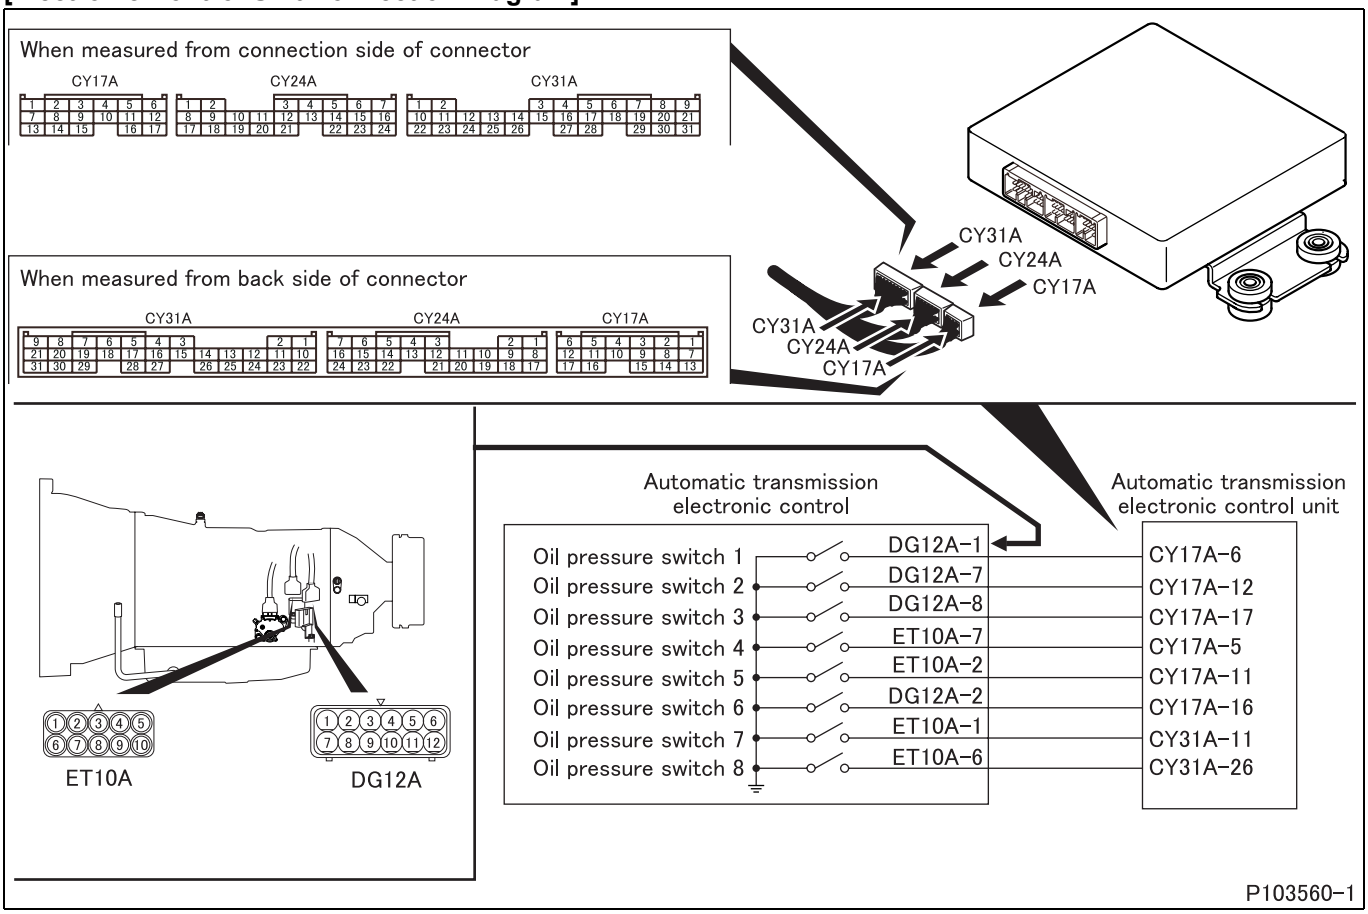
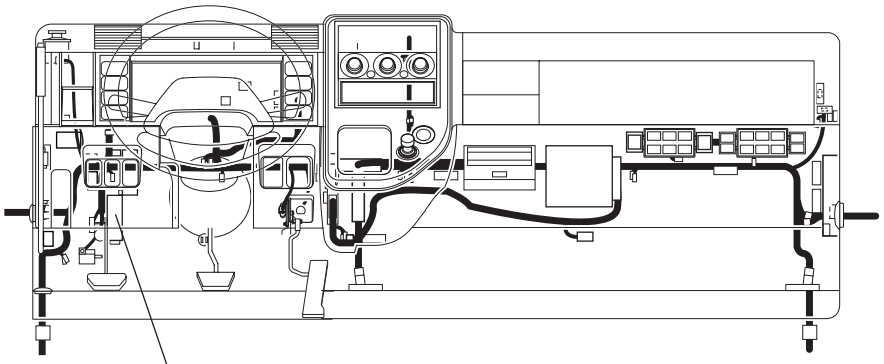
- Open-circuit or short-circuit of harness between electronic control unit and oil pressure switch 8
- Malfunction of each connector
- Malfunction of oil pressure switch 8
- Malfunction of electronic control unit

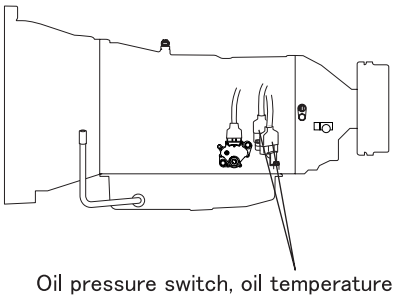
[Recoverability]
- Recovered if signal becomes normal when starter switch is turned OFF to ON (power supply resumed to electronic control unit).

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]





P103560-2

[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of voltage between electronic control unit connector (CY31A) terminal No. 26 (+) and connector (CY24A) terminal No. 8 (–). **<Multi-Use Tester used>** Measure item No. 68 “Oil Press SW8” of Service Data.
	Inspection condition		Engine in operation **<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** • D range: 0 V • P, R, N range: 12 V **<Multi-Use Tester used>** • D range: ON • P, R, N range: OFF
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

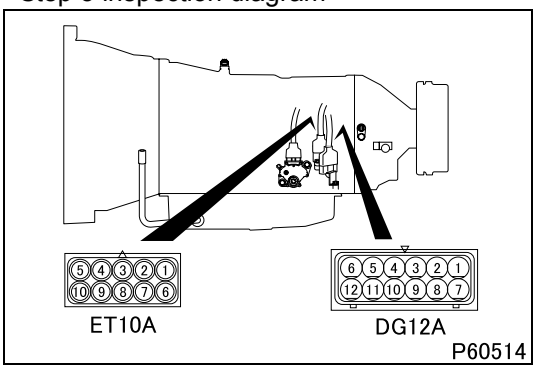
Step 2	Inspection items		Inspection by electronic control unit connector (signal)
	Maintenance item		Measure continuity between connector (CY31A) terminal No. 26 and chassis ground.
	Inspection condition		• Disconnect electronic control unit and harness, and measure from connection side of harness connector. • Starter switch: OFF
	Requirements		There is no continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Go to step 4.

Step 3	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify connector.

Step 4	Inspection items		Inspection of switch connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Modify connector.

Step 5	Inspection items		Inspection of switch unit
	Maintenance item		Check continuity between connector (ET10A) terminal No. 6 and automatic transmission case.
	Inspection condition		• Disconnect connector and measure switch side. • Starter switch: OFF
	Requirements		There is no continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Replacement of automatic transmission

<Step 5 inspection diagram>



Step 6	Inspection items		Inspection of harness between switch and electronic control unit (signal)
	Maintenance item		Check circuit between connector (ET10A) terminal No. 6 and electronic control unit connector (CY31A) terminal No. 26
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify harness.

Step 7	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of voltage between electronic control unit connector (CY31A) terminal No. 26 (+) and connector (CY24A) terminal No. 8 (–). **<Multi-Use Tester used>** Measure item No. 68 “Oil Press SW8” of Service Data.
	Inspection condition		Engine in operation **<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** • D range: 0 V • P, R, N range: 12 V **<Multi-Use Tester used>** • D range: ON • P, R, N range: OFF
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P0707/Flash code: 43
[Monitor ID]
19
[Fault (outline)]
Failure of inhibitor switch
[Diagnosis check]
- Inhibitor switch output is monitored under conditions below for open-circuit.
- Condition (1): Oil pressure switch 8 in OFF position.
- Condition (2): When range shifted

[Code generation condition]
- With oil pressure switch 8 in OFF position, all P, R and N output signals are not input from inhibitor switch for 2 consecutive seconds. <A>
- All P, R and N output signals are not input from inhibitor switch for 30 consecutive seconds. <B>
- Either R or N output signal is not input from inhibitor switch. <C>

[Diagnosis check timing]
- Fault diagnosis is continuously performed.

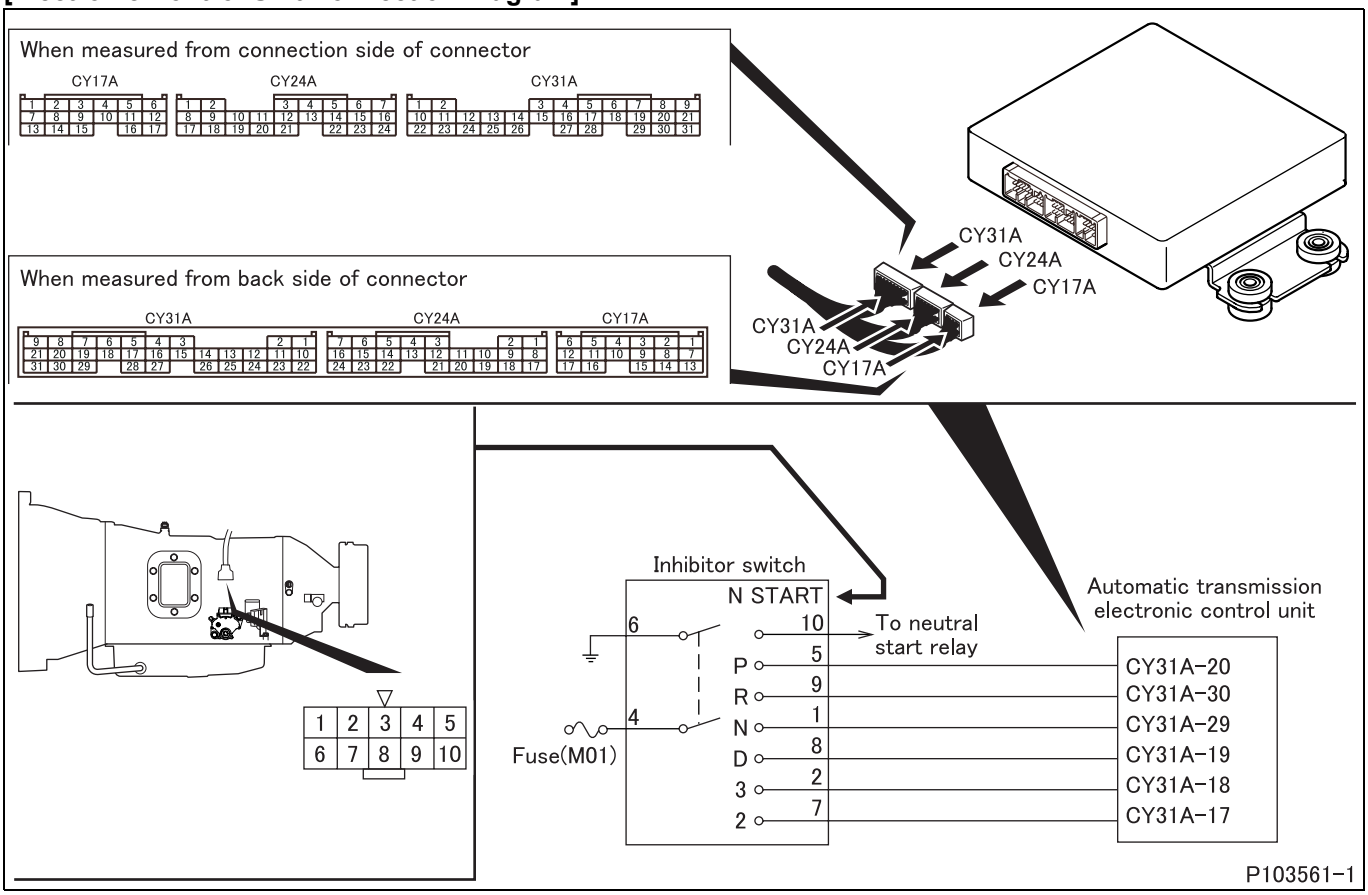
[Diagnostic requirement]
- Starter switch: ON

[Control effected by electronic control unit during fault]
- Control is effected on fixed speed gear output (3rd). <A, C>
- No control is effected in particular. <B>

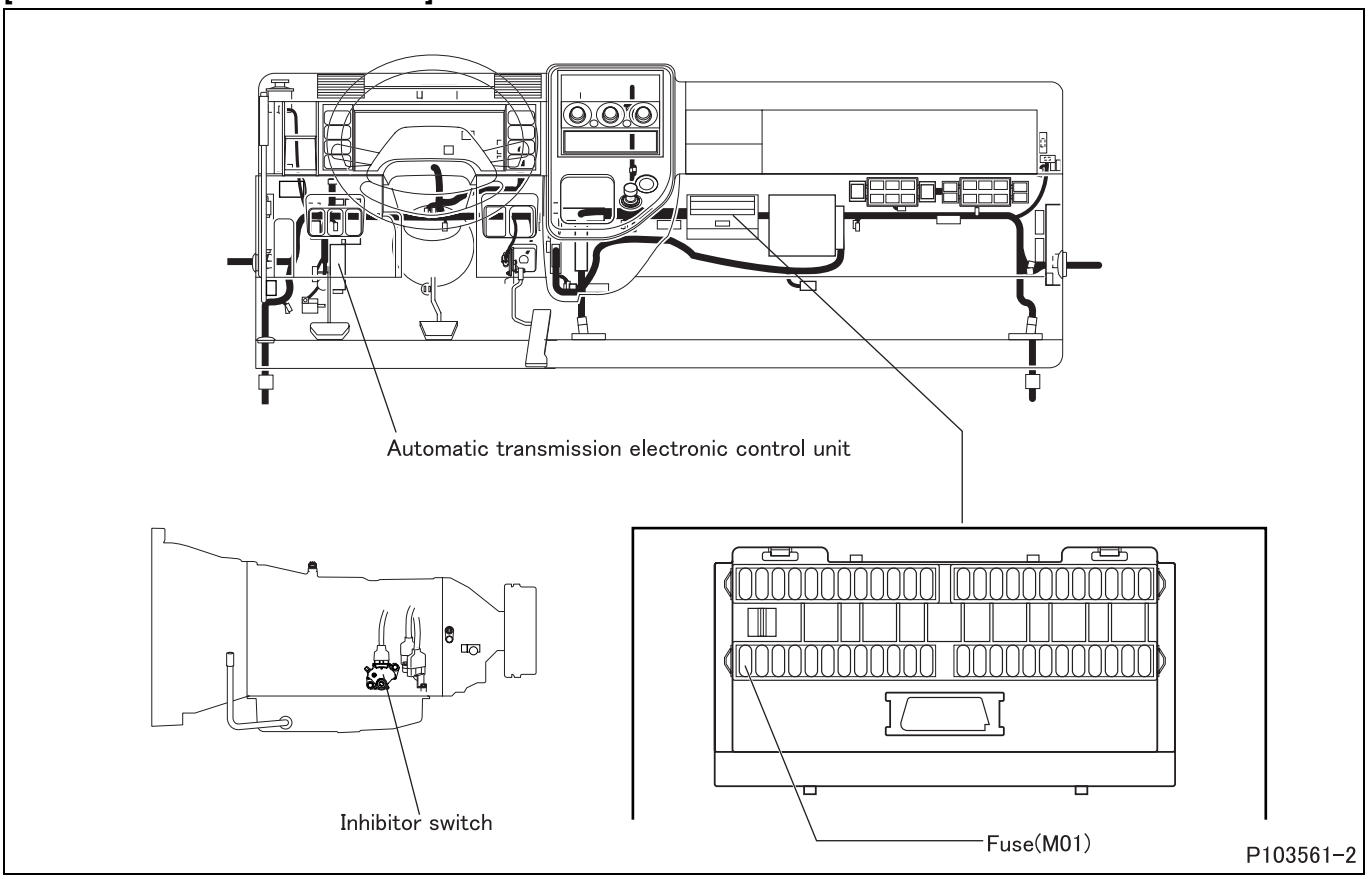
[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and inhibitor switch
- Malfunction of each connector
- Malfunction of inhibitor switch
- Maladjustment of selector cable
- Malfunction of electronic control unit

[Recoverability]
- Recovered if signal becomes normal when starter switch is turned OFF to ON (power supply resumed to electronic control unit). <A>
- Recovered if signal becomes normal with starter switch in ON position. <B, C>

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Go to step 2. **<Multi-Use Tester used>** Measure item No. 19 “P Pos.SW”, No. 20 “R Pos.SW”, No. 21 “N Pos.SW”, No. 22 “D Pos.SW”, No. 24 “3 Pos.SW”, No. 55 “Selector Pos.”, No. 78 “2 Pos.SW” of Service Data.
	Inspection condition		–
	Requirements		Synchronous with shift of range selector lever position.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

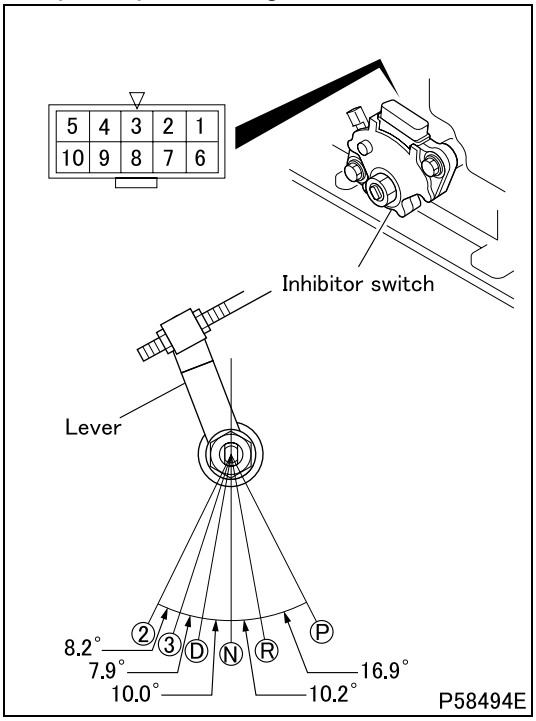
Step 2	Inspection items		Inspection by electronic control unit connector (signal)
	Maintenance item		<Range selector in P position> Measure value of voltage between connector (CY31A) terminal No. 20 (+) and (CY24A) terminal No. 8 (–). <Range selector in R position> Measure value of voltage between connector (CY31A) terminal No. 30 (+) and (CY24A) terminal No. 8 (–). <Range selector in N position> Measure value of voltage between connector (CY31A) terminal No. 29 (+) and (CY24A) terminal No. 8 (–). <Range selector in D position> Measure value of voltage between connector (CY31A) terminal No. 19 (+) and (CY24A) terminal No. 8 (–). <Range selector in 3rd position> Measure value of voltage between connector (CY31A) terminal No. 18 (+) and (CY24A) terminal No. 8 (–). <Range selector in 2nd position> Measure value of voltage between connector (CY31A) terminal No. 17 (+) and (CY24A) terminal No. 8 (–).
	Inspection condition		• Measure from back side of harness connector with harness left connected • Starter switch: ON • Check with range selector in each position.
	Requirements		12 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Go to step 4.

Step 3	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Replacement of electronic control unit
		NO	Modify connector.

Step 4	Inspection items		Inspection of inhibitor switch connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Modify connector.

Step 5	Inspection items		Inspection of inhibitor switch unit
	Maintenance item		**<P>** • Measure continuity between terminals No. 4 and No. 5 and between terminals No. 6 and No. 10. **<R>** • Measure continuity between terminals No. 4 and No. 9. **<N>** • Measure continuity between terminals No. 1 and No. 4 and between terminals No. 6 and No. 10. **<D>** • Measure continuity between terminals No. 4 and No. 8. **<3>** • Measure continuity between terminals No. 2 and No. 4. **<2>** • Measure continuity between terminals No. 4 and No. 7.
	Inspection condition		• Keep switch installed on vehicle. • Shift range selector lever from one range position to another and measure continuity each time. • Starter switch: ON
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Replacement of switch

<Step 5 inspection diagram>



Step 6	Inspection items		Inspection of harness between inhibitor switch and electronic control unit (signal)
	Maintenance item		**<P>** • Check circuit between switch connector terminal No. 5 and electronic control unit connector (CY31A) terminal No. 20 **<R>** • Check circuit between switch connector terminal No. 9 and electronic control unit connector (CY31A) terminal No. 30 **<N>** • Check circuit between switch connector terminal No. 1 and electronic control unit connector (CY31A) terminal No. 29 **<D>** • Check circuit between switch connector terminal No. 8 and electronic control unit connector (CY31A) terminal No. 19 **<3>** • Check circuit between switch connector terminal No. 2 and electronic control unit connector (CY31A) terminal No. 18 **<2>** • Check circuit between switch connector terminal No. 7 and electronic control unit connector (CY31A) terminal No. 17
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify harness.

Step 7	Inspection items		Inspection of harness between inhibitor switch and fuse (power supply)
	Maintenance item		Check circuit between switch connector terminal No. 4 and fuse (M01)
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify harness.

Step 8	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** <Range selector in P position> Measure value of voltage between connector (CY31A) terminal No. 20 (+) and (CY24A) terminal No. 8 (–). <Range selector in R position> Measure value of voltage between connector (CY31A) terminal No. 30 (+) and (CY24A) terminal No. 8 (–). <Range selector in N position> Measure value of voltage between connector (CY31A) terminal No. 29 (+) and (CY24A) terminal No. 8 (–). <Range selector in D position> Measure value of voltage between connector (CY31A) terminal No. 19 (+) and (CY24A) terminal No. 8 (–). <Range selector in 3rd position> Measure value of voltage between connector (CY31A) terminal No. 18 (+) and (CY24A) terminal No. 8 (–). <Range selector in 2nd position> Measure value of voltage between connector (CY31A) terminal No. 17 (+) and (CY24A) terminal No. 8 (–). **<Multi-Use Tester used>** Measure item No. 19 “P Pos.SW”, No. 20 “R Pos.SW”, No. 21 “N Pos.SW”, No. 22 “D Pos.SW”, No. 24 “3 Pos.SW”, No. 55 “Selector Pos.”, No. 78 “2 Pos.SW” of Service Data.
	Inspection condition		**<Multi-Use Tester not used>** • Measure from back side of harness connector with harness left connected • Starter switch: ON • Check with range selector in each position.
	Requirements		**<Multi-Use Tester not used>** 12 V **<Multi-Use Tester used>** Synchronous with shift of range selector lever position.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Check selector cables for incorrectly adjusted condition and adjust the cable if it is defective. If the fault is still not removed, replace the electronic control unit.

[Fault code]
Diagnosis code: P0708/Flash code: 43
[Monitor ID]
20
[Fault (outline)]
Failure of inhibitor switch
[Diagnosis check]
- Inhibitor switch output signal is monitored.

[Code generation condition]
- Two or more of inhibitor switch output signals P, R, N, D, 3 and 2 are continuously input for 0.5 second.

[Diagnosis check timing]
- Fault diagnosis is continuously performed.

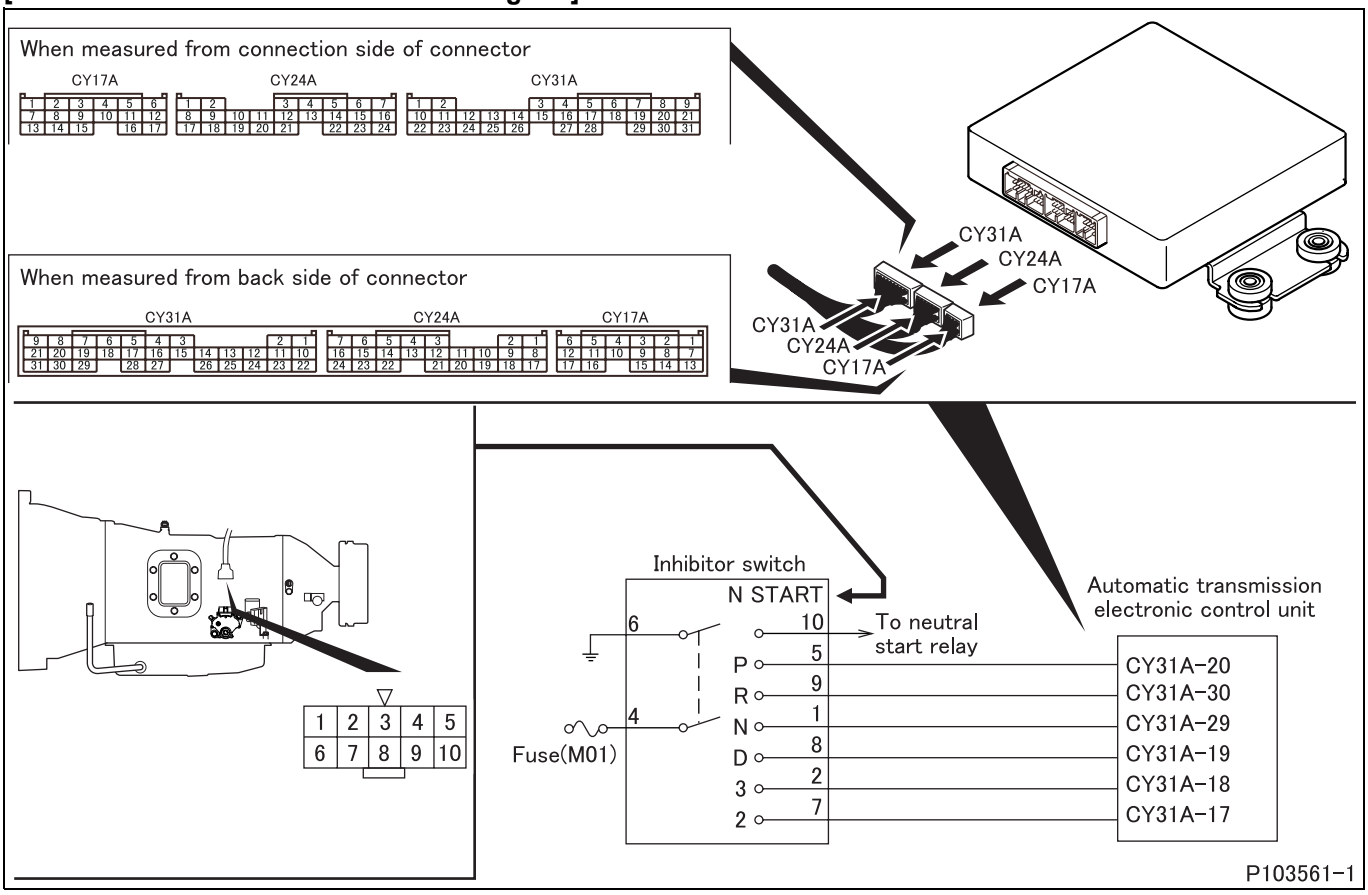
[Diagnostic requirement]
- Starter switch: ON

[Control effected by electronic control unit during fault]
- Control is effected on fixed speed gear output (3rd).

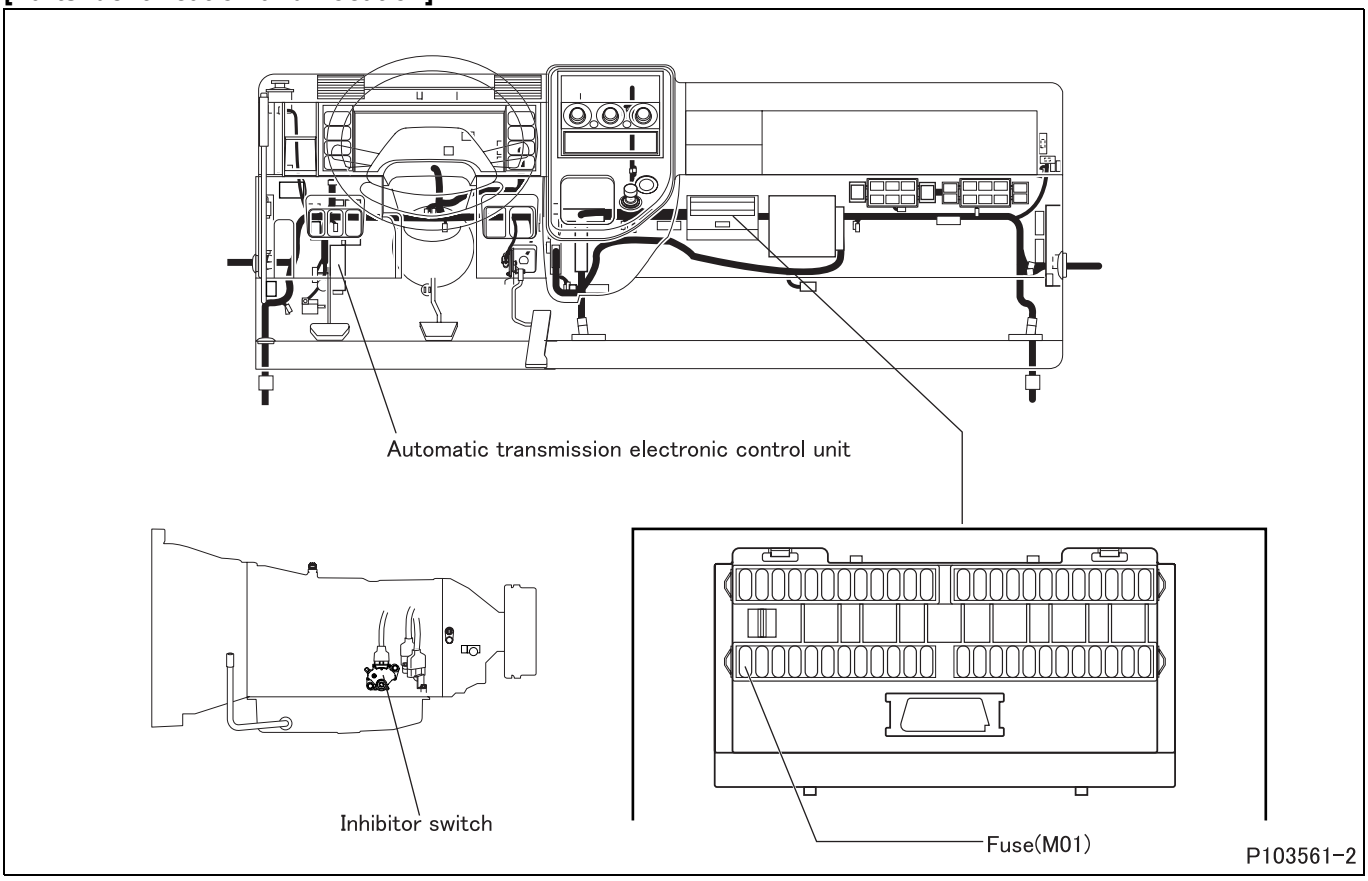
[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and inhibitor switch
- Malfunction of each connector
- Malfunction of inhibitor switch
- Malfunction of electronic control unit

[Recoverability]
- Recovered if signal becomes normal when starter switch is turned OFF to ON (power supply resumed to electronic control unit).

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Go to step 2. **<Multi-Use Tester used>** Measure item No. 19 “P Pos.SW”, No. 20 “R Pos.SW”, No. 21 “N Pos.SW”, No. 22 “D Pos.SW”, No. 24 “3 Pos.SW”, No. 55 “Selector Pos.”, No. 78 “2 Pos.SW” of Service Data.
	Inspection condition		–
	Requirements		Synchronous with shift of range selector lever position.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

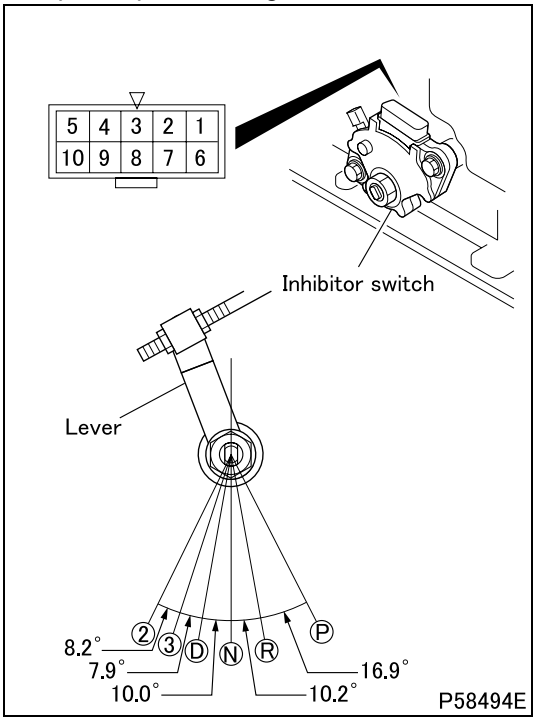
Step 2	Inspection items		Inspection by electronic control unit connector (signal)
	Maintenance item		<Range selector in P position> Measure value of voltage between connector (CY31A) terminal No. 20 (+) and (CY24A) terminal No. 8 (–). <Range selector in R position> Measure value of voltage between connector (CY31A) terminal No. 30 (+) and (CY24A) terminal No. 8 (–). <Range selector in N position> Measure value of voltage between connector (CY31A) terminal No. 29 (+) and (CY24A) terminal No. 8 (–). <Range selector in D position> Measure value of voltage between connector (CY31A) terminal No. 19 (+) and (CY24A) terminal No. 8 (–). <Range selector in 3rd position> Measure value of voltage between connector (CY31A) terminal No. 18 (+) and (CY24A) terminal No. 8 (–). <Range selector in 2nd position> Measure value of voltage between connector (CY31A) terminal No. 17 (+) and (CY24A) terminal No. 8 (–).
	Inspection condition		• Measure from back side of harness connector with harness left connected • Starter switch: ON • Check with range selector in each position.
	Requirements		12 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Go to step 4.

Step 3	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Replacement of electronic control unit
		NO	Modify connector.

Step 4	Inspection items		Inspection of inhibitor switch connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Modify connector.

Step 5	Inspection items		Inspection of inhibitor switch unit
	Maintenance item		**<P>** • Measure continuity between terminals No. 4 and No. 5 and between terminals No. 6 and No. 10. **<R>** • Measure continuity between terminals No. 4 and No. 9. **<N>** • Measure continuity between terminals No. 1 and No. 4 and between terminals No. 6 and No. 10. **<D>** • Measure continuity between terminals No. 4 and No. 8. **<3>** • Measure continuity between terminals No. 2 and No. 4. **<2>** • Measure continuity between terminals No. 4 and No. 7.
	Inspection condition		• Keep switch installed on vehicle. • Shift range selector lever from one range position to another and measure continuity each time. • Starter switch: ON
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Replacement of switch

<Step 5 inspection diagram>



Step 6	Inspection items		Inspection of harness between inhibitor switch and electronic control unit (signal)
	Maintenance item		**<P>** • Check circuit between switch connector terminal No. 5 and electronic control unit connector (CY31A) terminal No. 20 **<R>** • Check circuit between switch connector terminal No. 9 and electronic control unit connector (CY31A) terminal No. 30 **<N>** • Check circuit between switch connector terminal No. 1 and electronic control unit connector (CY31A) terminal No. 29 **<D>** • Check circuit between switch connector terminal No. 8 and electronic control unit connector (CY31A) terminal No. 19 **<3>** • Check circuit between switch connector terminal No. 2 and electronic control unit connector (CY31A) terminal No. 18 **<2>** • Check circuit between switch connector terminal No. 7 and electronic control unit connector (CY31A) terminal No. 17
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify harness.

Step 7	Inspection items		Inspection of harness between inhibitor switch and fuse (power supply)
	Maintenance item		Check circuit between switch connector terminal No. 4 and fuse (M01)
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify harness.

Step 8	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** <Range selector in P position> Measure value of voltage between connector (CY31A) terminal No. 20 (+) and (CY24A) terminal No. 8 (–). <Range selector in R position> Measure value of voltage between connector (CY31A) terminal No. 30 (+) and (CY24A) terminal No. 8 (–). <Range selector in N position> Measure value of voltage between connector (CY31A) terminal No. 29 (+) and (CY24A) terminal No. 8 (–). <Range selector in D position> Measure value of voltage between connector (CY31A) terminal No. 19 (+) and (CY24A) terminal No. 8 (–). <Range selector in 3rd position> Measure value of voltage between connector (CY31A) terminal No. 18 (+) and (CY24A) terminal No. 8 (–). <Range selector in 2nd position> Measure value of voltage between connector (CY31A) terminal No. 17 (+) and (CY24A) terminal No. 8 (–). **<Multi-Use Tester used>** Measure item No. 19 “P Pos.SW”, No. 20 “R Pos.SW”, No. 21 “N Pos.SW”, No. 22 “D Pos.SW”, No. 24 “3 Pos.SW”, No. 55 “Selector Pos.”, No. 78 “2 Pos.SW” of Service Data.
	Inspection condition		**<Multi-Use Tester not used>** • Measure from back side of harness connector with harness left connected • Starter switch: ON • Check with range selector in each position.
	Requirements		**<Multi-Use Tester not used>** 12 V **<Multi-Use Tester used>** Synchronous with shift of range selector lever position.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P0711/Flash code: 13
[Monitor ID]
13, 14
[Fault (outline)]
Failure of oil temperature sensor (inside)
[Diagnosis check]
- Automatic transmission fluid temperature immediately after starter switch is turned ON is monitored. <A>
- Automatic transmission fluid temperature during engine warm-up is monitored. <B>

[Code generation condition]
- Detected temperature of oil temperature sensor (inside) is less than –10°C {14°F} even after specified time of vehicle run. <A>
- Detected temperature of oil temperature sensor (inside) does not change by any more than 2°C {36°F}. <B>

[Diagnosis check timing]
- Fault diagnosis is performed once at the minimum during the driving cycle.

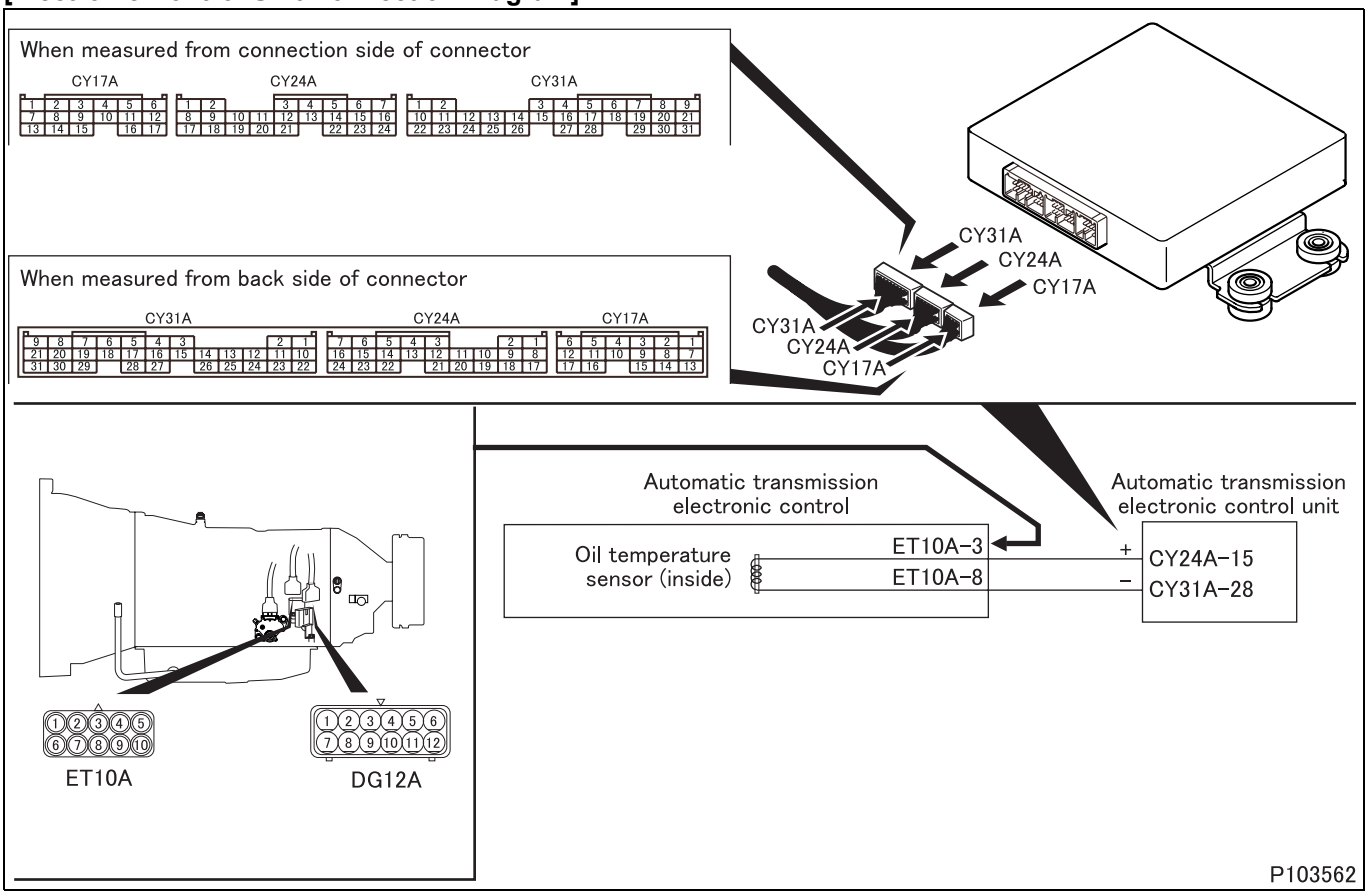
[Diagnostic requirement]
- Automatic transmission fluid temperature 1 sec. after the starter switch is turned from ON position: –50°C {–56°F} to –10°C {14°F} <A>
- Engine coolant temperature 1 sec. after the starter switch is turned from ON position: 70°C {160°F} or more <B>
- Temperature change in the engine coolant after the starter switch is turned to ON position: above 50°C {120°F} <B>
- Automatic transmission fluid temperature 1 sec. after the starter switch is turned from ON position: –50°C {–56°F} to 40°C {105°F} <B>
- Starter switch ON battery voltage: 10 V to 16 V
- Controller area network: Normal
- Elapsed time when the engine speed calculated from the output speed sensor signals exceeds 300 rpm: above 410 sec.

[Control effected by electronic control unit during fault]
- Control is effected on basis of low oil temperature (–30°C {–24°F}) immediately after starter switch is turned ON and normal oil temperature (80°C {175°F}) 5 minutes later.
- Braking force control is inhibited.

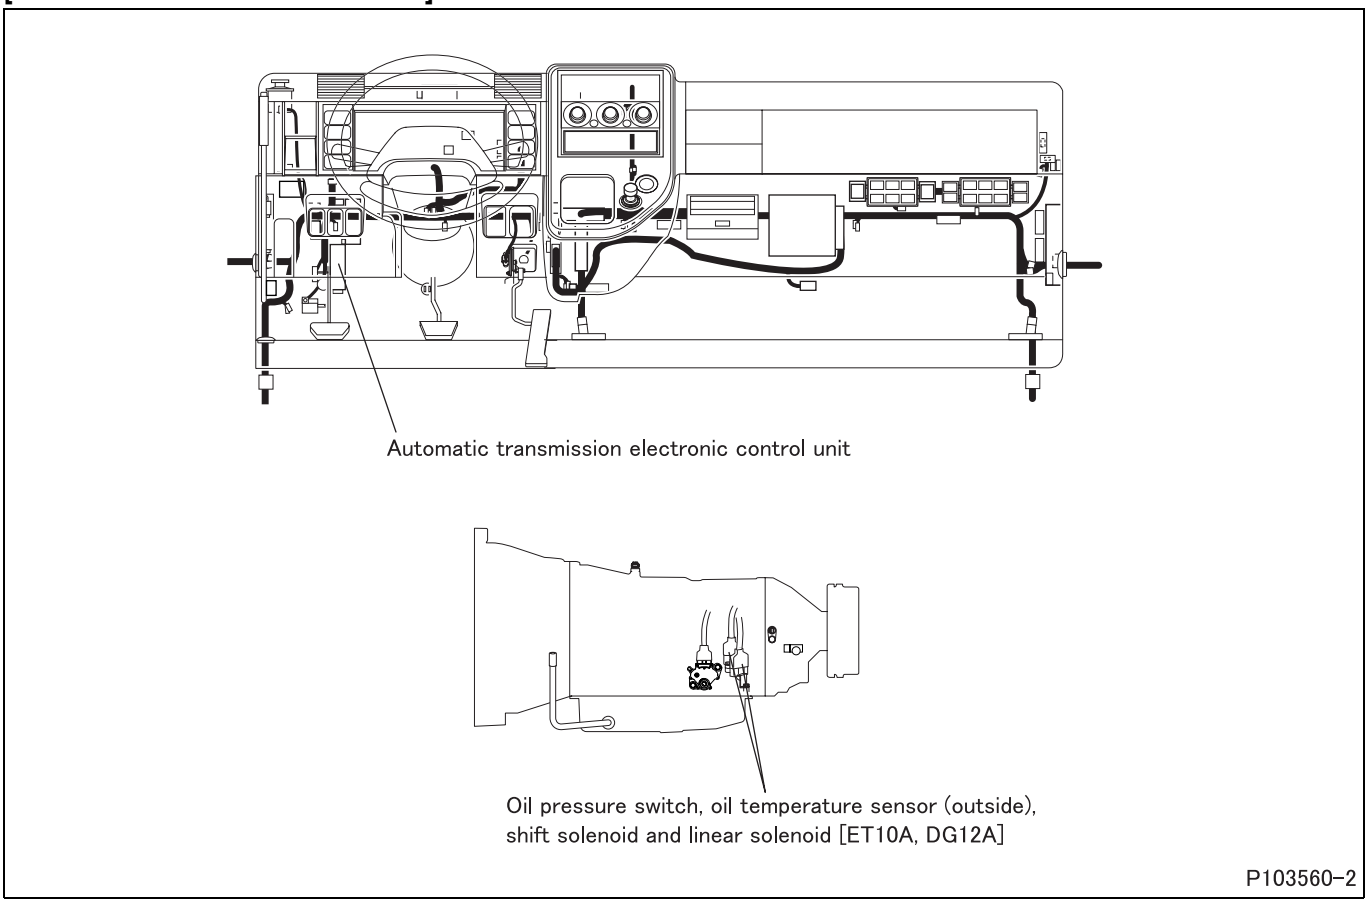
[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and oil temperature sensor (inside)
- Malfunction of each connector
- Malfunction of oil temperature sensor (inside)
- Malfunction of electronic control unit

[Recoverability]
- Recovered if signal becomes normal when starter switch is turned OFF to ON (power supply resumed to electronic control unit).

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of resistance between electronic control unit connector (CY24A) terminal No. 15 and connector (CY31A) terminal No. 28. **<Multi-Use Tester used>** Measure item No. 13 “A/T Oil Temp (OP)” of Service Data.
	Inspection condition		**<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** Cold engine → during warm-up: Resistance is gradually reduced. **<Multi-Use Tester used>** • Cold engine: Proportionate to outside air temperature • During warm-up: Gradually increased.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

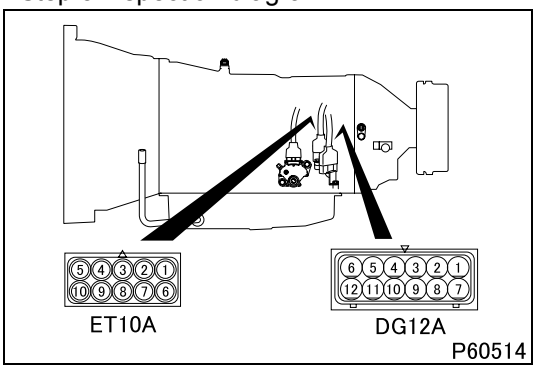
Step 2	Inspection items		Inspection by electronic control unit connector (signal)
	Maintenance item		Measure value of resistance between connector (CY24A) terminal No. 15 and connector (CY31A) terminal No. 28.
	Inspection condition		• Disconnect electronic control unit and harness, and measure from connection side of harness connector. • Starter switch: OFF
	Requirements		• –30°C {–22°F}: 44 ± 6.6 kΩ • 10°C {50°F}: 6445 ± 645 Ω • 110°C {230°F}: 247 ± 16 Ω • 145°C {295°F}: 111 ± 6 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Go to step 4.

Step 3	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Replacement of electronic control unit
		NO	Modify connector.

Step 4	Inspection items		Inspection of sensor connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Modify connector.

Step 5	Inspection items		Inspection of sensor unit
	Maintenance item		Measure value of resistance between connector (ET10A) terminal No. 3 and 8.
	Inspection condition		–
	Requirements		• –30°C {–22°F}: 44 ± 6.6 kΩ • 10°C {50°F}: 6445 ± 645 Ω • 110°C {230°F}: 247 ± 16 Ω • 145°C {295°F}: 111 ± 6 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Replacement of automatic transmission

<Step 5 inspection diagram>



Step 6	Inspection items		Inspection of harness between sensor and electronic control unit (signal)
	Maintenance item		Check circuit between connector (ET10A) terminal No. 3 and electronic control unit connector (CY24A) terminal No. 15.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify harness.

Step 7	Inspection items		Inspection of harness between sensor and electronic control unit (ground)
	Maintenance item		Check circuit between connector (ET10A) terminal No. 8 and electronic control unit connector (CY31A) terminal No. 28.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify harness.

Step 8	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of resistance between electronic control unit connector (CY24A) terminal No. 15 and connector (CY31A) terminal No. 28. **<Multi-Use Tester used>** Measure item No. 13 “A/T Oil Temp (OP)” of Service Data.
	Inspection condition		**<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** Cold engine → during warm-up: Resistance is gradually reduced. **<Multi-Use Tester used>** • Cold engine: Proportionate to outside air temperature • During warm-up: Gradually increased.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P0712/Flash code: 13
[Monitor ID]
11
[Fault (outline)]
Failure of oil temperature sensor (inside)
[Diagnosis check]
- Automatic transmission fluid temperature is monitored by oil temperature sensor (inside).

[Code generation condition]
- Oil temperature sensor (inside) output temperature remains excessively high (over 180°C {355°F}) for 0.5 second.

[Diagnosis check timing]
- Fault diagnosis is continuously performed.

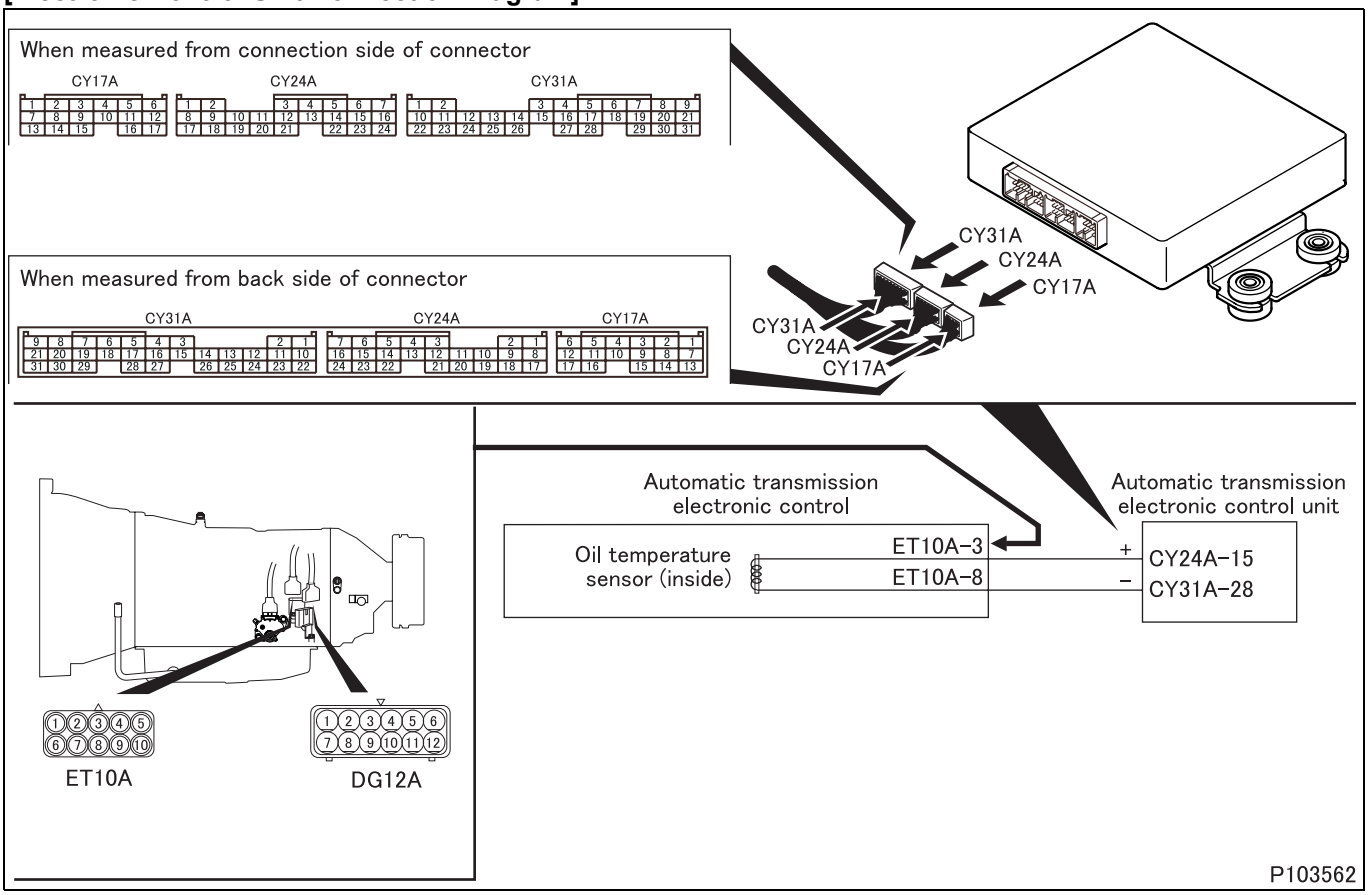
[Diagnostic requirement]
- Continuous

[Control effected by electronic control unit during fault]
- Control is effected on basis of low oil temperature (–30°C {–24°F}) immediately after starter switch is turned ON and normal oil temperature (80°C {175°F}) 5 minutes later.
- Braking force control is inhibited.

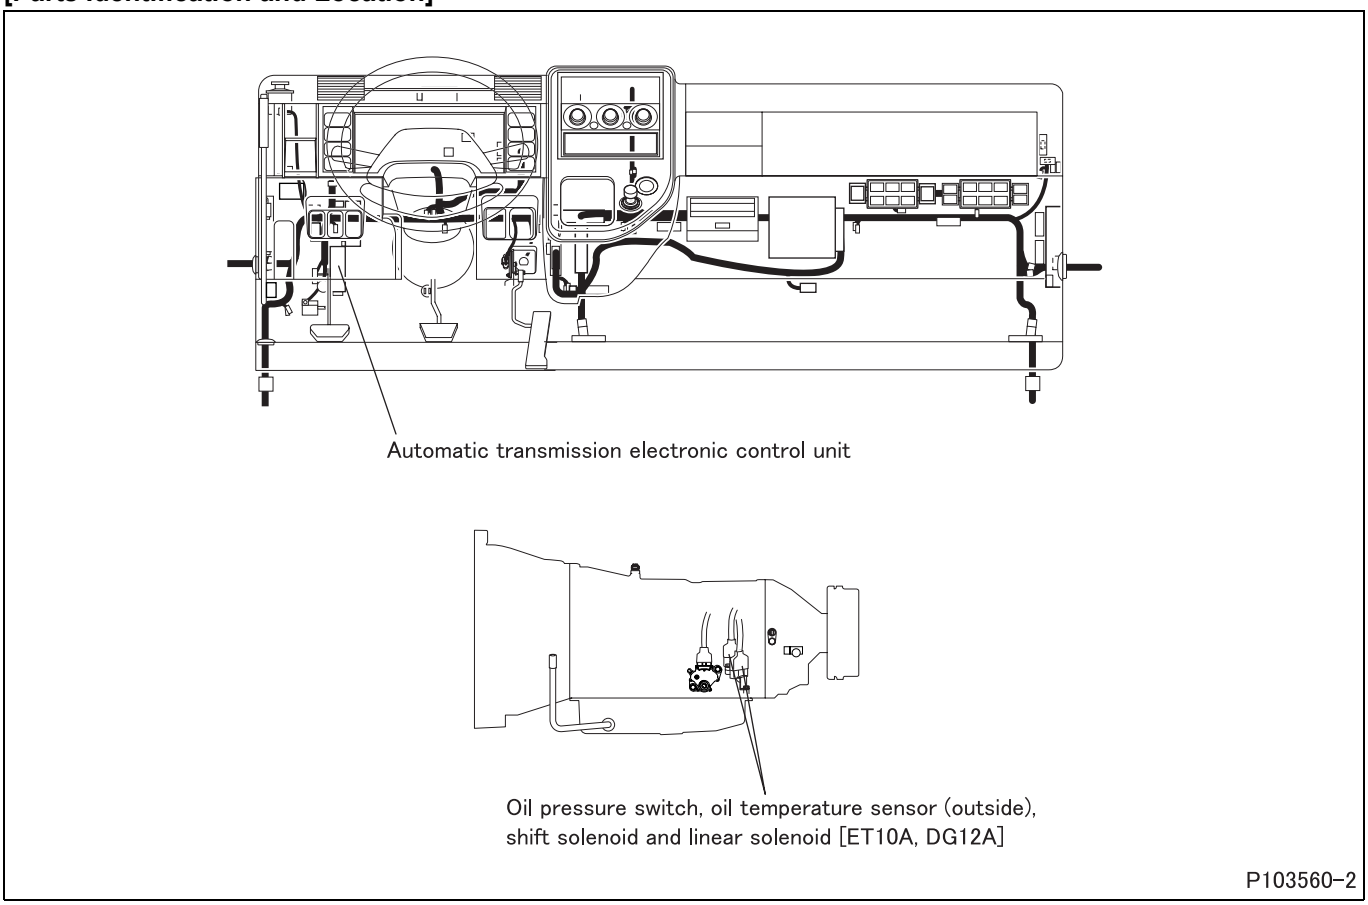
[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and oil temperature sensor (inside)
- Malfunction of each connector
- Malfunction of oil temperature sensor (inside)
- Malfunction of electronic control unit

[Recoverability]
- Recovered if signal becomes normal with starter switch in ON position.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of resistance between electronic control unit connector (CY24A) terminal No. 15 and connector (CY31A) terminal No. 28. **<Multi-Use Tester used>** Measure item No. 13 “A/T Oil Temp (OP)” of Service Data.
	Inspection condition		**<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** Cold engine → during warm-up: Resistance is gradually reduced. **<Multi-Use Tester used>** • Cold engine: Proportionate to outside air temperature • During warm-up: Gradually increased.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

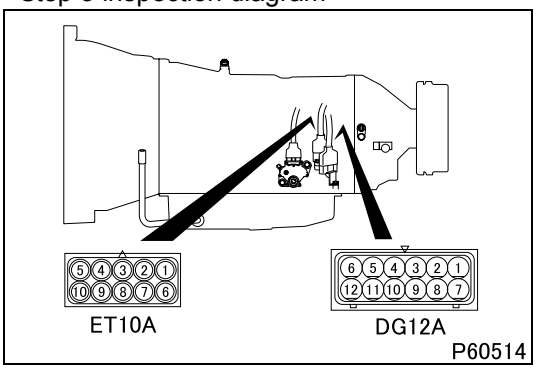
Step 2	Inspection items		Inspection by electronic control unit connector (signal)
	Maintenance item		Measure value of resistance between connector (CY24A) terminal No. 15 and connector (CY31A) terminal No. 28.
	Inspection condition		• Disconnect electronic control unit and harness, and measure from connection side of harness connector. • Starter switch: OFF
	Requirements		• –30°C {–22°F}: 44 ± 6.6 kΩ • 10°C {50°F}: 6445 ± 645 Ω • 110°C {230°F}: 247 ± 16 Ω • 145°C {295°F}: 111 ± 6 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Go to step 4.

Step 3	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Replacement of electronic control unit
		NO	Modify connector.

Step 4	Inspection items		Inspection of sensor connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Modify connector.

Step 5	Inspection items		Inspection of sensor unit
	Maintenance item		Measure value of resistance between connector (ET10A) terminal No. 3 and 8.
	Inspection condition		–
	Requirements		• –30°C {–22°F}: 44 ± 6.6 kΩ • 10°C {50°F}: 6445 ± 645 Ω • 110°C {230°F}: 247 ± 16 Ω • 145°C {295°F}: 111 ± 6 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Replacement of automatic transmission

<Step 5 inspection diagram>



Step 6	Inspection items		Inspection of harness between sensor and electronic control unit (signal)
	Maintenance item		Check circuit between connector (ET10A) terminal No. 3 and electronic control unit connector (CY24A) terminal No. 15.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify harness.

Step 7	Inspection items		Inspection of harness between sensor and electronic control unit (ground)
	Maintenance item		Check circuit between connector (ET10A) terminal No. 8 and electronic control unit connector (CY31A) terminal No. 28.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify harness.

Step 8	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of resistance between electronic control unit connector (CY24A) terminal No. 15 and connector (CY31A) terminal No. 28. **<Multi-Use Tester used>** Measure item No. 13 “A/T Oil Temp (OP)” of Service Data.
	Inspection condition		**<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** • Cold engine → during warm-up: Resistance is gradually reduced. **<Multi-Use Tester used>** • Cold engine: Proportionate to outside air temperature • During warm-up: Gradually increased.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P0713/Flash code: 13
[Monitor ID]
12
[Fault (outline)]
Failure of oil temperature sensor (inside)
[Diagnosis check]
- Automatic transmission fluid temperature is monitored by oil temperature sensor (inside).

[Code generation condition]
- Oil temperature sensor (inside) output temperature remains excessively low (below –50°C {–56°F}) for 0.5 second.

[Diagnosis check timing]
- Fault diagnosis is continuously performed.

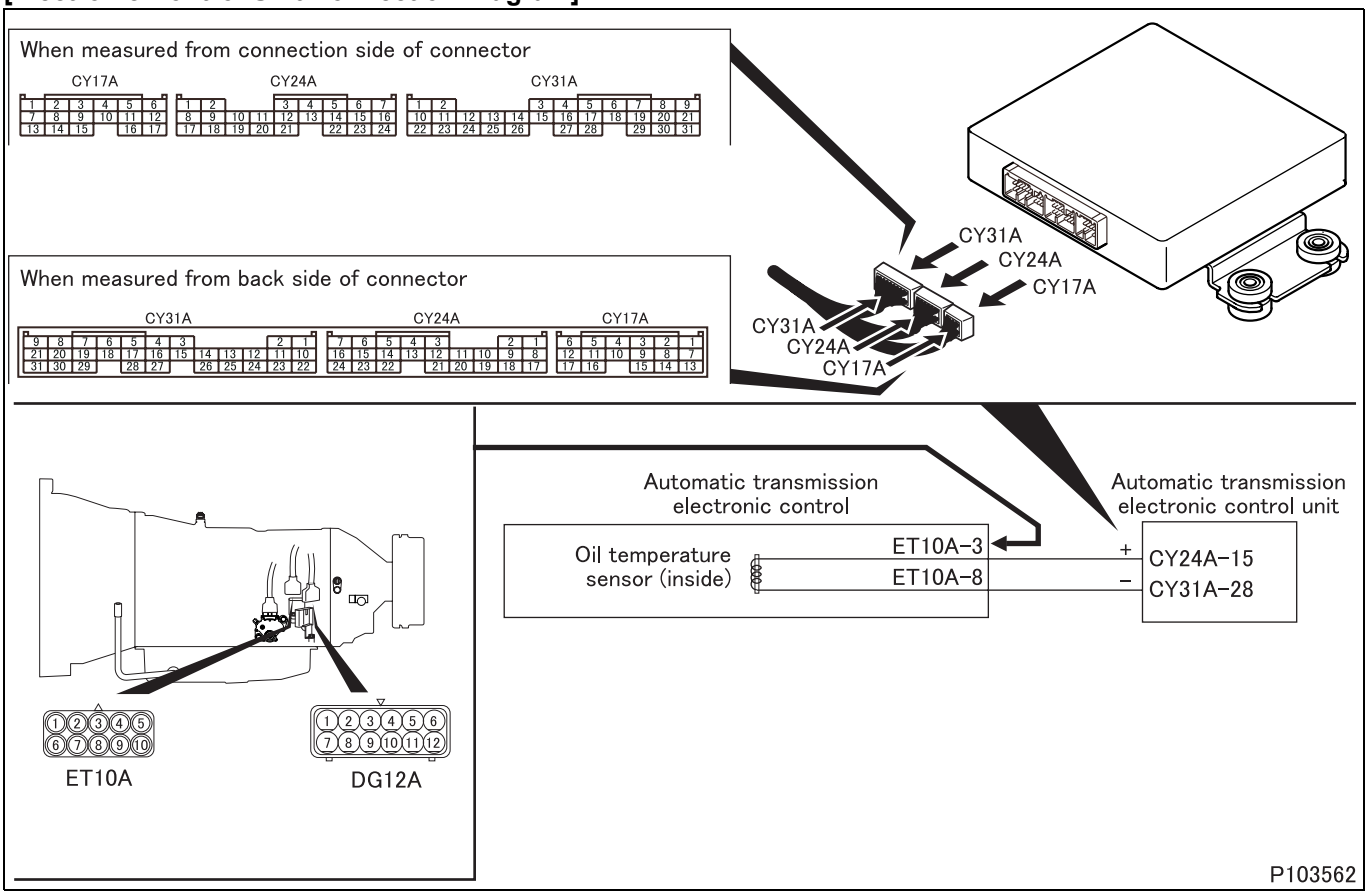
[Diagnostic requirement]
- Continuous

[Control effected by electronic control unit during fault]
- Control is effected on basis of low oil temperature (–30°C {–24°F}) immediately after starter switch is turned ON and normal oil temperature (80°C {175°F}) 5 minutes later.
- Braking force control is inhibited.

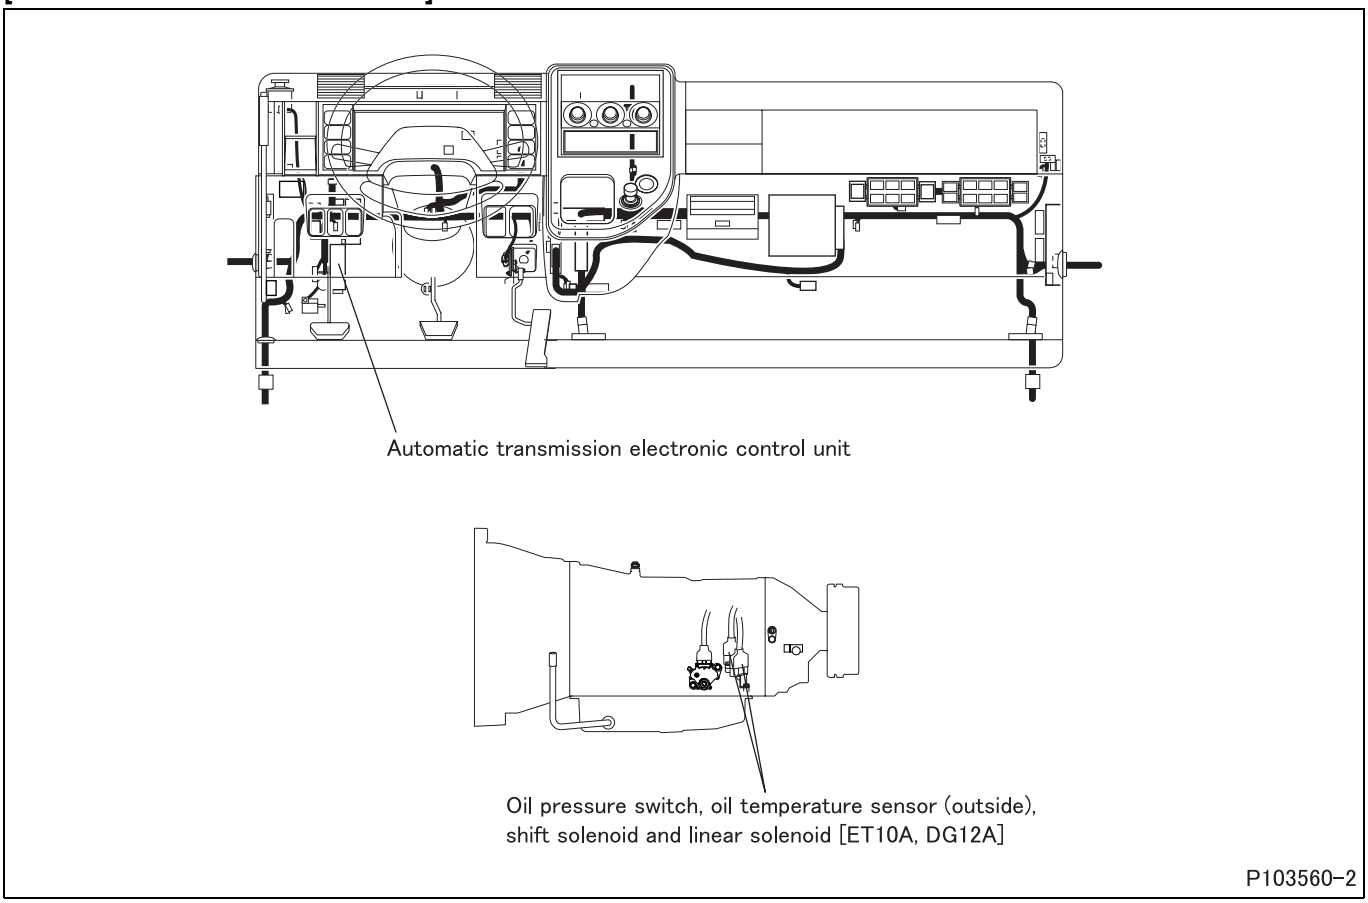
[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and oil temperature sensor (inside)
- Malfunction of each connector
- Malfunction of oil temperature sensor (inside)
- Malfunction of electronic control unit

[Recoverability]
- Recovered if signal becomes normal with starter switch in ON position.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of resistance between electronic control unit connector (CY24A) terminal No. 15 and connector (CY31A) terminal No. 28. **<Multi-Use Tester used>** Measure item No. 13 “A/T Oil Temp (OP)” of Service Data.
	Inspection condition		**<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** Cold engine → during warm-up: Resistance is gradually reduced. **<Multi-Use Tester used>** • Cold engine: Proportionate to outside air temperature • During warm-up: Gradually increased.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

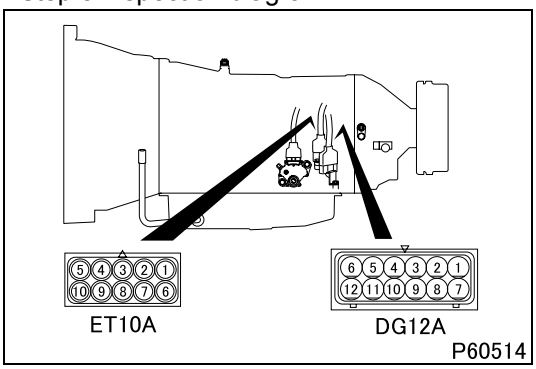
Step 2	Inspection items		Inspection by electronic control unit connector (signal)
	Maintenance item		Measure value of resistance between connector (CY24A) terminal No. 15 and connector (CY31A) terminal No. 28.
	Inspection condition		• Disconnect electronic control unit and harness, and measure from connection side of harness connector. • Starter switch: OFF
	Requirements		• –30°C {–22°F}: 44 ± 6.6 kΩ • 10°C {50°F}: 6445 ± 645 Ω • 110°C {230°F}: 247 ± 16 Ω • 145°C {295°F}: 111 ± 6 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Go to step 4.

Step 3	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Replacement of electronic control unit
		NO	Modify connector.

Step 4	Inspection items		Inspection of sensor connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Modify connector.

Step 5	Inspection items		Inspection of sensor unit
	Maintenance item		Measure value of resistance between connector (ET10A) terminal No. 3 and 8.
	Inspection condition		–
	Requirements		• –30°C {–22°F}: 44 ± 6.6 kΩ • 10°C {50°F}: 6445 ± 645 Ω • 110°C {230°F}: 247 ± 16 Ω • 145°C {295°F}: 111 ± 6 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Replacement of automatic transmission

<Step 5 inspection diagram>



Step 6	Inspection items		Inspection of harness between sensor and electronic control unit (signal)
	Maintenance item		Check circuit between connector (ET10A) terminal No. 3 and electronic control unit connector (CY24A) terminal No. 15.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify harness.

Step 7	Inspection items		Inspection of harness between sensor and electronic control unit (ground)
	Maintenance item		Check circuit between connector (ET10A) terminal No. 8 and electronic control unit connector (CY31A) terminal No. 28.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify harness.

Step 8	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of resistance between electronic control unit connector (CY24A) terminal No. 15 and connector (CY31A) terminal No. 28. **<Multi-Use Tester used>** Measure item No. 13 “A/T Oil Temp (OP)” of Service Data.
	Inspection condition		**<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** Cold engine → during warm-up: Resistance is gradually reduced. **<Multi-Use Tester used>** • Cold engine: Proportionate to outside air temperature • During warm-up: Gradually increased.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P0714/Flash code: 13
[Monitor ID]
15
[Fault (outline)]
Failure of oil temperature sensor (inside)
[Diagnosis check]
- Automatic transmission fluid temperature is monitored by oil temperature sensor (inside).

[Code generation condition]
- Oil temperature sensor (inside) signal remains intermittent for 7 seconds.

[Diagnosis check timing]
- Fault diagnosis is continuously performed.

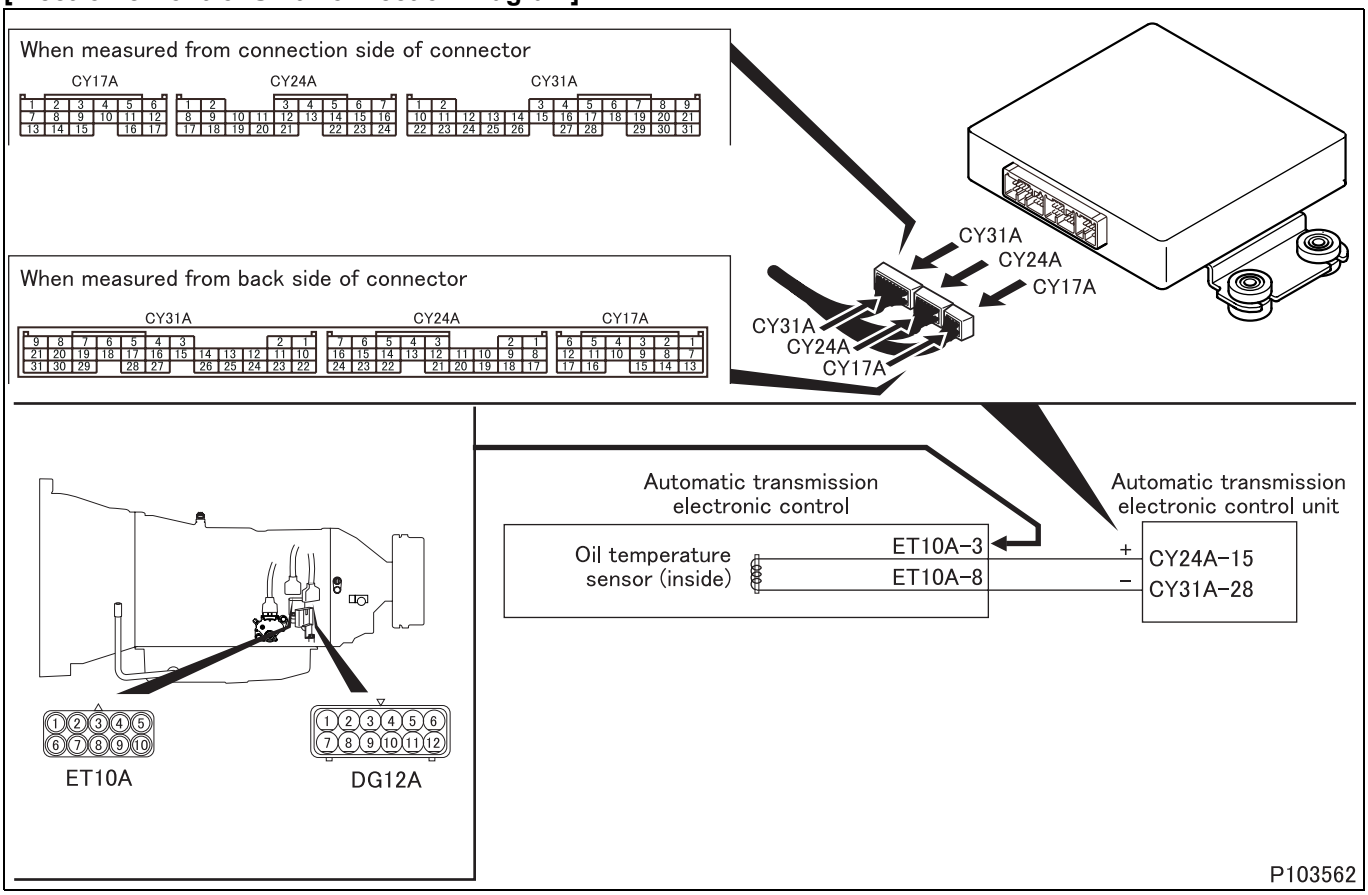
[Diagnostic requirement]
- Starter switch ON battery voltage: 10 V to 16 V

[Control effected by electronic control unit during fault]
- Control is effected on basis of low oil temperature (–30°C {–24°F}) immediately after starter switch is turned ON and normal oil temperature (80°C {175°F}) 5 minutes later.
- Braking force control is inhibited.

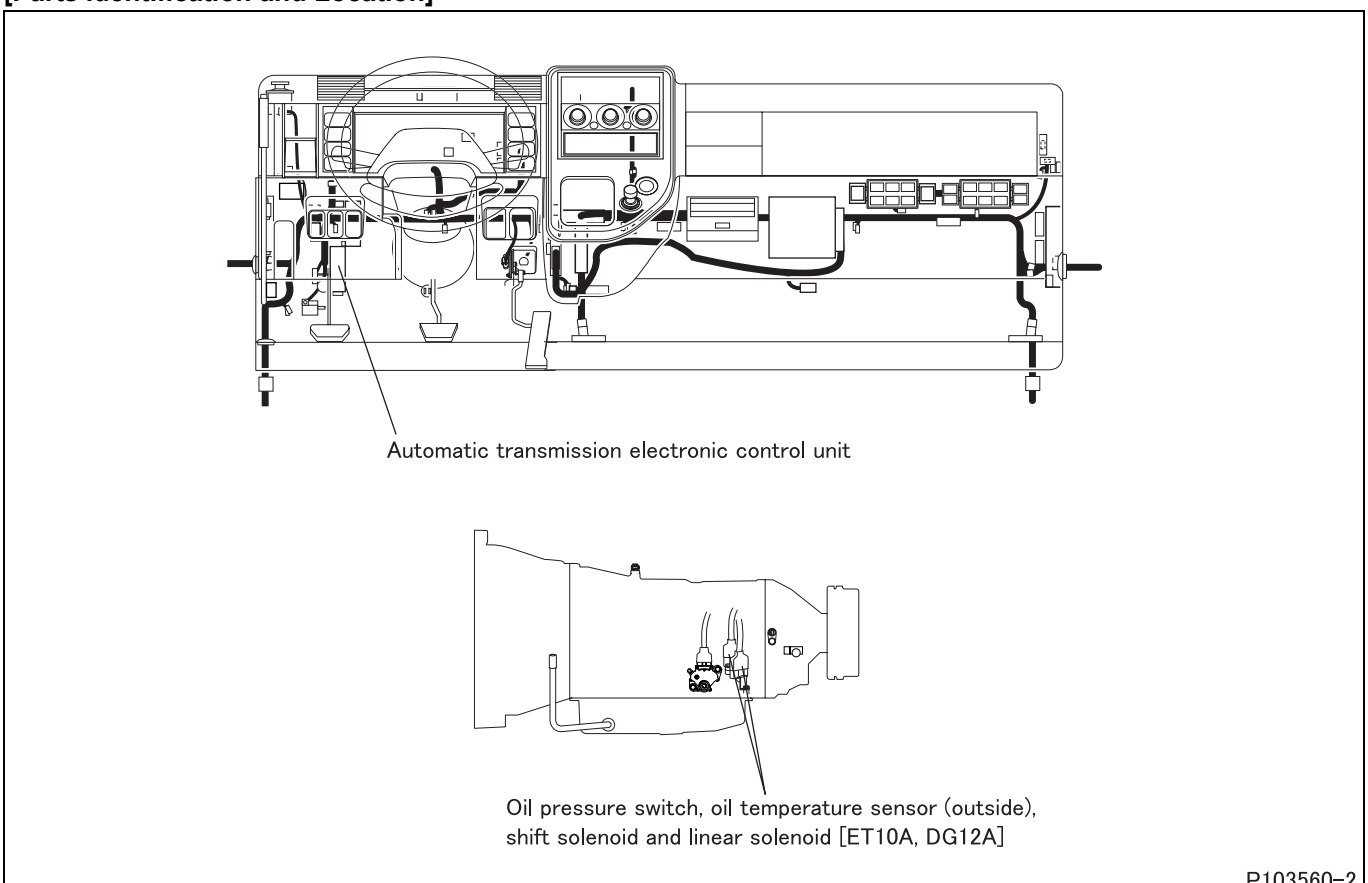
[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and oil temperature sensor (inside)
- Malfunction of each connector
- Malfunction of oil temperature sensor (inside)
- Malfunction of electronic control unit

[Recoverability]
- Recovered if signal becomes normal with starter switch in ON position.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of resistance between electronic control unit connector (CY24A) terminal No. 15 and connector (CY31A) terminal No. 28. **<Multi-Use Tester used>** Measure item No. 13 “A/T Oil Temp (OP)” of Service Data.
	Inspection condition		**<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** • Cold engine → during warm-up: Resistance is gradually reduced. **<Multi-Use Tester used>** • Cold engine: Proportionate to outside air temperature • During warm-up: Gradually increased.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

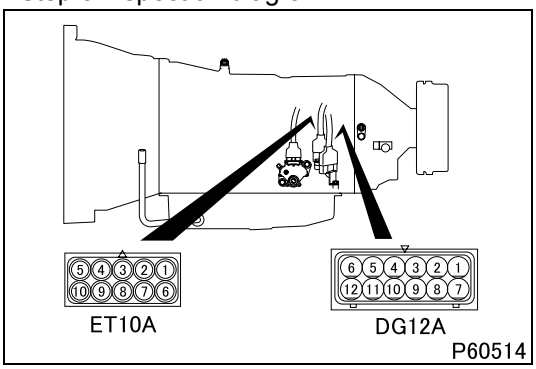
Step 2	Inspection items		Inspection by electronic control unit connector (signal)
	Maintenance item		Measure value of resistance between connector (CY24A) terminal No. 15 and connector (CY31A) terminal No. 28.
	Inspection condition		• Disconnect electronic control unit and harness, and measure from connection side of harness connector. • Starter switch: OFF
	Requirements		• –30°C {–22°F}: 44 ± 6.6 kΩ • 10°C {50°F}: 6445 ± 645 Ω • 110°C {230°F}: 247 ± 16 Ω • 145°C {295°F}: 111 ± 6 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Go to step 4.

Step 3	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Replacement of electronic control unit
		NO	Modify connector.

Step 4	Inspection items		Inspection of sensor connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Modify connector.

Step 5	Inspection items		Inspection of sensor unit
	Maintenance item		Measure value of resistance between connector (ET10A) terminal No. 3 and 8.
	Inspection condition		–
	Requirements		• –30°C {–22°F}: 44 ± 6.6 kΩ • 10°C {50°F}: 6445 ± 645 Ω • 110°C {230°F}: 247 ± 16 Ω • 145°C {295°F}: 111 ± 6 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Replacement of automatic transmission

<Step 5 inspection diagram>



Step 6	Inspection items		Inspection of harness between sensor and electronic control unit (signal)
	Maintenance item		Check circuit between connector (ET10A) terminal No. 3 and electronic control unit connector (CY24A) terminal No. 15.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify harness.

Step 7	Inspection items		Inspection of harness between sensor and electronic control unit (ground)
	Maintenance item		Check circuit between connector (ET10A) terminal No. 8 and electronic control unit connector (CY31A) terminal No. 28.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify harness.

Step 8	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of resistance between electronic control unit connector (CY24A) terminal No. 15 and connector (CY31A) terminal No. 28. **<Multi-Use Tester used>** Measure item No. 13 “A/T Oil Temp (OP)” of Service Data.
	Inspection condition		**<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** Cold engine → during warm-up: Resistance is gradually reduced. **<Multi-Use Tester used>** • Cold engine: Proportionate to outside air temperature • During warm-up: Gradually increased.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P0717/Flash code: 16
[Monitor ID]
5
[Fault (outline)]
Failure of turbine speed sensor
[Diagnosis check]
- Turbine speed sensor is monitored for fault when vehicle is running without gear shifted.

[Code generation condition]
- Input signal from turbine speed sensor is missing when output speed sensor output is normal.

[Diagnosis check timing]
- Fault diagnosis is performed once at the minimum during the driving cycle.

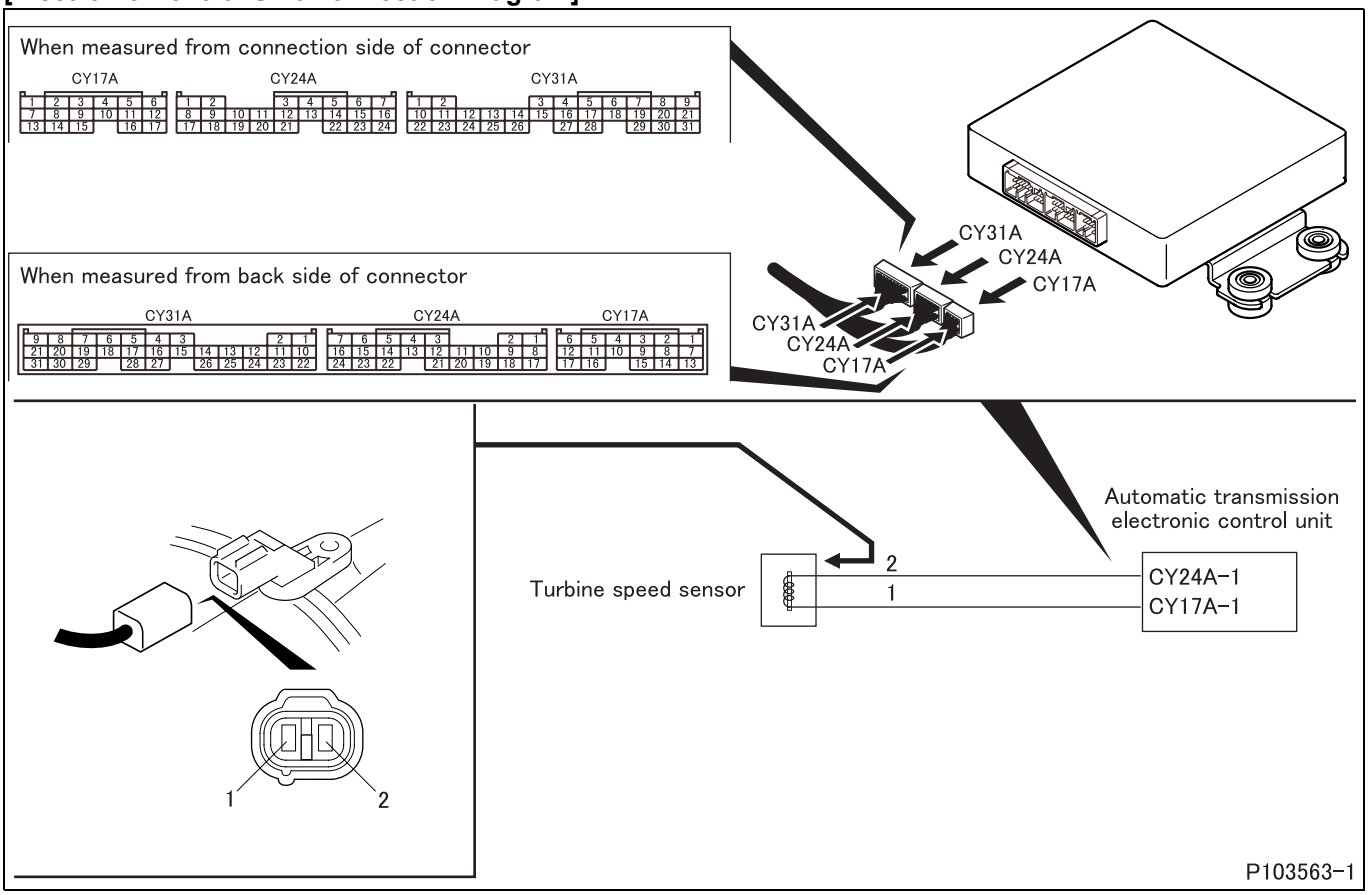
[Diagnostic requirement]
- Vehicle speed: above 5 km/h {3 mph} (not less than 4 sec.)
- Shift position: except P or N range
- Engine revolution: 300 rpm or higher
- Control at the time of gear shifting is not effected.

[Control effected by electronic control unit during fault]
- Oil pressure control by linear solenoids 1, 2 and 3 is switched from vehicle speed feedback to controlling in accordance with elapsed time from speed change.
- Braking force control is inhibited.

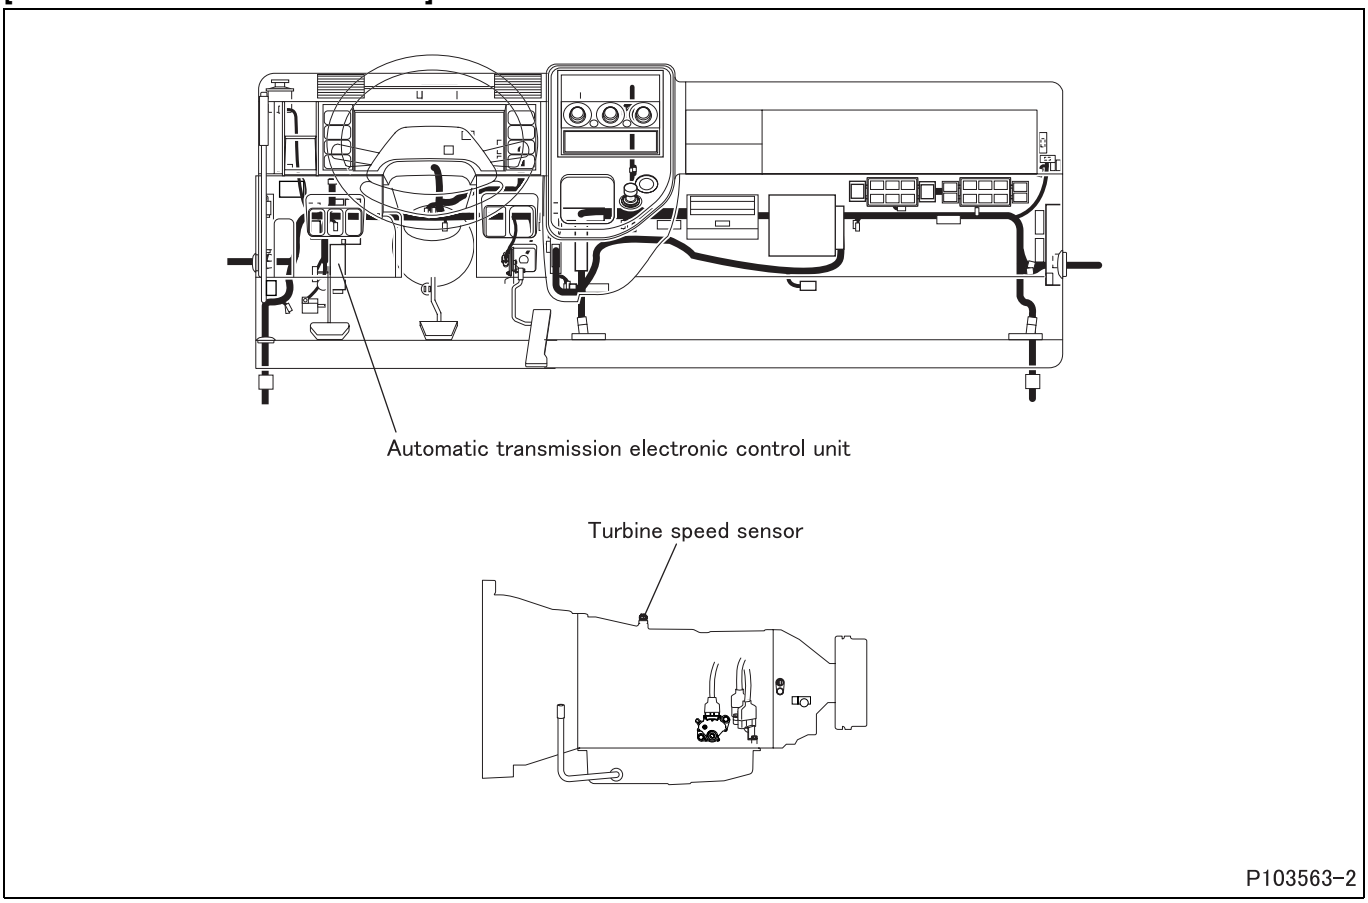
[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and turbine speed sensor
- Malfunction of each connector
- Malfunction of turbine speed sensor
- Malfunction of electronic control unit

[Recoverability]
- Recovered if signal becomes normal with starter switch in ON position.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

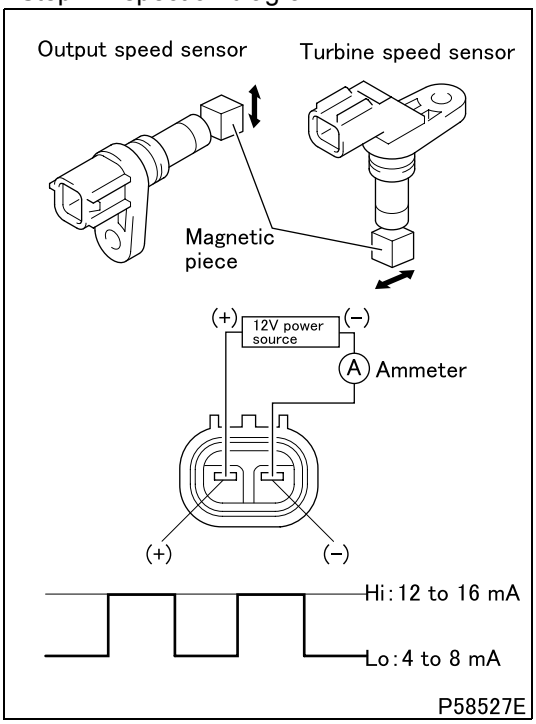
Step 1	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Go to step 2. **<Multi-Use Tester used>** Measure item No. 16 “Turbine Speed” of Service Data.
	Inspection condition		–
	Requirements		• Vehicle standing with range selector in D position: 0 rpm • Vehicle running from above state: Gradually increased.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

Step 2	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Modify connector.

Step 3	Inspection items		Inspection of sensor connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	Modify connector.

Step 4	Inspection items		Inspection of sensor unit
	Maintenance item		Measure current between terminals.
	Inspection condition		• Wire sensor as illustrated. • Move magnetic piece at sensor tip in illustrated direction. (Distance between sensor and magnetic piece: Within 5 mm [0.20 in.])
	Requirements		• Hi: 12 to 16 mA • Low: 4 to 8 mA
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Replacement of sensor

<Step 4 inspection diagram>



Step 5	Inspection items		Inspection of harness between sensor and electronic control unit (signal)
	Maintenance item		Check circuit between sensor connector terminal No. 2 and electronic control unit connector (CY24A) terminal No. 1.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Replacement of harness

Step 6	Inspection items		Inspection of harness between sensor and electronic control unit (ground)
	Maintenance item		Check circuit between sensor connector terminal No. 1 and electronic control unit connector (CY17A) terminal No. 1.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Replacement of harness

Step 7	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Check for recurrence of the same diagnosis code. **<Multi-Use Tester used>** Measure item No. 16 “Turbine Speed” of Service Data.
	Inspection condition		**–**
	Requirements		**<Multi-Use Tester not used>** • If the same diagnosis code occurs, replace electronic control unit. **<Multi-Use Tester used>** • Vehicle standing with range selector in D position: 0 rpm • Vehicle running from above state: Gradually increased.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P0721/Flash code: 25
[Monitor ID]
4
[Fault (outline)]
Failure of output speed sensor
[Diagnosis check]
- Output speed sensor is monitored for fault with vehicle in running condition.

[Code generation condition]
Vehicle speed sensor is judged faulty in either of the following cases.
- Electronic control unit determines vehicle stop after sudden input of deceleration signal from output speed sensor. (Lamp indication: IMB) <A>
- Abnormality established by comparison with turbine speed sensor and vehicle speed sensor and of output gear ratio has continued for 4 seconds. (Lamp indication: 2DC) <B>

[Diagnosis check timing]
- Fault diagnosis is performed once at the minimum during the driving cycle.

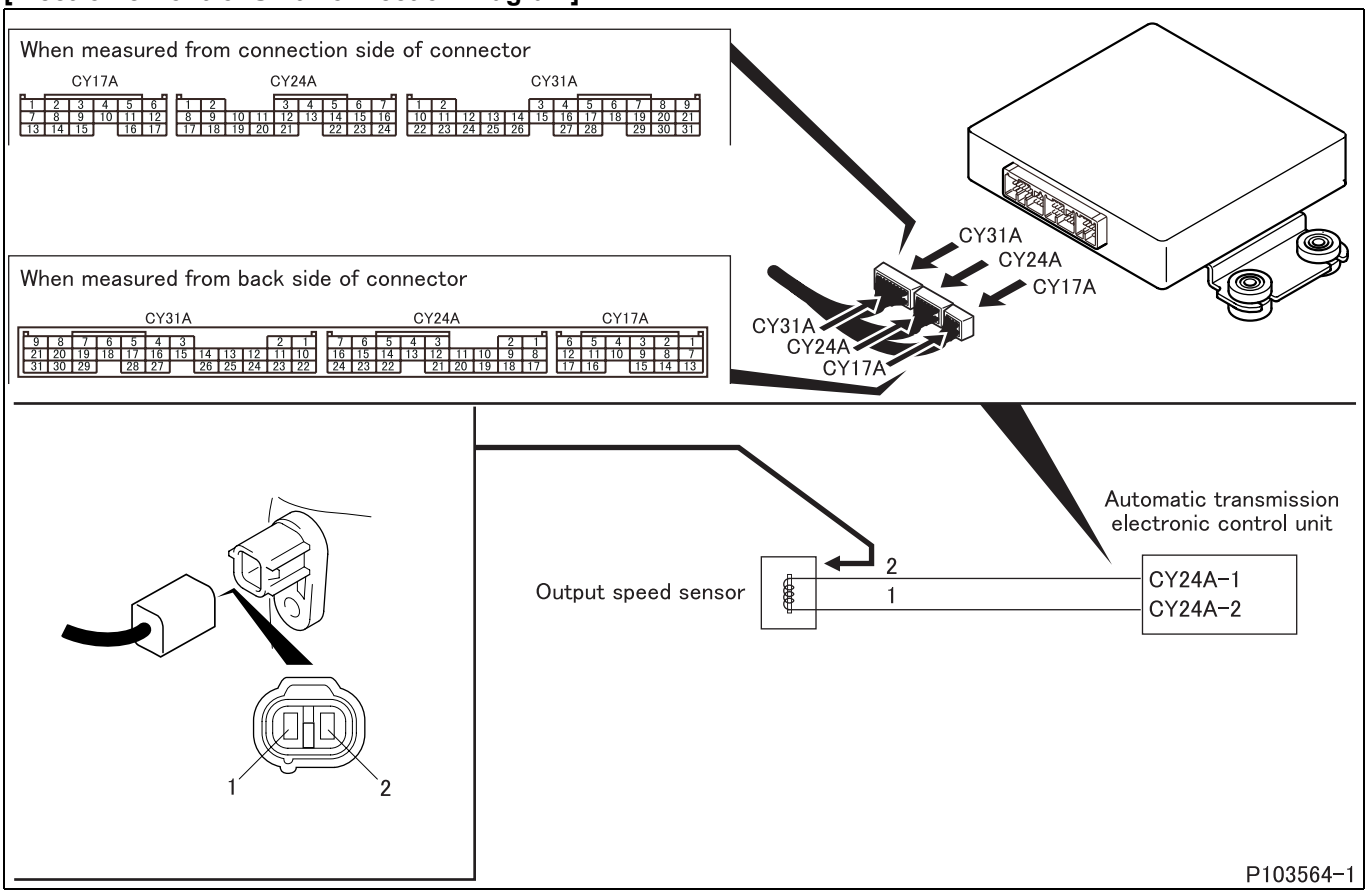
[Diagnostic requirement]
- Vehicle speed sensor related diagnosis code (P0500, P0501) does not occur.
- Output speed sensor related diagnosis code (P0722) does not occur.
- Turbine speed sensor related diagnosis code does not occur.
- Engine speed sensor related diagnosis code does not occur.
- Inhibitor switch related diagnosis code does not occur.
- Control with the fixed speed gear signals outputted under fault conditions is not effected.
- Shift position: except P or N range
- Control at the time of gear shifting is not effected.

[Control effected by electronic control unit during fault]
- The gear last selected is active on a steady basis.

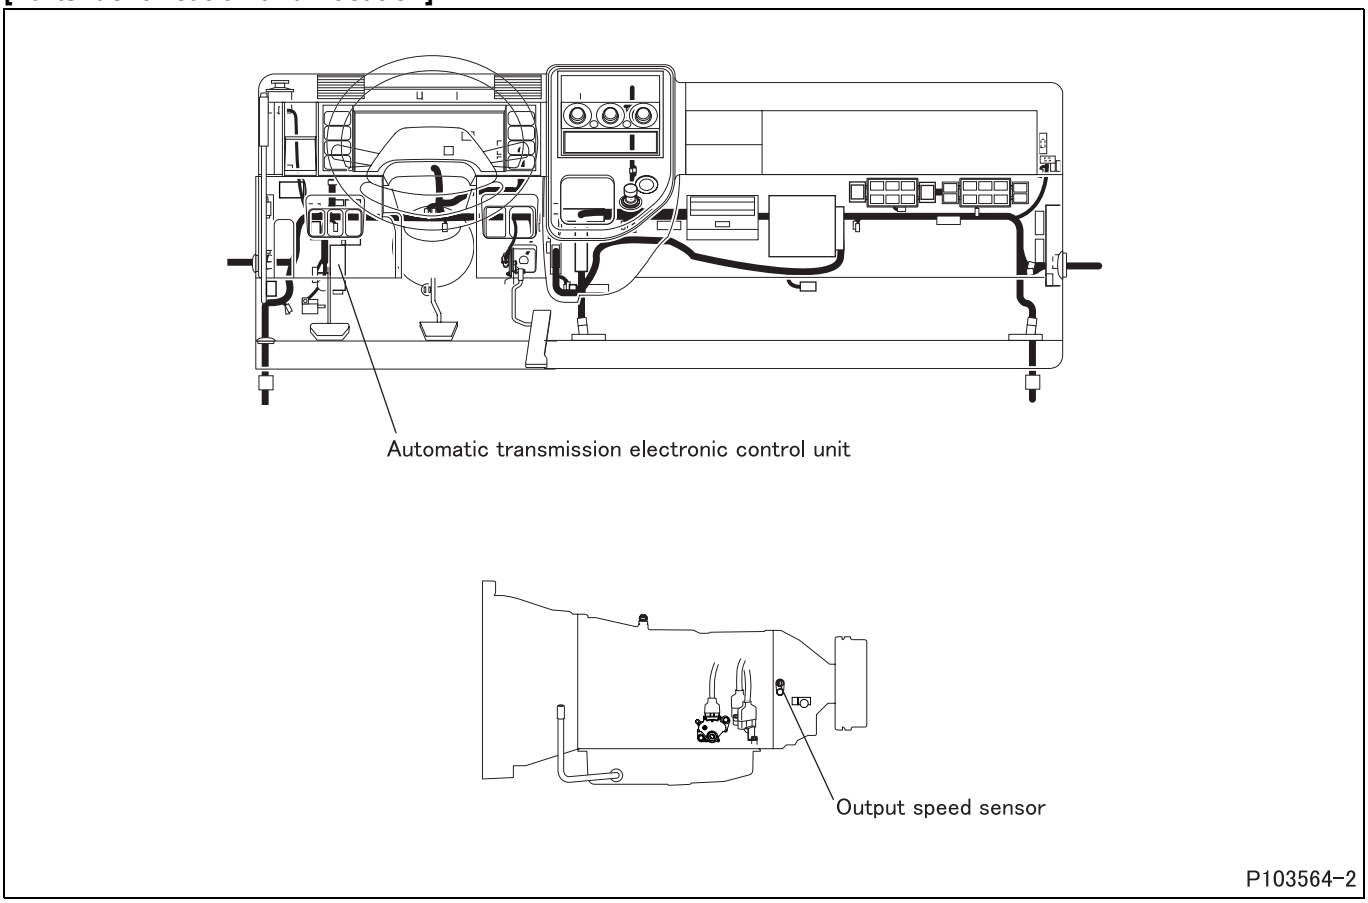
[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and output speed sensor
- Malfunction of each connector
- Malfunction of output speed sensor
- Malfunction of electronic control unit

[Recoverability]
- Recovered if signal becomes normal with starter switch in ON position.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

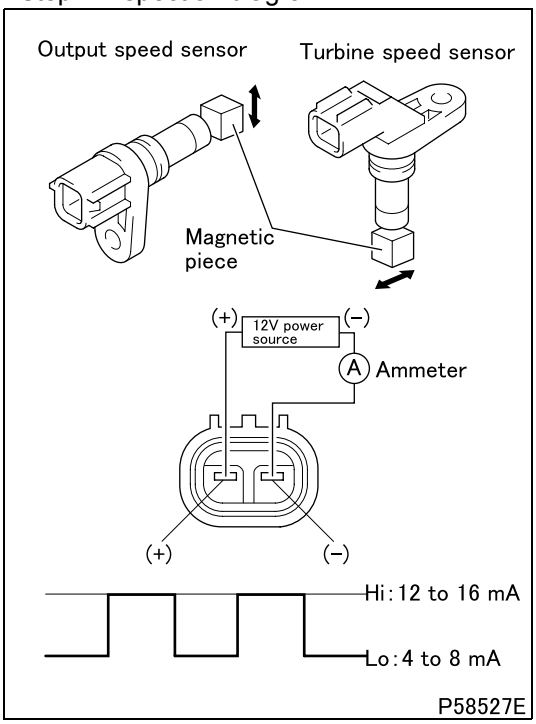
Step 1	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Go to step 2. **<Multi-Use Tester used>** Measure item No. 25 “VEH Speed 2” of Service Data.
	Inspection condition		–
	Requirements		During vehicle run: Synchronous with speedometer.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

Step 2	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Modify connector.

Step 3	Inspection items		Inspection of sensor connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	Modify connector.

Step 4	Inspection items		Inspection of sensor unit
	Maintenance item		Measure current between terminals.
	Inspection condition		• Wire sensor as illustrated. • Move magnetic piece at sensor tip in illustrated direction. (Distance between sensor and magnetic piece: Within 5 mm [0.20 in.])
	Requirements		• Hi: 12 to 16 mA • Low: 4 to 8 mA
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Replacement of sensor

<Step 4 inspection diagram>



Step 5	Inspection items		Inspection of harness between sensor and electronic control unit (signal)
	Maintenance item		Check circuit between sensor connector terminal No. 2 and electronic control unit connector (CY24A) terminal No. 1.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Replacement of harness

Step 6	Inspection items		Inspection of harness between sensor and electronic control unit (ground)
	Maintenance item		Check circuit between sensor connector terminal No. 1 and electronic control unit connector (CY24A) terminal No. 2.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Replacement of harness

Step 7	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Check for recurrence of the same diagnosis code. **<Multi-Use Tester used>** Measure item No. 25 “VEH Speed 2” of Service Data.
	Inspection condition		**–**
	Requirements		**<Multi-Use Tester not used>** If the same diagnosis code occurs, replace electronic control unit. **<Multi-Use Tester used>** During vehicle run: Synchronous with speedometer.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P0722/Flash code: 25
[Monitor ID]
3
[Fault (outline)]
Failure of output speed sensor
[Diagnosis check]
- Output speed sensor is monitored for fault during vehicle run (after at least 4 seconds of running at 5 km/h or more)

[Code generation condition]
- Input signal from output speed sensor is missing when vehicle speed sensor output is normal.

[Diagnosis check timing]
- Fault diagnosis is performed once at the minimum during the driving cycle.

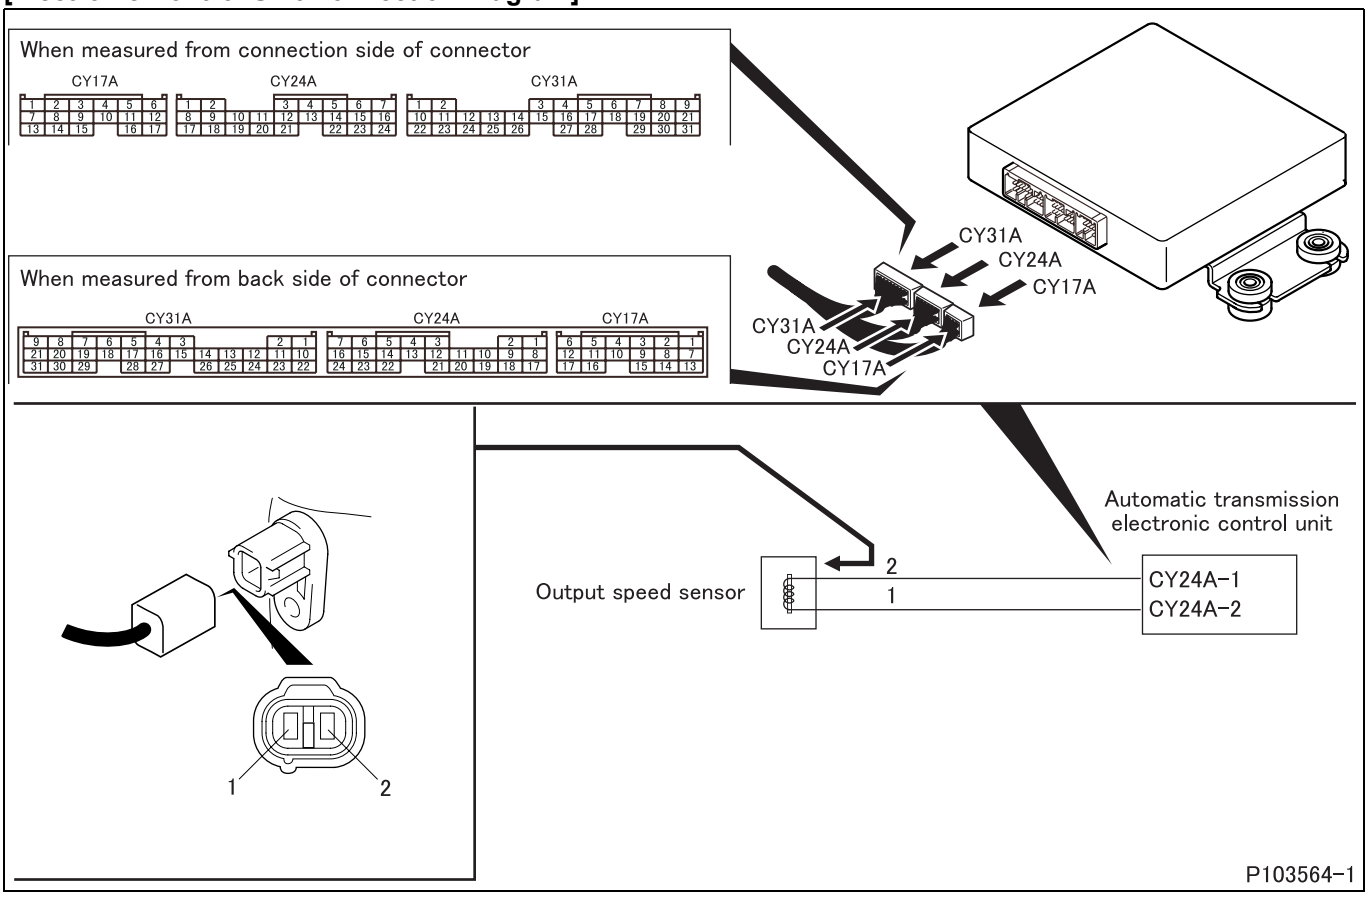
[Diagnostic requirement]
- Vehicle speed: above 5 km/h {3 mph} (not less than 4 sec.)
- Shift position: except P or N range
- Vehicle speed sensor related diagnosis code (P0500, P0501) does not occur.

[Control effected by electronic control unit during fault]
- Control is effected using vehicle speed sensor.
- Oil pressure control by linear solenoids 1, 2 and 3 is switched from vehicle speed feedback to controlling in accordance with elapsed time from speed change.
- Braking force control is inhibited.

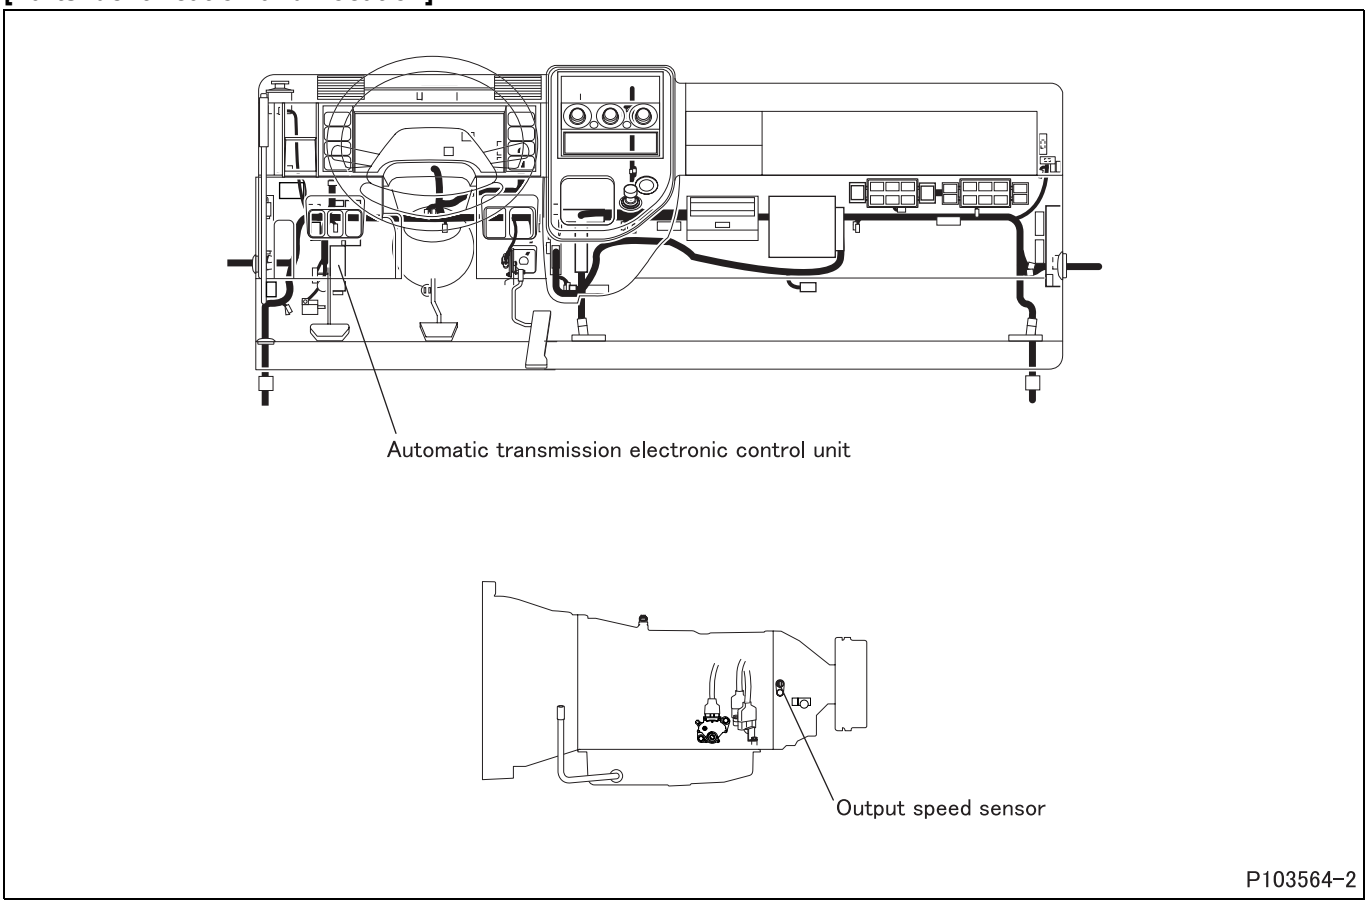
[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and output speed sensor
- Malfunction of each connector
- Malfunction of output speed sensor
- Malfunction of electronic control unit

[Recoverability]
- Recovered if signal becomes normal with starter switch in ON position.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

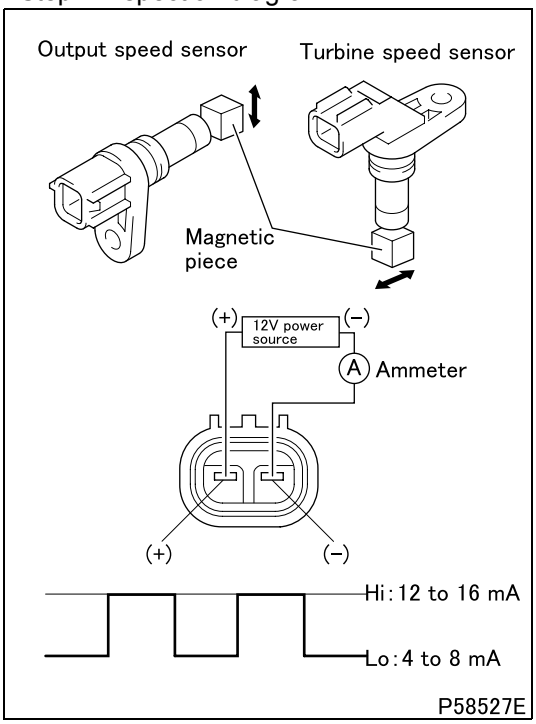
Step 1	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Go to step 2. **<Multi-Use Tester used>** Measure item No. 25 “VEH Speed 2” of Service Data.
	Inspection condition		–
	Requirements		During vehicle run: Synchronous with speedometer.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

Step 2	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Modify connector.

Step 3	Inspection items		Inspection of sensor connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	Modify connector.

Step 4	Inspection items		Inspection of sensor unit
	Maintenance item		Measure current between terminals.
	Inspection condition		• Wire sensor as illustrated. • Move magnetic piece at sensor tip in illustrated direction. (Distance between sensor and magnetic piece: Within 5 mm [0.20 in.])
	Requirements		• Hi: 12 to 16 mA • Low: 4 to 8 mA
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Replacement of sensor

<Step 4 inspection diagram>



Step 5	Inspection items		Inspection of harness between sensor and electronic control unit (signal)
	Maintenance item		Check circuit between sensor connector terminal No. 2 and electronic control unit connector (CY24A) terminal No. 1.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Replacement of harness

Step 6	Inspection items		Inspection of harness between sensor and electronic control unit (ground)
	Maintenance item		Check circuit between sensor connector terminal No. 1 and electronic control unit connector (CY24A) terminal No. 2.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Replacement of harness

Step 7	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Check for recurrence of the same diagnosis code. **<Multi-Use Tester used>** Measure item No. 25 “VEH Speed 2” of Service Data.
	Inspection condition		–
	Requirements		**<Multi-Use Tester not used>** If the same diagnosis code occurs, replace electronic control unit. **<Multi-Use Tester used>** During vehicle run: Synchronous with speedometer.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P0726/Flash code: 15
[Monitor ID]
6
[Fault (outline)]
Abnormality of engine speed signal
[Diagnosis check]
- Engine speed signal from engine electronic control unit is monitored during vehicle run.

[Code generation condition]
- Engine speed signal from engine electronic control unit remains less than specified (300 rpm) for 4 seconds.

[Diagnosis check timing]
- Fault diagnosis is performed once at the minimum during the driving cycle.

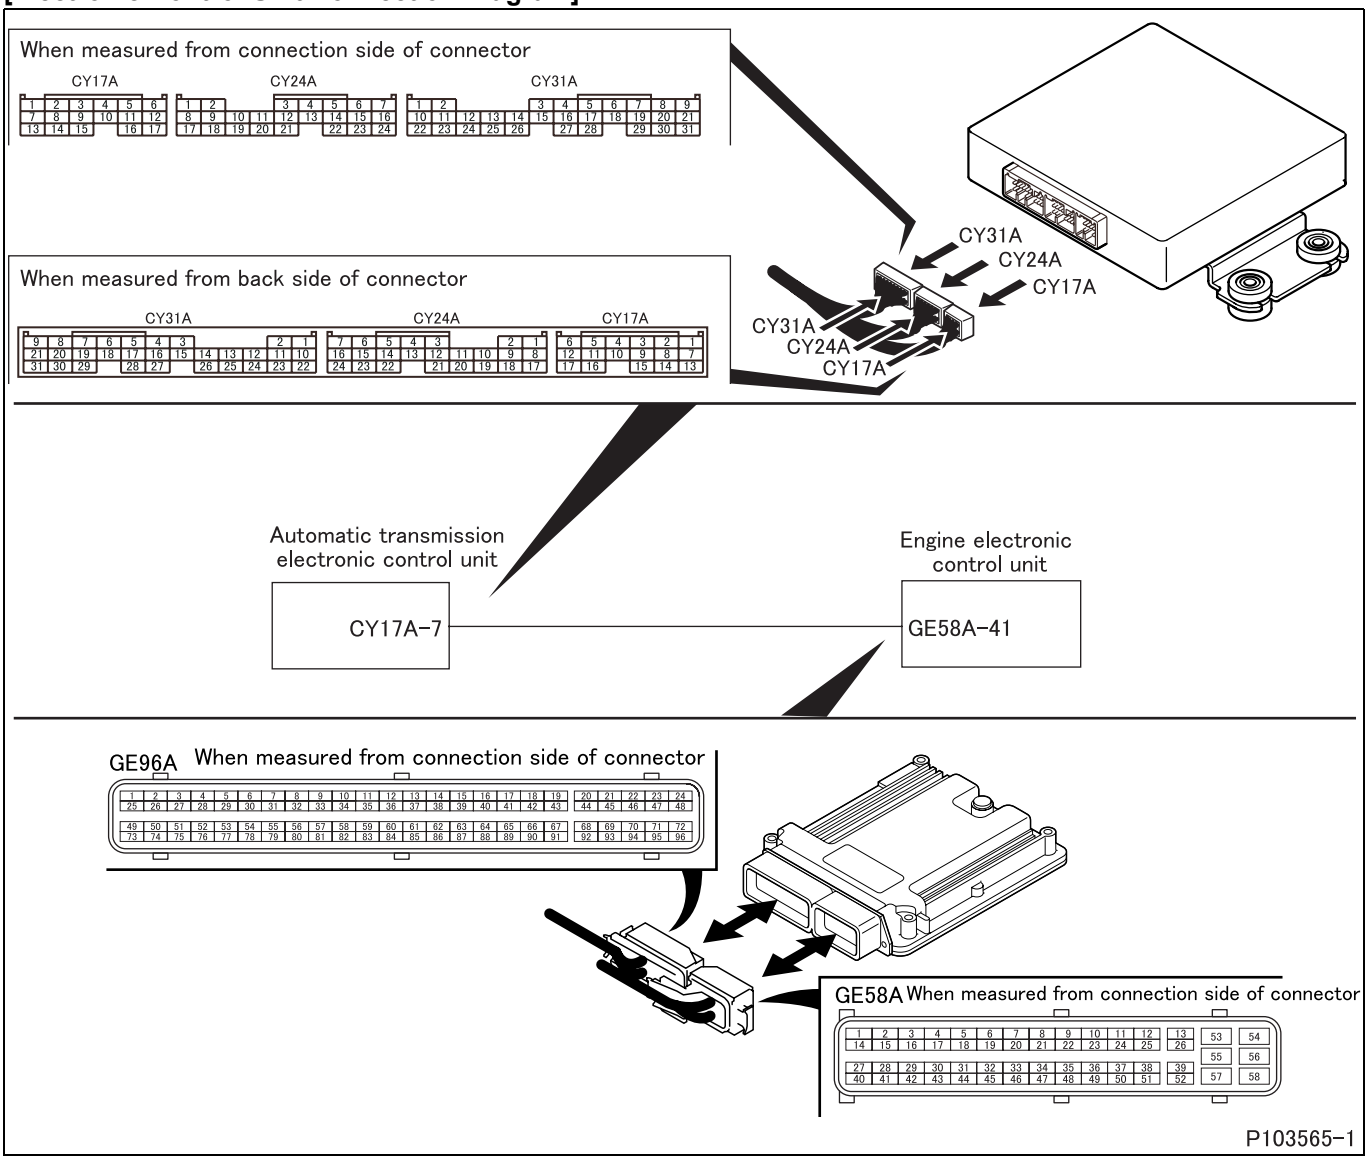
[Diagnostic requirement]
- Output shaft speed: above 1000 rpm
- Shift position: except P or N range

[Control effected by electronic control unit during fault]
- Control is effected with engine speed at specified value (Specified values differ by type of control.)
- Braking force control is inhibited.

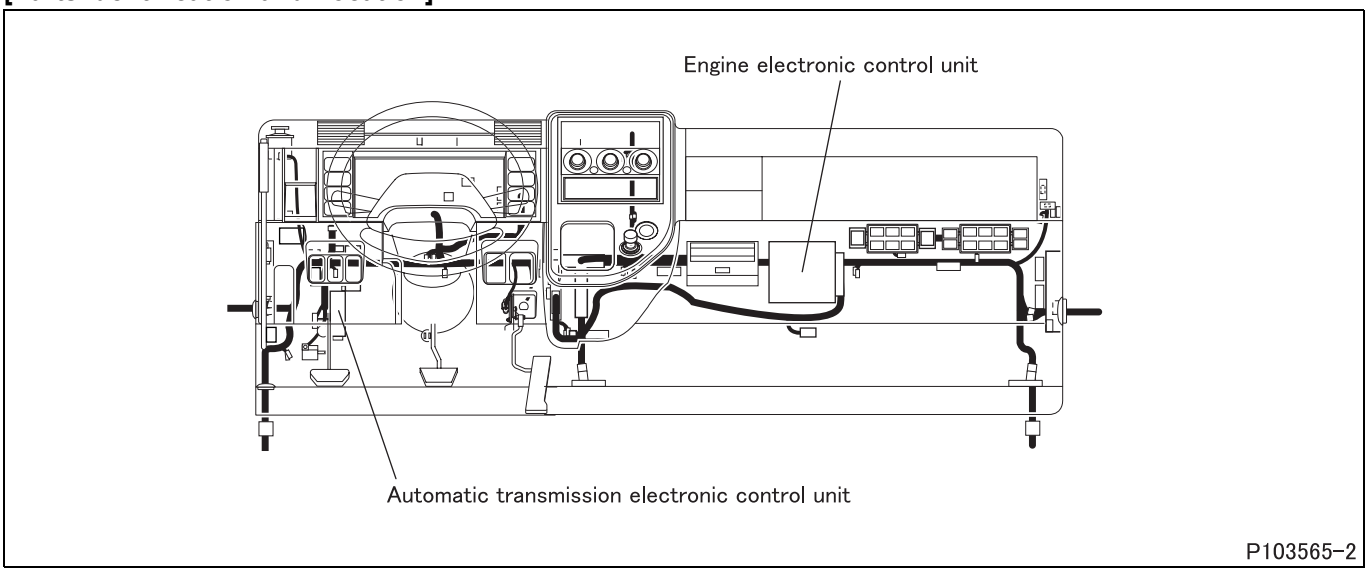
[Probable cause of trouble]
- Open-circuit or short-circuit between electronic control unit and engine electronic control unit or between engine electronic control unit and engine speed sensor
- Malfunction of each connector
- Malfunction of engine speed sensor
- Malfunction of electronic control unit
- Malfunction of engine electronic control unit

[Recoverability]
- Recovered if signal becomes normal with starter switch in ON position.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Go to step 2. **<Multi-Use Tester used>** Measure item No. 15 “Engine Speed” of Service Data.
	Inspection condition		–
	Requirements		Racing (engine in operation): Synchronous with tachometer
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

Step 2	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Modify connector.

Step 3	Inspection items		Inspection of engine electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	Modify connector.

Step 4	Inspection items		Inspection of engine electronic control unit
	Maintenance item		Inspection of engine electronic control unit
	Inspection condition		–
	Requirements		Free of errors related to engine speed
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Perform troubleshooting on engine electronic control unit (See Gr13EA.).

Step 5	Inspection items		Inspection of harness between electronic control unit and engine electronic control unit
	Maintenance item		Check circuit between electronic control unit connector (CY17A) terminal No. 7 and engine electronic control unit connector (GE58A) terminal No. 41.
	Inspection condition		Disconnect each electronic control unit from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Modify harness.

Step 6	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Check for recurrence of the same diagnosis code. **<Multi-Use Tester used>** Measure item No. 15 “Engine Speed” of Service Data.
	Inspection condition		–
	Requirements		**<Multi-Use Tester not used>** If the same diagnosis code occurs, replace electronic control unit. (If replacement of electronic control unit does not eliminate trouble, replace engine electronic control unit.) **<Multi-Use Tester used>** Racing (engine in operation): Synchronous with tachometer
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of harness (If replacement of electronic control unit does not eliminate trouble, replace engine electronic control unit.)

[Fault code]
Diagnosis code: P0730/Flash code: 37
[Monitor ID]
7, 8
[Fault (outline)]
Incorrect gear ratio
[Diagnosis check]
- Turbine speed sensor, output speed sensor and ongoing gear ratio are monitored to determine whether control is effected at optimal gear ratio.

[Code generation condition]
- The difference of more than 500 rpm between turbine speed and output shaft speed × gear ratio continues for 0.5 second.

[Diagnosis check timing]
- Fault diagnosis is performed each time when the applicable gear speed is selected.

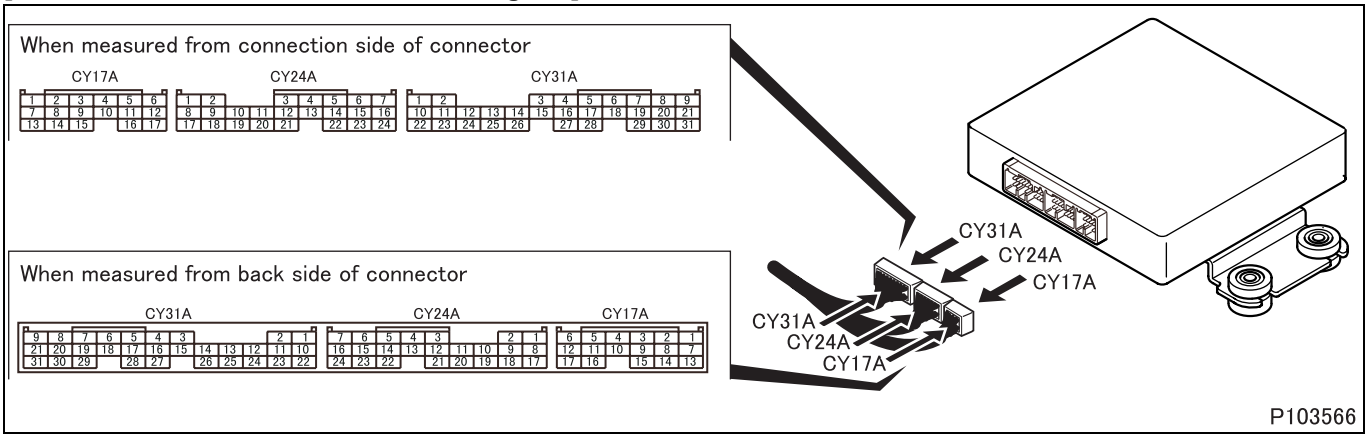
[Diagnostic requirement]
- Each solenoid, oil pressure switch, inhibitor switch, output speed sensor, or turbine speed sensor related diagnosis code does not occur.
- Automatic transmission fluid temperature: above –10°C {14°F}
- Output shaft speed: above 250 rpm
- Shift position: D, 3 or 2 range
- Shift solenoids: Disengaged
- Accelerator pedal position: 5% or more <1st>
- Turbine speed is 100 rpm slower than the engine speed <1st>

[Control effected by electronic control unit during fault]
- Control is effected on fixed speed gear output (3rd).

[Probable cause of trouble]
- Open-circuit or short-circuit between electronic control unit and turbine speed sensor/output speed sensor
- Malfunction of each connector
- Malfunction of turbine speed sensor or output speed sensor
- Malfunction of electronic control unit
- Malfunction of automatic transmission

[Recoverability]
- Recovered if signal becomes normal when starter switch is turned OFF to ON (power supply resumed to electronic control unit).

[Electronic Control Unit Connection Diagram]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Go to step 2. **<Multi-Use Tester used>** Measure item No. 16 “Turbine Speed”, No. 25 “VEH Speed 2” and No. 56 “Gear Pos.” of Service Data.
	Inspection condition		• Output shaft speed [rpm]: Item No. 25 “VEH Speed 2” [MPH] × 4.268 × final gear ratio/tire radius [m] • Turbine speed [rpm]: Item No. 16 “Turbine Speed” • Calculated gear ratio: Turbine speed/Output shaft speed • Specified gear ratio: 1st (3.742), 2nd (2.003), 3rd (1.343), 4th (1.000), 5th (0.773), 6th (0.634), Rev (3.539)
	Requirements		Specified and calculated gear ratios at corresponding gear position: Matched
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

Step 2	Inspection items		Inspection of automatic transmission
	Maintenance item		**<Multi-Use Tester not used>** Measure values of voltage between the following terminals. • Oil pressure switch 1: Electronic control unit connector (CY17A) terminal No. 6 (+) - Connector (CY24A) terminal No. 8 (–) • Oil pressure switch 2: Electronic control unit connector (CY17A) terminal No. 12 (+) - Connector (CY24A) terminal No. 8 (–) • Oil pressure switch 3: Electronic control unit connector (CY17A) terminal No. 17 (+) - Connector (CY24A) terminal No. 8 (–) • Oil pressure switch 4: Electronic control unit connector (CY17A) terminal No. 5 (+) - Connector (CY24A) terminal No. 8 (–) • Oil pressure switch 5: Electronic control unit connector (CY17A) terminal No. 11 (+) - Connector (CY24A) terminal No. 8 (–) • Oil pressure switch 6: Electronic control unit connector (CY17A) terminal No. 16 (+) - Connector (CY24A) terminal No. 8 (–) • Shift solenoid 1: Electronic control unit connector (CY31A) terminal No. 1 (+) - Connector (CY24A) terminal No. 8 (–) • Shift solenoid 2: Electronic control unit connector (CY31A) terminal No. 2 (+) - Connector (CY24A) terminal No. 8 (–) • Shift solenoid 3: Electronic control unit connector (CY31A) terminal No. 3 (+) - Connector (CY24A) terminal No. 8 (–) **<Multi-Use Tester used>** Measure item No. 31 “Shift Valve 1”, No. 32 “Shift Valve 2”, No. 33 “Shift Valve 3”, No. 56 “Gear Pos.”, No. 61 “Oil Press SW1”, No. 62 “Oil Press SW2”, No. 63 “Oil Press SW3”, No. 64 “Oil Press SW4”, No. 65 “Oil Press SW5” and No. 66 “Oil Press SW6”.
	Inspection condition		Operating status of oil pressure switches 1 through 6 and shift solenoids 1 through 3 is checked for match with respective gear positions (1st, 2nd ... 6th). **<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** Matched (oil pressure switch: O if 0 V; shift solenoid: O if 12 V) **<Multi-Use Tester used>** Matched
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Replacement of automatic transmission

<Step 2 operating status diagram>

	1st	2nd	3rd	4th	5th	6th

Oil pressure switch 5	○					
Oil pressure switch 6	○					
Shift solenoid 1			○	○		
Shift solenoid 2				○	○	○
Shift solenoid 3	○					

○ : ON P60524E

Step 3	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Check for recurrence of the same diagnosis code. **<Multi-Use Tester used>** Measure item No. 16 “Turbine Speed”, No. 25 “VEH Speed 2” and No. 56 “Gear Pos.” of Service Data.
	Inspection condition		• Output shaft speed [rpm]: Item No. 25 “VEH Speed 2” [MPH] × 4.268 × final gear ratio/tire radius [m] • Turbine speed [rpm]: Item No. 16 “Turbine Speed” • Calculated gear ratio: Turbine speed/Output shaft speed • Specified gear ratio: 1st (3.742), 2nd (2.003), 3rd (1.343), 4th (1.000), 5th (0.773), 6th (0.634), Rev (3.539)
	Requirements		**<Multi-Use Tester not used>** If the same diagnosis code occurs, replace automatic transmission. **<Multi-Use Tester used>** Specified and calculated gear ratios at corresponding gear position: Matched
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of automatic transmission

[Fault code]
Diagnosis code: P0746/Flash code: 41
[Monitor ID]
38, 39
[Fault (outline)]
Linear solenoid 1 binds in OFF state.
[Diagnosis check]
- Linear solenoid 1 is monitored for fault when switched from low to high pressure according to the response of oil pressure switch 1.

[Code generation condition]
- Linear solenoid 1 is judged faulty when oil pressure switch 1 remains OFF (low pressure) for 1.5 second, then N, R or P range is selected and oil pressure switch 8 remains OFF for 0.5 second (check if stuck ON).

[Diagnosis check timing]
- Fault diagnosis is performed each time when the control is activated.

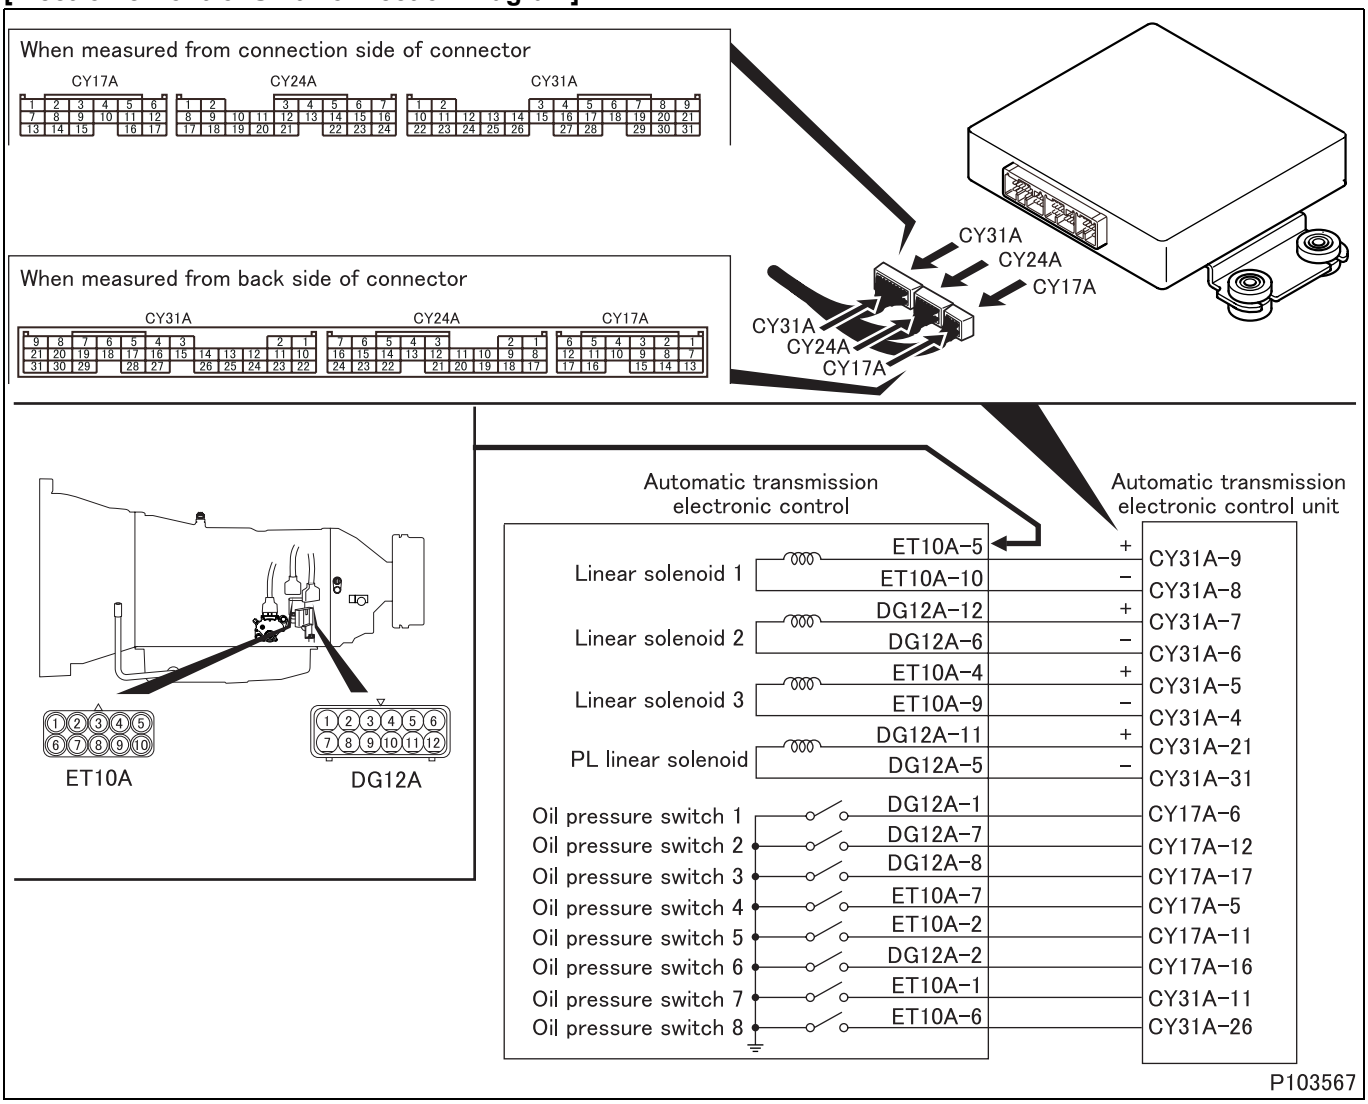
[Diagnostic requirement]
- Oil pressure switch 8: ON
- Shift position: D, 3 or 2 range
- Automatic transmission fluid temperature: above –10°C {14°F} <used for a part of judgment>

[Control effected by electronic control unit during fault]
- Lockup control is turned OFF
- Control is effected on fixed speed gear output (3rd).

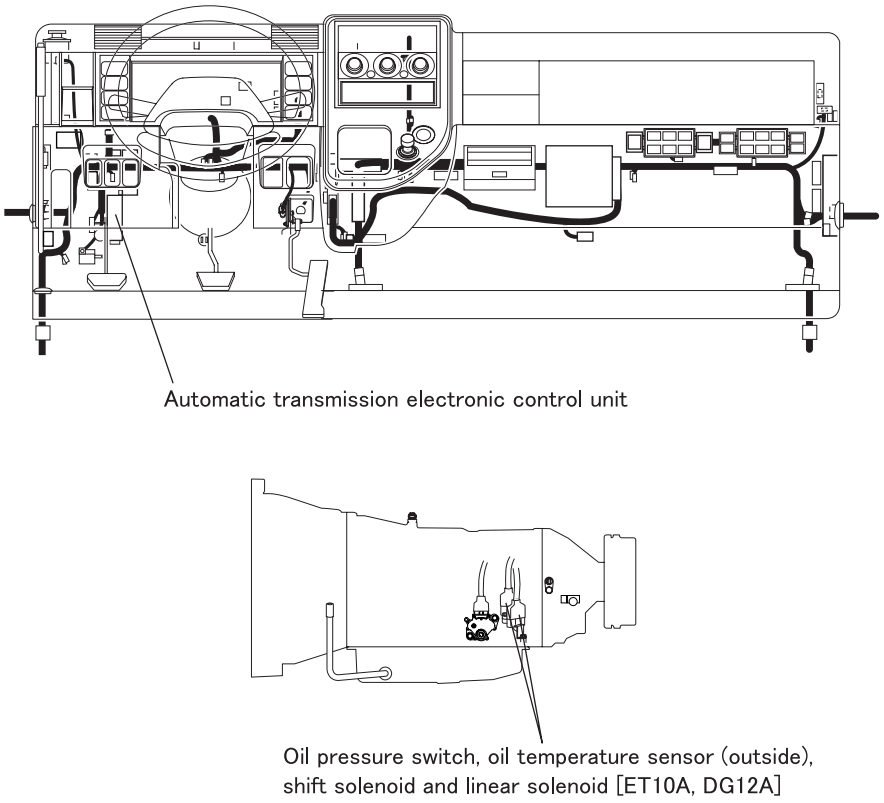
[Probable cause of trouble]
- Open-circuit or short-circuit between electronic control unit and linear solenoid 1/oil pressure switch 1
- Malfunction of each connector
- Malfunction of linear solenoid 1/oil pressure switch 1
- Malfunction of electronic control unit

[Recoverability]
- Recovered if signal becomes normal when starter switch is turned OFF to ON (power supply resumed to electronic control unit).

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Go to step 2. **<Multi-Use Tester used>** Measure item No. 26 “Linear Sol Press 1” of Service Data.
	Inspection condition		Vehicle run
	Requirements		• During speed change (1st to 2nd, 3rd to 4th, 5th to 6th): Rises • During speed change (2nd to 3rd, 4th to 5th): Declines
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

Step 2	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of voltage between electronic control unit connector (CY17A) terminal No. 6 (+) and connector (CY24A) terminal No. 8 (–). **<Multi-Use Tester used>** Measure item No. 61 “Oil Press SW 1” of Service Data.
	Inspection condition		Engine in operation **<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** • In 2nd, 4th, 6th gears: 0 V • In 1st, 3rd, 5th gears: 12 V **<Multi-Use Tester used>** • In 2nd, 4th, 6th gears: ON • In 1st, 3rd, 5th gears: OFF
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 3.

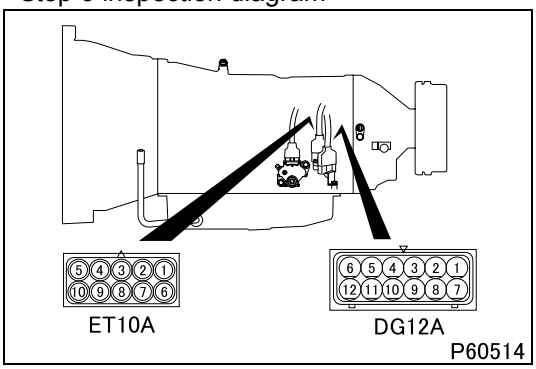
Step 3	Inspection items		Inspection by electronic control unit connector (signal)
	Maintenance item		Measure value of resistance between connector (CY31A) terminal No. 9 and 8.
	Inspection condition		• Disconnect electronic control unit and harness, and measure from connection side of harness connector. • Starter switch: OFF
	Requirements		5.5 ± 0.5 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	Go to step 5.

Step 4	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 9.
		NO	Modify connector.

Step 5	Inspection items		Inspection of solenoid connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Modify connector.

Step 6	Inspection items		Inspection of solenoid unit
	Maintenance item		Measure value of resistance between connector (ET10A) terminal No. 5 and 10.
	Inspection condition		• Disconnect connector and measure solenoid side. • Starter switch: OFF
	Requirements		5.5 ± 0.5 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Replacement of automatic transmission

<Step 6 inspection diagram>



Step 7	Inspection items		Inspection of harness between solenoid and electronic control unit (power supply)
	Maintenance item		Check circuit between connector (ET10A) terminal No. 5 and electronic control unit connector (CY31A) terminal No. 9.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify harness.

Step 8	Inspection items		Inspection of harness between solenoid and electronic control unit (ground)
	Maintenance item		Check circuit between connector (ET10A) terminal No. 10 and electronic control unit connector (CY31A) terminal No. 8.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 9.
		NO	Modify harness.

Step 9	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Check for recurrence of the same diagnosis code. **<Multi-Use Tester used>** Measure item No. 26 “Linear Sol Press 1” of Service Data.
	Inspection condition		Vehicle run
	Requirements		**<Multi-Use Tester not used>** If the same diagnosis code occurs, replace electronic control unit. **<Multi-Use Tester used>** • During speed change (1st to 2nd, 3rd to 4th, 5th to 6th): Rises • During speed change (2nd to 3rd, 4th to 5th): Declines
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 10.

Step 10	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of voltage between electronic control unit connector (CY17A) terminal No. 6 (+) and connector (CY24A) terminal No. 8 (–). **<Multi-Use Tester used>** Measure item No. 61 “Oil Press SW 1” of Service Data.
	Inspection condition		Engine in operation **<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** • In 2nd, 4th, 6th gears: 0 V • In 1st, 3rd, 5th gears: 12 V **<Multi-Use Tester used>** • In 2nd, 4th, 6th gears: ON • In 1st, 3rd, 5th gears: OFF
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	• Check if a diagnosis code related to the oil pressure switch 1 occurs. If it does, perform troubleshooting of the code. • Replacement of electronic control unit

[Fault code]
Diagnosis code: P0747/Flash code: 41
[Monitor ID]
40
[Fault (outline)]
Linear solenoid 1 binds in ON state.
[Diagnosis check]
- Linear solenoid 1 is monitored for fault when switched from high to low pressure according to the response of oil pressure switch 1.

[Code generation condition]
- Oil pressure switch 1 remains ON (high pressure).

[Diagnosis check timing]
- Fault diagnosis is performed each time when the control is activated.

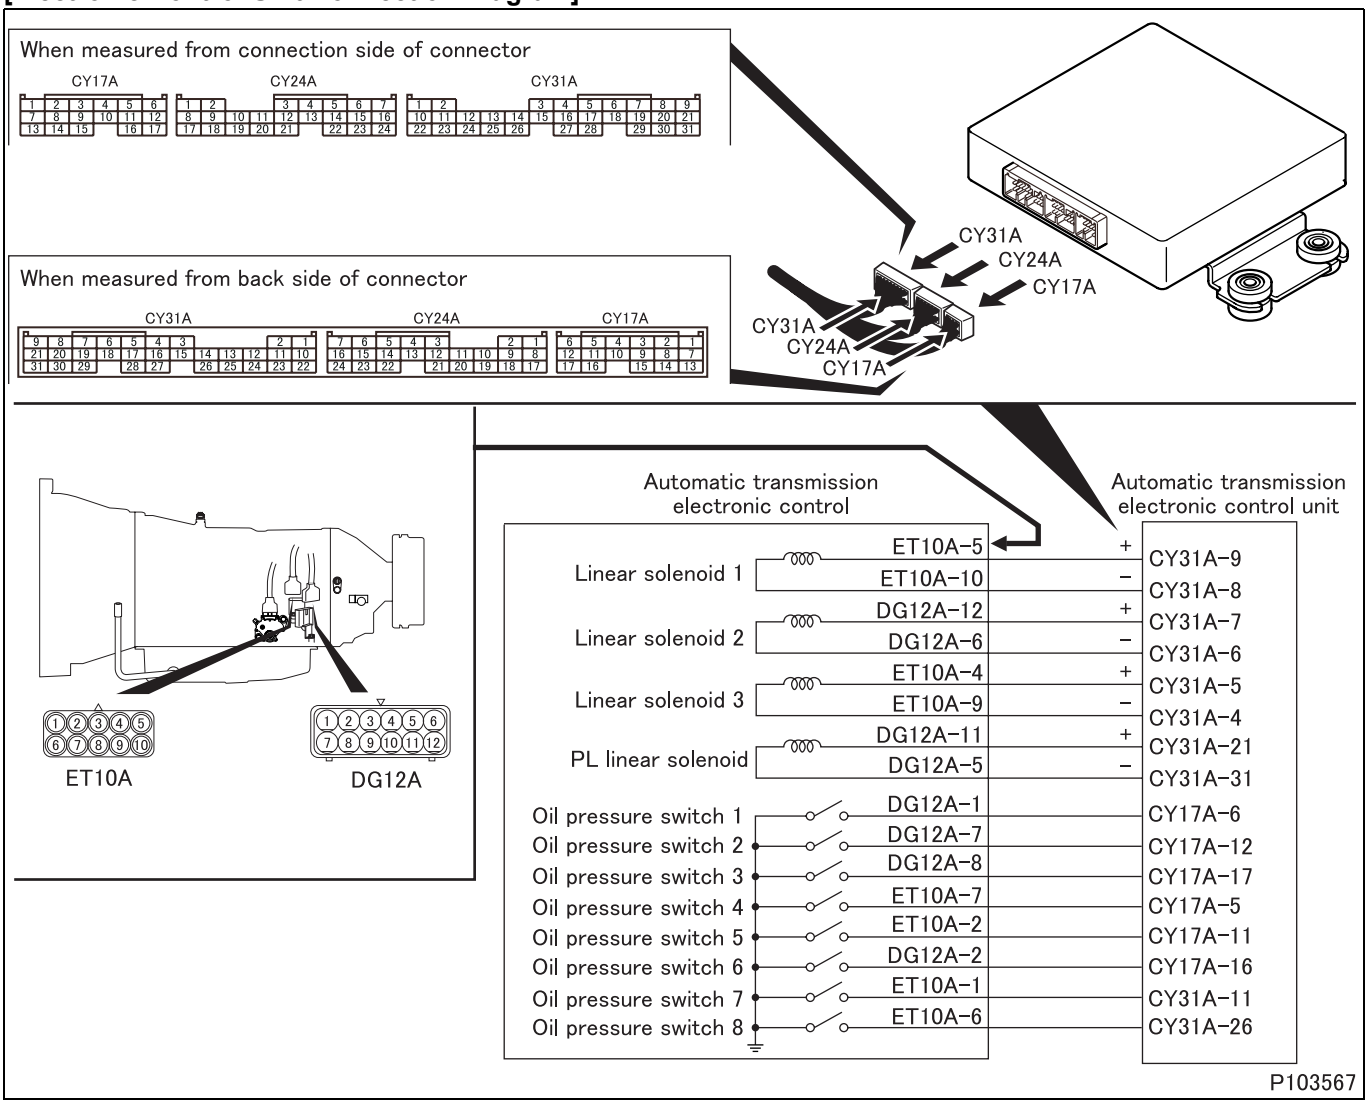
[Diagnostic requirement]
- After linear solenoid 1 switched from high to low pressure

[Control effected by electronic control unit during fault]
- Lockup control is turned OFF
- Control is effected on fixed speed gear output (4th).

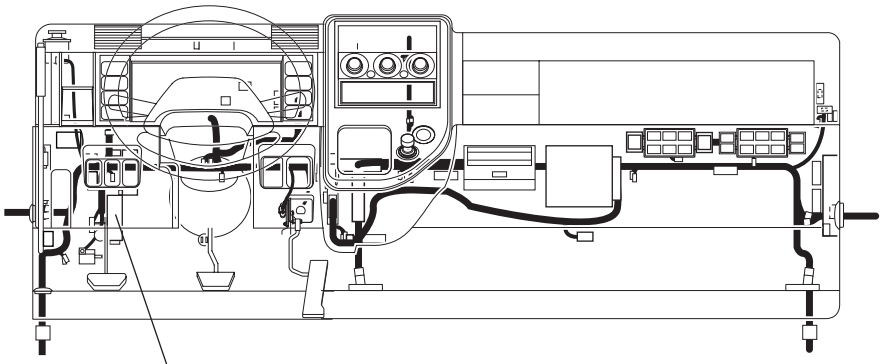
[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and linear solenoid 1 or oil pressure switch 1
- Malfunction of each connector
- Malfunction of linear solenoid 1 or oil pressure switch 1
- Malfunction of electronic control unit

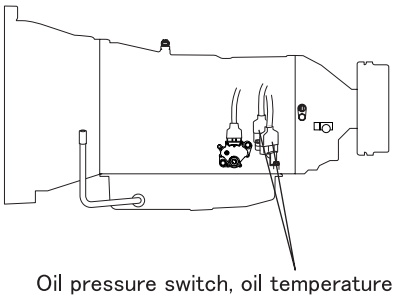
[Recoverability]
- Recovered if signal becomes normal when starter switch is turned OFF to ON (power supply resumed to electronic control unit).

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]





P103560-2

[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Go to step 2. **<Multi-Use Tester used>** Measure item No. 26 “Linear Sol Press 1” of Service Data.
	Inspection condition		Vehicle run
	Requirements		• During speed change (1st to 2nd, 3rd to 4th, 5th to 6th): Rises • During speed change (2nd to 3rd, 4th to 5th): Declines
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

Step 2	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of voltage between electronic control unit connector (CY17A) terminal No. 6 (+) and connector (CY24A) terminal No. 8 (–). **<Multi-Use Tester used>** Measure item No. 61 “Oil Press SW 1” of Service Data.
	Inspection condition		Engine in operation **<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** • In 2nd, 4th, 6th gears: 0 V • In 1st, 3rd, 5th gears: 12 V **<Multi-Use Tester used>** • In 2nd, 4th, 6th gears: ON • In 1st, 3rd, 5th gears: OFF
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 3.

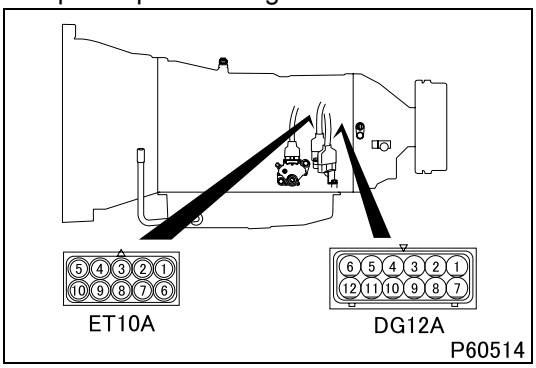
Step 3	Inspection items		Inspection by electronic control unit connector (signal)
	Maintenance item		Measure value of resistance between connector (CY31A) terminal No. 9 and 8.
	Inspection condition		• Disconnect electronic control unit and harness, and measure from connection side of harness connector. • Starter switch: OFF
	Requirements		5.5 ± 0.5 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	Go to step 5.

Step 4	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 9.
		NO	Modify connector.

Step 5	Inspection items		Inspection of solenoid connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Modify connector.

Step 6	Inspection items		Inspection of solenoid unit
	Maintenance item		Measure value of resistance between connector (ET10A) terminal No. 5 and 10.
	Inspection condition		• Disconnect connector and measure solenoid side. • Starter switch: OFF
	Requirements		5.5 ± 0.5 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Replacement of automatic transmission

<Step 6 inspection diagram>



Step 7	Inspection items		Inspection of harness between solenoid and electronic control unit (power supply)
	Maintenance item		Check circuit between connector (ET10A) terminal No. 5 and electronic control unit connector (CY31A) terminal No. 9.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify harness.

Step 8	Inspection items		Inspection of harness between solenoid and electronic control unit (ground)
	Maintenance item		Check circuit between connector (ET10A) terminal No. 10 and electronic control unit connector (CY31A) terminal No. 8.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 9.
		NO	Modify harness.

Step 9	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Check for recurrence of the same diagnosis code. **<Multi-Use Tester used>** Measure item No. 26 “Linear Sol Press 1” of Service Data.
	Inspection condition		Vehicle run
	Requirements		**<Multi-Use Tester not used>** If the same diagnosis code occurs, replace electronic control unit. **<Multi-Use Tester used>** • During speed change (1st to 2nd, 3rd to 4th, 5th to 6th): Rises. • During speed change (2nd to 3rd, 4th to 5th): Declines.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 10.

Step 10	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of voltage between electronic control unit connector (CY17A) terminal No. 6 (+) and connector (CY24A) terminal No. 8 (–). **<Multi-Use Tester used>** Measure item No. 61 “Oil Press SW 1” of Service Data.
	Inspection condition		Engine in operation **<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** • In 2nd, 4th, 6th gears: 0 V • In 1st, 3rd, 5th gears: 12 V **<Multi-Use Tester used>** • In 2nd, 4th, 6th gears: ON • In 1st, 3rd, 5th gears: OFF
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	• Check if a diagnosis code related to the oil pressure switch 1 occurs. If it does, perform troubleshooting of the code. • Replacement of electronic control unit

[Fault code]
Diagnosis code: P0748/Flash code: 26
[Monitor ID]
21, 22
[Fault (outline)]
Linear solenoid 1 is open-circuited or short-circuited.
[Diagnosis check]
- Resistance and current value in linear solenoid 1 is monitored for fault.

[Code generation condition]
Linear solenoid is judged faulty in either of the following cases.
- Resistance across the linear solenoid 1 remains higher than the specification (100 kΩ) for 0.065 second (open-circuited or circuit shorted to power supply).
- Current flowing in the linear solenoid 1 remains higher than the specification (4A) for 0.065 second (circuit shorted to ground).

[Diagnosis check timing]
- Fault diagnosis is continuously performed.

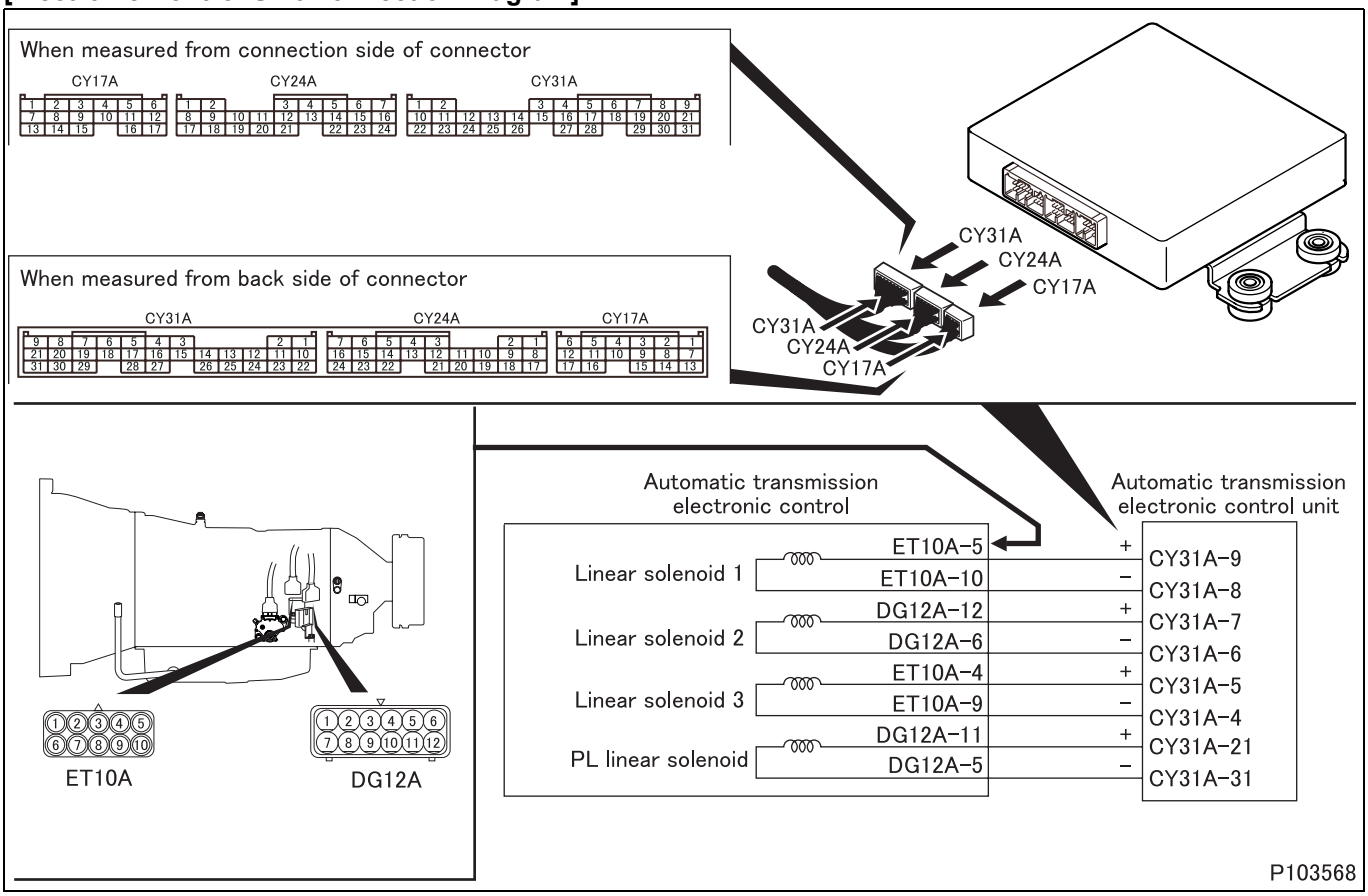
[Diagnostic requirement]
- Continuous

[Control effected by electronic control unit during fault]
- Lockup control is turned OFF
- Control is effected on fixed speed gear output (3rd for open-circuit, 4th for short-circuit).

[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and linear solenoid 1
- Malfunction of each connector
- Malfunction of linear solenoid 1
- Malfunction of electronic control unit

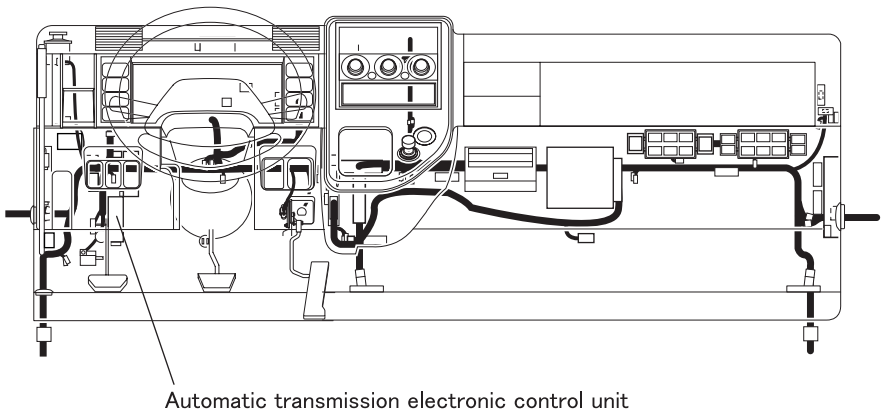
[Recoverability]
- Recovered if signal becomes normal when starter switch is turned OFF to ON (power supply resumed to electronic control unit).

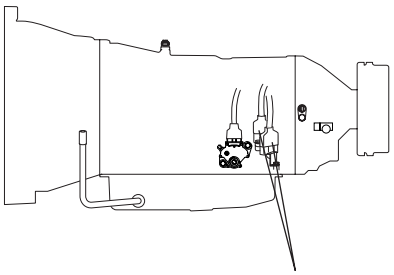
[Electronic Control Unit Connection Diagram]



P103568

[Parts Identification and Location]





P103560-2

[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Go to step 2. **<Multi-Use Tester used>** Measure item No. 26 “Linear Sol Press 1” of Service Data.
	Inspection condition		Vehicle run
	Requirements		• During speed change (1st to 2nd, 3rd to 4th, 5th to 6th): Rises • During speed change (2nd to 3rd, 4th to 5th): Declines
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

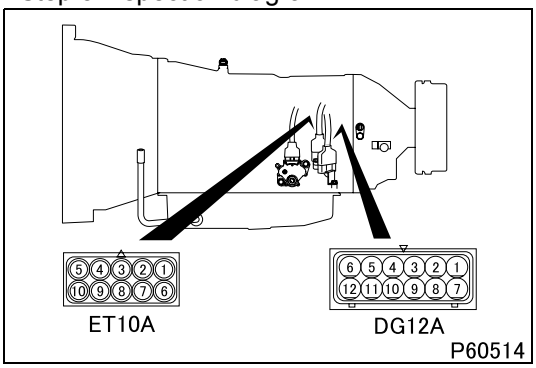
Step 2	Inspection items		Inspection by electronic control unit connector (signal)
	Maintenance item		Measure value of resistance between connector (CY31A) terminal No. 9 and 8.
	Inspection condition		• Disconnect electronic control unit and harness, and measure from connection side of harness connector. • Starter switch: OFF
	Requirements		5.5 ± 0.5 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Go to step 4.

Step 3	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify connector.

Step 4	Inspection items		Inspection of solenoid connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Modify connector.

Step 5	Inspection items		Inspection of solenoid unit
	Maintenance item		Measure value of resistance between connector (ET10A) terminal No. 5 and 10.
	Inspection condition		• Disconnect connector, and measure solenoid side terminal. • Starter switch: OFF
	Requirements		5.5 ± 0.5 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Replacement of automatic transmission

<Step 5 inspection diagram>



Step 6	Inspection items		Inspection of harness between solenoid and electronic control unit (power supply)
	Maintenance item		Check circuit between connector (ET10A) terminal No. 5 and electronic control unit connector (CY31A) terminal No. 9.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify harness.

Step 7	Inspection items		Inspection of harness between solenoid and electronic control unit (ground)
	Maintenance item		Check circuit between connector (ET10A) terminal No. 10 and electronic control unit connector (CY31A) terminal No. 8.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify harness.

Step 8	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Check for recurrence of the same diagnosis code. **<Multi-Use Tester used>** Measure item No. 26 “Linear Sol Press 1” of Service Data.
	Inspection condition		Vehicle run
	Requirements		**<Multi-Use Tester not used>** If the same diagnosis code occurs, replace electronic control unit. **<Multi-Use Tester used>** • During speed change (1st to 2nd, 3rd to 4th, 5th to 6th): Rises • During speed change (2nd to 3rd, 4th to 5th): Declines
	Inspection result (Is the judging standard satisfied?)	YES	If the diagnosis code remains after actual run, replace the electronic control unit.
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P0751/Flash code: 45
[Monitor ID]
52
[Fault (outline)]
Shift solenoid 1 binds in OFF state.
[Diagnosis check]
- Shift solenoid 1 is monitored for fault when switched from pressure OFF to pressure ON according to the response of oil pressure switch 3

[Code generation condition]
- Oil pressure switch 3 remains OFF (low pressure).

[Diagnosis check timing]
- Fault diagnosis is performed each time when the control is activated.

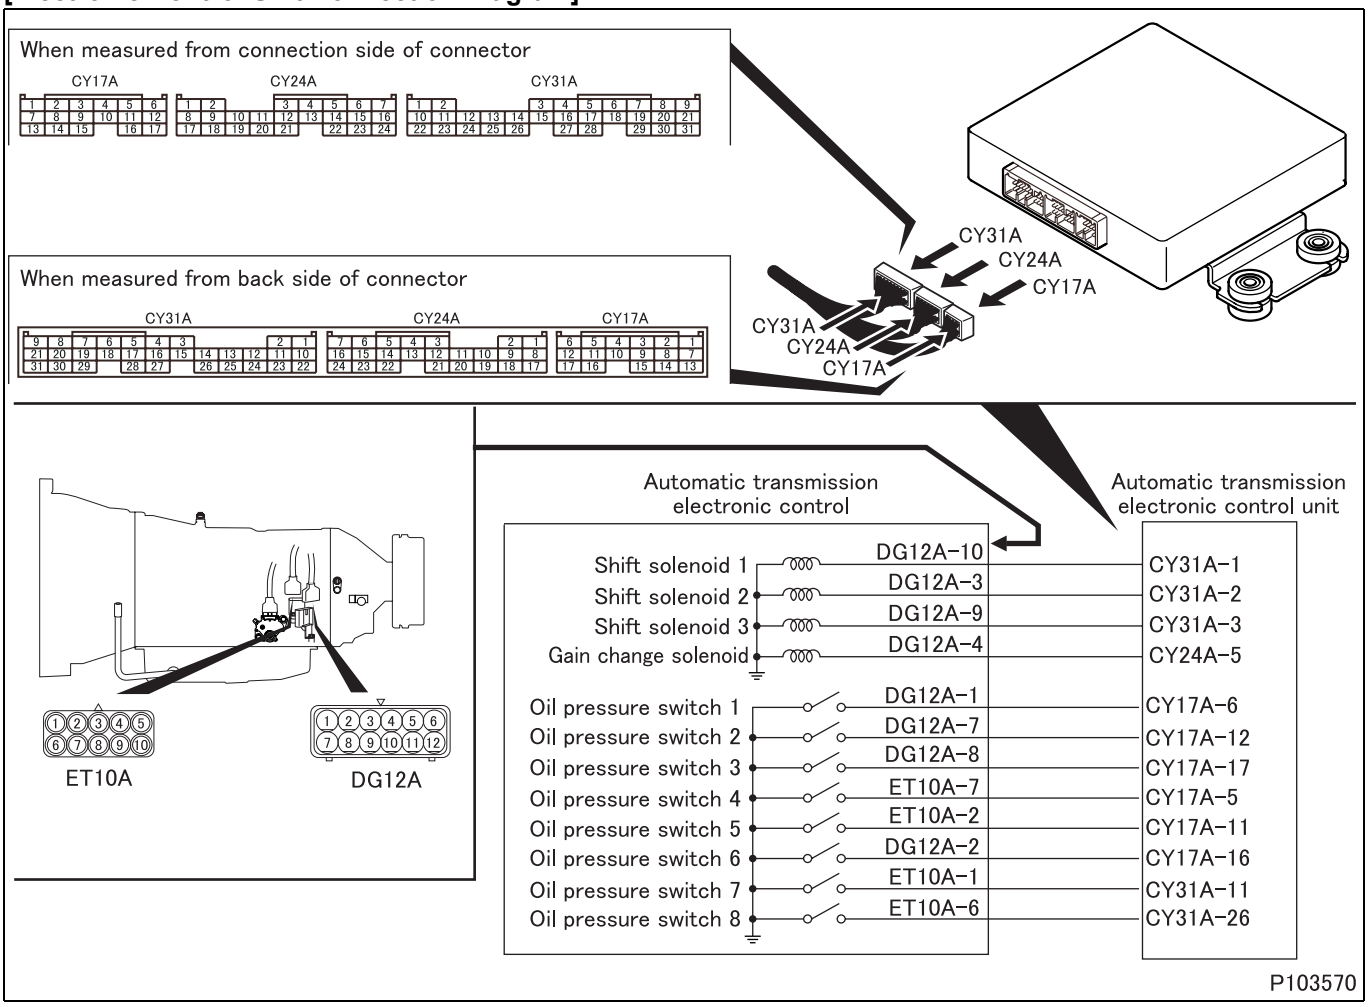
[Diagnostic requirement]
- After shift solenoid 1 switched from pressure OFF to ON

[Control effected by electronic control unit during fault]
- Lockup control is turned OFF
- Control is effected on fixed speed gear output (3rd).

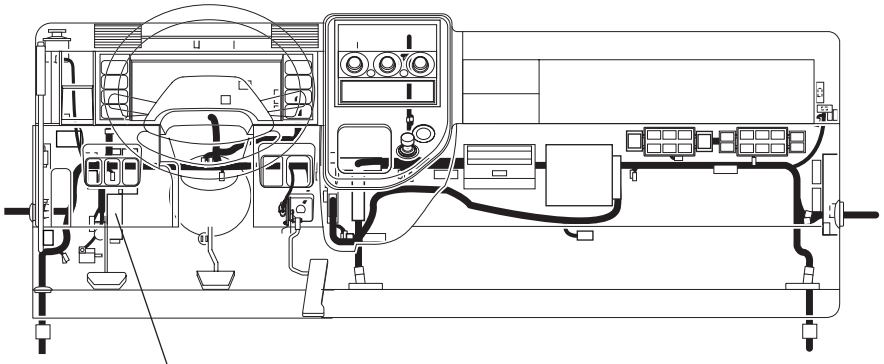
[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and shift solenoid 1 or oil pressure switch 3
- Malfunction of each connector
- Malfunction of shift solenoid 1 or oil pressure switch 3
- Malfunction of electronic control unit

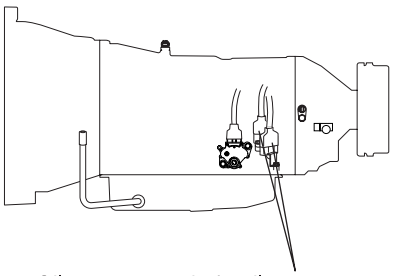
[Recoverability]
- Recovered if signal becomes normal when starter switch is turned OFF to ON (power supply resumed to electronic control unit).

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]





P103560-2

[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of voltage between electronic control unit connector (CY31A) terminal No. 1 (+) and connector (CY24A) terminal No. 8 (–). **<Multi-Use Tester used>** Measure items No. 31 “Shift Valve 1” and No. 71 “Shift Valve Press 1” of Service Data.
	Inspection condition		Vehicle run **<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** • In 3rd, 4th gears: 12 V • In any gears except above: 0 V **<Multi-Use Tester used>** <No. 31 “Shift Valve 1”> • In 3rd, 4th gears: ON • In any gears except above: OFF <No. 71 “Shift Valve Press 1”> • In 3rd, 4th gears: HIGH • In any gears except above: LOW
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

Step 2	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of voltage between electronic control unit connector (CY17A) terminal No. 17 (+) and connector (CY24A) terminal No. 8 (–). **<Multi-Use Tester used>** Measure item No. 63 “Oil Press SW 3” of Service Data.
	Inspection condition		Engine in operation **<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** • In 3rd, 4th gears: 0 V • In 1st, 2nd, 5th, 6th gears: 12 V **<Multi-Use Tester used>** • In 3rd, 4th gears: ON • In 1st, 2nd, 5th, 6th gears: OFF
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 3.

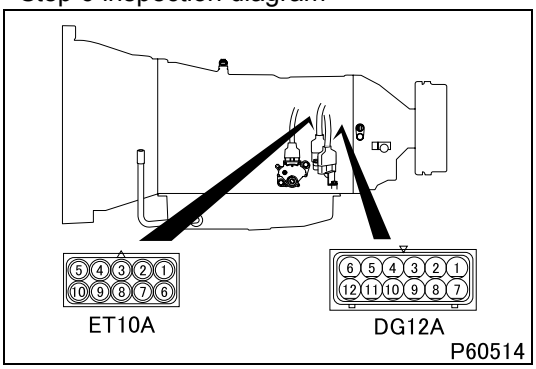
Step 3	Inspection items		Inspection by electronic control unit connector (signal)
	Maintenance item		Measure value of resistance between connector (CY31A) terminal No. 1 and chassis ground.
	Inspection condition		• Disconnect electronic control unit and harness, and measure from connection side of harness connector. • Starter switch: OFF
	Requirements		13 ± 2 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	Go to step 5.

Step 4	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify connector.

Step 5	Inspection items		Inspection of solenoid connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Modify connector.

Step 6	Inspection items		Inspection of solenoid unit
	Maintenance item		Measure value of resistance between connector (DG12A) terminal No. 10 and automatic transmission case.
	Inspection condition		• Disconnect connector, and measure solenoid side terminal. • Starter switch: OFF
	Requirements		13 ± 2 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Replacement of automatic transmission

<Step 6 inspection diagram>



Step 7	Inspection items		Inspection of harness between solenoid and electronic control unit (power supply)
	Maintenance item		Check circuit between connector (DG12A) terminal No. 10 and electronic control unit connector (CY31A) terminal No. 1.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify harness.

Step 8	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of voltage between electronic control unit connector (CY31A) terminal No. 1 (+) and connector (CY24A) terminal No. 8 (–). **<Multi-Use Tester used>** Measure items No. 31 “Shift Valve 1” and No. 71 “Shift Valve Press 1” of Service Data.
	Inspection condition		Vehicle run **<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** • In 3rd, 4th gears: 12 V • In any gears except above: 0 V **<Multi-Use Tester used>** <No. 31 “Shift Valve 1”> • In 3rd, 4th gears: ON • In any gears except above: OFF <No. 71 “Shift Valve Press 1”> • In 3rd, 4th gears: HIGH • In any gears except above: LOW
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 9.

Step 9	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of voltage between electronic control unit connector (CY17A) terminal No. 17 (+) and connector (CY24A) terminal No. 8 (–). **<Multi-Use Tester used>** Measure item No. 63 “Oil Press SW 3” of Service Data.
	Inspection condition		Engine in operation **<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** • In 3rd, 4th gears: 0 V • In 1st, 2nd, 5th, 6th gear: 12 V **<Multi-Use Tester used>** • In 3rd, 4th gears: ON • In 1st, 2nd, 5th, 6th gear: OFF
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	• Check if a diagnosis code related to the oil pressure switch 3 occurs. If it does, perform troubleshooting of the code. • Replacement of electronic control unit

[Fault code]
Diagnosis code: P0752/Flash code: 45
[Monitor ID]
51
[Fault (outline)]
Shift solenoid 1 binds in ON state.
[Diagnosis check]
- Shift solenoid 1 is monitored for fault when switched from pressure ON to pressure OFF according to the response of oil pressure switch 3

[Code generation condition]
- Oil pressure switch 3 remains ON (high pressure).

[Diagnosis check timing]
- Fault diagnosis is performed each time when the control is activated.

[Diagnostic requirement]
- After shift solenoid 1 switched from pressure ON to OFF

[Control effected by electronic control unit during fault]
- Lockup control is turned OFF
- Control is effected on fixed speed gear output (3rd).

[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and shift solenoid 1 or oil pressure switch 3
- Malfunction of each connector
- Malfunction of shift solenoid 1 or oil pressure switch 3
- Malfunction of electronic control unit

[Recoverability]
- Recovered if signal becomes normal when starter switch is turned OFF to ON (power supply resumed to electronic control unit).

[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of voltage between electronic control unit connector (CY31A) terminal No. 1 (+) and connector (CY24A) terminal No. 8 (–). **<Multi-Use Tester used>** Measure items No. 31 “Shift Valve 1” and No. 71 “Shift Valve Press 1” of Service Data.
	Inspection condition		Vehicle run **<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** • In 3rd, 4th gears: 12 V • In any gears except above: 0 V **<Multi-Use Tester used>** <No. 31 “Shift Valve 1”> • In 3rd, 4th gears: ON • In any gears except above: OFF <No. 71 “Shift Valve Press 1”> • In 3rd, 4th gears: HIGH • In any gears except above: LOW
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

Step 2	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of voltage between electronic control unit connector (CY17A) terminal No. 17 (+) and connector (CY24A) terminal No. 8 (–). **<Multi-Use Tester used>** Measure item No. 63 “Oil Press SW 3” of Service Data.
	Inspection condition		Engine in operation **<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** • In 3rd, 4th gears: 0 V • In 1st, 2nd, 5th, 6th gears: 12 V **<Multi-Use Tester used>** • In 3rd, 4th gears: ON • In 1st, 2nd, 5th, 6th gears: OFF
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 3.

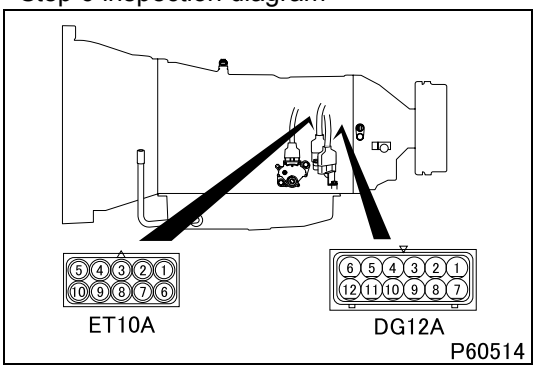
Step 3	Inspection items		Inspection by electronic control unit connector (signal)
	Maintenance item		Measure value of resistance between connector (CY31A) terminal No. 1 and chassis ground.
	Inspection condition		• Disconnect electronic control unit and harness, and measure from connection side of harness connector. • Starter switch: OFF
	Requirements		13 ± 2 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	Go to step 5.

Step 4	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify connector.

Step 5	Inspection items		Inspection of solenoid connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Modify connector.

Step 6	Inspection items		Inspection of solenoid unit
	Maintenance item		Measure value of resistance between connector (DG12A) terminal No. 10 and automatic transmission case.
	Inspection condition		• Disconnect connector, and measure solenoid side terminal. • Starter switch: OFF
	Requirements		13 ± 2 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Replacement of automatic transmission

<Step 6 inspection diagram>



Step 7	Inspection items		Inspection of harness between solenoid and electronic control unit (power supply)
	Maintenance item		Check circuit between connector (DG12A) terminal No. 10 and electronic control unit connector (CY31A) terminal No. 1.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify harness.

Step 8	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of voltage between electronic control unit connector (CY31A) terminal No.1 (+) and connector (CY24A) terminal No. 8 (–). **<Multi-Use Tester used>** Measure items No. 31 “Shift Valve 1” and No. 71 “Shift Valve Press 1” of Service Data.
	Inspection condition		Vehicle run **<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** • In 3rd, 4th gears: 12 V • In any gears except above: 0 V **<Multi-Use Tester used>** <No. 31 “Shift Valve 1”> • In 3rd, 4th gears: ON • In any gears except above: OFF <No. 71 “Shift Valve Press 1”> • In 3rd, 4th gears: HIGH • In any gears except above: LOW
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 9.

Step 9	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of voltage between electronic control unit connector (CY17A) terminal No. 17 (+) and connector (CY24A) terminal No. 8 (–). **<Multi-Use Tester used>** Measure item No. 63 “Oil Press SW 3” of Service Data.
	Inspection condition		Engine in operation **<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** • In 3rd, 4th gears: 0 V • In 1st, 2nd, 5th, 6th gear: 12 V **<Multi-Use Tester used>** • In 3rd, 4th gears: ON • In 1st, 2nd, 5th, 6th gear: OFF
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	• Check if a diagnosis code related to the oil pressure switch 3 occurs. If it does, perform troubleshooting of the code. • Replacement of electronic control unit

[Fault code]
Diagnosis code: P0756/Flash code: 46
[Monitor ID]
56
[Fault (outline)]
Shift solenoid 2 binds in OFF state.
[Diagnosis check]
- Shift solenoid 2 is monitored for fault when switched from pressure OFF to pressure ON according to the response of oil pressure switch 4

[Code generation condition]
- Oil pressure switch 4 remains OFF (low pressure).

[Diagnosis check timing]
- Fault diagnosis is performed each time when the control is activated.

[Diagnostic requirement]
- After shift solenoid 2 switched from pressure OFF to ON

[Control effected by electronic control unit during fault]
- Lockup control is turned OFF
- Control is effected on fixed speed gear output (3rd).

[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and shift solenoid 2 or oil pressure switch 4
- Malfunction of each connector
- Malfunction of shift solenoid 2 or oil pressure switch 4
- Malfunction of electronic control unit

[Recoverability]
- Recovered if signal becomes normal when starter switch is turned OFF to ON (power supply resumed to electronic control unit).

P103560-2

[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of voltage between electronic control unit connector (CY31A) terminal No.2 (+) and connector (CY24A) terminal No. 8 (–). **<Multi-Use Tester used>** Measure items No. 32 “Shift Valve 2” and No. 72 “Shift Valve Press 2” of Service Data.
	Inspection condition		**<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** • In 4th, 5th, and 6th gears: 12 V • In any gears except above: 0 V **<Multi-Use Tester used>** <No. 32 “Shift Valve 2”> • In 4th, 5th, and 6th gears: ON • In any gears except above: OFF <No. 72 “Shift Valve Press 2”> • In 4th, 5th, and 6th gears: HIGH • In any gears except above: LOW
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

Step 2	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of voltage between connector (CY17A) terminal No. 5 (+) and connector (CY24A) terminal No. 8 (–). **<Multi-Use Tester used>** Measure item No. 64 “Oil Press SW 4” of Service Data.
	Inspection condition		Engine in operation **<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** • In 4th, 5th, 6th gears: 0 V • In 1st, 2nd, 3rd gears: 12 V **<Multi-Use Tester used>** • In 4th, 5th, 6th gears: ON • In 1st, 2nd, 3rd gears: OFF
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 3.

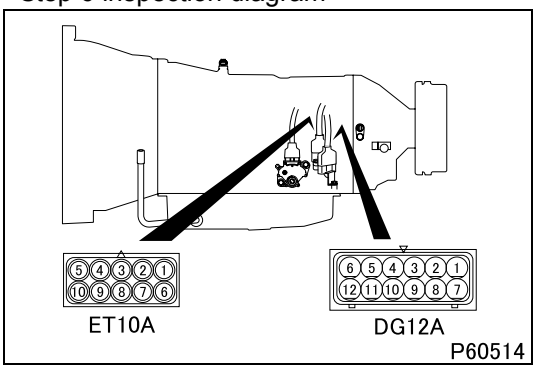
Step 3	Inspection items		Inspection by electronic control unit connector (signal)
	Maintenance item		Measure value of resistance between connector (CY31A) terminal No. 2 and chassis ground.
	Inspection condition		• Disconnect electronic control unit and harness, and measure from connection side of harness connector. • Starter switch: OFF
	Requirements		13 ± 2 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	Go to step 5.

Step 4	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify connector.

Step 5	Inspection items		Inspection of solenoid connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Modify connector.

Step 6	Inspection items		Inspection of solenoid unit
	Maintenance item		Measure value of resistance between connector (DG12A) terminal No. 3 and automatic transmission case.
	Inspection condition		• Disconnect connector, and measure solenoid side terminal. • Starter switch: OFF
	Requirements		13 ± 2 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Replacement of automatic transmission

<Step 6 inspection diagram>



Step 7	Inspection items		Inspection of harness between solenoid and electronic control unit (power supply)
	Maintenance item		Check circuit between connector (DG12A) terminal No. 3 and electronic control unit connector (CY31A) terminal No. 2.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify harness.

Step 8	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of voltage between electronic control unit connector (CY31A) terminal No.1 (+) and connector (CY24A) terminal No. 8 (–). **<Multi-Use Tester used>** Measure items No. 32 “Shift Valve 2” and No. 72 “Shift Valve Press 2” of Service Data.
	Inspection condition		**<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** • In 4th, 5th, and 6th gears: 12 V • In any gears except above: 0 V **<Multi-Use Tester used>** <No. 32 “Shift Valve 2”> • In 4th, 5th, and 6th gears: ON • In any gears except above: OFF <No. 72 “Shift Valve Press 2”> • In 4th, 5th, and 6th gears: HIGH • In any gears except above: LOW
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 9.

Step 9	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of voltage between connector (CY17A) terminal No. 5 (+) and connector (CY24A) terminal No. 8 (–). **<Multi-Use Tester used>** Measure item No. 64 “Oil Press SW 4” of Service Data.
	Inspection condition		Engine in operation **<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** • In 4th, 5th, 6th gears: 0 V • In 1st, 2nd, 3rd gears: 12 V **<Multi-Use Tester used>** • In 4th, 5th, 6th gears: ON • In 1st, 2nd, 3rd gears: OFF
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	• Check if a diagnosis code related to the oil pressure switch 4 occurs. If it does, perform troubleshooting of the code. • Replacement of electronic control unit

[Fault code]
Diagnosis code: P0757/Flash code: 46
[Monitor ID]
55
[Fault (outline)]
Shift solenoid 2 binds in ON state.
[Diagnosis check]
- Shift solenoid 2 is monitored for fault when switched from pressure ON to pressure OFF according to the response of oil pressure switch 4

[Code generation condition]

P103560-2

[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of voltage between electronic control unit connector (CY31A) terminal No. 2 (+) and connector (CY24A) terminal No. 8 (–). **<Multi-Use Tester used>** Measure items No. 32 “Shift Valve 2” and No. 72 “Shift Valve Press 2” of Service Data.
	Inspection condition		**<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** • In 4th, 5th, and 6th gears: 12 V • In any gears except above: 0 V **<Multi-Use Tester used>** <No. 32 “Shift Valve 2”> • In 4th, 5th, and 6th gears: ON • In any gears except above: OFF <No. 72 “Shift Valve Press 2”> • In 4th, 5th, and 6th gears: HIGH • In any gears except above: LOW
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

Step 2	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of voltage between connector (CY17A) terminal No. 5 (+) and connector (CY24A) terminal No. 8 (–). **<Multi-Use Tester used>** Measure item No. 64 “Oil Press SW 4” of Service Data.
	Inspection condition		Engine in operation **<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** • In 4th, 5th, 6th gears: 0 V • In 1st, 2nd, 3rd gears: 12 V **<Multi-Use Tester used>** • In 4th, 5th, 6th gears: ON • In 1st, 2nd, 3rd gears: OFF
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 3.

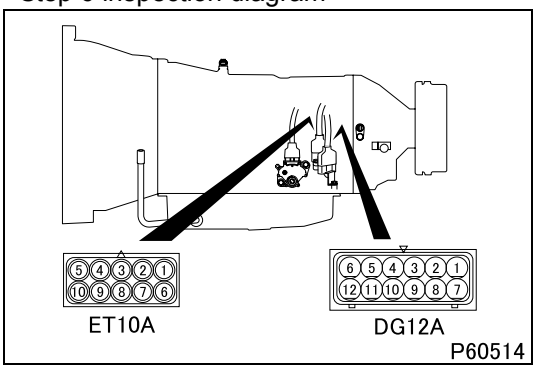
Step 3	Inspection items		Inspection by electronic control unit connector (signal)
	Maintenance item		Measure value of resistance between connector (CY31A) terminal No. 2 and chassis ground.
	Inspection condition		• Disconnect electronic control unit and harness, and measure from connection side of harness connector. • Starter switch: OFF
	Requirements		13 ± 2 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	Go to step 5.

Step 4	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify connector.

Step 5	Inspection items		Inspection of solenoid connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Modify connector.

Step 6	Inspection items		Inspection of solenoid unit
	Maintenance item		Measure value of resistance between connector (DG12A) terminal No. 3 and automatic transmission case.
	Inspection condition		• Disconnect connector, and measure solenoid side terminal. • Starter switch: OFF
	Requirements		13 ± 2 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Replacement of automatic transmission

<Step 6 inspection diagram>



Step 7	Inspection items		Inspection of harness between solenoid and electronic control unit (power supply)
	Maintenance item		Check circuit between connector (DG12A) terminal No. 3 and electronic control unit connector (CY31A) terminal No. 2.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify harness.

Step 8	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of voltage between electronic control unit connector (CY31A) terminal No.1 (+) and connector (CY24A) terminal No. 8 (–). **<Multi-Use Tester used>** Measure items No. 32 “Shift Valve 2” and No. 72 “Shift Valve Press 2” of Service Data.
	Inspection condition		**<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** • In 4th, 5th, and 6th gears: 12 V • In any gears except above: 0 V **<Multi-Use Tester used>** <No. 32 “Shift Valve 2”> • In 4th, 5th, and 6th gears: ON • In any gears except above: OFF <No. 72 “Shift Valve Press 2”> • In 4th, 5th, and 6th gears: HIGH • In any gears except above: LOW
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 9.

Step 9	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of voltage between connector (CY17A) terminal No. 5 (+) and connector (CY24A) terminal No. 8 (–). **<Multi-Use Tester used>** Measure item No. 64 “Oil Press SW 4” of Service Data.
	Inspection condition		Engine in operation **<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** • In 4th, 5th, 6th gears: 0 V • In 1st, 2nd, 3rd gears: 12 V **<Multi-Use Tester used>** • In 4th, 5th, 6th gears: ON • In 1st, 2nd, 3rd gears: OFF
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	• Check if a diagnosis code related to the oil pressure switch 4 occurs. If it does, perform troubleshooting of the code. • Replacement of electronic control unit

[Fault (outline)]
Shift solenoid 3 binds in OFF state.
[Diagnosis check]
- Shift solenoid 3 (shift solenoid valve 3) is monitored for fault when switched from pressure OFF to pressure ON according to the response of oil pressure switch 5

[Code generation condition]
- Oil pressure switch 5 remains OFF.

[Diagnosis check timing]
- Fault diagnosis is performed each time when the control is activated.

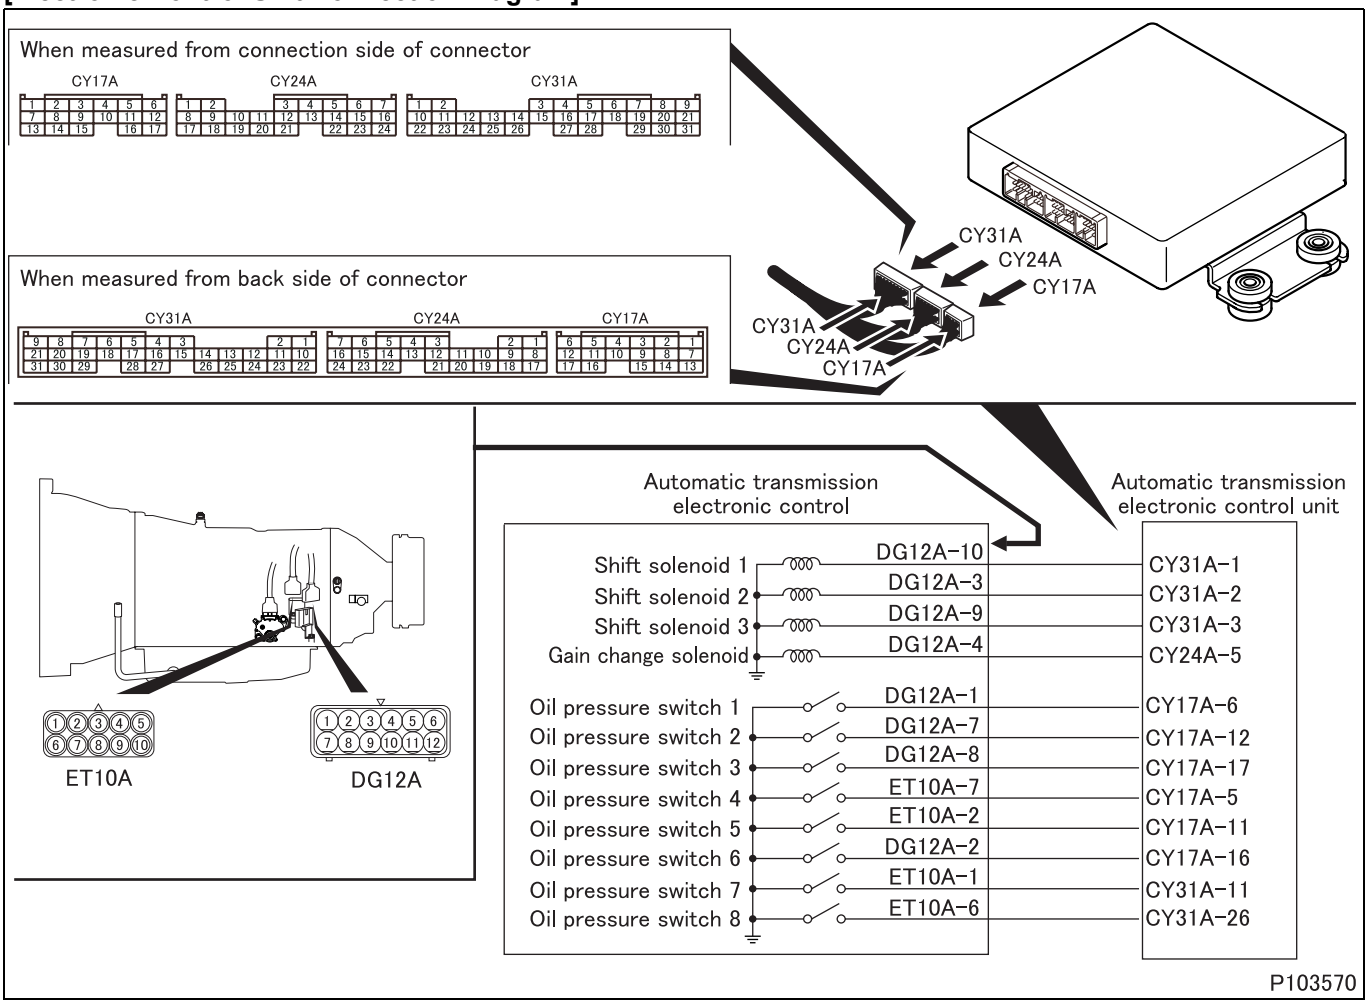
[Diagnostic requirement]
- After shift solenoid 3 (shift solenoid valve 3) switched from pressure OFF to ON

[Control effected by electronic control unit during fault]
- Lockup control is turned OFF
- Control is effected on fixed speed gear output (2nd).

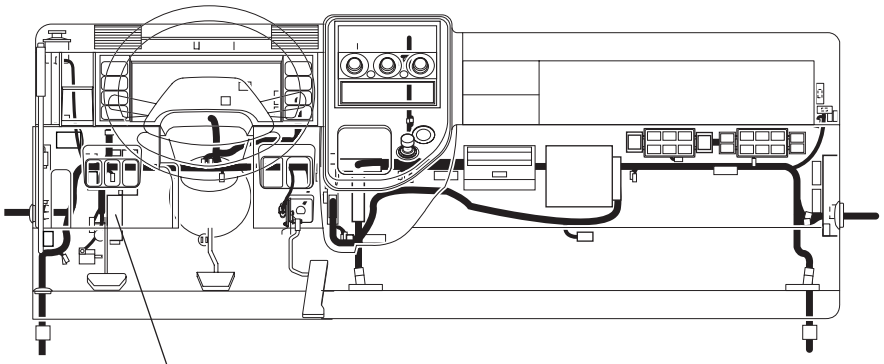
[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and shift solenoid 3 or oil pressure switch 5
- Malfunction of each connector
- Malfunction of shift solenoid 3 or oil pressure switch 5
- Malfunction of electronic control unit

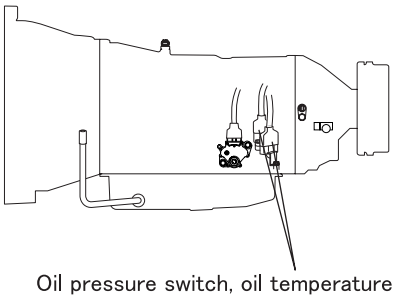
[Recoverability]
- Recovered if signal becomes normal when starter switch is turned OFF to ON (power supply resumed to electronic control unit).

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]





P103560-2

[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of voltage between connector (CY31A) terminal No. 3 (+) and connector (CY24A) terminal No. 8 (–). **<Multi-Use Tester used>** Measure items No. 33 “Shift Valve 3” and No. 73 “Shift Valve Press 3” of Service Data.
	Inspection condition		**<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** • In 1st gear: 12 V • In any gears except above: 0 V **<Multi-Use Tester used>** <No. 33 “Shift Valve 3”> • In 1st gear: ON • In any gears except above: OFF <No. 73 “Shift Valve Press 3”> • In 1st gear: HIGH • In any gears except above: LOW
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

Step 2	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of voltage between connector (CY17A) terminal No. 11 (+) and connector (CY24A) terminal No. 8 (–). **<Multi-Use Tester used>** Measure item No. 65 “Oil Press SW 5” of Service Data.
	Inspection condition		Engine in operation **<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** • In 1st gear: 0 V • In 2nd, 3rd, 4th, 5th, 6th gears: 12 V **<Multi-Use Tester used>** • In 1st gear: ON • In 2nd, 3rd, 4th, 5th, 6th gears: OFF
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 3.

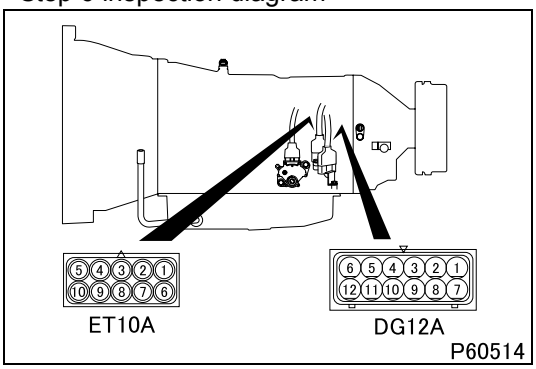
Step 3	Inspection items		Inspection by electronic control unit connector (signal)
	Maintenance item		Measure value of resistance between connector (CY31A) terminal No. 3 and chassis ground.
	Inspection condition		• Disconnect electronic control unit and harness, and measure from connection side of harness connector. • Starter switch: OFF
	Requirements		13 ± 2 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	Go to step 5.

Step 4	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify connector.

Step 5	Inspection items		Inspection of solenoid connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Modify connector.

Step 6	Inspection items		Inspection of solenoid unit
	Maintenance item		Measure value of resistance between connector (DG12A) terminal No. 9 and automatic transmission case.
	Inspection condition		• Disconnect connector, and measure solenoid side terminal. • Starter switch: OFF
	Requirements		13 ± 2 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Replacement of automatic transmission

<Step 6 inspection diagram>



Step 7	Inspection items		Inspection of harness between solenoid and electronic control unit (power supply)
	Maintenance item		Check circuit between connector (DG12A) terminal No. 9 and electronic control unit connector (CY31A) terminal No. 3.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify harness.

Step 8	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of voltage between connector (CY31A) terminal No. 3 (+) and connector (CY24A) terminal No. 8 (–). **<Multi-Use Tester used>** Measure items No. 33 “Shift Valve 3” and No. 73 “Shift Valve Press 3” of Service Data.
	Inspection condition		**<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** • In 1st gear: 12 V • In any gears except above: 0 V **<Multi-Use Tester used>** <No. 33 “Shift Valve 3”> • In 1st gear: ON • In any gears except above: OFF <No. 73 “Shift Valve Press 3”> • In 1st gear: HIGH • In any gears except above: LOW
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 9.

Step 9	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of voltage between connector (CY17A) terminal No. 11 (+) and connector (CY24A) terminal No. 8 (–). **<Multi-Use Tester used>** Measure item No. 65 “Oil Press SW 5” of Service Data.
	Inspection condition		Engine in operation **<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** • In 1st gear: 0 V • In 2nd, 3rd, 4th, 5th, 6th gears: 12 V **<Multi-Use Tester used>** • In 1st gear: ON • In 2nd, 3rd, 4th, 5th, 6th gears: OFF
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	• Check if a diagnosis code related to the oil pressure switch 5 occurs. If it does, perform troubleshooting of the code. • Replacement of electronic control unit

[Fault code]
Diagnosis code: P0762/Flash code: 47
[Monitor ID]
59
[Fault (outline)]
Shift solenoid 3 binds in ON state.
[Diagnosis check]
- Shift solenoid 3 (shift solenoid valve 3) is monitored for fault when switched from pressure ON to pressure OFF according to the response of oil pressure switch 5

[Code generation condition]
- Oil pressure switch 5 remains ON (high pressure).

[Diagnosis check timing]
- Fault diagnosis is performed each time when the control is activated.

[Diagnostic requirement]
- After shift solenoid 3 (shift solenoid valve 3) switched from pressure ON to OFF

[Control effected by electronic control unit during fault]
- Lockup control is turned OFF
- Control is effected on fixed speed gear output (2nd).

[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and shift solenoid 3 or oil pressure switch 5
- Malfunction of each connector
- Malfunction of shift solenoid 3 or oil pressure switch 5
- Malfunction of electronic control unit

[Recoverability]
- Recovered if signal becomes normal when starter switch is turned OFF to ON (power supply resumed to electronic control unit).

[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of voltage between connector (CY31A) terminal No. 3 (+) and connector (CY24A) terminal No. 8 (–). **<Multi-Use Tester used>** Measure items No. 33 “Shift Valve 3” and No. 73 “Shift Valve Press 3” of Service Data.
	Inspection condition		**<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** • In 1st gear: 12 V • In any gears except above: 0 V **<Multi-Use Tester used>** <No. 33 “Shift Valve 3”> • In 1st gear: ON • In any gears except above: OFF <No. 73 “Shift Valve Press 3”> • In 1st gear: HIGH • In any gears except above: LOW
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

Step 2	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of voltage between connector (CY17A) terminal No. 11 (+) and connector (CY24A) terminal No. 8 (–). **<Multi-Use Tester used>** Measure item No. 65 “Oil Press SW 5” of Service Data.
	Inspection condition		Engine in operation **<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** • In 1st gear: 0 V • In 2nd, 3rd, 4th, 5th, 6th gears: 12 V **<Multi-Use Tester used>** • In 1st gear: ON • In 2nd, 3rd, 4th, 5th, 6th gears: OFF
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 3.

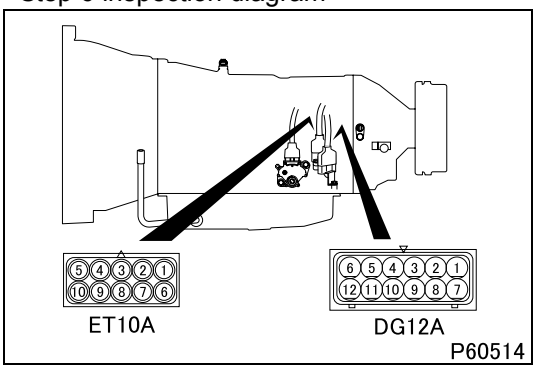
Step 3	Inspection items		Inspection by electronic control unit connector (signal)
	Maintenance item		Measure value of resistance between connector (CY31A) terminal No. 3 and chassis ground.
	Inspection condition		• Disconnect electronic control unit and harness, and measure from connection side of harness connector. • Starter switch: OFF
	Requirements		13 ± 2 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	Go to step 5.

Step 4	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify connector.

Step 5	Inspection items		Inspection of solenoid connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Modify connector.

Step 6	Inspection items		Inspection of solenoid unit
	Maintenance item		Measure value of resistance between connector (DG12A) terminal No. 9 and automatic transmission case.
	Inspection condition		• Disconnect connector, and measure solenoid side terminal. • Starter switch: OFF
	Requirements		13 ± 2 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Replacement of automatic transmission

<Step 6 inspection diagram>



Step 7	Inspection items		Inspection of harness between solenoid and electronic control unit (power supply)
	Maintenance item		Check circuit between connector (DG12A) terminal No. 9 and electronic control unit connector (CY31A) terminal No. 3.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify harness.

Step 8	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of voltage between connector (CY31A) terminal No. 3 (+) and connector (CY24A) terminal No. 8 (–). **<Multi-Use Tester used>** Measure items No. 33 “Shift Valve 3” and No. 73 “Shift Valve Press 3” of Service Data.
	Inspection condition		**<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** • In 1st gear: 12 V • In any gears except above: 0 V **<Multi-Use Tester used>** <No. 33 “Shift Valve 3”> • In 1st gear: ON • In any gears except above: OFF <No. 73 “Shift Valve Press 3”> • In 1st gear: HIGH • In any gears except above: LOW
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 9.

Step 9	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of voltage between connector (CY17A) terminal No. 11 (+) and connector (CY24A) terminal No. 8 (–). **<Multi-Use Tester used>** Measure item No. 65 “Oil Press SW 5” of Service Data.
	Inspection condition		Engine in operation **<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** • In 1st gear: 0 V • In 2nd, 3rd, 4th, 5th, 6th gears: 12 V **<Multi-Use Tester used>** • In 1st gear: ON • In 2nd, 3rd, 4th, 5th, 6th gears: OFF
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	• Check if a diagnosis code related to the oil pressure switch 5 occurs. If it does, perform troubleshooting of the code. • Replacement of electronic control unit

[Fault code]
Diagnosis code: P0766/Flash code: 55
[Monitor ID]
64
[Fault (outline)]
Shift solenoid 3 binds in OFF state.
[Diagnosis check]
- Shift solenoid 3 (shift solenoid valve 4) is monitored for fault when switched from pressure OFF to pressure ON according to the response of oil pressure switch 6

[Code generation condition]
- Oil pressure switch 6 remains OFF (low pressure).

[Diagnosis check timing]
- Fault diagnosis is performed each time when the control is activated.

[Diagnostic requirement]
- After shift solenoid 3 (shift solenoid valve 4) switched from pressure OFF to ON

[Control effected by electronic control unit during fault]
- Lockup control is turned OFF
- Control is effected on fixed speed gear output (2nd).

[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and shift solenoid 3 or oil pressure switch 6
- Malfunction of each connector
- Malfunction of shift solenoid 3 or oil pressure switch 6
- Malfunction of electronic control unit

[Recoverability]
- Recovered if signal becomes normal when starter switch is turned OFF to ON (power supply resumed to electronic control unit).

[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of voltage between connector (CY31A) terminal No. 3 (+) and connector (CY24A) terminal No. 8 (–). **<Multi-Use Tester used>** Measure items No. 33 “Shift Valve 3” and No. 73 “Shift Valve Press 3” of Service Data.
	Inspection condition		**<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** • In 1st gear: 12 V • In any gears except above: 0 V **<Multi-Use Tester used>** <No. 33 “Shift Valve 3”> • In 1st gear: ON • In any gears except above: OFF <No. 73 “Shift Valve Press 3”> • In 1st gear: HIGH • In any gears except above: LOW
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

Step 2	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of voltage between connector (CY17A) terminal No. 16 (+) and connector (CY24A) terminal No. 8 (–). **<Multi-Use Tester used>** Measure item No. 66 “Oil Press SW 6” of Service Data.
	Inspection condition		Engine in operation **<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** • In 1st gear: 0 V • In 2nd, 3rd, 4th, 5th, 6th gears: 12 V **<Multi-Use Tester used>** • In 1st gear: ON • In 2nd, 3rd, 4th, 5th, 6th gears: OFF
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 3.

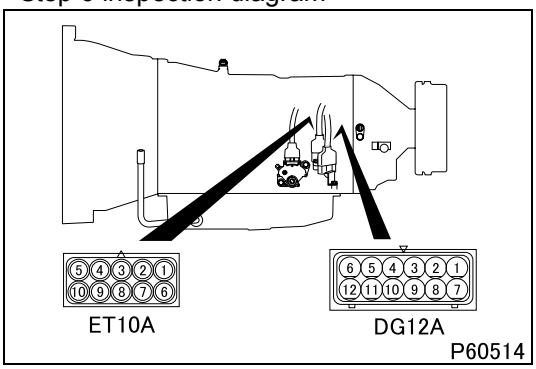
Step 3	Inspection items		Inspection by electronic control unit connector (signal)
	Maintenance item		Measure value of resistance between connector (CY24A) terminal No. 5 and chassis ground.
	Inspection condition		• Disconnect electronic control unit and harness, and measure from connection side of harness connector. • Starter switch: OFF
	Requirements		13 ± 2 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	Go to step 5.

Step 4	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify connector.

Step 5	Inspection items		Inspection of solenoid connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Modify connector.

Step 6	Inspection items		Inspection of solenoid unit
	Maintenance item		Measure value of resistance between connector (DG12A) terminal No. 4 and automatic transmission case.
	Inspection condition		• Disconnect connector, and measure solenoid side terminal. • Starter switch: OFF
	Requirements		13 ± 2 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Replacement of automatic transmission

<Step 6 inspection diagram>



Step 7	Inspection items		Inspection of harness between solenoid and electronic control unit (power supply)
	Maintenance item		Check circuit between connector (DG12A) terminal No. 4 and electronic control unit connector (CY24A) terminal No. 5.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify harness.

Step 8	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of voltage between connector (CY31A) terminal No. 3 (+) and connector (CY24A) terminal No. 8 (–). **<Multi-Use Tester used>** Measure items No. 33 “Shift Valve 3” and No. 73 “Shift Valve Press 3” of Service Data.
	Inspection condition		**<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** • In 1st gear: 12 V • In any gears except above: 0 V **<Multi-Use Tester used>** <No. 33 “Shift Valve 3”> • In 1st gear: ON • In any gears except above: OFF <No. 73 “Shift Valve Press 3”> • In 1st gear: HIGH • In any gears except above: LOW
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 9.

Step 9	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of voltage between connector (CY17A) terminal No. 16 (+) and connector (CY24A) terminal No. 8 (–). **<Multi-Use Tester used>** Measure item No. 66 “Oil Press SW 6” of Service Data.
	Inspection condition		Engine in operation **<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** • In 1st gear: 0 V • In 2nd, 3rd, 4th, 5th, 6th gears: 12 V **<Multi-Use Tester used>** • In 1st gear: ON • In 2nd, 3rd, 4th, 5th, 6th gears: OFF oil pressure switch 6
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	• Check if a diagnosis code related to the oil pressure switch 6 occurs. If it does, perform troubleshooting of the code. • Replacement of electronic control unit

[Fault code]
Diagnosis code: P0767/Flash code: 55
[Monitor ID]
63
[Fault (outline)]
Shift solenoid 3 binds in ON state.
[Diagnosis check]
- Shift solenoid 3 (shift solenoid valve 4) is monitored for fault when switched from pressure ON to pressure OFF according to the response of oil pressure switch 6

[Code generation condition]
- Oil pressure switch 6 remains ON (high pressure).

[Diagnosis check timing]
- Fault diagnosis is performed each time when the control is activated.

[Diagnostic requirement]
- After shift solenoid 3 (shift solenoid valve 4) switched from pressure ON to OFF

[Control effected by electronic control unit during fault]

[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of voltage between connector (CY31A) terminal No. 3 (+) and connector (CY24A) terminal No. 8 (–). **<Multi-Use Tester used>** Measure items No. 33 “Shift Valve 3” and No. 73 “Shift Valve Press 3” of Service Data.
	Inspection condition		**<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** • In 1st gear: 12 V • In any gears except above: 0 V **<Multi-Use Tester used>** <No. 33 “Shift Valve 3”> • In 1st gear: ON • In any gears except above: OFF <No. 73 “Shift Valve Press 3”> • In 1st gear: HIGH • In any gears except above: LOW
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

Step 2	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of voltage between connector (CY17A) terminal No. 16 (+) and connector (CY24A) terminal No. 8 (–). **<Multi-Use Tester used>** Measure item No. 66 “Oil Press SW 6” of Service Data.
	Inspection condition		Engine in operation **<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** • In 1st gear: 0 V • In 2nd, 3rd, 4th, 5th, 6th gears: 12 V **<Multi-Use Tester used>** • In 1st gear: ON • In 2nd, 3rd, 4th, 5th, 6th gears: OFF
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 3.

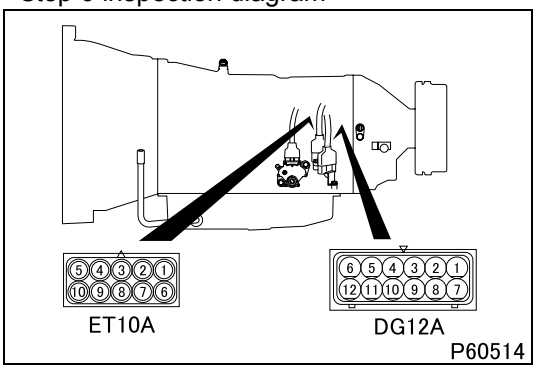
Step 3	Inspection items		Inspection by electronic control unit connector (signal)
	Maintenance item		Measure value of resistance between connector (CY24A) terminal No. 5 and chassis ground.
	Inspection condition		• Disconnect electronic control unit and harness, and measure from connection side of harness connector. • Starter switch: OFF
	Requirements		13 ± 2 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	Go to step 5.

Step 4	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify connector.

Step 5	Inspection items		Inspection of solenoid connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Modify connector.

Step 6	Inspection items		Inspection of solenoid unit
	Maintenance item		Measure value of resistance between connector (DG12A) terminal No. 4 and automatic transmission case.
	Inspection condition		• Disconnect connector, and measure solenoid side terminal. • Starter switch: OFF
	Requirements		13 ± 2 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Replacement of automatic transmission

<Step 6 inspection diagram>



Step 7	Inspection items		Inspection of harness between solenoid and electronic control unit (power supply)
	Maintenance item		Check circuit between connector (DG12A) terminal No. 4 and electronic control unit connector (CY24A) terminal No. 5.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify harness.

Step 8	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of voltage between connector (CY31A) terminal No. 3 (+) and connector (CY24A) terminal No. 8 (–). **<Multi-Use Tester used>** Measure items No. 33 “Shift Valve 3” and No. 73 “Shift Valve Press 3” of Service Data.
	Inspection condition		**<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** • In 1st gear: 12 V • In any gears except above: 0 V **<Multi-Use Tester used>** <No. 33 “Shift Valve 3”> • In 1st gear: ON • In any gears except above: OFF <No. 73 “Shift Valve Press 3”> • In 1st gear: HIGH • In any gears except above: LOW
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 9.

Step 9	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of voltage between connector (CY17A) terminal No. 16 (+) and connector (CY24A) terminal No. 8 (–). **<Multi-Use Tester used>** Measure item No. 66 “Oil Press SW 6” of Service Data.
	Inspection condition		Engine in operation **<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** • In 1st gear: 0 V • In 2nd, 3rd, 4th, 5th, 6th gears: 12 V **<Multi-Use Tester used>** • In 1st gear: ON • In 2nd, 3rd, 4th, 5th, 6th gears: OFF
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	• Check if a diagnosis code related to the oil pressure switch 6 occurs. If it does, perform troubleshooting of the code. • Replacement of electronic control unit

[Fault code]
Diagnosis code: P0776/Flash code: 42
[Monitor ID]
43, 44
[Fault (outline)]
Linear solenoid 2 binds in OFF state.
[Diagnosis check]
- Linear solenoid 2 is monitored for fault when switched from low to high pressure according to the response of oil pressure switch 2

[Code generation condition]
- Oil pressure switch 2 remains OFF (low pressure).

[Diagnosis check timing]
- Fault diagnosis is performed each time when the control is activated.

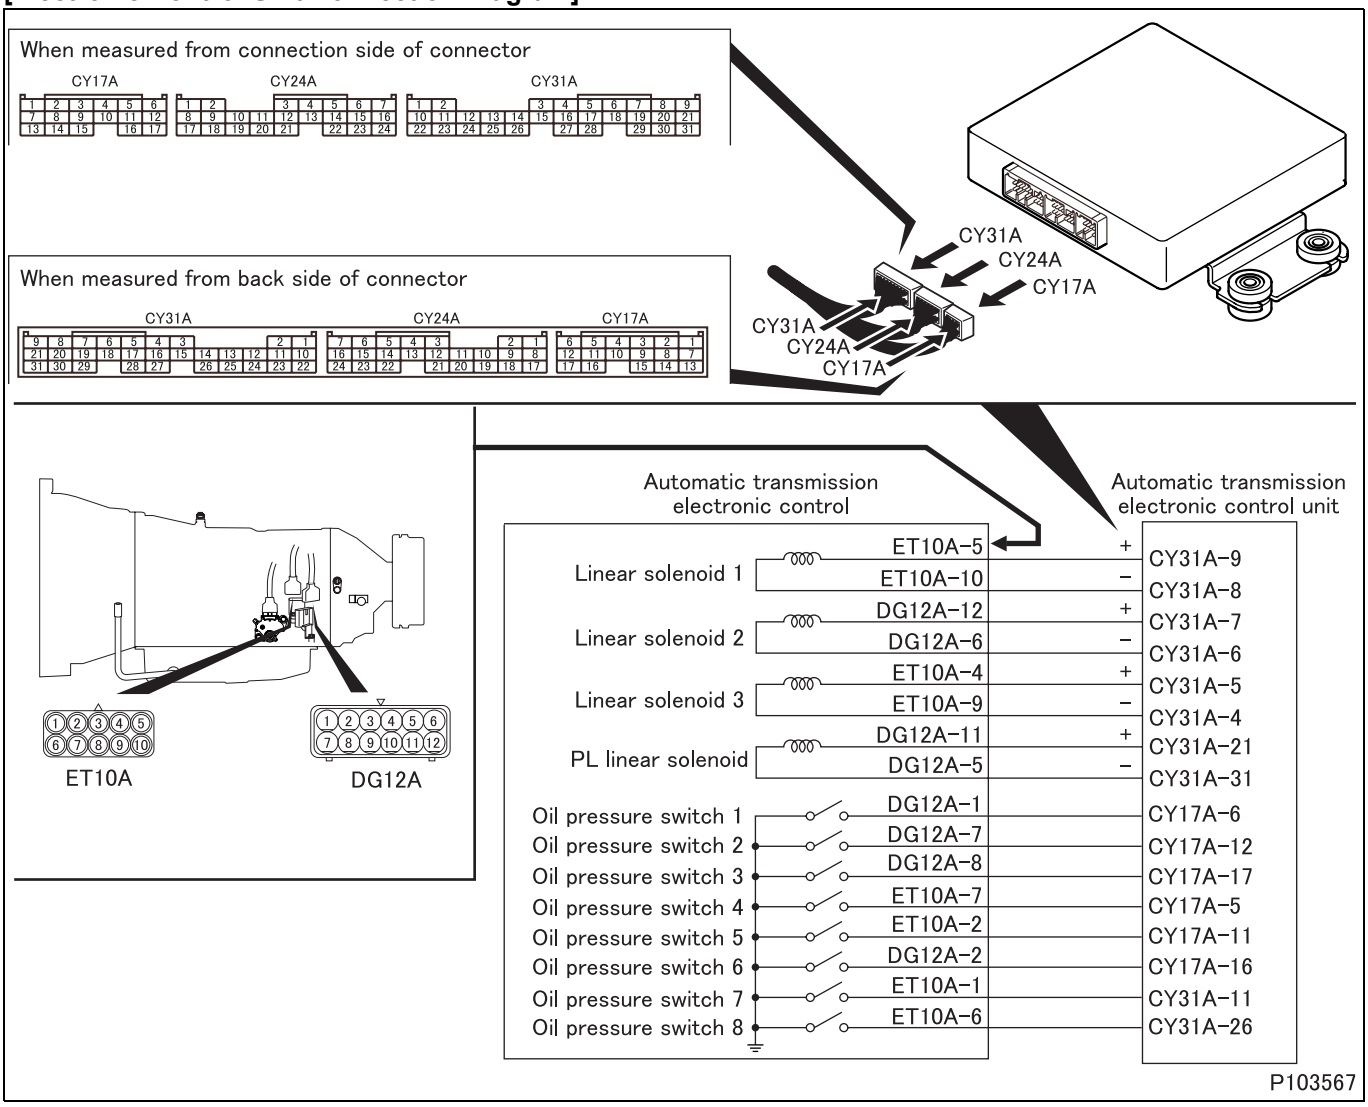
[Diagnostic requirement]
- After linear solenoid 2 switched from low to high pressure
- Automatic transmission fluid temperature: above –10°C {14°F} <used for a part of judgment>

[Control effected by electronic control unit during fault]
- Lockup control is turned OFF
- Control is effected on fixed speed gear output (4th).

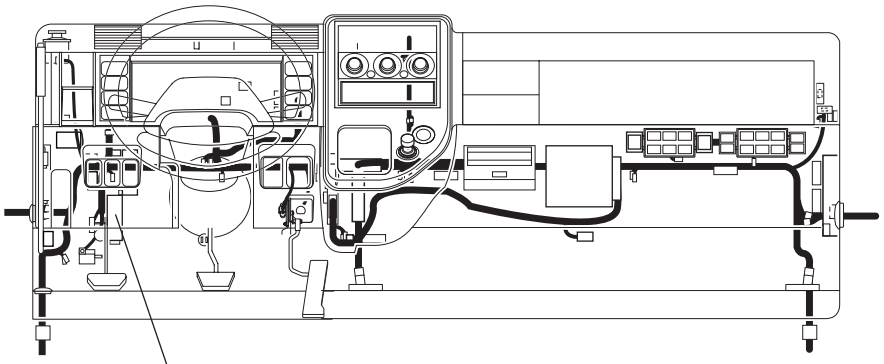
[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and linear solenoid 2 or oil pressure switch 2
- Malfunction of each connector
- Malfunction of linear solenoid 2 or oil pressure switch 2
- Malfunction of electronic control unit

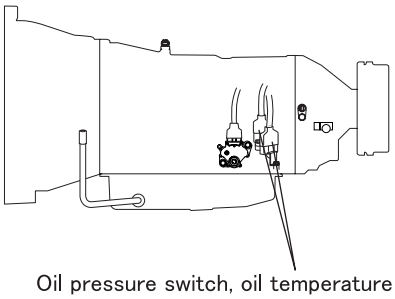
[Recoverability]
- Recovered if signal becomes normal when starter switch is turned OFF to ON (power supply resumed to electronic control unit).

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]





P103560-2

[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Go to step 2. **<Multi-Use Tester used>** Measure item No. 27 “Linear Sol Press 2” of Service Data.
	Inspection condition		Vehicle run
	Requirements		• During speed change (2nd to 3rd, 4th to 5th): Rises • During speed change (1st to 2nd, 3rd to 4th, 5th to 6th): Declines
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

Step 2	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of resistance between connector (CY17A) terminal No. 12 (+) and connector (CY24A) terminal No. 8 (–). **<Multi-Use Tester used>** Measure item No. 62 “Oil Press SW 2” of Service Data.
	Inspection condition		Engine in operation **<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** • In 1st, 3rd, 5th gears: 0 V • In 2nd, 4th, 6th gears: 12 V **<Multi-Use Tester used>** • In 1st, 3rd, 5th gears: ON • In 2nd, 4th, 6th gears: OFF
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 3.

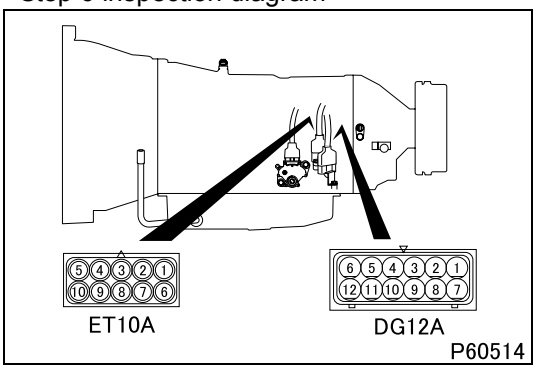
Step 3	Inspection items		Inspection by electronic control unit connector (signal)
	Maintenance item		Measure value of resistance between connector (CY31A) terminal No. 6 and 7.
	Inspection condition		• Disconnect electronic control unit and harness, and measure from connection side of harness connector. • Starter switch: OFF
	Requirements		5.5 ± 0.5 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	Go to step 5.

Step 4	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 9.
		NO	Modify connector.

Step 5	Inspection items		Inspection of solenoid connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Modify connector.

Step 6	Inspection items		Inspection of solenoid unit
	Maintenance item		Measure value of resistance between connector (DG12A) terminal No. 6 and 12.
	Inspection condition		• Disconnect connector, and measure solenoid side terminal. • Starter switch: OFF
	Requirements		5.5 ± 0.5 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Replacement of automatic transmission

<Step 6 inspection diagram>



Step 7	Inspection items		Inspection of harness between solenoid and electronic control unit (power supply)
	Maintenance item		Check circuit between connector (DG12A) terminal No. 12 and electronic control unit connector (CY31A) terminal No. 7.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify harness.

Step 8	Inspection items		Inspection of harness between solenoid and electronic control unit (ground)
	Maintenance item		Check circuit between connector (DG12A) terminal No. 6 and electronic control unit connector (CY31A) terminal No. 6.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 9.
		NO	Modify harness.

Step 9	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Check for recurrence of the same diagnosis code. **<Multi-Use Tester used>** Measure item No. 27 “Linear Sol Press 2” of Service Data.
	Inspection condition		Vehicle run
	Requirements		**<Multi-Use Tester not used>** If the same diagnosis code occurs, replace electronic control unit. **<Multi-Use Tester used>** • During speed change (2nd to 3rd, 4th to 5th): Rises • During speed change (1st to 2nd, 3rd to 4th, 5th to 6th): Declines
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 10.

Step 10	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of resistance between connector (CY17A) terminal No. 12 (+) and connector (CY24A) terminal No. 8 (–). **<Multi-Use Tester used>** Measure item No. 62 “Oil Press SW 2” of Service Data.
	Inspection condition		Engine in operation **<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** • In 1st, 3rd, 5th gears: 0 V • In 2nd, 4th, 6th gears: 12 V **<Multi-Use Tester used>** • In 1st, 3rd, 5th gears: ON • In 2nd, 4th, 6th gears: OFF
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	• Check if a diagnosis code related to the oil pressure switch 2 occurs. If it does, perform troubleshooting of the code. • Replacement of electronic control unit

[Fault code]
Diagnosis code: P0777/Flash code: 42
[Monitor ID]
45
[Fault (outline)]
Linear solenoid 2 binds in ON state.
[Diagnosis check]
- Linear solenoid 2 is monitored for fault when switched from high to low pressure according to the response of oil pressure switch 2

[Code generation condition]
- Oil pressure switch 2 remains ON (high pressure).

[Diagnosis check timing]
- Fault diagnosis is performed each time when the control is activated.

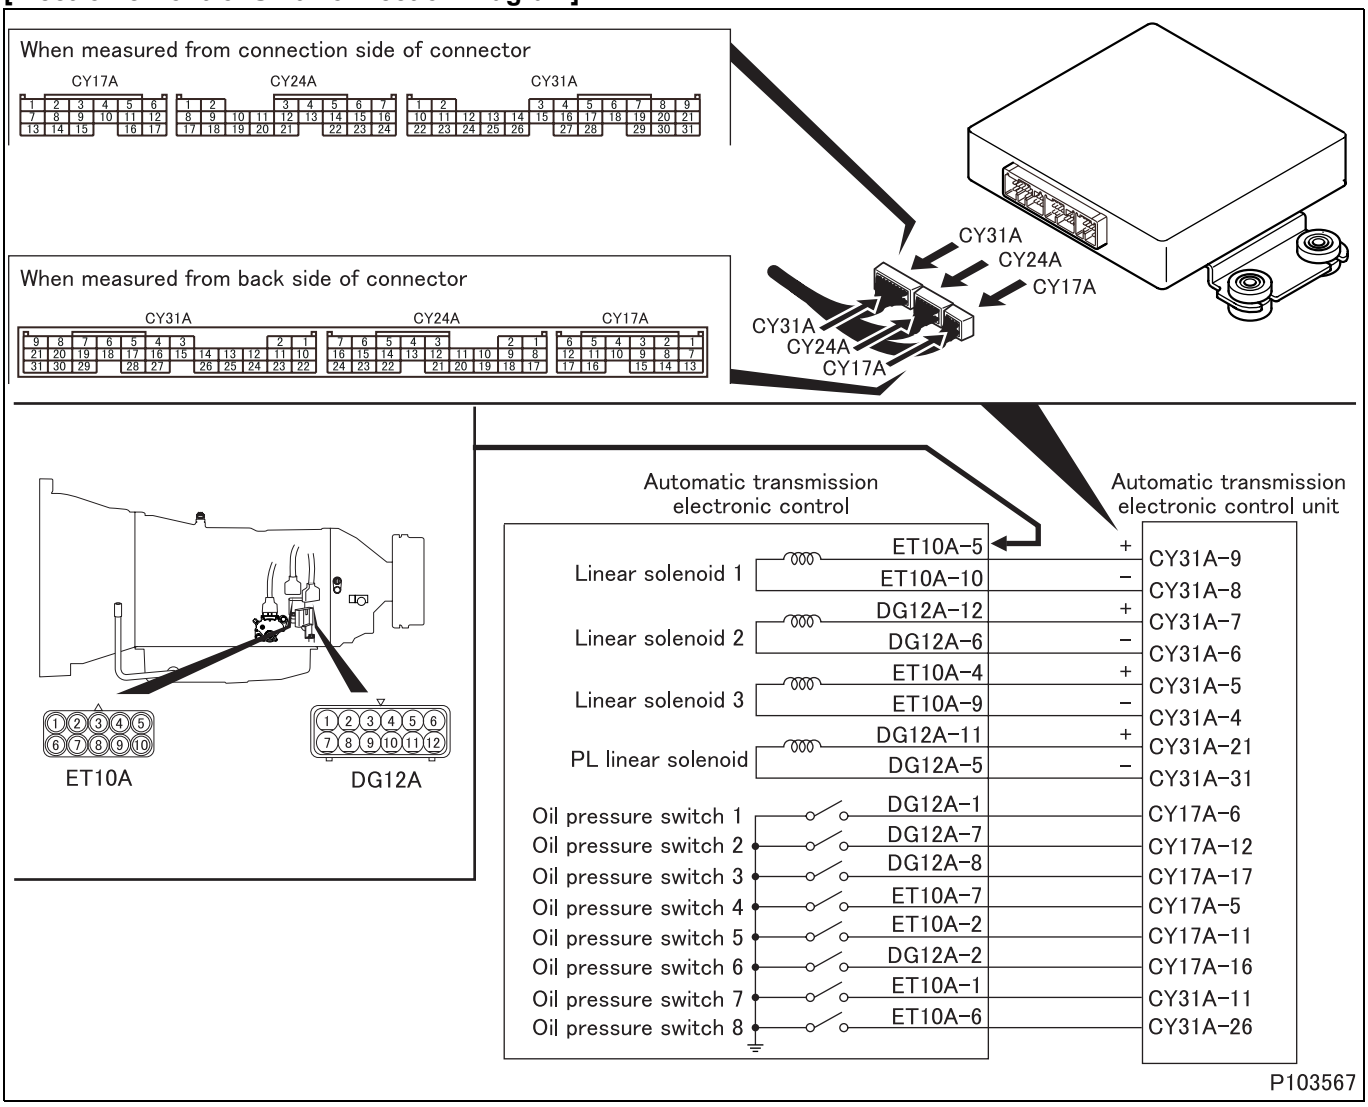
[Diagnostic requirement]
- After linear solenoid 2 switched from high to low pressure

[Control effected by electronic control unit during fault]
- Lockup control is turned OFF
- Control is effected on fixed speed gear output (3rd).

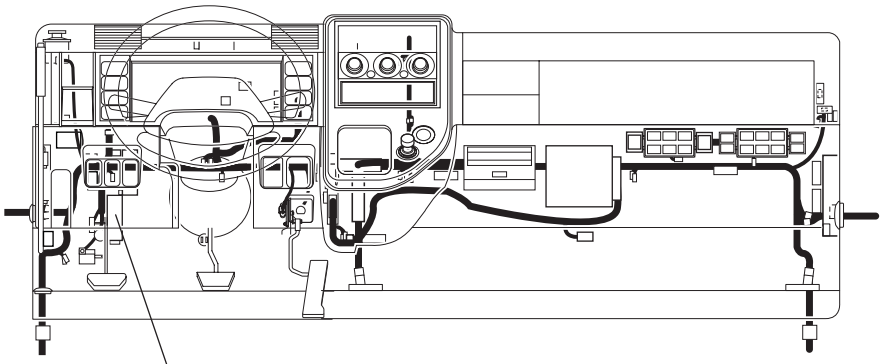
[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and linear solenoid 2 or oil pressure switch 2
- Malfunction of each connector
- Malfunction of linear solenoid 2 or oil pressure switch 2
- Malfunction of electronic control unit

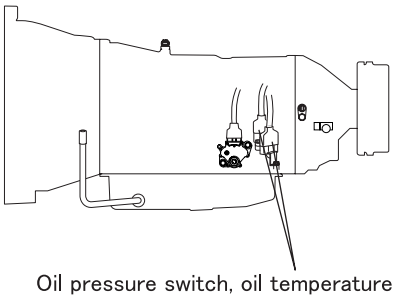
[Recoverability]
- Recovered if signal becomes normal when starter switch is turned OFF to ON (power supply resumed to electronic control unit).

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]





P103560-2

[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Go to step 2. **<Multi-Use Tester used>** Measure item No. 27 “Linear Sol Press 2” of Service Data.
	Inspection condition		Vehicle run
	Requirements		• During speed change (2nd to 3rd, 4th to 5th): Rises • During speed change (1st to 2nd, 3rd to 4th, 5th to 6th): Declines
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

Step 2	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of resistance between connector (CY17A) terminal No. 12 (+) and connector (CY24A) terminal No. 8 (–). **<Multi-Use Tester used>** Measure item No. 62 “Oil Press SW 2” of Service Data.
	Inspection condition		Engine in operation **<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** • In 1st, 3rd, 5th gears: 0 V • In 2nd, 4th, 6th gears: 12 V **<Multi-Use Tester used>** • In 1st, 3rd, 5th gears: ON • In 2nd, 4th, 6th gears: OFF
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 3.

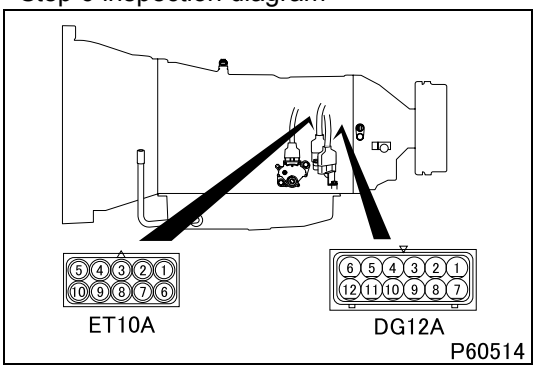
Step 3	Inspection items		Inspection by electronic control unit connector (signal)
	Maintenance item		Measure value of resistance between connector (CY31A) terminal No. 6 and 7.
	Inspection condition		• Disconnect electronic control unit and harness, and measure from connection side of harness connector. • Starter switch: OFF
	Requirements		5.5 ± 0.5 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	Go to step 5.

Step 4	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 9.
		NO	Modify connector.

Step 5	Inspection items		Inspection of solenoid connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Modify connector.

Step 6	Inspection items		Inspection of solenoid unit
	Maintenance item		Measure value of resistance between connector (DG12A) terminal No. 6 and 12.
	Inspection condition		• Disconnect connector, and measure solenoid side terminal. • Starter switch: OFF
	Requirements		5.5 ± 0.5 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Replacement of automatic transmission

<Step 6 inspection diagram>



Step 7	Inspection items		Inspection of harness between solenoid and electronic control unit (power supply)
	Maintenance item		Check circuit between connector (DG12A) terminal No. 12 and electronic control unit connector (CY31A) terminal No. 7.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify harness.

Step 8	Inspection items		Inspection of harness between solenoid and electronic control unit (ground)
	Maintenance item		Check circuit between connector (DG12A) terminal No.6 and electronic control unit connector (CY31A) terminal No. 6.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 9.
		NO	Modify harness.

Step 9	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Check for recurrence of the same diagnosis code. **<Multi-Use Tester used>** Measure item No. 27 “Linear Sol Press 2” of Service Data.
	Inspection condition		Vehicle run
	Requirements		**<Multi-Use Tester not used>** If the same diagnosis code occurs, replace electronic control unit. **<Multi-Use Tester used>** • During speed change (2nd to 3rd, 4th to 5th): Rises • During speed change (1st to 2nd, 3rd to 4th, 5th to 6th): Declines
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 10.

Step 10	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of resistance between connector (CY17A) terminal No. 12 (+) and connector (CY24A) terminal No. 8 (–). **<Multi-Use Tester used>** Measure item No. 62 “Oil Press SW 2” of Service Data.
	Inspection condition		Engine in operation **<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** • In 1st, 3rd, 5th gears: 0 V • In 2nd, 4th, 6th gears: 12 V **<Multi-Use Tester used>** • In 1st, 3rd, 5th gears: ON • In 2nd, 4th, 6th gears: OFF
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	• Check if a diagnosis code related to the oil pressure switch 2 occurs. If it does, perform troubleshooting of the code. • Replacement of electronic control unit

[Fault code]
Diagnosis code: P0778/Flash code: 27
[Monitor ID]
23, 24
[Fault (outline)]
Linear solenoid 2 is open-circuited or short-circuited.
[Diagnosis check]
- Resistance and current value in linear solenoid 2 is monitored for fault.

[Code generation condition]
Linear solenoid is judged faulty in either of the following cases.
- Resistance across the linear solenoid 2 remains higher than the specification (100 Ω) for 0.065 second (open-circuited or circuit shorted to power supply).
- Current flowing in the linear solenoid 2 remains higher than the specification (4A) for 0.065 second (circuit shorted to ground).

[Diagnosis check timing]
- Fault diagnosis is continuously performed.

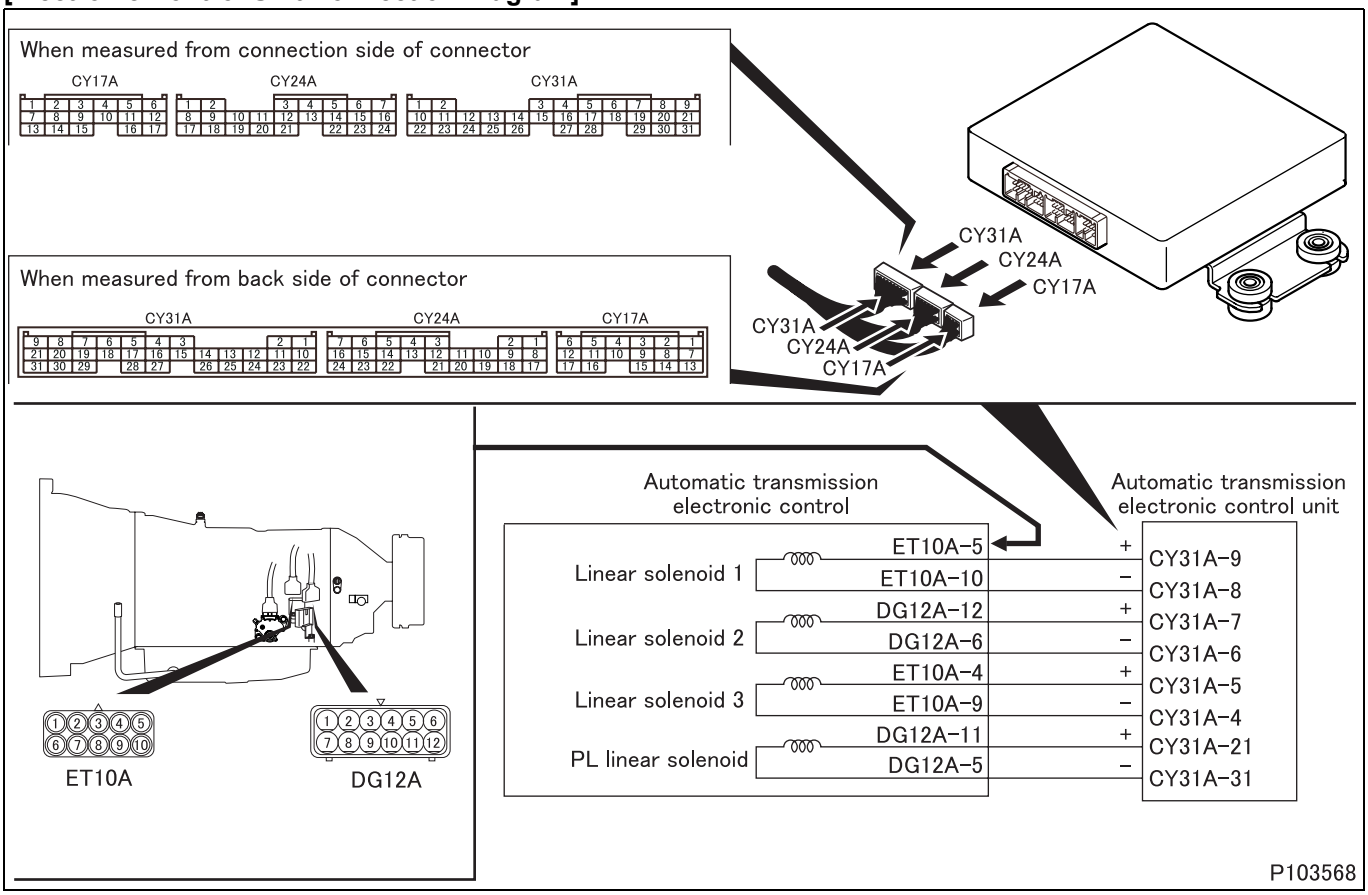
[Diagnostic requirement]
- Continuous

[Control effected by electronic control unit during fault]
- Lockup control is turned OFF
- Control is effected on fixed speed gear output (4th for open-circuit, 3rd for short-circuit).

[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and linear solenoid 2
- Malfunction of each connector
- Malfunction of linear solenoid 2
- Malfunction of electronic control unit

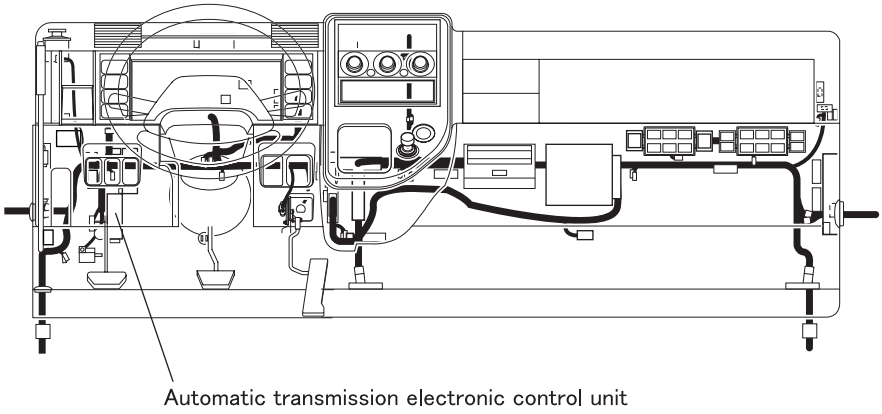
[Recoverability]
- Recovered if signal becomes normal when starter switch is turned OFF to ON (power supply resumed to electronic control unit).

[Electronic Control Unit Connection Diagram]



P103568

[Parts Identification and Location]



P103560-2

[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Go to step 2. **<Multi-Use Tester used>** Measure item No. 27 “Linear Sol Press 2” of Service Data.
	Inspection condition		Vehicle run
	Requirements		• During speed change (2nd to 3rd, 4th to 5th): Rises • During speed change (1st to 2nd, 3rd to 4th, 5th to 6th): Declines
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

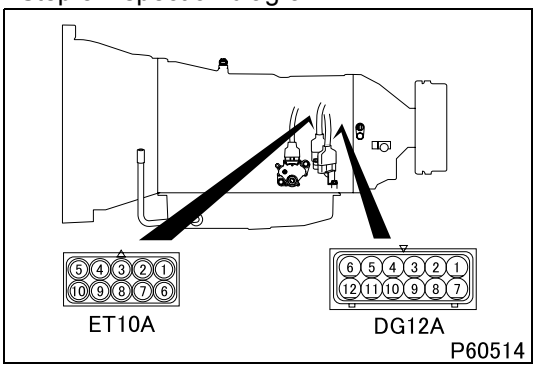
Step 2	Inspection items		Inspection by electronic control unit connector (signal)
	Maintenance item		Measure value of resistance between connector (CY31A) terminal No. 6 and 7.
	Inspection condition		• Disconnect electronic control unit and harness, and measure from connection side of harness connector. • Starter switch: OFF
	Requirements		5.5 ± 0.5 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Go to step 4.

Step 3	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify connector.

Step 4	Inspection items		Inspection of solenoid connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Modify connector.

Step 5	Inspection items		Inspection of solenoid unit
	Maintenance item		Measure value of resistance between connector (DG12A) terminal No. 6 and 12.
	Inspection condition		• Disconnect connector, and measure solenoid side terminal. • Starter switch: OFF
	Requirements		5.5 ± 0.5 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Replacement of automatic transmission

<Step 5 inspection diagram>



Step 6	Inspection items		Inspection of harness between solenoid and electronic control unit (power supply)
	Maintenance item		Check circuit between connector (DG12A) terminal No. 12 and electronic control unit connector (CY31A) terminal No. 7.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify harness.

Step 7	Inspection items		Inspection of harness between solenoid and electronic control unit (ground)
	Maintenance item		Check circuit between connector (DG12A) terminal No. 6 and electronic control unit connector (CY31A) terminal No. 6.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify harness.

Step 8	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Check for recurrence of the same diagnosis code. **<Multi-Use Tester used>** Measure item No. 27 “Linear Sol Press 2” of Service Data.
	Inspection condition		Vehicle run
	Requirements		**<Multi-Use Tester not used>** If the same diagnosis code occurs, replace electronic control unit. **<Multi-Use Tester used>** • During speed change (2nd to 3rd, 4th to 5th): Rises • During speed change (1st to 2nd, 3rd to 4th, 5th to 6th): Declines
	Inspection result (Is the judging standard satisfied?)	YES	If the diagnosis code remains after actual run, replace the electronic control unit.
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P0796/Flash code: 48
[Monitor ID]
47
[Fault (outline)]
Linear solenoid 3 is binds in OFF state.
[Diagnosis check]
- When the garage control (selector lever is shifted from N to D or R range) is terminated, the linear solenoid 3 is monitored for flow of the maximum oil pressure according to the response of oil pressure switch 7 and its condition is decided by the electronic control unit.

[Code generation condition]
- Oil pressure switch 7 remains OFF (low pressure).

[Diagnosis check timing]
- Fault diagnosis is performed each time when the control is activated.

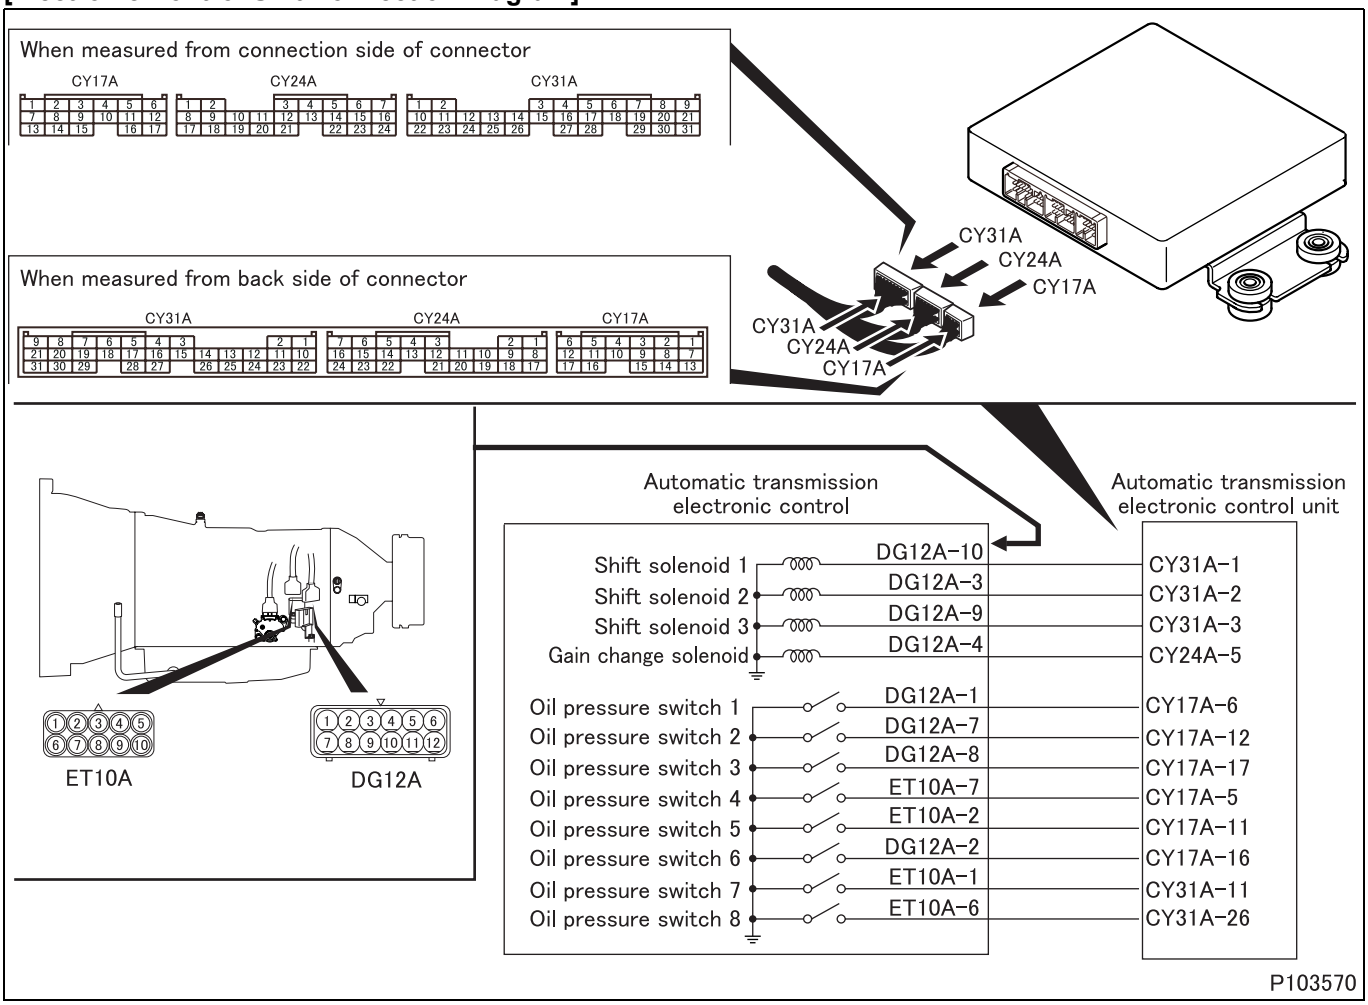
[Diagnostic requirement]
- Garage control: termination

[Control effected by electronic control unit during fault]
- Lockup control is turned OFF
- Control is effected on fixed speed gear output (3rd).

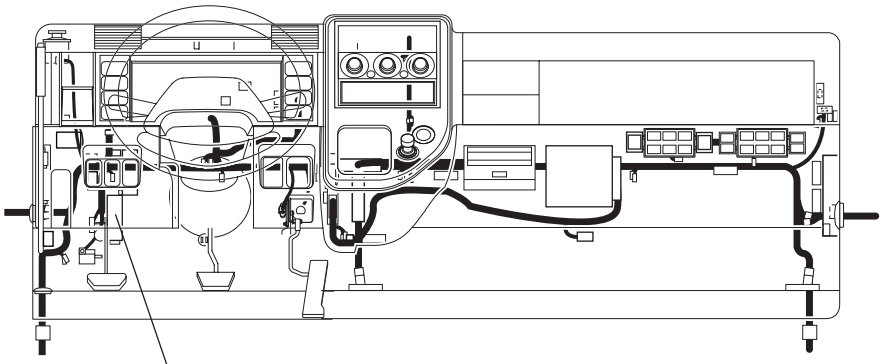
[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and linear solenoid 3 or oil pressure switch 7
- Malfunction of each connector
- Malfunction of linear solenoid 3 or oil pressure switch 7
- Malfunction of electronic control unit

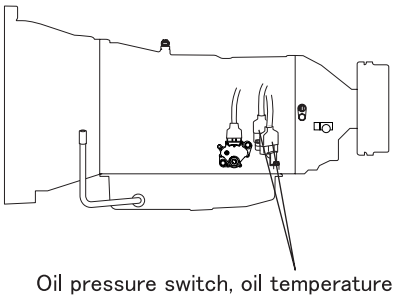
[Recoverability]
- Recovered if signal becomes normal when starter switch is turned OFF to ON (power supply resumed to electronic control unit).

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]





P103560-2

[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Go to step 2. **<Multi-Use Tester used>** Measure item No. 35 “Linear Sol Press 3” of Service Data.
	Inspection condition		Engine in operation <When shifting from N to D> With the brake pedal pressed down, shift the range selector lever (from N to D). <In lock-up state> • Item No. 13 “A/T Oil Temp (OP)” indicates 25°C {77°F} or higher. • Lock-up speed (6th gear, accelerator pedal fully pressed down): 73 to 75 km/h {45.4 to 46.6 mph}
	Requirements		• When shifting from N to D: Varies • In lock-up state: 100 lbf/in^2
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

Step 2	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of voltage between connector (CY31A) terminal No.11 (+) and connector (CY24A) terminal No. 8 (–). **<Multi-Use Tester used>** Measure item No. 67 “Oil Press SW 7” of Service Data.
	Inspection condition		Engine in operation **<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** When shifting N to D: 12 V → 0 V → 12 V **<Multi-Use Tester used>** When shifting N to D: OFF → ON → OFF
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 3.

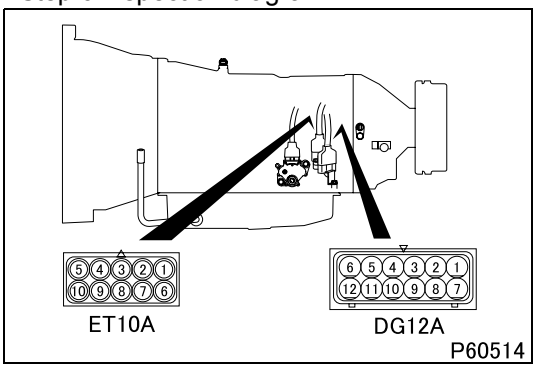
Step 3	Inspection items		Inspection by electronic control unit connector (signal)
	Maintenance item		Measure value of resistance between connector (CY31A) terminal No. 5 and 4.
	Inspection condition		• Disconnect electronic control unit and harness, and measure from connection side of harness connector. • Starter switch: OFF
	Requirements		5.5 ± 0.5 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	Go to step 5.

Step 4	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 9.
		NO	Modify connector.

Step 5	Inspection items		Inspection of solenoid connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Modify connector.

Step 6	Inspection items		Inspection of solenoid unit
	Maintenance item		Measure value of resistance between connector (ET10A) terminal No. 4 and 9.
	Inspection condition		• Disconnect connector, and measure solenoid side terminal. • Starter switch: OFF
	Requirements		5.5 ± 0.5 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Replacement of automatic transmission

<Step 6 inspection diagram>



Step 7	Inspection items		Inspection of harness between solenoid and electronic control unit (power supply)
	Maintenance item		Check circuit between connector (ET10A) terminal No. 4 and electronic control unit connector (CY31A) terminal No. 5.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify harness.

Step 8	Inspection items		Inspection of harness between solenoid and electronic control unit (ground)
	Maintenance item		Check circuit between connector (ET10A) terminal No. 9 and electronic control unit connector (CY31A) terminal No. 4.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 9.
		NO	Modify harness.

Step 9	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Check for recurrence of the same diagnosis code. **<Multi-Use Tester used>** Measure item No. 35 “Linear Sol Press 3” of Service Data.
	Inspection condition		Engine in operation <When shifting from N to D> With the brake pedal pressed down, shift the range selector lever (from N to D). <In lock-up state> • Item No. 13 “A/T Oil Temp (OP)” indicates 25°C {77°F} or higher. • Lock-up speed (6th gear, accelerator pedal fully pressed down): 73 to 75 km/h {45.4 to 46.6 mph}
	Requirements		**<Multi-Use Tester not used>** If the same diagnosis code occurs, replace electronic control unit. **<Multi-Use Tester used>** • When shifting from N to D: Varies • In lock-up state: 100 lbf/in^2
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 10.

Step 10	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of voltage between connector (CY31A) terminal No.11 (+) and connector (CY24A) terminal No. 8 (–). **<Multi-Use Tester used>** Measure item No. 67 “Oil Press SW 7” of Service Data.
	Inspection condition		Engine in operation **<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** When shifting N to D: 12 V → 0 V → 12 V **<Multi-Use Tester used>** When shifting N to D: OFF → ON → OFF
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	• Check if a diagnosis code related to the oil pressure switch 7 occurs. If it does, perform troubleshooting of the code. • Replacement of electronic control unit

[Fault code]
Diagnosis code: P0797/Flash code: 48
[Monitor ID]
46
[Fault (outline)]
Linear solenoid 3 is binds in ON state.
[Diagnosis check]
- Linear solenoid 3 is monitored for fault when switched from high to low pressure with the oil pressure switch 6 turned ON (gain change solenoid ON) according to the response of oil pressure switch 7

[Code generation condition]
- Oil pressure switch 7 remains ON (high pressure).

[Diagnosis check timing]
- Fault diagnosis is performed each time when the control is activated.

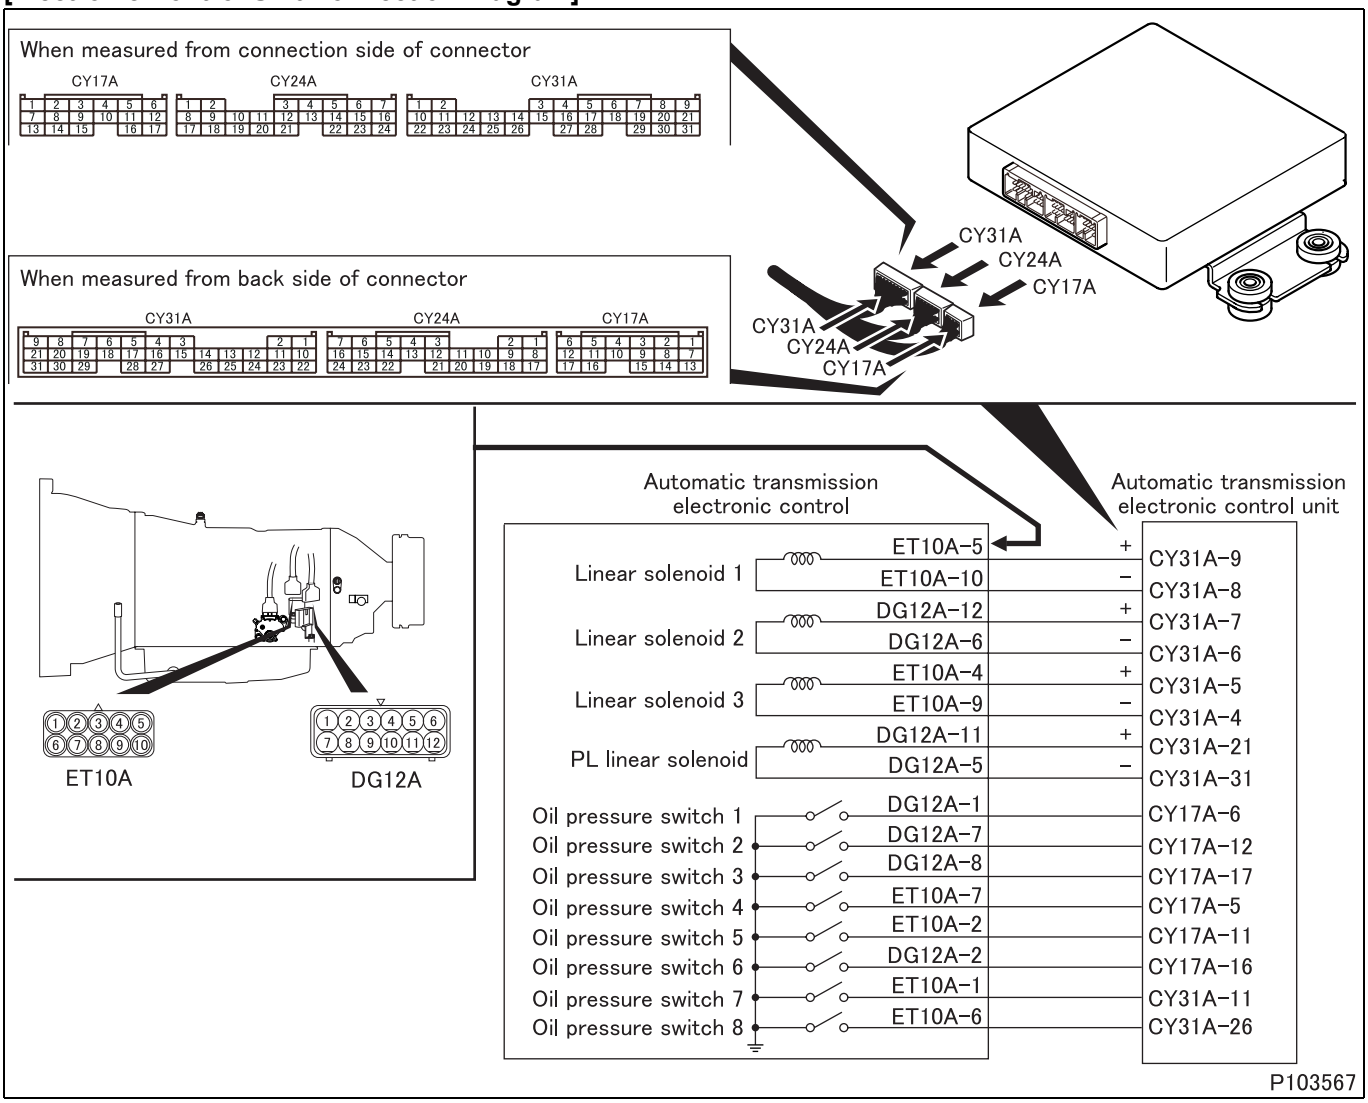
[Diagnostic requirement]
- Oil pressure switch 6: ON

[Control effected by electronic control unit during fault]
- Lockup control is turned OFF
- Control is effected on fixed speed gear output (2nd).

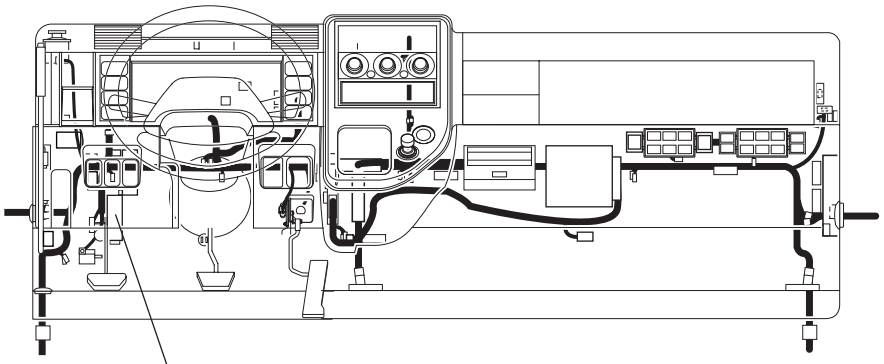
[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and linear solenoid 3 or oil pressure switch 7
- Malfunction of each connector
- Malfunction of linear solenoid 3 or oil pressure switch 7
- Malfunction of electronic control unit

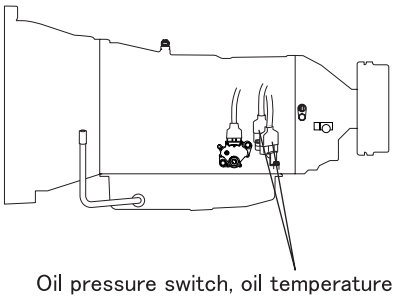
[Recoverability]
- Recovered if signal becomes normal when starter switch is turned OFF to ON (power supply resumed to electronic control unit).

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]





P103560-2

[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Go to step 2. **<Multi-Use Tester used>** Measure item No. 35 “Linear Sol Press 3” of Service Data.
	Inspection condition		Engine in operation <When shifting from N to D> With the brake pedal pressed down, shift the range selector lever (from N to D). <In lock-up state> • Item No. 13 “A/T Oil Temp (OP)” indicates 25°C {77°F} or higher. • Lock-up speed (6th gear, accelerator pedal fully pressed down): 73 to 75 km/h {45.4 to 46.6 mph}
	Requirements		• When shifting from N to D: Varies • In lock-up state: 100 lbf/in^2
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

Step 2	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of voltage between connector (CY31A) terminal No. 11 (+) and connector (CY24A) terminal No. 8 (–). **<Multi-Use Tester used>** Measure item No. 67 “Oil Press SW 7” of Service Data.
	Inspection condition		Engine in operation **<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** When shifting N to D: 12 V → 0 V → 12 V **<Multi-Use Tester used>** When shifting N to D: OFF → ON → OFF
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 3.

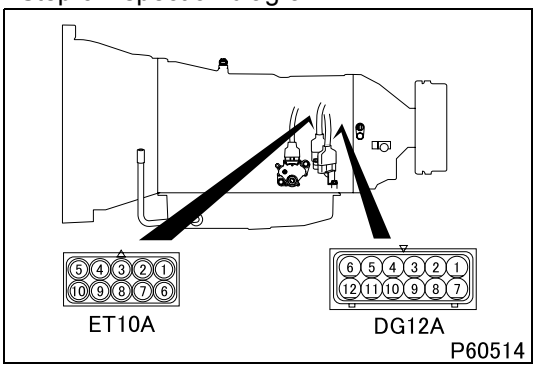
Step 3	Inspection items		Inspection by electronic control unit connector (signal)
	Maintenance item		Measure value of resistance between connector (CY31A) terminal No. 5 and 4.
	Inspection condition		• Disconnect electronic control unit and harness, and measure from connection side of harness connector. • Starter switch: OFF
	Requirements		5.5 ± 0.5 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	Go to step 5.

Step 4	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 9.
		NO	Modify connector.

Step 5	Inspection items		Inspection of solenoid connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Modify connector.

Step 6	Inspection items		Inspection of solenoid unit
	Maintenance item		Measure value of resistance between connector (ET10A) terminal No. 4 and 9.
	Inspection condition		• Disconnect connector, and measure solenoid side terminal. • Starter switch: OFF
	Requirements		5.5 ± 0.5 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Replacement of automatic transmission

<Step 6 inspection diagram>



Step 7	Inspection items		Inspection of harness between solenoid and electronic control unit (power supply)
	Maintenance item		Check circuit between connector (ET10A) terminal No. 4 and electronic control unit connector (CY31A) terminal No. 5.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify harness.

Step 8	Inspection items		Inspection of harness between solenoid and electronic control unit (ground)
	Maintenance item		Check circuit between connector (ET10A) terminal No. 9 and electronic control unit connector (CY31A) terminal No. 4.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 9.
		NO	Modify harness.

Step 9	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Check for recurrence of the same diagnosis code. **<Multi-Use Tester used>** Measure item No. 35 “Linear Sol Press 3” of Service Data.
	Inspection condition		Engine in operation <When shifting from N to D> With the brake pedal pressed down, shift the range selector lever (from N to D). <In lock-up state> • Item No. 13 “A/T Oil Temp (OP)” indicates 25°C {77°F} or higher. • Lock-up speed (6th gear, accelerator pedal fully pressed down): 73 to 75 km/h {45.4 to 46.6 mph}
	Requirements		**<Multi-Use Tester not used>** If the same diagnosis code occurs, replace electronic control unit. **<Multi-Use Tester used>** • When shifting from N to D: Varies • In lock-up state: 100 lbf/in^2
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic control unit

Step 10	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of voltage between connector (CY31A) terminal No.11 (+) and connector (CY24A) terminal No. 8 (–). **<Multi-Use Tester used>** Measure item No. 67 “Oil Press SW 7” of Service Data.
	Inspection condition		Engine in operation **<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** When shifting N to D: 12 V → 0 V → 12 V **<Multi-Use Tester used>** When shifting N to D: OFF → ON → OFF
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	• Check if a diagnosis code related to the oil pressure switch 7 occurs. If it does, perform troubleshooting of the code. • Replacement of electronic control unit

[Fault code]
Diagnosis code: P083D/Flash code: 48
[Monitor ID]
48
[Fault (outline)]
Failure of oil pressure switch 7
[Diagnosis check]
- With the oil pressure switch 6 turned ON (gain change solenoid ON), oil pressure switch 7 is monitored for fault when the linear solenoid 3 is deenergized (low pressure).

[Code generation condition]
- Oil pressure switch 7 remains ON (high pressure) for 0.18 second.

[Diagnosis check timing]
- Fault diagnosis is performed each time when the control is activated.

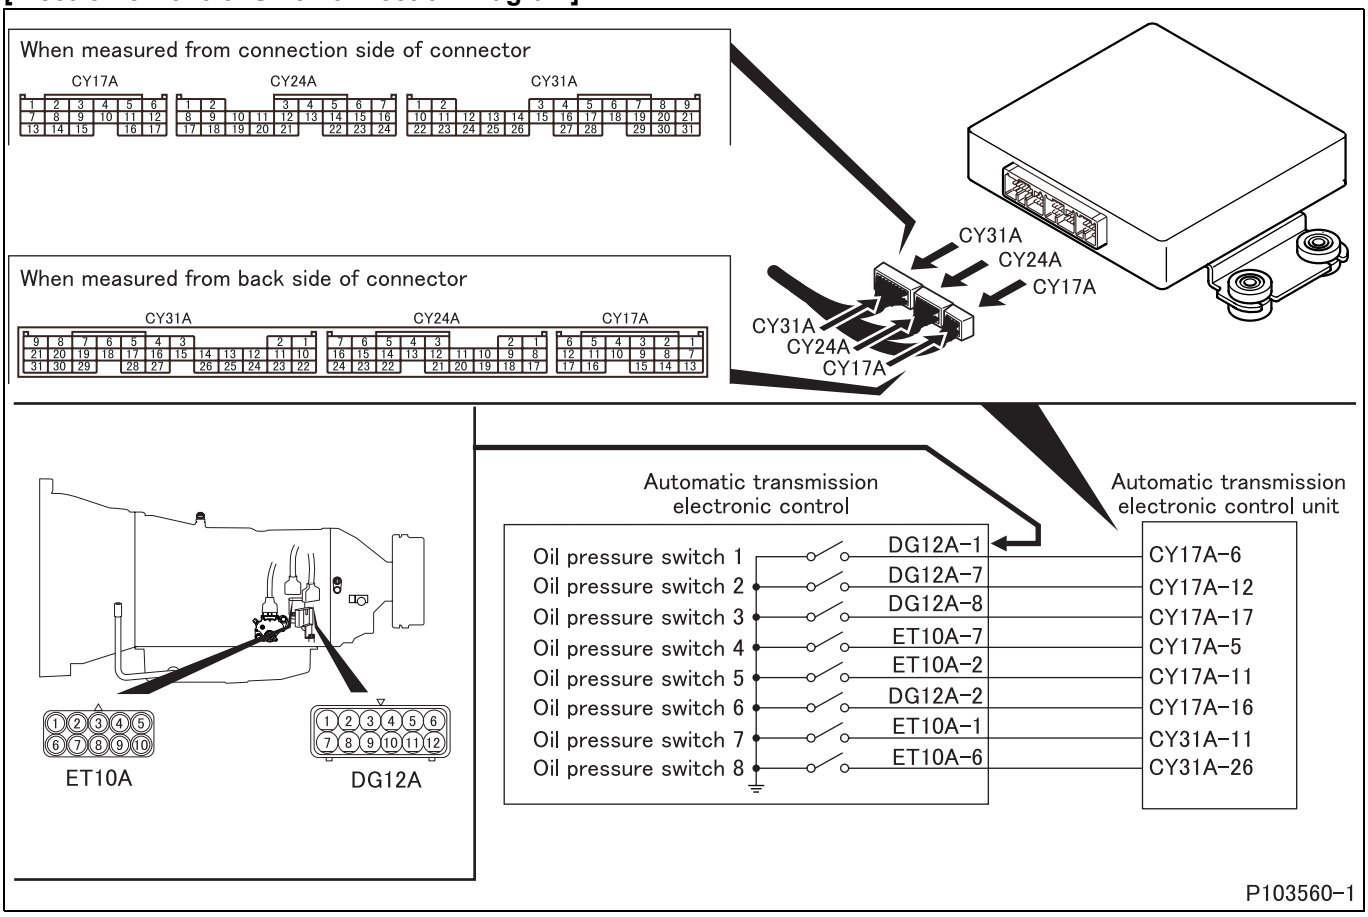
[Diagnostic requirement]
- Oil pressure switch 6: ON
- Linear solenoid 3 is low pressure

[Control effected by electronic control unit during fault]
- Lockup control is turned OFF
- Control is effected on fixed speed gear output (2nd).

[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and oil pressure switch 7 or linear solenoid 3
- Malfunction of each connector
- Malfunction of oil pressure switch 7 or linear solenoid 3
- Malfunction of electronic control unit

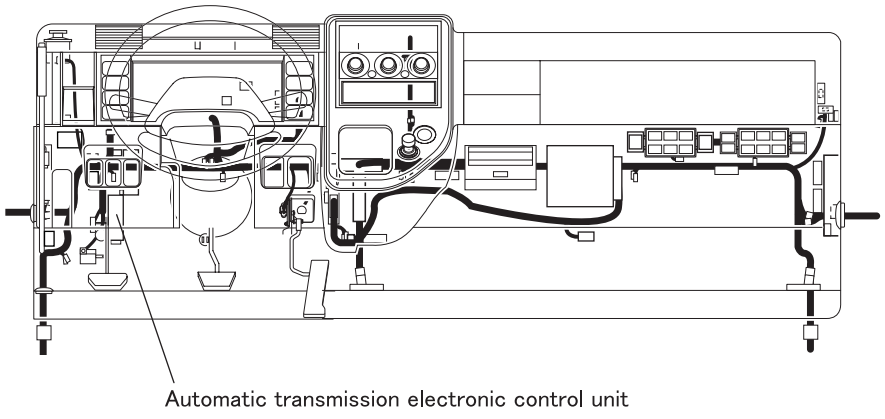
[Recoverability]
- Recovered if signal becomes normal when starter switch is turned OFF to ON (power supply resumed to electronic control unit).

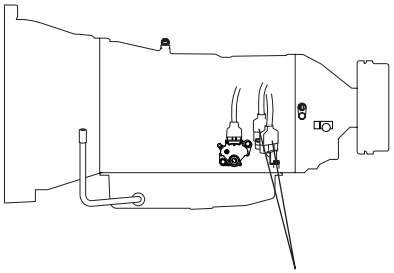
[Electronic Control Unit Connection Diagram]



P103560-1

[Parts Identification and Location]





P103560-2

[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of voltage between connector (CY31A) terminal No. 11 (+) and connector (CY24A) terminal No. 8 (–). **<Multi-Use Tester used>** Measure item No. 67 “Oil Press SW 7” of Service Data.
	Inspection condition		Engine in operation **<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** When shifting from N to D: 12 V → 0 V → 12 V **<Multi-Use Tester used>** When shifting from N to D: OFF → ON → OFF
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

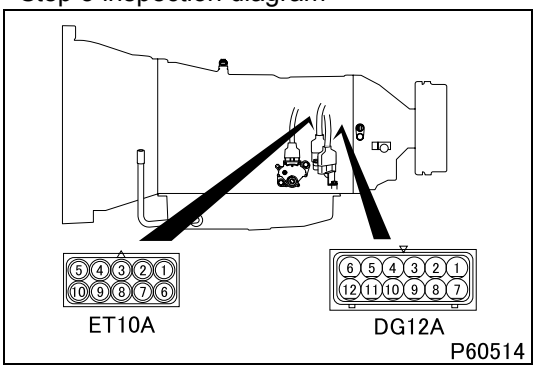
Step 2	Inspection items		Inspection by electronic control unit connector (signal)
	Maintenance item		Measure continuity between connector (CY31A) terminal No. 11 and chassis ground.
	Inspection condition		• Disconnect electronic control unit and harness, and measure from connection side of harness connector. • Starter switch: OFF
	Requirements		There is no continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Go to step 4.

Step 3	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify connector.

Step 4	Inspection items		Inspection of switch connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Modify connector.

Step 5	Inspection items		Inspection of switch unit
	Maintenance item		Check continuity between connector (ET10A) terminal No. 1 and automatic transmission case.
	Inspection condition		• Disconnect connector, and measure switch side terminal. • Starter switch: OFF
	Requirements		There is no continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Replacement of automatic transmission

<Step 5 inspection diagram>



Step 6	Inspection items		Inspection of harness between switch and electronic control unit (signal)
	Maintenance item		Check circuit between connector (ET10A) terminal No. 1 and electronic control unit connector (CY31A) terminal No. 11.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify harness.

Step 7	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of voltage between connector (CY31A) terminal No. 11 (+) and connector (CY24A) terminal No. 8 (–). **<Multi-Use Tester used>** Measure item No. 67 “Oil Press SW 7” of Service Data.
	Inspection condition		Engine in operation **<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** When shifting from N to D: 12 V → 0 V → 12 V **<Multi-Use Tester used>** When shifting from N to D: OFF → ON → OFF
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	• Check if a diagnosis code related to the linear solenoid 3 occurs. If it does, perform troubleshooting of the code. • Replacement of electronic control unit

[Fault code]
Diagnosis code: P0842/Flash code: 41
[Monitor ID]
37
[Fault (outline)]
Failure of oil pressure switch 1
[Diagnosis check]
- Oil pressure switch 1 is monitored for fault when the linear solenoid 1 is energized (high pressure).

[Code generation condition]
- Oil pressure switch 1 is judged faulty when the oil pressure switch 1 remains OFF (low pressure) for 2 seconds, then N, R or P range is selected and the oil pressure switch 8 remains OFF for 0.5 second (check if stuck ON).

[Diagnosis check timing]
- Fault diagnosis is performed each time when the control is activated.

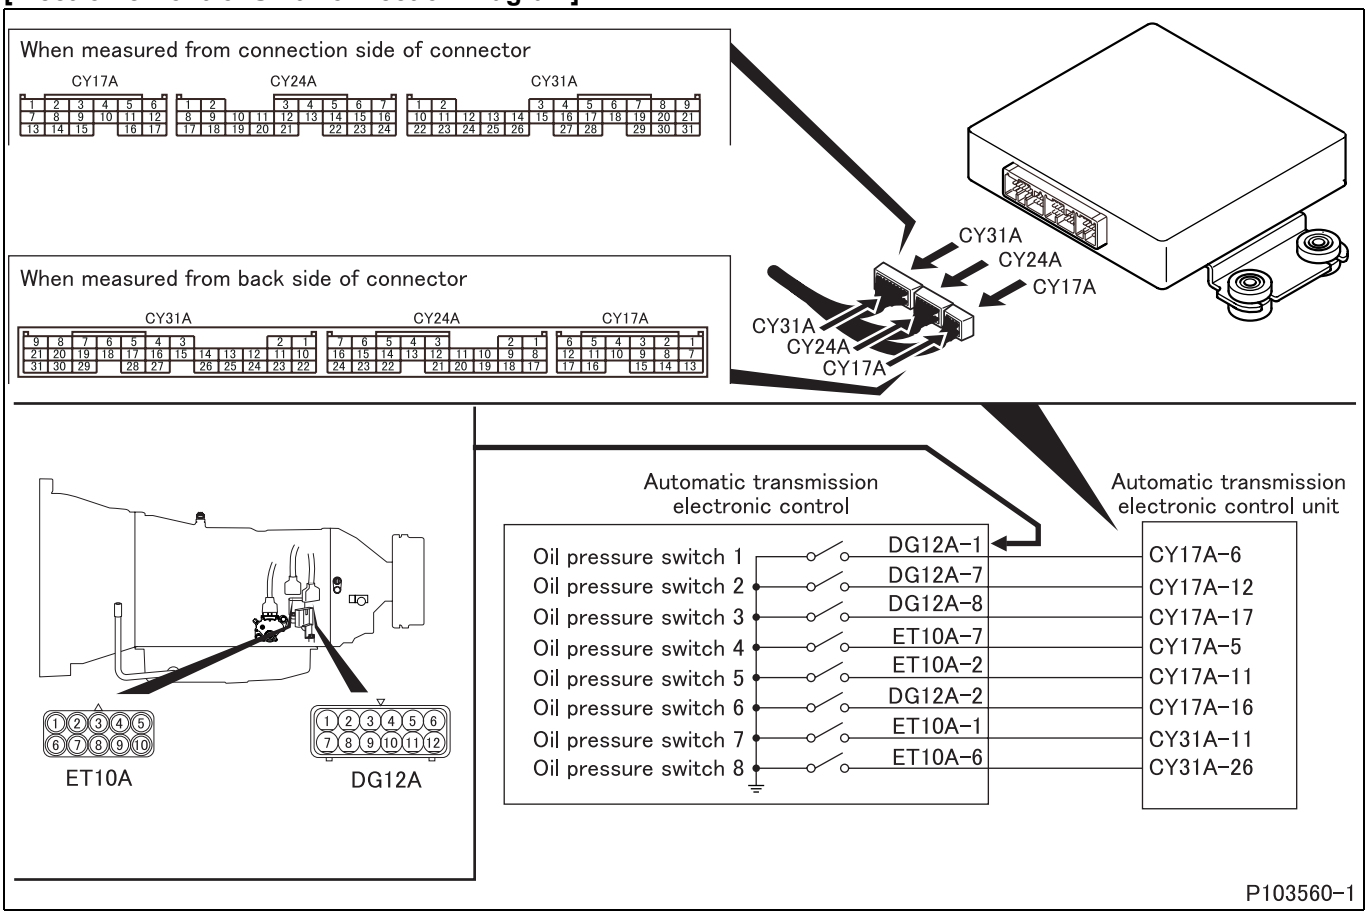
[Diagnostic requirement]
- Oil pressure switch 8: ON
- Shift position: D, 3 or 2 range
- Linear solenoid 1 is high pressure

[Control effected by electronic control unit during fault]
- Lockup control is turned OFF
- Control is effected on fixed speed gear output (3rd).

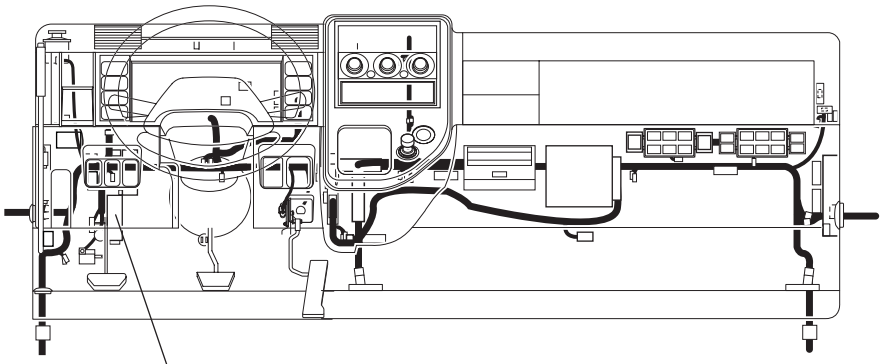
[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and oil pressure switch 1 or linear solenoid 1
- Malfunction of each connector
- Malfunction of oil pressure switch 1 or linear solenoid 1
- Malfunction of electronic control unit

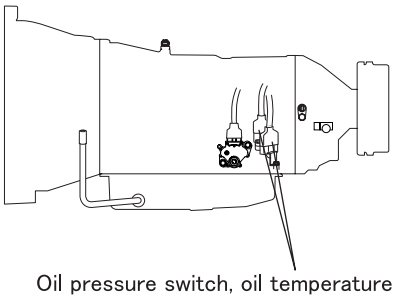
[Recoverability]
- Recovered if signal becomes normal when starter switch is turned OFF to ON (power supply resumed to electronic control unit).

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]





P103560-2

[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of voltage between connector (CY17A) terminal No. 6 (+) and connector (CY24A) terminal No. 8 (–). **<Multi-Use Tester used>** Measure item No. 61 “Oil Press SW 1” of Service Data.
	Inspection condition		Engine in operation **<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** • In 2nd, 4th, 6th gears: 0 V • In 1st, 3rd, 5th gears: 12 V **<Multi-Use Tester used>** • In 2nd, 4th, 6th gears: ON • In 1st, 3rd, 5th gears: OFF
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

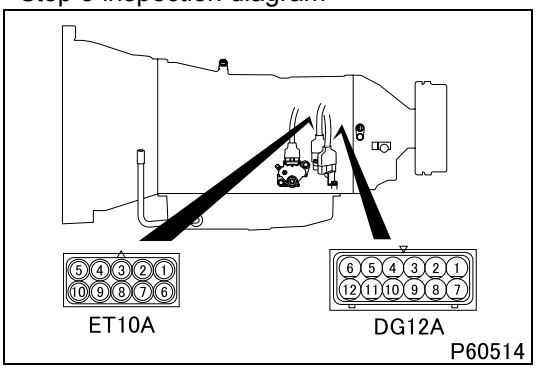
Step 2	Inspection items		Inspection by electronic control unit connector (signal)
	Maintenance item		Measure continuity between connector (CY17A) terminal No. 6 and chassis ground.
	Inspection condition		• Disconnect electronic control unit and harness, and measure from connection side of harness connector. • Starter switch: OFF
	Requirements		There is no continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Go to step 4.

Step 3	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify connector.

Step 4	Inspection items		Inspection of switch connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Modify connector.

Step 5	Inspection items		Inspection of switch unit
	Maintenance item		Check continuity between connector (DG12A) terminal No. 1 and automatic transmission case.
	Inspection condition		• Disconnect connector, and measure switch side terminal. • Starter switch: OFF
	Requirements		There is no continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Replacement of automatic transmission

<Step 5 inspection diagram>



Step 6	Inspection items		Inspection of harness between switch and electronic control unit (signal)
	Maintenance item		Check circuit between connector (DG12A) terminal No. 1 and electronic control unit connector (CY17A) terminal No. 6.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify harness.

Step 7	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of voltage between connector (CY17A) terminal No. 6 (+) and connector (CY24A) terminal No. 8 (–). **<Multi-Use Tester used>** Measure item No. 61 “Oil Press SW 1” of Service Data.
	Inspection condition		Engine in operation **<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** • In 2nd, 4th, 6th gears: 0 V • In 1st, 3rd, 5th gears: 12 V **<Multi-Use Tester used>** • In 2nd, 4th, 6th gears: ON • In 1st, 3rd, 5th gears: OFF
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	• Check if a diagnosis code related to the linear solenoid 1 occurs. If it does, perform troubleshooting of the code. • Replacement of electronic control unit

[Fault code]
Diagnosis code: P0843/Flash code: 41
[Monitor ID]
36
[Fault (outline)]
Failure of oil pressure switch 1
[Diagnosis check]
- Oil pressure switch 1 is monitored for fault when the linear solenoid 1 is deenergized (low pressure).

[Code generation condition]
- Oil pressure switch 1 remains ON (high pressure) for 0.1 second.

[Diagnosis check timing]
- Fault diagnosis is performed each time when the control is activated.

[Diagnostic requirement]
- Linear solenoid 1 is low pressure

[Control effected by electronic control unit during fault]
- Lockup control is turned OFF
- Control is effected on fixed speed gear output (4th).

[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and oil pressure switch 1 or linear solenoid 1
- Malfunction of each connector
- Malfunction of oil pressure switch 1 or linear solenoid 1
- Malfunction of electronic control unit

[Recoverability]
- Recovered if signal becomes normal when starter switch is turned OFF to ON (power supply resumed to electronic control unit).

[Electronic Control Unit Connection Diagram]

P103560-2

[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of voltage between connector (CY17A) terminal No. 6 (+) and connector (CY24A) terminal No. 8 (–). **<Multi-Use Tester used>** Measure item No. 61 “Oil Press SW 1” of Service Data.
	Inspection condition		Engine in operation **<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** • In 2nd, 4th, 6th gears: 0 V • In 1st, 3rd, 5th gears: 12 V **<Multi-Use Tester used>** • In 2nd, 4th, 6th gears: ON • In 1st, 3rd, 5th gears: OFF
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

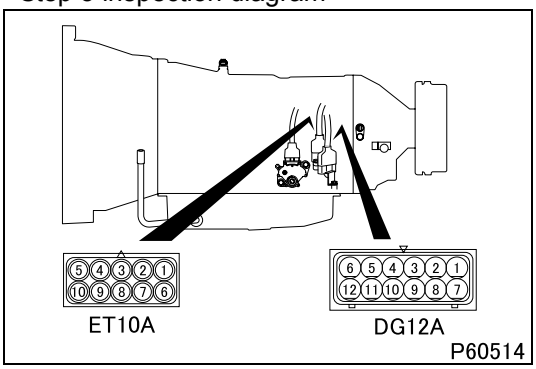
Step 2	Inspection items		Inspection by electronic control unit connector (signal)
	Maintenance item		Measure continuity between connector (CY17A) terminal No. 6 and chassis ground.
	Inspection condition		• Disconnect electronic control unit and harness, and measure from connection side of harness connector. • Starter switch: OFF
	Requirements		There is no continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Go to step 4.

Step 3	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify connector.

Step 4	Inspection items		Inspection of switch connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Modify connector.

Step 5	Inspection items		Inspection of switch unit
	Maintenance item		Check continuity between connector (DG12A) terminal No. 1 and automatic transmission case.
	Inspection condition		• Disconnect connector, and measure switch side terminal. • Starter switch: OFF
	Requirements		There is no continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Replacement of automatic transmission

<Step 5 inspection diagram>



Step 6	Inspection items		Inspection of harness between switch and electronic control unit (signal)
	Maintenance item		Check circuit between connector (DG12A) terminal No. 1 and electronic control unit connector (CY17A) terminal No. 6.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify harness.

Step 7	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of voltage between connector (CY17A) terminal No. 6 (+) and connector (CY24A) terminal No. 8 (–). **<Multi-Use Tester used>** Measure item No. 61 “Oil Press SW 1” of Service Data.
	Inspection condition		Engine in operation **<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** • In 2nd, 4th, 6th gears: 0 V • In 1st, 3rd, 5th gears: 12 V **<Multi-Use Tester used>** • In 2nd, 4th, 6th gears: ON • In 1st, 3rd, 5th gears: OFF
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	• Check if a diagnosis code related to the linear solenoid 1 occurs. If it does, perform troubleshooting of the code. • Replacement of electronic control unit

[Fault code]
Diagnosis code: P0847/Flash code: 42
[Monitor ID]
42
[Fault (outline)]
Failure of oil pressure switch 2
[Diagnosis check]
- Oil pressure switch 2 is monitored for fault when the linear solenoid 2 is energized (high pressure).

[Code generation condition]
- Oil pressure switch 2 remains OFF (low pressure) for 2 seconds.

[Diagnosis check timing]
- Fault diagnosis is performed each time when the control is activated.

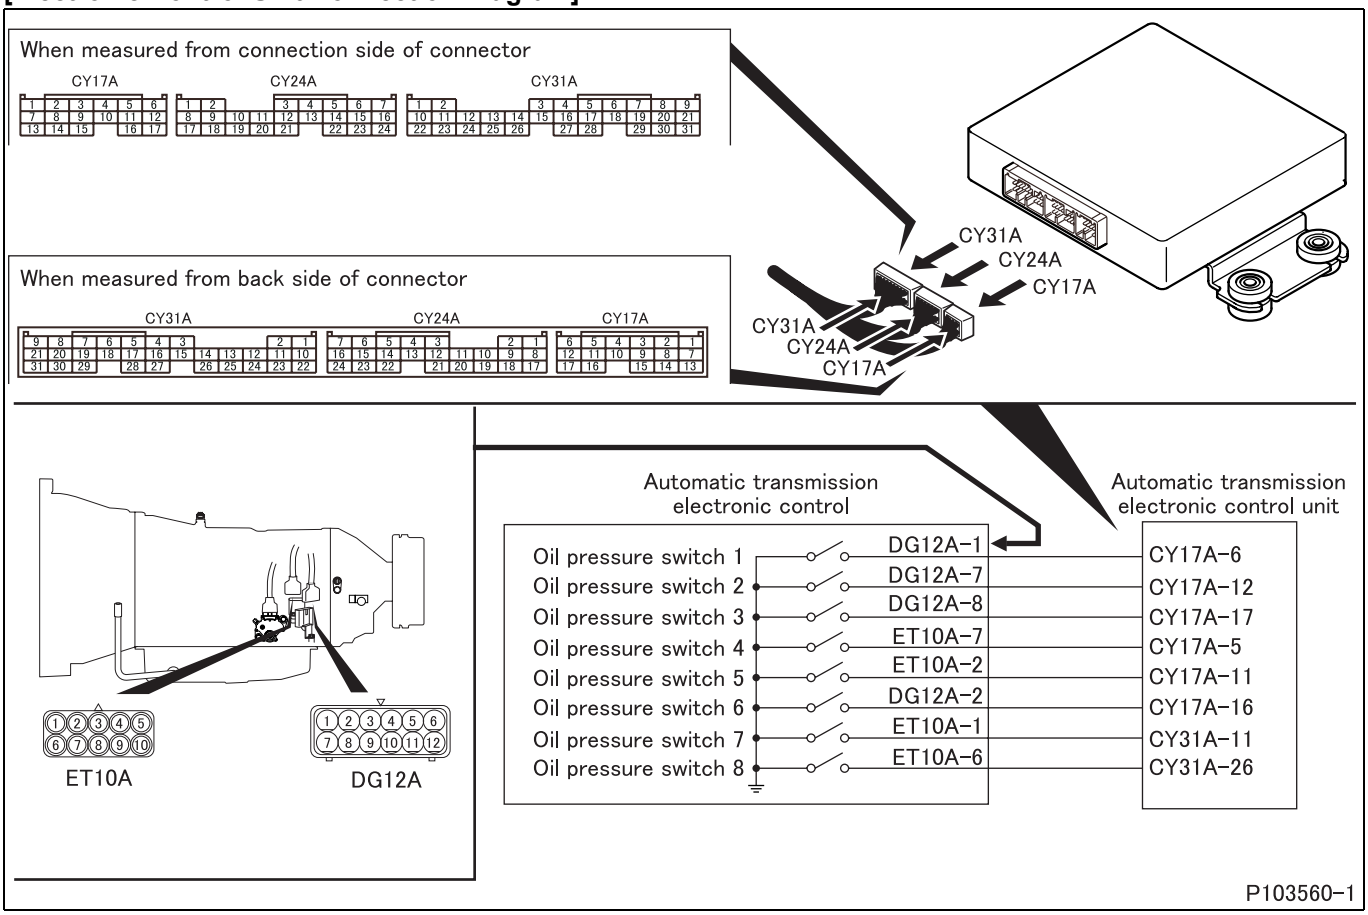
[Diagnostic requirement]
- Linear solenoid 2 is high pressure

[Control effected by electronic control unit during fault]
- Lockup control is turned OFF
- Control is effected on fixed speed gear output (4th).

[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and oil pressure switch 2 or linear solenoid 2
- Malfunction of each connector
- Malfunction of oil pressure switch 2 or linear solenoid 2
- Malfunction of electronic control unit

[Recoverability]
- Recovered if signal becomes normal when starter switch is turned OFF to ON (power supply resumed to electronic control unit).

[Electronic Control Unit Connection Diagram]



P103560-1

P103560-2

[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of voltage between connector (CY17A) terminal No. 12 (+) and connector (CY24A) terminal No. 8 (–). **<Multi-Use Tester used>** Measure item No. 62 “Oil Press SW 2” of Service Data.
	Inspection condition		Engine in operation **<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** • In 1st, 3rd, 5th gears: 0 V • In 2nd, 4th, 6th gears: 12 V **<Multi-Use Tester used>** • In 1st, 3rd, 5th gears: ON • In 2nd, 4th, 6th gears: OFF
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

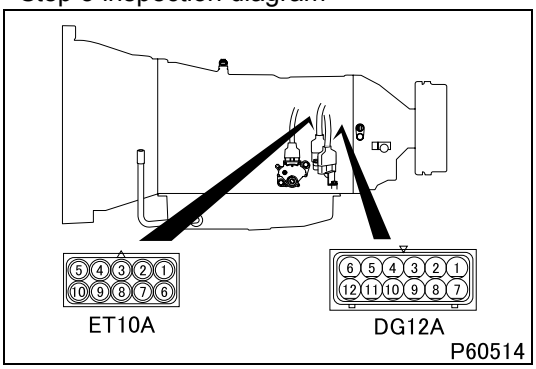
Step 2	Inspection items		Inspection by electronic control unit connector (signal)
	Maintenance item		Measure continuity between connector (CY17A) terminal No. 12 and chassis ground.
	Inspection condition		• Disconnect electronic control unit and harness, and measure from connection side of harness connector. • Starter switch: OFF
	Requirements		There is no continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Go to step 4.

Step 3	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify connector.

Step 4	Inspection items		Inspection of switch connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Modify connector.

Step 5	Inspection items		Inspection of switch unit
	Maintenance item		Check continuity between connector (DG12A) terminal No. 7 and automatic transmission case.
	Inspection condition		• Disconnect connector, and measure switch side terminal. • Starter switch: OFF
	Requirements		There is no continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Replacement of automatic transmission

<Step 5 inspection diagram>



Step 6	Inspection items		Inspection of harness between switch and electronic control unit (signal)
	Maintenance item		Check circuit between connector (DG12A) terminal No. 7 and electronic control unit connector (CY17A) terminal No. 12.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify harness.

Step 7	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of voltage between connector (CY17A) terminal No. 12 (+) and connector (CY24A) terminal No. 8 (–). **<Multi-Use Tester used>** Measure item No. 62 “Oil Press SW 2” of Service Data.
	Inspection condition		Engine in operation **<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** • In 1st, 3rd, 5th gears: 0 V • In 2nd, 4th, 6th gears: 12 V **<Multi-Use Tester used>** • In 1st, 3rd, 5th gears: ON • In 2nd, 4th, 6th gears: OFF
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	• Check if a diagnosis code related to the linear solenoid 2 occurs. If it does, perform troubleshooting of the code. • Replacement of electronic control unit

[Fault code]
Diagnosis code: P0848/Flash code: 42
[Monitor ID]
41
[Fault (outline)]
Failure of oil pressure switch 2
[Diagnosis check]
- Oil pressure switch 2 is monitored for fault when the linear solenoid 2 is deenergized (low pressure).

[Code generation condition]
- Oil pressure switch 2 remains ON (high pressure) for 0.1 second.

[Diagnosis check timing]
- Fault diagnosis is performed each time when the control is activated.

[Diagnostic requirement]
- Linear solenoid 2 is low pressure

[Control effected by electronic control unit during fault]
- Lockup control is turned OFF
- Control is effected on fixed speed gear output (3rd).

[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and oil pressure switch 2 or linear solenoid 2
- Malfunction of each connector
- Malfunction of oil pressure switch 2 or linear solenoid 2
- Malfunction of electronic control unit

[Recoverability]
- Recovered if signal becomes normal when starter switch is turned OFF to ON (power supply resumed to electronic control unit).

P103560-2

[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of voltage between connector (CY17A) terminal No. 12 (+) and connector (CY24A) terminal No. 8 (–). **<Multi-Use Tester used>** Measure item No. 62 “Oil Press SW 2” of Service Data.
	Inspection condition		Engine in operation **<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** • In 1st, 3rd, 5th gears: 0 V • In 2nd, 4th, 6th gears: 12 V **<Multi-Use Tester used>** • In 1st, 3rd, 5th gears: ON • In 2nd, 4th, 6th gears: OFF
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

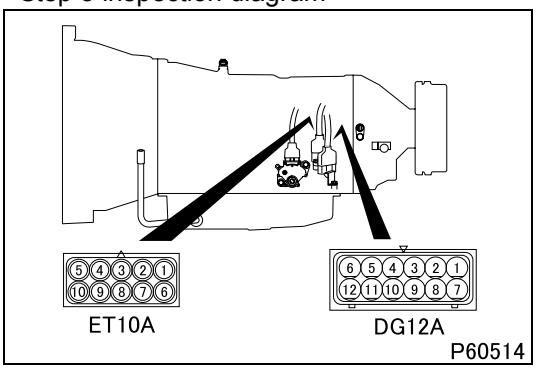
Step 2	Inspection items		Inspection by electronic control unit connector (signal)
	Maintenance item		Measure continuity between connector (CY17A) terminal No. 12 and chassis ground.
	Inspection condition		• Disconnect electronic control unit and harness, and measure from connection side of harness connector. • Starter switch: OFF
	Requirements		There is no continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Go to step 4.

Step 3	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify connector.

Step 4	Inspection items		Inspection of switch connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Modify connector.

Step 5	Inspection items		Inspection of switch unit
	Maintenance item		Check continuity between connector (DG12A) terminal No. 7 and automatic transmission case.
	Inspection condition		• Disconnect connector, and measure switch side terminal. • Starter switch: OFF
	Requirements		There is no continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Replacement of automatic transmission

<Step 5 inspection diagram>



Step 6	Inspection items		Inspection of harness between switch and electronic control unit (signal)
	Maintenance item		Check circuit between connector (DG12A) terminal No. 7 and electronic control unit connector (CY17A) terminal No. 12.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify harness.

Step 7	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of voltage between connector (CY17A) terminal No. 12 (+) and connector (CY24A) terminal No. 8 (–). **<Multi-Use Tester used>** Measure item No. 62 “Oil Press SW 2” of Service Data.
	Inspection condition		Engine in operation **<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** • In 1st, 3rd, 5th gears: 0 V • In 2nd, 4th, 6th gears: 12 V **<Multi-Use Tester used>** • In 1st, 3rd, 5th gears: ON • In 2nd, 4th, 6th gears: OFF
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	• Check if a diagnosis code related to the linear solenoid 2 occurs. If it does, perform troubleshooting of the code. • Replacement of electronic control unit

[Fault code]
Diagnosis code: P0863/Flash code: 88
[Monitor ID]
67
[Fault (outline)]
Abnormality in controller area network communication
[Diagnosis check]
- Controller area network communication is monitored for abnormality according to the controller area network signal to be received 5 seconds after the starter switch is turned ON.

[Code generation condition]
- No controller area network signals are received for 1 second.

[Diagnosis check timing]
- Fault diagnosis is continuously performed.

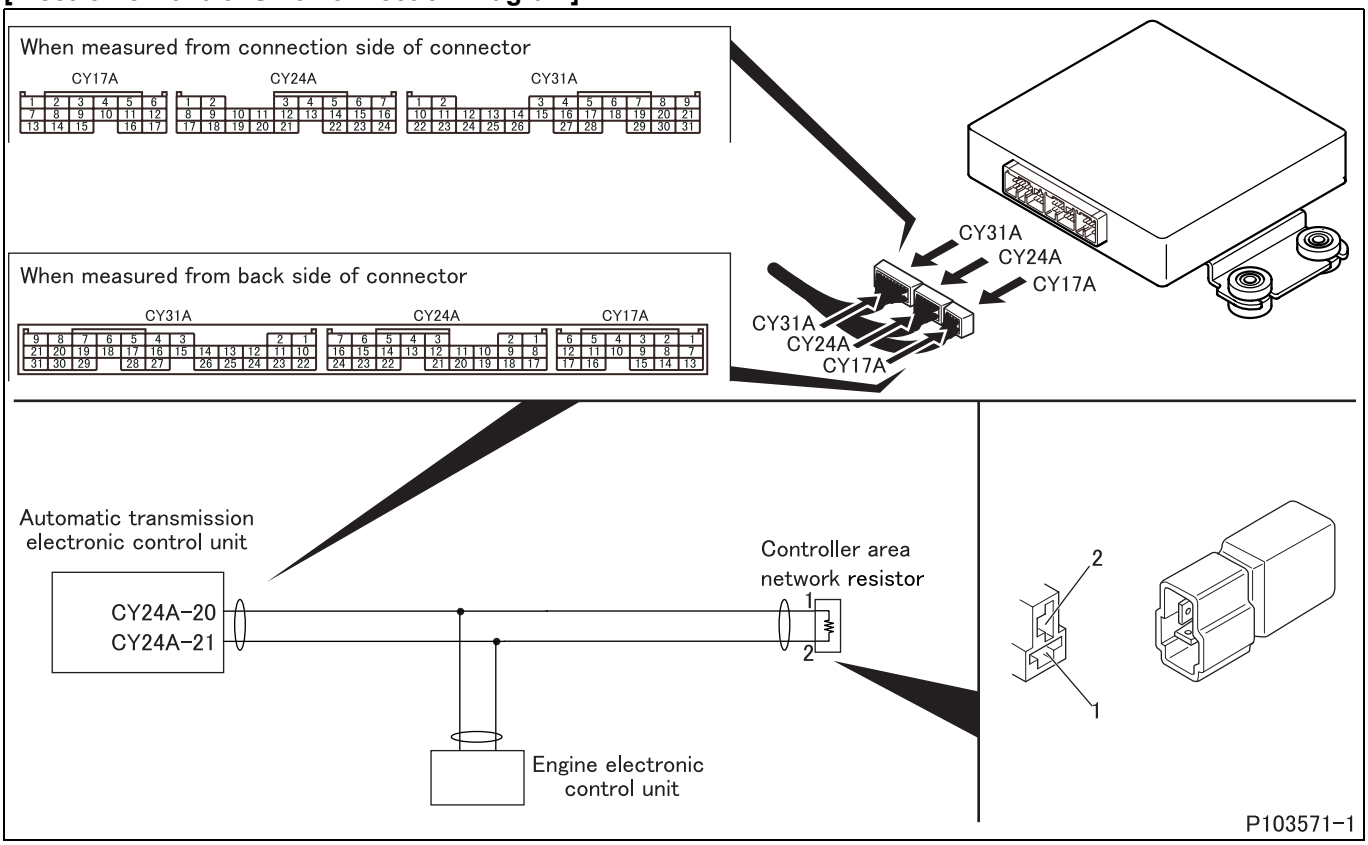
[Diagnostic requirement]
- Continuous

[Control effected by electronic control unit during fault]
- Change point control and lock-up control are effected with accelerator pedal position at 0% (shift-up and lock-up vehicle speeds are switched to low side).
- Line pressure control is effected with accelerator pedal position at 100% (speed change shock occurs).
- Garage control is effected at 0% during idling and 50% otherwise (speed change shock occurs).

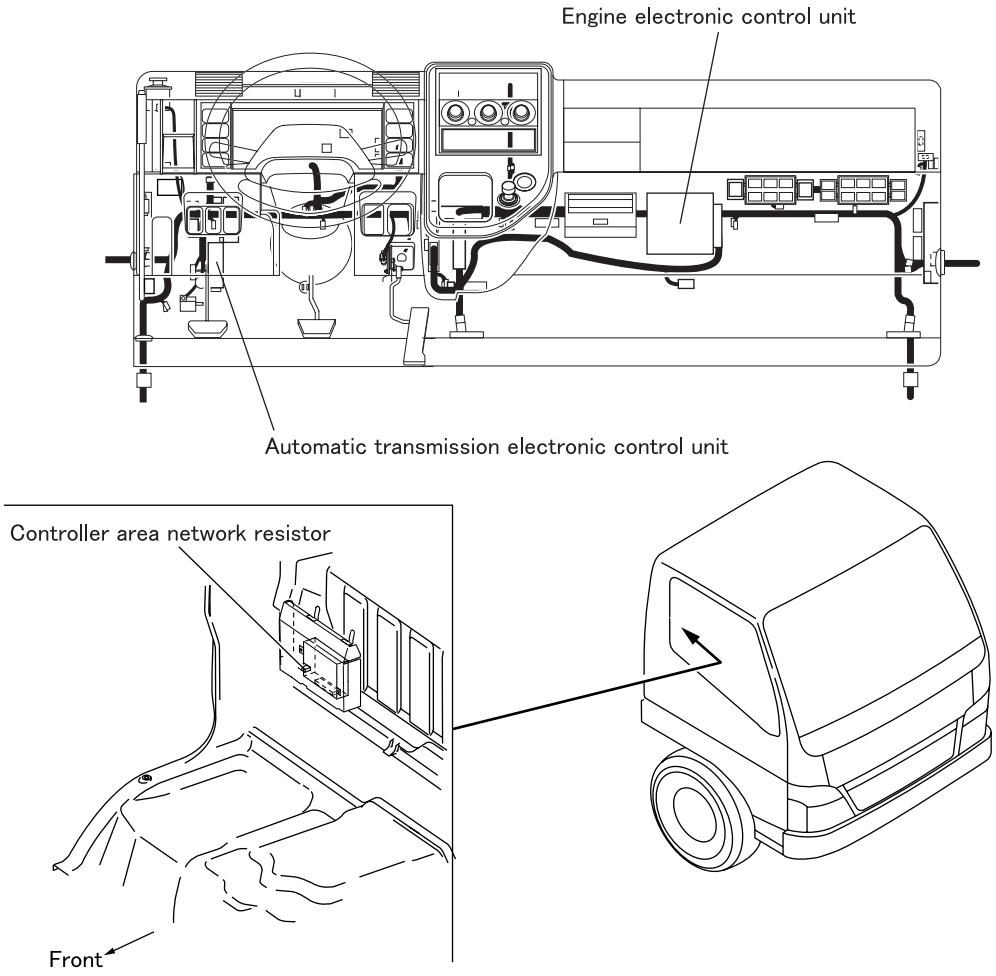
[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and controller area network resistor
- Malfunction of each connector
- Malfunction of controller area network resistor
- Malfunction of electronic control unit

[Recoverability]
- Recovered if signal becomes normal with starter switch in ON position.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



P103571-2

[Fault diagnosis]

- Perform checks in the sequence of the following steps.

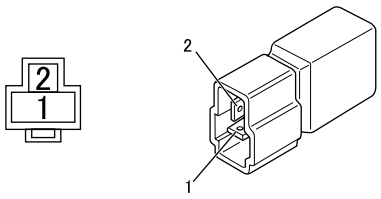
Step 1	Inspection items		Inspection by electronic control unit connector
	Maintenance item		Measure value of resistance between connector (CY24A) terminal No. 20 and 21.
	Inspection condition		• Disconnect the engine electronic control unit and automatic transmission electronic control unit connectors, and measure from connection side of harness connector. • Starter switch: OFF
	Requirements		120 ± 6 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

Step 2	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Modify connector.

Step 3	Inspection items		Inspection of controller area network resistor connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	Modify connector.

Step 4	Inspection items		Inspection of controller area network resistor unit
	Maintenance item		Measure value of resistance between connector terminals No. 1 and 2.
	Inspection condition		–
	Requirements		120 ± 6 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Replacement of controller area network resistor

<Step 4 inspection diagram>



P63068

Step 5	Inspection items		Inspection of harness between electronic control unit and controller area network resistor (HIGH)
	Maintenance item		Check circuit between controller area network resistor connector terminal No. 1 and electronic control unit connector (CY24A) terminal No. 20.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Modify harness.

Step 6	Inspection items		Inspection of harness between electronic control unit and controller area network resistor (LOW)
	Maintenance item		Check circuit between controller area network resistor connector terminal No. 2 and electronic control unit connector (CY24A) terminal No. 21.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify harness.

Step 7	Inspection items		Inspection by Multi-Use Tester diagnosis code
	Maintenance item		Check for occurrence of the diagnosis code No. P0863 “CAN Communication”.
	Inspection condition		Starter switch: ON
	Requirements		No codes occur.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Perform troubleshooting for the controller area network communication system in the engine electronic control. If the fault is not still removed, replace the automatic transmission electronic control unit.

[Fault code]
Diagnosis code: P0872/Flash code: 45
[Monitor ID]
54
[Fault (outline)]
Failure of oil pressure switch 3
[Diagnosis check]
- Oil pressure switch 3 is monitored for fault when the shift solenoid 1 is energized (high pressure).

[Code generation condition]
- Oil pressure switch 3 remains OFF (low pressure) for 0.1 second.

[Diagnosis check timing]
- Fault diagnosis is performed each time when the control is activated.

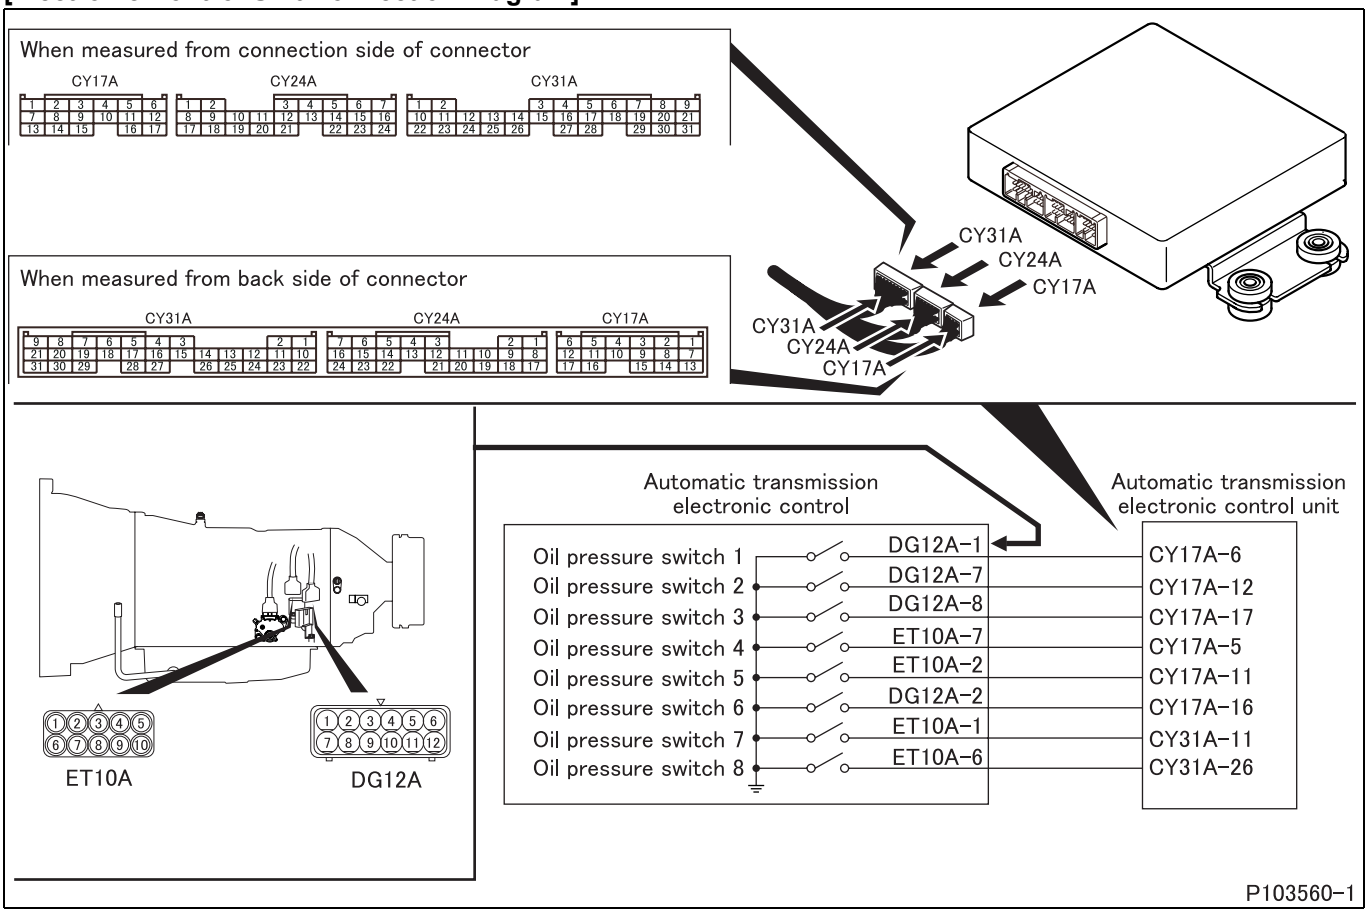
[Diagnostic requirement]
- Shift solenoid 1 is ON

[Control effected by electronic control unit during fault]
- Lockup control is turned OFF
- Control is effected on fixed speed gear output (3rd).

[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and oil pressure switch 3 or shift solenoid 1
- Malfunction of each connector
- Malfunction of oil pressure switch 3 or shift solenoid 1
- Malfunction of electronic control unit

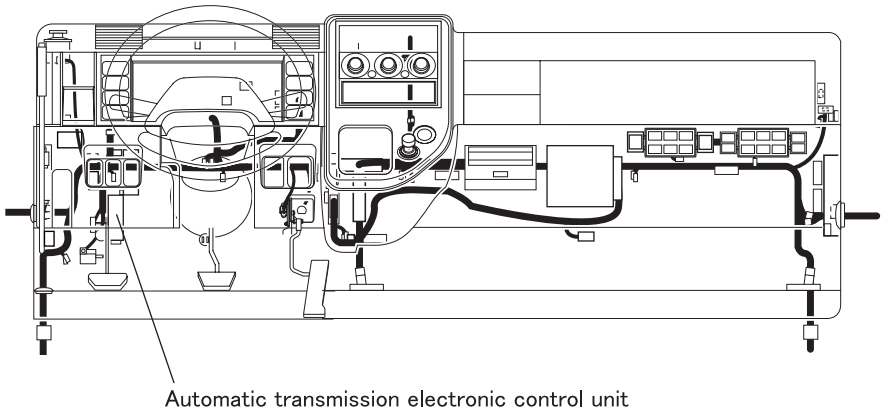
[Recoverability]
- Recovered if signal becomes normal when starter switch is turned OFF to ON (power supply resumed to electronic control unit).

[Electronic Control Unit Connection Diagram]



P103560-1

[Parts Identification and Location]



P103560-2

[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of voltage between connector (CY17A) terminal No. 17 (+) and connector (CY24A) terminal No. 8 (–). **<Multi-Use Tester used>** Measure item No. 63 “Oil Press SW 3” of Service Data.
	Inspection condition		Engine in operation **<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** • In 3rd, 4th gears: 0 V • In 1st, 2nd, 5th, 6th gears: 12 V **<Multi-Use Tester used>** • In 3rd, 4th gears: ON • In 1st, 2nd, 5th, 6th gears: OFF
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

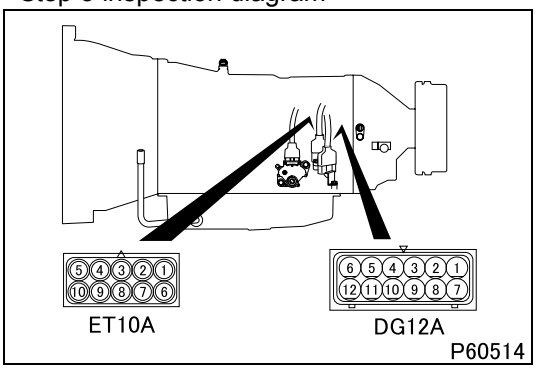
Step 2	Inspection items		Inspection by electronic control unit connector (signal)
	Maintenance item		Measure continuity between connector (CY17A) terminal No. 17 and chassis ground.
	Inspection condition		• Disconnect electronic control unit and harness, and measure from connection side of harness connector. • Starter switch: OFF
	Requirements		There is no continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Go to step 4.

Step 3	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify connector.

Step 4	Inspection items		Inspection of switch connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Modify connector.

Step 5	Inspection items		Inspection of switch unit
	Maintenance item		Check continuity between connector (DG12A) terminal No. 8 and automatic transmission case.
	Inspection condition		• Disconnect connector, and measure switch side terminal. • Starter switch: OFF
	Requirements		There is no continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Replacement of automatic transmission

<Step 5 inspection diagram>



Step 6	Inspection items		Inspection of harness between switch and electronic control unit (signal)
	Maintenance item		Check circuit between connector (DG12A) terminal No. 8 and electronic control unit connector (CY17A) terminal No. 17.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify harness.

Step 7	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of voltage between connector (CY17A) terminal No. 17 (+) and connector (CY24A) terminal No. 8 (–). **<Multi-Use Tester used>** Measure item No. 63 “Oil Press SW 3” of Service Data.
	Inspection condition		Engine in operation **<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** • In 3rd, 4th gears: 0 V • In 1st, 2nd, 5th, 6th gears: 12 V **<Multi-Use Tester used>** • In 3rd, 4th gears: ON • In 1st, 2nd, 5th, 6th gears: OFF
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	• Check if a diagnosis code related to the shift solenoid 1 occurs. If it does, perform troubleshooting of the code. • Replacement of electronic control unit

[Fault code]
Diagnosis code: P0873/Flash code: 45
[Monitor ID]
53
[Fault (outline)]
Failure of oil pressure switch 3
[Diagnosis check]
- Oil pressure switch 3 is monitored for fault when the shift solenoid 1 is deenergized (low pressure).

[Code generation condition]
- Oil pressure switch 3 remains ON (high pressure) for 0.1 second.

[Diagnosis check timing]
- Fault diagnosis is performed each time when the control is activated.

[Diagnostic requirement]
- Shift solenoid 1 is OFF

[Control effected by electronic control unit during fault]
- Lockup control is turned OFF
- Control is effected on fixed speed gear output (3rd).

[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and oil pressure switch 3 or shift solenoid 1
- Malfunction of each connector
- Malfunction of oil pressure switch 3 or shift solenoid 1
- Malfunction of electronic control unit

[Recoverability]
- Recovered if signal becomes normal when starter switch is turned OFF to ON (power supply resumed to electronic control unit).

[Electronic Control Unit Connection Diagram]

P103560-2

[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of voltage between connector (CY17A) terminal No. 17 (+) and connector (CY24A) terminal No. 8 (–). **<Multi-Use Tester used>** Measure item No. 63 “Oil Press SW 3” of Service Data.
	Inspection condition		Engine in operation **<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** • In 3rd, 4th gears: 0 V • In 1st, 2nd, 5th, 6th gears: 12 V **<Multi-Use Tester used>** • In 3rd, 4th gears: ON • In 1st, 2nd, 5th, 6th gears: OFF
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

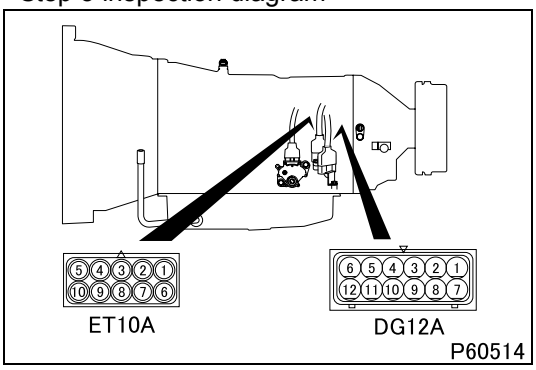
Step 2	Inspection items		Inspection by electronic control unit connector (signal)
	Maintenance item		Measure continuity between connector (CY17A) terminal No. 17 and chassis ground.
	Inspection condition		• Disconnect electronic control unit and harness, and measure from connection side of harness connector. • Starter switch: OFF
	Requirements		There is no continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Go to step 4.

Step 3	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify connector.

Step 4	Inspection items		Inspection of switch connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Modify connector.

Step 5	Inspection items		Inspection of switch unit
	Maintenance item		Check continuity between connector (DG12A) terminal No. 8 and automatic transmission case.
	Inspection condition		• Disconnect connector, and measure switch side terminal. • Starter switch: OFF
	Requirements		There is no continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Replacement of automatic transmission

<Step 5 inspection diagram>



Step 6	Inspection items		Inspection of harness between switch and electronic control unit (signal)
	Maintenance item		Check circuit between connector (DG12A) terminal No. 8 and electronic control unit connector (CY17A) terminal No. 17.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify harness.

Step 7	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of voltage between connector (CY17A) terminal No. 17 (+) and connector (CY24A) terminal No. 8 (–). **<Multi-Use Tester used>** Measure item No. 63 “Oil Press SW 3” of Service Data.
	Inspection condition		Engine in operation **<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** • In 3rd, 4th gears: 0 V • In 1st, 2nd, 5th, 6th gears: 12 V **<Multi-Use Tester used>** • In 3rd, 4th gears: ON • In 1st, 2nd, 5th, 6th gears: OFF
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	• Check if a diagnosis code related to the shift solenoid 1 occurs. If it does, perform troubleshooting of the code. • Replacement of electronic control unit

[Fault code]
Diagnosis code: P0877/Flash code: 46
[Monitor ID]
58
[Fault (outline)]
Failure of oil pressure switch 4
[Diagnosis check]
- Oil pressure switch 4 is monitored for fault when the shift solenoid 2 is energized (high pressure).

[Code generation condition]
- Oil pressure switch 4 remains OFF (low pressure) for 0.1 second.

[Diagnosis check timing]
- Fault diagnosis is performed each time when the control is activated.

[Diagnostic requirement]
- Shift solenoid 2 is ON

[Control effected by electronic control unit during fault]
- Lockup control is turned OFF
- Control is effected on fixed speed gear output (3rd).

[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and oil pressure switch 4 or shift solenoid 2
- Malfunction of each connector
- Malfunction of oil pressure switch 4 or shift solenoid 2
- Malfunction of electronic control unit

[Recoverability]
- Recovered if signal becomes normal when starter switch is turned OFF to ON (power supply resumed to electronic control unit).

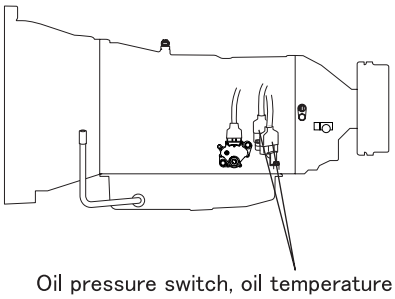
Automatic transmission electronic control unit



Oil pressure switch, oil temperature sensor (outside), shift solenoid and linear solenoid [ET10A, DG12A]

P103560-2

[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of voltage between connector (CY17A) terminal No. 5 (+) and connector (CY24A) terminal No. 8 (–). **<Multi-Use Tester used>** Measure item No. 64 “Oil Press SW 4” of Service Data.
	Inspection condition		Engine in operation **<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** • In 4th, 5th, 6th gears: 0 V • In 1st, 2nd, 3rd gears: 12 V **<Multi-Use Tester used>** • In 4th, 5th, 6th gears: ON • In 1st, 2nd, 3rd gears: OFF
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

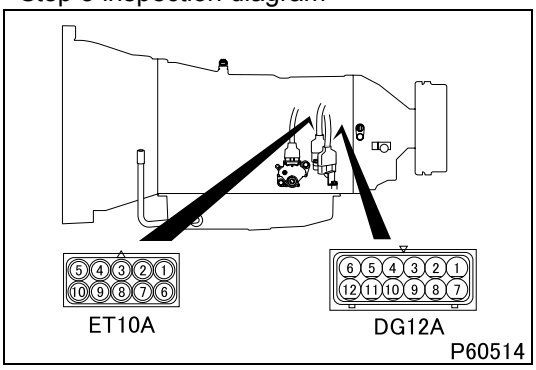
Step 2	Inspection items		Inspection by electronic control unit connector (signal)
	Maintenance item		Measure continuity between connector (CY17A) terminal No. 5 and chassis ground.
	Inspection condition		• Disconnect electronic control unit and harness, and measure from connection side of harness connector. • Starter switch: OFF
	Requirements		There is no continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Go to step 4.

Step 3	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify connector.

Step 4	Inspection items		Inspection of switch connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Modify connector.

Step 5	Inspection items		Inspection of switch unit
	Maintenance item		Check continuity between connector (ET10A) terminal No. 7 and automatic transmission case.
	Inspection condition		• Disconnect connector, and measure switch side terminal. • Starter switch: OFF
	Requirements		There is no continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Replacement of automatic transmission

<Step 5 inspection diagram>



Step 6	Inspection items		Inspection of harness between switch and electronic control unit (signal)
	Maintenance item		Check circuit between connector (ET10A) terminal No. 7 and electronic control unit connector (CY17A) terminal No. 5.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify harness.

Step 7	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of voltage between connector (CY17A) terminal No. 5 (+) and connector (CY24A) terminal No. 8 (–). **<Multi-Use Tester used>** Measure item No. 64 “Oil Press SW 4” of Service Data.
	Inspection condition		Engine in operation **<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** • In 4th, 5th, 6th gears: 0 V • In 1st, 2nd, 3rd gears: 12 V **<Multi-Use Tester used>** • In 4th, 5th, 6th gears: ON • In 1st, 2nd, 3rd gears: OFF
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	• Check if a diagnosis code related to the shift solenoid 2 occurs. If it does, perform troubleshooting of the code. • Replacement of electronic control unit

[Fault code]
Diagnosis code: P0878/Flash code: 46

[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of voltage between connector (CY17A) terminal No. 5 (+) and connector (CY24A) terminal No. 8 (–). **<Multi-Use Tester used>** Measure item No. 64 “Oil Press SW 4” of Service Data.
	Inspection condition		Engine in operation **<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** • In 4th, 5th, 6th gears: 0 V • In 1st, 2nd, 3rd gears: 12 V **<Multi-Use Tester used>** • In 4th, 5th, 6th gears: ON • In 1st, 2nd, 3rd gears: OFF
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

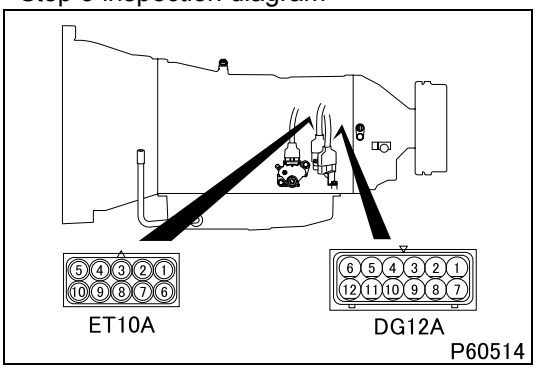
Step 2	Inspection items		Inspection by electronic control unit connector (signal)
	Maintenance item		Measure continuity between connector (CY17A) terminal No. 5 and chassis ground.
	Inspection condition		• Disconnect electronic control unit and harness, and measure from connection side of harness connector. • Starter switch: OFF
	Requirements		There is no continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Go to step 4.

Step 3	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify connector.

Step 4	Inspection items		Inspection of switch connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Modify connector.

Step 5	Inspection items		Inspection of switch unit
	Maintenance item		Check continuity between connector (ET10A) terminal No. 7 and automatic transmission case.
	Inspection condition		• Disconnect connector, and measure switch side terminal. • Starter switch: OFF
	Requirements		There is no continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Replacement of automatic transmission

<Step 5 inspection diagram>



Step 6	Inspection items		Inspection of harness between switch and electronic control unit (signal)
	Maintenance item		Check circuit between connector (ET10A) terminal No. 7 and electronic control unit connector (CY17A) terminal No. 5.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify harness.

Step 7	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of voltage between connector (CY17A) terminal No. 5 (+) and connector (CY24A) terminal No. 8 (–). **<Multi-Use Tester used>** Measure item No. 64 “Oil Press SW 4” of Service Data.
	Inspection condition		Engine in operation **<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** • In 4th, 5th, 6th gears: 0 V • In 1st, 2nd, 3rd gears: 12 V **<Multi-Use Tester used>** • In 4th, 5th, 6th gears: ON • In 1st, 2nd, 3rd gears: OFF
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	• Check if a diagnosis code related to the shift solenoid 2 occurs. If it does, perform troubleshooting of the code. • Replacement of electronic control unit

[Fault code]
Diagnosis code: P0973/Flash code: 31
[Monitor ID]
29
[Fault (outline)]
Failure of shift solenoid 1
[Diagnosis check]
- Current in the shift solenoid 1 is monitored for fault.

[Code generation condition]
- Current in the shift solenoid 1 remains at or above the specified value (4A) for 0.1 second (short-circuit in ground side).

[Diagnosis check timing]
- Fault diagnosis is continuously performed.

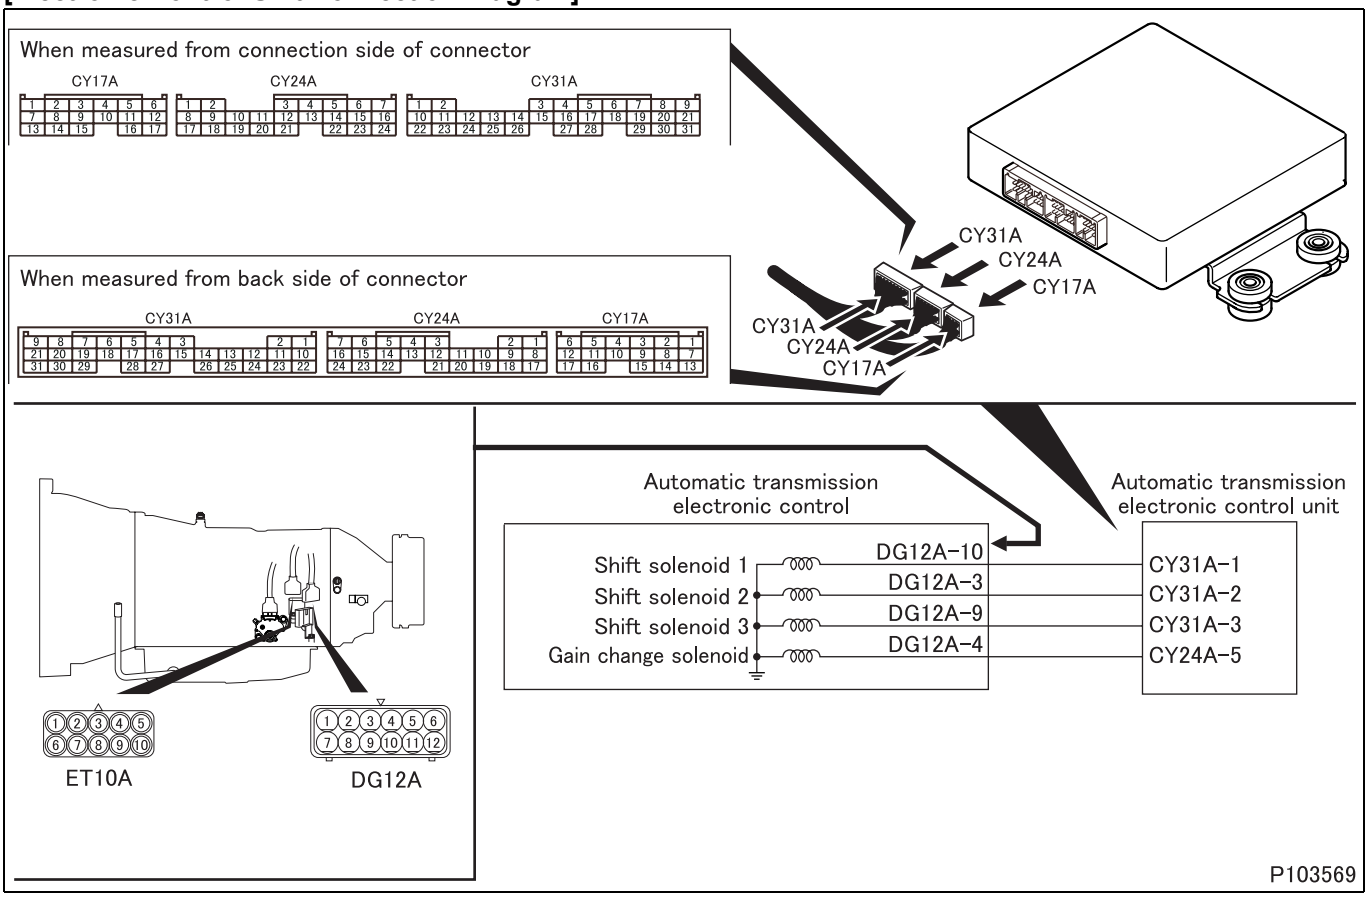
[Diagnostic requirement]
- Continuous

[Control effected by electronic control unit during fault]
- Lockup control is turned OFF
- Control is effected on fixed speed gear output (3rd).

[Probable cause of trouble]
- Short-circuit of harness between electronic control unit and shift solenoid 1
- Malfunction of each connector
- Malfunction of shift solenoid 1
- Malfunction of electronic control unit

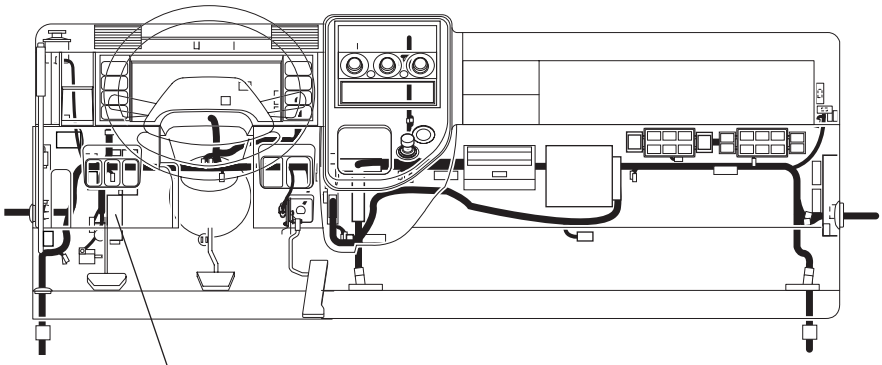
[Recoverability]
- Recovered if signal becomes normal when starter switch is turned OFF to ON (power supply resumed to electronic control unit).

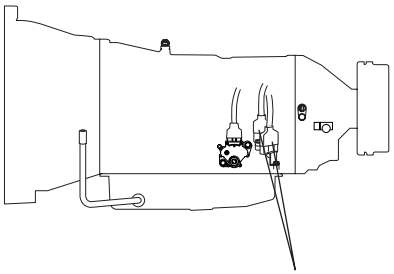
[Electronic Control Unit Connection Diagram]



P103569

[Parts Identification and Location]





P103560-2

[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of voltage between connector (CY31A) terminal No. 1 (+) and connector (CY24A) terminal No. 8 (–). **<Multi-Use Tester used>** Measure items No. 31 “Shift Valve 1” and No. 71 “Shift Valve Press 1” of Service Data.
	Inspection condition		Vehicle run **<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** • In 3rd, 4th gears: 12 V • In any gears except above: 0 V **<Multi-Use Tester used>** <No. 31 “Shift Valve 1”> • In 3rd, 4th gears: ON • In any gears except above: OFF <No. 71 “Shift Valve Press 1”> • In 3rd, 4th gears: HIGH • In any gears except above: LOW
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

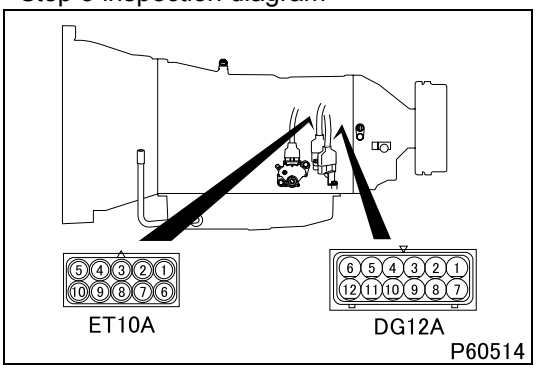
Step 2	Inspection items		Inspection by electronic control unit connector (signal)
	Maintenance item		Measure value of resistance between connector (CY31A) terminal No. 1 and chassis ground.
	Inspection condition		• Disconnect electronic control unit and harness, and measure from connection side of harness connector. • Starter switch: OFF
	Requirements		13 ± 2 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Go to step 4.

Step 3	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify connector.

Step 4	Inspection items		Inspection of solenoid connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Modify connector.

Step 5	Inspection items		Inspection of solenoid unit
	Maintenance item		Measure value of resistance between connector (DG12A) terminal No. 10 and automatic transmission case.
	Inspection condition		• Disconnect connector, and measure solenoid side terminal. • Starter switch: OFF
	Requirements		13 ± 2 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Replacement of automatic transmission

<Step 5 inspection diagram>



Step 6	Inspection items		Inspection of harness between solenoid and electronic control unit (power supply)
	Maintenance item		Check circuit between connector (DG12A) terminal No. 10 and electronic control unit connector (CY31A) terminal No. 1.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify harness.

Step 7	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of voltage between connector (CY31A) terminal No. 1 (+) and connector (CY24A) terminal No. 8 (–). **<Multi-Use Tester used>** Measure items No. 31 “Shift Valve 1” and No. 71 “Shift Valve Press 1” of Service Data.
	Inspection condition		Vehicle run **<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** • In 3rd, 4th gears: 12 V • In any gears except above: 0 V **<Multi-Use Tester used>** <No. 31 “Shift Valve 1”> • In 3rd, 4th gears: ON • In any gears except above: OFF <No. 71 “Shift Valve Press 1”> • In 3rd, 4th gears: HIGH • In any gears except above: LOW
	Inspection result (Is the judging standard satisfied?)	YES	If the diagnosis code remains after actual run, replace the electronic control unit.
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P0974/Flash code: 31
[Monitor ID]
30
[Fault (outline)]
Failure of shift solenoid 1
[Diagnosis check]
- Resistance in the shift solenoid 1 is monitored for fault.

[Code generation condition]
- Resistance in the shift solenoid 1 remains at or above the specified value (100 kΩ) for 0.1 second (open-circuit or short-circuit in power supply side).

[Diagnosis check timing]
- Fault diagnosis is continuously performed.

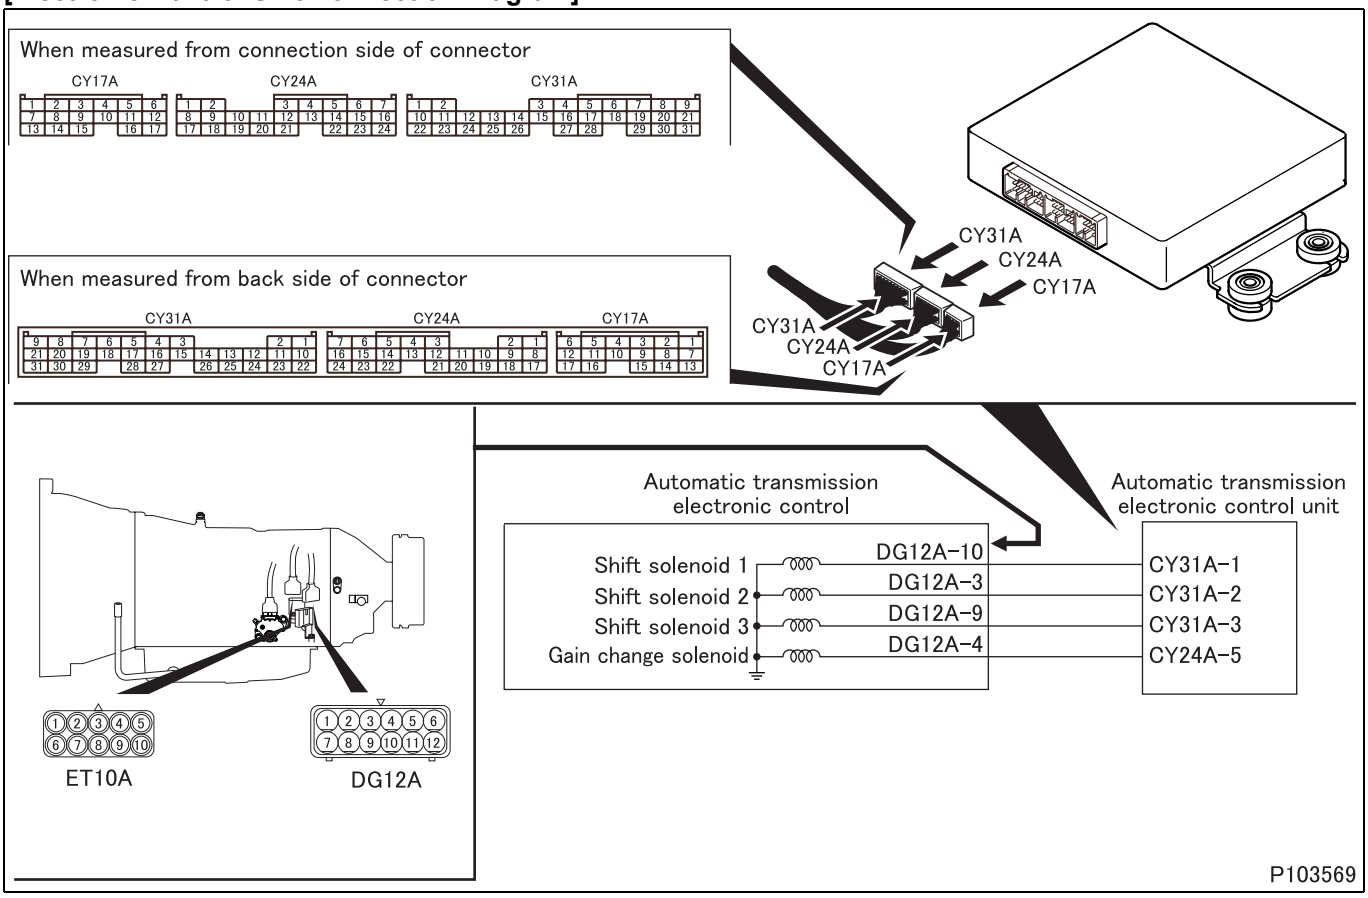
[Diagnostic requirement]
- Continuous

[Control effected by electronic control unit during fault]
- Lockup control is turned OFF
- Control is effected on fixed speed gear output (3rd).

[Probable cause of trouble]
- Short-circuit of harness between electronic control unit and shift solenoid 1
- Malfunction of each connector
- Malfunction of shift solenoid 1
- Malfunction of electronic control unit

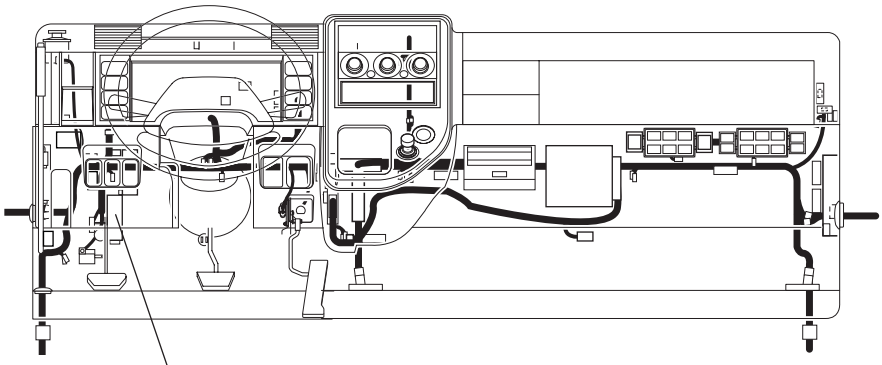
[Recoverability]
- Recovered if signal becomes normal when starter switch is turned OFF to ON (power supply resumed to electronic control unit).

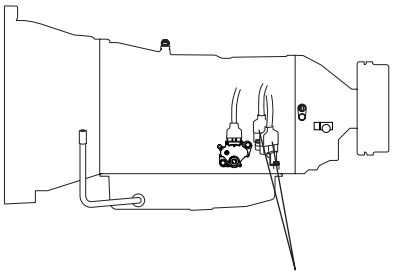
[Electronic Control Unit Connection Diagram]



P103569

[Parts Identification and Location]





P103560-2

[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of voltage between connector (CY31A) terminal No. 1 (+) and connector (CY24A) terminal No. 8 (–). **<Multi-Use Tester used>** Measure items No. 31 “Shift Valve 1” and No. 71 “Shift Valve Press 1” of Service Data.
	Inspection condition		Vehicle run **<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** • In 3rd, 4th gears: 12 V • In any gears except above: 0 V **<Multi-Use Tester used>** <No. 31 “Shift Valve 1”> • In 3rd, 4th gears: ON • In any gears except above: OFF <No. 71 “Shift Valve Press 1”> • In 3rd, 4th gears: HIGH • In any gears except above: LOW
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

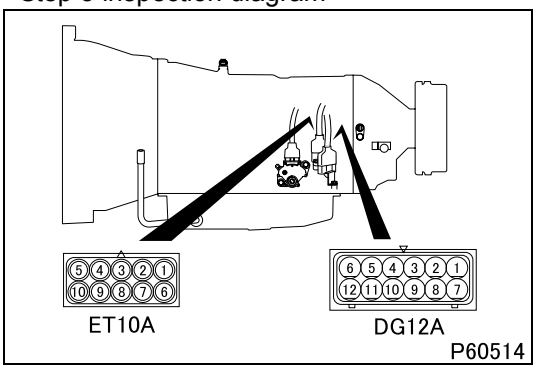
Step 2	Inspection items		Inspection by electronic control unit connector (signal)
	Maintenance item		Measure value of resistance between connector (CY31A) terminal No. 1 and chassis ground.
	Inspection condition		• Disconnect electronic control unit and harness, and measure from connection side of harness connector. • Starter switch: OFF
	Requirements		13 ± 2 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Go to step 4.

Step 3	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify connector.

Step 4	Inspection items		Inspection of solenoid connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Modify connector.

Step 5	Inspection items		Inspection of solenoid unit
	Maintenance item		Measure value of resistance between connector (DG12A) terminal No. 10 and automatic transmission case.
	Inspection condition		• Disconnect connector, and measure solenoid side terminal. • Starter switch: OFF
	Requirements		13 ± 2 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Replacement of automatic transmission

<Step 5 inspection diagram>



Step 6	Inspection items		Inspection of harness between solenoid and electronic control unit (power supply)
	Maintenance item		Check circuit between connector (DG12A) terminal No. 10 and electronic control unit connector (CY31A) terminal No. 1.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify harness.

Step 7	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of voltage between connector (CY31A) terminal No. 1 (+) and connector (CY24A) terminal No. 8 (–). **<Multi-Use Tester used>** Measure items No. 31 “Shift Valve 1” and No. 71 “Shift Valve Press 1” of Service Data.
	Inspection condition		Vehicle run **<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** • In 3rd, 4th gears: 12 V • In any gears except above: 0 V **<Multi-Use Tester used>** <No. 31 “Shift Valve 1”> • In 3rd, 4th gears: ON • In any gears except above: OFF <No. 71 “Shift Valve Press 1”> • In 3rd, 4th gears: HIGH • In any gears except above: LOW
	Inspection result (Is the judging standard satisfied?)	YES	If the diagnosis code remains after actual run, replace the electronic control unit.
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P0976/Flash code: 32
[Monitor ID]
31
[Fault (outline)]
Failure of shift solenoid 2
[Diagnosis check]
- Current in the shift solenoid 2 is monitored for fault.

[Code generation condition]
- Current in the shift solenoid 2 remains at or above the specified value (4A) for 0.1 second (short-circuit in ground side).

[Diagnosis check timing]
- Fault diagnosis is continuously performed.

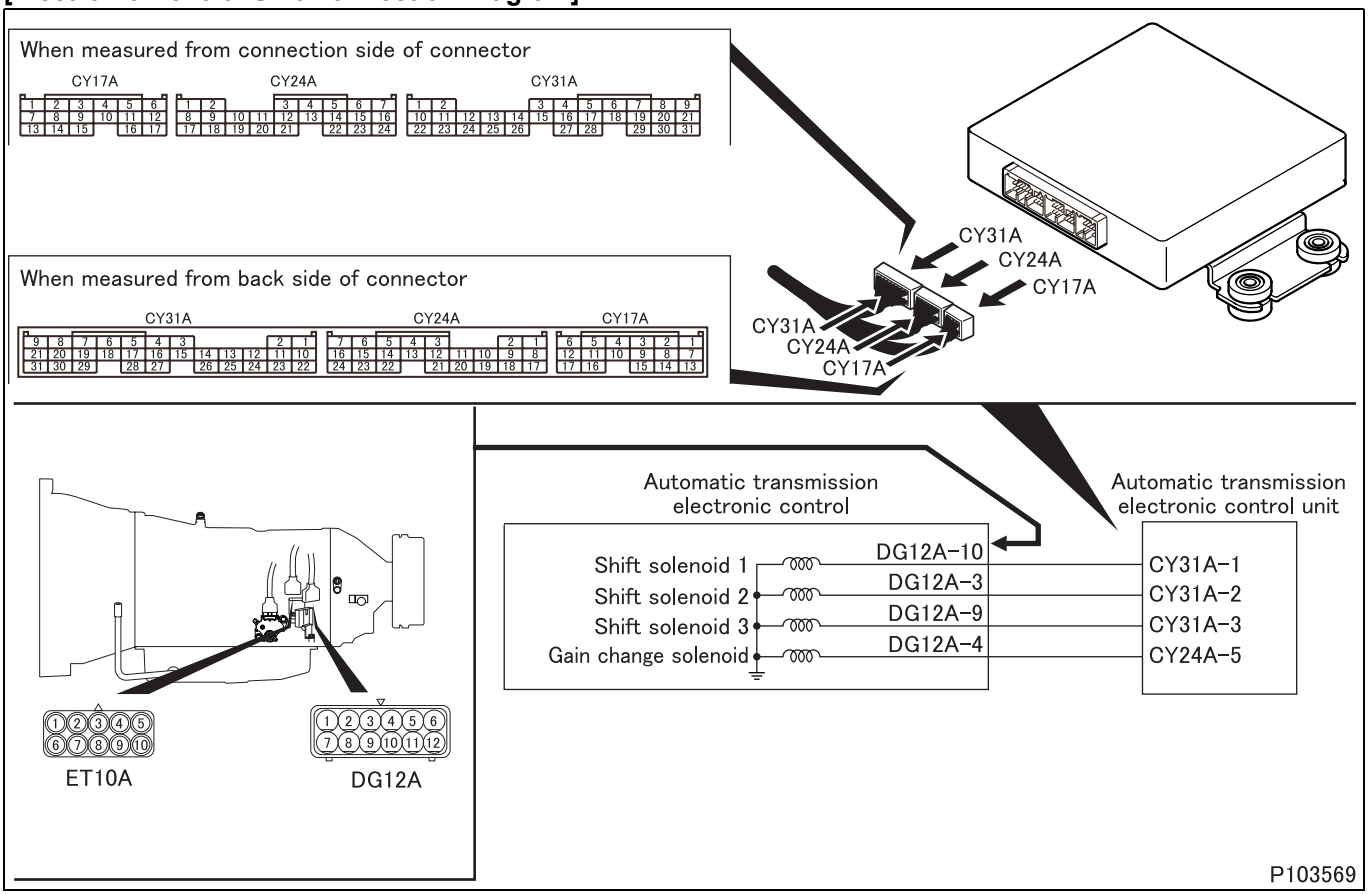
[Diagnostic requirement]
- Continuous

[Control effected by electronic control unit during fault]
- Lockup control is turned OFF
- Control is effected on fixed speed gear output (5th).

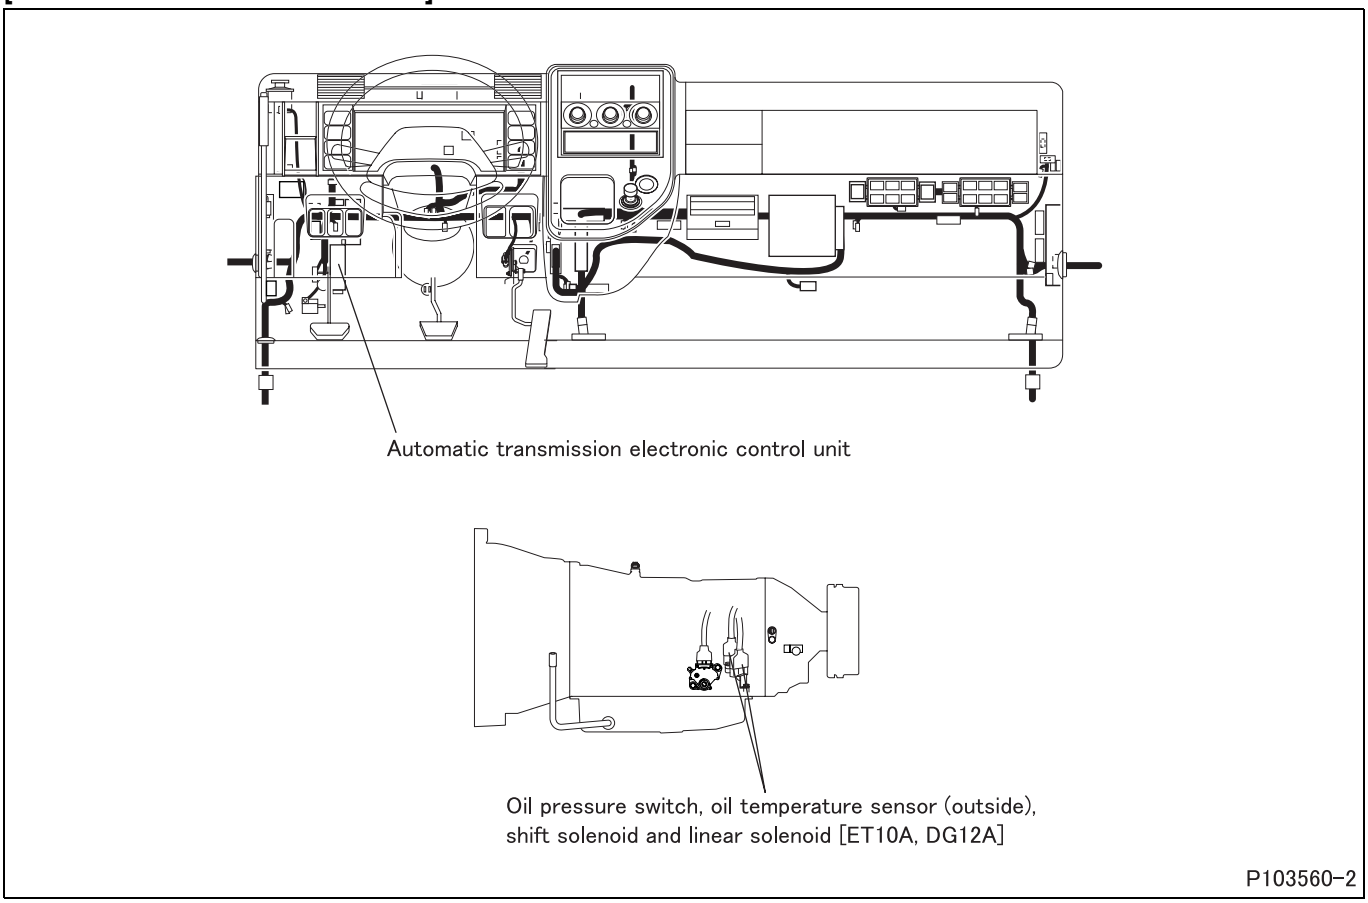
[Probable cause of trouble]
- Short-circuit of harness between electronic control unit and shift solenoid 2
- Malfunction of each connector
- Malfunction of shift solenoid 2
- Malfunction of electronic control unit

[Recoverability]
- Recovered if signal becomes normal when starter switch is turned OFF to ON (power supply resumed to electronic control unit).

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of voltage between connector (CY31A) terminal No. 2 (+) and connector (CY24A) terminal No. 8 (–). **<Multi-Use Tester used>** Measure items No. 32 “Shift Valve 2” and No. 72 “Shift Valve Press 2” of Service Data.
	Inspection condition		**<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** • In 4th, 5th, 6th gears: 12 V • In any gears except above: 0 V **<Multi-Use Tester used>** <No. 32 “Shift Valve 2”> • In 4th, 5th, 6th gears: ON • In any gears except above: OFF <No. 72 “Shift Valve Press 2”> • In 4th, 5th, 6th gears: HIGH • In any gears except above: LOW
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

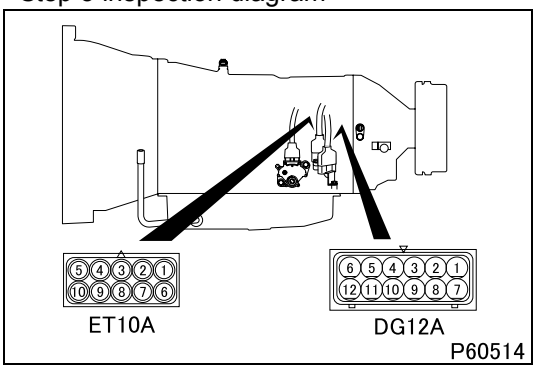
Step 2	Inspection items		Inspection by electronic control unit connector (signal)
	Maintenance item		Measure value of resistance between connector (CY31A) terminal No. 2 and chassis ground.
	Inspection condition		• Disconnect electronic control unit and harness, and measure from connection side of harness connector. • Starter switch: OFF
	Requirements		13 ± 2 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Go to step 4.

Step 3	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify connector.

Step 4	Inspection items		Inspection of solenoid connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Modify connector.

Step 5	Inspection items		Inspection of solenoid unit
	Maintenance item		Measure value of resistance between connector (DG12A) terminal No. 3 and automatic transmission case.
	Inspection condition		• Disconnect connector, and measure solenoid side terminal. • Starter switch: OFF
	Requirements		13 ± 2 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Replacement of automatic transmission

<Step 5 inspection diagram>



Step 6	Inspection items		Inspection of harness between solenoid and electronic control unit (power supply)
	Maintenance item		Check circuit between connector (DG12A) terminal No. 3 and electronic control unit connector (CY31A) terminal No. 2.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify harness.

Step 7	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of voltage between connector (CY31A) terminal No. 2 (+) and connector (CY24A) terminal No. 8 (–). **<Multi-Use Tester used>** Measure items No. 32 “Shift Valve 2” and No. 72 “Shift Valve Press 2” of Service Data.
	Inspection condition		**<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** • In 4th, 5th, 6th gears: 12 V • In any gears except above: 0 V **<Multi-Use Tester used>** <No. 32 “Shift Valve 2”> • In 4th, 5th, 6th gears: ON • In any gears except above: OFF <No. 72 “Shift Valve Press 2”> • In 4th, 5th, 6th gears: HIGH • In any gears except above: LOW
	Inspection result (Is the judging standard satisfied?)	YES	If the diagnosis code remains after actual run, replace the electronic control unit.
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P0977/Flash code: 32
[Monitor ID]
32
[Fault (outline)]
Failure of shift solenoid 2
[Diagnosis check]
- Resistance in the shift solenoid 2 is monitored for fault.

[Code generation condition]
- Resistance in the shift solenoid 2 remains at or above the specified value (100 kΩ) for 0.1 second (open-circuit or short-circuit in power supply side).

[Diagnosis check timing]
- Fault diagnosis is continuously performed.

[Diagnostic requirement]
- Continuous

[Control effected by electronic control unit during fault]
- Faulty solenoid is turned OFF
- Lockup control is turned OFF
- Control is effected on fixed speed gear output (5th).

[Probable cause of trouble]
- Short-circuit of harness between electronic control unit and shift solenoid 2
- Malfunction of each connector
- Malfunction of shift solenoid 2
- Malfunction of electronic control unit

[Recoverability]
- Recovered if signal becomes normal when starter switch is turned OFF to ON (power supply resumed to electronic control unit).

[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of voltage between connector (CY31A) terminal No. 2 (+) and connector (CY24A) terminal No. 8 (–). **<Multi-Use Tester used>** Measure items No. 32 “Shift Valve 2” and No. 72 “Shift Valve Press 2” of Service Data.
	Inspection condition		**<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** • In 4th, 5th, 6th gears: 12 V • In any gears except above: 0 V **<Multi-Use Tester used>** <No. 32 “Shift Valve 2”> • In 4th, 5th, 6th gears: ON • In any gears except above: OFF <No. 72 “Shift Valve Press 2”> • In 4th, 5th, 6th gears: HIGH • In any gears except above: LOW
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

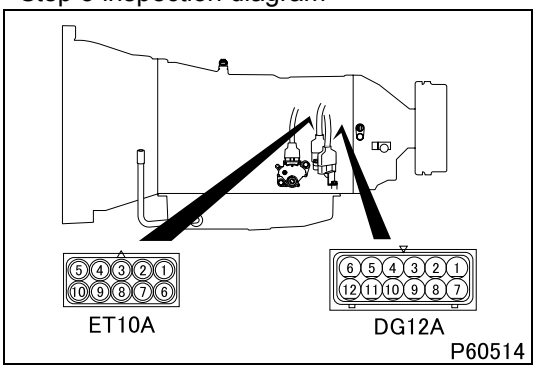
Step 2	Inspection items		Inspection by electronic control unit connector (signal)
	Maintenance item		Measure value of resistance between connector (CY31A) terminal No. 2 and chassis ground.
	Inspection condition		• Disconnect electronic control unit and harness, and measure from connection side of harness connector. • Starter switch: OFF
	Requirements		13 ± 2 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Go to step 4.

Step 3	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify connector.

Step 4	Inspection items		Inspection of solenoid connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Modify connector.

Step 5	Inspection items		Inspection of solenoid unit
	Maintenance item		Measure value of resistance between connector (DG12A) terminal No. 3 and automatic transmission case.
	Inspection condition		• Disconnect connector, and measure solenoid side terminal. • Starter switch: OFF
	Requirements		13 ± 2 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Replacement of automatic transmission

<Step 5 inspection diagram>



Step 6	Inspection items		Inspection of harness between solenoid and electronic control unit (power supply)
	Maintenance item		Check circuit between connector (DG12A) terminal No. 3 and electronic control unit connector (CY31A) terminal No. 2.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify harness.

Step 7	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of voltage between connector (CY31A) terminal No. 2 (+) and connector (CY24A) terminal No. 8 (–). **<Multi-Use Tester used>** Measure items No. 32 “Shift Valve 2” and No. 72 “Shift Valve Press 2” of Service Data.
	Inspection condition		**<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** • In 4th, 5th, 6th gears: 12 V • In any gears except above: 0 V **<Multi-Use Tester used>** <No. 32 “Shift Valve 2”> • In 4th, 5th, 6th gears: ON • In any gears except above: OFF <No. 72 “Shift Valve Press 2”> • In 4th, 5th, 6th gears: HIGH • In any gears except above: LOW
	Inspection result (Is the judging standard satisfied?)	YES	If the diagnosis code remains after actual run, replace the electronic control unit.
		NO	Replacement of electronic control unit

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of voltage between connector (CY31A) terminal No. 3 (+) and connector (CY24A) terminal No. 8 (–). **<Multi-Use Tester used>** Measure items No. 33 “Shift Valve 3” and No. 73 “Shift Valve Press 3” of Service Data.
	Inspection condition		**<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** • In 1st gear: 12 V • In any gears except above: 0 V **<Multi-Use Tester used>** <No. 33 “Shift Valve 3”> • In 1st gear: ON • In any gears except above: OFF <No. 73 “Shift Valve Press 3”> • In 1st gear: HIGH • In any gears except above: LOW
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

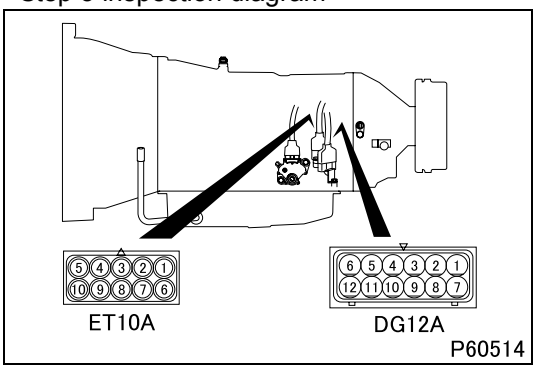
Step 2	Inspection items		Inspection by electronic control unit connector (signal)
	Maintenance item		Measure value of resistance between connector (CY31A) terminal No. 3 and chassis ground.
	Inspection condition		• Disconnect electronic control unit and harness, and measure from connection side of harness connector. • Starter switch: OFF
	Requirements		13 ± 2 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Go to step 4.

Step 3	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify connector.

Step 4	Inspection items		Inspection of solenoid connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Modify connector.

Step 5	Inspection items		Inspection of solenoid unit
	Maintenance item		Measure value of resistance between connector (DG12A) terminal No. 9 and automatic transmission case.
	Inspection condition		• Disconnect connector, and measure solenoid side terminal. • Starter switch: OFF
	Requirements		13 ± 2 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Replacement of automatic transmission

<Step 5 inspection diagram>



Step 6	Inspection items		Inspection of harness between solenoid and electronic control unit (power supply)
	Maintenance item		Check circuit between connector (DG12A) terminal No. 9 and electronic control unit connector (CY31A) terminal No. 3.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify harness.

Step 7	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of voltage between connector (CY31A) terminal No. 3 (+) and connector (CY24A) terminal No. 8 (–). **<Multi-Use Tester used>** Measure items No. 33 “Shift Valve 3” and No. 73 “Shift Valve Press 3” of Service Data.
	Inspection condition		**<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** • In 1st gear: 12 V • In any gears except above: 0 V **<Multi-Use Tester used>** <No. 33 “Shift Valve 3”> • In 1st gear: ON • In any gears except above: OFF <No. 73 “Shift Valve Press 3”> • In 1st gear: HIGH • In any gears except above: LOW
	Inspection result (Is the judging standard satisfied?)	YES	If the diagnosis code remains after actual run, replace the electronic control unit.
		NO	Replacement of electronic control unit

[Fault code]

[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of voltage between connector (CY31A) terminal No. 3 (+) and connector (CY24A) terminal No. 8 (–). **<Multi-Use Tester used>** Measure items No. 33 “Shift Valve 3” and No. 73 “Shift Valve Press 3” of Service Data.
	Inspection condition		**<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** • In 1st gear: 12 V • In any gears except above: 0 V **<Multi-Use Tester used>** <No.33 “Shift Valve 3”> • In 1st gear: ON • In any gears except above: OFF <No. 73 “Shift Valve Press 3”> • In 1st gear: HIGH • In any gears except above: LOW
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

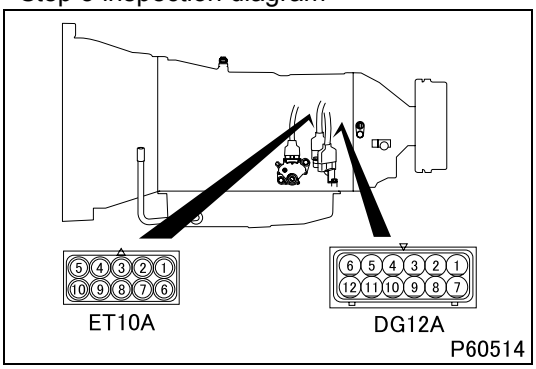
Step 2	Inspection items		Inspection by electronic control unit connector (signal)
	Maintenance item		Measure value of resistance between connector (CY31A) terminal No. 3 and chassis ground.
	Inspection condition		• Disconnect electronic control unit and harness, and measure from connection side of harness connector. • Starter switch: OFF
	Requirements		13 ± 2 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Go to step 4.

Step 3	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify connector.

Step 4	Inspection items		Inspection of solenoid connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Modify connector.

Step 5	Inspection items		Inspection of solenoid unit
	Maintenance item		Measure value of resistance between connector (DG12A) terminal No. 9 and automatic transmission case.
	Inspection condition		• Disconnect connector, and measure solenoid side terminal. • Starter switch: OFF
	Requirements		13 ± 2 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Replacement of automatic transmission

<Step 5 inspection diagram>



Step 6	Inspection items		Inspection of harness between solenoid and electronic control unit (power supply)
	Maintenance item		Check circuit between connector (DG12A) terminal No. 9 and electronic control unit connector (CY31A) terminal No. 3.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify harness.

Step 7	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of voltage between connector (CY31A) terminal No. 3 (+) and connector (CY24A) terminal No. 8 (–). **<Multi-Use Tester used>** Measure items No. 33 “Shift Valve 3” and No. 73 “Shift Valve Press 3” of Service Data.
	Inspection condition		**<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** • In 1st gear: 12 V • In any gears except above: 0 V **<Multi-Use Tester used>** <No.33 “Shift Valve 3”> • In 1st gear: ON • In any gears except above: OFF <No. 73 “Shift Valve Press 3”> • In 1st gear: HIGH • In any gears except above: LOW
	Inspection result (Is the judging standard satisfied?)	YES	If the diagnosis code remains after actual run, replace the electronic control unit.
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P0985/Flash code: 52
[Monitor ID]
None
[Fault (outline)]
Failure of gain change solenoid
[Diagnosis check]
- Current in the gain change solenoid is monitored for fault.

[Code generation condition]
- Current in the gain change solenoid remains at or above the specified value (4A) for 0.1 second (short-circuit in ground side).

[Diagnosis check timing]
- Fault diagnosis is continuously performed.

[Diagnostic requirement]
- Continuous

[Control effected by electronic control unit during fault]
- Effects no special control (gearshifting performance is reduced).

[Probable cause of trouble]
- Short-circuit of harness between electronic control unit and gain change solenoid
- Malfunction of each connector
- Malfunction of gain change solenoid
- Malfunction of electronic control unit

[Recoverability]
- Recovered if signal becomes normal when starter switch is turned OFF to ON (power supply resumed to electronic control unit).

[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of voltage between connector (CY24A) terminal No. 5 (+) and connector (CY24A) terminal No. 8 (–). **<Multi-Use Tester used>** Measure items No. 52 “Shift Valve 4” and No. 74 “Shift Valve Press 4” of Service Data.
	Inspection condition		**<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** • In R range (high accelerator pedal position): 12 V • In R range (low accelerator pedal position): 0 V **<Multi-Use Tester used>** <No. 52 “Shift Valve 4”> • In R range (high accelerator pedal position): OFF • In R range (low accelerator pedal position): ON <No. 74 “Shift Valve Press 4”> • In R range (high accelerator pedal position): HIGH • In R range (low accelerator pedal position): LOW
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

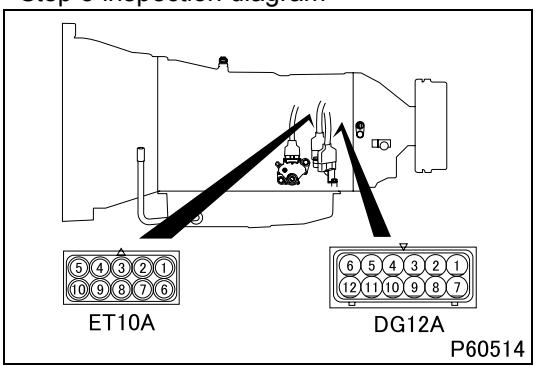
Step 2	Inspection items		Inspection by electronic control unit connector (signal)
	Maintenance item		Measure value of resistance between connector (CY24A) terminal No. 5 and chassis ground.
	Inspection condition		• Disconnect electronic control unit and harness, and measure from connection side of harness connector. • Starter switch: OFF
	Requirements		13 ± 2 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Go to step 4.

Step 3	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify connector.

Step 4	Inspection items		Inspection of solenoid connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Modify connector.

Step 5	Inspection items		Inspection of solenoid unit
	Maintenance item		Measure value of resistance between connector (DG12A) terminal No. 4 and automatic transmission case.
	Inspection condition		• Disconnect connector, and measure solenoid side terminal. • Starter switch: OFF
	Requirements		13 ± 2 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Replacement of automatic transmission

<Step 5 inspection diagram>



Step 6	Inspection items		Inspection of harness between solenoid and electronic control unit (power supply)
	Maintenance item		Check circuit between connector (DG12A) terminal No. 4 and electronic control unit connector (CY24A) terminal No. 5.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify harness.

Step 7	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of voltage between connector (CY24A) terminal No. 5 (+) and connector (CY24A) terminal No. 8 (–). **<Multi-Use Tester used>** Measure items No. 52 “Shift Valve 4” and No. 74 “Shift Valve Press 4” of Service Data.
	Inspection condition		**<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** • In R range (high accelerator pedal position): 12 V • In R range (low accelerator pedal position): 0 V **<Multi-Use Tester used>** <No. 52 “Shift Valve 4”> • In R range (high accelerator pedal position): OFF • In R range (low accelerator pedal position): ON <No. 74 “Shift Valve Press 4”> • In R range (high accelerator pedal position): HIGH • In R range (low accelerator pedal position): LOW
	Inspection result (Is the judging standard satisfied?)	YES	If the diagnosis code remains after actual run, replace the electronic control unit.
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P0986/Flash code: 52
[Monitor ID]
35
[Fault (outline)]
Failure of gain change solenoid
[Diagnosis check]
- Resistance in the gain change solenoid is monitored for fault.

[Code generation condition]
- Resistance in the gain change solenoid remains at or above the specified value (100 kΩ) for 0.1 second (open-circuit or short-circuit in power supply side).

[Diagnosis check timing]
- Fault diagnosis is continuously performed.

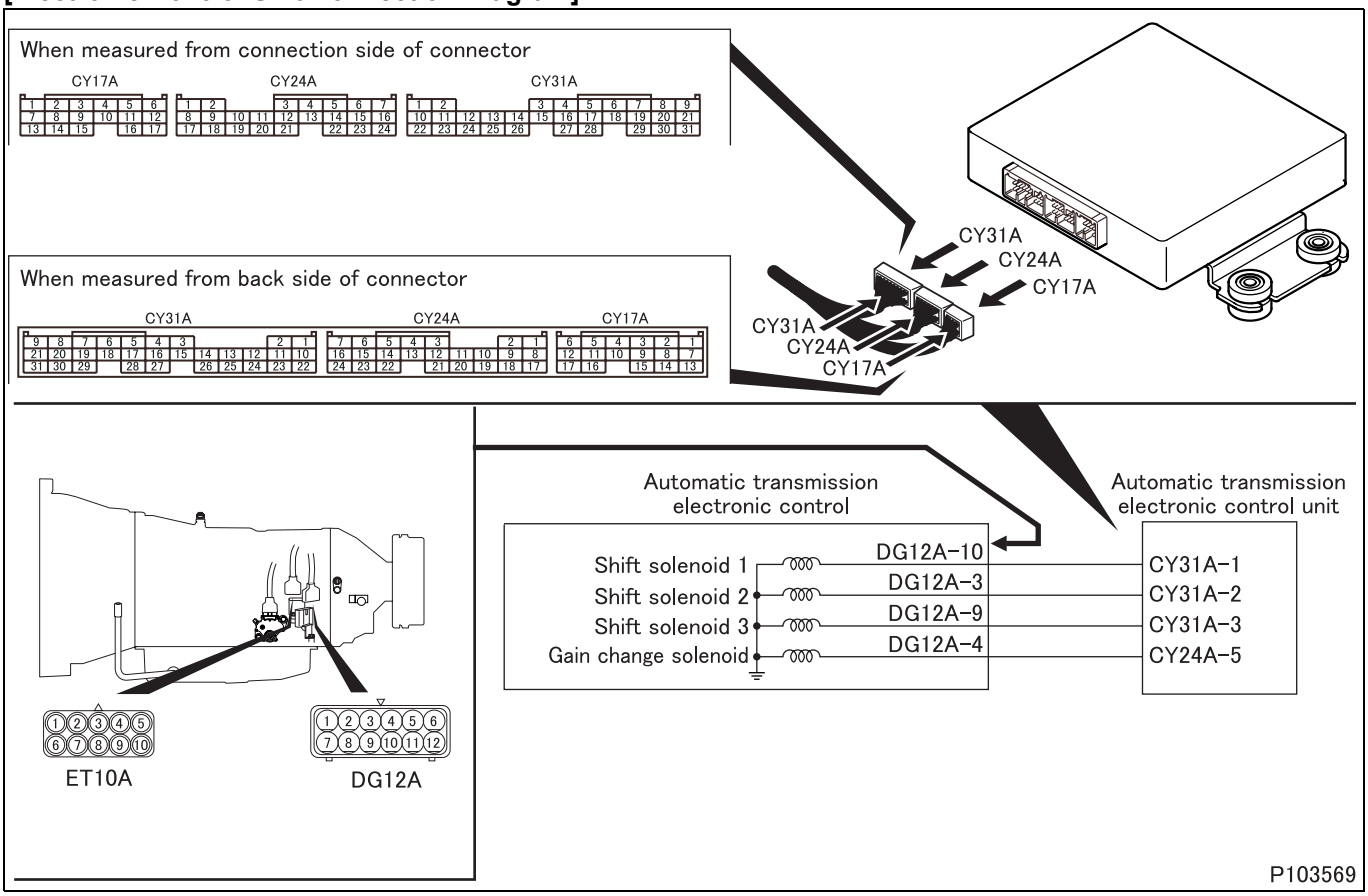
[Diagnostic requirement]
- Continuous

[Control effected by electronic control unit during fault]
- Requested to send output signals to the engine electronic control unit during engine starting.

[Probable cause of trouble]
- Short-circuit of harness between electronic control unit and gain change solenoid
- Malfunction of each connector
- Malfunction of gain change solenoid
- Malfunction of electronic control unit

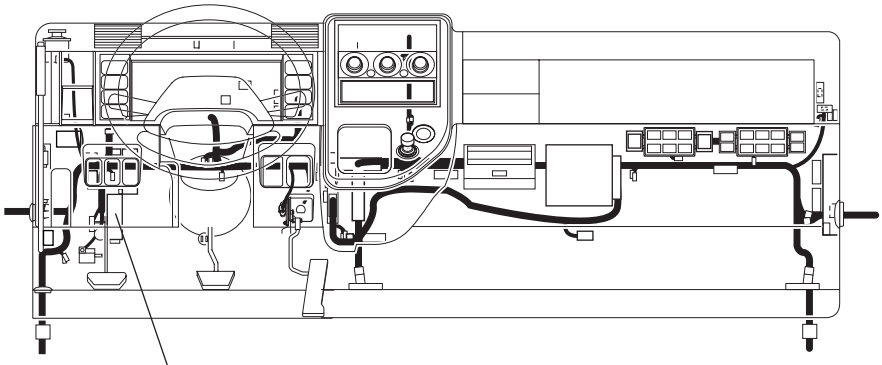
[Recoverability]
- Recovered if signal becomes normal when starter switch is turned OFF to ON (power supply resumed to electronic control unit).

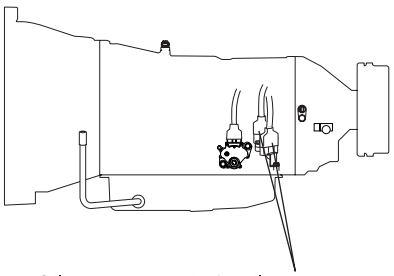
[Electronic Control Unit Connection Diagram]



P103569

[Parts Identification and Location]





P103560-2

[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of voltage between connector (CY24A) terminal No. 5 (+) and connector (CY24A) terminal No. 8 (–). **<Multi-Use Tester used>** Measure items No. 52 “Shift Valve 4” and No. 74 “Shift Valve Press 4” of Service Data.
	Inspection condition		**<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** • In R range (high accelerator pedal position): 12 V • In R range (low accelerator pedal position): 0 V **<Multi-Use Tester used>** <No. 52 “Shift Valve 4”> • In R range (high accelerator pedal position): OFF • In R range (low accelerator pedal position): ON <No. 74 “Shift Valve Press 4”> • In R range (high accelerator pedal position): HIGH • In R range (low accelerator pedal position): LOW
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

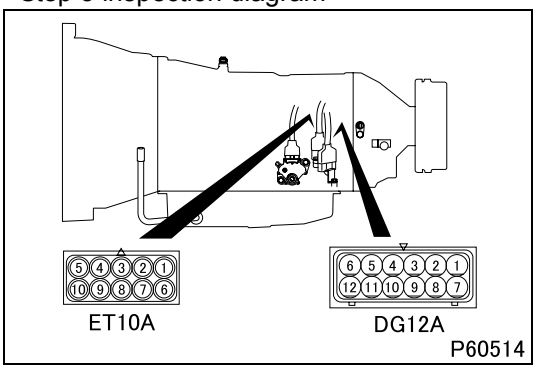
Step 2	Inspection items		Inspection by electronic control unit connector (signal)
	Maintenance item		Measure value of resistance between connector (CY24A) terminal No. 5 and chassis ground.
	Inspection condition		• Disconnect electronic control unit and harness, and measure from connection side of harness connector. • Starter switch: OFF
	Requirements		13 ± 2 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Go to step 4.

Step 3	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify connector.

Step 4	Inspection items		Inspection of solenoid connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Modify connector.

Step 5	Inspection items		Inspection of solenoid unit
	Maintenance item		Measure value of resistance between connector (DG12A) terminal No. 4 and automatic transmission case.
	Inspection condition		• Disconnect connector, and measure solenoid side terminal. • Starter switch: OFF
	Requirements		13 ± 2 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Replacement of automatic transmission

<Step 5 inspection diagram>



Step 6	Inspection items		Inspection of harness between solenoid and electronic control unit (power supply)
	Maintenance item		Check circuit between connector (DG12A) terminal No. 4 and electronic control unit connector (CY24A) terminal No. 5.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify harness.

Step 7	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of voltage between connector (CY24A) terminal No. 5 (+) and connector (CY24A) terminal No. 8 (–). **<Multi-Use Tester used>** Measure items No. 52 “Shift Valve 4” and No. 74 “Shift Valve Press 4” of Service Data.
	Inspection condition		**<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** • In R range (high accelerator pedal position): 12 V • In R range (low accelerator pedal position): 0 V **<Multi-Use Tester used>** <No. 52 “Shift Valve 4”> • In R range (high accelerator pedal position): OFF • In R range (low accelerator pedal position): ON <No. 74 “Shift Valve Press 4”> • In R range (high accelerator pedal position): HIGH • In R range (low accelerator pedal position): LOW
	Inspection result (Is the judging standard satisfied?)	YES	If the diagnosis code remains after actual run, replace the electronic control unit.
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P0989/Flash code: 47
[Monitor ID]
62
[Fault (outline)]
Failure of oil pressure switch 5
[Diagnosis check]
- Oil pressure switch 5 is monitored for fault when the shift solenoid 3 is energized (high pressure).

[Code generation condition]
- Oil pressure switch 5 remains OFF (low pressure) for 0.1 second.

[Diagnosis check timing]
- Fault diagnosis is performed each time when the control is activated.

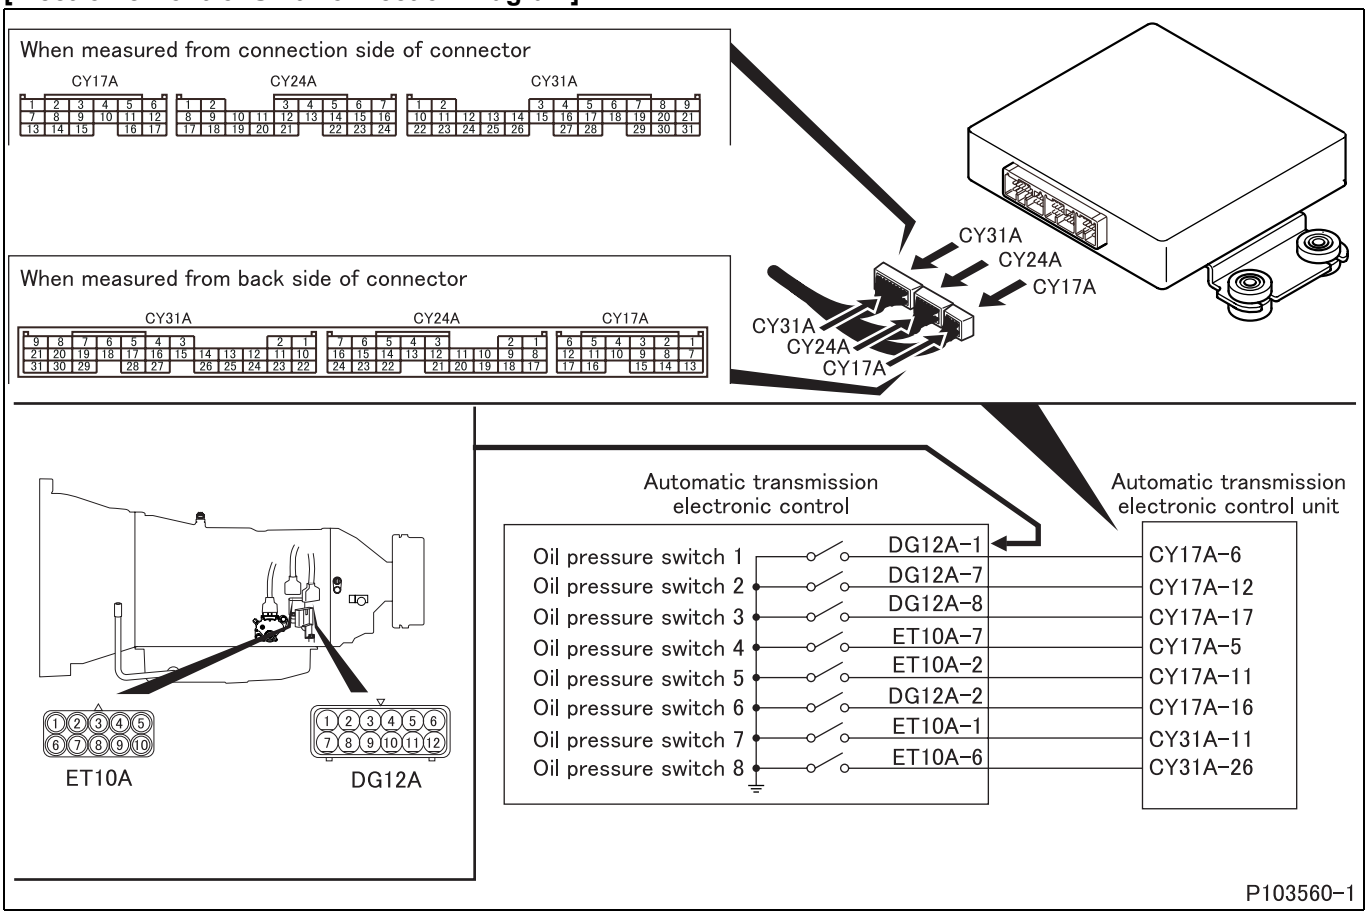
[Diagnostic requirement]
- Shift solenoid 3 is ON

[Control effected by electronic control unit during fault]
- Lockup control is turned OFF
- Control is effected on fixed speed gear output (2nd).

[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and oil pressure switch 5 or shift solenoid 3
- Malfunction of each connector
- Malfunction of oil pressure switch 5 or shift solenoid 3
- Malfunction of electronic control unit

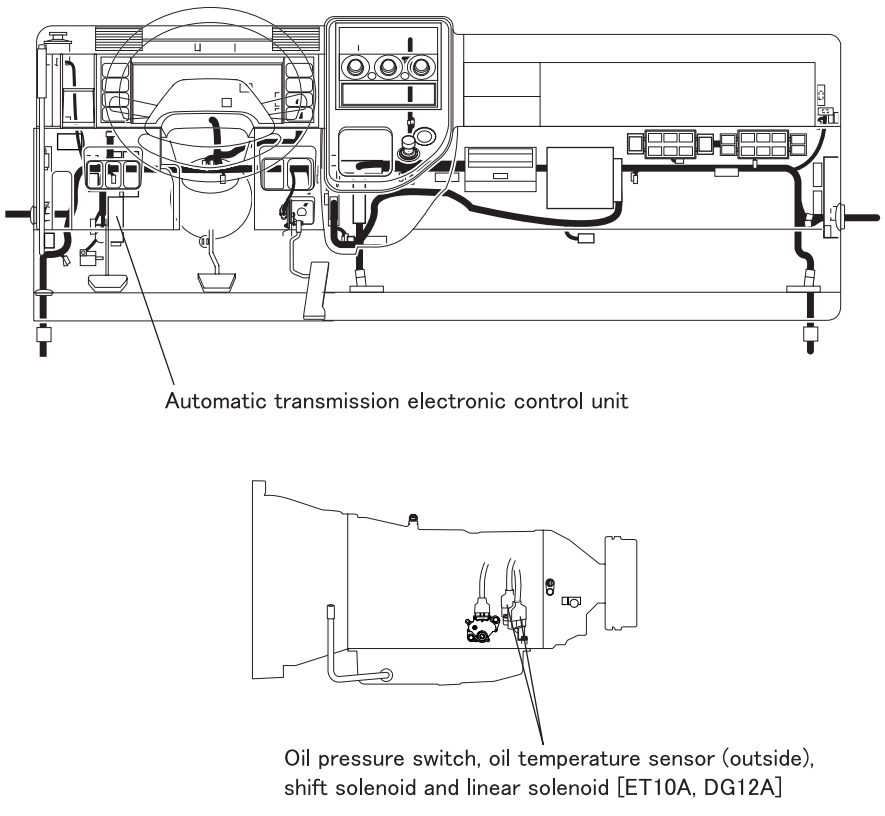
[Recoverability]
- Recovered if signal becomes normal when starter switch is turned OFF to ON (power supply resumed to electronic control unit).

[Electronic Control Unit Connection Diagram]



P103560-1

[Parts Identification and Location]



P103560-2

[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of voltage between connector (CY17A) terminal No. 11 (+) and connector (CY24A) terminal No. 8 (–). **<Multi-Use Tester used>** Measure item No. 65 “Oil Press SW 5” of Service Data.
	Inspection condition		Engine in operation **<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** • In 1st gear: 0 V • In 2nd, 3rd, 4th, 5th, 6th gears: 12 V **<Multi-Use Tester used>** • In 1st gear: ON • In 2nd, 3rd, 4th, 5th, 6th gears: OFF
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

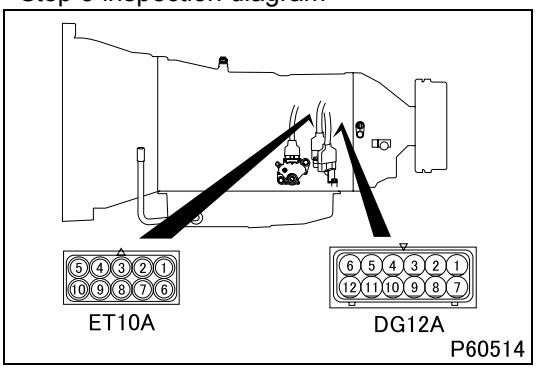
Step 2	Inspection items		Inspection by electronic control unit connector (signal)
	Maintenance item		Measure continuity between connector (CY17A) terminal No. 11 and chassis ground.
	Inspection condition		• Disconnect electronic control unit and harness, and measure from connection side of harness connector. • Starter switch: OFF
	Requirements		There is no continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Go to step 4.

Step 3	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify connector.

Step 4	Inspection items		Inspection of switch connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Modify connector.

Step 5	Inspection items		Inspection of switch unit
	Maintenance item		Check continuity between connector (ET10A) terminal No. 2 and automatic transmission case.
	Inspection condition		• Disconnect connector, and measure switch side terminal. • Starter switch: OFF
	Requirements		There is no continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Replacement of automatic transmission

<Step 5 inspection diagram>



Step 6	Inspection items		Inspection of harness between switch and electronic control unit (signal)
	Maintenance item		Check circuit between connector (ET10A) terminal No. 2 and electronic control unit connector (CY17A) terminal No. 11.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify harness.

Step 7	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of voltage between connector (CY17A) terminal No. 11 (+) and connector (CY24A) terminal No. 8 (–). **<Multi-Use Tester used>** Measure item No. 65 “Oil Press SW 5” of Service Data.
	Inspection condition		Engine in operation **<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** • In 1st gear: 0 V • In 2nd, 3rd, 4th, 5th, 6th gears: 12 V **<Multi-Use Tester used>** • In 1st gear: ON • In 2nd, 3rd, 4th, 5th, 6th gears: OFF
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	• Check if a diagnosis code related to the shift solenoid 3 occurs. If it does, perform troubleshooting of the code. • Replacement of electronic control unit

[Fault code]
Diagnosis code: P0990/Flash code: 47
[Monitor ID]
61
[Fault (outline)]
Failure of oil pressure switch 5
[Diagnosis check]
- Oil pressure switch 5 is monitored for fault when the shift solenoid 3 is deenergized (low pressure).

	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

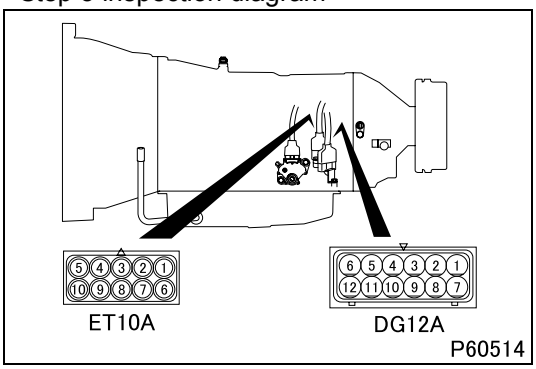
Step 2	Inspection items		Inspection by electronic control unit connector (signal)
	Maintenance item		Measure continuity between connector (CY17A) terminal No. 11 and chassis ground.
	Inspection condition		• Disconnect electronic control unit and harness, and measure from connection side of harness connector. • Starter switch: OFF
	Requirements		There is no continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Go to step 4.

Step 3	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify connector.

Step 4	Inspection items		Inspection of switch connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Modify connector.

Step 5	Inspection items		Inspection of switch unit
	Maintenance item		Check continuity between connector (ET10A) terminal No. 2 and automatic transmission case.
	Inspection condition		• Disconnect connector, and measure switch side terminal. • Starter switch: OFF
	Requirements		There is no continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Replacement of automatic transmission

<Step 5 inspection diagram>



Step 6	Inspection items		Inspection of harness between switch and electronic control unit (signal)
	Maintenance item		Check circuit between connector (ET10A) terminal No. 2 and electronic control unit connector (CY17A) terminal No. 11.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify harness.

Step 7	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of voltage between connector (CY17A) terminal No. 11 (+) and connector (CY24A) terminal No. 8 (–). **<Multi-Use Tester used>** Measure item No. 65 “Oil Press SW 5” of Service Data.
	Inspection condition		Engine in operation **<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** • In 1st gear: 0 V • In 2nd, 3rd, 4th, 5th, 6th gears: 12 V **<Multi-Use Tester used>** • In 1st gear: ON • In 2nd, 3rd, 4th, 5th, 6th gears: OFF
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	• Check if a diagnosis code related to the shift solenoid 3 occurs. If it does, perform troubleshooting of the code. • Replacement of electronic control unit

[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of voltage between connector (CY17A) terminal No. 16 (+) and connector (CY24A) terminal No. 8 (–). **<Multi-Use Tester used>** Measure item No. 66 “Oil Press SW 6” of Service Data.
	Inspection condition		Engine in operation **<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** • In 1st gear: 0 V • In 2nd, 3rd, 4th, 5th, 6th gears: 12 V **<Multi-Use Tester used>** • In 1st gear: ON • In 2nd, 3rd, 4th, 5th, 6th gears: OFF
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

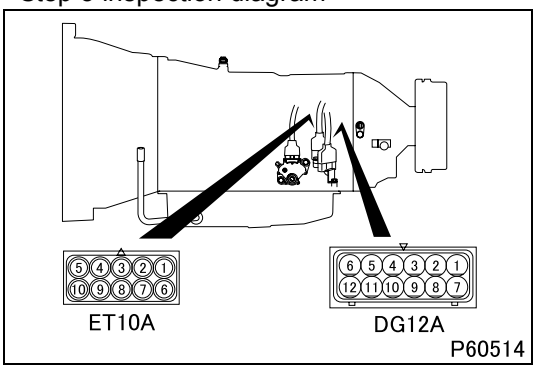
Step 2	Inspection items		Inspection by electronic control unit connector (signal)
	Maintenance item		Measure continuity between connector (CY17A) terminal No. 16 and chassis ground.
	Inspection condition		• Disconnect electronic control unit and harness, and measure from connection side of harness connector. • Starter switch: OFF
	Requirements		There is no continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Go to step 4.

Step 3	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify connector.

Step 4	Inspection items		Inspection of switch connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Modify connector.

Step 5	Inspection items		Inspection of switch unit
	Maintenance item		Check continuity between connector (DG12A) terminal No. 2 and automatic transmission case.
	Inspection condition		• Disconnect connector, and measure switch side terminal. • Starter switch: OFF
	Requirements		There is no continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Replacement of automatic transmission

<Step 5 inspection diagram>



Step 6	Inspection items		Inspection of harness between switch and electronic control unit (signal)
	Maintenance item		Check circuit between connector (DG12A) terminal No. 2 and electronic control unit connector (CY17A) terminal No. 16.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify harness.

Step 7	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of voltage between connector (CY17A) terminal No. 16 (+) and connector (CY24A) terminal No. 8 (–). **<Multi-Use Tester used>** Measure item No. 66 “Oil Press SW 6” of Service Data.
	Inspection condition		Engine in operation **<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** • In 1st gear: 0 V • In 2nd, 3rd, 4th, 5th, 6th gears: 12 V **<Multi-Use Tester used>** • In 1st gear: ON • In 2nd, 3rd, 4th, 5th, 6th gears: OFF
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	• Check if a diagnosis code related to the shift solenoid 3 occurs. If it does, perform troubleshooting of the code. • Replacement of electronic control unit

[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of voltage between connector (CY17A) terminal No. 16 (+) and connector (CY24A) terminal No. 8 (–). **<Multi-Use Tester used>** Measure item No. 66 “Oil Press SW 6” of Service Data.
	Inspection condition		Engine in operation **<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** • In 1st gear: 0 V • In 2nd, 3rd, 4th, 5th, 6th gears: 12 V **<Multi-Use Tester used>** • In 1st gear: ON • In 2nd, 3rd, 4th, 5th, 6th gears: OFF
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

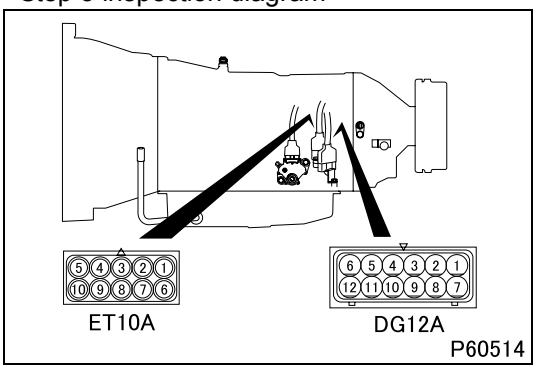
Step 2	Inspection items		Inspection by electronic control unit connector (signal)
	Maintenance item		Measure continuity between connector (CY17A) terminal No. 16 and chassis ground.
	Inspection condition		• Disconnect electronic control unit and harness, and measure from connection side of harness connector. • Starter switch: OFF
	Requirements		There is no continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Go to step 4.

Step 3	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify connector.

Step 4	Inspection items		Inspection of switch connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Modify connector.

Step 5	Inspection items		Inspection of switch unit
	Maintenance item		Check continuity between connector (DG12A) terminal No. 2 and automatic transmission case.
	Inspection condition		• Disconnect connector, and measure switch side terminal. • Starter switch: OFF
	Requirements		There is no continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Replacement of automatic transmission

<Step 5 inspection diagram>



Step 6	Inspection items		Inspection of harness between switch and electronic control unit (signal)
	Maintenance item		Check circuit between connector (DG12A) terminal No. 2 and electronic control unit connector (CY17A) terminal No. 16.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify harness.

Step 7	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of voltage between connector (CY17A) terminal No. 16 (+) and connector (CY24A) terminal No. 8 (–). **<Multi-Use Tester used>** Measure item No. 66 “Oil Press SW 6” of Service Data.
	Inspection condition		Engine in operation **<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** • In 1st gear: 0 V • In 2nd, 3rd, 4th, 5th, 6th gears: 12 V **<Multi-Use Tester used>** • In 1st gear: ON • In 2nd, 3rd, 4th, 5th, 6th gears: OFF
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	• Check if a diagnosis code related to the shift solenoid 3 occurs. If it does, perform troubleshooting of the code. • Replacement of electronic control unit

[Fault code]
Diagnosis code: P1604/Flash code: 24
[Monitor ID]
10
[Fault (outline)]
Abnormality in accelerator pedal position signal
[Diagnosis check]
- Accelerator pedal position signal from engine electronic control unit is monitored for abnormality.

[Code generation condition]
- Signal outputted from engine electronic control unit remains abnormal for 5 seconds. (This condition is not caused by abnormal accelerator opening but by abnormal signal.)

[Diagnosis check timing]
- Fault diagnosis is continuously performed.

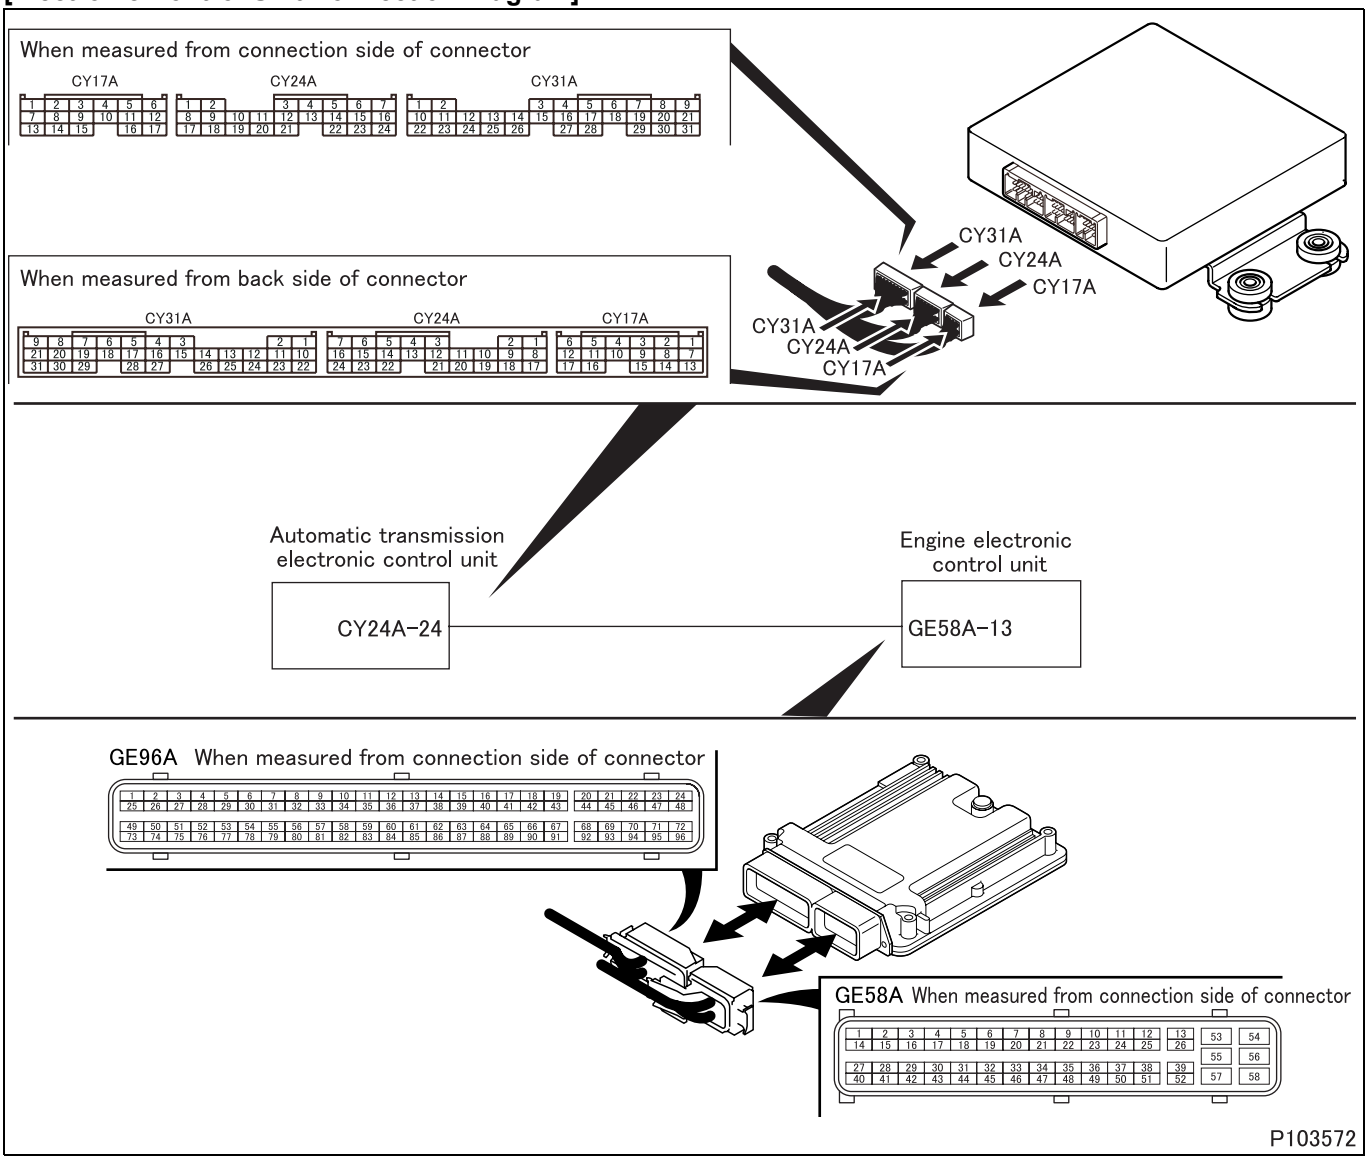
[Diagnostic requirement]
- Starter switch: ON

[Control effected by electronic control unit during fault]
- Oil pressure control is executed on the basis of the preset value for accelerator pedal position of 100%
- Shift point control is executed on the basis of the preset value for the accelerator pedal position of 0%
- Braking force control is inhibited.

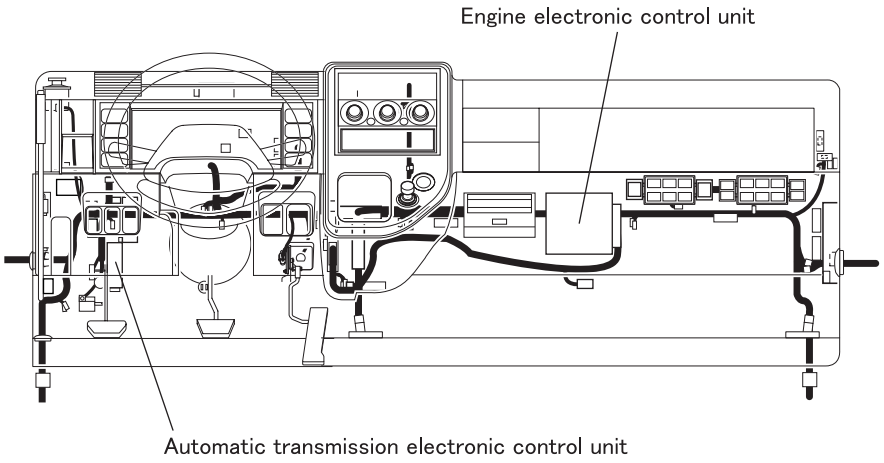
[Probable cause of trouble]
- Open-circuit or short-circuit between electronic control unit and engine electronic control unit or between engine electronic control unit and accelerator pedal position sensor
- Malfunction of each connector
- Malfunction of accelerator pedal position sensor
- Malfunction of electronic control unit
- Malfunction of engine electronic control unit

[Recoverability]
- Recovered if signal becomes normal with starter switch in ON position.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



P103565-2

[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Go to step 2. **<Multi-Use Tester used>** Measure item No. 58 “Accel Percent” of Service Data.
	Inspection condition		–
	Requirements		• Accelerator pedal released (fully closed): 0% • Accelerator pedal pressed (fully opened): 100%
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

Step 2	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Modify connector.

Step 3	Inspection items		Inspection of engine electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	Modify connector.

Step 4	Inspection items		Inspection of engine electronic control unit
	Maintenance item		Inspection of engine electronic control unit
	Inspection condition		–
	Requirements		Free of errors related to accelerator opening
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Perform troubleshooting on engine electronic control unit (See Gr13EA).

Step 5	Inspection items		Inspection of harness between electronic control unit and engine electronic control unit
	Maintenance item		Check circuit between connector (CY24A) terminal No. 24 and engine electronic control unit connector (GE58A) terminal No. 13.
	Inspection condition		Disconnect each electronic control unit from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Modify harness.

Step 6	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Check for recurrence of the same diagnosis code. **<Multi-Use Tester used>** Measure item No. 58 “Accel Percent” of Service Data.
	Inspection condition		–
	Requirements		**<Multi-Use Tester not used>** If the same diagnosis code occurs, replace electronic control unit. **<Multi-Use Tester used>** • Accelerator pedal released (fully closed): 0% • Accelerator pedal pressed (fully opened): 100%
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic control unit (If replacement of electronic control unit does not eliminate trouble, replace engine electronic control unit.)

[Fault code]
Diagnosis code: P2716/Flash code: 34
[Monitor ID]
27, 28
[Fault (outline)]
PL linear solenoid is open-circuited or short-circuited.
[Diagnosis check]
- Resistance and current in the PL linear solenoid are monitored for fault.

[Code generation condition]
- Resistance in the PL linear solenoid remains at or above the specified value (100 kΩ) for 0.065 second (open-circuit or short-circuit in power supply side).
- Current in the PL linear solenoid remains at or above the specified value (4A) for 0.065 second (short-circuit in ground side).

[Diagnosis check timing]
- Fault diagnosis is continuously performed.

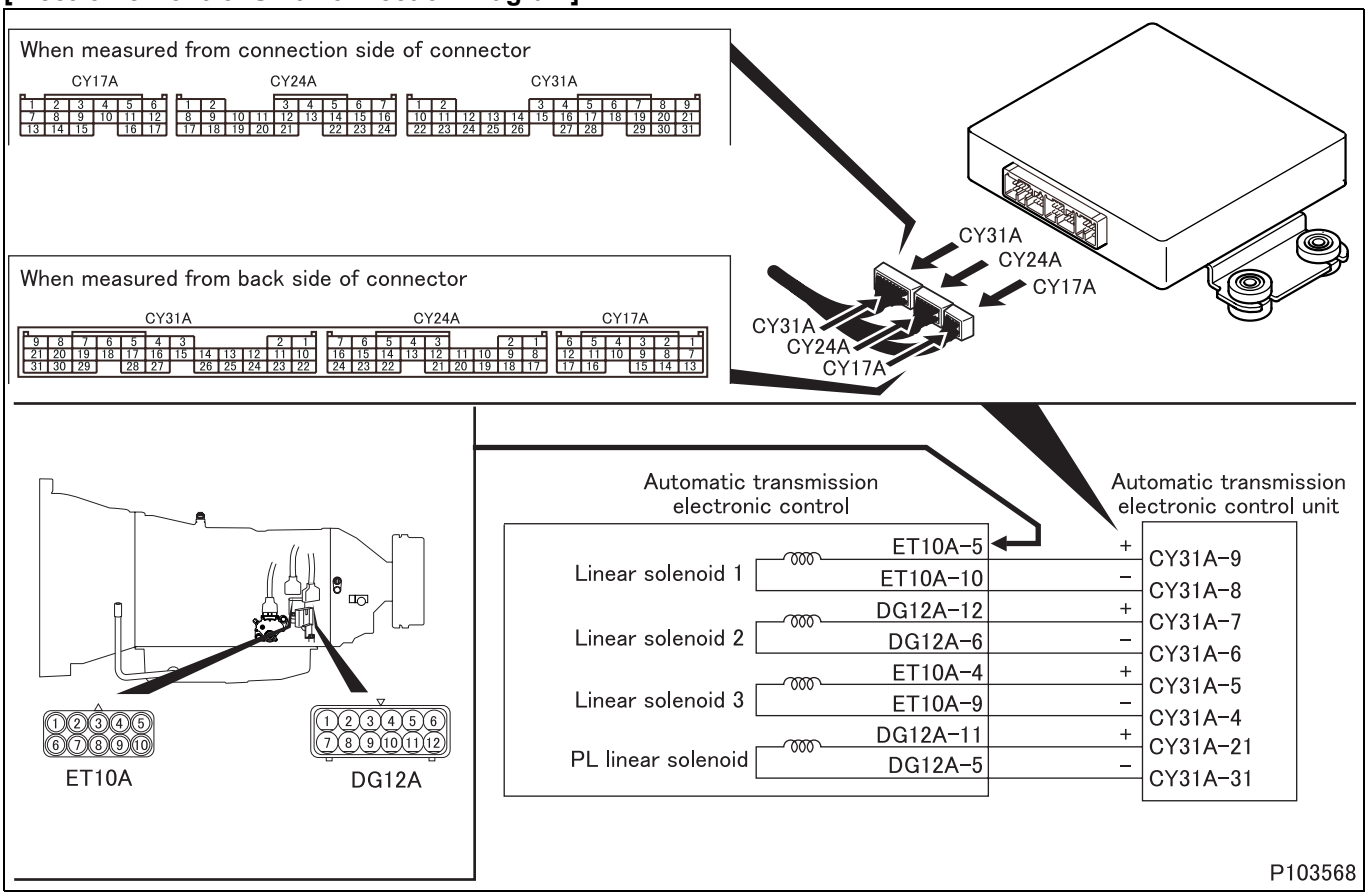
[Diagnostic requirement]
- Continuous

[Control effected by electronic control unit during fault]
- PL linear solenoid is turned OFF (line pressure held in high pressure side).

[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and PL linear solenoid
- Malfunction of each connector
- Malfunction of PL linear solenoid
- Malfunction of electronic control unit

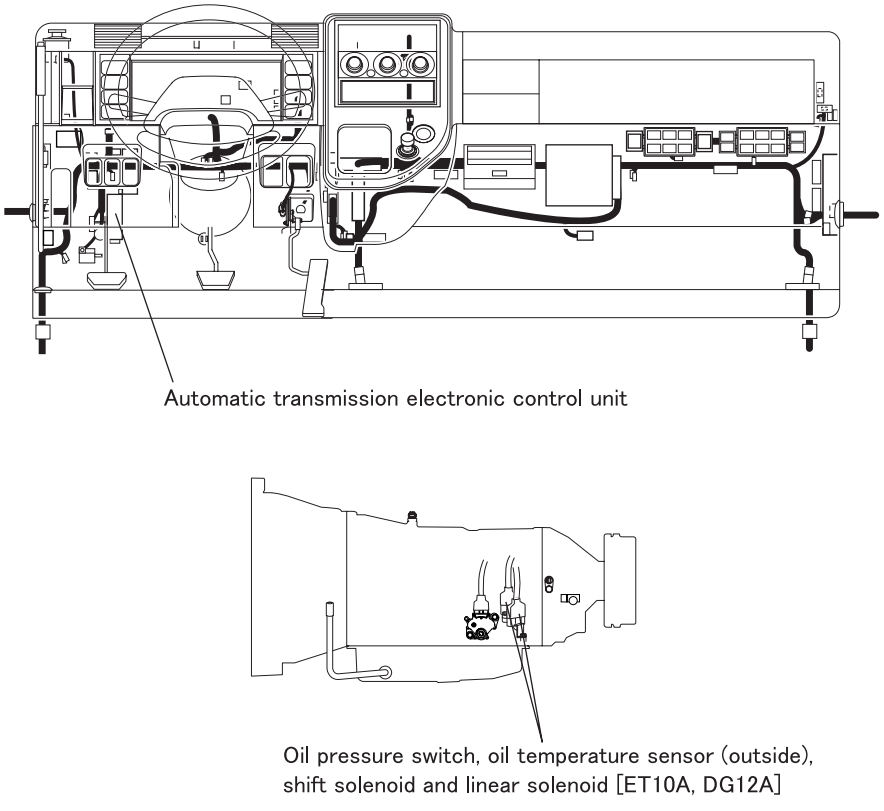
[Recoverability]
- Recovered if signal becomes normal when starter switch is turned OFF to ON (power supply resumed to electronic control unit).

[Electronic Control Unit Connection Diagram]



P103568

[Parts Identification and Location]



P103560-2

[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Go to step 2. **<Multi-Use Tester used>** Measure item No. 34 “Linear Sol Press 4” of Service Data.
	Inspection condition		• Engine in operation • With the brake pedal pressed down, shift the range selector lever.
	Requirements		• In R range, 1st gear (high accelerator pedal position): 260 lbf/in^2 • In any gears except above: 100 lbf/in^2
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

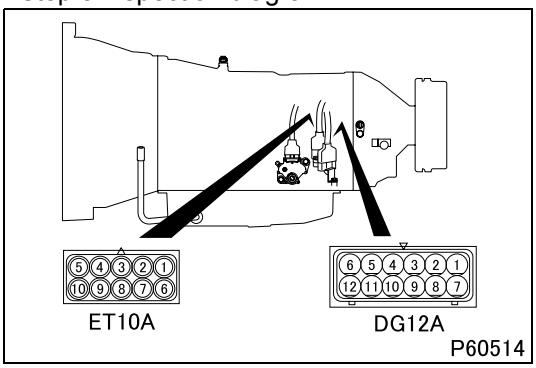
Step 2	Inspection items		Inspection by electronic control unit connector (signal)
	Maintenance item		Measure value of resistance between connector (CY31A) terminals No. 21 and 31.
	Inspection condition		• Disconnect electronic control unit and harness, and measure from connection side of harness connector. • Starter switch: OFF
	Requirements		5.5 ± 0.5 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Go to step 4.

Step 3	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify connector.

Step 4	Inspection items		Inspection of solenoid connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Modify connector.

Step 5	Inspection items		Inspection of solenoid unit
	Maintenance item		Measure value of resistance between connector (DG12A) terminals No. 11 and 5.
	Inspection condition		• Disconnect connector, and measure solenoid side terminal. • Starter switch: OFF
	Requirements		5.5 ± 0.5 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Replacement of automatic transmission

<Step 5 inspection diagram>



Step 6	Inspection items		Inspection of harness between solenoid and electronic control unit (power supply)
	Maintenance item		Check circuit between connector (DG12A) terminal No. 11 and electronic control unit connector (CY31A) terminal No. 21.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify harness.

Step 7	Inspection items		Inspection of harness between solenoid and electronic control unit (ground)
	Maintenance item		Check circuit between connector (DG12A) terminal No. 5 and electronic control unit connector (CY31A) terminal No. 31.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify harness.

Step 8	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Check for recurrence of the same diagnosis code. **<Multi-Use Tester used>** Measure item No. 34 “Linear Sol Press 4” of Service Data.
	Inspection condition		• Engine in operation • With the brake pedal pressed down, shift the range selector lever.
	Requirements		**<Multi-Use Tester not used>** If the same diagnosis code occurs, replace electronic control unit. **<Multi-Use Tester used>** • In R range, 1st gear (high accelerator pedal position): 260 lbf/in^2 • In any gears except above: 100 lbf/in^2
	Inspection result (Is the judging standard satisfied?)	YES	If the diagnosis code remains after actual run, replace the electronic control unit.
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P2742/Flash code: 17
[Monitor ID]
16
[Fault (outline)]
Failure of oil temperature sensor (outside)
[Diagnosis check]
- Automatic transmission fluid temperature is monitored by oil temperature sensor (outside).

[Code generation condition]
- Oil temperature sensor (outside) output temperature remains excessively high (over 180°C {355°F}) for 0.5 second.

[Diagnosis check timing]
- Fault diagnosis is continuously performed.

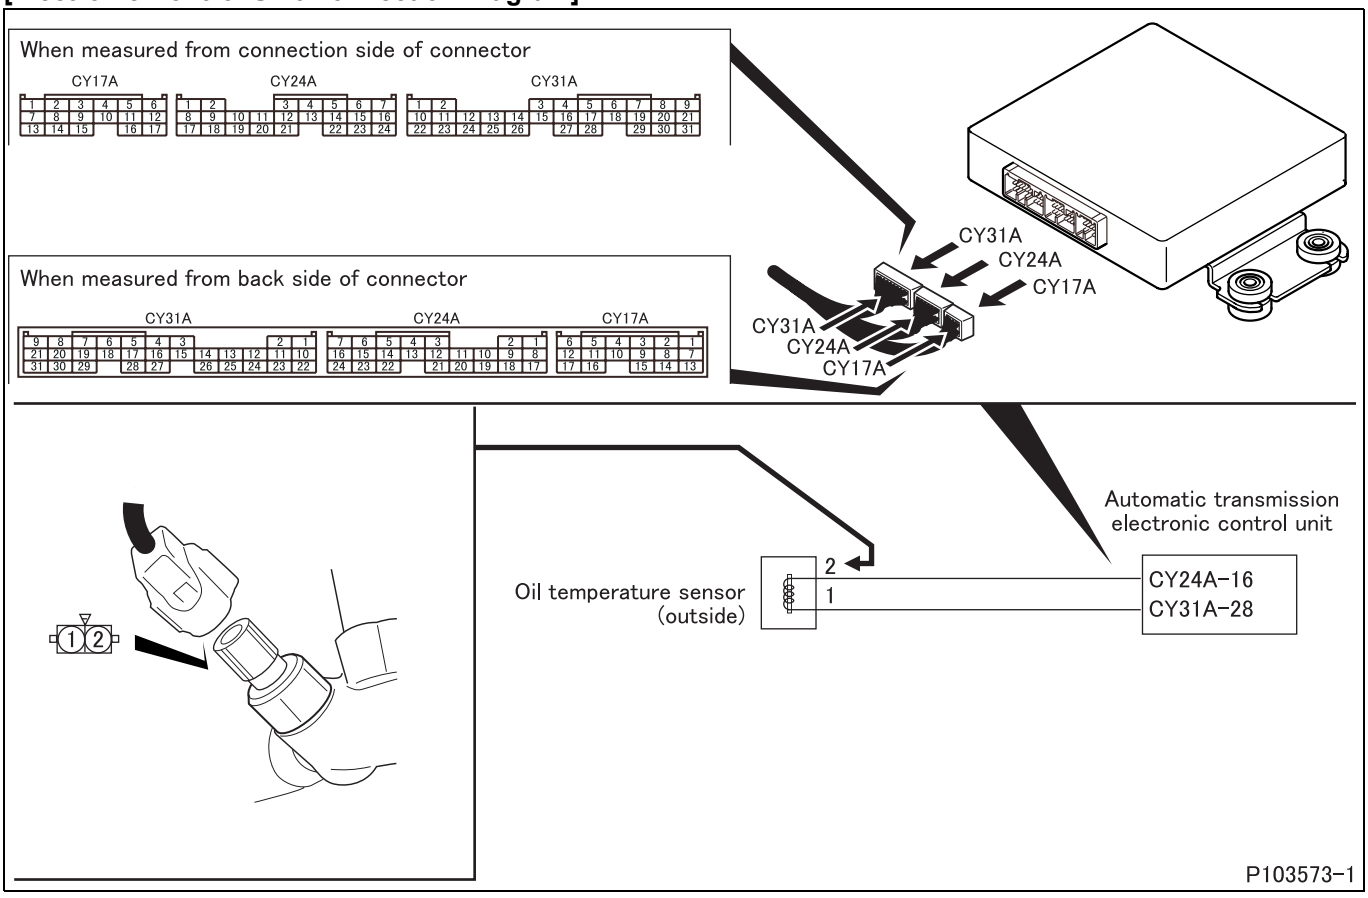
[Diagnostic requirement]
- Continuous

[Control effected by electronic control unit during fault]
- Control is effected with oil temperature at 80°C {175°F}.
- Braking force control is inhibited.

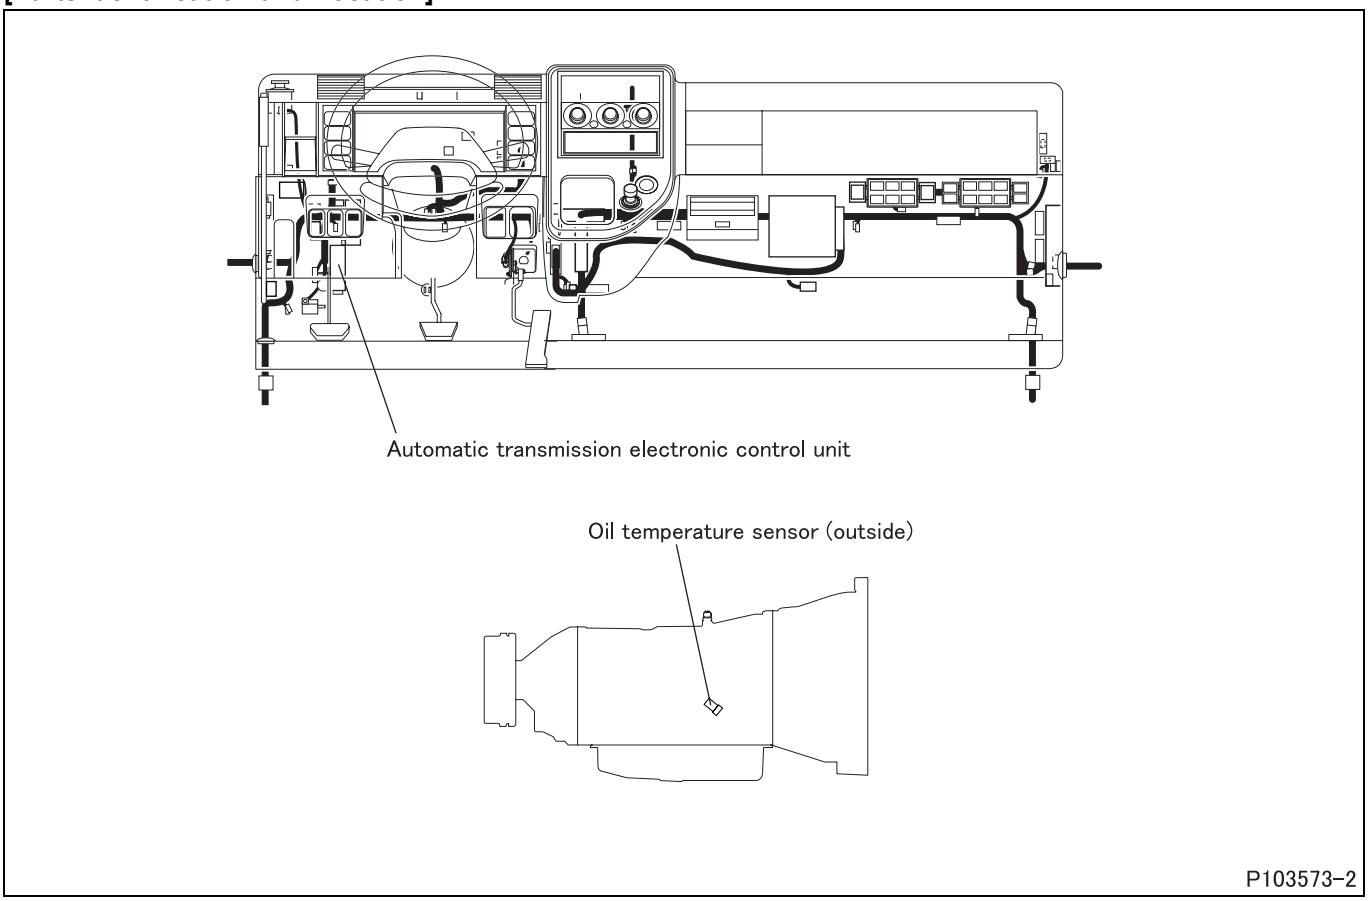
[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and oil temperature sensor (outside)
- Malfunction of each connector
- Malfunction of oil temperature sensor (outside)
- Malfunction of electronic control unit

[Recoverability]
- Recovered if signal becomes normal with starter switch in ON position.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of resistance between connector (CY24A) terminal No. 16 and connector (CY31A) terminal No. 28. **<Multi-Use Tester used>** Measure item No. 17 “A/T Oil Temp (TC)” of Service Data.
	Inspection condition		**<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** Cold engine → during warm-up: Resistance is gradually reduced. **<Multi-Use Tester used>** • Cold engine: Proportionate to outside air temperature • During warm-up: Gradually increased.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

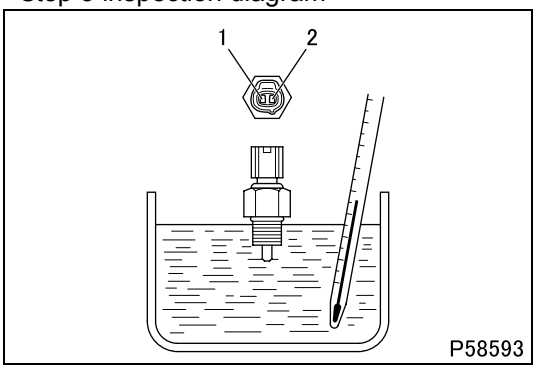
Step 2	Inspection items		Inspection by electronic control unit connector (signal)
	Maintenance item		Measure value of resistance between connector (CY24A) terminal No. 16 and connector (CY31A) terminal No. 28.
	Inspection condition		• Disconnect electronic control unit and harness, and measure from connection side of harness connector. • Starter switch: OFF
	Requirements		• 115°C {240°F}: 655 to 730 Ω • 120°C {250°F}: 585 to 645 Ω • 145°C {295°F}: 340 to 375 Ω • 155°C {310°F}: 280 to 305 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Go to step 4.

Step 3	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Replacement of electronic control unit
		NO	Modify connector.

Step 4	Inspection items		Inspection of sensor connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Modify connector.

Step 5	Inspection items		Inspection of sensor unit
	Maintenance item		Measure value of resistance between connector terminal No. 1 or 2 and body.
	Inspection condition		• Put sensor in vessel filled with automatic transmission fluid. • Measure value of resistance the sensor in each temperature (Wait for more than 5 minutes in each time to measure correct resistances).
	Requirements		• 115°C {240°F}: 655 to 730 Ω • 120°C {250°F}: 585 to 645 Ω • 145°C {295°F}: 340 to 375 Ω • 155°C {310°F}: 280 to 305 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Replacement of sensor

<Step 5 inspection diagram>



Step 6	Inspection items		Inspection of harness between sensor and electronic control unit (signal)
	Maintenance item		Check circuit between connector terminal No. 2 and electronic control unit connector (CY24A) terminal No. 16.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify harness.

Step 7	Inspection items		Inspection of harness between sensor and electronic control unit (ground)
	Maintenance item		Check circuit between connector terminal No. 1 and electronic control unit connector (CY31A) terminal No. 28.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify harness.

Step 8	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of resistance between connector (CY24A) terminal No. 16 and connector (CY31A) terminal No. 28. **<Multi-Use Tester used>** Measure item No. 17 “A/T Oil Temp (TC)” of Service Data.
	Inspection condition		**<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** Cold engine → during warm-up: Resistance is gradually reduced. **<Multi-Use Tester used>** • Cold engine: Proportionate to outside air temperature • During warm-up: Gradually increased.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P2743/Flash code: 17
[Monitor ID]
17, 18
[Fault (outline)]
Failure of oil temperature sensor (outside)
[Diagnosis check]
- Automatic transmission fluid temperature is monitored by oil temperature sensor (outside).

[Code generation condition]
Diagnosis code is generated under either of the following conditions.
- Oil temperature sensor (outside) output temperature remains excessively low (under –50°C {–56°F}) for 0.5 second. (Lamp indication: IMD) <A>
- Engine coolant temperature is above 70°C {160°F} and while oil temperature sensor (inside) output temperature is less than 60°C {140°F}, oil temperature sensor (outside) output temperature remains not less than 140°C {285°F} for 1 minute. (Lamp indication: 2DC) <B>

[Diagnosis check timing]
- Fault diagnosis is continuously performed.

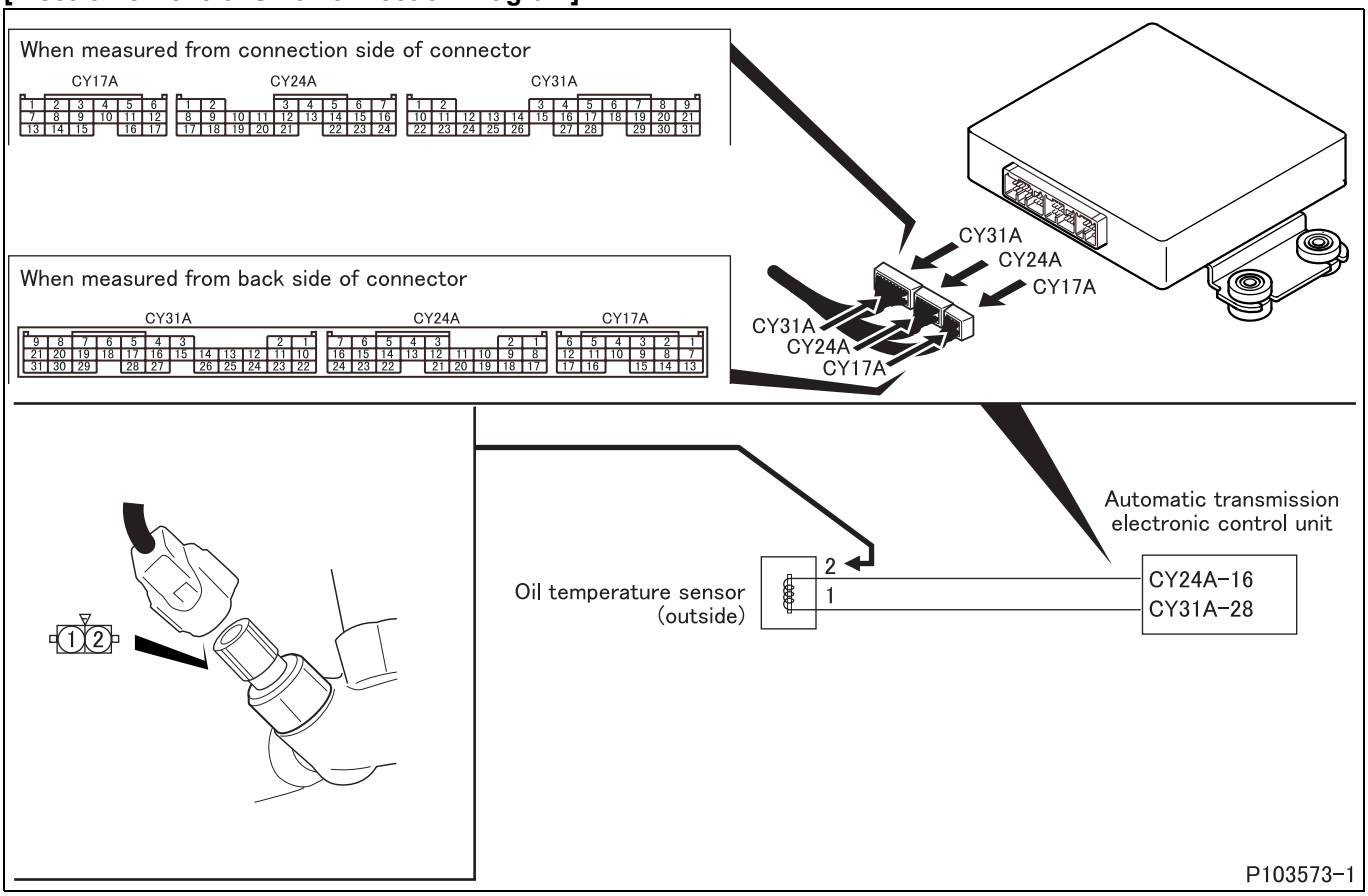
[Diagnostic requirement]
- Continuous

[Control effected by electronic control unit during fault]
- Control is effected with oil temperature at 80°C {175°F}. <A>
- Braking force control is inhibited. <A>
- None <B>

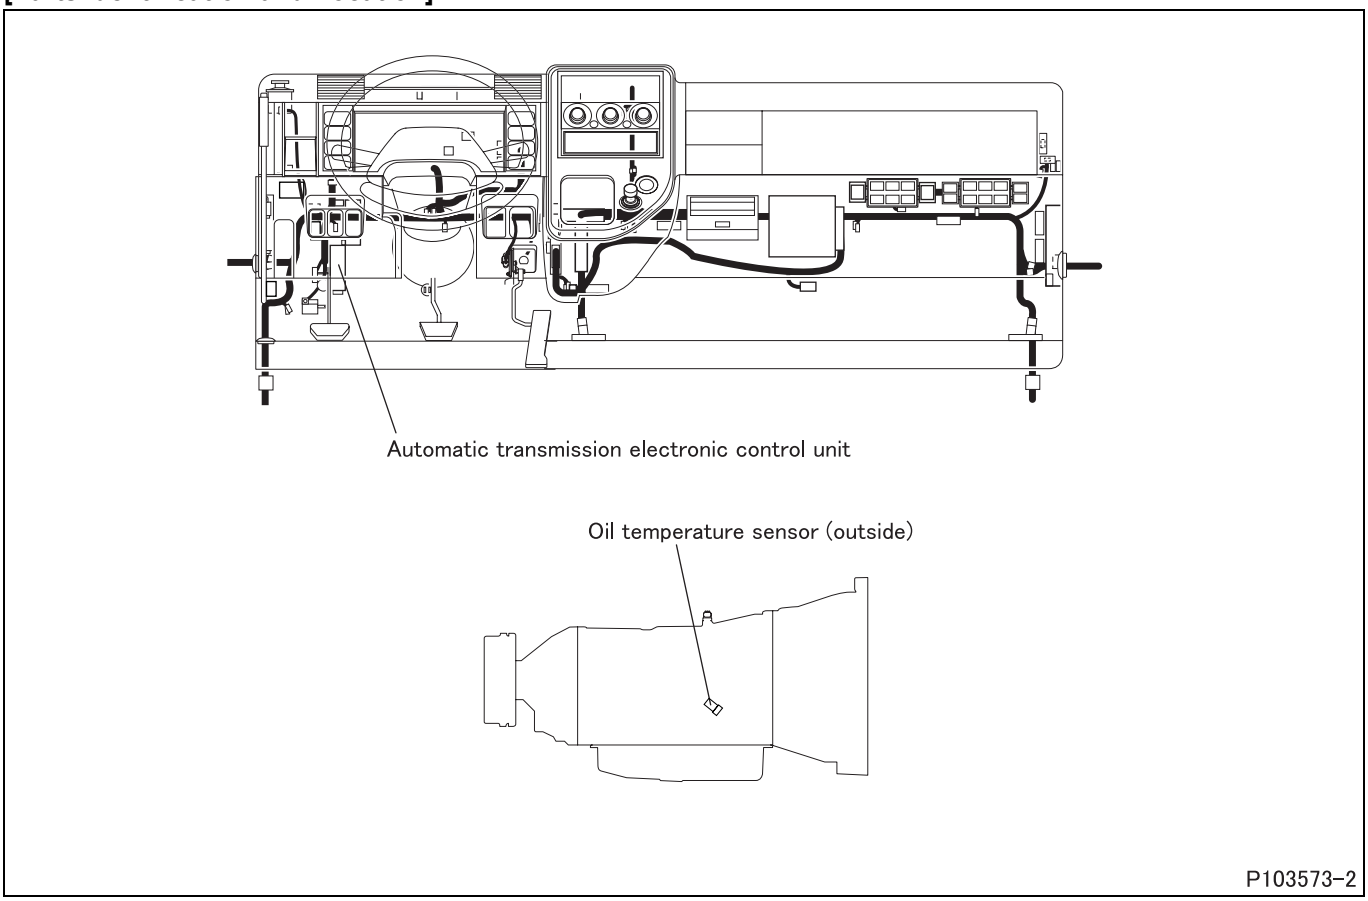
[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and oil temperature sensor (outside)
- Malfunction of each connector
- Malfunction of oil temperature sensor (outside)
- Malfunction of electronic control unit

[Recoverability]
- Recovered if signal becomes normal with starter switch in ON position. <A>

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of resistance between connector (CY24A) terminal No. 16 and connector (CY31A) terminal No. 28. **<Multi-Use Tester used>** Measure item No. 17 “A/T Oil Temp (TC)” of Service Data.
	Inspection condition		**<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** Cold engine → during warm-up: Resistance is gradually reduced. **<Multi-Use Tester used>** • Cold engine: Proportionate to outside air temperature • During warm-up: Gradually increased.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

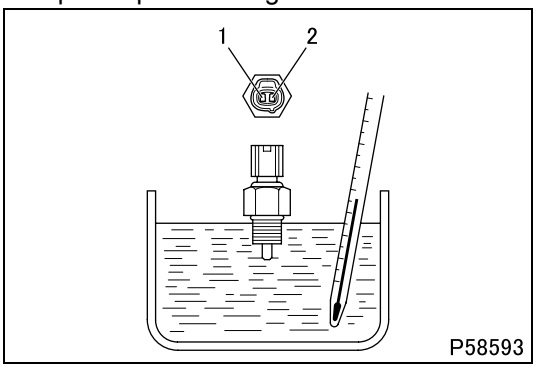
Step 2	Inspection items		Inspection by electronic control unit connector (signal)
	Maintenance item		Measure value of resistance between connector (CY24A) terminal No. 16 and connector (CY31A) terminal No. 28.
	Inspection condition		• Disconnect electronic control unit and harness, and measure from connection side of harness connector. • Starter switch: OFF
	Requirements		• 115°C {240°F}: 655 to 730 Ω • 120°C {250°F}: 585 to 645 Ω • 145°C {295°F}: 340 to 375 Ω • 155°C {310°F}: 280 to 305 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Go to step 4.

Step 3	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Replacement of electronic control unit
		NO	Modify connector.

Step 4	Inspection items		Inspection of sensor connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Modify connector.

Step 5	Inspection items		Inspection of sensor unit
	Maintenance item		Measure value of resistance between connector terminal No. 1 or 2 and body.
	Inspection condition		• Put sensor in vessel filled with automatic transmission fluid. • Measure value of resistance the sensor in each temperature (Wait for more than 5 minutes in each time to measure correct resistances).
	Requirements		• 115°C {240°F}: 655 to 730 Ω • 120°C {250°F}: 585 to 645 Ω • 145°C {295°F}: 340 to 375 Ω • 155°C {310°F}: 280 to 305 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Replacement of sensor

<Step 5 inspection diagram>



Step 6	Inspection items		Inspection of harness between sensor and electronic control unit (signal)
	Maintenance item		Check circuit between connector terminal No. 2 and electronic control unit connector (CY24A) terminal No. 16.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify harness.

Step 7	Inspection items		Inspection of harness between sensor and electronic control unit (ground)
	Maintenance item		Check circuit between connector terminal No. 1 and electronic control unit connector (CY31A) terminal No. 28.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify harness.

Step 8	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Measure value of resistance between connector (CY24A) terminal No. 16 and connector (CY31A) terminal No. 28. **<Multi-Use Tester used>** Measure item No. 17 “A/T Oil Temp (TC)” of Service Data.
	Inspection condition		**<Multi-Use Tester not used>** Measure from back side of harness connector with electronic control unit connected to harness.
	Requirements		**<Multi-Use Tester not used>** Cold engine → during warm-up: Resistance is gradually reduced. **<Multi-Use Tester used>** • Cold engine: Proportionate to outside air temperature • During warm-up: Gradually increased.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P2757/Flash code: 61
[Monitor ID]
9
[Fault (outline)]
Failure of lockup clutch
[Diagnosis check]
- Engine speed is compared with turbine speed during lockup control.

[Code generation condition]
- Difference between engine speed and turbine speed is higher than specification (200 rpm).

[Diagnosis check timing]
- Fault diagnosis is performed each time when the control is activated.

[Diagnostic requirement]
- Lockup control: Lockup is in operation.
- Turbine speed sensor related diagnosis code does not occur.
- Engine speed sensor related diagnosis code does not occur.

[Control effected by electronic control unit during fault]
- Lockup control is turned OFF.

[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and turbine speed sensor
- Malfunction of each connector
- Malfunction of turbine speed sensor
- Malfunction of electronic control unit
- Malfunction of automatic transmission

[Recoverability]
- Recovered if signal becomes normal when starter switch is turned OFF to ON (power supply resumed to electronic control unit).

[Fault diagnosis]
- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Replacement of automatic transmission **<Multi-Use Tester used>** Measure item No. 15 “Engine Speed” and No. 16 “Turbine Speed” of Service Data.
	Inspection condition		• P0717 “Turbine Speed Sensor No Signal” and P0726 “Engine Speed Sensor Performance” diagnosis codes do not occur. • Item No. 13 “A/T Oil Temp (OP)” indicates 25°C {77°F} or higher. • Item No. 67 “Oil Press SW7”: ON (vehicle runs at the lockup speed) • Lockup speed (2nd gear, accelerator pedal fully pressed down): 22 to 24 km/h {13.7 to 14.9 mph} • Item No. 15 “Engine Speed” is compared with No. 16 “Turbine Speed” during lockup operation.
	Requirements		Both speeds are matched.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of automatic transmission

[Fault code]
Diagnosis code: P2759/Flash code: 35
[Monitor ID]
25, 26
[Fault (outline)]
Linear solenoid 3 is open-circuited or short-circuited.
[Diagnosis check]
- Resistance and current in the linear solenoid 3 are monitored for fault.

[Code generation condition]
- Resistance in the linear solenoid 3 remains at or above the specified value (100 kΩ) for 0.065 second (open-circuit or short-circuit in power supply side).
- Current in the linear solenoid 3 remains at or above the specified value (4A) for 0.065 second (short-circuit in ground side).

[Diagnosis check timing]
- Fault diagnosis is continuously performed.

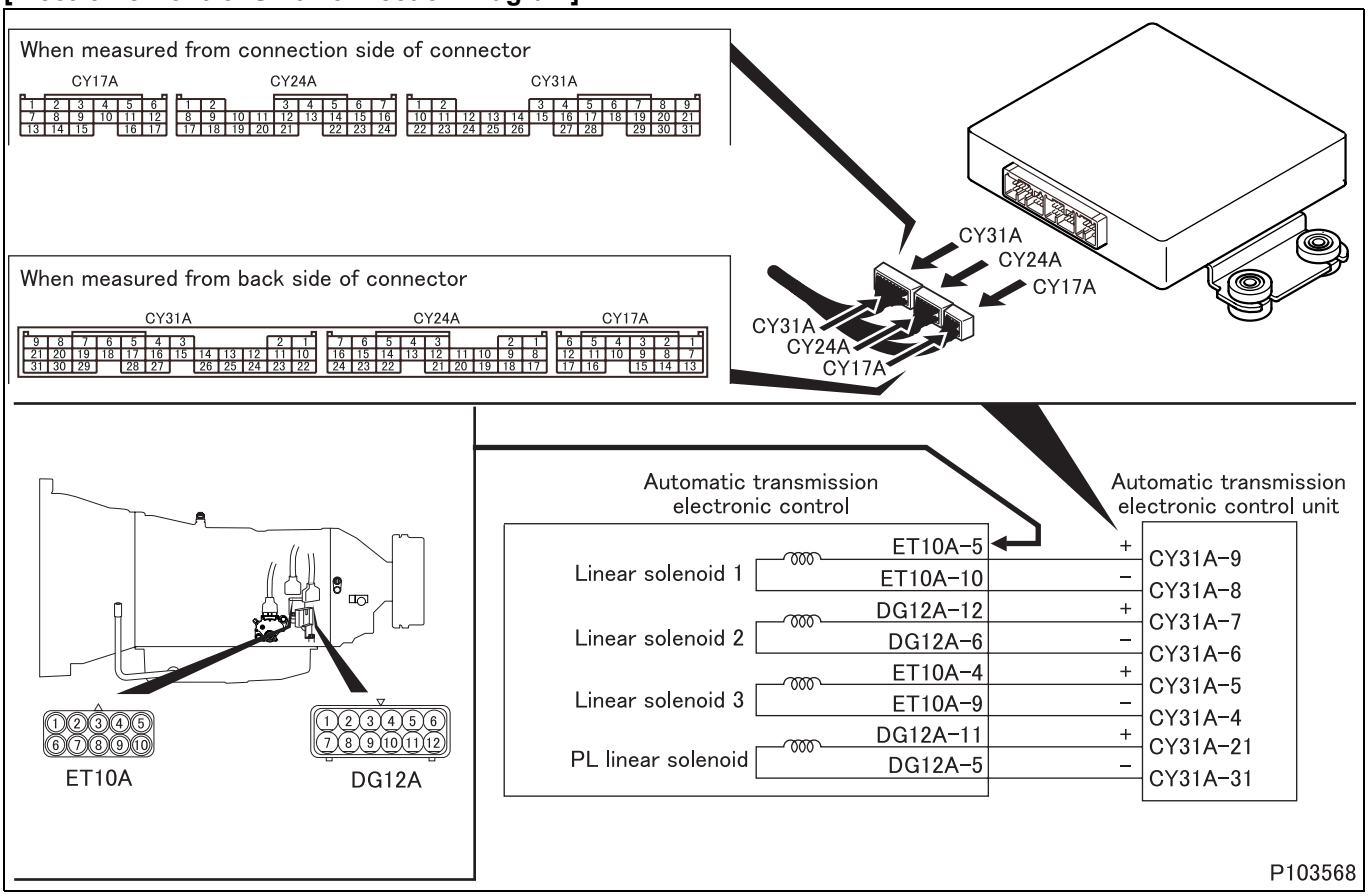
[Diagnostic requirement]
- Continuous

[Control effected by electronic control unit during fault]
- Lockup control is turned OFF
- Control is effected on fixed speed gear output (3rd for open-circuit, 2nd for short-circuit).

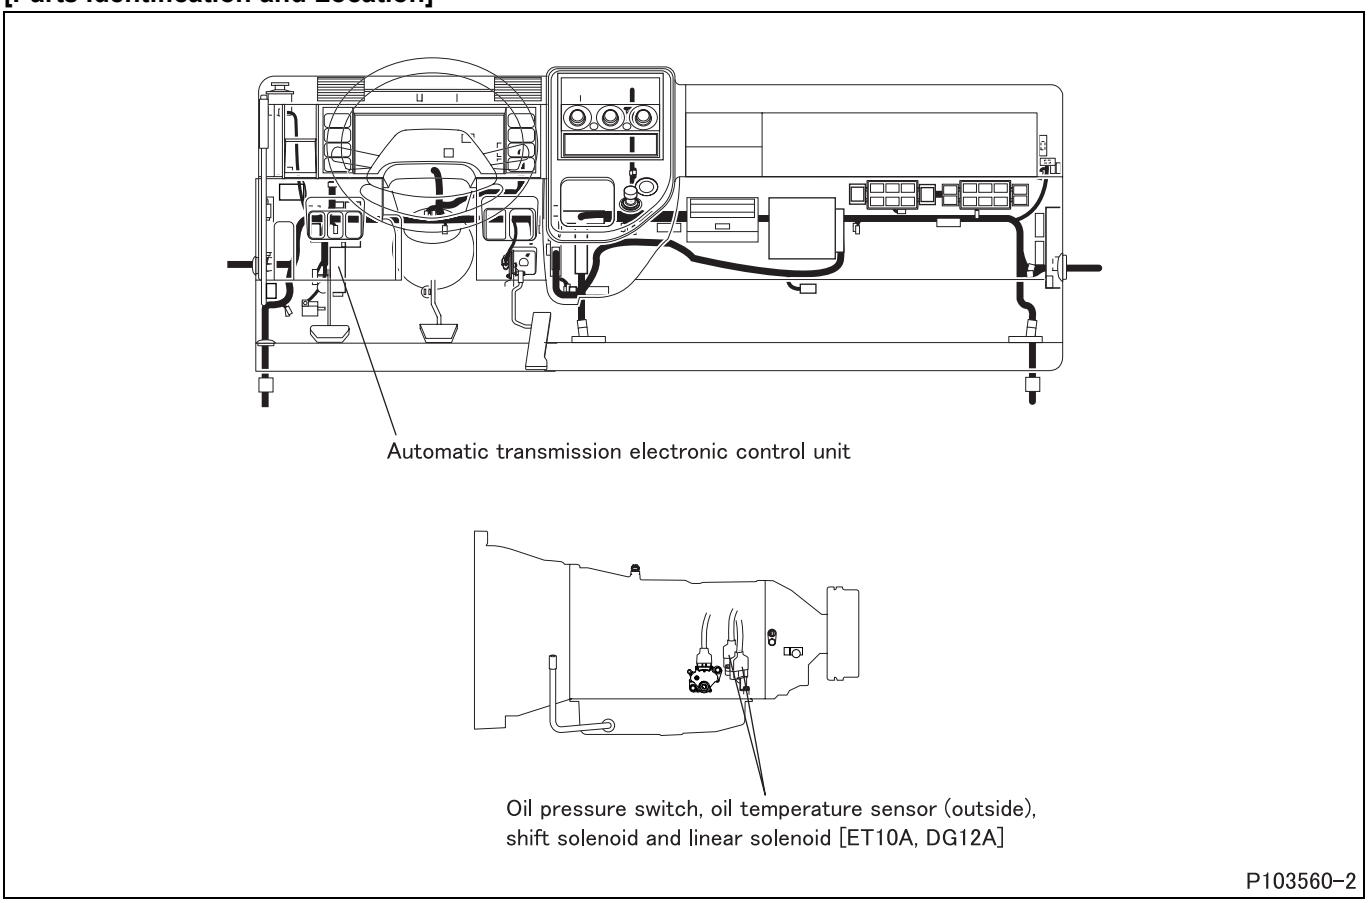
[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and linear solenoid 3
- Malfunction of each connector
- Malfunction of linear solenoid 3
- Malfunction of electronic control unit

[Recoverability]
- Recovered if signal becomes normal when starter switch is turned OFF to ON (power supply resumed to electronic control unit).

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Go to step 2. **<Multi-Use Tester used>** Measure item No. 35 “Linear Sol Press 3” of Service Data.
	Inspection condition		Engine in operation <When shifting from N to D> With the brake pedal pressed down, shift the range selector lever (from N to D). <In lock-up state> • Item No. 13 “A/T Oil Temp (OP)” indicates 25°C {77°F} or higher. • Lock-up speed (6th gear, accelerator pedal fully pressed down): 73 to 75 km/h {45.4 to 46.6 mph}
	Requirements		• When shifting from N to D: Varies • In lock-up state: 100 lbf/in^2
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

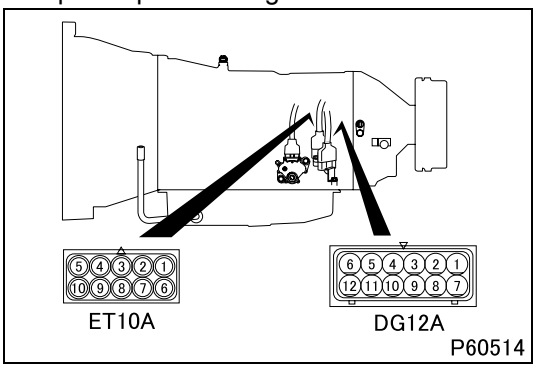
Step 2	Inspection items		Inspection by electronic control unit connector (signal)
	Maintenance item		Measure value of resistance between connector (CY31A) terminals No. 5 and 4.
	Inspection condition		• Disconnect electronic control unit and harness, and measure from connection side of harness connector. • Starter switch: OFF
	Requirements		5.5 ± 0.5 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Go to step 4.

Step 3	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify connector.

Step 4	Inspection items		Inspection of solenoid connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Modify connector.

Step 5	Inspection items		Inspection of solenoid unit
	Maintenance item		Measure value of resistance between connector (ET10A) terminals No. 4 and 9.
	Inspection condition		• Disconnect connector, and measure solenoid side terminal. • Starter switch: OFF
	Requirements		5.5 ± 0.5 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Replacement of automatic transmission

<Step 5 inspection diagram>



Step 6	Inspection items		Inspection of harness between solenoid and electronic control unit (power supply)
	Maintenance item		Check circuit between connector (ET10A) terminal No. 4 and electronic control unit connector (CY31A) terminal No. 5.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify harness.

Step 7	Inspection items		Inspection of harness between solenoid and electronic control unit (ground)
	Maintenance item		Check circuit between connector (ET10A) terminal No. 9 and electronic control unit connector (CY31A) terminal No. 4.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify harness.

Step 8	Inspection items		Inspection by control data
	Maintenance item		**<Multi-Use Tester not used>** Check for recurrence of the same diagnosis code. **<Multi-Use Tester used>** Measure item No. 35 “Linear Sol Press 3” of Service Data.
	Inspection condition		Engine in operation <When shifting from N to D> With the brake pedal pressed down, shift the range selector lever (from N to D). <In lock-up state> • Item No. 13 “A/T Oil Temp (OP)” indicates 25°C {77°F} or higher. • Lock-up speed (6th gear, accelerator pedal fully pressed down): 73 to 75 km/h {45.4 to 46.6 mph}
	Requirements		**<Multi-Use Tester not used>** If the same diagnosis code occurs, replace electronic control unit. **<Multi-Use Tester used>** • When shifting from N to D: Varies • In lock-up state: 100 lbf/in^2
	Inspection result (Is the judging standard satisfied?)	YES	If the diagnosis code remains after actual run, replace the electronic control unit.
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: U0100/Flash code: 88
[Monitor ID]
68, 69, 70, 71
[Fault (outline)]
Abnormality in controller area network communication
[Diagnosis check]
- Controller area network communication between engine electronic control unit is monitored for abnormality according to the controller area network signal to be received 1 second after the starter switch is turned ON.

[Code generation condition]
- Any of the signals to be received from engine electronic control unit through controller area network communication is not received for 0.5 second.

[Diagnosis check timing]
- Fault diagnosis is continuously performed.

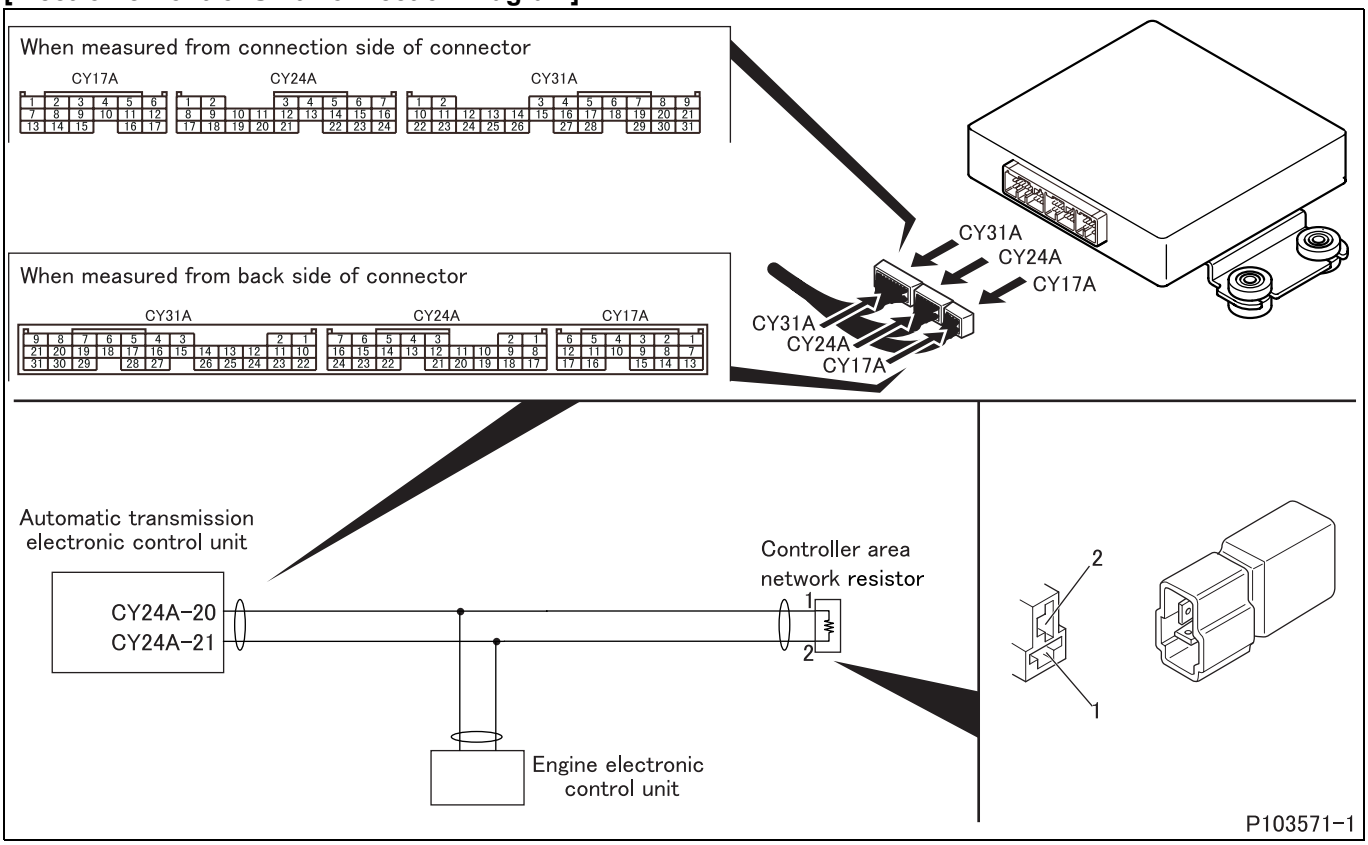
[Diagnostic requirement]
- Starter switch ON battery voltage is higher than 10 V.
- Starter switch: ON (not less than 1 sec.)

[Control effected by electronic control unit during fault]
- Effects no special control.

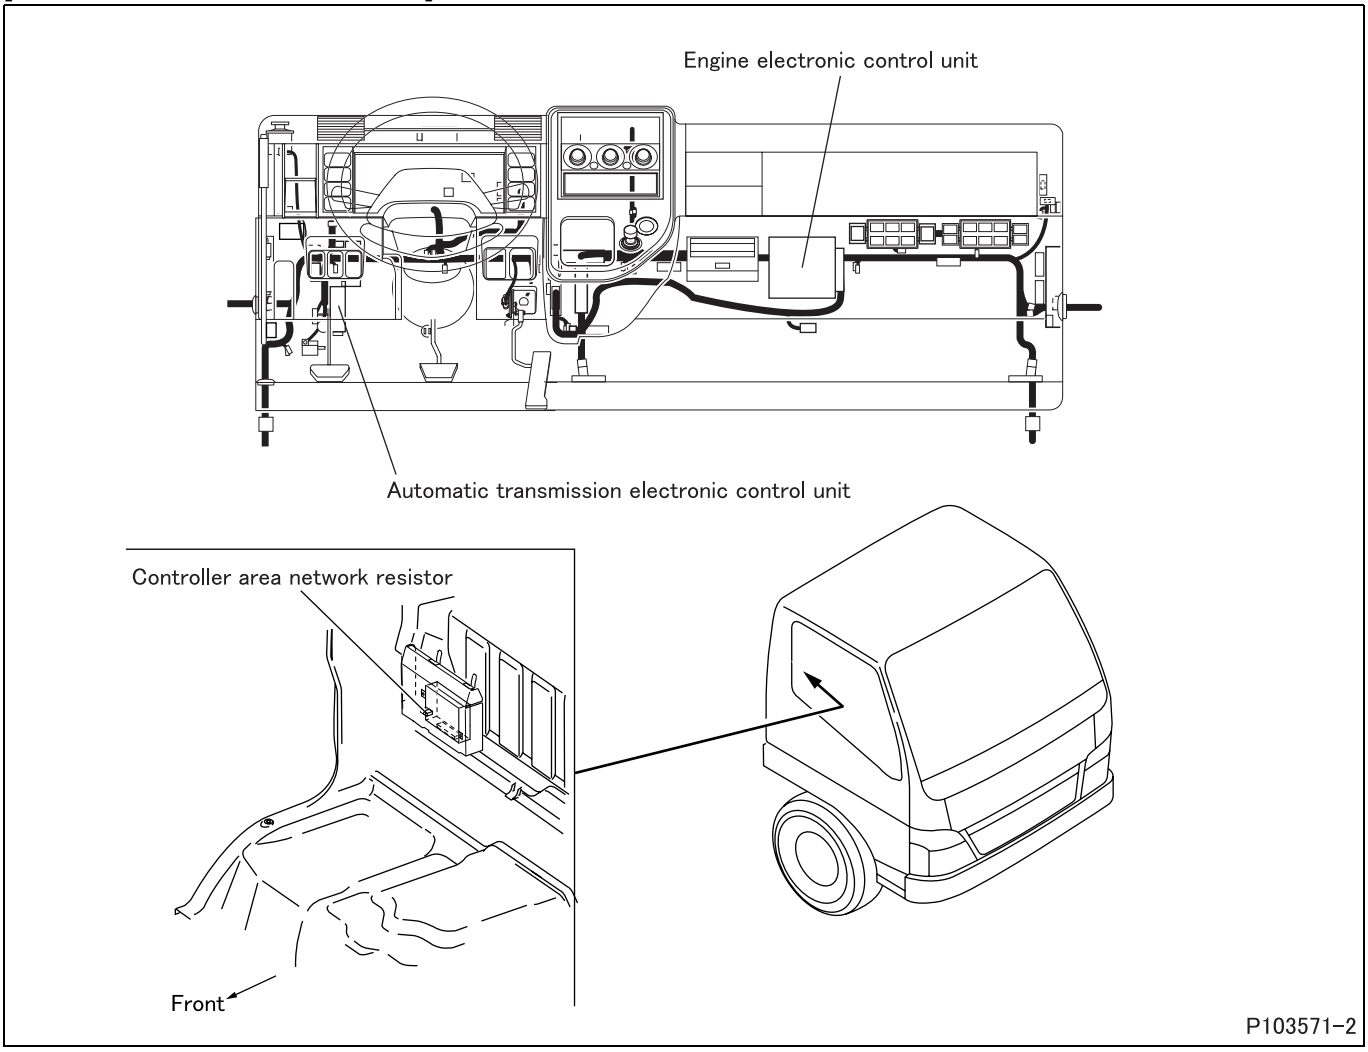
[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and controller area network resistor
- Malfunction of each connector
- Malfunction of controller area network resistor
- Malfunction of electronic control unit

[Recoverability]
- Recovered if signal becomes normal with starter switch in ON position.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

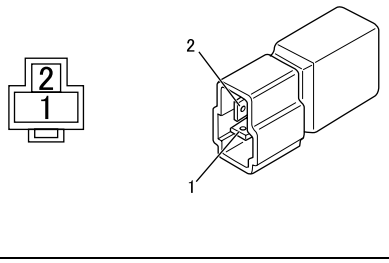
Step 1	Inspection items		Inspection by electronic control unit connector
	Maintenance item		Measure value of resistance between connector (CY24A) terminal No. 20 and 21.
	Inspection condition		• Disconnect the engine electronic control unit and automatic transmission electronic control unit connectors, and measure from connection side of harness connector. • Starter switch: OFF
	Requirements		120 ± 6 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

Step 2	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Modify connector.

Step 3	Inspection items		Inspection of controller area network resistor connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	Modify connector.

Step 4	Inspection items		Inspection of controller area network resistor unit
	Maintenance item		Measure value of resistance between connector terminals No. 1 and 2.
	Inspection condition		–
	Requirements		120 ± 6 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Replacement of controller area network resistor

<Step 4 inspection diagram>



Step 5	Inspection items		Inspection of harness between electronic control unit and controller area network resistor (HIGH)
	Maintenance item		Check circuit between controller area network resistor connector terminal No. 1 and electronic control unit connector (CY24A) terminal No. 20.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Modify harness.

Step 6	Inspection items		Inspection of harness between electronic control unit and controller area network resistor (LOW)
	Maintenance item		Check circuit between controller area network resistor connector terminal No. 2 and electronic control unit connector (CY24A) terminal No. 21.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify harness.

Step 7	Inspection items		Inspection by Multi-Use Tester diagnosis code
	Maintenance item		Check for occurrence of the diagnosis code No. P0863 “CAN Communication”.
	Inspection condition		Starter switch: ON
	Requirements		No codes occur.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Perform troubleshooting for the controller area network communication system in the engine electronic control. If the fault is not still removed, replace the automatic transmission electronic control unit.

4. Multi-Use Tester Service Data

NOTE

- **It is possible to see service data and actuator tests simultaneously.**

No.	Item	Data	Inspection condition	Requirement
11	IG	■■. ■V	Stater switch ON	Value matches battery voltage.
12	VEH Speed 1	■■■. ■MPH	Vehicle being driven	Value corresponds to speedometer indication.
13	A/T Oil Temp (OP)	■■■■.°F	Engine cold	Value corresponds to ambient temperature.
			Engine in process of warming up	Value gradually increases.
15	Engine Speed	■■■■.rpm	Racing (engine running)	Value corresponds to tachometer indication.
16	Turbine Speed	■■■■.rpm	Vehicle stationary with shift lever in D position	0 rpm
			Vehicle driven from abovementioned condition	Value increases.
17	A/T Oil Temp (TC)	■■■■.°F	Engine cold	Value corresponds to ambient temperature.
			Engine in process of warming up	Value gradually increases.
19	P Pos. SW	ON/OFF	Shift lever in P position	ON
			Shift lever in position except P	OFF
20	R Pos. SW	ON/OFF	Shift lever in R position	ON
			Shift lever in position except R	OFF
21	N Pos. SW	ON/OFF	Shift lever in N position	ON
			Shift lever in position except N	OFF
22	D Pos. SW	ON/OFF	Shift lever in D position	ON
			Shift lever in position except D	OFF
24	3 Pos. SW	ON/OFF	Shift lever in 3 position	ON
			Shift lever in position except 3	OFF
25	VEH Speed 2	■■■. ■MPH	Vehicle being driven	Value corresponds to speedometer indication.
26	Linear Sol Press 1	■■■. ■lbf/in^2	When shifting (1→2, 3→4, 5→6)	Increase
			When shifting (2→3, 4→5)	Decrease
27	Linear Sol Press 2	■■■. ■lbf/in^2	When shifting (2→3, 4→5)	Increase
			When shifting (1→2, 3→4, 5→6)	Decrease
28	OD-OFF SW	ON/OFF	Overdrive switch ON	ON
			Overdrive switch OFF	OFF
31	Shift Valve 1	ON/OFF	In 3rd gear and in 4th gear	ON
			In any gear except above	OFF
32	Shift Valve 2	ON/OFF	In 4th gear, in 5th gear and in 6th gear and in R range	ON
			In any gear except above	OFF
33	Shift Valve 3	ON/OFF	In 1st gear	ON
			In any gear except above	OFF
34	Linear Sol Press 4	■■■. ■lbf/in^2	In R range and 1st gear (large throttle opening)	260 lbf/in^2
			In any range/gear except above	100 lbf/in^2

No.	Item	Data	Inspection condition	Requirement
35	Linear Sol Press 3	■■■. ■lbf/in^2	Shift from N to D	Value changes
			During lockup in 6th gear	100 lbf/in^2
36	Oil Temp Lamp	ON/OFF	Oil temperature abnormal (excessively high)	ON
			Oil temperature normal	OFF
37	Brake SW	ON/OFF	Brake pedal pressed	ON
			Brake pedal not pressed	OFF
38	Exh. Brake SIG	ON/OFF	Decelerating (engine braking in progress)	ON
			Accelerating	OFF
47	ABS SW	ON/OFF	Anti-lock brake system operating	ON
			Anti-lock brake system not operating	OFF
49	Diagnosis SW	ON/OFF	Diagnosis switch fuse removed	ON
			Diagnosis switch fuse fitted	OFF
52	Shift Valve 4	ON/OFF	In R range (large throttle opening)	OFF
			In R range (small throttle opening)	ON
53	Diagnosis Lamp	ON/OFF	Warning lamp illuminated	ON
			Warning lamp not illuminated	OFF
54	Exh Brake Cut SIG	ON/OFF	Decelerate and stop	OFF → ON
			Accelerating	OFF
55	Selector Pos.	P-Range/R-Range/ N-Range/D-Range/ 3-Range/2-Range	Shift lever in P position	P-Range
			Shift lever in R position	R-Range
			Shift lever in N position	N-Range

			In 3rd gear	3RD
			In 4th gear	4TH
			In 5th gear	5TH
			In 6th gear	6TH
			In neutral (shift lever in P or N position)	N
			Reversing	R
58	Accel Percent	■■■%	Accelerator pedal not pressed (throttle fully closed)	0%
			Accelerator pedal pressed (throttle wide open)	100%
61	Oil Press SW1	ON/OFF	In 2nd gear, in 4th gear and in 6th gear	ON
			In 1st gear, in 3rd gear and in 5th gear	OFF
62	Oil Press SW2	ON/OFF	In 1st gear, in 3rd gear and in 5th gear	ON
			In 2nd gear, in 4th gear and in 6th gear	OFF

No.	Item	Data	Inspection condition	Requirement
63	Oil Press SW3	ON/OFF	In 3rd gear and in 4th gear	ON
			In 1st gear, in 2nd gear, in 5th gear and in 6th gear	OFF
64	Oil Press SW4	ON/OFF	In 4th gear, in 5th gear and in 6th gear	ON
			In 1st gear, in 2nd gear and in 3rd gear	OFF
65	Oil Press SW5	ON/OFF	In 1st gear	ON
			In 2nd gear, in 3rd gear, in 4th gear, in 5th gear and in 6th gear	OFF
66	Oil Press SW6	ON/OFF	In 1st gear	ON
			In 2nd gear, in 3rd gear, in 4th gear, 5th gear and in 6th gear	OFF
67	Oil Press SW7	ON/OFF	Shift from N to D or during lockup	OFF → ON → OFF
68	Oil Press SW8	ON/OFF	In D range	ON
			In P, R, N range	OFF
69	Coolant Temp	■■■■.°F	Engine cold	Value corresponds to ambient temperature.
			Engine in process of warming up	Value gradually increases.
			Engine stopped after warming up	Value gradually decreases.
71	Shift Valve Press 1	HIGH/LOW	In 3rd gear and in 4th gear	HIGH
			In any gear except above	LOW
72	Shift Valve Press 2	HIGH/LOW	In 4th gear, in 5th gear and 6th gear and in R range	HIGH
			In any gear except above	LOW
73	Shift Valve Press 3	HIGH/LOW	In 1 gear	HIGH
			In any gear except above	LOW
74	Shift Valve Press 4	HIGH/LOW	In R range (large throttle opening)	HIGH
			In R range (small throttle opening)	LOW
78	2 Pos. SW	ON/OFF	Shift lever in 2 position	ON
			Shift lever in position except 2	OFF

5. Possible Causes of Symptoms

Symptoms / Possible causes	Abnormal movement						Shift abnormality					
	Vehicle can be driven in N range.	Transmission stays in P range when lever is moved out of P position.	Vehicle moves with lever in P position.	Vehicle does not move in any range.	Vehicle does not move in R range.	Vehicle does not move in D, 3, and 2 ranges.	Lockup point is excessively high or low.	Lockup does not occur.	Engine braking does not occur in 3 range.	Engine braking does not occur in 2 range.	Kickdown does not occur.	Shift point is excessively high or low.

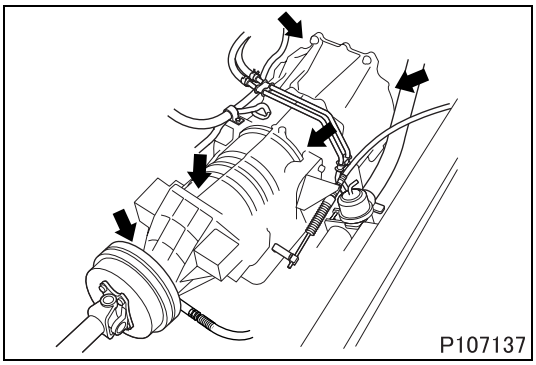
ON-VEHICLE INSPECTION AND ADJUSTMENT

1. Inspection of Automatic Transmission Oil Leakage



1.1 Inspection of oil leakage at each part of transmission body

- Check the oil leakage at each part of automatic transmission body in visual.
  If the oil leakage is found, replace the defective part.

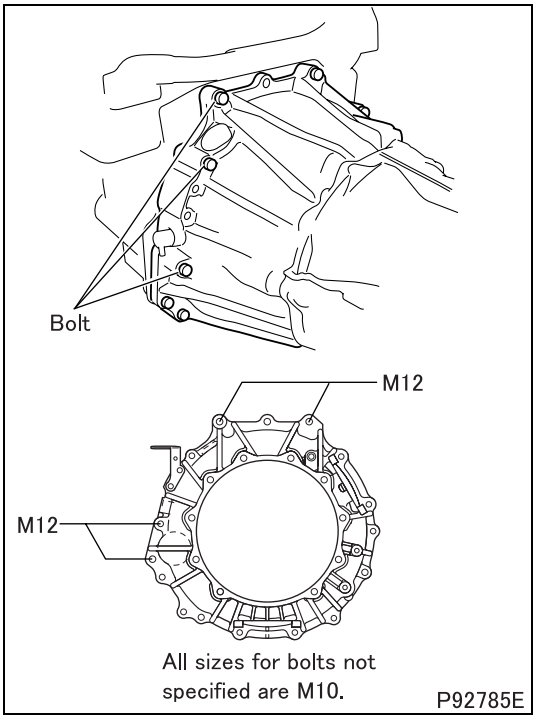
1.2 Inspection of oil leakage around transmission mounting part

- Check there is not oil stain on flywheel housing and automatic transmission mounting part caused by oil leakage from engine.
- If there is the oil stain, remove the automatic transmission and clean the mounting surface of converter housing and flywheel housing using brake cleaner etc. after repairing oil leakage part. Because the oil stain may loosen the automatic transmission mounting bolts. (See “REMOVAL AND INSTALLATION OF AUTOMATIC TRANSMISSION”.)

2. Check for Looseness in Automatic Transmission Mounting Bolts

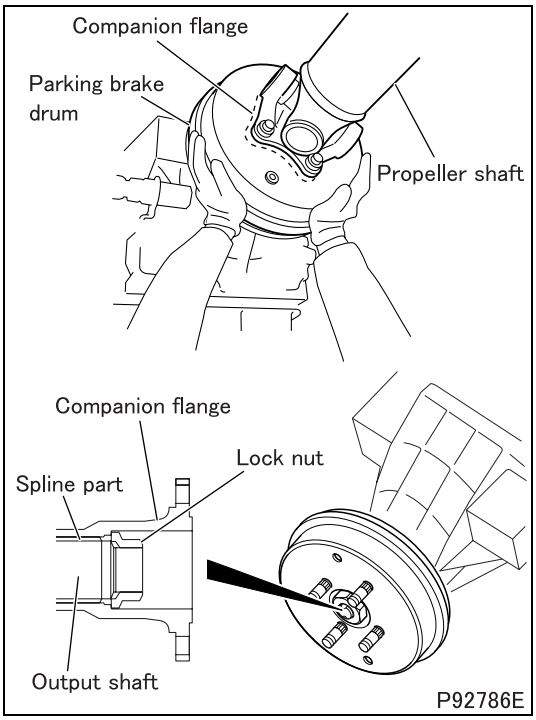
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
–	Bolt (automatic transmission mounting)	47 {35, 4.8}	M10
		82 {60, 8.4}	M12



- Check the automatic transmission mounting bolts for looseness.
- Retighten any loose bolt to the specified torque.

3. Inspection of Play in Companion Flange and Looseness in Lock Nut



- Move the parking brake drum or companion flange in axial and vertical directions to check for excessive play between the companion flange and output shaft.
- If excessive play is detected, remove the propeller shaft, then check the lock nut for looseness and the splines on companion flange and output shaft for abnormalities.
- If found loose, tighten the lock nut to the specified torque, then crimp it at two places. (See “PARKING BRAKE”.)
- If the companion flange is found detective, replace the part. (See “PARKING BRAKE” section.)
- If the companion flange is not found detective, the output shaft may be defective, replace automatic transmission.

4. Inspection of Automatic Transmission Fluid

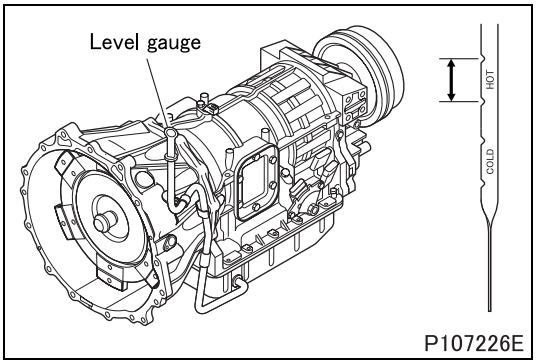
Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
–	Automatic transmission	Mobil ATF3309 or equivalent	–

- If the automatic transmission fluid level is too low, the pump can draw in air together with the automatic transmission fluid, and the resulting air bubbles can make the automatic transmission fluid spongy, resulting in a pressure reduction that causes the clutches in the automatic transmission to slip.
- If the automatic transmission fluid level is too high owing to incorrect replenishment, rotating parts can agitate it, resulting in air bubbles that, as with an excessively low automatic transmission fluid level, make the automatic transmission fluid spongy, resulting in a pressure reduction that causes the clutches in the automatic transmission to slip.
- Whether the automatic transmission fluid level is too low or too high, air bubbles lead to overheating and to oxidation of and varnish formation by the oil, thereby impeding proper operation of the valves and clutches.
- Air bubbles can also cause foaming such that automatic transmission fluid emerges from the vent hole and filler tube of the automatic transmission. This phenomenon can be mistaken for automatic transmission fluid leakage.
- To prevent the above mentioned problems, you must check the automatic transmission fluid level accurately in accordance with the following instructions.

4.1 Inspection of automatic transmission fluid condition

- If the automatic transmission fluid smells burned and contains particles of metal and friction material, a complete overhaul of the automatic transmission is necessary. Carefully inspect the automatic transmission fluid that adheres to the level gauge. If you have any doubts about the condition of the automatic transmission fluid, take a sample and perform another check.



4.2 Inspection of automatic transmission fluid level

- Drive the vehicle until the automatic transmission fluid is adequately warm (70 to 80°C {160 to 175°F}).
- Stop the vehicle on a level surface, securely apply the parking brake, and apply chocks to the wheels.
- With the engine idling, slowly move the range selector lever from the P position to each position through L then back to the P position to ensure that the hydraulic circuit is filled with automatic transmission fluid.
- Remove all dirt from the top of the filler tube.
- With the engine still idling, withdraw the level gauge, wipe the ATF off it, and re-insert it. Then, withdraw the level gauge again and check the automatic transmission fluid level.
- The automatic transmission fluid level is acceptable if the level on the level gauge is within the HOT range.

CAUTION ⚠

- **Be sure to inspect the automatic transmission fluid level with the vehicle parked on a level surface.**
- **Be sure to inspect the automatic transmission fluid level with the engine idling and with the N range selected. If the engine was not running during the inspection, the automatic transmission fluid level would look higher.**
- **Since the engine is running, you must pay attention to safety. Be careful not to get trapped or burned.**
- **Keep the engine idling until you have finished adjusting the automatic transmission fluid level. Do not increase the engine speed.**

- If the automatic transmission fluid level is too low, add specified automatic transmission fluid through the filler tube until it reaches the specified part of the level gauge.

CAUTION ⚠

- **Never use the automatic transmission fluid except the specified one.**

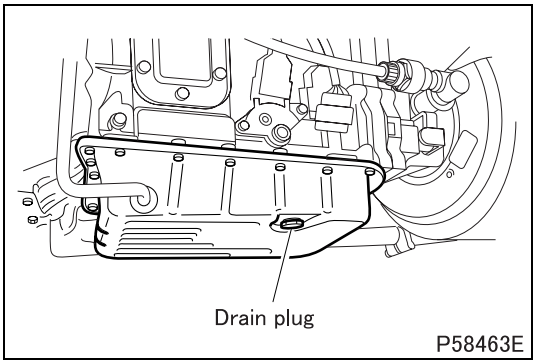
5. Replacement of Automatic Transmission Fluid

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
–	Drain plug	27 {20, 2.8}	–

Lubricant and/or sealant

Mark	Points of application		Specified lubricant and/or sealant	Quantity
–	Automatic transmission	Replaced with oil pan removed	Mobil ATF3309 or equivalent	Approx. 8.4 L {8.9 qts}
		Replaced with drain plug removed		Approx. 6.4 L {6.8 qts}



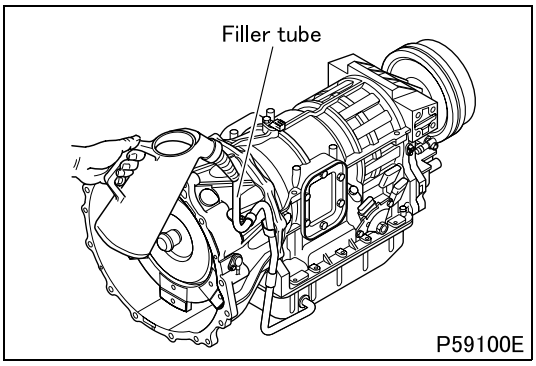
5.1 Draining

- Place a container under the transmission oil pan. Remove the drain plug near the front of the oil pan and allow the automatic transmission fluid to drain out.
- At the same time, check whether the drained automatic transmission fluid is dirty and whether it contains metallic particles.
  Note that the automatic transmission fluid will drain out more quickly if you warm it by allowing the engine to warm up.

CAUTION ⚠

- **The automatic transmission fluid is extremely hot immediately after driving. To avoid the risk of being scalded, wait for the automatic transmission fluid to cool to a safe temperature before starting work.**
- **It is not possible to drain out the automatic transmission fluid that is in the hydraulic circuit, torque converter, and oil cooler.**

- At this point, approximately 2 L {2.1 qts} of automatic transmission fluid remains in the oil pan. If you wish to replace this automatic transmission fluid, remove the oil pan.



5.2 Filling

- Make ready the new automatic transmission fluid.
- Fit the oil pan drain plug and gasket in their original conditions.
- Supply new automatic transmission fluid through the filler tube in a quantity equivalent to that of the automatic transmission fluid that drained out.

CAUTION ⚠

- **Never use the automatic transmission fluid except the specified one.**
- **Be careful not to allow dirt and other foreign matter to enter.**

- Place the range selector lever in the P position. Start the engine and allow it to idle for at least 2 minutes.
- Place the range selector lever in each other position then return it to the P position.

CAUTION ⚠

- **Keep the engine idling. Do not rev the engine.**

- Check the automatic transmission fluid level.

5.3 Fluid leakage

- Check the torque converter housing for fluid leakage. If fluid leakage is found, locate the origin of the leakage.
  - If leakage is found on the torque converter or the surrounding area, it is not necessarily automatic transmission fluid but can possibly be leaked engine oil.
  - Automatic transmission fluid is red in color and therefore is distinguishable from engine oil.
  - If the fluid that is leaking is automatic transmission fluid, check carefully whether it is from the torque converter, or from the transmission (through the oil seal of the oil pump housing or from between the oil pump housing and transmission case).

6. Stall Test

Service standards

Mark	Maintenance item	Standard value	Limit	Remedy
–	Stall speed	2000 ± 150 rpm	–	Replace

6.1 Purpose of stall test

- A stall test is performed to check for slipping of the frictional elements in the transmission and of the one-way clutch in the torque converter. It gives an indication of the torque converter's operating condition and of the engine's overall performance.

6.2 Test procedure

CAUTION ⚠

- **Before performing the test, make sure there is no worker in front and at the rear of the vehicle.**

- Before performing a stall test, inspect the engine coolant, engine oil, and automatic transmission fluid levels. Then, allow the engine and transmission to warm up.
- To prevent the vehicle from moving, apply the parking brake and place chocks before and after the front and rear wheels. Also, hold down the brake pedal firmly when pressing the accelerator pedal during the test.
- Start the engine and move the range selector lever to the D position.
- Gradually press the accelerator pedal until it reaches the end of its stroke. When the engine speed stabilizes, promptly read the engine speed (this is the stall speed) and release the accelerator pedal.

CAUTION ⚠

- **The period during which the accelerator pedal is fully pressed must be shorter than 5 seconds. Complete the measurement within this period.**
- **If the engine speed does not stabilize (if the engine speed continues to gradually increase or the engine suddenly revs), immediately stop the test.**

- Move the range selector lever to the N position, then allow the engine to cool down by running it at 1200 rpm for one minutes or longer.
- Perform the test procedure similarly for the R range.

6.3 Evaluation of test results

Test result	Main causes
Stall speed is lower than standard value in each range.	Engine output is insufficient. (See Gr11.)
	One-way clutch in torque converter is malfunctioning.
Stall speed is higher than standard value in D range.	Clutch No. 1 is slipping.
	One-way clutch is malfunctioning.
	Line pressure is too low.
Stall speed is higher than standard value in R range.	Clutch No. 3 is slipping.
	Brake No. 2 is slipping.
	Line pressure is too low.

- If abnormalities are found in the automatic transmission unit itself, replace automatic transmission.

7. Time Lag Test

Service standards

Mark	Maintenance item		Standard value	Limit	Remedy
–	Time lag	With shift from N to D	0.7 sec	–	Replace
		With shift from N to R	1.2 sec		

7.1 Purpose of time lag test

- A time lag test is performed to check the respective conditions of the one-way clutch, clutch No. 1, clutch No. 3, and brake No. 2.

7.2 Test procedure

CAUTION ⚠

- **Before performing the test, make sure there is no worker in front and at the rear of the vehicle.**

- Raise the oil temperature to 50 to 80°C {120 to 175°F} (the range that corresponds to normal vehicle operation).
- Apply chocks to the front and rear wheels from both sides and apply the parking brake to hold the vehicle in place.
- Start the engine and check the idling speed.
- While stepping on the brake pedal, move the range selector lever from the N position to the D position. Use a stopwatch to measure the time (time lag) that elapses until you feel shock.
- In a similar manner, measure the time lag for a shift from the N range to the R range.

7.3 Evaluation of results

Test result	Conceivable cause
Time lag with shift from N to D is too long.	Line pressure is too low.
	Clutch No. 1 is slipping.
	One-way clutch is malfunctioning.
Time lag with shift from N to R is too long.	Line pressure is too low.
	Clutch No. 3 is slipping.
	Brake No. 2 is slipping.

- If abnormalities are found in the automatic transmission unit itself, replace automatic transmission.

8. Line Pressure Test

Service standards

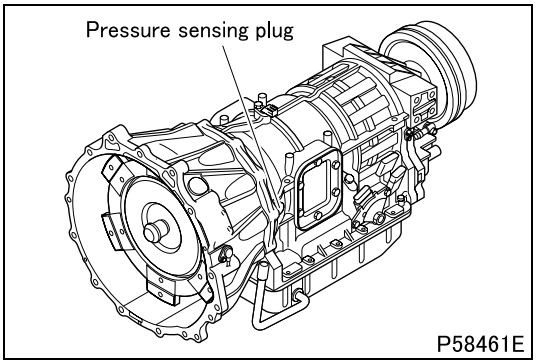
Mark	Maintenance item			Standard value	Limit	Remedy
–	Line pressure	At idling speed	D range	1000 to 2010 kPa {145 to 290 psi, 10.2 to 20 kgf/cm^2}	–	Replace
			R range			
		At stalling speed	D range	1660 to 2010 kPa {240 to 290 psi, 17 to 20 kgf/cm^2}		
			R range			

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
–	Pressure sensing plug	27 {20, 2.8}	1/2-20 UNF

8.1 Purpose of line pressure test

- A line pressure test is performed to check the performance of the oil pump, to check the functionality of the control valve, and to check parts for oil leakage.



8.2 Test procedure

CAUTION ⚠

- **Before performing the test, make sure there is no worker in front and at the rear of the vehicle.**

- Apply chocks to the front and rear wheels from both sides and apply the parking brake to hold the vehicle in place.
- The line pressure test should be performed by two people. One person moves away from the vehicle and checks the condition of the tires and wheel chocks. The other person performs the test.
- Remove the pressure sensing plug and fit the oil pressure gauge.
- Start the engine. Allow it to warm up until the automatic transmission fluid reaches a temperature of 50 to 80°C {120 to 175°F}. Check the idling speed.
- Press the brake pedal firmly with your left foot. While holding down the brake pedal, shift to the D range. Then, measure the oil pressure while the engine is idling.

- Fully press the accelerator pedal. Quickly measure the oil pressure at the stall speed.

CAUTION ⚠

- **If the engine speed does not reach the stall level and the rear wheels start to turn, ease off the accelerator pedal and stop the test.**

- Take a measurement in a similar manner for the R range.
- After taking the measurements, fit the pressure sensing plug and tighten it to the specified torque.
- If the measured value does not conform to the standard value, locate the possible cause by referring to the following table and inspect.

8.3 Locating possible causes

Test result	Conceivable cause
Measured value is higher than standard value in all ranges.	Regulator valve is sticking.
Measured value is lower than standard value in all ranges.	Regulator valve is sticking.
	Oil pump is worn.
Measured value is lower than standard value in D range only.	Oil leak exists in D range system.
	Clutch No. 1 is abnormal.
Measured value is lower than standard value in R range only.	Oil leak exists in R range system.
	Clutch No. 3 is abnormal.
	Brake No. 2 is abnormal.

- If abnormalities are found in the automatic transmission unit itself, replace automatic transmission.

9. Road Test

Service standards (Unit: km/h {mph})

Location	Maintenance item			Standard value	Limit	Remedy
–	Vehicle speeds during shifts (D range)	Half open (accelerator pedal position: 4/8)	1st → 2nd	8 to 10 {4.97 to 6.21}	–	Replace
			2nd → 3rd	23 to 25 {14.3 to 15.5}	–	
			3rd → 4th	36 to 38 {22.4 to 23.6}	–	
			4th → 5th	47 to 49 {29.2 to 30.4}	–	
			5th → 6th	59 to 61 {36.7 to 37.9}	–	
		Fully open (accelerator pedal position: 8/8)	1st → 2nd	15 to 17 {9.32 to 10.6}	–	
			2nd → 3rd	34 to 36 {21.1 to 22.4}	–	
			3rd → 4th	53 to 55 {32.9 to 34.2}	–	
			4th → 5th	73 to 75 {45.4 to 46.6}	–	
			5th → 6th	95 to 96 {59.0 to 59.7}	–	
		Fully closed (accelerator pedal position: 0/8)	1st → 2nd	8 to 10 {4.97 to 6.21}	–	
			2nd → 3rd	18 to 20 {11.2 to 12.4}	–	
			3rd → 4th	28 to 30 {17.4 to 18.6}	–	
			4th → 5th	39 to 41 {24.2 to 25.5}	–	
			5th → 6th	55 to 57 {34.2 to 35.4}	–	
–	Vehicle speeds during lockup	Half open (accelerator pedal position: 4/8)	2nd gear ON	15 to 17 {9.32 to 10.6}	–	Replace
			3rd gear ON	23 to 25 {14.3 to 15.5}	–	
			4th gear ON	33 to 35 {20.5 to 21.7}	–	
			5th gear ON	40 to 42 {24.9 to 26.1}	–	
			6th gear ON	49 to 51 {30.4 to 31.7}	–	
		Fully open (accelerator pedal position: 8/8)	2nd gear ON	22 to 24 {13.7 to 14.9}	–	
			3rd gear ON	34 to 36 {21.1 to 22.4}	–	
			4th gear ON	46 to 48 {28.6 to 29.8}	–	
			5th gear ON	60 to 62 {37.3 to 38.5}	–	
			6th gear ON	73 to 75 {45.4 to 46.6}	–	
		Fully closed (accelerator pedal position: 0/8)	2nd gear OFF	14 to 16 {8.70 to 9.94}	–	
			3rd gear OFF	21 to 23 {13.0 to 14.3}	–	
			4th gear OFF	28 to 30 {17.4 to 18.6}	–	
			5th gear OFF	37 to 39 {23.0 to 24.2}	–	
			6th gear OFF	45 to 47 {28.0 to 29.2}	–	

9.1 Test procedure

- Before performing a road test, check the fluid level and automatic transmission fluid condition and make sure the selector cable and accelerator control cable are correctly adjusted.
- During the road test, operate the automatic transmission in each range. Check the slip feel and other changes during shifts.
- Check whether the shift feel gets firmer and softer.
- Check the shift points where upshifts and downshifts occur.
- When a Multi-Use Tester is used, check the lockup points by observing when Multi-Use Tester Service Data No. 67 “Oil Press SW7” turns on.
- All data correspond to a differential ratio of 5.285 and to a tire radius of 0.387 m (215/85R16).
- If the differential ratio or tire radius is different, the speeds will be concomitantly slower or higher. Adjust the values in the table accordingly.
- If measurements deviate from specified standard values, replace automatic transmission.

10. Dealer Adjust

• What is Dealer Adjust?

Individual automatic transmissions have different characteristics from each other. By carrying out Adjust Steps 1 to 4, electronic control unit will learn specific characteristics of the automatic transmission that it controls and thereby compensate for improved gear shift quality.

Dealer Adjust must be performed whenever:
- The automatic transmission has been replaced.
- The electronic control unit has been replaced.

NOTE
- **If the dealer adjustment has not performed, ATF temperature warning lamp stays on.**
- **During Dealer Adjust process, the clutches will be activated, which may generate shock loads and/or clutch noise.**
- **To ensure safety, chock all of the front and rear wheels and firmly apply the parking brake.**
- **When the engine speed is set at 1000 to 1500 rpm during Dealer Adjust, firmly press the brake pedal with your left foot.**

10.1 Dealer Adjust procedure

- Turn off all electrical equipment including the air conditioner and headlights.
- Ensure that the parking brake is applied ant that all wheels are chocked.
- Ensure that automatic transmission fluid is at the specified level.
- Start the engine and run it at idle for 5 minutes for warm-up.
- Move the range selector lever form N to D, and from N to R. Repeat this 3 to 5 times.

↓

Enter Adjust Mode
ATF temperature warning lamp flashes (at intervals of 0.2 sec.)

Conditions for entering Adjust Mode
- Diagnosis switch: Open
- Output shaft speed: 0 rpm (vehicle stationary)
- Brake pedal: Pressed
- Automatic transmission fluid temperature: 40 to 90°C {105 to 195°F}
- Engine speed: 500 rpm or above
- Move the lever from D to 3, three times within 10 sec.

If the ATF temperature warning lamp comes on, this means that the temperature of automatic transmission fluid in the oil pan is below the specified level. Warm up the transmission and try entering Adjust Mode again.

↓

Ensure that the engine speed remains stable within the specified idle speed range.

↓

Prepare for Adjust Steps 1 and 2

Conditions for Adjust Steps 1 and 2
- Range selector lever: In D range
- Overdrive switch: ON → OFF (5th and 6th gears disabled)
- Brake pedal: Pressed

NOTE
- **If the vehicle moves after Adjust Steps have started, Dealer Adjust process needs to be stopped (ATF temperature warning lamp illuminates 2 sec. and then extinguishes 1 sec., and repeats this cycle). Stop the engine and try the procedure again from the start.**

↓

(Continued to next page)

(Continued from previous page)

↓

Start Adjust Step 1
ATF temperature warning lamp flashes (intervals: 0.2 sec. → 0.5 sec.)

- Succeeded: ATF temperature warning lamp flashes (at intervals of 0.2 sec.)
- Failed: ATF temperature warning lamp illuminates

If failed, ensure that the engine is running within the specified idle speed range. Prepare for Adjust Steps 1 and 2 again.

↓

Within 30 sec. from the time when Adjust Step 1 has successfully started, press the accelerator pedal to maintain the engine speed within the range of 1000 to 1500 rpm.

↓

Start Adjust Step 2
ATF temperature warning lamp continues to flash (at intervals of 0.2 sec.)

Maintain the current state (engine running at 1000 to 1500 rpm)

- Succeeded: ATF temperature warning lamp extinguishes
- Failed: ATF temperature warning lamp illuminates

If failed, ensure that the engine is running within the specified idle speed range. Prepare for Adjust Steps 1 and 2 again.

↓

Ensure that the engine speed remains stable within the specified idle speed range.

↓

Prepare for Adjust Steps 3 and 4

Conditions for Adjust Steps 3 and 4

- Range selector lever: In R range
- Overdrive switch: ON → OFF (5th and 6th gears disabled)
- Brake pedal: Pressed

↓

Start Adjust Step 3
ATF temperature warning lamp extinguishes → flashes (at intervals of 0.5 sec.)

- Succeeded: ATF temperature warning lamp flashes (at intervals of 0.2 sec.)
- Failed: ATF temperature warning lamp illuminates

If failed, prepare for Adjust Steps 3 and 4 again.

↓

Within 30 sec. from the time when Adjust Step 3 has successfully started, press the accelerator pedal to maintain the engine speed within the range of 1000 to 1500 rpm.

↓

(Continued to next page)

(Continued from previous page)

↓

Start Adjust Step 4
ATF temperature warning lamp continues to flash (at intervals of 0.2 sec.)

Maintain the current state (engine running at 1000 to 1500 rpm)
- Succeeded: ATF temperature warning lamp extinguishes
- Failed: ATF temperature warning lamp illuminates

When the lamp has illuminated or extinguished, release the accelerator pedal and return the engine to idle speed.

If failed, prepare for Adjust Steps 3 and 4 again.

↓

End of Adjust Steps
ATF temperature warning lamp flashes
(extinguishes for 2 sec., then illuminates for 1 sec., and this is repeated)

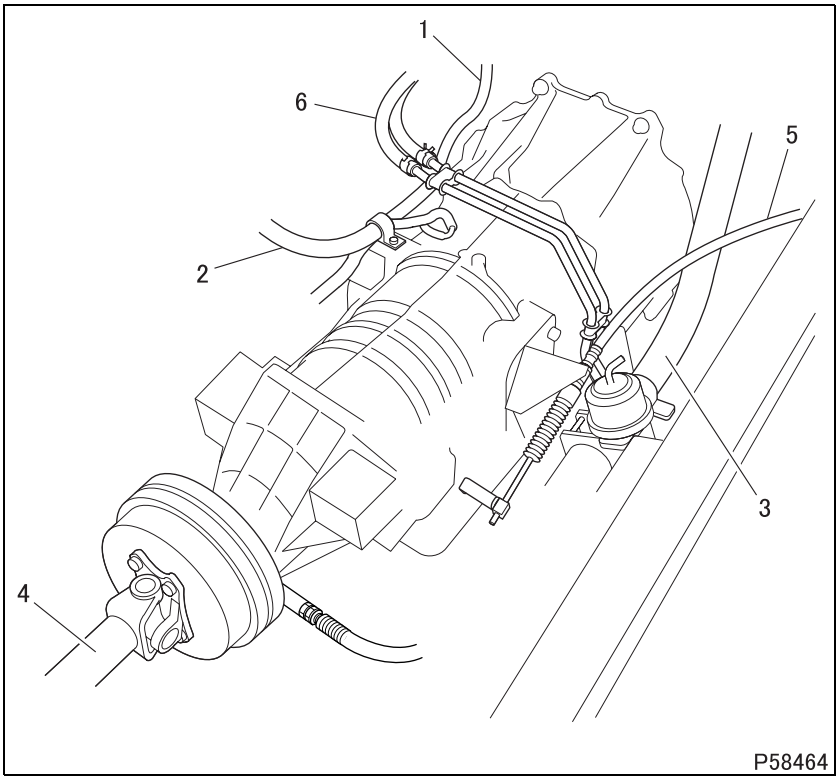
↓

Move the range selector lever to P range.

↓

Stop the engine. This is the end of Dealer Adjust.
ATF temperature warning lamp extinguishes.

Preparatory Work



● Removal sequence

1 Filler tube
2 Electrical harness
3 Exhaust pipe
4 Propeller shaft (See Gr25.)
5 Selector cable (See later section.)
6 Oil cooler hose (See later section.)

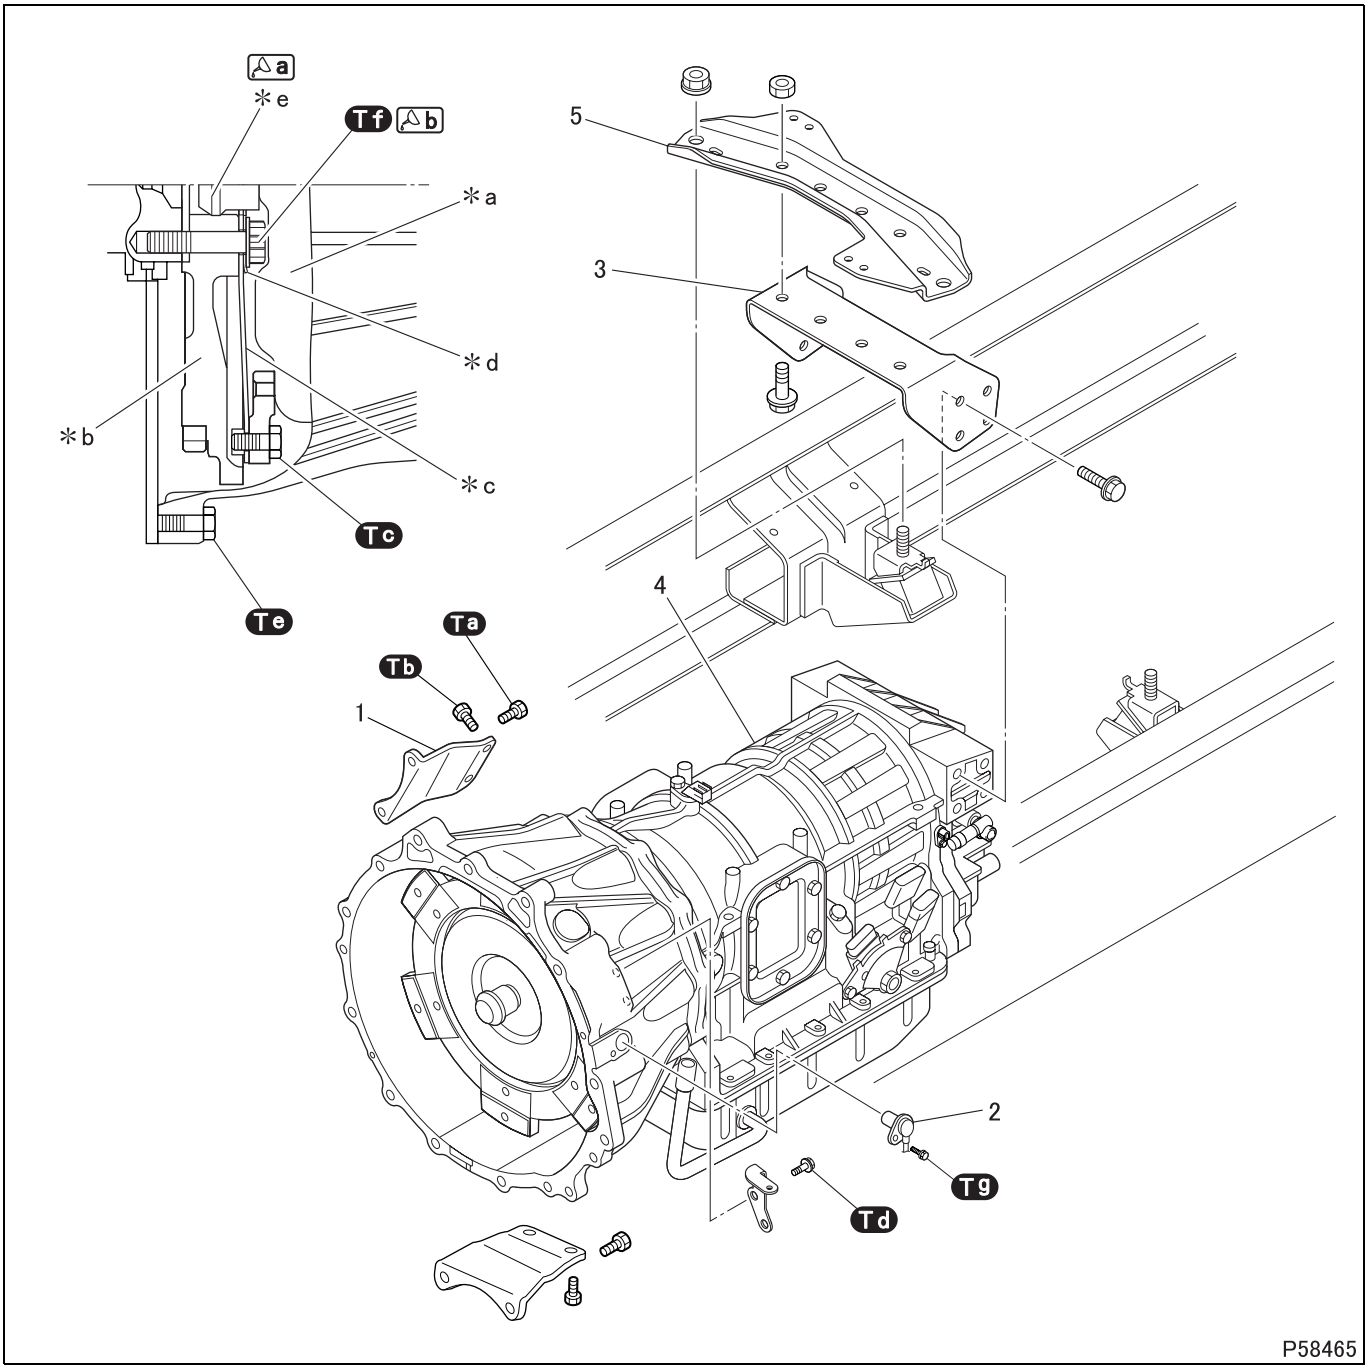
● Installation sequence

Perform installation by following the removal sequence in reverse.

CAUTION ⚠

- **If the automatic transmission fluid contains a large amount of impurities when you replace the automatic transmission because of an abnormality in the main body of the automatic transmission, flush the oil cooler circuit.**

M E M O



● **Removal sequence**

1 Dust cover
2 Engine speed sensor (See Gr13EA.)
3 Mounting bracket
4 Automatic transmission
5 Mounting support

***a**: Torque converter
***b**: Flywheel
***c**: Drive plate
***d**: Wear plate
***e**: Pilot

● **Installation sequence**

Follow the removal sequence in reverse.

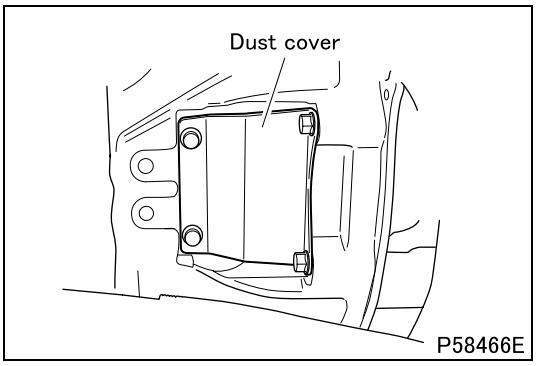
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Bolt (dust cover and automatic transmission mounting)	47 {35, 4.8}	–
Tb	Bolt (dust cover mounting)	13 {9.6, 1.3}	–
Tc	Bolt (flywheel and drive plate mounting)	50 {37, 5.1}	–
Td	Bolt (bracket mounting)	40 {30, 4.1}	–
Te	Bolt (automatic transmission mounting)	82 {60, 8.4}	M12
		47 {35, 4.8}	M10
Tf	Bolt (drive plate mounting)	118 {87, 12} + 90°	Wet
Tg	Bolt (engine speed sensor mounting)	8 {5.9, 0.82}	–

Lubricant and/or sealant

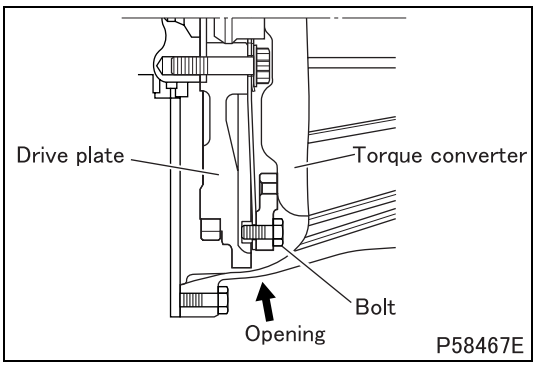
Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Pilot of torque converter	Molybdenum disulfide grease [NLGI No. 2 (Li soap)]	As required
b	Bolt threads	Engine oil	As required

◆Removal procedure◆

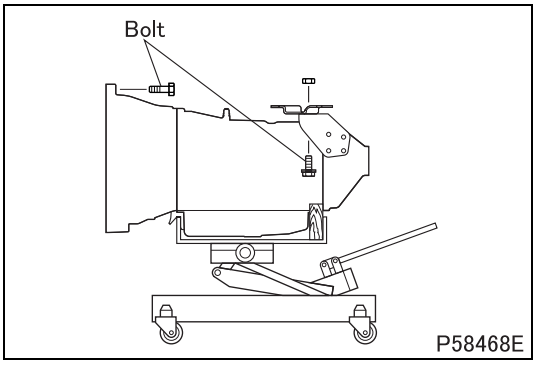


■ **Removal: Automatic transmission**

- Remove the dust cover.



- Crank the engine to bring one of the bolts to the opening.
- Remove the bolt that is accessible through the opening. Also remove all of the rest of the six bolts, cranking the engine to bring each one to the opening in turn.



- Support the automatic transmission with a jack and remove each of the bolts.
- Move the automatic transmission rearward to remove it.

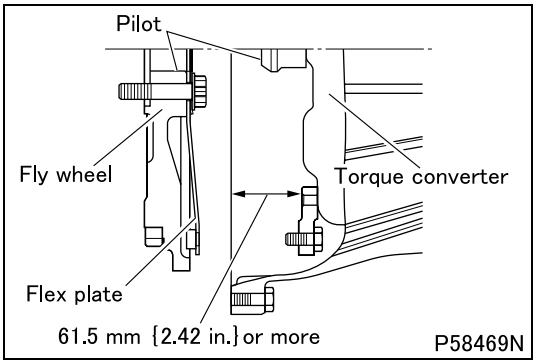
CAUTION ⚠

- **Do not apply the jack to the oil pan. Doing so would deform the oil pan and the oil pan gasket.**
- **The torque converter will come away by itself. Be careful not to let it drop.**

NOTE

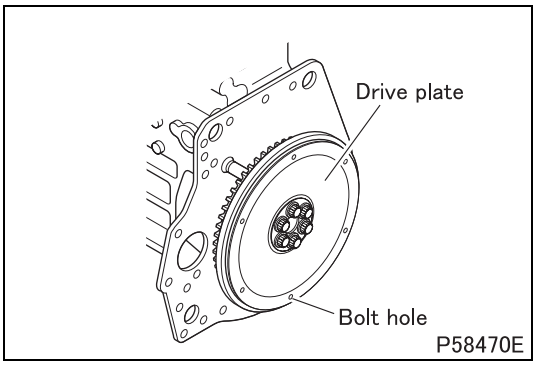
- **The bolts that join the automatic transmission to the engine are not all the same length. Make a note of the position of each one as you remove it.**

◆Installation procedure◆

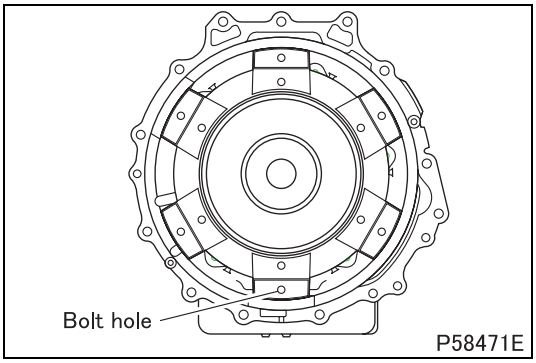


■ Installation: Automatic transmission

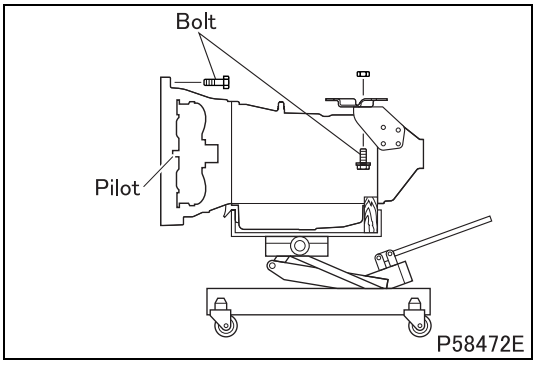
- Make sure the torque converter is correctly installed on the automatic transmission. With the torque converter correctly installed, the dimension from the drive plate surface to the case mounting surface is as shown in the diagram.
- Apply grease to the pilot.



- Position one of the drive plate's mounting bolt holes at the very bottom.



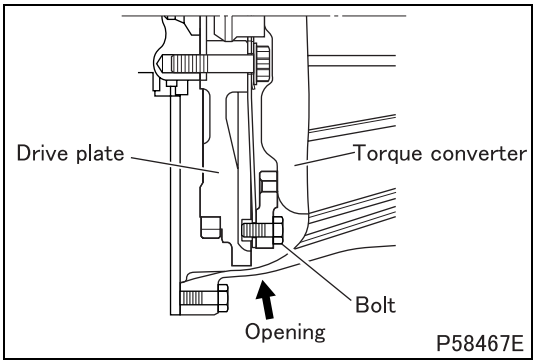
- Position one of the torque converter's mounting bolt holes at the very bottom.



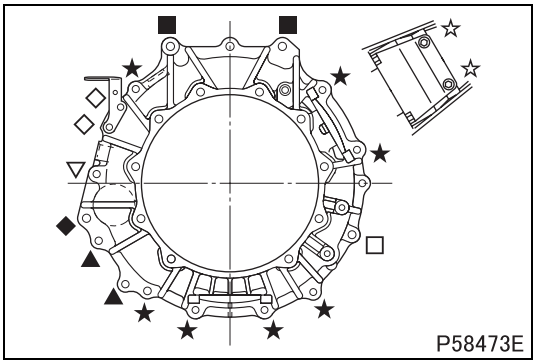
- Wipe all oil and grease off the inside wall of the torque converter housing.
- With the pilot of the torque converter and the dowel pin of the rear plate aligned with each other, slowly move the assembly onto the engine.
- Fit several of the bolts that join the automatic transmission to the engine, then tighten the rear mounting bolt to the specified torque.

NOTE

- **The torque converter can easily come off by itself. Slightly lower the rear of the automatic transmission to keep the torque converter correctly positioned.**

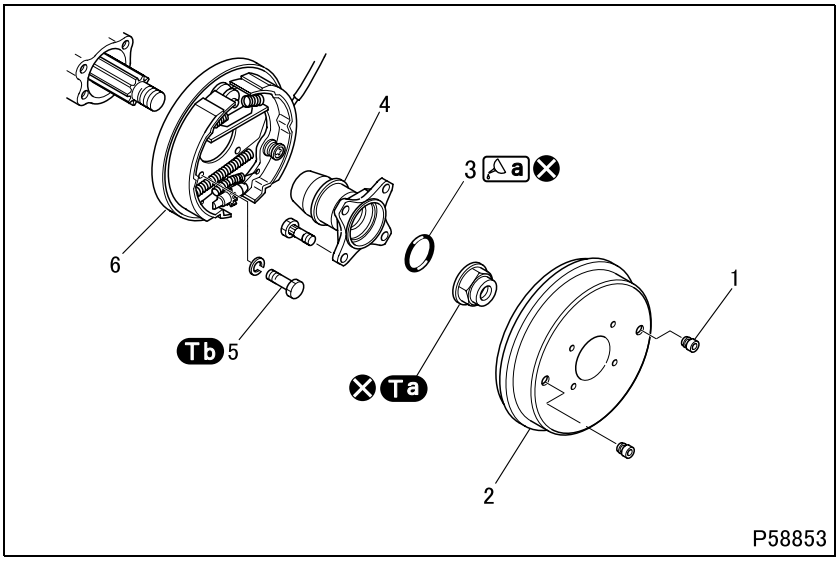


- Through the opening, align the holes for one of the bolts that join the drive plate and the torque converter and fit the bolt.
- Fit all of the rest of the six bolts, cranking the engine to bring the holes to the opening for each one. Next, tighten each bolt to specification, cranking the engine to being each bolt to the opening in turn.



- With the dust cover and bracket mounted using the same bolts, tighten to torque all of the bolts that join the automatic transmission and engine.
  - ▲: M10 × 1.25 - 55
  - ★: M10 × 1.25 - 80
  - □: M10 × 1.25 - 95
  - ◇: M10 × 1.5 - 20 (for bracket)
  - ◆: M12 × 1.75 - 45
  - ■: M12 × 1.75 - 60
  - ▽: M12 × 1.75 - 100
- Tighten the dust cover's remaining mounting bolts (marked ☆) to the specified torque to retain the dust cover.

PARKING BRAKE



● **Removal sequence**

1 Dust plug
2 Parking brake drum
3 O-ring
4 Companion flange
5 Reamer bolt
6 Parking brake (See Gr36.)

⊗: Non-reusable parts

● **Installation sequence**

Follow the removal sequence in reverse.

Service standards (Unit: mm {in.})

Location	Maintenance item		Standard value	Limit	Remedy
2	Parking brake drum	Inner diameter	$\phi 190\ ^{+0.2}_{0}$ {7.48 $^{+0.0079}_{0}$}	ϕ191 {7.52}	Replace
		Squareness	0 to 0.05 {0 to 0.0020}	–	
		Concentricity	0 to 0.1 {0 to 0.0039}	–	
		Cylindricity	0 to 0.05 {0 to 0.0020}	–	
		Static rotation imbalance	0 to 0.0049 N·m {0 to 0.004 ft.lbs, 0 to 0.5 gf·m}	–	
4	Runout at socket portion of companion flange		0 to 0.15 {0.0059}	0.5 {0.020}	

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Lock nut (companion flange mounting)	190 {140, 19}	After tightening, crimp at two places.
Tb	Reamer bolt	52 to 66.7 {38 to 49, 5.3 to 6.8}	–

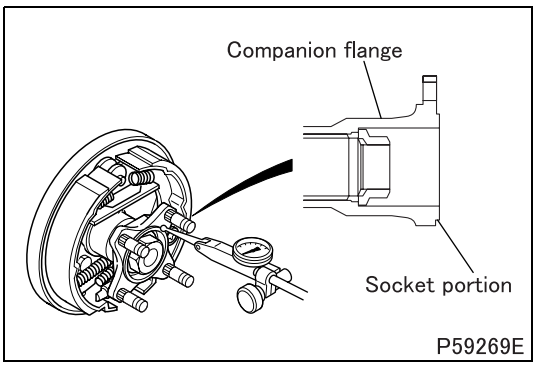
Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	O-ring	Mobil ATF3309	As required

Special tools (Unit: mm {in.})

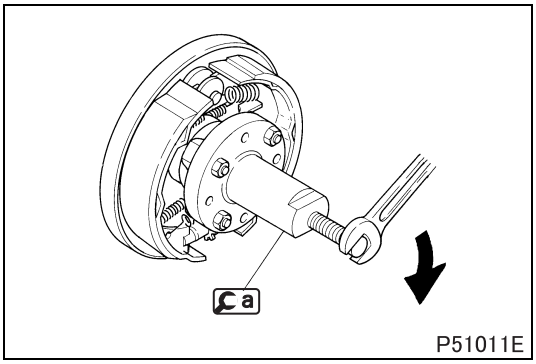
Mark	Tool name and shape	Part No.	Application
a	Flange puller A: ϕ95 {3.74} B: ϕ100 {3.94} C: ϕ90 {3.54} 	MH061848	Removal of companion flange

◆Removal procedure◆



■ **Inspection: Runout of socket portion of companion flange**

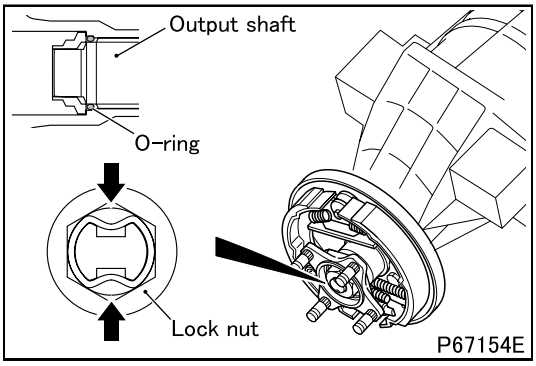
- If the measured valve exceeds the limit, replace the companion flange.



■ **Removal: Companion flange**

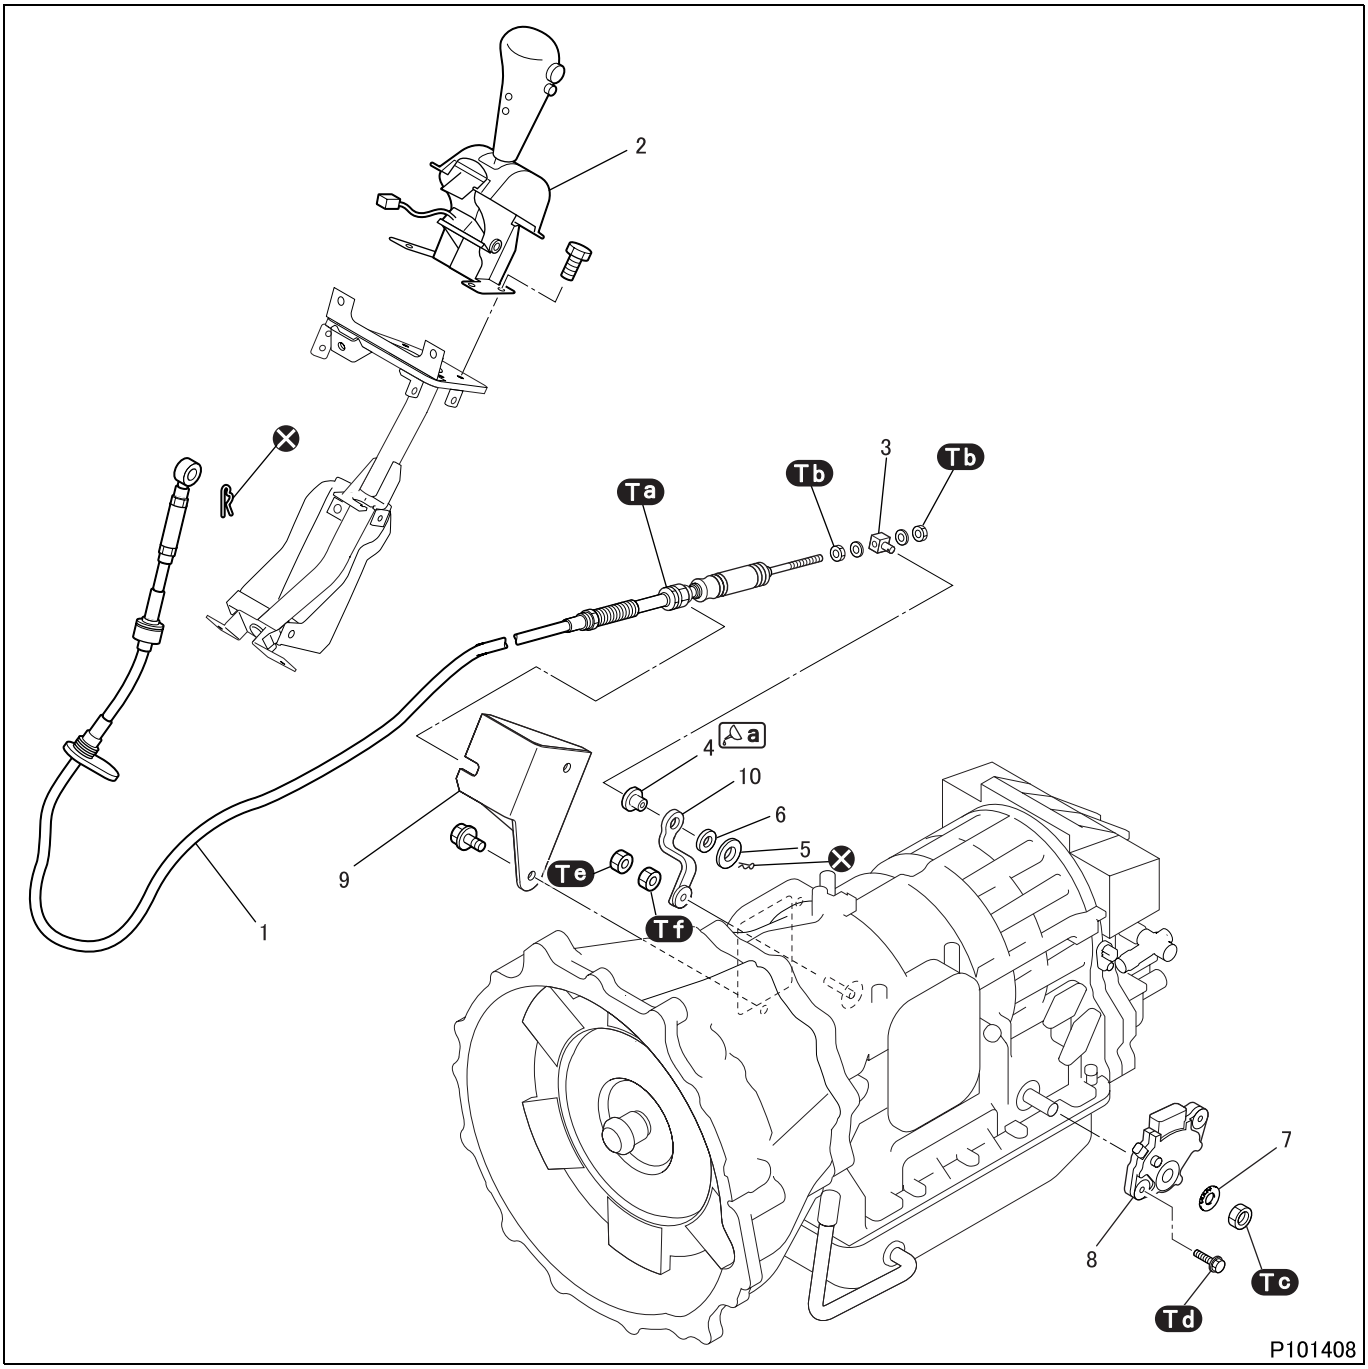
- Attach the special tool a to the companion flange with propeller shaft mounting nut. Using a, remove the companion flange.

◆Installation procedure◆



■ **Inspection: Companion flange**

- After installing O-ring to output shaft and tightening the lock nut to the specified torque, crimp the lock nut at two places.
- After installing the companion flange, check the companion flange for excessive play and looseness. (See “ON-VEHICLE INSPECTION AND ADJUSTMENT.”)



● **Removal sequence**

1 Selector cable
2 Range selector lever (See later section.)
3 Adjuster
4 Bush
5 Plane washer
6 Spacer
7 Lock washer
8 Inhibitor switch
9 Bracket
10 Control lever

⊗: Non-reusable parts

● **Installation sequence**

Follow the removal sequence in reverse.

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Selector cable (mounting on bracket)	59 to 83 {44 to 61, 6.0 to 8.5}	–
Tb	Nut (adjuster mounting)	4 to 6 {3.0 to 4.4, 0.4 to 0.6}	–
Tc	Nut (inhibitor switch mounting)	7 {5.2, 0.7}	–
Td	Bolt (inhibitor switch mounting)	12.5 {9.2, 1.3}	–
Te	Nut (control lever mounting)	15 {11, 1.5}	Outside
Tf	Nut (control lever mounting)	13 {9.6, 1.3}	Inside

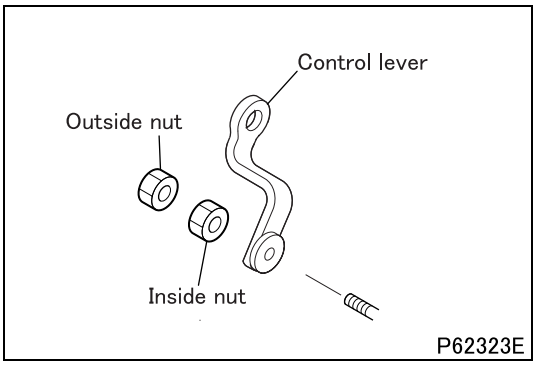
Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Part of bush that slides against adjuster	Wheel bearing grease [NLGI No. 2 (Li soap)]	As required

Special tools

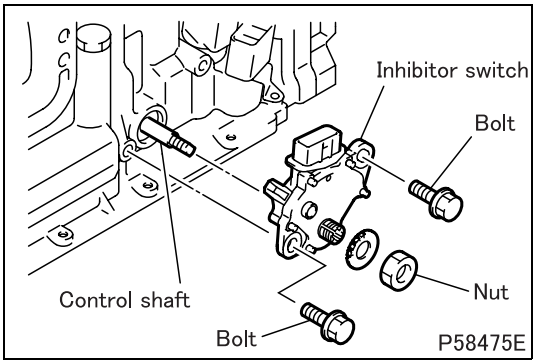
Mark	Tool name and shape	Part No.	Application
a	Plate  P59101	MH063642	Locating inhibitor switch

◆Installation procedure◆



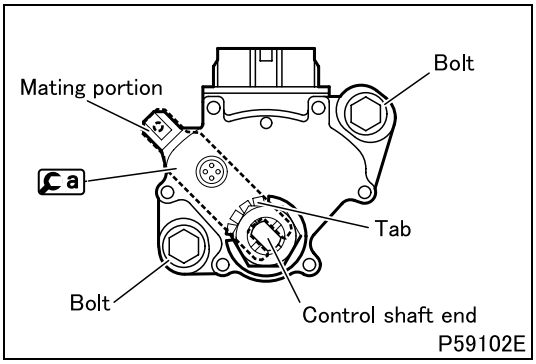
■ Installation: Control lever

- Tighten inside nut to the specified torque and then tighten outside nut to the specified torque with holding the inside nut by spanner.



■ Installation: Inhibitor switch

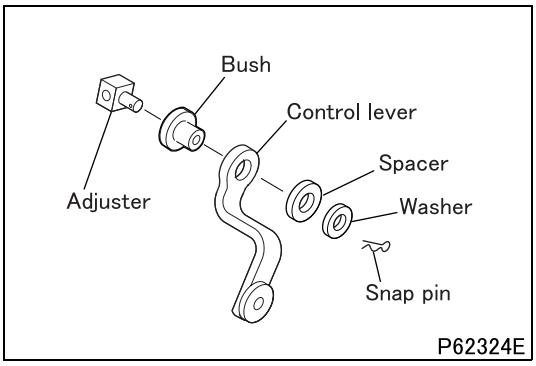
- Position the inhibitor switch onto the control shaft.
- Loosely tighten the bolts (× 2).
- Tighten the nut to the specified torque.



- Loosen the two bolts to enable the special tool a to be installed such that one end of the tool with a pin engages with the mating portion of the inhibitor switch while the other end of the tool engages with the end of the control shaft.
- While holding the inhibitor switch with one hand, tighten the two bolts to the specified torque.
- Stake the nut by bending over two of the tabs on the inhibitor switch.

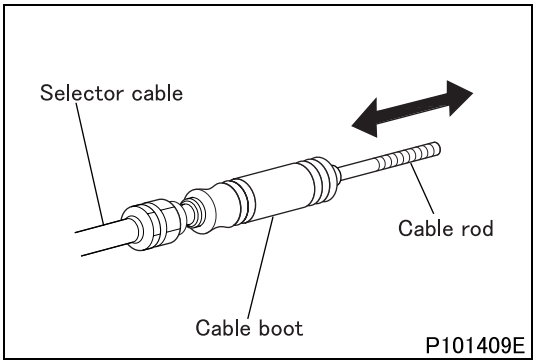
CAUTION ⚠

- **After installation, check the inhibitor switch if it is normal. This must be confirmed before commencing the following work.**



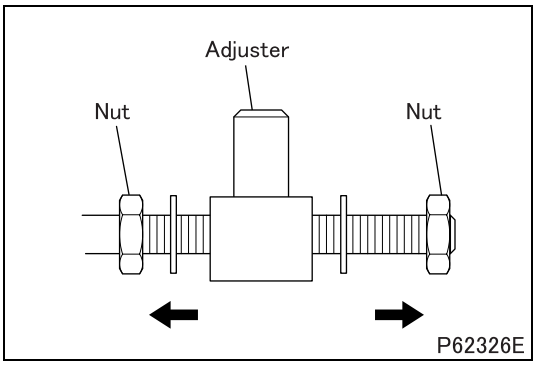
■ Installation: Adjuster

- Check if the adjuster turns smoothly to the control lever after mounting the adjuster to the control lever with the snap pin.
- When if the adjuster does not turn smoothly, replace the adjuster, plane washer, snap pin and control lever.
- Check the abrasion and damage of the brush and the spacer. This damage means dust, breakage, loosen, bend, twist, and so on.

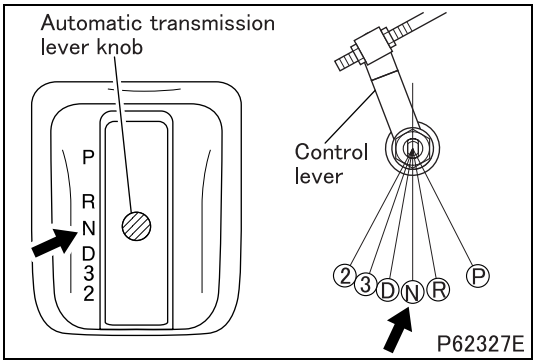


■ Installation: Selector cable

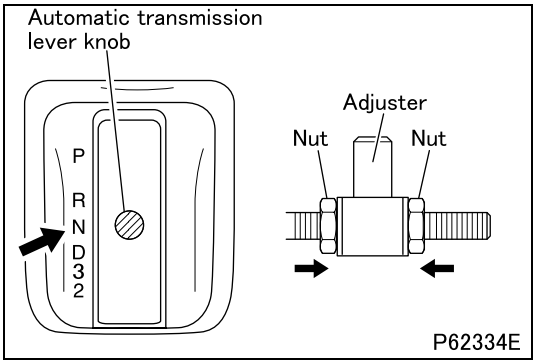
- When the selector cable stroke is not smooth, replace selector cable.
- Check the damage of the cable boot and the cable rod. Replace the selector cable if necessary. This damage means dust, breakage, loosen, bend, twist, and so on.



- Loosen the nuts to the both ends of thread.



- Place the automatic transmission lever knob inside the cab in the N position. Also, place the control lever on the automatic transmission main body side in the N position.

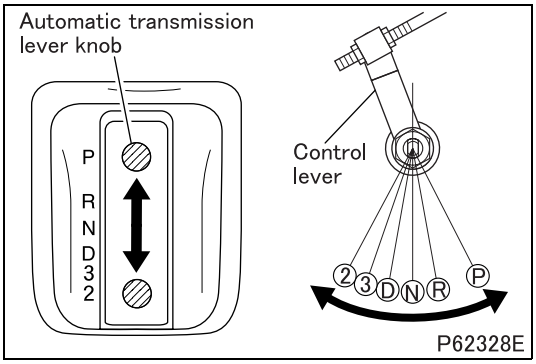


- Confirm that the automatic transmission lever knob inside the cab is in the N position, then tighten the nuts to the specified torque.

CAUTION ⚠

- **Do not move the adjuster's set position when tightening the nuts.**

◆Inspection after installation◆



■ Inspection: Operate performance of range selector lever

[Inspection]

- After fixing adjuster, move the automatic transmission lever knob from the P position to the 2 position and back to the P position two or three times and check the following.

(1) The automatic transmission lever knob inside the cab and the control lever on the automatic transmission main body side correctly enter each range position between the 2 position and the P position.

(2) On the meter cluster, the range indicator lamp of the selected range illuminates.

(3) The range selector lever operates smoothly and has a positive in-position feel in each range position.

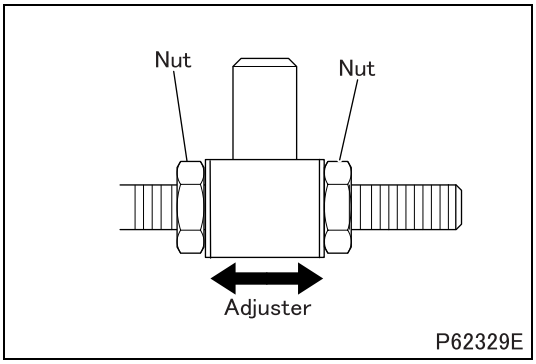
(4) The starter key can be removed from the key cylinder at the P position.

(5) The backup lamp turns on and the back buzzer sounds in the R position, and the engine starter operates in the N and P position.

CAUTION ⚠

- **This inspection should be performed after taking measures to prevent the vehicle from moving.**
- **Inspect the item (5) after confirming that there is no abnormality related to items (1) to (4).**

- If there is abnormality related to items (1) through (4), adjust the selector cable. If there is abnormality related to item (5), check the backup lamp circuit and the engine starter circuit. (See Gr54.)



[Adjustment]

- Loosen each nut and then adjust the adjuster position in accordance with the procedure in "■**Installation: Selector cable**".
- If the control lever is shifted toward "2" position, move the adjuster toward the selector cable end. If the lever is shifted toward "P" position, move the adjuster in the opposite direction.
- After adjustment, recheck the operate performance of range selector lever to confirm that there is no abnormality.
- If the abnormality has not solved by the adjustment, check the indicator lamp-related circuit in the meter cluster (See Gr54.) and P range switch.

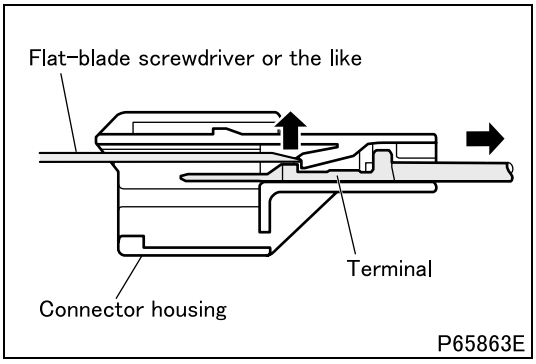
Tc	Screw (shift lock actuator mounting)	1 to 2 {0.7 to 1.5, 0.10 to 0.20}	–
Td	Nut (lever mounting)	9 to 14 {6.6 to 10, 0.92 to 1.4}	–
Te	Screw (P range switch mounting)	0.1 to 0.15 {0.074 to 0.11, 0.01 to 0.02}	–

Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Sliding part of detent spring	Chassis grease [NLGI No. 1 (Ca soap)]	As required
	Sliding parts of shift lock actuator and arm		
	Sliding parts of spring and arm		
	Bushing		
	Detent pin of lever		
	Part of bracket that makes contact with detent pin		
	Part of sleeve that makes contact with push-button, and sliding part of sleeve		

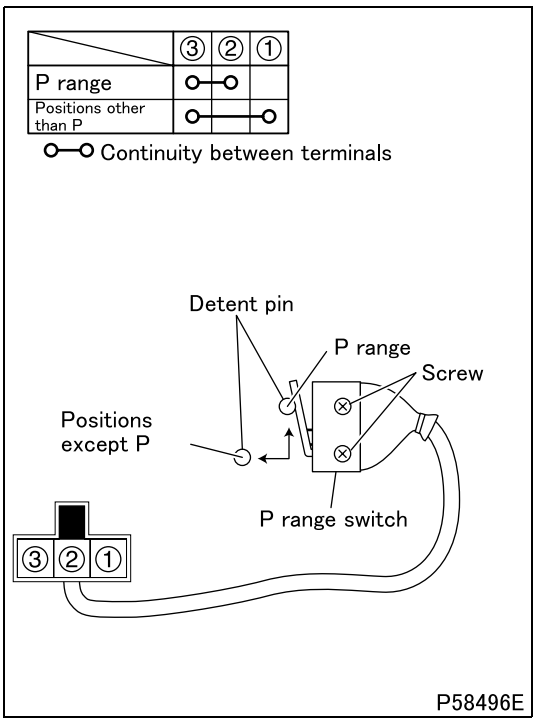
◆Removal procedure◆



■ Removal: Connector housing

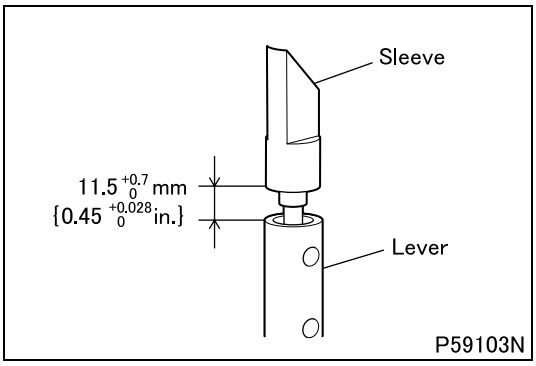
- Use a flat-blade screwdriver or the like to free the terminal in the connector, then remove the connector housing.

◆Installation procedure◆



■ **Installation: P range switch**

- Tighten the screws to the specified torque with the P range switch positioned such that the continuity of the P range switch is as shown in the illustration.



■ **Installation: Sleeve**

- Turn the sleeve to install it such that the dimension between the sleeve and the end of the lever is as shown in the illustration when the lever is in the R position.
- Install the sleeve with its tapered part on the same side as the push-button.

● **Installation sequence**

Perform installation by following the removal sequence in reverse.

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Eyebolt	29 to 34 {21 to 25, 3.0 to 3.5}	–
Tb	Oil cooler tube (flare nut)	53 {39, 5.4}	Wet
Tc	ATF thermo switch	29 to 39 {21 to 29, 3.0 to 4.0}	Sealant
Td	Plug	167 ± 20 {125 ± 15, 17 ± 2.0}	Wet

Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Thread of ATF thermo switch	ThreeBond 1110B	As required
b	Thread of oil cooler tube	Mobil ATF3309 or equivalent	As required
	Thread of plug		

◆Work before installation◆

■ Flushing: Oil cooler circuit

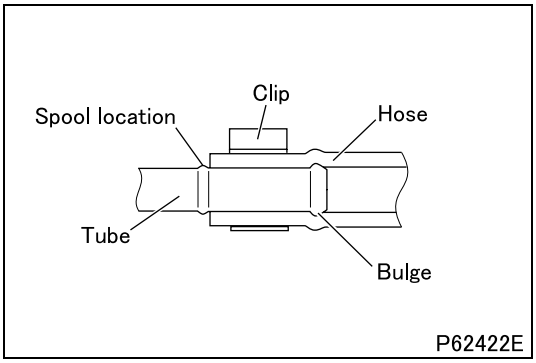
- If the oil cooler circuit contains a large amount of impurities, flush the cooler circuit.
- Remove the cooler tubes from the automatic transmission and oil cooler.
- Blow compressed air into the oil cooler and cooler tubes to clean them.

◆Inspection after installation◆

■ Inspection: Automatic transmission fluid level

- After oil line is removed, check the automatic transmission fluid level and replenish the fluid if necessary.

◆Installation procedure◆



■ Installation: Oil cooler hose

- Fit the oil cooler hose all the way to the spool at the end or the oil cooler tube.
- Fasten the hose with the clip avoiding the bulge.

CAUTION ⚠

- **Install the oil cooler hose without forced bend and twist.**
- **When installing the oil cooler hose, do not apply oil to its joints.**

***a**: Frame

● **Installation sequence**

Perform installation by following the removal sequence in reverse.

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Eyebolt	29 to 34 {21 to 25, 3.0 to 3.5}	–
Tb	Oil cooler tube (flare nut)	53 {39, 5.4}	Wet
Tc	ATF thermo switch	29 to 39 {21 to 29, 3.0 to 4.0}	Sealant
Td	Plug	167 ± 20 {125 ± 15, 17 ± 2.0}	Wet

Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Thread of ATF thermo switch	ThreeBond 1110B	As required
b	Thread of oil cooler tube	Mobil ATF3309 or equivalent	As required
	Thread of plug		

◆Work before installation◆

■ Flushing: Oil cooler circuit

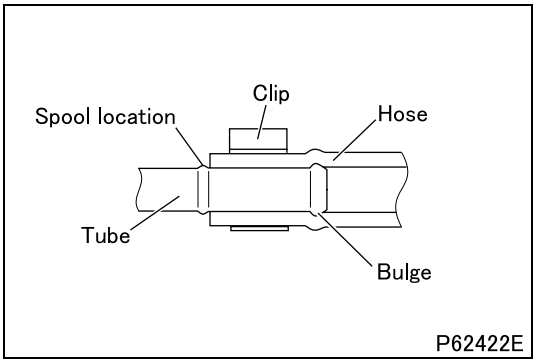
- If the oil cooler circuit contains a large amount of impurities, flush the cooler circuit.
- Remove the cooler tubes from the automatic transmission and oil cooler.
- Blow compressed air into the oil cooler and cooler tubes to clean them.

◆Inspection after installation◆

■ Inspection: Automatic transmission fluid level

- After oil line is removed, check the automatic transmission fluid level and replenish the fluid if necessary.

◆Installation procedure◆



■ Installation: Oil cooler hose

- Fit the oil cooler hose all the way to the spool at the end or the oil cooler tube.
- Fasten the hose with the clip avoiding the bulge.

CAUTION ⚠

- **Install the oil cooler hose without forced bend and twist.**
- **When installing the oil cooler hose, do not apply oil to its joints.**

REPLACEMENT OF PARTS OF AUTOMATIC TRANSMISSION MAIN BODY

⊗: Non-reusable parts

● Installation sequence

Perform installation by following the removal sequence in reverse.

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Drain plug	27 {20, 2.8}	Magnet attached
Tb	Bolt (oil pan mounting)	7 {5.2, 0.7}	–
Tc	Bolt (oil strainer mounting)	10 {7.4, 1.0}	–
Td	Bolt (output speed sensor and turbine speed sensor mounting)	8 {5.9, 0.8}	–
Te	Elbow mounting	32 {24, 3.3}	–
Tf	Oil temperature sensor (outside) mounting	34 {25, 3.5}	–
Tg	Bolt (lock plate mounting)	12.5 {9.2, 1.3}	–
Th	L-joint	34 to 39 {25 to 29, 3.5 to 4.0}	–
	Nut (speedometer joint mounting)		
Ti	Vehicle speed sensor	14.7 to 29.4 {11 to 22, 1.5 to 3.0}	–
Tj	Speedometer joint	20 to 30 {15 to 22, 2.0 to 3.1}	–

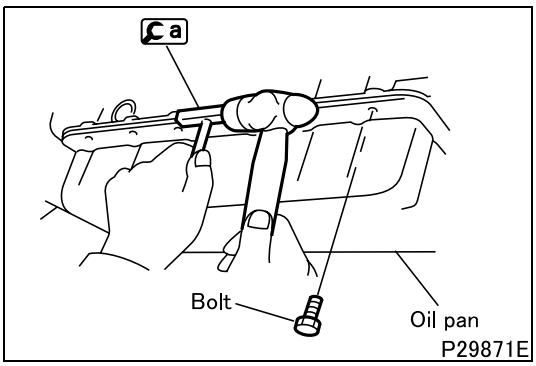
Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	O-ring	Mobil ATF3309 or equivalent	As required
	Torque converter		2 L {2.1 qts}
	Front oil seal (automatic transmission)		As required
b	Rear oil seal lips	Wheel bearing grease [NLGI No. 2 (Li soap)]	As required

Special tools

Mark	Tool name and shape	Part No.	Application
a	Oil pan remover  P29856	MD998727	Removal of oil pan
b	Oil seal installer A: ϕ66, B: ϕ53, C: 17  P59105	MH063641	Installing rear oil seal

◆Removal procedure◆



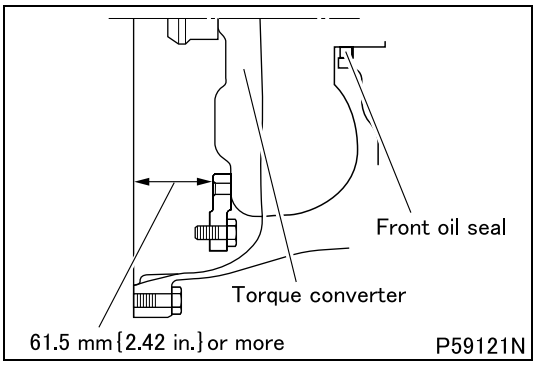
■ **Removal: Oil pan**

- Remove the bolts, leaving one bolt (not tightened) in every third hole to prevent the oil pan from falling.
- Remove the oil pan using the special tool a as illustrated. Insert the special tool at one corner of the oil pan.

CAUTION ⚠

- **Do not deform the oil pan when tapping in the special tool a.**
- **Oil remains in the oil pan. Do not tip the oil pan when removing it.**

◆Installation procedure◆



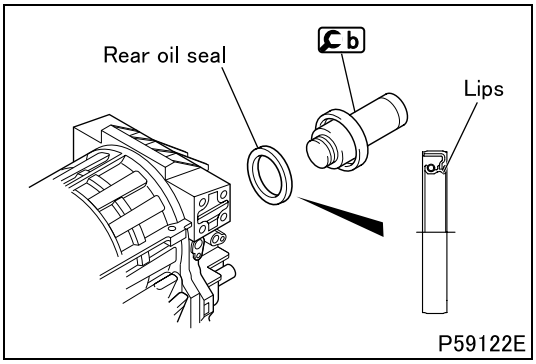
■ **Installation: Torque converter**

- If the torque converter is replaced and the replacement is new, fill it with fresh automatic transmission fluid up to the specified level.
- Apply automatic transmission fluid to the front oil seal, then install the torque converter on the oil pump.

CAUTION ⚠

- **Do not damage the oil seal when installing the torque converter.**

- Measure the dimension from the torque converter housing to the torque converter's set block. Confirm that the torque converter is correctly positioned.



■ **Installation: Rear oil seal**

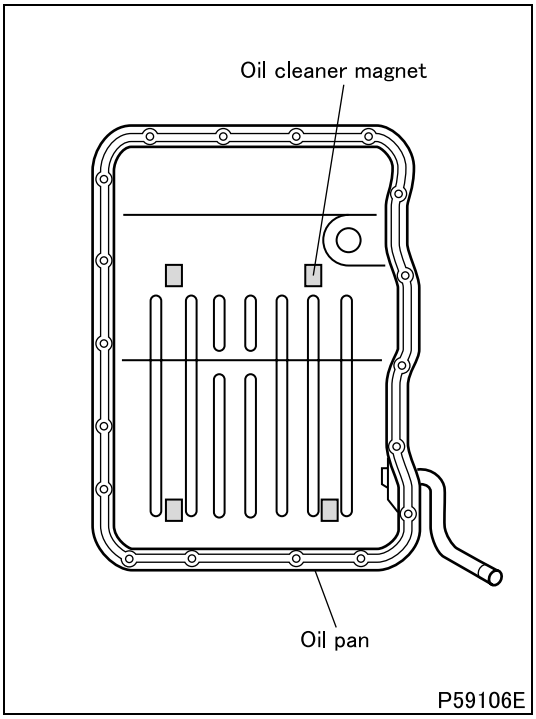
NOTE

- **Before installing the rear oil seal, ensure that the seal mounting face on the automatic transmission is clean.**

- Apply grease to the rear oil seal lips.
- Install the rear oil seal using b. Ensure that the seal is firmly against the extension housing end face of the automatic transmission main body.

CAUTION ⚠

- **Install the rear oil seal evenly throughout its periphery.**
- **Be careful not to deform or otherwise damage the rear oil seal.**

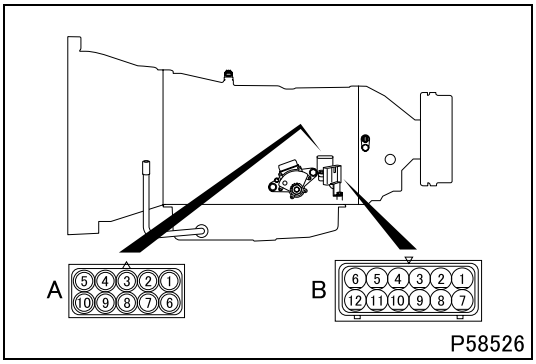


■ **Installation: Oil pan**

- Remove any gasket that may be remaining on the mating faces of the automatic transmission main body and the oil pan.
- Clean the oil cleaner magnet and install it onto the oil pan.
- Install new gasket onto the oil pan, then install them onto the automatic transmission main body.
- Tighten the bolts evenly in several steps, in each step tightening individual bolts a little in a set sequence to the specified torque.

CAUTION ⚠

- **Ensure that the mating faces of the oil pan and the automatic transmission main body are free from automatic transmission fluid spill.**
- **After installing the oil pan, do not operate the automatic transmission for at least one hour.**



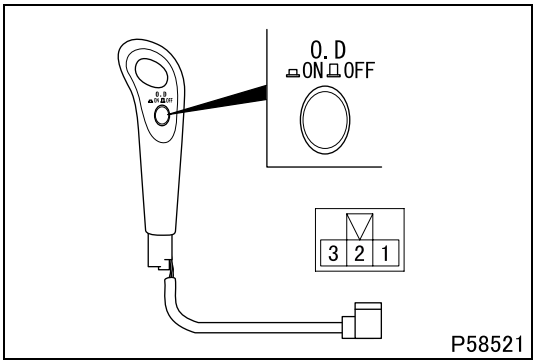
#140 Inspection of oil pressure switch

- Measure the resistance between the indicated terminals.

Standard value	Oil pressure switch 1	B1-*	No continuity (When starter switch is OFF)
	Oil pressure switch 2	B7-*	
	Oil pressure switch 3	B8-*	
	Oil pressure switch 4	A7-*	
	Oil pressure switch 5	A2-*	
	Oil pressure switch 6	B2-*	
	Oil pressure switch 7	A1-*	
	Oil pressure switch 8	A6-*	

*: Automatic transmission case

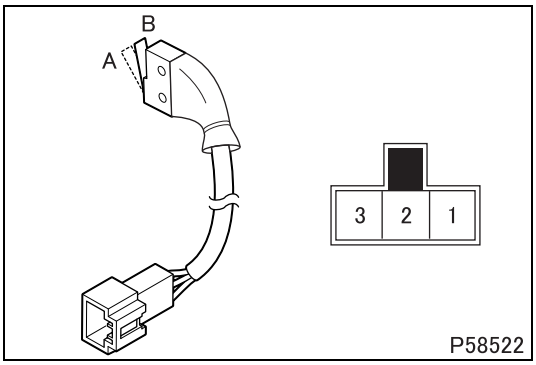
- If any measured value is out of specification, replace automatic transmission.



#150 Inspection of overdrive switch

Switch position	Terminals with continuity
OFF	1-3
ON	2-3

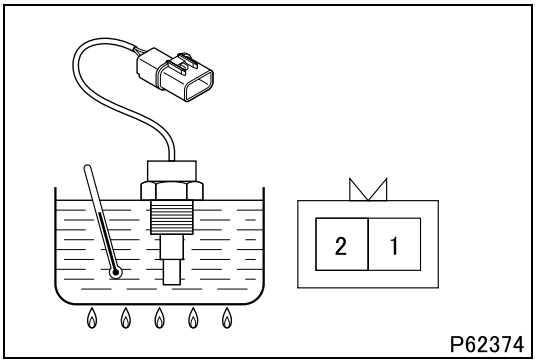
- If there is any abnormality, replace the knob.



#151 Inspection of P range switch

Switch position	Terminals with continuity
A	1-3
B	2-3

- If there is any abnormality, replace the P range switch.



#153 Inspection of ATF thermo switch

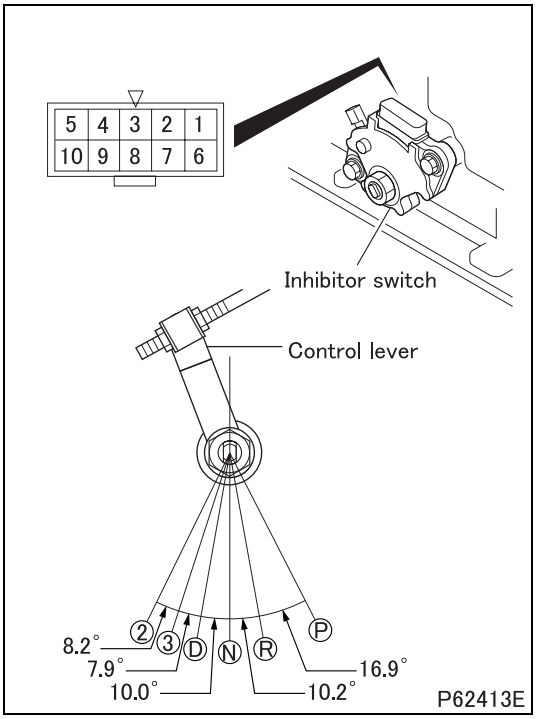
- Place the ATF thermo switch in a container filled with automatic transmission fluid and use a heater to raise the temperature of the fluid.
- Measure the temperature of the fluid at which continuity becomes established between terminals 1 and 2 and check that the measurement is within the standard value range.

Standard value (OFF to ON temperature)	97 ± 3°C {205 ± 5.4°F}

- Measure the temperature of the fluid at which the continuity between terminals 1 and 2 is lost and check that the measurement is within the standard value range.

Standard value (ON to OFF temperature)	90°C {195°F} or higher

- If any of the above measurements is not within the standard value range, replace the ATF thermo switch.

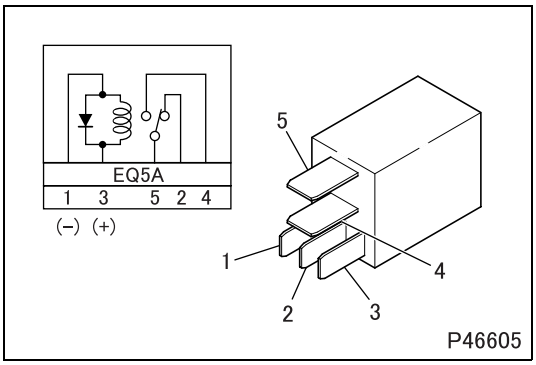


#159 Inspection of Inhibitor switch

- After installing the inhibitor switch to the automatic transmission and connecting the control lever, check the continuity in the following conditions.

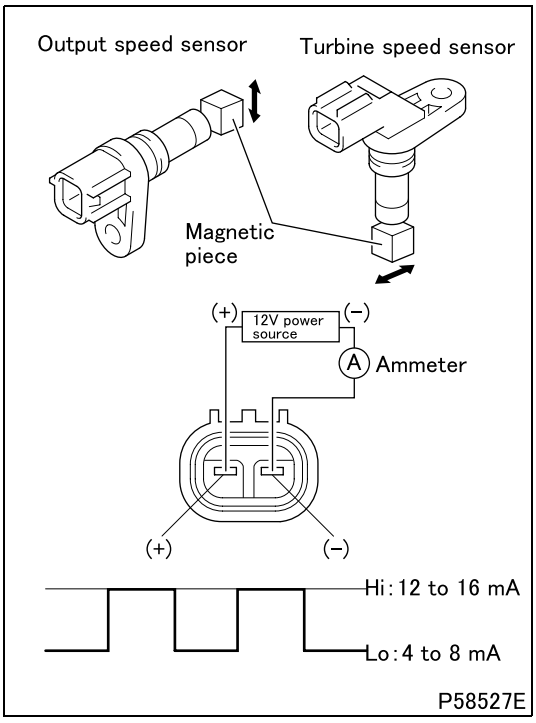
Transmission control lever position	Terminals with continuity
P	4-5, 6-10
R	4-9
N	1-4, 6-10
D	4-8
3	2-4
2	4-7

- If there is any abnormality, replace the inhibitor switch.



#201 Inspection of relay (normally open, 5-pin type)

- Perform a continuity check and an operation check. If there is any abnormality, replace the relay.

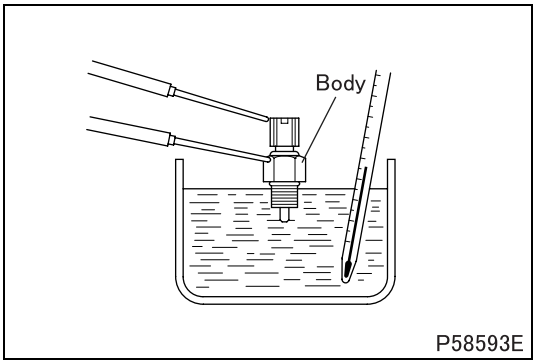


#293 Inspection of speed sensors

- Connect the speed sensor to the power source and an ammeter as illustrated.
- While moving a magnetic piece (metal that attaches to magnet) in the illustrated directions near the end of the speed sensor, read the ammeter. (Distance between sensor and magnetic piece: 5 mm {0.20 in.} or less)

Standard value (at normal temperature)	Hi	12 to 16 mA
	Lo	4 to 8 mA

- If the measured value does not conform to the standard value, replace the speed sensor.



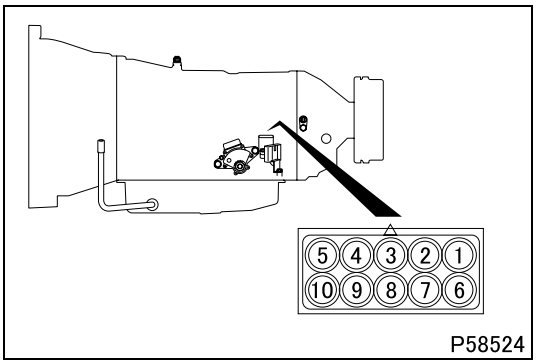
#312 Inspection of oil temperature sensor

<Outside>

- Immerse the oil temperature sensor in a container filled with automatic transmission fluid.
- Measure the resistance at the temperatures listed below. (To obtain the correct reading, the sensor needs to be exposed to the specified temperature for at least 5 minutes.)

Standard value	115°C {240°F}	655 to 730 Ω
	120°C {250°F}	585 to 645 Ω
	145°C {295°F}	340 to 375 Ω
	155°C {310°F}	280 to 305 Ω

- If there is any abnormality, replace the oil temperature sensor.

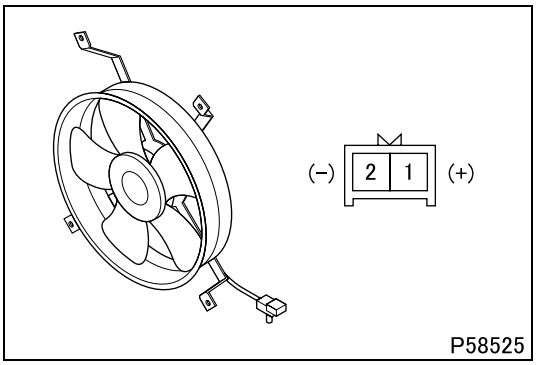


<Inside>

- Measure the resistance between terminals 3 and 8 on the automatic transmission.

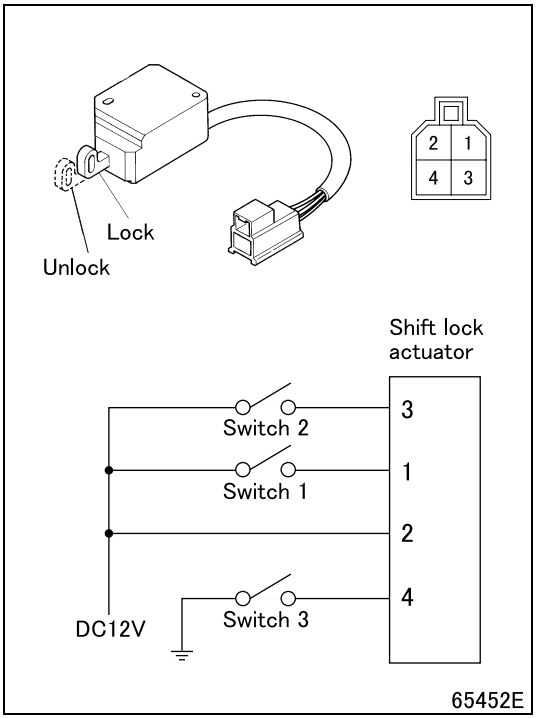
Standard value	–30°C {–22°F}	44 ± 6.6 kΩ
	10°C {50°F}	6445 ± 645 Ω
	110°C {230°F}	247 ± 16 Ω
	145°C {295°F}	111 ± 6 Ω

- If a measured value differs greatly from the standard value or the resistance does not change when the temperature is changed, replace automatic transmission.



#489 Inspection of ATF cooler fan motor

- Check that the ATF cooler fan motor runs when the battery voltage is applied to terminals 1 and 2.
- If there is any abnormality, replace the ATF cooler fan motor.

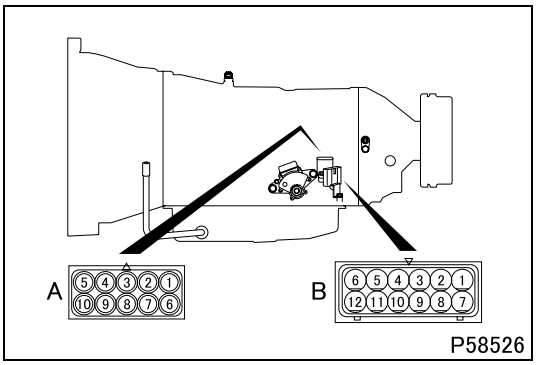


#535 Inspection of shift lock actuator

- Wire the shift lock actuator as illustrated.
- Check the lever position with each combination of switch conditions shown in the following table.

Switch 1	Switch 2	Switch 3	Lever position
ON	ON	ON	Unlock
ON	OFF	ON	Lock
ON	ON	OFF	Unlock
ON	OFF	OFF	Unlock
OFF	ON	ON	Lock
OFF	OFF	ON	Lock
OFF	ON	OFF	Unlock
OFF	OFF	OFF	Unlock

- If there is any abnormality, replace the shift lock actuator.



#585 Inspection of solenoids

- Measure the resistance between the indicated terminals.

Standard value (at normal temperature)	Shift solenoid 1	B10-*	13 ± 2 Ω
	Shift solenoid 2	B3-*	
	Shift solenoid 3	B9-*	
	Gain change solenoid	B4-*	
	Linear solenoid 1	A5-A10	5.5 ± 0.5 Ω
	Linear solenoid 2	B6-B12	
	Linear solenoid 3	A4-A9	
	PL linear solenoid	B5-B11	

*: Automatic transmission case

- If any measured value is out of specification, replace automatic transmission.

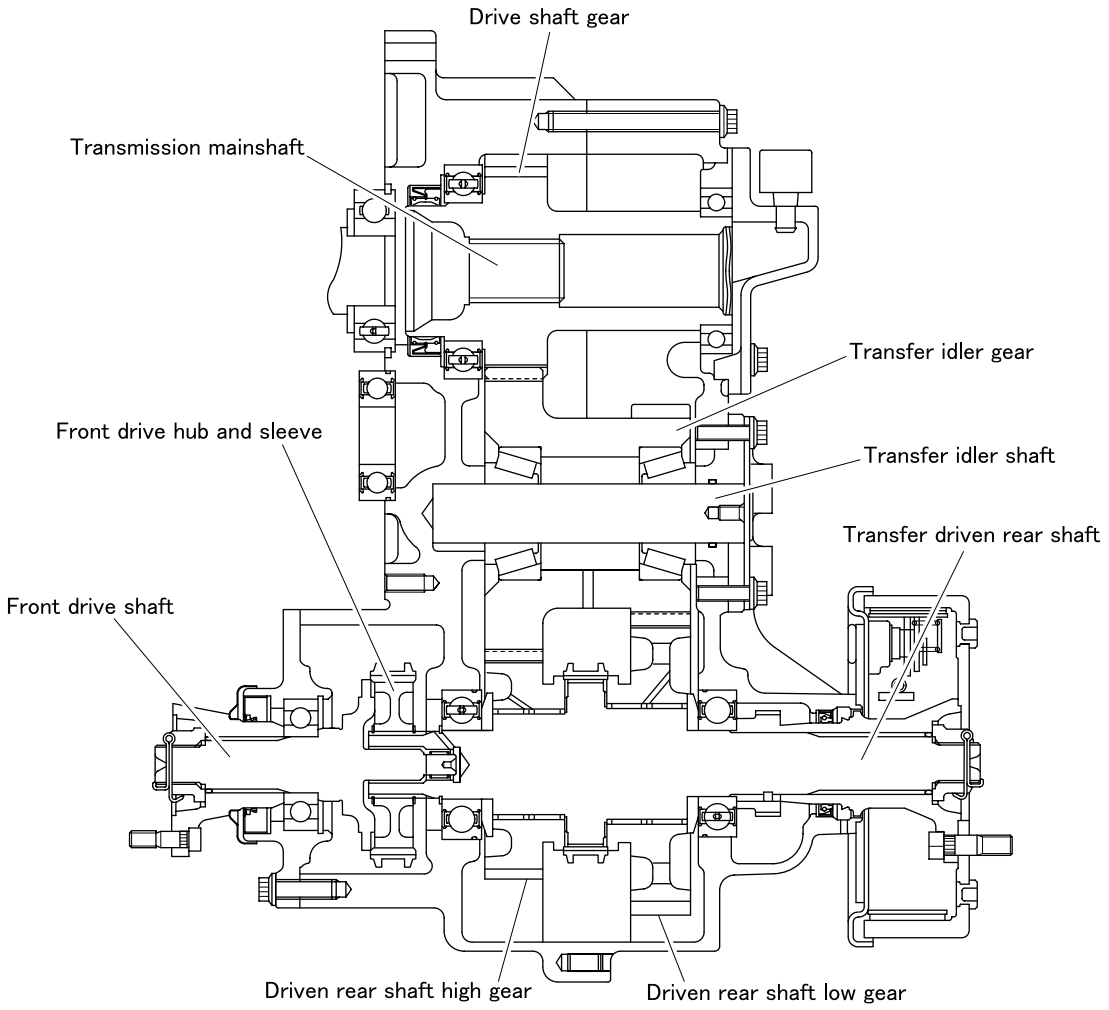
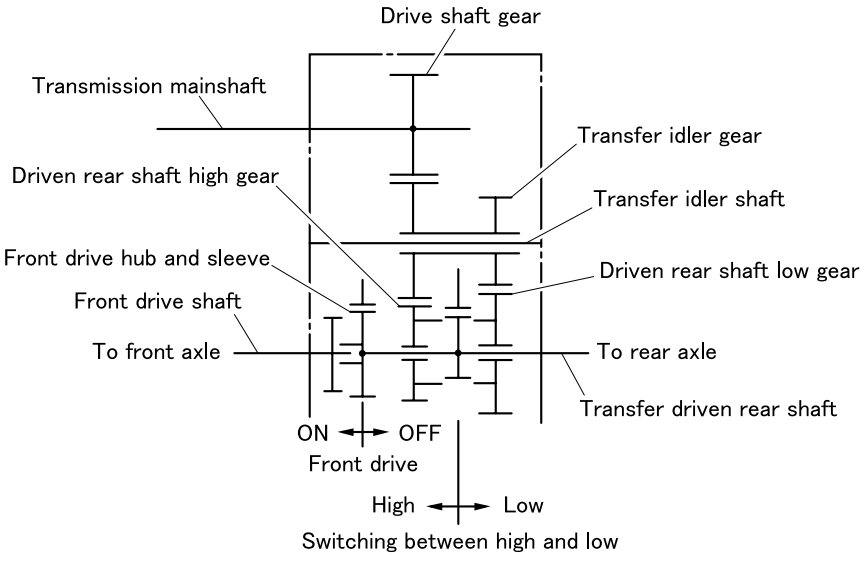
TRANSFER CONTROL (HIGH-LOW SWITCHING) 24-34

SPECIFICATIONS

Item		Specifications
Model		TF3
Transfer type		Part-time
Drive type		Gear
Gear ratio	High	1.090
	Low	1.987
Transfer oil	Gear oil	General: API GL-3 SAE 80 Warm region: API GL-3 SAE 90 Tropical region: API GL-4 SAE 90
	Oil quantity L {qts.}	3.1 {3.3}
Mass (including transmission body) kg {lb}		160 {350}
Control	Front drive switching	Electric and vacuum type
	HIGH-LOW switching	Floor change remote control type

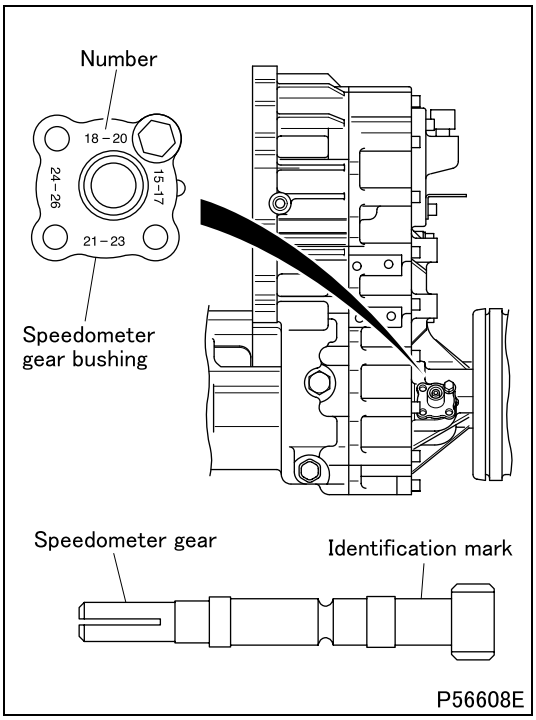
1. Transfer





- The transfer has two functions of distribution of all-wheel drive and a sub transmission with a reduction gear.
- The transfer is of a three-shaft constant-mesh type.
- The switch of a driver seat enables switching between engagement and disengagement of the front drive.
- The transfer control lever in the cab enables switching between the high and low range.

2. Speedometer Gear Bushing



- The speedometer gear bushing is eccentric, and displacing the installed position allows it to correspond to the different number of teeth of the speedometer gear.
- The numbers marked on the front at four locations show the range of the number of teeth of the corresponding speedometer gear.
  “15-17”: Number of teeth 15 to 17.
- An identification mark showing the number of teeth is marked on the speedometer gear.

Identification mark	A	B	C	D
Number of tooth	15	16	17	18
Gear ratio	3.0	3.2	3.4	3.6

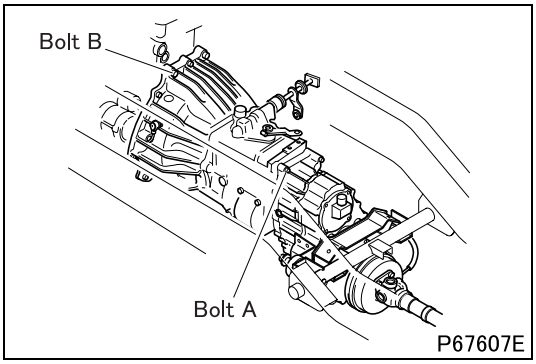
Possible causes	Symptoms	Noise when cruising	Gears cannot be engaged when switching to front drive	Gears cannot be engaged when switching between high and low gear	Gears slip out of engagement during driving with front drive engaged	Gears slip out of engagement during driving	Gears cannot be disengaged when switching to front drive	Gears cannot be disengaged when switching between high and low	Indicator does not light though front drive is engaged	Indicator does not light though low gear is engaged	Indicator lights though front drive is not engaged	Indicator lights though low gear is not engaged
Transfer body faulty	Front drive shaft and spline of constant sleeve worn				O							
	Hub and spline of high and low constant sleeve worn					O						
	Transfer idler bearing worn or damaged	O										
	Transfer drive gear bearing worn or damaged	O										
	Transfer driven rear shaft bearing worn or damaged	O										
	Transfer driven rear shaft needle bearing worn or damaged	O										
	Gears damaged	O										
	Backlash of low gear and high gear of driven shaft excessive	O										
	Transfer oil insufficient	O										
	Transfer oil viscosity inadequate	O										
	Constant sleeve and dog clutch broken		O		O							
	High and low constant sleeve and hub broken			O		O						
Control mechanism faulty	Shift rail bent		O	O								
	Shift rail sliding movement faulty		O	O								
	Shift fork bent		O	O								
	Shift fork claws worn		O	O								
	Steel ball and groove of shift rail poppet worn					O						
	Poppet spring fatigued or damaged					O						
Transfer control system faulty	Transfer low switch faulty									O		O
	Transfer four-wheel drive switch faulty								O		O	
	Blowout of fuse and high-current fuse		O						O			
	Battery overcharge		O									
	3-way magnet valve faulty		O		O		O					
	Broken wire, poor connection								O	O		
	Air leakage in vacuum piping		O		O							
	Vacuum actuator faulty		O		O		O					
	Control cable faulty			O				O				

ON-VEHICLE INSPECTION AND ADJUSTMENT

1. Inspection of Looseness in Transmission and Transfer Mounting Bolts

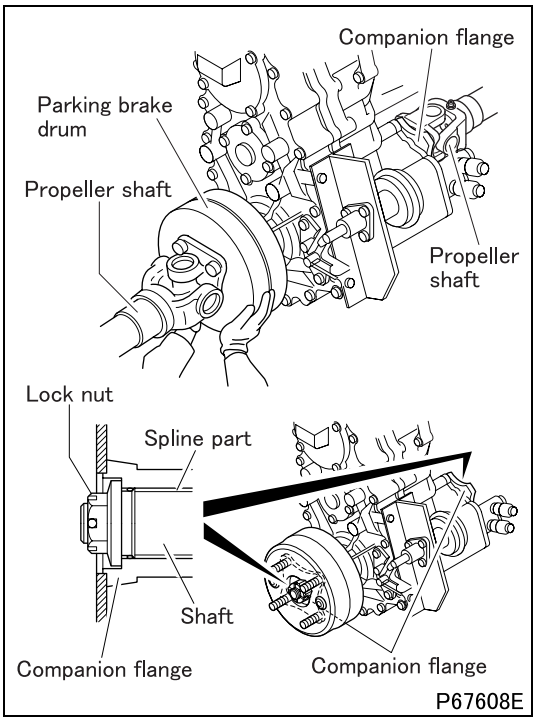
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened		Tightening torque	Remarks
–	Bolt A (transfer mounting)		44.5 {33, 4.5}	–
–	Bolt B (transmission mounting)	M10	47.1 {35, 4.8}	–
		M12	82.4 {61, 8.4}	–



- Check the transmission and transfer mounting bolts for looseness.
- Retighten any loose bolt to the specified torque.

2. Inspection of Play and Looseness in Companion Flange



- Check for looseness in the propeller shaft mounting bolts. (See Gr25.)
- Move the parking brake drum (on the rear drive side) and the companion flange (on the front drive side) in axial and vertical directions to check for excessive play between the companion flange and the shaft.
- If excessive play is detected, remove the propeller shaft, then check the lock nut for looseness and the splines on companion flange and shaft for abnormalities. If any part is found defective, replace the part. (See FRONT DRIVE and REAR DRIVE sections.)

3. Inspection and Replacement of Transfer Oil

WARNING ⚠

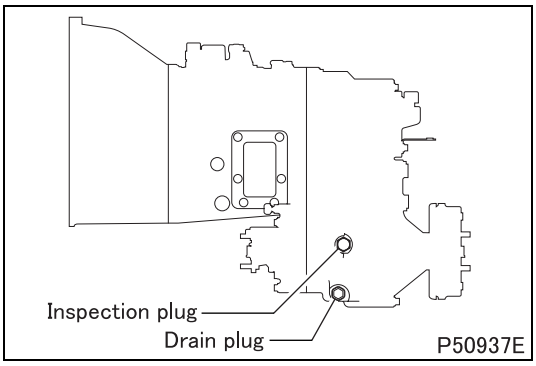
- **Temperature of transfer oil is high immediately after driving. Perform work when oil is cold.**

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
–	Inspection plug	68.6 ± 14.7 {51 ± 11, 7.0 ± 1.5}	–
	Drain plug (magnet type)		

Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
–	Thread area of inspection plug	ThreeBond 1105	As required
	Thread area of drain plug		
–	Transfer case	General: API GL-3 SAE 80 Warm region: API GL-3 SAE 90 Tropical region: API GL-4 SAE 90	3.1 L {3.3 qts.}



[Inspection]

(1) Inspection of oil quantity

- Remove the inspection plug, and check that transfer oil is filled up to the neck.
- If oil is not sufficient, fill oil from the inspection plug hole up to the neck.
- After filling, apply sealant to the inspection plug and tighten it to the specified torque.

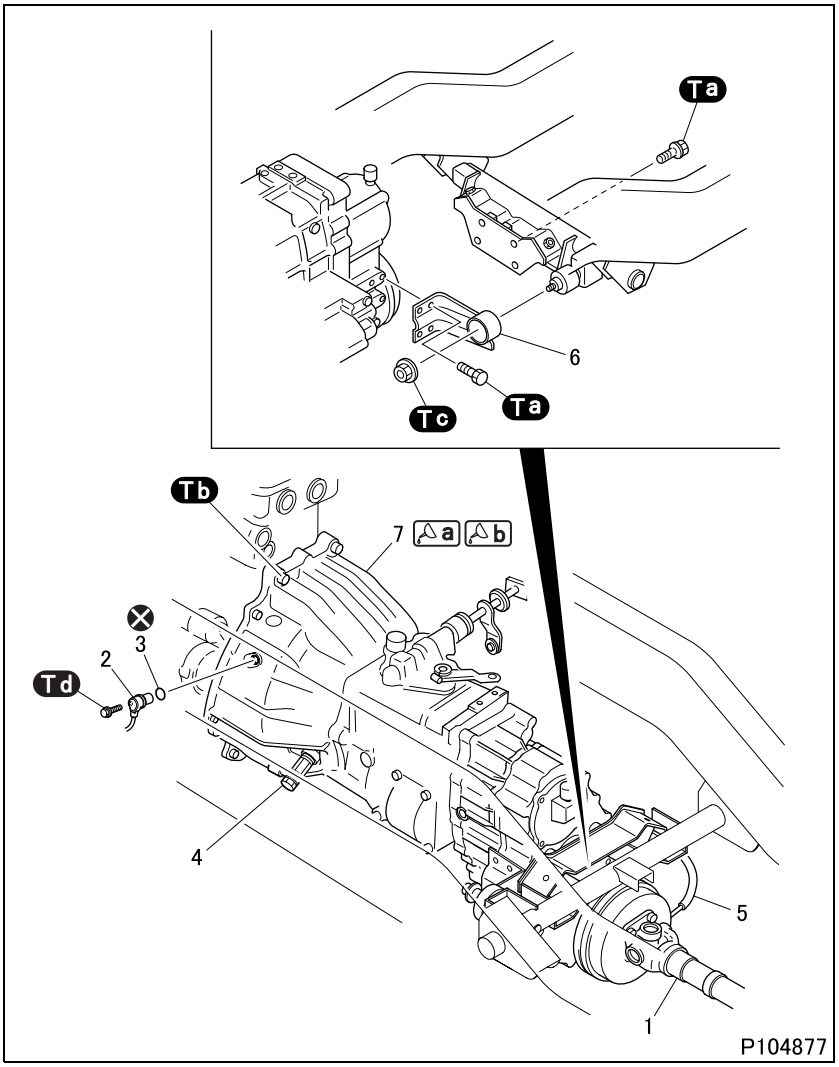
(2) Inspection of oil quality and inclusions

- When draining transfer oil, check for oil quality, metal chips and metal powder.
- If an abnormally large amount of metal chips and metal powder is found, disassemble the transfer assembly for service, as abnormalities may be caused inside.

[Replacement]

- Remove the drain plug to drain transfer oil. Drainage can be made quickly with the inspection plug removed.
- After draining transfer oil, apply sealant to the drain plug and tighten it to the specified torque. In case of the drain plug of magnet type, clean it before installation.
- Fill transfer oil of the specified quantity from the inspection plug hole.
- After filling, check that transfer oil is filled up to the neck. If oil is not sufficient, replenish it.
- After completing work, apply sealant to the inspection plug and tighten it to the specified torque.

REMOVAL AND INSTALLATION OF TRANSMISSION (WITH TRANSFER)



● Removal sequence

1 Propeller shaft (See Gr25.)
2 Engine speed sensor
3 O-ring
4 Connector (See Gr21.)
5 Parking brake cable (See Gr36.)
6 Roll stopper bracket
7 Transmission

● Installation sequence

Follow the removal sequence in reverse.

- Check and adjust the parking brake lever after the installation. (See Gr36.)

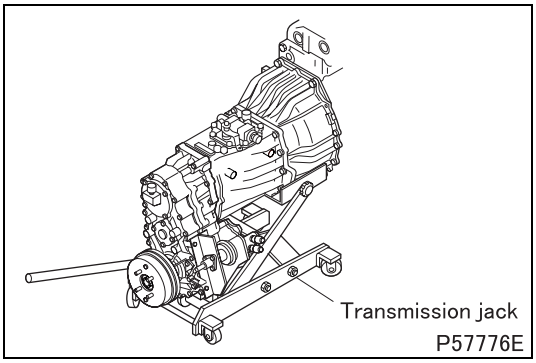
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened		Tightening torque	Remarks
Ta	Bolt (transmission mounting)		45 to 65 {33 to 48, 4.6 to 6.6}	–
Tb	Bolt (transmission mounting)	M10	47.1 {35, 4.8}	–
		M12	82.4 {61, 8.4}	–
Tc	Nut (roll stopper bracket mounting)		38 to 54 {28 to 40, 3.9 to 5.5}	–
Td	Bolt (engine speed sensor mounting)		8 {0.82}	–

Lubricant and/or sealant

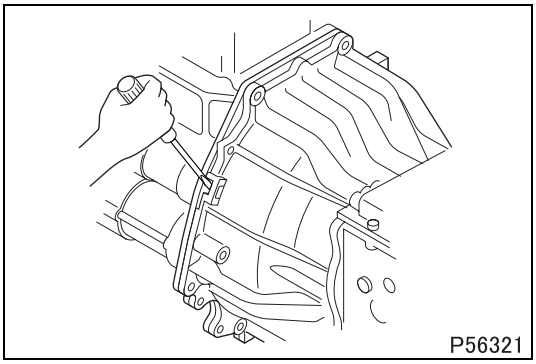
Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Drive pinion spline	Molybdenum disulfide grease [NLGI No. 2 (Li soap)]	As required
b	Mating surface of clutch housing and engine	ThreeBond 1215	As required

◆Removal procedure◆



■ **Removal: Transmission**

- Support the transmission on the transmission jack and remove transmission mounting bolts.

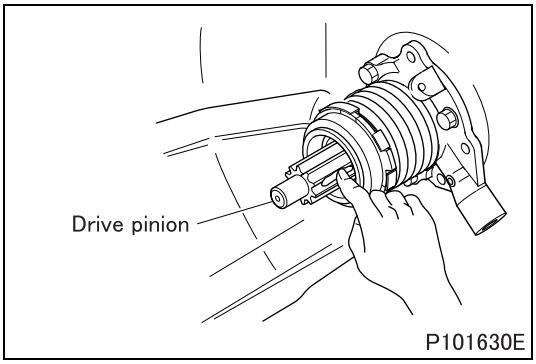


- Insert a screwdriver into the three removal grooves and pry the transmission from the engine.
- Move the transmission backward until the spline of the drive pinion is detached from the clutch.

CAUTION ⚠

- **Make sure that you pull the transmission out in a straight line. If you seesaw the transmission violently, you will damage the spline that connects the drive pinion and the clutch.**

◆Installation procedure◆

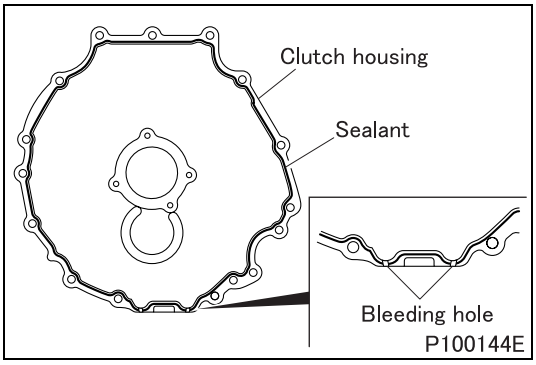


■ **Installation: Transmission**

- Check the spline of the drive pinion for rust.
- If rust is found, remove it using a wire brush.
- Rub grease evenly onto the clutch disc sliding surface of the drive pinion using your hand.

CAUTION ⚠

- **Make sure that you apply only the necessary amount of grease because too much grease would drip and cause clutch slip.**



[Applying sealant]

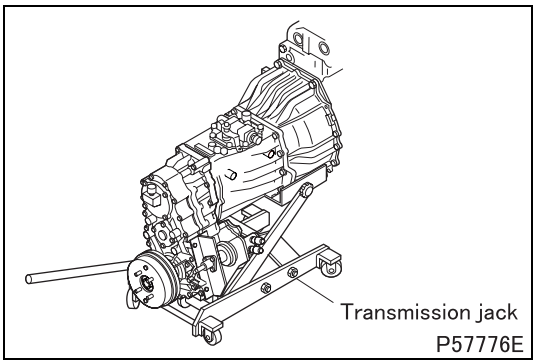
- Apply sealant following manners shown below.

CAUTION ⚠

- **Take care not to apply sealant under any of the following conditions. Otherwise it causes water infiltration.**
  - **There is dust, oil, grease, etc. on the mating surface.**
  - **The diameter or thickness of the applied sealant is extremely different at each part.**
  - **The applied sealant has some breaks.**
  - **The applied sealant covers the bleeding hole of the clutch housing and engine parts.**

<Case of using nozzle gun>

- Clean the mating surfaces of each part.
- Apply sealant on the width center of the mating surfaces so that the diameter of the applied sealant is the same as the diameter of the nozzle. The line of applying sealant is illustrated.



<Case of using spatula, etc.>

- Clean the mating surfaces of each part.
- Apply sealant evenly on the entire mating surfaces.

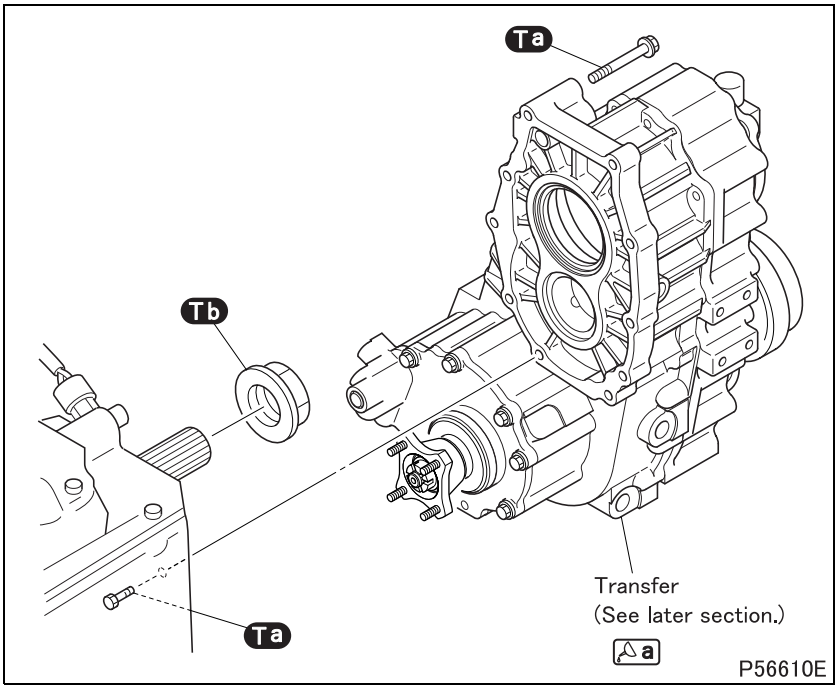
[Installation]

- After applying the sealant, install the transmission before the sealant dries. Be sure not to allow the sealant to be displaced.
- Do not start the engine within one hour after installing the transmission.
- When loosing or removing transmission mounting bolts, be sure to reapply the sealant.

- Support the transmission on the transmission jack, and insert the transmission into the pilot bearing of the flywheel paying attention to the drive pinion spline.
- Tighten transmission mounting bolts to the specified torque.

M E M O

REMOVAL AND INSTALLATION OF TRANSFER



CAUTION ⚠

- **Do not shake the transmission violently when removing the transfer from it, as doing so may damage the mainshaft end and gears.**

NOTE

- **The lock nut does not need to be removed if the transfer alone is removed.**

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Bolt (transfer mounting)	44.5 {33, 4.5}	–
Tb	Lock nut	490 ± 49 {360 ± 36, 50 ± 5}	–

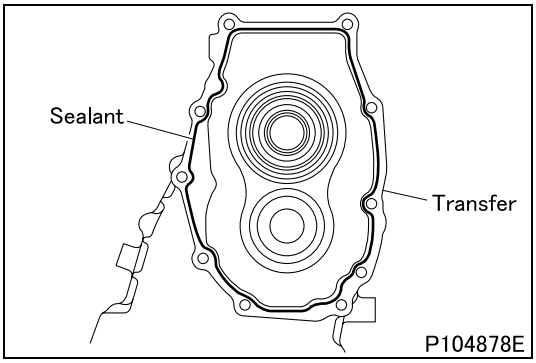
Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Transmission mounting surface of transfer	ThreeBond 1215	As required

Special tools (Unit: mm {in.})

Mark	Tool name and shape	Part No.	Application
a	Socket wrench A: 60 {2.36}  P56611	MH063006	Removal and installation of lock nut

◆Installation procedure◆



■ Installation: Transfer

[Applying sealant]

- Apply sealant following manners shown below.

CAUTION ⚠

- **Take care not to apply sealant under any of the following conditions. Otherwise it causes oil leak.**
  - **There is dust, oil, grease, etc. on the mating surface.**
  - **The diameter or thickness of the applied sealant is extremely different at each part.**
  - **The applied sealant has some breaks.**

<Case of using nozzle gun>

- Clean the mating surfaces of each part.
- Apply sealant on the width center of the mating surfaces so that the diameter of the applied sealant is the same as the diameter of the nozzle. The line of applying sealant is illustrated.

<Case of using spatula, etc.>

- Clean the mating surfaces of each part.
- Apply sealant evenly on the entire mating surfaces.

[Installation]

- After applying the sealant, install the transfer before the sealant dries. Be sure not to allow the sealant to be displaced.
- Do not start the engine within one hour after installing the transfer.
- When loosing or removing transfer mounting bolts, be sure to re-apply the sealant.

● **Assembly sequence**

Follow the disassembly sequence in reverse except for the following.
23→24→25

Service standards (Unit: mm {in.})

Location	Maintenance item	Standard value	Limit	Remedy
7	Airtightness of vacuum actuator (Applying negative pressure: 66.7 kPa {19.7 in.Hg, 500 mmHg}, measure after 15 sec.)	Negative pressure: 63.3 kPa {18.7 in.Hg, 475 mmHg} or more	–	Replace
16	Poppet spring installed load (installed length 22 {0.87})	81 N {18 lbs, 8.3 kgf}	65 N {15 lbs, 6.6 kgf}	Replace
33	Shift lug spring installed load (installed length 20.6 {0.81})	22 N {5.0 lbs, 2.2 kgf}	18 N {4.0 lbs, 1.8 kgf}	Replace
34, 35	Clearance between front drive shift fork and synchronizer sleeve	0.3 to 0.5 {0.012 to 0.020}	1.0 {0.039}	Replace

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ⓣa	Bolt (shift rail cover mounting)	44.5 {33, 4.5}	–
	Bolt (front drive case cover mounting)		
Ⓣb	Transfer low switch	34.3 ± 4.9 {25 ± 3.6, 3.5 ± 0.5}	–
	Transfer four-wheel drive switch		
	Plug		
Ⓣc	Screw plug	39.2 {29, 4}	–
Ⓣd	Lock nut	294 ± 49 {215 ± 36, 30 ± 5}	–
Ⓣe	Set bolt	29.4 {22, 3}	After tightening, caulk it at three locations.

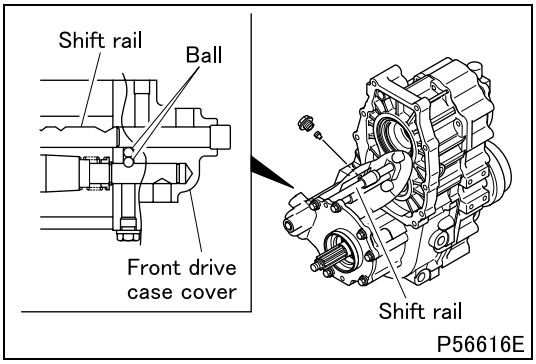
Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Lip area of oil seal	Wheel bearing grease [NLGI No. 2 (Li soap)]	As required
b	Thread area of screw plug	ThreeBond 1215	As required
	Transfer mounting surface of front drive case cover		

Special tools (Unit: mm {in.})

Mark	Tool name and shape	Part No.	Application
a	Oil seal installer A: φ35 {1.38}, B: φ15.5 {0.61}, C: 9 {0.35}  P56613	MH061923	Installation of oil seal
b	Bearing installer A: φ52 {2.05}, B: φ42 {1.65}  P56614	MB999104	Installation of oil seal
c	Differential bearing inner race installer adapter A: φ88 {3.46}, B: φ50 {1.97}  P56615	MB999105	
d	Snap ring expander  P01137	MH061268	Removal and installation of snap ring

◆Removal procedure◆



P56616E

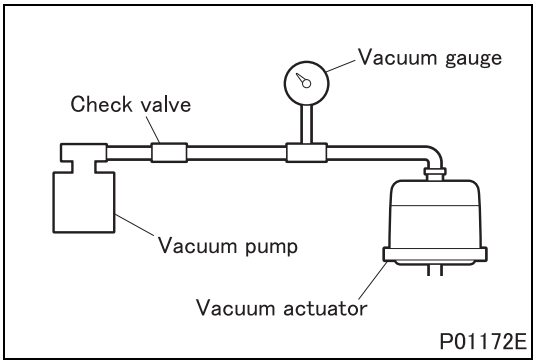
■ Removal: Front drive case cover

- After removing the plug and set bolt, pull the high and low shift rail toward the parking brake side until the rail stops (the rail moves to the illustrated position) and remove the front drive case cover.

NOTE

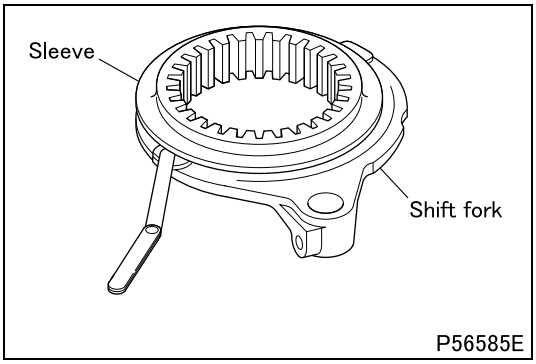
- **Be careful that the interlock balls may fall when the front drive case cover is removed.**

◆Inspection procedure◆



■ **Inspection: Vacuum actuator**

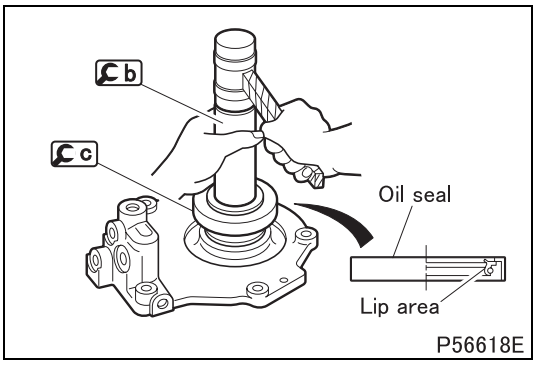
- Pipe the vacuum pump, check valve and vacuum gauge, apply negative pressure of 66.7 kPa {19.7 in.Hg, 500 mmHg} to the vacuum actuator, and stop the vacuum pump. After 15 seconds, measure the negative pressure with the vacuum gauge.
- If the measured value deviates from the standard value, replace the vacuum actuator.



■ **Inspection: Clearance between front drive shift fork and synchronizer sleeve**

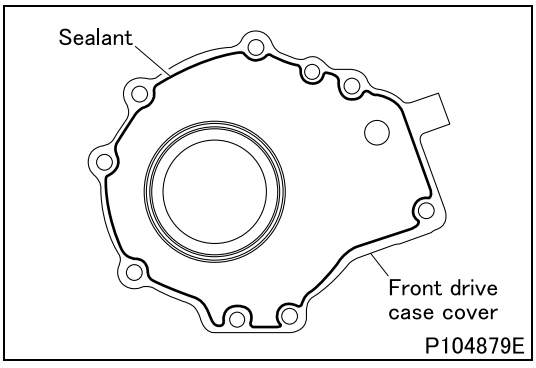
- If the measured value exceeds the limit, replace defective parts.

◆Installation procedure◆



■ **Installation: Oil seal**

- Apply grease to the lip area of the oil seal and install it on the front drive case cover in the illustrated direction.



■ **Installation: Front drive case cover**

[Applying sealant]

- Apply sealant following manners shown below.

CAUTION ⚠

- **Take care not to apply sealant under any of the following conditions. Otherwise it causes oil leak.**
  - **There is dust, oil, grease, etc. on the mating surface.**
  - **The diameter or thickness of the applied sealant is extremely different at each part.**
  - **The applied sealant has some breaks.**

<Case of using nozzle gun>

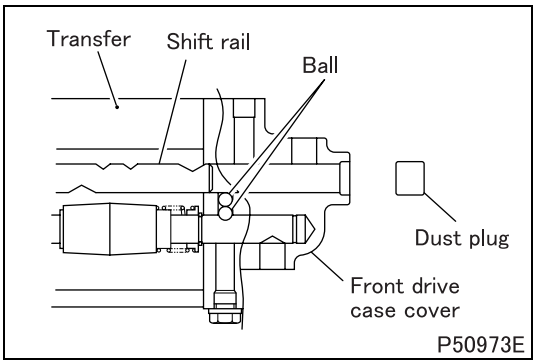
- Clean the mating surfaces of each part.
- Apply sealant on the width center of the mating surfaces so that the diameter of the applied sealant is the same as the diameter of the nozzle. The line of applying sealant is illustrated.

<Case of using spatula, etc.>

- Clean the mating surfaces of each part.
- Apply sealant evenly on the entire mating surfaces.

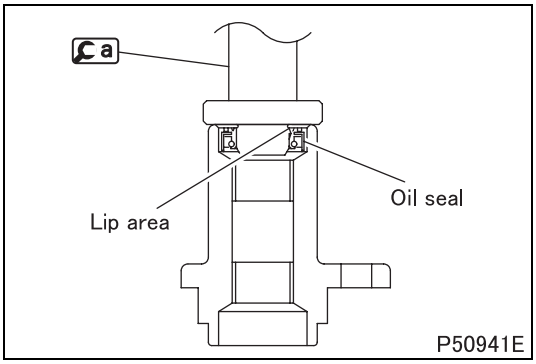
[Installation]

- After applying the sealant, install the front drive case cover before the sealant dries. Be sure not to allow the sealant to be displaced.
- Do not start the engine within one hour after installing the front drive case cover.
- When loosing or removing front drive case cover mounting bolts, be sure to reapply the sealant.



■ Installation: Interlock ball

- Install the front drive case cover on the transfer.
- Push in the high and low shift rail to the illustrated position (until the hole in which the balls enter is visible from the dust plug hole), and roll in the interlock balls from the dust plug to install.



■ Installation: Oil seal

- Apply grease to the lip area of the oil seal and install it in the illustrated direction.

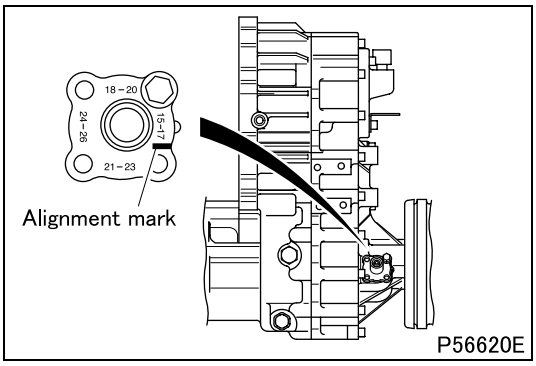
Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Transfer mating surface of idler rear cover	ThreeBond 1215	As required
	Transfer mating surface of input rear cover		
b	Speedometer gear bushing sliding area of speedometer gear	Molybdenum disulfide grease [NLGI No. 2 (Li soap)]	As required
c	Lip area of oil seal	Wheel bearing grease [NLGI No. 2 (Li soap)]	As required

Special tools (Unit: mm {in.})

Mark	Tool name and shape	Part No.	Application
ⓒa	Flange puller A: ϕ95 {3.74} B: ϕ100 {3.94} C: ϕ90 {3.54}  P56577	MH061848	Removal of companion flange

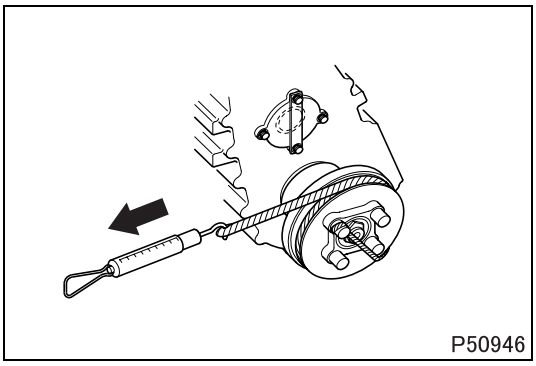
◆Work before removal◆



P56620E

■ **Alignment marks: Speedometer gear bushing**

- The installed direction of the speedometer gear bushing is determined by the number of the speedometer gear tooth.
- Put alignment marks to prevent misassembly.

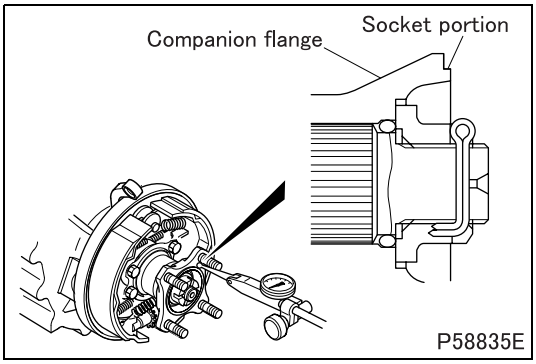


P50946

■ **Inspection: Startup torque of idler gear bearing**

- Measure the tangential force at the outer diameter of the parking brake drum using a spring balance.

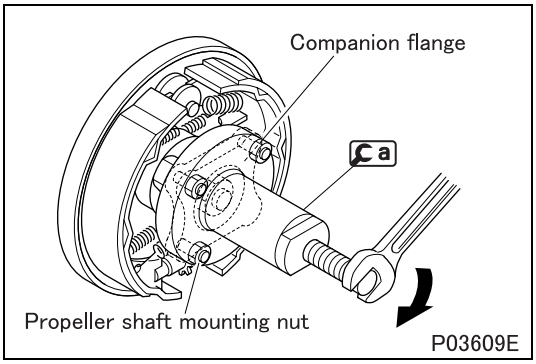
◆Removal procedure◆



P58835E

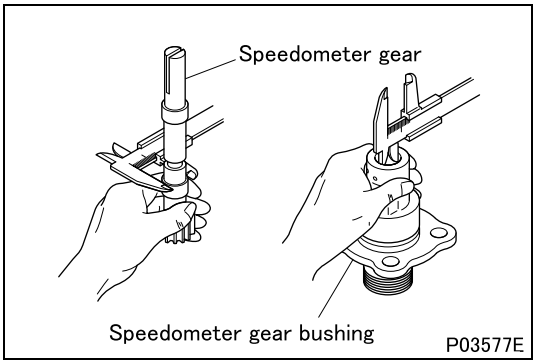
■ **Inspection: Runout at socket portion of companion flange**

- After removing the parking brake drum, measure runouts of the companion flange at its socket portion.
- If the measurement exceeds the specified limit, replace the companion flange.



■ **Removal: Companion flange**

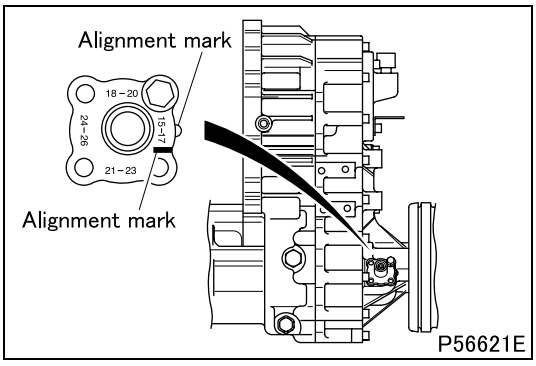
◆Inspection procedure◆



■ **Inspection: Clearance between speedometer gear and speedometer gear bushing**

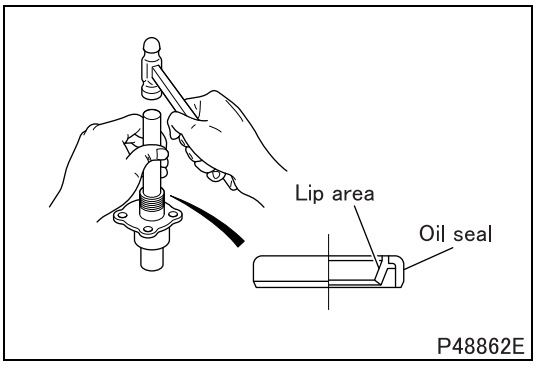
- If the clearance exceeds the limit, replace defective parts.

◆Installation procedure◆



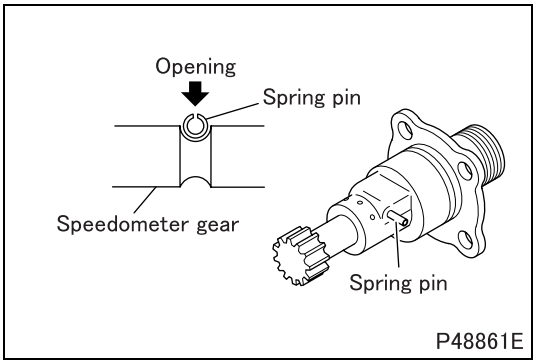
■ **Installation: Speedometer gear bushing**

- When replacing the speedometer gear bushing, align the alignment mark of the old part with that of the transfer to install.



■ **Installation: Oil seal**

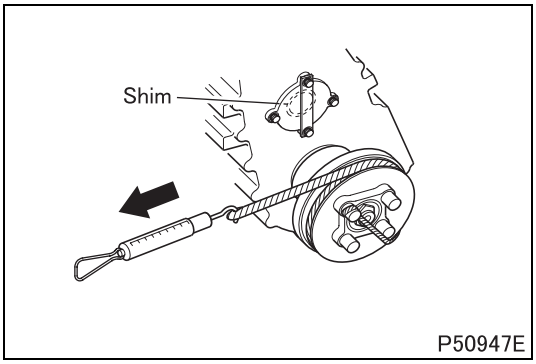
- Apply grease to the lip area of the oil seal.
- Install the oil seal evenly in the illustrated direction using a round bar of outer diameter of approx. 15 mm {0.59 in.}.



■ **Installation: Spring pin**

- Install the spring pin in the speedometer gear bushing in the illustrated direction.

◆Inspection after installation◆



■ **Inspection: Starting torque of pinion bearing**

- Measure the tangential force at the outer diameter of the parking brake drum using a spring balance.
- If the tangential force meets the specified value, the startup torque becomes the standard value.
- If the measured value deviates from the standard value, adjust by changing thickness of the shim.
  Kinds of shim: 0.10, 0.15, 0.20, 0.50 mm {0.0039, 0.0059, 0.0079, 0.020 in.}

● **Assembly sequence**

Follow the disassembly sequence in reverse.

Service standards (Unit: mm {in.})

Location	Maintenance item		Standard value	Limit	Remedy
–	End play	Driven rear shaft low gear	0.25 to 0.40 {0.0098 to 0.016}	0.6 {0.024}	Replace
		Driven rear shaft high gear			
9	Tilt of high and low shift fork claws		0 to 0.1 {0 to 0.0039}	0.2 {0.0079}	Replace
9, 14	Clearance between high and low shift fork and synchronizer sleeve of transfer driven rear shaft		0.3 to 0.5 {0.012 to 0.020}	1.0 {0.039}	Replace
10, 13	Bend of high and low shift rail		0 to 0.02 {0 to 0.00079}	0.03 {0.0012}	Replace

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Bolt (transfer cover mounting)	44.5 {33, 4.5}	–
Tb	Set bolt	29.4 {22, 3}	After tightening, caulk it at three locations.

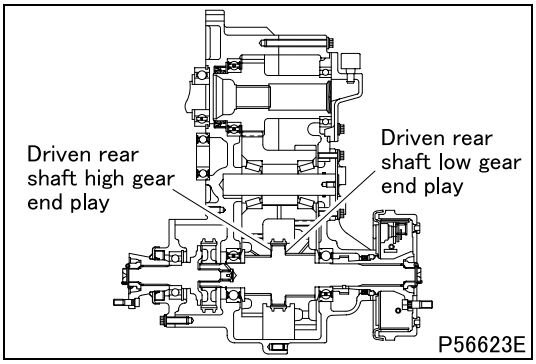
Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Transfer case mating surface of transfer cover	ThreeBond 1215	As required
b	Lip area of oil seal	Wheel bearing grease [NLGI No. 2 (Li soap)]	As required

Special tools (Unit: mm {in.})

Mark	Tool name and shape	Part No.	Application
a	Oil seal installer A: ϕ64 {2.52}, B: ϕ50 {1.97}, C: 17 {0.67}  P56578	MH062691	Installation of oil seal
b	Oil seal installer A: ϕ35 {1.38}, B: ϕ15.5 {0.61}, C: 9 {0.35}  P56613	MH061923	Installation of oil seal

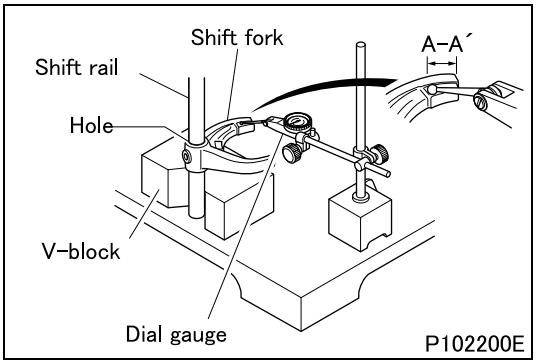
◆Work before removal◆



■ Inspection: End play of gears

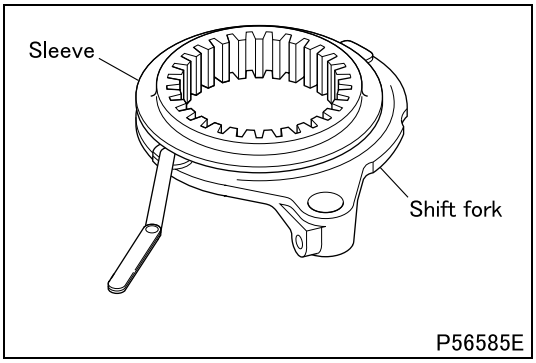
- Measure the end play using feeler gauge from the actuator bracket mounting face side.
- If the measured value exceeds the limit, replace defective parts.
- Check the play again after assembly and make sure it does not exceed the limit.

◆Inspection procedure◆



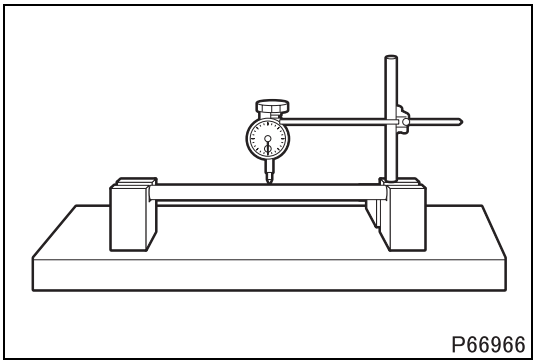
■ Inspection: Tilt of high and low shift fork claws

- Measure the tilt (difference between A and A') of claw A–A' against the high and low shift rail hole of high and low shift fork with pressing the rail to V-block and standing it vertically.
- If the measurement exceeds the limit, replace the high and low shift fork.



■ Inspection: Clearance between high and low shift fork and synchronizer sleeve of transfer driven rear shaft

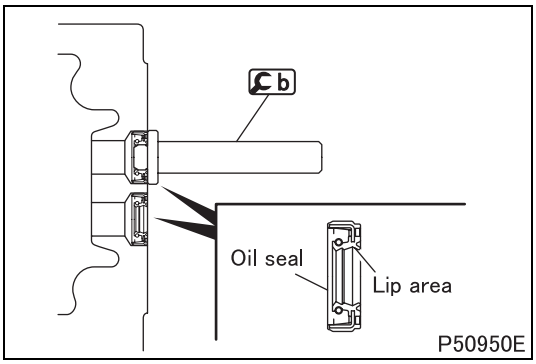
- Measure clearance between the shift fork claws and synchronizer sleeve groove.
- If the measured value exceeds the limit, replace defective parts.



■ Inspection: Bend of high and low shift rail

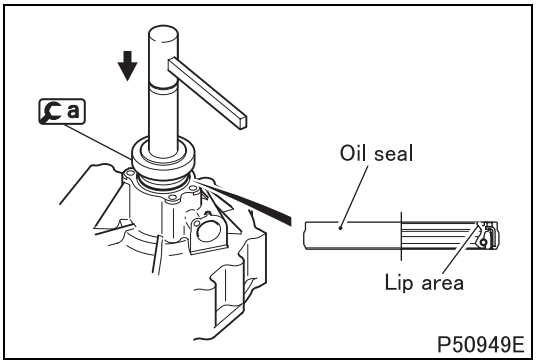
- Measure the extent of bending at the middle of the high and low shift rail.
- While rotating the high and low shift rail by one revolution, read how much the dial gauge needle will move. A half of the reading observed represents the bend, if any, of the shaft.
- If measurement exceeds the limit, correct or replace the high and low shift rail.

◆Installation procedure◆



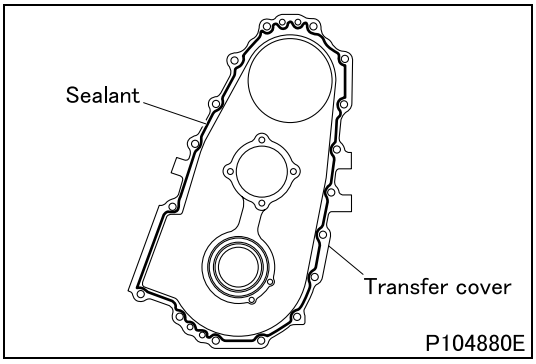
■ Installation: Oil seal

- Apply grease to the lip area of the oil seal and install it on the transfer cover in the illustrated direction.



■ **Installation: Oil seal**

- Apply grease to the lip area of the oil seal and install it on the transfer cover in the illustrated direction.



■ **Installation: Transfer cover**

[Applying sealant]

- Apply sealant following manners shown below.

CAUTION ⚠

- **Take care not to apply sealant under any of the following conditions. Otherwise it causes oil leak.**
  - **There is dust, oil, grease, etc. on the mating surface.**
  - **The diameter or thickness of the applied sealant is extremely different at each part.**
  - **The applied sealant has some breaks.**

<Case of using nozzle gun>

- Clean the mating surfaces of each part.
- Apply sealant on the width center of the mating surfaces so that the diameter of the applied sealant is the same as the diameter of the nozzle. The line of applying sealant is illustrated.

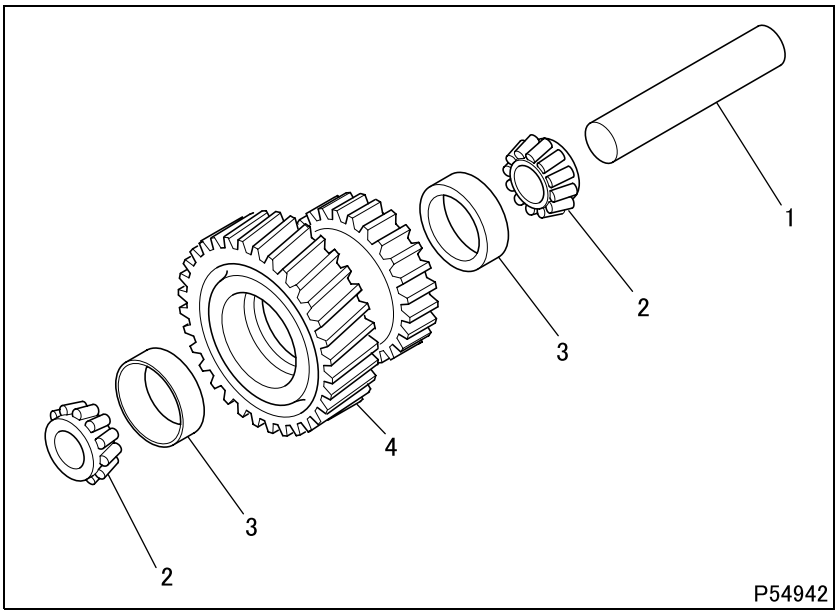
<Case of using spatula, etc.>

- Clean the mating surfaces of each part.
- Apply sealant evenly on the entire mating surfaces.

[Installation]

- After applying the sealant, install the transfer cover before the sealant dries. Be sure not to allow the sealant to be displaced.
- Do not start the engine within one hour after installing the transfer cover.
- When loosing or removing transfer cover mounting bolts, be sure to reapply the sealant.

Transfer Idler Gear



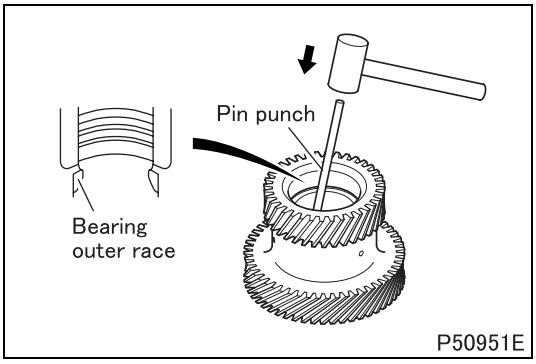
● **Disassembly sequence**

1 Transfer idler shaft
2 Bearing inner race
3 Bearing outer race
4 Transfer idler gear

● **Assembly sequence**

Follow the disassembly sequence in reverse.

◆**Removal procedure**◆



■ **Removal: Bearing outer race**

- Evenly tap the bearing outer race to take it out from the transfer idler gear.

Transfer Drive Gear

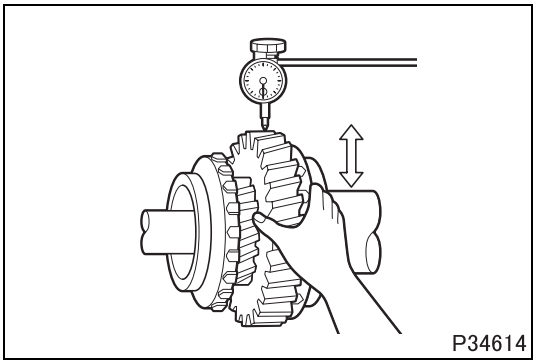
◆Inspection before removal◆



P34614

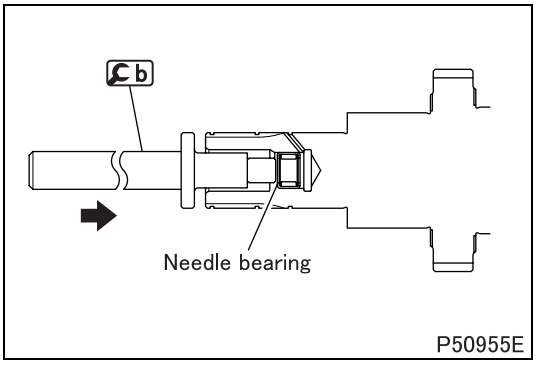
■ **Inspection: Play of driven rear shaft gears in diameter direction**

- If the measured value exceeds the limit, replace defective parts.
- Check the play again after assembly and make sure it does not exceed the limit.

NOTE

- **When either of the needle bearings of a gear needs to be replaced, replace both of them at the same time. Make sure the new needle bearings have the same package color.**

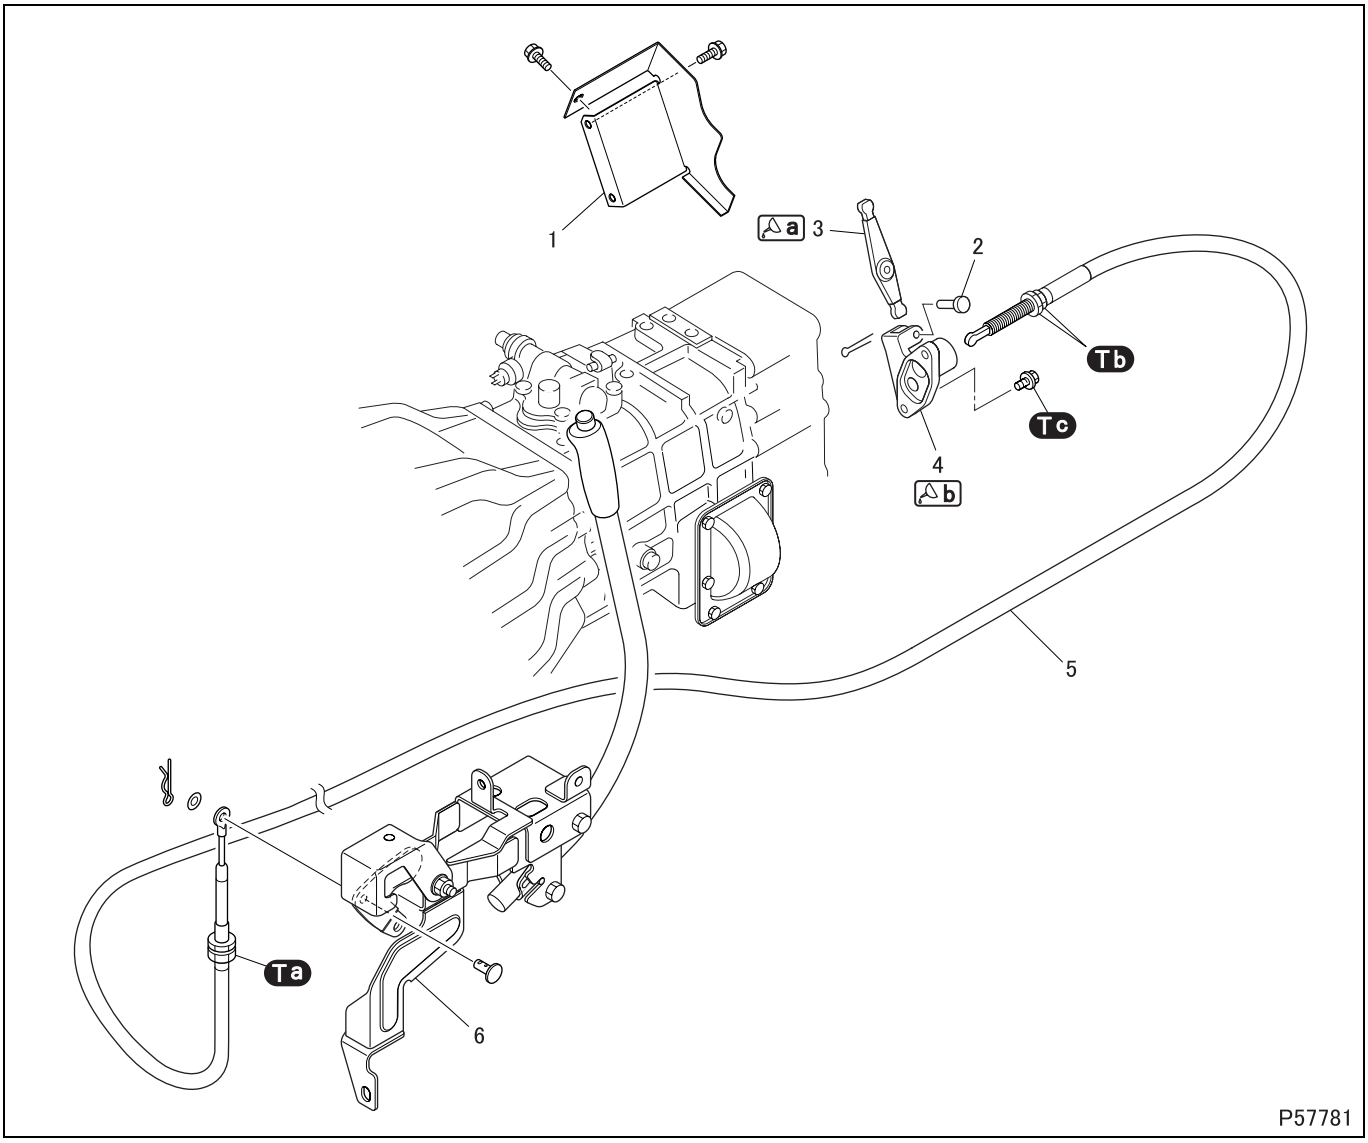
◆Installation procedure◆



P50955E

■ **Installation: Needle bearing**

TRANSFER CONTROL (HIGH-LOW SWITCHING)



● **Disassembly sequence**

1 Actuator rear cover
2 Clevis pin
3 Transfer gear shift lever
4 Shift rail cover
5 Transfer control cable
6 Transfer control lever (See later section.)

● **Assembly sequence**

Follow the disassembly sequence in reverse.

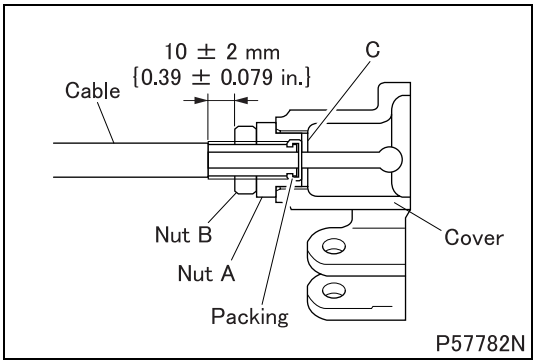
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Lock nut of transfer control cable on transfer control lever	28.7 to 38.7 {21 to 29, 2.9 to 3.9}	–
Tb	Lock nut of transfer control cable on transfer body	44 to 59 {32 to 44, 4.5 to 6.0}	–
Tc	Bolt (shift rail cover mounting)	44.5 {33, 4.5}	–

Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Both ends and fulcrum of transfer gear shift lever	Wheel bearing grease [NLGI No. 2 (Li soap)]	As required
b	Transfer mounting surface of shift rail cover	ThreeBond 1215	As required

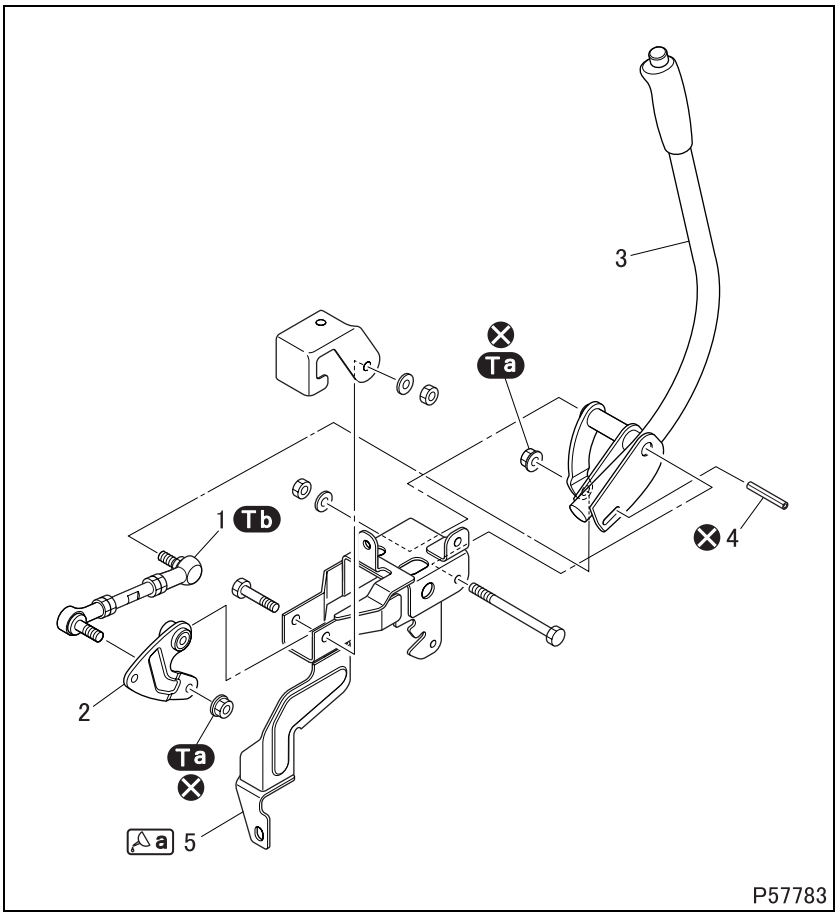
◆Installation procedure◆



■ Installation: Transfer control cable

- Install the cable in the shift rail cover being careful not to let the packing project from surface C in the cover, and then tighten nut A to the specified torque.
- Tighten nut B to the specified torque and to the dimension indicated in the illustration.

Transfer Control Lever



● **Disassembly sequence**

1 Rod
2 Lever
3 Transfer lever
4 Spring pin
5 Transfer control bracket

⊗: Non-reusable parts

● **Assembly sequence**

Follow the disassembly sequence in reverse.

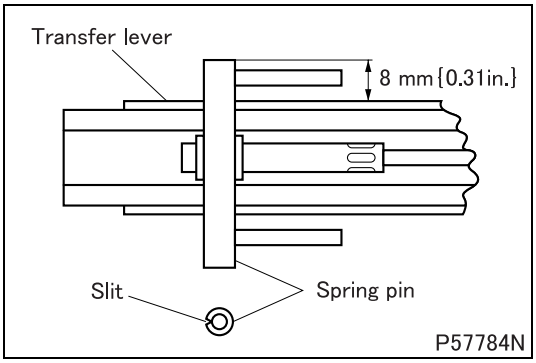
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Nut (rod mounting)	39 to 50 {29 to 37, 4.0 to 5.1}	–
Tb	Lock nut of rod	18.6 to 27.5 {14 to 20, 1.9 to 2.8}	

Lubricant and/or sealant

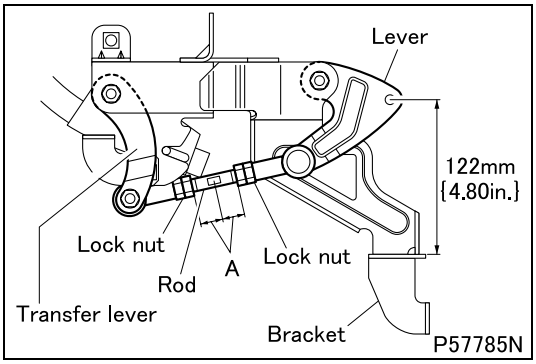
Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Spring pin mating area of transfer control bracket	Wheel bearing grease [NLGI No. 2 (Li soap)]	As required

◆**Installation procedure**◆



■ **Installation: Spring pin**

- Install the spring pin so that the protruding distance from the transfer lever and the slit direction of the spring pin are as illustrated.



■ **Installation: Rod**

- Install the rod on the lever and transfer lever.
- Loosen the lock nuts on the rod and turn the rod until the distance between the lever and transfer control bracket is as indicated in the illustration. Make sure that distance A in the illustration does not exceed 32.3 mm {1.27 in.}.
- Tighten the lock nuts after the above adjustment.

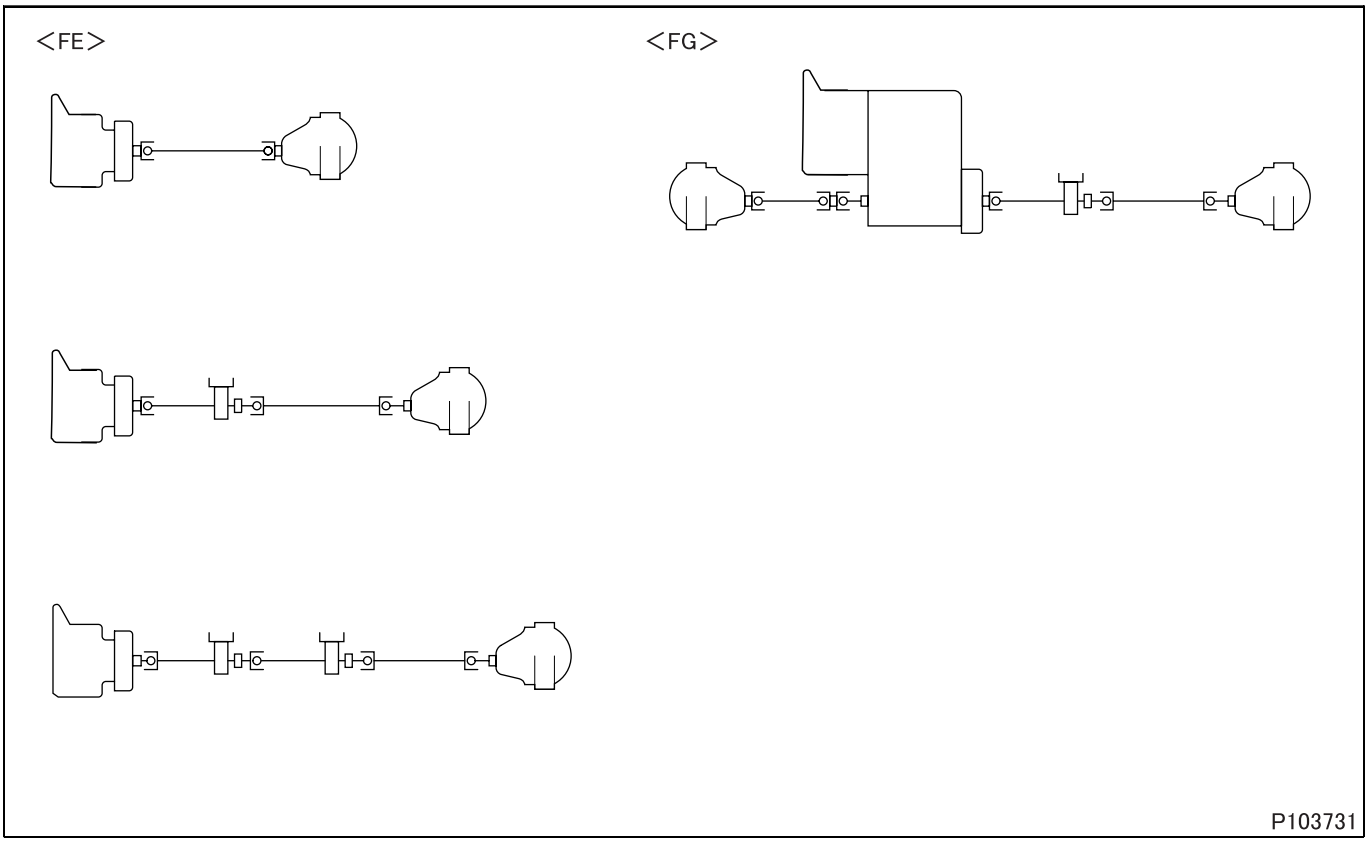
SPECIFICATIONS

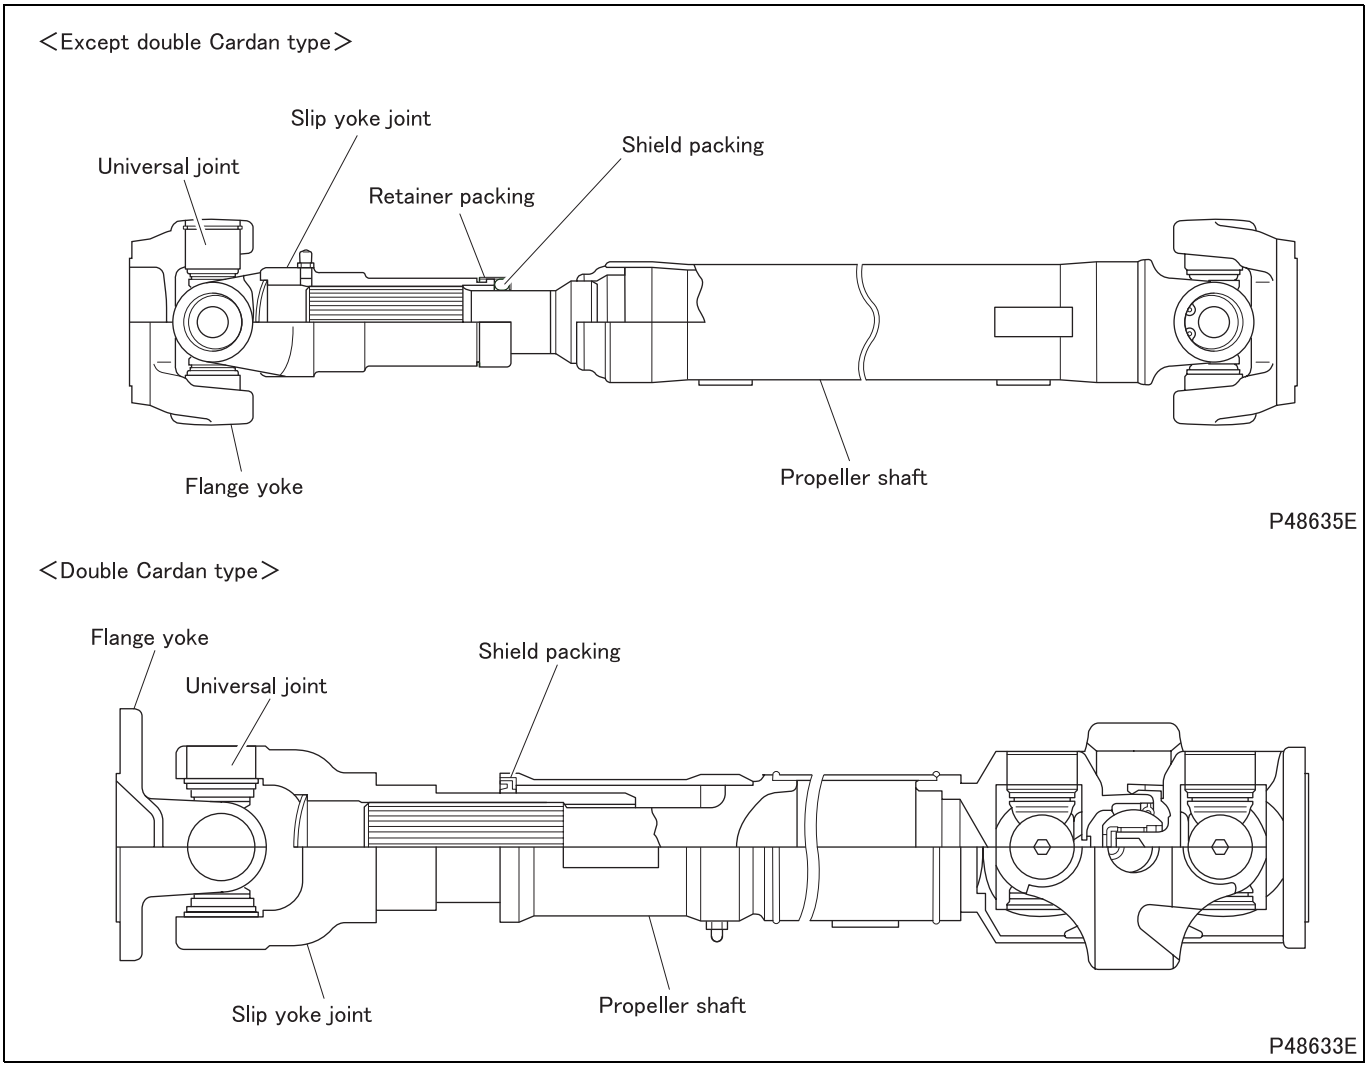
Item		Specifications	
		FG <Front axle>	FE, FG
Propeller shaft	Model	P2	P3

STRUCTURE AND OPERATION

1. Configuration of Propeller Shaft Connection

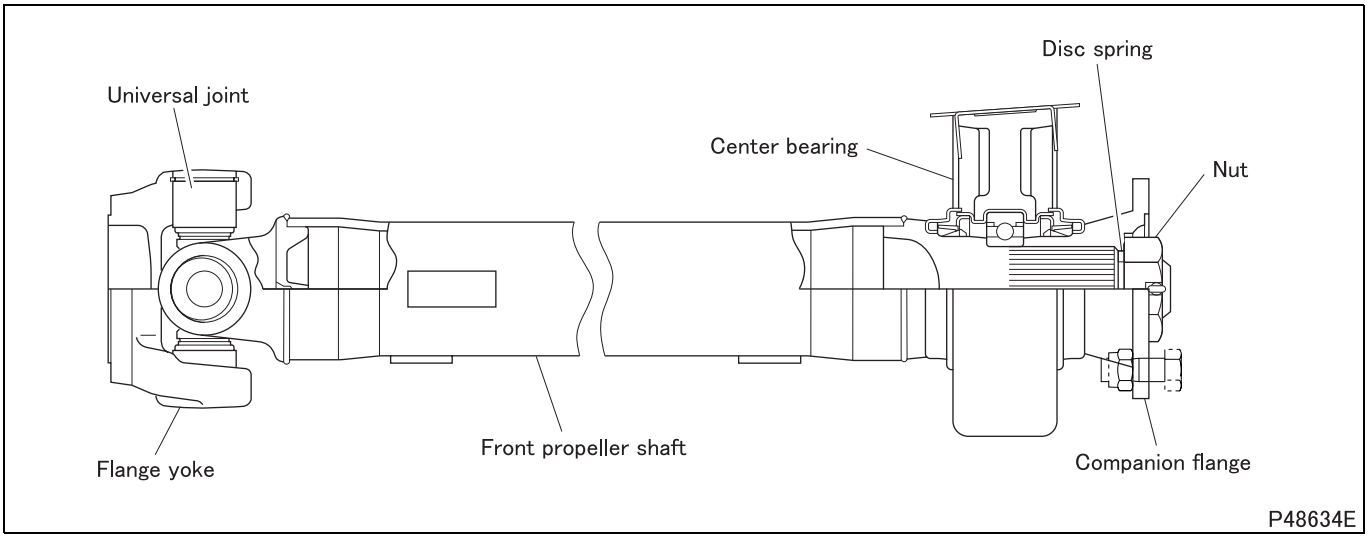


2. Propeller Shaft <Without Center Bearing>



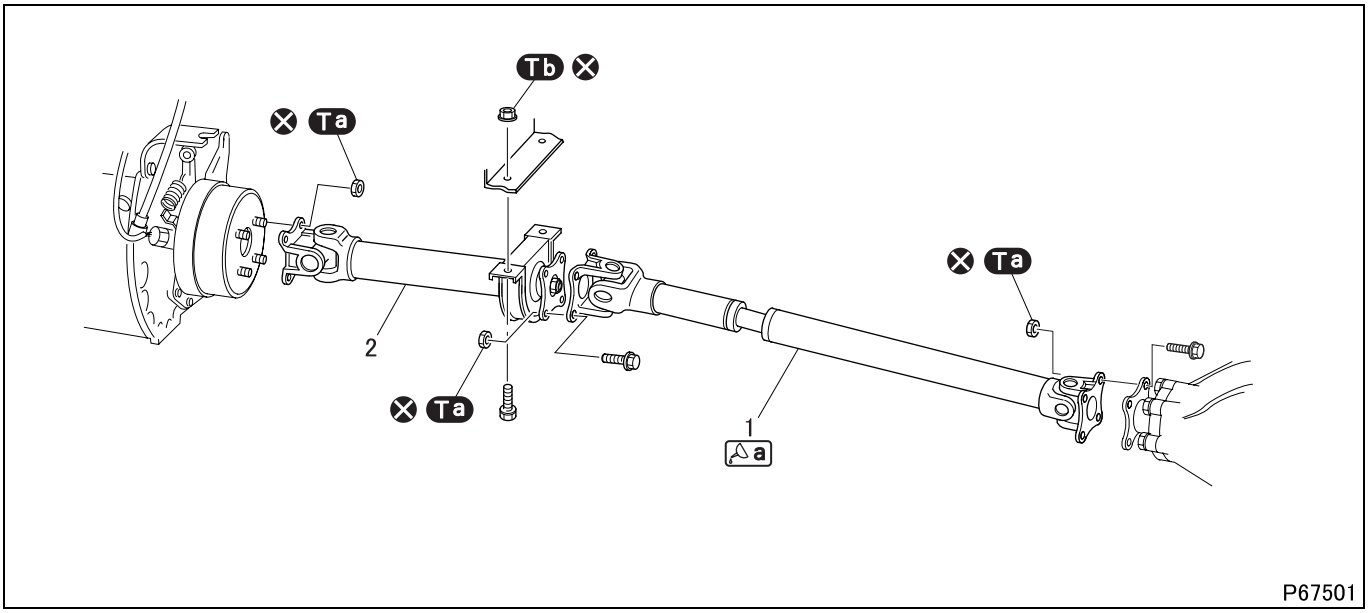
- Propeller shafts used with FG front axles are of double Cardan type suited for suppressing vibrations caused by angle changes in universal joint.

3. Propeller Shaft <With Center Bearing>



Possible causes \ Symptoms		Propeller shaft vibrates		Abnormal noise from propeller shaft	
		Vibration at high speed	Vibration at low speed	Abnormal noise at acceleration from zero or at coasting	Abnormal noise at normal running
Wrong combination of flange yoke directions		O			
Slip yoke joint	Insufficient grease				O
	Excessive play at spline		O	O	
Universal joint	Excessive clearance in axial direction of spider shaft		O		O
	Insufficient needle bearing greasing				O
	Worn out needle bearing	O		O	O
Center bearing	Insufficient grease				O
	Seizure, wear or improper rotation	O			O
	Deteriorated or deformed cushion rubber			O	
	Loose hanger mounting bolt			O	
Propeller shaft	Loose mounting bolts	O		O	
	Bent	O			
	Dynamic balance improper	O			
Transmission in high speed gear			O		

REMOVAL AND INSTALLATION OF PROPELLER SHAFT <BETWEEN T/M (OR T/F) AND REAR AXLE>



Shown above is a tandem propeller shaft for FE. The illustration applies to other propeller shafts.

● **Removal sequence**

1 Propeller shaft <Without center bearing> (See later section.)
2 Propeller shaft <With center bearing> (See later section.)

⊗: Non-reusable parts

CAUTION ⚠

- **Securely chock the wheels so that the vehicle does not move.**
- **Do not remove the chocks until the entire operation is completed.**

● **Installation sequence**

Follow the removal sequence in reverse.

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

◆Work before removal◆

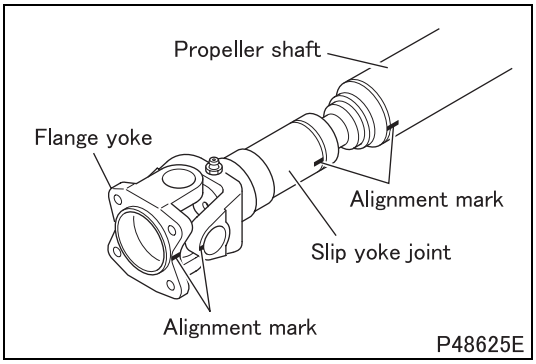
■ Inspection: Axial clearance of spider

- Press down on the needle bearing, and measure clearances between snap ring and flange yoke, slip yoke joint and propeller shaft.
- If measured value exceeds the standard value, change snap ring thickness for adjustment.
  To adjust, use snap rings for both ends with the same thickness. Select optimal combination of snap rings from the table below if necessary.

Variety and combination of snap rings (solid line indicates best combination)

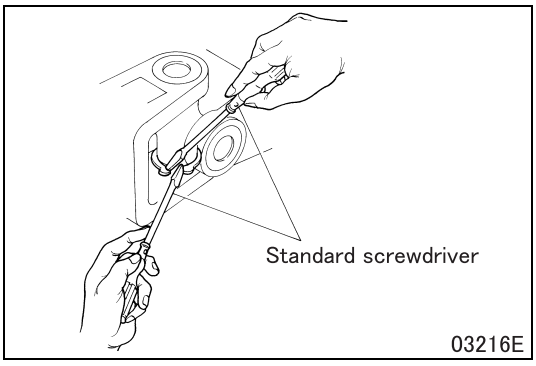
Thickness	Identification color	Combination	Thickness	Identification color
1.5 mm {0.059 in.}	None		1.5 mm {0.059 in.}	None
1.55 mm {0.061 in.}	Yellow		1.55 mm {0.061 in.}	Yellow
1.6 mm {0.063 in.}	Blue		1.6 mm {0.063 in.}	Blue
1.65 mm {0.065 in.}	Purple		1.65 mm {0.065 in.}	Purple



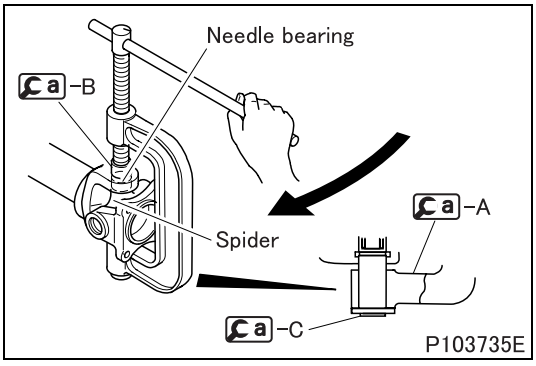
■ **Alignment mark: Propeller shaft**

- To prevent assembly of wrong parts, make alignment marks on flange yoke, slip yoke joint and propeller shaft.

◆Removal procedure◆



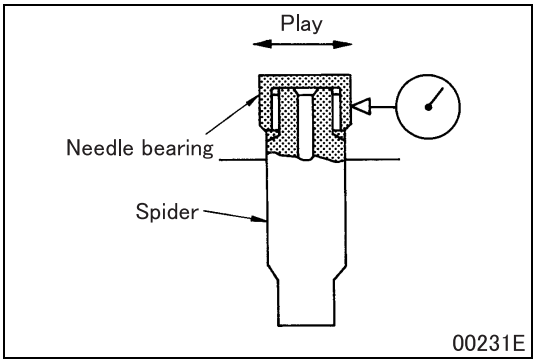
■ **Removal: Snap ring**



■ **Removal: Needle bearing**

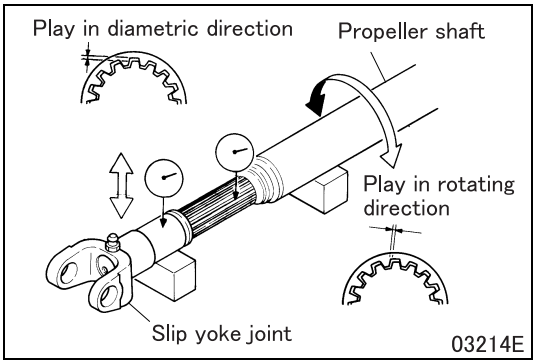
- Fit a -C into a -A from outside.
- Applying a -B to spider, screw a -A to force out spider and remove needle bearing.

◆Inspection procedure◆



■ **Inspection: Clearance between needle bearing and spider**

- If the measurement exceeds the limit, replace with the universal joint spider kit.

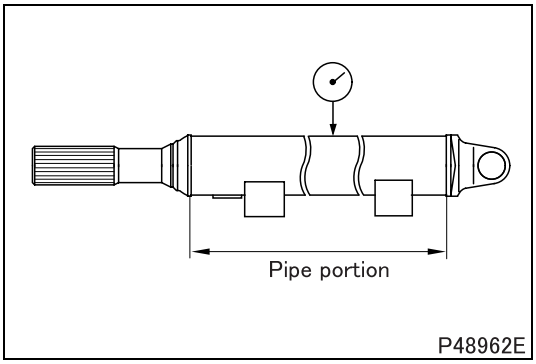


■ **Inspection: Play between slip yoke joint and propeller shaft spline**

- Check the following, and if the measurement is higher than the limit, replace the faulty part.

(1) Play of spline in rotating direction

(2) Play of spline in diametric direction



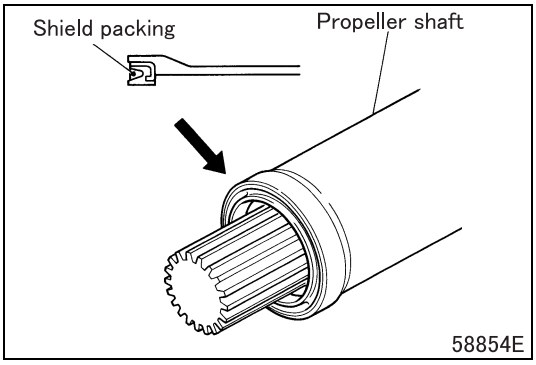
■ **Inspection: Bend of propeller shaft**

- Measure bend of propeller shaft at the center of its pipe portion.
- If the measurement is higher than the limit, correct the bend with a press or replace the propeller shaft.

NOTE

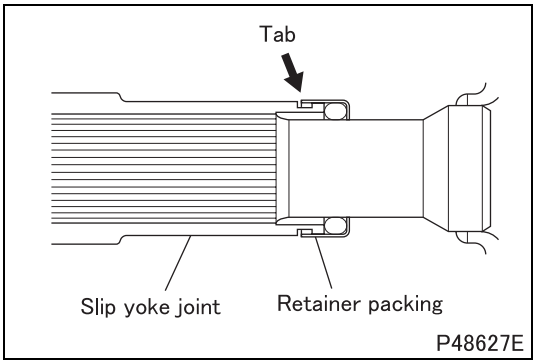
- **To measure the bend of propeller shaft, turn it fully once and read the dial gauge indicator. The bend is one half of the indicated value.**
- **Check the propeller shaft for cracks in the welded area after correcting the bend using a press. If cracking is found, replace the shaft.**

◆Installation procedure◆



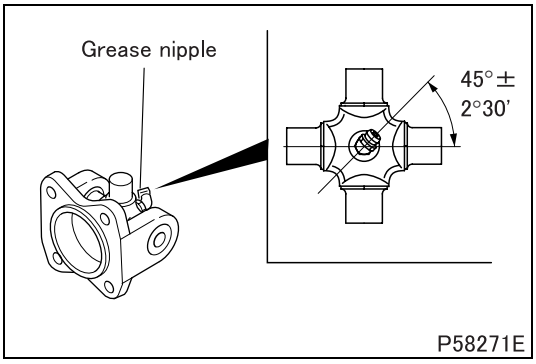
■ **Installation: Shield packing**

- Install shield packing flush onto propeller shaft in the illustrated direction.



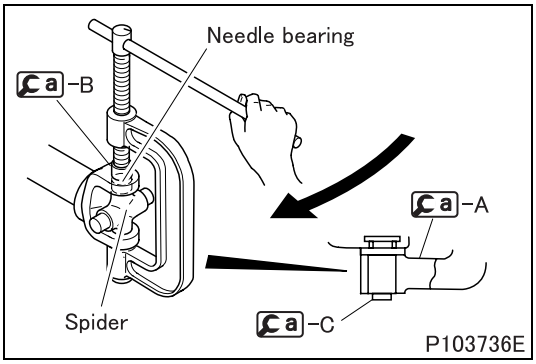
■ **Installation: Retainer packing <Except double Cardan type>**

- Hold retainer packing against slip yoke joint and crimp tabs (at eight places).



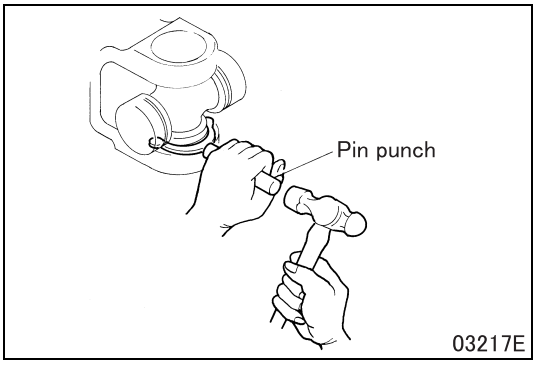
■ **Installation: Grease nipple**

- Install the grease nipple on the spider at an angle conforming to the indication in the illustration.



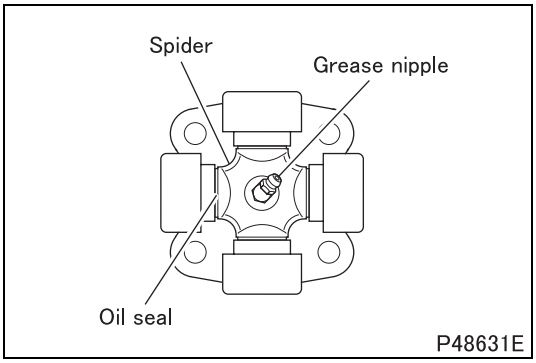
■ **Installation: Needle bearing**

- Fit ⓐ-C into ⓐ-A from inside.
- Operating ⓐ-A, install needle bearing into place.



■ **Installation: Snap ring**

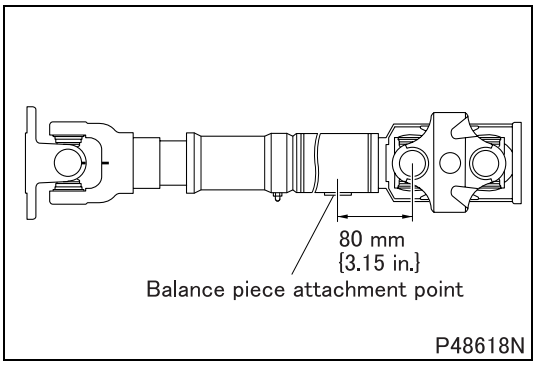
◆Work after installation◆



■ **Lubrication: Grease nipple**

- Fill grease through grease nipple until clean grease overflows from all of the four oil seals of spider.
- If grease does not overflow from all of the four oil seals or rust, water and dirt come out with grease, replace the spider with the spider kit.

◆Inspection procedure◆



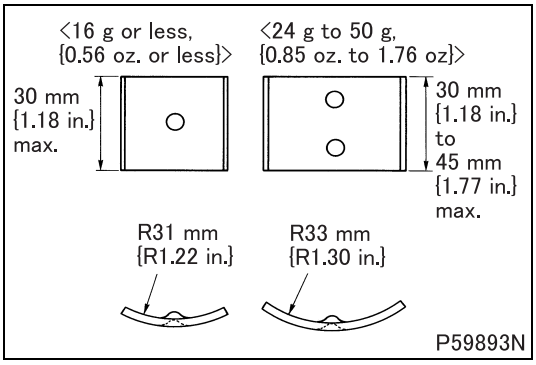
■ **Inspection: Propeller shaft**

[Inspection]

- Measure the amount of balance (dynamic balance) of completed propeller shaft assembly on a balancing machine.
- If measured value exceeds the standard value, make adjustment as follows.

[Adjustment]

- Attach appropriate balance pieces at the illustrated points so that the amount of unbalance comes within the specified standard value.
- Maximum balance piece allowance for one point is 100 g {3.53 oz.}.
- Use a combination that keeps the number of balance pieces to a minimum.



- Available balance pieces

■ **Alignment mark: Propeller shaft**

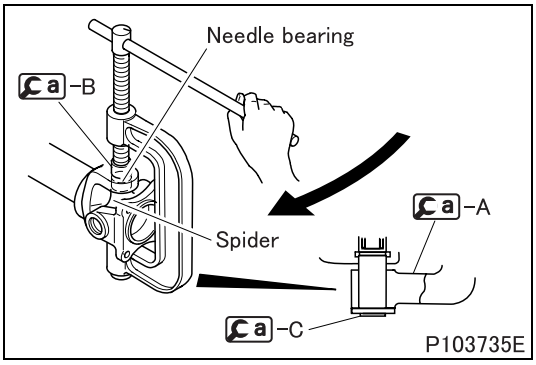
- To prevent assembly of wrong parts, make alignment marks on flange yoke, companion flange and propeller shaft.

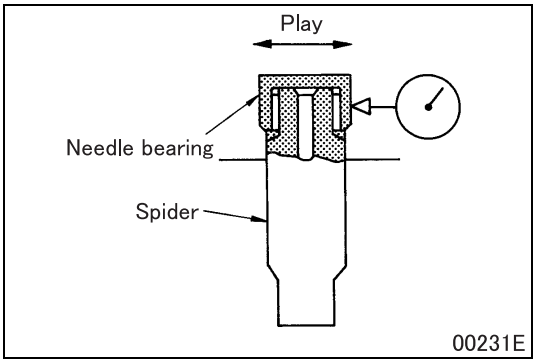
◆Removal procedure◆



■ **Removal: Needle bearing**

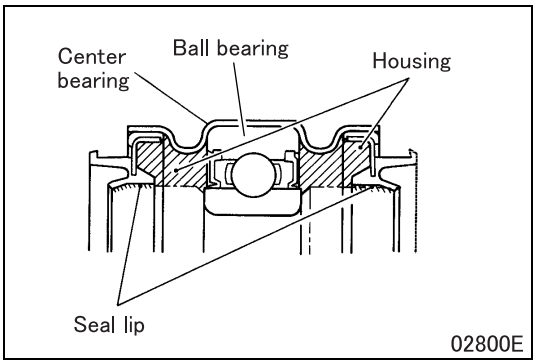
- Fit a -C into a -A from outside.
- Applying a -B to spider, operate a -A to force out spider and remove needle bearing.

◆Inspection procedure◆



■ **Inspection: Clearance between needle bearing and spider**

- If the measurement is higher than the limit, replace with the universal joint spider kit.

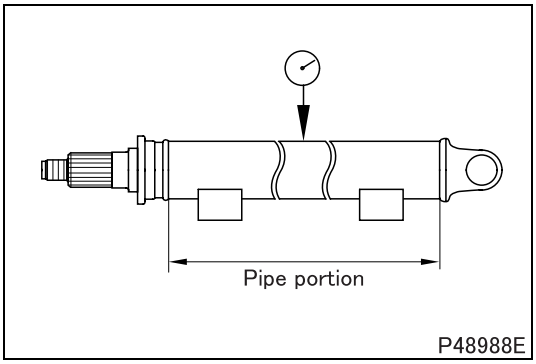


■ **Inspection: Center bearing**

- Check at every 50,000 km {31070 mile} or each official vehicle inspection. If excessive grease outflow is evident, pack grease in center bearing housing up to 70 to 100% (20 to 29 g {0.71 to 1.02 oz.}) of space capacity.
- Apply grease to seal lips.

NOTE

- **The ball bearing portion of center bearing is provided with oil seal and requires no supply of grease.**



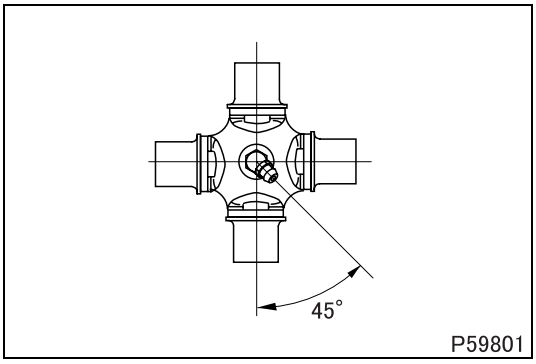
■ **Inspection: Bend of propeller shaft**

- Measure end of propeller shaft at the center of its pipe portion.
- If the measurement is higher than the limit, correct the bend with a press or replace propeller shaft.

NOTE

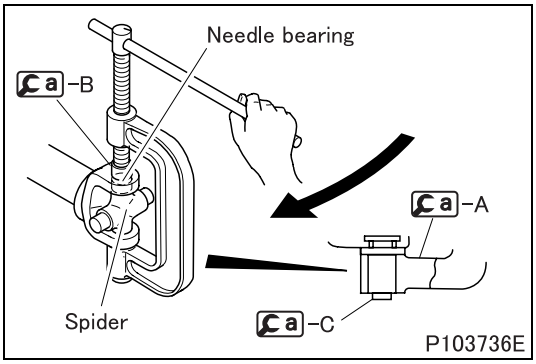
- **To measure the bend of propeller shaft, turn it fully once and read the dial gauge indicator. The bend is one half of the indicated value.**
- **Check propeller shaft for cracks in welded area after correcting the bend with a press. If cracking is found, replace propeller shaft.**

◆Installation procedure◆



■ **Inspection: Grease nipple**

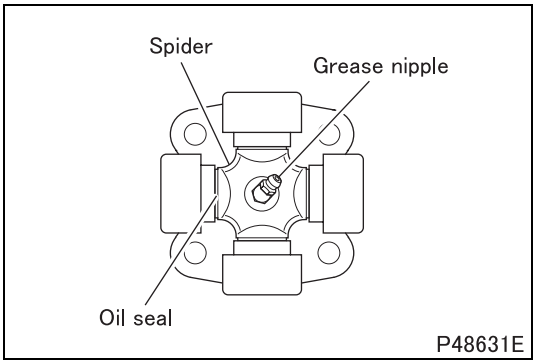
- Install the grease nipple on the spider at an angle conforming to the indication in the illustration.



■**Installation: Needle bearing**

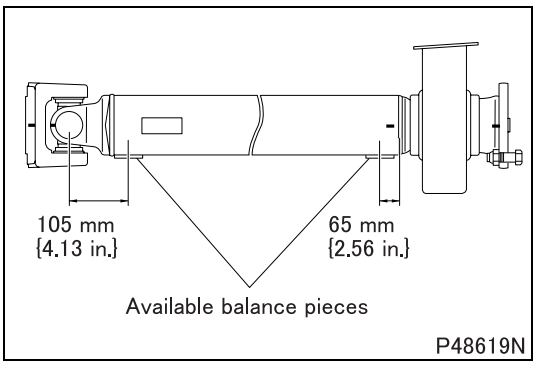
- Fit Ⓐ-C into Ⓐ-A from inside.
- Operating Ⓐ-A, install needle bearing into place.

◆**Work after installation**◆



■ **Lubrication: Grease nipple**

- Fill grease through grease nipple until grease overflows from oil seal of spider.



■ **Inspection: Propeller shaft**

[Inspection]

- Measure the amount of balance (dynamic balance) of completed propeller shaft on a balancing machine.
- If measured value exceeds the standard value, make adjustment as follows.

[Adjustment]

- Attach appropriate balance pieces at the illustrated points so that the amount of unbalance comes within the standard value.

	Tire inflation pressure too little				O					
	Inflation pressure uneven for right and left tires							O		
	Size and type of right and left tires different							O	O	
	Outer diameters of right and left tires remarkably different							O		
	Handling of tires inadequate								O	

ON-VEHICLE INSPECTION AND ADJUSTMENT

1. Inspection and Adjustment of Wheel Alignment

Before carrying out inspection and adjustment of wheel alignment, set the vehicle to the following condition.

- Park the vehicle unloaded on a level place.
- The vehicle needs to be equipped with proper size tires.
- If the wear condition of tires on the right is remarkably different from that of tires on the left, replace tires.
- Tires need inflation to specified pressure.
- Correct if the vehicle tilts due to faulty suspension.
- Service all parts of the front axle and ensure that there is no fault such as the following.
  - Play at or loose kingpin
  - Loose front wheel hub
  - Loose bolts used for tightening various parts of tie rod arm, knuckle arm and tie rod
  - Bend of knuckle and front axle
- Adjust play at steering wheel properly.
- For wheel alignment, which is related to the side slip amount, both wheel alignment and the side slip amount must conform to the standard values.

Service standards (Unit: mm {in.})

Location	Maintenance item	Standard value	Limit	Remedy
–	Toe-in	0 to 6 (3 ± 3) {0 to 0.24 (0.12 ± 0.12)}	–	Adjust
	Camber	1°00 ± 1°00’	–	*
	Caster	1°15’ ± 45’	–	Replace
	Kingpin inclination angle	8° ± 30’	–	Replace

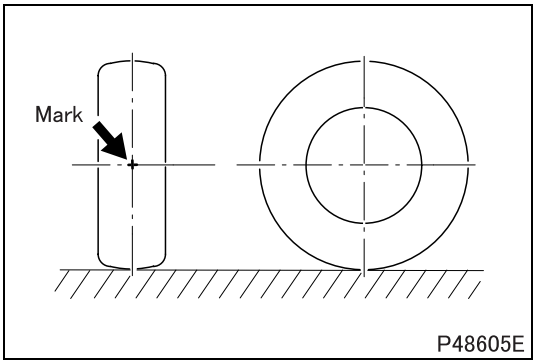
*: If the measured value deviates from the standard value, abnormalities such as wear of kingpin and kingpin bushing, loose hub bearing, and bend of knuckle and front axle are suspected. Inspect each part and replace defective parts.

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
–	Clamp nut (tie rod end clamp fastening)	25 ± 5 {18 ± 3.6, 2.5 ± 0.5}	–
–	Alignment gauge adapter	113 ± 15 {83 ± 11, 11.5 ± 1.5}	–

Special tools (Unit: mm {in.})

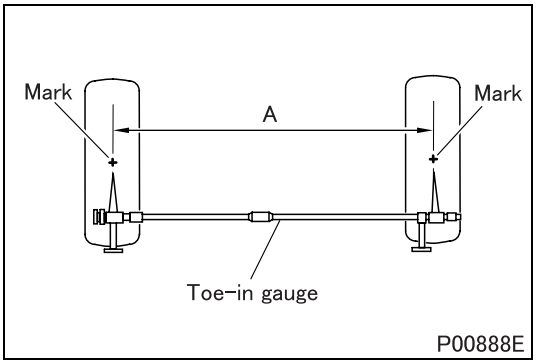
Mark	Tool name and shape	Part No.	Application
a	Hubcap wrench  P49261 **A**: 0.5 {0.020} **B**: 78°	MB999108	Removal of hubcap
b	Alignment gauge adapter  P48604 **A**: φ80 {3.15} **B**: 69 {2.72} **C**: φ45 {1.77} **D**: M24 × 1.5	MH063428	Measurement of camber, caster and kingpin inclination angle



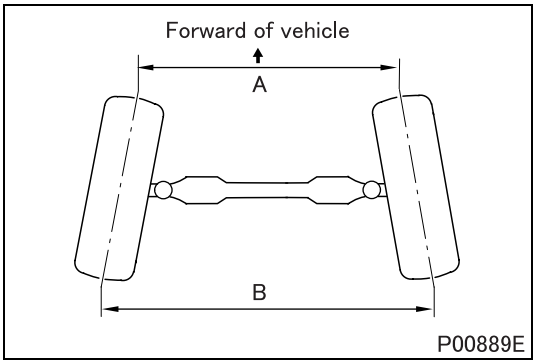
1.1 Inspection and adjustment of toe-in

[Inspection]

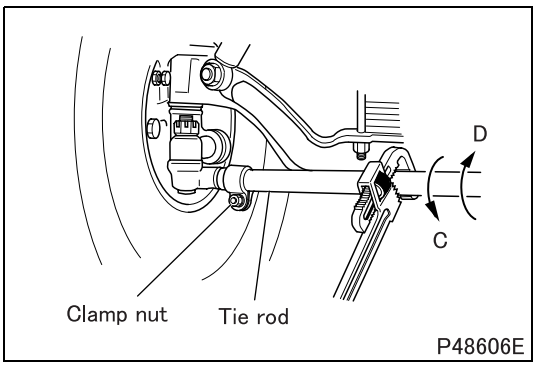
- Direct the front wheels exactly to forward running position.
- Put a mark to each tire of right and left at the height of front wheel axis and in the middle of tire width.



- Align the two points of the toe-in gauge with respective marks and measure distance A between the marks.

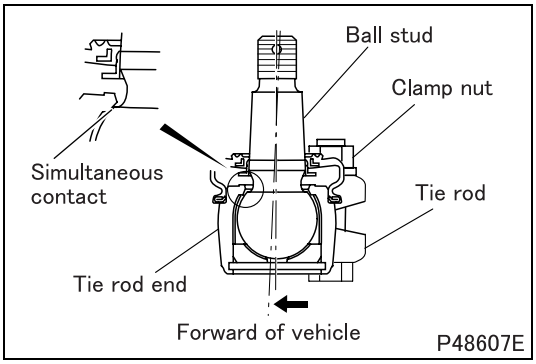


- Push the vehicle to roll the tires 180 degrees.
- Measure distance B between the marks that have moved to the rear of the vehicle.
- If toe-in (difference between A and B) deviates from the standard value, adjust.



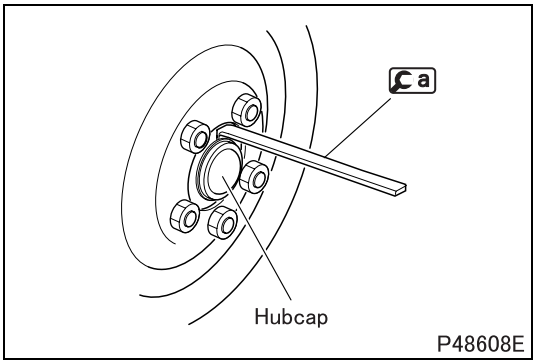
[Adjustment]

- Loosen the clamp nuts on the right and left.
- Turn the tie rod with a pipe wrench to adjust the toe-in.
  C: When adjusting to the toe-out direction
  D: When adjusting to the toe-in direction
- After adjustment, tighten the clamp nut to the specified torque.



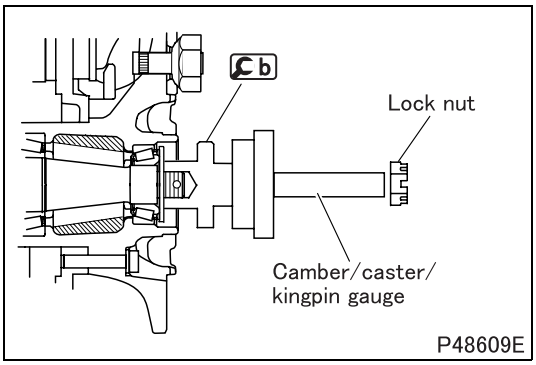
CAUTION ⚠

- **Hold down the tie rod end toward the front of the vehicle with the front wheels directed to forward running position so that the right and left tie rod ends are in contact with the ball studs at the same time. In this state adjust so that the specified toe-in is achieved and tighten the clamp nut to secure the tie rod.**



1.2 Inspection of camber

- Direct the front wheels exactly to forward running position.
- Remove the hubcap using a.

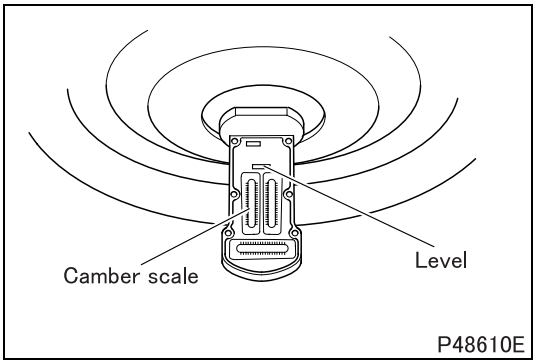


- Remove the lock nut.

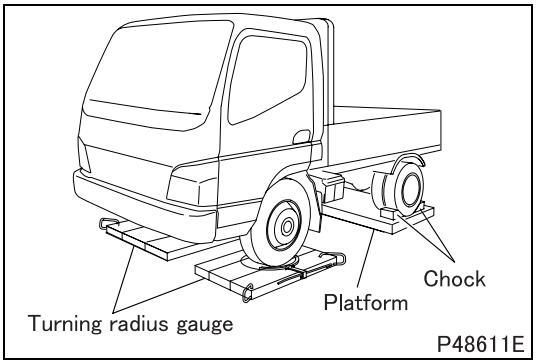
CAUTION ⚠

- **Do not apply a vehicle weight to the hub bearing with the lock nut loosened.**

- Wipe off grease from the knuckle end, attach b and tighten it to the specified torque.
- Attach the camber/caster/kingpin gauge.

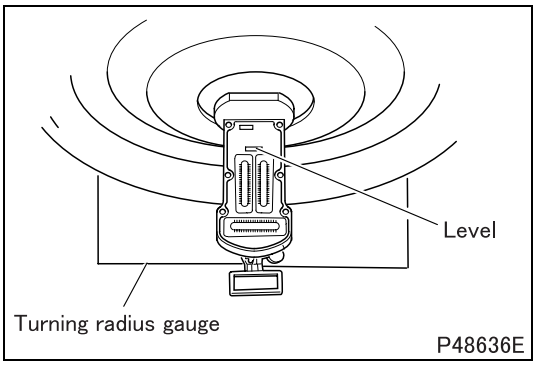


- Place the level in order to have bubble stay in the middle.
- Read center of bubble on camber scale to find the camber. Do the same way for the right and left front tires.
- If the measured value deviates from the standard value, disassemble the front axle for service.

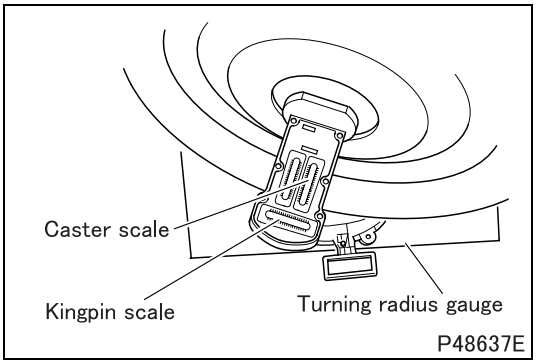


1.3 Inspection of caster and kingpin inclination angle

- Prepare a platform with the same height as the turning radius gauge and place it under the rear wheels so that the vehicle may be placed level.
- Apply chocks to the rear wheels.
- Keep the turning radius gauge locked.
- Jack up the vehicle, and set the right and left front wheels so that respective ground contact area centers of two wheels and turn table centers may meet.



- Unfasten locking of the turning radius gauge, and set the scale to 0 degrees.
- In the same manner as in case of measuring camber in Section **1.2**, attach the camber/caster/kingpin gauge, and set the level so that the bubble comes in the middle.



- Apply brake, and with brake applied to the front wheels, turn steering wheel slowly from the point of 0 degrees on the turning radius gauge, until the direction is changed by 20 degrees each to the right side in case of the right front wheel and to the left in case of the left front wheel.

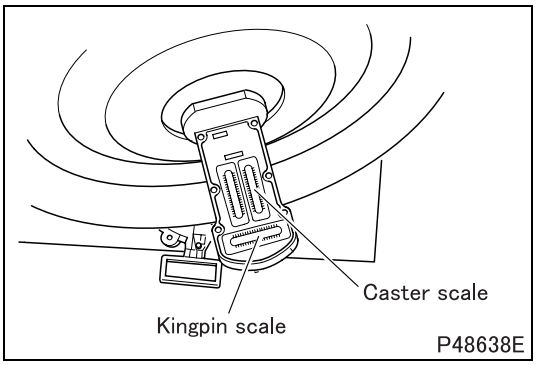
NOTE

- **It is not possible to make exact measurement unless brake is kept applied, because otherwise wheels will turn slightly.**

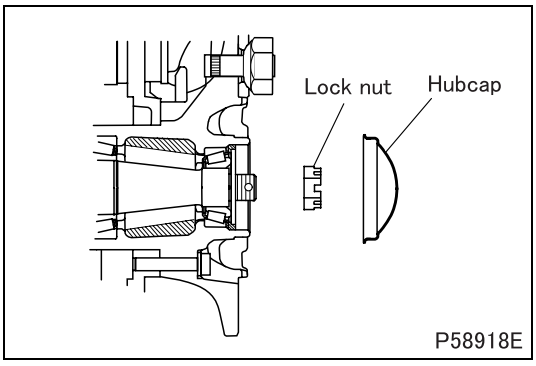
- At the point where steering has been steered 20 degrees, set the caster scale and the center of the bubble of the kingpin scale to 0 degrees by turning the adjuster.

NOTE

- **Pay attention to the kingpin scale because it has scales for right and left: align the right kingpin scale in case of the right front wheel, and left kingpin scale in case of the left front wheel.**



- Reverse this position, turn the steering wheel slowly until the direction of the front wheels changes by 20 degrees in the opposite direction.
- Read the center of bubbles at this position at the caster scale and kingpin scale to find caster and kingpin inclination angles.
- If the measured value deviates from the standard value, disassemble the front axle for service.



- After inspection, install the lock nut and measure the starting torque of the wheel hub bearing. If the starting torque deviates from the standard value, check the wheel bearings and perform expedient adjustment.
- Fill the specified amount of grease into wheel hub by using nozzle so that the outer bearing is covered with the grease and then install a new hubcap.

2. Inspection and Adjustment of Steering Angle

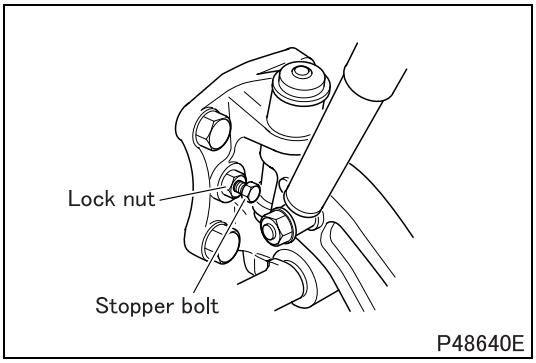
- Perform steering angle inspection and adjustment only after wheel alignment inspection and adjustment has been completed.

Service standards

Location	Maintenance item		Standard value	Limit	Remedy
–	Steering angle	Inside (outside steering angle is for reference only)	45° $^{+0°}_{-2°}$ (34°)	–	Adjust

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
–	Lock nut (knuckle stopper bolt mounting)	46.5 ± 7 {34 ± 5.4, 4.75 ± 0.75}	–



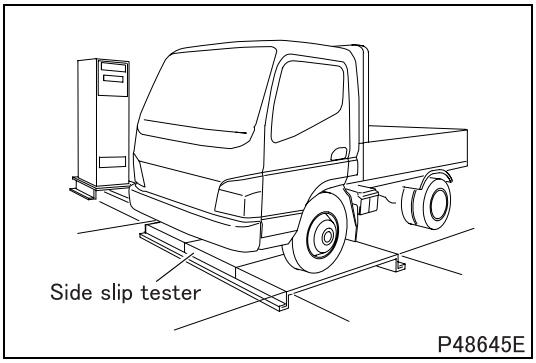
- Set the turning radius gauge and a platform on the vehicle in the same manner as in case of caster and kingpin inclination angle measurement performed in Section **1.3**.
- Turn the steering wheel right or left completely from the position where the turning radius gauge is set to 0 degrees, and read the scale of the turning radius gauge to measure the steering angle.
- If the measured value deviates from the standard value, adjust with the knuckle stopper bolt and tighten the lock nut to the specified torque.

3. Inspection of Side Slip

- Perform side slip inspection only after wheel alignment inspection and adjustment has been completed.
- For the side slip amount, which is related to wheel alignment, both the side slip amount and wheel alignment must conform to the standard values.

Service standards (Unit: mm {in.})

Location	Maintenance item	Standard value	Limit	Remedy
–	Side slip amount	0 ± 3 {0 ± 0.12}	–	Adjust



- Set the front wheels exactly to forward running position.
- Move the vehicle forward past the side slip tester as slowly as possible to inspect side slip.

NOTE

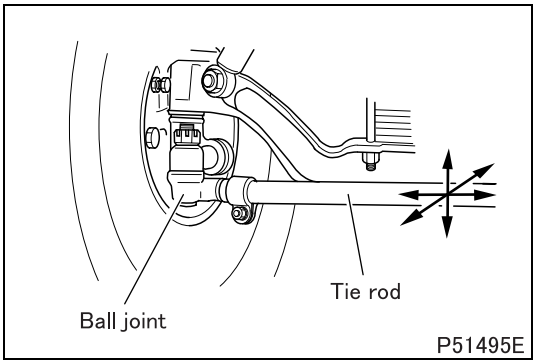
- **Pay attention to the following when moving over the side slip tester.**
- **Be sure to hold steering exactly at the forward running position, and make no turn.**
- **Do not apply brake.**
- **Keep the speed constant.**

- If the measured value deviates from the standard value, inspect and adjust wheel alignment.

4. Inspection of Tie Rod End Ball Joint

Service standards (Unit: mm {in.})

Location	Maintenance item	Standard value	Limit	Remedy
–	Play of tie rod end ball joint	0	–	Replace



(1) Play of tie rod end ball joint

- Hold the tie rod section of the tie rod with the vehicle kept stationary, and move it in the back-and-forth, up-and-down and right-and-left directions to check for play at ball joints of the tie rod end.

NOTE

- **Be sure to check for play at ball joints of both right and left sides of the tie rod.**

- If feeling play with your hand, replace the tie rod end of the tie rod.

(2) Dust cover

- Check the dust cover for wear, cracks and other damage.
- If there is any abnormality, replace the tie rod end.

⊗: Non-reusable parts

CAUTION ⚠

- **Plug the brake hose to prevent entry of dust and dirt after it has been removed.**
- **Be careful not to damage the tip of the wheel speed sensor after removing it.**

NOTE

- **Do not remove the anti-lock brake system rotor unless replacing it.**
- **Do not disassemble the wheel hub and disc rotor unless replacing them.**

● **Assembly sequence**

Follow the disassembly sequence in reverse.

CAUTION ⚠

- **Make sure that the disc rotor surface and disc brake pad surface are free from grease to avoid malfunction of brakes.**
- **Make sure that the brake hose is not twisted when installing it.**
- **Inspect the drag torque of disc brakes after assembly. (See Gr35A.)**

Service standards (Unit: mm {in.})

Location	Maintenance item		Standard value	Limit	Remedy
–	Starting torque of wheel hub bearing (tangential force at hub bolt position with oil seal assembled)		1 to 3.5 N·m {0.7 to 2.6 ft.lbs, 0.10 to 0.35 kgf·m} (tangential force: 8.8 to 28.4 N {2.0 to 6.4 lbs., 0.9 to 2.9 kgf})	–	Adjust or replace
19	Disc rotor	Runout (measure, assembling it into front axle)	0.07 {0.0028} or less	0.10 {0.0039}	Replace
		Thickness	40 {1.57}	38 {1.50}	Replace

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened		Tightening torque	Remarks
Ta	Brake hose		25.5 to 34.3 {18.8 to 25.3, 2.6 to 3.5}	–
Tb	Eyebolt		22 ± 2 {16 ± 1.5, 2.25 ± 0.25}	–
Tc	Bolt (front disc brake mounting)		152 ± 25 {112 ± 18, 15.5 ± 2.5}	–
Td	Lock nut	Primary tightening	113 ± 15 {83 ± 11, 11.5 ± 1.5}	–
		Secondary tightening after complete tightening	59 {44, 6}	Back-off angle 45° (1/8 of a turn)
Tf	Bolt (wheel hub and disc rotor mounting)		85.8 ± 12 {63 ± 8.9, 8.75 ± 1.25}	–
Tg	Bolt (adapter mounting)		118 ± 20 {87 ± 1.5, 12 ± 2}	–
Th	Bolt (speed sensor mounting)		12.3 ± 2.5 {9.1 ± 1.8, 1.25 ± 0.25}	–

Lubricant and/or sealant

Mark	Points of application			Specified lubricant and/or sealant	Quantity
△a	Pack outside of wheel hub	5 studs		Wheel bearing grease [NLGI No. 2 (Li soap)]	※ 65 ± 10 g {2.29 ± 0.35 oz}
		6 studs			※ 90 ± 10 g {3.17 ± 0.35 oz}
	Pack inside of wheel hub	5 studs			※ 210 ± 20 g {7.41 ± 0.71 oz}
		6 studs	FE84		※ 130 ± 10 g {4.59 ± 0.35 oz}
			FE85		※ 155 ± 10 g {5.47 ± 0.35 oz}
	Pack space between rollers of outer bearing inner race and inner bearing inner race				As required
	Lip area of oil seal				

※: For a wheel hub

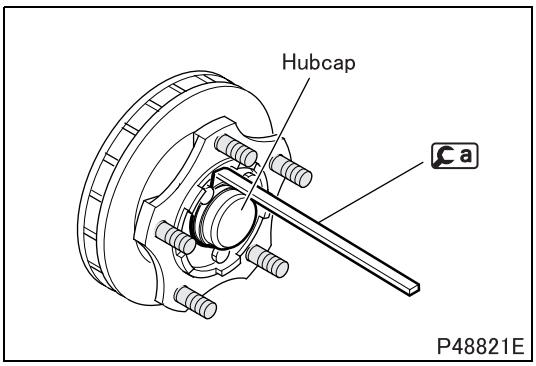
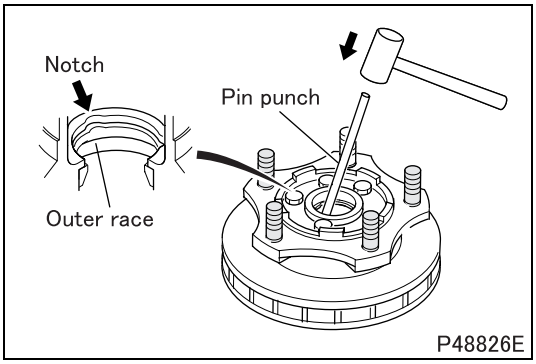
◆Removal procedure◆

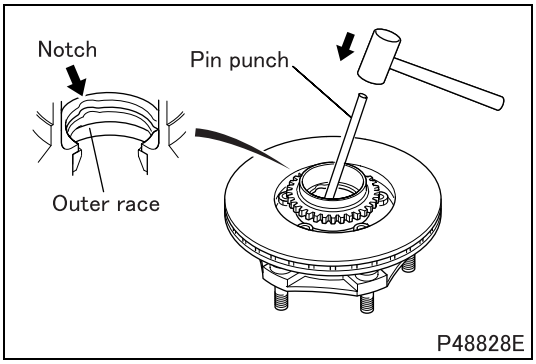


■ **Removal: Hubcap**



■ **Removal: Inner bearing outer race**

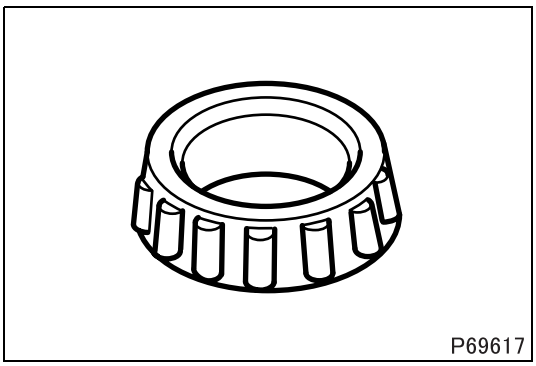
- Drive out the inner bearing outer race by tapping evenly at three indented parts in the wheel hub.



■ **Removal: Outer bearing outer race**

- Drive out the outer bearing outer race by tapping evenly at three indented parts in the wheel hub.

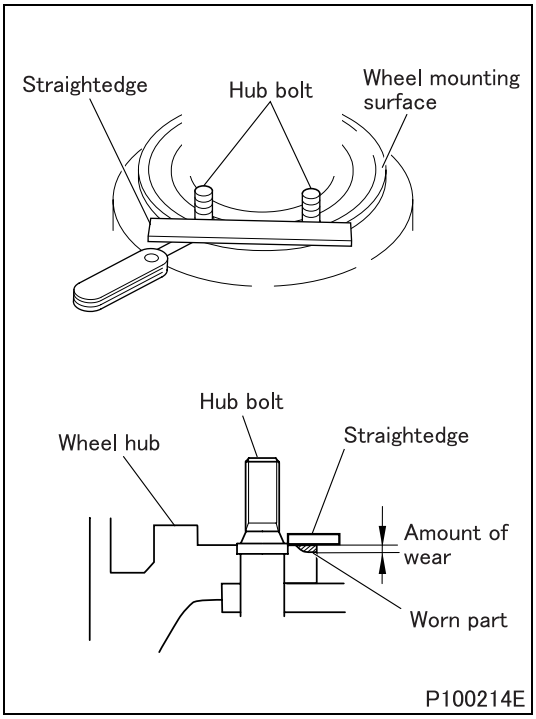
◆Inspection procedure◆



P69617

■ **Inspection: Outer bearing inner race**

- Inspect the outer bearing inner race after cleaning the bearing to remove grease completely.
- If any damage, wear, or poor rotating condition is evident in the inner race, replace it with a new one.
- The inner race and outer race should be replaced as a set.



P100214E

■ **Inspection: Wheel hub**

(1) Visual inspection

- Check the disc wheel mounting surface of the wheel hub by watching and touching. If there is damage or crack on it, replace the wheel hub.
- Make sure that there is not rust, dust, paint or foreign body on the disc wheel mounting surface of the wheel hub to prevent the wheel nut to loosen.
- If any abnormality is found, remove it with sandpaper.

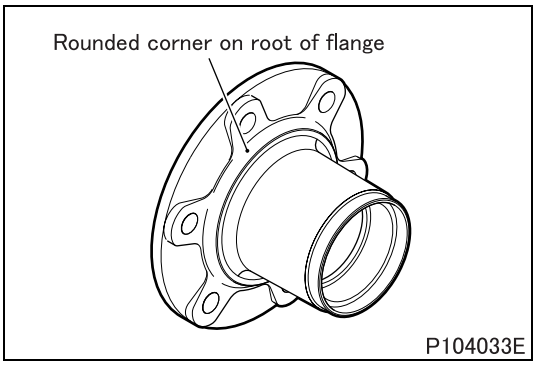
(2) Wear in disc wheel mounting part of wheel hub

- Clean the wheel mounting surface of the wheel hub before inspection.
- Place a straightedge on the hub so as to contact to the two hub bolts on the disc wheel mounting surface.

CAUTION ⚠

- **Make sure that the straightedge does not run onto the hub bolt.**

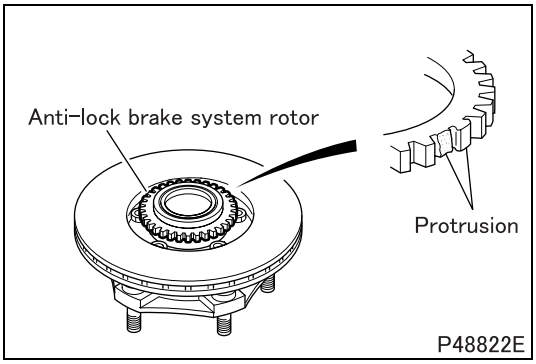
- Using feeler gauges to measure the amount of wear at the outer periphery of the wheel hub.
  Measure the amount of wear in the area of every hub bolt.
- If the amount of wear at any point exceeds the following standard value, inspect the crack check of wheel hub.
  Wear standard value: 0.8 mm



P104033E

(3) Crack check

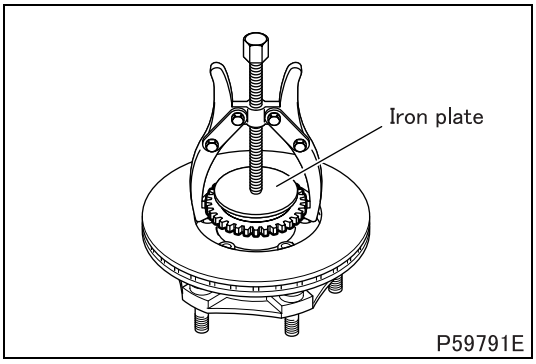
- Check if there is not crack on the entire rounded corner on the root of flange of the wheel hub by magnetic particle or liquid penetrant testing. If crack is found, replace the wheel hub.
- If crack is found on the wheel hub bolt, replace it.
- If there is crack or stepped wear on the wheel hub mounting surface of wheel disc, replace it. (See Gr31.)



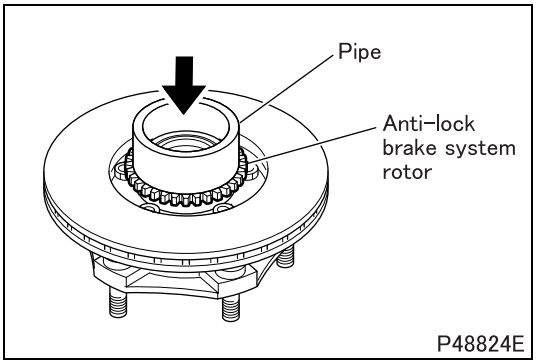
■ **Inspection: Anti-lock brake system rotor**

[Inspection]

- Check protrusions of the anti-lock brake system rotor for chipping and flattening.
- If any abnormality is found, replace the anti-lock brake system rotor.



[Removal]



[Installation]

- Warm the anti-lock brake system rotor to approximately 150°C.
- Install the anti-lock brake system rotor and wheel hub evenly using a pipe so as not to allow them to tilt.

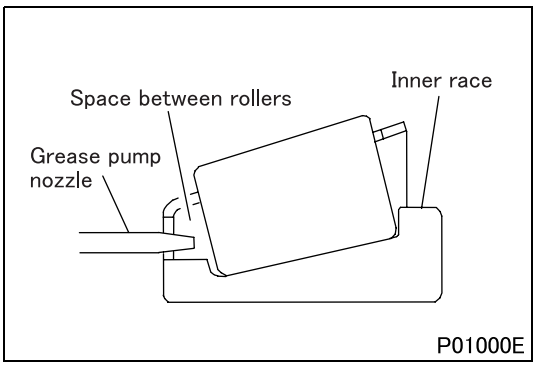
WARNING ⚠

- **Handling the warmed rotor by bare hands may burn.**

■ **Inspection: Inner bearing inner race**

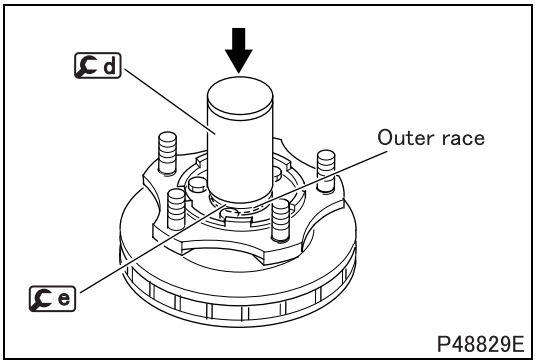
- Inspect the inner bearing inner race in the same manner as for the outer bearing inner race.
  (See **"■ Inspection: Outer bearing inner race".**)

◆Installation procedure◆

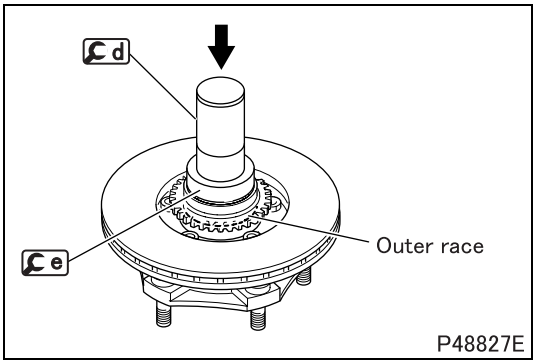


■ Installation: Packing grease in inner bearing inner race

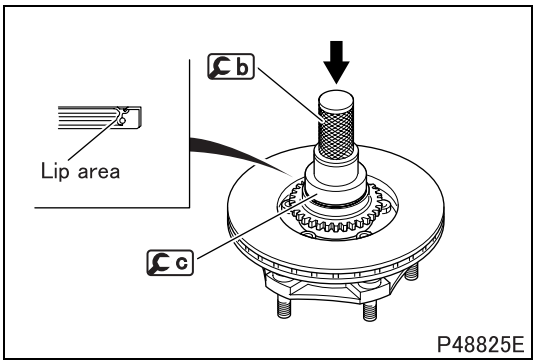
- Insert the grease pump nozzle into the space between rollers of the inner bearing inner race to pack grease sufficiently.



■ Installation: Outer bearing outer race



■ Installation: Inner bearing outer race

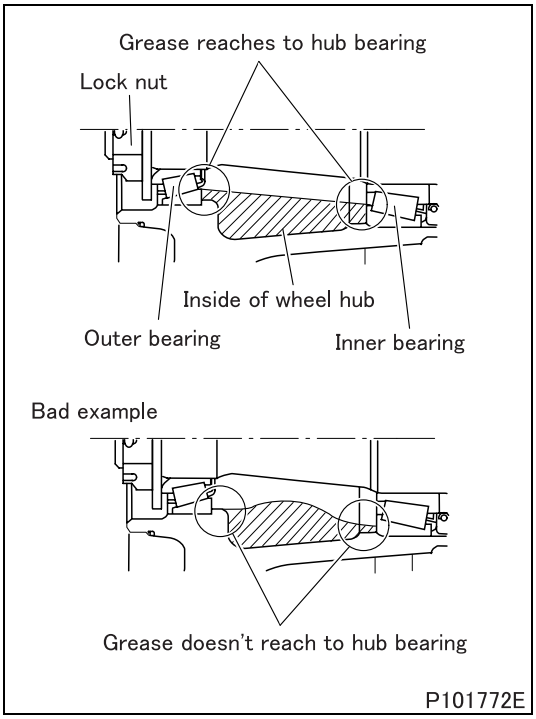


■ Installation: Oil seal

- Apply grease to the lip area of the oil seal and install it on the wheel hub in the illustrated direction.

■ Installation: Packing grease in outer bearing inner race

- Follow the same procedure as for packing the inner bearing inner race with grease.
  (See **"■ Installation: Packing grease in inner bearing inner race".**)

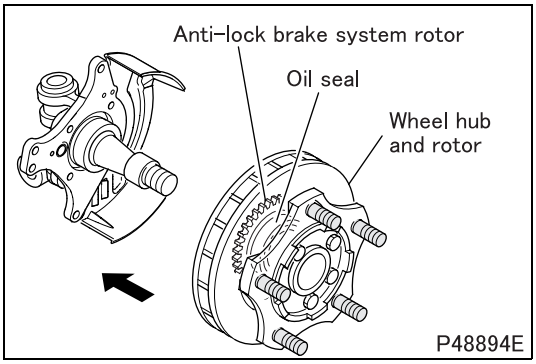


■ **Installation: Packing grease inside of wheel hub**

- Apply specified amount of grease to inside A of wheel hub so that the grease reaches inner bearing and outer bearing as illustrated.
- After installing lock nut, insert grease pump nozzle into outside B of wheel hub and fill specified amount of grease so as to make a grease wall outside of the outer bearing.

CAUTION ⚠

- **Applying grease as illustrated in the "bad example" causes the wheel hub bearing to seize.**

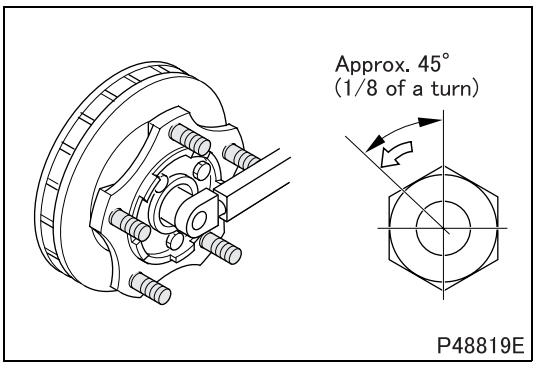


■ **Installation: Wheel hub and rotor**

- Slowly install the wheel hub and rotor assembly so as not to cause damage to the oil seal and anti-lock brake system rotor.

CAUTION ⚠

- **If the anti-lock brake system rotor is damaged, wheel speed sensor signals become abnormal, causing the anti-lock brake system to malfunction.**



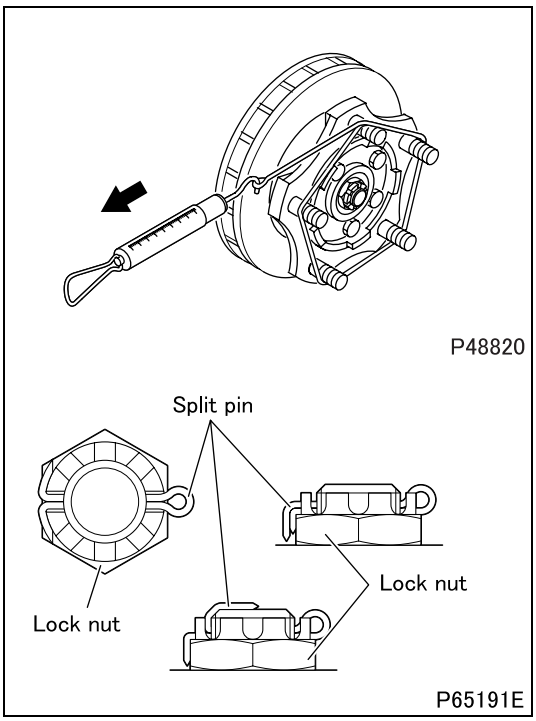
■ **Adjustment: Starting torque of wheel hub bearing**

CAUTION ⚠

- **Unless this adjustment procedure is performed, seizure of the wheel hub bearing can be caused.**

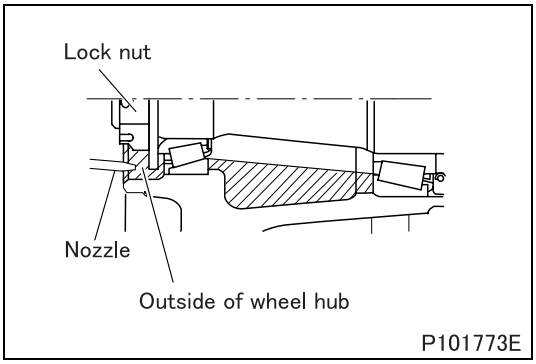
[Adjustment]

- Tighten the lock nut to the specified torque (primary tightening) while turning the wheel hub and rotor, and then loosen it completely.
- Smooth operation of the outer bearing and inner bearing by turning the wheel hub and rotor several times, and then tighten the lock nut to the specified torque (secondary tightening).
- Return the lock nut by approximately 45 degrees (1/8 of a turn) and secure it with a split pin. If pin holes do not align, align them in the course of loosening. Make sure that there is no play in the axial direction.



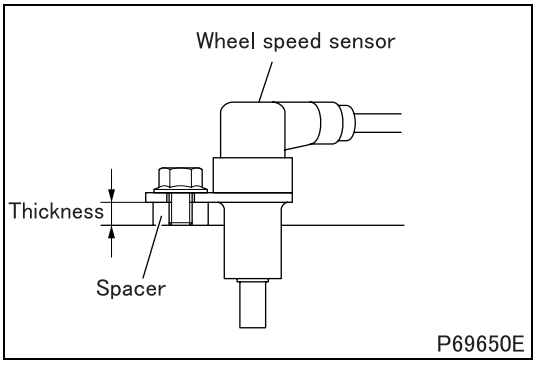
[Inspection]

- After installing the lock nut, perform the following inspection.
- Measure the tangential force at the hub bolt position using a spring balance.
- If the tangential force is within the specified value, the starting torque conforms to the standard value. When the measured value is the specified value, install the split pin following either of method in the illustration.
- If the measured value deviates from the specified value, repeat adjustment because the adjustment of the lock nut may be insufficient.
- If the result is found to be abnormal, replace the outer and inner bearings.



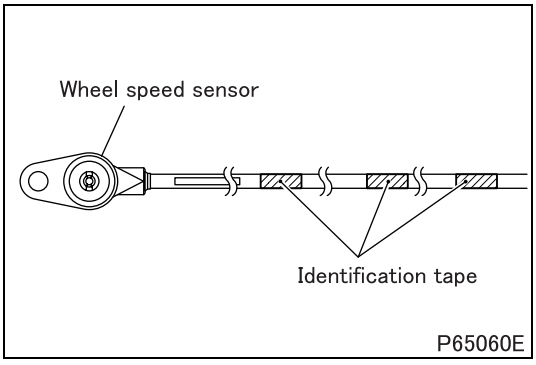
■ Installation: Packing grease outside of wheel hub

- After installing lock nut, insert grease pump nozzle into outside of wheel hub and fill specified amount of grease so as to make a grease wall outside of the outer bearing.



■ Installation: Spacer

- Install a spacer and wheel speed sensor in the position shown in the illustration.
  Thickness of spacer: 16.0 mm <FE (Except FE85)>
  14.5 mm <FE85>



■ Installation: Wheel speed sensor

- Using clips, secure in place the wheel speed sensor harness at the identification tape portions, ensuring that the harness is free of kinks, slack and/or interference with other parts.

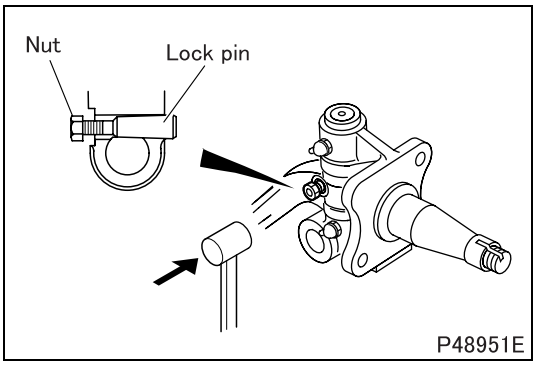
Special tools (Unit: mm {in.})

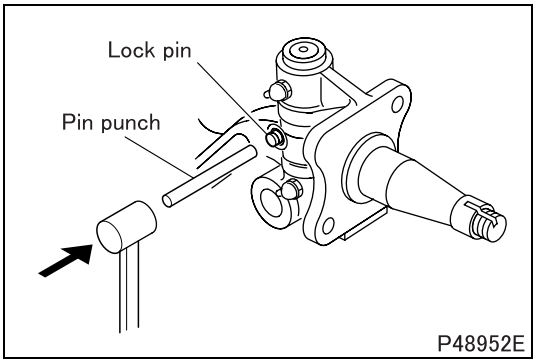
Mark	Tool name and shape	Part No.	Application
a	Kingpin puller **A:** Pipe **B:** Bolt **C:** Cap **D:** Nut  06102	MB999013 A: MB999014 B: MB999015 C: MB999016 D: MB999017	Removal of kingpin
b	Bushing installer **A:** Bushing installer A **B:** Bushing installer B  06103 **C**: ϕ25 {0.98}; **D**: ϕ30 {1.18}; **E**: ϕ28 {1.10}; **F**: ϕ25 {0.98}; **G**: ϕ32.8 {1.29}	MB999066 A: MB999067 B: MB999068	Removal and installation of kingpin bushing

◆Removal procedure◆

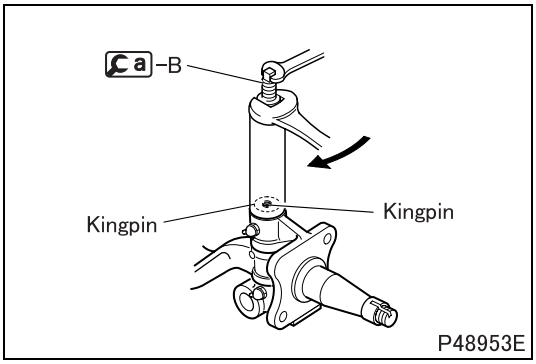


■ **Removal: Lock pin**

- Remove the nut, spring washer and washer.
- Screw in the nut again until just before it is flush with the lock pin, and lightly tap the nut to loosen the lock pin.



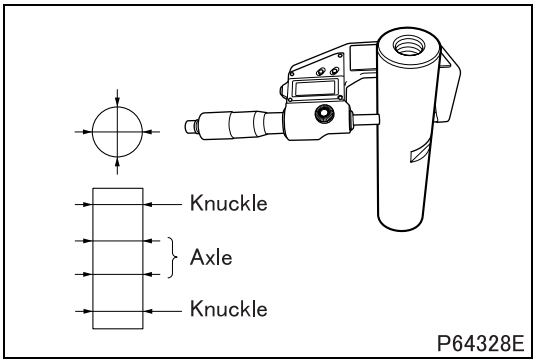
- Remove the nut, apply a pin punch to the lock pin and lightly tap it to remove.



■ **Removal: Kingpin**

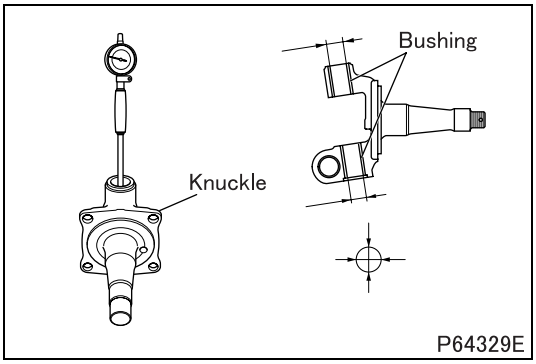
- Screw a -B into the kingpin threads to remove the kingpin.

◆Inspection procedure◆



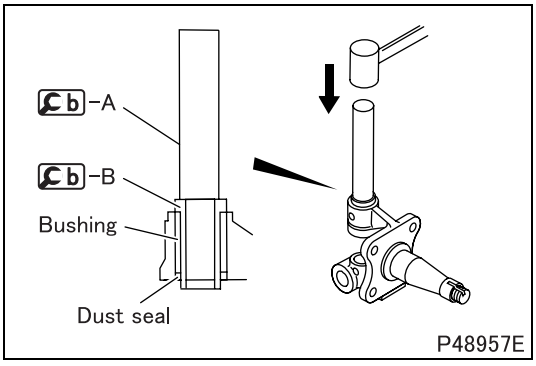
■ **Inspection: Outer diameter of kingpin**

- Take measurement at a total of four levels on the kingpin: two levels for the axle fitting portion and one level each for the upper and lower knuckle fitting portions.
- If the measured value is under the limit, replace the kingpin with a new one.



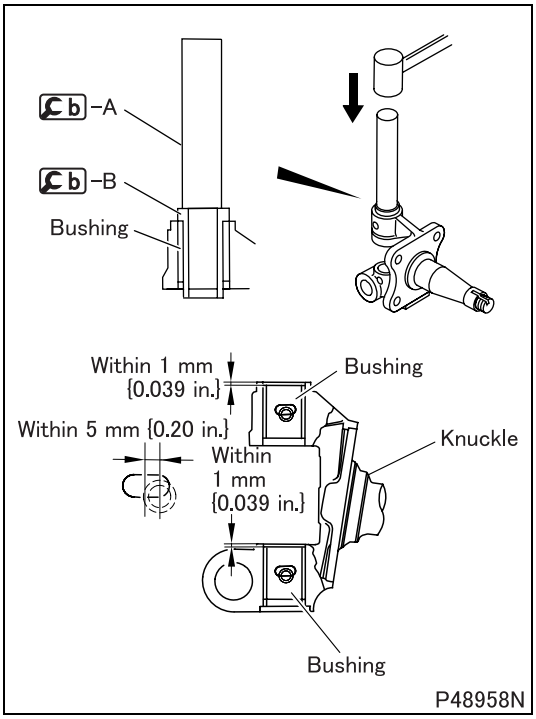
■ **Inspection: Clearance between kingpin and bushing**

- Measure the inner diameter of the upper and lower bushings using a cylinder gauge and calculate the clearance deducting the outer diameter of the kingpin from the inner diameter of the bushing.
  If the clearance exceeds the limit, replace the bushings with new ones.



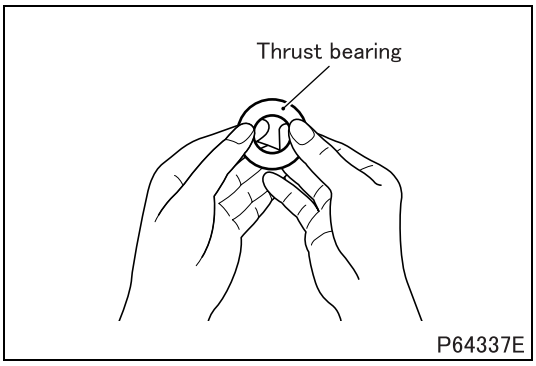
Replacement of bushing
[Removal]

- Remove the bushing and the dust seal at the same time using b.



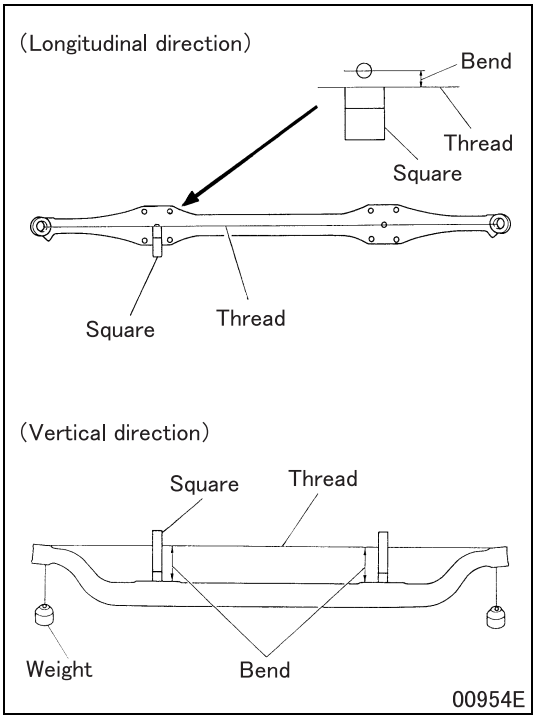
[Installation]

- Install the bushing using Cb so that a step height between the bushing and knuckle is within 1 mm {0.039 in.}.
- The oil hole of the bushing must not deviate from the screw hole of the knuckle more than 5 mm {0.20 in.}.



■ Inspection: Thrust bearing

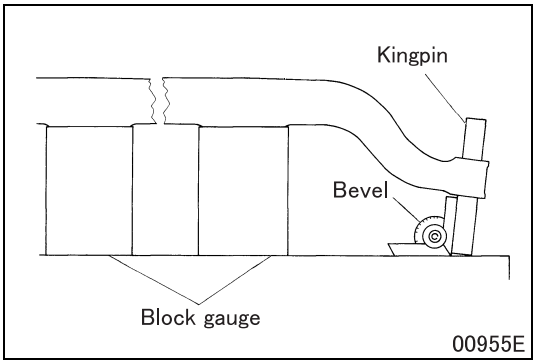
- Inspect the aspect and smooth turning of the thrust bearing. If any crack, damage, or un-smooth turning is found, replace the thrust bearing with a new one.



■ Inspection: Front axle

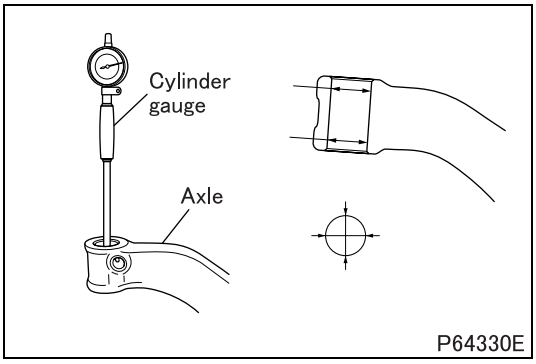
(1) Bend of front axle in the back-and-forth direction and vertical direction

- Put a piece of thread through kingpin holes of the front axle and hang weights at both ends.
- Use a square to find bend to each of back-and-forth and vertical directions.
- If the measured value exceeds the limit, replace the front axle.



(2) Kingpin inclination angle

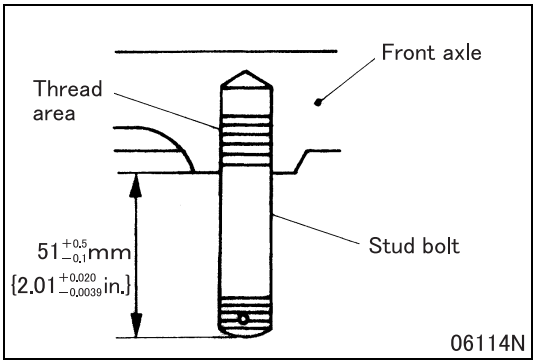
- Set the kingpin on the front axle as illustrated to measure the angle.
- If the measured value deviates from the standard value, replace the front axle.



(3) Clearance between kingpin and front axle

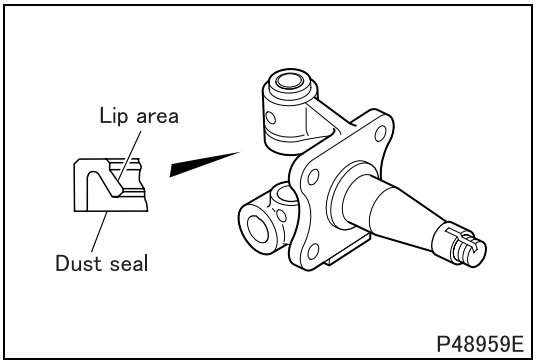
- Measure the inner diameter of the axle's hole where the kingpin is inserted using a cylinder gauge and calculate the clearance deducting the outer diameter of the kingpin from the inner diameter.
  If the clearance exceeds the limit, replace the axle or the kingpin with a new one.

◆Installation procedure◆



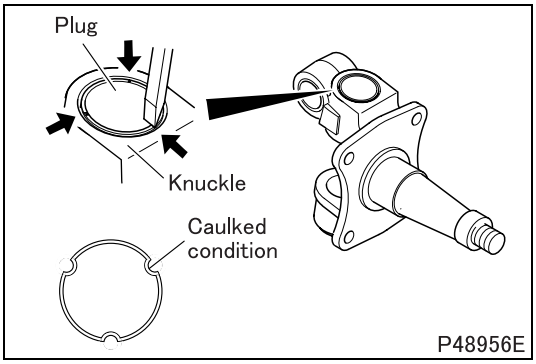
■ Installation: Stud bolt

- Apply Loctite to front axle mounting threads of the stud bolt.
- Install the stud bolt to the dimension as illustrated.



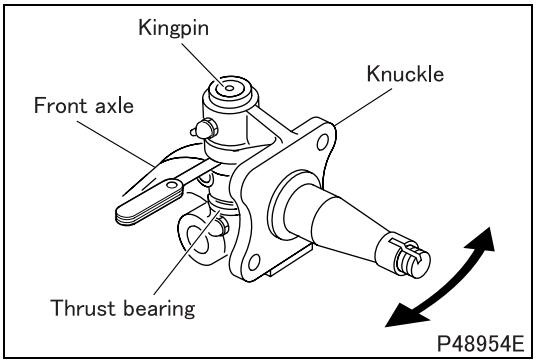
■ Installation: Dust seal

- Apply grease to the lip area of the dust seal and install it on the knuckle in the illustrated direction.



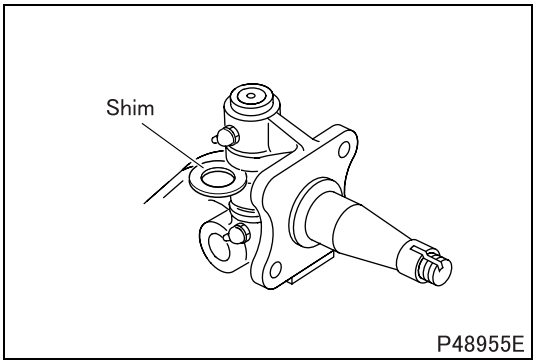
■ **Installation: Plug**

- After installing the plug, caulk the knuckle at three evenly spaced points of the plug circumference avoiding previously caulked points.



■ **Installation: Knuckle**

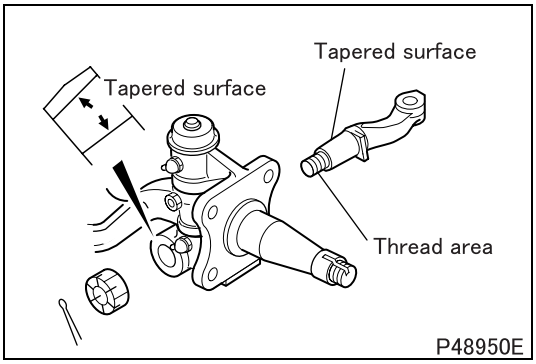
- After temporarily assembling the thrust bearing, knuckle and kingpin into the front axle, move the knuckle several times to smooth its operation.
- Measure clearance between the front axle top face and the knuckle bottom.



- If the measured value exceeds the limit, adjust with a kingpin shim.
  Thickness of kingpin shims available
  0.10, 0.15, 0.20, 0.30, 0.40, 0.50, 0.60, 0.70 mm
  {0.0039, 0.0059, 0.0079, 0.012, 0.016, 0.020, 0.023, 0.028 in.}
  (Eight thickness)

CAUTION ⚠

- **Select a kingpin shim so that the clearance is as small as possible within the range of the standard value.**
- **After assembly, make sure that the knuckle moves smoothly.**



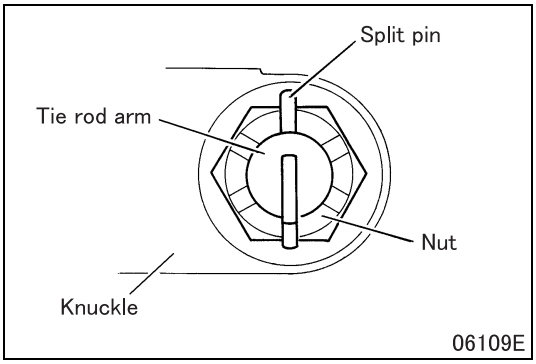
■ **Installation: Tie rod arm and knuckle**

(1) When one or both of the tie rod arm and knuckle need reassembly making use of existing parts

- Polish the entire tapered surfaces of the tie rod arm and knuckle evenly by means of sand paper #120 or above until sand paper score is visible on polished surfaces. (This does not apply to new replacement parts.)
- Clean the tapered surfaces and thread areas of the tie rod arm and knuckle.

NOTE

- **Use acetone, cleaning fluid for color check, or equivalent as solvent.**



- Apply grease to the thread area of the tie rod arm and install it.

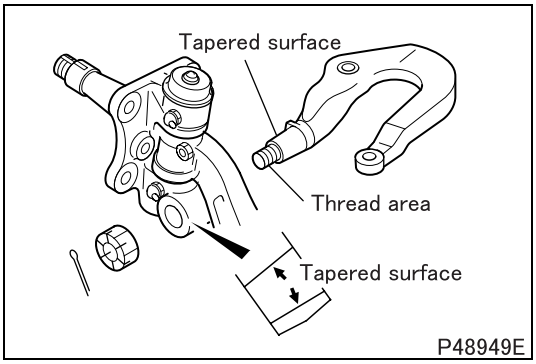
CAUTION ⚠

- **When installing the tie rod arm, make sure that tapered surfaces of the tie rod arm and knuckle are free from grease.**

- Tighten the nut to the specified torque. Be sure to align pin holes in the course of tightening and insert the split pin as illustrated.

(2) When both of the tie rod arm and knuckle for assembling are new parts

- Clean tapered surfaces and thread areas of the tie rod arm and knuckle.
- Tighten the nut to the specified torque. Be sure to align pin holes in the course of tightening and insert the split pin as illustrated.



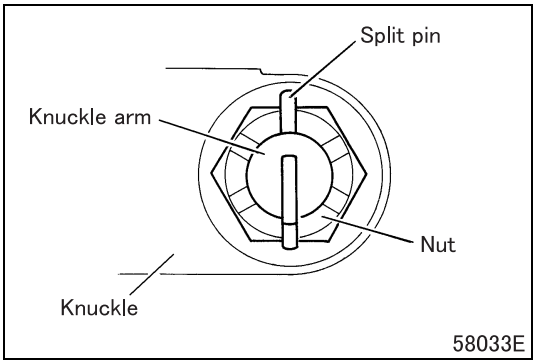
■ Installation: Knuckle arm and knuckle

(1) When one or both of the knuckle arm and knuckle need reassembly making use of existing parts

- Polish the entire tapered surfaces of the knuckle arm and knuckle evenly by means of sand paper #120 or above until sand paper score is visible on polished surfaces. (This does not apply to new replacement parts.)
- Clean the tapered surfaces and thread areas of the knuckle arm and knuckle.

NOTE

- **Use acetone, cleaning fluid for color check, or equivalent as solvent.**



- Apply grease to the thread area of the knuckle arm and install it.

CAUTION ⚠

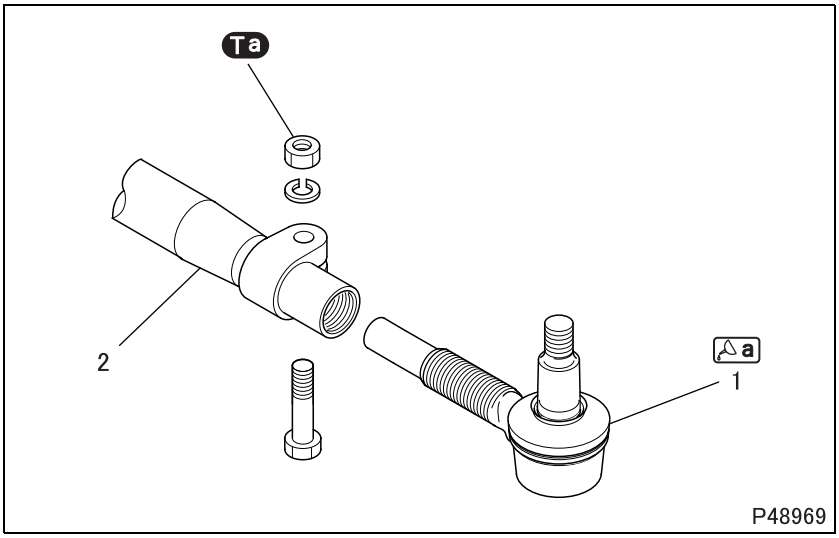
- **When installing the knuckle arm, make sure that tapered surfaces of the knuckle arm and knuckle are free from grease.**

- Tighten the nut to the specified torque. Be sure to align pin holes in the course of tightening and insert the split pin as illustrated.

(2) When both of the knuckle arm and knuckle for assembling are new parts

- Clean tapered surfaces and thread areas of the knuckle arm and knuckle.
- Tighten the nut to the specified torque. Be sure to align pin holes in the course of tightening and insert the split pin as illustrated.

TIE ROD



● **Disassembly sequence**

1 Tie rod end
2 Tie rod

CAUTION ⚠

- **If any abnormality such as tear is found in the dust boot of the tie rod end, replace the tie rod end.**

NOTE

- **Do not disassemble the tie rod end, as it is of non-disassembly type.**

● **Assembly sequence**

Follow the disassembly sequence in reverse.

Service standards (Unit: mm {in.})

Location	Maintenance item		Standard value	Limit	Remedy
1	Ball joint of tie rod end	Play (± 980 N {220 lbs, ± 100 kgf} loaded)	0 to 0.15 {0 to 0.0059}	–	Replace
		Rotation torque	1.0 to 5.9 N·m {0.7 to 4.4 ft.lbs, 0.1 to 0.6 kgf·m}	–	
2	Bend of tie rod		–	1 {0.039} or less	Correct or replace

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Nut (tie rod end tightening)	25 ± 5 {18 ± 3.7, 2.5 ± 0.5}	–

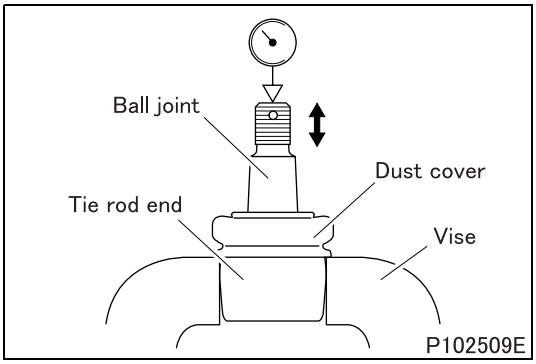
Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Lip area of dust cover of tie rod end	Wheel bearing grease [NLGI No. 2 (Li soap)]	As required

Special tools

Mark	Tool name and shape	Part No.	Application
a	Preload socket  P48876	MB999326	Measurement of rotation torque of tie rod end

◆Inspection procedure◆



■ **Inspection: Tie rod end**

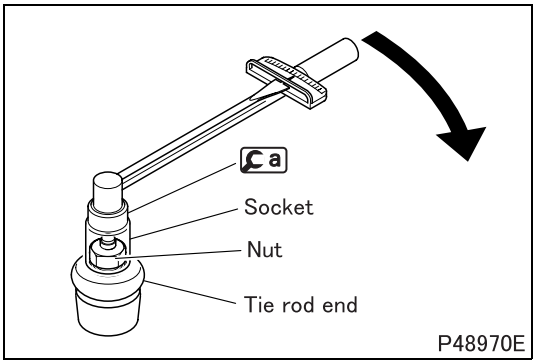
(1) Play

- Fix the tie rod end with a vise.

CAUTION ⚠

- **Take care not to deform or damage the dust cover when fixing it with a vise.**

- If measured value deviates from the standard value with applying the specified load (push and pull) to the ball joint, replace the tie rod end.

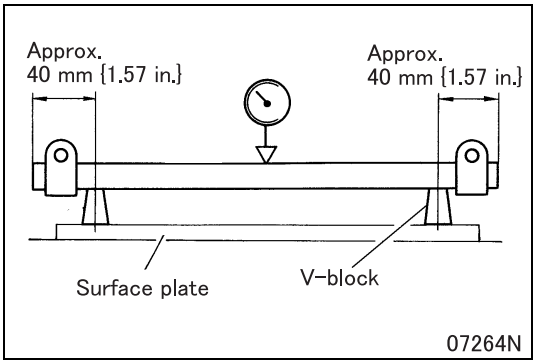


(2) Rotation torque

- Install the tie rod mounting nut on the tie rod end.
- Install the socket, Ca and torque wrench to measure the rotation torque.
- If the measured value deviates from the standard value, replace the tie rod end.

(3) Dust cover

- Check the dust cover for wear, cracks and other damage. These abnormalities may cause water infiltration to the ball joint and wear out it at early stage.
- If any abnormality is found in the dust cover, replace the tie rod end.



■ **Inspection: Bend of tie rod**

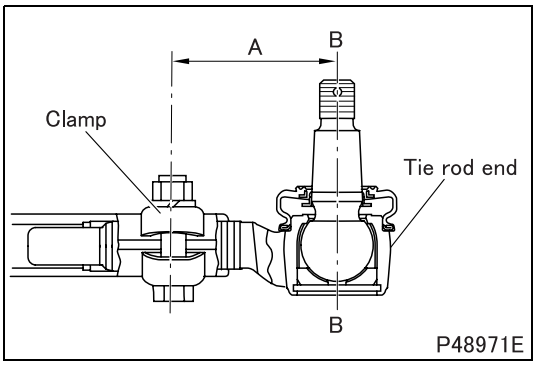
- Measure the bend of the tie rod at its center.

NOTE

- **Give the tie rod one complete turn and read the dial gauge at this time. The bend is one half of the reading.**

- If the measured value exceeds the limit, correct or replace the tie rod.

◆Installation procedure◆



■ **Installation: Tie rod end**

- Screw in the tie rod end so that difference of dimension A between the tie rod end and the clamp is within 1.5 mm {0.059 in.} between right and left.
  A: Approximately 74 mm {2.91 in.}

CAUTION ⚠

- **Ensure that difference of an amount of screwing in the tie rod end between right and left is within one turn.**
- **Secure the tie rod ends so that illustrated axis B-B on the right is parallel to that on the left.**

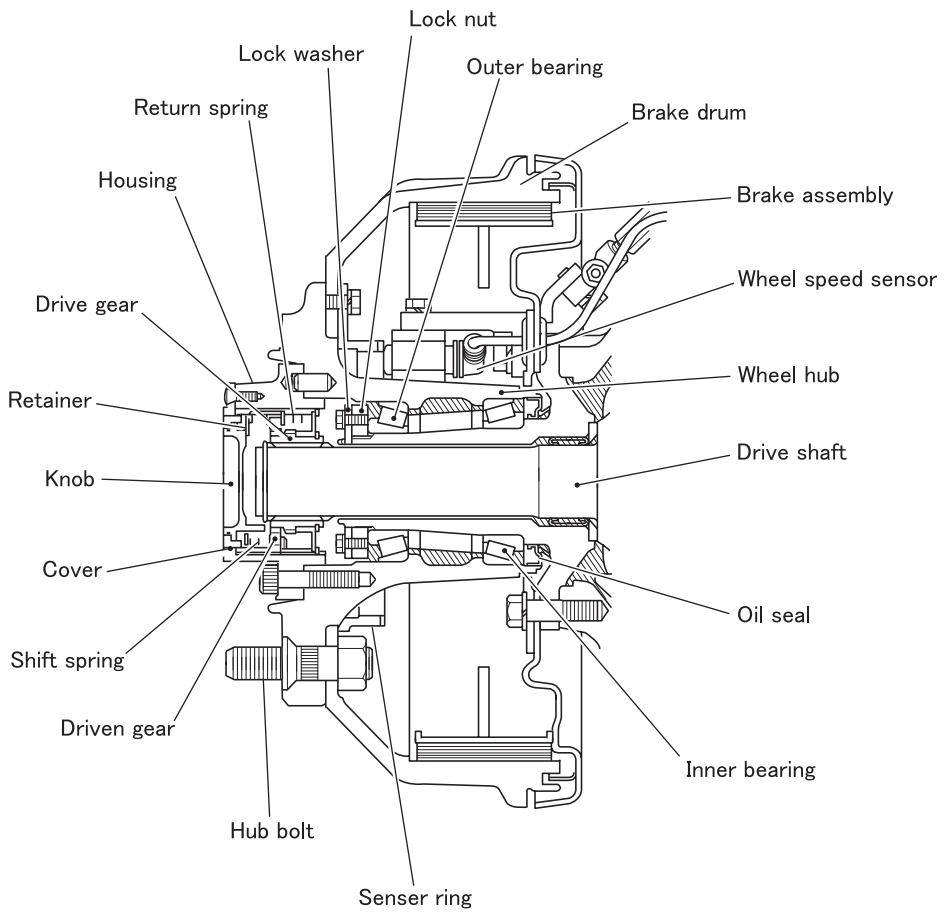
SPECIFICATIONS

Item		Specifications
Front axle	Model	F200TW
	Type	Banjo type, full floating, with Birfield joint
Tread (dimension notified to the authorities) mm {in.}		1650 {65.0}
Reduction	Model	D1H modified
	Type	Single-reduction hypoid gear
	Gear ratio	4.875
Differential	Tooth shape	Straight bevel gear
Gear oil	Grade	Normal: Maximum air temperature during operation below 40°C {104°F} API GL-5 SAE 90 Hot area: Maximum air temperature during operation above 40°C {104°F} API GL-5 SAE 140
	Quantity L {qts.}	3.0 {3.2}
Mass kg {lb.}		Approx. 250 {550}

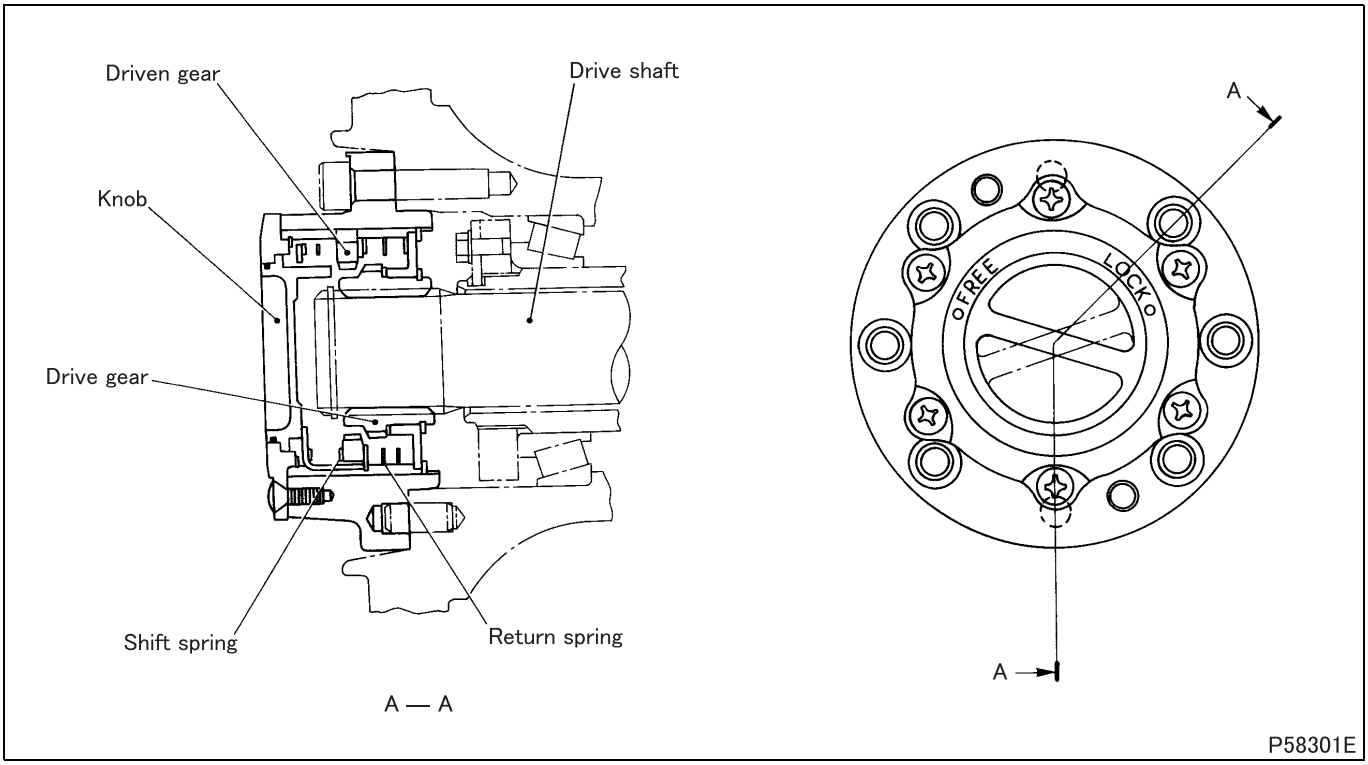
- Use the gear oil with a SAE viscosity grade of 140 when a vehicle is used under heavily-loaded, severe conditions such as continuous driving on uphill grades. However, the air temperature must be above 10°C {50°F}.

STRUCTURE AND OPERATION

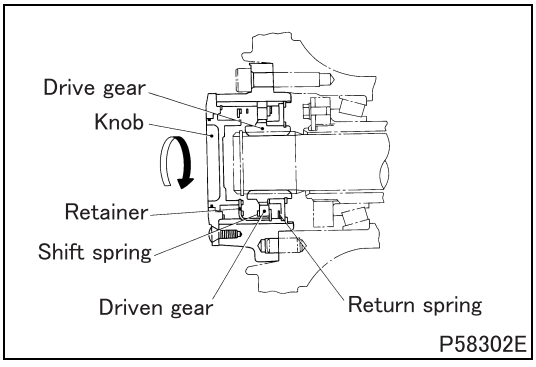
1. Wheel Hub and Brake Drum



2. Free Wheel Hub



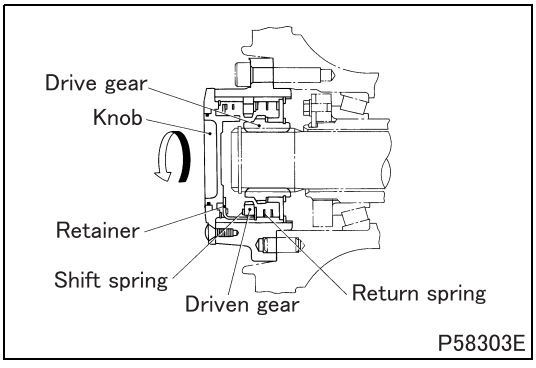
- In the case of a four-wheel drive vehicle, even when it is running in rear-wheel drive only, the drive shaft, differential, propeller shaft, and driving parts of the transfer front drive shaft continue to run due to transmission of rotation from the wheels. This subjects the vehicle drive to a load, and it causes loss of driving power.
  Now, with a free wheel hub, transmission of rotation from the front wheels to the drive shaft is cut, reducing driving loss when running in rear-wheel drive only. This improves fuel efficiency and reduces vibration and noise.
- With a free wheel hub, FREE (cutting of driving power) ↔ LOCK (transmission of driving power) is made easily by manual operation.



Operating mechanism

● From FREE to LOCK

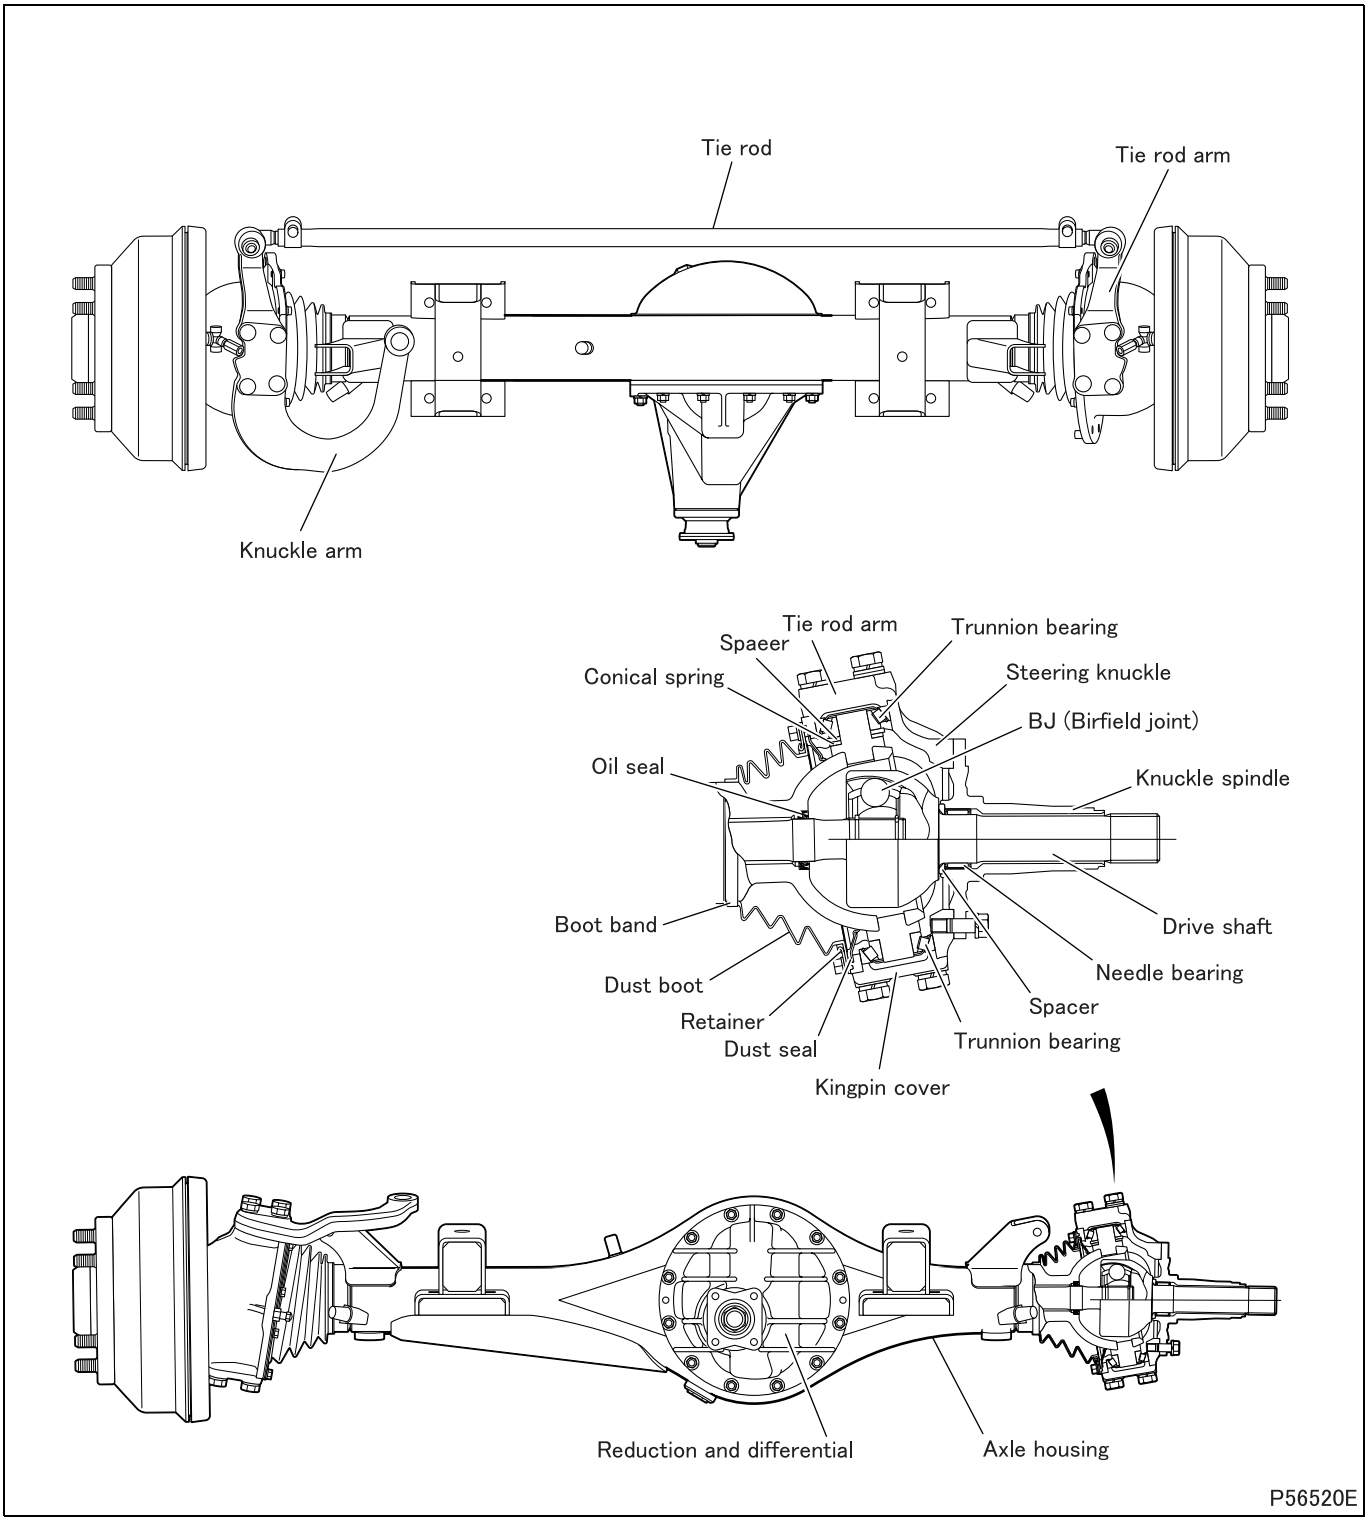
When knob is turned to LOCK, retainer shifts to the inside along with the shape of the knob, pressing return spring. At this instance, driven gear, being pressed by shift spring, engages with drive gear at the spline, and transmits the driving power.



● From LOCK to FREE

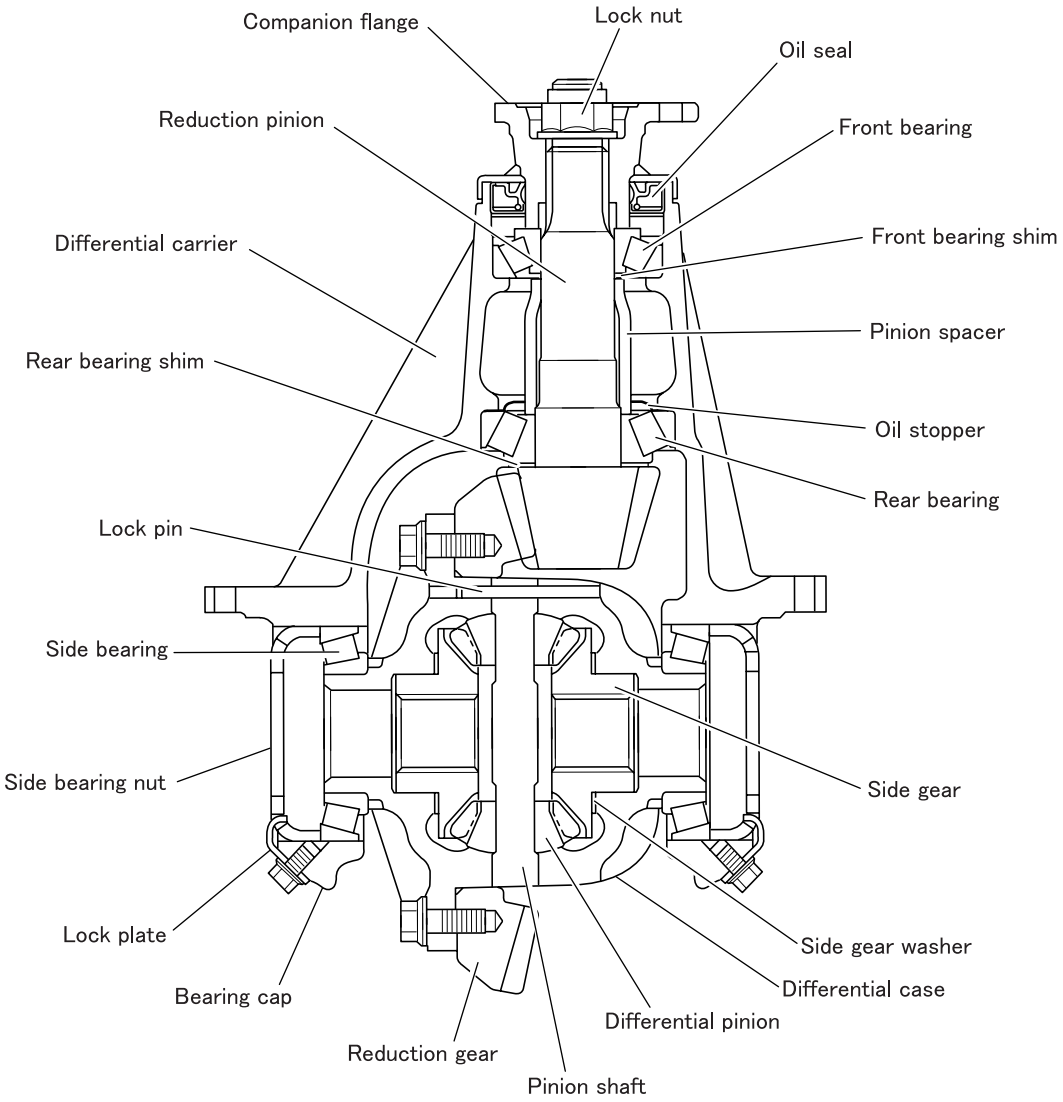
When knob is turned to FREE, the action is the reverse of FREE to LOCK, and the driving power is disengaged.

3. Drive Shaft and Steering Knuckle, Axle Housing



- The drive shaft must transfer power according to rotation speed fluctuations caused by change of steering angle when a vehicle is steered. Therefore, a constant velocity universal joint, which eliminates rotation speed fluctuations between the drive shaft and the driven shaft and transfers power evenly, is used for the Birfield joint of the drive shaft.

4. Reduction and Differential



Possible causes	Symptoms	Power transmission insufficient: Noise when starting and changing gears	Power transmission insufficient: Continuous noise while cruising	Power transmission insufficient: Intermittent noise while cruising	Power transmission insufficient: Noise while cornering	Power transmission insufficient: Tires drag while cornering	Power transmission insufficient: Propeller shaft turns but front tires do not turn (on a bench tester)	Oil leakage from companion flange	Oil leakage from differential carrier and axle housing	Oil leakage from drive shaft	Steering wheel shakes	Steering feels stiff	Steering wheel return poor	Unable to steer the steering wheel	Steering pulls to one side	Uneven wear or early wear of front tires	Reference Gr

M E M O

ON-VEHICLE INSPECTION AND ADJUSTMENT

1. Inspection and Adjustment of Wheel Alignment

Before performing inspection and adjustment of wheel alignment, set the vehicle to the following condition.

- Park the vehicle unloaded on a level place.
- The vehicle needs to be equipped with proper size tires.
- If the wear condition of tires on the right is remarkably different from that of tires on the left, replace tires.
- Tires need inflation to specified pressure.
- Correct if the vehicle tilts due to faulty suspension.
- Service all parts of the front axle and ensure that there is no fault such as the following.
  - Loose trunnion bearing
  - Loose front wheel hub
  - Loose bolts used for tightening various parts of tie rod arm, knuckle arm and tie rod
  - Bend of knuckle spindle and axle housing
- Adjust play at steering wheel properly
- For wheel alignment, which is related to the side slip amount, both wheel alignment and the side slip amount must conform to the standard values.

Service standards (Unit: mm {in.})

Location	Maintenance item	Standard value	Limit	Remedy
–	Toe-in	0 to 6 {0 to 0.24}	–	Adjust
	Camber	1°00’ ± 30’	–	*
	Caster	0°30’ ± 1°00’	–	Replace
	Kingpin inclination angle	9°30’ ± 30’	–	Replace

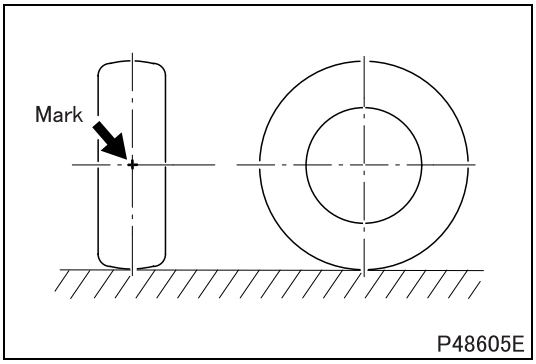
*: If the measured value deviates from the standard value, abnormalities such as loose trunnion bearing, loose hub bearing and bend of knuckle and front axle housing are suspected. Inspect each part and replace defective parts.

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
–	Clamp nut (tie rod end clamp fastening)	20 to 29 {15 to 21, 2 to 3}	–

Special tools (Unit: mm {in.})

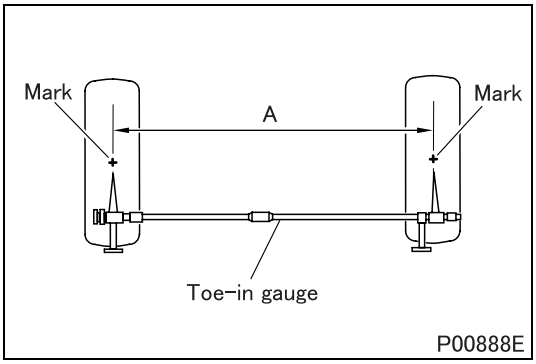
Mark	Tool name and shape	Part No.	Application
a	Alignment gauge adapter A: ϕ56.5 {2.22}, B: ϕ95 {3.74} 	MH062337	Measurement of camber, caster and kingpin inclination angle



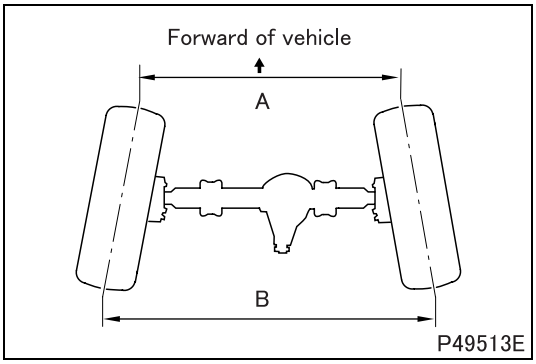
1.1 Inspection and adjustment of toe-in

[Inspection]

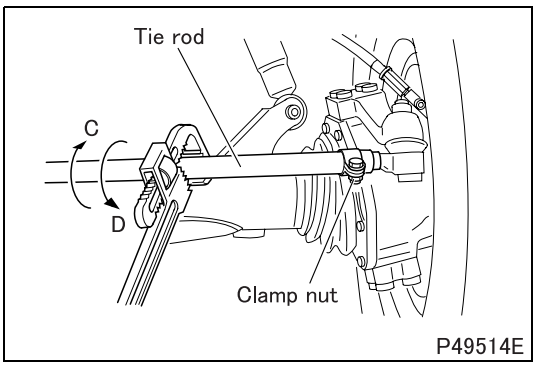
- Direct the front wheels exactly to forward running position.
- Put a mark to each tire of right and left at the height of front wheel axis and in the middle of tire width.



- Align the two points of the toe in gauge with respective marks and read distance A between the marks.

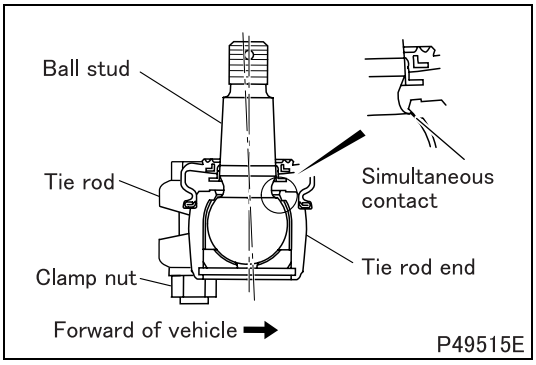


- Push the vehicle to roll the tires 180 degrees.
- Measure distance B between the marks that have moved to the rear of the vehicle.
- If toe-in (difference between A and B) deviates from the standard value, adjust.



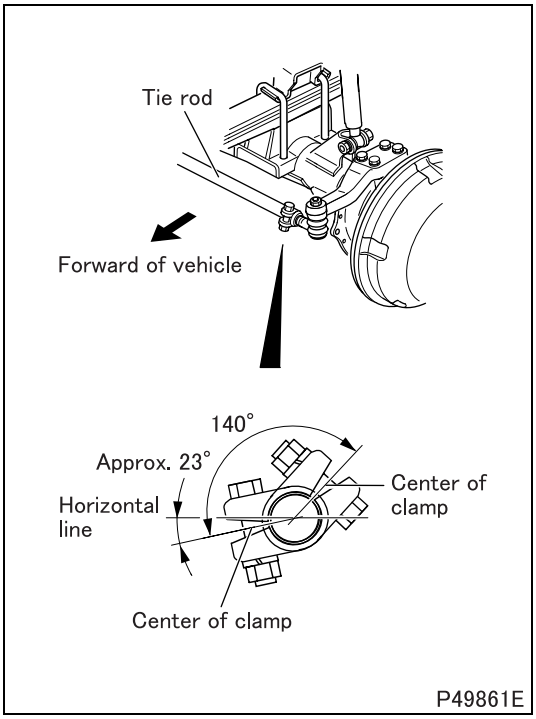
[Adjustment]

- Loosen the clamp nuts on the right and left.
- Turn the tie rod with a pipe wrench to adjust the toe-in.
  C: When adjusting to the toe-out direction
  D: When adjusting to the toe-in direction
- After adjustment, tighten the clamp nut to the specified torque.

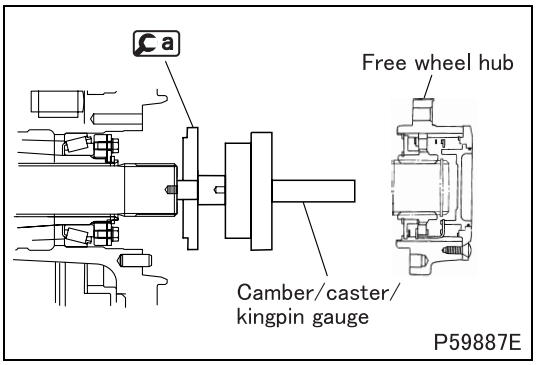


CAUTION ⚠

- **Hold down the tie rod end toward the front of the vehicle with the front wheels directed to forward running position so that the right and left tie rod ends are in contact with the ball studs at the same time. In this state adjust so that the specified toe-in is achieved and tighten the clamp nut to secure the tie rod.**

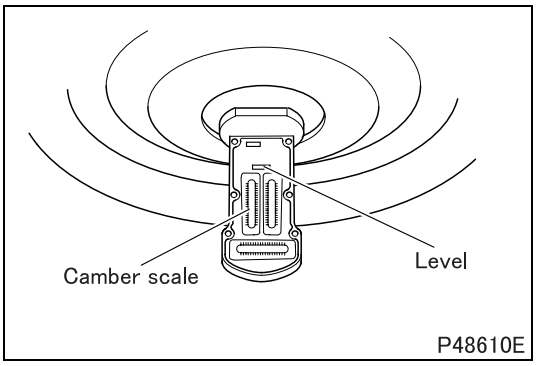


- Make sure that the center of the tie rod clamp is within the illustrated range.
- If it is out of the illustrated range, change the center position of the clamp.

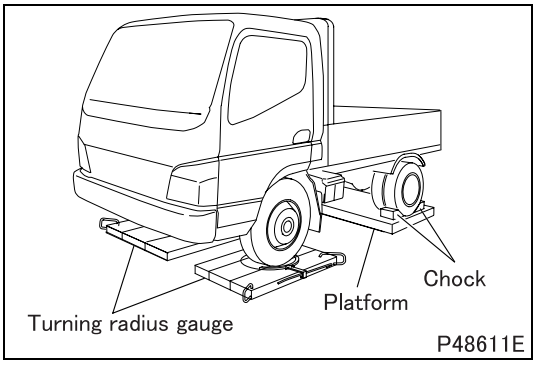


1.2 Inspection of camber

- Direct the front wheels exactly to forward running position.
- Remove the free wheel hub.
- Install Ca on the drive shaft tip.
- Install the camber/caster/kingpin gauge.

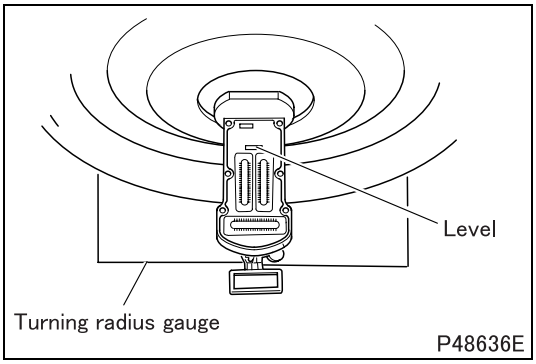


- Place the level in order to have bubble stay in the middle.
- Read center of bubble on camber scale to find the camber. Do the same way for the right and left front tires.
- If the measured value deviates from the standard value, disassemble the front axle for service.

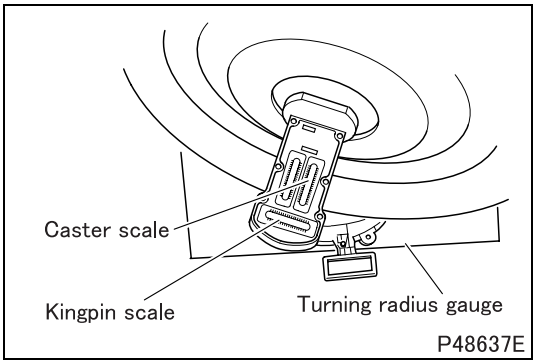


1.3 Inspection of caster and kingpin inclination angle

- Prepare a platform with the same height as the turning radius gauge and place it under the rear wheels so that the vehicle may be placed level.
- Apply chocks to the rear wheels.
- Keep the turning radius gauge locked.
- Jack up the vehicle, and set the right and left front wheels so that respective ground contact area centers of two wheels and turntable centers may meet.



- Unfasten locking of the turning radius gauge, and set the scale to 0 degrees.
- In the same manner as in case of measuring camber in Section **1.2**, attach the camber/caster/kingpin gauge, and set the level so that the bubble comes in the middle.



- Apply brake, and with brake applied to the front wheels, turn steering wheel slowly from the point of 0 degrees on the turning radius gauge, until the direction is changed by 20 degrees each to the right side in case of the right front wheel and to the left in case of the left front wheel.

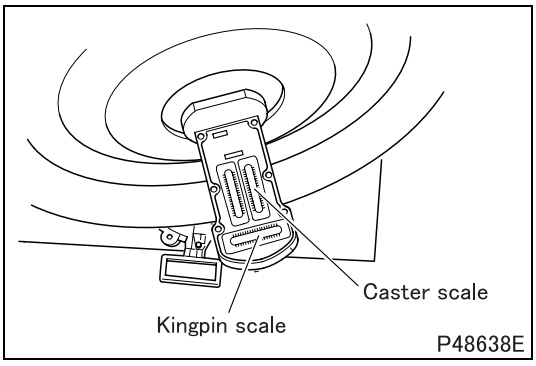
NOTE

- **It is not possible to make exact measurement unless brake is kept applied, because otherwise wheels will turn slightly.**

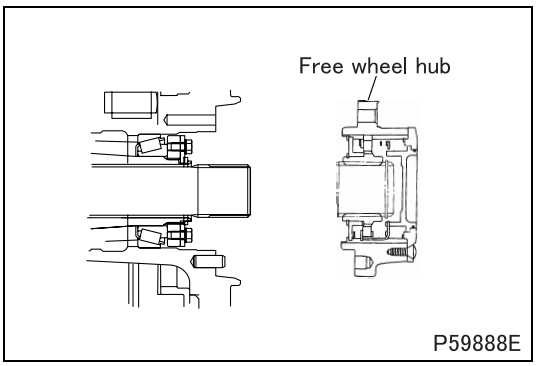
- At the point where steering has been steered 20 degrees, set the caster scale and the center of the bubble of the kingpin scale to 0 degrees by turning the adjuster.

NOTE

- **Pay attention to the kingpin scale because it has scales for right and left: align the right kingpin scale in case of the right front wheel, and left kingpin scale in case of the left front wheel.**



- Reverse this position, turn the steering wheel slowly until the direction of the front wheels changes by 20 degrees in the opposite direction.
- Read the center of bubbles at this position at the caster scale and kingpin scale to find caster and kingpin inclination angles.
- If the measured value deviates from the standard value, disassemble the front axle for service.



- After inspection, install the free wheel hub.

2. Inspection and Adjustment of Steering Angle

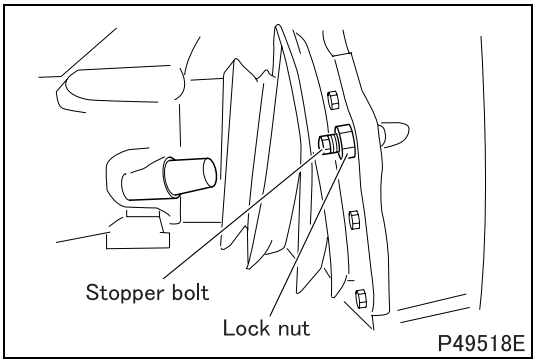
- Perform steering angle inspection and adjustment only after wheel alignment inspection and adjustment has been completed.

Service standards

Location	Maintenance item		Standard value	Limit	Remedy
–	Steering angle	Inside (outside steering angle is for reference only)	35° $^{0}_{-2}$° (34°)	–	Adjust

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
–	Lock nut (knuckle stopper bolt tightening)	96 ± 12 {71 ± 9, 9.75 ± 1.25}	–



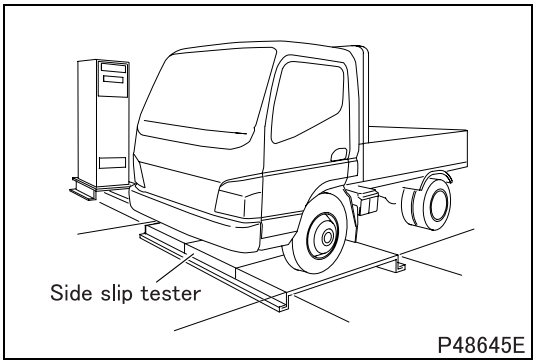
- Set the turning radius gauge and a platform on the vehicle in the same manner as in case of caster and kingpin inclination angle measurement performed in Section **1.3**.
- Turn the steering wheel right or left completely from the position where the turning radius gauge is set to 0 degrees, and measure the steering angle, reading the scale of the turning radius gauge.
- If the measured value deviates from the standard value, adjust with the knuckle stopper bolt and tighten the lock nut to the specified torque.

3. Inspection of Side Slip

- Perform side slip inspection only after wheel alignment inspection and adjustment has been completed.
- For the side slip amount, which is related to wheel alignment, both the side slip amount and wheel alignment must conform to the standard values.

Service standards (Unit: mm {in.})

Location	Maintenance item	Standard value	Limit	Remedy
–	Side slip amount (per 1 m {3.3 ft})	3 {0.12} or less	–	Adjust



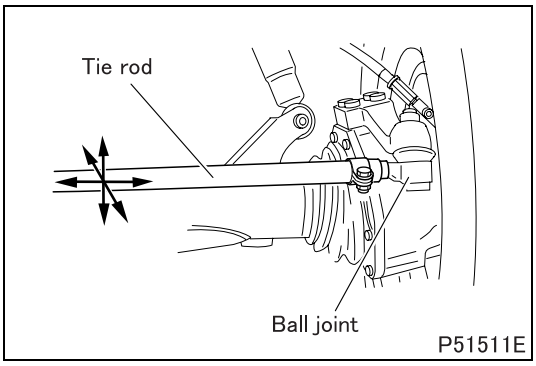
- Set the front wheels exactly to forward running position.
- Move the vehicle forward past the side slip tester as slowly as possible to inspect side slip.

NOTE

- **Pay attention to the following when moving over the side slip tester.**
- **Be sure to hold steering exactly at the forward running position, and make no turn.**
- **Do not apply brake.**
- **Keep the speed constant.**

- If the measured value deviates from the standard value, inspect and adjust wheel alignment.

4. Inspection of Tie Rod End Ball Joint



(1) Play

- Hold the tie rod section of the tie rod with the vehicle kept stationary, and move it in the back-and-forth, up-and-down and right-and-left directions to check for play at ball joints of the tie rod end.

NOTE

- **Be sure to check for play at ball joints of both right and left sides of the tie rod.**

- If there is play, replace the tie rod end of the tie rod.

(2) Dust cover

- Check the dust cover for wear, cracks and other damage.
- If there is any abnormality, replace the tie rod end.

5. Inspection and Replacement of Axle Oil

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
–	Inspection plug	110 ± 10 {81 ± 7.4, 11 ± 1}	–
	Drain plug		

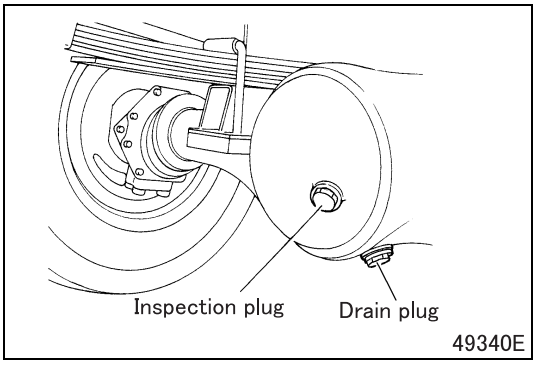
Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
–	Axle housing	Normal: Maximum air temperature during operation below 40°C {104°F} API GL-5 SAE 90 Hot area: Maximum air temperature during operation above 40°C {104°F} API GL-5 SAE 140	3 L {3.2 qts.}

- Use the gear oil with a SAE viscosity grade of 140 when a vehicle is used under heavily-loaded, severe conditions such as continuous driving on uphill grades. However, the air temperature must be above 10°C {50°F}.

WARNING ⚠

- **The oil temperature is high immediately after the vehicle has stopped, so take care not to scald yourself.**



[Inspection]

(1) Inspection of oil quantity

- Remove the inspection plug, and check that gear oil is filled up to the neck.
- If gear oil is not sufficient, fill oil from the inspection plug hole up to the neck.

(2) Inspection of oil quality and inclusions

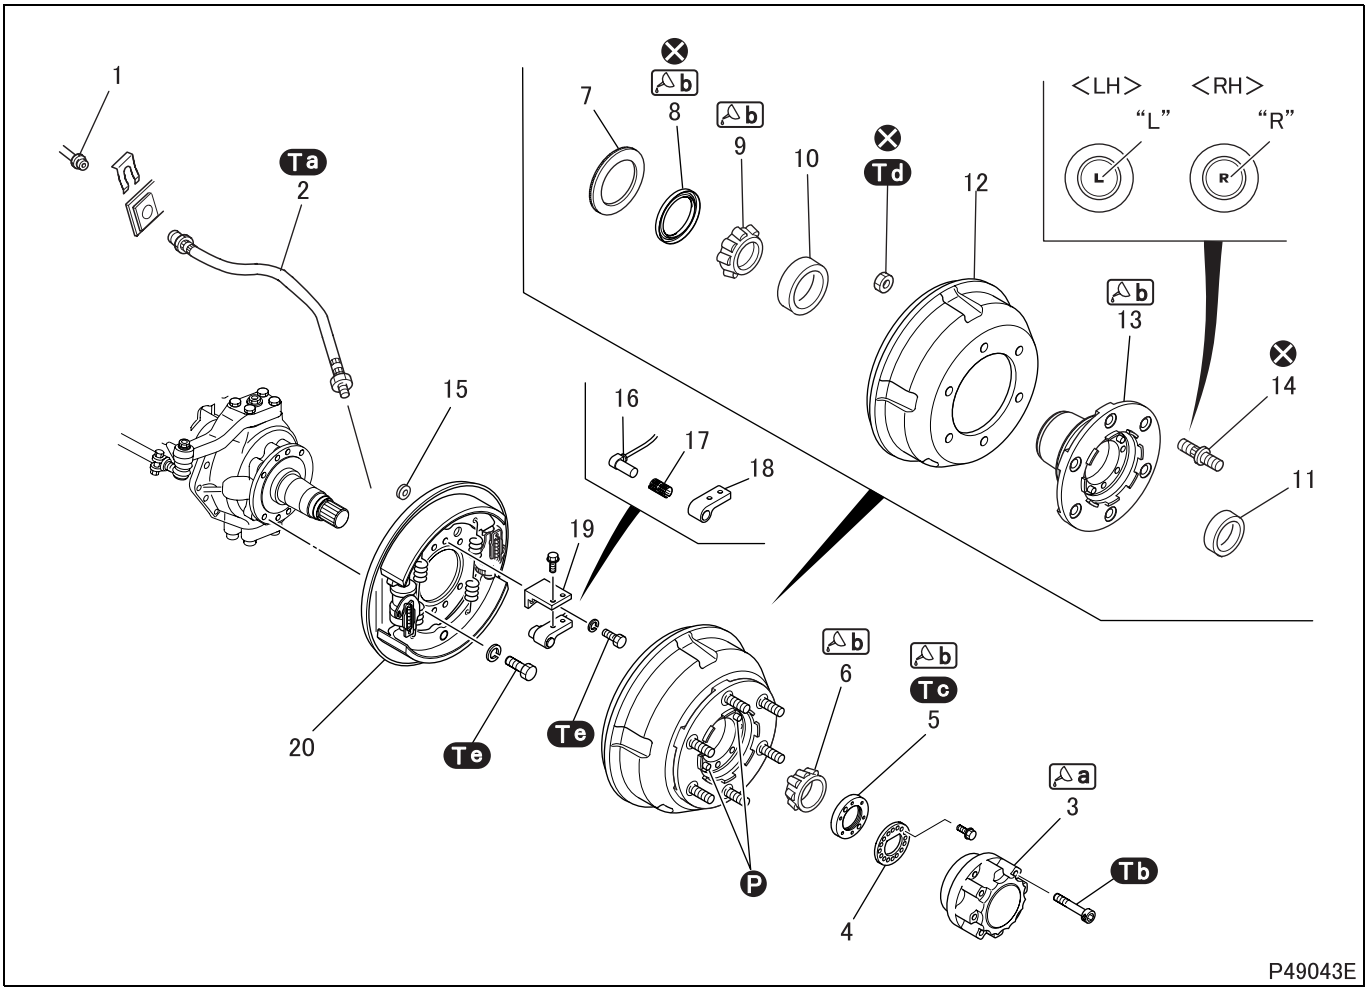
- When draining gear oil, check for oil quality, metal chips and metal powder.
- If an abnormally large amount of metal chips and metal powder is found, disassemble the assembly for service, as abnormalities may be caused inside.

[Replacement]

- Remove the drain plug to drain gear oil. Drainage can be made quickly with the inspection plug removed.
- As the drain plug is a magnet, clean it before installation.
- Fill the specified quantity of gear oil from the inspection plug hole.
- After filling, check that gear oil is filled up to the neck. If oil is not sufficient, replenish it.

M E M O

WHEEL HUB AND BRAKE DRUM



● **Disassembly sequence**

1 Brake pipe
2 Brake hose
3 Free wheel hub
4 Lock washer
5 Lock nut
6 Outer bearing inner race
7 Anti-lock brake system rotor
8 Oil seal
9 Inner bearing inner race
10 Inner bearing outer race
11 Outer bearing outer race
12 Brake drum
13 Wheel hub
14 Hub bolt
15 Grommet
16 Wheel speed sensor
17 Spring spacer
18 Sensor holder
19 Bracket
20 Front drum brake (See Gr35A.)

Ⓟ: Locating pin
⊗: Non-reusable parts

CAUTION ⚠

- **Plug the brake hose to prevent entry of dust and dirt after it has been removed.**

NOTE

- **Do not remove the anti-lock brake system rotor unless replacing it.**
- **Do not disassemble the brake drum and wheel hub unless replacing them.**

● **Assembly sequence**

Follow the disassembly sequence in reverse.

CAUTION ⚠

- **Make sure that the brake lining surface of the front drum brake and the inner surface of the brake drum are free from grease to avoid malfunction of brakes.**
- **Make sure that the brake hose is not twisted when installing it.**
- **Adjust brake shoe clearance after assembly. (See Gr35A.)**

Service standards (Unit: mm {in.})

Location	Maintenance item		Standard value	Limit	Remedy
–	Starting torque of wheel hub bearing (tangential force at hub bolt position with oil seal assembled)		2 to 3.9 N·m {1.5 to 2.9 ft.lbs, 0.20 to 0.40 kgf·m} (tangential force: 17.7 to 34.3 N {4.0 to 7.7 lbs., 1.8 to 3.3 kgf})	–	Adjust or replace
12	Brake drum	Inside diameter	320 {12.60}	322 (※ 321) {12.68 (※ 12.64)}	Correct or replace
		Cylindricity	0.05 {0.0020}	0.20 {0.079}	

※ shows the correction limit value.

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened		Tightening torque	Remarks
Ta	Brake hose		12.7 to 16.7 {9.4 to 12, 1.3 to 1.7}	–
Tb	Bolt (free wheel hub mounting)		68.6 ± 4.9 {51 ± 3.6, 7.0 ± 0.5}	–
Tc	Lock nut	Primary tightening	113 ± 15 {83 ± 11, 11.5 ± 1.5}	–
		Secondary tightening after complete tightening	25 ± 5 {18 ± 3.6, 2.5 ± 0.5}	–
Td	Nut (brake drum and wheel hub mounting)		343 ± 39 {253 ± 29, 35 ± 4}	–
Te	Bolt (bracket mounting)		123 ± 5 {90 ± 3.6, 12.5 ± 0.5}	–
	Bolt (front drum brake mounting)			

Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Wheel hub contact surface of free wheel hub	ThreeBond 1104J or 1215	As required
b	Thread area of lock nut	Wheel bearing grease [NLGI No. 2 (Li soap)]	As required
	Pack space between rollers of outer bearing inner race and inner bearing inner race		
	Lip area of oil seal		
	Pack inside of wheel hub		※ 60 ± 10 g {2.12 ± 0.35 oz.}

※ For a wheel hub

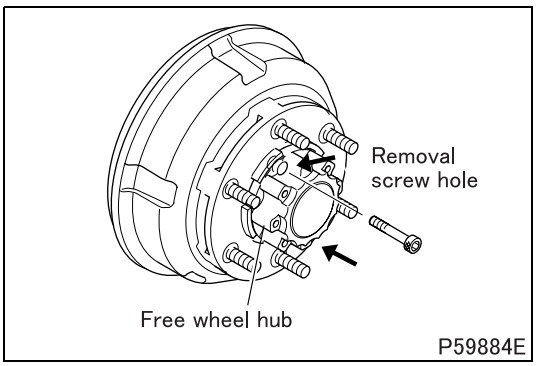
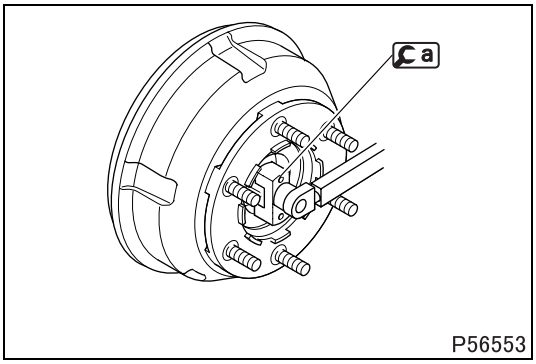
◆Removal procedure◆

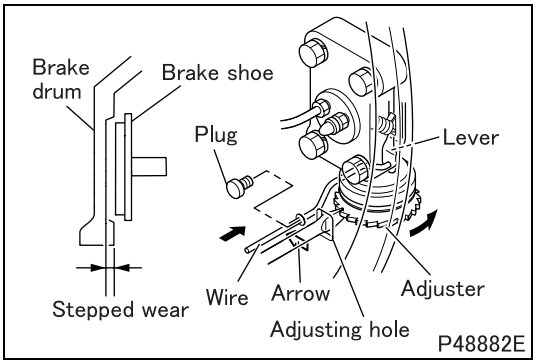


■ **Removal: Free wheel hub**

- Screw two bolts evenly into the free wheel hub removal screw holes to remove the free wheel hub.



■ **Removal: Lock nut**

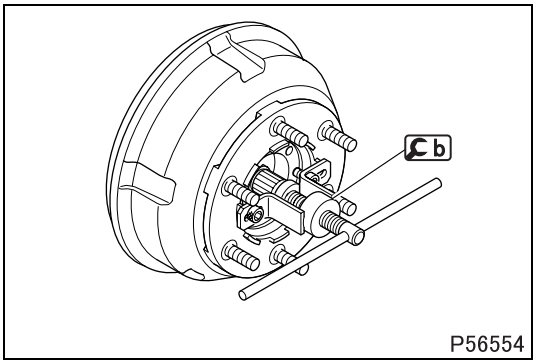


■ **Removal: Wheel hub and brake drum**

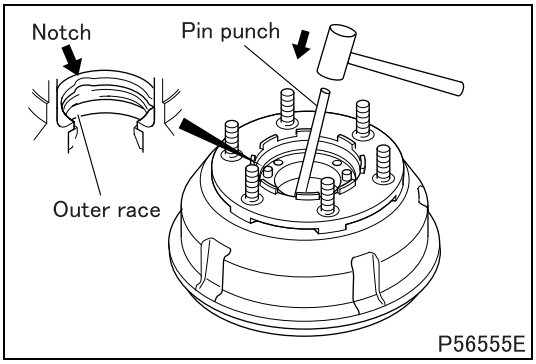
- If the brake drum has stepped wear and the wear prevents the wheel hub and brake drum from being removed, the removal can still be effected by taking the following procedure.
  - Insert a wire of approx. ϕ2 mm {0.079 in.} into the hole from which the plug has been removed, and lift up the adjust lever of the wheel cylinder.
  - Turn the adjuster from the adjust hole in the opposite direction to the arrow on the backing plate to increase the clearance between the brake drum and the brake shoe. Then, remove the wheel hub and brake drum.

CAUTION ⚠

- **Correct or replace the brake drum if any fault is found.**

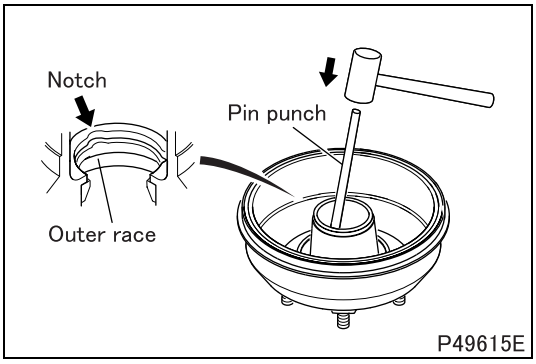


- Install b using free wheel hub mounting bolts to remove the wheel hub and brake drum.



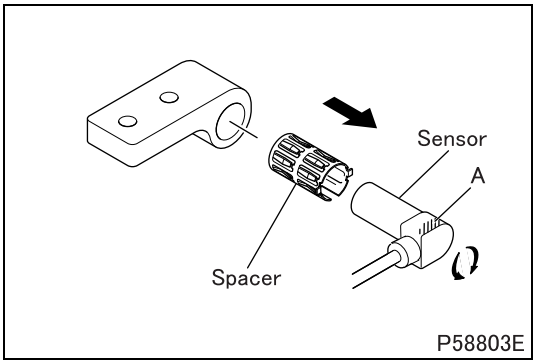
■ **Removal: Inner bearing outer race**

- Drive out the inner bearing outer race by tapping evenly at three indented parts in the wheel hub.



■ **Removal: Outer bearing outer race**

- Drive out the outer bearing outer race by tapping evenly at three indented parts in the wheel hub.



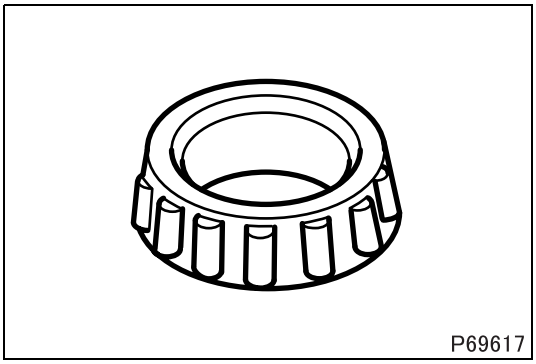
■ **Removal: Wheel speed sensor**

- Hold shaded section A of wheel speed sensor with pliers, and remove the sensor by twisting it slightly in left and right directions.

CAUTION ⚠

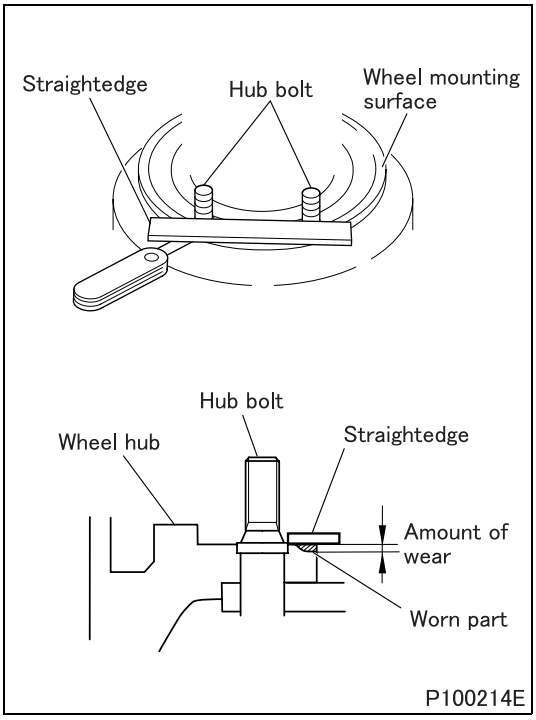
- **When removing the wheel speed sensor, never apply a force to it such as tapping it with a hammer, prying it with a screwdriver and pulling the harness, as doing so causes the wire to be broken.**
- **If the wheel speed sensor pulls out lightly, replace the spring spacer.**

◆Inspection procedure◆



■ **Inspection: Outer bearing inner race**

- Inspect the outer bearing inner race after cleaning the bearing to remove grease completely.
- If any damage, wear, or poor rotating condition is evident in the inner race, replace it with a new one.
- The inner race and outer race should be replaced as a set.



■ **Inspection: Wheel hub**

(1) Visual inspection

- Check the disc wheel mounting surface of the wheel hub by watching and touching. If there is damage or crack on it, replace the wheel hub.
- Make sure that there is not rust, dust, paint or foreign body on the disc wheel mounting surface of the wheel hub to prevent the wheel nut to loosen.
- If any abnormality is found, remove it with sandpaper.

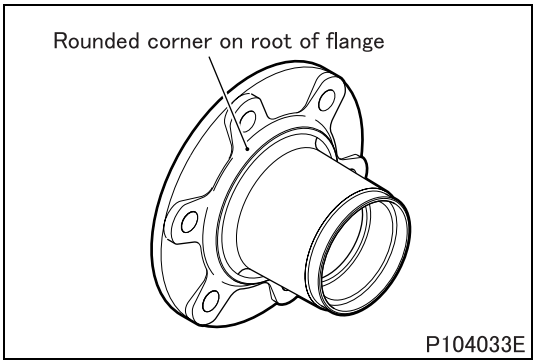
(2) Wear in disc wheel mounting part of wheel hub

- Clean the wheel mounting surface of the wheel hub before inspection.
- Place a straightedge on the hub so as to contact to the two hub bolts on the disc wheel mounting surface.

CAUTION ⚠

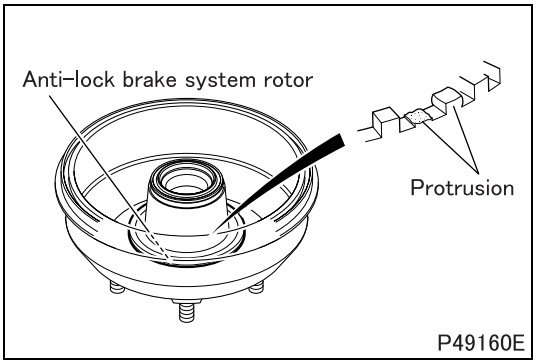
- **Make sure that the straightedge does not run onto the hub bolt.**

- Using feeler gauges to measure the amount of wear at the outer periphery of the wheel hub.
  Measure the amount of wear in the area of every hub bolt.
- If the amount of wear at any point exceeds the following standard value, inspect the crack check of wheel hub.
  Wear standard value: 0.8 mm



(3) Crack check

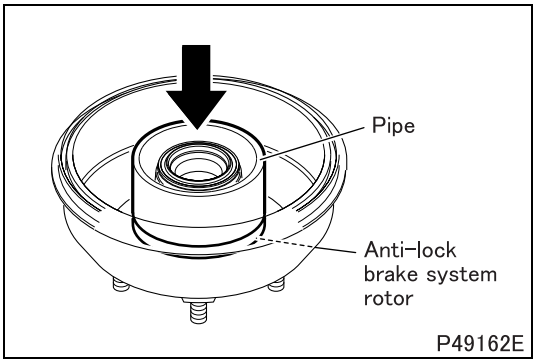
- Check if there is not crack on the entire rounded corner on the root of flange of the wheel hub by magnetic particle or liquid penetrant testing. If crack is found, replace the wheel hub.
- If crack is found on the wheel hub bolt, replace it.
- If there is crack or stepped wear on the wheel hub mounting surface of wheel disc, replace it. (See Gr31.)



■ **Inspection: Anti-lock brake system rotor**

[Inspection]

- Check protrusions of the anti-lock brake system rotor for chipping and flattening.
- If any abnormality is found, replace the anti-lock brake system rotor.



[Installation]

- Warm the anti-lock brake system rotor to approximately 150°C {302°F}.
- Install the anti-lock brake system rotor and wheel hub evenly using a pipe so as not to allow them to tilt.

WARNING ⚠

- **Handling the warmed rotor by bare hand causes scald.**

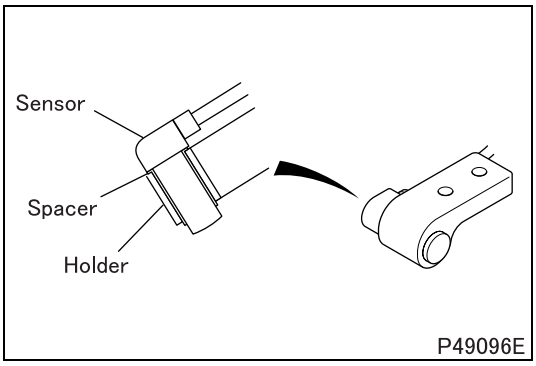
■ **Inspection: Brake drum**

- If cylindricity of the brake drum exceeds the limit or the brake drum has seams, cut the brake drum integrally with the wheel hub within the range of the correction limit.

■ **Inspection: Inner bearing inner race**

- Inspect the inner bearing inner race in the same manner as for the outer bearing inner race.
  (See **"■ Inspection: Outer bearing inner race".**)

◆Installation procedure◆

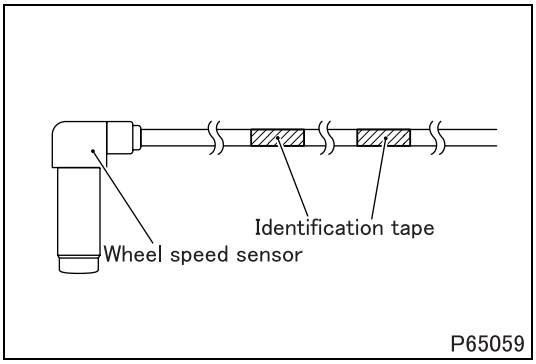


■ **Installation: Wheel speed sensor**

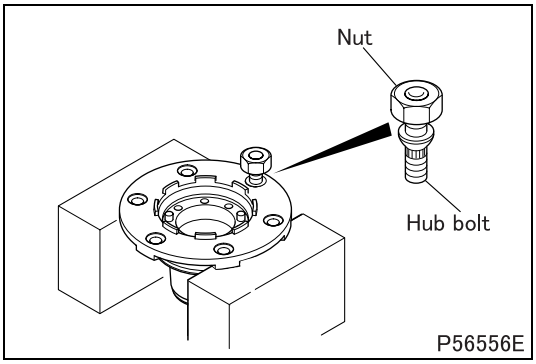
- Install the wheel speed sensor so that it securely contacts the sensor holder together with the spring spacer.

CAUTION ⚠

- **When installing the wheel speed sensor, never apply a force to it such as tapping it with a hammer, prying it with a screwdriver and pulling the harness, as doing so causes the wire to be broken.**

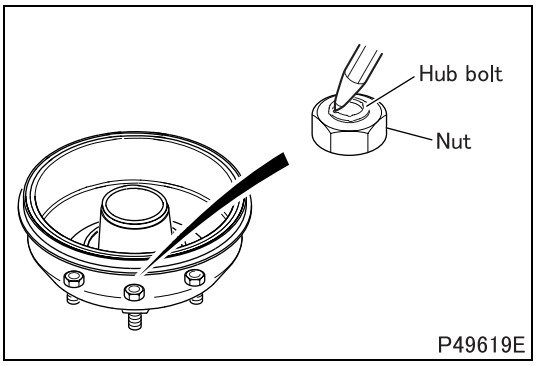


- Using clips, secure in place the wheel speed sensor harness at the identification tape portions, ensuring that the harness is free of kinks, slack and/or interference with other parts.

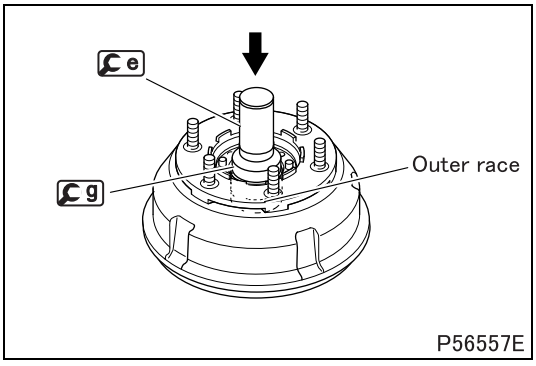


■ **Installation: Hub bolt**

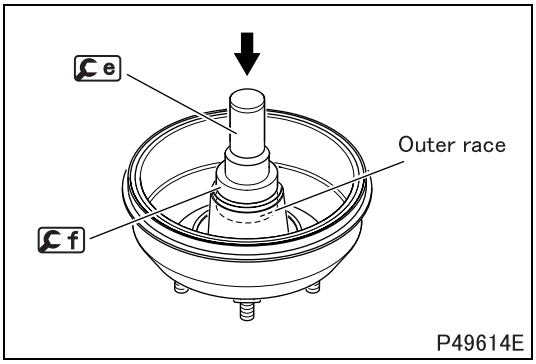
- Screw the nut into the hub bolt until just before they become flush.
- Drive the hub bolt into the wheel hub vertically by hitting the end face of the nut.



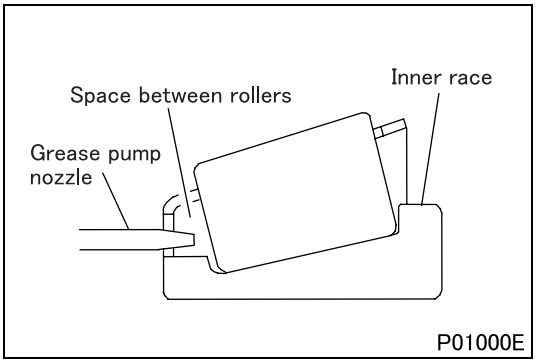
- Assemble the brake drum and wheel hub with the hub bolt. After tightening the nut to the specified torque, caulk it with a punch.



■ **Installation: Outer bearing outer race**

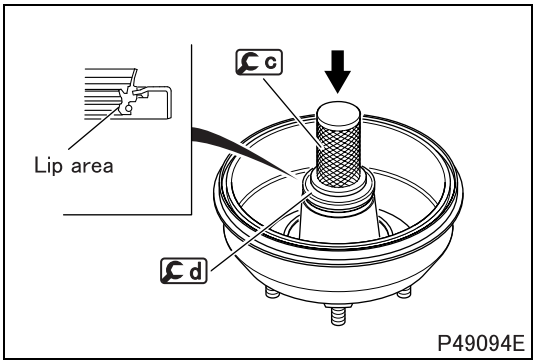


■ **Installation: Inner bearing outer race**



■ **Installation: Packing grease in inner bearing inner race**

- Insert the grease pump nozzle into the space between rollers of the inner bearing inner race to pack grease sufficiently.

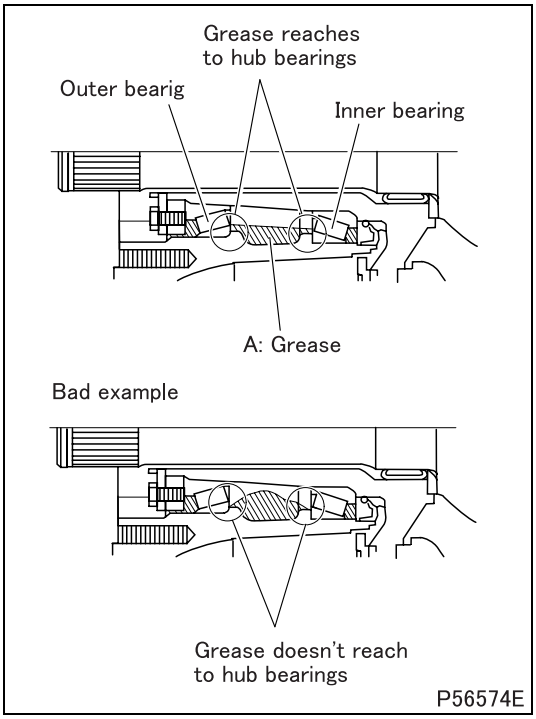


■ **Installation: Oil seal**

- Apply grease to the lip area of the oil seal and install it on the wheel hub in the illustrated direction.

■ **Installation: Packing grease in outer bearing inner race**

- Follow the same procedure as for packing the inner bearing inner race with grease.
  (See **"■ Installation: Packing grease in inner bearing inner race".**)

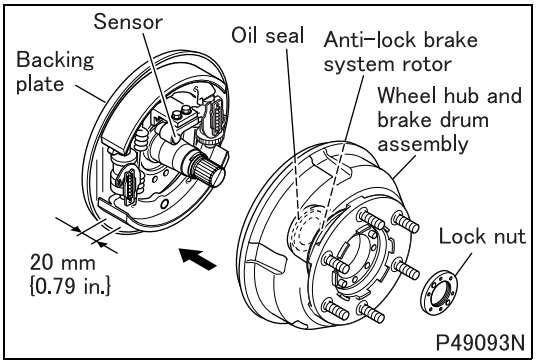


■ **Installation: Packing grease inside of wheel hub**

- Apply specified amount of grease to inside A of wheel hub so that the grease reaches to inner bearing and outer bearing as illustrated.

CAUTION ⚠

- **Applying grease as illustrated in the "bad example" causes the wheel hub bearing to seize.**



■ **Installation: Wheel hub and brake drum**

- Slowly install the wheel hub and brake drum assembly so as not to cause damage to the oil seal and anti-lock brake system rotor.

CAUTION ⚠

- **If the anti-lock brake system rotor is damaged, wheel speed sensor signals become abnormal, causing the anti-lock brake system to malfunction.**

- Position the wheel hub and brake drum assembly only 20 mm {0.79 in.} before the backing plate, and hereafter slowly tighten the lock nut to install the wheel hub and brake drum assembly.

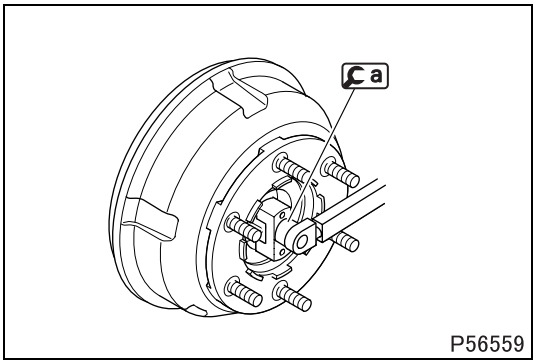
CAUTION ⚠

- **Be careful that installing the wheel hub and brake drum assembly without leaving a clearance with the backing plate may damage the wheel speed sensor.**

■ **Adjustment: Starting torque of wheel hub bearing**

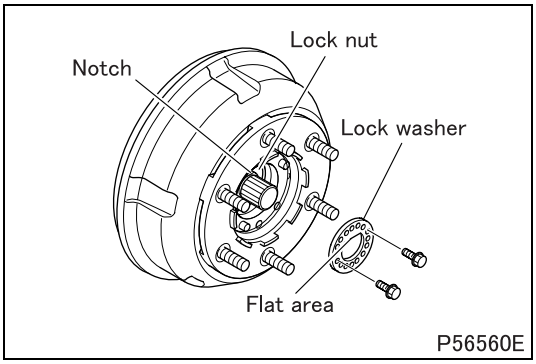
CAUTION ⚠

- **Unless this adjustment procedure is performed, seizure of the wheel hub bearing can be caused.**

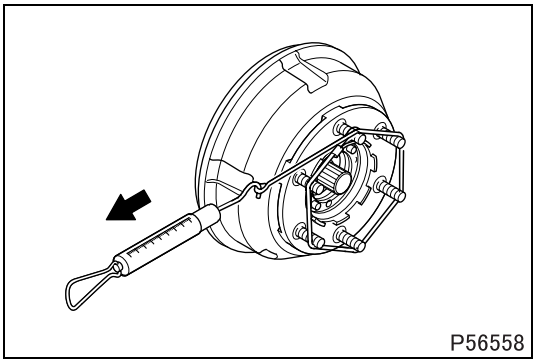


[Adjustment]

- Tighten the lock nut to the specified torque (primary tightening) while turning the wheel hub and brake drum assembly, and then loosen it completely.
- Smooth operation of the outer bearing and inner bearing by turning the wheel hub and brake drum assembly several times, and then tighten the lock nut to the specified torque (secondary tightening).



- Insert the flat area of the lock washer, aligning it with the notch of the knuckle spindle, and mount two bolts diagonally to the lock nut.
- If the lock nut does not align with a screw hole of the lock washer, align by loosening the lock nut. Make sure that there is no play in the axial direction.



[Inspection]

- Make sure that there is no drag in the brake lining and brake drum.
- If any abnormality is found, adjust the brake shoe clearance.
- Measure the tangential force at the hub bolt position using a spring balancer.

CAUTION ⚠

- **Do not assemble the free wheel hub when inspecting.**

- If the tangential force is within the specified value, the starting torque conforms to the standard value. If the measured value deviates from the specified value, repeat adjustment because the adjustment of the lock nut may be insufficient.
- If the result is found to be abnormal, replace the outer and inner bearings.

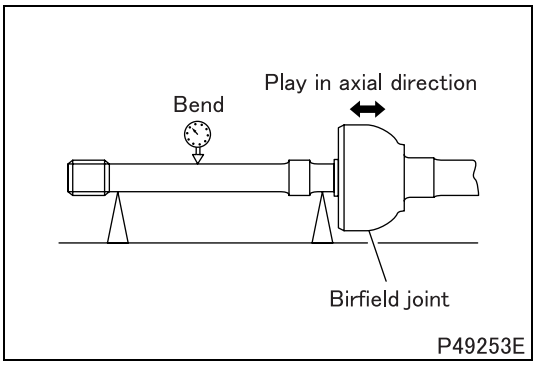
a	Oil seal installer A: ϕ55 {2.17} B: ϕ34 {1.34}  51042	MB999152	Installation of oil seal

◆Inspection procedure◆



P49253E

■ **Inspection: Drive shaft**

- Carry out the following inspections. If any abnormality is found, replace the drive shaft.

(1) Bend of drive shaft

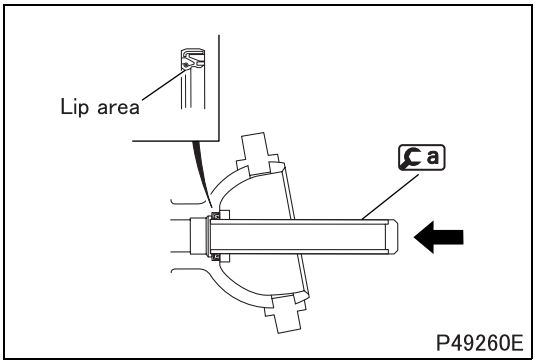
- Measure the bend at the center of the inner shaft of the drive shaft.

NOTE

- **Give the drive shaft one complete turn and read the dial gauge at this time. The bend is one half of the reading.**

(2) Play in Birfield joint axial direction

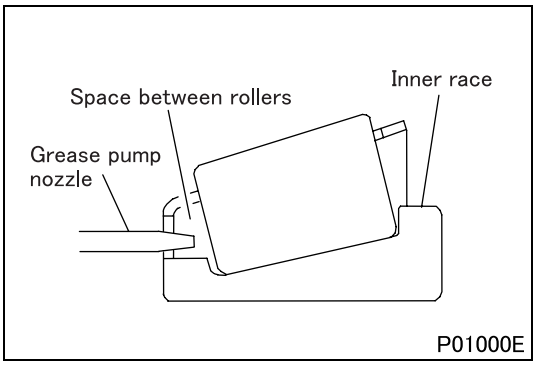
◆Installation procedure◆



P49260E

■ **Installation: Oil seal**

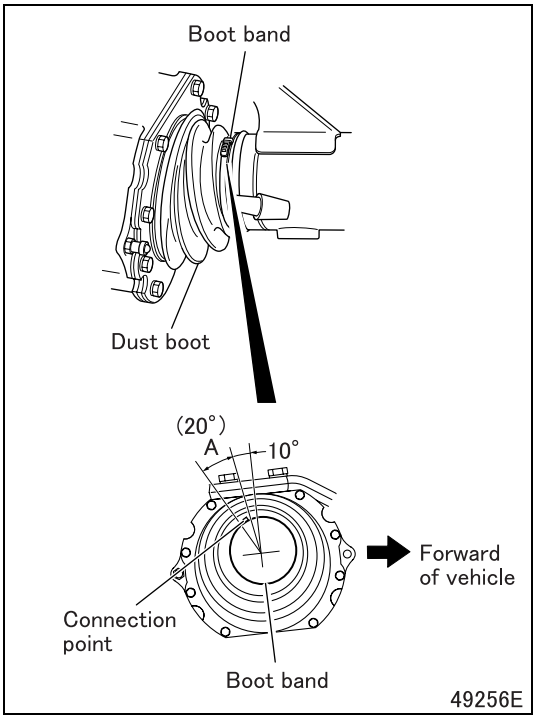
- Apply grease to the lip area of the oil seal and install it on the axle housing in the illustrated direction.



P01000E

■ **Installation: Packing grease in trunnion bearing inner race**

- Insert the grease pump nozzle into the space between rollers of the trunnion bearing inner race to pack grease sufficiently.

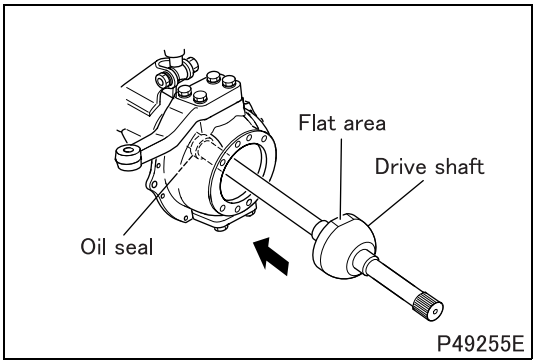


■ **Installation: Boot band**

- Install the boot band within illustrated range A.

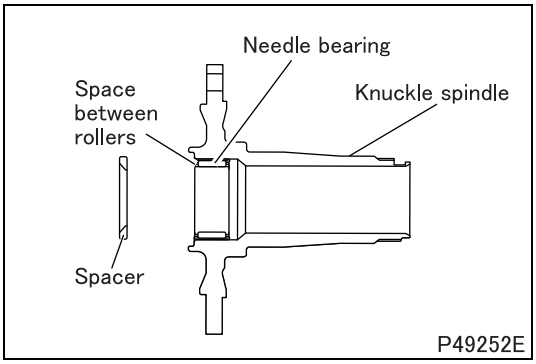
CAUTION ⚠

- **When installing the boot band, do not tighten the dust boot excessively so as not to allow the dust boot to stick out of the mating surface remarkably.**



■ **Installation: Drive shaft**

- Install the drive shaft with the flat area of the Birfield joint of the drive shaft placed in a vertical direction.
- Slowly install the drive shaft to avoid damage to the oil seal.



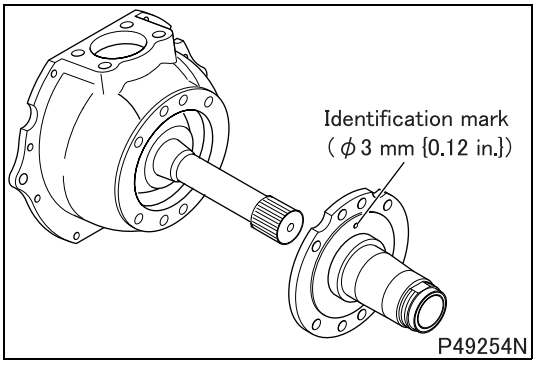
■ **Installation: Spacer and needle bearing**

- Pack grease sufficiently in the space between rollers of the needle bearing, and install the needle bearing so that it is flush with the end face of the knuckle spindle.

CAUTION ⚠

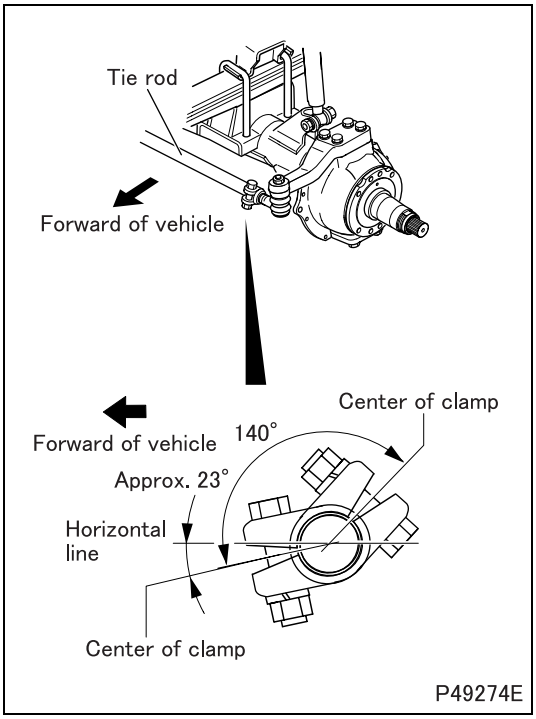
- **Do not drive in the needle bearing excessively.**

- Install the spacer on the knuckle spindle in the illustrated direction.



■ **Installation: Knuckle spindle**

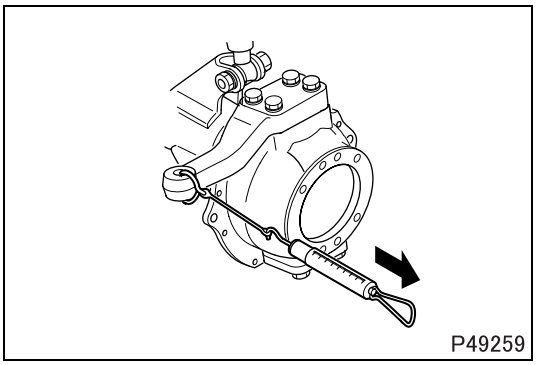
- Install the knuckle spindle on the steering knuckle in the illustrated direction.



■ **Installation: Tie rod**

- When installing the tie rod, make sure that the center of the tie rod clamp is within the illustrated range.
- If it is out of the illustrated range, change the center position by loosening the clamp.

◆Inspection after installation◆



■ **Inspection: Starting torque of steering knuckle**

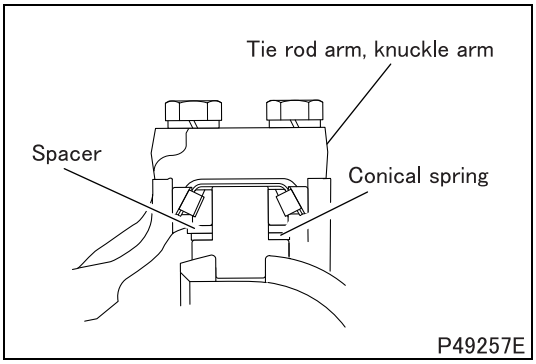
[Inspection]

- Measure the tangential force at the tie rod arm and knuckle arm end on the tie rod side using a spring balancer.

CAUTION ⚠

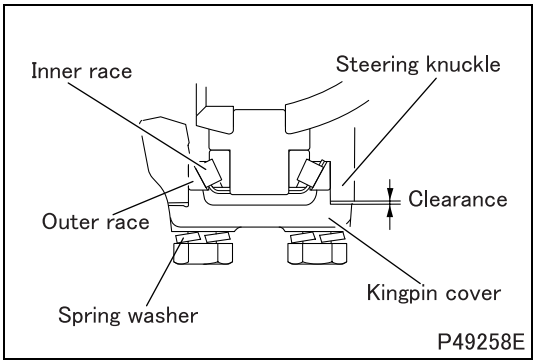
- **Do not assemble the dust boot and dust seal when measuring.**

- If the tangential force is within the specified value, the starting torque conforms to the standard value.
  If the measured value deviates from the specified value, adjust.
- Perform measurement again after adjustment. If any fault is found, replace the trunnion bearing.



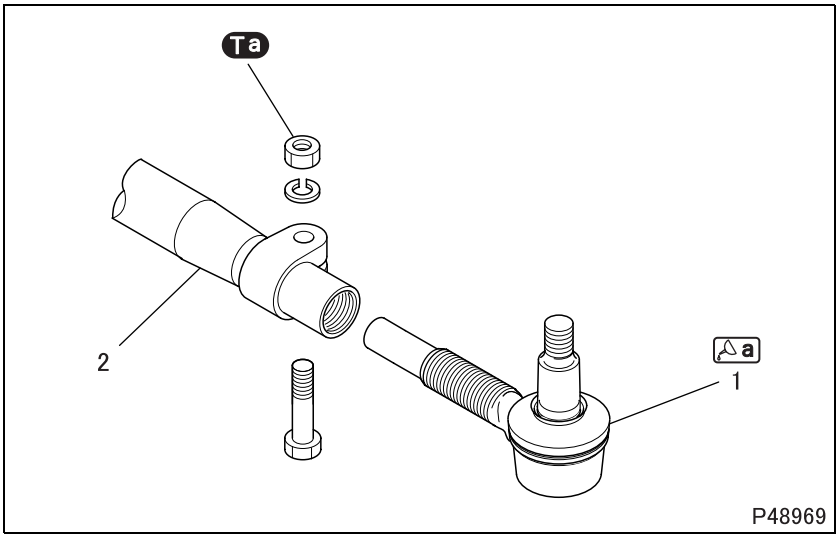
[Adjustment]

- Insert the conical spring and spacer (t = 3.2 mm {0.13 in.}) as illustrated and assemble the tie rod arm and knuckle arm as illustrated. Then, temporarily tighten them with bolts.



- Install the kingpin cover on the steering knuckle and tighten bolts to such extent that no tension is applied to the spring washers.
- Lift up the kingpin cover by hand until it securely contacts the trunnion bearing outer race and trunnion bearing inner race.
- Measure clearance between the steering knuckle and kingpin cover and select a spacer.
  When clearance is 0.6 mm {0.024 in.} or more: Spacer of 3.2 mm {0.13 in.}
  When clearance is less than 0.6 mm {0.024 in.}: Spacer of 3.6 mm {0.14 in.}
- Install the selected spacer and tighten bolts to the specified torque.

TIE ROD



● **Disassembly sequence**

1 Tie rod end
2 Tie rod

CAUTION ⚠

- **If any abnormality such as tear is found in the dust boot of the tie rod end, replace the tie rod end.**

NOTE

- **Do not disassemble the tie rod end, as it is of non-disassembly type.**

● **Assembly sequence**

Follow the disassembly sequence in reverse.

Service standards (Unit: mm {in.})

Location	Maintenance item		Standard value	Limit	Remedy
1	Ball joint of tie rod end	Play (± 980 N {220 lbs, ± 100 kgf} loaded)	0 to 0.15 {0 to 0.0059}	–	Replace
		Rotation torque	1.0 to 5.9 N·m {0.7 to 4.4 ft.lbs, 0.1 to 0.6 kgf·m}	–	
2	Bend of tie rod		–	1 or less	Correct or replace

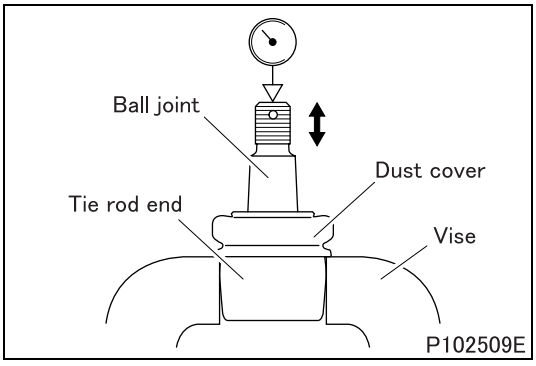
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Nut (tie rod end tightening)	20 to 29 {15 to 21, 2 to 3}	–

Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Lip area of dust cover of tie rod end	Wheel bearing grease [NLGI No. 2 (Li soap)]	As required

◆Inspection procedure◆



■ **Inspection: Tie rod end**

(1) Play

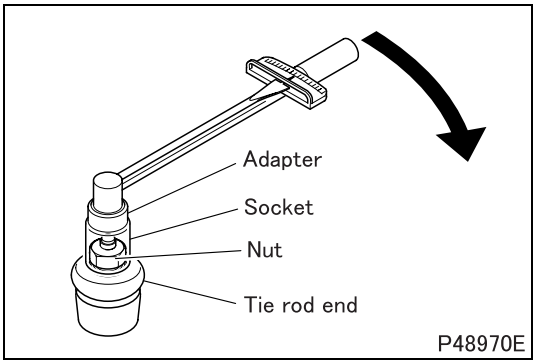
- Fix the tie rod end with a vise.

CAUTION ⚠

- **Take care not to deform or damage the dust cover when fixing it with a vise.**

- The position of the ball joint with applying no load is adjusted to standard position.
- Measure each play of the ball joint with applying the specified push and pull load from the standard position.

- Total each play and if the total deviates from standard value, replace the tie rod end.

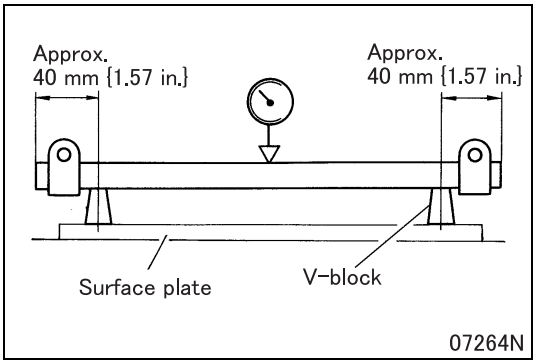


(2) Rotation torque

- Install the tie rod mounting nut on the tie rod end.
- Install the socket, adapter and torque wrench to measure the rotation torque.
- If the measured value deviates from the standard value, replace the tie rod end.

(3) Dust cover

- Check the dust cover for wear, cracks and other damage. These abnormalities may cause water infiltration to the ball joint and wear out it at early stage.
- If any abnormality is found in the dust cover, replace the tie rod end.



■ Inspection: Bend of tie rod

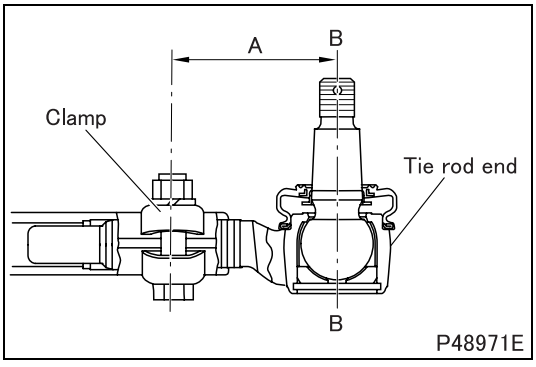
- Measure the bend of the tie rod at its center.

NOTE

- **Give the tie rod one complete turn and read the dial gauge at this time. The bend is one half of the reading.**

- If the measured value exceeds the standard value, correct or replace the tie rod.

◆Installation procedure◆



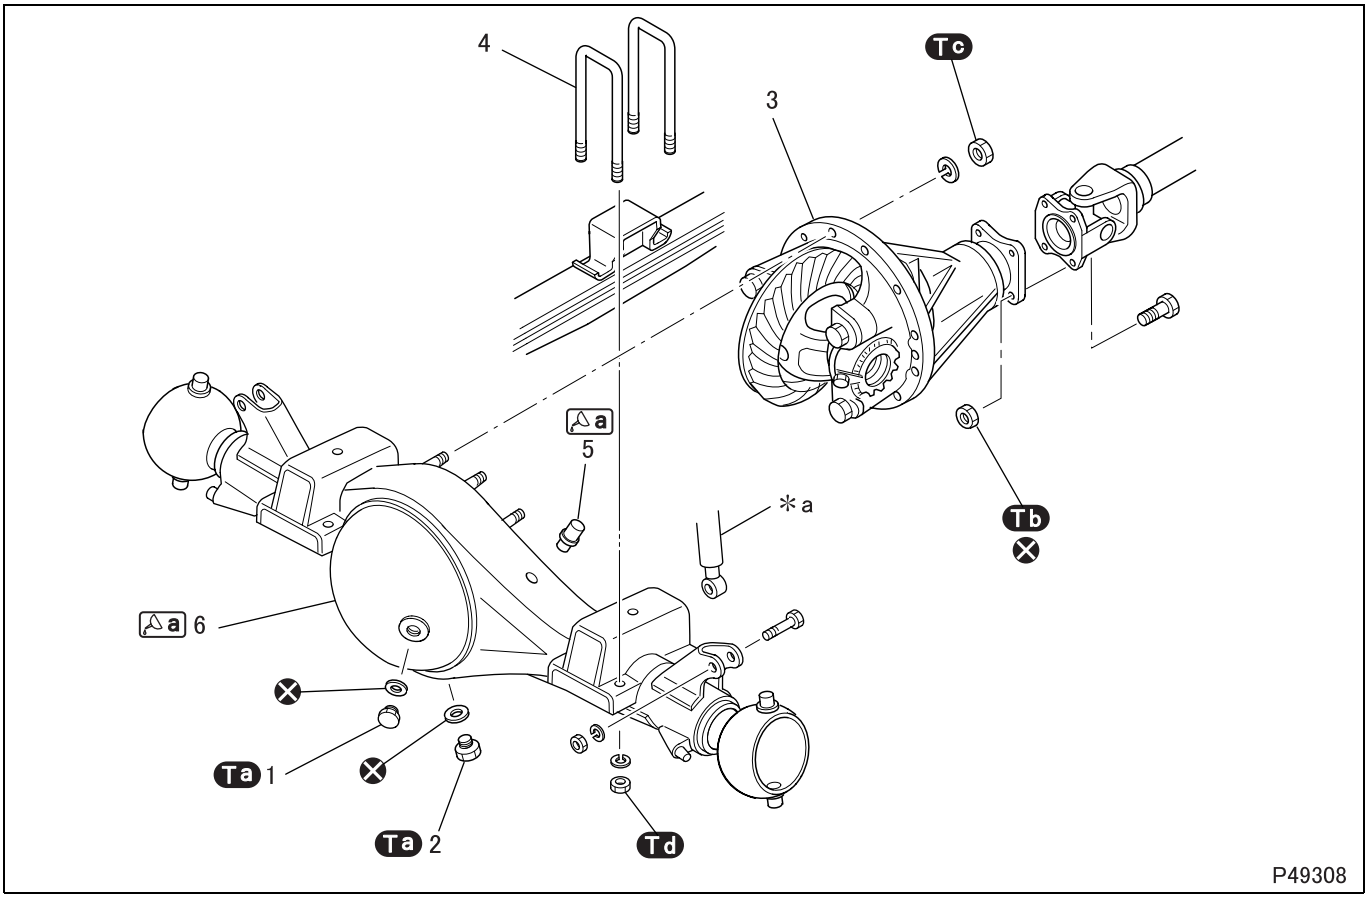
■ Installation: Tie rod end

- Screw in the tie rod end so that difference of dimension A between the tie rod end and the clamp is within 1.5 mm {0.059 in.} between right and left.
  A: Approximately 74 mm {2.91 in.}

CAUTION ⚠

- **Ensure that difference of an amount of screwing in the tie rod end between right and left is within one turn.**
- **Secure the tie rod ends so that illustrated axis B-B on the right is parallel to that on the left.**

AXLE HOUSING



● **Disassembly sequence**

1 Inspection plug
2 Drain plug
3 Reduction and differential (See later section.)
4 U-bolt
5 Vent plug
6 Axle housing

***a**: Shock absorber
⊗: Non-reusable parts

NOTE

- **Do not remove the axle housing unless any abnormality is found.**

● **Assembly sequence**

Follow the disassembly sequence in reverse.

Service standards (Unit: mm {in.})

Location	Maintenance item	Standard value	Limit	Remedy
5	Injection-valve opening pressure of vent plug	4.9 kPa {0.7 psi, 0.05 kfg/cm^2} or less	–	Replace

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Inspection plug	110 ± 10 {81 ± 7.4, 11 ± 1}	–
	Drain plug		
Tb	Nut (propeller shaft mounting)	60 to 75 {44 to 55, 6 to 7.5}	–
Tc	Nut (reduction and differential mounting)	41 ± 6 {30 ± 4.4, 4.15 ± 0.65}	–
Td	Nut (U-bolt mounting)	106 ± 8 {78 ± 5.9, 10.8 ± 0.8}	–

Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity

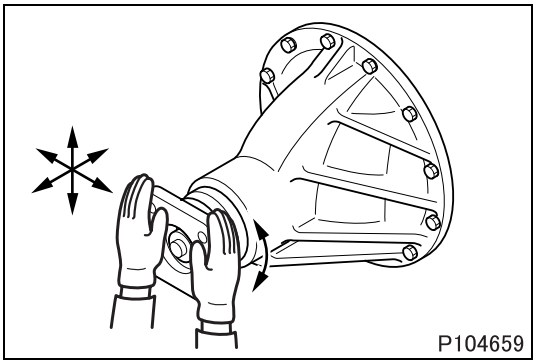
	Reduction and differential mounting surface of axle housing		

Special tools (Unit: mm {in.})

Mark	Tool name and shape	Part No.	Application
a	Differential carrier base A: ϕ28 {1.1} 	MB999102	Removal and installation of reduction and differential assembly

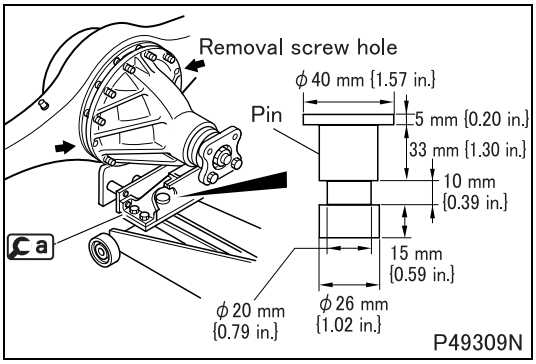
◆Work before removal◆



■ Inspection: Play at companion flange

- Move the companion flange in the back-and-forth, up-and-down, right-and-left and rotation direction to check for play.
- If there is play in either of directions, replace the following all parts.
  - Front bearing and rear bearing
  - Pinion spacer
  - Reduction gear set (reduction pinion and reduction gear)
  - Companion flange

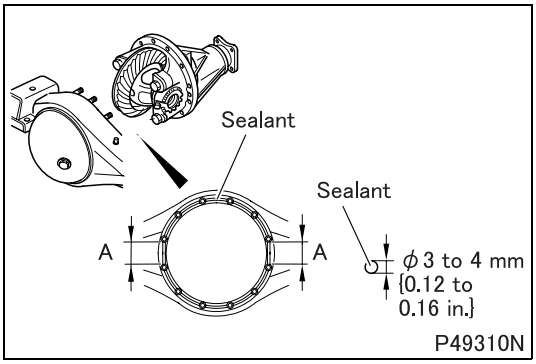
◆Removal procedure◆



■ Removal: Reduction and differential

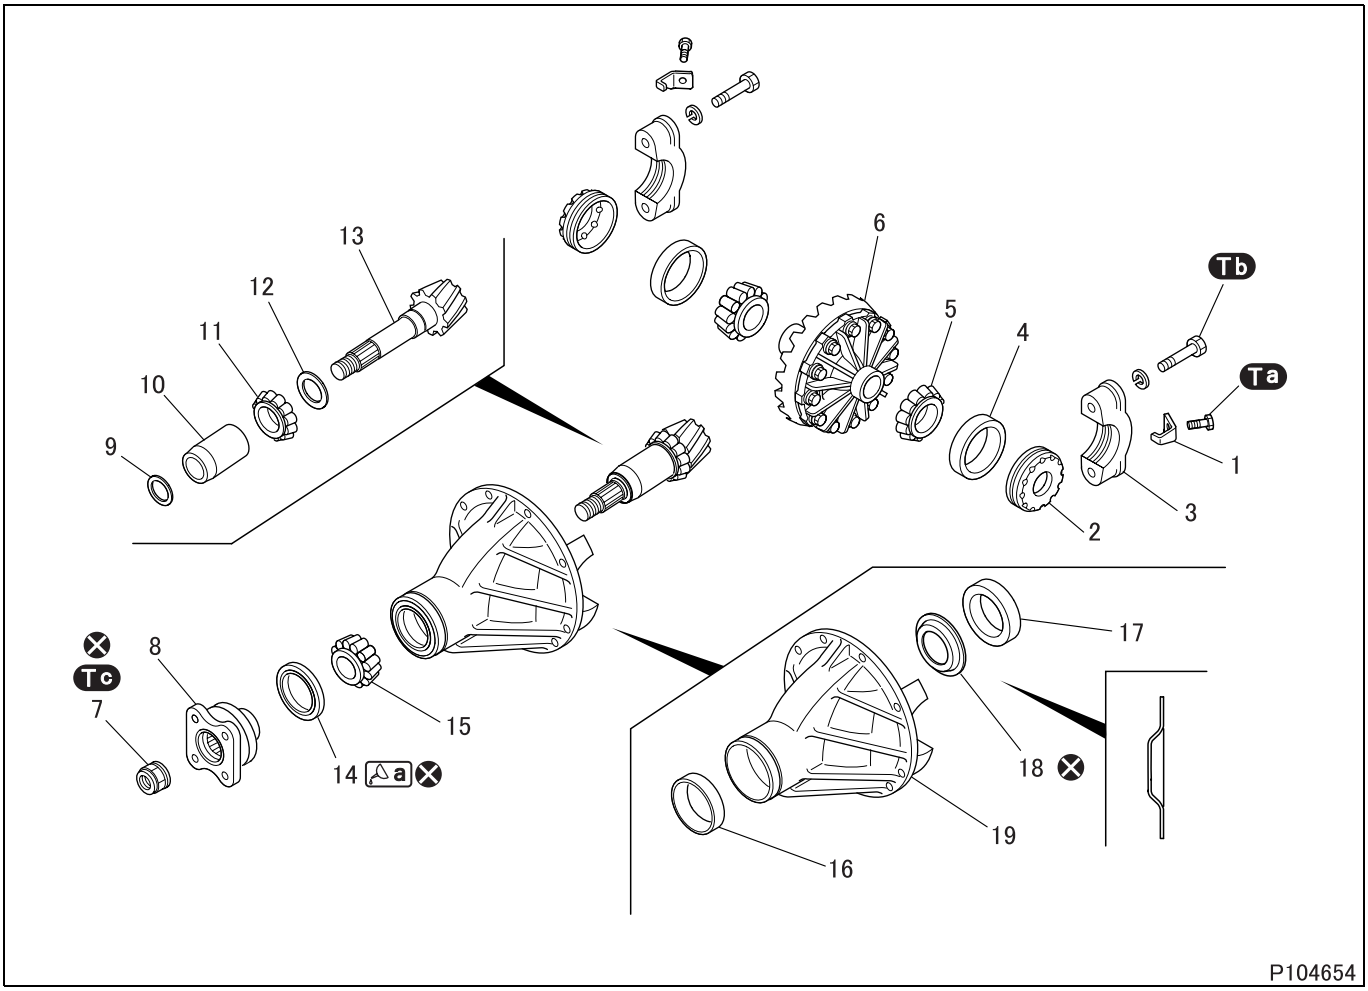
- Remove the saucer of the garage jack and place a on it. Fabricate the pin as illustrated, insert and fix it with bolts that have fixed the saucer.
- Screw two M10 × 1.25 mm bolts evenly into the reduction and differential removal screw holes (as shown in illustration) to remove the reduction and differential.

◆Installation procedure◆



■ Installation: Reduction and differential

- Clean a seal surface of each part.
- Apply sealant to the reduction and differential mounting surface of the axle housing evenly and without breaks. Apply sealant in a straight line direction for illustrated position A.



● **Disassembly sequence**

1 Lock plate
2 Side bearing nut
3 Bearing cap
4 Side bearing outer race
5 Side bearing inner race
6 Differential (See later section.)

14 Oil seal
15 Front bearing inner race
16 Front bearing outer race
17 Rear bearing outer race
18 Oil stopper
19 Differential carrier

⊗: Non-reusable parts

CAUTION ⚠

- **Keep side bearings that have been removed separated from each other and ensure that during installation each one is correctly placed.**
- **Be sure to replace the bearing cap, differential carrier and bolts as a differential carrier set.**
- **Be sure to replace the reduction pinion and the reduction gear of the differential as a reduction gear set.**

NOTE

- **Record the number, thickness and height of front bearing shims, pinion spacers and rear bearing shims to use them as reference at assembly.**

● **Assembly sequence**

Follow the disassembly sequence in reverse.

Service standards (Unit: mm {in.})

Location	Maintenance item	Standard value	Limit	Remedy
–	Starting torque of pinion bearing (with no oil seal installed)	0.69 to 1.27 N·m {0.5 to 0.94 ft.lbs, 0.07 to 0.13 kgf·m}	–	Adjust or replace
6	Wobble at back face of reduction gear	0.1 {0.0039} or less	–	Replace
6, 13	Backlash between reduction gear and reduction pinion	0.15 to 0.20 {0.0059 to 0.0079}	–	Adjust or replace

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks

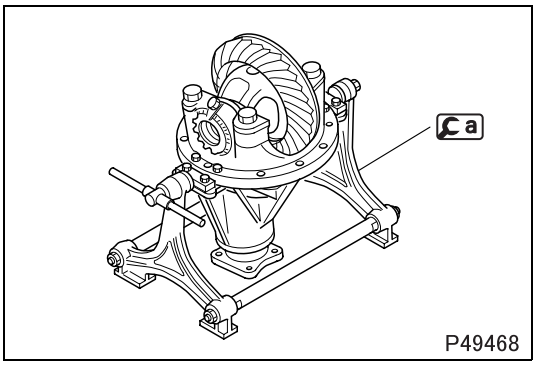
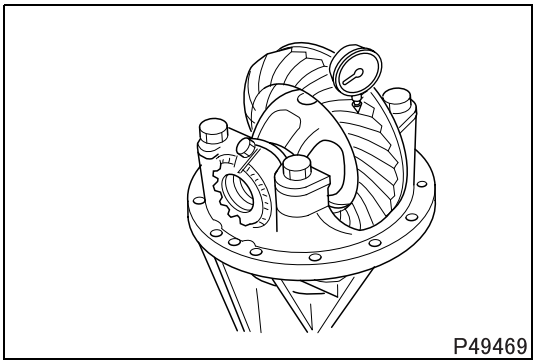
◆Work before removal◆



P49468

■ **Preparatory work: Installation of differential working base assembly**

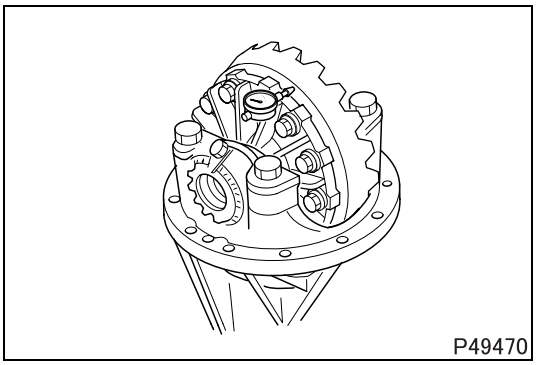
- Install the reduction and differential on ⓐ.



P49469

■ **Inspection: Backlash between reduction gear and reduction pinion**

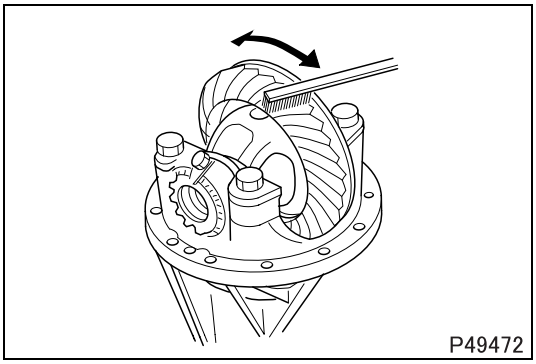
- If backlash is found faulty, the tightening amount of the side bearing nut is probably inappropriate.



P49470

■ **Inspection: Wobble at back face of reduction gear**

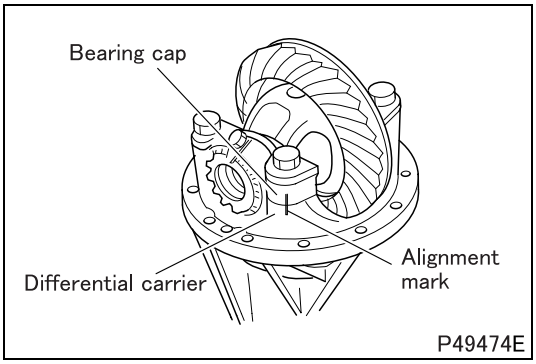
- Measure wobble at the illustrated position of the reduction gear.



P49472

■ **Inspection: Tooth contact of reduction gear**

- Apply red lead to three to four teeth at three equally spaced points of the reduction gear.
- Turn the reduction gear several times to check for tooth contact.

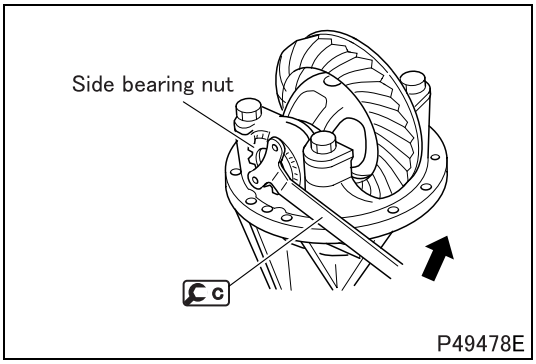


P49474E

■ **Alignment marks: Bearing cap and differential carrier**

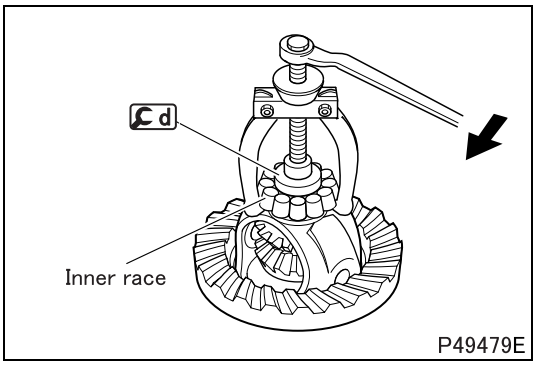
- Put alignment marks on the bearing cap and differential carrier for correct identification of right and left parts.

◆Removal procedure◆



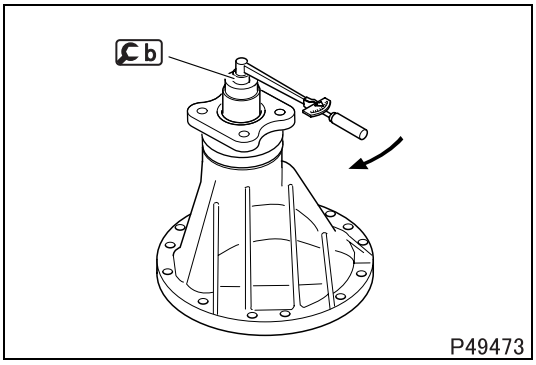
P49478E

■ **Removal: Side bearing nut**



P49479E

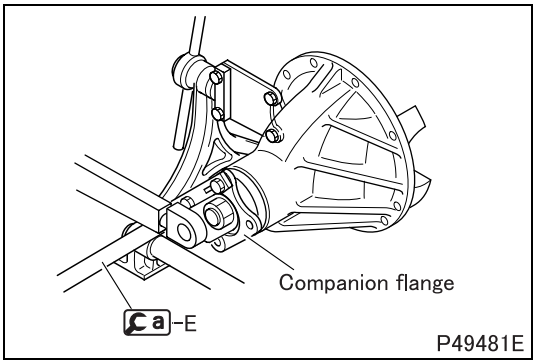
■ **Removal: Side bearing inner race**



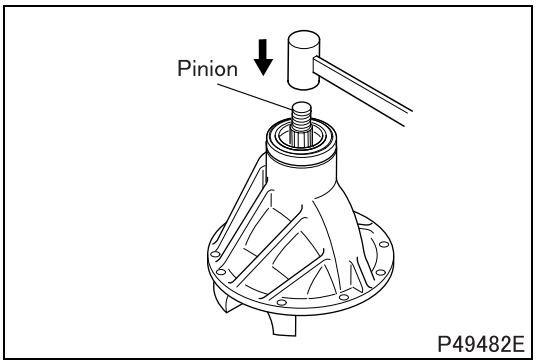
P49473

■ **Inspection: Starting torque of pinion bearing**

- After removing the differential, measure the starting torque of the pinion bearing.

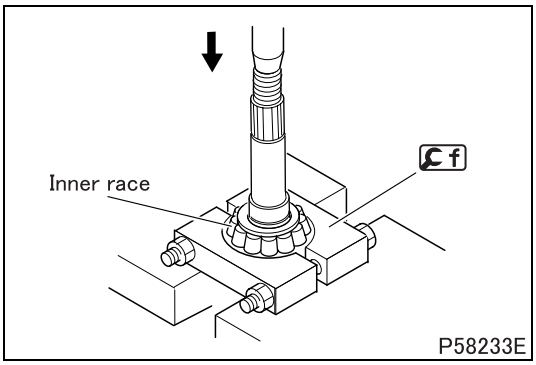


■ **Removal: Companion flange**

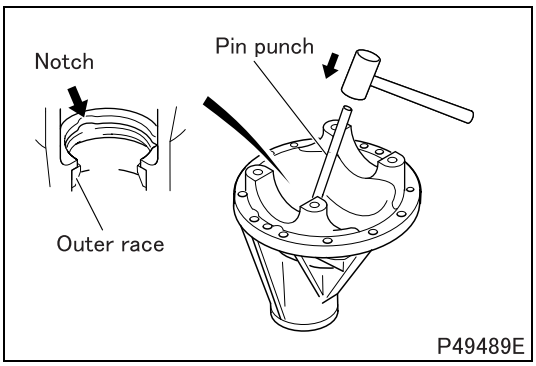


■ **Removal: Reduction pinion**

- Tap the reduction pinion with a plastic hammer and hold the reduction pinion with your hand to prevent it from falling.

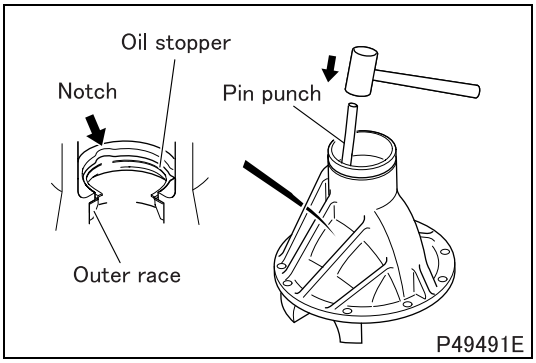


■ **Removal: Rear bearing inner race**



■ **Removal: Front bearing outer race**

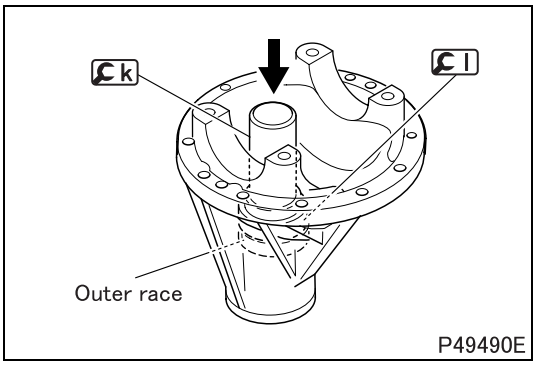
- Drive out the front bearing outer race by tapping evenly at three indented parts in the differential carrier.



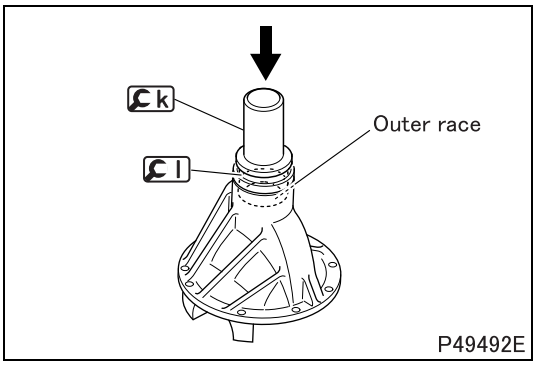
■ **Removal: Rear bearing outer race**

- Drive out the rear bearing outer race, together with the oil stopper, by tapping evenly at three indented parts in the differential carrier.

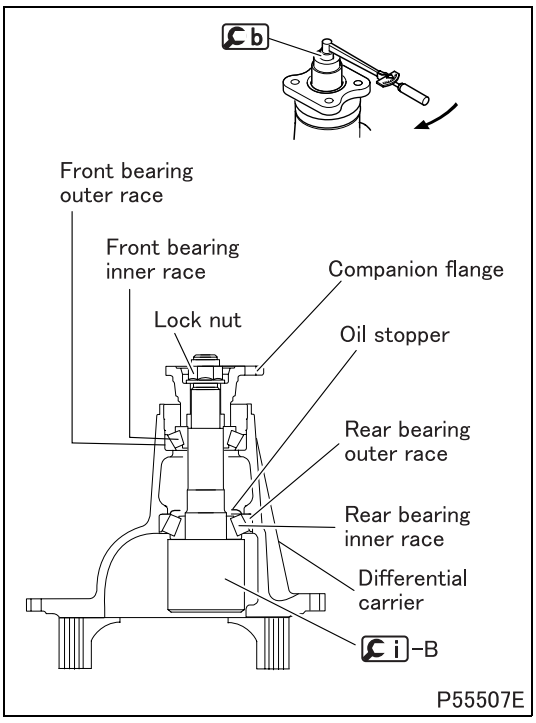
◆Installation procedure◆



■ **Installation: Rear bearing outer race**



■ **Installation: Front bearing outer race**



■ **Installation: Rear bearing shim**

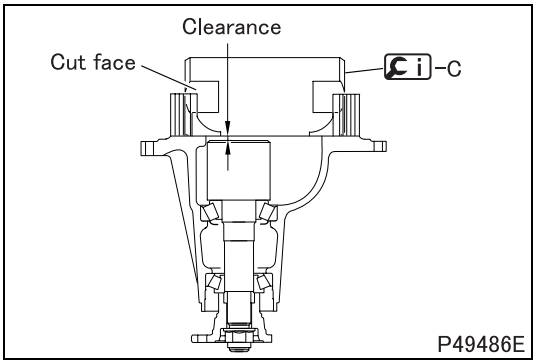
[Selection (pinion height adjustment)]

- After installing the front bearing outer race, temporarily assemble i-B together with the illustrated parts into the differential carrier.

CAUTION ⚠

- **Do not assemble parts except the illustrated ones.**

- Tighten the lock nut so that the starting torque of the pinion bearing at i-B conforms to the standard value.



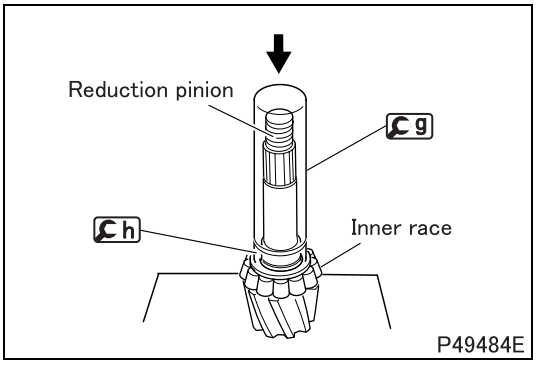
- Set i -C in the illustrated direction and measure clearance as illustrated.
- Select shims so that clearance becomes 1.5 mm {0.059 in.}.
  Thickness of shims available
  0.30 and 1.38 to 1.65 mm {0.012 and 0.054 to 0.065 in.} (10 thickness in 0.03 mm {0.012 in.} increments)

CAUTION ⚠

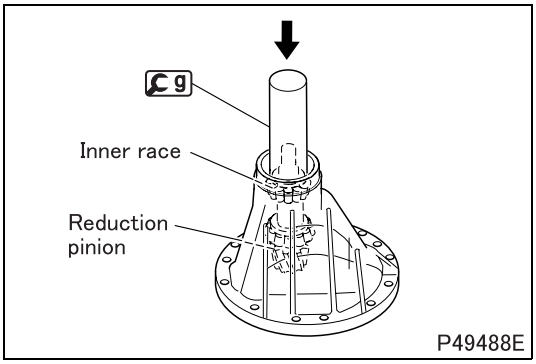
- **Select the number of rear bearing shims as least as possible.**

[Installation]

- If using a shim of 0.30 mm {0.012 in.} in thickness in combination with a shim of other thickness for installing rear bearing shims, install a shim of 0.30 mm {0.012 in.} in thickness on the rear bearing inner race to prevent wear-out.

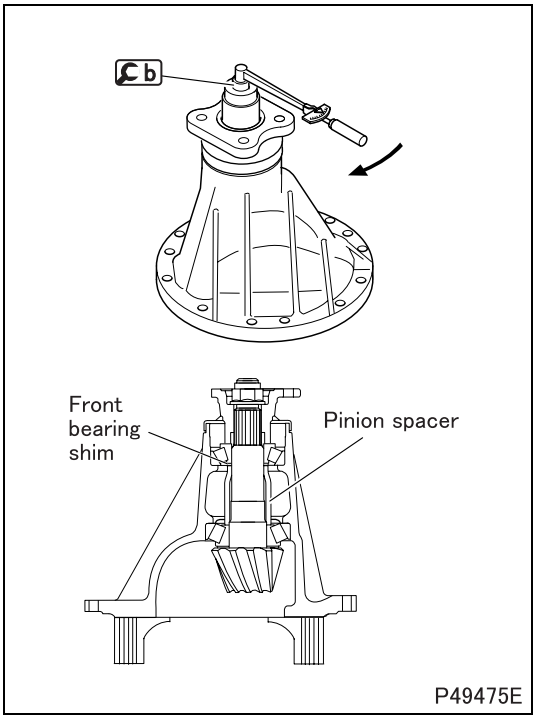


■ Installation: Rear bearing inner race



■ Installation: Front bearing inner race

- Install the front bearing inner race with the reduction pinion assembled into the differential carrier.

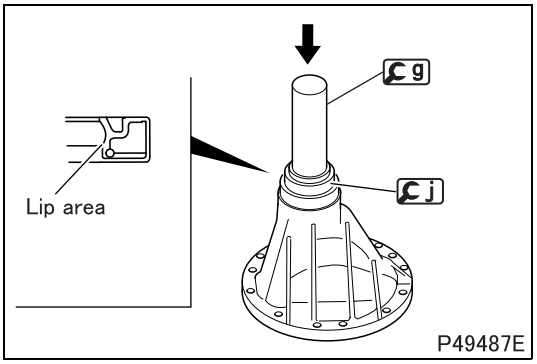


■ **Inspection: Starting torque of pinion bearing**

- After installing front bearing shims, measure the starting torque of the pinion bearing with no oil seal assembled.
- If the measured value deviates from the standard value, adjust by changing a pinion spacer and front bearing shims.
  Thickness of pinion spacers available
  64.07, 64.40 mm {2.52, 2.54 in.} (painted in white)
  Thickness of front bearing shims available
  0.03 and 2.00 to 2.33 mm {0.0012 and 0.079 to 0.092 in.} (12 thickness in 0.03 mm {0.012 in.} increments)

CAUTION ⚠

- **Select a pinion spacer so that the number of front bearing shims becomes as least as possible.**

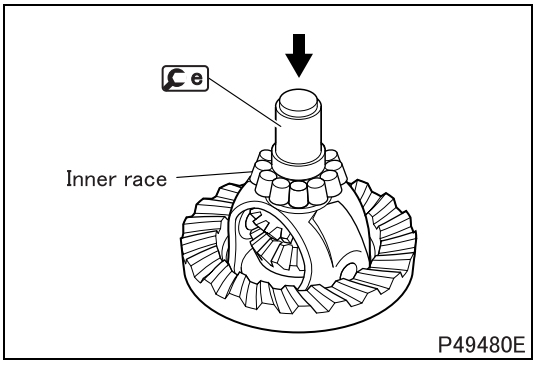


■ **Installation: Oil seal**

- Apply grease to the lip area of the oil seal and install it on the differential carrier in the illustrated direction.

■ **Installation: Companion flange**

- Install the companion flange in the same manner as for removal. (See **"■ Removal: Companion flange"**.)

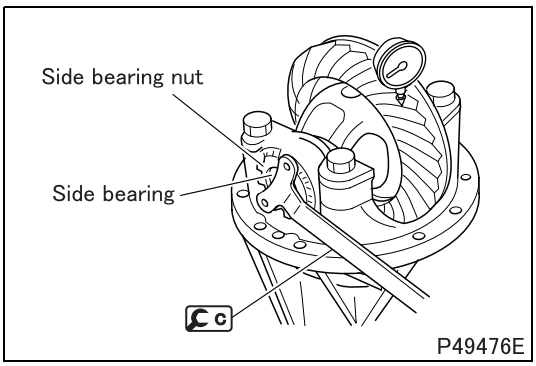


■ **Installation: Side bearing inner race**

■ **Installation: Side bearing nut**

- Install the side bearing nut in the same manner as for removal. (See **"■ Removal: Side bearing nut"**.)

◆Work after installation◆

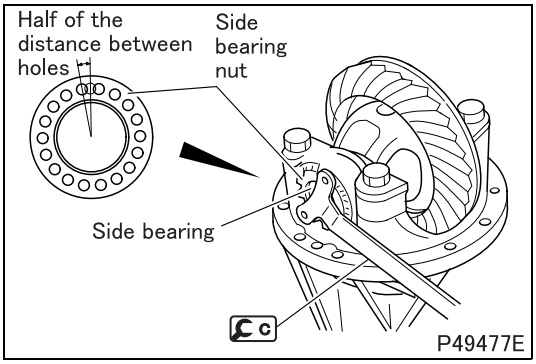


■ Adjustment: Backlash between reduction gear and reduction pinion

- Tighten the side bearing nut for adjustment to such extent that no preload is applied to the side bearing.

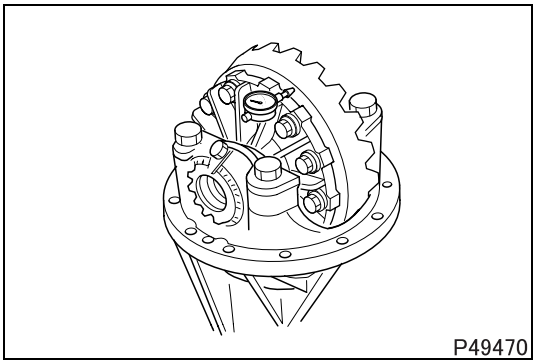
CAUTION ⚠

- **When one side bearing nut is loosened, be sure to tighten the other one the same amount to prevent the side bearing preload from changing.**



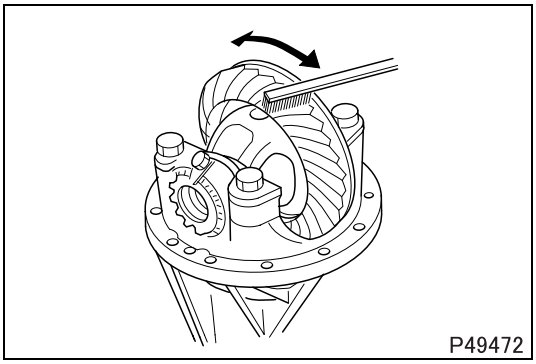
■ Adjustment: Side bearing preload

- After adjusting backlash between the reduction gear and reduction pinion, further tighten both of the side bearing nuts within the range of backlash to provide preload to the side bearing.
- The tightening amount of preload must be limited to the distance between two holes for combination of right and left sides.



■ Inspection: Wobble at back face of reduction gear

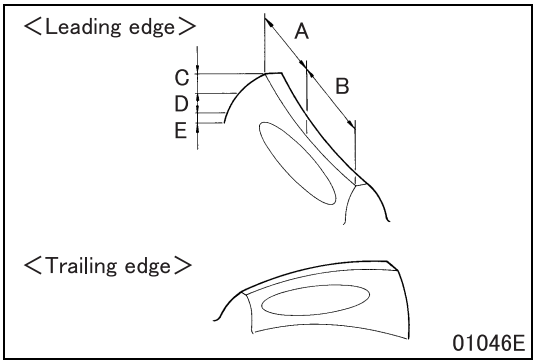
- Measure wobble at the illustrated position of the reduction gear.
- If the measured value deviates from the standard value, replace the reduction gear and reduction pinion of the differential as a set.



■ Inspection: Tooth contact of reduction gear

[Inspection]

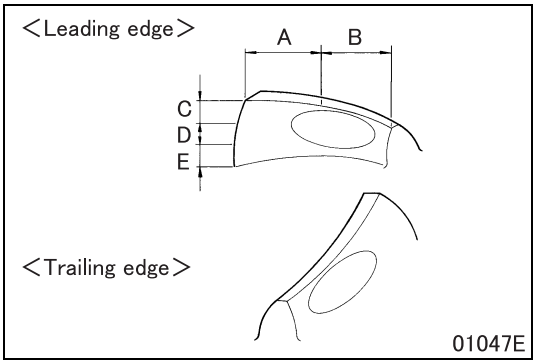
- Apply red lead to three to four teeth at three equally spaced points of the reduction gear.
- Turn the reduction gear several times to check for tooth contact.
- Adjust tooth contact if it is remarkably offset.



● Correct tooth contact at no load

<Reduction gear>

A: Heel
B: Toe
C: Face
D: Flank
E: Clearance



<Reduction pinion>

A: Heel
B: Toe
C: Face
D: Flank
E: Clearance

Maintenance item			Assembly standards
At no load	Tooth contact position	Lengthwise direction of tooth	From center towards toe
		Vertical direction	From center towards top of tooth for reduction gear and center for reduction pinion
	Tooth contact shape	Length	Approximately 50 to 70% of tooth width
		Width	Approximately 50 to 70% of tooth depth
	Degree of tooth contact		It becomes weaker as it nears tooth root and tooth tip

NOTE

- **When tooth contact is near the toe at no load, it becomes middle area contact at load.**

[Adjustment]

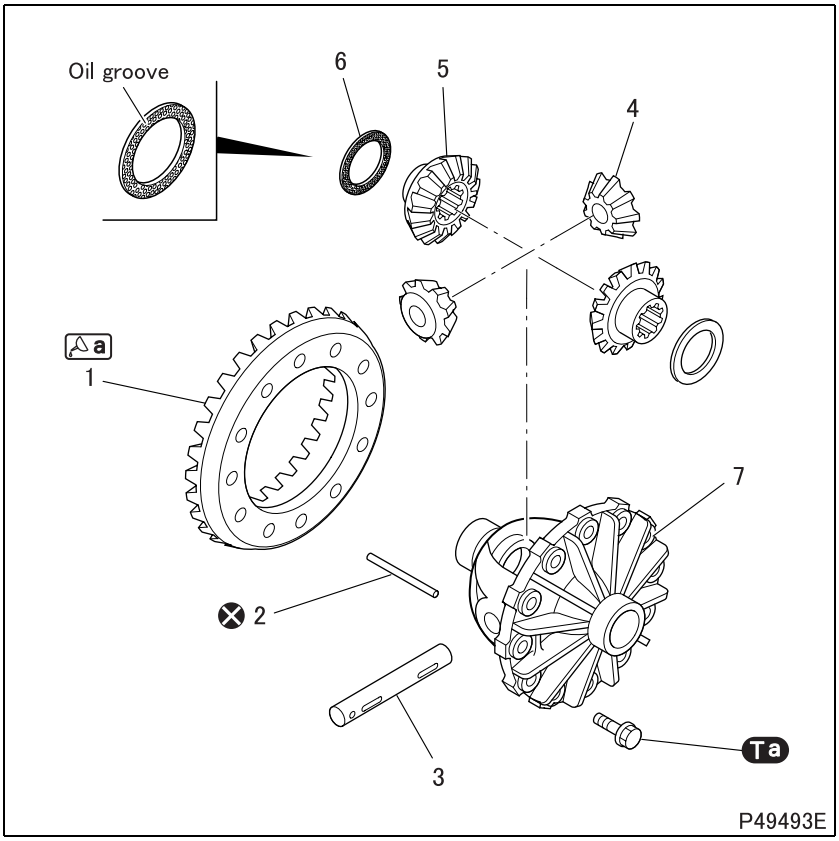
- Adjust by backlash between reduction gear and reduction pinion (to be adjusted with the side bearing nut) and addition or reduction of rear bearing shims.

CAUTION ⚠

- **Make sure to replace as a reduction gear set (reduction gear and reduction pinion), when replacing the gear because of excessive teeth wear.**

	Method of adjustment	Moving direction	
Tooth contact by addition or reduction of shims	Advance reduction pinion to reduction gear (shims are added)  55497	 55501E	Tooth contact moves towards tooth root
	Retard reduction pinion from reduction gear (shims are reduced)  55498	 55502E	Tooth contact moves towards tooth tip
Tooth contact by adjustment with side bearing nut	Advance reduction gear to reduction pinion center (less backlash)  55499	 55503E	Tooth contact moves in lengthwise direction of tooth Leading edge: Nearer to toe and slightly nearer to root of tooth Trailing edge: Nearer to heel and slightly nearer to top of tooth
	Retard reduction gear from reduction pinion center (more backlash)  55500	 55504E	Tooth contact moves in lengthwise direction of tooth Leading edge: Nearer to heel and slightly nearer to top of tooth Trailing edge: Nearer to toe and slightly nearer to root of tooth

Differential



● **Disassembly sequence**

1 Reduction gear
2 Lock pin
3 Pinion shaft
4 Differential pinion
5 Side gear
6 Side gear washer
7 Differential case

⊗: Non-reusable parts

CAUTION ⚠

- **Be sure to replace the differential pinion and the side gear as a side gear set.**

● **Assembly sequence**

Follow the disassembly sequence in reverse.

Service standards (Unit: mm {in.})

Location	Maintenance item	Standard value	Limit	Remedy
4, 5	Backlash between differential pinion and side gear	0.15 to 0.20 {0.0059 to 0.0078}	0.3 {0.012}	Adjust or replace
5	Backlash between side gear and spline of drive shaft	0.07 to 0.16 {0.0028 to 0.0063}	0.5 {0.020}	Replace

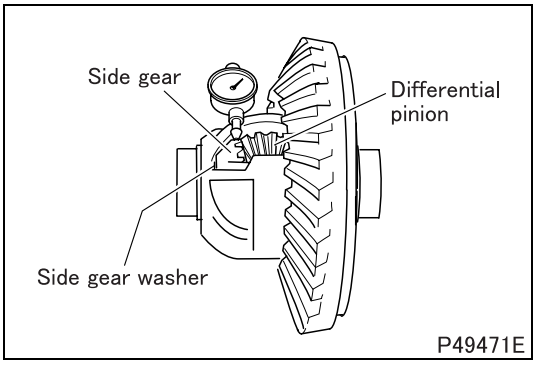
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Bolt (reduction gear mounting)	137.2 to 166.6 {101 to 122, 14 to 17}	–

Lubricant and/or sealant

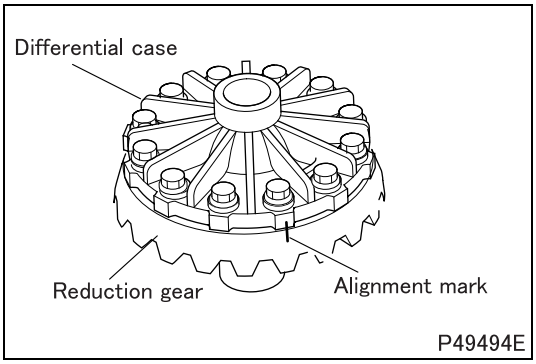
Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Bolt threads of reduction gear	Loctite 271	As required

◆Work before removal◆



■ **Inspection: Backlash between differential pinion and side gear**

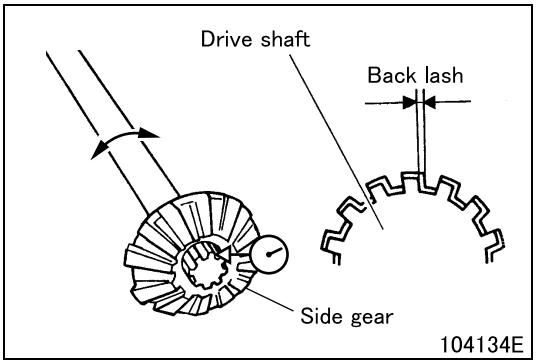
- If backlash is found faulty, thickness of the side gear washer is probably inappropriate.



■ **Alignment marks: Reduction gear and differential case**

- Put alignment marks on the reduction gear and the differential case.

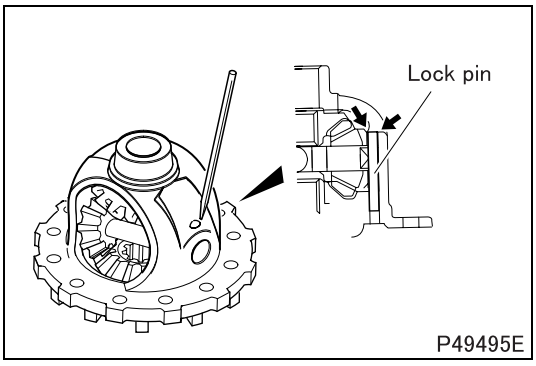
◆Inspection procedure◆



■ **Inspection: Backlash between side gear and spline of drive shaft**

- If the measured value exceeds the limit, replace defective parts.

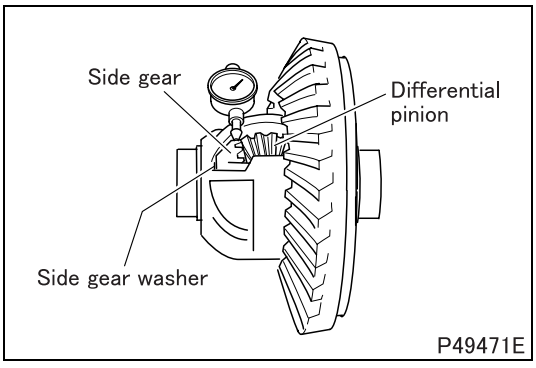
◆Installation procedure◆



■ **Installation: Lock pin**

- After installing the lock pin, caulk it with a punch (two locations).

◆Inspection after installation◆



■ **Inspection: Backlash between differential pinion and side gear**

- If the measured value deviates from the standard value, adjust by changing thickness of the side gear washer.
  Thickness of side gear washers available
  1.4, 1.5, 1.6 mm {0.055, 0.059, 0.063 in.} (three thickness)

CAUTION ⚠

- **Use side gear washers of the same thickness for the right and left sides.**

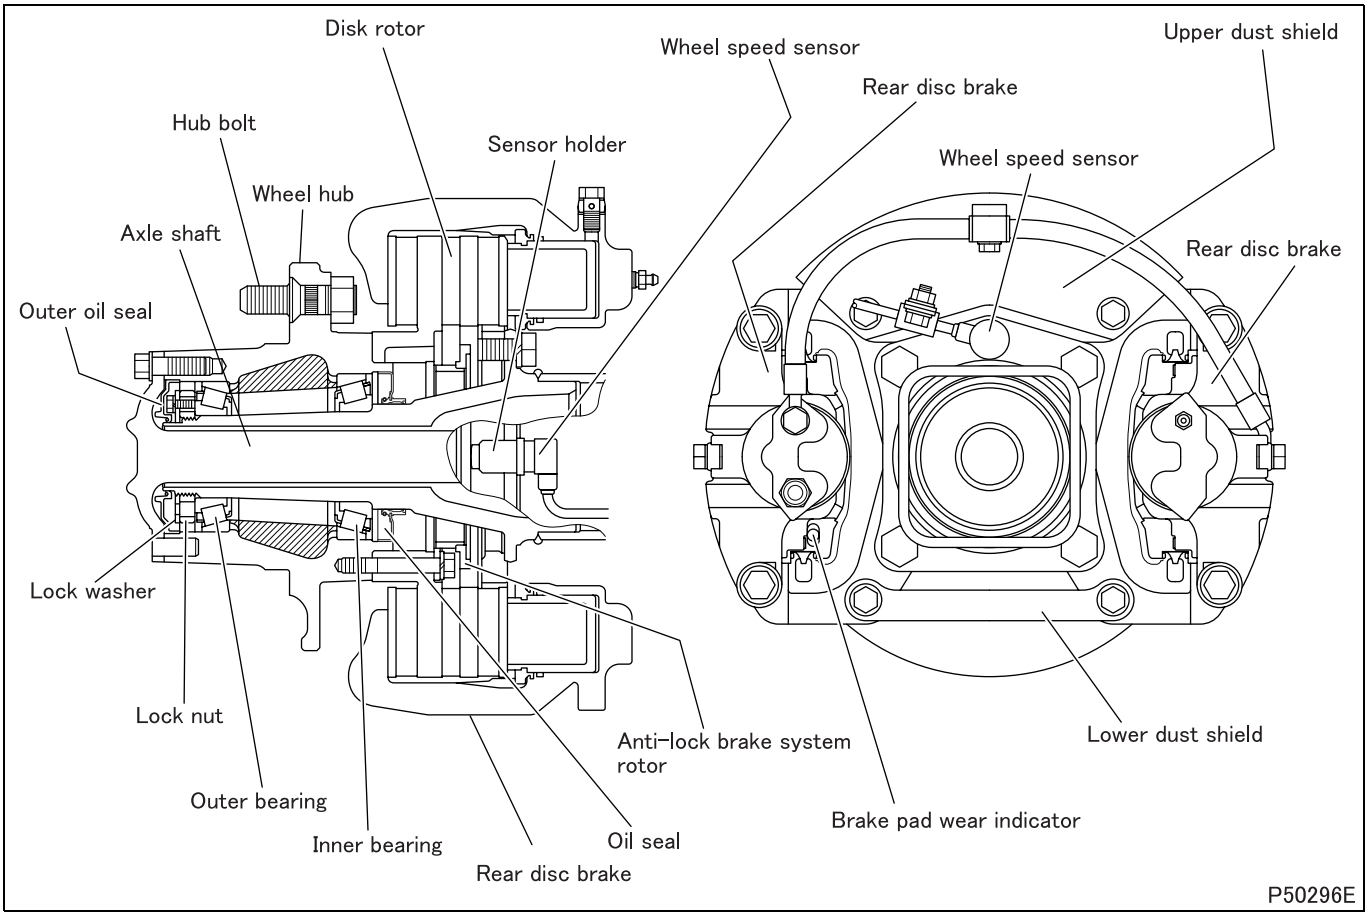
	Gear ratio	4.875 5.285	5.285 5.714
Differential	Tooth shape	Straight bevel gear	
Gear oil	Grade	Normal : Maximum air temperature during operation below 40°C {104°F} API GL-5 SAE 90 Hot area : Maximum air temperature during operation above 40°C {104°F} API GL-5 SAE 140	
	Quantity L {qts}	4.5 {4.8}	
Mass kg {lb}		210 to 230 {460 to 505} (approximately)	250 {550} (approximately)

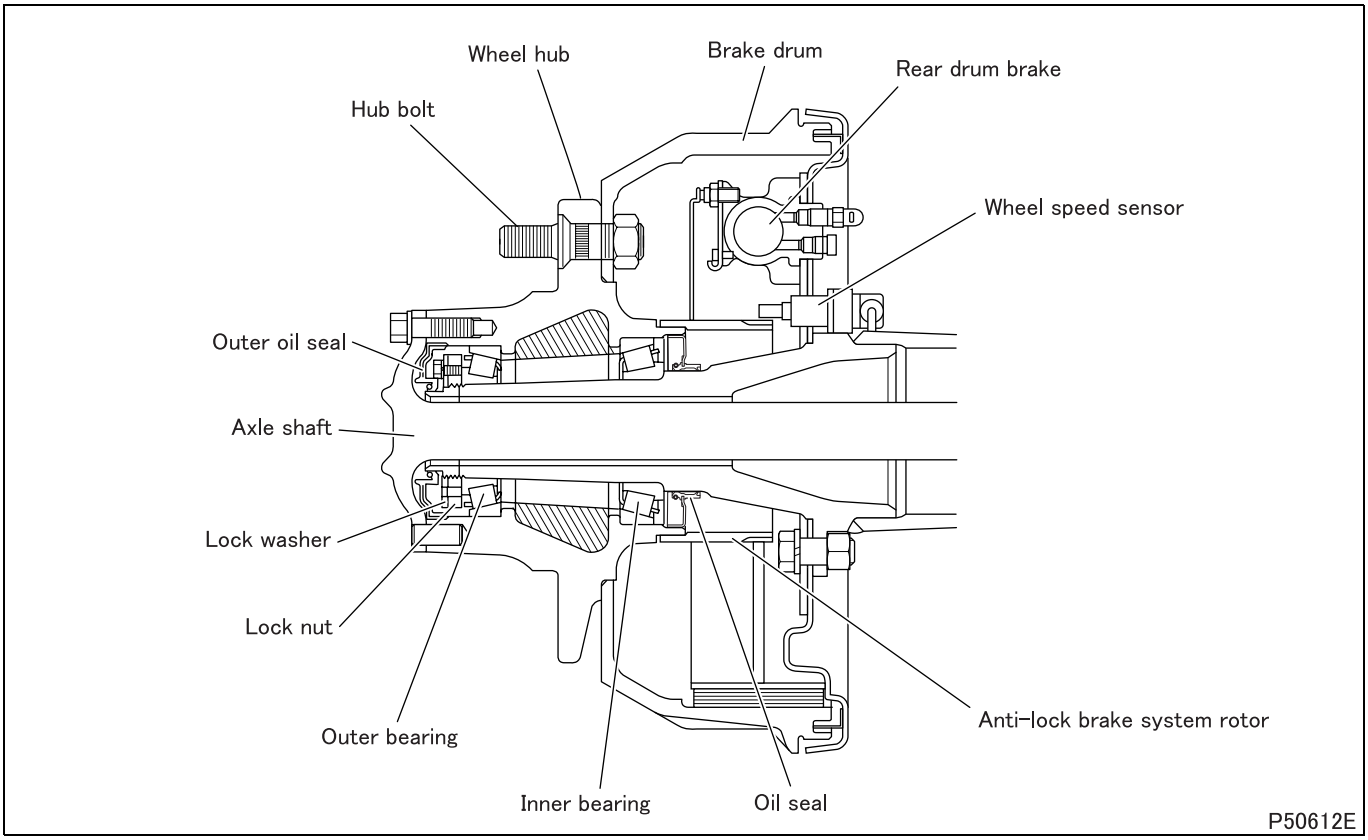
- Use the gear oil with a SAE viscosity of 140 when a vehicle is used under heavily-loaded, severe conditions such as continuous driving on uphill grades. However, the air temperature must be above 10°C.
- Limited slip differential oil API GL-5 SAE 90 is used for models with LSD (Limited Slip Differential).
- The mass differs between vehicle models.

1. Wheel Hub and Rotor

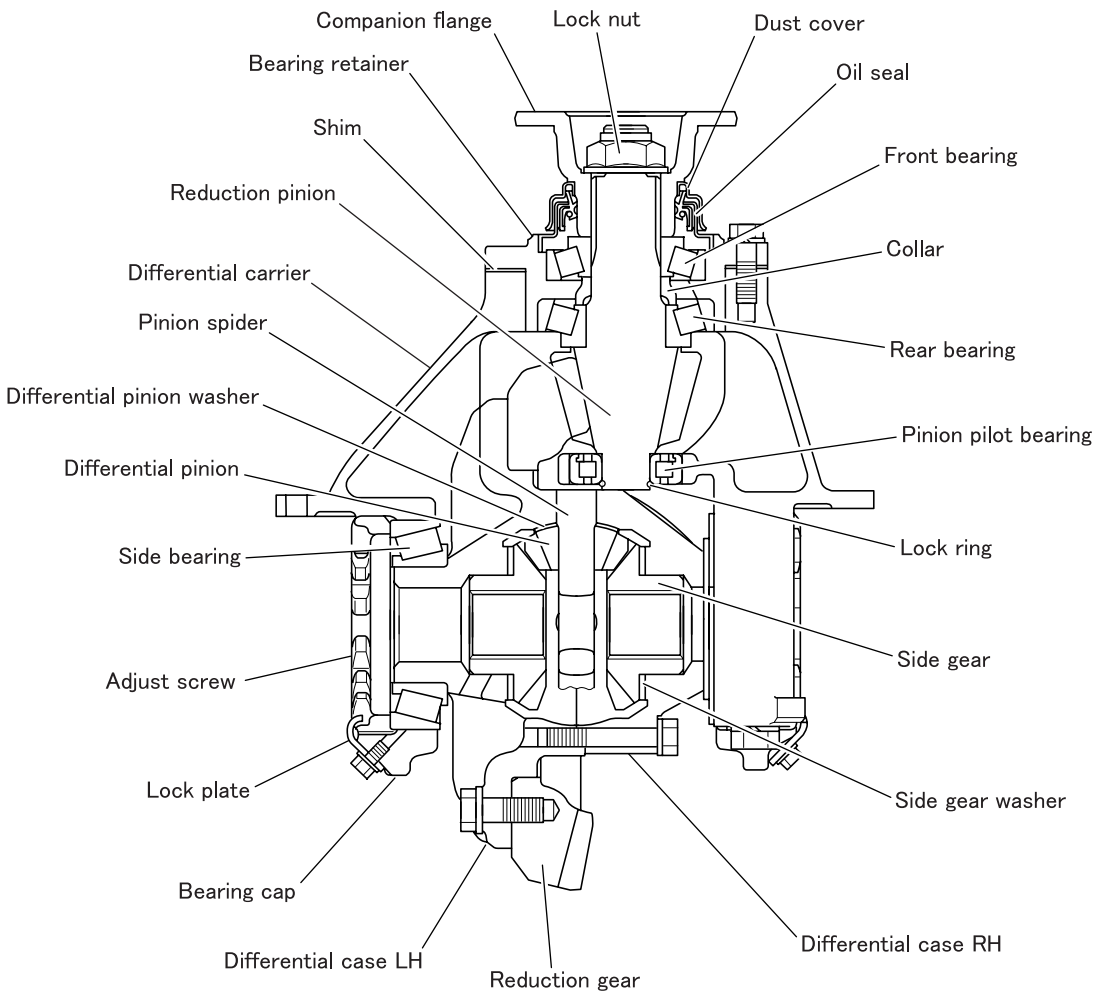


- The brake pad wear indicator is installed only on the right wheels.

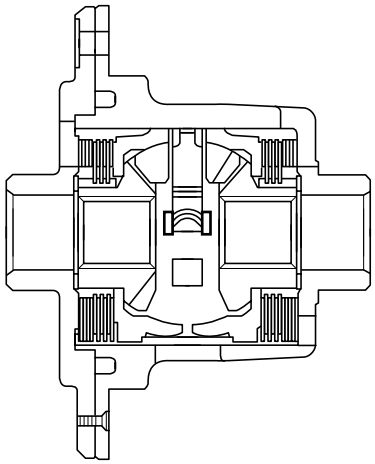
2. Wheel Hub and Brake Drum



3. Reduction and Differential

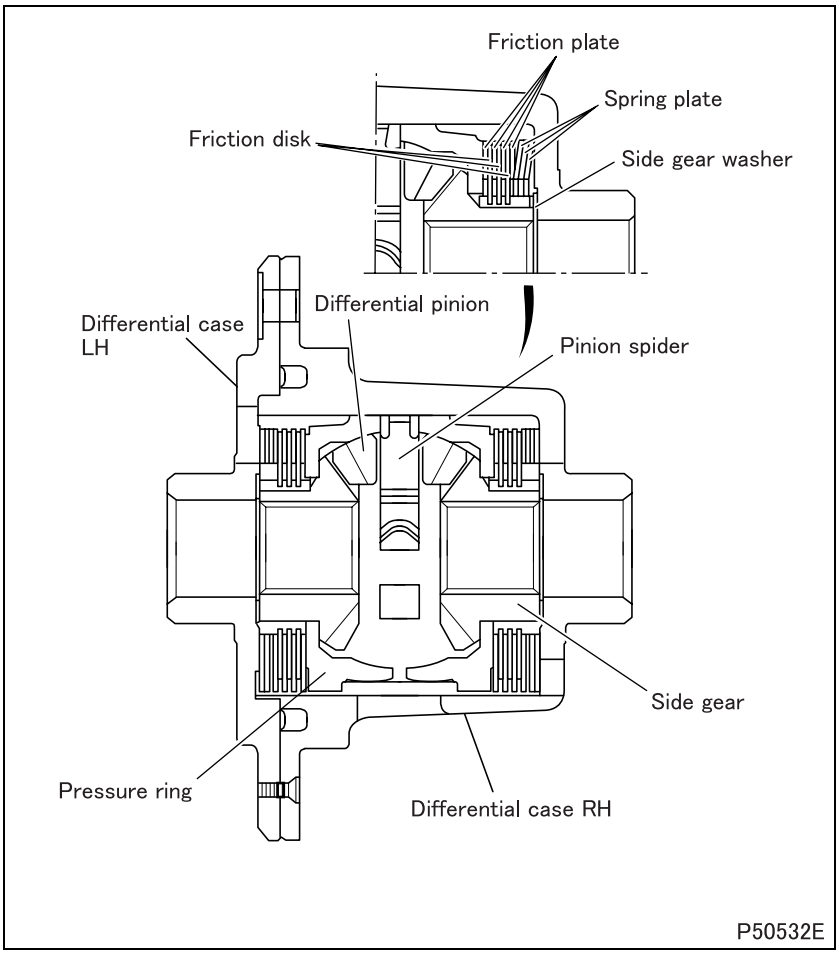


Limited slip differential



P58332E

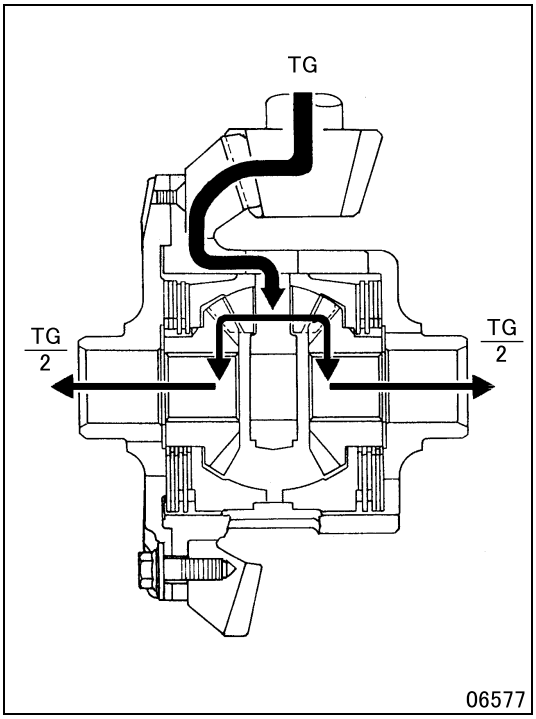
4. Limited Slip Differential



- The friction discs and spring discs, which are fitted in the side gears, and the friction plates, which are fitted in the differential case RH, are pushed against the pressure rings by the spring plates.
- The pressure rings fit in the groove inside the differential case RH and always rotate at the same speed.

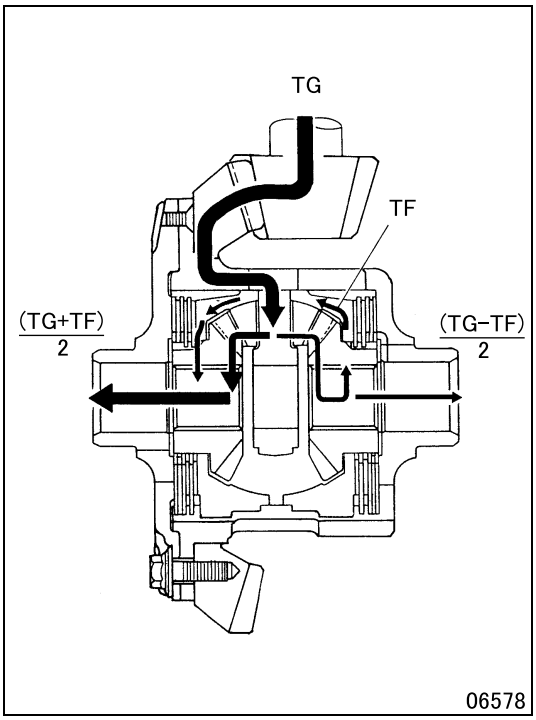
4.1 Operating mechanism

- When one wheel spins, a difference in the revolution speed generates between the side gear and the differential case, LH and RH, which causes the friction discs, spring discs and friction plates to revolve relatively to each other. This relative revolution produces a friction torque between the friction discs and friction plates.



4.2 Operation during straight driving

- During straight driving, the right and left axle shafts rotate at the same speed, and no friction torque generates.
  TG: input torque



4.3 Operation when there is a difference in rotation speed between right and left wheels

- If one wheel is on a slippery surface such as mud and the other wheel is not, the differential function becomes effective due to a difference in surface resistance. In this state, friction torque TF is generated and this torque works in such a manner as to reduce the difference in rotations between right and left wheels. That is, the faster axle shaft is forced to slow down, and the slower axle shaft is forced to turn faster.
  If one wheel spins due to mud and the like, a large friction torque generates because such a spinning makes large rotational speed difference. Accordingly, a small torque is distributed to the spinning wheel while a large torque is distributed to the non-spinning wheel, which makes it easier for the vehicle to get out of the mud.

$\frac{TG-TF}{2}$ High-speed side (spinning side)

$\frac{TG+TF}{2}$ Low-speed side

1. Inspection and Replacement of Axle Oil

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
–	Inspection plug	110 ± 10 {81 ± 7.4, 11 ± 1}	–
	Drain plug		

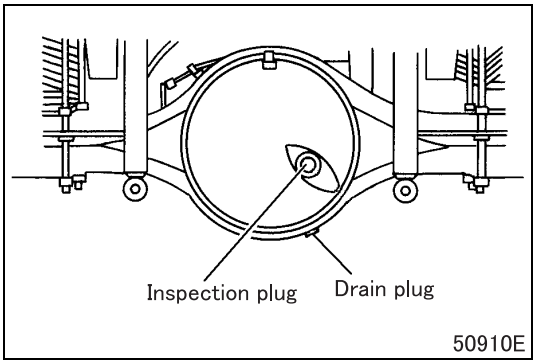
Lubricant and/or sealant

Mark	Points of application		Specified lubricant and/or sealant	Quantity
–	Axle housing	D033H, D035H	Gear oil : Normal : Maximum air temperature during operation below 40°C {104°F} API GL-5 SAE 90 Hot area : Maximum air temperature during operation above 40°C {104°F} API GL-5 SAE 140	4.5 L {4.8 qts}

- Use the gear oil with a SAE viscosity of 140 under heavily-loaded, severe conditions such as continuous driving on uphill grades. However, the air temperature must be above 10°C {50°F}.
- Limited slip differential oil API GL-5 SAE 90 is used for models with limited slip differential.

WARNING ⚠

- **The oil temperature is high immediately after the vehicle has stopped, so take care not to scald yourself.**



[Inspection]

(1) Inspection of oil quantity

- Remove the inspection plug, and check that oil is filled up to the neck.
- If oil is not sufficient, fill oil from the inspection plug hole up to the neck.

(2) Inspection of oil quality and inclusions

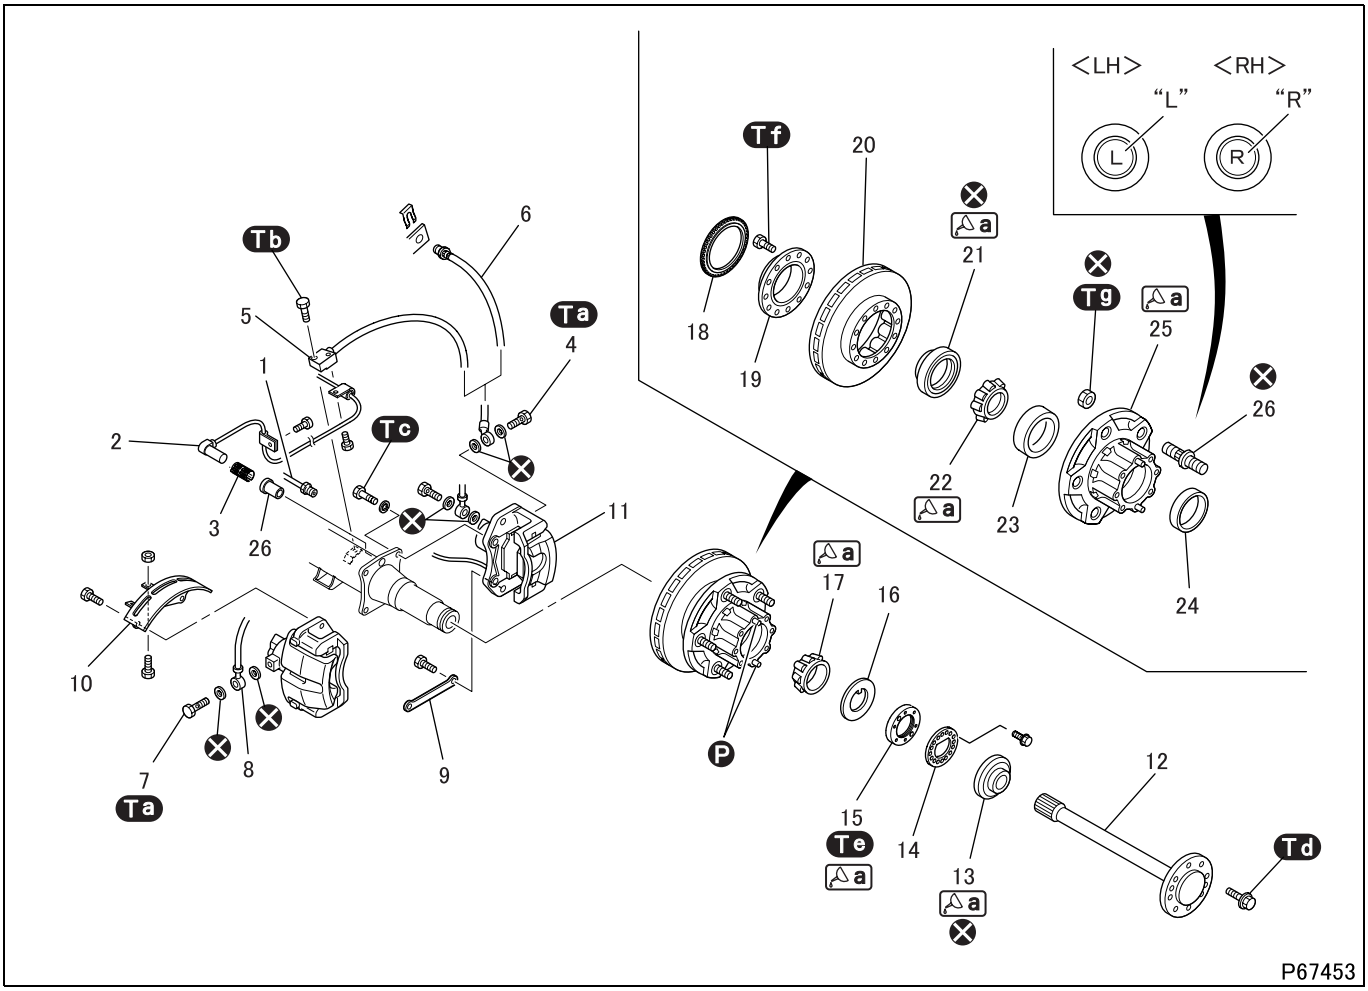
- When draining gear oil, check for oil quality, metal chips and metal powder.
- If an abnormally large amount of metal chips and metal powder is found, disassemble the assembly for service, as abnormalities may be caused inside.

[Replacement]

- Remove the drain plug to drain gear oil. Drainage can be made quickly with the inspection plug removed.
- As the drain plug (magnet type) is a magnet, clean it before installation.
- Fill the specified quantity of gear oil from the inspection plug hole.
- After filling, check that oil is filled up to the neck. If oil is not sufficient, replenish it.

M E M O

WHEEL HUB AND ROTOR



● **Disassembly sequence**

1 Brake pipe
2 Wheel speed sensor
3 Spring spacer
4 Eyebolt
5 Brake hose (with connector)
6 Brake hose (without connector)
7 Eyebolt
8 Brake hose
9 Lower dust shield
10 Upper dust shield
11 Rear disc brake (See Gr35A.)
12 Axle shaft
13 Outer oil seal
14 Lock washer
15 Lock nut
16 Lock plate <FE85>
17 Outer bearing inner race
18 Anti-lock brake system rotor
19 Anti-lock brake system rotor flange
20 Disc rotor
21 Oil seal
22 Inner bearing inner race
23 Inner bearing outer race
24 Outer bearing outer race
25 Wheel hub
26 Hub bolt
27 Sensor holder

Ⓟ: Locating pin
⊗: Non-reusable parts

CAUTION ⚠

- **Plug the brake hose to prevent entry of dust and dirt after it has been removed.**

NOTE

- **Do not remove the anti-lock brake system rotor and sensor holder unless replacing them.**
- **Do not disassemble the disc rotor and wheel hub unless replacing them.**

● Assembly sequence

Follow the disassembly sequence in reverse.

CAUTION ⚠

- **Make sure that the disc rotor surface and disc brake pad surface are free from grease to avoid malfunction of brakes.**
- **Make sure that the brake hose is not twisted when installing it.**
- **Inspect the drag torque of disc brakes after assembly. (See Gr35A.)**

Service standards (Unit: mm {in.})

Location	Maintenance item		Standard value	Limit	Remedy
–	Starting torque of wheel hub bearing (tangential force at hub bolt position with oil seal assembled)		2.0 to 3.9 N·m {1.4 to 2.9 ft.lbs, 0.2 to 0.4 kgf·m} (tangential force: 18 to 32 N {4.0 to 7.2 lbs, 1.8 to 3.3 kgf})	–	Adjust or replace
12	Axle shaft	Bend	1 {0.039} or less	2 {0.079}	Replace
		Bend at flange face	0.03 {0.0012} or less	0.05 {0.0020}	
19	Disc rotor	Runout (measure runout, assembling disc rotor in rear axle)	0.07 {0.0028} or less	0.10 {0.0039}	Replace
		Thickness	40 {1.57}	38 {1.50}	

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened			Tightening torque	Remarks
Ta	Eyebolt			22 ± 2 {16 ± 1.5, 2.25 ± 0.25}	–

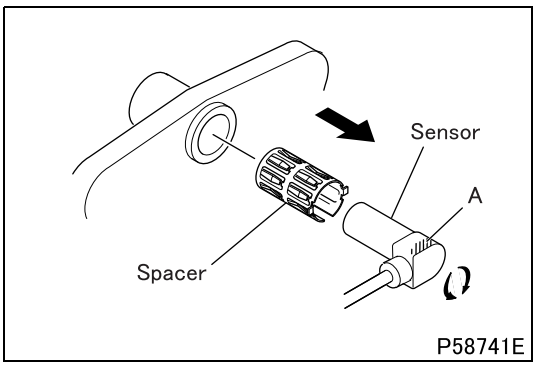
◆Removal procedure◆

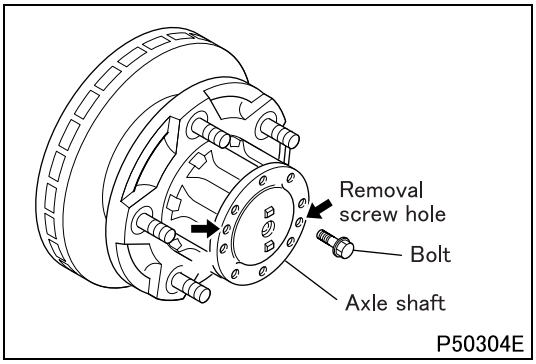


■ **Removal: Wheel speed sensor**

- Hold shaded section A of wheel speed sensor with pliers, and remove the sensor by twisting it slightly in left and right direction.

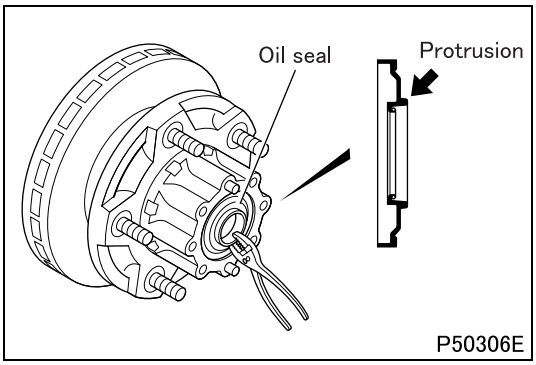
CAUTION ⚠

- **When removing the wheel speed sensor, never apply a force to it such as tapping it with a hammer, prying it with a screwdriver and pulling the harness, as doing so causes the wire to be broken.**
- **If the wheel speed sensor pulls out lightly, replace the spring spacer.**



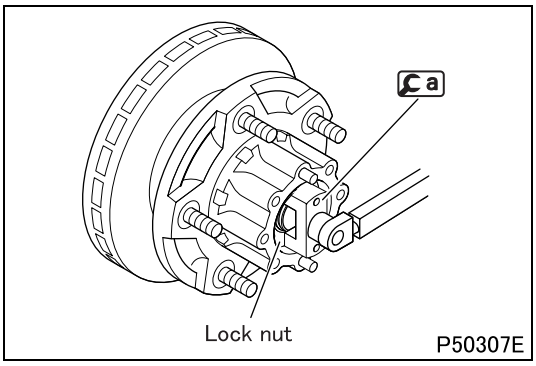
■ **Removal: Axle shaft**

- Screw two axle shaft mounting bolts evenly into the axle shaft removal screw holes to remove the axle shaft.

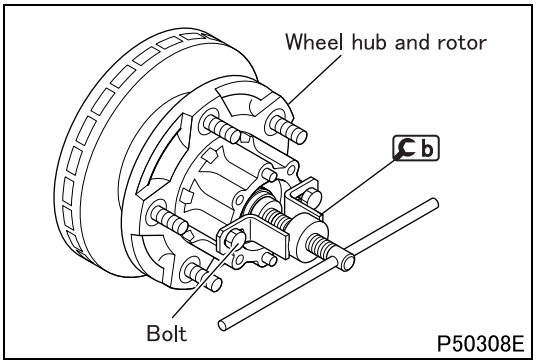


■ **Removal: Outer oil seal**

- To remove the outer oil seal, pull protrusions on the outer periphery of the outer oil seal evenly around the whole circumference with pliers.

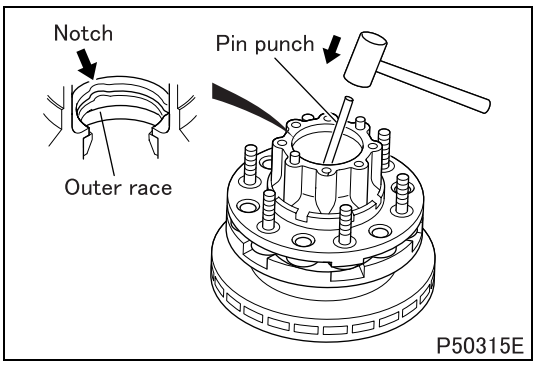


■ **Removal: Lock nut**



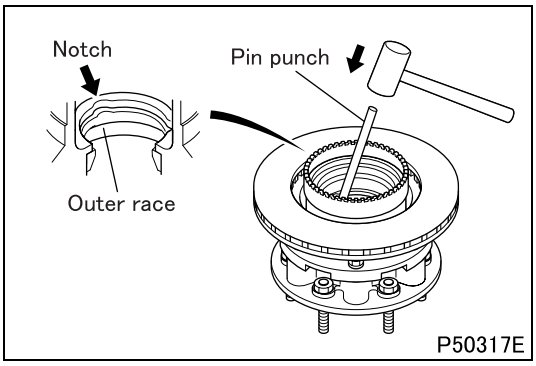
■ **Removal: Wheel hub and rotor**

- Install Cb using axle shaft mounting bolts and remove the wheel hub and rotor assembly.



■ **Removal: Inner bearing outer race**

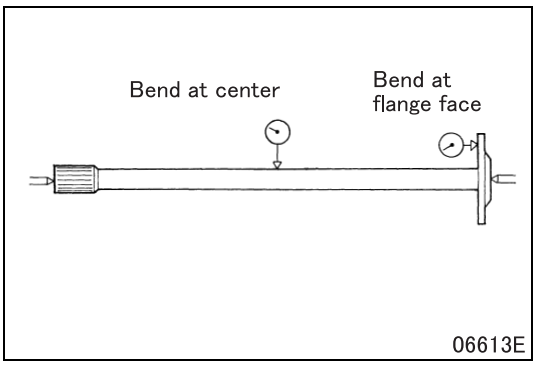
- Drive out the inner bearing outer race by tapping evenly at three indented parts in the wheel hub.



■ **Removal: Outer bearing outer race**

- Drive out the outer bearing outer race by tapping evenly at three indented parts in the wheel hub.

◆Inspection procedure◆



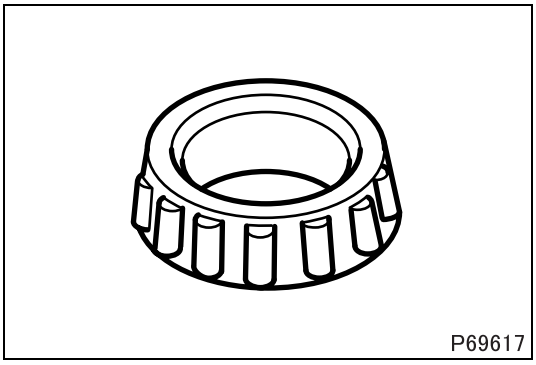
■ **Inspection: Axle shaft**

- Measure the bend of the axle shaft at its center.

NOTE

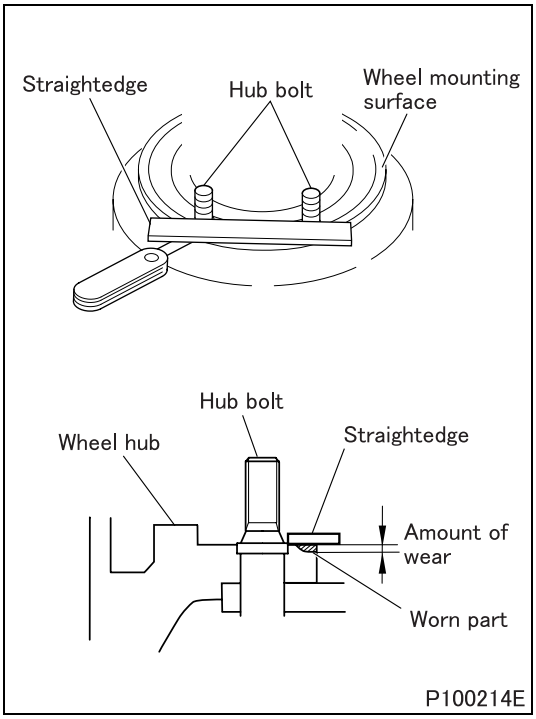
- **Give the axle shaft one complete turn and read the dial gauge at this time. The bend is one half of the reading.**

- If the measured value exceeds the limit, replace the axle shaft.
- Measure the bend of the flange face of the axle shaft.
- If the measured value exceeds the limit, replace the axle shaft.



■ **Inspection: Outer bearing inner race**

- Inspect the outer bearing inner race after cleaning the bearing to remove grease completely.
- If any damage, wear, or poor rotating condition is evident in the inner race, replace it with a new one.
- The inner race and outer race should be replaced as a set.



■ **Inspection: Wheel hub**

(1) Visual inspection

- Check the disc wheel mounting surface of the wheel hub by watching and touching. If there is damage or crack on it, replace the wheel hub.
- Make sure that there is not rust, dust, paint or foreign body on the disc wheel mounting surface of the wheel hub to prevent the wheel nut to loosen.
- If any abnormality is found, remove it with sandpaper.

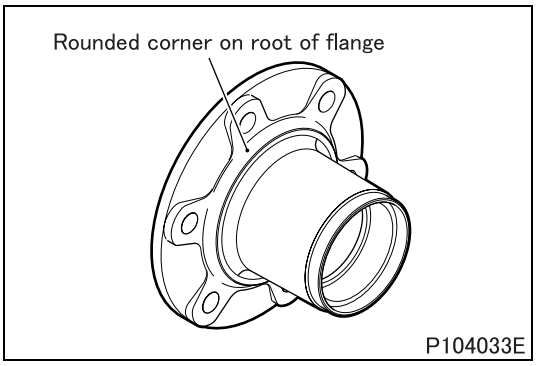
(2) Wear in disc wheel mounting part of wheel hub

- Clean the wheel mounting surface of the wheel hub before inspection.
- Place a straightedge on the hub so as to contact to the two hub bolts on the disc wheel mounting surface.

CAUTION ⚠

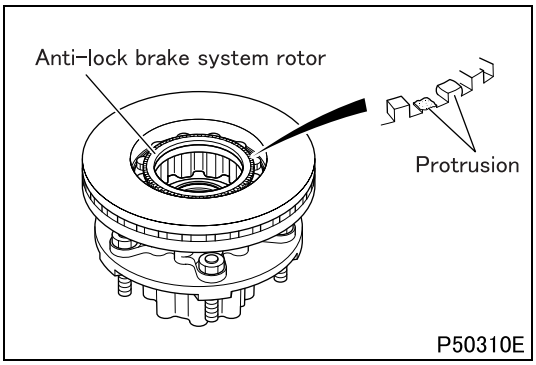
- **Make sure that the straightedge does not run onto the hub bolt.**

- Using feeler gauges to measure the amount of wear at the outer periphery of the wheel hub.
  Measure the amount of wear in the area of every hub bolt.
- If the amount of wear at any point exceeds the following standard value, inspect the crack check of wheel hub.
  Wear standard value: 0.8 mm



(3) Crack check

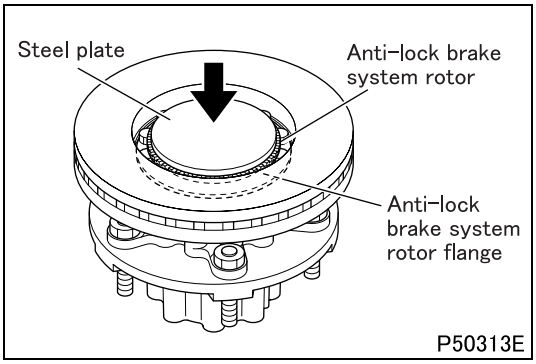
- Check if there is not crack on the entire rounded corner on the root of flange of the wheel hub by magnetic particle or liquid penetrant testing. If crack is found, replace the wheel hub.
- If crack is found on the wheel hub bolt, replace it.
- If there is crack or stepped wear on the wheel hub mounting surface of wheel disc, replace it. (See Gr31.)



■ **Inspection: Anti-lock brake system rotor**

[Inspection]

- Remove any debris on the anti-lock brake system rotors and check protrusions of the anti-lock brake system rotor for chipping and flattening.
- If any abnormality is found, replace the anti-lock brake system rotor.



[Installation]

- Warm the anti-lock brake system rotor to approximately 150°C.
- Install the anti-lock brake system rotor and anti-lock brake system rotor flange evenly using a steel plate so as not to allow them to tilt.

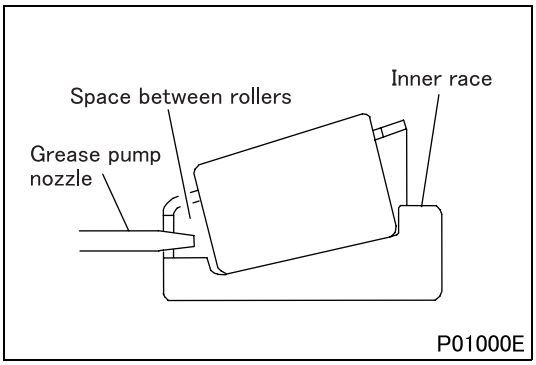
WARNING ⚠

- **Handling the warmed rotor by bare hand causes scald.**

■ Inspection: Inner bearing inner race

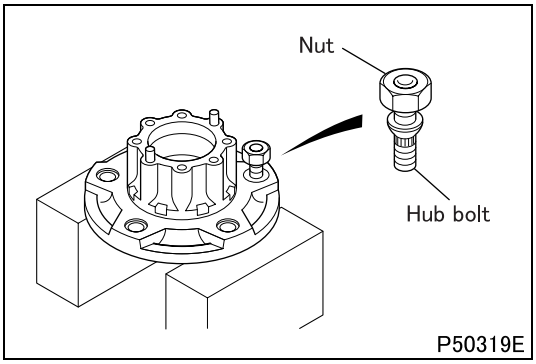
- Inspect the inner bearing inner race in the same manner as for the outer bearing inner race.
  (See **"■ Inspection: Outer bearing inner race".**)

◆Installation procedure◆



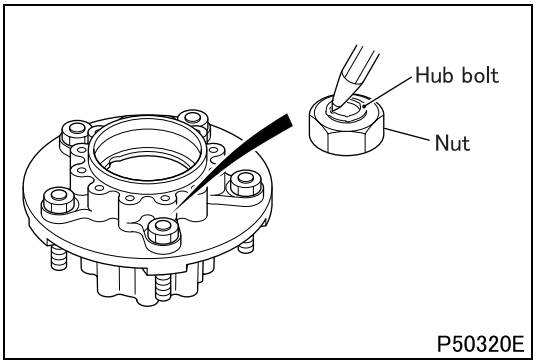
■ Installation: Packing grease in inner bearing inner race

- Insert the grease pump nozzle into the space between rollers of the inner bearing inner race to pack grease sufficiently.

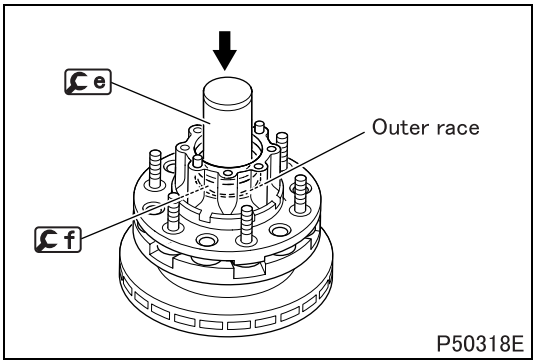


■ Installation: Hub bolt

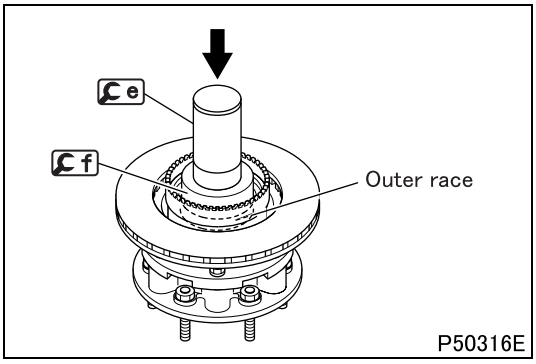
- Screw the nut into the hub bolt until just before they become flush.
- Drive the hub bolt into the wheel hub vertically by hitting the end face of the nut with a brass punch or the like.



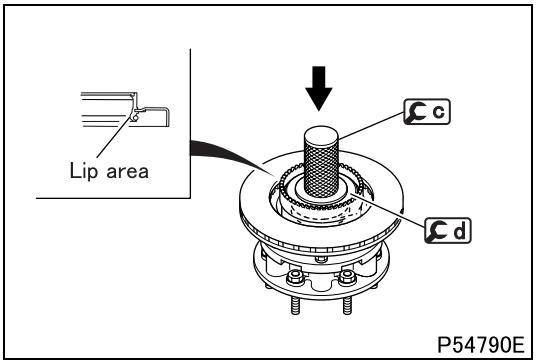
- After tightening the nut to the specified torque, caulk it with a punch.



■ **Installation: Outer bearing outer race**



■ **Installation: Inner bearing outer race**

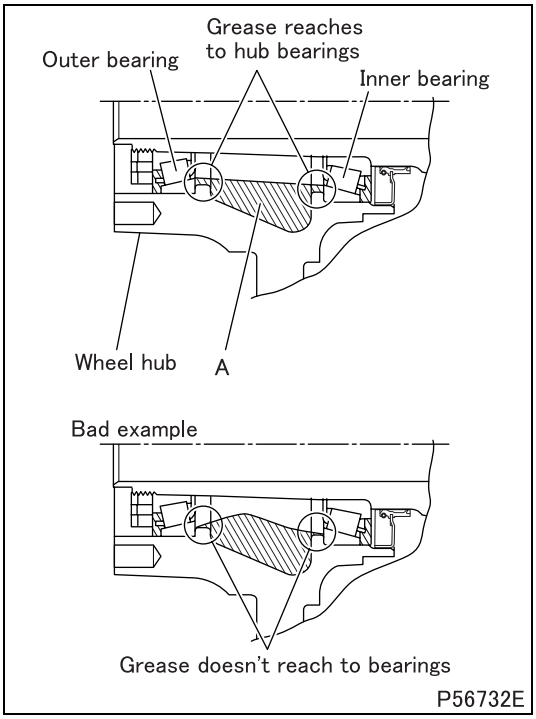


■ **Installation: Oil seal**

- Apply grease to the lip area of the oil seal and install it on the wheel hub in the illustrated direction.

■ **Installation: Packing grease in outer bearing inner race**

- Follow the same procedure as for packing the inner bearing inner race with grease.
  (See **"■ Installation: Packing grease in inner bearing inner race"**.)

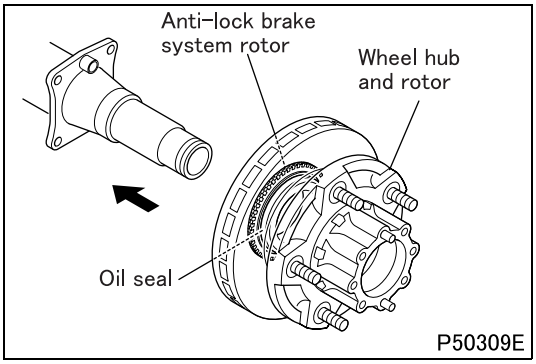


■ **Installation: Packing grease in wheel hub**

- Apply specified amount of grease to inside A of wheel hub so that the grease reaches to inner bearing and outer bearing as illustrated.

CAUTION ⚠

- **Applying grease as illustrated in the "bad example" causes the wheel hub bearing to seize.**



■ **Installation: Wheel hub and rotor**

- Slowly install the wheel hub and rotor assembly so as not to cause damage to the oil seal and anti-lock brake system rotor.

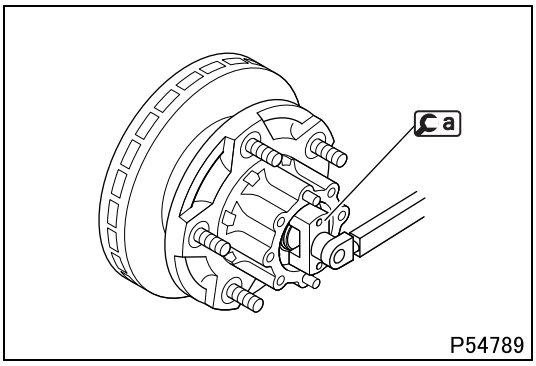
CAUTION ⚠

- **If the anti-lock brake system rotor is damaged, wheel speed sensor signals become abnormal, causing the anti-lock brake system to malfunction.**

■ **Adjustment: Starting torque of wheel hub bearing**

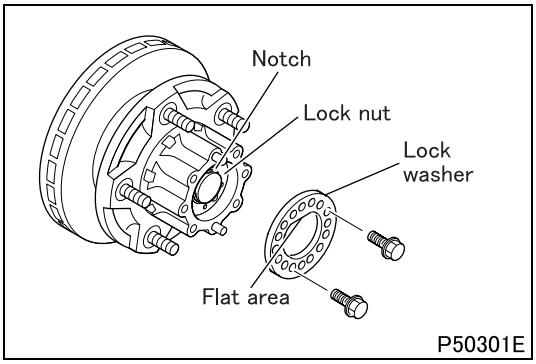
CAUTION ⚠

- **Unless this adjustment procedure is performed, seizure of the wheel bearing can be caused.**

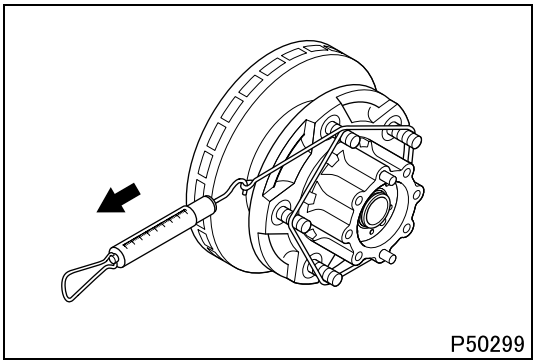


[Adjustment]

- Tighten the lock nut to the specified torque (primary tightening) while turning the wheel hub and rotor, and then loosen it completely.
- Smooth operation of the outer bearing and inner bearing by turning the wheel hub and rotor several times, and then tighten the lock nut to the specified torque (secondary tightening).

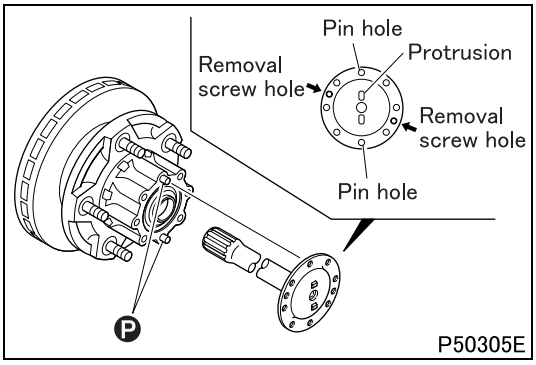


- Insert the flat area of the lock washer, aligning it with the notch of the axle housing, and mount two bolts diagonally to the lock nut.
- If the lock nut does not align with a screw hole of the lock washer, align by loosening the lock nut. Make sure that there is no play in the axial direction.



[Inspection]

- After installing the lock washer, carry out the following inspections.
- Measure the tangential force at the hub bolt position using a spring balancer.
- If the tangential force is within the specified value, the starting torque conforms to the standard value. If the measured value deviates from the specified value, repeat adjustment because the adjustment of the lock nut may be insufficient.
- If the result is found to be abnormal, replace the outer and inner bearings.

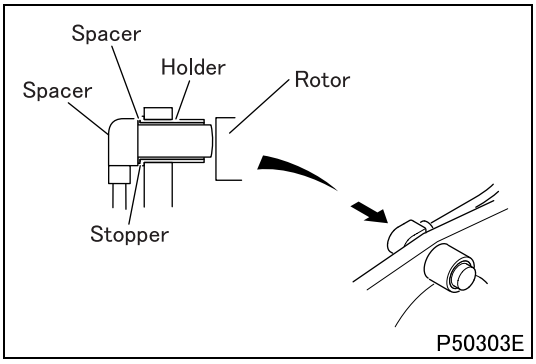


■ Installation: Axle shaft

- Align the pin hole of the locating pin with that of the axle shaft to install the axle shaft.

NOTE

- **A pin hole is not necessarily located at the position of a protrusion on the axle shaft flange face as illustrated. The second hole from a removal screw hole clockwise is a pin hole.**

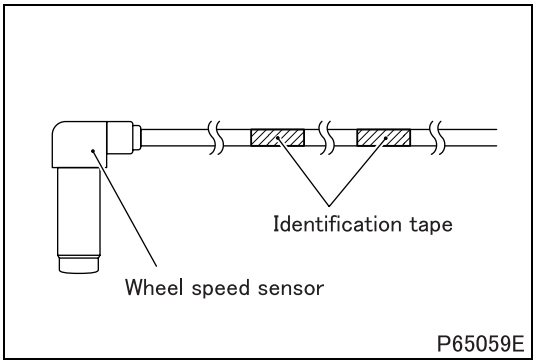


■ Installation: Wheel speed sensor

- Install the wheel speed sensor so that it securely contacts the sensor holder together with the spring spacer.

CAUTION ⚠

- **When installing the wheel speed sensor, never apply a force to it such as tapping it with a hammer, prying it with a screwdriver and pulling the harness, as doing so causes the wire to be broken.**



- Using clips, secure in place the wheel speed sensor harness at the identification tape portions, ensuring that the harness is free of kinks, slack and/or interference with other parts.

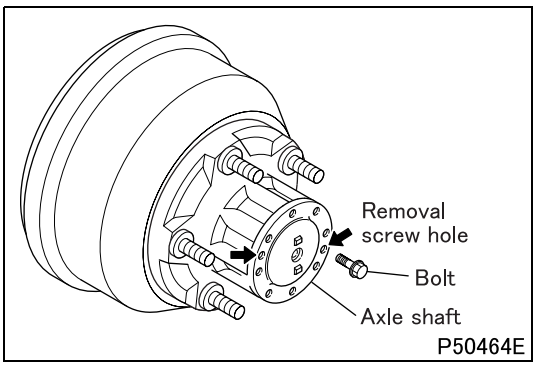
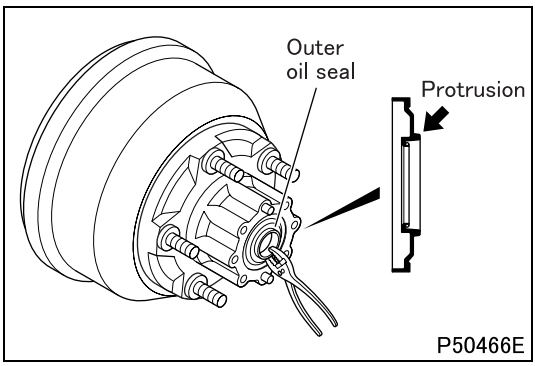
◆Removal procedure◆



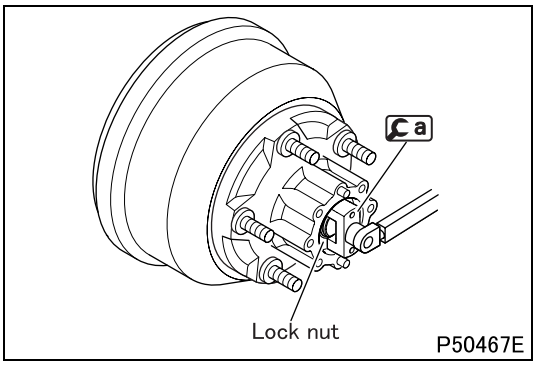
■ **Removal: Axle shaft**

- Screw two axle shaft mounting bolts evenly into the axle shaft removal screw holes to remove the axle shaft.

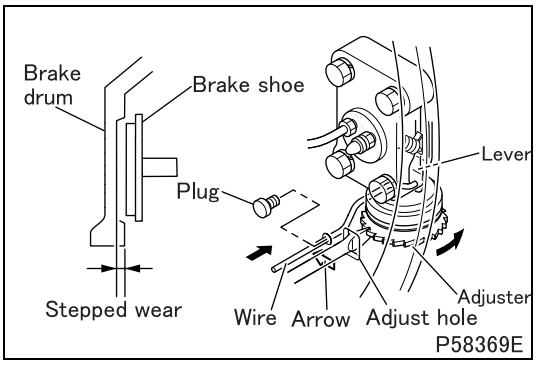


■ **Removal: Outer oil seal**

- To remove the outer oil seal, pull protrusions on the outer periphery of the outer oil seal evenly around the whole circumference with pliers.



■ **Removal: Lock nut**

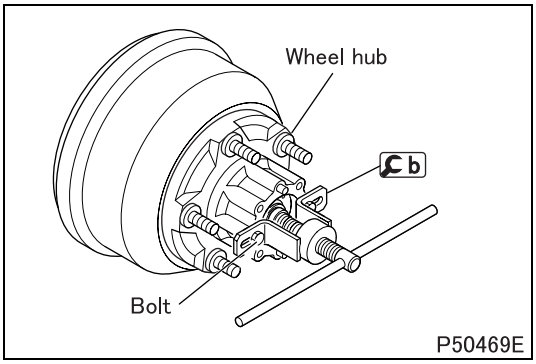


■ **Removal: Wheel hub and brake drum**

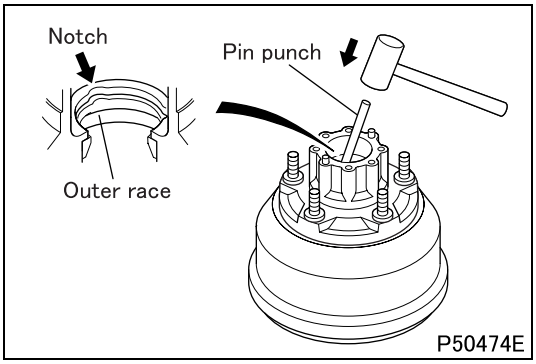
- If the brake drum has stepped wear and the wear prevents the wheel hub and brake drum assembly from being removed, the removal can still be effected by taking the following procedure.
- Insert a wire of approx. ϕ2 mm {0.079 in.} into the hole from which the plug has been removed, and lift up the adjust lever of the wheel cylinder.
- Turn the adjuster from the adjust hole in the opposite direction to the arrow on the backing plate to increase the clearance between the brake drum and the brake shoe. Then, remove the wheel hub and brake drum assembly.

CAUTION ⚠

- **Correct or replace the brake drum if any fault is found.**

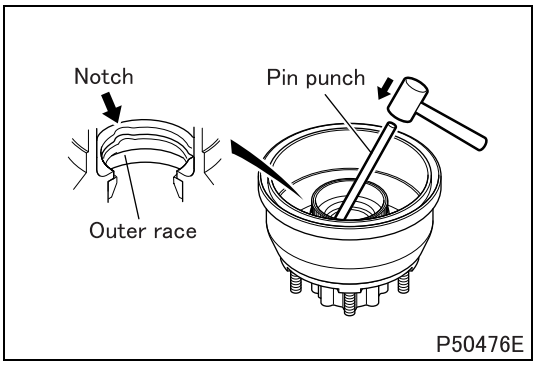


- Install b using axle shaft mounting bolts to remove the wheel hub and brake drum assembly.



■ **Removal: Inner bearing outer race**

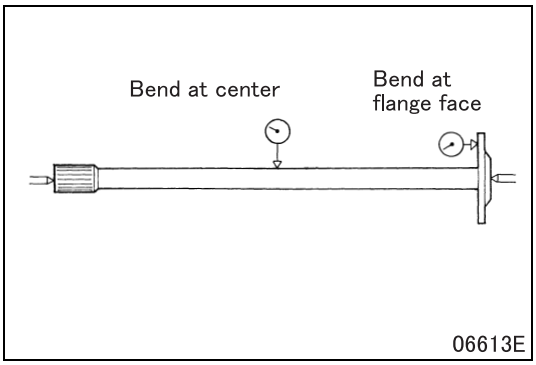
- Drive out the inner bearing outer race by tapping evenly at three or four indented parts in the wheel hub.



■ **Removal: Outer bearing outer race**

- Drive out the outer bearing outer race by tapping evenly at three or four indented parts in the wheel hub.

◆Inspection procedure◆



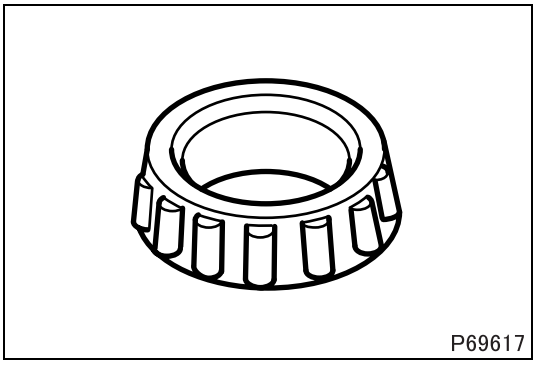
■ **Inspection: Axle shaft**

- Measure the bend of the axle shaft at its center.

NOTE

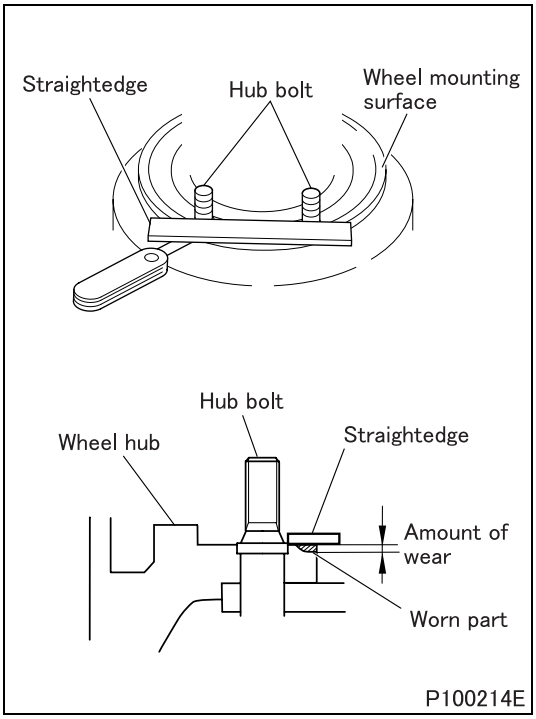
- **Give the axle shaft one complete turn and read the dial gauge at this time. The bend is one half of the reading.**

- If the measured value exceeds the limit, replace the axle shaft.
- Measure the bend of the flange face of the axle shaft.
- If the measured value exceeds the limit, replace the axle shaft.



■ **Inspection: Outer bearing inner race**

- Inspect the outer bearing inner race after cleaning the bearing to remove grease completely.
- If any damage, wear, or poor rotating condition is evident in the inner race, replace it with a new one.
- The inner race and the outer race should be replaced as a set.



■ **Inspection: Wheel hub**

(1) Visual inspection

- Check the disc wheel mounting surface of the wheel hub by watching and touching. If there is damage or crack on it, replace the wheel hub.
- Make sure that there is not rust, dust, paint or foreign body on the disc wheel mounting surface of the wheel hub to prevent the wheel nut to loosen.
- If any abnormality is found, remove it with sandpaper.

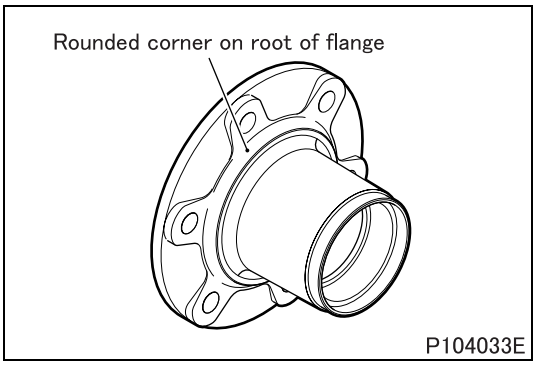
(2) Wear in disc wheel mounting part of wheel hub

- Clean the wheel mounting surface of the wheel hub before inspection.
- Place a straightedge on the hub so as to contact to the two hub bolts on the disc wheel mounting surface.

CAUTION ⚠

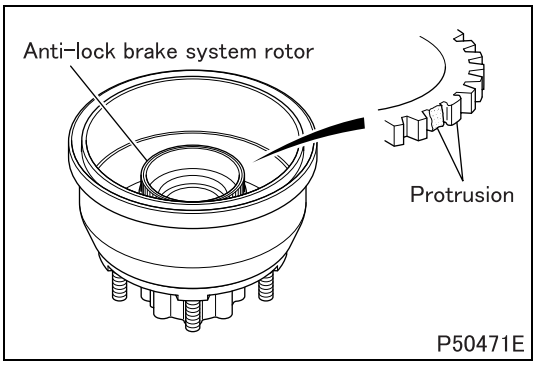
- **Make sure that the straightedge does not run onto the hub bolt.**

- Using feeler gauges to measure the amount of wear at the outer periphery of the wheel hub.
  Measure the amount of wear in the area of every hub bolt.
- If the amount of wear at any point exceeds the following standard value, inspect the crack check of wheel hub.
  Wear standard value: 0.8 mm



(3) Crack check

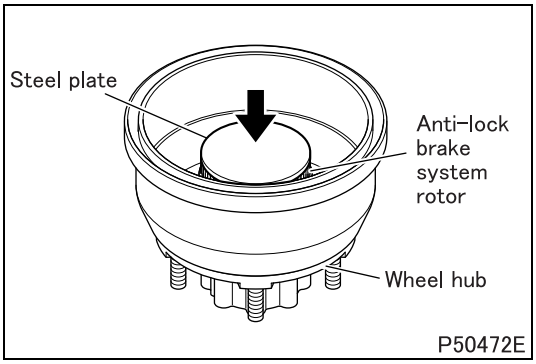
- Check if there is not crack on the entire rounded corner on the root of flange of the wheel hub by magnetic particle or liquid penetrant testing. If crack is found, replace the wheel hub.
- If crack is found on the wheel hub bolt, replace it.
- If there is crack or stepped wear on the wheel hub mounting surface of wheel disc, replace it. (See Gr31.)



■ **Inspection: Anti-lock brake system rotor**

[Inspection]

- Remove any debris on the anti-lock brake system rotor and check protrusions of the anti-lock brake system rotor for chipping and flattening.
- If any abnormality is found, replace the anti-lock brake system rotor.



[Installation]

- Warm the anti-lock brake system rotor to approximately 150°C.
- Install the anti-lock brake system rotor and anti-lock brake system rotor flange evenly using a steel plate so as not to allow them to tilt.

WARNING ⚠

- **Handling the warmed rotor by bare hand causes scald.**

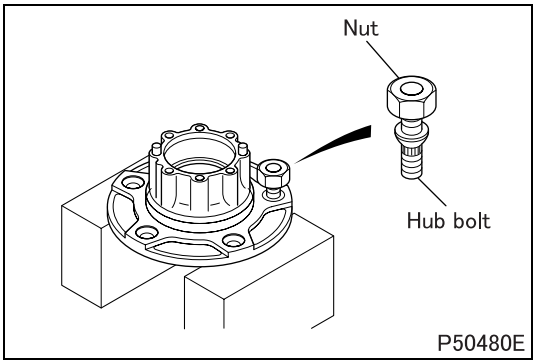
■ Inspection: Brake drum

- If cylindricity of the brake drum exceeds the limit or the brake drum has seams, correct the brake drum integrally with the wheel hub within the range of the correction limit.

■ Inspection: Inner bearing inner race

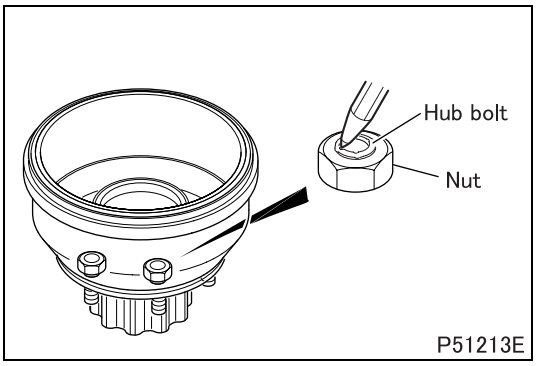
- Inspect the inner bearing inner race in the same manner as for the outer bearing inner race.
  (See **"■ Inspection: Outer bearing inner race"**.)

◆Installation procedure◆

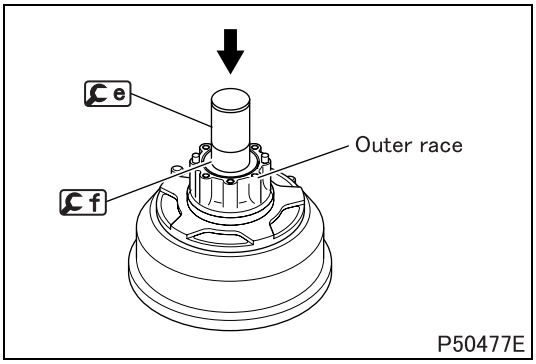


■ Installation: Hub bolt

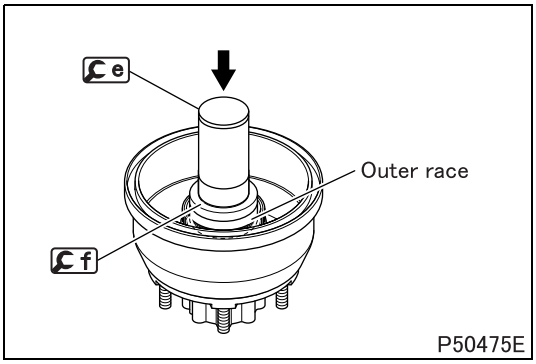
- Screw the nut into the hub bolt until just before they become flush.
- Drive the hub bolt into the wheel hub vertically by hitting the end face of the nut with a brass punch or the like.



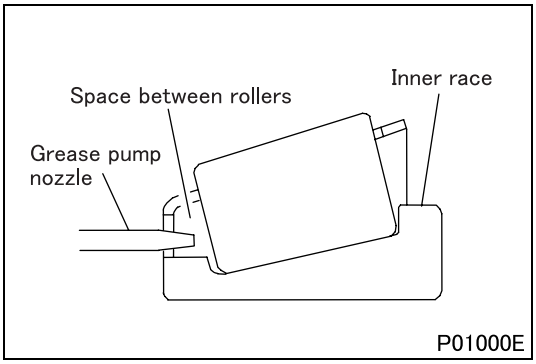
- Assemble the brake drum and wheel hub with the hub bolt. After tightening the nut to the specified torque, crimp it with a punch.



■ Installation: Outer bearing outer race

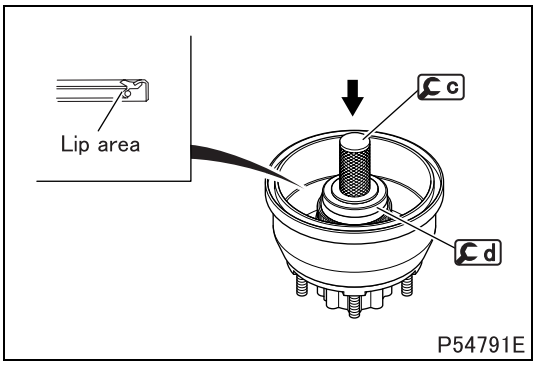


■ **Installation: Inner bearing outer race**



■ **Installation: Packing grease in inner bearing inner race**

- Insert the grease pump nozzle into the space between rollers of the inner bearing inner race to pack grease sufficiently.

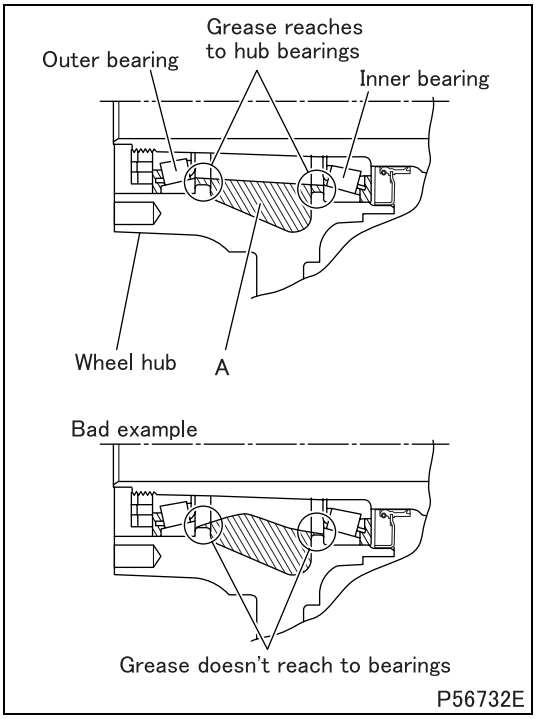


■ **Installation: Oil seal**

- Apply grease to the lip area of the oil seal and install it on the wheel hub in the illustrated direction.

■ **Installation: Packing grease in outer bearing inner race**

- Follow the same procedure as for packing the inner bearing inner race with grease.
  (See **"■ Installation: Packing grease in inner bearing inner race"**.)

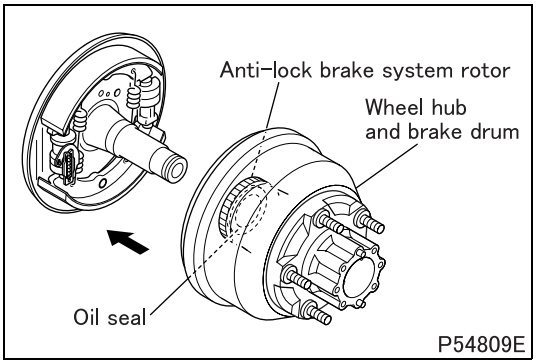


■ **Installation: Parking grease in wheel hub**

- Apply specified amount of grease to inside A of wheel hub so that the grease reaches inner bearing and outer bearing as illustrated.

CAUTION ⚠

- **Applying grease as illustrated in the "bad example" causes the wheel hub bearing to seize.**



■ **Installation: Wheel hub and brake drum**

- Slowly install the wheel hub and brake drum assembly so as not to cause damage to the oil seal and anti-lock brake system rotor.

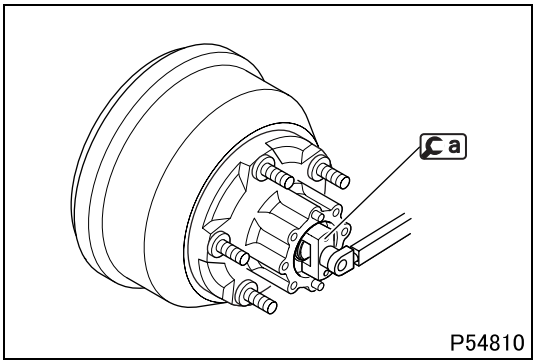
CAUTION ⚠

- **If the anti-lock brake system rotor is damaged, wheel speed sensor signals become abnormal, causing the anti-lock brake system to malfunction.**

■ **Adjustment: Starting torque of wheel hub bearing**

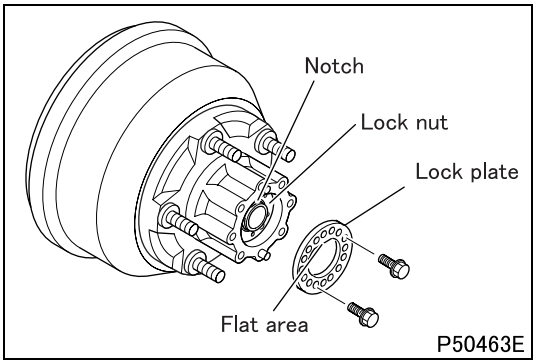
CAUTION ⚠

- **Unless this adjustment procedure is performed, seizure of the wheel bearing can be caused.**

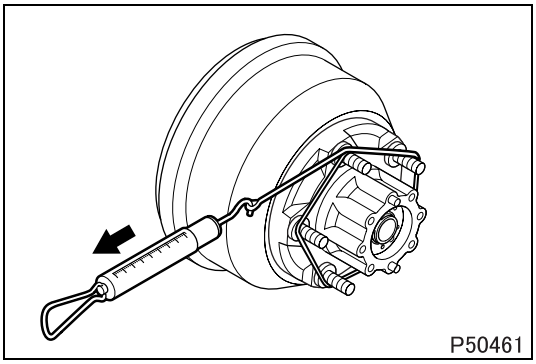


[Adjustment]

- Tighten the lock nut to the specified torque (primary tightening) while turning the wheel hub and brake drum, and then loosen it completely.
- Smooth operation of the outer bearing and inner bearing by turning the wheel hub and brake drum several times, and then tighten the lock nut to the specified torque (secondary tightening).

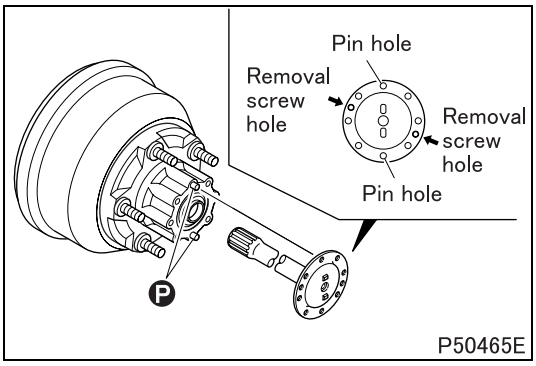


- Insert the flat area of the lock washer, aligning it with the notch of the axle housing, and mount two bolts diagonally to the lock nut.
- If the lock nut does not align with a screw hole of the lock washer, align by loosening the lock nut. Make sure that there is no play in the axial direction.



[Inspection]

- After installing the lock washer, carry out the following inspections.
- Make sure that there is no drag in the brake lining and brake drum.
- If any abnormality is found, adjust the brake shoe clearance.
- Measure the tangential force at the hub bolt position using a spring balancer.
- If the tangential force is within the specified value, the starting torque conforms to the standard value. If the measured value deviates from the specified value, repeat adjustment, because the adjustment of the lock nut may be insufficient.
- If the result is found to be abnormal, replace the outer and inner bearings.

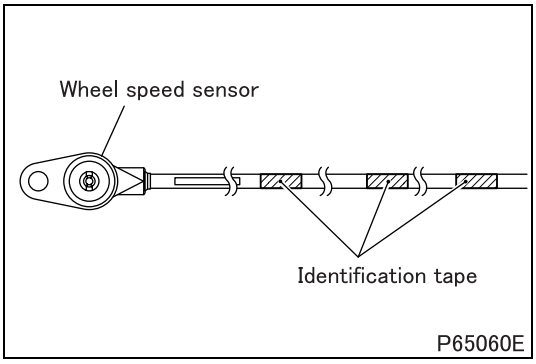


■ Installation: Axle shaft

- Align the pin hole of the locating pin with that of the axle shaft to install the axle shaft.

NOTE

- **A pin hole is not necessarily located at the position of a protrusion on the axle shaft flange face. The second hole from a removal screw hole clockwise is a pin hole.**



■ Installation: Wheel speed sensor

- Using clips, secure in place the wheel speed sensor harness at the identification tape portions, ensuring that the harness is free of kinks, slack and/or interference with other parts.

⊗: Non-reusable parts

CAUTION ⚠

- **Plug the brake hose and the brake pipe to prevent entry of dust and dirt after they have been removed.**

NOTE

- **Do not remove the axle housing unless it is found faulty.**

● Installation sequence

Follow the removal sequence in reverse.

Service standards (Unit: mm {in.})

Location	Maintenance item		Standard value	Limit	Remedy
8	Injection-valve opening pressure of vent plug		4.9 kPa {0.7 psi, 0.05 kfg/cm^2} or less	–	Replace
12	Axle housing	Runout at outer bearing portion	0.5 {0.020} or less	1 {0.039}	Replace
		Difference between before and after rotation at center	1 {0.039} or less	5 {0.20}	

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened		Tightening torque	Remarks
Ta	Inspection plug		98 ± 120 {72 ± 89, 10 ± 12}	–
	Drain plug			
Tb	Nut (propeller shaft mounting)		100 to 120 {74 to 89, 10 to 12}	M12
Tc	Nut (reduction and differential mounting)		69 to 93 {51 to 69, 7 to 9.5}	–
Td	Bolt (reduction and differential mounting)		83 to 108 {61 to 80, 8.5 to 11}	–
Te	Brake hose	FE (except crew cab)	20.6 to 31.4 {15.2 to 23.2, 2.1 to 3.2}	–
		Crew cab, FG	25.5 to 34.3 {18.8 to 25.3, 2.6 to 3.5}	–
Tf	Nut (U-bolt mounting)	FE (except crew cab)	292 to 394 {215 to 290, 30 ± 40}	M18
		Crew cab	339.1 ± 51 {250 ± 38, 35 ± 5.2}	M18
		FG	240 ± 15 {175 ± 11, 24.5 ± 1.5}	M16
Tg	Brake pipe		12.7 to 16.7 {9.4 to 12, 1.3 to 1.7}	–

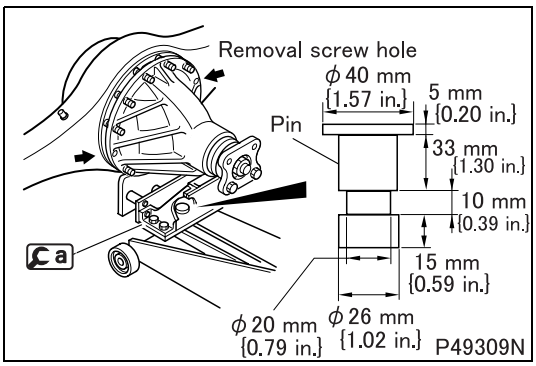
Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Thread area of bolt	ThreeBond 1215	As required
	Reduction and differential mounting surface of axle housing		
b	Axle housing mounting surface of vent plug <Except FG>	ThreeBond 1216	As required

Special tools (Unit: mm {in.})

Mark	Tool name and shape	Part No.	Application
a	Differential carrier base A: ϕ28 {1.10}  06679	MB999102	Removal and installation of reduction and differential

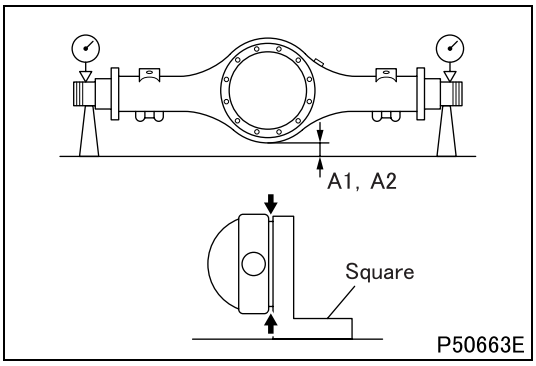
◆Removal procedure◆



■ Removal: Reduction and differential

- Remove the saucer of the garage jack and place [a] on it. Fabricate the pin as illustrated, insert and fix it with bolts that have fixed the saucer.
- Screw two bolts evenly into the reduction and differential removal screw holes (as shown in illustration) to remove the reduction and differential.
  Bolt size: M12 × 1.25 mm

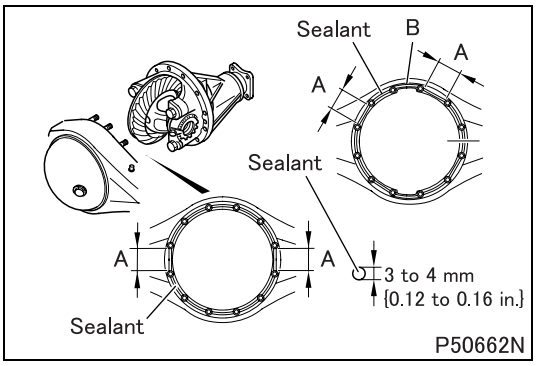
◆Inspection procedure◆



■ Inspection: Axle housing

- Horizontally support the inner bearing fittings at both ends of the housing spindle of the axle housing.
- Apply a dial gauge to the outer bearing fitting and turn it 360 degrees to measure runout.
- For measurement of A1 and A2, place the axle housing at right angles using a square and measure A1. Then, turn it 180 degrees and measure A2.
- If the measured value exceeds the limit, replace the axle housing.

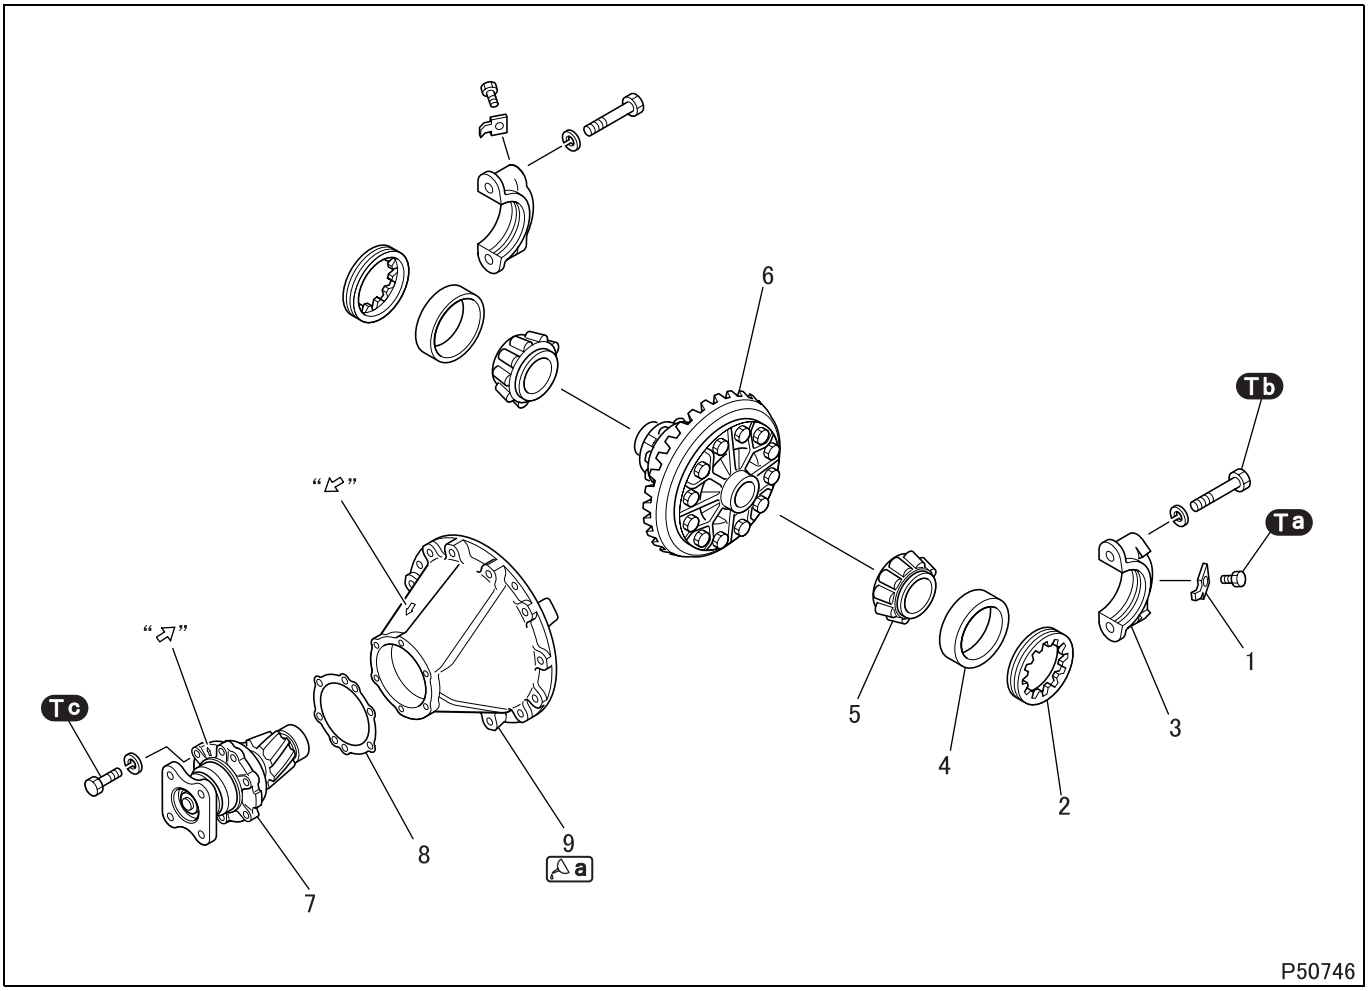
◆Installation procedure◆



■ Installation: Reduction and differential

- Clean a seal surface of each part.
- Apply sealant to the reduction and differential mounting surface of the axle housing evenly and without breaks. Apply sealant in a straight line direction for illustrated position A and along the outer periphery for notches of illustrated position B.

M E M O



● **Disassembly sequence**

1 Lock plate
2 Side bearing nut
3 Bearing cap
4 Side bearing outer race
5 Side bearing inner race
6 Differential (See later sections.)
7 Reduction pinion (See later sections.)
8 Shim
9 Differential carrier

CAUTION ⚠

- **Keep side bearings that have been removed separated from each other and ensure that during installation each one is correctly placed.**
- **Be sure to replace the bearing cap, differential carrier and bolts as a differential carrier set.**
- **Be sure to replace the reduction pinion and the reduction gear of the differential as a reduction gear set.**

NOTE

- **Record the number and thickness of shims to use them as reference at assembly.**

● **Assembly sequence**

Follow the disassembly sequence in reverse.

Service standards (Unit: mm {in.})

Location	Maintenance item	Standard value	Limit	Remedy
7, 8	Starting torque of side bearing	2.0 to 2.9 N·m {1.4 to 2.2 ft.lbs, 0.2 to 0.3 kgf·m}	–	Adjust
9	Wobble at back face of reduction gear	0.1 {0.0039} or less	–	Replace
9, 11	Backlash between reduction gear and reduction pinion	0.20 to 0.28 {0.0079 to 0.011}	0.5 {0.020}	Adjust or replace

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks

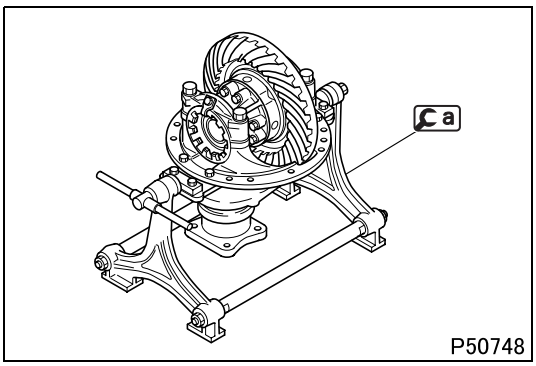
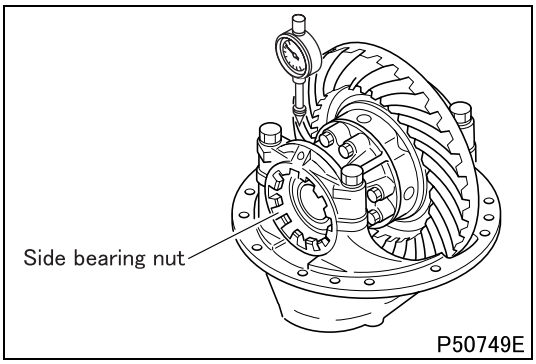
◆Work before removal◆



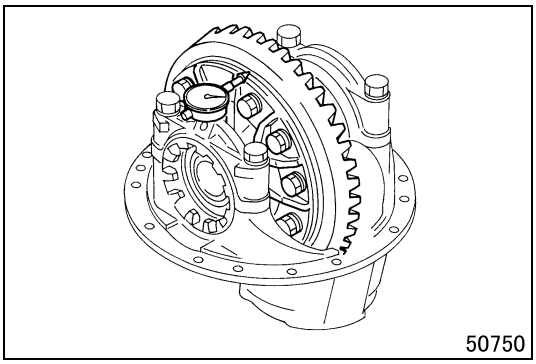
■ **Preparatory work: Installation of differential working base assembly**

- Install the reduction and differential on a.



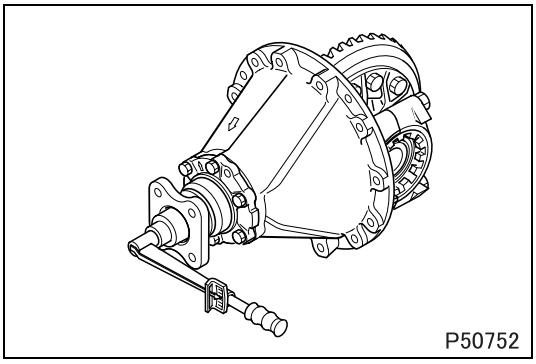
■ **Inspection: Backlash between reduction gear and reduction pinion**

- If backlash is found faulty, the tightening amount of the side bearing nut is probably inappropriate.



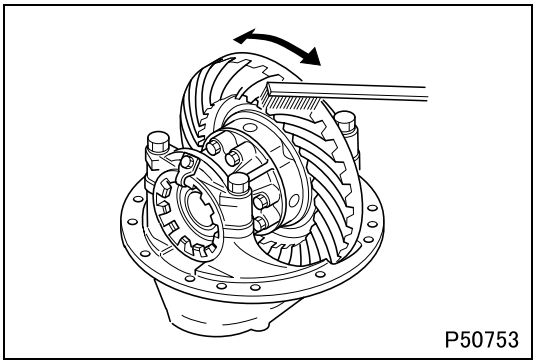
■ **Inspection: Wobble at back face of reduction gear**

- Measure wobble at the illustrated position of the reduction gear.



■ **Inspection: Starting torque of side bearing**

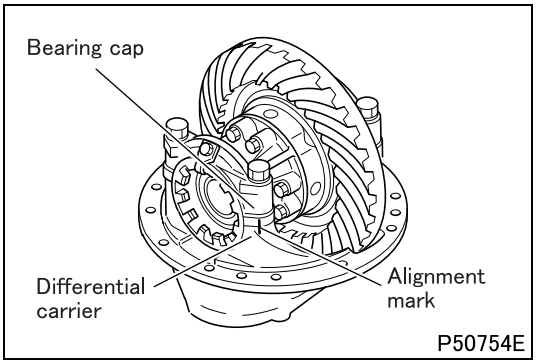
- Measure starting torque of the pinion assembly using a torque wrench and calculate the starting torque of the side bearing using the following formula.
  (Total starting torque – Pinion bearing starting torque (See later section.)) × Final ratio = Side bearing starting torque



P50753

■ **Inspection: Tooth contact of reduction gear**

- Apply red lead to three to four teeth at three equally spaced points of the reduction gear.
- Turn the reduction gear several times to check for tooth contact.

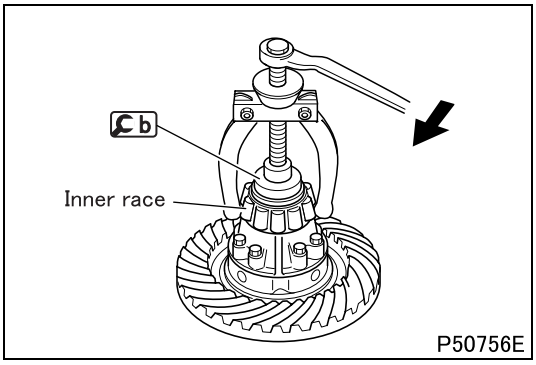


P50754E

■ **Alignment marks: Bearing cap and differential carrier**

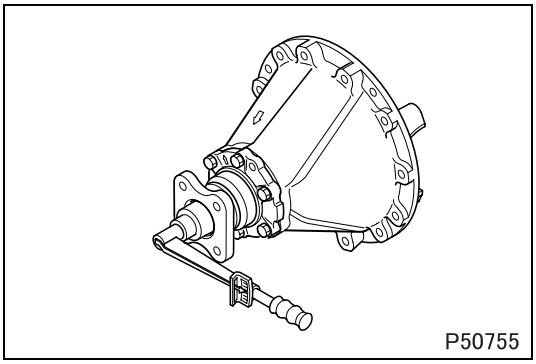
- Put alignment marks on the bearing cap and differential carrier for correct identification of right and left parts.

◆Removal procedure◆



P50756E

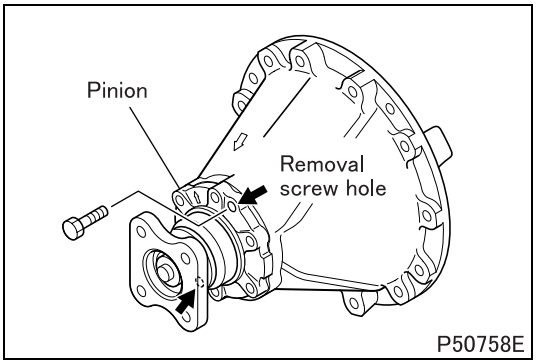
■ **Removal: Side bearing inner race**



P50755

■ **Inspection: Starting torque of pinion bearing**

- After removing the differential, measure the starting torque of the pinion bearing.

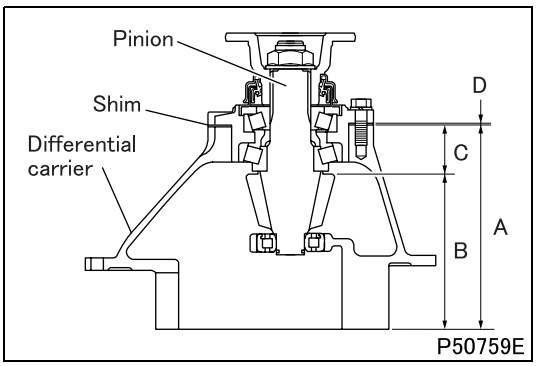


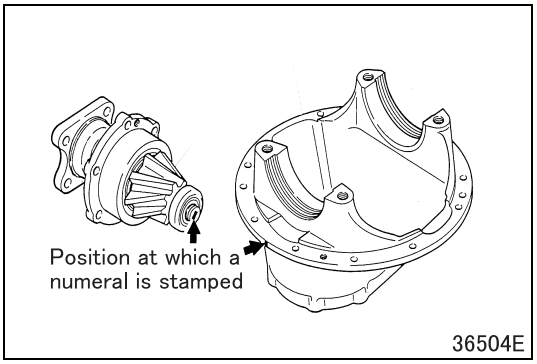
P50758E

■ **Removal: Pinion**

- Screw two bolts evenly into the pinion removal screw holes to remove the pinion.

◆Adjustment procedure◆





■ **Adjustment: Reduction pinion**

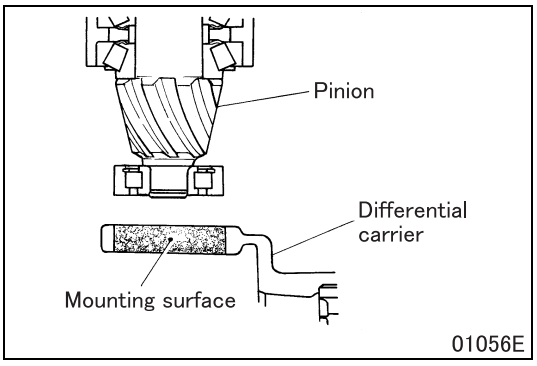
- Perform the following steps to adjust A, B and C within the specified dimensions.
- Calculate shim thickness D by using the following formula based on the machining error data stamped on pinion assembly and differential carrier.
- Formula:
  D = 0.5 mm {0.020 in.} – a + b + c
  a = Deviation from standard dimension A
  b = Deviation from standard dimension B
  c = Deviation from standard dimension C

Unit: mm {in.}

Location	Standard dimension	How to calculate deviation
Shim thickness	0.5 {0.020}	–
A	203 {7.99}	A numeral, multiplied by 100, is stamped on the outer periphery of the flange of the differential carrier.
B	157 {0.18}	A numeral is stamped on the top of the pinion assembly.
C	46.5 {1.8}	Measure deviation from dimension C using a dial gauge. Taking measurement is usually not feasible and assume a value from 0 to 0.2 mm.

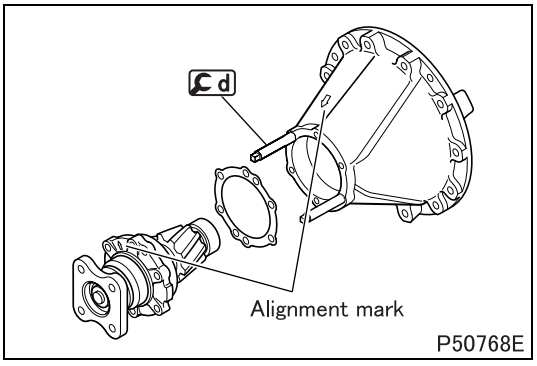
- Select a shim based on shim thickness D.
  Thickness of shims available
  0.1 mm {0.0039 in.}, 0.2 mm {0.0079 in.} (two thickness)

◆Installation procedure◆



■ **Installation: Reduction pinion**

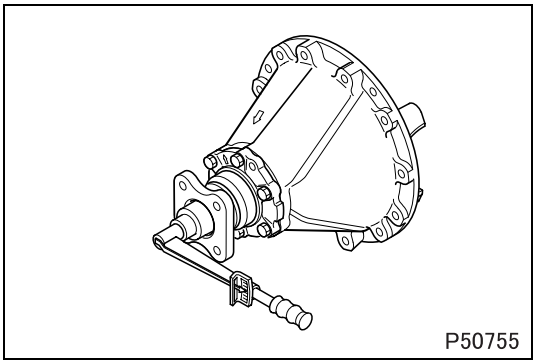
- Apply sealant to the pilot bearing mounting surface of the differential carrier.



- Aligning the embossed alignment mark on the bearing retainer of the pinion assembly with that on the differential carrier, mount the pinion assembly.

CAUTION ⚠

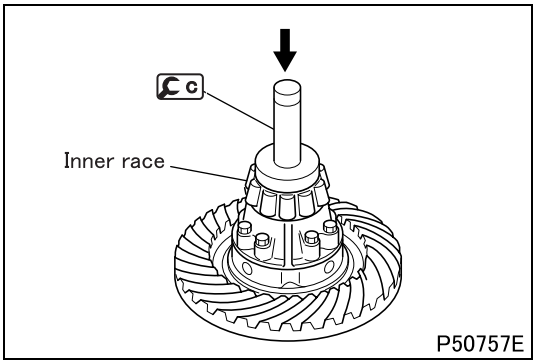
- **Leave for 30 minutes to 2 hours after installation to let the sealant harden.**
- **Wait at least three hours or, if feasible 24 hours, before running the vehicle to let the sealant harden.**



P50755

■ **Inspection: Starting torque of pinion bearing**

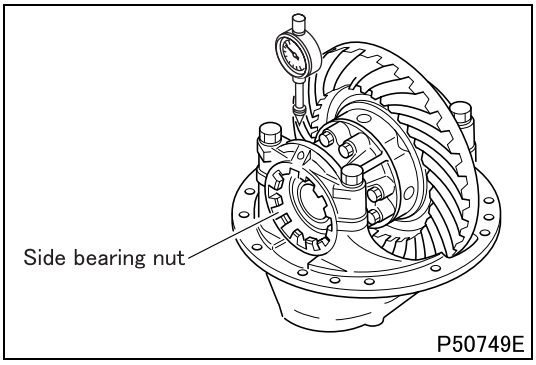
- After installing the pinion, measure the starting torque of the pinion bearing.
- If the measured value deviates from the standard value, adjust.



P50757E

■ **Installation: Side bearing inner race**

◆Work after installation◆



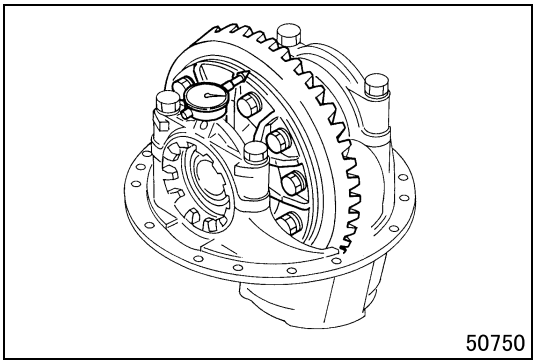
P50749E

■ **Adjustment: Backlash between reduction gear and reduction pinion**

- Adjust backlash with the side bearing nut, using care not to allow the side bearing starting torque to change.

CAUTION ⚠

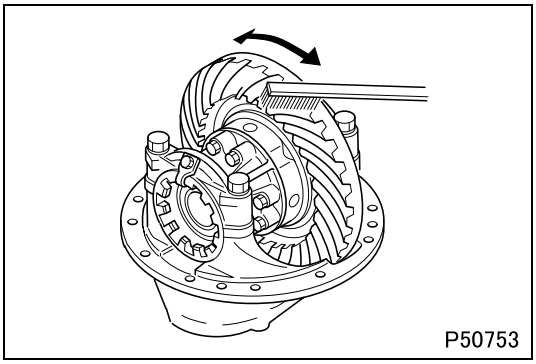
- **When one side bearing nut is loosened, be sure to tighten the other one the same amount to prevent the side bearing starting torque from changing.**



50750

■ **Inspection: Wobble at back face of reduction gear**

- Measure wobble at the illustrated position of the reduction gear.
- If the measured value deviates from the standard value, replace the reduction gear and reduction pinion of the differential as a set.

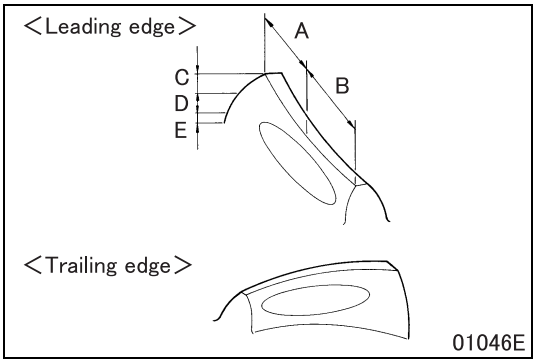


P50753

■ **Inspection: Tooth contact of reduction gear**

[Inspection]

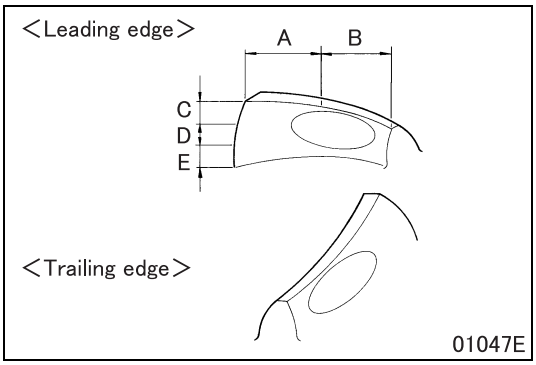
- Apply red lead to three to four teeth at three equally spaced points of the reduction gear.
- Turn the reduction gear several times to check for tooth contact.
- Adjust tooth contact if it is remarkably offset.



● **Correct tooth contact at no load**

<Reduction Gear>

A: Heel
B: Toe
C: Face
D: Flank
E: Clearance



<Reduction Pinion>

A: Heel
B: Toe
C: Face
D: Flank
E: Clearance

Maintenance item			Assembly standards
At no load	Tooth contact position	Lengthwise direction of tooth	From center towards toe
		Vertical direction	From center towards top of tooth for reduction gear and center for reduction pinion
	Tooth contact shape	Length	Approximately 50 to 70% of tooth width
		Width	Approximately 50 to 70% of tooth depth
	Degree of tooth contact		It becomes weaker as it nears tooth root and tooth tip

NOTE

- **When tooth contact is near the toe at no load, it becomes middle area contact at load.**

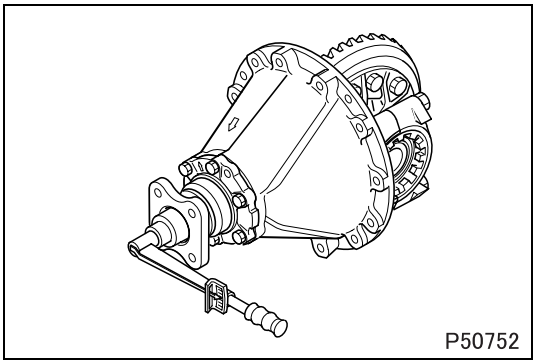
[Adjustment]

- Adjust by backlash between reduction gear and reduction pinion (to be adjusted with the side bearing nut) and addition or reduction of rear bearing shims.

CAUTION ⚠

- **Make sure you replace as a reduction gear set (reduction gear and reduction pinion), when you replace the gear because of excessive teeth wear.**

	Method of adjustment	Moving direction	
Tooth contact by addition or reduction of shims	Advance reduction pinion to reduction gear (shims are reduced)  55497	 55501E	Tooth contact moves towards tooth root
	Retard reduction pinion from reduction gear (shims are added)  55498	 55502E	Tooth contact moves towards tooth tip
Tooth contact by adjustment with side bearing nut	Advance reduction gear to reduction pinion center (less backlash)  55499	 55503E	Tooth contact moves in lengthwise direction of tooth Leading edge: Nearer to toe and slightly nearer to root of tooth Trailing edge: Nearer to heel and slightly nearer to top of tooth
	Retard reduction gear from reduction pinion center (more backlash)  55500	 55504E	Tooth contact moves in lengthwise direction of tooth Leading edge: Nearer to heel and slightly nearer to top of tooth Trailing edge: Nearer to toe and slightly nearer to root of tooth



P50752

■ **Inspection: Starting torque of side bearing**

[Inspection]

- Measure starting torque of the pinion assembly using a torque wrench and calculate the starting torque of the side bearing using the following formula.
  (Total starting torque – Pinion bearing starting torque (See later section.)) × Final ratio = Side bearing starting torque

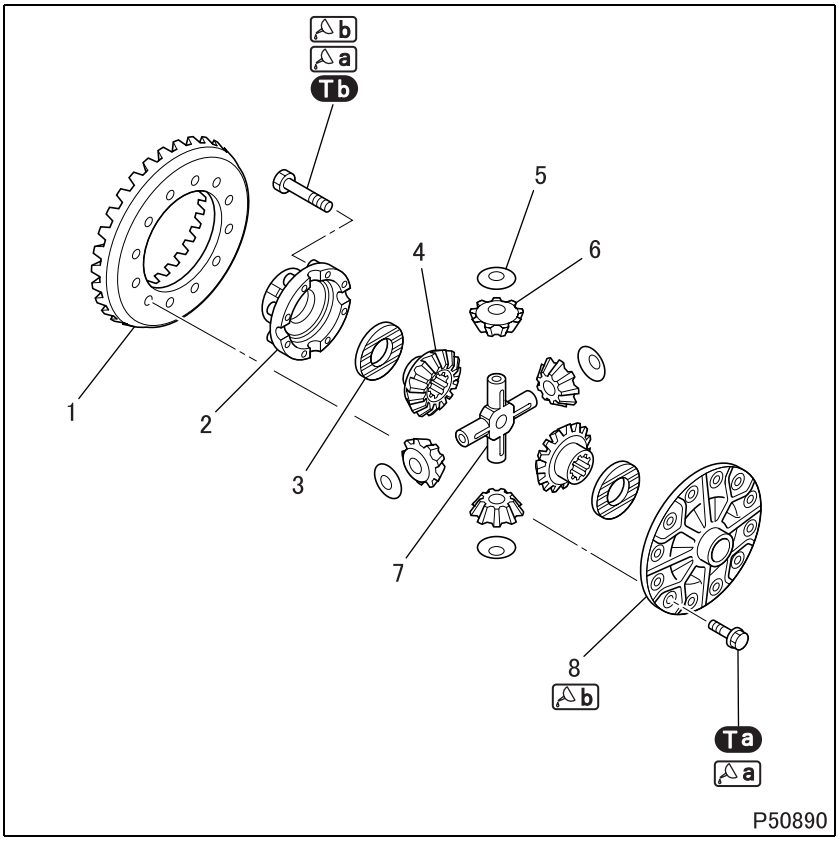
[Adjustment]

- Adjust by means of the right- and left-hand adjusting screws.

CAUTION ⚠

- **Always adjust both adjusting screws by the same amount.**
- **The starting torque must be adjusted without causing the backlash between the reduction gear and reduction pinion out of the standard value.**

Differential



● Disassembly sequence

1 Reduction gear
2 Differential case RH
3 Side gear washer
4 Side gear
5 Pinion washer
6 Differential pinion
7 Pinion spider
8 Differential case LH

CAUTION ⚠

- **Be sure to replace the differential case RH and the differential case LH as a differential case set.**
- **Be sure to replace the side gear and the differential pinion as a side gear set.**

● Assembly sequence

Follow the disassembly sequence in reverse.

Service standards (Unit: mm {in.})

Location	Maintenance item	Standard value	Limit	Remedy
4	Backlash between side gear and spline of axle shaft	0.05 to 0.15 {0.0020 to 0.0059}	0.5 {0.020}	Replace
4, 6	Backlash between side gear and differential pinion	0.15 to 0.20 {0.0059 to 0.0079}	0.5 {0.020}	Replace
6, 7	Clearance between differential pinion and pinion spider	0.17 to 0.27 {0.0067 to 0.011}	0.5 {0.020}	Replace

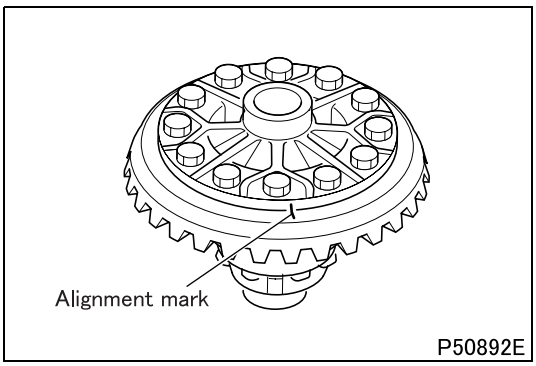
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Bolt (reduction gear mounting)	166.6 to 225.4 {120 to 165, 17 to 23}	–
Tb	Bolt (differential case RH and differential case LH mounting)	83.3 to 112.7 {61 to 83, 8.5 to 11.5}	–

Lubricant and/or sealant

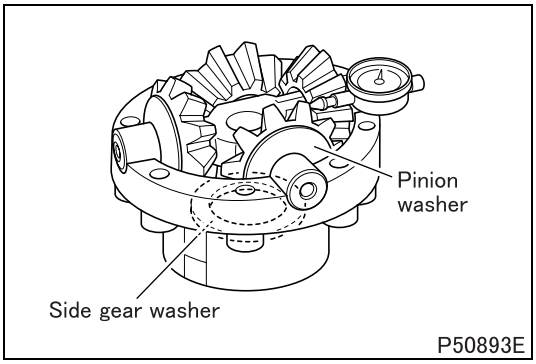
Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Entire bolt	Rust preventive	As required
b	Thread area of bolt	Loctite 271	As required
	Bolt tip of differential case LH		

◆Work before removal◆



■ **Alignment marks: Reduction gear and differential case LH**

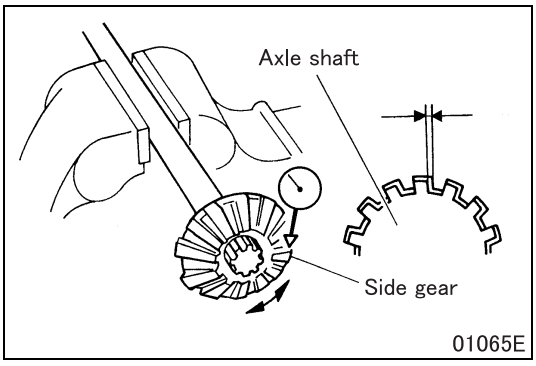
- Put alignment marks on the reduction gear and differential case LH.



■ **Inspection: Backlash between side gear and differential pinion**

- If backlash is found faulty, thickness of the side gear washer and pinion washer is probably inappropriate.

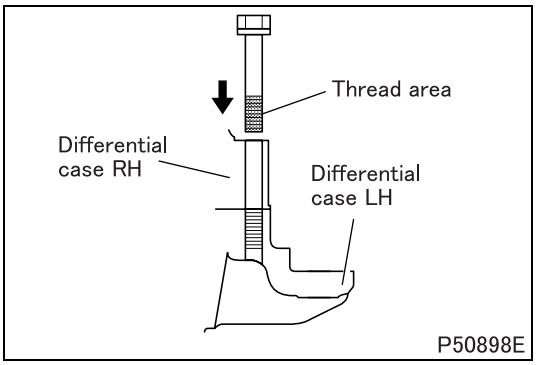
◆Inspection procedure◆



■ **Inspection: Backlash between side gear and axle shaft**

- If the measured value exceeds the limit, replace defective parts.

◆Installation procedure◆

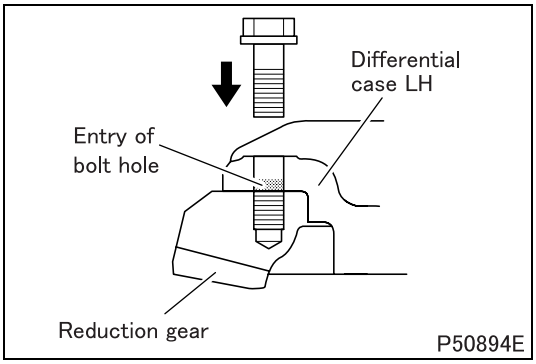


■ **Installation: Differential case RH and differential case LH**

- Apply rust preventive to the entire surface of the bolt. After applying it, blow off the excess rust preventive on the bolt by compressed air.
- Apply thread lock cement to the bolt threads.
- Tighten the bolt to the specified torque.

CAUTION ⚠

- **Make sure to apply rust preventive when tightening the bolt to the specified torque.**
- **Wait at least one hour after installation before actually running the vehicle to let the thread lock cement harden.**
- **Wait at least four hours after installation before operating the vehicle at full torque to let the thread lock cement harden.**



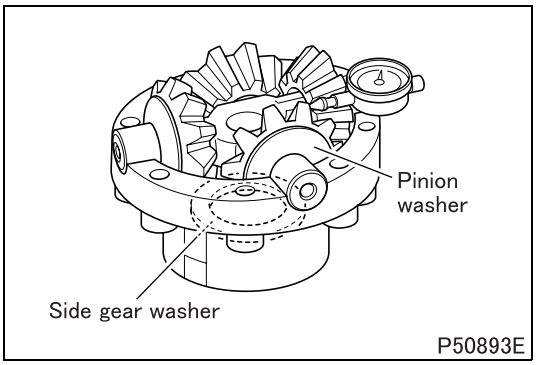
■ **Installation: Reduction gear and differential case LH**

- Apply rust preventive to the entire surface of the bolt. After applying it, blow off the excess rust preventive on the bolt by compressed air.
- Apply thread lock cement at the entry of bolt holes on differential case LH.
- Tighten the bolt to the specified torque.

CAUTION ⚠

- **Make sure to apply rust preventive when tightening the bolt to the specified torque.**
- **Wait at least one hour after installation before actually running the vehicle to let the thread lock cement harden.**
- **Wait at least four hours after installation before operating the vehicle at full torque to let the thread lock cement harden.**

◆Work after installation◆



■ **Inspection: Backlash between side gear and differential pinion**

- If the measured value deviates from the standard value, replace the side gear washer and pinion washer.
  Thickness of side gear washers available
  3.0 mm {0.11 in.} (one thickness)
  Thickness of pinion washers available
  1.6 mm {0.063 in.} (one thickness)

CAUTION ⚠

- **Use side gear washers of the same thickness for the right and left sides.**
- **Use pinion washers of the same thickness at four locations.**

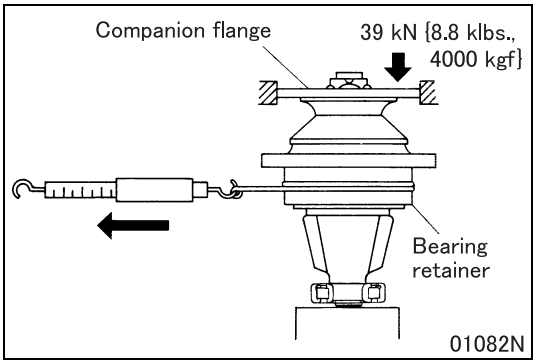
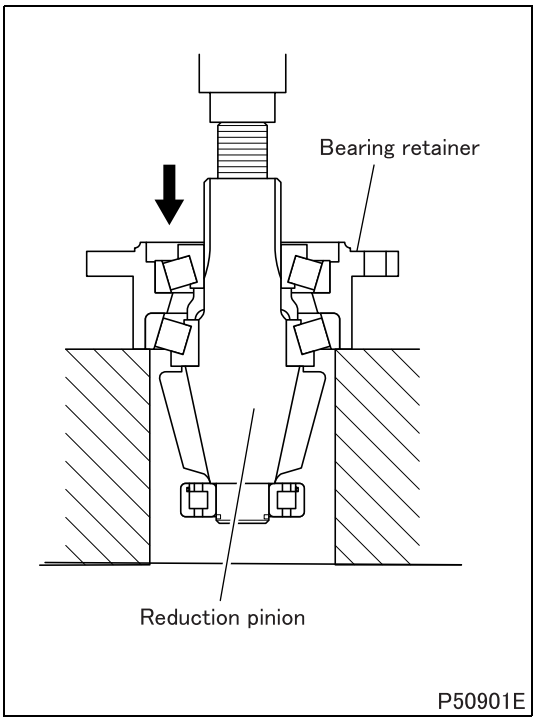
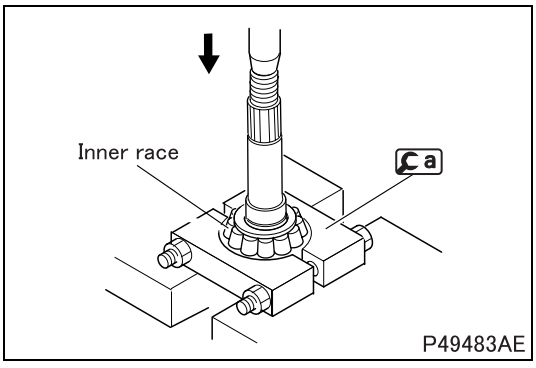
f	Pinion bearing installer A: ϕ99 {3.90}, B: ϕ88 {3.46}  01078	MH061264	Installation of rear bearing outer race

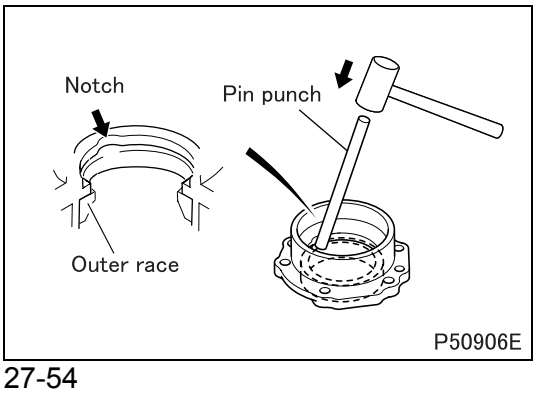
◆Work before removal◆



◆Removal procedure◆







■ **Inspection: Starting torque of pinion bearing**

- Apply the specified load to the companion flange or tighten the lock nut to the specified torque.
- Measure the tangential force at outer periphery point of the bearing retainer using a spring balancer.

CAUTION ⚠

- **Securely fix the companion flange to measure.**

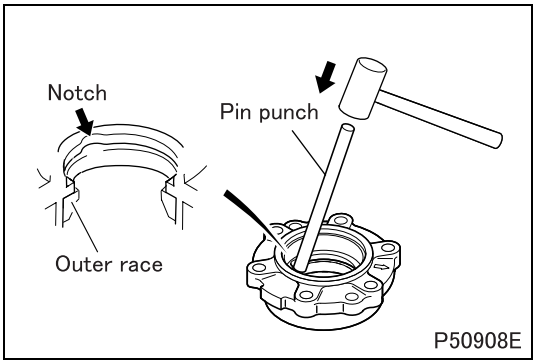
- If the measured tangential force is within the specified value, the starting torque conforms to the standard value.

■ **Removal: Reduction pinion**

■ **Removal: Rear bearing inner race**

■ **Removal: Front bearing outer race**

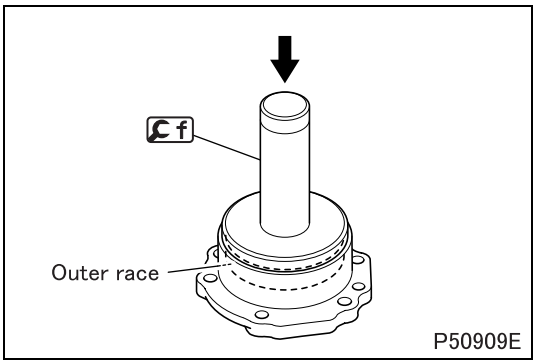
- Drive out the front bearing outer race by tapping evenly at three indented parts in the bearing retainer.



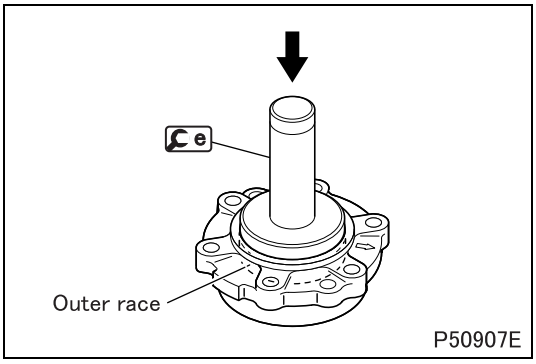
■ **Removal: Rear bearing outer race**

- Drive out the rear bearing outer race by tapping evenly at three indented parts in the bearing retainer.

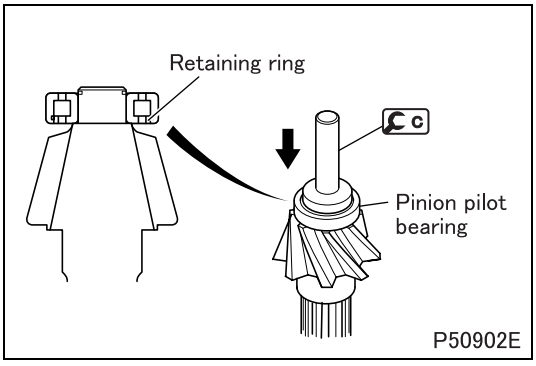
◆**Installation procedure**◆



■ **Installation: Rear bearing outer race**

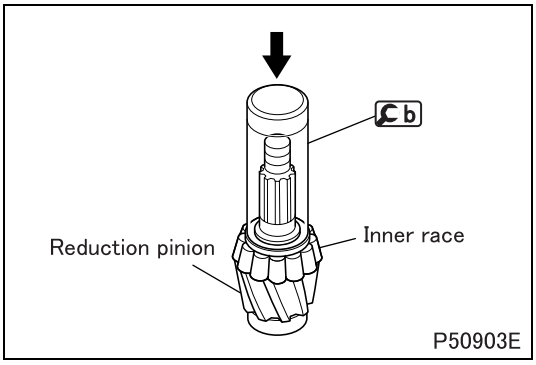


■ **Installation: Front bearing outer race**

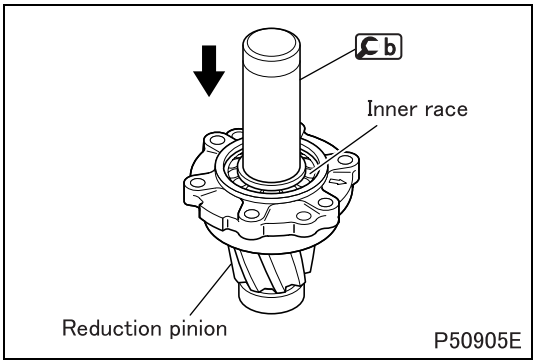


■ **Installation: Pinion pilot bearing**

- Install the pinion pilot bearing with its retaining ring placed on the gear.

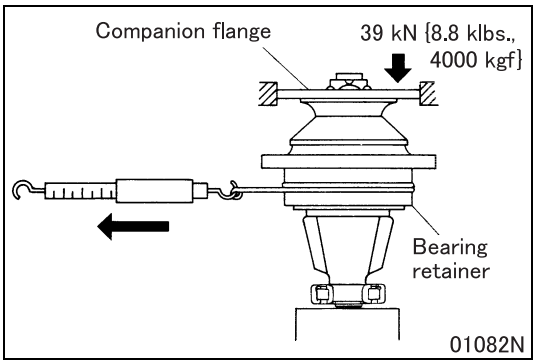


■ **Installation: Rear bearing inner race**



■ **Installation: Front bearing inner race**

- Install the front bearing inner race with the pinion assembled into the bearing retainer.



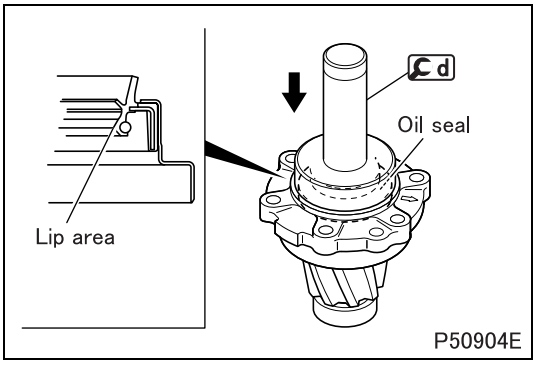
■ **Inspection: Starting torque of pinion bearing**

- Apply the specified load to the companion flange or tighten the lock nut to the specified torque.
- Measure the tangential force at outer periphery point of the bearing retainer using a spring balance.

CAUTION ⚠

- **Securely fix the companion flange to measure.**
- **Do not assemble the oil seal when measuring the tangential force.**

- If the measured tangential force is within the specified value, the starting torque conforms to the standard value.
- If the measured value deviates from the standard value, adjust by changing a collar.
  Thickness of collars available
  15.600 to 16.200 mm {0.61 to 0.64 in.} (25 thickness in 0.025 mm {0.00098 in.} increments)



■ **Installation: Oil seal**

- Apply grease to the lip area of the oil seal and install it on the bearing retainer in the illustrated direction.

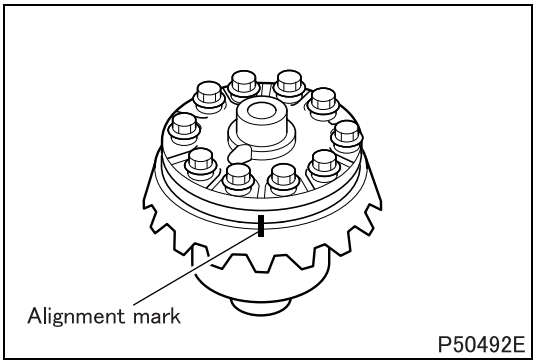
◆Work before removal◆

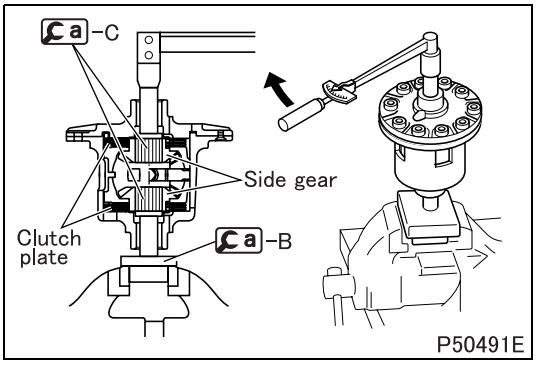


P50492E

■ **Alignment marks: Reduction gear and limited slip differential**

- Put alignment marks on the reduction gear and limited slip differential.

◆Inspection procedure◆



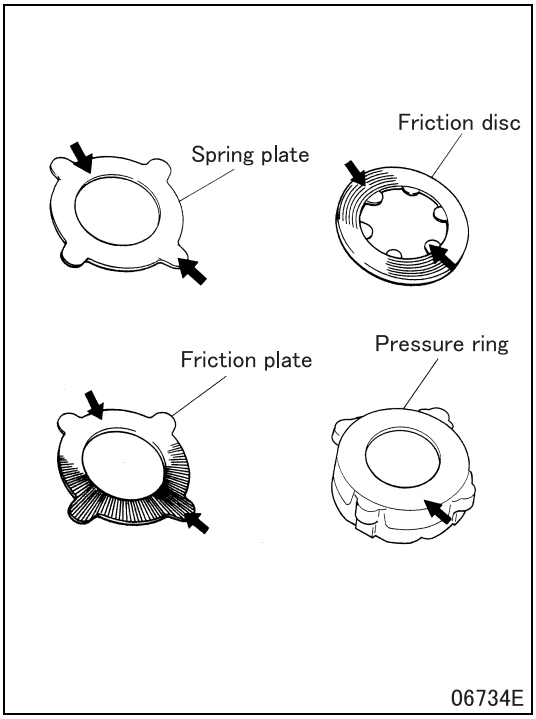
P50491E

■ **Inspection: Rotation torque of LSD clutch plate**

- After removing the reduction gear, carry out the following inspection.
- Measure the rotation torque to check for the friction force of the clutch plate.

NOTE

- **For measurement of rotation torque, rotate the side gears to sufficiently smooth their operation and measure the value during their rotation.**



■ **Inspection: Limited slip differential**

(1) Inspection of contacting and sliding surfaces

- If heat discoloration and remarkable wear are found on friction surfaces and sliding surfaces of the spring plates, spring discs, friction discs and friction plates, replace defective parts.

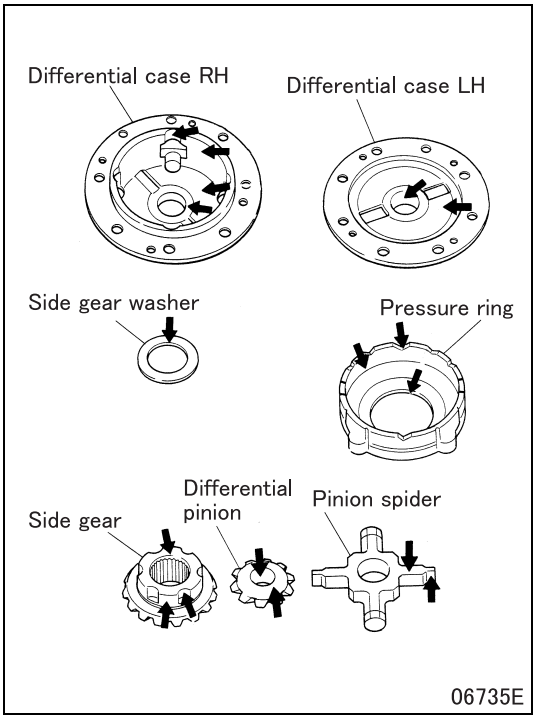
NOTE

- **Strong contact on the inner periphery of friction surfaces is caused by the spring force of each plate and disc. Do not mistake that it is caused by abnormal wear.**

- If cracks and damage are found on protrusions on the inside and outside periphery of the spring plates, friction discs and friction plates, replace defective parts.
- If dents and damage are found on the friction surfaces and sliding surfaces of the pressure rings to friction discs, polish them with an oilstone, and lap and correct them with a compound on a surface plate.

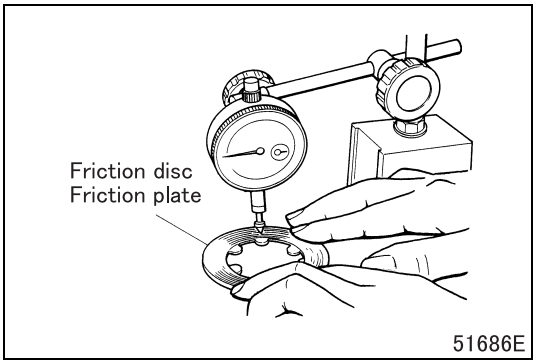
NOTE

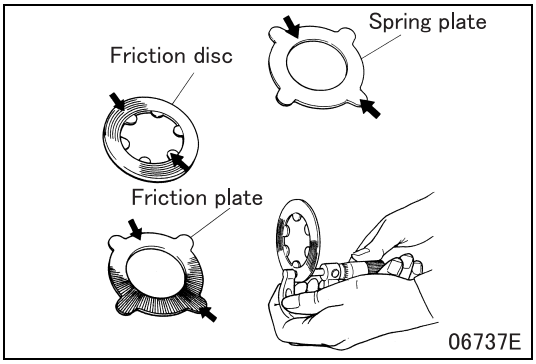
- **Strong contact on the inner periphery of friction surfaces is caused by the spring force of each plate and disc. Do not mistake that it is caused by abnormal wear.**
- Inspect contacting and sliding areas ← of the differential case LH, side gear washers, pressure rings, side gears, differential pinion, pinion spider and differential case RH, and correct burrs and dents with an oilstone.



(2) Inspection of distortion

- Apply a dial gauge to the friction disc and friction plate on a surface plate and measure their distortion (flatness) while turning them. If the measured value exceeds the limit, replace.





(3) Inspection of thickness

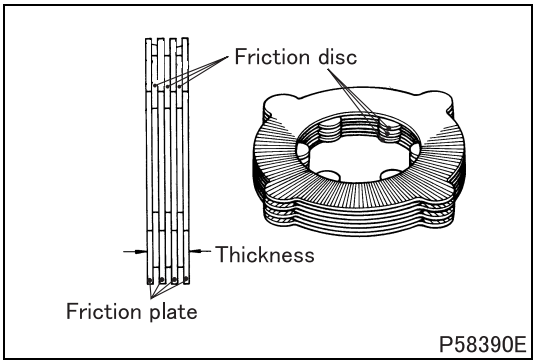
- Measure thickness of the friction surfaces and protrusions ⬅ of the spring plate, friction disc and friction plate, and find the difference. If it exceeds the limit, replace defective parts.

NOTE

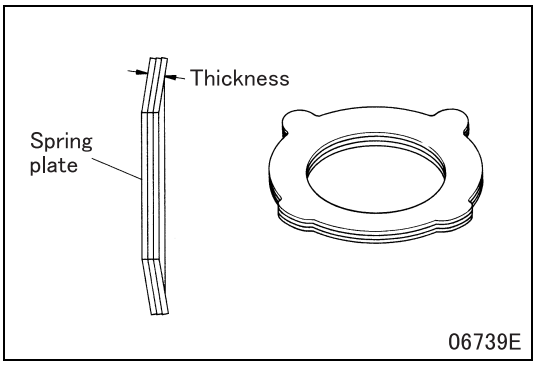
- **Take measurement at several points for each part.**

◆Work before assembly◆

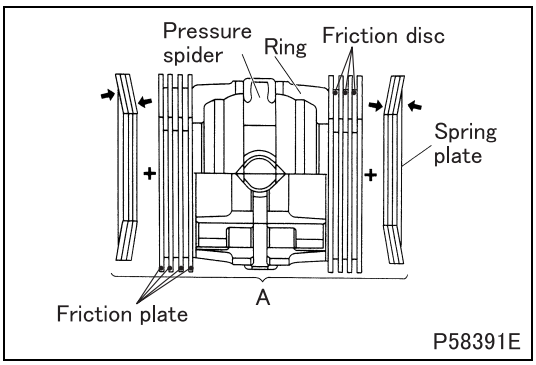
- Before assembling the limited slip differential, adjust the dimensional difference (friction force of clutch plate) in the axial direction and the clearance in the side gear axial direction, when assembling integral parts of the differential cases LH and RH, in the following procedure.



- Pile friction discs and friction plates as illustrated and measure thickness with a micrometer. Select the combination so that the difference in thickness between the right and left combination falls within the range of the standard value.
  Thickness of friction discs available
  1.9, 2.0, 2.1 mm {0.075, 0.079, 0.083 in.} (three sizes)
  Thickness of friction plates available
  2.0 mm {0.079 in.} (one size)



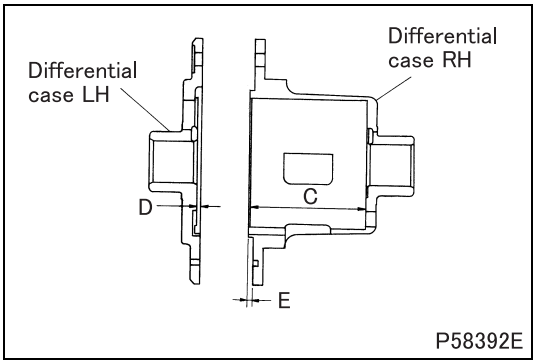
- Pile a spring plate and a spring disc as illustrated and measure thickness with a micrometer. Select the combination so that the difference in thickness between the right and left combination is as small as possible.
  Thickness of spring plates available
  2.0 mm {0.079 in.} (one size)



- Assemble the pressure rings, pinion spiders, friction discs, friction plates, spring plates and spring discs and measure overall width A with a micrometer.

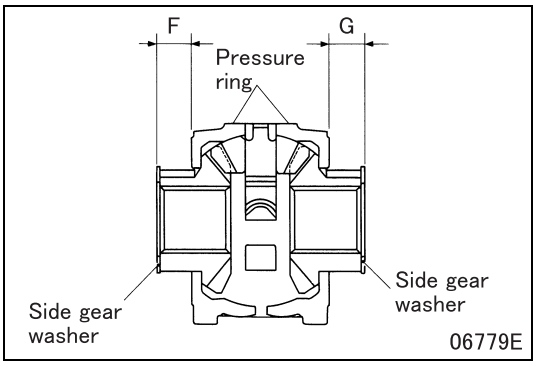
NOTE

- **Measure the overall width with the V-shaped groove of the pressure ring pressed against the pinion spider from both sides to obtain secure contact.**



- Find dimension B between spring plate contact faces when the differential cases LH and RH are combined.
  B=C+D–E

- If overall width A measured in the previous item and the clearance (B-A) between the differential cases LH and RH deviate from the standard value, adjust by changing a friction plate.
  Thickness of friction plates available
  1.9, 2.0, 2.1 mm {0.075, 0.079, 0.083 in.} (three sizes)

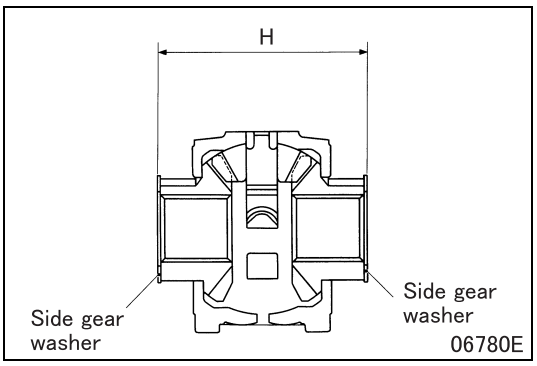


- After installing the side gear washers as illustrated, make sure that the difference between F and G dimensions from the back face of the pressure rings to the end face of the side gear washers falls within the range of the standard value.

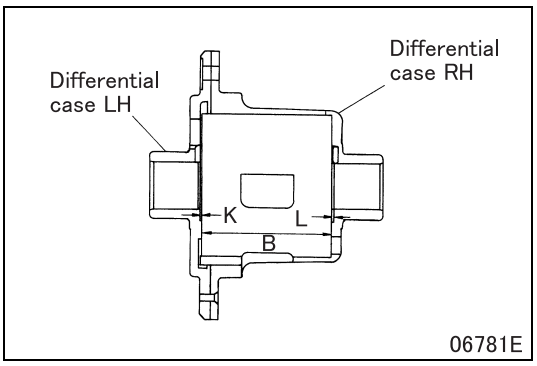
NOTE

- **Measure the dimensions with the V-shaped groove of the pressure ring pressed against the pinion spider from both sides to obtain secure contact.**

- If the difference in dimension deviates from the standard value, adjust by changing the side gear washer.
  Thickness of side gear washers available
  1.5, 1.6, 1.7 mm {0.059, 0.063, 0.067 in.} (three sizes)



- Measure overall width H.



- Find dimension J between side gear washer contact faces when the differential cases LH and RH are combined.
  J=B+K+L

NOTE

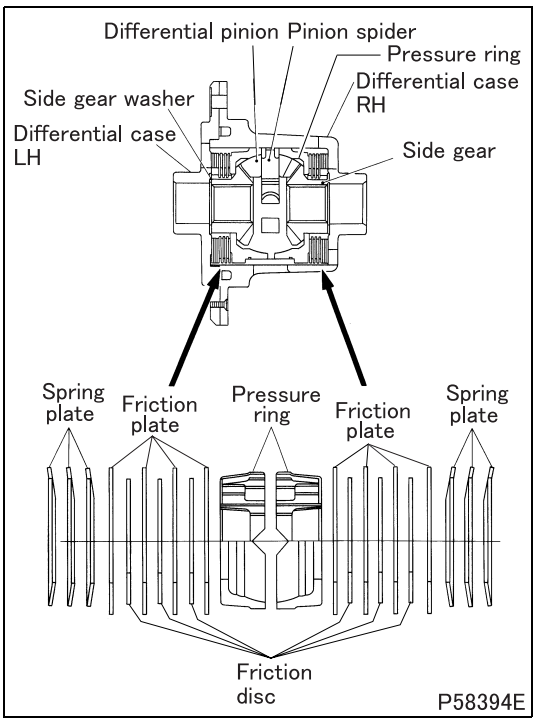
- **For dimension B, refer to the difference between spring plate contact surfaces found in the previous item when the differential cases LH and RH are combined.**

- Check that clearance in the side gear axial direction is within the range of the standard value.
- If the clearance deviates from the standard value, adjust by changing the side gear washer.
  Thickness of side gear washer available
  1.5, 1.6, 1.7 mm {0.059, 0.063, 0.067 in.} (three sizes)

NOTE

- **Select side gear washers so that the right and left dimensional difference from the back face of the pressure rings to the end face of the side gear washers conforms to the standard value.**

◆Assembly procedure◆

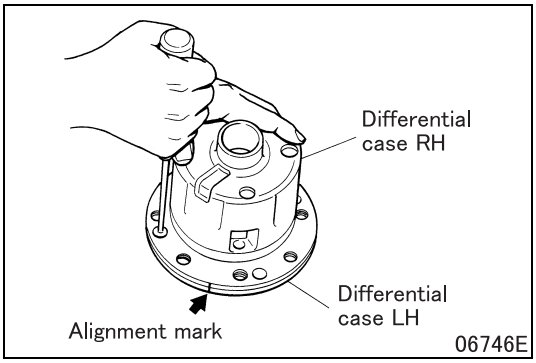


■ **Assembly: LSD (Limited Slip Differential)**

- Assemble each part into the differential case RH in the illustrated direction.

NOTE

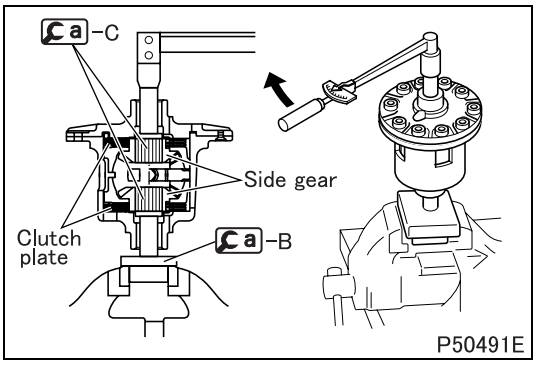
- **Take care not to install the friction discs and friction plates in a wrong sequence and the spring plates in a wrong direction.**
- **When assembling, apply gear oil to each part. Especially, apply gear oil carefully to contact surfaces and sliding surfaces.**



- Aligning the alignment mark (the same Arabic numeral) of the differential case LH with that of the differential case RH, tighten screws in the diagonal sequence gradually and evenly.

NOTE

- **If the differential cases LH and RH do not contact positively each other even after screws have been tightened fully, improperly assembled side gear washers and spring plates are suspected. In that case, reassemble these parts.**



■ **Inspection: Rotation torque of limited slip differential clutch plate**

- After assembling LSD, carry out the following inspection.
- Measure the rotation torque to check for the friction force of the clutch plate.

NOTE

- **For measurement of rotation torque, rotate the side gears to sufficiently smooth their operation and measure the value during their rotation.**

- If the measured value deviates from the standard value, replace defective parts of the internal components.

SPECIFICATIONS 31-2

TROUBLESHOOTING 31-3

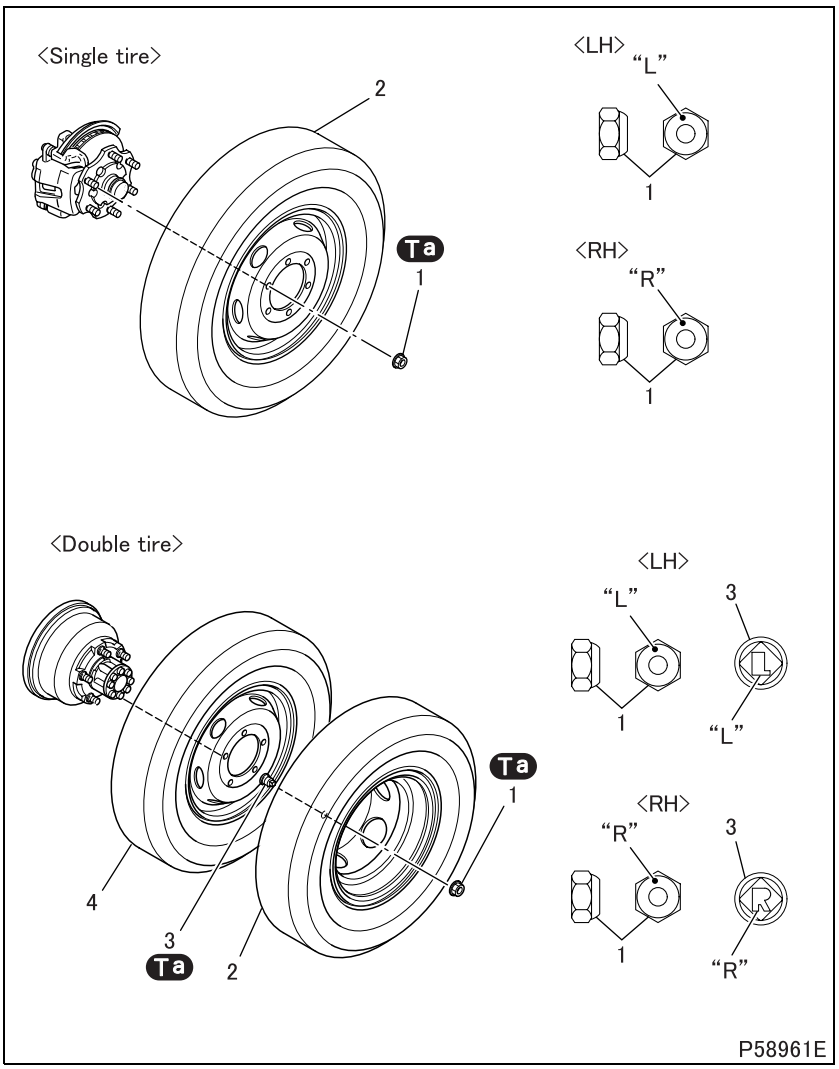
WHEEL AND TIRE 31-4

SPECIFICATIONS

Tire size	Wheel type
215/85R16	16 × 6K-127
215/75R17.5	17.5 × 6.00-127
235/85R16	16 × 6K-135

- Tire pressures specified for each tire size are shown on the tire pressure label.

Symptoms / Possible causes			Tire tread wear										Reference Gr
			Both shoulders worn	Center worn	Outside worn	Inside worn	Worn in feather pattern from outside in	Worn in feather pattern from inside out	Worn in wave pattern	Worn in concave (one spot or more)	Worn in pit over the entire periphery	Worn in serration	
Overload			O										
Tire pressure		Too low	O						O	O	O	O	
		Too high		O									
Wheel alignment	Toe-in	Excessive			O		O						Gr26
		Insufficient				O							
	Camber	Excessive			O								
		Insufficient				O							
	Excessive toe-out					O		O					
	Multiple misalignment		O		O	O	O	O	O	O	O		
Knuckle arm bent					O	O	O	O					
Left and right tie-rods different in length							O						
Wheels out of balance									O	O	O	O	
Wheel bearing loose									O	O	O	O	Gr26, 27
Ball joint loose										O			Gr26
Tie-rod end loose										O			Gr37
Brake drum eccentrically mounted <Drum brake>										O	O		Gr26B, 27
Axle bent									O	O			Gr26, 27
Left and right wheels steered at improper angles												O	Gr26
Hard acceleration, braking, or steering												O	
Specific road surface conditions					O	O							



CAUTION ⚠

- **Use right-hand threaded wheel nuts marked "R" for right side wheels and left-hand threaded wheel nuts marked "L" for left side wheels.**

●Removal sequence

1 Wheel nut <Single tire>
Wheel nut (outer) <Double tire>
2 Tire (See later section.)
3 Wheel nut (inner) <Double tire>
4 Tire <Double tire>
(See later section.)

●Installation sequence

Follow the removal sequence in reverse.

CAUTION ⚠

- **The wheel nuts are designed to be tightened without any coating of grease. Never grease the wheel nuts. Even if tightened to the specified torques, greased wheel nuts can become loose.**

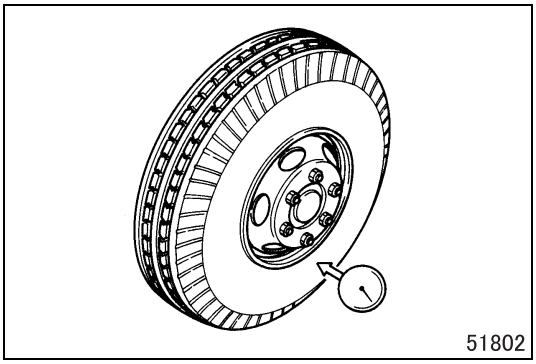
Service standards (Unit: mm {in.})

Location	Maintenance item	Standard value	Limit	Remedy
2, 4	Tire lateral runout (sideway deflection)	3.5 {0.14} or less	–	Correct or replace

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

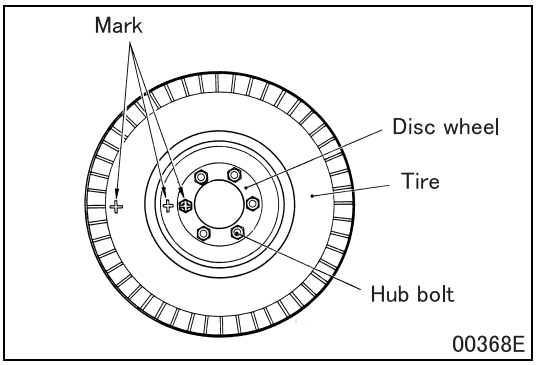
Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Wheel nut	490 ± 49 {360 ± 36, 50 ± 5.0}	–

◆Inspection procedure◆



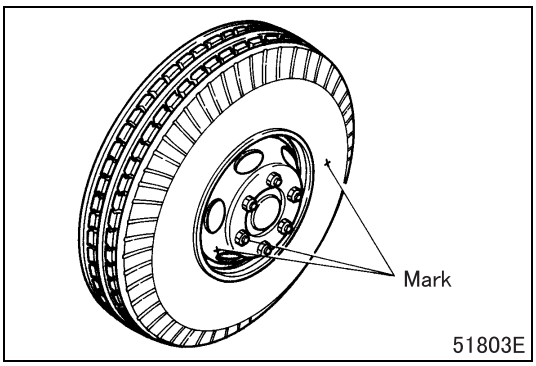
■ **Inspection: Tire**

- Measure the tire for lateral runout (sideway deflection).
- If the measured value is equal to or exceeds the standard value, correct as follows.



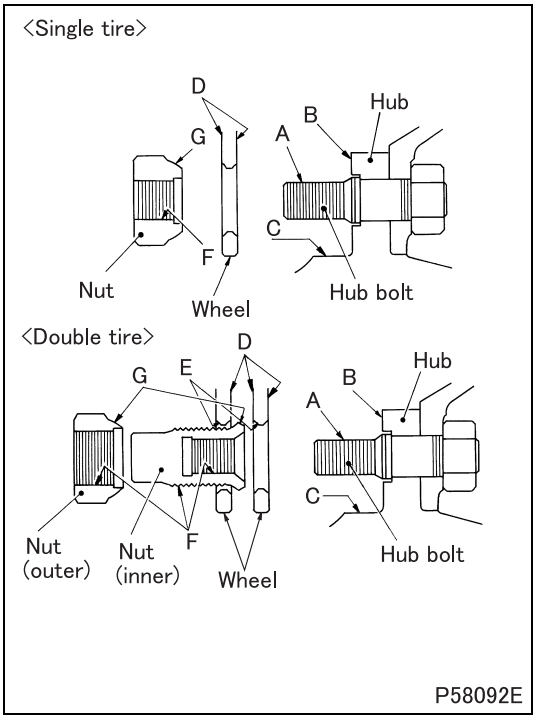
■ **Correction: Tire**

- Mark the tire, disc wheel, and one of the hub bolts in the illustrated locations.
- Remove the tire from the disc wheel.



- Measure the disc wheel for lateral runout.
- If the disc wheel's maximum runout is located near the mark on the wheel, install the tire such that the mark on the tire is 180° away from the mark on the disc wheel.
- Measure the tire again for lateral runout.
- If the measured value still does not conform to the standard value, replace the tire.

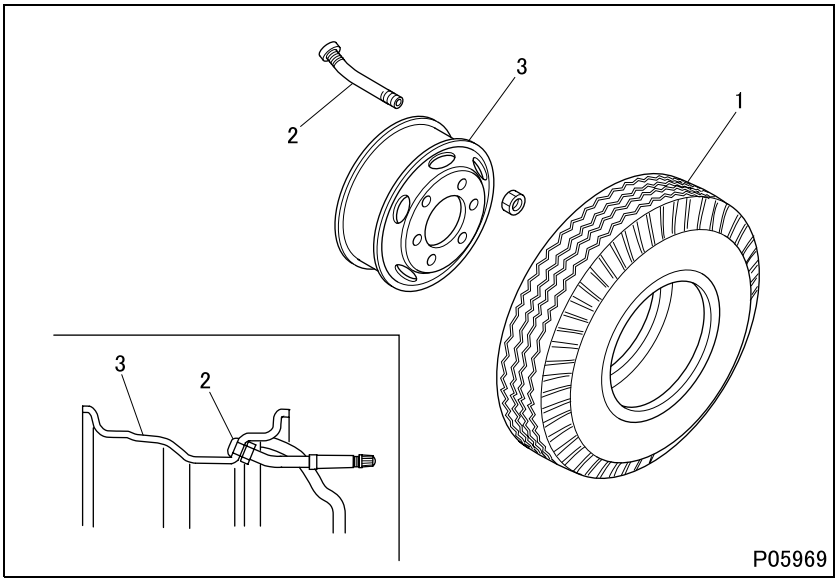
◆Installation procedure◆



■ Installation: Tire

- To prevent hardware and parts from becoming loose and/or damaged, thoroughly clean the following areas, removing rust, dirt, paint and foreign matter, before installing the tire.
  - A: Threaded portion of hub bolt
  - B: Wheel mounting surface of hub
  - C: Wheel alignment area of hub
  - D: Mating surfaces of disc wheel
  - E: Wheel nut mounting surface of disc wheel
  - F: Threaded portion of wheel nut
  - G: Spherical portion of wheel nut

Tire



●Disassembly sequence

1 Tire
2 Air valve
3 Disc wheel

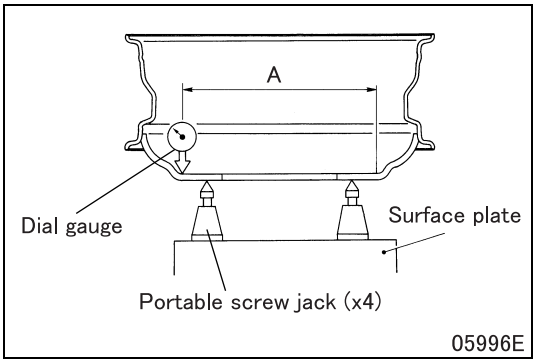
●Assembly sequence

Follow the disassembly sequence in reverse.

Service standards (Unit: mm {in.})

Location	Maintenance item		Standard value	Limit	Remedy
–	Tire assembly static unbalance tolerance		70 g {2.47 oz} or less	–	Correct
3	Disc wheel	Flatness (at hub surface)	0.3 {0.012} or less	–	Replace
		Lateral runout (sideway deflection)	1.5 {0.059} or less	–	
		Radial runout (vertical deflection)	1.5 {0.059} or less	–	

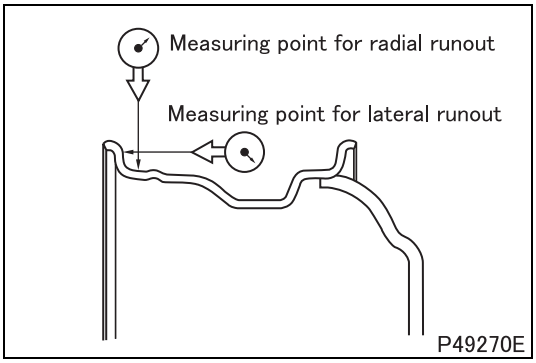
◆Inspection procedure◆



■ **Inspection: Disc wheel**

(1) Flatness

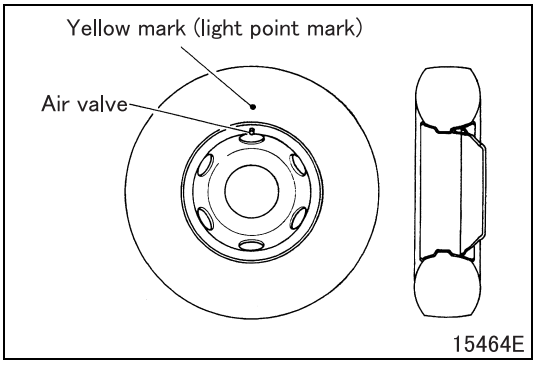
- Using a dial gauge, measure the disc wheel for flatness (difference between the maximum and minimum values measured) at specified distance A from the center of the wheel, at 5 locations for 5-stud units and 6 locations for 6-stud units that are equally divided around the specified circumference on the wheel.
  A: ϕ170 mm, 270 mm {6.69, 10.6 in.} 16 × 6K-127
  16 × 6K-135
  ϕ175 mm, 275 mm {6.89, 10.8 in.} 17.5 × 6.00-127
- If the measured flatness is equal to or exceeds the specified value, replace the disc wheel.



(2) Runout

- If the measured value is equal to or exceeds the standard value, replace the disc wheel.

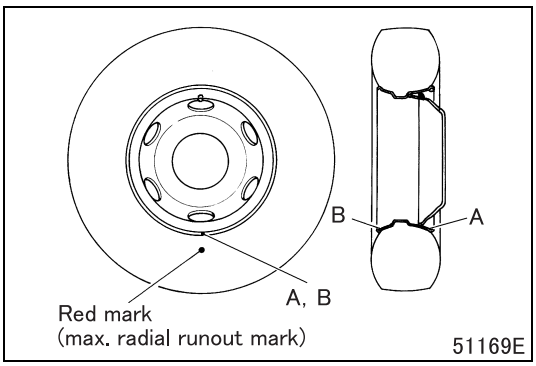
◆Installation procedure◆



■ **Installation: Tire**

<Tire with no red mark>

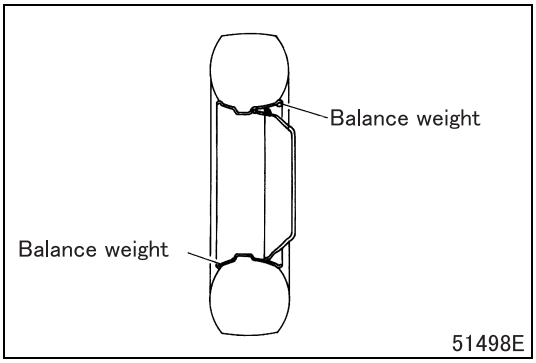
- Install the tire such that the yellow mark (light point mark) on the tire is aligned with the air valve on the disc wheel.



<Tire with red mark>

- Install the tire such that the red mark (max. radial runout mark) on the tire is aligned with mark A or B on the disc wheel.
  A: Front face of disc wheel <All wheels except 17.5-inch wheel>
  B: Back face of disc wheel <17.5-inch wheel>

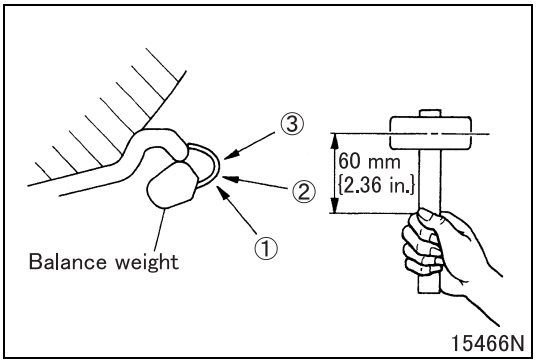
◆Installation procedure◆



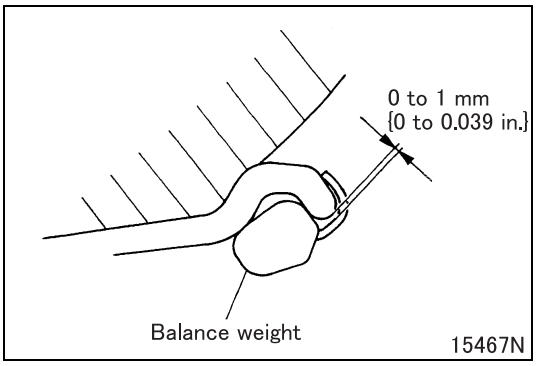
■ **Installation: Balance weight**

- Install balance weights onto the front and back sides of the disc of the tires listed in the table below. Ensure that the static unbalance of the tire being balanced remains within the standard value.

Tires being balanced	Vehicle model
Tires on front axle	FE
Tires on front axle, tires on rear axle	FG



- Use a 1-pound resin hammer to drive balance weights into position.
- To install a balance weight, tap the clip of the weight in the center at 1, 2 and 3 in that order.



- Leave a clearance of approx. 0 to 1 mm {0 to 0.039 in.} between the clip and the disc wheel. Ensure that the balance weight is not loose after installation.
- Do not use a balance weight that has been improperly tapped or dropped to the floor during installation attempt.
- When 2 weights are being installed, these weights should be as much equal to each other as possible in weight. Also remember that the center point between the weights will become the support point for a balancer.

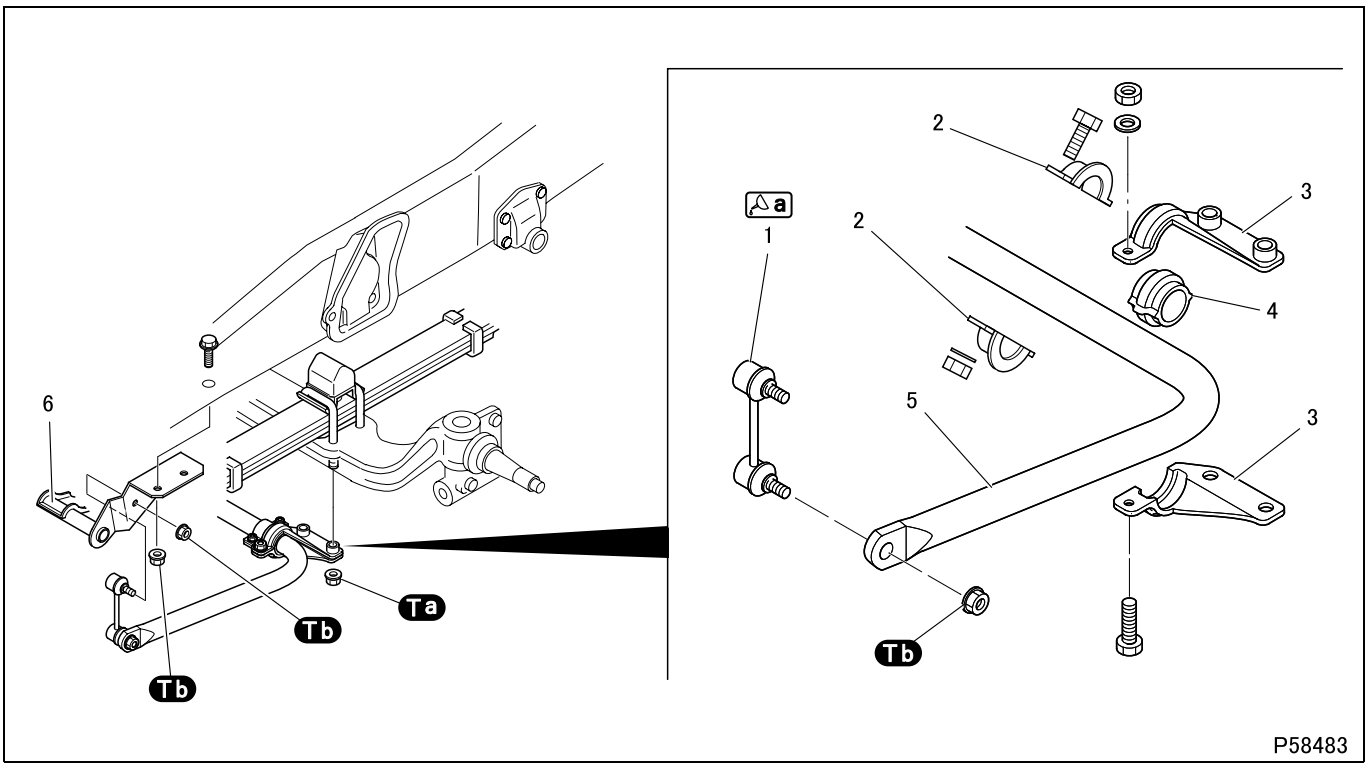
STABILIZER



● **Removal sequence**

1 Stabilizer link
2 Stabilizer retainer
3 Stabilizer clamp
4 Stabilizer bushing
5 Stabilizer bar
6 Stabilizer bar bracket

● **Installation sequence**

Follow the removal sequence in reverse.

Service standards (Unit: mm {in.})

Location	Maintenance item		Standard value	Limit	Remedy
1	Stabilizer link	Starting torque	0.68 to 1.96 N·m {0.5 to 1.4 ft.lbs, 0.7 to 2.0 kgf·m}	–	Replace
		Play	0.2 {0.0079} or less	–	

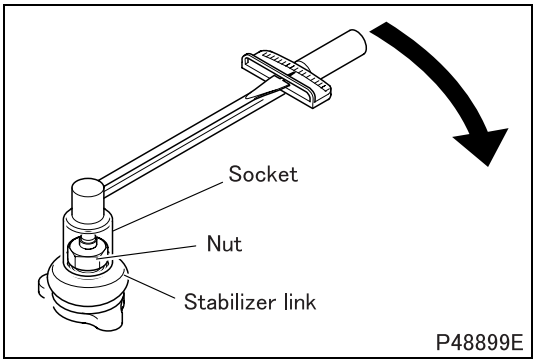
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Nut (U-bolt mounting)	162 ± 15 {120 ± 11, 16.5 ± 1.5}	–
Tb	Nut (stabilizer mounting)	90 to 120 {66 to 89, 9.0 to 12}	–
	Nut (stabilizer link mounting)		
	Nut (stabilizer bar bracket mounting)		

Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Dust cover lips on stabilizer link	Mitsubishi wheel bearing grease [NLGI No. 2 (Li soap)]	As required

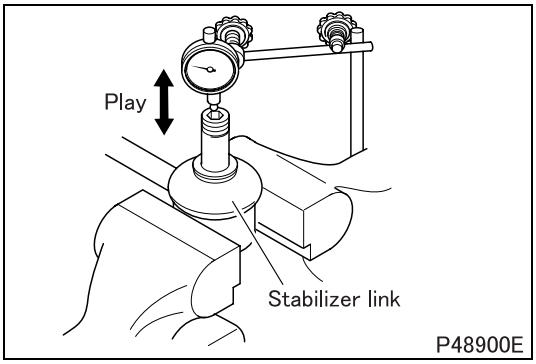
◆Inspection procedure◆



■ **Inspection: Stabilizer link**

(1) Starting torque

- Install a nut onto the stabilizer link.
- Install a socket and a torque wrench onto the nut. Measure the starting torque of the stabilizer link.
- If the measured value does not conform to the standard value, replace the stabilizer link.



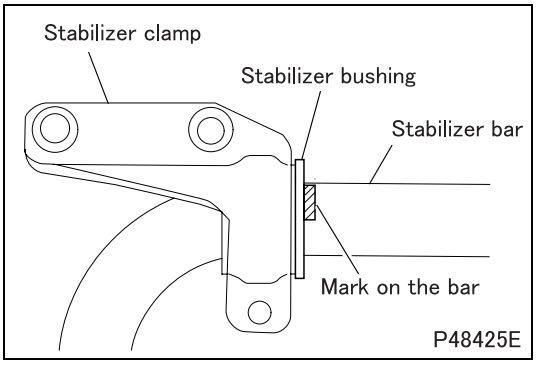
(2) Play

- If the measured value does not conform to the standard value, replace the stabilizer link.

(3) Dust cover

- If the dust cover has wear, crack, or damage, replace the stabilizer link.

◆Installation procedure◆



■ **Installation: Stabilizer clamp and bushing**

- Position the stabilizer bushing onto the stabilizer bar such that the end of the bushing aligns with the mark on the bar. Clamp them in place with the stabilizer clamp.

13 Spacer

⊗: Non-reusable parts

●Installation sequence

Follow the removal sequence in reverse.

CAUTION ⚠

- **U-bolt and mounting nut are non-reusable. <FE85>**
- **Make sure to jack the vehicle up when tightening the U-bolt mounting nut to specified torque.**
- **Make sure to tighten the U-bolt mounting nut in dry tightening. If putting any oil or solvent on the nut, never use it.**

NOTE

- **The right-hand and left-hand leaf spring assemblies have different cambers from each other. Ensure that both assemblies are installed correctly. Reversed installation results in a slanted vehicle.**

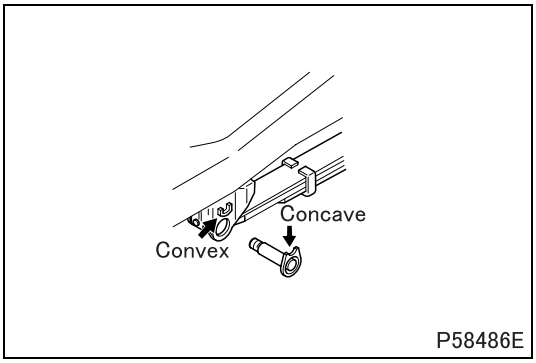
Service standards (Unit: mm {in.})

Location	Maintenance item	Standard value	Limit	Remedy
3 to 5	Clearance between spring pin and rubber bushings	0 to 0.03 {0.0012}	–	Replace
7 to 11	Clearance between spring shackle and rubber bushings	0 to 0.03 {0.0012}	–	Replace

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

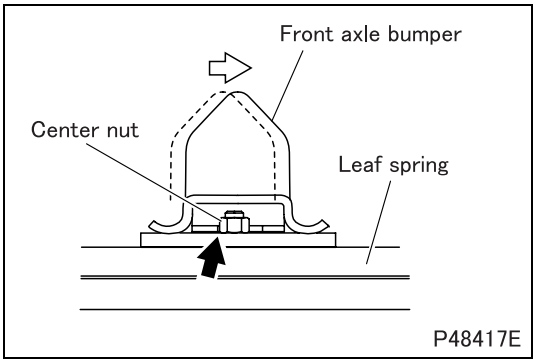
Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Nut (U-bolt mounting)	162 ± 15 {119 ± 11, 16.5 ± 1.5}	Nut color: Yellow
Tb	Nut (U-bolt mounting)	175 ± 5 {129 ± 3.7, 17.8 ± 0.5}	Nut color: Green

◆Installation procedure◆



■ **Installation: Spring pin**

- Install the spring pin such that the concave on the pin engages with the convex on the frame.

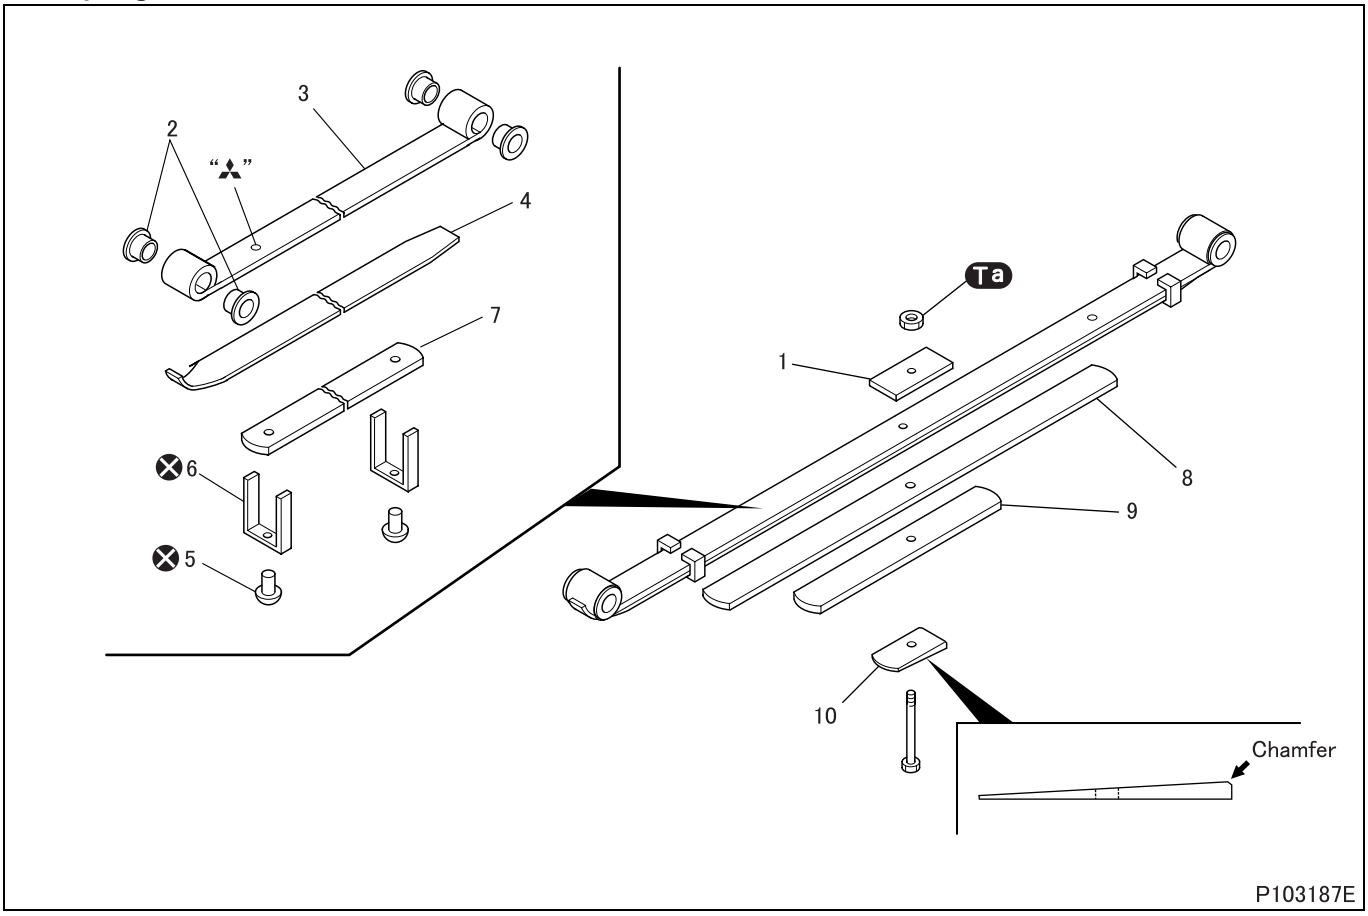


■ **Installation: Front axle bumper**

- With the unloaded vehicle, slide the front axle bumper on the leaf spring to the rear of the vehicle until it is against the center nut of the leaf spring. Then, install the bumper using U-bolts.

LEAF SPRING <FE>

Leaf Spring



- The above schematic is only an example. Details may differ depending on vehicle models, such as the number of spring leaves, spacers, and the parts used.

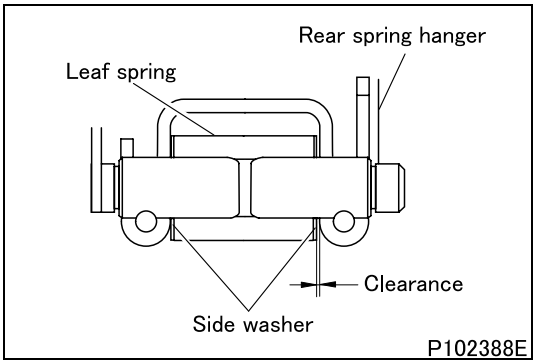
◆Inspection procedure◆



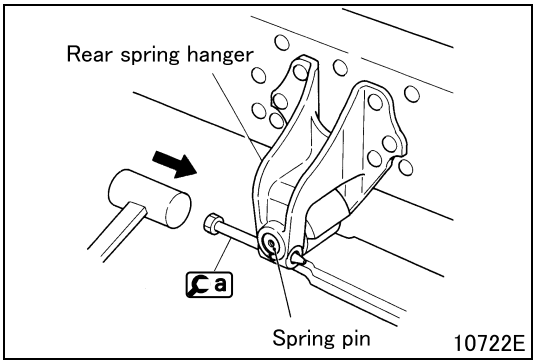
■ **Inspection: Clearance between rear spring hanger and leaf spring**

- Measure the spring-to-hanger clearance using feeler gauge. If the measured value is equal to or exceeds the limit, adjust by means of side washers.

Side washer sizes available (mm {in.})

FE (except FE84DHW)	2.8, 3.2, 3.5, 3.8, 4.0 {0.11, 0.13, 0.14, 0.15, 0.16}
FE84DHW, FG	0.5, 1.0 {0.020, 0.039}

◆Installation procedure◆



■ **Installation: Spring pin**

<FE (except FE84DHW)>

- Using a, align the bolt hole in the rear spring hanger with the bolt groove in the spring pin.

<FE84DHW, FG>

- Substitute an appropriate bolt or the like for a.

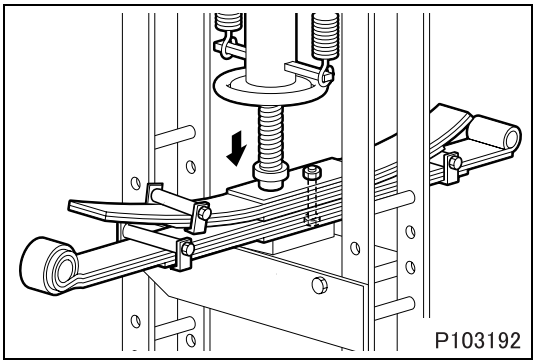
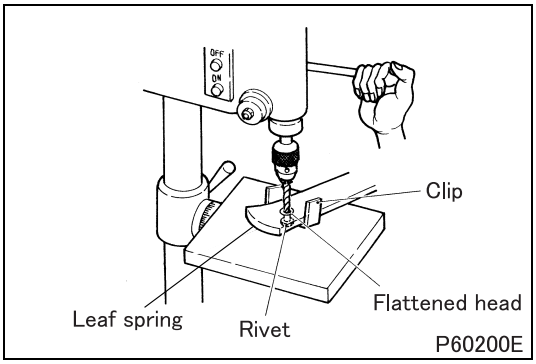
◆Work before removal◆



■ Compression: Leaf spring

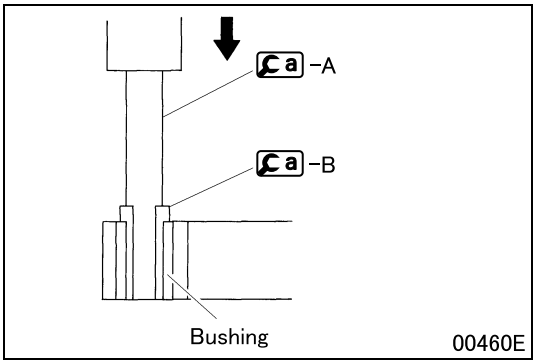
- Using a press, compress the leaf spring as illustrated for subsequent operations.
- Using a chisel or the like, open the bent ends of the clip. <Bent type>

◆Removal procedure◆



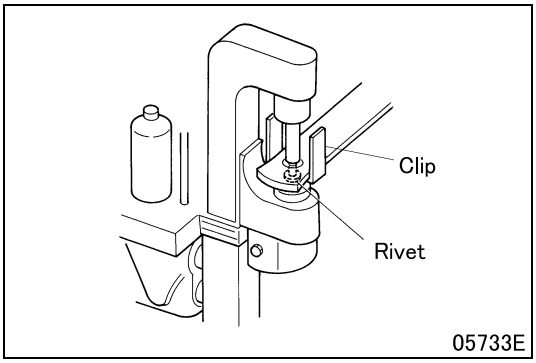
■ Removal: Clip

- Using a drill press, break the flattened head of the rivet and remove the clip from the leaf spring.



■ **Removal: Metal bushing**

◆**Installation procedure**◆

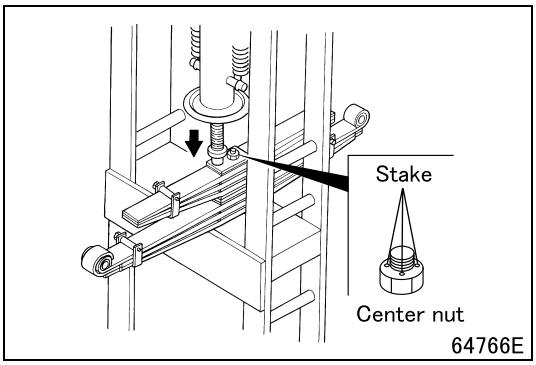


■ **Installation: Clip**

- Using a riveting machine, rivet a clip onto the leaf spring.

■ **Installation: Metal bushing**

- Install the metal bushing in a manner similar to that for removal. (See **"■Removal: Metal bushing"**.)



■ **Installation: Leaf spring**

- Pass the bolt to hold the leaf springs together.
- Stack the leaf springs tightly using a press and tighten the nut to the specified torque.
- After installing the nut, stake it at three locations.

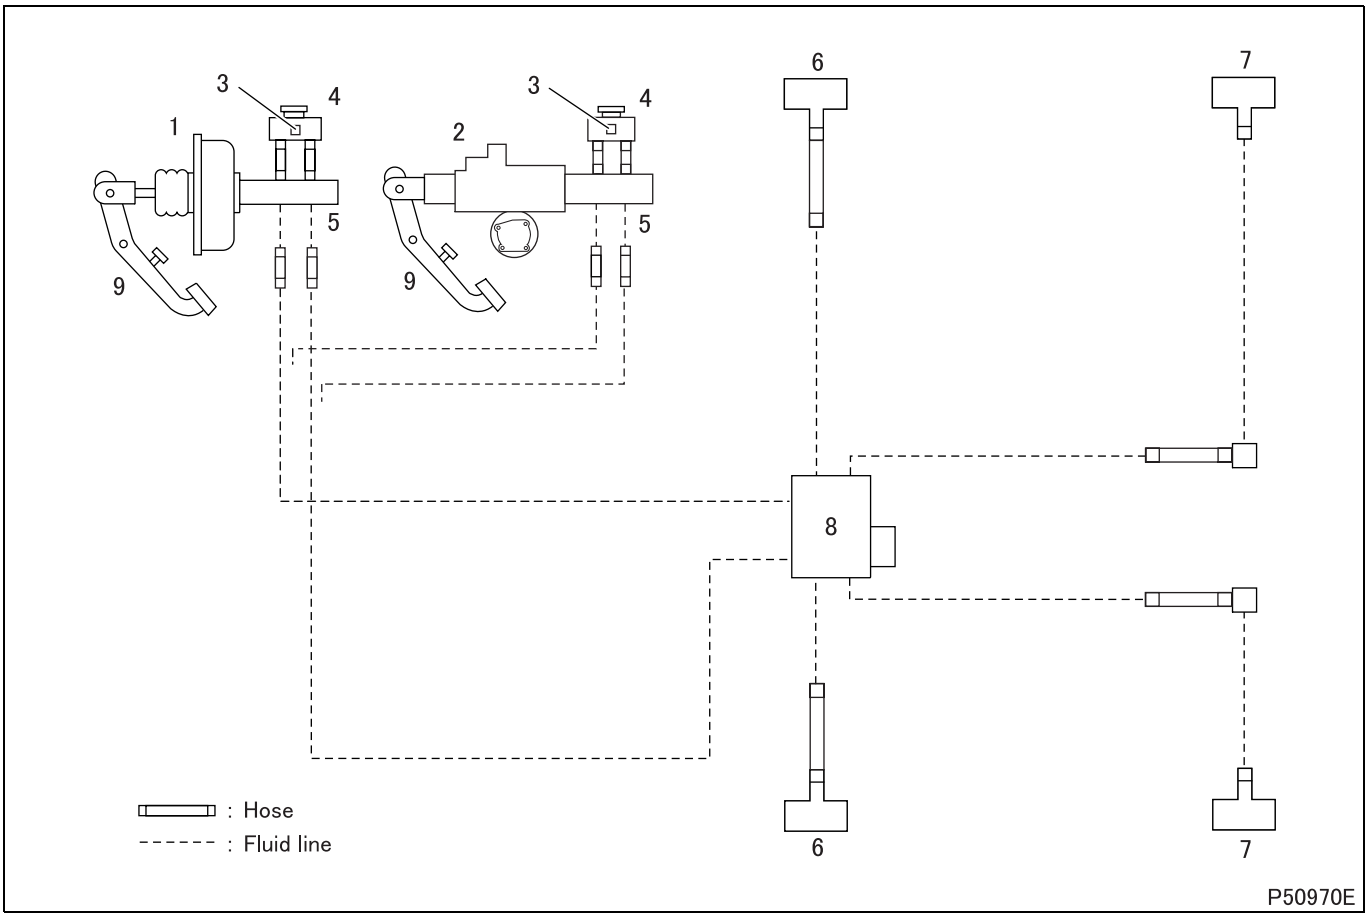
1. Brake System

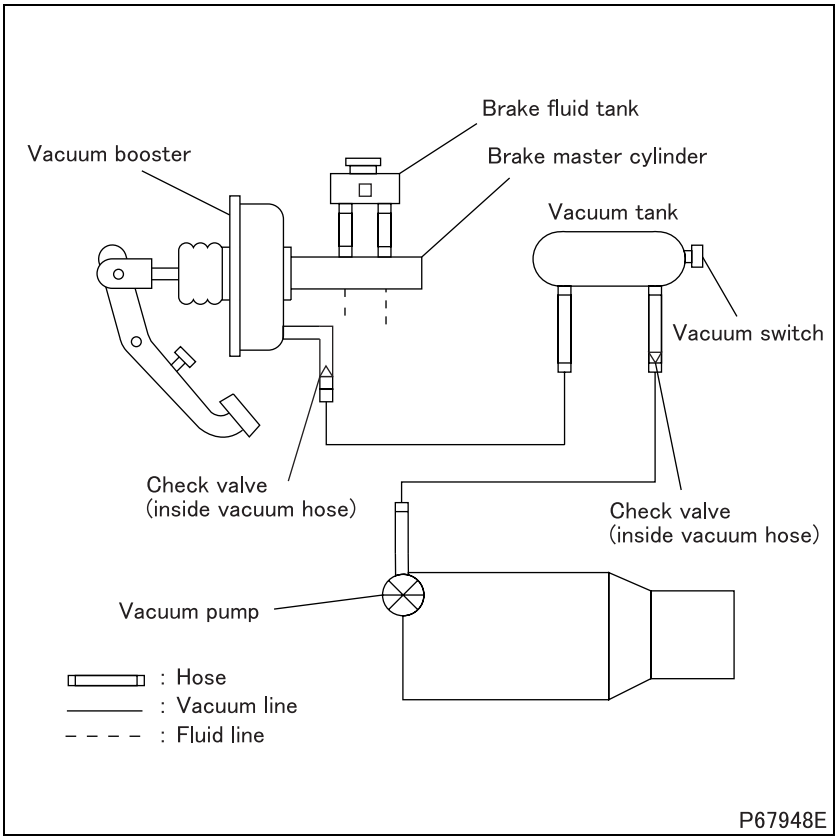
1.1 Brake fluid line



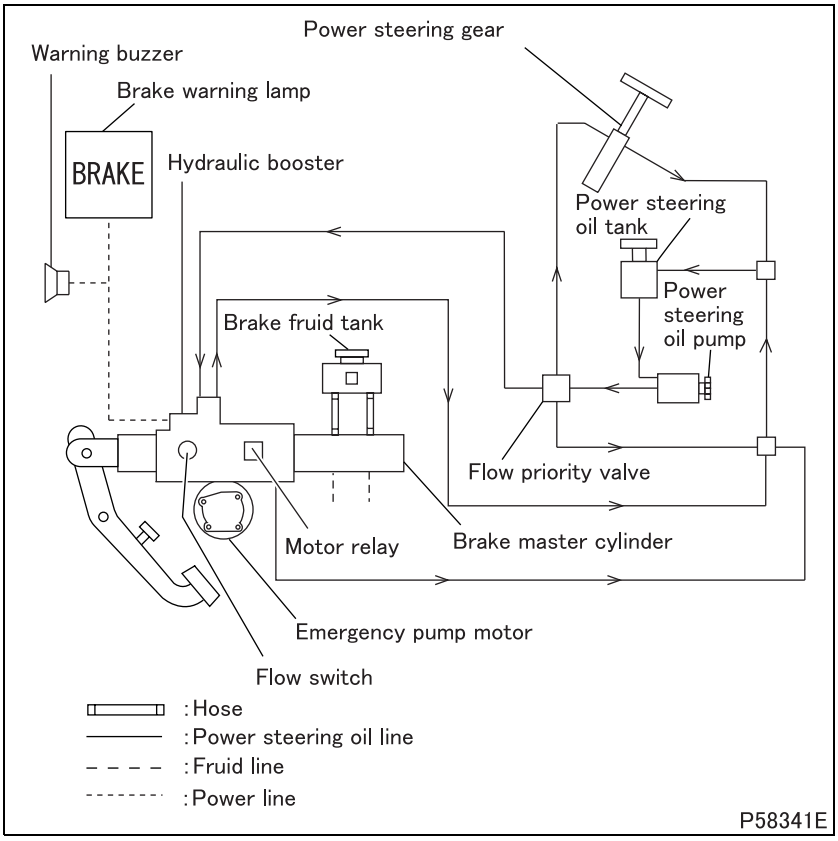
1 Vacuum booster <Except FE85>
2 Hydraulic booster <FE85>
3 Brake fluid level switch
4 Brake fluid tank
5 Brake master cylinder
6 Front wheel brake
7 Rear wheel brake
8 Hydraulic unit (anti-lock brake system)
9 Stop lamp switch

- The brake system incorporating the vacuum booster uses vacuum to provide servo-assisted braking to all wheels of the vehicle onto which it is mounted. <Except FE85>
- The brake system incorporating the hydraulic booster uses the power steering oil pump pressure to provide servo-assisted braking to all wheels of the vehicle onto which it is mounted. <FE85>

1.2 Vacuum booster line <Except FE85>



1.3 Hydraulic booster line <FE85>



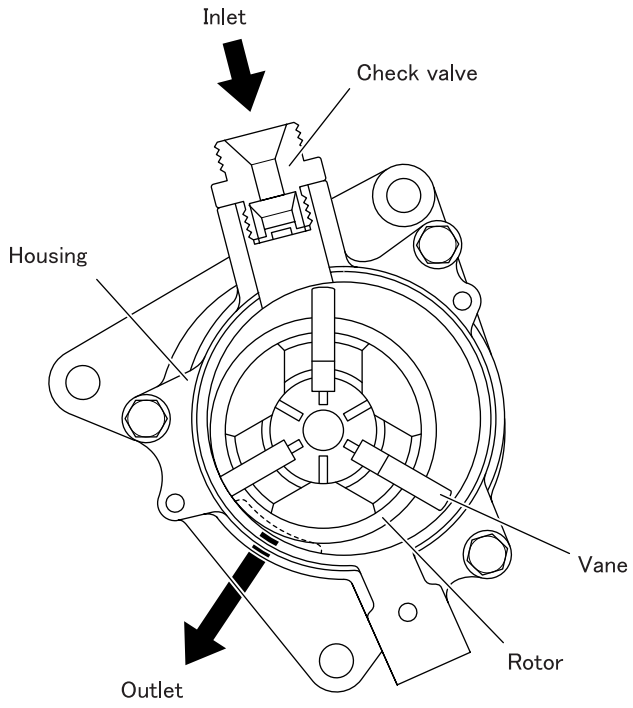
- The stepping force applied on the brake pedal is boosted by the hydraulic booster which operates on the pressure provided by the power steering oil pump.
- When brakes are applied hard while the steering wheel is turned, the associated steering shock is dampened by the flow priority valve in the system.
- When engine stall, power steering oil pump failure, or oil leakage from the power steering line causes oil pressure to drop, the flow switch detects this. This causes the motor relay to switch over, providing power to the emergency pump motor which then turns to generate emergency oil pressure.

- The emergency pump motor operates only when the brake pedal is pressed. The motor has various operating modes, as summarized below.

Starter switch	Engine	Parking switch	Warning		Power steering oil pressure	Emergency pump motor O: ON ×: OFF	Vehicle state
			Brake warning lamp O: ON ×: OFF	Warning buzzer O: ON ×: OFF			
ON	Run	ON (pulled)	O	×	Available	×	Normal
			O	×	Not available	O	* Oil leakage from power steering line
		OFF (released)	×	×	Available	×	Normal
			O	O	Not available	O	* Oil leakage from power steering line
	Stop	ON (pulled)	O	×		O	At engine start
						O	Engine stalled at uphill start
		OFF (released)	O	O		O	Engine stall
OFF		ON (pulled)	×	×		O	Vehicle moved after parked (parking brake lever pulled insufficiently)
		OFF (released)	×	×		O	Engine stopped before vehicle came to complete halt

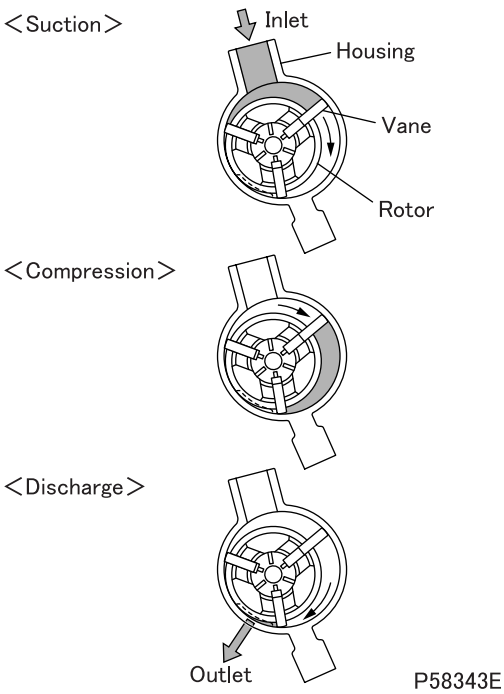
*: The failsafe feature of the hydraulic booster cuts off oil supply to the power steering line to maintain oil pressure.

2. Vacuum Pump



P58342E

- The vacuum pump is mounted onto the timing gear case, and is driven by the idler gear.
- The check valve is provided to ensure that no air or engine oil flow from the vacuum pump back to the vacuum tank when the engine is stationary.

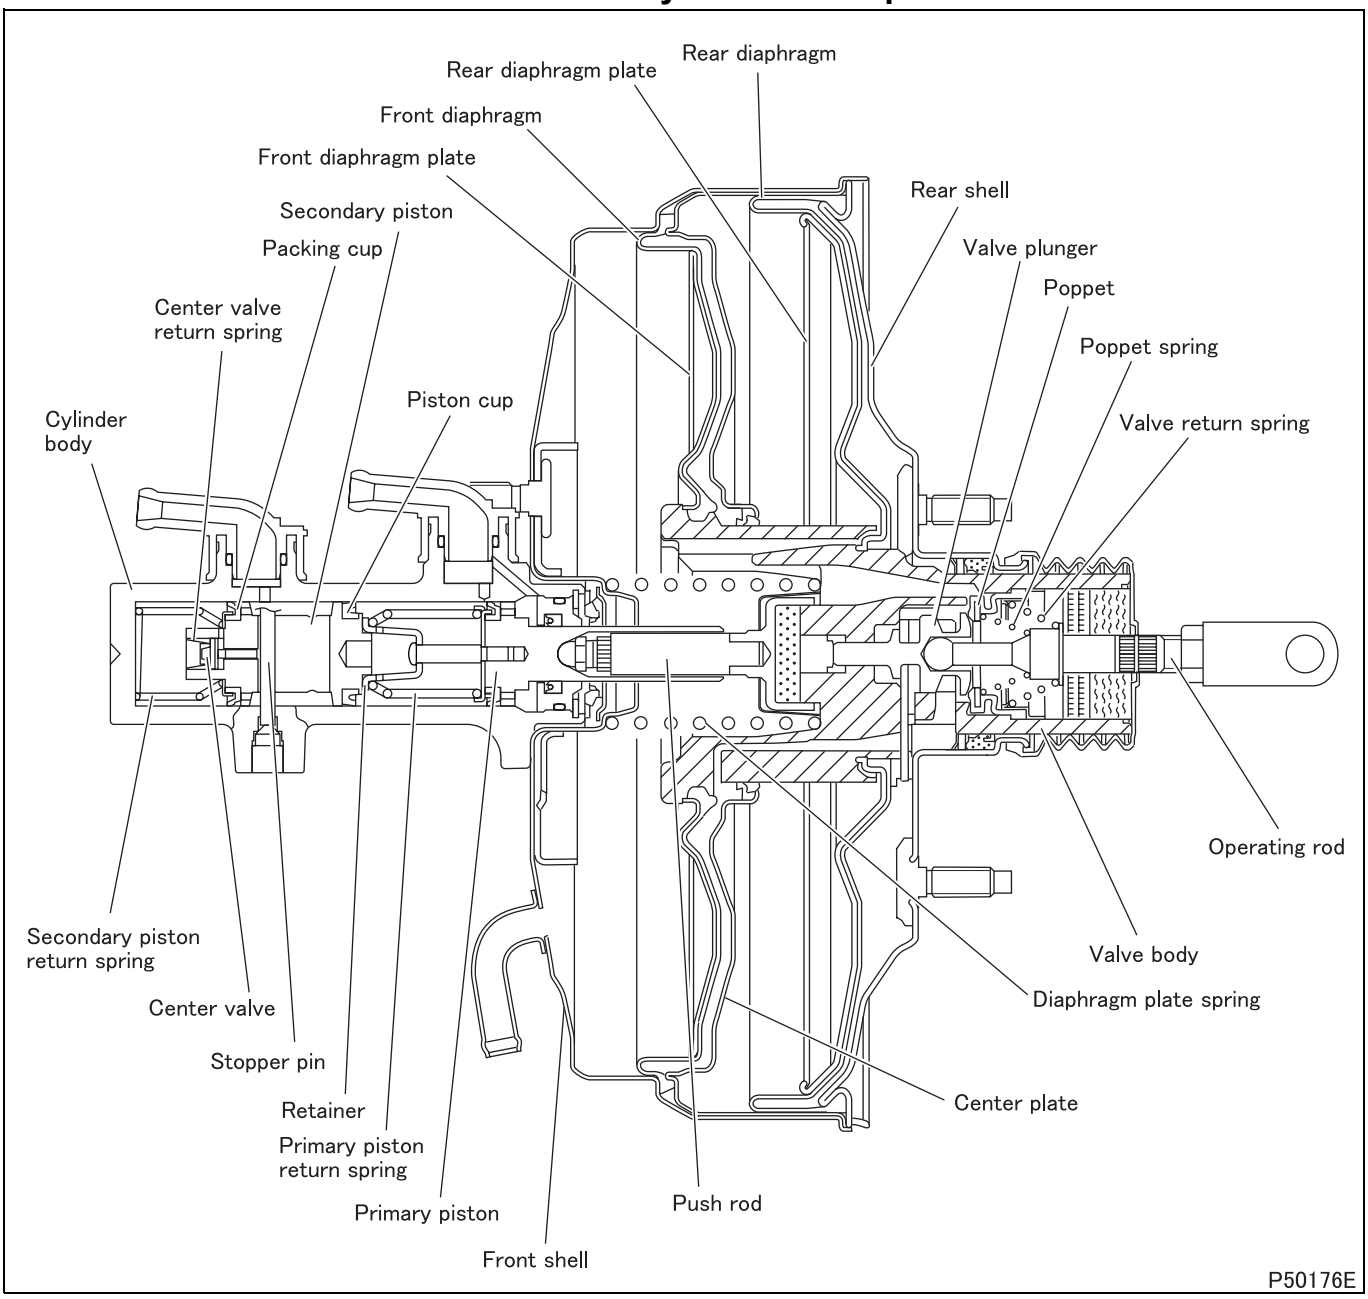


P58343E

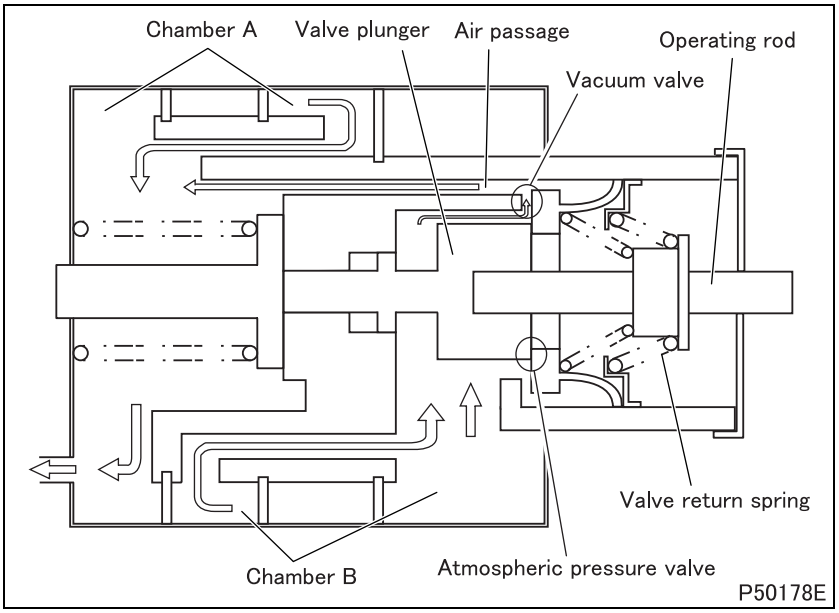
2.1 Operation

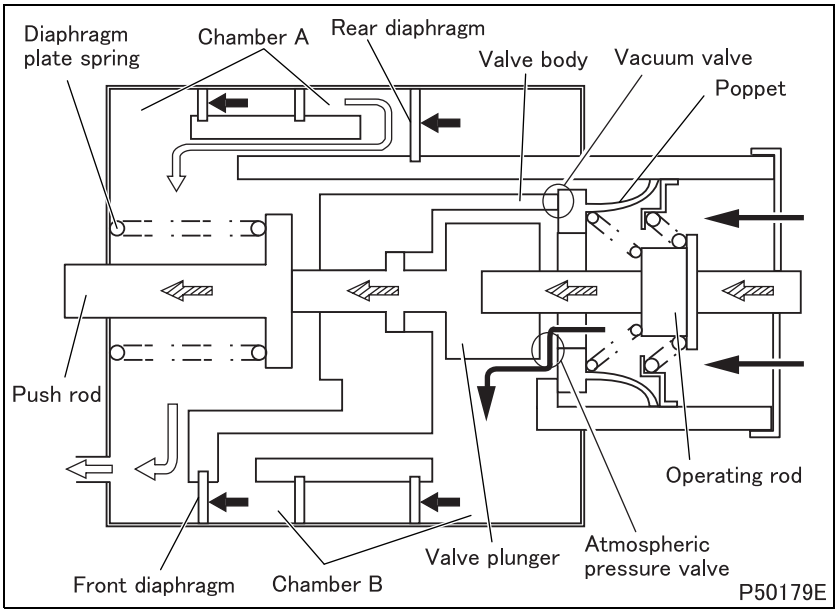
- A rotor with 3 movable vanes is housed in a cylindrical housing. As the rotor rotates, the vanes are pressed against the inner face of the housing by centrifugal force.
- The rotor is eccentrically mounted relative to the housing. As the rotor rotates, air in the vacuum tank is sucked through the pump inlet and then compressed before being discharged through the outlet. The suction-compression-discharge cycle is repeated to generate vacuum in the vacuum tank.
- The inside of the housing is lubricated and cooled by engine oil. After lubrication/cooling, the engine oil together with the compressed air is returned through the pump outlet and into the oil pan.

3. Vacuum Booster and Brake Master Cylinder <Except FE85>



- The vacuum booster magnifies the stepping force applied onto the brake pedal (therefore reduces the operator's pedal effort) through the utilization of pressure difference between the vacuum it generates and the atmospheric pressure. The system is of a tandem type and has 2 vacuum chambers, achieving size reduction while offering a great capacity for highly efficient boosting performance.
- The brake master cylinder serves both the front and rear brake systems that are independent of each other. Should fluid leakage occur in either the front or rear brake system, stopping power can still be provided by whichever system is intact.

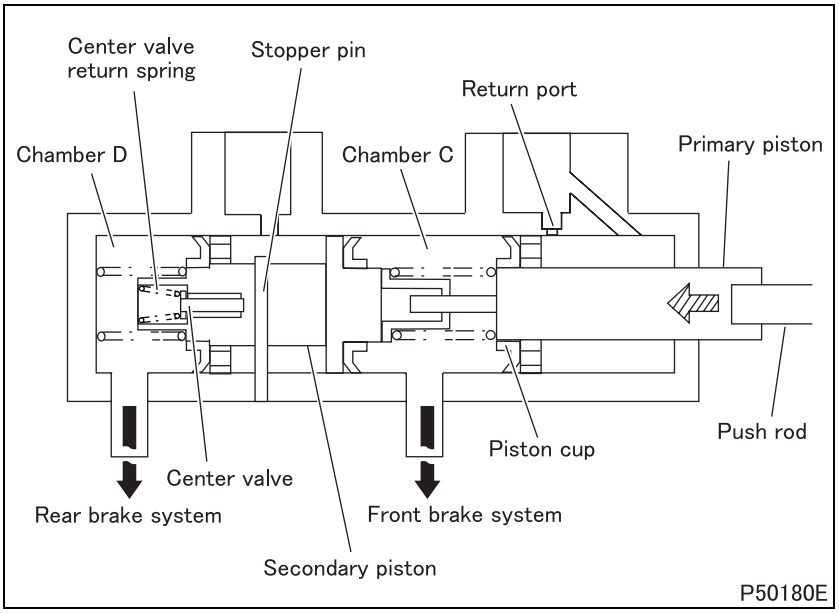




3.1 When brake pedal is pressed

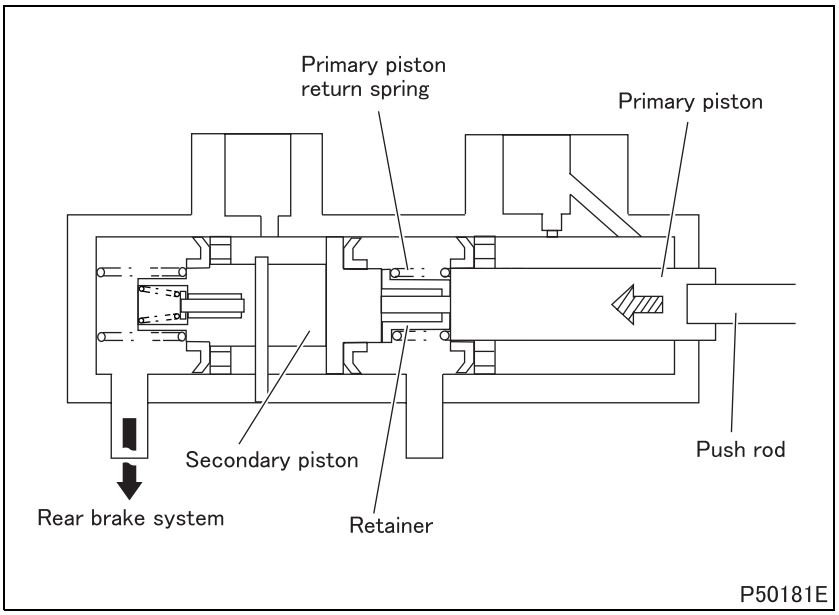
(1) Vacuum booster operation

- With the brake pedal released and no stepping force applied to the brake pedal, the operating rod and the valve plunger are held to the right by the force of the valve return spring. The atmospheric pressure valve remains closed while the vacuum valve remains open.
- The vacuum pump creates vacuum in chamber A. As the atmospheric pressure valve is closed, no outside air flows into chamber B. Instead, vacuum in chamber A flows through the air passage and into chamber B. Chambers A and B are both filled with vacuum, and there is no pressure difference between the chambers. No boosting occurs.
- As the brake pedal is pressed, the stepping force acts on the operating rod. This seats the poppet onto the valve body, closing the vacuum valve and cutting off vacuum supply into chamber B. As the brake pedal is pressed further, the valve plunger separates from the poppet. This opens the atmospheric pressure valve, allowing outside air into chamber B. There is now a pressure difference between chambers A and B.
- The stepping force, boosted as a result of the pressure difference between chambers A and B, overcomes the force of the diaphragm plate spring, pushing the front and rear diaphragms and the push rod to operate the brake master cylinder.



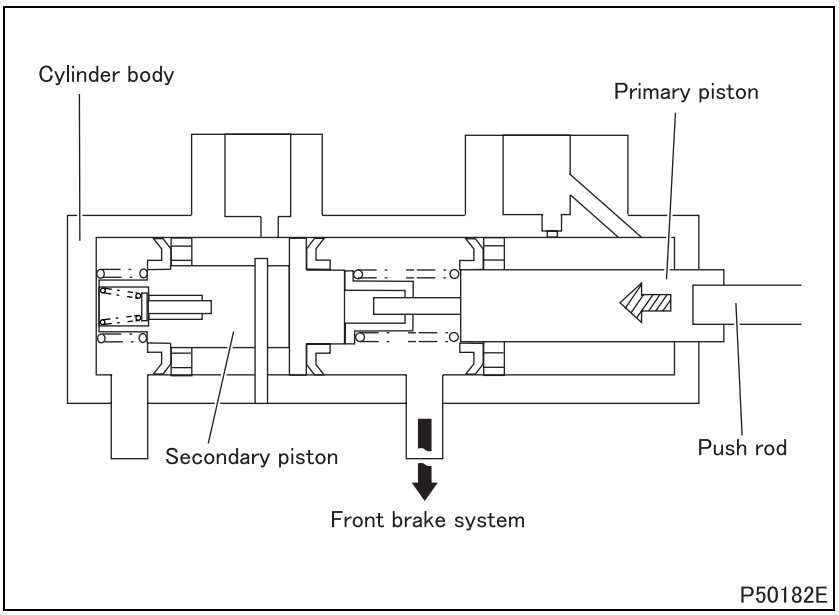
(2) Brake master cylinder operation

- As the push rod pushes the primary piston, the return port is closed by the piston cup. Fluid pressure now builds up in chamber C.
- The pressure buildup is sent to the front brake system and at the same time pushes the secondary piston.
- The center valve in front of the secondary piston separates from the stopper pin. The center valve return spring now closes the center valve, seating it onto the secondary piston.
- Fluid pressure now builds up in chamber D in front of the secondary piston, and the pressure is sent to the rear brake system.



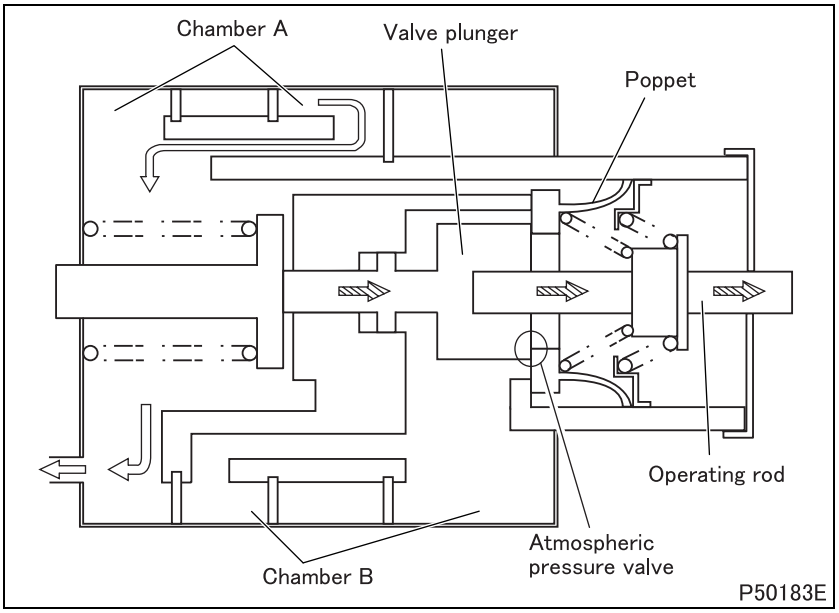
3.2 Fluid leakage in front brake system

- As the brake pedal is pressed, the push rod moves to push the primary piston. As there is fluid leakage in the front brake system, no fluid pressure builds up in that system.
- As the brake pedal is pressed further, the primary piston overcomes the force of the primary piston return spring and, via the retainer, pushes the secondary piston. Fluid pressure is now sent to the rear brake system.



3.3 Fluid leakage in rear brake system

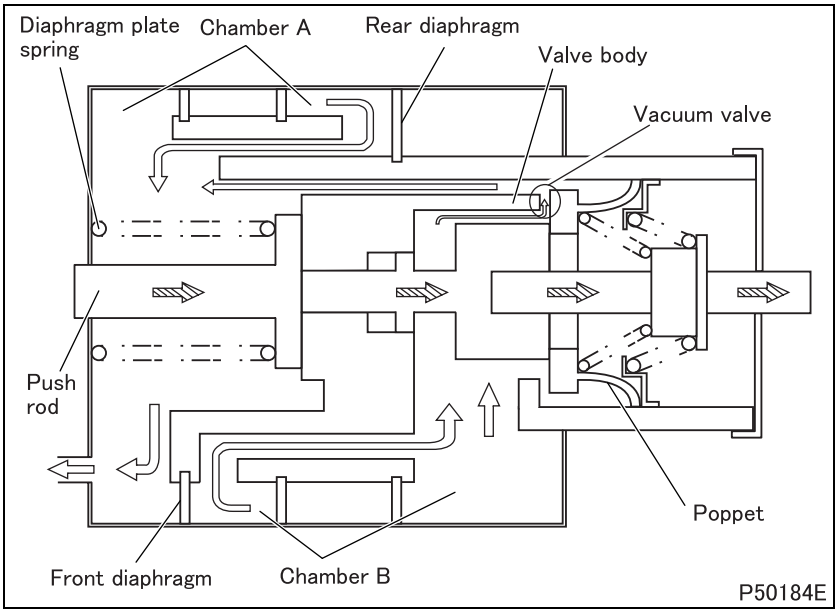
- As the brake pedal is pressed, the push rod moves to push the primary and secondary pistons. As there is fluid leakage in the rear brake system, no pressure builds up in that system.
- As the brake pedal is pressed further, the tip of the secondary piston contacts the cylinder body while the primary piston continues to be pushed. Fluid pressure builds up further in the front brake system.



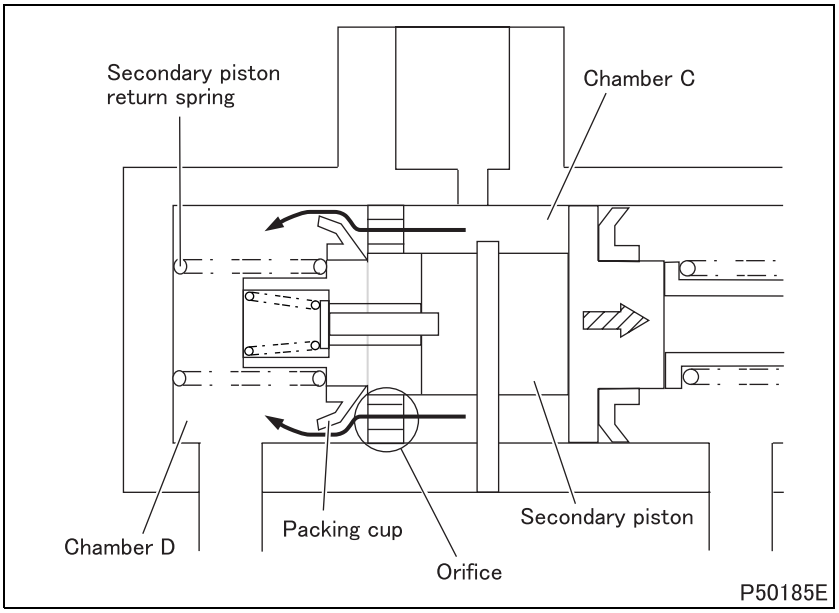
3.4 When brake pedal is released

(1) Vacuum booster operation

- With the brake pedal pressed, chamber A is filled with vacuum generated by the vacuum pump while chamber B is open to the atmosphere. When the brake pedal is released, the stepping force no longer acts on the operating rod. This causes the valve plunger to seat on the poppet, closing the atmospheric pressure valve and cutting off air flow into chamber B.

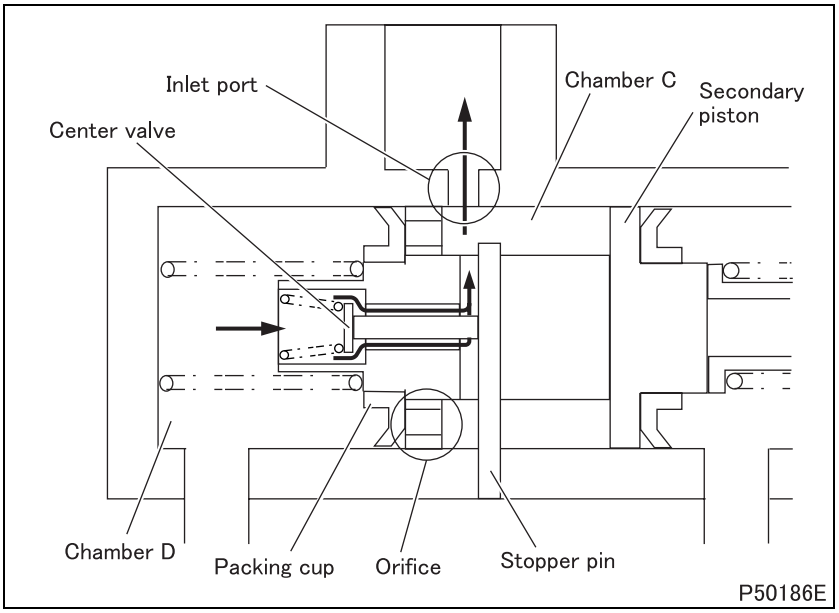


- In further progression, the poppet separates from the valve body. This opens the vacuum valve, allowing vacuum from the vacuum pump to flow into chamber B. As there is now no pressure difference between chambers A and B, the diaphragm plate spring pushes back the front and rear diaphragms and also the push rod to their original positions.

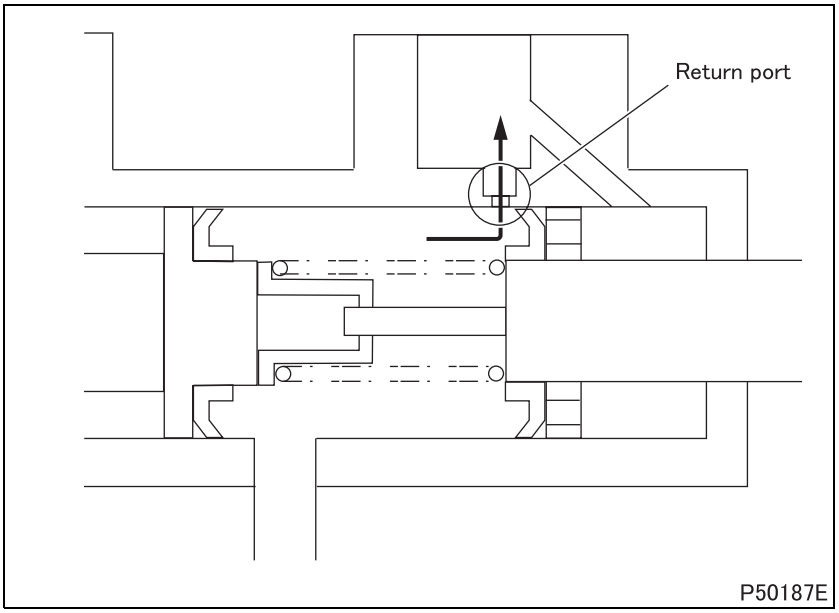


(2) Brake master cylinder operation

- As the push rod returns to its original position, the secondary piston immediately starts to be pushed back by the force of the secondary piston return spring. The speed of return is gradual as there is no difference between chambers C and D in fluid pressure supplied by the brake master cylinder.
- As the secondary piston starts to return to its original position, the pressure in chamber D becomes lower than the pressure in chamber C. The pressure difference causes the packing cup to buckle, allowing the fluid pressure in chamber C to flow through the orifices and into chamber D.



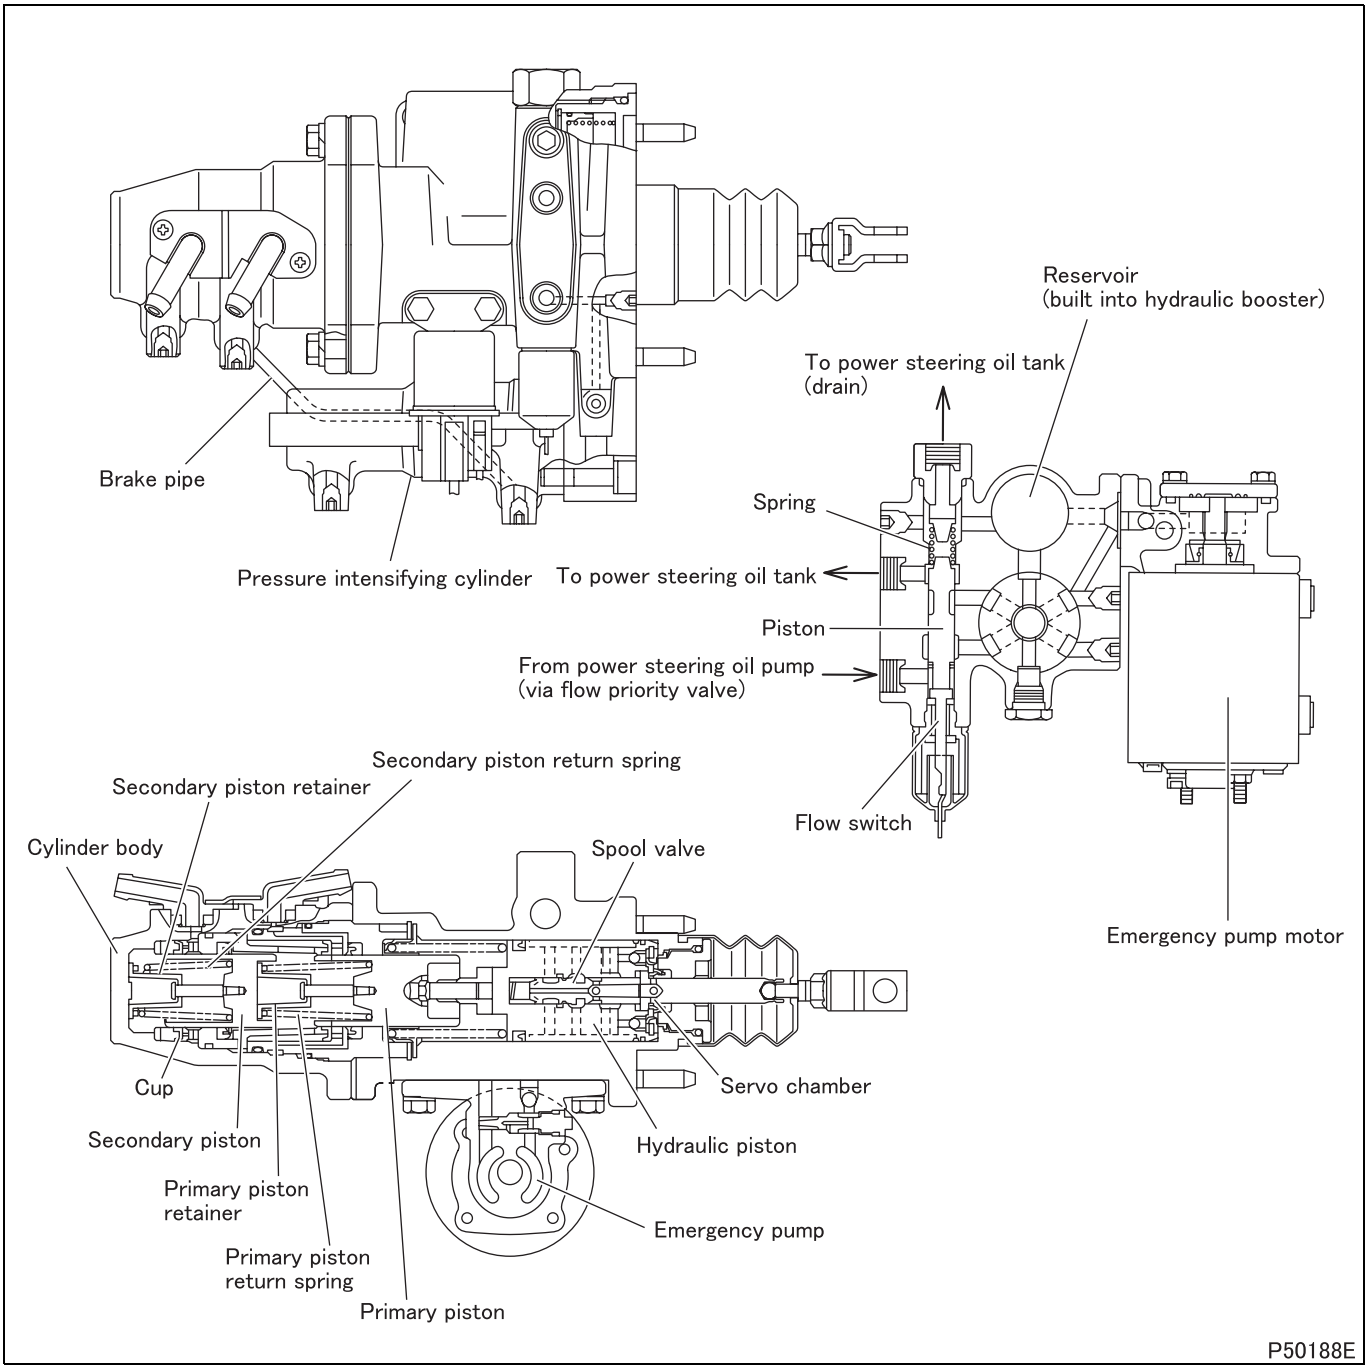
- With the secondary piston back in its original position, there is no difference in fluid pressure between chambers C and D. The packing cup restores its original shape, blocking the orifices. The liquid pressure in the brake line now flows through the center valve, which has been open since hitting the stopper pin. The liquid pressure then returns through the inlet port to the brake fluid tank.



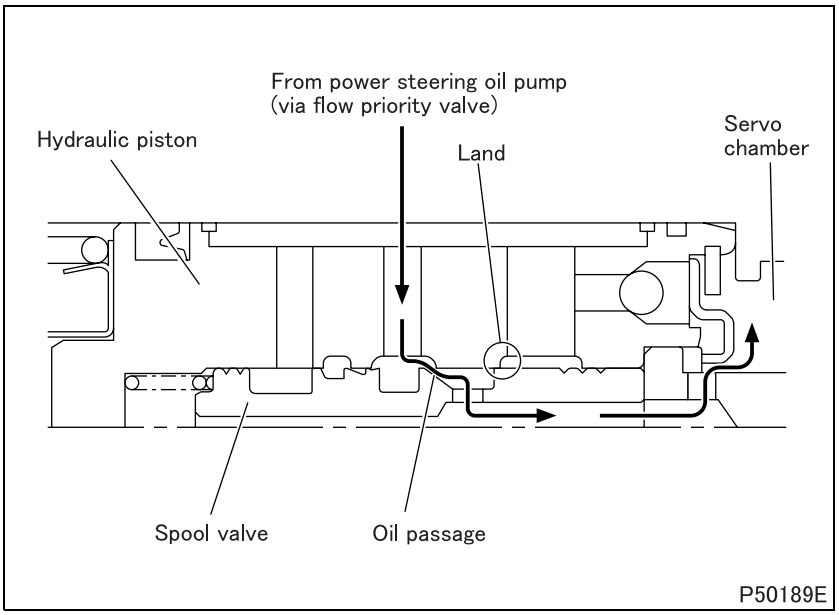
- The fluid pressure in the primary (front) brake line returns through the return port to the brake fluid tank.

M E M O

4. Hydraulic Booster and Brake Master Cylinder <FE85>



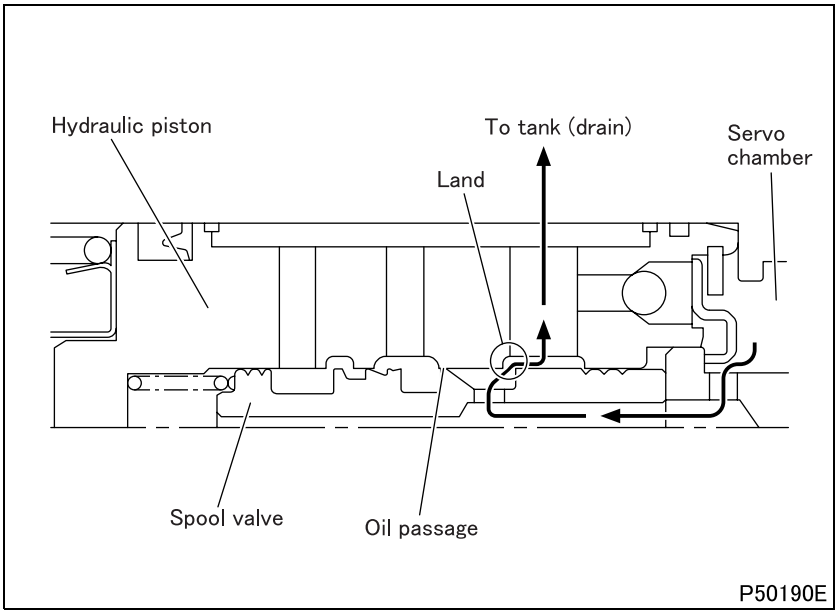
- The hydraulic booster magnifies the stepping force applied onto the brake pedal (therefore reduces the operator's pedal effort) through the utilization (via the flow priority valve) of the steering pump pressure.
- The brake master cylinder serves both the front and rear brake systems that are independent of each other. Should fluid leakage occur in either the front or rear brake system, stopping power can still be provided by whichever system is intact.
- The spool valve is connected to the brake pedal, and generates oil pressure proportional to the pedal stepping force.
- The hydraulic piston, which is connected to the brake master cylinder, operates to store oil supplied via the spool valve into the servo chamber for pressure boost.
- Should oil pressure is lost, the piston is pushed to the left by the force of the spring, blocking oil flow from the power steering oil pump and to the power steering oil tank. At the same time, the flow switch is turned ON, providing power to the emergency pump motor. The emergency pump generates oil pressure for the hydraulic booster to continue to operate.



4.1 Spool valve

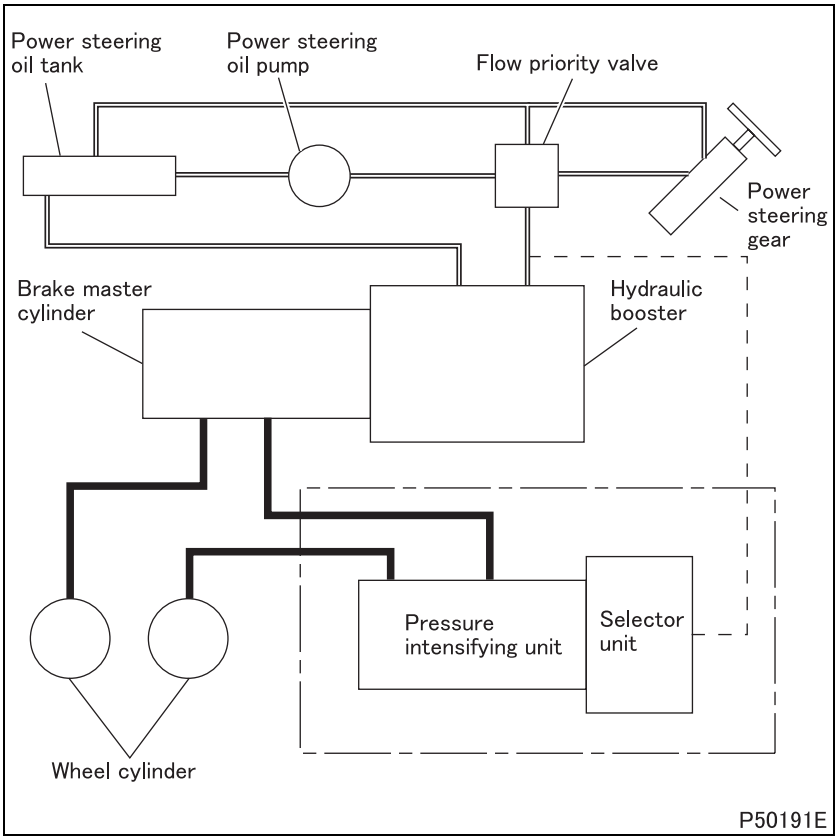
(1) When brake pedal is pressed

- As the brake pedal is pressed, the spool valve moves to the left, closing the land.
- Oil pressure from the flow priority valve builds up.
- The high pressure oil flows through the oil passage and into the servo chamber.
- The hydraulic piston is pushed to the left.
- The pistons in the brake master cylinder are moved, supplying pressure for brake application.



(2) When brake pedal is released

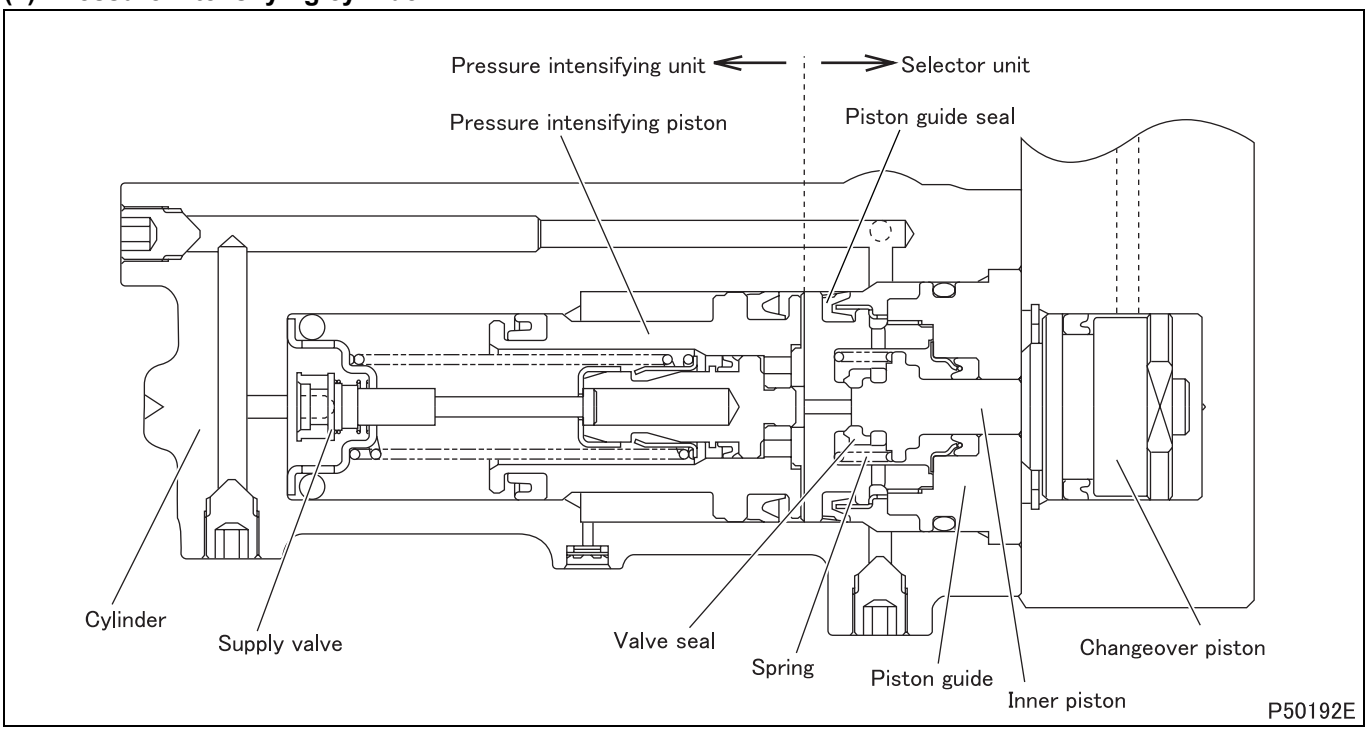
- As the brake pedal is released, the spool valve moves to the right. This opens the land while the oil passage is closed.
- Oil pressure from the flow priority valve drops.
- The oil in the servo chamber drains to the tank as well as to the reservoir.
- The hydraulic piston returns to its original position.
- Pressure acting on the pistons in the brake master cylinder is released.



4.2 Pressure intensifying cylinder system

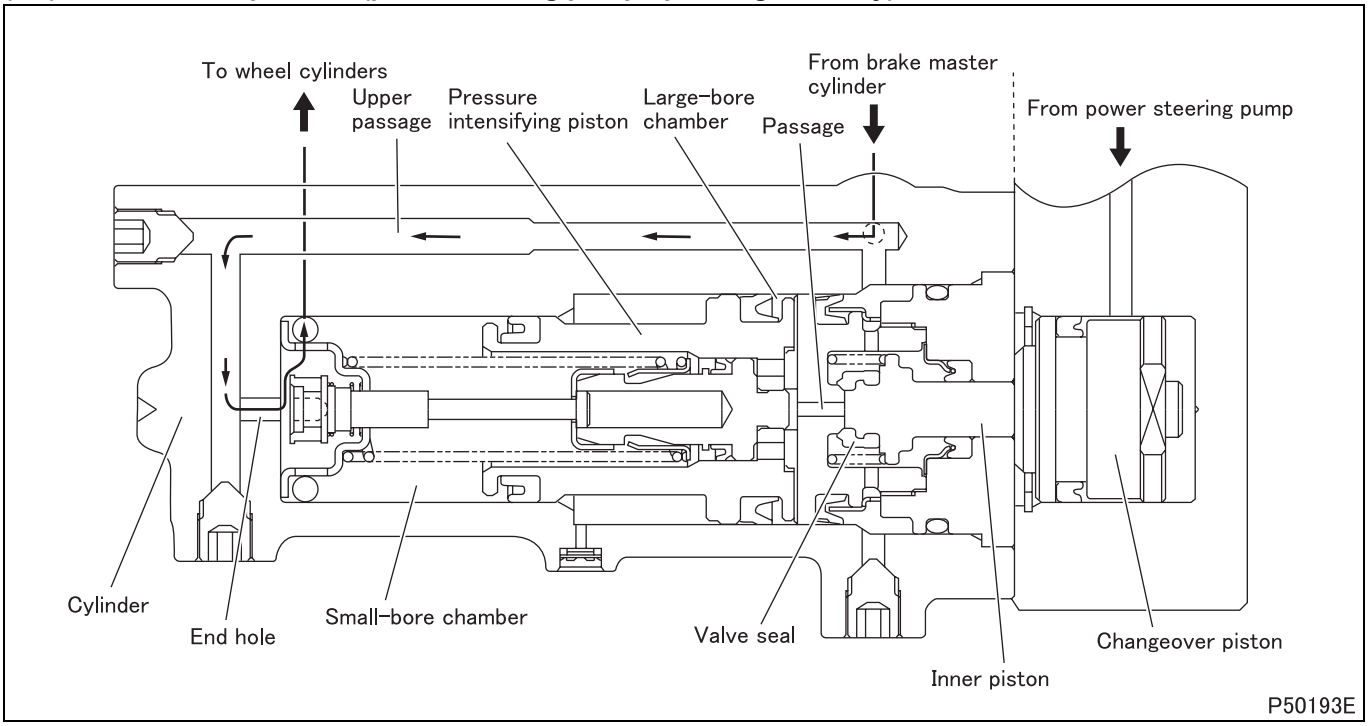
- The pressure intensifying cylinder system is attached onto the hydraulic booster which operates on the power steering oil pump pressure.
- Should the pump fail, pressing the brake pedal causes the system to boost the fluid pressure from the brake master cylinder and send it to the wheel cylinders.

(1) Pressure intensifying cylinder



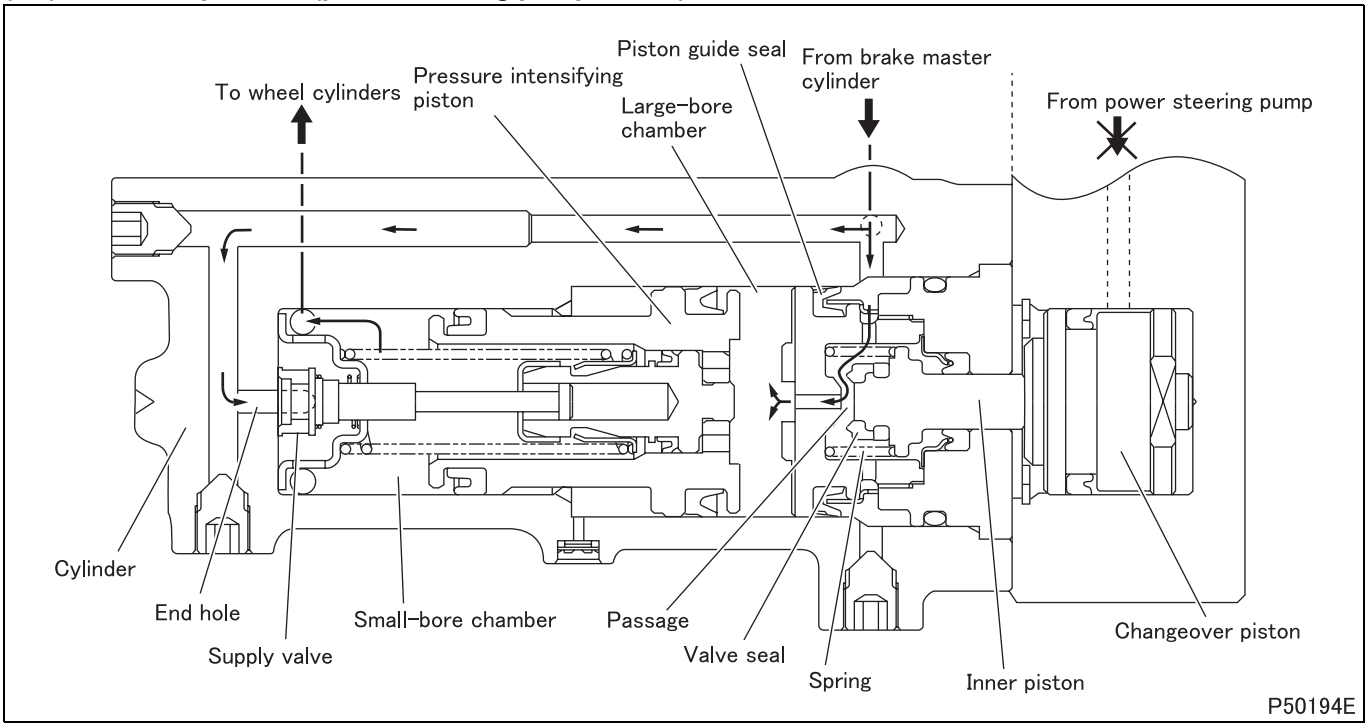
- Should the power steering pump fail to discharge oil, the selector unit detects this. The unit also ensures that pressure not be intensified when the power steering pump is functioning normally.
- Should the power steering pump fail, the pressure intensifying unit comes into action, boosting the fluid pressure from the brake master cylinder before sending it to the wheel cylinders.

(1.1) When not in operation (power steering pump operating normally)



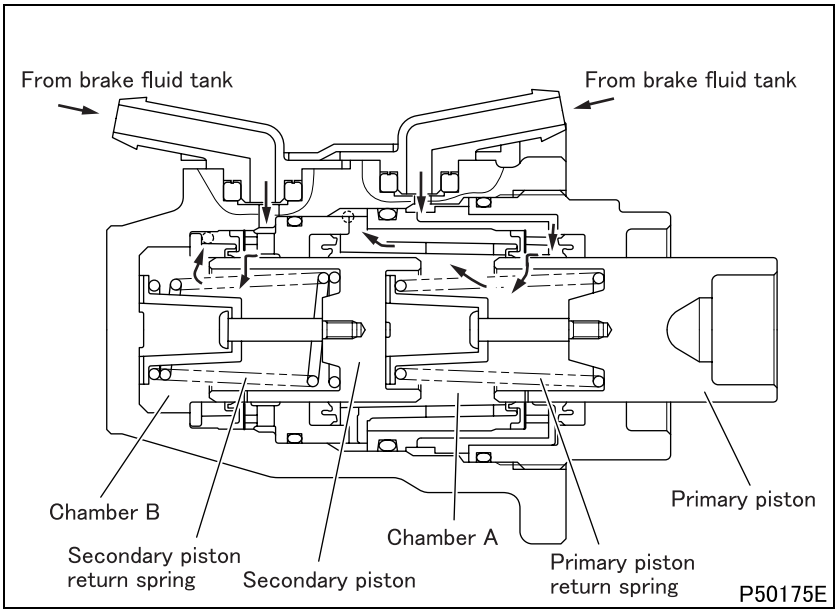
- Power steering oil pump pressure pushes the changeover piston, which then moves the inner piston. As a result, the passage to the large-bore chamber is blocked by the valve seal. Fluid pressure from the brake master cylinder flows through the upper passage, the end hole, the small-bore chamber, and into the wheel cylinders. As fluid pressure acts only on the small-bore end of the pressure intensifying piston, the piston remains in the same position.

(1.2) When in operation (power steering pump failure)



- When the power steering oil pump fails to discharge oil, the spring at the end of the inner piston pushes back the inner and changeover pistons. This opens up the passage through the valve seal into the large-bore chamber.
- Fluid pressure from the brake master cylinder flows into both the large- and small-bore chambers. As the large-bore end of the pressure intensifying piston has a larger area than the small-bore end, the piston moves to the left. As a result, the end hole is blocked by the supply valve.

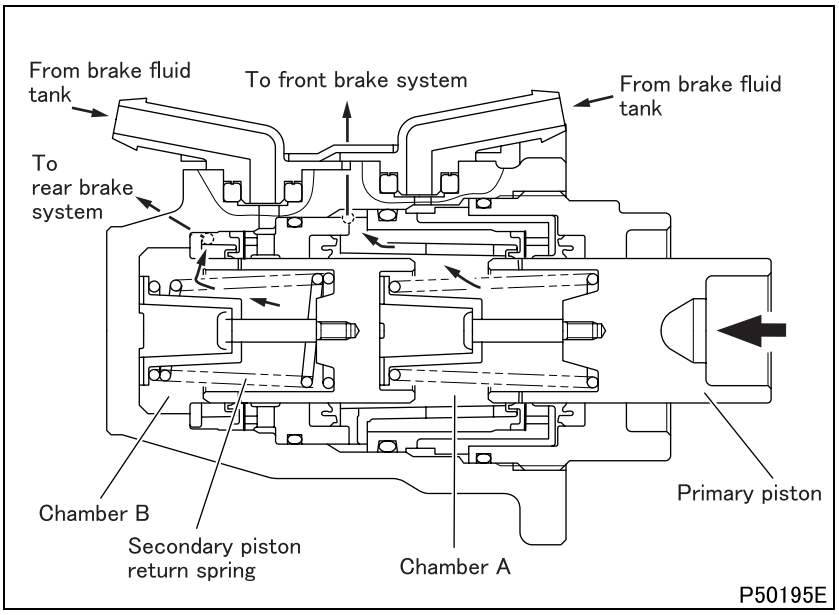
- The brake master cylinder continues to supply fluid into the pressure intensifying cylinder, which in turn sends the increasing pressure to the wheel cylinders.
- When the brake pedal is released, pressure fluid in the large-bore chamber flows through the valve seal, the back of the piston guide seal, and to the brake master cylinder.



4.3 Brake master cylinder

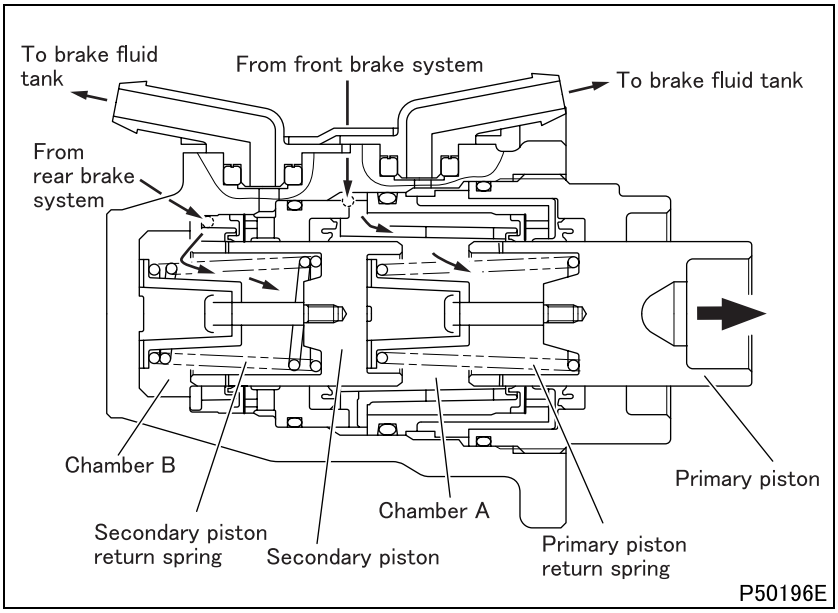
(1) When not in operation

- With the brake pedal released, the primary and secondary pistons are held to the right by the forces of the primary and secondary piston return springs respectively.
- Chambers A and B are open to the brake fluid tank.



(2) When brake pedal is pressed

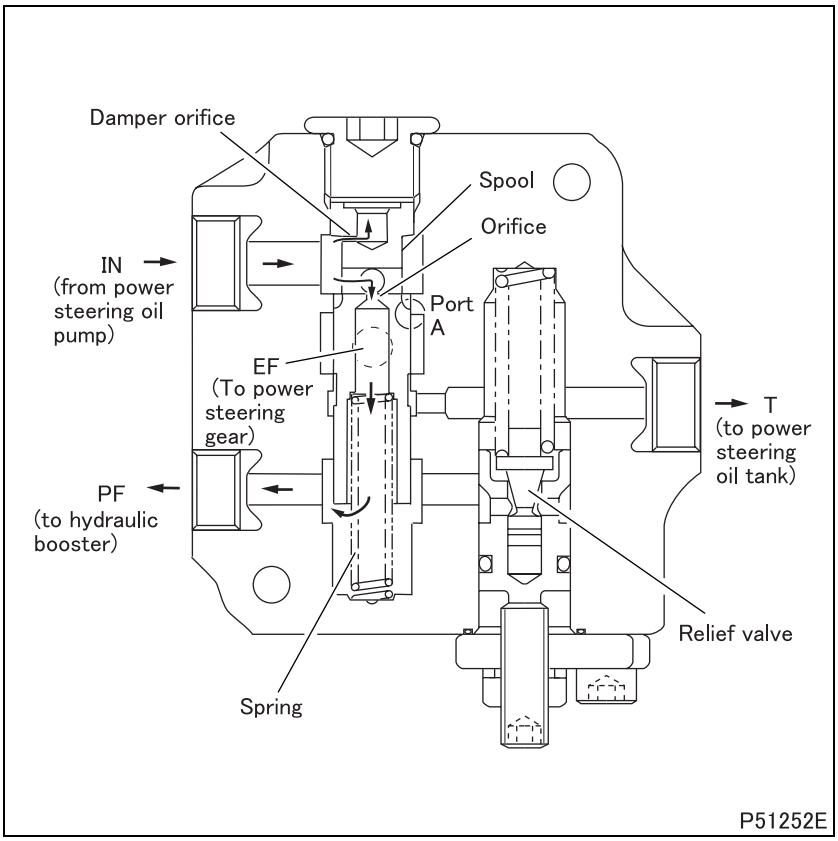
- As the brake pedal is pressed, the primary piston is pushed via the push rod.
- The secondary piston return spring is compressed, and the passages from chambers A and B to the brake fluid tank are blocked.
- As the brake pedal is pressed further, the primary piston is pushed. Fluid pressure builds up in chambers A and B, and is sent to the front and rear brake systems respectively.
- When fluid leakage occurs in either the front or rear brake system, the master cylinder operates basically in the same manner as the master cylinder with the vacuum booster.



(3) When brake pedal is released

- As the brake pedal is released and the push rod returns to the original position, the primary piston return spring pushes back the primary piston. Chamber A restores the original volume and the pressure in the chamber drops accordingly.
- The secondary piston return spring pushes back the secondary piston. Chamber B restores the original volume and pressure.
- Chambers A and B open up to the brake fluid tank.
- Pressure fluid in the front and rear brake lines flows back into chambers A and B.

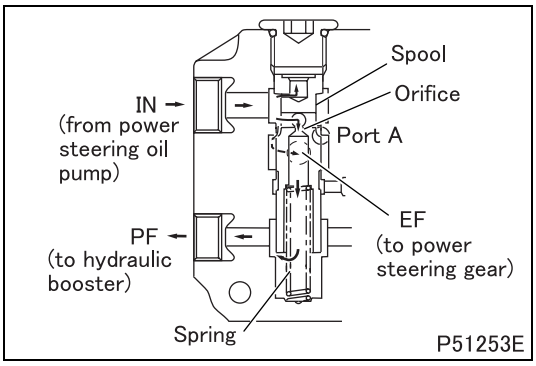
5. Flow Priority Valve <FE85>



- When brakes are applied hard while the steering wheel is turned, the flow priority valve dampens the associated steering shock by appropriately distributing the flow from the power steering oil pump between the hydraulic booster and the power steering gear.

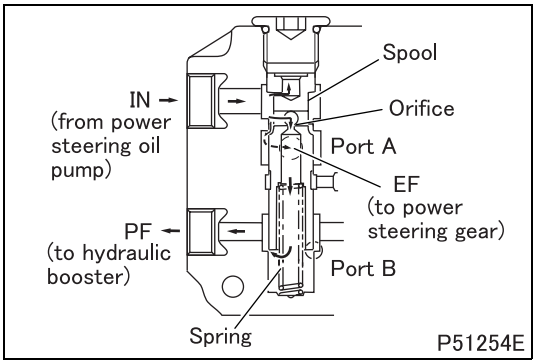
5.1 When pump output is at or below regulated flow rate

- The power steering oil pump output flows through the orifice and to the hydraulic booster.
- The pressure difference across the orifice acts on the spool which is then pushed down against the spring. However, port A remains blocked by the spool. As a result, the full flow from the pump is directed to PF.



5.2 When pump output exceeds regulated flow rate

- When the pump output exceeds the regulated flow rate, the pressure difference across the orifice becomes greater and acts on the spool such that the spool is pushed down against the spring until port A opens. Excess flow is directed through port A and into EF.
- In this state, if the hydraulic booster is operated and a greater flow is demanded by PF line (PF pressure > EF pressure), the spool moves to reduce the opening of port A so that the required pressure and the regulated flow rate are both achieved.



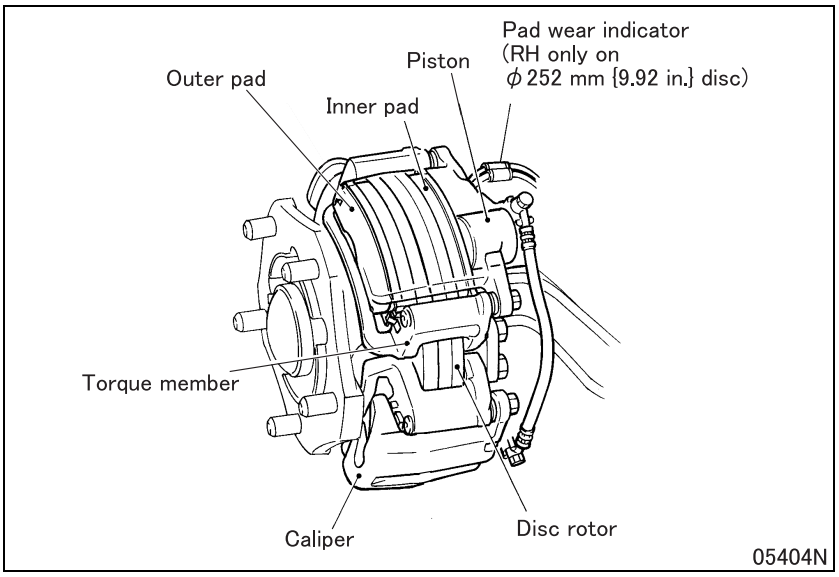
5.3 When power steering gear (EF line) is operated

- When power steering gear (EF line) is operated and a greater flow is demanded by EF line (PF pressure < EF pressure), the pressure difference across the orifice acts on the spool such that the spool is pushed down against the spring until the opening of port B is reduced. As a result, the required pressure and the regulated flow rate are both achieved.

5.4 When hydraulic booster (PF line) and power steering gear (EF line) are both operated

- When the hydraulic booster (PF line) and the power steering gear (EF line) are both operated and greater flows are demanded by these lines, the spool is moved against the spring such that the openings of ports A and B are appropriately balanced to achieve the regulated flow rate.

6. Front Disc Brake <FE>

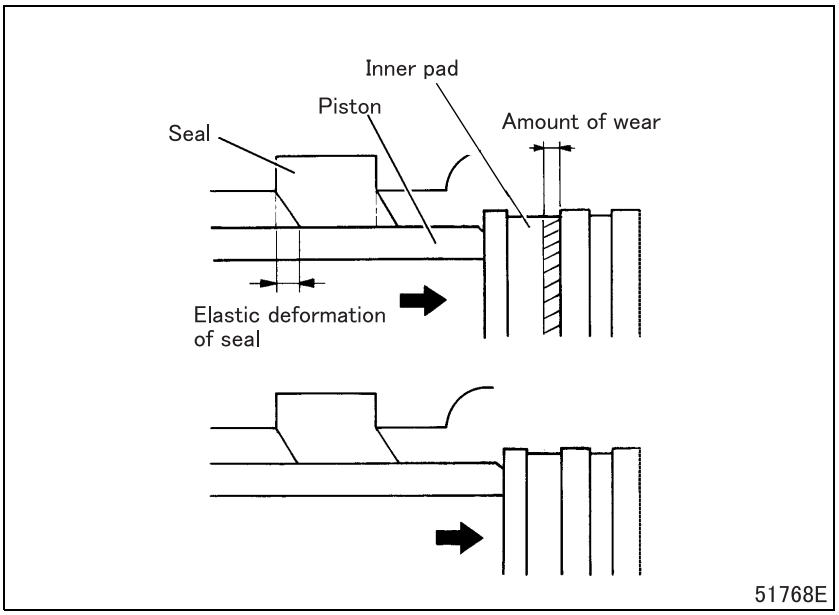


- The front disc brake uses a twin floating-type calipers.
- The caliper houses one each of cylinder and piston. Stopping power is generated by squeezing the disc rotor between the pads, with the outer pad pressed against the disc rotor by reaction.
- The inner pad is equipped with wear indicator which serves to indicate replacement timing for both the inner and outer pads.
- The front disc brake is equipped with a self-adjusting mechanism to compensate for pad wear and maintain the correct clearances between the disc rotor and the inner and outer pads. The adjustment is made each time braking is performed.

6.1 Self-adjusting mechanism

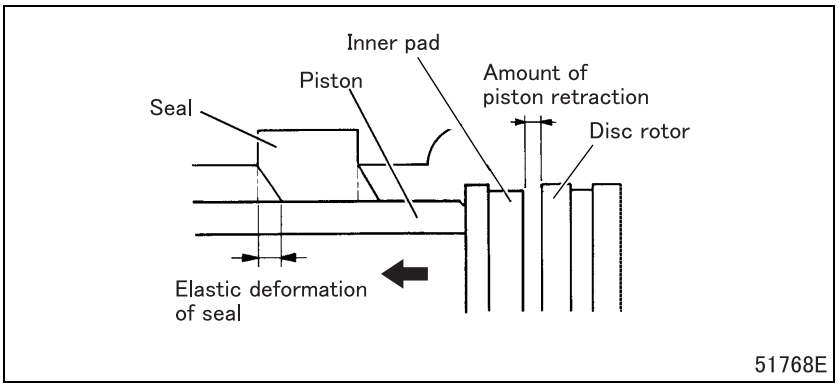
(1) Operation

(1.1) When brake pedal is pressed



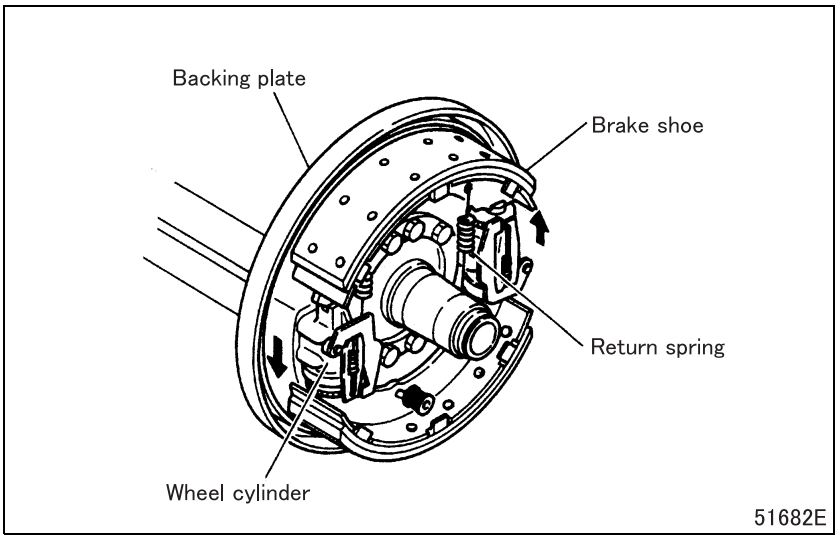
- The piston extends in excess of the seal's elastic deformation by the amount of inner pad wear (shown hatched).

(1.2) When brake pedal is released

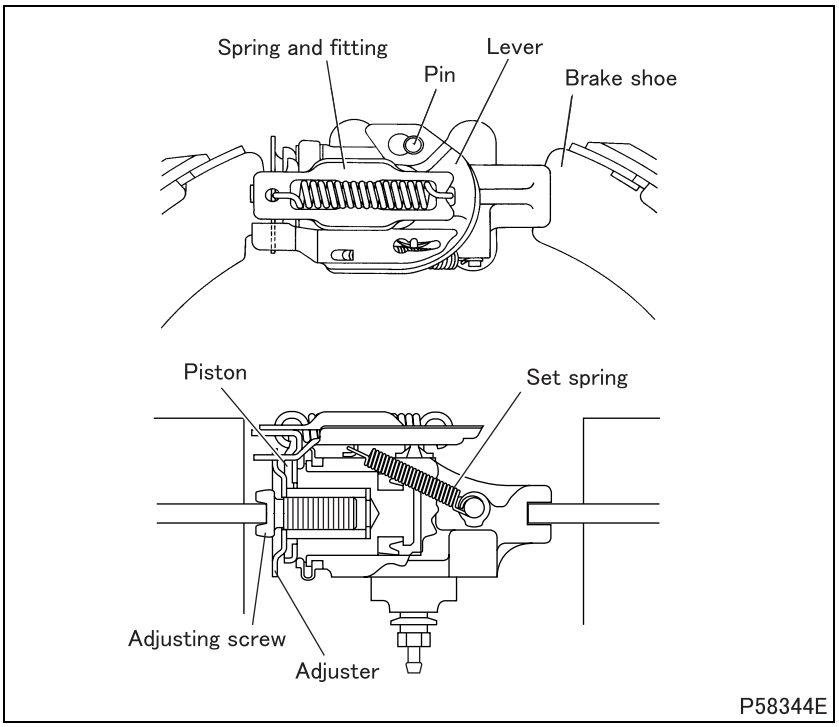


- The piston retracts as much as the amount of the seal's elastic deformation, thus maintaining the correct clearance between the disc rotor and the inner pad.

7. Front Drum Brake <FG>

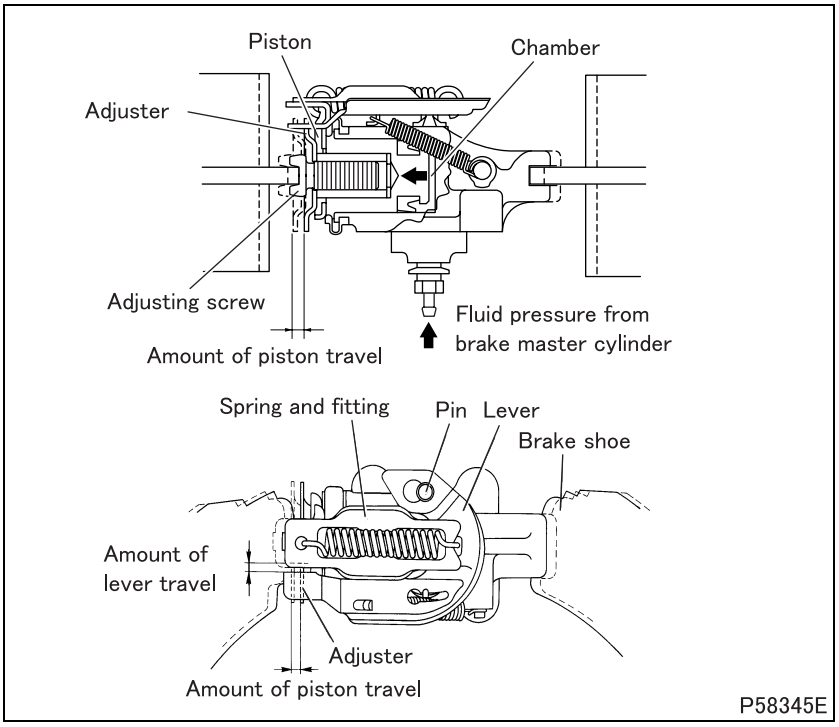


- The front drum brake is of a 2-leading type.
- Single-acting wheel cylinders activate brake shoes, both as a leading shoe, in forward-travel braking. By self-boosting effect, the 2-leading shoe brake generates a great stopping power.



7.1 Wheel cylinder

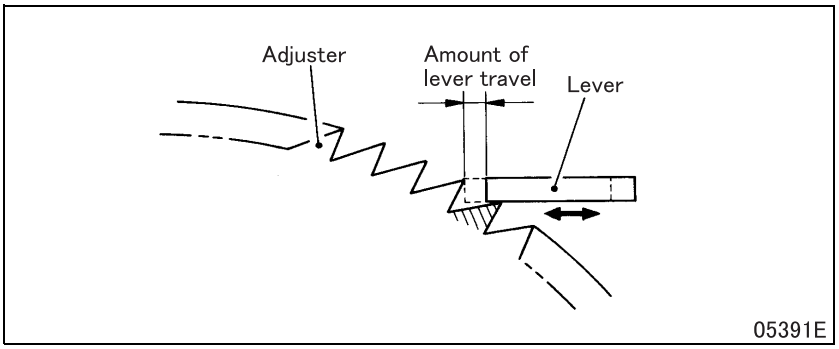
- The wheel cylinder is equipped with a self-adjusting mechanism to compensate for lining wear and maintain the correct clearance between the lining and the drum. The adjustment is made each time braking is performed.



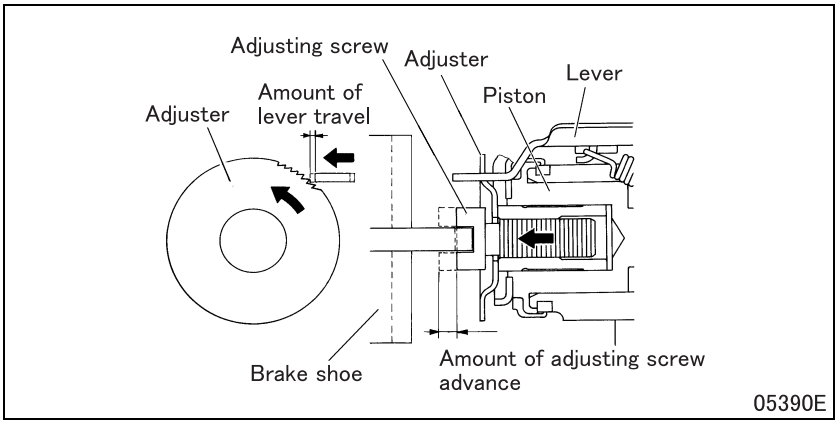
7.2 Self-adjusting mechanism

(1) Operation

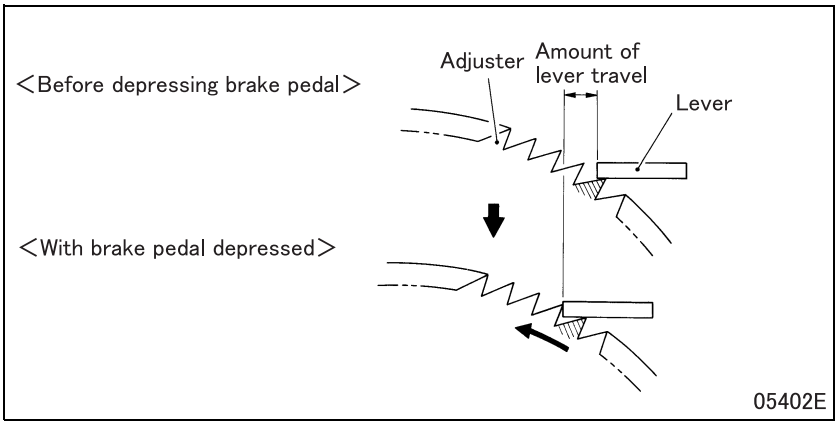
- When the brake pedal is pressed, fluid pressure from the brake master cylinder enters into chamber and pushes the piston, which then extends the spring and fitting. The lever, which is connected to the spring and fitting, pivots about the pin.

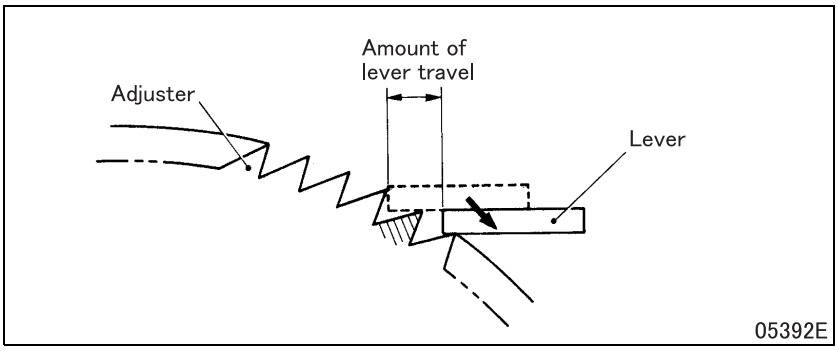


- When the brake drum-to-lining clearance is correct, the amount of lever travel when the brake pedal is pressed is not enough to turn the adjuster which therefore remains in the same place.



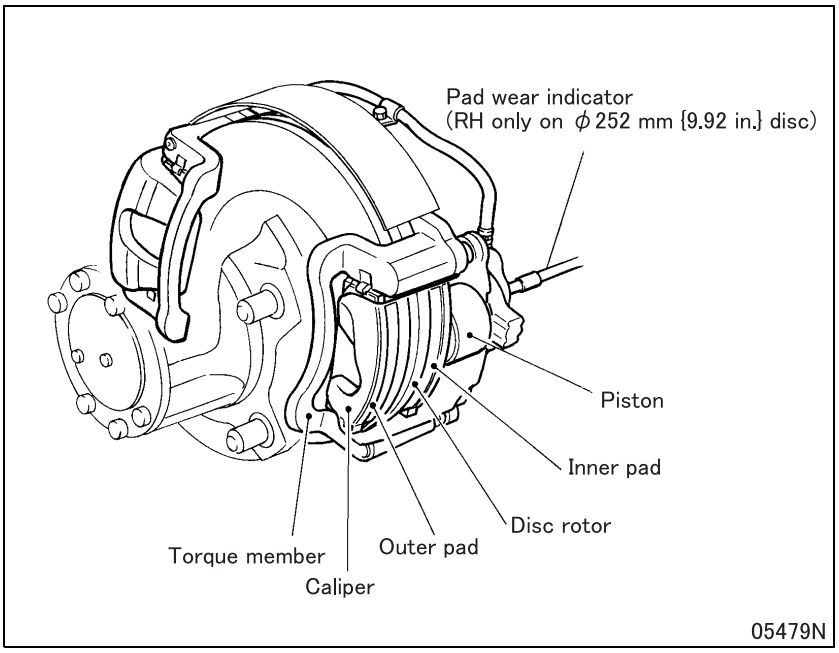
- As the brake drum-to-lining clearance grows, the amount of piston travel, and therefore the amount of lever travel, becomes greater.
- When the lever travels far enough to turn the adjuster, the threads on the adjuster causes the adjusting screw to advance. As a result, the brake shoe extends.





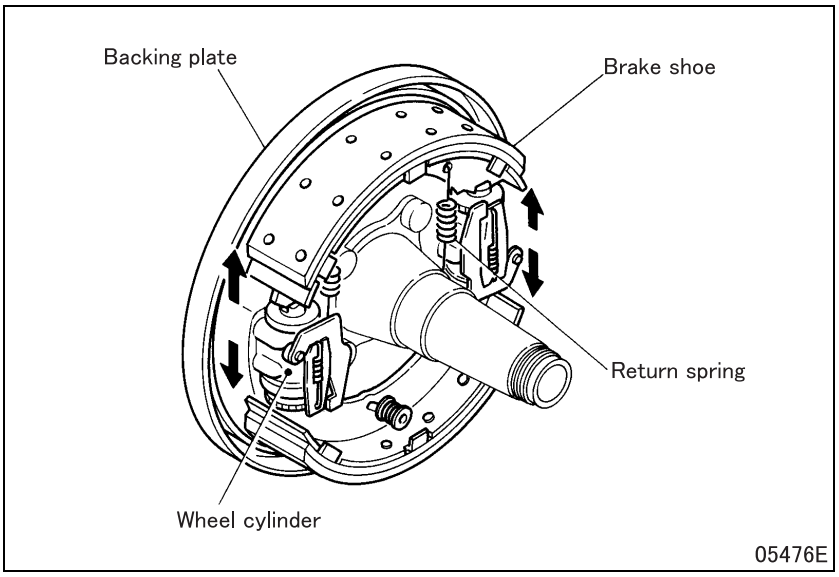
- As the brake pedal is released, the adjuster remains in the new position while the lever retracts by one tooth. The brake drum-to-lining clearance is now correctly adjusted.

8. Rear Disc Brake <FE>

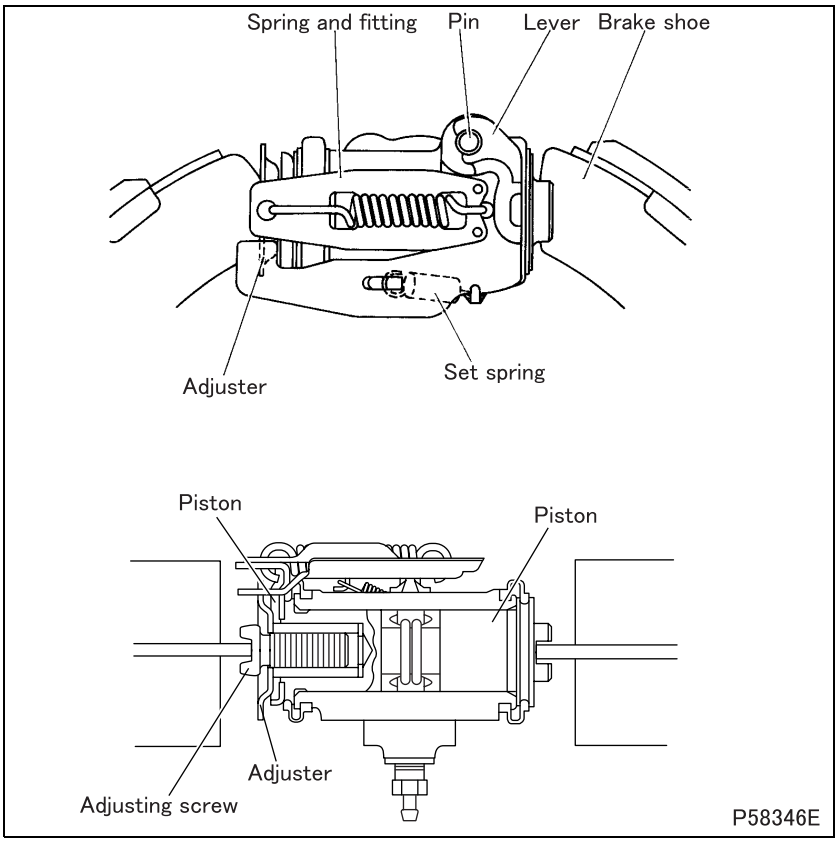


- The rear disc brake uses a twin floating-type calipers.
- The caliper houses one each of cylinder and piston. Stopping power is generated by squeezing the disc rotor between the pads, with the outer pad pressed against the disc rotor by reaction.
- The inner pad is equipped with wear indicator which serves to indicate replacement timing for both the inner and outer pads.
- The rear disc brake is equipped with a self-adjusting mechanism to compensate for pad wear and maintain the correct clearances between the disc rotor and the inner and outer pads. The adjustment is made each time braking is performed.
- The self-adjusting mechanism operates in the same manner as that of the front disc brake.

9. Rear Drum Brake <FG>



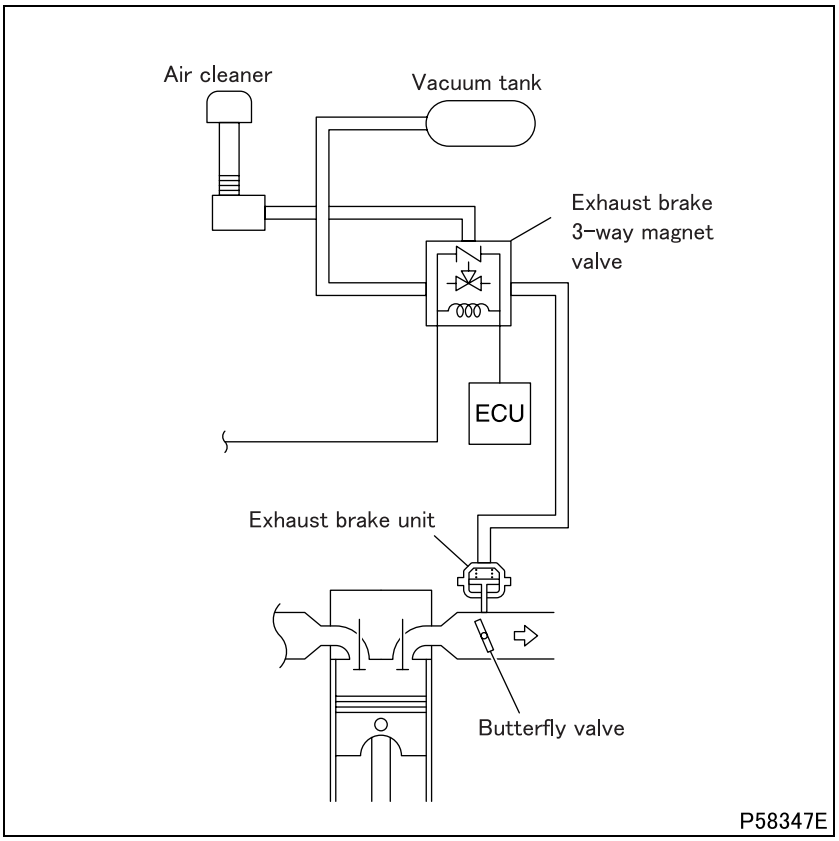
- The rear drum brake is of a dual 2-leading type.
- Double-acting wheel cylinders activate brake shoes, both as a leading shoe, in forward- and rearward-travel braking. By self-boosting effect, the dual 2-leading shoe brake generates a great stopping power.



9.1 Wheel cylinder

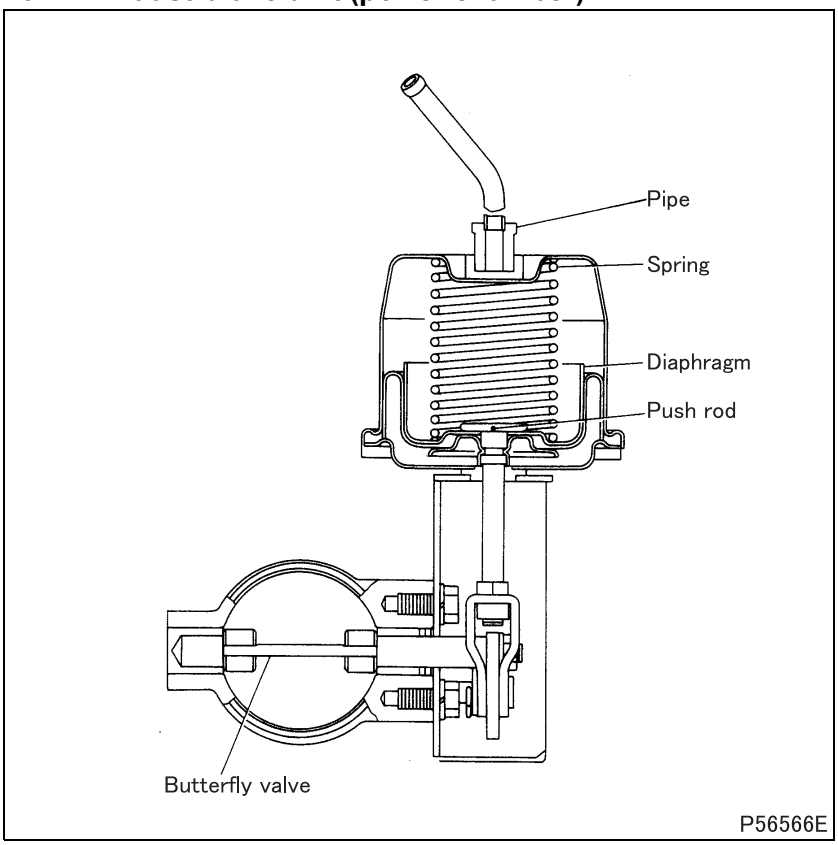
- The wheel cylinder is equipped with a self-adjusting mechanism to compensate for lining wear and maintain the correct clearance between the lining and the drum. The adjustment is made each time braking is performed.
- The self-adjusting mechanism operates in the same manner as that of the front drum brake.

10. Exhaust Brake System <FE>



- The exhaust brake system provides stopping power by closing the exhaust piping. Specifically, pressure builds up in the blocked exhaust piping, which then is used to resist the pistons as they move to discharge exhaust in the exhaust stroke.
- The exhaust brake system supplements the foot brake. It is equipped with the exhaust brake unit incorporating a butterfly valve.
- When the exhaust brake switch is turned ON, the excitation winding within the exhaust brake 3-way magnet valve is magnetized. This closes the atmospheric pressure valve while opening the vacuum valve. Vacuum in the vacuum tank acts on the exhaust brake unit, closing the butterfly valve and bringing the exhaust braking in operation.

10.1 Exhaust brake unit (power chamber)



M E M O

Wheel Brake

Possible causes	Symptoms	Brake application one sided							Noise and shock when brake pedal pressed			Reference Gr
		Brake drag (slow disengagement after pedal release)	Stopping power different from right to left	Unstable stopping power	Locking point varies	Other	Insufficient stopping power	Reduced pedal travel	Noise generated when wheels are turned with jacked-up vehicle	Continuous noise during brake application (at low vehicle speed)	Other

ON-VEHICLE INSPECTION AND ADJUSTMENT

1. Replacement of Brake Fluid

- Brake fluid is shared by the brake and clutch systems, and is divided in the brake fluid tank into the two systems. This section describes the replacement of the brake fluid for the brake system. In order to completely replace the brake fluid, the brake fluid in the clutch system should also be replaced.

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened		Tightening torque	Remarks
–	Air bleeder	Disc brake	5.8 to 8.8 {4.3 to 6.5, 0.6 to 0.9}	–
		Drum brake	6.86 to 8.83 {5.1 to 6.5, 0.7 to 0.9}	–

Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
–	Brake fluid tank	Brake fluid (SAE J1703 or FMVSS No. 116 DOT3)	As required

WARNING ⚠

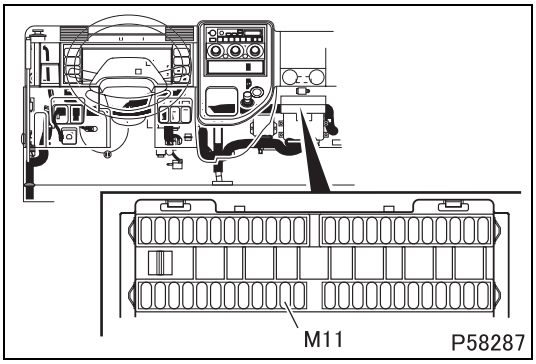
- **Be sure to use new brake fluid. Do not mix it with brake fluid of different properties or mineral oil (gas oil, engine oil, gear oil, automatic transmission fluid, etc.). This will alter the original properties of FUSO Brake Fluid, causing the boiling point to drop as well as the brake rubber parts to swell. Faulty operation of the brake will result.**
- **Ensure that no foreign matter or water enter into the brake fluid when refilling it, as they will cause faulty brake operation.**
- **Use a mug exclusively kept for the specified brake fluid. This ensures that no brake fluid of different properties or mineral oil enter into the system.**

CAUTION ⚠

- **Brake fluid is corrosive on paintwork. Be careful not to spill it onto the paintwork. If brake fluid is spilled onto the paintwork, immediately wipe it off.**

NOTE

- **During brake fluid replacement operation, a change in color of the brake fluid being discharged indicates that the old brake fluid in the system has been replaced with new brake fluid.**
- **During the replacement, be sure to keep the brake fluid level at the "MAX" mark on the tank.**



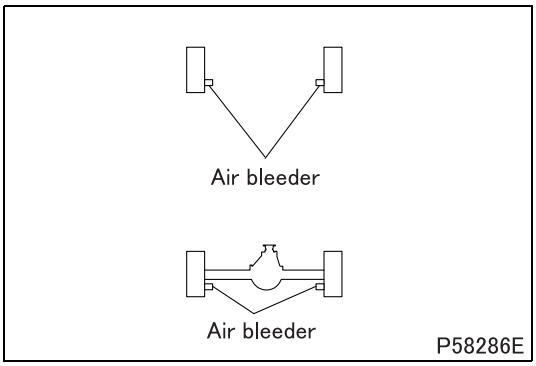
1.1 Work before replacement

- Remove the power fuse (M11) for the electronic control unit of anti-lock brake system.

WARNING ⚠

- **Do not install the power fuse until after the brake fluid replacement is completed. Otherwise, the initial system check starts, possibly causing air to enter into the secondary system (anti-lock brake system operating circuit).**

- On vehicles equipped with a vacuum booster, in order to ensure that the vacuum booster function properly, start the engine and keep it running at idle until the replacement is completed.
- On vehicles equipped with a hydraulic booster, the emergency pump is used for the replacement operation. Therefore, stop the engine and turn the starter switch ON.
- Install one end of a vinyl pipe onto each air bleeder. Place the loose end into a container.



1.2 Replacement of brake fluid

- Loosen each bleeder screw, and press and release the brake pedal repetitively until brake fluid is no longer discharged from the pipes.
- While filling the brake fluid tank with new brake fluid up to the “MAX” mark, cycle the brake pedal repetitively until the old brake fluid being discharged is replaced with new brake fluid. Tighten each air bleeder to the specified torque.
- Proceed to Air Bleeding of Brake System.

2. Air Bleeding of Brake System

- Brake fluid is shared by the brake and clutch systems, and is divided in the brake fluid tank into the two systems. This section describes the air bleeding of the brake system.

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened		Tightening torque	Remarks
–	Air bleeder	Disc brake	5.8 to 8.8 {4.3 to 6.5, 0.6 to 0.9}	–
		Drum brake	6.86 to 8.83 {5.1 to 6.5, 0.7 to 0.9}	–

Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
–	Brake fluid tank	Brake fluid (SAE J1703 or FMVSS No. 116 DOT3)	As required

WARNING ⚠

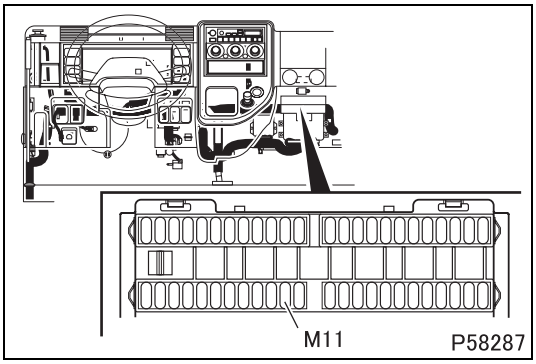
- **Be sure to use new brake fluid. Do not mix it with brake fluid of different properties or mineral oil (gas oil, engine oil, gear oil, automatic transmission fluid, etc.). This will alter the original properties of FUSO Brake Fluid, causing the boiling point to drop as well as the brake rubber parts to swell. Faulty operation of the brake will result.**
- **Ensure that no foreign matter or water enter into the brake fluid when refilling it, as they will cause faulty brake operation.**
- **Use a mug exclusively kept for the specified brake fluid. This ensures that no brake fluid of different properties or mineral oil enter into the system.**

CAUTION ⚠

- **Brake fluid is corrosive on paintwork. Be careful not to spill it onto the paintwork. If brake fluid is spilled onto the paintwork, immediately wipe it off.**

NOTE

- **Brake fluid level drops during the air bleeding operation. Be sure to keep the brake fluid level at the "MAX" mark on the tank.**



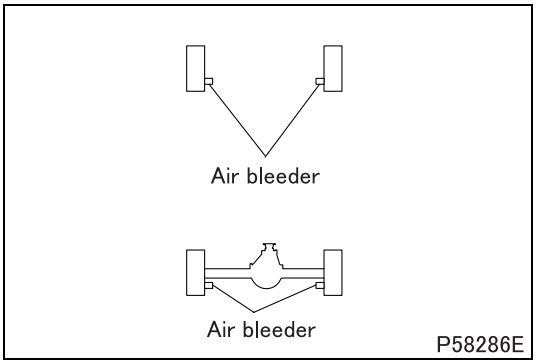
2.1 Work before replacement

- Remove the power fuse (M11) for the electronic control unit of anti-lock brake system.

WARNING ⚠

- **Do not install the power fuse until after the air bleeding of the primary brake system (normal circuit) is completed. Otherwise, the initial system check starts, possibly causing air to enter into the secondary system (anti-lock brake system operating circuit).**

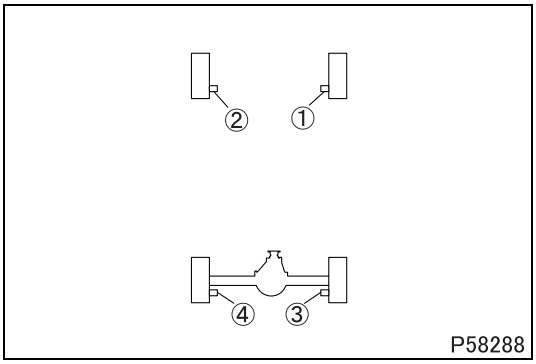
- On vehicles equipped with a vacuum booster, in order to ensure that the vacuum booster function properly, start the engine and keep it running at idle until the replacement is completed.
- On vehicles equipped with a hydraulic booster, the emergency pump is used for the replacement operation. Therefore, stop the engine and turn the starter switch ON.
- Install one end of a vinyl pipe onto each air bleeder. Place the loose end into a container.



2.2 Air bleeding of brake system

(1) Air bleeding of primary brake system (normal circuit)

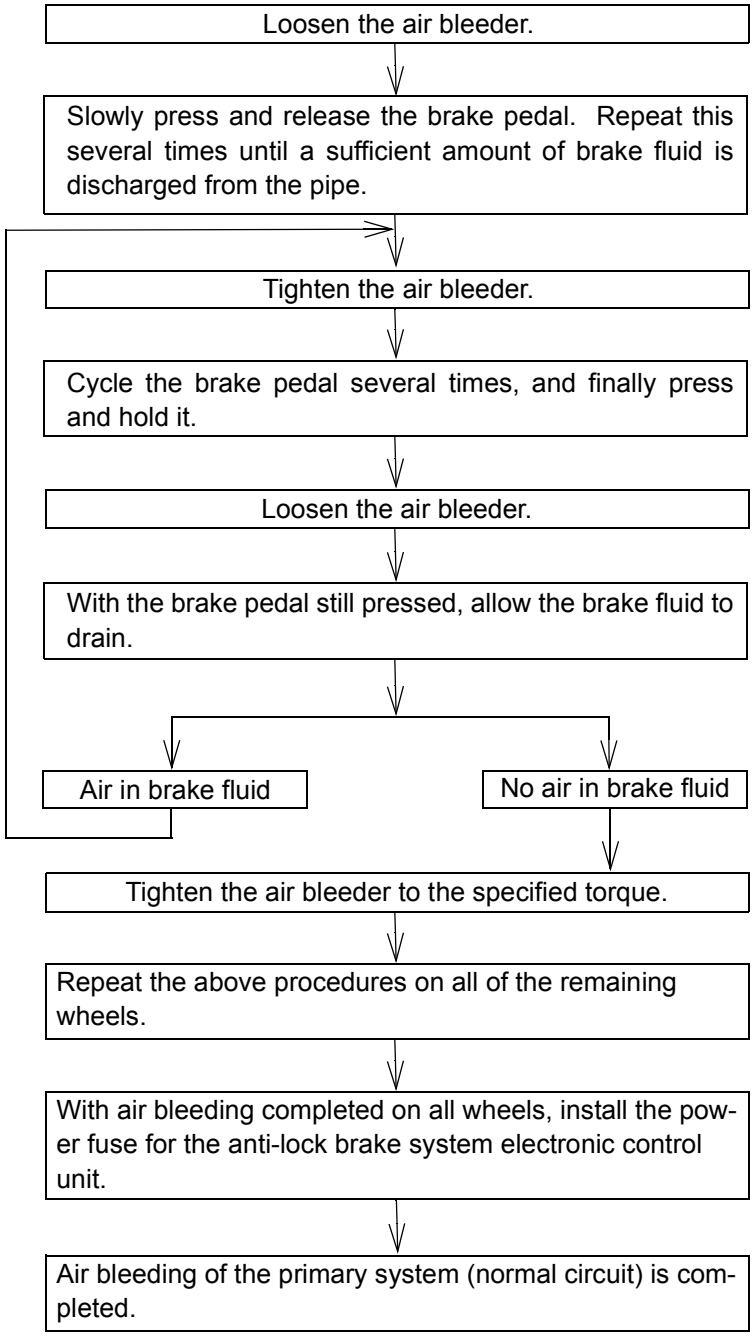
- Perform the air bleeding sequence described below on each of the 4 wheels in the order of the following table.



Order of air bleeding	Brake system	Wheel
(1)	Front	Front right
(2)		Front left
(3)	Rear	Rear right
(4)		Rear left

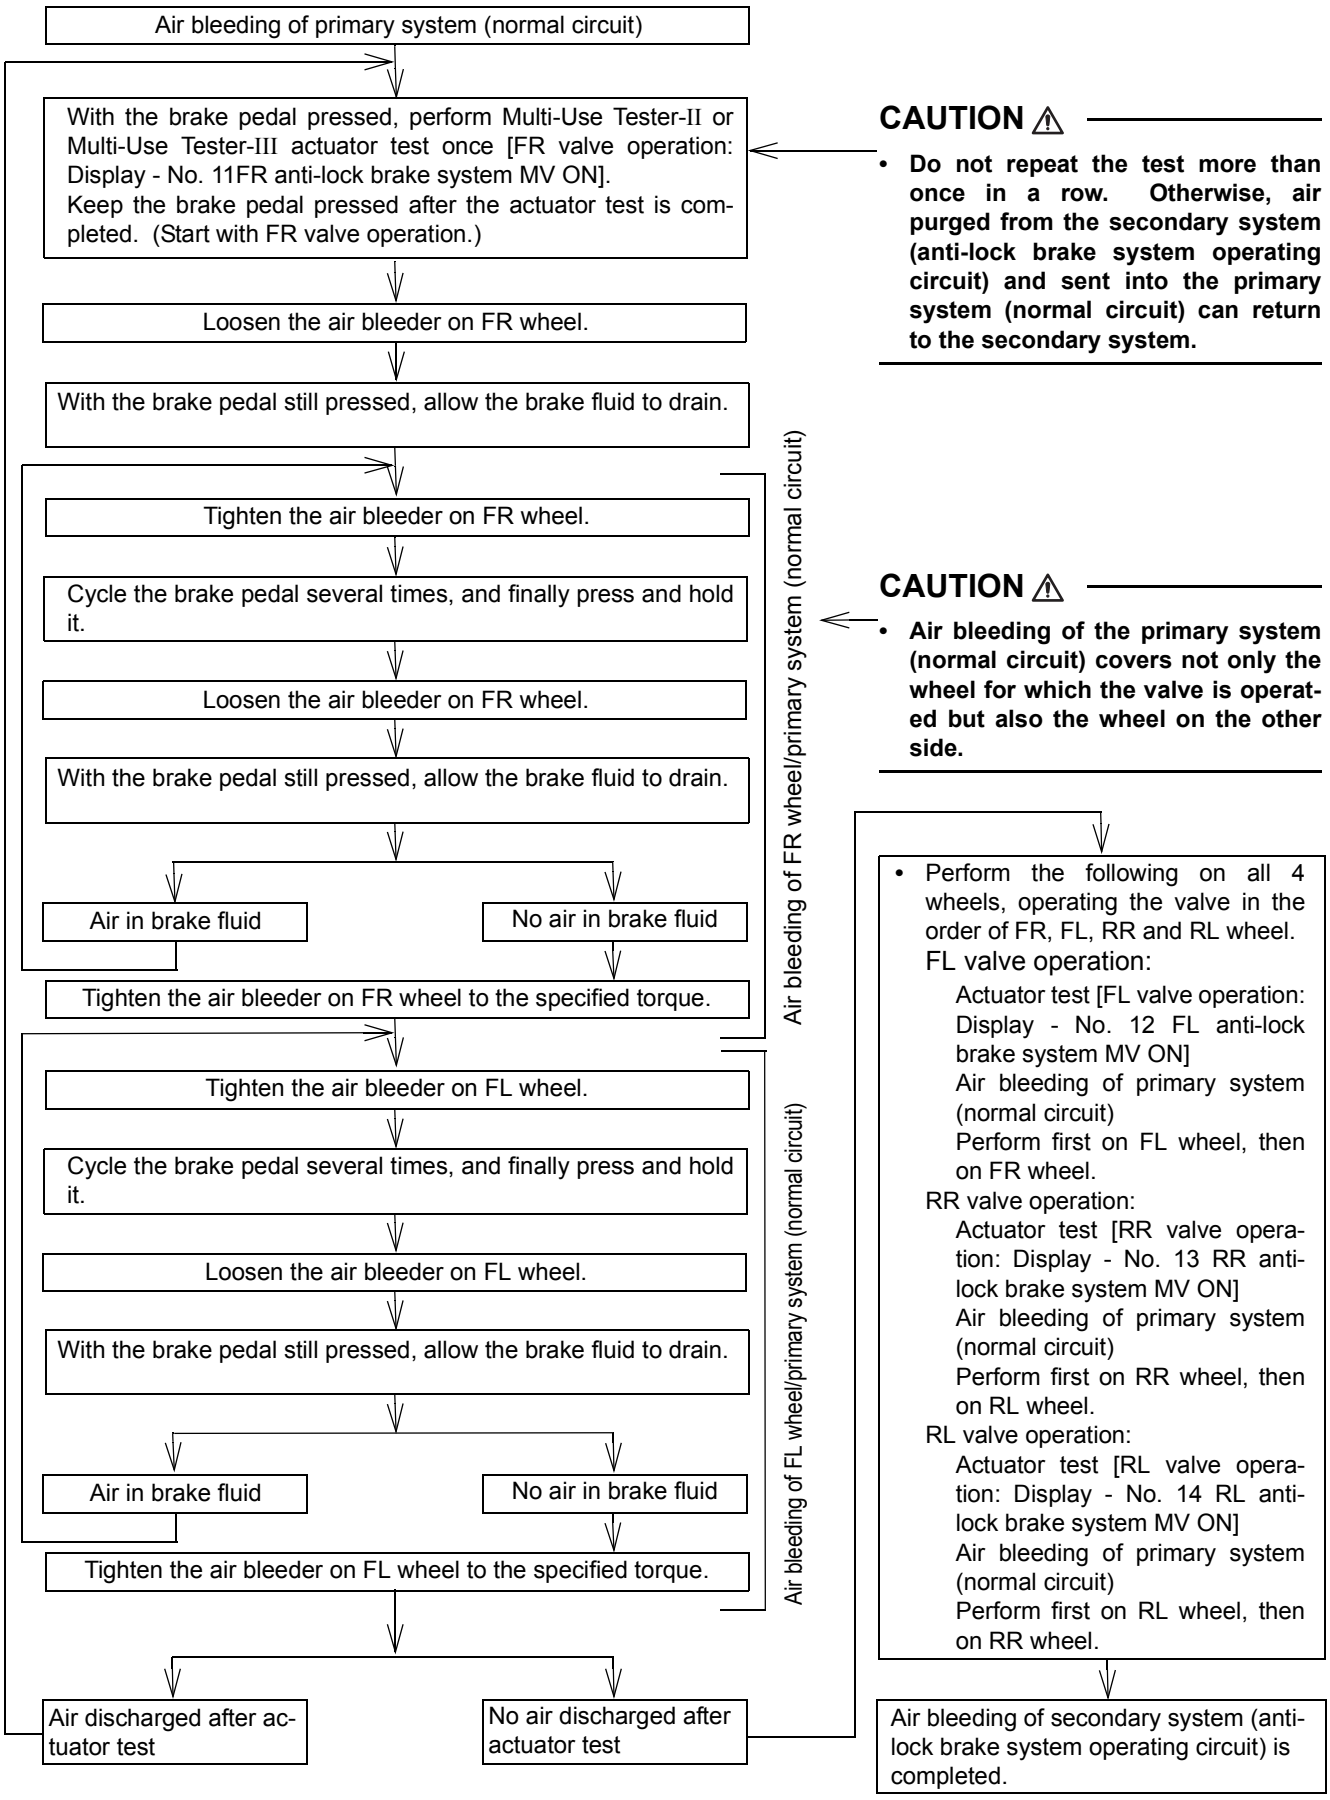
CAUTION ⚠

- **If air has entered into the secondary brake system (anti-lock brake system operating circuit), bleed air from the secondary system after completing the air bleeding of the primary system (normal circuit).**
- **Normally, during air bleeding or hydraulic unit replacement operation, air cannot enter into the secondary system (anti-lock brake system operating circuit) which is filled with brake fluid and is closed off. Therefore, only the primary system (anti-lock brake system operating circuit) needs to be bled of air.**



(2) Air bleeding of secondary brake system (anti-lock brake system operating circuit)

- If the anti-lock brake system system is operated with air still remaining in the primary brake system (normal circuit), air can enter into the secondary brake system (anti-lock brake system operating circuit).
- If air has entered into the secondary system (anti-lock brake system operating circuit), that air can also flow into the primary system (normal circuit) when the anti-lock brake system system is operated, possibly causing the brake pedal stroke to extend.
- Multi-Use Tester-II or Multi-Use Tester-III actuator test (anti-lock brake system operating mode) is performed as part of the air bleeding procedures.

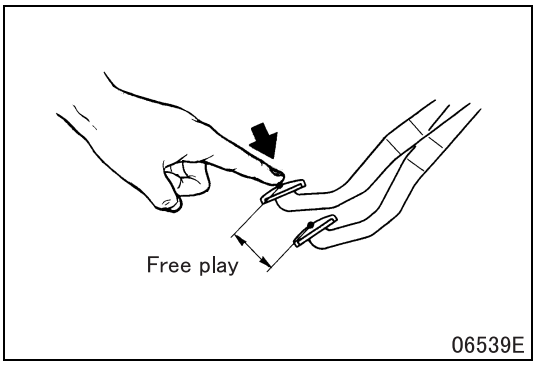


Air bleeding of primary system (normal circuit)
With the brake pedal pressed, perform Multi-Use Tester-II or Multi-Use Tester-III actuator test once [FR valve operation: Display - No. 11FR anti-lock brake system MV ON].
Keep the brake pedal pressed after the actuator test is completed. (Start with FR valve operation.)
Loosen the air bleeder on FR wheel.
With the brake pedal still pressed, allow the brake fluid to drain.
Tighten the air bleeder on FR wheel.
Cycle the brake pedal several times, and finally press and hold it.
Loosen the air bleeder on FR wheel.
With the brake pedal still pressed, allow the brake fluid to drain.
Air in brake fluid
No air in brake fluid
Tighten the air bleeder on FR wheel to the specified torque.
Air bleeding of FR wheel/primary system (normal circuit)
Tighten the air bleeder on FL wheel.
Cycle the brake pedal several times, and finally press and hold it.
Loosen the air bleeder on FL wheel.
With the brake pedal still pressed, allow the brake fluid to drain.
Air in brake fluid
No air in brake fluid
Tighten the air bleeder on FL wheel to the specified torque.
Air bleeding of FL wheel/primary system (normal circuit)
Air discharged after actuator test
No air discharged after actuator test
CAUTION
• Do not repeat the test more than once in a row. Otherwise, air purged from the secondary system (anti-lock brake system operating circuit) and sent into the primary system (normal circuit) can return to the secondary system.
CAUTION
• Air bleeding of the primary system (normal circuit) covers not only the wheel for which the valve is operated but also the wheel on the other side.
• Perform the following on all 4 wheels, operating the valve in the order of FR, FL, RR and RL wheel.
FL valve operation:
Actuator test [FL valve operation: Display - No. 12 FL anti-lock brake system MV ON]
Air bleeding of primary system (normal circuit)
Perform first on FL wheel, then on FR wheel.
RR valve operation:
Actuator test [RR valve operation: Display - No. 13 RR anti-lock brake system MV ON]
Air bleeding of primary system (normal circuit)
Perform first on RR wheel, then on RL wheel.
RL valve operation:
Actuator test [RL valve operation: Display - No. 14 RL anti-lock brake system MV ON]
Air bleeding of primary system (normal circuit)
Perform first on RL wheel, then on RR wheel.
Air bleeding of secondary system (anti-lock brake system operating circuit) is completed.

3. Inspection and Adjustment of Brake Pedal Free Play

Service standards (Unit: mm {in.})

Location	Maintenance item	Standard value	Limit	Remedy
–	Pedal free play	0.1 to 3 {0.0034 to 0.12}	–	Adjust



[Inspection]

- With the engine stationary, ensure that the pedal play conforms to the standard value.
- If the measured value does not conform to the standard value, adjust the installed height of the brake pedal.

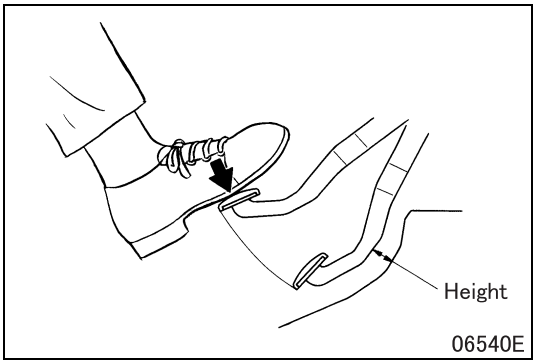
[Adjustment]

- For adjustment procedures, see “5. Inspection of Brake Pedal Full Stroke and Adjustment of Installed Height of Brake Pedal.”

4. Inspection and Adjustment of Brake Pedal Pressed Height from Floor

Service standards (Unit: mm {in.})

Location	Maintenance item	Standard value	Limit	Remedy
–	Brake pedal height from floor (when pressed with a force of 490 N {110 lbs, 50 kgf}	20 {0.79} or above	–	Adjust



[Inspection]

- With the engine running at idle, press the brake pedal with a force of 490 N {110 lbs, 50 kgf} and measure the brake pedal height from the floor.
- If the measured value does not conform to the standard value, adjust the installed height of the brake pedal.

[Adjustment]

- For adjustment procedures, see “5. Inspection of Brake Pedal Full Stroke and Adjustment of Installed Height of Brake Pedal.”

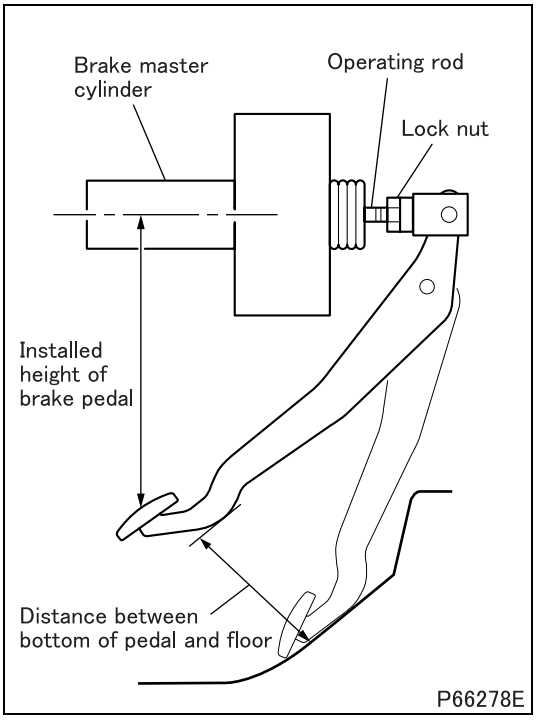
5. Inspection of Brake Pedal Full Stroke and Adjustment of Installed Height of Brake Pedal

Service standards (Unit: mm {in.})

Location	Maintenance item		Standard value	Limit	Remedy
–	Pedal full stroke (distance between bottom of pedal and floor with brake pedal released)	Except FE85	170 to 177 {6.68 to 6.97}	–	Adjust
		FE85	173 to 181 {6.82 to 7.11}	–	
	Installed height of brake pedal (pedal pad center to brake master cylinder center)	Except FE85	233 ± 3 {9.17 ± 0.12}	–	Adjust
		FE85	230.2 ± 3 {9.06 ± 0.12}	–	

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened		Tightening torque	Remarks
–	Lock nut	Except FE85	21.6 ± 2.94 {16 ± 2.2, 2.2 ± 0.3}	–
		FE85	9.8 to 15.7 {7.2 to 12, 1.0 to 1.6}	–



5.1 Inspection of pedal stroke

- With the brake pedal released, measure the distance between the bottom of pedal and the floor. If the measurement conforms to the standard value, the pedal full stroke is correctly adjusted.
- If the above measurement does not conform to the standard value, adjust the installed height of the brake pedal.

5.2 Adjustment of installed height of brake pedal

- After loosening the lock nut, turn the operating rod of the vacuum booster/hydraulic booster until the distance from the pedal pad center to the axis of brake master cylinder conforms to the standard value.
- Tighten the lock nut to the specified torque.
- With the lock nut correctly tightened, adjust the stop lamp switch and inspect the brake pedal play.

CAUTION ⚠

- **When the pedal is fully pressed, the vacuum booster/hydraulic booster operating rod functions as a stopper for the brake pedal.**
- **To prevent brakes from dragging, ensure that the threaded end of the stop lamp switch does not touch the brake pedal stopper.**

6. Inspection and Replacement of Disc Brake Pad <FE>

Service standards (Unit: mm {in.})

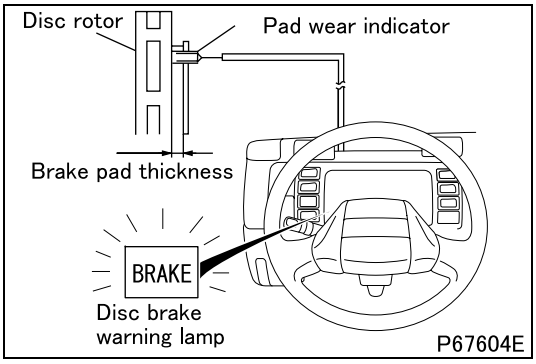
Location	Maintenance item	Standard value	Limit	Remedy
–	Thickness of outer/inner pad	14 {0.55}	4 {0.16}	Replace

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
–	Pin bolt	40 to 50 {30 to 37, 4.0 to 5.0}	–

Special tools (Unit: mm {in.})

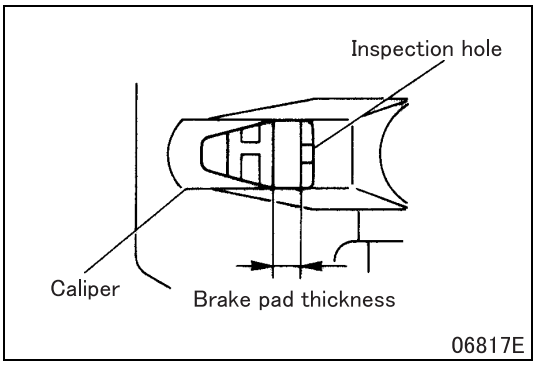
Mark	Tool name and shape	Part No.	Application
ⓐ	Piston expander A: 50 {1.97}, B: 5 {0.20}  06815	MB990520	Pressing piston during brake pad replacement



P67604E

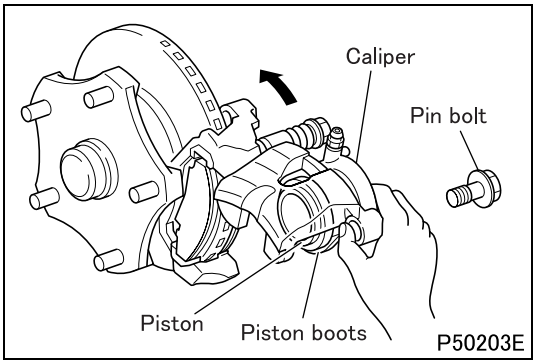
[Inspection]

- When a brake pad has worn down to a thickness of approximately 4 mm {0.16 in.}, the pad wear indicator contacts the disc rotor. This breaks the circuit, illuminating the disc brake warning lamp on the meter cluster to tell the operator that the brake pads need replacement.



06817E

- Through the inspection hole in the caliper, measure the brake pad thickness. If the measured value is less than the limit, replace all of the brake pads on that axle with a new kit.



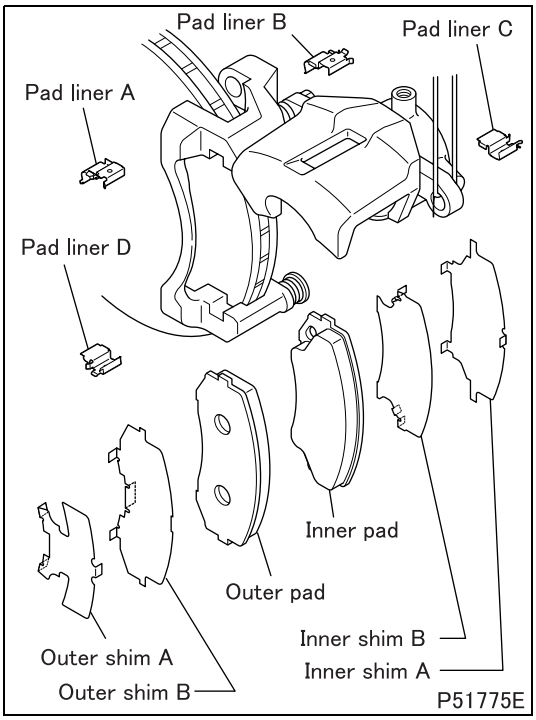
[Replacement]

- Remove the lower pin bolt. Flip the caliper upwards and suspend it in place using a wire or the like.

CAUTION ⚠

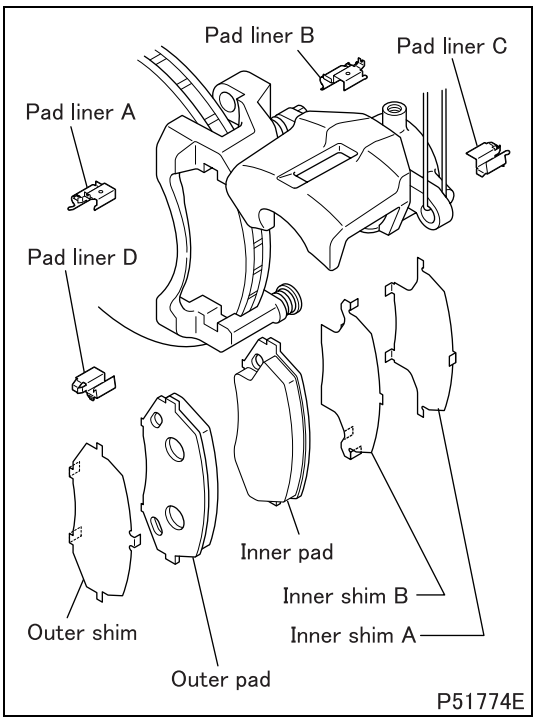
- **The caliper needs to be suspended firmly in place so that it does not drop, without stretching, squeezing or otherwise forcing the brake hosing or harness.**

- Inspect the piston for fluid leakage. Inspect the piston boots for damage. Faulty parts must be replaced.
- Remove the following parts. Installation follows the removal procedure in reverse. When installing shims onto the pads, be sure to face them in the illustrated directions.



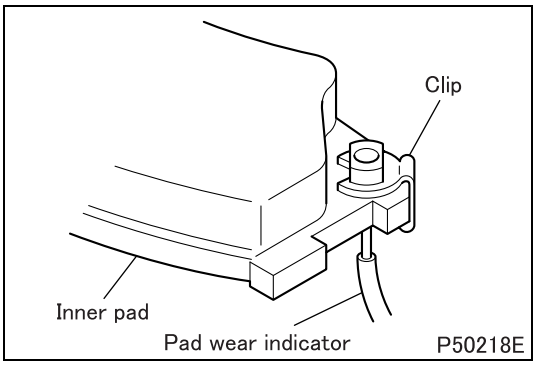
<ϕ235 mm {9.25 in.} disc>

- The inner pad on RH wheel and the inner pad on LH wheel are both equipped with a pad wear indicator.



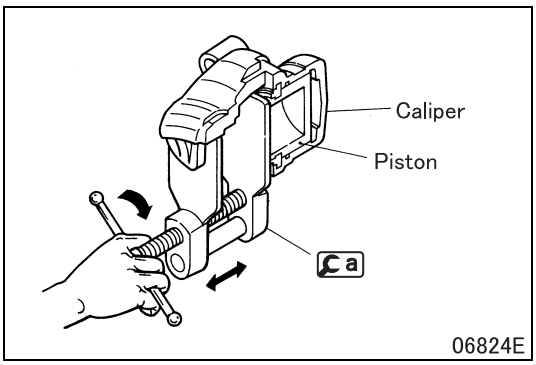
<φ252 mm {9.92 in.} disc>

- The inner pad on RH wheel and the inner pad on LH wheel are both equipped with a pad wear indicator.

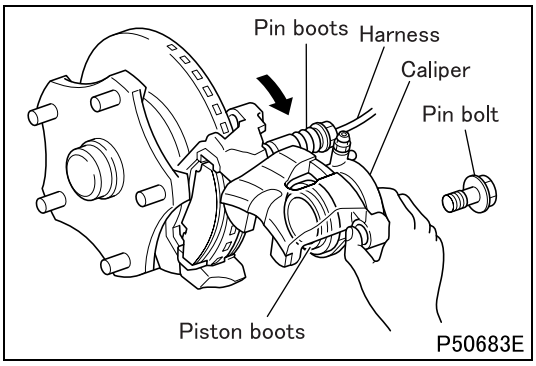


- Install a pad wear indicator onto the inner pad (included in the pad kit) using a clip (included in the pad wear indicator kit).

Pad wear indicator to be installed on	Inner pads on RH and LH wheels



- Using a, screw in the piston of the caliper until it bottoms on the back of the caliper.



- Move the caliper back to the original place while taking care not to damage the piston boots.
- Bleed the pin boots of air.
- Ensure that the pin boots are firmly attached into the groove on the slide pin.
- Tighten the pin bolt to the specified torque.
- Correctly route the harness(es) for the pad wear indicator(s).
- Measure the drag torque of the disc brake.
- Cycle the brake pedal several times, and check the brake fluid level in the tank. The fluid level should be at the “MAX” mark on the tank. Add brake fluid as required.

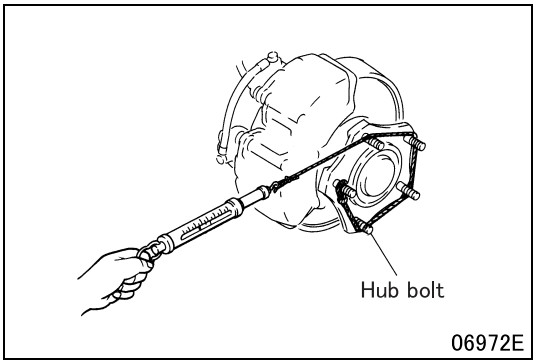
7. Measurement of Disc Brake Drag Torque <FE>

Service standards

Location	Maintenance item		Standard value	Limit	Remedy
–	Drag torque of disc brake (tangential force at hub bolts)	Approx. 5 sec. after releasing brake pedal	9.8 N·m {7.2 ft.lbs, 1.0 kgf·m} or less	–	Inspect
		After turning disc rotor 10 revolutions	6.9 N·m {5.1 ft.lbs, 0.7 kgf·m} or less	–	

Table of tangential forces

		Approx. 5 sec. after releasing brake pedal	After turning disc rotor 10 revolutions
FE	Front	81 N {8.3 kgf}	57 N {5.8 kgf}
	Rear	83 N {8.5 kgf}	59 N {6 kgf}
FG	Front	85 N {8.7 kgf}	60 N {6.1 kgf}
	Rear	83 N {8.5 kgf}	59 N {6 kgf}



- Ensure that the starting torque of the wheel hub bearings conforms to the standard value.
- Using a spring balance, measure the tangential force at the hub bolts.
- The tangential force is calculated by the following formula.
  Tangential force = Dragging torque / (hub bolt P.C.D. / 2)
- If the measured tangential force conforms to the specified value, this means that the drag torque of the disc brake conforms to the standard value.
- If the measured value does not conform to the specified torque, check the sliding portions of the piston and piston seal.

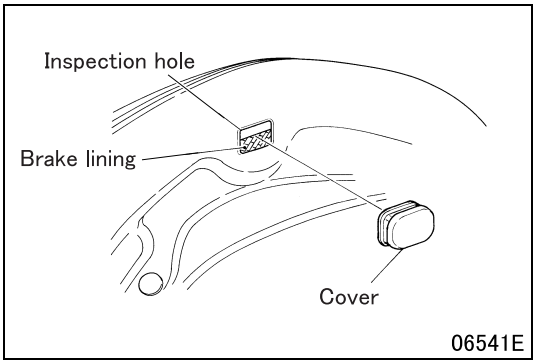
8. Inspection of Drum Brake Lining Thickness <FG>

CAUTION ⚠

- **To ensure correct operation of the brakes, be sure to inspect both linings on each wheel.**

Service standards (Unit: mm {in.})

Location	Maintenance item	Standard value	Limit	Remedy
–	Brake lining thickness	–	4.0 {0.16}	Replace



- Remove the cover from the backing plate. Through the inspection hole, check the thickness of the brake lining.
- If the measured value is equal to or less than the limit, replace all of the brake linings or shoes on the same axle.
- After the inspection, be sure to install the cover.

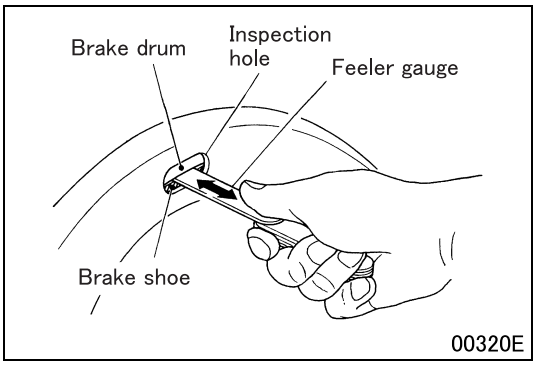
9. Initial Setting of Clearance between Brake Drum and Shoe <FG>

CAUTION ⚠

- **To ensure correct operation of the brakes, be sure to inspect both shoes on each wheel.**

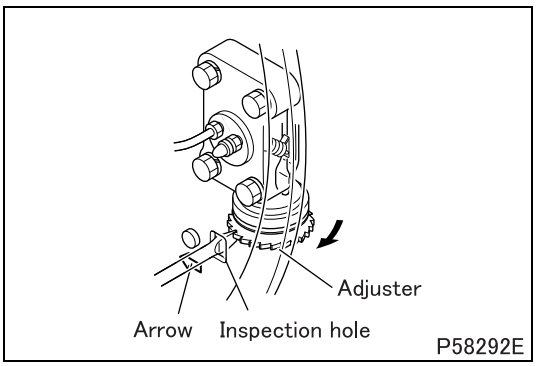
Service standards (Unit: mm {in.})

Location	Maintenance item	Standard value	Limit	Remedy
–	Clearance between brake drum and shoe	0.2 {0.0079}	–	Inspect, and adjust as required



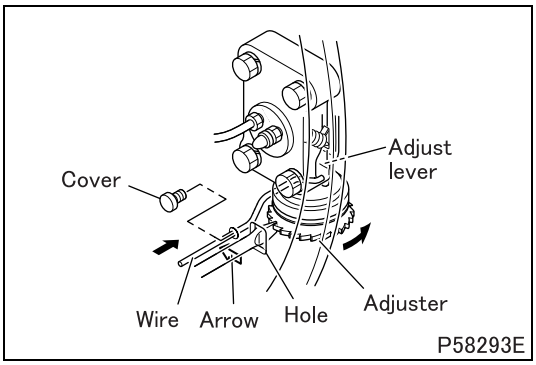
[Inspection]

- Cycle the brake pedal a couple of times to bring the brake shoes to conditions appropriate for the inspection.
- Through the inspection hole, insert a feeler gauge between the brake drum and lining. The gauge should be able to be inserted and out with slight resistance.
- If the clearance does not conform to the standard value, perform the following adjustment.



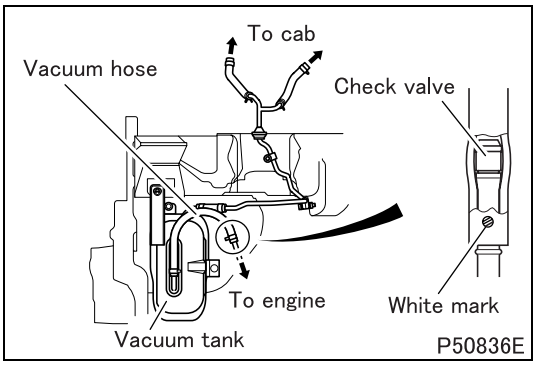
[Adjustment]

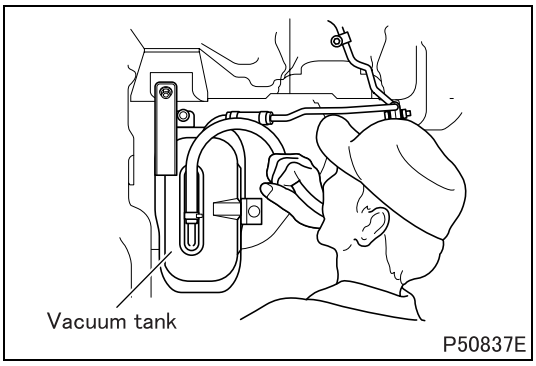
- Jack up the wheel being adjusted. Ensure that the wheel hub bearings are not loose.
- With a 0.3 mm {0.012 in.} feeler gauge inserted through the inspection hole, adjust the drum-to-lining clearance in the following manners such that the gauge can be inserted and out with slight resistance.
- If the feeler gauge can be inserted and out with no resistance, turn the adjuster through the inspection hole in the direction of the arrow on the backing plate.



- If the clearance is too small to insert the feeler gauge or there is considerable resistance when inserting the gauge, remove the cover and insert a ϕ2 mm {0.079 in.} wire through the hole to lift the adjust lever for the wheel cylinder. Then, through the inspection hole turn the adjuster in the direction opposite to the arrow on the backing plate to increase the clearance between the brake drum and shoe.
- Then, cycle the brake pedal a couple of times. This will automatically bring the brake drum-to-shoe clearance to 0.2 mm {0.0079 in.}.
- Insert a 0.2 mm {0.0079 in.} feeler gauge between the brake drum and lining. It should be able to be inserted and out with slight resistance.
- Check the disc brake for normal operation. If faulty, disassemble and inspect the wheel cylinders.

10. Inspection of Check Valve in Vacuum Line Hose





CAUTION ⚠

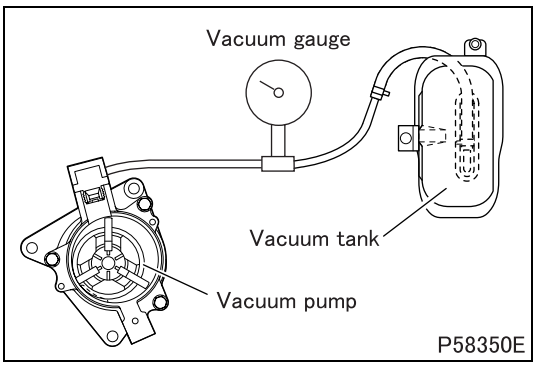
- **Be careful not to allow moisture into the check valve.**
- **During the inspection, ensure that the check valve opens as well as closes correctly.**
- **Do not attempt to remove the check valve from the vacuum hose.**

- Perform the following inspections. If the check valve does not pass both inspections, replace the check valve complete with the vacuum hose.
  - Blow into the hose. The check valve should close, preventing the breath from passing it.
  - Suck on the hose. The check valve should open, allowing air to pass.

11. Inspection of Vacuum Pump

Service standards

Location	Maintenance item		Standard value	Limit	Remedy
–	Time to reach vacuum of 80 kPa {23.6 in.Hg, 600 mmHg}	At 1500 rpm	Within 20 sec.	–	Replace
		At 3000 rpm	Within 12 sec.	–	



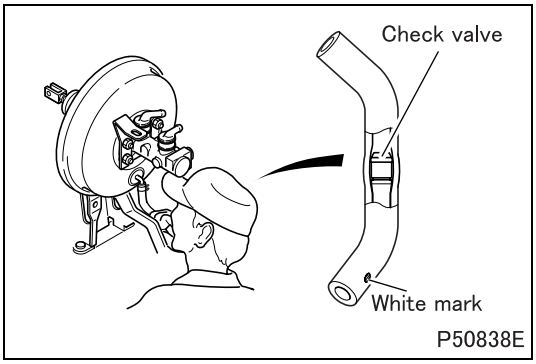
- Install a vacuum gauge between the vacuum tank and the vacuum pump.
- Start the engine and measure the time taken to reach the specified degree of vacuum.
- If the measured time does not conform to the standard value, disassemble and service the vacuum pump.

12. Inspection of Vacuum Booster <Except FE85>

- The vacuum booster can be inspected in 2 ways: one without using any tester and the other using a simplified tester. In either way, ensure that the brake piping and hosing and their connections are free of leakage, damage, or other faults.

Service standards

Location	Maintenance item		Standard value	Limit	Remedy
–	Precision inspection (vacuum loss) (vacuum of 67 kPa {19.8 in.Hg, 500 mmHg}, 15 sec. after engine stop)		3.3 kPa {0.97 in.Hg, 25 mmHg} or less	–	Replace
–	Fluid pressure at vacuum of 67 kPa {19.8 in.Hg, 500 mmHg}	ϕ8 + ϕ9 inch vacuum booster, ϕ30.16 mm {1.19 in.} brake master cylinder	4830 kPa {700 psi, 49.3 kgf/cm^2} (pedal pressed with a force of 98 N {22.0 lbs, 10 kgf})	–	Replace
			8230 kPa {1190 psi, 83.9 kgf/cm^2} (pedal pressed with a force of 295 N {66.3 lbs, 30 kgf})	–	
		ϕ9 + ϕ10 inch vacuum booster, ϕ31.75 mm {1.25 in.} brake master cylinder	4360 kPa {630 psi, 44.5 kgf/cm^2} (pedal pressed with a force of 98 N {22.0 lbs, 10 kgf})	–	
			8800 kPa {1280 psi, 89.7 kgf/cm^2} (pedal pressed with a force of 295 N {66.3 lbs, 30 kgf})	–	
–	Fluid pressure at vacuum of 0 kPa {0 in.Hg, 0 mmHg}	ϕ8 + ϕ9 inch vacuum booster, ϕ30.16 mm {1.19 in.} brake master cylinder	345 kPa {50 psi, 3.5 kgf/cm^2} (pedal pressed with a force of 98 N {22.0 lbs, 10 kgf})	–	Replace
			1720 kPa {250 psi, 17.5 kgf/cm^2} (pedal pressed with a force of 295 N {66.3 lbs, 30 kgf})	–	
		ϕ9 + ϕ10 inch vacuum booster, ϕ31.75 mm {1.25 in.} brake master cylinder	315 kPa {46 psi, 3.2 kgf/cm^2} (pedal pressed with a force of 98 N {22.0 lbs, 10 kgf})	–	
			1550 kPa {225 psi, 15.8 kgf/cm^2} (pedal pressed with a force of 295 N {66.3 lbs, 30 kgf})	–	



12.1 Inspection of check valve in vacuum hose

CAUTION ⚠

- **Be careful not to allow moisture into the check valve.**
- **During the inspection, ensure that the check valve opens as well as closes correctly.**
- **Do not attempt to remove the check valve from the vacuum hose.**

- Start the engine and charge the vacuum tank with vacuum.
- Stop the engine, and immediately remove the clamp fixing the vacuum hose onto the vacuum pipe, and hold the hose in the mouth.
- Blow into the hose. The check valve should close, preventing the breath from passing it.
- Suck on the hose while pressing the brake pedal. The check valve should immediately open, allowing air to pass.
- If any fault is encountered during the above inspections, replace the check valve complete with the vacuum hose.

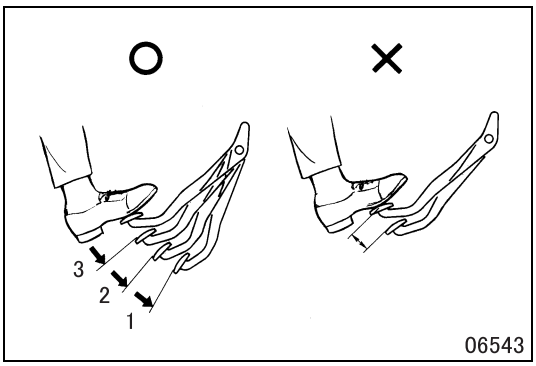
12.2 Operational check of vacuum booster

CAUTION ⚠

- **The vacuum booster operational checks described below are only of summary nature. If the vacuum booster continues to malfunction, perform a bench test specified by a service station of the manufacturer on the vacuum booster after removing it from the vehicle.**
- **If the vacuum booster is found to be faulty during the specified testing, ask the service station of the manufacturer for repair.**

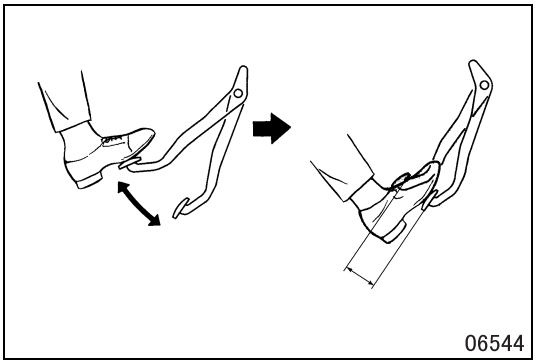
(1) Operational check without any tester

- Inspect the check valve in the vacuum hose for normal operation.
- Perform the checks described below. If any fault is found during these checks, inspect the following parts.
  - Vacuum booster
  - Vacuum pump



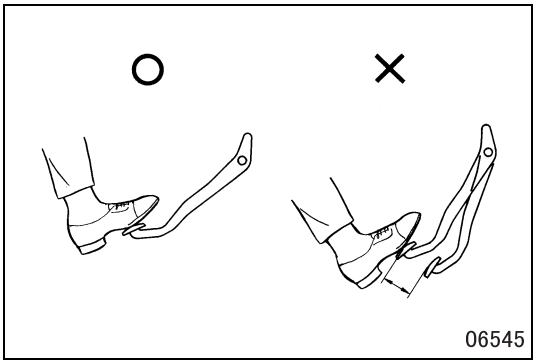
[Check 1]

- Start the engine and run it for 1 to 2 minutes. Stop the engine.
- Press the brake pedal repetitively with the normal stepping force.
- The pedal stroke should become smaller each time the pedal is pressed.



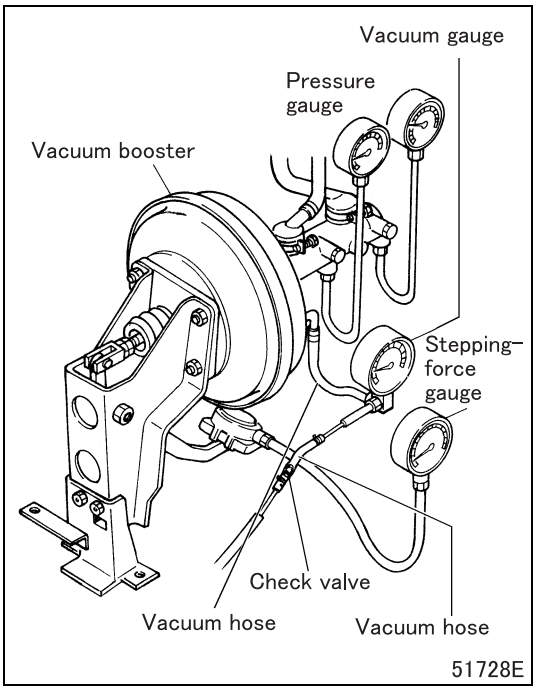
[Check 2]

- With the engine stationary, press the brake pedal several times.
- With the brake pedal pressed, start the engine. The pedal should sink slightly.



[Check 3]

- With the engine running and the brake pedal pressed, stop the engine.
- The brake pedal should maintain the same height for approximately 30 seconds.



(2) Operational check with a simplified tester

(2.1) Airtightness check

- Inspect the check valve in the vacuum hose for normal operation.
- Remove the vacuum hose from the vacuum booster and connect it to the vacuum gauge.
- Connect another hose (not equipped with a check valve) onto the vacuum booster and the vacuum gauge.
- Install 2 pressure gauges and 1 stepping-force gauge as illustrated. Bleed the pressure gauges of air.
- Perform the following checks. If any fault is encountered during these checks, inspect the vacuum booster.

[Check 1]

- Start the engine. When the reading on the vacuum gauge has reached 67 kPa {19.8 in.Hg, 500 mmHg}, stop the engine.
- The vacuum lost in approximately 15 seconds of the engine stop should conform to the standard value.

[Check 2]

- Start the engine, and press the brake pedal. When the reading on the vacuum gauge has reached 67 kPa {19.8 in.Hg, 500 mmHg}, stop the engine.
- The vacuum lost in approximately 15 seconds of the engine stop should conform to the standard value.

(2.2) System characteristics check

- Perform the following system characteristics checks after the air-tightness check described above is completed.
- Perform the following checks. If any fault is encountered during these checks, inspect the vacuum booster.

[Check 1]

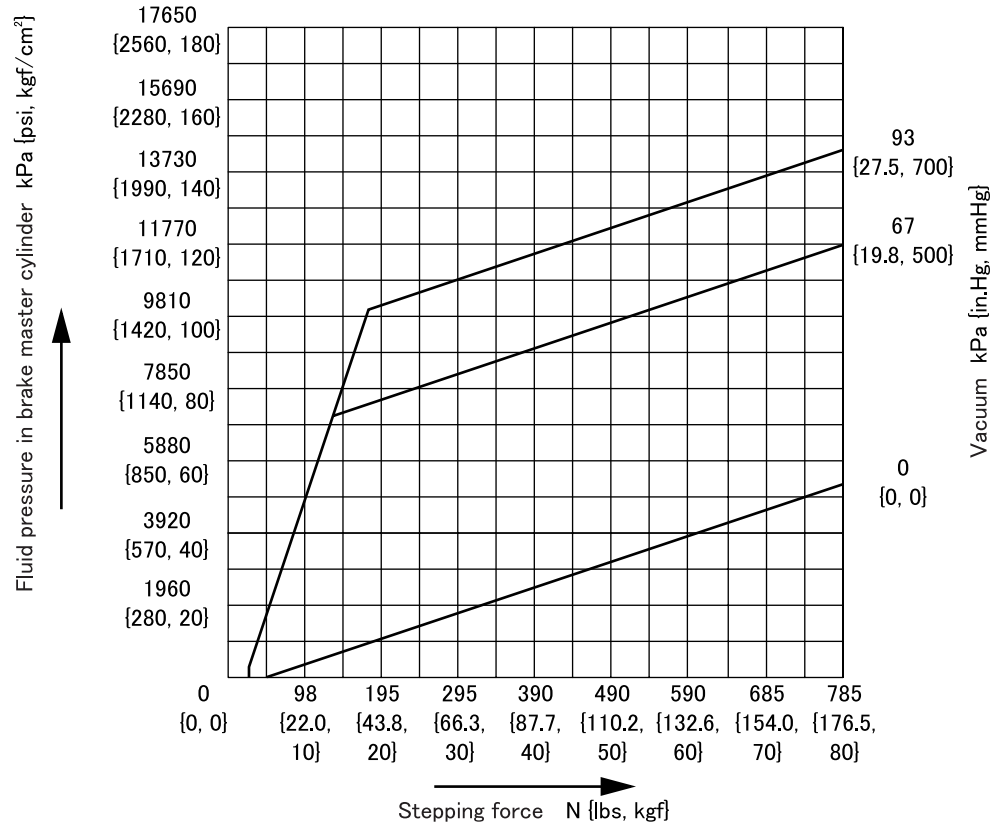
- Start the engine. When the reading on the vacuum gauge has reached 67 kPa {19.8 in.Hg, 500 mmHg}, press the brake pedal with the specified stepping forces.
- The fluid pressures indicated on the pressure gauges should conform to the specified values.

[Check 2]

- Start the engine. When the reading on the vacuum gauge has reached 0 kPa {0 in.Hg, 0 mmHg}, press the brake pedal with the specified stepping forces.
- The fluid pressures indicated on the pressure gauges should conform to the specified values.

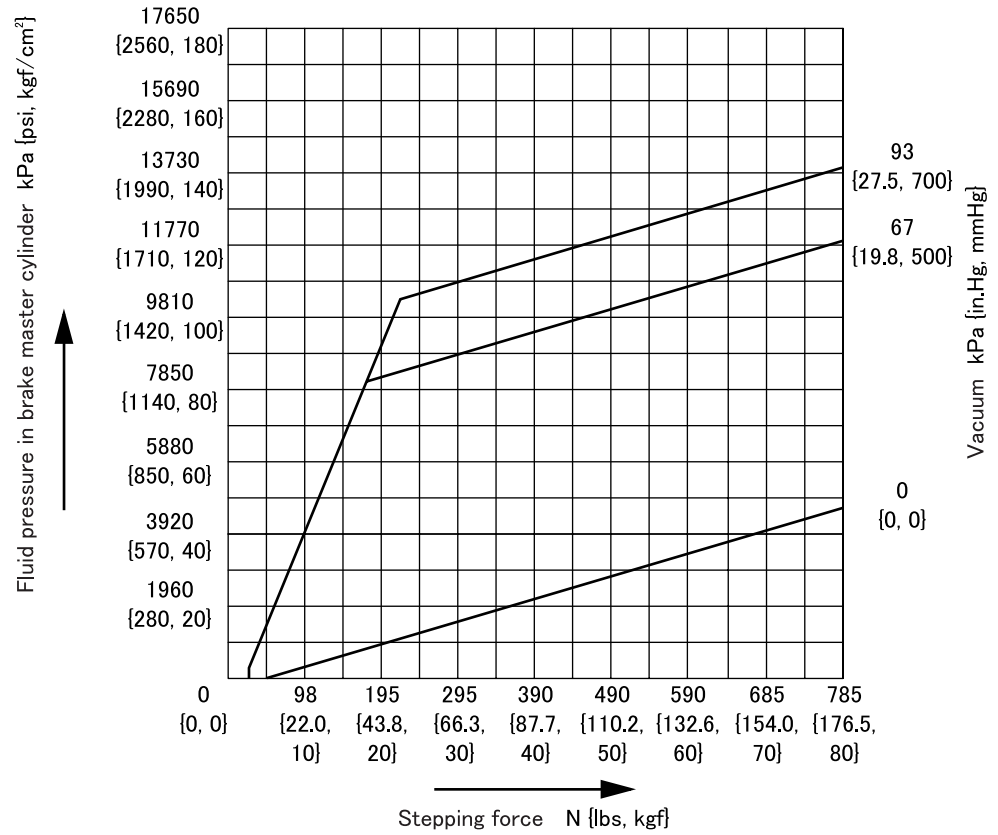
(2.3) Vacuum booster performance graph

＜φ8＋φ9 inch vacuum booster, φ30.16 mm {1.19 in.} brake master cylinder＞



P59004N

＜φ9＋φ10 inch vacuum booster, φ30.75 mm {1.25 in.} brake master cylinder＞



P59006N

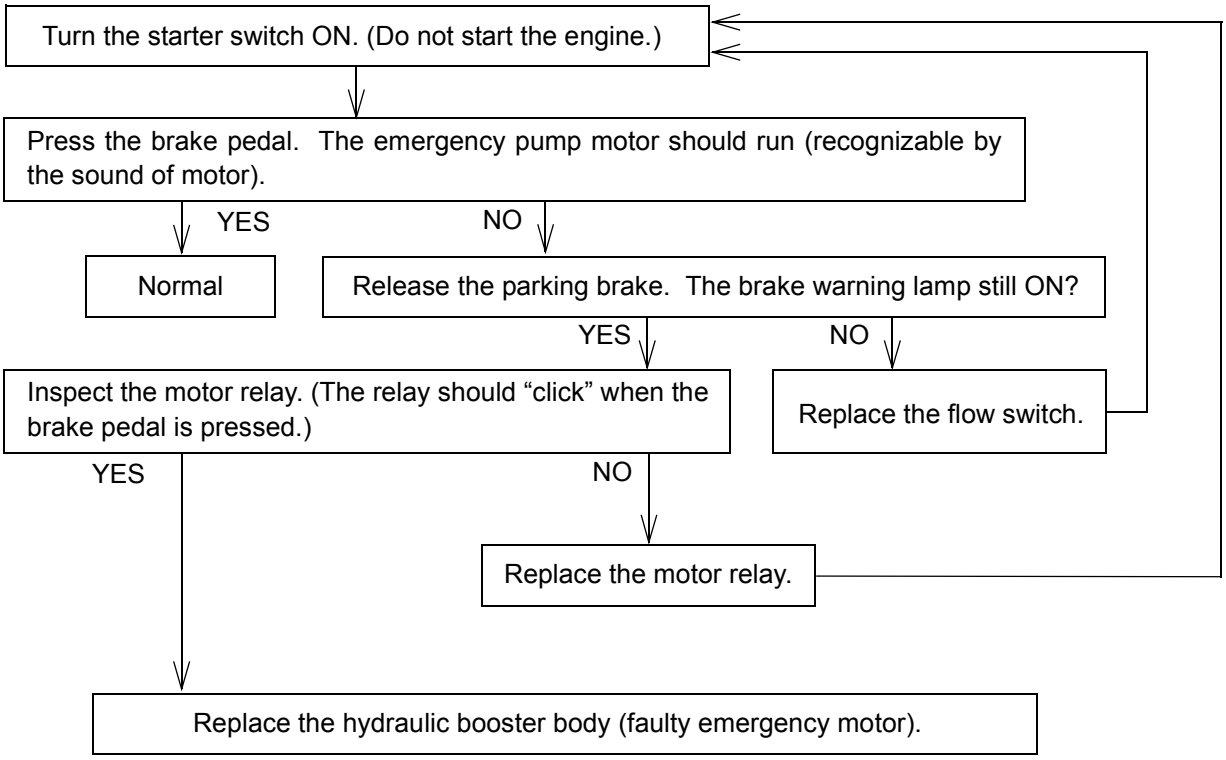
13. Inspection of Hydraulic Booster <FE85>

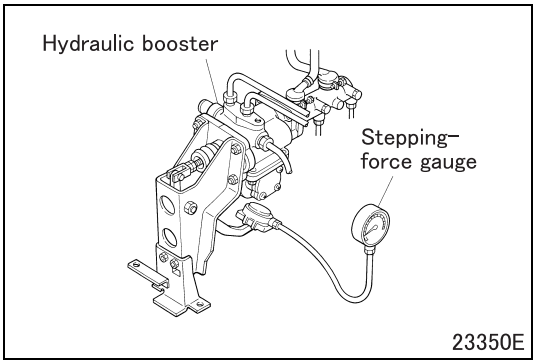
Service standards

Location	Maintenance item		Standard value	Limit	Remedy
–	Fluid pressure at power steering oil temperature of 60°C {140°F} or below	Pedal pressed with a force of 98 N {22.0 lbs, 10 kgf}	4620 kPa {670 psi, 47.1 kgf/cm^2}	–	Replace
		Pedal pressed with a force of 295 N {66.3 lbs, 30 kgf}	13600 kPa {1970 psi, 138.7 kgf/cm^2}	–	

13.1 Inspection of electric equipment

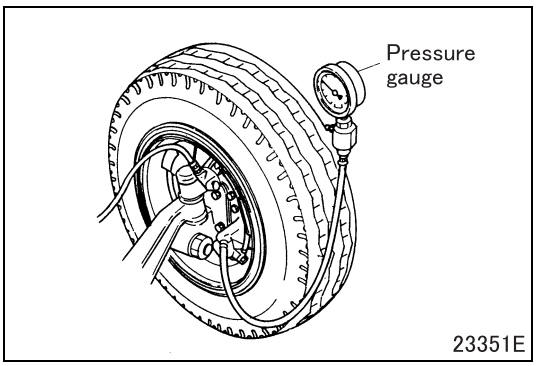
- Inspect in accordance with the following flow chart.
- Before inspection, park the vehicle on a flat surface, apply the parking brake firmly, and chock the wheels.





13.2 Functional check

- Install a stepping-force gauge onto the brake pedal. Remove an air bleeder from the front wheel brake, and install a pressure gauge. Bleed the gauge of air.
- Carry out performance test on the power steering system. Ensure that the system pressure is to specification.
- After confirming that the electric equipment has passed the inspection described above, press the brake pedal with varying forces. The reading of the front wheel brake fluid pressure should follow the pressure line of the graph.



- If any fault is observed during these checks, replace the hydraulic booster.

13.3 Hydraulic booster performance graph

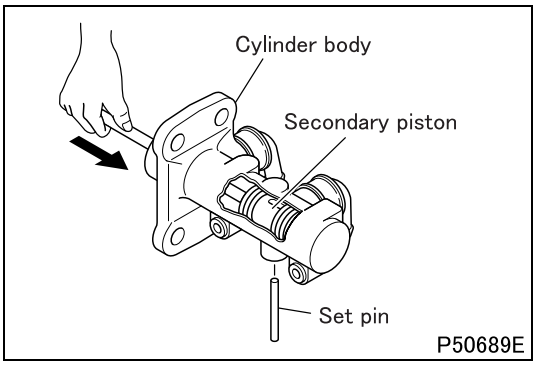
◆Removal procedure◆

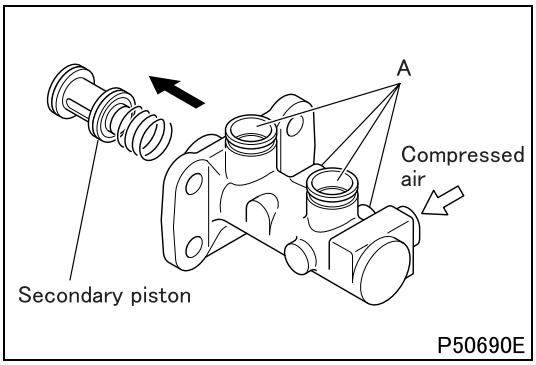


■ **Removal: Secondary piston**

- Position the cylinder body such that the set pin faces down. Using a rod or the like, compress the secondary piston to ease out the set pin.

CAUTION ⚠

- **As the secondary piston is compressed, the set pin will fall out. Be sure to catch it with hand. Do not drop it on the floor.**

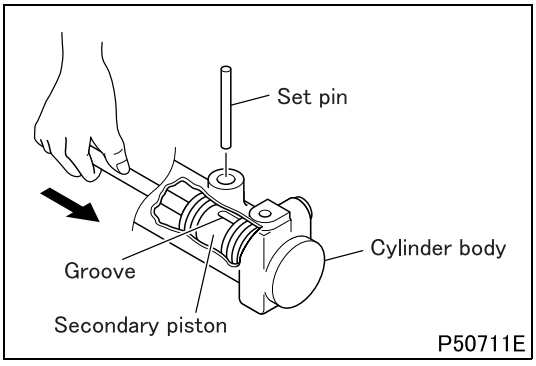


- With ports A blocked, feed compressed air in the direction of the arrow, gradually increasing pressure from 0 kPa {0 kgf/cm^2}, to remove the secondary piston.

WARNING ⚠

- **Do not apply compressed air suddenly and at high pressure. Otherwise, the secondary piston may fly out with full force.**

◆Installation procedure◆

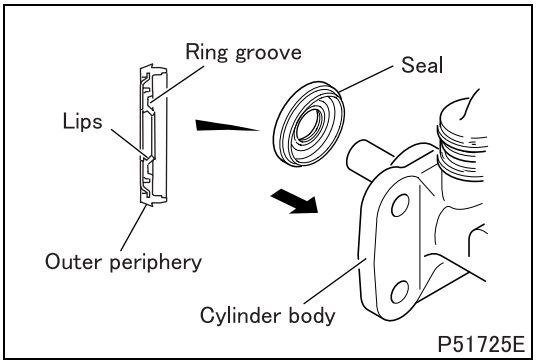


■ **Installation: Secondary piston**

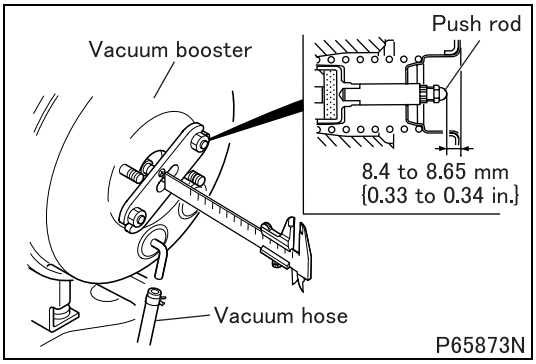
- Position the cylinder body such that the set pin hole faces up. Using a rod or the like, insert the secondary piston into the cylinder body while at the same time trying to insert the set pin.

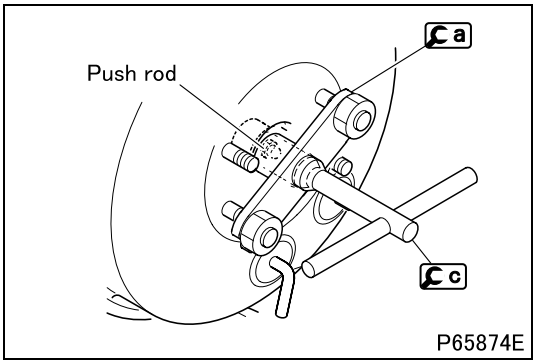
NOTE

- **If necessary, rotate the secondary piston to align the groove on the piston with the set pin hole.**



◆Work after installation◆





■ Installation: Seal

- Apply grease onto the lips and outer periphery of the seal. Also, pack grease into the seal's ring groove. Then, face the seal in the illustrated direction before installing it onto the cylinder body.

CAUTION ⚠

- **Ensure that the seal has been assembled correctly onto the cylinder body, i.e. facing the illustrated direction and without roll-up or damage. Otherwise, vacuum may be lost through the seal.**

■ Inspection: Brake pedal & vacuum booster

CAUTION ⚠

- **If the brake master cylinder or the primary piston is replaced, be sure to inspect and, if required, adjust the illustrated distance between the push rod and the end of the brake pedal & vacuum booster.**

[Inspection]

- Remove the vacuum hose from the brake pedal & vacuum booster to fill the vacuum booster with the atmospheric pressure.

CAUTION ⚠

- **The vacuum booster needs to be filled with the atmospheric pressure to obtain accurate results from the inspection.**

- Measure the distance (illustrated) between the push rod and the end of the brake pedal & vacuum booster.
- If the measured value does not conform to the specified value, adjust the distance as follows.

[Adjustment]

- Set the distance to the specified value by turning in or out the push rod.

Location	Maintenance item	Standard value	Limit	Remedy
1	Return spring load (installed length 190 {7.48})	195 to 235 N {44 to 53 lbs, 19.8 to 24.2 kgf}	175 N {39 lbs, 18.0 kgf}	Replace
7	Brake lining thickness	8.8 {0.35}	4.0 {0.16}	Replace

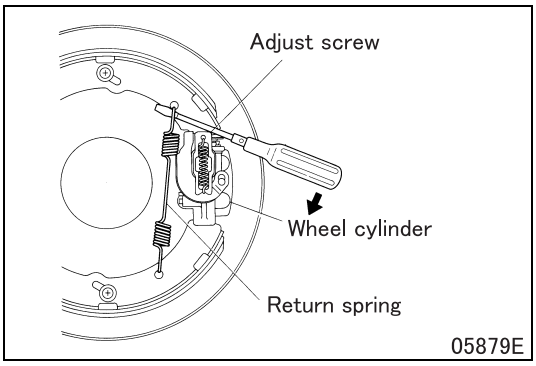
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Brake pipe	13 to 15 {9.6 to 11, 1.3 to 1.5}	–
	Extension		
Tb	Bolt (connector mounting)	7.8 to 12 {5.8 to 8.9, 0.8 to 1.2}	–
Tc	Bolt (wheel cylinder mounting)	37 to 49 {27 to 36, 3.8 to 5.0}	–

Lubricant and/or sealant

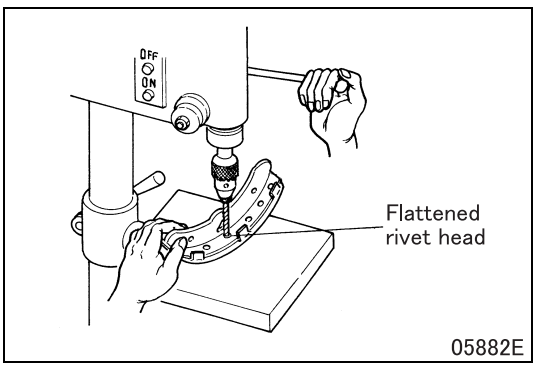
Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Contact areas between brake shoe and wheel cylinder	Brake grease	As required
	Contact areas between backing plate and brake shoe		

◆Removal procedure◆



■ Removal: Return spring

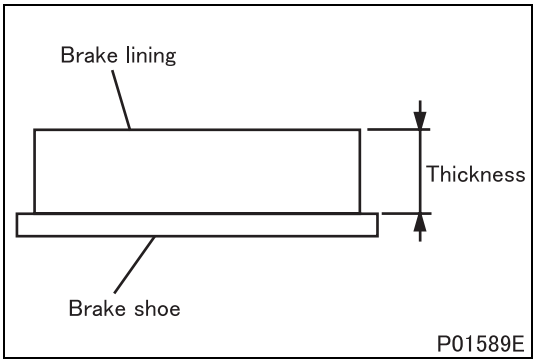
- Using a flat-head screwdriver, remove the return spring. To do this, rest the screwdriver on the wheel cylinder adjust screw. Then, with the adjust screw as a fulcrum, engage the screwdriver with the spring hook and pry away the spring.



■ Removal: Brake lining

- Using a drilling machine, break the flattened rivet heads on the brake shoe side to release the brake lining.

◆Inspection procedure◆



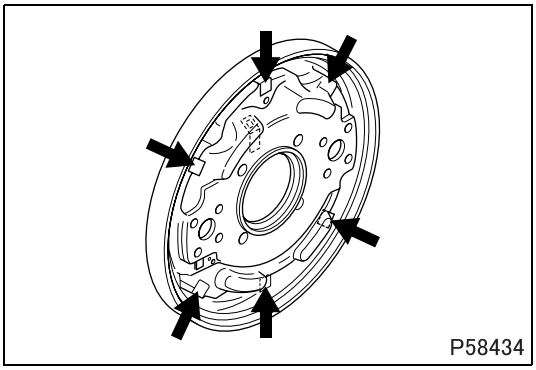
■ **Inspection: Brake shoe**

- Measure the thickness of the brake lining. If the measured value is less than the limit, replace all of the brake linings on the same axle.

CAUTION ⚠

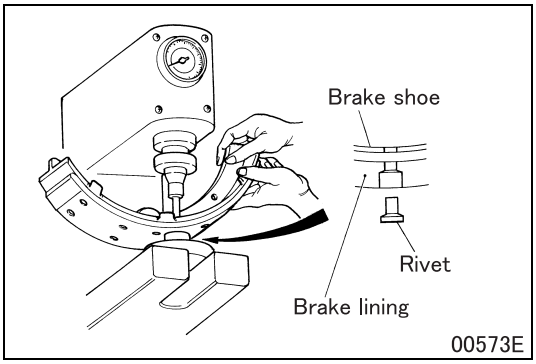
- **Brake linings used on the same axle should be in the same size and have the same identification mark. Otherwise, braking performance can be different from left to right.**

◆Installation procedure◆



■ **Installation: Backing plate**

- Grease the backing plate at the illustrated locations.



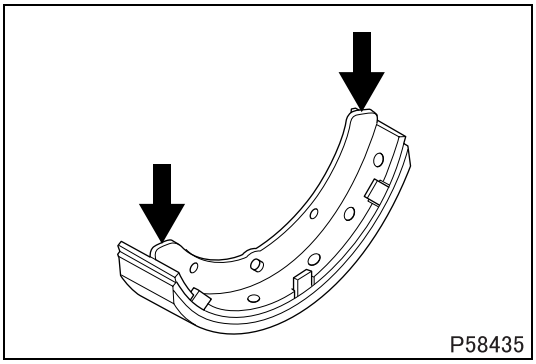
■ **Installation: Brake lining**

- Using cleaning fluid, clean the surface of the brake shoe to which the brake lining is to be mounted. Dry the brake shoe.
- Insert rivets from the lining to the shoe. Stake them, starting from the center of the shoe and moving towards the ends. Ensure that the shoe-to-lining clearances conform to the following specifications.
  - Around the rivets: 0.05 {0.0020 in.} mm or less
  - Along the shoe/lining sides: 0.4 mm {0.016 in.} or less
  - Along the shoe/lining ends: 0.2 mm {0.0078 in.} or less
- Stake the rivets with a force of 17650 ± 980 N {38920 ± 2160 lbs, 1800 ± 100 kgf}.

CAUTION ⚠

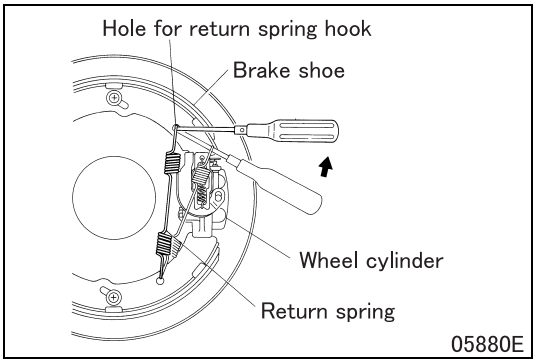
- **Replace all of the brake linings on the same axle and the brake linings should be in the same size and have the same identification mark. Otherwise, braking performance can be different from left to right.**

- After assembly, check the drum-to-lining contact. Correct as required.



■ **Installation: Brake shoe**

- Grease the brake shoe at the illustrated locations.



■ **Installation: Return spring**

- Hook the end of the return spring that has a smaller number of coils onto the brake shoe on the adjust screw side of the wheel cylinder.
- Engage a small Phillips screwdriver into the return spring hook. Then, using the screwdriver insert the spring hook into the hook hole in the brake shoe and attach the hook onto the shoe.

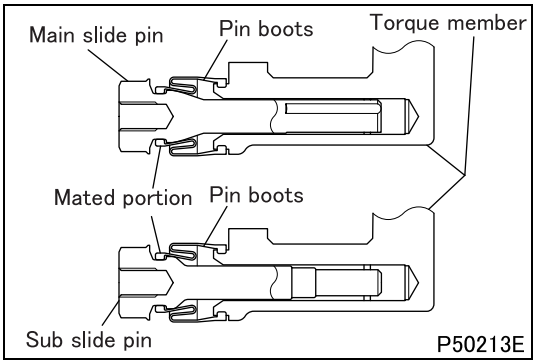
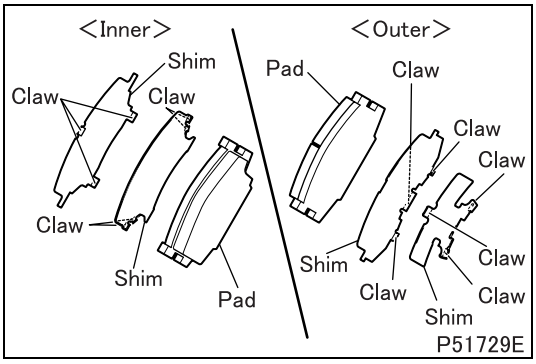
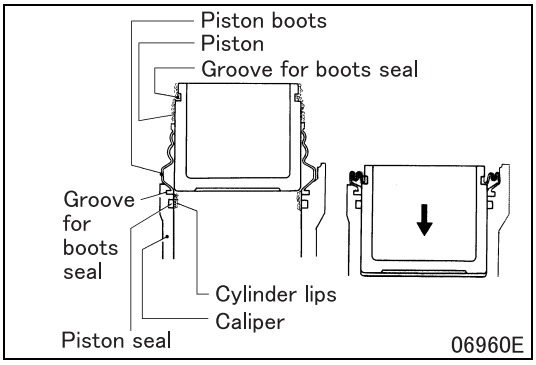
b	Inner periphery of caliper cylinder lips	Rubber grease	As required
	Outer periphery of main and sub slide pins		
	Pin boots mating surfaces with slide pins		
	Torque member grooves and guide holes for pin boots		

◆Installation procedure◆







■ Installation: Main slide pin, sub slide pin, pin boots, and torque member

- On the torque member, apply grease onto the grooves and guide holes for the pin boots.
- Apply grease onto the outer peripheries of the main and sub slide pins. Apply grease onto the surfaces of the pin boots that are to be mated with the slide pins. Then, assemble these onto the torque member.
- Ensure that the seals on the pin boots are correctly attached onto the mated pin-boots portions.

■ Installation: Shims

- Position shims such that they face the illustrated directions before installing them onto the pads.

■ Installation: Piston boots, piston, and piston seal

- Apply brake fluid onto the outer periphery of the piston. Then, insert the piston boots over the piston.
- On the piston seal, spread the grease, already applied on it, evenly over the seal. Then, install the seal into the groove on the caliper.
- Apply grease evenly along the inner periphery of the cylinder lips on the caliper.
- Install the caliper-end seal of the piston boots into the groove on the caliper.
- Press fit the piston further into the boots. Ensure that the piston-end seal of the piston boots is engaged in the groove on the piston.

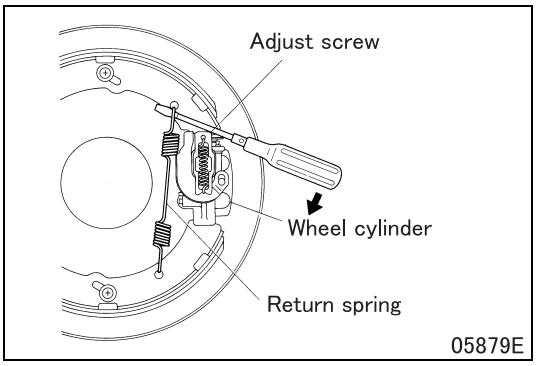
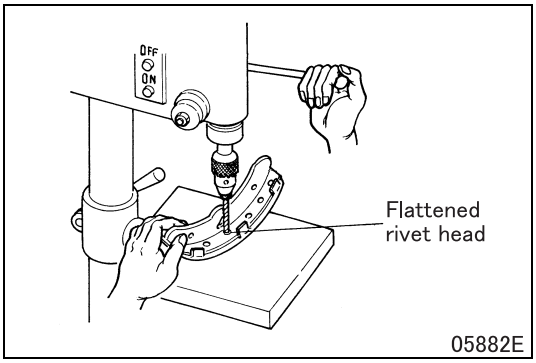
◆Removal procedure◆



■ Removal: Return spring

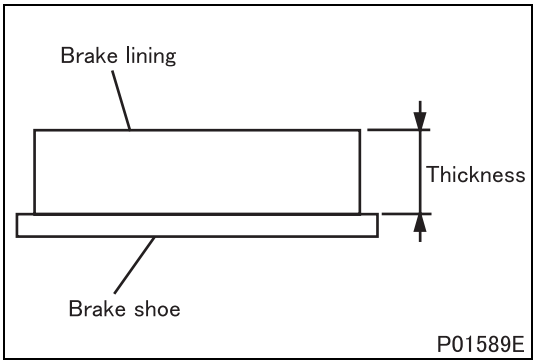
- Using a flat-head screwdriver, remove the return spring. To do this, rest the screwdriver on the wheel cylinder adjust screw. Then, with the adjust screw as a fulcrum, engage the screwdriver with the spring hook and pry away the spring.



■ Removal: Brake lining

- Using a drilling machine, break the flattened rivet heads on the brake shoe side to release the brake lining.

◆Inspection procedure◆



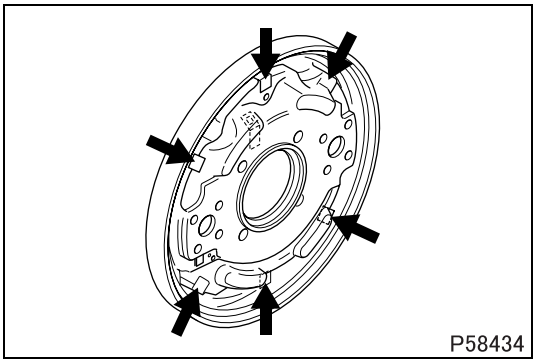
■ Inspection: Brake shoe

- Measure the thickness of the brake lining. If the measured value is less than the limit, replace all of the brake linings on the same axle.

CAUTION ⚠

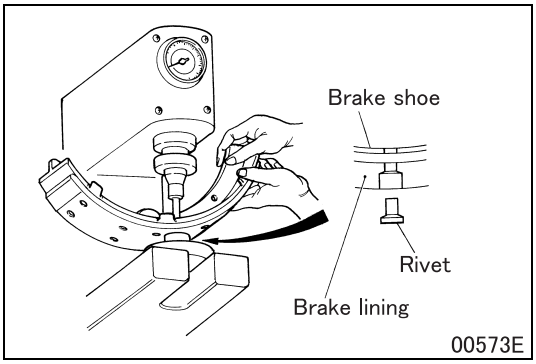
- **Brake linings used on the same axle should be in the same size and have the same identification mark. Otherwise, braking performance can be different from left to right.**

◆Installation procedure◆



■ **Installation: Backing plate**

- Grease the backing plate at the illustrated locations.



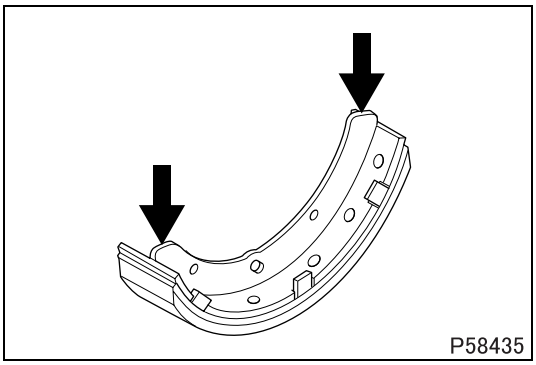
■ **Installation: Brake lining**

- Using cleaning fluid, clean the surface of the brake shoe to which the brake lining is to be mounted. Dry the brake shoe.
- Insert rivets from the lining to the shoe. Stake them, starting from the center of the shoe and moving towards the ends. Ensure that the shoe-to-lining clearances conform to the following specifications.
  - Around the rivets: 0.05 mm {0.0020 in.} or less
  - Along the shoe/lining sides: 0.4 mm {0.016 in.} or less
  - Along the shoe/lining ends: 0.5 mm {0.020 in.} or less
- Stake the rivets with a force of 21 ± 1.0 kN {4720 ± 225 lbs, 2100 ± 100 kgf}.

CAUTION ⚠

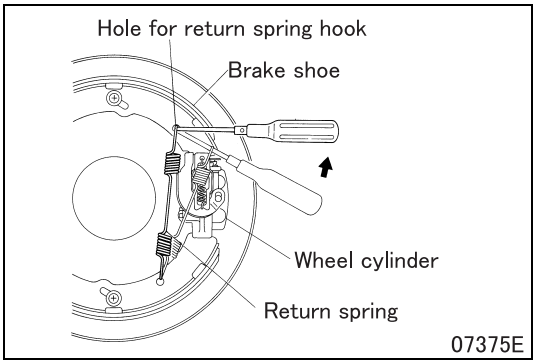
- **Replace all of the brake linings on the same axle and the brake linings should be in the same size and have the same identification mark. Otherwise, braking performance can be different from left to right.**

- After assembly, check the drum-to-lining contact. Correct as required.



■ **Installation: Brake shoe**

- Grease the brake shoe at the illustrated locations.



■ **Installation: Return spring**

- Hook the end of the return spring that has a smaller number of coils onto the brake shoe on the adjust screw side of the wheel cylinder.
- Engage a small Phillips screwdriver into the return spring hook. Then, using the screwdriver insert the spring hook into the hook hole in the brake shoe and attach the hook onto the shoe.

CAUTION ⚠

- **Do not attempt to disassemble the power chamber.**

NOTE

- **For removal and installation procedures of the exhaust brake unit, see Gr15.**

● **Assembly sequence**

Follow the disassembly sequence in reverse.

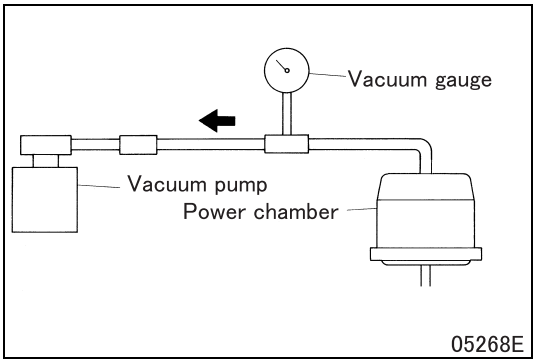
Service standards (Unit: mm {in.})

Location	Maintenance item	Standard value	Limit	Remedy
–	Average of top and bottom clearances between butterfly valve and body with valve fully closed (with power chamber vacuum of 87 to 93 kPa {25.7 to 27.5 in.Hg, 650 to 700 mmHg} or above)	0.10 to 0.25 {0.0039 to 0.0098}	–	Adjust
4	Air-tightness of power chamber (at 15 sec. after vacuum of 67 kPa {19.8 in.Hg, 500 mmHg} is achieved in chamber)	63 kPa {18.6 in.Hg, 475 mmHg} or above	–	Replace

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Bolt (cover mounting)	4.9 to 6.9 {3.6 to 5.1, 0.5 to 0.7}	–
Tb	Lock nut (clevis retention)	9.8 to 16 {7.2 to 12, 1.0 to 1.6}	–
Tc	Nut (power chamber mounting)	11 to 17 {8.0 to 12, 1.10 to 1.70}	–
	Nut (lever mounting)		

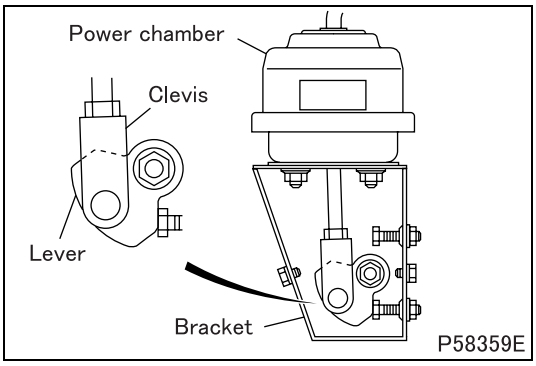
◆Inspection procedure◆



■ **Inspection: Power chamber air-tightness**

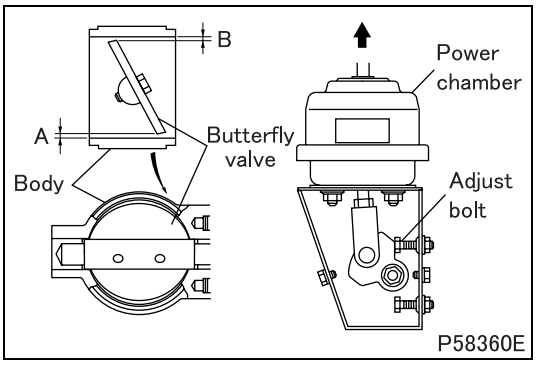
- Connect the components with piping as illustrated. When a vacuum of 67 kPa {19.8 in.Hg, 500 mmHg} or above is applied to the power chamber, stop the vacuum pump.
- Fifteen seconds later, the reading on the vacuum gauge should conform to the standard value.
- If not, replace the power chamber.

◆Adjustment after installation◆



■ **Adjustment: Clevis**

- Assemble the power chamber onto the bracket. Then, adjust the location of the clevis such that the hole in the clevis is aligned by half with the hole in the lever.

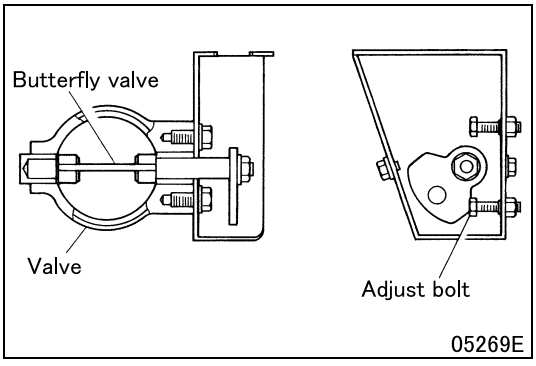


■ **Adjustment: Butterfly valve**

(1) Butterfly valve fully-closed position

- Apply a vacuum of 87 to 93 kPa {25.7 to 27.5 in.Hg, 650 to 700 mmHg} to the power chamber to fully close the butterfly valve. With the valve fully closed, measure the top and bottom clearances B and A between the valve and the body, and obtain the average of the two. The average value should conform to the standard value. Adjust with the adjust bolt as required.

$$\text{Average clearance} = \frac{(A + B)}{2}$$



(2) Valve fully-open position

- Adjust the butterfly valve to the full open position using the adjust bolt.

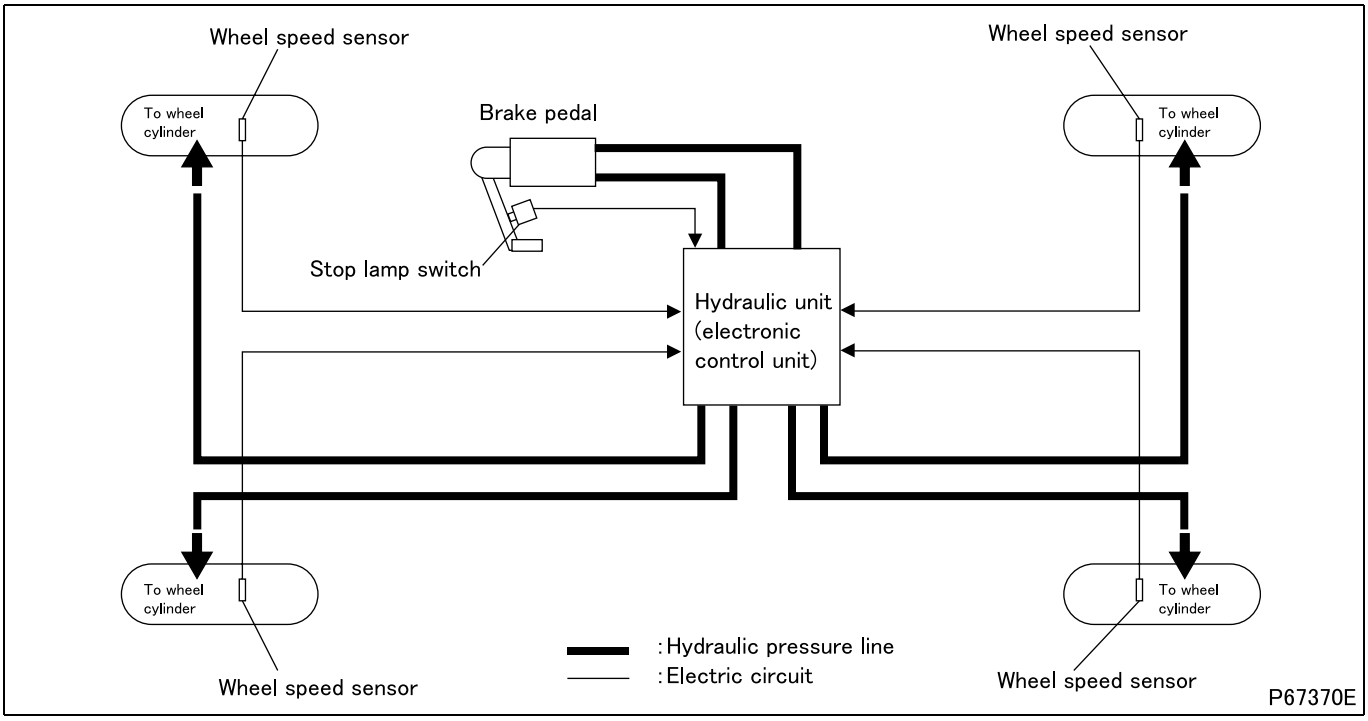
G sensor	Manufacturer		MITSUBISHI ELECTRIC
	Rated voltage	V	DC12
	Working voltage range	V	DC8 to 16

*Manufacturers of wheel speed sensor differ depending on the model of the brakes.

M E M O

1. Overview

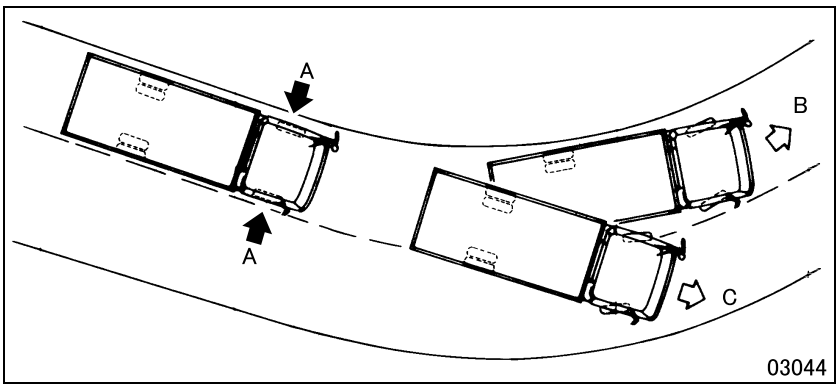


- The anti-lock brake system (ABS) prevents wheel lock-up and resultant skid when braking hard or on slippery roads, thus maintain vehicle stability and steerability.

1.1 Outline of anti-lock brake system

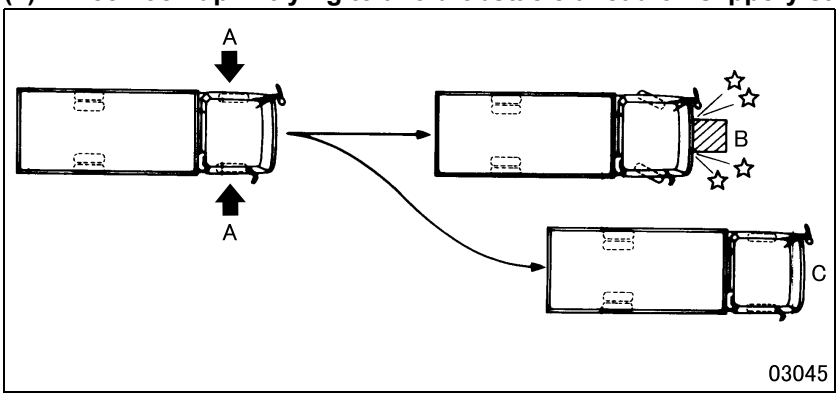
- Wheels will roll along on the road in the direction of their rotation. Therefore, the driver can steer the vehicle as he/she wishes by maneuvering the steering wheel.
  However, on vehicles not equipped with ABS, applying the brakes hard can cause wheel lock-up. Once tires are locked up, they are simply a piece of rubber in contact with the road surface and steering control will be lost. The vehicle will skid in the direction of inertia irrespective of the steering angle.
  In other words, vehicle stability and steerability are lost and the vehicle is beyond the driver's control.
- On vehicles equipped with anti-lock brake system, the system prevents wheel lock-up by reducing the braking power to the wheel that is about to lock up and, thereby, maintain vehicle stability and steerability.

(1) Wheel lock-up when cornering on slippery road



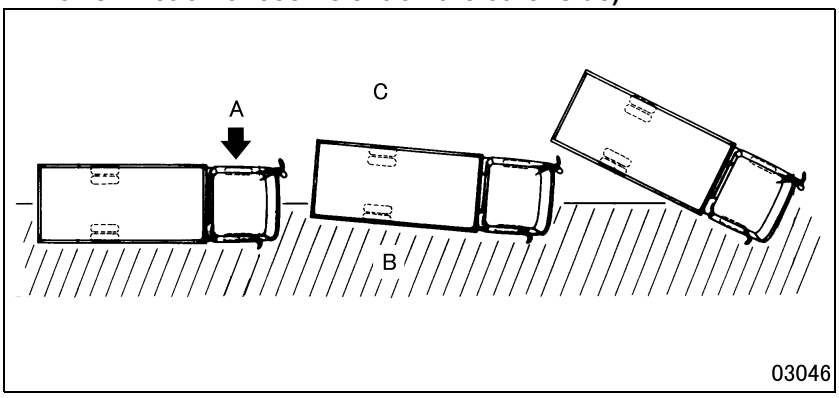
- If wheel lock-up occurs during braking on a slippery curve, steering control will be lost. If this happens, the vehicle may deviate, while skidding, from the intended course no matter how the driver maneuvers the steering wheel.
  A: Application of brakes (wheel lock-up)
  B: Intended course
  C: Go out of course

(2) Wheel lock-up in trying to avoid obstacle ahead on slippery straight road



- If wheel lock-up occurs during hard braking on a slippery straight road in trying to avoid an obstacle ahead, steering control will be lost. If this happens, the vehicle will not be able to avoid the obstacle no matter how the driver maneuvers the steering wheel.
  A: Application of brakes (wheel lock-up)
  B: Obstacle
  C: Intended course

(3) Split μ (Wheel lock-up on asymmetrical road surface, with higher friction of coefficient on one side and lower friction of coefficient on the other side)



- If the front and rear wheels on one side of the vehicle are on the side of the road that has a lower friction of coefficient and therefore is more slippery than the other side of the road, these wheels are more likely to lock up and slip than the wheels on the other side of the vehicle. When the brakes are applied under such conditions, the braking efficiency will be different between the right and left sides of the vehicle and the vehicle will lose stability. Braking hard under such conditions can even cause the vehicle to spin.
  A: Application of brakes (wheel lock-up)
  B: Less slippery road surface
  C: More slippery road surface

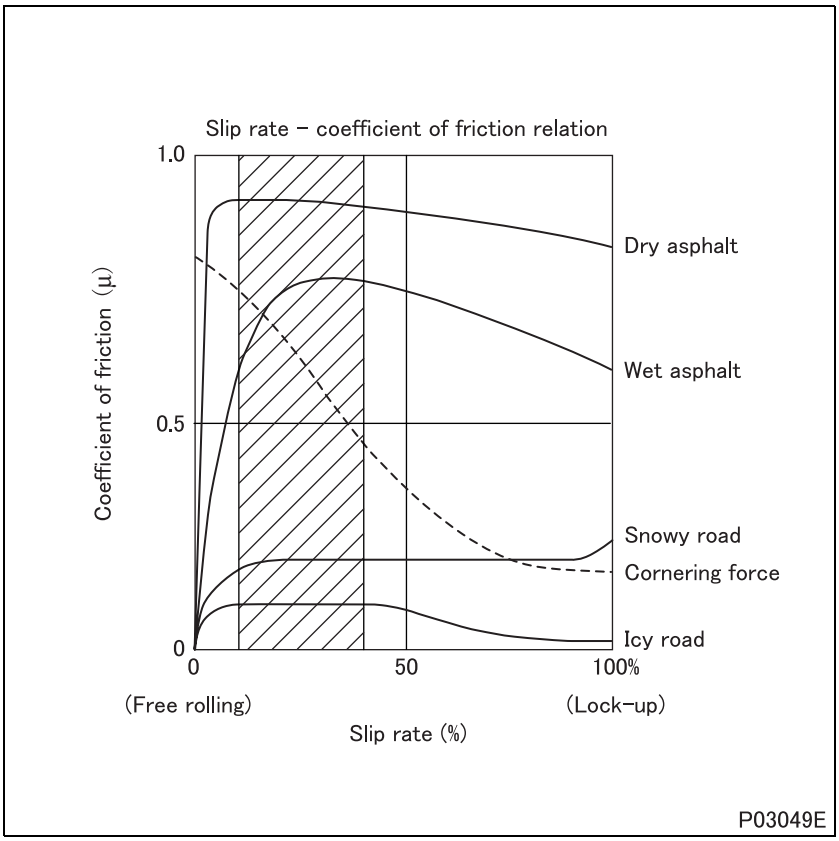
- As mentioned above, the system prevents wheel lock-up by providing controlled braking force to each wheel. This prevents wheel slip and skid and ensures steering control and vehicle stability even during hard braking.

1.2 Anti-lock brake system control process

- Anti-lock brake system ensures controlled yet optimum braking in a given road surface condition by placing the braking force within a certain range of slip rate determined by the wheel speed - vehicle speed relation.
- Stepping on the brake pedal causes the wheel speed to slow down and, as a result, the vehicle also slows down. However, the vehicle will still try to move on due to the inertia that has built up. This causes a difference between the wheel speed and the vehicle speed, or, in other words, slip. The amount of slip can be expressed as slip rate, as follows.

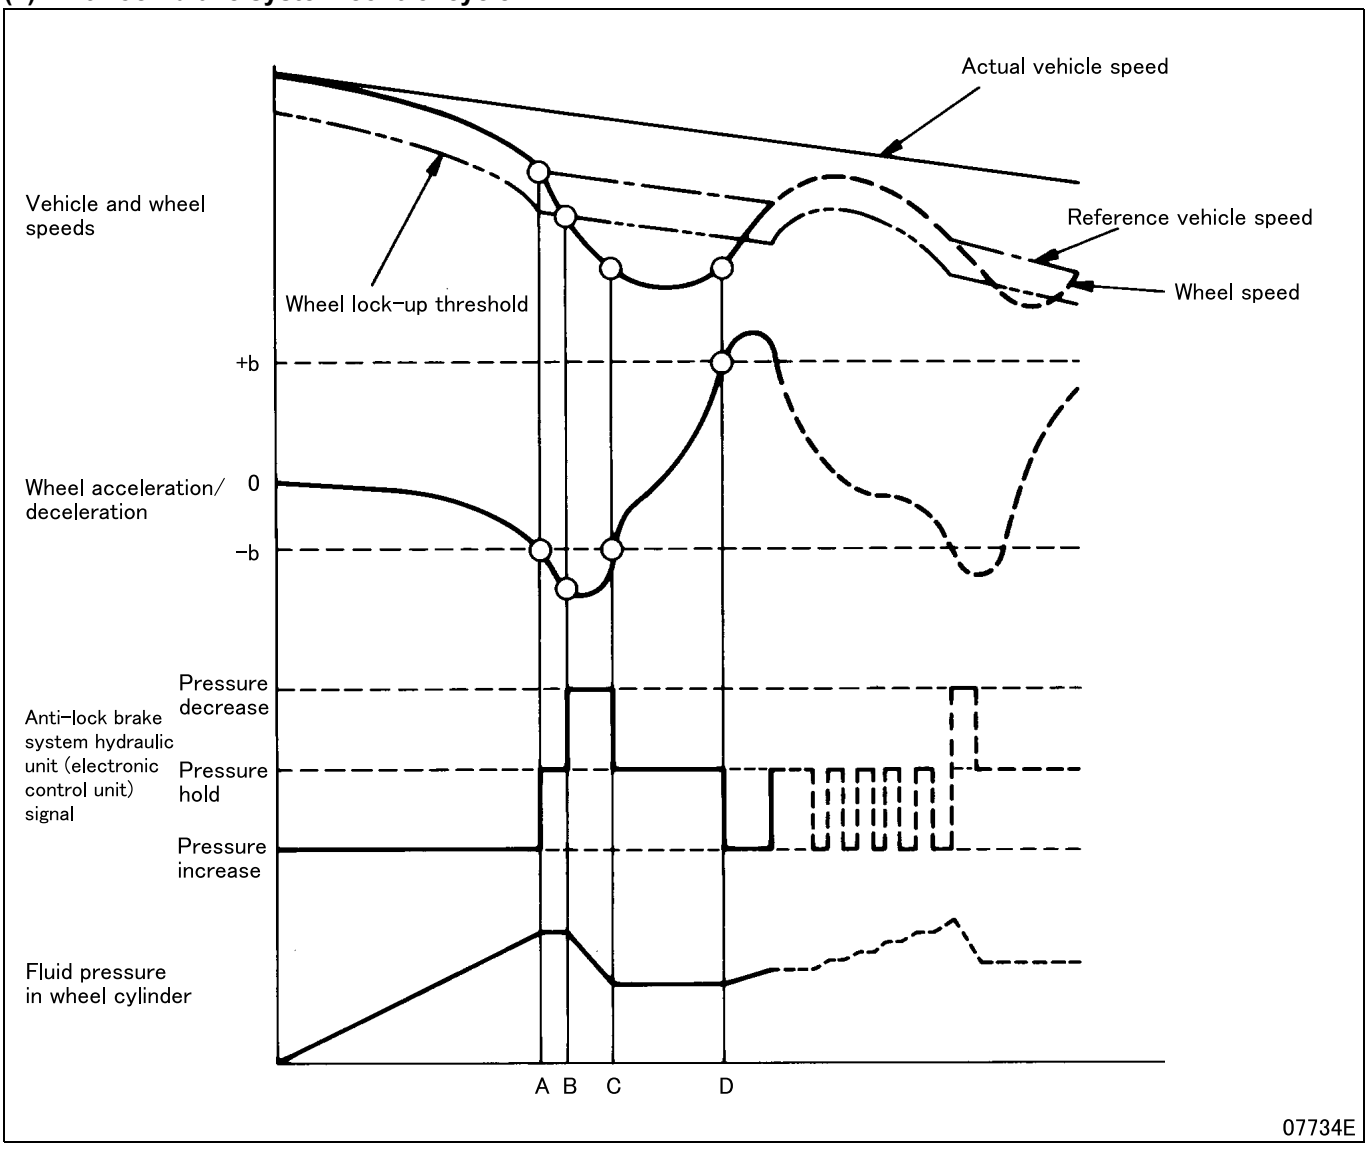
$$\text{Slip rate (\%)} = \frac{\text{Vehicle speed} - \text{Wheel speed}}{\text{Vehicle speed}} \times 100$$

- A slip ratio of 0% means that there is no slip between the wheel and the road surface. A slip rate of 100% means that the wheel is locked up.



- The graph shows the variation in the tire's coefficient of friction from free rolling to lock-up. As the brake pedal is slowly pressed, the tires continue to rotate but start slipping.
- As the stepping force on the brake pedal increases, the tires will stop rotating and the vehicle will just skid. This is wheel lock-up.
- As the graph shows, the coefficient of friction peaks within the hatched area.
- In other words, the maximum coefficient of friction can be achieved, not by stepping on the brake pedal with full force, but by doing so moderately to try to place the slip rate within the hatched area.
- On vehicles equipped with anti-lock brake system, the hydraulic control unit (electronic control unit) controls the braking force so that it falls within the hatched area. This will ensure that the tires do not lock up but have the maximum coefficient of friction, thus achieving efficient braking performance.

(1) Anti-lock brake system control cycle



- The above chart shows the typical control cycle of anti-lock brake system following the application of brakes, detailing in time series the variation in wheel speed, wheel speed acceleration/deceleration and fluid pressure in the wheel cylinder.
- When the wheel speed acceleration/deceleration drops to the “–b” threshold at A, the hydraulic unit (electronic control unit) sends “pressure hold” signal to maintain the fluid pressure in the wheel cylinder.
  At the same time, the hydraulic unit (electronic control unit) calculates the reference vehicle speed.
- When the vehicle decelerates to the wheel lock-up threshold at B, the hydraulic unit (electronic control unit) interprets this as imminent wheel lock-up and sends “pressure decrease” signal to reduce the fluid pressure in the wheel cylinder.
- When the wheel speed picks up and exceeds the “–b” threshold at C, the hydraulic unit (electronic control unit) sends “pressure hold” signal to maintain the fluid pressure in the wheel cylinder at the current level.
- When the wheel speed exceeds the “+b” threshold at D, the hydraulic unit (electronic control unit) determines that the imminent wheel lock-up has gone and sends “pressure increase” signal to increase the fluid pressure in the wheel cylinder.
- The pressure hold-decrease-increase cycle is repeated to keep the slip rate at optimum levels to prevent wheel lock-up.

1.3 Hydraulic unit (electronic control unit)

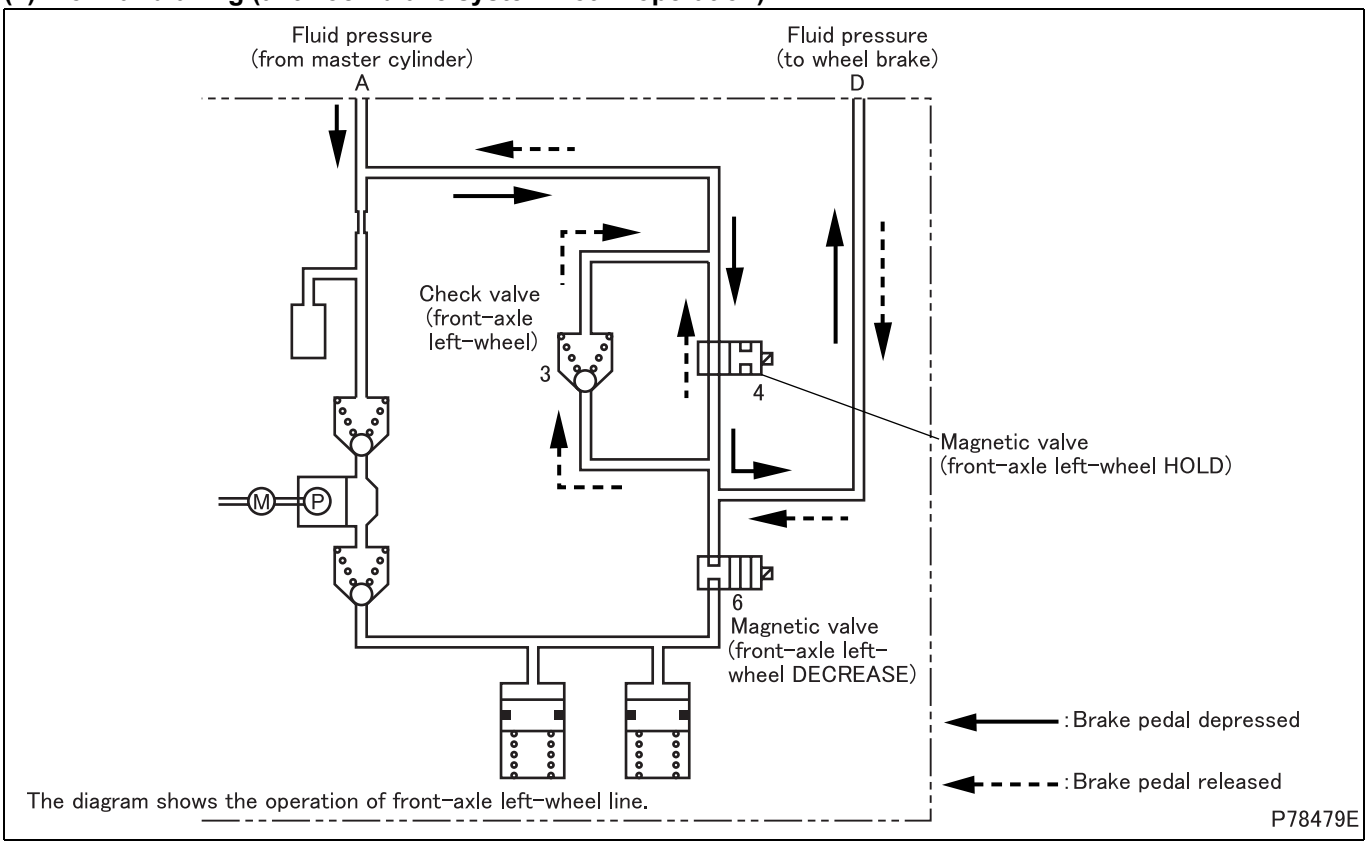
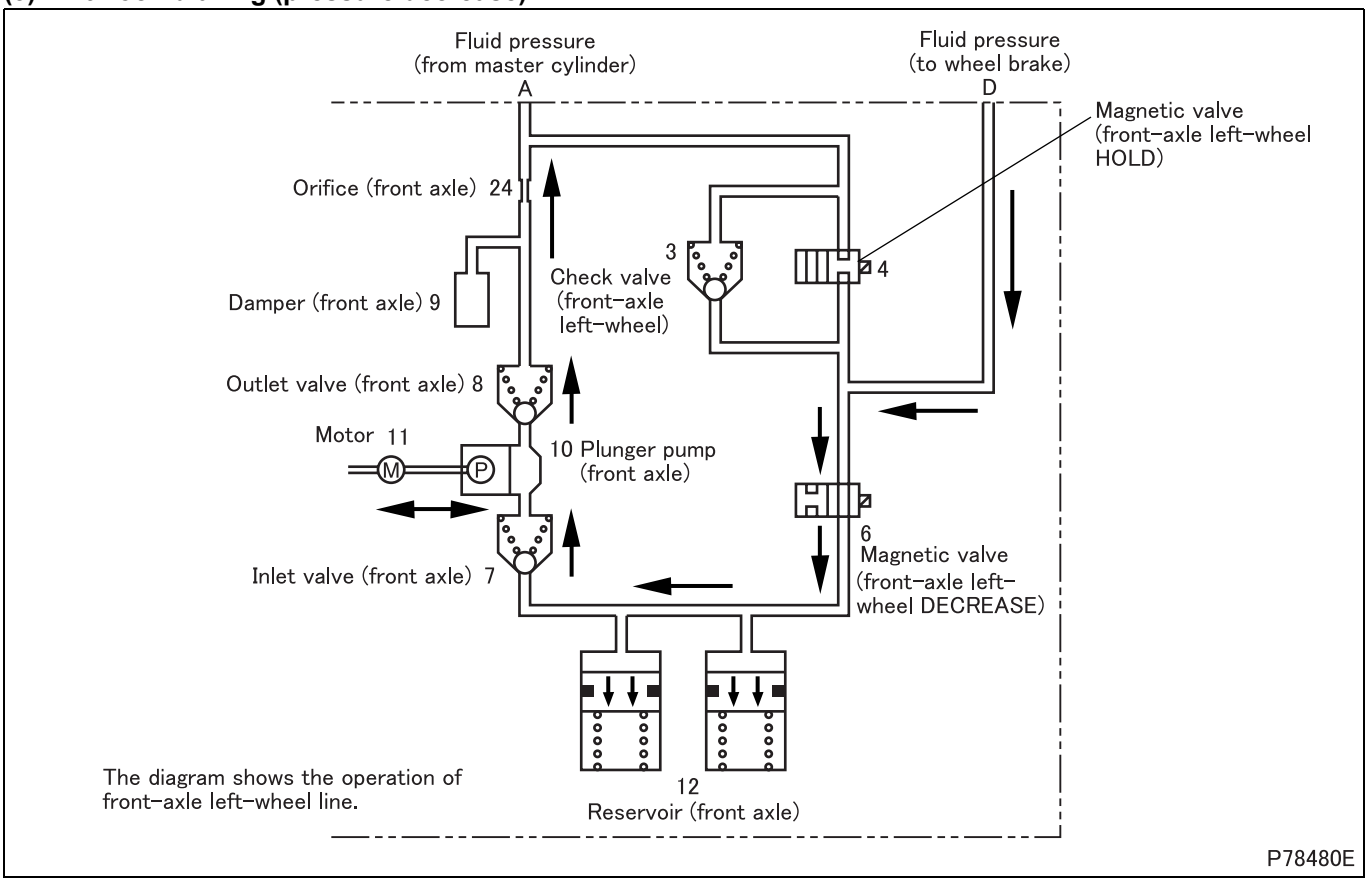
×: OFF

(2) Normal braking (anti-lock brake system not in operation)



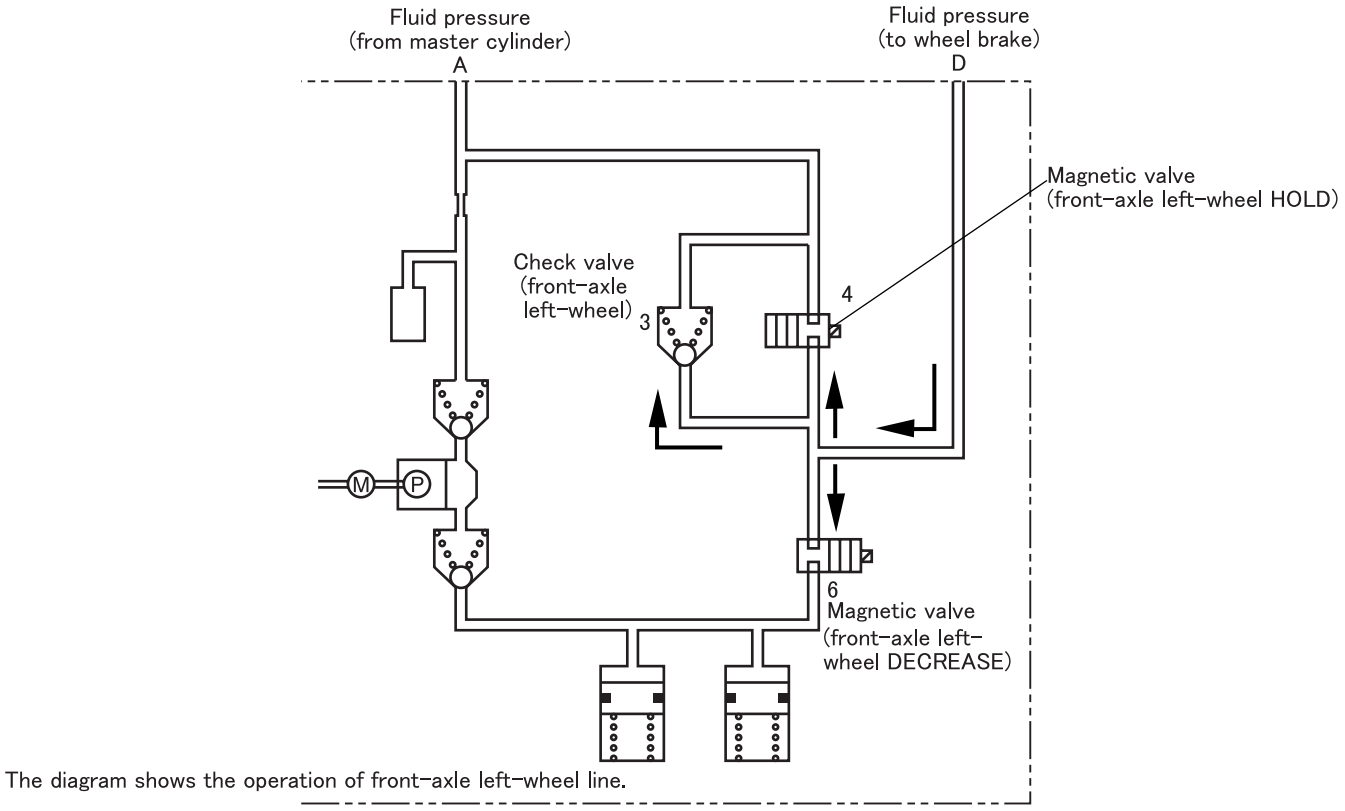
- When the brake pedal is pressed and there is no imminent wheel lock-up, the hydraulic unit (electronic control unit) will not send any control signal to the magnetic valve (front-axle left-wheel DECREASE) or to the magnetic valve (front-axle left-wheel HOLD). The former valve remains closed while the latter valve stays open.
- Pressure fluid A from the brake master cylinder flows past the magnetic valve (front-axle left-wheel HOLD) and to the wheel brake D.
- When the brake pedal is released, pressure fluid A from the brake master cylinder drops. Pressure fluid from the wheel brake D now flows past the magnetic valve (front-axle left-wheel HOLD) and the check valve (front-axle left-wheel) and returns to the brake master cylinder.

(3) Anti-lock braking (pressure decrease)



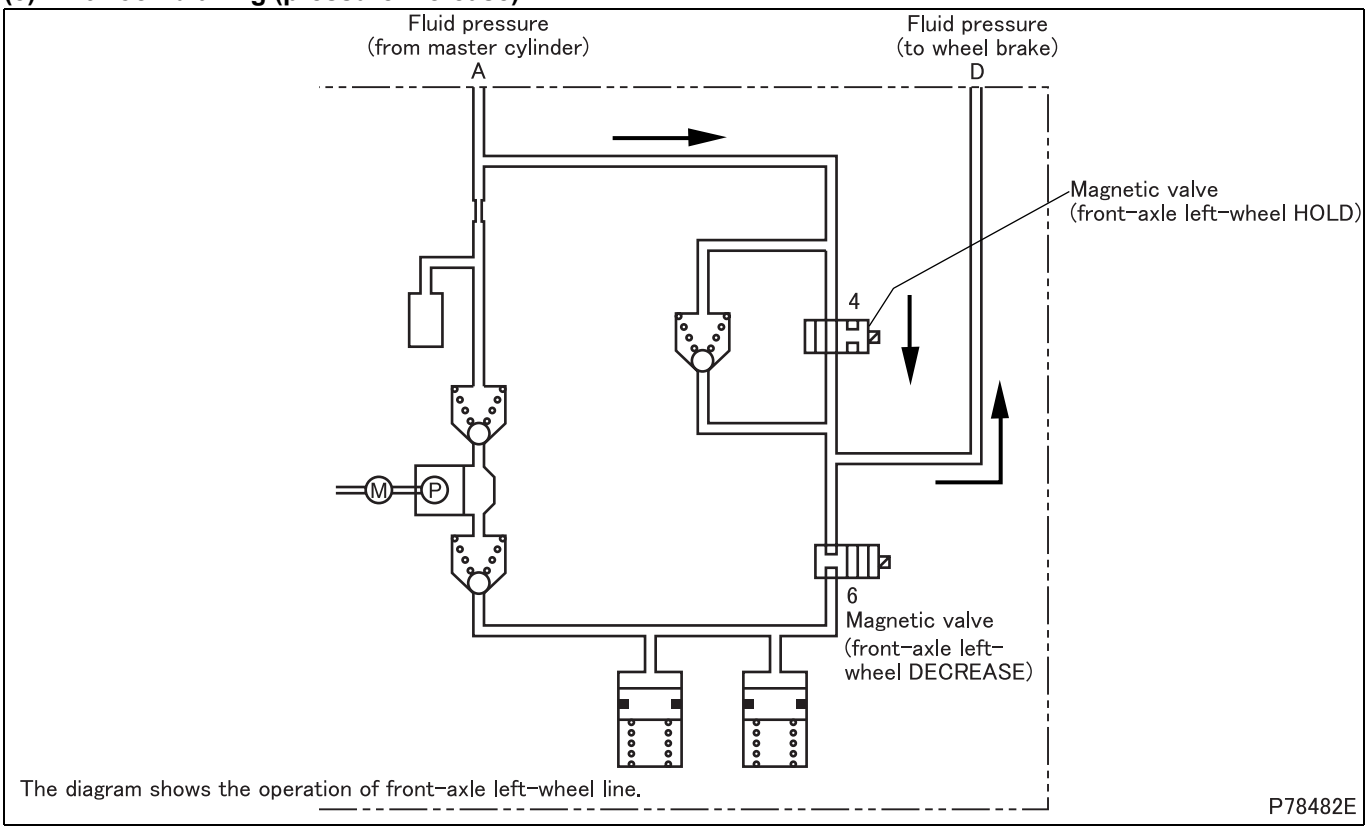
- When the brake pedal is pressed and there is imminent wheel lock-up, the hydraulic unit (electronic control unit) sends control signal to the magnetic valve (front-axle left-wheel DECREASE) and the magnetic valve (front-axle left-wheel HOLD). The former valve will open while the latter valve will close.
- Pressure fluid form the wheel brake D now flows past the magnetic valve (front-axle left-wheel DECREASE) and to the reservoirs. The line pressure will drop.
- When the hydraulic unit (electronic control unit) sends control signal to the magnetic valve (front-axle left-wheel DECREASE) and the magnetic valve (front-axle left-wheel HOLD), it also sends control signal to the motor at the same time, causing the plunger pump (front axle) to start pumping. Pressure fluid in the reservoirs now flows past the inlet valve (front axle), the outlet valve (front axle), the damper (front axle) and the orifice (front axle) and returns to the master cylinder.
- During this process, the check valve (front-axle left-wheel) remains closed by the fluid pressure A from the brake master cylinder. As a result, no pressure fluid from the master cylinder flows to the wheel brake.

(4) Anti-lock braking (pressure hold)



- When it becomes necessary to hold the fluid pressure D in the wheel brake at the same level as part of anti-lock brake system control, the hydraulic unit (electronic control unit) sends “HOLD” signal to the magnetic valve (front-axle left-wheel HOLD). As a result, both of the magnetic valve (front-axle left-wheel HOLD) and the magnetic valve (front-axle left-wheel DECREASE) will be closed, which holds the fluid pressure in the wheel brake at the current level.
- The check valve (front-axle left-wheel) remains closed by the fluid pressure A from the brake master cylinder.

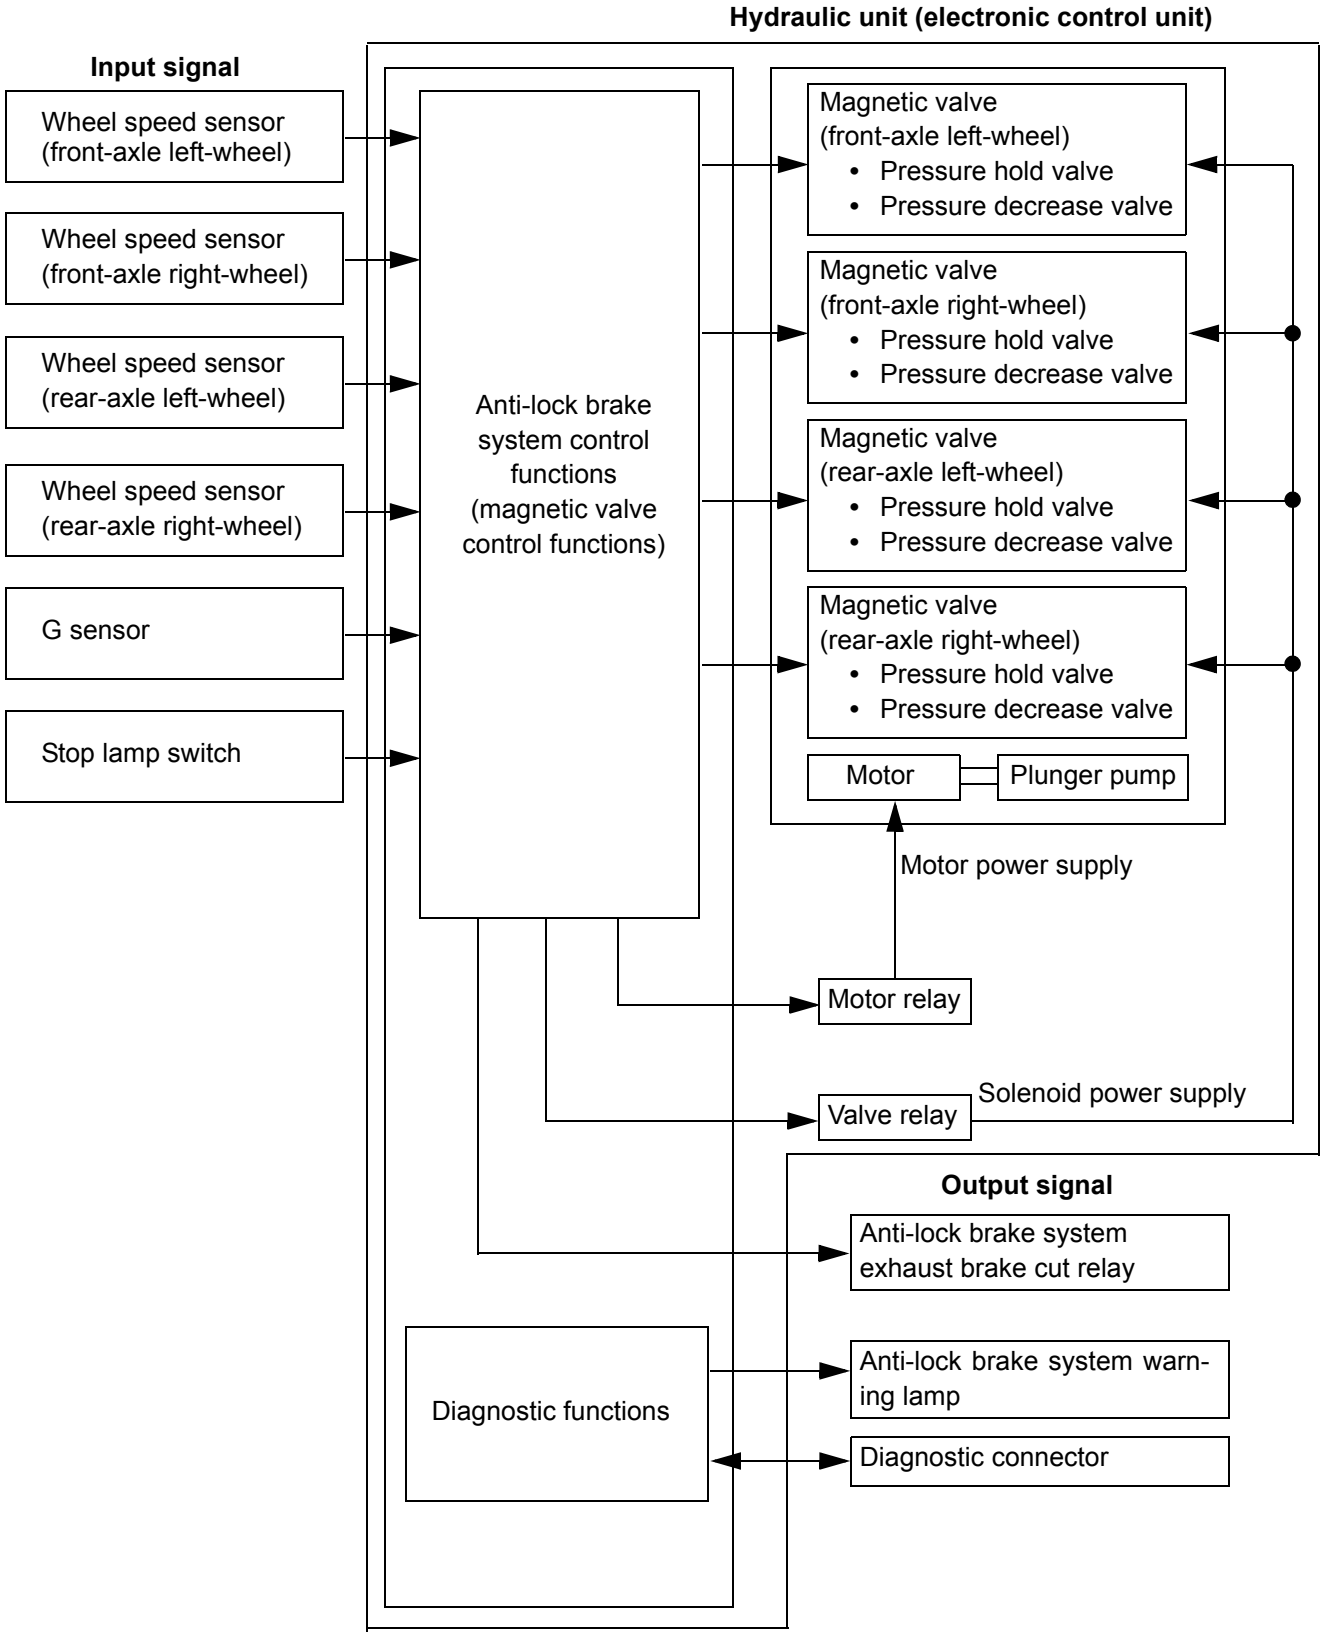
(5) Anti-lock braking (pressure increase)



- When it becomes necessary to increase the fluid pressure D in the wheel brake, control signal from the hydraulic unit (electronic control unit) to the magnetic valve (front-axle left-wheel HOLD) and to the magnetic valve (front-axle left-wheel DECREASE) will be cut off.
- As a result, the magnetic valve (front-axle left-wheel HOLD) will open while the magnetic valve (front-axle left-wheel DECREASE) will close. Both valves are now in their normal-braking positions. Fluid pressure A being generated by the depression of the brake pedal is now applied to the wheel brake to increase the braking force.

2. Electronic Control System

2.1 Block diagram



Part	Primary function or operation
Wheel speed sensor	Senses wheel speed
G sensor	Senses acceleration/deceleration
Stop lamp switch	Senses the depression of brake pedal
Anti-lock brake system exhaust brake cut relay	Cuts off exhaust brake in anti-lock braking mode
Anti-lock brake system warning lamp	Displays anti-lock brake system faults; Performs system check
Diagnostic connector	Communicates with Multi-Use Tester; Displays/Clears diagnosis codes

2.2 Anti-lock brake system control functions

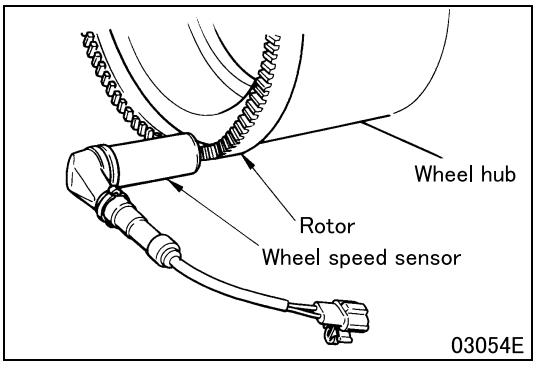
- The hydraulic unit (electronic control unit) continuously monitors signals from the wheel speed sensors. The unit sends signal to magnetic valves.

(1) Anti-lock brake system fail-safe

- If any fault occurs in the anti-lock brake system, the warning lamp comes on to warn the driver of the fault and the normal braking will resume in place of the anti-lock braking which will be disabled.

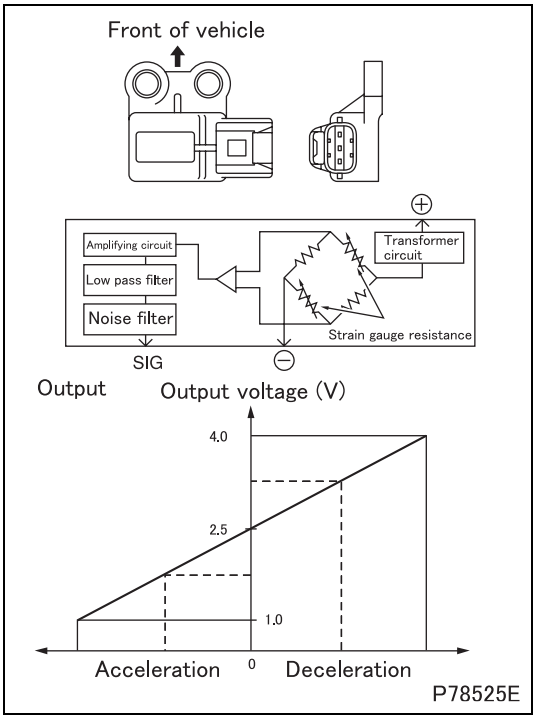
(2) Anti-lock brake system and exhaust brake

- On slippery roads, wheel lock-up can result even from application of the exhaust brake. In the anti-lock braking mode, activation of the exhaust brake makes it difficult for anti-lock brake system to perform controlled braking. To avoid this, the exhaust brake will be disabled upon activation of anti-lock brake system even when the exhaust brake switch is in the “ON” position.
  The exhaust brake will automatically be enabled upon deactivation of anti-lock brake system.



(3) Wheel speed sensor

- Each wheel speed sensor detects wheel speed and sends this as a signal to the hydraulic unit (electronic control unit). The sensor is essentially a magnetic pickup unit, consisting of a permanent magnet core and a coil of wire wound around the core.
- A rotor is fitted onto the wheel hub. This rotor, like a ring gear, has a set of evenly-spaced teeth directly facing the sensor. As the wheel rotates, these teeth pass through the magnetic flux of the sensor, inducing potential difference in the coil which is then sent as a signal (alternating voltage proportional to the wheel speed) to the hydraulic unit (electronic control unit).



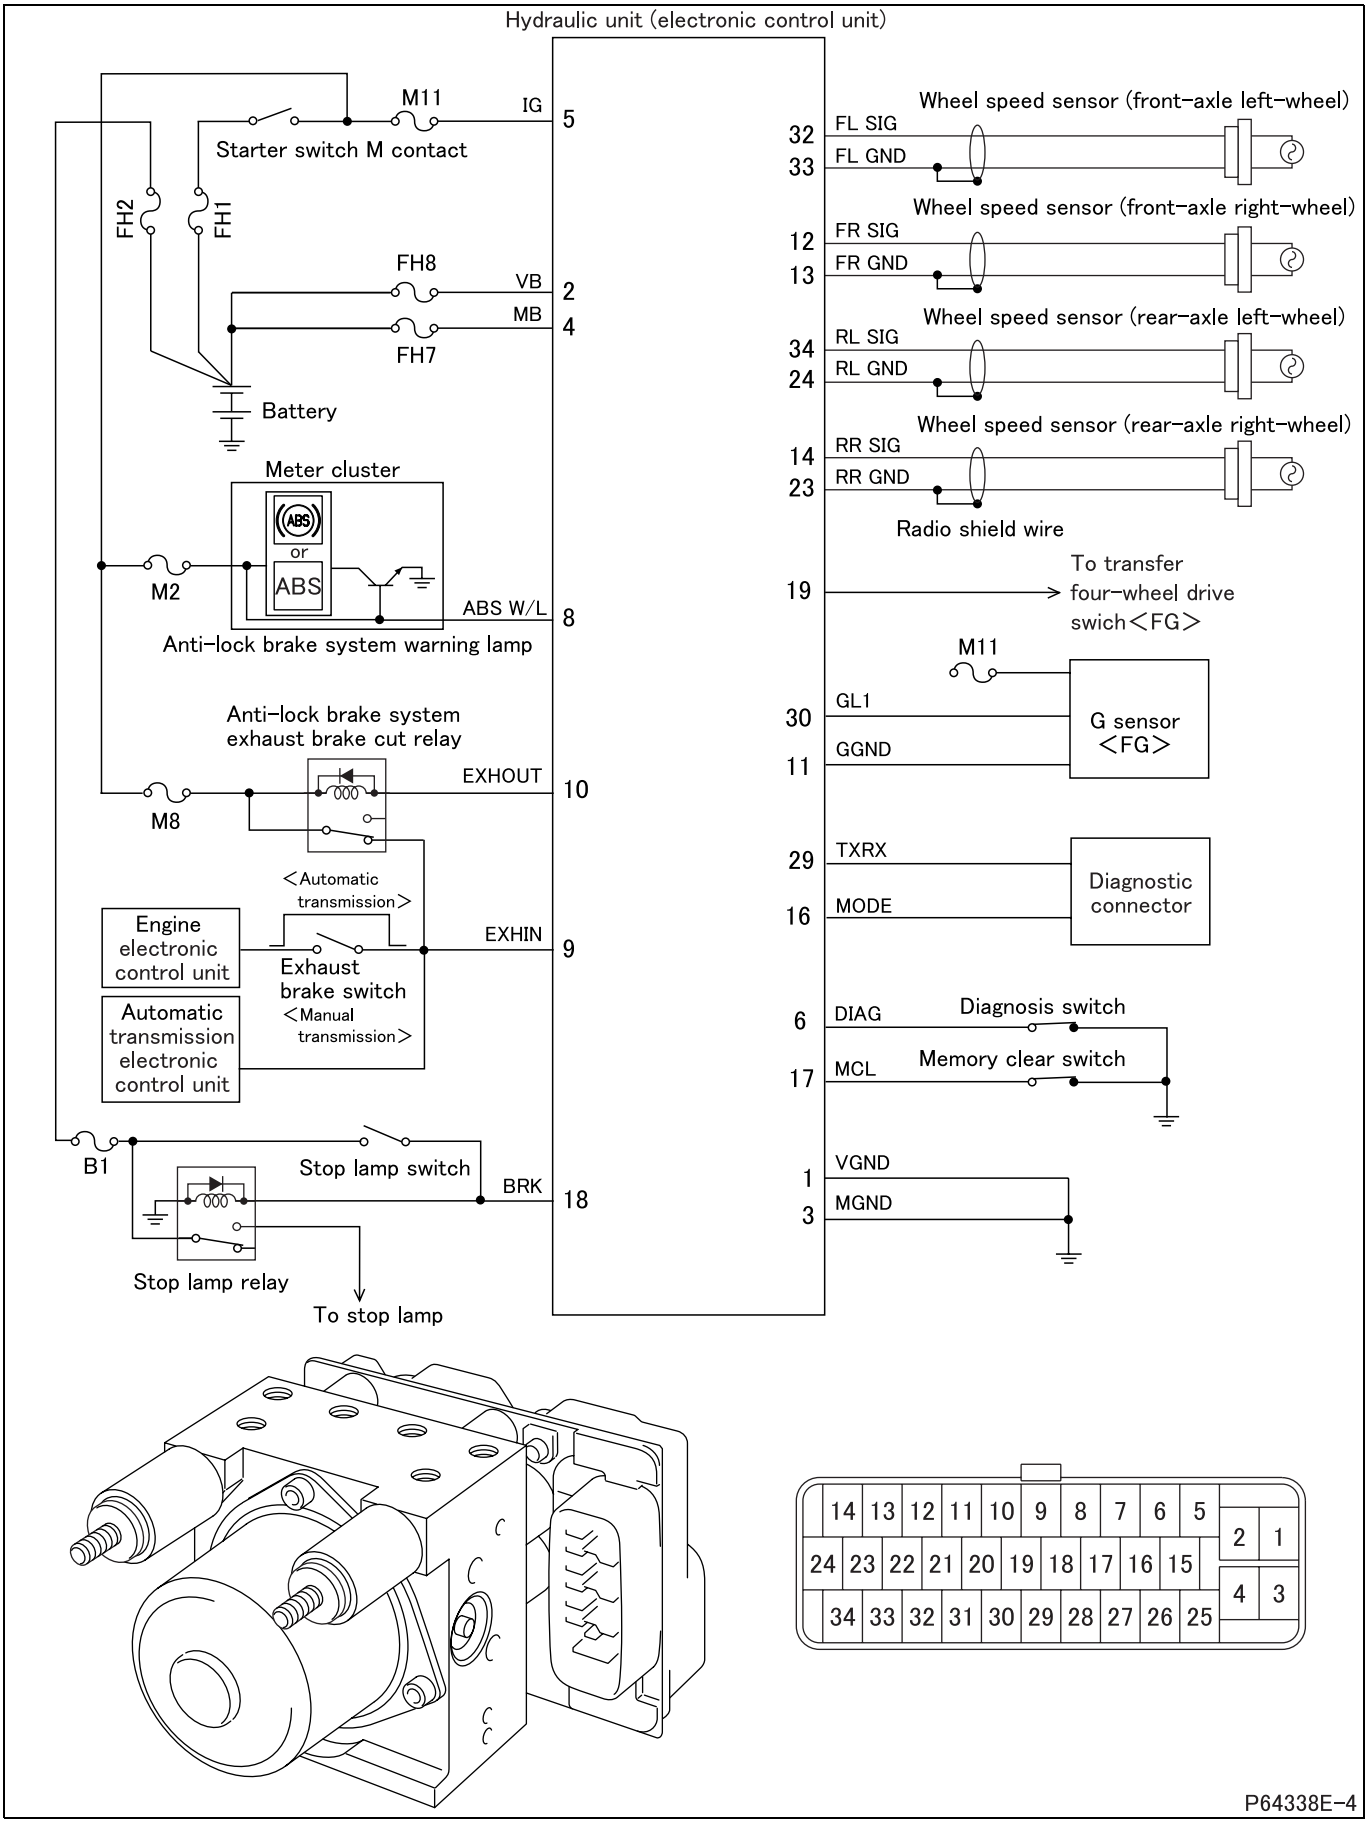
(4) G sensor

- On slippery roads, trucks can experience wheel lock-up due to the inertia of the powertrain. This makes it difficult for anti-lock brake system to perform controlled braking.
- To avoid this, in addition to the wheel speed sensors, a G sensor is also used to detect acceleration/deceleration and assist anti-lock brake system control.
- The G sensor is a semiconductor-type strain gauge. It detects acceleration or deceleration by converting acceleration/deceleration inertia into resistance and further converting this into voltage.

2.3 Diagnostic functions

- When the starter switch is in the ON position, the system continuously monitors the sensors and other system components. If any fault is detected, the system warns the driver of this by displaying the relevant fault information on the meter cluster. At the same time, the system also stores a relevant diagnosis code in the memory and starts operation in the fault mode.
- In the fault-mode operation, the system functions are limited to ensure safety for the driver and the vehicle. Stored diagnosis codes can be accessed using Scanning tool or can be read by observing the flashing of the warning lamp.

3. Electronic Control Unit Schematic Diagram

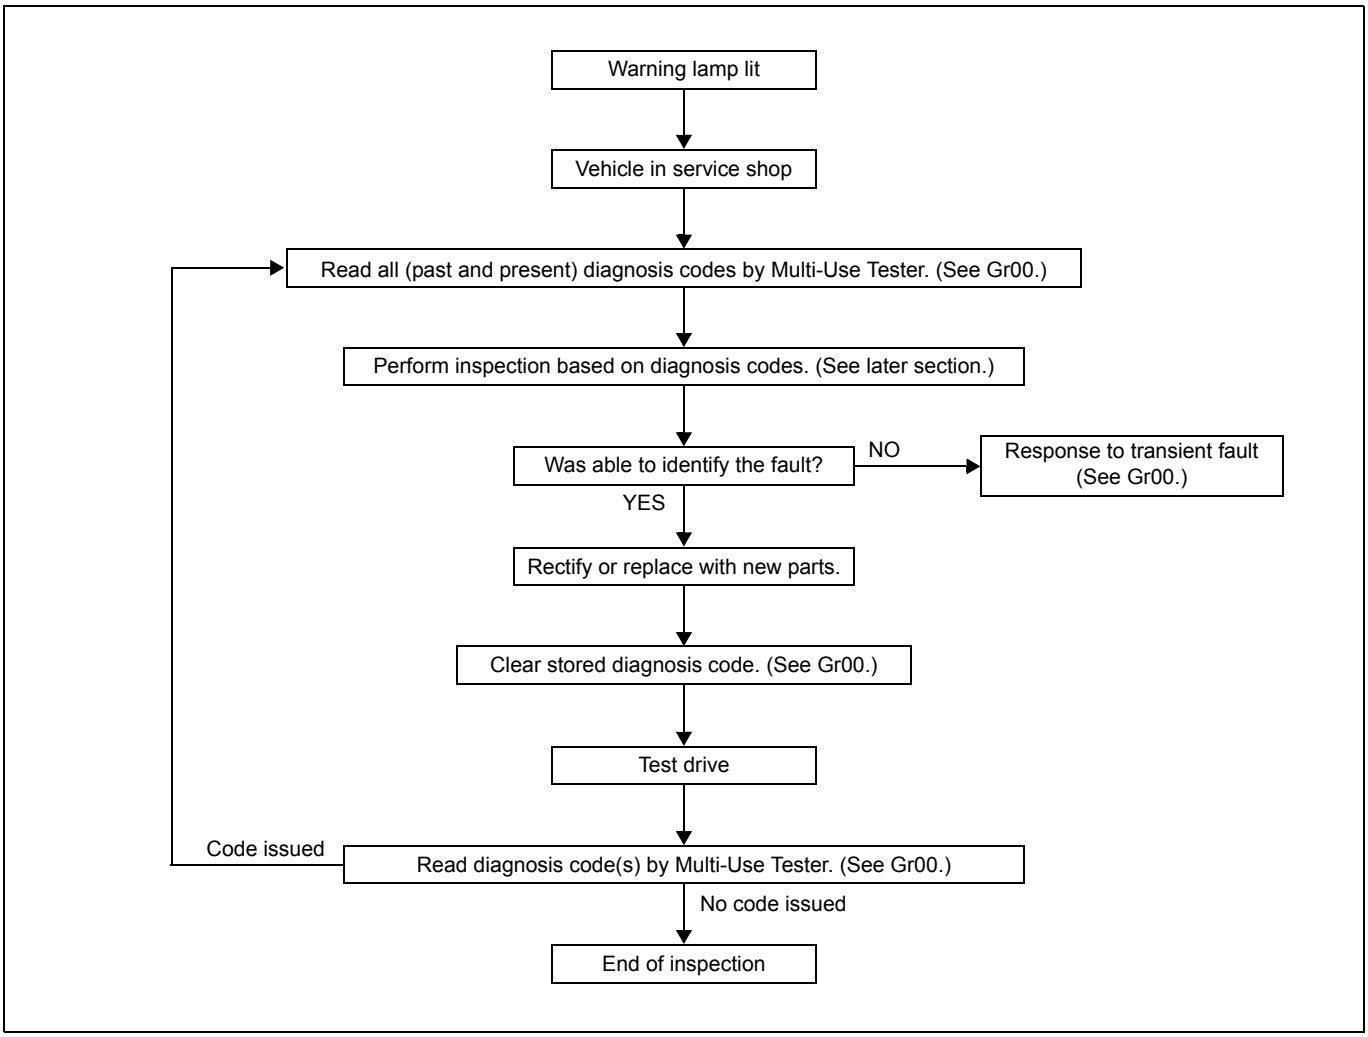


M E M O

TROUBLESHOOTING

1. Diagnosis Procedure

- Perform the inspection in accordance with the following flowchart.



2. Diagnostic Precautions

- Before measuring voltage, check the battery for charged condition and specific gravity. If system inspection is performed with the battery uncharged or reduced in specific gravity, accurate measurements cannot be achieved.
- Before disconnecting battery cables, harnesses and connectors, set the starter switch to LOCK or OFF, then allow at least 20 seconds.
- To avoid having electrical parts damaged, set the starter switch and lighting switch to LOCK or OFF before reconnecting battery cables, harnesses and connectors.
- When performing measurement with the tester, handle the test bar carefully so that it does not damage internal circuit and other electrical parts of the electronic control unit to result in a short-circuit failure between terminals in connector or between connector and car body.
- Resistance is affected by temperature. Determine the necessity of resistance measurement following given temperature specification as a guide. Otherwise, use normal temperature (10 to 35°C {50 to 95°F}) as the measuring condition.

3. Diagnosis Based on Diagnosis Codes

3.1 List of diagnosis codes

Code	Message	Warning lamp indication
11	FR SENSOR	O
12	FL SENSOR	O
13	RR SENSOR	O

3.2 Code generation criteria and inspection items

11: FR SENSOR

Code generation criteria		Wheel speed sensor resistance out of range
Resettability		System resets when normal resistance is detected after starter switch OFF → ON.
Electronic control unit control		Anti-lock brake system disabled
Inspection item	Service data	11: FR SPEED
	Electronic control unit connector	01: Wheel speed sensor
	Electrical part	#329: Wheel speed sensor
	Wiring diagram	Wheel speed sensor circuit

12: FL SENSOR

Code generation criteria		Wheel speed sensor resistance out of range
Resettability		System resets when normal resistance is detected after starter switch OFF → ON.
Electronic control unit control		Anti-lock brake system disabled
Inspection item	Service data	12: FL SPEED
	Electronic control unit connector	01: Wheel speed sensor
	Electrical part	#329: Wheel speed sensor
	Wiring diagram	Wheel speed sensor circuit

13: RR SENSOR

Code generation criteria		Wheel speed sensor resistance out of range
Resettability		System resets when normal resistance is detected after starter switch OFF → ON.
Electronic control unit control		Anti-lock brake system disabled
Inspection item	Service data	13: RR SPEED
	Electronic control unit connector	01: Wheel speed sensor
	Electrical part	#329: Wheel speed sensor
	Wiring diagram	Wheel speed sensor circuit

14: RL SENSOR

Code generation criteria		Wheel speed sensor resistance out of range
Resettability		System resets when normal resistance is detected after starter switch OFF → ON.
Electronic control unit control		Anti-lock brake system disabled
Inspection item	Service data	14: RL SPEED
	Electronic control unit connector	01: Wheel speed sensor
	Electrical part	#329: Wheel speed sensor
	Wiring diagram	Wheel speed sensor circuit

21: FR SENSOR SIG

Code generation criteria		When driving off, no wheel speed sensor output or abrupt change in wheel speed sensor output
Resettability		System resets upon normal signal input after starter switch OFF → ON
Electronic control unit control		Anti-lock brake system disabled
Inspection item	Service data	11: FR SPEED
	Electrical part	#329: Wheel speed sensor
	Wiring diagram	Wheel speed sensor circuit
	Other	• Inspect rotor (See Gr26.) • Incorrectly installed wheel speed sensor

22: FL SENSOR SIG

Code generation criteria		When driving off, no wheel speed sensor output or abrupt change in wheel speed sensor output
Resettability		System resets upon normal signal input after starter switch OFF → ON
Electronic control unit control		Anti-lock brake system disabled
Inspection item	Service data	12: FL SPEED
	Electrical part	#329: Wheel speed sensor
	Wiring diagram	Wheel speed sensor circuit
	Other	• Inspect rotor (See Gr26.) • Incorrectly installed wheel speed sensor

23: RR SENSOR SIG

Code generation criteria		When driving off, no wheel speed sensor output or abrupt change in wheel speed sensor output
Resettability		System resets upon normal signal input after starter switch OFF → ON
Electronic control unit control		Anti-lock brake system disabled
Inspection item	Service data	13: RR SPEED
	Electrical part	#329: Wheel speed sensor
	Wiring diagram	Wheel speed sensor circuit
	Other	• Inspect rotor (See Gr27.) • Incorrectly installed wheel speed sensor

24: RL SENSOR SIG

Code generation criteria		When driving off, no wheel speed sensor output or abrupt change in wheel speed sensor output
Resettability		System resets upon normal signal input after starter switch OFF → ON
Electronic control unit control		Anti-lock brake system disabled
Inspection item	Service data	14: RL SPEED
	Electrical part	#329: Wheel speed sensor
	Wiring diagram	Wheel speed sensor circuit
	Other	• Inspect rotor (See Gr27.) • Incorrectly installed wheel speed sensor

31: BATT VOLT ERR

Code generation criteria		Electronic control unit power-supply terminal voltage out of range
Resettability		Normal signal with starter switch in the ON position
Electronic control unit control		Anti-lock brake system enabled
Inspection item	Service data	15: BATT VOLTAGE
	Electronic control unit connector	02: Electronic control unit power-supply voltage
	Wiring diagram	Electronic control unit power supply circuit

34: G SENSOR

Code generation criteria		G sensor terminal voltage out of range
Resettability		Normal signal after starter switch OFF → ON (re-energize electronic control unit)
Electronic control unit control		Anti-lock brake system enabled
Inspection item	Service data	16: G-SNS VOLTAGE
	Electrical part	#327: G sensor
	Other	G sensor circuit

35: EXB CUT RLY

Code generation criteria		Anti-lock brake system exhaust brake cut relay monitor terminal voltage out of range
Resettability		Normal signal after starter switch OFF → ON (re-energize electronic control unit)
Electronic control unit control		Exhaust brake control disabled (no exhaust brake cut during Anti-lock brake system operation)
Inspection item	Service data	22: EXB CUT RLY, 23: EXB MONITOR
	Actuator test	22: EXB RLY ON
	Electronic control unit connector	03: Anti-lock brake system exhaust brake cut relay
	Electrical part	#201: Anti-lock brake system exhaust brake cut relay
	Wiring diagram	Anti-lock brake system exhaust brake cut relay circuit

41: FR VALVE

Code generation criteria		Magnetic valve terminal voltage out of range
Resettability		Normal signal after starter switch OFF → ON (re-energize electronic control unit)
Electronic control unit control		Anti-lock brake system enabled
Inspection item	Service data	15: BATT VOLTAGE
	Actuator test	11: FR ABS MV ON
	Electronic control unit connector	02: Electronic control unit power-supply voltage
	Wiring diagram	Electronic control unit power-supply circuit
	Other	Clear memory and re-energize. If system still does not reset when driving at 10km/h or above, replace hydraulic unit (electronic control unit).

42: FL VALVE

Code generation criteria		Magnetic valve terminal voltage out of range
Resettability		Normal signal after starter switch OFF → ON (re-energize electronic control unit)
Electronic control unit control		Anti-lock brake system enabled
Inspection item	Service data	15: BATT VOLTAGE
	Actuator test	12: FL ABS MV ON
	Electronic control unit connector	02: Electronic control unit power-supply voltage
	Wiring diagram	Electronic control unit power-supply circuit
	Other	Clear memory and re-energize. If system still does not reset when driving at 10km/h or above, replace hydraulic unit (electronic control unit).

43: RR VALVE

Code generation criteria		Magnetic valve terminal voltage out of range
Resettability		Normal signal after starter switch OFF → ON (re-energize electronic control unit)
Electronic control unit control		Anti-lock brake system enabled
Inspection item	Service data	15: BATT VOLTAGE
	Actuator test	13: RR ABS MV ON
	Electronic control unit connector	02: Electronic control unit power-supply voltage
	Wiring diagram	Electronic control unit power-supply circuit
	Other	Clear memory and re-energize. If system still does not reset when driving at 10km/h or above, replace hydraulic unit (electronic control unit).

44: RL VALVE

Code generation criteria		Magnetic valve terminal voltage out of range
Resettability		Normal signal after starter switch OFF → ON (re-energize electronic control unit)
Electronic control unit control		Anti-lock brake system enabled
Inspection item	Service data	15: BATT VOLTAGE
	Actuator test	14: RL ABS MV ON
	Electronic control unit connector	02: Electronic control unit power-supply voltage
	Wiring diagram	Electronic control unit power-supply circuit
	Other	Clear memory and re-energize. If system still does not reset when driving at 10km/h or above, replace hydraulic unit (electronic control unit).

51: VALVE RLY

Code generation criteria		Terminal voltage of valve relay in electronic control unit out of range
Resettability		Normal signal after starter switch OFF → ON (re-energize electronic control unit)
Electronic control unit control		Anti-lock brake system enabled
Inspection item	Service data	15: BATT VOLTAGE
	Electronic control unit connector	02: Electronic control unit power-supply voltage
	Wiring diagram	Electronic control unit power-supply circuit
	Other	Clear memory and re-energize. If system still does not reset when driving at 10km/h or above, replace hydraulic unit (electronic control unit).

52: MOTOR RLY

Code generation criteria		Terminal voltage of motor relay in electronic control unit out of range
Resettability		Normal signal after starter switch OFF → ON (re-energize electronic control unit)
Electronic control unit control		Anti-lock brake system enabled
Inspection item	Service data	32: MOTOR RLY
	Actuator test	21: ABS MOTOR ON
	Electronic control unit connector	02: Electronic control unit power-supply voltage
	Wiring diagram	Electronic control unit power-supply circuit

53: MOTOR ERR

Code generation criteria		Motor terminal voltage out of range
Resettability		Normal signal after starter switch OFF → ON (re-energize electronic control unit)
Electronic control unit control		Anti-lock brake system enabled
Inspection item	Wiring diagram	Electronic control unit power-supply circuit
	Other	Clear memory and re-energize. If system still does not reset when driving at 10km/h or above, replace hydraulic unit (electronic control unit).

61: ECU ID ERR

Code generation criteria		Wiring incorrect for vehicle system
Resettability		Normal signal after starter switch OFF → ON (re-energize electronic control unit)
Electronic control unit control		Anti-lock brake system enabled
Inspection item	Electronic control unit connector	04: Configuration check
	Wiring diagram	Anti-lock brake system EXB cut relay circuit

63: ECU ERR

Code generation criteria	Electronic control unit internal fault
Resettability	Normal signal after starter switch OFF → ON (re-energize electronic control unit)
Electronic control unit control	Anti-lock brake system enabled
Other	Clear memory and re-energize. If system still does not reset, replace hydraulic unit (electronic control unit).

64: ILLEGAL WHEEL

Code generation criteria		At 30 km/h {18.6 mph} or above, difference in output signal between wheel speed sensors exceeds the limit. (The difference should be less than 20% between front and rear wheel speed sensors and less than 10% between left and right wheel speed sensors.)
Resettability		Normal signal after starter switch OFF → ON (re-energize electronic control unit)
Electronic control unit control		Anti-lock brake system disabled
Inspection item	Service data	11: FR SPEED, 12: FL SPEED, 13: RR SPEED, 14: RL SPEED * Min. speed displayed = 2 km/h {1.2 mph}
	Electrical part	#329: Wheel speed sensor
	Wiring diagram	Wheel speed sensor circuit

65: LONG ABS

Code generation criteria		Anti-lock brake system operates longer than the specified time duration.
Resettability		Normal signal after starter switch OFF → ON (re-energize electronic control unit)
Electronic control unit control		Anti-lock brake system disabled
Inspection item	Service data	11: FR SPEED, 12: FL SPEED, 13: RR SPEED, 14: RL SPEED
	Electrical part	#329: Wheel speed sensor
	Wiring diagram	Wheel speed sensor circuit
	Other	• Inspect rotor (See Gr26, Gr27.) • Incorrectly installed wheel speed sensor

4. Multi-Use Tester Service Data

NOTE

- **Service data can be accessed while actuator test is being performed, and vice versa.**

No.	Item	Data	Diagnosis condition	Pass criteria
11	FR SPEED	■■■. ■km/h	Drive at a constant speed	Synchronized with speedometer
12	FL SPEED	■■■. ■km/h		
13	RR SPEED	■■■. ■km/h		
14	RL SPEED	■■■. ■km/h		
15	BATT VOLTAGE	■■. ■■V	Starter switch ON	Correspond with battery voltage
16	G-SNS VOLTAGE	■. ■■■V	Vehicle parked horizontally; Starter switch ON	2.3 to 2.7 V
21	BRAKE SW	ON/OFF	Brake pedal pressed	ON
			Brake pedal released	OFF
22	EXB CUT RLY	ON/OFF	When anti-lock brake system exhaust brake cut relay activated	ON
			When anti-lock brake system exhaust brake cut relay not activated	OFF
			[Actuator test] 22: EXB RLY ON	
23	EXB MONITOR	ON/OFF	When anti-lock brake system exhaust brake cut relay activated	ON
			When anti-lock brake system exhaust brake cut relay not activated	OFF
			[Actuator test] 22: EXB RLY ON	
24	ABS LAMP	ON/OFF	Anti-lock brake system warning lamp ON	ON
			Anti-lock brake system warning lamp OFF	OFF
			[Actuator test] 23: ABS LAMP ON	
25	DIAGNOSIS SW	OPEN/CLOSE	Diagnosis switch fuse removed	OPEN
			Diagnosis switch fuse plugged in	CLOSE
26	DIAG.RESET SW	OPEN/CLOSE	Memory clear switch fuse removed	OPEN
			Memory clear switch fuse plugged in	CLOSE
27	4WD SW	4WD/2WD	FE	4WD
			FG	2WD
31	VALVE RLY	ON/OFF	When valve relay activated	ON
			When valve relay not activated	OFF
32	MOTOR RLY	ON/OFF	Motor in operation	ON
			Motor stationary	OFF
			[Actuator test] 11: FR ABS MV ON 12: FL ABS MV ON 13: RR ABS MV ON 14: RL ABS MV ON 21: ABS MOTOR ON	

No.	Item	Data	Diagnosis condition	Pass criteria
41	FR-DV	ON/OFF	Magnetic valve energized (front-axle right-wheel DECREASE)	ON
			Magnetic valve de-energized (front-axle right-wheel DECREASE)	OFF
			[Actuator test] 11: FR ABS MV ON	
42	FR-HV	ON/OFF	Magnetic valve energized (front-axle right-wheel HOLD)	ON
			Magnetic valve de-energized (front-axle right-wheel HOLD)	OFF
			[Actuator test] 11: FR ABS MV ON	
43	FL-DV	ON/OFF	Magnetic valve energized (front-axle left-wheel DECREASE)	ON
			Magnetic valve de-energized (front-axle left-wheel DECREASE)	OFF
			[Actuator test] 12: FL ABS MV ON	
44	FL-HV	ON/OFF	Magnetic valve energized (front-axle left-wheel HOLD)	ON
			Magnetic valve de-energized (front-axle left-wheel HOLD)	OFF
			[Actuator test] 12: FL ABS MV ON	
45	RR-DV	ON/OFF	Magnetic valve energized (rear-axle right-wheel DECREASE)	ON
			Magnetic valve de-energized (rear-axle right-wheel DECREASE)	OFF
			[Actuator test] 13: RR ABS MV ON	
46	RR-HV	ON/OFF	Magnetic valve energized (rear-axle right-wheel HOLD)	ON
			Magnetic valve de-energized (rear-axle right-wheel HOLD)	OFF
			[Actuator test] 13: RR ABS MV ON	
47	RL-DV	ON/OFF	Magnetic valve energized (rear-axle left-wheel DECREASE)	ON
			Magnetic valve de-energized (rear-axle left-wheel DECREASE)	OFF
			[Actuator test] 14: RL ABS MV ON	
48	RL-HV	ON/OFF	Magnetic valve energized (rear-axle left-wheel HOLD)	ON
			Magnetic valve de-energized (rear-axle left-wheel HOLD)	OFF
			[Actuator test] 14: RL ABS MV ON	

5. Actuator Test Using Multi-Use Tester

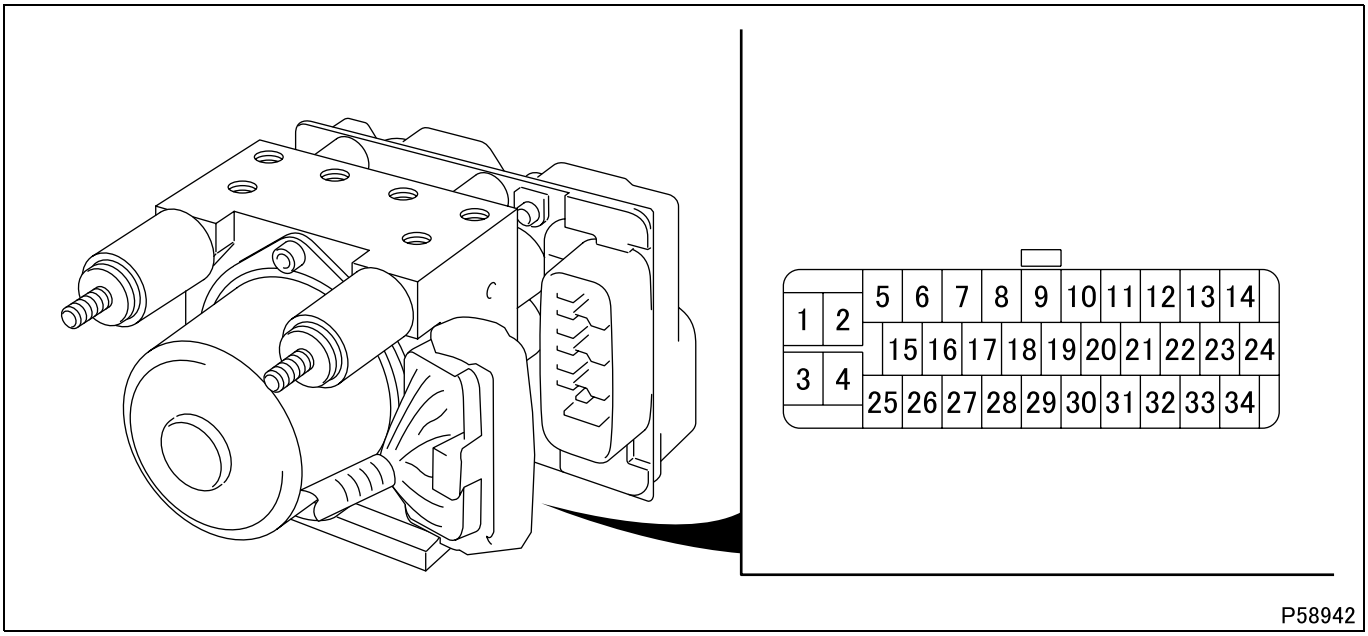
NOTE

- **Service data can be accessed while actuator test is being performed, and vice versa.**

No.	Item	Description	Verification method
11	FR ABS MV ON	 P49621E	Hydraulic unit (electronic control unit) functional check [Service data] 32: MOTOR RLY 41: FR-DV 42: FR-HV 43: FL-DV 44: FL-HV 45: RR-DV 46: RR-HV 47: RL-DV 48: RL-HV Use the data when bleeding the system (See Gr 35A.)
12	FL ABS MV ON		
13	RR ABS MV ON		
14	RL ABS MV ON		
21	ABS MOTOR ON	Operates the motor (for 2 sec).  P49620E	Motor noise [Service data] 32: MOTOR RLY
22	EXB RLY ON	Operates the anti-lock brake system exhaust brake cut relay (for 2 sec).  P49620E	Relay noise [Service data] 22: EXB CUT RLY 23: EXB MONITOR
23	ABS LAMP ON	Turns on the anti-lock brake system warning lamp (For 2 sec).  P49620E	Anti-lock brake system warning lamp ON [Service data] 24: ABS LAMP

6. Inspection at Hydraulic Unit (Electronic Control Unit) Connector

- This inspection is intended to aid troubleshooting by verifying whether or not hydraulic unit (electronic control unit) signals are correctly transmitted via the vehicle harness and connector.
  The **01**, **02** ··· in the table below is a cross reference to the electronic control unit connector inspection items listed in the table in "**3. Diagnosis Based on Diagnosis Codes**" of this manual.



- The inspection requires the connector with a locking feature to be uncoupled. Before carrying out the inspection, read the "Hydraulic Unit Connector Uncoupling and Coupling" in this manual.

CAUTION ⚠

- **Do not touch terminals that are irrelevant to the inspection being performed. When using a tester, be careful not to cause short circuit across the terminals being measured.**

Check item	Measurement
01 Wheel speed sensor resistance	[Condition] • Starter switch OFF • With the connector uncoupled, inspect at vehicle harness connector half [Pass criteria] Between terminals: 12 and 13 (FR) Between terminals: 32 and 33 (FL) Between terminals: 14 and 23 (RR) Between terminals: 34 and 24 (RL) • The resistance measured should be 1 to 2 kΩ
02 Electronic control unit power-supply voltage	[Condition] • Starter switch ON • With the connector uncoupled, inspect at vehicle harness connector half [Pass criteria] Between terminals (+) - (–): 2 - 1 (VB) 4 - 3 (MB) 5 - 1 (IG) • 10 to 18 V

Check item	Measurement
03 Anti-lock brake system exhaust brake cut relay voltage	[Condition] • Starter switch ON • With the connector uncoupled, inspect at vehicle harness connector half [Pass criteria] Between terminals (+) - (–): 10 - 1 (EXHOUT) 9 - 1 (EXHIN) • 10 to 18 V
04 Configuration check	[Pass criteria] Terminals 11, 22 and 30 should be free (no wiring connected). <Two-wheel drive> **CAUTION ⚠** • **If wires are connected to these terminals, disconnect the wires and insulate the exposed portions.**

ON-VEHICLE INSPECTION AND ADJUSTMENT

1. Functional Check

1.1 Inspection with vehicle stationary

- While pressing the brake pedal, check the hydraulic unit (electronic control unit) and the brake pipes and connections for fluid leakage.
- If fluid is leaking from the hydraulic unit (electronic control unit), replace the unit. If fluid is leaking from the brake pipes or connections, retighten the hardware.

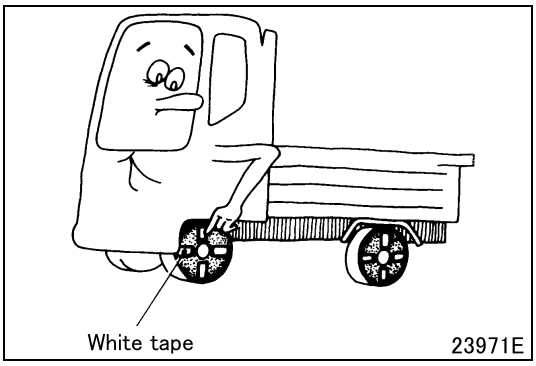
1.2 Inspection using brake tester

- Using the brake tester, check each wheel for braking force following the normal procedures.
- If faulty, check the wheel brake in question, the service brake system and the hydraulic unit (electronic control unit).

1.3 Inspection of anti-lock brake system operation while driving the vehicle

WARNING ⚠

- **During this inspection, do not allow any other vehicle or anyone into the test course.**

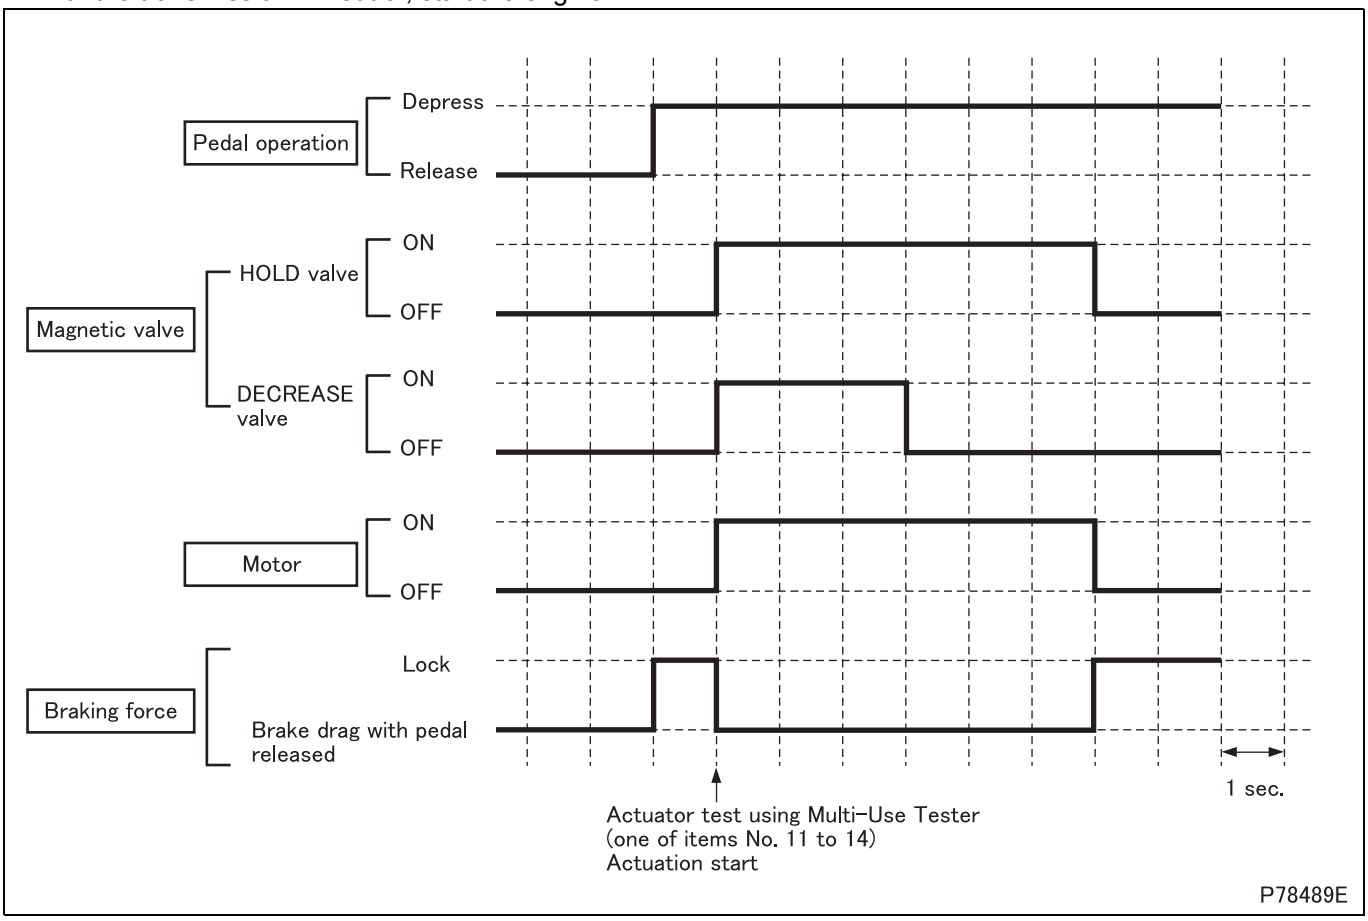


- The vehicle being tested should be in the unloaded state.
- Apply white tapes onto the walls of front and rear tires to aid the observation of wheel rotation.
- Turn the starter switch from LOCK to ON. The warning lamp should come on and, in several seconds, go out.
- Drive the vehicle at 20 to 30 km/h {12 to 19 mph} and apply the brakes hard. The wheels should not lock up.

2. Inspection of Hydraulic Unit (Electronic Control Unit) Operation

2.1 Inspection using Multi-Use Tester

- The hydraulic unit (electronic control unit) cannot be inspected for operation during control effected by the electronic control unit at the time of a fault which will cause a diagnosis code to occur. The inspection should be performed after system recovery from the control through troubleshooting.
- Jack up the vehicle and support it on rigid racks, or place the vehicle on the rollers of a brake tester.
- Apply the parking brake when testing the front brake. Apply chokes to the front wheels when testing the rear brake.
- During inspection, keep the brake tester rollers and the tires dry.
- With the parking brake released, feel the brake drag of each wheel. When the brake tester is used, read the brake drag indicated in the tester.
- Connect the Multi-Use Tester. (See Gr00.)
- With the transmission in neutral, start the engine.



Diagnosis table (actuator test using Multi-Use Tester)

No.	Multi-Use Tester display	Operation	Inspection
11	FR ABS MV ON	(1) Press the brake pedal to lock up the wheel. (2) Using Multi-Use Tester, select the wheel being tested and move the relevant actuator. (3) Rotate the wheel being tested using the brake tester or by hand, and check the variation in braking force.	Braking force drops for 6 seconds following wheel lock-up.
12	FL ABS MV ON		
13	FR ABS MV ON		
14	RL ABS MV ON		

- When abnormality is found as a result of inspection, take a remedial action in accordance with the table below.

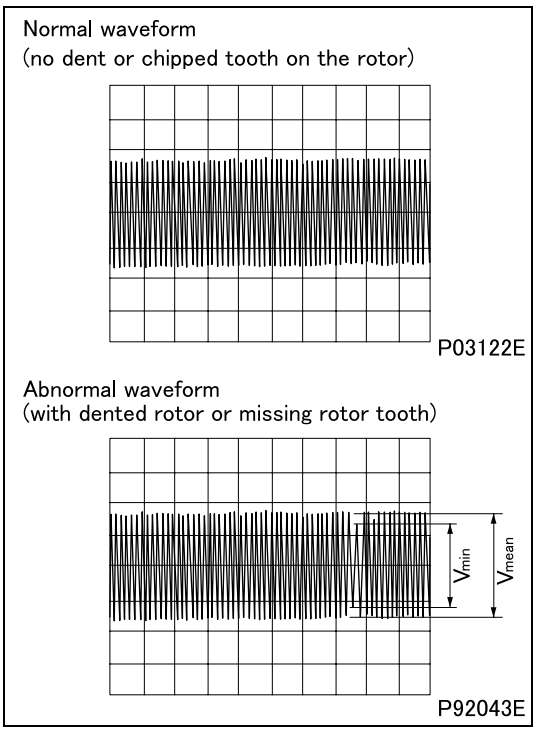
Symptom	Cause	Remedial action
Wheel will not lock up when brake pedal is pressed.	Clogged brake line outside hydraulic unit (electronic control unit)	Inspect and clean brake line
	Clogged line inside hydraulic unit (electronic control unit)	Replace hydraulic unit (electronic control unit)
Braking force will not drop.	Incorrectly connected hydraulic unit (electronic control unit) brake piping	Connect piping correctly
	Faulty hydraulic unit (electronic control unit) magnetic valve	Replace hydraulic unit (electronic control unit)

3. Inspection after Replacing or Removing/Installing Hydraulic Unit (Electronic Control Unit)

- Check the hydraulic unit (electronic control unit) for normal operation.
- After replacing or removing/installing the hydraulic unit (electronic control unit), always check the system for normal operation. Controlled braking will not be available if the piping is incorrect.
- After replacement or reinstallation of the hydraulic unit (electronic control unit), be sure to bleed the brake system. (See Gr35A.)
- The vehicle harness connector is equipped with a locking device. For correct use of the device, see “HYDRAULIC UNIT CONNECTOR COUPLING AND UNCOUPLING” in this manual.

4. Oscilloscopic Inspection through Wheel Speed Sensor Signal Waveform

- The tester is inappropriate to inspection for dented rotor or missing rotor tooth. Instead, use the oscilloscope function of the Multi-Use Tester or an oscilloscope capable of waveform recording.
- In many cases, dented rotor or missing rotor tooth results from the contact of the rotor press-fitted in the hub tip with the axle or elsewhere that can occur in the process of the hub and brake drum being assembled to the axle. Therefore, care should be taken so that the rotor does not touch other parts when the hub and brake drum are assembled to the axle.



4.1 Inspection

- Jack up the wheel under inspection. Disconnect the wheel speed sensor connector.
- Connect the oscilloscope terminals to the disconnected connector. Rotate the wheel at a certain speed and check oscilloscopic waveform for dented rotor or missing rotor tooth.
- If any wave is evidently smaller in width than others, there should be a dented rotor or missing rotor tooth. The standard wave width is as calculated below.

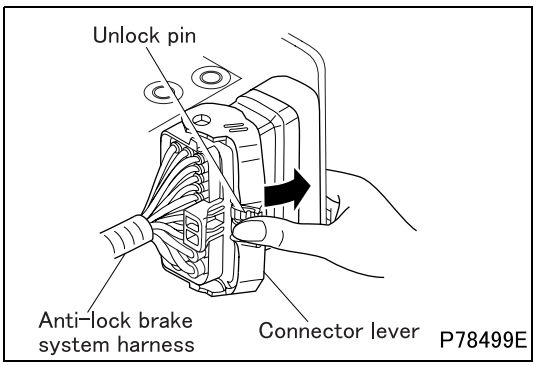
$$\frac{\text{Vmean} - \text{Vmin}}{\text{Vmean}} \times 100 \leq 20\%$$

where
Vmin: Minimum wave width
Vmean: Average of maximum wave widths

- If there is a wave more than 20% smaller in width than others, visually examine the rotor for the defect and replace if necessary. (See Gr26, 27).

HYDRAULIC UNIT CONNECTOR COUPLING AND UNCOUPLING

◆Removal procedure◆

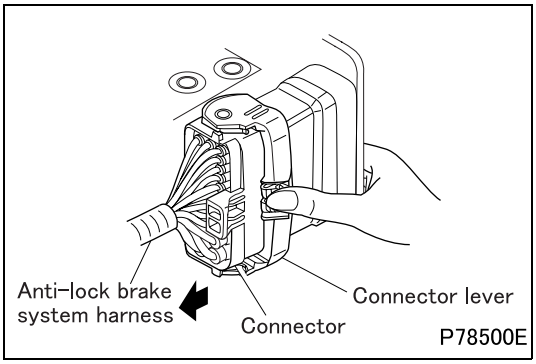


■ **Removal: Hydraulic unit connector**

- While holding the connector, push the unlock pin on the connector lever with finger and unlock.
- With the connector unlocked, push the connector lever in the direction of the arrow.

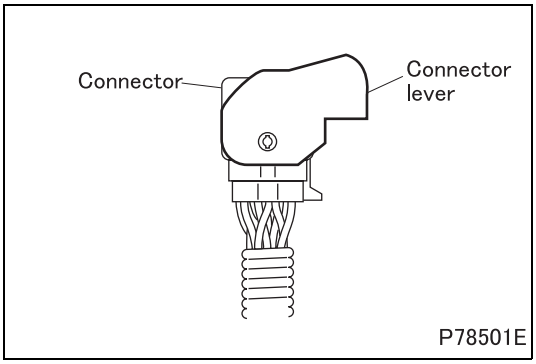
CAUTION ⚠

- **If the connector lever is hard to move, return the lever to the locked position and then try again. Forcing the lever to move may damage the lever.**



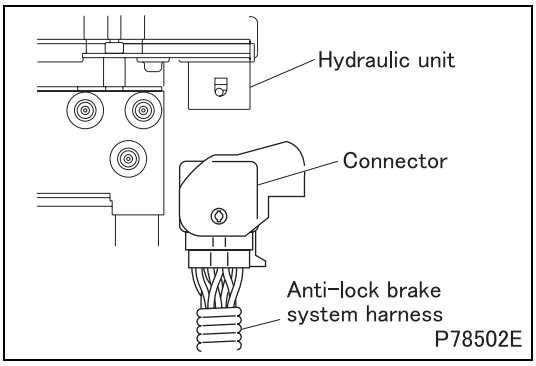
- With the connector lever fully pushed back, remove it together with the anti-lock brake system harness while holding the connector.

◆Installation procedure◆

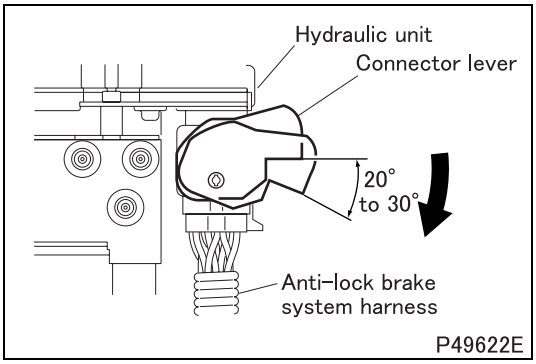


■ **Installation: Hydraulic unit connector**

- Ensure that the connector terminals are clean and free from foreign matter.
- Set the connector lever to the illustrated position.



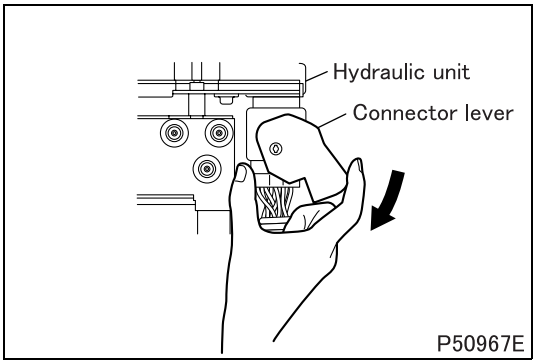
- Insert the anti-lock brake system harness connector straight into the other connector half on the hydraulic unit.



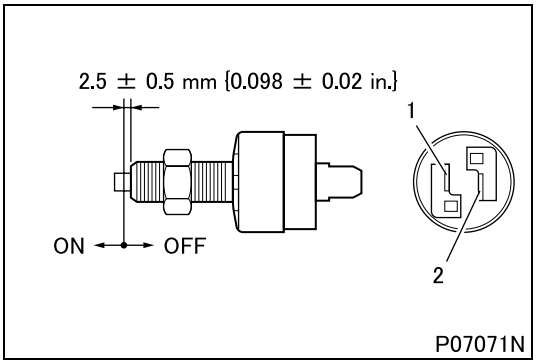
- Check that the connector lever can be turned with a small force to the specified angle in the direction of the arrow.

CAUTION ⚠

- **If the connector lever fails to turn to the specified angle, perform connector installation procedure again from the beginning. Without doing this, the connector lever could be broken when it is turned in the next step.**



- In order to lock the connector lever, turn the lever in the direction of the arrow until it clicks by applying force to the central portion while holding the connector body.
- If the connector is not completely connected, the anti-lock brake system (ABS) warning lamp may be illuminated. If the lamp is illuminated, connector installation steps must be performed again from the beginning.

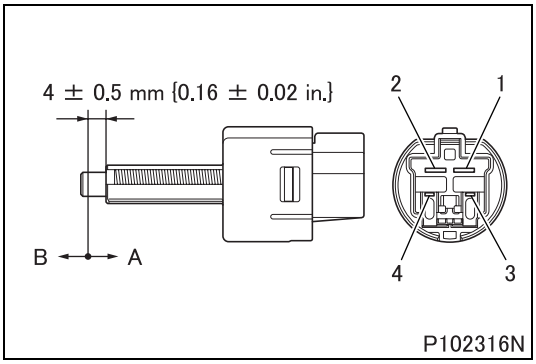


#042 Inspection of stop lamp switch

<Type (1)>

Switch position	Continuity between the terminals
OFF	–
ON	1 – 2

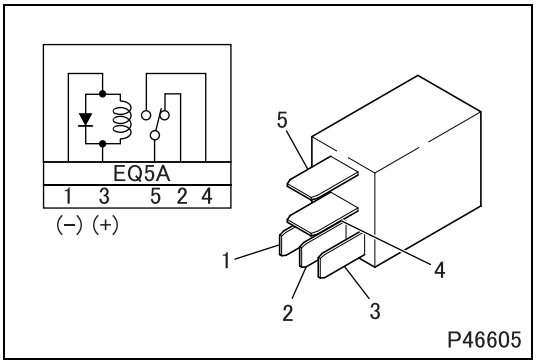
- If faulty, replace the switch.



<Type (2)>

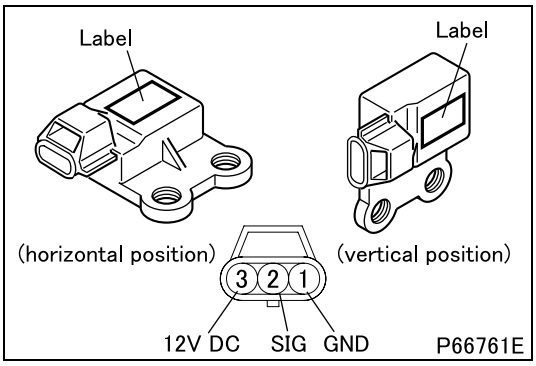
Switch position	Continuity between the terminals
A	3 – 4
B	1 – 2

- If faulty, replace the switch.



#201 Inspection of relay (normally open 5-pin relay)

- Check the relay for continuity and normal operation. If faulty, replace the relay.

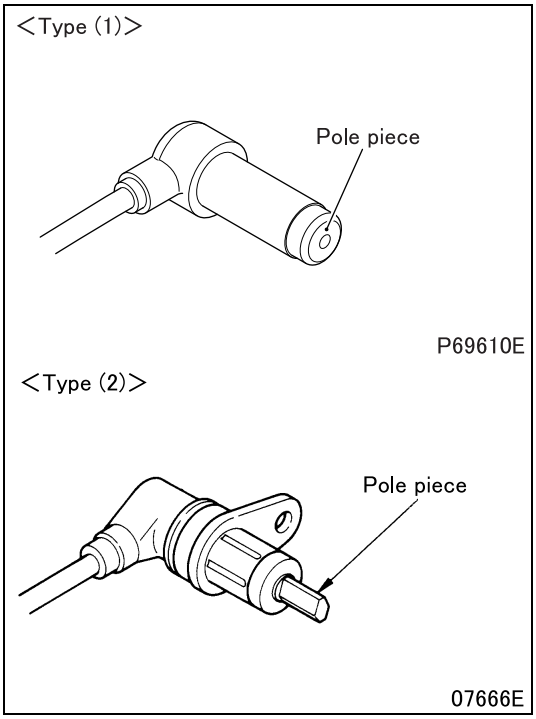


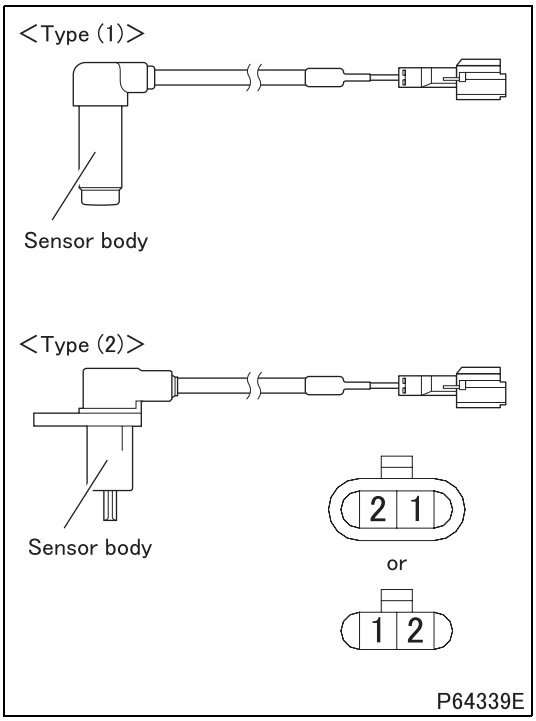
#327 Inspection of G sensor

- Apply a 12V DC across terminals 3 and 1 of the G sensor.
- Measure the G sensor output voltage between terminals 2 and 1 for both when the sensor is in a horizontal position and when it is in a vertical position.

Standard value	Horizontal position	2.3 to 2.7 V
	Vertical position	3.3 to 3.7 V

- If any of the measurements is not within the standard value range, replace the sensor.





#329 Inspection of wheel speed sensor

- Manufacturer of wheel speed sensor.

Type	Manufacturer
(1)	SUMITOMO ELECTRIC
(2)	Bosch

- Carry out the following checks. If faulty, replace the wheel speed sensor.

CAUTION ⚠

- **The pole piece is magnetized by the magnet housed in the wheel speed sensor. Be careful not to allow metal parts to stick onto the pole piece.**

(1) Resistance between terminals

Standard value	Type (1)	1.4 ± 0.2 kΩ
	Type (2)	1.6 ± 0.16 kΩ

(2) Insulation resistance (between the sensor body and each terminal)

Standard value	Type (1)	1000 kΩ or above
	Type (2)	100 kΩ or above

(3) Open circuit

- If open circuit is suspected, remove the harness clamps and wiggle the harness to determine whether it is an intermittent fault or not. Check also the connector terminals for proper connection.

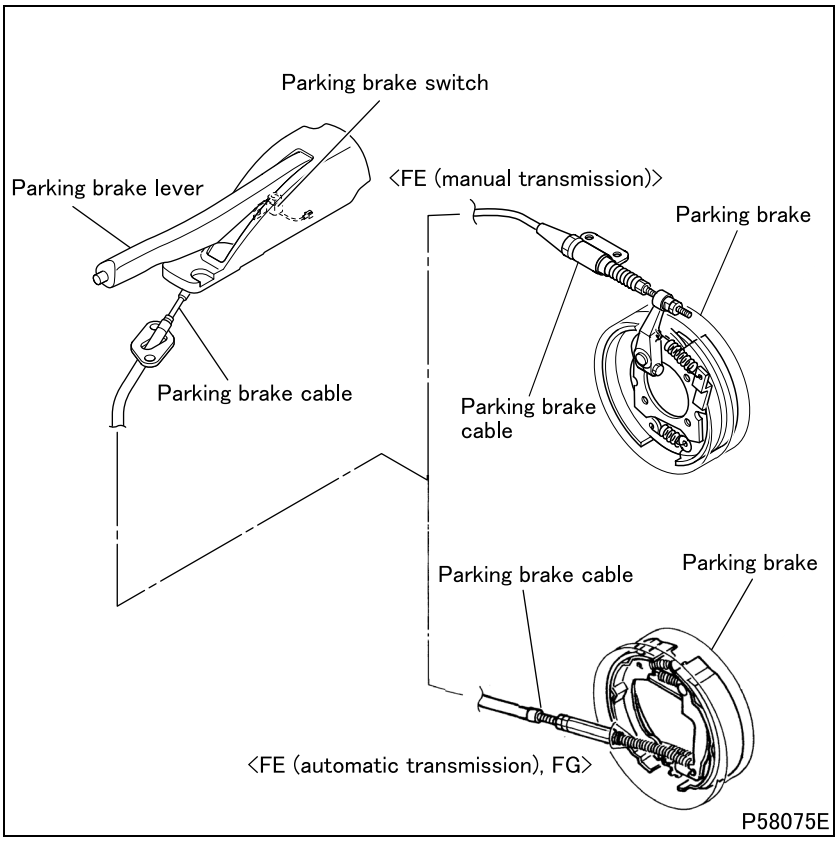
<FE (AUTOMATIC TRANSMISSION)> 36-16
<FG> 36-18

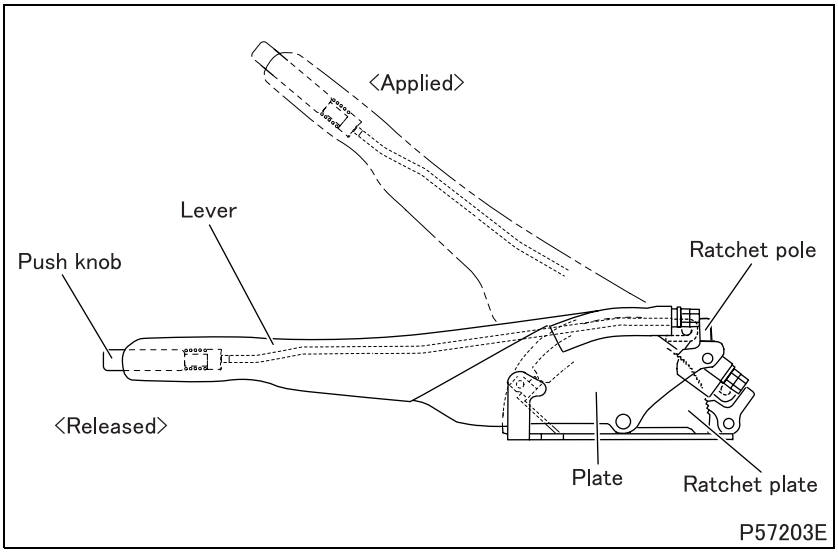
SPECIFICATIONS

Item			Specifications		
			FE		FG
			Automatic transmission	Manual transmission	
Brake	Type		Internal expanding type acting on propeller shaft		
	Operation type		Mechanical cable type		
Parking brake	Type		Duo servo type		
	Brake drum I.D.	mm {in.}	ϕ190 {7.48}	ϕ203.2 {8.00}	ϕ180 {7.09}
	Lining width × thickness	mm {in.}	45 × 4.0 {1.77 × 0.16}	50 × 4.0 {1.97 × 0.16}	35 × 5 {1.38 × 0.20}

1. Components and Parts



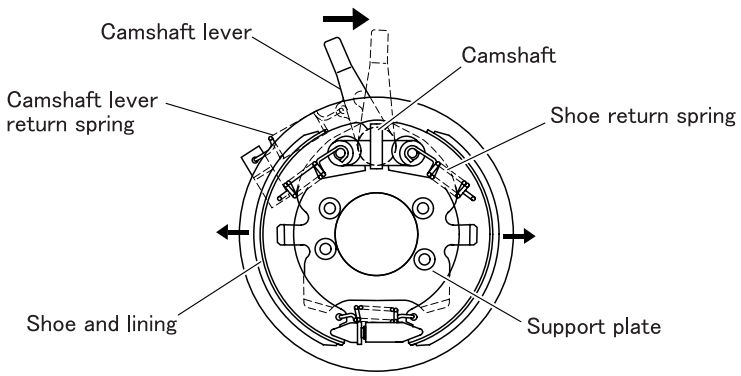
2. Parking Brake Lever



- Pulling the parking brake lever makes the parking brake work, at which point the ratchet pole engages with the ratchet plate and the lever is locked.
- To release the parking brake lever, slightly pull it up while pushing the release knob. This disengages the ratchet pole from the ratchet plate, allowing the parking brake lever to return to the released position.

3. Parking Brake

3.1 Duo servo type <FE (manual transmission)>

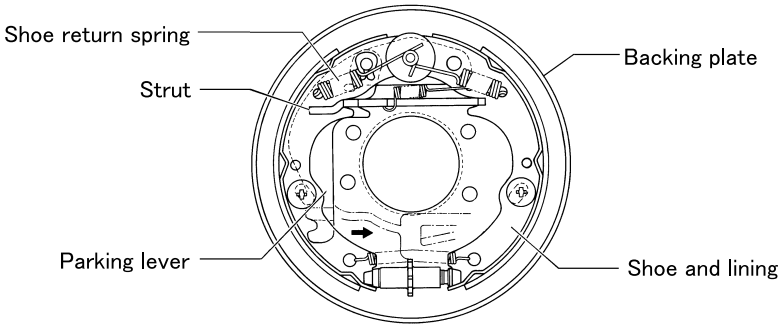


P56131E

- The camshaft lever, which is used to actuate the shoes/linings, is built into the parking brake unit. Pulling the parking brake lever actuates the camshaft lever via the parking brake cable.
- Actuation of the camshaft lever causes the camshaft to rotate, which expands both shoes/linings onto the brake drum. In this case, both shoes/drums function as a leading shoe.
- As the parking brake lever (camshaft lever) is released, the forces of shoe and camshaft lever return springs restore the components to their home positions. This releases the parking brake.

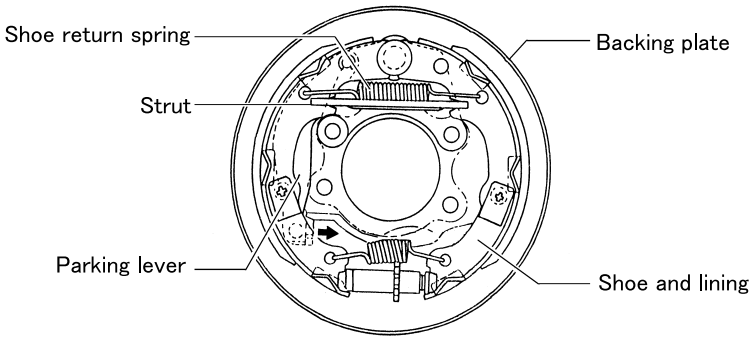
3.2 Duo servo type

<FE (automatic transmission)>



57228E

<FG>



P58291E

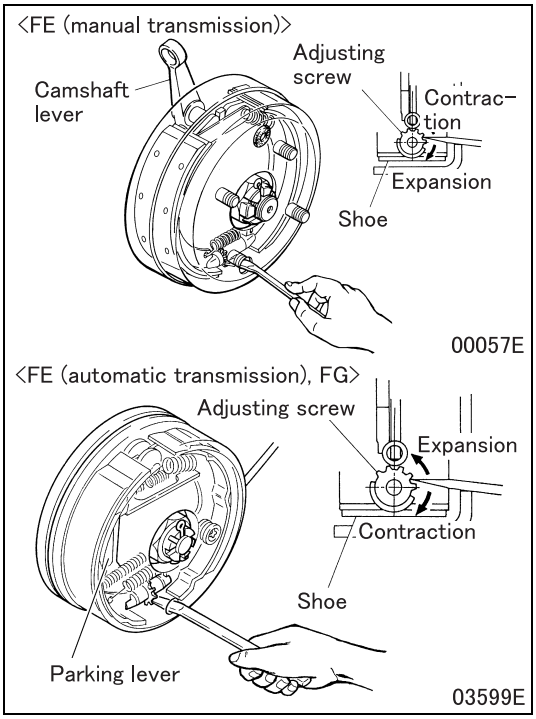
- The parking lever that actuates the shoe and lining is a built-in component of the parking brake body. Pulling the parking brake lever pulls the parking brake cable, which in turn pulls the parking lever.
- When the parking lever is pulled, one shoe and lining is forced to expand with the medium of strut. At the same time, the parking lever directly expands the other shoe and lining. Thus, each shoe and lining assembly works as a leading shoe.
- When the parking brake lever (parking lever) is returned to the released position, the repercussive force of the shoe return spring releases the brake.

Possible causes / Symptoms		Parking brake does not work	Parking brake release not smooth (dragging)	Parking brake lever operating physical force insufficient	Parking brake lever operating physical force excessive	Reference Gr
Parking brake cable	Inner cable stretched or damaged	O	O	O	O	
	Inner cable improperly adjusted	O	O	O	O	
	Front parking cable and rear parking cable improperly connected	O	O	O	O	
	Front parking cable and rear parking cable joints in poor contact	O	O	O	O	
Parking brake lever	Ratchet pole and ratchet plate pawl engaged improperly	O				
	Pulling stroke insufficient		O		O	
	Pulling stroke excessive	O		O		
Parking brake	Shoe clearance insufficient		O		O	
	Shoe clearance excessive	O		O		
	Parking brake drum inner surface deformed or warped	O		O		
	Lining worn unevenly	O		O		
	Brake drum inner surface greasy or oily	O				
	Lining surface greasy or oily	O				
	Camshaft lever return spring fatigued or fractured <FE (manual transmission)>		O			
	Shoe return spring fatigued or fractured		O			

1. Adjustment of Parking Brake Shoe Clearance

Service standards (Unit: mm {in.})

Location	Maintenance item		Standard value	Limit	Remedy
–	Brake shoe clearance	FE (manual transmission)	0.1 to 0.25 {0.0039 to 0.0098}	–	Adjust
		FE (automatic transmission)	0.2 to 0.25 {0.0079 to 0.0098}	–	
		FG	0.25 to 0.3 {0.0098 to 0.012}	–	



- Chock the front wheels and raise the rear wheels with a jack before adjusting the shoe clearance.
- Operate the parking brake lever to release the parking brake. (The parking lever or camshaft lever is released from locking.)
- Using a standard screwdriver inserted through the shoe adjusting hole in the parking brake drum, turn the adjusting screw in the C direction (expansion) shown to bring the shoe into close contact with the brake drum.
- Turn the adjusting screw 8 notches in the B direction (contraction) shown from the position where the shoe is in close contact with the drum. The shoe clearance should be adjusted to the standard value.

2. Inspection and Adjustment of Parking Brake Lever

Service standards

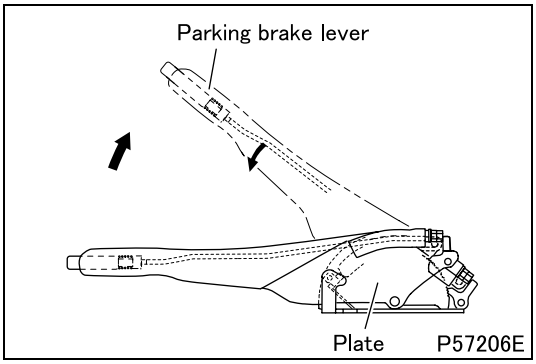
Location	Maintenance item	Standard value	Limit	Remedy
–	Parking brake lever pulling stroke (with operating physical operating of 300N {67 lbs, 31 kgf})	7 to 9 notches	–	Adjust or inspect

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
–	Lock nut <FE (automatic transmission), FG>	18.7 to 27.5 {14 to 20, 1.9 to 2.8}	–

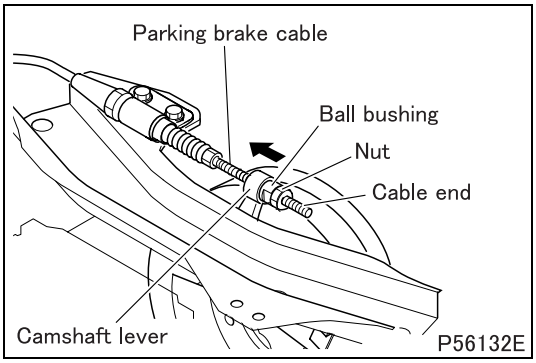
Lubricant and/or sealant

Mark	Point of application	Specified lubricant and/or sealant	Quantity
–	Camshaft lever (on sliding face with parking brake cable and on contact face with ball bushing) <FE (manual transmission)>	Chassis grease [NLGI No. 1 (Li soap)]	As required



[Inspection]

- Pull the parking brake lever from the released position with an operating physical force of 300N {67 lbs, 31 kgf} and count the number of cleared notches.
- If the count of notches deviates from the specified range of standard values, adjust the length of the parking brake cable.
- If the count of notches (pulling stroke) is still out of the specified range after cable length adjustment, check the parking brake shoe clearance.



[Adjustment]

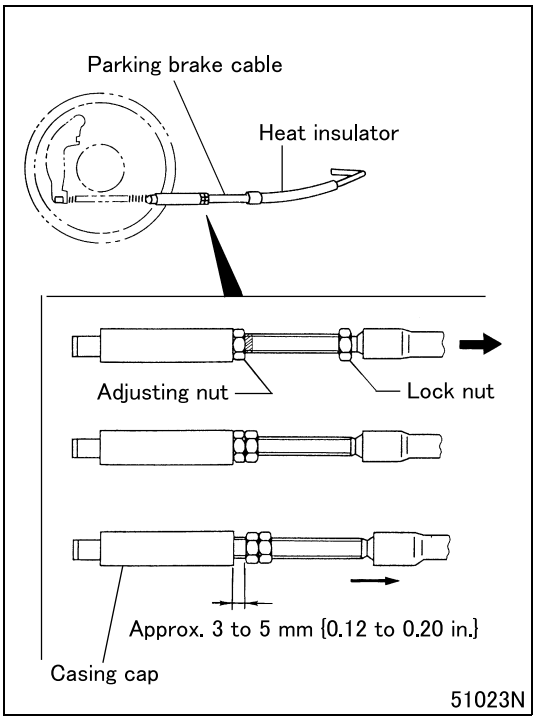
<FE (manual transmission)>

- Pull on the parking brake cable end with a force of 100 N {22 lbs, 10 kgf} to remove any slack from the cable.
- Apply grease onto the camshaft lever, on the sliding face with the parking brake cable and on the contact face with the ball bushing.
- While pulling the cable end of the camshaft lever in the direction of the arrow with a force of 45 to 50 N {10 to 11 lbs, 4.6 to 5.1 kgf}, rotate the ball bushing until it contacts the cable end of the camshaft lever.

CAUTION ⚠

- **Do not rotate the ball bushing so much as to cause the camshaft lever to move.**

- Pull the parking brake lever 3 times with a force of 500 N {110 lbs, 51 kgf}.
- This operation causes the cable to extend. Rotate the ball bushing again until it contacts the camshaft lever. Then, pull the parking brake lever with a force of 45 to 50 N {10 to 11 lbs, 4.6 to 5.1 kgf}. The camshaft lever should not move more than 1mm {0.039 in.}.



- Pull the parking brake lever from the released position with a force of 300 N {67 lbs, 31 kgf}. The lever should travel past the specified number of notches. Tighten the nut.

<FE (automatic transmission), FG>

- Pull the outer cable of the parking brake cable with a force of 60 to 100 N {13 to 22 lbs, 6.1 to 10 kgf} to zero the parking brake shoe clearance.

CAUTION ⚠

- **When pulling the outer cable, take care not to move heat insulator on the parking brake cable out of place.**

- While pulling the parking brake cable, tighten the adjust nut until it seats the cable support end.
- Lock the adjust nut with the lock nut.
- Operate the parking brake lever several times with the force of 500 N {110 lbs, 51 kgf}.
- Pull the outer cable of the rear parking brake cable again with the force of 60 to 100 N {13 to 22 lbs, 6.1 to 10 kgf}.

CAUTION ⚠

- **When pulling the outer cable, take care not to move heat insulator on the parking brake cable out of place.**

- Holding the parking brake cable in the pulled state, turn the adjusting nut until its distance from the casing cap becomes 3 to 5 mm {0.12 to 0.20 in.} as shown in the illustration.
- Return the parking brake cable to the original position.
- Tighten the lock nut to the specified torque.

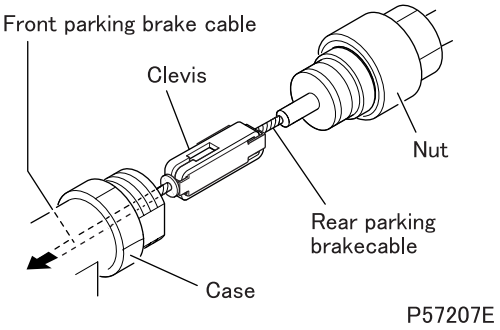
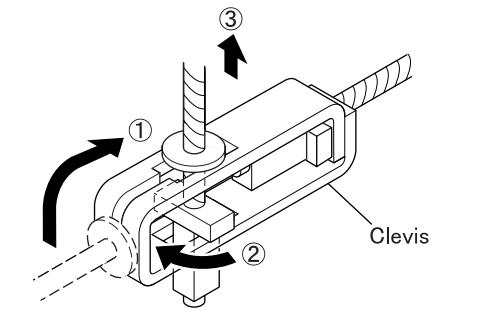
	Spherical face of ball bushing <FE (manual transmission)>		

◆Removal procedure◆



P57207E

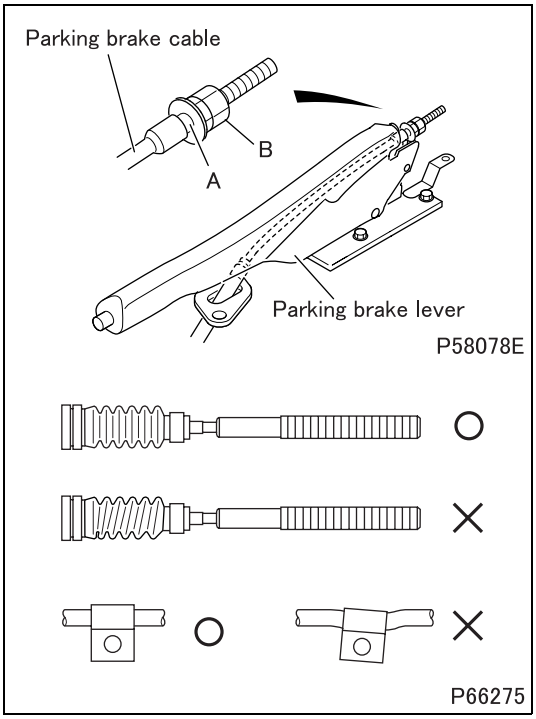


P50252E

■ **Removal: Front parking brake cable <FE (automatic transmission), FG>**

- Loosen the nut connecting the front and rear parking brake cables, then separate the front parking brake cable case from the rear parking brake cable.
- Remove the cap and pull out the clevis from the front parking brake cable case and remove it at the steps of 1, 2 and 3 in that order as shown.

◆Installation procedure◆

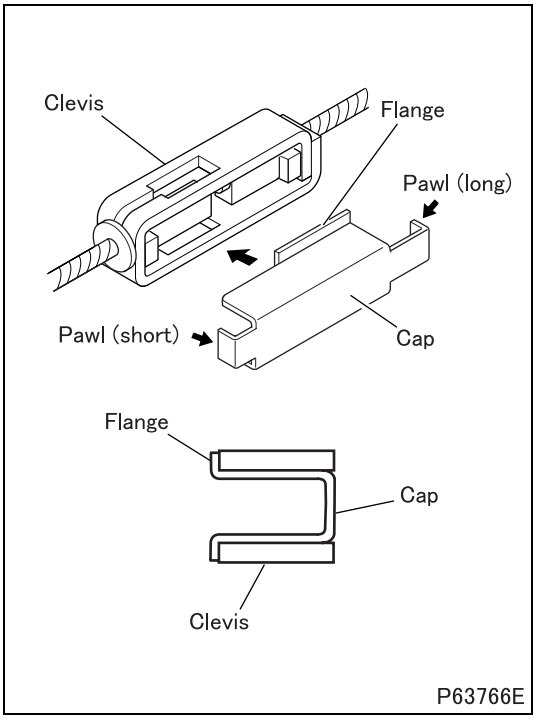


■ **Installation: Front parking brake cable or parking brake cable**

- Connect the front parking brake cable to the rear parking brake cable by following the removal procedure in reverse. <FE (automatic transmission), FG>
- Attach the parking brake cable to the parking brake lever by fully tightening nut A, then tightening nut B to the specified torque.

CAUTION ⚠

- **Cable bending radius must be at least 100 mm.**
- **The cable must not be bent at clamped portions.**
- **There must not be torsion in the boot.**
- **Avoid any interference with other components when routing the cable.**

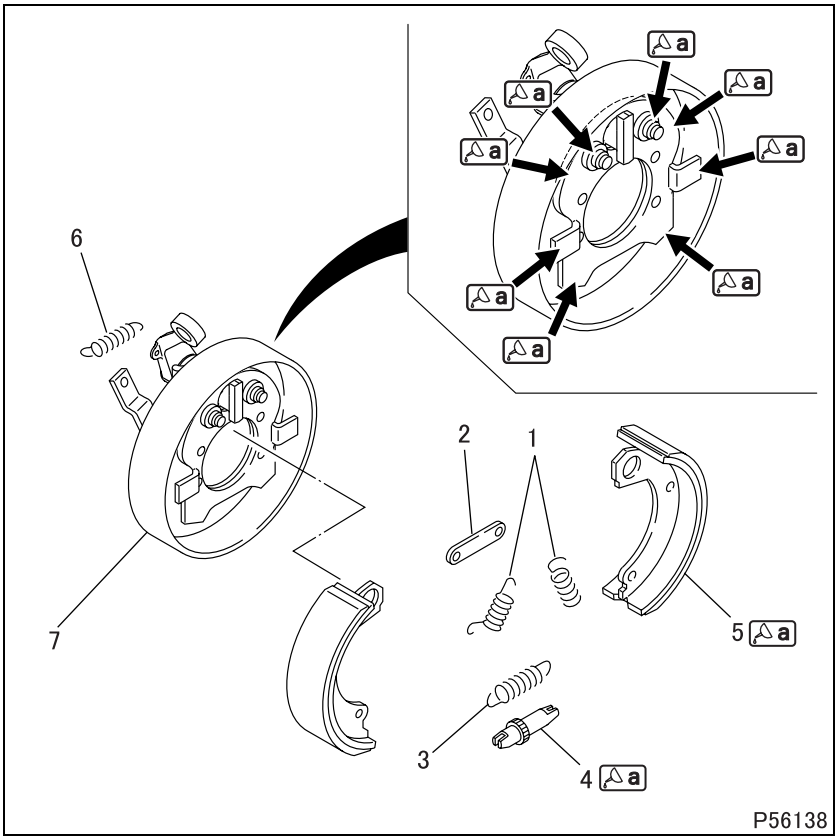


■ **Installation: Cap <FE (automatic transmission), FG>**

- Attach the cap to the clevis of the rear parking brake cable from the direction shown in the illustration.
- Fit the cap into the clevis all the way so that the flange of the cap comes out at the other side of the clevis.

M E M O

PARKING BRAKE <FE (MANUAL TRANSMISSION)>



● **Disassembly sequence**

1 Shoe return spring
2 Anchor pin brace
3 Adjust wheel return spring
4 Adjust screw
5 Shoe & lining
6 Camshaft lever return spring
7 Support plate & dust cover

● **Assembly sequence**

Follow the disassembly sequence in reverse.

CAUTION ⚠

- **To prevent poor working of the brake, do not smear the surface of shoe and lining with grease or oil.**
- **When the shoe and lining has been replaced with a new one, always check it for contact with the parking brake drum.**

- See Gr22 for parking brake removal and installation procedures.

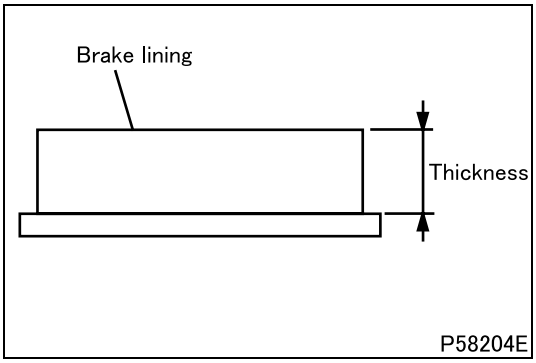
Service standards (Unit: mm {in.})

Location	Maintenance item	Standard value	Limit	Remedy
1	Shoe return spring installed load (installed length: 57.5 {2.26})	145 ± 15 N {33 ± 3.3 lbs, 15 ± 1.5 kgf}	115 N {26 lbs, 12 kgf}	Replace
3	Adjust wheel return spring installed load (installed length: 59 {2.32})	78 ± 7.8 N {18 ± 1.8 lbs, 8 ± 0.8 kgf}	63 N {14 lbs, 6.4 kgf}	Replace
5	Brake lining thickness	4.0 {0.16}	1.4 {0.055}	Replace
6	Cam shaft lever return spring installed load (installed length: 85 {3.35})	62 ± 5.9 N {14 ± 1.3 lbs, 6.3 ± 0.6 kgf}	49 N {11 lbs, 5.0 kgf}	Replace

Lubricant and/or sealant

Mark	Point of application	Specified lubricant and/or sealant	Quantity
a	Adjust screw ends' contact faces with shoe & lining	Brake grease (AKB100)	As required
	Contact faces between support plate, camshaft and shoe & lining		
	Contact faces between support plate, anchor pin and shoe & lining		

◆Inspection procedure◆



■ **Inspection: Brake lining thickness of shoe and lining**

- If the measured value is lower than the limit, replace the shoe and lining.

PARKING BRAKE <FE (AUTOMATIC TRANSMISSION)>

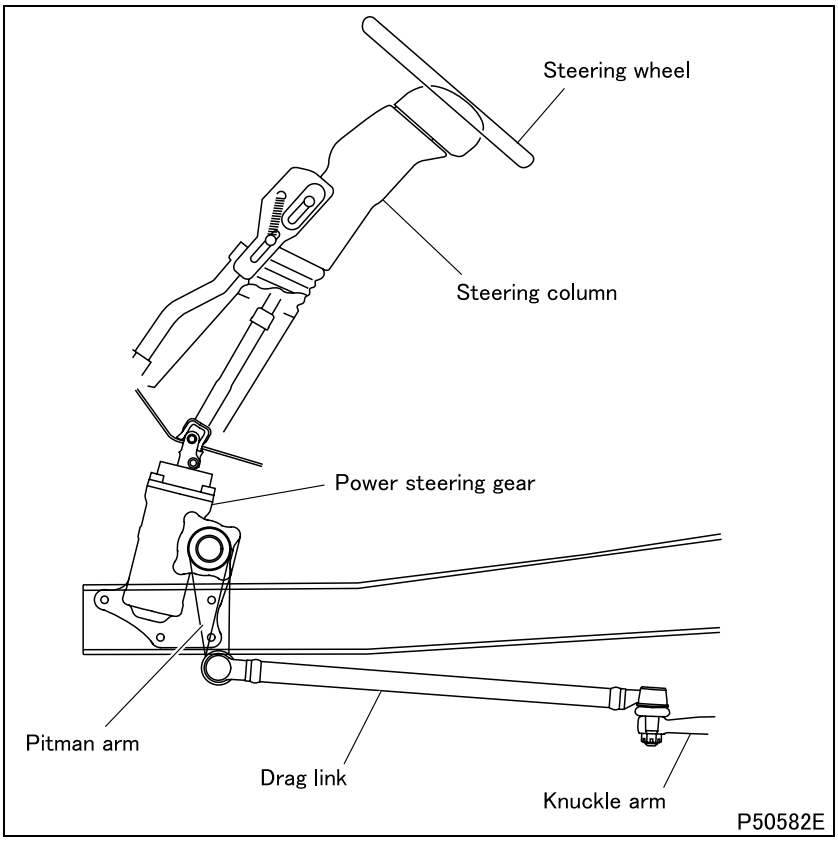
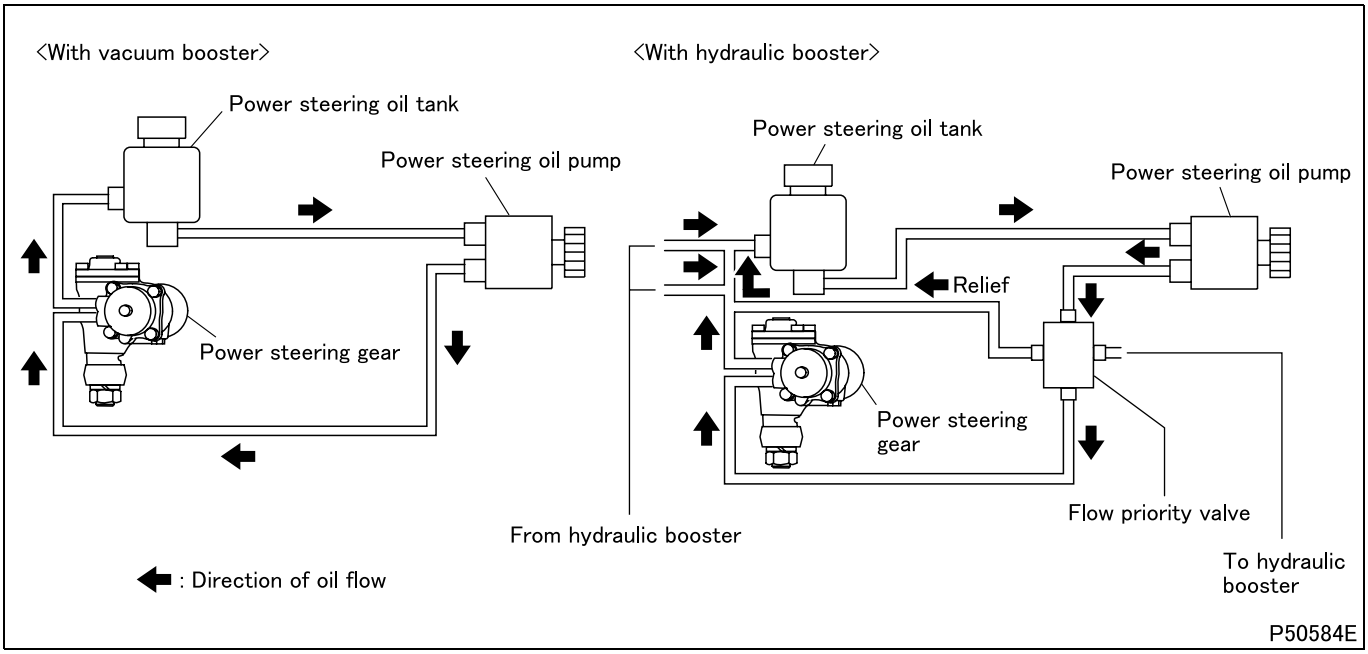
Permissible revolutions rpm	600 to 6500	

M E M O

1. Steering System

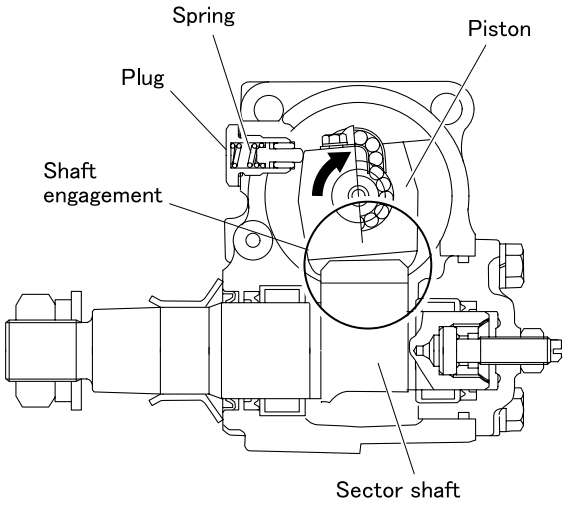


2. Oil Flow



- The power steering system with hydraulic booster is provided with a flow priority valve to reduce steering shock that occurs when the brakes are suddenly applied during steering wheel manipulation.

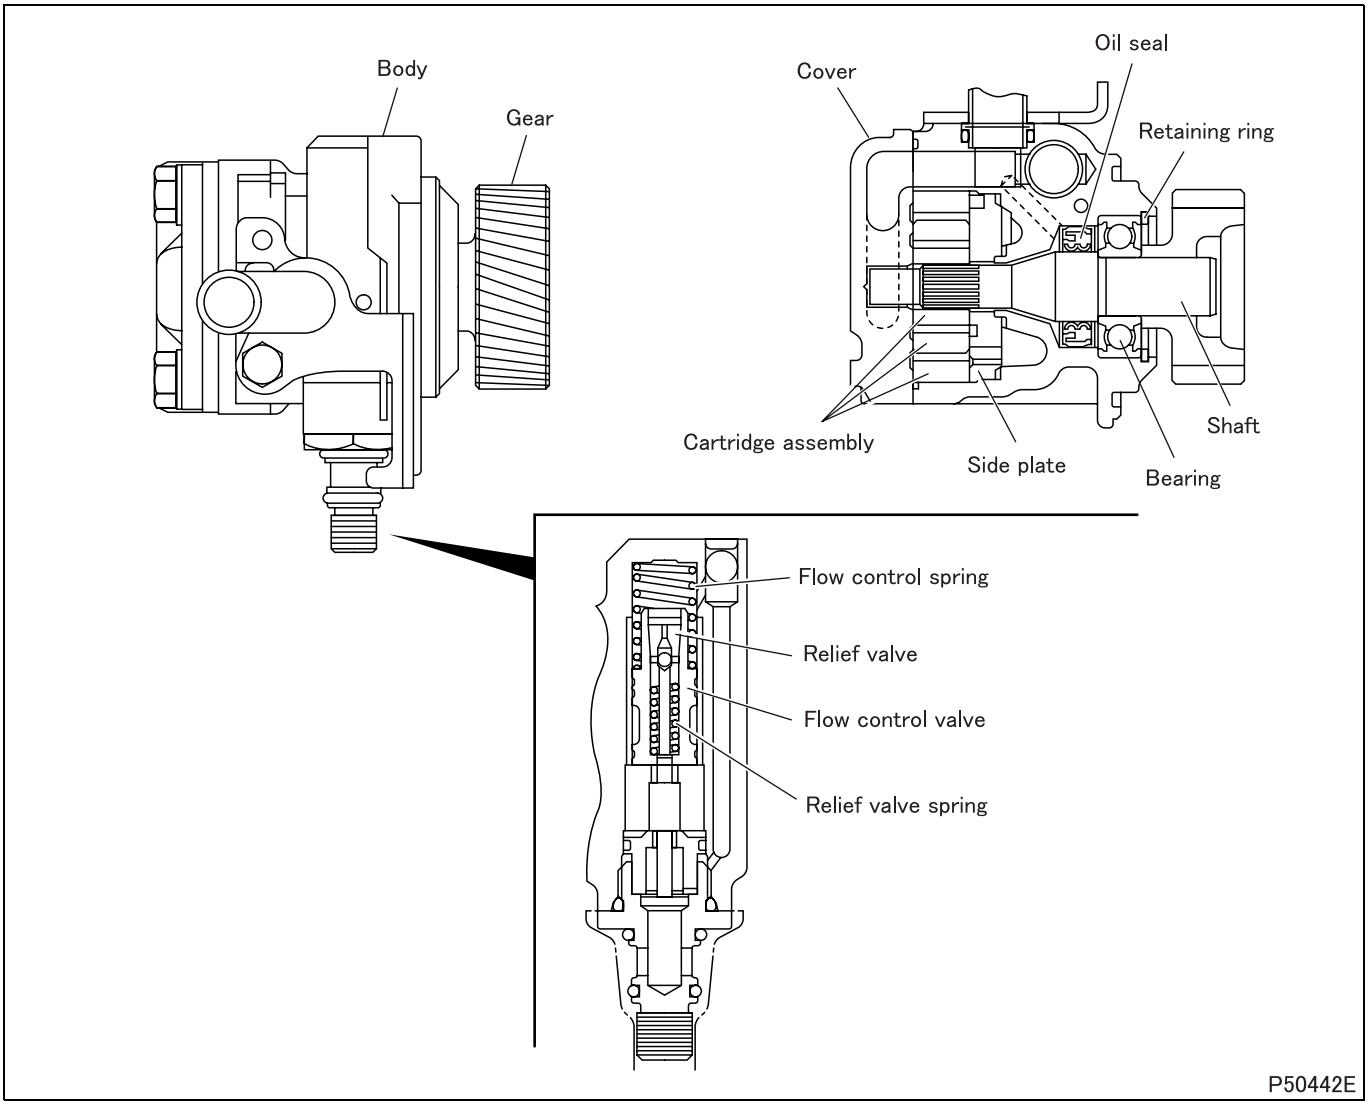
3. Power Steering Gear (Backlash Compensation Mechanism)



P67496E

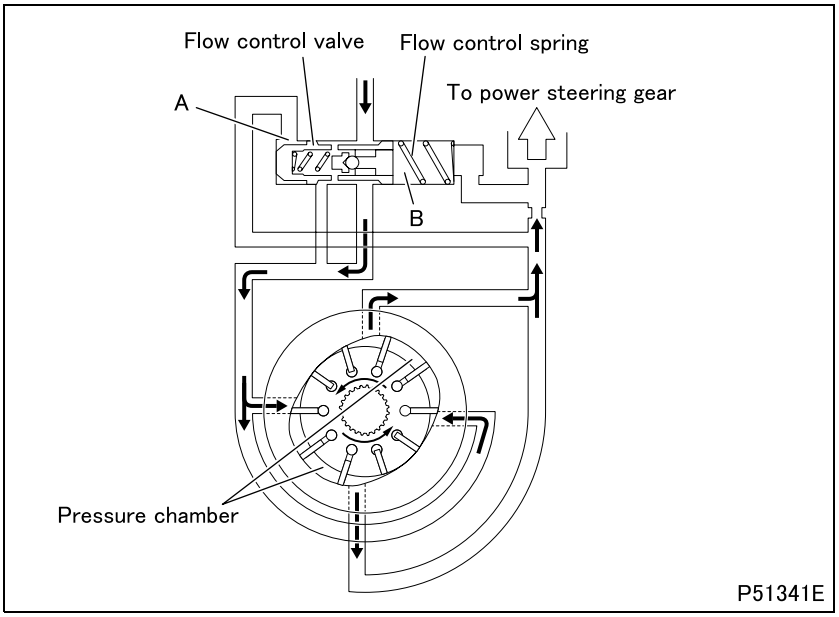
- The plug constantly presses the piston in the illustrated turning direction with the force of internal spring.
- This eliminates play between the piston and sector shaft where they are engaged to suppress backlash during straight travel, thus improving steerability.

4. Power Steering Oil Pump <KYB Product>



- The power steering oil pump is a hydraulic source pump with the vane in the rotor groove and is geared to the engine.
- The power steering oil pump consists of a cartridge assembly that discharges oil, a flow control valve that controls the oil flow rate and a relief valve that prevents free oil pressure rise.
- The flow control valve maintains constant the quantity of oil to the power steering gear during steering wheel manipulation.
  The relief valve is provided in the flow control valve to prevent oil pump pressure from rising beyond necessary level during stationary swing operation.

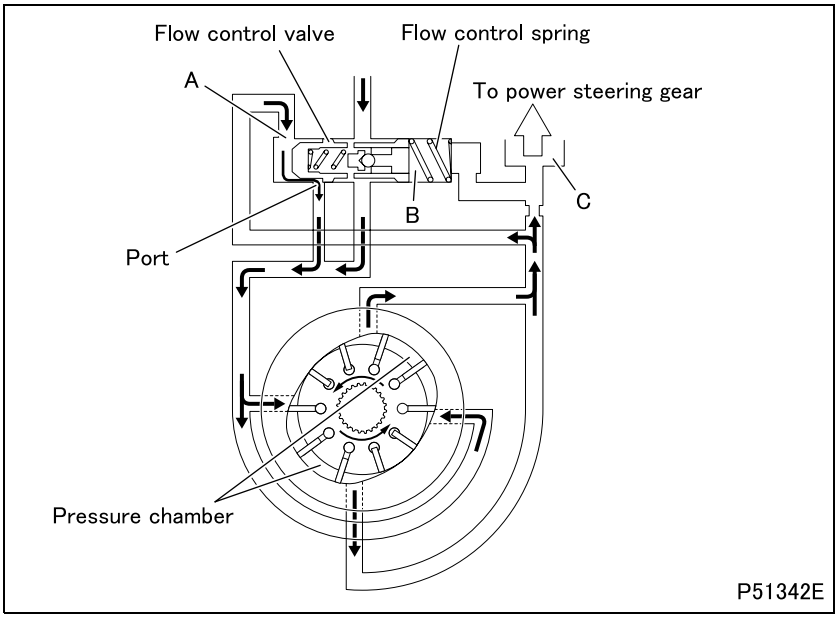
4.1 Flow control valve



(1) Operation of flow control valve

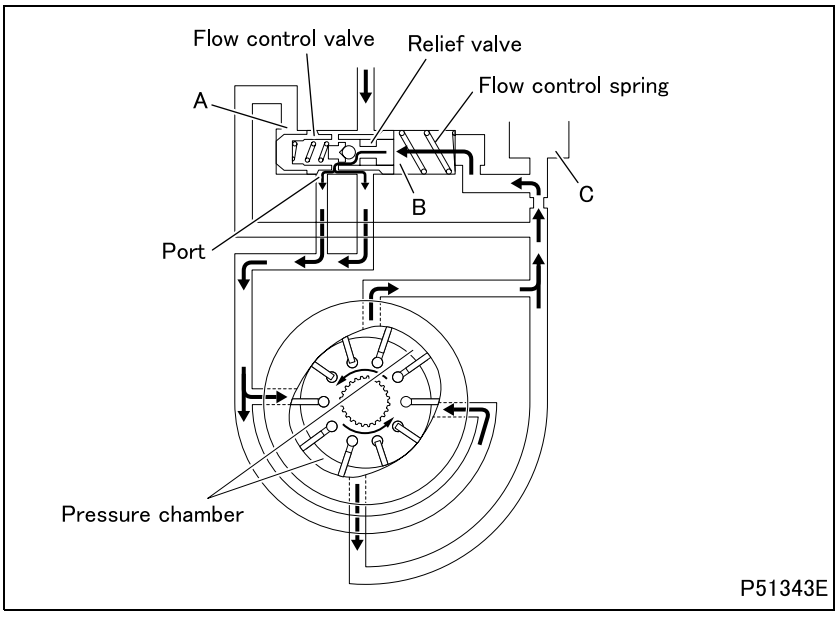
(1.1) When not functioning (oil pump in operation at low speed)

- Oil pressure in the chamber A is weaker than the combined force of oil pressure in the chamber B and tension of the flow control spring, and the flow control valve remains stationary.



(1.2) When functioning (oil pump in operation at middle to high speeds)

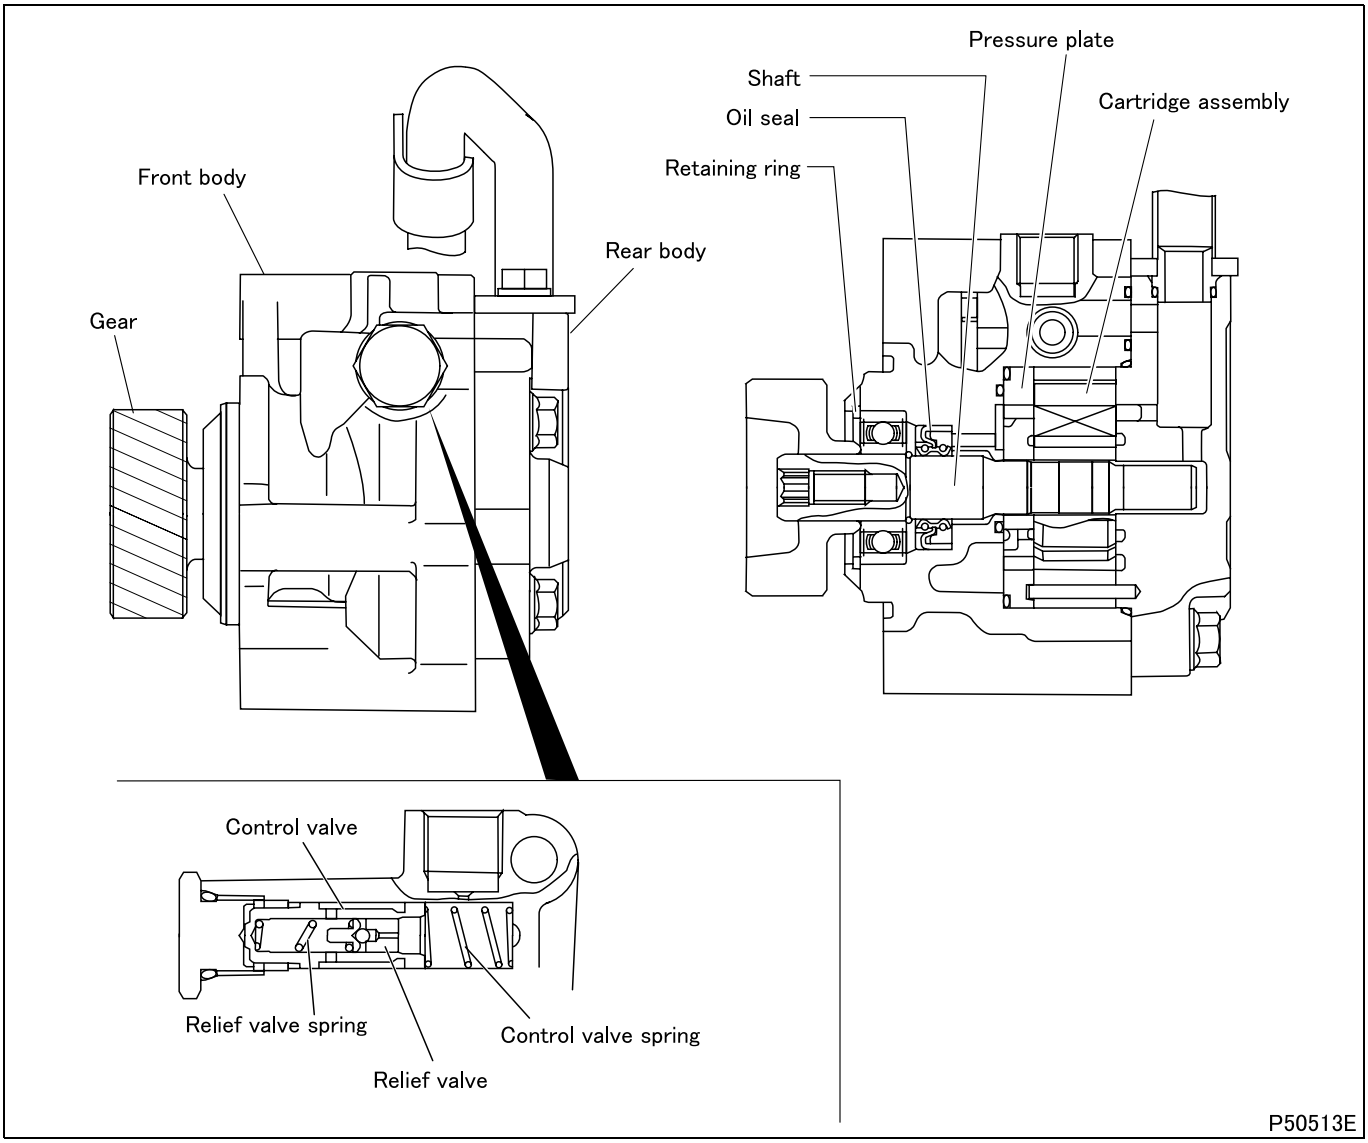
- Oil pressure in the chamber A overcomes the combined force of oil pressure in the chamber B and tension of the flow control spring, and the flow control valve is shifted.
- Port is made open to release oil pressure, and the flow rate from the chamber C is maintained constant.



(2) Operation of relief valve

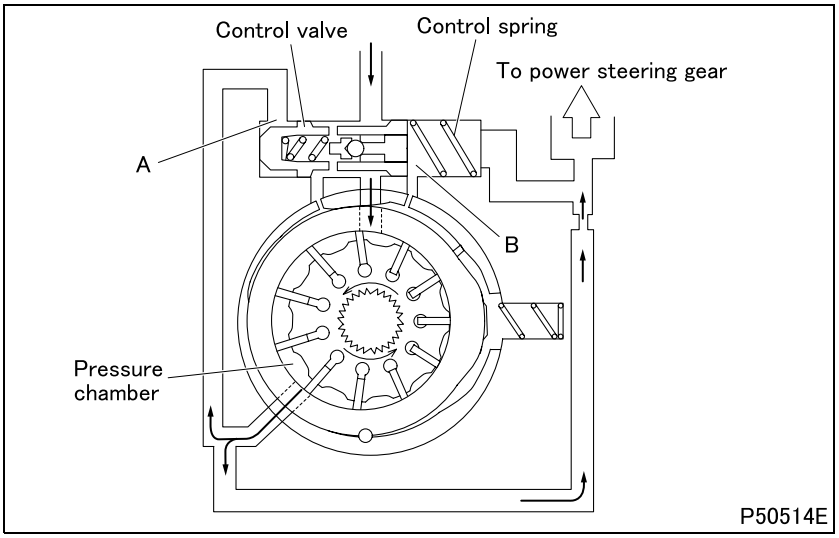
- When the combined force of oil pressure in the chamber B and tension of the flow control spring overcomes oil pressure in the chamber A, the flow control valve is shifted. Further increased oil pressure in the chamber B pushes the relief valve to open port, thus preventing excessive oil pressure from going to the chamber C.

5. Power Steering Oil Pump <Unisia JKC Steering Systems Product>



- The power steering oil pump is a hydraulic source pump with the vane in the rotor groove and is geared to the engine.
- The power steering oil pump consists of a cartridge assembly that discharges oil, a control valve that control the oil flow rate and a relief valve that prevents free oil pressure rise.
- The control valve maintains constant the quantity of oil to the power steering gear during steering wheel manipulation. The relief valve is provided in the control valve to prevent oil pump pressure from rising beyond necessary level during stationary swing operation.

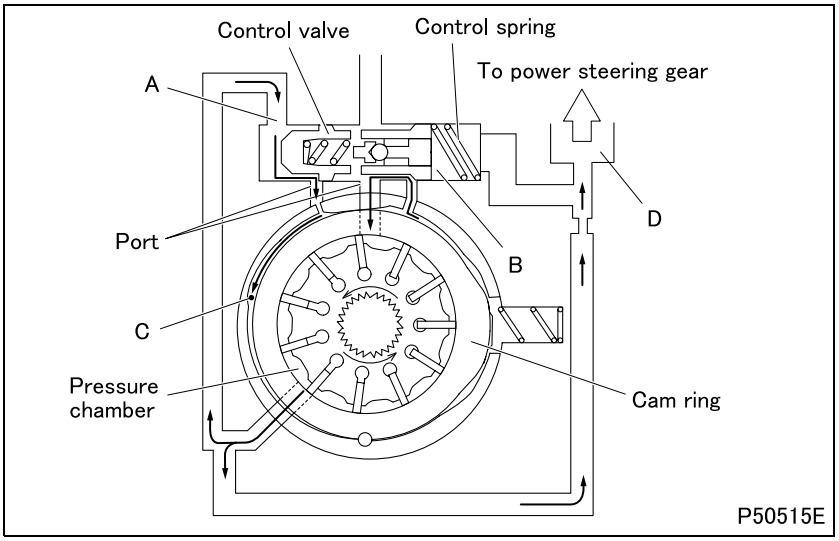
5.1 Control valve



(1) Operation of control valve

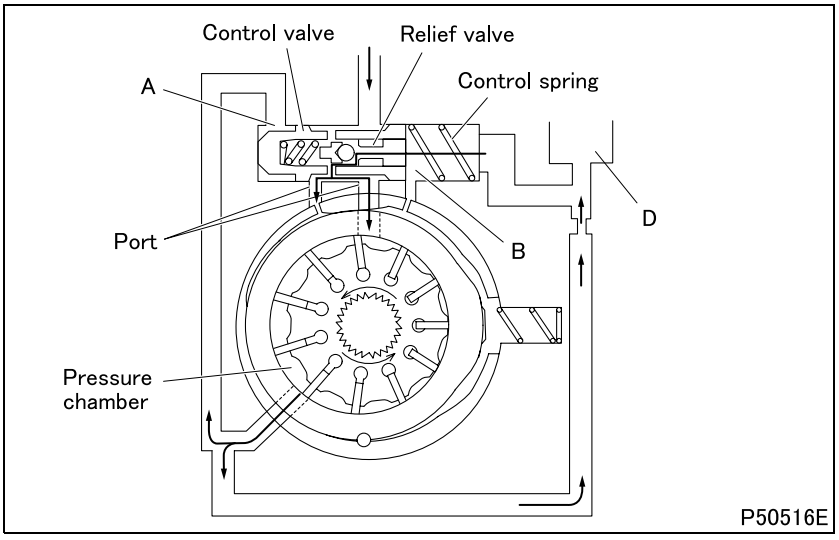
(1.1) When not functioning (oil pump in operation at low speed)

- Oil pressure in the chamber A is weaker than the combined force of oil pressure in the chamber B and tension of the control spring, and the control valve remains stationary.



(1.2) When functioning (oil pump in operation at medium to high speeds)

- Oil pressure in the chamber A overcomes the combined force of oil pressure in the chamber B and tension of the control spring, and shifts the control valve.
- Port is made open to release oil pressure in the chamber A into the chamber C, and the cam ring is shifted to right.
- This reduces the pressure chamber in capacity to decrease oil pump output per revolution, thus maintaining constant the flow rate from the chamber D.



(2) Operation of relief valve

- The combined force of oil pressure in the chamber B and tension of the control spring overcomes oil pressure in the chamber A, and the control valve is shifted.
  Increased oil pressure in the chamber B pushes the relief valve to open port, thus preventing excessive oil pressure from going to the chamber D.

Possible causes \ Symptoms		Steering wheel heavy to operate	Steering wheel play excessive and unstable	Steering wheel pulled to one side	Steering wheel vibration	Steering wheel return not smooth	Steering wheel does not turn	Steering angle insufficient or different between right and left	Oil leakage	Oil pump oil pressure abnormal	Noise from oil pump (grinding)	Noise from oil pump (squeaking)	Noise from oil pump (low whirring)	Reference Gr

ON-VEHICLE INSPECTION AND ADJUSTMENT

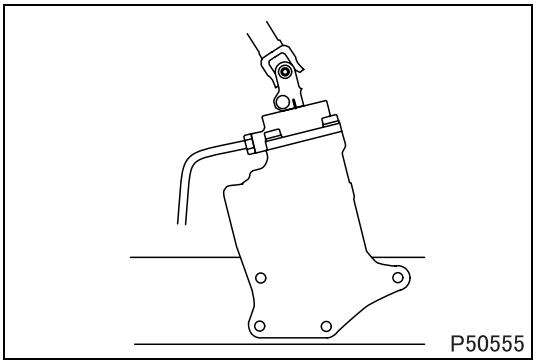
1. Change of Power Steering Fluid

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
–	Feed pipe and return pipe	11.8 to 17.6 {8.7 to 13, 1.2 to 1.8}	–

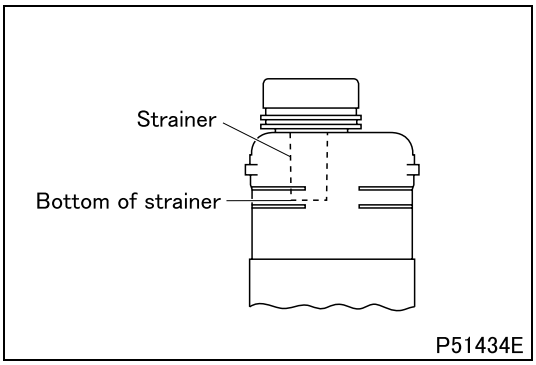
Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
–	Power steering oil tank	Automatic transmission fluid (DEXRON, DEXRON II or DEXRON III type)	Between MIN and MAX of power steering oil tank



(1) Draining

- Jack up the front wheels.
- Clean the port areas of feed and return pipes to prevent ingress of dirt, dust, and other foreign matters inside the power steering gear.
- Loosen feed and return pipes connected to the power steering gear.
- Repeatedly turn the steering wheel fully left and right to drain the fluid from the power steering gear.
- After draining the fluid, tighten the feed and return pipes to specified torque.



(2) Filling

- Pour fluid into the power steering oil tank up to the bottom of the strainer.

CAUTION ⚠

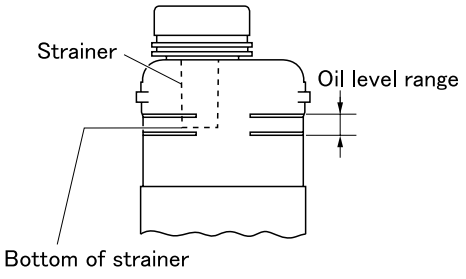
- **Power steering fluid is used for brake booster (hydraulic booster). Therefore, do not supply any other oil than power steering fluid such as brake fluid to the oil tank. <Hydraulic booster>**

- Bleed the power steering system of air.

2. Bleeding of Power Steering System

Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
–	Power steering oil tank	Automatic transmission fluid (DEXRON, DEXRON II or DEXRON III type)	Between MIN and MAX of power steering oil tank



P50444E

- Pour fluid to the power steering oil tank up to the bottom of the strainer.

CAUTION ⚠

- **Power steering fluid is used for brake booster (hydraulic booster). Therefore, do not supply any other oil than power steering fluid such as brake fluid to the oil tank. <Hydraulic booster>**

- With the engine stopped, jack up the front wheels.
- Repeatedly turn the steering wheel fully left and right. When the fluid level has dropped, add fluid enough to maintain the fluid level within the specified range.
- Start the engine to idle.
- When the fluid level has dropped, stop the engine and add fluid enough to maintain the fluid level within the specified range.
- Restart the engine. While checking for a drop in fluid level, turn the steering wheel fully left and right and add fluid as much as necessary. Repeat this practice until the fluid level is stabilized within the specified range.
- Fully press the brake pedal (with a foot force of approximately 250 N {55 lbs., 25 kgf or more}) a few times. Repeat this until the fluid level is stabilized within the specified range. (In this case, there is no need to operate the steering wheel.) <Hydraulic booster>
- Turn the steering wheel fully left and right repeatedly.

CAUTION ⚠

- **To avoid seizure of the power steering oil pump, do not keep the steering wheel turned fully to left or right for more than 10 seconds when the engine is running.**

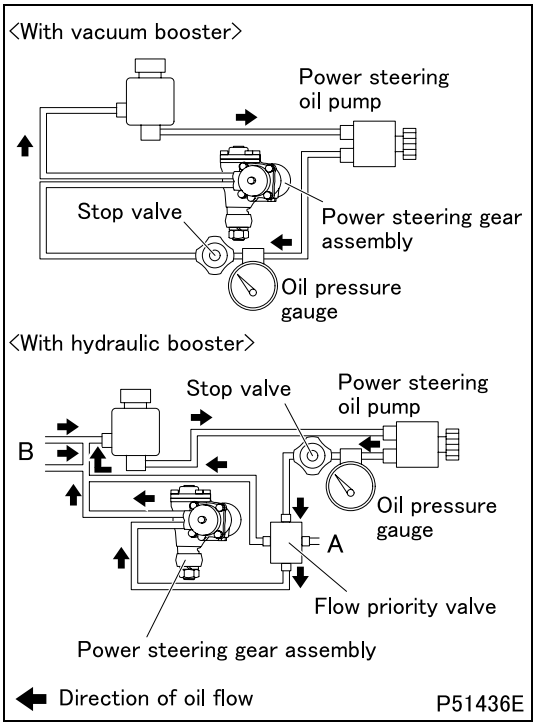
- If there is any abnormal noise or a fluid level fluctuation, air should be still trapped in the power steering system. Turn the steering wheel several times to raise the fluid temperature to approximately 60 to 80°C {140 to 175°F}.
- Stop the engine and wait for approximately five minutes.
- Lower the front wheels and turn the steering wheel several times. If there is no noise or fluid level fluctuation, the bleeding of the power steering system is completed.
- With the engine stopped, press the brake pedal several times and bleed the brake booster (hydraulic booster) by means of emergency pump. <Hydraulic booster>
- Repeat starting and stopping the engine several times to remove small air bubbles left in the power steering oil tank.
- If air bubbles are not removed completely, drive the vehicle for a while, then check for abnormal noise and oil level fluctuation.
- When bleeding is finished, check that fluid in the power steering oil tank is within the specified level range. Also check pipe and hose connections for fluid leaks.
- After bleeding is finished, check the brake booster (hydraulic booster) for performance (input and output characteristics). <Hydraulic booster>

3. Performance Verification Test of Power Steering System

Service standards

Location	Maintenance item		Standard value	Limit	Remedy
–	Power steering system fluid pressure (with hands off steering wheel)	With vacuum booster	490 kPa {71 psi, 5.0 kgf/cm^2} or less	–	Repair *
		With hydraulic booster	980 kPa {140 psi, 10.0 kgf/cm^2} or less	–	
–	Relief set pressure	With vacuum booster	$10.8\ ^{+0.20}_{-0.49}$ MPa {$1560\ ^{+29}_{-71}$ psi, $110\ ^{+2}_{-5}$ kgf/cm^2}	–	Replace
		With hydraulic booster	$12.3\ ^{0}_{-0.49}$ MPa {$1780\ ^{0.0}_{-71}$ psi, $125\ ^{0}_{-5}$ kgf/cm^2}	–	

*: Check the power steering gear assembly and hydraulic circuit for clogging.



- Perform the tests with the following measuring conditions to verify normal operation of the power steering gear assembly and power steering oil pump.
  A: To hydraulic booster
  B: From hydraulic booster

- Install oil pressure gauge capable of measuring upward of 13.2 MPa {1910 psi,135 kgf/cm^2} and stop valve between power steering oil pump and power steering gear assembly <With vacuum booster> or flow priority valve <With hydraulic booster>, then bleed air.
- Start engine to idle.
- Turn steering wheel left and right several times to raise fluid temperature up to 50 to 60°C {122 to 140°F}.
- With the engine idling, fully open stop valve.

CAUTION ⚠

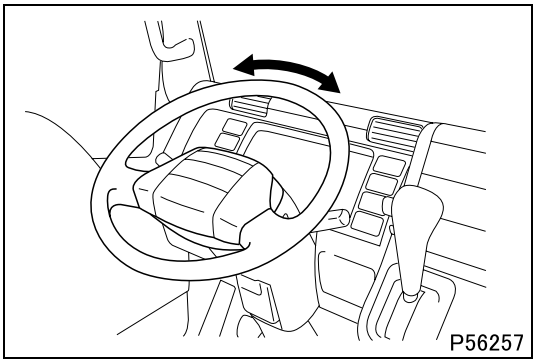
- **To avoid seizure of the power steering oil pump, never close the stop valve for more than 10 seconds.**

Test item	Test procedure	Judging standard
Verification of smooth operation	• Jack up front wheels and turn steering wheel fully left and right.	Smooth operation throughout test
Measurement of fluid pressure in power steering system	• Measure fluid pressure with hands off steering wheel.	Specified standard value
Measurement of relief set pressure	• Gradually increase engine speed to 1000 to 1500 rpm, then close stop valve and measure maximum fluid pressure. • Do not close stop valve for longer than 10 seconds.	Specified standard value

4. Steering Wheel Play

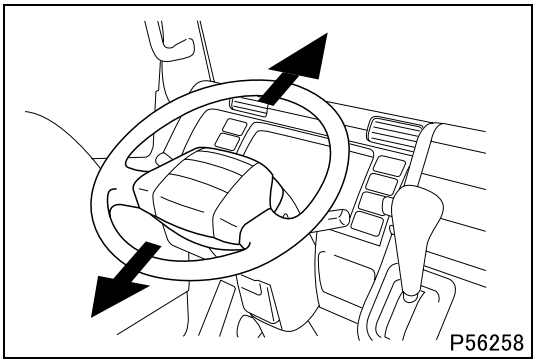
Service standards (Unit: mm {in.})

Location	Maintenance item	Standard value	Limit	Remedy
–	Steering wheel play (measure at the periphery of steering wheel)	5 to 50 {0.2 to 2.0}	–	Adjust



- With vehicle placed straight forward, start the engine and gently turn the steering wheel left and right to measure its peripheral play.
- If the play deviates from the standard value, check tightening points and the power steering gear.

5. Steering Column Looseness

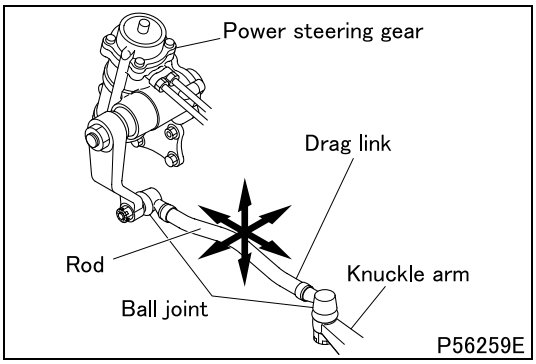


- Push and pull the steering wheel by hand to check the steering column for looseness.
- With the steering column tilted all the way forward, pull the steering wheel backward and check the steering column for looseness.
- If the steering column is loose, adjust the tilting and telescoping lever.

6. Inspection of Drag Link Ball Joint

Service standards (Unit: mm {in.})

Location	Maintenance item	Standard value	Limit	Remedy
–	Play of drag link ball joint	0	–	Replace



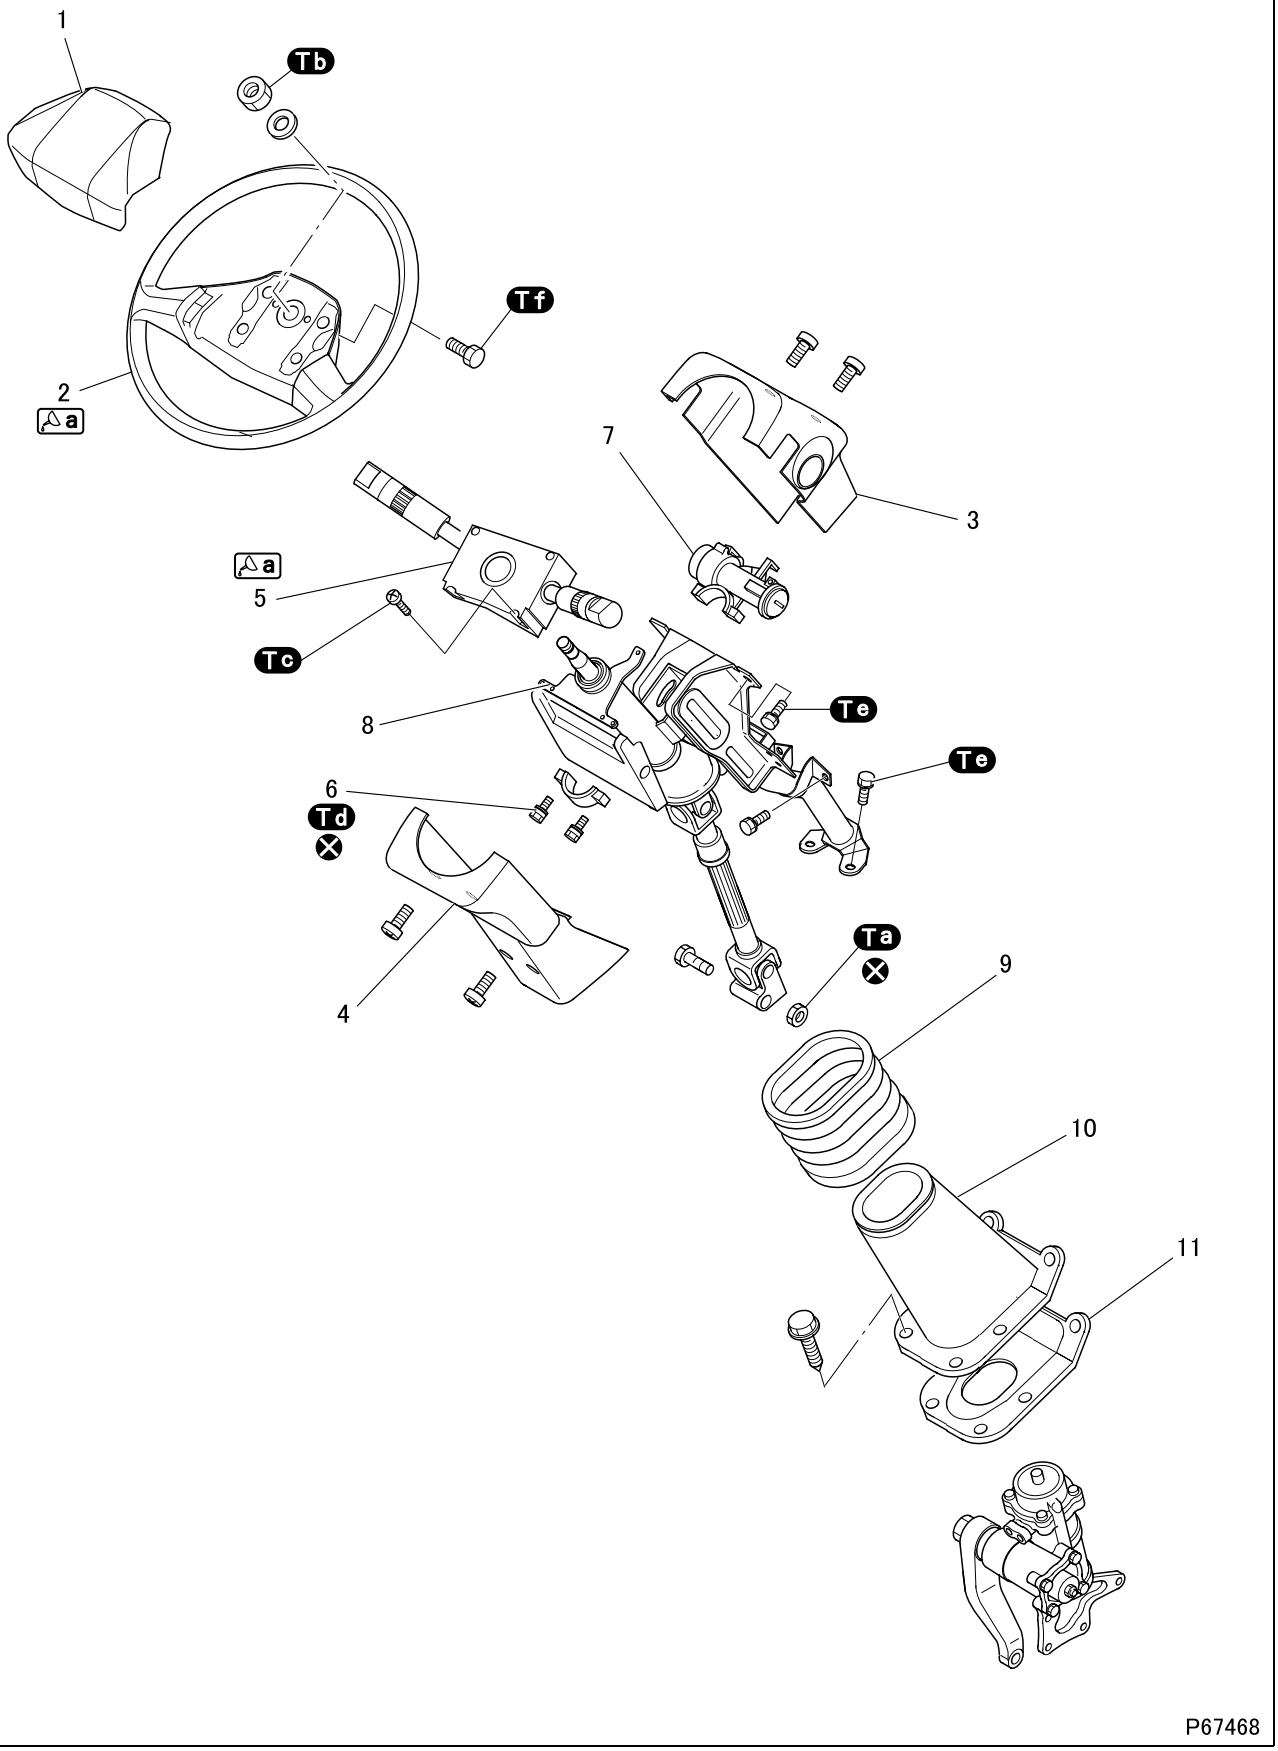
(1) Play of drag link ball joint

- With the vehicle in the stationary state, move the drag link by the rod in the forward, backward, vertical and lateral directions of the vehicle and check for play at the ball joints with the gear power steering gear and knuckle arm.
- If feeling play with your hand, replace the drag link.

(2) Dust cover

- Check the dust cover for wear, cracks and other damage.
- If there is any abnormality, replace the drag link.

STEERING COLUMN



● **Removal sequence**

1 Horn pad
2 Steering wheel
3 Front column cover
4 Rear column cover
5 Combination switch
6 Twist-off bolt
7 Starter switch
8 Steering column
(For details, see later pages.)
9 Dust cover
10 Dust cover
11 Dust cover

⊗: Non-reusable parts

● **Installation sequence**

Follow the removal sequence in reverse.

- After installation, check the steering column for looseness. (See ON-VEHICLE INSPECTION AND ADJUSTMENT.)

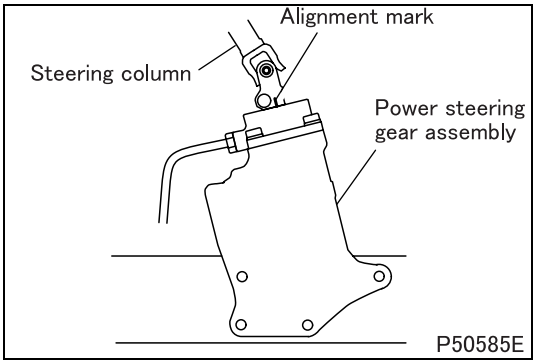
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Nut (steering column and power steering gear mounting)	22 to 31 {16 to 23, 2.2 to 3.2}	–
Tb	Nut (steering wheel mounting)	39 to 49 {29 to 36, 4.0 to 5.0}	–
Tc	Screw (combination switch mounting)	2.5 ± 0.5 {1.8 ± 0.4, 0.3 ± 0.1}	–
Td	Twist-off bolt (starter switch mounting)	14.2 ± 1.5 {10 ± 1.1, 1.4 ± 0.2}	–
Te	Bolt (steering column assembly mounting)	17 to 25 {12 to 19, 1.7 to 2.6}	–
Tf	Bolt (horn pad mounting)	7 to 11 {5.2 to 8.1, 0.7 to 1.1}	–

Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Contact ring under steering wheel	Wheel bearing grease [NLGI No. 2 (Li soap)]	As required
	Horn contact piece on combination switch side		

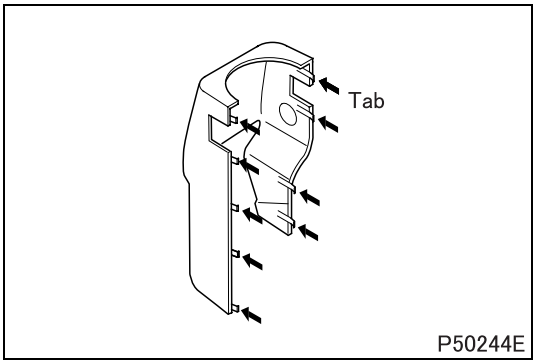
◆Work before removal◆



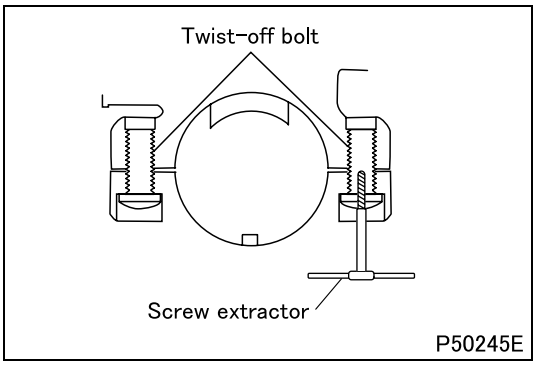
■ **Alignment mark: Steering column and power steering gear assembly**

- Provide alignment marks on the steering column and power steering gear assembly.

◆Removal procedure◆

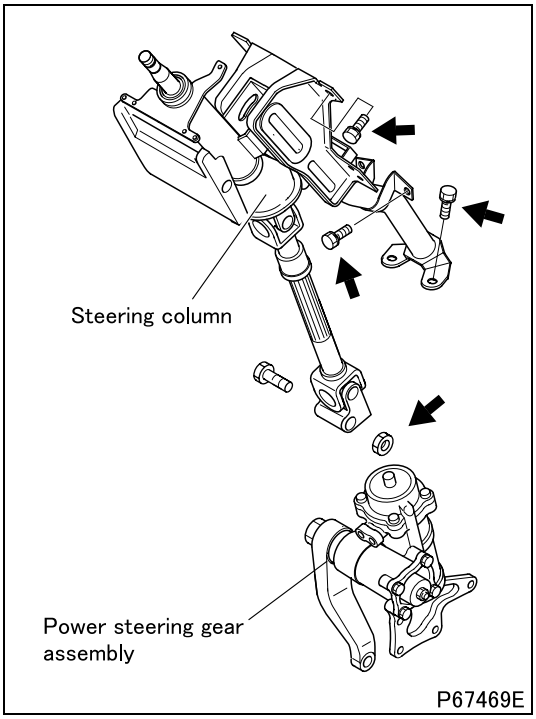


■ **Removal: Front column cover**



■ **Removal: Starter switch**

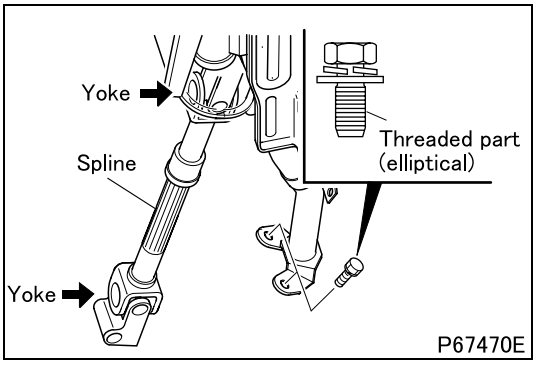
- Drill a hole of 5.5 to 6 mm {0.22 to 0.24 in.} in diameter to a depth of 10 to 15 mm {0.39 to 0.59 in.} in the twist-off bolt.
- Using the drilled hole, screw the screw extractor counterclockwise into the twist-off bolt and remove it.



■ **Removal: Steering column**

- To remove the steering column, remove the nut connecting it to the power steering gear, in addition to mounting bolts in the cab.

◆Installation procedure◆

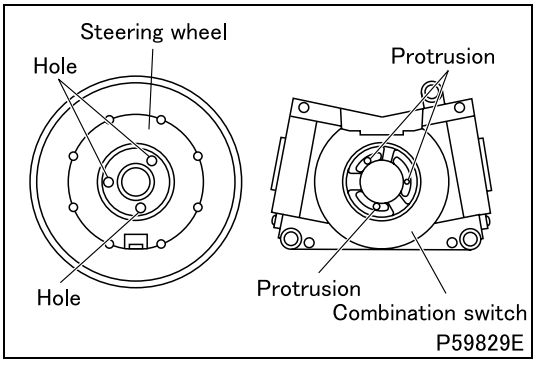


■ **Installation: Steering column**

- If the spline is off the steering column, assemble them with the yokes facing in the same direction.
- Install the steering column using the illustrated bolts. The threaded portion of these bolts is elliptical for grounding the horn circuit properly.

■ **Installation: Starter switch**

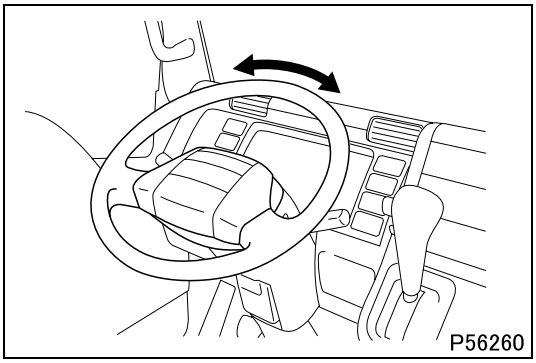
- Install the starter switch using new twist-off bolts. Tighten the bolts to specified torque to snap off their heads.



■ **Installation: Steering wheel**

- Align the three holes of the steering wheel with three protrusions of the cancel cam on the combination switch to attach the steering wheel.

◆Inspection after installation◆



■ **Inspection: Noise from steering wheel**

- Lightly turn the steering wheel left and right and check for noise and other abnormalities.
- If any abnormality is found, disassemble the steering wheel, remove the cause and reinstall.

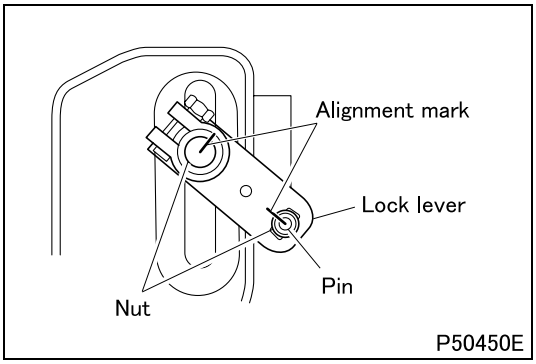
	Staked area of link plate		
	Friction surface and thread of bolt		
	Friction surface of spacer		
	Friction surfaces of steering column support and steering column		
	Friction surface of bolt		

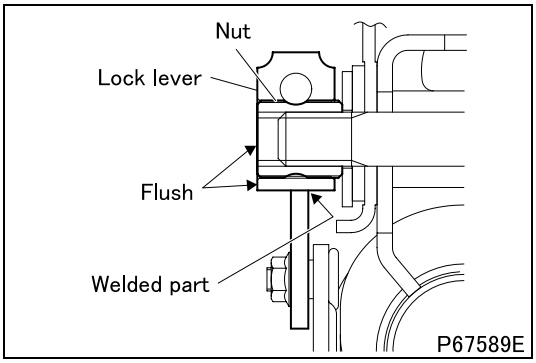
◆**Work before removal**◆



■ **Alignment mark: Nut and lock lever**

- Be sure to provide alignment marks on the lock lever and nuts before removal.

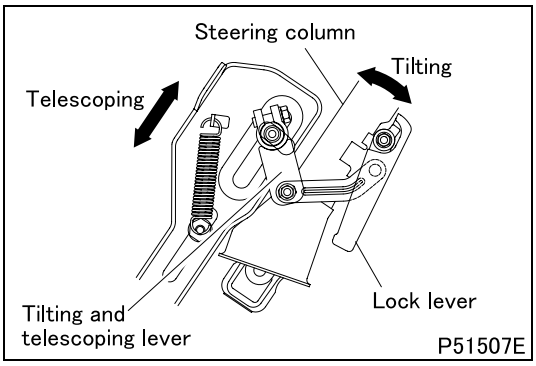
◆Installation procedure◆



■ **Installation: Lock lever**

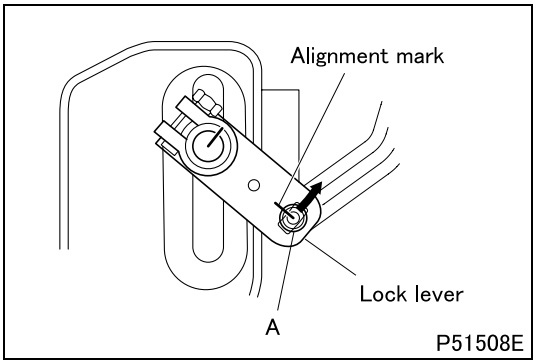
- Install the lock lever flush with the nut, with the welded part facing in the illustrated direction.

◆Inspection after installation◆



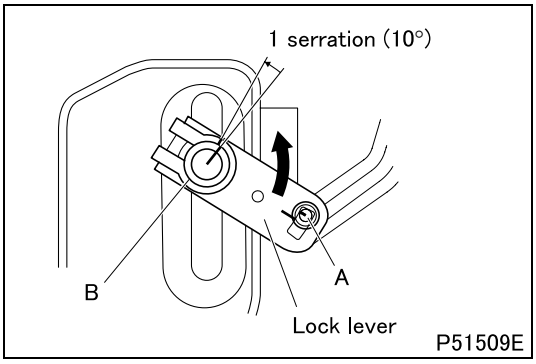
■ **Inspection: Tilting and telescoping lever operating force**

- Tilt the steering column all the way forward and telescope it to the mid-point of the movable range.
- Push the tilting and telescoping lever in and lock the steering column. In this state, check that the force required to operate the tilting and telescoping lever is 140 N {31 lbs, 14 kgf} or more.
- Push the steering column forward by hand to check that it is securely held.
- Adjust the installed position of the lock lever if necessary.



■ **Adjustment: Lock lever**

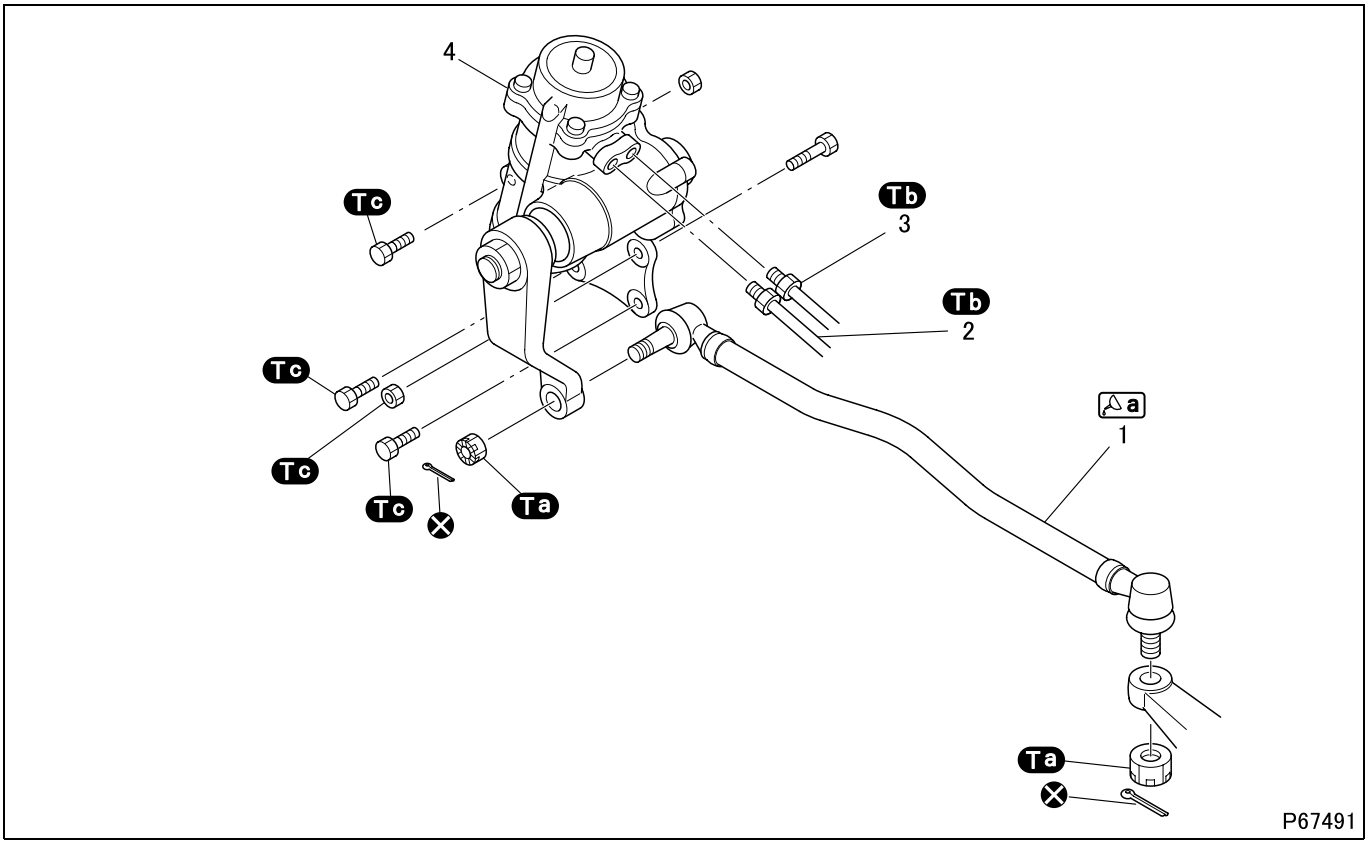
- Loosen nut A.
- Move the lock lever to relocate the nut A in the slot from the alignment mark in the arrow direction, then tighten the nut A in that position.



- If the nut A is already at the end of the slot in the lock lever and cannot be relocated, remove the lock lever and turn the nut B one serration (10°) from the alignment mark in the arrow direction, then reinstall the lock lever.
- Adjust the tightening position of the nut A so that the tilting and telescoping lever operating force becomes 140 N {31 lbs, 14 kgf} or more.

M E M O

POWER STEERING GEAR ASSEMBLY AND DRAG LINK



● **Removal sequence**

1 Drag link
2 Feed pipe
3 Return pipe
4 Power steering gear assembly

⊗: Non-reusable parts

CAUTION ⚠

- **When removing the drag link, take care not to deform or damage the dust cover.**

- Do not attempt to disassemble the drag link because it is of a unit construction.

● **Installation sequence**

Follow the removal sequence in reverse.

Service standards

Location	Maintenance item		Standard value	Limit	Remedy
1	Ball joint of drag link	Play (± 980 N {220 lbs ± 100 kgf} loaded)	0 to 0.15 {0 to 0.0059}	–	Replace
		Rotation torque	1.0 to 5.9 N·m {0.1 to 4.4 ft.lbs, 0.1 to 0.6 kgf·m}	–	

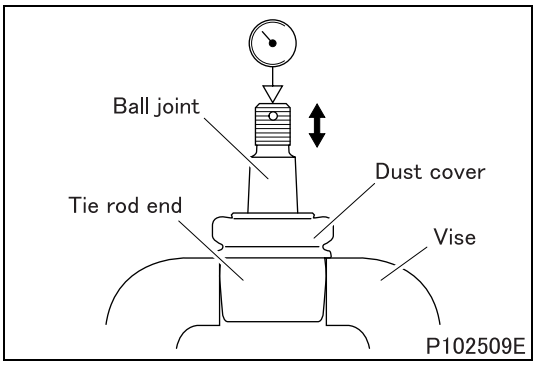
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Nut (drag link mounting)	137 to 196 {100 to 145, 14 to 20}	–
Tb	Feed pipe and return pipe	11.8 to 17.6 {8.7 to 13, 1.2 to 1.8}	–
Tc	Bolt or nut (power steering gear mounting)	83.5 to 108 {61 to 80, 8.5 to 11}	–

Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Lip area of drag link ball joint dust cover	Wheel bearing grease [NLGI No. 2 (Li soap)]	As required

◆Inspection procedure◆



■ **Inspection: Drag link**

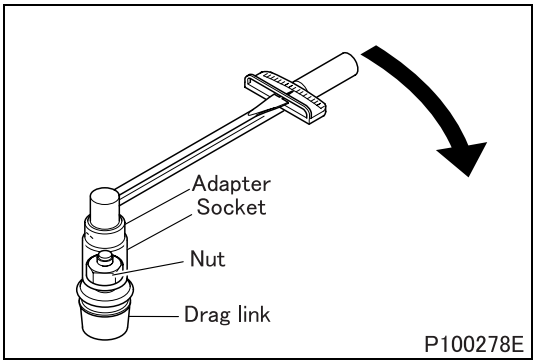
(1) Play

- Fix the tie drag link with a vise.

CAUTION ⚠

- **Take care not to deform or damage the dust cover when fixing it with a vise.**

- If measured value deviates from the standard value with applying the specified load (push and pull) to the ball joint, replace the tie drag link.



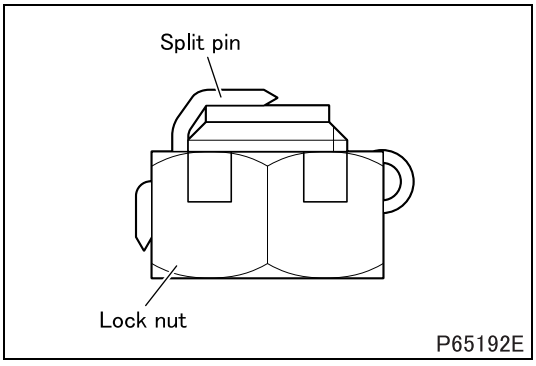
(2) Rotation torque

- Install the drag link mounting nut on the drag link.
- Install the socket, adapter and torque wrench to measure the rotation torque.
- If the measured value deviates from the standard value, replace the drag link.

(3) Dust cover

- Check the dust cover for wear, cracks and other damage. These abnormalities may cause water infiltration to the ball joint and wear out it at early stage.
- If any abnormality is found in the dust cover, replace the drag link.

◆Installation procedure◆



■ **Installation: Drag link**

- Align a slot in the lock nut with the split pin hole in the ball joint by turning the lock nut in the tightening direction while checking the torque is within the specified range, then install the split pin as shown in the illustration.

*: Unisia JKC Steering Systems part numbers

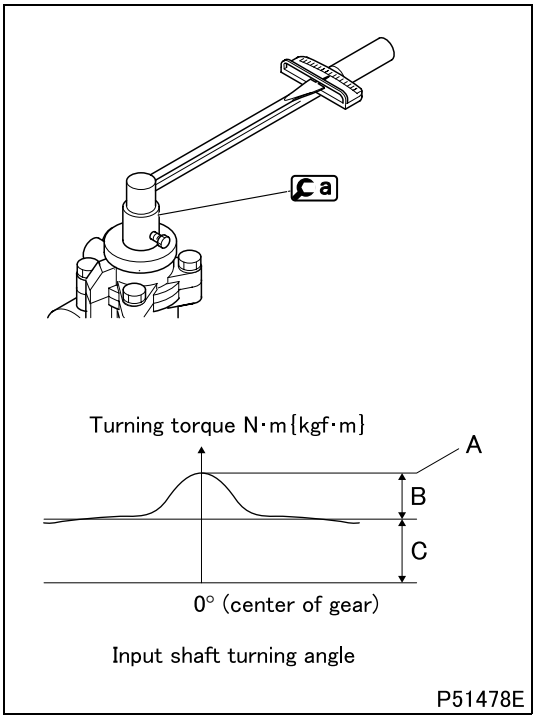
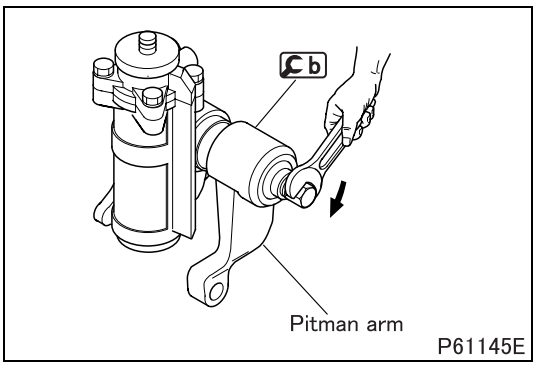
◆Inspection before removal◆



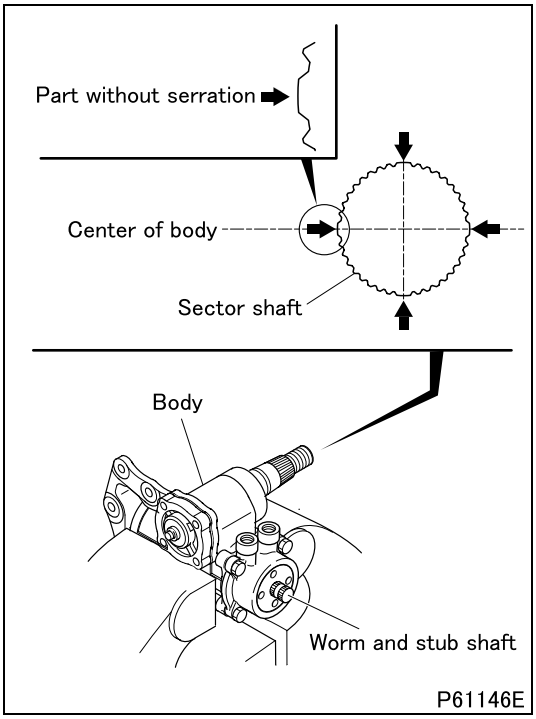
■ **Inspection: Starting torque**

- Using a, measure the starting torque of the power steering gear assembly for reference at the time of reassembly before removal.
  - A: Starting torque (= engagement torque + normal turning torque)
  - B: Engagement torque
  - C: Normal turning torque

◆Removal procedure◆

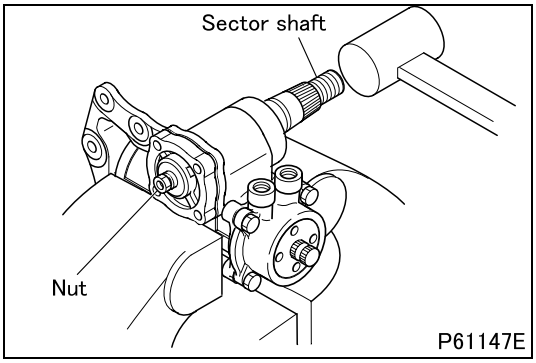


■ **Removal: Pitman arm**

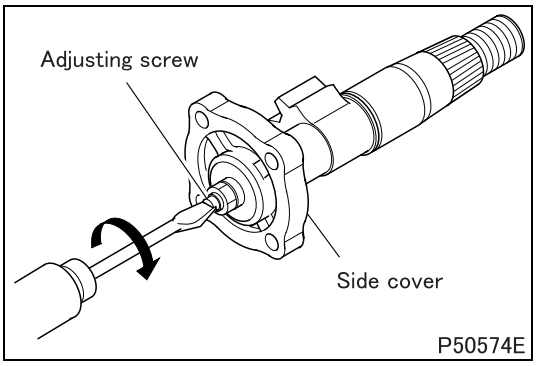


■ **Removal: Sector shaft**

- Before removing, set the sector shaft in neutral position as follows.
- Turn the worm and stub shaft counterclockwise into the lock position, then back it up roughly 2.6 turns to bring the serration missing part of the serrated portion of the sector shaft into parallelism with the center of the body as shown.

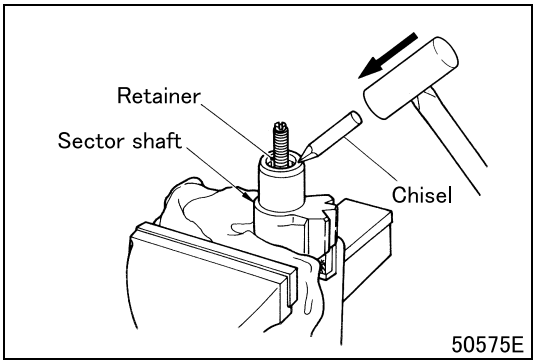


- Loosen nut, and remove the sector shaft by tapping the shaft end with a plastic hammer.
- If the sector shaft is stuck, it should be out of neutral position. In such a case, do not attempt to force it out by hammering but redo the neutral positioning procedure.



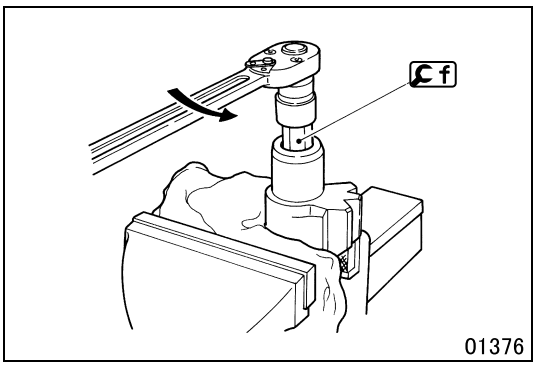
■ **Removal: Side cover**

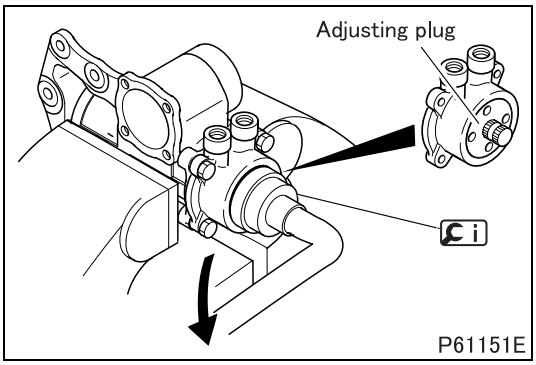
- Remove the side cover by screwing in the adjusting screw.



■ **Removal: Retainer**

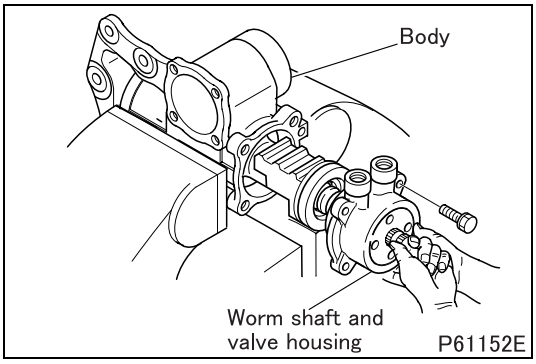
- Undo the crimp of the retainer (at 2 points) using a chisel.
- When holding the sector shaft with a vise, be sure to cover it with a cloth or the like for protection.





■ **Removal: Worm shaft and valve housing**

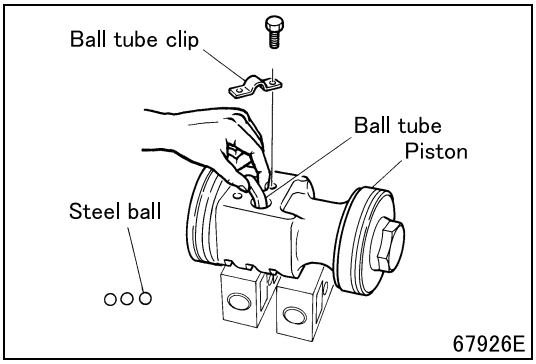
- Before removing the worm shaft and valve housing, turn back the adjusting plug by roughly 180° with i.
- Do not remove the adjusting plug. If it is removed, the bearing in the valve housing may pop out.



- Remove the worm shaft and valve housing from the body.

CAUTION ⚠

- **Take care so that balls in the worm shaft and valve housing do not pop out.**
- **Take care not to scratch or otherwise damage the inner surface of the body and piston.**

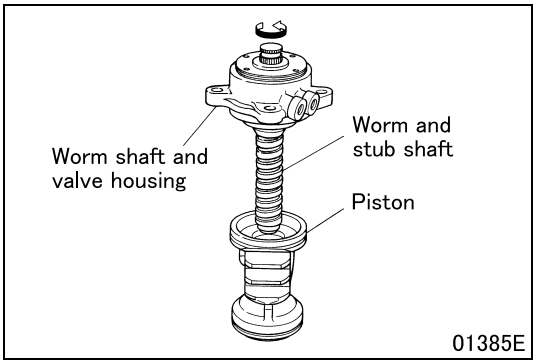


■ **Removal: Ball tube and steel ball**

- First remove steel balls from the piston, then remove ball tube clip. Hold the ball tube between fingers and remove it from the piston moving it lightly.

CAUTION ⚠

- **Be careful not to lose the steel balls (28 pieces in all).**

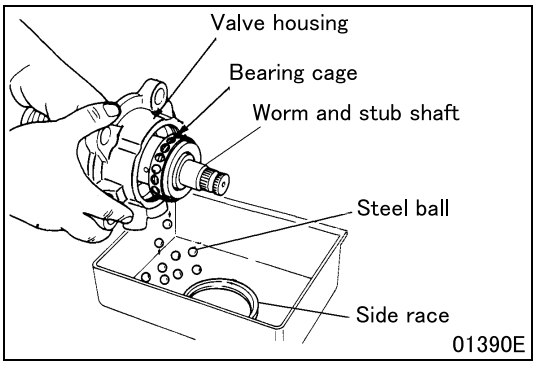


■ **Removal: Piston**

- Holding the worm shaft and valve housing with the piston downward, turn the worm and stub shaft and remove the piston.

CAUTION ⚠

- **Be careful not to tilt the piston during removal. If it is tilted, steel balls will fall off the race of the piston and worm and stub shaft into the piston.**



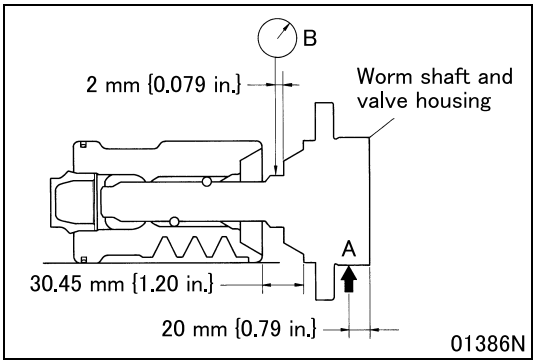
■ **Removal: Worm and stub shaft**

- Remove the worm and stub shaft by pushing its piston-side end out.

CAUTION ⚠

- **Use a suitable receptacle not to lose the side race, steel balls and bearing cage that fall off in separated pieces.**

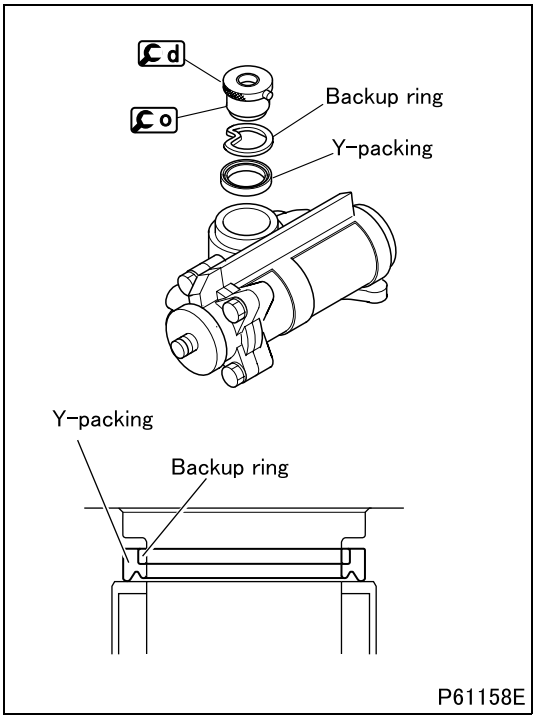
◆Inspection procedure◆



■ **Inspection: Side play of piston and worm and stub shaft**

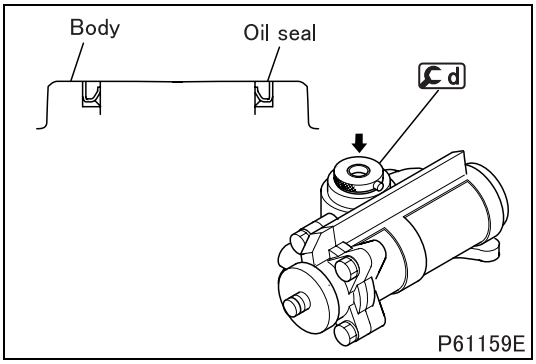
- Apply a force of 49 N {11 lbs, 5.0 kgf} to the illustrated point A and measure play B (play in the diametric direction) of the worm shaft and valve housing.
- If the measurement exceeds the limit, replace the faulty parts.

◆Installation procedure◆



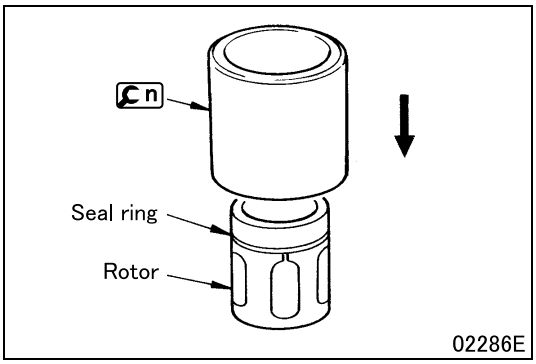
■ **Installation: Backup ring and Y-packing**

- Fill grease in the groove of Y-packing and install Y-packing in the illustrated direction.
- Install backup ring, formed as shown, using d and o.



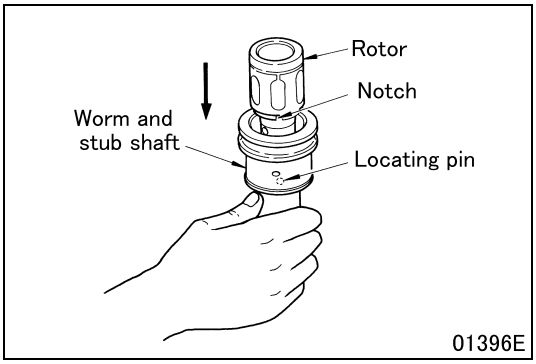
■ **Installation: Oil seal**

- Install the oil seal to the body in the illustrated direction.



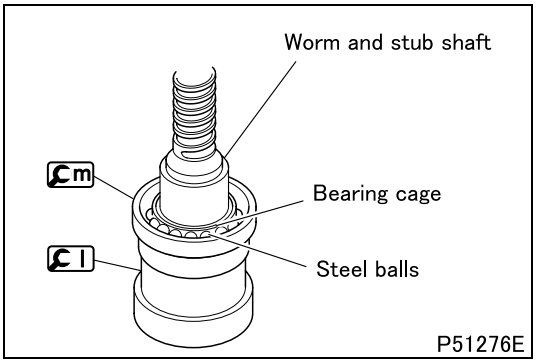
■ **Installation: Seal ring**

- Install the seal ring onto the rotor.
- Form the seal ring to fit the rotor using n.



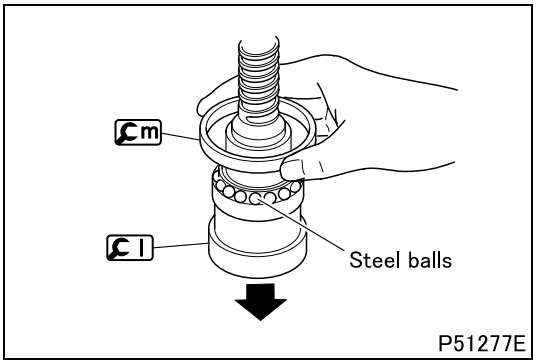
■ **Installation: Rotor**

- Install the rotor aligning its notch with the locating pin of the worm and stub shaft.

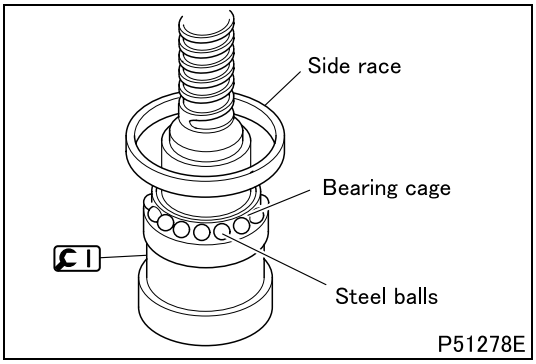


■ **Installation: Side race, steel balls and bearing cage**

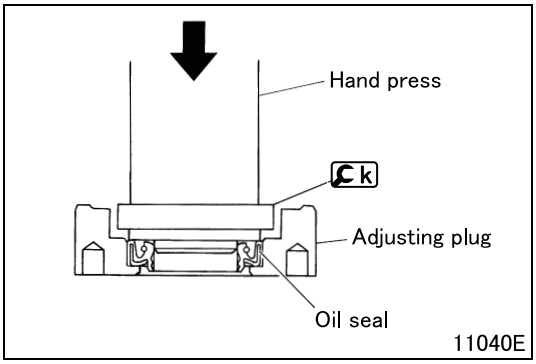
- Using [l] and [m] assembled, install the worm and stub shaft in the illustrated direction.
- Install the bearing cage and steel balls onto the worm and stub shaft.



- Holding [m] with hand, slide [l] downward to have steel balls set in place.

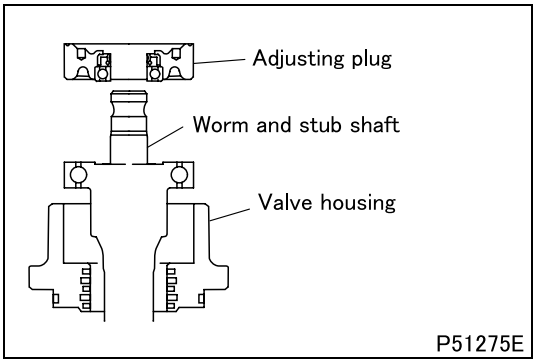


- Install the side race onto the steel balls and bearing cage.



■ **Installation: Oil seal**

- Using k, press oil seal in the illustrated direction into the adjusting plug.

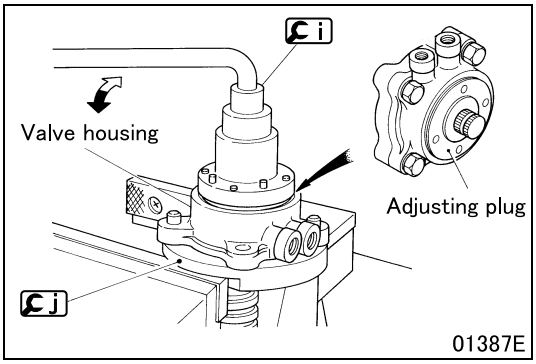


■ **Installation: Worm and stub shaft**

- Install the valve housing onto the worm and stub shaft and secure it in place with adjusting plug.

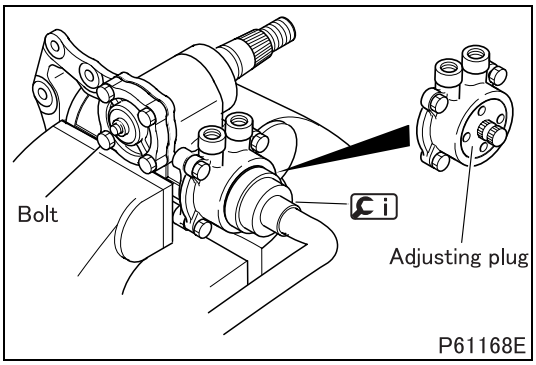
CAUTION ⚠

- **Take care not to damage the seal rings with the ball race of the worm and stub shaft.**

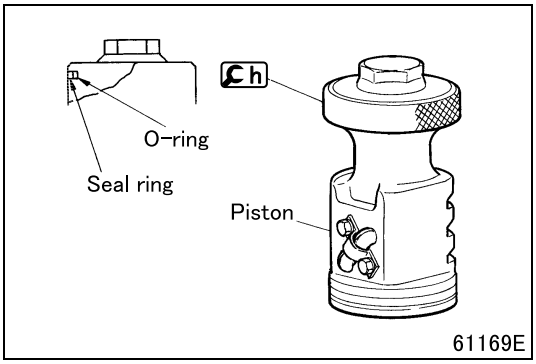


■ **Installation: Adjusting plug**

- Hold j with a vise and secure the valve housing to it.
- Tighten the adjusting plug to the specified torque using i, then back it up by approximately 180°.

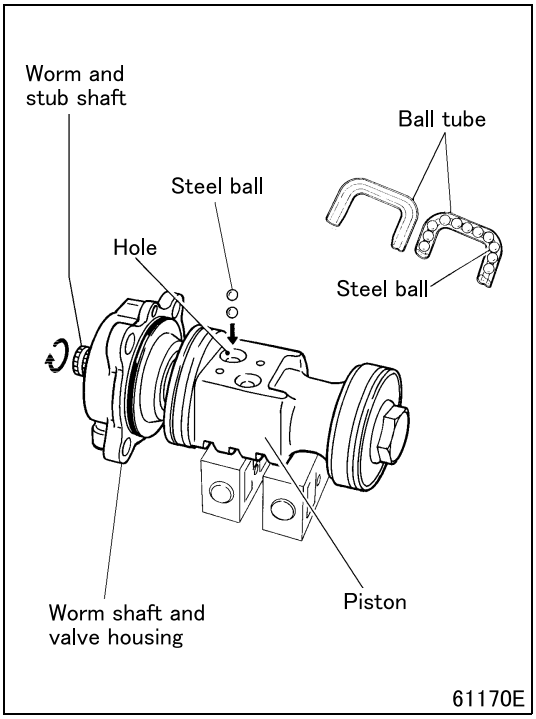


- Tighten bolt to the specified torque, then retighten the adjusting plug using i.



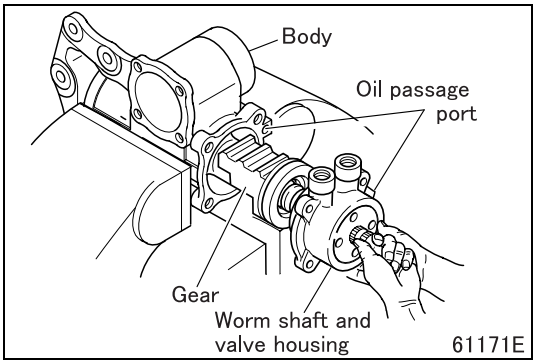
■ **Installation: Seal ring and O-ring**

- Install seal ring and O-ring in the outer surface grooves of the piston, and form the seal ring to fit in place using Ch.



■ **Installation: Ball tube**

- Pack grease in one half of the ball tube, place 10 to 11 steel balls in it and put the other half upon it.
- Place the piston on a flat workbench, align the positions of the worm shaft and valve housing and piston ball race, then while turning the worn and stub shaft, let steel balls fall from the ball tube hole.
- Do not draw out the worm shaft and valve housing until its end passes over the ball tube hole during installation. Otherwise the steel balls will come out of the ball race.

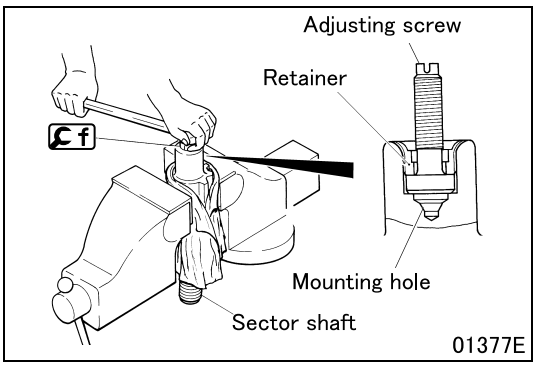


■ **Installation: Worm shaft and valve housing**

- Position the gear toothed portion of the worm shaft and valve housing in the illustrated direction so that it engages with the sector shaft.
- Install the worm shaft and valve housing to the body, lightly holding it with hand so that its gear portion does not turn out of position. When installing, align the oil passage ports of the worm shaft and valve housing and body.

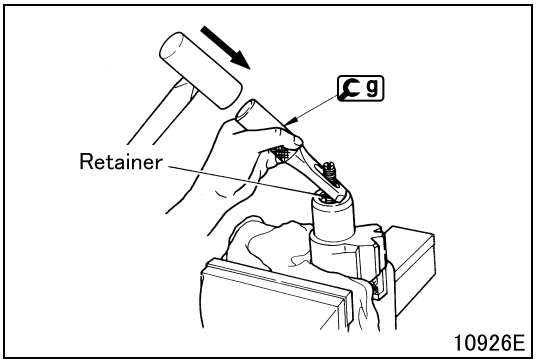
CAUTION ⚠

- **Be careful not to damage the seal ring on the piston and the inner surface of the body.**

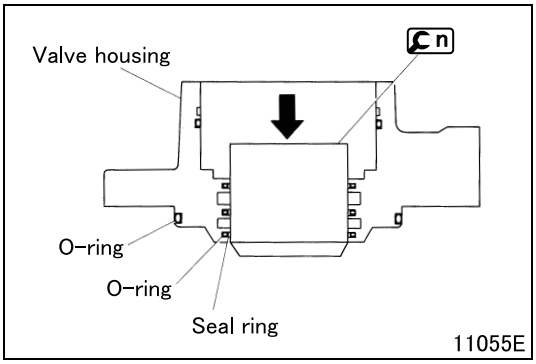


■ **Installation: Retainer**

- Pack grease in the adjusting screw mounting hole on the sector shaft.
- Install the adjusting screw into the sector shaft.
- Using f, tighten the retainer into place in the sector shaft.
- Back up the retainer by 180°, retighten it to a torque of 39 N·m {29 ft.lbs, 4 kgf·m}, then back it up again by 20°.
- Check that the adjusting screw turns smoothly.

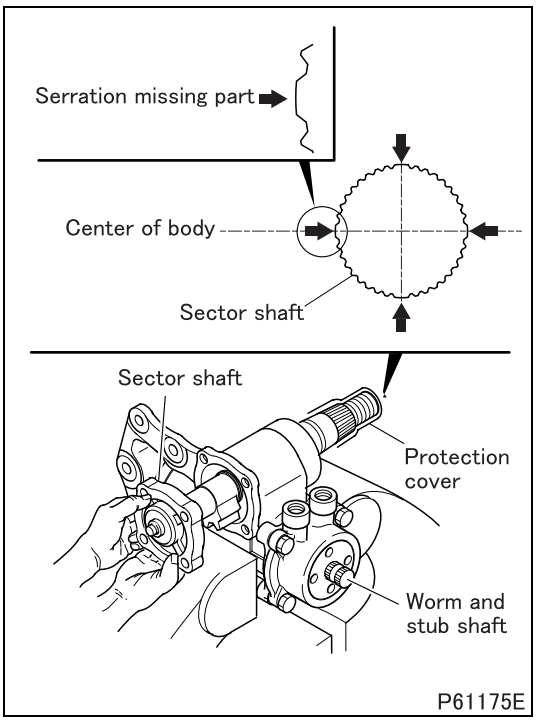


- Using g, crimp the retainer at two places.



■ **Installation: Seal ring and O-rings**

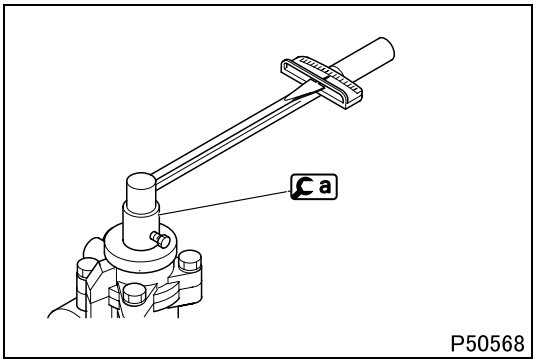
- Install seal ring and O-rings to the valve housing.
- Form seal ring to fit the valve housing using n.



■ **Installation: Sector shaft**

- Set the sector shaft in the neutral position and install it into the body.
- When installing the sector shaft, cover up its threaded end and serration portions for protection.
- Turn the worm and stub shaft to check that it makes roughly five turns lock to lock.
- If the number of turns is less, check engagement of the worm and stub shaft with the sector shaft, and correct if necessary.

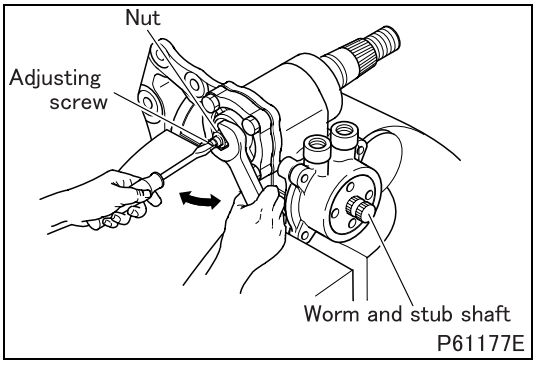
◆Adjustment after installation◆



■ **Inspection: Starting torque**

[Inspection]

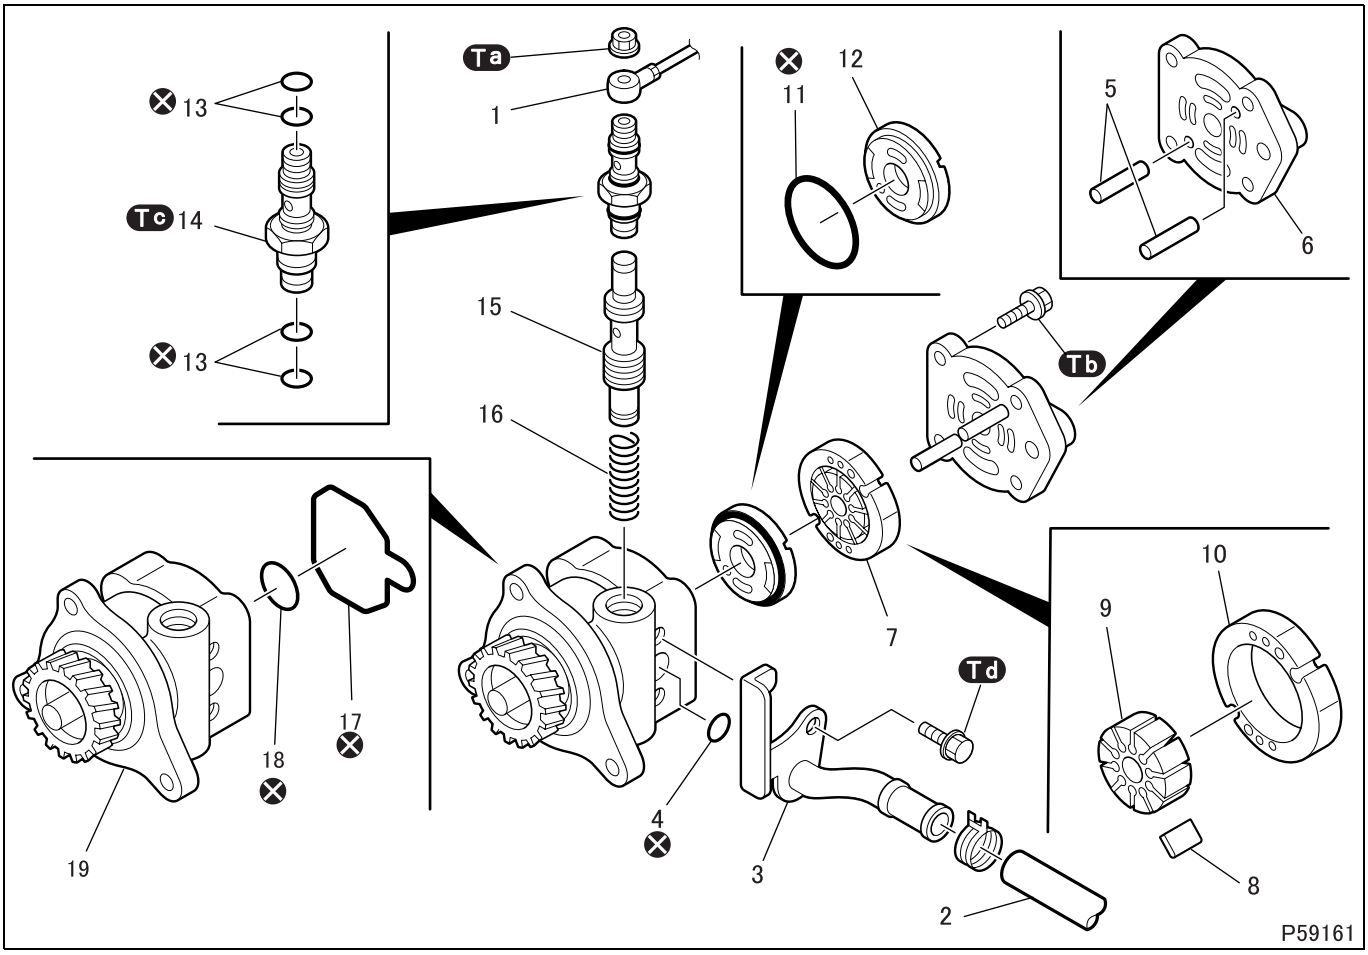
- Using a, measure the starting torque of the power steering gear assembly in the same manner as the measurement before removal. If the measurement deviates from the standard value, adjust the power steering gear assembly for proper starting torque or replace.



[Adjustment]

- Loosen nut.
- Rotating the worm and stub shaft approximately 1/4 turns left and right, make adjustment for proper starting torque with the adjusting screw.

POWER STEERING OIL PUMP <KYB Product>



● **Disassembly sequence**

1 Pipe
2 Hose
3 Suction connector
4 O-ring
5 Pin
6 Cover
7 Cartridge assembly
8 Vane
9 Rotor
10 Cam ring

13 O-ring
14 Connector
15 Flow control valve
16 Flow control spring
17 O-ring
18 O-ring
19 Body

⊗: Non-reusable parts

- Do not attempt to disassemble the flow control valve and body because they are of unit construction.
- See Gr11 for removal and installation of the power steering oil pump.

● **Assembly sequence**

Follow the disassembly sequence in reverse.

Repair kit: Seal repair kit

Service standards (Unit: mm {in.})

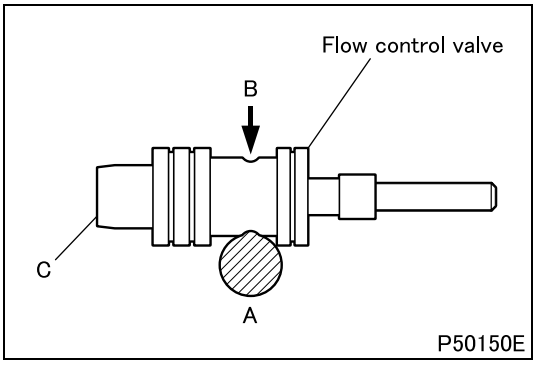
Location	Maintenance item	Standard value	Limit	Remedy
6	Stepped wear on rotor and vane contact surfaces of cover	–	0.05 {0.0020}	Replace*
8, 9	Clearance between vane and rotor	0.01 {0.00039}	0.06 {0.0024}	Replace
12	Stepped wear on rotor and vane contact surfaces of side plate	–	0.05 {0.0020}	Replace*
15, 19	Clearance between flow control valve and body	0.01 to 0.02 {0.00039 to 0.00079}	0.03 {0.0012}	Replace*
16	Free length of flow control spring	36.5 {1.44}	33.5 {1.32}	Replace

*: Replace the power steering oil pump.

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Nut (pipe mounting)	29.4 to 39.2 {22 to 29, 3 to 4}	–
Tb	Bolt (cover mounting)	18 to 22 {13 to 16, 1.8 to 2.2}	–
Tc	Connector	49 to 69 {36 to 51, 5.0 to 7.0}	–
Td	Bolt (suction connector mounting)	7.8 to 11.8 {5.8 to 8.7, 0.8 to 1.2}	–

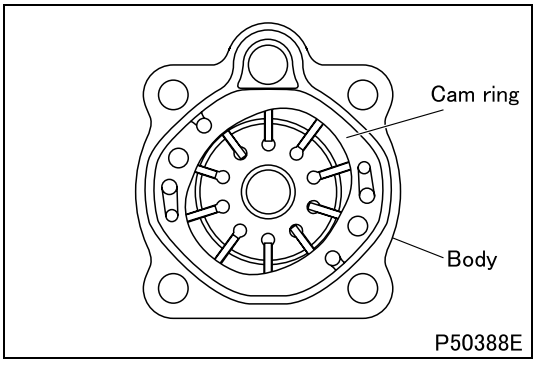
◆Inspection procedure◆



■ Inspection: Flow control valve

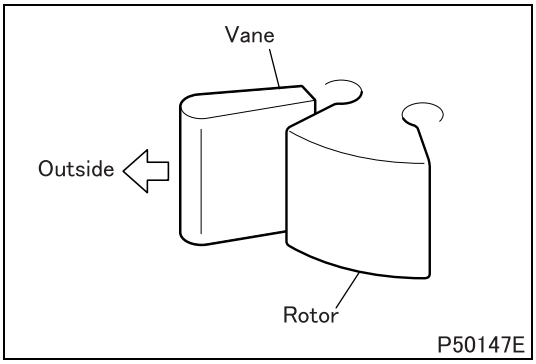
- Cover port A of the flow control valve with a finger.
- Apply air pressure (390 to 490 kPa {57 to 71 psi, 4.0 to 5.0 kgf/cm^2}) to port B.
- Check for a leak of air from port C.
- If there is an air leakage, replace the power steering oil pump.

◆Installation procedure◆



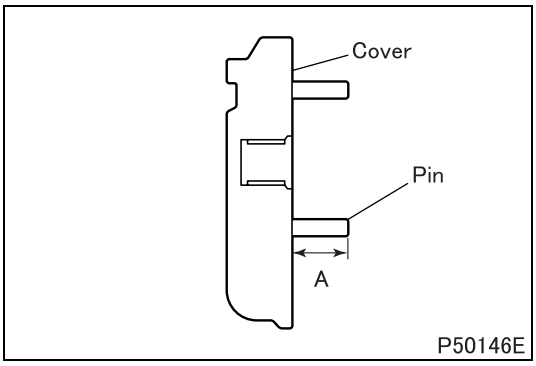
■ Installation: Cam ring

- Install the cam ring in the illustrated direction to the body.



■ **Installation: Vane**

- Fit the vane into the rotor, with its round edge facing toward outside.



■ **Installation: Pin**

- Fit the pins into the cover so that they protrude to the illustrated length A from the cover.
  A: 18.1 mm {0.71 in.}

28 Front body

⊗: Non-reusable parts

CAUTION ⚠

- **If the cartridge assembly is difficult to disassemble, do not attempt to pry it out but heat the side surface of the front body with a dryer.**

- Do not attempt to disassemble the control valve and front body because they are of unit construction.
- See Gr11 for removal and installation of the power steering oil pump.

● Assembly sequence

Follow the disassembly sequence in reverse.

Repair kit: Repair kit

Service standards (Unit: mm {in.})

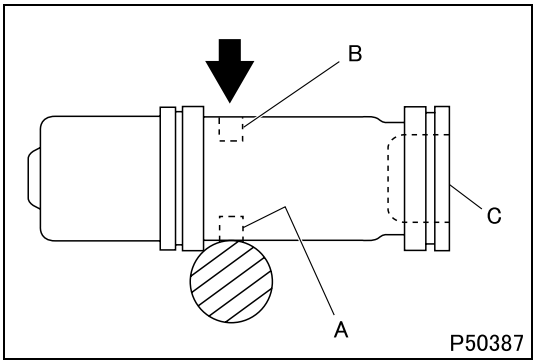
Location	Maintenance item	Standard value	Limit	Remedy
8	Free length of spring	24 {0.94}	23 {0.91}	Replace
11, 28	Clearance between control valve and front body	0.02 {0.00079}	0.03 {0.0012}	Replace*
12	Free length of control valve spring	26.2 {1.03}	23.6 {0.93}	Replace
15	Stepped wear on rotor and vane contact surfaces of rear body	–	0.01 {0.00039}	Replace*
17, 18	Clearance between vane and rotor	0.02 {0.00079}	0.03 {0.0012}	Replace
23	Stepped wear on rotor and vane contact surfaces of pressure plate	–	0.01 {0.00039}	Replace*

*: Replace the power steering oil pump.

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Eyebolt (pipe mounting)	49.0 to 63.7 {36 to 47, 5.0 to 6.5}	–
Tb	Bolt (suction connector mounting)	17.7 to 24.5 {13 to 18, 1.8 to 2.5}	–
	Bolt (rear body mounting)		
Tc	Plug	29.4 to 39.2 {22 to 29, 3.0 to 4.0}	–

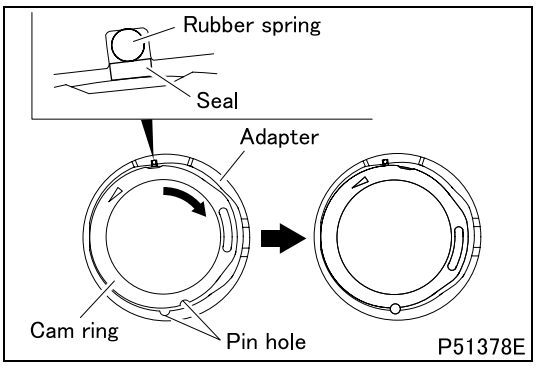
◆Inspection procedure◆



■ Inspection: Control valve

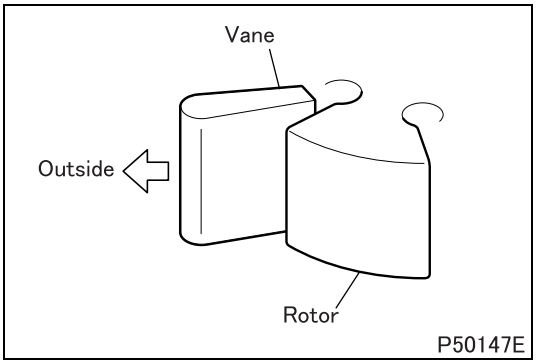
- Cover port A of the control valve with a finger.
- Apply air pressure (390 to 490 kPa {57 to 71 psi, 4.0 to 5.0 kgf/cm^2}) to port B.
- Check for a leak of air from port C.
- If there is an air leakage, replace the control valve.

◆Installation procedure◆



■ Installation: Seal and rubber spring

- Align the peripheral groove of the cam ring to the inner groove of the adapter, then fit the rubber spring (black) into the adapter and the seal (white) into the cam ring.
- Turn the cam ring clockwise to align pin holes.



■ **Installation: Vane**

- Fit the vane into the rotor, with its round edge facing toward outside.

Bumper And Frame

Table of Contents

Back

Home

MITSUBISHI FUSO TRUCK OF AMERICA, Inc.

Pub.No.TWSE0713-41

INDEX

SPECIFICATIONS 41-2

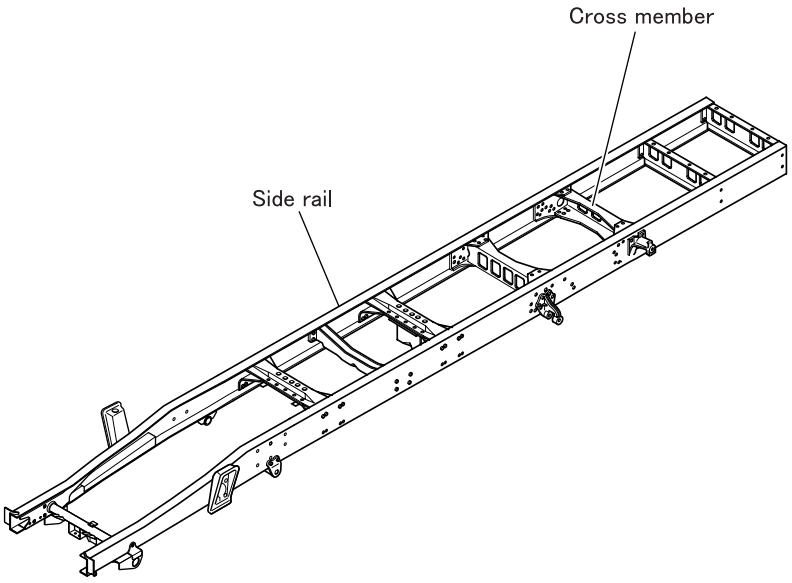
STRUCTURE AND OPERATION 41-3

FRONT BUMPER 41-4

FRAME 41-6

SPECIFICATIONS

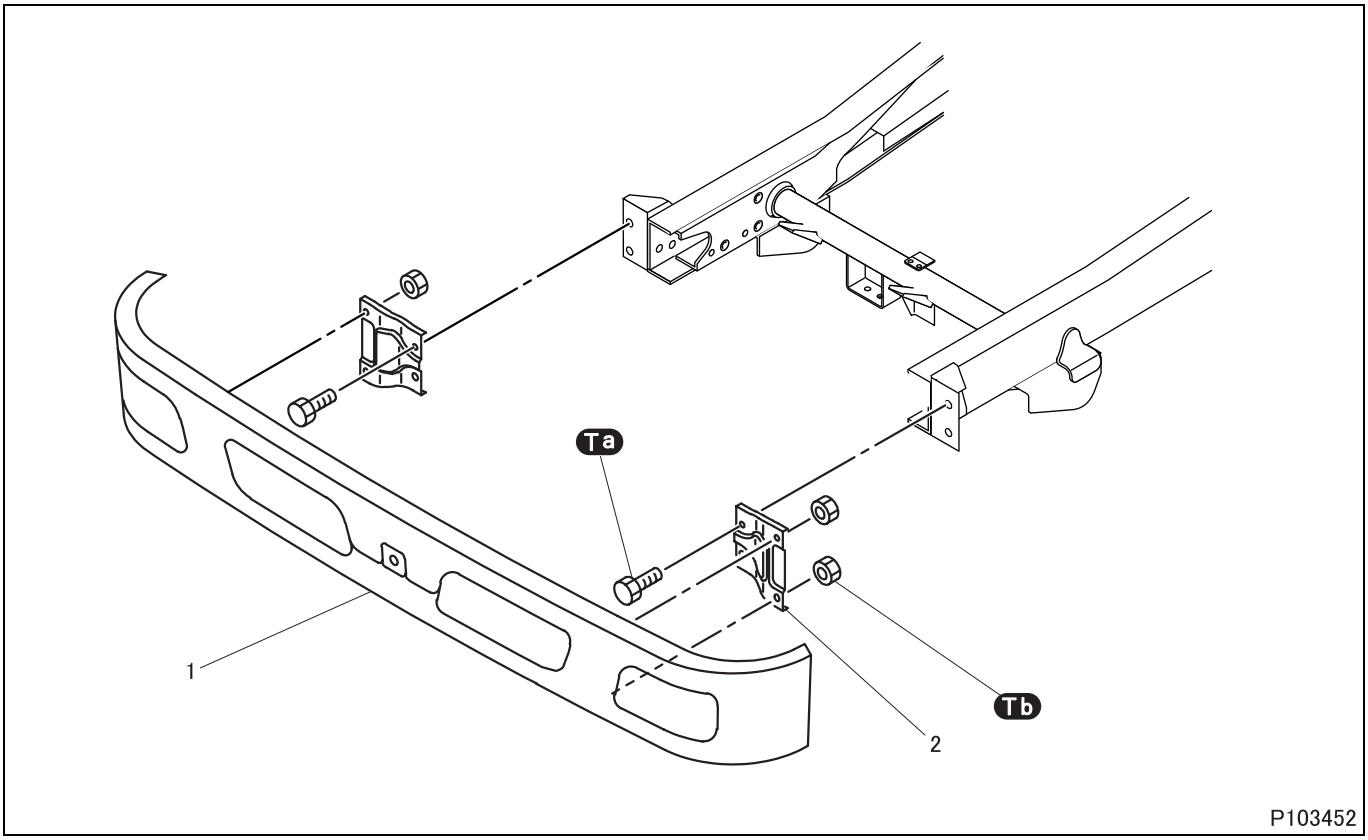
Item	Specifications	
	Except 4WD	4WD
Frame type	Ladder type	
Cross section configuration of side rail	⊐ shaped (open) channel section	



P67917E

- The frame has cross members fastened to the web of side rails (lateral linkage) so that stress on the joints is very small. This allows joint rivets to maintain tightness and ensures long-lasting high torsional stiffness.
- Unlike vertical linkage where cross members are fastened to the flange of side rails, no rivets appear on top of the frame, making the body mounting greatly easier.

FRONT BUMPER



● **Removal sequence**

1 Front bumper
2 Bumper stay

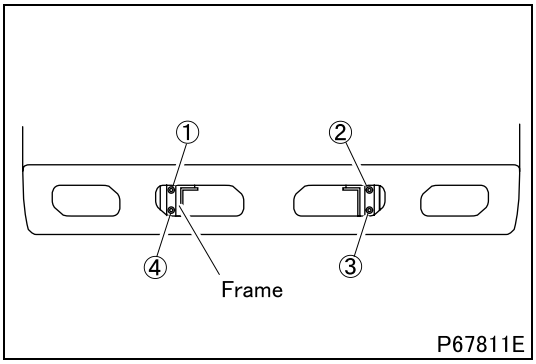
● **Installation sequence**

Follow the removal sequence in reverse.

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Bolt (bumper stay mounting)	45 to 54 {33 to 40, 4.6 to 5.5}	–
Tb	Nut (front bumper mounting)	26 to 31 {19 to 23, 2.7 to 3.2}	–

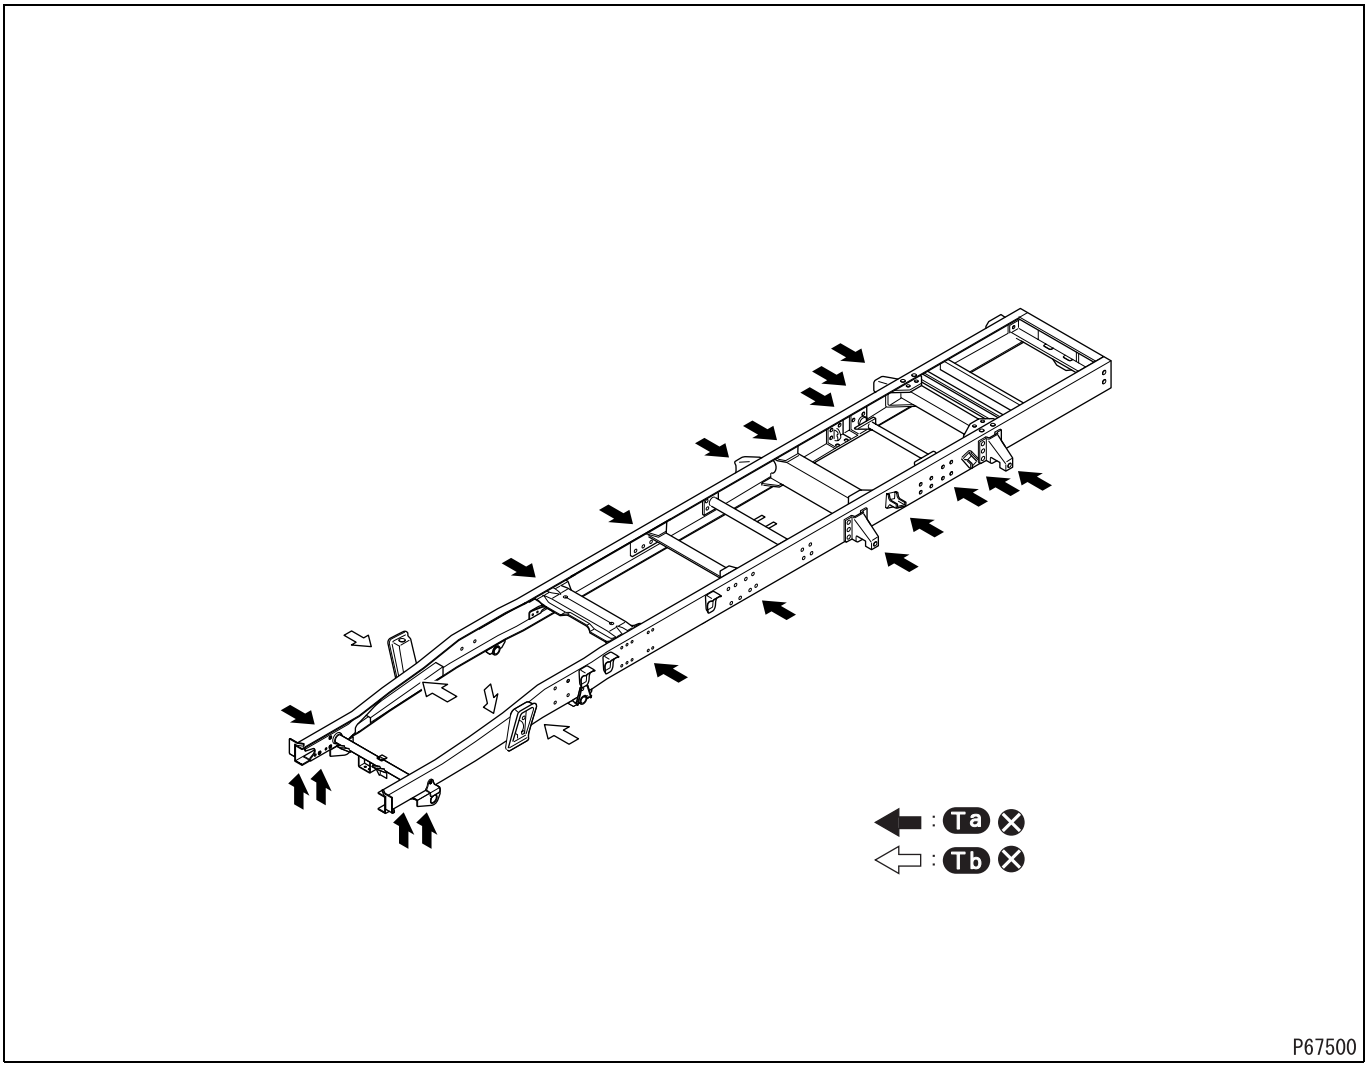
◆**Installation procedure**◆



■ **Installation: Bumper stay**

- Install the bumper stay on the frame by tightening the bolts (four places) to the specified torque in the order of the numbers (1 to 4) indicated in the illustration.

M E M O



⊗: Non-reusable parts

CAUTION ⚠

- **Since the mounting bolts and nuts are tightened by a torque-to-yield method, they must not be reused.**

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	M10 bolt or nut	60 to 80 {43 to 58, 6 to 8}	–
Tb	M12 bolt or nut	98 to 120 {72 to 87, 10 to 12}	–

◆Cleaning procedure◆

■ Cleaning: Frame

- Thoroughly remove mud, grease, rust etc. from the outer and inner surfaces of the frame.

◆Inspection procedure◆

■ Inspection: Frame

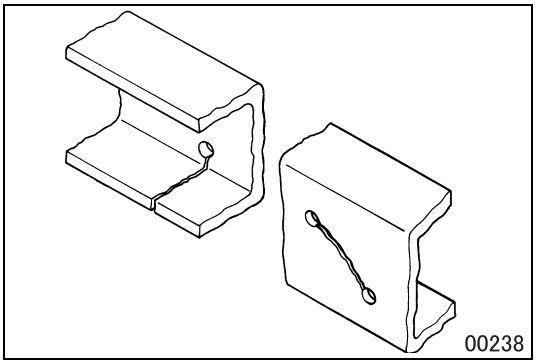
(1) Inspection for deformation

- If deformation or any other defect is found, repair the frame.

(2) Inspection for cracks

- Remove paint from suspected areas and carefully inspect exposed surfaces for cracks.
- If visual inspection is difficult, perform dye check or any other suitable examination.

  If a crack is found, repair as follows.

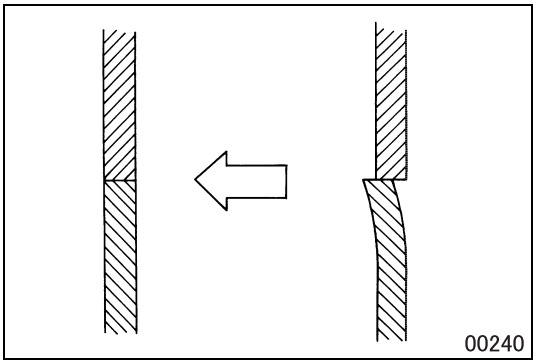


(3) Repair of crack in frame

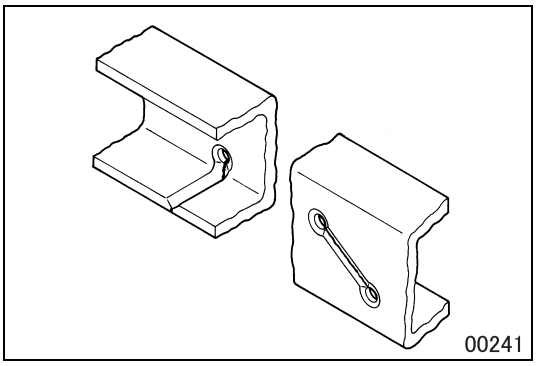
- With the vehicle unloaded, level the frame.
- Drill a hole, roughly twice the thickness of frame plate in diameter, 10 mm {0.39 in.} from the inside end of crack.

NOTE

- **If crack is within the frame plate, drill holes at both ends of the crack.**



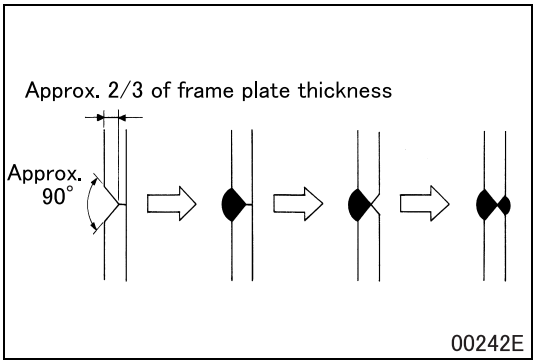
- If the edges of crack are uneven, make them even.



- Using a grinder, cut a 90° V-channel at the crack to a depth of approximately 2/3 of the frame plate thickness, then fill the channel with filler metal by welding.

CAUTION ⚠

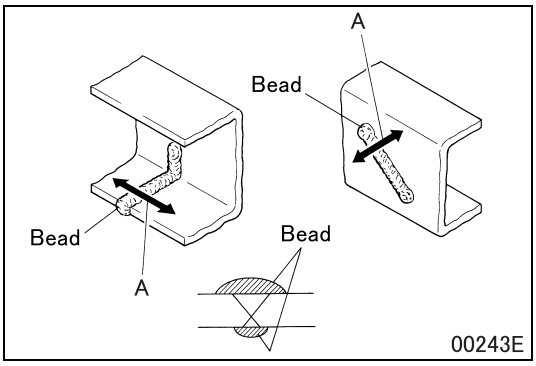
- **Avoid gas welding because heat embrittles the material of welded area. Be sure to use electric welding.**
- **Electric welding could allow the welding current to reverse through ground circuit and burn electrical components. To prevent this, be sure to disconnect negative cable from the battery and ground the welding machine at a point near the weld zone before work.**
- **For electric welding, follow other precautions given elsewhere.**
- **If there are any combustibles, such as pipeline, wiring harness, rubber part and fuel tank, near the weld zone, be sure to cover them for protection.**
- **Use low-hydrogen type coated CO_2 and arc welding electrodes for welding and check that there are not harmful defects such as undercut and blow hole after welding.**
- **Preheat the area around weld zone to approximately 50 to 350°C {120 to 660°F} before welding when the workshop temperature is below 0°C {32°F}.**
- **Be sure to protect mountings that may be affected by heat, such as main sills, using heat insulators or the like.**



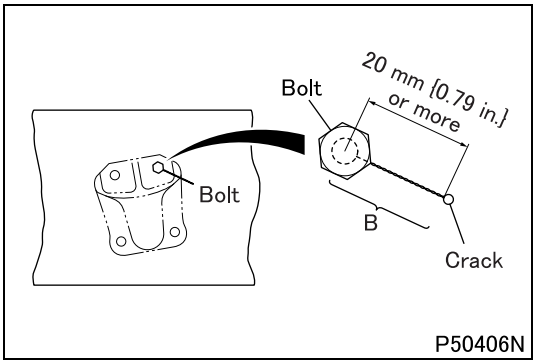
- Then, make a similar V-channel on the opposite side of the weld and fill it with filler metal by electric welding as well. At the same time, deposit metal to cover up the hole or holes at both ends of the crack by welding.

NOTE

- **In cold districts, heat the weld zone to approximately 200°C {390°F} after welding.**

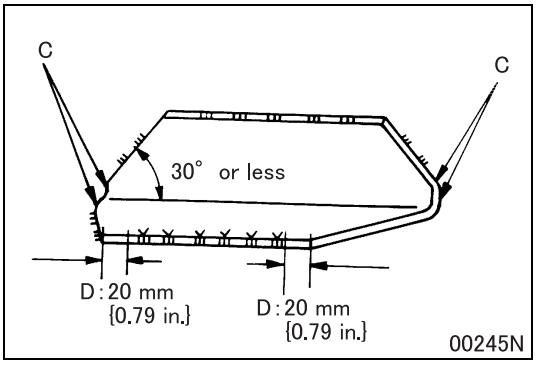


- After welding, run a grinder over the bead at right angles A to remove the hatched portion from the weld on each side of the plate.
- Finish the ground surfaces flat to a thickness equal to the original plate thickness.



[Repairing crack from rivet or bolt hole]

- To make the edges of cracked hole even, temporarily tighten bolt in the hole.
- First weld to close the crack at a point at least 20 mm {0.79 in.} apart from the center of the bolt.
  For this welding, refer to the aforementioned welding procedures for crack repair.
- Remove the temporary bolt. After making hole edges even, weld to close the rest B of the crack. Fill the hole with weld metal at the same time.
- Drill a hole at the location of original hole, and install a rivet or bolt in it.



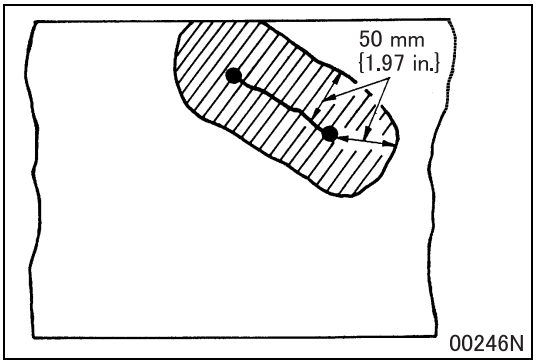
[Repairing using reinforcement plate]

- To prevent the concentration of welding stress at both ends C of the reinforcement plate, cut the ends at a bevel of 30° or less for welding. Do not weld at points D.
- The reinforcement plate must have enough to cover the cracked area.

NOTE

- **Reinforcement plate thickness: Equal to frame plate thickness**
- **Reinforcement plate material: As specified below or equivalent**

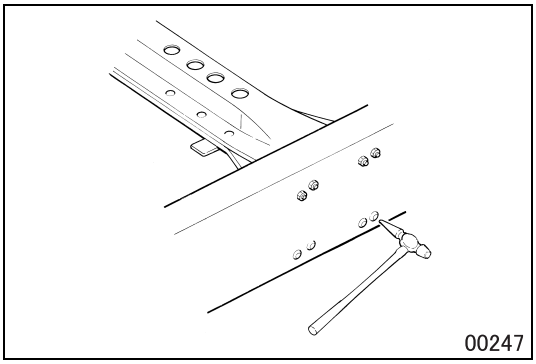
SAPH440 (Hot rolled steel for automobiles), or SS400 (Rolled steel for general structures)



- After welding, heat the hatched area to 600 to 700°C {1110 to 1292°F}.

CAUTION ⚠

- **Be sure to protect mountings that may be affected by heat, such as main sills, using heat insulators or the like.**

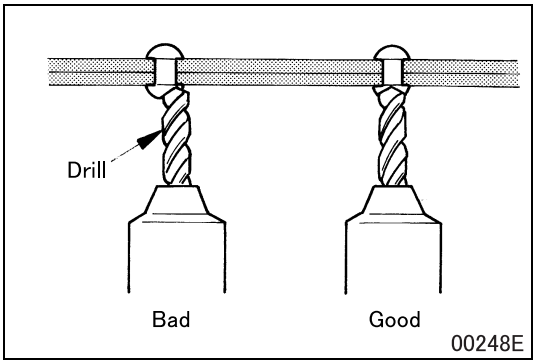


(4) Inspection of rivets for looseness

- Lightly tap the head of each rivet using an inspection hammer and feel or listen for the echo to determine if the rivet is loose.
- Rusting between rivet and frame plate is an indication of loosened rivet.

CAUTION ⚠

- **Be sure to replace loose rivets. They could break off or allow cracks to develop from the rivet holes, leading to an accident.**

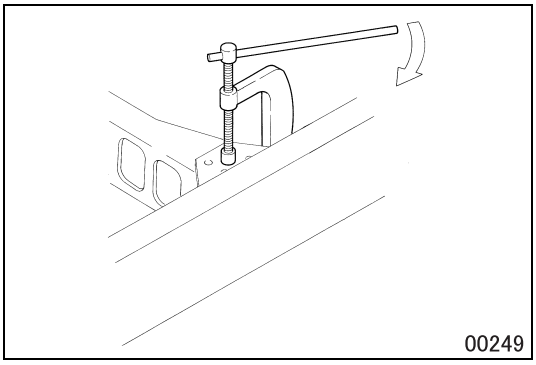


(5) Replacement of rivet

- To remove a loosened rivet, eliminate its head using a drill or grinder. When a drill is used, make a dent in the middle of the rivet's head and align the drill bit to the dent as shown.

NOTE

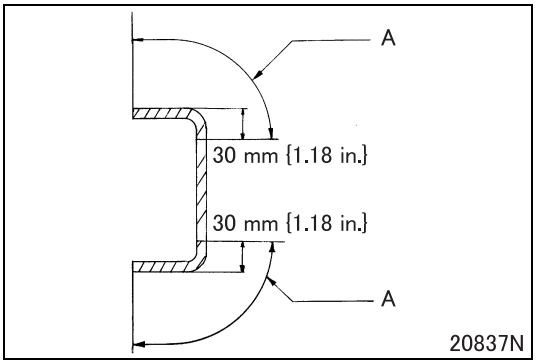
- **The rivet hole must be intact.**



- Before rivetting, clamp the two plates closely together near the rivet hole using a C vice.
- Using a rivetting machine, drive the rivet (cold rivet) into the rivet hole.
- If rivetting is impracticable, ream the rivet hole, drive a reamer bolt in the hole, fully tighten the nut, then weld it in place.
  As the reamer bolt and nut, use a flange bolt and a flange nut.

(6) Inspection of bolts and nuts for looseness

- Inspect the bolts attaching cross members to the side rails for looseness. If any loose bolt is found, retighten it to specified torque.



(7) Drilling hole in frame

- When drilling holes in the frame becomes necessary, perform it using care in the following respects.

CAUTION ⚠

- **When drilling holes in the side rail, avoid the illustrated ranges A to prevent cracking.**
- **Grind the edge of drilled hole smooth.**
- **Avoid drilling a hole in the vicinity of a point where the rigidity of the side rail change sharply, such as an area near the joint to the cross member or an end of the stiffener.**
- **The diameter of drilled holes must be 11 mm {0.43 in} or smaller and the hole-to-hole distance must be 20 mm {0.79 in} or larger.**

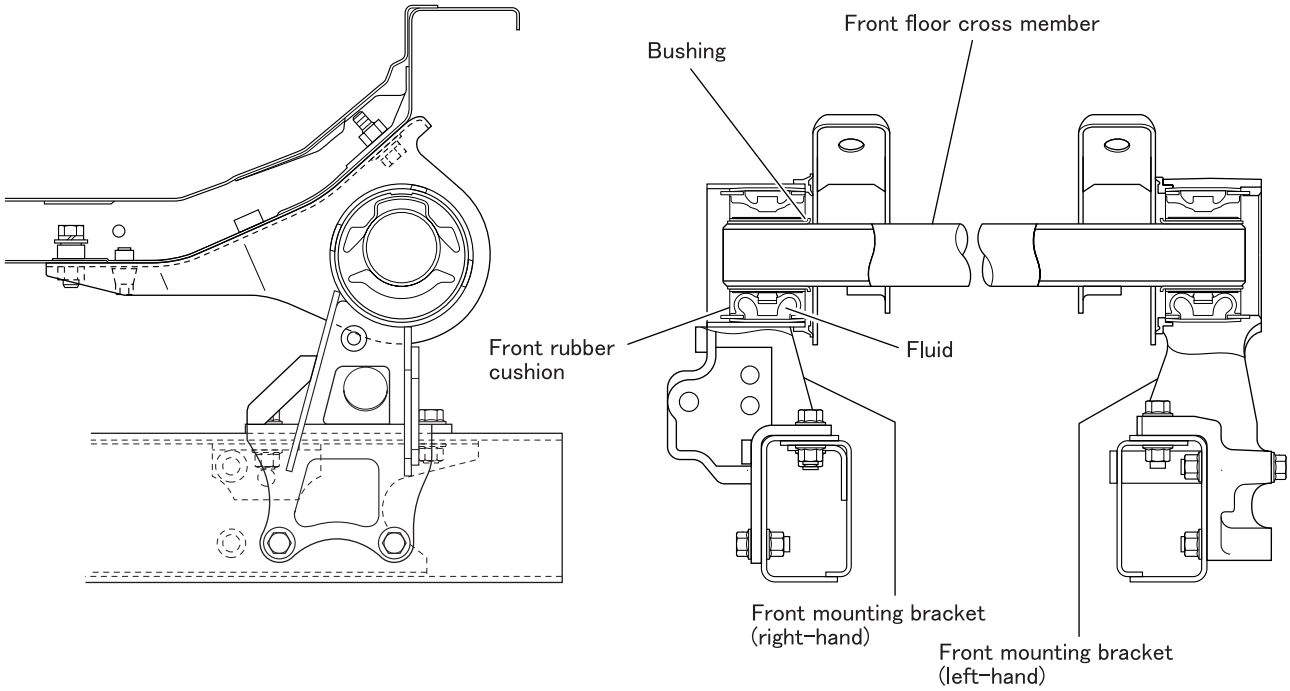
P58035E

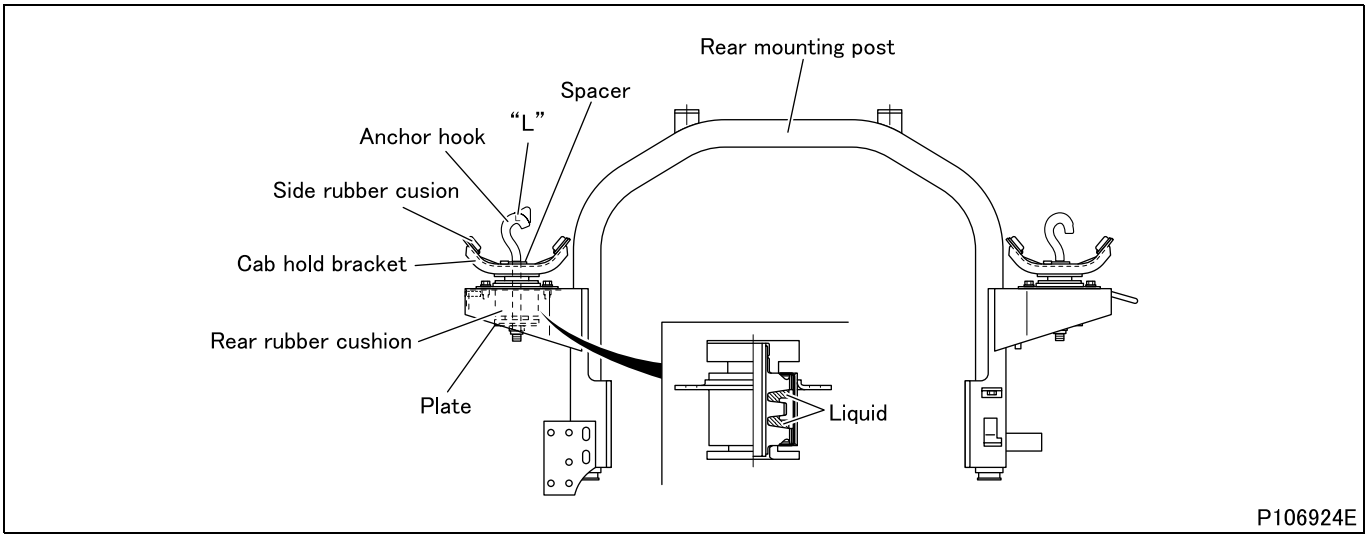
<Crew cab>



P58036E

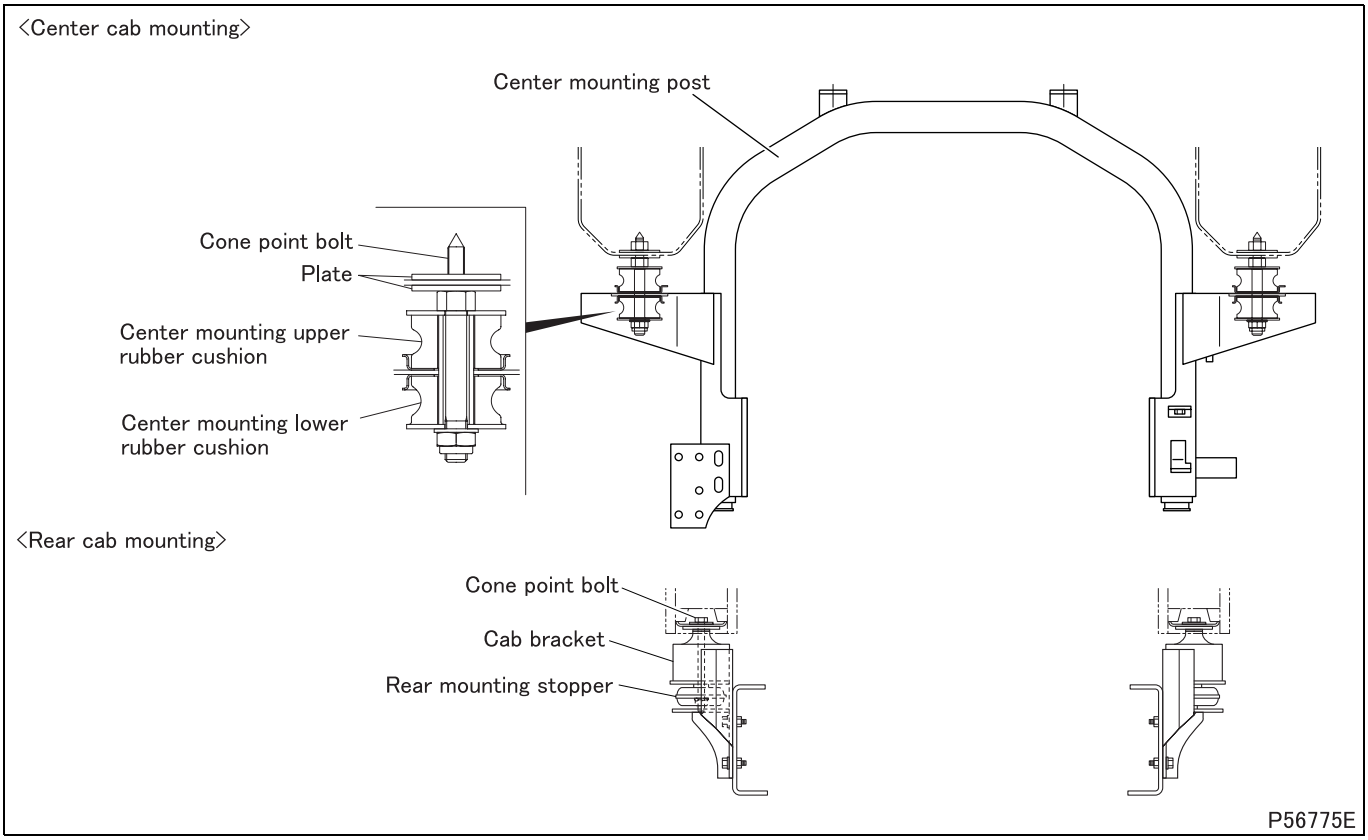
- The operating physical force for the cab tilt system can be adjusted using the adjusting bolt of the front mounting bracket. <Except crew cab>
- The front rubber cushion reduces the vibration and noise of the cab.

2. Rear Cab Mounting <Except Crew Cab>



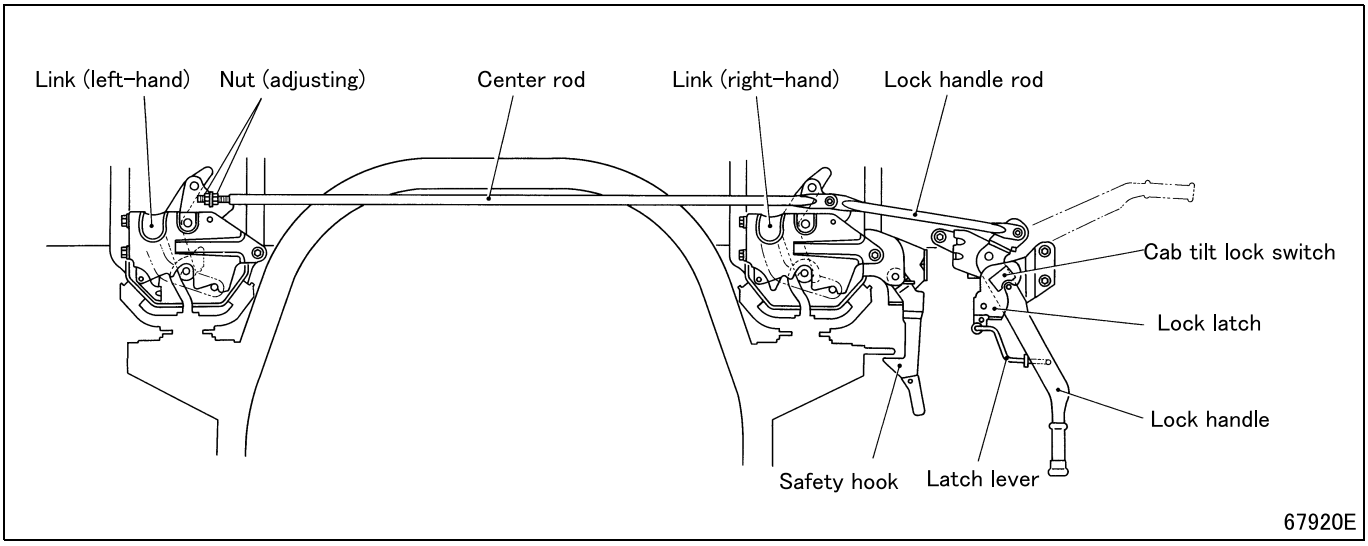
- The operating physical force for the lock handle can be adjusted by increasing and decreasing the number of spacers provided between anchor hook and cab hold bracket.
- Rear mounting upper and lower rubber cushions reduce the vibration and noise of the cab.

3. Center and Rear Cab Mountings <Crew Cab>



- Center mounting upper and lower rubber cushions reduce the vibration and noise of the cab.

4. Cab Tilt Link <Except Crew Cab>



- The length of center rod is adjustable with the adjusting nut.
- The cab tilt lock switch of the manual cab tilt system monitors the locking status of the lock handle.

Cabs in general

Possible causes \ Symptoms			Cab shimmy (vibration with pitching and rolling)	High-frequency vibration (above 20Hz) and noise in cab and steering wheel	Reference Gr
Cab-related problems	Front cab mounting	Front mounting bracket loose, play	O		
		Sagging of front rubber cushion		O	
	Center or rear cab mounting	Sagging of mounting rubber cushion		O	
	Cab improperly mounted			O	
Engine-related problems		Propeller shaft inclination angle excessive due to increased tilt angle caused by deteriorated engine mounting		O	Gr11
		Engine improperly mounted		O	
		Intake and exhaust system components improperly installed		O	Gr15
Transmission-related problem		Transmission improperly mounted		O	Gr22

ON-VEHICLE INSPECTION AND ADJUSTMENT

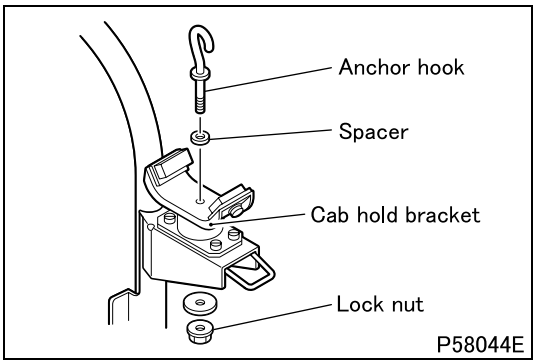
1. Adjustment of Cab Tilt System <Except Crew Cab>

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
–	Lock nut (anchor hook fitting)	83 to 98 {61 to 72, 8.5 to 10}	–

Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
–	Sliding contact surfaces of lock handle and link	Chassis grease [NLGI No. 1 (Li soap)]	As required



1.1 Inspection of lock handle operating physical force

[Inspection]

- If the lock handle is excessively light to operate, make adjustment as follows.
- If the lock handle is excessively heavy, apply grease to the sliding contact surfaces of handle and link, then operate the handle again for physical operating force. If the lock handle is still heavy, make adjustment as follows.

[Adjustment]

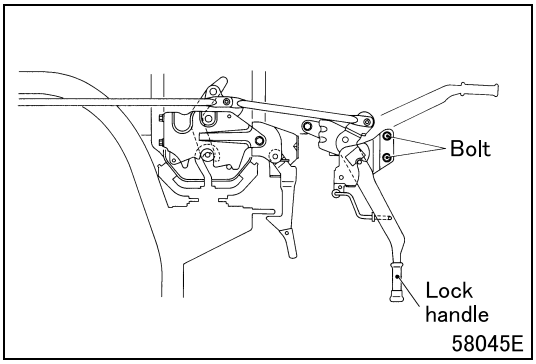
- Remove the lock nut, then remove the anchor hook.
- Adjust the operating physical force increasing or decreasing the number of spacers between anchor hook and cab hold bracket as follows.

	Number of spacers
If lock handle feels too heavy	Increase
If lock handle feels too light	Decrease

- After adjustment, tighten the lock nut to the specified torque.

CAUTION ⚠

- **If the lock handle feels too light, it is an indication that the handle could be easily unlocked by the vibration of the running vehicle.**

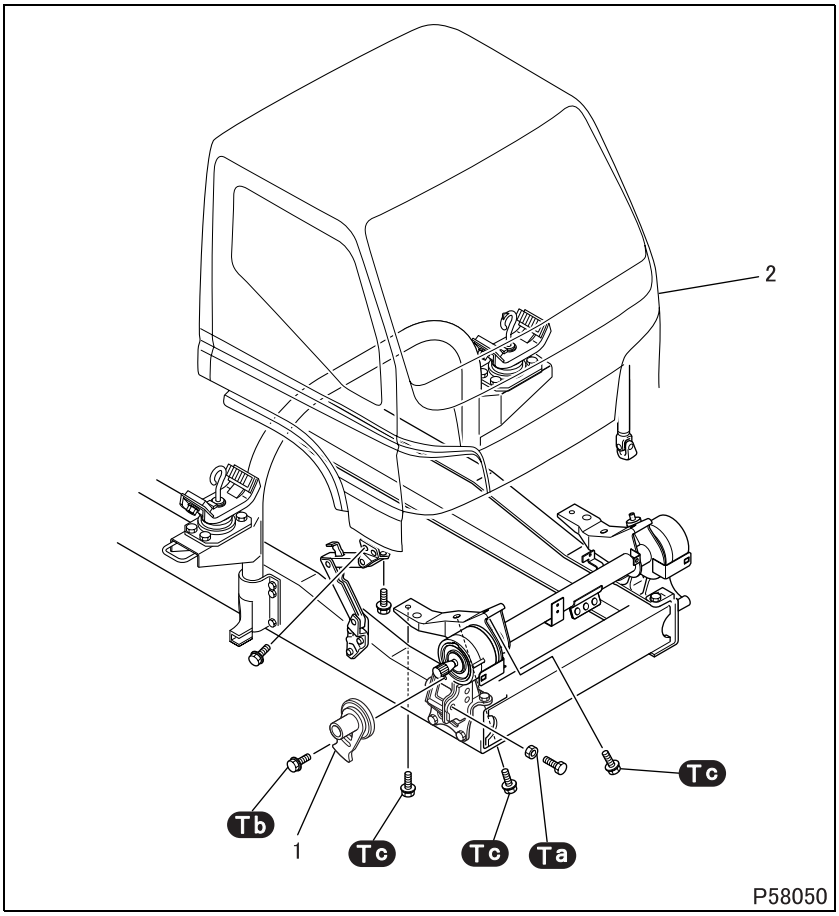


1.2 Adjustment of latch

- If the latch resists, loosen bolts and adjust the installed position of the lock handle using bolt slot.
- After adjustment, retighten the bolts.

M E M O

REMOVAL AND INSTALLATION OF CAB <EXCEPT CREW CAB>



● **Removal sequence**

1 Anchor lever
2 Cab

WARNING ⚠

- **During removal and installation of the cab, the parking brake is not available for holding the vehicle at a standstill. Therefore, be sure to apply chocks to the tires to ensure that the vehicle does not move.**
- **Never remove the chocks until all the operations are completed.**

- Disconnect all cables, hoses and wires before removal and installation of the cab.

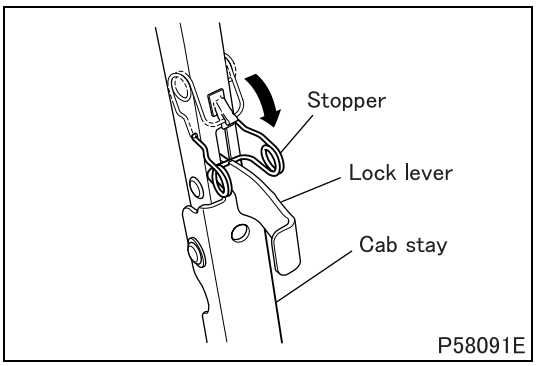
● **Installation sequence**

Follow the removal sequence in reverse.

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Lock nut (anchor lever adjusting bolt locking)	59 to 83 {43 to 61, 6 to 8.5}	–
Tb	Bolt (anchor lever attaching)	34 to 54 {25 to 40, 3.5 to 5.5}	–
Tc	Bolt (cab mounting)	100 to 120 {74 to 89, 10 to 12}	–

◆**Removal procedure**◆

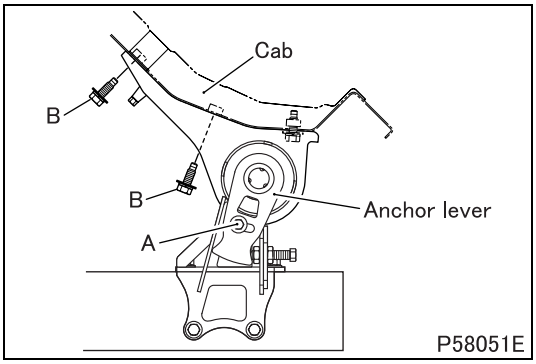


■ **Removal: Cab**

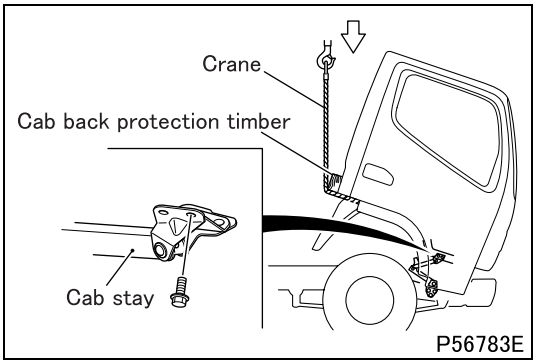
- Tilt the cab to securely lock the cab stay.

WARNING ⚠

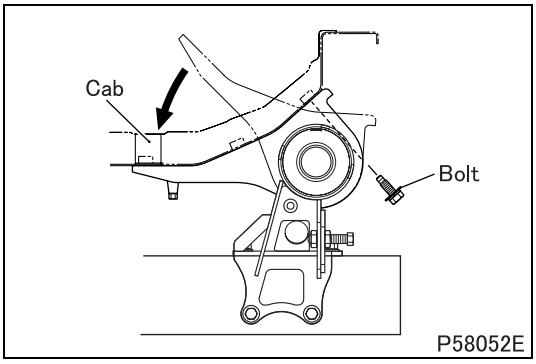
- **Be sure to fit the stopper onto the lock lever to lock the cab stay.**



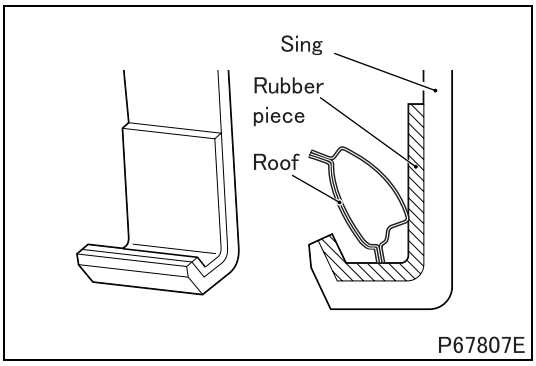
- Remove the bolt A, then detach the anchor lever.
- Remove the bolts B holding the cab in place.



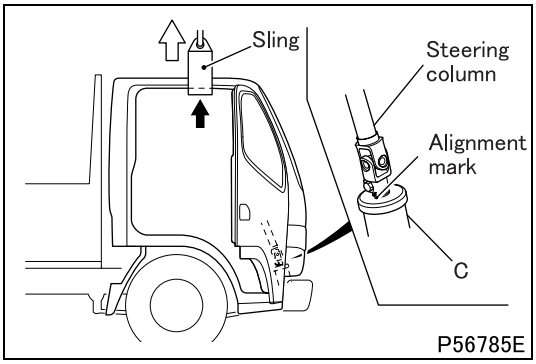
- Supporting the tilted cab with the crane, remove the cab stay.



- Lower the cab all the way, then remove bolt.



- Make available slings rigid enough to carry the weight of the cab.
- The hook portion of the sling must be lined with a rubber piece as shown to prevent deformation of the roof of the cab.

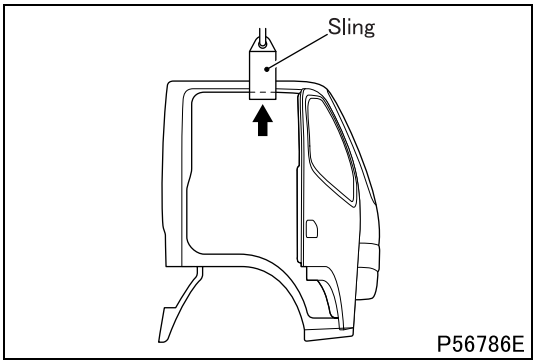


- Hook the slings on the cab roof as shown, then hoist the cab a little to see if it maintains level (balanced at the center of gravity).
- Provide alignment marks on the power steering gear C and steering column, then separate the steering column.
- To prevent the steering column from falling off, tie it securely to the cab using a rigid cord.
- Slowly and slightly hoist the cab straightly up to check that all cables, hoses and electric wiring have been disconnected before removing the cab.
- Lift off the cab straight.

WARNING ⚠

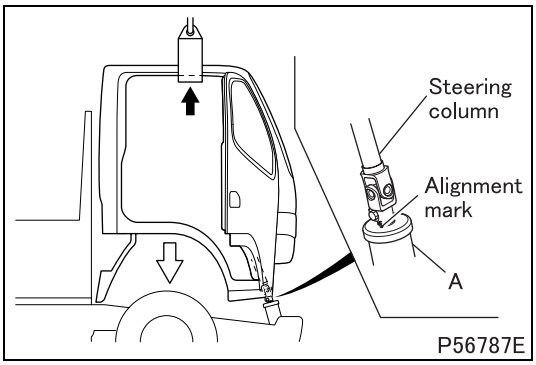
- **While the cab is up in the air, be sure to stay out from under it.**

◆Installation procedure◆

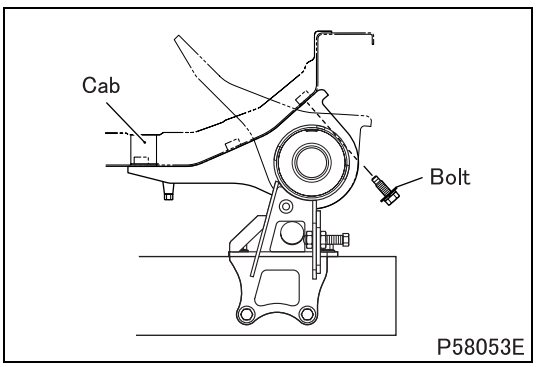


■ Installation: Cab

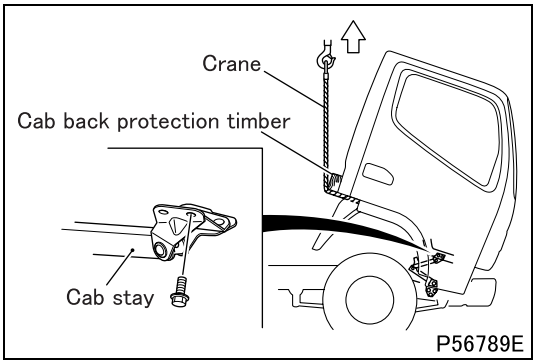
- Hook the slings at center-of-gravity points on both sides of the cab roof, and lift the cab.



- Slowly lower the cab halfway.
- Join the power steering gear A and steering column together in accordance with the alignment marks.



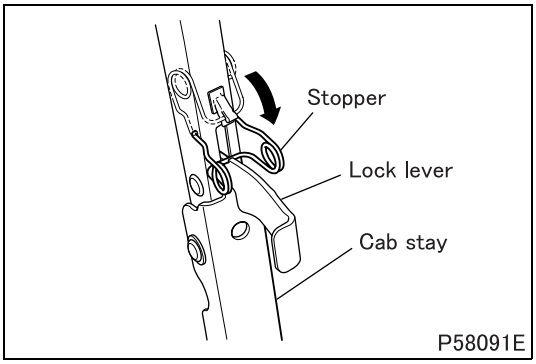
- Further lower the cab slowly to mount in position, then unhook the slings.
- Tighten mounting bolts to specified torque.



- Before tilting, support the cab using the crane.
- Tilt the cab with the crane, and install the cab stay.

WARNING ⚠

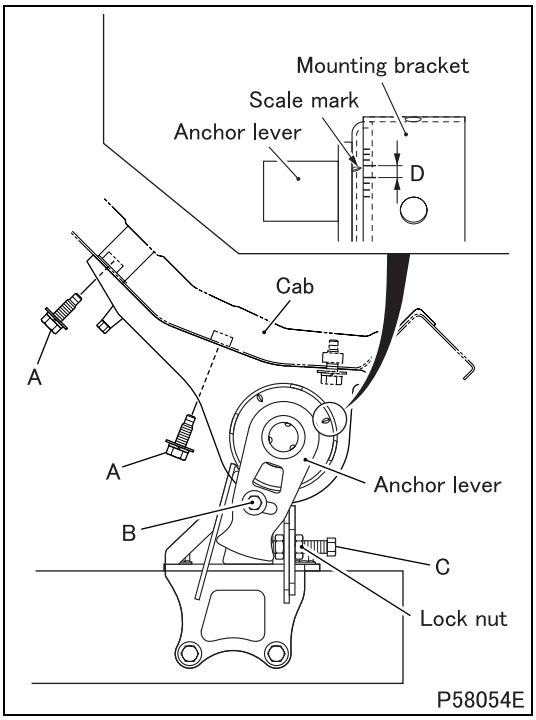
- **Be careful not to tilt the cab more than necessary. Doing so is extremely dangerous because it causes the cab to fall down forward.**



- After the cab stay is installed, tilt the cab to securely lock the cab stay. Then, remove the crane from the cab.

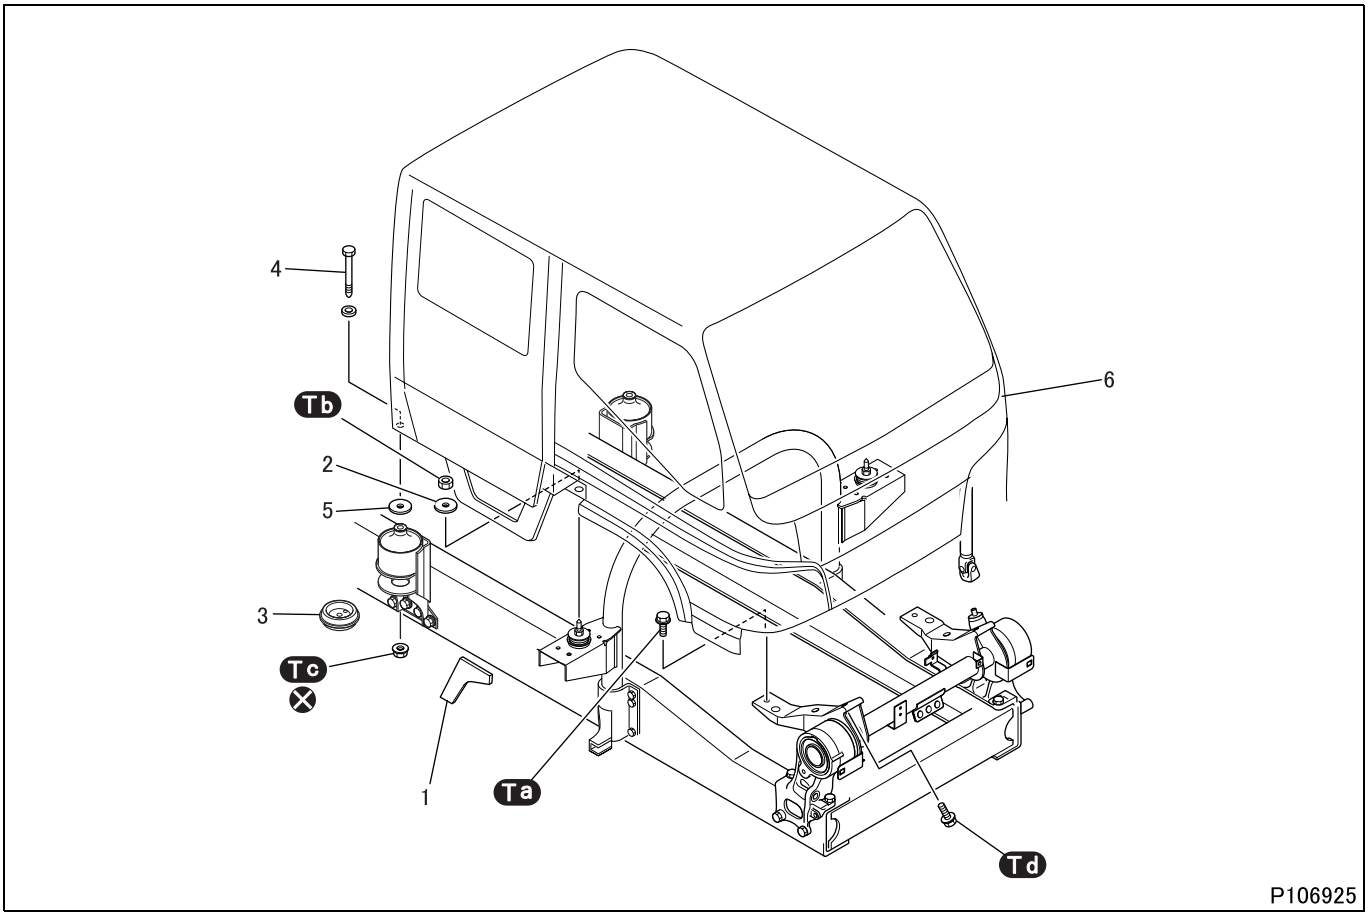
WARNING ⚠

- **Be sure to fit the stopper onto the lock lever to lock the cab stay.**



- Tighten the bolt A to specified torque.
- Align the graduated line of the anchor lever to the illustrated range of D (long division) of the scale graduated on the mounting bracket, then install the bolt B handtight.
- After contacting the bolt C with the anchor lever, tighten the bolt C by 10 mm {0.39 in.} (six and two third turns).
- Tighten the lock nut to specified torque.
- Tighten the handtight bolt B to specified torque.

REMOVAL AND INSTALLATION OF CAB <CREW CAB>



● **Disassembly sequence**

1 Garnish
2 Plate
3 Rear mounting stopper
4 Cone point bolt
5 Plate
6 Cab

⊗: Non-reusable parts

CAUTION ⚠

- **During removal and installation of the cab, the parking brake is not available to hold the vehicle at a standstill. Be sure to apply chocks to the tires to ensure that the vehicle does not move.**
- **Never remove the chocks until all the operations are completed.**
- **Before removal and installation, disconnect all cables, hoses and wires.**

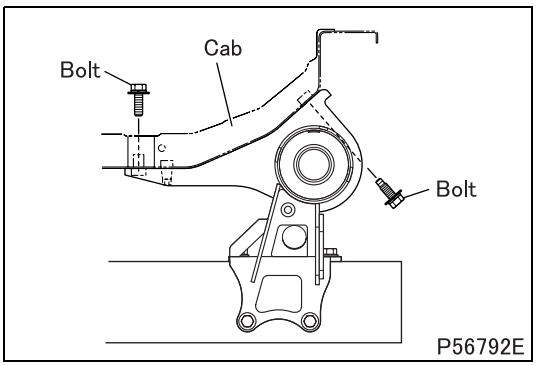
● **Assembly sequence**

Follow the disassembly sequence in reverse.

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

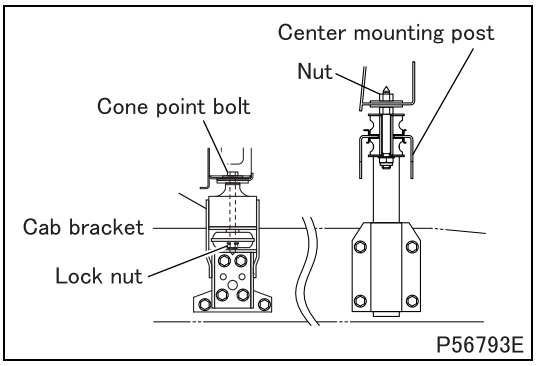
Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Bolt (cab mounting)	70 to 95 {51 to 70, 7.1 to 9.7}	–
Tb	Nut (cab mounting)	39 to 59 {30 to 43, 4 to 6}	–
Tc	Lock nut (cab mounting)	59 to 69 {43 to 51, 6 to 7}	–
Td	Bolt (cab mounting)	100 to 120 {74 to 89, 10 to 12}	–

◆Removal procedure◆

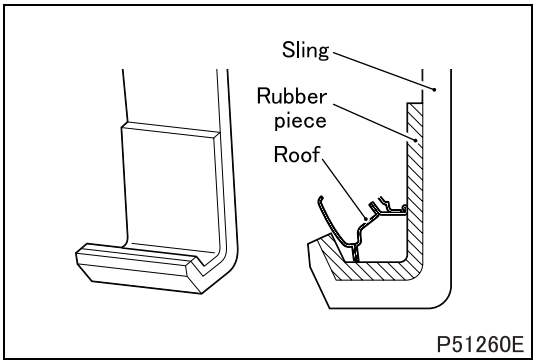


■ **Removal: Cab**

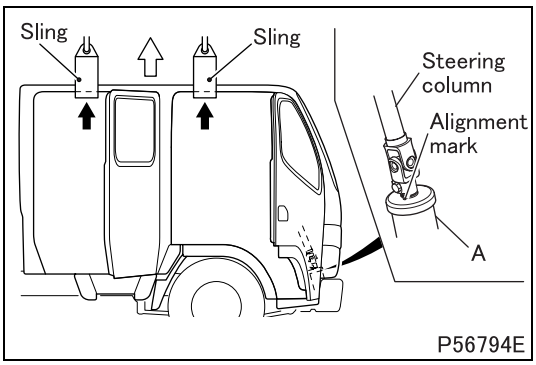
- Remove bolts from inside and outside the cab.



- Remove nuts from the center mounting post, then remove lock nut and cone point bolt from the cab bracket.



- Make available slings rigid enough to support the weight of the cab.
- Line the hook portion of each sling with a rubber piece to prevent deformation of the roof of the cab.

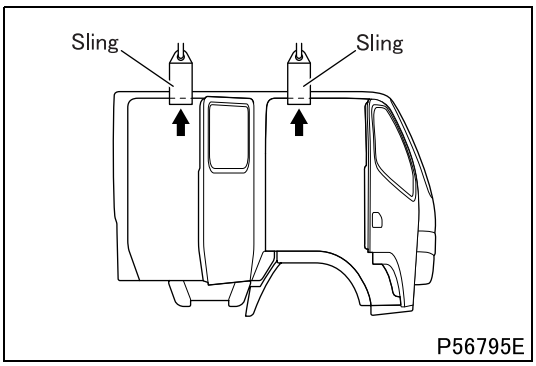


- Hook the slings at appropriate points on the roof of the cab, and lift the cab a little to see if it maintains level (balanced at the center of gravity).
- Provide alignment marks on the power steering gear A, then separate the steering column.
- Tie the steering column securely to the cab with a rigid cord not to fall off.
- Slowly and slightly hoist the cab straightly up to check that all cables, hoses and electric wiring have been disconnected before removing the cab.
- Slowly lift off the cab.

WARNING ⚠

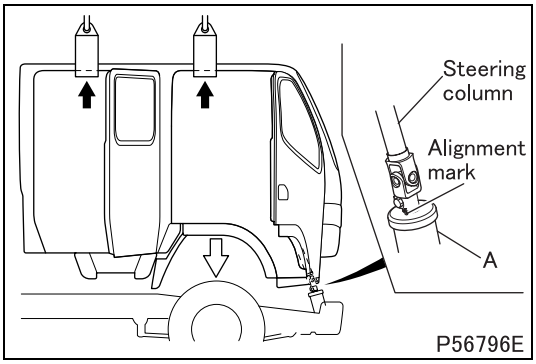
- **When the cab is up in the air, be sure to stay out from under it.**

◆Installation procedure◆

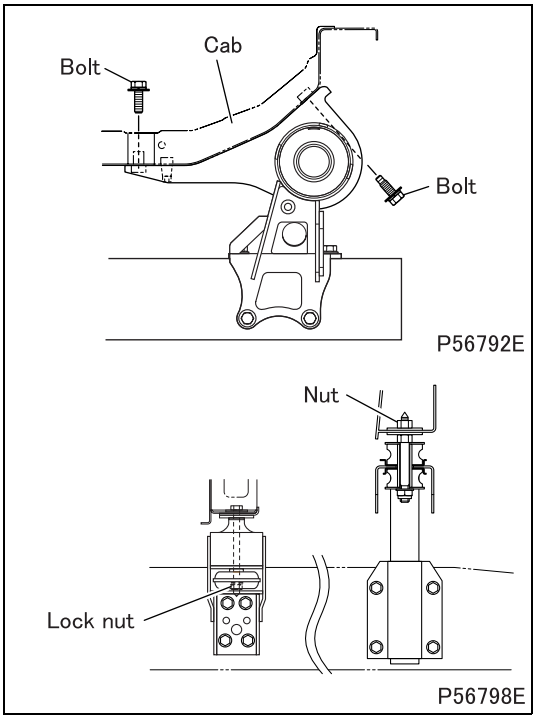


■ **Installation: Cab**

- Hook the slings at equilibrium center-of-gravity points on the roof of the cab.



- Slowly lower the cab.
- Join the power steering gear A and steering column together in accordance with the alignment marks on them.



- Further lower the cab slowly into place. Then unhook the slings and tighten bolts, nuts and lock nuts to specified torques.

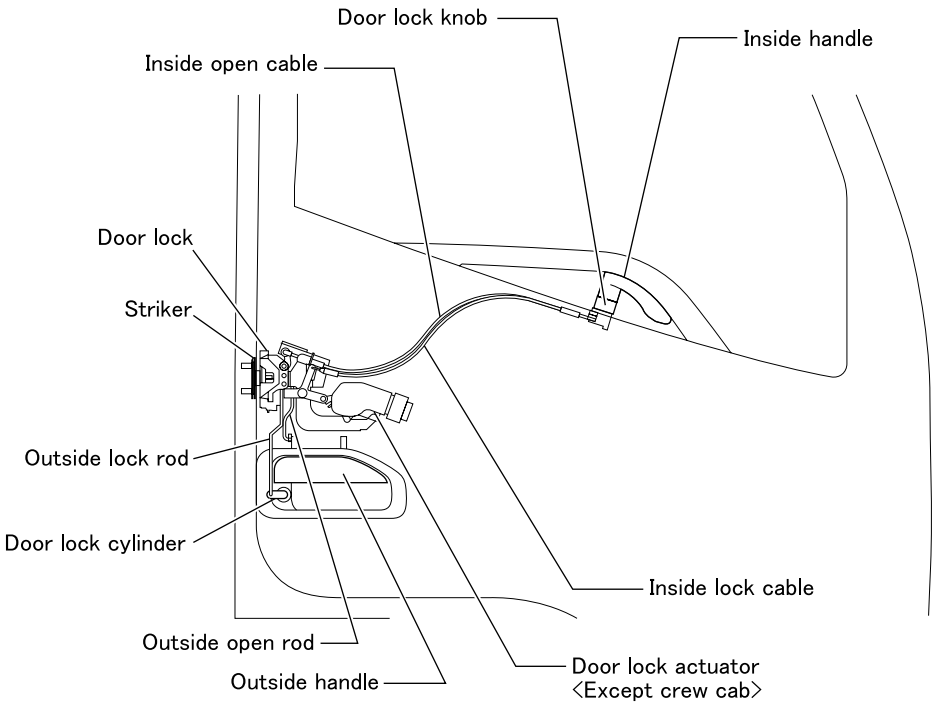
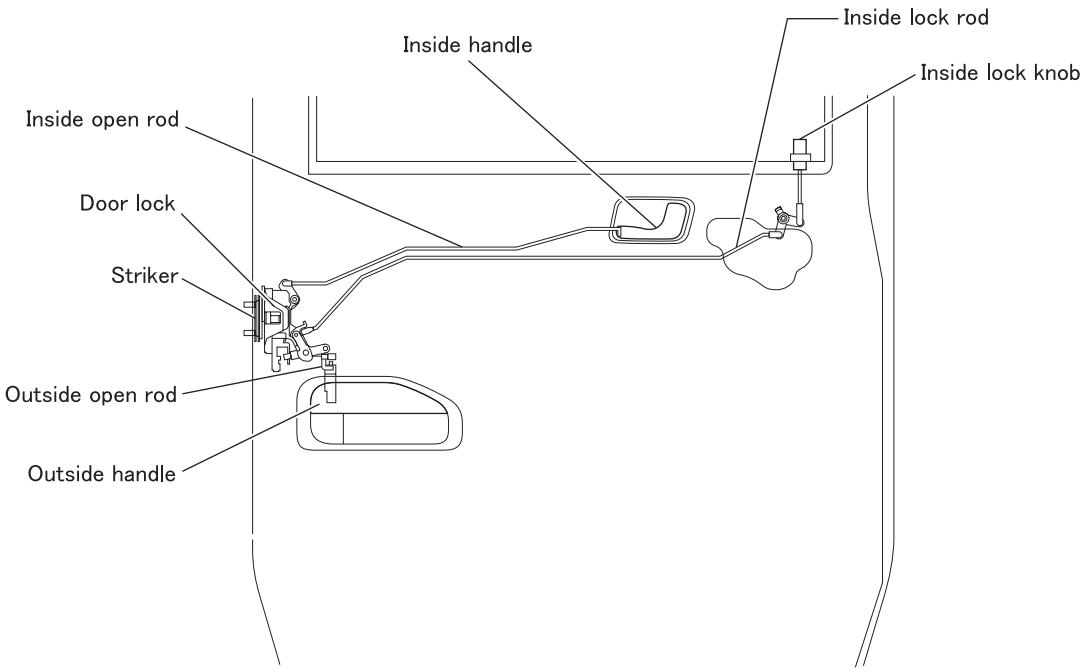
	Door glass opening and closing mechanism	–	Manual control type

1. Front Door Lock System



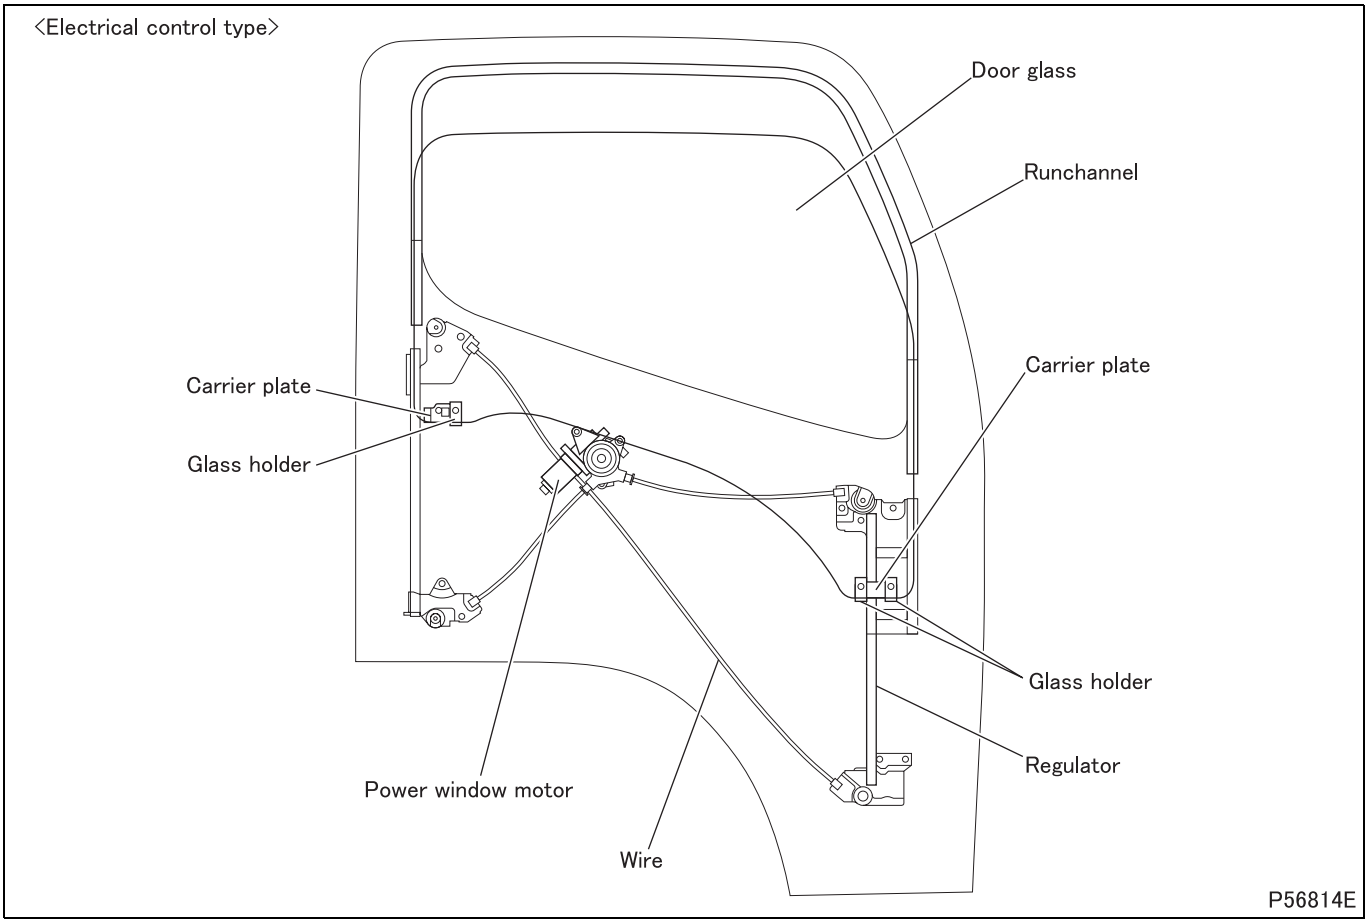
P58094E

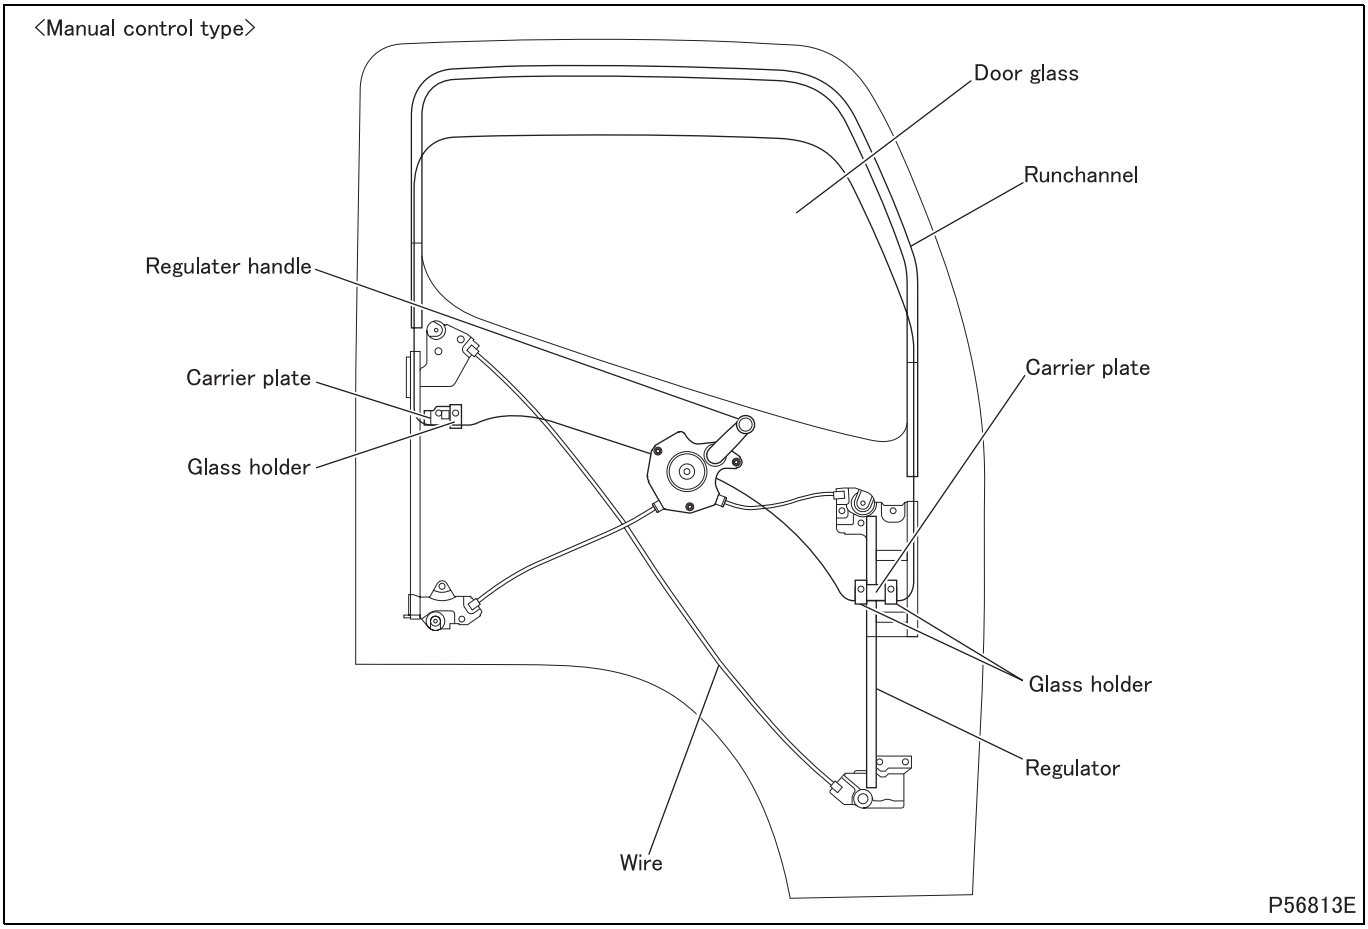
2. Rear Door Lock System <Crew Cab>



P67519E

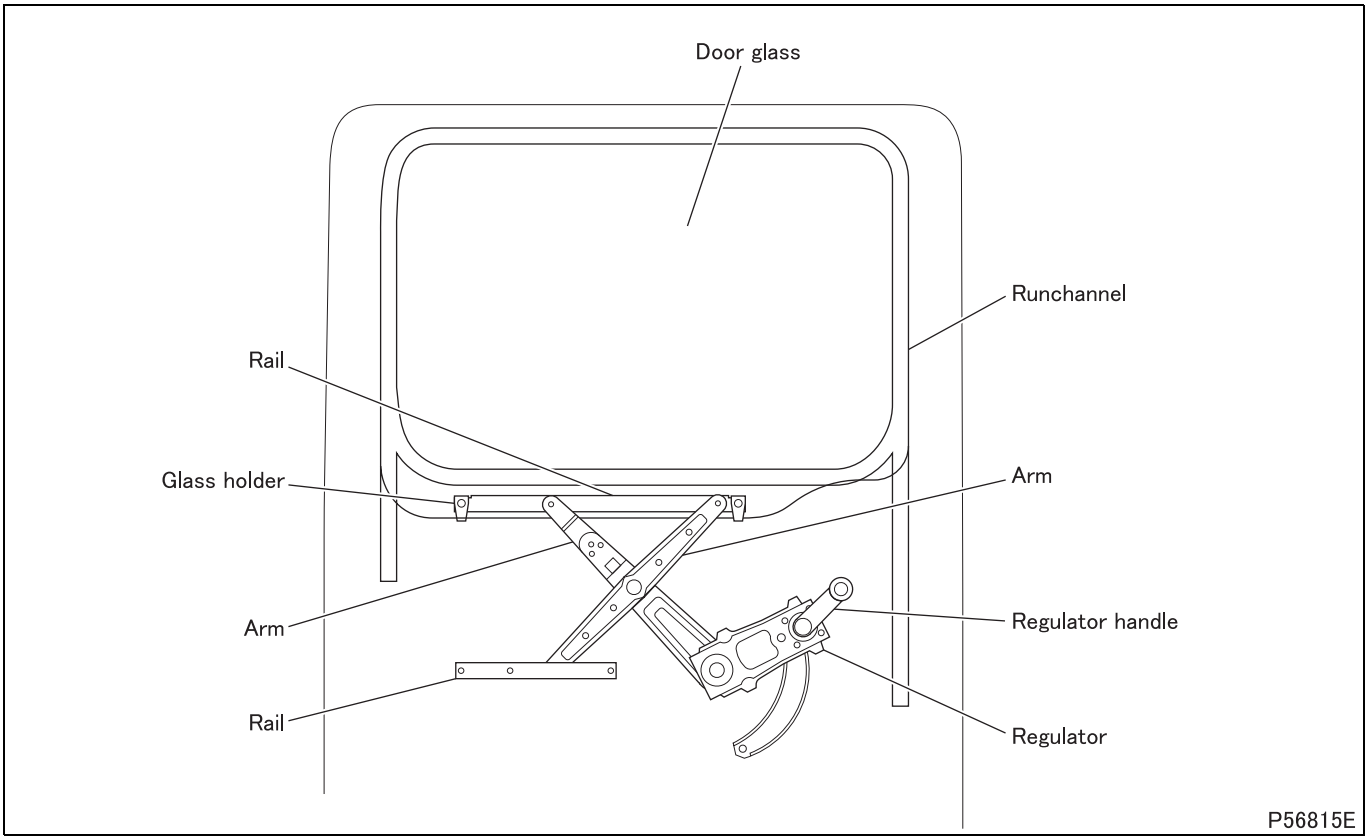
3. Front Door Glass Opening and Closing Mechanism





- The door glass is secured to the carrier plate by the medium of glass holder.
- With the rotation of the power window motor <Electrical control type> or regulator handle <Manual control type>, the carrier plate is moved up and down by means of the wire to open and close the door glass.

4. Rear Door Glass Opening and Closing Mechanism <Crew Cab>



- The door glass is secured to the rail by the medium of glass holder.
- The rail is secured to the door panel, and the arms slide back and forth inside the rail.
- Turning the regulator handle moves the rail up and down by means of the regulator and arm to open and close the door glass.

M E M O

Door Glass Opening and Closing Mechanism <Electrical control type>

Symptoms / Possible causes	Door glass falls by gravity when vehicle is running	Regulator or motor emits noise when vehicle is running	Power window fails to operate	Power window fails to stop	Power window emits noise when in motion	Reference Gr

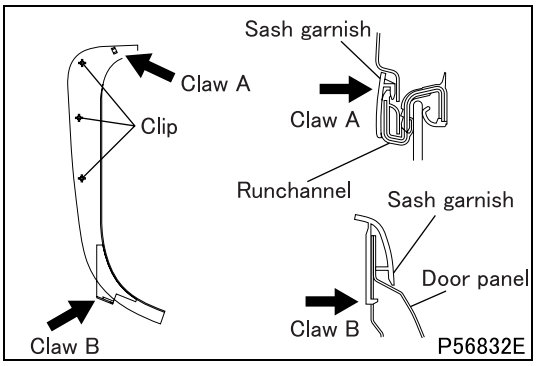
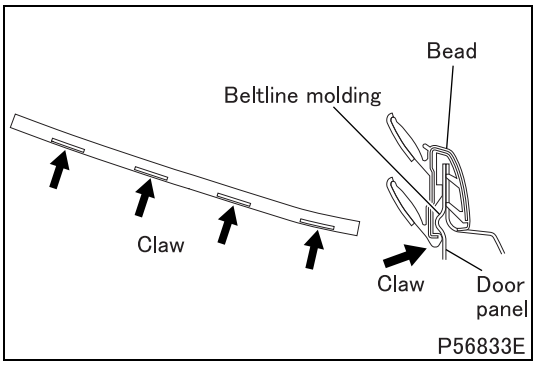
◆ Removal sequence ◆



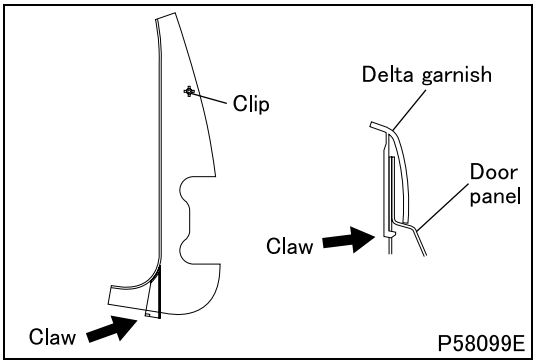
■Removal: Sash garnish

- Disengage claw A on upper part of the sash garnish from the runchannel, then remove clips (3 places).
- Disengage claw B on the lower part of the sash garnish from the door panel.



■Removal: Beltline molding

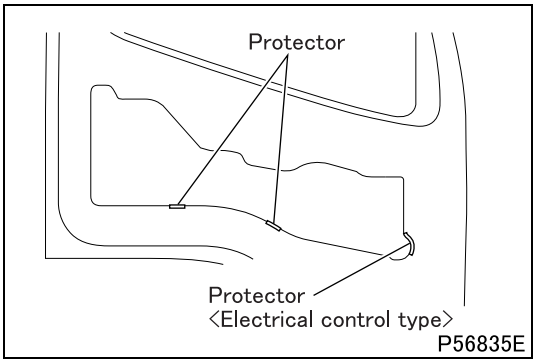
- Disengage claws (4 places) and remove the beltline molding from the door panel bead.



■**Removal: Delta garnish**

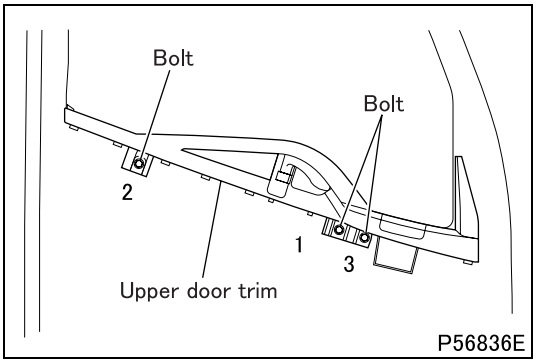
- Disengage clip (1 place) first and then claw to remove the delta garnish from the door panel.

◆**Installation procedure**◆



■**Installation: Protector**

- Fit the protectors (three on electrical control type; two on manual control type) to the door panel in the illustrated positions.

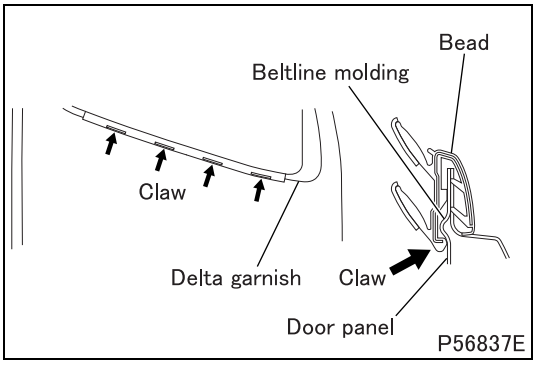


■**Installation: Upper door trim**

- Tighten bolts to specified torque in numerical order (1 to 3) as shown to secure the upper door trim.

■**Installation: Delta garnish**

- To install the delta garnish, follow the removal procedure in reverse.
  (See **"■Removal: Delta garnish"**.)

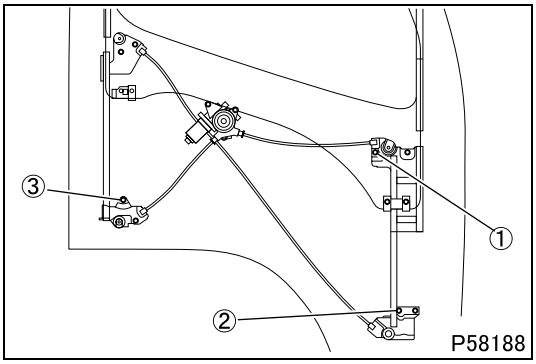


■**Installation: Beltline molding**

- Position the beltline molding with its front side applied to the delta garnish, then engage claws (4 places) with the door panel bead to secure the beltline molding in place.

■**Installation: Sash garnish**

- To install the sash garnish, follow the removal procedure in reverse.
  (See **"■Removal: Sash garnish"**.)



■**Installation: Regulator and motor or manual regulator**

- Tighten bolts (3 places) to specified torque in numerical order (1 to 3) as shown, then tighten the remaining bolts and nuts to specified torque.

●Disassembly sequence

1 Clamp
2 Mirror
3 Cover
4 Mirror stay

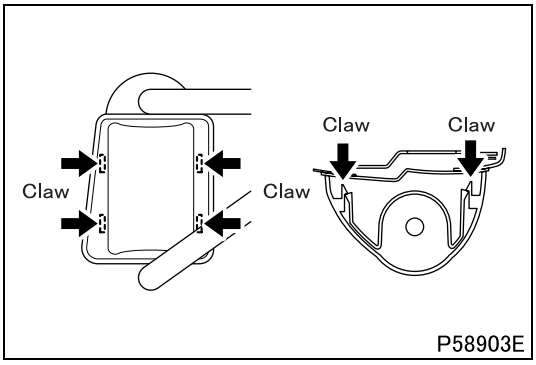
●Assembly sequence

Follow the disassembly sequence in reverse.

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

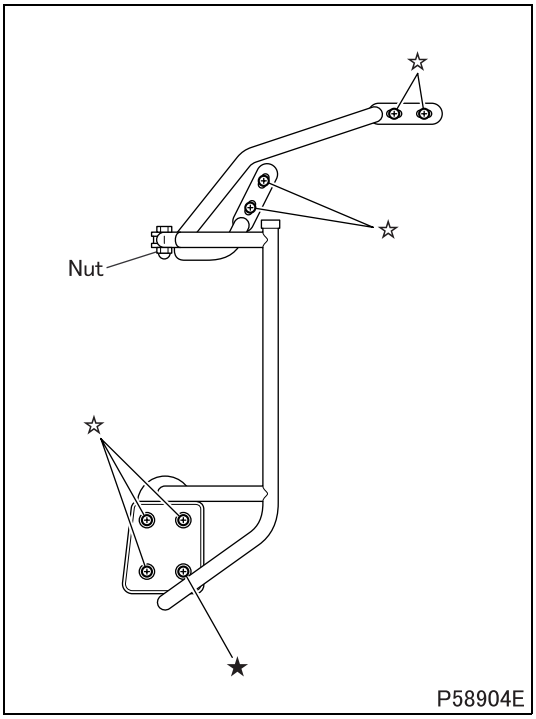
Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Bolt (mirror mounting)	6.5 to 7.2 {4.8 to 5.3, 0.66 to 0.73}	–
Tb	Screw (mirror stay mounting)	9 to 14 {6.6 to 10, 0.9 to 14}	–
Tc	Nut (mirror stay fastening)	19 to 28 {14 to 21, 1.9 to 2.9}	–

◆Removal procedure◆



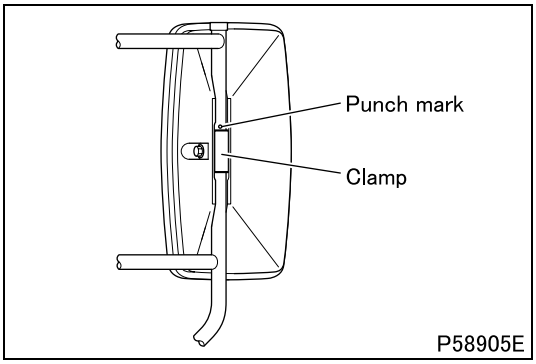
■Removal: Cover

◆Installation procedure◆



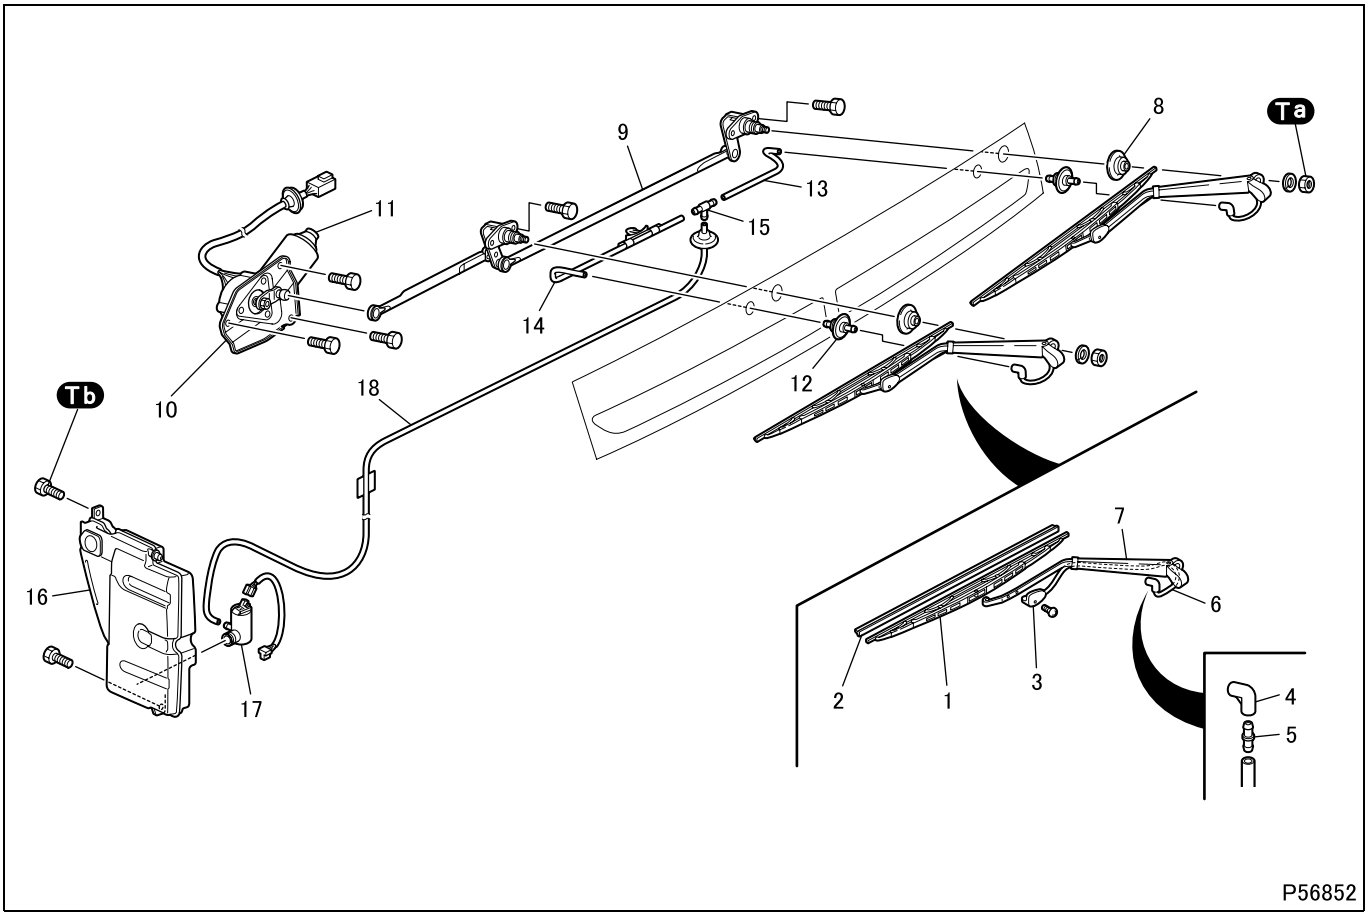
■Installation: Mirror stay

- Install the one screw marked ★ and adjust the position of the mirror stay.
- Install all the remaining seven screws marked ☆ to secure the mirror stay.
- Fasten the mirror stay nut to the specified torque.



■Installation: Mirror

- Adjust the height of the mirror by aligning the punch mark on the mirror stay with the clamp edge as shown in the illustration.



●Disassembly sequence

1 Wiper blade
2 Blade rubber
3 Washer nozzle
4 Elbow joint
5 Joint
6 Hose
7 Wiper arm
8 Pivot cap
9 Wiper link
10 Wiper motor bracket
11 Wiper motor
12 Joint
13 Washer hose
14 Washer hose
15 Joint
16 Washer tank
17 Washer motor
18 Washer hose

NOTE

- **Before disconnecting the connector to remove the wiper motor, pull out cab side harness enough, otherwise it will fall in the cab side and cannot be taken out without removing the instrument panel.**

●Assembly sequence

Follow the disassembly sequence in reverse.

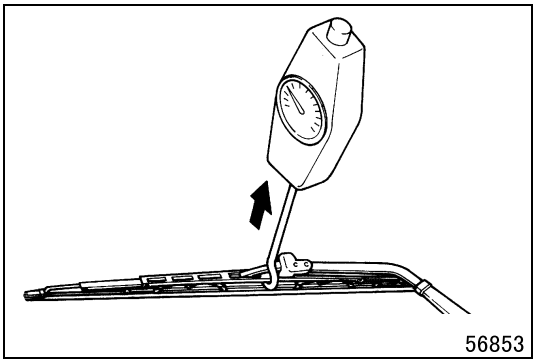
Service standards

Location	Maintenance item	Standard value	Limit	Remedy
7	Wiper arm force to press blade against windshield	6.2 ± 0.5 N {1.4 ± 0.11 lbs, 0.63 ± 0.05 kgf}	–	Replace

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Nut (wiper arm and blade attaching)	10.8 to 15.7 {8.0 to 12, 1.1 to 1.6}	–
Tb	Bolt (washer tank attaching)	7.8 to 11.8 {5.8 to 8.7, 0.8 to 1.2}	–

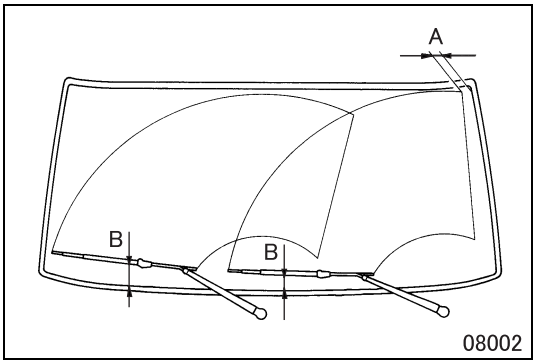
◆Inspection procedure◆



■Inspection: Wiper arm

- Measure the wiper arm force to press the blade against the windshield.
- If the measurement deviates from the standard value, replace the wiper arm.

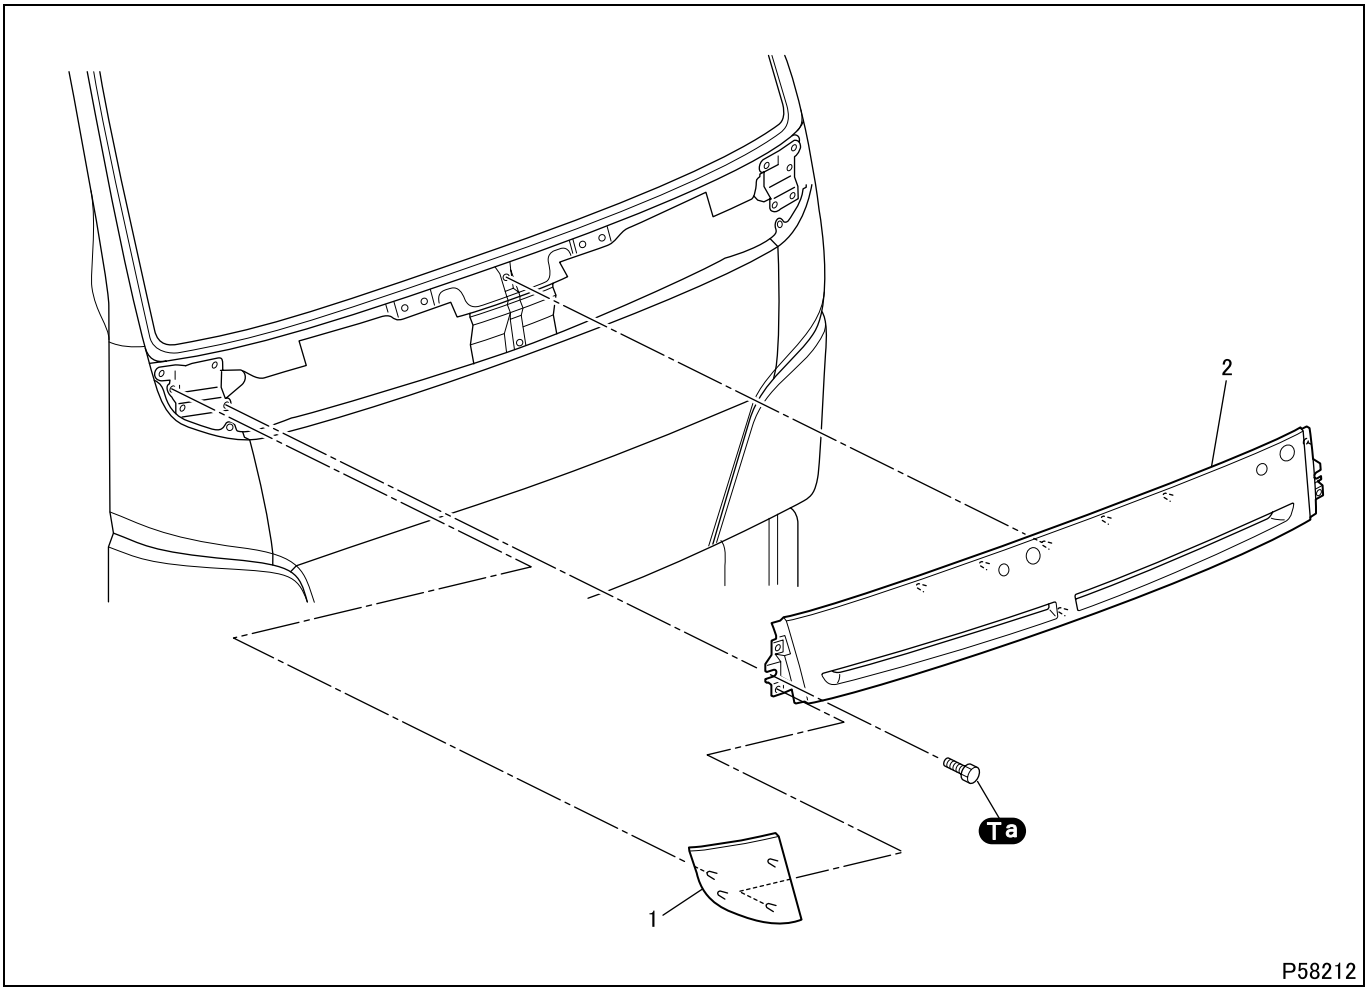
◆Installation procedure◆



■Installation: Wiper arm and blade

- Install the wiper arm and blade so that the blades come to the illustrated points as much as A and B apart from the edge of weatherstrip.
  A: 50 mm {1.97 in.}
  B: 59 ± 5 mm {2.3 ± 0.20 in.}

FRONT COVER



● **Disassembly sequence**

1 Front side cover
2 Front cover

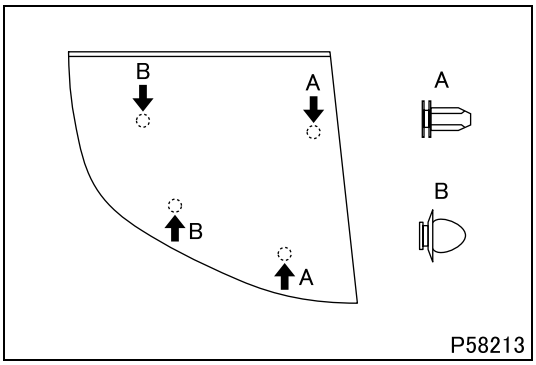
● **Assembly sequence**

Follow the disassembly sequence in reverse.

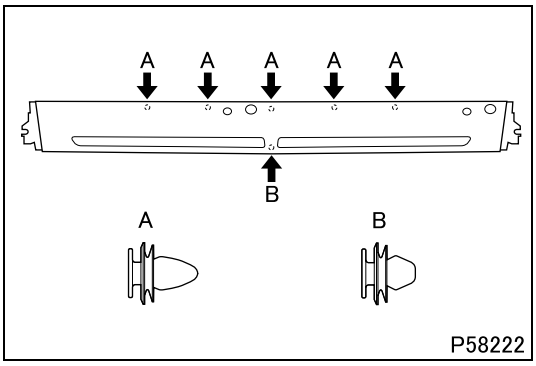
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Bolt (front cover attaching)	9 to 14 {6.6 to 10, 0.9 to 1.4}	–

◆Removal procedure◆

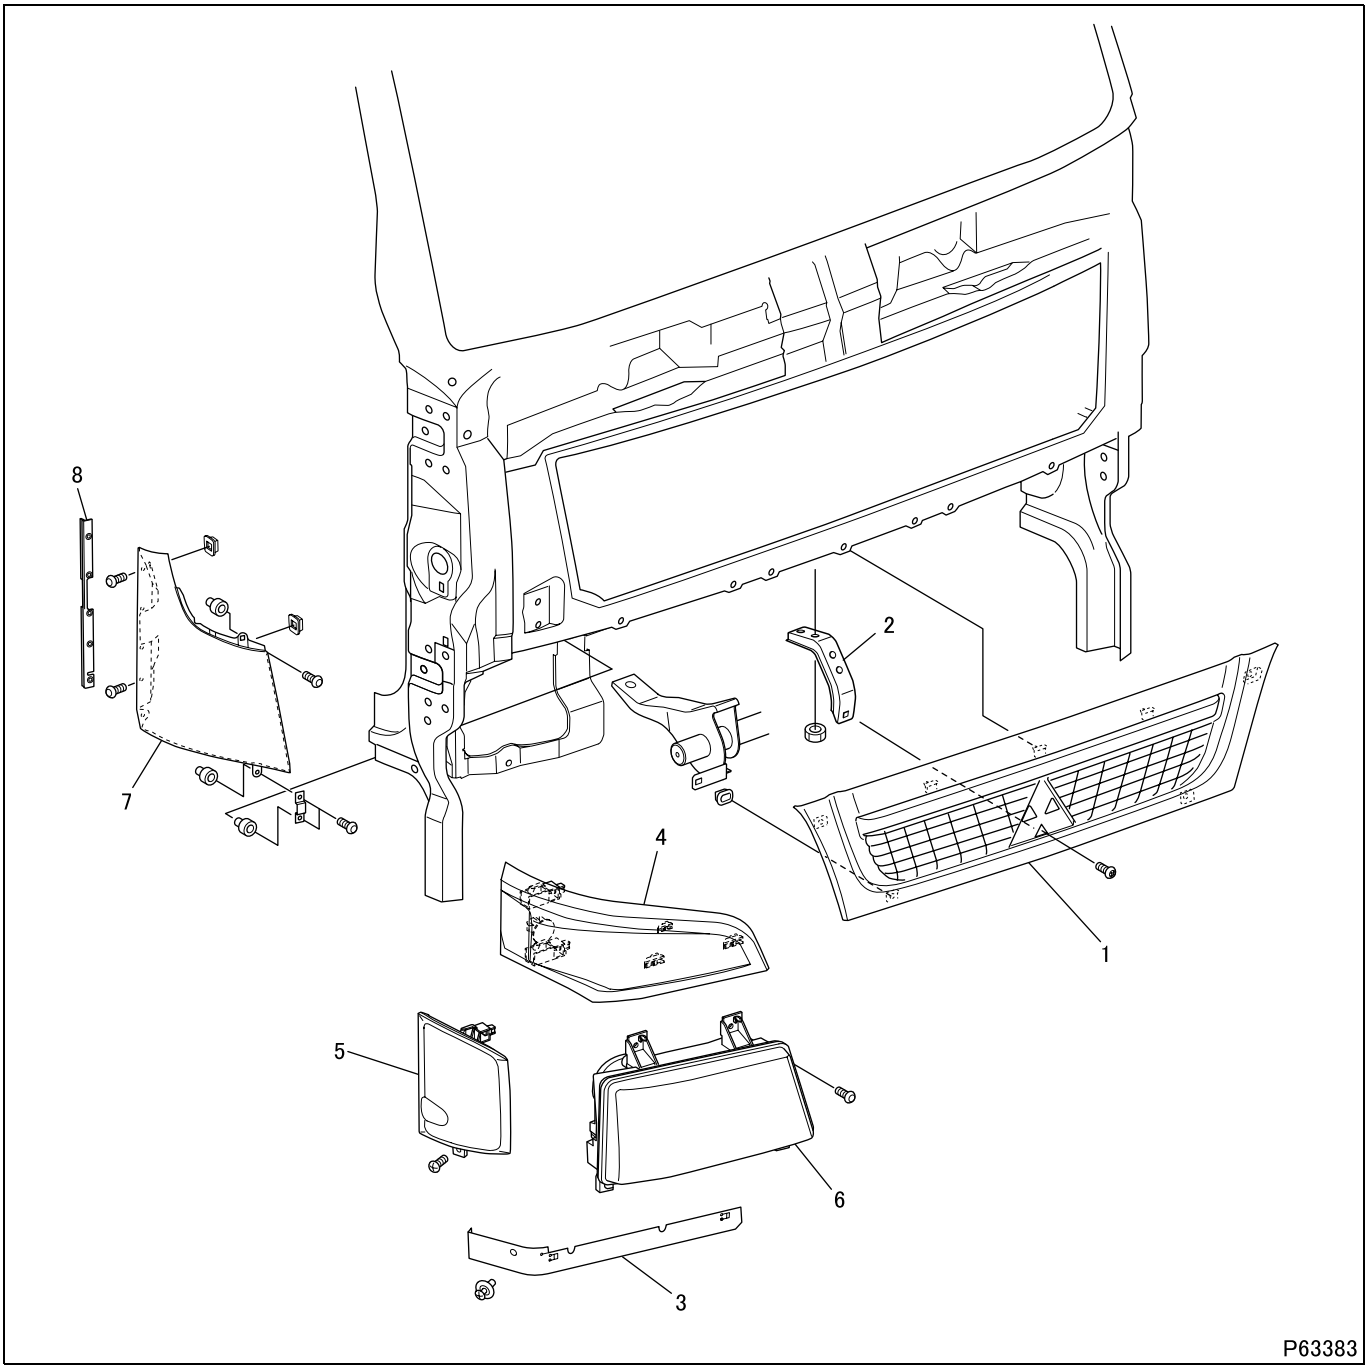


■Removal: Front side cover



■Removal: Front cover

FRONT GRILLE, FRONT CORNER PANEL AND HEADLAMP



● **Disassembly sequence**

1 Front grille
2 Bracket
3 Lamp rubber
4 Turn signal lamp
5 Dummy lamp
6 Headlamp
7 Front corner panel
8 Door opening seal

CAUTION ⚠

- **Do not attempt to forcedly remove lamp rubber, turn signal lamp, dummy lamp and headlamp. Their mounting claws could be damaged.**

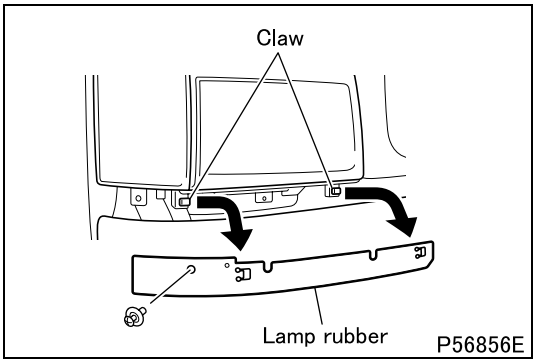
NOTE

- **Do not remove door opening seal unless absolutely necessary.**

● **Assembly sequence**

Follow the disassembly sequence in reverse.

◆Removal procedure◆

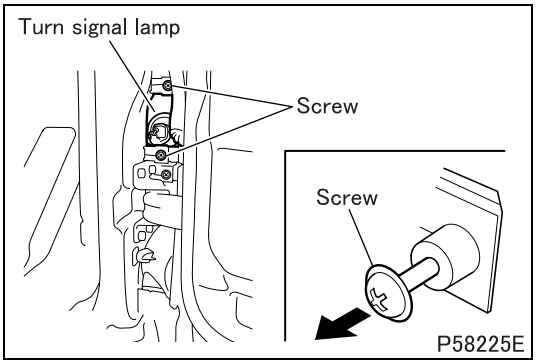


■**Removal: Lamp rubber**

- Slide the lamp rubber sideways to disengage from the claws of the headlamp.

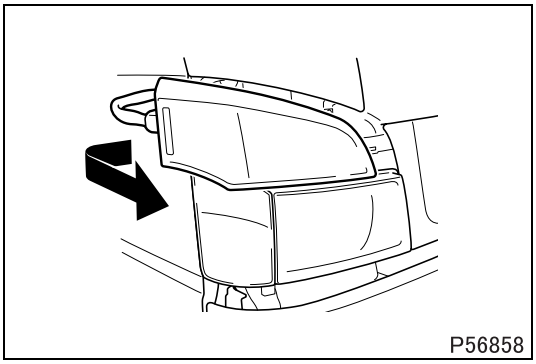
CAUTION ⚠

- **Do not pull the lamp rubber to forcedly remove. It could be damaged.**

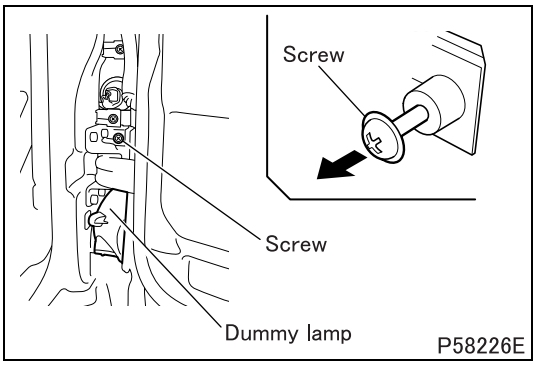


■**Removal: Turn signal lamp**

- Open the door. Loosen screws securing the turn signal lamp from behind to such an extent that they freely turn.
- Draw out the loosened screws.

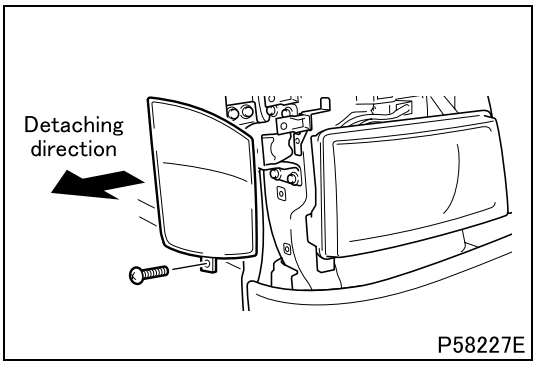


- Close the door. Move the turn signal lamp sideways to disengage its claws.
- Ascertain the disengagement of the claws, then pull out the turn signal lamp.

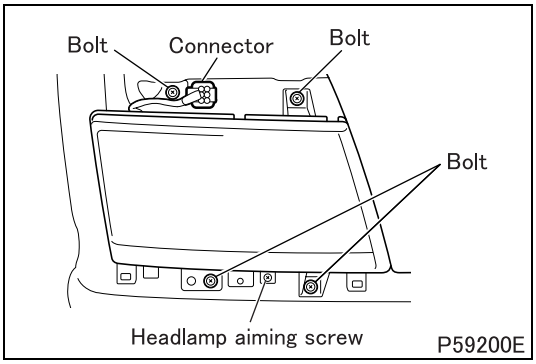


■**Removal: Dummy lamp**

- Open the door. Loosen screw securing the dummy lens from behind to such an extent that it freely turn.
- Pull out the loosened screw.



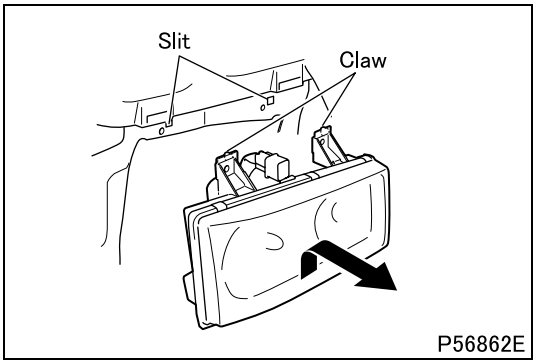
- Close the door, and remove the dummy lamp.



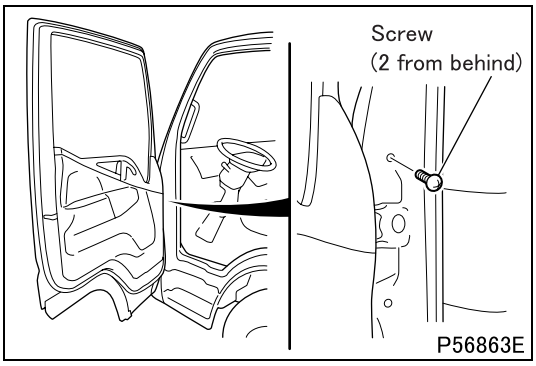
■Removal: Headlamp

CAUTION ⚠

- **The headlamp has aiming screw at the illustrated positions. Do not mistake them for mounting bolts.**



- Lift the headlamp a little to disengage its claws from the slits, then pull it out.



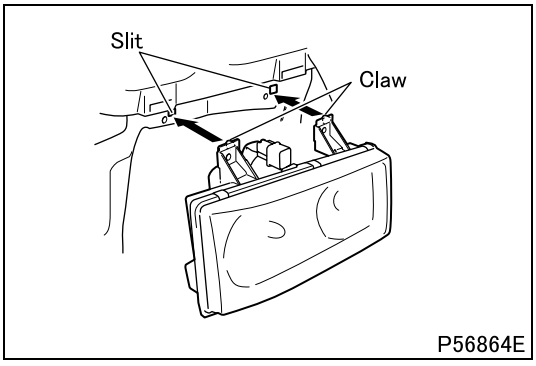
■Removal: Front corner panel

- Open the door. Remove two screws securing the front corner panel from behind.
- Close the door. Remove three screws securing the front corner panel from front.
- Remove the front corner panel.

◆Installation procedure◆

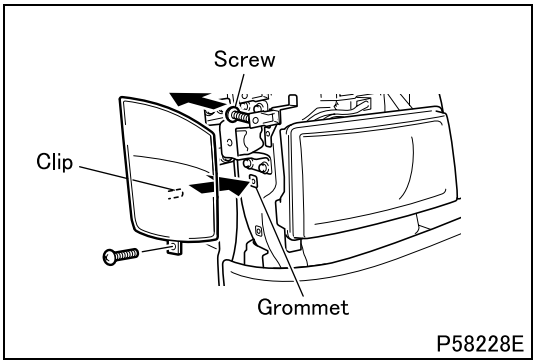
■Installation: Front corner panel

- Perform the removal procedure in reverse. (See **"■Removal: Front corner panel"**.)



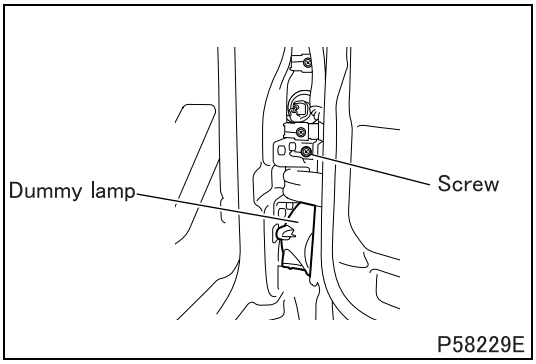
■Installation: Headlamp

- Install the headlamp with its claws inserted in the slits.



■Installation: Dummy lamp

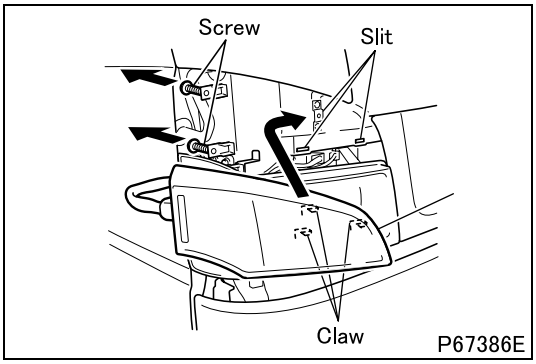
- Check to see if the threaded portion of cab-side screw protrudes. If it does, move it out of the way in the illustrated direction.
- Insert the clip of the dummy lamp into the grommet.



- Open the door. Tighten the screw securing the dummy lens from behind.

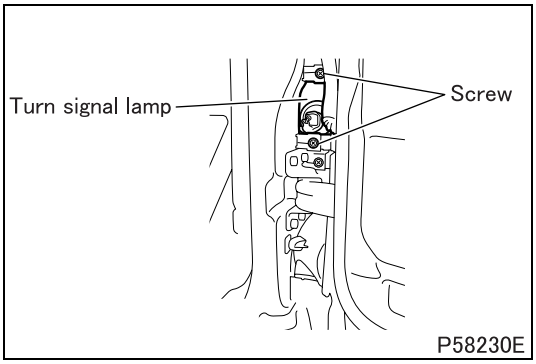
CAUTION ⚠

- **Do not overtighten the screw. Doing so may damage the dummy lamp.**



■Installation: Turn signal lamp

- Check to see if the threaded portions of screws protrude. If they protrude, move them out of the way in the illustrated direction.
- Put the claws of the turn signal lamp in the cab-side slits, then press-fit the lamp sideways into place.



- Open the door, and secure the turn signal lamp by tightening screws from behind.

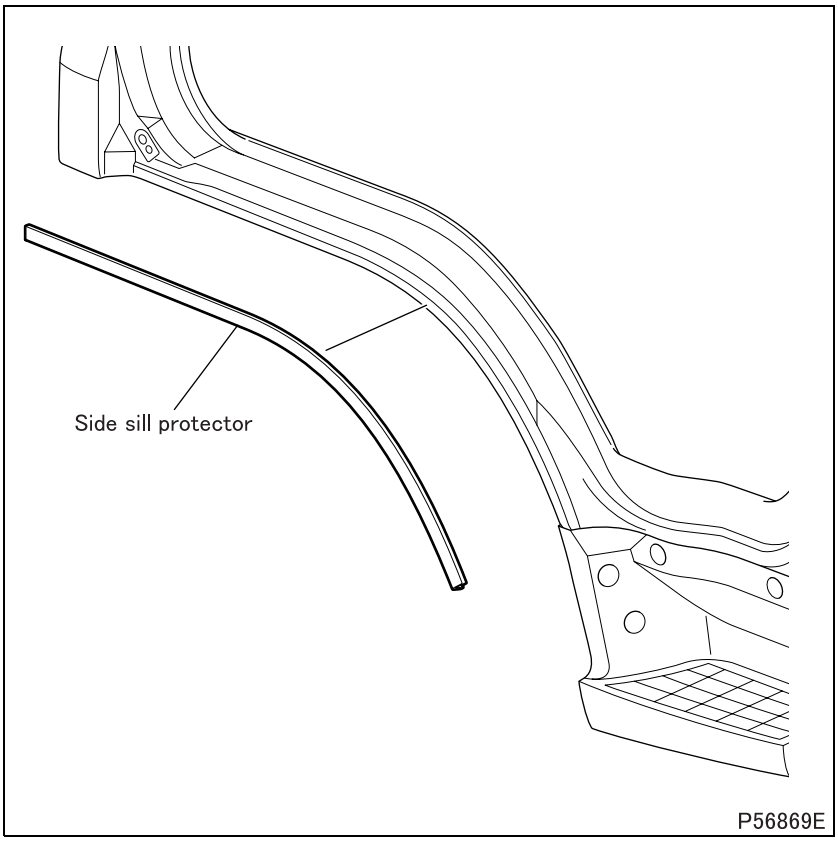
CAUTION ⚠

- **Do not open the door when the turn signal lamp is not seated completely. Doing so may damage the turn signal lamp.**
- **Do not overtighten the screws. Doing so may damage the turn signal lamp.**

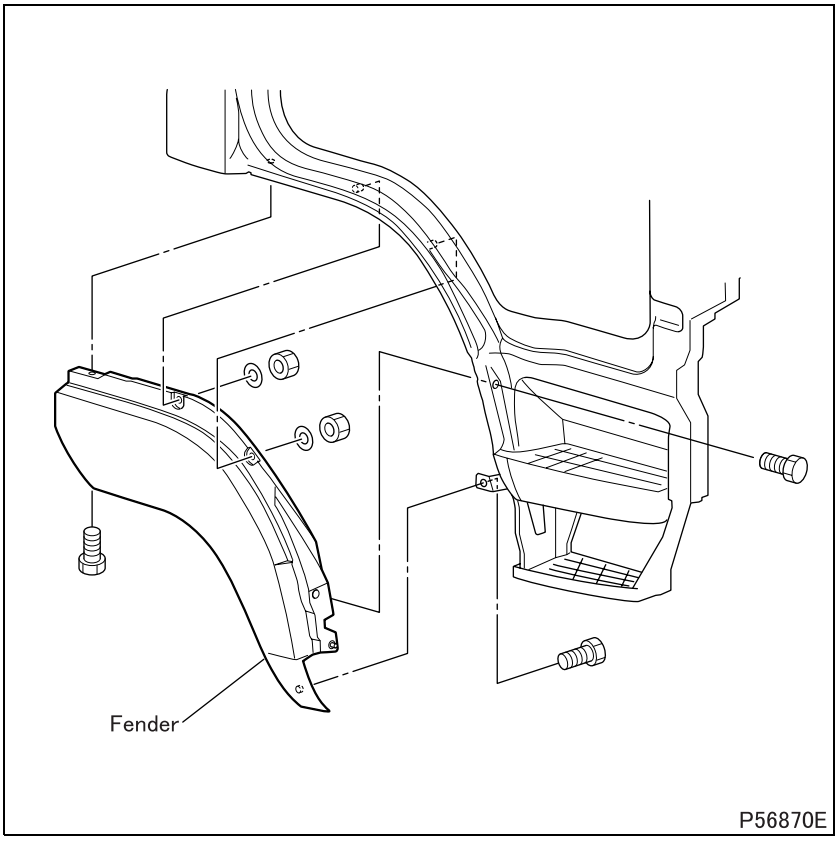
■Installation: Lamp rubber

- Perform the removal procedure in reverse.
  (See **"■Removal: Lamp rubber"**.)

<FE>



<FG>

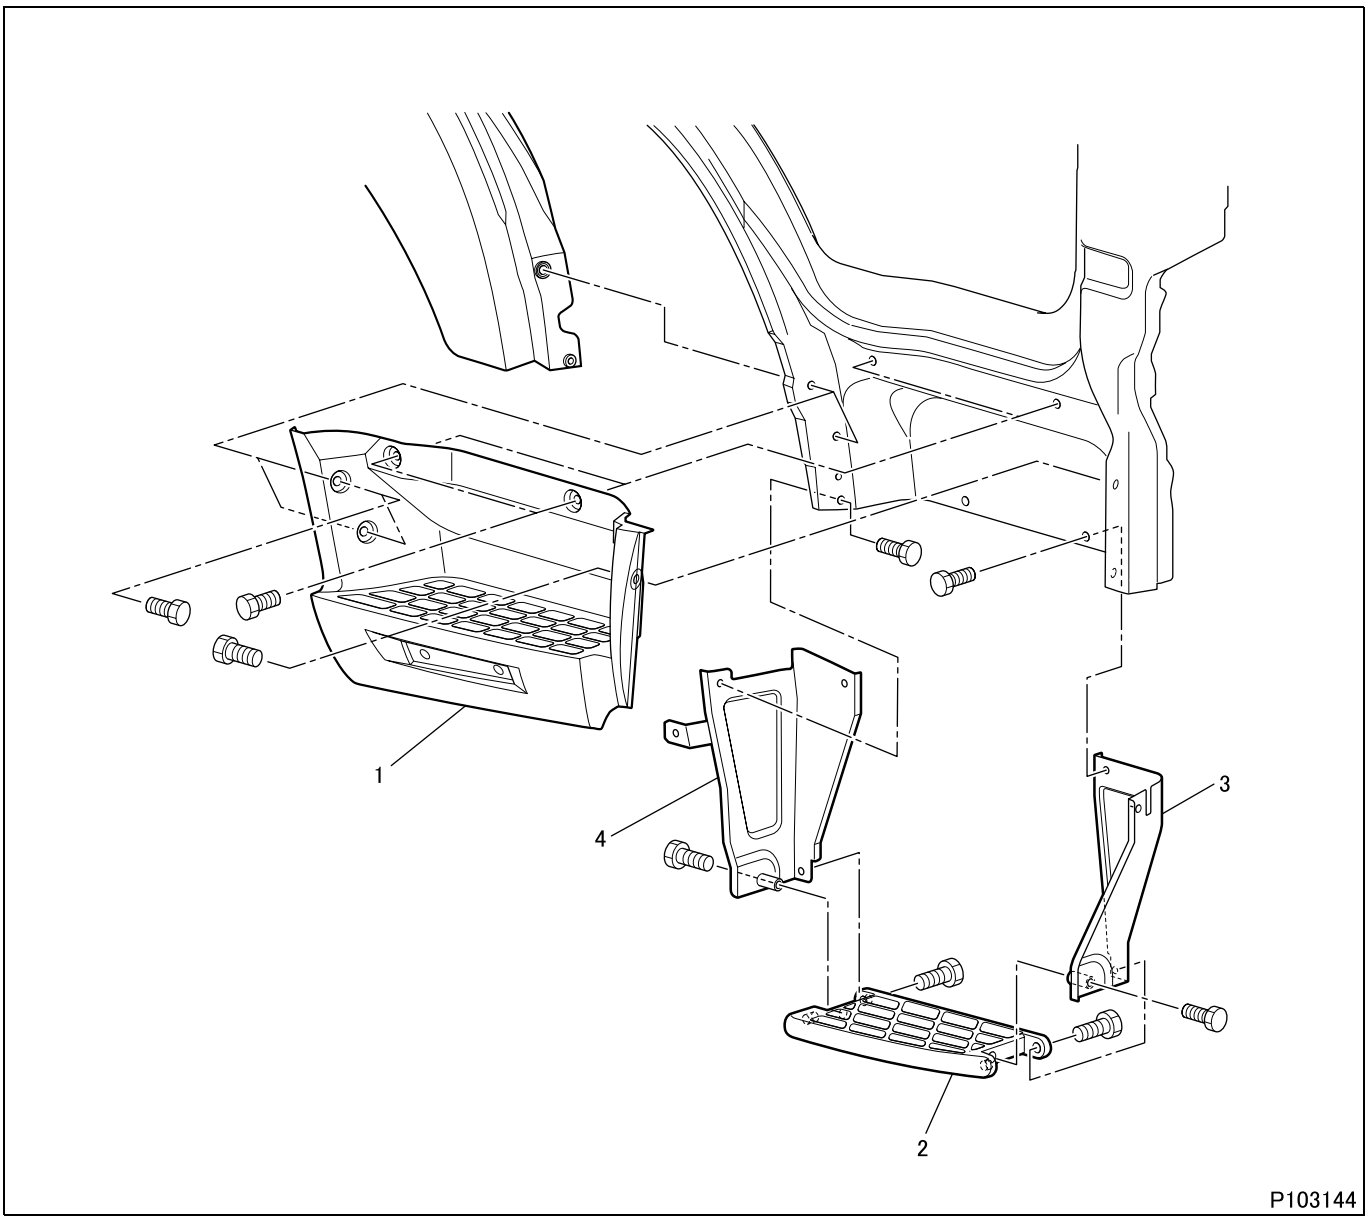


NOTE

- **For details on removal and installation of the fender, see Gr43.**
- **Attach the side sill protector using double-coated adhesive tape.**

M E M O

STEP



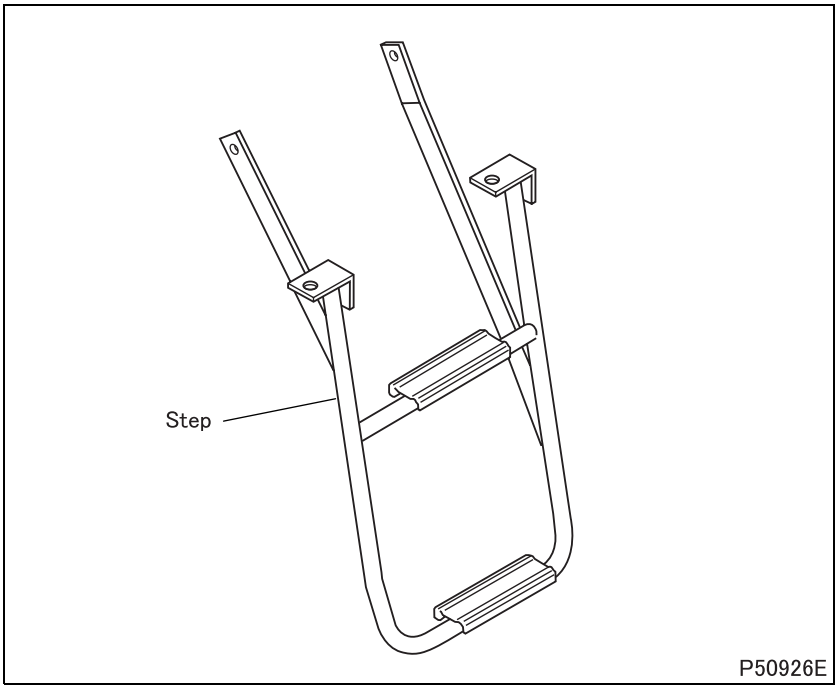
●Removal sequence

1 Step
2 No. 1 step <FG>
3 No. 1 step front bracket <FG>
4 No. 1 step rear bracket <FG>

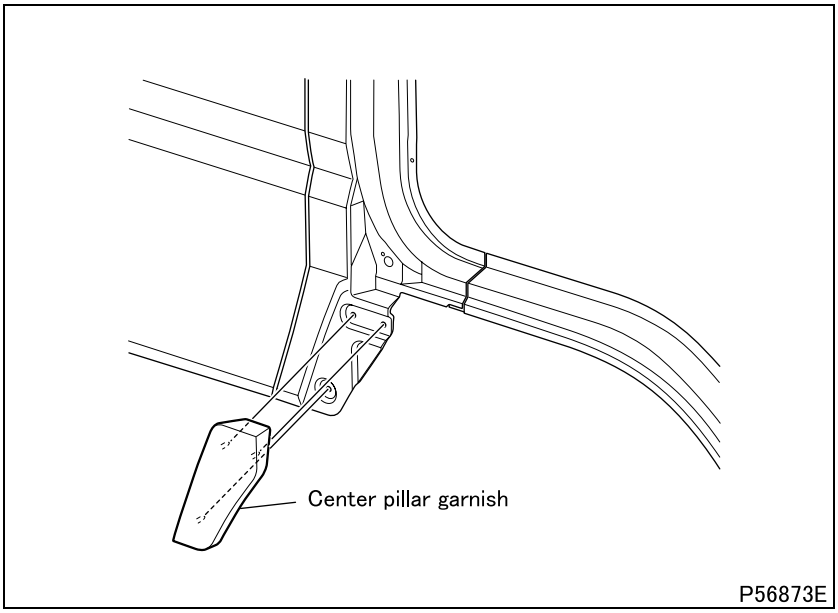
●Installation sequence

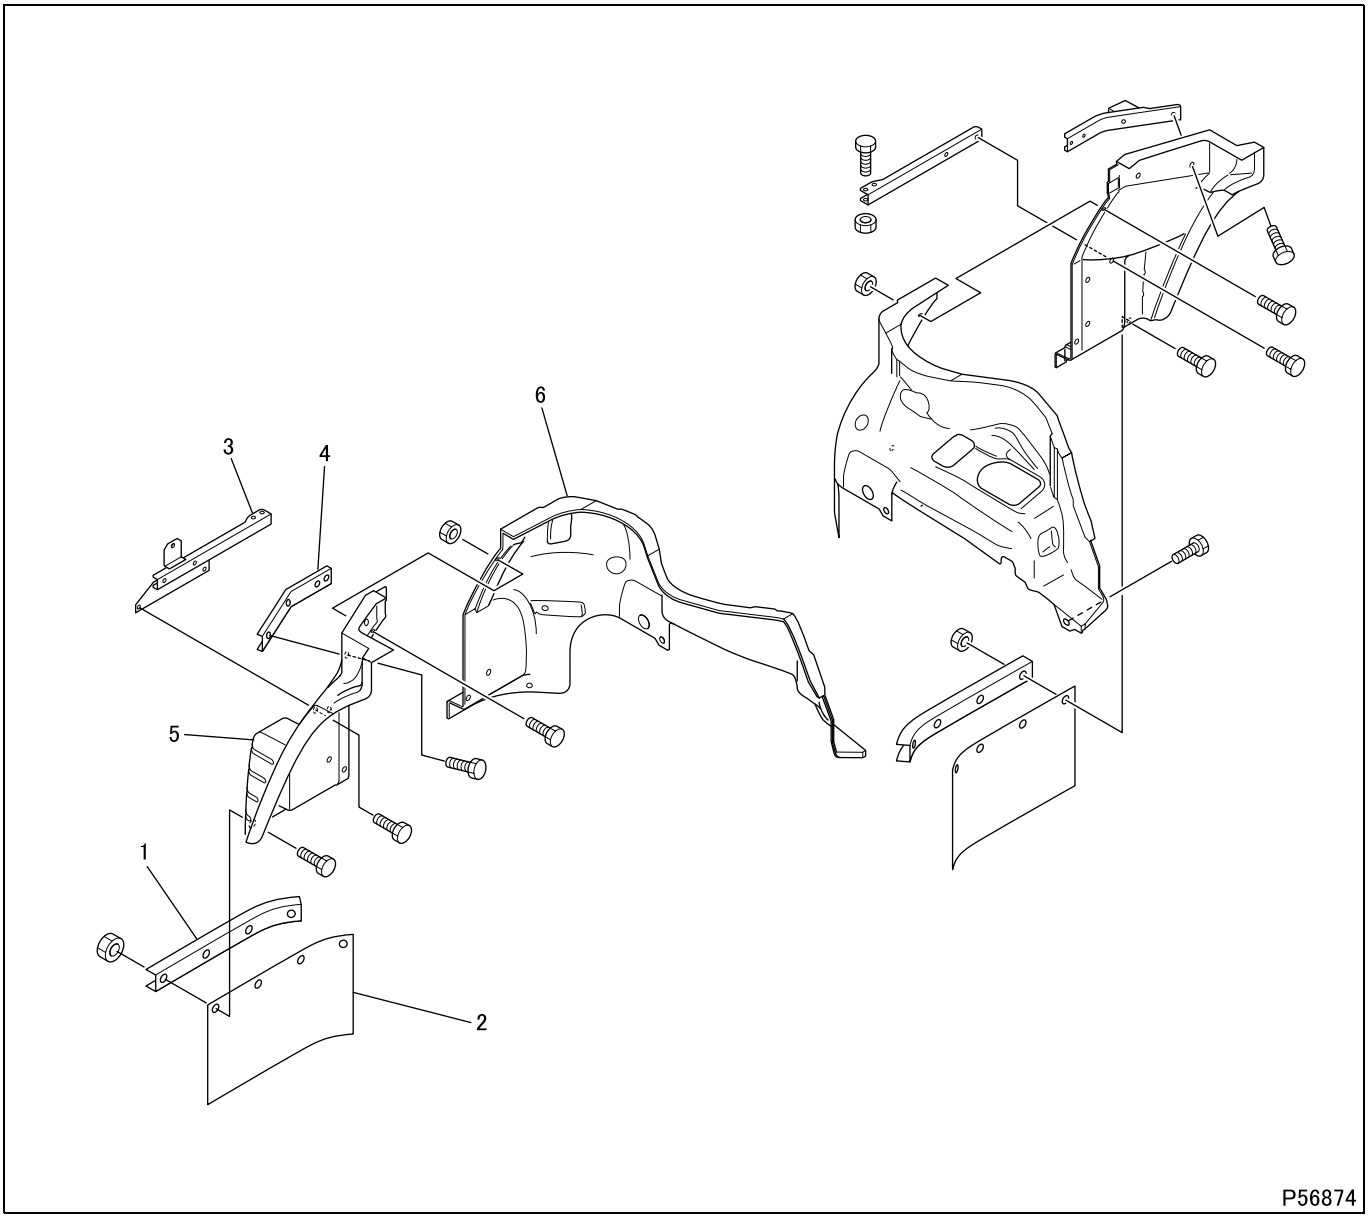
Follow the removal sequence in reverse.

<Rear Step (crew cab)>



GARNISH <CREW CAB>





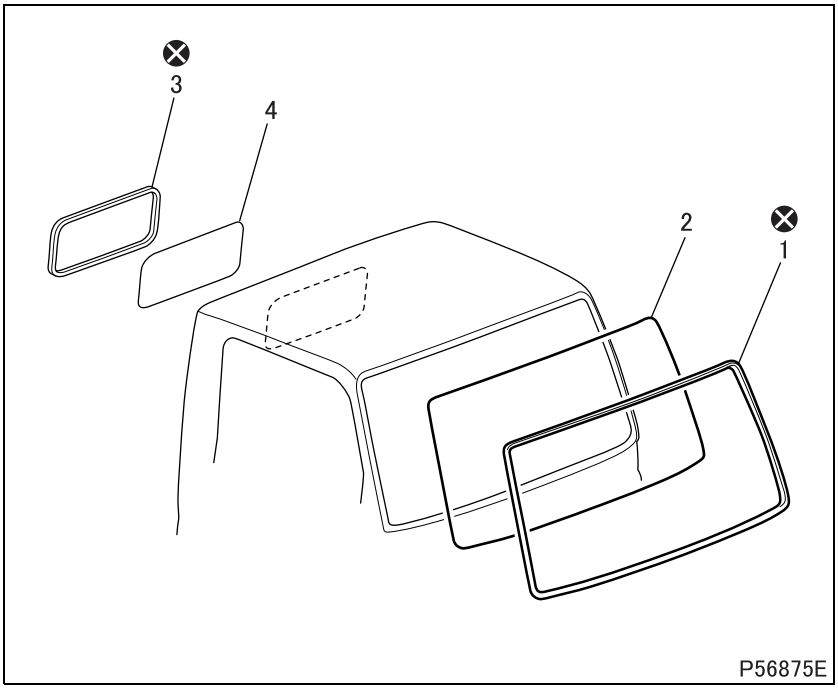
●Removal sequence

1 Apron support
2 Mud guard apron
3 Mud guard lower stay
4 Mud guard upper stay
5 Mud under guard
6 Lower shield panel

●Installation sequence

Follow the removal sequence in reverse.

WINDOW GLASS



●Removal sequence

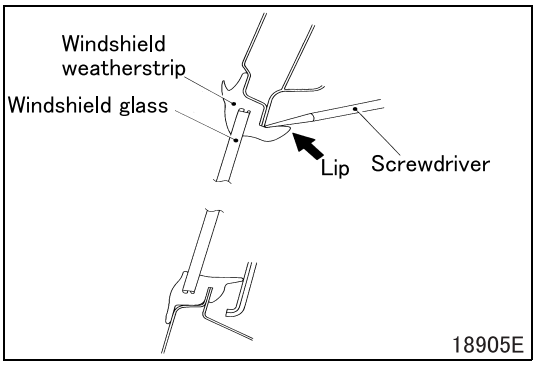
1 Windshield weatherstrip
2 Windshield glass
3 Rear window weatherstrip
4 Rear window glass

⊗: Non-reusable parts

●Installation sequence

Follow the removal sequence in reverse.

◆Removal procedure◆



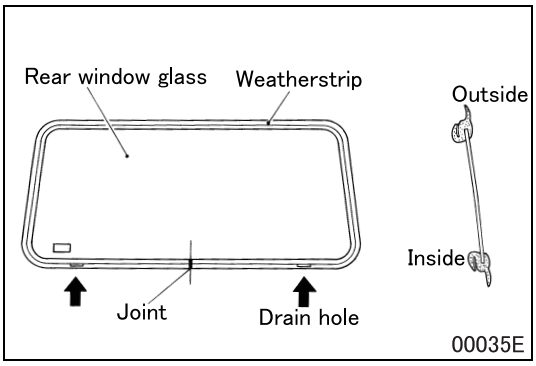
■Removal: Windshield weatherstrip and windshield glass

- While prying up the lip of the weatherstrip with the tip of a screwdriver, push the windshield glass out from inside the cab.

CAUTION ⚠

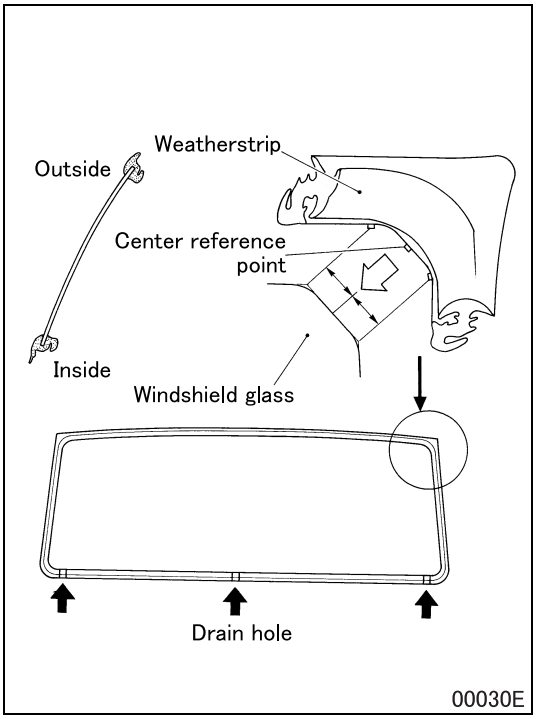
- **Be careful not to damage the painted surface of the cab. Damaged surface may form rust.**

◆Installation procedure◆



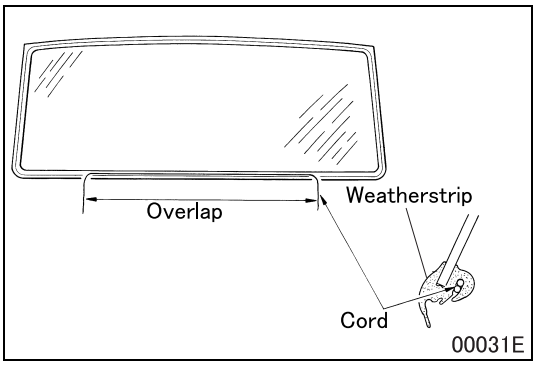
■Installation: Rear window weatherstrip and rear window glass

- Fit the rear window weatherstrip round the rear window glass so that the joint of weatherstrip comes at the bottom center of the glass.
- Except for the point mentioned above, install the rear window glass in the same manner as the windshield glass.

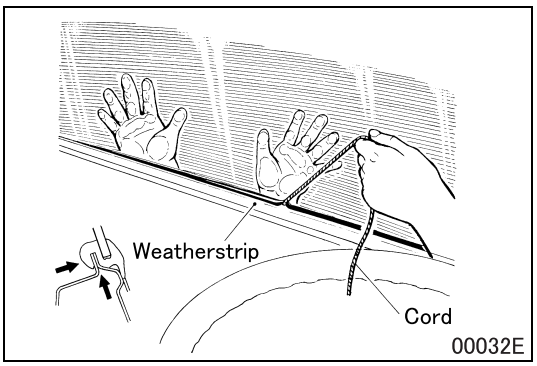


■Installation: Windshield weatherstrip and windshield glass

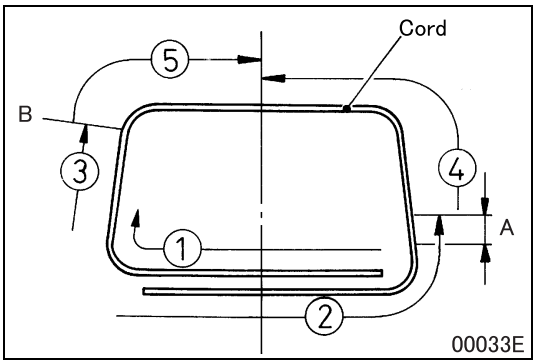
- Install the weatherstrip with its center reference point aligned with the center of the cut at each corner of the glass.



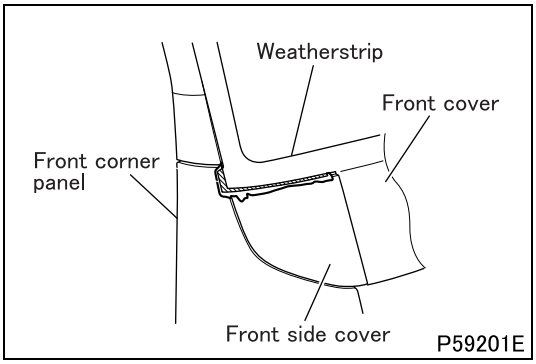
- Put a piece of strong cord in the cab flange fitting groove in the weatherstrip with its end portions overlapped.



- With the glass strongly pushed from outside, pull out the cord by its ends from inside the cab to gradually fit the flange of the cab in the inner groove of the weatherstrip.



- Pull the cord in the numerical order of steps as shown. At the same time, while tapping with a rubber-headed mallet from outside the cab, settle the windshield glass in place in the weatherstrip.
  - A: Approx. 100 mm {3.9 in.} from the beginning of straight portion
  - B: Up to the end of straight portion



- To ensure watertightness, put the hatched part of the weatherstrip inside between the cab and the front cover, front side cover and front corner panel.

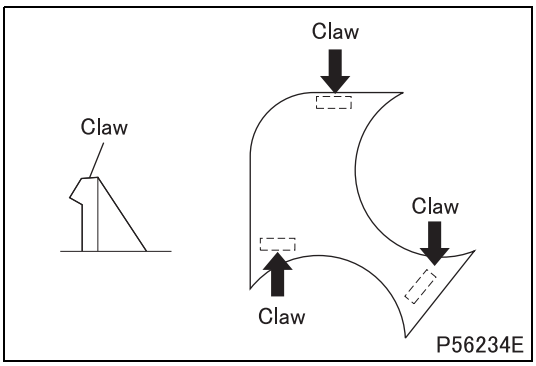
17 Plug
18 Lid (for inspection of fuses)
19 Clip
20 Lower center panel
21 Passenger panel B
22 Clip
23 Passenger panel A
24 Switch or plug
25 Clip (× 3 <FE>, × 4 <FG>)
26 Driver panel

M/T: Manual transmission
A/T: Automatic transmission

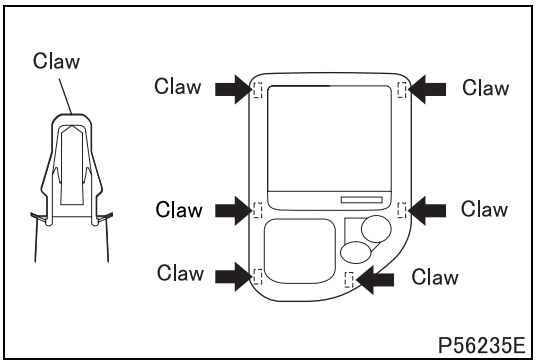
● Installation sequence

Follow the removal sequence in reverse.

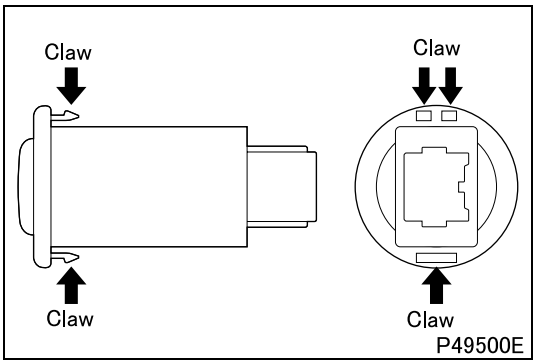
◆Removal procedure◆



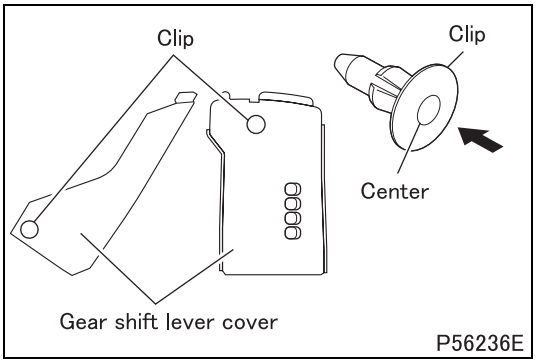
■ **Removal: Panel cover**



■ **Removal: Upper center panel**

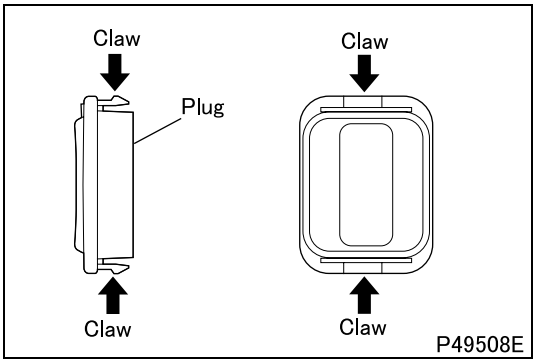


■ **Removal: Hazard switch**

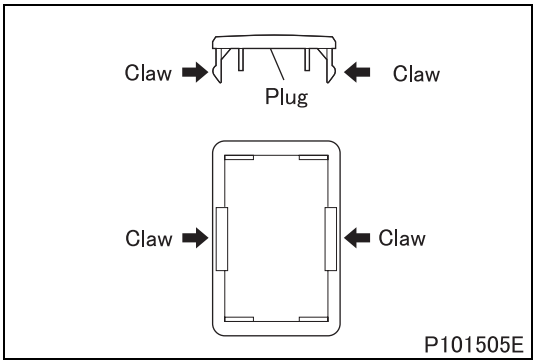


■ **Removal: Gear shift lever cover**

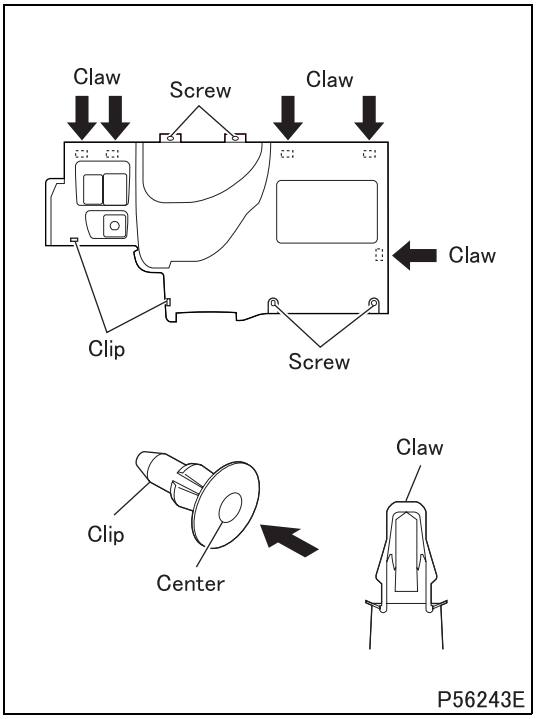
- Push the clips (× 3) in the center to disengage them from the gear shift lever cover.



■ **Removal: Plug**

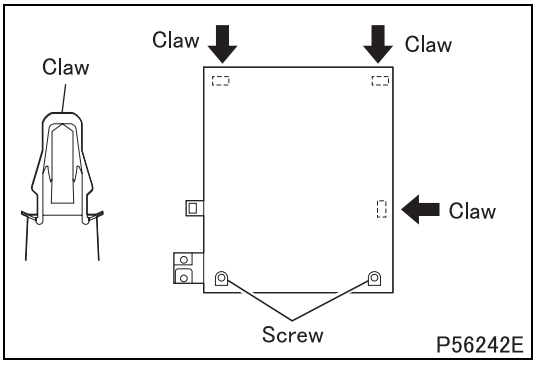


■ **Removal: Plug**

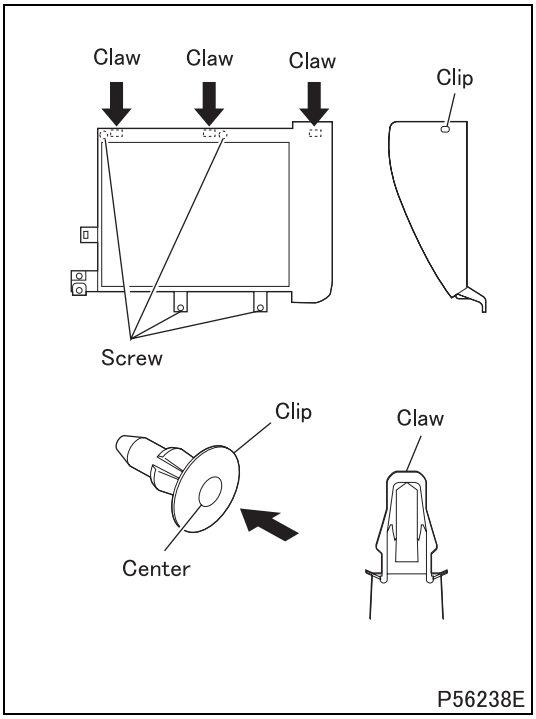


■ **Removal: Lower center panel**

- Remove the screws (× 4) from the lower center panel.
- Push the clips (× 2) in the center to disengage them from the lower center panel.

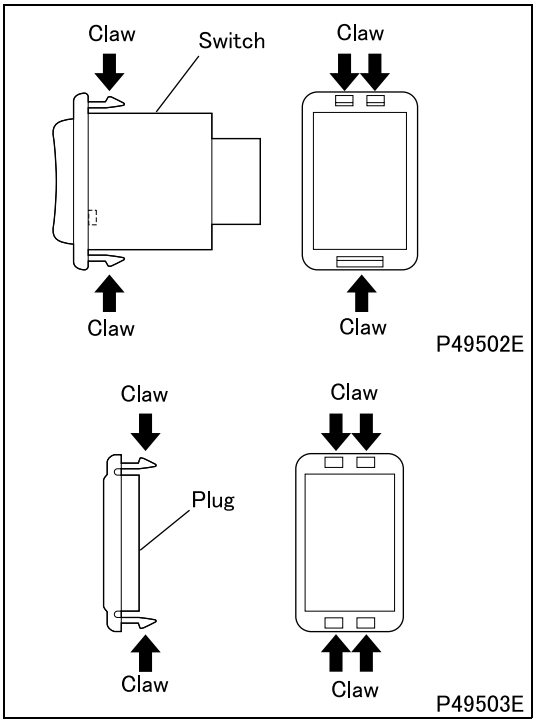


■ **Removal: Passenger panel B**

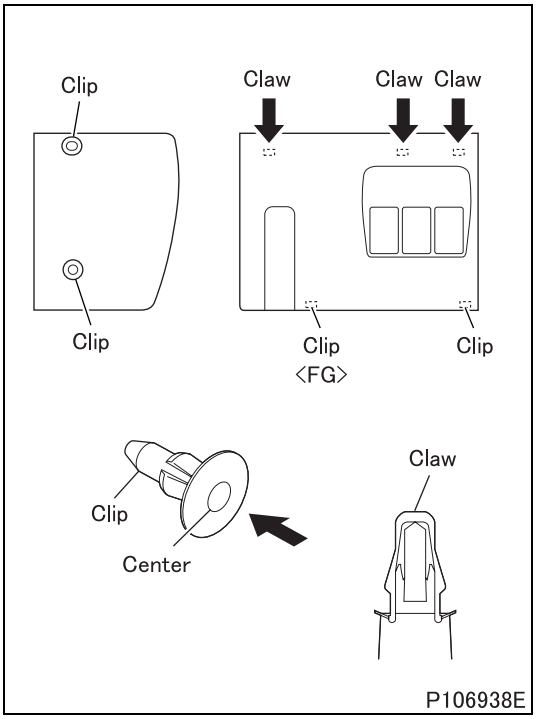


■ **Removal: Passenger panel A**

- Remove the screws (× 4) from the passenger panel.
- Push the clip (× 1) in the center to disengage it from the passenger panel.



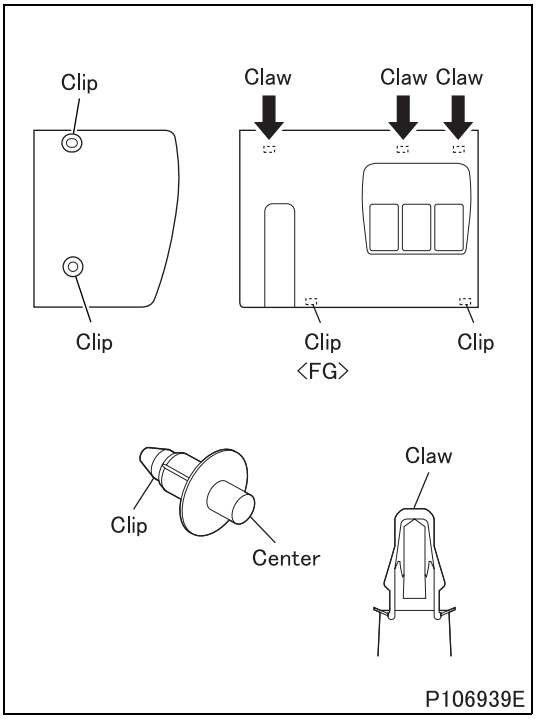
■ **Removal: Switch or plug**



■ **Removal: Driver panel**

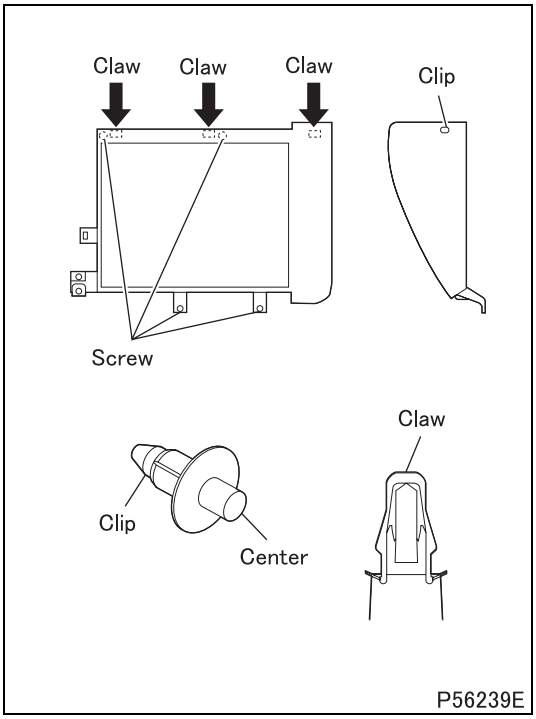
- Push the clips (× 3 <FE>, × 4 <FG>) in the center to disengage them from the driver panel.

◆Installation procedure◆



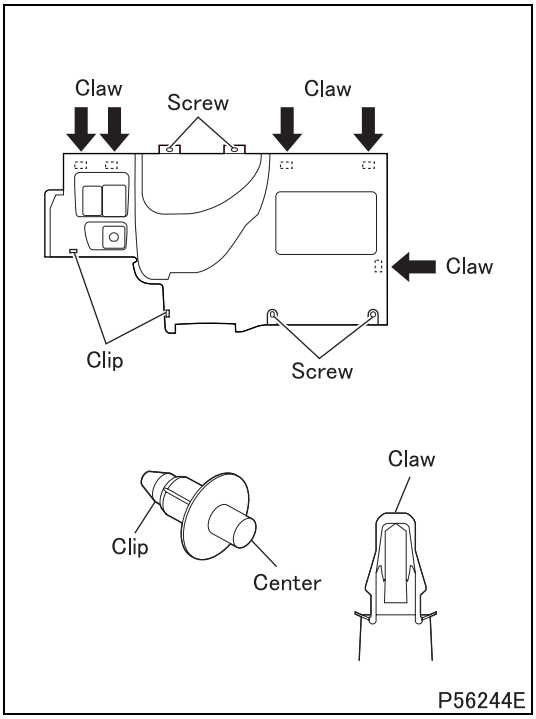
■ **Installation: Driver panel**

- Insert the clips (× 3 <FE>, × 4 <FG>) at the illustrated locations and push them in the center to engage into the driver panel.



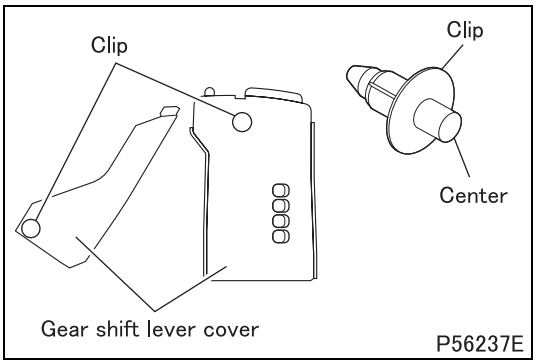
■ **Installation: Passenger panel A**

- Insert the clip (× 1) at the illustrated location and push it in the center to engage into the passenger panel.
- Install the screws (× 4) to the passenger panel.



■ **Installation: Lower center panel**

- Insert the clips (× 2) at the illustrated locations and push them in the center to engage into the lower center panel.
- Install the screws (× 4) to the lower center panel.

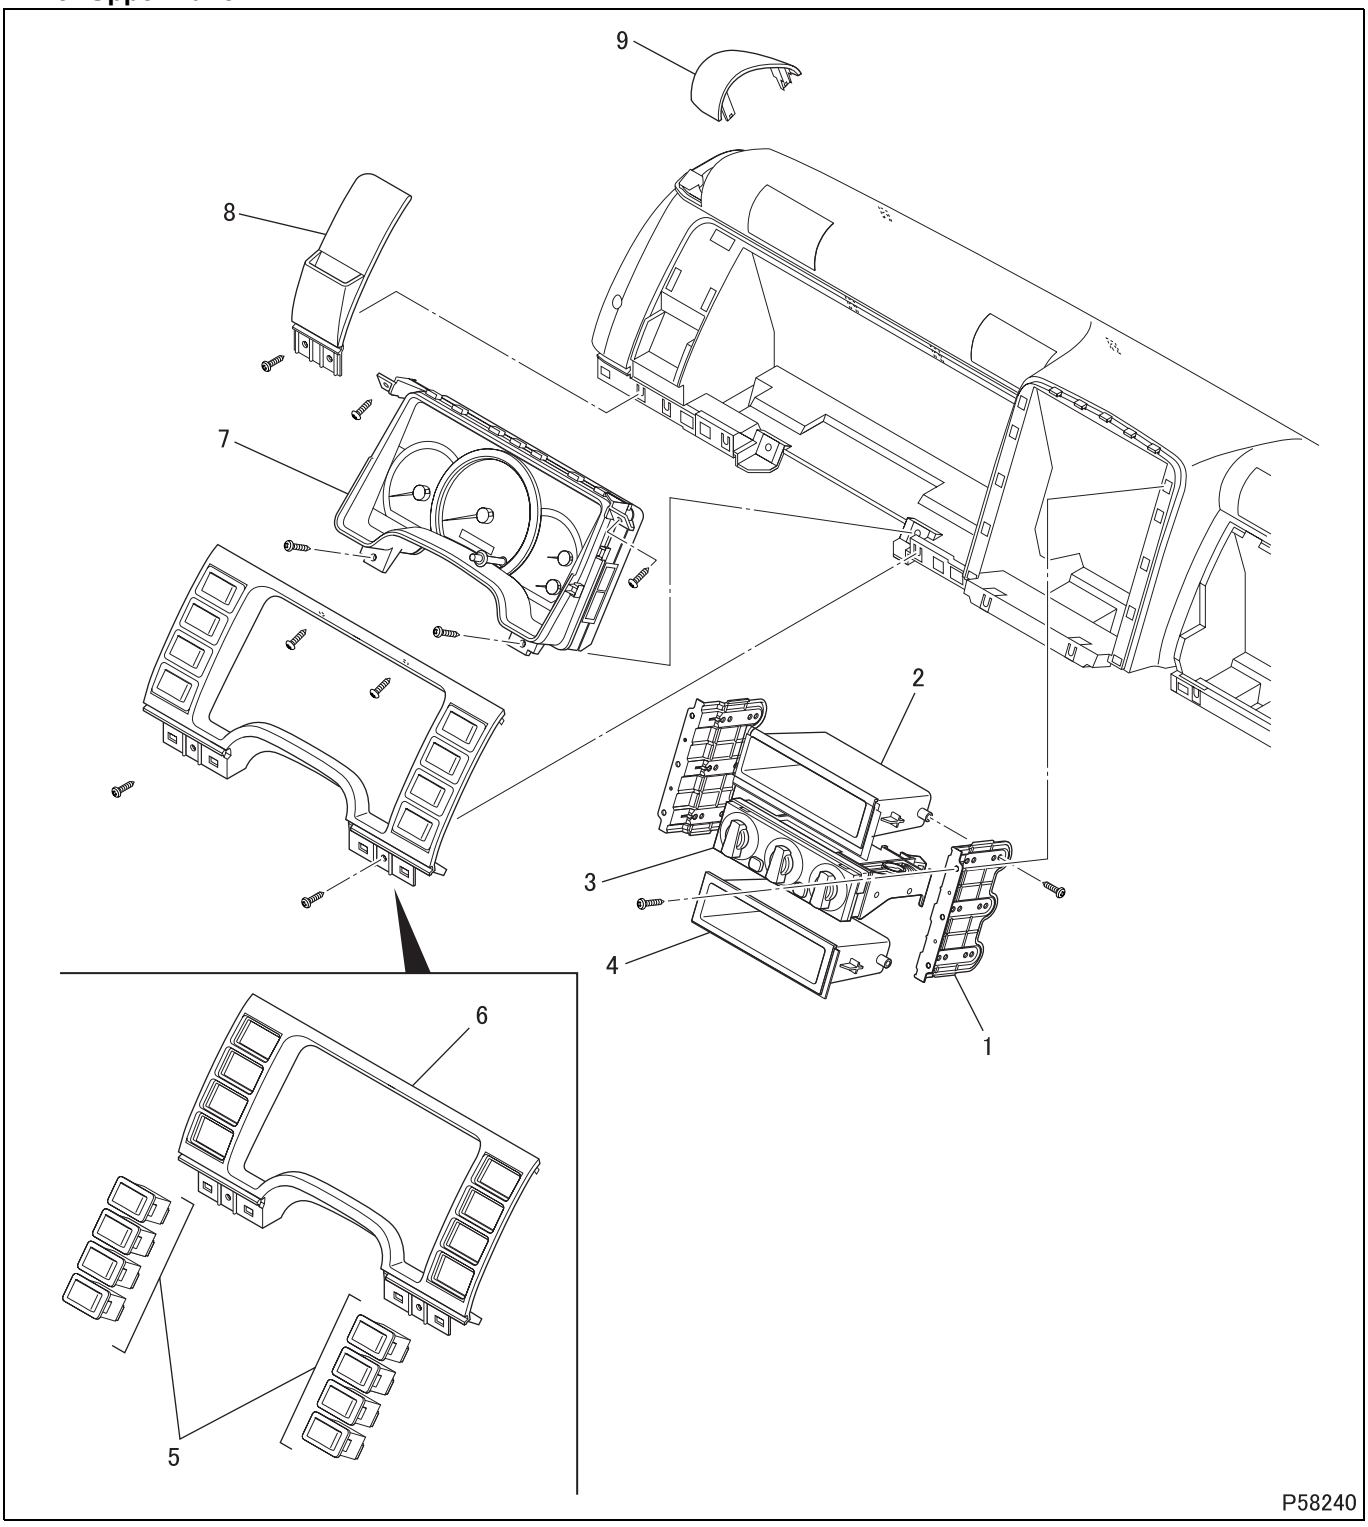


■ **Installation: Gear shift lever cover**

- Insert the clips (× 3) at the illustrated locations and push them in the center to engage into the gear shift lever cover.

INSTRUMENT PANEL

Driver Upper Panel



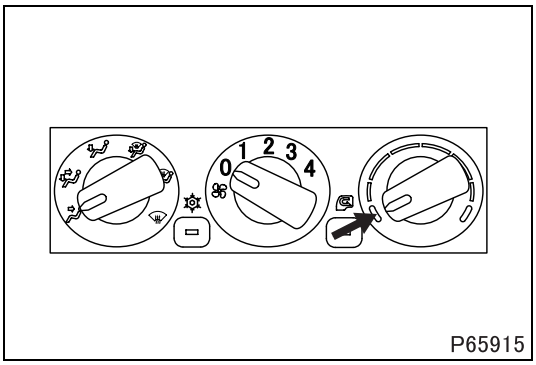
● **Removal sequence**

1 Radio bracket
2 Box
3 Heater control unit
4 Box
5 Switch or plug
6 Meter bezel
7 Meter cluster
8 Lid (accessories box)
9 Lid (brake fluid tank)

● **Installation sequence**

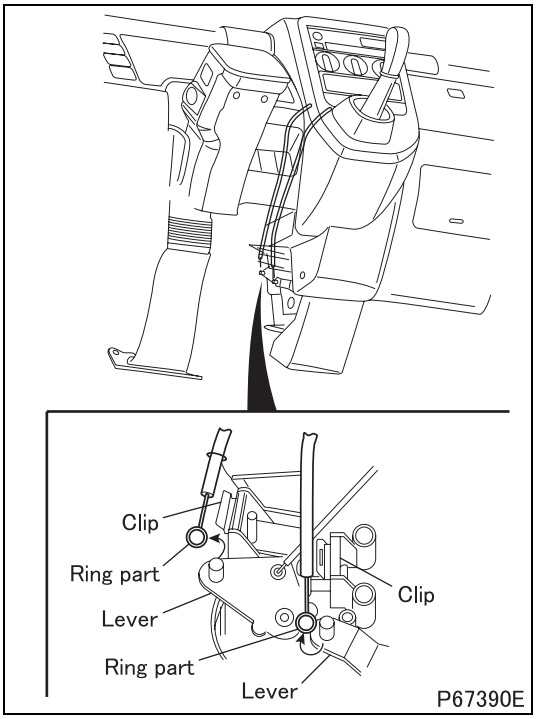
Follow the removal sequence in reverse.

◆Work before removal◆

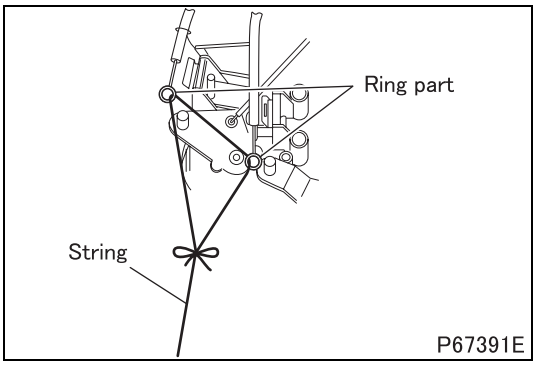


■ **Removal: Control cables**

- Turn the temperature control knob of the heater controls to the MAX-COOL position.

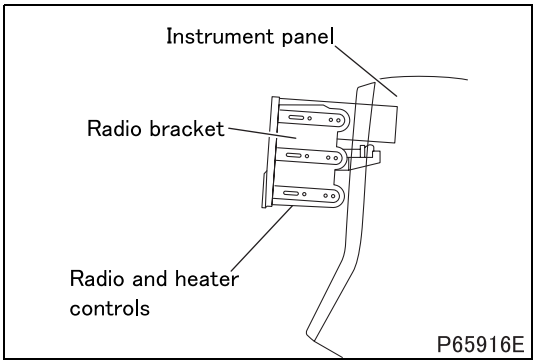


- Before disconnecting the cables from the levers, put pairing marks on each cable and its lever.
- Disconnect the control cables from the heater unit.



- In order that the control cables can be pulled back at the time of installation, attach string to the ring parts of the cables as shown in the illustration.

◆Removal procedure◆

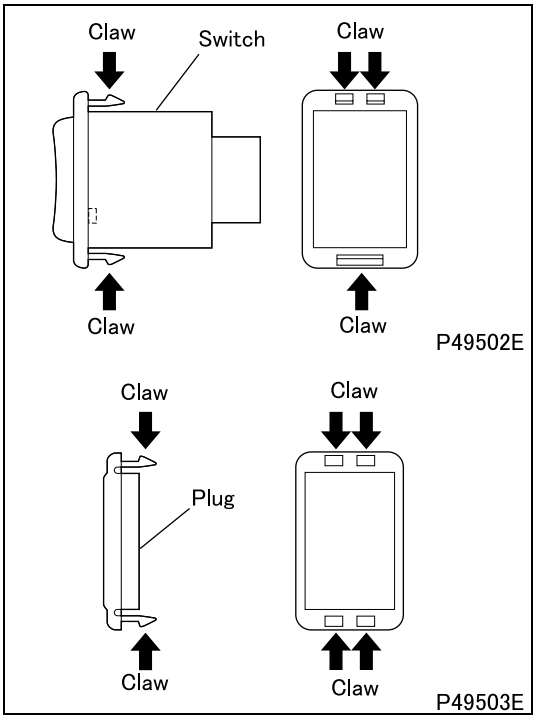


■ **Removal: Radio bracket**

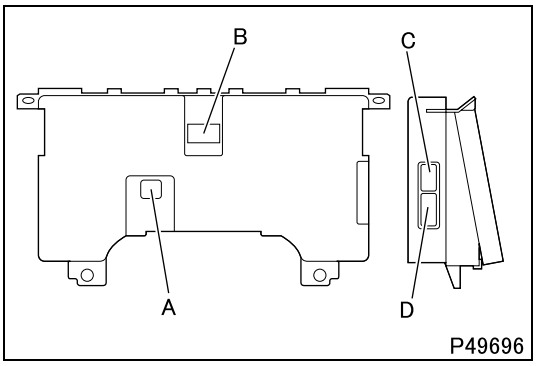
- Pull out the radio bracket for radio and heater controls until it completely comes out of the instrument panel as shown in the illustration.

CAUTION ⚠

- **Do not pull the bracket with a strong force. Pulling it strongly could give damage to the heater controls and control cables.**



■ **Removal: Switch or plug**

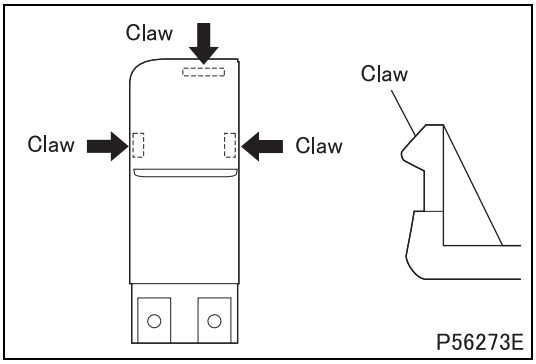


■ **Removal: Meter cluster**

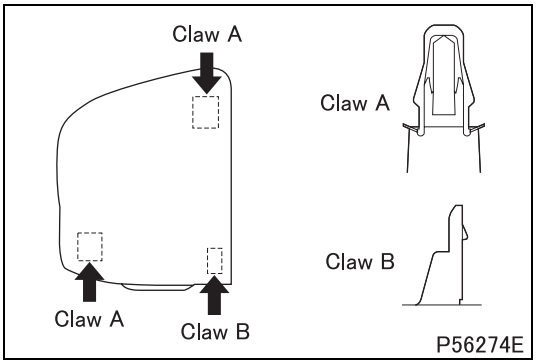
- Disconnect the cab harness connectors A to D from the meter cluster and remove the meter cluster from the instrument panel. (The illustration shows the rear face of the meter cluster.)

Connector poles

A	B	C	D
10	20	18	22

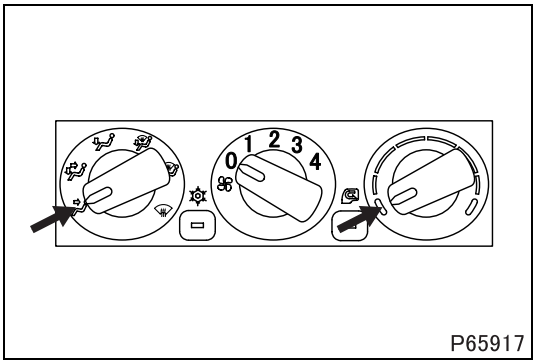


■ **Removal: Lid (accessories box)**



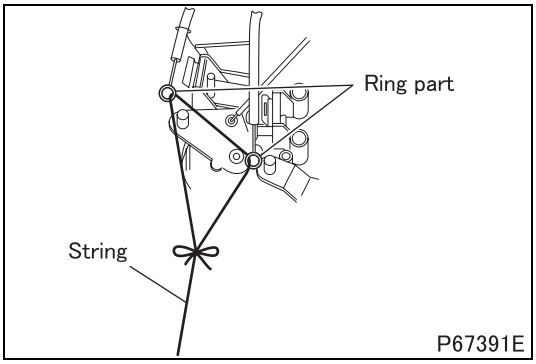
■ **Removal: Lid (brake fluid tank)**

◆Work after installation◆



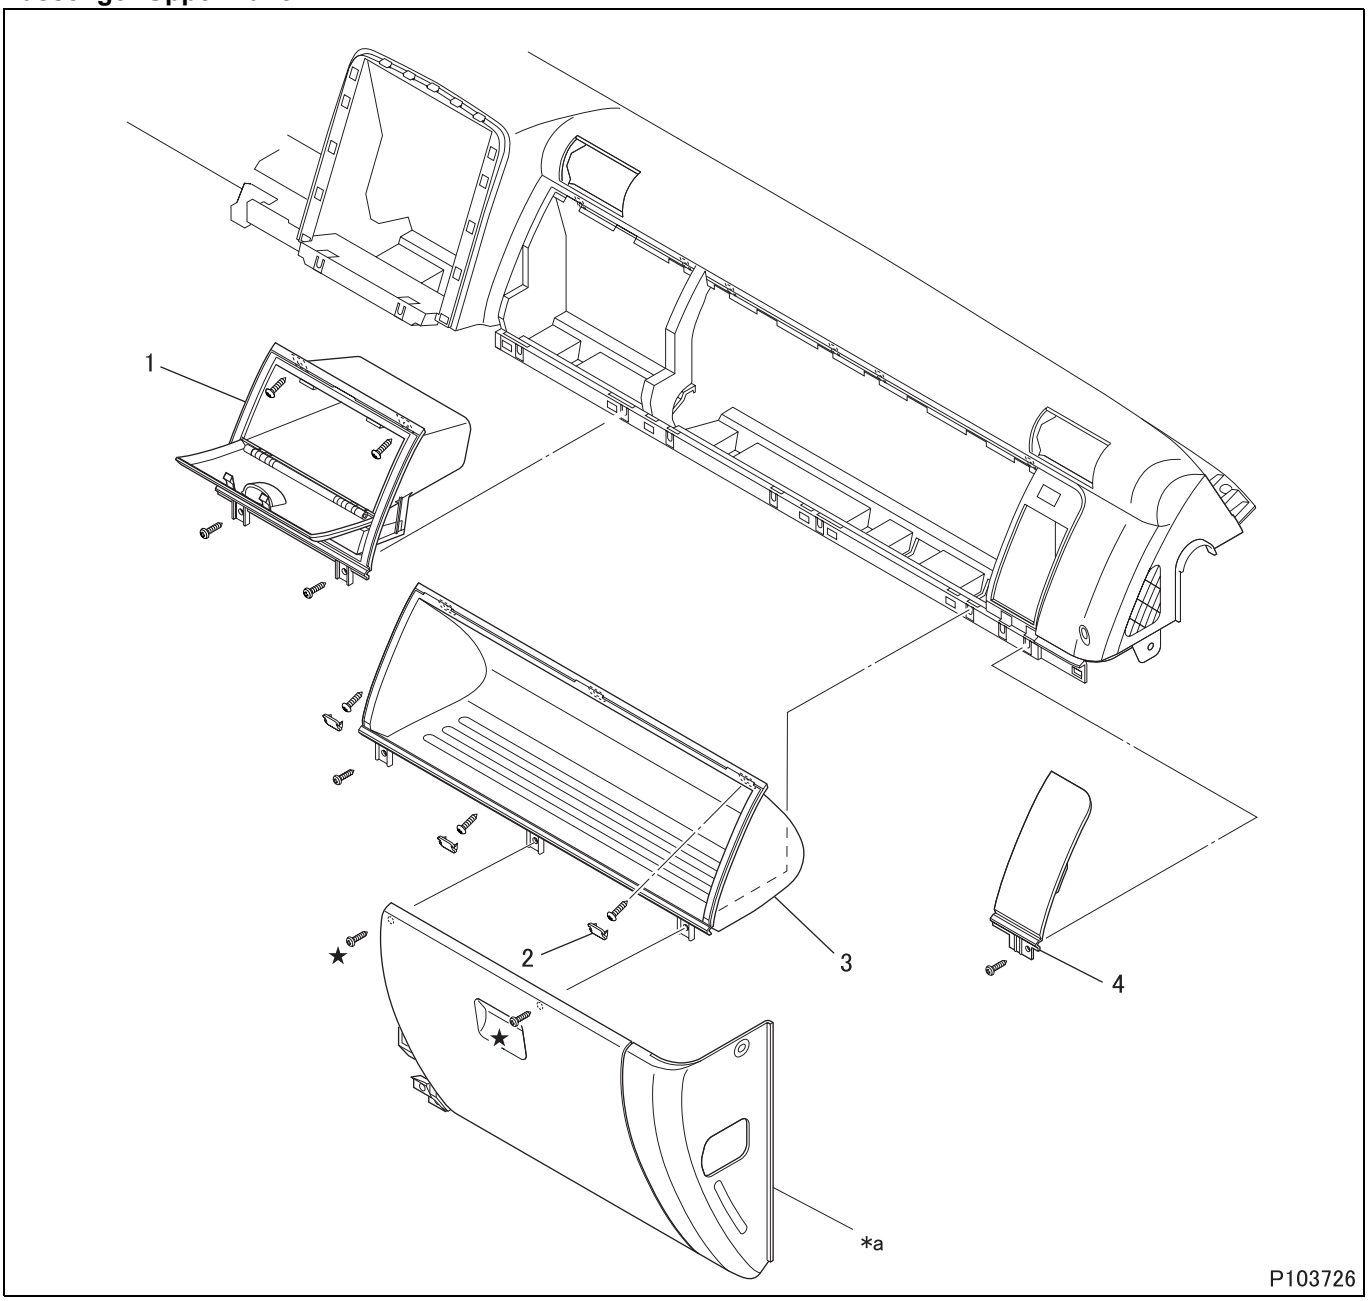
■**Installation: Control cables**

- Of the heater controls, turn the temperature control knob to the MAX-COOL position and also turn the mode selector knob to the face position.



- Pull out the control cables using the string that was attached to them at the time of removal.
- According to the pairing marks, reconnect the cables to the heater unit levers correctly. (See Gr55.)

Passenger Upper Panel



●Removal sequence

1 Glove box
2 Plug
3 Parcel tray
4 Lid

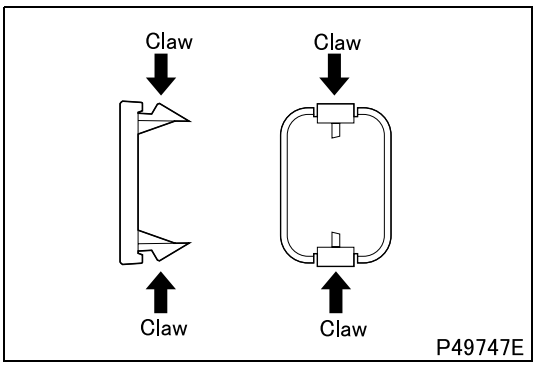
***a**: Passenger panel A

- ★ marked: Fastened together with passenger panel A

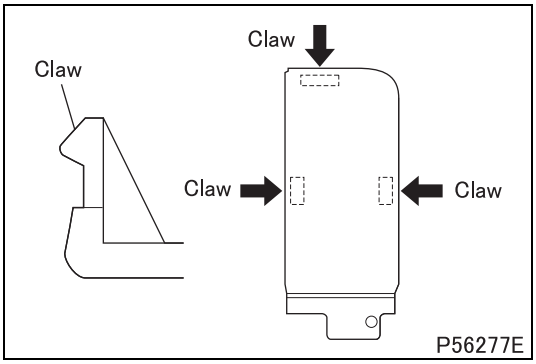
● Installation sequence

Follow the removal sequence in reverse.

◆Removal procedure◆



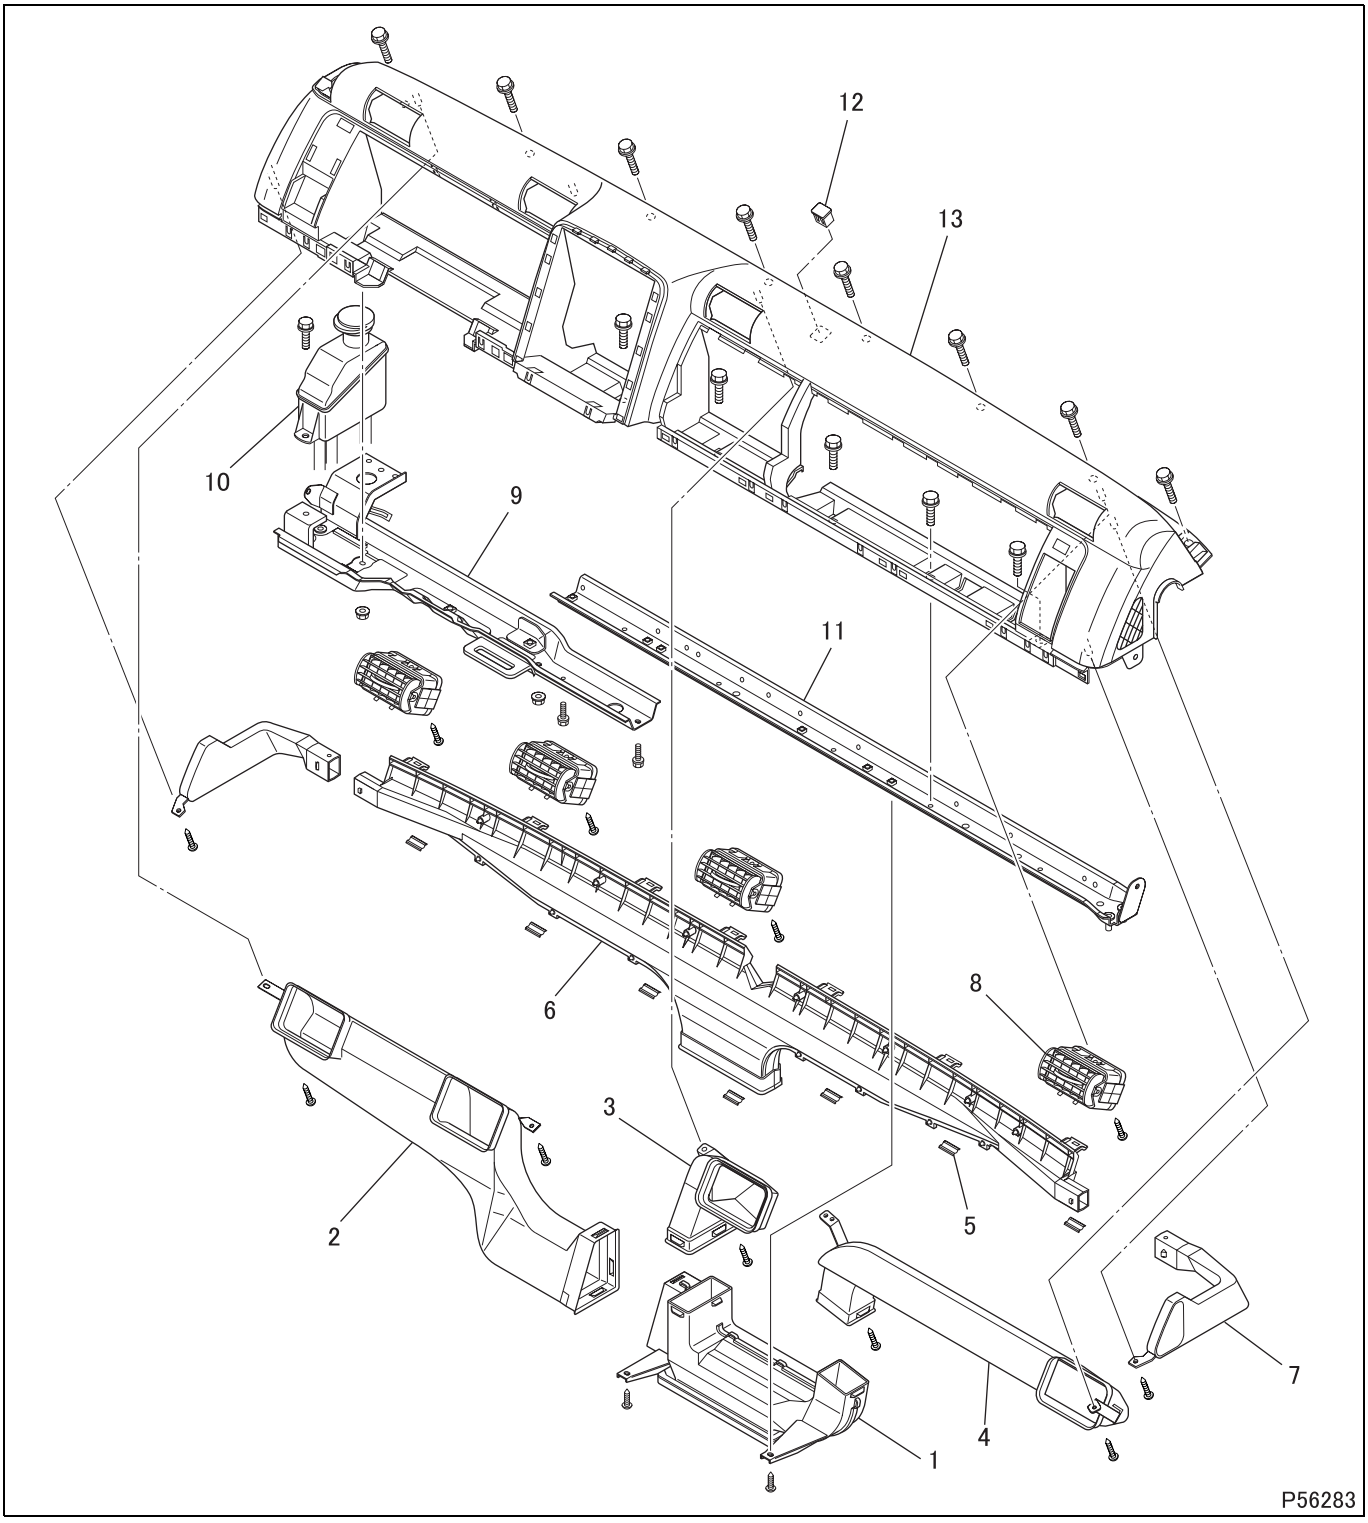
■ Removal: Plug



■ Removal: Lid

INSTRUMENT PANEL

Instrument Panel



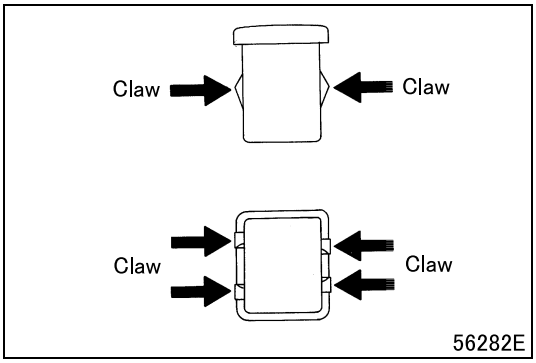
● **Removal sequence**

1 Center duct
2 Driver face duct
3 Center face duct
4 Passenger face duct
5 Clip (× 7)
6 Front defroster duct
7 Side defroster duct
8 Air outlet grille
9 Driver instrument panel frame
10 Brake fluid tank
11 Passenger instrument panel frame
12 Plug
13 Instrument panel

● Installation sequence

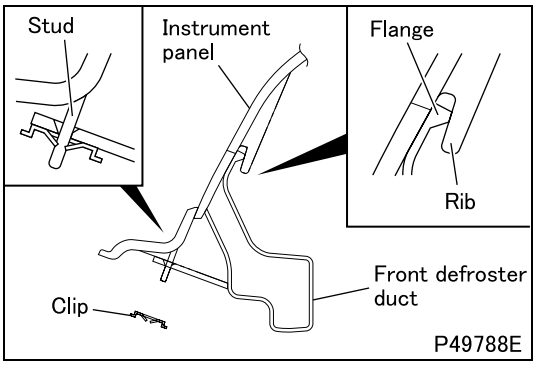
Follow the removal sequence in reverse.

◆Removal procedure◆



■ **Removal: Plug**

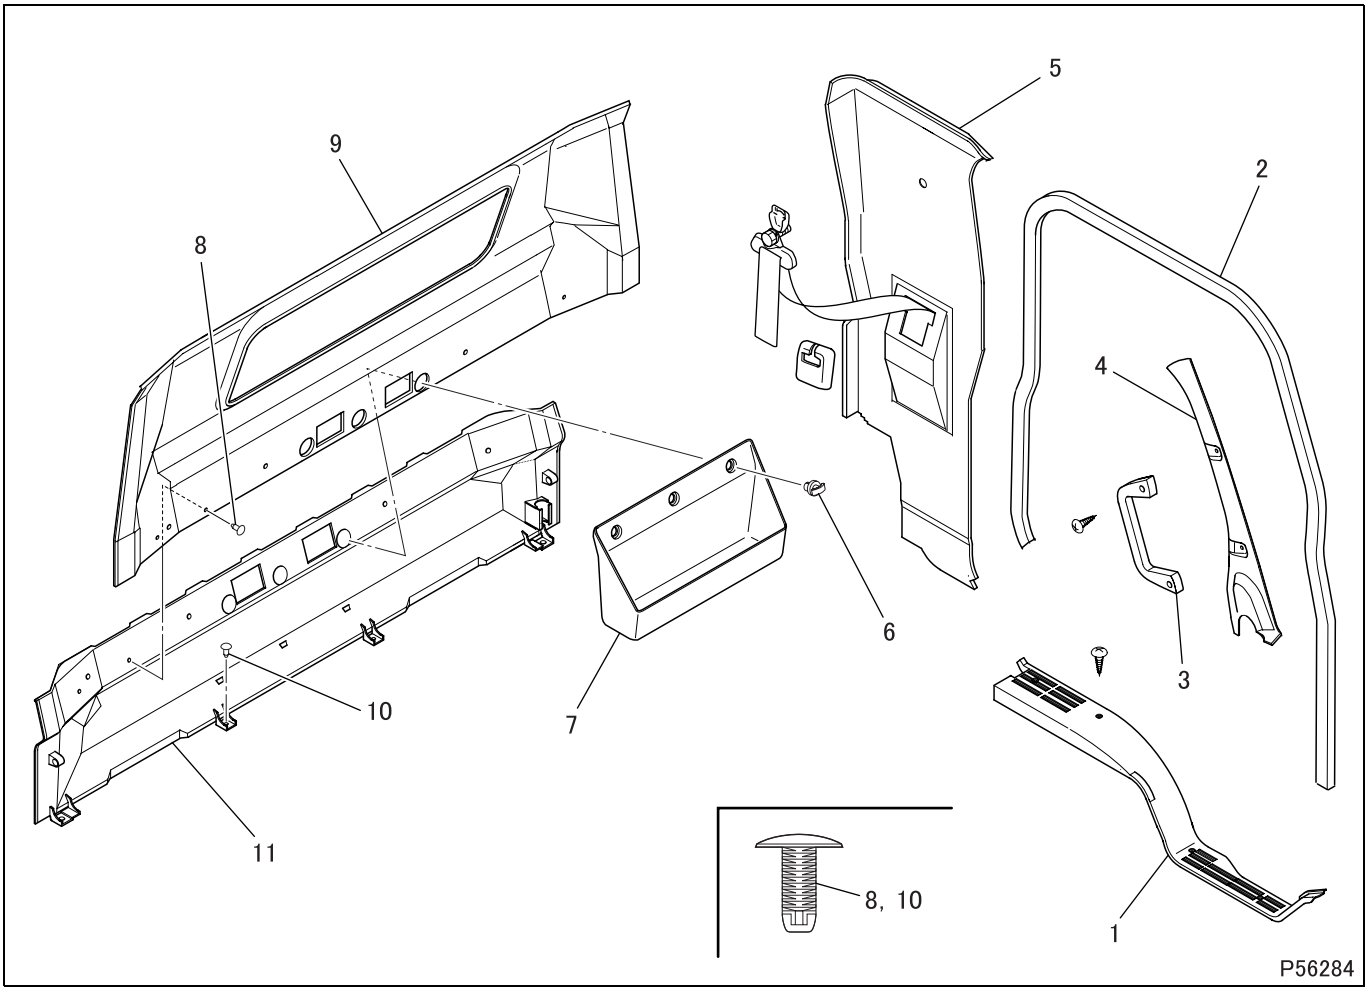
◆Installation procedure◆



■ **Installation: Front defroster duct**

- Insert the front defroster duct flanges into the instrument panel ribs.
- Insert the instrument panel studs into the front defroster duct holes and clip them together.

TRIM AND SCUFF PLATE <EXCEPT CREW CAB>



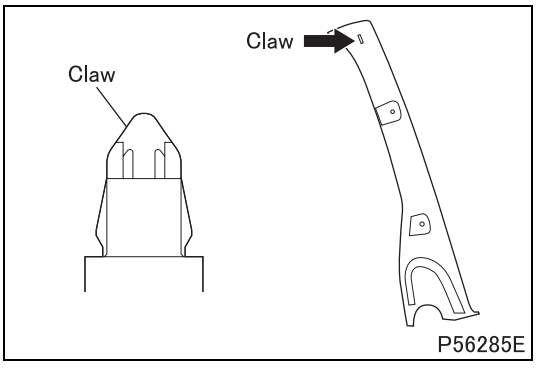
● **Removal sequence**

1 Scuff plate
2 Weatherstrip
3 Grip
4 Front pillar trim
5 Rear pillar trim
6 Hook (× 3)
7 Back panel tray
8 Clip
9 Upper rear trim
10 Clip
11 Lower rear trim

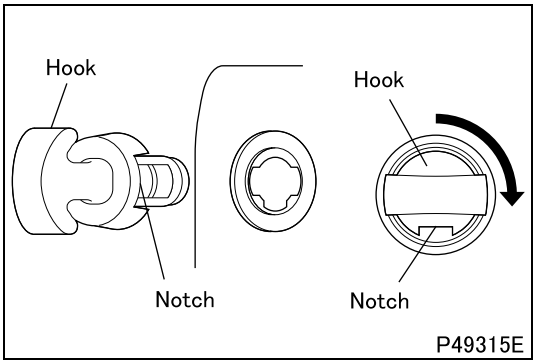
● **Installation sequence**

Follow the removal sequence in reverse.

◆**Removal procedure**◆



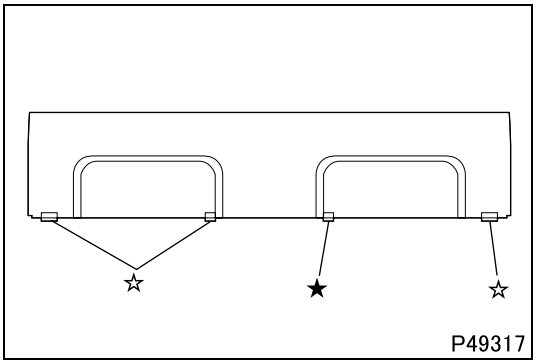
■ **Removal: Front pillar trim**



■ **Removal: Hook**

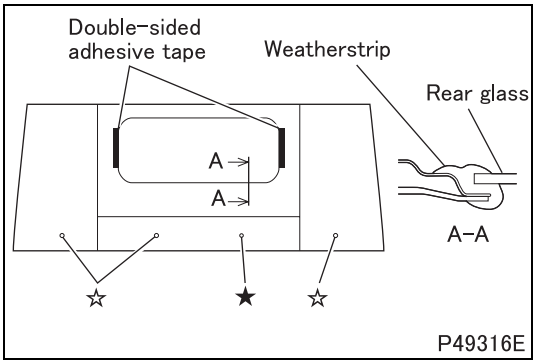
- Turn the hook 90° to disengage it.

◆Installation procedure◆



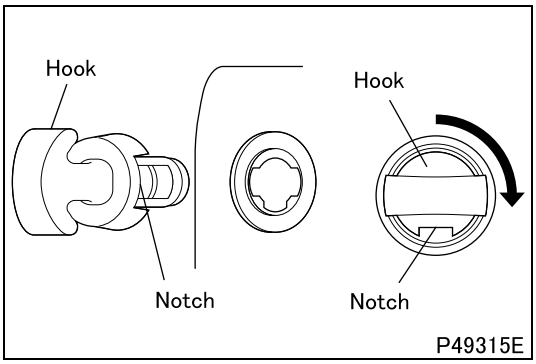
■ **Installation: Lower rear trim**

- Locate the lower rear trim correctly in position by installing a clip into the hole ★.
- Install 3 clips into the holes ☆ to completely fix the lower rear trim in position.



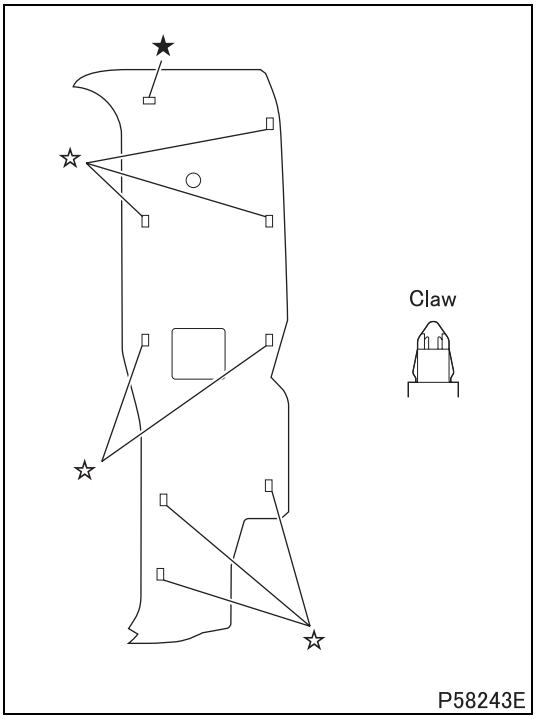
■ **Installation: Upper rear trim**

- Stick double-sided adhesive tapes onto the upper rear trim along the strips illustrated.
- Locate the upper rear trim correctly in position by installing a clip into the hole ★.
- Remove the backing strips from the double-sided adhesive tapes. Press the trim firmly on where the adhesive tapes are applied on the back. Then, install 3 clips at the places ☆.
- Install the rear glass by inserting the rear glass weatherstrip over the upper rear trim.



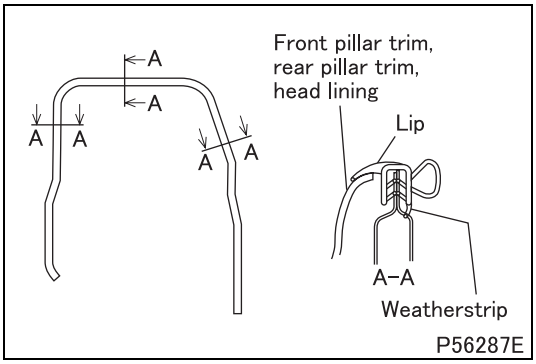
■ **Installation: Hook**

- With the notch facing in the illustrated direction, insert the hook into the lower rear trim.
- To engage the hook, turn it 90° until the notch faces downwards.



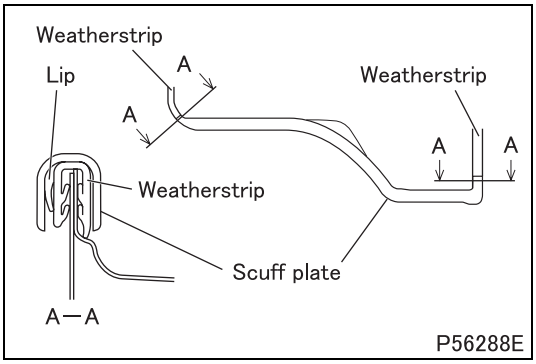
■ **Installation: Rear pillar trim**

- Locate the rear pillar trim correctly onto the cab by engaging the claw ★.
- Engage the claws ☆ (× 8) onto the cab, from the front to the rear.



■ **Installation: Weatherstrip**

- Install the weatherstrip in such a manner that the lip of the strip holds down the front pillar trim, rear pillar trim, and head lining.

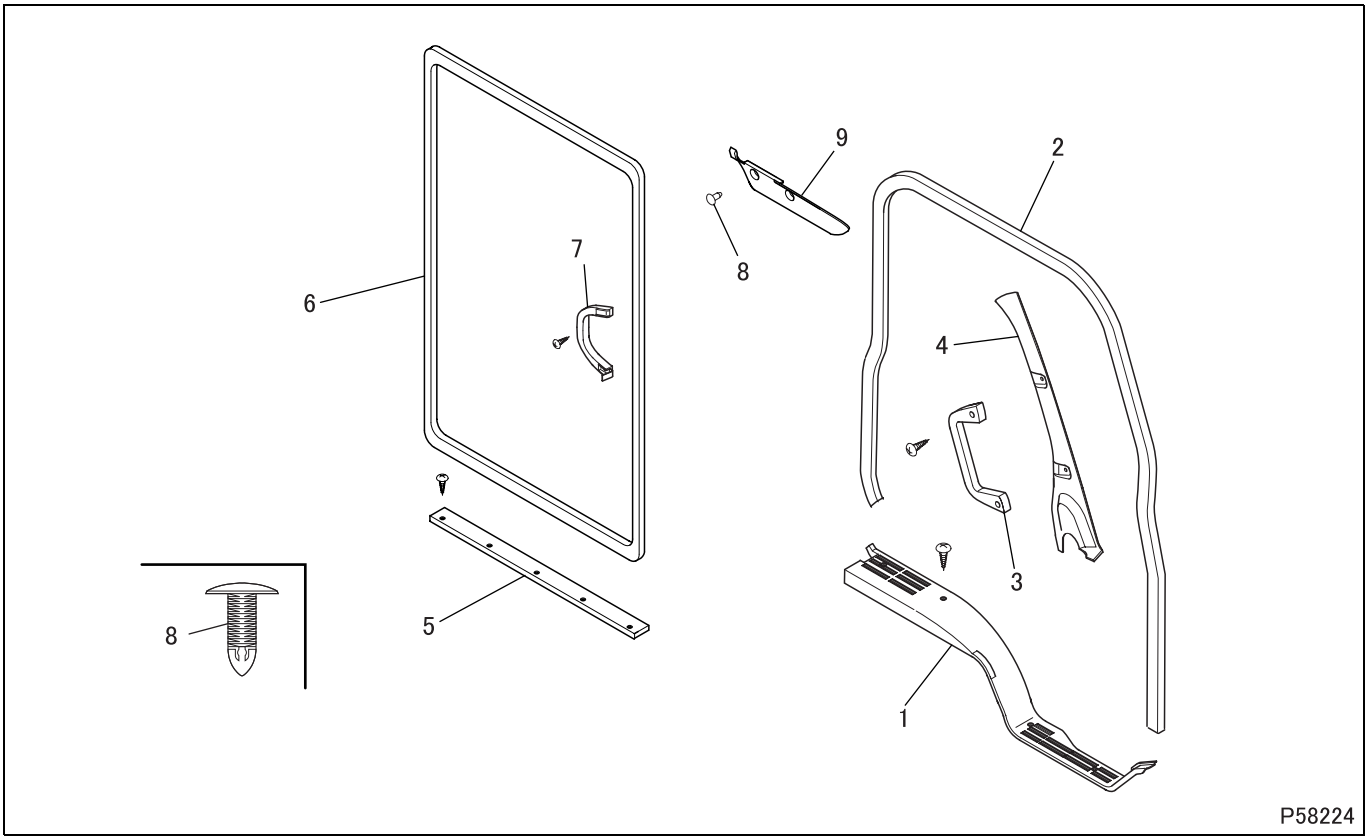


■ **Installation: Scuff plate**

- Install the scuff plate in such a manner that it holds down the lip of the weatherstrip.

M E M O

TRIM AND SCUFF PLATE <CREW CAB>



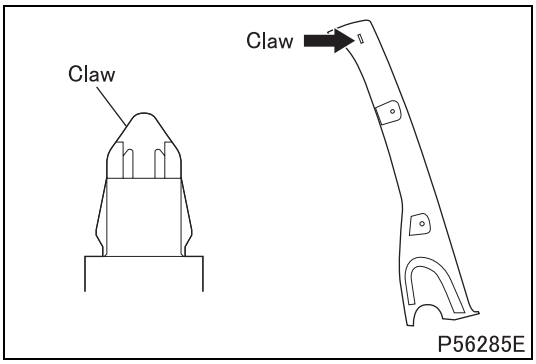
● **Removal sequence**

1 Front scuff plate
2 Weatherstrip
3 Front grip
4 Front pillar trim
5 Rear scuff plate
6 Weatherstrip
7 Rear grip
8 Clip
9 Center pillar trim

● **Installation sequence**

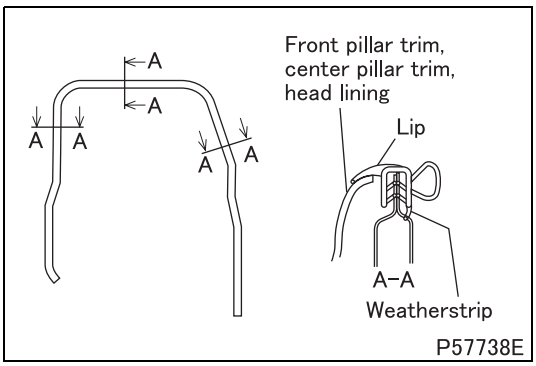
Follow the removal sequence in reverse.

◆**Removal procedure**◆



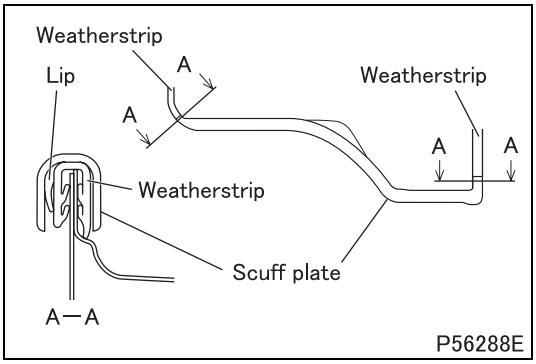
■ **Removal: Front pillar trim**

◆Installation procedure◆



■ **Installation: Weatherstrip**

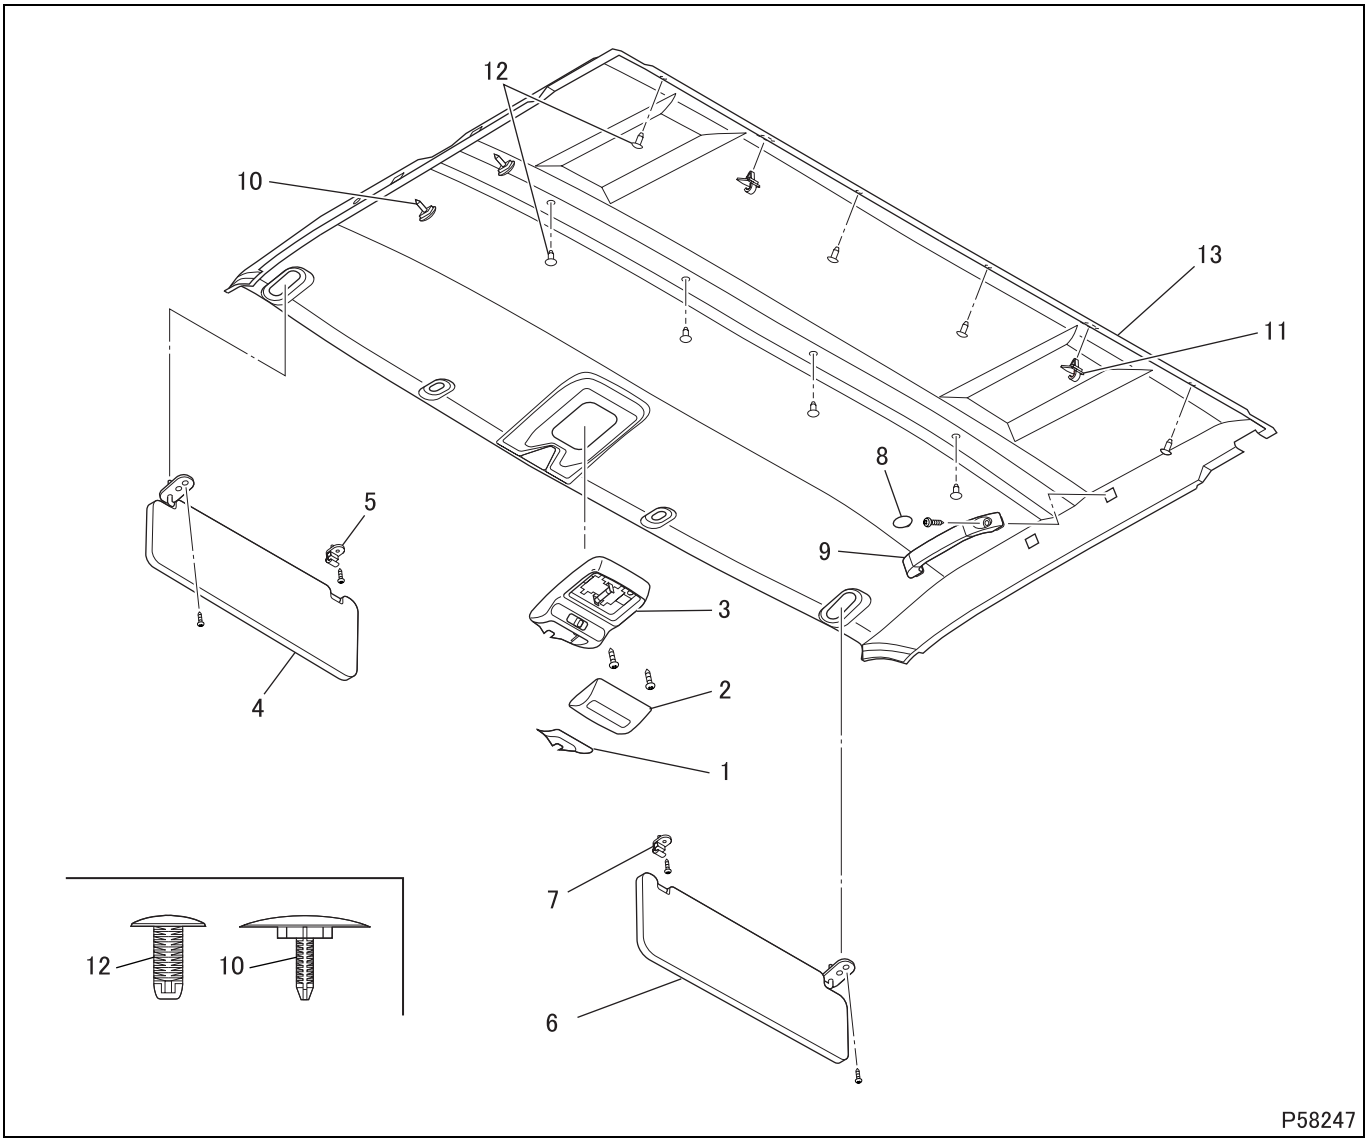
- Install the weatherstrip in such a manner that the lip of the strip holds down the front pillar trim, center pillar trim, and head lining.



■ **Installation: Scuff plate**

- Install the scuff plate in such a manner that it holds down the lip of the weatherstrip.

HEAD LINING <EXCEPT CREW CAB>



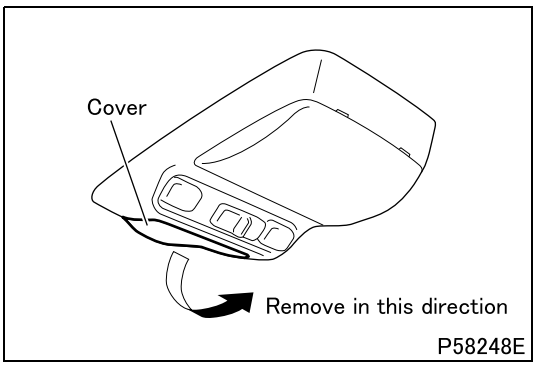
● **Removal sequence**

1 Cover
2 Lens
3 Room lamp
4 Sun visor (left-hand)
5 Sun visor hook
6 Sun visor (right-hand)
7 Sun visor hook
8 Cap
9 Grip
10 Plug
11 Coat hanger
12 Clip (× 8)
13 Head lining

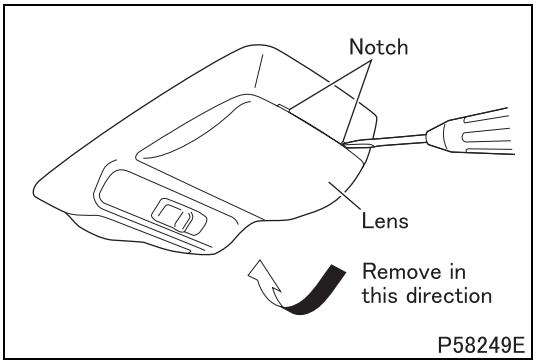
● **Installation sequence**

Follow the removal sequence in reverse.

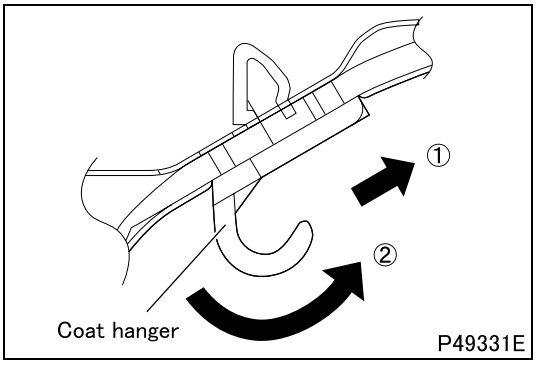
◆Removal procedure◆



■ **Removal: Cover**



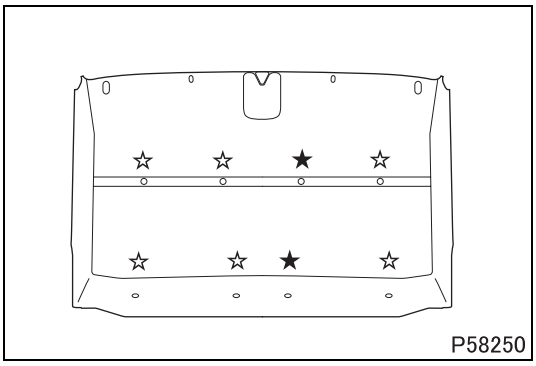
■ **Removal: Lens**



■ **Removal: Coat hanger**

- Remove the coat hanger from the head lining by pulling it in the direction of “2” while pressing it in the direction of “1”.

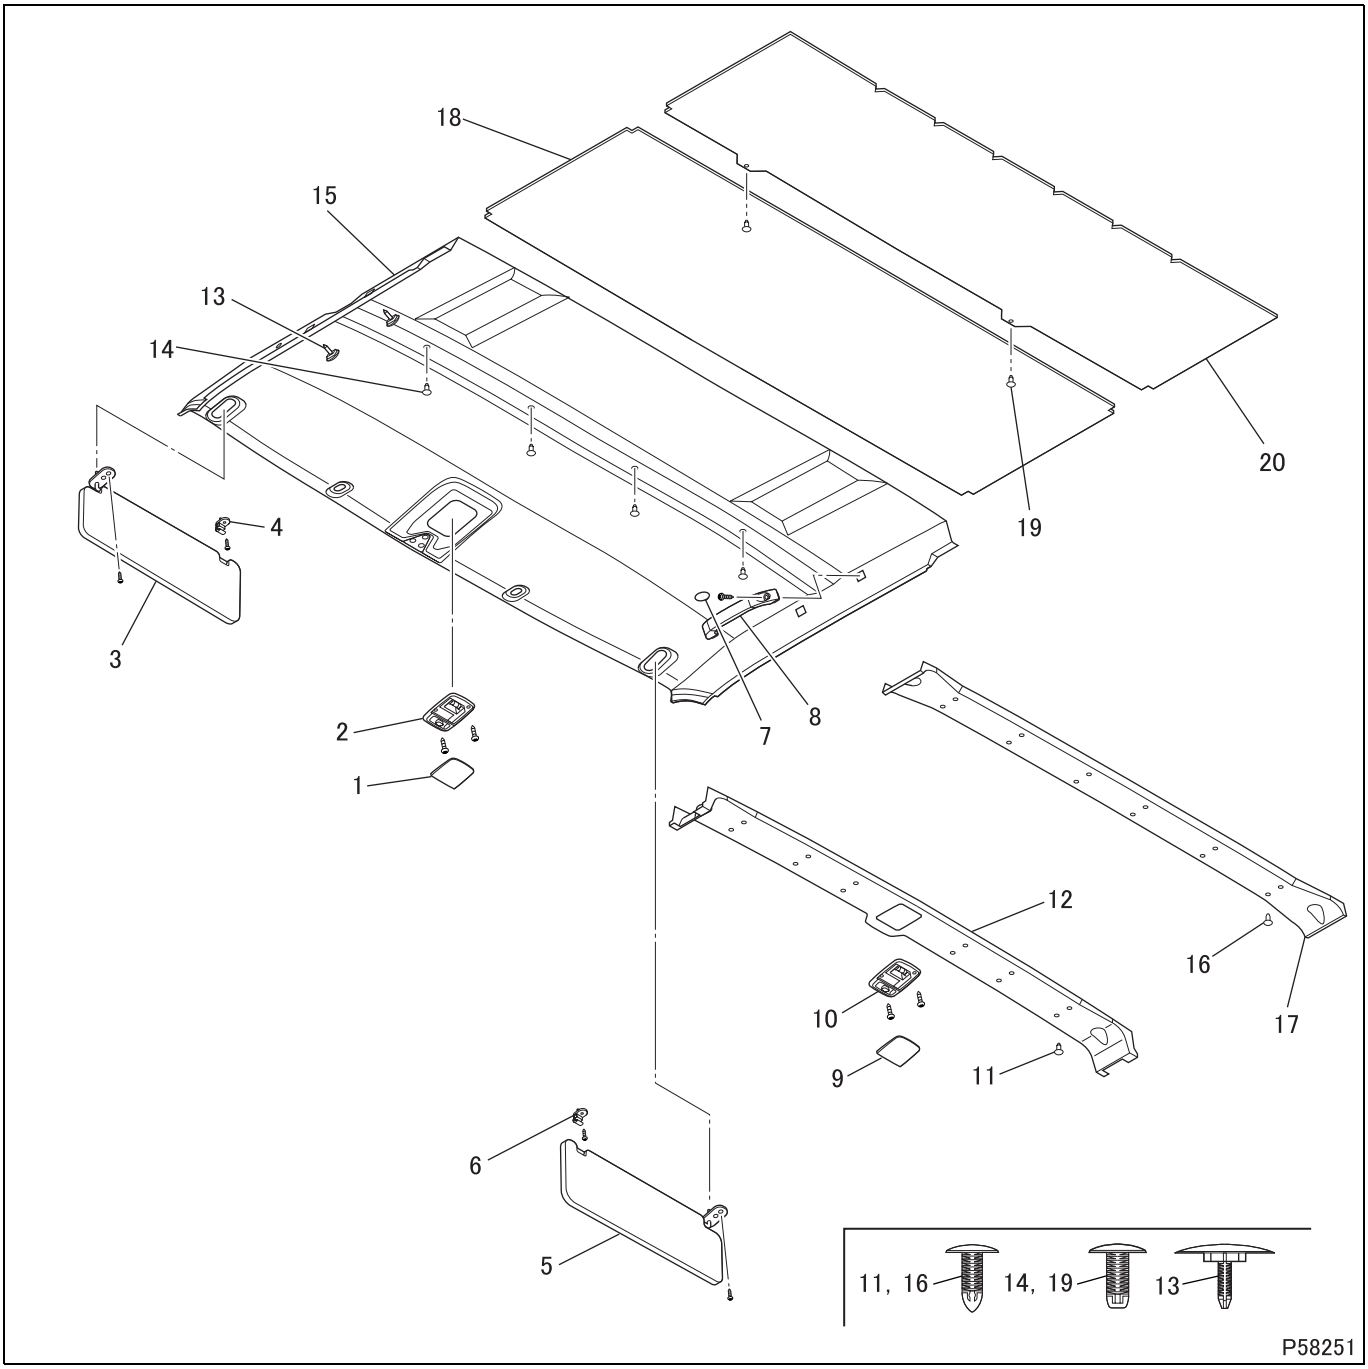
◆Installation procedure◆



■ **Installation: Head lining**

- Locate the head lining correctly onto the cab by installing clips at the locations ★ (× 2). Install clips at the locations ☆ (× 6).

HEAD LINING <CREW CAB>



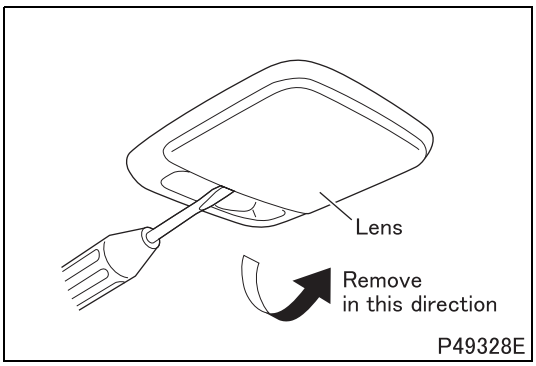
● **Removal sequence**

1 Lens
2 Room lamp
3 Sun visor (left-hand)
4 Sun visor hook
5 Sun visor (right-hand)
6 Sun visor hook
7 Cap
8 Grip
9 Lens
10 Rear room lamp
11 Clip (× 14)
12 Center roof garnish
13 Plug
14 Clip (× 4)
15 Front head lining
16 Clip (× 14)
17 Rear roof garnish
18 Center head lining
19 Clip
20 Rear head lining

● **Installation sequence**

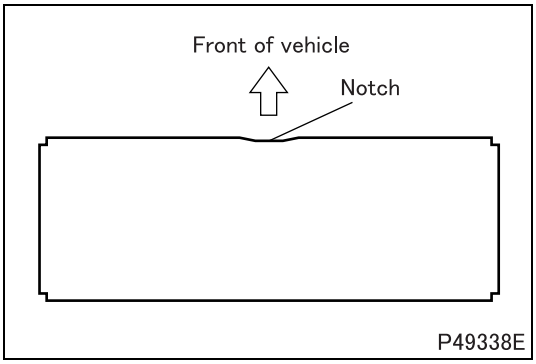
Follow the removal sequence in reverse.

◆Removal procedure◆



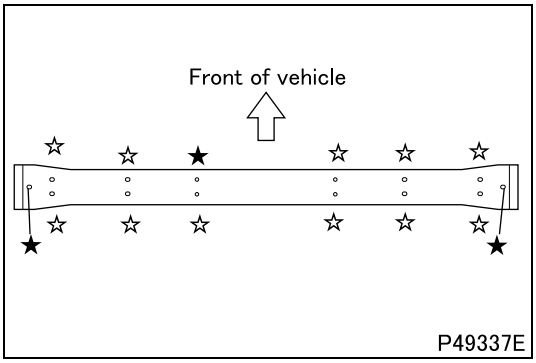
■ **Removal: Lens**

◆Installation procedure◆



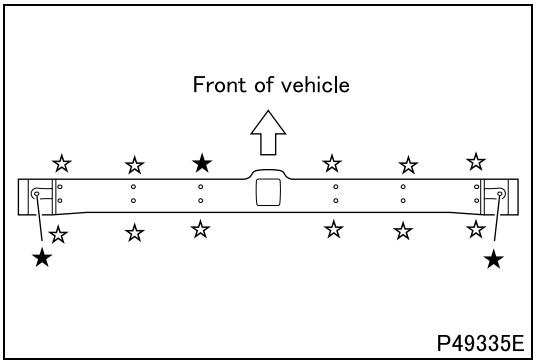
■ **Installation: Center head lining**

- On a standard-cab-width vehicle, install the center head lining with its edges directed as shown in the illustration.



■ **Installation: Rear roof garnish**

- Locate the rear roof garnish correctly onto the cab by installing clips at the locations ★ (× 3). Install clips at the locations ☆ (× 11).



■ **Installation: Center roof garnish**

- Locate the center roof garnish correctly onto the cab by installing clips at the locations ★ (× 3). Install clips at the locations ☆ (× 11).

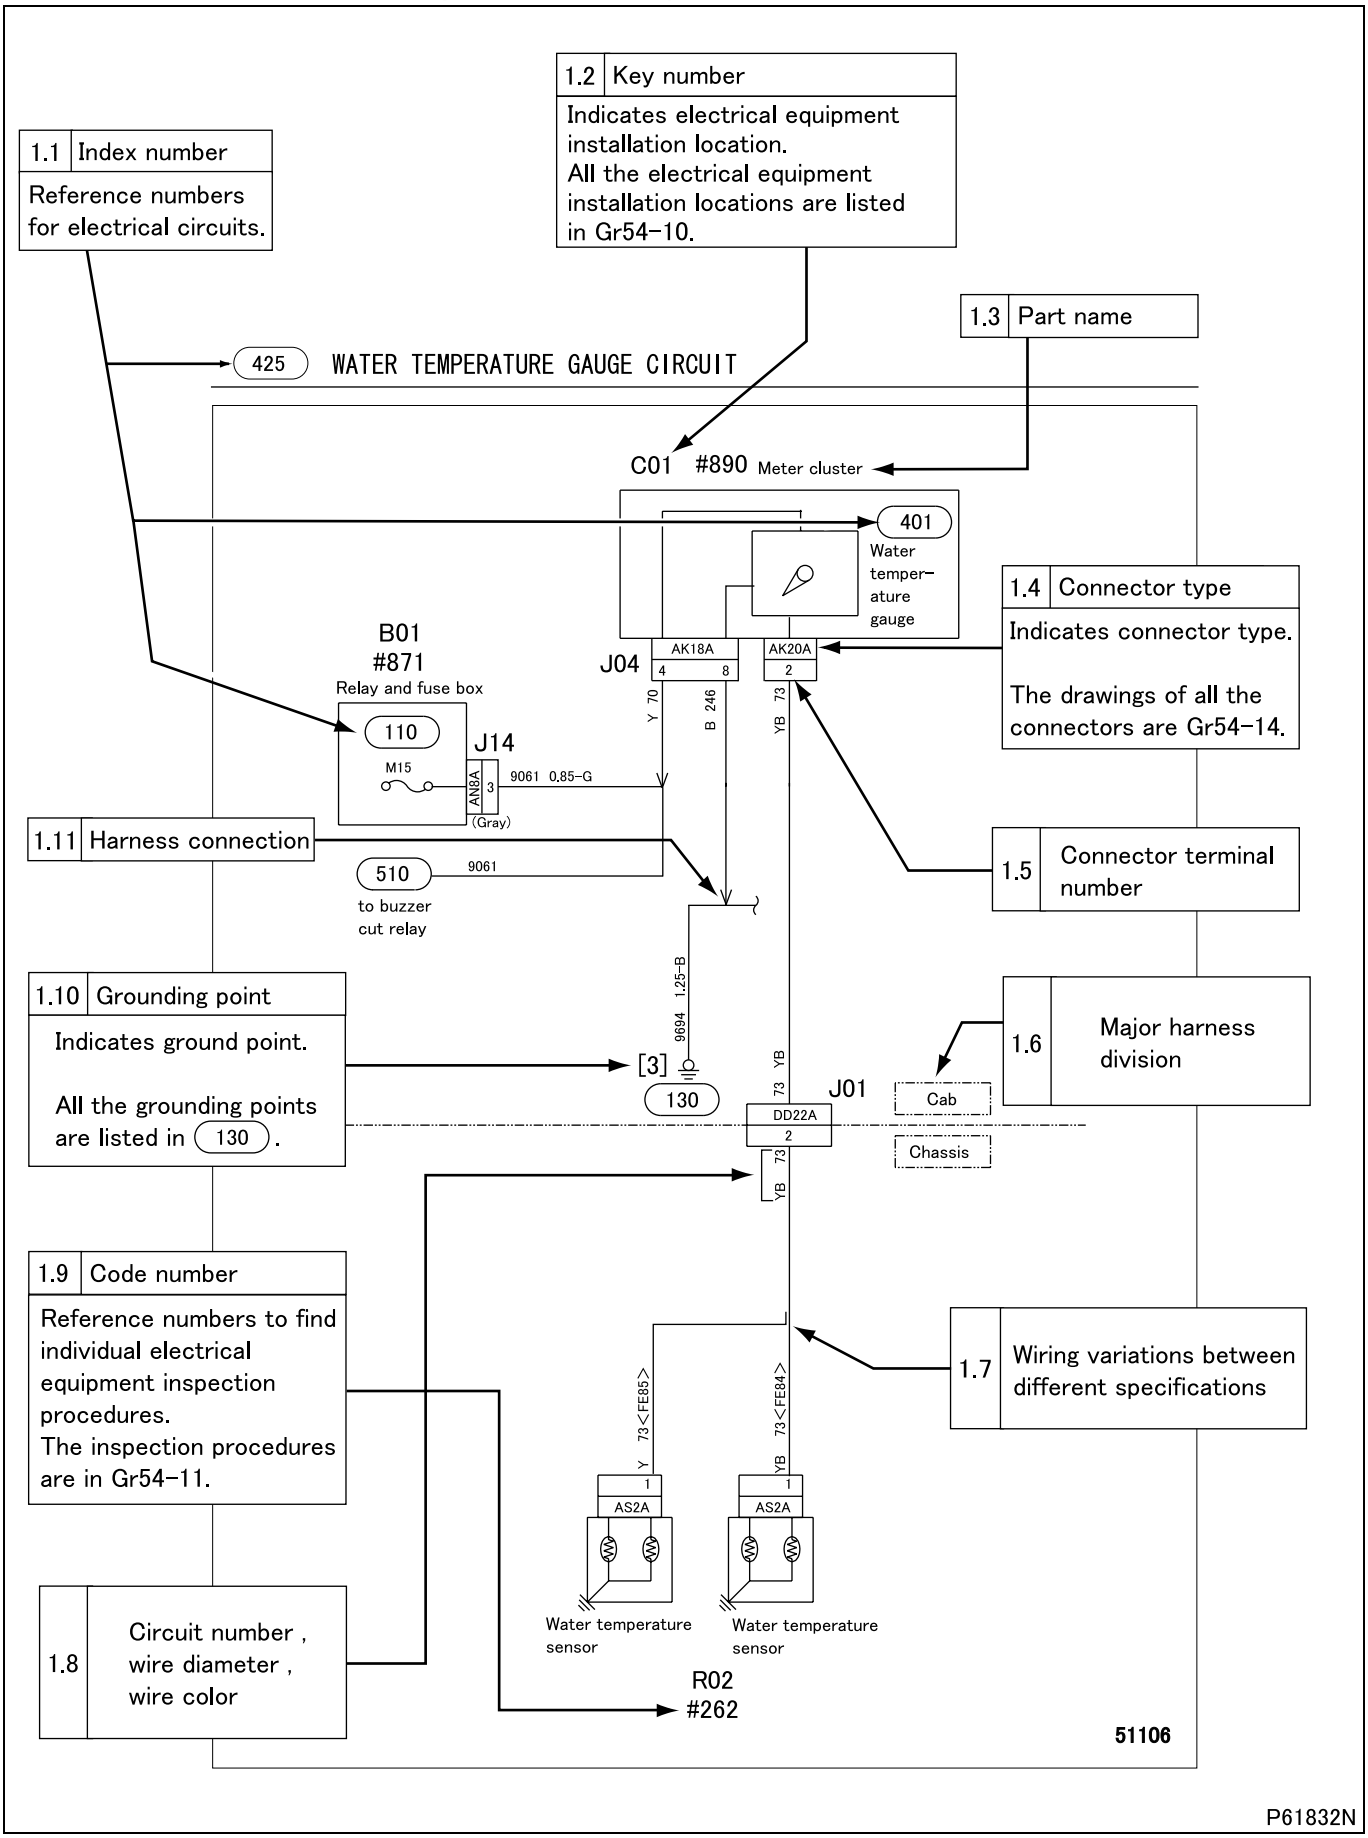
CONNECTOR CONFIGURATION CHART 54-14-2

HOW TO READ THIS GROUP

HOW TO READ CIRCUITS (ELECTRICAL)



1.1 Index number: (100) to (999)

- Index numbers are used as reference numbers for electrical circuits. Each electrical circuit has been assigned its own index number.

1.2 Key number: A01 to Z99

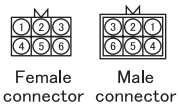
- Key numbers indicate parts installation locations. The installation location of a part can be easily found using its key number shown in a circuit diagram.
  All of the electrical equipment installation locations are listed in Gr54-10.

1.3 Part name

1.4 Connector type (type indication)

- A list of the connectors used is included in Gr54-14.

1.5 Connector terminal number



Connector terminal numbering starts with the upper left corner for female connectors and with the upper right corner for male connectors.

P50678E

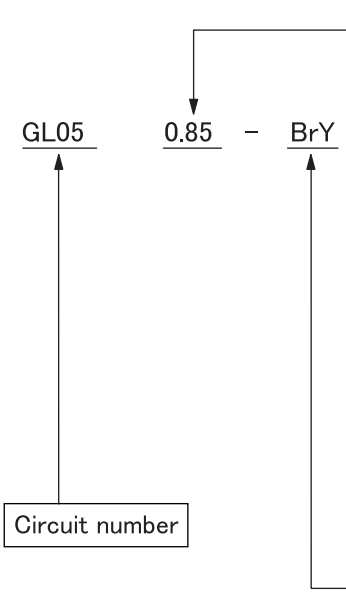
1.6 Major harness division

- Major harness divisions are shown.

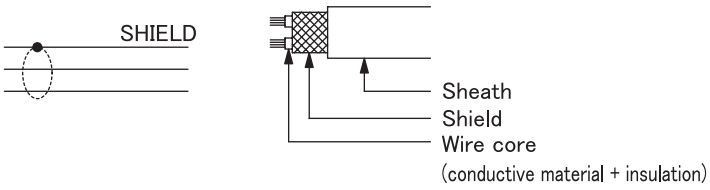
1.7 Wiring variations between different specifications

- Variations in wiring/circuit between different vehicle specifications are clearly indicated as shown.

1.8 Circuit number, wire diameter, wire color



"Wire diameter" represents the cross section of the wire's conductive material. For example, "0.85" corresponds to 0.85 mm^2. On the circuit diagrams, the unit "mm^2" is omitted. Wires with a conductive cross section of 0.5 mm^2 are shown without the wire diameter or unit. As indicated below, shielding wires are marked with "SHIELD," and shielded wires are circled by a dotted line.



On the circuit drawings, twisted wires are indicated as shown below.

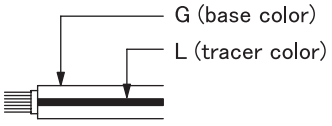
Wire colors are represented by the first letter of the color.
Colors that all start with the letter "B" are indicated as follows.

- BLACK → B
- BLUE → L
- BROWN → Br

Wires that have both base and tracer colors are indicated by two letters.

RY (Yellow tracer on Red base)

GL (Blue tracer on Green base)



P50680E

1.9 Code number: #001 to #999

- Code numbers are reference numbers to find individual electrical equipment inspection procedures. The inspection procedure for a electrical equipment can be found using its code number shown in a circuit diagram.

HOW TO READ THIS GROUP

1.10 Grounding point: [1] to [99]

- Locations where wires are grounded to the vehicle. All of the grounding points are listed in (130).

1.11 Harness connection

- The arrow in the wiring diagram indicates where harnesses are connected, and NOT the flow of electricity.

Wire color

Wire color		Base color + tracer											
B	Black	BW	Black/ white	BY	Black/ yellow	BR	Black/red	BG	Black/ green	BL	Black/ blue		
Br	Brown	BrW	Brown/ white	BrB	Brown/ black	BrY	Brown/ yellow	BrR	Brown/ red	BrG	Brown/ green

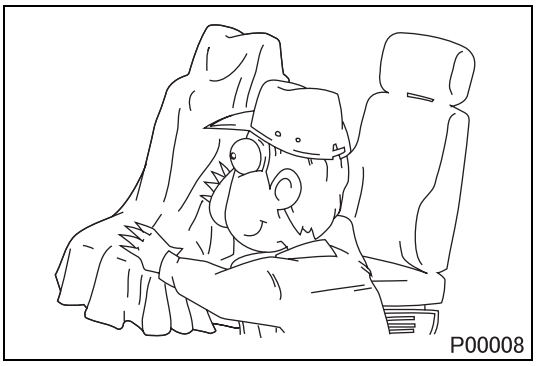
		YP	Yellow/ pink	YV	Yellow/ violet								

54-00A GENERAL

PRECAUTIONS FOR MAINTENANCE OPERATION

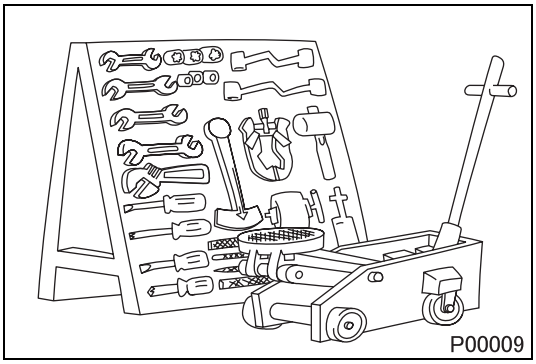
- Before performing service operations, inquire into the customer's complaints and ascertain the condition by checking the total distance travelled, the conditions under which the vehicle is operated, and other relevant factors about the vehicle. And note the necessary information. This information will help you to service the vehicle efficiently.

- Check the location of the fault, and identify its cause. Based on your findings, determine whether parts must be removed or disassembled. Then, follow the service procedure given in this manual.



P00008

- Perform service operations on a level surface. Before starting, take the following preparatory steps:
  - To prevent soiling and damage, place covers over the seats, trim and floor in the cab and over the paintwork of the body.

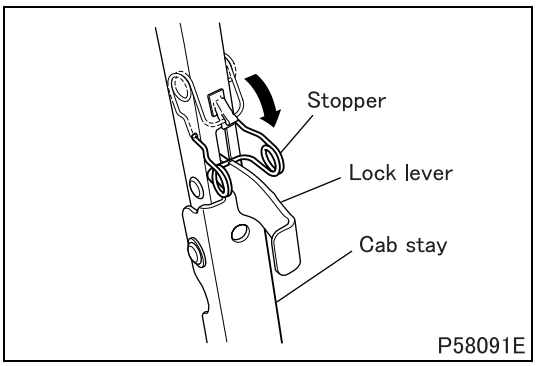


P00009

- Prepare all the general and special tools necessary for the job.

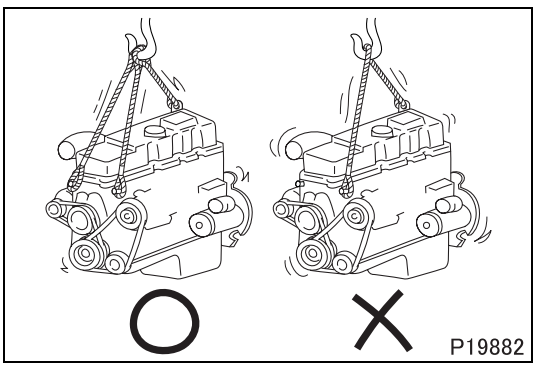
WARNING ⚠

- **Special tools must be used wherever specified in this manual. Do not attempt to use other tools since they could cause injuries and/or vehicle damage.**



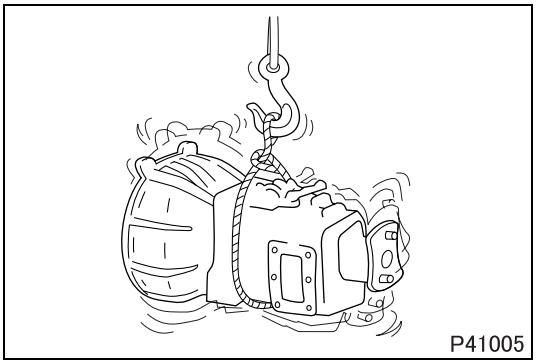
P58091E

- After tilting the manual tilt type cab, be sure to engage the stopper with the lock lever to lock the cab stay securely.

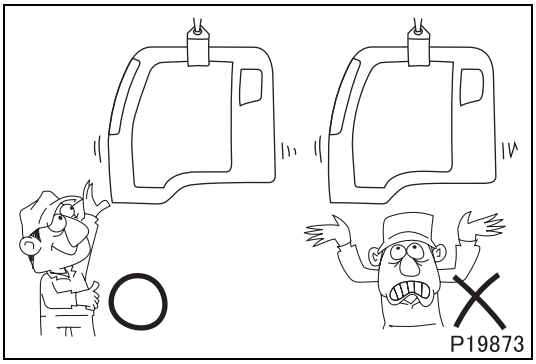


P19882

- Take extreme care when removing/installing heavy items such as engine, transmission and axle. When lifting heavy items using a cable etc., observe the following precautions.
  - Identify the mass of the item being lifted. Use the cable that is strong enough to support the mass.

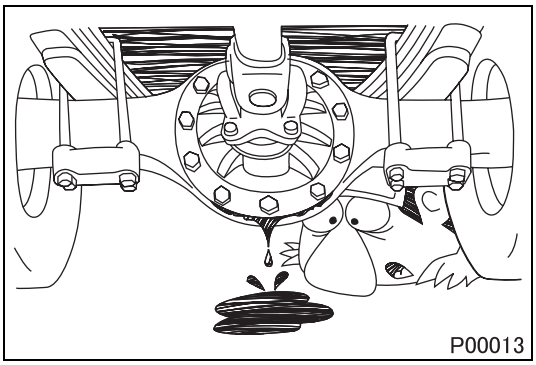


- If lifting eyes are not provided on the item being lifted, tie a cable around the item taking into account the item's center of gravity.

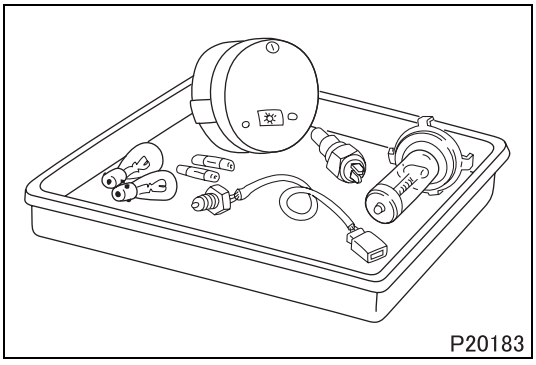


- Do not allow anyone to pass or stay under a lifted item which may possibly fall.

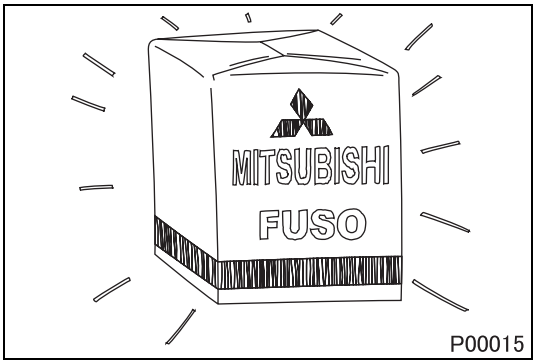
- Never work in shoes that have oily soles.
  When working with a partner or in a group, use pre-arranged signals and pay constant attention to safety. Be careful not to touch switches and levers unintentionally.



- Inspect for oil leakage etc. before washing the vehicle. If the order is reversed, any oil leakage or fault that may exist could go unnoticed during inspection.

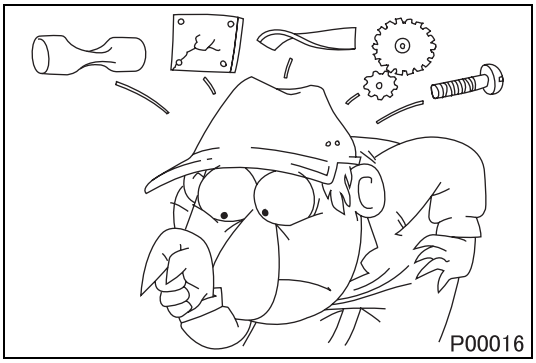


- Prepare replacement parts ready for installation.



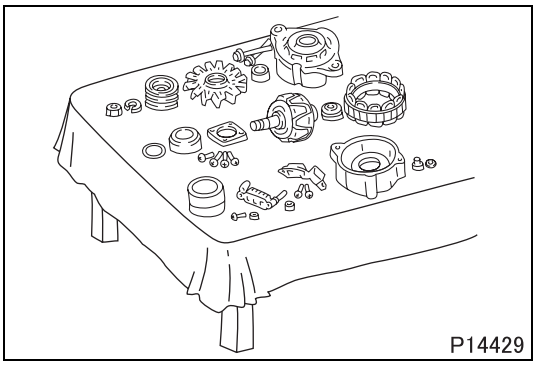
P00015

- Oil seals, packings, O-rings and other rubber parts, gaskets, and split pins must be replaced with new ones after removal. Use only genuine MITSUBISHI replacement parts.



P00016

- When disassembling parts, visually check them for wear, cracks, damage, deformation, deterioration, rust, corrosion, defective rotation, fatigue, clogging and any other possible defect.

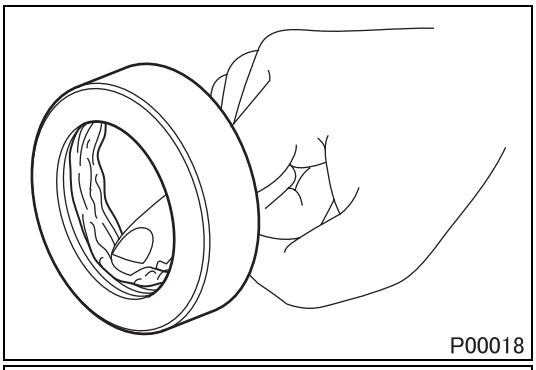


P14429

- To facilitate correct reassembly of parts, make alignment marks on them before disassembly and arrange disassembled parts neatly. Make punch marks and other alignment marks where they will not detract from parts' functionality and appearance.
- After removing parts from the vehicle, cover the area to keep it free of dust.

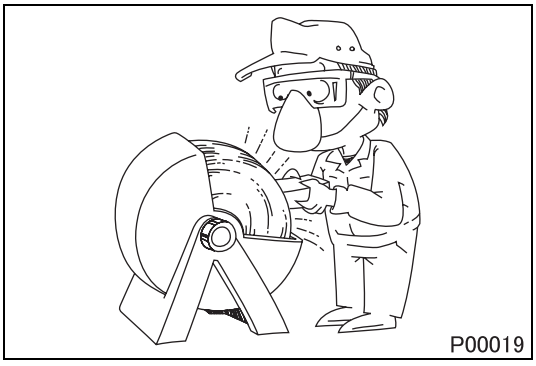
CAUTION ⚠

- **Be careful not to mix up identical parts, similar parts and parts that have left/right alignments.**
- **Keep new replacement parts and original (removed) parts separately.**



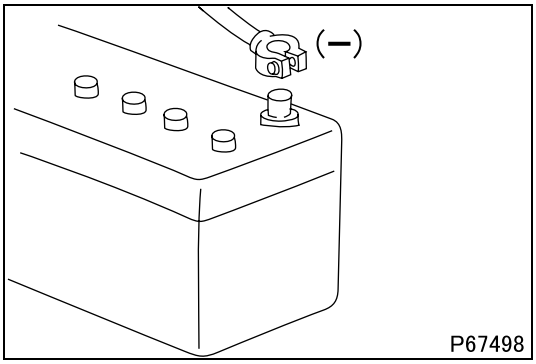
P00018

- Apply the specified oil or grease to U-seals, oil seals, dust seals and bearings before reassembly.
- Always use the specified oils and greases when performing inspection or replacement. Immediately wipe away any excess oil or grease with a rag.



P00019

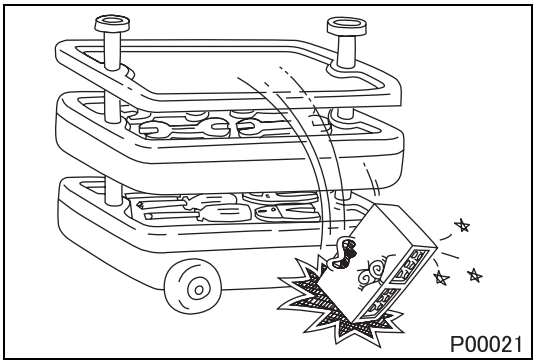
- Wear safety goggles when using a grinder or welder. Wear gloves when necessary, and watch out for sharp edges and other items that might wound your hands.



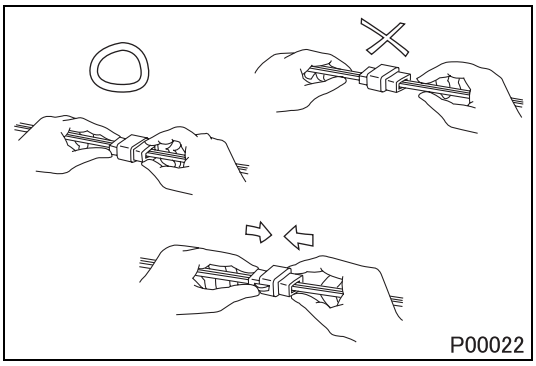
- Before working on the electrical system, disconnect the (–) battery cable to prevent short circuits.

CAUTION ⚠

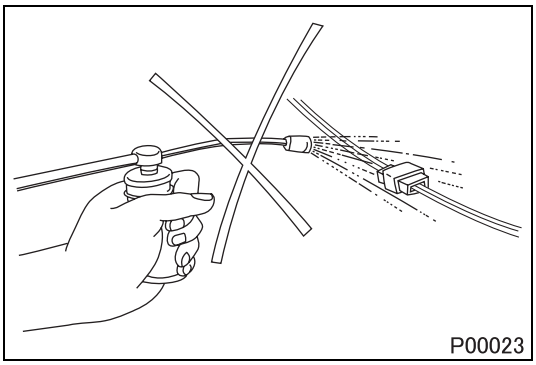
- **Make sure the starter switch and lighting switches are OFF before disconnecting or connecting battery cable. Semiconductor components may otherwise be damaged.**



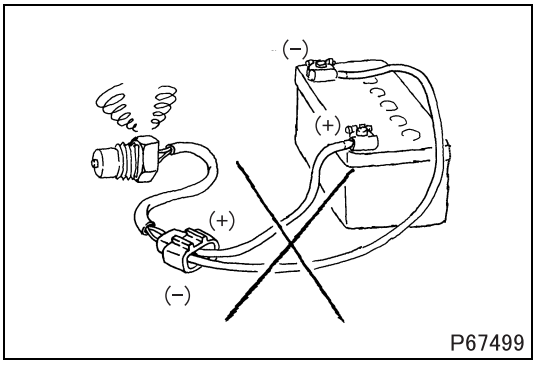
- Carefully handle sensors relays, and other items that are sensitive to shock and heat. Do not remove or paint the cover of any control unit.



- When separating connectors, grasp the connectors themselves rather than the harnesses.
- To separate locking connectors, first push them in the direction of the arrows. To reconnect locking connectors, push them together until they click.

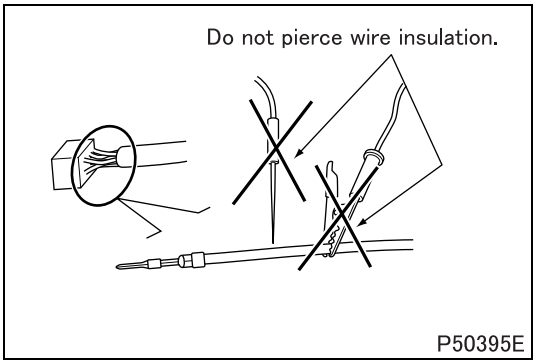


- Before washing the vehicle, cover electrical parts to keep them dry. (Use plastic sheets or the like.) Keep water away from harness connectors and sensors and immediately wipe off any water that gets on them.



- When applying a voltage to a part for inspection purposes, check that the (+) and (–) cables are connected properly then gradually increase the voltage from zero. Do not exceed the specified voltage.
  Remember that control units and sensors do not necessarily operate on the battery voltage.

1. Handling Precautions for Electric Circuits



CAUTION ⚠

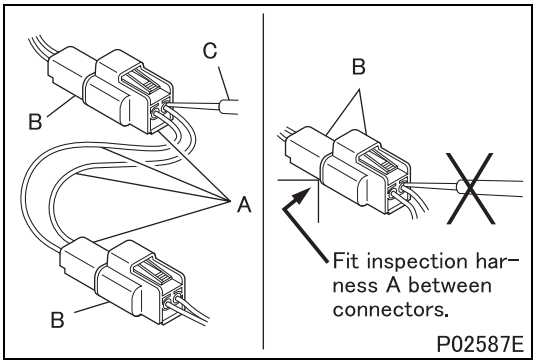
- **Do not pierce wire insulation with test probes or alligator clips when performing electrical inspections. Doing so can, particularly with the chassis harness, hasten corrosion.**

1.1 Inspection of harnesses

(1) Inspections with connectors fitted together

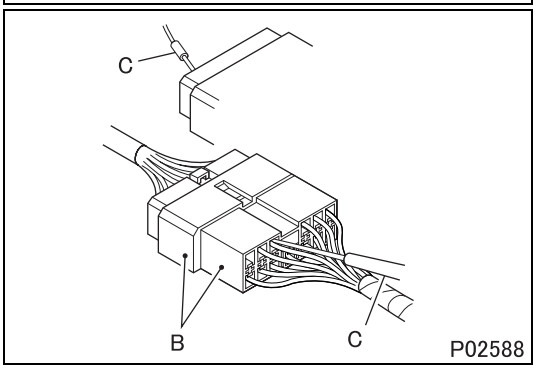
(1.1) Waterproof connectors

- Connect an inspection harness and connector A between the connectors B of the circuit to be inspected. Perform the inspection by applying a test probe C to the connectors of the inspection harness. Do not insert the test probe C into the wire-entry sides of the waterproof connectors since this would damage their waterproof seals and lead to rust.



(1.2) Non-waterproof connectors

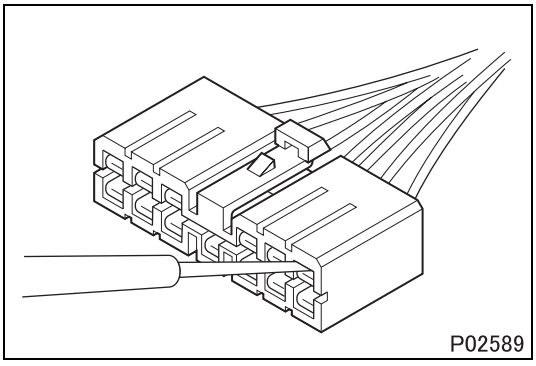
- Perform the inspection by inserting a test probe C into the wire-entry sides of the connectors. An extra-narrow probe is required for control unit connectors, which are smaller than other types of connector. Do not force a regular-size probe into control unit connectors since this would cause damage.



(2) Inspections with connectors separated

(2.1) Inspections on female terminals

- Perform the inspection by carefully inserting a test probe into the terminals. Do not force the test probe into the terminals since this could deform them and cause poor connections.

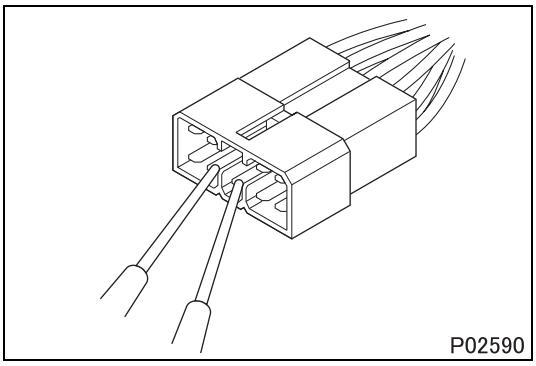


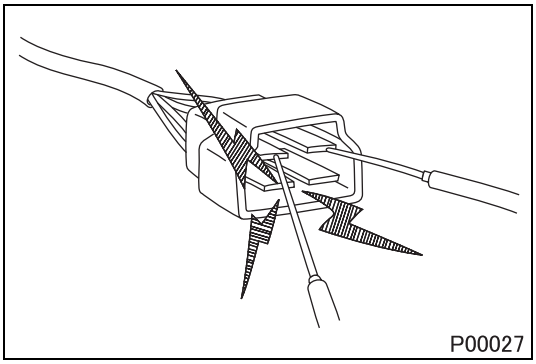
(2.2) Inspections on male terminals

- Perform the inspection by applying test probes directly to the pins.

CAUTION ⚠

- **Be careful not to short-circuit pins together with the test probes. With control unit connectors, short-circuiting of pins can cause damage to the control unit's internal circuitry.**

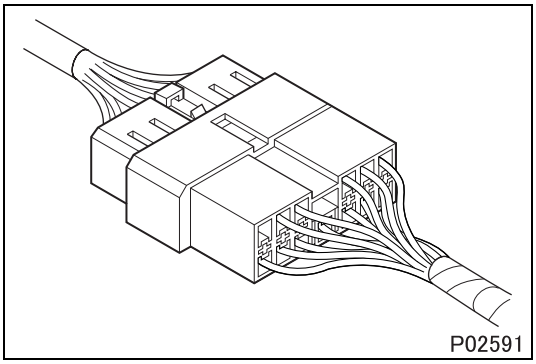




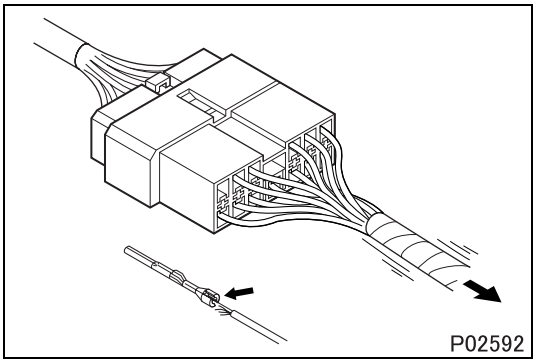
- When using a multimeter to check continuity, do not allow the test probes to touch the wrong terminals.

1.2 Inspection of connectors

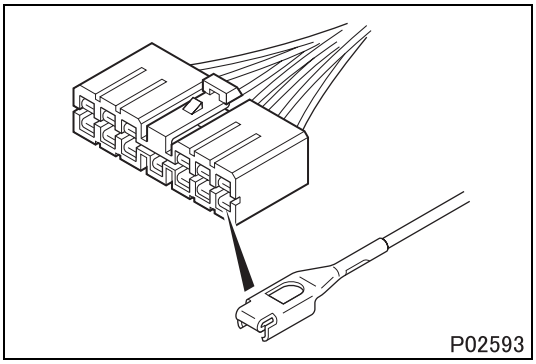
(1) Visual inspection



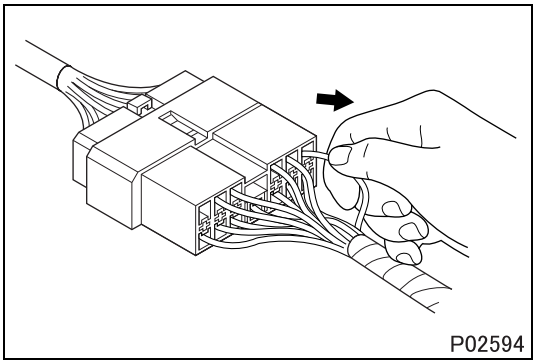
- Check that the connectors are fitted together securely.



- Check whether wires have been separated from their terminals due to pulling of the harness.



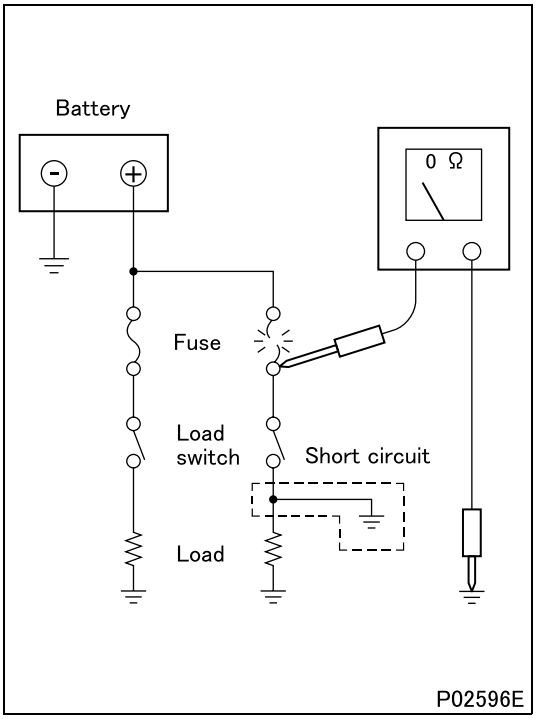
- Check that male and female terminals fit together tightly.
- Check for defective connections caused by loose terminals, by rust on terminals, or by contamination of terminals by foreign substances.



P02594

(2) Checking for loose terminals

- If connector terminal retainers become damaged, male and female terminals may not mate with each other when the connector bodies are fitted together. To check for such terminals, gently pull each wire and see whether any terminals slip out of their connector housings.

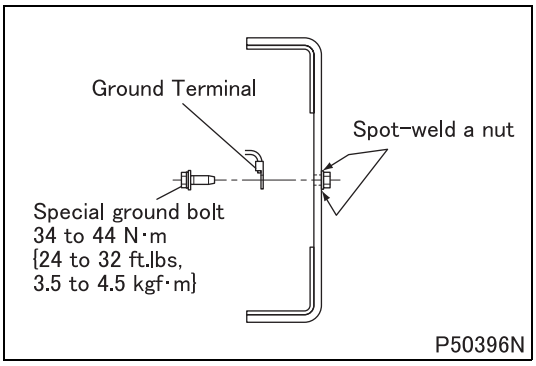


P02596E

1.3 Inspections when a fuse blows

- Remove the fuse, then measure the resistance between ground and the fuse's load side.
  Next, close the switch of each circuit connected to the fuse. If the resistance measurement between any switch and ground is zero, there is a short circuit between the switch and the load. If the resistance measurement is not zero, the circuit is not currently short-circuited; the fuse probably blew due to a momentary short circuit.

- The main causes of short circuits are as follows:
  - Harnesses trapped between chassis parts
  - Harness insulation damage due to friction or heat
  - Moisture in connectors or circuitry
  - Human error (accidental short-circuiting of components)

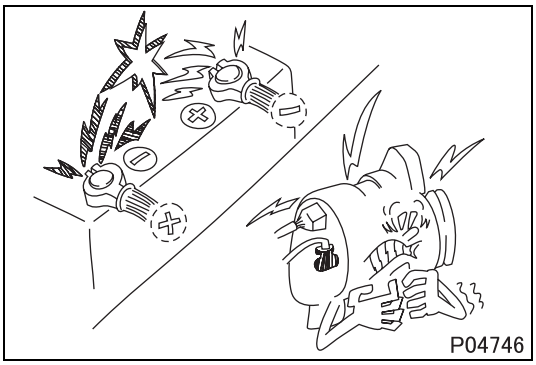


P50396N

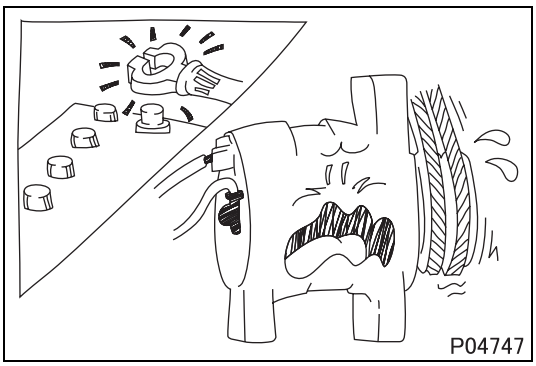
1.4 Inspection of chassis ground

- A special ground bolt is used to tighten a ground terminal. When servicing the ground point, be sure to follow the procedures described below:
  - When reinstalling the ground bolt
    Tighten the ground bolt to the specified torque.
  - When relocating the ground point
    A special ground bolt must be used. Spot-weld a nut to a frame and tighten the ground bolt to the specified torque. Be sure to apply touch-up paint to the welded point.

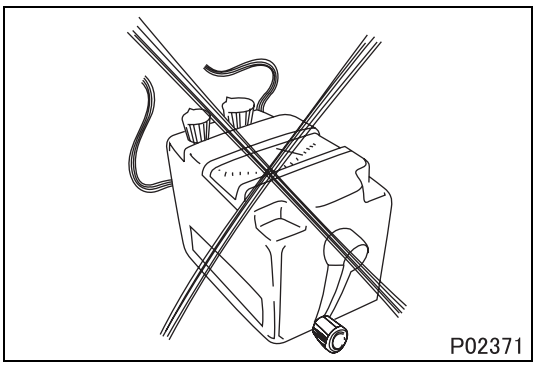
2. Service Precautions for Alternators



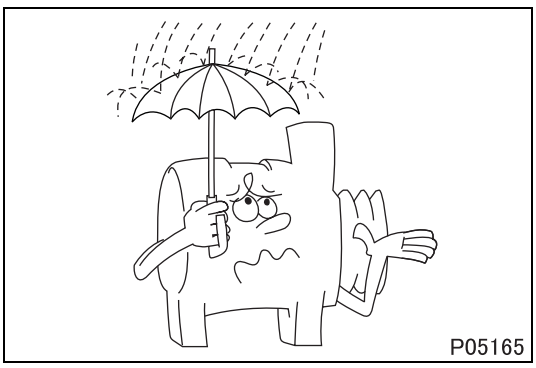
- When servicing alternators, observe the following precautions:
  - Never reverse the polarity of battery connections.
    If the polarity of the battery connections were to be reversed, a large current would flow from the battery to the alternator, damaging the diodes and regulator.



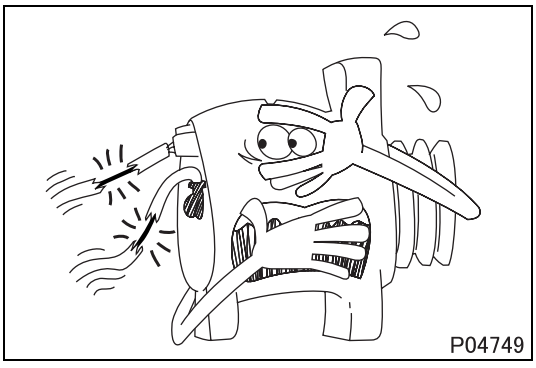
- Never disconnect the battery cables with the engine running.
  Disconnection of the battery cables during engine operation would cause a surge voltage, leading to deterioration of the diodes and regulator.



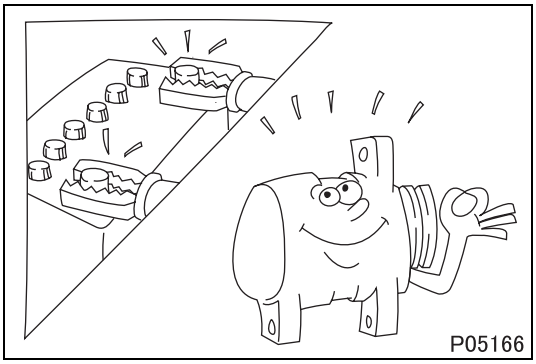
- Never perform inspections using a high-voltage multimeter.
  The use of a high-voltage multimeter could damage the diodes and regulator.



- Keep alternators dry.
  Water on alternators can cause internal short circuits and damage.

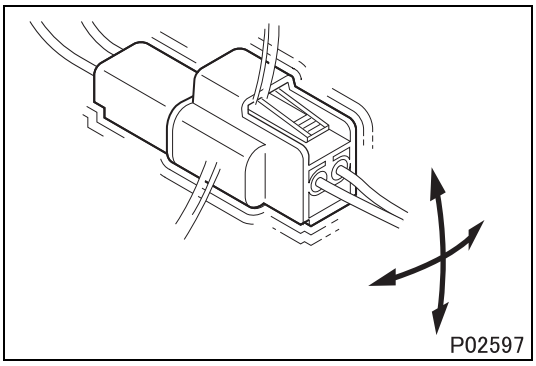


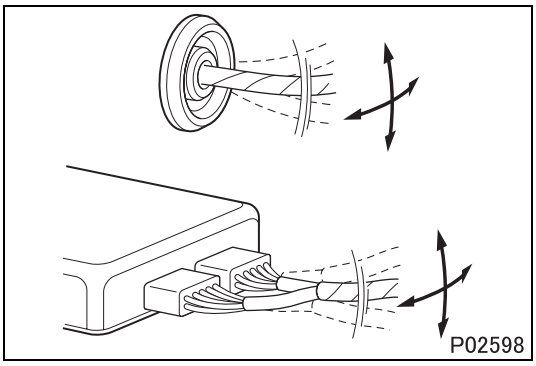
- Never operate an alternator with the B and L terminals short-circuited. Operation with the B and L terminals connected together would damage the diode trio.

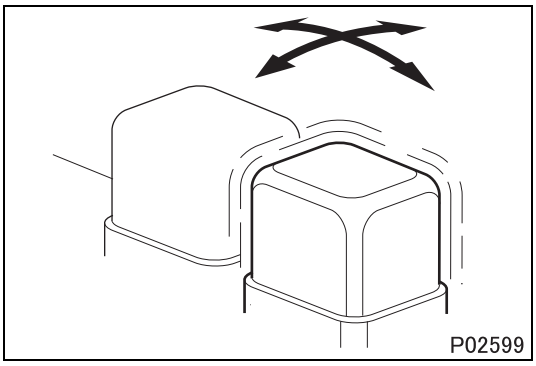


- Disconnect the battery cables (+) and (–) before quick-charging the battery with a quick charger.
  Unless the battery cables are disconnected, quick-charging can damage the diodes and regulator.

3. Intermittent Faults





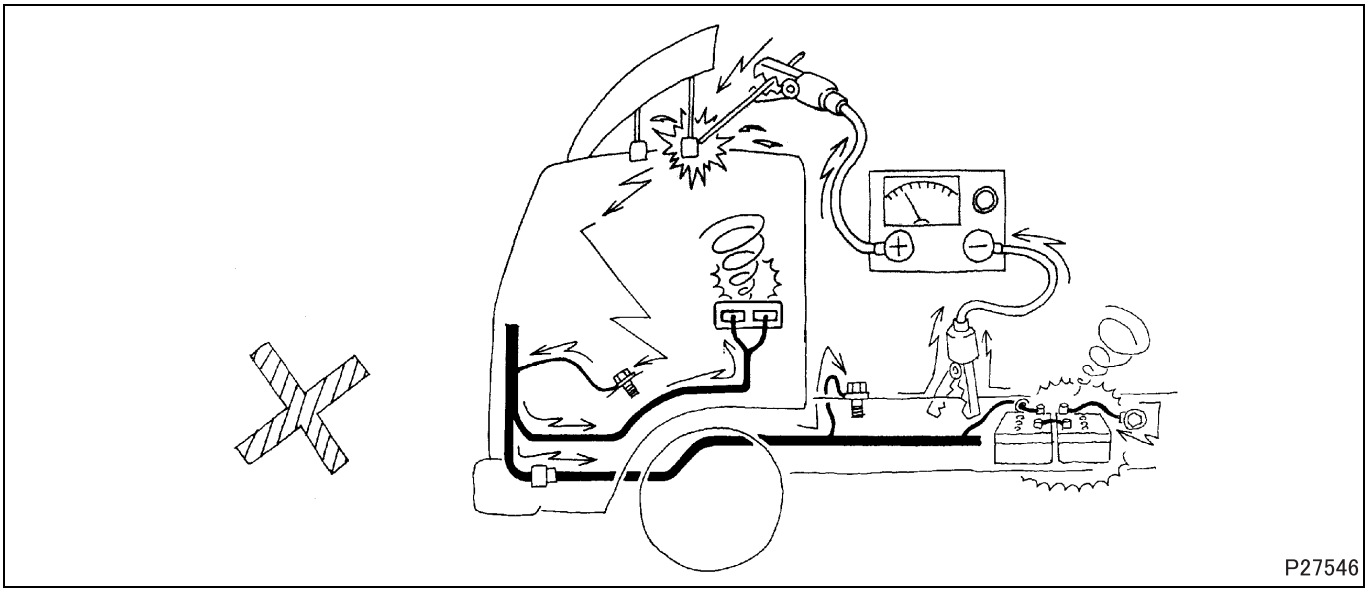


- An intermittent fault typically occurs only under certain operating conditions. Once these conditions have been identified, the cause of the intermittent fault can be ascertained easily. First, ask the customer about the vehicle operating conditions and weather conditions under which the fault occurs. Also ask about the frequency with which the fault occurs and about the fault symptoms. Then, reproduce the fault based on this information.
  In accordance with the conditions under which the fault occurs, determine whether the fault is caused by vibration, heat or other factors. if vibration is a possible factor, see if the fault can be reproduced by performing the following checks on individual connectors and other parts:
  - Gently move connectors up and down and to left and right.
  - Gently move wiring harnesses up and down and to left and right.
  - Gently wiggle sensors and other devices by hand.
  - Gently wiggle wiring harnesses on suspension systems and other moving parts.

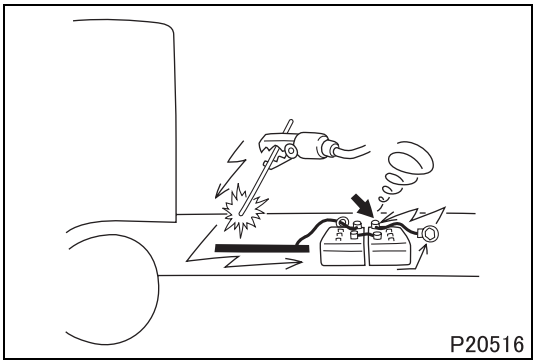
- Connectors and other parts to be checked are those included or given as likely fault locations in inspection procedures corresponding to diagnosis codes and/or fault symptoms.

4. Precautions for Arc Welding

- When arc welding is performed, current from the welder flows to ground via the vehicle's metal parts. Unless appropriate steps are taken, this current can damage control units, other electrical devices and wiring harnesses. And any electrical device near the point on the vehicle to which the (–) cable of the welder is connected, might be largely damaged.



- Current flows backward as shown below.



4.1 From battery (–) cable

To prevent damage to the battery and to electrical devices that are connected directly to the battery, it is essential to disconnect the battery's (–) cable.

4.2 Procedure

- Turn the starter switch to the LOCK position.
- Disconnect the battery's (–) cable.
- Cover all parts of the vehicle that may be damaged by welding sparks.
- Connect the welder's (–) cable to the vehicle as close as possible to the area being welded. Do not connect the welder's (–) cable to the cab if the frame is being welded, and vice versa.
- Set the welding current in accordance with the part being welded.

54-00B SPECIFICATIONS

SPECIFICATIONS

Battery

Item		Specifications
Model		130E41L
Voltage × Quantity	V	12 × 2
Capacity (5-hour rating)	Ah	92

Alternator

Item		Specifications
Manufacturer		MITSUBISHI ELECTRIC
Type		Alternator with built-in regulator (without brush, external fan)
Model		A4TU1593
Output	V-A	12–100

Starter and Preheat System

Item			Specifications
Starter	Manufacturer		MITSUBISHI ELECTRIC
	Model		M008T55671
	Output	V-kW	12–3.0
	Reduction gear mechanism		Planetary gears
	Magnetic switch operating voltage	V	8 or less
Starter relay	Model		U001X13972
	Excitation current	V-A	12–4
	Closing voltage	V	8 or less
	Opening voltage	V	3.5 or less
	Allowable cutoff current	A	200
Glow relay <Except FE83>	Model		U001T11872
	Excitation current	V-A	12–4
	Closing voltage	V	8 or less
	Opening voltage	V	3.5 or less
	Allowable cutoff current	A	60
	Temperature fuse capacity	A	127
Glow electronic control unit <FE83>	Manufacturer		Bosch
	Operating voltage	V	8 to 16
Glow plug	Model		Sheathed type
	Excitation current	V-A	11–5 (reference value)

Lighting

Item			Specifications
Headlamp	Model		Unconventional, rectangular, 2-lamp-system, semi-sealed beam
	Type		Parabola reflector type
	Upper beam (HIGH)	W	HB2 halogen 60/55 (HIGH/LOW)
	Lower beam (LOW)	W	
	Parking lamp	W	5
Front side turn signal lamp (serving also as hazard warning lamp)		W	21
Clearance and side marker lamp		W	7.5
Rear combination lamp	Stop and tail lamp (stop/tail)	W	21/5 (double filament type)
	Rear turn signal lamp (serving also as hazard warning lamp)	W	21
	Backup lamp	W	21
License plate lamp		W	7.5 <Except crew cab, FG>, 8 <Crew cab, FG>
Identification lamp		W	7.5
Cab lamp		W	10

Meter

Item			Specifications
Meter cluster	Manufacturer		DENSO
	Voltage	V	12
	Speedometer indicating range	km/h {MPH}	0 to 160 ($^{+3.5}_{0}$ at 60 km/h) {0 to 100 ($^{+2.5}_{0}$ at 40 MPH)}
	Tachometer indicating range	rpm	0 to 4000 (±150 at 3000 rpm)
	Water temperature gauge indicating range		<M/T> 109°C {228°F}, 70 to 101°C {158 to 214°F}, 50°C {122°F} P102527N <A/T> 109°C {228°F}, 70 to 101°C {158 to 214°F}, 50°C {122°F} P102528N
	Meter warning buzzer	Rated current mA	50 or less
		Sound pressure dB	60 $^{+6}_{0}$ (at 1 m {3.3 ft.})

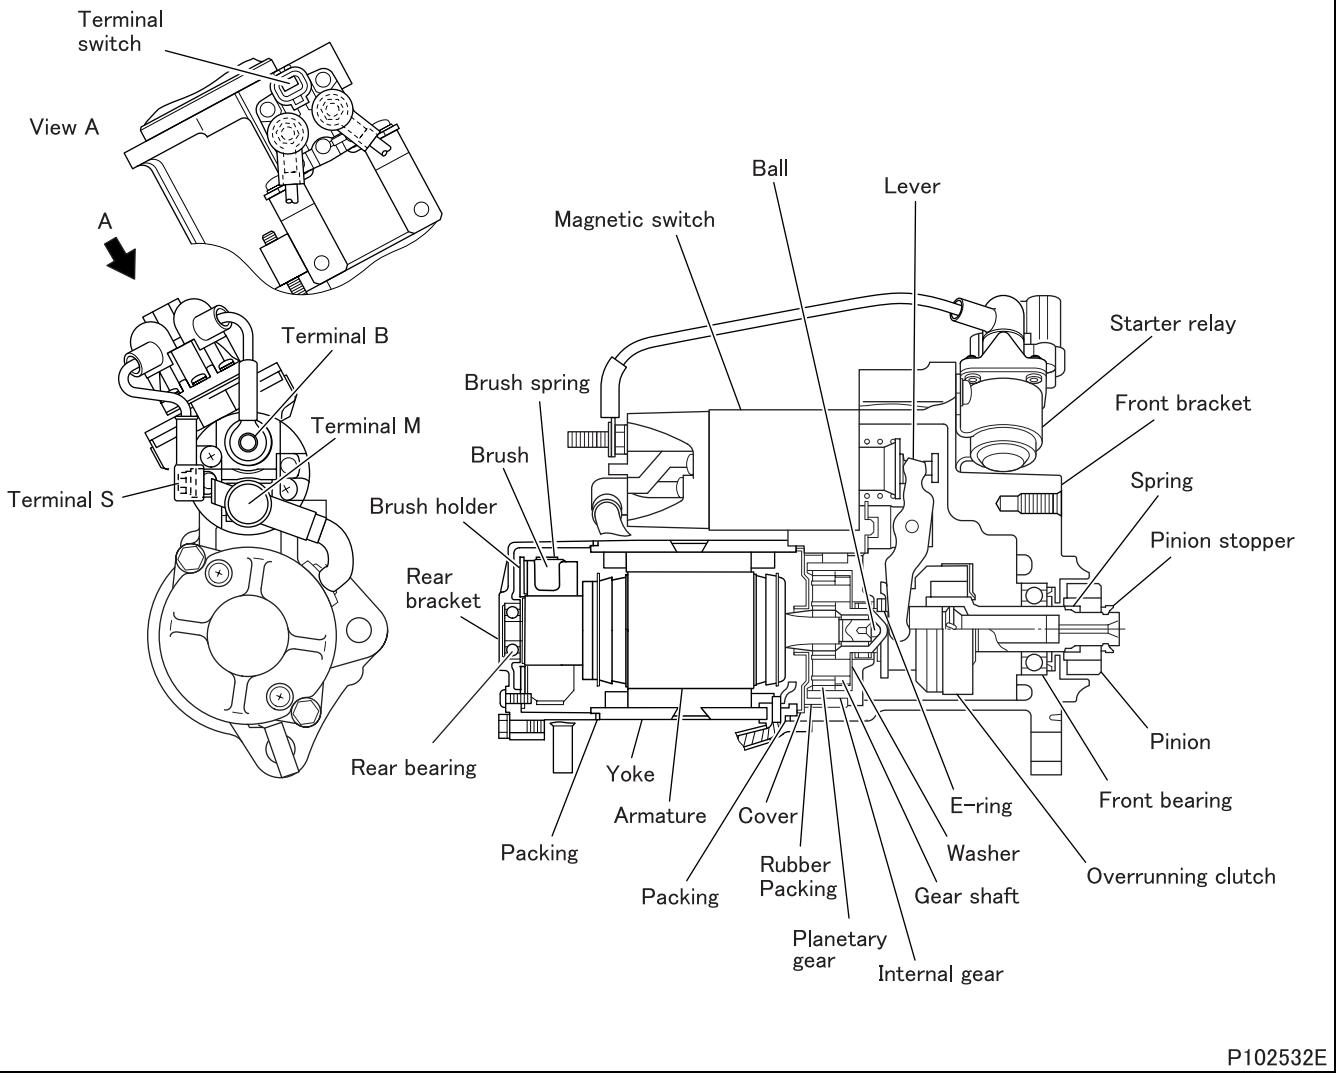
A/T: Automatic transmission
M/T: Manual transmission

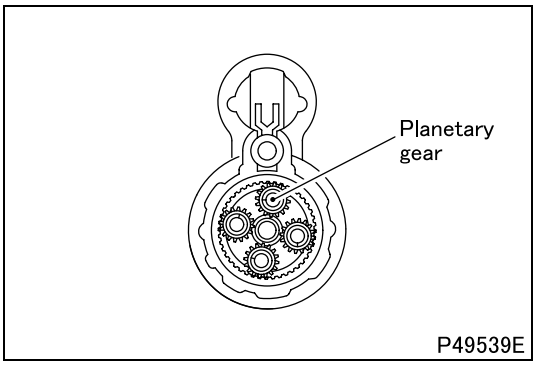
Relay, Radio, Motor, Horn, Buzzer

Item			Specifications
Minimum operating voltage of relay		V	8 or less
Loudspeaker	Rated input	W	15
	Maximum input	W	25
	Impedance	Ω	4 ± 0.6
Wiper motor	Rated voltage	V	12
	No-load current	A	4 or less
	Bound current	A	30 or less
Washer motor	Rated voltage	V	12
	Rated current	A	3.8 or less
Power window motor	Rated voltage	V	12
	Rated current	A	5 or less
Electric horn	Rated voltage	V	12
	Current consumption	A	3 or less
	Sound pressure	dB	110 ± 5 (at 2 m {6.6 ft.})
Back buzzer	Rated voltage	V	12
	Rated current	mA	50 or less
	Sound pressure	dB	85 ± 10 (at 1 m {3.3 ft.})
Cab tilt buzzer <Except crew cab>	Rated voltage	V	12
	Rated current	mA	66 or less
	Sound pressure	dB	73 ± 10 (at 1 m {3.3 ft.})
Hydraulic warning buzzer (only attached hydraulic brake)	Rated voltage	V	12
	Rated current	mA	100 or less
	Sound pressure	dB	90 to 105 (at 1 m {3.3 ft.})

54-00C STRUCTURE AND OPERATION

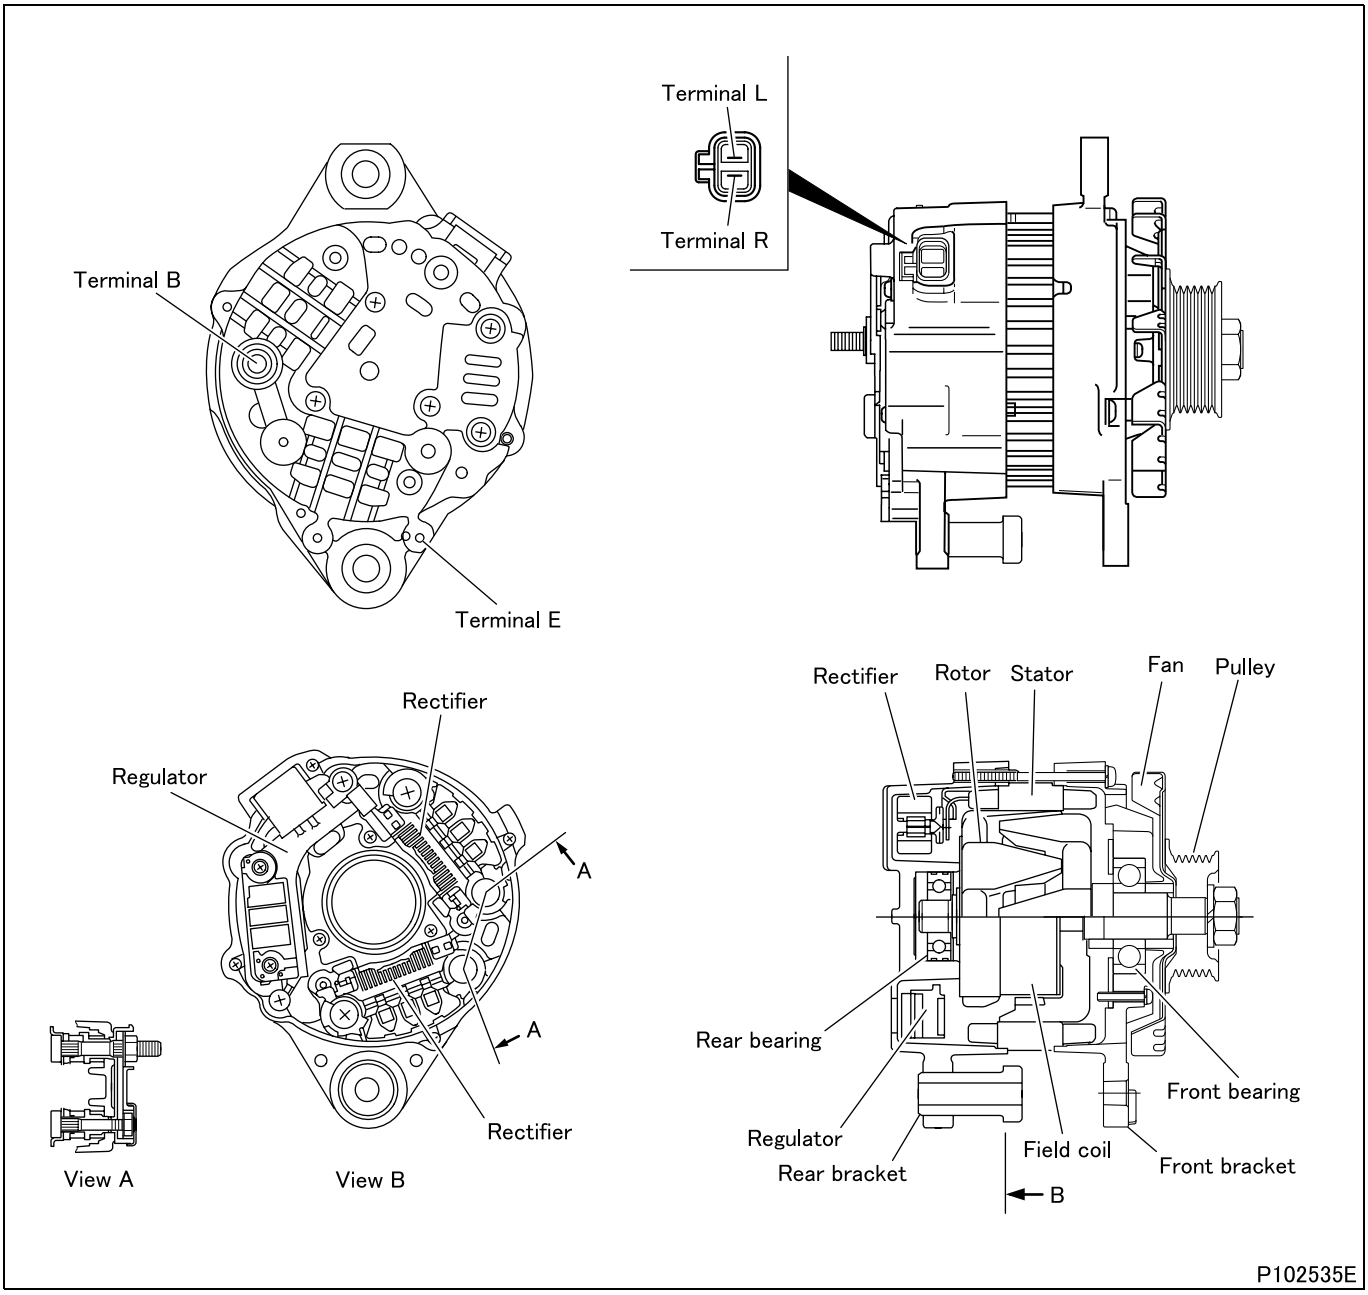
1. Starter



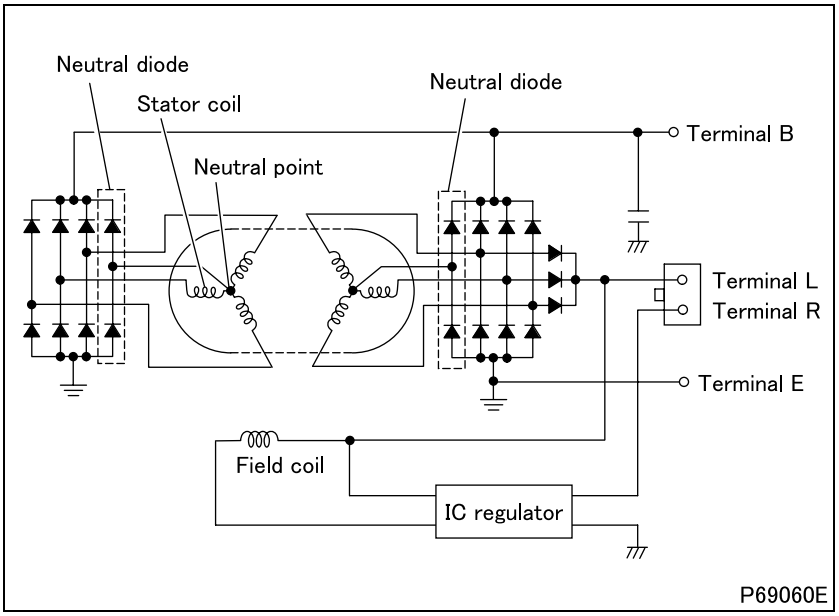


- This starter uses planetary gears as its reduction gearing mechanism.

2. Alternator

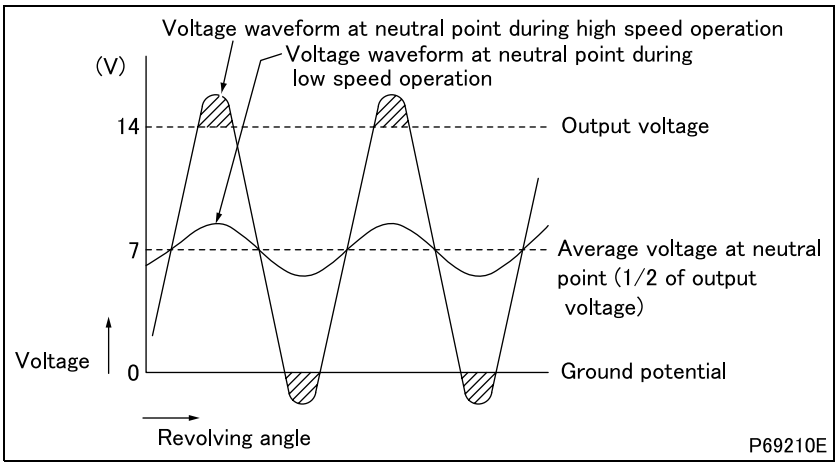


2.1 Alternator with neutral diodes



(1) Features

- The alternator is the same as the current alternator except that neutral diodes have been added.
- These neutral diodes enable this alternator to provide higher DC output during operation at high speeds than the alternator without neutral diodes.

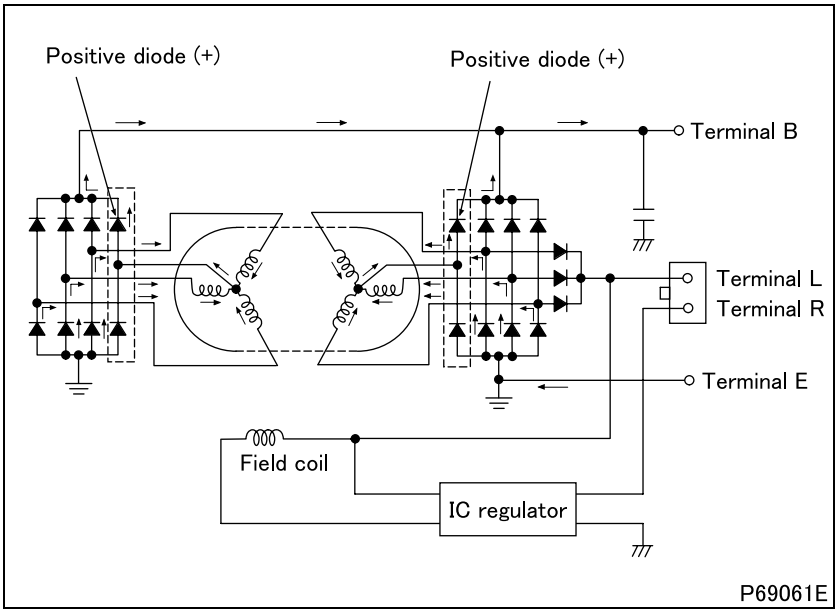


(2) Variations of voltage at neutral point and operation of neutral diodes

- The potential at the neutral point varies up and down with the neutral point DC voltage (1/2 of output voltage) as a center as shown.
- When the alternator is operated at high speeds, the voltage at the neutral point can increase to exceed the output voltage (14V) and decrease to become lower than the ground voltage (0V). To adjust these over-voltage and under-voltage (shaded portions of diagram) the current from the excess voltages is taken by neutral diodes and added to the DC output.

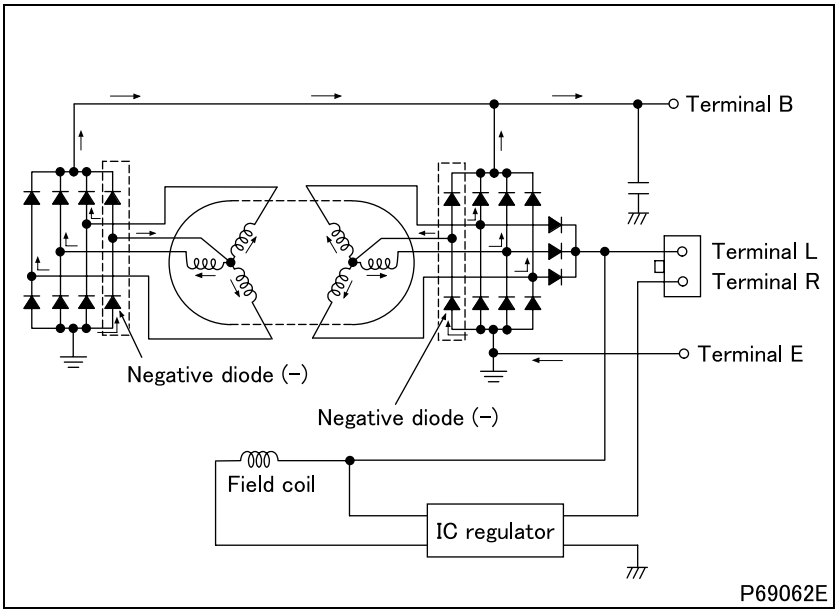
The operation of neutral diodes for each voltage and potential is as follows.

- When the voltage at neutral point is in the range from 0 to 14V, the other six diodes are operated. Neutral diodes are not operated.



(3) When the voltage at neutral point exceeds 14V

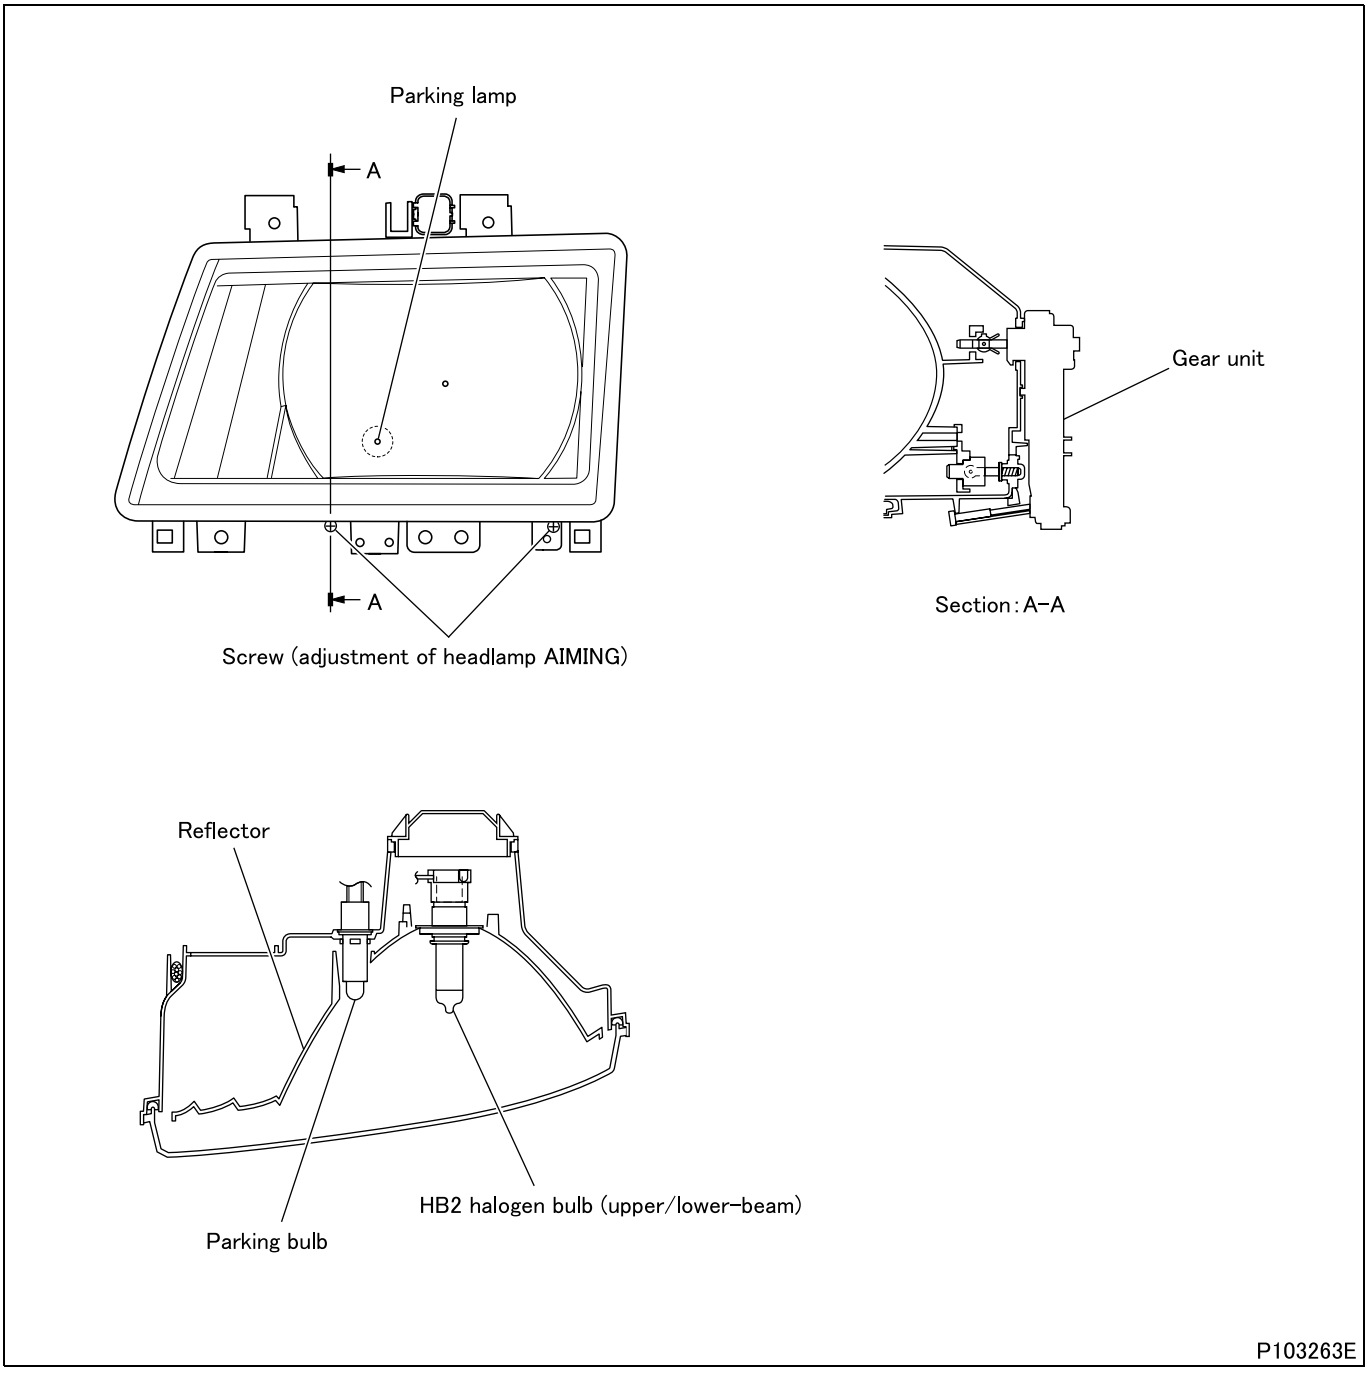
- The positive diode (+) adds extra output to the DC output for supply to each electric equipment.



(4) When the voltage at neutral point drops below 0V

- The negative diode (–) supplies the output from neutral point through other three diodes.

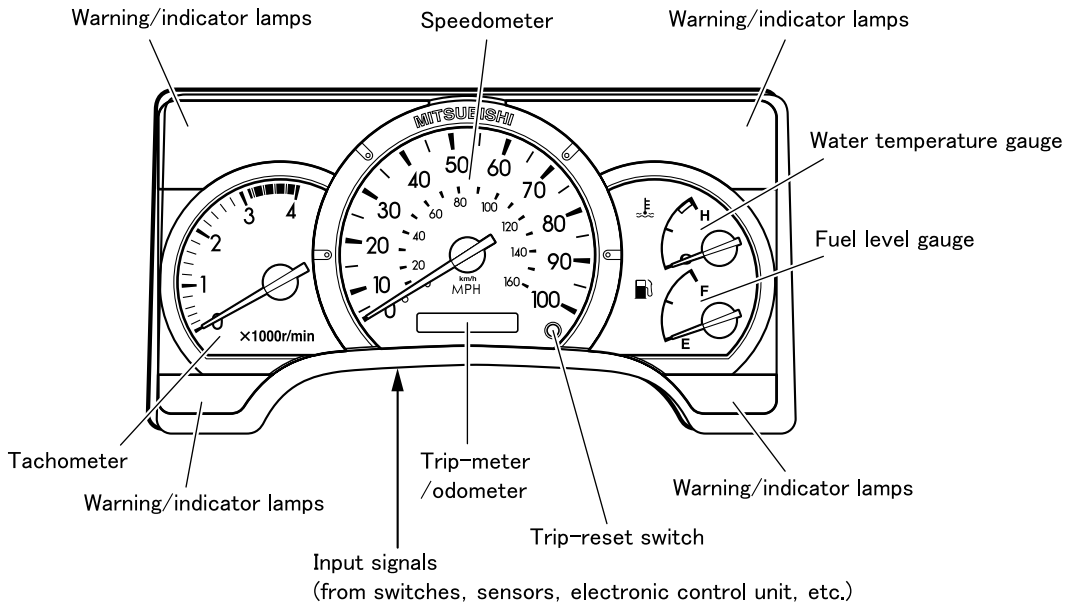
3. Headlamps



(Left headlamps are shown in this illustration)

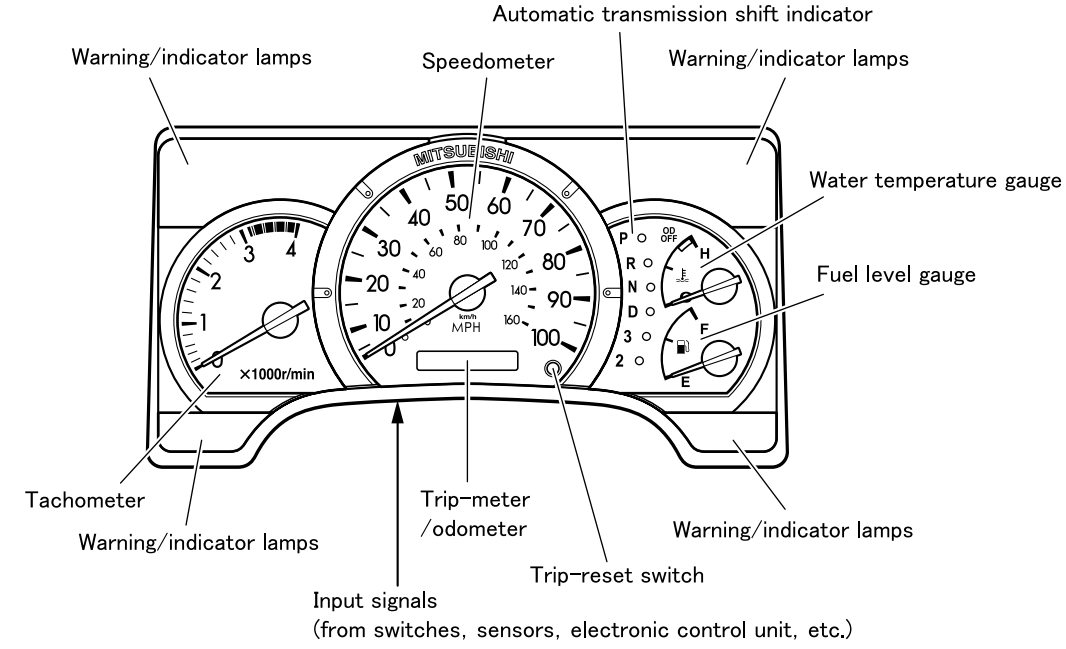
4. Meter Cluster

＜Manual transmission＞



P64157E

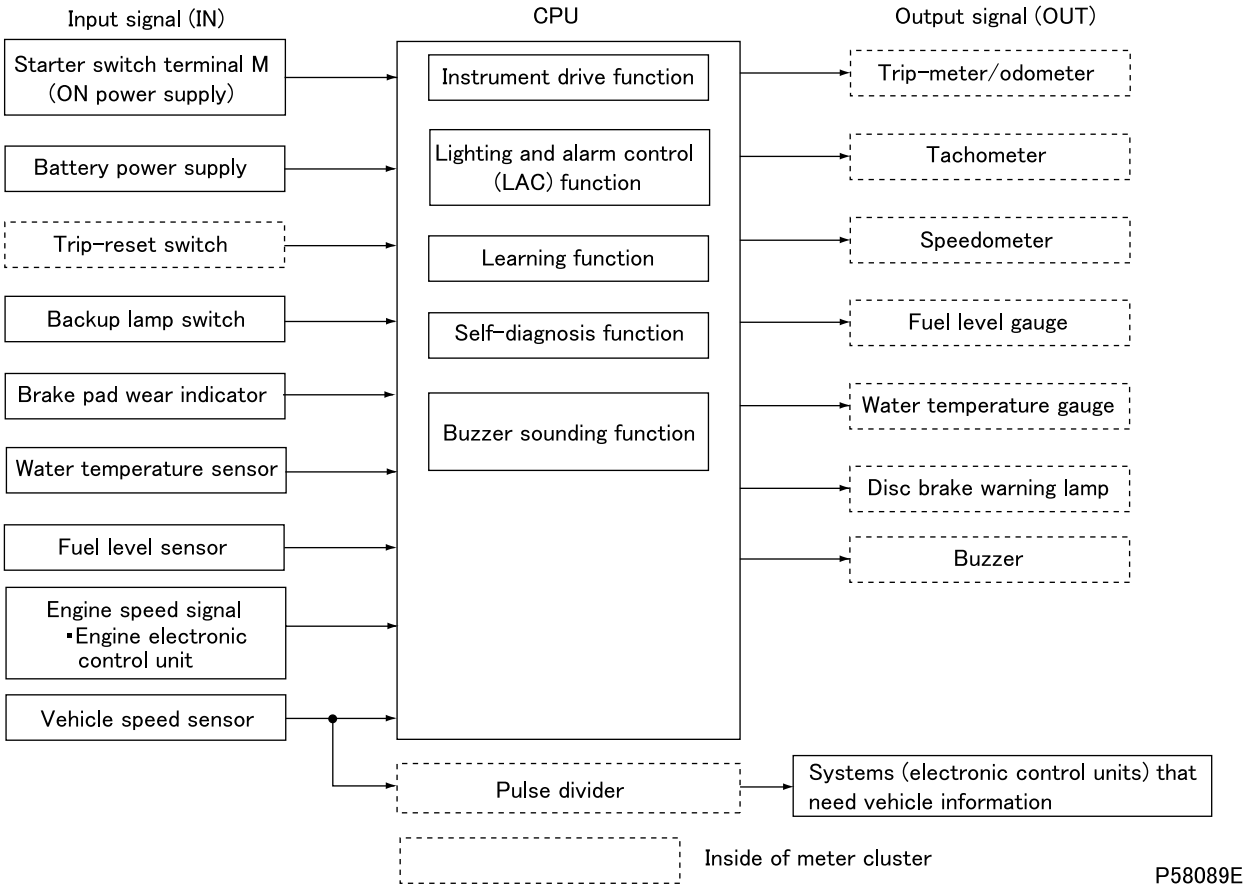
＜Automatic transmission＞



P64158E

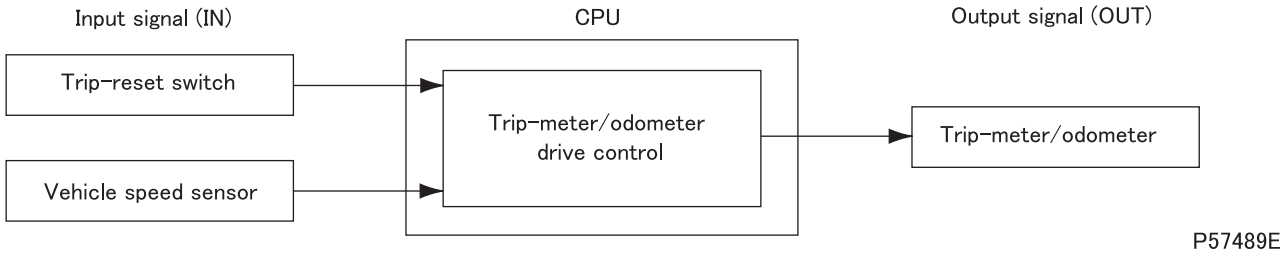
- The meter cluster incorporates a CPU, which contains the lighting and alarm control (LAC) function, learning function, and self-diagnosis function.

4.1 Electronic control unit in the meter cluster system block diagram

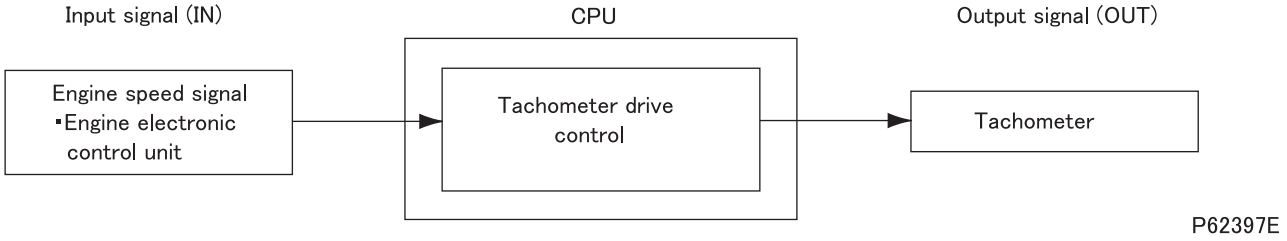


4.2 Instrument drive function

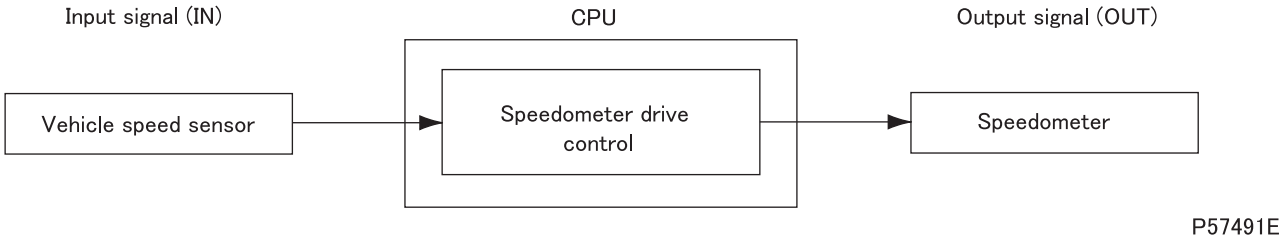
(1) Trip-meter/odometer



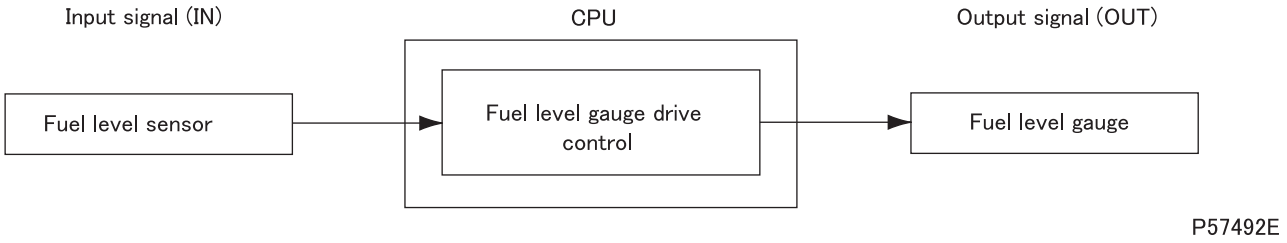
(2) Tachometer



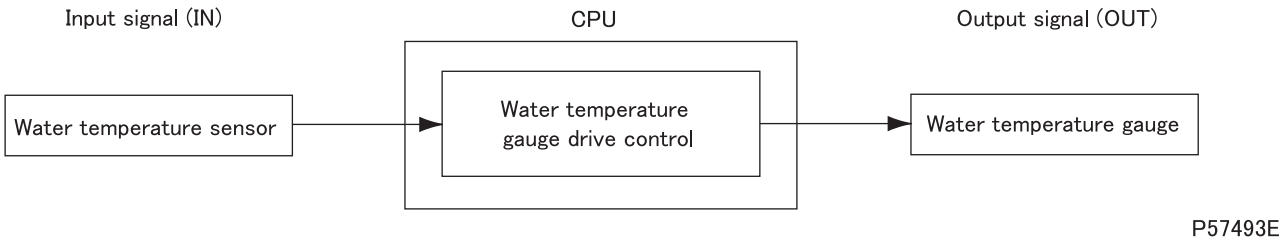
(3) Speedometer



(4) Fuel level gauge

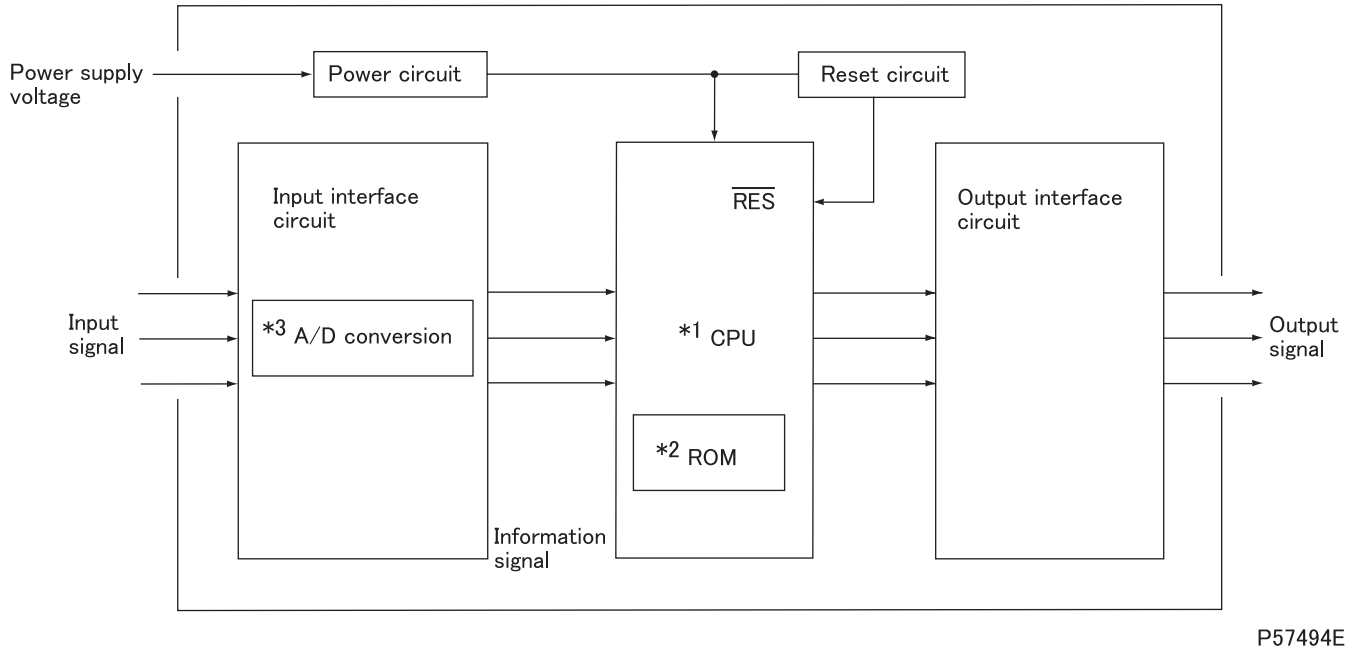


(5) Water temperature gauge



4.3 Lighting and alarm control (LAC) function

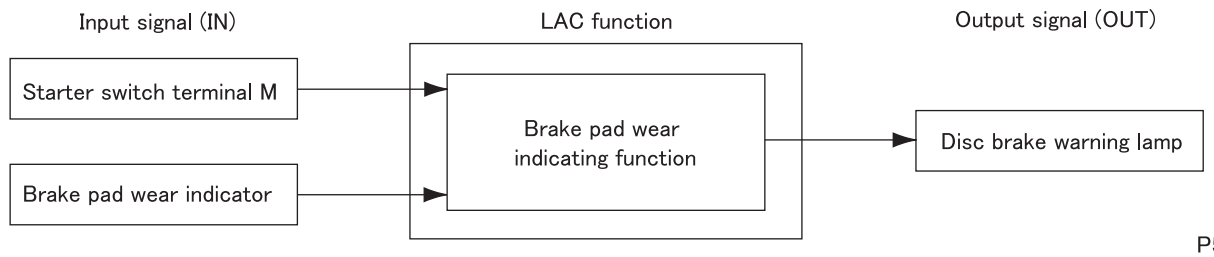
(1) Internal structure of LAC



P57494E

- Internally, the LAC is essentially made up of the input interface circuit, *1CPU, *2ROM, and output interface circuit.
  - *1CPU:
    An abbreviation for Central Processing Unit. It compares the input information and the information stored in the ROM, makes a decision and sends commands to the outputs.
  - *2ROM:
    An abbreviation for Read-Only Memory. Its contents are only for reading. It stores fixed data and programs, and such retained information is not deleted even after power is cut off.
- Information sources such as the sensor and switch send input signals to the input interface circuit.
- The input interface circuit performs *3A/D conversion of the input signals, and the converted signals are transmitted to the CPU as information signals.
  - *3A/D conversion:
    An abbreviation for Analog/Digital conversion. It converts analog signals to digital signals. This conversion enables calculation to be made in the CPU.
- The CPU compares the received signals with the data in the ROM, makes a decision, and sends the results to the output interface circuit.
- The output interface circuit transmits these results to each system as output signals to instruct operations.
- Performing these series of operations continuously enables optimum control of each function.

(2) LAC function system block diagram



P57495E

(3) Brake pad wear indicating function

- The LAC function determines ON or OFF state of the brake pad wear indicator, and causes the disc brake warning lamp to turn on if necessary.

4.4 Learning function

- The learning function makes the electronic control unit in the meter cluster recognize the specifications of the vehicle, without which the meter cluster cannot provide proper indications.
- There are the following two learning items:
  - "With" or "without" brake pad wear indicator.
  - "With" or "without" clutch disc wear indicator switch.

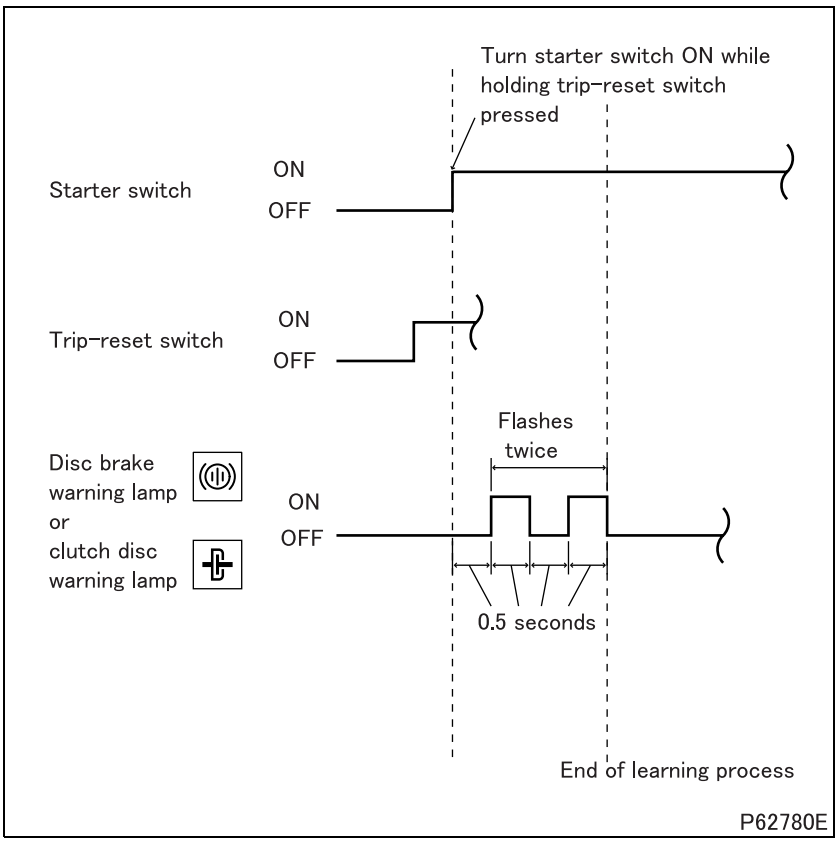
CAUTION ⚠

- **When making the electronic control unit recognize "with" for the brake pad wear indicator or clutch disc wear indicator switch, make sure that there is no open circuit in any of the relevant brake pad wear indicator or clutch disc wear indicator switch circuits. (If any circuit is found open, replace the corresponding switch.)**

(1) Learning operation

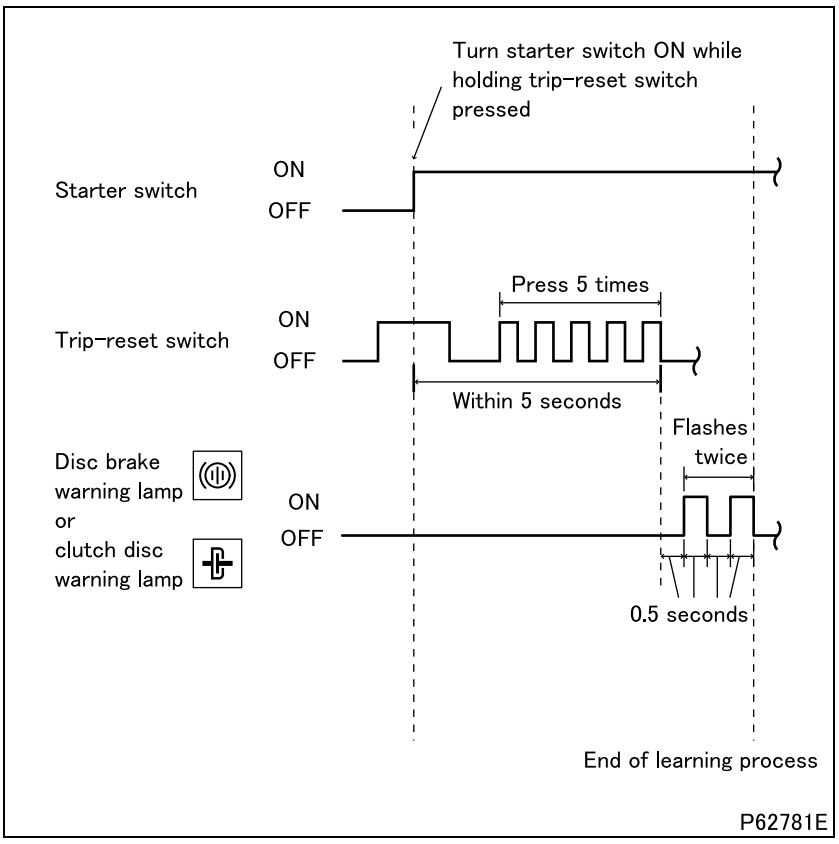
- The learning operation method differs depending on the odometer reading as follows:
  - Less than 3 km (for when the meter cluster is replaced with a new one).
  - 3 km or more (for when re-learning is required due to such a reason as wrong initial learning).

(2) Learning operation for odometer reading of less than 3 km



- Turn the starter switch to ON while holding the trip-reset switch pressed, then release the reset switch.
- After 0.5 seconds, the disc brake warning lamp or clutch disc warning lamp will flash twice, indicating completion of the learning process.
- If the vehicle is not equipped with the brake pad wear indicator or clutch disc wear indicator switch, the corresponding warning lamp does not flash.

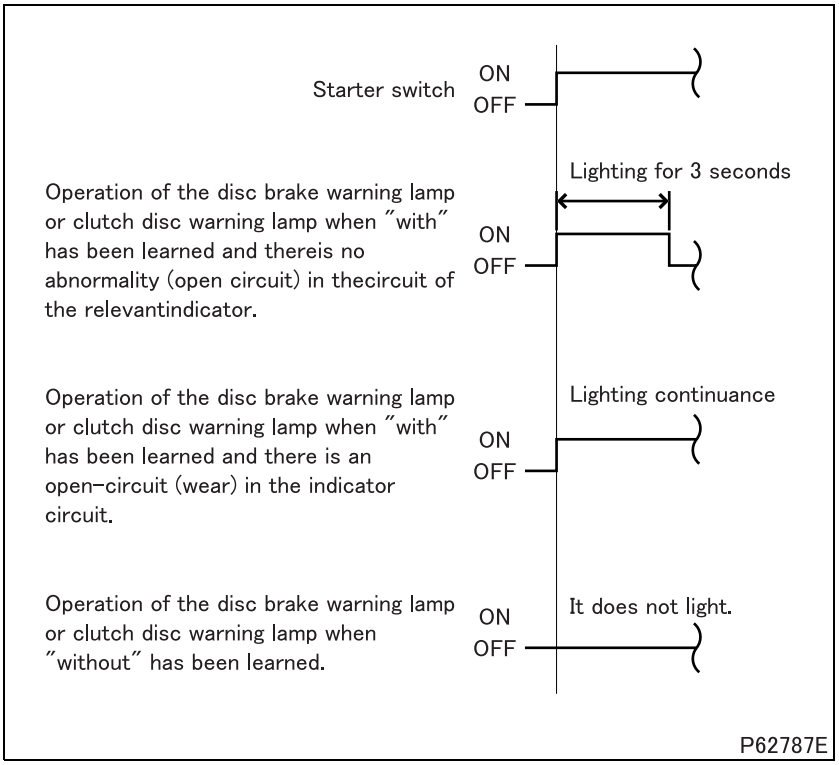
(3) Learning operation for odometer reading of 3 km or more



- Turn the starter switch to ON while holding the trip-reset switch pressed, then release the reset switch.
- Within 5 seconds after turning the starter switch to ON, press again the trip-reset switch 5 times.
- After 0.5 seconds, the disc brake warning lamp or clutch disc warning lamp will flash twice, indicating completion of the learning process.
- If the vehicle is not equipped with the brake pad wear indicator or clutch disc wear indicator switch, the corresponding warning lamp does not flash.

(4) Learning result confirmation and open-circuit checking

- After every learning operation, turn the starter switch to OFF and then to ON again to make sure that the indicator lamp for which “equipment” has been learnt illuminates.



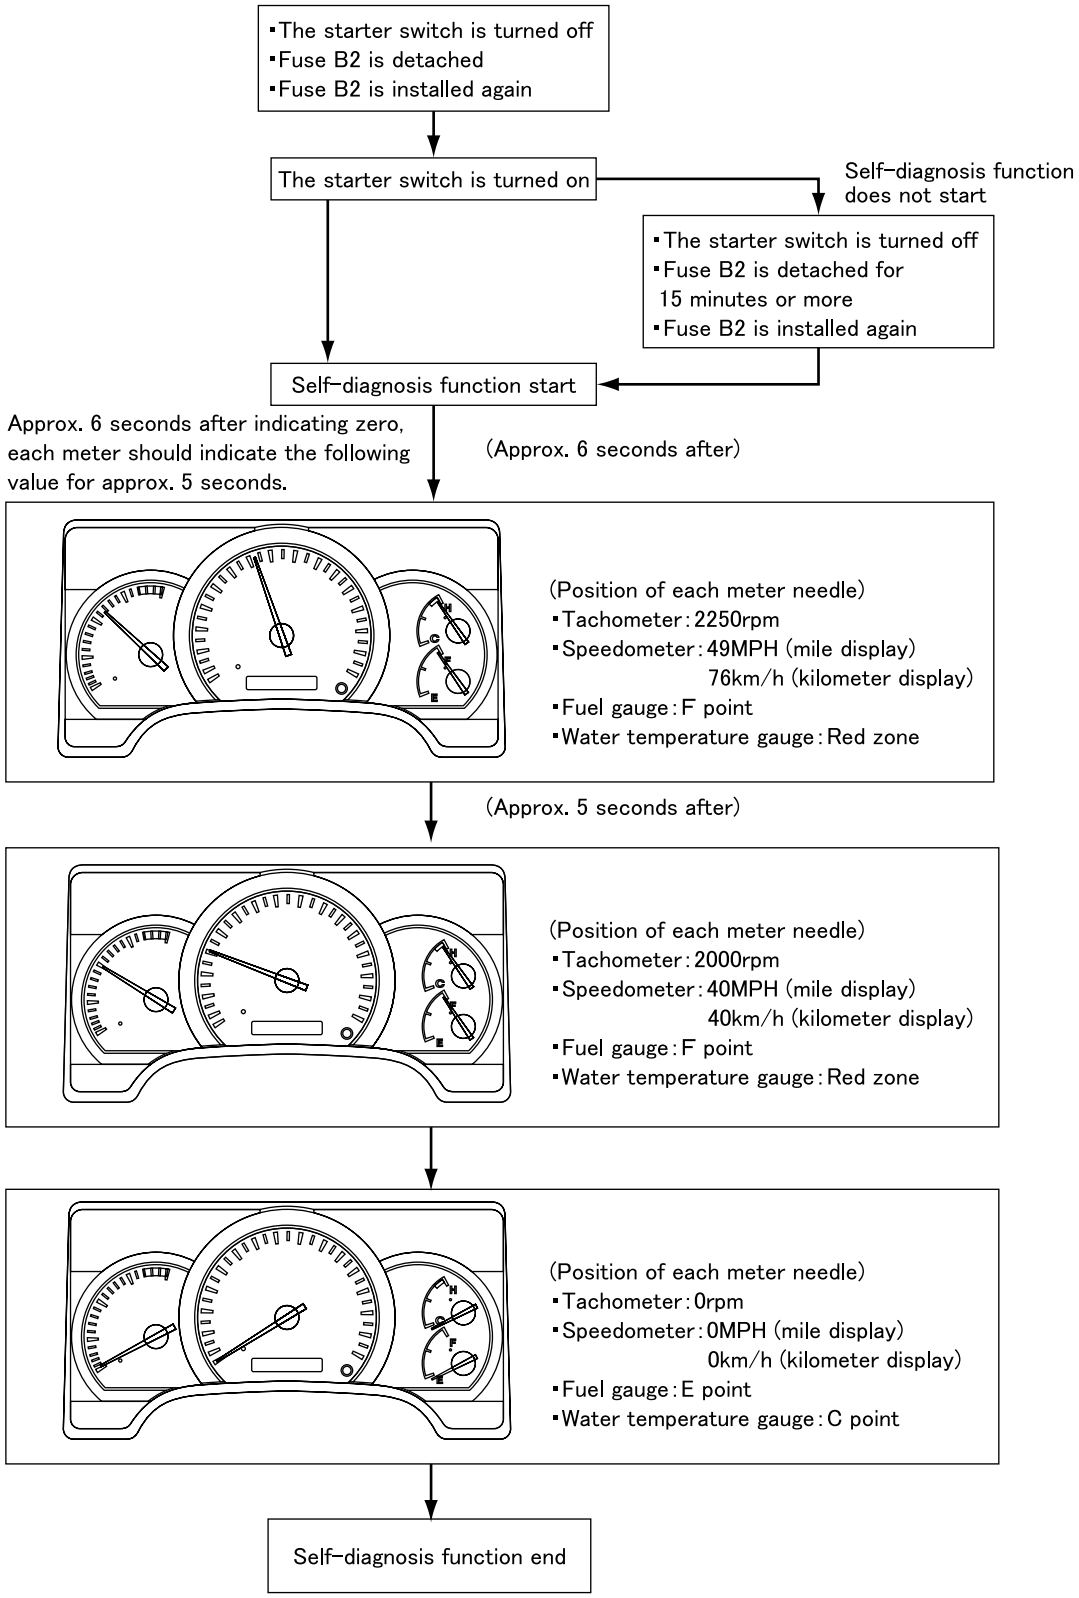
- The open-circuit checking function checks that the indicator lamp(s) for which “equipment” has been learned illuminates normally when the starter switch is turned to ON.

4.5 Self-diagnosis function

- This function is used to check meters in the meter cluster for normal operation when the meter cluster is replaced.

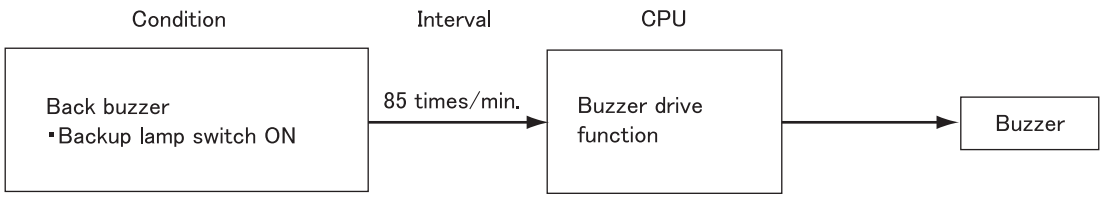
(1) Diagnosis procedure

- If any meter does not function as follows, the meter cluster may be faulty.



P107068E

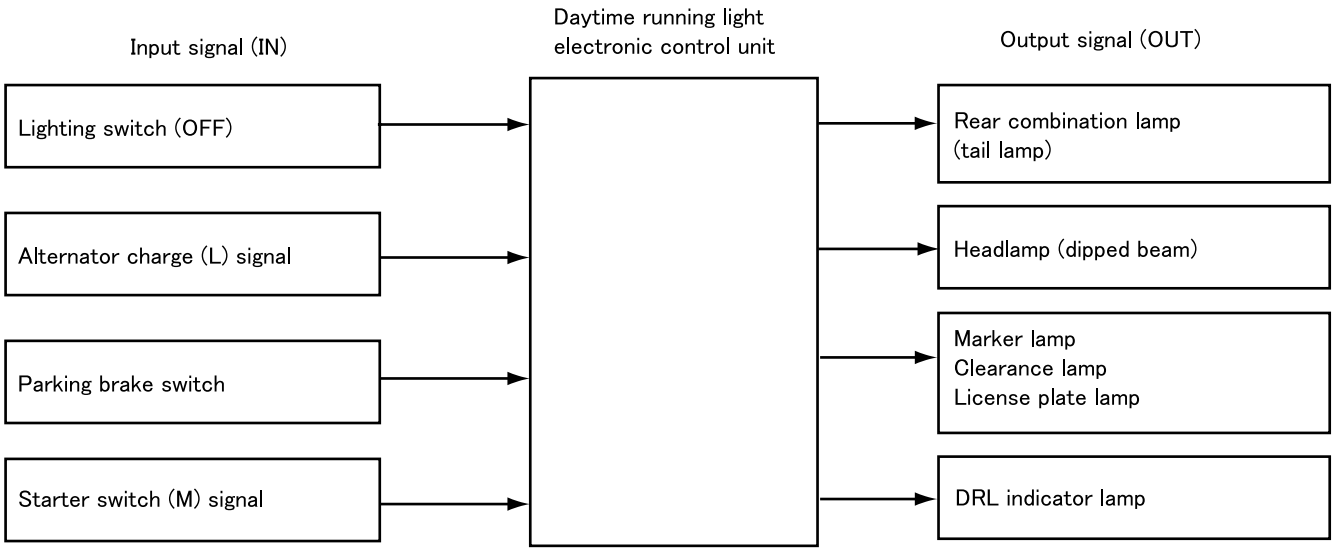
4.6 Buzzer sounding function



P62494E

M E M O

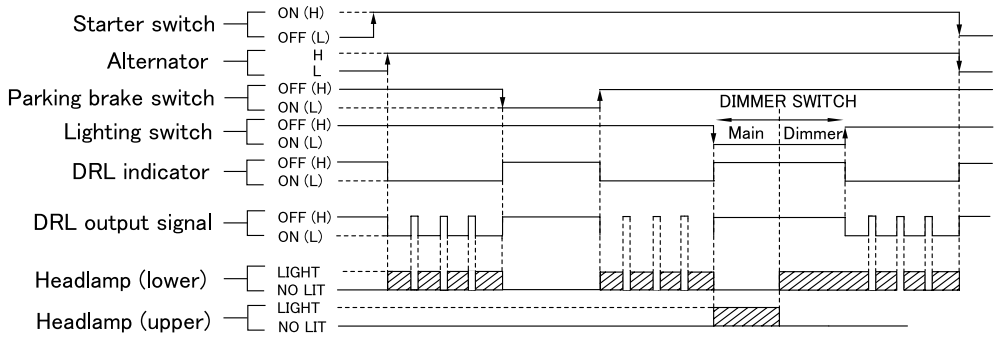
5. Daytime Running Light System



P58722E

- In a daytime running light system, regardless the position of lighting switch while engine is running, the dipped beam of the headlamp and the tail lamp of the rear combinations, position lamp, license plate lamp will light on.
- Except for that the lighting switch is OFF or when the passing switch is ON, the same lamps as usual switch operation will light.

5.1 Timing chart

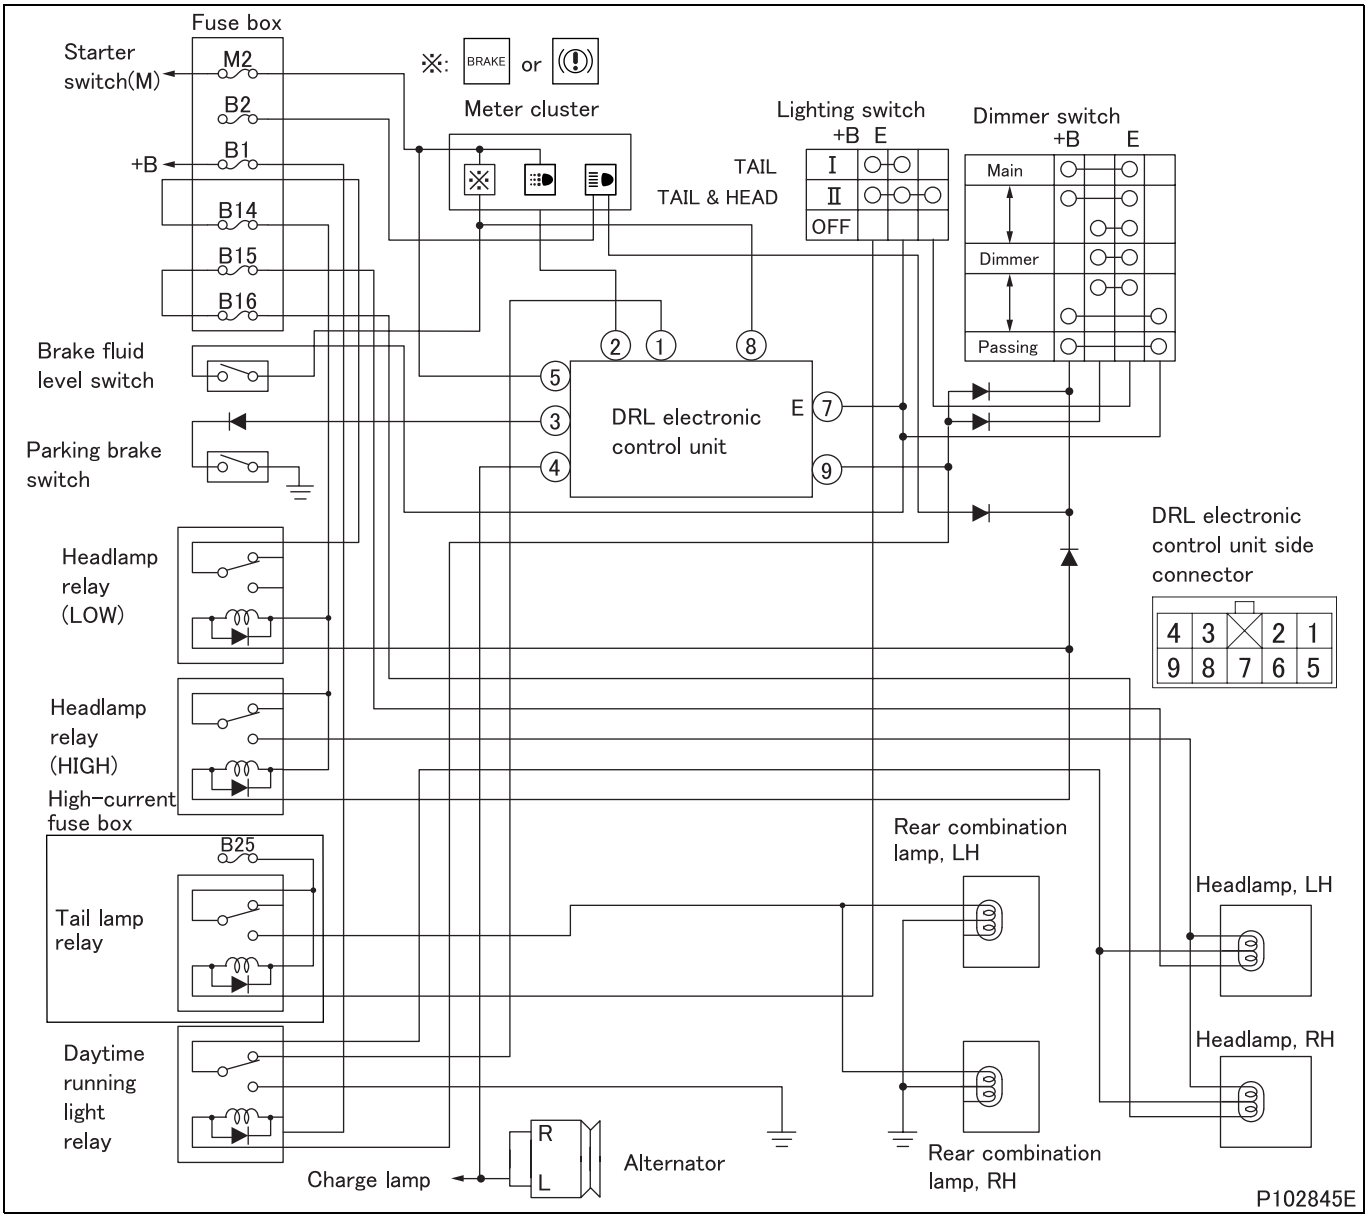


P36413E

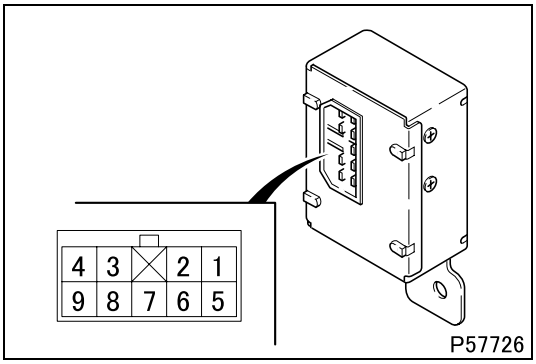
Headlamps repeat ON/OFF operations at 120 Hz according to the above timing chart. Because of the cyclic ON/OFF operations, the headlamps are dimmer than when the headlamp switch is ON.
Explanation of timing chart

- After the engine starts, when alternator begins generating electricity with starter switch in the ON position, headlamps light.
- When parking brake switch is ON, the DRL turns off to switch off the headlamps.

5.2 Daytime running light electronic control unit circuit diagram



5.3 DRL electronic control unit



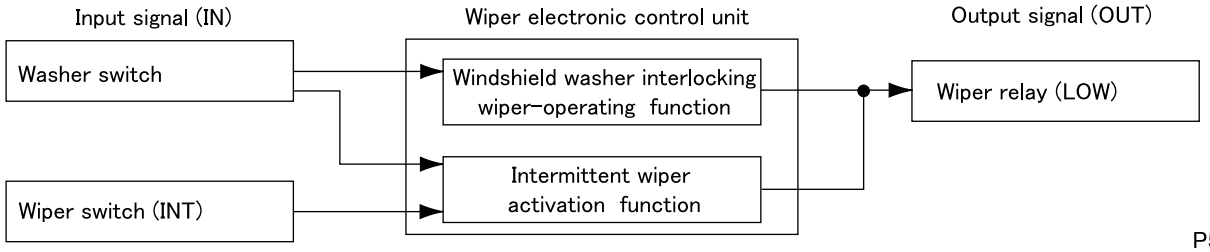
Terminal No.	Connecting destinations	Terminal No.	Connecting destinations
1	Head lamp (dipped)	6	–
2	DRL indicator lamp	7	Ground
3	Parking brake switch	8	Parking brake indicator lamp
4	Alternator L terminal	9	Lighting switch
5	Starter switch M terminal	–	–

6. Wiper Control

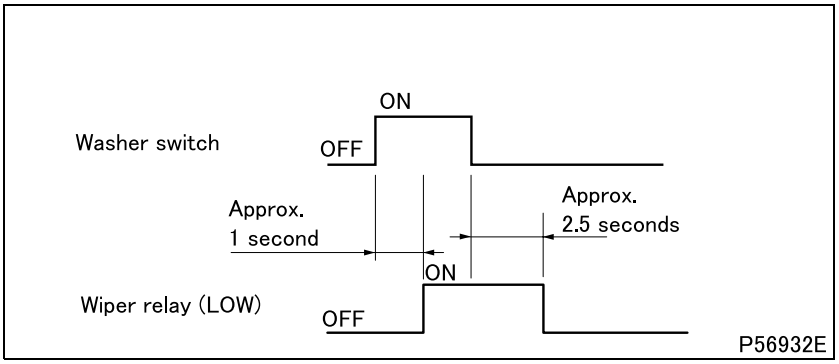
6.1 Outline

- This wiper electronic control unit is an integrated control unit controlling the following functions.
  - Windshield washer interlocking wiper-operating function.
  - Intermittent wiper activation function.

(1) System function schematic

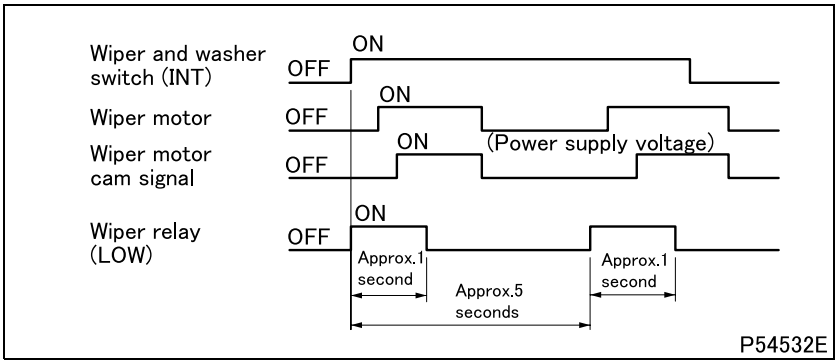


6.2 Windshield washer interlocking wiper-operating function



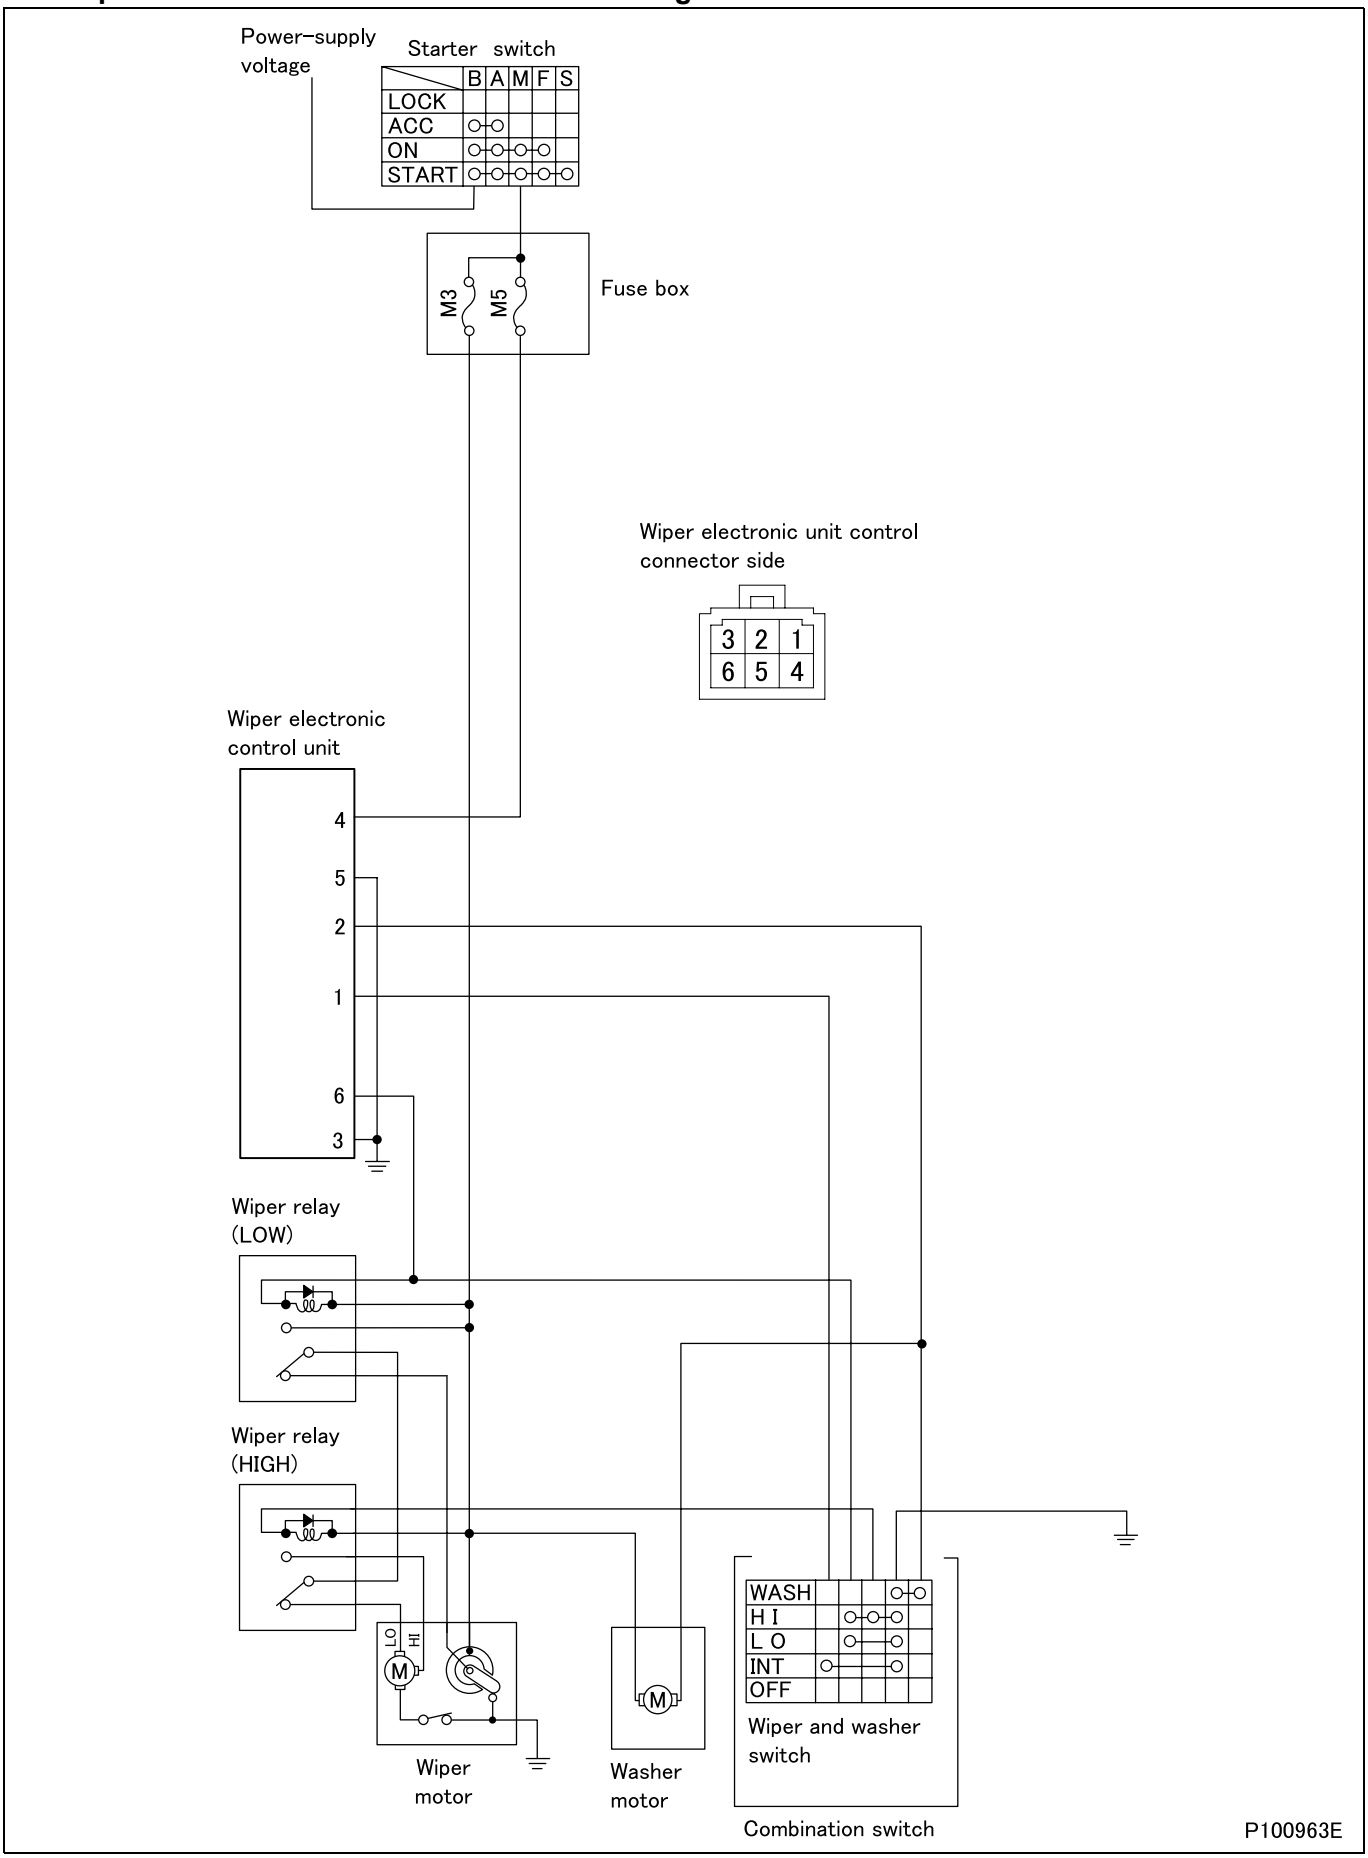
- This function causes the windshield wipers to operate a few times at low speed when the windshield washer switch is turned ON.
- As shown in the drawing, the wiper electronic control unit introduces a short delay between detecting the ON condition of the wiper and washer switch (washer switch) and activating the wiper relay.

6.3 Intermittent wiper activation function



- Wiper electronic control unit causes intermittent wiper operation to take place as shown in the drawing.

6.4 Wiper electronic control unit connection diagram

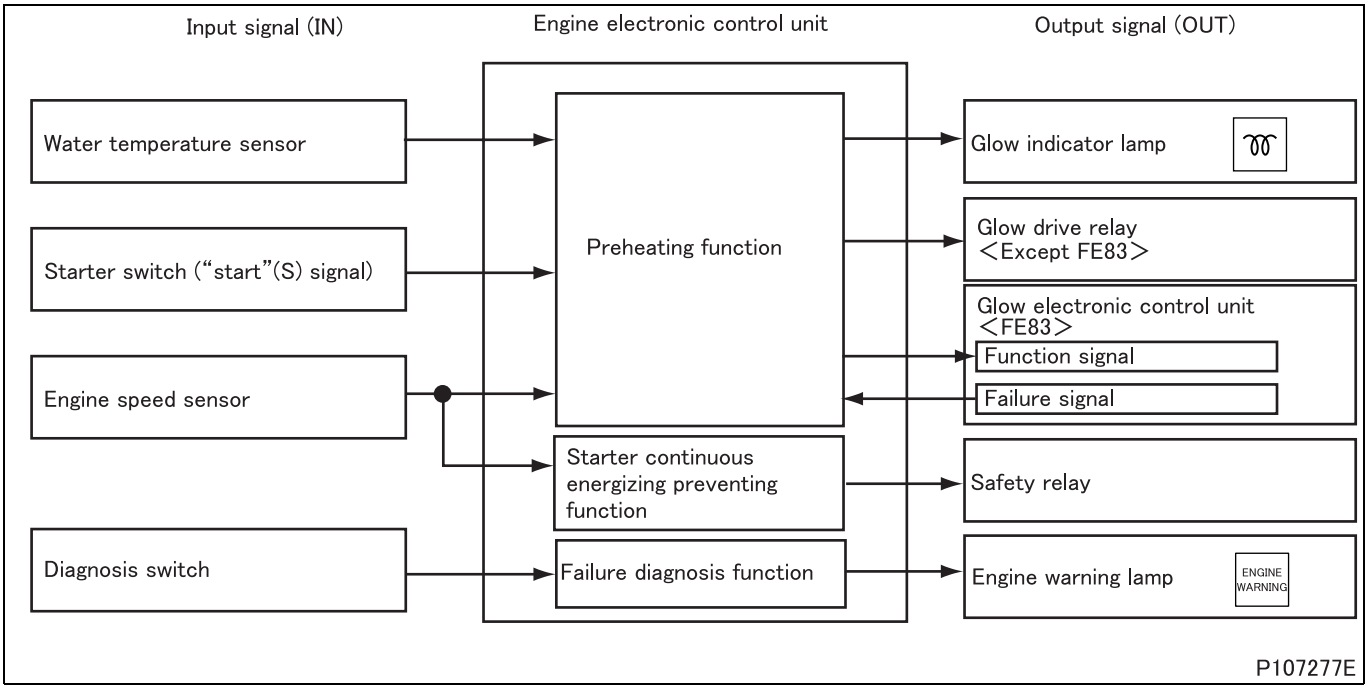


7. Starter Continuous Energizing Preventing Function and Preheating Function

7.1 Outline

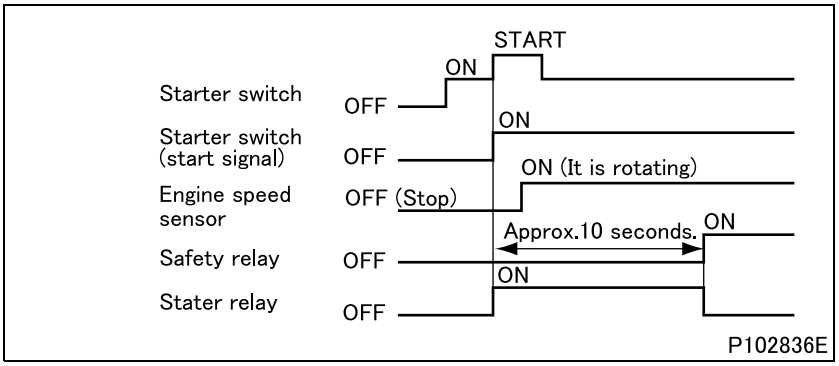
- These functions are controlled by the engine electronic control unit.

(1) System function schematic



Parts name	Major function and operation
Water temperature sensor	Engine water temperature detection
Starter switch	Start position detection
Engine speed sensor	Engine speed detection
Diagnosis switch	Output of diagnosis code
Engine warning lamp	Abnormality of each function
Safety relay	Release of starter continuous energizing
Glow electronic control unit <FE83>	Fault detection for glow function

7.2 Starter continuous energizing preventing function

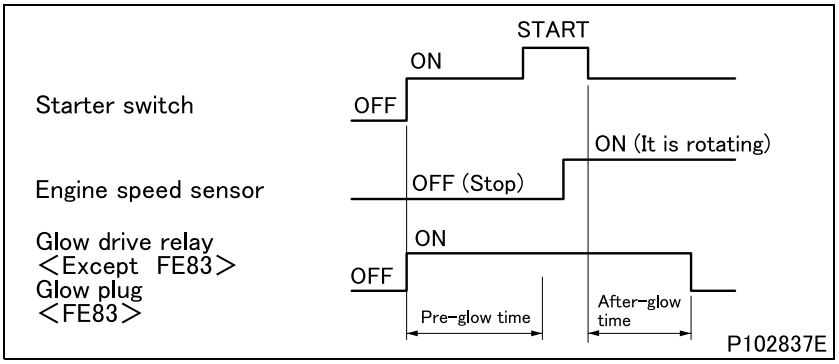


- This function is provided to prevent starter over-run.
- If the starter operates for longer than a predetermined period following engine startup, the Engine electronic control unit deems that it has been energized continuously for too long. The Engine electronic control unit then stops the flow of current to the starter and starter relay, thereby preventing the starter from seizing.

- If the engine electronic control unit determines, based on the engine speed signal it receives, that the engine has run at or above the specified speed for longer than the specified time period after start-up, the unit trips the safety relay open.

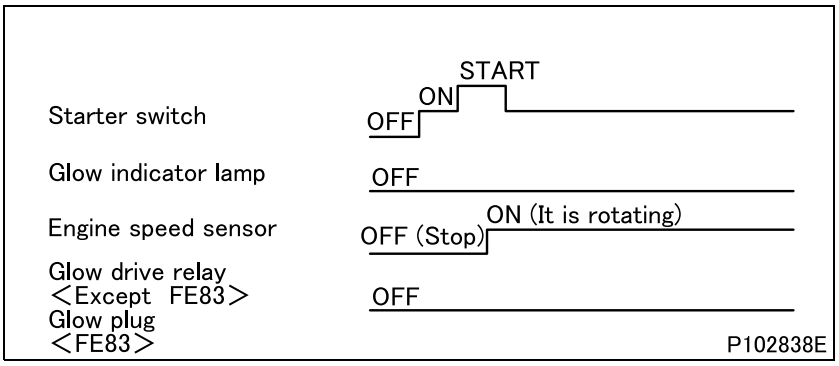
7.3 Preheating function

- This preheating function aims to enhance the engine start up when the engine coolant is low in cold weather or temperature.
  Engine electronic control unit the entire function as follows:



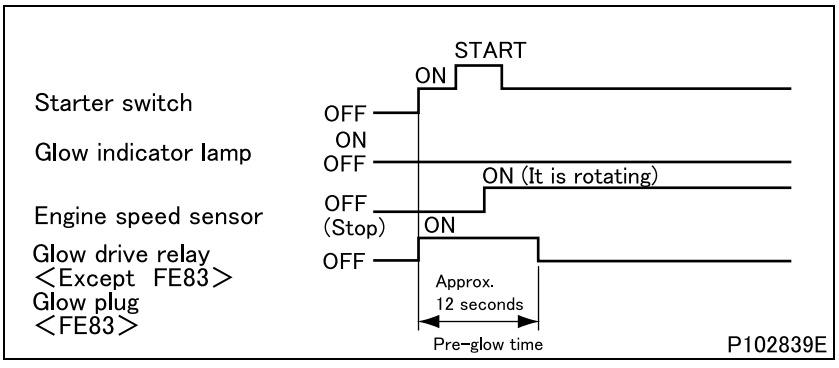
(1) Pre-glow and After-glow

The preheating is operated with a pre-glow before the engine starts and an after-glow after the engine starts. They are controlled by the starter switch (S terminal) signal, engine water temperature signal and the engine speed signal.

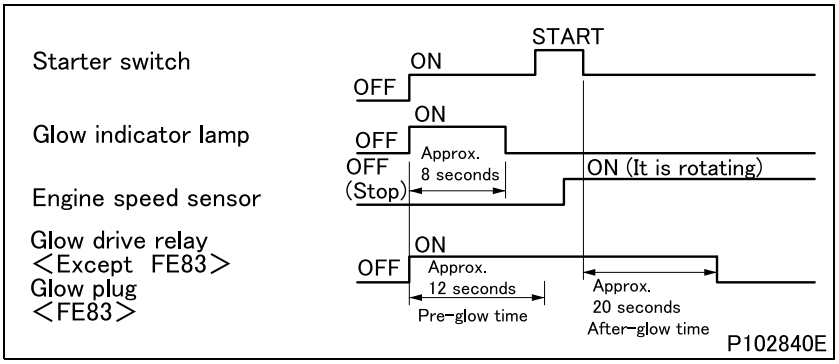


(2) Operation mode

- When the engine coolant temperature is 60°C {140°F} or more.



- When the engine coolant temperature is 0 to 60°C {32 to 140°F}.



- When the engine coolant temperature is 0°C {32°F} or less.

7.4 Fault diagnosis function

- While the starter switch is in the ON position, the sensors and other components are continuously monitored for faults. In the event that a component is found faulty, an indication is made in the meter cluster to alert the driver, the fault location is memorized in the form of a diagnosis code, and backup control necessitated by the fault is initiated.
- While the backup control is taking place, the system's functionality is limited to ensure vehicle and driver safety. It is possible to read the memorized diagnosis code using a Multi-Use Tester or from flashing of the warning lamp.

NOTE

- **Diagnosis codes shown by the Multi-Use Tester and those indicated by flashing of the warning lamp are different.**
- **The Multi-Use Tester is capable of showing more detailed diagnosis codes.**

54-00D TROUBLESHOOTING

1. Power and Charging

Symptoms / Possible causes		Battery electrolyte decreases too early.	Battery overheating.	Battery is normal but over-discharged.	Charge warning lamp does not light when starter switch is turned ON, with engine stopped.	Alternator is normal but battery over-discharged.	Reference Gr
Connector connection faulty, harness broken, grounding faulty				O		O	
Fuse blown				O	O	O	
Belts loose				O		O	Gr14
Belts damaged				O		O	Gr14
Battery faulty		O				O	
Alternator	Stator coil broken			O			
	Stator coil short-circuited with core			O			
	Field coil broken			O			
	Rectifier faulty			O			
	Regulator faulty		O	O	O		
	Wiring faulty			O			
Meter cluster faulty					O		

2. Engine Starting, Stopping and Preheating

Symptoms / Possible causes		Starter does not operate.	Starter operates but engine does not start			Engine does not stop.	Engine cannot be preheated.	Engine is hard to start.	Engine warm-up function does not operate.	Reference Gr
			Pinion does not engage with ring gear.	Pinion engages with ring gear but does not rotate.	Flywheel rotates but engine does not start.					
Connector connection faulty, harness broken, grounding faulty		O			O	O	O		O	
High-current fuse blown		O								
Fuse blown		O				O	O		O	
Battery voltage insufficient		O		O						
Starter	Magnetic switch contacts stuck or fused together	O								
	Open circuit in magnetic switch coil	O								
	Overrunning clutch malfunctioning			O						
	Pinion worn or damaged		O							
Starter relay faulty		O								
Starter switch faulty		O				O				
Flywheel ring gear worn or damaged			O							Gr11
Glow plugs faulty							O	O		
Glow relay faulty <Except FE83>							O	O		
Glow drive relay faulty <Except FE83>							O	O		
Glow electronic control unit faulty <FE83>							O	O		Gr13E
Safety relay faulty		O								
Water temperature sensor faulty							O	O	O	
Engine electronic control unit faulty		O					O	O	O	Gr13E
Exhaust brake system faulty								O	O	Gr35
Connection plate connection faulty <Except FE83>							O	O		Gr11
Transmission neutral switch faulty <M/T>									O	
Neutral start relay faulty <A/T>		O								
Inhibitor switch faulty <A/T>		O								

A/T: Automatic transmission
M/T: Manual transmission

3. Lighting

Symptoms / Possible causes		Headlamp				Tail lamp does not light.	Stop lamp does not light.	Identification lamp, clearance and side marker lamp	Parking lamp does not light.	License plate lamp does not light.	Backup lamp does not light.	Back buzzer does not sound.	Reference Gr
		Does not light.	Dim.	Does not switch to main beam.	Does not switch to dipped beam.								
Connector connection faulty, harness broken, grounding faulty		O				O	O	O	O	O	O	O	
Fuse blown		O				O	O	O	O	O	O	O	
Battery voltage insufficient			O										
Alternator output insufficient			O										
Bulb burnt-out		O				O	O	O	O	O	O	O	
Combination switch	Lighting switch faulty	O				O		O	O	O		O	
	Dimmer switch faulty			O	O								
Headlamp relay (HIGH, LOW) faulty		O		O	O								
Tail lamp relay faulty						O		O	O	O		O	
Stop lamp relay faulty							O						
Stop lamp switch faulty							O						
Backup lamp switch faulty											O		

Symptoms / Possible causes		Turn signal lamp (serving also as hazard warning lamp)					Cab lamp does not light.	Interior illumination lamps for meters, radio system, etc. do not light.	Reference Gr
		Does not blink.	Stay ON.	Blinks too slowly.	Blinks too quickly.	Blinks irregularly.			
Connector connection faulty, harness broken, grounding faulty		O					O	O	
Fuse blown		O					O		
Battery voltage insufficient			O						
Alternator output insufficient			O						
Bulb burnt-out		O			O		O	O	
Power (wattage) of bulb is lower than specified value					O				
Power (wattage) of bulb is higher than specified value				O					
Combination switch	Lighting switch faulty							O	
	Turn signal lamp switch faulty	O							
Tail lamp relay faulty								O	
Turn signal lamp relay faulty		O							
Flasher unit faulty		O	O	O	O	O			
Cab lamp switch faulty							O		
Cab lamp faulty							O		
Door switch faulty							O		
Hazard warning lamp switch faulty		O	O						
Rheostat switch faulty								O	

Symptoms / Possible causes		Van body dome light does not light.	Daytime running light system does not operate after engine starts, and headlamps do not light.	Reference Gr
Connector connection faulty, harness broken, grounding faulty		O	O	
Fuse blown		O		
Bulb burnt-out		O		
Combination switch	Lighting switch faulty	O		
Relay box	Headlamp relay (HIGH, LOW) faulty		O	
	Tail lamp relay faulty		O	
	Daytime running light relay		O	
Van body dome light relay faulty		O		
Van body dome light switch faulty		O		
Daytime running light electronic control unit faulty			O	

4. Meter

Symptoms / Possible causes		Pointer does not move.	Pointer movement unstable.	Indication error large.	Abnormal noise from meter.	Reference Gr
Connector connection faulty, harness broken, grounding faulty		O	O			
Fuse blown		O				
Internal circuits of meter cluster faulty		O	O	O		
Printed wiring board of meter cluster faulty		O				
Tachometer	Engine speed sensor coil open-circuited	O				
	Engine speed sensor improperly mounted	O	O			
	Tachometer faulty	O	O	O	O	
Speedometer	Vehicle speed sensor faulty	O				
	Vehicle speed sensor improperly mounted		O			
	Specified tires not used			O		Gr31
	Tires worn or inflation pressure incorrect			O		Gr31
	Specified L-joint of transmission not used (difference in gear ratio)			O		Gr22
	Specified speedometer gear of transmission not used (difference in gear ratio)			O		Gr22
	Installation angle of speedometer gear bushing on transmission incorrect (not set at correct gear ratio position)			O		Gr22
	Speedometer faulty	O	O	O	O	
Water temperature gauge	Water temperature sensor faulty	O		O		
	Water temperature gauge faulty	O		O		
	Thermostat does not close	O				Gr14
Fuel gauge	Fuel level sensor faulty	O		O		
	Fuel gauge faulty	O		O		

5. Cigarette Lighter and Audio

Symtoms / Possible causes	Cigarette lighter			Audio	Reference Gr
	Does not glow.	Does not return.	Night lamp does not light up.	Radio does not work.	
Connector connection faulty, harness disconnection, grounding faulty	O		O	O	
Fuse blown	O		O	O	
Cigarette lighter faulty	O	O			
Tail lamp relay faulty			O		
Antenna and antenna cable connection faulty				O	
Radio amplifier faulty				O	
Radio tuner faulty				O	
Speaker faulty				O	

Accessory Noise Generation Source

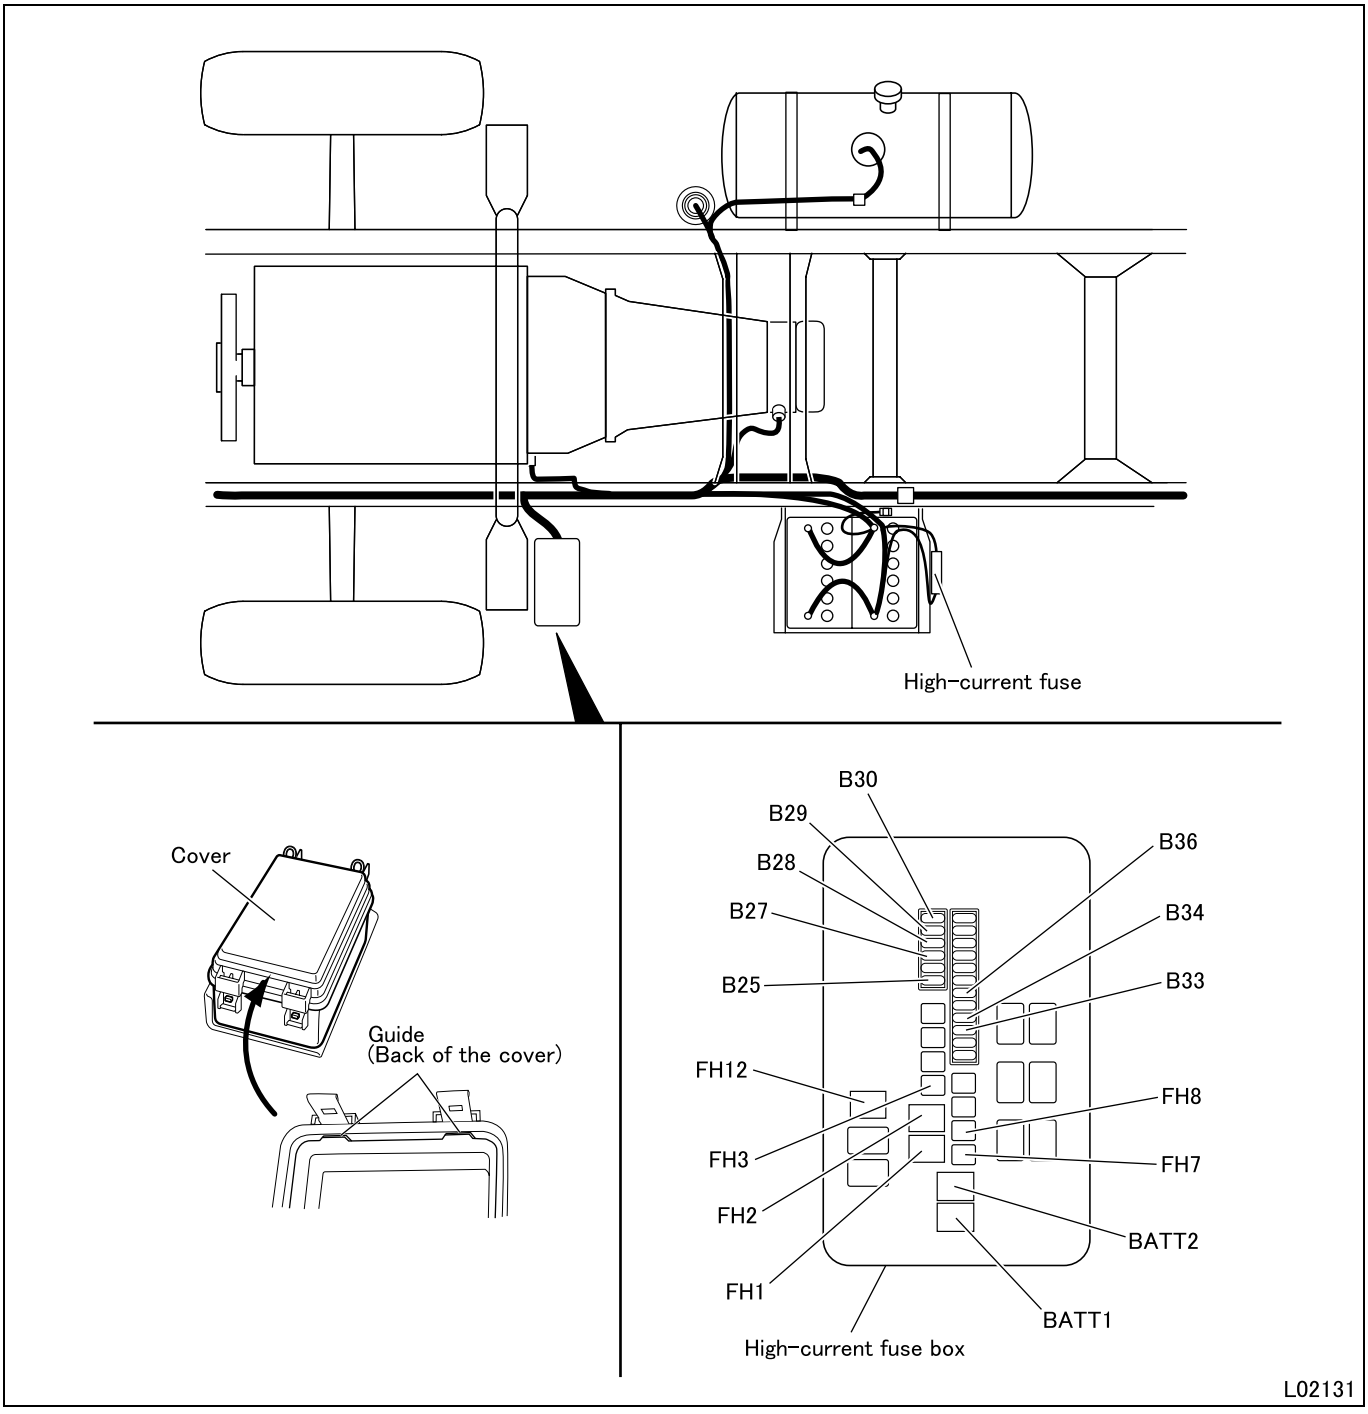
Accessory	Noise	Symptoms
Alternator	Whistling	High pitch sound when accelerator pedal suddenly pressed (Stops soon after engine stopped)
Water temperature gauge	Scratching	Occurs when engine running (Continues for a while after engine stops)
Engine oil pressure switch	Rattling	Depends on engine speed (Does not occur during idling)
Fuel level sensor	Scratching	Occurs when engine suddenly revved, while running on rough roads, or starter switch turned ON
Flasher unit	Banging	When turn signal blinks
Horn	Hissing	Occurs when horn button pressed or released
Wiper motor	Whining	Depends on windshield wiper speed
Washer motor	Whining	When windshield washer operates

6. Horn

Symptoms / Possible causes	Horn				Reference Gr
	No sound	Continuous sound	Small sound	Sound quality poor	
Connector connection faulty, harness disconnection, grounding faulty	O				
Fuse blown	O				
Horn switch faulty	O	O			
Horn faulty	O		O	O	
Horn stay warped			O	O	
Battery voltage insufficient	O		O		

54-01 POWER, CHARGE AND GROUND CIRCUIT

HIGH-CURRENT FUSE BOX



WARNING ⚠

- **To prevent possible injury, be sure to disconnect the negative (–) cable of the battery and insulate it with tape before removing high-current fuses.**

CAUTION ⚠

- **With the negative (–) cable of the battery connected, some high-current fuses are always under battery voltage. An arc will be generated when any of these high-current fuses is replaced without disconnecting the battery negative cable, and this could cause the related electric devices to be damaged.**
- **If a fuse blows out, identify and remedy the cause, then replace the fuse.**
- **Be sure to use the fuse with the specified ampere.**
- **When installing the cover on the high-current fuse box, lightly press the cover directly down until the guide on the cover securely fits in the guide on the fuse box. Do not push the cover inward with excessive force, as doing so could easily damage the guides.**

High-current fuse

Main load	Capacity
Alternator (terminal B)	120A

● When removing a relay fitted with a relay lock, disengage the claw hook of the connector with a flat-blade screwdriver and open the relay lock. Then remove the relay.

● When installing the relay, fit the relay in position and securely engage the claw hook of the connector with the relay lock.

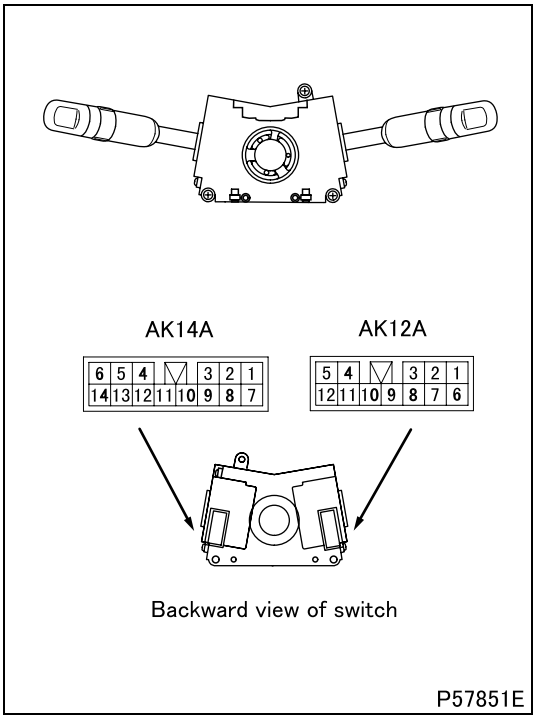
L03434

54-11 INSPECTION OF ELECTRICAL EQUIPMENT



#001 Inspection of combination switch

AK12A connector connection table

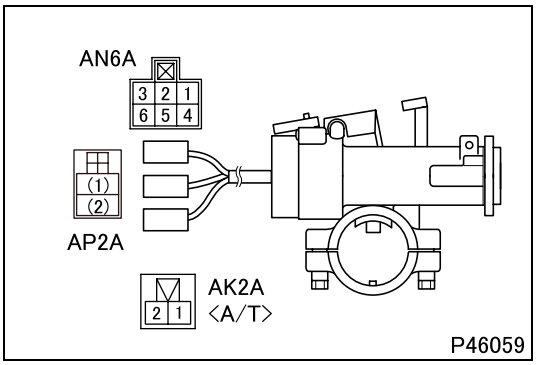
Switch position		Continuity terminal
Lighting switch	OFF	–
	I	1–2
	II	1–2–3
Dimmer switch	Main	3–12
	Dimmer	3–9
	Passing	11–12
Turn signal lamp switch	LH	6–8
	N (neutral)	–
	RH	7–8

- Terminal 3 is for internal connection in the combination switch unit.

AK14A connector connection table

Switch position		Continuity terminal
Wiper and washer switch	OFF	–
	INT (interval)	5–7
	LO (low)	3–5
	HI (high)	3–4–5
	WASH (washer)	5–12
Horn switch	OFF	–
	ON	13-body ground
Exhaust brake switch	ON	8–9
	OFF	–

- If any fault is found, replace the switch. (See Gr37.)



#002 Inspection of starter switch

AP2A, AN6A connector connection table

Switch position	Continuity terminal
LOCK	–
ACC	(2)–3, 5–6
ON	(1)–(2)–3–4, 5–6
START	(1)–(2)–2–3–4, 5–6

- Terminal numbers within parentheses ( ) show terminals of AP2A.

AK2A connector connection table

<Key interlock solenoid (A/T)>

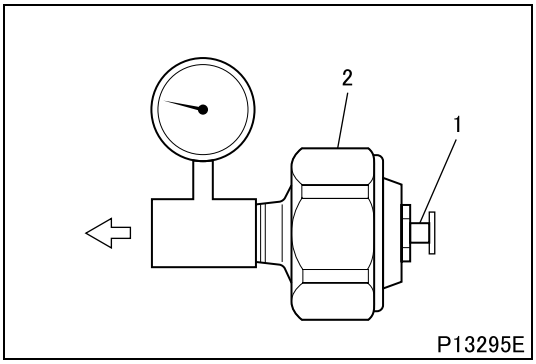
Shift position	Continuity terminal	Remarks
P range: OFF	–	The key must be turned to the lock direction
Without P range: ON	(+) 1–2 (–)	The key must not be turned to the lock direction

A/T: Automatic transmission

- If any fault is found, replace the switch. (See Gr37.)

#011 Inspection of rheostat switch

- The rheostat switch contains a control circuit, because of this it is difficult to inspect the rheostat switch independently, therefore you should inspect the rheostat switch indirectly by inspecting the system harness and the related parts.
- If no fault is found in the related parts but the system is faulty, replace the switch.



#023 Inspection of vacuum switch

- Perform the following checks, and if any fault is found, replace the switch. (See Gr35A.)

(1) Inspection without applying negative pressure

- Make sure that there is no continuity between terminals 1 and 2 (body).

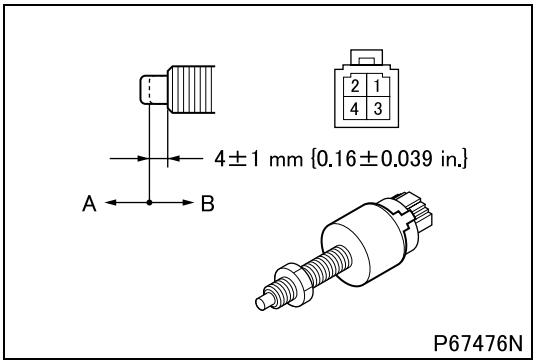
(2) Inspection by applying negative pressure

- Gradually apply negative pressure to the switch starting from 0 kPa {0 psi, 0 kgf/cm^2}.
- Measure the degree of air pressure at the moment when continuity is detected between terminals 1 and 2 (body), and make sure to confirm if the value meets the standard.

Standard value	$-(47\ ^{+3.3}_{-4.0})$ kPa {$-(13.8\ ^{+0.98}_{-1.18})$ in.Hg, $-(350\ ^{+25}_{-30})$ mmHg}

#026, #027 Inspection of power window switch

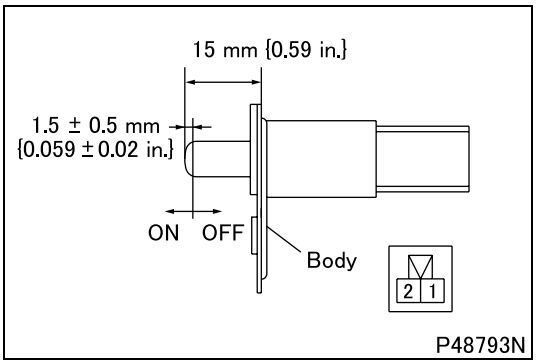
- Because it is not easy to check these swtches individually, determine quality of the switches indirectly by checking related parts, such as harnesses, power window motor, etc. in the system.
- If there is nothing abnormal in related parts, but still something wrong with the system, then replace the switches. (See Gr43.)



#031 Inspection of clutch switch

Switch position	Continuity terminal
A	1–4
B	2–3

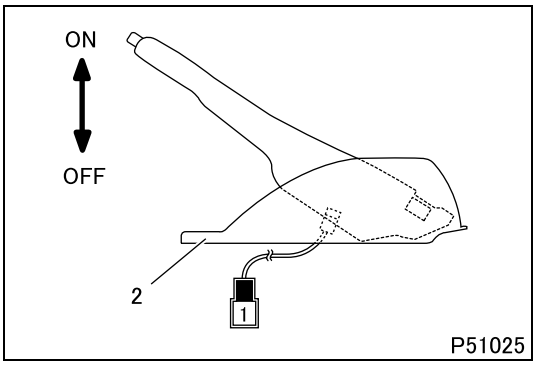
- If any fault is found, replace the switch. (See Gr21.)



#035 Inspection of door switch

Switch position	Continuity terminal
OFF	–
ON	1-body, 2-body

- If any fault is found, replace the switch. (See Gr43.)

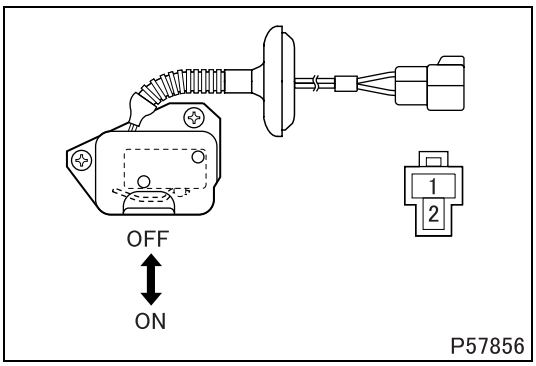


#038 Inspection of parking brake switch

- Measure continuity between terminals 1 and 2 (body) ground.

Pull the parking brake lever	Continuity exists
Release the parking brake lever	Continuity does not exist

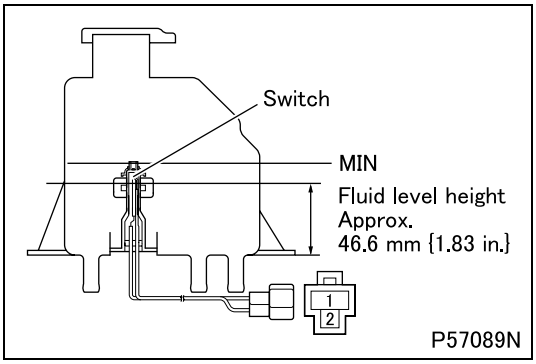
- If any fault is found, replace the switch. (See Gr36.)



#039 Inspection of cab tilt lock switch

Switch position	Continuity terminal
OFF	–
ON	1–2

- If any fault is found, replace the switch. (See Gr42.)



#041 Inspection of brake fluid level switch

- Gradually drain brake fluid from the brake fluid tank.

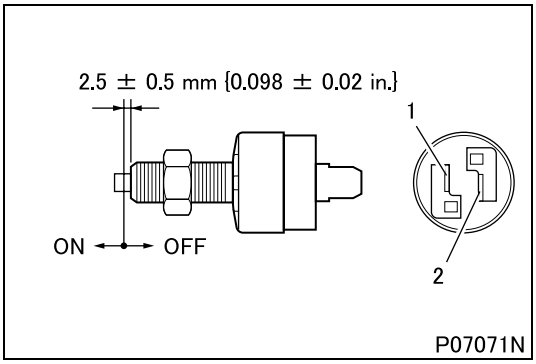
CAUTION ⚠

- **Brake fluid contains ingredients that dissolve paint on the bodywork of a vehicle. Quickly wipe off brake fluid when it is spilled.**

- Measure height of the switch when continuity is detected between terminals 1 and 2.

Standard value	46.6 mm {1.83 in.}

- If the measured value deviates from the standard value, replace the brake fluid tank. (See Gr52.)

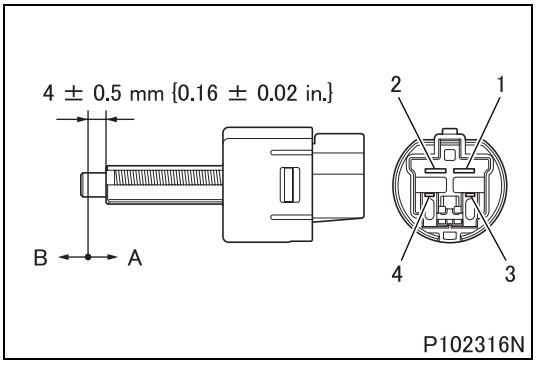


#042 Inspection of stop lamp switch

<Without auto cruise>

Switch position	Continuity terminal
OFF	–
ON	1–2

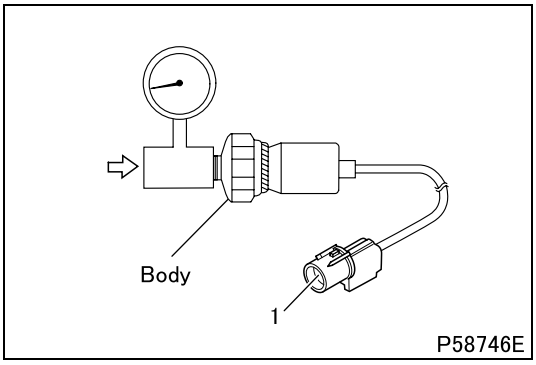
- If any fault is found, replace the switch. (See Gr35A.)



<With auto cruise>

Switch position	Continuity terminal
A	3–4
B	1–2

- If any fault is found, replace the switch. (See Gr35A.)



#044 Inspection of engine oil pressure switch

- Perform the following checks, and if any fault is found, replace the switch. (See Gr12.)

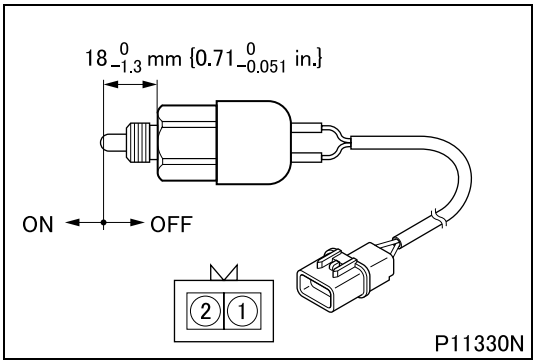
(1) Inspection without applying air pressure

- Make sure that there is continuity between terminals 1 and body.

(2) Inspection by applying air pressure

- Gradually apply air pressure to the switch starting from 0 kPa {0 psi, 0 kgf/cm^2}.
- Measure the degree of air pressure at the moment when continuity is not detected between terminals 1 and body, and make sure to confirm if the value meets the standard.

Standard value (operating pressure)	50 ± 10 kPa {7.1 ± 1.4 psi, 0.5 ± 0.1 kgf/cm^2}

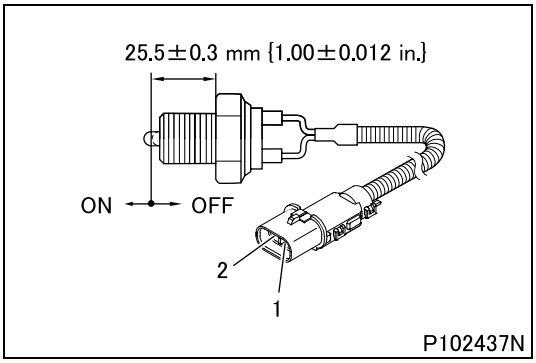


#054 Inspection of switch

- Backup lamp switch. (See Gr22.)
- Transfer four-wheel drive switch. <FG> (See Gr24.)
- Transfer low switch. <FG> (See Gr24.)

Switch position	Continuity terminal
OFF	–
ON	1–2

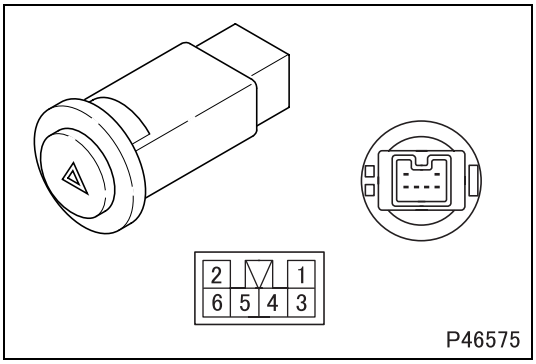
- If any fault is found, replace the switch.



#056 Inspection of transmission neutral switch

Switch position	Continuity terminal
OFF	–
ON	1–2

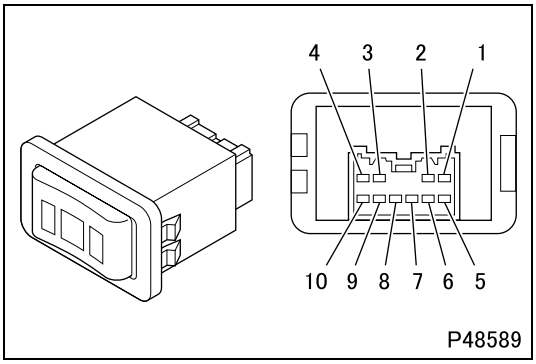
- If any fault is found, replace the switch. (See Gr22.)



#081 Inspection of hazard switch

Switch position	Continuity terminal	Night illumination
OFF	–	(+) 2-1 (–)
ON	4–5–6	

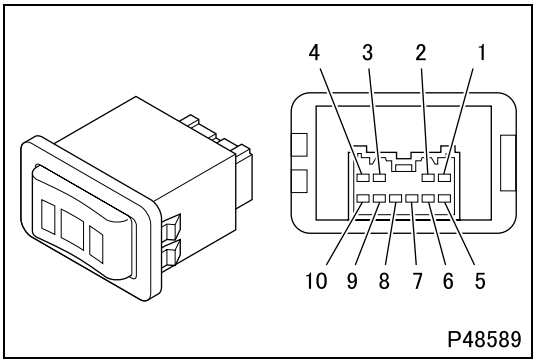
- If any fault is found, replace the switch. (See Gr52.)



#087 Inspection of van body dome light switch

Switch position	Continuity terminal	Operation illumination	Night illumination
OFF	1–8	–	(+) 2-3 (–)
ON	1–7	(–) 3–9 (+)	

- If any fault is found, replace the switch.

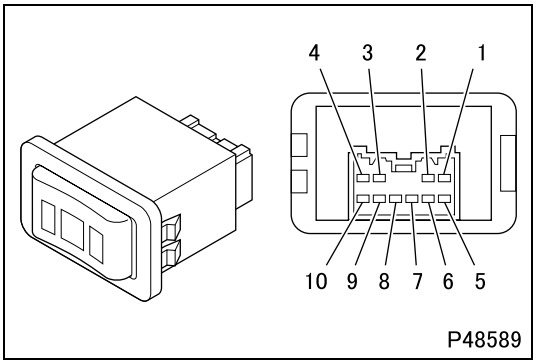


#089 Inspection of switch

- Front drive switch
- Warm-up switch

Switch position	Continuity terminal	Night illumination
OFF	1–8	(+) 2-3 (–)
ON	1–7	

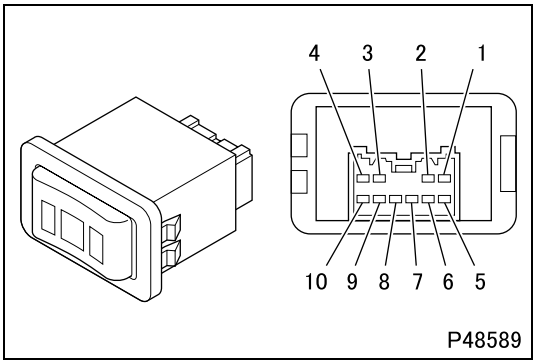
- If any fault is found, replace the switch. (See Gr52.)



#092 Inspection of engine oil level check switch

Switch position	Continuity terminal
–	–
CHK	1–7, 5–6

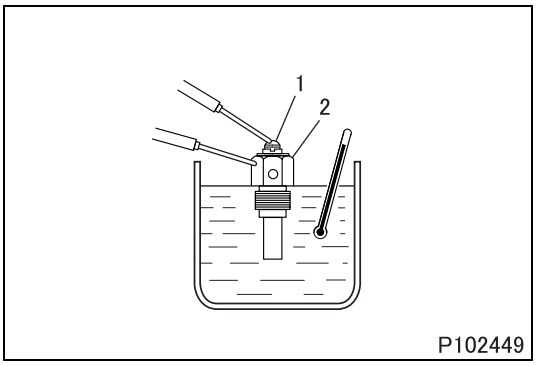
- If any fault is found, replace the switch. (See Gr52.)



#094 Inspection of door lock switch

Switch position	Continuity terminal	Night illumination
LOCK	1–7	(+) 2–3 (–)
Neutral	–	
UNLK	1–8	

- If any fault is found, replace the switch. (See Gr43.)

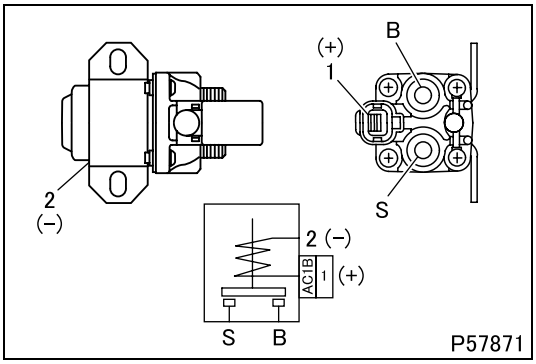


#160 Inspection of overheating switch

- Dip the switch in a container filled with engine oil.
- Raise the oil temperature to the specified values and stir the oil.
- Measure the operating temperature between terminals 1 and 2 (body) respectively.

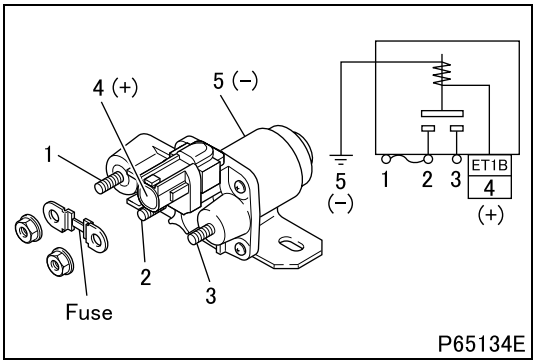
Standard Value	When temperature increase (OFF→ON)	115 ± 2°C {239 ± 3.6°F}
	When temperature decrease (ON→OFF)	115 ± 4°C {239 ± 7.2°F}

- If the measured value deviates from the standard value, replace the switch. (See Gr14.)



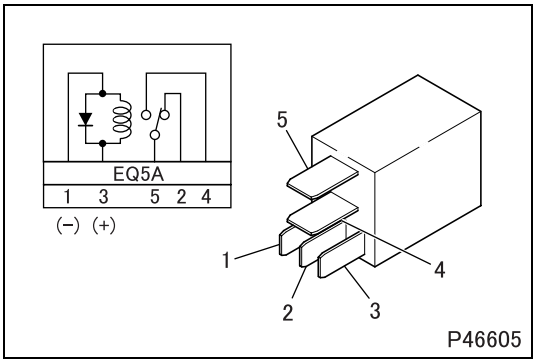
#187 Inspection of starter relay

- Perform continuity check and operation check, and if any fault is found, replace the relay.



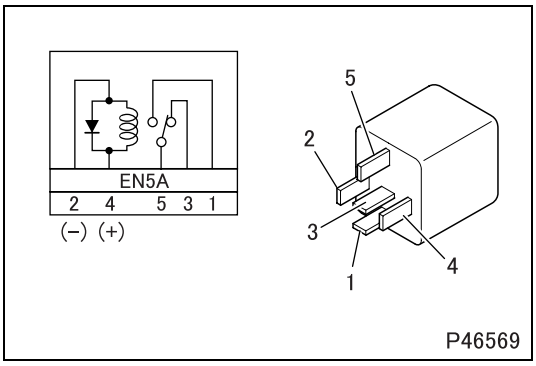
#195 Inspection of glow relay

- Perform continuity check and operation check, and if any fault is found, replace the relay.



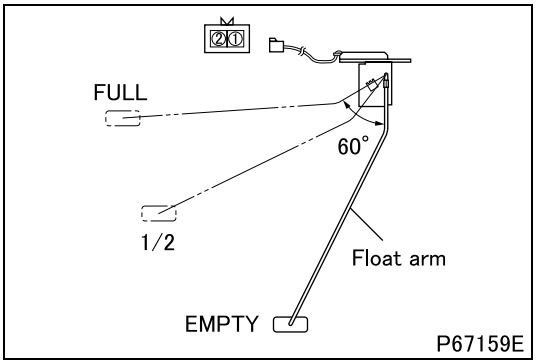
#201 Inspection of relay (normally open type 5 pin)

- Perform continuity check and operation check, and if any fault is found, replace the relay.



#202 Inspection of relay (normally open type 5 pin)

- Perform continuity check and operation check, and if any fault is found, replace the relay.

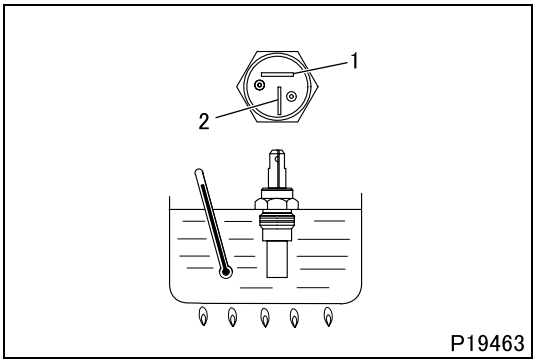


#258 Inspection of fuel level sensor

- Measure resistance values between terminals 1 and 2 when bringing the float arm into contact with stoppers (at EMPTY and FULL positions) and placing it at the midpoint position.

Standard value	at FULL position	0^{+2}_{0} Ω
	at 1/2 position	50 ± 3 Ω
	at EMPTY position	150 ± 10 Ω

- If the measured value deviates from the standard value, replace the sensor. (See Gr13A.)



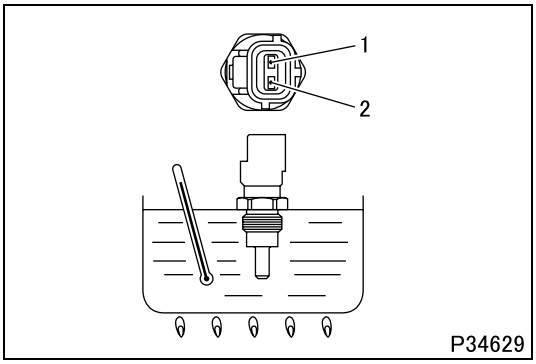
#262 Inspection of water temperature sensor

<For water temperature gauge>

- Dip the sensor in a container filled with engine oil.
- Raise the oil temperature to the specified one while stirring oil.
- Measure resistance values between terminals 1 and 2 and body.
  Terminal 1: water temperature gauge connected side
  Terminal 2: engine ECU connected side

Standard value	1 and body (water temperature gauge connected side)	50°C {122°F}	153.9 Ω (reference value)
		80°C {176°F}	$51.9^{+4.9}_{-4.4}$ Ω
		100°C {212°F}	$27.4^{+1.9}_{-1.2}$ Ω
	2 and body (engine ECU connected side)	–20°C {–68°F}	24.8 ± 2.5 kΩ
		0°C {0°F}	8.62 kΩ (reference value)
		20°C {68°F}	3.25 ± 0.33 kΩ
		60°C {140°F}	620 Ω (reference value)
		80°C {176°F}	300 Ω (reference value)

- If the measured value deviates from the standard value, replace the sensor. (See Gr14.)
  ECU: electronic control unit

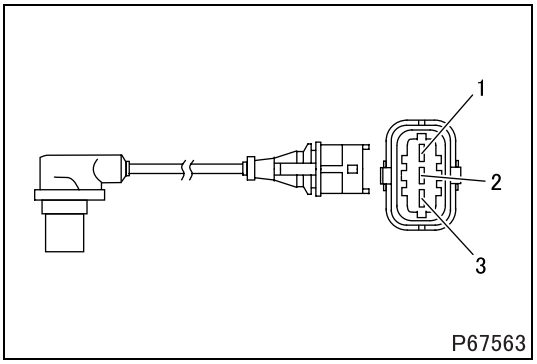


<For engine control>

- Place the sensor in engine oil in a container.
- Raise the oil temperature to the specified values and stir the oil.
- Measure the resistance between terminals 1 and 2.

Standard value	20°C {68°F}	2.45 ± 0.14 kΩ
	80°C {176°F}	0.32 kΩ (reference value)
	110°C {230°F}	147.1 ± 2 Ω

- If the measured value deviates from the standard value, replace the sensor. (See Gr14.)

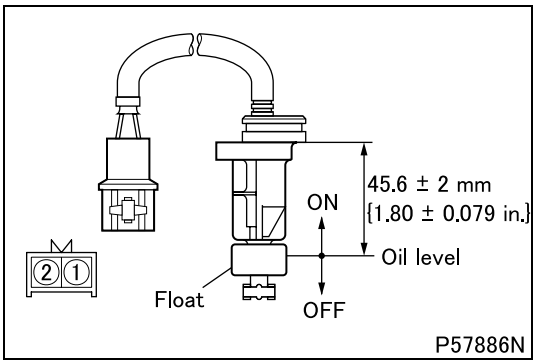


#263 Inspection of engine speed sensor

- Measure the resistance between terminals 1 and 2.

Standard value (at 20°C {68°F})	860 ± 86 Ω

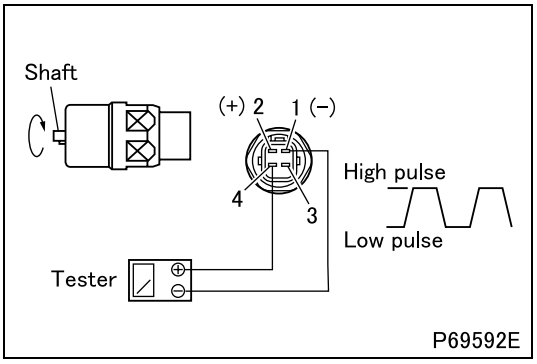
- If the measured value deviates from the standard value, replace the sensor. (See Gr13E.)



#264 Inspection of engine oil level sensor

Switch position	Continuity terminal
OFF	–
ON	1–2

- If any fault is found, replace the sensor. (See Gr12.)

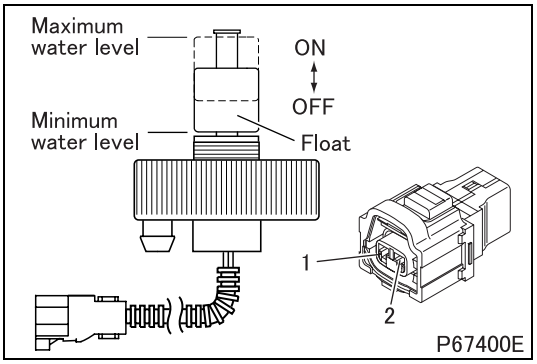


#265 Inspection of vehicle speed sensor

- With the 12 volts DC applied to terminals 1 and 2, slowly turn the shaft of the vehicle speed sensor.
- Measure the maximum value (high pulse voltage) and the minimum value (low pulse voltage) of the voltage generated at each terminal.

Standard value	Between 25 pulse output terminals 1 and 4	Low pulse voltage	0.5 V or less
		High pulse voltage	8 ± 1 V

- If the measurement is not within the range of the standard value, replace the sensor. (See Gr22.)



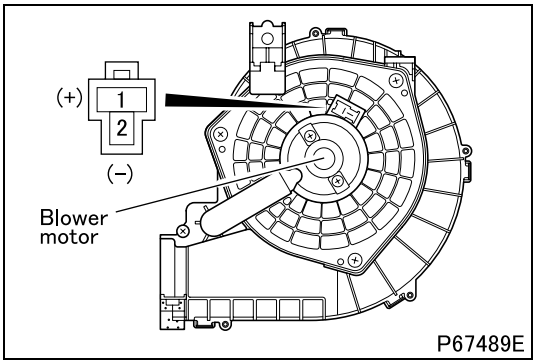
#274 Inspection of water separator sensor

Condition	Continuity terminal
ON (when coolant quantity is approx. 100 cm^3 {6.10 cu.in.})	1–2
OFF	–

- If any fault is found, replace the sensor (See Gr13A.)

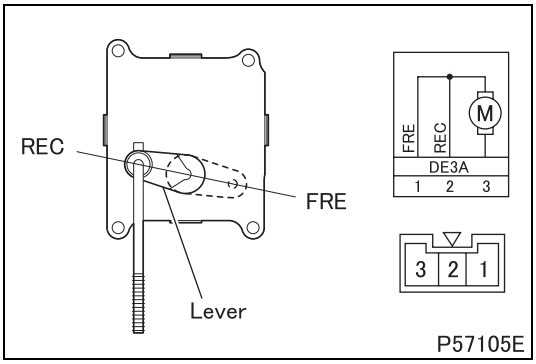
#350 Inspection of control unit and other units

- Since the units alone cannot be readily checked in the off-vehicle state, check the harness, switch and other related parts in each system.
- If any fault is not found in the related parts, and the problem still remains in the system, replace the control units or other units.



#411 Inspection of blower motor

- Make sure that the motor operates when battery voltage is applied between terminals 1 and 2.
- If any fault is found, replace the motor. (See Gr55.)



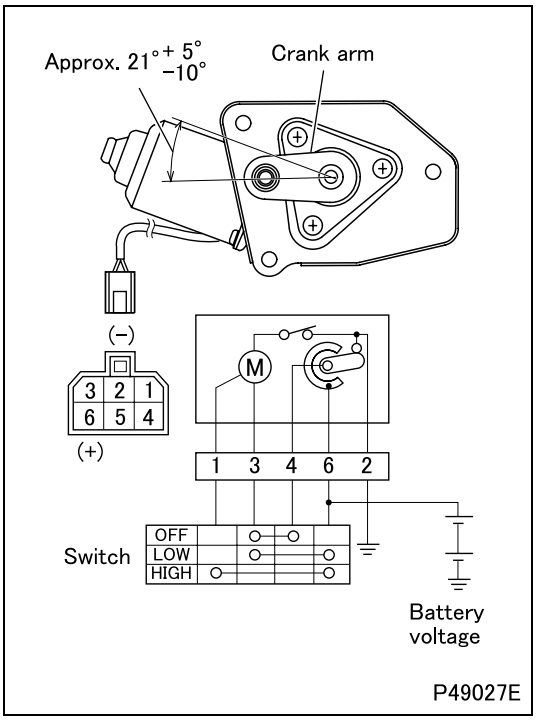
#415 Inspection of fresh/recirculation changeover motor

- Perform the following checks, and if any fault is found, replace the motor. (See Gr55.)
- Make sure that the motor operates when battery voltage is applied between each terminal.

Lever position	Terminal
REC (inside air)	(+) 3–2 (–)
FRE (outside air)	(+) 3–1 (–)

CAUTION ⚠

- **Stop applying battery voltage if the lever stops spontaneously at the REC or FRE position.**



#422 Inspection of wiper motor

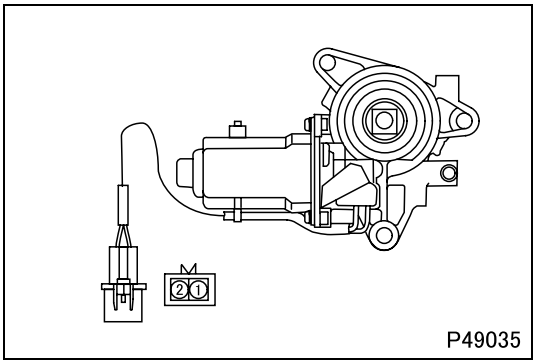
- Connect a switch to wiper motor as shown.
- Check the motor for correct operation as follows. If any fault is found, replace the motor. (See Gr51.)

(1) Inspection of motor operation

- Set switch to HIGH position to check that the motor rotates at high speed.
- Set switch to LOW position to check that the motor rotates at low speed.

(2) Inspection of automatic stop position

- Set switch to LOW position to let the motor rotate at low speed.
- When the crank arm is in a position other than automatic stop position (outside the angles shown), set switch to OFF position.
- Check to see that the crank arm stops at the automatic stop position (within the angles range shown).

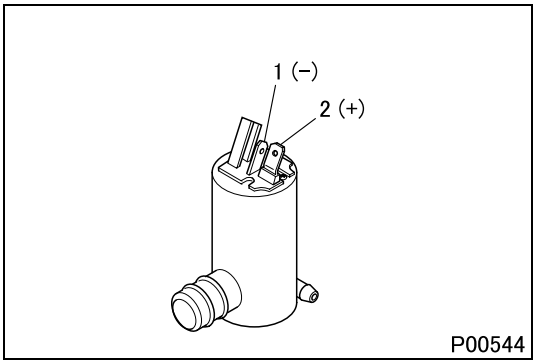


#423 Inspection of power window motor

- Make sure that the motor operates when battery voltage is applied between terminals 1 and 2.

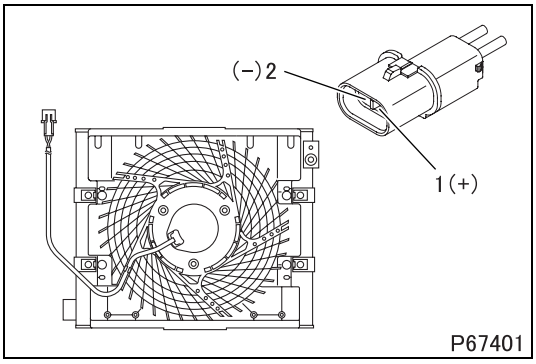
Rotation direction	Terminal
Left	(+) 2–1 (–)
Right	(+) 1–2 (–)

- If any fault is found, replace the motor and the regulator as a set. (See Gr43.)



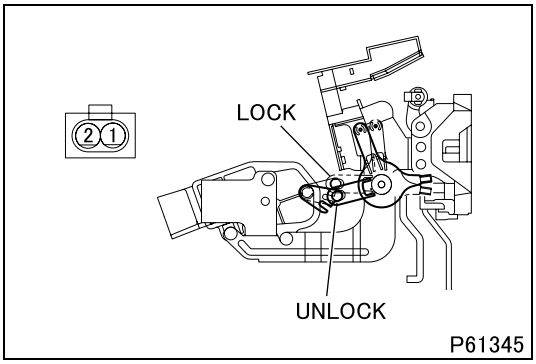
#428 Inspection of windshield washer motor

- Make sure that the motor operates when battery voltage is applied between terminals 1 and 2.
- If any fault is found, replace the motor. (See Gr51.)



#431 Inspection of condenser fan motor

- Make sure that the motor operates when battery voltage is applied between terminals 1 and 2.
- If any fault is found, replace the motor. (See Gr55.)

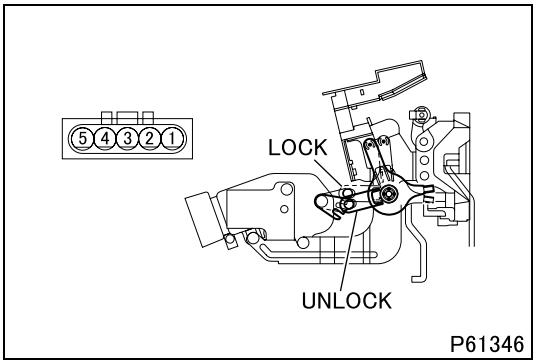


#510 Inspection of door lock actuator (on assistant driver's side)

- Apply battery voltage between each terminals confirm that the actuator operates.

Switch position	Terminal
LOCK	(+) 1–2 (–)
UNLOCK	(+) 2–1 (–)

- If any fault is found, replace the actuator. (See Gr43.)

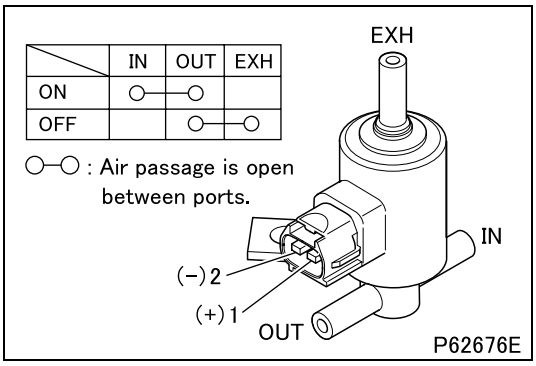


#511 Inspection of door lock actuator (on driver's side)

- Apply battery voltage between each terminals confirm that the actuator operates.

Switch position	Continuity terminal	Terminal
LOCK	1–2	(+) 3–4 (–)
UNLOCK	1–5	(+) 4–3 (–)

- If any fault is found, replace the actuator. (See Gr43.)



#565 Inspection of magnetic valve

<Type-1>

- Perform the following checks, and if any fault is found, replace the 2-way magnetic valve.

(1) Operation check

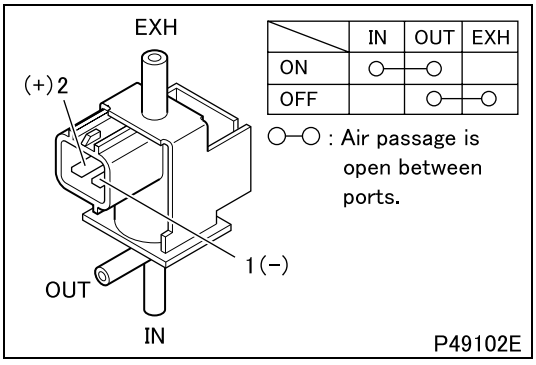
- Gradually apply DC current between terminals 1 and 2 starting from 0 V.

Measure the voltage at which the 2-way magnetic valve operates. (Determine ON/OFF of the magnetic valve by operating noises.)

Standard value (minimum operating voltage)	11 V or less

(2) Inspection of continuity and air tightness

Negative pressure when inspected: –100 kPa {–29.5 in.Hg, –750 mmHg}



<Type-2>

- Perform the following checks, and if any fault is found, replace the 3-way magnetic valve.

(1) Operation check

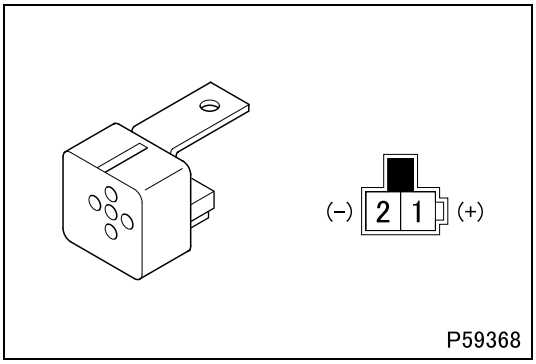
- Gradually apply DC current between terminals 1 and 2 starting from 0 V.

Measure the voltage at which the 3-way magnetic valve operates. (Determine ON/OFF of the magnetic valve by operating noises.)

Standard value (minimum operating voltage)	8 V or less

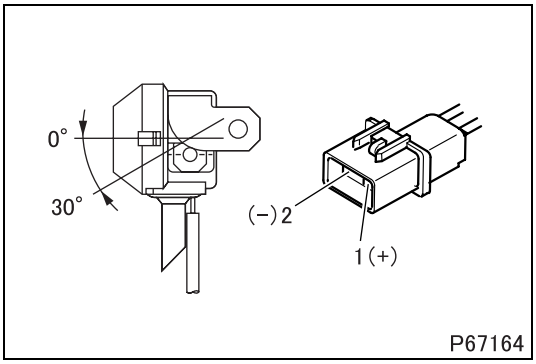
(2) Inspection of continuity and air tightness

- Negative pressure when inspected: –60 kPa {–17.7 in.Hg, –450 mmHg}



#611 Inspection of warning buzzer

- Make sure that the buzzer sounds when battery voltage is applied between terminals 1 and 2.
- If any fault is found, replace the buzzer.



#614 Inspection of back buzzer

[Inspection]

- Make sure to confirm if the buzzer intermittently sounds by applying the battery voltage between terminals 1 and 2.
- If any fault is found, replace the buzzer.

[Installation]

- Install the back buzzer to the frame in the range of angles as illustrated.

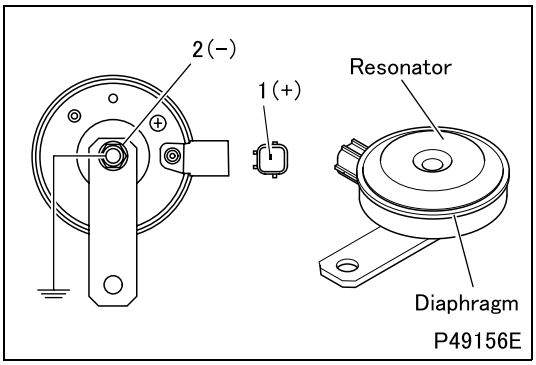
CAUTION ⚠

- **Beware that if the installed angle of the buzzer is out of the range as illustrated, water in the buzzer will not be drained normally.**

#615 Inspection of electric horn

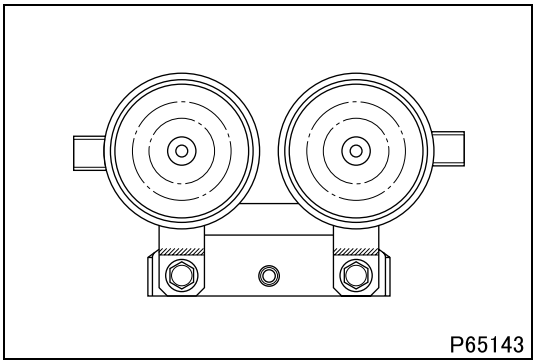
CAUTION ⚠

- **Bending the stay changes the sound quality of the horn, degrading the horn performance.**
- **Never bend or damage the stay.**



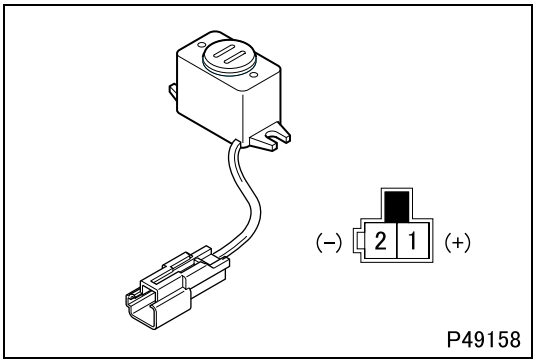
[Inspection]

- Make sure to confirm whether the horn sounds by applying the battery voltage between terminals 1 and 2 (body).
- Remove foreign substances adhered to the resonator and diaphragm.
- If any fault is found, replace the horn.



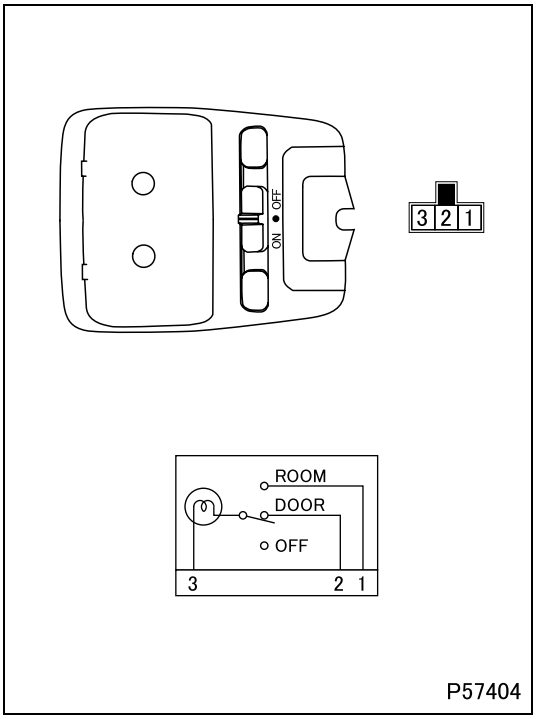
[Installation]

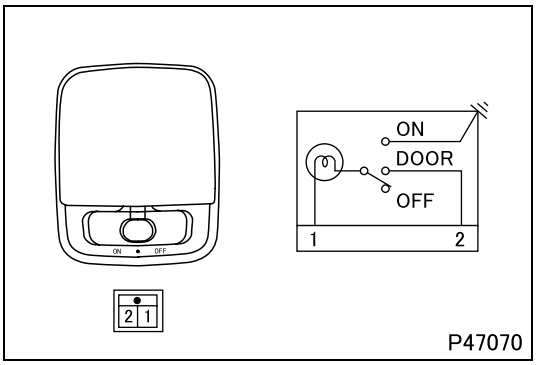
- Install in the direction as illustrated.



#618 Inspection of cab tilt buzzer

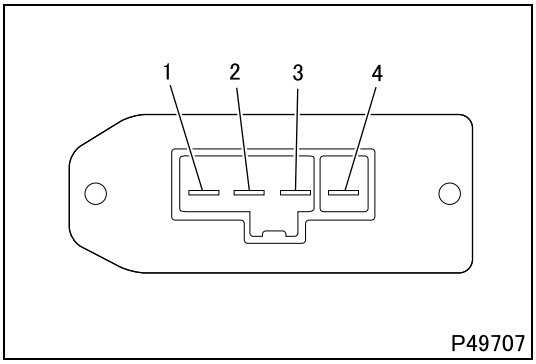
- Make sure that the buzzer sounds when battery voltage is applied between terminals 1 and 2.
- If any fault is found, replace the buzzer.





#656 Inspection of cab lamp

- If any fault is found, replace the lamp.

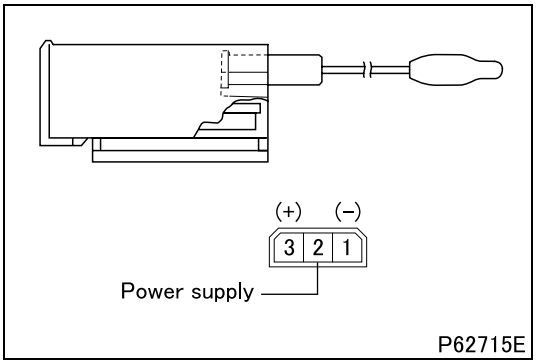


#750 Inspection of blower resistor

- Measure resistance values between each terminals.

Position	Terminal	Standard value
MEDIUM HIGH	1–4	0.24 Ω
MEDIUM LOW	3–4	0.93 Ω
LOW	2–4	1.5 Ω

- If the measured value deviates from the standard value, replace the blower resistor. (See Gr55.)

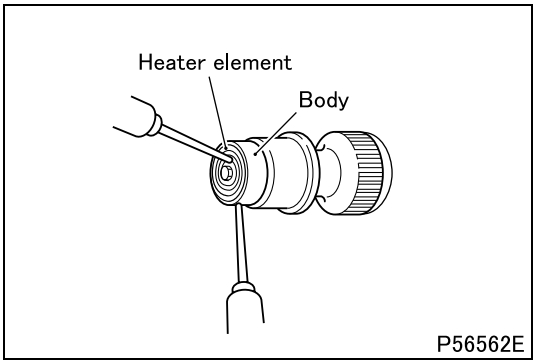


#751 Inspection of thermostat

- Measure resistance values between each terminals 1 and 3 at the specified temperature.

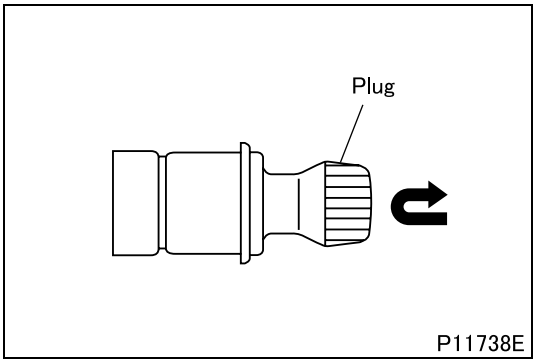
Switch position	Continuity terminal
OFF (4.2°C)	–
ON (5.2°C)	1–3

- If any fault is found, replace the thermostat. (See Gr55.)



#754 Inspection of cigarette lighter

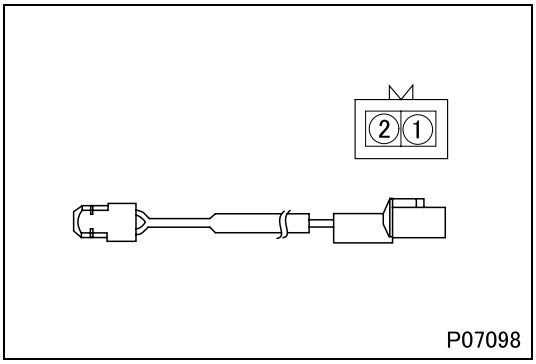
- Perform the following checks, and if any fault is found, replace the cigarette lighter. (See Gr52.)
- Make sure that there is continuity between heater element and body.



- Make sure that when plug is pushed in by hand, it immediately returns to its original position.
- Place the starter switch at ACC or ON position.
- Push plug into the socket in the cab.
- Measure the time required for plug to automatically return.

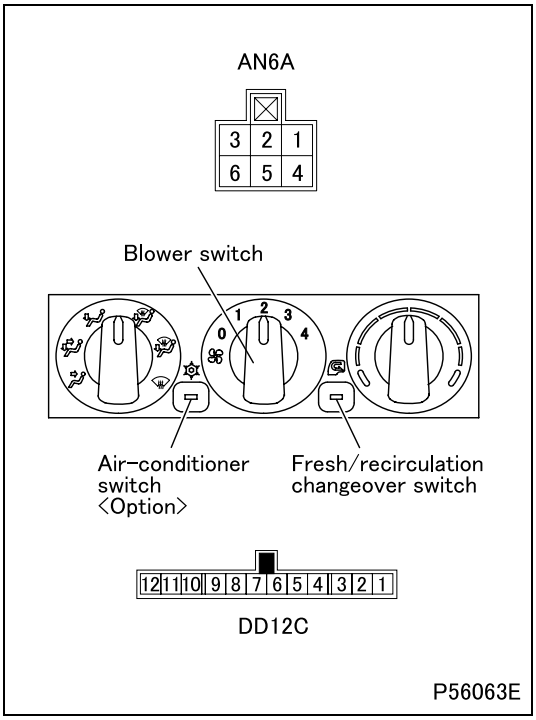
Standard value	15 ± 5 seconds

- Check to see that heater element is red-hot.



#759 Inspection of brake pad wear indicator

- Make sure that there is continuity between terminals 1 and 2.
- If any fault is found, replace the brake pad wear indicator. (See Gr35A.)



#763 Inspection of heater control panel

- Perform the following checks, and if any fault is found, replace the heater control panel. (See Gr52.)

(1) Blower switch <AN6A connector>

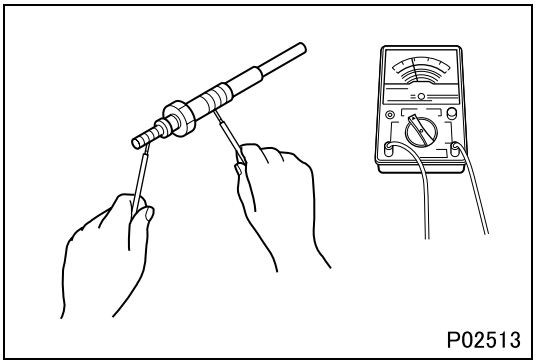
Switch position	Continuity terminal
0 : OFF	–
1 : LO (LOW)	4–5–6
2 : ML (MEDIUM LOW)	1–5–6
3 : MH (MEDIUM HIGH)	2–5–6
4 : HI (HIGH)	3–5–6

(2) Fresh/recirculation changeover switch <DD12C connector>

Switch position	Continuity terminal	Operation illumination	Night illumination
OFF : Fresh air	9–10	–	(+) 7–8 (–)
ON : Recirculation air	10–11	(+) 12–10 (–)	

(3) Air-conditioner switch <DD12C connector>

Switch position	Continuity terminal	Operation illumination	Night illumination
OFF	–	–	(+) 7–8 (–)
ON	3–4–6	(+) 3–6 (–) (+) 4–6 (–)	



#764 Inspection of glow plug

- Measure resistance value of glow plug as shown.

Standard value (cold resistance of glow plug)	Approx. 1.0 Ω

- If the measured value deviates from the standard value, replace the glow plug. (See Gr11.)

DANGER ⚠

- **Since flammable hydrogen gas is generated by the battery be sure to obey the following warnings:**
  - **Do not short-circuit the (+) and (–) terminals on the battery.**
  - **Keep sparks and lit cigarettes away from the battery.**
  - **Do not wear metal objects on your arms and lean over battery.**
- **Because the battery electrolyte is made of diluted sulfuric acid and is corrosive, when handling battery wear safety glasses and rubber gloves to protect the eyes and hands.**

WARNING ⚠

- **Make sure that you disconnect battery cable (–) first when you disconnect battery cables.**

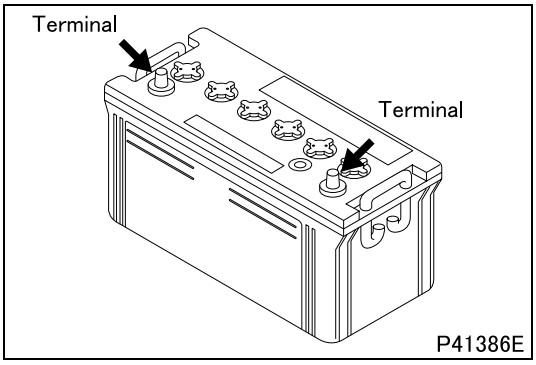
CAUTION ⚠

- **Make sure that all electrical switches of the vehicle are OFF before connecting battery cables.**
- **Make sure that you connect battery cable (+) before you connect battery cable (–).**
- **To prevent a short-circuit be sure that disconnected battery cables do not accidentally touch the battery terminals.**

Service standards

Location	Maintenance item	Standard value	Limit	Remedy
–	Specific gravity of battery electrolyte (20°C {68°F})	1.280	1.220	Charge or replace

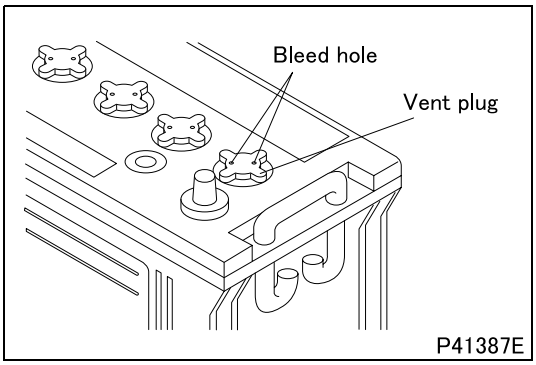
◆Service procedure◆



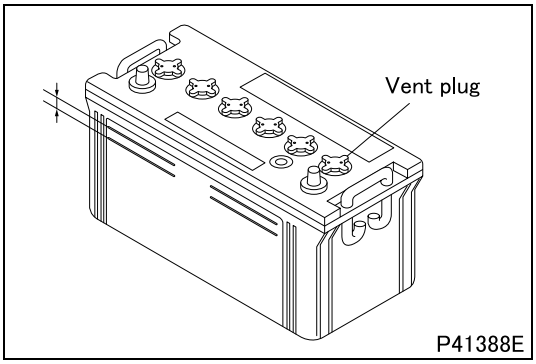
Inspection of battery

(1) Visual inspection

- If terminal is corroded, scrub off the corrosion from it using a wire brush.
- If cracks or defects are found on battery, replace it since the cracks or defects can cause liquid spills.

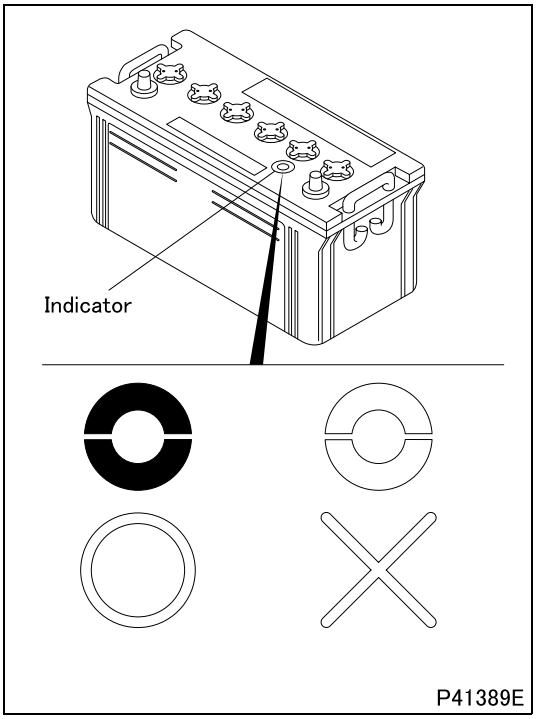


- If bleed hole of vent plug is clogged, clean the hole.



(2) Inspection of fluid level

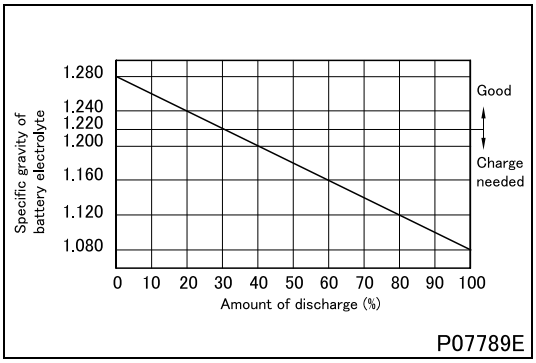
- Make sure that the battery electrolyte level is between UPPER and LOWER.
- If the level is below LOWER, remove vent plug and fill the battery with distilled water or battery replenisher to UPPER.



(3) Measurement of specific gravity

You can tell the specific gravity of the battery electrolyte by the color shown in indicator.

Blue : Good
White : Charge or replace



(4) Charging

- Although, as a rule, battery charging should be done with the battery removed from the vehicle, if you have to charge the battery while it is on the vehicle, make sure that you stop the engine and disconnect battery cable (–).
- Remove vent plug before charging the battery.
- For the recommended charge time and current, see the following table to avoid overcharging.

	Charge current (A)	Charge time (H)	Upper limit of fluid temperature (°C {°F})
Normal charge	Value of 5-hour rating capacity / 10	*Amount of discharge (Ah) / Charge current (A) ×1.2 (to 1.5)	45 {113}
Quick charge	Value of 5-hour rating capacity / 1.5	0.5	55 {131}

* Amount of discharge (Ah) =

$$\text{5-hour rating capacity (Ah)} \times \frac{\text{Amount of discharge (\%)}}{100}$$

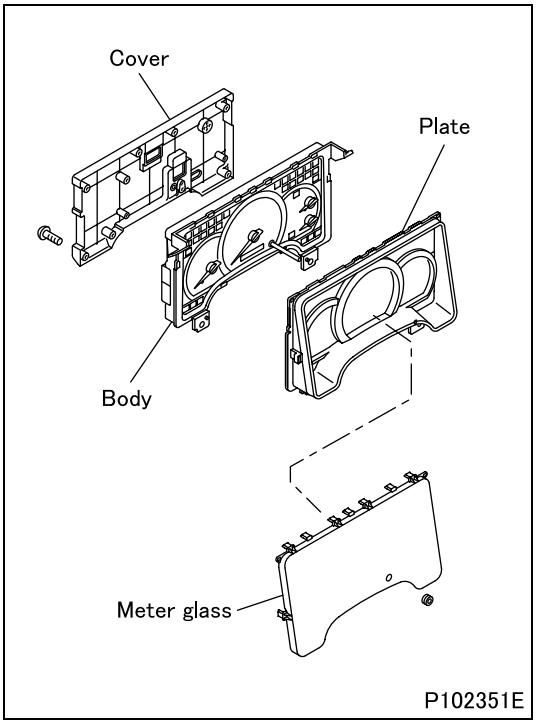
- Use the graph shown on the left to calculate the amount of discharge (%).
- Use diluted sulfuric acid, made up of sulfuric acid and refined or distilled water, as the battery electrolyte.

DANGER ⚠

- **Keep naked light away from the battery while charging to prevent explosion.**
- **It is dangerous to generate sparks while charging the battery.**
- **Do not charge battery if the electrolyte level is below LOWER LEVEL, since it can cause early deterioration, heating, or explosion. Make sure to add the fluid to the specified level before charging.**

WARNING ⚠

- **Do not let the battery electrolyte level rise and overflow while charging the battery.**
- **After charging the battery, tighten vent plug, wash away sulfuric acid from the battery using water, and dry the surface.**



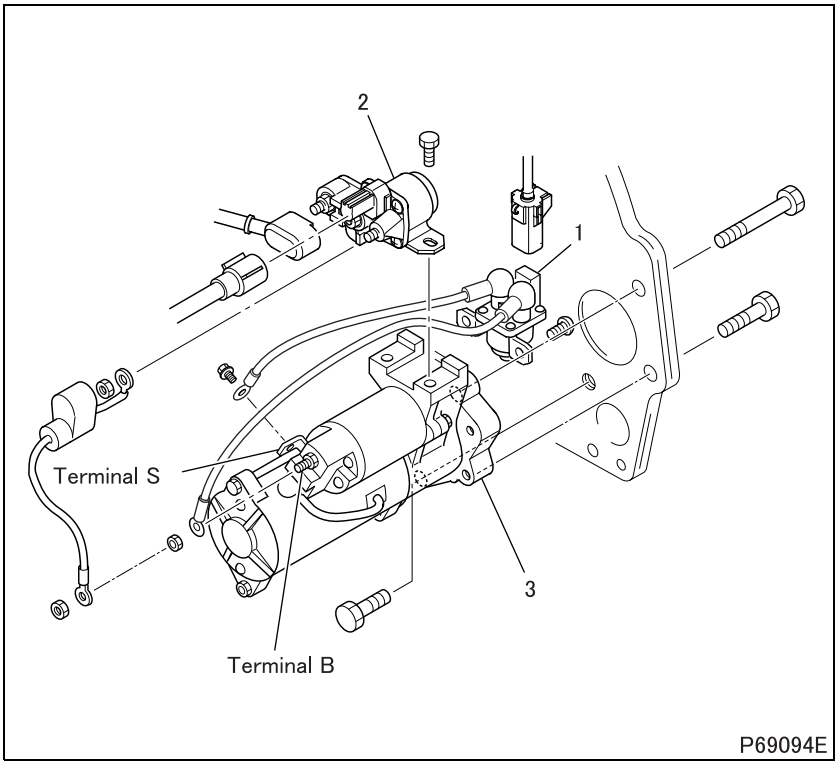
#890 Meter cluster

■Inspection: Meters

- Each sensor signal is converted into digital signal in the meter cluster and then the value is indicated by the corresponding meter on the cluster. Therefore, a single meter inspection cannot be performed.
  Each meter should be checked indirectly by checking its related harnesses and parts.
- If the related harnesses and parts are normal but the meter indication is faulty, replace the meter cluster.

54-12 STARTER AND ALTERNATOR

#930 STARTER



● **Removal sequence**

1 Starter relay
2 Glow relay <Except FE83>
3 Starter

WARNING ⚠

- **Before removing the starter, disconnect the (–) battery cable and insulate the cable and the (–) battery terminal with tape.**
- **It is dangerous to leave the (–) battery cable connected since the battery cable voltage is always present at terminal B.**

● **Installation sequence**

Follow the removal sequence in reverse.

M E M O

#930 STARTER

31 Oil seal
32 Front bracket

⊗: Non-reusable parts

CAUTION ⚠

- **When the armature is removed, the ball may come out with it. Take care not to lose the ball.**

- Do not remove the rear bearing unless defects are evident.
- It is not necessary to remove the pinion when only the motor section needs to be disassembled for inspection, like when inspecting brushes and related parts.
- Be sure to remove the pinion before disassembling any other parts.

● Assembly sequence

Follow the disassembly sequence in reverse.

- Whenever the magnetic switch is replaced, the pinion gap must be adjusted.
- The rubber packing is serviceable if any defect is not found.

Service standards (Unit: mm {in.})

Location	Maintenance item			Standard value	Limit	Remedy
–	Pinion gap			0.5 to 2.0 {0.02 to 0.079}	–	Adjust
–	No-load characteristics	With 11 V applied	Current	180 A or less	–	Correct or replace
			Rotation speed	3800 rpm or higher	–	
9	Brush spring pressure			29.2 to 39.4 N {6.6 to 8.9 lbs, 3 to 4 kgf}	13.7 N {3.1 lbs, 1.4 kgf}	Replace

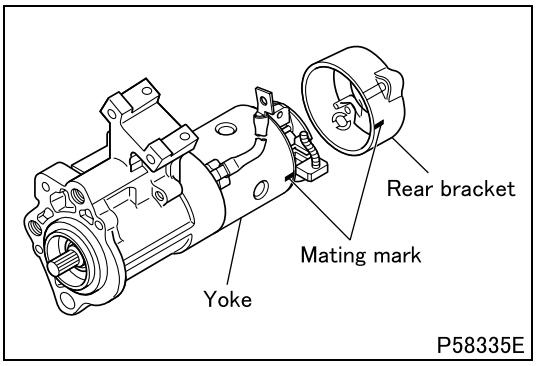
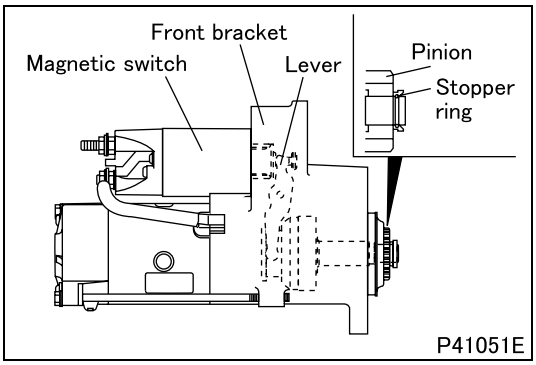
◆Work before disassembly◆



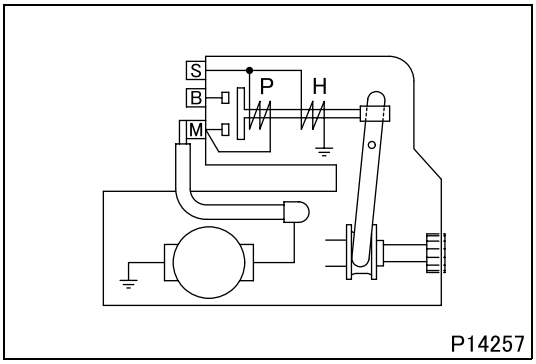
P58335E

■ **Mating mark: Rear bracket and yoke**

◆Disassembly procedure◆



P41051E



P14257

■ **Disassembly: Pinion**

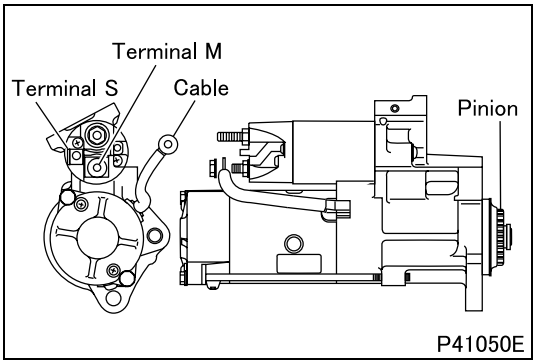
- For removal of the pinion, current must be supplied to the starter such that the pinion springs out.

WARNING ⚠

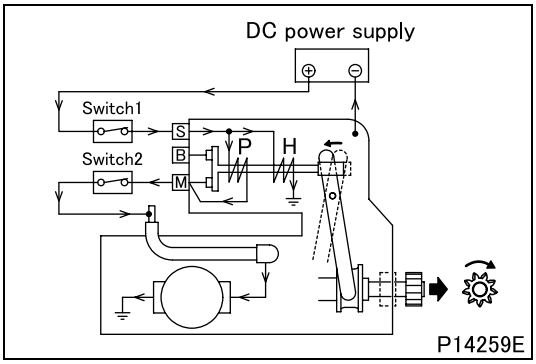
- **When the starter is energized, the pinion will spring out and rotate. Be careful not to touch it with your hands.**
- **The magnetic switch may become very hot during inspections. Be careful when touching it.**

CAUTION ⚠

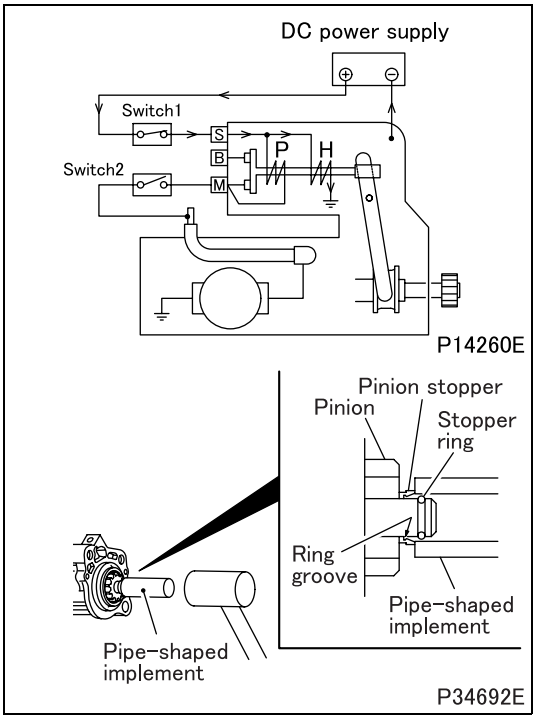
- **Do not energize the pull-in coil P for longer than 10 seconds, and do not energize the holding coil H for longer than 30 seconds. If these periods are exceeded, the coils may overheat and burn out.**
- **To make the pinion spring out, be sure to energize the starter such that its parts are positioned correctly. If the starter is not energized and the lever is pulled to make the pinion come out, the front bracket and/or lever may be damaged by the shock inflicted upon them when the stopper ring is removed.**
- **When current is supplied to the starter, a large current (100 A or higher) will flow. For inspection purposes, use booster cables or similarly thick cables. It is also important to ensure that all connections are secure.**



- Connect the starter as illustrated.



- The following operations are performed with current supplied to the starter. Thus, the entire procedure for removal of the pinion must be completed within 30 seconds.
  - Turn ON switches 1 and 2 to supply current to the starter. The pinion will spring out and rotate.



- After the pinion starts to rotate, quickly (within five seconds) turn OFF switch 2 to stop the pinion's rotation.

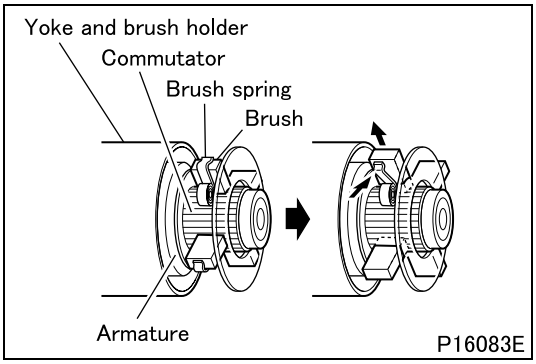
CAUTION ⚠

- **When switches 1 and 2 are turned ON, the pull-in coil P and holding coil H are both energized. The circuit is connected such that no voltage is applied to starter terminal B, so current flows to the pull-in coil while the pinion rotates. To prevent the pull-in coil from burning out, it is essential to turn OFF switch 2 quickly (within five seconds) after the pinion starts to rotate.**

- Apply a pipe-shaped implement to the pinion stopper.
- Using a hammer, lightly tap the pipe-shaped implement to remove the stopper ring from the ring groove of the pinion stopper.
- Remove the stopper ring and pinion.
- Turn OFF switch 1 to de-energize the starter.

CAUTION ⚠

- **When the starter is de-energized, the mechanism will attempt to pull in the pinion. Thus, the stopper ring may slip back into the ring groove of the pinion stopper. If this happens, energize the starter and go through the pinion removal procedure again.**



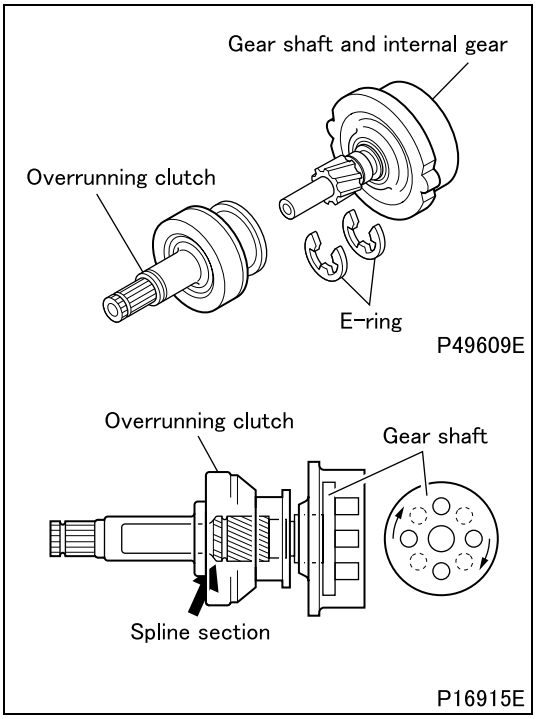
■ **Disassembly: Yoke and brush holder**

- Use the following method to remove the yoke and brush holder in order to prevent the commutator of the armature from being damaged by the brushes.
  - Lift the brushes away from the commutator and hold them lifted by applying the brush springs against the sides of the brush springs.

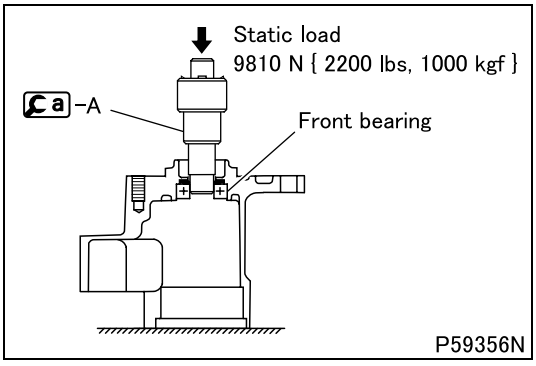
  - Pull part A of each brush spring and pull up the brushes.
  - Hold the brushes in position with the brush springs as illustrated.
  - Remove the yoke and brush holder.

■ **Disassembly: Gear shaft and internal gear**

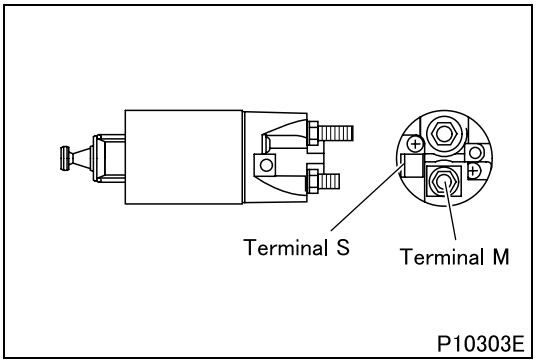
- Remove the E-rings and then the gear shaft and internal gear from the overrunning clutch.
  Proceed as follows if the gear shaft cannot be removed due to interference of the splined section of gear shaft with internal parts of the overrunning clutch.
  - Press the gear shaft against the overrunning clutch.
  - Turn the gear shaft approx. 1/8 of a turn to change the position of splined section.



■ **Disassembly: Front bearing**



◆Inspection procedure◆

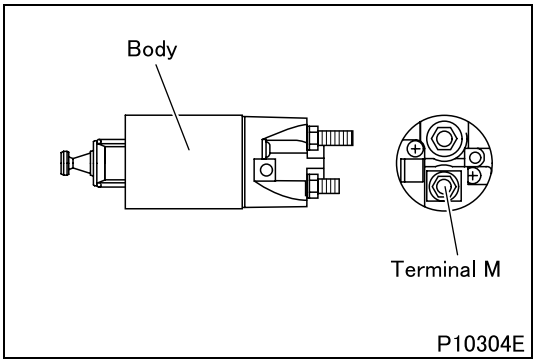


■**Inspection: Magnetic switch**

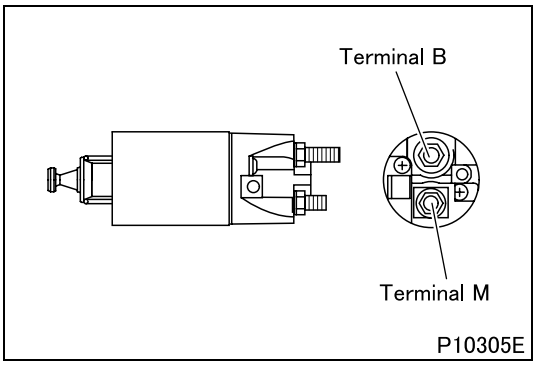
- Perform the following checks, and if any fault is found, replace the switch.

(1) Test for coil open circuit

- Check that continuity exists between terminals S and M.

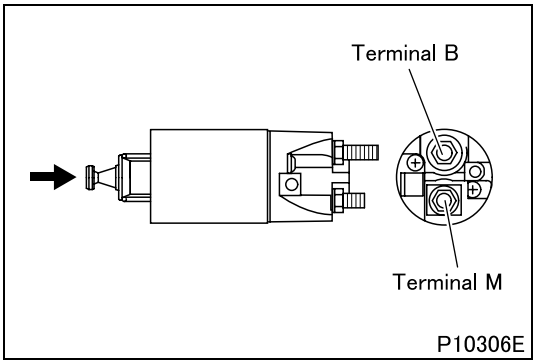


- Check that continuity exists between terminal M and the body.



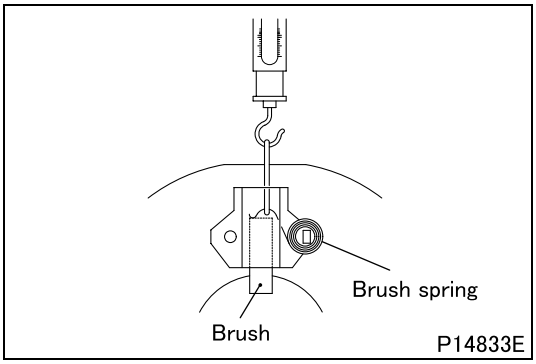
(2) Test for fused-together contacts

- Check that continuity does not exist between terminals B and M.



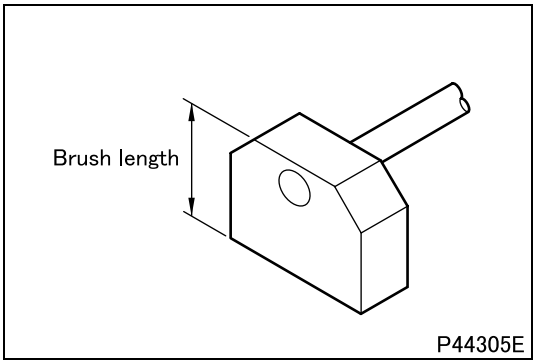
(3) Test for contact-to-contact continuity

- Push in the end of the magnetic switch to close the internal contacts. Then, check that continuity exists between terminals B and M.



■ **Inspection: Brush spring**

- Using new brushes, measure the load required to separate each brush spring from its brush.
- If either measurement is lower than the specified limit, replace the brush springs.



■ **Inspection: Brush (–)**

(1) Brush length

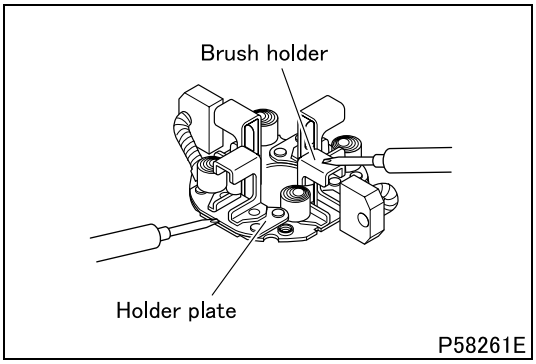
- If either brush (–) is shorter than the limit, it must be replaced.

CAUTION ⚠

- **Brush (–) must be replaced together with the brush holder.**

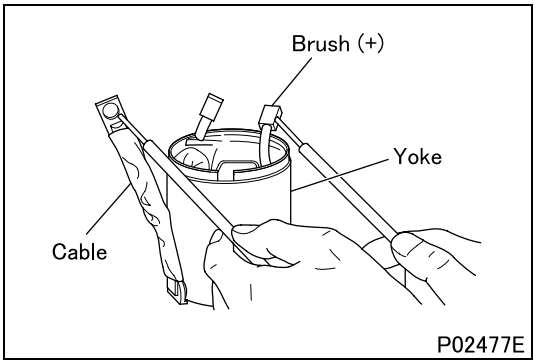
(2) Armature commutator contact surface of brush

- If the commutator contact surface of either brush is rough or unevenly worn, rectify it with emery paper (#300 to 500).



■ **Inspection: Brush holder**

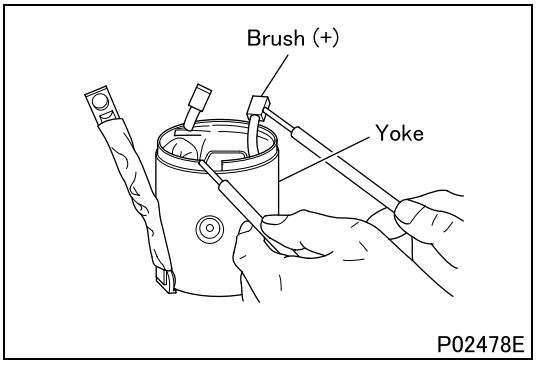
- Thoroughly clean the (+) brush holder and the (–) holder plate, then, check that continuity does not exist between them.
- If continuity exists, there is a short circuit and the brush holder must be replaced.



■ **Inspection: Yoke**

(1) Test for coil open circuit

- Check that continuity exists between the cable and the (+) brush.
- If there is no continuity, there is an open circuit and the yoke or (+) brush must be replaced.

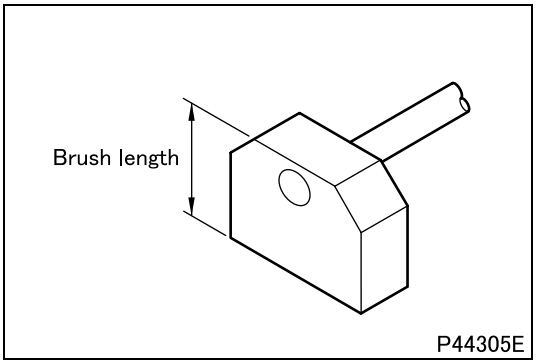


(2) Test for coil grounding

- Check that continuity does not exist between the yoke and the (+) brush.
- If continuity exists, the coil is grounded. Inspect the insulation, and replace the yoke and the (+) brush if the insulation cannot be rectified.

CAUTION ⚠

- **The coil may be grounded to the yoke due to the accumulation of worn-off metal particles from the brushes and/or armature.**



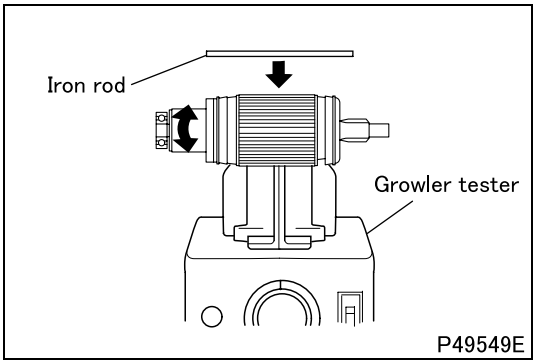
■ **Inspection: Brush (+)**

(1) Brush length

- If either brush (+) is shorter than the limit, it must be replaced.

(2) Armature commutator contact surface of brush

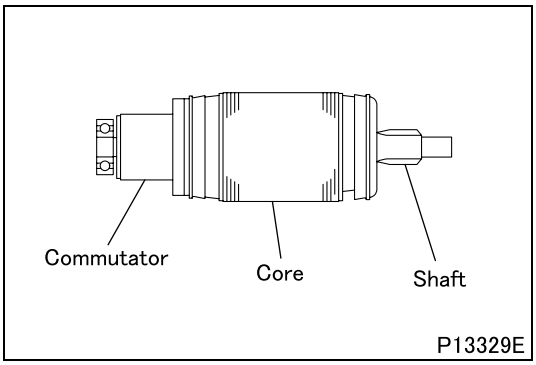
- If the commutator contact surface of either brush is rough or unevenly worn, rectify it with emery paper (#300 to 500).



■ **Inspection: Armature**

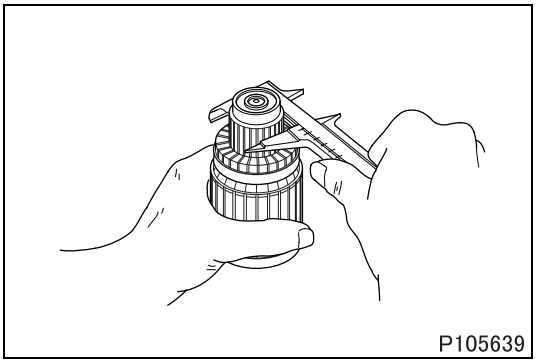
(1) Test for coil short circuit

- Hold an iron rod parallel with the armature.
- Slowly rotate the armature by hand.
- If the iron rod vibrates or is pulled toward the armature, the coil is short-circuited and the armature must be replaced.



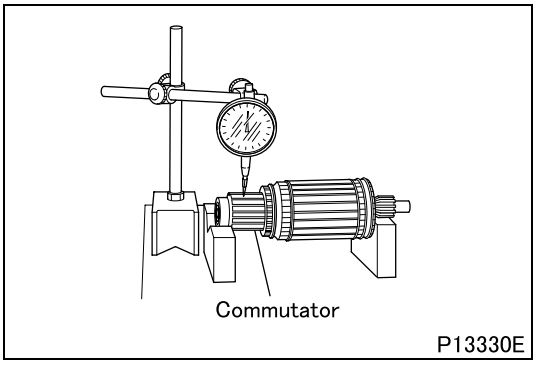
(2) Test for coil grounding

- Check that continuity does not exist between the commutator and the core (or shaft).
- If continuity exists, the coil is grounded and the armature must be replaced.



(3) Commutator outside diameter

- If the measurement is out of specification, replace the armature.

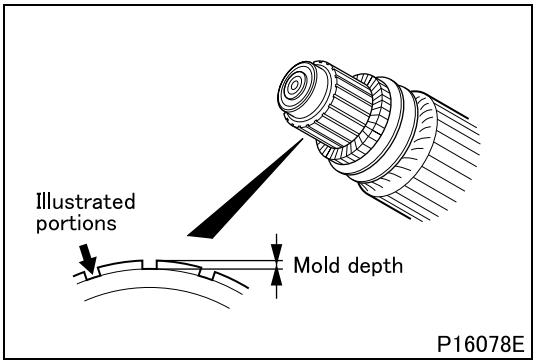


(4) Runout of commutator periphery

- If the reading exceeds the specified limit, rectify the commutator of the armature, making sure the outside diameter stays within specification.

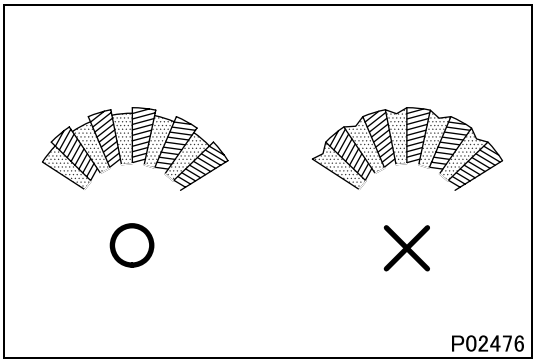
(5) Condition of commutator surface

- If the surface is rough or has stepped wear, rectify it with emery paper (#300 to 500).
- After rectifying the surface, check the extent of commutator runout.



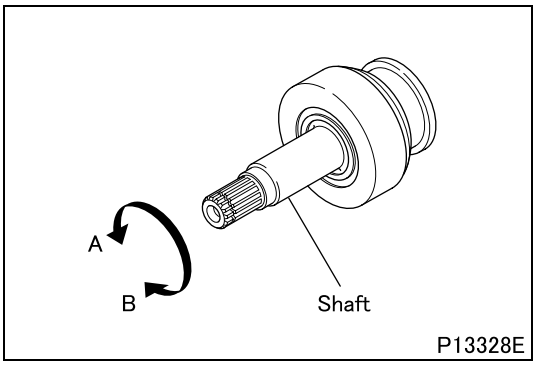
(6) Mold depth between segments

- If the measurement is lower than the specified limit, rectify or replace the armature.
- To rectify the armature, grind the illustrated portions.



- If the mold is worn as illustrated, rectify or replace the armature.

○: Acceptable
×: Unacceptable

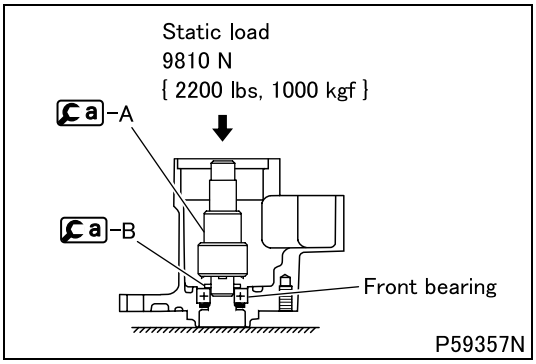


■ Inspection: Overrunning clutch

If the following inspections reveal any abnormality, replace the overrunning clutch.

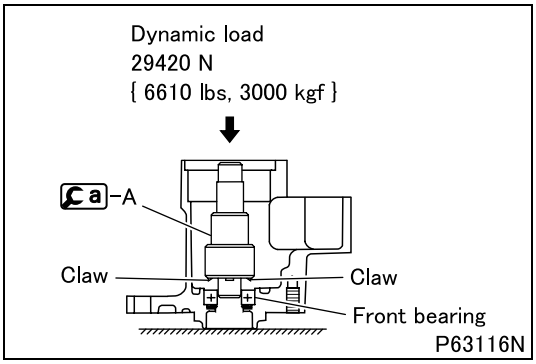
- Turn the shaft in direction B and check that it rotates smoothly.
- Turn the shaft in direction A and check that it locks.

◆Assembly procedure◆



■ Assembly: Front bearing

- Press-fit the front bearing using Ca-A and Ca-B.



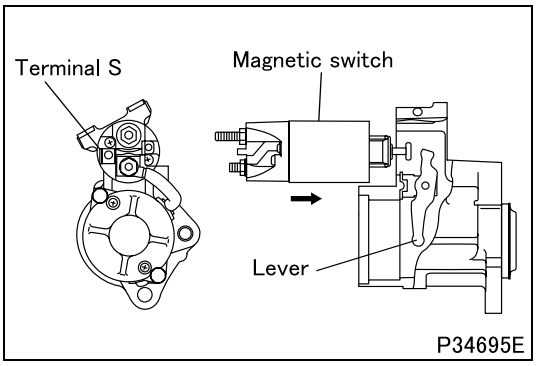
- After the press fitting, caulk the front bearing using the claw on a -A.

CAUTION ⚠

- **Avoid re-caulking previously caulked points.**

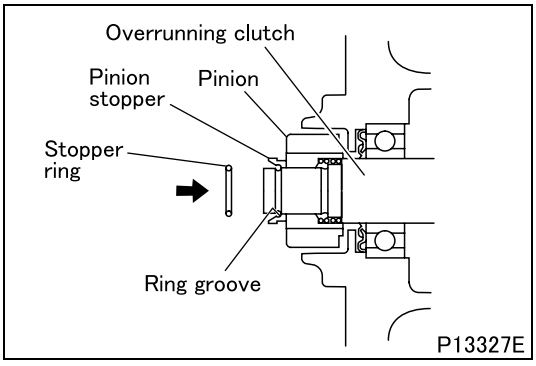
■ Assembly: Yoke and brush holder

- To install the yoke and brush holder, follow the removal sequence in reverse.
  (See "**■ Disassembly: Yoke and brush holder**".)



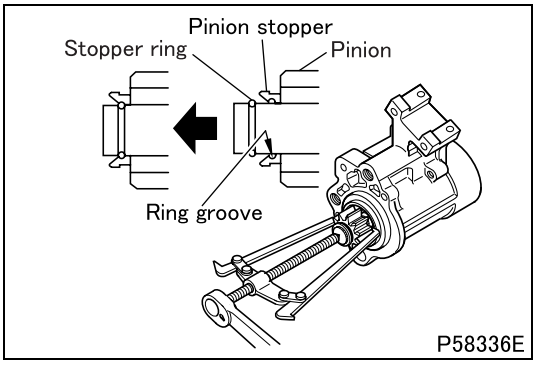
■ Assembly: Magnetic switch

- Fit the magnetic switch onto the lever with terminal S aligned as illustrated.



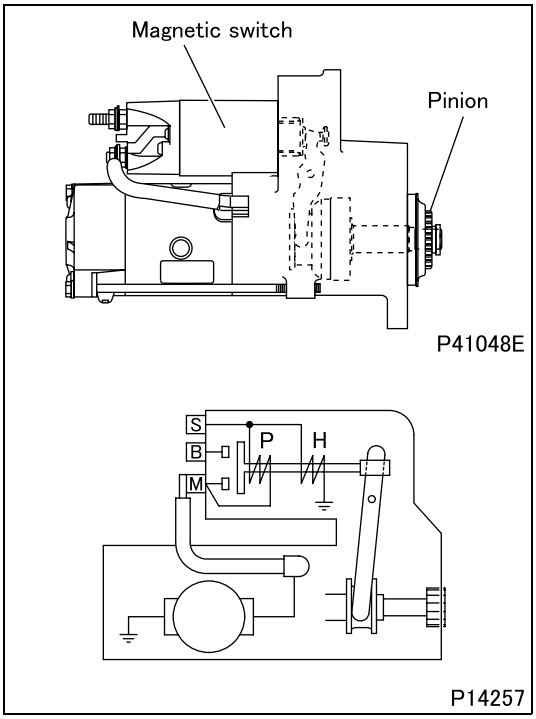
■ Assembly: Pinion

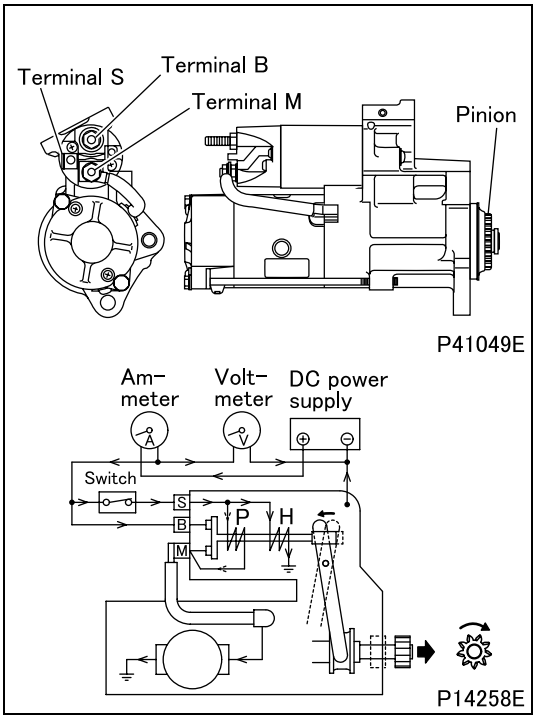
- For installation of the pinion, it is not necessary to supply current to the starter.
  - Fit the pinion stopper and pinion onto the overrunning clutch, making sure they are oriented as illustrated.
  - Fit the stopper ring into the ring groove of the overrunning clutch.



- Pull the pinion hard and securely fit the stopper ring into the ring groove of the pinion stopper.

◆Inspection after assembly◆





■ **Inspection: Performance and pinion gap**

- After assembling the starter, perform inspections with current supplied to it.

WARNING ⚠

- **When the starter is energized, the pinion will spring out and rotate. Be careful not to touch it with your hands.**
- **The magnetic switch may become very hot during inspections. Be careful when touching it.**

CAUTION ⚠

- **Do not energize the pull-in coil P for longer than 10 seconds, and do not energize the holding coil H for longer than 30 seconds. If these periods are exceeded, the coils may overheat and burn out.**
- **When current is supplied to the starter, a large current (100 A or higher) will flow. For inspection purposes, booster cables or similarly thick cables must therefore be used. It is also important to ensure that all connections are secure.**

(1) Performance test

- Connect the starter as illustrated.
- Set the voltage to 11 volts DC.

CAUTION ⚠

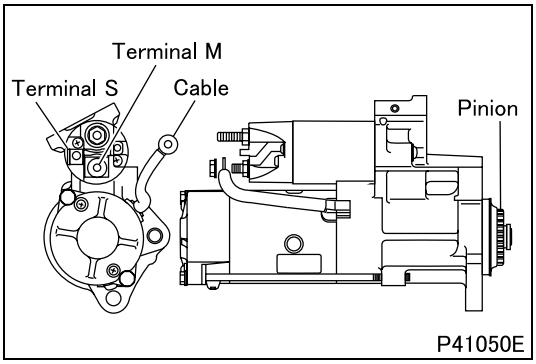
- **The voltage applied must not exceed 12 V.**

- The following operations are performed with current supplied to the starter. Thus, the entire test (consisting of measurement of the current flowing through the starter and measurement of the starter's rotational speed) must be completed within 30 seconds.
  - Turn ON the switch to supply current to the starter. The pinion will spring out and rotate.

CAUTION ⚠

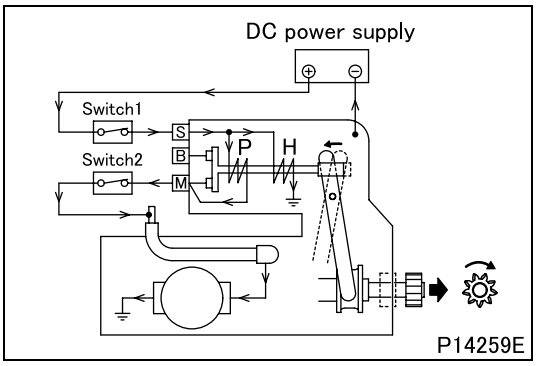
- **When the switch is turned ON, the pull-in coil P and holding coil H are both energized. When the large current from the DC power supply flows from terminal B to terminal M, the supply of current to the pull-in coil P is cut; only the holding coil H remains energized. To prevent the holding coil from burning out, it is essential to complete all operations within 30 seconds.**

  - Measure the current and the starter's rotational speed. To measure the rotational speed, shine a stroboscope on the pinion.
  - Turn OFF the switch to de-energize the starter.
- If either measurement is out of specification, disassemble and inspect the starter again.



(2) Pinion gap

- Connect the starter as illustrated.



- The following operations are performed with current supplied to the starter. Thus, the entire procedure for measurement of the pinion gap must be completed within 30 seconds.
  - Turn ON switches 1 and 2 to supply current to the starter. The pinion will spring out and rotate.

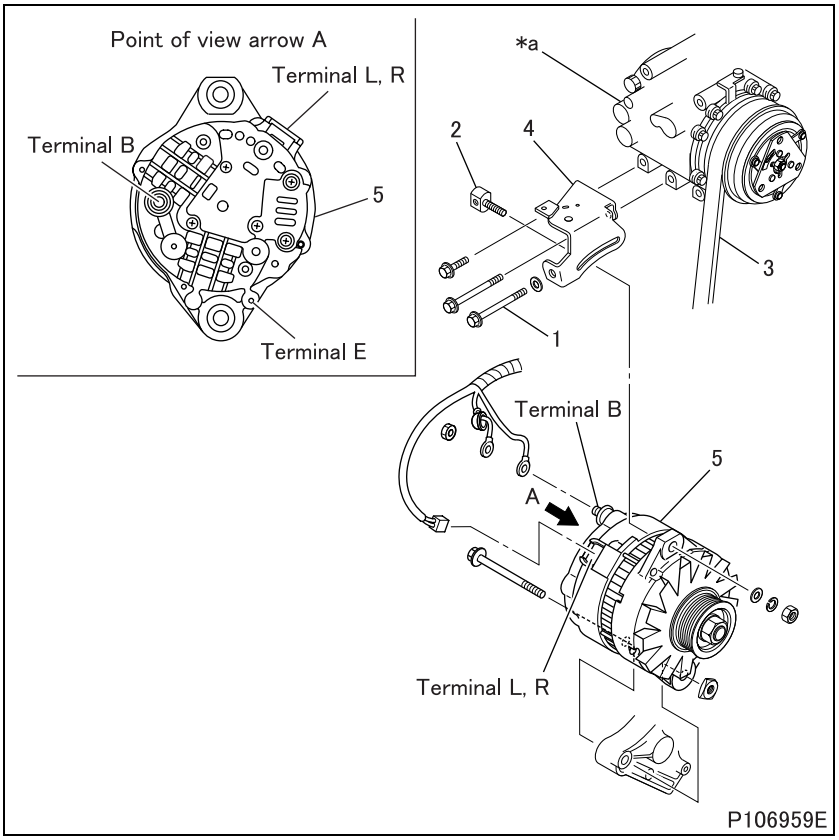
  - After the pinion starts to rotate, quickly (within five seconds) turn OFF switch 2 to stop the pinion's rotation.

CAUTION ⚠

- **When switches 1 and 2 are turned ON, the pull-in coil P and holding coil H are both energized. The circuit is connected such that no voltage is applied to starter terminal B, so current flows to the pull-in coil while the pinion rotates. To prevent the pull-in coil from burning out, it is essential to turn OFF switch 2 quickly (within five seconds) after the pinion starts to rotate.**

  - Pull out the end of the overrunning clutch and then lightly push in the end of the overrunning clutch and measure the amount of movement in the axial direction, i.e., the pinion gap.
  - Turn OFF switch 1 to de-energize the starter.
- If the measurement is out of specification, replace the lever.

#940 ALTERNATOR



● **Removal sequence**

1 Adjusting bolt
2 Adjusting shaft
3 Belt
4 Adjusting plate
5 Alternator

***a**: Air-conditioner compressor

WARNING ⚠

- **Before removing the alternator, disconnect the (–) battery cable and insulate the cable and the (–) battery terminal with tape.**
- **It is dangerous to leave the (–) battery cable connected since the battery cable voltage is always present at terminal B.**

● **Installation sequence**

Follow the removal sequence in reverse.

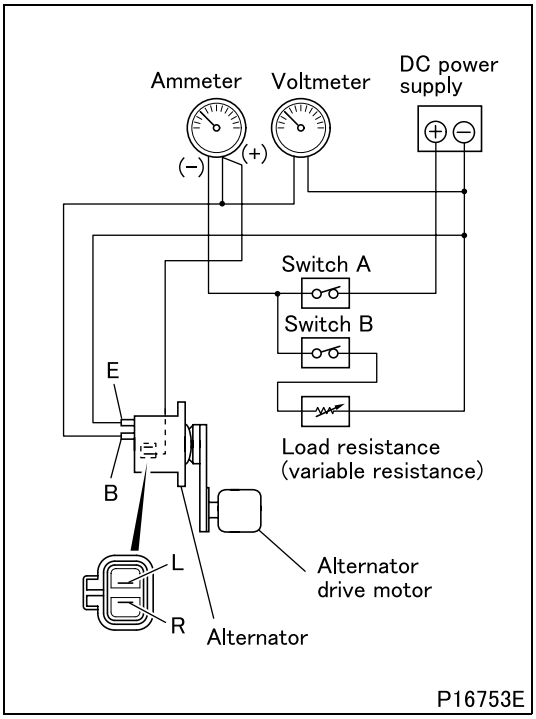
After installing the alternator, adjust the belt tension. (See Gr14.)

Service standards

Location	Maintenance item		Standard value	Limit	Remedy
5	Alternator output current (*when alternator is hot and producing 13.5 V)	At 1500 rpm	51.5 A or more	–	Correct or replace
		At 2500 rpm	82.5 A or more	–	
		At 5000 rpm	104 A or more	–	
	Adjustment voltage of regulator (at 5000 rpm, 5 A is loaded)		14.7 ± 0.3 V	–	Replace

* The hot condition is that which occurs after the alternator has been running at normal ambient temperature at 5000 rpm and maximum output for 30 minutes.

◆Inspection procedure◆



■ Inspection: Alternator

(1) Alternator output current (bench test)

- Connect the alternator as illustrated.

CAUTION ⚠

- **Wires with sufficient thickness should be used for wiring and each connection should be securely fastened.**

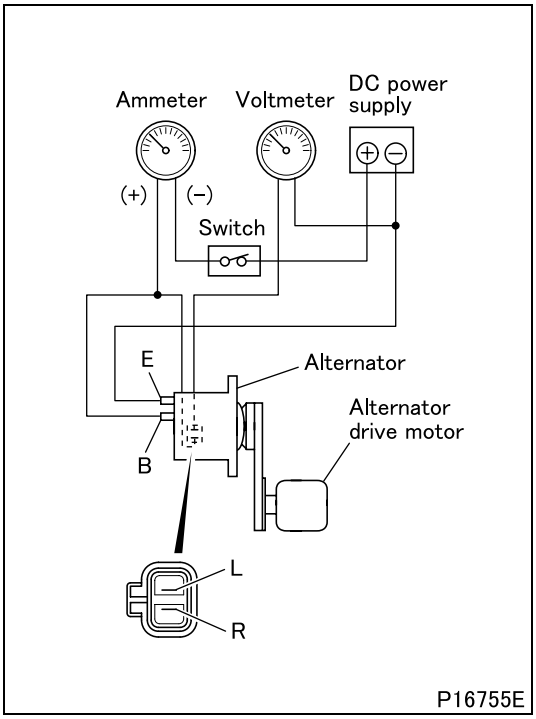
B: Terminal B
E: Terminal E
L: Terminal L
R: Terminal R

- Increase load resistance to the maximum (condition under which the load current hardly flows).
- Turn switch A and B ON.
- Run alternator at 5000 rpm for 30 minutes by adjusting load resistance so that electric current can conform to the following standard.

  Alternator nominal current

Current
Approx. 104 A

- Measure the current at each specified revolution of alternator.
- If the measured value is lower than the standard value, disassemble and check alternator.



(2) Adjustment voltage of regulator (bench test)

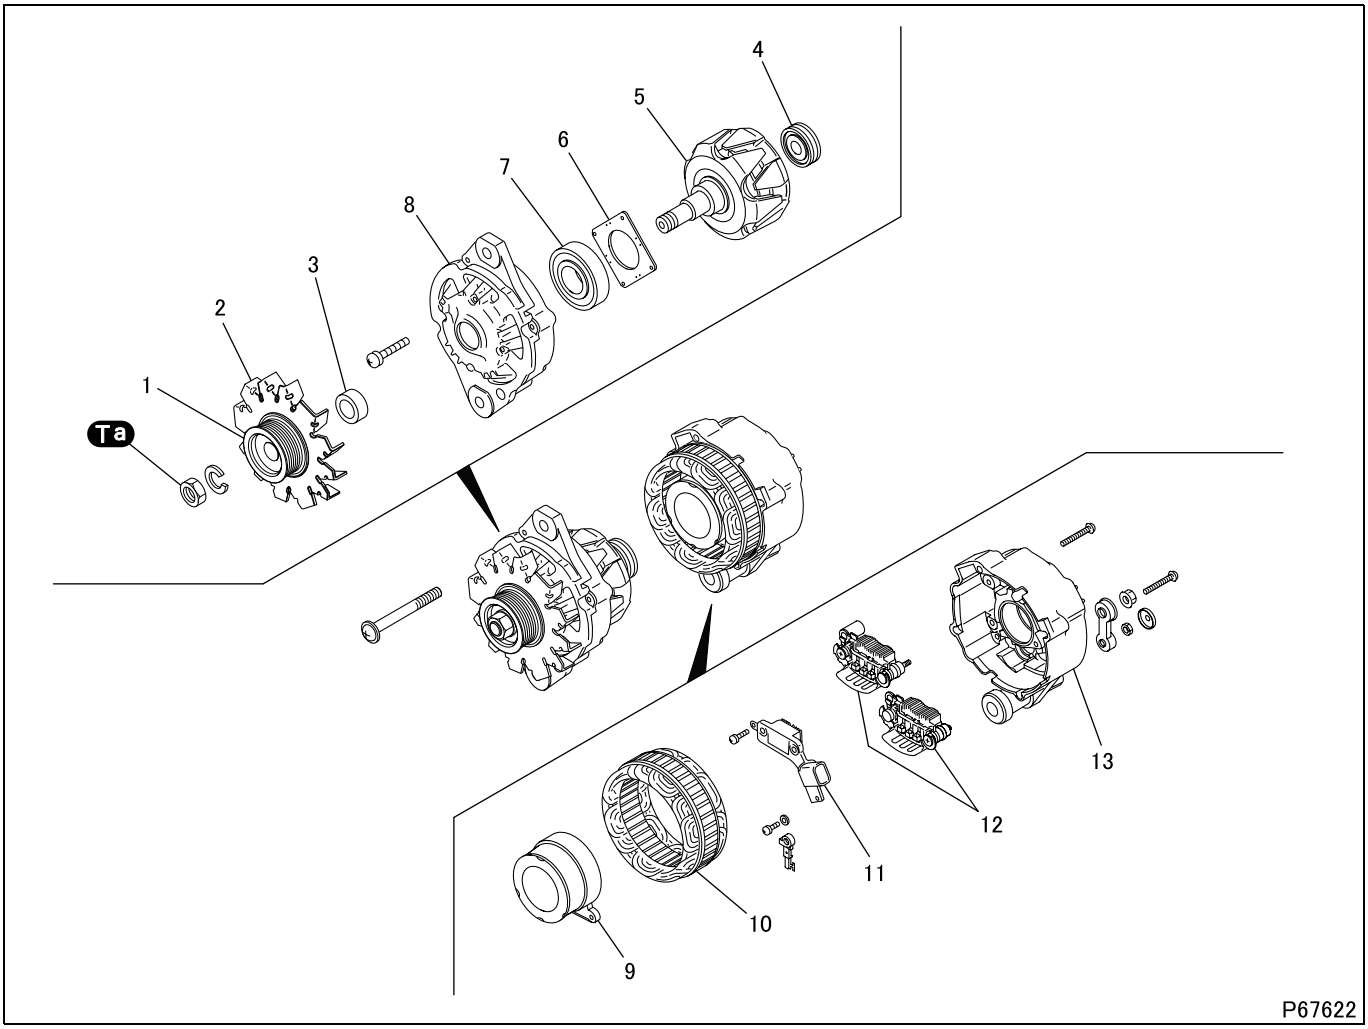
- Connect the alternator as illustrated.

B: Terminal B
E: Terminal E
L: Terminal L
R: Terminal R

- Turn switch ON.
- Run alternator at low speeds.
- Increase the speed of alternator to 5000 rpm and measure the voltage (adjustment voltage) at this speed. At the same time, make sure that the current is 10 amperes or less at 5000 rpm.
- If the measured value deviates from the standard value, do as follows:
  - If higher than the standard value: Replace the regulator.
  - If lower than the standard value: Inspect the alternator related parts before replacing the regulator.

M E M O

#940 ALTERNATOR



● **Disassembly sequence**

1 Pulley
2 Fan
3 Spacer
4 Rear bearing
5 Rotor
6 Cover
7 Front bearing
8 Front bracket
9 Field coil
10 Stator
11 Regulator
12 Rectifier
13 Rear bracket

- Do not remove the rear and front bearing, stator unless faulty.

● **Assembly sequence**

Follow the disassembly sequence in reverse.

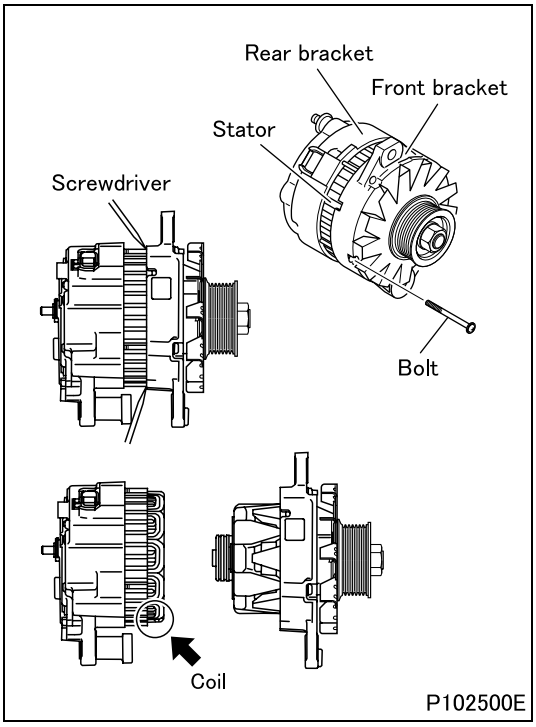
Service standards

Location	Maintenance item	Standard value	Limit	Remedy
9	Field coil resistance (at 20°C {68°F})	1.9 to 2.3 Ω	–	Replace

Tightening torque (Unit: N·m {ft. lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Nut (pulley mounting)	132 to 162 {97 to 120, 13 to 17}	–

◆Disassembly procedure◆

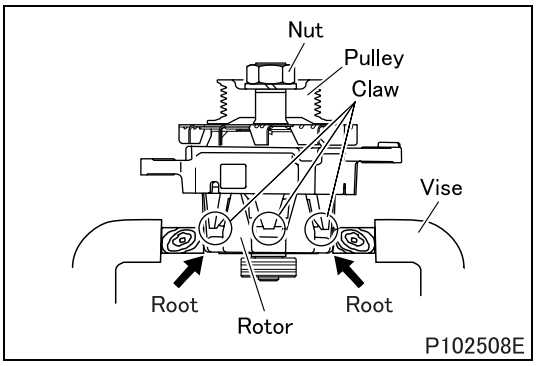


■ **Disassembly: Rotor and front bracket**

- Loosen the bolts retaining the front bracket and the rear bracket in position.
- Insert a screwdriver between front bracket and stator.
- Use the screwdriver to pry rotor and front bracket away from stator and rear bracket.

CAUTION ⚠

- **Be careful not to insert the screwdriver too deep or it will damage coil of stator and might cause a short-circuit.**

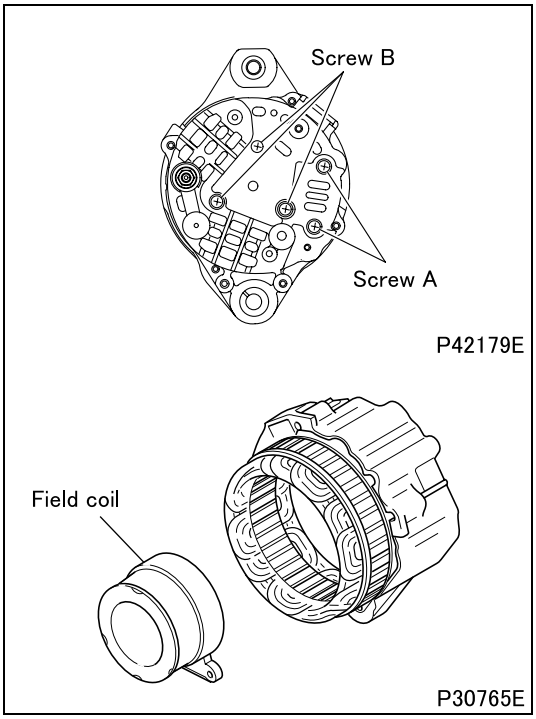


■ **Disassembly: Pulley**

- Hold the rotor in a vise and loosen the nuts to remove the pulley.

CAUTION ⚠

- **Make sure to grip the root of the core claws when you hold the rotor in a vice. Gripping claws can damage them.**



■ **Disassembly: Field coil**

- Remove screw A (2 places).

CAUTION ⚠

- **If screw B are removed first, the weight of field coil may be placed on the joining portion with regulator which is fixed with screw A, causing break of the joining portion. To avoid this, remove screw A first.**

- Remove screw B (3 places).

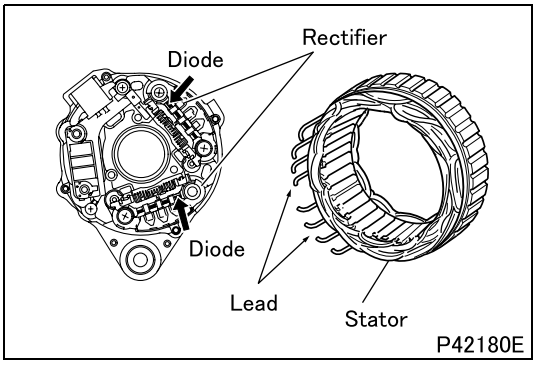
CAUTION ⚠

- **If screw B are removed, the field coil will fall under its own weight. Keep the field coil supported by your hand.**

- Remove field coil.

CAUTION ⚠

- **Do not remove the field coil forcibly. Otherwise the portion that joins with the regulator may be caught by the stator coil.**



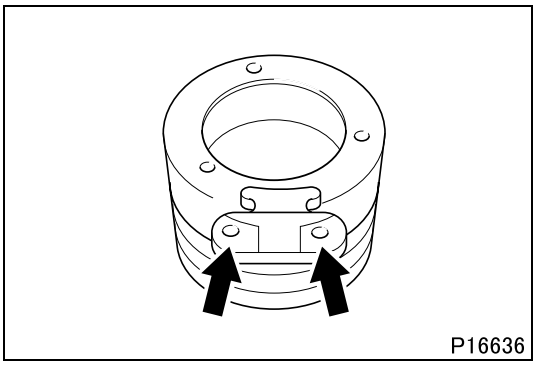
■ **Disassembly: Stator**

- Disconnect lead of stator from rectifier. The lead is soldered to diode of the rectifier at 8 places. (Each of the 2 rectifiers has 4 soldered sections.)

CAUTION ⚠

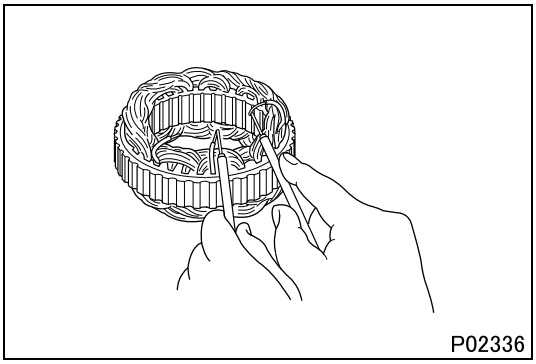
- **Unsolder within as short a time period as possible (within 5 seconds), otherwise diode can be easily damaged by heat.**

◆Inspection procedure◆



■ **Inspection: Field coil**

- Measure the resistance between the terminals of field coil.
- If the measured value deviates from the standard value, replace field coil.

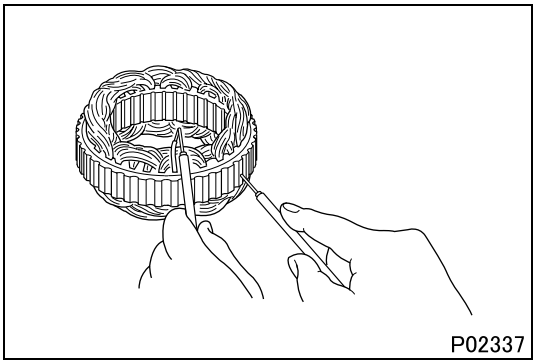


■ **Inspection: Stator**

- Perform the following checks, and if any fault is found, replace the stator.

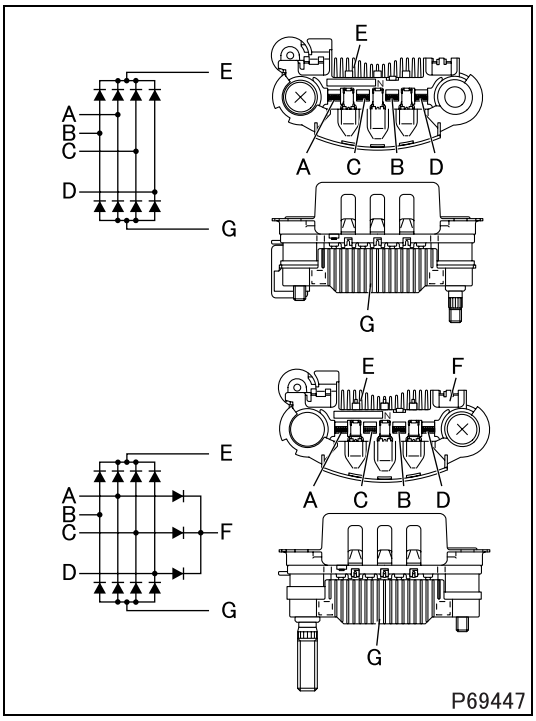
(1) Continuity between each lead wire

- Check that there is continuity between each stator lead.
- If there is no continuity, the lead has broken.



(2) Continuity between each lead wires and the core

- Check that there is no continuity between lead wires and the core.
- If there is continuity, the lead wire has short-circuited.



■ **Inspection: Rectifier**

- Check the function of diodes within rectifier properly. If any fault is found, replace the rectifier.

  If resistance is infinite in both cases, the diode is open.
  If resistance is close to 0 Ω in both cases, the diode has shorted.

  A, B, C, D: Lead connecting area of stator coil
  E, G: Heat sink area
  F: Regulator connecting area

- Inspection should be conducted twice, changing over the positive probe and the negative probe of the tester.
- When inspecting using a tester, the current flowing through the rectifier is smaller than usual. Therefore, an incorrect resistance value may be indicated on the tester.
  Additionally, incorrect indications become larger as the range of the tester gets smaller. Set the tester to a largest possible scale.

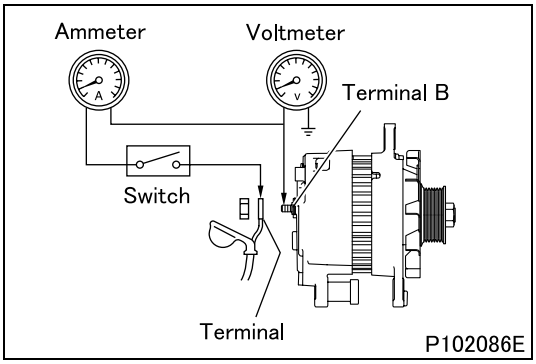
◆Assembly procedure◆

■ **Assembly: Stator**

- To install the stator, follow the disassembly sequence in reverse. (See "■ **Disassembly: Stator**".)

54-13 ON-VEHICLE INSPECTION AND ADJUSTMENT

#950 INSPECTION OF ALTERNATOR



Performance test

- The on-vehicle inspection is only a simplified check. Use a test bench for accurate checking.
- Connect the meters to the alternator as shown.

WARNING ⚠

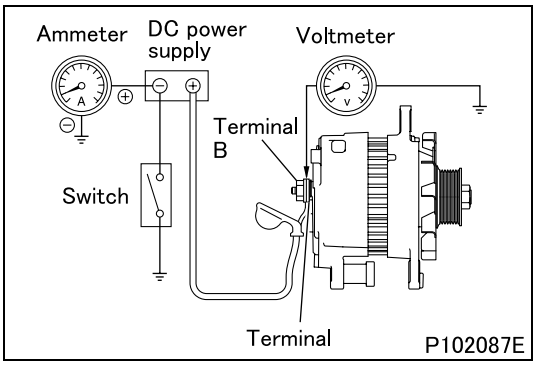
- **To prevent possible injury, be sure to disconnect the negative battery cable and insulate the cable and the negative battery terminal with tape before working on the wiring. With the negative (–) battery cable connected, battery voltage is always applied to terminal B.**
- **To connect to switch, use a lead wire with the same or larger diameter than that of the chassis harness connected to terminal B.**

- Turn on switch and make sure that voltmeter indicates battery voltage.
- Start the engine.
- Immediately turn on the switches for all lamps on the vehicle.
- Immediately accelerate the engine to the speed indicated below and measure the alternator's output current.
  Approx. 2400 rpm
- The alternator is considered to be good if the measured value is 70% or more of the nominal output current.
  Alternator nominal output

Voltage	Output current
12 V	100 A

Service standards

Location	Maintenance item	Standard value	Limit	Remedy
–	Adjusting voltage	14.7 ± 0.3 V	–	Replace



- Connect the meters to the alternator as shown.

WARNING ⚠

- **To prevent possible injury, be sure to disconnect the negative battery cable and insulate the cable and the negative battery terminal with tape before working on the wiring. With the negative (–) battery cable connected, battery voltage is always applied to terminal B.**
- **To connect to switch, use a lead wire with the same or larger diameter than that of the chassis harness connected to terminal B.**

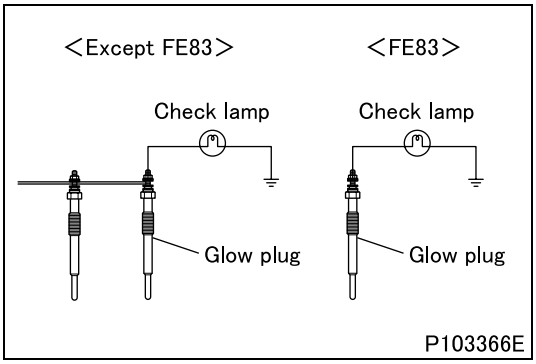
- Turn off the switches for lamps, heater, etc. so that electric loads may not be applied during the inspection.
- Turn on switch and then start the engine.
- If the output current is 5 amperes or less when the engine speed is raised to the appropriate speed indicated below, then measure the voltage at terminal B.
  Approx. 2400 rpm
- If the output current is not less than 5 amperes, the measured value (regulated voltage) will be slightly lower.
- If the output current is 5 amperes or more, do one of the following:
  - Run the engine for a while to charge the battery.
  - Replace the battery with a fully-charged one.
- If the measured value deviates from the standard value, conduct checking again on the test bench.

#955 INSPECTION OF PREHEATING SYSTEM

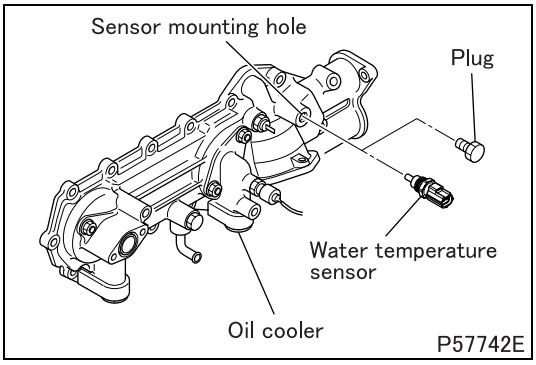
1. Preparation for inspection

Service standards

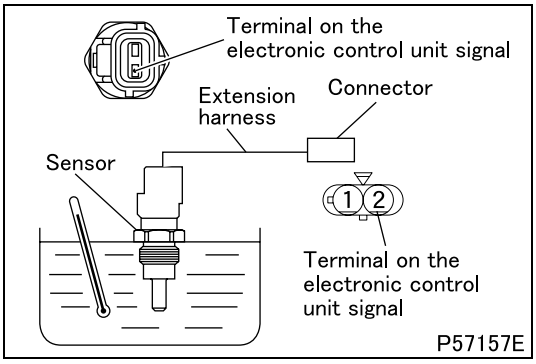
Location	Maintenance item			Standard value	Limit	Remedy
–	Coolant temperature	Pre-glow time	60°C {140°F} or higher	No pre-glow operation	–	Inspect
			0 to 60°C {32 to 140°F}	About 12 seconds	–	
			0°C {32°F} or below	About 12 seconds	–	
		After-glow time	60°C {140°F} or higher	No after-glow operation	–	
			0 to 60°C {32 to 140°F}	No after-glow operation	–	
			0°C {32°F} or below	About 20 seconds	–	
		Indicator lamp ON time	60°C {140°F} or higher	No illumination	–	
			0 to 60°C {32 to 140°F}	No illumination	–	
			0°C {32°F} or below	About 8 seconds	–	



- Turn the starter switch to OFF.
- Connect a check lamp to the glow plug.
- In model FE83, the glow plugs are not connected to the connection plate. Check the glow plug by connecting the lamp to the glow plug one by one.



- Remove the water temperature sensor from the engine, and close the sensor mounting hole with the plug (M16 × 1.5 mm).



- Connect the extension harness between the water temperature sensor and connector.
- Place the water temperature sensor in a container of water.
- Conduct the following test while changing the temperature of water in the container. If anything abnormal is found, check relevant components.

(1) Pre-glow time and indicator lamp ON time checking

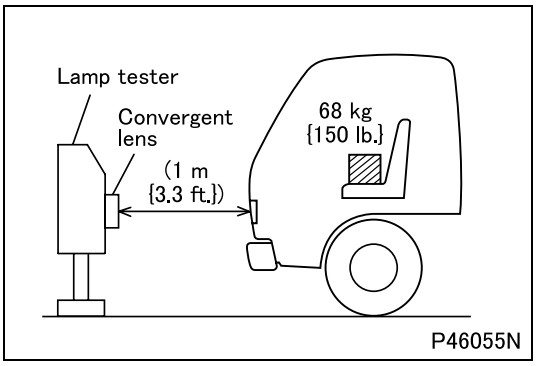
- Turn the starter switch to ON (without starting the engine), and confirm that the pre-glow time and indicator lamp ON time at each water temperature conform with standard values.
- Measure the illuminating time of the check lamp to measure the pre-glow time.
- Measure the meter cluster glow lamp illuminating time to measure the indicator lamp ON time.

(2) After-glow time checking

- Start the engine, and measure how long the illumination of check lamp lasts after the glow lamp on the meter cluster goes out to ensure that the after-glow time conforms with the standard value.

#960 HEADLAMP AIMING

1. Preparation before Adjustment

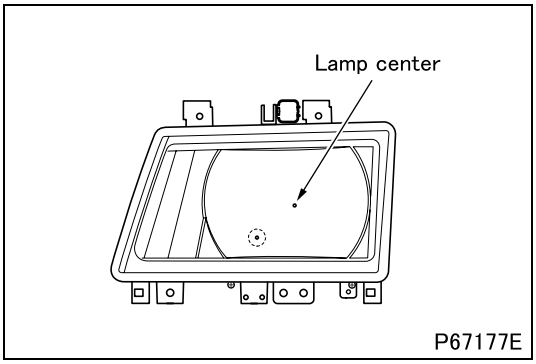


- Park the vehicle on a level place.

WARNING ⚠

- **Be sure to put tire chocks securely in place.**

- Unload the vehicle and make sure no one is in it.
- Inflate the tires to the specified pressure. (See Gr31.)
- Seat one person of an equivalent mass (68 kg {150 lb.}) in the vehicle.
- Start the engine and check that the battery is being charged.
- Place convergent lamp tester and the vehicle facing each other as shown in the drawing.



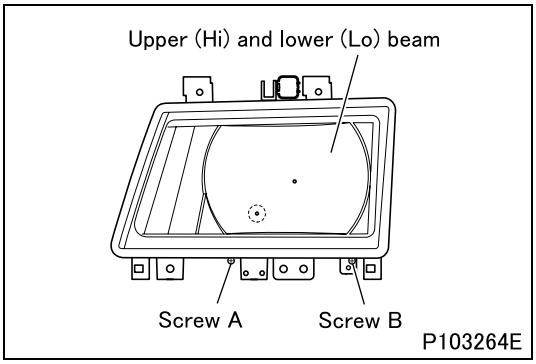
- Turn on headlamp. Align the center of headlamp bulb and the center of convergent lens of convergent lamp tester. (The drawing shows the left-hand headlamp.)

WARNING ⚠

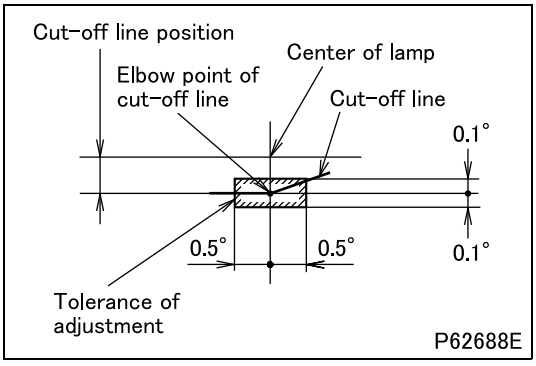
- **Do not mask a lit headlamp for more than 10 minutes or the heat generated might cause a fire.**

2. Adjustment

2.1 Adjustment of Lower Beam



- Turn on lower beam.
- Make adjustment by the following procedure so that the elbow point of lower beam cut-off line is in the illustrated position.
- Vertical adjustment: Turn screw A.
- Horizontal adjustment: Turn screw B.



- Adjust the optical axes of the lower beams so that the cut-off line position can conform to the standard value.

Cut-off line position	Standard value
	0.7°

Adjusting direction for optical axis

<Left-hand headlamp>

	Upward	Downward	Leftward	Rightward
Screw A	Counter-clockwise	Clockwise	–	–
Screw B	–	–	Clockwise	Counter-clockwise

<Right-hand headlamp>

	Upward	Downward	Leftward	Rightward
Screw A	Counter-clockwise	Clockwise	–	–
Screw B	–	–	Counter-clockwise	Clockwise

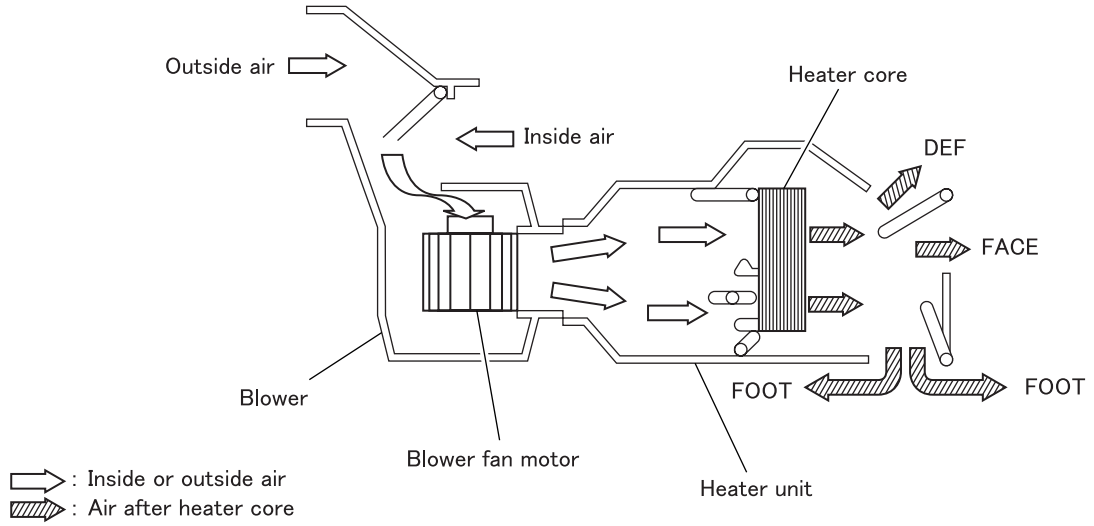
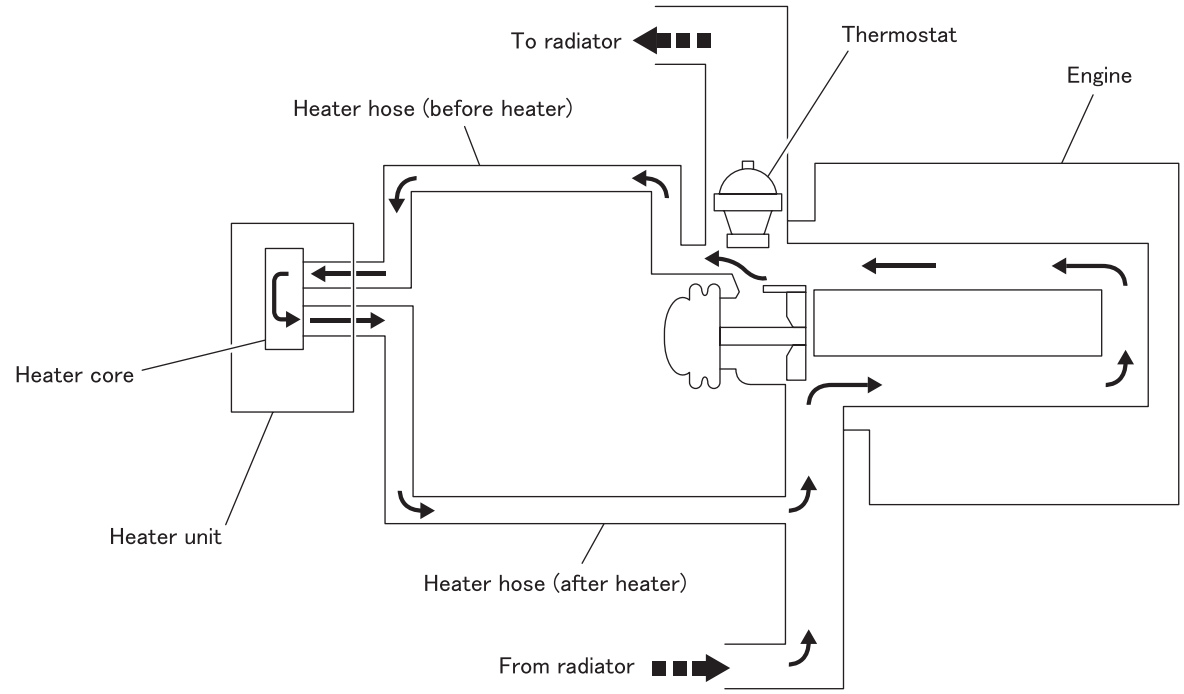
	Capacity cm^3 {cu.in.}		350 {21.4}

1. Heater



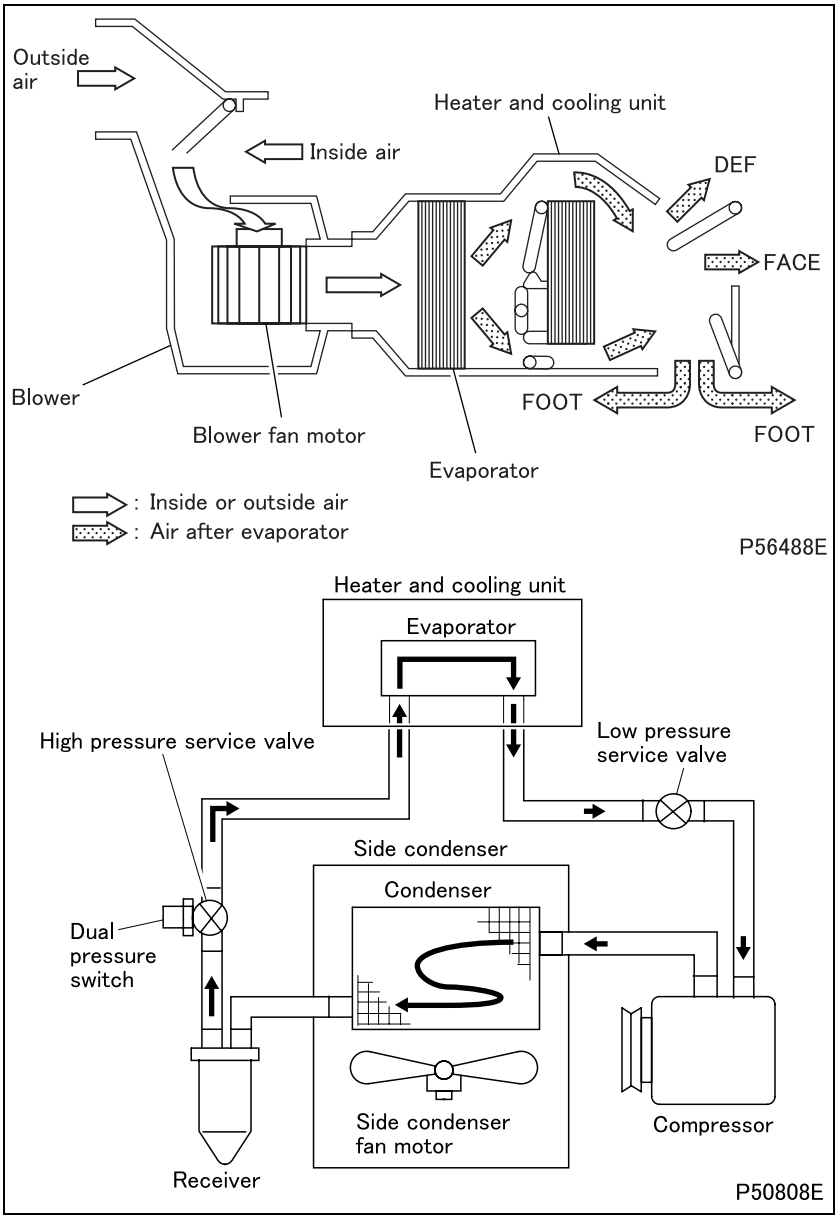
P56487E



P11955E

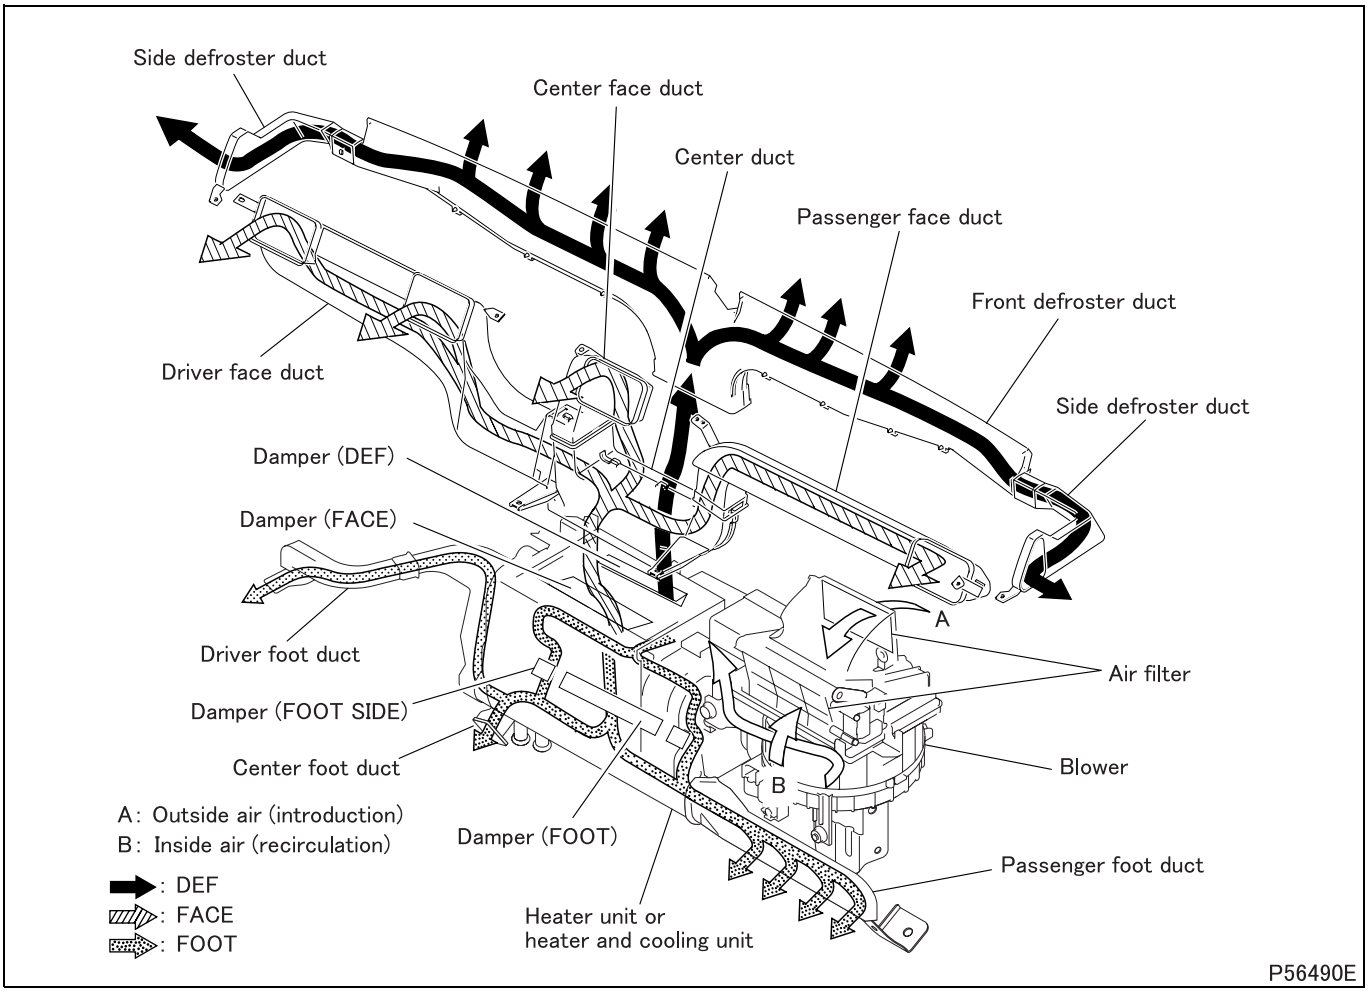
- The blower sends air to the heater unit, where the air is heated by the heater core (heat exchanger). The warmed-up air is then sent through the ducts into the cab.
- Water (engine coolant) warmed up by the heat from the engine circulates permanently through the heater core, irrespective of whether the thermostat is open or closed.

2. Air Conditioner



- The blower sends air to the heater and cooling unit, where the air is cooled by the evaporator. The cooled air is then sent through the ducts into the cab.
- Refrigerant in gas form is compressed by the compressor. The compressed gas is then sent to the side condenser, where it is cooled by outside air and condenses into liquid form.
- The liquid refrigerant is sprayed into the evaporator, where it quickly evaporates into gas form while at the same time absorbing heat from the surrounding air.
- The refrigerant in gas form is again sent to the compressor and is compressed there.
- When the refrigerant pressure in the high pressure line reaches the specified limit, the dual pressure switch senses this and turns itself OFF. At the same time, the magnet clutch is turned OFF.

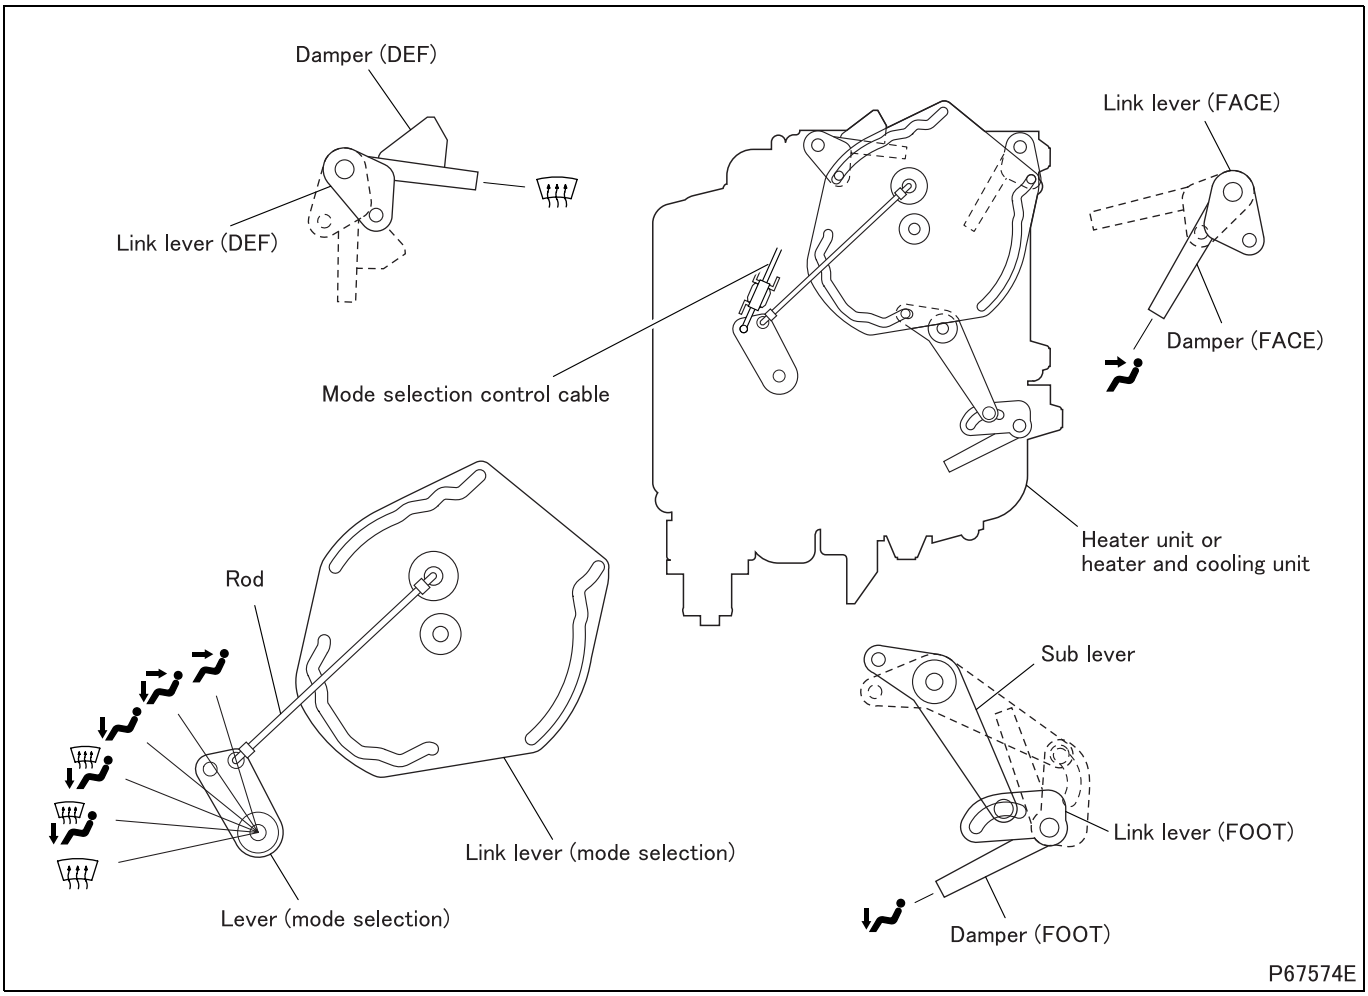
3. Air Duct



- The blower sends outside air A or inside air B through the heater unit or heater and cooling unit to the ducts. The flow of air is dependent on the open/closed positions of the various dampers.

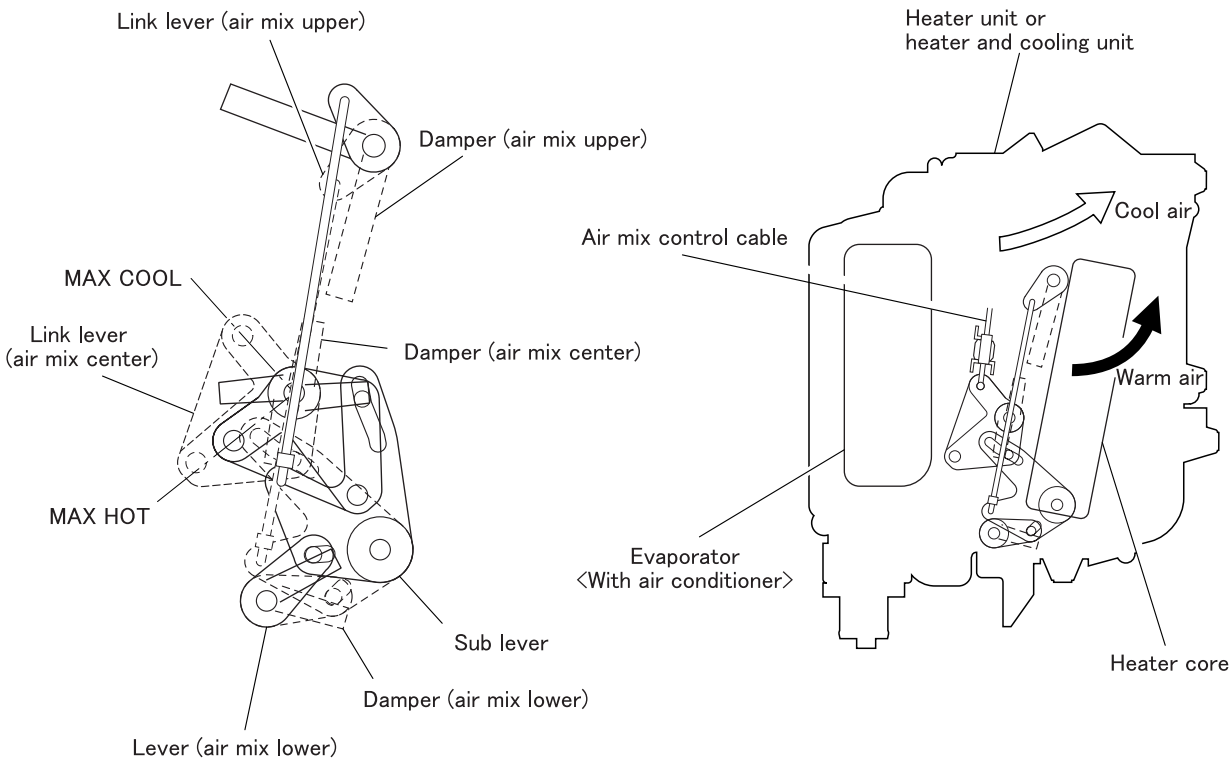
4. Heater Control

4.1 Mode selection



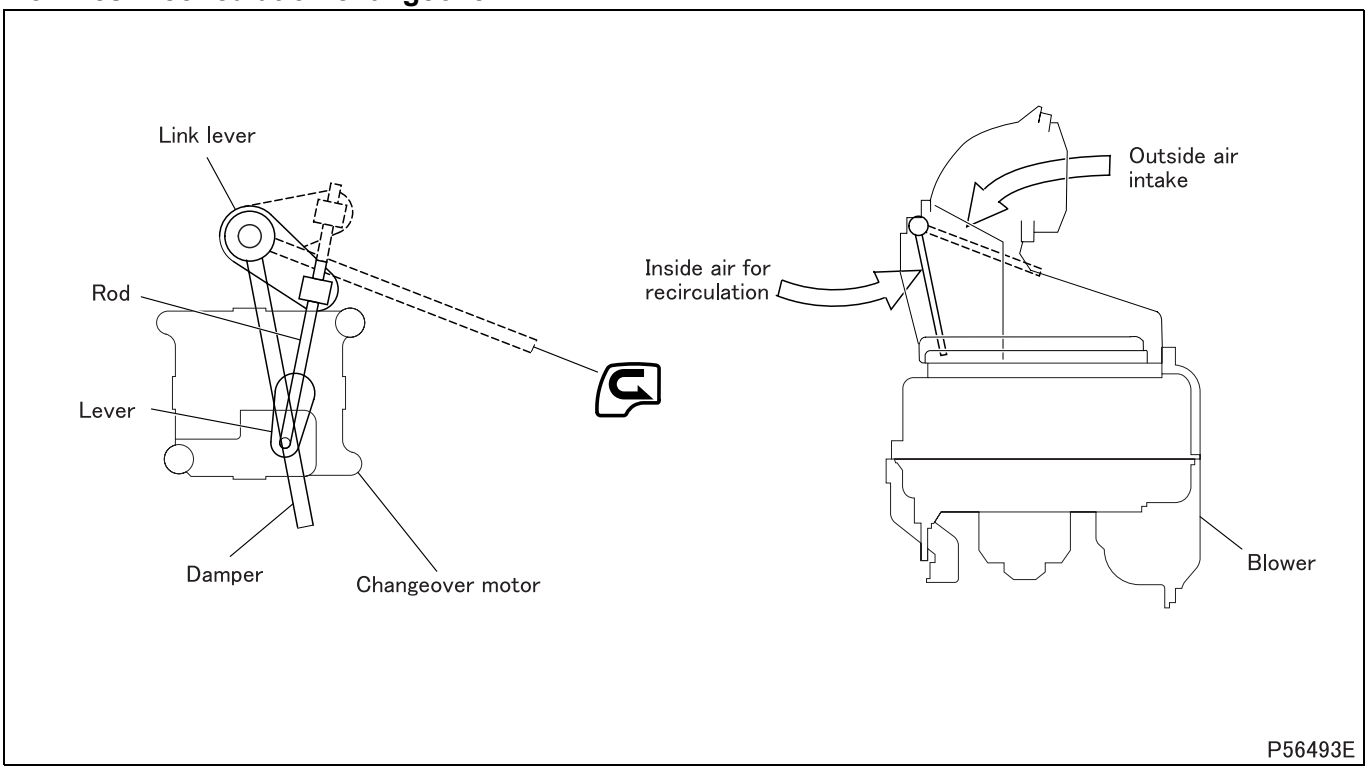
- Mode selection (opening/closing the dampers) is achieved by the operation of the mode selection control cables and the resultant movement of the related parts linked to the cables.

4.2 Air mix selection



- Air mix selection is achieved by controlling the positions of the dampers, thereby proportioning the volumes of warm and cool air that is and is not sent through the heater core.

4.3 Fresh/recirculation changeover



- The fresh/recirculation changeover damper is operated by means of motor.

Heater, Front Air Conditioner

Symptoms / Possible causes	No air from vents	Poor cooling	Poor heating	No mode selection	Draft from vents	No temperature setting	No fresh/recirculation selection	Air volume from vents unstable	Controls require too much effort	Reference Gr
Blower motor coil open, shorted	O									Gr54
Blower motor relay contacts stuck closed, coil open, shorted	O									
Blower resistor malfunction								O		
Compressor seized, malfunction <A/C>		O

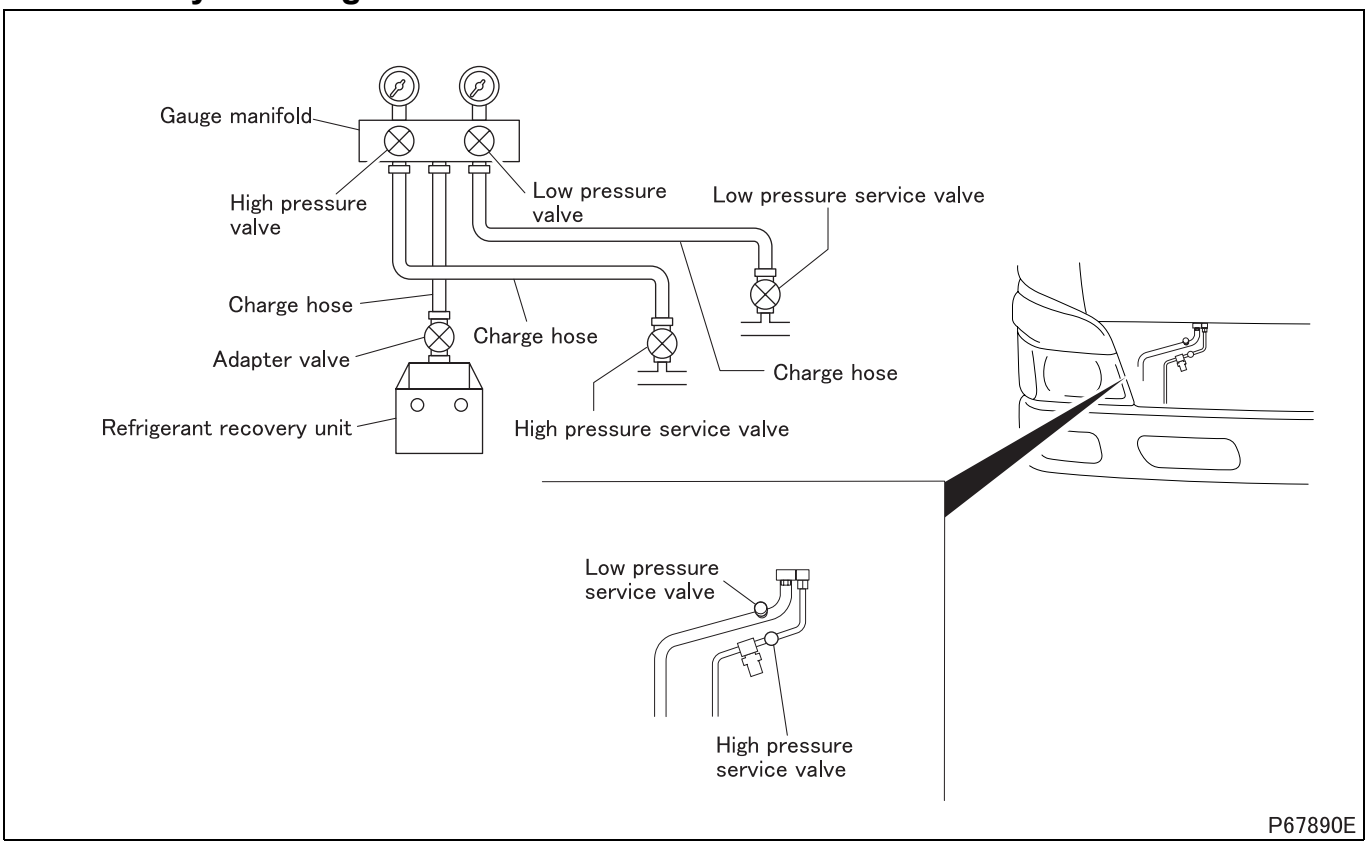
Lever bent				O	O		O		O	
Lever sliding section worn, out of grease				O	O		O		O	

<A/C>: Air conditioner

M E M O

1. Recovery of Refrigerant



- Recover refrigerant from the air conditioning system in accordance with the following flow chart.
  - Installation of the refrigerant recovery unit

↓

Close both the low pressure and high pressure valves.

↓

Connect the charge hose to the low pressure service valve.

↓

Connect the charge hose to the high pressure service valve.

↓

Connect the charge hose to the adapter valve.

↓

Open both the low pressure and high pressure valves.

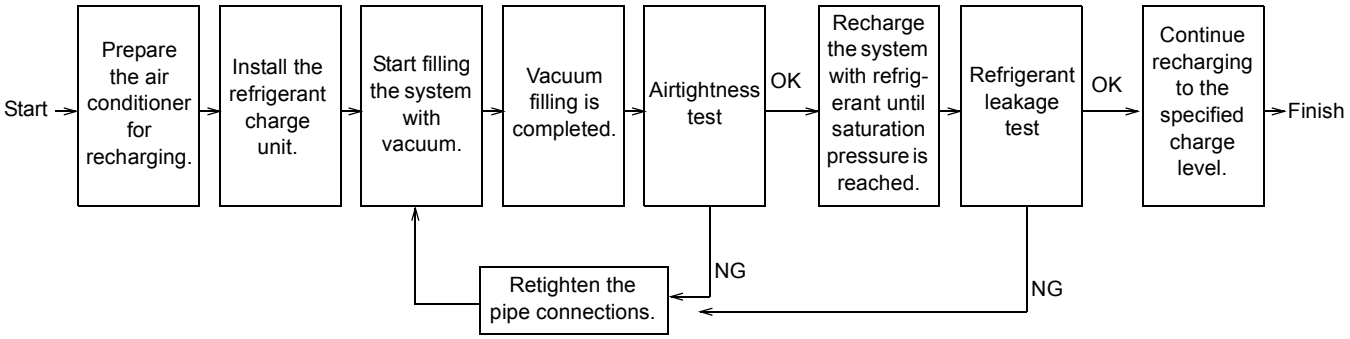
↓

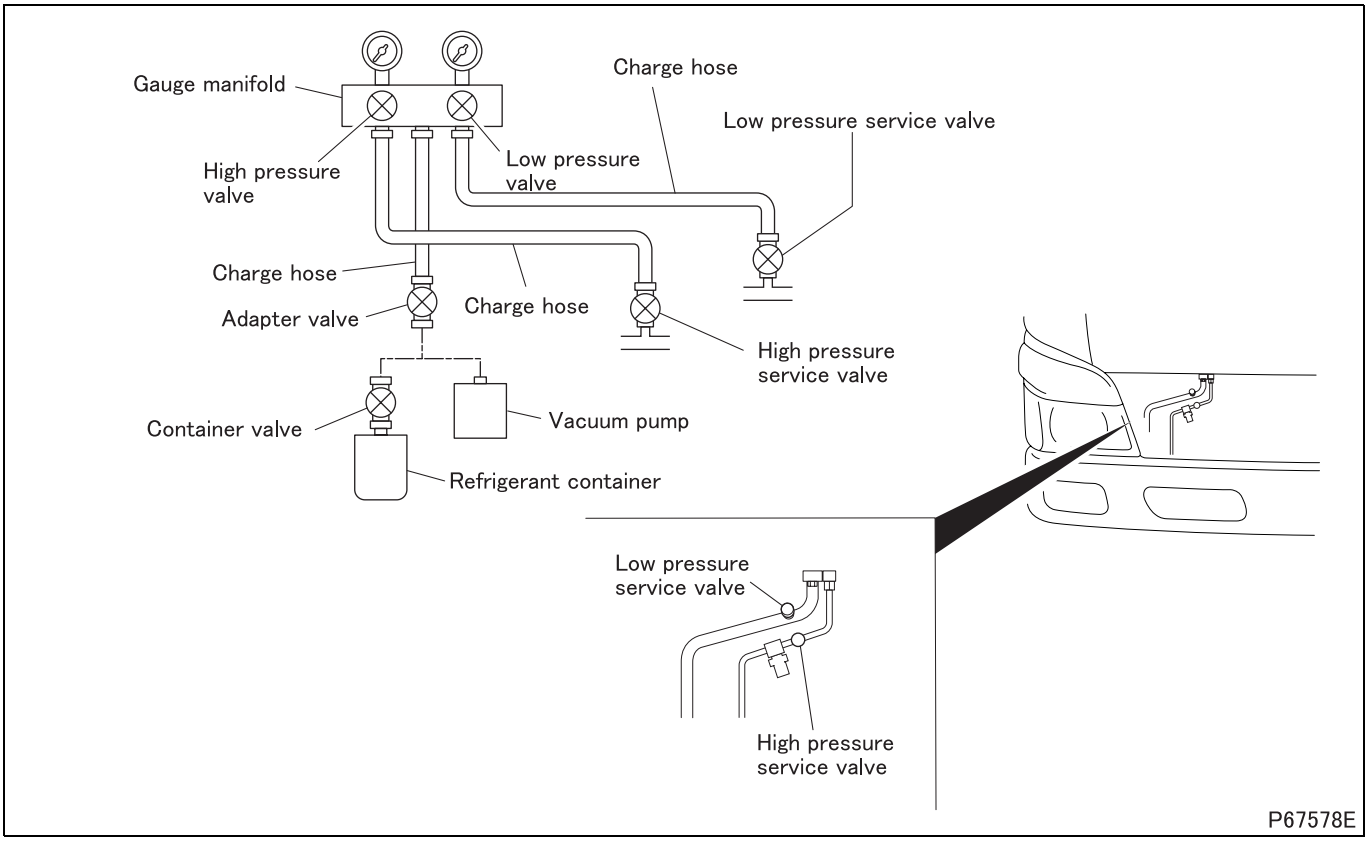
Open the adapter valve.

↓

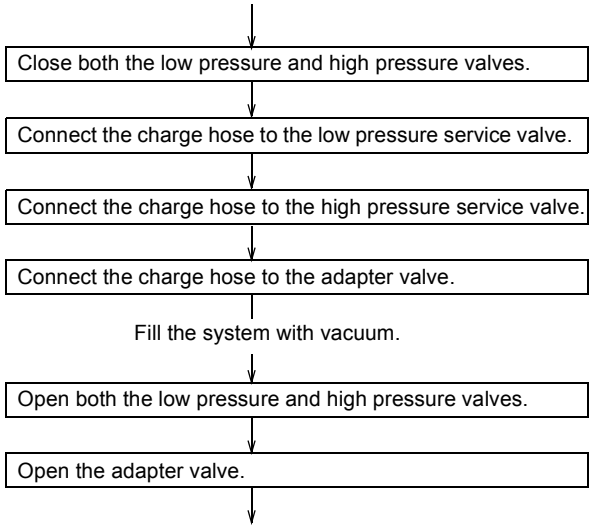
Run the recovery unit to collect the refrigerant.

2. Recharging the System with Refrigerant





- Recharge the system with refrigerant in accordance with the following flow chart.
  - Installation of the refrigerant charge unit



Run the vacuum pump.

Continue to run the pump for a minimum of 10 to 15 minutes. Close the adapter valve.

Stop the vacuum pump.

CAUTION ⚠

- **Make sure that the adapter valve is closed before stopping the vacuum pump.**

Close both the low pressure and high pressure valves.

Wait for 5 minutes. During this interval, the readings on the gauges installed on the gauge manifold should stay where they are and should not move towards zero.

Vacuum filling is now completed.

Recharging the system with refrigerant

With the adapter valve still closed, remove it from the vacuum pump. Connect the valve to the refrigerant container via the container valve.

Open the container valve and then the adapter valve.

Open the low pressure valve to fill refrigerant in gas form.

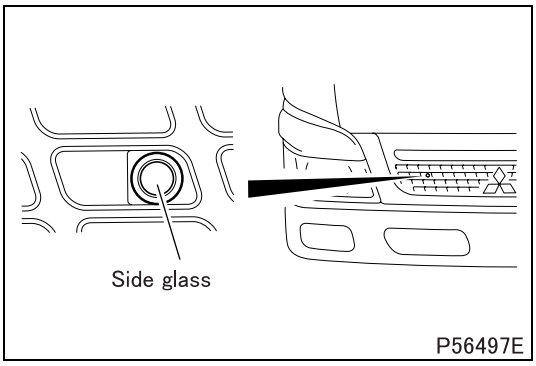
CAUTION ⚠

- **Filling refrigerant into the system in liquid form may damage the compressor. To prevent this, keep the refrigerant container in the upright position so that refrigerant is filled in gas form.**

When the refrigerant container is empty, close the adapter valve and install a new container. Continue filling the system.

When the air conditioning system is saturated, start the engine. Turn on the air conditioner to run the compressor, and continue recharging until the specified charge level is reached.

3. Checking Refrigerant Charge Level



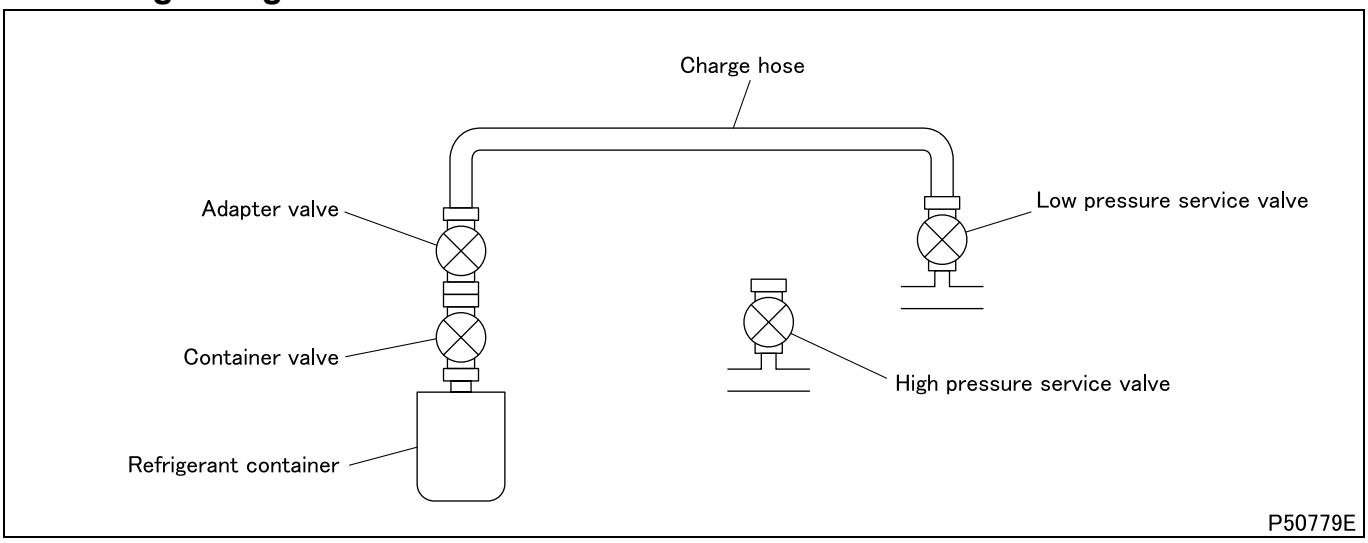
- To check the refrigerant charge level, observe the flow of refrigerant through the sight glass. If the visual inspection indicates a low charge level, add refrigerant.
- The visual check should be performed under the following conditions.
  - Engine speed: 1400 rpm
  - Air conditioner switch: ON
  - Fan speed control dial: 4 (MAX)
  - Temperature control dial: MAX COOL
  - Ventilation/recirculation changeover switch: Indicator lamp in the switch (OFF: Ventilation)
  - Doors: Fully open

CAUTION ⚠

- **Never run the air conditioner with no or low level of refrigerant. Failure to observe this will damage the compressor.**

	Normal level	Low level	No refrigerant
Sight glass	P06554 With a careful look, something like mist can be seen flowing.	 P06553 Air bubbles are seen flowing at all times. The refrigerant may be transparent or whitish.	 P06552 The refrigerant is almost transparent. Air bubbles may be seen flowing, but they disappear when the engine is revved up and down.
High/low pressure piping	The high pressure piping is hot while the low pressure piping is cold.	The high pressure piping is warm while the low pressure piping is slightly cold.	There is almost no difference in temperature between the high and low pressure piping.

4. Adding Refrigerant



- Add refrigerant in accordance with the following flow chart.

With the adapter valve closed, connect the charge hose to the low pressure service valve.

CAUTION ⚠

- **If the charge hose is connected to the high pressure service valve, refrigerant may flow back, possibly damaging the refrigerant container and charge hose.**

Open and close the adapter valve to bleed air of the charge hose.
After air bleeding is completed, close the adapter valve.

Take the refrigerant container and valve assembly. With the container valve closed, connect the assembly to the adapter valve.

CAUTION ⚠

- **Filling refrigerant into the system in liquid form may damage the compressor. To prevent this, keep the refrigerant container in the upright position so that refrigerant is filled in gas form.**

Open the container valve and then the adapter valve.

Start the engine.

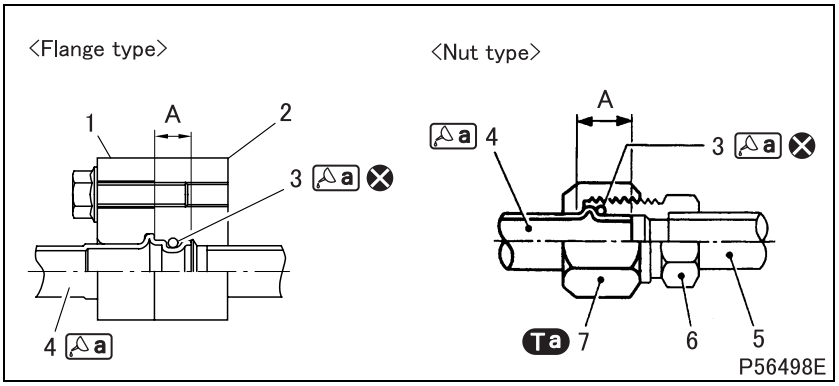
Set the temperature control to MAX COOL. Turn on the air conditioner to run the compressor.

Continue adding refrigerant while observing the sight glass for charge level.

When “normal level” is confirmed through the sight glass, add refrigerant further 50 g {1.76 oz}.

When charging is completed, close the adapter and container valves. Remove the charge hose and the refrigerant container from the low pressure service valve.

If there is still some refrigerant in the container, keep it for the next opportunity. Be sure to keep the container valve closed.



1 Flange (pipe end) <Flange type>
2 Flange (mating end) <Flange type>
3 O-ring
4 Pipe
5 Pipe <Nut type>
6 Union <Nut type>
7 Nut <Nut type>

A: Refrigerating machine oil application area
⊗: Non-reusable parts

Tightening torque (Unit: N·m {kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Nut	11.8 to 14.7 {1.2 to 1.5}	–

Lubricant and/or sealant

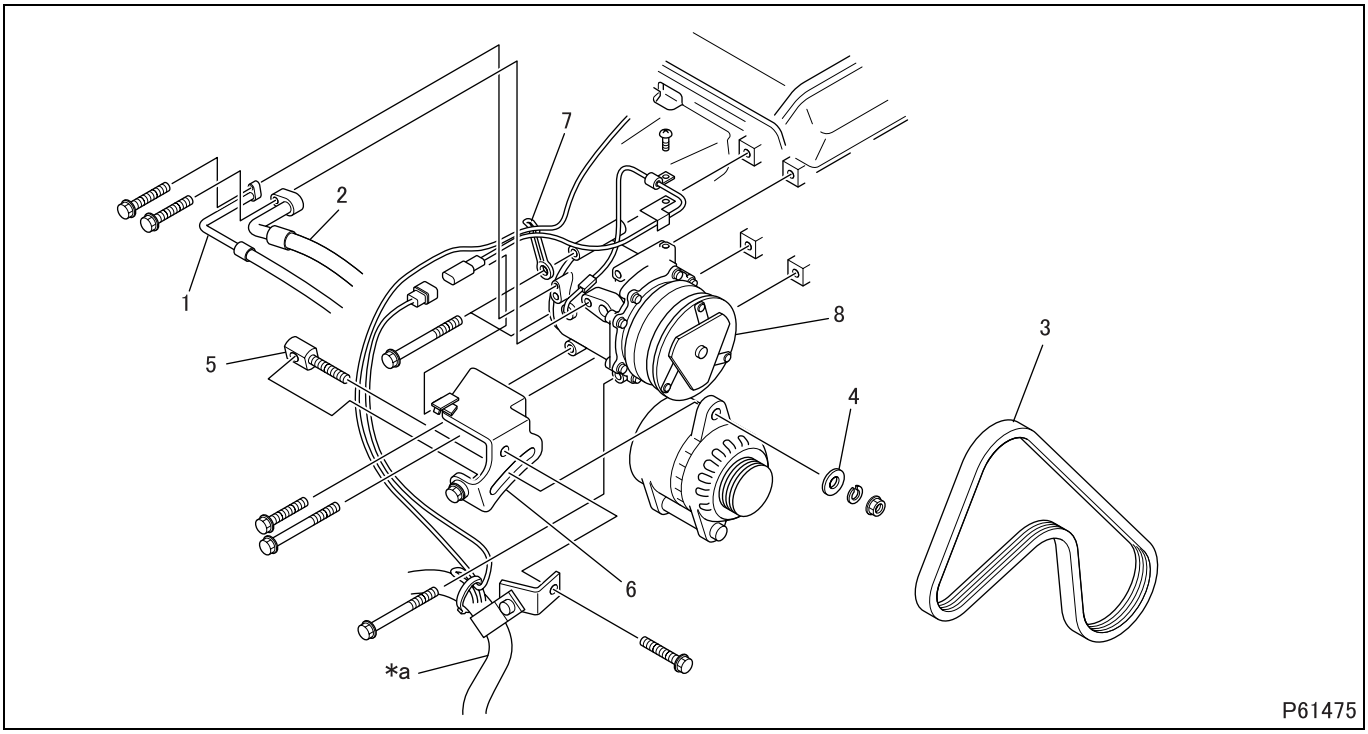
Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	O-ring	Refrigerating machine oil SUN PAG56	As required
	Outer periphery of pipe end (area A)		

- There are 2 types of air conditioner pipe/hose connections: flange type and nut type. When connecting/tightening the connections, observe the following precautions.

CAUTION ⚠

- **The connected parts are sealed by the O-ring. Be careful not to damage the O-ring, such as by twisting.**
- **The O-rings are exclusively designed for HFC-134a refrigerant and are not reusable. The O-rings are available at the MITSUBISHI HEAVY INDUSTRIES, LTD. service stations.**
- **Never tighten the nut-type connection by rotating the union. This will deform the piping, allowing refrigerant to leak out. Tighten by rotating the nut while holding the union in position.**

COMPRESSOR



● **Removal sequence**

1 Discharge hose (high pressure side)
2 Suction hose (low pressure side)
3 Belt
4 Spacer
5 Shaft
6 Adjusting plate
7 Clamp
8 Compressor

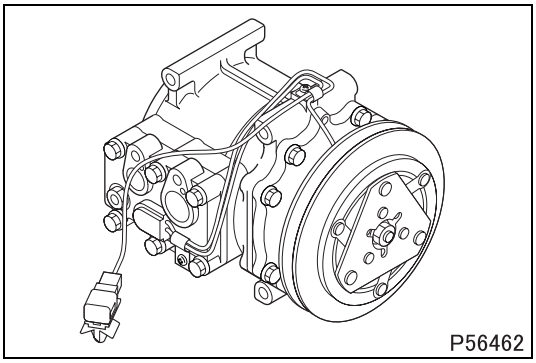
***a**: Vehicle harness

● **Installation sequence**

Follow the removal sequence in reverse.

- After installation, tension the belt to specification. (See Gr14.)
- See the CONNECTING AIR CONDITIONER PIPING section for the installation of hose.

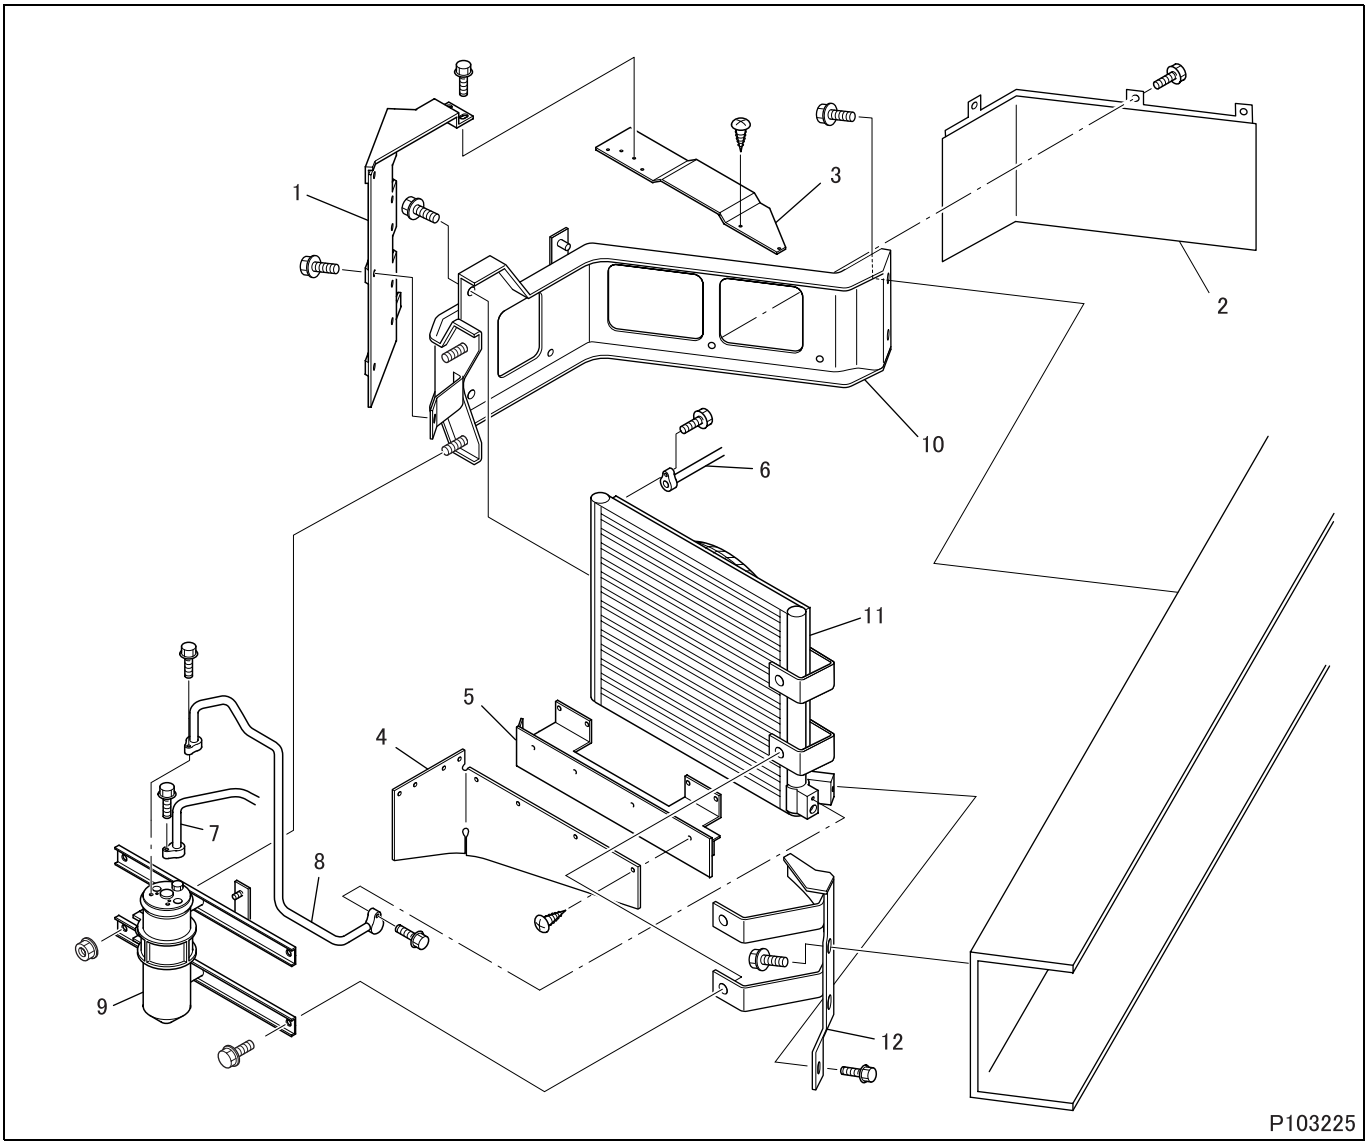
◆Inspection procedure◆



■ Inspection: Compressor

- Check the compressor proper for malfunction and oil leakage.
- If there is anything wrong with the compressor, replace it or have it overhauled at a nearest MITSUBISHI HEAVY INDUSTRIES, LTD. service station.

CONDENSER, RECEIVER



● **Removal sequence**

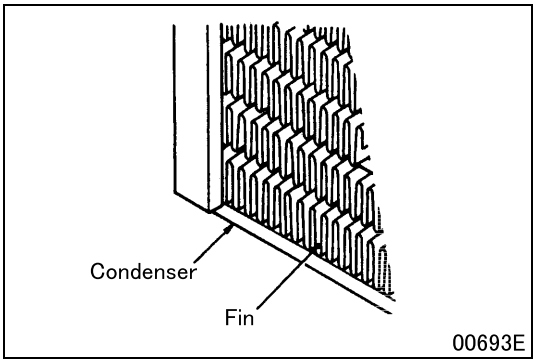
1 Baffle plate
2 Intercept plate
3 Baffle plate (upper)
4 Eva plate
5 Baffle plate (lower)
6 Discharge hose (compressor end)
7 Liquid hose (heater and cooling unit end)
8 Liquid pipe
9 Receiver
10 Condenser rear bracket
11 Condenser
12 Condenser front bracket

● **Installation sequence**

Follow the removal sequence in reverse.

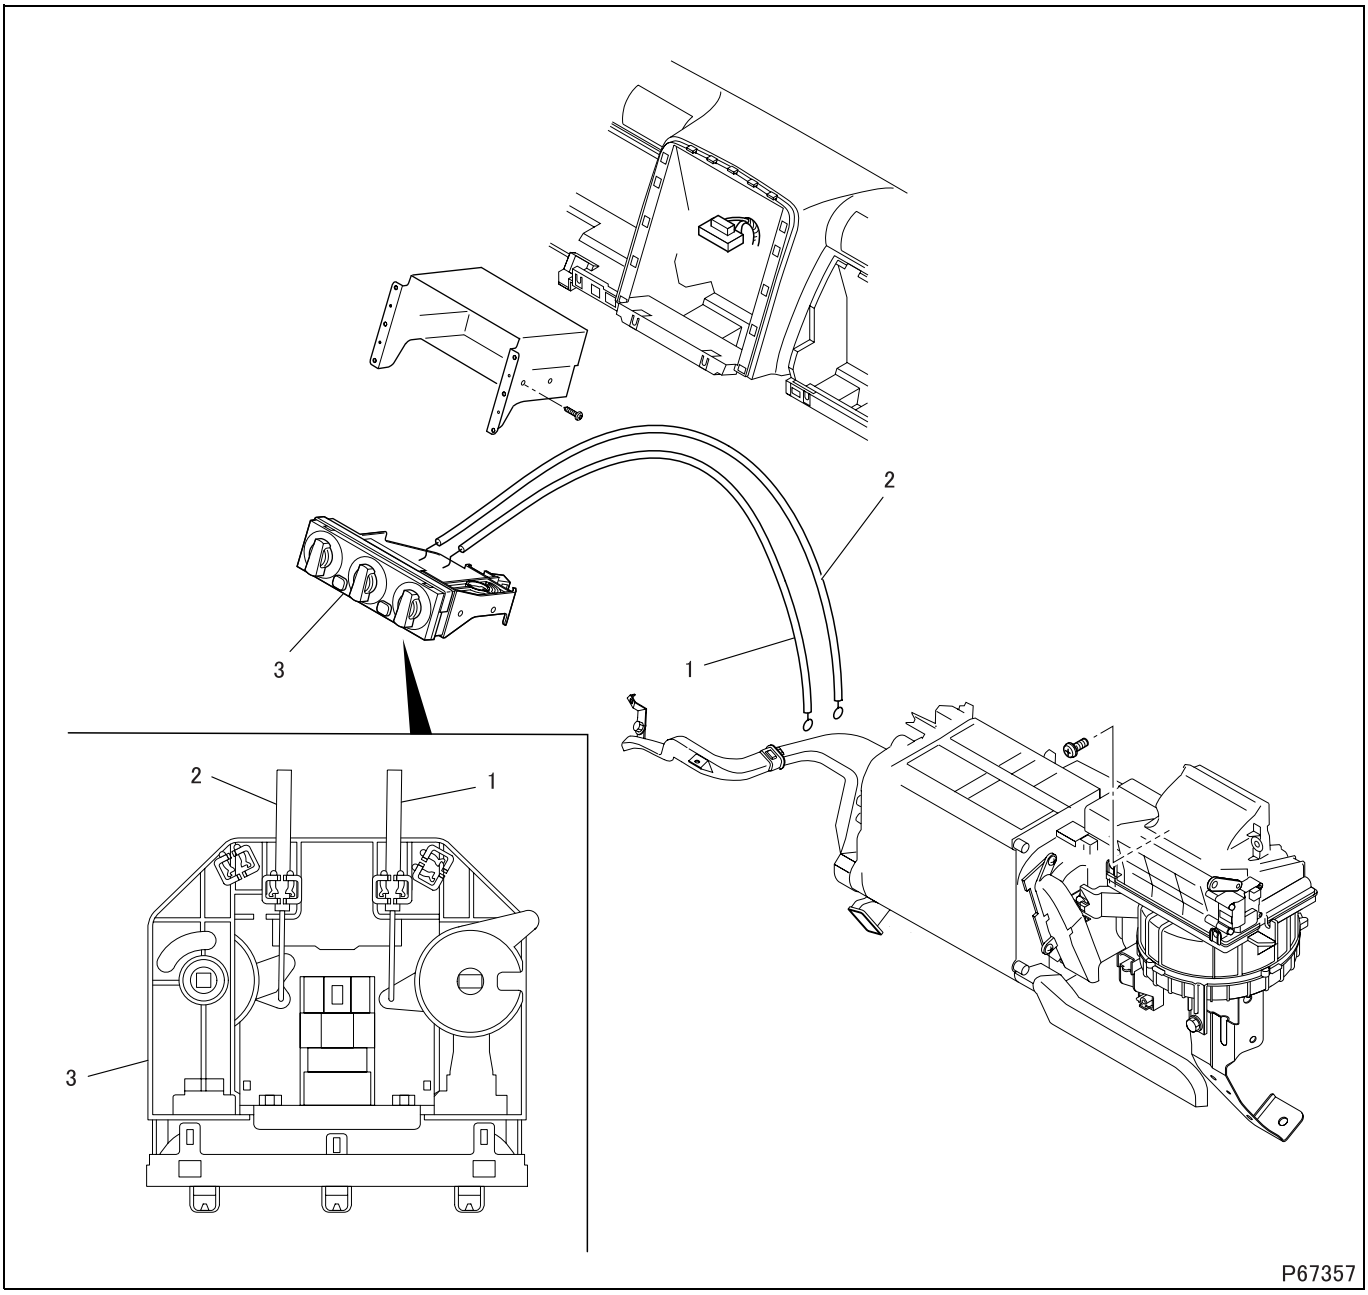
- See the CONNECTING AIR CONDITIONER PIPING section for the installation of hose and pipe.

◆Inspection procedure◆



■ Inspection: Condenser

- If the condenser fins are clogged with dirt, dust or other foreign matter, wash it out. Any deformed fins should be straightened using a spatula or the like.



● **Removal sequence**

1 Air mix control cable (BLACK)
2 Mode selection control cable (NATURAL)
3 Heater controls

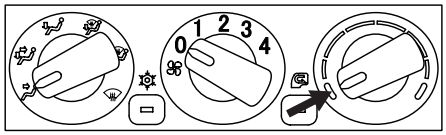
CAUTION ⚠

- **Never remove the cable(s) from the heater controls except when the control cable(s) needs to be replaced. Failure to observe this may damage the claws of the cable clip.**

● **Installation sequence**

Follow the removal sequence in reverse.

◆Work before removal◆

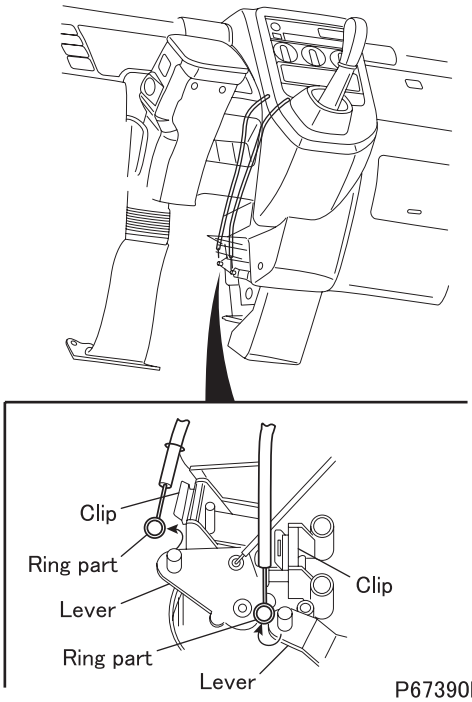


P65915

■ **Adjustment: Temperature control knob**

- Before disconnecting the control cables, turn the temperature control knob of the heater controls to the MAX-COOL position.

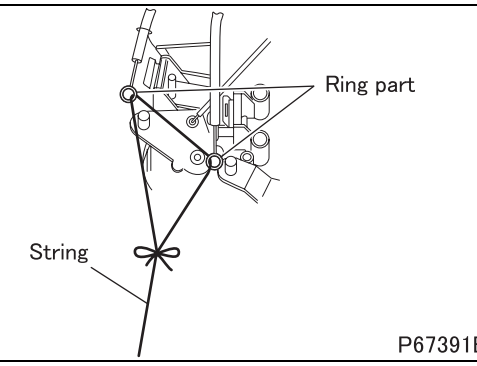
◆Removal procedure◆



P67390E

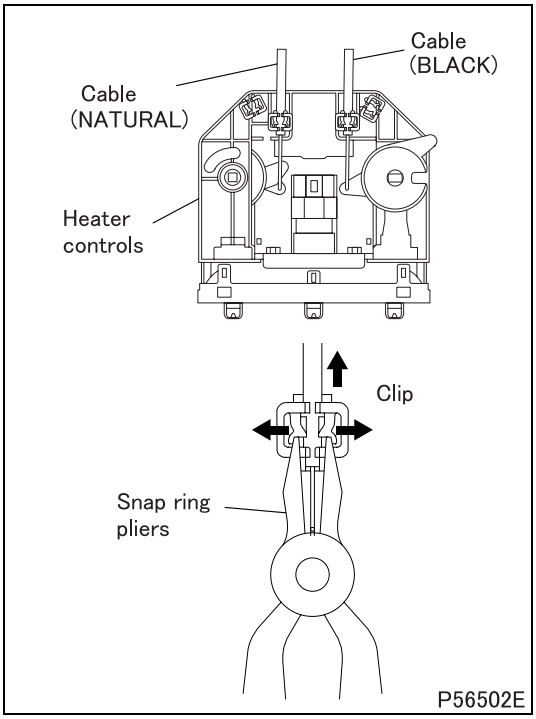
■ **Removal: Control cables**

- Before disconnecting the cables from the levers, put pairing marks on each cable and its lever.
- Disconnect the control cables from the heater unit.



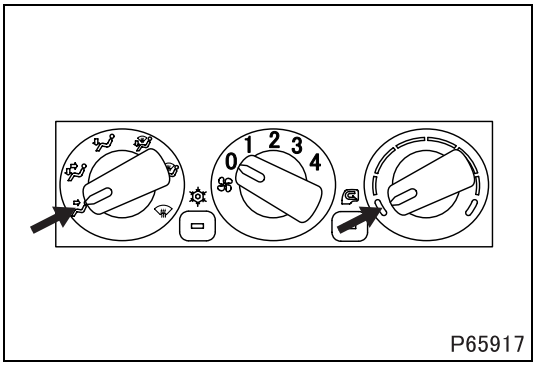
P67391E

- In order that the control cables can be pulled back at the time of installation, attach string to the ring parts of the cables as shown in the illustration.



- Remove the heater controls from the instrument panel.
- Use snap ring pliers to disconnect the cable(s) from the heater controls.

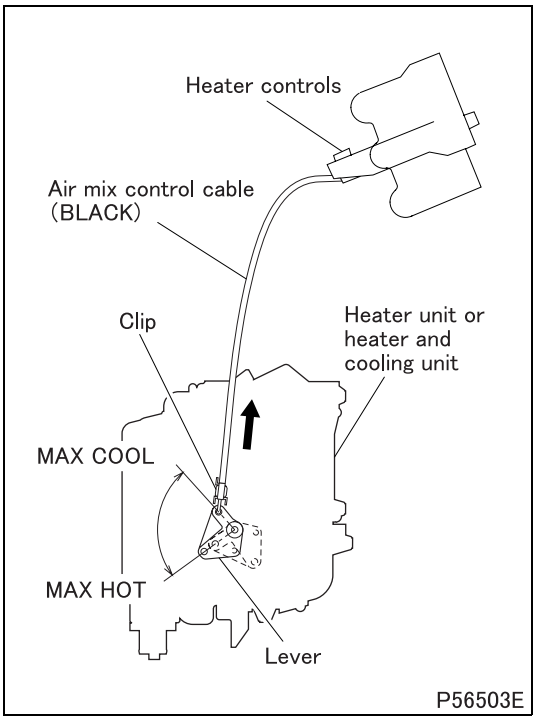
◆Work before installation◆



■Adjustment: Heater controls knobs

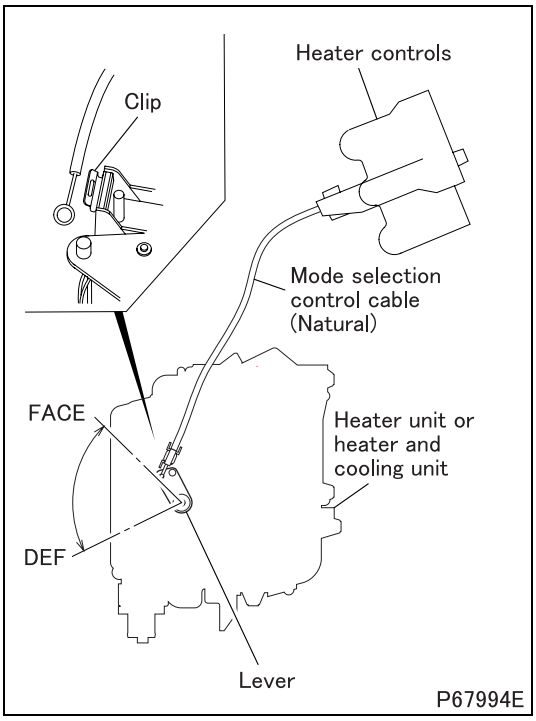
- At the heater controls, turn the temperature control knob to the MAX-COOL position and turn the mode selector knob to the face position before reconnecting the control cables.

◆Installation procedure◆



■ Installation: Air mix control cable

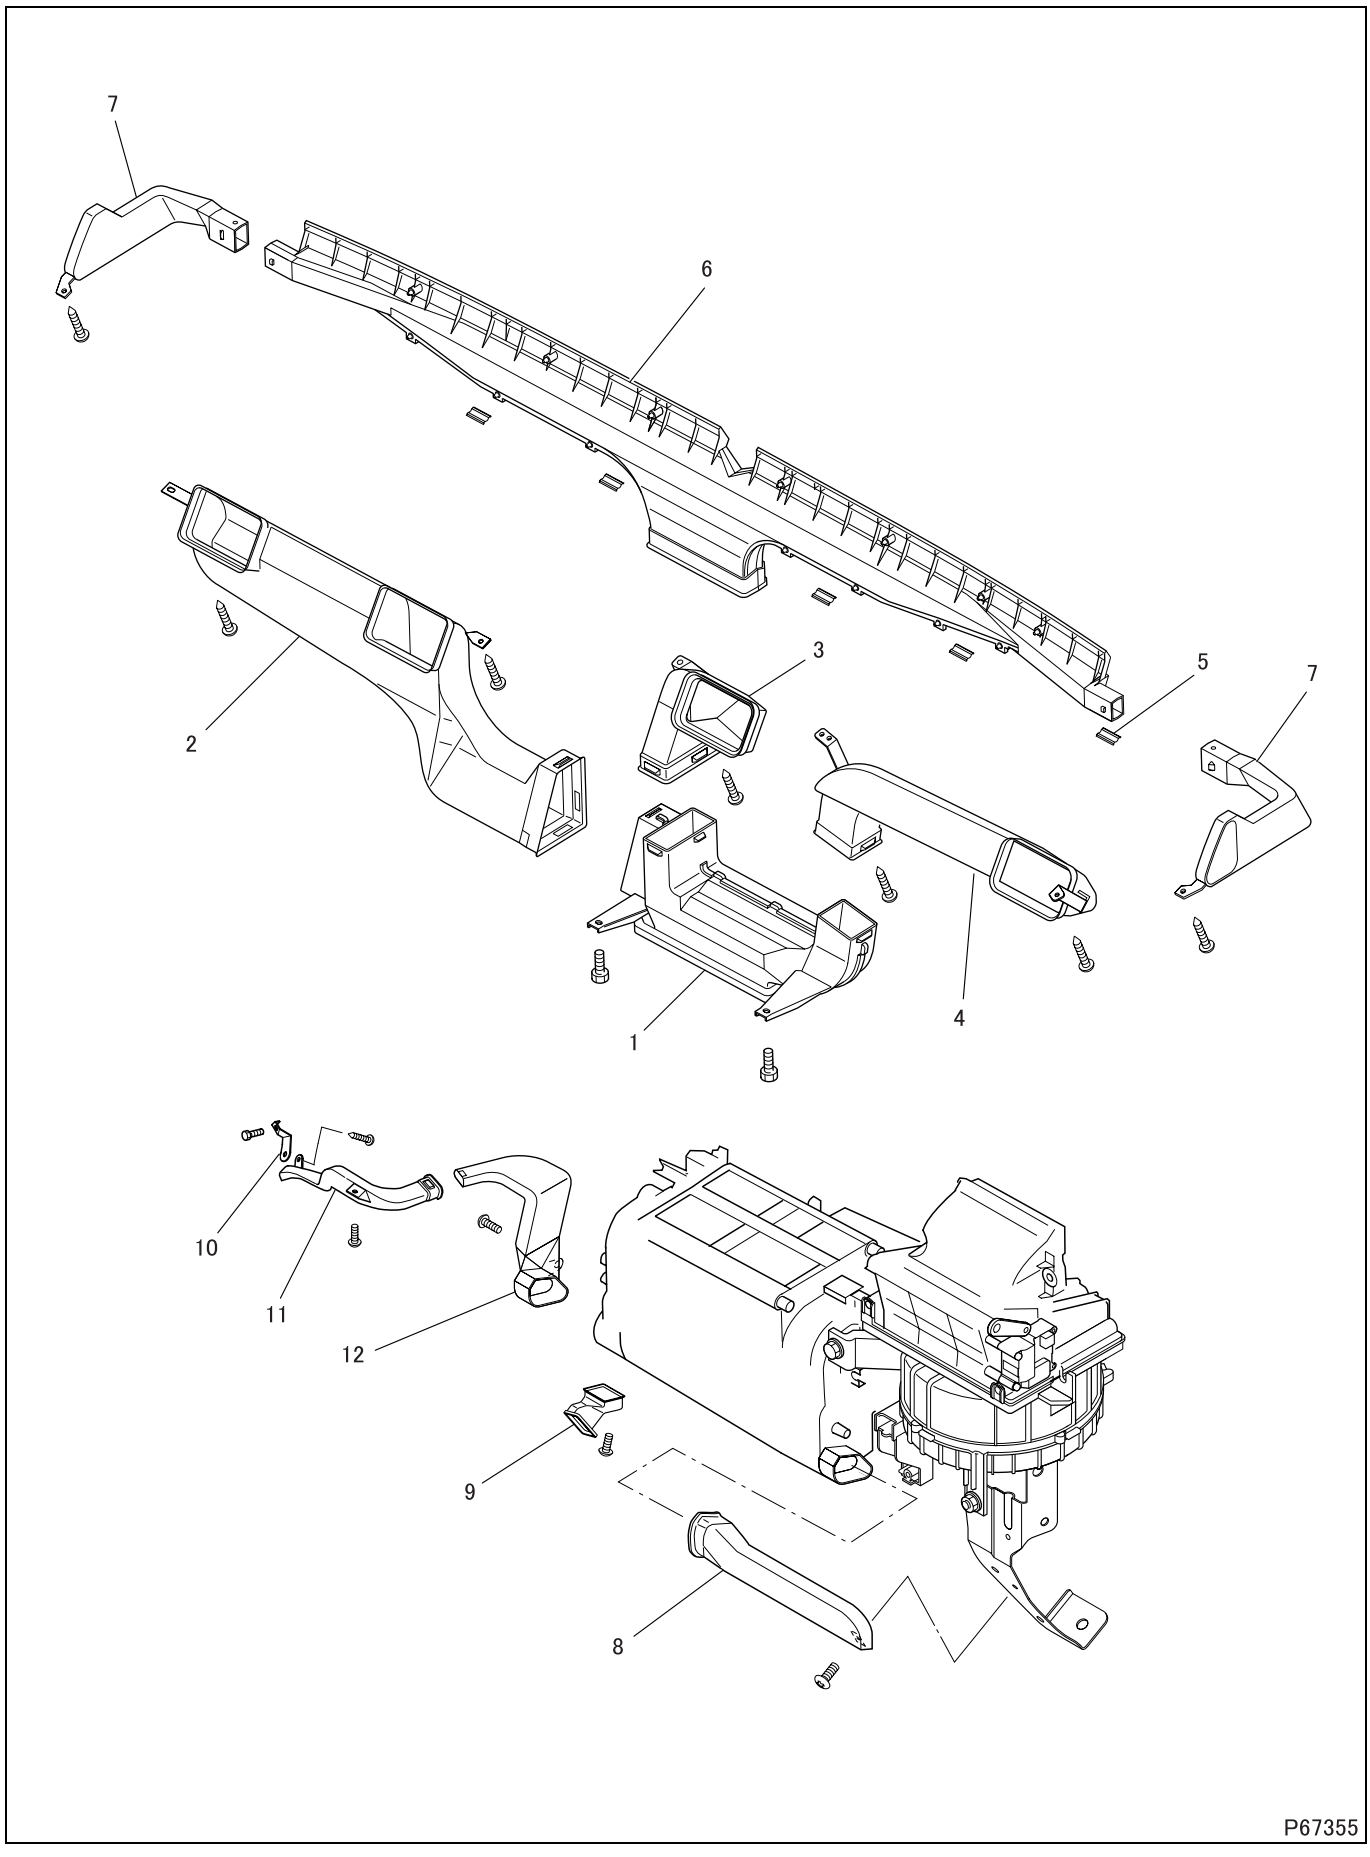
- Install one end of the air mix control cable to the heater control unit.
- Set the unit's temperature control dial to MAX COOL.
- Pull back the control cable using the string attached at the removal procedure.
- Install the other end of the air mix control cable to the lever on the heater unit or heater and cooling unit.
- With the air mix control cable connected to the lever, pull the cable in the direction of the arrow to move the lever to MAX COOL (upper) position. Clip the cable into the position.
- Move the temperature control knob to MAX COOL and MAX HOT. Make sure that the lever moves to the corresponding MAX COOL and MAX HOT positions. If not, repeat the above sequence to correctly install the cable. Also, make sure that the cable being installed is in the correct color.



■ Installation: Mode selection control cable

- Install one end of the mode selection control cable to the heater controls.
- Set the controls' mode control dial to FACE.
- Pull back the control cable using the string attached at the removal procedure.
- Install the other end of the mode selection control cable to the lever on the heater unit or heater and cooling unit.
- With the mode selection control cable connected to the lever, and push the cable into the clip.
- Move the mode control knob to FACE and DEF. Make sure that the lever moves to the corresponding FACE and DEF positions. If not, repeat the above sequence to correctly install the cable. Also, make sure that the cable being installed is in the correct color.

AIR DUCT



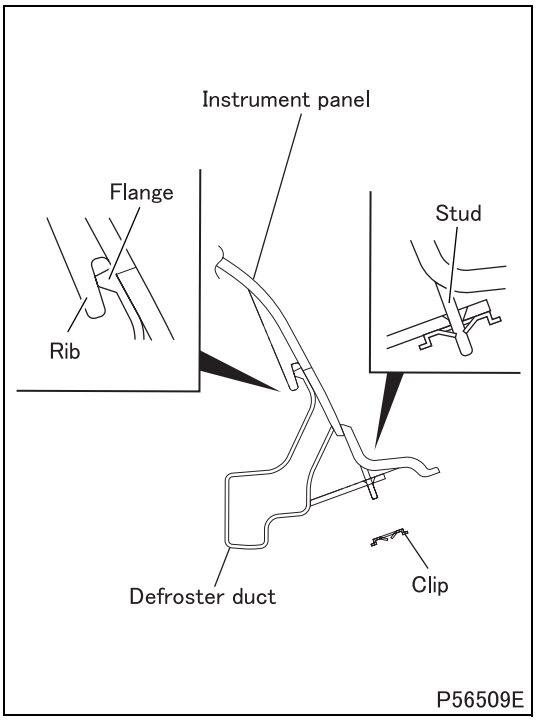
● Removal sequence

1 Center duct
2 Driver face duct
3 Center face duct
4 Passenger face duct
5 Clip (× 7)
6 Front defroster duct
7 Side defroster duct
8 Passenger foot duct
9 Center foot duct
10 Foot duct bracket
11 Driver foot duct B
12 Driver foot duct A

● Installation sequence

Follow the removal sequence in reverse.

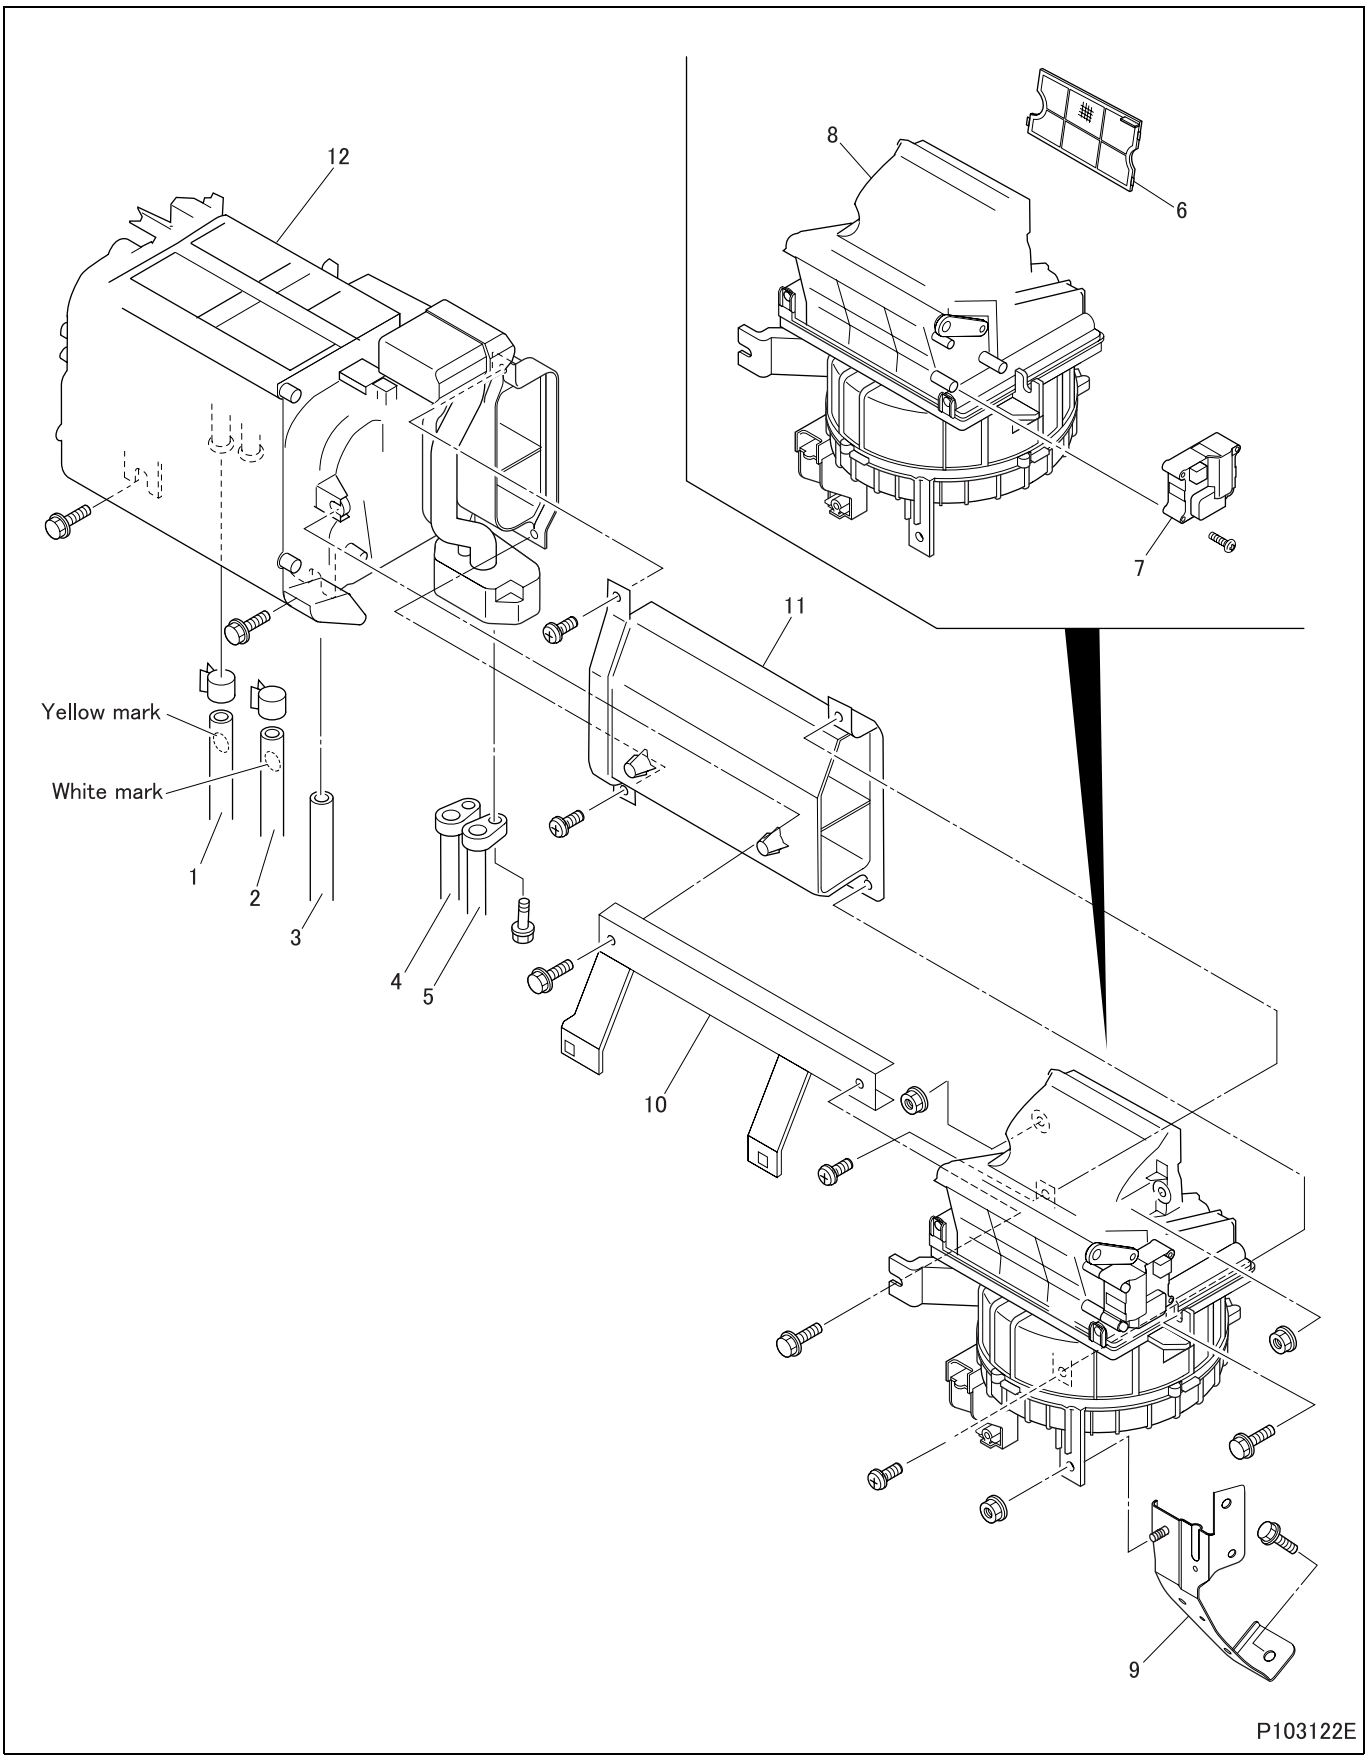
◆Installation procedure◆



■ **Installation: Front defroster duct**

- Insert the front defroster duct flanges into the instrument panel ribs.
- Insert the instrument panel studs into the front defroster duct holes and clip them together.

HEATER AND COOLING UNIT, BLOWER



● Removal sequence

1 Heater hose (outlet)
2 Heater hose (return)
3 Drain hose
4 Discharge hose (high pressure)
5 Suction hose (low pressure)
6 Air filter
7 Fresh/recirculation changeover motor
8 Blower
9 Bracket
10 Bracket
11 Joint duct
12 Heater and cooling unit (See later sections.)

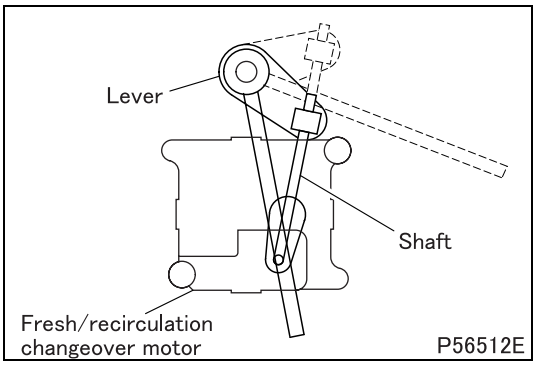
- Remove the front grill before removing hoses. (See Gr51.)
- Drain coolant out of the radiator when removing the heater hoses. (See Gr14.)

● Installation sequence

Follow the removal sequence in reverse.

- See the CONNECTING AIR CONDITIONER PIPING section for the installation of hose and pipe.

◆Installation procedure◆

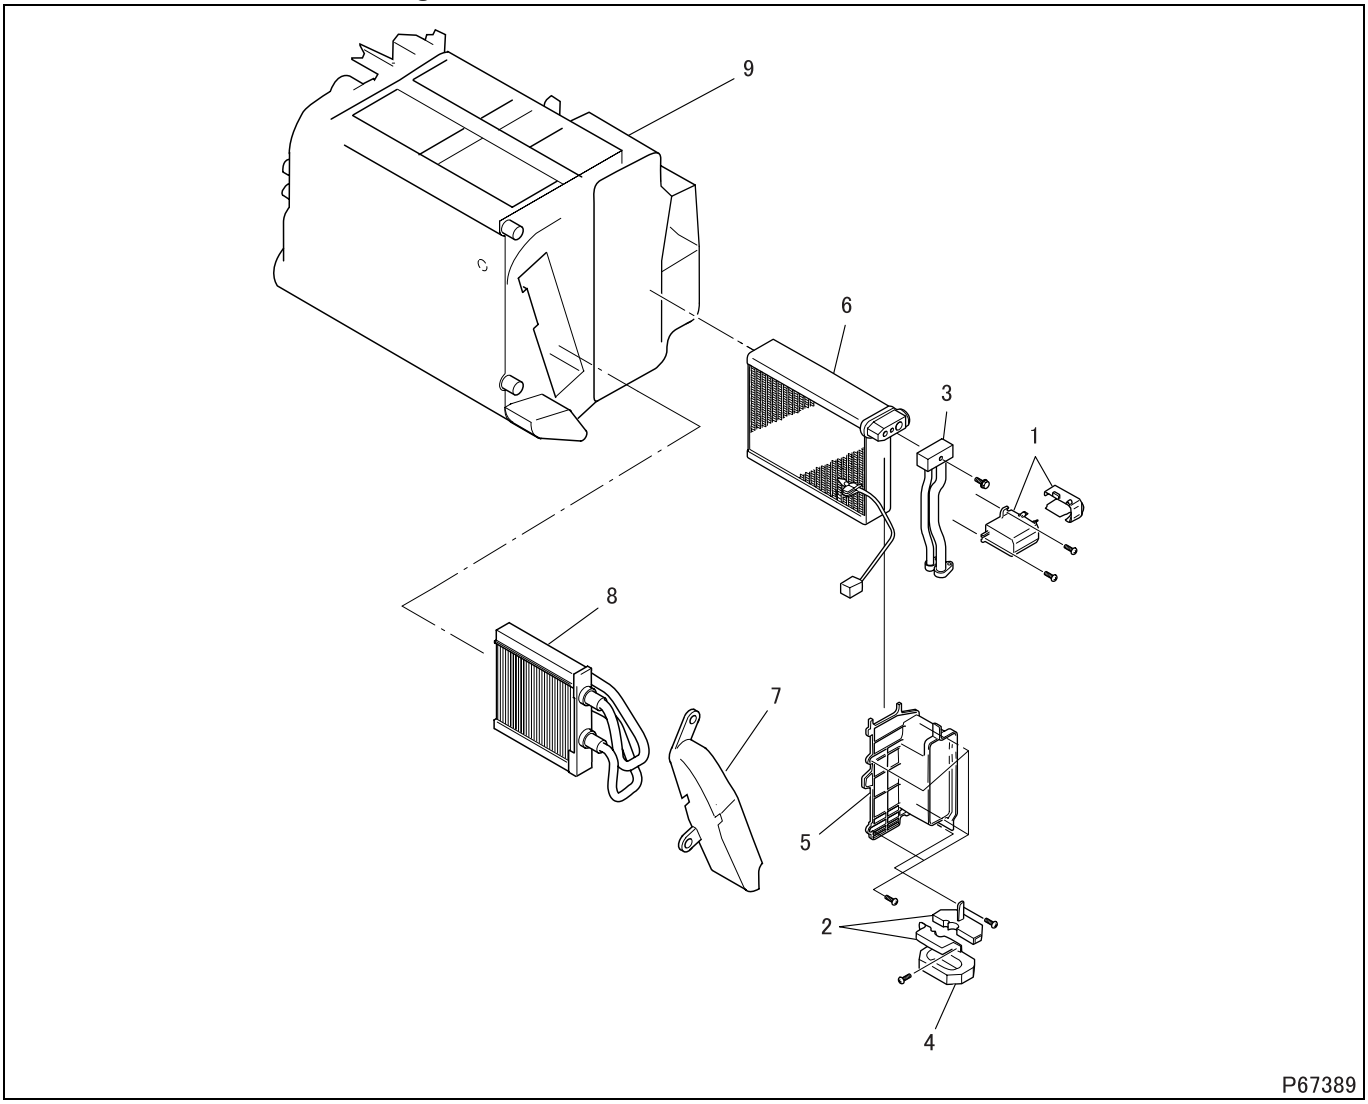


■ Installation: Fresh/recirculation changeover motor

- With the lever set to the “Ventilation” position, install the motor shaft through the lever.

HEATER AND COOLING UNIT, BLOWER

Heater Unit or Heater and Cooling Unit



● Disassembly sequence

1 Cover <A/C>
2 Baffle cover <A/C>
3 Pipe assembly <A/C>
4 Rubber insulation <A/C>
5 Case cover
6 Evaporator assembly <A/C>
7 Cover
8 Heater core
9 Heater and cooling unit case

<A/C>: With air conditioner

● Assembly sequence

Follow the disassembly sequence in reverse.

SERVICE MANUAL
2008 Model
FOREWORD

This Service Manual contains maintenance and repair methods for the Mitsubishi Fuso Truck FK. FM Series. Read this manual carefully as an aid in providing correct, efficient maintenance. Please note that the information and specifications contained within this manual may change without notice. This is due to product modifications and continued vehicle improvements that are made throughout the model years. Should you encounter any discrepancy in the information provided, please do not hesitate to contact your nearest Mitsubishi Fuso Dealer or Mitsubishi Fuso Truck of America, Inc.

HOW TO READ THIS MANUAL

This manual consists of the following parts:
- Specifications
- Structure and Operation
- Troubleshooting
- On-vehicle Inspection and Adjustment
- Service procedures

On-vehicle Inspection and Adjustment

- Procedures for inspection and adjustment of individual parts and assemblies as mounted on the vehicle are described including specific items to check and adjust. Specified or otherwise, inspection should be performed for looseness, play, backlash, crack, damage, etc.

Service procedure

- Procedures for servicing components and parts off the vehicle are described centering on key points in their removal, installation, disassembly, reassembly, inspection, etc.

Inspection

- Check items subject to acceptance or otherwise on the basis of service standards are all given.
- Some routine visual checks and cleaning of some reused parts are not described but must be always included in actual service work.

Caution

- This service manual contains important cautionary instructions and supplementary information under the following four headings which identify the nature of the instructions and information:

DANGER ⚠	Precautions that should be taken in handing potentially dangerous substances such as battery fluid and coolant additives.
WARNING ⚠	Precautionary instructions, which, if not observed, could result in serious injury or death.
CAUTION ⚠	Precautionary instructions, which, if not observed, could result in damage to or destruction of equipment or parts.
NOTE	Suggestions or supplementary information for more efficient use of equipment or a better understandings.

Terms and Units

● Front and rear

The forward running direction of the vehicle is the front and the reversing direction is the rear.

● Left and right

Left hand side and right hand side, when facing the forward running direction of the vehicle, are respectively left and right.

● Standard value

Standard value dimensions in designs indicating: the design dimensions of individual parts, the standard clearance between two parts when assembled, and the standard value for an assembly part, as the case may be.

● Limit

When the value of a part exceeds this, it is no longer serviceable in respect of performance and strength and must be replaced or repaired.

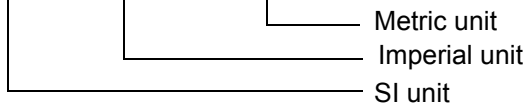
● Tightening torque

- Values are directly specified for out-of-standard tightening torques for bolts and nuts.
- Where there is no specified figure for tightening torque, follow the table covering standard tightening torques. (Values for standard tightening torques are based on thread size and material.)
- When the item is to be tightened in a wet state, “wet” is indicated. Where there is no indication, read it as dry.

● Units

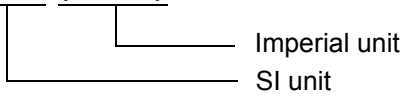
Tightening torques and other parameters are given in SI* units with imperial unit and metric units added in brackets { }.
*SI: Le Système International d’Unités

Example: 390 N·m {290 ft.lbs, 40 kgf·m}



Unit		SI unit {imperial unit, metric unit}	Conversion factor
Force		N {lbs, kgf}	9.80665 N {2.2046 lbs, 1 kgf}
Moment of force		N·m {ft.lbs, kgf·m}	9.80665 N·m {7.2329 ft.lbs, 1 kgf·m}
Pressure	Positive pressure	kPa {psi, kgf/cm^2}	98.0665 kPa {14.22 psi, 1 kgf/cm^2}
	Vacuum pressure	kPa {in.Hg, mmHg}	0.133322 kPa {0.03937 in.Hg, 1 mmHg}
Volume		J {BTU, kcal}	4186.05 J {3.96825BTU, 1 kcal}
Heat quantity		W {BTU/h, kcal/h}	1.16279W {3.96825BTU/h, 1 kcal/h}

Example: 30 mm {1.18 in.}

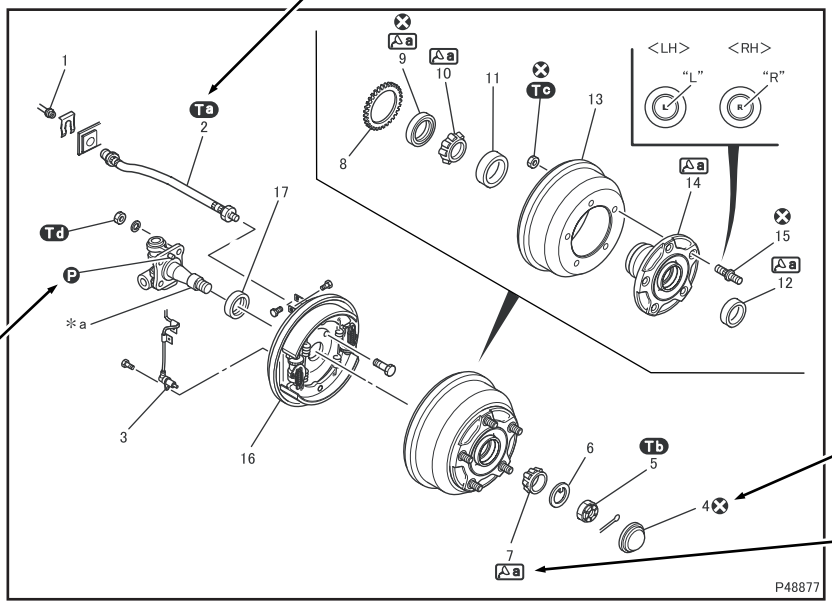


Unit	SI unit {imperial unit}	Conversion factor
Length	mm {in.}	1 mm {0.03937 in.}
	m {ft.}	1 m {3.2808 ft.}
	km {mile}	1 km {0.6214 mile}
Mass	kg {lb}	1 kg {2.2046 lb}
	g {oz}	1 g {0.035274 oz}
Temperature (in degree Celsius)	°C {°F}	1°C {(1°C × 1.8 + 32) °F}
Velocity	km/h {mph}	1 km/h {0.6214 mph}
	m/s {ft/s}	1 m/s {3.281 ft/s}
Volume	L {qts}, L {gal}	1 L {1.05336 qts}, 1 L {0.2642 gal}
	cm^3 {cu.in.}	1 cm^3 {0.061023 cu.in.}
Area	m^2 {in^2}, m^2 {ft^2}	1 m^2 {1.550 × 10^3 in^2}, 1 m^2 {1.076 × 10 ft^2}

Symbol	Denotation	Application	Remarks
Ta	Tightening torque	Parts not tightened to standard torques (standard torques specified where necessary for servicing)	Specified values shown in table See Table of Standard Tightening Torques for parts for which no tightening torques are specified.
P	Locating pin	Parts to be positioned for installation	
⊗	Non-reusable parts	Parts not to be reused	
a	Lubricant and/or sealant	Parts to be coated with lubricant or sealant for assembly or installation	Necessary lubricant and/or sealant, quantity required, etc. are specified in table.
a	Special tool	Parts for which special tools are required for service operation	Tool name/shape and part number are shown in table.
*a	Associated part	Parts associated with those removed/disassembled for servicing	

Denotes that tightening torque is specified.

WHEEL HUB AND BRAKE DRUM



Indicates position of locating pin.

Identifies non-reusable parts.

Denotes that coating with lubricant or sealant is required.

● Disassembly sequence

1 Brake pipe
2 Brake hose
3 Wheel speed sensor
4 Hub cap
5 Lock nut
6 Lock washer
7 Outer bearing inner race
8 Anti-lock brake system rotor
9 Oil seal
10 Inner bearing inner race
11 Inner bearing outer race
12 Outer bearing outer race
13 Brake drum
14 Wheel hub
15 Hub bolt
16 Front drum brake (See Gr.35A)
17 Spacer

*a: Knuckle
P: Locating pin
⊗: Non-reusable parts

● Assembly sequence

Follow the disassembly sequence in reverse.

Service standards (unit: mm {in.})

Location	Maintenance item		Standard value	Limit	Remedy
7, 10, 11, 12	Starting torque of wheel hub bearing (Tangential force at hub bolt position with oil seal fitted in)		1 to 3.5 N·m {0.7 to 2.6 ft.lbs, 0.10 to 0.35 kgf·m} (Tangential force:8.8 to 28.4 N {2.0 to 6.4 lbs, 0.9 to 2.9 kgf})	–	Adjust or replace
14	Brake drum	Inside diameter	320 {12.6}	322 {12.7}	Repair or replace
		Cylindricality	0.05 {0.0020}	0.05 {0.0079}	

These location numbers correspond with disassembly sequence numbers.

P58289N

"Wet" is indicated when part is to be tightened with oil or grease applied to its threaded part.

Tightening torque (unit: N·m {ft.lbs, kgf·m})

Mark	Part to be tightened	Tightening torque	Remarks
Ta	Brake force tightening	13 to 17 {9.6 to 13, 1.3 to 1.7}	–
Tb	Lock nut	113 ± 15 {83 ± 11, 11.5 ± 1.5}	Wet
Tc	Nut (brake drum and wheel hub mounting)	343 ± 39 {250 ± 29, 35 ± 4}	–
Td	Nut (front drum brake mounting)	118 ± 20 {87 ± 15, 12 ± 2}	–

Lubricant and/or sealant

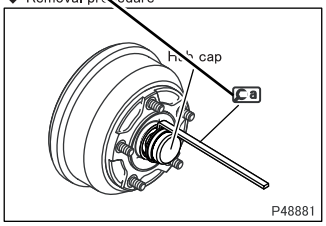
Mark	Point of application	Specified lubricant and/or sealant	Quantity
Sa	Between rolls of outer bearing inner race and inner bearing inner race	Mitsubishi wheel bearing grease	As required
	Inside wheel hub		395 ± 40 g {13.9 ± 1.41 oz}

Special tools (unit: mm {in.})

Mark	Tool name and shape	Part No.	Application
Ca	Hub Cap Wrench A: 0.5°, B: 78°  P49261	MB999108	Removal of hub cap
Cb	Oil Seal Installer A: ϕ84 {3.31}, B: ϕ70 {2.76}  05619	MB999097	Installation of oil seal

Identification marks for special tools are the same as used in the text.

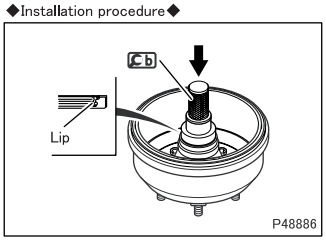
◆ Removal procedure



P48881

■Removal: Hub cap

◆Installation procedure◆



P48886

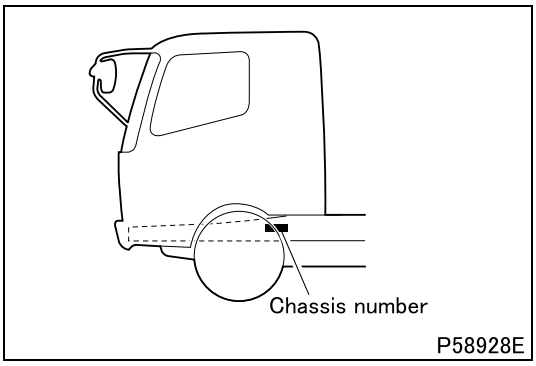
■Installation: Oil seal

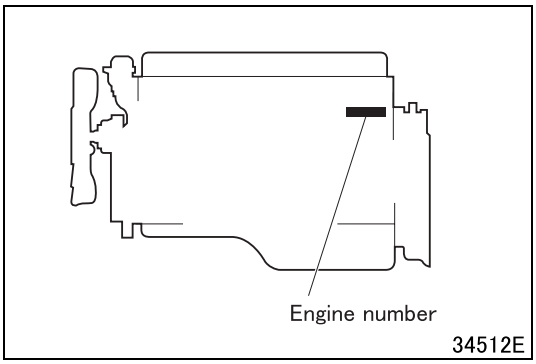
Apply grease to the lip of the oil seal, then fit the oil seal onto the wheel huh in the illustrated direction.

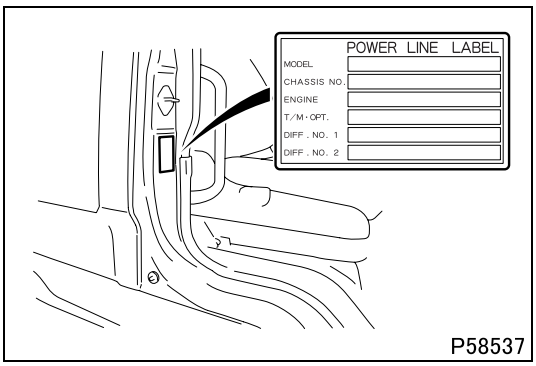
P58290N

CHASSIS NUMBER, ENGINE NUMBER, POWER TRAIN LABEL

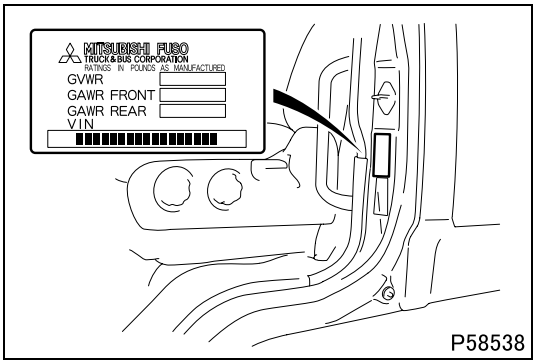
- Chassis and engine numbers are allocated to each vehicle and engine respectively in the order of production. These numbers are required at vehicle inspection for registration.







- Power train label located in the position illustrated indicates the vehicle model, chassis number and information relevant to the vehicle's power train components.



- The vehicle identification number is punch-marked on the plate, which is attached in the position as illustrated.
  The vehicle identification number consists of a 17-digit set of alphanumeric characters. Each digit represents the following specifications.

J L 6 D F F 1 E ■ 9 K ■■■■■■

(1) (2) (3) (4) (5) (6) (7) (8) (9) (10) (11) (12)

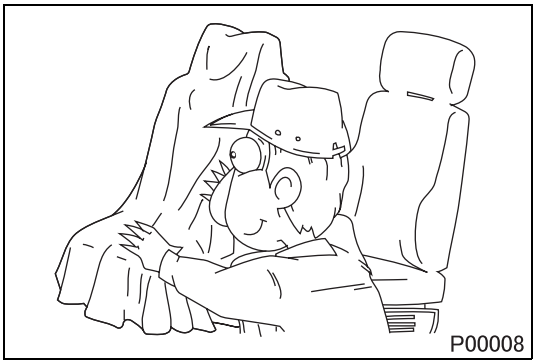
(1)	Country	J: Japan
(2)	Make	L: Mitsubishi Fuso
(3)	Type	6: Incomplete vehicle
(4)	Gross vehicle weight / Brake system	
		D: 19,501 to 26,000 lbs. / Air over hydraulic
		F: 26,001 to 33,000 lbs. / Full air
		H: 19,501 to 26,000 lbs. / Full air
(5)	Line	F: FK61F
		J: FM65F
		K: FK62F
		L: FK65F
(6)	Series (Wheel base)	F: 3.5 to 3.79 m (11.48 to 12.43 ft.)
		J: 4.4 to 4.69 m (14.43 to 15.38 ft.)
		K: 4.7 to 4.99 m (15.41 to 16.37 ft.)
		L: 5.0 to 5.29 m (16.40 to 17.35 ft.)
		M: 5.3 to 5.59 m (17.38 to 18.33 ft.)
		P: 5.9 to 6.19 m (19.35 to 20.30 ft.)
		S: 6.2 to 6.59 m (20.34 to 21.62 ft.)
(7)	Cab chassis type	1: Chassis cab
(8)	Engine	E: 7.545 L Diesel turbo charged and charge air cooled
(9)	Check digit	
(10)	Model year	9: 2009
(11)	Plant	K: Kawasaki
(12)	Plant sequential No.	

PRECAUTIONS FOR MAINTENANCE OPERATION

DANGER ⚠

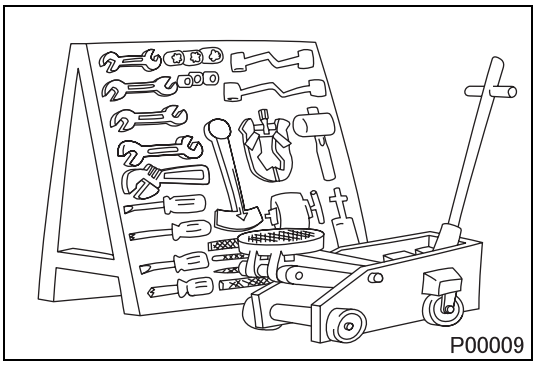
- **This product contains or emits chemicals known to the State of California to cause cancer and birth defects or other reproductive harm.**

- Before performing service operations, inquire into the customer's complaints and ascertain the condition by checking the total distance traveled, the conditions under which the vehicle is operated, and other relevant factors on the vehicle. And note the necessary information. This information will help you to service the vehicle efficiently.
- Check the location of the fault, and identify its cause. Based on your findings, determine whether parts must be removed or disassembled. Then, follow the service procedure given in this manual.



P00008

- Perform service operations on a level surface. Before starting, take the following preparatory steps:
  - To prevent soiling and damage, place covers over the seats, trim and floor in the cab and over the paintwork of the body.

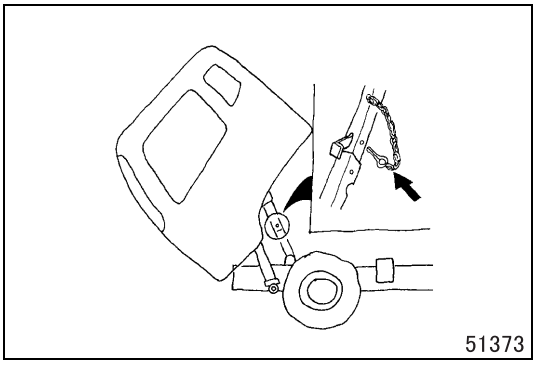


P00009

- Prepare all the general and special tools necessary for the job.

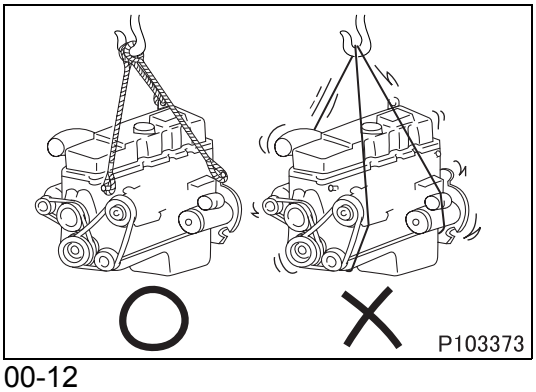
WARNING ⚠

- **Special tools must be used wherever specified in this manual. Do not attempt to use other tools since they could cause injuries and/or vehicle damage.**



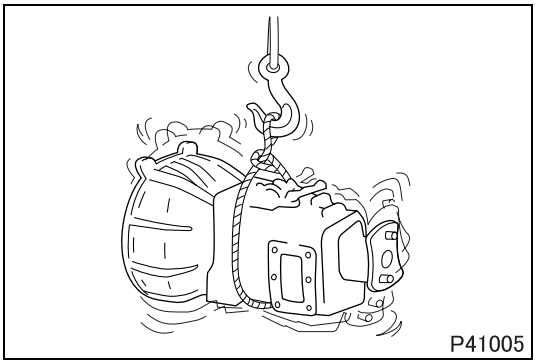
51373

- After manually tilting the cab, be sure to fit the safety pin into the hole to secure the cab stay in a rigid state.

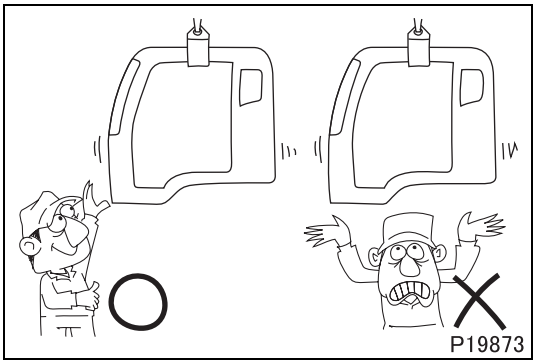


P103373

- Take extreme care when removing/installing heavy items such as engine, transmission and axle. When lifting heavy items using a cable etc., observe the following precautions.
  - Identify the mass of the item being lifted. Use the cable that is strong enough to support the mass.

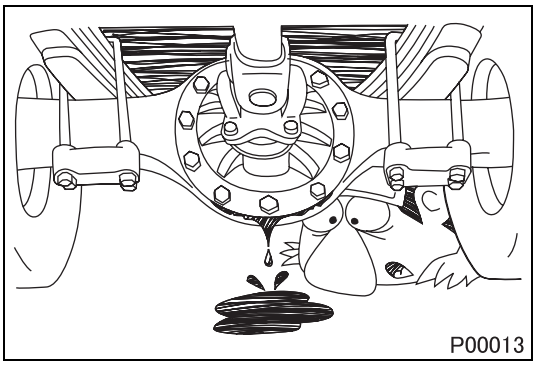


- If lifting eyes are not provided on the item being lifted, tie a cable around the item taking into account the item's center of gravity.

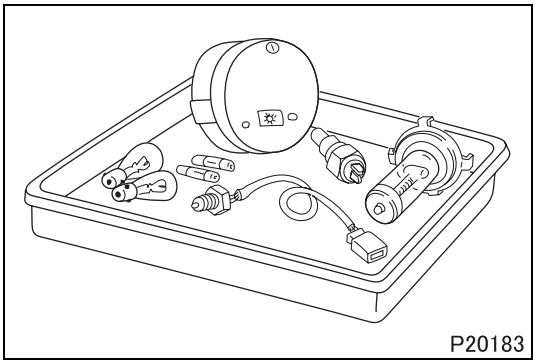


- Do not allow anyone to pass or stay under a lifted item which may possibly fall.

- Never work in shoes that have oily soles.
  When working with a partner or in a group, use pre-arranged signals and pay constant attention to safety. Be careful not to touch switches and levers unintentionally.

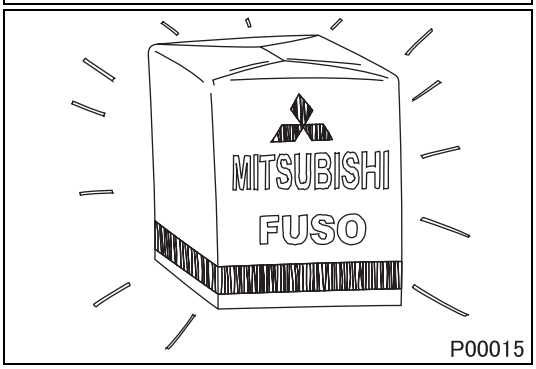


- Inspect for oil leakage etc. before washing the vehicle. If the order is reversed, any oil leakage or fault that may exist could go unnoticed during inspection.



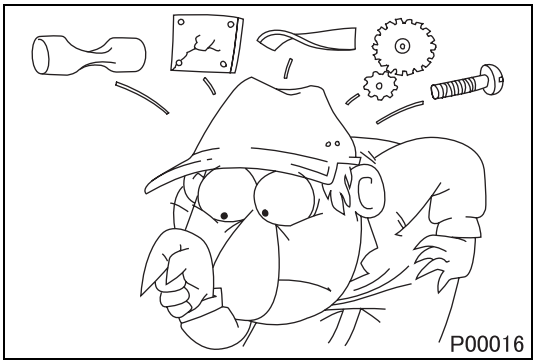
P20183

- Prepare replacement parts ready for installation.



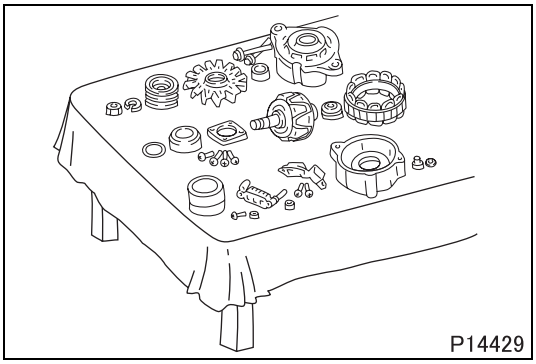
P00015

- Oil seals, packings, O-rings and other rubber parts, gaskets, and split pins must be replaced with new ones after removal. Use only genuine MITSUBISHI replacement parts.



P00016

- When disassembling parts, visually check them for wear, cracks, damage, deformation, deterioration, rust, corrosion, defective rotation, fatigue, clogging and any other possible defect.

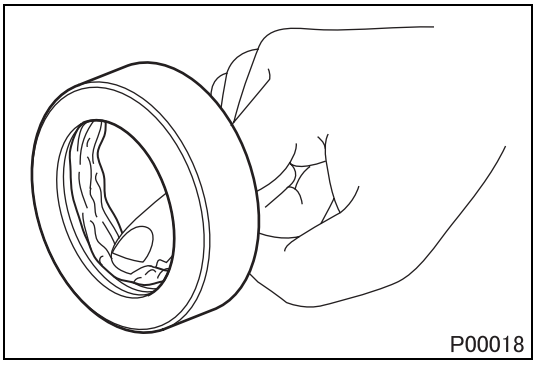


P14429

- To facilitate correct reassembly of parts, make alignment marks on them before disassembly and arrange disassembled parts neatly. Make punch marks and other alignment marks where they will not detract from parts' functionality and appearance.
- After removing parts from the vehicle, cover the area to keep it free of dust.

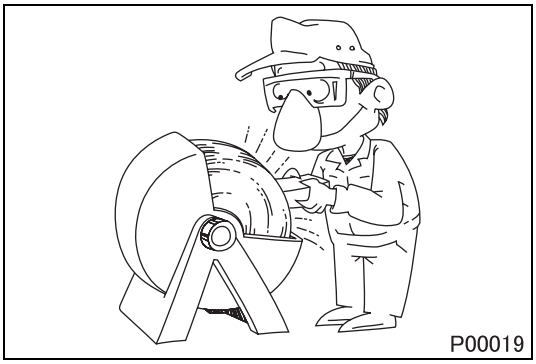
CAUTION ⚠

- **Be careful not to mix up identical parts, similar parts and parts that have left/right alignments.**
- **Keep new replacement parts and original (removed) parts separately.**



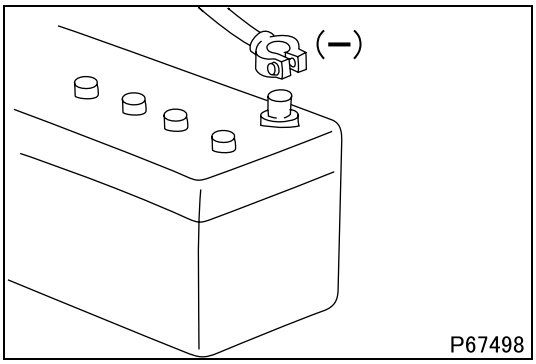
P00018

- Apply the specified oil or grease to U-seals, oil seals, dust seals and bearings before reassembly.
- Always use the specified oils and greases when performing inspection or replacement. Immediately wipe away any excess oil or grease with a rag.



P00019

- Wear safety goggles when using a grinder or welder. Wear gloves when necessary, and watch out for sharp edges and other items that might wound your hands.

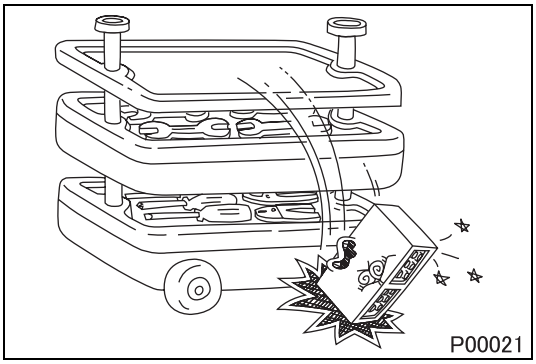


P67498

- Before working on the electrical system, disconnect the battery (–) terminal to prevent short circuits.

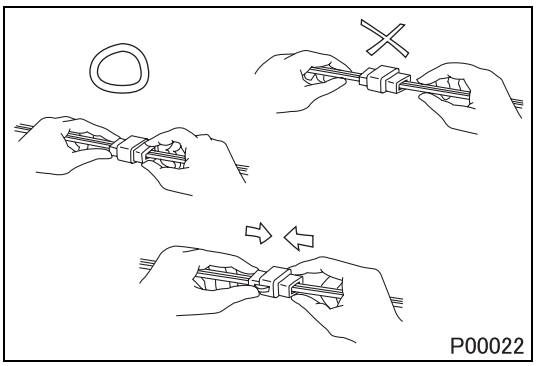
CAUTION ⚠

- **Make sure the starter switch and lighting switches are OFF before disconnecting or connecting battery cable. Semiconductor components may otherwise be damaged.**



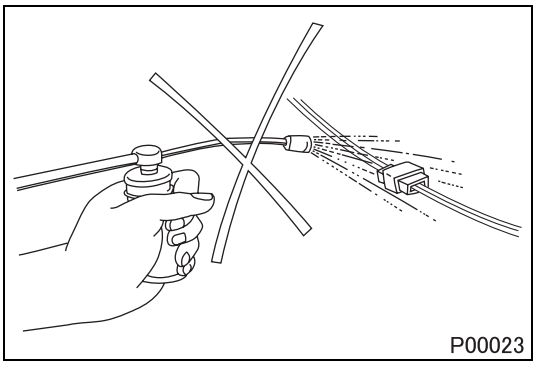
P00021

- Carefully handle sensors relays, and other items that are sensitive to shock and heat. Do not remove or paint the cover of any control unit.



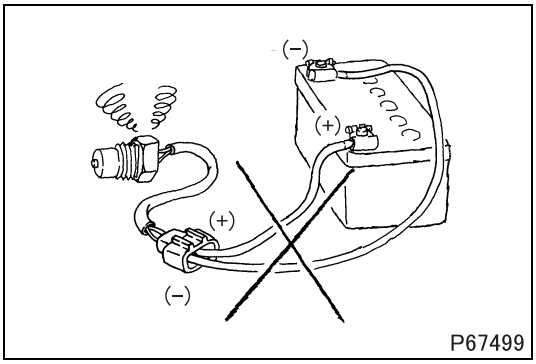
P00022

- When separating connectors, grasp the connectors themselves rather than the harnesses.
- To separate locking connectors, first push them in the direction of the arrows. To reconnect locking connectors, push them together until they click.



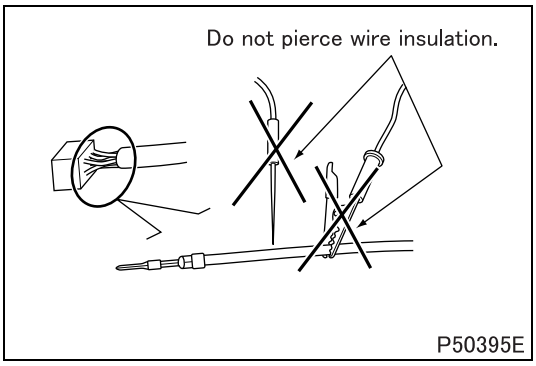
P00023

- Before washing the vehicle, cover electrical parts to keep them dry. (Use plastic sheets or the like.) Keep water away from harness connectors and sensors and immediately wipe off any water that gets on them.



- When applying a voltage to a part for inspection purposes, check that the (+) and (–) cables are connected properly then gradually increase the voltage from zero. Do not exceed the specified voltage.
  Remember that control units and sensors do not necessarily operate on the battery voltage.

1. Handling Precautions for Electric Circuits



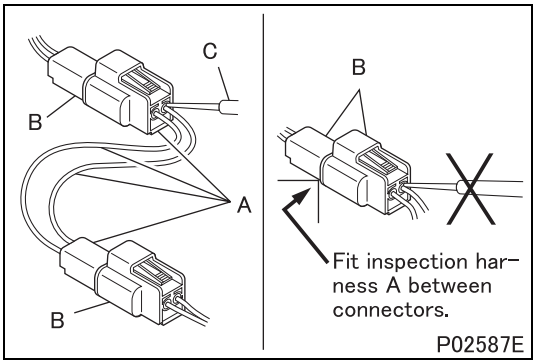
CAUTION ⚠

- **Do not pierce wire insulation with test probes or alligator clips when performing electrical inspections. Doing so can, particularly with the chassis harness, hasten corrosion.**

1.1 Inspection of harnesses

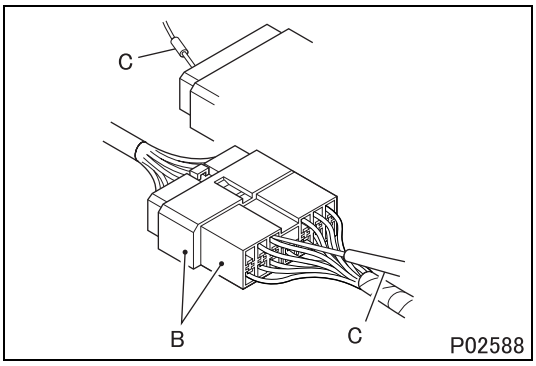
(1) Inspections with connectors fitted together

(1.1) Waterproof connectors

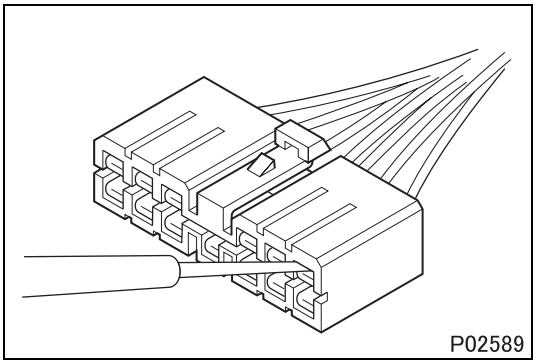


- Connect an inspection harness and connector A between the connectors B of the circuit to be inspected. Perform the inspection by applying a test probe C to the connectors of the inspection harness. Do not insert the test probe C into the wire-entry sides of the waterproof connectors since this would damage their waterproof seals and lead to rust.

(1.2) Non-waterproof connectors



- Perform the inspection by inserting a test probe C into the wire-entry sides of the connectors. An extra-narrow probe is required for control unit connectors, which are smaller than other types of connector. Do not force a regular-size probe into control unit connectors since this would cause damage.

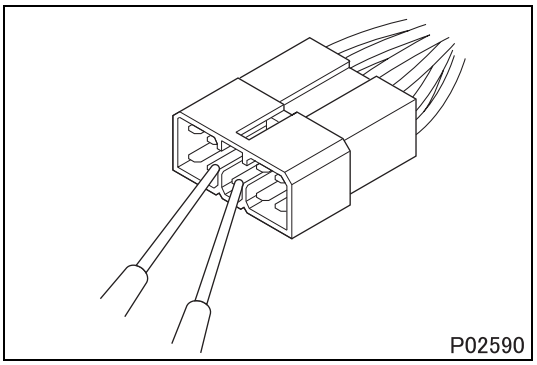


P02589

(2) Inspections with connectors separated

(2.1) Inspections on female terminals

- Perform the inspection by carefully inserting a test probe into the terminals. Do not force the test probe into the terminals since this could deform them and cause poor connections.



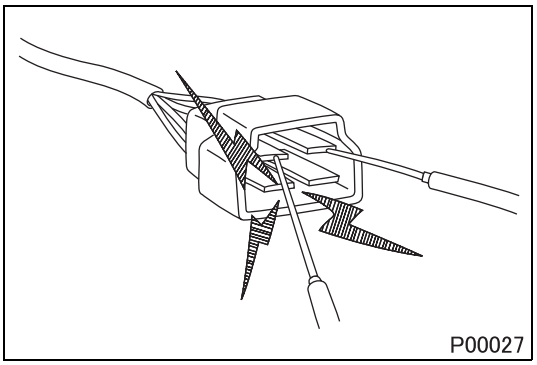
P02590

(2.2) Inspections on male terminals

- Perform the inspection by applying test probes directly to the pins.

CAUTION ⚠

- **Be careful not to short-circuit pins together with the test probes. With control unit connectors, short-circuiting of pins can cause damage to the control unit's internal circuitry.**

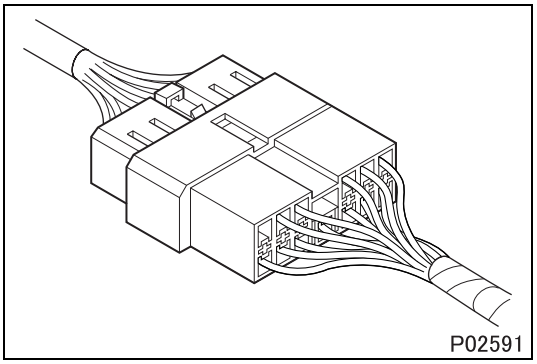


P00027

- When using a multimeter to check continuity, do not allow the test probes to touch the wrong terminals.

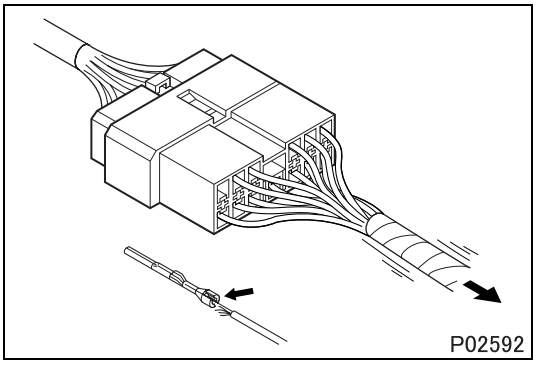
1.2 Inspection of connectors

(1) Visual inspection



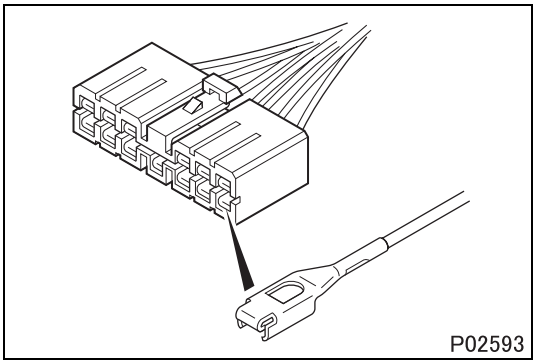
P02591

- Check that the connectors are fitted together securely.



P02592

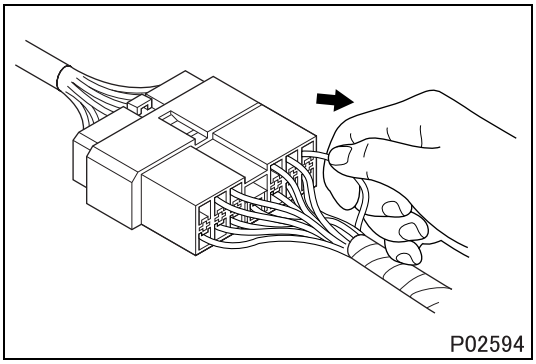
- Check whether wires have been separated from their terminals due to pulling of the harness.



P02593

- Check that male and female terminals fit together tightly.

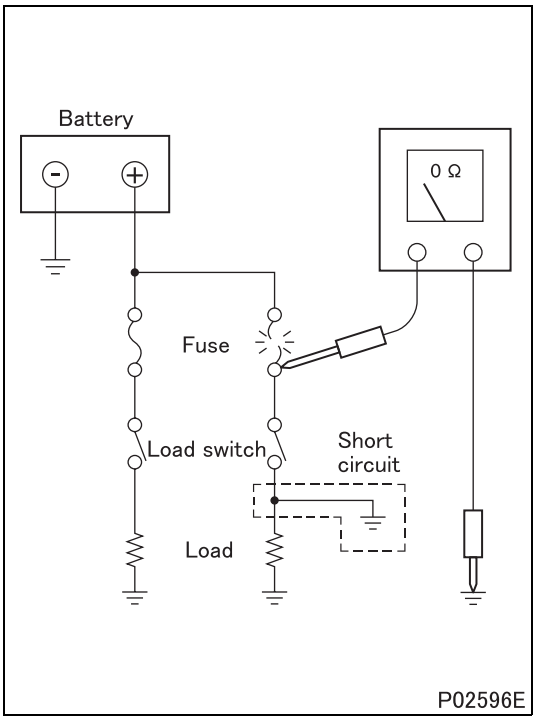
- Check for defective connections caused by loose terminals, by rust on terminals, or by contamination of terminals by foreign substances.



P02594

(2) Checking for loose terminals

- If connector terminal retainers become damaged, male and female terminals may not mate with each other when the connector bodies are fitted together. To check for such terminals, gently pull each wire and see whether any terminals slip out of their connector housings.

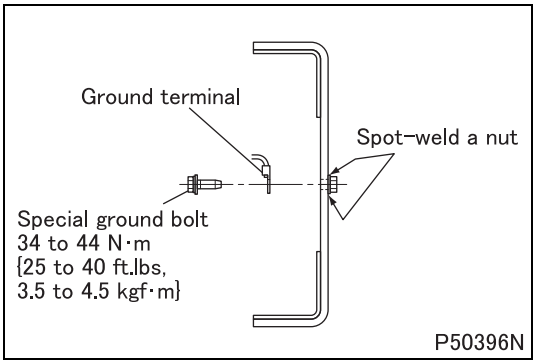


P02596E

1.3 Inspections when a fuse blows

- Remove the fuse, then measure the resistance between ground and the fuse's load side.
  Next, close the switch of each circuit connected to the fuse. If the resistance measurement between any switch and ground is zero, there is a short circuit between the switch and the load. If the resistance measurement is not zero, the circuit is not currently short-circuited; the fuse probably blew due to a momentary short circuit.

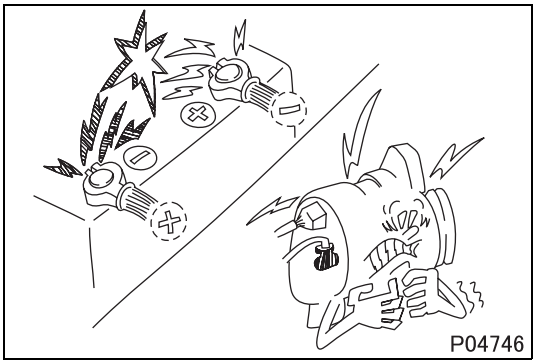
- The main causes of short circuits are as follows:
  - Harnesses trapped between chassis parts
  - Harness insulation damage due to friction or heat
  - Moisture in connectors or circuitry
  - Human error (accidental short-circuiting of components)



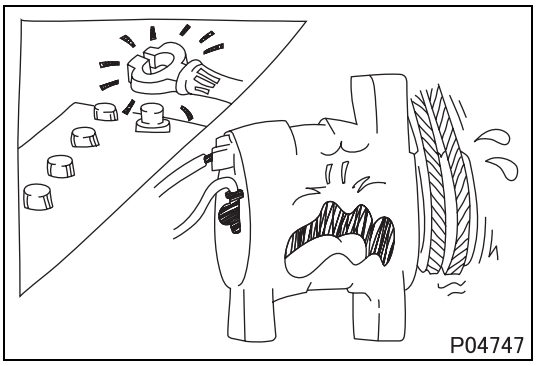
1.4 Inspection of chassis ground

- A special ground bolt is used to tighten a ground terminal. When servicing the ground point, be sure to follow the procedures described below:
  - When reinstalling the ground bolt
    Tighten the ground bolt to the specified torque.
  - When relocating the ground point
    A special ground bolt must be used. Spot-weld a nut to a frame and tighten the ground bolt to the specified torque. Be sure to apply touch-up paint to the welded point.

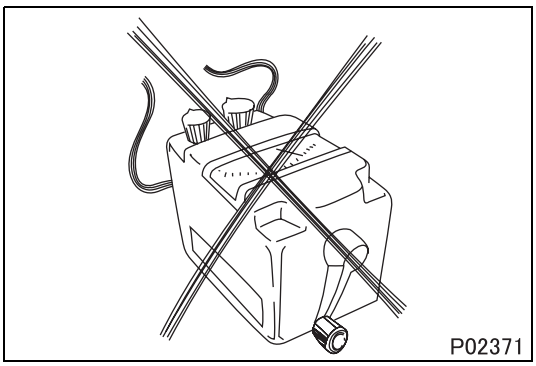
2. Service Precautions for Alternators



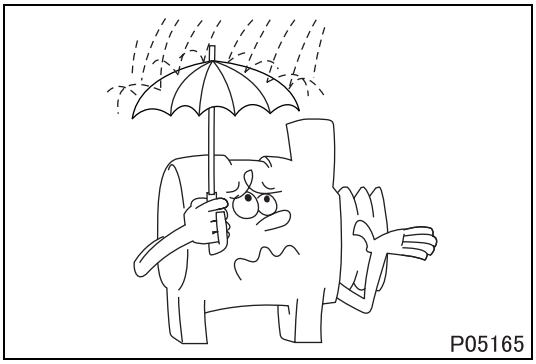
- When servicing alternators, observe the following precautions:
  - Never reverse the polarity of battery connections.
    If the polarity of the battery connections were to be reversed, a large current would flow from the battery to the alternator, damaging the diodes and regulator.



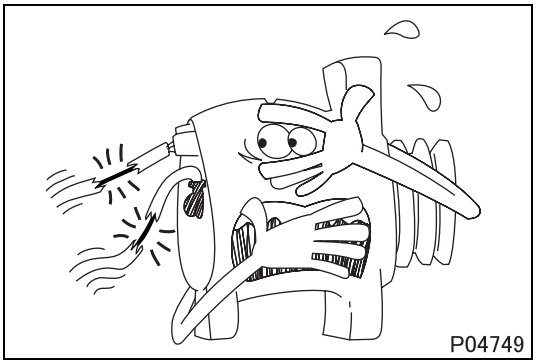
- Never disconnect the battery cables with the engine running.
  Disconnection of the battery cables during engine operation would cause a surge voltage, leading to deterioration of the diodes and regulator.



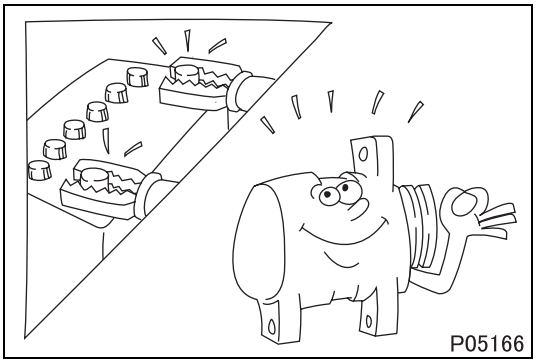
- Never perform inspections using a high-voltage multimeter.
  The use of a high-voltage multimeter could damage the diodes and regulator.



- Keep alternators dry.
  Water on alternators can cause internal short circuits and damage.

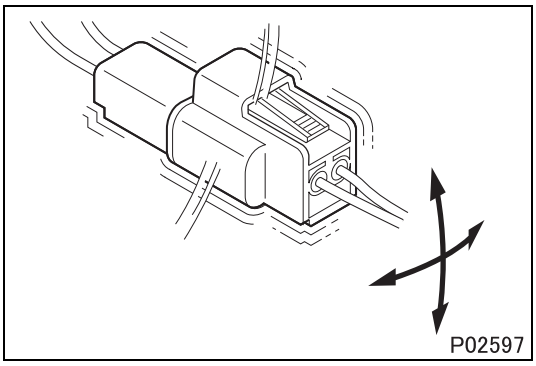


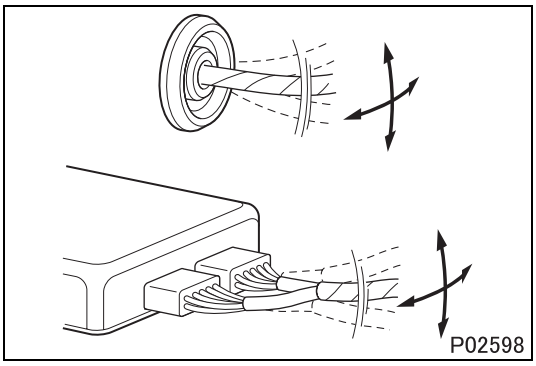
- Never operate an alternator with the B and L terminals short-circuited. Operation with the B and L terminals connected together would damage the diode trio.

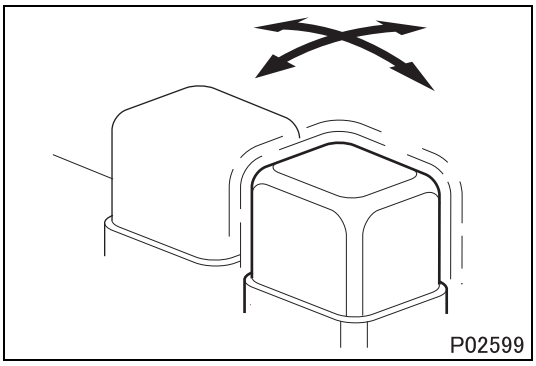


- Disconnect the battery cables before quick-charging the battery with a quick charger.
  Unless the battery cables are disconnected, quick-charging can damage the diodes and regulator.

3. Intermittent Faults





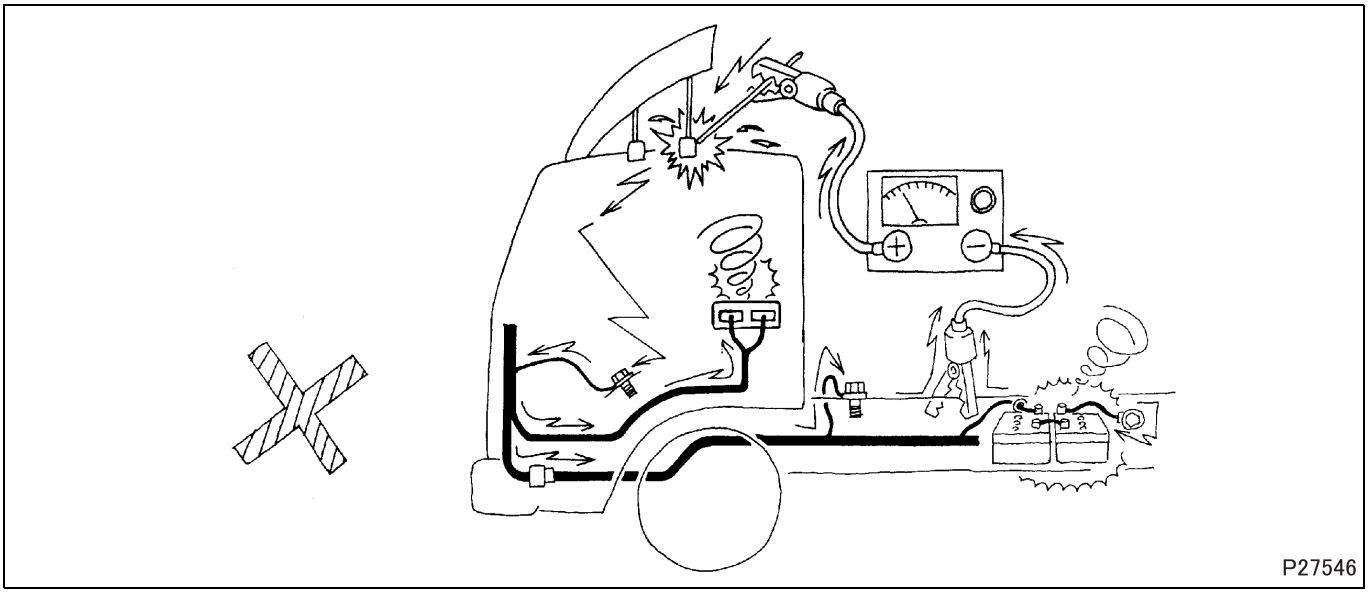


- An intermittent fault typically occurs only under certain operating conditions. Once these conditions have been identified, the cause of the intermittent fault can be ascertained easily. First, ask the customer about the vehicle operating conditions and weather conditions under which the fault occurs. Also ask about the frequency with which the fault occurs and about the fault symptoms. Then, reproduce the fault based on this information.
  In accordance with the conditions under which the fault occurs, determine whether the fault is caused by vibration, heat or other factors. if vibration is a possible factor, see if the fault can be reproduced by performing the following checks on individual connectors and other parts:
  - Gently move connectors up and down and to left and right.
  - Gently move wiring harnesses up and down and to left and right.
  - Gently wiggle sensors and other devices by hand.
  - Gently wiggle wiring harnesses on suspension systems and other moving parts.

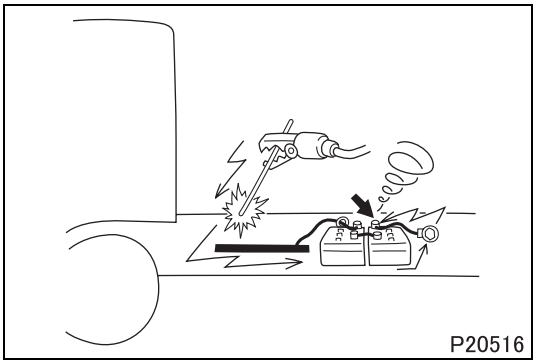
- Connectors and other parts to be checked are those included or given as likely fault locations in inspection procedures corresponding to diagnosis codes and/or fault symptoms.

4. Precautions for Arc Welding

- When arc welding is performed, current from the welder flows to ground via the vehicle's metal parts. Unless appropriate steps are taken, this current can damage control units, other electrical devices and wiring harnesses. And any electrical device near the point on the vehicle to which the (–) cable of the welder is connected, might be largely damaged.



- Current flows backward as shown below.



4.1 From battery (–) terminal

To prevent damage to the battery and to electrical devices that are connected directly to the battery, it is essential to disconnect the battery's (–) cable.

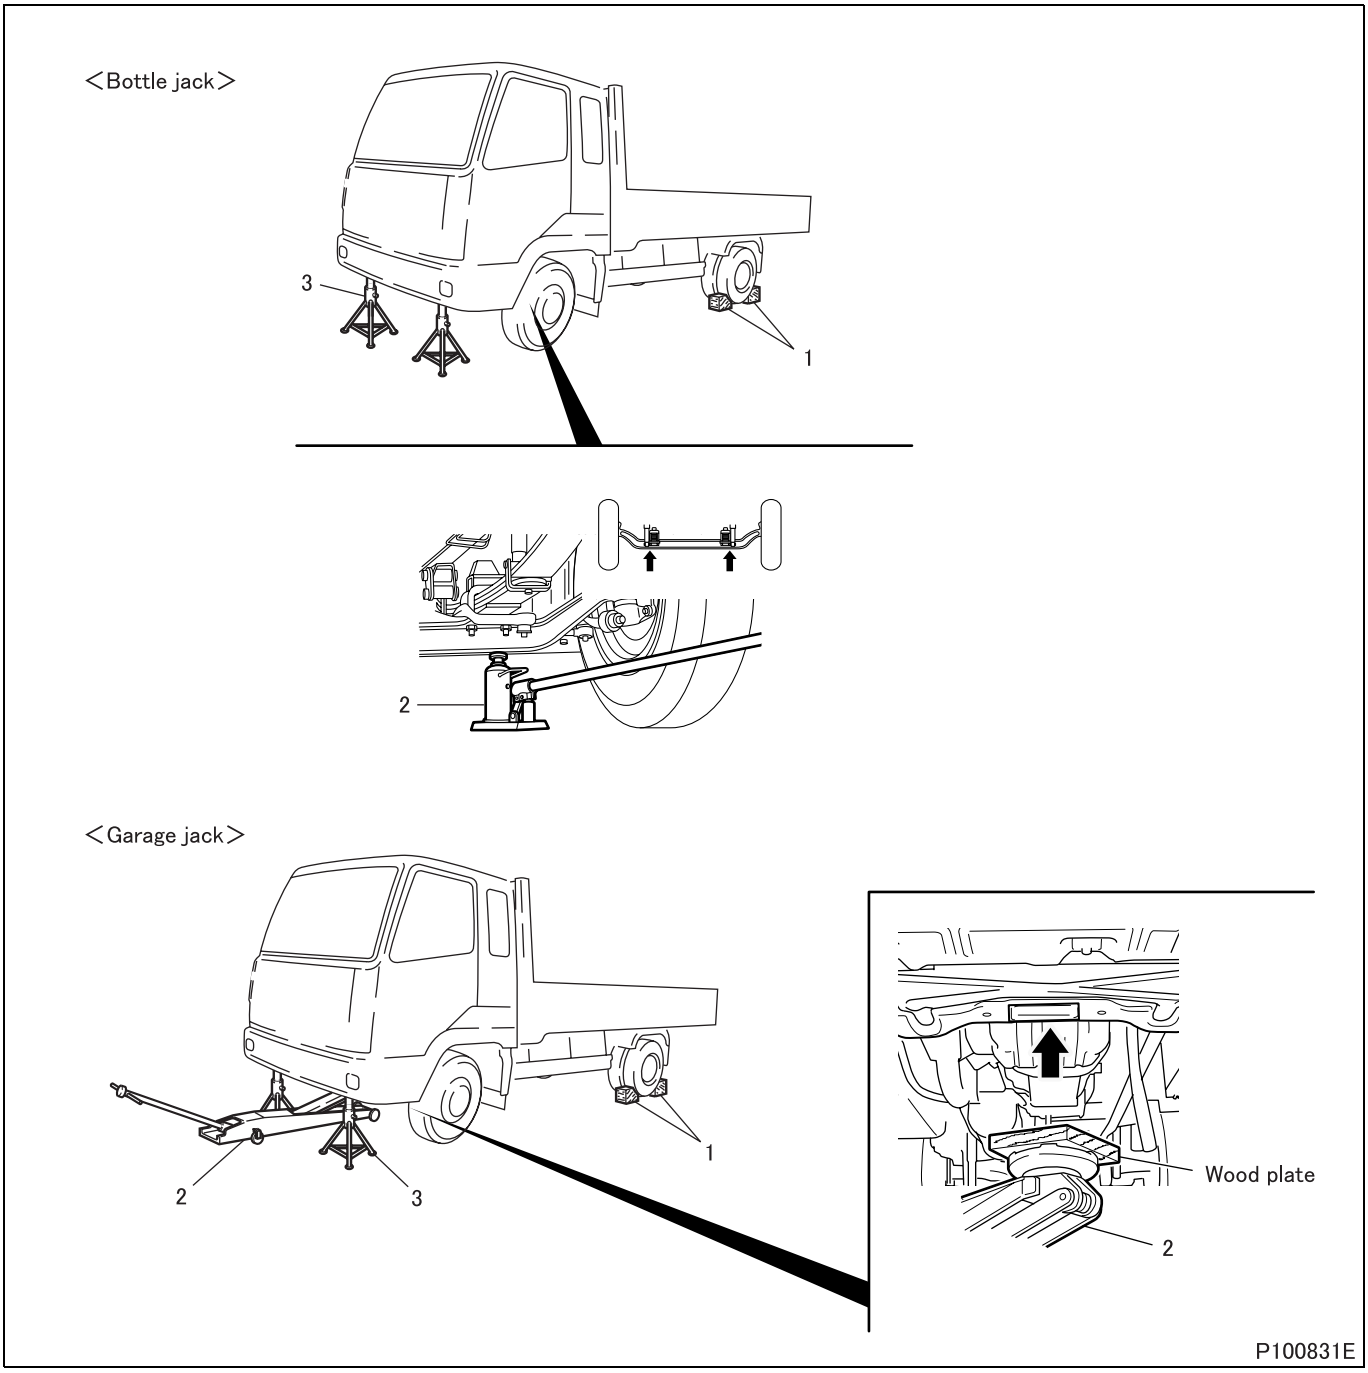
4.2 Procedure

- Turn the starter switch to the LOCK position.
- Disconnect the battery's (–) cable.
- Cover all parts of the vehicle that may be damaged by welding sparks.
- Connect the welder's (–) cable to the vehicle as close as possible to the area being welded. Do not connect the welder's (–) cable to the cab if the frame is being welded, and vice versa.
- Set the welding current in accordance with the part being welded.

M E M O

JACKING UP THE VEHICLE

<Front of vehicle>



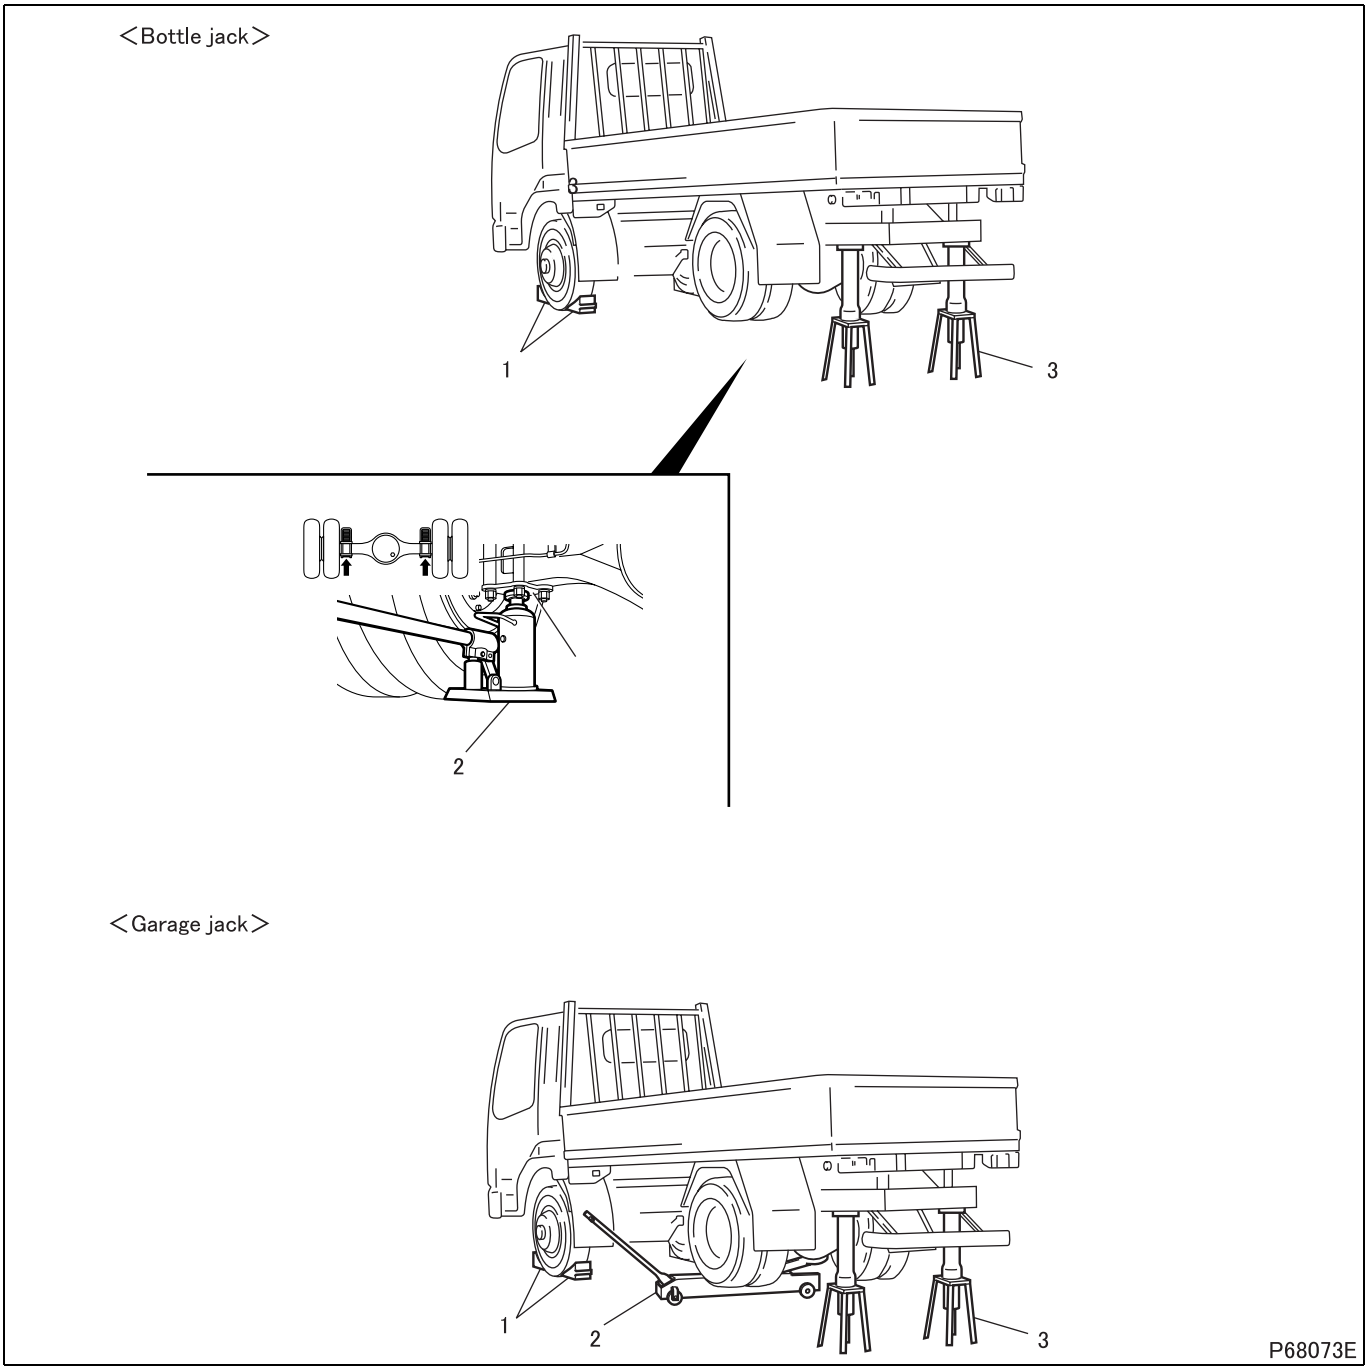
Jacking up procedure

1 Place chocks against the rear wheels.
2 Set a bottle jack or garage jack and jack up the front of the vehicle.
3 Support the front of the vehicle frame on jack stands.

WARNING ⚠

- **Chock the wheels firmly to prevent the vehicle from rolling away.**
- **Do not attempt to remove the chocks until the operation is completed.**
- **It is extremely dangerous to support the vehicle with only bottle jack or garage jack. Be sure to additionally support the front of the vehicle frame on rigid racks.**
- **Never attempt to remove any of the bottle jack, garage jack, or jack stands until the operation is completed.**

<Rear of Vehicle>



Jacking up procedure

1 Place chocks against the front wheels.
2 Set a bottle jack or garage jack and jack up the rear of the vehicle.
3 Support the vehicle frame on jack stands on both sides.

WARNING ⚠

- **Chock the wheels firmly to prevent the vehicle from rolling away.**
- **Do not attempt to remove the chocks until the operation is completed.**
- **It is extremely dangerous to support the vehicle with only bottle jack or garage jack. Be sure to additionally support the vehicle frame on jack stands on both sides.**
- **Never attempt to remove any of the bottle jack, garage jack, or jack stands until the operation is completed.**

DIAGNOSIS CODES

1. Diagnosis Codes

- Diagnosis codes indicate the faulty sections of the vehicle.
- A fault can be repaired by reading out the diagnosis code(s) stored in the control unit and performing the remedy for that code(s).
- Diagnosis codes can be displayed in the following two methods. Select either of them according to the system to be diagnosed.
  - Using a scanning tool (General Scanning Tool or Multi-Use Tester)
  - Using flashing of a warning lamp on meter cluster
- The table below indicates the systems for which diagnosis codes can be displayed and the methods usable for individual systems.

1.1 Systems and diagnosis code displaying methods

Warning lamp	System		Diagnosis codes displaying methods		Reference Gr
			Scanning tool	Flashing of warning lamp	
CHECK ENGINE or	Common rail		O	O	13EA
	Turbocharger				15
	Diesel particulate filter				
	Exhaust gas recirculation				17
	Starter continuous energizing preventing function, Preheating system				54
MVCU	Vehicle speed limitation (SLD)		O	O	13EB
	Auto cruise				
	Automatic transmission	1000RDS, 2200RDS	△	–	23A
		3000RDS	△	Displayed on the range selector (See Gr23B.)	23B
ABS or ABS	Anti-lock brake system		O	O	35E

△: Can be displayed by the Allison exclusive diagnosis tool.

1.2 Types of diagnosis codes <Engine control>

- The diagnosis codes has no distinction of present and past.
- If a fault occurs and an electronic control unit detects the fault, the electronic control unit will store a diagnosis code in memory after a diagnosing time predetermined for each fault content and turn on the warning lamp.
- When the fault has solved, the warning lamp goes off, but the diagnosis code still remains in the memory.
- The diagnosis codes can be erased by using the scanning tool (General Scanning Tool or Multi-Use Tester) or they will be erased automatically after a specified period.

1.3 Types of diagnosis codes <Except engine control>

(1) System for which present and past codes are discriminately displayed

(1.1) Present diagnosis code

- Fault developed in the vehicle after the starter switch is set to ON is indicated by corresponding diagnosis code.
- The fault warning lamp is lit at the same time.

(1.2) Past diagnosis code

- Past fault developed in the vehicle is indicated by corresponding diagnosis code stored in the memory of the electronic control unit.
- With the vehicle restored to its normal condition or the starter switch turned from OFF to ON after inspection or repair against present diagnosis codes, the present diagnosis code is stored as past diagnosis codes in the memory of the electronic control unit.
- The warning lamp is not lit because the indicated fault is not present one.

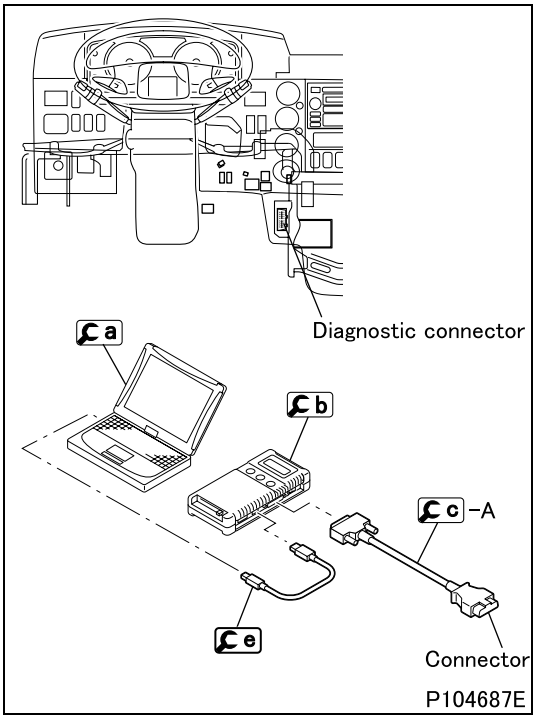
2. Reading and Erasing the Diagnosis Code

2.1 Using a Multi-Use Tester

(1) Connecting a Multi-Use Tester

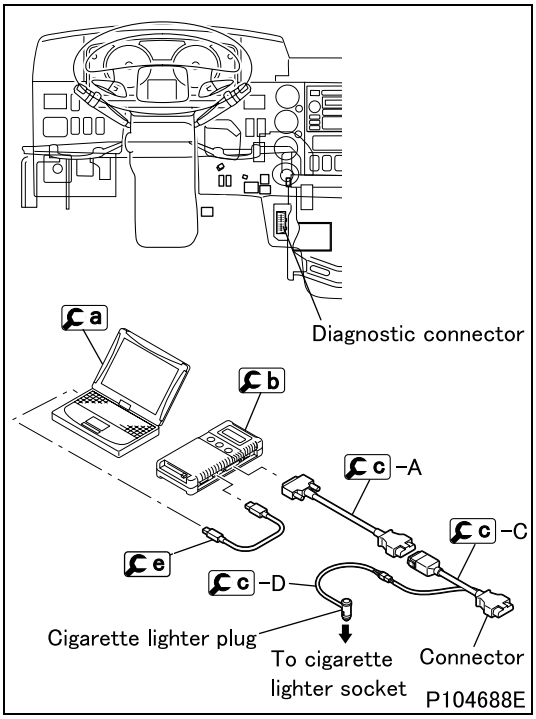
Special tools

Mark	Tool name and shape	Part No.	Application
a	PC  P57295	FMS-E08-1 (Multi-Use Tester-III version)	Data transmission to/from V.C.I.
b	V.C.I.  P57296	MH062927	Data transmission between electronic control unit and PC
c	Multi-Use Tester test Harness E A: Harness for inspection and drive recorder B: Harness for drive recorder C: Drive recorder harness D: Cigarette lighter plug harness  P100753	MH063659 A: MH063661 B: MH063663 C: MH063665 D: MH063666	Power supply to V.C.I. and communication with electronic control unit
d	Multi-Use Tester test harness D (used for extension)  P57299	MH062951	Multi-Use Tester test harness B extension
e	USB cable P57300	MH063668	Communication between V.C.I. and PC



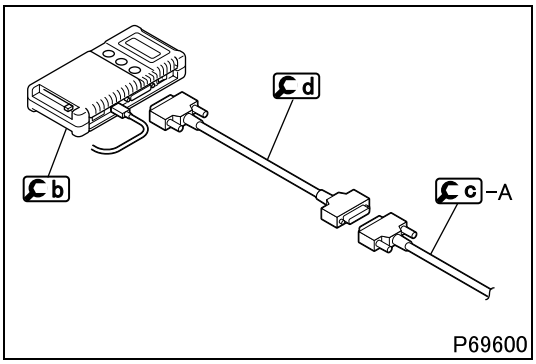
(1.1) To perform system inspection

- Move the starter switch to the LOCK position.
- Connect a, b, c-A and e as shown.
- Connect c-A connector to the diagnostic connector on the vehicle.



(1.2) To use drive recorder function

- Move the starter switch to the LOCK position.
- Connect a, b, c-A, c-C, c-D and e as shown.
- Connect c-C connector to the diagnostic connector on the vehicle.
- Connect the cigarette lighter plug of c-D to the cigarette lighter socket on the vehicle.



(1.3) To extend the Multi-Use Tester test harness

- Connect d to c-A to extend the test harness to use the Multi-Use Tester outside the vehicle.

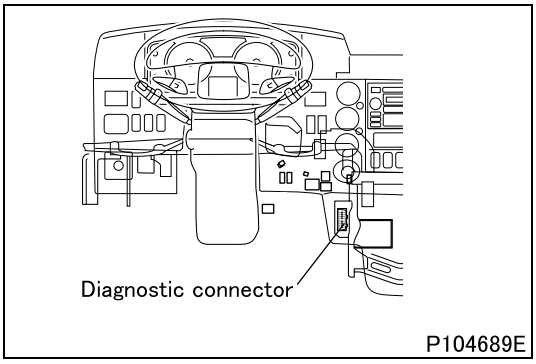
(2) Access of diagnosis code

- Set the starter switch to ON.
- Operate the Multi-Use Tester for a display of necessary diagnosis code stored in the memory of the electronic control unit and identify the location of the fault.

(3) Clearing of diagnosis code

- Set the starter switch to ON (the engine not to be started).
- Operate the Multi-Use Tester to delete all the diagnosis codes stored in the memory of the electronic control unit.
- After the diagnosis codes of anti-lock brake system are cleared by the Multi-Use Tester, the anti-lock brake system warning lamp continues illuminating until the starter switch is turned to OFF or until the communication with the Multi-Use Tester ends.

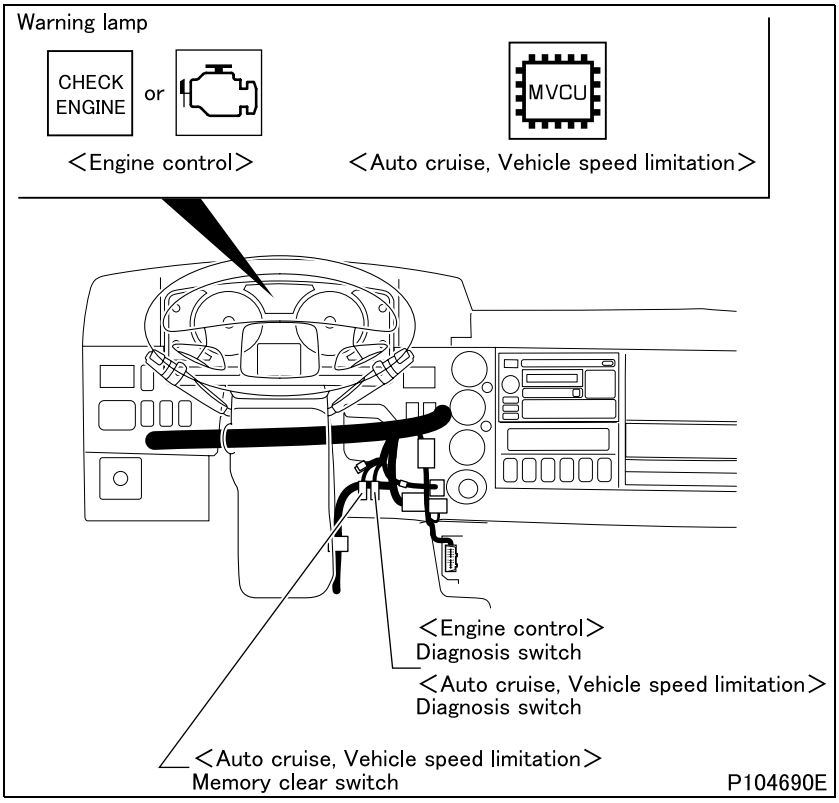
2.2 Using a General Scanning Tool



- For the usage of a General Scanning Tool, refer to the instruction manual for that tool.

2.3 Using flashing of a warning lamp on meter cluster

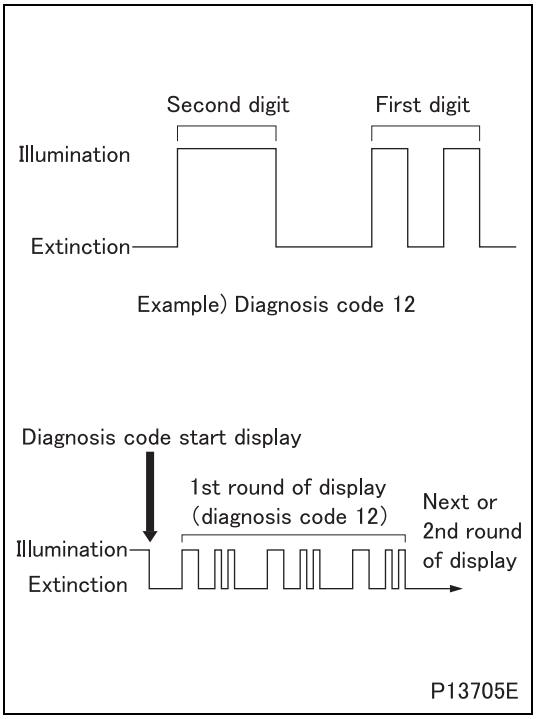
(1) Engine control, auto cruise, vehicle speed limitation



- Using the diagnosis and memory clear switches, display diagnosis codes.

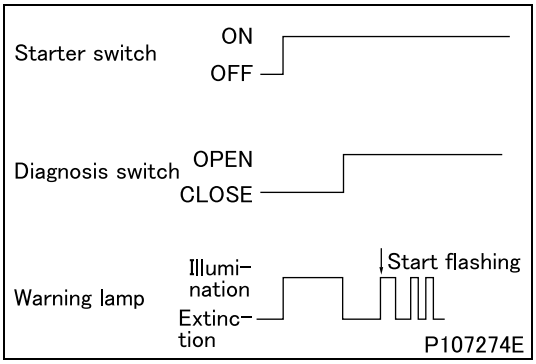
CAUTION ⚠

- **Opening the memory clear switch followed by its reconnection will erase the stored diagnosis codes from the memory. To avoid inadvertently erasing necessary codes, be sure to read well the procedure described below before handling diagnosis codes. <Except engine control>**



(1.1) Reading diagnosis codes by flashing of warning lamp

- To read a diagnosis code, observe how may times the warning lamp flashes and how long each illumination lasts.
- The duration of illumination differs between the first and second digits.
  - Second digit: 1.2 sec.
  - First digit: 0.4 sec.
- A diagnosis code consists of the flashing of second digit and the flashing of first digit in that order. If a diagnosis code has “0” in the second digit, only the first digit will be displayed.
- The diagnosis code 01 will be displayed if the system is normal.
- The same diagnosis code will be displayed 3 times in a row before moving to the display of the next code.
- After the last diagnosis code is displayed, the first code will be displayed again 3 times in a row and then the subsequent codes. This will be repeated.



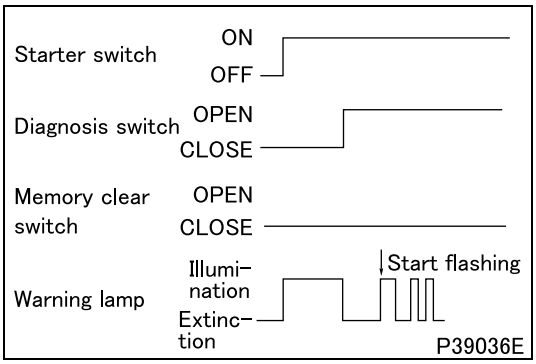
(1.2) Reading and erasing diagnosis codes <Engine control>

● Reading diagnosis codes

- Turn the starter switch ON.
- Remove the diagnosis switch.
- Diagnosis codes will be displayed by flashing of the warning lamp.
- When the diagnosis switch is connected, electronic control unit will stop (terminate) displaying diagnosis codes.

● Erasing diagnosis codes

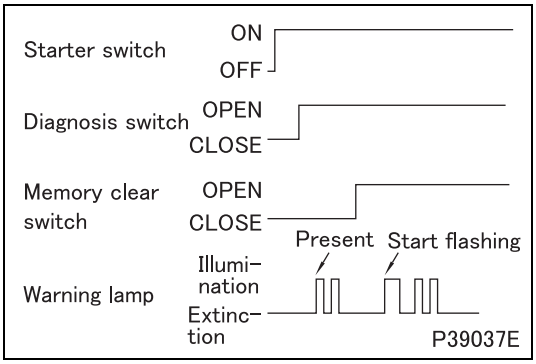
- Erase diagnosis codes with a scanning tool (general scanning tool or Multi-Use Tester).



(1.3) Reading and erasing diagnosis codes <Except engine control>

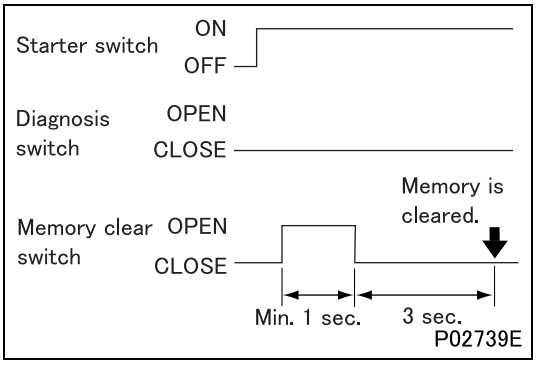
● Present diagnosis codes

- Turn the starter switch ON.
- Remove the diagnosis switch.
- Present diagnosis codes will be displayed by flashing of the warning lamp.
- When the diagnosis switch is connected, electronic control unit will stop (terminate) displaying diagnosis codes.



● Present and past diagnosis codes

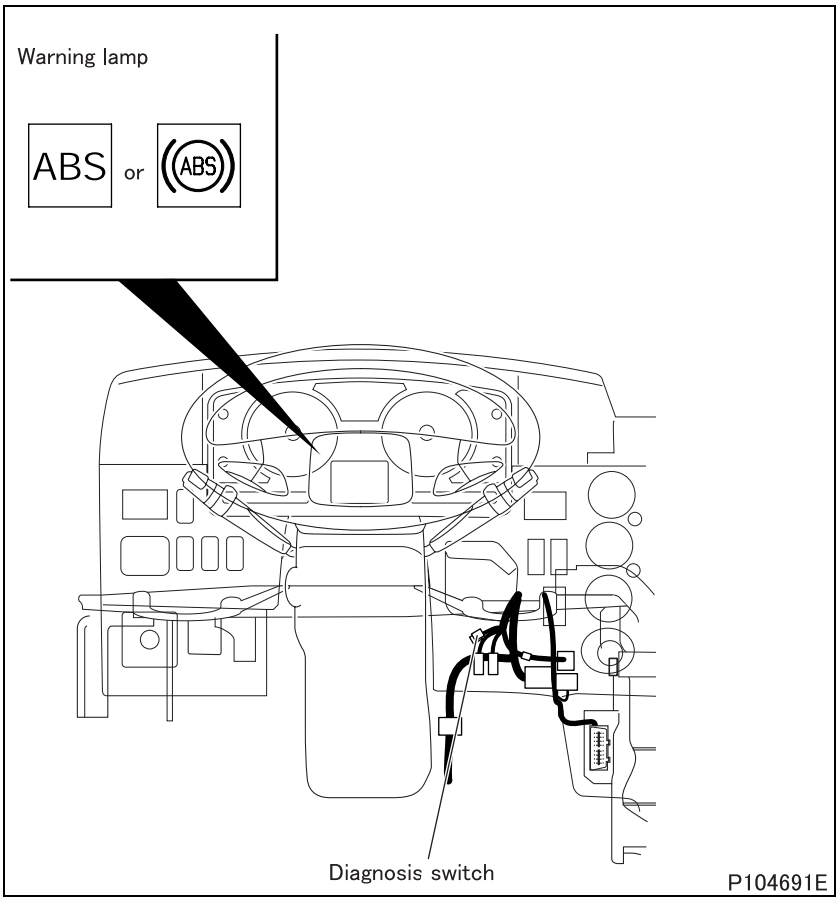
- Turn the starter switch to the ON position.
- Open the diagnosis switch.
- Present diagnosis codes will be displayed by flashing of the warning lamp.
- Open the memory clear switch.
- Present and past diagnosis codes will be displayed by flashing of the warning lamp.
- Turn the starter switch to the OFF position and connect the memory clear switch and diagnosis switch to terminate the diagnosis code displaying mode.



● Erasing diagnosis codes

- Turn the starter switch to the ON position (do not start the engine).
- Open the memory clear switch and reconnect it; all diagnosis codes stored in electronic control unit memory will be erased.
  To cancel diagnosis code erasure after opening the memory clear switch, turn the starter switch to the OFF position and then reconnect the memory clear switch.

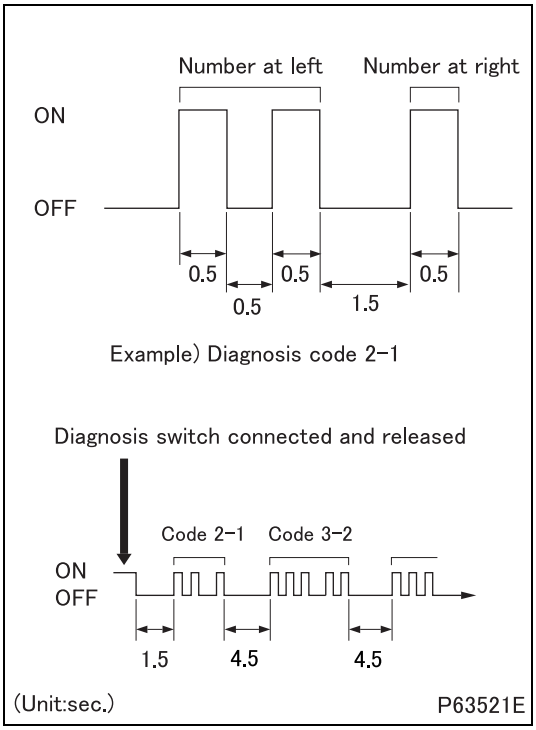
(2) Anti-lock brake system

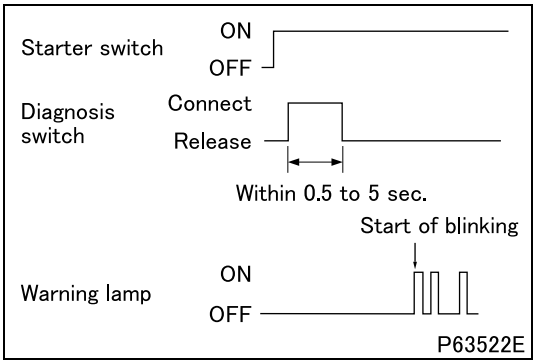


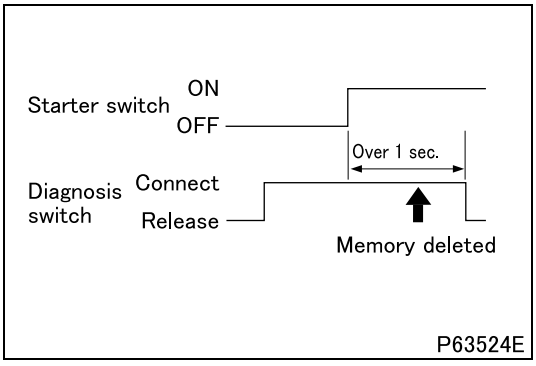
- Use the diagnosis switch to have diagnosis codes shown.

CAUTION ⚠

- **Diagnosis codes are cleared by diagnosis switch operation for connection and release. Be sure to familiarize with the sequence before operation.**







(2.1) Observation of diagnosis code

- Observe diagnosis codes according to the number and time interval of blinks of the warning lamp.
- Diagnosis codes are indicated in the order of the numbers of blinks at left and right.
- Diagnosis codes are given, one at a time.

(2.2) Indication of diagnosis code

- Set the starter switch to ON.
- Connect the diagnosis switch, then release.
- Diagnosis codes are indicated according to the number of blinks of the warning lamp.
- With the starter switch turned back to OFF or all diagnosis codes displayed, the electronic control unit stops (finishes) the code indication.

(2.3) Clearing of diagnosis code

- Connect the diagnosis switch with the starter switch in the OFF position, then set the starter switch to ON. This deletes all the diagnosis codes stored in the memory of the electronic control unit. To abort the clearing of diagnosis codes after the diagnosis switch is connected, release the diagnosis switch with the starter switch left in the OFF position.
- After the clearing of diagnosis codes, do not forget to release the diagnosis switch.

CAUTION ⚠

- **If the diagnosis switch is not released, the contents of the memory are deleted each time the starter switch is set to ON.**

M E M O

TABLE OF STANDARD TIGHTENING TORQUES

- Use specified bolts and nuts, tightening them to the torques specified in this section unless otherwise stated.
- Threaded portions and bearing surfaces should be dry.
- Where the property class differs between the nut and bolt (or stud bolt), use the tightening torque specified in the table for the bolt.

Hexagon Headed Bolt, Stud Bolt (Unit: N·m {ft.lbs, kgf·m})

Strength	4T		7T		8T	
Identification symbol / Nominal diameter	(Stud)		 (Stud)		(Stud)

HOW TO READ THE MAINTENANCE SCHEDULE TABLES

Example Table:

*1: 30,000 km/18,000 miles or 6 months, whichever occurs first
*2: 60,000 km/36,000 miles or 12 months, whichever occurs first
*3: FK61
*4: FK62, FK65, FM
*5: FK65
*6: FK
Ⓔ: Exhaust emission items
Ⓝ: Noise control items

Item (1)	Time of inspection and maintenance (2)					Working procedures (3)	Reference Gr (4)
	Pre-operational checks	New vehicle at 4,000 km/ 2,500 miles	Inspection interval: Every 10,000 km/ 6,000 miles	Inspection interval: Every 30,000 km/ 18,000 miles *1	Inspection interval: Every 60,000 km/ 36,000 miles *2		
ENGINE							
Air, fuel, oil or coolant leaks from engine	×		×			Check engine for air, fuel, oil and coolant leaks.	Gr11, 12, 13A, 14
ⒺⓃ Engine starting performance, speed, noise and exhaust gas conditions			×			Check for engine starting performance, idling speed, abnormal engine noise, black smoke or other abnormal exhaust gas during idling and acceleration. Check engine speed on tachometer.	Gr11, 13A, 15
Retightening, inlet and exhaust manifold bolts					×	Retighten. Checking of the tightening torque is unnecessary.	Gr15
Ⓔ Valve cle…					×	Check valve clearance with thic…	Gr11

(1) This column contains the maintenance and inspection items.

(2) The periods between inspection and service are based on the assumption that the vehicle will be driven approximately 60,000 kilometers (36,000 miles) per year.
Inspections which must be made are indicated by an "×" or by the appropriate period between servicing.

(3) This column provides a simplified explanation of the operational procedures involved for each inspection or maintenance item.

(4) The Gr. No. refers to the "group number" in this Service Manual. For visual checks and simple inspections, see the sections labelled "Working Procedures".

			Every 10,000 km/ 6,000 miles	Every 30,000 km/ 18,000 miles *1	Every 60,000 km/ 36,000 miles *2		
Ⓔ Turbocharger rotor play			Every 250,000 km/ 150,000 miles			Check rotor for excessive end play by using a dial indicator.	Gr15
ⒺⓃ Cleaning the air cleaner element	×		×			Clean the air cleaner element. The element must be cleaned when the red dust indicator signal appears, irrespective of the cleaning interval.	Gr15
ⒺⓃ Air cleaner element replacement			Every 80,000 km/ 48,000 miles or 12 months			Replace element.	Gr15
ⒺⓃ Damage of air intake system, looseness of clamp and loss of parts			×			Check air intake system for damage and inspect all parts for installation.	Gr15
ⒺⓃ Exhaust system			×			Check the exhaust system for damage, corrosion and loose connection causing leakage.	Gr15
Ⓔ PCV (Positive Crankcase Ventilation) valve element replacement			×			Replace element.	Gr17
Ⓔ DPF pressure sensor hose replacement			Every 24 months			Replace DPF pressure sensor hose.	Gr15
Starter function					×	Operate starter switch and check the switch for proper function.	Gr54
Alternator function					×	Check for function with a circuit tester.	Gr54
Ⓔ DPF			Every 10,000 km/ 6,000 miles or 12 months			Check DPF for blocking.	Gr15
			First 320,000 km/200,000 miles Every 240,000 km/150,000 miles thereafter			DPF Ash Cleaning	
POWER TRAIN							
Air or oil leaks from power train			×			Check power train for air and oil leaks.	Gr21, 22, 23, 25
Clutch pedal play			×			Press clutch pedal lightly and check that its play is adequate.	Gr21
Clutch function			×			• Press the clutch pedal to check for unusual noise or stiffness. Also check if gear engages quietly. • Check that clutch does not slip and engages smoothly.	Gr21

MAINTENANCE SCHEDULE TABLES

Item	Time of inspection and maintenance					Working procedures	Reference Gr
	Pre-operational checks	New vehicle at 4,000 km/ 2,500 miles	Inspection interval				
			Every 10,000 km/ 6,000 miles	Every 30,000 km/ 18,000 miles *1	Every 60,000 km/ 36,000 miles *2		
Manual transmission gearshift control looseness				×		In NEUTRAL position, check gearshift lever for looseness. With gearshift lever in each gear position, check all gears engage smoothly without excessive looseness. Also check that control cable is not damaged.	Gr22
Automatic transmission range selector linkage condition *6				×		Shifting to each position must be correct and secure.	Gr23A
Propeller shaft couplings and bearings looseness		×	×			Check flange yoke bolts and center bearing bolts for looseness.	Gr25
			×			• Turn propeller shaft manually to check for loose spline coupling. • Check for looseness between spider and needle roller bearing.	
FRONT AND REAR AXLES							
Axle shaft torsion and cracks					×	Remove axle shaft and check for torsion, bend, and cracks.	Gr27
Front wheel hub bearing looseness				×		With front axle jacked up, move wheel up and down by holding tire's top and bottom to check for bearing looseness.	Gr26
Rear wheel hub bearing damage					×	Disassemble rear wheel and check for hub bearing wear and damage.	Gr27
Retightening wheel nuts		×	×			Check wheel nuts for looseness.	P01-10
Disc wheel damage			×			Check disc wheel for corrosion, deformation and cracks.	Gr31
Tire inflation pressure, cracking, tread groove depth, abnormal wear, etc.	×		×			• Measure inflation pressure with a tire pressure gauge, and check that tire tread groove is deep enough. • Check tire tread and side walls for cracks, damage, uneven, ridgy, and other abnormal wear.	P01-10
Tire rotation			×			Rotate all tires.	P01-10
SUSPENSION SYSTEM							
Looseness, play and damage of suspension system				×		Check suspension system for looseness, play and damage.	Gr33, 34
Damage and looseness of leaf springs	×			×		Check leaf springs for damage and looseness.	Gr33, 34
Retightening U-bolts		×		×		Check U-bolts for looseness.	Gr33, 34
Air leak and damage of air spring *5			×			Check air spring for air leak and damage of diaphragm. Check the air spring height.	Gr34B
Air spring diaphragm replacement *5			Every 36 months			Check diaphragm and replace if necessary.	Gr34B
Oil leaks and damage of shock absorbers				×		Check for oil leaks from and damage of cylinders and other parts.	Gr33, 34

Item	Time of inspection and maintenance					Working procedures	Reference Gr
	Pre-operational checks	New vehicle at 4,000 km/ 2,500 miles	Inspection interval				
			Every 10,000 km/ 6,000 miles	Every 30,000 km/ 18,000 miles *1	Every 60,000 km/ 36,000 miles *2		
BRAKING SYSTEM							
Air pressure and its charging speed	×					After discharging air from air tank, start and run the engine at idle and measure time taken to charge air to specified pressure in air tank.	Gr35A, B
Air and fluid leaks from braking system			×			Check braking system for air and fluid leaks.	Gr35A, B
Looseness, play and damage of braking system parts			×			Check braking system parts for looseness, play and damage.	Gr35A, B
Condensation in air tank	×					Open drain cock, and check for presence of condensation in air tank.	Gr35A, B
Operation of brake pedal			×			Depress the brake pedal and release it, checking for the sound of air being released from the brake valve and to ensure that the pedal returns normally without catching. Press the brake pedal with a finger to the point where resistance is felt and measure the distance (play) over which the pedal has moved.	Gr35A, B
Foot brake effectiveness	×		×			While driving the vehicle at low speed, check braking effect and check for uneven braking.	Gr35A, B
Operation of exhaust brake	×		×			Check for exhaust brake operation.	Gr35A, B
Exhaust brake control cylinder packing replacement			Every 12 months			Check exhaust brake control cylinder packing, replace if necessary.	Gr35A, B
Operation of air drier			×			Open drain cock of air tank and make sure there is no drainage.	Gr35A, B
Check drain from air drier exhaust port			×			Check to see that oil is not discharged abnormally from exhaust port of air drier.	Gr35A, B
Air drier disassembly and check					×	Disassemble air drier and check every part of it. If more than 1/5 of the drying agent is discolored, replace drying agent.	Gr35A, B
Replacement of drying agent in air drier			Every 60,000 km/ 36,000 miles or 12 months			Disassemble air drier and replace drying agent and rubber parts.	Gr35A, B
Brake shoe clearance				×		Measure clearance with feeler gauge.	Gr35A, B
Brake lining wear				×		Check for lining wear.	Gr35A, B
Brake drum wear					×	Disassemble and check drum for wear, cracks and damage.	Gr35A, B
Parking brake effectiveness			×			On a slope, check that vehicle can be held stationary.	Gr36
Parking brake operation *4	×		×			• Check for operation of parking brake control valve. • Check operation when brake line air pressure is reduced.	Gr36B

Item	Time of inspection and maintenance					Working procedures	Reference Gr
	Pre-operational checks	New vehicle at 4,000 km/ 2,500 miles	Inspection interval				
			Every 10,000 km/ 6,000 miles	Every 30,000 km/ 18,000 miles *1	Every 60,000 km/ 36,000 miles *2		
Parking brake lever stroke *3	×		×			With lever full pulled, check that lever is locked completely and that there is allowance in pulling stroke.	Gr36A
Parking brake drum and lining wear *3					×	Disassemble and check drum for wear, cracks and damage and lining for wear.	Gr36A
Damage on boot of brake chamber expander *4					×	Check boot at expander for damage.	Gr35B
Replacement of piston cup and boot of front and rear brake wheel cylinder *3			Every 12 months			Check piston cup and boot of front and rear brake wheel cylinder; replace if necessary.	Gr35A
Replacement of cup packing and rubber parts of brake booster *3			Every 12 months			Check cup packing and rubber parts of brake booster; replace if necessary.	Gr35A
Replacement of brake hose			Every 12 months			Check brake hose; replace if necessary.	Gr35A, B
Replacement of packing and rubber parts of brake valve			Every 12 months			Check packing and rubber parts of brake valve; replace if necessary.	Gr35A, B
Replacement of hoses connecting air compressor to air dryer			Every 12 months			Replace hoses connecting air compressor to air dryer.	Gr35A, B
Replacement of check valve			Every 24 months			Replace check valve.	Gr35A, B
Replacement of cup packing and rubber parts of brake booster *3			Every 24 months			Replace cup packing and rubber parts of brake booster.	Gr35A
Replacement of tube of brake fluid reservoir tank *3			Every 24 months			Check and replace tube of brake fluid reservoir tank.	Gr35A
Replacement of packing and rubber parts of front and rear brake chamber *4			Every 24 months			Replace packing and rubber parts of front and rear brake chamber.	Gr35B
Replacement of rubber parts of front and rear brake expander *4			Every 36 months			Replace rubber parts of front and rear brake expander.	Gr35B
Replacement of piggy back of rear brake chamber *4			Every 36 months			Replace piggy back of rear brake chamber.	Gr35B
STEERING SYSTEM							
Fluid leaks from steering system			×			Check steering system for fluid leaks.	Gr37
Steering wheel play	×		×			Turn steering wheel right and left to measure play at steering wheel rim. Measure while engine is running.	Gr37
Steering operating condition	×		×			Check steering wheel to see if it vibrates, pulls to one side or requires unusual steering effort.	Gr37
Looseness and play of steering system (including hoses and pipes)			×			• Check steering system for looseness and play. • Check power steering hoses and pipes for looseness.	Gr37

Item	Time of inspection and maintenance					Working procedures	Reference Gr
	Pre-operational checks	New vehicle at 4,000 km/ 2,500 miles	Inspection interval				
			Every 10,000 km/ 6,000 miles	Every 30,000 km/ 18,000 miles *1	Every 60,000 km/ 36,000 miles *2		
Wheel alignment					×	Measure toe-in, camber, caster and kingpin inclination angles.	Gr26
Right and left turning angles and power steering function					×	• Check that stopper bolt is sufficiently tight without damage and that steering linkage operates smoothly until blocked by stopper bolt. • Check that steering wheel does not contact other parts.	Gr26
Power steering booster and oil pump internal rubber parts replacement			Every 48 month			Replace internal rubber parts.	Gr37
Power steering hose replacement			Every 48 month			Replace power steering hose.	Gr37
Drag link ball joint dust cover				×		Check the dust cover for wear, cracks and other damage.	Gr37
CAB AND FRAME							
Looseness and damage of chassis and body			×			• Check frame, crossmembers and other parts for cracks and damage and check for loose rivets. • Also, check for body damage and loose mounting bolts.	Gr41, 42
Heater and defroster operation			×			Check operation and installation of defroster.	Gr55
Condition of rearview mirrors and reflectors	×					Check reflecting condition, stains and damage.	Gr51
Door lock function			×			Check door lock mechanism for proper functioning.	Gr43
Seat belt mounting condition			×			Check seat belt for damage, buckle and retracting function and mounting condition.	Gr52
ELECTRICAL SYSTEM							
Looseness and damage of electrical wiring and connections			×			Check wiring, connectors and battery terminals for looseness and corrosion.	Gr54
Battery electrolyte level and specific gravity			Every 20,000 km/ 12,000 miles			• Check electrolyte level. • Measure electrolyte specific gravity with hydrometer.	Gr54
Operation and damage of lighting system and turn signal lamps	×		×			Check operation, damage and installation of an lighting units. Also check turn signal lamps operated by turn signal switch.	Gr54
Operation of horn	×		×			Check operation, damage and mounting condition.	Gr54
Operation and fluid level of windshield wiper and washer	×		×			Check operation, damage and mounting condition. Check fluid level in washer tank.	Gr51
Gauge and warning/indicator lamp function	×		×			Check function of gauges and warning/indicator lamps.	Gr54
Switch function					×	Check operation, damage and installation of every switch.	Gr54

MAINTENANCE SCHEDULE TABLES

Item	Time of inspection and maintenance					Working procedures	Reference Gr
	Pre-operational checks	New vehicle at 4,000 km/ 2,500 miles	Inspection interval				
			Every 10,000 km/ 6,000 miles	Every 30,000 km/ 18,000 miles *1	Every 60,000 km/ 36,000 miles *2		
Battery	×					Check the battery fluid level.	Gr54
OTHERS							
Road test of vehicle			×			Drive the vehicle to check for vehicle general operating condition.	–

M E M O

Tire

Service standards (Unit: mm {in.})

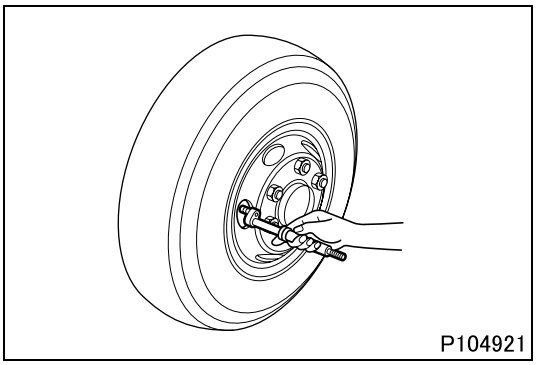
Location	Maintenance item		Standard value	Limit	Remedy
–	Depth of tire tread grooves	Normal roads	–	1.6 {0.063}	Replace
		Freeways		3.2 {0.13}	

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

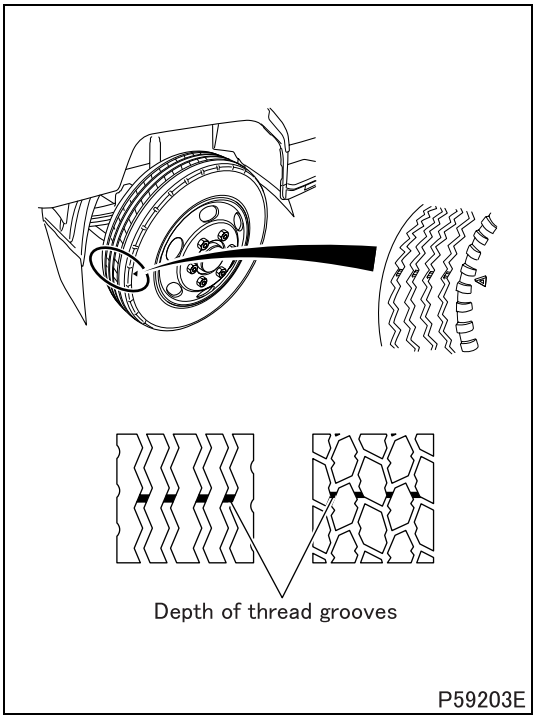
Mark	Parts to be tightened		Tightening torque	Remarks
–	Wheel nut	8-stud	540 to 590 {400 to 435, 55 to 60}	–
		6-stud	370 to 410 {275 to 305, 38 to 42}	

Lubricant and/or sealant

Mark	Points of application	Lubricant and/or sealant	Quantity
–	Wheel nut spherical area	Chassis grease [NLGI No. 1 (Li soap)] or Wheel bearing grease [NLGI No. 2 (Li soap)]	As required
–	Wheel nut (inner) at thread area and spherical area		
–	Thread area of hub bolt		



P104921



P59203E

Air pressure

Tire air pressure should be checked before the vehicle is driven, while the tires are still cool.

Item / Vehicle model	Tire size	Air pressure kPa {psi, kgf/cm^2}
FK61	225/70R19.5	660 {95, 6.60}
FK62, FK65	10R22.5-14PR	790 {115, 8.06}
FM	11R22.5-14PR	720 {105, 7.20}

CAUTION ⚠

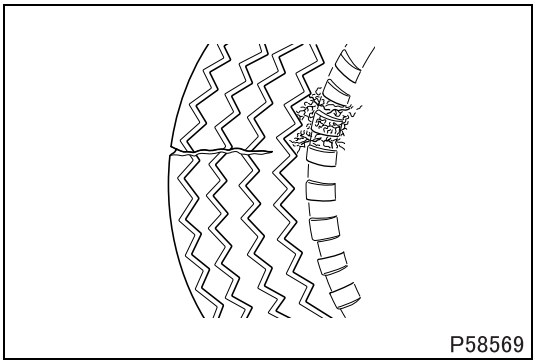
- **Make certain that there is no difference in the air pressure between the inner and outer rear tires.**
- **Make certain you use valve caps on the air valves.**
- **It is not necessary to increase the air pressure for high-speed driving.**

Checking tread depth

- Check all around the tire treads to make sure that the depth of the tread grooves is above the wear limit.
- If the tread grooves are not deep enough, slip sign appears at the position of the ⧋ mark, where the tread groove has worn away.

WARNING ⚠

- **If the depth of the tread grooves is not adequate, the tires will slip on wet roads and present a hazard. Such tires are also extremely dangerous because they are more susceptible to hydroplaning when the vehicle is running at high speeds in the rain. Such tires must be replaced with new ones as soon as possible.**



P58569

Checking for cracks, damage, and objects embedded in the treads

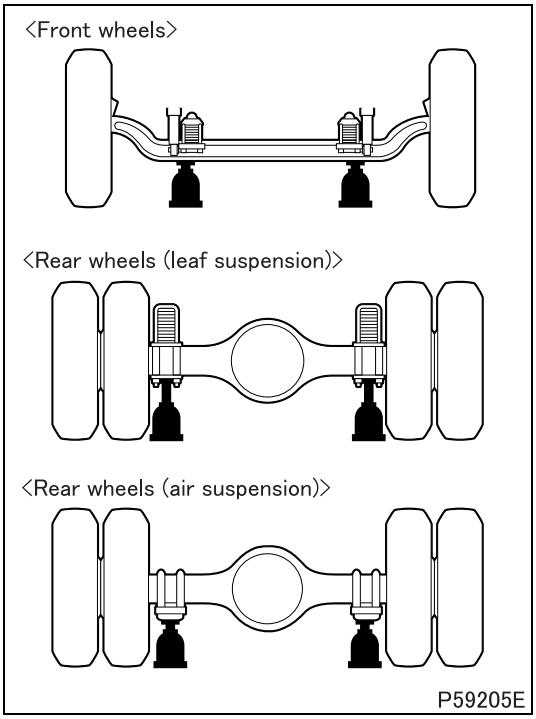
- Check the tire treads and walls for cracks and damage.
- Check tire treads for uneven wear or other abnormal wear.
- Check if metal objects or nails have penetrated the tires.
- Check for stones embedded between double tires.

WARNING ⚠

- **Badly damaged or worn tires are extremely dangerous, because they can be punctured more easily when the vehicle is running, they must be replaced with new ones as soon as possible.**

Removing tires

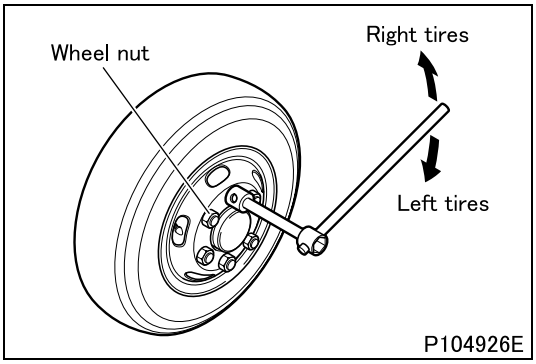
- Jacking up point.
  - For front wheels: Below the front axle
  - For rear wheels <leaf suspension>: Below the rear axle housing
  - For rear wheels <air suspension>: Below the rear leaf springs



P59205E

WARNING ⚠

- **The jack should be placed on flat, solid ground, and should not be used to raise the vehicle higher than necessary.**
- **Do not use the jack at vehicle locations other than those illustrated.**
- **Keep in mind the danger of slipping jack. Never crawl under the vehicle while the jack is in use or rock the vehicle. Also, do not start the engine while the vehicle is jacked up.**
- **To increase safety, use supports tor the vehicle when it is necessary to leave it jacked up for long periods.**
- **Chock both the tire to be removed and tire diagonally opposite to it so that they will not rotate when you are removing the tire.**



- Loosen wheel nuts slightly. The wheel nuts for right tires have right-hand threads “R”, and the wheel nuts for left tires have left-hand threads “L”.

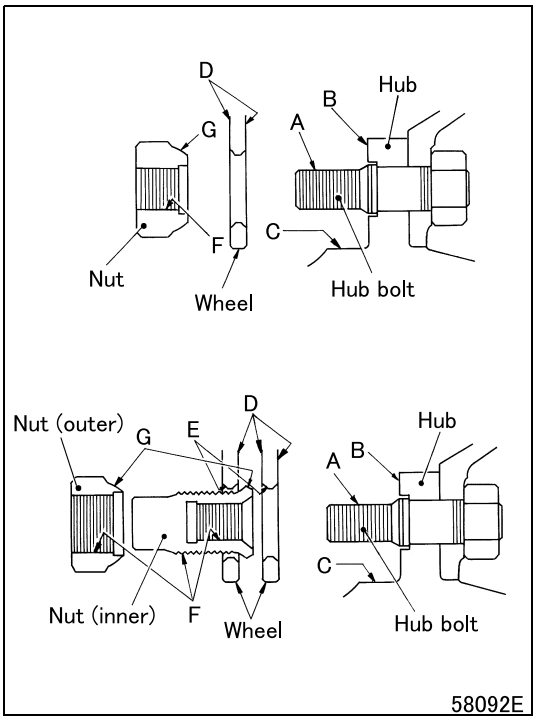
WARNING ⚠

- **Make certain that wheel nut wrench is fully engaged, all the way to the back of nuts. If it is not, it could slip.**

CAUTION ⚠

- **Only loosen wheel nuts slightly. Do not remove them.**

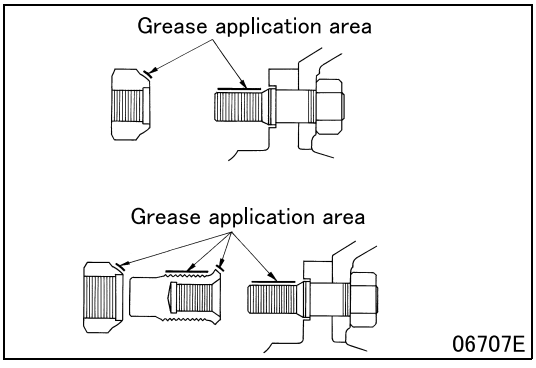
- Jack up the vehicle carefully, until the tire is slightly off the ground.
  Remove wheel nuts, then remove the tire.
- When working on the double tires at the rear of the vehicle, first remove the outside tire, then lower the vehicle and loosen the nuts on the inside tire. After doing this, jack the vehicle back up and remove the tire.

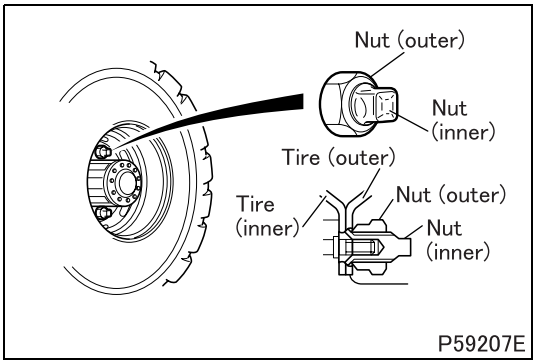


Mounting tires

To prevent wheel nuts and hub bolt from becoming loose and to prevent mounted parts (tire assemblies and hub) from being damaged, remove rust, dust, additional coatings of paint, and foreign particles from the following areas:

A: Hub bolt thread area
B: Wheel mounting surface of hub
C: Wheel alignment area of hub
D: Disc wheel mating surface
E: Disc wheel nut mounting surface
F: Wheel nut thread area
G: Wheel nut spherical area





- Install the dual rear tires as follows:
  - After mounting inner tire and fully tightening inner wheel nuts, jack the vehicle up and mount on outer tire, then tighten outer wheel nuts.
  - Even if only outside tire is to be changed, do not mount it until inner wheel nuts have been fastened at the specified torque.
  - Slide the air valves on the inside and outside tires down when mounting the tires.

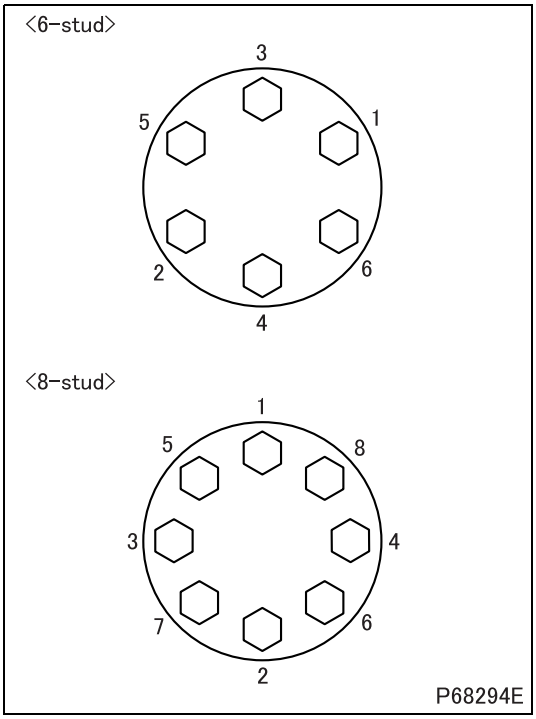
WARNING ⚠

- **If the threads are scored, or the disc wheel is deformed or cracked, change bolts, nuts and disc. Driving the truck before correcting such problems can cause the tire in question to come loose, which could be the source of major accidents.**

CAUTION ⚠

- **Check hub bolt threads carefully for damage before putting the tire on.**

- Place the tapered end of wheel nuts towards the disc wheel and fasten temporarily. Center so that there is no eccentricity between bolts and the disc wheel bolt holes.
- Lower the vehicle.



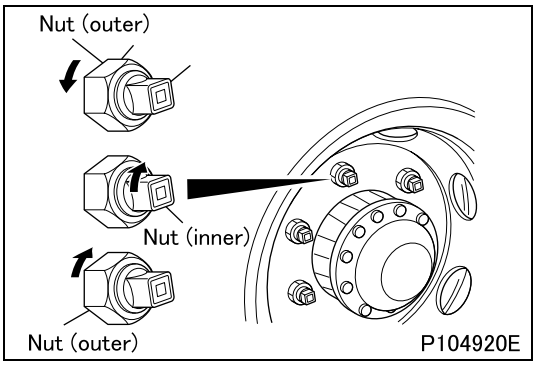
- Tighten the nuts in the order as illustrated, tightening each nut two or three times. To finish, tighten each nut at the specified torque.

WARNING ⚠

- **Always use the specified torque when tightening the wheel nuts. If the wheel nuts are not tightened properly, the wheels could come loose while the vehicle is being driven, which could result in life threatening accidents or the truck being disabled.**

CAUTION ⚠

- **Over-tightening the wheel nuts can damage them.**



Checking the wheel nuts for looseness

The wheel nuts should be checked for looseness every 10,000 km (6,000 miles). All nuts should be tightened at the specified torque.

- Check the double rear tires for looseness as follows:

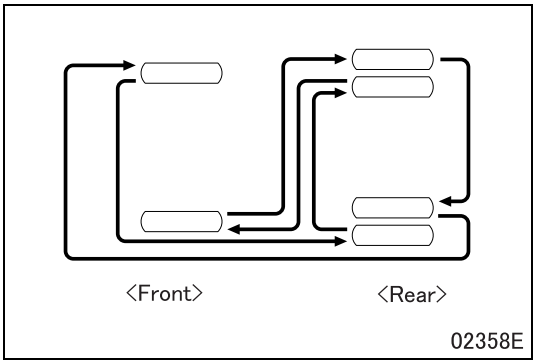
(1) Loosen outer wheel nuts.
(2) Tighten inner wheel nuts at specified torque.
(3) Tighten outer wheel nuts at specified torque.

CAUTION ⚠

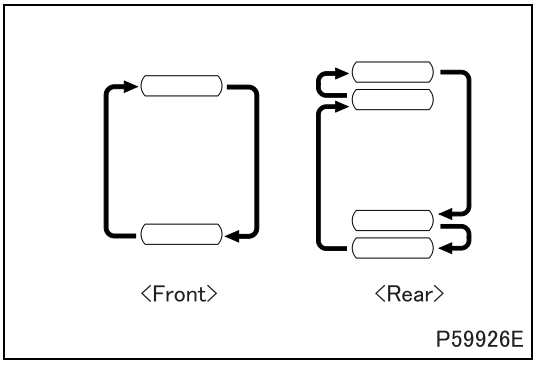
If outer wheel nuts are tightened without first being loosened, it might not be possible to tighten them at the specified torque.

Tire rotation

Tires wear differently, according to the location where they are mounted. To make this wear uniform and prolong the life of your tires, they should be rotated every 10,000 km (6,000 miles) in the rotation order shown below:



- When the tread patterns for all tires are identical:



- When the tread patterns are different for the front and rear tires:

CAUTION ⚠

- **Always adjust air pressure after running-in new tires.**
- **When using tires of different tread patterns, use rib-type patterns for the front tires and traction type patterns for the rear tires.**
- **Avoid using both radial and biased tires on the same vehicle.**

M E M O

LUBRICATION TABLES

*1: 30,000 km/18,000 miles or 6 months, whichever occurs first
*2: 60,000 km/36,000 miles or 12 months, whichever occurs first
*3: FK61F
Ⓔ: Exhaust emission items

Items	Time of inspection and maintenance					Lubrication procedures	Reference Gr

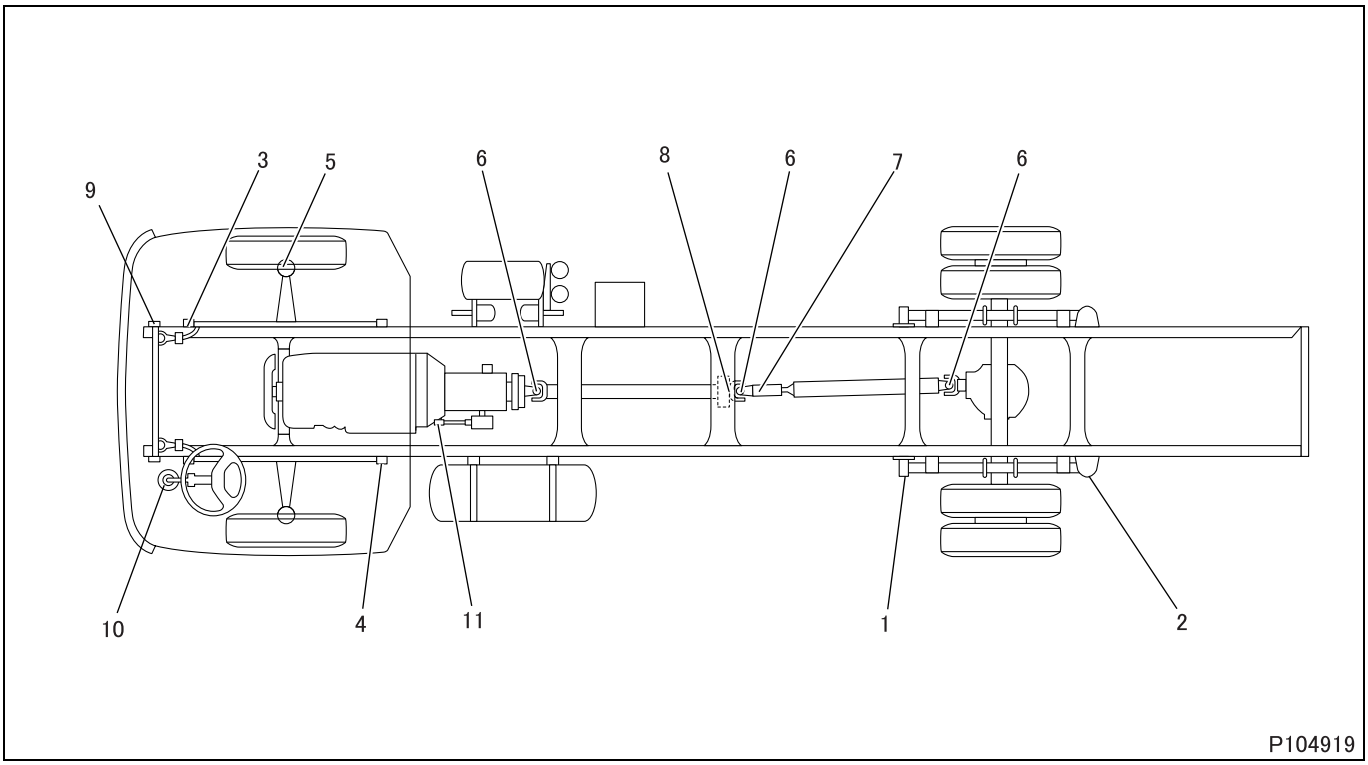
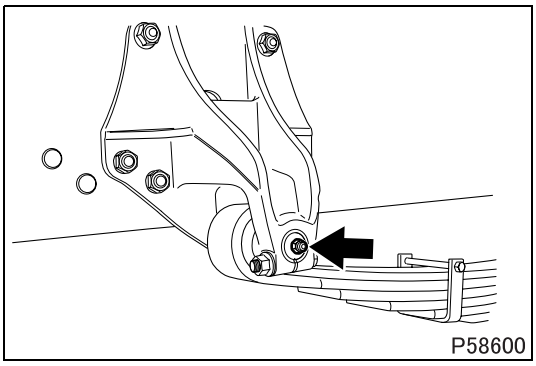
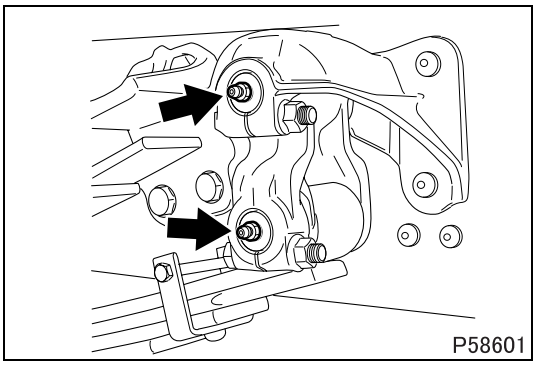
Greasing Various Areas of Chassis

Carefully clean away all dust and dirt from the grease nipples, and use the specified type of grease. The areas to be greased are shown in the following illustration.

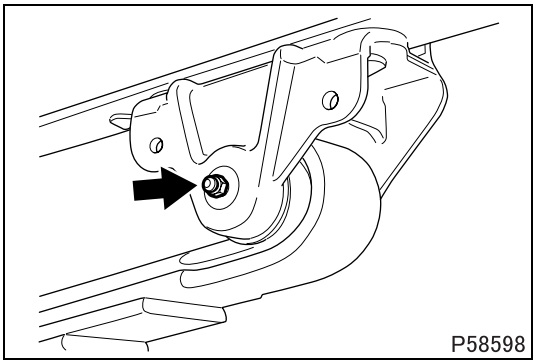




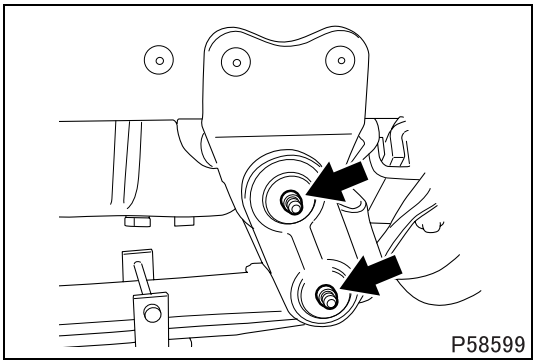
1. Rear spring pin front (left and right, 2 points)
   <Except air suspension>



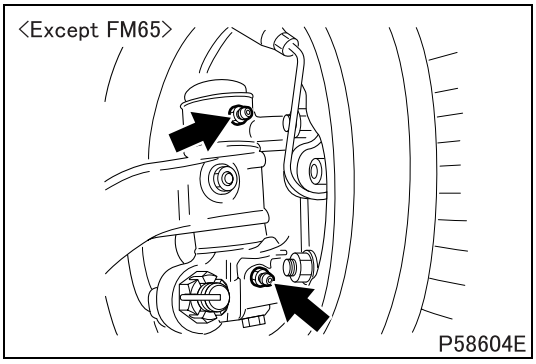
2. Rear spring pin rear (left and right, 4 points)
   <Except air suspension>



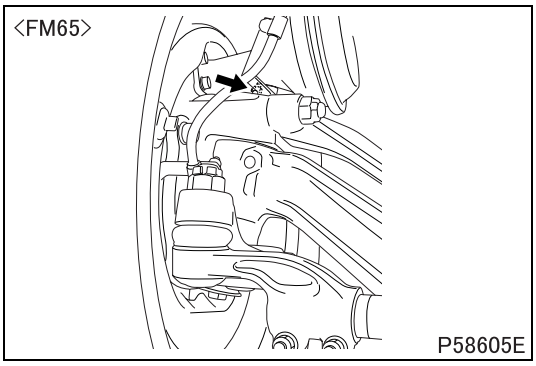
3. Front spring pin front (left and right, 2 points)

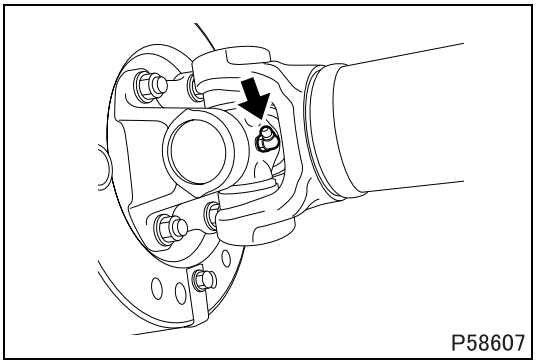


4. Front spring pin rear (left and right, 4 points)

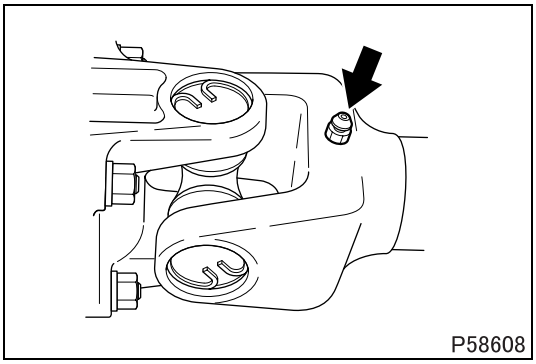


5. Kingpin bearing (left and right, 4 points <Except FM65>, 2 points <FM65>)

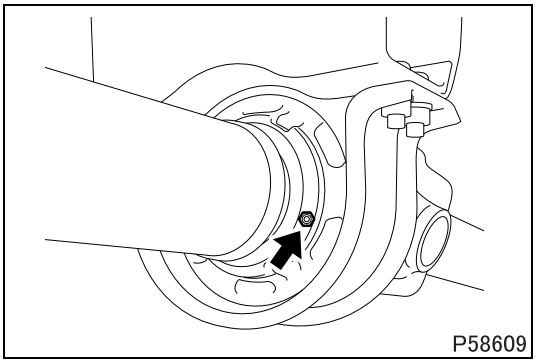




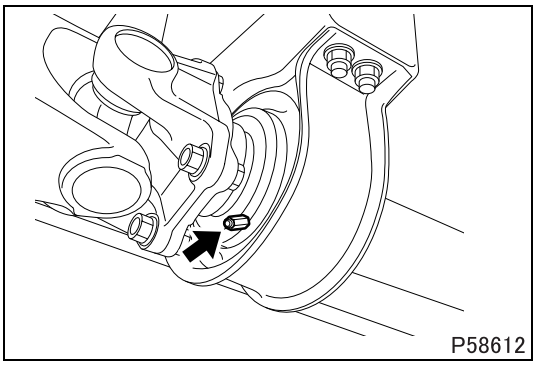
6. Propeller shaft universal joint



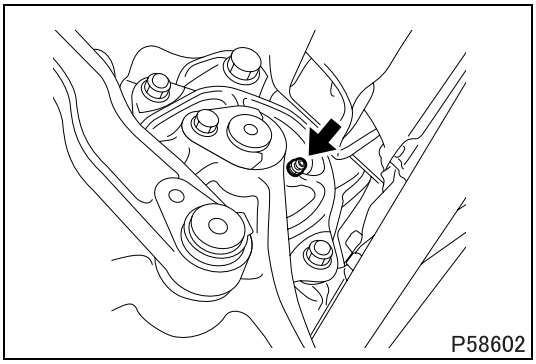
7. Propeller shaft slip joint



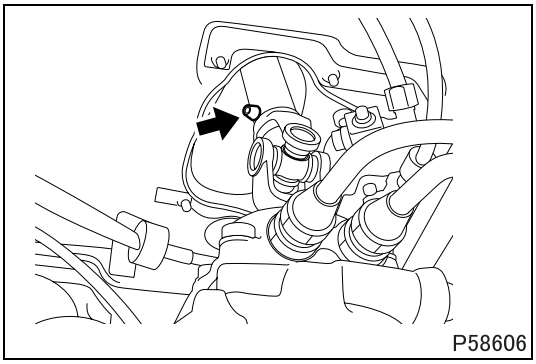
8. Propeller shaft center bearing



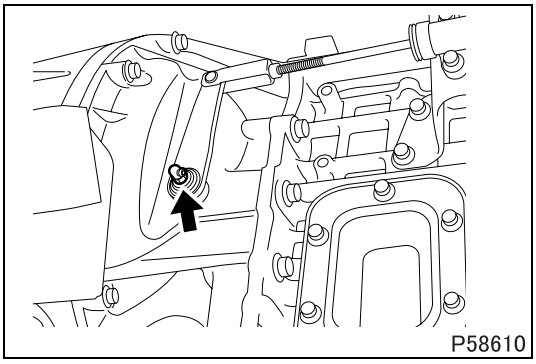
Supply grease to the center bearing until grease overflows from the relief valve at the back of the grease nipple.



9. Cab hinge (left and right, 2 points)



10. Steering shaft



11. Clutch fork shaft (left and right, 2 points)

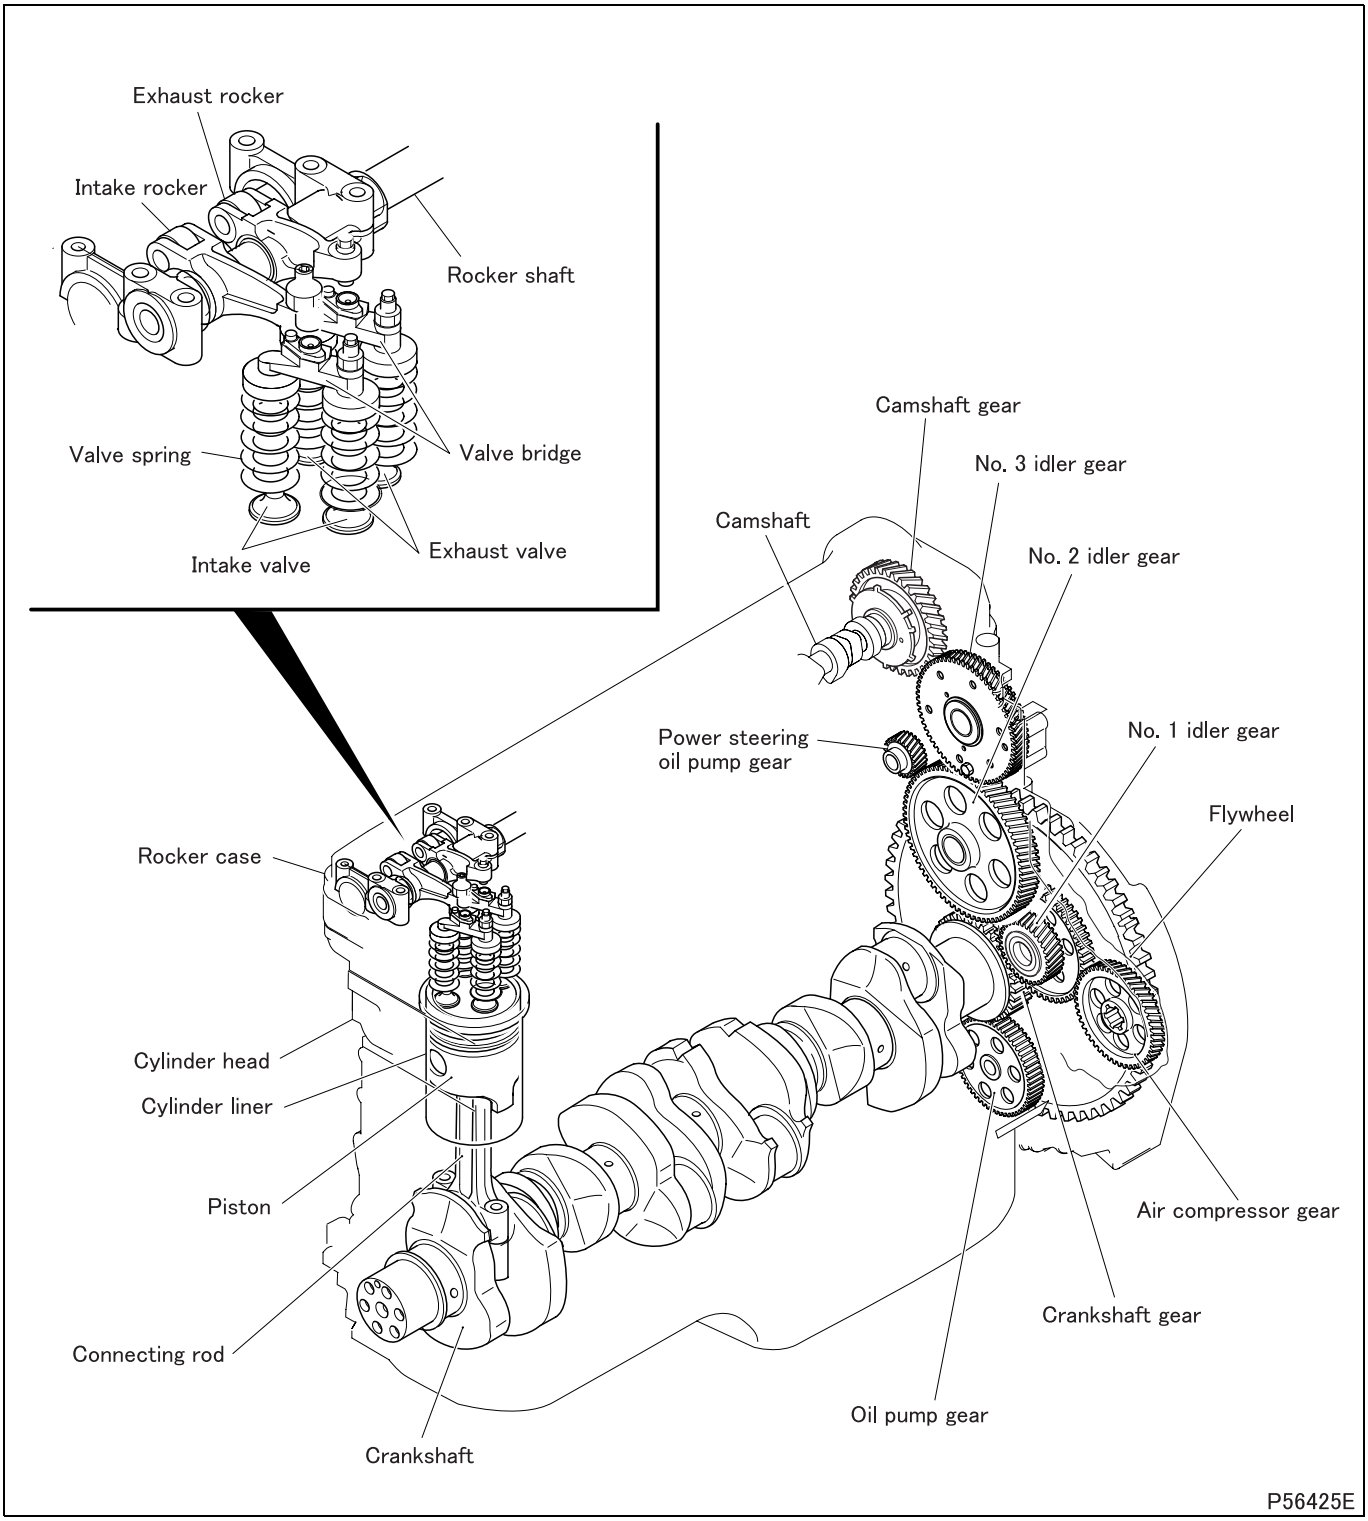
SPECIFICATIONS

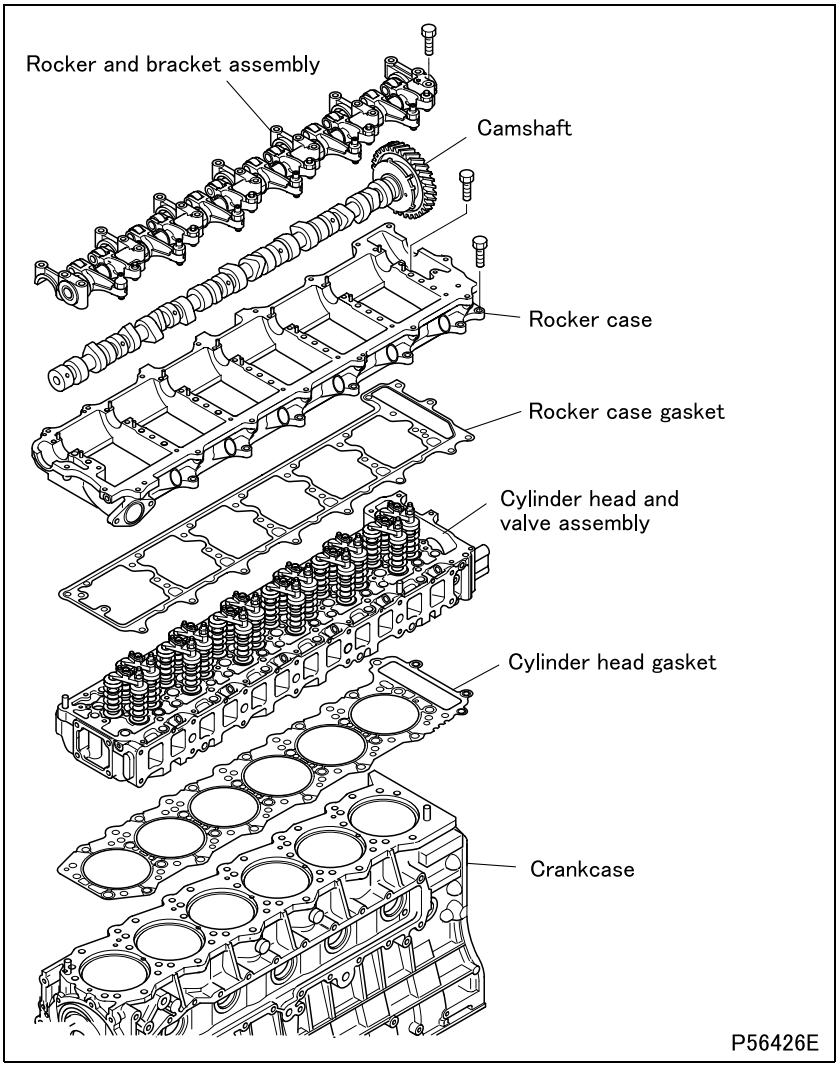
Item		Specifications
Engine mode		6M60T1
Type		6-cylinder, in-line, water-cooled, 4-cycle diesel engine
Combustion chamber		Direct injection type
Valve mechanism		Overhead camshaft (OHC) system
Maximum output	HP/rpm	243/2600
Maximum torque	ft.lbs/rpm	516/1400
Bore × stroke	mm {in.}	ϕ118 × 115 {ϕ4.65 × 4.53}
Total displacement	cm^3 {cu.in.}	7545 {460}
Compression ratio		17.5

1. Engine Proper



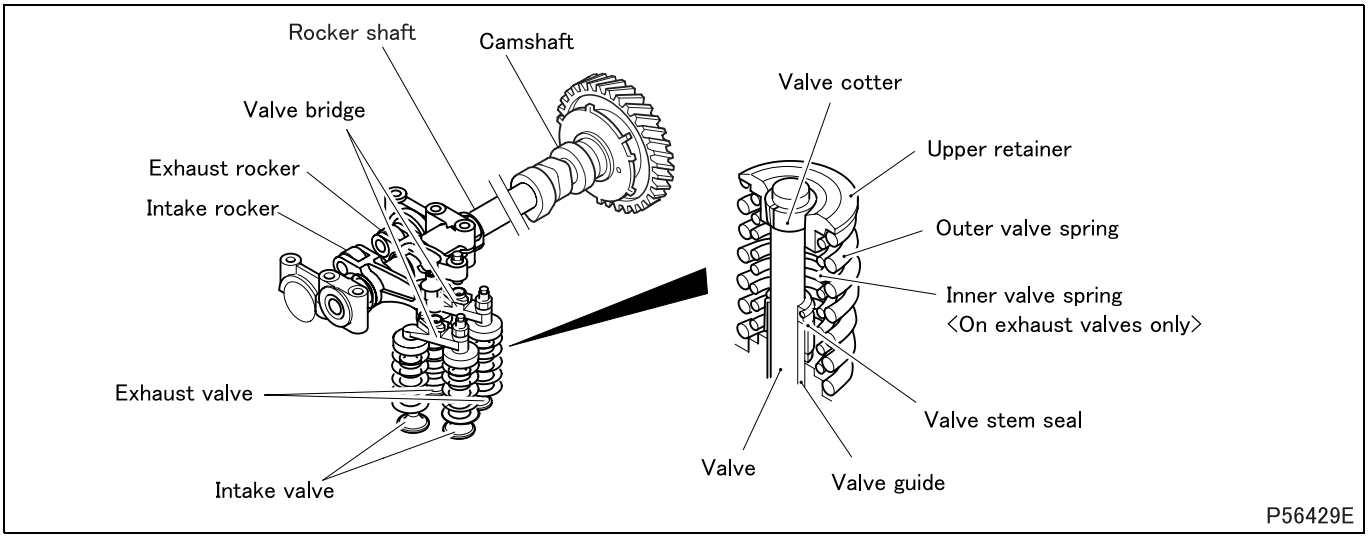
- The 6M6 engine employs an overhead camshaft (OHC) system, with the valve mechanism and the timing gears arranged as shown above.

2. Rocker and Bracket Assembly, Camshaft, Rocker Case and Cylinder Head Gasket



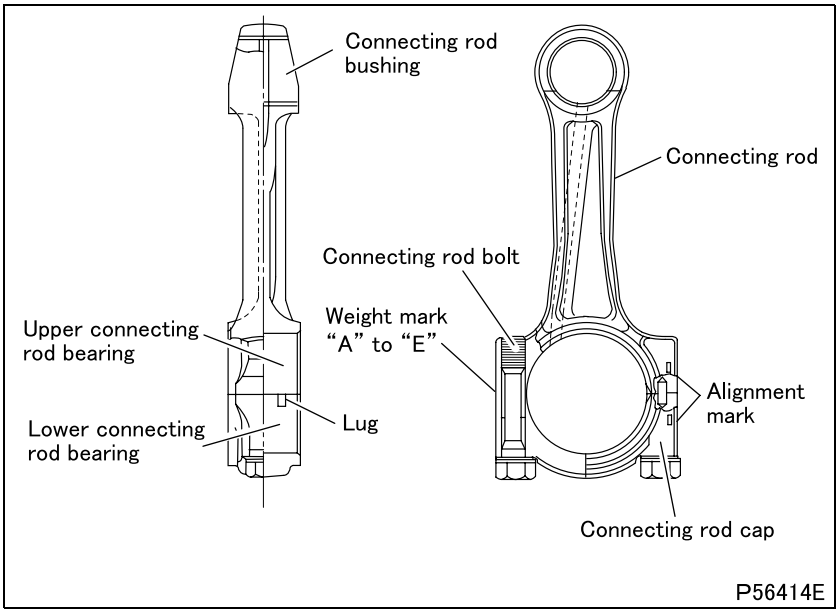
- The camshaft is directly supported at its journals by the rocker case, and is held in place from above by the rocker and bracket assembly.
- The camshaft journals are directly supported by the rocker case and the rocker and bracket assembly, without using any camshaft bearings. The rocker case and brackets have been machined together, meaning that they all need to be replaced for a new set when one of them becomes defective.

3. Valve Mechanism



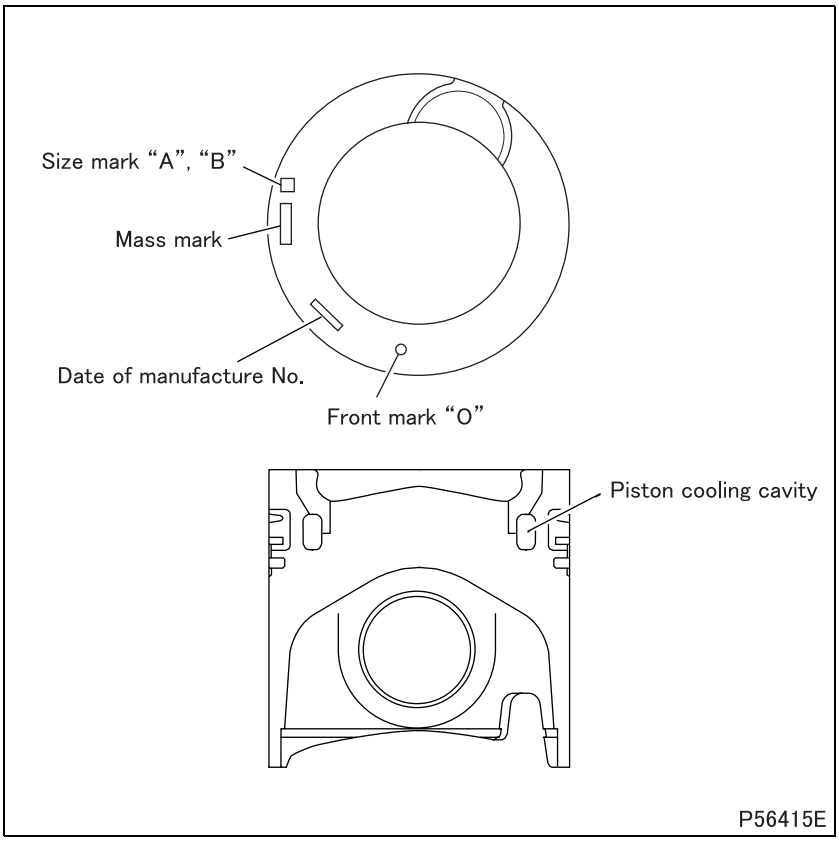
- Each valve has a valve stem seal, which regulates the flow of lubricating oil to the contact surface between the valve and the valve guide.
- The valve springs have a variable pitch to prevent abnormal vibration at high engine speed. The exhaust valves use a double spring, with the inner and outer springs coiled in different directions to prevent them from jamming each other.

4. Connecting Rod



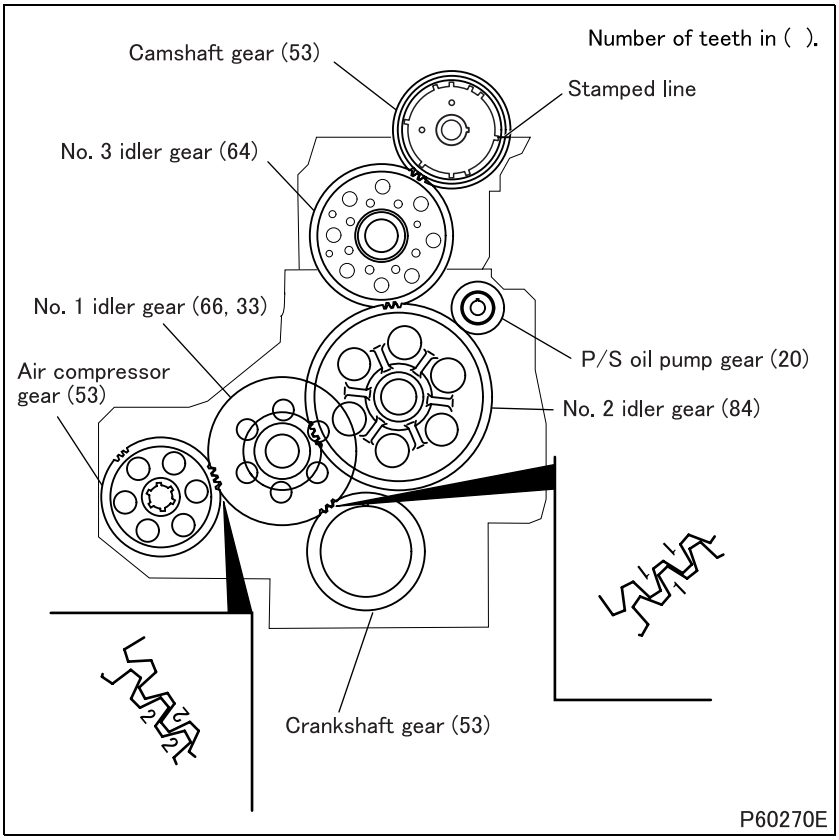
- Weight mark: "A" to "E"
- "E" indicates the greatest connecting rod mass.

5. Piston

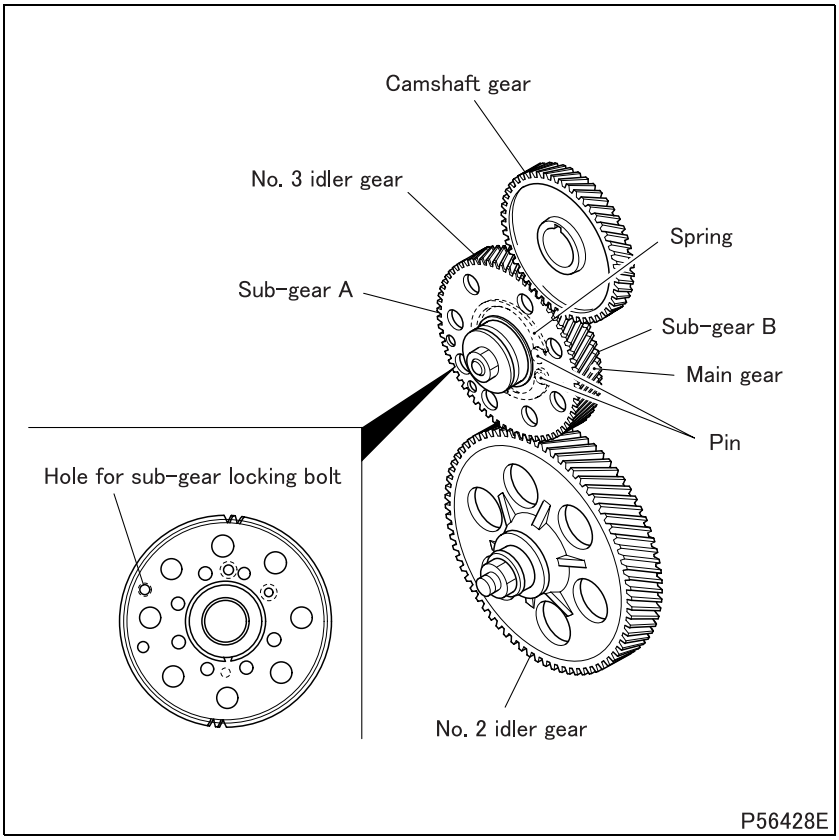


- The piston, the cylinder liner and the crankcase bore all must have the same size marks to ensure a good fit between them.
- The pistons are made of special aluminum alloy, and are provided with a recess on each end of the piston pin boss to reduce weight.

6. Timing Gears

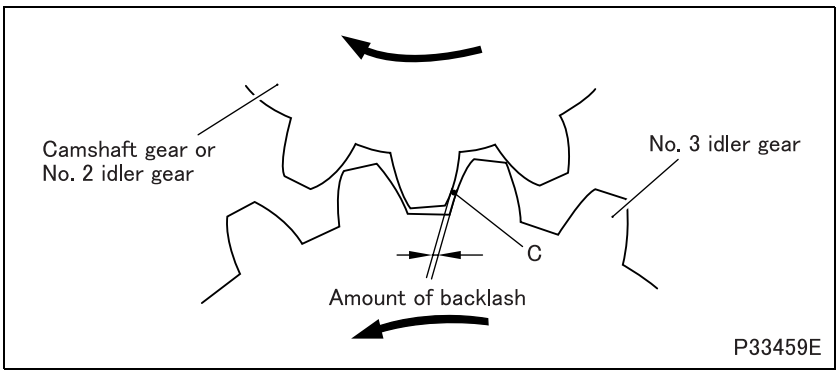


- The timing gears are provided with timing marks to help ensure correct assembly.
- Timing marks are provided on the following gears.
  - Camshaft gear: stamped line
  - Crankshaft gear: "1"
  - Air compressor gear: "2"
  - No. 1 idler gear: "1", "2"



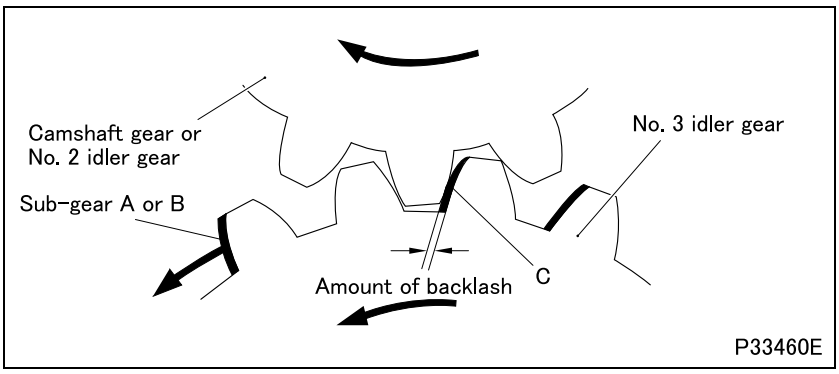
6.1 No. 3 idler gear

- The No. 3 idler gear consists of the sub-gear A, the sub-gear B and the main gear.
- A spring is installed between the sub-gear A and the main gear, as well as between the sub-gear B and the main gear. The springs are locked in place with pins.
- The sub-gears are installed as follows. The sub-gear A has been turned in such a way as to compress the spring before meshing with the camshaft gear. Likewise, the sub-gear B has been turned to compress the spring before meshing with the No. 2 idler gear.



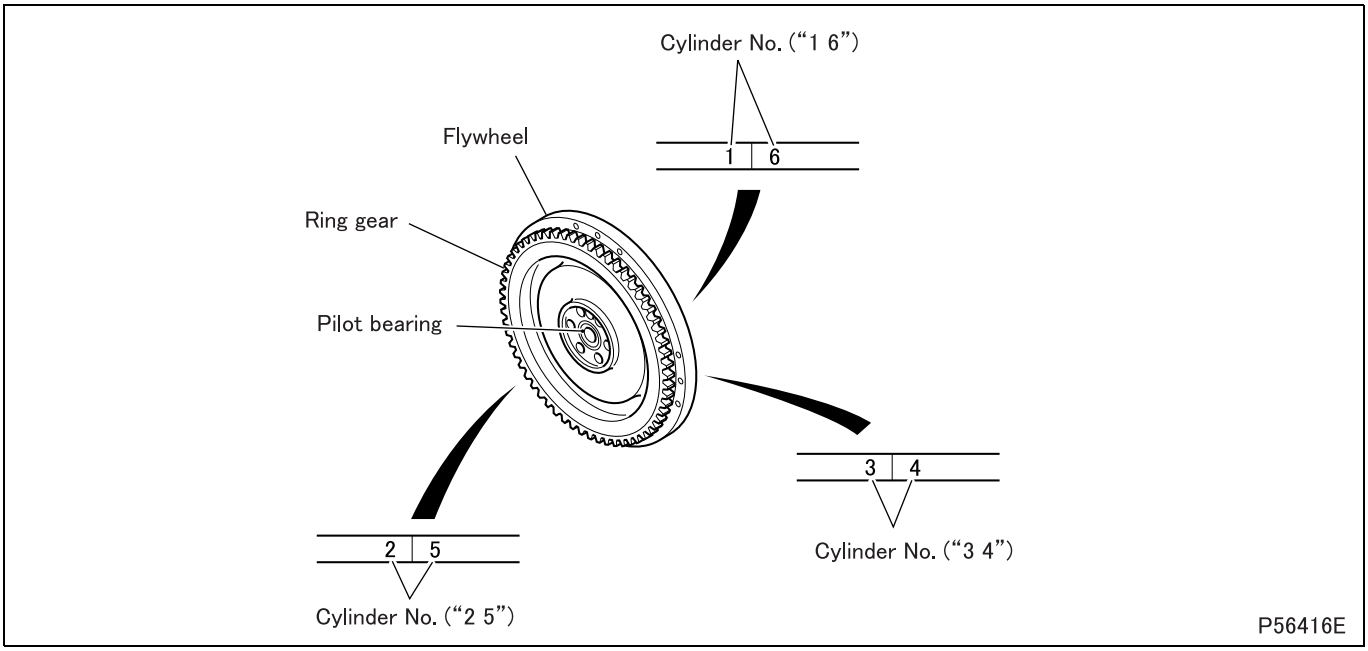
(1) Non-backlash mechanism

- Engine hunting during idling causes fluctuation in the speed of camshaft and No. 2 idler gears.
- Without the non-backlash mechanism, the backlash at C changes between zero and the maximum, generating gear rattle noise.



- With the non-backlash mechanism equipped on the engine, the sub-gears A and B maintain the backlash at C to zero even when the engine hunts, eliminating gear rattle during idling.

7. Flywheel



- One side of each flywheel ring gear tooth is chamfered to facilitate the engagement of the starter pinion.

Possible causes \ Symptoms		Low power output	Abnormal engine noise	Reference Gr
Cylinder head and valve mechanism	Incorrect valve clearance	O	O	
	Defective cylinder head gasket	O	O	
	Worn valve and valve seat; carbon deposits	O	O	
	Weakened valve spring	O	O	
	Defective rocker shaft and bracket		O	
	Poor lubrication of rocker shaft bracket		O	
Timing gears	Incorrect backlash in timing gears		O	
	Poor lubrication of timing gears and idler shaft		O	
Camshaft	Excessive end play in camshaft		O	
	Worn camshaft		O	
Pistons and connecting rods	Worn/damaged piston ring groove(s)	O	O	
	Worn/damaged piston ring(s)	O	O	
	Worn piston pin and connecting rod small end		O	
Crankshaft	Excessive end play in crankshaft		O	
	Incorrectly fitted crankshaft pulley		O	
	Worn/damaged crankshaft pins and connecting rod bearings		O	
	Worn/damaged crankshaft journals and main bearings		O	
Fuel system	Supply pump faulty	O	O	Gr13EA
	Defective injector	O	O	
	Air trapped in fuel system	O		Gr13A

ON-VEHICLE INSPECTION AND ADJUSTMENT

1. Measuring Compression Pressure

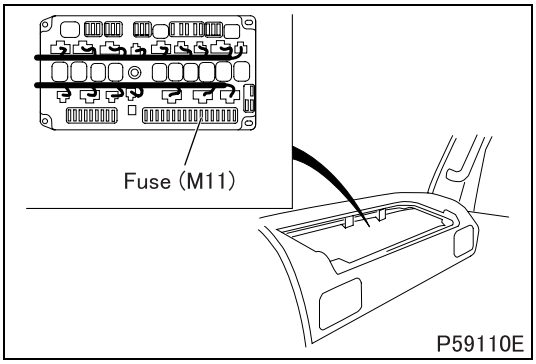
Service standards

Location	Maintenance item		Standard value	Limit	Remedy
–	Compression pressure	Each cylinder (at 200 rpm)	2,940 kPa {426 psi, 30 kgf/cm^2}	1,960 kPa {284 psi, 20 kgf/cm^2}	Inspect
		Cylinder-to-cylinder pressure difference	–	390 kPa {57 psi, 4 kgf/cm^2} or less	Inspect

Special tools (Unit: mm)

Mark	Tool name and shape	Part No.	Application
a	Compression gauge adapter A: 16 W × 18 threads  13660	MH063384	Measuring compression pressure
b	Nozzle extractor A: M18 × 1.25  13523	MH061071	Removal of injector
c	Injector extractor adaptor  P36242	MH062560	Removal of injector (used with MH061071)

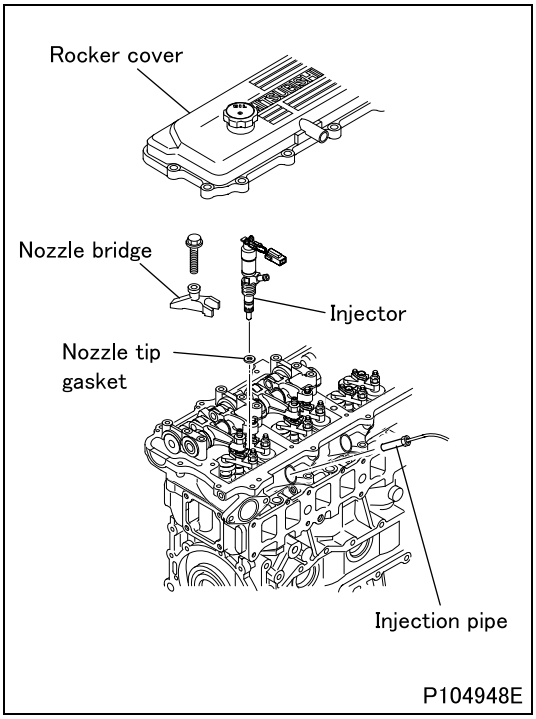
- A drop in compression pressure can be used as a guide to determine when the engine should be overhauled.
- Measure the compression pressure at regular intervals. Keeping track of its transitions can provide a useful tool for troubleshooting. On new vehicles and vehicles with newly replaced parts, the compression pressure will be somewhat higher depending on the break-in condition of piston rings, valve seats, etc., but this will return to normal as the parts wear down.
- Before the compression measurement, confirm that the engine oil, starter, and battery are in normal condition.
- Place the vehicle in the following conditions.
  - Warm up the engine until the coolant temperature reaches approximately 75 to 85°C {167 to 185°F}.
  - Turn off the lights and auxiliaries.
  - Place the transmission in neutral. (Place the automatic transmission in P range.)
  - Place the steering wheel in the straight-ahead position.



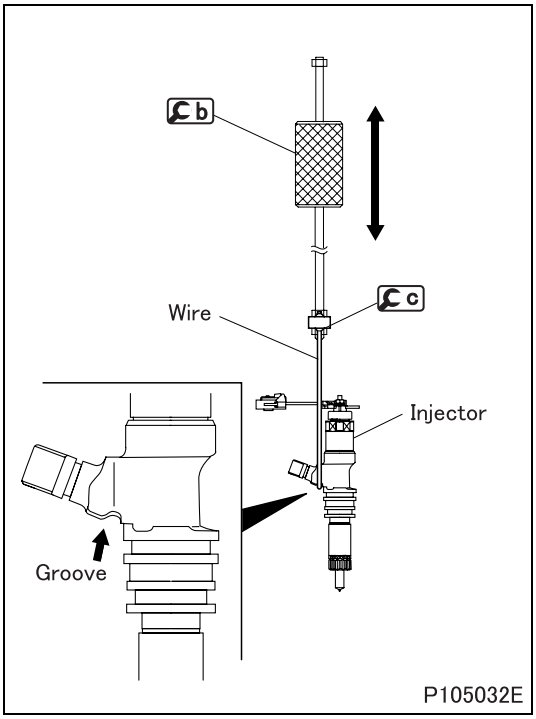
- Remove the fuse (M11) from the relay and fuse box in the cab to prevent fuel from being injected while the engine is cranked using the starter.

CAUTION ⚠

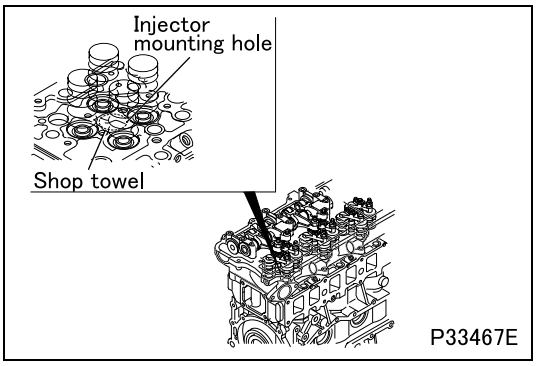
- **When cranking the engine, never shut off the power to the engine electronic control unit by disconnecting the engine electronic control unit connector or the like.**
- **If the engine is cranked while shutting off the power to the engine electronic control unit, the electronic control unit cannot control the supply pump and this may cause failure to the pump.**



- Remove all the injectors.



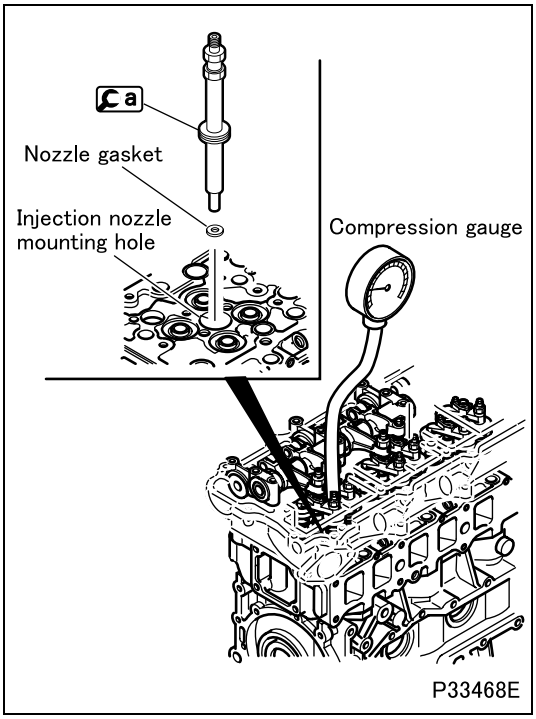
- Remove the injector using b and c, with the wire of c engaged in the groove on the injector.



- Cover the injector mounting holes with shop towels or other similar cloth. Crank the engine using the starter. Ensure that no foreign matter is attached on the shop towels.

WARNING ⚠

- **If cracks or any other damage are evident in the cylinders, this means that the coolant, engine oil or fuel, or other substances, has entered the cylinders. If this is the case, it is extremely dangerous to crank the engine as these substances will gush out at high temperature from the injector mounting holes. Stay away from the engine when cranking it.**



- Attach the nozzle gasket and a to one of the injection nozzle mounting holes. Then, connect a compression gauge to a.
- Crank the engine and measure the compression pressure.
- Measure the compression pressure for all the cylinders one after another. Determine the compression pressure difference between the cylinders.
- If the compression pressure is below the limit or the cylinder-to-cylinder pressure differences is not within the limit, pour a small amount of engine oil into the corresponding injection nozzle mounting hole and remeasure the compression pressure.
  - If the compression pressure increases, the piston rings and cylinder surfaces may be badly worn or otherwise damaged.
  - If the compression pressure remains unchanged, there may be seizure in the valves, the valves may be incorrectly seated or the cylinder head gasket may be defective.

- After the measurement and before installing the rocker cover, reapply sealant to the packing (half-round) between the rocker case upper and rocker case. (See ROCKER COVER, ROCKER AND BRACKET, CAMSHAFT.)

2. Inspection and Adjustment of Valve Clearances

Service standards (Unit: mm {in.})

Location	Maintenance item	Standard value	Limit	Remedy
–	Valve clearance (when cold)	0.6 {0.024}	–	Adjust

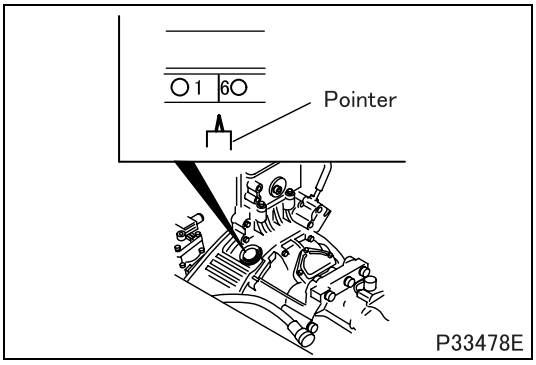
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
–	Lock nut (adjusting screw tightening)	59 {44, 6.0}	–
–	Lock nut (rocker arm adjusting screw tightening)	34 {25, 3.5}	–

Special tools

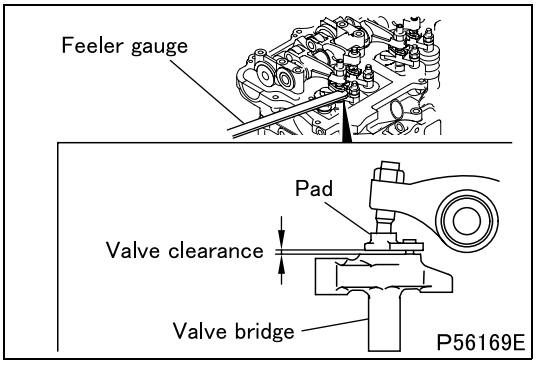
Mark	Tool name and shape	Part No.	Application
a	Socket wrench  14437	MH063003	Tightening the lock nut

- Valve clearances should be checked and adjusted as follows while the engine is still cold.



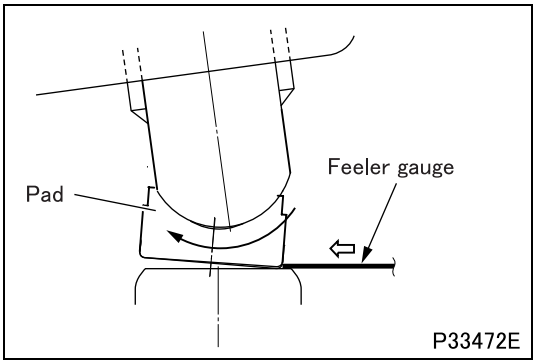
[Inspection]

- Remove the rocker cover.
- Bring the No. 1 or No. 6 cylinder piston to the top dead center (TDC) on the compression stroke according to the following procedure:
  - Rotate the crankshaft until the pointer is aligned with the “1 6” mark on the flywheel.
  - This will place either the No. 1 or No. 6 cylinder piston at TDC on the compression stroke. The cylinder in which the rocker arms for both the intake and exhaust valves can be pushed down by hand by the valve clearance amounts has its piston at TDC. Rotate the engine by one full turn to switch the TDCs of the No. 1 and No. 6 cylinder pistons.

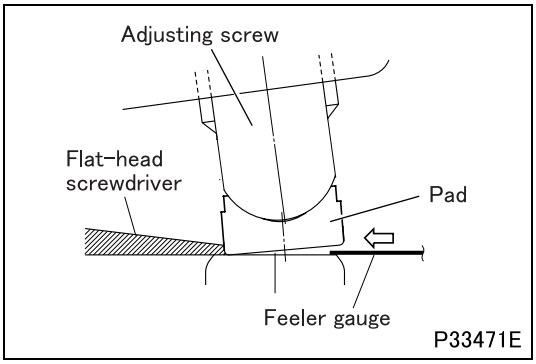


- With the No. 1 or No. 6 cylinder piston at TDC, measure the clearance of the valves (clearance between valve bridge and pad) marked with a circle in the table below.

Cylinder No.	1		2		3		4		5		6	
Valve	IN	EX	IN	EX	IN	EX	IN	EX	IN	EX	IN	EX
No. 1 cylinder piston at TDC on compression stroke	O	O	O	–	–	O	O	–	–	O	–	–
No. 6 cylinder piston at TDC on compression stroke	–	–	–	O	O	–	–	O	O	–	O	O

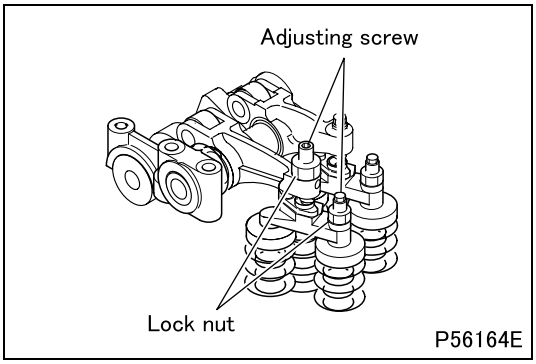


- Any attempt to insert a feeler gauge without first securing sufficient space, as described above, between the pad and the valve bridge will fail, as the pad will tilt as shown in the illustration, thus blocking the entry of a feeler gauge.

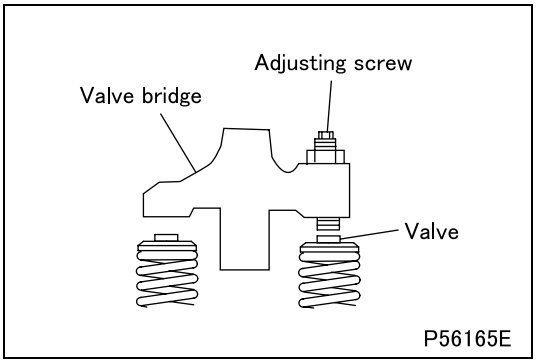


- Before inserting a feeler gauge, push the adjusting screw pad on the side opposite from where a feeler gauge is to be inserted, as shown in the illustration, using a flat-head screwdriver or other similar tool. This will create space necessary for the gauge to be inserted.
- The measurement is correct when the feeler gauge feels slightly resisted as it is inserted.
- The measurement is not yet correct if the feeler gauge can still be inserted smoothly.
- If the measurement deviates from the standard value, adjust as follows.

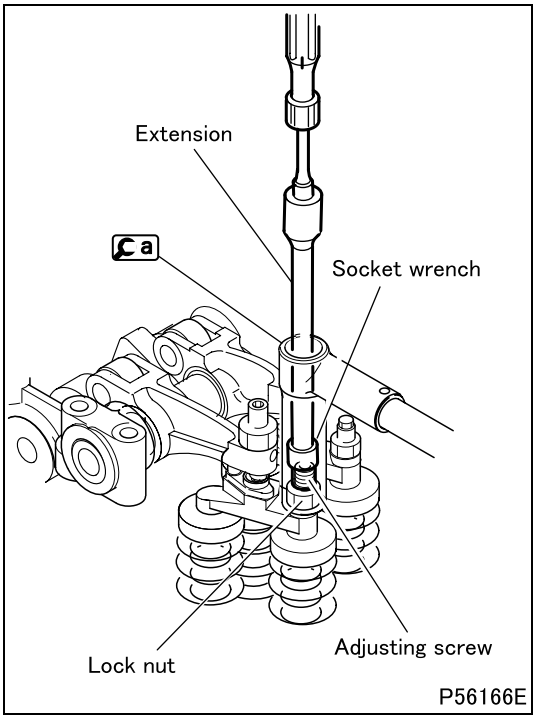
[Adjustment]



- Loosen the lock nuts and adjusting screws on the valve bridge and rocker arm.



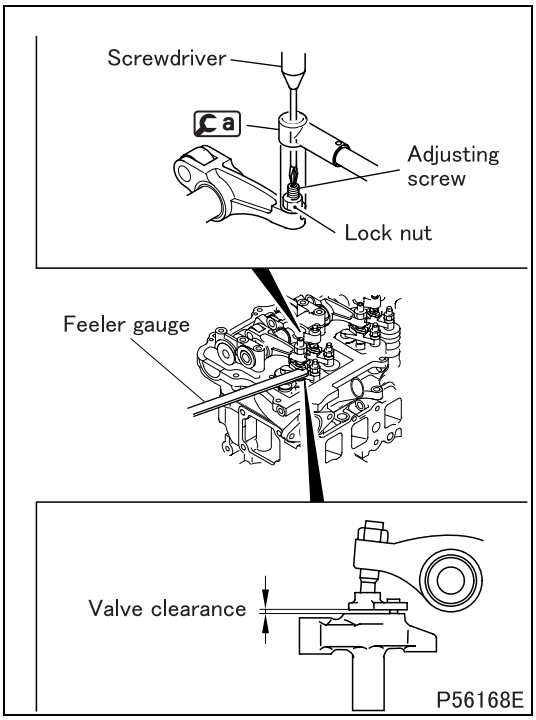
- While holding the valve bridge by hand, screw in the adjusting screw until it lightly contacts the valve stem end.
- Then, further screw in the adjusting screw by 45°.



- While holding the adjusting screw in this position with a socket wrench and extension, tighten the lock nut to the specified torque using a.

CAUTION ⚠

- **After adjusting the adjusting screw, be sure to tighten the lock nut to the specified torque. Insufficient torquing will compromise the parallelism of the valve bridge, damaging the valve mechanism.**

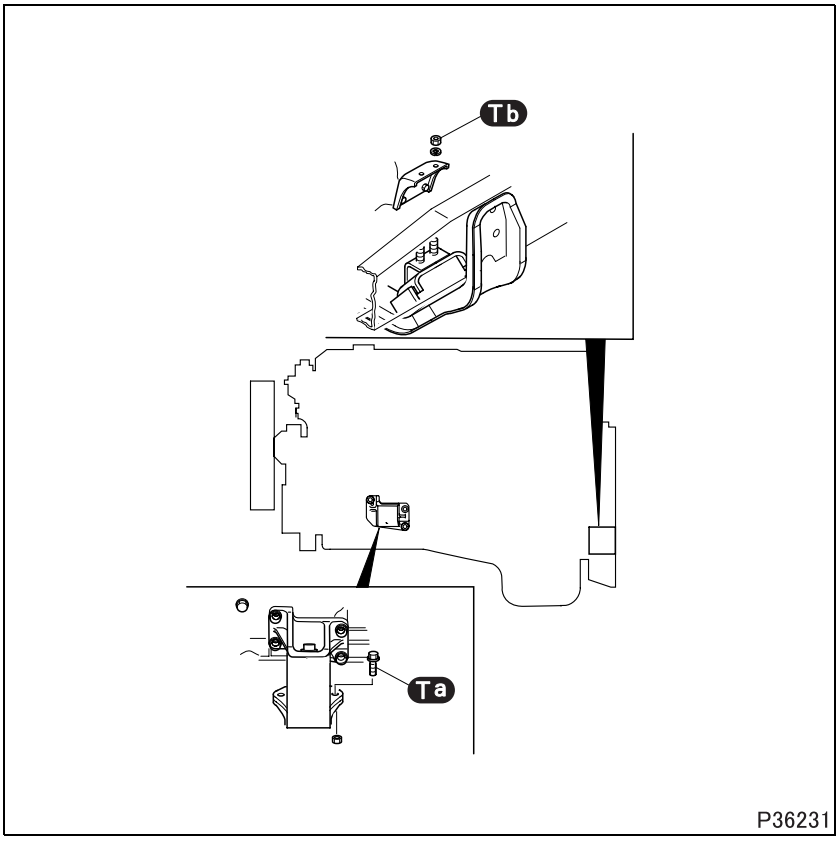


- Screw in or out the adjusting screw on the rocker arm until the correct feeler gauge can be inserted with a slight resistance.
- While holding the adjusting screw in this position with a screwdriver, tighten the lock nut to the specified torque using a.
- Recheck the valve clearance using the correct feeler gauge.

[Installation]

- Before installing the rocker cover, reapply sealant to the packing (half-round) between the rocker case upper and rocker case. (See ROCKER COVER, ROCKER AND BRACKET, CAMSHAFT.)

M E M O



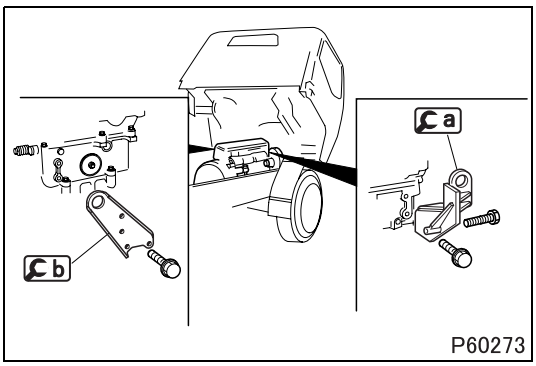
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Bolt (front engine mounting installation)	50 to 65 {37 to 48, 5.0 to 6.5}	–
Tb	Nut (rear engine mounting installation)	60 to 85 {44 to 63, 6.0 to 8.5}	–

Special tools

Mark	Tool name and shape	Part No.	Application
Ca	Front hanger  P59850	ME303276	Removal and installation of engine
Cb	Rear hanger  P59851	ME303283	Removal and installation of engine

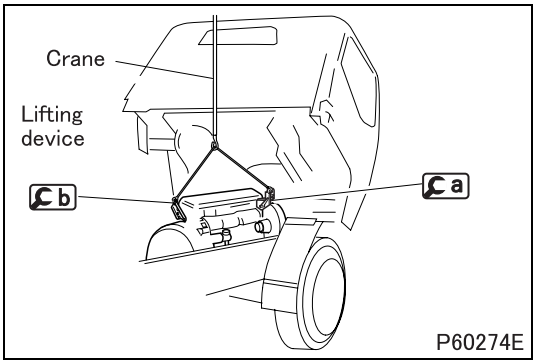
◆Work before removal◆



■ **Preparation: Installation of engine hangers**

- Install a onto the cylinder head and exhaust manifold using three flange bolts (2 × 22 mm-long M10 × 1.5 mm bolts and 1 × 76 mm-long M10 × 1.5 mm bolt). Tighten the bolts to a torque of 76 N·m {55 ft.lbs, 7.7 kgf·m}.
- Install b onto the cylinder head and flywheel housing using four flange bolts (22 mm-long M10 × 1.5 mm). Tighten the bolts to a torque of 76 N·m {55 ft.lbs, 7.7 kgf·m}.

◆Removal procedure◆



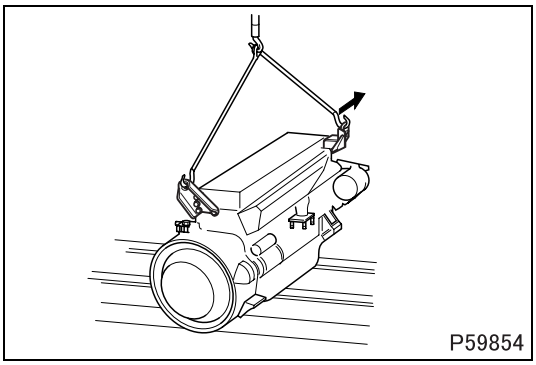
■ **Removal: Engine and transmission**

- Hook a lifting device onto a and b, and lift the device with a crane until it is taut.

WARNING ⚠

- Use a lifting device that can comfortably withstand the mass of the engine (approx. 700 kg {1540 lb.}).

- Ensure that the harnesses, piping and other relevant parts have been disconnected.



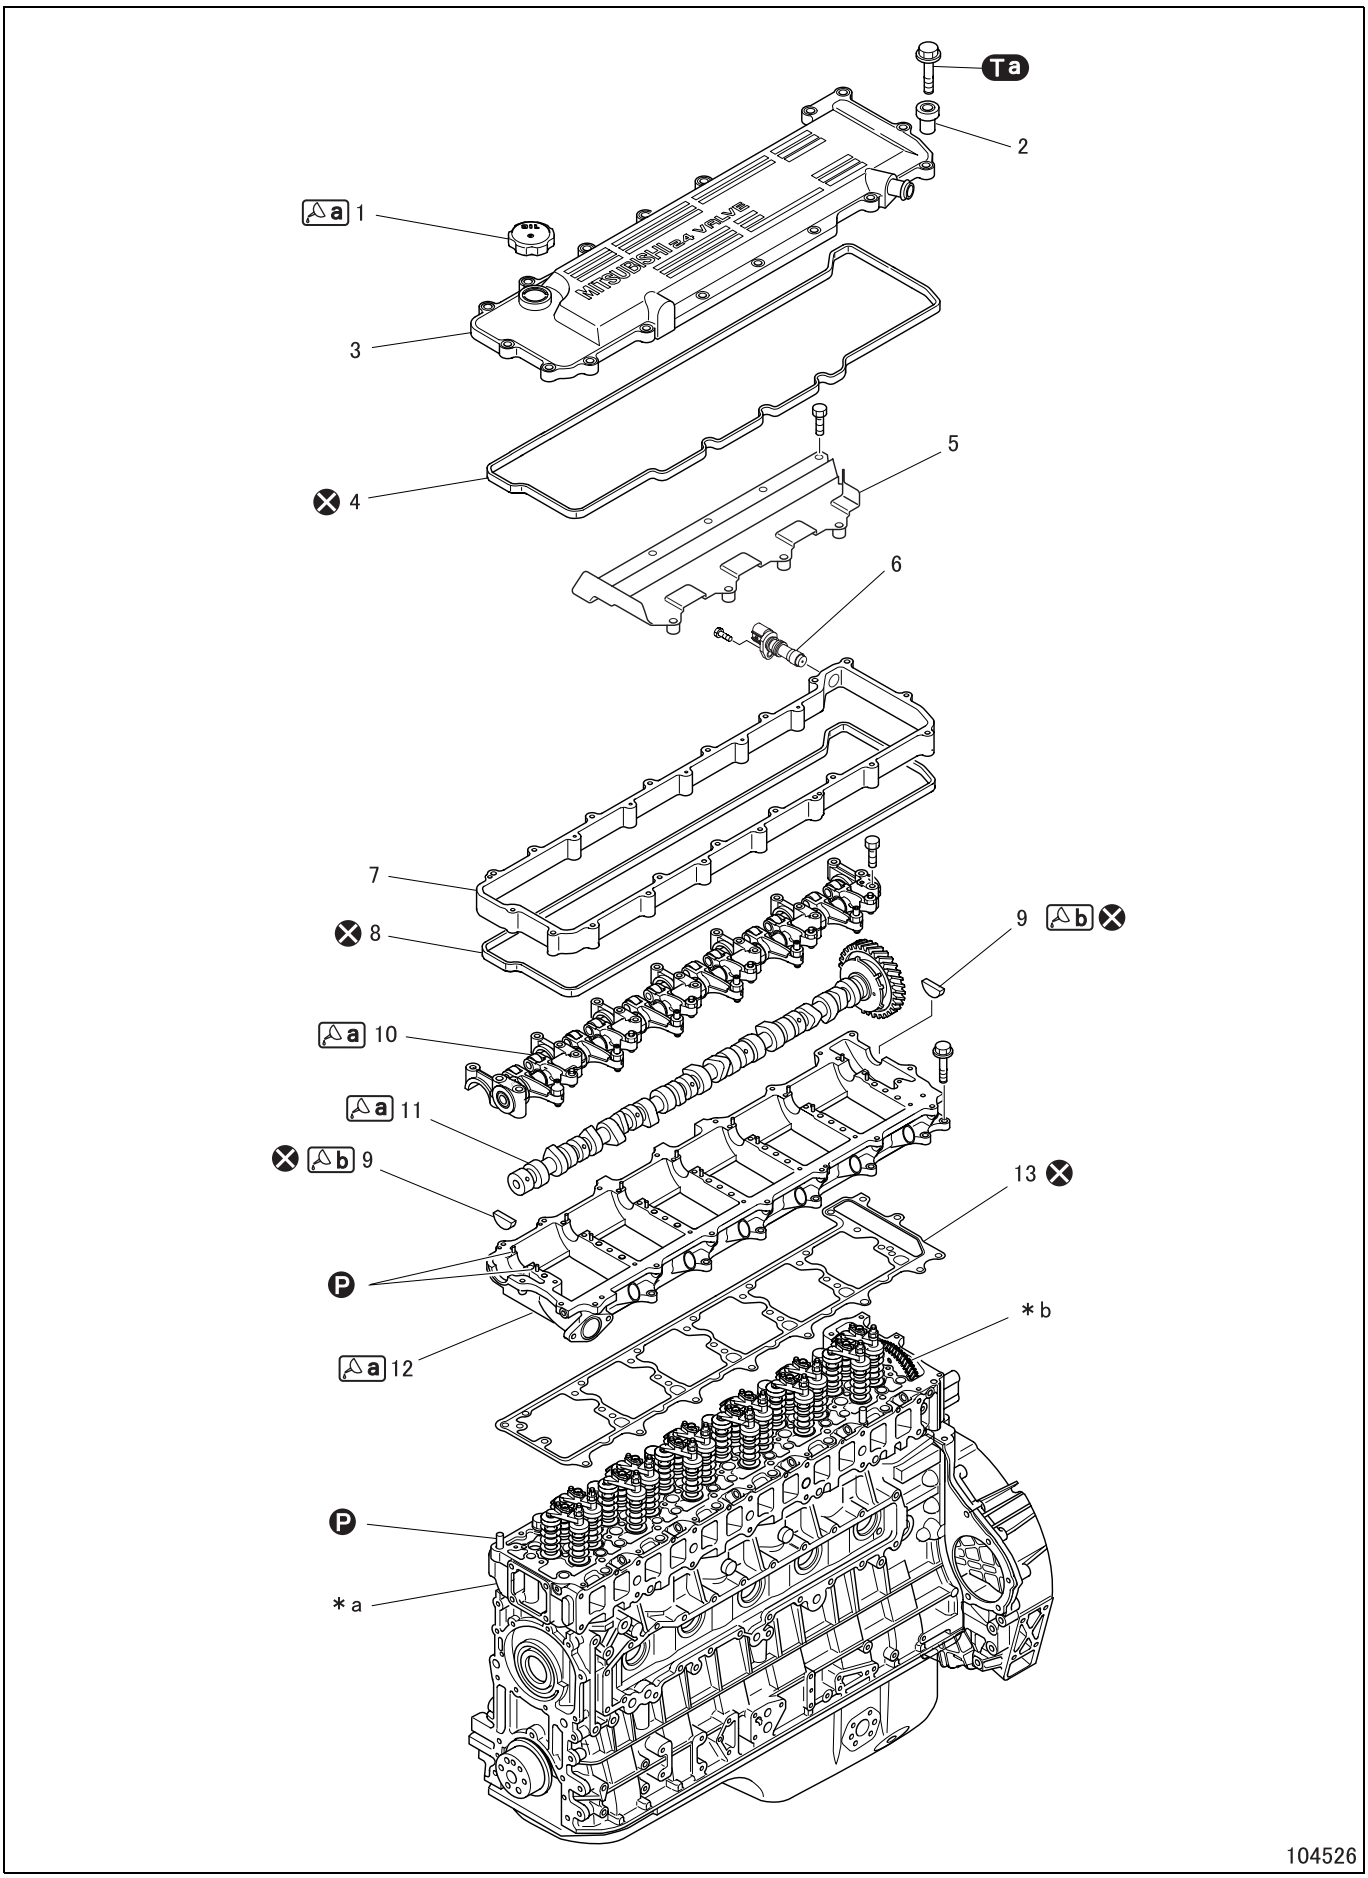
- Remove the bolts and nuts from the engine mounts. Slowly lift the engine, taking care not to hit the engine against the frame or cab.
- Once the bottom of the engine is out of the frame, turn the engine by 90° and remove it out of the vehicle.

◆Installation procedure◆

■ **Installation: Engine and transmission**

- Follow the removal sequence in reverse.
  (See "■ **Removal: Engine and transmission**".)

ROCKER COVER, ROCKER AND BRACKET, CAMSHAFT



● **Disassembly sequence**

1 Oil filler cap
2 Rubber
3 Rocker cover
4 Rocker cover gasket
5 Baffle plate
6 Cylinder recognition sensor
7 Rocker case upper
8 Rocker case upper gasket
9 Packing
10 Rocker and bracket assembly (See later section.)
11 Camshaft (See later section.)
12 Rocker case
13 Rocker case gasket

Ⓟ: Locating pin
⊗: Non-reusable parts
***a**: Cylinder head
***b**: No. 3 idler gear

CAUTION ⚠

- **The rocker case and the brackets of the rocker and bracket assembly have been machined together, which means that they all must be replaced together. Never swap the locations of the brackets, either.**

● **Assembly sequence**

Follow the disassembly sequence in reverse.

NOTE

- **Tighten the rocker case mounting bolts diagonally from the center towards the ends.**

Service standards (Unit: mm {in.})

Location	Maintenance item	Standard value	Limit	Remedy
–	Camshaft end play	0.05 to 0.20 {0.0020 to 0.0079}	0.4 {0.016}	Inspect
11, *b	Backlash between camshaft gear and No. 3 idler gear	0.18 to 0.26 {0.0071 to 0.010}	0.35 {0.014}	Replace

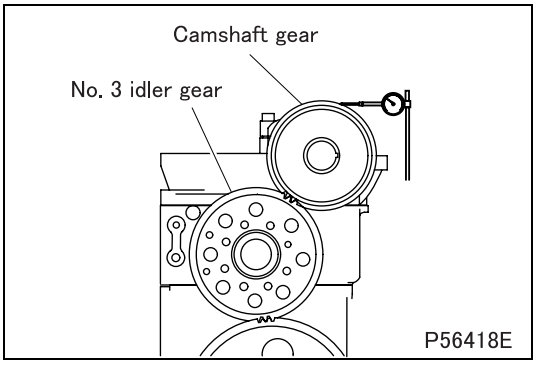
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Bolt (rocker cover mounting)	9 {6.5, 0.9}	–

Lubricant and/or sealant

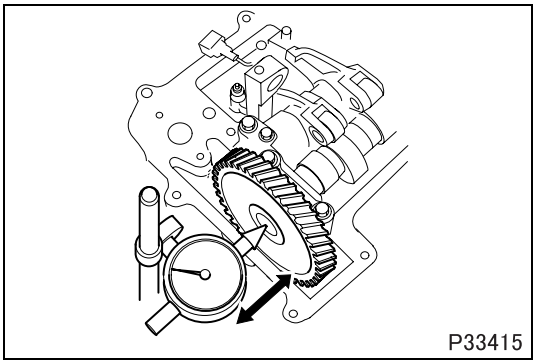
Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Rubber portion of oil filler cap	Engine oil	As required
	Camshaft journal supports on rocker and bracket assembly		
	Camshaft journals and cams		
	Camshaft journal supports on rocker case		
b	Periphery and top surface of packing	ThreeBond 1217H	As required

◆**Work before removal**◆



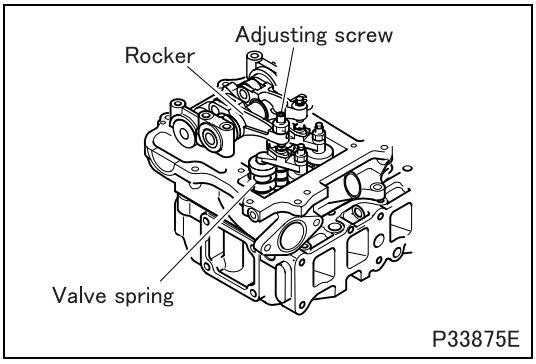
■ **Inspection: Backlash between camshaft gear and No. 3 idler gear**

- Measure the backlash at least at three different locations. If the measurement exceeds the limit, replace the defective part(s).



■ **Inspection: Camshaft end play**

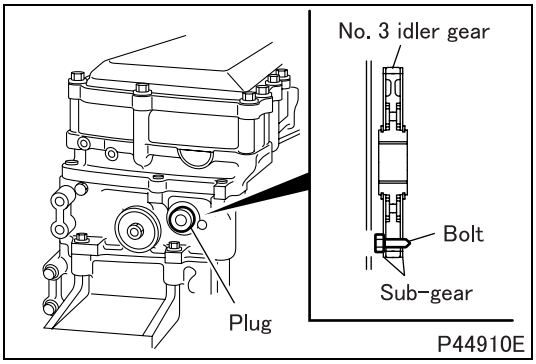
- If the measurement exceeds the limit, replace the defective part(s).



■ **Releasing valve spring force**

- Before loosening the rocker and bracket assembly mounting bolts, check whether the valve springs are compressed by the rockers. If so, loosen the adjusting screws on the rockers to relieve the spring force. This will eliminate the possibility of compressed springs damaging parts when they are released.

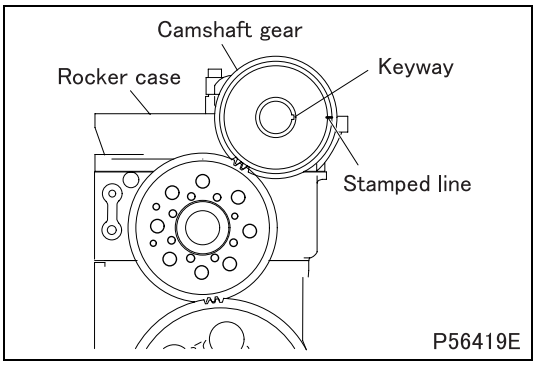
◆Removal procedure◆



■ **Removal: Camshaft**

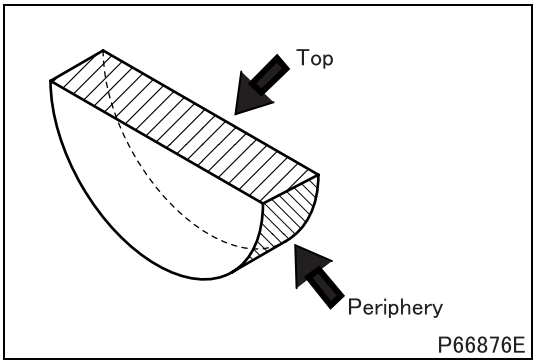
- Remove the plug at the rear end of the cylinder head.
- Insert a sub-gear locking bolt (M8 × 1.25 mm) into the dedicated hole in the No. 3 idler gear to lock the sub-gears. Remove the camshaft.

◆Installation procedure◆



■ **Installation: Camshaft**

- Position the No. 1 cylinder at the top dead center in the compression stroke.
- Install the camshaft such that the stamped line on the camshaft gear is level with the top surface of the rocker case.

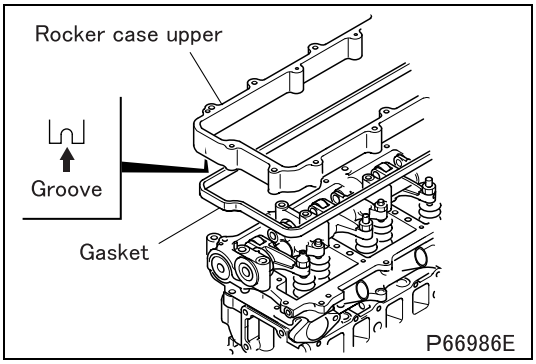


■ **Installation: Packing**

- Apply sealant to the periphery of the packing.
- Install the packing to the rocker case immediately after the sealant application.
- Apply sealant to the top of the packing after installing the rocker case.
- Install the rocker case upper and rocker cover immediately after the sealant application.

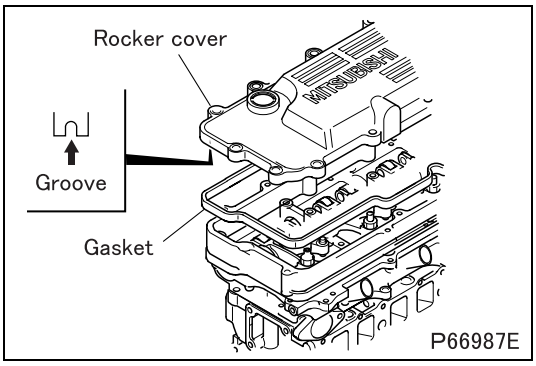
CAUTION ⚠

- **Be sure to use the specified sealant. Use of other sealant may cause an oil leak.**
- **Do not start the engine for at least an hour after the rocker case and rocker cover are installed.**
- **If the rocker cover is removed after installed, be sure to re-apply the sealant to the packing.**



■ **Installation: Rocker case upper gasket**

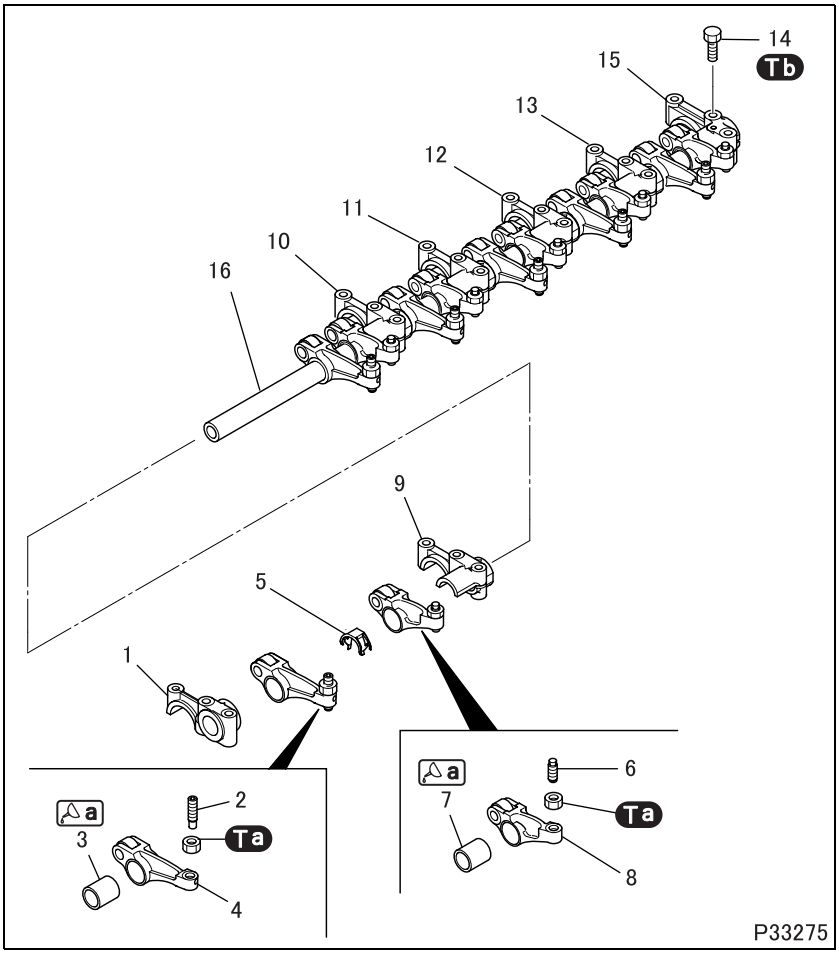
- Clean the gasket mounting groove in the rocker case if grease and dirt are in it.
- Before installing the gasket, make sure that it is free of grease or any foreign matter that can cause an oil leak.



■ **Installation: Rocker cover gasket**

- Clean the gasket mounting groove in the rocker cover if grease and dirt are in it.
- Before installing the gasket, make sure that it is free of grease and any foreign matter that can case an oil leak.

Rocker and Bracket Assembly



● **Disassembly sequence**

1 Front bracket
2 Adjusting screw
3 Rocker bushing
4 Intake rocker
5 Rocker shaft spring
6 Adjusting screw
7 Rocker bushing
8 Exhaust rocker
9 No. 1 center bracket
10 No. 2 center bracket
11 No. 3 center bracket
12 No. 4 center bracket
13 No. 5 center bracket
14 Set screw
15 Rear bracket
16 Rocker shaft

● **Assembly sequence**

Follow the disassembly sequence in reverse.

Service standards (Unit: mm {in.})

Location	Maintenance item	Standard value	Limit	Remedy
3, 7, 16	Clearance between rocker shaft and bushing	0.006 to 0.076 {0.00024 to 0.0030}	0.114 {0.0045}	Replace
4, 8	Radial clearance of rocker (roller)	0.022 to 0.039 {0.00087 to 0.0015}	–	Replace

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Lock nut (adjusting screw tightening)	34 {25, 3.5}	–
Tb	Set screw (rocker shaft tightening)	3.9 {2.9, 0.4}	–

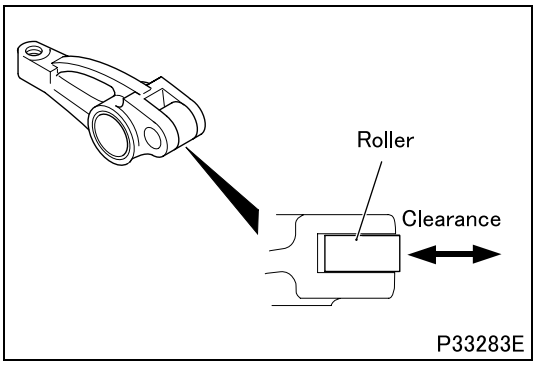
Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Inside surface of rocker bushing	Engine oil	As required

Special tools (Unit: mm {in.})

Mark	Tool name and shape	Part No.	Application
a	Rocker bushing puller A: φ 25 {0.98} B: φ 27.5 {1.08}  01951	MH062727	Removal and installation of rocker bushing

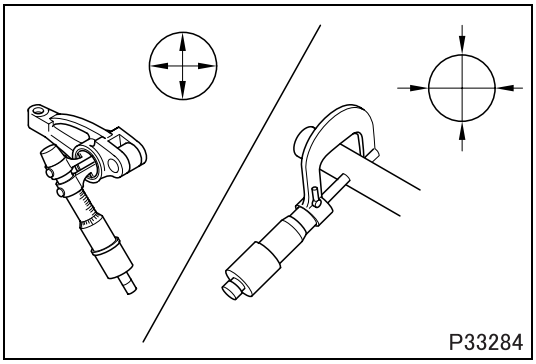
◆Inspection procedure◆



P33283E

■ **Inspection: Radial clearance of rocker (roller)**

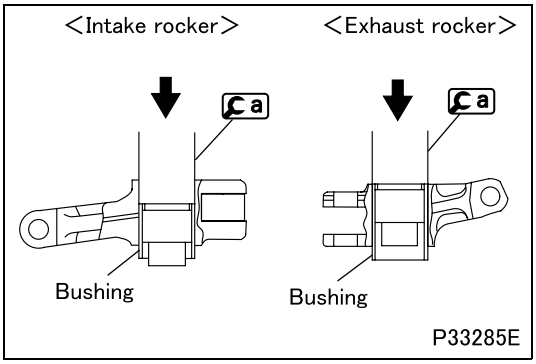
- If the measurement deviates from the standard value, replace the defective part(s).



P33284

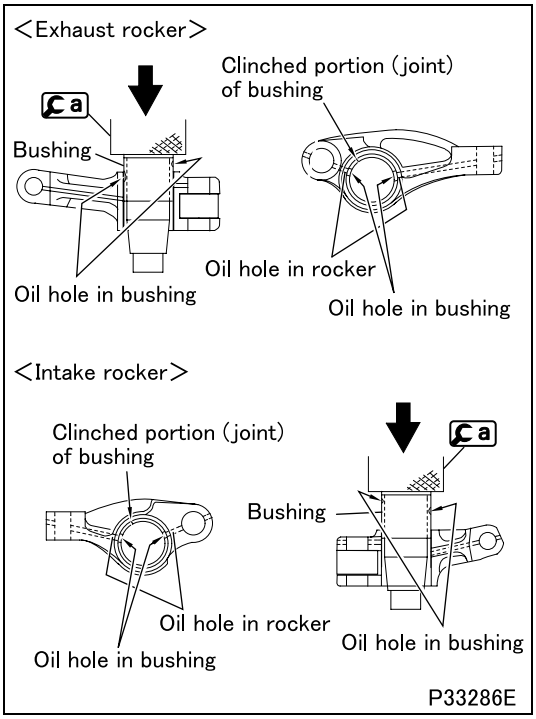
■ **Inspection: Clearance between rocker shaft and bushing**

- If the measurement exceeds the limit, replace the bushing.



P33285E

Replace of rocker bushing
[Removal]



[Installation]
