ.
  2 (M17) → **4** (coil) —Ⓔ→ 5 (RLY)
- **2** (M17) → **4** (contact point) → **3** (contact point) → **6** (LO) → **6** (D) → Ground
  Wiper motor **6** rotates at low speed.

- Multipurpose timing control unit **5** turns wiper motor driving signal Ⓔ OFF for specified time.
  The illustrated part ⊣⊢ of the circuit turns OFF.
- Wiper motor **6** stops. 🕮 Gr 42-14
- After specified time has passed, multipurpose timing control unit **5** sends wiper motor driving signal Ⓔ again.
- Wiper motor **6** rotates at low speed.



12201



11949

When washer operating

Operation mode with multipurpose timing control unit **5**

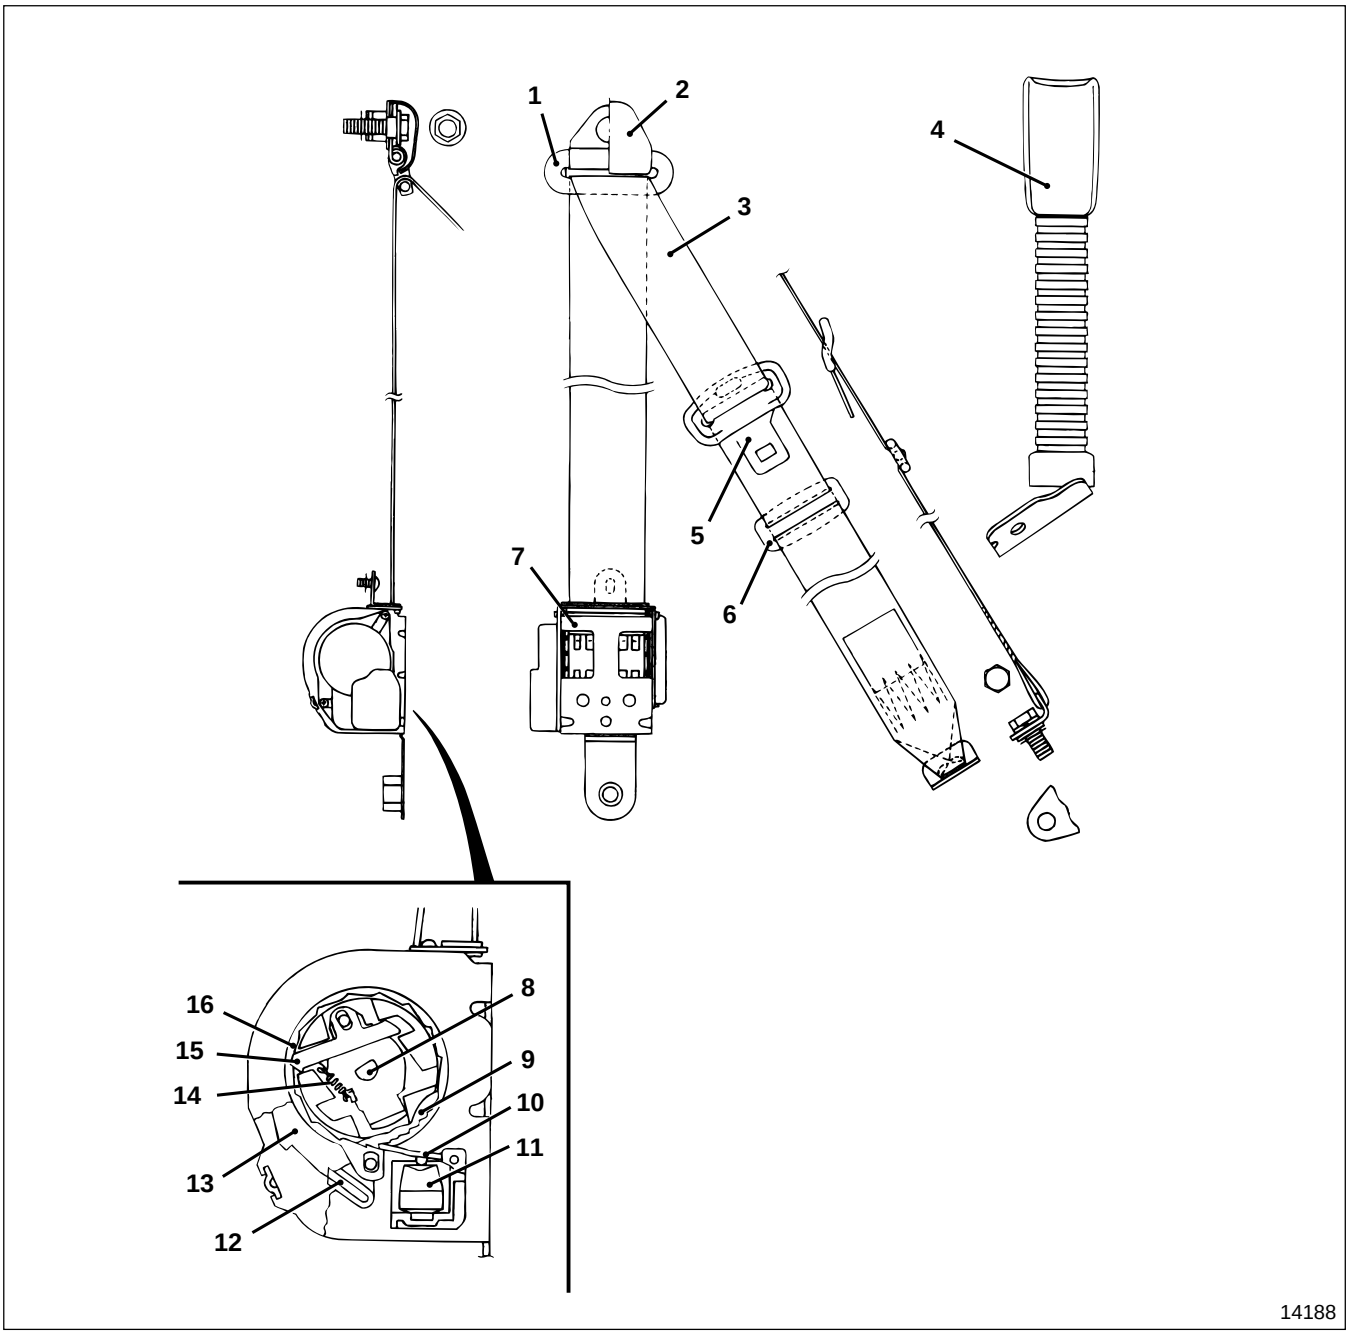
Position of wiper and washer switch **9** : WASH

- **2** (M15) → **5** (B) → Ground
- **2** (M17) → **7** → **9** → Ground
  5 (WASH)-Ⓖ

When washer motor **7** operates to spray washer fluid, multipurpose timing control unit **5** transmits washer switch signal Ⓖ.

- **2** (M17) → **4** (coil) —Ⓔ→ **5** (RLY)
  Washer switch signal Ⓖ makes multipurpose timing control unit **5** input wiper motor drive signal Ⓔ.
- **2** (M17) → **4** (contact point) → **3** (contact point) → **6** (LO) → **6** (D) → Ground
  Wiper motor **6** operates at LOW speed.
- When wiper and washer switch **9** is turned to OFF, washer motor **7** stops.
- Then, washer switch signal Ⓖ is turned off and multipurpose timing control unit **5** turns off wiper motor drive signal Ⓔ after specified time.
- Wiper motor **6** automatically stops.
  P42-14

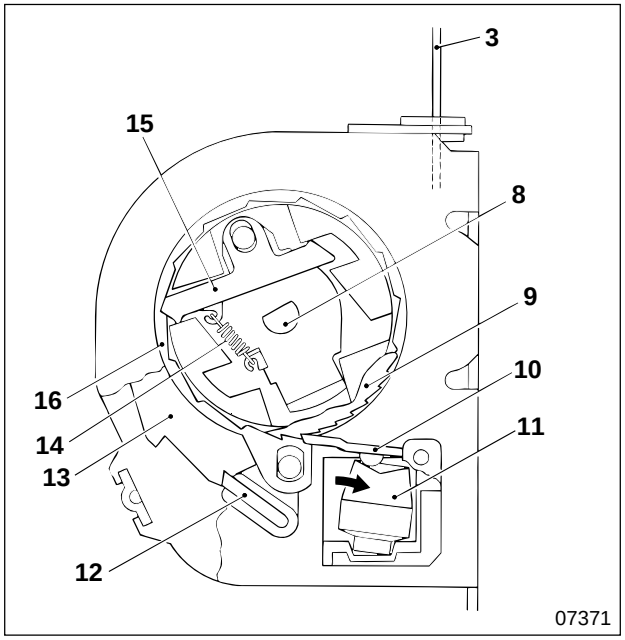
Emergency Locking Retractor (ELR) Type Seat Belt



1 Sash guide
2 Cover
3 Webbing
4 Buckle assembly
5 Tongue plate
6 Tongue stopper
7 Emergency locking retractor assembly
8 Spindle
9 Locking gear
10 Mechanism lever
11 Mechanism weight
12 Pawl
13 Ratchet gear
14 Sensor spring
15 Lock arm
16 Clutch

CAUTION⚠

Do not disassemble emergency locking retractor assembly 7, or malfunctions might occur.



Webbing detecting lock

- When the vehicle is subjected to a sudden impact, such as a crash, webbing **3** retracts according to the movement of passengers, and spindle **8** rotates.
- As the rotation of spindle **8** is higher than the specified value, the repercussive force of sensor spring **14** can no longer retain lock arm **15**. Then, the arm is pulled out from the specified position and is locked by clutch **16**.
- If spindle **8** further rotates, clutch **16** lifts pawl **12** to lock with ratchet gear **13**, making spindle rotation impossible.

Body detecting lock

- When the body is tilted excessively, mechanism weight **11** is tilted, engaging mechanism lever **10** with locking gear **9**, locking it.
- If spindle **8** further rotates, clutch **16** operates as described above, and the spindle cannot rotate.

M E M O

Cab as a Whole

Possible causes / Symptoms		Cab shimmy (pitching and rolling vibration)	Cab or steering wheel high-frequency vibration (above 20 Hz) or noise	Cab cannot be tilted up	Cab cannot be locked to rear mounting post	Cab tilt warning lamp does not light	Cab tilt warning lamp does not go out	Remarks
Cab-related	Cab mounting loose or play	○						
	Front rubber, rear rubber deteriorated		○					
	Cab mounted incorrectly		○					
	Main hook from hook pin bracket does not release			○				
	L-lever release faulty			○				
	Torsion bar damaged or fatigued			○				
	Torsion bar arm installation position incorrect			○				
	Main hook not hooked to hook pin bracket				○			
	Bottom bracket contact with cushion incorrect				○			
	Cab tilt lock switch adjusted incorrectly					○	○	
	Cab tilt lock switch faulty					○	○	
	Cab tilt warning lamp bulb burnt-out					○		
	Fuse, high-current fuse blown					○		
	Wiring broken or connection faulty					○		
Engine-related	Crossed axes angle of propeller shaft excessive due to increased tilt caused by deteriorated engine mounting		○					
	Engine installation faulty		○					Gr 10
	Intake and exhaust system installation faulty		○					
Transmission-related	Transmission installation faulty		○					Gr 22A, Gr 22B, Gr 23
Propeller shaft-related	Propeller shaft run-out excessive		○					
	Universal joint worn excessively		○					
	Slip yoke joint spline play		○					
	Center bearing play excessive		○					Gr 25
	Crossed axes angle of mounting dimension excessive due to deteriorated center bearing cushion rubber, etc.			○				
	Crossed axes angle of propeller shaft excessive due to increased tilt of drive axis caused by overloading		○					

Possible causes / Symptoms		Cab shimmy (pitching and rolling vibration)	Cab or steering wheel high-frequency vibration (above 20 Hz) or noise	Cab cannot be tilted up	Cab cannot be locked to rear mounting post	Cab tilt warning lamp does not light	Cab tilt warning lamp does not go out	Remarks
Front axle-related	Axle seat resonance	○						Gr 26
Rear axle-related	Reduction gear engaged incorrectly		○					Gr 27
	Differential gear engaged incorrectly		○					
Wheel and tire-related	Wheel and tire run-out excessive	○						Gr 31
	Wheel and tire unbalanced	○						
	Size and kinds of tire unequal	○						
	Wheel mounting surface warped	○						
Front suspension-related	Leaf spring friction between leaves excessive	○						Gr 33
Brake-related	Brake drum unbalanced	○						Gr 35
	Brake drum eccentric	○						
	Rotor of disc brake eccentric	○						

TROUBLESHOOTING

Door Lock

Symptoms / Possible causes		Inside handle can not open door	Inside handle heavy to operate	Outer handle can not open door	Outer handle heavy to operate	Door does not open and close smoothly	Auto door lock system does not operate: Procedure by key	Auto door lock system does not operate: Procedure by door lock knob	Auto door lock system does not operate: Procedure by auto door lock switch	Remarks
Door setting ot of adjustment			○		○	○				
Each door rod	Rod deformed		○		○					
	Rod out of position	○		○			○	○	○	
	Rod interference		○		○					
Door lock cylinder deformed or damaged							○			
Power window and door lock switch assembly defective									○	Gr 54
Door lock actuator defective							○	○	○	
Door latch deformed or damaged			○		○	○				
Fuse of high current fuse blown							○	○	○	
Connector improperly connected, harness open-circuited, improperly grounded							○	○	○	Gr 54
Battery capacity insufficient							○	○	○	
Power window electronic control unit defective							○	○	○	
Striker deformed		○		○		○				
Outer handle out of adjustment					○					

Power Window

Symptoms / Possible causes	Door window glass falls of its own accord in cruising	Power window regulator generates strange sound in cruising	Power window does not operate	Power window does not stop	Power window generates strange sound when it operates	Remarks
Power window switch defective			○	○		
Power window control unit defective			○	○		
Power window regulator defective	○	○	○		○	Gr 54
Power window regulator improperly mounted					○	
Fuse or high current fuse blown			○			
Connector improperly connected, harness open-circuited, improperly grounded			○			

Wiper and Washer

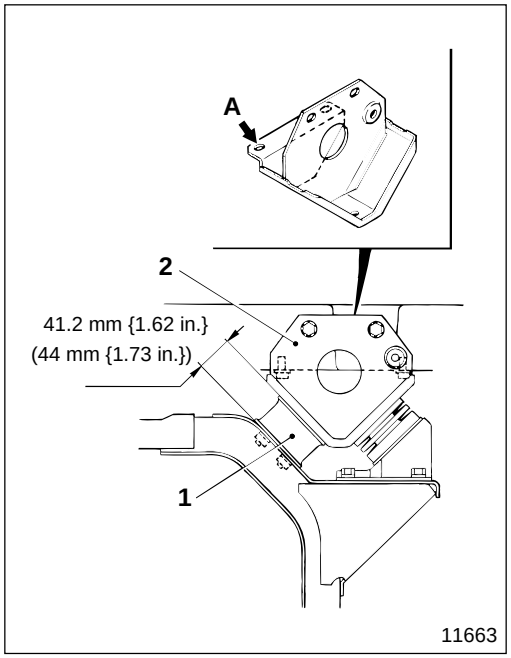
Symptoms / Possible causes	Wiper doe not work	Wiper does not stop	Wiper intermittent operation does not work	Wiper blade stop position incorrect	Wiper operation inadequate	Noise during wiper operation	Washer motor does not work	Washer fluid jetting insufficient	Washer fluid does not jet	Remarks
Wiper motor faulty	○	○		○		○				
Washer motor faulty							○	○	○	
Wiper and washer switch faulty	○	○	○				○			
Multipurpose timing control unit faulty			○							Gr 54
Wiper relay faulty	○						○			
Fuse, high-current fuse blown	○						○			
Wiring broken or connection faulty	○		○				○		○	
Wiper motor crank arm set position faulty				○						
Wiper link and wiper arm connection faulty						○				
Wiper blade faulty					○	○				
Wiper arm faulty					○					
Washer hose twisted								○		
Washer hose connected incorrectly									○	
Washer nozzle clogged								○	○	
Washer fluid insufficient									○	

M E M O

Adjustment of Cab Tilt

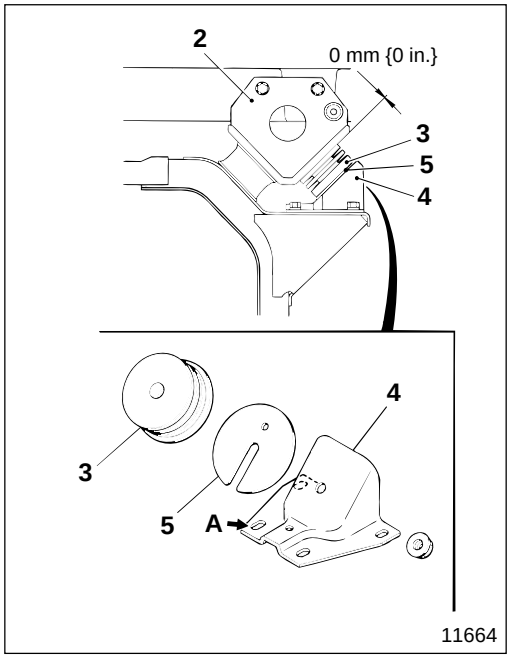
Lubricant

Location	Points of application	Kinds	Quantity
1	Contact surfaces between side cushion and bottom bracket	Molybdenum disulfide grease [NLGI No.2 (Li soap)] (Molykote BR 2 plus)	As required



(1) Contact adjustment between bottom bracket and side cushion

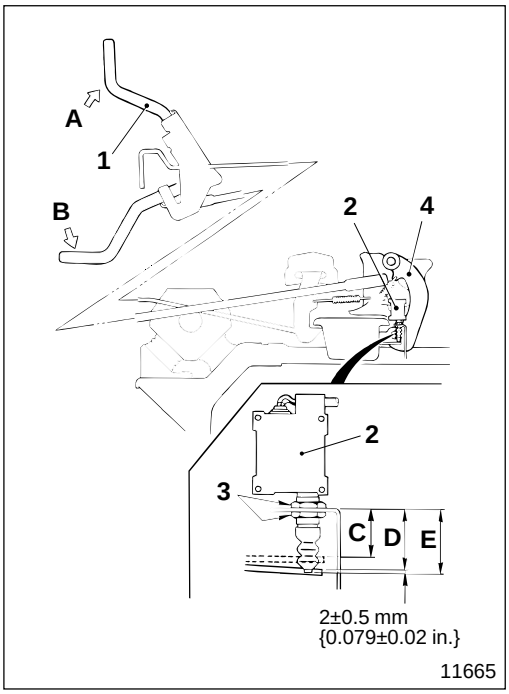
- Tilt the cab down and lock securely.
- To position side cushion **1** as high as illustrated, move it horizontally to install bottom bracket **2**.
  A : Oval hole for adjustment (4 points)
  ( ): Indicates free length.



(2) Contact adjustment between bottom bracket and compression cushion

- Tilt the cab down and lock.
- Adjust the clearance between compression cushion **3** and bottom bracket **2** to 0 mm {0 in.} as follows:
  - Adjust the installation position of mounting bracket **4** by moving it horizontally.
    A : Oval hole for adjustment (4 points)
  - Adjust by changing the thickness of shim **5**.
    Available shim thicknesses: 1.0 mm {0.039 in.}, 2.0 mm {0.079 in.}

Adjustment of Cab Tilt Lock Switch



- Turn the starter switch to ON.
- Use nut **3** to adjust the position of cab tilt lock switch **2** so that when you operate hook control lever **1**, warning lamp in the meter cluster turns on or off in accordance with the following conditions.

• Position of hook control lever **1** : **A** (Main hook **4** is locked.)

State of cab tilt		Adjustment dimension of cab tilt lock switch **2**
When tilted down	OFF	**C** : 31 mm {1.22 in.}

•Position of hook control lever **1** : **B** (Main hook **4** is released.)

State of cab tilt		Adjustment dimension of cab tilt lock switch **2**
When tilted down	ON	**D** : 37 mm {1.46 in.}
When tilted up	ON	**E** : 39 mm {1.54 in.}

ON-VEHICLE INSPECTION AND ADJUSTMENT

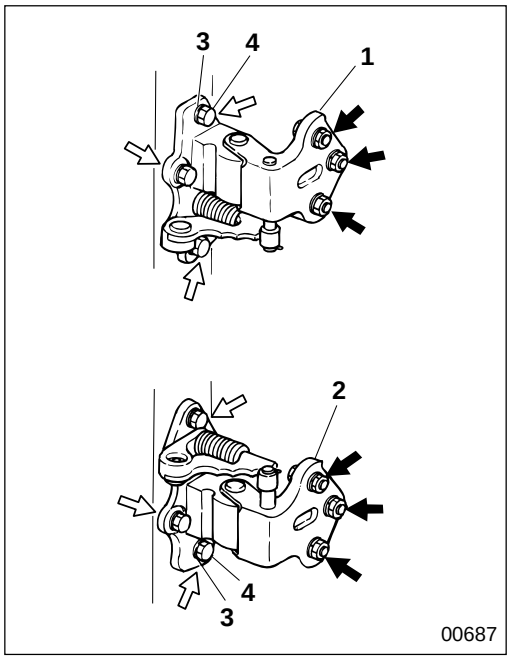
Adjustment of Door Fitting

Ⓣ Tightening torque

Unit : N·m {ft.lbs, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
4	Bolt (Upper and lower hinge mounting)	17 to 25 {12 to 19, 1.7 to 2.6}	—
6	Screw (Striker mounting)	8.8 to 14 {6.5 to 10, 0.9 to 1.4}	—

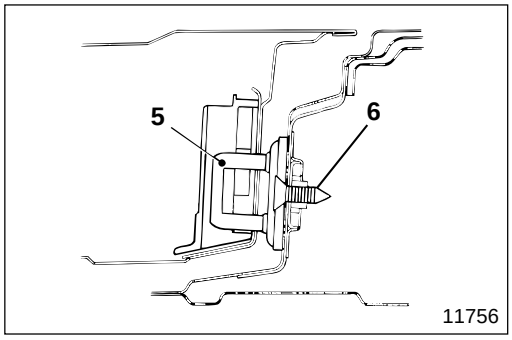
Adjust door fitting at hinge and striker.
(For door fitting dimensions : 🕮 P42-29)



(1) Adjustment of hinge

Adjust upper hinge **1** and lower hinge **2**. Adjustment depends on whether washer **3** is welded or unwelded.

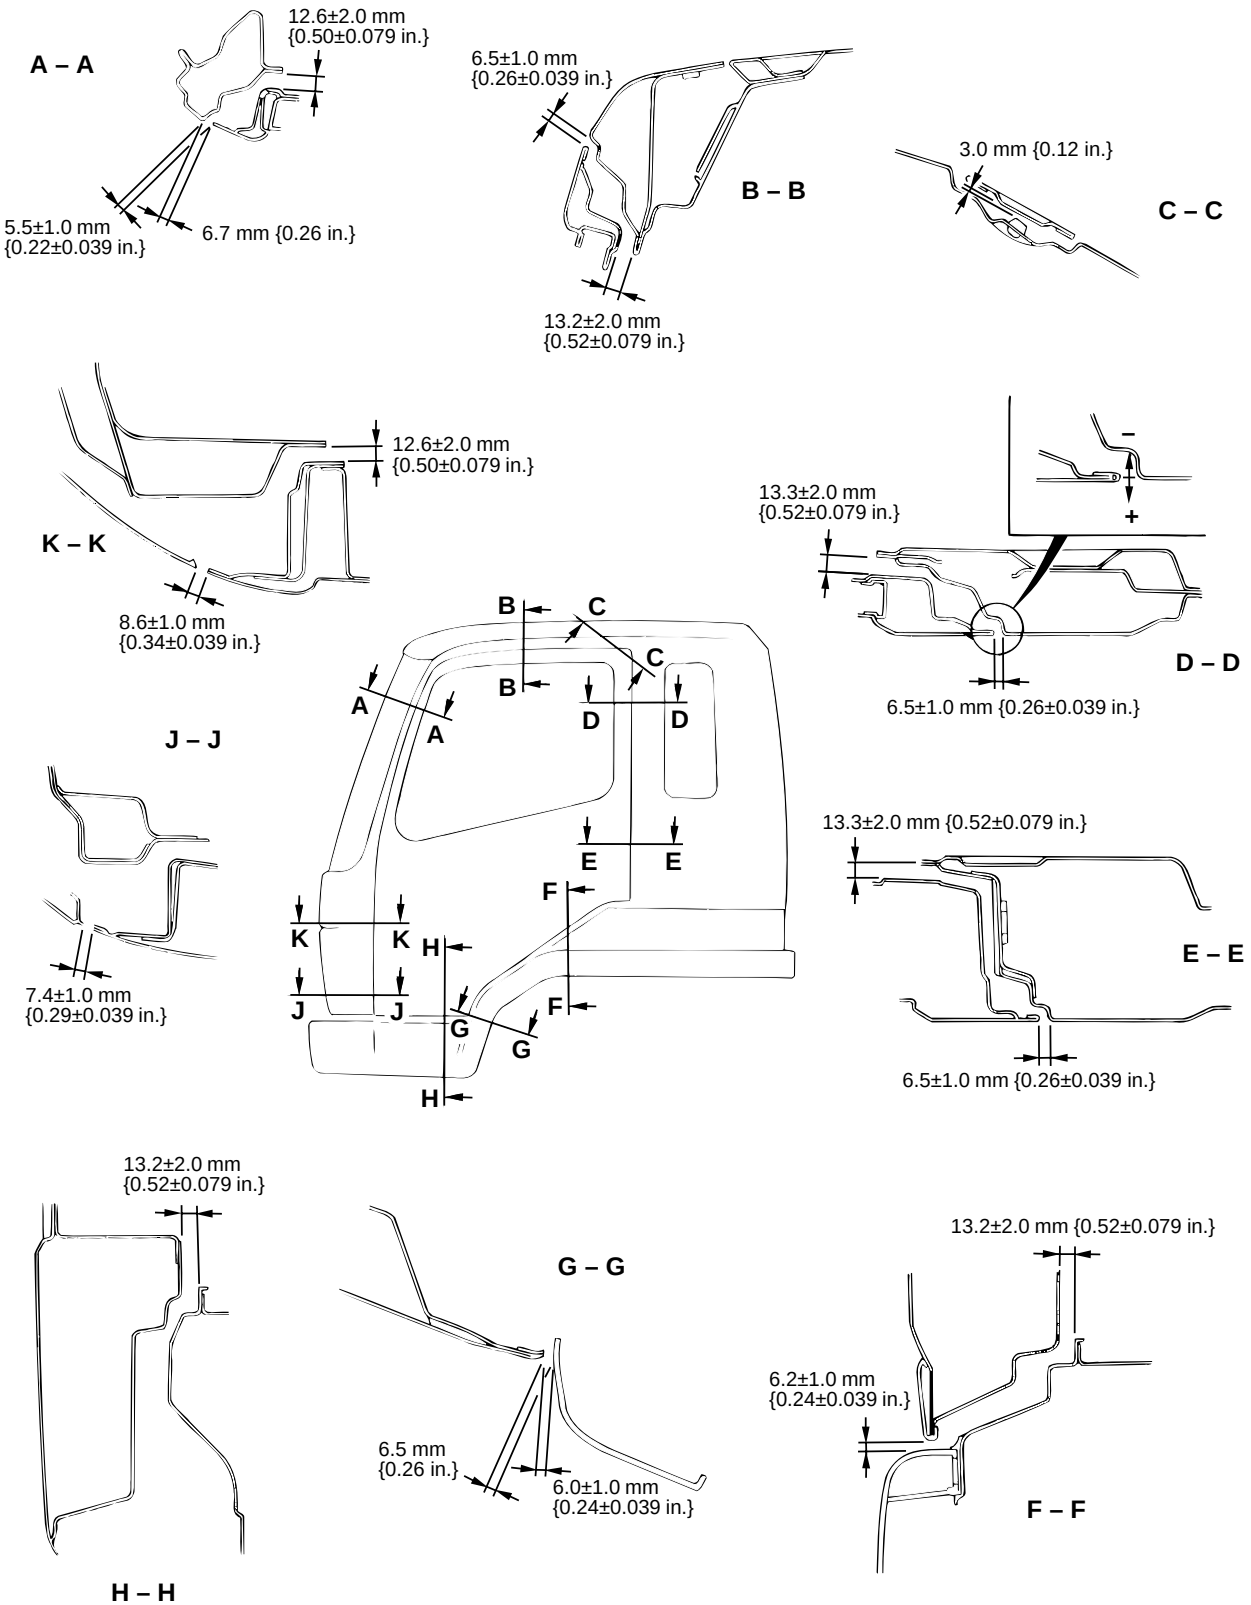
- For washer **3** that is welded:
  Adjust bolts **4** indicated by ➡.
- For washer **3** that is not welded:
  Adjust bolts **4** indicated by ⇨.



(2) Adjustment of striker

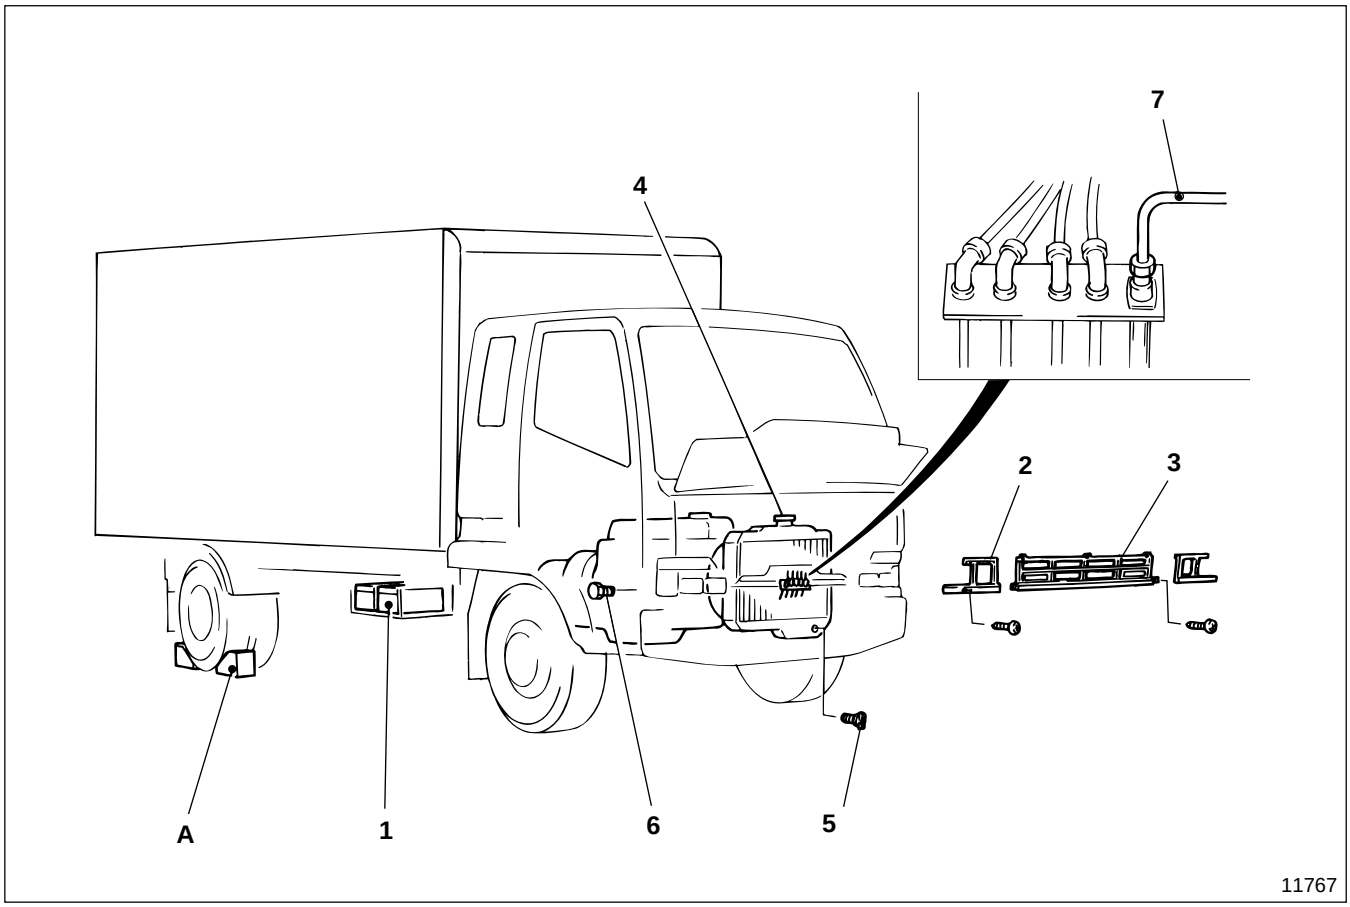
Adjust installation screw **6** of striker **5**.

Door Fitting Dimensions



REMOVAL AND INSTALLATION OF CAB

Preliminary Work



● **Disassembly sequence**

1 Battery (negative terminal) Gr 54
2 Headlamp bezel
3 Front grille Gr 42-52
4 Pressure cap Gr 14
5 Radiator drain plug Gr 14
6 Crankcase drain plug Gr 14
7 Clutch fluid pipe (Clutch)
< Manual transmission > Gr 21

A : Wheel chock

Work items

- Draining, filling, and air bleeding of clutch fluid and brake fluid Gr 21, Gr 35A
- Draining, filling, and air bleeding of coolant Gr 14

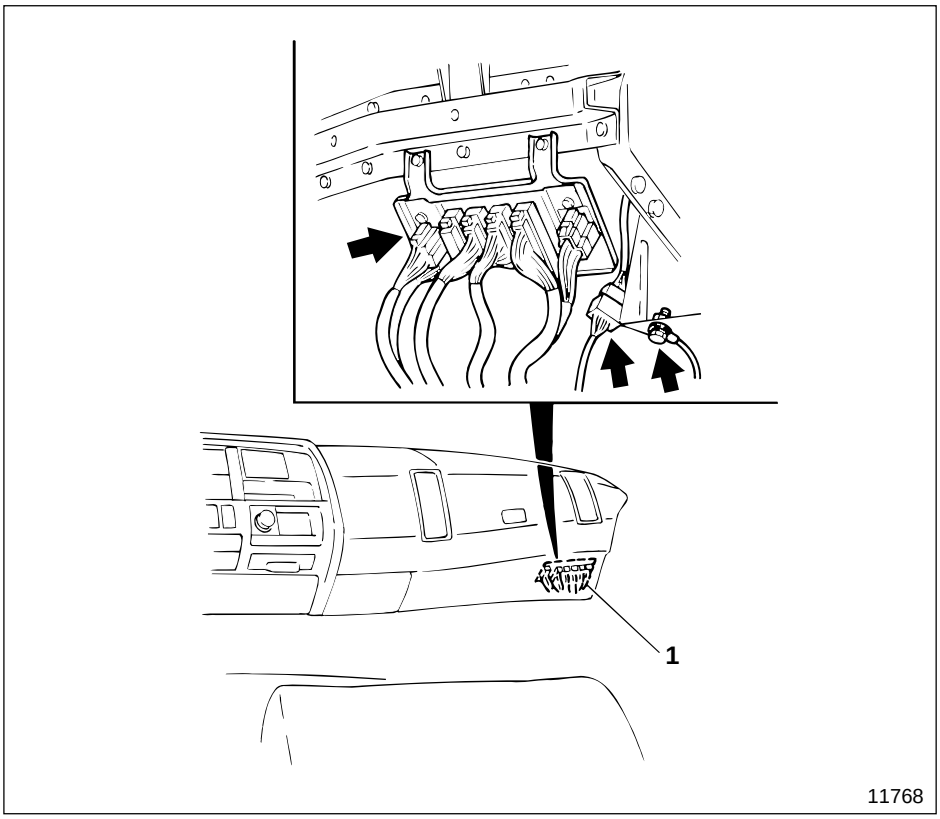
WARNING

- **Put chocks A securely in place because the vehicle cannot be maintained at a standstill just by using the parking brake, in the case of a vehicle fitted with a center brake, during removal and installation of the cab.**
- **Do not remove chocks A until the entire operation is completed.**

● **Assembly sequence**

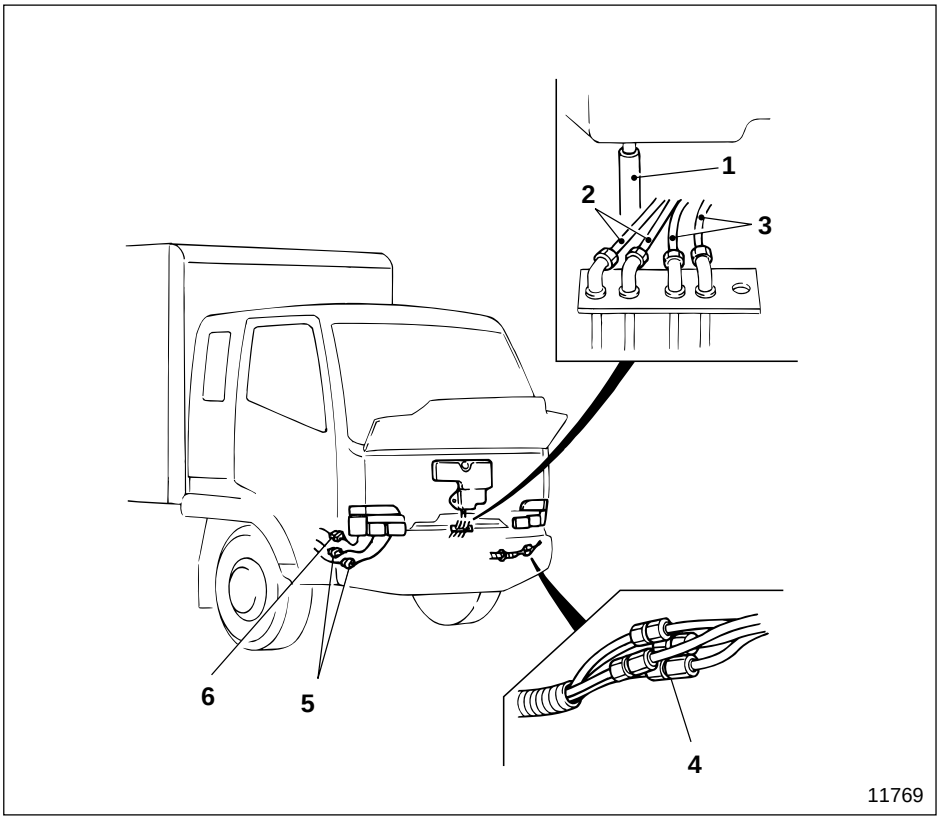
Follow the disassembly sequence in reverse.

Work Inside Cab



1 Connection between cab harness and chassis harness

Work from Front of Cab



● **Disassembly sequence**

1 Coolant reservoir hose
2 Nylon tube (Parking brake) < FM >
3 Nylon tube (Air gauge)
4 Nylon tubes (1 for air horn, 4 for brake)
5 Headlamp harness connector
6 Clearance lamp harness connector

● **Assembly sequence**

Follow the disassembly sequence in reverse.

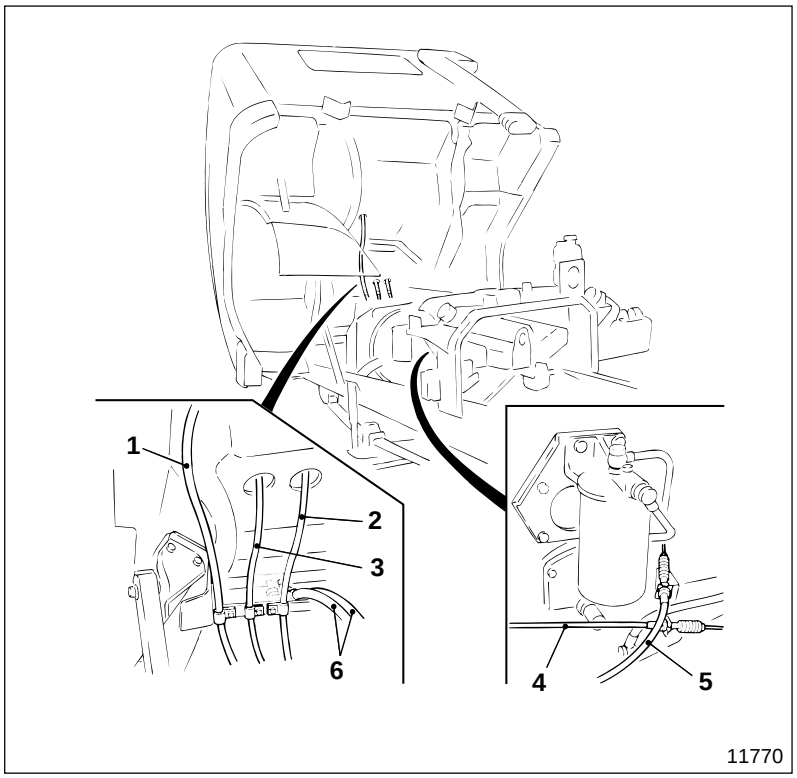
NOTE

Nylon tubes 2 to 4 are identified with colored tape. Be sure to match up the tape colors when installing.

Installation procedure: Gr 35A, B

REMOVAL AND INSTALLATION OF CAB

Work with Cab Tilted Up



● **Disassembly sequence**

1 Parking brake cable < Center brake > Gr 36A
2 Shift cable < Manual transmission > Gr 22A, Gr 22B
Range selector cable < Automatic transmission > Gr 23
3 Select cable < Manual transmission > Gr 22A, Gr 22B
4 Engine stop cable Gr 13
5 Accelerator control cable Gr 13
6 Heater hose Gr 55B

● **Assembly sequence**

Follow the disassembly sequence in reverse.

***3** : Steering shaft
***4** : Gear box bracket
***5** : Cab hinge bracket

● **Assembly sequence**

Follow the disassembly sequence in reverse.

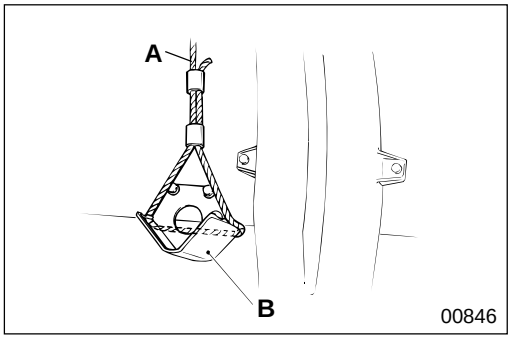
● **Inspection and adjustment after installation**

P42-26

Lubricant

Location	Points of application	Kinds	Quantity
6, 8	Contact area of torsion bar arm with torsion bar support	Chassis grease [NLGI No.1 (Ca soap)]	As required

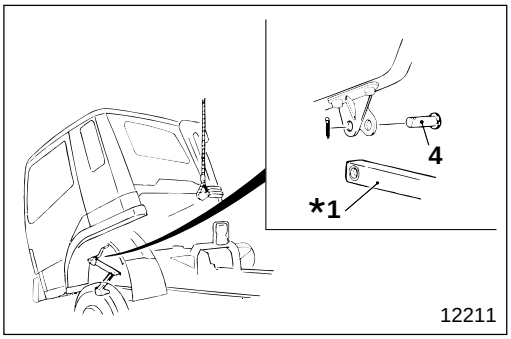
◆ Service procedure



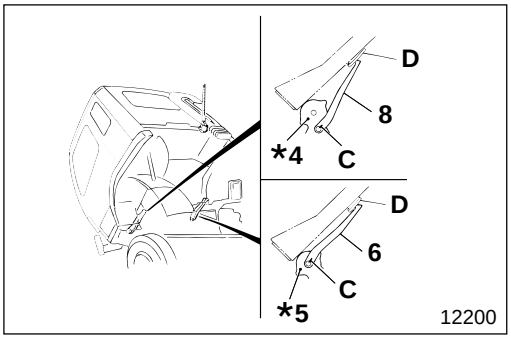
9 **Cab assembly**

[Removal]

- Tilt the cab, then fasten the hoist attachment of crane **A** around bottom bracket **B** of the cab.



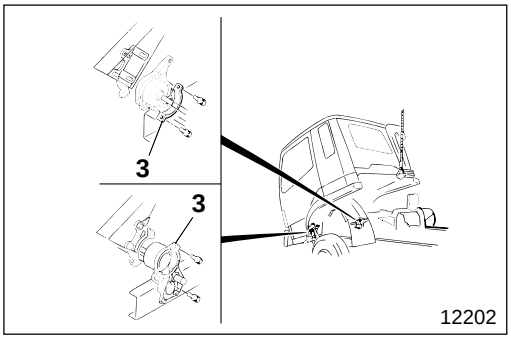
- Lower the cab until cab stay ***1** is no longer locked.
- Remove clevis pin **4** of cab stay ***1**, and separate the cab stay from the cab.



- Before removing torsion bar arm RH **6**, LH **8**, make alignment marks **C** across the torsion bar arm, cab hinge bracket ***5**, and gear box bracket ***4**.
  Remove the torsion bar arm by lifting up the cab with the crane until the torsion bar arm separates from torsion bar support **D**. If necessary, remove the torsion bar support first.

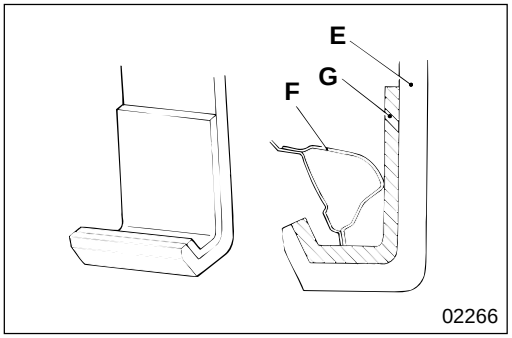
WARNING⚠

- **You must pay close attention to the tilt angle when tilting the cab. It is very dangerous to tilt the cab excessively because it will topple over.**
- **Lower the cab as soon as the torsion bar arm has been removed.**



- When you remove cab hinge cap **3**, tilt the cab only by the barest minimum needed to carry out the work.

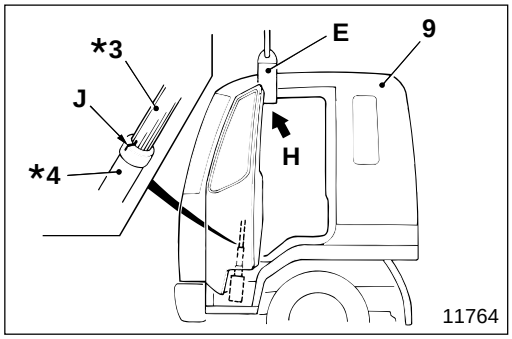
REMOVAL AND INSTALLATION OF CAB



- Set up hoist attachment **E** for the cab as illustrated.

CAUTION⚠

- **Make sure when you set up hoist attachment E that it is capable of lifting cab assembly 9 which weighs approximately 440 kg {970 lb}.**
- **Make sure you install rubber G on hoist attachment E to prevent cab roof F being deformed when the cab is lifted.**



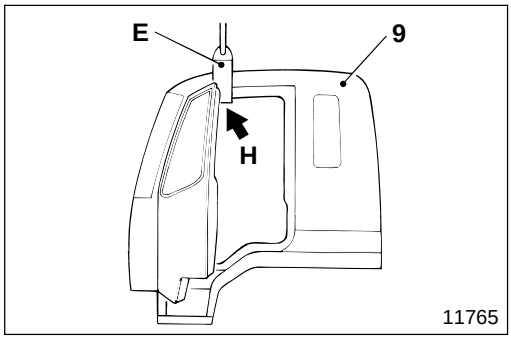
- Mount hoist attachment **E** at center-of-gravity point **H** of cab assembly **9**. Verify the position at which the cab can be lifted horizontally when the cab is lifted slightly.
- Slowly lift cab assembly **9** straight up, and finish lifting when steering yoke ***3** is pulled out from steering shaft ***4**. Make alignment mark **J** before the steering yoke is pulled out from the steering shaft.

WARNING⚠

Never get under cab assembly 9 when it is being lifted.

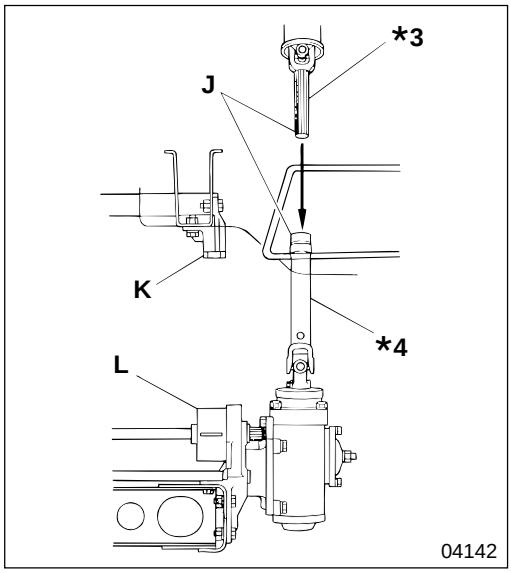
CAUTION⚠

Make sure, when lifting cab assembly 9, that the wiring harness, cable, hoses, etc. are completely disconnected when the cab is lifted slightly.

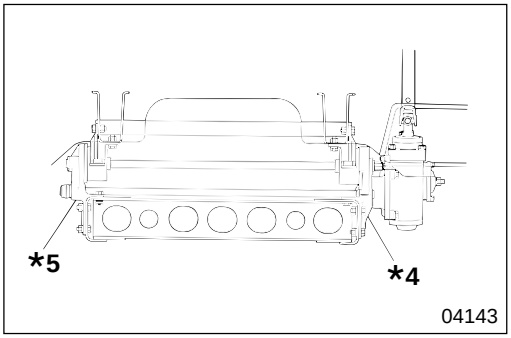


[Installation]

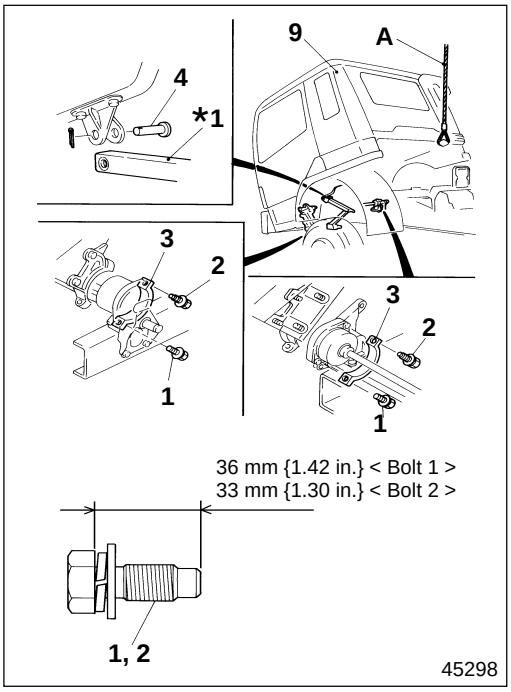
- Mount hoist attachment **E** at center-of-gravity point **H** of cab assembly **9**.



- Slowly lower cab assembly **9** horizontally to insert steering yoke ***3** into steering shaft ***4**, aligning alignment mark **J**.
- Install cab hinge upper bracket **K** aligning it to cab hinge cushion **L**.



- Check if the cab is installed one-sided in relation to cab hinge bracket ***5** or gear box bracket ***4**, and correct as necessary.



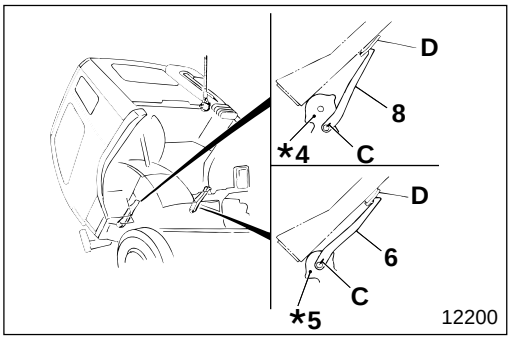
- Securely support the cab on crane **A** to tilt cab assembly **9**.
- Using crane **A** tilt cab assembly **9**, and install cab hinge cap **3** and clevis pin **4**.

WARNING

You must pay close attention to the tilt angle when tilting cab assembly 9 using crane A. It is very dangerous to tilt the cab excessively because it will topple over.

NOTE

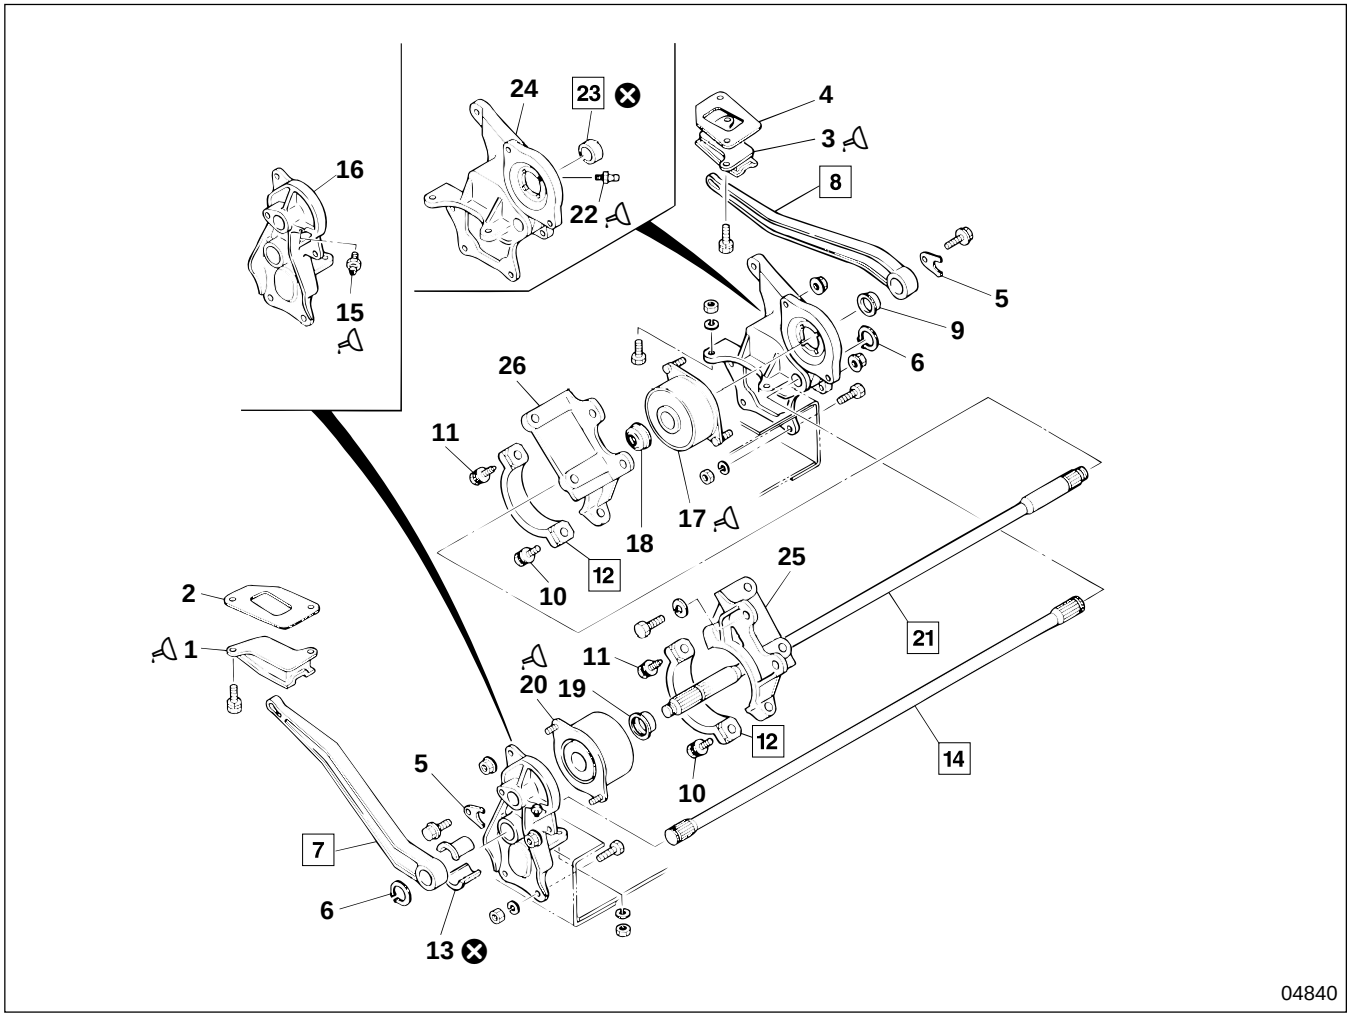
The cab hinge cap mounting bolts have different shapes, so pay close attention when you install them.



- Install torsion bar arm LH **6**, RH **8** aligning alignment marks **C** on the torsion bar arm, cab hinge bracket ***5**, and gear box bracket ***4**.
  If torsion bar support **D** has been removed, reinstall it after installing the torsion bar arm.

- After installation, tilt cab assembly **9** slowly until it is completely tilted, securely lock the cab stay, then detach the cab from crane **A**.

FRONT CAB MOUNTING



● **Disassembly sequence**

1 Torsion bar support, RH
2 Shim (for adjustment)
3 Torsion bar support, LH
4 Shim (for adjustment)
5 Stopper plate
6 Snap ring

23 Bushing
24 Gear box bracket
25 Cab hinge upper bracket, RH
26 Cab hinge upper bracket, LH

⊗ : Non-reusable parts

NOTE

Do not remove bushing 23 unless it is faulty.

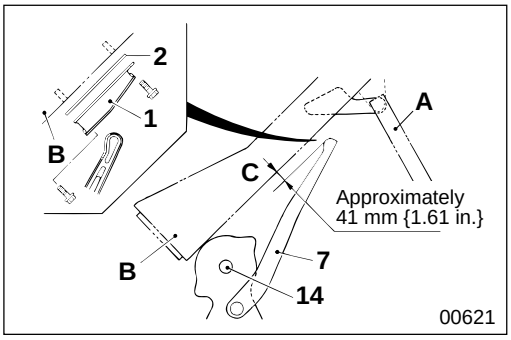
● **Assembly sequence**

Follow the disassembly sequence in reverse.

Lubricant

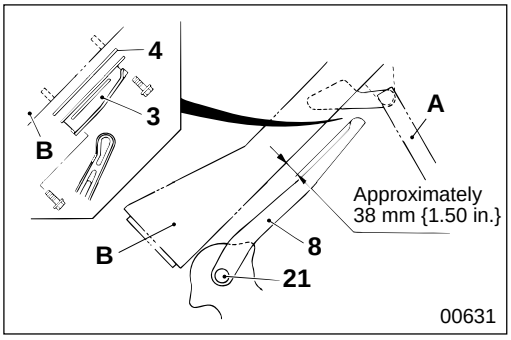
Location	Points of application	Kinds	Quantity
1	Torsion bar arm at the area which receives torsion bar support RH	Chassis grease [NLGI No. 1 (Ca soap)]	As required
3	Torsion bar arm at the area which receives torsion bar support LH	Chassis grease [NLGI No. 1 (Ca soap)]	As required
15, 22	Supply via grease nipple	Chassis grease [NLGI No. 1 (Ca soap)]	As required
17, 20	Interior of cab hinge cushion	Chassis grease [NLGI No. 1 (Ca soap)]	As required

◆ Service procedure



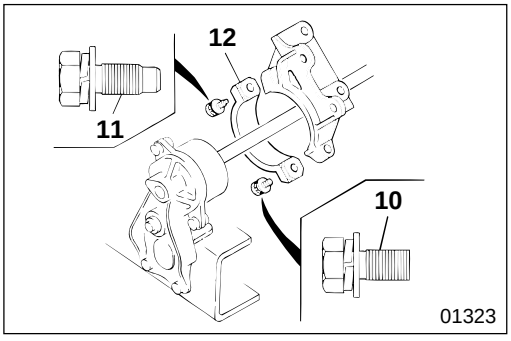
7 Installation of torsion bar arm RH

- Tilt up the cab and support using cab stay **A**.
- Install torsion bar arm RH **7** to lower torsion bar **14** so that clearance **C** between main sill **B** of the cab and the torsion bar arm conforms to the value as illustrated.
- If clearance **C** deviates from the value as illustrated, adjust using shim **2**. The shim must be installed between torsion bar support RH **1** and the cab when torsion bar support RH is installed.



8 Installation of torsion bar arm LH

- Tilt up the cab and support using cab stay **A**.
- Install torsion bar arm LH **8** to lower torsion bar **21** so that clearance **C** between main sill **B** of the cab and the torsion bar arm conforms to the value as illustrated.
- If clearance **C** deviates from the value as illustrated, adjust using shim **4**. The shim must be installed between torsion bar support LH **3** and the cab when torsion bar LH is installed.

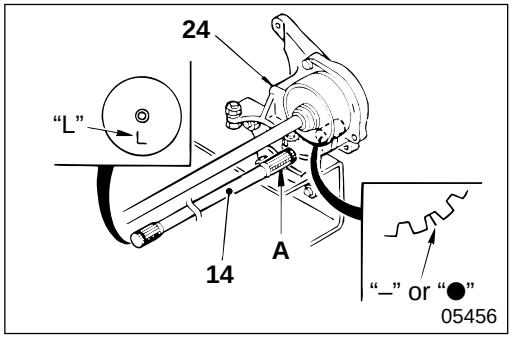


12 Installation of cab hinge cap

NOTE

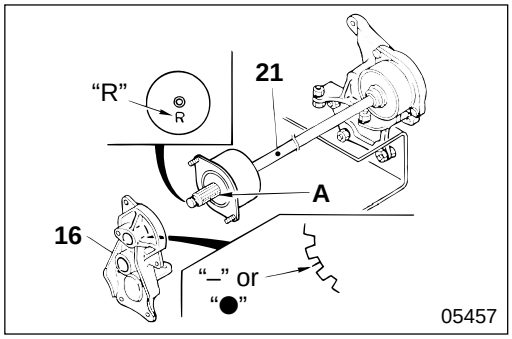
Bolts 10, 11 have different shapes, so pay close attention when you install them.

FRONT CAB MOUNTING



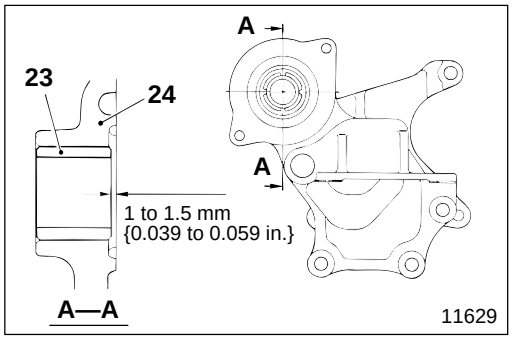
14 **Installation of lower torsion bar**

Install lower torsion bar **14** in gear box bracket **24** in the direction as illustrated. At this point, align white paint mark **A** on the torsion bar with alignment mark "–" or "●" on the gear box bracket.



21 **Installation of upper torsion bar**

Install upper torsion bar **21** to cab hinge bracket **16** in the direction as illustrated. At this point, align white paint mark **A** on the torsion bar with alignment mark "–" or "●" on the cab hinge bracket.



23 **Installation of bushing**

Install bushing **23** in gear box bracket **24** so that the illustrated dimension is obtained.

Ⓣ Tightening torque

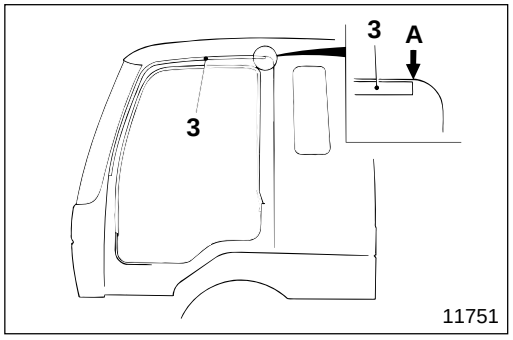
Unit : N·m {ft.lbs, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
1	Bolt (Door assembly mounting)	17 to 26 {12 to 19, 1.7 to 2.6}	—
6	Screw (Striker mounting)	9 to 14 {6.5 to 10.1, 0.9 to 1.4}	—
8	Bolt (Lower and upper hinge mounting)	17 to 26 {12 to 19, 1.7 to 2.6}	—

Lubricant

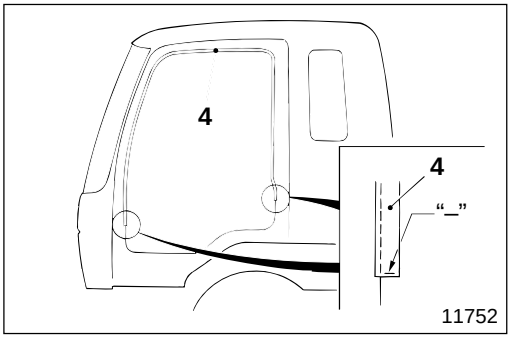
Location	Points of application	Kinds	Quantity
9, 10	Rotating and friction areas of lower hinge and upper hinge	Chassis grease [NLGI No.1 (Ca soap)]	As required

◆ Service procedure



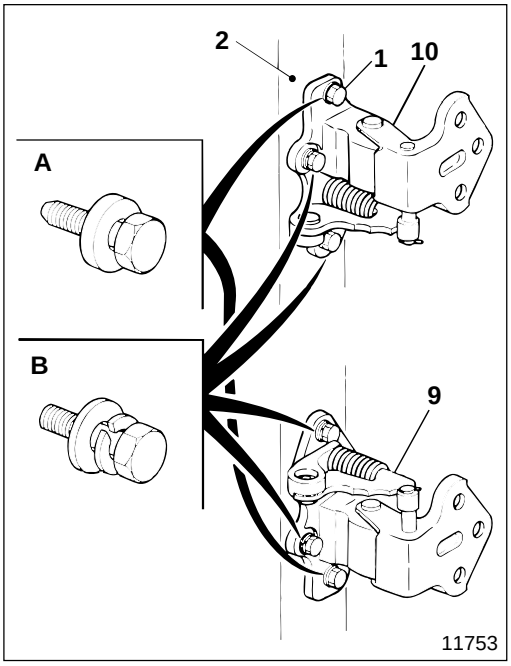
3 **Installation of roof side weatherstrip**

Install roof side weatherstrip **3** on the cab starting from point **A** as illustrated.



4 **Installation of door inner weatherstrip**

Install door weatherstrip **4** on the cab, aligning both ends of the weatherstrip with alignment marks "–" on the cab side.



9 **10** **Installation of lower and upper hinges**

- Two types of bolt **1** are provided to install lower hinge **9** and upper hinge **10** to door assembly **2**:
  A : Bolt with built-in washer
  B : Bolt with built-in washer and spring washer
- Bolt **A** with built-in washer comes in two types; in one type the washer is welded to lower hinge **9** and upper hinge **10**, and in the other it is not welded to lower hinge **9** and upper hinge **10**.
- If the washers are not welded to the hinges, bolt **B** with built-in washer and spring washer can be used in place of bolt **A** with the built-in washer.

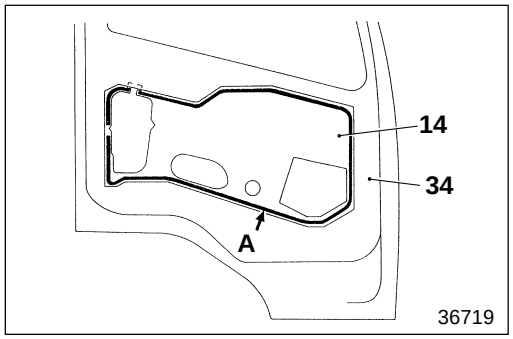
Lubricant and/or sealant

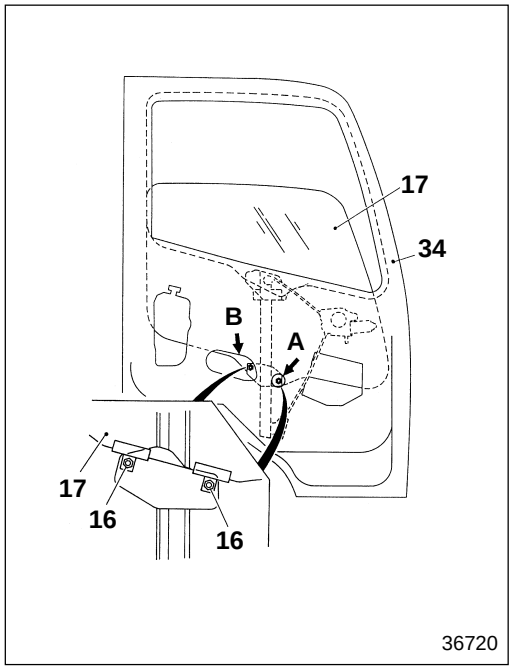
Location	Points of application	Specified lubricant and/or sealant	Quantity
15	Rotating surface of inside handle	Multipurpose grease [NGLI No.2 (Li soap)]	As required
18	Door glass mounting surface of glass holder	YH America Inc. M(RC-50KE) Primer	As required
19	Glass holder mounting surface of door glass	YH America Inc. G(MS-90) Primer	As required
	Glass holder mounting surface, 5 minutes after application of above primer	YH America Inc. WS-70FK Sealant (Urethame Base)	As required
23	Regulator sliding section of regulator & rail assembly	Dynamic GB	As required
26	Sliding surface of door lock actuator	Multipurpose grease [NGLI No.2 (Li soap)]	As required
34	Waterproof cover installation surface of door panel	Butyl tape	As required

◆ Service procedure



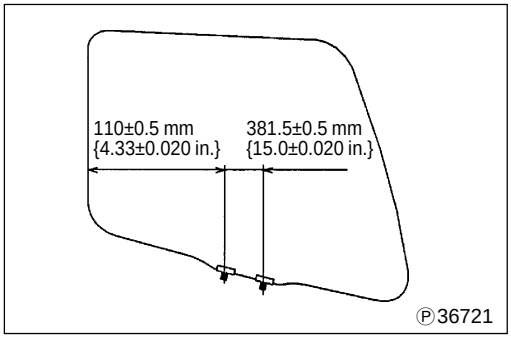
14 **Installation of waterproof cover**

- Apply butyl tape **A** to door panel **34**, as indicated in the illustration.
- Install waterproof cover **14** by pasting onto butyl tape **A**.



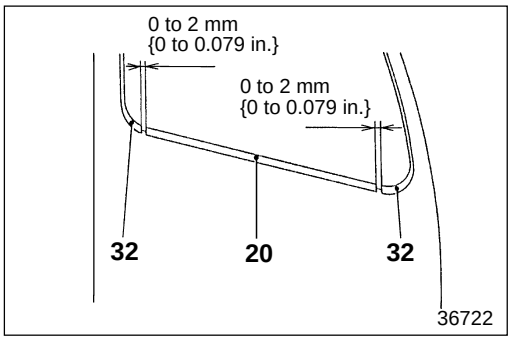
17 **Removal and installation of door glass assembly**

- Move door glass assembly **17** until bolts **16** of the door glass assembly become visible through holes **A** and **B** in the door panel **34**.
- While supporting door glass assembly **17** by hand, remove bolts **16**.
- Remove door glass assembly **17** through the open space in the door.
- To install, follow the removal procedure in reverse.



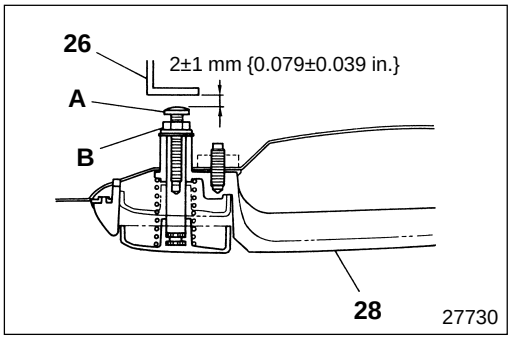
18 **Installation of glass holder**

Install glass holder **18** to door glass **19** at the location indicated in the illustration.



20 **Installation of door belt line molding**

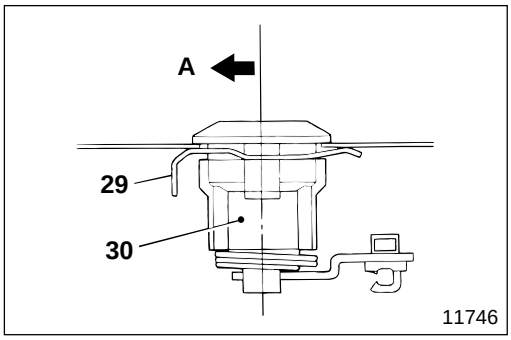
Install door belt line molding **20** so that gaps between the molding and run channel **32** are as indicated in the illustration.



28 **Installation of outside handle**

Turn push bolt **A** of outside handle **28** to adjust the gap between the push bolt and door actuator **26** as indicated in the illustration.

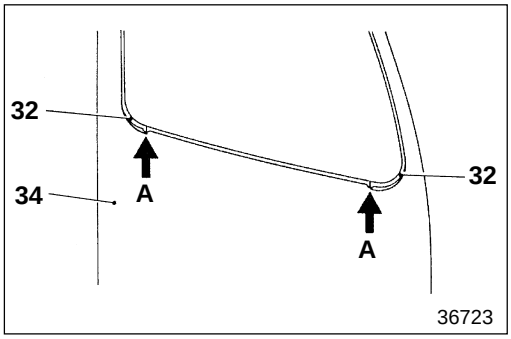
B : Lock nut



30 **Installation of door lock cylinder**

Install door lock cylinder **30** with clip **29** in the direction indicated in the illustration.

A : Vehicle front side



32 **Installation of run channel**

Install run channel **32** by aligning it with notches **A** on door panel **34**.

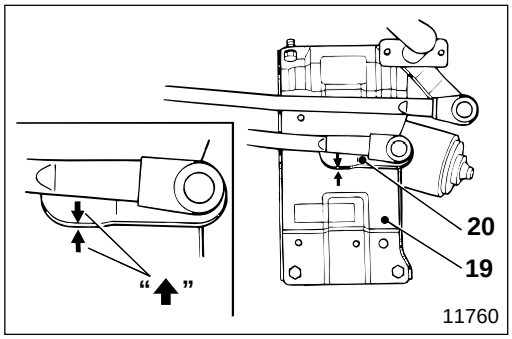
Unit : N·m {ft.lbs, kgf·m}

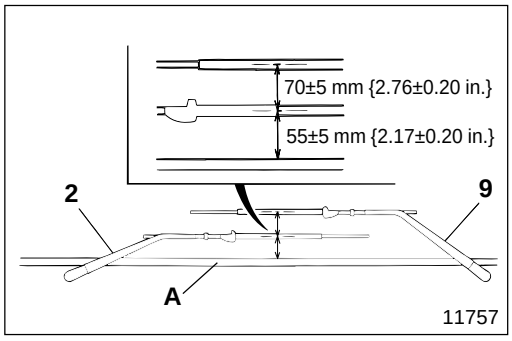
Location	Parts to be tightened	Tightening torque	Remarks
1	Nut (Wiper arm and blade assembly mounting)	17 to 23 {12.3 to 16.6, 1.7 to 2.3}	—
11	Nut (Wiper link and motor assembly mounting)	17 to 23 {12.3 to 16.6, 1.7 to 2.3}	—
13	Bolt (Wiper motor bracket mounting)	9 to 14 {6.5 to 10.1, 0.9 to 1.4}	—
14	Bolt (Link assembly mounting)	10 to 15 {7.2 to 10.8, 1.0 to 1.5}	—
16	Nut (Crank arm mounting)	16.7 to 23.5 {12.3 to 17.4, 1.7 to 2.4}	—
24	Nut (Hose joint connecting)	0.6 to 0.9 {0.43 to 0.65, 0.06 to 0.09}	—
28	Bolt (Washer tank mounting)	7.8 to 11.8 {5.8 to 8.7, 0.8 to 1.2}	—

◆ Service procedure

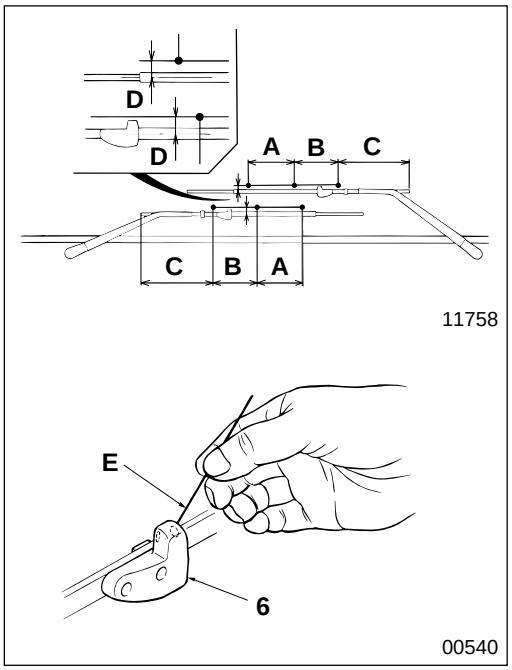


2 **9** **Installation of wiper arm and blade assembly**

- Align alignment marks "⬆" on wiper motor bracket **19** and crank arm **20**.



- Install wiper arm and blade assembly RH **2**, LH **9** so that dimensions from the edges of weatherstrip **A** are as illustrated.



6 **Inspection of washer nozzle**

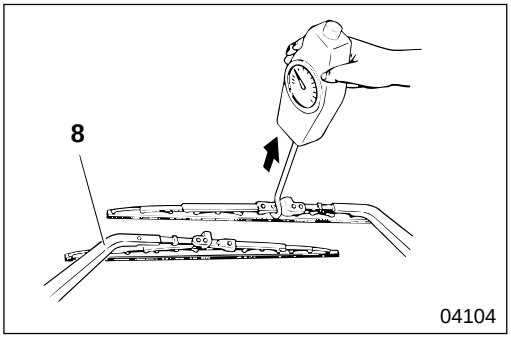
Make sure that washer fluid spreading target positions ("●" as illustrated) are within dimensions **A** to **D**.

A	130 mm {5.12 in.}
B	130 mm {5.12 in.}
C	210 mm {8.27 in.}
D	15 mm {0.59 in.}

If the washer fluid spreading target positions deviate from these dimensions, adjust the jet hole angle of washer nozzle **6** using wire **E**.

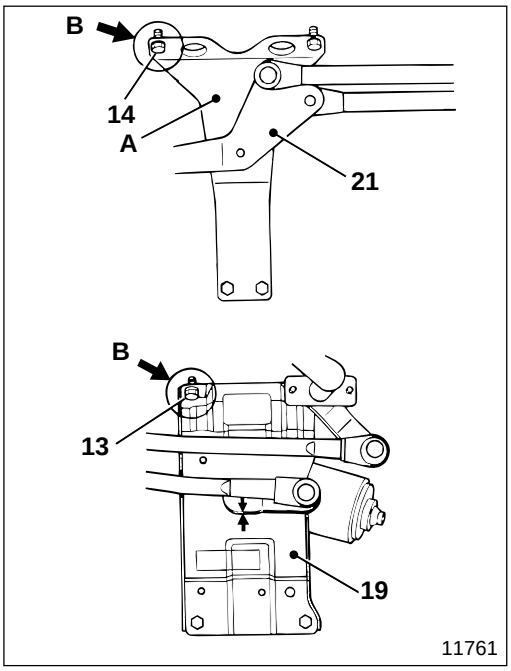
CAUTION⚠

Be careful not to damage the jet hole of washer nozzle 6 with wire E when adjusting the angle.



8 **Inspection of wiper arm**

If the measured value deviates from the standard value, replace wiper arm **8**.



15 **Installation of wiper link and wiper motor assembly**

- Wiper motor bracket **19** and idler bracket **A** of link assembly **21** have reference holes **B** for installation.
- Tighten installation bolts **13**, **14** for wiper motor bracket **19** and idler bracket **A** starting from reference holes **B**.

CAB INTERIOR FITTING

Trim

17 Bolt
18 Rear pillar grip, RH
19 Inside air outlet garnish
20 Seat belt guide, RH
21 Seat belt assembly
22 Side trim, RH
23 Bolt

CAUTION⚠

Do not disassemble seat belt assemblies 15, 21 because this might cause malfunction of the emergency locking retractor.

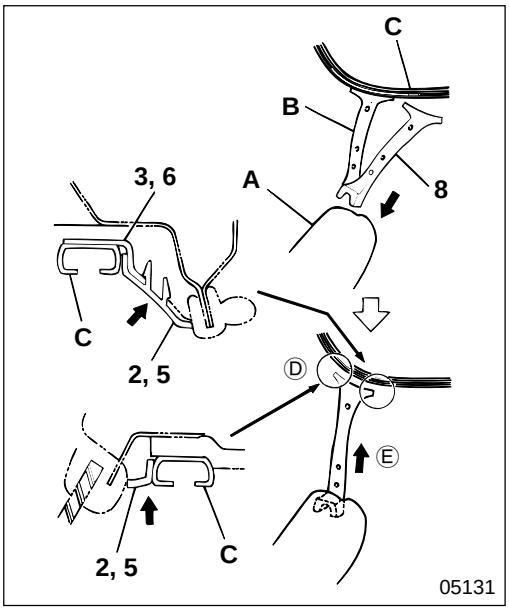
● **Installation sequence**

Follow the removal sequence in reverse.

Tightening torque

Unit : N·m {ft.lbs, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
15, 21	Bolts of seat belt assembly shoulder anchor and floor anchor	34 to 54 {25 to 40, 3.5 to 5.5}	—
17, 23	Bolt (Seat belt assembly mounting)	34 to 54 {25 to 40, 3.5 to 5.5}	—



◆ Service procedure

2 **5** **Installation of front pillar trim**

- Insert lower end of front pillar trim LH **2**, RH **5** between instrument panel **A** and front pillar inner panel **B**.
- Insert upper end of trim between curtain rail **C** and front pillar inner panel **B**.
- Fit in part Ⓓ of trim as illustrated.
- Fit in part Ⓔ of trim as illustrated.

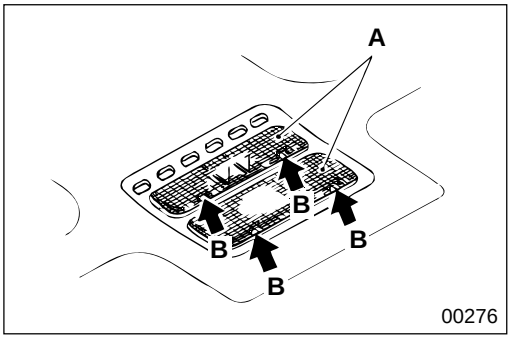
Tightening torque

Unit : N·m {ft.lbs, kgf·m}

Location	Parts to be tightened	Tightening torque	Remarks
2	Bolt (Cab and spot light lamp mounting)	2.9±0.5 {2.2±0.36, 0.3±0.05}	—
17, 22	Screw (Speaker mounting)	2.5 {1.8, 0.25}	—
19, 24	Screw (Speaker cover mounting)	1.8 {1.3, 0.18}	—



◆ Service procedure

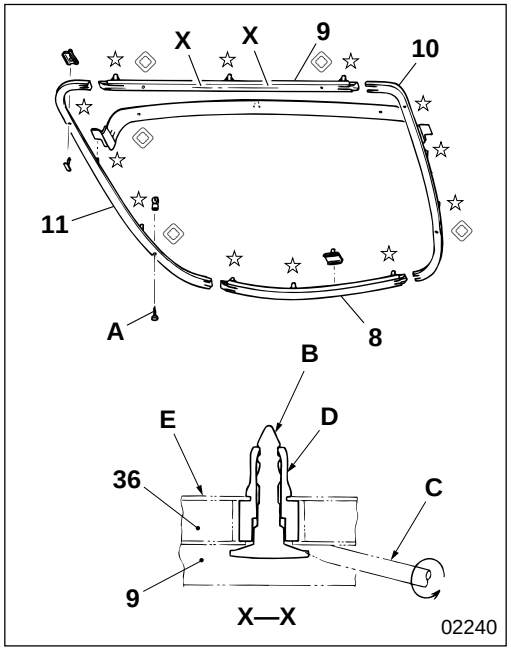
3 **Removal of cab and spot lamp**

Insert the tip of a screwdriver in groove area **B** of lens **A**, and use the screwdriver as a pry bar.

CAUTION

Make sure that you do not pry at any area other than B or you will damage the lens.

CAB INTERIOR FITTING



8 to 11 Removal of curtain rail

- Remove tapping screws **A**. (six points in ◇ mark)
- Insert screwdriver **C** into the taper of rail pins **B** and lever out curtain rails **8** to **11** from rail clips **D** by turning the screwdriver. (13 points in ☆ mark)

36 : Rear head lining
E : Cab metal

CAUTION ⚠

- **Be sure that you remove rail pins B first because the curtain rails would be deformed if you were to remove the rail pins after levering out curtain rails 8 to 11.**
- **Prepare extra fittings in advance because rail pins B and rail clips D might be damaged during removal.**

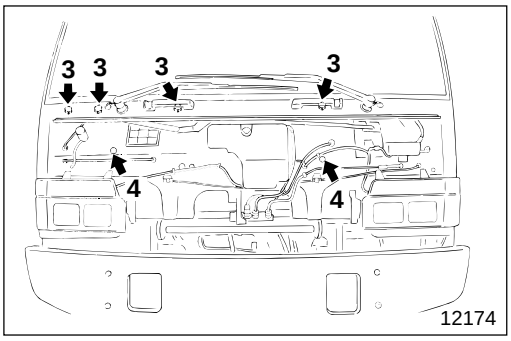
Sealant

Location	Points of application	Kinds	Quantity
4, 5	Bolt (Instrument panel frame mounting)	SUMITOMO 3M scotch grip 2353	For re-use

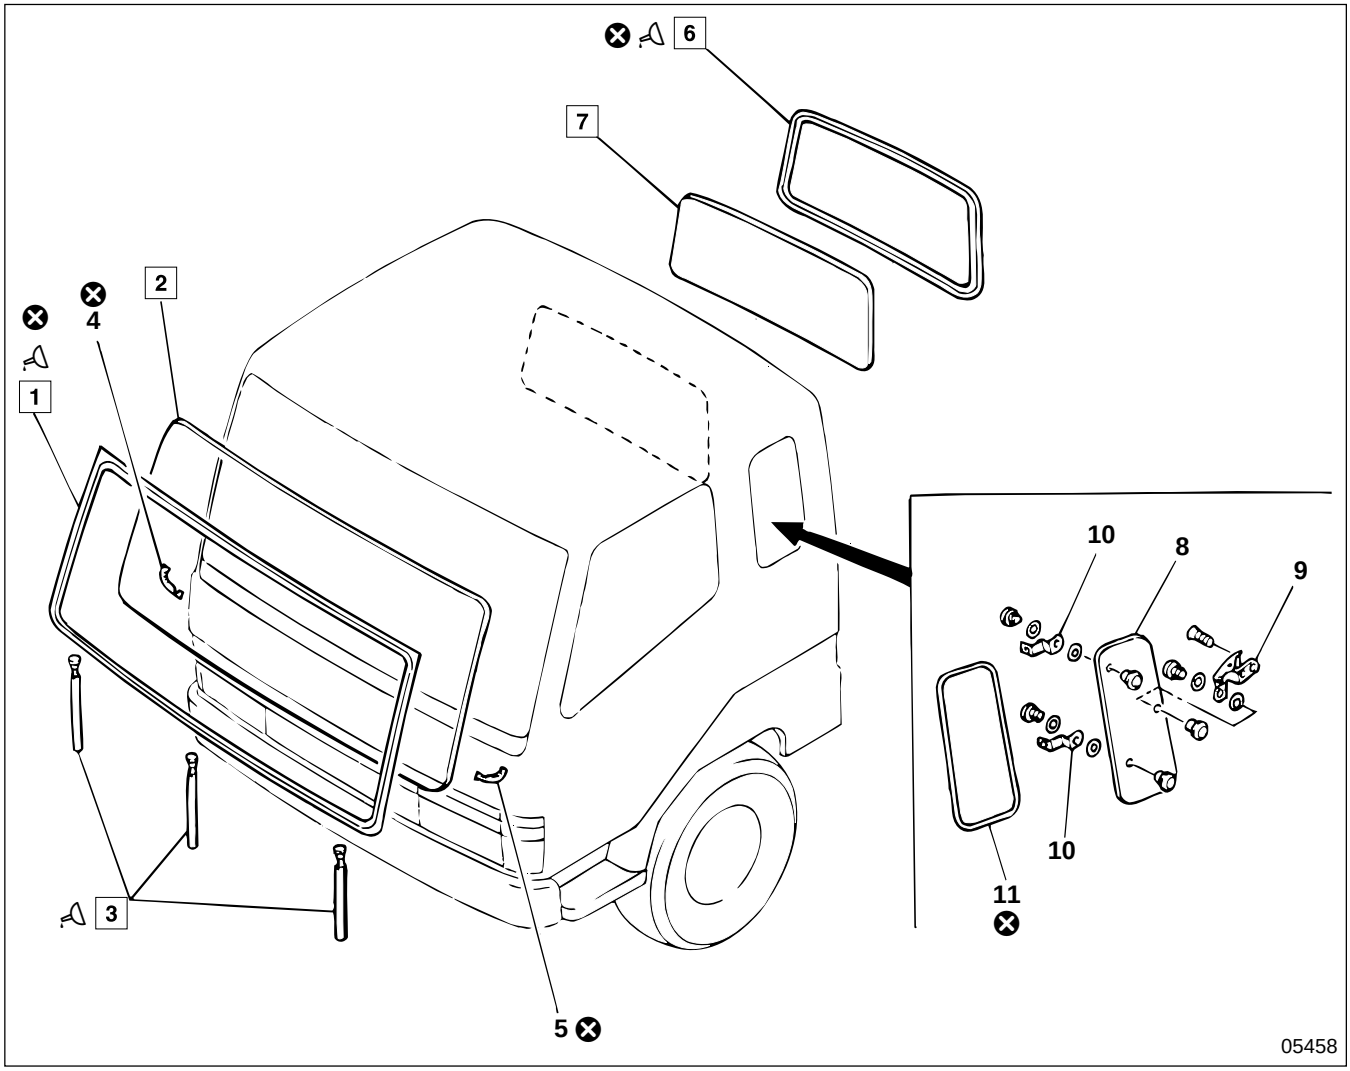


◆ Service procedure

3 **4** **Mounting position of nut and bolt**

- The four mounting positions for nut **3** are indicated by **3** ➡.
- The two mounting positions for bolt **4** are indicated by **4** ➡.

WINDOW GLASS



● **Disassembly sequence**

1 Windshield weatherstrip
2 Windshield
3 Drain hose
4 Seal tape, LH
5 Seal tape, RH
6 Rear window weatherstrip
7 Rear window glass
8 Side window glass
9 Side window link
10 Side window hinge
11 Side window weatherstrip

⊗ : Non-reusable parts

● **Assembly sequence**

Follow the disassembly sequence in reverse.

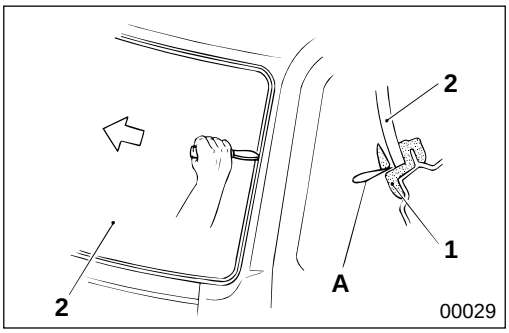
NOTE

The illustration shows the left side. The right side is symmetrical to the left side.

Lubricant and sealant

Location	Points of application	Kinds	Quantity
1, 6	Lip area of weatherstrip	Soapy water	As required
3	Fill the area around the drain hose mounting flange on cab	CEMEDINE 3061-D	As required

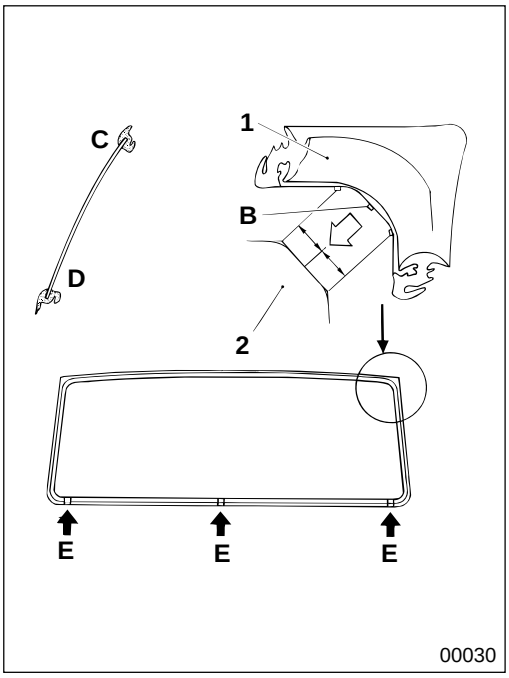
◆ Service procedure



1 **2** **Weatherstrip and windshield**

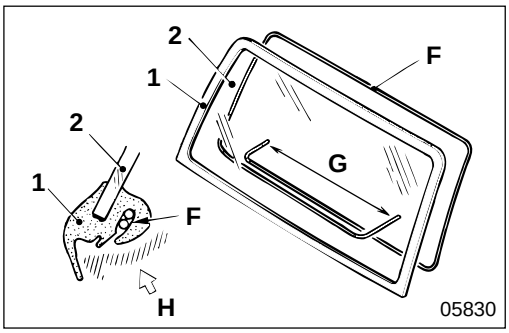
[Removal]

- Cut weatherstrip **1** with knife **A** at the area as illustrated.
- Support windshield **2**, and remove by pressing it from inside the cab.

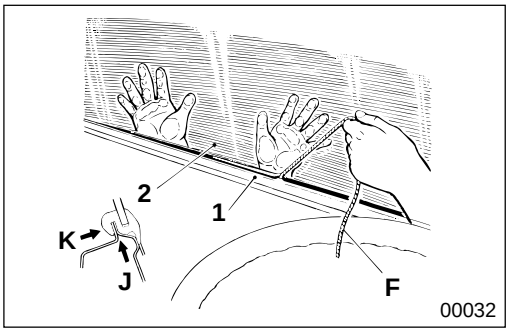


[Installation]

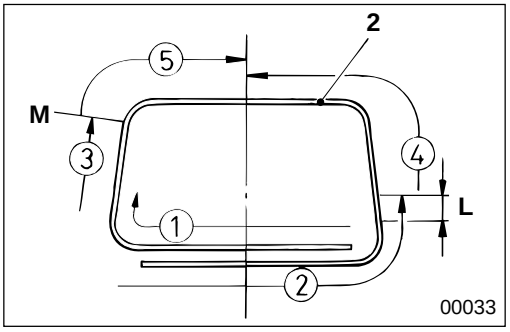
- Install weatherstrip **1** so that central basic point **B** meets the middle at the chamfered part of windshield **2**.
  C : Outside
  D : Inside
  E : Water drain hole



- Lay cord **F** in the cab mounting groove of weatherstrip **1** as illustrated, and overlap the cord at the lower side of the glass by the specified length, see **G**.
- Apply soapy water **H** to weatherstrip **1**.
- Align windshield **2** with the cab.



- Push windshield **2** inward from the outside of the cab firmly.
- Inside the cab, pull one end of cord **F** to install lip **K** of weatherstrip **1** into flange lip **J** of the cab.

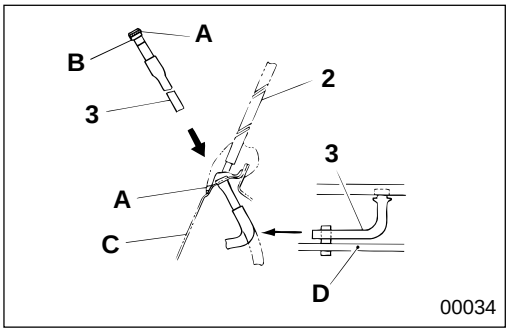


- Pull cord **F** in the numbered order as illustrated and at the same time have someone push windshield **2** into weatherstrip **1**, tapping the windshield with a rubber-headed mallet.

  L : approximately 100 mm {3.94 in.} from the starting point of the straight section
  M : up to the end of the straight section

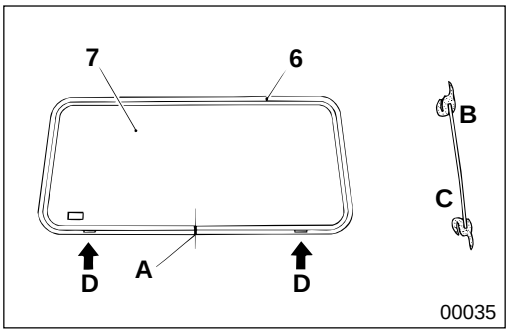
CAUTION

Make sure that windshield 2 is installed correctly into the cab before hitting the windshield with the rubber-headed mallet, otherwise the windshield might be broken.



3 **Installation of drain hose**

- Fill the area around the flange of drain hose **3** with sealant **A**, and press the drain hose in until its flared area **B** fits into cab **C**. Carefully smooth down excess sealant that is squeezed out so that the hose opening is not clogged.
- Secure drain hose **3** at the middle of the vehicle together with windshield washer hose **D**.



6 **7** **Weatherstrip and rear window glass**

- Install so that joint **A** of weatherstrip **6** is at the bottom center of rear window glass **7**.

  B : Outside
  C : Inside
  D : Drain hole

- Except for the point mentioned above, follow the same service procedure as for installation of the windshield.
  P42-75

HOW TO READ THIS GROUP

HOW THIS GROUP IS STRUCTURED 2

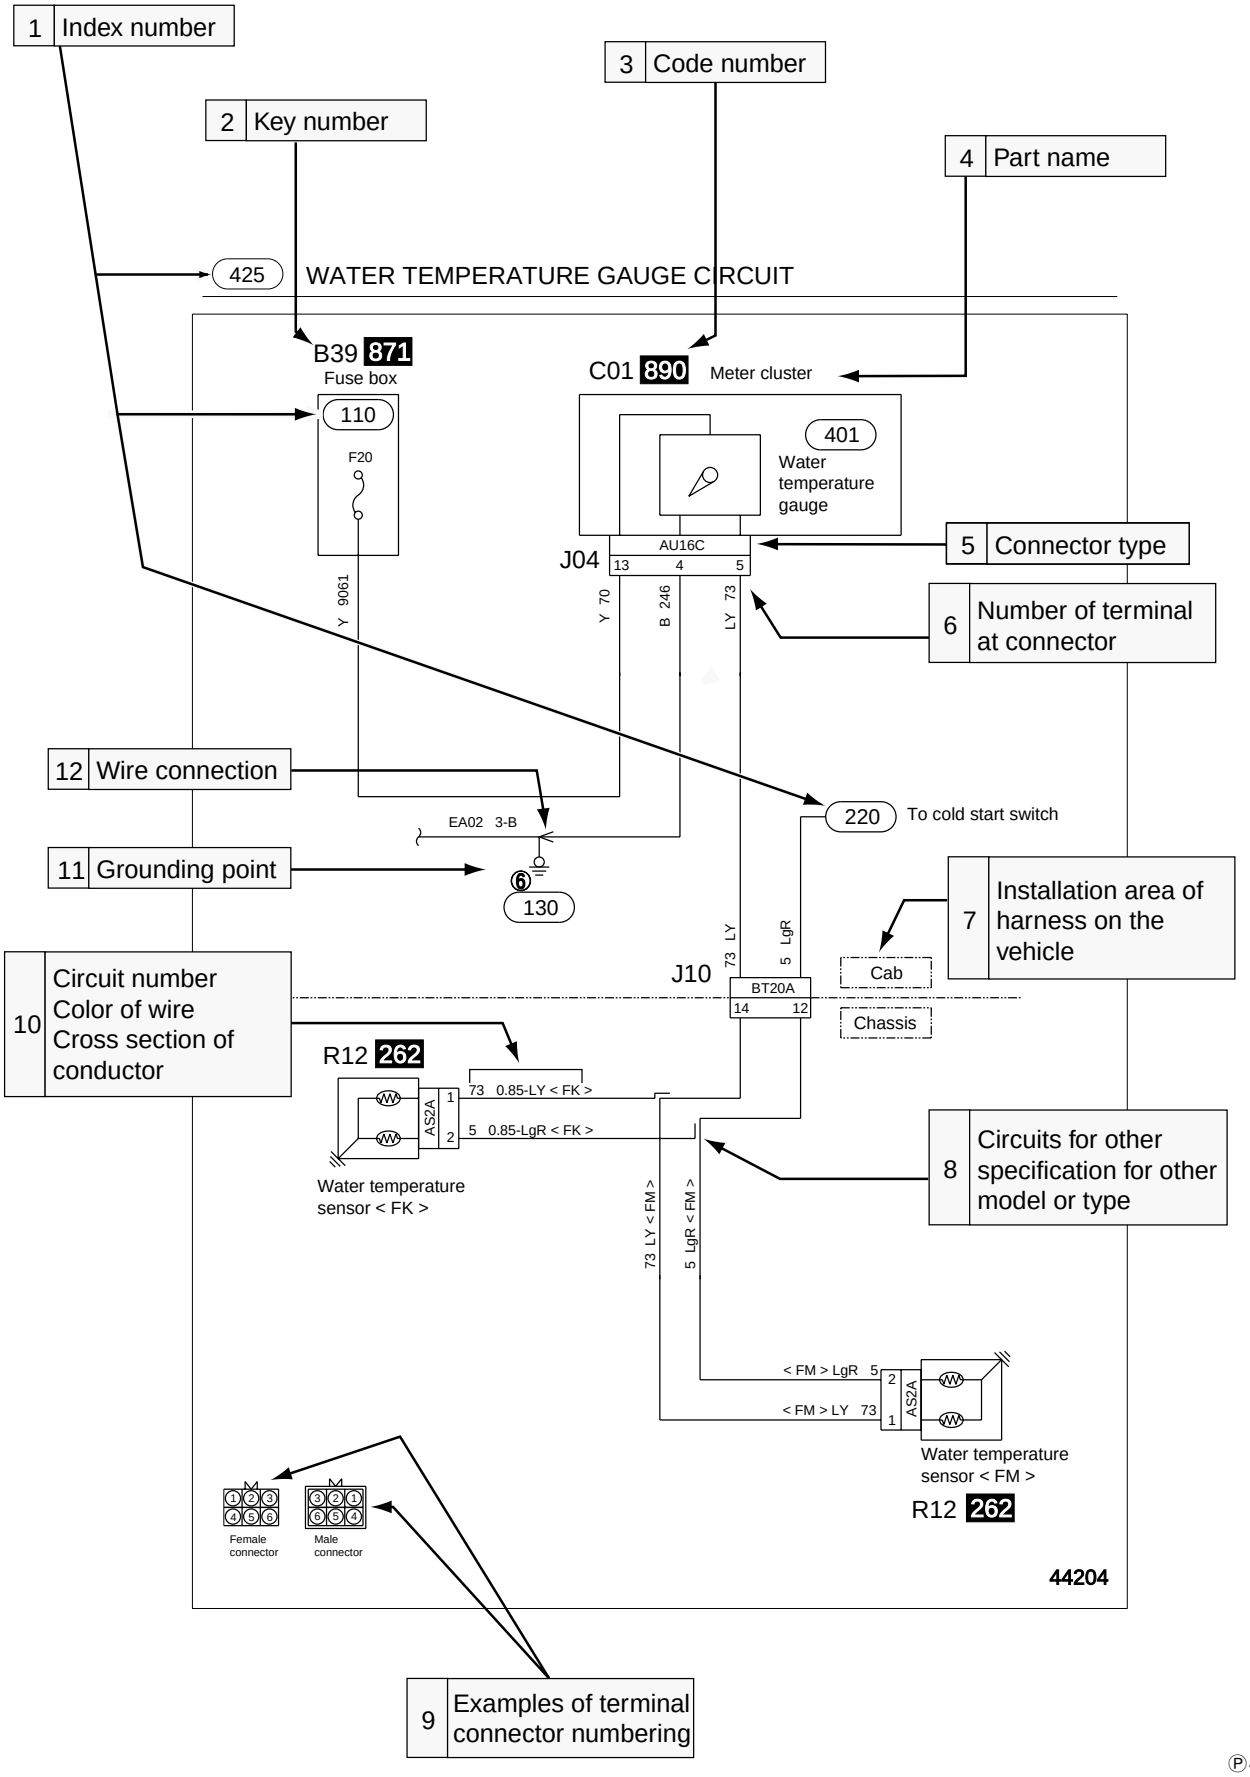
HOW TO READ CIRCUITS(GROUP 54)



Ⓟ45348

1 Index number: **110**

Each circuit has its own Index number identified with three digits (**110**).
How to read index number

- By referring to the index number, it is possible to easily locate the circuit drawing in the manual as they are classified by function. (including “POWER CIRCUIT” **110** and “GROUND” **130** .)
- How to check the location of circuit drawing in each part
  The circuit drawing which can not be diagramed in one page due to its complicated structure (such as meter cluster and electronic control unit etc.), has its remarked index number to be connected to other circuit drawing. (**401** , **910** , etc.)

2 Key number: A01~

Key number identifies the installation position of the parts, and is shown by A01 ~ Z.
The details of the installation position are described in GROUP 10 .

3 Code number: **001** ~

Code number indicates an inspection procedure or detail exists and has three digits (**001**).
The details of the parts to be checked are described in GROUP 11 .

4 Part name

5 Connector type

Connectors are shown by □ without reference to Male or Female. In the box is a description of connector, number of terminals and its classification, etc.
Table of connectors is described in GROUP 00.

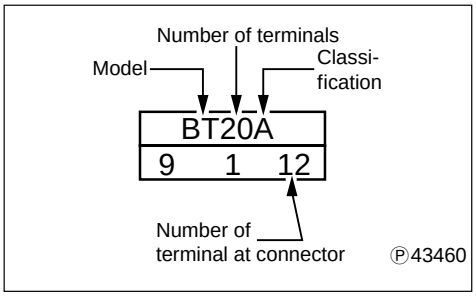
6 Number of terminal at connector

Terminal numbers of connector are shown by figures in the box.

7 Installation area of harness on the vehicle

The location and boundary of the harnesses in the vehicle are shown in the each circuit drawing and it may help to check mounting position of connectors.

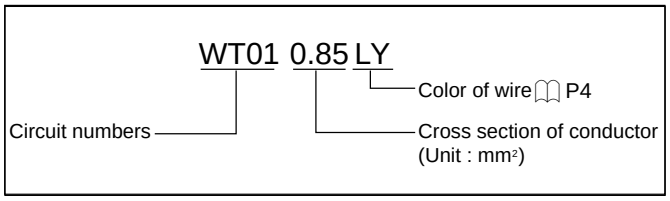
8 Circuits for other specification for other model or type



9 Examples of terminal connector numbering

As it is shown, for female connectors, with placing the lock upward then starting to put numbers from the upper left. And when it is male connector, put numbers from the upper right, also with placing the lock upward.

10 Circuit number, color of wire, and cross section of conductor are shown in circuit drawings.



Except for 0.5 mm², Wire thickness is described in the circuit drawing. The reason why only wire thickness, 0.5 mm² is not described in the drawings is 0.5 mm² is so common and so that the circuit drawing can be seen more easily.
(Examples) 0.5 mm²: Y
0.85 mm²: 0.85 — LY
3 mm²: 3 — B

11 Grounding point

The actual locations of grounding points on the vehicle are shown. Refer to **130** for detailed information.

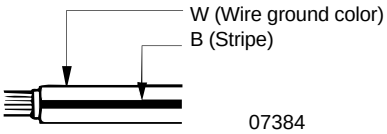
12 Wire connection

When the wires are connected into one point of the harnesses, the circuit drawing shows “Arrow mark”.

CAUTION !
Be careful as the direction of the arrow does not show the direction of the electric current flow.

● Wire Colors

Example: WB means a wire whose ground color is white and whose stripe is black.



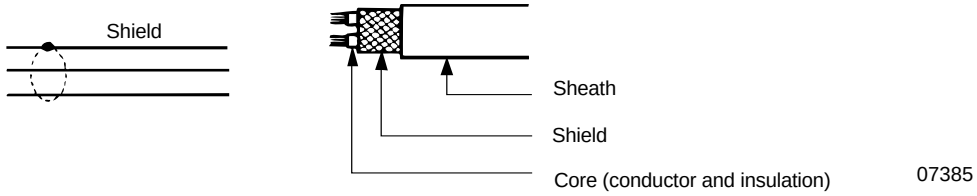
07384

Wire ground color		Wire ground color + Stripe							
W	White	WR	White red	WB	White black	WL	White blue	WG	White green
B	Black	BW	Black white	BY	Black yellow	BR	Black red		
R	Red	RW	Red white	RB	Red black	RY	Red yellow	RG	Red green
Y	Yellow	YR	Yellow red	YB	Yellow black	YG	Yellow green	YL	Yellow blue
G	Green	GW	Green white	GR	Green red	GY	Green yellow	GB	Green black
Br	Brown	BrW	Brown white						
L	Blue	LW	Blue white	LR	Blue red	LY	Blue yellow	LB	Blue black
Lg	Yellow green	LgR	Yellow green red	LgY	Yellow green yellow	LgB	Yellow green black	LgW	Yellow green white
O	Orange								
P	Pink	PB	Pink black						

● Shield Wire

A shield wire is clearly identified as follows:

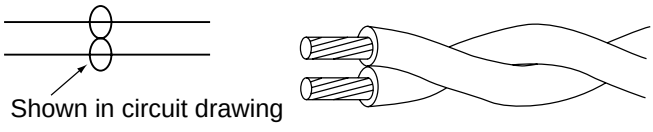
Example



07385

● Twist wire

Twist wires are made by twisting the core of wires by the constant pitch.
Example:



Ⓟ43533

B : Terminal B
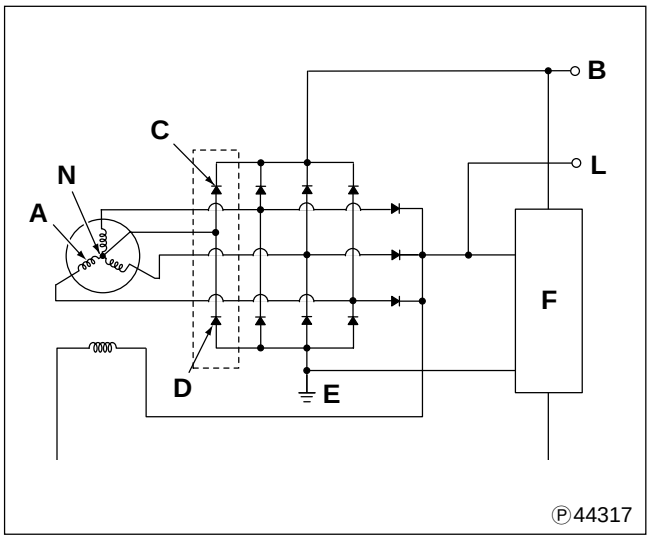
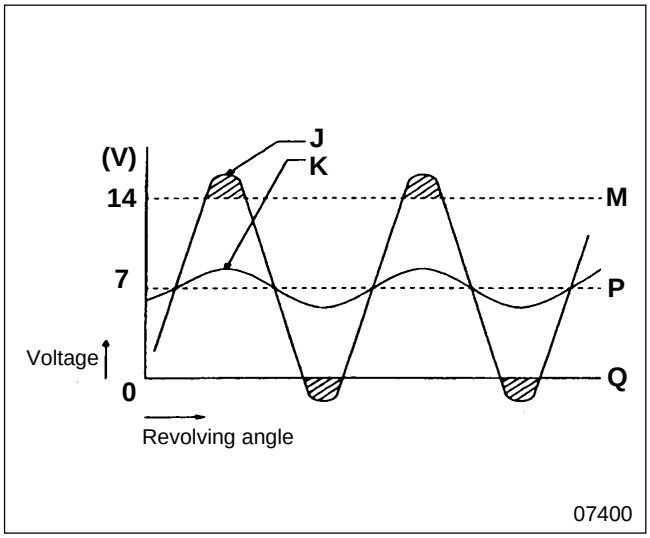
E : Terminal E
F : Terminal F
L : Terminal L



Features of alternator with neutral diodes

- The alternator is the same as the current alternator except neutral diodes **C** and **D** added.
- These neutral diodes **C** and **D** enable this alternator to provide higher DC output during operation at high speeds than the alternator without neutral diodes.

A: Stator coil
B: Alternator terminal B
E: Alternator terminal E
F: IC regulator
L: Alternator terminal L
N: Neutral point



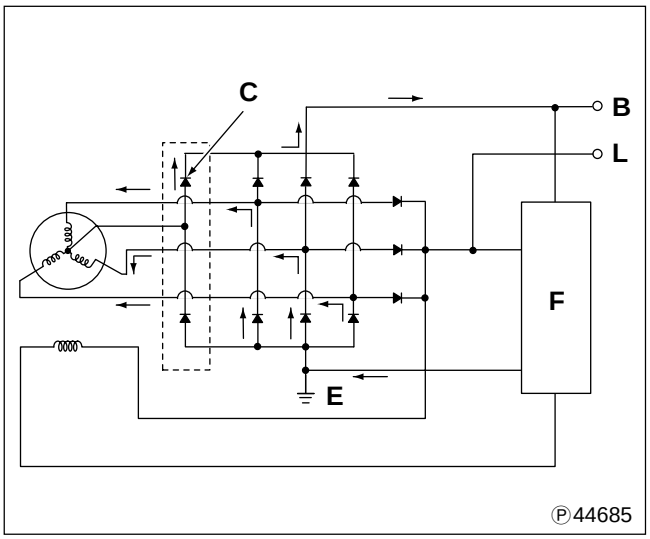
Variations of voltage at neutral point and operation of neutral diodes

- The potential at the neutral point **N** varies up and down with the neutral point DC voltage **P** as a center as shown.
- When alternator is operated at high speeds, the voltage at the neutral point **N** can increase to exceed the output voltage **M** (16 volts) and decrease to become lower than the ground voltage **Q** (0 volt). To adjust these over-voltage and under-voltage (shaded portions of diagram) the current from the excess voltages is taken by neutral diodes **C** and **D** and added to the DC output.

J: Voltage waveform at neutral point during high speed operation
K: Voltage waveform at neutral point during low speed operation
M: Output voltage
P: Average voltage at neutral point (1/2 of output voltage)
Q: Ground potential

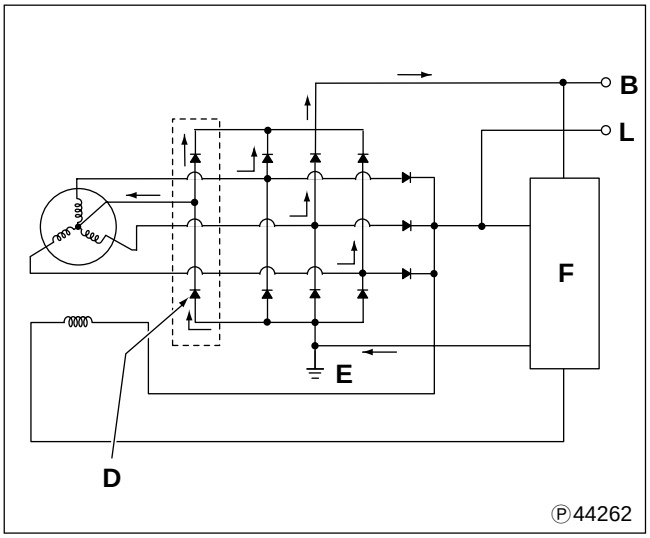
The operation of neutral diodes **C** and **D** for each voltage and potential is as follows.

- When the voltage at neutral point is in the range from 0 to 16 volts, the other 6 diodes are operated. Neutral diodes are not operated.



● **When the voltage at neutral point exceeds 14 volts**

The positive diode **C** adds extra output to the DC output for supply to each electric equipment.

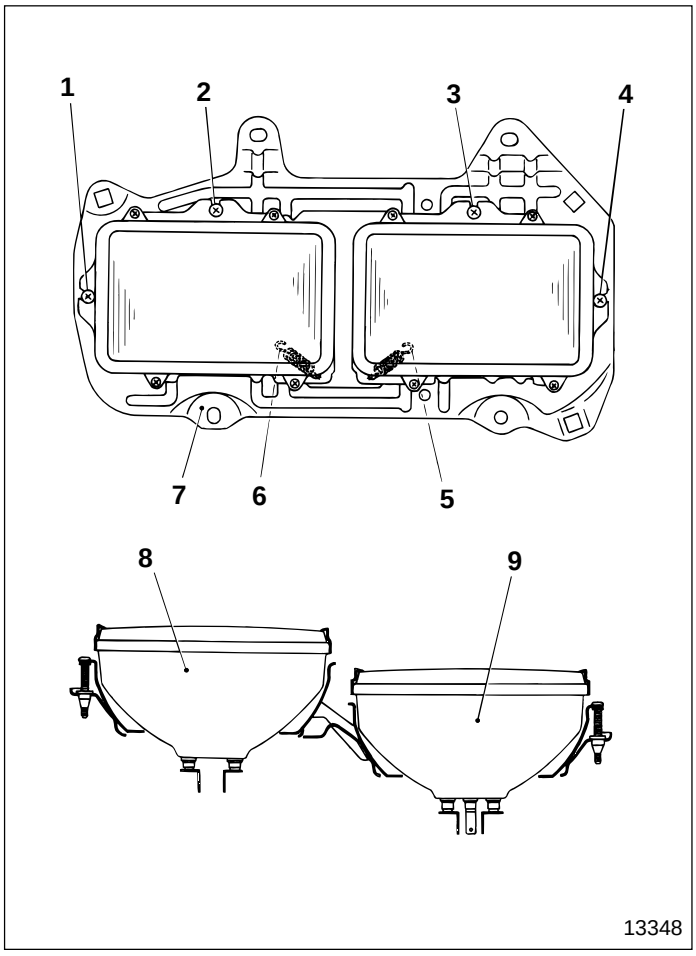


● **When the voltage at neutral point drops below 0 volt**

The negative diode **D** supplies the output from neutral point through other 3 diodes.

3. Lamp

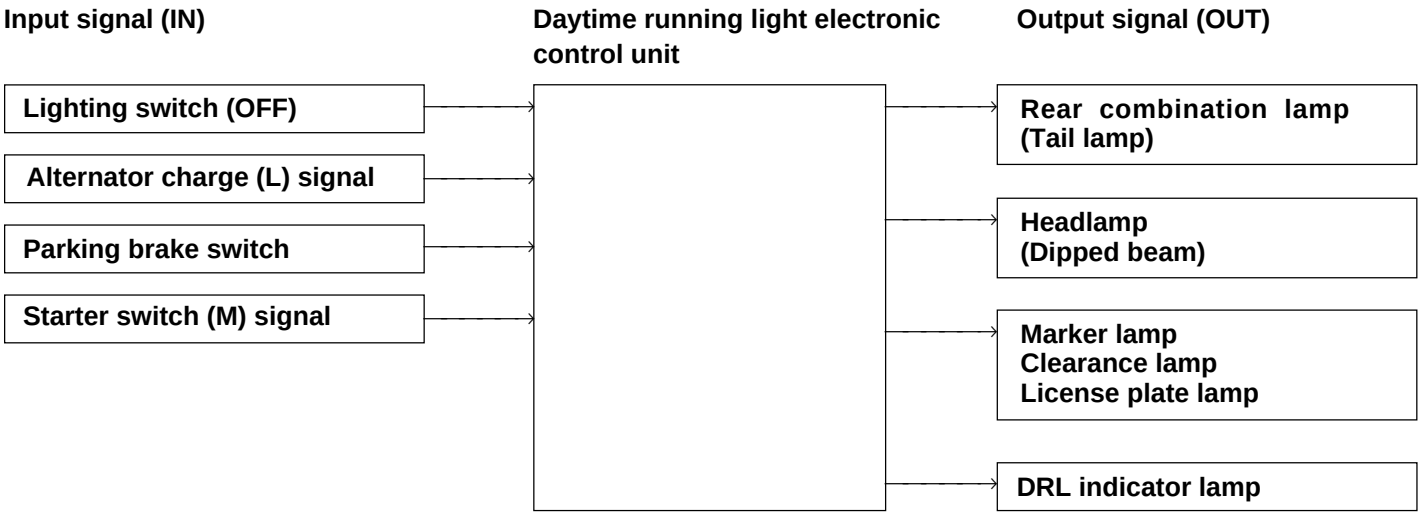
Headlamp



1 Screw (Main beam, horizontal adjustment)
2 Screw (Main beam, vertical adjustment)
3 Screw (Dipped beam, vertical adjustment)
4 Screw (Dipped beam, horizontal adjustment)
5 Extension spring
6 Extension spring
7 Housing
8 Sealed beam unit (Main beam)
9 Sealed beam unit (Dipped beam)

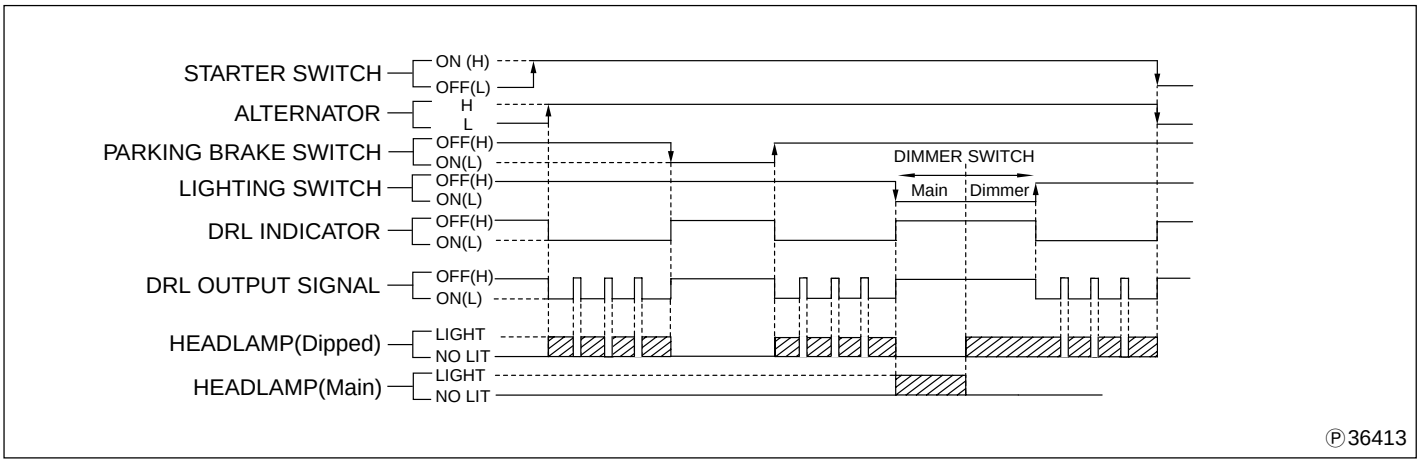
- The headlamp unit consists of sealed beam units **8, 9** separately installed in housing **7**. Sealed beam unit **8** is for Main beam, and sealed beam unit **9** is for Dipped beam.
- The headlamp aiming can be adjusted by changing the installation angle of sealed beam units **8, 9**.
- To adjust the installation angle of sealed beam unit **8**, turn screws **1, 2**. Extension spring **6** sets the angle of the sealed beam unit.
- To adjust the installation angle of sealed beam unit **9**, turn screws **3, 4**. Extension spring **5** sets the angle in the same way as for sealed beam unit **8**.

Daytime running light system



- In a daytime running light system, regardless the position of lighting switch while engine is running, the dipped beam of the headlamp and the tail lamp of the rear combinations, position lamp, license plate lamp will light on.
- Except for that the lighting switch is OFF or when the passing switch is ON, the same lamps as usual switch operation will light.

• Timing chart



Headlamps repeat ON/OFF operations at 120 Hz according to the above timing chart. Because of the cyclic ON/OFF operations, the headlamps are dimmer than when the headlamp switch is ON.

Explanation of timing chart

- After the engine starts, when alternator begins generating electricity with starter switch in the ON position, headlamps light.
- When parking brake switch is ON, the DRL turns off to switch off the headlamps.

4	Alternator L terminal	9	Lighting switch
5	Starter switch M terminal	–	–

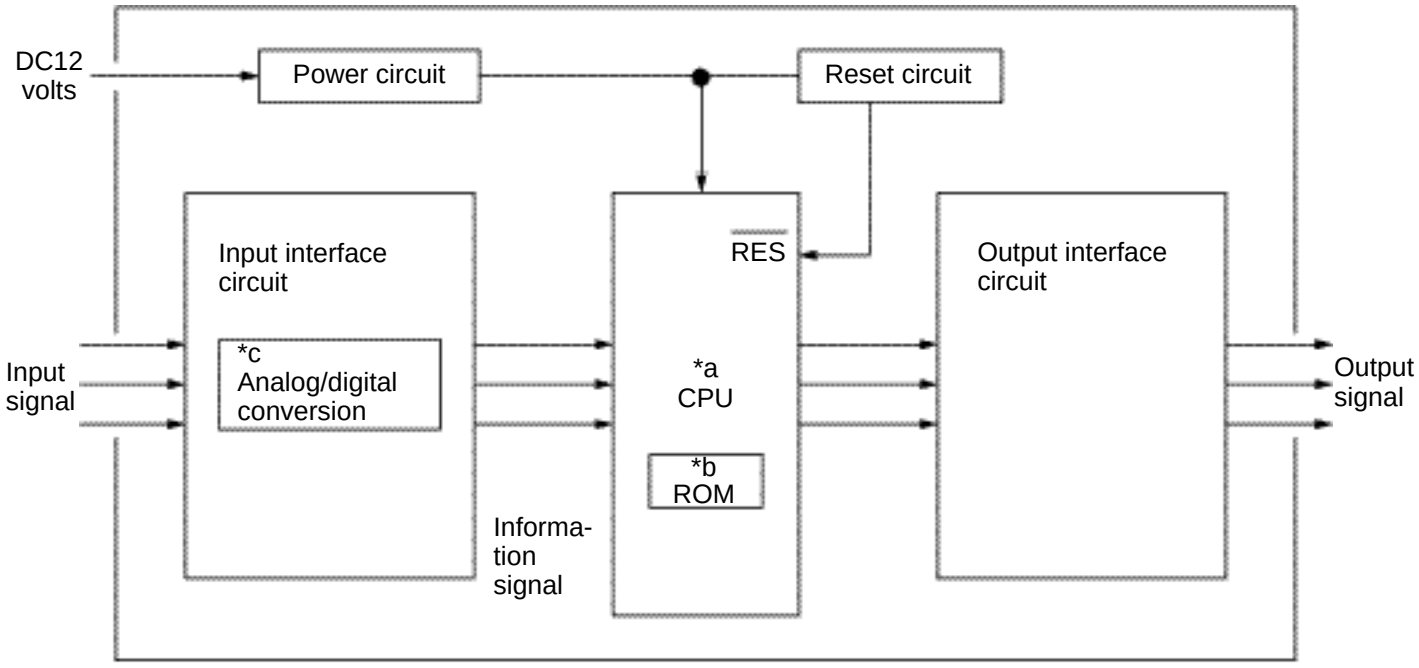
4. MUTIC (Multipurpose Timing Control Unit)

- This control unit is an integrated control unit for controlling the following functions.

Preheating function	P54-0-18
Intermittent wiper activation function	Gr 42
Wiper activation function (Even if the wiper switch is OFF, this function automatically activates the wiper when the window washer works)	Gr 42
Water level warning function	Gr 14
Starter continuous-ON prevention function	P54-0-20

- For controlling each function, sensors and switches are needed as sources of information, and they are provided for respective systems.
- Based on the information provided by the sensors and switches, the MUTIC controls above functions by means of the circuits inside itself.

● **Internal structure of MUTIC**



- The MUTIC is internally made up roughly of the input interface circuit, CPU*a, ROM*b, and output interface circuit.
  *a: An abbreviation for Central Processing Unit. It compares the input information and the information stored in the ROM and makes a decision and sends commands to the outputs.
  *b: An abbreviation for Read-Only Memory. It is an element used exclusively to have its contents read. It stores fixed data and program, and such retained information is not deleted even after power is cut off.
- Information sources such as sensor, switch send input signal to the input interface circuit.
- The input interface circuit performs A/D conversion*c of the input signals, and the converted signals are transmitted to the CPU as information signals.
  *c: An abbreviation for Analog/Digital conversion. It is a conversion from analog to digital signals. This conversion enables calculation to be made in the CPU.
- The CPU compares the received signals with the data in the ROM, makes a decision, and sends the results to the output interface circuit.
- The output interface circuit transmits these results to each system as output signals to instruct operations.
- Performing these series of operations continuously enables optimum control of each function.

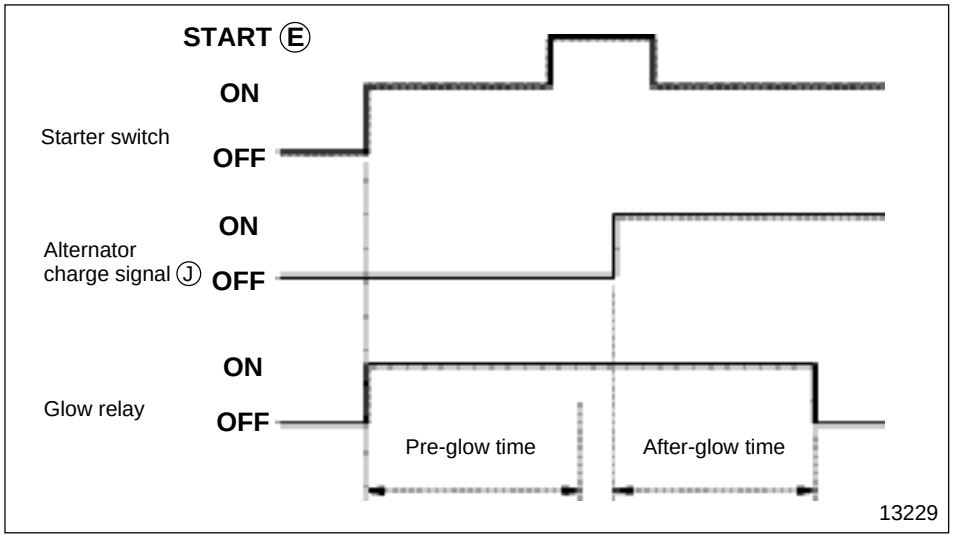
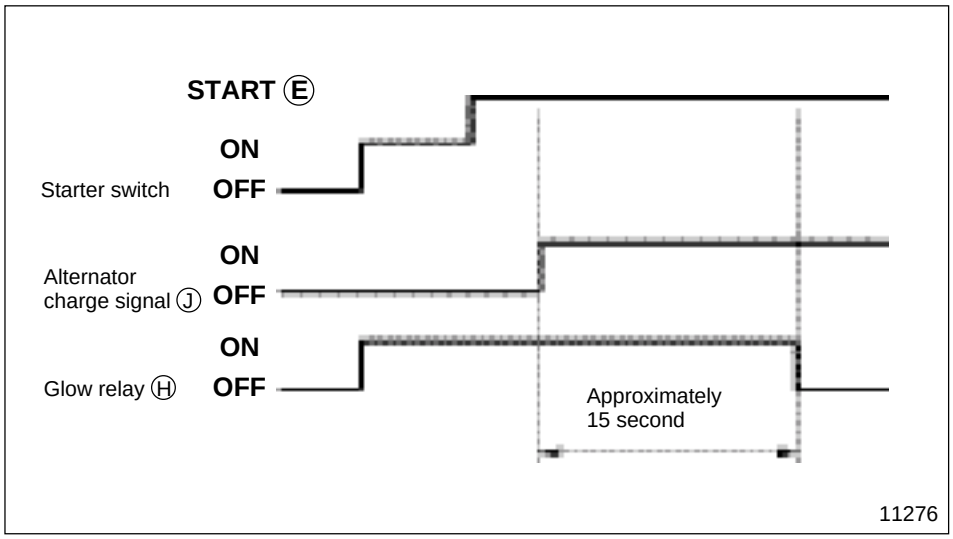
Preheating Function

This preheating function aims to enhance the engine start up when the engine coolant is low in cold weather or temperature.
MUTIC (Multipurpose Timing Control Unit) controls the entire function as follows:



Pre-glow and After-glow

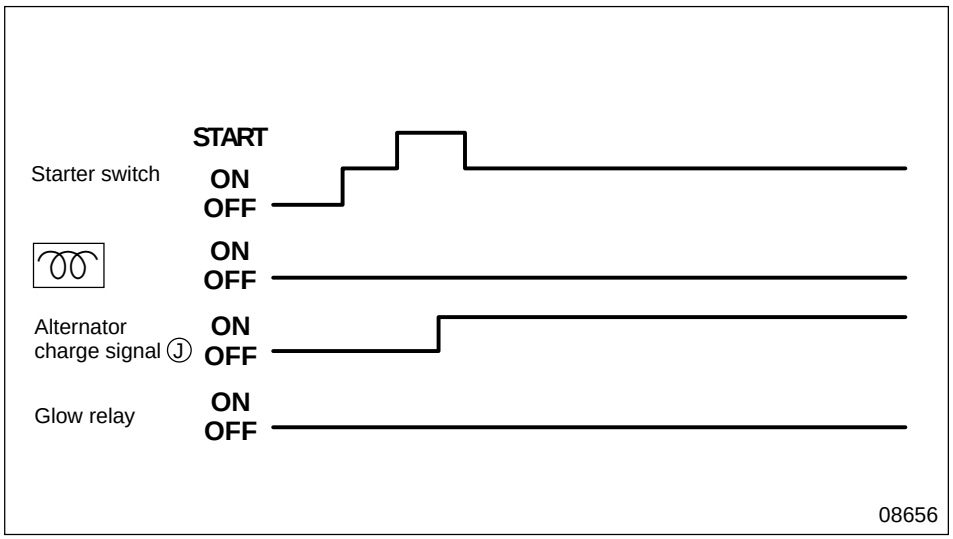
The preheating is operated with a pre-glow before the engine starting and an after-glow after the engine starting, which are controlled by the starter switch (S terminal) signal Ⓔ and the alternator (L terminal) signal Ⓙ.



Fail Safe

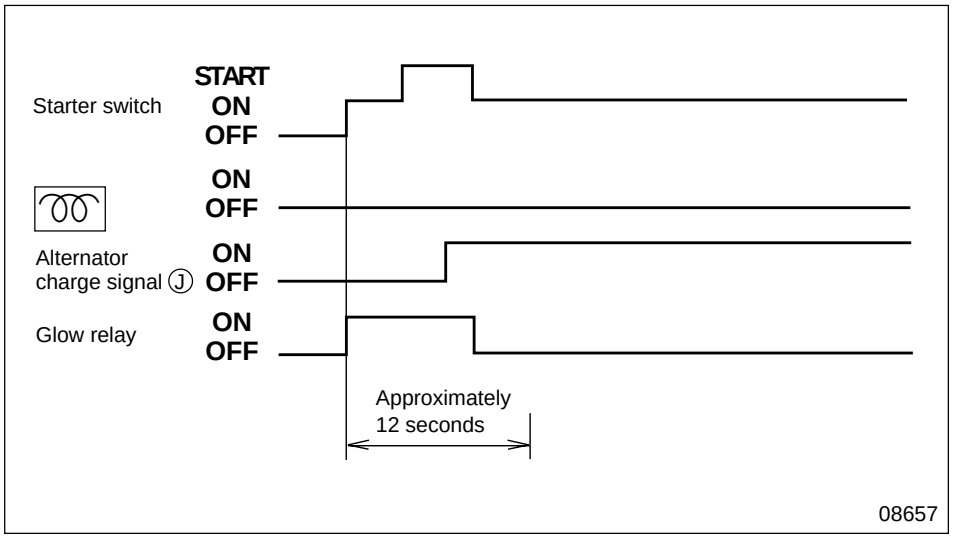
- In case the contact point operating the glow relay in MUTIC has melted, the preheating indicator lamp flashes to warn this abnormality.
- Operation mode turns glow relay activation signal Ⓗ to OFF only after all the following conditions are met.
  - Where the engine coolant temperature is 60°C or less.
  - Alternator (L terminal) signal Ⓙ is ON for 15 seconds continuously.
  - Starter switch (S terminal) signal Ⓔ is ON.

ON
OFF

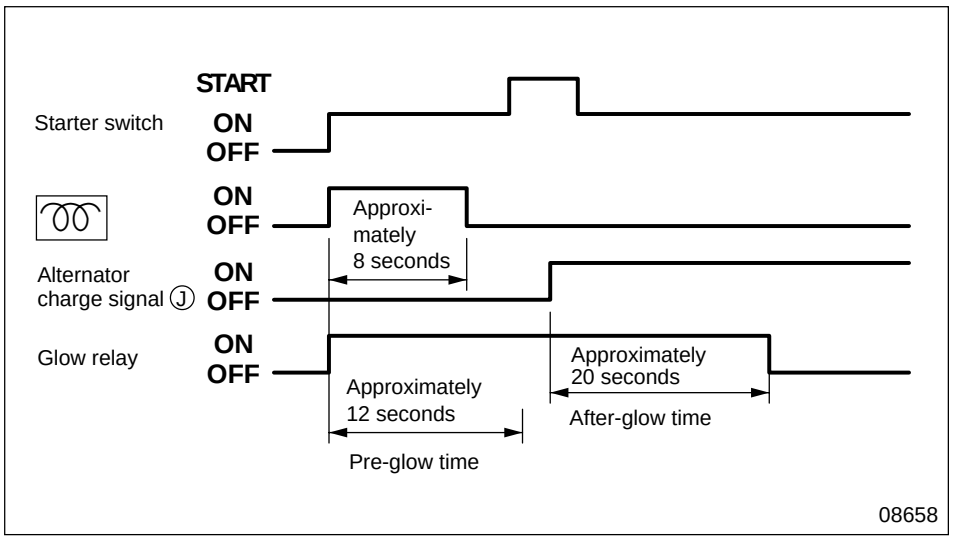


Operation mode

- Where the engine coolant temperature is 60°C {140°F} or more.



- Where the engine coolant temperature is 0 to 60°C {32 to 140°F}.



- Where the engine coolant temperature is 0°C {32°F} or less.

Starter Continuous-ON Prevention Function

- This function prevents a starter overrun.
- If the start continues to operate for more than a preset time after the engine starts, the MUTIC detects a starter continuous-ON condition, and stops the current to the starter and starter relay to prevent the starter from seizing.

When a preset time elapses after the engine starts, the safey relay is activated (opening of contact) by signal Ⓙ from the alternator (terminal L).

Operation mode

TROUBLESHOOTING

Power and charging

Possible causes \ Symptoms		Battery electrolyte decreases too early	Battery overheating	Battery is normal but overdischarged	Charge warning lamp [-+] does not light when starter switch is turned ON, with engine stopped	Alternator is normal but battery overdischarged	Remarks
Defective connector connection, harness open/short circuit, defective grounding				○		○	
Fuse blown				○	○	○	
V-belts loose				○		○	Gr 14
V-belts damaged				○		○	Gr 14
Battery faulty		○				○	
Alternator	Stator coil broken			○			
	Stator coil short-circuited with core			○			
	Field coil faulty			○			
	Rectifier faulty			○			
	Regulator faulty		○	○	○		
	Wiring faulty			○			
Meter cluster faulty					○		

Engine starting, preheating and stopping

Symptoms / Possible causes		Starter does not operate	Starter operates but engine does not start: Pinion does not engage with ring gear	Starter operates but engine does not start: Pinion engages with ring gear but does not rotate	Starter operates but engine does not start: Flywheel rotates but engine does not start	Engine does not stop	Engine cannot be preheated	Engine is hard to start	Remarks
Defective connector connection, harness open/short circuit, defective grounding		○			○	○	○		
High-current fuse blown		○							
Fuse blown		○				○	○		
Battery insufficiently charged		○		○					
Starter	Magnetic switch contacts stuck or fused together	○							
	Open circuit in magnetic switch coil	○							
	Overrunning clutch malfunctioning			○					
	Pinion worn or damaged		○						
Starter relay defective		○							
Starter switch defective		○				○			
Flywheel ring gear worn or damaged			○						^ Gr 11
Glow plugs defective							○	○	
Glow relay defective							○	○	
Water temperature sensor defective							○	○

Van body dome light switch faulty		○			
Daytime running light electronic control unit faulty			○		

Meter

Possible causes \ Symptoms		Pointer does not move	Pointer movement unstable	Indication error large	Abnormal noise from meter	Remarks
Defective connector connection, harness open/short circuit, defective grounding		○	○			
Fuse blown		○				
Internal circuits of meter cluster faulty		○	○	○		
Printed wiring board of meter cluster faulty		○				
Tachometer	Engine speed sensor coil open-circuited	○				
	Engine speed sensor improperly mounted	○	○			Gr 11, 13
	Tachometer faulty	○	○	○	○	
	Engine electronic control unit faulty	○	○	○		Gr 13
Speedometer	Speedometer cable broken	○				
	Speedometer cable connection faulty		○		○	
	Speedometer cable lubricant exhausted		○		○	
	Specified tires not used			○		Gr 31
	Tires worn or inflation pressure incorrect			○		Gr 31
	Specified L-joint of transmission not used (Different in gear ratio)			○		Gr 22
	Specified speedometer gear of transmission not used (Different in gear ratio)			○		Gr 22
	Installation angle of speedometer gear bushing on transmission incorrect (Not set at correct gear ratio position)			○		Gr 22
	Speedometer faulty	○	○	○	○	
Water temperature gauge	Water temperature sensor faulty	○		○		
	Water temperature gauge faulty	○		○		
	Thermostat does not close	○				Gr 14
Fuel gauge	Fuel level sensor faulty	○		○		
	Fuel gauge faulty	○		○		

Cigarette lighter and Audio

Symptoms / Possible causes	Cigarette lighter			Audio					Remarks
	Does not glow	Does not return	Night lamp does not light up	Specific frequency band does not work	Spurious noise generated	Sound quality poor	Sound from one side only	Left and right volume different	
Defective connector connection, harness open/short circuit, defective grounding	○		○		○		○		
Fuse blown	○		○						
Cigarette lighter faulty	○	○							
Tail lamp relay faulty			○						
Antenna and antenna cable connection faulty					○				
Speaker faulty				○	○	○	○	○	
Left and right speaker impedance different								○	

Accessory noise generation source

Accessory	Noise	Symptoms
Alternator	Whistling	High pitch sound when accelerator pedal suddenly depressed (Stops soon after engine stopped)
Water temperature gauge	Scratching	Occurs when engine running (Continues for a while after engine stops)
Engine oil pressure switch	Rattling	Depends on engine speed (Does not occur during idling)
Fuel level sensor	Scratching	Occurs when engine suddenly revved, while running on rough roads, or starter switch turned ON
Flasher unit	Banging	When turn signal blinks
Horn	Hissing	Occurs when horn button pressed or released
Wiper motor	Whining	Depends on wiper speed
Windshield washer motor	Whining	When windshield washer operates

Horn

Symptoms / Possible causes	Horn				Remarks
	No Sound	Continuous sound	Small sound	Sound quality poor	
Defective connector connection, harness open/short circuit, defective grounding	○				
Fuse blown	○				
Horn switch faulty	○	○			
Horn faulty	○		○	○	
Horn stay warped			○	○	
Battery voltage insufficient	○		○		
Air leaking from air system	○		○	○

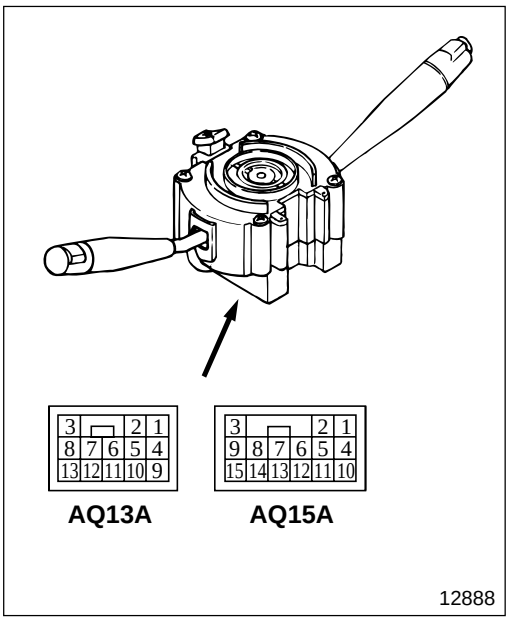
11 INSPECTION OF PARTS



001 Inspection of combination switch

- Follow the table below to check for continuity.
  ○—○ : There is continuity between terminals.
- If any fault is found, replace the switch.

AQ15A Connector connection table

		①	②	③	⑤	⑥	⑦	⑧	⑨	⑬	Body ground
Lighting switch	OFF										
	I						○			○	
	II				○		○			○

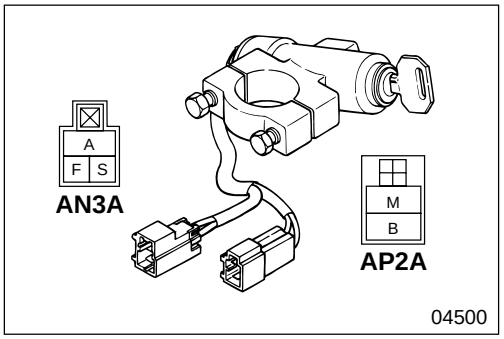
	INT (intermittent)								○			○
	LO (LOW)								○		○	
	HI (HIGH)								○	○	○	
	WASH (washer)							○	○			
Exhaust brake switch < Manual transmission >	OFF											
	ON	○	○									
Hazard switch	OFF											
	ON			○	○	○	○					



002 Inspection of starter switch

- Follow the table below to check for continuity.

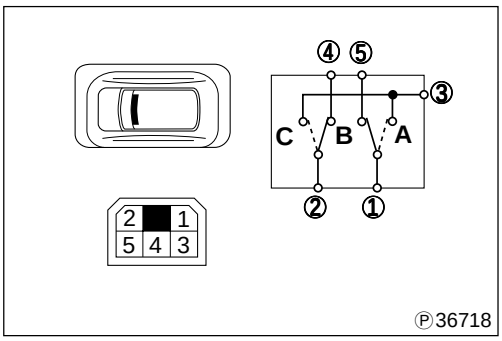
	AP2A		AN6A		
	②	①	①	③	②
LOCK					
ACC	○	———	○		
ON	○	———	○	———	○
START	○	———	○	———	○
	B	M	A	F	S

○——○ : There is continuity between terminals.

- If any fault is found, replace the switch. Gr 37

011 Inspection of rheostat switch

- Rheostat switch contains a control circuit, because of this it is difficult to inspect rheostat switch independently, therefore you should inspect the rheostat switch indirectly, by inspecting the system harness and the related parts.
- If no fault is found in the related parts but the system is faulty, replace the switch.



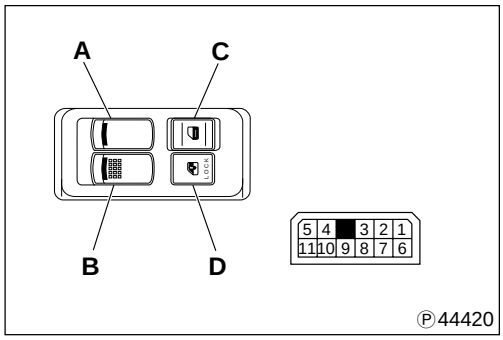
026 Inspection of power window switch (assistant driver's seat side)

- Follow the table below to check for continuity.

	①	②	③	④	⑤
A : OPEN	○	———	○		
		○	———	○	
B : OFF		○	———	○	
	○	———		———	○
C : CLOSE	○				○
		○	———	○	

○——○ : There is continuity between terminals.

- If any fault is found, replace the switch.



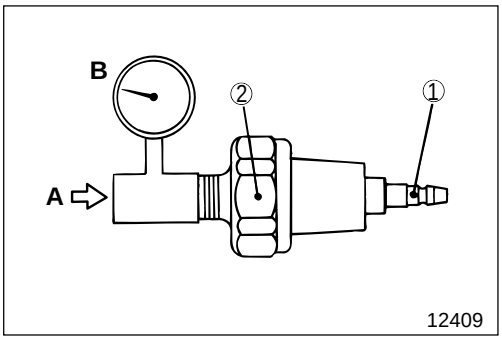
027 Inspection of power window switch (driver's seat side)

- Follow the table below to check for continuity.

			①	②	⑤	⑥	⑦	⑧	⑨	⑩	⑪
A : Assistant driver's seat side window switch	UP		○						○		
	NEUTRAL										
	DOWN			○					○		
B : Driver's seat side window switch	UP	Manual					○		○		
		Auto					○	○	○		
	NEUTRAL										
	DOWN	Manual				○			○		
		Auto				○		○	○		
C : Door lock switch	UNLOCK									○	○
	LOCK				○					○	
D : Assistant driver's seat side window lock switch	UNLOCK		○							○	
				○						○	
	LOCK										

○—○ : There is continuity between terminals.

- If any fault is found, replace the switch.



028 Inspection of low air pressure switch

Perform the following checks, and if any fault is found, replace the switch.

(1) Inspection by without applying air pressure

Make sure that there is continuity between terminals ① and ② (body).

(2) Inspection by applying air pressure

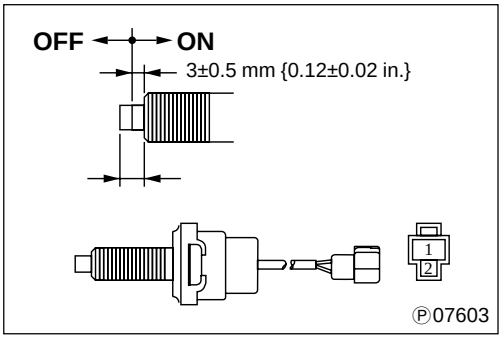
- Gradually apply air pressure **A** to the switch starting from 0 kPa {0 psi, 0 kgf/cm^2}.
- Measure the degree of air pressure at the moment when continuity is not detected between terminals ① and ② (body), and make sure to confirm if the value meets the standard.

B : Air pressure gauge

Standard value (When applying pressure ON → OFF)	470 to 510 kPa {68 to 74 psi, 4.8 to 5.2 kgf/cm^2}

- Apply air pressure **A** up to 785 kPa {115 psi, 8 kgf/cm^2} then gradually decrease the air pressure.
- Measure the degree of air pressure at the moment when continuity is detected between terminals ① and ② (body), and make sure to confirm if the value meets the standard.

Standard value (When releasing pressure OFF → ON)	470 to 559 kPa {68 to 81 psi, 4.8 to 5.7 kgf/cm^2}



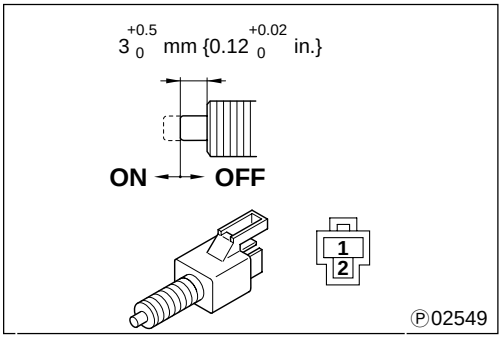
029 Inspection of accelerator switch

- Follow the table below to check for continuity.

	①	②
OFF		
ON	○—○	

○—○ : There is continuity between terminals.

- If any fault is found, replace the switch.



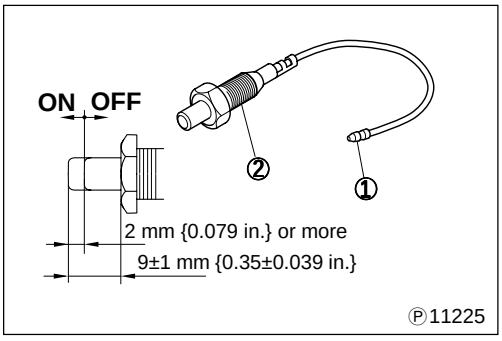
031 Inspection of clutch switch

- Follow the table below to check for continuity.

	①	②
OFF		
ON	○—○	

○—○ : There is continuity between terminals.

- If any fault is found, replace the switch. Gr 21



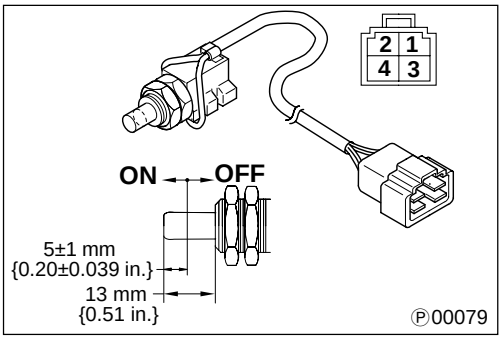
035 Inspection of door switch

- Follow the table below to check for continuity.

	①	②
OFF		
ON	○—○	

○—○ : There is continuity between terminals.

- If any fault is found, replace the switch. Gr 42



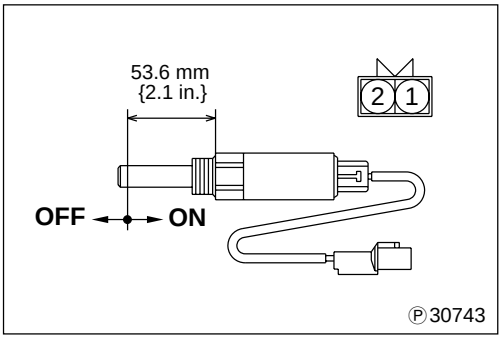
038 Inspection of parking brake switch

- Follow the table below to check for continuity.

	①	②	③	④
ON (PARK)		○		○
OFF (DRIVE)	○		○	

○—○ : There is continuity between terminals.

- If any fault is found, replace the switch. Gr 36A



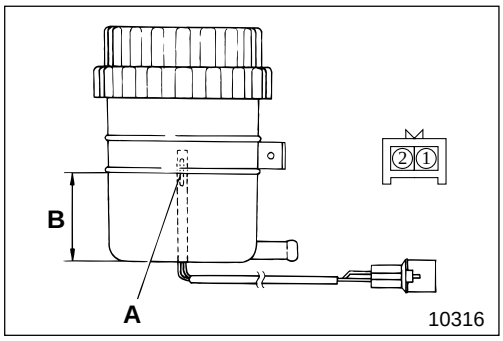
040 Inspection of brake booster stroke switch

- Follow the table below to check for continuity.

	①	②
OFF		
ON	○—○	

○—○ : There is continuity between terminals.

- If any fault is found, replace the switch. Gr 35A



041 Inspection of brake fluid level switch

- Remove brake fluid slowly from fluid tank assembly.

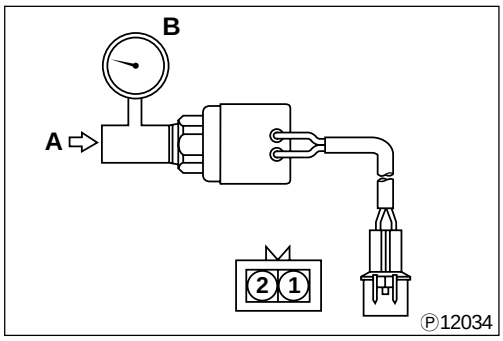
CAUTION

If brake fluid is gets on a painted surface it will dissolve the paint, so wipe it off immediately.

- Measure the height **B** of switch **A** when the continuity is detected between terminals ① and ②.

Standard value	$57^{+3.5}_{-0.5}$ mm {$2.24^{+0.14}_{-0.02}$ in.} (equivalent to 345 cm³ {21.1 cu.in., 0.345 L})

- If the measured value deviates from the standard value, replace the brake fluid tank assembly. Gr 42



042 Inspection of stop lamp switch

Perform the following checks, and if any fault is found, replace the switch. Gr 35

(1) Inspection by without applying air pressure

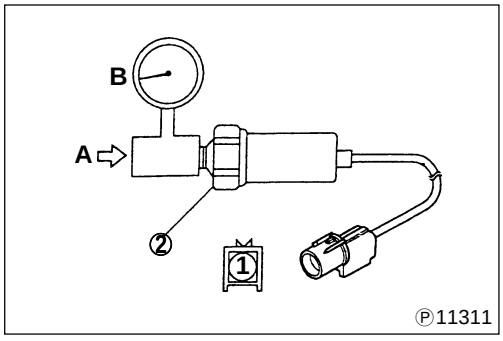
Make sure that there is no continuity between terminals ① and ②.

(2) Inspection by applying air pressure

- Gradually apply air pressure **A** to the switch starting from 0 kPa {0 psi, 0 kgf/cm²}.
- Measure the degree of air pressure at the moment when continuity is detected between terminals ① and ②, and make sure to confirm if the value meets the standard.

B : Air pressure gauge

Standard value (operating pressure)	29±9.8 kPa {4.3±1.4 psi, 0.3±0.1 kgf/cm²}



044 Inspection of engine oil pressure switch

Perform the following checks, and if any fault is found, replace the switch.

(1) Inspection by without applying air pressure

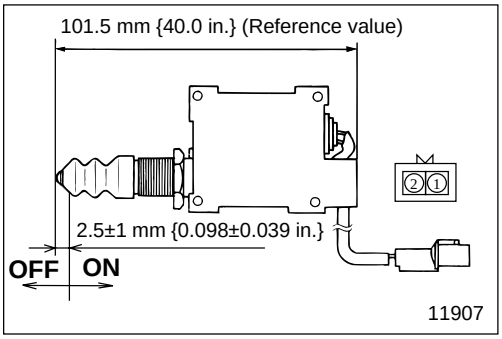
Make sure that there is continuity between terminals ① and ② (body).

(2) Inspection by applying air pressure

- Gradually apply air pressure **A** to the switch starting from 0 kPa {0 psi, 0 kgf/cm²}.
- Measure the degree of air pressure at the moment when continuity is not detected between terminals ① and ② (body), and make sure to confirm if the value meets the standard.

B : Air pressure gauge

Standard value (operating pressure)	49±9.8 kPa {7.1±1.4 psi, 0.5 ± 0.1 kgf/cm²}



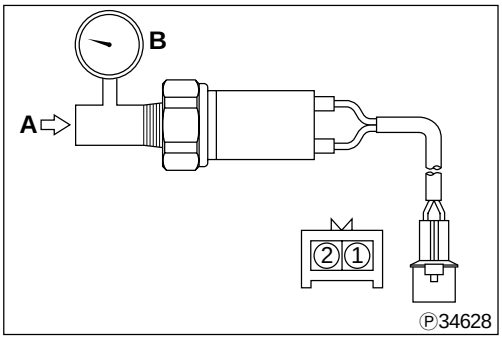
045 Inspection of cab tilt lock switch

- Follow the table below to check for continuity.

	①	②
ON	○	○
OFF		

○——○ : There is continuity between terminals.

- If any fault is found, replace the switch. Gr 42



048 Inspection of parking brake switch

Perform the following checks, and if any fault is found, replace the switch. Gr 36B

(1) Inspection by without applying air pressure

Make sure that there is no continuity between terminals ① and ②.

(2) Inspection by applying air pressure

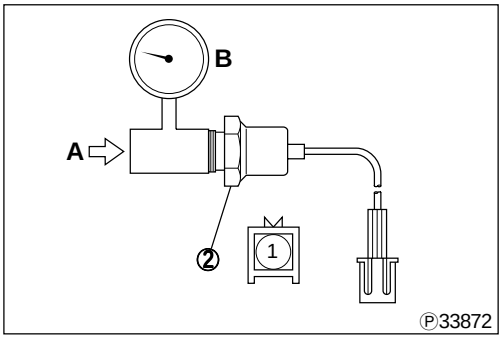
- Gradually apply air pressure **A** to the switch starting from 0 kPa {0 psi, 0 kgf/cm²}.
- Measure the degree of air pressure at the moment when continuity is not detected between terminals ① and ②, and make sure to confirm if the value meets the standard.

B : Air pressure gauge

Standard value (When applying pressure ON → OFF)	441 to 539 kPa {64 to 72 psi, 4.5 to 5.5 kgf/cm²}

- Apply air pressure **A** up to 785 kPa {115 psi, 8 kgf/cm²} then gradually decrease the air pressure.
- Measure the degree of air pressure at the moment when continuity is detected between terminals ① and ② (body), and make sure to confirm if the value meets the standard.

Standard value (When releasing pressure OFF → ON)	461 to 559 kPa {67 to 81 psi, 4.7 to 5.7 kgf/cm²}



053 Inspection of engine oil bypass alarm switch

Perform the following checks, and if any fault is found, replace the switch. Gr 12

(1) Inspection by without applying air pressure

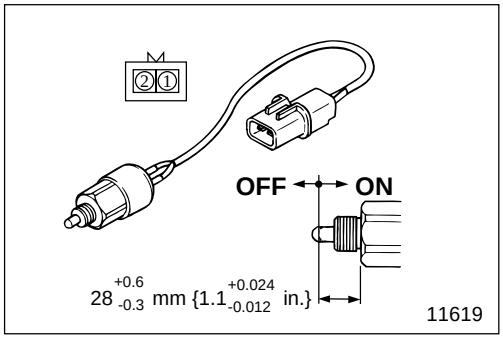
Make sure that there is no continuity between terminals ① and ② (body).

(2) Inspection by applying air pressure

- Gradually apply air pressure **A** to the switch starting from 0 kPa {0 psi, 0 kgf/cm²}.
- Measure the degree of air pressure at the moment when continuity is detected between terminals ① and ② (body), and make sure to confirm if the value meets the standard.

B : Air pressure gauge

Standard value (operating pressure)	185^{+49}_{0} kPa {$27^{+7.1}_{0}$ psi, $1.9^{+0.5}_{0}$ kgf/cm²}



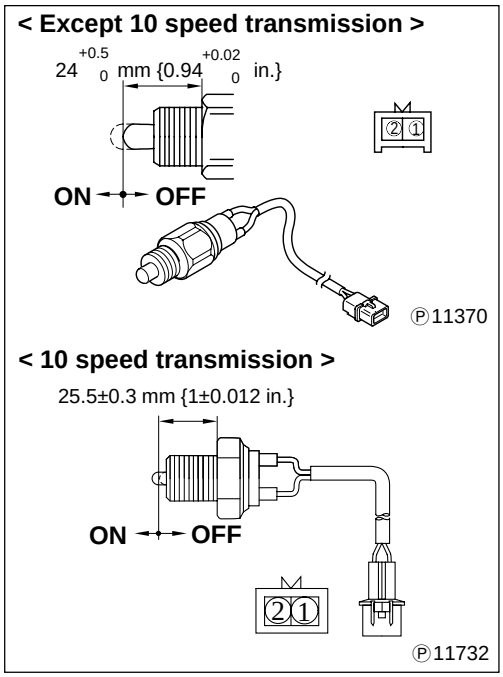
054 Inspection of backup lamp switch

- Follow the table below to check for continuity.

	①	②
OFF		
ON	○—○	

○—○ : There is continuity between terminals.

- If any fault is found, replace the switch. Gr 22



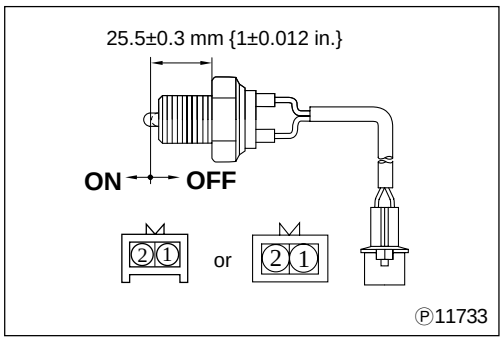
056 Inspection of transmission neutral switch

- Follow the table below to check for continuity.

	①	②
OFF		
ON	○—○	

○—○ : There is continuity between terminals.

- If any fault is found, replace the switch. Gr 22



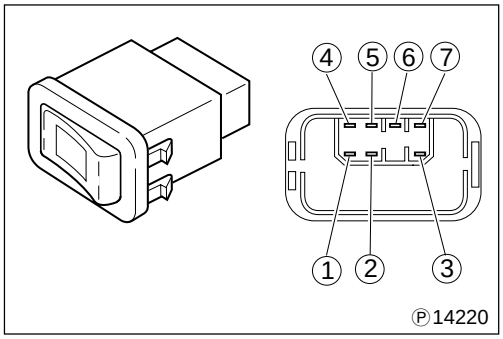
068 Inspection of transmission HIGH/LOW changeover switch

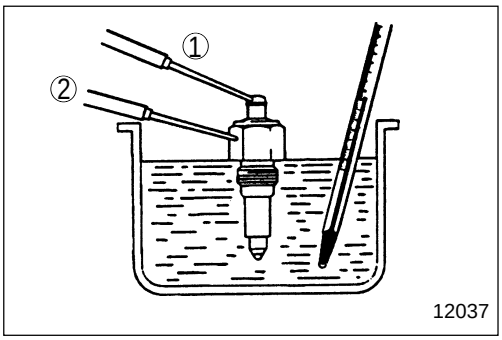
- Follow the table below to check for continuity.

	①	②
OFF		
ON	○—○	

○—○ : There is continuity between terminals.

- If any fault is found, replace the switch. Gr 22





087 Inspection of van body dome light switch

- Follow the table below to check for continuity.

	①	⑤	⑦	LED (Operation indication light	③
ON	○—○		○	⟋⟍⟋ ⊳|	○
OFF					

○—○ : There is continuity between terminals.

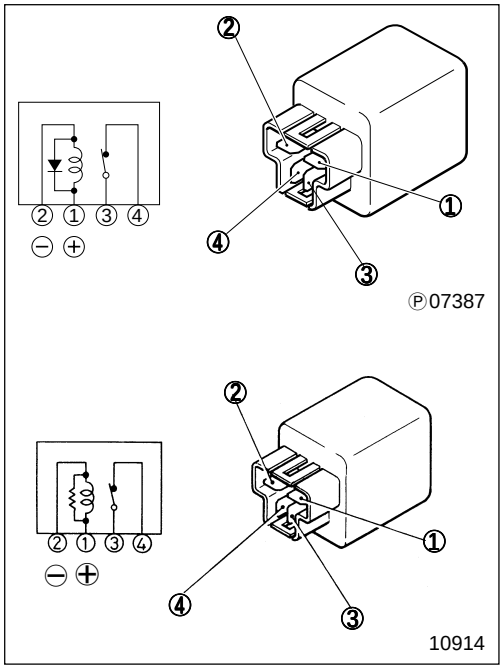
- If any fault is found, replace the switch.

160 Inspection of overheating switch

- Place the switch in engine oil in a container.
- Raise the oil temperature to the specified values and stir the oil.
- Measure the operating temperature between terminals ① and ② (body) respectively.

Standard Value	When temperature increase (ON→OFF)	110±2°C {230±36°F}
	When temperature decrease (OFF→ON)	99.5 to 112.5 °C {211 to 235 °F}

- If the measured value deviates from the standard value, replace the switch. Gr 14



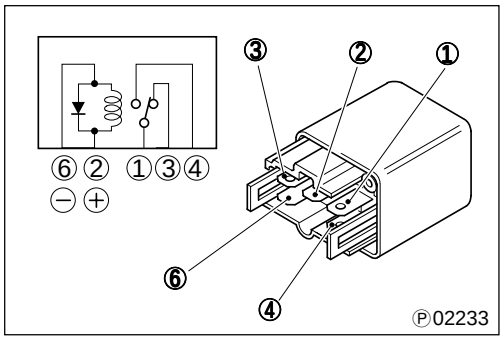
180 Inspection of relay (Close type 4-pin)

- Follow the table below to check for continuity and operation.

	①	②	③	④
No current	○	○	○	○
Current	⊕	⊖	◌	◌

○—○ : There is continuity between terminals.
⊕—⊖ : Indicates the terminals where battery voltage is to be applied.
◌—◌ : Indicates the terminals across which there is no continuity.

- If any fault is found, replace the relay.



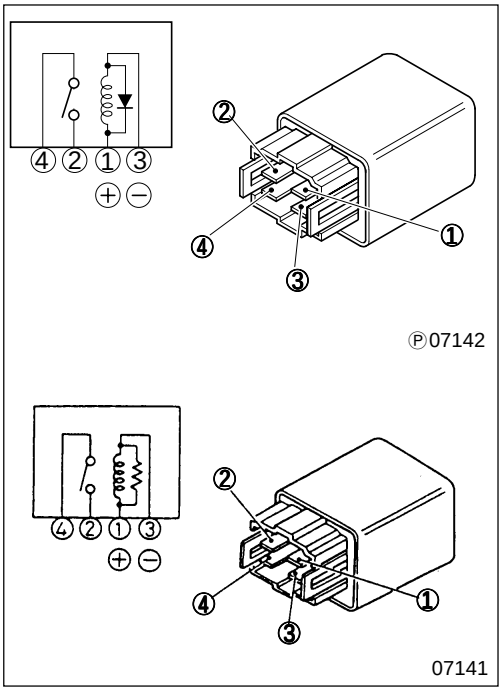
182 Inspection of relay (Open type 6-pin)

- Follow the table below to check for continuity and operation.

	①	②	③	④	⑥
No current	○	○	○		○
Current	○	⊕		○	⊖

○—○ : There is continuity between terminals.
⊕—⊖ : Indicates the terminals where battery voltage is to be applied.

- If any fault is found, replace the relay.



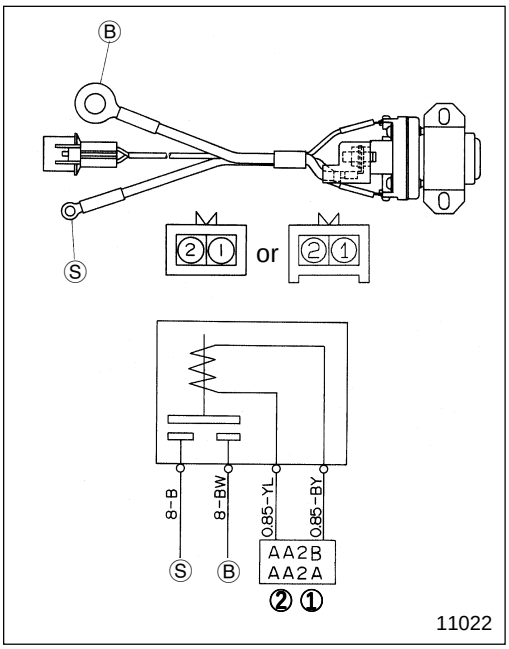
185 Inspection of relay (Open type 4-pin)

- Follow the table below to check for continuity and operation.

	①	②	③	④
No current	○		○	
Current	⊕		⊖	○

○—○ : There is continuity between terminals.
⊕—⊖ : Indicates the terminals where battery voltage is to be applied.

- If any fault is found, replace the relay.



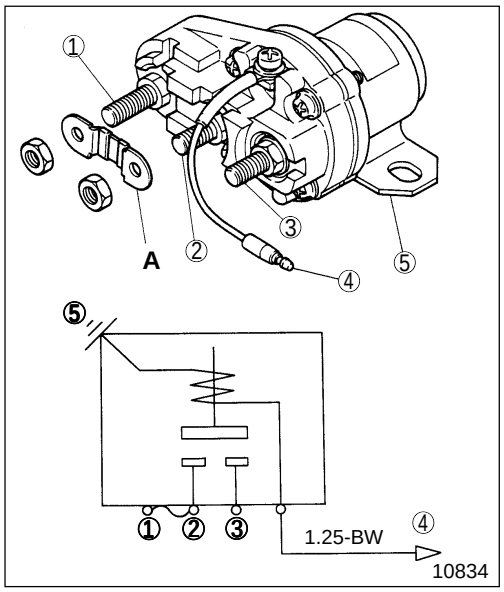
187 Inspection of starter relay

- Follow the table below to check for continuity and operation.

	B	S	①	②
No current			○	○
Current	○	○	⊖	⊕

○—○ : There is continuity between terminals.
⊕—⊖ : Indicates the terminals where battery voltage is to be applied.

- If any fault is found, replace the relay.



195 Inspection of glow relay

(1) Inspection of fuse

If any fault is found, replace the fuse **A** (127 ampere).

(2) Inspection of main body

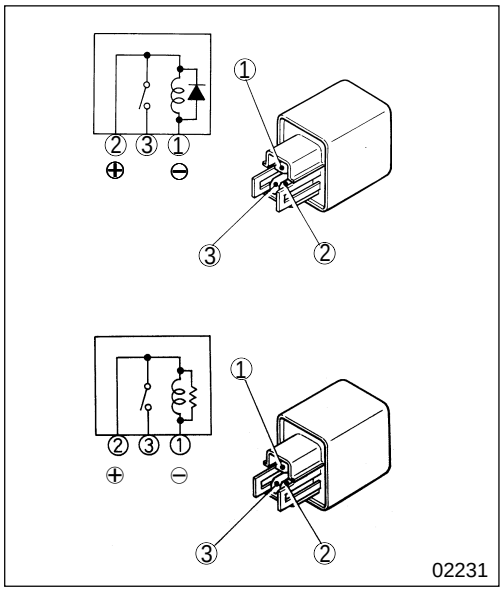
- Follow the table below to check for continuity and operation.

	①	②	③	④	⑤ (Body)
OFF	○	○		○	○
ON	○	○	○	⊕	⊖

○—○ : There is continuity between terminals.

⊕—⊖ : Indicates the terminals where battery voltage is to be applied.

- If any fault is found, replace the relay.



197 Inspection of relay (Open type 3-pin)

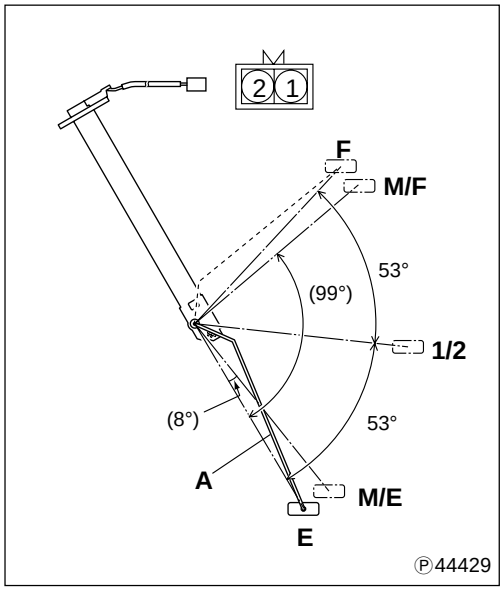
- Follow the table below to check for continuity and operation.

	①	②	③
No current	○	○	
Current	⊕	○ ⊖	○

○—○ : There is continuity between terminals.

⊕—⊖ : Indicates the terminals where battery voltage is to be applied.

- If any fault is found, replace the relay.

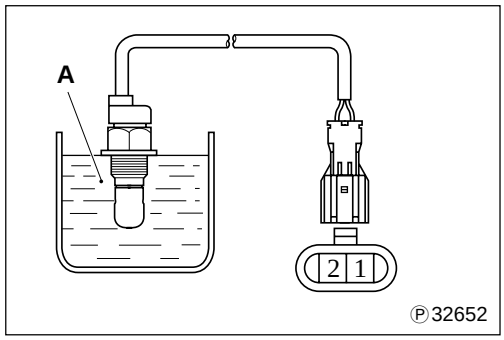


258 Inspection of fuel level sensor

- Measure the resistance between terminals ① and ② when float arm **A** contacts to both stoppers (positions **E** and **F**) and also M/E, 1/2 and M/F position.

Standard value	F (FULL)	0 Ω
	M/F (MIDDLE FULL)	4 Ω
	1/2	50±3 Ω
	M/E (MIDDLE EMPTY)	135 Ω
	E (EMPTY)	150±10 Ω

- If the measured value deviates from the standard value, replace the sensor. Gr 13



259 Inspection of water level sensor

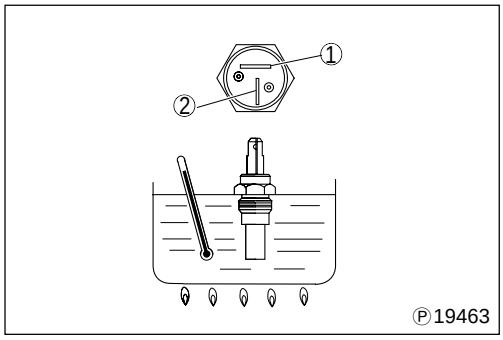
- Follow the table below to check for continuity.

	①	②
When water level sensor is out of the water		
When water level sensor is in the water	○	○

○——○ : There is continuity between terminals.

- If any fault is found, replace the sensor. Gr 14

A : Engine coolant



262 Inspection of water temperature sensor

< For multipurpose timing control unit >

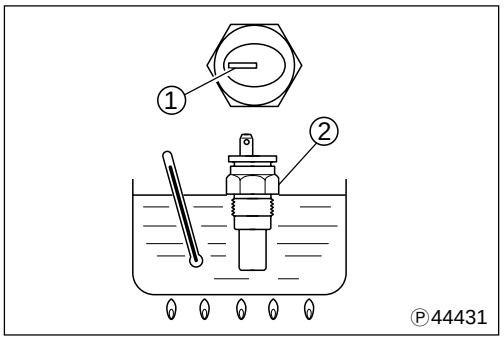
- Place the sensor in engine oil in a container.
- Raise the oil temperature to the specified values and stir the oil.
- Measure the resistance between terminals ① and ②, and the body respectively.

  Terminal ① : Water temperature gauge connection

  Terminal ② : Multipurpose timing control unit connection

Standard Value	①—Body (connection side of water temperature sensor)	50°C {122°F}	153.9 Ω (Reference value)
		80°C {176°F}	$51.9^{+4.9}_{-4.4}$ Ω
		100°C {212°F}	$27.4^{+1.9}_{-1.2}$ Ω
	②—Body (connection side of multipurpose timing control unit)	20°C {68°F}	3.25 ± 0.33 kΩ
		60°C {140°F}	620 Ω (Reference value)
		80°C {176°F}	300 Ω (Reference value)

- If the measured value deviates from the standard value, replace the sensor. Gr 14

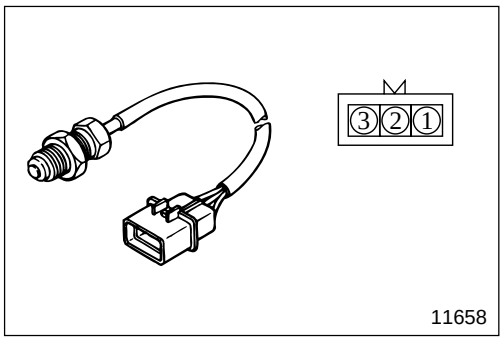


< For engine control >

- Place the sensor in engine oil in a container.
- Raise the oil temperature to the specified values and stir the oil.
- Measure the resistance between terminals ① and ② (body).

Standard value	20°C {68°F}	3.25 kΩ (Reference value)
	60°C {140°F}	620±62 Ω
	80°C {176°F}	300 Ω (Reference value)

- If the measured value deviates from the standard value, replace the sensor. Gr 14

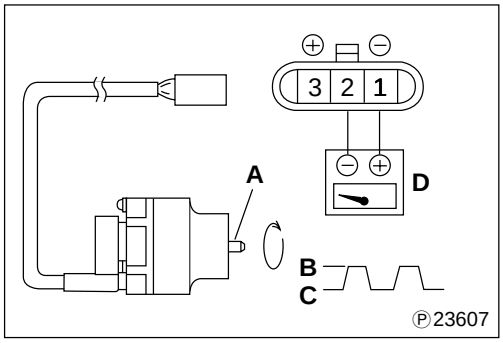


263 Inspection of engine speed sensor

- Measure the resistance between terminals ① and ②.

Standard value (at 25°C {77°F})	2.3±0.2 kΩ

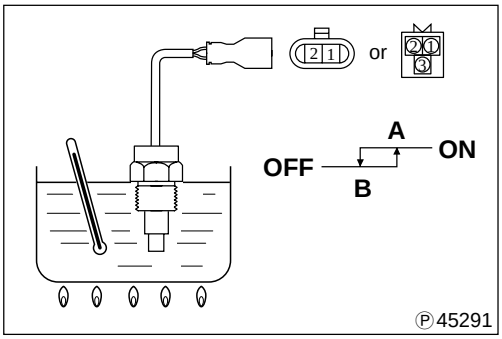
- If the measured value deviates from the standard value, replace the sensor.



265 Inspection of vehicle speed sensor

- Perform the following checks, and if any fault is found, replace the sensor. Gr 22, 23A
  - Turn slowly the portion **A** of the sensor with battery voltage applied between terminals ① and ③.
  - Measure the maximum value (high level **B**) and minimum value (low level **C**) of the voltages generated between terminals ① and ②.
    D : Tester

Standard value	Low level of pulse	0.5 V or less
	High level of pulse	8±1 V



275 Inspection of automatic transmission fluid temperature sensor

Perform the following checks, and if any fault is found, replace the sensor. Gr 23

- Make sure that there is no continuity between terminals ① and ② at room temperature (20±5°C {68±41°F}).
- Place the sensor in a container filled with engine oil and raise the oil temperature while stirring the oil. Measure the temperature when there is continuity between terminals ① and ②, and make sure that the measured value conforms to the standard value.
- Lower the oil temperature and measure the temperature when continuity is lost between terminals ① and ②, and make sure that the measured value conforms to the standard value.

A : When temperature is increase (OFF → ON)
B : When temperature is decrease (ON → OFF)

- Sensor for engine output control

Standard value	A	140±3°C {284±37°F}
	B	133°C {271°F} MIN

- Sensor for fan motor

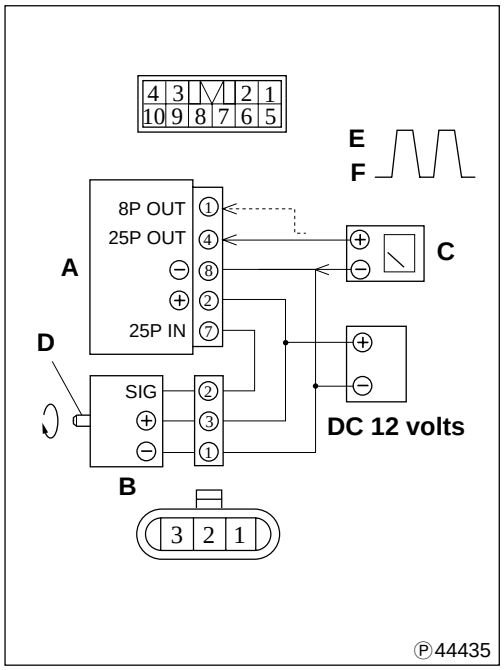
Standard value	A	97±3°C {207±37°F}
	B	90°C {194°F} MIN

- Sensor for warning lamp

Standard value	A	145±3°C {293±37°F}
	B	138°C {280°F} MIN

350 Inspection of control units and other units

- Since the units alone cannot be readily checked in the off-vehicle state, check the harness, switch and other related parts in each system.
- If any fault is not found in the related parts, and the problem still remains in the system, replace the control units or other units.

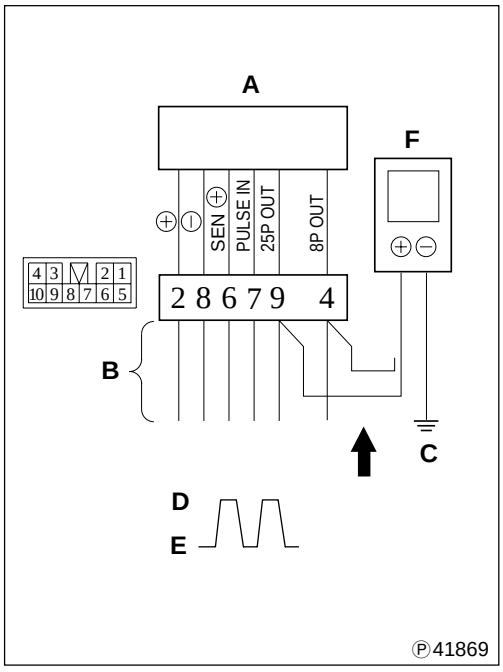


351 Inspection of pulse divider

- Connect the pulse divider **A** as shown.
  B : Vehicle speed sensor (25-pulse)
  C : Tester
- Slowly rotate the shaft **D** of the vehicle speed sensor **B** by hand and measure the maximum voltage (high pulse voltage **E**) and the minimum voltage (low pulse voltage **F**) of the voltage generated across each of the output terminals ①, ④ and terminal ⑧ of the pulse divider **A**.

Standard value (Output voltage)	8-pulse	Low pulse voltage **F**	1.5 V or less
		High pulse voltage **E**	8 ± 1 V
	25-pulse	Low pulse voltage **F**	0.6 V or less
		High pulse voltage **E**	8 ± 1 V

- If the measured value deviates from the standard value, replace the pulse divider **A**.

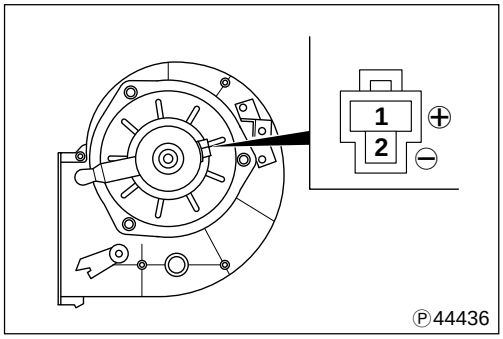


352 Inspection of pulse converter

- Inspect with the engine speed sensor installed in the engine.
- Install the inspection harness **C** on the connector between pulse converter **A** and body harness **B**.
- Start the engine and measure the maximum (high pulse voltage **D**) and minimum (low pulse voltage **E**) value generated at inspection harness **C**.
  F : Tester

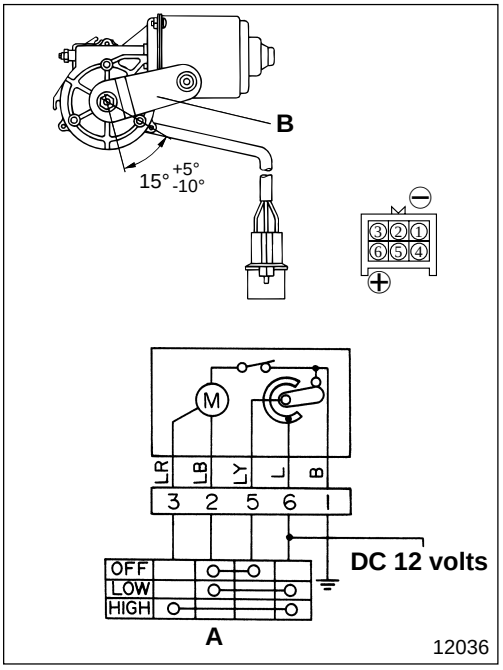
Standard value (Output voltage)	8-pulse	Low pulse voltage **E**	1.0 V or less
		High pulse voltage **D**	8–0.5 V or more
	25-pulse	Low pulse voltage **E**	0.5 V or less
		High pulse voltage **D**	8±1 V

- If the measured value deviates from the standard value, replace the pulse coverter A.



411 Inspection of blower motor

- Make sure that the motor operates when battery voltage is applied between terminals ① and ②.
- If any fault is found, replace the motor. Gr 55



422 Inspection of wiper motor

- Connect a switch to the motor as shown.

  A : Switch

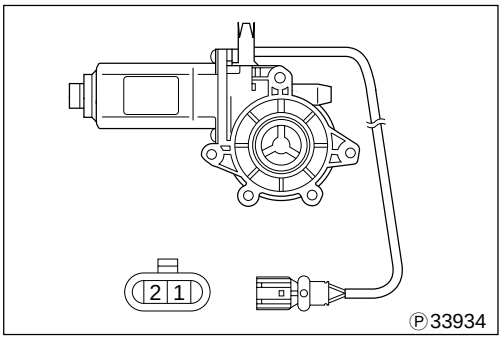
- Check the motor for correct operation as follows. If any fault is found, replace the motor. Gr 42

(1) Inspection of motor operation

- Set switch **A** in HIGH position to check that the motor rotates at high speed.
- Set switch **A** in LOW position to check that the motor rotates at low speed.

(2) Inspection of automatic stop position

- Set switch **A** in LOW position to let the motor rotates at low speed.
- When crank arm **B** is at a position other than the automatic stop position (outside the angles shown), set switch **A** in OFF position.
- Check to see the crank arm **B** stops at the automatic stop position (within the angles range shown).



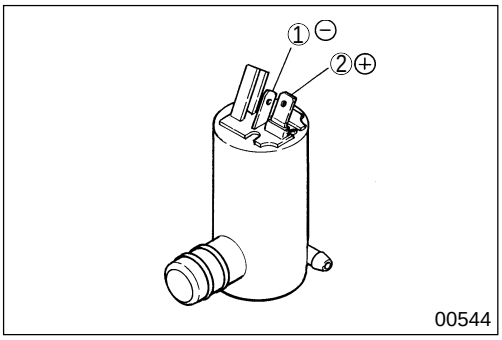
423 Inspection of power window motor

- Follow the table below to check for operation.

	①	②
UP	⊖	⊕
DOWN	⊕	⊖

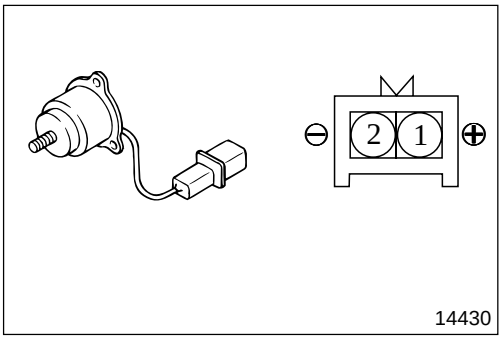
⊕——⊖ : Indicates the terminals where battery voltage is to be applied.

- If any fault is found, replace the motor. Gr 42



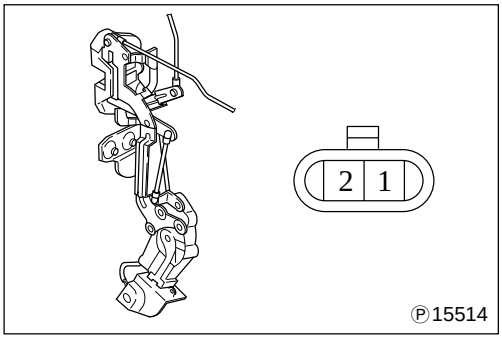
428 Inspection of windshield washer motor

- Make sure that the motor operates when battery voltage is applied between terminals ① and ②.
- If any fault is found, replace the motor. Gr 42



435 Inspection of automatic transmission fluid cooler fan motor

- Make sure that the motor operates when battery voltage is applied between terminals ① and ②.
- If any fault is found, replace the motor. Gr 23



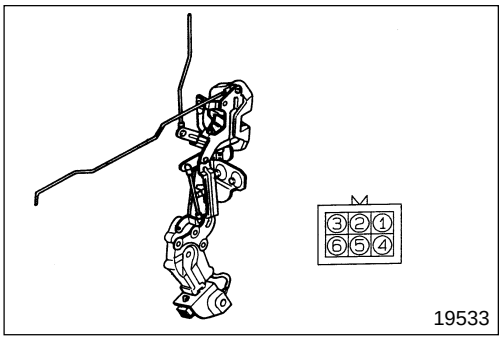
510 Inspection of door lock actuator (Assistant driver's seat side)

- Follow the table below to check for operation.

	①	②
LOCK	⊕	⊖
UNLOCK	⊖	⊕

⊕——⊖ : Indicates the terminals where battery voltage is to be applied.

- If any fault is found, replace the actuator. Gr 42



511 Inspection of door lock actuator (Driver's seat side)

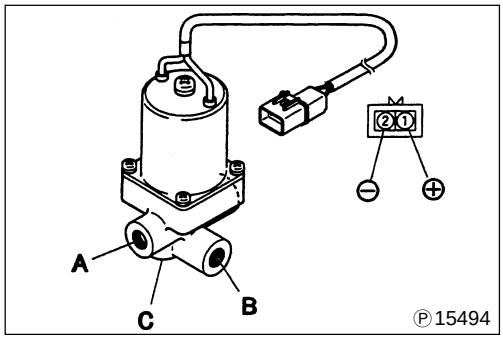
- Follow the table below to check for continuity and operation.

	①	③	②	④	⑤
LOCK		○——○		⊖	⊕
UNLOCK	○——○			⊕	⊖

○——○ : There is continuity between terminals. (OFF in LOCK position)

⊕——⊖ : Indicates the terminals where battery voltage is to be applied.

- If any fault is found, replace the actuator. Gr 42



569 Inspection of exhaust brake 3-way magnetic valve

Perform the following checks, and if any fault is found, replace the 3-way magnetic valve.

(1) Operation test

- Gradually apply battery voltage to between terminals ① and ② from 0 volt.
- Measure the voltage (minimum operating voltage) at the moment when the 3-way magnetic valves starts operating. (The OFF to ON operating can be noticed from a sound the magnetic valve generates.)

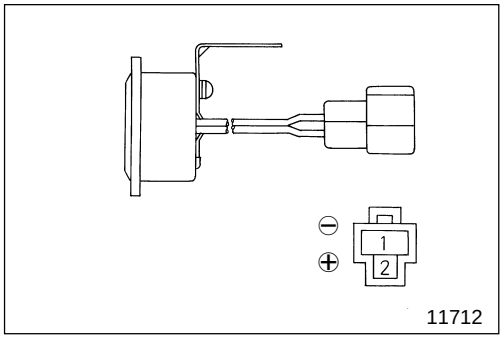
Standard value (Minimum operating voltage)	10 V or less

(2) Continuity and airtightness test

Follow the table below to check for continuity.

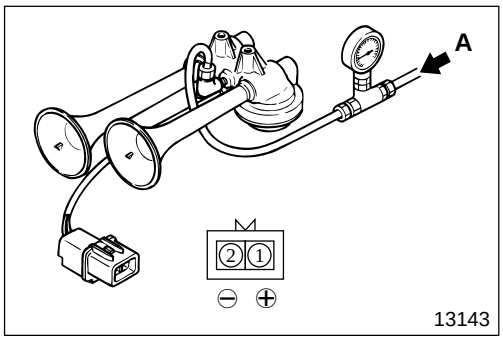
	Input port A	Output port B	Exhaust port C
ON	○———	———○	
OFF		○———	———○

Air circuit table (○——○ : Air passage is open between ports.)
Air pressure at the time of check : 981 kPa {140 psi, 10 kgf/cm^2}



611 Inspection of warning buzzer

- Make sure that the buzzer sounds when battery voltage is applied between terminals ① and ②.
- If any fault is found, replace the buzzer.



612 Inspection of air horn

Perform the following checks, and if any fault is found, replace the horn.

(1) Minimum operating voltage of air horn valve

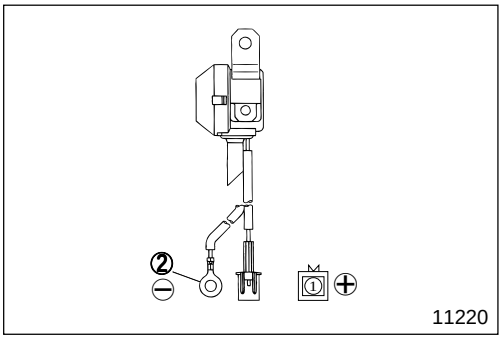
- Apply air pressure **A** of 785 kPa {115 psi, 8 kgf/cm²} to the horn.
- Apply voltage between terminals ① and ② starting from 0 volt gradually.
- Measure the voltage when the horn sounds.

Standard value	10 V or less

(2) Operating pressure of horn

- Apply battery voltage between terminals ① and ②.
- Apply air pressure **A** to the horn starting from 0 kPa {0 psi, 0 kgf/cm²} gradually.
- Measure air pressure **A** when the horn sounds.

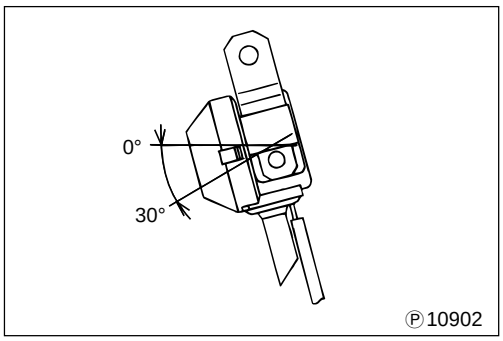
Standard value	195 to 980 kPa {28 to 142 psi, 2 to 10 kgf/cm²}



614 Back buzzer

[Inspection]

- Make sure that the buzzer sounds intermittently when battery voltage is applied between terminals ① and ②.
- If any fault is found, replace the buzzer.

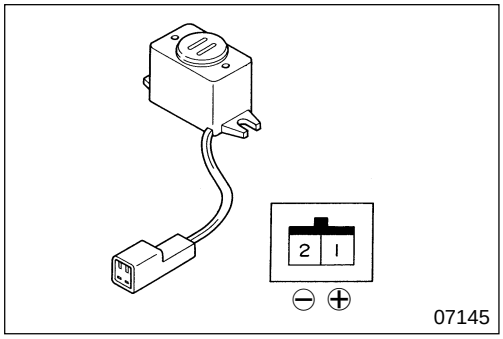


[Installation]

Attach the buzzer to the frame at an angle within the range shown.

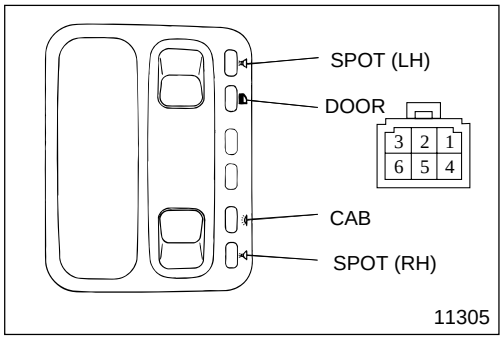
CAUTION ⚠

Be careful to install the buzzer within the illustrated angle range or the buzzer will not be drained normally.



616 Inspection of reverse warning buzzer

- Make sure that the buzzer sounds when battery voltage is applied between terminals ① and ②.
- If any fault is found, replace the buzzer.



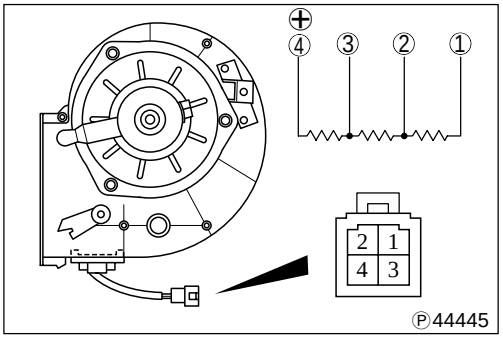
656 Inspection of cab lamp

- Follow the table below to check for continuity.

	①	③	⑤
OFF			
SPOT (LH)	○—○		
SPOT (RH)	○—○		
DOOR	○		○
CAB	○—○		

○—○ : There is continuity between the terminals. (when bulb is installed)

- If any fault is found, replace the lamp.

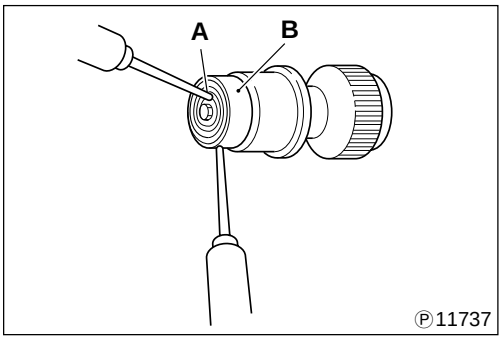


750 Inspection of blower resistor

- Follow the table below to check for resistance of between terminals

Standard value	LOW	①—④	1.78 Ω
	MIDDLE LOW	③—④	0.88 Ω
	MIDDLE HIGH	②—④	0.27 Ω

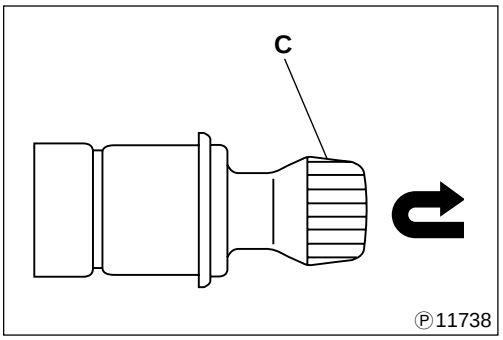
- If the measured value deviates from the standard value, replace the blower resistor.



754 Inspection of cigarette lighter

Perform the following checks, and if any fault is found, replace the cigarette lighter.

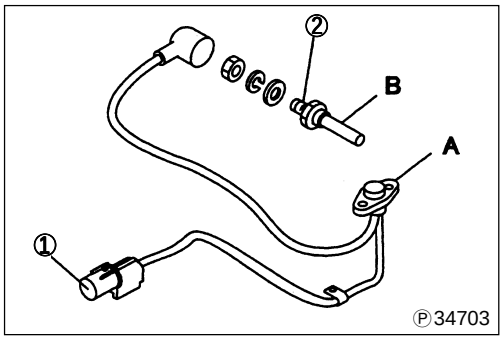
- Make sure that there is continuity between heater element **A** and body **B**.



- Make sure that when plug **C** is pushed in by hand, it immediately returns to its original position.
- Turn the starter switch at ACC or ON position.
- Push plug **C** into the socket in the cab.
- Measure the time required for plug **C** automatically returns.

Standard value	15±5 seconds

- Check to see that heater element **A** is red-hot.



758 Inspection of air dryer

Perform the following checks, and if any fault is found, replace the air dryer. Gr 35

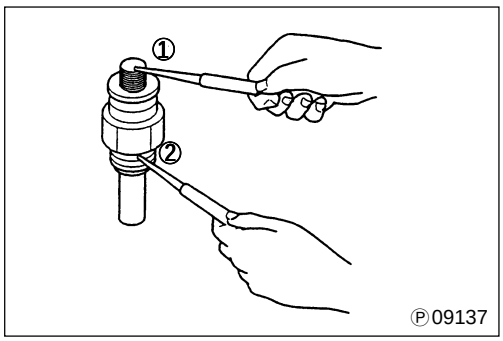
(1) Inspection of thermostat assembly

- Lower the temperature at thermostat **A** to 0°C {32°F} or lower, then gradually raise the temperature.
- Measure the degree of temperature at the moment when continuity is detected between terminals ① and ②, and make sure to confirm if the value meets the standard.

Standard value (During temperature increase: OFF → ON)	7±4.0°C {45±39.2°F}

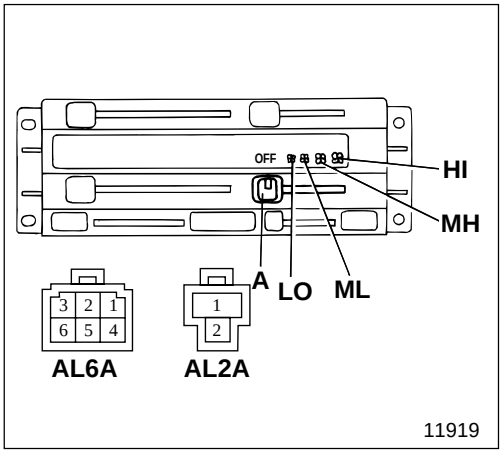
- Raise the temperature at thermostat **A** to 20°C {68°F} or higher, then gradually lower the temperature.
- Measure the degree of temperature at the moment when continuity is not detected between terminals ① and ②, and make sure to confirm if the value meets the standard.

Standard value (During temperature decrease: ON → OFF)	20°C {68°F} or less



(2) Inspection of heater

- Make sure that there is continuity between terminals ① and ②.
- If any fault is found, replace the heater.



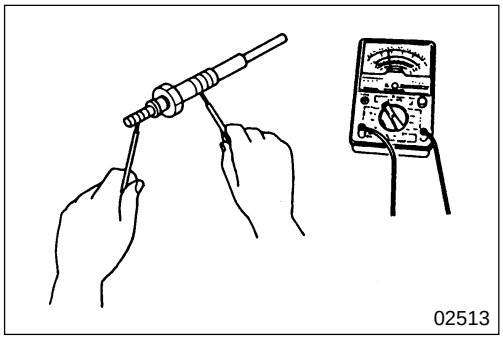
763 Inspection of heater control assembly

- Follow the table below to check for continuity.

	AL6A						AL2A	
	①	③	②	⑤	⑥	④	①	②
OFF								
LOW	○	○				○		
MIDDLE LOW	○		○			○		
MIDDLE HIGH	○			○		○		
HIGH	○				○	○		
	C	L	ML	MH	H	E	ILL	

○—○ :There is continuity between terminals.

- If any fault is found, replace the switch **A** or heater control assembly.
- If the illumination lamp has blown out, replace the bulb.



764 Inspection of glow plug

- Measure the resistance of glow plug as shown.

Standard Value (Cold resistance of glow plug)	1.0 Ω (Reference value)

- If the measured value deviates from the standard value, replace the glow plug. Gr 11

DANGER⚠

- **Because flammable hydrogen gas is generated from battery, be sure to obey the following:**
  - **Never attempt to short-circuit the positive and negative terminals of battery, and generate sparks, or smoke a cigarette near it.**
  - **Do not wear metal objects on your arms or do not lean over battery.**
- **Sulfuric acid of the electrolyte is very corrosive. Whenever handling battery, wear safety goggles and rubber gloves to protect your eyes and hands.**
- **Battery posts, terminals and related accessories contain lead and lead compounds. Wash hands after handling.**

WARNING⚠

- **When you disconnect battery cables, disconnect the negative battery cable ⊖ first.**

CAUTION⚠

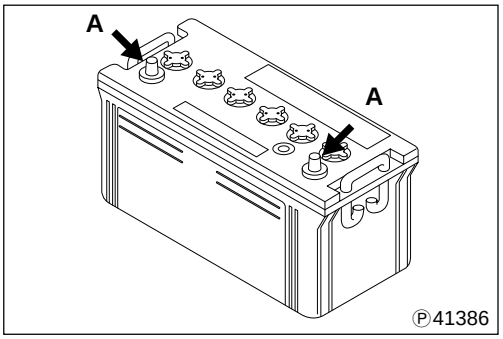
- **Make sure that all electrical switches of the vehicle are off before connecting battery cables.**
- **Be sure to connect the positive battery cable ⊕ first before you connect the negative battery cable ⊖.**
- **To prevent a short-circuit, take care that disconnected battery cables may not accidentally touch the battery terminals.**

Service standards

Location	Maintenance item	Standard value	Limit	Remedy
—	Specific gravity of battery electrolyte (20°C {68°F})	1.220 to 1.290	—	Charge or replace

◆ Service procedure

Inspection of battery

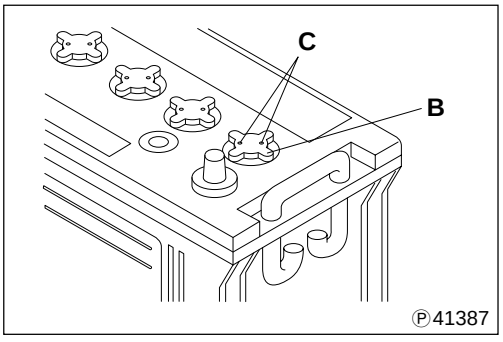


(1) Visual inspection

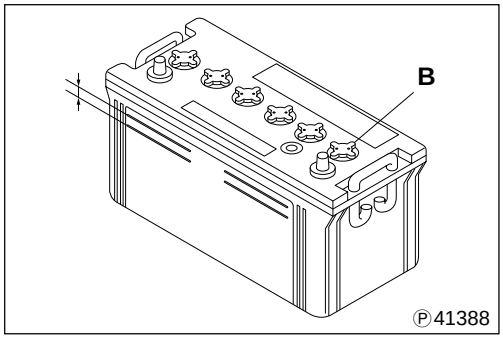
- If terminal **A** is corroded, scrub off the corrosion from it using a wire brush.
- If cracks or defects are found on battery, replace it since the cracks or defects can cause liquid spills.

CAUTION⚠

Make sure you grease the ⊕ side of terminal A because it is easily corroded.

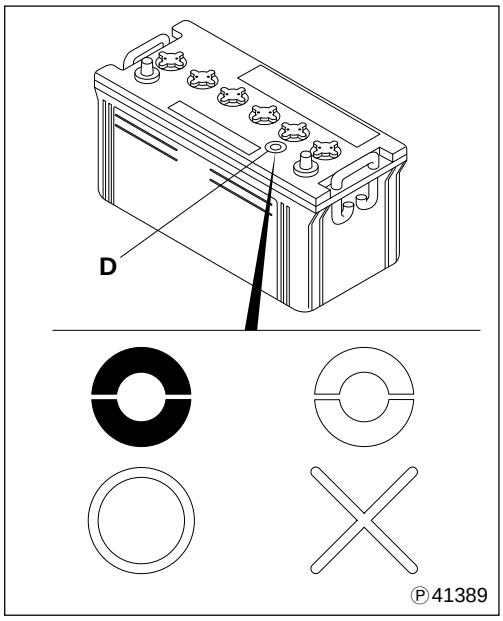


- If bleed hole **C** of vent plug **B** is clogged, clean the hole.



(2) Inspection of fluid level

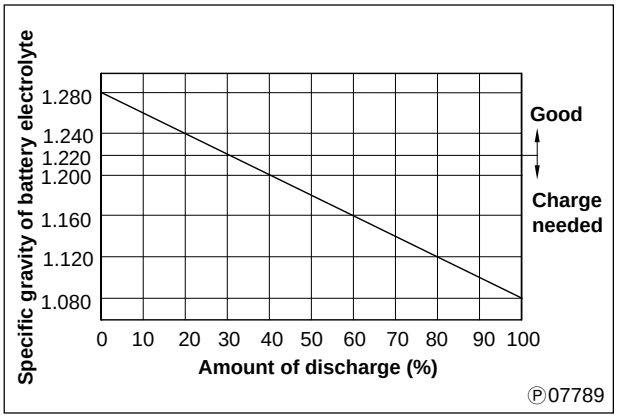
- Make sure that the battery electrolyte level is between UPPER and LOWER.
- If the level is below LOWER, remove vent plug **B** and fill the battery with distilled water or battery replenisher to UPPER.



(3) Measurement of specific gravity

You can tell the specific gravity of the battery electrolyte by the color shown in indicator **D**.

Blue : Good
White : Charge or replace



(4) Charging

- Although, as a rule, battery charging should be done with the battery removed from the vehicle, if you have to charge the battery while it is on the vehicle, make sure that you stop the engine and disconnect battery cable ⊖.
- Remove vent plug before charging the battery.
- For the recommended charge time and current, see the following table to avoid overcharging.

	Charge current (A)	Charge time (H)	Upper limit of fluid temperature (°C {°F})
Normal charge	$\frac{\text{Value of 5-hour rating capacity}}{10}$	$\frac{\text{*Amount of discharge (Ah)}}{\text{Charge current (A)}} \times 1.2$ (to 1.5)	45 {113}
Quick charge	$\frac{\text{Value of 5-hour rating capacity}}{1.5}$	0.5	55 {131}

* Amount of discharge (Ah)=5-hour rating capacity (Ah)$\times \frac{\text{Amount of discharge (\%)}}{100}$

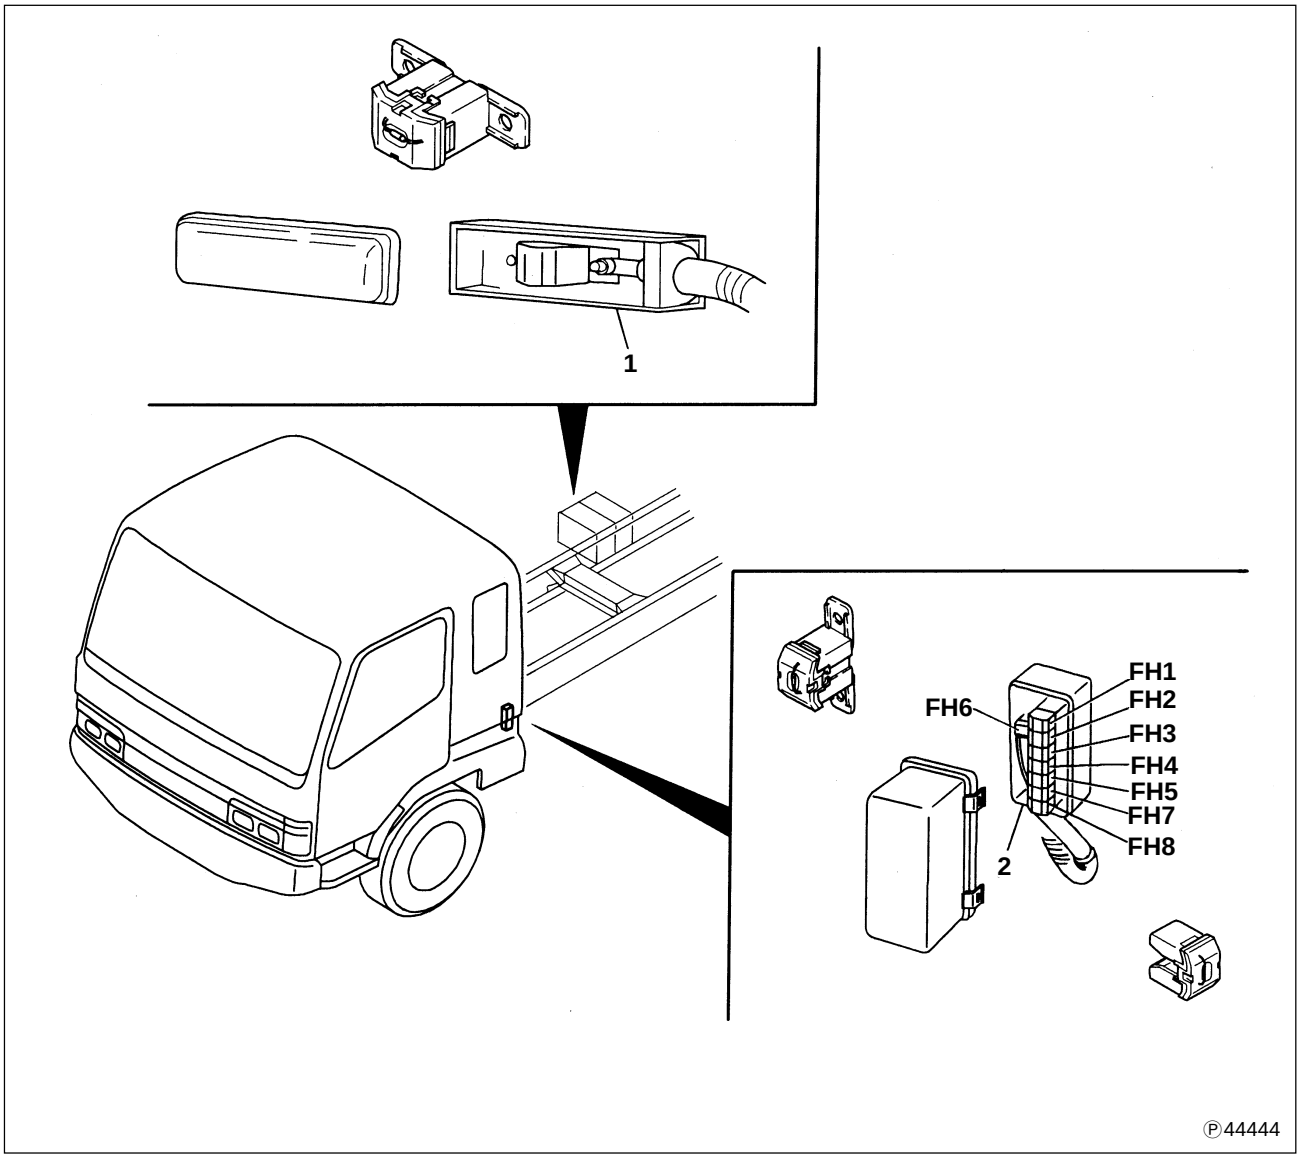
- Use the graph shown on the left to calculate the amount of discharge (%).
- Use diluted sulfuric acid, made up of sulfuric acid and refined or distilled water, as the battery electrolyte.
- The specific gravity of fully-charged battery electrolyte is 1.280 with the temperature at 20°C {68°F}.

DANGER⚠

- **Do not let the battery electrolyte level rise and overflow while charging the battery.**
- **Keep open flame away from the battery while charging it or it might explode.**
- **Be careful not to generate sparks while charging the battery because it is dangerous.**
- **After charging the battery, tighten the vent plugs, wash away sulfuric acid from the battery using water, and dry the surface.**
- **Be sure to check the electrolyte level before charging the battery. Charging with the electrolyte level below the lower limit (LOWER LEVEL) can cause premature deterioration, heat generation and explosion of the battery.**

870 to 889 FUSE

870 High-current fuse box



1 Main high-current fuse
2 High-current fuse box

WARNING⚠

To prevent possible injury, be sure to disconnect the negative terminal ⊖ of the battery and insulate it with tape before removing high-current fuses (FH1 to FH8). 🕮 860

With the negative terminal ⊖ of the battery connected, battery voltage is always applied to each fuse.
The battery voltage is applied to the fuses under the following conditions:
Always (directly connected to the battery): FH1 to FH8

CAUTION⚠

- **If a fuse blows out, identify and remedy the cause, then replace the fuse.**
- **Be sure to use the fuse of the specified ampere.**

Main high-current fuse

Fuse No.	Main load	Capacity
—	High-current fuse box	140A

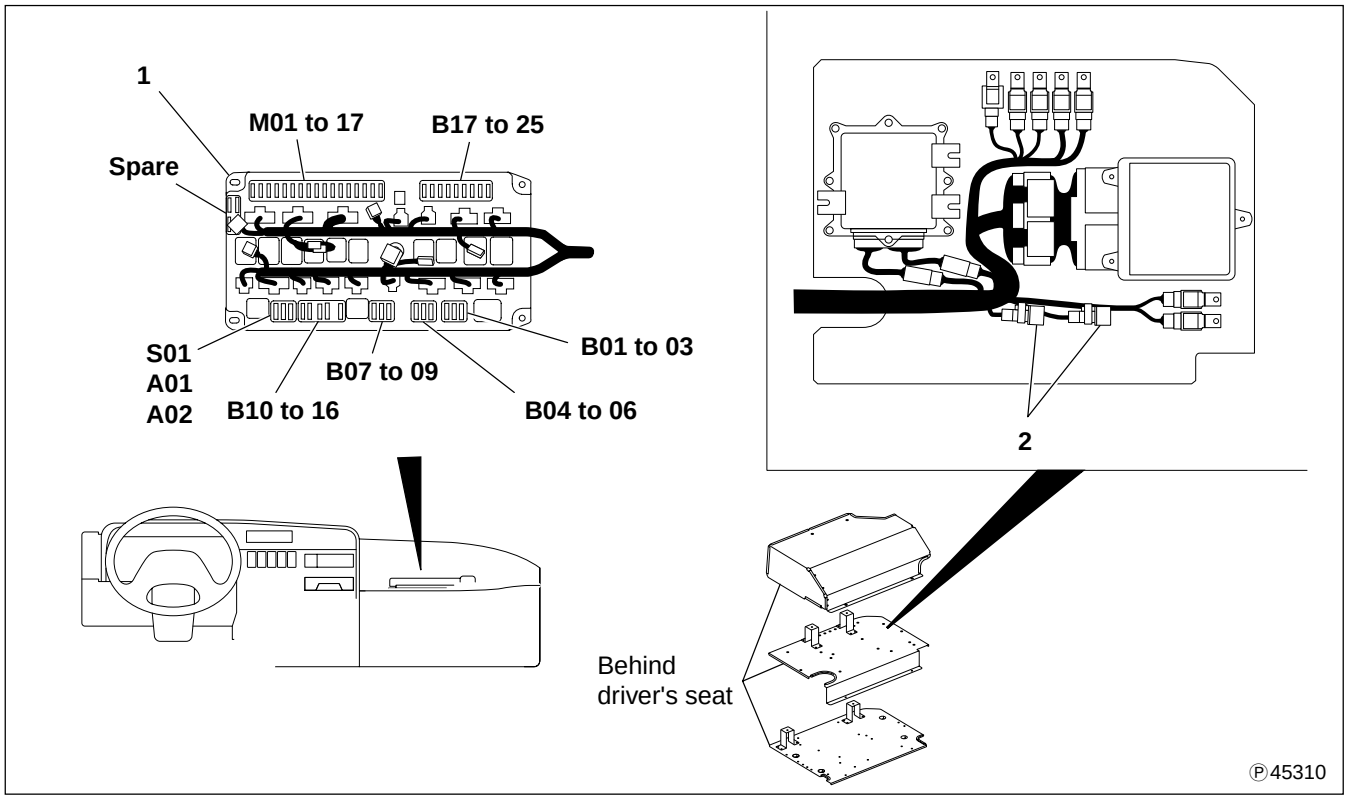
High-current fuse box

Fuse No.	Main load	Capacity
FH1	Starter switch (terminal B)	50A
FH2	Fuse (B07 to B16)	40A
FH3	Fuse (B18 to B24)	40A
FH4	Fuse (B01 to B04)	40A
FH5	Glow relay (terminal B)	50A
FH6	Alternator (terminal B)	140A
FH7	Fuse (B06)	40A
FH8	A/T<FM657>	60A

A/T : Automatic transmission

870 to 889 FUSE

871 Relay and fuse box



1 Relay and fuse box
2 Fuse holder

WARNING⚠

To prevent possible injury, be sure to disconnect the negative terminal ⊖ of the battery and insulate it with tape before removing fuses. 🕮 860

With the negative terminal ⊖ of the battery connected, battery voltage is always applied to each fuse.
The battery voltage is applied to the fuses under the following conditions:
Always (directly connected to the battery) : B01 to B25
When starter switch is in ON position : M01 to M17
When starter switch is in ACC position : A01 to A02
When starter switch is in START position : S01

CAUTION⚠

- **If a fuse blows out, identify and remedy the cause, then replace the fuse.**
- **Be sure to use a fuse of the specified ampere.**

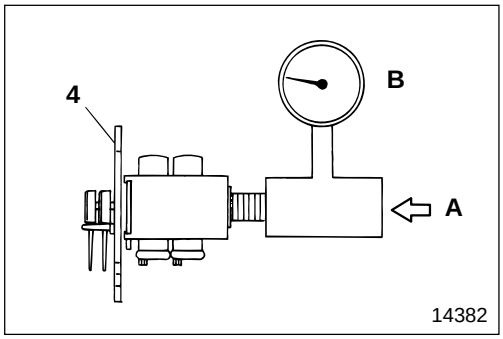
			At 80 km/h	$80^{+4.5}_{0}$ km/h		
			At 100 km/h	100^{+5}_{0} km/h		

◆ Service procedure

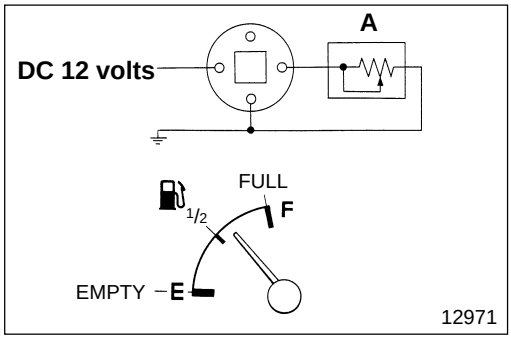
3 Inspection of tachometer

- Use the engine revolution counter to check that the indication area of tachometer **3** is in the standard value at each revolution.
- If the measured value deviates from the standard value, replace tachometer **3**.



4 Inspection of air pressure gauge

- Apply air pressure **A** to air pressure gauge **4**.
  B : Air pressure gauge
- Measure the indication range of air pressure gauge **4** at standard pressure.
- If the measured value deviates from the standard value, replace air pressure gauge.



5 Inspection of fuel gauge and water temperature gauge

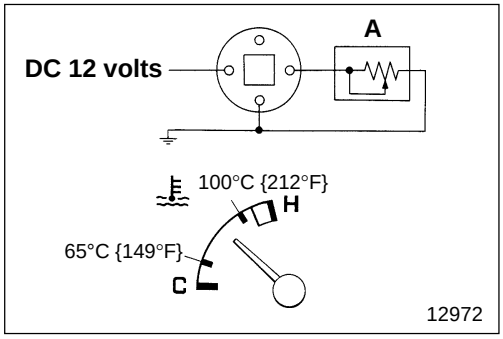
(1) Inspection of fuel gauge

- Connect a variable resistor to fuel gauge **5** as shown.
  A : Variable resistor
- Measurement order
  FULL → 1/2 → EMPTY

NOTE

The movement of the gauge needle is subject to hysteresis (oscillation). Be sure to measure following the measurement order.

- Increase the value of variable resistor **A** gradually from 0 Ω.
- Measure the resistance respectively when the needle of fuel gauge **5** indicates FULL, 1/2, and EMPTY.
- If the measured value deviates from the standard value, replace fuel gauge **5**.



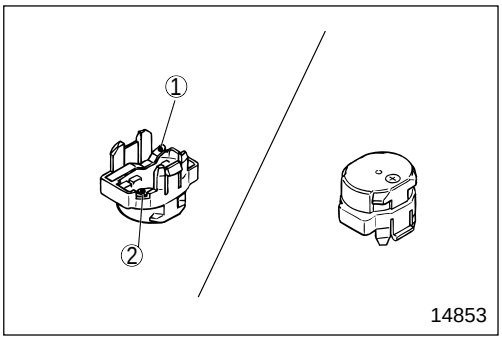
(2) Inspection of water temperature gauge

- Connect a variable resistor to water temperature gauge **5** as shown.
  A : Variable resistor
- Measurement order
  65°C {149°F}→ 100°C {212°F}

NOTE

The movement of the gauge needle is subject to hysteresis (oscillation). Be sure to measure following the measurement order.

- Increase the value of variable resistor **A** gradually from 0 Ω.
- Measure the resistance respectively when the needle of water temperature gauge **5** indicates 65°C {149°F} and 100°C {212°F}.
- If the measured value deviates from the standard value, replace water temperature gauge **5**.



8 **Inspection of meter warning buzzer**

- Make sure that the buzzer operates when battery voltage is applied between terminals ① and ②.

CAUTION ⚠

- **Be careful not to mix up ⊕ and ⊖ when you apply voltage to the buzzer 8, because this would damage the meter warning buzzer.**
- **Make sure you check ⊕ and ⊖ on the top of the buzzer 8.**

- If any fault is found, replace the buzzer.

11 **Inspection of speedometer**

Use the speedometer tester to check that the indication area of speedometer **11** does not deviate from the standard value at each speed. If the measured value deviates from the standard value, replace the speedometer.

12 STARTER AND ALTERNATOR

CAUTION⚠

- **Do not remove bearings 17, 36 unless they are faulty.**
- **Be careful not to lose ball 19, since it might come out together with armature assembly 16 when you remove it.**

NOTE

- **You do not have to remove pinion 3 when you disassemble or inspect only the motor assembly, for example: when inspection of the brush assembly is required.**
- **Except for the above, make sure you remove pinon 3 before disassembling any parts.**

● **Assembly sequence**

Follow the disassembly sequence in reverse.

NOTE

Whenever magnetic switch assembly 5 has been replaced, be sure to adjust the pinion gap.

● **Inspection after assembly**

Ⓟ14257

◆ Service procedure

● Inspection after assembly

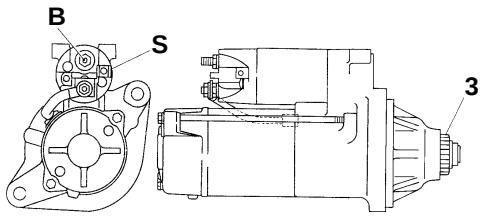
Inspection after assembling the starter should be carried out with current fed to the starter.

WARNING⚠

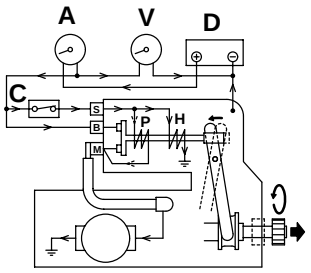
- **Do not touch pinion 3 because it jumps out and turns when current is fed to the starter.**
- **Take care not to burn your hand, magnetic switch assembly 5 might be hot during inspection.**

CAUTION⚠

- **The current feeding time to the starter should be within 10 seconds at pull-in coil P side and within 30 seconds at holding coil H side. If the current feeding time exceeds these limits the coil might burn due to overheating.**
- **The current, when fed to the starter, is over 100 amperes. When inspecting, use thick cable, such as a booster cable, and make secure connections.**



26379



Ⓟ14258

(1) Performance test

- Connect the starter as shown.

A : Ammeter	**D** : 12 volts DC
B : Terminal B of starter	**S** : Terminal S of starter
C : Switch	**V** : Voltmeter

- Set the voltage to 11 volts DC.

CAUTION⚠

Up to 12 volts can be loaded.

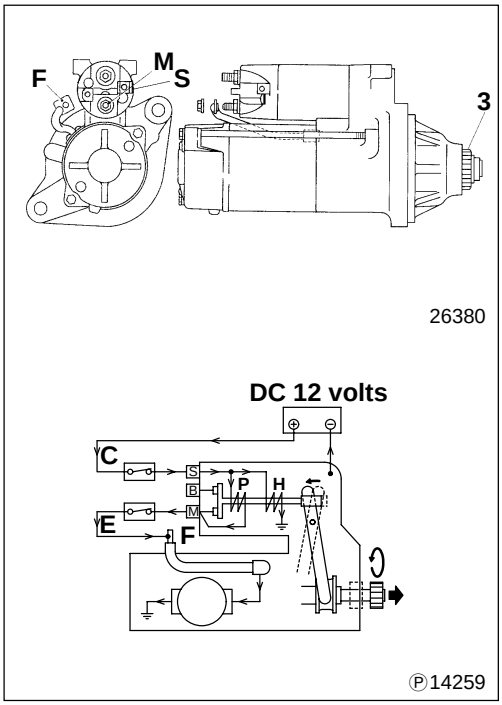
- The following work should be done with current fed to the starter. You must complete measurement of the current and the number of revolutions within 30 seconds.
  - Turn switch **C** ON and feed current to the starter. In this state, pinion **3** jumps out and rotates.

CAUTION⚠

When switch C is turned ON, current is fed both to pull-in coil P and holding coil H. When a large amount of current is fed into terminal M from DC power supply D, via terminal B of the starter, the current stops flowing into the pull-in coil but continues to flow into the holding coil.

To avoid burning the holding coil, be sure to carry out the performance test within 30 seconds.

  - Measure the current and the number of revolutions of the starter. Train a strobe light on pinion **3** to measure the number of revolutions.
  - Turn switch **C** OFF to stop current to the starter.
- If the measured value deviates from the standard value, disassemble the starter again and inspect it.



(2) Pinion gap

[Inspection]

- Connect the starter as shown.
  C : Switch
  E : Switch
  F : Cable
  M : Terminal M of starter
  S : Terminal S of starter

- The following work should be done with current fed to the starter. You must complete measurement of the pinion gap within 30 seconds.
  - Turn switches **C** and **E** ON and feed current to the starter. In this state, pinion **3** jumps out and rotates.

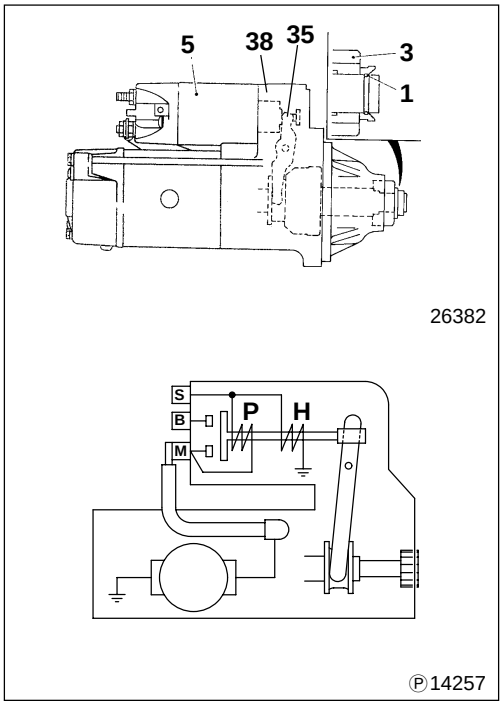
  - Within 5 seconds of pinion **3** rotating, turn switch **E** OFF to stop rotation of the pinion.

CAUTION ⚠

When switches C and E are turned ON, current is fed both to pull-in coil P and holding coil H. The circuit is wired in such a way that the voltage is not applied to terminal B of the starter, so the current continues to flow into the pull-in coil while pinion 3 rotates.

To avoid burning the pull-in coil, be sure to turn switch E OFF within 5 seconds of the pinion rotating.

  - Hold the end of overrunning clutch **32** with fingers, and pull it. Measure the distance **G** (pinion gap) in the shaft direction that the overrunning clutch moves when it is lightly pushed back by hand.
  - Turn switch **C** OFF to stop current to the starter.
- If the measured value deviates from the standard value, replace lever **35**.



3 **Pinion**

[Removal]

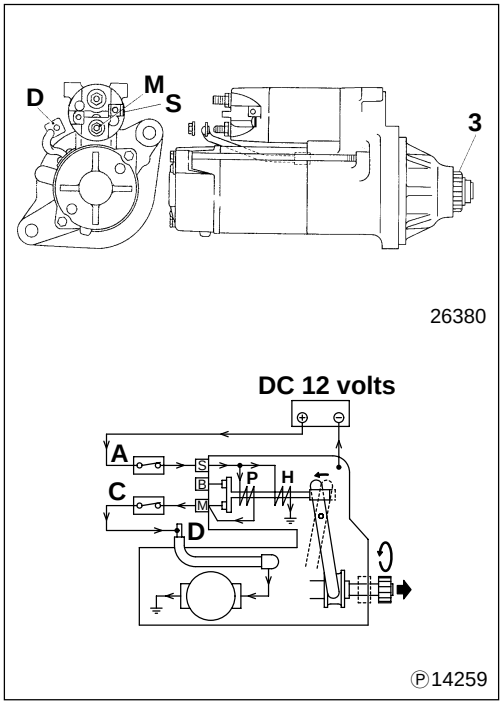
Feed current to the starter and protrude pinion **3** to remove the pinion.

WARNING⚠

- **Do not touch pinion 3 because it jumps out and turns when current is fed to the starter.**
- **Take care not to burn your hand, magnetic switch assembly 5 might be hot after inspection.**

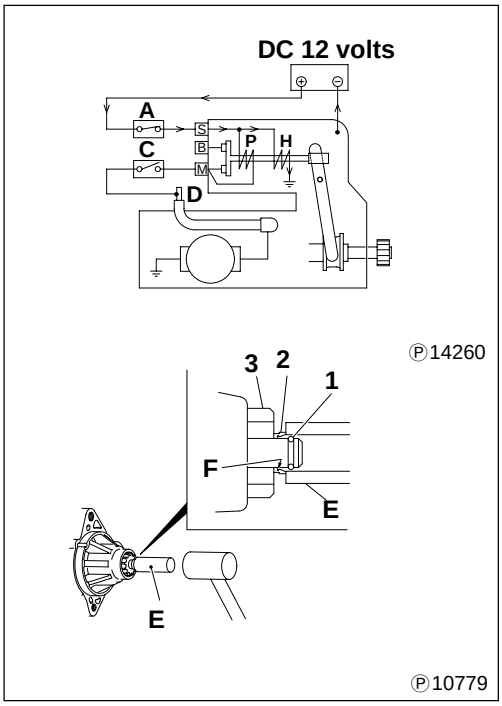
CAUTION⚠

- **The current feeding time to the starter should be within 10 seconds at pull-in coil P side and within 30 seconds at holding coil H side. If the current feeding time exceeds these limits, the coil might burn due to overheating.**
- **Before making pinion 3 jump out, be sure to feed current to the starter to obtain the correct state. If current is not fed to the starter and lever 35 is pulled to protrude the pinion, front bracket 38 or the lever might be damaged due to the shock produced on removal of stopper ring 1.**
- **The current, when fed to the starter, is over 100 amperes. When inspecting, use thick cable, such as a booster cable, and make secure connections.**



- Connect the starter as shown.
  A : Switch
  C : Switch
  D : Cable
  M : Terminal M of starter
  S : Terminal S of starter

- The following work should be done with current fed to the starter. You must complete removal of pinion **3** within 30 seconds.
  - Turn switches **A** and **C** ON and feed current to the starter. In this state, pinion **3** jumps out and rotates.



- Within 5 seconds of pinion **3** rotating, turn switch **C** OFF to stop rotation of the pinion**.**

CAUTION⚠

When switches A and C are turned ON, current is fed both to pull-in coil P and holding coil H. The circuit is wired in such a way that the voltage is not applied to terminal B of the starter, so the current continues to flow into the pull-in coil while pinion 3 rotates.

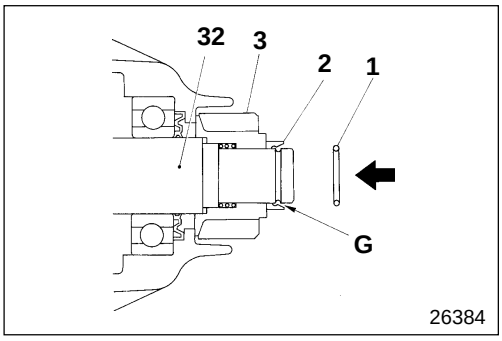
To avoid burning pull-in coil P, be sure to turn switch C OFF within 5 seconds after the pinion rotates.

- Apply pipe-shaped tool **E** onto pinion stopper **2**.
- Hit tool **E** lightly using a mallet to remove stopper ring **1** from ring groove **F** of pinion stopper **2**.
- Remove stopper ring **1** and pinion **3**.
- Turn switch **A** OFF to stop current to the starter.

NOTE

When the current to the starter is stopped, stopper ring 1 might fall back into ring groove F of pinion stopper 2 because pinion 3 is pushed inside.

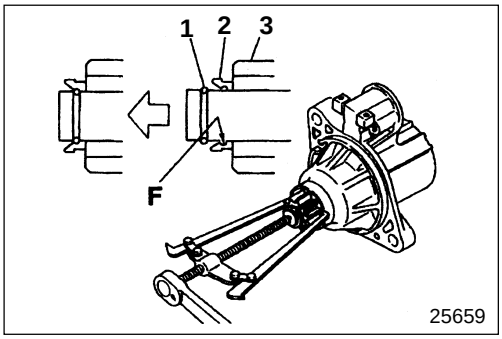
If this occurs, feed current to the starter again and carry out the work.



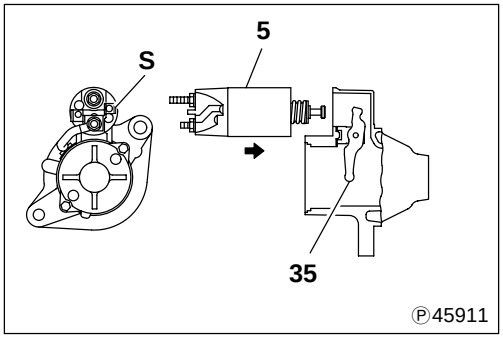
[Installation]

When installing pinion **3**, it is not necessary to feed current to the starter.

- Install pinion stopper **2** and pinion **3** onto overrunning clutch **32** in the direction as shown.
- Fit stopper ring **1** into ring groove **G** of overrunning clutch **32**.

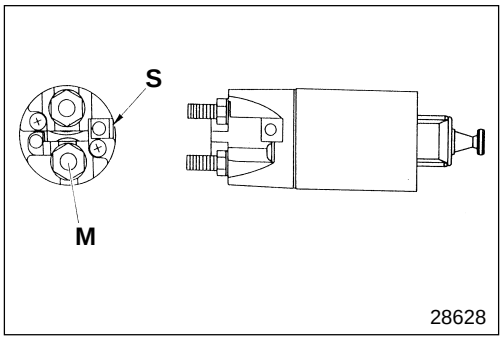


- Pull pinion **3** firmly and set stopper ring **1** on groove **F** of pinion stopper **2** securely.



5 Magnetic switch assembly

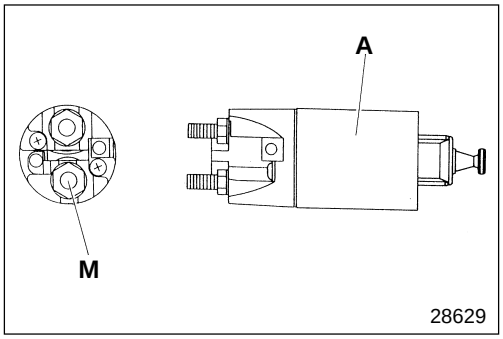
[Installation]
Install magnetic switch assembly **5** to lever **35**, with terminal **S** facing the direction as shown.



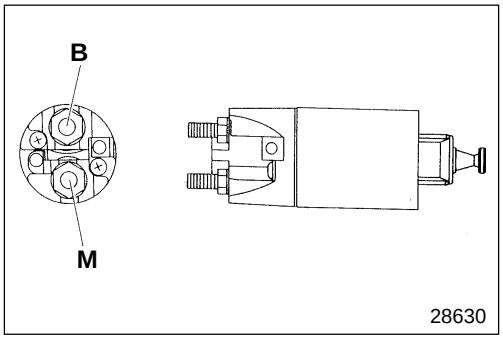
[Inspection]

(1) Testing for coil breakage

- Make sure that there is continuity between terminals **S** and **M**.
- If there is no continuity, replace magnetic switch assembly **5**.

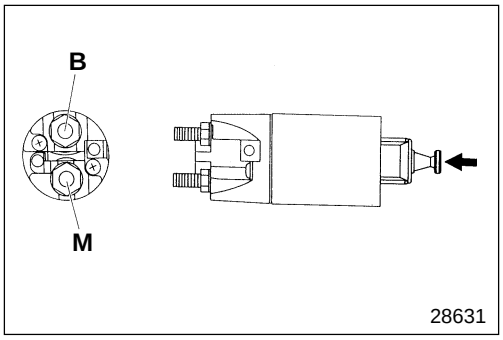


- Make sure that there is continuity between terminal **M** and body **A**.
- If there is no continuity, replace magnetic switch assembly **5**.



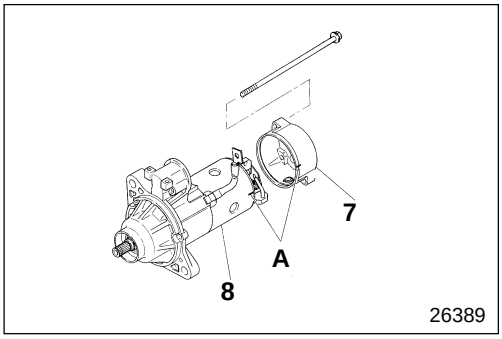
(2) Inspection of welded connections

- Make sure that there is no continuity between terminals **B** and **M**.
- If there is continuity, replace magnetic switch assembly **5**.



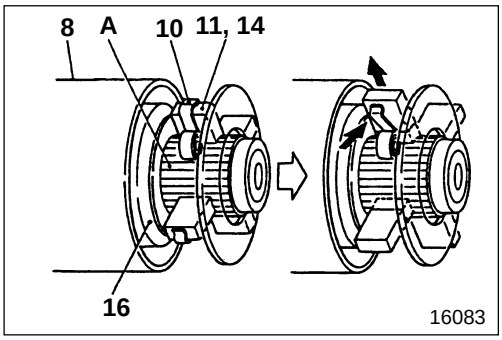
(3) Inspection of connections

- Push the tip of magnetic switch assembly **5** to close the internal connection.
  Make sure that there is continuity between terminals **B** and **M**.
- If there is no continuity, replace magnetic switch assembly **5**.



7 **Installation of rear bracket**

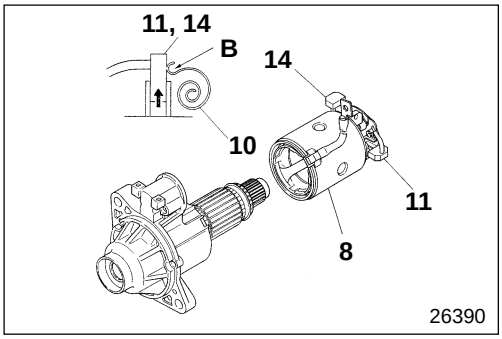
A : Alignment mark



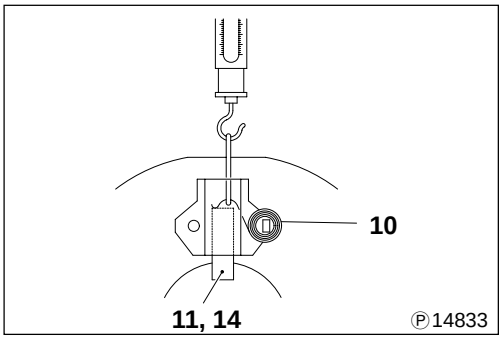
8 **Removal and installation of yoke and brush holder assembly**

Use the following method to remove the yoke and brush holder assembly **8** in order to prevent the commutator **A** of the armature assembly **16** from being damaged by the brushes **11** and **14**.

- Lift the brushes **11** and **14** away from the commutator **A** and hold them lifted by applying the brush springs **10** against the sides of the brush springs.

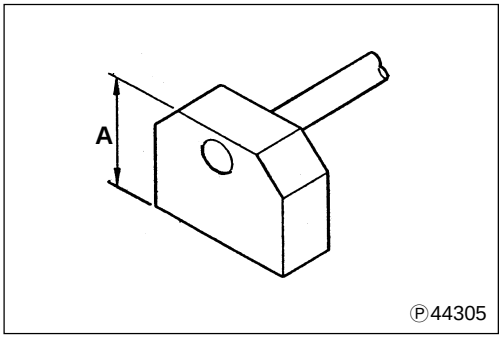


- Pull part **B** of each brush spring **10** and pull up the brushes **11** and **14**.
- Hold the brushes **11** and **14** in position with brush spring **10** as shown.
- Remove yoke and brush holder assembly **8**.
- To reinstall the yoke and brush holder assembly **8**, follow the removal instructions in, reverse.



10 **Inspection of brush spring**

- Use new brushes **11, 14** and measure the load when brush spring **10** is detached from the brushes.
- If the measured value is lower than the limit, replace brush spring **10**.



11 **14** **Inspection of brush**

(1) Length of brush

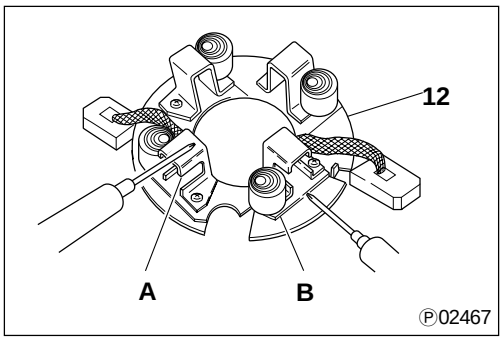
If the measured value **A** is lower than the limit, replace brushes **11, 14**.

NOTE

To replace brush ⊖ 11, replace entire brush holder assembly 12.

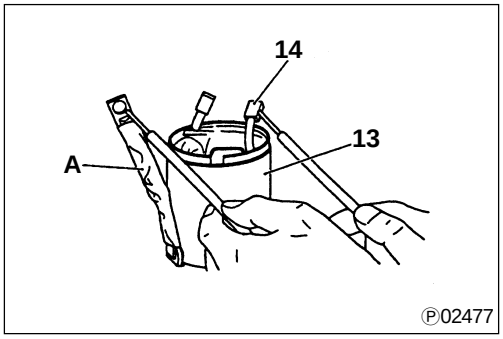
(2) Contact surface with commutator

If the surface where the brushes contact the commutator is rough or is worn unevenly, polish the surface with emery paper (300 to 500 grit)



12 Inspection of brush holder assembly

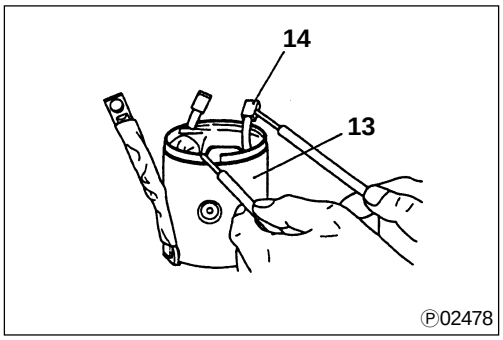
- Cleaning the brush holder **A** and holder plate **B**.
- Make sure that there is no continuity between the ⊕ side of the brush holder **A** and the ⊖ side of the holder plate **B**.
- If there is continuity between them, they are short-circuited. Replace brush holder assembly **12**.



13 Inspection of yoke assembly

(1) Testing for coil breakage

- Make sure that there is continuity between cable **A** and brush ⊕ **14**.
- If there is no continuity, they are broken. Replace brush ⊕ **14** or yoke assembly **13**.

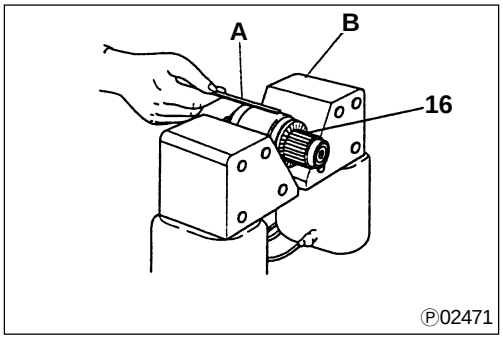


(2) Testing for coil grounding

- Make sure that there is no continuity between yoke assembly **13** and brush ⊕ **14**.
- If there is continuity, they are short-circuited. Inspect the insulated point. If it is hard to repair, replace brush ⊕ **14** or yoke assembly **13**.

NOTE

The coil may be short-circuited to the yoke assembly 13 due to the accumulation of worn-off metal particles from the brushes and/or armature.



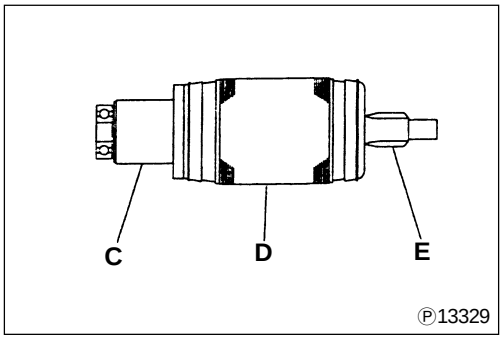
16 Inspection of armature assembly

(1) Testing for coil short-circuit

- Hold an iron rod **A** parallel with the armature assembly **16**.

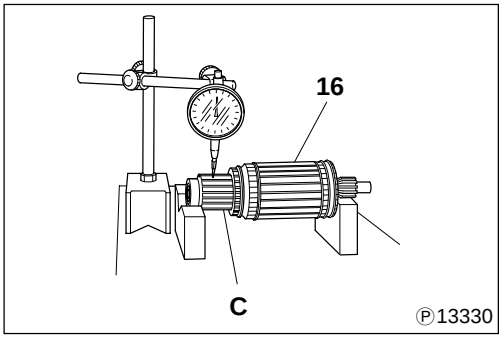
B : Armature tester

- Slowly rotate the armature assembly **16** by hand.
- If the iron rod **A** vibrates or is pulled toward the armature assembly **16**, the coil is short-circuited and the armature assembly must be replaced.



(2) Testing for coil grounding

- Make sure that there is no continuity between commutator **C** and core **D** (or shaft **E**).
- If there is continuity between them, they are short-circuited. Replace armature assembly **16**.

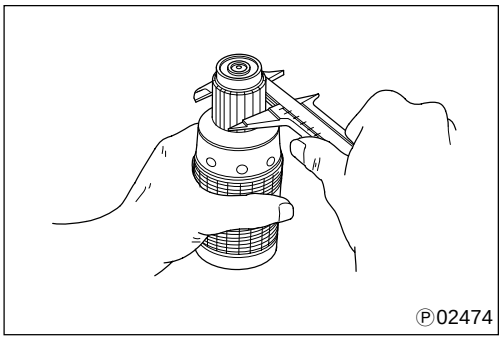


(3) Deflection of commutator

If the measured value is higher than the limit, correct the outer diameter of commutator **C** within the limit.

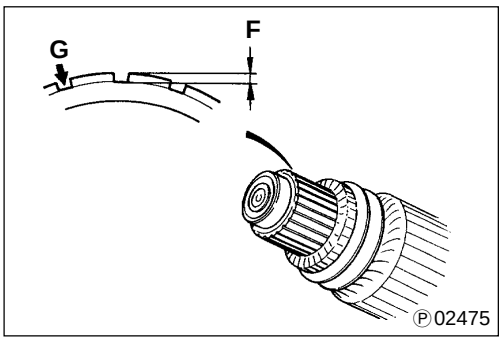
(4) Condition of the surface of cummutator

- If the surface is rough or has stepped wear, polish the surface with emery paper (300 to 500 grit).
- After polishing, check deflection of commutator **C**.



(5) Outer diameter of commutator

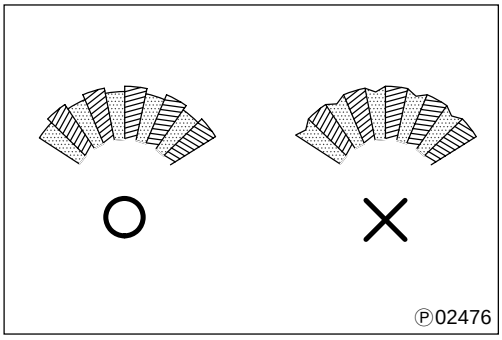
If the measured value is higher than the limit, replace armature assembly **16**.



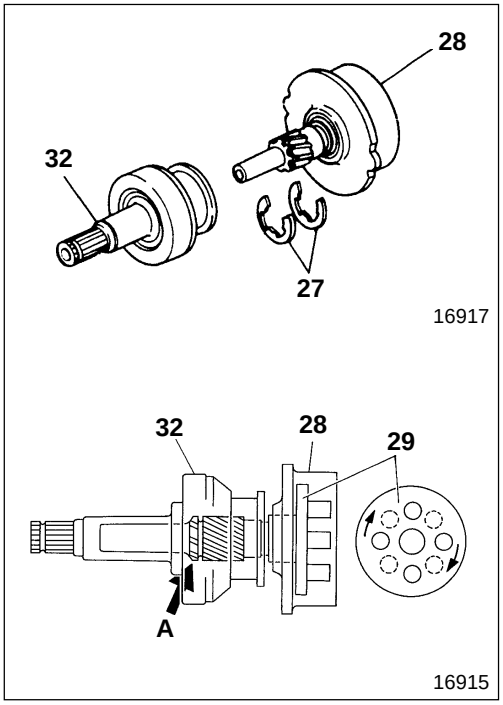
(6) Mold depth between segments

- If the measured value is lower than the limit, replace armature assembly **16**.
  F : Mold depth

- To rectify the armature assembly **16**, grind the shown portions **G**.



- If the mold is worn as shown, correct or replace armature assembly **16**.
  ○ : Good
  × : Faulty

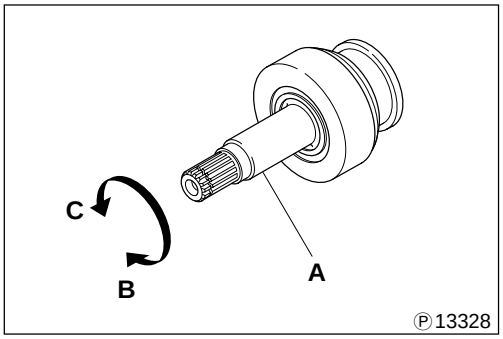


28 Removal of gear shaft and internal gear assembly

Remove the E-rings **27** and then the gear shaft and internal gear assembly **28** from the overrunning clutch **32**.

Proceed as follows if the gear shaft and internal gear assembly **28** cannot be removed due to interference of the splined section **A** of gear shaft assembly **29** with internal parts of the overrunning clutch **32**.

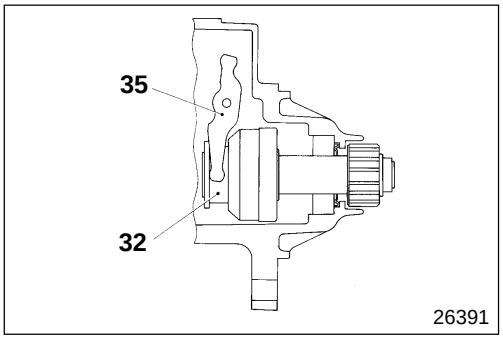
- Press the gear shaft assembly **29** against the overrunning clutch **32**.
- Turn the gear shaft assembly **29** approx. 1/8 of a turn to change the position of splined section **A**.



32 Inspection of overrunning clutch

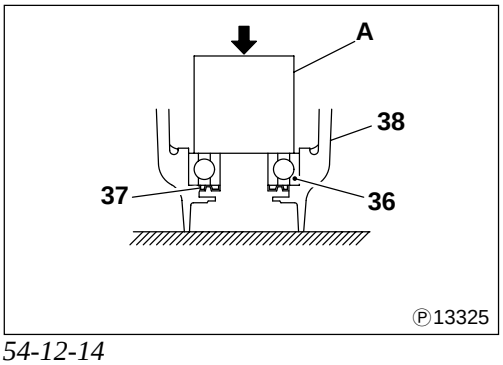
Perform the following checks, and if any fault is found, replace the overrunning clutch **32**.

- Make sure that shaft **A** turns smoothly when turned in direction **B**.
- Make sure that shaft **A** locks when turned in direction **C**.



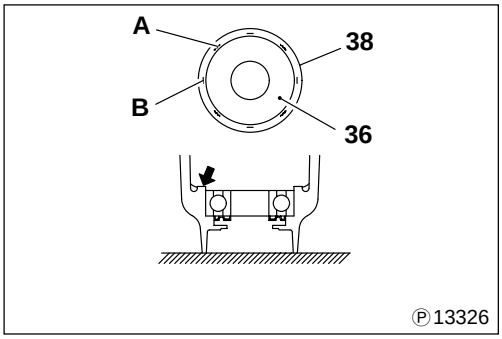
35 Installation of lever

Install lever **35** onto overrunning clutch **32** in the direction as shown.



36 Installation of front bearing

- Install oil seal **37** before press-fitting front bearing **36**.
- Press-fit front bearing **36** into front bracket **38** using pipe-shaped tool **A**.



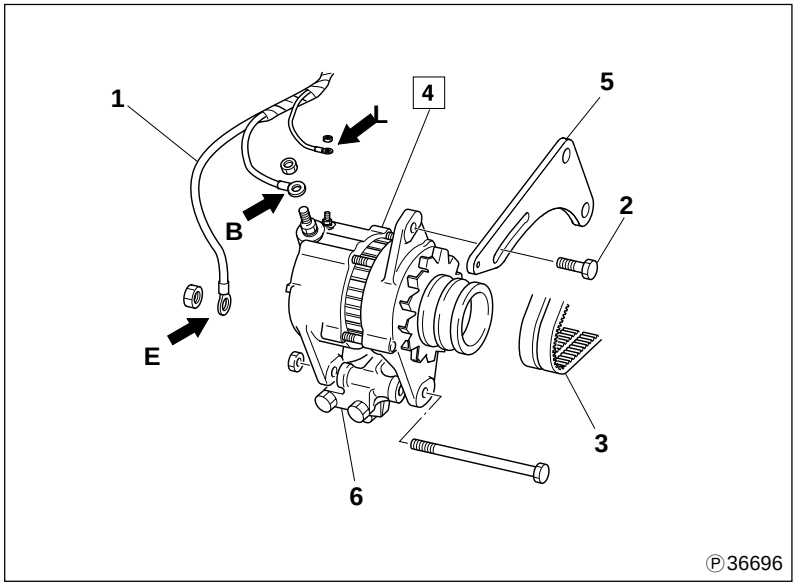
- Re-caulk the side of front bracket **38**.

NOTE

Do not re-caulk previously caulked points B.

A : Caulking points (4 points)

940 ALTERNATOR



● **Removal sequence**

1 Chassis harness
2 Adjusting bolt
3 V-belts
4 Alternator 🕮 P54-12-18
5 Adjusting plate
6 Alternator bracket

B : To terminal B
E : To terminal E
L : To terminal L

WARNING⚠

To prevent possible injury, be sure to disconnect the negative terminal ⊖ of the battery and insulate it with tape before removing alternator 4.
With the negative terminal ⊖ of the battery connected, battery voltage is always applied to the terminal B.

● **Installation sequence**

Follow the removal sequence in reverse.

● **Adjustment after installation**

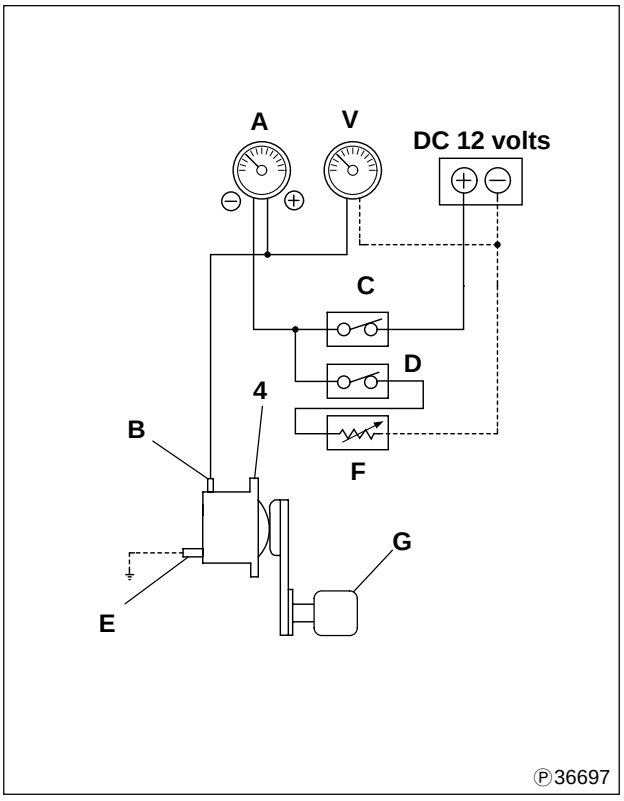
For adjustment of V-belt 3 tension 🗀 Gr 14

Service standards

Location	Maintenance item		Standard value	Limit	Remedy
4	Alternator output current (*When alternator is hot and producing 13.5 V) at 25°C	At 1000 rpm	Approximately 20 A	—	Inspect
		At 2000 rpm	Approximately 80 A	—	
		At 3500 rpm	Approximately 100 A	—	
	Adjustment voltage of regulator (At 5000 rpm, 10 A is loaded) at 25°C		14.2±0.2 V	—	Replace

* The hot condition is the one after the alternator has been run at normal ambient temperature with 5000 rpm and maximum output for 30 minutes.

◆ Service procedure



4 Inspection of alternator

(1) Alternator performance check (bench test)

- Connect the alternator **4** as shown.

CAUTION⚠

Sufficiently thick wires should be used for wiring and each connection should be securely fastened.

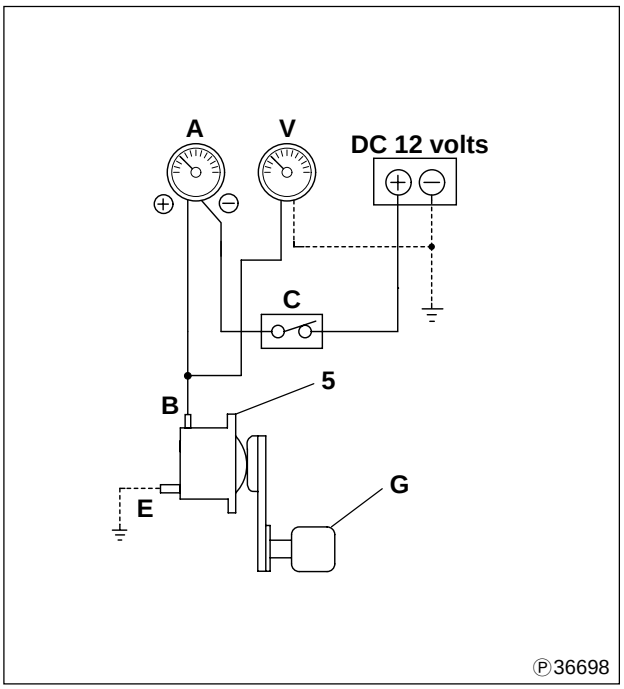
A : Ammeter
B : Alternator terminal B
C : Switch
D : Switch
E : Alternator terminal E
F : Load resistance (variable resistance)
G : Alternator drive motor
V : Voltmeter

- Increase load resistance **F** to the maximum (condition which the load current hardly flow).
- Turn switches **C** and **D** ON.
- Run alternator at 5000 rpm for 30 minutes by adjusting load resistance **F** so that electric current can conform to the specified standard.

Alternator nominal current

12V-100A

- Measure the current at each specified revolution of alternator **4**.
- If the measured value deviates from the standard value, disassemble and check alternator **4**. 📖 P54-12-18



(2) Regulator performance check (bench test)

- Connect the alternator **4** as shown.

A : Ammeter
B : Alternator terminal B
C : Switch
E : Alternator terminal E
G : Alternator drive motor
V : Voltmeter

- Turn switches **C** ON.
- Run alternator **4** at low speeds.
- Increase the speed of alternator **4** to 5000 rpm and measure the voltage (adjustment voltage) at this speed. At the same time, make sure that the current is 10 amperes or less at 5000 rpm.
- If the measured value deviates from the standard value, do as follows:
  - If higher than the standard value: Replace the regulator.
  - If follow than the standard value: Inspect the alternator related parts before replacing the regulator.

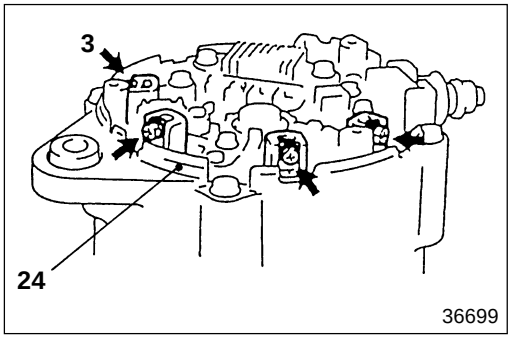
Tightening torque

Unit : N·m {ft.lbs, kgf·m}

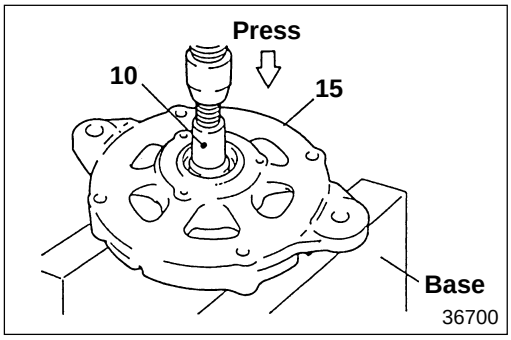
Location	Parts to be tightened	Tightening torque	Remarks
6	Nut (Pulley mounting)	117.6 to 137.2 {26 to 31, 12 to 14}	—



◆ Service procedure

5 **Drive frame assembly**

Remove screw **3** and separate the stator **17** outlet terminal and the rectifier **24**.



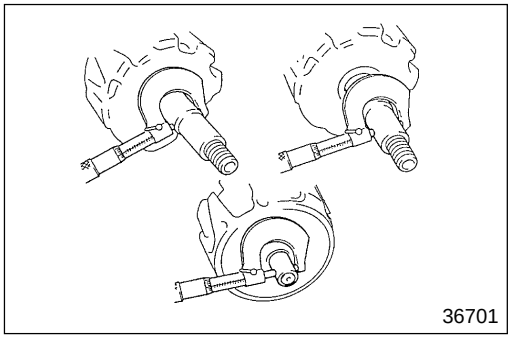
10 **Rotor**

[Removal]

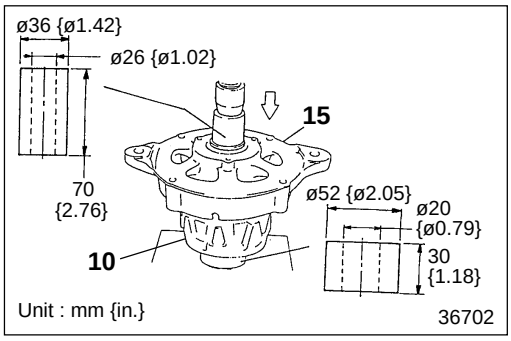
Using a press, remove the rotor **10** from the drive frame **15**.

CAUTION⚠

Do not drop the rotor 10.



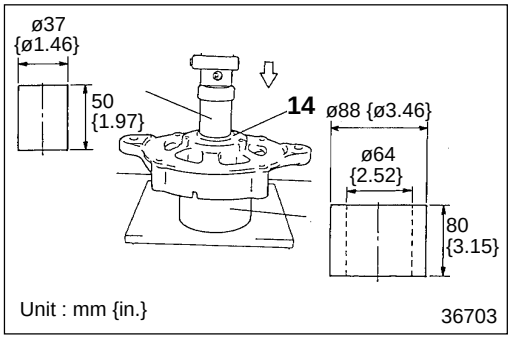
[Inspection]
- Measure the outer diameter of the portion as shown.
- If the measured value deviates from the standard value, replace the rotor **10**.



[Installation]
Using a press, press the rotor **10** into the bearing in the drive frame **15**.

CAUTION

Press the rotor 10 while making sure that the rotor's shaft is perpendicular to the bearing. During pressing, make sure not to damage the portion of the rotor 10 that presses into the rear bearing 28.

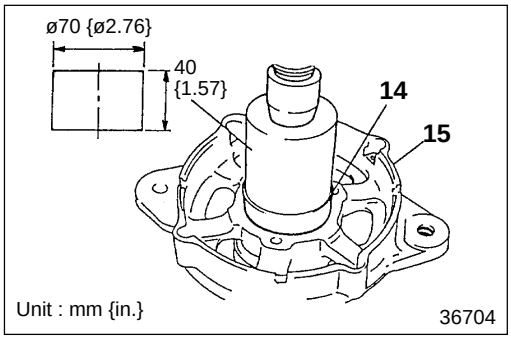


14 **Front bearing**

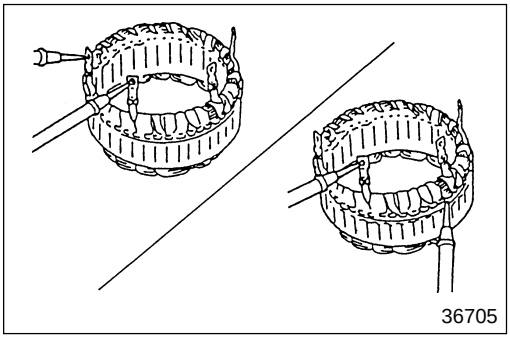
[Removal]
Using a press, remove the front bearing **14** from the drive frame **15**.

CAUTION

Do not drop the front bearing 14.

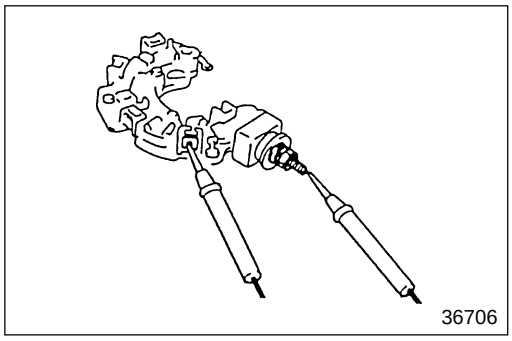


[Installation]
Using a press, press the front bearing **14** into the drive frame **15**.



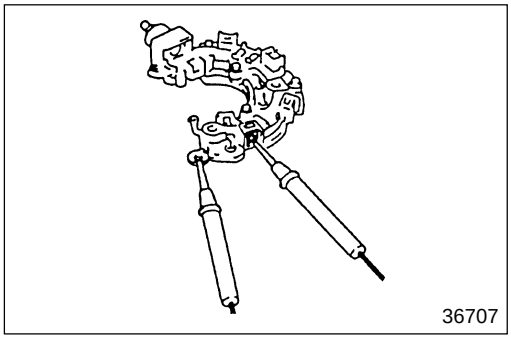
17 **Inspection of stator**

- Measure the resistance between the coil outlet terminals. (using a circuit tester)
- Measure the resistance between the coil outlet terminal and core. (using a megger tester)
- If the measured value deviates from the standard value, replace the stator **17**.

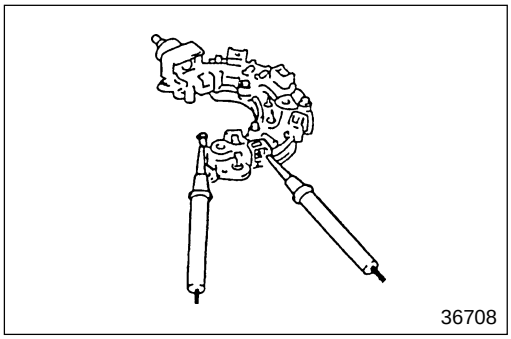


24 **Inspection of rectifier**

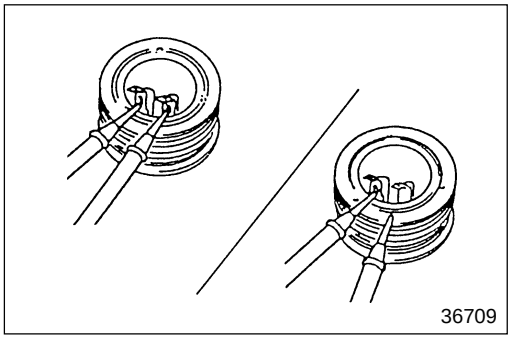
- Check for continuity between the terminal **B** and the heat sink.
- When polarity is changed, there is continuity in one direction but not in the opposite direction.



- Check for continuity between the terminal ⊖ and the heat sink.
- When polarity is changed, there is continuity in one direction but not in the opposite direction.

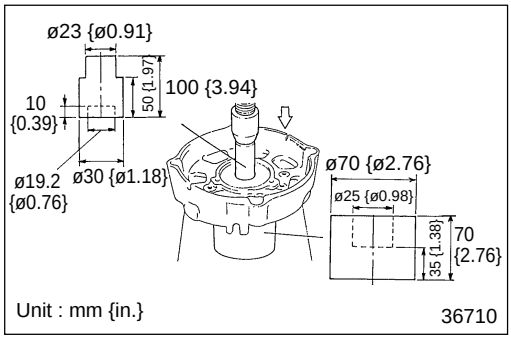


- Check for continuity between the auxiliary diode terminal and the heat sink.
- When polarity is changed, there is continuity in one direction but not in the opposite direction.



27 **Inspection of exciting coil**

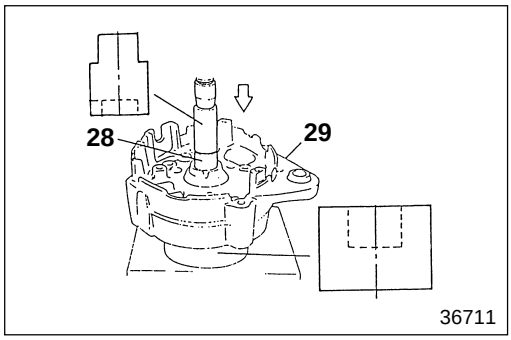
- Measure the resistance between the coil outlet terminal. (using a circuit tester)
- Measure the resistance between the coil outlet terminal and core.
- If the measured value deviates from the standard value, replace the exciting coil **27**.



28 **Rear bearing**

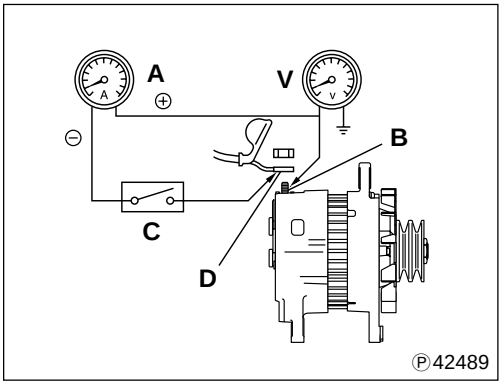
[Removal]
Using a press, remove the rear bearing **28** from the rear frame **29**.

CAUTION
Do not drop the rear bearing 28.



[Installation]
Using a press, press a new rear bearing **28** into the rear frame **29**.

CAUTION
Once a bearing is removed, do not reuse it.



Performance test

- Connect the meters to the alternator as shown.

  A : Ammeter (100 amperes class)
  B : Alternator terminal B
  C : Switch
  D : Terminal
  V : Voltmeter

WARNING⚠

- **To prevent possible injury, be sure to disconnect the negative terminal of the battery and insulate it with tape before working on the wiring. With the negative terminal ⊖ of the battery connected, battery voltage is always applied to the terminal B.**
- **To connect to switch C, use a lead wire with the same or larger diameter than that of the chassis harness connected to terminal B.**

- Turn on switch **C** and make sure that voltmeter **V** indicates battery voltage.
- Start the engine.
- Immediately turn on the switches for all lamps on the vehicle.
- Immediately accelerate the engine to the speed indicated below and measure the alternator's output current.

Engine speed	Approx. 2400 rpm

- The alternator is considered to be good if the measured value is 70% or more of the nominal output current.
  Alternator nominal output

Voltage	Output current
12V	100A

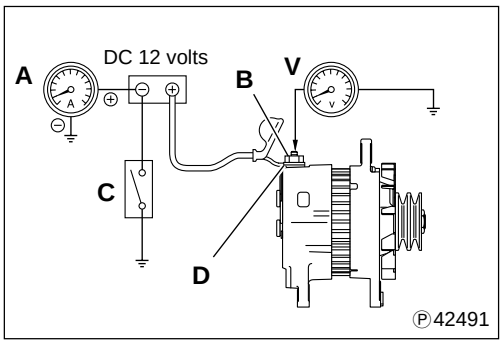
NOTE

The on-vehicle inspection is only a simplified check. Use a test bench for accurate checking. 🕮 940

951 INSPECTION OF REGULATOR

Service standards

Location	Check item	Standard value	Limit	Remedy
—	Regulator adjusting voltage	14.2±0.2V	—	Replace



- Connect the meters to the alternator as shown.

  A : Ammeter (100 amperes class)
  B : Alternator terminal B
  C : Switch
  D : Terminal
  V : Voltmeter

WARNING⚠

- **To prevent possible injury, be sure to disconnect the negative terminal of the battery and insulate it with tape before working on the wiring. With the negative terminal ⊖ of the battery connected, battery voltage is always applied to the terminal B.**
- **To connect to switch C, use a lead wire with the same or larger diameter than that of the chassis harness connected to terminal B.**

- Turn off the switches for lamps, heater, etc. so that electric loads may not be applied during the inspection.
- Turn on switch **C** and then start the engine.
- If the output current is 10 amperes or less when the engine speed is raised to the appropriate speed indicated below, then measure the voltage at terminal **B**.

Speed (rpm)
Approx. 2400

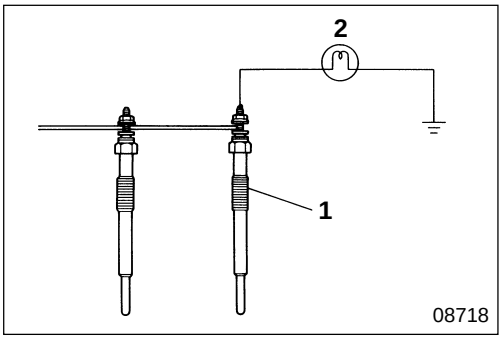
- If the output current is 10 amperes or more, do one of the following:
  - Run the engine for a while to charge the battery.
  - Replace the battery with a fully-charged one.
- If the measured value deviates from the standard value, conduct checking again on the test bench.

13 ON-VEHICLE INSPECTION AND ADJUSTMENT

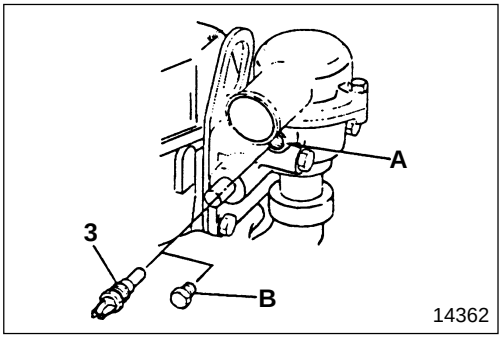
955 INSPECTION OF PREHEATING SYSTEM

Service standards

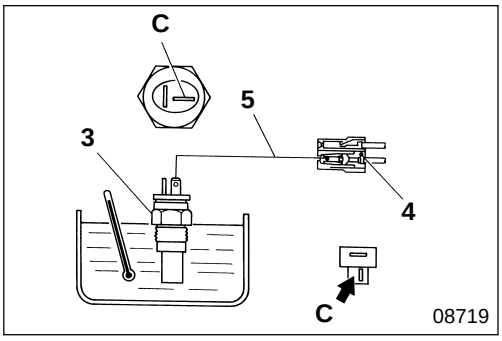
Location	Maintenance item			Standard value	Limit	Remedy
—	Pre-glow time	Coolant temperature	60°C {140°F} or more	Does not pre-glow	—	Inspect
			0 to 60°C {32 to 140°F}	About 12 seconds	—	
			0°C {32°F} or less	About 12 seconds	—	
	After-glow time	Coolant temperature	60°C {140°F} or more	Does not after-glow	—	
			0 to 60°C {32 to 140°F}	Does not after-glow	—	
			0°C {32°F} or less	About 20 seconds	—	
	Indicator lamp ON time	Coolant temperature	60°C {140°F} or more	Does not illuminate	—	
			0 to 60°C {32 to 140°F}	Does not illuminate	—	
			0°C {32°F} or less	About 8 seconds	—	



- Turn the starter switch to OFF.
- Connect a check lamp **2** to the glow plug **1** as shown.



- Remove the water temperature sensor **3** from the engine, and close the sensor mounting hole **A** with the plug **B** (M16 × 1.5 mm).
  Removal and installation of the water temperature sensor **3** Gr 14



- Connect the extension harness **5** between the water temperature sensor **3** and connector **4**.

NOTE

Connect the extension harness 5 to the terminal C on the MUTIC (multipurpose timing control unit).

- Put water temperature sensor **3** into a container filled with water.
- Carry out the following inspection while changing the water temperature in the container. If any fault is found, inspect each unit.

(1) Inspection of pre-glow time and indicator lamp lighting time

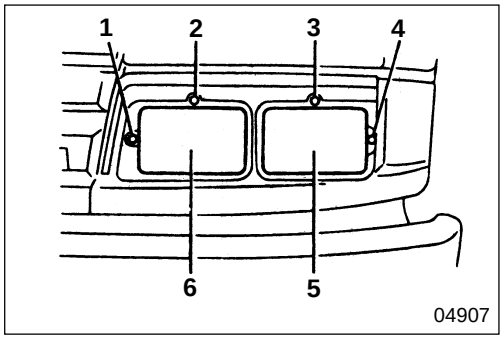
Turn the starter switch ON but do not start the engine. Make sure that the pre-glow time and the indicator lamp lighting time at each water temperature conform to the standard value.

- For pre-glow time inspection, measure the lighting time of inspection lamp **2**.
- For indicator lamp lighting time inspection, measure the lighting time of lamp within the meter cluster directly.

(2) Inspection of after-glow time

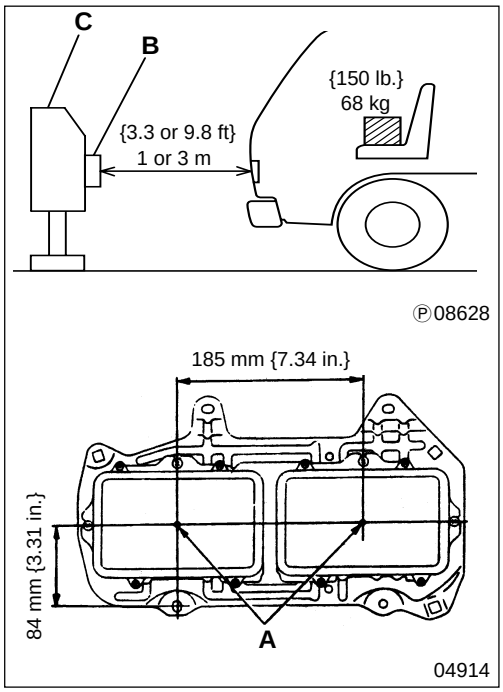
Start the engine and measure the lighting time of inspection lamp **2** from the point lamp within the meter cluster goes off, and make sure that the after-glow time conforms to the standard value.

960 HEADLAMP AIMING



1 Screw (Main beam, horizontal adjustment)
2 Screw (Main beam, vertical adjustment)
3 Screw (Dipped beam, horizontal adjustment)
4 Screw (Dipped beam, vertical adjustment)
5 Dipped beam
6 Main beam

To adjust the headlamp move the optical axis of Main beam **6** by turning screws **1, 2** and move the optical axis of Dipped beam **5** by turning screws **3, 4**. You need to adjust the aiming of both the Main and the Dipped beams on both the left and right headlamps.



(1) Preparation before adjustment

- Park the vehicle on a level place.

WARNING

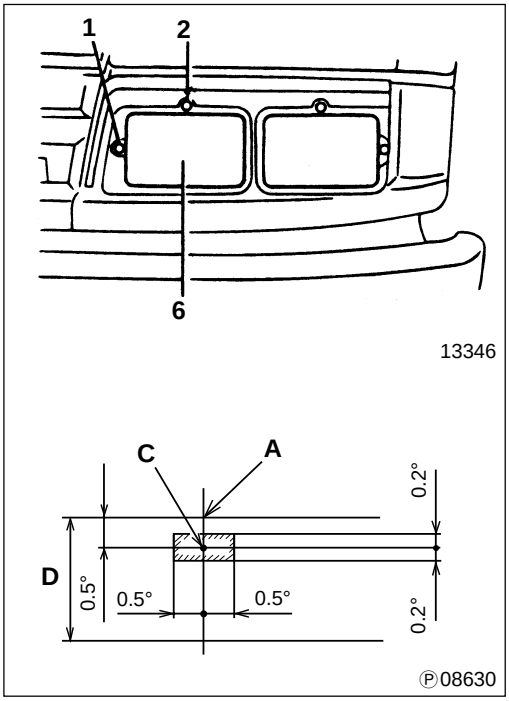
Be sure to put tire chocks securely in place.

- Unload the vehicle and make sure no one is in it.
- Inflate the tires to the specified pressure. Gr 31
- Seat one person of an equivalent mass (68 kg {150 lb.}) in the vehicle
- Start the engine and check that the battery is being charged.
- Place convergent headlamp tester **C** in line with Main beam **6** or Dipped beam **5** of either the left or right headlamp at a distance of 1 m {3.3 ft.} or 3 m {9.8 ft.}.
- Align the center of convergent lens **B** of convergent headlamp tester **C** with lamp center **A** of Main beam **6** or Dipped beam **5**. (The illustration shows a left headlamp.)
- When adjusting one headlamp, mask the other to avoid light leakage.

(2) Adjustment

WARNING

Do not mask a lit headlamp for more than 10 minutes or the heat generated might cause a fire.



● **Adjustment of Main beam unit**

- Turn on Main beam **6**.
- Adjust as follows so that the optical axis (max luminous illumination point) **C** of Main beam **6** is located as shown:
  - Vertical adjustment: Turn screw **2** to adjust.
  - Horizontal adjustment: Turn screw **1** to adjust.

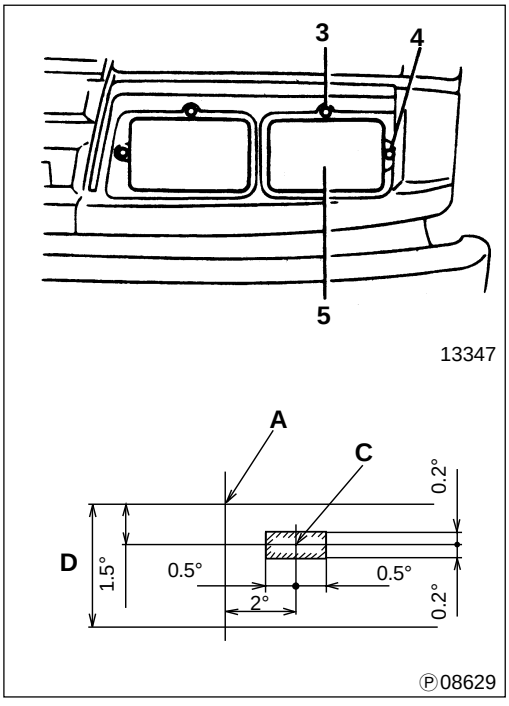
  The aiming of both left and right Main beams **6** should be adjusted to the position as shown.

▨ : Tolerance of adjustment

A : Center of headlamp
D : Height from the ground to headlamp center

	Adjusting direction for optical axis			
	Upward	Downward	Leftward	Rightward
Screw 1	—	—	(Counter-clockwise)	(Clockwise)
Screw 2	(Clockwise)	(Counter-clockwise)	—	—

Turning direction of the screws in the table is as viewed from the front.



● **Adjustment of Dipped beam unit**

- Turn on the LOW beam of Dipped beam **5**.
- Adjust as follows so that the optical axis (max luminous illumination point) **C** of Dipped beam is located as shown:
  - Vertical adjustment: Turn screw **3** to adjust.
  - Horizontal adjustment: Turn screw **4** to adjust.

  The aiming of both left and right Dipped beams **5** should be adjusted to the position as shown.

▨ : Tolerance of adjustment

	Upward	Downward	Leftward	Rightward
Screw 3	(Clockwise)	(Counter-clockwise)	—	—
Screw 4	—	—	(Clockwise)	(Counter-clockwise)

Turning direction of the screws in the table is as viewed from the front.

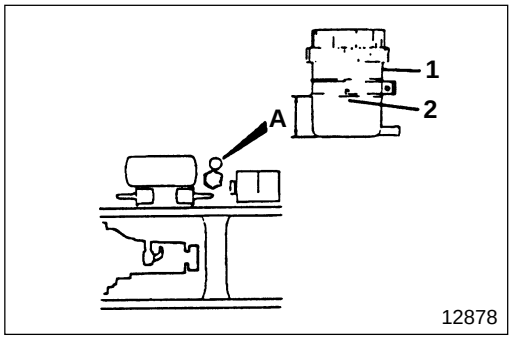
965 INSPECTION OF BRAKE FLUID LEVEL SWITCH

< Center parking >

Service standards

Unit : mm {in.}

Location	Maintenance item	Standard value	Limit	Remedy
—	Warning lamp lighting position for brake fluid level switch	$57^{+3.5}_{-0.5}$ {$2.24^{+0.14}_{-0.02}$}	—	Replace



- Start engine.
- Drain the brake fluid gradually from fluid tank assembly **1**.

CAUTION

If brake fluid is spilt on any part of the vehicle, wipe it off immediately, since the solvent in the fluid can damage the paintwork.

- Measure height **A** of brake fluid level switch **2** when BRAKE FLUID warning lamp within the meter cluster lights.
- If the measured value deviates from the standard value, remove and check fluid tank assembly **1**.

2. OUTLINES OF REFRIGERATION SYSTEM ---- 2
3. CONSTRUCTION ---- 4
4. TROUBLE SHOOTING ---- 11
5. REMOVAL AND INSTALLATION ---- 18
6. TREATMENT AFTER INSTALLATION ---- 21
7. MAINTENANCE ---- 27
8. COOLING UNIT ASSEMBLY ---- 28
9. COMPRESSOR & CLUTCH ASSEMBLY ---- 30

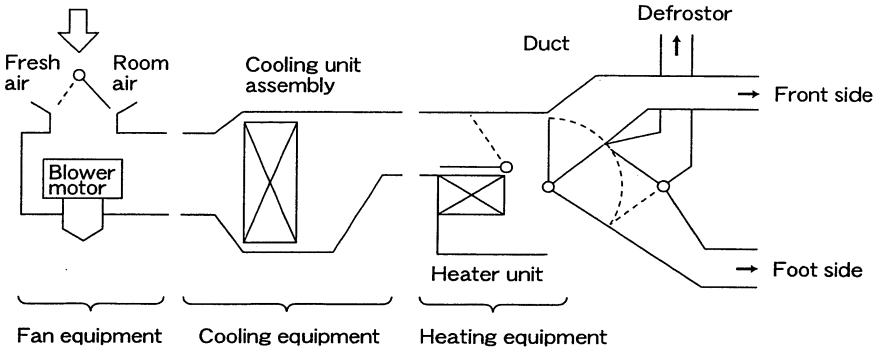
1. SPECIFICATIONS

Item			Specification
Vehicle model			FK/FM
* Cooling capacity (on JIS conditions)			4,650W
Compressor	Model		MSC90T
	Displacement		90㎤
	Maximum revolution		MAX 9000min^{-1}
	Compressor oil		SUN PAG 56, 120㎤
Magnetic clutch	Type		Dry single disc magnet
	Voltage & input		DC12V, 45W
Cooling unit assembly	Type		Laminated fin type
Controls	Air flow control		Slide switch, Four step type
	Temperature control		Electric thermostat
Condenser	Type		Corrugate fin type
Receiver assembly			Cylinder type, approx 300㎤
Protective equipment	Frost prevention (Thermostat)		OFF : 1.6℃ ON : 4.6℃
	Releif valve		Open : 3.50~4.10MPa Close : 2.94MPa
	Dual pressure switch	Low pressure switch	OFF : 0.20MPa ON : 0.225MPa
		High pressure switch	OFF : 2.94MPa ON : 2.35MPa
	Fuse (Fan equipmemt) Fuse (Magnetic clutch)		10A 10A
Refrigerant and quantity			HFC-134a, 740g

- The * marked cooling capacity is based on JIS conditions.
- Compressor speed : 1,800min^{-1}
- Condensing temperature : 55℃
- Cooling unit inlet air dry bulb temperature : 27℃DB
- Cooling unit inlet air wet bulb temperature : 19.5℃WB
- Terminal voltage :DC24V

2 . OUTLINES OF REFRIGERATION SYSTEM

2.1 Air system



Cooling operation

Fresh air is induced to the cooling unit assembly by a blower fan, where it is cooled down and dehydrated, charged at the front side outlet through a duct.

Heating operation

Fresh air is induced to the heater unit by a blower fan through the cooling unit assembly, where it is heated, then discharged at the foot side outlet through a duct.

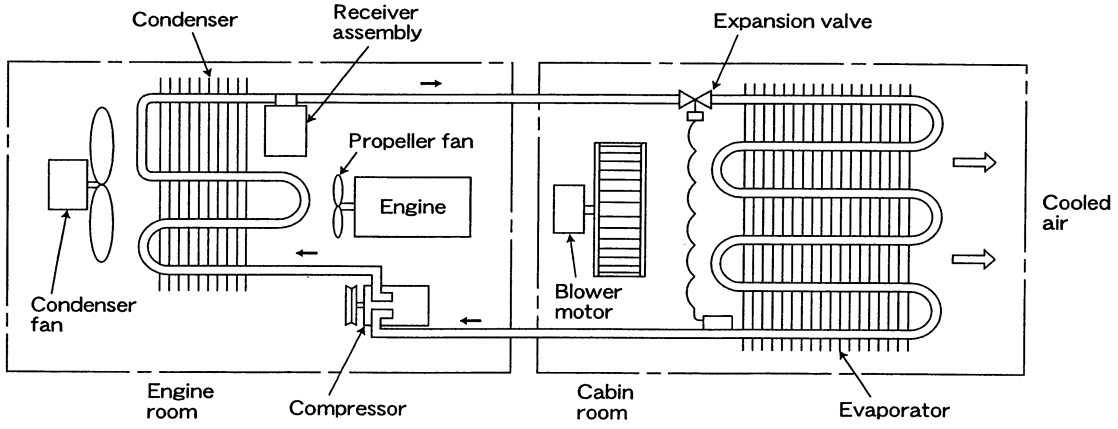
Dehumidifying operation

Fresh air is induced to the cooling by a blower fan, where it is cooled down and dehydrated, and succeedingly to the heater unit for warming, then discharged at the front side outlet through a duct.

Temperature control

Cooled air and warmed air are mixed for temperature control of the room inside.

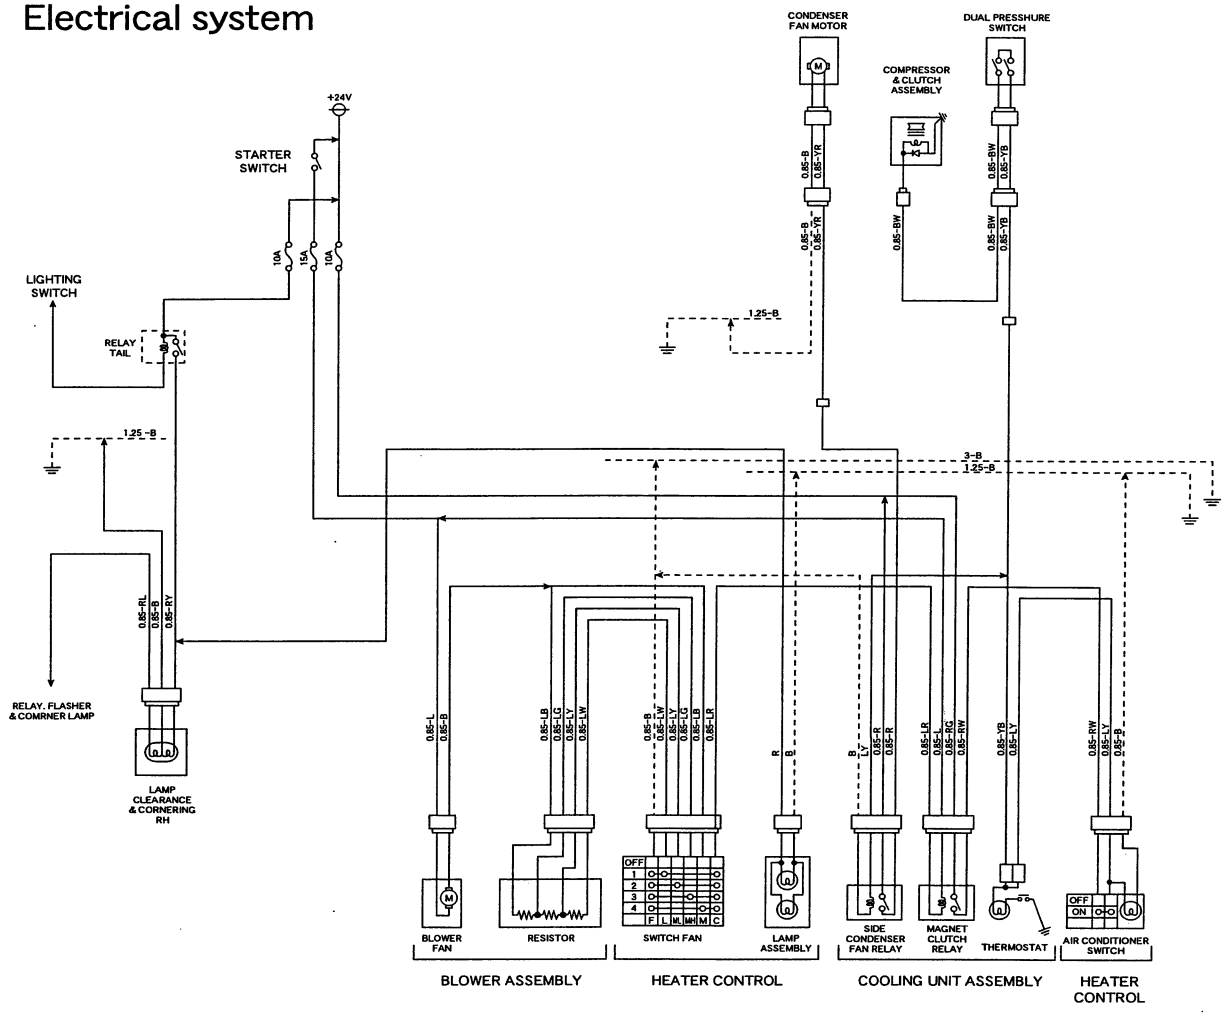
2.2 Refrigerating circuit



While the refrigerant, HFC-134a is cooling the air drawn into the evaporator, it evaporates and becomes a gas. This gas is compressed to high pressure and temperature in the compressor, and sent into the condenser, where it is cooled and becomes liquid.
This cooling in the condenser is carried out by the open air passing through the condenser sucked by radiator fan and vehicle motion of the vehicle.
The liquid refrigerant flows through the receiver assembly where water and dirt are removed, and then it enters the expansion valve. Here the liquid refrigerant is throttled and changed to a mixture of liquid and gas in low temperature and low pressure, and is sent to the evaporator.

In the evaporator, the refrigerant absorbs heat from the surroundings and becomes a gas. That is, because the evaporator it self is cooled at this time, the return air to the cooling unit assembly is cooled,
and the interior of the vehicle becomes cool. In this way the refrigerant flow makes a complete circuit.

2.3 Electrical system

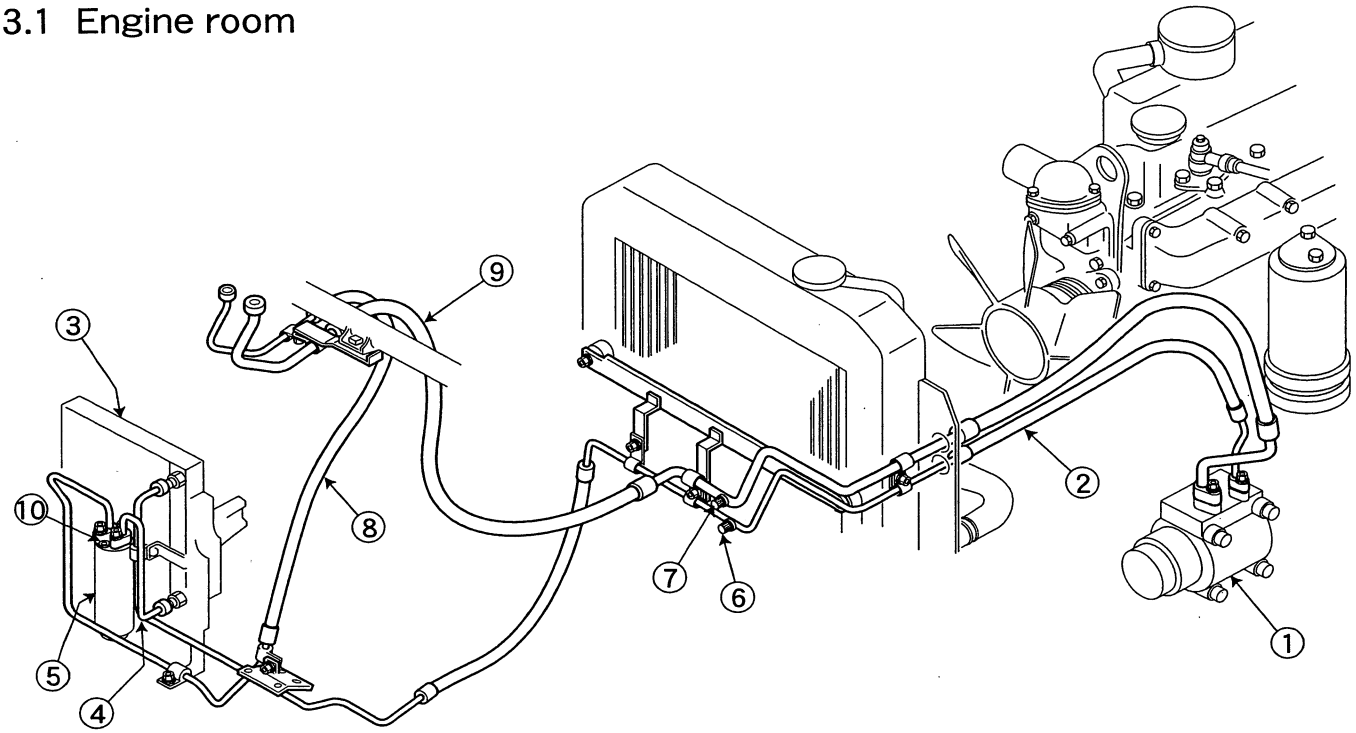


The power source is supplied from the TRUCK battery. When the blower switch is put ON, the power relay becomes ON, and electricity is connected to the magnetic clutch of the compressor. The magnetic clutch switches ON or OFF by air conditioner switch, fin thermo, and low pressure switch as the controls for operation service, or safety protection.

The cabin room air temperature is set to a preset point by adjusting the temperature control lever, and the opening degree of the air mix damper.

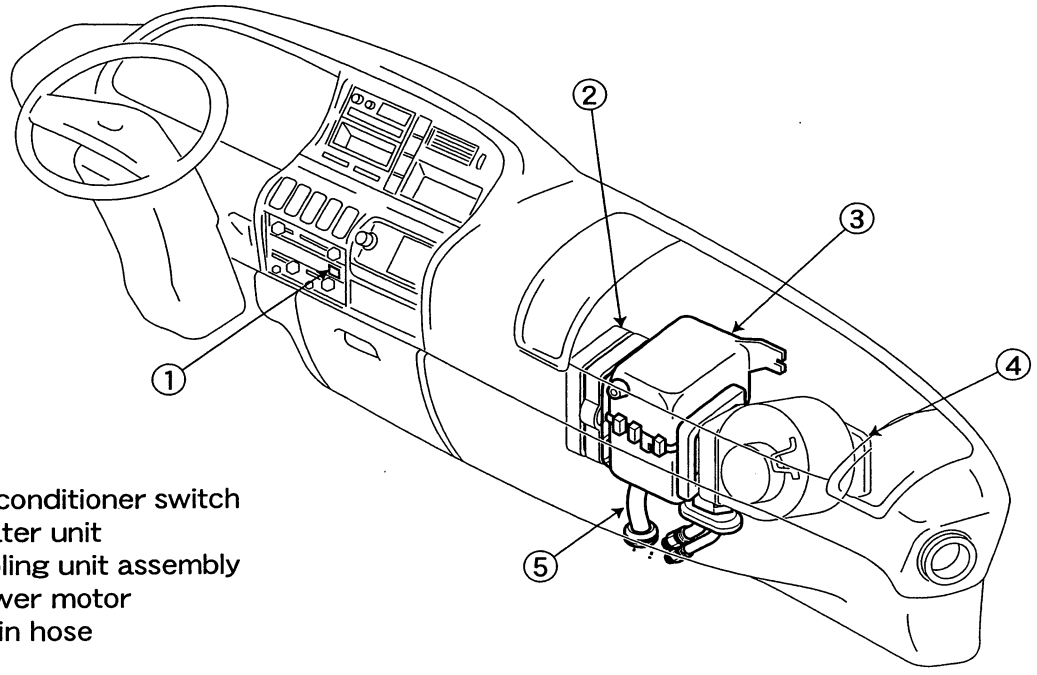
3 . CONSTRUCTION

3.1 Engine room



① Compressor & clutch assembly
② Discharge hose
③ Side condenser assembly
④ Pipe (LQ)
⑤ Receiver assembly
⑥ Check valve (HP)
⑦ Check valve (LP)
⑧ Liquid hose
⑨ Suction hose
⑩ Sight glass

3.2 Cabin room



① Air conditioner switch
② Heater unit
③ Cooling unit assembly
④ Blower motor
⑤ Drain hose

3.3 Control system

(1) Control in panel

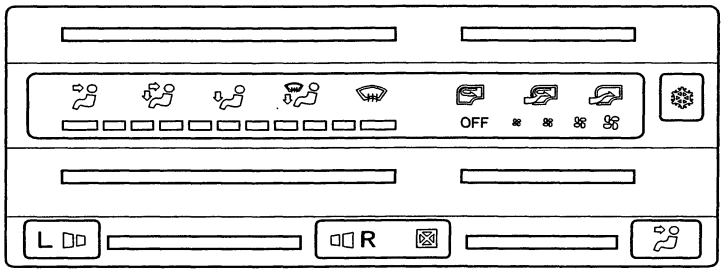
☐ Air outlet mode select switch
The air outlet is selected by positioning in cooling and heating operation.

- ----- The conditioned air is discharged at the center and both side outlets directed by the louvers as reguired.
- ----- The conditioned air is discharged at the center and both side and foot outlets directed by the louvers as reguired.
- ----- The conditioned air is discharged at the foot outlets directed by the louvers as reguired.
- ----- The conditioned air for dehumidifying is discharged at the foot outlets and to the front glass.
- ----- The conditioned air for dehumidifying is discharged to the front glass.

☐ Air circulation shift lever
The recirculation air is selectable out of the below circulation models.

- ----- ROOM AIR CIRCULATION
- ----- ROOM AIR CIRCULATION AND FRESH AIR INTAKE
- ----- FRESH AIR INTAKE

☐ Air conditioner switch
By pushing the air conditioner switch initially in cooling or drying operation, the compressor starts running.
By pushing it secondarily, the compressor stops.



☐ A lager volume of air is discharged to the driver's feet.
R ----- Evenly to the left and right.
L ----- A lager flow to driver's feet.

☐ Temperature control switch
The discharged air temperature is controllable by selecting the position of the control lever in cooling, heating or drying operation.
BLUE ZONE ------ For cool air blow
WHITE ZONE ----- For dry air blow
RED ZONE ------- For warm air blow
By moving the lever toward the BLUE and RED ZONE sides, the supply air temperature becomes more cooler and warmer respectively.

☐ Fan switch
The air flow is selectable, out of the below four volume.
OFF ------- No air flow
------- Gentle
------- Low
------- Medium
------- High

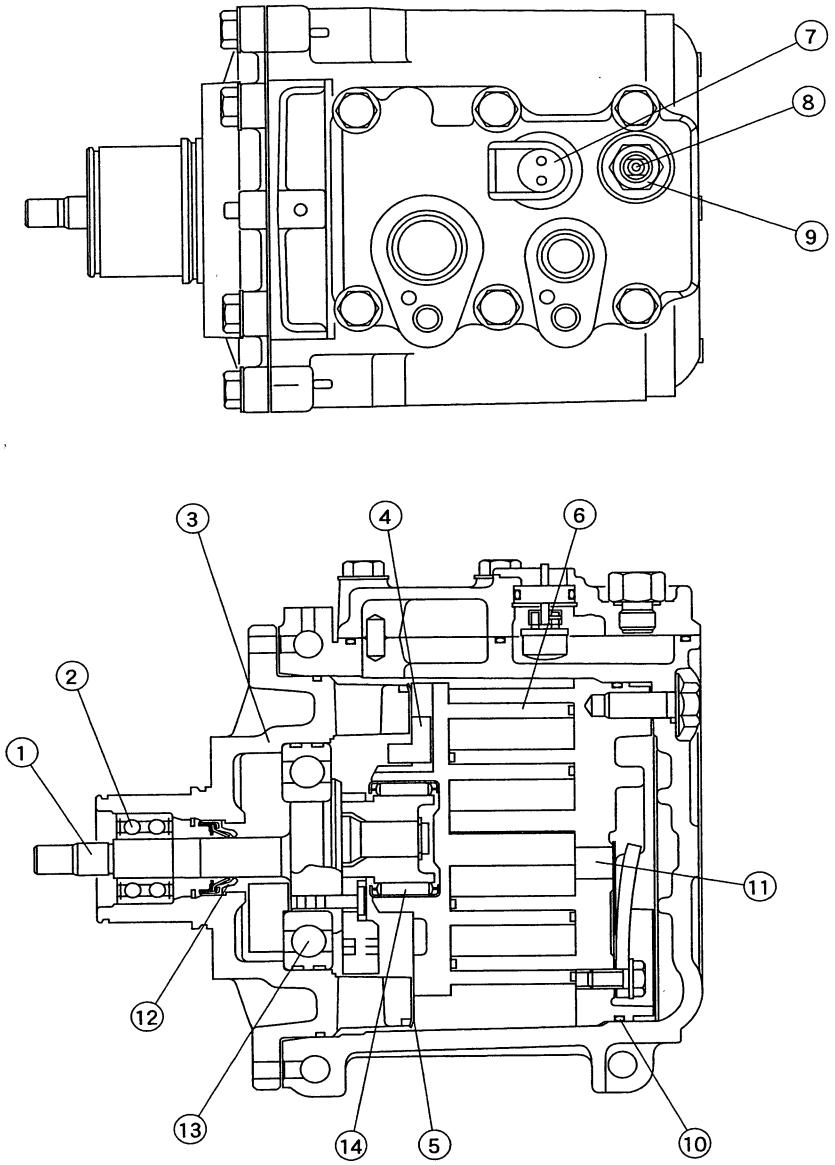
☐ Cool air lever
While heating the vehicle with the air outlet shift lever is set to the , or position, cool air can be flowed out from the ventilator to get rid of a glow in the upper half of the body.
Cool air does not flow out when the lever is in the position.

(2) Operation control

Operation mode	Setting control lever	Air delivery	Remarks
COOL			Earlier cooling service, or conditioning at dusty, polluted air prevailing places : Shift lever : Air circulation
HEAT			Earlier cooling service, or conditioning at dusty, polluted air prevailing places : Shift lever : Air circulation Air outlet mode select switch
DEHUMIDIFY			Wetty conditioning in head cooled, and foot warmed : Shift lever : Air outlet Air outlet mode select switch
DEFROST			
VENTILATION			

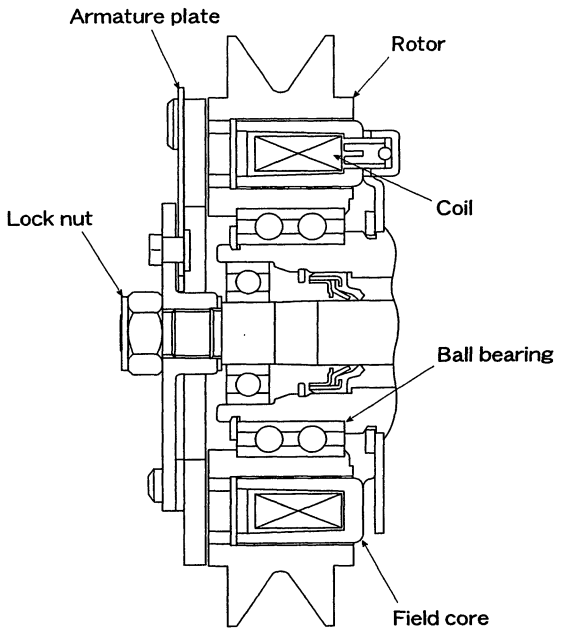
3.4 Compressor and clutch assembly

3.4.1 Compressor



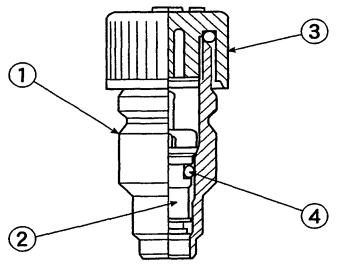
① Crankshaft
② Bearing
③ Front case assembly
④ Housing assembly
⑤ Thrust plate
⑥ Orbit scroll assembly
⑦ Thermostat
⑧ Dust seal
⑨ H/P relief valve
⑩ O-ring
⑪ Port hole
⑫ Shaft seal
⑬ Bearing
⑭ Needle bearing

3.4.2 Magnetic clutch



The magnetic clutch is mounted on the compressor crankshaft to start and stop the compressor.
This means that the magnetic clutch is actuated to control the compressor operation electrically by the thermostat.

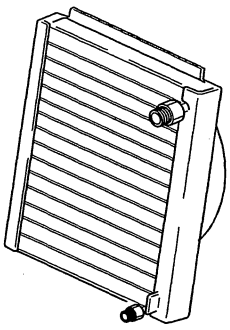
3.5 Check valve



① Valve body ③ Cap
② Valve core ④ Packing

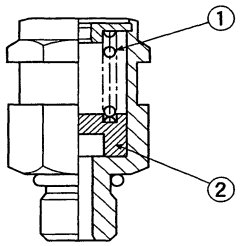
The suction hose and discharge hose are provided with check valve, and designed for gas evacuation and charging service. (shown above)
In the valves, a valve rubber tube, as in automobile tire tubes, is provided as shown in the figure.
Stackening the flare nut on the gauge manifold causes the passage to close automatically by the spring force, and tightening the flare nut causes the passage to open while pressing the compressed spring.

3.6 Side condenser assembly



The condenser is a means to liquefy the refrigerant gas. As the condenser is cooled by the air pulled in by the condenser fan, the refrigerant in the condenser is cooled into liquid. Therefore, when any obstacle prevents the air from flowing evenly to the condenser or the air flow is short circuited, the cooling effect is reduced, with a decrease in the performance of the condenser. When the vehicle is driven at a high speed, the air flow increases resulting in an increase of the cooling effect, and performance of the condenser.

3.7 Relief valve



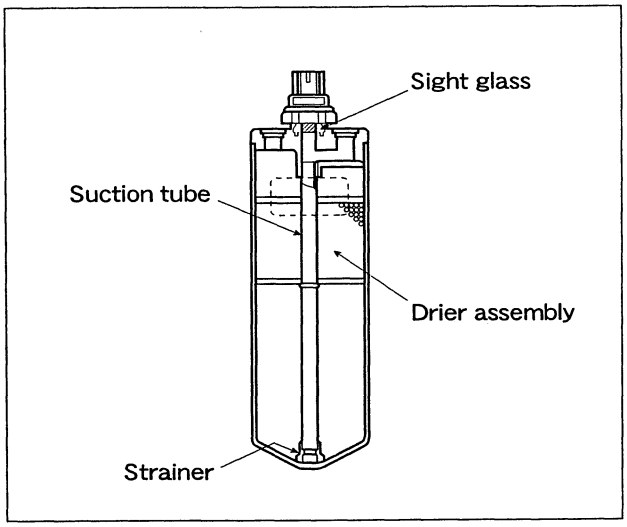
① Spring ② Valve

The relief valve is mounted to the compressor & clutch assembly. The relief valve is usually closed by spring.
If pressure of refrigerant in air conditioner system is higher than spring pressure, refrigerant is discharged from relief valve. The pressure drop due to discharge refrigerant, and relief valve is closed again.

Unit : MPa

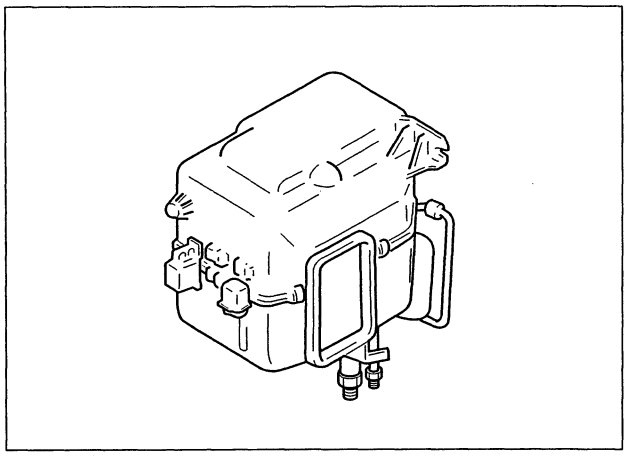
Open	3.50~4.10
Close	2.94

3.8 Receiver assembly



The receiver assembly is served as a refrigerant reservoir located between the condenser and expansion valve. The receiver assembly consists of a filter and a sight glass. The filter is used to remove dust , the drier is used to remove moisture from the refrigerant in the circuit, and the sight glass is used to check the refrigerant charge. Any moisture in the refrigerant may not only corrode metal surfaces in the refrigerant circuit, but also cause the throttle of the expansion valve to be frosted, resulting in the interruption of refrigerant circulation.
Therefore, the receiver assembly must be handled very carefully. When storing or installing it, care should be taken to protect it from the deterioration of drying performance due to exposure to the air.
The retardation of heat exchange, or any fire around the refrigerant circuit will cause excessive pressurization or heating of the refrigerant. Should such an accident occur, the refrigerant in the circuit must be expelled to the outside to prevent the above hazards.
The sight glass is a sort of peep window used to check the refrigerant flow in the refrigerant circuit.
The sight glass appears clear when the refrigerant flow is enough, and shows bubbles flowing when the refrigerant flow is short.

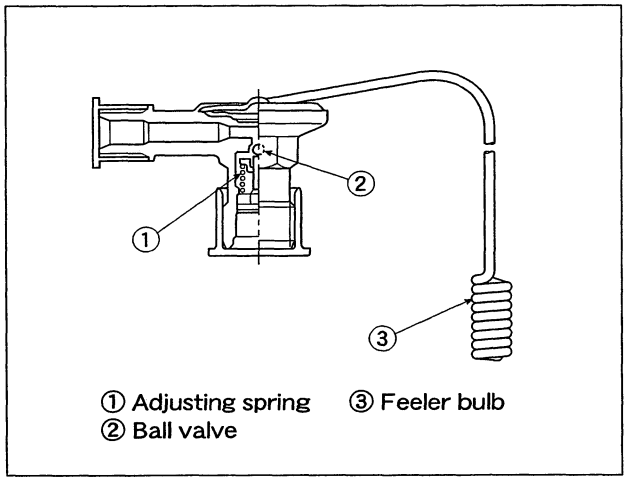
3.9 Cooling unit assembly



The evaporator core is a type of corrugated fin and tube. The tube is arranged in zigzag to achieve high effciency, and to make the core system compact.
A thicker reinforced plastic plate is used as the enclosure to inclease heat and shock resistance, and to protect the core from humidity. This case is a split type, and in a simple design to facilitate installation on the floor panel and the instrument panel frame of the vehicle.

3.10 Expansion valve

The expansion valve is mounted at the inlet of the cooling unit. The liquid refrigerant from the receiver is led to it through a narrow passage (for throttle action), where-in, the liquid refrigerant is condensed with pressure dropping and at the same time the flow rate is adjusted before the refrigerant is sent to the cooling unit.
The refrigeration load in the cooling unit is not constant, but usually fluctuates over a certain range. So the refrigerant flow should under go the control in design.
An automatic expansion valve performs this function automatically. The air condenser uses a thermal type automatic expansion valve.

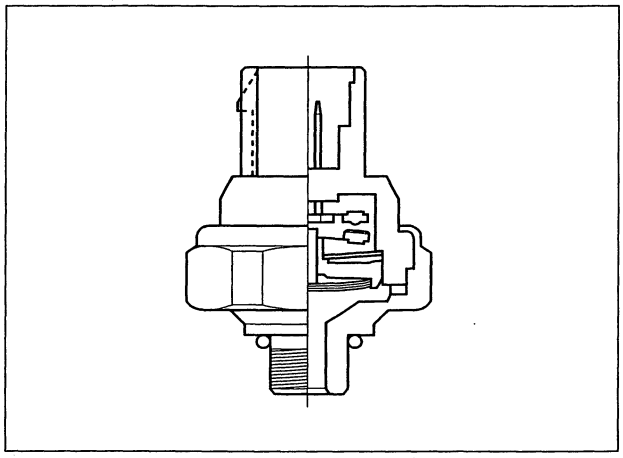


3.11 Dual pressure switch

The dual pressure switch, fixed to the receiver functions as a protector for stopping the compressor (OFF) at a preset value of pressure in the refrigerant circuit.

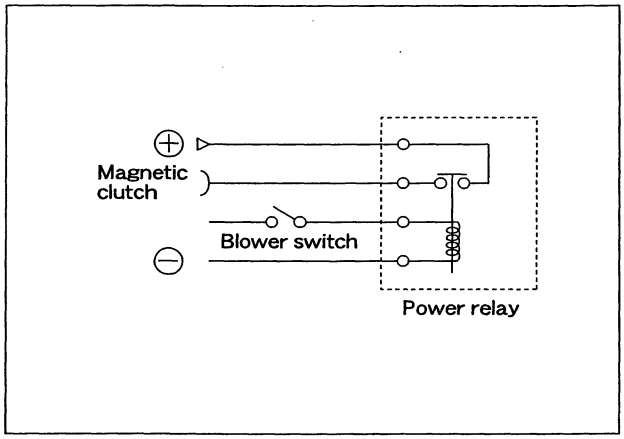
Unit : MPa

	LP side	HP side
OFF	0.20	2.94
ON	0.225	2.35



3.12 Power relay

The power relay is excited at a closed position of the micro switch and enables the magnetic clutch to be ready for engaging electically.

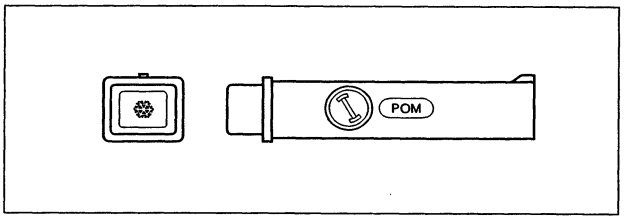


3.13 Air conditioner switch

The air conditioner switch functions as an operation controller for starting or stopping the compressor in cooling and dehumidifying.

By initially depressing it, the magnetic clutch becomes engaged and the compressor starts with the indication lamp signing.

By secondarily depressing it, the magnetic clutch becomes disengaged and the compressor stops with the indication lamp signing.

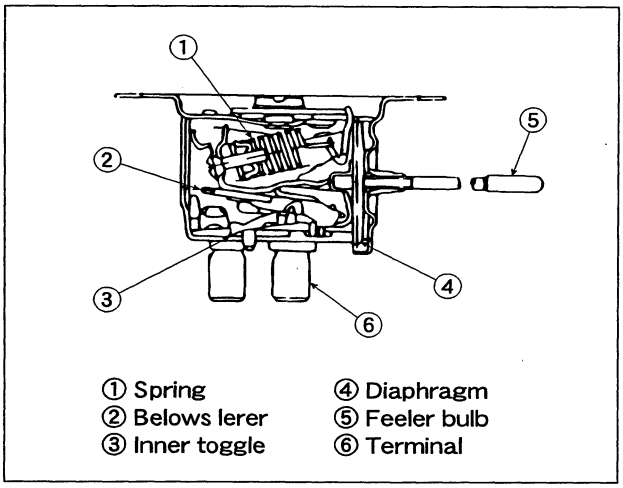


3.14 Thermostat

The thermostat is mounted on the evaporator case. It senses the temperature of evaporator fins, and controls the compressor operation for ON or OFF as specified below.

Unit : ℃

OFF	1.6
ON	4.6



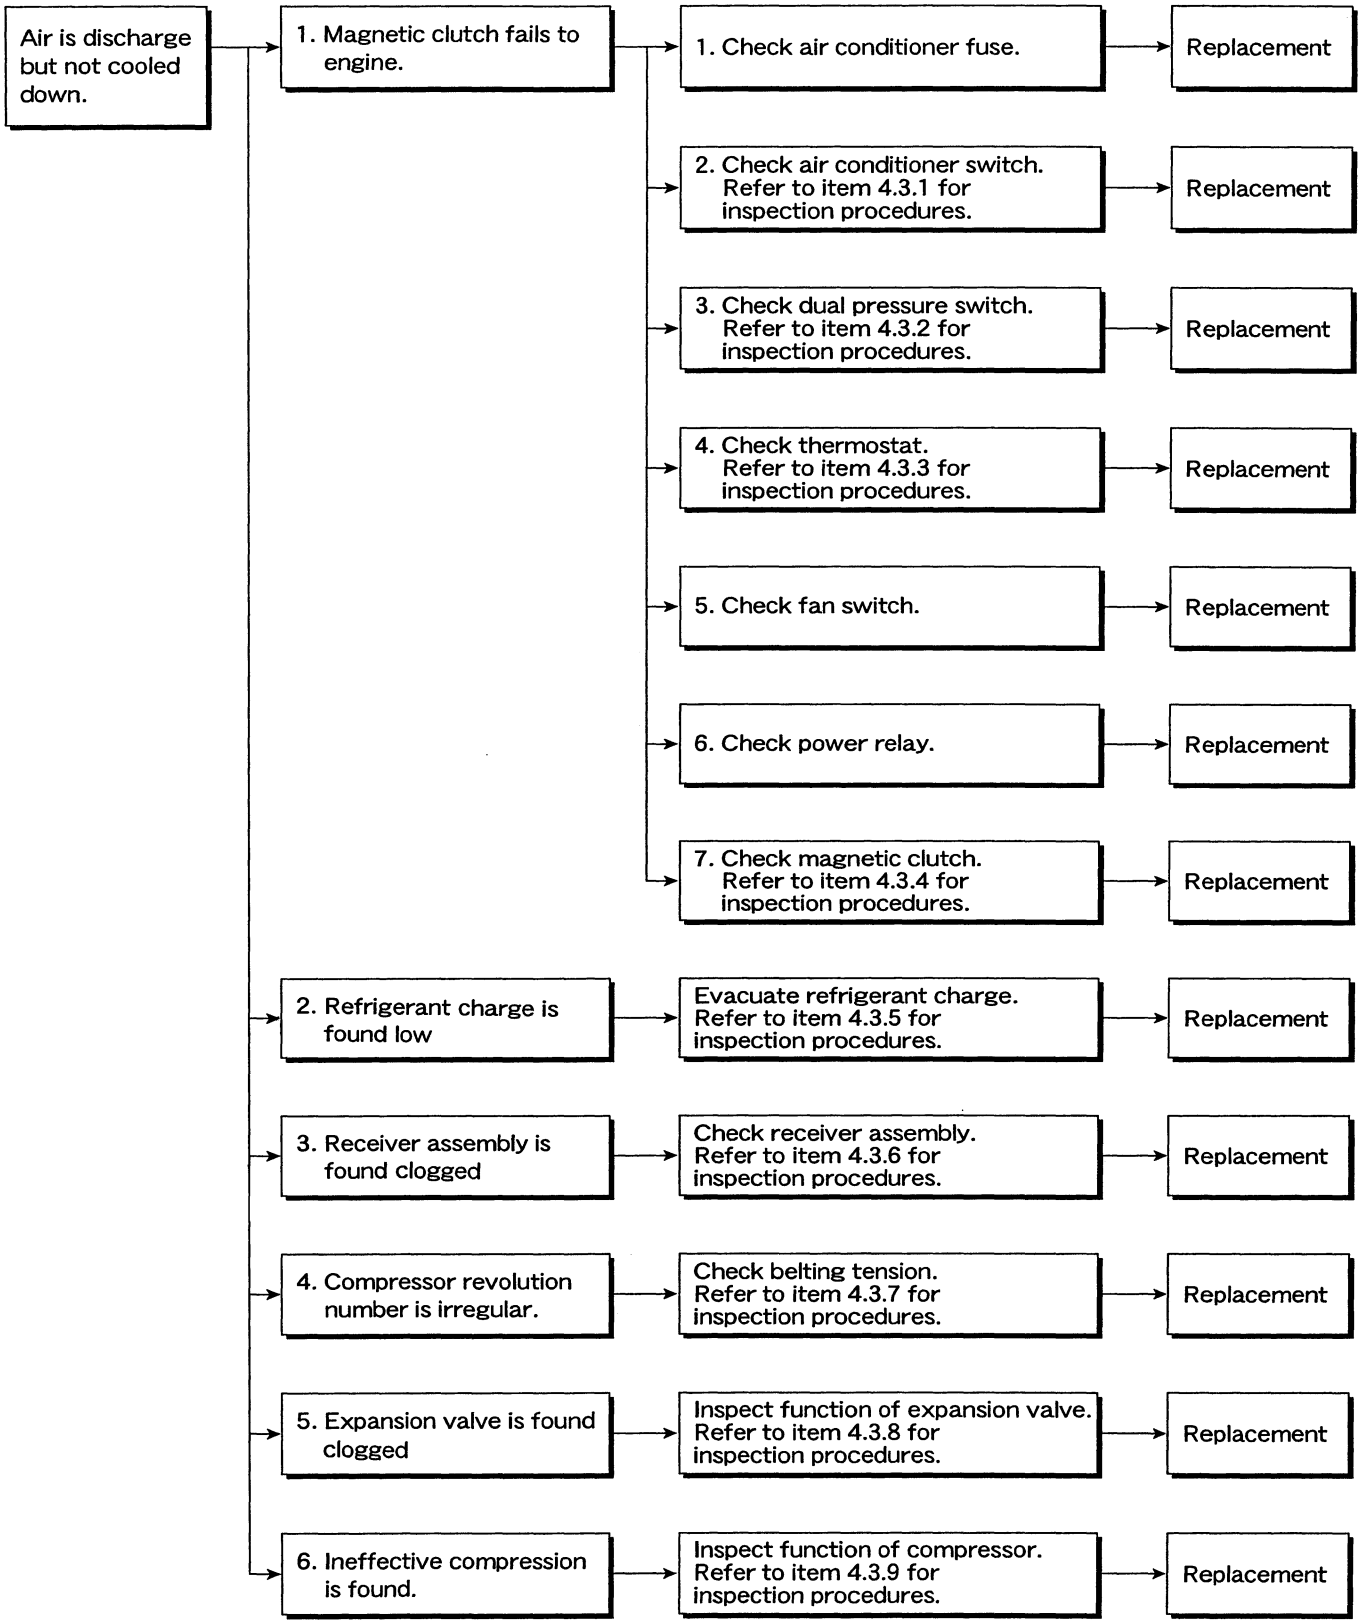
4 . TROUBLE SHOOTING

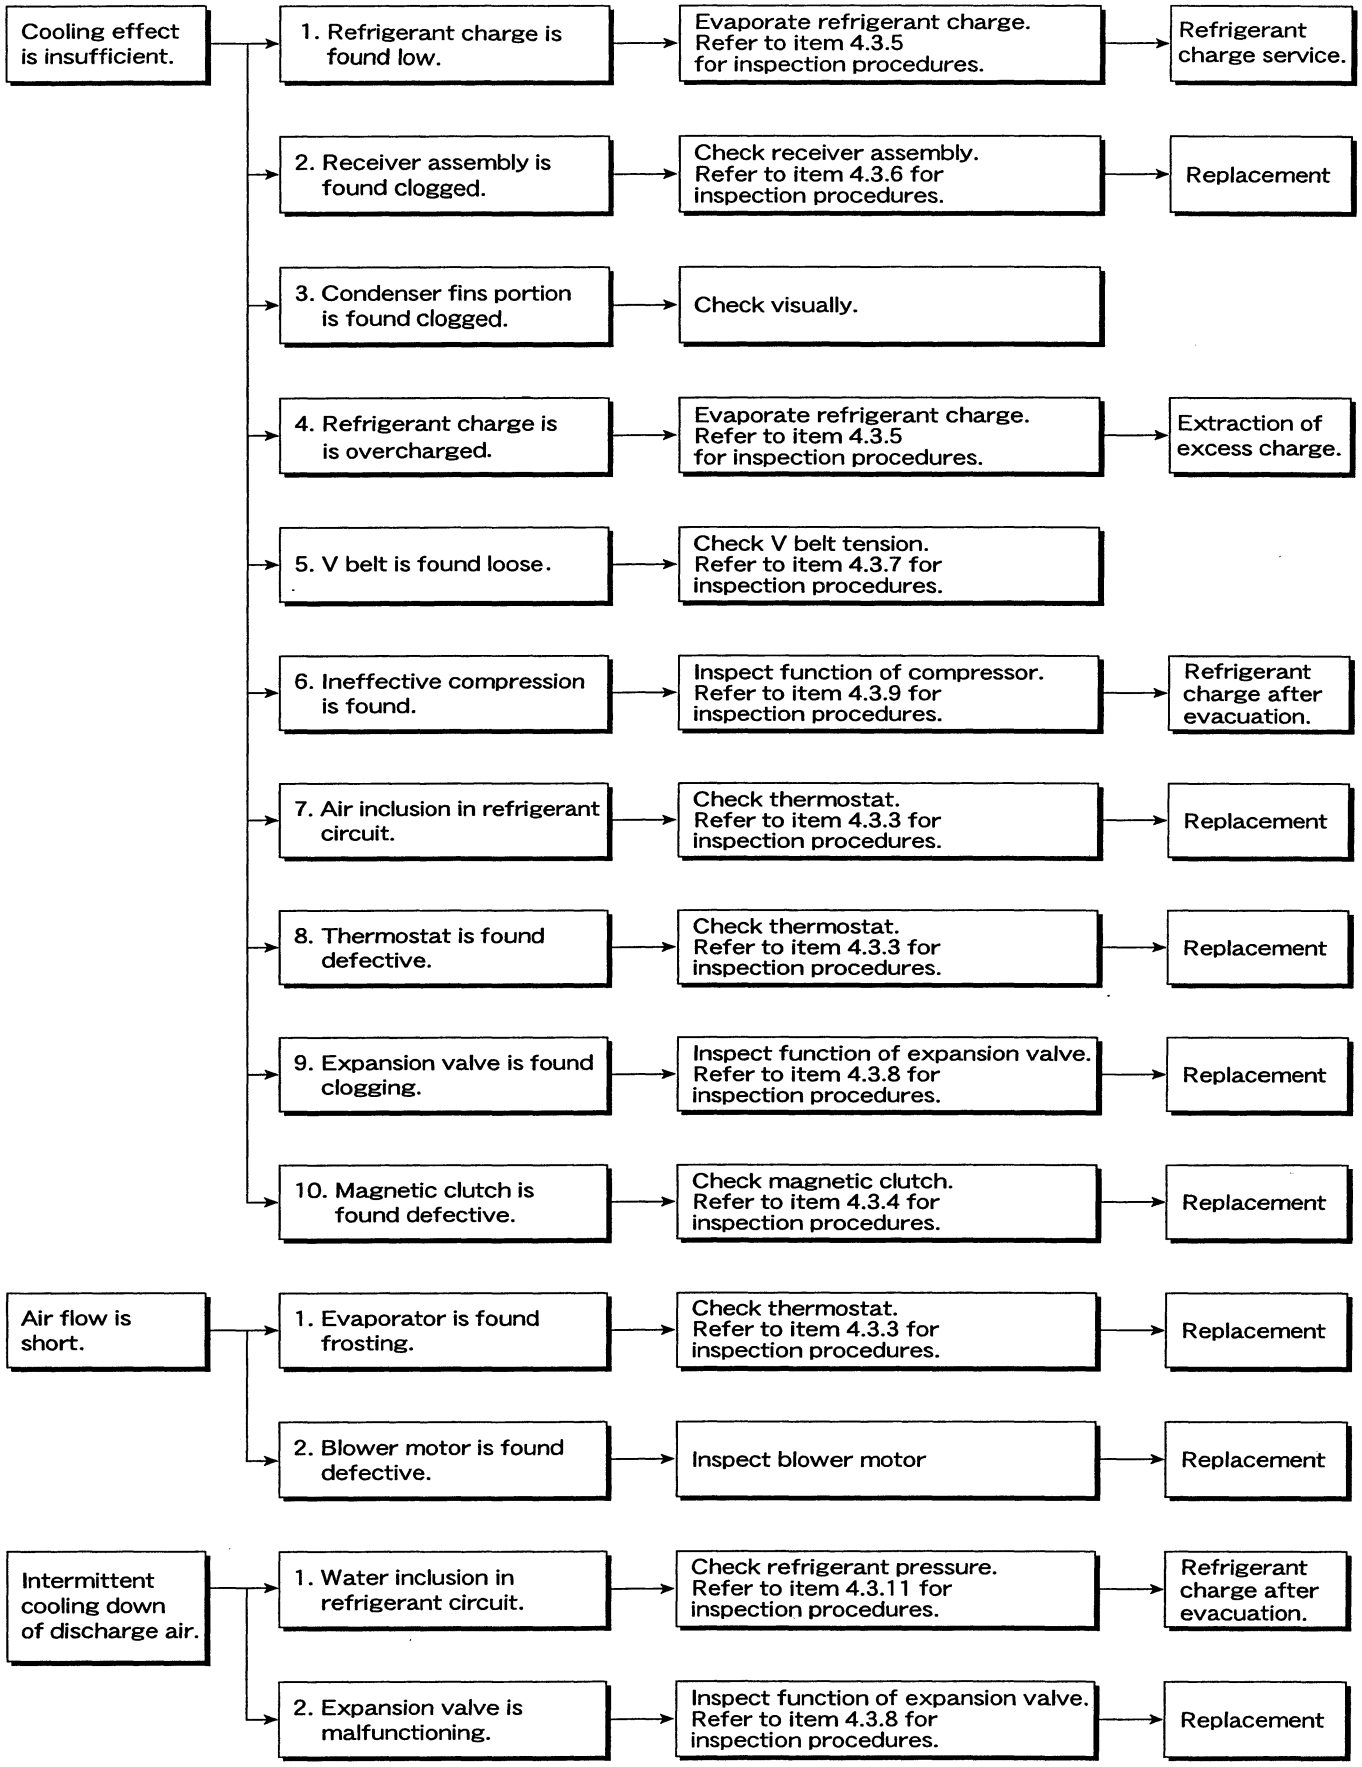
4.1 General precaution

(1) When handling refrigerant (HFC-134a), the following precautions must be observed.
   a. Allways wear eye protection and a pair of gloves which handling refrigerant.
   b. Be careful the liquid refrigerant dose not contact the skin.
   c. Keep the refrigerant container blow 40 degrees C.
   d. Do not handle the refrigerant in an enclosed area having an open flame. The refrigerant may produce a poisonous gas.
   e. When dumping the refrigerant from the system, release it slowly so as not to expell all the compressor oil.

(2) If liquid refrigerant strikes eye or skin.
   a. Do not rub eye or skin.
   b. Splash large quantities of cool water on the eye or skin.
   c. Rush to a physician or hospital for immediate professional treatment.

4.2 Trouble cause and remedy





Cooling effect is insufficient.
1. Refrigerant charge is found low.
Evaporate refrigerant charge. Refer to item 4.3.5 for inspection procedures.
Refrigerant charge service.
2. Receiver assembly is found clogged.
Check receiver assembly. Refer to item 4.3.6 for inspection procedures.
Replacement
3. Condenser fins portion is found clogged.
Check visually.
4. Refrigerant charge is is overcharged.
Evaporate refrigerant charge. Refer to item 4.3.5 for inspection procedures.
Extraction of excess charge.
5. V belt is found loose.
Check V belt tension. Refer to item 4.3.7 for inspection procedures.
6. Ineffective compression is found.
Inspect function of compressor. Refer to item 4.3.9 for inspection procedures.
Refrigerant charge after evacuation.
7. Air inclusion in refrigerant circuit.
Check thermostat. Refer to item 4.3.3 for inspection procedures.
Replacement
8. Thermostat is found defective.
Check thermostat. Refer to item 4.3.3 for inspection procedures.
Replacement
9. Expansion valve is found clogging.
Inspect function of expansion valve. Refer to item 4.3.8 for inspection procedures.
Replacement
10. Magnetic clutch is found defective.
Check magnetic clutch. Refer to item 4.3.4 for inspection procedures.
Replacement
Air flow is short.
1. Evaporator is found frosting.
Check thermostat. Refer to item 4.3.3 for inspection procedures.
Replacement
2. Blower motor is found defective.
Inspect blower motor
Replacement
Intermittent cooling down of discharge air.
1. Water inclusion in refrigerant circuit.
Check refrigerant pressure. Refer to item 4.3.11 for inspection procedures.
Refrigerant charge after evacuation.
2. Expansion valve is malfunctioning.
Inspect function of expansion valve. Refer to item 4.3.8 for inspection procedures.
Replacement

4.3 Inspection procedure

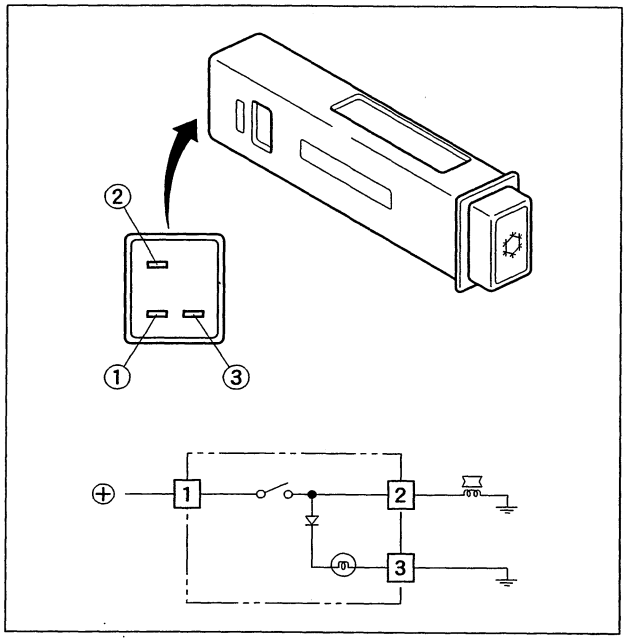
4.3.1 Air conditioner switch

(1) Unplug the air conditioner switch.
(2) Check the continuity between terminals of the air conditioner switch with a tester.

Continuity

Switch position	Terminal's number	Result, in normal
OFF	①-②	No
	②-③	Yes
ON	①-②-③	Yes

Switch position \ Terminal's number	1	2	2	Lighting
OFF				OFF
ON				ON

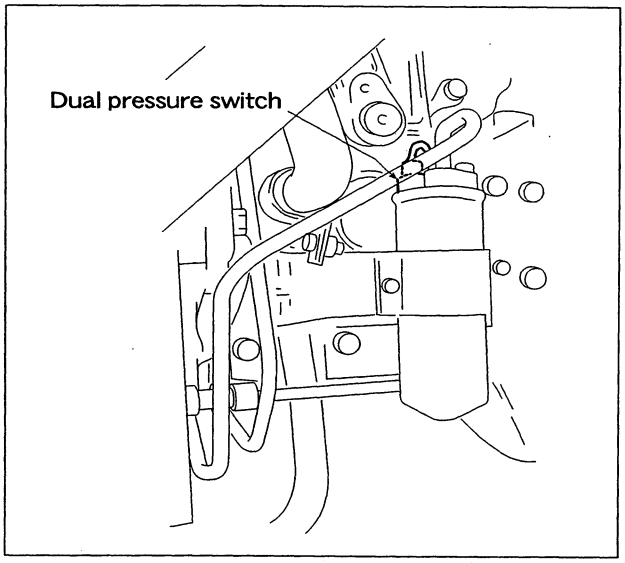


4.3.2 Dual pressure switch

The dual pressure switch is attached to the receiver assembly for controlling the operation of the air conditioner by checking the inside pressure of the receiver assembly.

Unit : MPa

	LP side	HP side
OFF	0.20	2.94
ON	0.225	2.35



(1) Unplug the connector at the receiver assembly.
(2) Check the continuity between terminals of the connector with a tester.
(3) When electric continuity is found, connect the connector to the high pressure switch.
(4) Attach the high pressure gauge and low pressure gauge.
(5) Operate the air conditioner.
(6) Cover the surface of the condenser by using a piece of paper.
(7) When the high pressure exceeds 2.94 MPa, if the magnetic clutch is turned off, the switch is normal.
(8) If the magnetic clutch is not turned off, replace pressure switch with new one.
(9) Check the accuracy of the preset as below.
  (a) Stop the air conditioner.
  (b) Purge the air conditioner of refrigerant slowly starting at over 0.225 MPa.
  (c) At reading the pressure 0.20 MPa, the switch opens.
  (d) Here, stop the purging, then turn it to charging.
  (e) At reading the pressure 0.225 MPa, the switch closes.

If the dual pressure switch does not meet specifications, replace the switch.

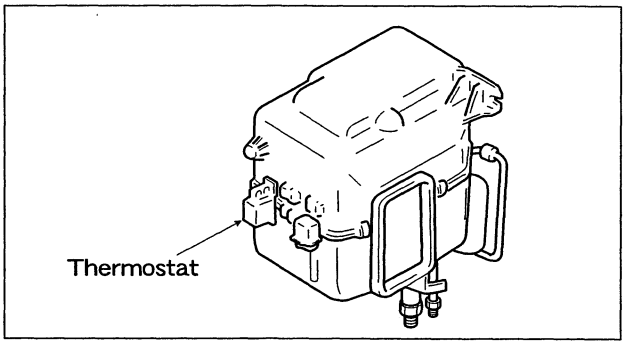
4.3.3 Thermostat

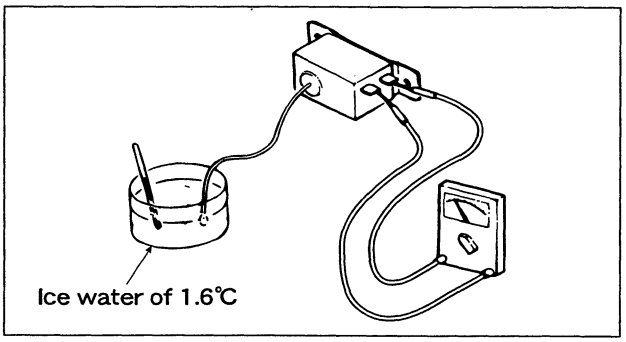
The thermostat is mounted on the evaporator case. It controls the operation of the air conditioner by sensing the temperature of the evaporator fins.

Unit : ℃

OFF	1.6
ON	4.6

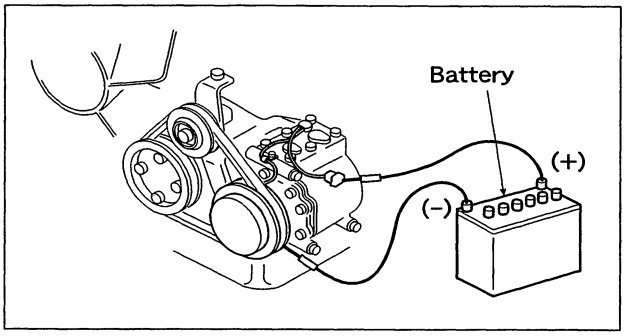
(1) Check the accuracy of the preset as below.
  (a) Soak the sensor of the thermostat in ice-water of below 1.6℃.
  (b) Check the continuity between the switch terminals.
  (c) Pull the senser out of the ice-water, and check the continuity at over 4.6℃ of the senser.





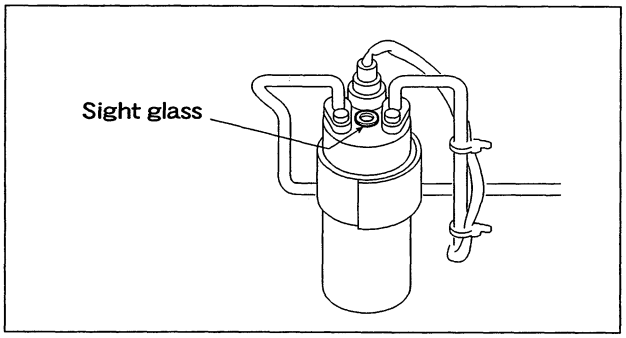
4.3.4 Magnetic clutch

(1) Disconnect the wiring to the magnetic clutch.
(2) Apply a positive side power voltage to the magnetic clutch through the wiring.
(3) In the case of regular functioning, the pulley and magnetic clutch are engaged with a clicking sound. The falling means any malfunction of the magnetic clutch.



4.3.5 Refrigerant charge

(1) Set the temperature control lever at the cool position.
(2) Open doors of the room.
(3) Set the blower switch at the ON position.
(4) Adjust the engine revolution at 1500min^{-1}.
(5) Operation the air conditioner switch for comp. ON.
(6) Watch the sight glass of the liquid hose at the inside of the engine room.
  (a) If judged insufficient refrigerant charging, repair the leaks, then charge it additionally.
  (b) If judged as over charging of refrigerant, extract an excess refrigerant.
(7) Diagnosis by pressure reading.
  (a) Short of refrigerant:
    Lower pressure for both LP and HP reading.
  (b) Express of refrigerant:
    Higher pressure for LP and HP reading.

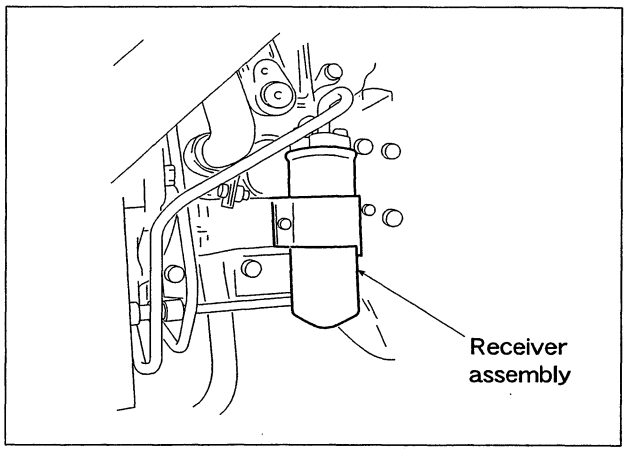


Sight glass		Remarks
Proper refrigerant level	Bubble	1. Bubble occasionally appears. 2. Bubble disappear if speed is a little increased.

Sight glass		Remarks
Insufficient refrigerant	Bubble	Considerable bubbles appear. If the system is extremely short of refrigerant, the sight glass appear white.
Excessive refrigerant		1. No bubbles appear. 2. Slight bubbles appear if speed is decreased.

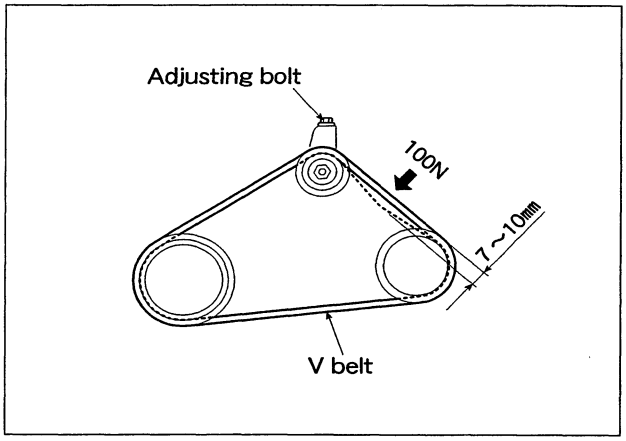
4.3.6 Receiver assembly

(1) While operating the air conditioner, touch the refrigerant piping with a hand at the inlet and outlet portions.
  (a) Sensed temperature difference:
    It is possible that clogging is happening at the inside, liquid receiver assembly is to be replaced with a new one.



4.3.7 Belt tension

(1) Depress the V belt with a thumb at the ⬅ marked position, and adjust the stretching as below.
  Stretching degree : 7~10 ㎜
  (deflection)
(2) Adjustment
  (a) Loosen the nut of the tension pulley.
  (b) Control the belting tension by the adjusting bolt.
  (c) After finishing, retighten the nut as before.

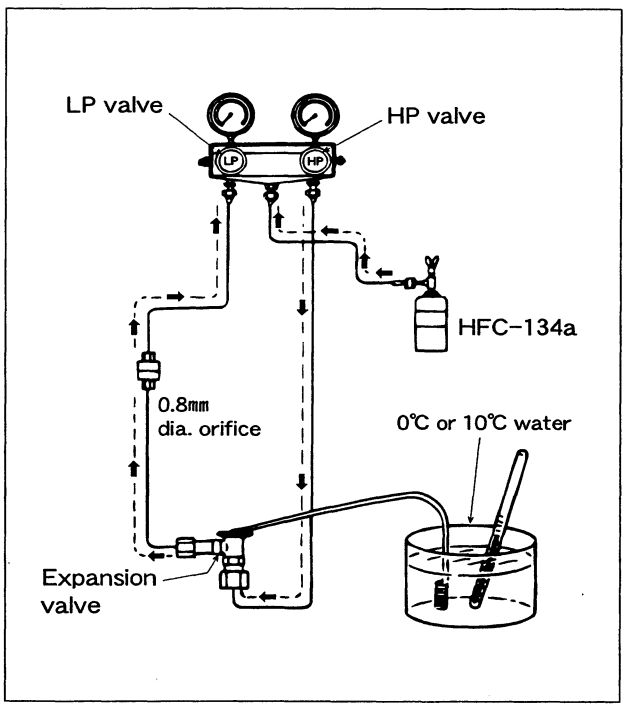


4.3.8 Expansion valve

⚠ CAUTION

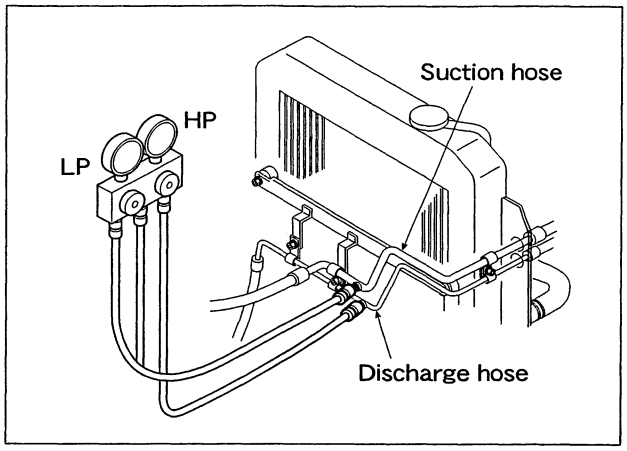
The test should be applied to only the case of the other components being free from troubles, and the expansion malfunctioning singly.

(1) Build up the test circuit with a gauge manifold.
(2) Soak the sensor bulb in ice water of 0℃, and of 10℃ respectively.
(3) Pressurize the HP side with dry nitrogen gas of 1.03MPa.
(4) Check the reading of the LP side pressure gauge for the standard range.
  At 0℃ ····0.127MPa
  At 10℃ ····0.23MPa



4.3.9 Pressure check

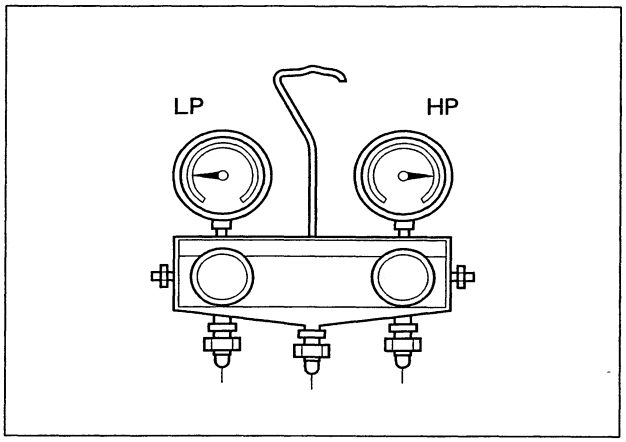
(1) Mount a low pressure gauge hose and a high pressure gauge hose on the check valve.
(2) Drive the air conditioner.
(3) Showing of higher LP side pressure and lower HP side pressure evidences ineffective compression.
Standard pressure
LP side pressure About 0.26MPa
HP side pressure About 1.42MPa



4.3.10 Air inclusion in ref.circuit

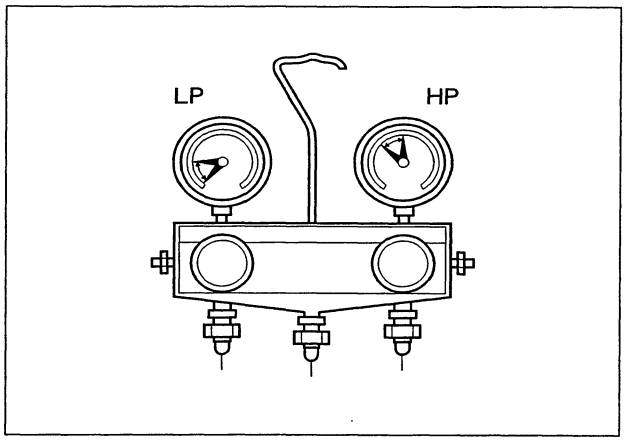
The abnormal reading of refrigerant circuit evidences afraid air inclusion.

A little higher LP side pressure. Noticeably higher HP side pressure.



4.3.11 Moisture inclusion in ref.circuit

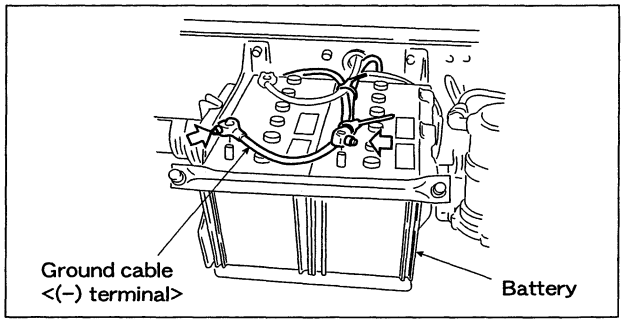
(1) During the operation, cooled air supply is interrupted periodically with a time interval.
This phenomenon evidences water inclusion.
(2) Check the refrigerant pressure at a stop of the cooled air supply to make sure of the water inclusion.
LP side pressure ····Almost vacuum
HP side pressure ····Noticeably low



5 . REMOVAL AND INSTALLATION

5.1 Precaution for removal and installation

(1) Disconnect the (-) ground cable from the battery, and place a cover on the battery.

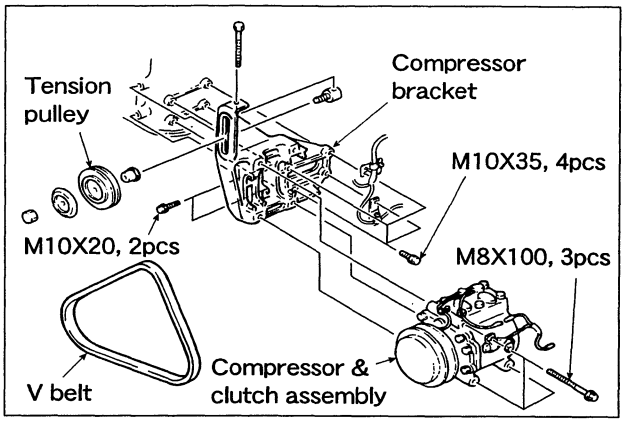


(2) Make certain all the openings are covered with caps in order to prevent entry of foreign substances such as dust and dirt.
(3) Never tamper with the brake and fuel systems, including the brake tubes and hoses.
(4) Avoid doing the work in a dusty place or outdoors in rainy weather. If tubes or functional parts are removed, put a cap in position immediately in order to prevent entry of dust and moisture.
(5) Connect the charging hose of the gauge manifold to the check valves (suction and discharge) of the suction hose and discharge hose, and recover the refrigerant by refrigerant recovery unit until its pressure is reduced to 0 kPa.
(Make sure that there is no internal pressure in the equipment.)
About discharging might result in the discharge of the refrigerant oil from the compressor.
(6) Be sure to use two spanners when removing pipes. Loosen the flare nut on the pipe with one spanner while holding the opposite part in position with the other spanner.
(7) When coupling the flared tube, coat the flared portion with the compressor oil at the inner side.
(8) Make sure to use the wheel chocks.

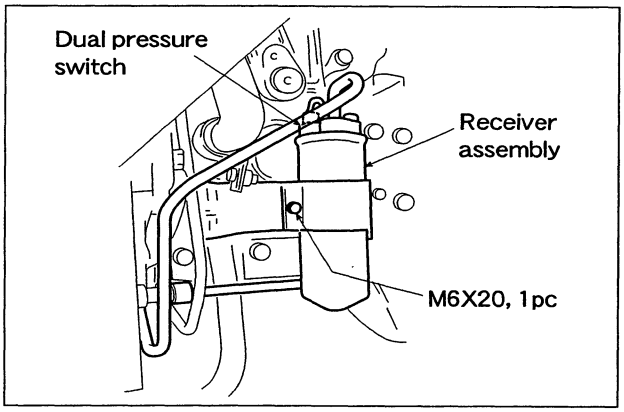
5.2 Removal

5.2.1 Inside engine room

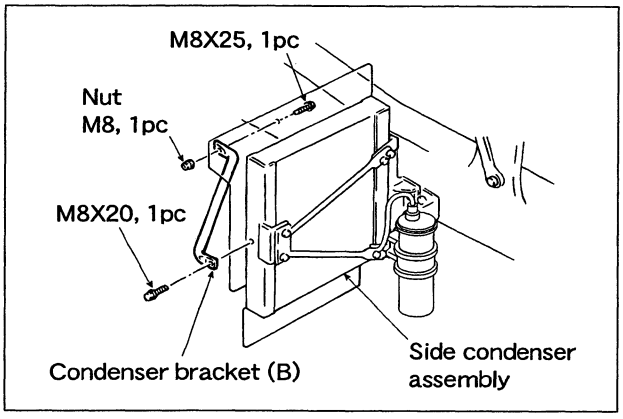
(1) Compressor & clutch assembly
(a) Remove the duct for air cleaner.
(b) Withdraw the wiring of the magnetic clutch at the connector.
(c) Remove the V belt by loosening fixature of the tension pulley.
(d) Take of the anchor bolts : M8X100, 3pcs.
(e) Dismount the compressor & clutch assembly.



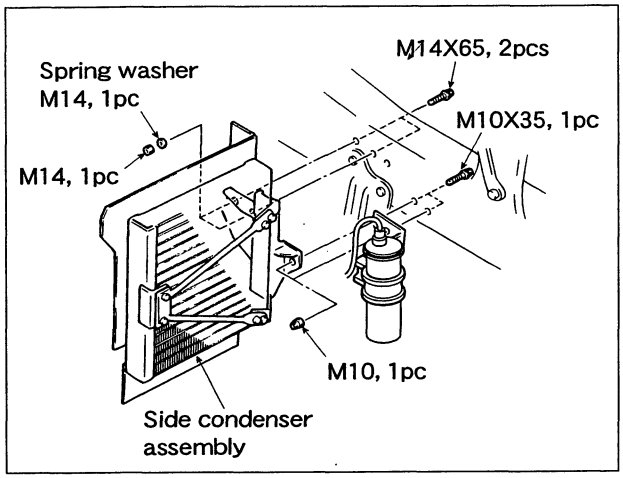
(2) Reciever assembly
(a) Unplug the dual pressure switch at the connector.
(b) Separete the interconnecting refrigerant pipe of the receiver assembly.
(c) Take off the fixing bolt : M6X20, 1pc.
(d) Dismount the receiver assembly.



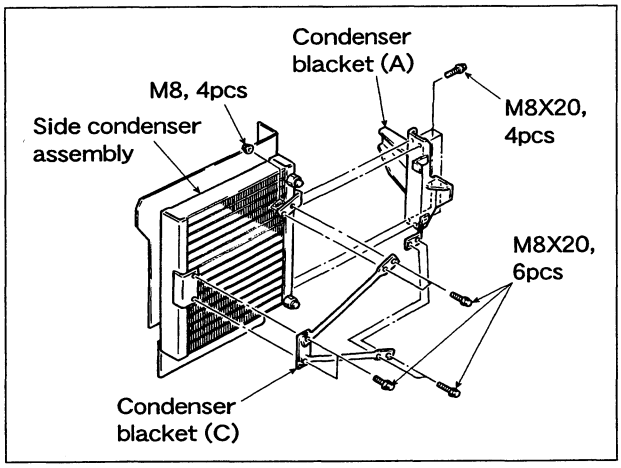
(3) Side condenser assembly
(a) Take off the fixing bolt : M8X20. 1pc, M8X25, 1pc, fixing nut : M8, 1pc.
(b) Dismount the condenser bracket (B).



(c) Take off the fixing bolt : M14X65. 2pcs, spring washer : M14, 2pcs, and nut : M14, 2pcs, and bolt : M10X35, 1pc, and nut : M10, 1pc.
(b) Dismount the condenser bracket (A).

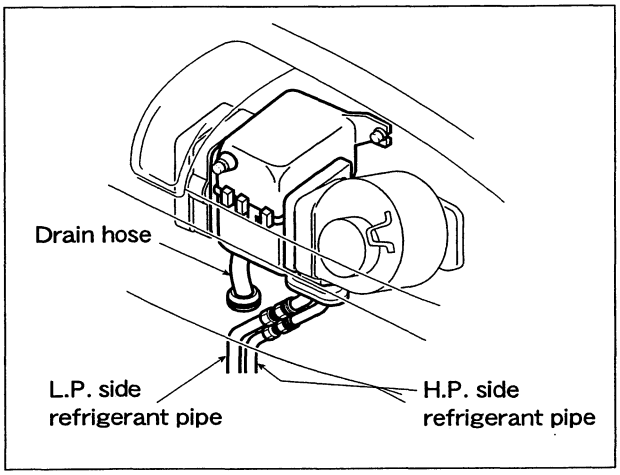


(e) Take off the fixing bolt : M8X20, 4pcs and M8X20, 6pcs, and nut : M8, 4pcs.
(f) Dismount the side condenser assembly.

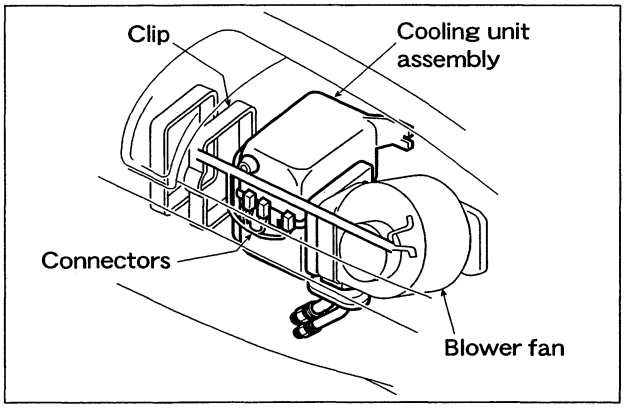


5.2.2 Cabin room

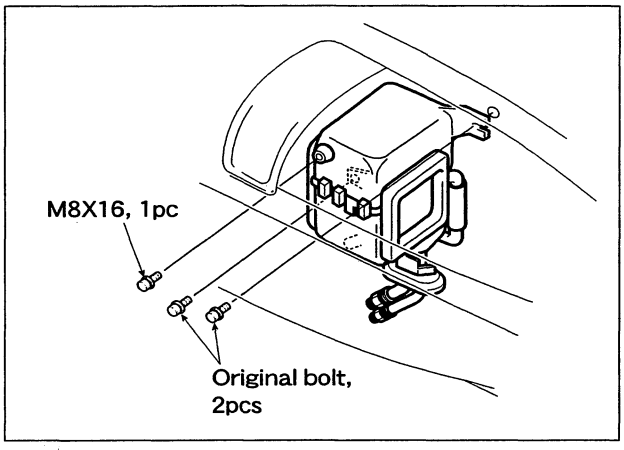
(1) Cooling unit assembly
(a) Separate the interconnecting refrigerant pipes of the cooling unit assembly.
(b) Remove the drain hose.



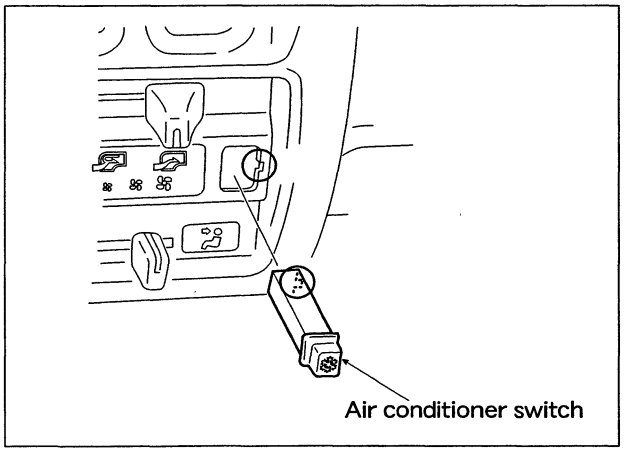
(c) Dismount the clip to the cooling unit assembly.
(d) Dismount the blower fan.
(e) Withdraw the wiring of the cooling unit assembly at the connectors.



(f) Tale off the fixing bolt : M8X16, 1pc and original bolts, 2pcs.
(g) Dismount the cooling unit assembly.



(2) Air conditioner switch
Pull out the air conditioner switch.



5.3 Installation

Installation is performed in the opposite sequence of removal.

○ Torque for tightening coupler of refrigerant tubing.

Unit : N・m

Compressor suction hose	29~34
Compressor discharge hose	20~25
Condenser inlet hose	20~25
Condenser outlet hose	12~14
Liquid receiver assembly inlet and outlet hoses	12~14
Cooling unit inlet hose	12~14
Cooling unit outlet hose	29~34

○ Torque for tightening general bolt and nut

Unit : N・m

Nominal size	Pitch	Tightening torque		
		Head mark 4	Head mark 7	Head mark 8
M5	0.8	3~4	5~6	5~7
M6	1.0	5~6	9~11	8~12
M8	1.25	12~14	19~24	19~29
M10	1.25	24~29	38~48	43~58
M10	1.5	17~26	32~48	41~58
M12	1.25	34~43	58~77	82~106
M14	1.5	72~82	115~134	125~173

NOTE

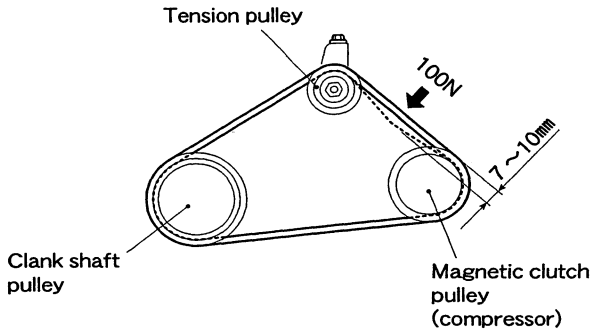
For the cases of spring washer seated, and thread or seating surface coated with oil, the value shall be reduced down to 85 percent of the data listed.

6. TREATMENT AFTER INSTALLATION

6.1 Check and adjustment

After installation, check the following points and confirm that everything is normal, then charge the gas, and do the performance and operation tests.

(1) Check if any abnormal vehicle performance, happens or not by installing the air conditioner.
(2) Check the operation of the magnetic clutch. (with the compressor disengaged)
(3) Check if any parts left unmounted or any tool left in the vehicle.
(4) Check to ensure that the temperature control lever operates properly.
(5) Check the tension of the belt.



6.2 Leak test

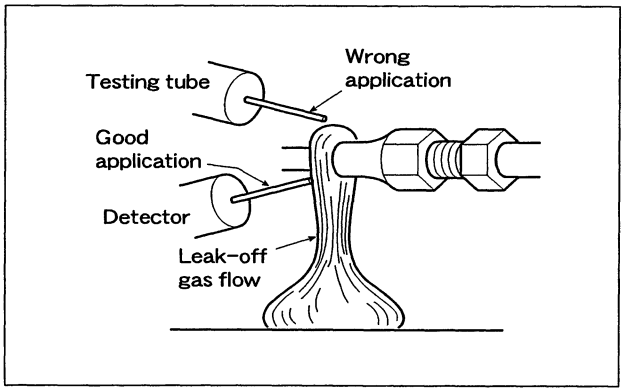
After all the piping works are completed, conduct an leak test by the following procedure to check any leaks at the flare coupling, etc. and then evacuate the system. If this leak test is omited and evacuation is immediately started, there is no way of detecting possible leak. If there are leaks, the specified vacuum cannot be attained. In order to save the service time be sure to conduct the leak test before evacuation.

6.2.1 Test points

(1) All pipe joint.
(2) Shaft seal and check valve on the compressor.

6.2.2 Test procedure

(1) For the gas leak test, the use of an electric gas leak detector is recommended. (HFC-134a SAE Approved)
(2) Perform the test at a place as in free from air flowing.
(3) The refrigerant is heavier than air. Leaks will concentrate at the bottom. Make certain that the testing tube is applied below the check point.



(4) The test should be performed patiently. Make certain that testing tube is moved slowly [approx. 10mm/sec].
(5) The high pressure side refrigerant circuit should be tested for gas leaks during operation. Those areas which are dangerous or hard to test during operation (including areas around the compressor and condenser) should be tested direct after shutdown.

(6) The low pressure side refrigerant circuit should be tested during shutdown after the gas pressure has balanced.
(7) The test should be performed on the basis of the following standards:

Gas leak test standards

test point / Instrument	Compressor shaft seal	Other parts
Electric gas leak detector	Pointer shall not swing more than 0.1mA at the low sensitivity.	Pointer shall not swing more than 0.1mA at the low sensitivity.
handle torch gas leak detector	Flame colour (moss green) shall not change.	

⚠ WARNING

- Smoking should be forbidden if a gas leak is detected.
- If a flame is applied to the refrigerant, toxic phosgene gas will be produced. Do not keep the detector in contact with a leaky point for a long time.

- Leak test procedure

1. Attach refrigerant supply and gauge set as shown with all valves closed. Open refrigerant supply valve on can.
2. Loosen the center charging hose fitting at the gauge manifold end to blow any air from the hose until it hisses for a few seconds, then refrigerant.
3. Open both gauge valves to partially charge the system and then close both valves.
4. The system can then be checked for leaks using an electronic leak detector.
5. If leaks are found that require the system to be opened (to repair or replace hoses, fittings, etc.), release any charge in the system.
6. After checking and repairing leaks, system must be evacuated.

6.3 System charging

GENERAL PRECAUTIONS

⚠ WARNING

When handling refrigerant (HFC-134a), the following precautions must be observed.

- Always wear eye protection and gloves while handling refrigerant.
- Be careful that liquid refrigerant does not contact the skin.
  If liquid refrigerant strikes eye or skin:
  - Do not rub on skin.
  - Splash large quantities of cool water on the eye or skin.
  - Flush eyes or skin with cool water for 5 minutes.
  - Rush to a physician or hospital for immediate professional treatment.
  - Do not attempt to treat it yourself.
- Keep the refrigerant (HFC-134a) container below 40℃.
- Do not handle the refrigerant in an enclosed area having an open flame; the refrigerant may produce a poisonous gas.
- Use approved recovery equipment to recover HFC-134a refrigerant before attempting service of this or any other HFC-134a system.
- Do not attempt to leak test an HFC-134a system with high pressure air or nitrogen. Mixing HFC-134a with a concentrated quantity of air may be combustible in the presence of ignition.

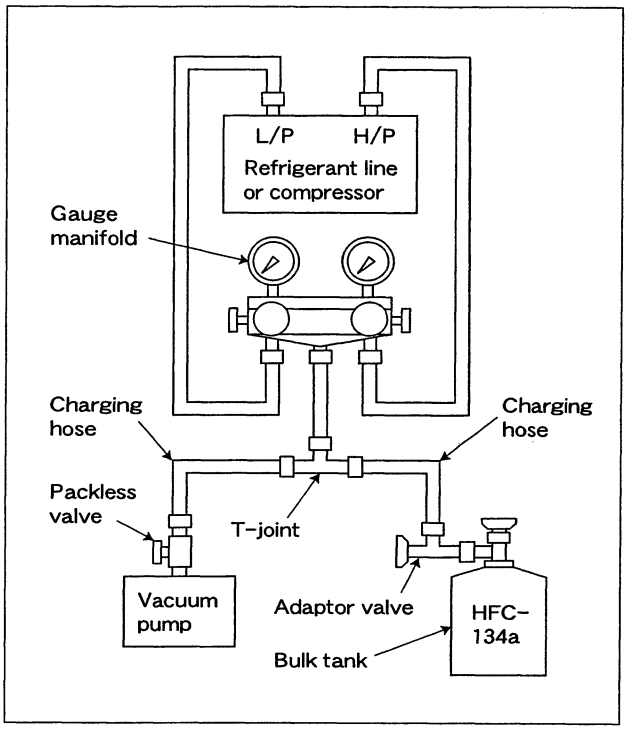
6.3.1 Evacuation

INSTALLATION OF CHARGE EQUIPMENT

(1) Connect the gauge manifold to the service valves.
(2) Connect the packless valve to the vacuum pump.
(3) With the charge valve handle turned back all the way, install the bulk tank.
(4) Connect each charge equipment as illustrated.

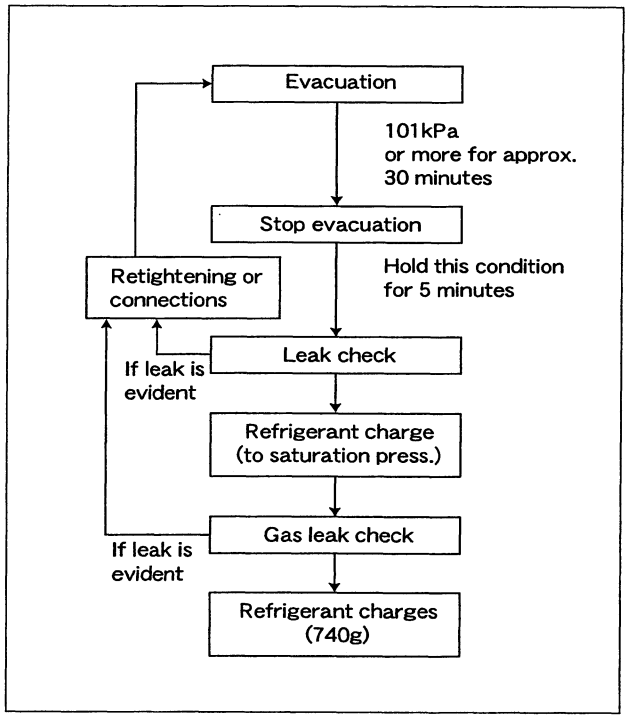
⚠ CAUTION

1. Do not connect the high and low pressure sides adversely. (Connect high pressure side to the condenser and low pressure side to the cooling unit.)
2. The indications "DIS" and "SUC" on the compressor indicate high and low pressure sides respectively.



6.3.2 Evacuate the system

The refrigerant system must have been evacuated using the previous procedure before charging. Charge using only HFC-134a refrigerant. HFC-134a is available in bulk tank. Follow the safety precautions for handling HFC-134a as listed in this section.
Follow the evacuation procedure below and at right.
This procedure assumes no HFC-134a refrigerant has been introduced into the system. If evacuating a charged system, it is necessary to recover the existing HFC-134a refrigerant before continuing with these instructions.
Refer to the recover equipment manufacture's instructions for proper refrigerant recovery.



CHARGING WITH BULK TANK

When using disposable cans of this type, follow carefully the tank manufactures instructions.

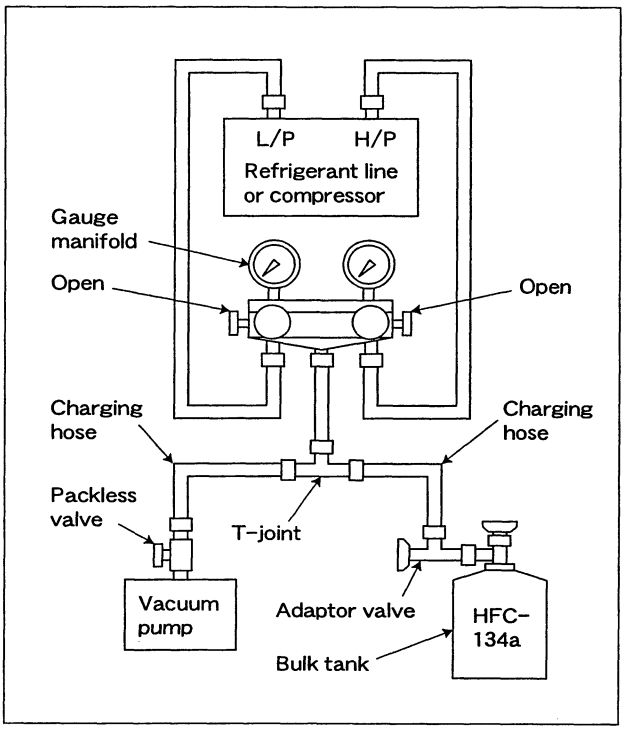
(1) Start up the vacuum pump.

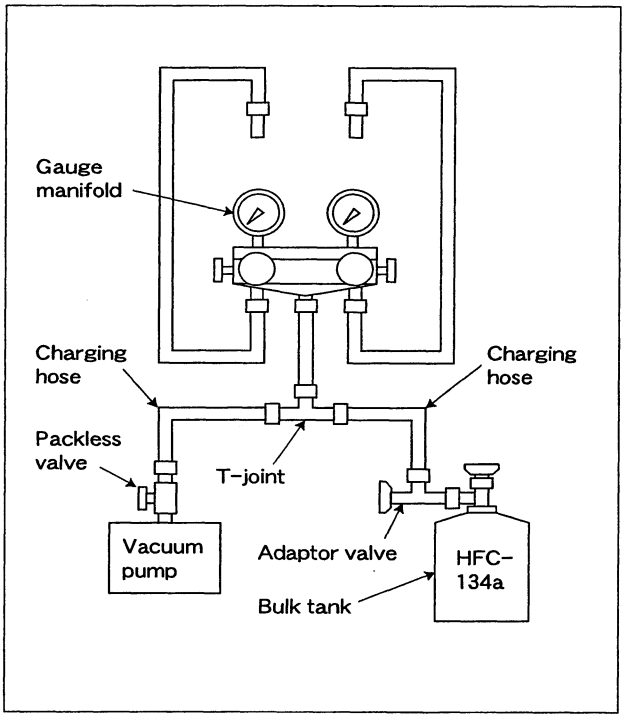
> ⚠ CAUTION
>
> 1. Do not use the compressor for evacuation.
> 2. Do not operate the compressor in the vacuum condition; damage may occur.

(2) Open the gauge manifold handles and the packless valve.
(3) Evacuate to a vacuum reading of 101kPa higher (approx.30 minutes).
(4) Turn back the packless valve all the way and close the bulk tank.
(5) Stop the vacuum pump and allow to stand for 5 minutes.
(6) Check for leak. (Good if the vacuum is held.)
(7) Tighten the charge valve handle to puncture the bulk tank.
(8) Open the charge valve to charge the system with refrigerant.
(9) When the refrigerant is no longer drawn in, turn back the high pressure side gauge manifold handles.
(10) Check for gas leaks using a leak detector.
(11) Start the engine.
(12) Operate the air conditioner and set at the lowest temperature (MAX. COOL).
(13) Fix the engine speed at 1500min^{-1}.
(14) Continue charging system until proper refrigerant quantity is introduced into the system.

> ⚠ CAUTION
>
> If the bulk tank is inverted, liquid refrigerant may be drawn into the compressor damaging it by liquid compression. Keep the bulk tank upright to ensure that refrigerant is charged in gas state.

(15) Upon completion of charging, turn back the low pressure side gauge manifold handles.





6.3.3 Removal of charge equipment

(1) Close the charge valve.
(2) Remove the gauge manifold from each service valves.

> ⚠ CAUTION
>
> Do not remove the bulk tank, T-joints and adaptor valves but keep them connected for next charge operation.

OPERATING LOW REFRIGERANT LEVEL

Locate the souce of the low refrigerant level, recover system, repair system, evacuate system, charge ststem, check for leaks.

> ⚠ CAUTION
>
> If the bulk tank is not emptied completely, keep the charge valve connected to the tank for next charging.

6.3.4 Discharging system

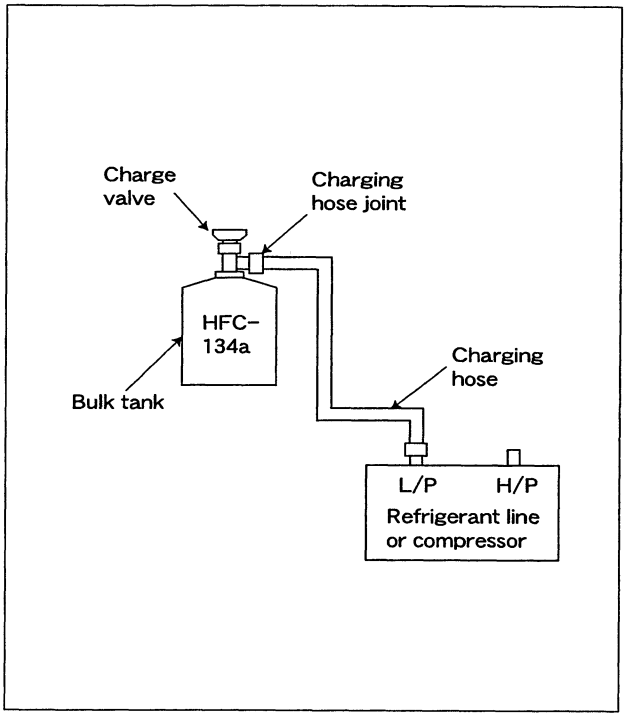
Use the refrigerant recovery unit which can be purchased in local market to discharge refrigerant gas from the system.

> ⚠ CAUTION
>
> Refer to that Refrigerant Recovery Unit Instruction Manual for operation which is attached on the unit.

LIQUID CHARGE, through high side using charging station:

> ⚠ CAUTION
>
> Do not run engine when performing liquid charge; compressor will be damage.

(1) After the system is evacuated, close gauge valves, connect center hose to refrigerant supply. Loosen center fitting at gauge to blow any air out of the hose and then retighten.
(2) Following charging station manufacture's instructions charge the system until 740g of refrigerant is pumped into the system.
(3) When system is fully charged, close high gauge valve and refrigerant supply valve, then quickly disconnect gauge hoses from service
(4) After charging the system, refer to pre-delivery inspection.



6.4 Performance test

6.4.1 Preparation

Reinstall all vehicle parts that were removed for installation of the air conditioner at their original positions, adjust the mounting, and test the following items.

(1) Installation of grommets.

Install the specified grommets.

6.4.2 Stationary performance test

(1) Operating conditions

(a) Place the vehicle in the shade with doors open.

(b) Keep the return air temperature between 25 to 30℃, (Adjust by changing the opening degree of the doors).

(c) Set the fan switch to the max position.

(d) Turn the thermostat control lever to the cool position.

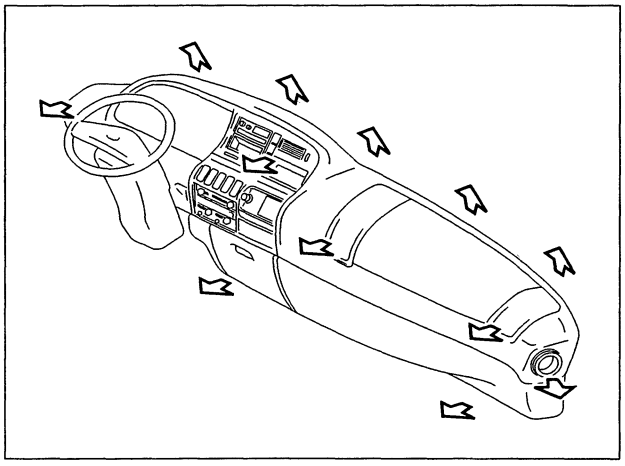
(e) Set the engine speed to approx. 1500min^{-1}.

(f) Set the high pressure at 1.17 to 1.37 MPa.

(If the high side pressure does not rise up, place paper or the like in front of the condenser.)

(2) Test procedure

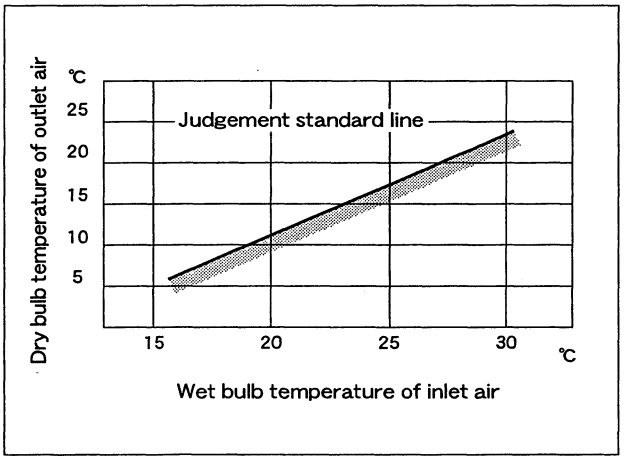
Operate the air conditioner for more than 10 minutes under the above operating conditions in order to stabilize the high and low pressures. Then perform the test by the following procedure:



(a) Measure the outlet air temperature at the inside space of the outlet grille.

(b) Measure the air conditioner intake air temperature, humidity, etc, and the items shown in the Table of Measuring Items at a position free from the effects of cool outlet air.

(c) The intersecting point of the plotted line perpendicular to the point which corresponds to the air conditioner intake and outlet air temperature difference and the plotted line perpendicular to the relative humidity of intake air should be between the oblique lines in figure.



7. MAINTENANCE

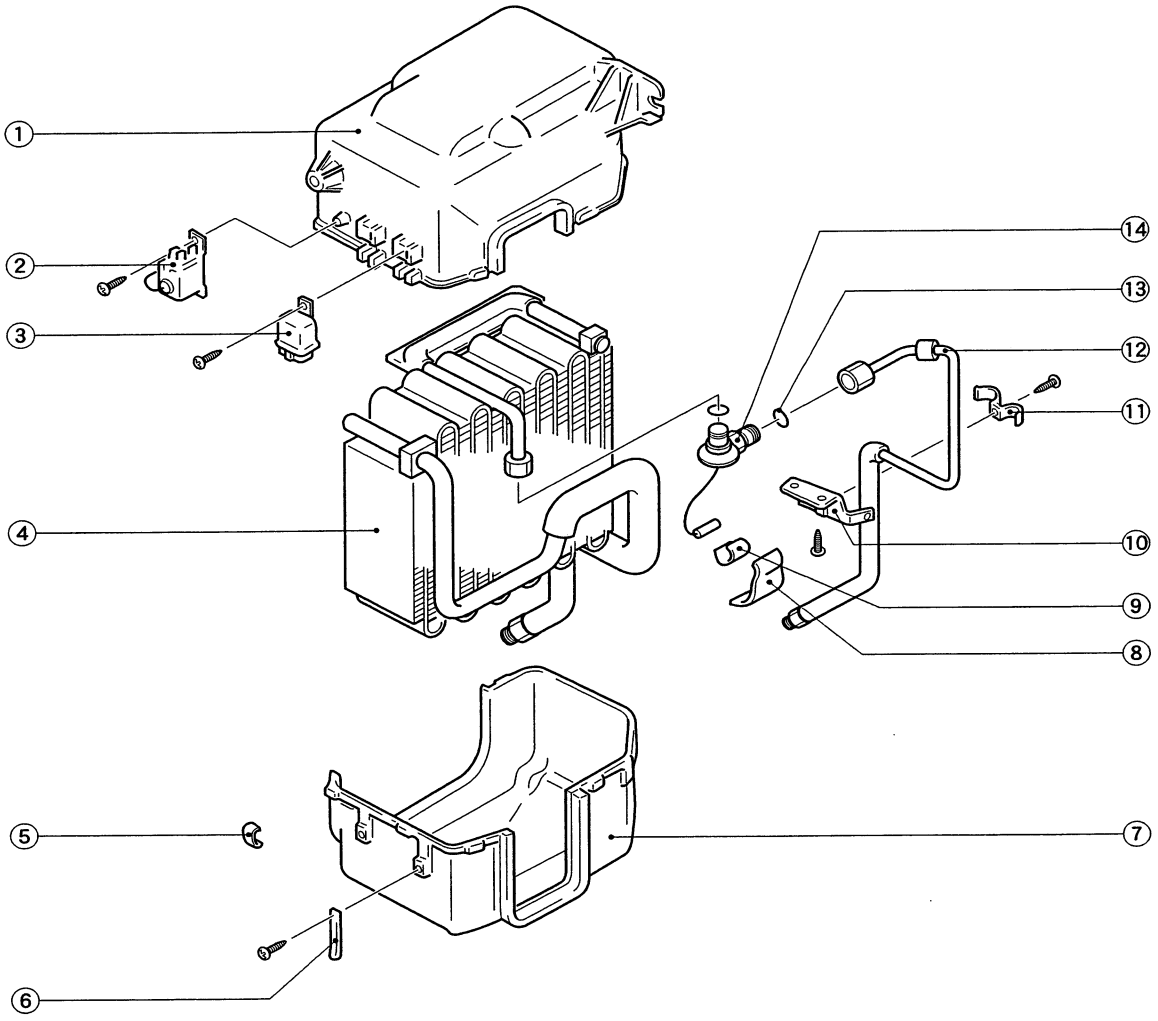
No.	Check point	Service and inspection intervals				
		When used only in summer (approx. for three months)		When used in all seasons		
		At the beginning or season	At the end of season	Every 5,000km (3,000miles)	Every 10,000km (6,000miles)	Every 20,000km (12,000miles)
1	Check condenser and radiator fin for clogging.	○	○	○		
2	Retighten all bolts.	○			○	
3	Check for refrigerant leaks.	○			○	
4	Check refrigerant level.	○		○		
5	Check V-belt tension.	○		○		
6	Check operation of magnetic clutch.	○			○	
7	Check operation of thermostat.	○				○
8	Cooling unit assembly performance test.	○		○		
9	Compressor overhaul.			Every four years		Every 40,000km (24,000miles)

⚠ WARNING

Even after the hot season is over, the air conditioner should be kept ready for operation all year round. Do not remove the V-belt or other parts.
This is because the air conditioner must be operated once a week for several minutes regardless of the season in order to prevent gas leaks caused by drying of the compressor shaft seal, and also to maintain the compressor itself in the best condition.

8. COOLING UNIT ASSEMBLY

8.1 Components



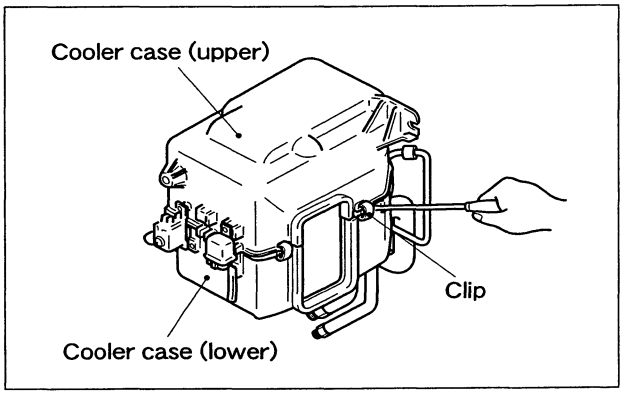
① Cooler case (upper)
② Thermostat
③ Power relay
④ Evaporator
⑤ Clip
⑥ Clamp
⑦ Cooler case (lower)
⑧ Insulation rubber
⑨ Clip
⑩ Bracket
⑪ Clamp
⑫ Pipe
⑬ O-ring
⑭ Expansion valve

8.2 Cautions in disassembling

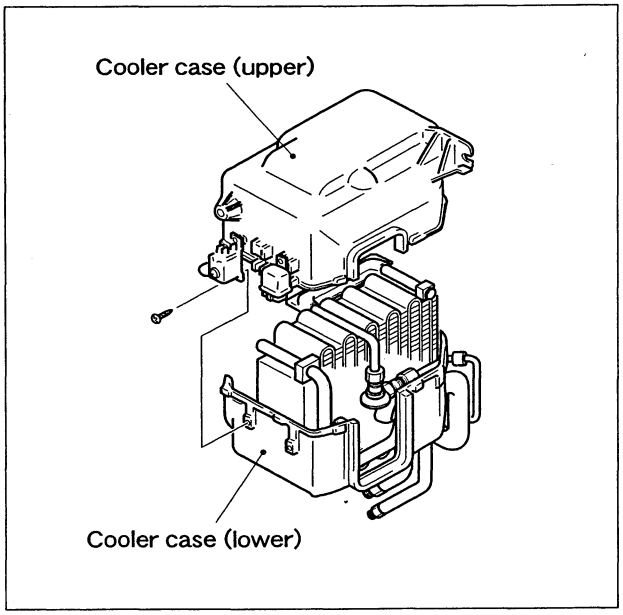
(1) Direct after disconnecting the refrigerant piping plug the opening to prevent dust and moisture etc. from entering in it.
(2) When disconnecting the expansion valve, surely apply two spanners to prevent unstable twisting from applyng with the one for supporting and the other for torquing at the connection.
(3) Pipings in the cooling unit assembly should be handled gently. Particularly, during the installation and removal.
(4) If the cooling unit assembly is stored, or transported on disassembled condition, be careful not to deform the fins.
(5) When disconnecting the wiring, avoid pulling it with the insulation cover catched, but apply force by pinching the terminals or by catching the connectors.

8.3 Disassembling

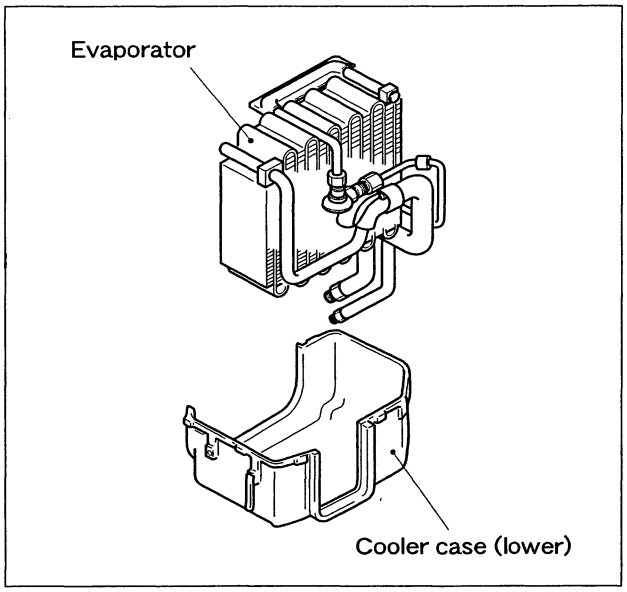
(1) Remove the clips for jointings the upper & lower side cooler case with a flat type screwdriver.



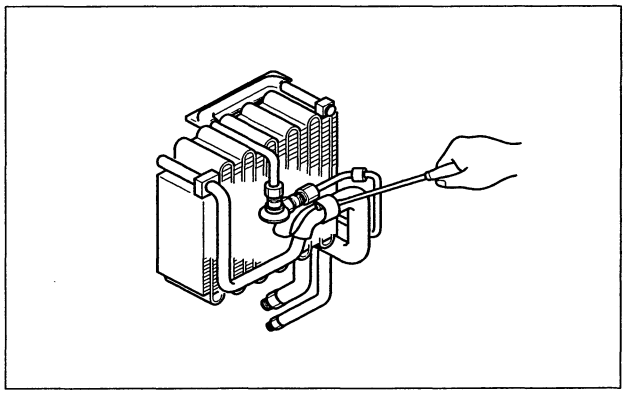
(2) Dismount the cooler case (upper).



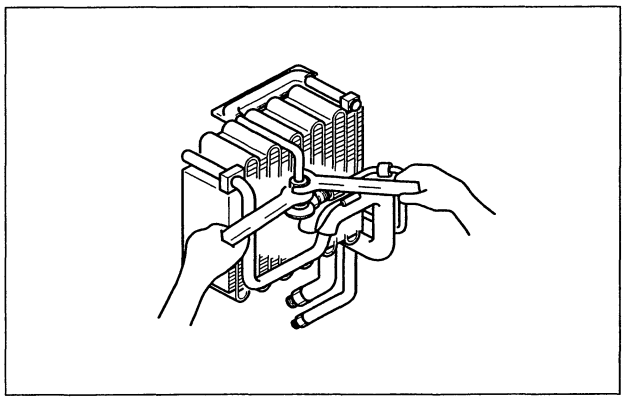
(3) Dismount the evaporator.



(4) Separate the expansion valve.
Dismount the feeler bulb at the suction side.

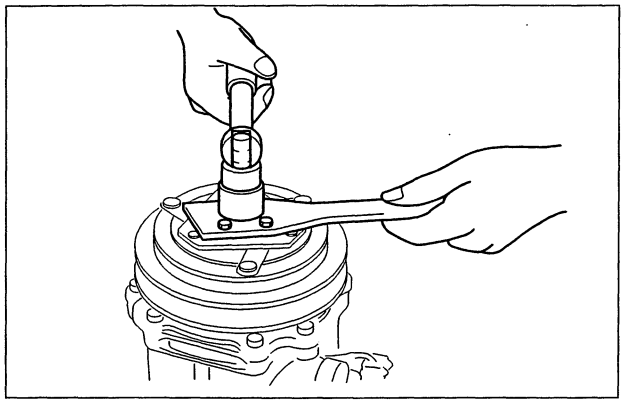


(5) Dismount the expansion valve from the circuit.

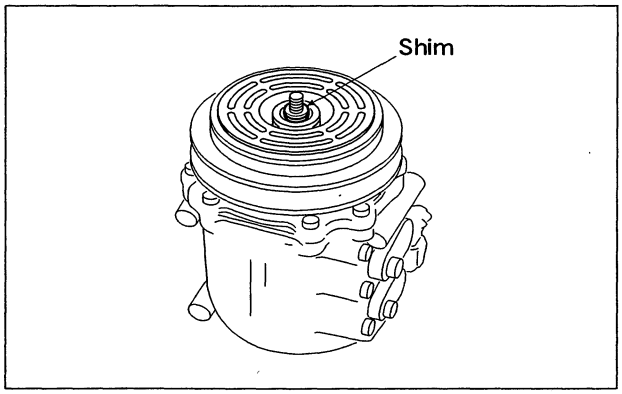


9. COMPRESSOR & CLUTCH ASSEMBLY

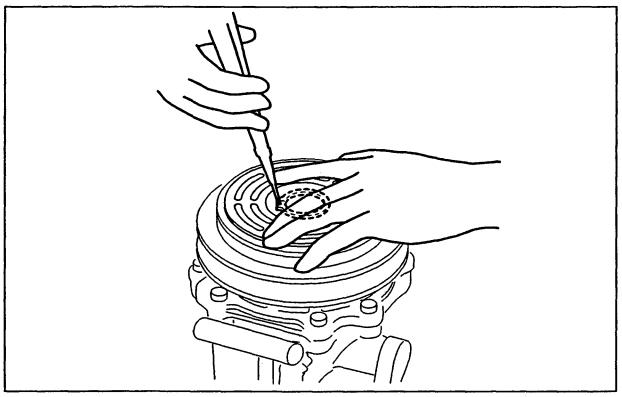
9.1 Disassembling the clutch



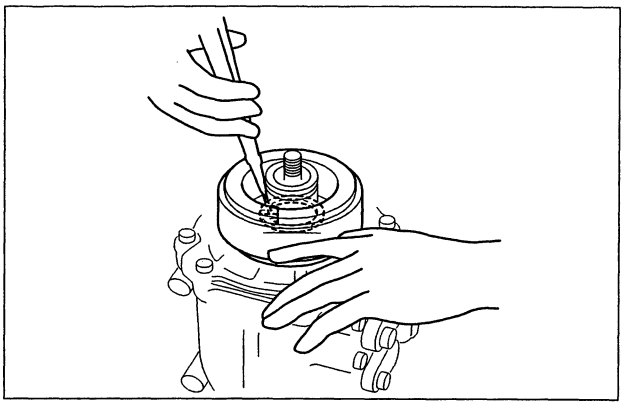
(1) Removal of armature plate.
  (a) Lock up the armature plate with a armature plate fixture and remove the lock nut.
  (b) Remove the armature plate.



(2) Remove the shim.



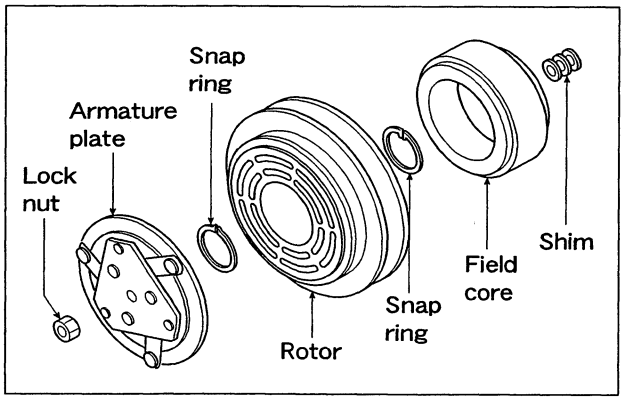
(3) Withdrawing rotor.
  (a) Remove the snap ring at the front case side with snap ring pliers.
  (b) Withdraw the rotor toward you and remove it from the front case.



(4) Removal of field core.
  (a) Remove the snap ring for fixing the field core with snap ring pliers.

  (b) Remove the ground wire with a cross point screwdriver and withdraw the field core toward you to remove it from the crank case.

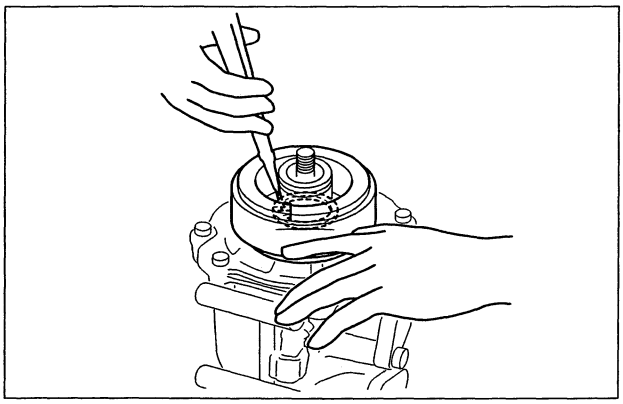
(5) Removal of key.
  Remove the key from the shaft using the top of a flat type screwdriver.



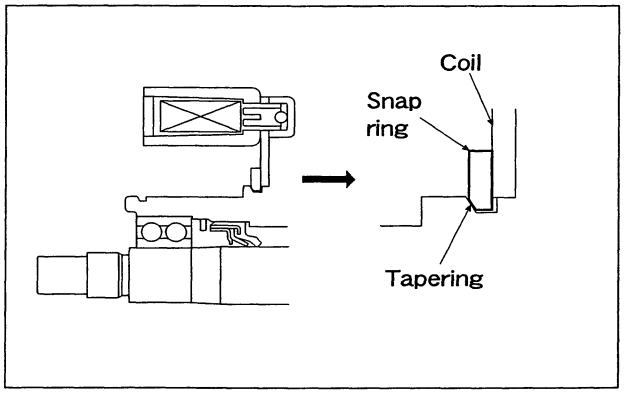
(6) Components of magnetic clutch.

9.2 Reassembly the clutch

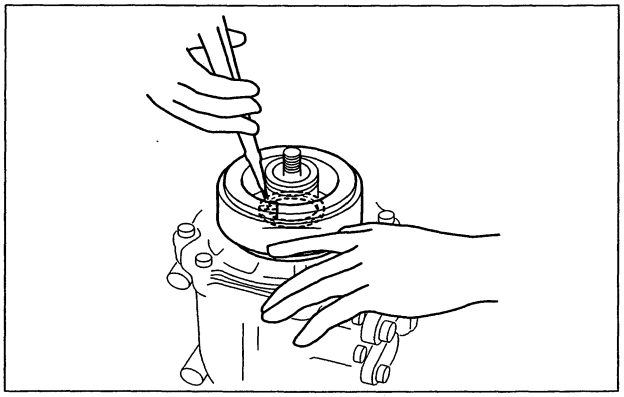
(1) Insert the key into the clankshaft.
(2) Insert the field core.



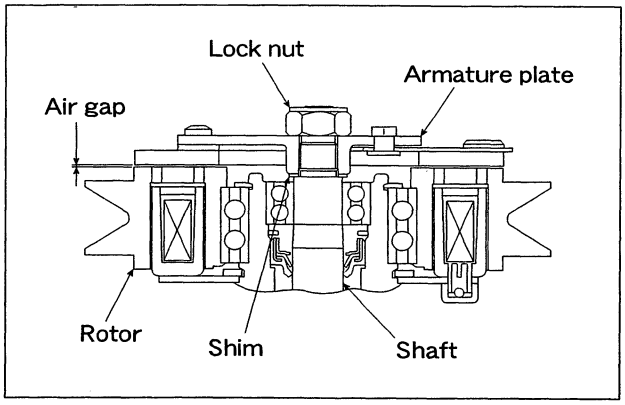
(a) Insert the field core into the front case and position it with a knock pin.
(b) Insert the snap ring for fixing field core into the groove and fix it with snap ring pliers as shown the below.



(c) Connect the ground wire.
(3) Insert the rotor into the front case.



(4) Insert the snap ring for the front case side into the groove with snap ring pliers.



(5) Insert the armature plate.
(a) Place a shim on the end of the shaft and insert the armature plate, adjusting to the key.
(b) Tighten the center bolt to the specified torque, 15.7N.m, with in between plain washer.
(c) Measure the air gap.
The air gap should be within 0.4 to 0.65 ㎜.
Adjust it by shim if it is not within the specifications.
Adjusting shim : 0.1, 0.3, 0.5, or 0.8 ㎜.

9.3 Special tool figure

The dimensions are in millimeter

(1) Armature plate fixture

SPECIFICATIONS/STRUCTURE AND OPERATION

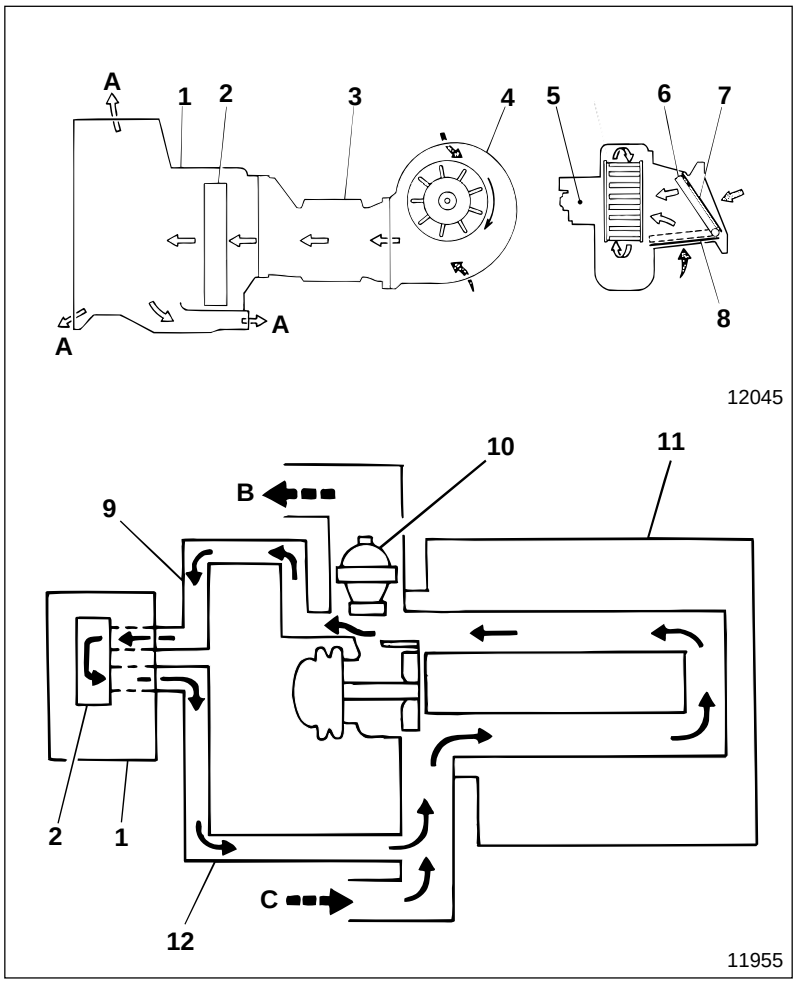
SPECIFICATIONS

Items			Specifications
System	Type		Inside/outside air combining, hot-water type heating system
	Standard voltage	V	12
	Damper changeover system		Manual cable type
Blower assembly	Manufacturer		DENSO
	Power consumption	W	170
	Maximum rotation	rpm	3550
Heater unit assembly	Manufacturer		DENSO
	Temperature control system		Air mixing type
	*Heating performance kW {BTU/h, kcal/h}		*4.31{14720, 3710}

* : Heating performance is shown under the following conditions.
Temperature difference : 65°C {119°F}
Water flow : 6 L/min {0.0035 ft^3/s}
Voltage : 12 V DC

STRUCTURE AND OPERATION

Heater



1 Heater unit
2 Heater core
3 Joint duct
4 Blower assembly
5 Blower motor
6 Damper
7 Air filter (Outside air)
8 Air filter (Inside air)
9 Heater hose (Heater in)
10 Thermostat
11 Engine
12 Heater hose (Heater out)

A : To duct
B : To radiator
C : From radiator

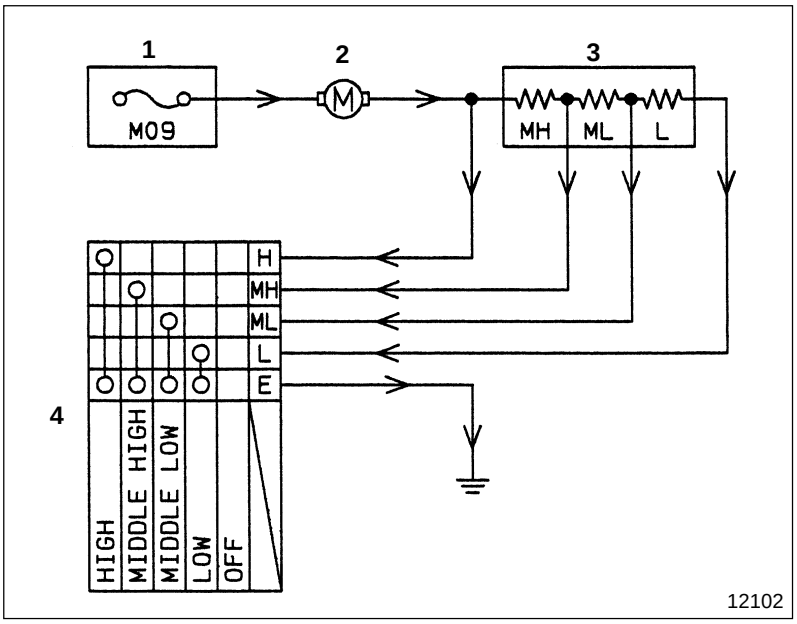
Outside air (Intake)

Inside air (Circulation)

Filtered air

- Warm engine coolant that has absorbed heat from engine **11** does not flow through thermostat **10** but circulates as follows:
  9→2→12→11
  ↑ ↓
- Air sent to heater unit **1** from blower assembly **4** is warmed by heater core **2** (heat exchanger). Then the ducts deliver the warmed air to the cab.

Heater Electric Circuit



1 Relay and fuse box
2 Blower motor
3 Blower resistor
4 Fan switch (Heater switch)

- The resistance of blower resistor **3** controls blower motor **2**, which in turn controls the air flow, except when the air flow is set to H (high speed). When the air flow is set to H, the current does not flow through the blower resistor.

Fan switch 4 set to L position

- **1**→**2**→**3** (L)→**4** (L)→Ground

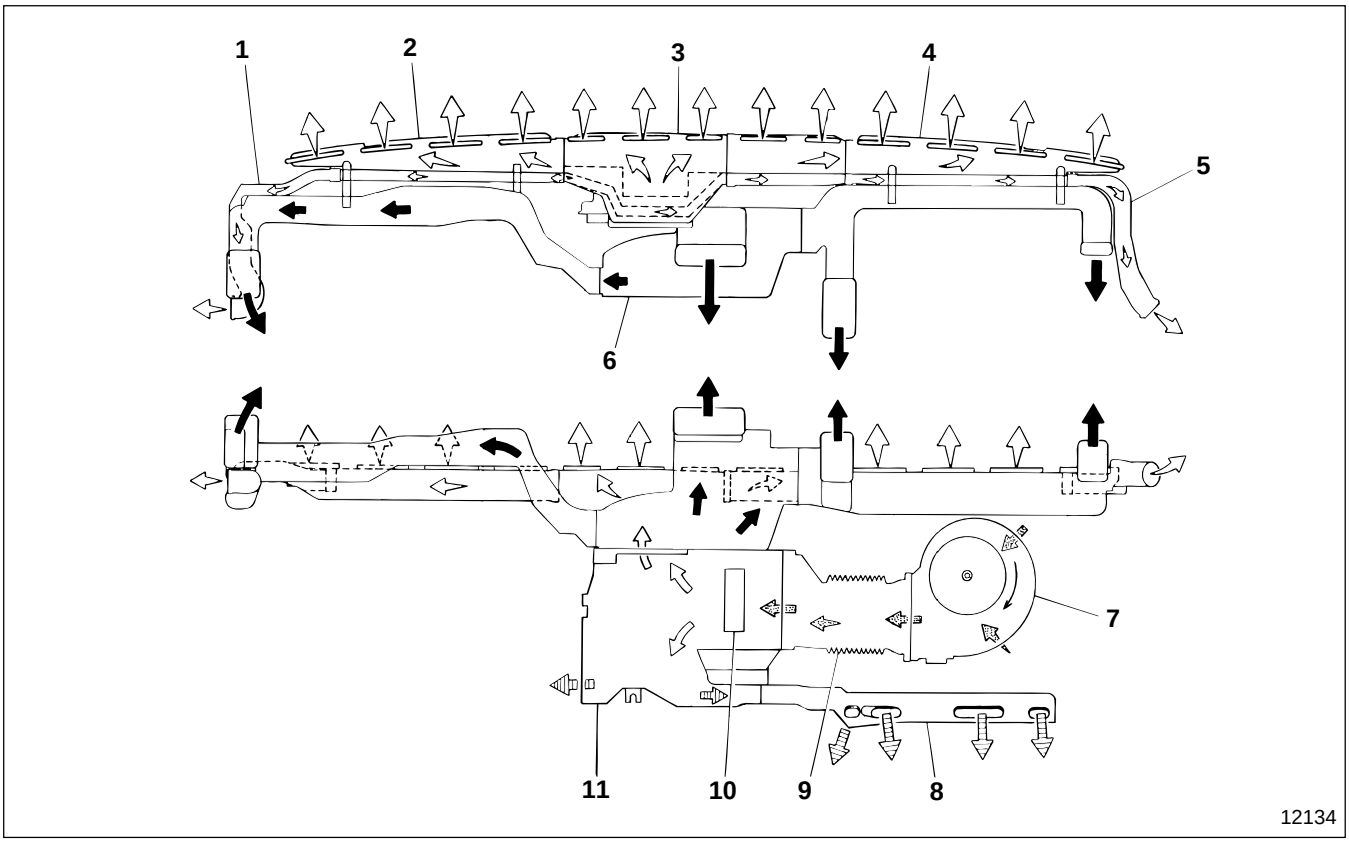
Fan switch 4 set to H position

- **1**→**2**→**4** (H)→Ground

Fan switch 4 set to either ML or MH position

The current flows through blower resistor **3** in the same way as when set to L position, routing ML or MH respectively instead of L.

Air Duct

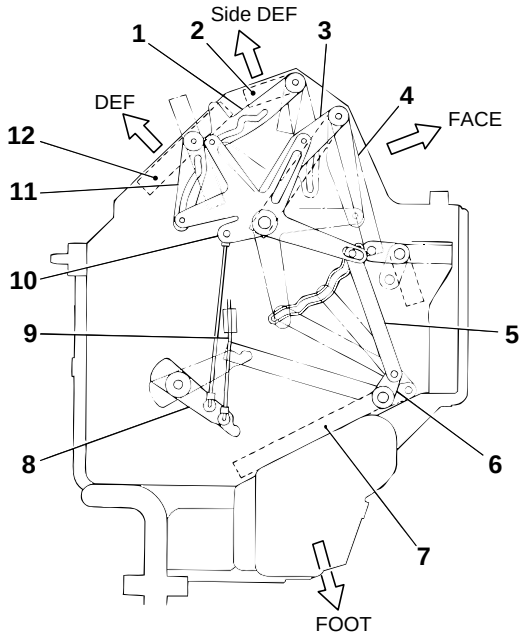


1 Defroster side duct, LH
2 Front duct, LH
3 Center duct
4 Front duct, RH
5 Defroster side duct, RH
6 Face center duct
7 Blower assembly
8 Foot duct
9 Joint duct
10 Heater core
11 Heater unit

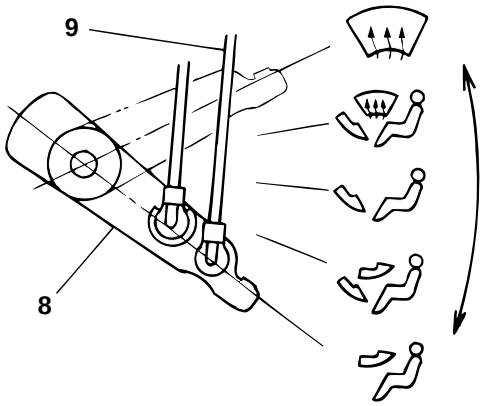
Outside air (Intake) Inside air (Circulation) Filtered air (in heater and cooling unit)

Air (FACE) ( )Air (DEF) Air (FOOT)

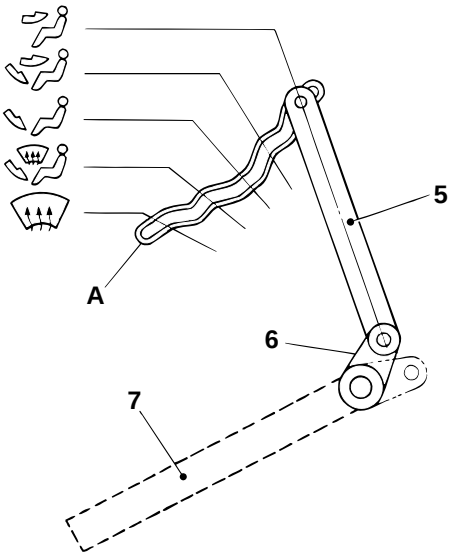
Since the opening and closing of the dampers of heater unit **11** is controlled by the switching operation of the heater unit assembly, the outside air and the inside air from blower assembly **7** flow as illustrated.



12203



12204



12205

● **Mode changeover system**

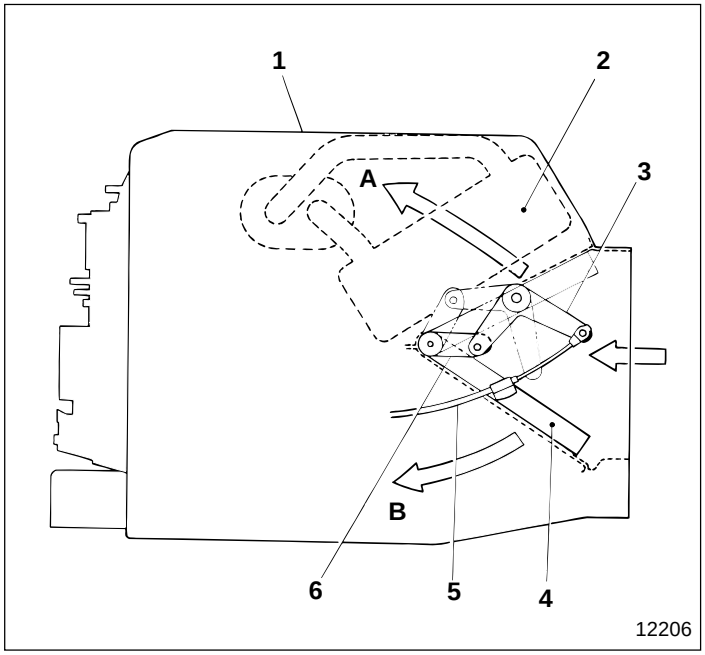
1 Plate
2 Damper (Side DEF)
3 Plate
4 Damper (FACE)
5 Plate
6 Plate
7 Damper (FOOT)
8 Lever (MODE-SUB)
9 Mode changeover control cable
10 Lever (MODE-MAIN)
11 Plate
12 Damper (DEF)

A : Rail

- The opening and closing of dampers **2**, **4**, **7, 12** is mechanically controlled by the movement of mode changeover control cable **9**, transmitted as follows:
  9→**8**→**10**→**11**→**12** (DEF)
  →**1**→**2** (Side DEF)
  →**3**→**4** (FACE)
  →**5**→**6**→**7** (FOOT)

  Plates **1, 3, 5, 6, 11** move together with lever **10**. Dampers **2, 4 , 7, 12** move together with plates 1, **3, 5, 6, 11,** but the degree of opening of the dampers is determined by the shape of the plate grooves.

- Plate **5** is connected to rail **A**. Since the plate moves along the groove of the rail, damper **7** (FOOT) can be opened and closed in combination with other modes to activate bi-level mode.

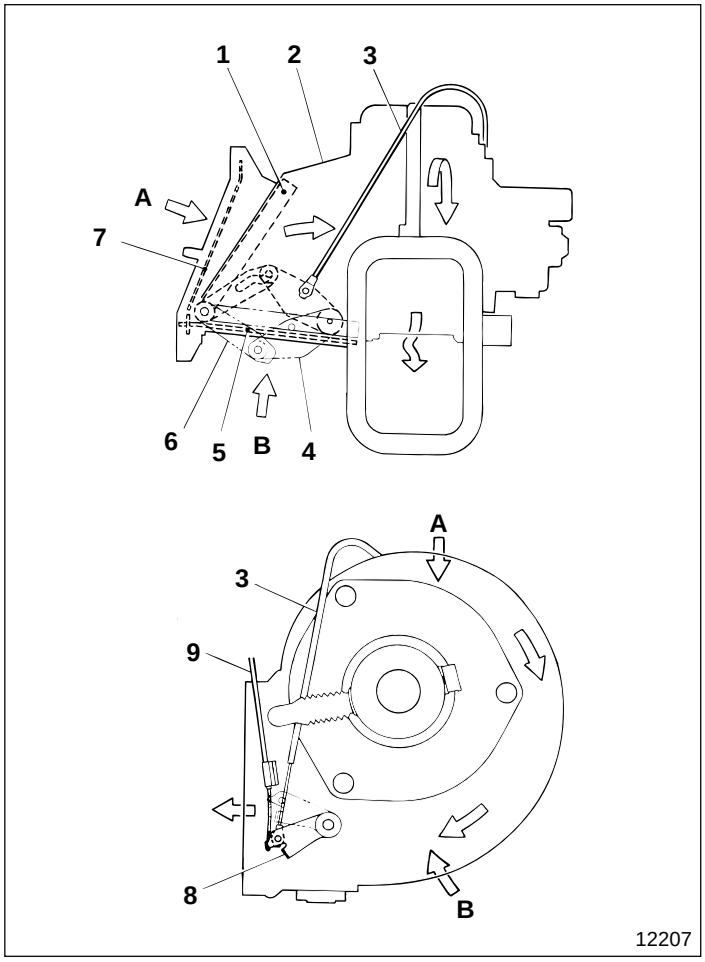


● **Air mixing control**

1 Heater unit
2 Heater core
3 Lever
4 Damper
5 Air mixing control cable
6 Plate

A : Warm air
B : Unwarmed air

- The degree of opening of damper **4** controls the flow of both air **A** that has passed through and been warmed by heater core **2**, and air **B** that has not been warmed.
- Damper **4** is mechanically operated by the movement of air mixing control cable **5**, transmitted as follows:
  5→3→6→4
  Plate **6** moves together with damper **4**.

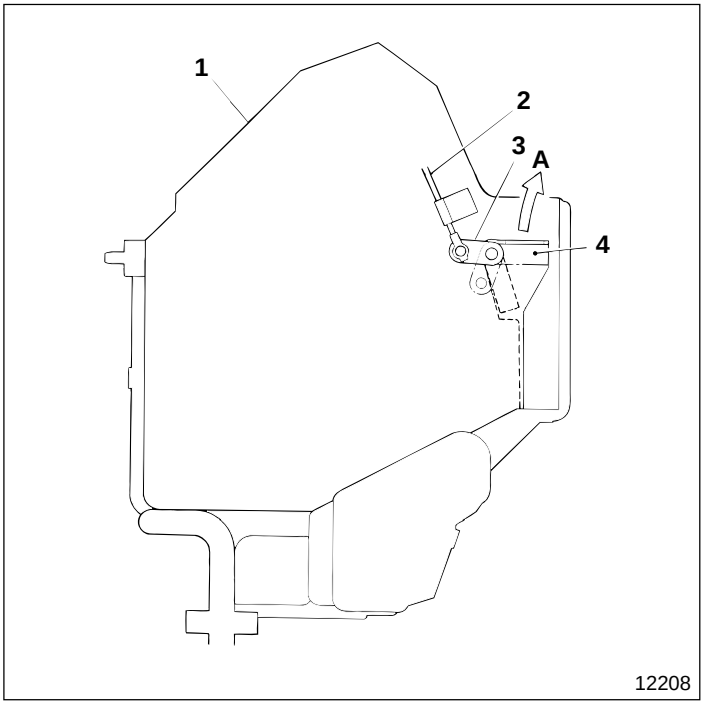


● **Air intake control**

1 Damper
2 Blower assembly
3 Control cable
4 Lever
5 Air filter (Inside air)
6 Shaft
7 Air filter (Outside air)
8 Lever
9 Air intake control cable

A : Outside air
B : Inside air

- Changeover of air intake from inside to outside is controlled by the opening and closing of damper **1**.
- Damper **1** is mechanically operated by the movement of air intake control cable **9**.
  9→8→3→4→6→1
  Shaft **6** moves together with damper **1**.



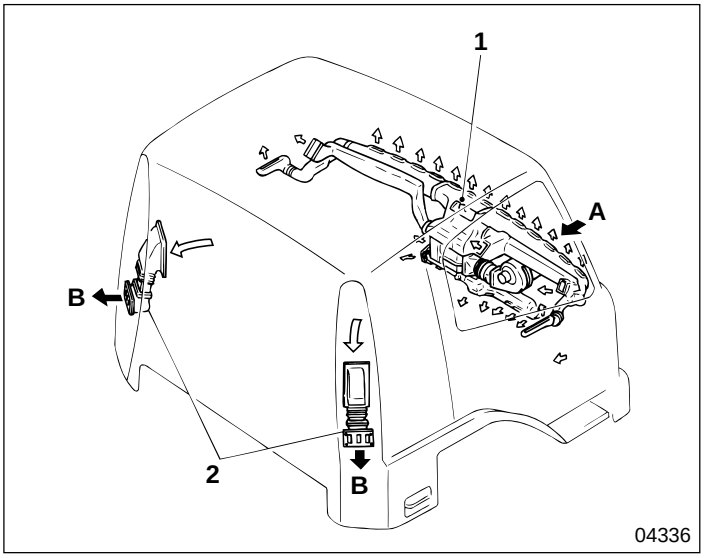
● **Air flow bypass changeover**

1 Heater unit
2 Air bypass changeover control cable
3 Plate
4 Damper

A : Air not warmed by heater unit

- Damper **4** is opened and closed to change the air flow from warm air to air that has not passed through and been warmed by the heater core.
- Damper **4** is mechanically operated by the movement of air flow bypass changeover control cable **2**, transmitted as follows:
  2→3→4
  Plate 3 moves together with damper **4**.

Ventilation System



1 Heater and duct assembly
2 Air outlet ventilation

A : Incoming outside air
B : Outgoing inside air

The ventilation system replaces the air in the cabin using frontal air pressure, generated when the vehicle is in motion.

TROUBLESHOOTING

Symptoms / Possible causes	Air does not flow from vents	Heater does not work well	Airflow control setting cannot be changed	Drafts from vents	Temperature control setting cannot be adjusted	Outside/inside air control cannot be changed	Air volume from vents unstable	Control switches operation heavy	Air flow bypass cannot be changed	Remarks
Blower motor coil broken or short-circuited	○									
Blower resistor operation malfunctioning							○			
Mode damper opening and closing faulty			○	○				○		
Air mixing damper opening and closing faulty				○	○			○		
Inside/outside air changeover damper opening and closing faulty				○		○		○		
Heater control assembly faulty	○	○	○	○	○	○			○	
Thermostat does not close		○								Gr 14
Engine coolant insufficient		○								Gr 14
Connector connection faulty, harness broken or grounding faulty	○		○	○	○	○				
Fuse blown	○									
Heater pipes clogged, loose or connection faulty		○								
Duct connection faulty				○						
Heater unit clogged		○								
Control cable sliding movement faulty, installation faulty			○	○		○		○	○	
Control cable connecting lever of units bent			○	○		○		○		
Control cable connecting lever sliding parts of units worn or lubricated insufficiently			○	○		○		○		
Air flow bypass changeover damper opening and closing faulty									○

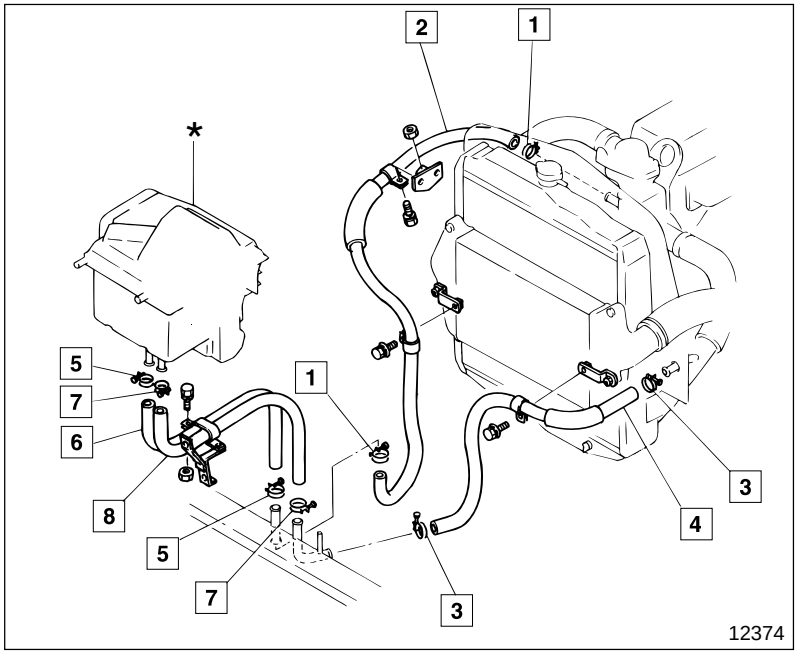
HEATER HOSE



● **Disassembly sequence**

1 Hose clamp
2 Heater hose (Engine out)
3 Hose clamp
4 Heater hose (Engine in)
5 Hose clamp
6 Heater hose (Heater in)
7 Hose clamp
8 Heater hose (Heater out)

***** : Heater unit

NOTE

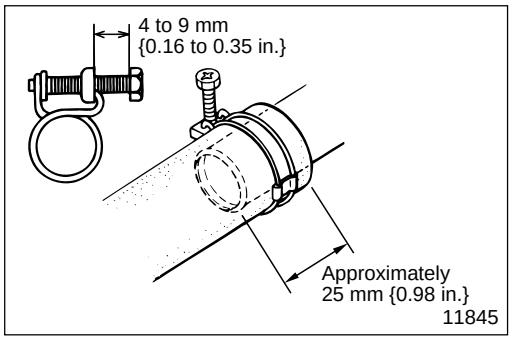
Drain engine coolant from radiator before removing the hoses. **Gr 14**

● **Assembly sequence**

Follow the disassembly sequence in reverse.

CAUTION ⚠

- **Be sure that hoses are inserted securely to prevent coolant leaking.**
- **Make sure not to mix up heater hoses 2, 4, 6, 8 when connecting them because mistaken connection would damage the heater unit.**



◆ Service procedure

1 **to** **8** **Installation of heater hose and hose clamp**

- Install heater hoses **2, 4, 6, 8** to conform to the dimension as illustrated.
- Tighten hose clamps **1, 3, 5, 7** to conform to the dimension as illustrated.

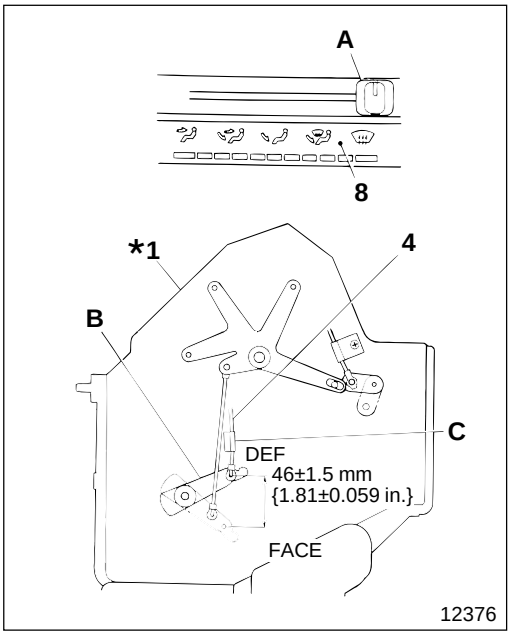
9 Harness

***1** : Heater unit 🕮 P55B-16
***2** : Blower assembly 🕮 P55B-16

● **Assembly sequence**

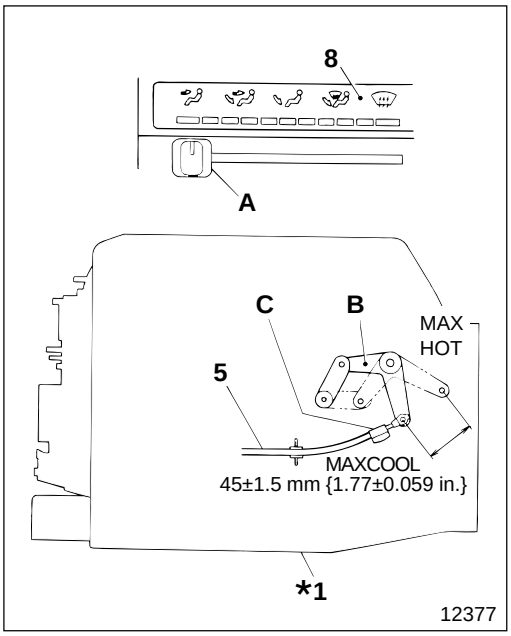
Follow the disassembly sequence in reverse.

◆ Service procedure



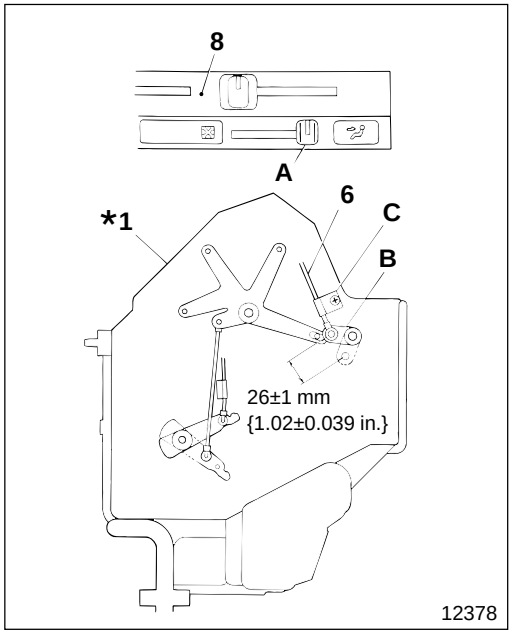
4 Installation of mode changeover control cable

- Set mode changeover lever **A** of heater control assembly **8** to (DEF).
- Set lever **B** of heater unit assembly ***1** to DEF.
- Under these conditions, install mode changeover control cable **4** onto lever **B**.
- Gently pull outer shield of mode changeover control cable **4** to DEF side (load of 4.9 N {1.1 lbf, 0.5 kgf} and fasten by locking clamp **C**.



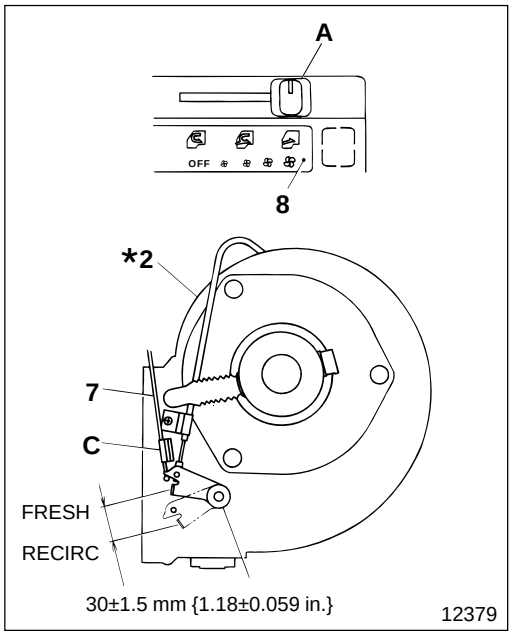
5 Installation of air mixing control cable

- Set temperature control lever **A** of heater control assembly **8** to MAX COOL.
- Set lever **B** of heater unit assembly ***1** to MAX COOL.
- Under these conditions, install air mixing control cable **5** onto lever **B**.
- Gently pull outer shield of air mixing control cable **5** to MAX COOL side (load of 4.9 N {1.1 lbf, 0.5 kgf} and fasten by locking clamp **C**.



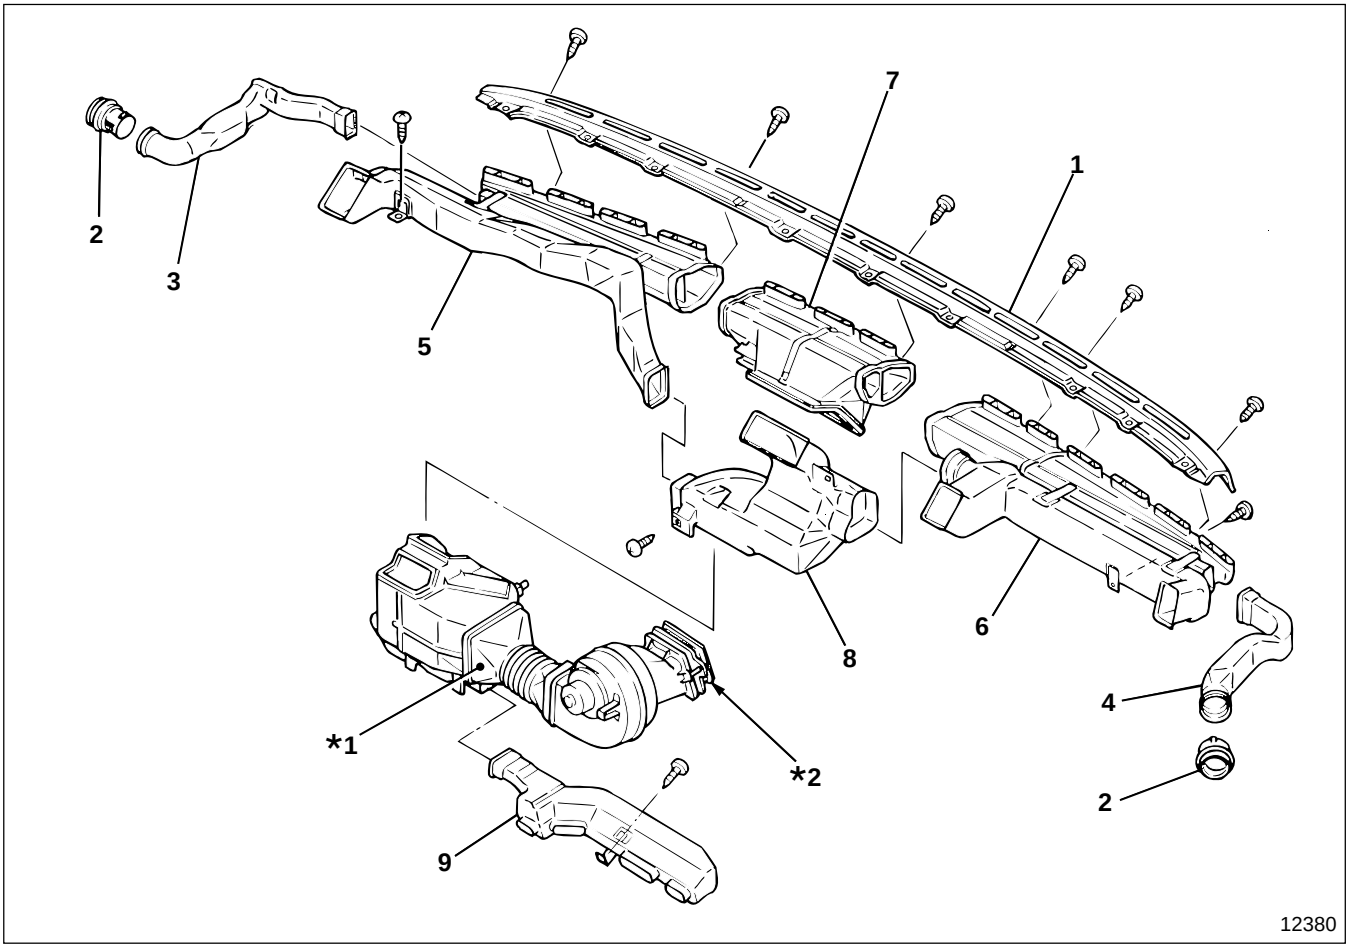
6 **Installation of air bypass changeover control cable**

- Set air bypass changeover control lever **A** of heater control assembly **8** to (OPEN).
- Set plate **B** of heater unit assembly ***1** to OPEN.
- Under these conditions, install air bypass changeover control cable **6** onto plate **B**.
- Gently pull outer shield of air bypass changeover control cable **6** to OPEN side (load of 4.9 N {1.1 lbf, 0.5 kgf} and fasten by locking clamp **C**.



7 **Installation of inside/outside air changeover control cable**

- Set inside/outside air changeover lever **A** of heater control assembly **8** to (FRESH).
- Set lever **B** of blower assembly ***2** to FRESH.
- Under these conditions, install inside/outside air changeover control cable **7** onto lever **B**.
- Gently pull outer shield of inside/outside air changeover control cable **7** to FRESH side (load of 4.9 N {1.1 lbf, 0.5 kgf} and fasten by locking clamp **C**.



● **Disassembly sequence**
