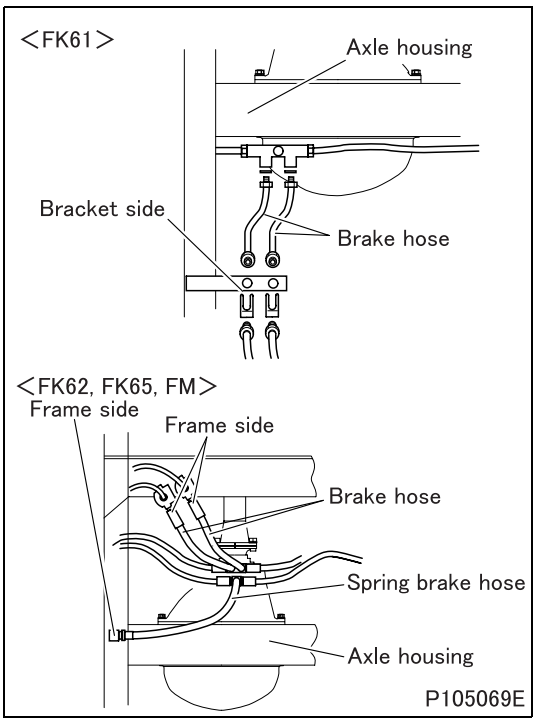
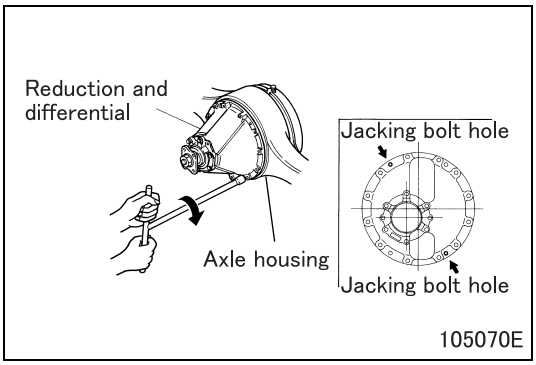
◆Removal procedure◆



■ **Removal: Brake hoses**

- When removing the brake hoses, disconnect them from the bracket side (frame side) first, and then from the axle housing side.



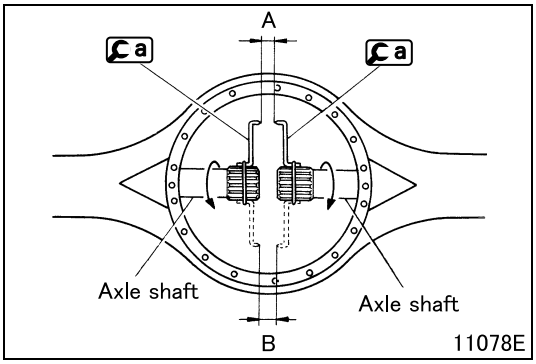
■ **Removal: Reduction and differential**

- Make two jacking bolts (M12 × 1.25 mm) available.
- Install and tighten the bolts evenly into the jacking holes in the reduction and differential.
- Jack away and remove the reduction and differential from the axle housing.

NOTE

- **Remove adhered sealant from the mounting surfaces of reduction differential assembly and axle housing.**

◆Inspection procedure◆



■ **Inspection: Bend of axle housing**

- Install axle shaft in axle housing.
- Install a on axle shaft.
- Measure clearance A.
- Turn axle shaft 180°.
- Measure clearance B.
- The difference between A and B is the amount of bend of axle housing.
- If the measurement exceeds the limit, replace the axle housing.

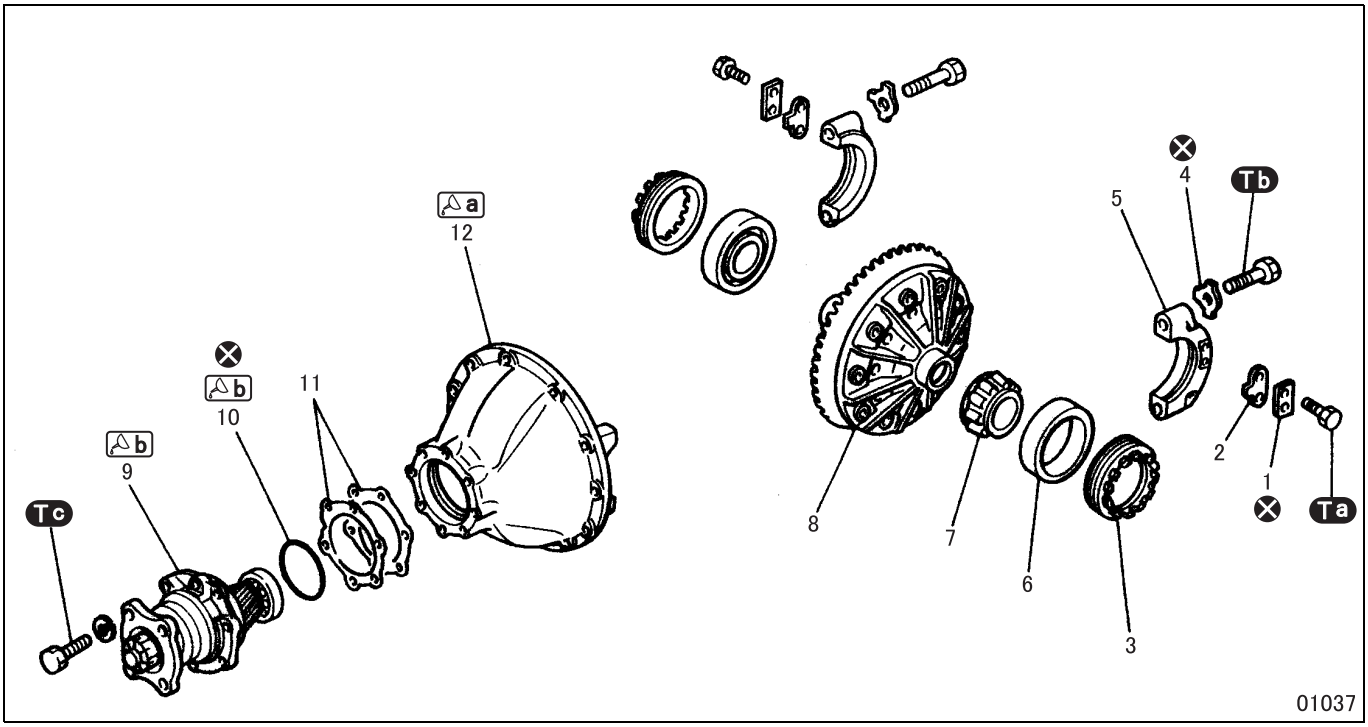
◆Installation procedure◆

■ Installation: Brake hoses, Air hoses

- Follows the removal procedure in reverse.
  (See "■ **Removal: Brake hoses**".)
- After installing, make sure that the brake hose does not interfere in the peripheral parts.

CAUTION ⚠

- **Make sure that the brake hose is not twisted when installing it.**



● **Disassembly sequence**

1 Lock sheet
2 Lock pawl
3 Adjusting screw
4 Lock plate
5 Bearing cap
6 Side bearing outer race
7 Side bearing inner race
8 Differential (See later section.)
9 Pinion (See later section.)
10 O-ring
11 Shim
12 Differential carrier

⊗: Non-reusable parts

CAUTION ⚠

- **Keep side bearings that have been removed separated from each other and ensure that during installation each one is correctly placed.**
- **Be sure to replace the bearing cap, differential carrier and bolts as a differential carrier set.**
- **Be sure to replace the reduction gear of the differential and reduction pinion of the pinion as a reduction gear set.**

NOTE

- **Record the number and thickness of shims to use them as reference at assembly.**

● **Assembly sequence**

Follow the disassembly sequence in reverse.

CAUTION ⚠

- **Be careful not to twist or damage the oil seal when installing it.**

Service standards (Unit: mm {in.})

Location	Maintenance item		Standard value	Limit	Remedy
6, 7	Starting torque of side bearing	D050H, D052H	2.0 to 2.9 N·m {1.4 to 2.2 ft.lbs, 0.2 to 0.3 kgf·m}	–	Adjust
		D8H	2.5 to 3.4 N·m {1.8 to 2.5 ft.lbs, 0.25 to 0.35 kgf·m}	–	Adjust
8	Wobble at back face of reduction gear		0 to 0.15 {0 to 0.0059}	0.2 {0.0079}	Adjust or replace
8, 9	Backlash between reduction gear and reduction pinion		0.25 to 0.33 {0.0098 to 0.013}	0.6 {0.024}	Adjust or replace

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened		Tightening torque	Remarks
Ta	Bolt (lock pawl mounting)		27 to 41 {20 to 30, 2.8 to 4.2}	–
Tb	Bolt (bearing cap mounting)	D050H, D052H	235 {175, 24}	–
		D8H	379 to 513 {280 to 380, 38.7 to 52.3}	
Tc	Bolt (pinion mounting)	D050H, D052H	63 to 94 {46 to 69, 6.4 to 9.6}	–
		D8H	94 to 141 {69 to 105, 9.6 to 14.4}	

Lubricant and/or sealant

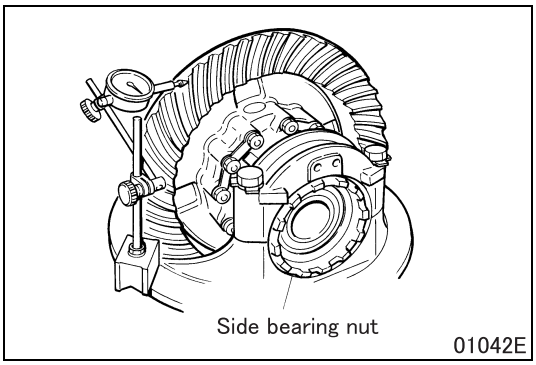
Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Pinion pilot bearing mounting surface of differential carrier	Loctite 601	As required
b	Differential carrier fitting surface of pinion	Gear oil [API GL-5, SAE 90]	As required
	O-ring		

Special tools (Unit: mm {in.})

Mark	Tool name and shape	Part No.	Application
a	Side bearing installer A: D050H, D052H: ϕ80 {3.15}; D8H: ϕ90 {3.74} B: D050H, D052H: ϕ70 {2.76}; D8H: ϕ85.5 {3.37}  P01039	<D050H, D052H> MH061748 <D8H> 03723-25000	Installation of side bearing inner race
b	Bearing retainer guide pin  P01041 D050H, D052H: A 18 {0.71}; B M12 × 1.25; C 85 {3.35}; D 12 {0.47} D8H: A 95 {3.74}; B M14 × 1.5; C 95 {3.74}; D 12 {0.47}	<D050H, D052H> MH061745 <D8H> MH061746	Installation of pinion (two pieces are used)

Mark	Tool name and shape	Part No.	Application
C	Bearing retainer remover A: 68 {2.68} B: M14 × 1.5  01040	<D8H> MH062172	Removal of pinion (two pieces are used)

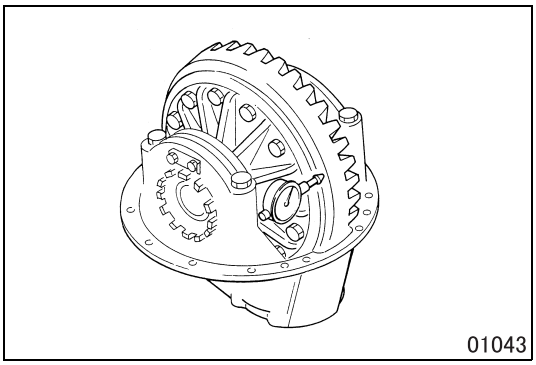
◆Work before removal◆



01042E

■ Inspection: Backlash between reduction gear and reduction pinion

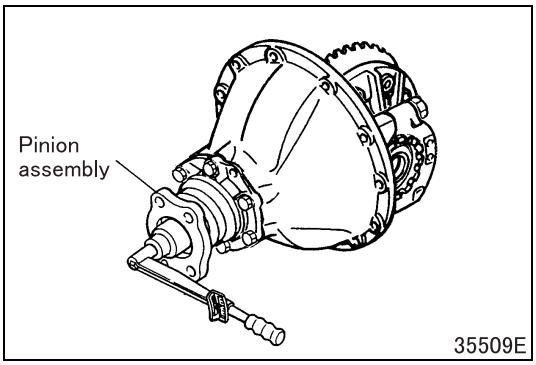
- If backlash is found faulty, the amount of tightening of the side bearing nut is probably inappropriate.



01043

■ Inspection: Wobble at back face of reduction gear

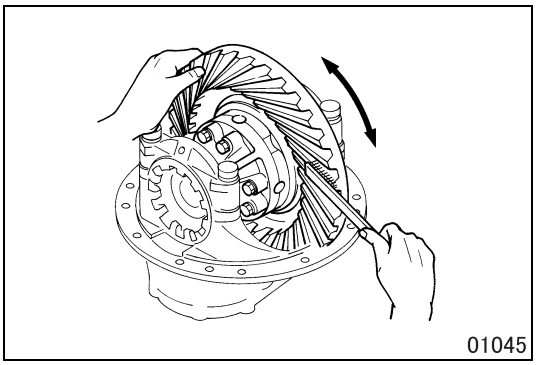
- Measure at R145 mm {5.71 in.} (on the radius) for <D050H, D052H>, 185 mm {7.28 in.} for <D8H>, from the center of the reduction gear.



35509E

■ Inspection: Starting torque of side bearing

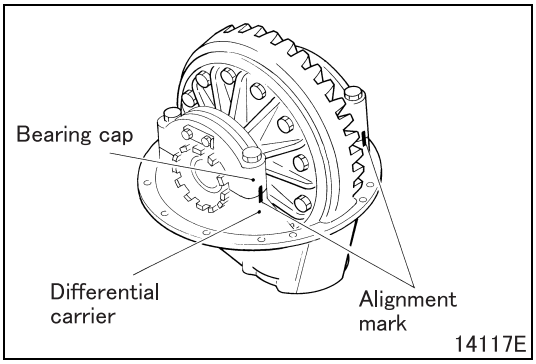
- Measure the starting torque of the pinion assembly using a torque wrench and calculate the starting torque of the side bearing using the following formula.
  (Total starting torque – Pinion bearing starting torque (See later section.)) × Final ratio = Side bearing starting torque



01045

■ Inspection: Tooth contact of reduction gear

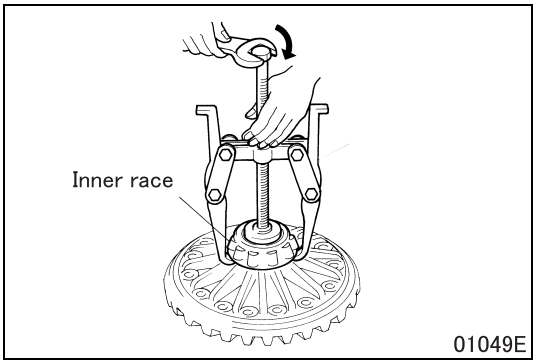
- Apply red lead to three to four teeth at three equally spaced points on the reduction gear.
- Turn the reduction gear several times to check for tooth contact.



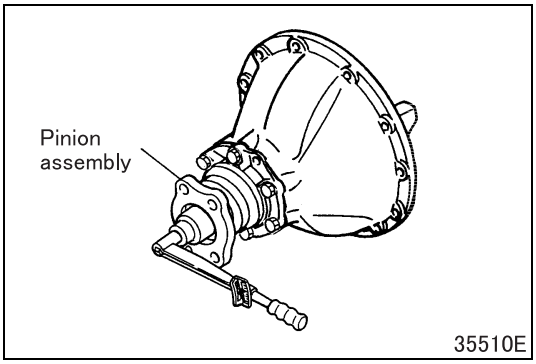
■ **Alignment marks: Bearing cap and differential carrier**

- Put alignment marks on the bearing cap and differential carrier for correct identification of right and left parts.

◆Removal procedure◆

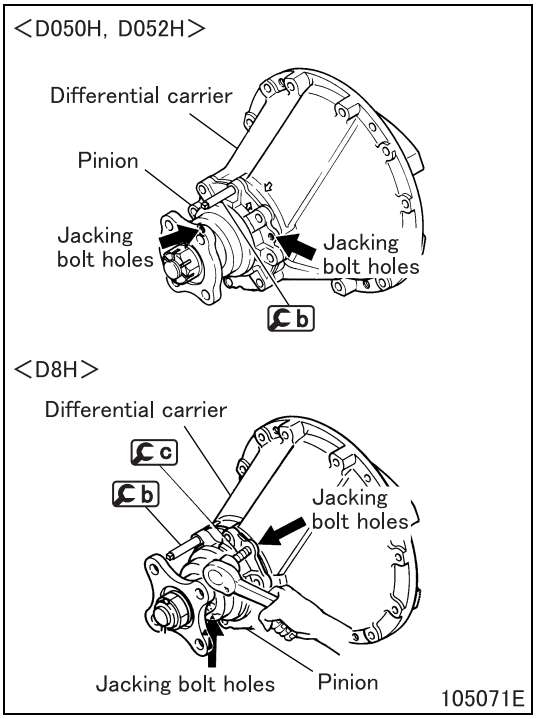


■ **Removal: Side bearing inner race**

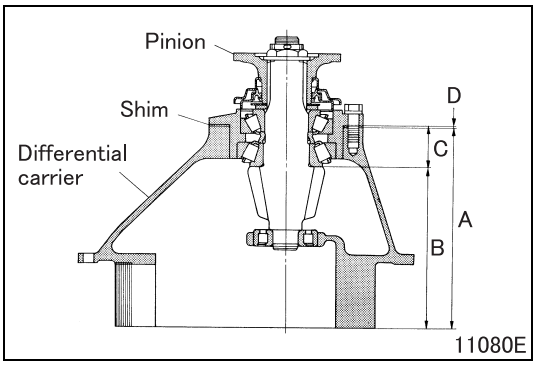


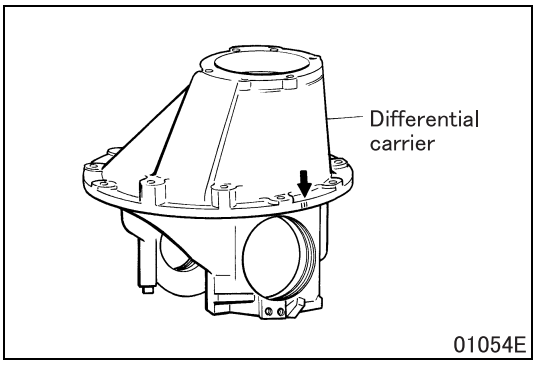
■ **Inspection: Starting torque of pinion bearing**

- With the differential removed, measure the starting torque of the pinion bearing using a torque wrench installed at the pinion. Refer to “Pinion” later in this manual for the standard value.



◆Installation procedure◆





■ Removal: Pinion

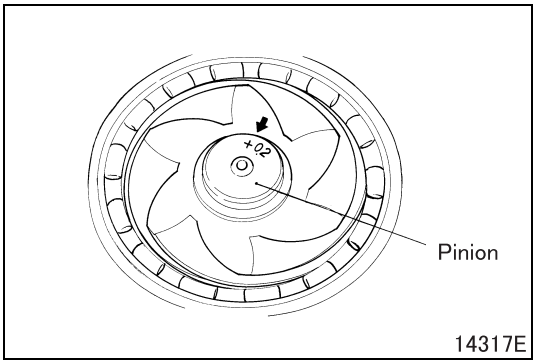
- Make two jacking bolts (M12 × 1.25 mm) available. <D050H>
- Install two pieces of b diagonally.
- Make two jacking bolts (M14 × 1.5 mm) available or c. <D8H>
- Install and tighten the bolts or c evenly into the jacking holes in the pinion.
- Jack away and remove the pinion from the differential carrier.

■ Adjustment: Pinion

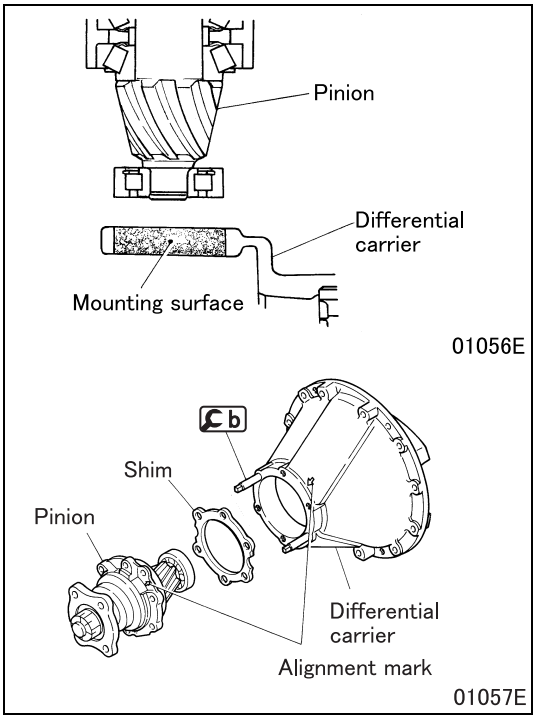
- Perform the following steps to adjust A, B and C within the specified dimensions.
- Calculate shim thickness D by using the following formula based on the machining error data stamped on pinion and differential carrier.
- Formula:
  D = 0.5 mm {0.020 in.} – a + b + c
  a = Deviation from standard dimension A
  b = Deviation from standard dimension B
  c = Deviation from standard dimension C

(Unit: mm {in.})

Location	Standard dimension		How to calculate deviation
	D050H, D052H	D8H	
Shim thickness	0.5 {0.020}		–
A	232 {9.13}	261 {10.3}	A numeral, multiplied by 100, is stamped on the outer periphery of the flange of the differential carrier.
B	180 {7.09}	208 {8.19}	A numeral is stamped on the top of the pinion assembly.
C	52 {2.05}	53.5 {2.11}	Measure deviation from dimension C using a dial gauge. Taking measurement is usually not feasible therefore assume the value is 0.2 mm {0.0079 in.}.



- Select a shim based on shim thickness D.
- Thickness of shims available: 0.1 mm {0.0039 in.}, 0.2 mm {0.0079 in.}



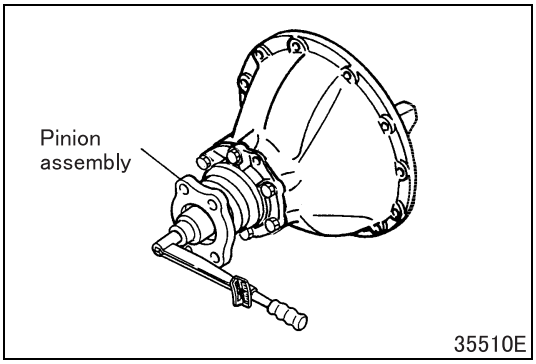
■ **Installation: Pinion**

- Apply sealant to the pilot bearing mounting surface of the differential carrier.
- Apply gear oil to the fitting area of the pinion and differential carrier.
- Aligning the embossed alignment mark on the bearing retainer of the pinion assembly with that on the differential carrier, mount the pinion assembly.

Bearing retainer	Differential carrier	
⇧ mark	▽ mark	D050H D052H
	⇩ mark	D8H

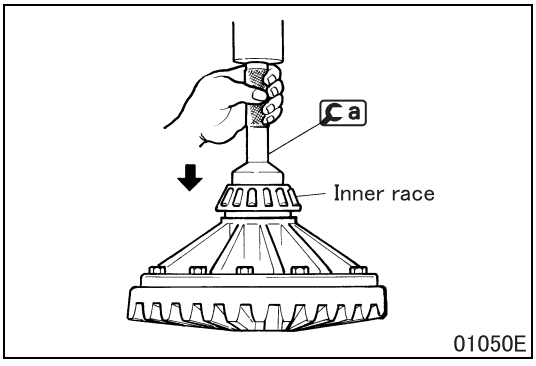
CAUTION ⚠

- **Leave for 30 minutes to 2 hours after installation to let the sealant harden.**
- **Wait at least three hours or, if feasible, 24 hours before running the vehicle to let the sealant harden.**



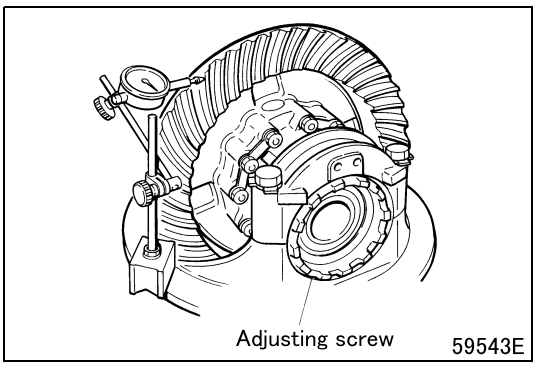
■ **Inspection: Starting torque of pinion bearing**

- With the pinion installed, measure the starting torque of the pinion bearing using a torque wrench installed at the pinion.
- Refer to “Pinion” later in this manual for the standard value.



■ **Installation: Side bearing inner race**

◆Work after installation◆

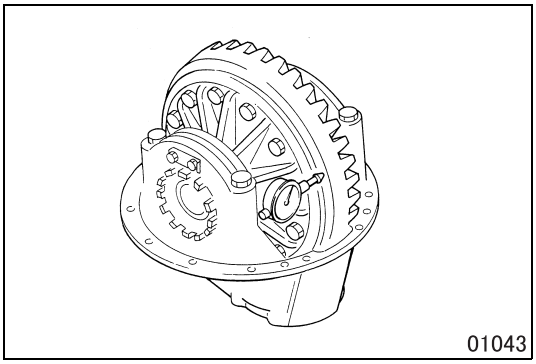


■ Adjustment: Backlash between reduction gear and reduction pinion

- Adjust by means of the right- and left-hand adjusting screws, taking care not to change the starting torque.

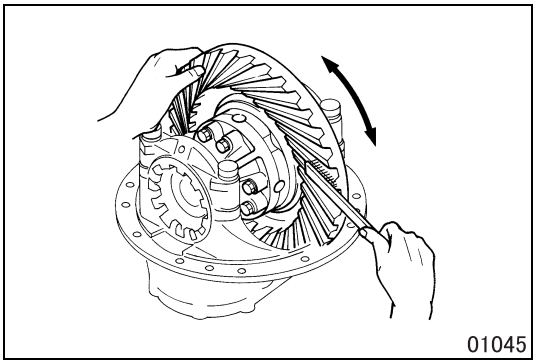
CAUTION ⚠

- **When one side bearing nut is loosened, be sure to tighten the other one by the same amount to prevent the side bearing starting torque from changing.**



■ Inspection: Wobble at back face of reduction gear

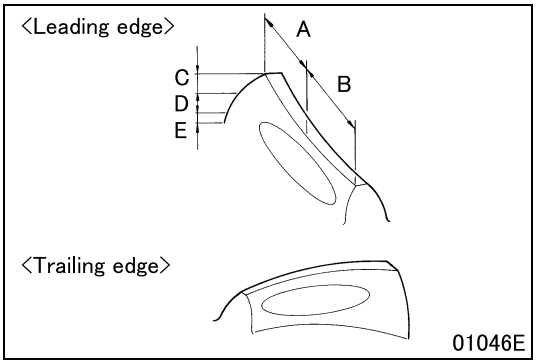
- Measure at R145 mm {5.71 in.} <D050H, D052H> or R185 mm {7.28 in.} <D8H> from the center of the reduction gear.



■ Inspection: Tooth contact of reduction gear

[Inspection]

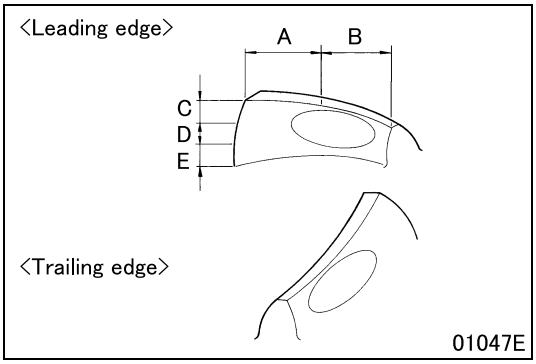
- Apply red lead to three to four teeth at three equally spaced points of the reduction gear.
- Turn the reduction gear several times to check for tooth contact.
- Adjust tooth contact if it is remarkably offset.



● Correct tooth contact at no load

<Reduction gear>

A: Heel
B: Toe
C: Face
D: Flank
E: Clearance



<Reduction pinion>

A: Heel
B: Toe
C: Face
D: Flank
E: Clearance

Maintenance item			Assembly standards
At no load	Tooth contact position	Lengthwise direction of tooth	Leading edge: From center towards toe
			Trailing edge: From center towards heel
		Vertical direction	Center
	Tooth contact shape	Length	Approximately 50 to 70% of tooth width
		Width	Approximately 50 to 70% of tooth depth
	Degree of tooth contact		It becomes weaker as it nears tooth root and tooth tip

NOTE

- **When tooth contact is near the toe at no load, it becomes middle area contact at load.**

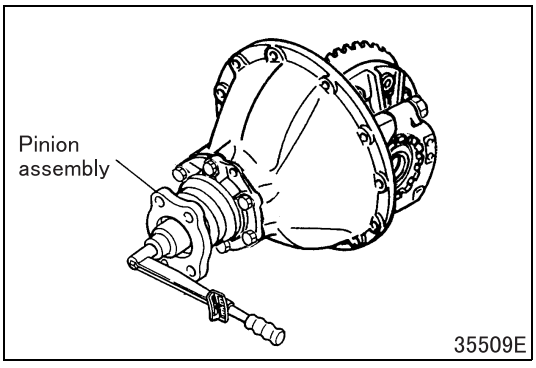
[Adjustment]

- Adjust by means of shimming and increasing/decreasing the backlash between the reduction gear and reduction pinion.

CAUTION ⚠

- **When either the reduction gear or the reduction pinion needs to be replaced due to abnormal tooth wear, always replace both the reduction gear and the reduction pinion as a reduction gear set.**
- **If the backlash between the reduction gear and reduction pinion does not conform to the standard value but good tooth contact is maintained between them, the good tooth contact takes priority over the backlash. In other words, if good tooth contact is maintained, a backlash as small as 0.15 mm {0.0059 in.}, but no smaller than 0.15 mm {0.0059 in.}, is acceptable and does not need to be adjusted to the standard value.**

	Method of adjustment	Moving direction	
Tooth contact by addition or reduction of shims	Advance reduction pinion to reduction gear (shims are reduced)  55497	 55501E	Tooth contact moves towards tooth root
	Retard reduction pinion from reduction gear (shims are added)  55498	 55502E	Tooth contact moves towards tooth tip
Tooth contact by adjustment with adjusting screw	Advance reduction gear to reduction pinion center (less backlash)  55499	 55503E	Tooth contact moves in lengthwise direction of tooth Leading edge: Nearer to toe and slightly nearer to root of tooth Trailing edge: Nearer to heel and slightly nearer to top of tooth
	Retard reduction gear from reduction pinion center (more backlash)  55500	 55504E	Tooth contact moves in lengthwise direction of tooth Leading edge: Nearer to heel and slightly nearer to top of tooth Trailing edge: Nearer to toe and slightly nearer to root of tooth



35509E

■ **Inspection: Starting torque of side bearing**

- After the inspection of tooth contact of reduction gear, carry out the following inspection.

[Inspection]

- Measure the starting torque of the pinion assembly using a torque wrench and calculate the starting torque of the side bearing using the following formula.
  (Total starting torque – Pinion bearing starting torque (See later section.)) × Final ratio = Side bearing starting torque
- If the calculated value does not meet the standard value, carry out the adjustment.

[Adjustment]

- Adjust by means of the right- and left-hand adjusting screws.

CAUTION ⚠

- **Always adjust both adjusting screws by the same amount.**
- **The starting torque must be adjusted without causing the backlash between the reduction gear and reduction pinion out of the standard value.**

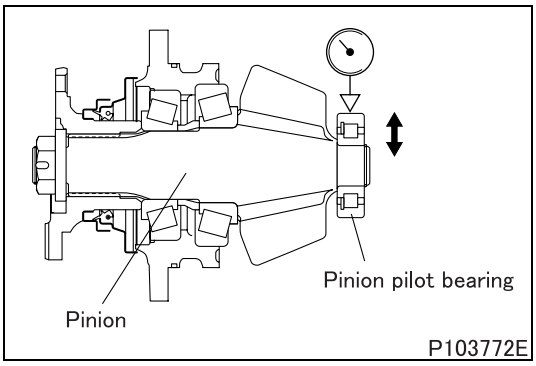
◆Inspection before removal◆

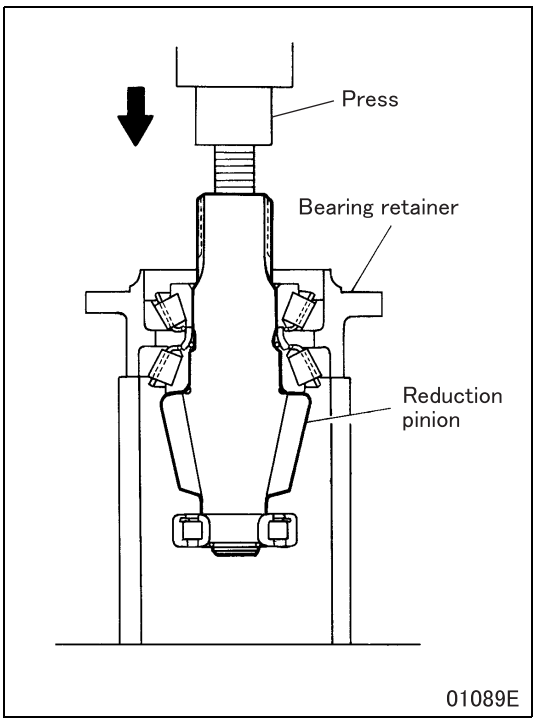


P103772E

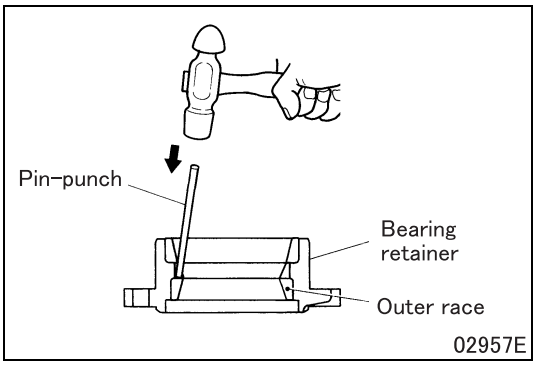
■ Inspection: Play in radial direction of pinion bearing

- Hold the pinion and measure the play with moving the pinion pilot bearing in radial direction.
- If the measured value exceeds the limit, replace the pinion pilot bearing.

◆Removal procedure◆

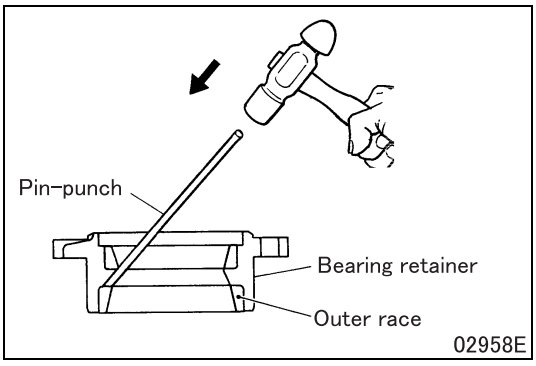


■ **Removal: Reduction pinion**



■ **Removal: Outer bearing outer race**

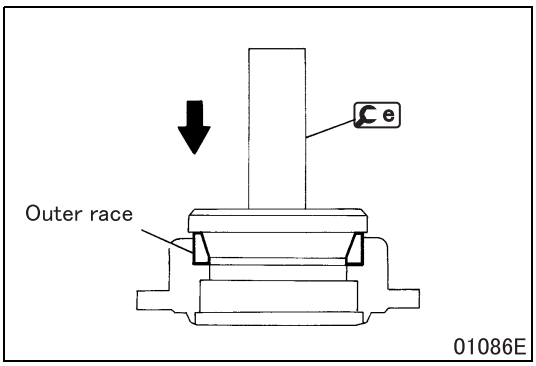
- Drive out the outer bearing outer race by tapping evenly at two notches in bearing retainer.



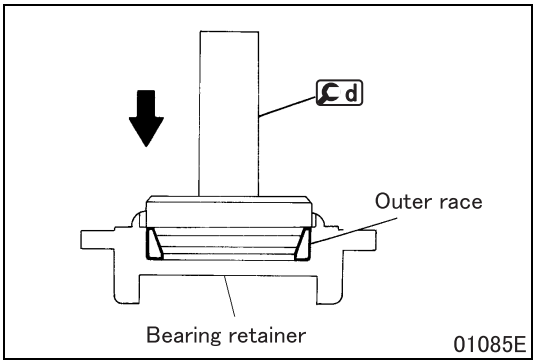
■ **Removal: Inner bearing outer race**

- Drive out the inner bearing outer race by tapping evenly at two notches in bearing retainer.

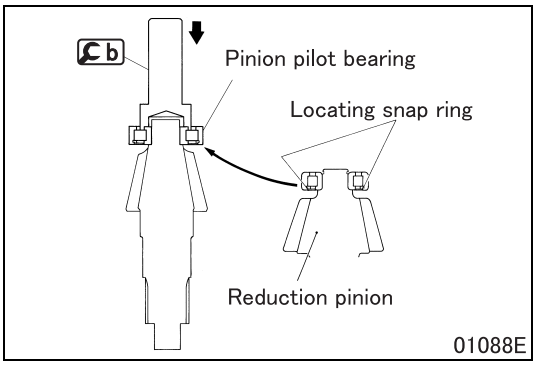
◆Installation procedure◆



■ Installation: Inner bearing outer race

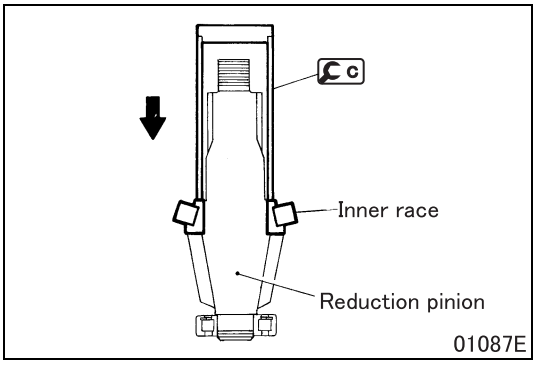


■ Installation: Outer bearing outer race

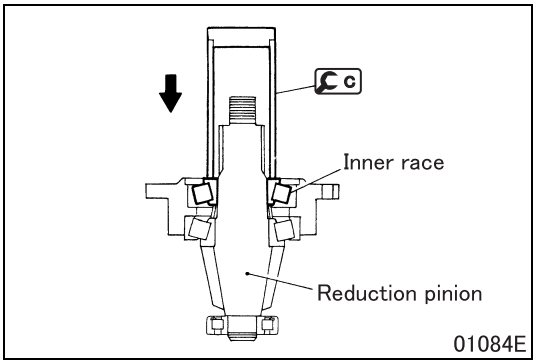


■ Installation: Pinion pilot bearing

- Install the pinion pilot bearing in the illustrated direction.
- After installing it, fit the lock ring.

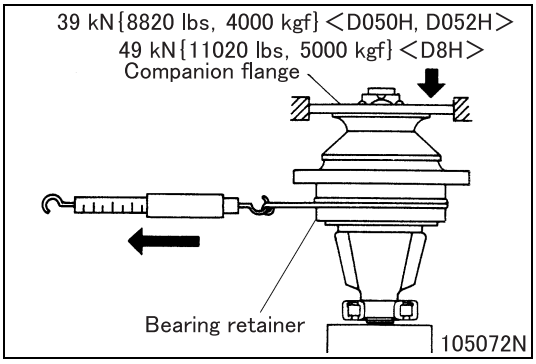


■ Installation: Inner bearing inner race



■ **Installation: Outer bearing inner race**

- Install the outer bearing inner race with the pinion assembled into the bearing retainer.



■ **Inspection: Starting torque of pinion bearing**

[Inspection]

- Apply the specified load to the companion flange or tighten the lock nut to the specified torque.
- Install a spring balance to the periphery of the bearing retainer and measure the tangential force. Bearing retainer outer periphery: ϕ170 mm {6.69 in.} <D050H, D052H>, ϕ160 mm {6.30 in.} <D8H>
- If the tangential force meets the specified value, the starting torque will also meet the specified value.
- If the measurement deviates from the specified value, adjust the tangential force.

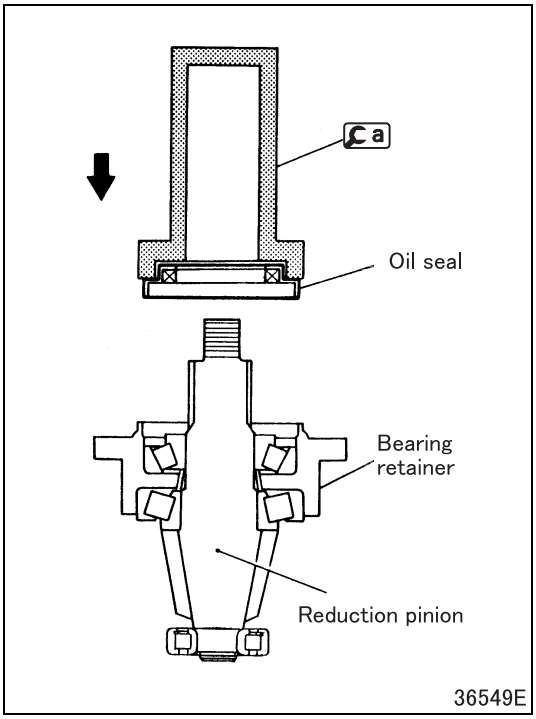
CAUTION ⚠

- **Securely fix the companion flange to measure.**
- **Do not assemble the oil seal when measuring the tangential force.**

[Adjustment]

- Select an appropriate collar from the table below to bring the tangential force to the standard value.

Model	Thickness of collar
D050H	13.875 to 14.475 mm {0.55 to 0.57 in.} (25 sizes in 0.025 mm {0.00098 in.} increments)
D052H	11.875 to 12.475 mm {0.47 to 0.49 in.} (25 sizes in 0.025 mm {0.00098 in.} increments)
D8H	14.975 to 15.575 mm {0.59 to 0.61 in.} (25 sizes in 0.025 mm {0.00098 in.} increments)



■ **Installation: Oil seal**

- Apply grease to the lip area of the oil seal and install it on the bearing retainer in the illustrated direction.

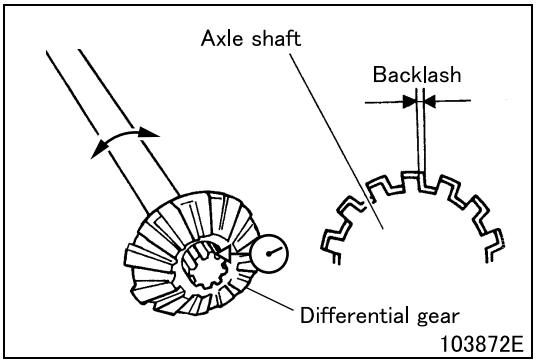
Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Entire bolt	Rust preventive	As required
b	Thread area of bolt	Loctite 271	As required

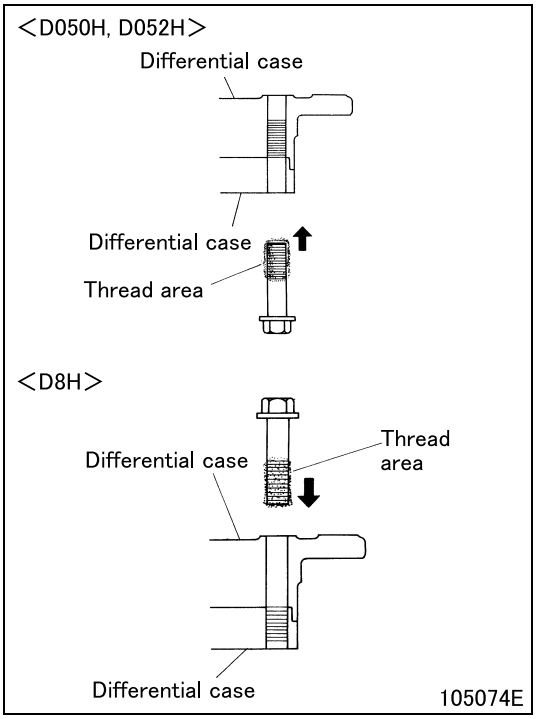
◆Inspection procedure◆



■ **Inspection: Backlash between differential gear and axle shaft splines**

- If the measurement is equal to or exceeds the limit, replace the defective part(s).

◆Installation procedure◆

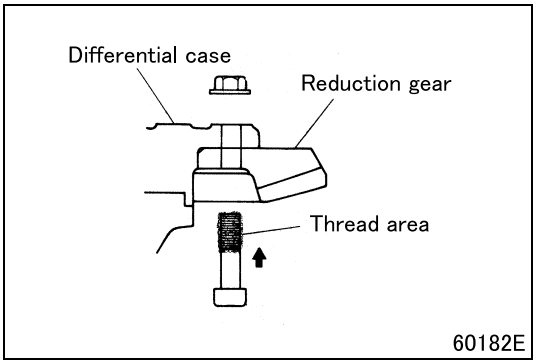


■ **Installation: Differential cases**

- Apply rust preventive over the entire bolt surface. After applying it, blow off the excess rust preventive on the bolt using compressed air.
- Apply thread lock cement to the bolt threads.
- Tighten the bolt to the specified torque.

CAUTION ⚠

- **The bolts must be coated with rust preventive before they are tightened to the specified torque.**
- **Do not drive the vehicle for at least an hour after the bolts have been tightened to let the thread lock cement harden.**
- **Do not drive the vehicle at full torque for at least four hours after the bolts have been tightened to let the thread lock cement harden.**



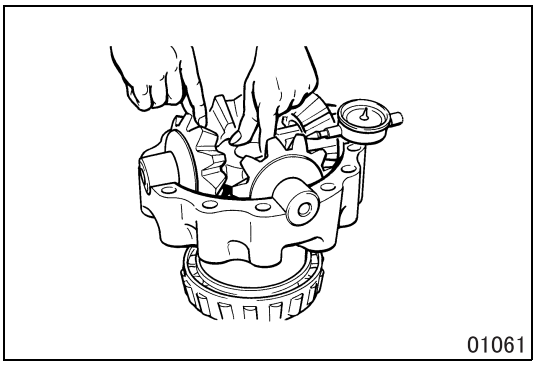
■ **Installation: Differential case and reduction gear**

- Apply rust preventive over the entire bolt surface. After applying it, blow off the excess rust preventive on the bolt using compressed air.
- Apply thread lock cement to the bolt threads.
- Tighten the bolt to the specified torque.

CAUTION ⚠

- **The bolts must be coated with rust preventive before the nuts are tightened to the specified torque.**
- **Do not drive the vehicle for at least an hour after the bolts have been tightened to let the thread lock cement harden.**
- **Do not drive the vehicle at full torque for at least four hours after the bolts have been tightened to let the thread lock cement harden.**

◆Adjustment after installation◆



■ **Adjustment: Backlash between differential gear and differential pinion**

- If the measurement is equal to or exceeds the limit, replace the differential gear washers.

ON-VEHICLE INSPECTION AND ADJUSTMENT

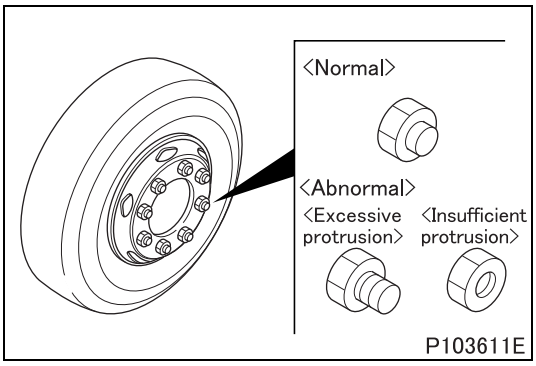
1. Inspection of Wheel Nut, Hub Bolt and Disc Wheel

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened		Tightening torque	Remarks
–	Wheel nut	8-stud type	540 to 590 {400 to 435, 55 to 60}	Wet
		6-stud type	370 to 410 {270 to 300, 38 to 42}	

Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
–	Spherical surface of wheel nut (outer)	Chassis grease [NLGI No.1 (Li soap)] or Wheel bearing grease [NLGI No.2 (Li soap)] or Engine oil	As required
	Outer threads of wheel nut (inner)		



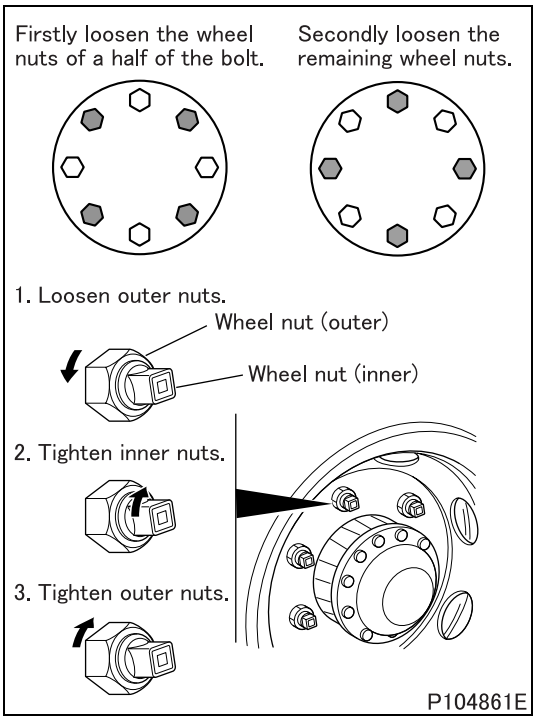
1.1 Visual inspection

- Check the end of each hub bolt for proper length of protrusion from the wheel nut. Excessive length of protrusion can lead to an elongated hub bolt and insufficient length can lead to a broken bolt. If any abnormality is found, replace all of the wheel nuts and hub bolts on the wheel. (See WHEEL AND TIRE, Gr26 and 27.)
- If there is any rust seepage from the wheel nuts, hub bolts, or disc wheel, check them for crack or other damage which may cause the rust. (See WHEEL AND TIRE.)

1.2 Inspection of loose nuts

(1) Single tire

- Tighten the wheel nuts to the specified torque using a torque wrench.
- If frequent loosening of tightened wheel nut or other similar abnormality is found, check the wheel nuts, hub bolts, and disc wheel for crack or other damage which may cause the abnormal condition. (See WHEEL AND TIRE.)



(2) Double tire

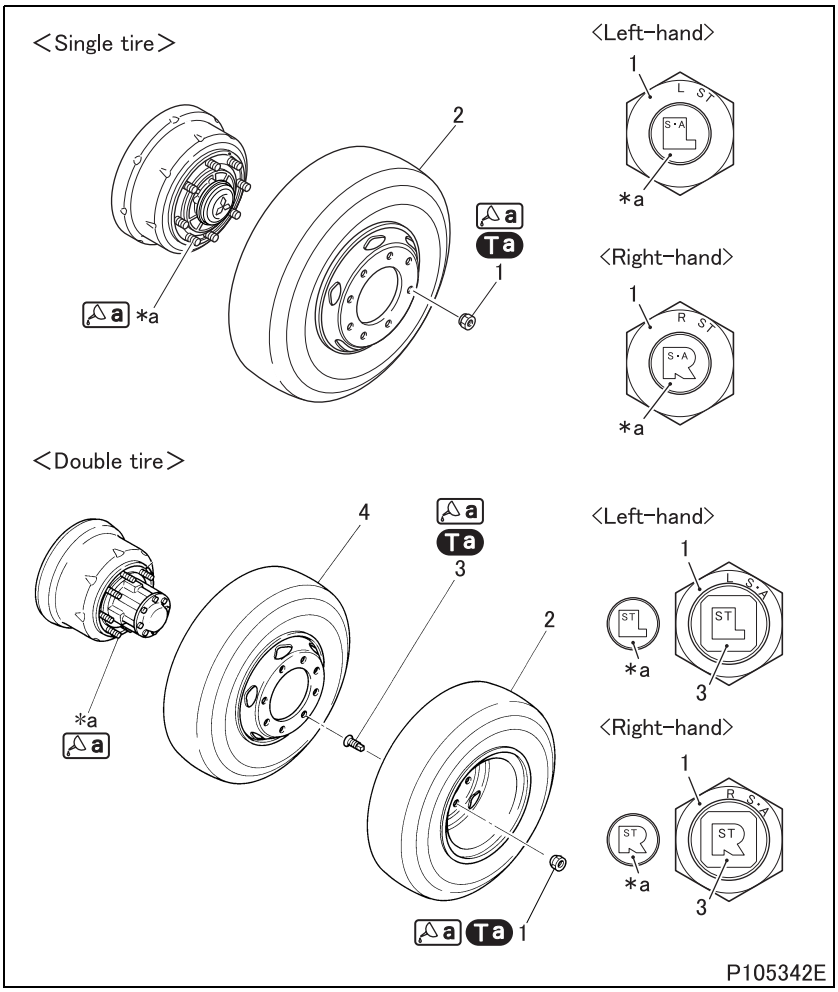
- Loosen outer wheel nuts of half of the wheel bolts (alternately) and then tighten the inner wheel nuts to the specified torque using a torque wrench. Only the 8-stud type wheel is shown in the drawing.
- Apply grease or engine oil to the spherical surface of the loosened outer wheel nuts and the outer threads of the inner wheel nuts.

CAUTION ⚠

- **Never use grease containing molybdenum disulfide. Greased wheel nuts can become loose.**

- Retighten the loosened outer wheel nut to the specified torque using a torque wrench.
- Follow the same procedure for the remaining outer wheel nuts and inner wheel nuts of half of the wheel bolts.
- If frequent loosening of tightened wheel nut or other similar abnormality is found, check the wheel nuts, hub bolts, and disc wheel for cracks or other damage which may cause the abnormal condition. (See WHEEL AND TIRE.)

M E M O



CAUTION ⚠

- **Use right-hand threaded wheel nuts marked "R" for right side wheels and left-hand threaded wheel nuts marked "L" for left side wheels.**

●Removal sequence

1 Wheel nut <Single tire>
Wheel nut (outer)
<Double tire>
2 Tire (See later section.)
3 Wheel nut (inner)
<Double tire>
4 Tire <Double tire>
(See later section.)

***a**: Hub bolt

●Installation sequence

Follow the removal sequence in reverse.

CAUTION ⚠

- **Never use grease containing molybdenum disulfide. Greased wheel nuts can become loose.**

Service standards (Unit: mm {in.})

Location	Maintenance item	Standard value	Limit	Remedy
3, 4	Tire lateral runout	3.5 {0.14} or less	–	Correct or replace

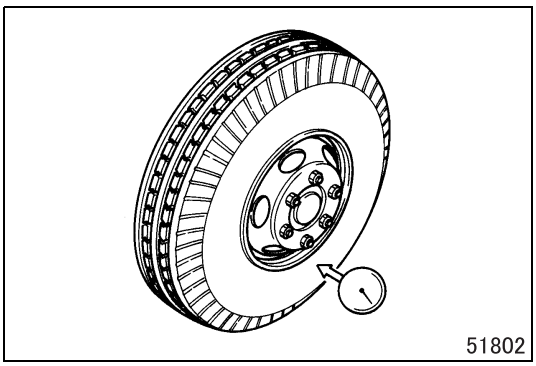
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened		Tightening torque	Remarks
Ta	Wheel nut	8-stud type	540 to 590 {400 to 435, 55 to 60}	Wet
		6-stud type	370 to 410 {275 to 305, 38 to 42}	

Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Wheel nut spherical area	Chassis grease [NLGI No.1 (Li soap)] or Wheel bearing grease [NLGI No.2 (Li soap)] or Engine oil	As required
	Thread and spherical area of wheel nut (inner)		
	Thread area of hub bolt		

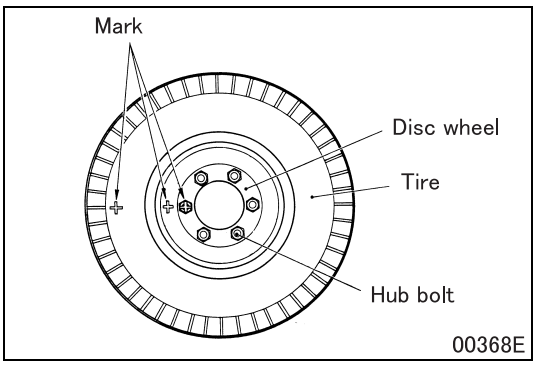
◆Inspection procedure◆



■ **Inspection: Tire lateral runout**

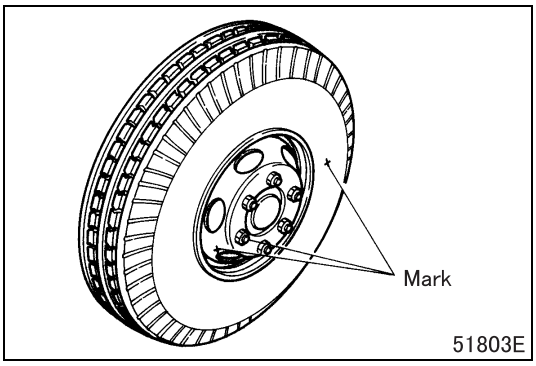
[Inspection]

- If the measured value deviates from the standard value, correct as follows.



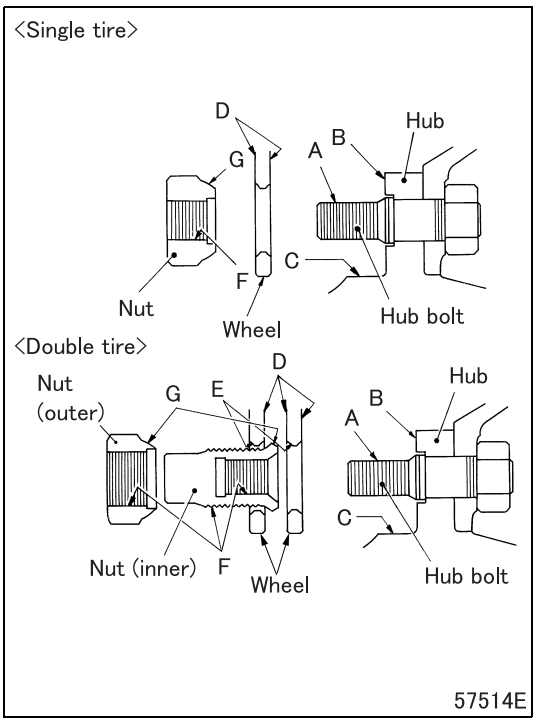
[Correction]

- Mark the tire, disc wheel, and one of the hub bolts in the illustrated locations.
- Remove the tire from the disc wheel.



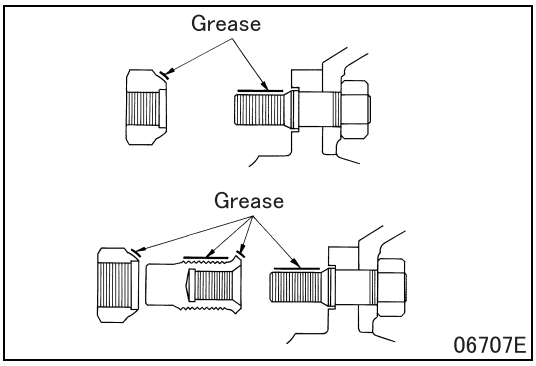
- Measure the disc wheel for lateral runout.
- If the disc wheel's maximum runout is located near the mark on the wheel, install the tire such that the mark on the tire is 180° away from the mark on the disc wheel.
- Measure the tire again for lateral runout.
- If the measured value still does not conform to the standard value, replace the tire.

◆Installation procedure◆



■ **Installation: Tire**

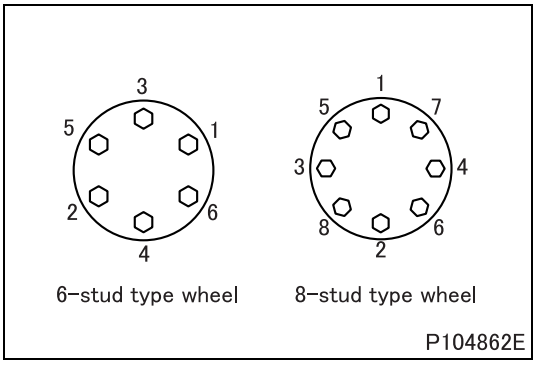
- To prevent hardware and parts from becoming loose and/or damaged, thoroughly clean the following areas, removing rust, dirt, paint and foreign matter, before installing the tire.
  - A: Threaded portion of hub bolt
  - B: Wheel mounting surface of hub
  - C: Wheel alignment area of hub
  - D: Mating surfaces of disc wheel
  - E: Wheel nut mounting surface of disc wheel
  - F: Threaded portion of wheel nut
  - G: Spherical portion of wheel nut



- Apply grease to the illustrated areas.

CAUTION ⚠

- **Never use grease containing molybdenum disulfide. Greased wheel nuts can become loose.**



- Install the wheel nuts by tightening them with fingers as far as they go to ensure that they smoothly turn. If there is any abnormality such as a sticking point, replace the hub bolt. (See Gr26A, 26B, and 27.)
- The wheel nuts should be tightened in the diagonal sequence in a few steps. Lastly, use a torque wrench to retighten them to the specified torque.
- When tightening the nuts with an impact wrench, use care of the time of tightening, compressed air pressure intensity or the like to prevent overtightening and use a torque wrench to retighten them in the final step.

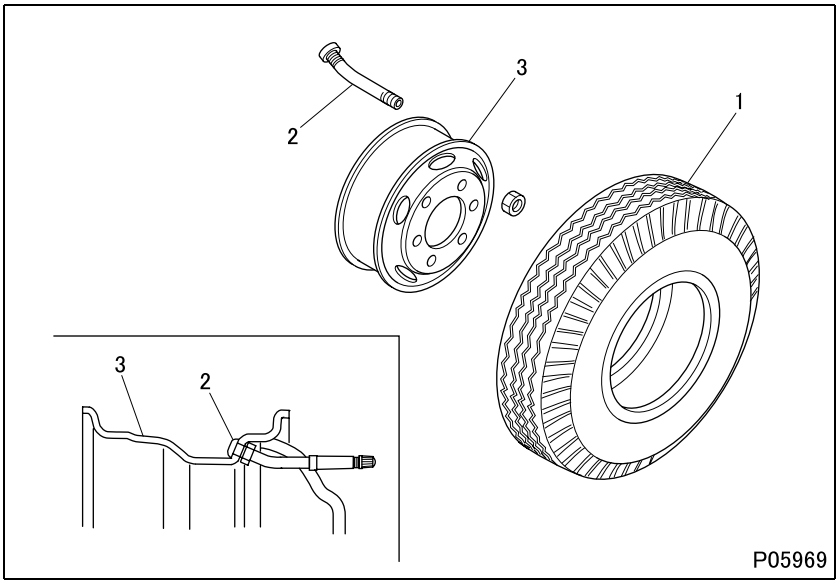
Tire



●Disassembly sequence

1 Tire
2 Air valve
3 Disc wheel

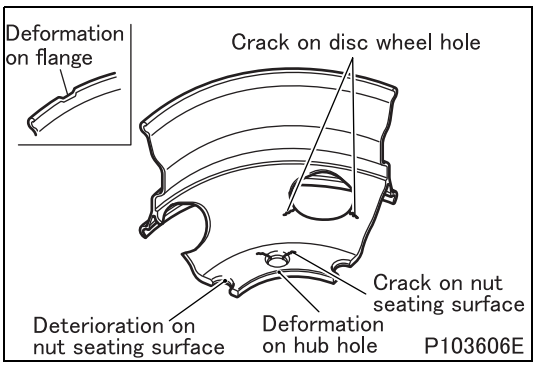
●Assembly sequence

Follow the disassembly sequence in reverse.

Service standards (Unit: mm {in.})

Location	Maintenance item			Standard value	Limit	Remedy
–	Static unbalance tolerance of wheel and tire			35 g {1.2 oz} or less	–	Correct
3	Disc wheel	19.5 × 6.75-136-12	Flatness	0.2 {0.0079} or less	–	Replace
			Lateral runout (sideway deflection)	2.0 {0.079} or less	–	
			Radial runout (vertical deflection)	1.8 {0.071} or less	–	
		22.5 × 7.50-162-13	Flatness	0.2 {0.0079} or less	–	
			Lateral runout (sideway deflection)	2.0 {0.079} or less	–	
			Radial runout (vertical deflection)	1.8 {0.071} or less	–	

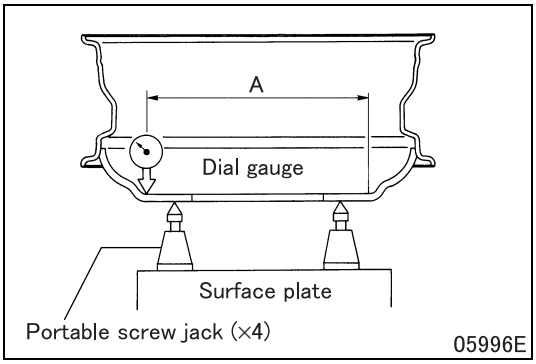
◆Inspection procedure◆



■ Inspection: Disc wheel

(1) Visual inspection

- Visually inspect the disc wheel for deformation, crack, deterioration, stepped wear on the wheel hub mounting surface. If any abnormality is found, replace the disc wheel with a new one.
- If any abnormality is found on the disc wheel, inspect the wheel hub. (See Gr26A, 26B, and 27.)

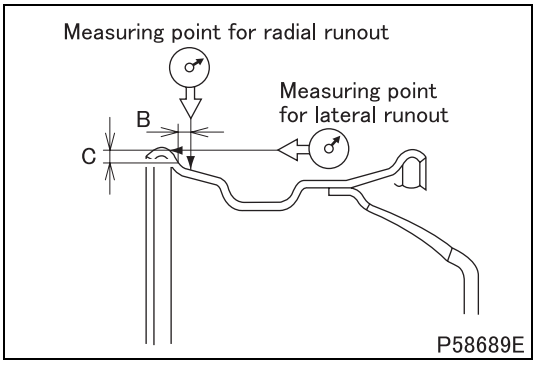


(2) Flatness

- Measure the flatness of specified position A from the center of the disc wheel. Measurement should be performed on the circles at twelve equally divided positions <6-hole wheel> or sixteen equally divided positions <8-hole wheel>.

Wheel	A
19.5 × 6.75-136-12	ϕ175 mm {6.89 in.} ϕ275 mm {10.8 in.}
22.5 × 7.50-162-13	ϕ235 mm {9.25 in.} ϕ340 mm {13.4 in.}

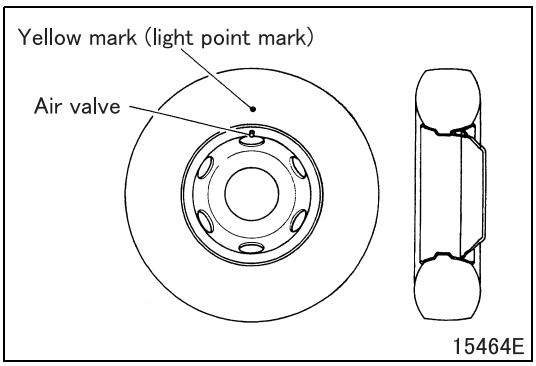
- If the measurement deviates from the standard value, replace the disc wheel.



(3) Runout

- Measure the runout at the locations on the periphery of disc wheel indicated in the drawing.
  B: 8 mm {0.31 in.}
  C: 8 mm {0.31 in.}
- If the measurement deviates from the standard value, replace the disc wheel.

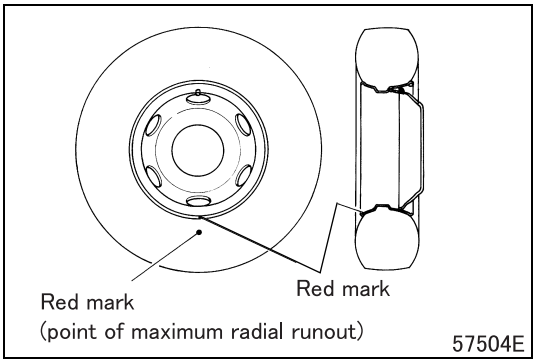
◆Installation procedure◆



■ **Installation: Tire**

<When there is no red mark on the tire>

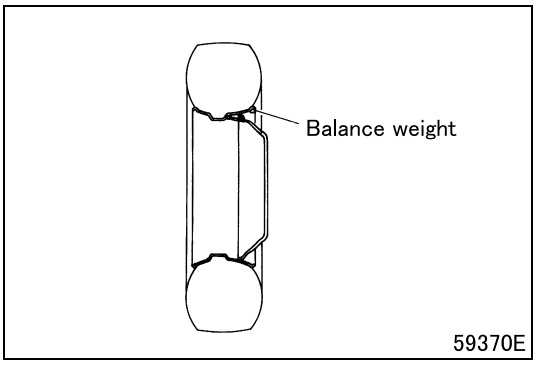
- Align the yellow mark (light point mark) on the tire with the air valve position of the disc wheel to assemble.



<When there is a red mark on the tire>

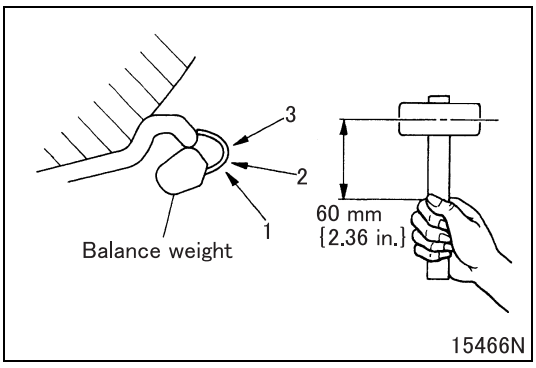
- Align the red mark (point of maximum radial runout) on the tire with the red mark on the disc wheel to assemble.

◆Work after installation◆

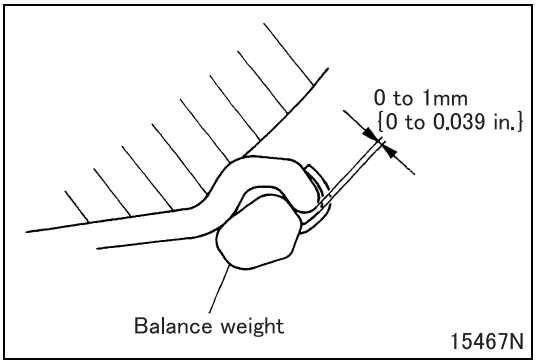


■ **Installation: Balance weight**

- Install balance weights on both sides of the disc at balancing tire positions so that the static unbalance tolerance does not exceed the limit.



- Use a one pond resin hammer to drive in balance weights.
- To install a balance weight, tap the clip of the weight in the center at 1, 2 and 3 in that order.



- Leave a clearance of approx. 0 to 1 mm {0 to 0.039 in.} between the clip and the disc wheel. Ensure that the balance weight is not loose after installation.
- Do not use a balance weight that has been improperly tapped or dropped to the floor during installation attempt.
- When 2 weights are being installed, these weights should be as much equal to each other as possible in weight. Also remember that the center point between the weights will become the support point for a balancer.

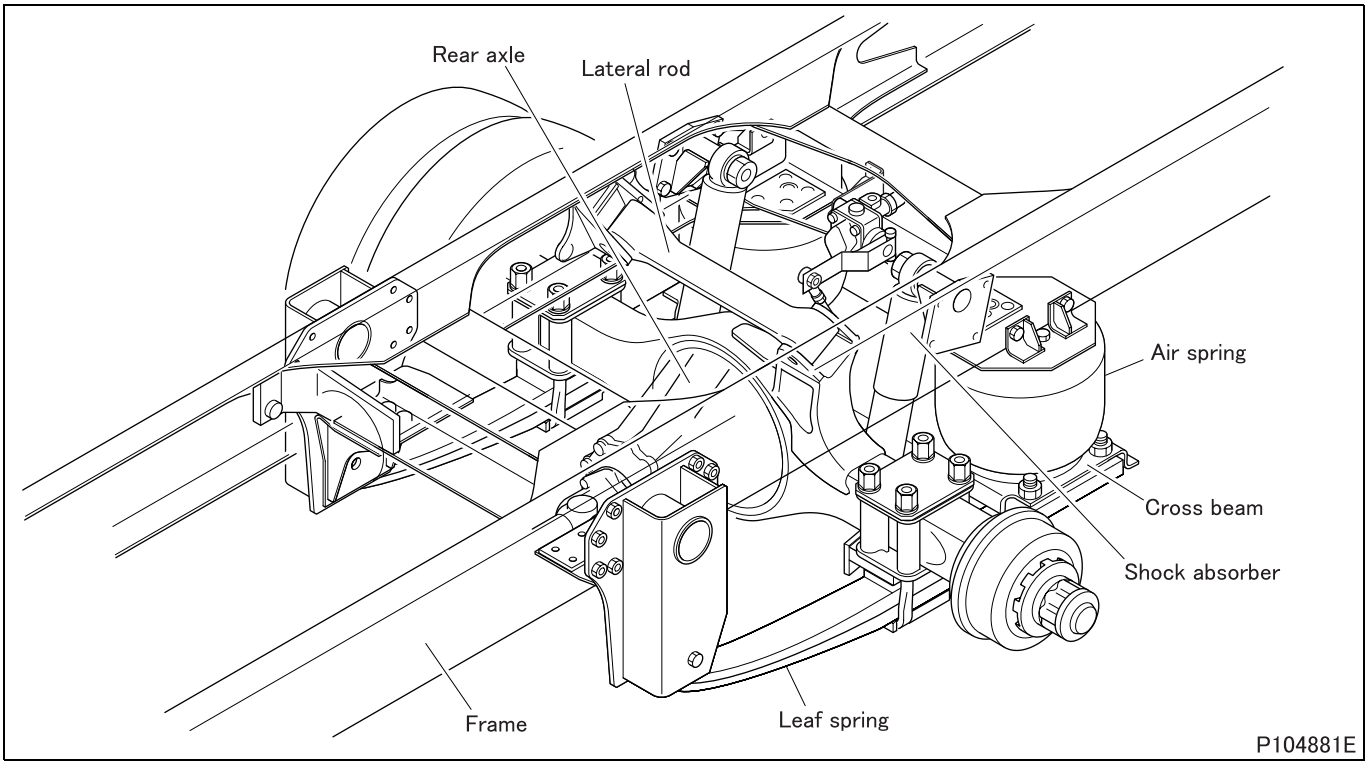
SPECIFICATIONS / STRUCTURE AND OPERATION

SPECIFICATIONS

Item		Specifications
Air spring (effective diameter × installed height)	mm {in.}	ϕ270 × 323 {10.6 × 12.7}
Leaf spring (length × width × thickness – No. of leaves)	mm {in.}	(665 + 430) × 80 × 35 – 2 {(26.2 + 16.9) × 3.15 × 1.38 – 2}

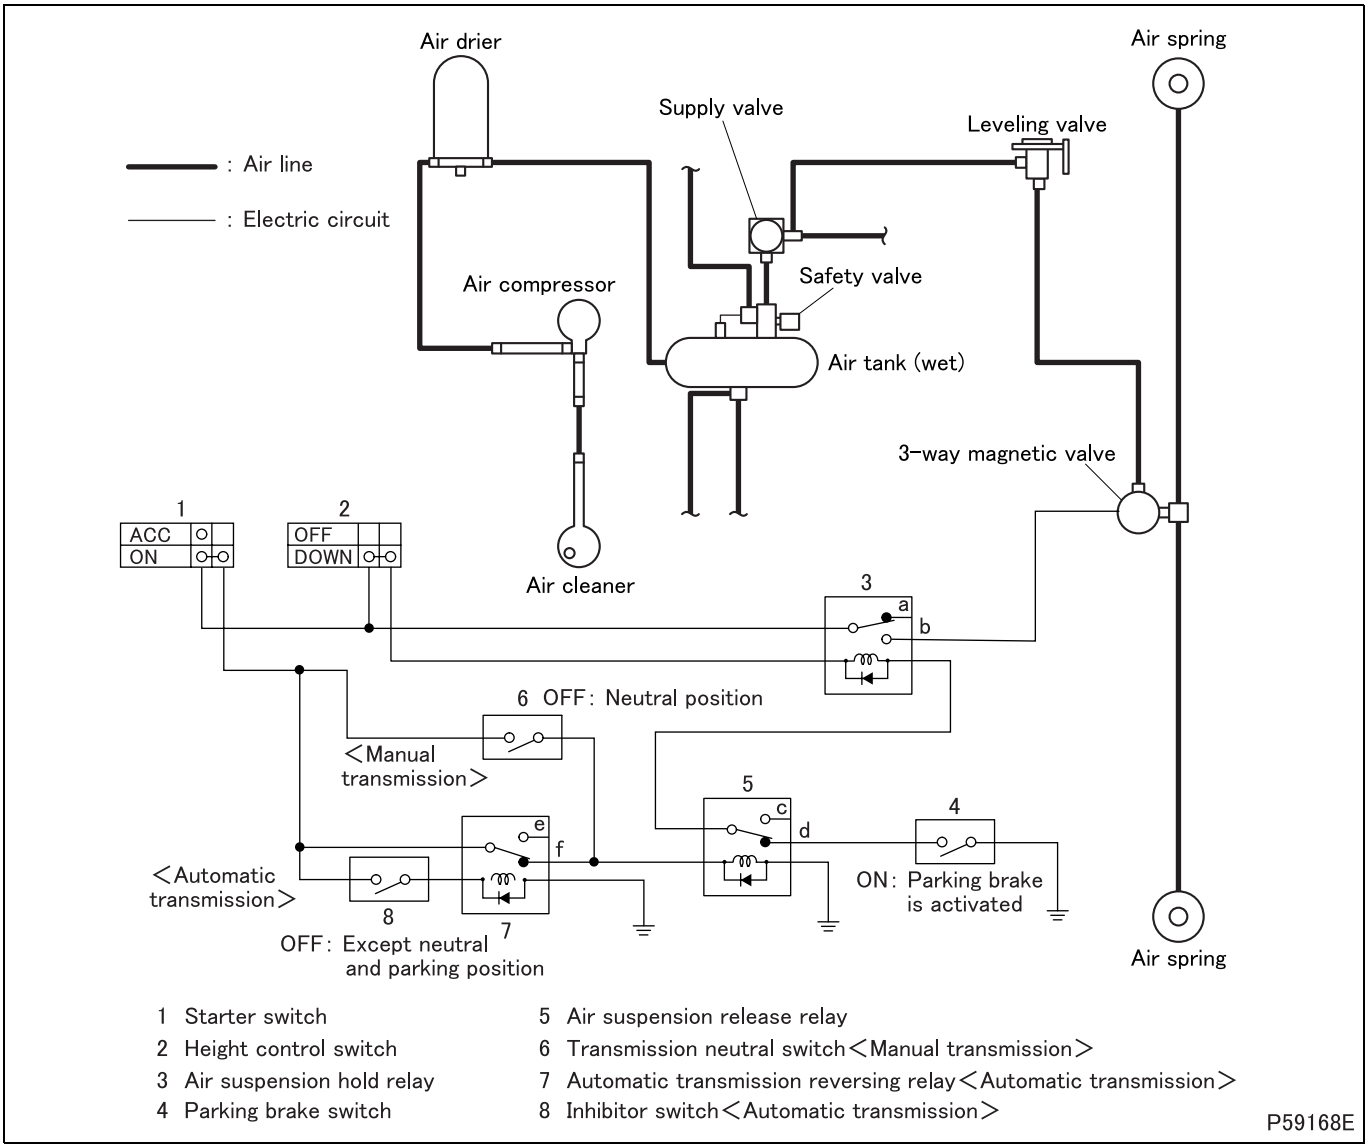
STRUCTURE AND OPERATION

1. Air Suspension



- Air spring, leaf spring, cross beam, and shock absorber are installed between frame and rear axle to support the vehicle body mass and absorb the vibration and shock from the road surface to prevent them from being directly transmitted to the vehicle body, thus protecting the vehicle body, occupants, and cargos. This construction also restricts irregular vibration of the wheels to ensure driving stability. The air spring is characterized by softer spring. Therefore, lateral rod is installed to reduce rolling which is larger in a softer suspension.
- Leveling valve is fitted on the rear axle housing. The leveling valve senses the increase and decrease of loads and controls the internal pressure of the air spring depending upon the load.

2. Air Suspension System



- The air suspension circuit operates 3-way magnetic valve to adjust the height of air spring. (Diagram shows air suspension circuit without current supply.)

2.1 Operable condition

If the following conditions are satisfied when height control switch is DOWN, 3-way magnetic valve operates.
In case of starter switch “ACC”

- The parking brake lever is activated. (Parking brake switch is ON.)

In case of starter switch “ON”

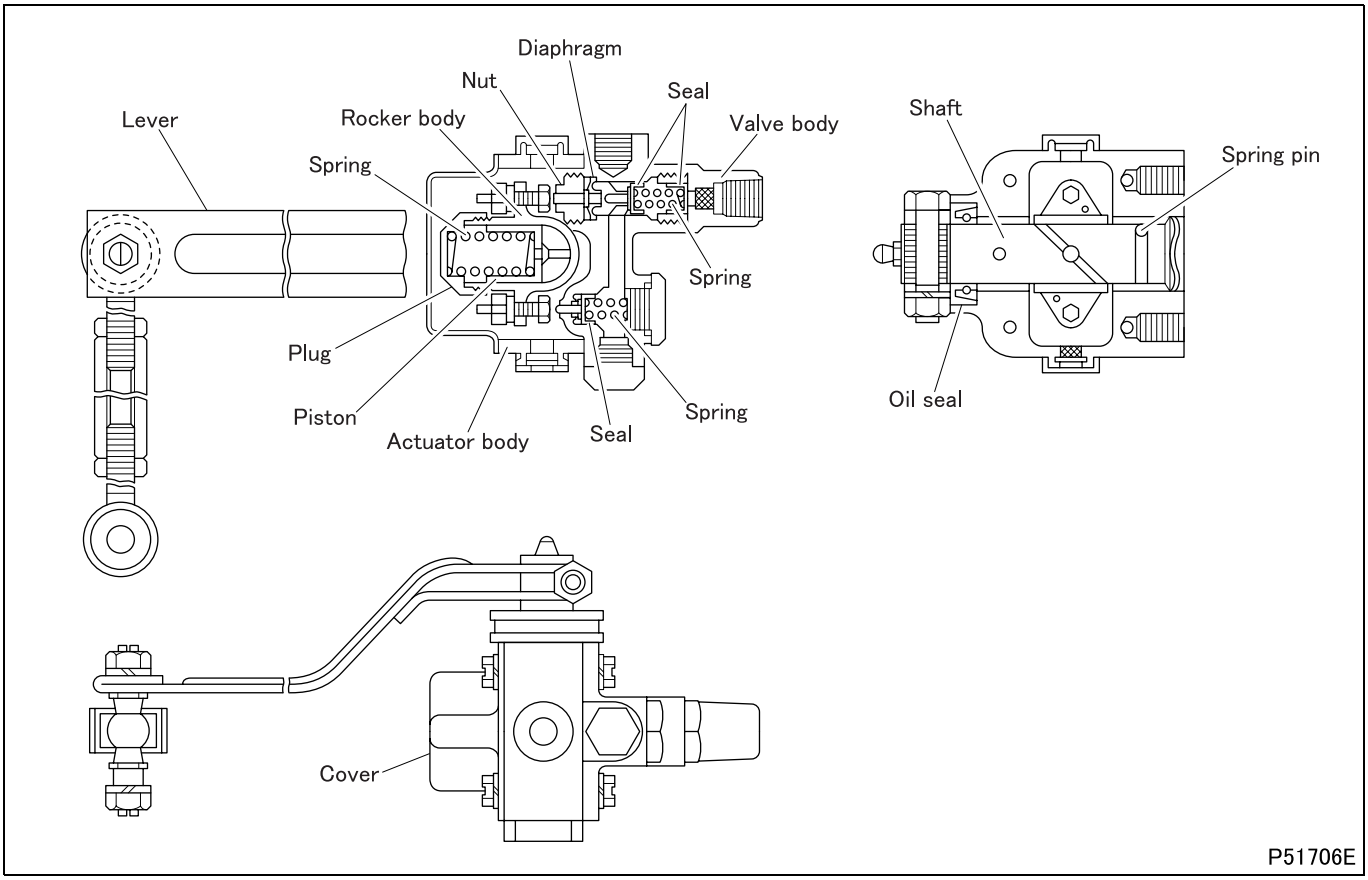
- The parking brake lever is activated. (Parking brake switch is ON.)
- The transmission is in the neutral position. (Transmission neutral switch is OFF or inhibitor switch is ON.)

The current flows as indicated below to operate 3-way magnetic valve.
1 → **2** (DOWN) → **3** (contact b) → **5** (ON) → **4** (ON) → GND

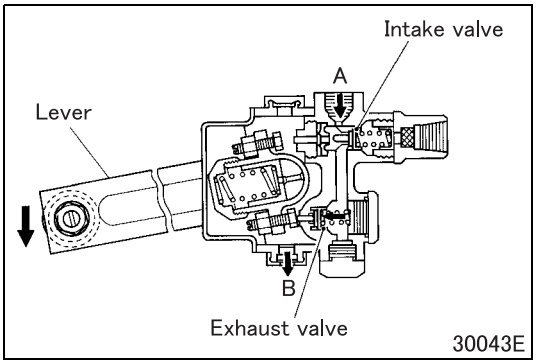
2.2 Non-operable condition

- With the transmission in the neutral position, when the parking brake is not engaged, air suspension hold relay is not activated. Therefore, operating current to 3-way magnetic valve is cut off and the 3-way magnetic valve does not operate. When the transmission is not in neutral position, air suspension hold relay is not activated as well.

3. Leveling Valve

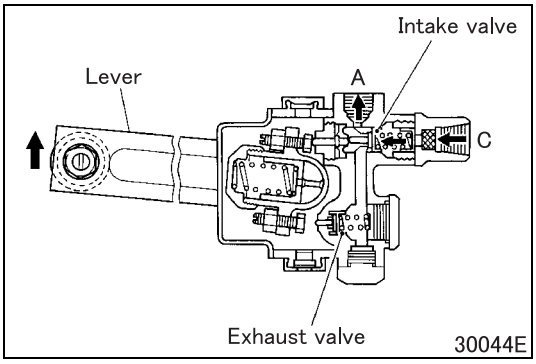


- The leveling valve is a control device which supplies or discharges compressed air to or from the air spring according to loads. The leveling valve body is mounted on the frame.



3.1 When load decreased

- The lever of the leveling valve is lowered below the neutral position. When the lever moves down beyond the dead zone, exhaust valve is opened. Since intake valve remains closed, therefore, the air from discharge port A flows through the opened exhaust valve and is discharged into the atmosphere from exhaust port B.



3.2 When load increased

- The lever of the leveling valve is raised above the neutral position. When the lever moves up beyond the dead zone, intake valve is opened. Since exhaust valve remains closed, therefore, the air flows from supply port C to discharge port A.

Possible causes \ Symptoms		Ride spongy	Noise generated with unloaded vehicle	Noise generated with loaded vehicle	Direct impact from uneven road surface	Periodic jolts during driving on smooth road surface	Large rolling	Large bouncing	Hard cushioning: Standard height of air spring too high	Hard cushioning: Standard height of air spring too low	Height control impossible	Too large amounts of air consumed during driving	Reference Gr

ON-VEHICLE INSPECTION AND ADJUSTMENT

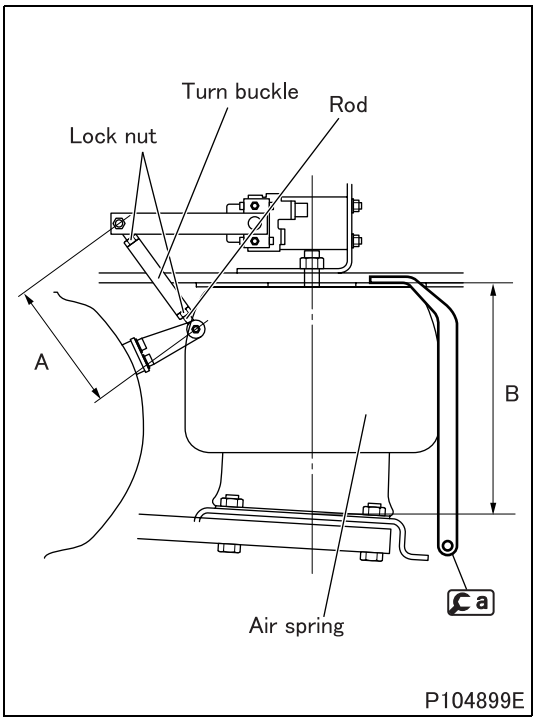
1. Adjustment of Air Spring Height

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Location	Parts to be tightened	Tightening torque	Remarks
–	Lock nut	12 to 15 {8.9 to 11, 1.2 to 1.6}	–

Special tools

Mark	Tool name and shape	Part No.	Application
a	Height gauge  20974	MC811682	Measurement of air spring height

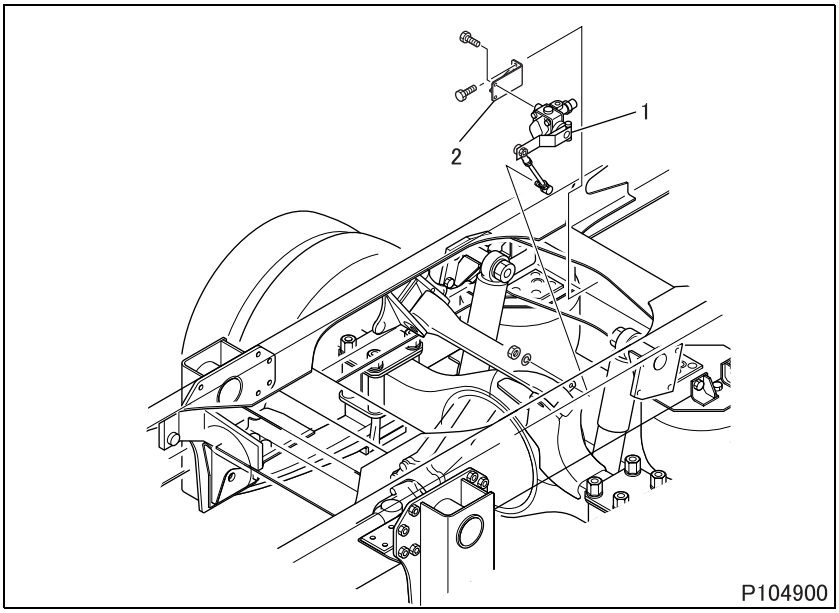


P104899E

CAUTION ⚠

- **Adjust air spring with no occupant in the vehicle.**

- Set air pressure in the air tank to the specified value.
- To prevent dead zone (play) of levelling valve from affecting adjustment, loosen lock nut of rod first, then turn turn buckle to shorten rod length A (distance between centers of eye sections at rod end). Then gradually extend the distance.
- Measure height of air spring using standard scale. When height B is the following value, tighten lock nut of rod.
  B: 329 mm {13.0 in.}



●Removal sequence

1 Leveling valve (See later section.)
2 Bracket

●Installation sequence

Follow the removal sequence in reverse.

- After installation, carry out the adjustment of air spring height. (See “ON-VEHICLE INSPECTION AND ADJUSTMENT”.)

LEVELING VALVE

Leveling valve

Repair kit: Leveling valve kit

Service standards (Unit: mm {in.})

Location	Maintenance item	Standard value	Limit	Remedy
17	Projecting length of diaphragm (stem) when specified air pressure of 590 kPa {174.3 in.Hg, 6 kgf/cm^2} is applied to the inlet side	1.25 ± 0.3 {0.049 ± 0.012}	–	Adjust
19	Dead zone at lever end hole (range where air does not flow in nor out)	8 ± 1 {0.31 ± 0.039}	–	Adjust

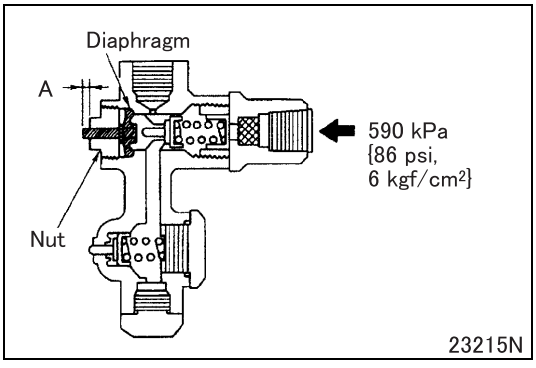
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Nut (rod mounting)	12 to 15 {8.9 to 11, 1.2 to 1.6}	–
	Nut (lever mounting)		
Tb	Nut (adjuster mounting)	5.5 to 7.3 {4.1 to 5.4, 0.55 to 0.75}	–
	Bolt (cover mounting)		
	Bolt (valve body mounting)		
Tc	Joint	20 to 29 {15 to 21, 2 to 3}	–
	Screw plug		
Td	Plug	16 to 19 {12 to 15, 1.6 to 2.0}	–
Te	Grease nipple	1.5 to 2.0 {1.1 to 1.5, 0.15 to 0.20}	–
Tf	Plug	10 to 15 {7.4 to 11.0, 1.0 to 1.5}	–

Lubricant and/or sealant

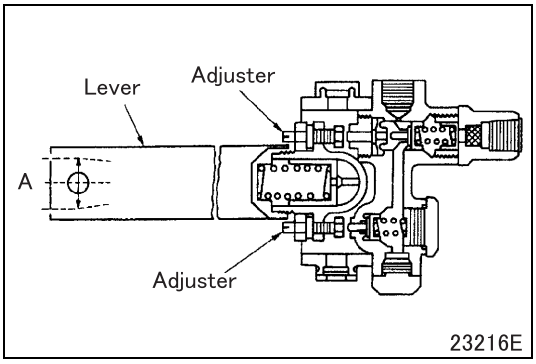
Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Threads of nut	Cemedine No. 575	As required
b	Grease nipple	Multipurpose grease [NLGI No. 2 (Li soap)]	As required
	Periphery of shaft		

◆Installation procedure◆



■ Installation: Diaphragm

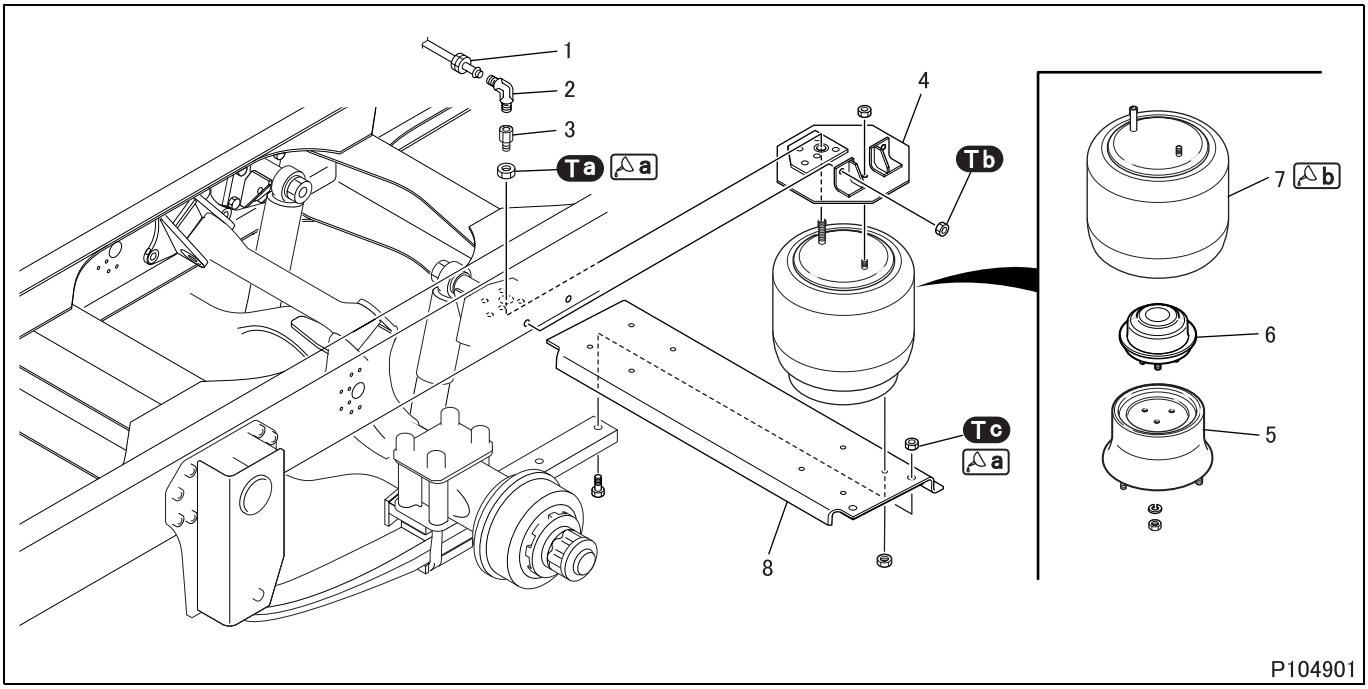
- Install diaphragm nut such that the projection length A of diaphragm (stem) meets the standard value when the specified air pressure of 590 kPa {86 psi, 6 kgf/cm^2} is applied to the inlet side.



■ Adjustment: Dead zone at the lever end

- Adjust dead zone A (lever end hole moving range where no air flow in nor out the valve) for the standard value, using adjuster.

AIR SPRING



● **Removal sequence**

1 Air pipe
2 Connector
3 Connector
4 Air spring bracket
5 Piston
6 Bump stopper
7 Diaphragm
8 Cross beam

● **Installation sequence**

Follow the removal sequence in reverse.

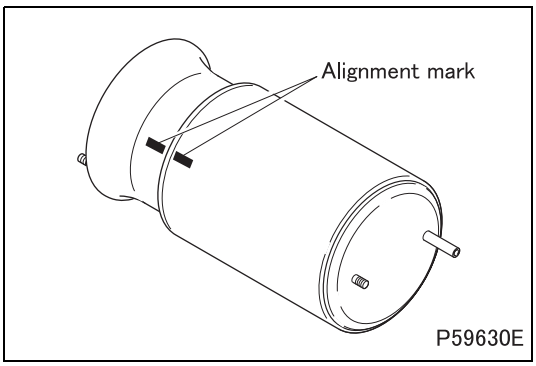
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Nut (air spring and air spring bracket mounting)	160 to 220 {120 to 160, 16.3 to 22.4}	–
Tb	Nut (air spring bracket mounting)	78 to 110 {59 to 81, 8 to 11}	–
Tc	Nut (cross beam mounting)	260 to 350 {190 to 260, 26.5 to 35.7}	–

Lubricant and/or sealant

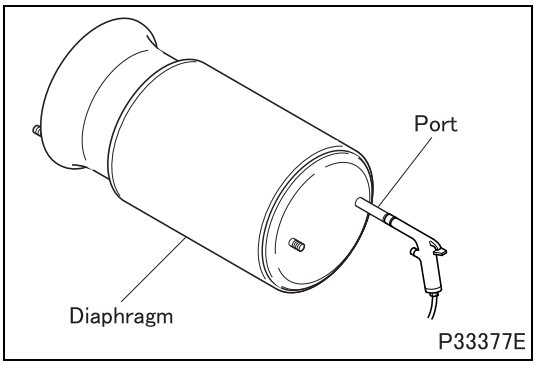
Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Nut thread	Chassis grease [NLGI No. 1 (Li soap)]	As required
b	Joint of diaphragm with bump stopper	Tire cream	As required

◆Work before removal◆



■ **Alignment mark: Diaphragm and piston**

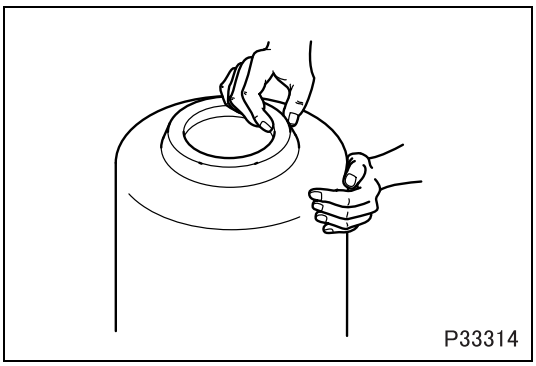
◆Removal procedure◆



■ **Removal: Diaphragm**

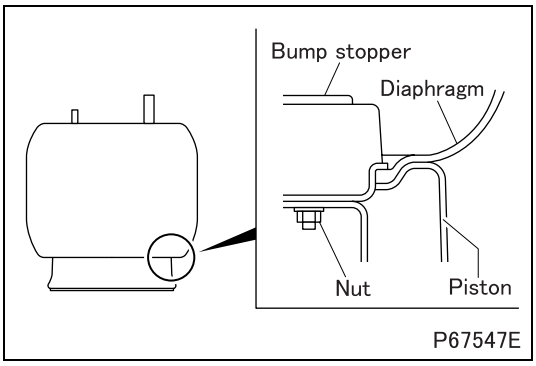
- Inject air from the inlet port to expand the diaphragm.
- While keeping this condition, remove the diaphragm which is caught between piston and bump stopper.

◆Installation procedure◆

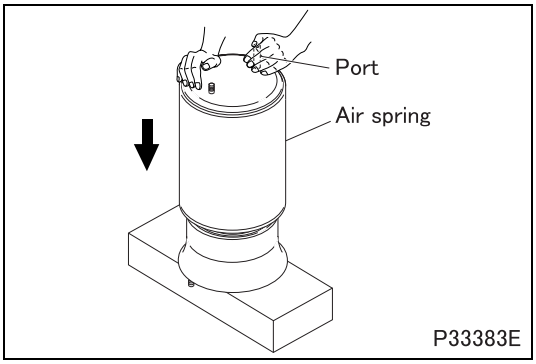


■ **Installation: Diaphragm**

- Before installing, apply tire cream to the diaphragm-to-bump stopper joint.

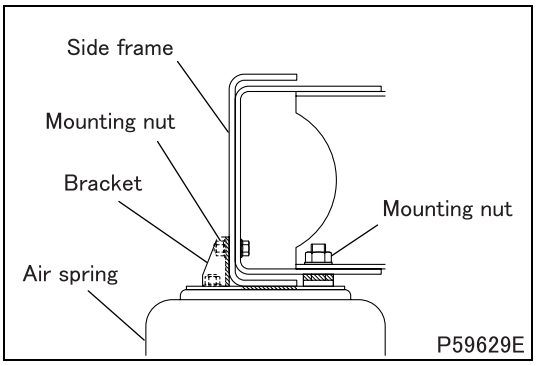


- Pull together bump stopper and diaphragm making sure they are in close contact, then install piston and secure it with nut.



■ **Installation: Air spring**

- Holding the air spring body erect, apply your hand over the port.
- While blocking the port to prevent the diaphragm from being damaged, press the air spring with air shut in.
- Gradually release air from the port to contract the diaphragm to a height at which the air spring will be installed to the vehicle.

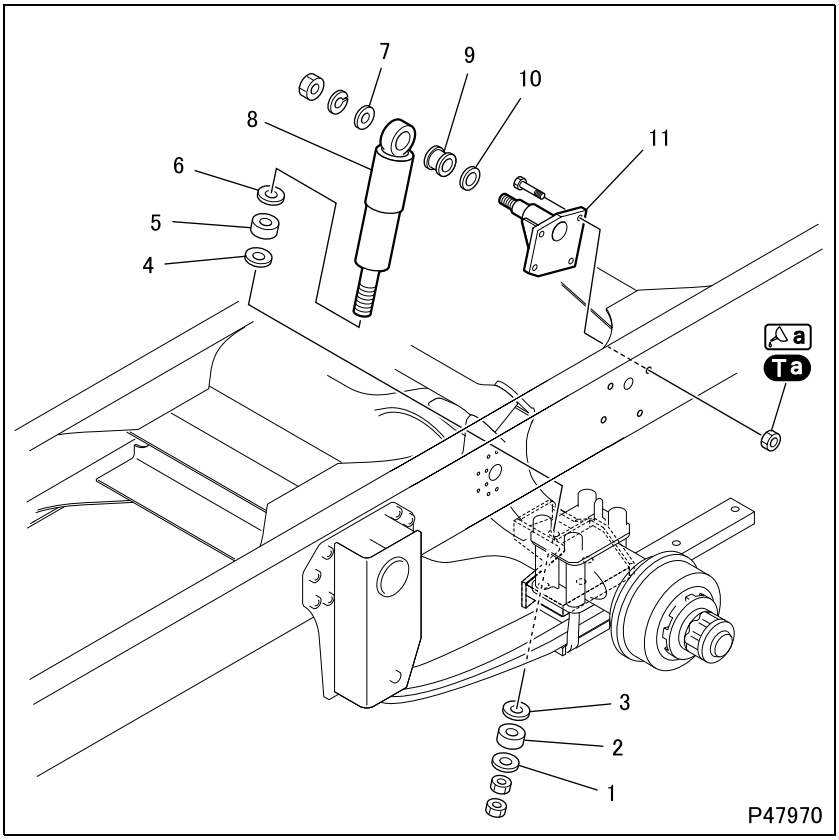


■ **Installation: Air spring bracket**

- Tighten the mounting nut to the specified torque while attaching the air spring bracket closely to the side frame mounting surface (diagonally shaded area) as shown in the drawing.

M E M O

SHOCK ABSORBER



●Removal sequence

1 Washer A
2 Rubber bushing
3 Centering washer
4 Centering washer
5 Rubber bushing
6 Washer C
7 Washer B
8 Shock absorber
9 Rubber bushing
10 Washer B
11 Shock absorber upper bracket

CAUTION ⚠

- **Before removing the shock absorber, be sure to remove the nut that holds cross beam and air spring to prevent the air spring from being damaged.**

●Installation sequence

Follow the removal sequence in reverse.

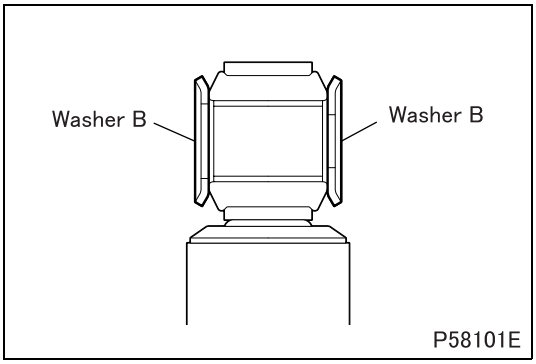
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Nut (shock absorber upper bracket mounting)	160 to 220 {120 to 160, 16.3 to 22.4}	Wet

Lubricant and/or sealant

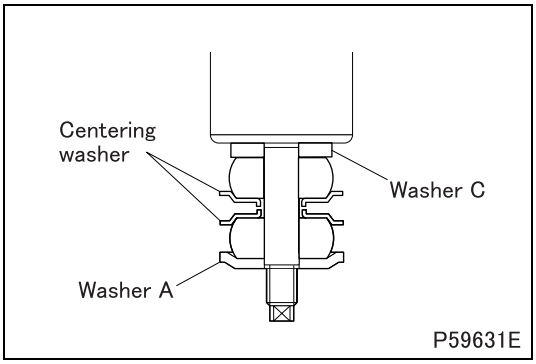
Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Nut thread	Chassis grease [NLGI No. 1 (Li soap)]	As required

◆Installation procedure◆



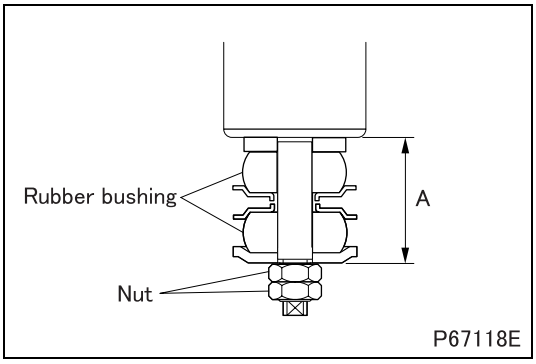
■ Installation: Washer B

- Install the washer B in the illustrated direction.



■ **Installation: Washer A and centering washer**

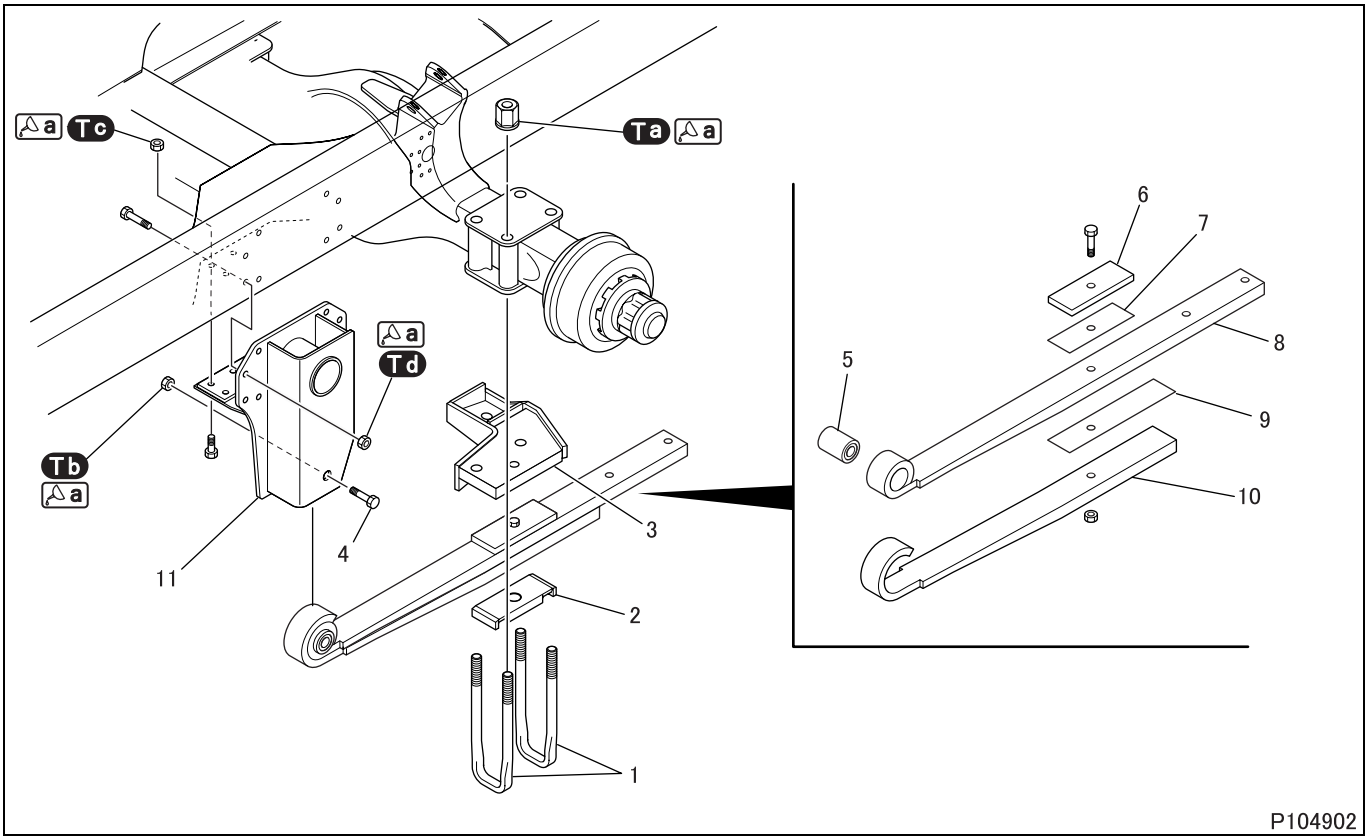
- Install the washer A and centering washer in the illustrated direction.



■ **Installation: Rubber bushing**

- Tighten the nut for the dimension A as indicated below.
  A: 68 mm {2.68 in.}

LEAF SPRING



●Disassembly sequence

1 U-bolt
2 Spring pad
3 Shock absorber lower bracket
4 Leaf spring bolt
5 Bushing
6 Caster shim
7 Center spacer
8 Leaf spring (No. 1)
9 Center spacer
10 Leaf spring (No. 2)
11 Leaf spring bracket

NOTE

- **Do not disassemble the leaf spring unless there is an abnormality.**

●Assembly sequence

Follow the disassembly sequence in reverse.

CAUTION ⚠

- **Do not fully tighten leaf spring bolts before adjusting the height of air spring. Otherwise, the bushings for the eyes of leaf spring may be twisted.**

Service standards (Unit: mm {in.})

Location	Maintenance item	Standard value	Limit	Remedy
4, 5	Clearance between leaf spring bolts and leaf spring bushings	0 to 0.03 {0 to 0.0012}	–	Replace

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Nut (U-bolt mounting)	740 to 830 {545 to 610, 75 to 85}	Wet
Tb	Nut (leaf spring mounting)	590 to 790 {435 to 580, 60 to 80.5}	Wet
Tc	Nut (leaf spring bracket mounting)	160 to 220 {120 to 160, 16.3 to 22.4}	Wet
Td	Nut (leaf spring bracket mounting)	260 to 350 {190 to 260, 27 to 36}	Wet

Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity

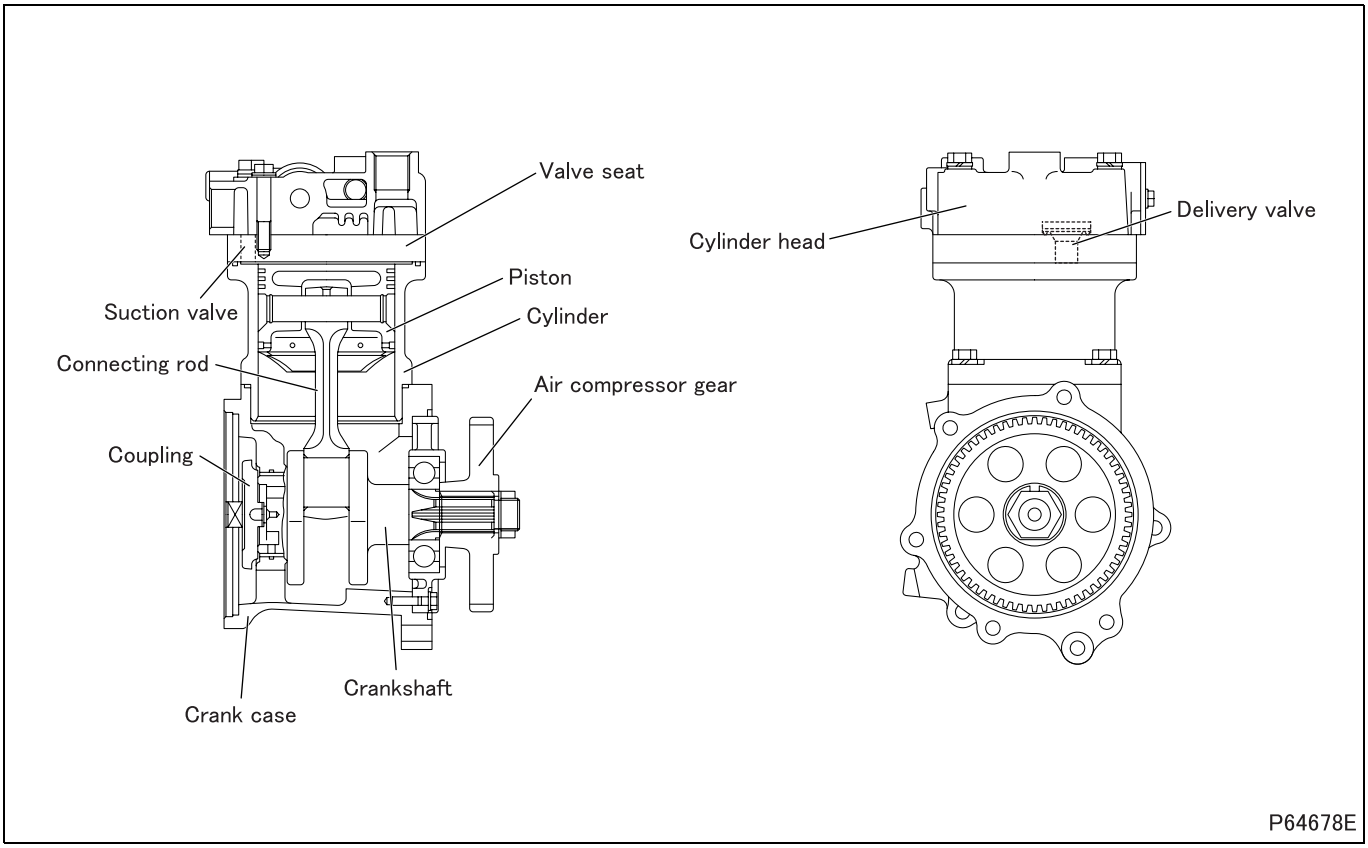
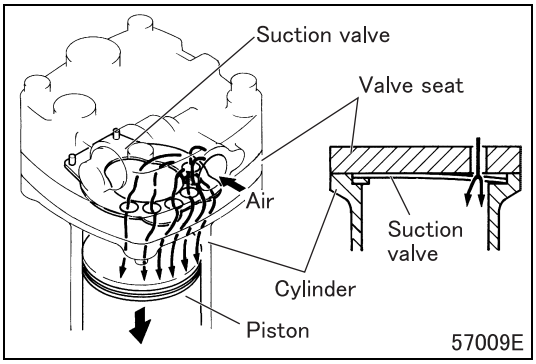
17 Waste gate magnetic valve
18 Stop lamp switch
19 Dual brake valve
20 Air pressure sensor

A : Fluid line
B : Air line
C : Hose
D : To air suspension seat <option>
E : To air horn

- The brake system is an air over hydraulic, all wheel brake type consisting of separate front and rear systems.
- The servo system is fitted with brake boosters.
- An exhaust brake system of the exhaust pipe opening and closing valve type, is fitted as a sub-brake system.

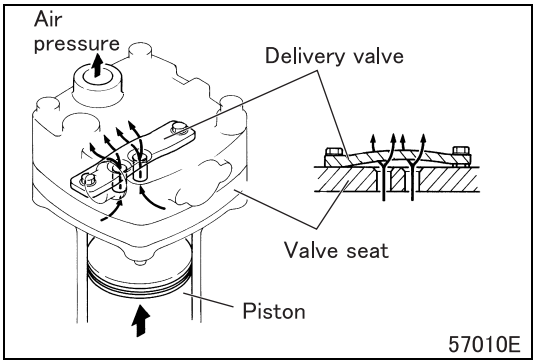
2. Air Compressor





2.1 During suction

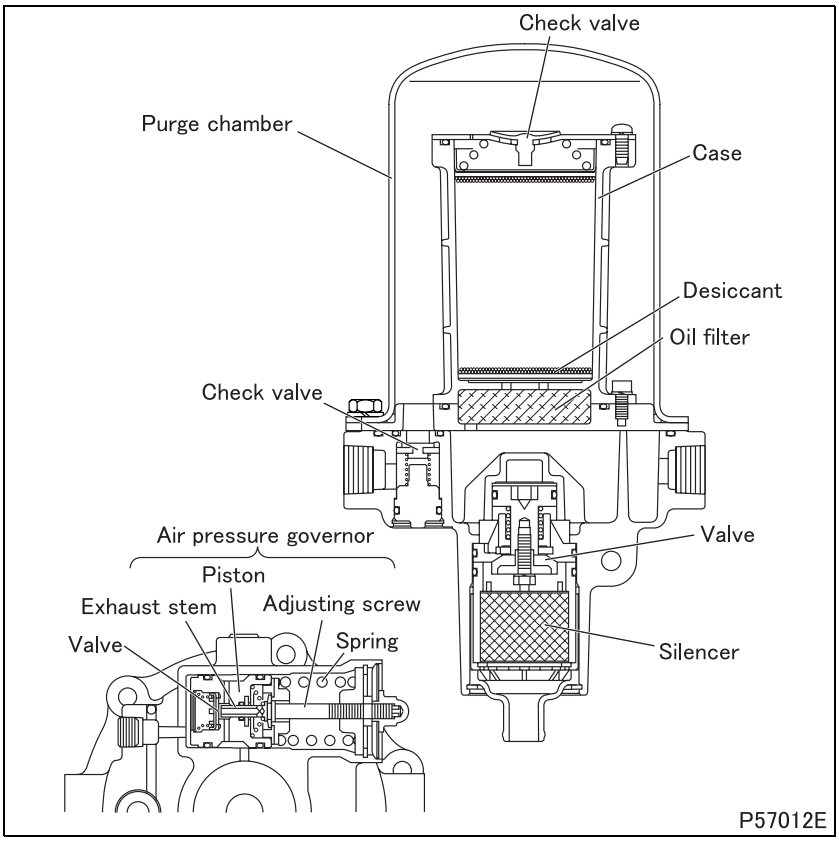
- When the piston goes down during the suction stroke cycle, the vacuum causes the suction valve to open, allowing air to be drawn into the cylinder.



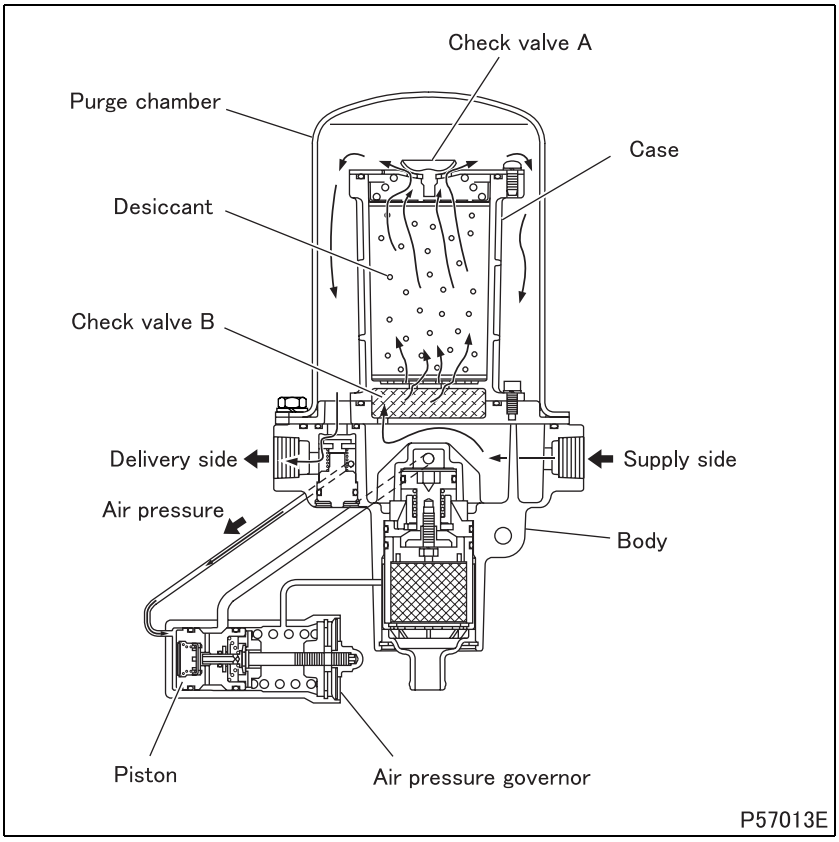
2.2 During compression and delivery

- When the piston goes up during the compression and delivery stroke cycle, the suction valve is closed by air pressure.
- Air pressure compressed by the piston forces open the delivery valve and makes its way to the air dryer and air tank.

3. Air Dryer

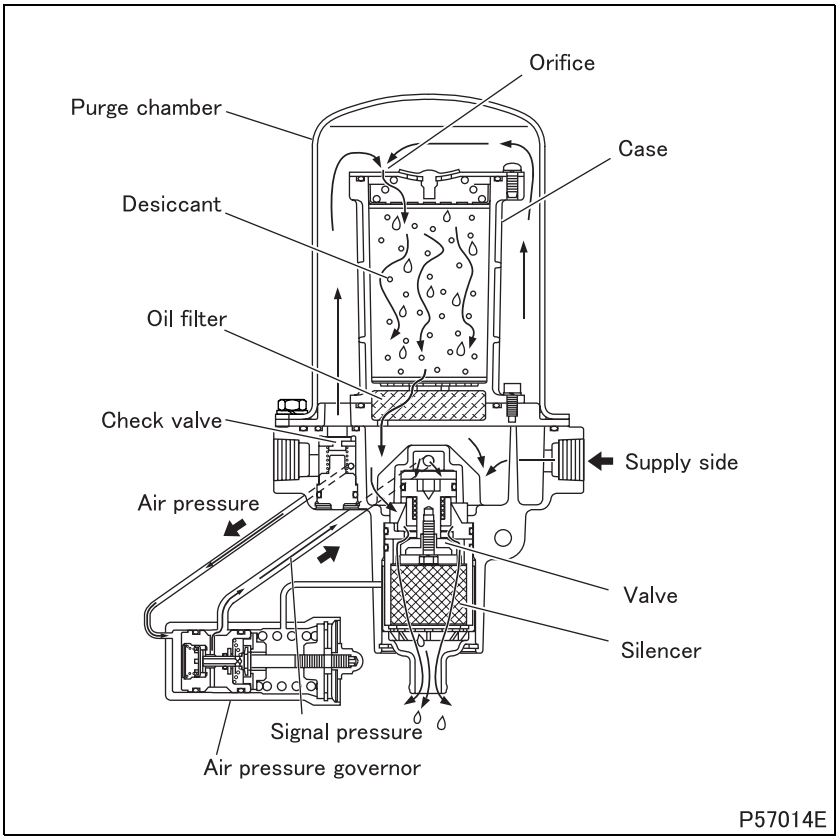


- The air dryer protects brake components by removing moisture and oil from air that has been compressed by the air compressor.
- The air dryer incorporates an air pressure governor, which keeps the pressure in the air tank constant by releasing air compressed by the air compressor to the atmosphere when the pressure in the air tank makes such operation necessary.



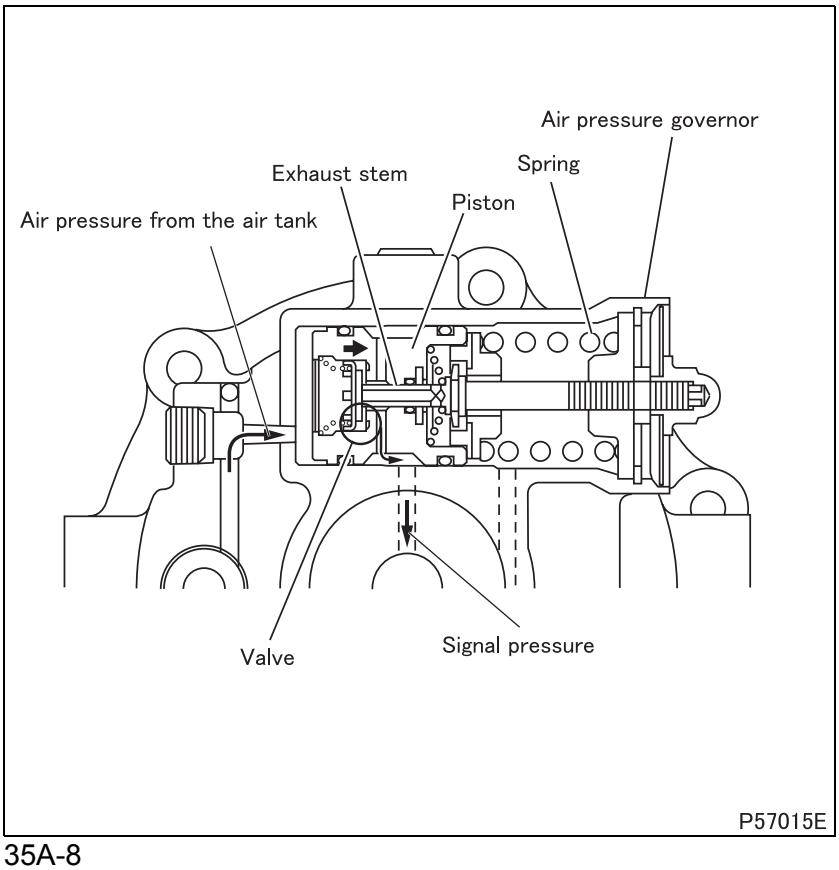
3.1 Drying action

- While the air tank is being charged, air from the air compressor enters the air dryer's supply side. Moisture and oil are separated from the air inside the body and collect in the bottom. The air then passes through the oil filter, which removes smaller oil droplets and particles of dust. The air then flows into the case, where the desiccant removes any remaining moisture.
- As the air flows upward in the case, it makes contact with increasingly dry desiccant and thus contains less and less moisture. When the air reaches the top of the case, it is dry. It flows through the check valve A, purge chamber, and check valve B, and it is then supplied from the delivery side to the air tank. Air pressure also acts upon the piston in the air pressure governor.



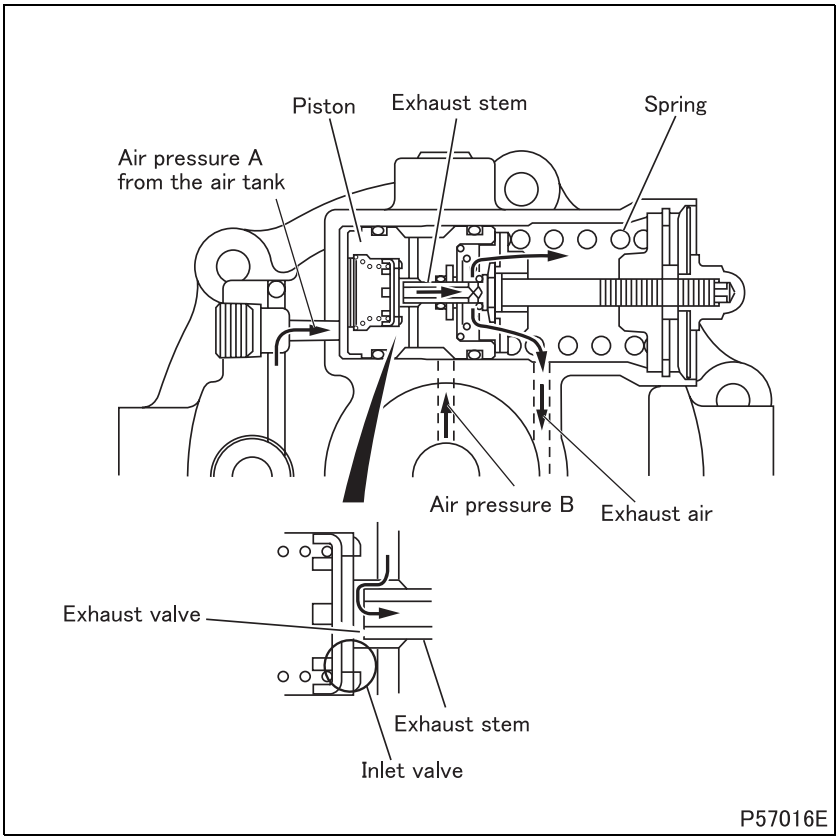
3.2 Regeneration of desiccant

- When the air pressure in the air tank reaches the upper threshold level, signal pressure from the air pressure governor causes the valve in the air dryer's control port to open. As a result, the pressure in the case cleans the oil filter and pushes the water and oil out into the atmosphere.
- Following the rapid drop in pressure, dry air in the purge chamber flows through the orifice, expands, and becomes super-dry. As this super-dry air flows backward through the case, it carries moisture from the desiccant out into the atmosphere, thereby completing the desiccant's regeneration.
- During the regeneration process, the check valve is closed. Thus, the signal pressure from the air pressure governor continues to act upon the control port and the valve remains open. Air from the air compressor thus flows through the valve, through the silencer, and out into the atmosphere.
- The regeneration process continues until air consumption causes the pressure in the air tank to decrease to the governor lower threshold level.



3.3 Operation when tank pressure reaches upper threshold level

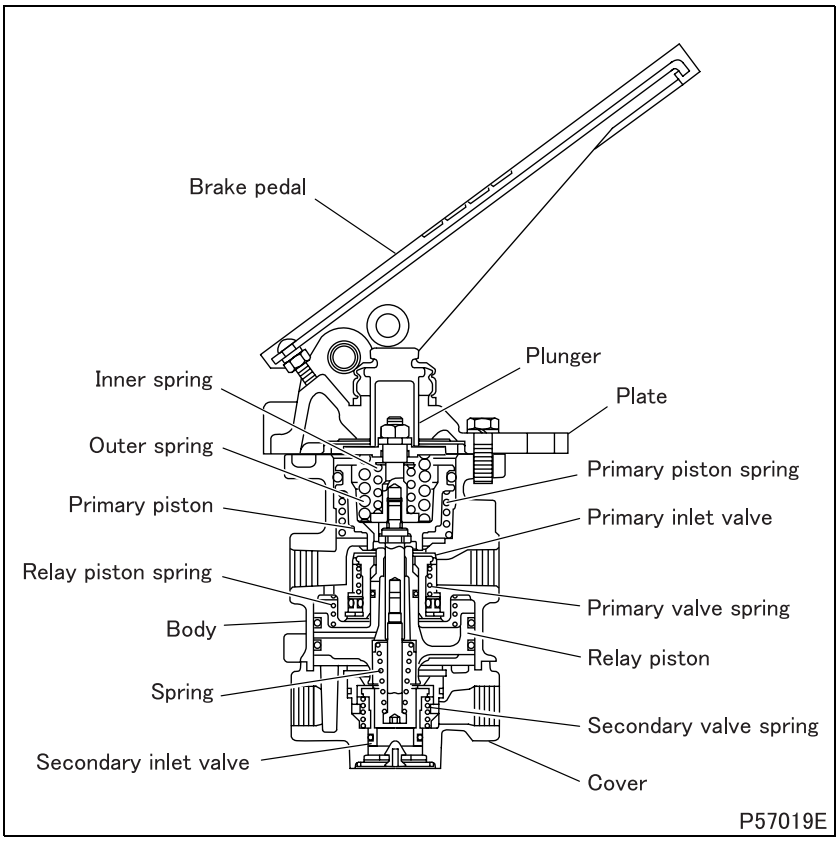
- Air pressure from the air tank continuously acts upon the piston.
- When the tank pressure increases to such a level that it overcomes the spring, it pushes the piston upward such that the valve closes.
- When the tank pressure increases further and exceeds the upper threshold level, the piston is pushed upward further such that the exhaust stem opens the inlet valve. Air pressure from the air tank thus flows out of the air pressure governor as signal pressure, causing the valve to open. Regeneration of the air dryer's desiccant thus begins.



3.4 Operation when tank pressure reaches lower threshold level

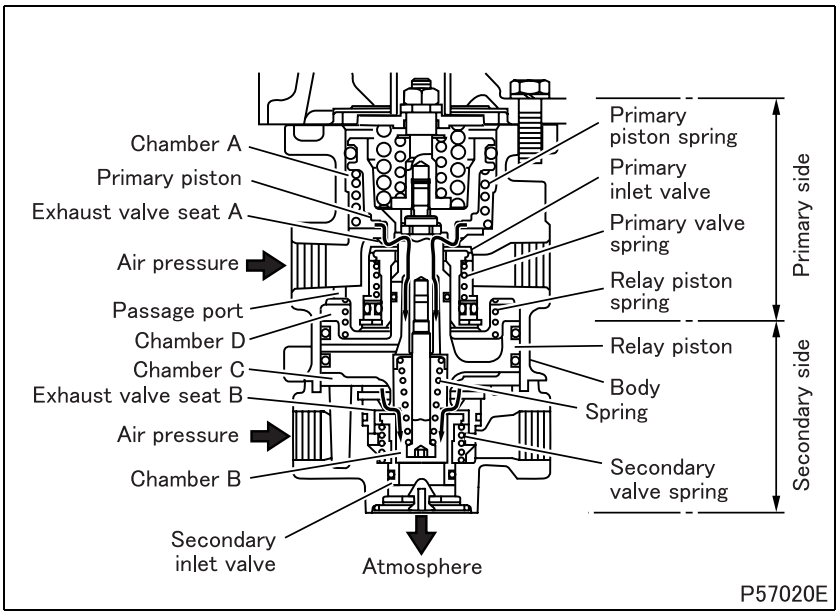
- When the air pressure A from the air tank drops below the lower threshold level, the piston is pushed downward by the spring such that the inlet valve closes and the exhaust valve opens. As a result, air pressure flows through the exhaust stem and escapes to the atmosphere.

4. Dual Brake Valve



- The dual brake valve controls the braking force of the vehicle by feeding pressurized air to the brake booster in accordance with the brake pedal depression angle of brake pedal.

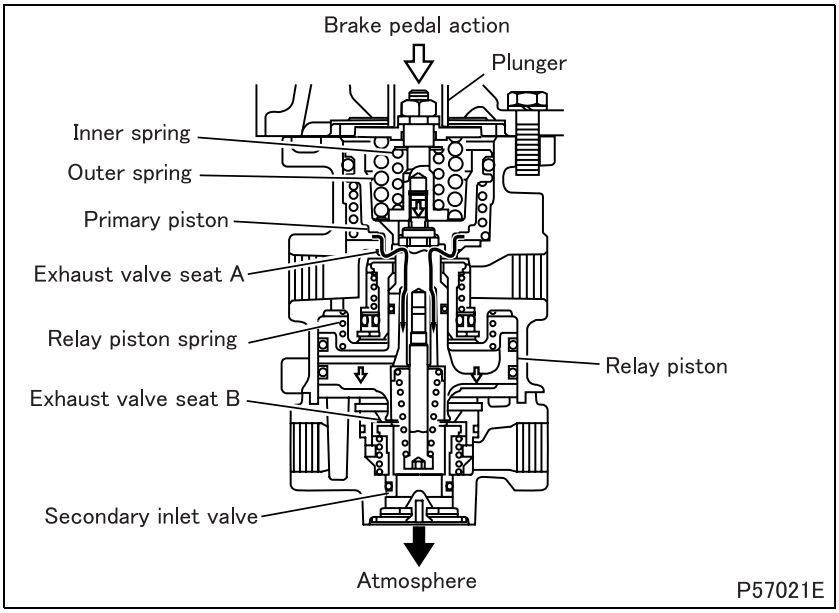
4.1 Normal operation



(1) When brake not operating

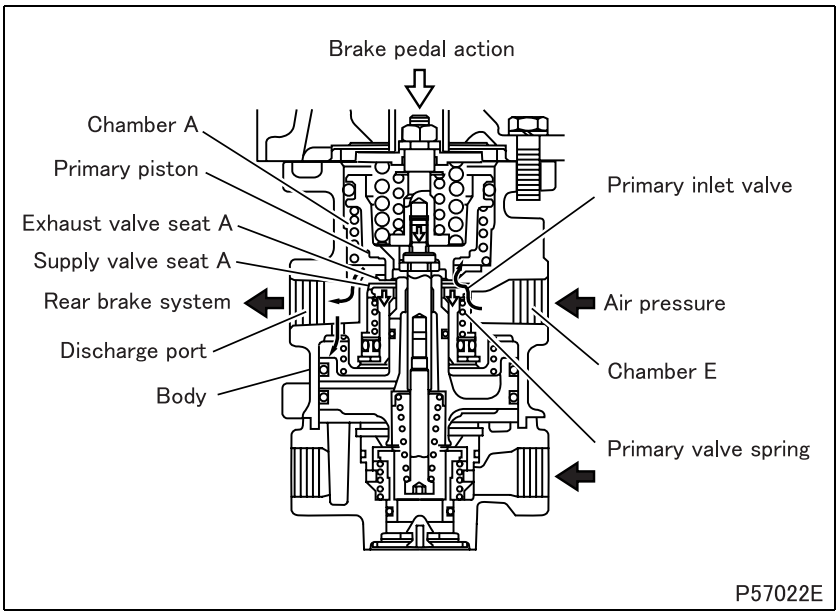
- The repercussive forces of primary valve springs, secondary valve spring seat primary inlet valve at primary side, and inlet valve at secondary side, on their respective seats. This shuts off air from the air tank to maintain airtightness.
- The repercussive force of primary piston spring raises primary piston to its upper position. Exhaust valve seat A opens and chamber A is open to atmosphere via chamber B.
- Since the repercussive forces of spring is stronger than the repercussive force of relay piston spring, relay piston is raised to its upper position and exhaust valve seat B is opened. This opens chamber C to atmosphere via chamber B.

  Chamber A at the primary side and chamber D at the upper part of relay piston at the secondary side are connected via passage port of body.



(2) When pressing brake pedal (before braking pressure is generated)

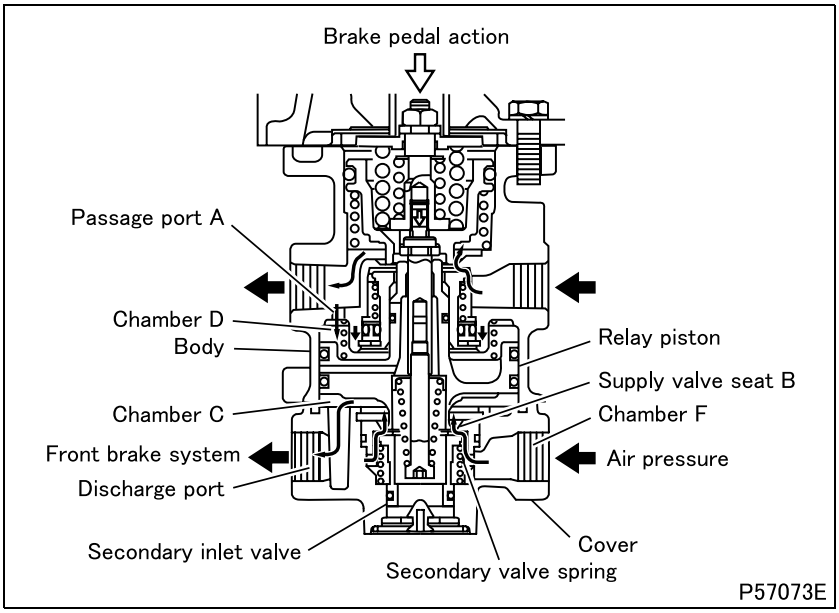
- Pressing the brake pedal (illustrated as pedal action), forces down primary piston via plunger.
- Forcing down primary piston changes the balance between the repercussive forces of inner spring and outer spring, and the repercussive force of relay piston spring, forcing down relay piston. This seats the relay piston on secondary inlet valve and closes exhaust valve seat B.
- This closes the secondary side exhaust passage; however, primary side exhaust valve seat A remains open. No braking pressure is generated at either primary or secondary sides.



(3) When pressing brake pedal (braking pressure is generated)

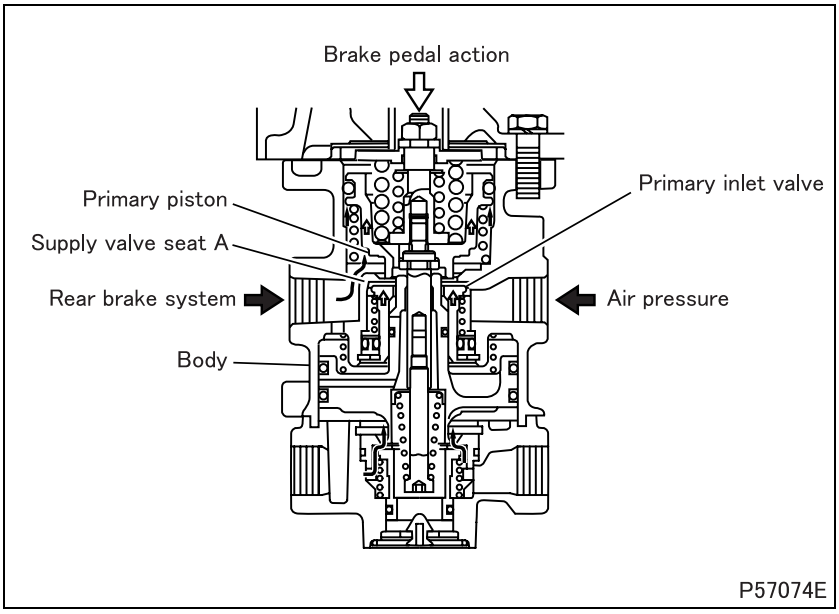
(3.1) Primary side

- As the brake pedal is pressed further (illustrated as brake pedal action), primary piston is forced down until it is seated on primary inlet valve, closing exhaust valve seat A.
- Primary inlet valve is forced down, compressing primary valve spring, and supply valve seat A of body separates from the primary inlet valve. The air in chamber E flows into chamber A and is fed to rear brake system via discharge port as braking pressure.



(3.2) Secondary side

- The air at the primary side flows into chamber D via passage port of body.
- The air fed into chamber D acts on the upper part of relay piston to force down the relay piston and compress secondary valve spring, forcing down secondary inlet valve.
- This separates supply valve seat B and secondary inlet valve of cover.
- The air in supply port chamber F flows into chamber C and is fed to front brake system via discharge port as braking pressure.

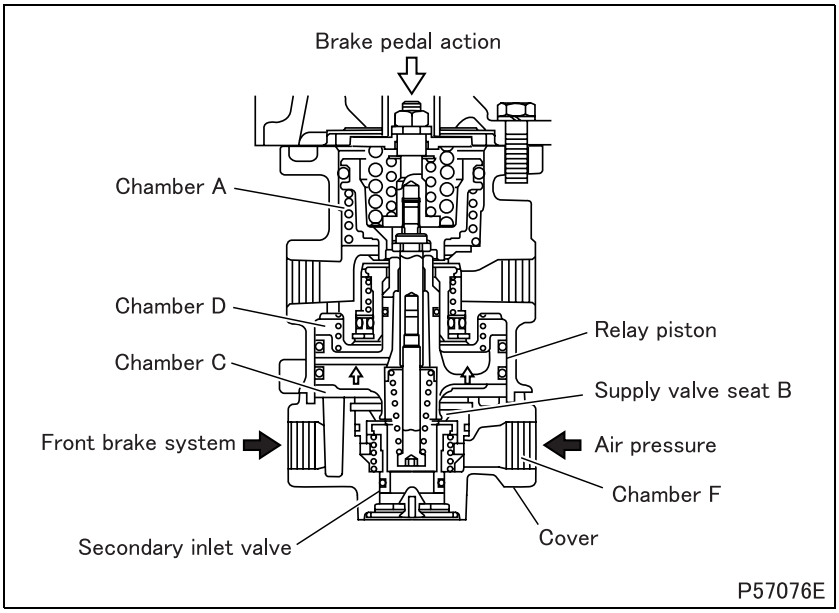


(4) Stabilization of braking pressure

- When the brake pedal remains pressed at the specified depression angle, the braking air pressure stabilizes at the pressure corresponding to the brake pedal depression angle.

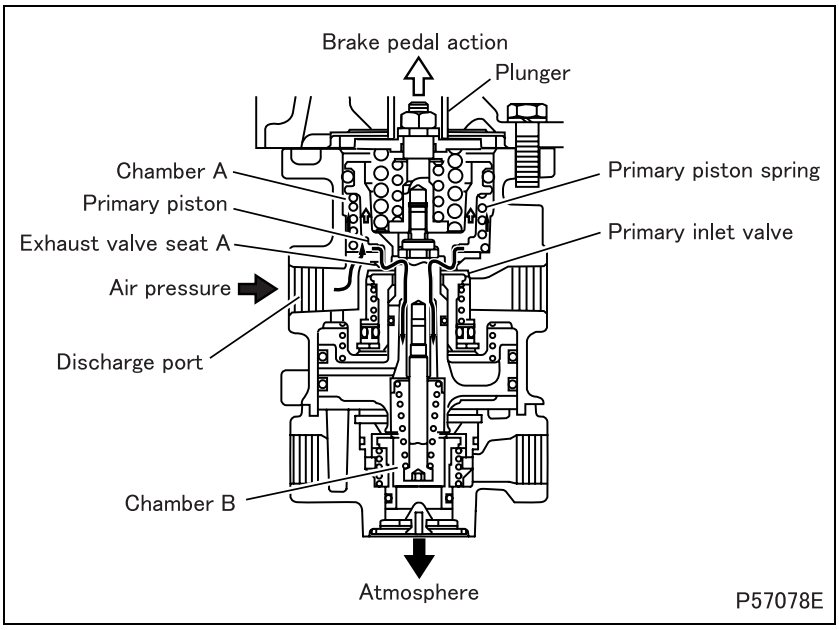
(4.1) Primary side

- The braking air pressure fed under the bottom of primary piston raises the primary piston and primary inlet valve together in tandem.
- Primary inlet valve makes contact with supply valve seat A of body, then the supply of air from the air tank ceases and the increases in the braking air pressure stops. This stabilizes braking pressure for the rear brake system.



(4.2) Secondary side

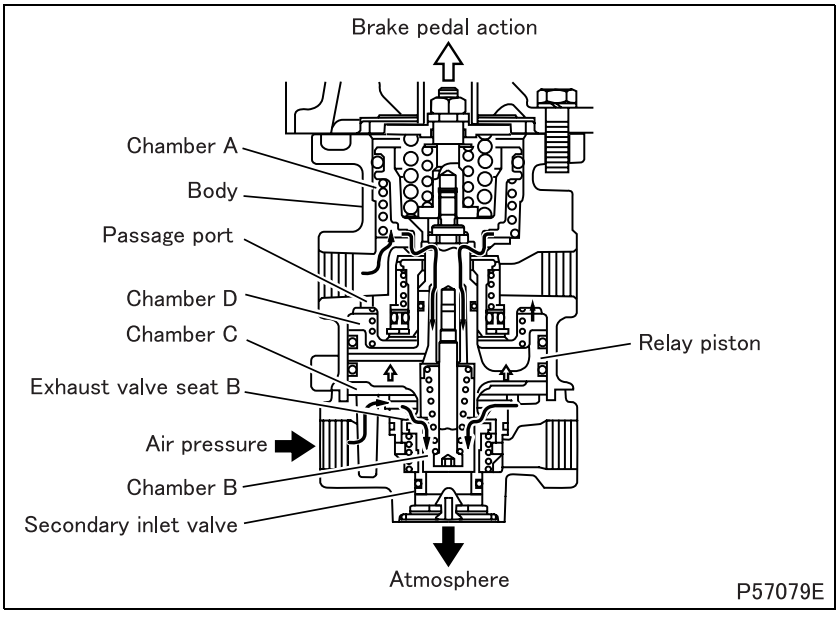
- As the braking pressure (pressure in chamber C) for the front brake system balances the pressures in chambers A and D, the force raising relay piston disappears, and the relay piston rises in tandem with secondary inlet valve.
- Secondary inlet valve makes contact with supply valve seat B of cover, then the supply of air from supply port chamber F to chamber C ceases. This stabilizes brake pressure for the front system.



(5) Release of brake pressure

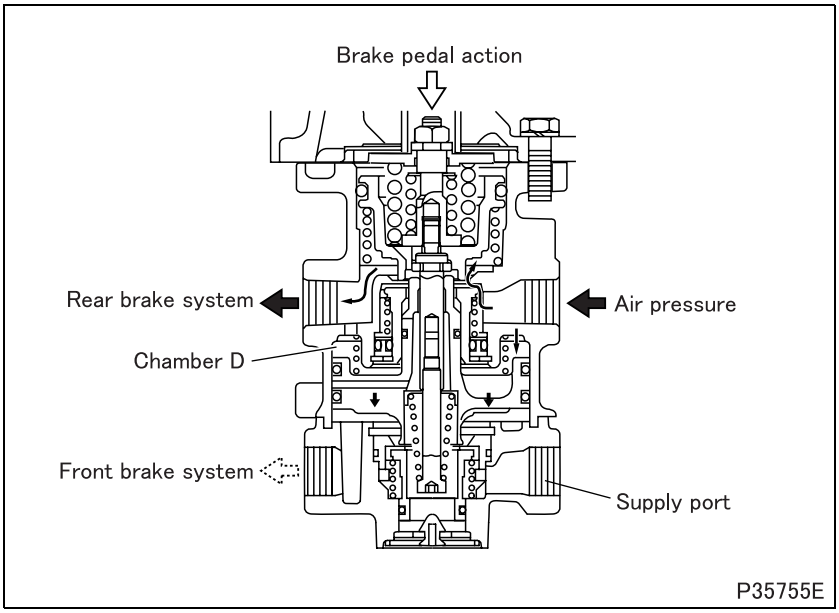
(5.1) Primary side

When the brake pedal is released (illustrated as brake pedal action), primary piston spring and air pressure at discharge port (pressure in chamber A) raise plunger and primary piston. Then, exhaust valve seat A at the lower end of the primary piston separates from primary inlet valve. The air pressure of the rear brake system flows through chamber A to be discharged from exhaust passage chamber B into atmosphere.



(5.2) Secondary side

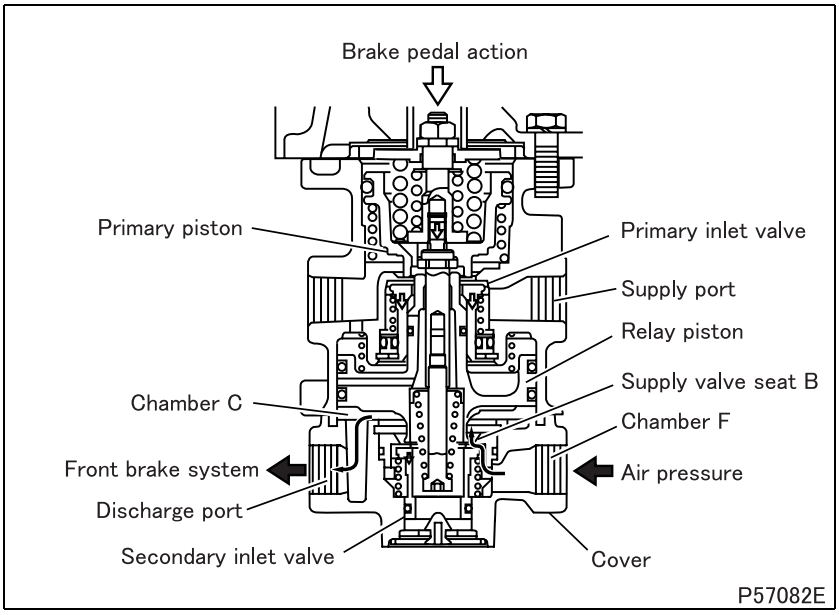
- As the air pressure in the rear brake system drops, the air pressure in chamber D is discharged via passage port of body, and chambers A and B into atmosphere.
- This changes the air pressure balance between chambers D and C. The air pressure in chamber C raises relay piston, and exhaust valve seat B at the lower end of the relay piston separates from secondary inlet valve. Air pressure in the front brake system is discharged from exhaust passage chamber B into atmosphere.



(6) When abnormality occurs

(6.1) Operation when the air pipe of the front brake system fails

- The primary side operates the same as normal, generating braking pressure in rear brake system.
- At the secondary side, even if the primary side generates air pressure in chamber D, braking pressure is not generated in front brake system, since no air pressure is generated in supply port.

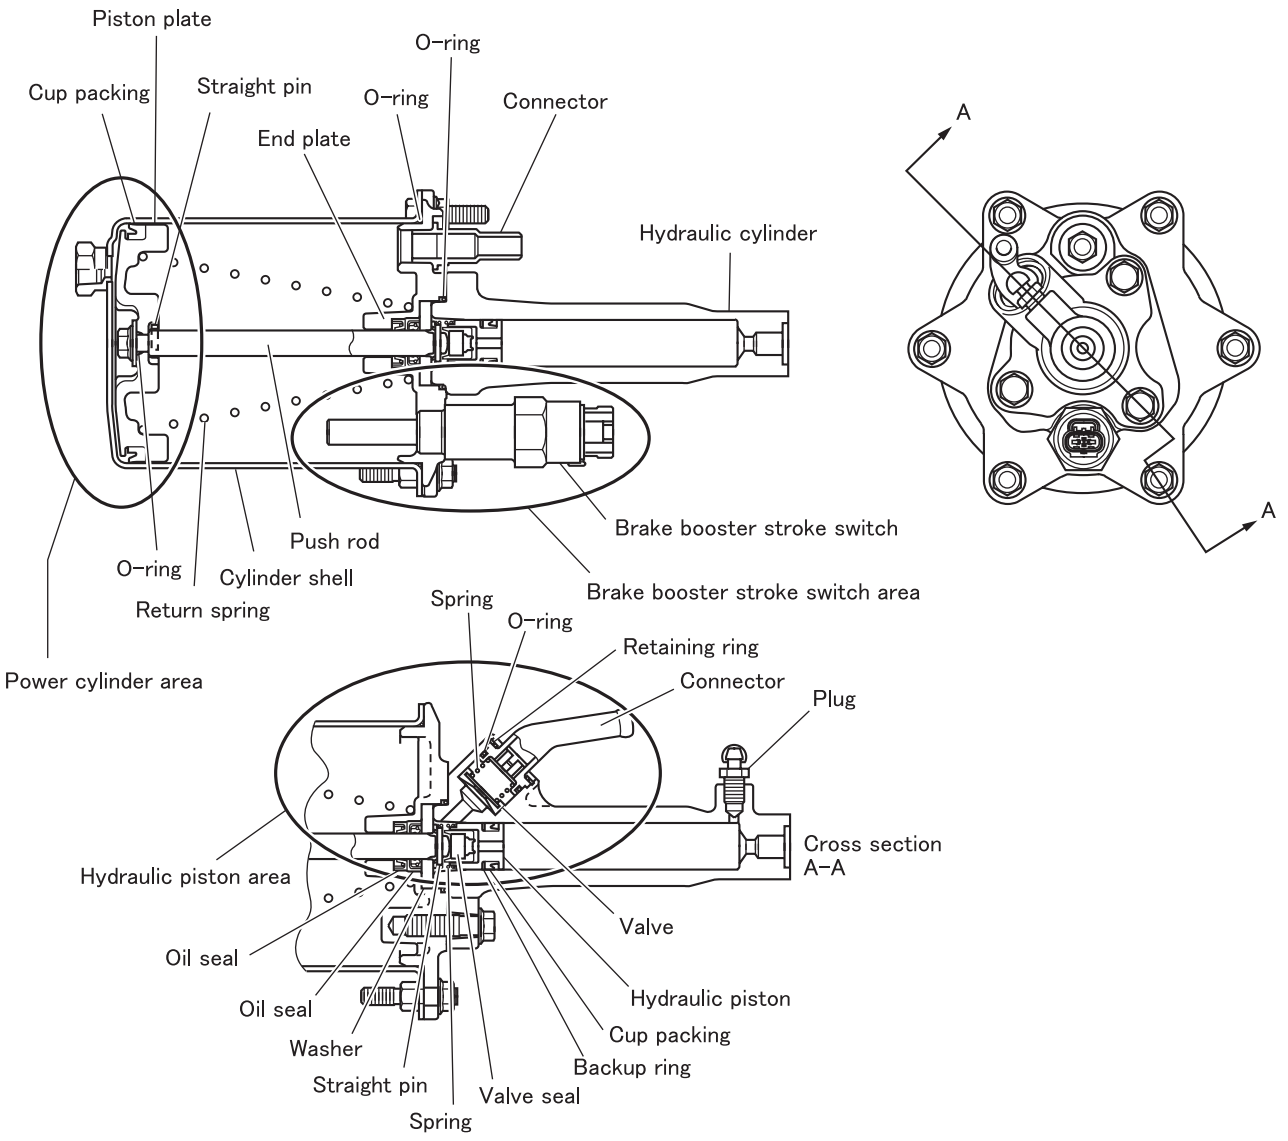


(6.2) Operation when the air pipe of the rear brake system fails

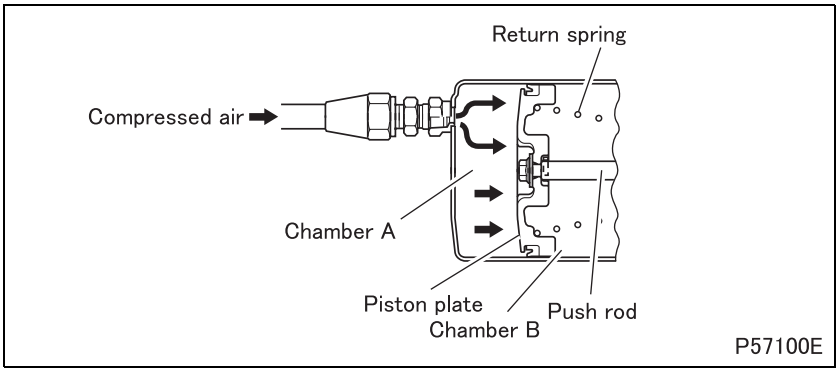
- In the rear brake system, air pressure is not generated up to supply port. Therefore, even if the brake pedal is pressed (causing primary piston to force down primary inlet valve), braking pressure is not generated.
- If the brake pedal is pressed further (illustrated as brake pedal action), primary piston makes contact with relay piston and they force down secondary inlet valve.
- This action separates supply valve seat B of cover from secondary inlet valve. The air pressure flows into chamber C from chamber F and is fed to front brake system via discharge port as braking pressure.

M E M O

5. Brake Booster

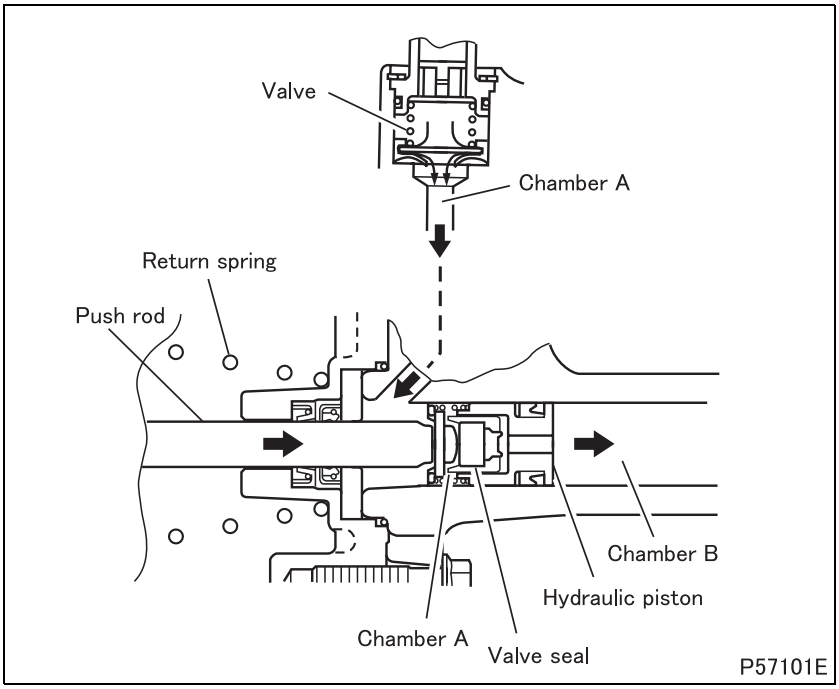


5.1 Power cylinder area



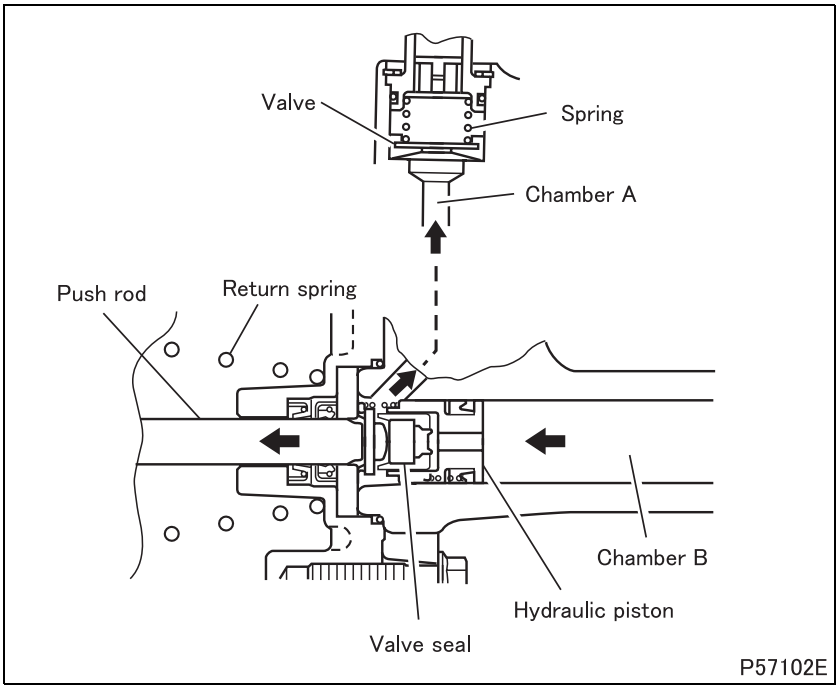
- Operation of the dual brake valve feeds compressed air into chamber A, activating the piston plate. As chamber B is opened to the atmosphere, a pressure difference between chambers A and B is generated. When this force becomes greater than the spring force of the return spring, the piston plate moves to the right.
- The piston plate is fitted with the push rod that transmits the force of the compressed air received at the piston plate to hydraulic piston area.

5.2 Hydraulic piston area



(1) When functioning

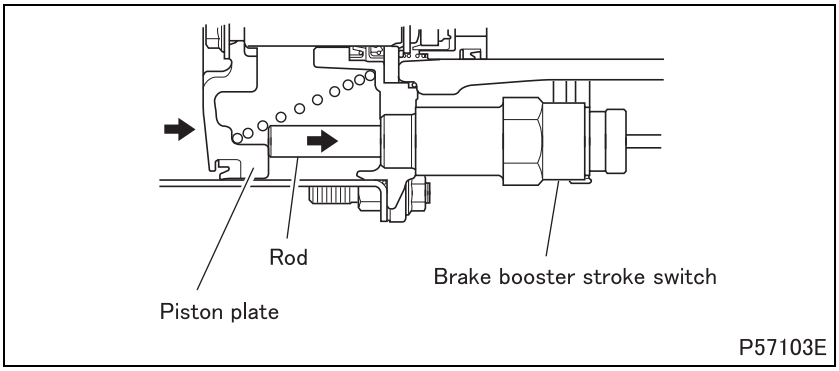
- The movement of the piston plate compresses the return spring, which moves the push rod, then the hydraulic piston to the right.
- The valve seal seats on the hydraulic piston, closing the passage between the chamber A on the fluid tank side and the chamber B on the wheel cylinder side. As the hydraulic piston moves to the right, the brake fluid in the chamber B is pressurized, and power is transmitted to the wheel cylinder.
- As the hydraulic piston moves to the right, the chamber A expands in volume and the pressure in the chamber drops. This causes the valve to open, and brake fluid is now drawn from the fluid tank.



(2) When released

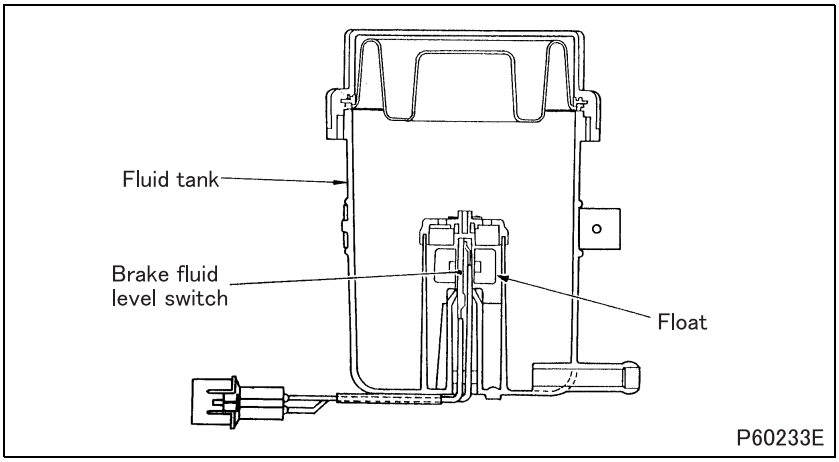
- Releasing the brake pedal frees the compressed air at the rear side of the piston plate into the atmosphere. The hydraulic piston is returned to its original position by the spring force of the return spring of the push rod and the brake fluid pressure of chamber B, then the valve seal hits the push rod, connecting chamber B and chamber A.
- The brake fluid flows back through the chamber A to the valve, where it compresses the spring and flows around the periphery of the valve and back to the fluid tank.
- The valve is held into position when equilibrium is reached between the brake fluid pressure and the force of the spring.

5.3 Brake booster stroke switch area

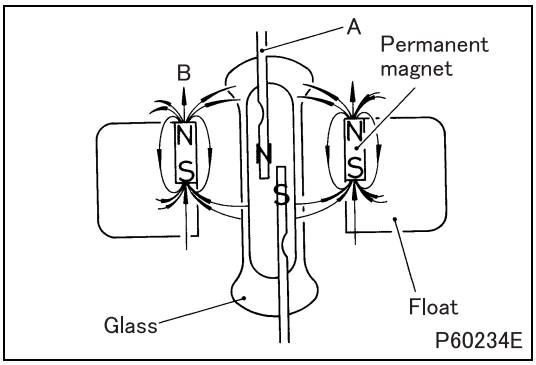


- When the brake lining is excessively worn, or the brake fluid leaks due to fractured brake piping, etc., the stroke of the piston plate grows excessive. As a result, the piston plate hits the rod and pushes it to the right.
- This moves the brake booster stroke switch to the ON position. The warning lamp on the meter cluster illuminates to alert the driver.

6. Fluid Tank

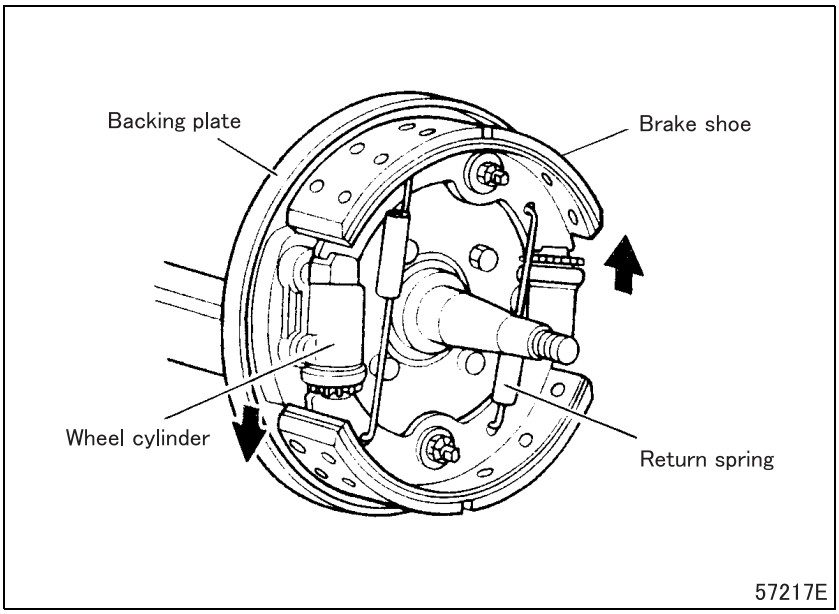


- The fluid tank is equipped with a brake fluid level switch which is designed to sense the brake fluid level in the tank. If the bake fluid level drops below a certain level, the float moves accordingly to actuate the brake fluid level switch. This causes the warning lamp on the meter cluster to turn on, alerting the driver.

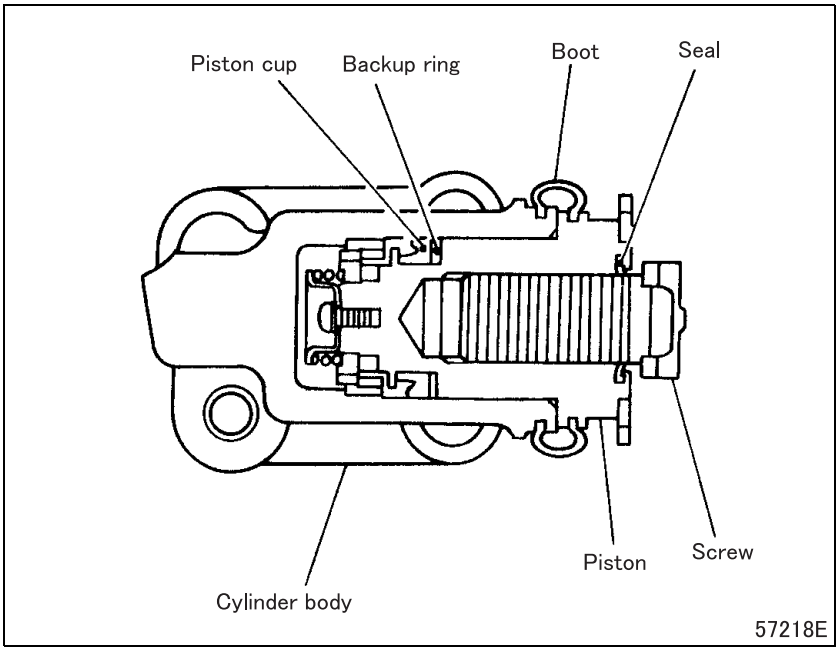


- When the brake fluid level in the fluid tank drops so much as to bring the float to or below the L level, many magnetic lines of flux B pass through the contact (ferromagnetic body A). As a result, the ends of the contacts turn into north and south poles. This causes the contacts to pull each other and attach together against their own force of spring, thereby forming an electric circuit.

7. Front Drum Brake

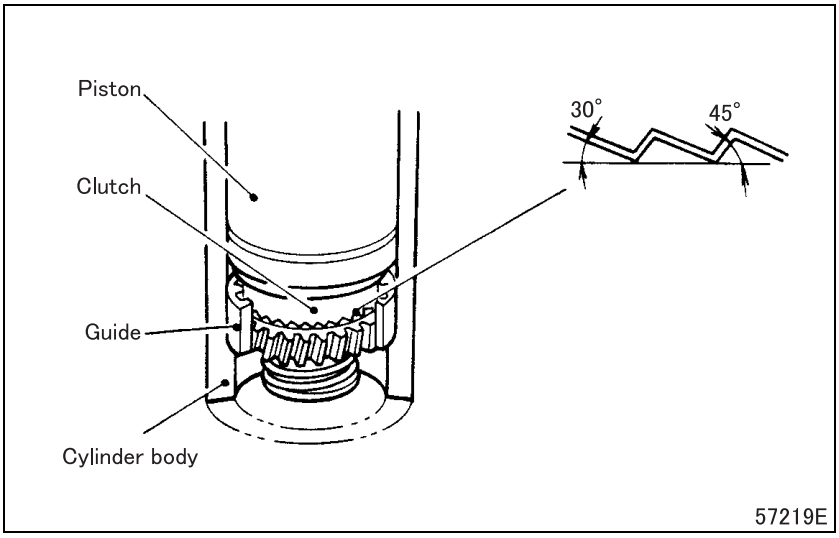


- The front drum brake is of a 2-leading type.
- Single-acing wheel cylinders activate brake shoes, both as a leading shoe, in forward-travel braking. By self-boosting effect, the 2-leading shoe brake generates a great stopping power.



7.1 Wheel cylinder

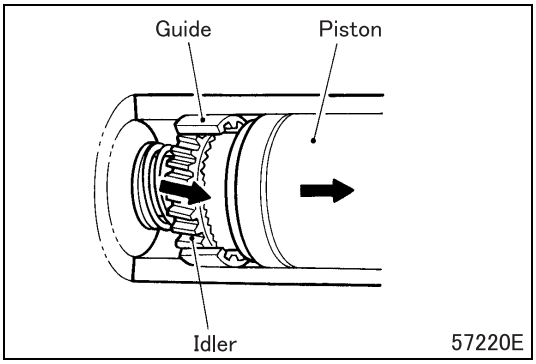
- The wheel cylinder is equipped with an automatic adjuster mechanism to compensate for lining wear and maintain the correct clearance between the lining and the drum. The adjustment is made each time braking is performed.



(1) Automatic adjuster mechanism

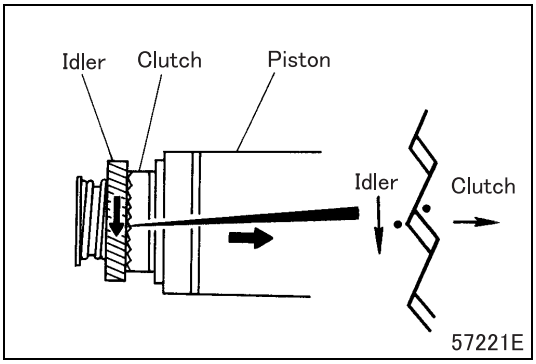
30°: The teeth can easily slide over the others as the piston is pushed out forward.

45°: As the piston rotates back, the teeth are positively held in mesh.

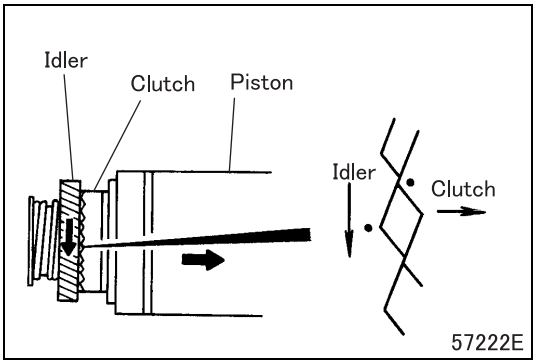


(1.1) When brake is being applied

- As brake fluid pressure is applied to the wheel cylinder, the piston is pushed out.
- As the piston is pushed out, the idler of the piston, which is in mesh with the internal helical gear of the guide on the cylinder body, rotates as it moves with the piston.



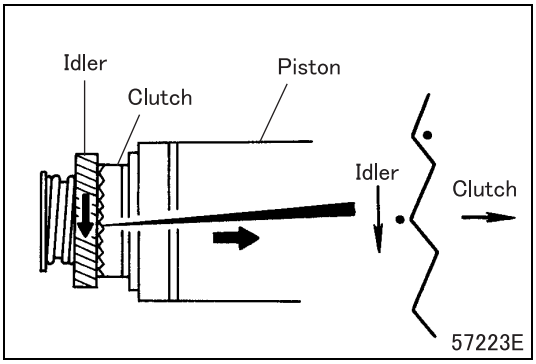
- As the idler rotates, the mesh between the idler and clutch comes loose.



(1.2) When brake has been applied

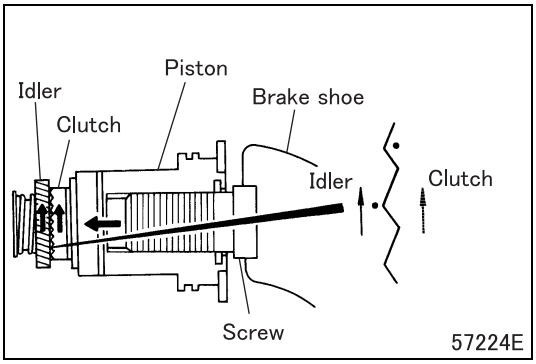
● When the brake shoe clearance is to specification

- The idler rotates in proportion to how far the piston travels. When the brake shoe clearance is to specification, the rotation of the idler is not enough to cause its teeth to slide over the teeth of the clutch.



● When the brake shoe clearance is excessive

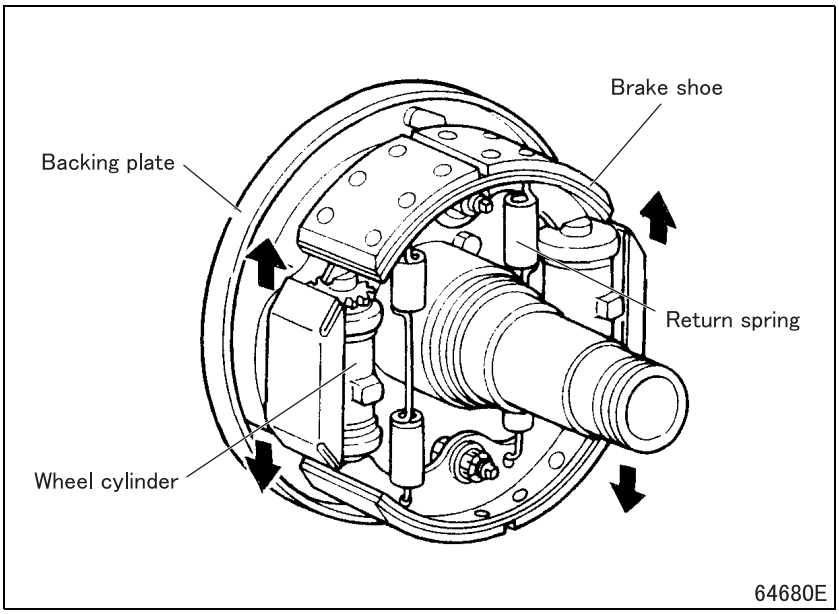
- When the brake shoe clearance is excessive, the rotation of the idler is sufficient to cause its teeth to go over the teeth of the clutch by one tooth before meshing with them again.



(1.3) When brake is being released

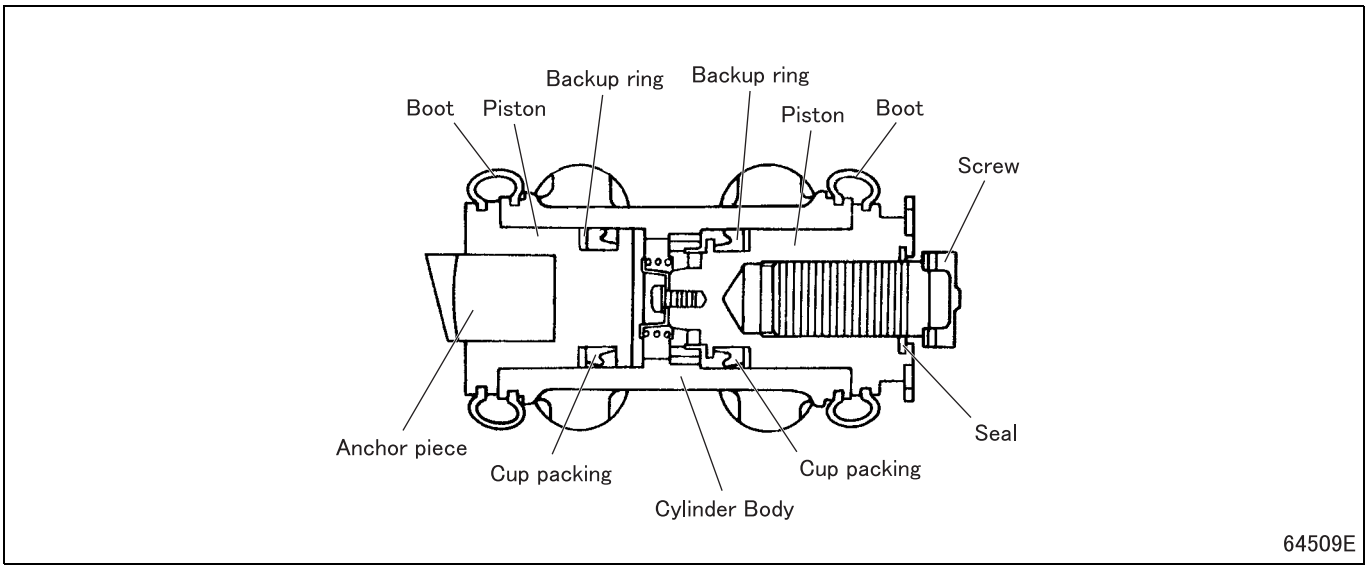
- As the brake fluid pressure drops and the piston is pulled in, the idler rotates back along the guide on the cylinder body.
- When the brake shoe clearance is to specification, the original mesh of the clutch has been maintained. With this, the piston is pulled in to the original position without turning.
- When the brake shoe clearance is excessive, the mesh between the idler and clutch has changed by one tooth. As a result, the piston rotates by the amount corresponding to one tooth as it is pulled in.
  This results in the piston having been pulled in further than before relative to the piston screw, which is fixed to the brake shoe and therefore does not rotate with the piston. Only the piston moves back and the brake shoe clearance now has been reduced to specification.

8. Rear Drum Brake



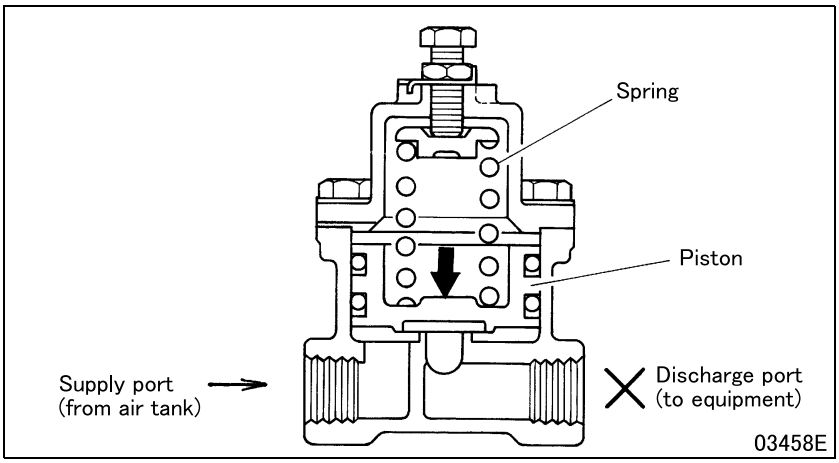
- The rear drum brake is of a dual 2-leading type.
- Double-acing wheel cylinders activate brake shoes, both as a leading shoe, in forward- and rearward-travel braking. By self-boosting effect, the dual 2-leading shoe brake generates a great stopping power.

8.1 Wheel cylinder



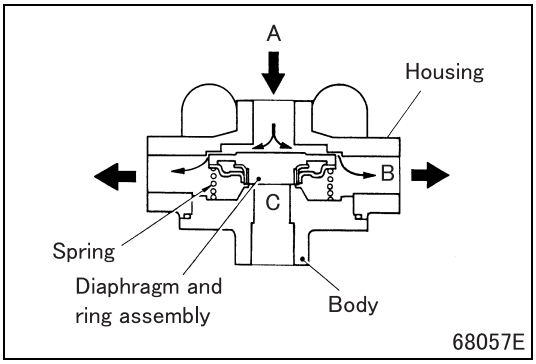
- The wheel cylinder is equipped with an automatic adjuster mechanism to compensate for lining wear and maintain the correct clearance between the lining and the drum. The adjustment is made each time braking is performed.
- The automatic adjuster mechanism operates on the same principles as those for the front drum brake.

9. Supply Valve



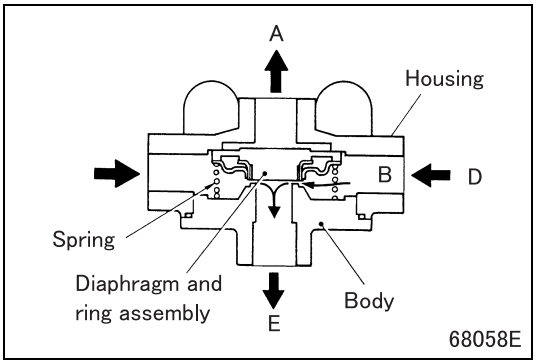
- Should air leak from any air system, the supply valve cuts off air supply to maintain braking air.
- The supply valve operates in such a way that when air pressure in any air system of equipment is lowered below the threshold level, the spring pushes down the piston to shut off the leaking air passage.

10. Quick Release Valve



10.1 Stabilization of brake pressure

- Air pressure A from the supply port pushes down diaphragm and ring assembly tightly up against body, thus shutting down chamber B from chamber C. It further presses down spring, causing the diaphragm and ring assembly to leave housing, which allows air pressure A to flow into chamber B.



10.2 When brake pedal is pressed

- Air pressure A is released from the supply port and the tension of spring causes diaphragm and ring assembly to leave body. At the same time, air pressure D from the brake chamber is discharged into the atmosphere through exhaust port E.

Wheel Brake

Possible causes	Symptoms	Wheel brake not effective				Brake drum over-heating						Reference Gr
		Air leaks when brake pedal is pressed down	Air leaks when brake pedal is free	Brake not quite effective though no air leakage	Air pressure too low	Brake shoe return slow when brake pedal is released (brake drum drags)	Noise generated when brake pedal is pressed down	Wheel brake application one sided	Wheel brake works suddenly	(!) warning lamp illuminates

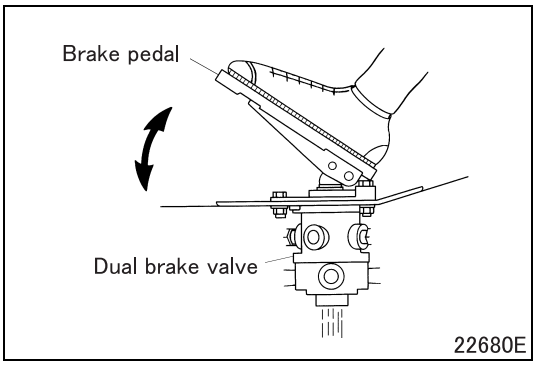
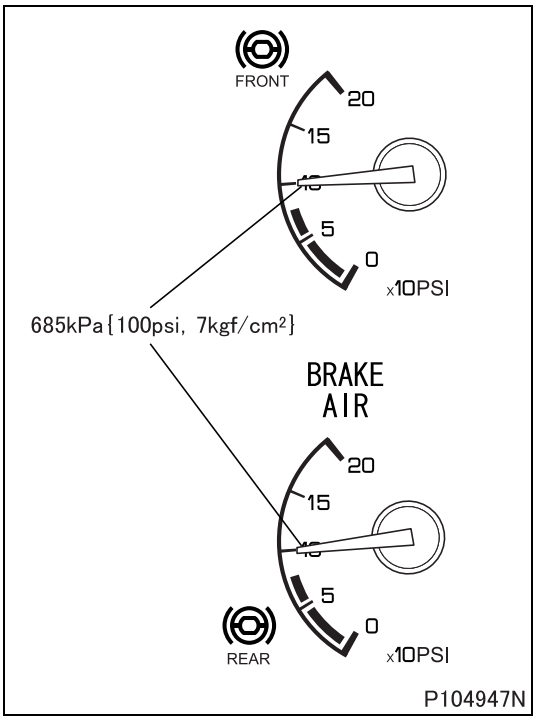
	Rising of oil level in air compressor					O	

1. Exhaust Noise from Brake Valve



- When the brake pedal is pressed and released, exhaust noise should be heard from the dual brake valve. Check if the pedal fully returns to its original position without hitching.

2. Air Pressure Build-up



- Fully discharge compressed air by opening the drain cock on the air tank.
- With the engine started and set at idle, measure the time it takes for the air pressure indicated on the gauge to rise from 0 kPa {0 psi, 0 kgf/cm^2} to 685 kPa {100 psi, 7 kgf/cm^2}. The time taken depends on the vehicle model.

Vehicle model	Time
FK61	6 min
FK62, FK65, FM	9 min

3. Replacement of Brake Fluid

Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
–	Brake fluid tank	Brake fluid (SAE J1703 or FMVSS No. 116, DOT3)	As required

Special tools (Unit: mm {in.})

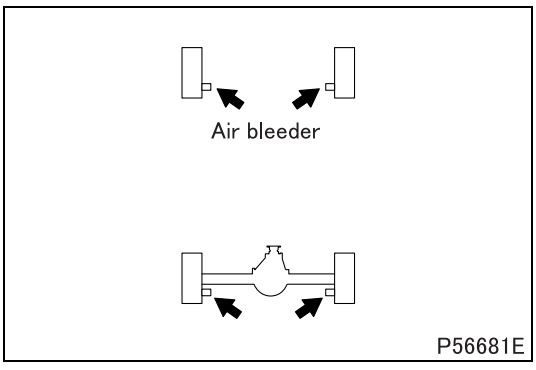
Mark	Tool name and shape	Part No.	Application
a	Vinyl pipe A: ϕ7 {0.28} B: 1200 {47.2}  P00328	MH033102	Replacement of brake fluid

CAUTION ⚠

- **Brake fluid is corrosive on paintwork. Be careful not to spill it onto the paint work. If brake fluid is spilled onto the paint work, immediately wipe it off.**
- **Be sire to use new brake fluid (SAE J1703 or FMVSS No. 116, DOT3). Do not mix it with brake fluid of different properties or mineral oil (gas oil, engine oil, gear oil, automatic transmission fluid, etc.). This will alter the original properties of brake fluid, causing the boiling point to drop as well as the brake rubber parts to swell. Faulty operation of the brake will result.**
- **Ensure that no foreign matter or water into the brake fluid when refilling it, as they will cause faulty brake operation.**
- **Using a mug exclusively kept for the specified brake fluid. This ensures that no brake fluid of different properties or mineral oil enter into the system.**
- **During brake fluid replacement operation, a change in color of the brake fluid being discharged indicates that the old brake fluid in the system has been replaced with the new brake fluid.**
- **During replacement, be sure to keep the brake fluid level at the "H" mark on the brake fluid tank.**

3.1 Preparation

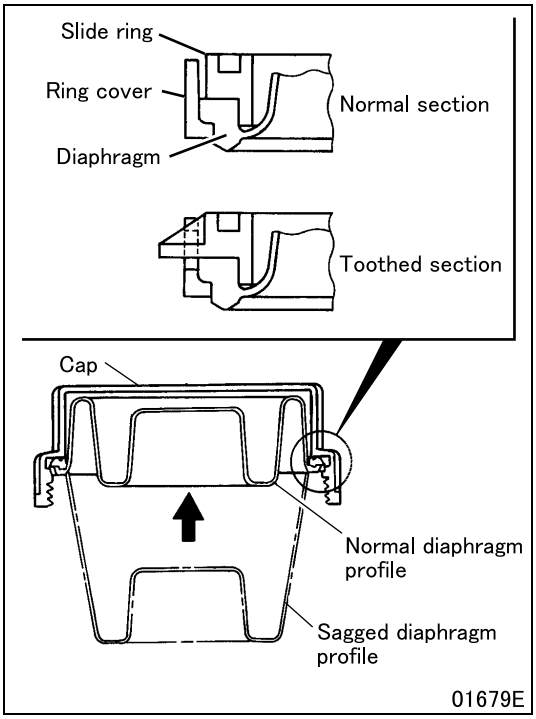
- In order to ensure that vacuum booster functions properly, start the engine and keep it running at idle until the replacement is completed.
- Attach a to the air bleeder and place the end in a container.



P56681E

3.2 Replacement of brake fluid

- Loosen each air bleeder and press and release the brake pedal repetitively to drain brake fluid completely.
- While filling the brake fluid tank with new brake fluid up to the "H" level of the brake fluid tank, cycle the brake pedal repetitively until the old brake fluid being discharged is replaced with new brake fluid.
- Tighten each air bleeder to the specified torque after the brake fluid replacement is complemented.



- If the diaphragm is not in the normal profile after the brake fluid is replenished, press it into the normal profile before installing the cap.
  If the brake fluid leaks through the cap, check if the diaphragm has been installed as shown in the illustration.

- Bleed the brake system of air.

4. Air Bleeding of Brake System

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened		Tightening torque	Remarks
–	Air bleeder	Wheel brake	9.8 ± 2.0 {7.2 ± 1.5, 1.0 ± 0.2}	–
		Brake booster	7 to 12 {5.2 to 8.9, 0.7 to 1.2}	

Lubricant and/or sealant

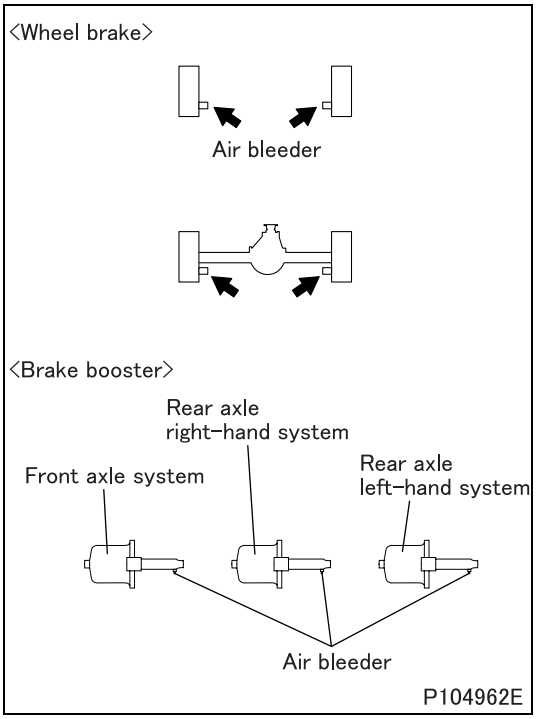
Mark	Points of application	Specified lubricant and/or sealant	Quantity
–	Brake fluid tank	Brake fluid (SAE J1703 or FMVSS No. 116, DOT3)	As required

Special tools (Unit: mm {in.})

Mark	Tool name and shape	Part No.	Application
Ca	Vinyl pipe A: ϕ7 {0.28}, B: 1200 {47.2}  P00328	MH033102	Replacement of brake fluid

CAUTION ⚠

- **Brake fluid is corrosive on paintwork. Be careful not to spill it onto the paint work. If brake fluid is spilled onto the paint work, immediately wipe it off.**
- **Be sire to use new brake fluid (SAE J1703 or FMVSS No. 116, DOT3). Do not mix it with brake fluid of different properties or mineral oil (gas oil, engine oil, gear oil, automatic transmission fluid, etc.). This will alter the original properties of brake fluid, causing the boiling point to drop as well as the brake rubber parts to swell. Faulty operation of the brake will result.**
- **Ensure that no foreign matter or water into the brake fluid when refilling it, as they will cause faulty brake operation.**
- **Using a mug exclusively kept for the specified brake fluid. This ensures that no brake fluid of different properties or mineral oil enter into the system.**
- **During brake fluid replacement operation, a change in color of the brake fluid being discharged indicates that the old brake fluid in the system has been replaced with the new brake fluid.**
- **During replacement, be sure to keep the brake fluid level at the "H" mark on the brake fluid tank.**



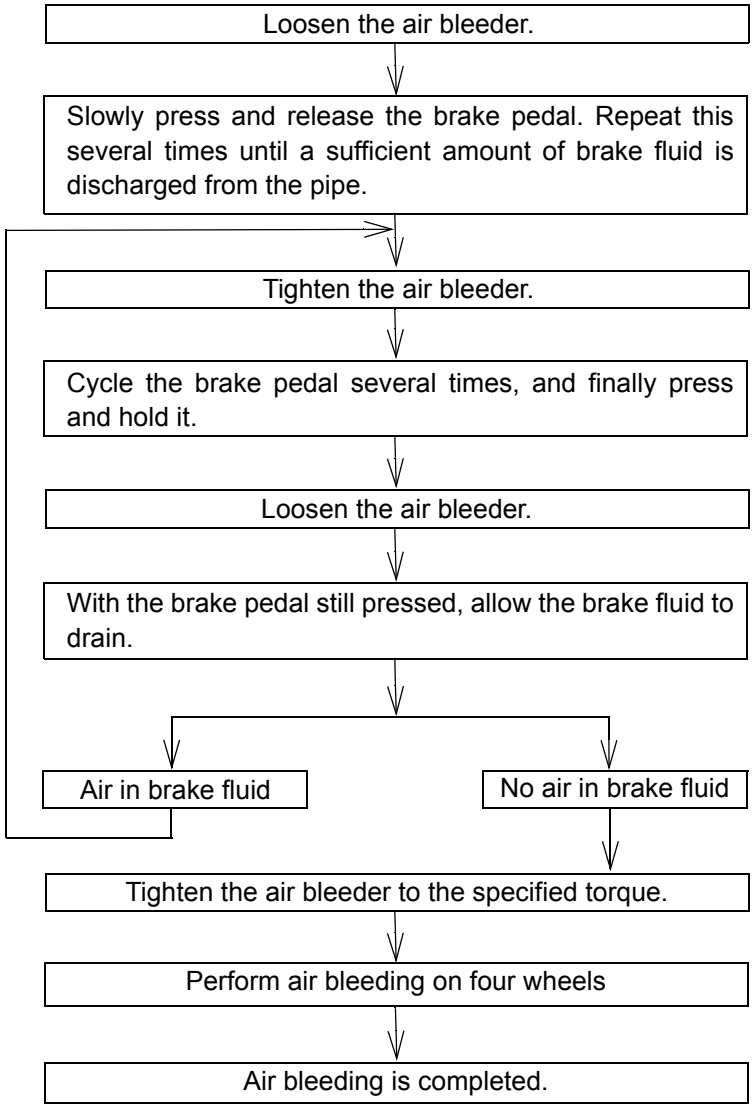
4.1 Preparations

- Start the engine and run it at idle until air bleeding is completed in order for the brake booster to operate normally.
- Install one end of [a] to the air bleeder. Place the other end of [a] into a container.

4.2 Air bleeding of brake system

- Perform air bleeding on each wheel in the order listed below until all wheels are bled of air.

Order of air bleeding	Brake system	Wheel
1	Front axle system	Brake booster (front axle system)
2		Front right-hand side wheel (FR)
3		Front left-hand side wheel (FL)
4	Rear axle system	Brake booster (rear axle right-hand system)
5		Rear right-hand side wheel (RR)
6		Brake booster (rear axle left-hand system)
7		Rear left-hand side wheel (RL)



Loosen the air bleeder.
Slowly press and release the brake pedal. Repeat this several times until a sufficient amount of brake fluid is discharged from the pipe.
Tighten the air bleeder.
Cycle the brake pedal several times, and finally press and hold it.
Loosen the air bleeder.
With the brake pedal still pressed, allow the brake fluid to drain.
Air in brake fluid
No air in brake fluid
Tighten the air bleeder to the specified torque.
Perform air bleeding on four wheels
Air bleeding is completed.

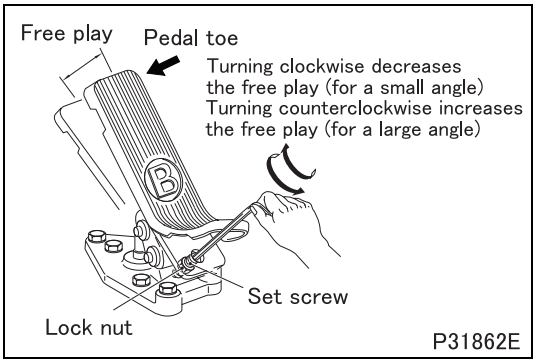
5. Inspection and Adjustment of Brake Pedal Free Play

Service standards (Unit: mm {in.})

Location	Maintenance item		Standard value	Limit	Remedy
–	Pedal free play	Depression angle	$3.5^{\circ}\ ^{+1.0^{\circ}}_{-0.5^{\circ}}$	–	Adjust
		Pedal toe	$12\ ^{+3.0}_{-1.5}$ {$0.47\ ^{+0.12}_{-0.059}$}		

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
–	Lock nut	5.0 to 7.8 {3.6 to 5.8, 0.5 to 0.8}	–



[Inspection]

- Measure the free play of the brake pedal by pressing the pedal tip by hand.
- If the measurement deviates from the standard values, make an adjustment.

[Adjustment]

- Loosen the lock nut and adjust the free play by turning the set screw.
- After adjustment, tighten the lock nut to the specified torque.

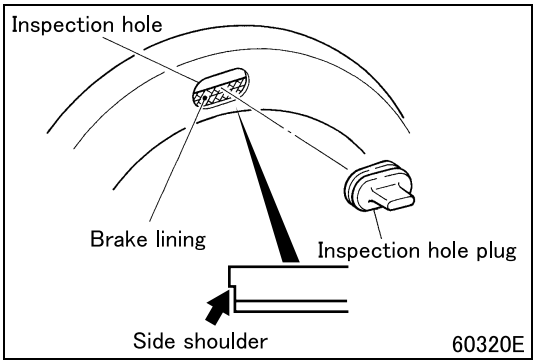
6. Inspection of Drum Brake Lining Thickness

CAUTION ⚠

- **Be sure to inspect both shoes on each wheel to avoid malfunction of brakes.**

Service standards (Unit: mm {in.})

Location	Maintenance item	Standard value	Limit	Remedy
–	Thickness of brake lining	12 {0.47}	5 {0.20} (side shoulder means wear limit)	Replace



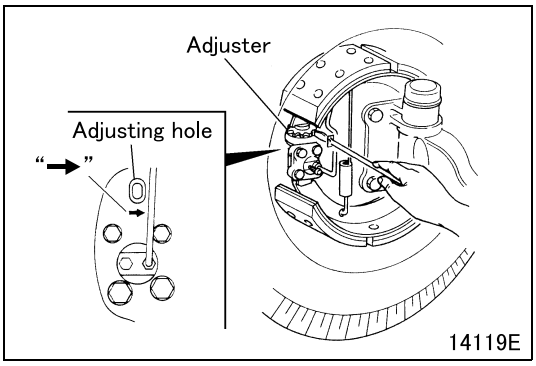
- Remove the inspection hole plug from the inspection hole in the backing plate. Through the inspection hole, measure the thickness of the brake lining.
- If any lining is worn down to the step on the side face, replace all linings on that axle.
- After the inspection, be sure to install the plug onto the inspection hole.

7. Initial Adjustment of Clearance between Brake Drum and Shoe

7.1 Front drum brake

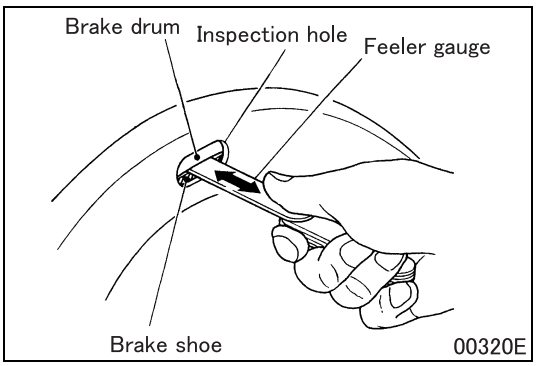
CAUTION ⚠

- **To ensure correct operation of the brakes, be sure to inspect both shoes on each wheel.**



- Jack up front wheel, and make sure that hub bearings are not loose. If loose, adjust the hub bearings. (See Gr26A.)
- Insert the screwdriver into the adjusting hole, turn the tire by hand, and turn the adjuster of front wheel to the direction as shown by arrow on the backing plate so that wheel will turn with slight friction.
- Step on brake pedal a few times, and make sure that tire turns by hand with slight friction. If wheel turns lightly, do over the above-mentioned procedure.

- Return the adjuster 8 or 9 notches opposite to the direction of arrow.
- Turn tire by hand and make sure that there is no friction. If there is friction, do over the above-mentioned procedure.

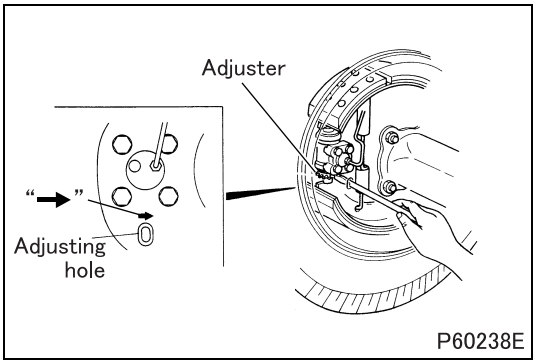


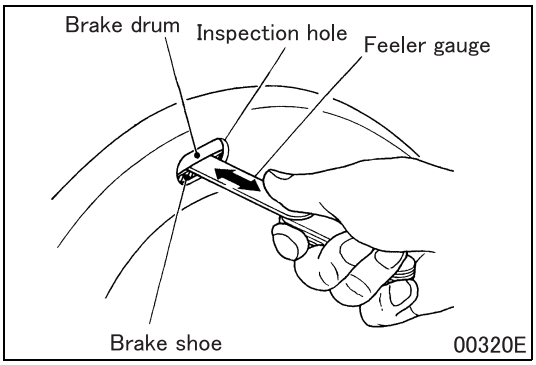
- Insert a 0.2 mm {0.0079 in.} feeler gauge through the inspection hole between the brake drum and lining, and make sure that you can slide the gauge to and fro with slight resistance.

7.2 Rear drum brake

CAUTION ⚠

- **To ensure correct operation of the brakes, be sure to inspect both shoes on each wheel.**

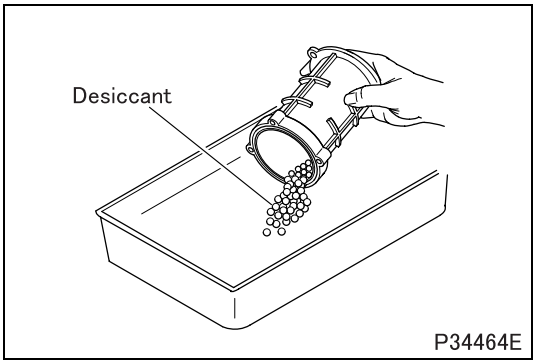




- Jack up front wheel, and make sure that hub bearings are not loose. If loose, adjust the hub bearings. (See Gr27.)
- Insert the screwdriver into the adjusting hole, turn the tire by hand, and turn the adjuster of front wheel to the direction as shown by arrow on the backing plate so that wheel will turn with slight friction.
- Step on brake pedal a few times, and make sure that tire turns by hand with slight friction.
  If wheel turns lightly, do over the above-mentioned procedure.
- Return the adjuster 8 or 9 notches opposite to the direction of arrow.
- Turn tire by hand and make sure that there is no friction. If there is friction, do over the above-mentioned procedure.
- Insert a 0.2 mm {0.0079 in.} feeler gauge through the inspection hole between the brake drum and lining, and make sure that you can slide the gauge to and fro with slight resistance.

8. Maintenance and Inspection of Air Dryer

Perform maintenance and inspections at each of the indicated intervals or distances.

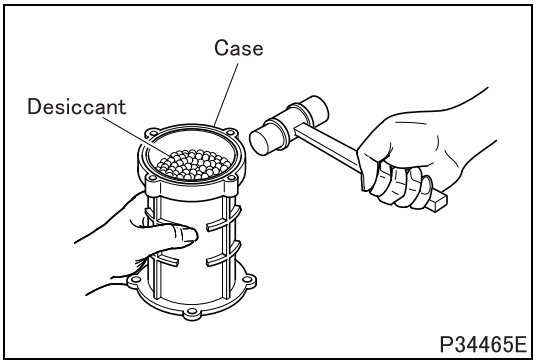


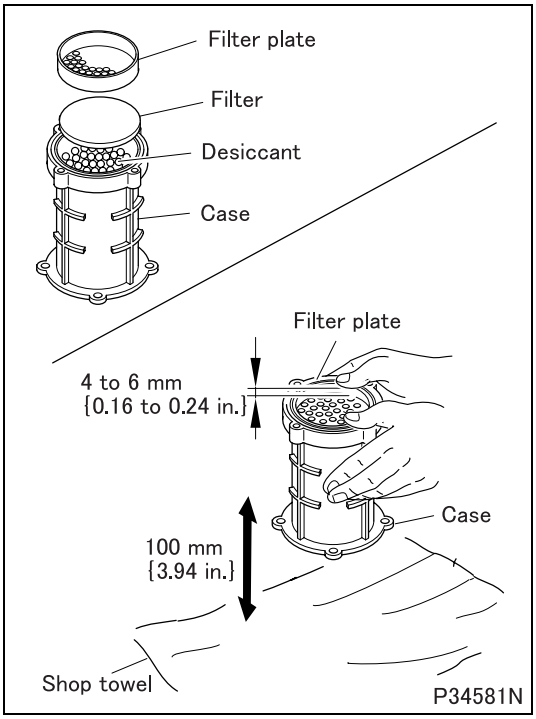
8.1 Every 10,000 km (6,000 miles)

- Check whether the air dryer is functioning properly by opening the drain cock on the air tank and checking whether water flows out.
- If a small amount of water flows out, check whether the desiccant has changed color. If one fifth or more of the desiccant has changed in color from white to brown, replace the desiccant. (See ‘‘AIR DRYER’’.)

NOTE

- **A small amount of moisture may collect whenever the temperature in the vicinity of the air tank drops by more than 16°C {61°F}.**
- Place the desiccant in the case, then settle the desiccant by tapping gently and evenly around the case with a plastic hammer.





- Place the soft layer side of the filter on the desiccant, and place the filter plate on the case, then tap the desiccant down.

<Tapping>

- Before tapping the case against the work surface, lay two or three layers of shop towel on the work surface to protect the bottom of the case from scratches.
- Holding down the filter plate with both hands, lift the case to a height of about 100 mm {3.94 in.} and tap it gently against the work surface.
- Tap the case about 30 more times. Make sure the filter plate drops by 4 to 6 mm {0.16 to 0.24 in.} from its original position.

WARNING ⚠

- **Unless the tapping procedure is performed, particles of desiccant may escape and create blockages in brake lines, thus preventing normal brake operation.**

- Look carefully at the water that flows out of the air dryer’s exhaust port. If the water is contaminated with oil, inspect the air compressor. (See ‘‘AIR COMPRESSOR’’.)

8.2 Every year or every 60,000 km {36,000 miles}

Disassemble the air dryer and replace the desiccant, oil filter, and replated rubber parts with repair kit A. (See ‘‘AIR DRYER’’.)

9. Inspection and Adjustment of Air Dryer's Air Pressure Governor

Service standards

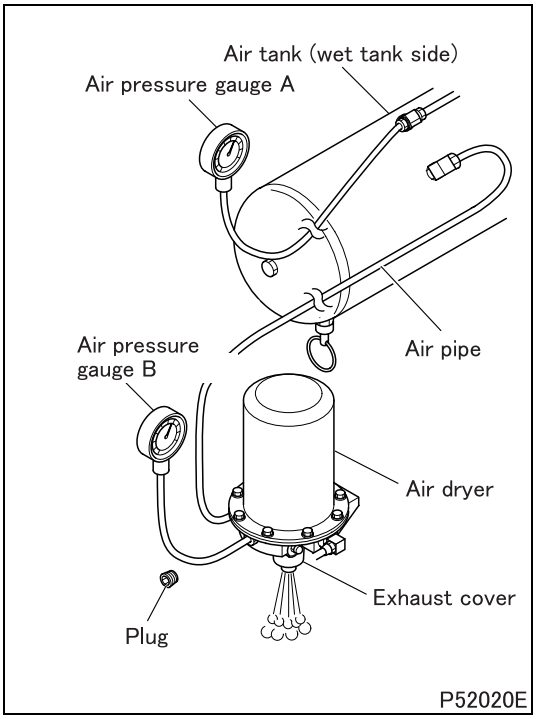
Location	Maintenance item		Standard value	Limit	Remedy
–	Threshold pressure	Upper threshold pressure	$890\ ^{+29}_{-20}$ kPa {$130\ ^{+4.2}_{-2.9}$ psi, $9.1\ ^{+0.3}_{-0.2}$ kgf/cm^2}	–	Adjust
		Lower threshold pressure	760 ± 15 kPa {110 ± 2.2 psi, 7.7 ± 0.2 kgf/cm^2}	–	Replace

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
–	Plug	14.7 to 24.5 {10.8 to 18.1, 1.5 to 2.5}	–
–	Cap nut (seat and plate mounting)	4.9 to 5.9 {3.6 to 4.4, 0.5 to 0.6}	–
–	Nut (for retention of adjusting screw)	6.9 to 7.8 {5.1 to 5.8, 0.7 to 0.8}	–

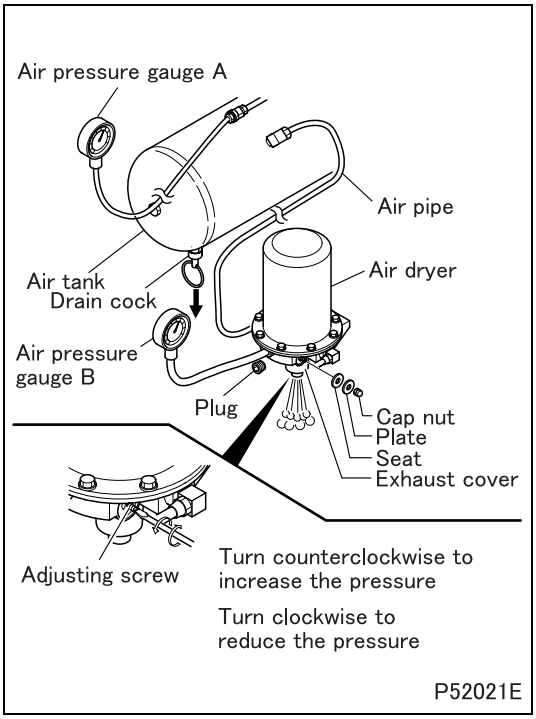
Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
–	Plug thread	ThreeBond 1110B	As required



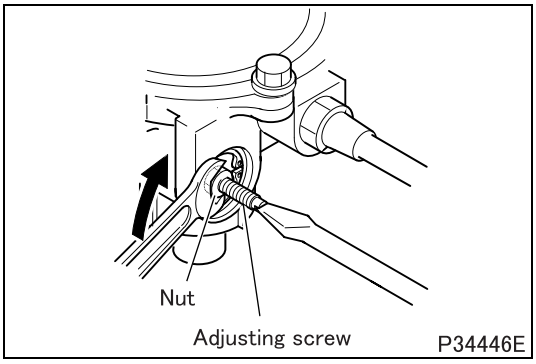
[Inspection]

- Install the air pressure gauge A between the air dryer and air tank (wet tank side).
- Remove the plug from the air dryer at the location shown in the drawing. Connect air pressure gauge B at that point.



[Adjustment]

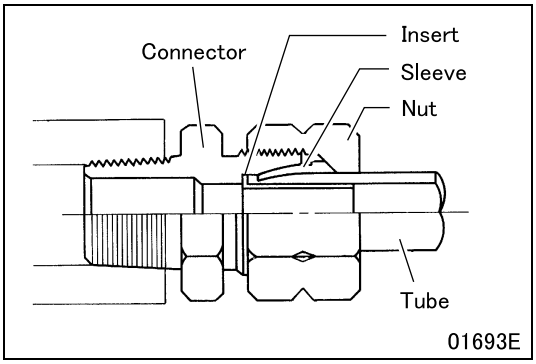
- Remove the cap nut, plate, and seat.
- Start the engine and gradually increase the air pressure in the air tank.
- Turn the adjusting screw until the pressure indicated by air pressure gauge A when air is expelled from the exhaust cover is the standard value (the upper threshold pressure).
- Reduce the air pressure to 690 kPa {100 psi, 7 kgf/cm^2} or lower, then gradually increase it again. Check whether the pressure indicated by the air pressure gauge A is the standard value (the upper threshold pressure). If the indicated pressure deviates from the standard value, make further adjustments.
- With the upper threshold pressure indicated, air from the air compressor is expelled from the exhaust cover continuously. With the equipment in this condition, open the drain cock to gradually reduce the air pressure. When air stops being expelled from the exhaust cover, check whether the pressure indicated by air pressure gauge B is the standard value (the lower threshold pressure). If the indicated pressure deviates from the standard value, replace relevant parts of the air compressor governor as an assembly.



- Tighten the nut to hold the adjusting screw in position.

M E M O

HANDLING OF NYLON TUBE FOR AIR LINE <COMPRESSION TYPE>



- The nylon tube (hereafter referred as “tube”), on which an insert has been installed, is retained in the connector by tightening the nut onto the connector, which causes the sleeve to bite into the tube and thereby air tightness is achieved. Therefore, once the nut is tightened, the tube, insert and sleeve are all deformed and cannot be reused. (See later section.)
- For information on removal and installation of the tube, see the procedure. (See later section.)

Special tools

Mark	Tool name and shape	Part No.	Application
ca	Tube cutter  28287	MC083532	Cutting of tube

(1) Precautions for handling the tube

- The tube can sustain damage or break when exposed to heat, acid, or when scored. Always replace the tube with a new part when the tube appears defective.
  - Do not expose the tube or connector to heat of 100°C {212°F} or above.
  - Whenever welding is performed, protect the tube from related heat and spark.
  - Do not allow the tube to come into contact with battery electrolyte.
  - Do not stamp on, fold, or press sharp edges against the tube.
  - When pressure washing the vehicle, do not place the nozzle too close to the tube.

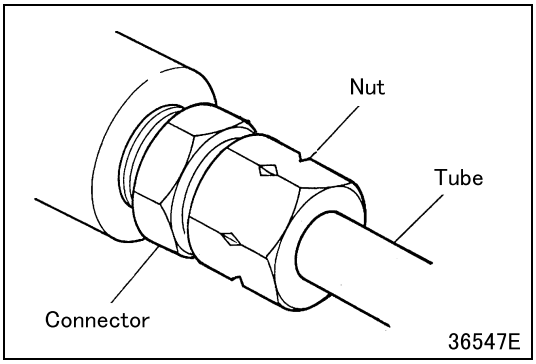
(2) Precautions for routing the tube

- Observe the minimum bending radius for the various types of tubes listed in the table below.
- Wherever the tube and connector are located near the engine or other hot spots, provide heat protection plates or other similar means to keep the temperatures of the tube and connector below 100°C {212°F}.
- Wherever the tube is likely to sustain damage or wear, protect them using corrugated tube, grommet or similar.
- Temperature change can cause the tube to lengthen or shrink. When routing the tube, provide an extra tube length of approx. +1 %.
- Use those clamps that are designed to not cause damage to the tube. The tube should be clamped at intervals of approx. 500 mm {19.7 in.}.
- Wherever possible, refrain from using relay connectors. If they need to be used, be sure to clamp them to prevent deflecting while taking care that the mounting area for the relay connector is also protected from damage.
- After several months following production, the tubes will likely start becoming stiffer, making them less easy to route. Wherever possible, use new tubes.
- After the tube has been routed, check it for air leakage, deflection or interference.

(3) Removal and installation of tube

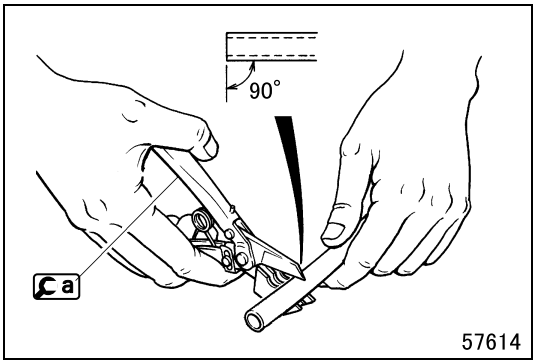
CAUTION ⚠

- **The tube can sustain damage during installation or removal. Do not remove and re-install them more often than necessary.**
- **A connector which is dirty inside must be replaced with a new part.**
- **Replace the tube with a new part when it is damaged or it has been cut too short.**



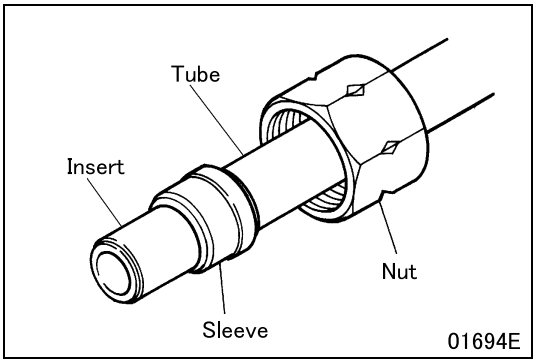
[Removal]

- Completely release air pressure from the tube.
- Before removing the tube from the connector, clean the periphery of the connector, nut and tube. A connector which is contaminated inside must not be reused.

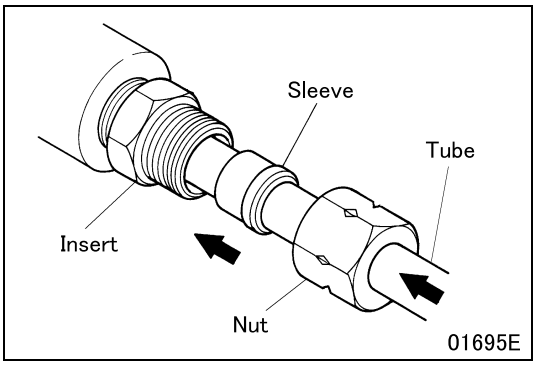


[Installation]

- Check the portion of the tube that is to be inserted into the connector for damage or contamination.
- Cut away any damage or curl in the tube insertion portion using a.



- Ensure that the insert, sleeve, nut and tube are arranged as shown in the illustration.



- Insert the tube into the connector until it reaches the end of the connector. Press the sleeve into the connector and temporarily tighten the nut by hand.
- Tighten the nut to the specified torque.
  Then, pull the tube to ensure that it will not come off and there is no air leakage.

1. Basic Identification Colors

- There are basic identification colors assigned to each pipe line.
- Numbers (1) to (4) shown in the identification color symbol column denote the priority of application.
- All color symbols are the same as those for electric harnesses except additional P, S, Gr and Br.

Pipe line	Tube identification color symbol				Denotation of line color (1)
	(1)	(2)	(3)	(4)	
1. Air charge line	R	RR	RW	RGr	Red
2. Rear brake line	P	PP	PW	PGr	Pink
3. Front brake line	O	OO	OW	OGr	Orange
4. Spring brake line	G	GG	GW	GGr	Green
5. Trailer brake line	Y	YY	YW	YGr	Yellow
6. Accessory line	L	LL	LW	Gr	Blue
7. Clutch fluid line	–	–	–	–	Purple
Composition of basic identification color	Line color	Line color × 2	Line color + white	Line color + gray	

2. Auxiliary Identification Colors

- Auxiliary identification colors for non-brake air lines are as specified below.

Pipe line	Auxiliary identification color				
6. Accessory line	LR	LP	LO	LY	LBr

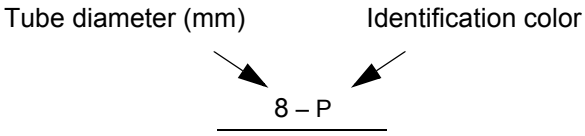
3. Use of Auxiliary Identification Colors by Equipment

3.1 Accessory line

- LL/LW, etc. in the Delivery column denote the colors for two output lines, of which LL and LW are mainly used for the left side and right side, respectively.

Location/Equipment	Identification color		Location/ Equipment	Identification color	
	Supply	Delivery		Supply	Delivery
1. Line in front of cab • Seat air suspension	LGr LBr		**3.** Line on left side of frame • Exhaust shutter valve • Differential lock	LL LBr L	LL/LW LL
2. Line on right side of frame • Clutch ϕ10	L LW	LGr			

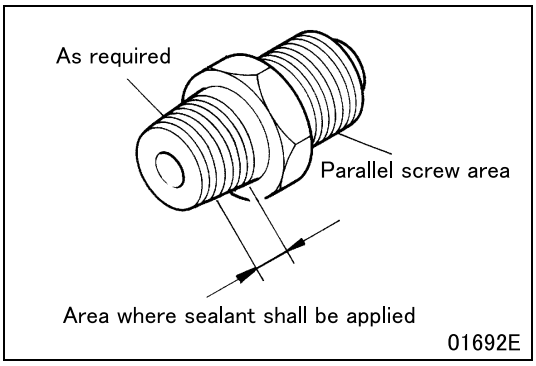
4. Tube Size and Identification Color



- Line tube ends are taped in different colors for identification. When tubes are connected and disconnected, make sure of their tape colors. When a tube is replaced, wrap the new tube with the tape in the same color. If no tape in the same color is available, tape the tube in such a manner that it can be clearly distinguished from others.

Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
–	Taper screw area of connector	ThreeBond 1110B	As required



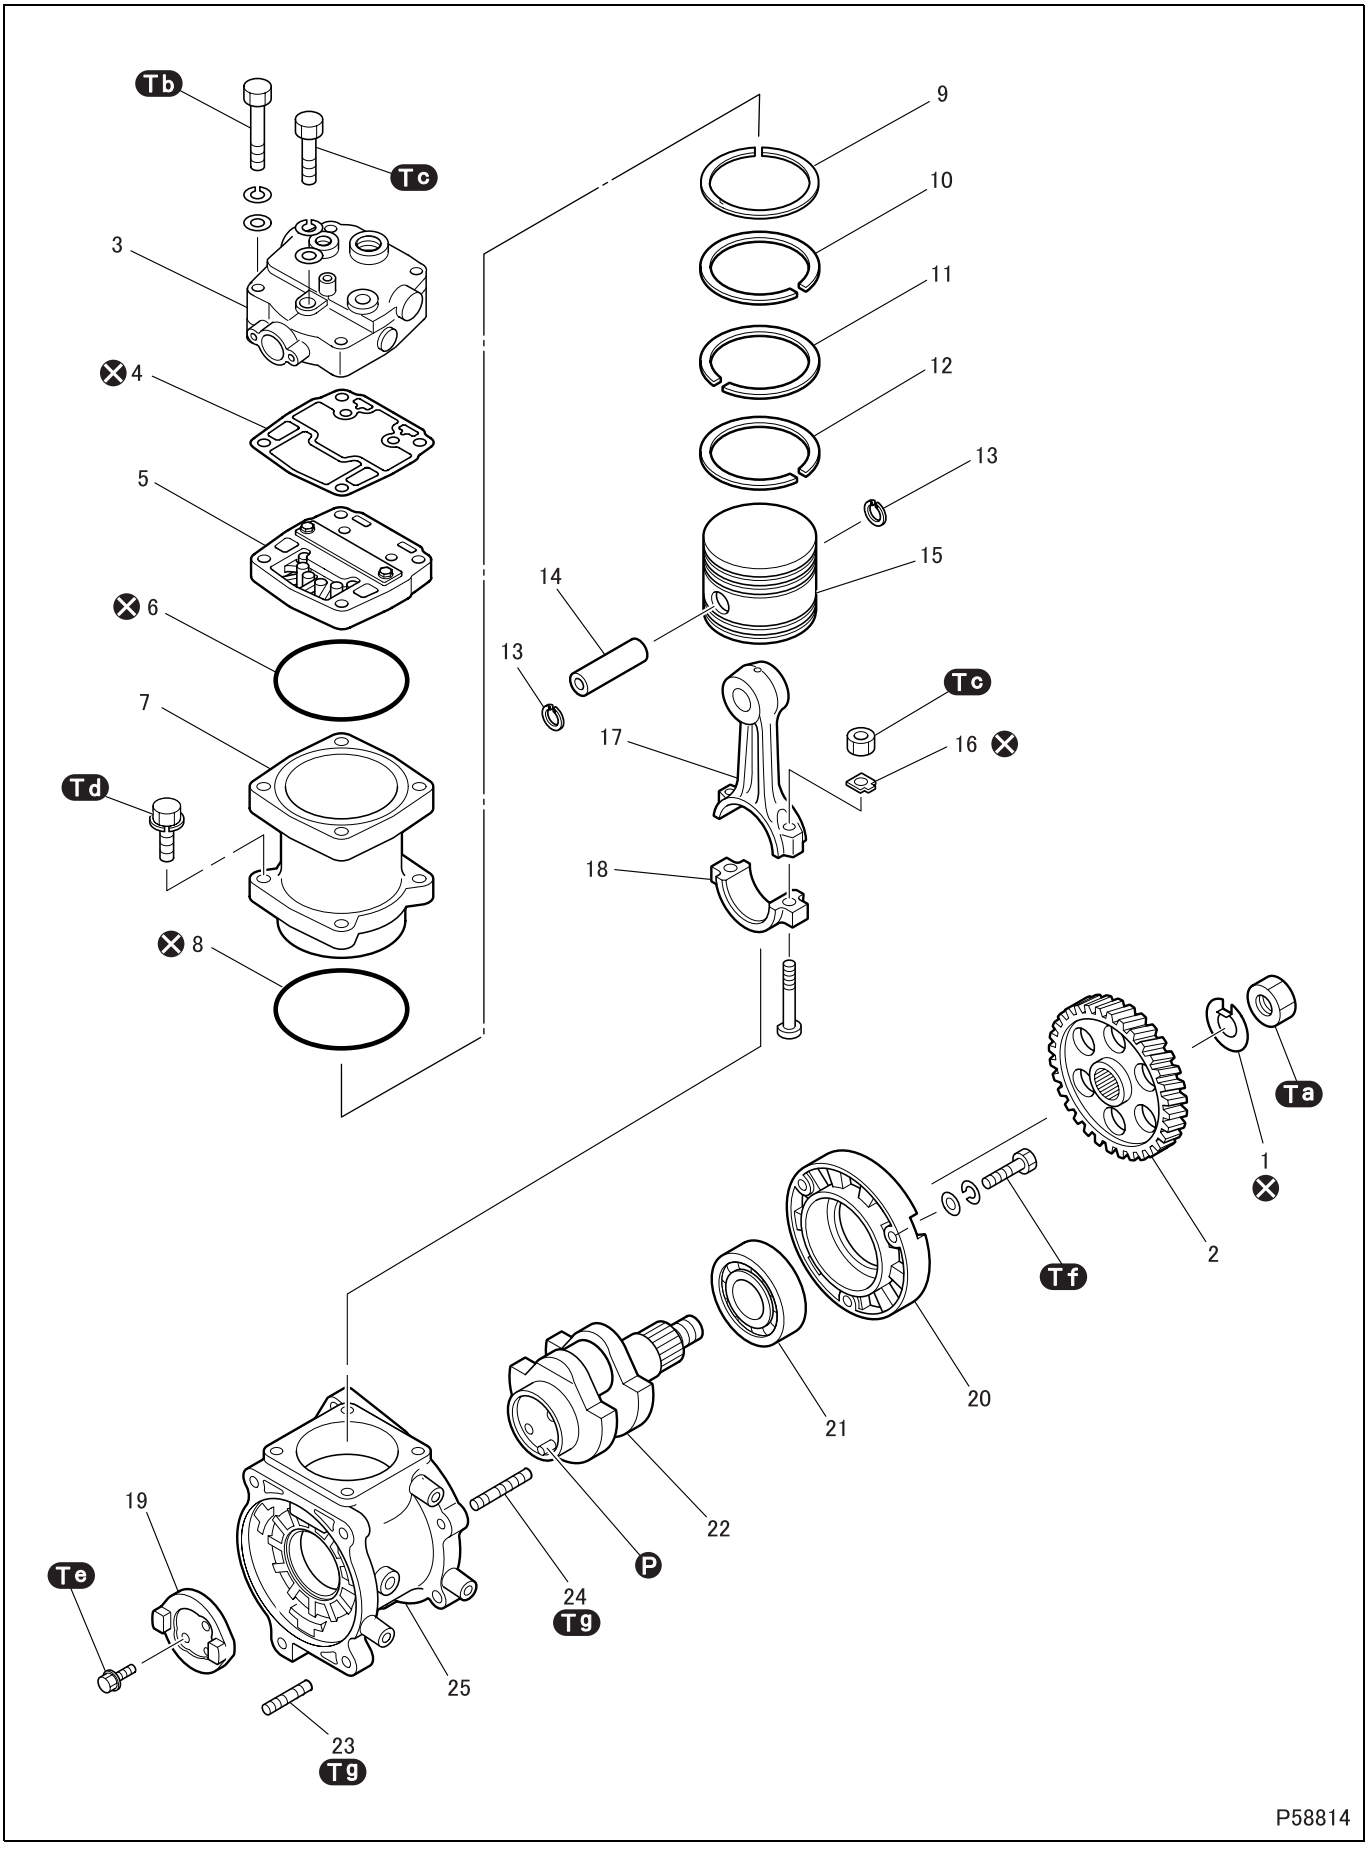
- When installing once removed connector of air system for brakes, remove remainder of sealant, oil, and water sufficiently.
- Apply sealant to threads leaving 1 or 2 threads on top blank.

CAUTION ⚠

- **Be careful not to apply sealant to the parallel screw area of the connector.**

- Where alignment is required, stop at aligning point in additional tightening process.

AIR COMPRESSOR



- For removal and installation of the air compressor, see Gr11.

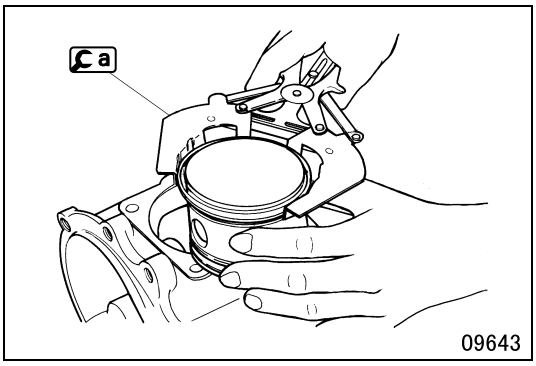
Special tools

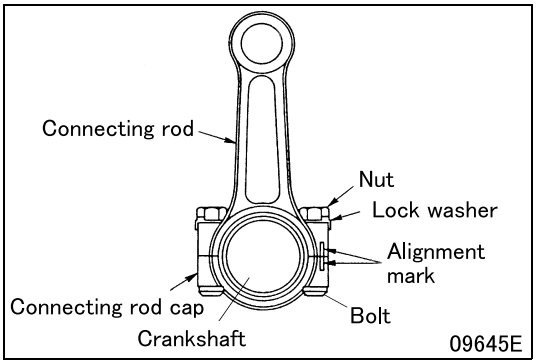
Mark	Tool name and shape	Part No.	Application
ⓒa	Piston ring tool  01732	MH060014	Removal and installation of compression rings

◆Removal procedure◆



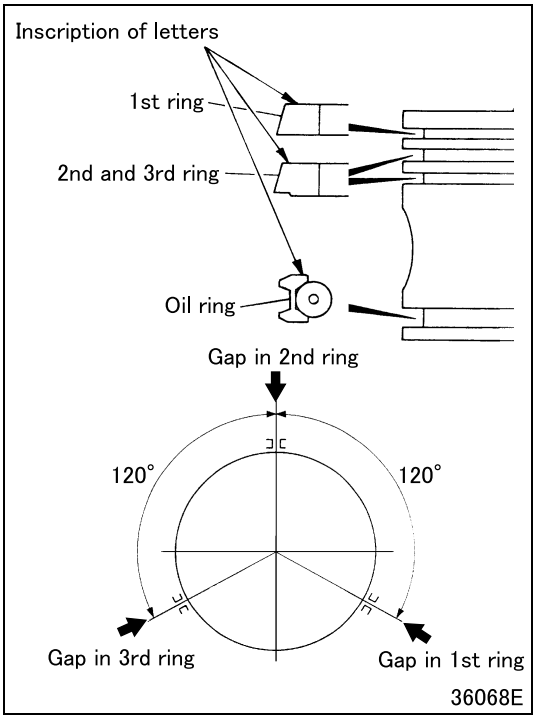
■ **Removal: Compression rings**

◆Installation procedure◆



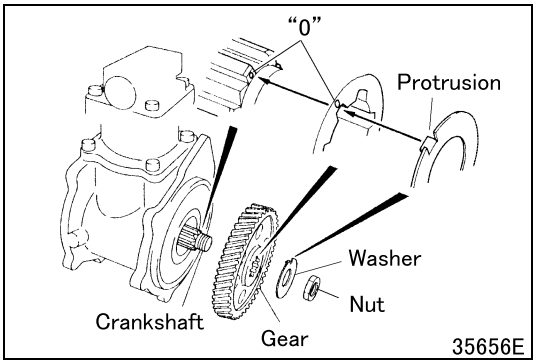
■ **Installation: Connecting rod cap and connecting rod**

- Assemble the connecting rod and cap while noting their alignment marks.
- Install bolts in such a way that the notches in the bolt heads are directed toward the inside of the connecting rod cap.
- After assembly, bend the lock washers.



■ **Installation: Compression rings**

- Install the compression rings, ensuring that their end gaps are located as shown in the illustration.
- Install the compression rings by following the removal sequence in reverse.
  (See "■ **Removal: Compression rings**".)



■ **Installation: Lock washer, compressor gear**

- Install the compressor gear onto the crankshaft, ensuring that "O" mark on the compressor gear is aligned with "O" mark on the crankshaft.
- Insert the protrusion of the lock washer such that the "O" mark on the compressor gear remains exposed.
- Tighten the nut to the specified torque. Bend one part at the bottom of the lock washer toward the nut to prevent the nut from loosening.

● Assembly sequence

Follow the disassembly sequence in reverse.

CAUTION ⚠

- **Check and adjust the air pressure governor after assembly. (See "ON-VEHICLE INSPECTION AND ADJUSTMENT".)**

Repair kit: Air dryer kit

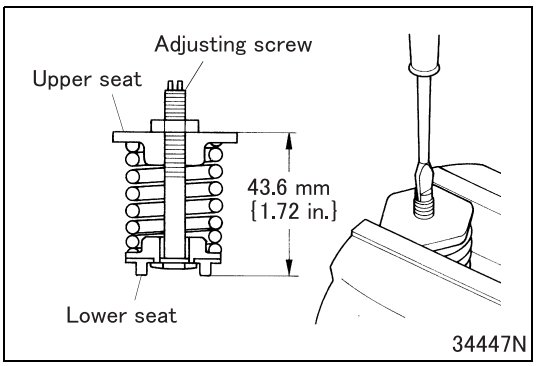
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Bolt (purge chamber, cover and body mounting)	17.7 to 27.5 {13 to 20, 1.8 to 2.8}	–
Tb	Bolt (case mounting)	2.0 to 3.9 {1.4 to 2.9, 0.2 to 0.4}	–
	Screw (case cover mounting)		
Tc	Cap nut (seat and plate mounting)	4.9 to 5.9 {3.6 to 4.3, 0.5 to 0.6}	–
Td	Nut (adjusting screw retaining)	6.9 to 7.8 {5.1 to 5.8, 0.7 to 0.8}	–
Te	Screw (clamp mounting)	1.0 to 1.5 {0.7 to 1.1, 0.1 to 0.15}	–
Tf	Screw (thermostat mounting)	0.5 to 1.0 {0.4 to 0.7, 0.05 to 0.10}	–
Tg	Heater	19.6 to 29.4 {14 to 22, 2 to 3}	–
Th	Bolt (valve, piston and valve body mounting)	3.9 to 6.9 {2.9 to 5.1, 0.4 to 0.7}	–
Ti	Plug	14.7 to 24.5 {11 to 18, 1.5 to 2.5}	–

Lubricant and/or sealant

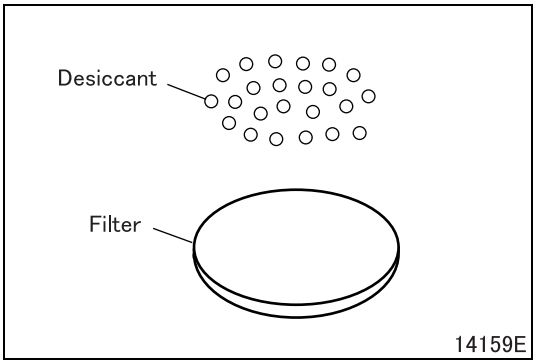
Mark	Points of application	Specified lubricant and/or sealant	Quantity
△a	O-ring	Multipurpose grease [NLGI No. 2 (Li soap)]	As required
	Adjusting screw (entire surface except thread)		
	Outer periphery of piston and O-ring groove		
	Body (inside surface)		
△b	Plug thread	ThreeBond 1110B	As required

◆Installation procedure◆



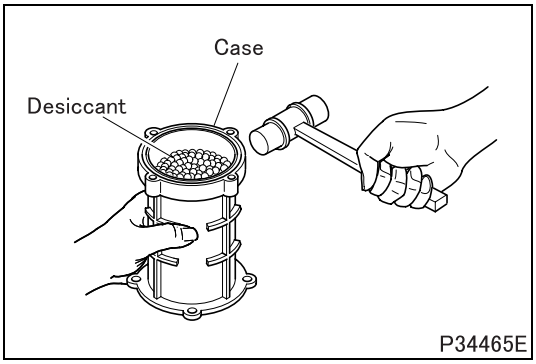
■ **Adjustment: Adjusting screw**

- Turn the adjusting screw to achieve the indicated dimension from the top of the upper spring seat to the bottom of the lower spring seat. Doing so will facilitate the threshold pressure adjustment to the specified value.

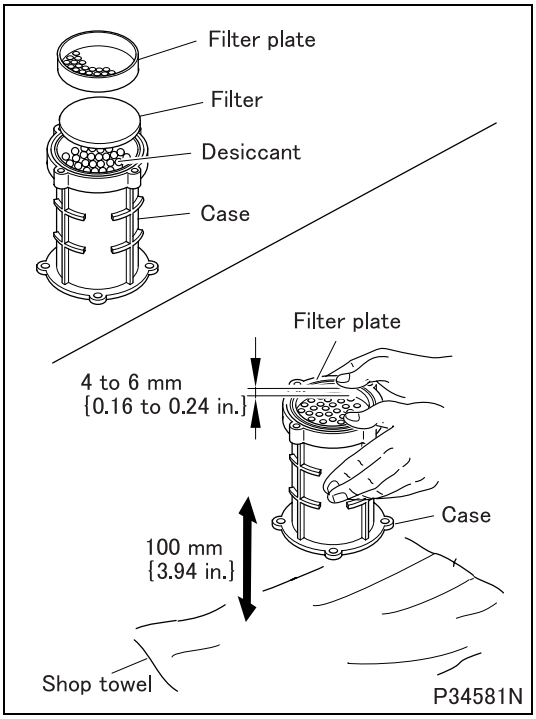


■ **Installation: Filters, desiccant, and filter plate**

- Install the filters with their soft layers facing the desiccant.



- Place the desiccant in the case, then settle the desiccant by tapping gently and evenly around the case with a plastic hammer.



- Place the soft layer side of the filter on the desiccant, and place the filter plate on the case, then tap the desiccant down.

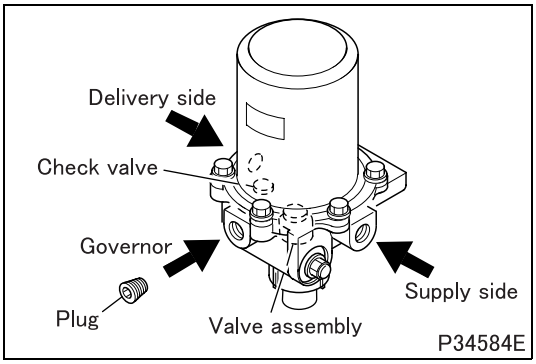
<Tapping>

- Before tapping the case against the work surface, lay two or three layers of shop towel on the work surface to protect the bottom of the case from scratches.
- Holding down the filter plate with both hands, lift the case to a height of about 100 mm {3.94 in.} and tap it gently against the work surface.
- Tap the case about 30 more times. Make sure the filter plate drops by 4 to 6 mm {0.16 to 0.24 in.} from its original position.

WARNING ⚠

- **Unless the tapping procedure is performed, particles of desiccant may escape and create blockages in brake lines, thus preventing normal brake operation.**

◆Inspection after installation◆



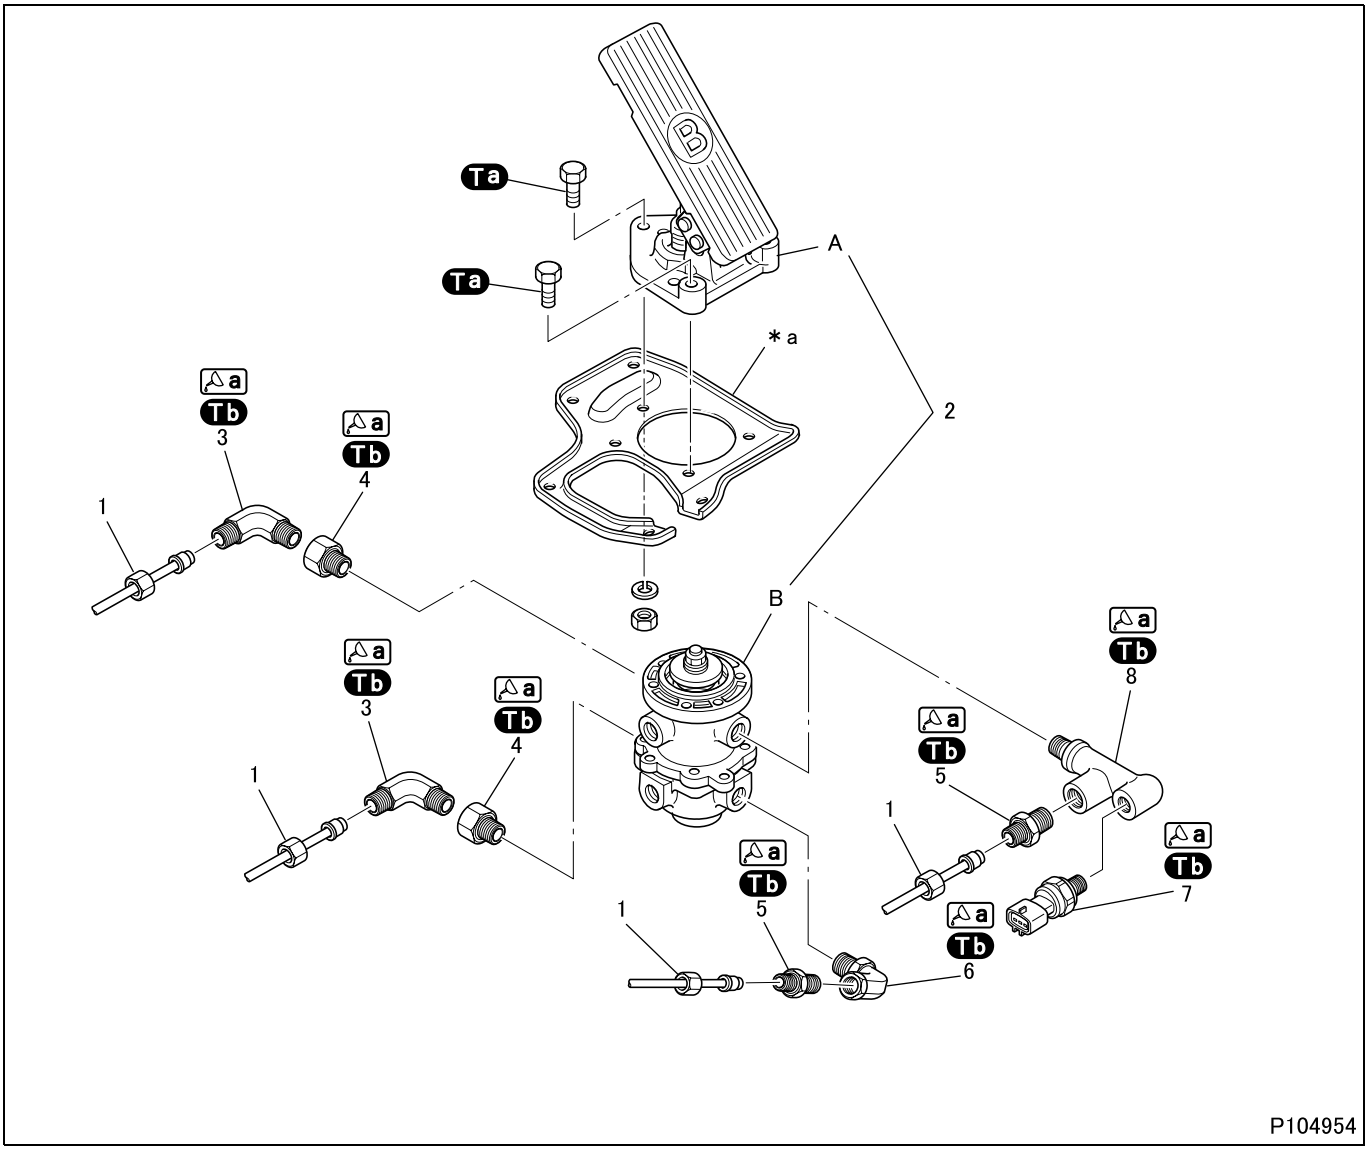
■ Inspection: Air leakage

- Completely plug the delivery side of the air dryer, then apply air pressure of 49 kPa {7.1 psi, 0.5 kgf/cm^2} or 780 kPa {115 psi, 8 kgf/cm^2} to the supply side and check that no air leaks from any joint.
  Leakage from the valve assembly must not exceed 20 cm^3 {1.22 cu.in.} per minute.
- Increase the pressure applied to the supply side to 932 kPa {135 psi, 9.5 kgf/cm^2} to cause purging (regeneration). Check that no air leaks from the check valve and from the air pressure governor (with the plug removed).

CAUTION ⚠

- **If there is air leakage from the air pressure governor or the check valves, charging (pressure filling) and purging (regeneration) will be performed continuously.**

BRAKE PEDAL



● **Removal sequence**

1 Nylon tube
2 Dual brake valve (See later section.)
3 Connector
4 Connector
5 Connector
6 Connector
7 Air pressure sensor
8 Connector

***a**: Valve board

- Remove pedal A upward from valve board, and valve B downward from the valve board to separate dual brake valve (pedal A and valve B).

● **Installation sequence**

Follow the removal sequence in reverse.

CAUTION ⚠

- **When installing the dual brake valve, use care that the nylon tube will not interfere with other neighboring parts.**

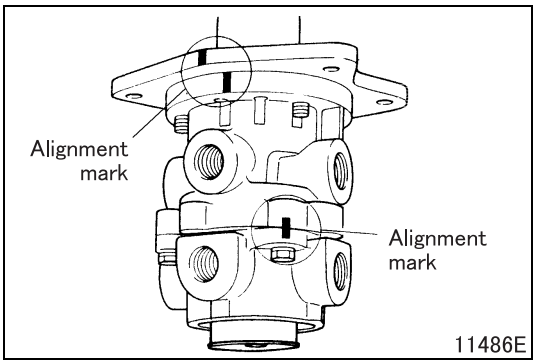
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Bolt (pedal and valve mounting)	11.8 to 18.6 {8.7 to 14, 1.2 to 1.9}	–
	Bolt (pedal and valve board mounting)		
Tb	Connector	39.2 to 117.7 {29 to 87, 4.0 to 12.0}	–
	Air pressure sensor		

Lubricant and/or sealant

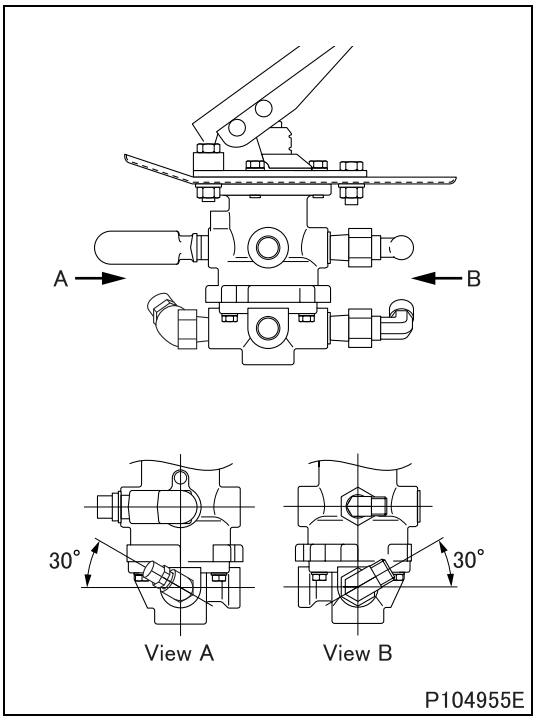
Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Thread of connnector and air pressure sensor	ThreeBond 1110B or Loctite 575	As required

◆Work before removal◆



■ **Alignment mark: Dual brake valve**

◆Installation procedure◆



■ **Installation: Connector**

- After tightening each connector to a torque just beyond the lower limit of the specified torque, adjust its direction by turning it within one turn. The installed angles of the connectors must be as shown in the illustration.

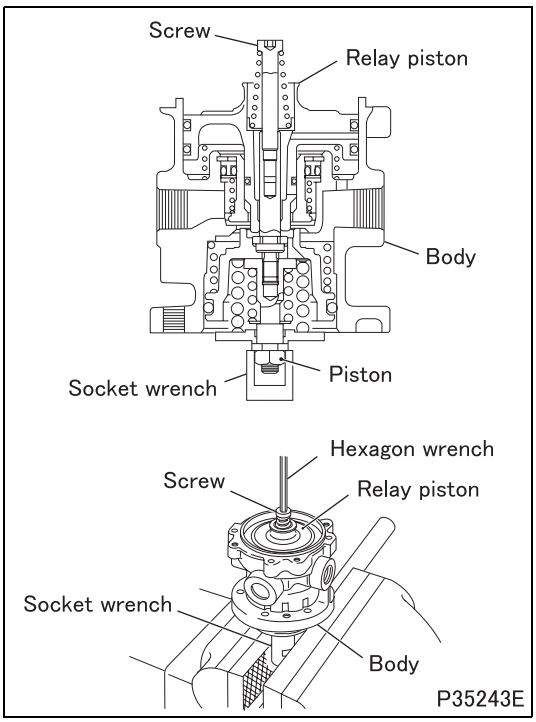
	Pack between boot and plunger		1 cm^3 {0.061 cu.in.}

Special tools

Mark	Tool name and shape	Part No.	Application
a	Insert tool	*910-24463	Installation of O-ring
b	Retainer	*910-24592	Holding of piston

*: Knorr-Bremse part No.

◆Removal procedure◆



■ **Removal: Relay piston**

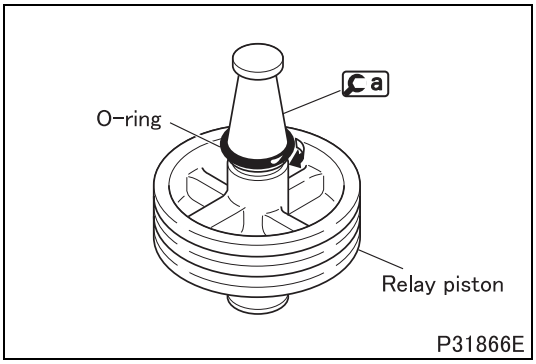
- Hold a socket wrench (10 mm {0.39 in.} between the flats) on vise.
- Insert the head of self-locking bolt into socket wrench to tighten body.

CAUTION ⚠

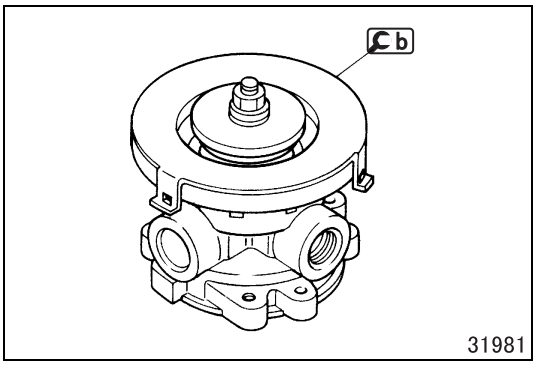
- **You must be careful when you loosen screw, because the spring in body can forcibly eject relay piston. To avoid this hazard, press down on the relay piston with your hand when you carry out the above work.**

- Using a hexagon wrench, slowly loosen the screw and remove the relay piston.
  Hexagon wrench: HEX4

◆Installation procedure◆

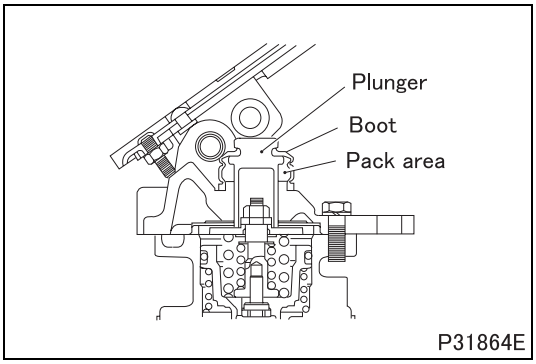


■ **Installation: O-ring**



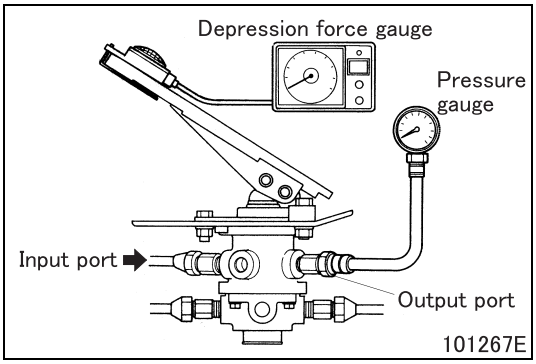
■ **Installation: Piston**

- Install b to prevent the piston from jumping out.
- After installing the body and cover, remove b.



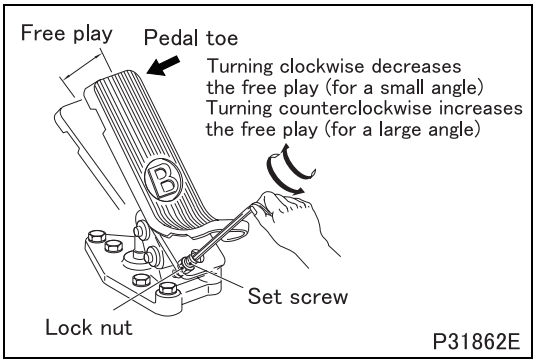
■ **Installation: Packing grease between boot and plunger**

◆**Inspection after installation**◆



■ **Inspection: Dual brake valve**

- When performing the functional check, check if primary output pressure and pedal depression force relative to the specified pedal depression angles conform to the corresponding standard values.
- Install a pressure gauge capable of measuring a minimum of 0.98 MPa {142 psi, 10 kgf/cm^2} to the primary output port.
- Install a depression force gauge to the brake pedal.
- While applying an air pressure of 0.7 MPa {100 psi, 7 kgf/cm^2} to the primary input port, check for air leakage.
- If air leakage is found, proceed as follows.
  - Retighten the connectors.
  - Disassemble the dual brake valve and check if the O-rings of each part are correctly installed.



- Using the set screw, adjust the brake pedal play, which is obtained when the pedal tip is pressed by hand, to the standard value.
- Secure the set screw in the correct position by tightening the lock nut to the specified torque.
- Now, while observing the pressure gauges, check if primary output pressure and pedal depression force relative to the specified pedal depression angles conform to the corresponding standard values shown in the input/output characteristic curve diagram.
- If the output pressure is lower than the standard values, replace the piston.

Input/output characteristic curve diagram

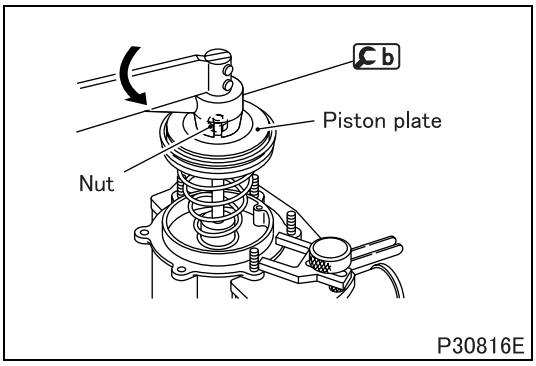
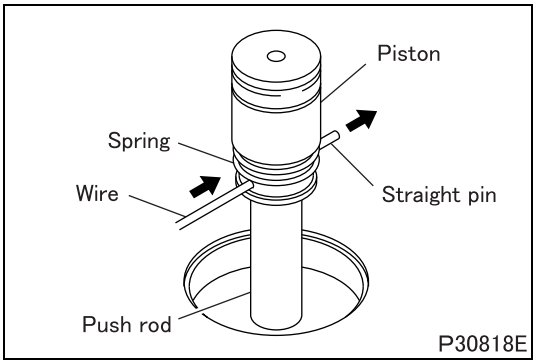
*: Knorr-Bremse part No.

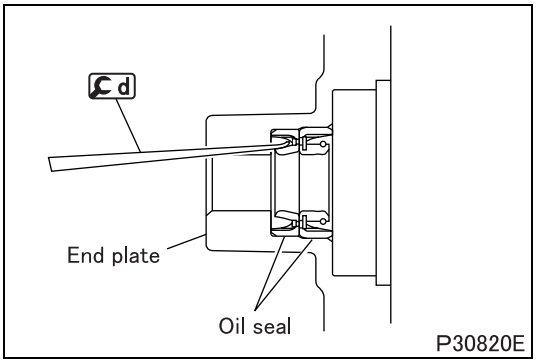
◆Removal procedure◆



■ **Removal: Piston plate**



■ **Removal: Hydraulic piston**

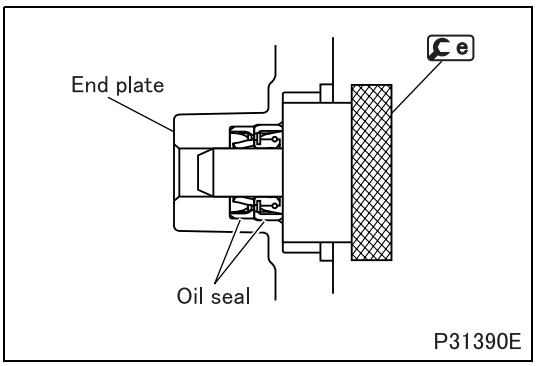


■ **Removal: Oil seal**

CAUTION ⚠

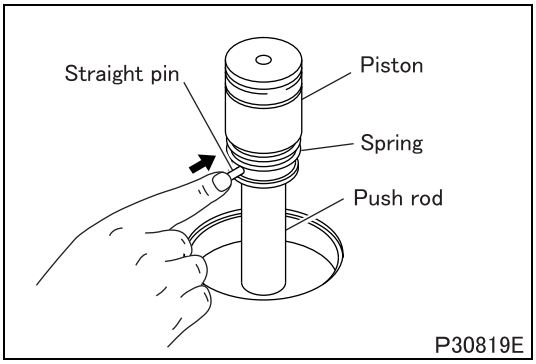
- **Remove the oil seals by tapping them evenly while taking care not to damage the inner surface of the end plate.**

◆Installation procedure◆



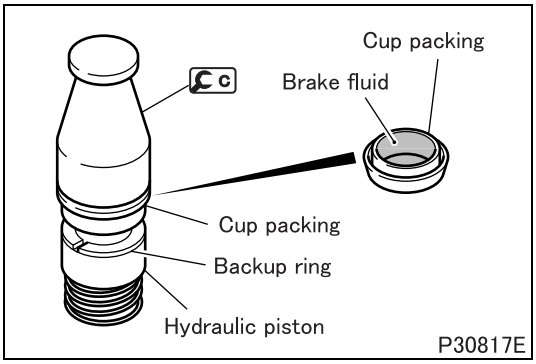
■ **Installation: Oil seal**

- Install each oil seal on the end plate in the illustrated direction.

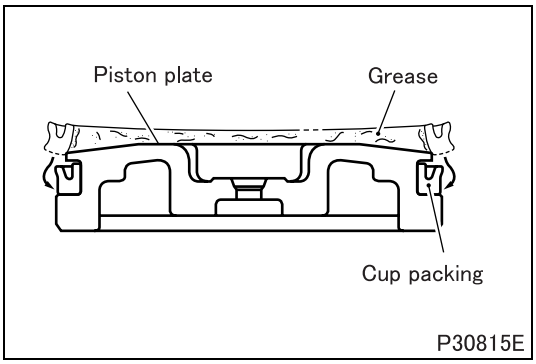


■ **Installation: Hydraulic piston**

- Align the holes of the hydraulic piston, valve seal and push rod before inserting the straight pin.
- After inserting the straight pin, make sure that the hydraulic piston spring is hanging over the straight pin and working as a stopper.

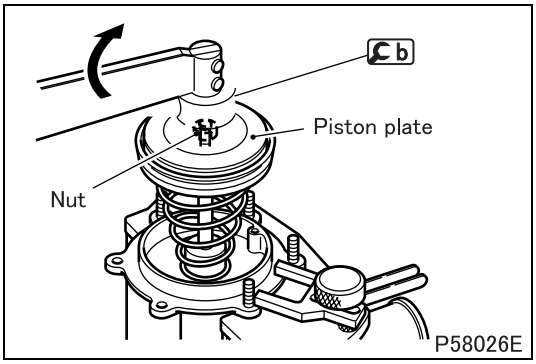


■ **Installation: Cup packing**



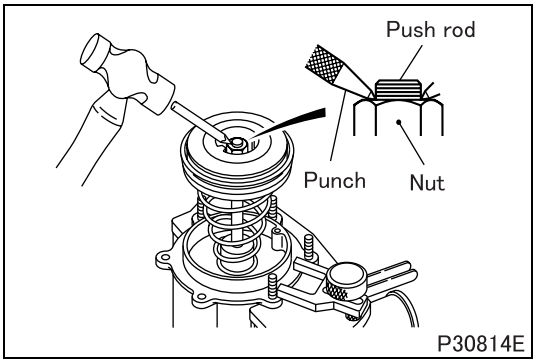
■ **Installation: Cup packing**

- Apply grease to the entire surface of the cup packing before installing it as shown in the illustration.

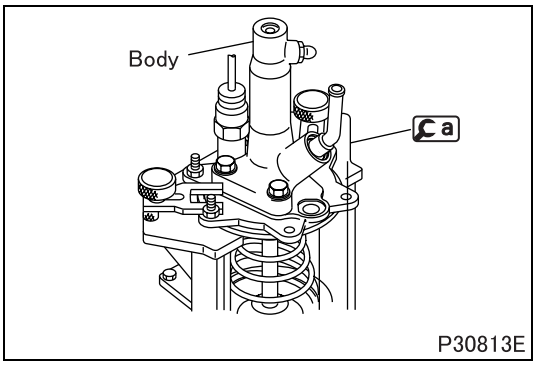


■ **Installation: Piston plate**

- Tighten the nut to the specified torque while pressing the piston plate fully towards the end plate.



- After tightening the nut at specified torque, caulk the nut and push rod thread area.



■ **Installation: Body**

◆Inspection after installation◆

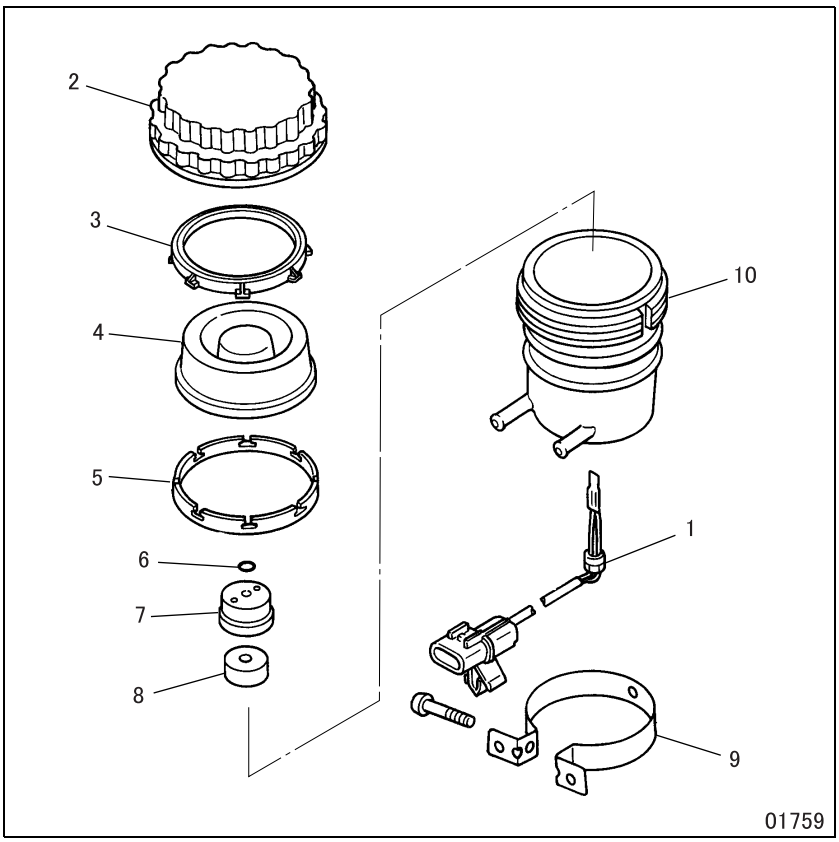
■ Installation: Brake booster

- With the brake booster installed on the vehicle, check if the booster operates correctly using [f].
- Installing pressure gauges
  - Install the air pressure gauge (PG4) onto the air supply port on the power cylinder.
  - Remove the air bleeder from the hydraulic cylinder, and connect the oil pressure gauge (PG2). Bleed the tester of air.
- Set the air tank pressure at 830 kPa {120 psi, 8.5 kgf/cm^2}. With the engine stationary, carry out the following tests.

Test	Test condition	Standard value	Limit	Remedy
Air tightness under full load	Air pressure drop at 15 sec. after brake pedal is fully pressed	10 kPa {1.5 psi, 0.1 kgf/cm^2} or less	60 kPa {8.7 psi, 0.6 kgf/cm^2} or less on air pressure gauge (PG4)	Replace defective part(s) (O-ring, cup packing, etc.)
Operation under full load	At air pressure reading of 930 kPa {135 psi, 9.5 kgf/cm^2} (PG4) with brake pedal fully pressed	Oil pressure gauge (PG2) 23.8 ± 0.7 MPa {3440 ± 100 psi, 242 ± 7 kgf/cm^2}	–	Replace defective part(s) (hydraulic piston, cup packing, etc.)
Brake booster starting pressure	At surge in oil pressure reading (PG2) as brake pedal is gradually pressed	Air pressure gauge (PG4) 24 ± 10 kPa {3.5 ± 1.5 psi, 0.2 ± 0.1 kgf/cm^2}	–	Replace defective part(s) (valve seal, cup packing, etc.)
Residual pressure	With brake pedal pressed, then released	Oil pressure gauge (PG2) 80 to 130 kPa {12 to 19 psi, 0.8 to 1.3 kgf/cm^2}	Oil pressure gauge (PG2) 60 to 150 kPa {8.7 to 110 psi, 0.6 to 15 kgf/cm^2}	Replace defective part(s) (valve, spring, etc.)

- After the above tests are completed, check the brake booster stroke switch for correct operation.
  - With the air bleeder loosened to allow fluid leakage, press the brake pedal to move the power piston full stroke in order to actuate the brake booster stroke switch. The brake warning lamp on the meter cluster should illuminate.
  - After the brake booster functional tests are completed, bleed the brake system of air and add brake fluid to the “H” mark on the fluid tank. (See “ON-VEHICLE INSPECTION AND ADJUSTMENT”.)

FLUID TANK



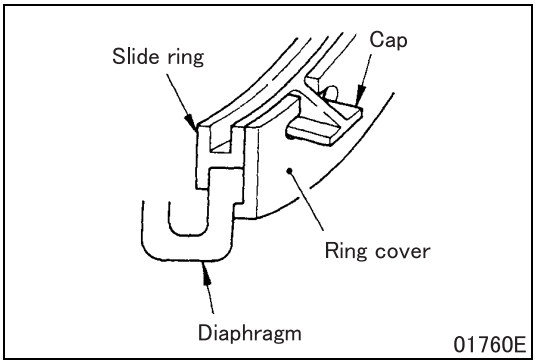
● Disassembly sequence

1 Fluid level switch
2 Cap
3 Slide ring
4 Diaphragm
5 Ring cover
6 Stopper ring
7 Float stopper
8 Float
9 Fluid tank bracket
10 Tank

● Assembly sequence

Follow the disassembly sequence in reverse.

◆Installation procedure◆

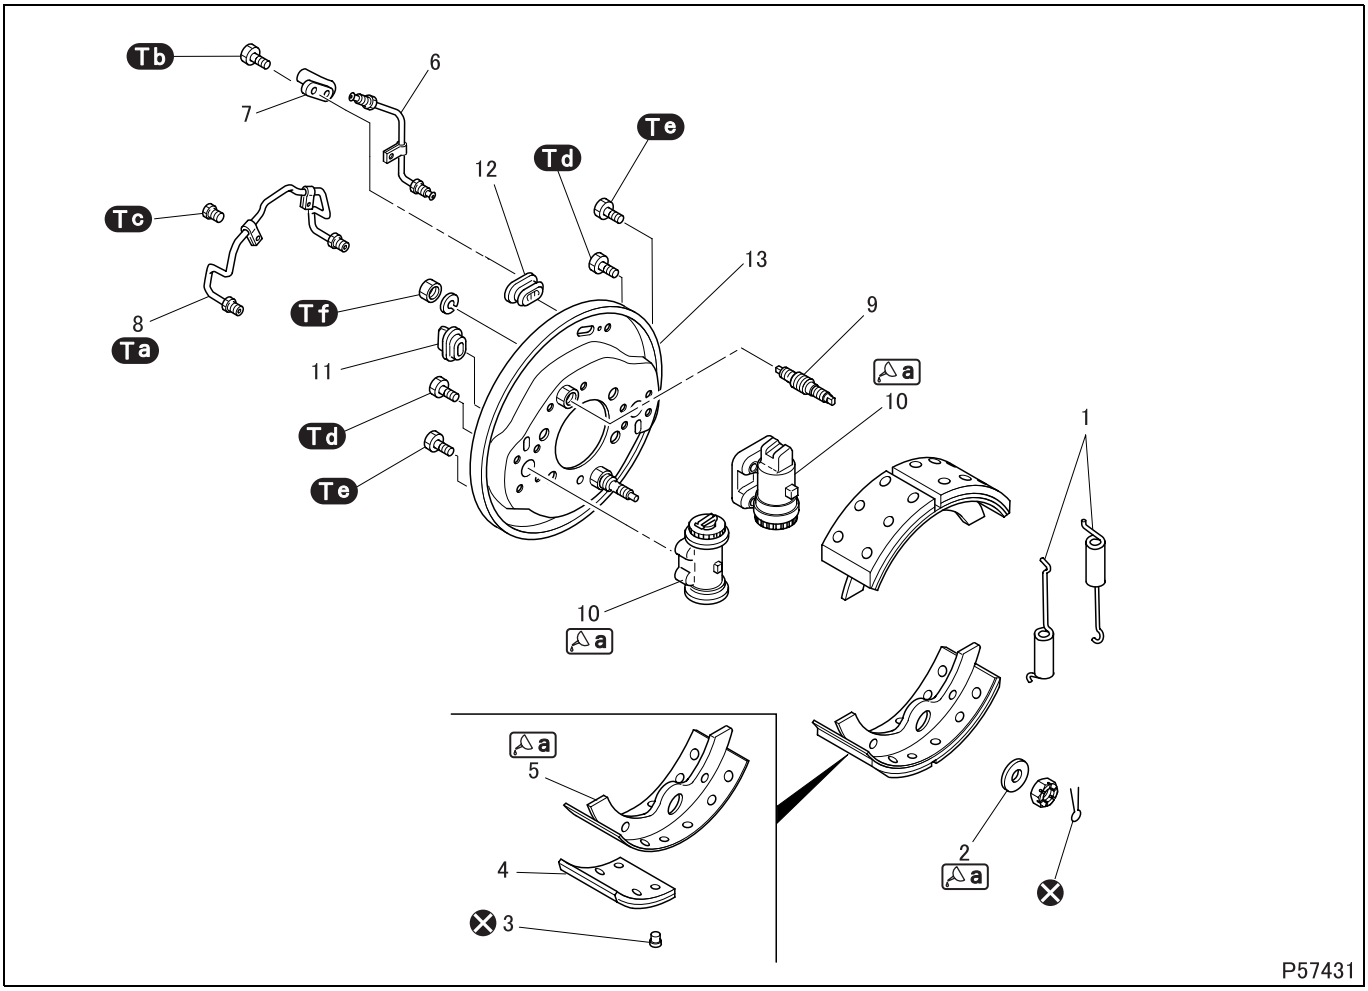


■ Installation: Slide ring, diaphragm

- Engage the slide ring hook firmly onto the ring cover. Ensure that the diaphragm is installed correctly, as shown in the illustration.

M E M O

FRONT WHEEL BRAKE



- For removal and installation of the front drum brake, see Gr26A.

● Disassembly sequence

1 Return spring
2 Washer
3 Rivet
4 Brake lining
5 Brake shoe
6 Brake pipe
7 Joint
8 Brake pipe
9 Holder pin
10 Wheel cylinder (See later section.)
11 Adjusting hole plug
12 Inspection hole plug
13 Backing plate

⊗: Non-reusable parts

CAUTION ⚠

- **Do not turn or remove the holder pins unless required. Doing that can alter the installed squareness of the brake shoes, resulting in brake drag. If the pins are removed, be sure to adjust them after reassembly.**

● Assembly sequence

Follow the disassembly sequence in reverse.

Repair kit: Brake lining kit

CAUTION ⚠

- **To prevent poor working of the brake, do not smear the surface of the brake lining with grease or oil.**
- **After reassembly, make the initial adjustment of the brake drum-to-shoe clearance. (See "ON-VEHICLE INSPECTION AND ADJUSTMENT".)**

Service standards (Unit: mm {in.})

Location	Maintenance item	Standard value	Limit	Remedy
1	Return spring load (installed length 192 {7.6})	460 ± 39 N {340 ± 29 lbs, 47 ± 4 kgf}	Clearance between coils or coil and cover	Replace
4	Brake lining thickness	12 {0.47}	5 {0.20} (side step shows wear limit)	Replace

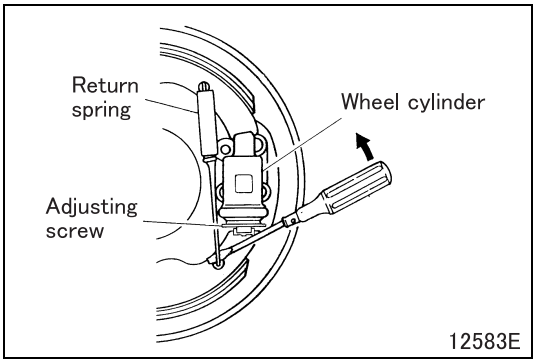
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Brake pipe	13.7 ± 2.0 {10 ± 1.5, 1.4 ± 0.2}	–
Tb	Bolt (joint mounting)	9.8 ± 2.0 {7.2 ± 1.5, 1.0 ± 0.2}	–
Tc	Bolt (pipe clamp mounting)	4.9 ± 1.0 {3.6 ± 0.74, 0.5 ± 0.1}	–
Td	Bolt (wheel cylinder mounting)	44.1 ± 8.8 {33 ± 6.5, 4.5 ± 0.9}	–
Te	Bolt (wheel cylinder mounting)	78 ± 16 {58 ± 12, 8.0 ± 1.6}	–
Tf	Nut (holder pin mounting)	29.4 ± 5.9 {22 ± 4.4, 3.0 ± 0.6}	–

Lubricant and/or sealant

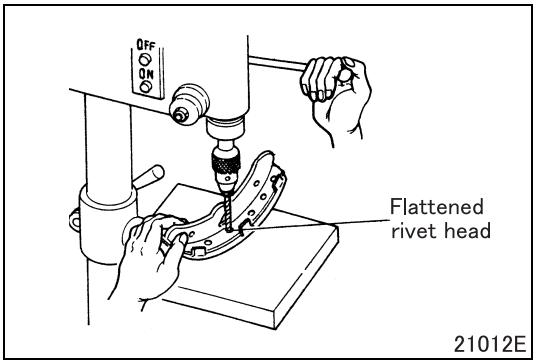
Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Contact areas between washer and brake shoe	Wheel bearing grease [NLGI No.2 (Li soap)]	As required
	Contact areas between brake shoe and wheel cylinder		

◆Removal procedure◆



■ Removal: Return spring

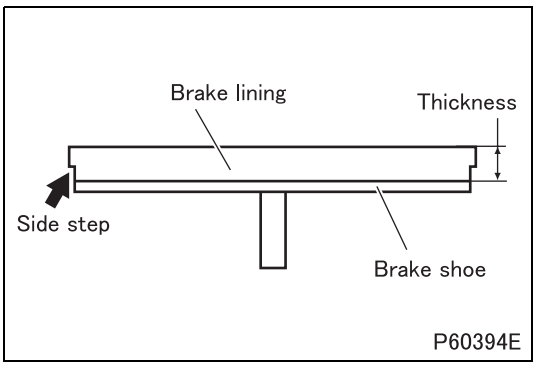
- Using a flat-head screwdriver, remove the return spring. To do this, rest the screwdriver on the wheel cylinder adjusting screw. Then, with the adjusting screw as a fulcrum, engage the screwdriver with the spring hook and pry away the spring.



■ Removal: Brake lining

- Using a drilling machine, break the flattened rivet heads on the brake shoe side to release the brake lining.

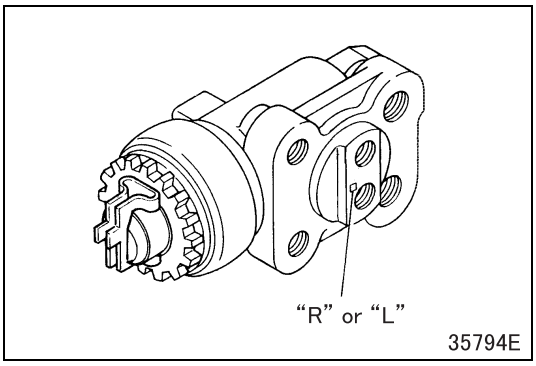
◆Inspection procedure◆



■ Inspection: Brake lining thickness

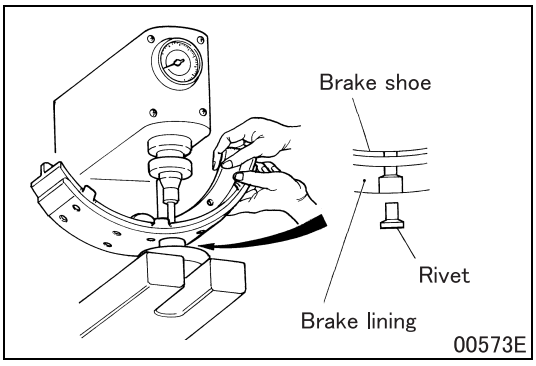
- If the brake lining is worn down to the side step, replace all brake linings on that axle.

◆Installation procedure◆



■ Installation: Wheel cylinder

"R": Right-hand side wheel
"L": Left-hand side wheel



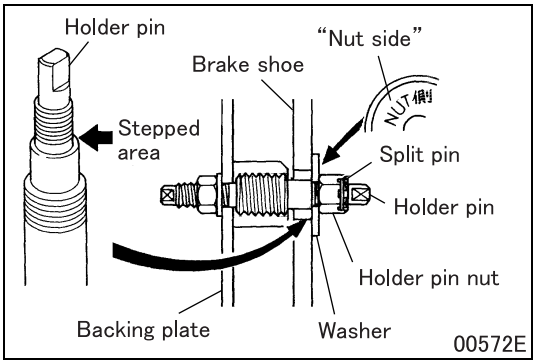
■ Installation: Brake lining

- Using cleaning fluid, clean the brake shoe surface to which the brake lining is to be mounted. Then, dry the shoe surface.
- Insert rivets from the brake lining to the shoe. Stake them, starting from the center of the shoe towards the ends. Ensure that the shoe-to-lining clearance conforms to the following values.
  - Around the rivets (within ϕ20 mm {0.79 in.}): 0.05 mm {0.0020 in.} or less
  - Except around the rivets: 0.2 mm {0.0079 in.} or less
  - The staking load for the rivets should be 22 ± 0.98 kN {4950 ± 220 lbs, 2200 ± 100 kgf}.

CAUTION ⚠

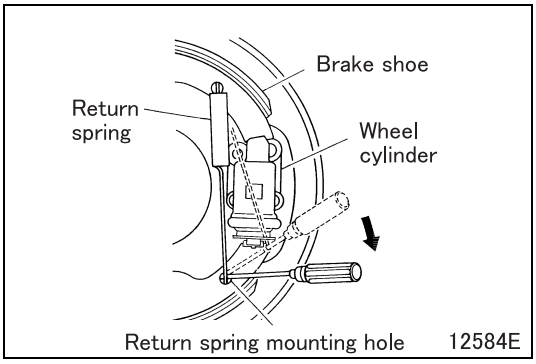
- **New replacement brake linings that are to be installed on the same axle should all be in the same size and have the same identification mark. Otherwise, braking performance can be different from left to right.**

- After assembly, check the brake drum-to-lining clearance. Correct as required.



■ **Installation: Brake shoe**

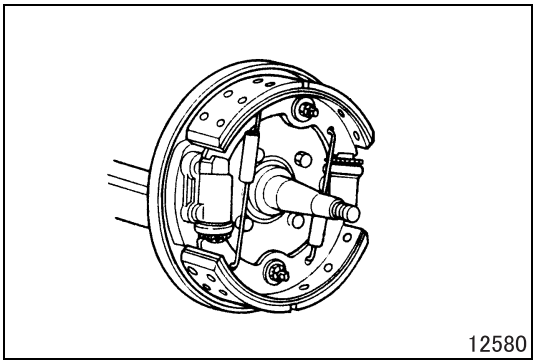
- Install the brake shoe.
- Insert the washer with the stamped word "NUT side" facing away from the brake shoe. Tighten the holder pin nut until the washer is slightly against the stepped area on the holder pin. Back off the holder pin nut between 0 to 60° until the first split pin holes in the nut and holder pin align with each other.
- Insert the split pin through the hole and bend it over.



■ **Installation: Return spring**

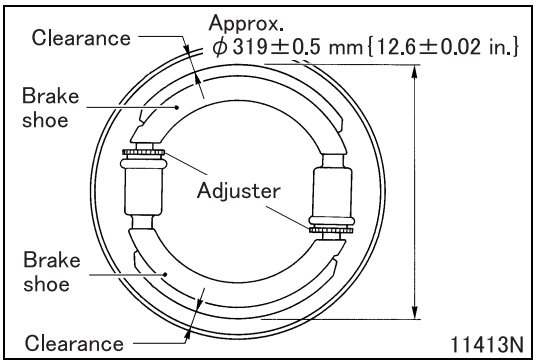
- Install the shorter hook of the return spring onto the brake shoe which is on the opposite side from the wheel cylinder adjuster.
- Hook up a small Phillips screwdriver tip to the longer hook of the return spring of the brake shoe assembly and install the return spring using the screwdriver like a prying lever.

◆Adjustment after installation◆

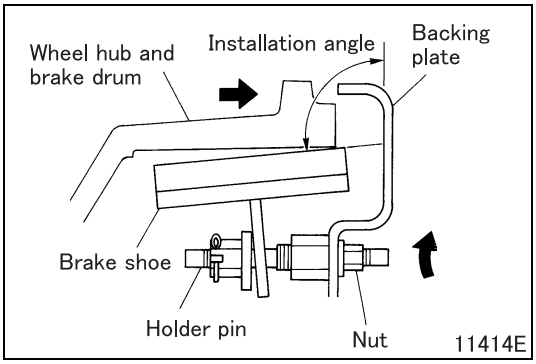


■ **Adjustment: Holder pin**

- Install the front wheel brake onto the front axle. (See Gr26A.)

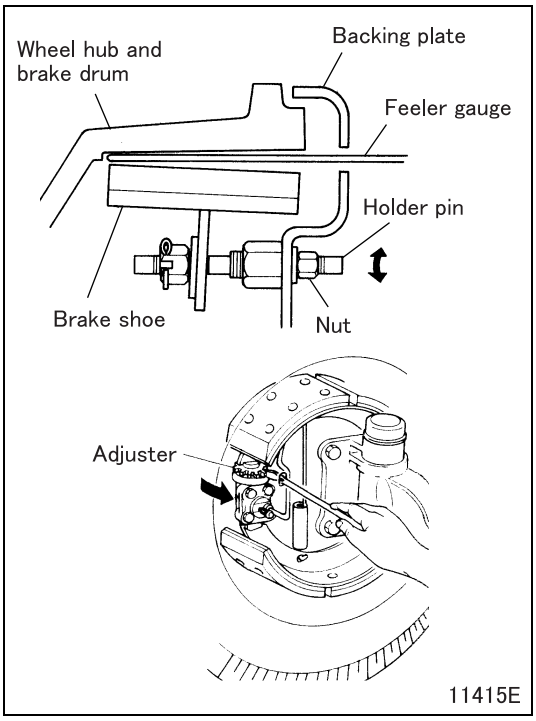


- Turn the adjuster until the distance between the brake shoes, indicated in the illustration, is obtained.
- Adjust the brake shoe-to-drum clearance evenly across by moving the brake shoe.

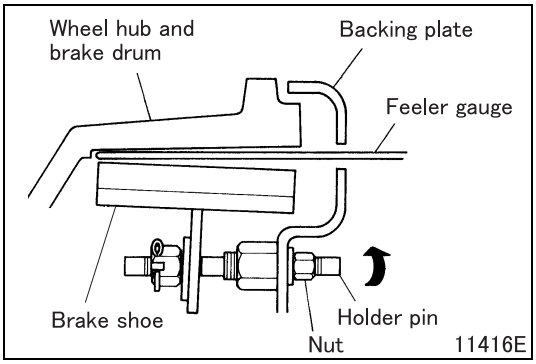


- Secure the wheel hub and brake drum onto the front wheel brake. (See Gr26A.)
  If the installation angle exceeds 90°, the wheel hub and brake cannot be installed correctly. If this is the case, loosen the nut while turning the holder pin in order to bring the installation angle as much close to 90° as possible.

- Bleed the brake system of air.
  (See “ON-VEHICLE INSPECTION AND ADJUSTMENT”.)



★• Expand the brake shoe towards the brake drum by turning the adjuster until it takes a reasonable force to insert a 0.2 mm feeler gauge between the brake drum and lining and out.
★• Loosen the nut and turn the holder pin clockwise or counterclockwise until the feeler gauge can be inserted and out with a slight resistance.
- Repeat the above steps, shown with ★, until it takes a reasonable force to insert the feeler gauge between the brake drum and lining and out.
- Lightly press the brake pedal a couple of times to regain the even drum-to-lining clearance obtained earlier.
- Repeat the above steps, shown with ★, until it takes a reasonable force to insert the feeler gauge between the brake drum and lining and out.



- When it takes a reasonable force to insert the feeler gauge between the brake drum and lining and out, this is because the feeler gauge is in contact with the entire width of the brake shoe.
- Now, pull out the feeler gauge. Then, with the feeler gauge inserted again, turn the holder pin until it takes a substantial force to remove and insert the feeler gauge across the entire width of the brake shoe.
- Tighten the nut to the specified torque.

Wheel cylinder

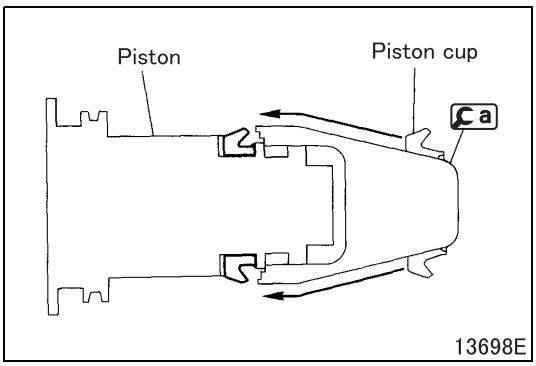
Mark	Tool name and shape	Part No.	Application
a	Piston cup guide A: ϕ41 {1.61}, B: 50 {1.97} 	MK356233	Installation of piston cup

◆Installation procedure◆



■ **Installation: Piston cup**

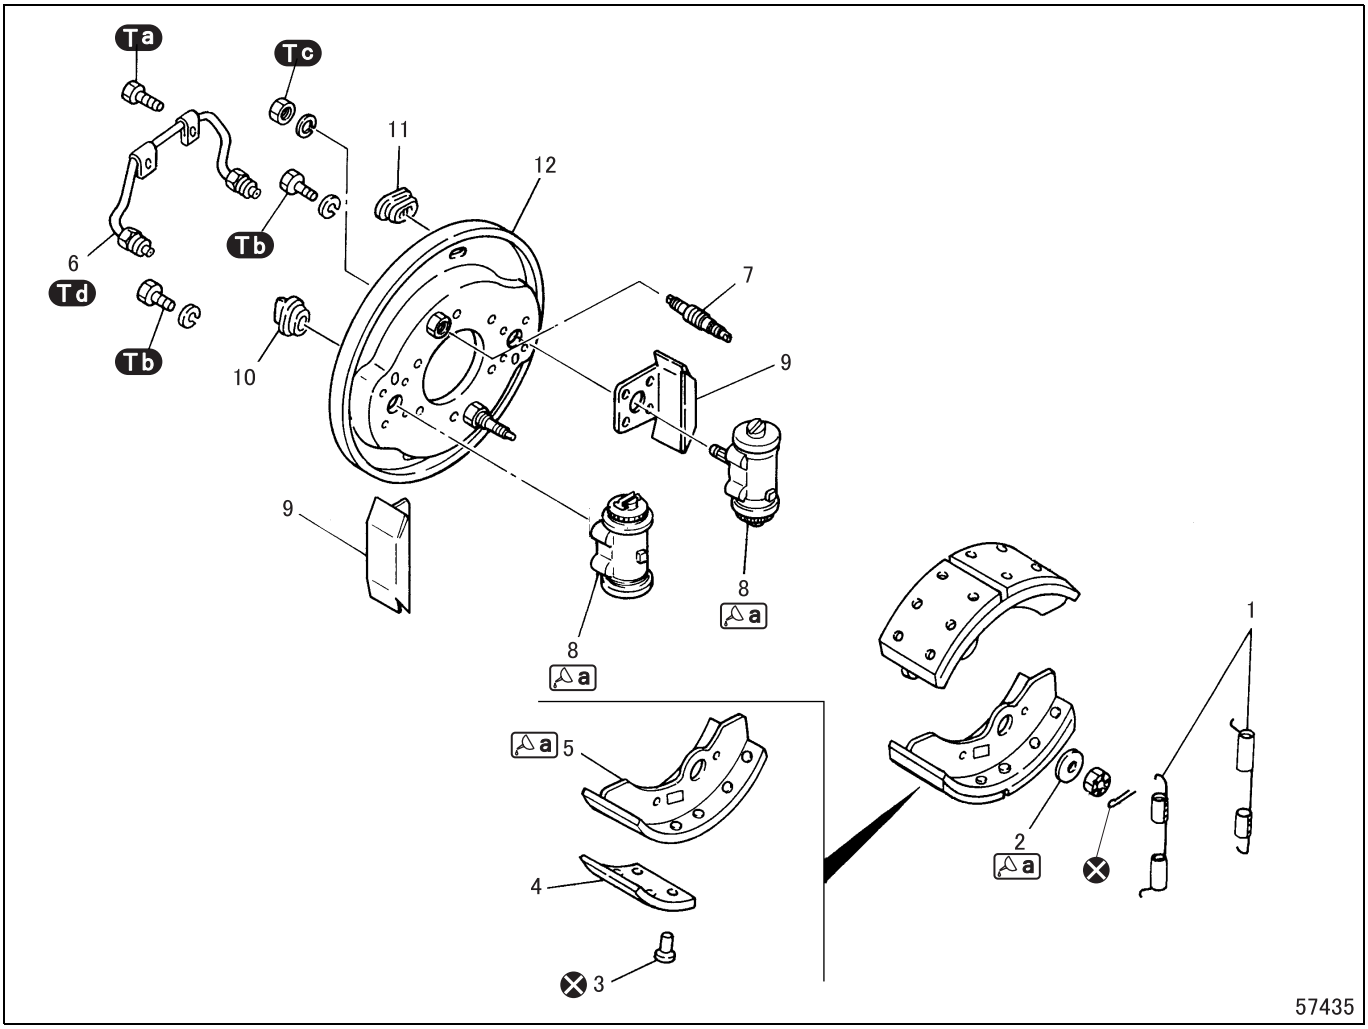
- Using a, install the piston cup as shown in the illustration.

CAUTION ⚠

- **Install the piston cup correctly, facing it as shown in the illustration, in order to prevent poor braking performance and brake fluid leakage.**

M E M O

REAR WHEEL BRAKE



- For removal and installation of the rear drum brake, see Gr27.

● Disassembly sequence

1 Return spring
2 Washer
3 Rivet
4 Brake lining
5 Brake shoe
6 Brake pipe
7 Holder pin
8 Wheel cylinder (See later section.)
9 Wheel cylinder cover
10 Adjusting hole plug
11 Inspection hole plug
12 Backing plate

⊗: Non-reusable parts

CAUTION ⚠

- **Do not turn holder pins or exert strong force on them. Otherwise, brake drag may result.**

● Assembly sequence

Follow the disassembly sequence in reverse.

Repair kit: Brake lining kit

CAUTION ⚠

- **To prevent poor working of the brake, do not smear the surface of the brake lining with grease or oil.**
- **After reassembly, make the initial adjustment of the brake drum-to-shoe clearance. (See "ON-VEHICLE INSPECTION AND ADJUSTMENT".)**

Service standards (Unit: mm {in.})

Location	Maintenance item	Standard value	Limit	Remedy
1	Return spring load (installed length 217 {8.54})	530 ± 49 N {120 ± 36 lbs, 54 ± 5 kgf}	Clearance between coils, or coil and cover	Replace
4	Brake lining thickness	12.9 {0.51}	5 {0.20} (side shoulder means wear limit)	Replace

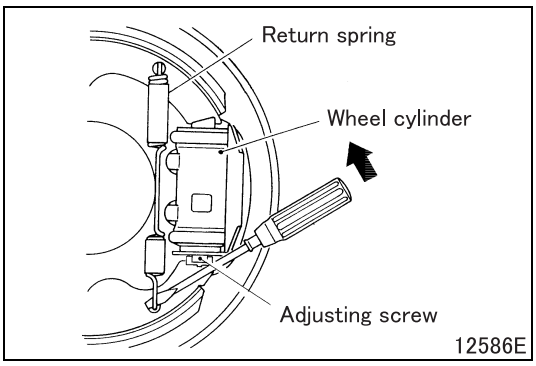
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Bolt (pipe clamp mounting)	4.9 ± 1.0 {3.6 ± 0.74, 0.5 ± 0.1}	–
Tb	Bolt (wheel cylinder mounting)	78 ± 16 {58 ± 12, 8.0 ± 1.6}	–
Tc	Nut (holder pin mounting)	29 ± 5.9 {21 ± 4.4, 3.0 ± 0.6}	–
Td	Brake pipe	14 ± 2.0 {10 ± 1.5, 1.4 ± 0.21}	–

Lubricant and/or sealant

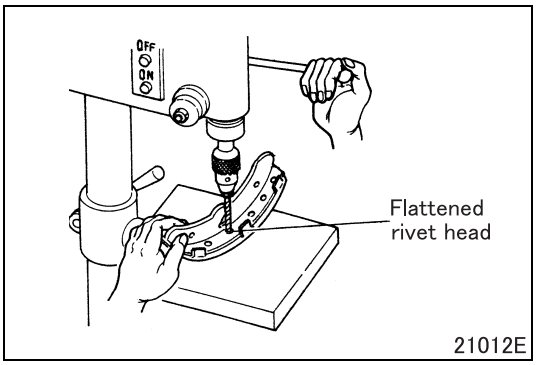
Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Brake shoe contact surfaces with washer	Wheel bearing grease [NLGI No.2 (Li soap)]	As required
	Brake shoe contact surfaces with wheel cylinder		

◆Removal procedure◆



■ Removal: Return spring

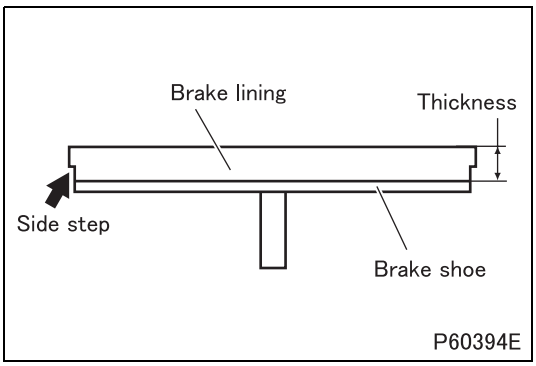
- Using a flat-head screwdriver, remove the return spring. To do this, rest the screwdriver on the wheel cylinder adjusting screw. Then, with the adjusting screw as a fulcrum, engage the screwdriver with the spring hook and pry away the spring.



■ Removal: Brake lining

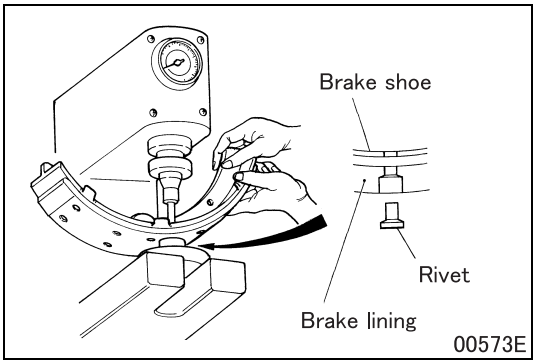
- Using a drilling machine, break the flattened rivet heads on the brake shoe side to release the brake lining.

◆Inspection procedure◆



■ **Inspection: Brake lining thickness**

- If the brake lining is worn down to the side step, replace all brake linings on that axle.



■ **Installation: Brake lining**

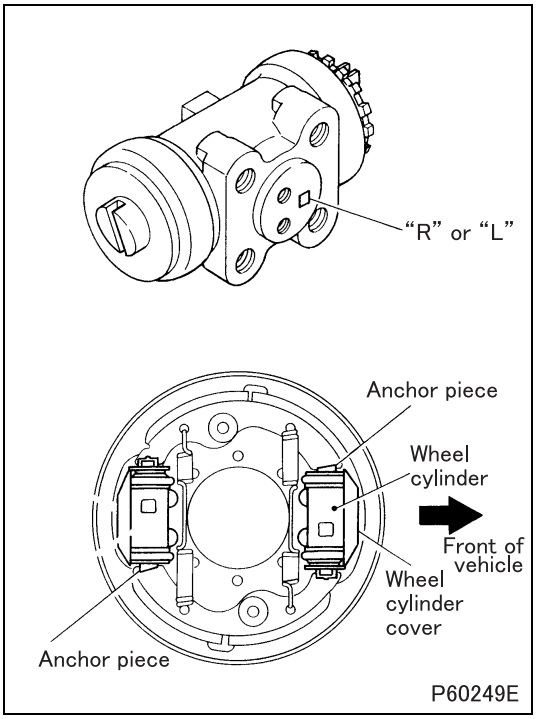
- Using cleaning fluid, clean the brake shoe surface to which the brake lining is to be mounted. Then, dry the shoe surface.
- Insert rivets from the brake lining to the shoe. Stake them, starting from the center of the shoe towards the ends. Ensure that the shoe-to-lining clearance conforms to the following values.
  - Around the rivets (within ϕ20 mm {0.0079 in.}): 0.05 mm {0.0020 in.} or less
  - Except around the rivets: 0.2 mm {0.0079 in.} or less
  - The staking load for the rivets should be 22 ± 0.98 kN {4950 ± 220 lbs, 2200 ± 100 kgf}.

CAUTION ⚠

- **New replacement brake linings that are to be installed on the same axle should all be in the same size and have the same identification mark. Otherwise, braking performance can be different from left to right.**

- After assembly, check the brake drum-to-lining clearance. Correct as required.

◆Installation procedure◆



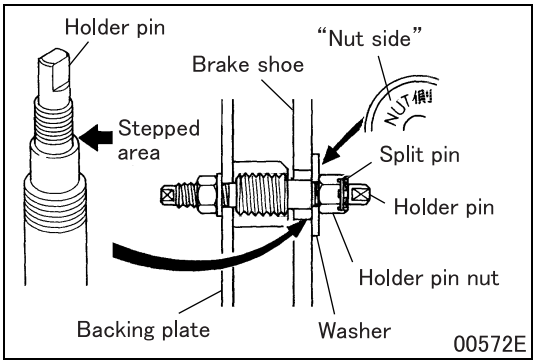
■ **Installation: Wheel cylinder**

Identification mark	Installation position
"R"	Right, front
"L"	Left, front
No mark	Right and left, rear

NOTE

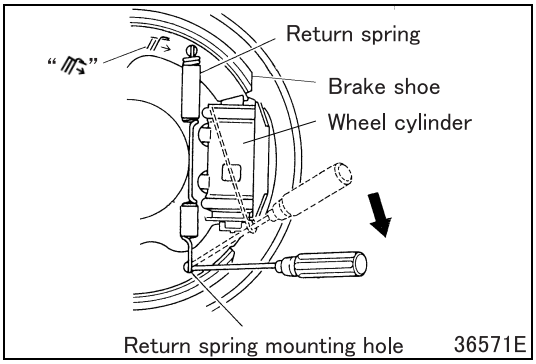
- **The illustration shows a right-hand wheel. Left-hand wheels are symmetrically arranged relative to the illustration.**

- Install the anchor pieces in the direction shown.



■**Installation: Brake shoe**

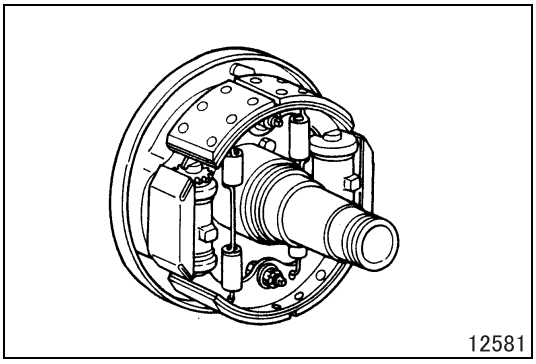
- Install the brake shoe.
- Insert the washer with the stamped word "NUT side" facing away from the brake shoe. Tighten the holder pin nut until the washer is slightly against the stepped area on the holder pin. Back off the holder pin nut between 0 to 60° until the first split pin holes in the nut and holder pin align with each other.
- Insert the split pin through the hole and bend it securely.



■ **Installation: Return spring**

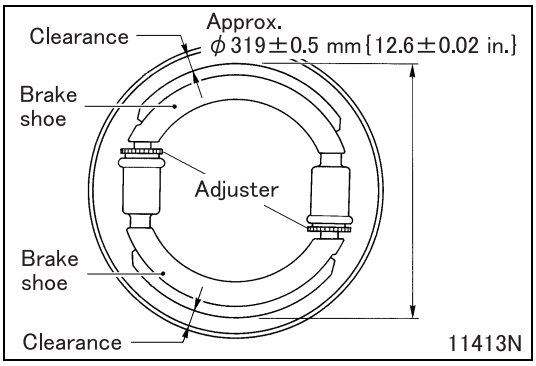
- Install the shorter hook of the return spring onto the brake shoe which is on the opposite side from the wheel cylinder adjuster.
- Hook up a small Phillips screwdriver tip to the longer hook of the return spring of the brake shoe assembly and install the return spring using the screwdriver like a prying lever.

◆Adjustment after installation◆

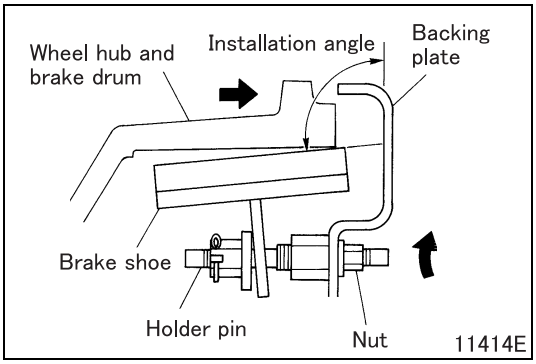


■ **Adjustment: Holder pin**

- Install the rear wheel brake onto the rear axle. (See Gr27.)

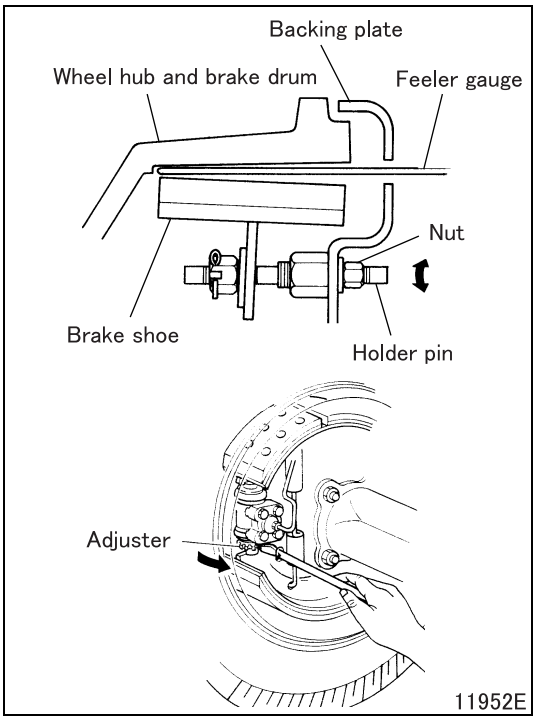


- Turn the adjuster until the distance between the brake shoes, indicated in the illustration, is obtained.
- Adjust the brake shoe-to-drum clearance evenly across by moving the brake shoe.

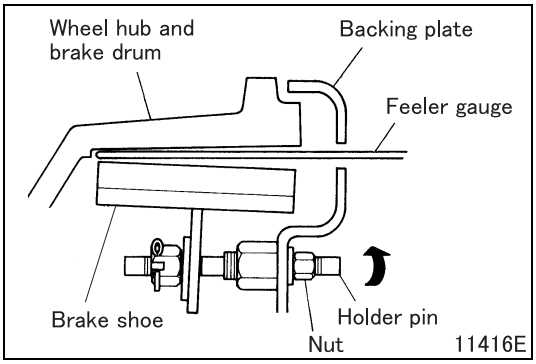


- Secure the wheel hub and brake drum onto the rear wheel brake. (See Gr27.)
  If the installation angle exceeds 90°, the wheel hub and brake cannot be installed correctly. If this is the case, loosen the nut while turning the holder pin in order to bring the installation angle as much close to 90° as possible.

- Bleed the brake system of air.
  (See “ON-VEHICLE INSPECTION AND ADJUSTMENT”.)



★• Expand the brake shoe towards the brake drum by turning the adjuster until it takes a reasonable force to insert a 0.2 mm {0.0079 in.} feeler gauge between the brake drum and lining and out.
★• Loosen the nut and turn the holder pin clockwise or counterclockwise until the feeler gauge can be inserted and out with a slight resistance.
- Repeat the above steps, shown with ★, until it takes a reasonable force to insert the feeler gauge between the brake drum and lining and out.
- Lightly press the brake pedal a couple of times to regain the even drum-to-lining clearance obtained earlier.
- Repeat the above steps, shown with ★, until it takes a reasonable force to insert the feeler gauge between the brake drum and lining and out.



- When it takes a reasonable force to insert the feeler gauge between the brake drum and lining and out, this is because the feeler gauge is in contact with the entire width of the brake shoe.
- Now, pull out the feeler gauge. Then, with the feeler gauge inserted again, turn the holder pin until it takes a substantial force to remove and insert the feeler gauge across the entire width of the brake shoe.
- Tighten the nut to the specified torque.

25 Parking brake control valve

A: Air pipe
B: Hose
C: To air horn
D: To air suspension seat

- The brake system is a full-air, all wheel brake type consisting of separate front and rear systems.
- Parking brake control valve is fitted as a safety mechanism. It provides normal braking action on the spring brake of rear brake chamber even if the rear brake system air line fails.
- An exhaust brake system, of the exhaust pipe opening and closing valve type, is fitted as a sub-brake system.

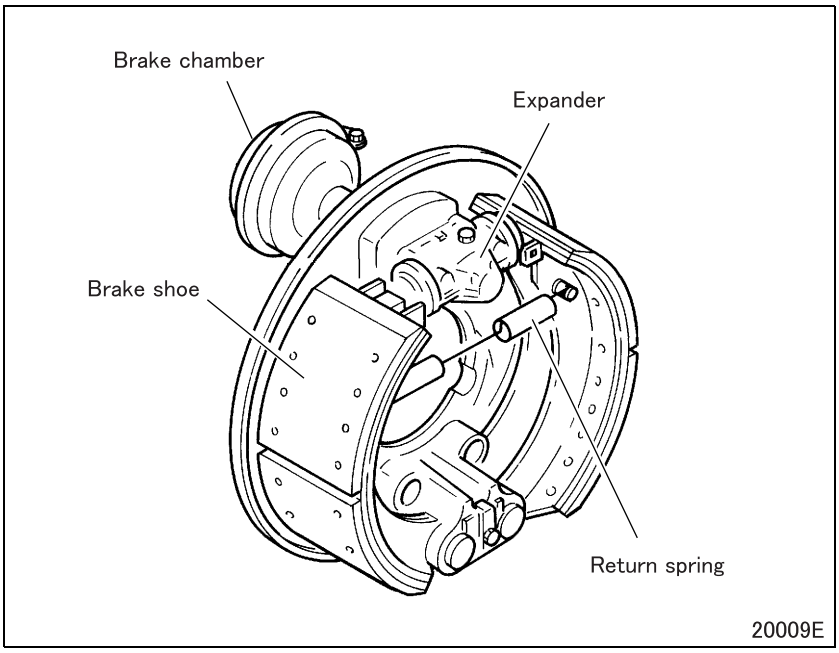
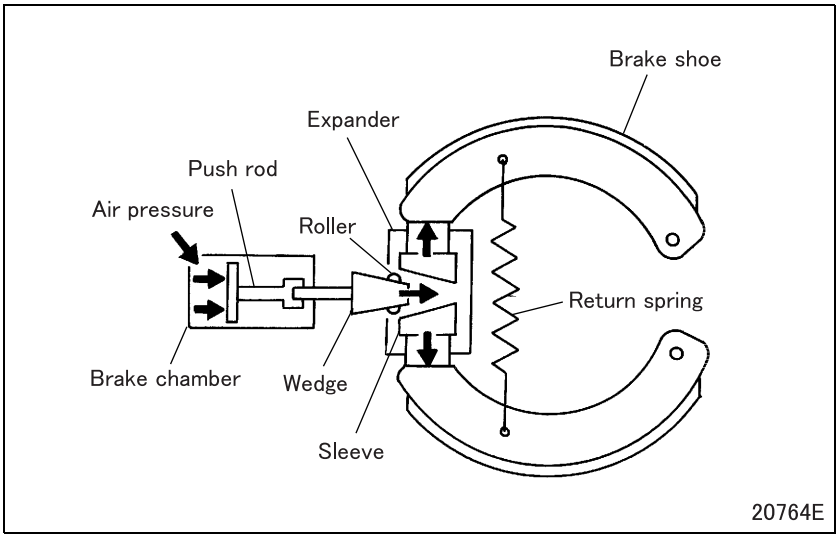
5. Front Drum Brake



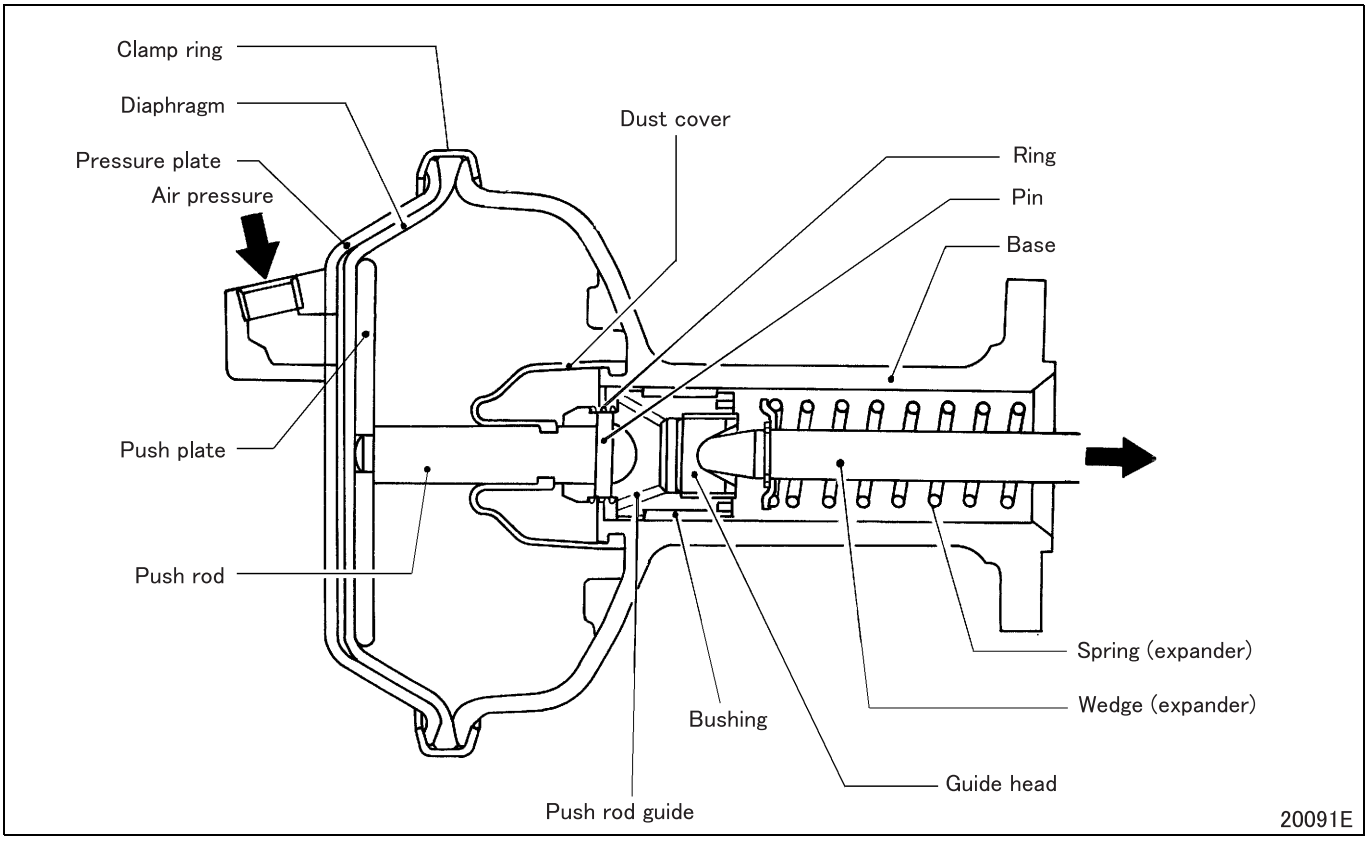
- The front drum brake is a leading-trailing shoe type brake.
- The double-acting expander ensures that, in both the forward- and rearward-travel braking, one of the brake shoes operates as a leading shoe which, through self-boosting effect, generates a great stopping power.

5.1 Wedge mechanism



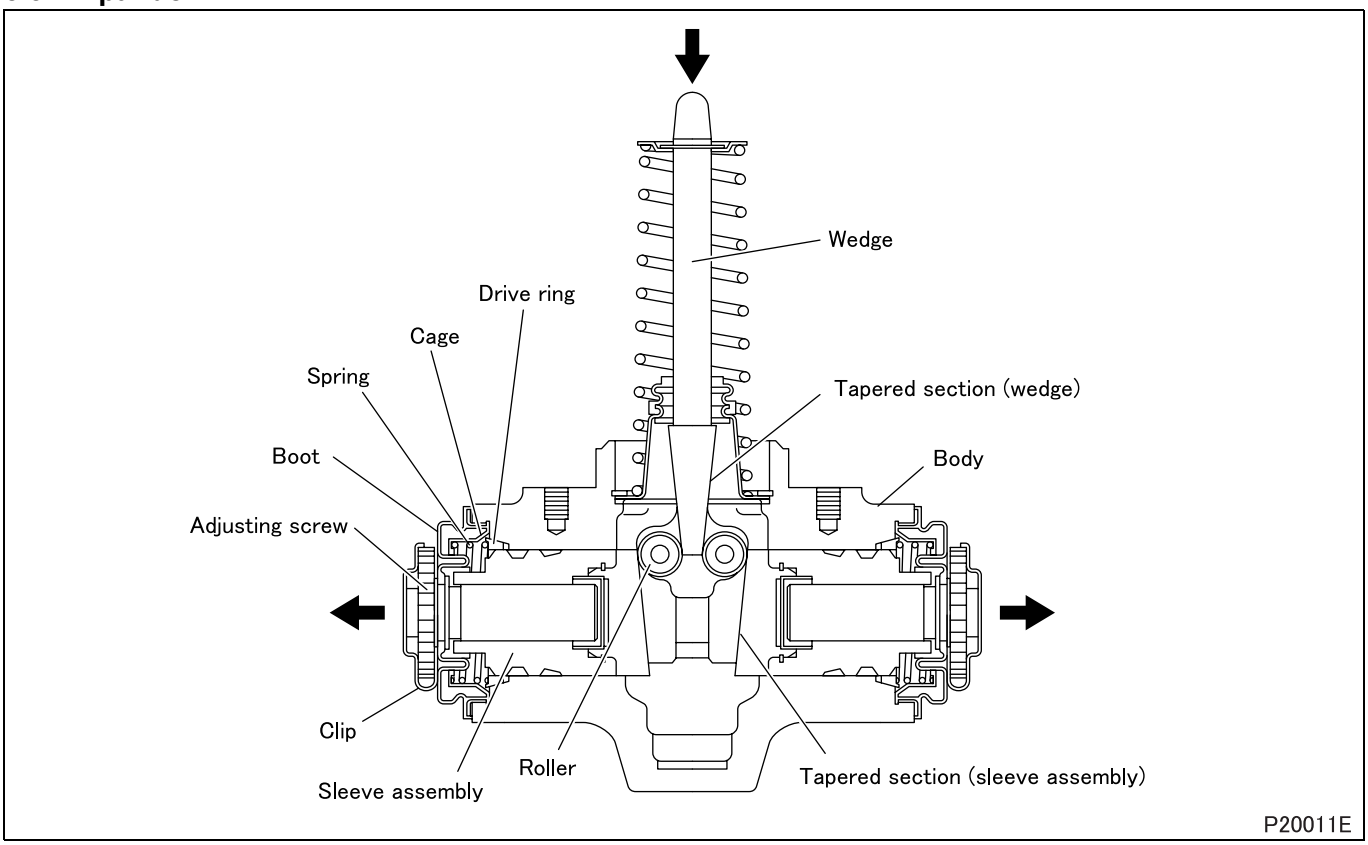
- When air pressure is applied to the brake chamber, the push rod is pushed into the wedge.
- This causes the wedge to push open the sleeves of the expander through rollers, expanding the brake shoes.

5.2 Brake chamber



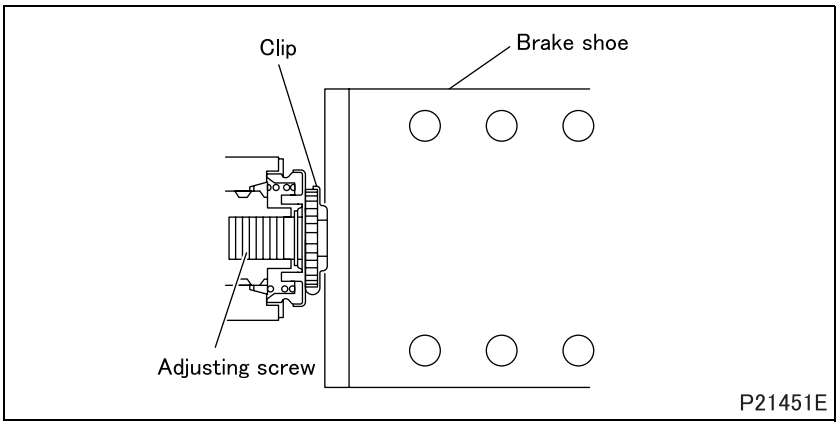
- When air pressure is applied to the brake chamber, the diaphragm moves to push the push rod which in turn pushes the wedge.
- When air pressure is released, the wedge and push rod are pushed back by the spring.

5.3 Expander

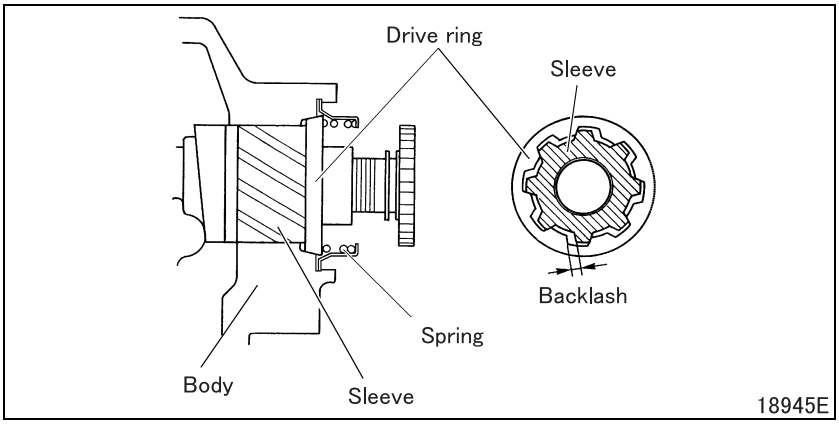


- When the wedge is pushed, its tapered section slides in between the rollers, pushing them open.
- The rollers roll along tapered section of the sleeve assemblies to push the sleeve assemblies and adjusting screws outward.
- The expander body incorporates an automatic adjuster mechanism which automatically adjusts the brake shoe-to-drum clearance.

(1) Automatic adjusting mechanism

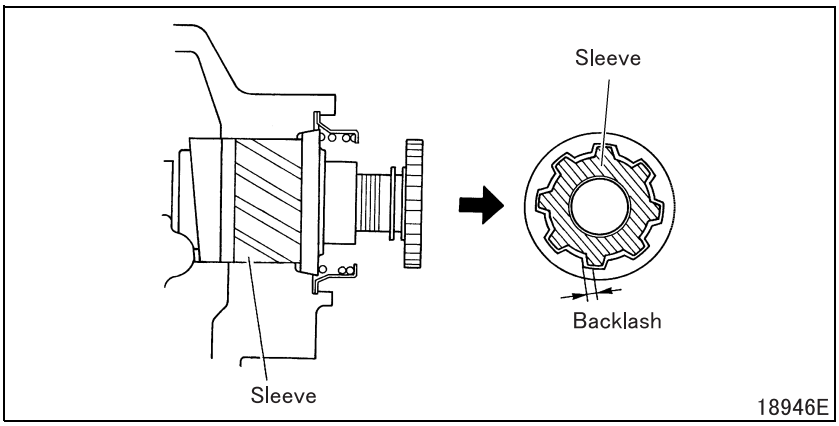


- The adjusting screw has its turning blocked by the clip.
- The clip has its turning blocked by the brake shoe.

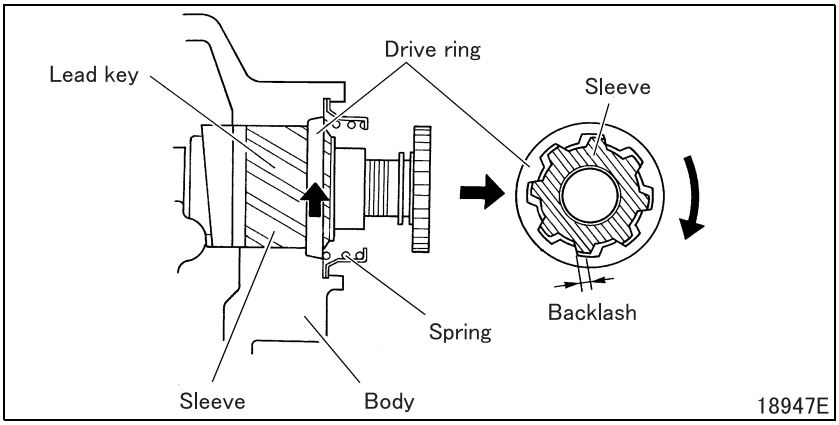


(1.1) In case that brake shoe clearance is specified value

- Before the brake is operated, the bottom of the sleeve assembly is in contact with the body.
- The drive ring is pushed against the body by the spring, being fixed in position.

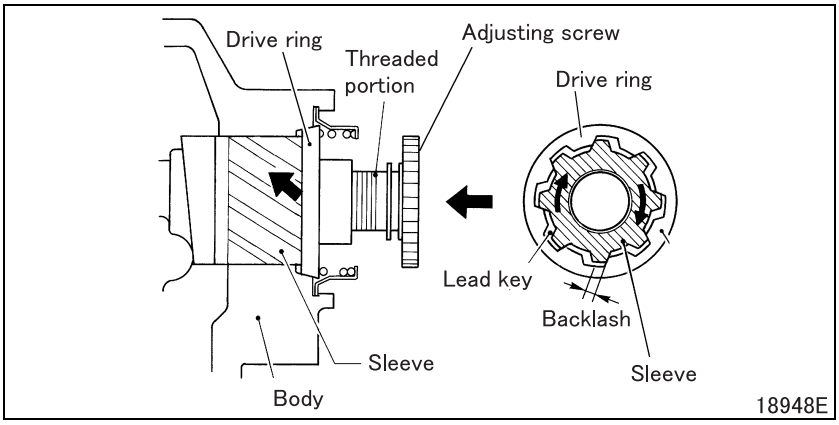


- When the brake is operated, the sleeve assembly moves within the range of backlash.



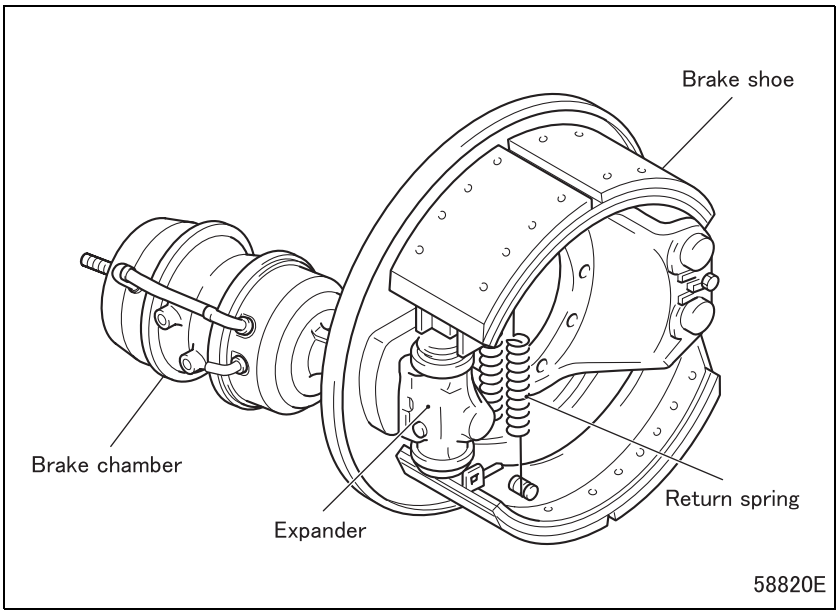
(1.2) In case that brake shoe clearance exceeds specified value

- When the brake is operated, the sleeve assembly moves beyond the range of backlash. Therefore, the drive ring is turned by the lead keys of the sleeve assembly since it is pushed by the spring.
- The drive ring is kept pressed against the body by the spring.



- When the brake is released, the sleeve assembly moves back until its bottom comes into contact with the body.
  At this time, the sleeve assembly moves without turning by the amount of backlash. After that point, the sleeve assembly is turned by the lead keys of drive ring. This causes adjusting screw to move out along threads, adjusting the brake shoe clearance to the specified value.

6. Rear Drum Brake

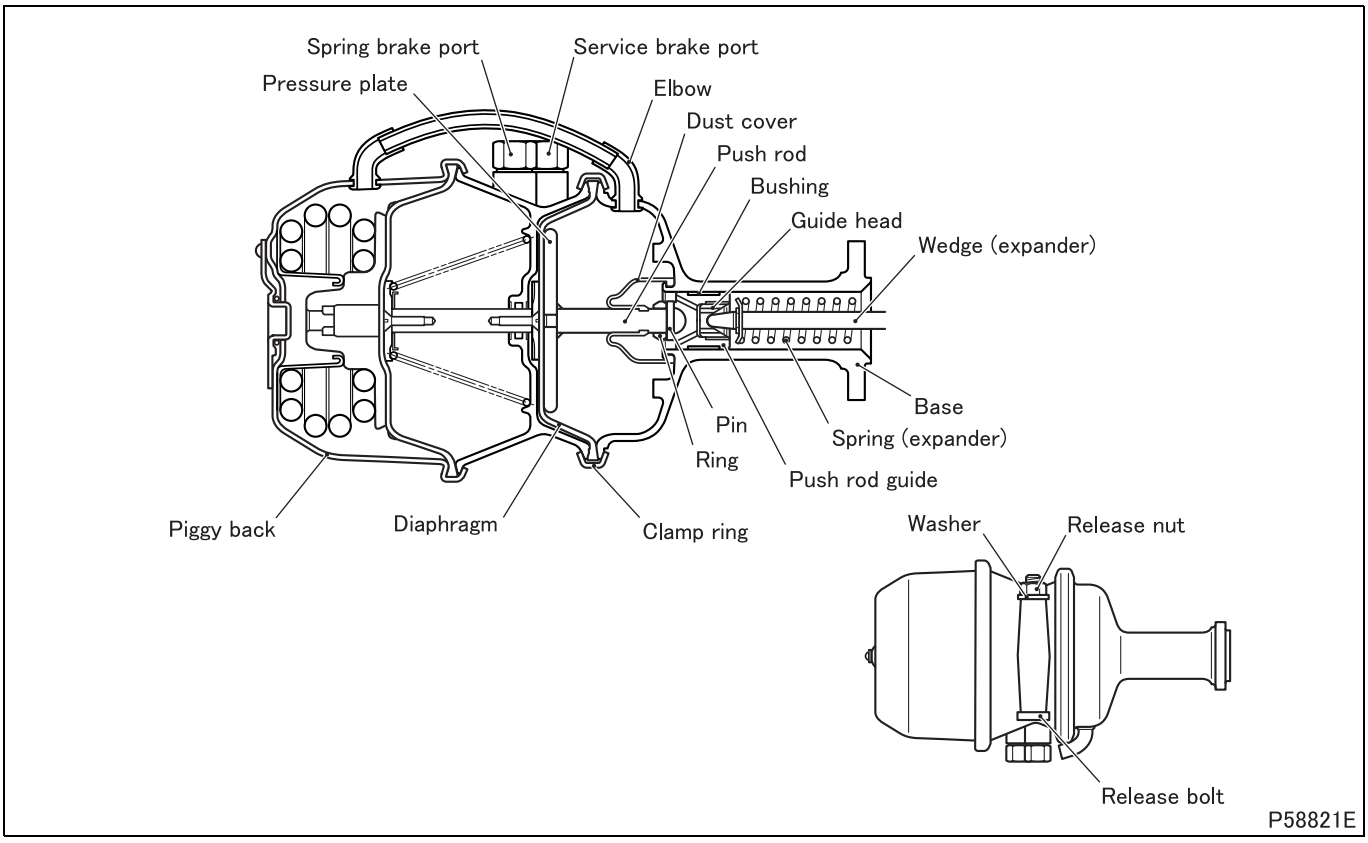


- The rear drum brake is a leading-trailing shoe type brake.
- The double-acting expander ensures that, in both the forward- and rearward-travel braking, one of the brake shoes operates as a leading shoe which, through self-boosting effect, generates a great stopping power.

6.1 Wedge mechanism

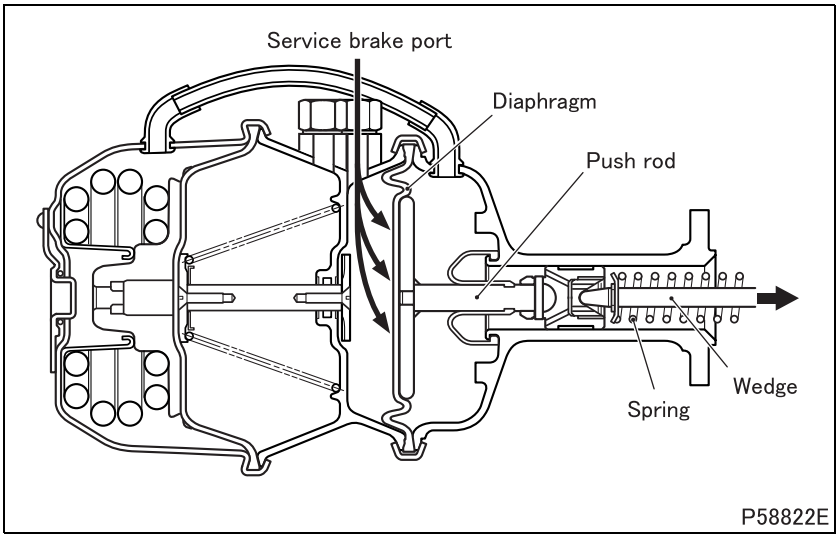
- The rear drum brake uses the same wedge mechanism that is used on the front drum brake.

6.2 Brake chamber



- The brake chamber offers a spring brake (wheel parking brake) function as well as service brake function.
- Washer, release nut and release bolt are used when releasing the spring brake mechanically.

(1) Automatic adjusting mechanism



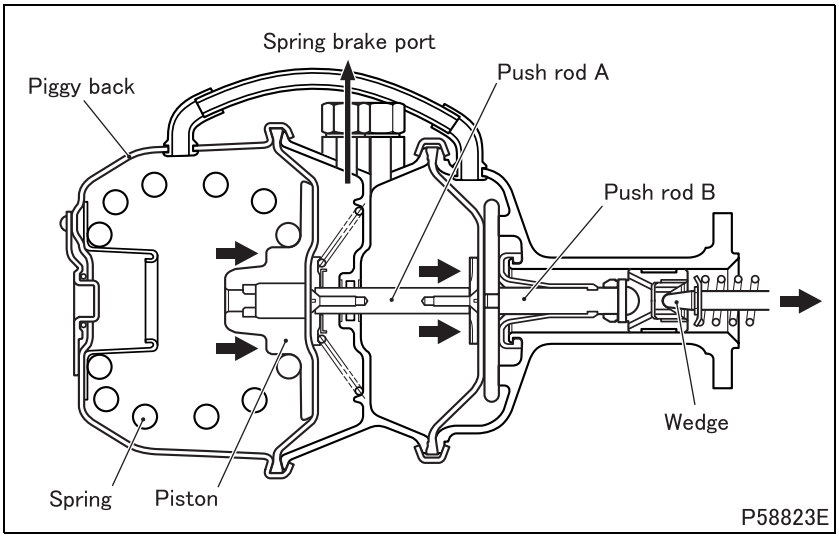
(1.1) When applied

- Air pressure introduced through the service brake port pushes the diaphragm which in turn pushes the push rod and wedge.

(1.2) When released

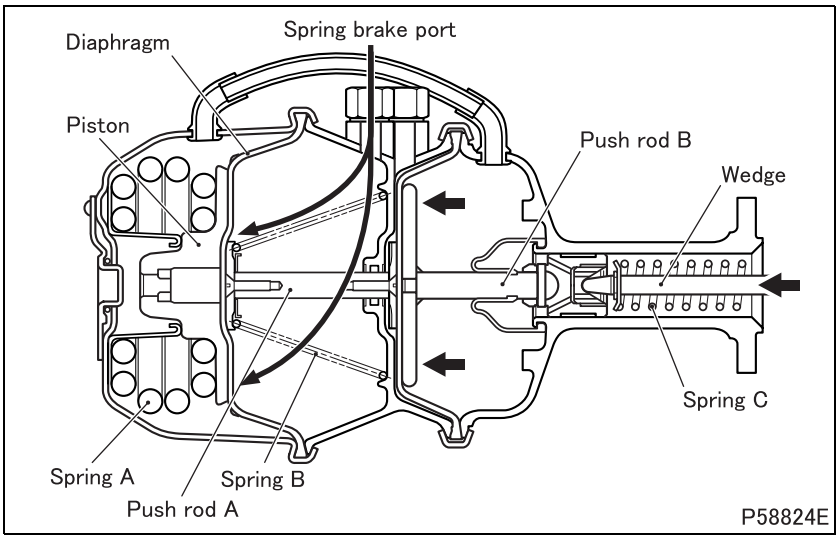
- Air pressure is discharged from the service brake port, which causes the wedge and push rod to be returned by the spring.

(2) Spring brake (wheel parking brake)



(2.1) When applied

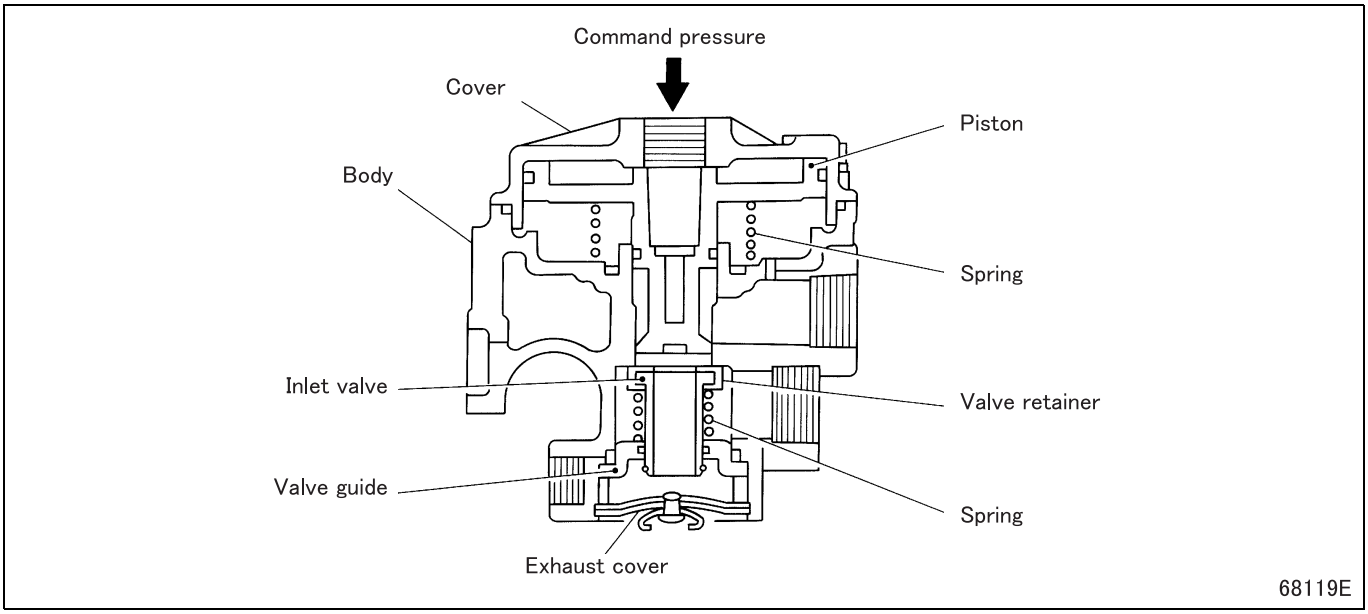
- Air pressure is discharged from the spring brake port, which causes the piston, push rods A, B and wedge to be pushed by the spring of piggy back.

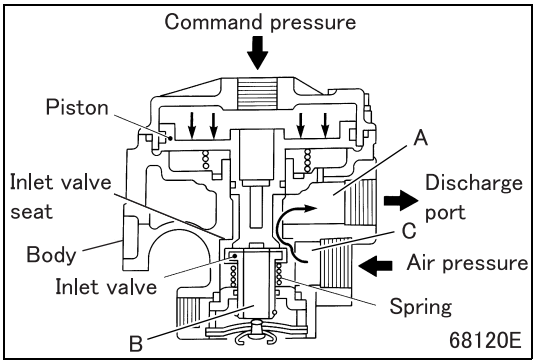


(2.2) When released

- Air pressure introduced through the spring brake port pushes back the piston through the diaphragm, compressing the spring.
- This causes push rod A to be pushed back by spring B.
- Wedge and push rod B are returned by spring C.

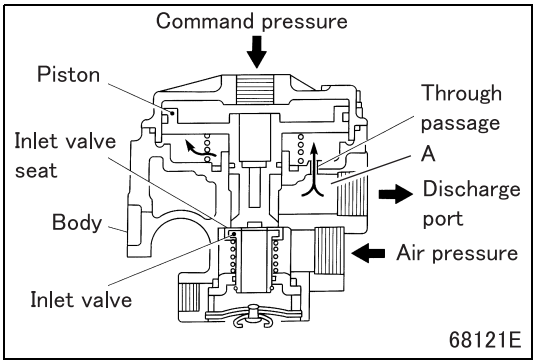
7. Relay Valve





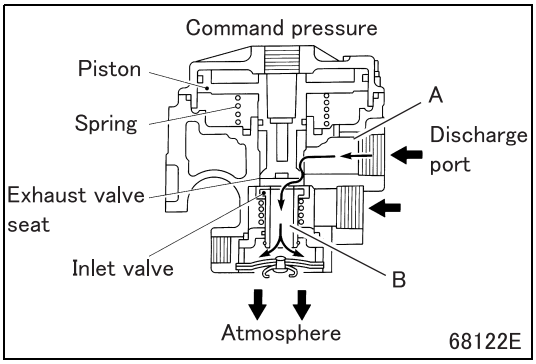
7.1 When brake pedal is depressed

- When command pressure comes in, piston moves downward to seat on inlet valve, closing exhaust passage chamber B. The inlet valve is then pushed down against spring, opening the gap between inlet valve seat of body and inlet valve. As a result, air pressure from the air tank flows from chamber C to chamber A, supplied to discharge port.



7.2 Stabilization of brake pressure

- When command pressure is maintained at a given level, the air pressure from discharge port is also stabilized. The air pressure in chamber A passes through passage to act on the bottom surface of piston, which pushes up the piston and inlet valve, each being held tightly up against each other. When the inlet valve touches inlet valve seat of body, it stops the supply of the air pressure from the air tank, stabilizing the brake air pressure at a given level.



7.3 Release of brake pressure

- When there is no command pressure, piston is pushed up by spring and the air pressure (pressure in chamber A) on the side of discharge port. This results in exhaust valve seat on the lower end of the piston leaving inlet valve. Air pressure on the discharge side is therefore discharged into atmosphere through exhaust passage chamber B.

M E M O

Wheel Brake

Symptoms / Possible causes		Wheel brake not effective				Brake drum over-heating				Reference Gr
		Air leaks when brake pedal is pressed down	Air leaks when brake pedal is free	Brake not quite effective though no air leakage	Low air pressure	Brake shoe return slow when brake pedal is released (brake drum drags)	Noise generated when brake pedal is pressed down	Wheel brake application one sided	Wheel brake works suddenly

	Rising of oil level in air compressor					O	

M E M O

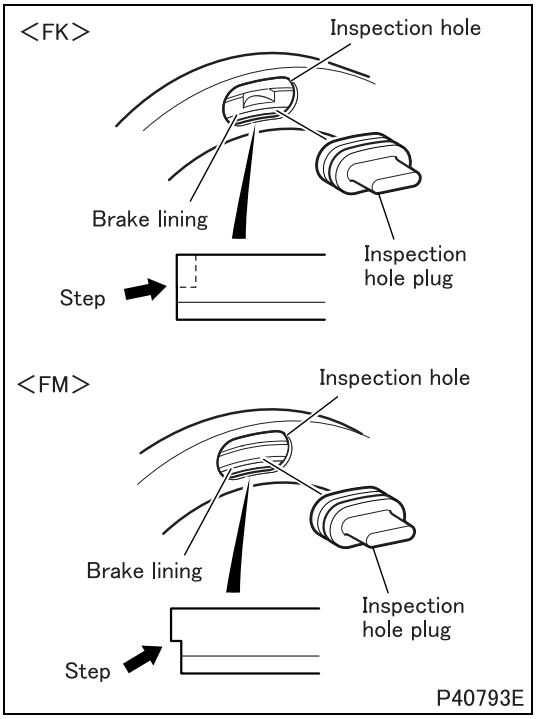
4. Inspection of Brake Lining Thickness

CAUTION ⚠

- **Be sure to inspect both shoes on each wheel to avoid malfunction of brakes.**

Service standards (Unit: mm {in.})

Location	Maintenance item		Standard value	Limit	Remedy
–	Brake lining thickness	FK	15 {0.59}	5 {0.20} (side step shows wear limit)	Replace
		FM	16 {0.63}	6 {0.24} (side step shows wear limit)	

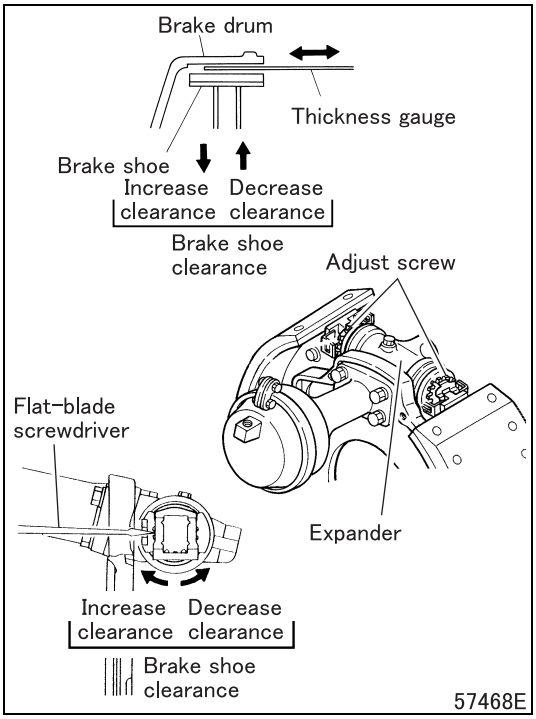


- Remove the inspection hole plug from the inspection hole in the dust cover. Through the inspection hole, measure the thickness of the brake lining.
- If any lining is worn down to the step on the side face, replace all linings on that axle.
- After the inspection, be sure to install the plug onto the inspection hole.

5. Initial Adjustment of Clearance between Brake Drum and Shoe

CAUTION ⚠

- **To ensure correct operation of the brakes, be sure to inspect both shoes on each wheel.**

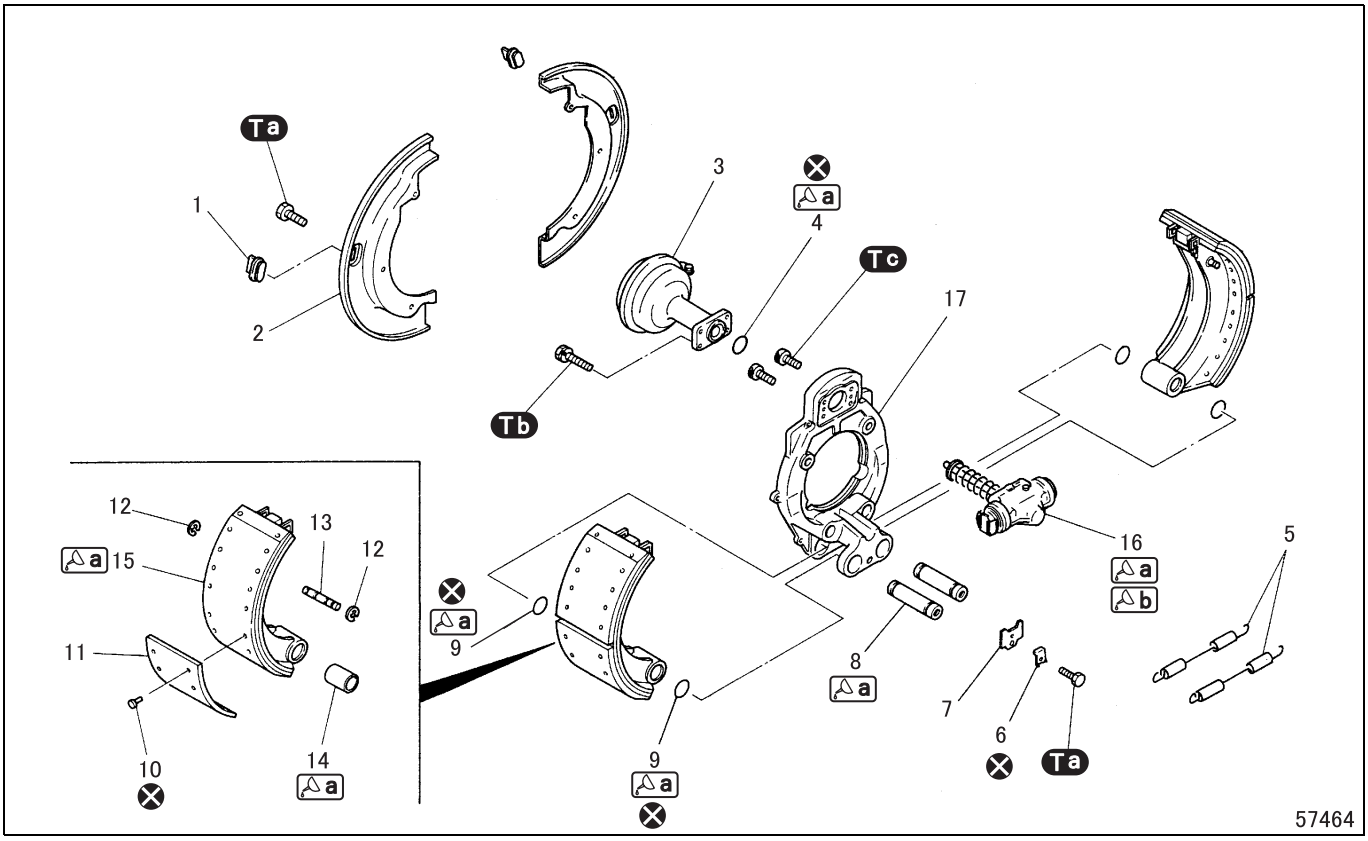


- Jack up front wheel, and make sure that hub bearings are not loose. If loose, adjust the hub bearings. (See Gr26B.)
- Remove the inspection hole plug from the dust cover.
- Through one of the inspection holes, insert a 0.3 to 0.5 mm {0.012 to 0.020 in.} thickness gauge between the brake lining and drum. Adjust the adjusting screw on the expander such that the gauge can be inserted and out with slight resistance. Repeat this through the other inspection hole.
- After adjustment, be sure to install the inspection hole plug.

CAUTION ⚠

- **When using a flat-blade screwdriver to turn the adjuster, take care not to damage the boots on the expander.**

FRONT WHEEL BRAKE



- For information on removal and installation of front drum brake, refer to Gr26B.

● Disassembly sequence

1 Inspection hole plug
2 Dust cover
3 Brake chamber (See later section.)
4 O-ring
5 Return spring
6 Lock washer
7 Lock plate
8 Anchor pin
9 O-ring
10 Rivet
11 Brake lining
12 Snap ring
13 Pin
14 Bushing
15 Brake shoe
16 Expander (See later section.)
17 Anchor bracket

⊗: Non-reusable parts

● Assembly sequence

Follow the disassembly sequence in reverse.

Repair kit: Brake lining kit

WARNING ⚠

- **To prevent poor working of the brake, do not smear the surface of the brake lining with grease or oil.**

Service standards (Unit: mm {in.})

Location	Maintenance item		Standard value	Limit	Remedy
5	Return spring load (installed length 252 {9.92} <FK>, 258 {10.2} <FM>)		292 ± 29 {66 ± 6.5 lbf, 29.8 ± 3.0 kgf}	Clearance between coils or coil and cover	Replace
8, 14	Clearance between anchor pin and bushing		0.05 to 0.14 {0.0020 to 0.0055}	0.3 {0.012}	Replace
11	Brake lining thickness	FK	15 {0.59}	5 {0.20} (side step shows wear limit)	Replace
		FM	16 {0.63}	6 {0.24} (side step shows wear limit)	

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Bolt (dust cover mounting)	20 ± 3.9 {15 ± 2.9, 2 ± 0.4}	–
	Bolt (lock plate mounting)		
Tb	Bolt (brake chamber assembly mounting)	50 ± 7.5 {37 ± 5.1, 5.1 ± 0.7}	–
Tc	Screw (expander mounting)	19 ± 4.9 {14 ± 3.6, 1.9 ± 0.5}	–

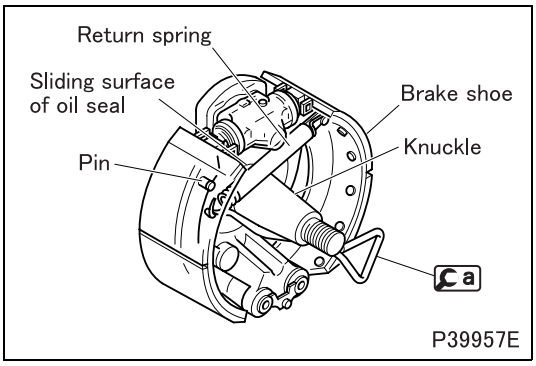
Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Anchor pin grease groove	Wheel bearing grease [NLGI No. 2 (Li soap)]	As required
	O-ring		
	Contact surface of brake shoe assembly and expander		
	Inner surface of bushing		
	Wedge pointed end of expander		
b	Section of expander into which wedge is inserted	Shell Darina Grease 2 [NLGI No. 2 (Non soap)]	10 g {0.35 oz}

Special tools (Unit: mm {in.})

Mark	Tool name and shape	Part No.	Application
ca	Return spring setter A: 500 {20}  01610	MC809749	Removal and installation of return spring
cb	Anchor pin puller  01611 A: ϕ60 {2.36}, B: M16 × 1.5, C: 173 {6.81}	03727-60000	Removal of anchor pin

◆Removal procedure◆



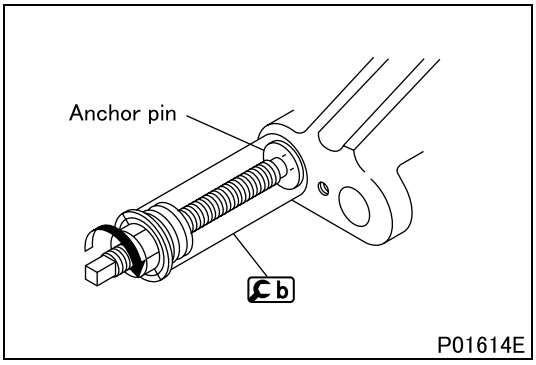
P39957E

■ **Removal: Return spring**

- Fit ca into the hooked part at one end of the return spring and use it to pry the return spring free.

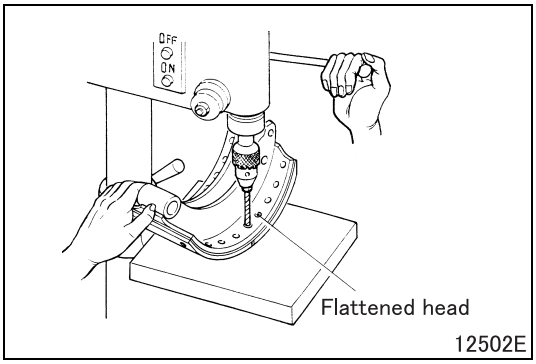
CAUTION ⚠

- **Do not hook ca onto the oil seal sliding portion of the knuckle.**



P01614E

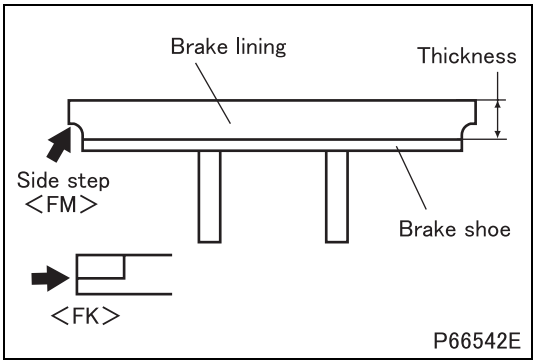
■ **Removal: Anchor pin**



■ **Removal: Brake lining**

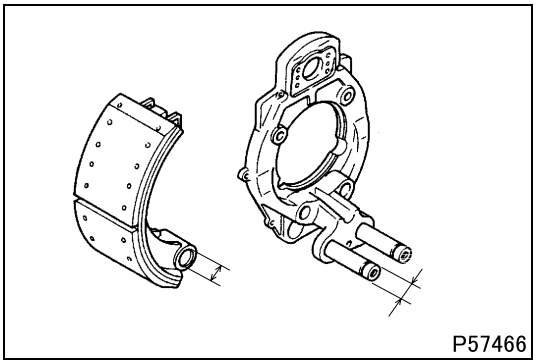
- Using a drilling machine, break the flattened rivet heads on the brake shoe side to release the brake lining.

◆Inspection procedure◆



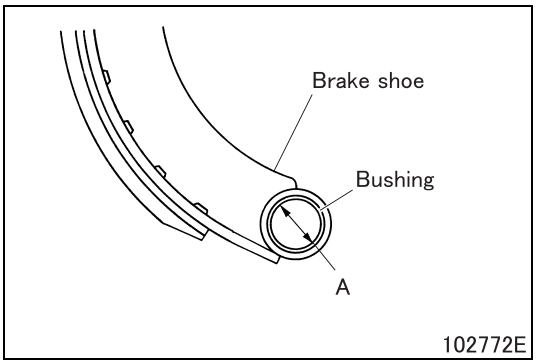
■ **Inspection: Brake lining thickness**

- If the brake lining is worn down to the side step, replace all brake linings on that axle.



■ **Inspection: Clearance between anchor pin and bushing**

- If the measurement exceeds the limit, replace the bushing.

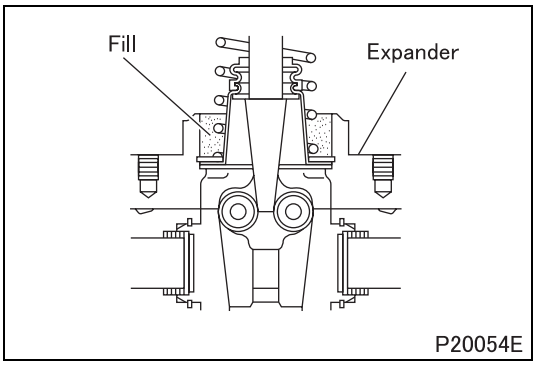


[Installation]

- With the bushing installed in the brake shoe, measure the inner diameter of the bushing.
- If the measured value is out of the dimension A shown below, ream the bushing.

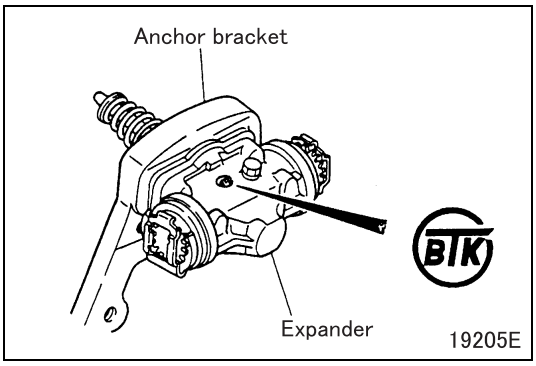
  A: $30^{+0.05}_{0}$ mm {$1.18^{+0.002}_{0}$ in.} <FK>
  $35^{+0.05}_{0}$ mm {$1.38^{+0.002}_{0}$ in.} <FM>

◆Installation procedure◆

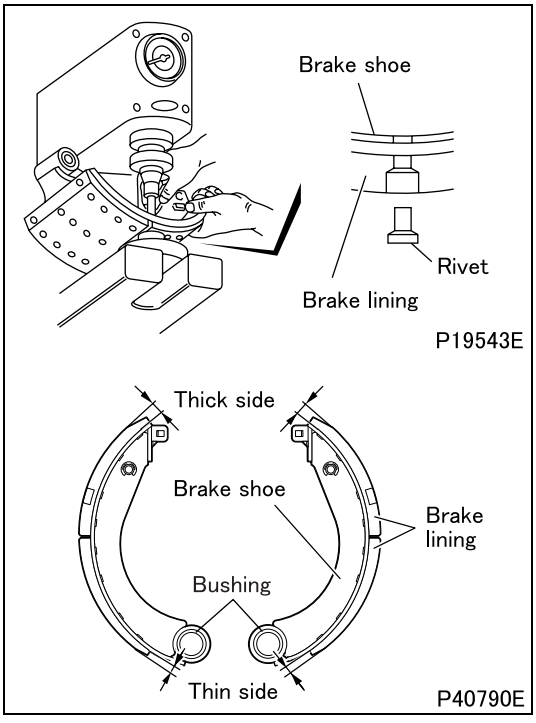


■ **Installation: Expander**

- Fill the expander with the specified quantity of grease as shown in the illustration.



- Mount the expander to the anchor bracket in the direction shown.



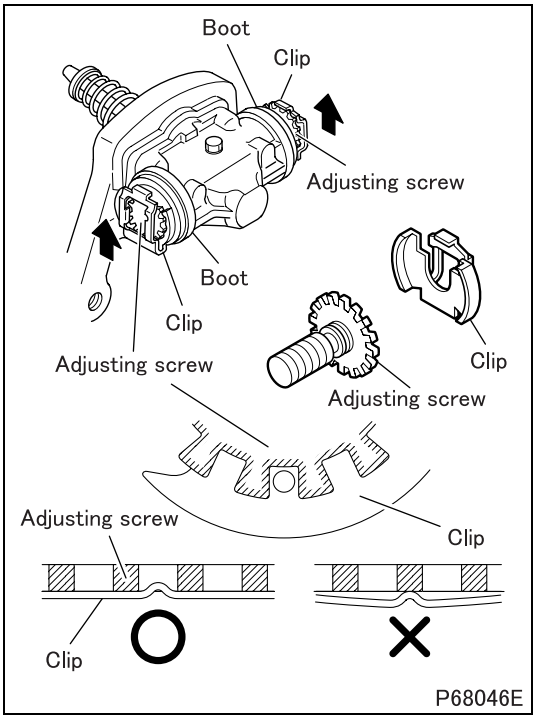
■ **Installation: Brake lining**

- Using cleaning fluid, clean the brake shoe surface to which the brake lining is to be mounted. Then, dry the shoe surface.
- Mount the brake lining on the brake shoe with the thin side of the brake lining pointing the bushing for the brake shoe.
- Insert rivets from the brake lining to the shoe. Stake them, starting from the center of the shoe towards the ends.
- The staking load for the rivets should be 19.6 ± 0.98 kN {4410 ± 220 lbs, 2000 ± 100 kgf}.

CAUTION ⚠

- **New replacement brake linings that are to be installed on the same axle should all be in the same size and have the same identification mark. Otherwise, braking performance can be different between the left and right wheels.**
- **The brake lining has a tapered end. If a lining is installed with its end pointing in the incorrect direction, poor braking performance or braking noise can be caused. <FK>**

- After assembly, check the brake drum-to-lining clearance. Correct as required.



■ **Installation: Brake shoe**

- Turn adjusting screw of expander assembly fully clockwise by hand.
  (Return of a screwing portion of adjusting screw)
- Confirm whether the open part of clip is in the drum side; if it is not in the drum side, turn adjusting screw further clockwise to match the position. (This rotation is due to the rotation sleeve assembly)

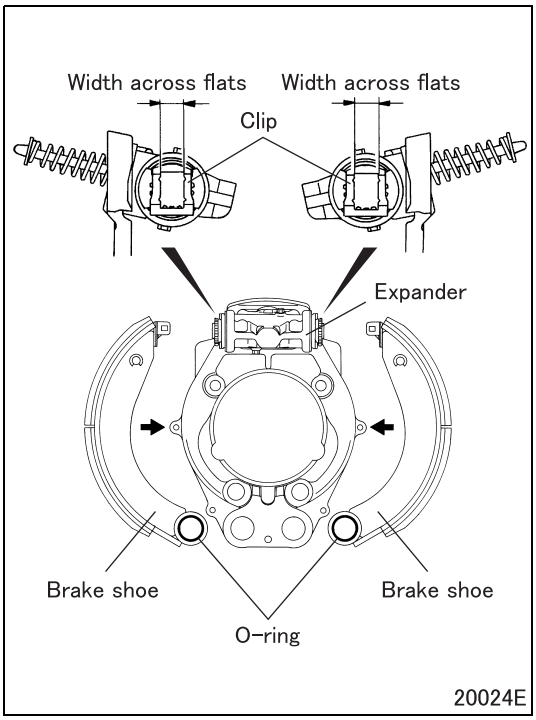
WARNING ⚠

- **Be sure to apply grease appropriately on the contact part of adjusting screw in boot; otherwise auto adjuster may be caused the malfunctioning due to breakage of boot.**

CAUTION ⚠

- **Turn is slowly so that boot may not be jammed.**
- **Be sure to keep the convex part of clip between teeth of adjusting screw (2 points).**

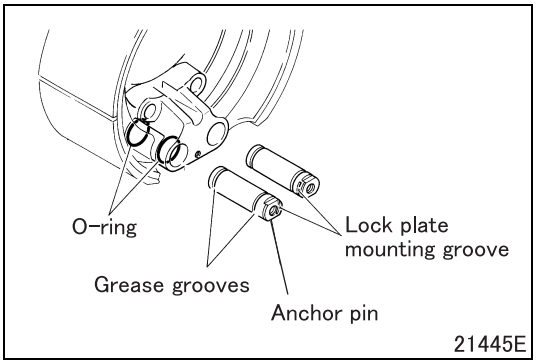
- Take care whether clip is misaligned, and return adjusting screw anticlockwise by two revolutions. (Only if the lining is replaced.)



- Install brake shoes such that their end may accurately fall within the width across flats of clip.

CAUTION ⚠

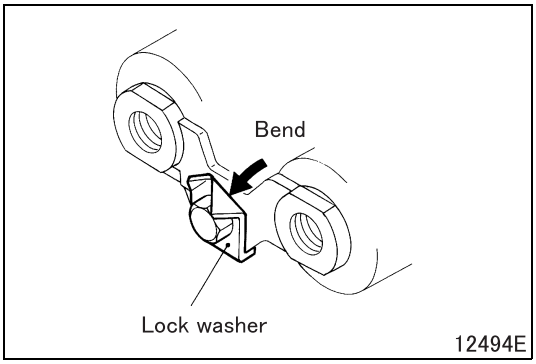
- **When installing brake shoes, be careful not to damage clips and O-rings.**



- Apply grease in grease grooves of the anchor pins.
- Install anchor pins in the illustrated direction.

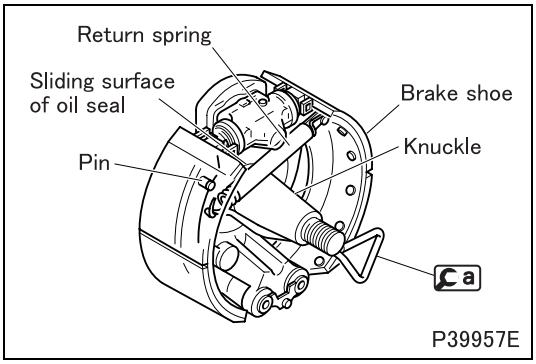
CAUTION ⚠

- **Use care not to install anchor pins in the wrong direction. Otherwise, damaged O-rings will result.**



■ Installation: Lock washer

- After tightening the lock plate bolt to the specified torque, stake the lock washer at one location.



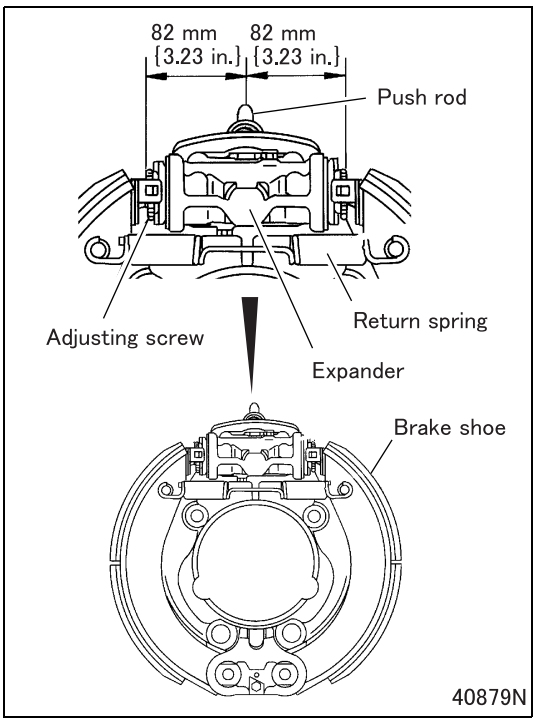
■ Installation: Return spring

- Fit the hooked part at one end of the return spring onto the pin in one of the brake shoe.
- Fit the hooked part at the other end of the return spring onto a and use a to fit it onto the pin in the other brake shoe assembly.

CAUTION ⚠

- **Do not hook a onto the oil seal sliding portion of the knuckle.**

◆Inspection after installation◆

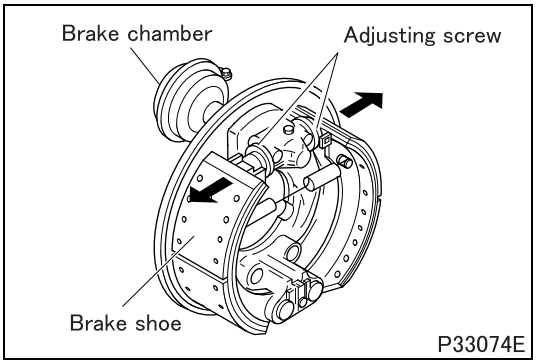


■ **Inspection: Check of operation**

- Ensure that the installed dimension of 82 mm {3.23 in.} is satisfied on the expander. If not, disassemble the expander and reinstall the adjusting screw(s). (See later section.)
- Reinstall the expander and brake shoes.
- Expand the brake shoes by pushing the push rod over its full stroke.
- Return the push rod to its original position and check whether the expander returns to the required dimension of 82 mm {3.23 in.}.
- If the results are unsatisfactory, check the force of the brake springs and the degree of stiffness in the brake shoes. Also inspect the expander again.

WARNING ⚠

- **Unless the check of operation after assembly is performed thoroughly, the automatic adjustment mechanism may not operate normally.**



- If the brake chamber was disassembled, perform the following checks:
  - Pull the brake shoes with a force of 20 to 30 N {4.4 to 6.6 lbs, 2 to 3 kgf} and make sure that the brake shoes do not move together with the adjusting screws of the expander.

  - If the brake shoes move, the push rod and pressure plate in the brake chamber are not fitted squarely. With the brake drum not fitted, press the brake pedal two or three times to position the push rod and pressure plate correctly.

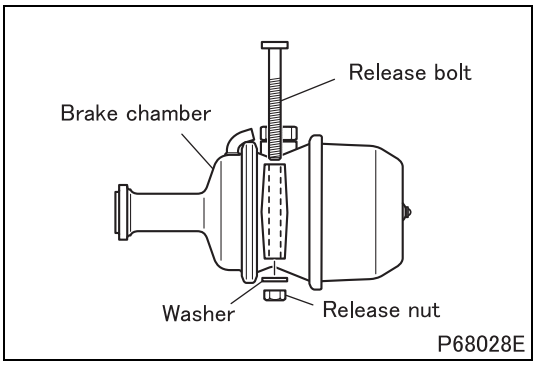
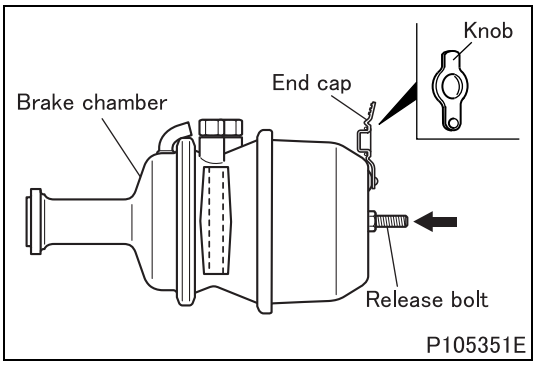
◆Work before removal◆



P68028E

■ Mechanical release of parking brake

- Release spring brake mechanically.
- Remove the release bolt, washer and release nut from the brake chamber.



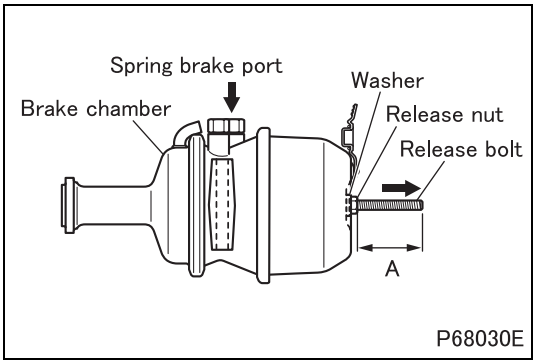
P105351E

- Remove the end cap without failling to pull up its knob by hand or using a plier or other tools.

CAUTION ⚠

- **Never remove the end cap by inserting a screwdriver or other tools into the brake chamber and prying it to open the chamber. Failure to observe the above can cause the brake chamber to be damaged, allowing water to intrude into the brake chamber. The water can cause rust on spring, leading to breakage in the spring.**

- Insert the release bolt deep into the chamber and turn it a quarter turn.
- Pull the release bolt to check that it does not come off the chamber.
- If the release bolt is pulled off, repeat the above procedure; insert the bolt deep into the chamber and turn it a quarter turn again.

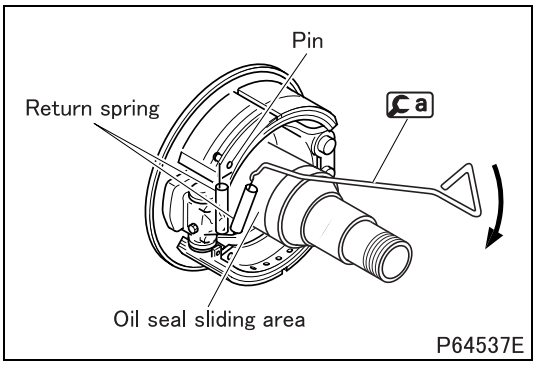


- Attach the washer and the release nut.
- While applying an air pressure of 640 kPa {92 psi, 6.5 kgf/cm^2} into the spring brake port (by setting the hand control valve to the released position), turn the release nut until the threaded portion of the release bolt extends by the dimension A shown below.
  A: 82 mm {3.23 in.} <FK>
  76 mm {2.99 in.} <FM>

CAUTION ⚠

- **Avoid turning the release nut with a torque exceeding 68.6 N·m {51 ft.lbs, 7 kgf·m}. It can damage the brake chamber assembly.**

◆Removal procedure◆

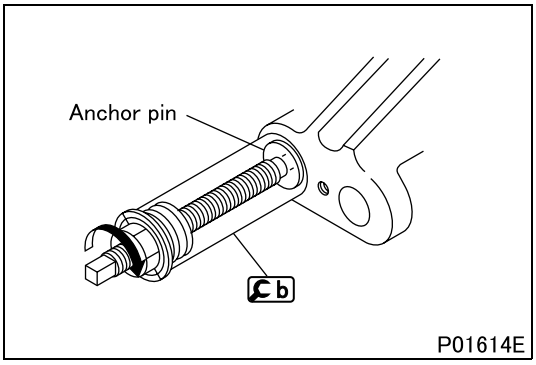


■ Removal: Return spring

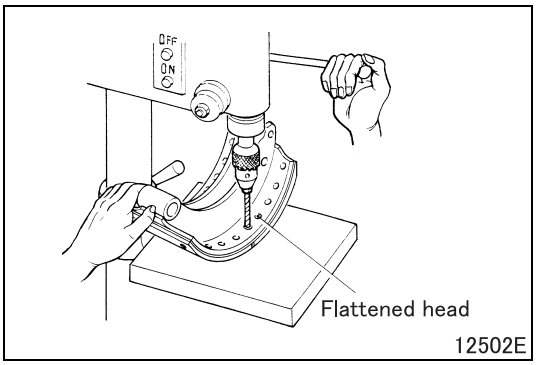
- Fit a into the hooked part at one end of the return spring and use it to pry the return spring free.

CAUTION ⚠

- **Do not hook a onto the oil seal sliding portion of the knuckle.**



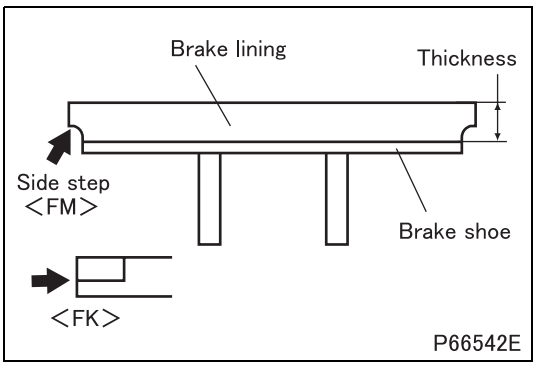
■ Removal: Anchor pin



■ Removal: Brake lining

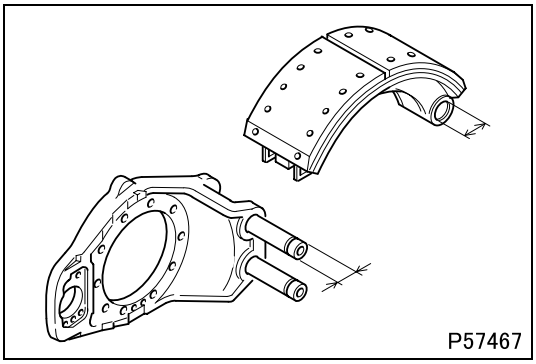
- Using a drilling machine, break the flattened rivet heads on the brake shoe side to release the brake lining.

◆Inspection procedure◆



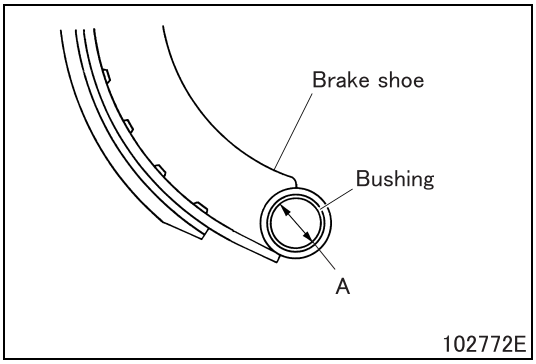
■ **Inspection: Brake lining thickness**

- If the brake lining is worn down to the side step, replace all brake linings on that axle.



■ **Inspection: Clearance between anchor pin and bushing**

- If the measurement exceeds the limit, replace the bushing.

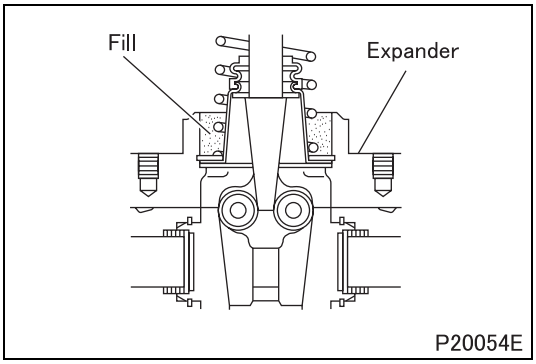


[Installation]

- With the bushing installed in the brake shoe, measure the inner diameter of the bushing.
- If the measured value is out of the dimension A shown below, ream the bushing.

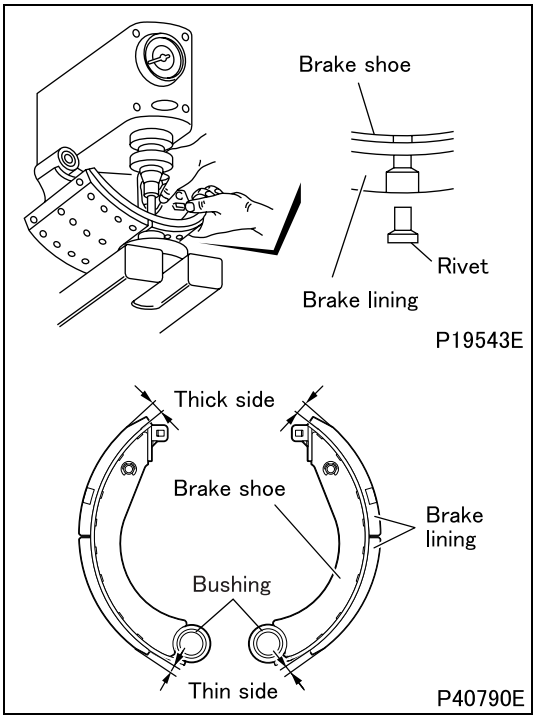
  A: $30^{+0.05}_{0}$ mm {$1.18^{+0.002}_{0}$ in.} <FK>
  $35^{+0.05}_{0}$ mm {$1.38^{+0.002}_{0}$ in.} <FM>

◆Installation procedure◆



■ **Installation: Expander**

- Fill the expander with the specified quantity of grease as shown in the illustration.



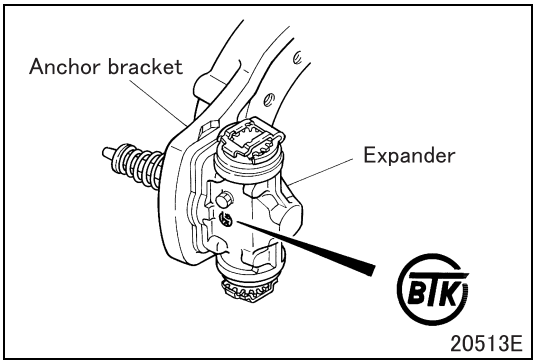
■ **Installation: Brake lining**

- Using cleaning fluid, clean the brake shoe surface to which the brake lining is to be mounted. Then, dry the shoe surface.
- Mount the brake lining on the brake shoe with the thin side of the brake lining pointing the bushing for the brake shoe.
- Insert rivets from the brake lining to the shoe. Stake them, starting from the center of the shoe towards the ends.
- The staking load for the rivets should be 19.6 ± 0.98 kN {4410 ± 220 lbs, 2000 ± 100 kgf}.

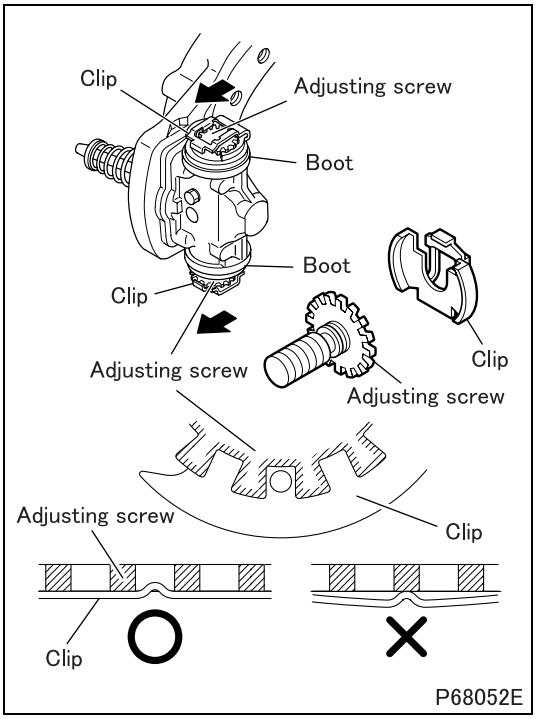
CAUTION ⚠

- **New replacement brake linings that are to be installed on the same axle should all be in the same size and have the same identification mark. Otherwise, braking performance can be different between the left and right wheels.**
- **The brake lining has a tapered end. If a lining is installed with its end pointing in the incorrect direction, poor braking performance or braking noise will be caused. <FK>**

- After assembly, check the brake drum-to-lining clearance. Correct as required.



- Install the expander to the anchor bracket facing in the illustrated direction.



■ **Installation: Brake shoe**

- Turn adjusting screw of expander assembly fully clockwise by hand.
- Install clip with the open side facing the drum. Turn adjusting screw further clockwise to match the position if alignment is incorrect.

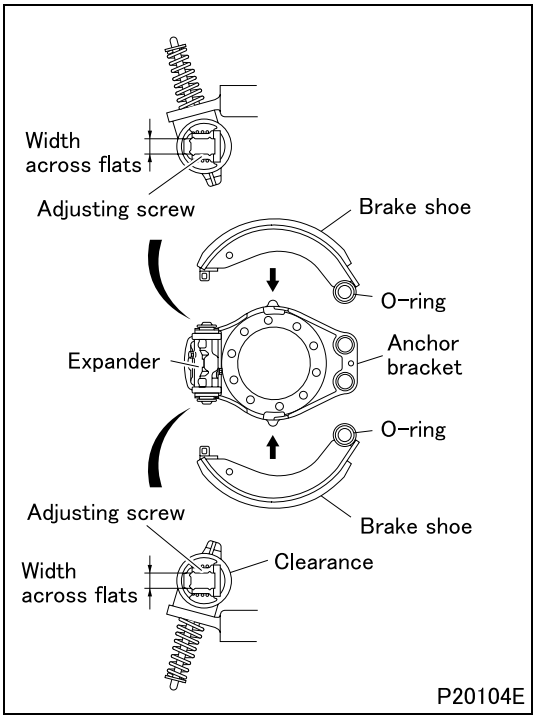
WARNING ⚠

- **Be sure to apply grease as required on the contact part of adjusting screw in boot; otherwise the auto adjuster may malfunction due to breakage of boot.**

CAUTION ⚠

- **Turn it slowly so that boot is not jammed.**
- **Be sure to keep the convex part of clip between teeth of adjusting screw (2 points).**

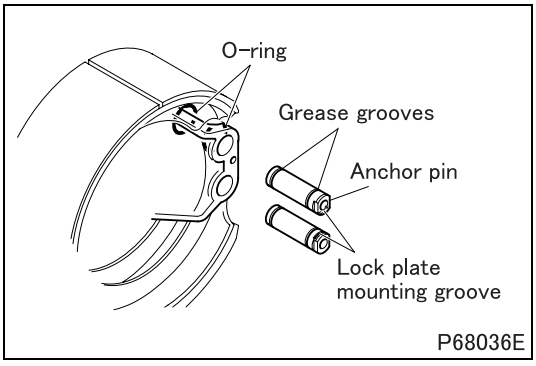
- If clip is misaligned, rotate adjusting screw counterclockwise by two revolutions so center of clip.



- Install brake shoes such that their end may accurately fall within the width across flats of clip.

CAUTION ⚠

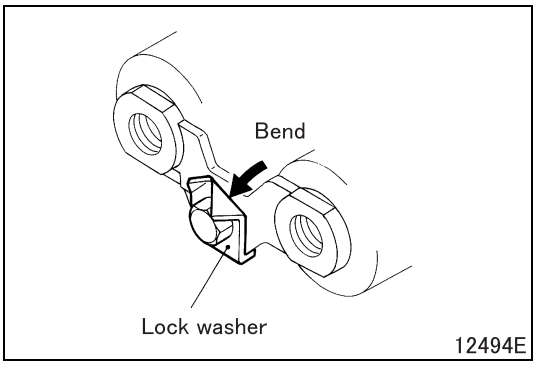
- **When installing brake shoes, be careful not to damage clips and O-rings.**



- Apply grease in grease grooves of the anchor pins.
- Install anchor pins in the illustrated direction.

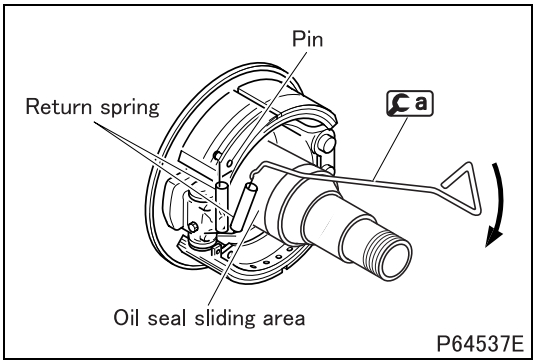
CAUTION ⚠

- **Take care not to install anchor pins in the wrong direction. Otherwise, damaged O-rings will result.**



■ Installation: Lock washer

- After tightening the lock plate bolt to the specified torque, stake the lock washer at one location.



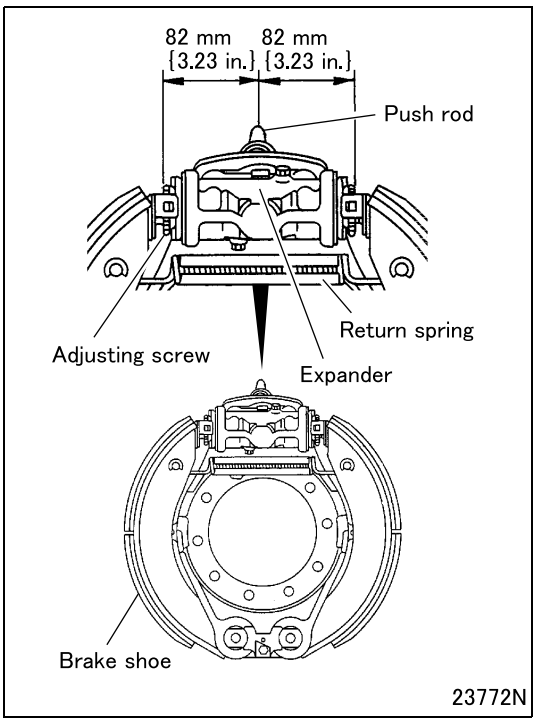
■ Installation: Return spring

- Fit the hooked part at one end of the return spring onto the pin in one of the brake shoe.
- Fit the hooked part at the other end of the return spring onto [a] and use [a] to fit it onto the pin in the other brake shoe assembly.

CAUTION ⚠

- **Do not hook [a] onto the oil seal sliding portion of the knuckle.**

◆Work after installation◆

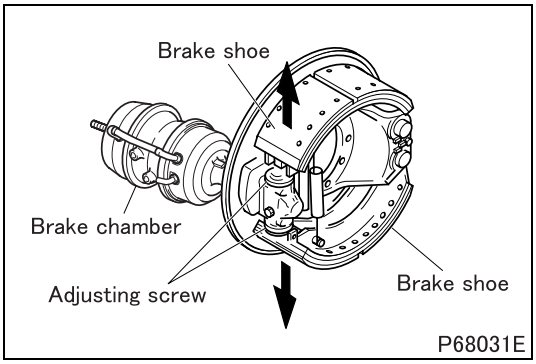


■ **Inspection: Check of operation**

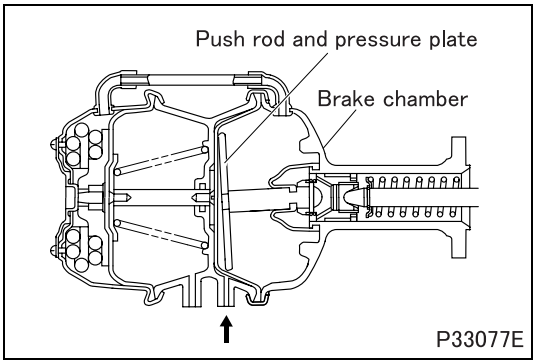
- Ensure that the installed dimension of 82 mm {3.23 in.} is satisfied on the expander. If not, disassemble the expander and reinstall the adjusting screw(s). (See later section.)
- Reinstall the expander and brake shoes.
- Expand the brake shoes by pushing the push rod over its full stroke.
- Return the push rod to its original position and check whether the expander returns to the required dimension of 82 mm {3.23 in.}.
- If the results are unsatisfactory, check the force of the brake springs and the degree of stiffness in the brake shoes. Also inspect the expander again.

WARNING ⚠

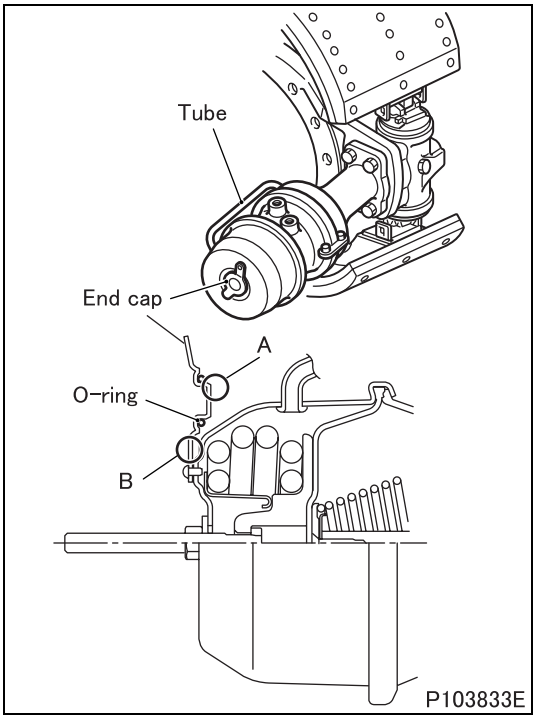
- **Unless the check of operation after assembly is performed thoroughly, the automatic adjustment mechanism may not operate normally.**



- If the brake chamber was disassembled, perform the following checks:
- Pull the brake shoes with a force of 20 to 30 N {4.4 to 6.6 lbs, 2 to 3 kgf} and make sure that the brake shoes do not move together with the adjusting screws of the expander.



- If the brake shoes move, the push rod and pressure plate in the brake chamber are not fitted squarely. With the brake drum not fitted, press the brake pedal two or three times to position the push rod and pressure plate correctly.



■ **Cancellation of mechanical release of parking brake**

- To cancel the mechanical release of parking brake, perform the mechanical release procedure in reverse while confirming the following items.
  (See "■ **Mechanical release of parking brake**".)
- Clean the end cap mounting position and confirm that there is no water or dust in that position.
- Confirm that an O-ring is attached to the end cap.
- Using a ϕ15 mm or thinner rod with a dull end such as a release bolt, push in the concave section at the center of the end cap squarely into the piggy back. A click is heard when the section A is securely seated into the piggy back.
- When seating the end cap, be careful not to bend or twist the section B.
- Confirm that there is no damage on the tube and the tube is installed securely.

M E M O

REAR WHEEL BRAKE

Brake Chamber Assembly

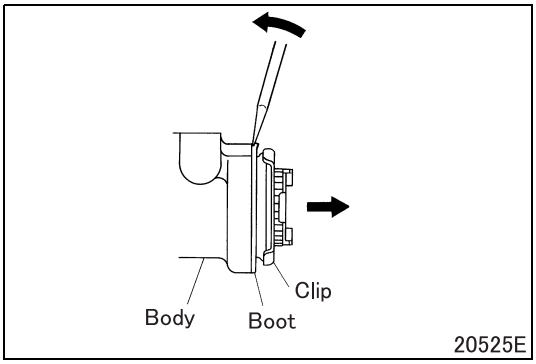
Mark	Tool name and shape	Part No.	Application
a	Clip adapter  19111 <table><tr><th>A</th><th>B</th><th>C</th></tr><tr><td>18 {0.71}</td><td>20 {0.79}</td><td>40 {1.57}</td></tr></table>	MC889860	Measurement of clip holding torque and sleeve rotation torque
b	Boot setter  19000	MC889862	Installation of boot
c	Spring holder  18999	MC889861	Removal and installation of spring

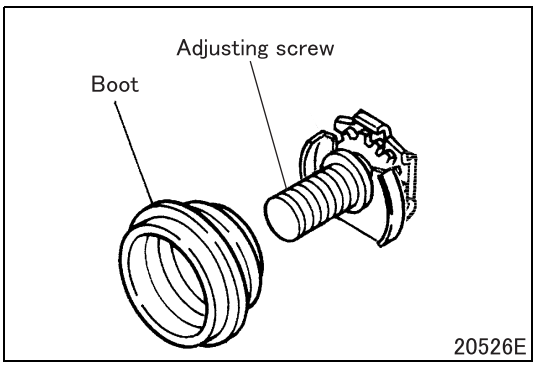
◆Removal procedure◆



20525E

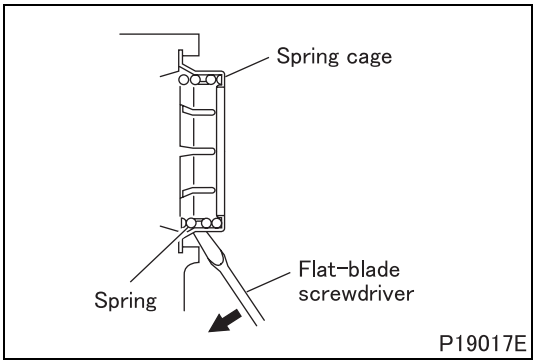
■ **Removal: Adjusting screw and boot**

- Using a flat-blade screwdriver, break the connection between boot and body.
- Turn adjusting screw assembly counterclockwise to remove the adjusting screw assembly together with boot.



20526E

- Remove boot from adjusting screw assembly.

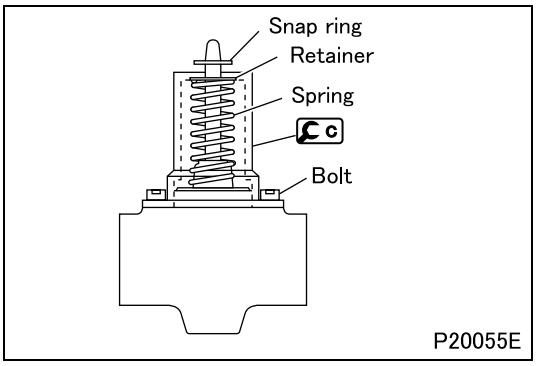


■ **Removal: Spring cage**

- Remove spring cage while holding it with fingers so as to prevent spring from springing out.

WARNING ⚠

- **Be careful of spring springing out.**



■ **Removal: Spring**

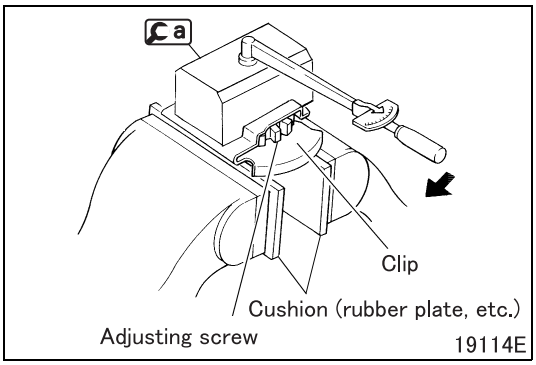
- Secure c with bolts to compress the spring.
- Remove snap ring.
- Remove bolts and c.

WARNING ⚠

- **When removing bolts, be careful of spring springing out.**

- Remove retainer and spring.

◆Inspection procedure◆



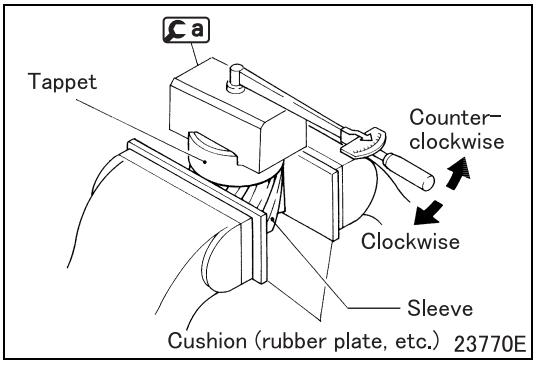
■ **Inspection: Clip**

- Clamp adjusting screw in a vise.

CAUTION ⚠

- **Use cushions such as rubber plates between jaws to prevent damage to adjusting screw. Damaged threads of the adjusting screw can cause the automatic adjusting mechanism to fail to operate properly.**

- Attach a to the clip.
- The reading when clip starts to turn shows the holding torque.
- If the measured value deviates from the standard value, replace the clip.



■ **Inspection: Rotating torque of sleeve <FK>**

- Clamp sleeve assembly in a vise.
- Install a.
- Read the torque when tappet starts to turn.
- If the measured value deviates from the standard value, replace the sleeve.

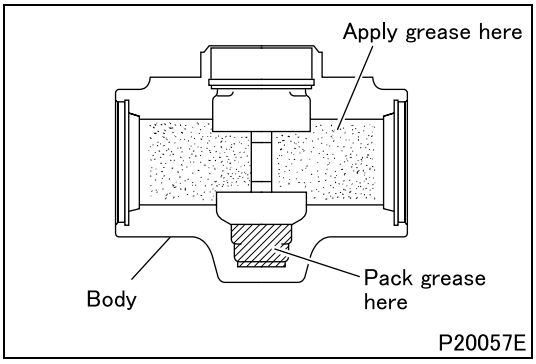
■ **Inspection: Damage on clips, boots and caps**

- If any damage such as deformation, break, crack or wear is found, replace the faulty part.

■ **Inspection: Wear of roller sliding surface on sleeve and wedge and roller**

- If a stepped wear is found on the roller sliding surface, measure the amount of wear.
- If the measurement exceeds the service limit, replace the sleeve.

◆Installation procedure◆

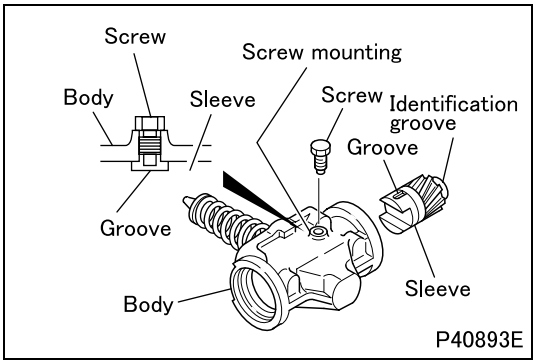


■ **Installation: Body**

- Coat inner surface of the body with grease.
- Fill the portion shown in the illustration with grease.

■ **Installation: Spring**

- Install the spring following the removal procedure in reverse. (See "■ **Removal: Spring**".)



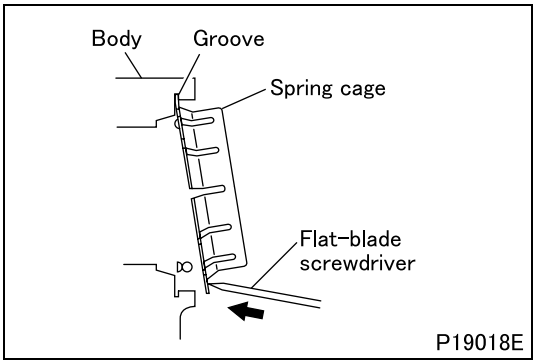
■ **Installation: Sleeve**

- The sleeve to be used differs from each other depending on the type of brake. Select a proper sleeve for the brake by checking the identification grooves provided in the tip of the sleeve.
  2 identification grooves <FK>
  No identification groove <FM>
- Apply grease to the outer periphery, threaded area and roller contacting surface of sleeve.
- Align slot in sleeve with screw fitting hole in body to fit the sleeve.
- Apply sealant to the threads of screw and tighten the screw to the specified torque.

NOTE

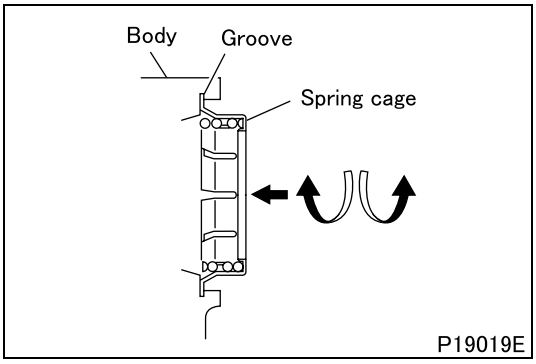
- **If screw is not inserted up to the position shown, the screw is possibly not in slot in sleeve.**

- Check that sleeve does not fall off.

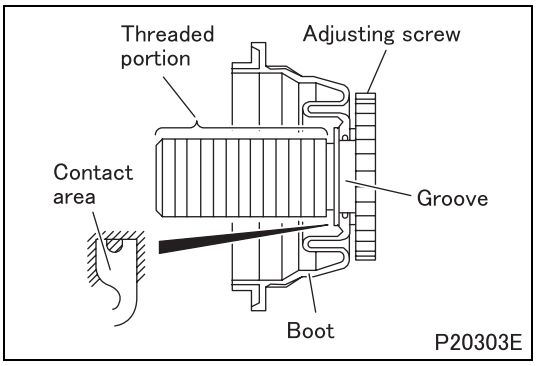


■ **Installation: Spring cage**

- Fit one side of the spring cage into the groove of the body.
- Using a flat-blade screwdriver, push the other side of spring cage in position.

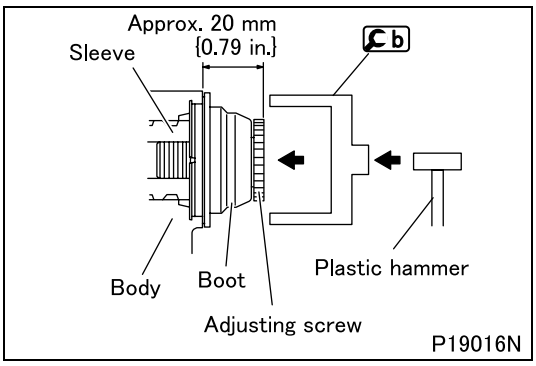


- To check that the spring cage is securely fitted in the groove of the body, turn the spring cage while pushing it. If it turns smoothly, it shows proper fit.

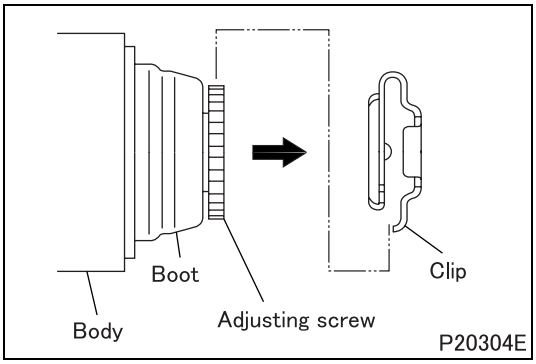


■ **Installation: Adjusting screw and boot**

- Apply grease to the boot at the contacting area with the adjusting screw and to the thread area of the adjusting screw.
- Fit the boot into the groove of adjusting screw.



- Screw the adjusting screw in the sleeve until the end face to end face distance between the adjusting screw and the body is approx. 20 mm {0.79 in.}.
- Lightly pull at the adjusting screw to make sure that the sleeve slides.
- Press-fit the boot with b.



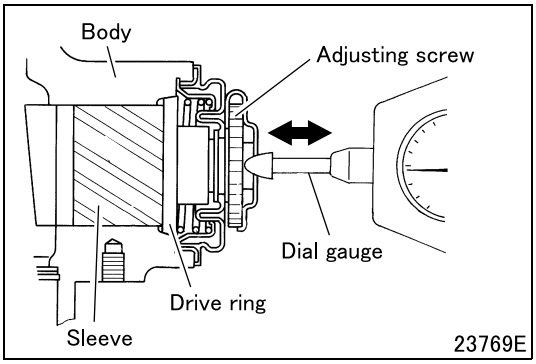
■ **Installation: Clip**

- To facilitate fitting the clip to the adjusting screw, turn the adjusting screw until it comes off the boot.
- Fit the clip.

CAUTION ⚠

- **Use care not to damage boot when fitting the clip.**

◆Inspection after installation◆

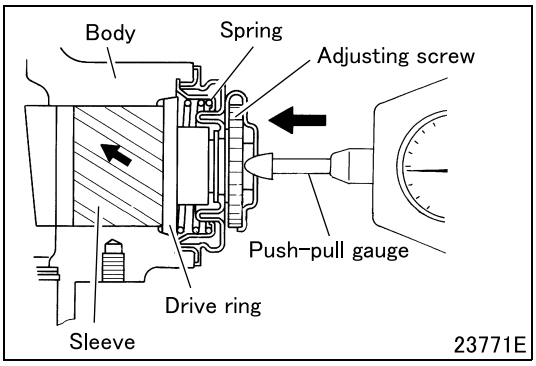


■ **Inspection: Backlash between drive ring and sleeve**

- Apply the probe of the dial gauge to the adjusting screw and move the assembly in the arrow direction to measure the backlash between the drive ring and the sleeve.
- If the measured value deviates from the standard value, replace the drive ring and sleeve.

CAUTION ⚠

- **When measuring the backlash, be careful so that the drive ring, pushed by the sleeve, does not move off from the body.**



■ **Inspection: Automatic adjuster mechanism actuating force**

- Pull the adjust screw (as much as it cannot be pulled any further). This makes the sleeve to push the drive ring against the force of the spring and the drive ring comes apart from the body.
- Back off the adjust screw (as much as possible with light force) in the direction of the arrow until the backlash between the drive ring and sleeve is eliminated.
- Using a push-pull gauge, push the adjust screw in the direction of the arrow. While doing this, note the maximum reading on the gauge.
- If the measurement deviates from the standard value, replace the sleeve.

● **Assembly sequence**

Follow the disassembly sequence in reverse.

Repair kit : Relay valve kit

Service standards (Unit : mm {in.})

Location	Maintenance item	Standard value	Limit	Remedy
6	Spring load (installed length 10.3 {0.41})	16 N {3.6 lbs, 1.65 kgf}	13 N {3.0 lbs, 1.35 kgf}	Replace
13	Spring load (installed length 15.7 {0.62})	29 N {6.6 lbs, 3.0 kgf·m}	24 N {5.3 lbs, 2.4 kgf}	Replace

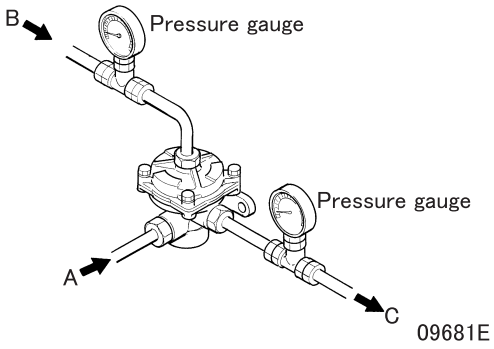
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

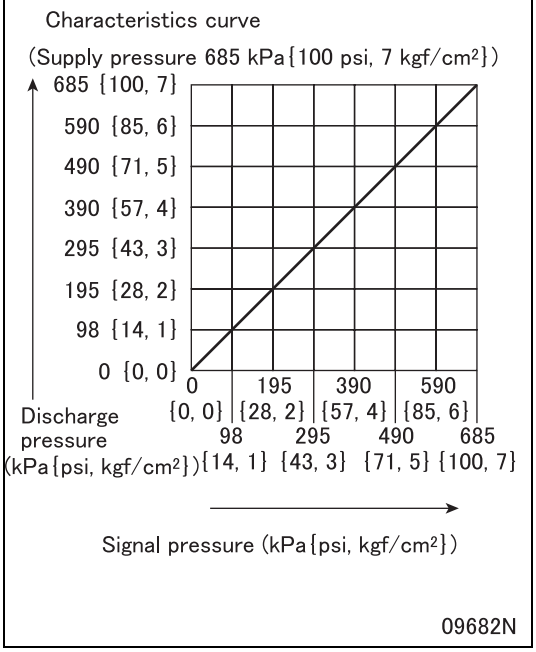
Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Bolt (cover and body mounting)	12 to 19 {8.7 to 14, 1.2 to 1.9}	–

Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Friction surface of cover and piston	Multipurpose grease [NLGI No. 2 (Li soap)]	As required
	Periphery of O-ring		
	Friction surface of inlet valve and valve guide		
	Friction surface of body and piston		

◆Adjustment after installation◆





■ Adjustment: Relay value

- Mount the gauges on the pipes as illustrated. Apply pressurized air to air supply port A and indicated pressure port B, and measure the difference in operating pressure between the indicated pressure and the discharge pressure.

  Operational pressure difference : 25 kPa {3.6 psi, 0.25 kgf/cm^2}
  C: Discharge port

  If any fault is found, replace springs.

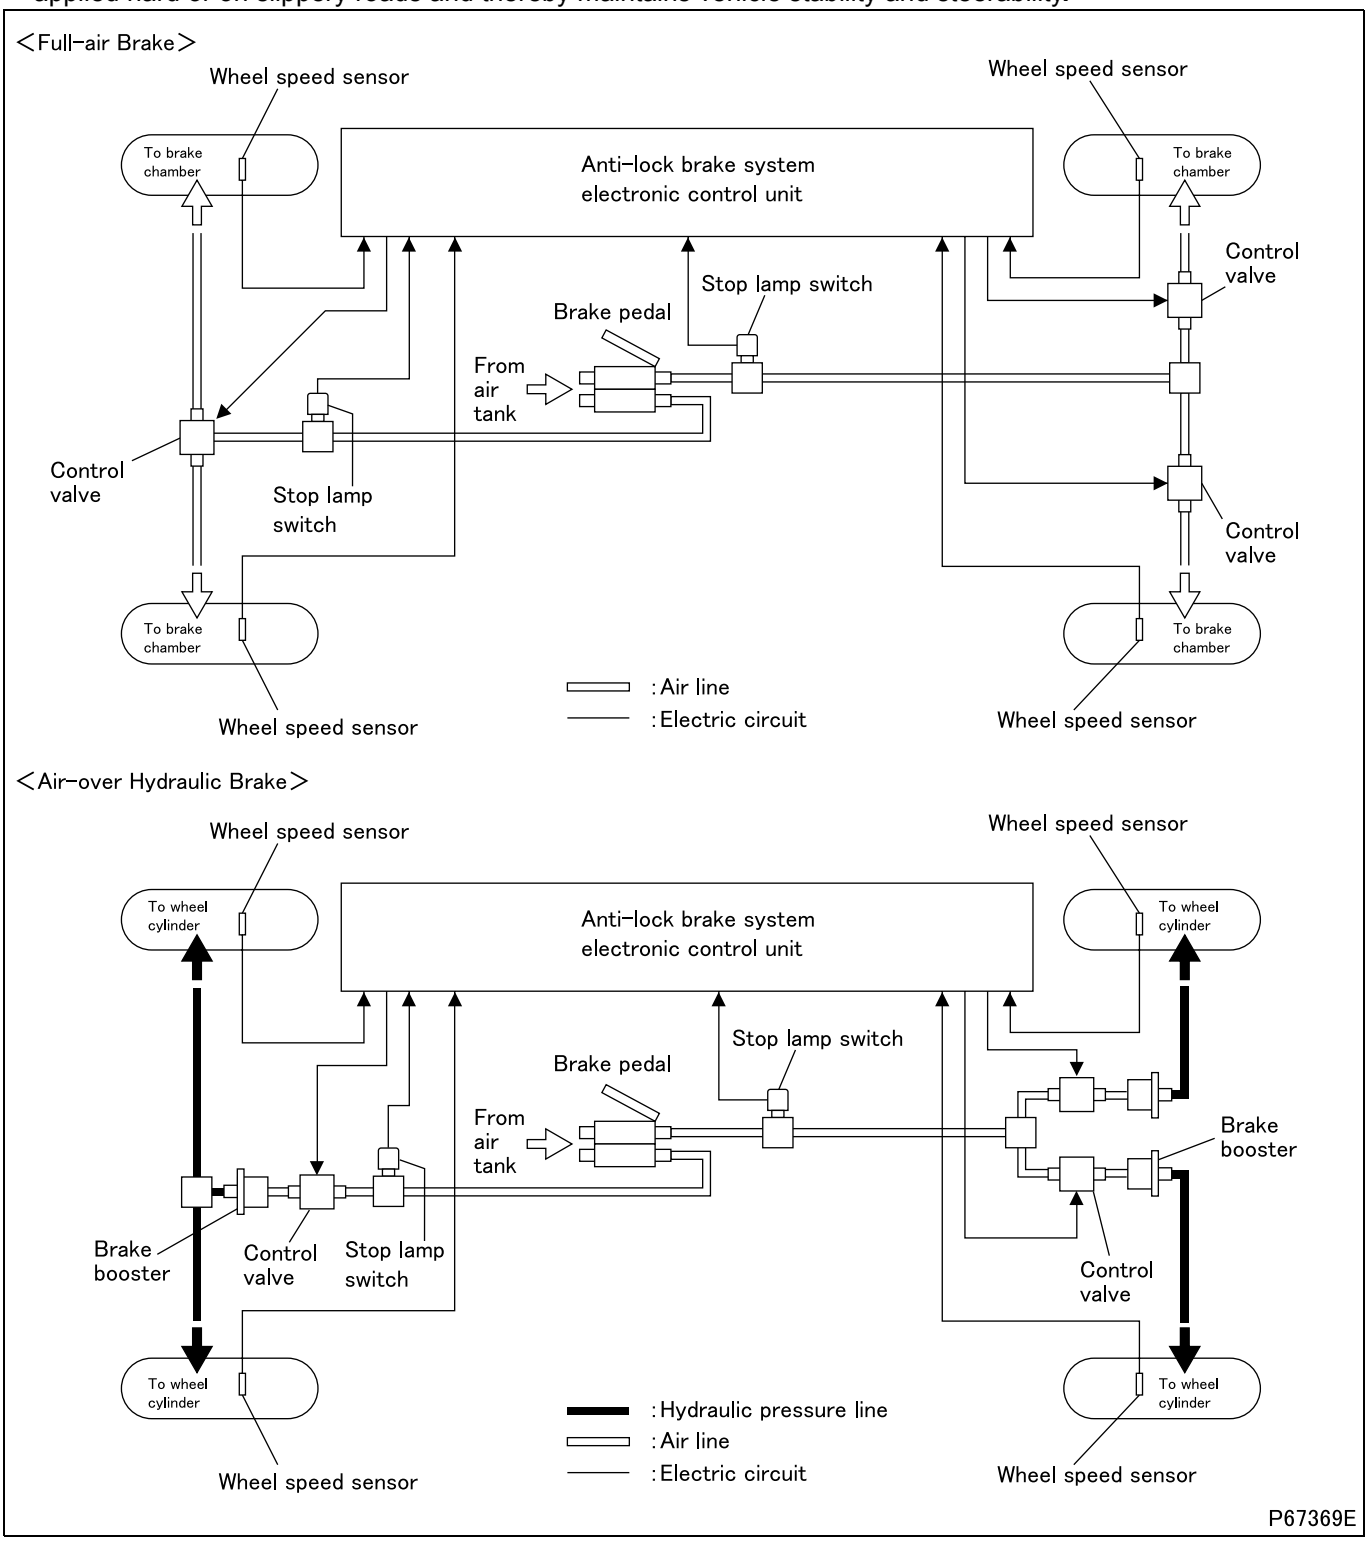
Wheel speed sensor	Manufacturer	Sumitomo Electric
	Type	Magnetic pickup
Anti-lock brake system electronic control unit	Manufacturer	Knorr-Bremse Commercial Vehicle Systems Japan
	Rated voltage V	DC12

M E M O

1. General Description

- The anti-lock brake system (ABS) prevents wheel lock-up and resultant skid that can occur when the brakes are applied hard or on slippery roads and thereby maintains vehicle stability and steerability.

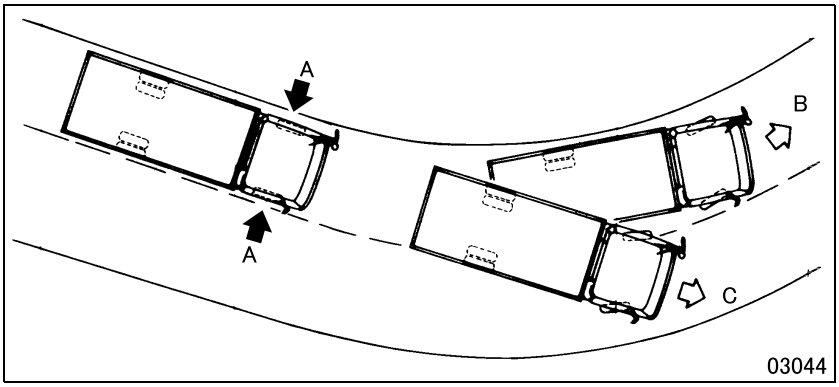


- Shown above is not a piping diagram but an illustration for explaining about the structure and operation of the anti-lock brake system. For details of the system piping diagram, see Gr35.

1.1 Outline of anti-lock brake system

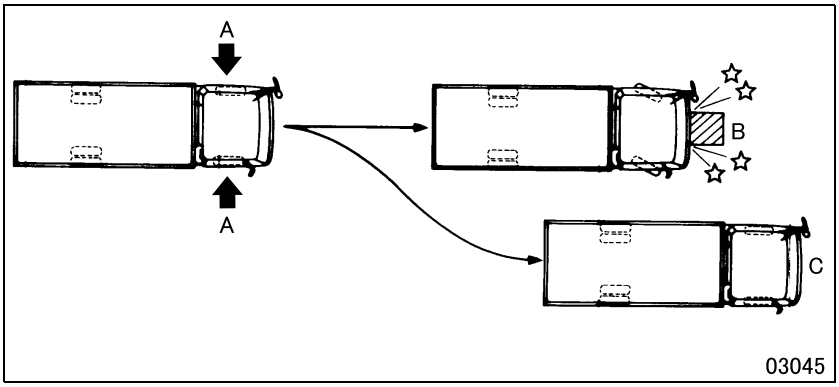
- Wheels rolling on the road will move along in the selected direction of their rotation. Therefore, the driver can steer the vehicle as he or she wishes by maneuvering the steering wheel.
  However, if the brake pedal is pressed all the way and the wheels are locked up, the tires will be no longer able to maintain their direction and become nothing but mere pieces of rubber that are in contact with the road surface. As a result, the tires will not roll as steered but slip in any direction of inertia. In other words, when a wheel lock-up occurs, the vehicle loses stability and steerability and goes beyond the driver's control.
- The anti-lock brake system prevents a wheel lock-up by reducing the braking power to the wheel that developed a tendency to lock-up, thereby ensuring vehicle stability and steerability.

(1) Wheel lock-up on slippery curve



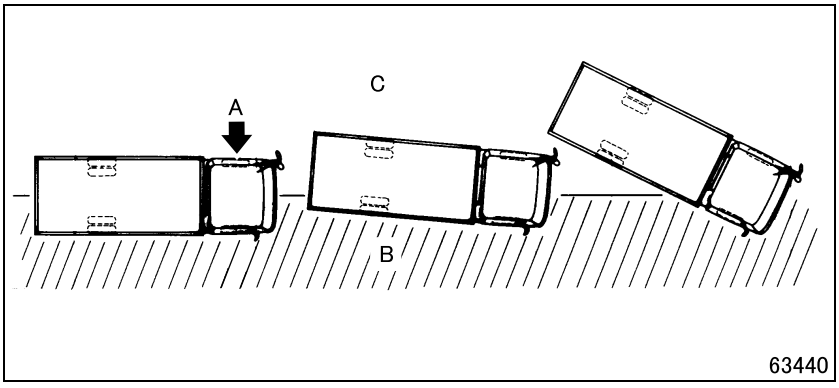
- If a wheel lock-up occurs during braking on a slippery curve, the vehicle will lose steerability and may skid out of the intended course no matter how the driver manipulates the steering wheel.
  A: Brakes application point (wheel lock-up)
  B: Intended course
  C: Skidding out of course

(2) Wheel lock-up on slippery straight road



- If a wheel lock-up occurs on a slippery straight road during hard braking in an attempt to avoid an obstacle ahead, the vehicle will lose steerability and will not able to avoid the obstacle no matter how the driver maneuvers the steering wheel.
  A: Brakes application point (wheel lock-up)
  B: Obstacle
  C: Course to avoid obstacle

(3) Split μ (wheel lock-up on road surface different in coefficient of friction between left and right sides)



- Tires in contact with one side of the road that has a smaller coefficient of friction tend to slip more easily than those on the other side and lock up first. In this state, braking efficiency is out of balance between the wheels and the vehicle can lose stability and go out of steering control. Braking hard under such conditions can cause the vehicle to spin.
  A: Brakes application point (wheel lock-up)
  B: Less slippery road surface
  C: More slippery road surface

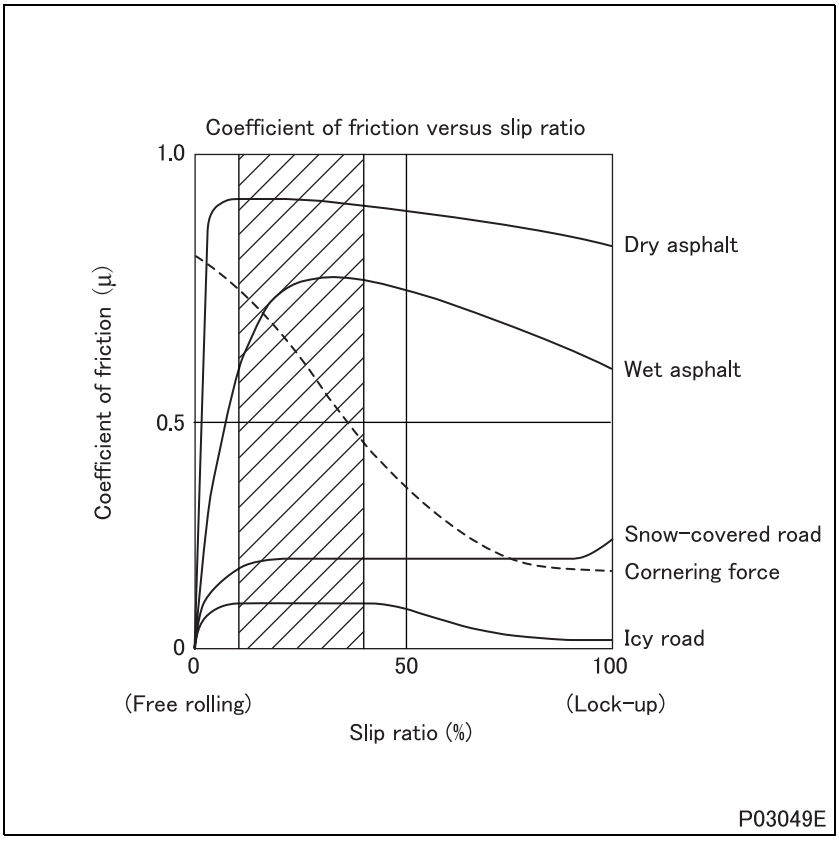
- The anti-lock brake system prevents wheel lock-up by providing optimally controlled braking force to each wheel and thus ensures vehicle stability and steerability without wheel slip and skid even during hard braking.

1.2 Anti-lock brake system control process

- According to the road surface condition, the anti-lock brake system controls the braking power in relation to the slip ratio dependent on wheel speed versus vehicle speed to ensure most efficient braking performance.
- Pressing the brake pedal retards the rotation of wheels and the vehicle slows down as a result. However, the vehicle is forced to move on by the inertia that has built up in the meantime. This causes a difference between the wheel and vehicle speeds resulting in a slip. The extent of the slip can be expressed by slip ratio as follows.

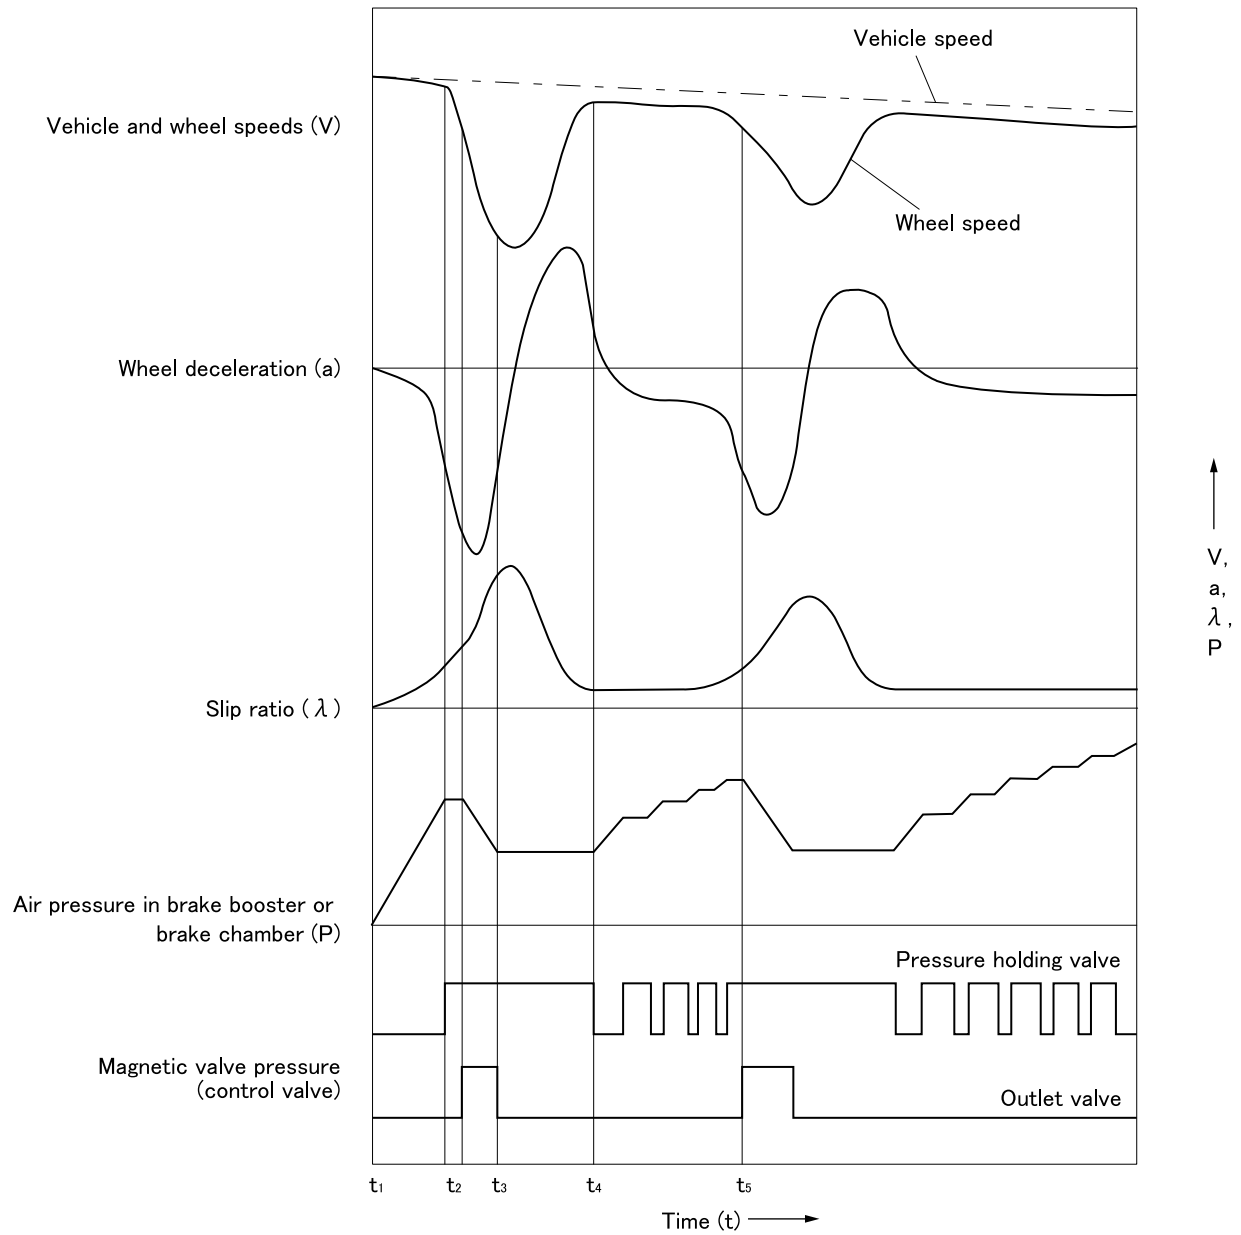
$$\text{Slip ratio (\%)} = \frac{\text{Vehicle speed} - \text{Wheel speed}}{\text{Vehicle speed}} \times 100$$

- A slip ratio of 0% means that there is no slip between the wheel and road surface. A slip ratio of 100% represents a wheel lock-up.



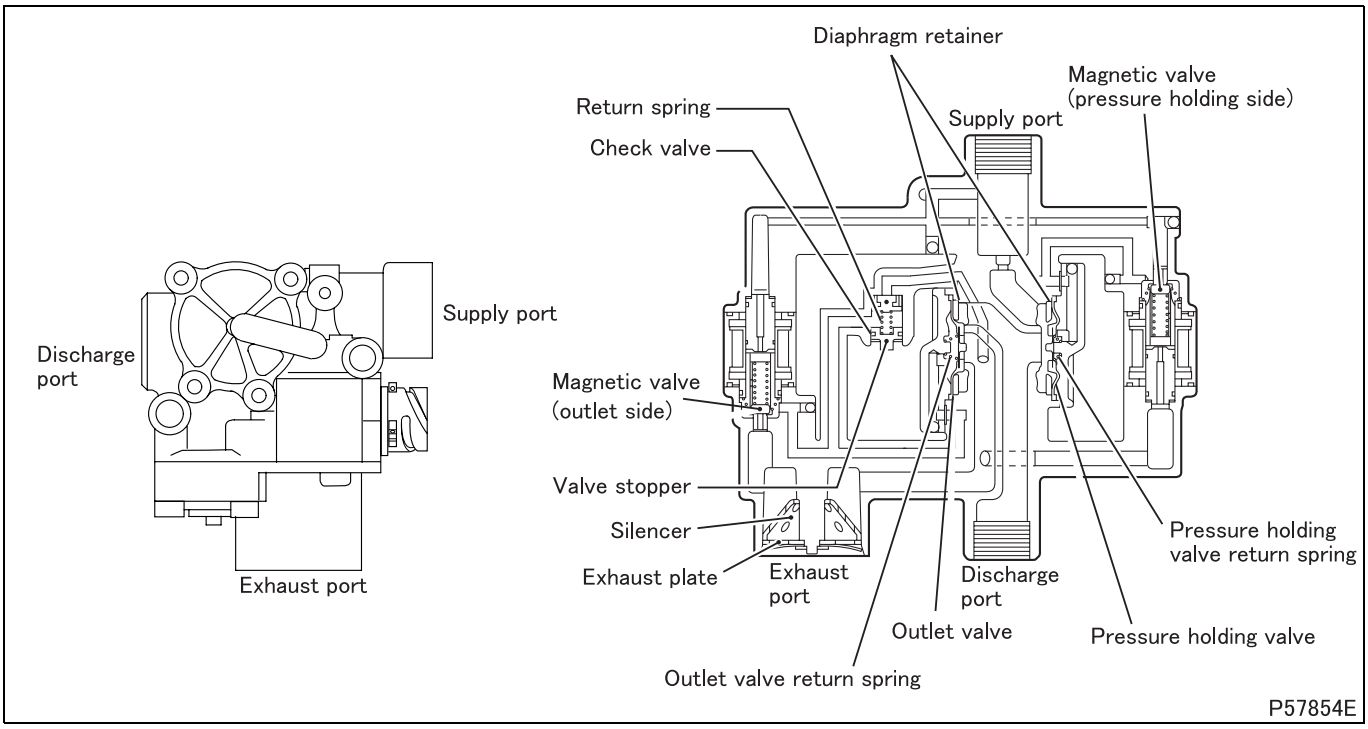
- The graph shows the change in the tire's coefficient of friction during the process of free rolling to lock-up; as the brake pedal is gradually pressed, the tires begin to slip while rolling along on the road surface.
- Pressing the brake pedal further causes the tires to stop rolling and only slip. This is a wheel lock-up.
- As the graph shows, the coefficient of friction peaks when the slip ratio comes within the hatched range.
- In other words, the maximum coefficient of friction of the tires can be obtained if the slip ratio is brought within the hatched range by applying the brakes, not hard but moderately.
- On vehicles equipped with anti-lock brake system, the electronic control unit controls the braking force to be within the hatched range so that the tires are not locked but have a maximum coefficient of friction, thereby ensuring stable braking performance.

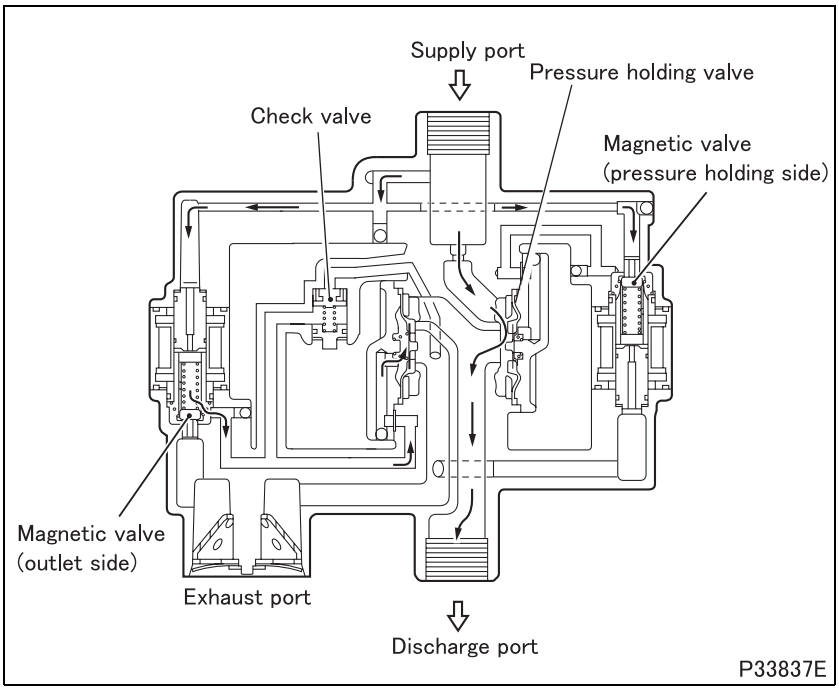
(1) Anti-lock brake system control cycle



- The above chart depicts the control characteristics of the anti-lock brake system, indicating changes in vehicle speed, wheel speeds and brake booster or brake chamber air pressures with the lapse of time (t) after the application of brakes.
- The electronic control unit computes the wheel speeds while estimating the vehicle speed according to wheel speed sensor output signals received and thus constantly monitors wheel slip ratio and wheel deceleration.
- When the electronic control unit detects a wheel lock-up being imminent, it sends control signals to the appropriate magnetic valves in the control valves. Required anti-lock control is thus effected as shown in the above chart.

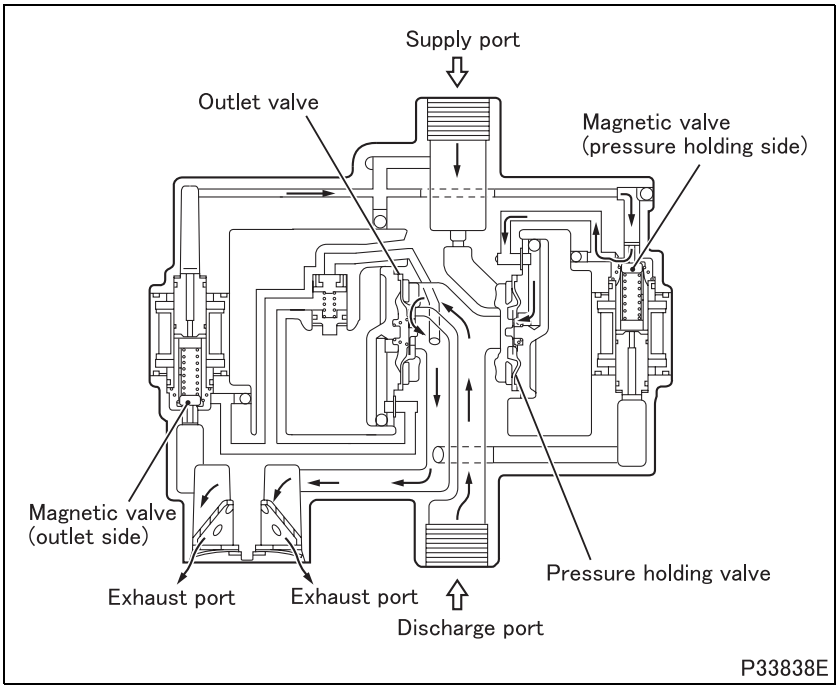
1.3 Control valve





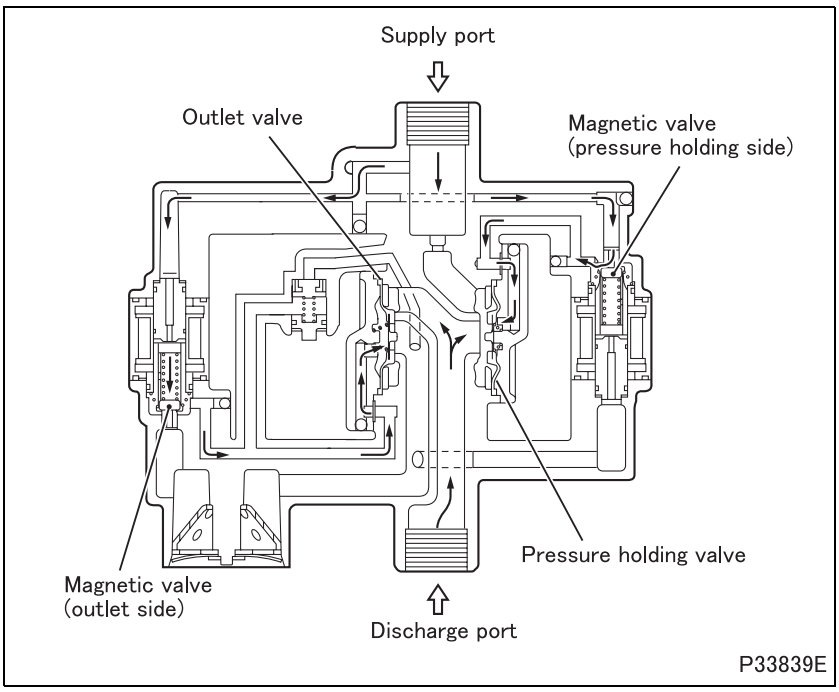
(1) Normal braking

- At normal braking, if there is no wheel lock-up tendency, the magnetic valve does not actuate. Air pressure that is the same as that from the dual brake valve is pressure-fed to the brake booster or brake chamber.
- Normally, the air pressure from the air discharge port is released from the exhaust port when the brake pedal is disengaged, but if the exhaust port is blocked by freezing, etc., the air pressure at the discharge port acts upon the pressure holding valve causing drag of the brakes.
  In this case, the air pressure from the discharge port is discharged from the supply side of the magnetic valve (outlet side) by the check valve.
  Supply port:
  from dual brake valve
  Discharge port:
  to brake chamber or brake booster



(2) When pressure decreased

- When braking is applied at t1 in the anti-lock brake control cycle above, the air pressure in the brake booster or brake chamber rises, the vehicle speed and wheel speed both begin to drop, and when the wheel show the lock-up tendency at t2, the control signal is sent from the electronic control unit to turn on the magnetic valve (holding valve) and magnetic valve (outlet valve).
- The pressure holding valve closes and the outlet valve opens. This discharges and decreases the air pressure in the brake chamber, and eases the lock-up tendency of the wheel. (t2 to t3)
  Supply port:
  from dual brake valve
  Discharge port:
  to brake chamber or brake booster
  Exhaust port:
  atmosphere

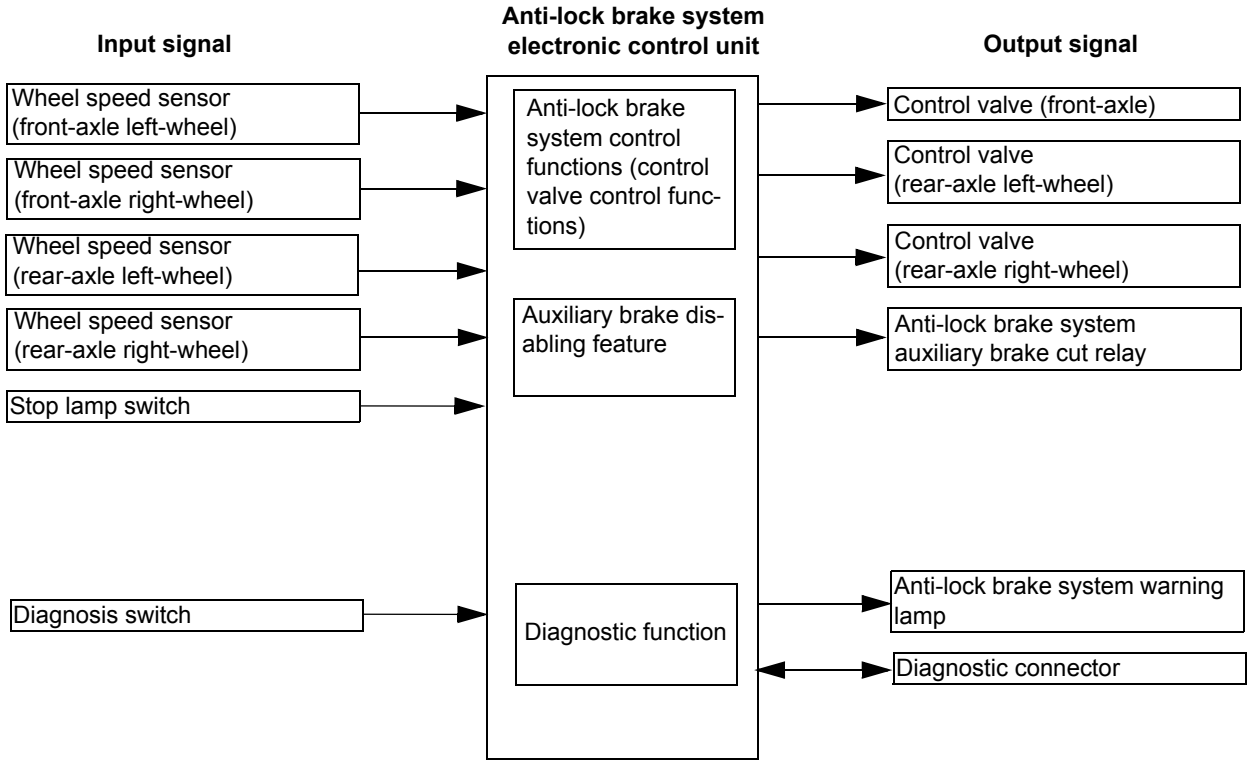


(3) When pressure held

- The magnetic valve (outlet valve) at t3 in the anti-lock brake system control cycle above turns off, the outlet valve closes, the air pressure in the brake booster or brake chamber is held, the slip ratio approaches λ=0, and the wheel speed accelerates.
- At t4, the magnetic valve (holding) repeats turning on and off until it reaches t5 and momentarily releases the pressure holding valve which causes the pressure to rise gradually. Then the wheel speed decelerates. This control cycle (from t2 to t5) repeats until the vehicle stops.
  Supply port:
  from dual brake valve
  Discharge port:
  to the brake chamber or brake booster

2. Electronic Control System

2.1 System block diagram



Part name	Primary function or operation
Wheel speed sensor	Detection of wheel speed
Stop lamp switch	Detection of brake pedal depression signal
Diagnosis switch	Indication of diagnosis codes
Control valve	Activation of anti-lock brake system
Anti-lock brake system auxiliary brake cut relay	Cut-off of exhaust brake in anti-lock braking mode
Anti-lock brake system warning lamp	Indication of anti-lock brake system faults
Diagnostic connector	Communication of system with Multi-Use Tester

2.2 Anti-lock brake system control functions (control functions of control valves)

- The anti-lock brake system uses wheel speed sensors and an electronic control unit to monitor the rolling status of the wheels. Whenever braking results in any wheels exceeding the specified deceleration or slip ratio, the electronic control unit determines that a lock-up of the wheels is imminent and activates the appropriate control valves to reduce the air pressure in the relevant brake chambers. As a result, the braking power is reduced to prevent the wheel lock-up. Subsequently, when the controlled wheels are restored to or below the specified deceleration or slip ratio, the relevant wheel speed sensors send control signals to the electronic control unit to the appropriate control valves. The air pressure to the relevant brake chambers is thereby increased to augment the braking power.
- This control cycle is repeated to prevent the wheel lock-up and make stable braking possible on slippery roads. The control valves for the front-axle and rear-axle left and right wheels are controlled independently of each other.

2.3 Auxiliary brake disabling feature

- The auxiliary brake alone can cause a wheel lock-up on slippery roads. Therefore, if the auxiliary brake is activated when the anti-lock brake system is in operation, it can compromise the effect of brake control by the system.
- To avoid this, during the anti-lock braking mode, the auxiliary brake is disabled even when the auxiliary brake switch is turned ON.
- The auxiliary brake is reactivated on deactivation of the anti-lock brake system if the auxiliary brake switch is ON.

2.4 Diagnostic functions

- When the starter switch is in the ON position, the system constantly monitors the operating condition of the sensors and other system components. If any fault is detected, the system displays the relevant information on the meter cluster to warn the driver of the fault status. At the same time, the system stores the relevant diagnosis code in the memory and starts operation in the fault-affected control mode.
- During the fault-affected control mode operation, the system functions are limited to ensure safety for the driver and the vehicle. Stored diagnosis codes can be accessed using Multi-Use Tester or through the warning lamp that blinks.
- Diagnosis codes are different between the Multi-Use Tester and warning lamp indication.
- The Multi-Use Tester provides more specific fault information.
- Even when the system has no fault, if any wheel speed sensor-related diagnosis code is issued during previous driving remains in the memory, the anti-lock brake system warning lamp continues to light until the vehicle speed reaches approximately 10 km/h {6.21 mph}.

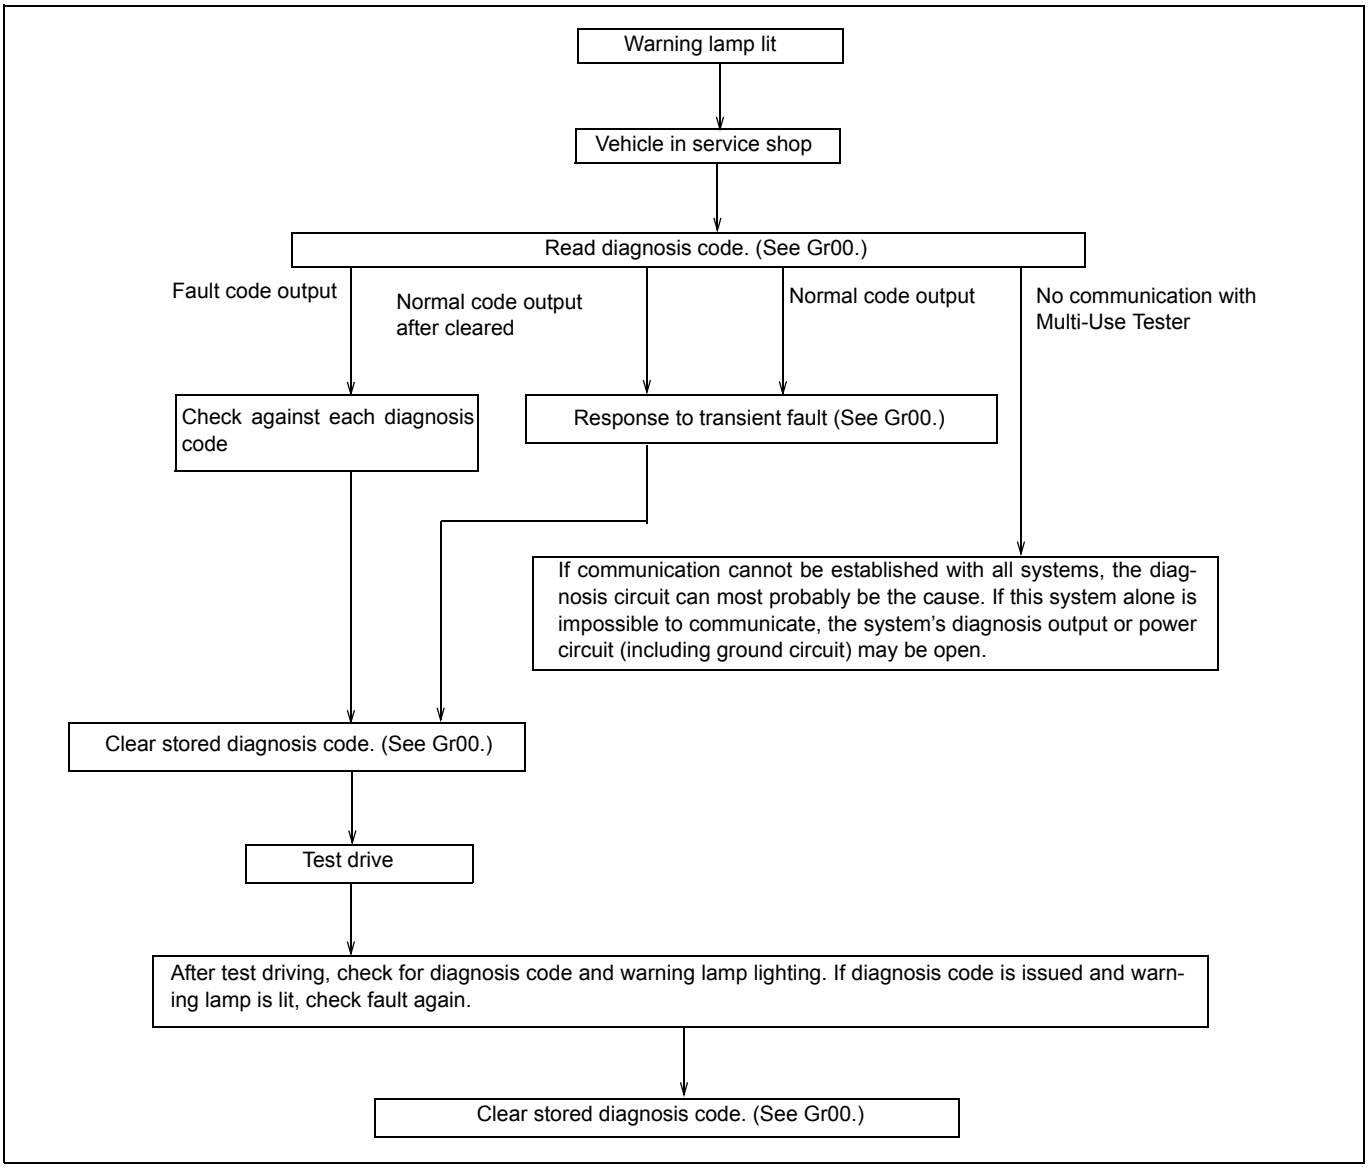
TROUBLESHOOTING

1. Diagnosis Procedure

- The system should be inspected in accordance with the following flowchart.
  System inspection can be accomplished basically in two ways according to trouble symptom and diagnosis code as shown below.
  - Check against each diagnosis code stored in memory by the electronic control unit
  - Response to transient fault



2. Diagnostic Precautions

- Before measuring voltage, check the battery for charged condition and specific gravity. If system inspection is performed with the battery uncharged or reduced in specific gravity, accurate measurements cannot be achieved.
- To avoid having electrical parts damaged, set the starter switch and lighting switch to LOCK or OFF before disconnecting and reconnecting battery cables.
- Before disconnecting connectors, set the starter switch to LOCK or OFF, then allow at least 20 seconds. Voltage may remain in electric parts or connected circuit.
- When performing measurement with the tester, handle the test bar carefully so that it does not damage internal circuit and other electrical parts of the electronic control unit to result in a short-circuit failure between terminals in connector or between connector and car body.
- Resistance is affected by temperature. Determine the necessity of resistance measurement following given temperature specification as a guide. Otherwise, use normal temperature (10 to 35°C {50 to 95°F}) as the measuring condition.

3. Inspection Based on Diagnosis Codes

3.1 List of diagnosis codes

- Diagnosis codes are different in the way of indication between the Multi-Use Tester and flashing warning lamp.
- Diagnosis codes on the Multi-Use Tester provide more specific information.

3.2 Diagnosis Code Generation Conditions and Inspection Items

10: ECU Internal (Warning Lamp: 15-1)

Code generation condition		Electronic control unit is internally faulty.
Resettability		System resets if normal signal is received with starter switch set OFF → ON (electronic control unit reactivated).
Electronic control unit control		Anti-lock brake system disabled
Inspection item	Other	If system does not reset despite repeated ON-OFF of starter switch, replace electronic control unit.

11: ECU Internal (Warning Lamp: 15-2)

Code generation condition		Electronic control unit is internally faulty.
Resettability		System resets if normal signal is received with starter switch set OFF → ON (electronic control unit reactivated).
Electronic control unit control		Anti-lock brake system disabled
Inspection item	Other	If system does not reset despite repeated ON-OFF of starter switch, replace electronic control unit.

12: ECU Internal (Warning Lamp: 15-7)

Code generation condition		Electronic control unit is internally faulty.
Resettability		System resets if normal signal is received with starter switch set OFF → ON (electronic control unit reactivated).
Electronic control unit control		Anti-lock brake system disabled
Inspection item	Other	If system does not reset despite repeated ON-OFF of starter switch, replace electronic control unit.

13: ECU Internal (Warning Lamp: 15-5)

Code generation condition		Electronic control unit is internally faulty.
Resettability		System resets if normal signal is received with starter switch set OFF → ON (electronic control unit reactivated).
Electronic control unit control		Anti-lock brake system disabled
Inspection item	Other	If system does not reset despite repeated ON-OFF of starter switch, replace electronic control unit.

14: ECU Internal (Warning Lamp: 15-6)

Code generation condition		Electronic control unit is internally faulty.
Resettability		System resets if normal signal is received with starter switch set OFF → ON (electronic control unit reactivated).
Electronic control unit control		Anti-lock brake system disabled
Inspection item	Other	If system does not reset despite repeated ON-OFF of starter switch, replace electronic control unit.

15: ECU Internal (Warning Lamp: 15-8)

Code generation condition		Electronic control unit is internally faulty.
Resettability		System resets if normal signal is received with starter switch set OFF → ON (electronic control unit reactivated).
Electronic control unit control		Anti-lock brake system disabled
Inspection item	Other	If system does not reset despite repeated ON-OFF of starter switch, replace electronic control unit.

16: Invalid Config in EEPROM (Warning Lamp: 15-9)

Code generation condition		Electronic control unit is internally faulty.
Resettability		System resets if normal signal is received with starter switch set OFF → ON (electronic control unit reactivated).
Electronic control unit control		Anti-lock brake system disabled
Inspection item	Other	If system does not reset despite repeated ON-OFF of starter switch, replace electronic control unit.

17: ECU Internal (ROM DATA) (Warning Lamp: 15-3)

Code generation condition		Electronic control unit is internally faulty.
Resettability		System resets if normal signal is received with starter switch set OFF → ON (electronic control unit reactivated).
Electronic control unit control		Anti-lock brake system disabled
Inspection item	Other	If system does not reset despite repeated ON-OFF of starter switch, replace electronic control unit.

18: ECU Internal (RAM) (Warning Lamp: 15-4)

Code generation condition		Electronic control unit is internally faulty.
Resettability		System resets if normal signal is received with starter switch set OFF → ON (electronic control unit reactivated).
Electronic control unit control		Anti-lock brake system disabled
Inspection item	Other	If system does not reset despite repeated ON-OFF of starter switch, replace electronic control unit.

1A: ECU Internal Relay (Warning Lamp: 15-10)

Code generation condition		Power relay in electronic control unit is faulty.
Resettability		System resets if normal signal is received with starter switch set OFF → ON (electronic control unit reactivated).
Electronic control unit control		Anti-lock brake system disabled
Inspection item	Other	If system does not reset despite repeated ON-OFF of starter switch, replace electronic control unit.

1B: ECU Internal Relay (Warning Lamp: 15-11)

Code generation condition		Power relay in electronic control unit is faulty.
Resettability		System resets if normal signal is received with starter switch set OFF → ON (electronic control unit reactivated).
Electronic control unit control		Normal control
Inspection item	Other	If system does not reset despite repeated ON-OFF of starter switch, replace electronic control unit.

20: V-IGN Over Voltage (Warning Lamp: 16-9)

Code generation condition		Electronic control unit power voltage is excessive (over 17.5V).
Resettability		System resets if normal signal is received with starter switch in ON position.
Electronic control unit control		Anti-lock brake system disabled
Inspection item	Service data	13: Voltage U-ign
	Electronic control unit connector	01: Power voltage for electronic control unit
	Wiring diagram	Starter switch ON power circuit

21: V-IGN LO Voltage (Warning Lamp: 16-10)

Code generation condition		Electronic control unit power voltage is too low (below 9V).
Resettability		System resets if normal signal is received with starter switch in ON position.
Electronic control unit control		Anti-lock brake system disabled
Inspection item	Service data	13: Voltage U-ign
	Electronic control unit connector	01: Power voltage for electronic control unit
	Wiring diagram	Starter switch ON power circuit

22: V-IGN LO Voltage during ABS Ctrl (Warning Lamp: 16-10)

Code generation condition		Electronic control unit power voltage drops (below 8V) when anti-lock brake system is in operation.
Resettability		System resets if normal signal is received with starter switch set OFF → ON (electronic control unit reactivated).
Electronic control unit control		Anti-lock brake system disabled
Inspection item	Service data	13: Voltage U-ign
	Electronic control unit connector	01: Power voltage for electronic control unit
	Wiring diagram	Starter switch ON power circuit

23: V-BAT Over Voltage (Warning Lamp: 16-1)

Code generation condition		Control valve power voltage is excessive (over 17.5V).
Resettability		System resets if normal signal is received with starter switch in ON position.
Electronic control unit control		Anti-lock brake system disabled
Inspection item	Service data	14: Voltage U-bat
	Electronic control unit connector	01: Power voltage for electronic control unit
	Wiring diagram	Battery circuit

24: V-BAT LO Voltage (Warning Lamp: 16-2)

Code generation condition		Control valve power voltage drops (below 9V).
Resettability		System resets if normal signal is received with starter switch in ON position.
Electronic control unit control		Anti-lock brake system disabled
Inspection item	Service data	14: Voltage U-bat
	Electronic control unit connector	01: Power voltage for electronic control unit
	Wiring diagram	Battery circuit

25: V-BAT LO Voltage during ABS Ctrl (Warning Lamp: 16-2)

Code generation condition		Control valve power voltage drops (below 8V) when anti-lock brake system is working.
Resettability		System resets if normal signal is received with starter switch set OFF → ON (electronic control unit reactivated).
Electronic control unit control		Anti-lock brake system disabled
Inspection item	Service data	14: Voltage U-bat
	Electronic control unit connector	01: Power voltage for electronic control unit
	Wiring diagram	Battery circuit

26: V-BAT Broken Wire (Warning Lamp: 16-3)

Code generation condition		Control valve power supply is open-circuited.
Resettability		System resets if normal signal is received with starter switch set OFF → ON (electronic control unit reactivated).
Electronic control unit control		Anti-lock brake system disabled
Inspection item	Service data	14: Voltage U-bat
	Electronic control unit connector	01: Power voltage for electronic control unit
	Wiring diagram	Battery circuit

29: Valve Gnd Short HI (Warning Lamp: 10-10)

Code generation condition		Control valve ground circuit is shorted to + side.
Resettability		System resets if normal signal is received with starter switch set OFF → ON (electronic control unit reactivated).
Electronic control unit control		Anti-lock brake system disabled
Inspection item	Wiring diagram	Control valve ground circuit

2A: Valve Short LO or ECU Internal (Warning Lamp: 10-11)

Code generation condition		Control valve power source or control valve ground circuit is shorted to – side or electronic control unit is internally faulty.
Resettability		System resets if normal signal is received with starter switch set OFF → ON (electronic control unit reactivated).
Electronic control unit control		Anti-lock brake system disabled
Inspection item	Wiring diagram	Control valve power source or control valve ground circuit

30: Ret Relay Short HI (Warning Lamp: 17-1)

Code generation condition		"Anti-lock brake system auxiliary brake cut relay short-circuited to + side" is detected when anti-lock brake system is working.
Resettability		System resets if normal signal is received with starter switch set OFF → ON (electronic control unit reactivated).
Electronic control unit control		Auxiliary brake disabling control disabled
Inspection item	Actuator test	03: Retarder relay
	Electronic control unit connector	02: Anti-lock brake system auxiliary brake cut relay
	Electrical part	#180: Anti-lock brake system auxiliary brake cut relay
	Wiring diagram	Anti-lock brake system auxiliary brake cut relay circuit

31: Ret Relay Short or Broken Wire (Warning Lamp: 17-2)

Code generation condition		"Anti-lock brake system auxiliary brake cut relay short-circuited to – side or open-circuited" is detected when anti-lock brake system is not working.
Resettability		System resets if normal signal is received with starter switch set OFF → ON (electronic control unit reactivated).
Electronic control unit control		Auxiliary brake disabling control disabled
Inspection item	Actuator test	03: Retarder relay
	Electronic control unit connector	02: Anti-lock brake system auxiliary brake cut relay
	Electrical part	#180: Anti-lock brake system auxiliary brake cut relay
	Wiring diagram	Anti-lock brake system auxiliary brake cut relay circuit

41: FL WSS Short or Broken Wire (Warning Lamp: 2-6)

Code generation condition		"Wheel speed sensor (front-axle, left-wheel) open-circuited or short-circuited" is detected.
Resettability		System resets if normal signal is received with starter switch set OFF → ON and vehicle runs at a speed over 10km/h (electronic control unit reactivated).
Electronic control unit control		Anti-lock brake system of front-axle left wheel disabled.
Inspection item	Service data	01: Wheel speed FL
	Electronic control unit connector	03: Wheel speed sensor
	Electrical part	#329: Wheel speed sensor
	Wiring diagram	Wheel speed sensor (front-axle left-wheel) circuit
	Other	Rotor and wheel hub bearing (See Gr26.)

45: FL WSS Bad Tooth Wheel (Warning Lamp: 2-3)

Code generation condition		"Rotor tooth missing" is determined from wheel speed sensor (front-axle, left-wheel) signal when vehicle is running.
Resettability		System resets if normal signal is received with starter switch set OFF → ON and vehicle runs at a speed over 10km/h (electronic control unit reactivated).
Electronic control unit control		Anti-lock brake system of front-axle left wheel disabled
Inspection item	Service data	01: Wheel speed FL
	Electronic control unit connector	03: Wheel speed sensor
	Electrical part	#329: Wheel speed sensor
	Wiring diagram	Wheel speed sensor (front-axle left-wheel) circuit
	Other	Rotor and wheel hub bearing (See Gr26.)

47: FL WSS Large Air Gap (Warning Lamp: 2-1)

Code generation condition		"Air gap (vehicle speed signal input start command) exceeding specified limit" is determined from wheel speed sensor (front-axle left-wheel) signal when vehicle is started.
Resettability		System resets if normal signal is received with starter switch set OFF → ON and vehicle runs at a speed over 10km/h (electronic control unit reactivated).
Electronic control unit control		Anti-lock brake system of front-axle left wheel disabled
Inspection item	Service data	01: Wheel speed FL
	Electronic control unit connector	03: Wheel speed sensor
	Electrical part	#329: Wheel speed sensor
	Wiring diagram	Wheel speed sensor (front-axle left-wheel) circuit
	Other	Rotor and wheel hub bearing (See Gr26.)

48: FL WSS Drive Off (Warning lamp: 2-2)

Code generation condition		"No wheel speed sensor (front-axle, left-wheel) output" continues for specified time even after vehicle is started.
Resettability		System resets if normal signal is received with starter switch set OFF → ON and vehicle runs at a speed over 10km/h (electronic control unit reactivated).
Electronic control unit control		Anti-lock brake system of front-axle left wheel disabled
Inspection item	Service data	01: Wheel speed FL
	Electronic control unit connector	03: Wheel speed sensor
	Electrical part	#329: Wheel speed sensor
	Wiring diagram	Wheel speed sensor (front-axle left-wheel) circuit
	Other	Rotor and wheel hub bearing (See Gr26.)

49: FL WSS Long Term Instability (Warning lamp: 2-4)

Code generation condition		"Wheel speed sensor (front-axle, left-wheel) output unstable" continues for specified time when vehicle is running.
Resettability		System resets if normal signal is received with starter switch set OFF → ON and vehicle runs at a speed over 10km/h (electronic control unit reactivated).
Electronic control unit control		Anti-lock brake system of front-axle left wheel disabled
Inspection item	Service data	01: Wheel speed FL
	Electronic control unit connector	03: Wheel speed sensor
	Electrical part	#329: Wheel speed sensor
	Wiring diagram	Wheel speed sensor (front-axle left-wheel) circuit
	Other	Rotor and wheel hub bearing (See Gr26.)

4A: FL WSS Loss of Sensor Signal (Warning lamp: 2-5)

Code generation condition		Abnormal deceleration is determined from wheel speed sensor (front-axle, left-wheel) signal when vehicle is running.
Resettability		System resets if normal signal is received with starter switch set OFF → ON and vehicle runs at a speed over 10km/h (electronic control unit reactivated).
Electronic control unit control		Anti-lock brake system of front-axle left wheel disabled
Inspection item	Service data	01: Wheel speed FL
	Electronic control unit connector	03: Wheel speed sensor
	Electrical part	#329: Wheel speed sensor
	Wiring diagram	Wheel speed sensor (front-axle, left-wheel) circuit
	Other	Rotor and wheel hub bearing (See Gr26.)

54: Fr Valve Gnd Broken Wire (Warning lamp: 8-4)

Code generation condition		"Control valve (front-wheel; ground side) or (front-wheel; pressure holding/outlet side) open-circuited" is detected.
Resettability		System resets if normal signal is received with starter switch set OFF → ON (electronic control unit reactivated).
Electronic control unit control		Anti-lock brake control limited to front-axle left wheel
Inspection item	Actuator test	04: Outlet Valve Fr 07: Inlet Valve Fr
	Electronic control unit connector	04: Control valve
	Electrical part	#589: Control valve
	Wiring diagram	Control valve (front-wheel) circuit

55: Fr Outlet Valve Broken Wire (Warning lamp: 8-3)

Code generation condition		"Control valve (front-wheel; outlet side) open-circuited" is detected.
Resettability		System resets if normal signal is received with starter switch set OFF → ON (electronic control unit reactivated).
Electronic control unit control		Anti-lock brake control limited to front-axle left wheel
Inspection item	Actuator test	04: Outlet Valve Fr
	Electronic control unit connector	04: Control valve
	Electrical part	#589: Control valve
	Wiring diagram	Control valve (front-wheel; outlet side) circuit

56: Fr Outlet Valve Short LO (Warning lamp: 8-2)

Code generation condition		"Control valve (front-wheel; outlet side) short-circuited to **–** side" is detected.
Resettability		System resets if normal signal is received with starter switch set OFF → ON (electronic control unit reactivated).
Electronic control unit control		Anti-lock brake control limited to front-axle left wheel
Inspection item	Actuator test	04: Outlet Valve Fr
	Electronic control unit connector	04: Control valve
	Electrical part	#589: Control valve
	Wiring diagram	Control valve (front-wheel; outlet side) circuit

57: Fr Outlet Valve Short HI (Warning lamp: 8-1)

Code generation condition		"Control valve (front-wheel; outlet side) short-circuited to + side" is detected.
Resettability		System resets if normal signal is received with starter switch set OFF → ON (electronic control unit reactivated).
Electronic control unit control		Anti-lock brake system totally disabled
Inspection item	Actuator test	04: Outlet Valve Fr
	Electronic control unit connector	04: Control valve
	Electrical part	#589: Control valve
	Wiring diagram	Control valve (front-wheel; outlet side) circuit

5D: Fr Valve Config Error (Warning lamp: 8-8)

Code generation condition		Electronic control unit error in recognition of appropriate control valve
Resettability		System resets if normal signal is received with starter switch set OFF → ON (electronic control unit reactivated).
Electronic control unit control		None
Inspection item	Other	Check to see if control valve is correctly connected.

61: RR WSS Short or Broken Wire (Warning lamp: 5-6)

Code generation condition		"Wheel speed sensor (rear-axle right-wheel) open-circuited or short-circuited" is detected.
Resettability		System resets if normal signal is received with starter switch set OFF → ON and vehicle runs at a speed over 10km/h (electronic control unit reactivated).
Electronic control unit control		Anti-lock brake system of rear-axle right wheel disabled
Inspection item	Service data	04: Wheel speed RR
	Electronic control unit connector	03: Wheel speed sensor
	Electrical part	#329: Wheel speed sensor
	Wiring diagram	Wheel speed sensor (rear-axle right-wheel) circuit
	Other	Rotor and wheel hub bearing (See Gr27.)

65: RR WSS Bad Tooth Wheel (Warning lamp: 5-3)

Code generation condition		"Rotor tooth missing" status is determined from wheel speed sensor (rear-axle right-wheel) signal when vehicle is running.
Resettability		System resets if normal signal is received with starter switch set OFF → ON and vehicle runs at a speed over 10km/h (electronic control unit reactivated).
Electronic control unit control		Anti-lock brake system of rear-axle right wheel disabled
Inspection item	Service data	04: Wheel speed RR
	Electronic control unit connector	03: Wheel speed sensor
	Electrical part	#329: Wheel speed sensor
	Wiring diagram	Wheel speed sensor (rear-axle right-wheel) circuit
	Other	Rotor and wheel hub bearing (See Gr27.)

67: RR WSS Large Air Gap (Warning lamp: 5-1)

Code generation condition		"Air gap (vehicle speed signal input start speed) exceeding specified limit" status is determined from wheel speed sensor (rear-axle right-wheel) signal when vehicle is started.
Resettability		System resets if normal signal is received with starter switch set OFF → ON and vehicle runs at a speed over 10km/h (electronic control unit reactivated).
Electronic control unit control		Anti-lock brake system of rear-axle right wheel disabled
Inspection item	Service data	04: Wheel speed RR
	Electronic control unit connector	03: Wheel speed sensor
	Electrical part	#329: Wheel speed sensor
	Wiring diagram	Wheel speed sensor (rear-axle right-wheel) circuit
	Other	Rotor and wheel hub bearing (See Gr27.)

68: RR WSS Drive Off (Warning lamp: 5-2)

Code generation condition		"No wheel speed signal (rear-axle right-wheel) input" continues for specified time after vehicle is started.
Resettability		System resets if normal signal is received with starter switch set OFF → ON and vehicle runs at a speed over 10km/h (electronic control unit reactivated).
Electronic control unit control		Anti-lock brake system of rear-axle right wheel disabled
Inspection item	Service data	04: Wheel speed RR
	Electronic control unit connector	03: Wheel speed sensor
	Electrical part	#329: Wheel speed sensor
	Wiring diagram	Wheel speed sensor (rear-axle right-wheel) circuit
	Other	Rotor and wheel hub bearing (See Gr27.)

69: RR WSS Long Term Instability (Warning lamp: 5-4)

Code generation condition		"Wheel speed signal (rear-axle right-wheel) unstable" continues for specified time when vehicle is running.
Resettability		System resets if normal signal is received with starter switch set OFF → ON and vehicle runs at a speed over 10km/h (electronic control unit reactivated).
Electronic control unit control		Anti-lock brake system of rear-axle right wheel disabled
Inspection item	Service data	04: Wheel speed RR
	Electronic control unit connector	03: Wheel speed sensor
	Electrical part	#329: Wheel speed sensor
	Wiring diagram	Wheel speed sensor (rear-axle right-wheel) circuit
	Other	Rotor and wheel hub bearing (See Gr27.)

6A: RR WSS Loss of Sensor Signal (Warning lamp: 5-5)

Code generation condition		Abnormal deceleration is determined from wheel speed sensor (rear-axle right-wheel) signal when vehicle is running.
Resettability		System resets if normal signal is received with starter switch set OFF → ON and vehicle runs at a speed over 10km/h (electronic control unit reactivated).
Electronic control unit control		Anti-lock brake system of rear-axle right wheel disabled
Inspection item	Service data	04: Wheel speed RR
	Electronic control unit connector	03: Wheel speed sensor
	Electrical part	#329: Wheel speed sensor
	Wiring diagram	Wheel speed sensor (rear-axle right-wheel) circuit
	Other	Rotor and wheel hub bearing (See Gr27.)

71: RR Inlet Valve Broken Wire (Warning lamp: 11-7)

Code generation condition		"Control valve (rear-axle right-wheel; pressure holding side) open-circuited" is detected.
Resettability		System resets if normal signal is received with starter switch set OFF → ON and vehicle runs at a speed over 10km/h (electronic control unit reactivated).
Electronic control unit control		Anti-lock brake control limited to rear-axle right wheel
Inspection item	Actuator test	11: Inlet Valve RR
	Electronic control unit connector	04: Control valve
	Electrical part	#589: Control valve
	Wiring diagram	Control valve (rear-axle right-wheel; pressure holding side) circuit

72: RR Inlet Valve Short LO (Warning lamp: 11-6)

Code generation condition		"Control valve (rear-axle right-wheel; pressure holding side) short-circuited to – side" is detected.
Resettability		System resets if normal signal is received with starter switch set OFF → ON and vehicle runs at a speed over 10km/h (electronic control unit reactivated).
Electronic control unit control		Anti-lock brake control limited to rear-axle right wheel
Inspection item	Actuator test	11: Inlet Valve RR
	Electronic control unit connector	04: Control valve
	Electrical part	#589: Control valve
	Wiring diagram	Control valve (rear-axle right-wheel; pressure holding side) circuit

73: RR Inlet Valve Short HI (Warning lamp: 11-5)

Code generation condition		"Control valve (rear-axle right-wheel; pressure holding side) short-circuited to + side" is detected.
Resettability		System resets if normal signal is received with starter switch set OFF → ON and vehicle runs at a speed over 10km/h (electronic control unit reactivated).
Electronic control unit control		Anti-lock brake system totally disabled
Inspection item	Actuator test	11: Inlet Valve RR
	Electronic control unit connector	04: Control valve
	Electrical part	#589: Control valve
	Wiring diagram	Control valve (rear-axle right-wheel; pressure holding side) circuit

74: RR Valve Gnd Broken Wire (Warning lamp: 11-4)

Code generation condition		"Control valve (rear-axle right-wheel; ground side) or (rear-axle right-wheel; pressure holding/outlet side) open-circuited" is detected.
Resettability		System resets if normal signal is received with starter switch set OFF → ON and vehicle runs at a speed over 10km/h (electronic control unit reactivated).
Electronic control unit control		Anti-lock brake control limited to rear-axle right wheel
Inspection item	Actuator test	10: Outlet Valve RR 11: Inlet Valve RR
	Electronic control unit connector	04: Control valve
	Electrical part	#589: Control valve
	Wiring diagram	Control valve (right-axle right-wheel) circuit

75: RR Outlet Valve Broken Wire (Warning lamp: 11-3)

Code generation condition		"Control valve (rear-axle right-wheel; outlet side) open-circuited" is detected.
Resettability		System resets if normal signal is received with starter switch set OFF → ON (electronic control unit reactivated)
Electronic control unit control		Anti-lock brake control limited to rear-axle right wheel
Inspection item	Actuator test	10: Outlet Valve RR
	Electronic control unit connector	04: Control valve
	Electrical part	#589: Control valve
	Wiring diagram	Control valve (rear-axle right-wheel; outlet side) circuit

76: RR Outlet Valve Short LO (Warning lamp: 11-2)

Code generation condition		"Control valve (rear-axle right-wheel; outlet side) short-circuited to – side" is detected.
Resettability		System resets if normal signal is received with starter switch set OFF → ON (electronic control unit reactivated)
Electronic control unit control		Anti-lock brake control limited to rear-axle right wheel
Inspection item	Actuator test	10: Outlet Valve RR
	Electronic control unit connector	04: Control valve
	Electrical part	#589: Control valve
	Wiring diagram	Control valve (rear-axle right-wheel; outlet side) circuit

77: RR Outlet Valve Short HI (Warning lamp: 11-1)

Code generation condition		"Control valve (rear-axle right-wheel; outlet side) short-circuited to + side" is detected.
Resettability		System resets if normal signal is received with starter switch set OFF → ON (electronic control unit reactivated)
Electronic control unit control		Anti-lock brake system totally disabled
Inspection item	Actuator test	10: Outlet Valve RR
	Electronic control unit connector	04: Control valve
	Electrical part	#589: Control valve
	Wiring diagram	Control valve (rear-axle right-wheel; outlet side) circuit

7D: RR Valve Config Error (Warning lamp: 11-8)

Code generation condition		Electronic control unit error in recognition of appropriate control valve
Resettability		System resets if normal signal is received with starter switch set OFF → ON (electronic control unit reactivated)
Electronic control unit control		None
Inspection item	Other	Check to see if control valve is correctly connected.

81: FR WSS Short or Broken Wire (Warning lamp: 3-6)

Code generation condition		"Wheel speed sensor (rear-axle right-wheel) open circuited or short-circuited" is detected.
Resettability		System resets if normal signal is received with starter switch set OFF → ON and vehicle runs at a speed over 10km/h (electronic control unit reactivated)
Electronic control unit control		Anti-lock brake system of front-axle right wheel disabled
Inspection item	Service data	02: Wheel speed FR
	Electronic control unit connector	03: Wheel speed sensor
	Electrical part	#329: Wheel speed sensor
	Wiring diagram	Wheel speed sensor (front-axle right-wheel) circuit
	Other	Rotor and wheel hub bearing (See Gr26.)

85: FR WSS Bad Tooth Wheel (Warning lamp: 3-3)

Code generation condition		"Rotor tooth missing" is determined from wheel speed sensor (front-axle right-wheel) signal when vehicle is running.
Resettability		System resets if normal signal is received with starter switch set OFF → ON and vehicle runs at a speed over 10km/h (electronic control unit reactivated)
Electronic control unit control		Anti-lock brake system of front-axle right wheel disabled
Inspection item	Service data	02: Wheel speed FR
	Electronic control unit connector	03: Wheel speed sensor
	Electrical part	#329: Wheel speed sensor
	Wiring diagram	Wheel speed sensor (front-axle right-wheel) circuit
	Other	Rotor and wheel hub bearing (See Gr26.)

87: FR WSS Large Air Gap (Warning lamp: 3-1)

Code generation condition		"Air gap (vehicle speed signal input start signal) exceeding specified limit" is determined from vehicle speed sensor (front-axle right-wheel) signal when vehicle is running.
Resettability		System resets if normal signal is received with starter switch set OFF → ON and vehicle runs at a speed over 10km/h (electronic control unit reactivated)
Electronic control unit control		Anti-lock brake system of front-axle right wheel disabled
Inspection item	Service data	02: Wheel speed FR
	Electronic control unit connector	03: Wheel speed sensor
	Electrical part	#329: Wheel speed sensor
	Wiring diagram	Wheel speed sensor (front-axle right-wheel) circuit
	Other	Rotor and wheel hub bearing (See Gr26.)

88: FR WSS Drive Off (Warning lamp: 3-2)

Code generation condition		"No vehicle speed signal (front-axle right-wheel) input" continues for specified time.
Resettability		System resets if normal signal is received with starter switch set OFF → ON and vehicle runs at a speed over 10km/h (electronic control unit reactivated)
Electronic control unit control		Anti-lock brake system of front-axle right wheel disabled
Inspection item	Service data	02: Wheel speed FR
	Electronic control unit connector	03: Wheel speed sensor
	Electrical part	#329: Wheel speed sensor
	Wiring diagram	Wheel speed sensor (front-axle right-wheel) circuit
	Other	Rotor and wheel hub bearing (See Gr26.)

89: FR WSS Long Term Instability (Warning lamp: 3-4)

Code generation condition		"Wheel speed signal (front-axle right-wheel) unstable" continues for specified time when vehicle is running.
Resettability		System resets if normal signal is received with starter switch set OFF → ON and vehicle runs at a speed over 10km/h (electronic control unit reactivated)
Electronic control unit control		Anti-lock brake system of front-axle right wheel disabled
Inspection item	Service data	02: Wheel speed FR
	Electronic control unit connector	03: Wheel speed sensor
	Electrical part	#329: Wheel speed sensor
	Wiring diagram	Wheel speed sensor (front-axle right-wheel) circuit
	Other	Rotor and wheel hub bearing (See Gr26.)

8A: FR WSS Loss of Sensor Signal (Warning lamp: 3-5)

Code generation condition		Abnormal deceleration is determined from wheel speed sensor (front-axle right-wheel) when vehicle is running.
Resettability		System resets if normal signal is received with starter switch set OFF → ON and vehicle runs at a speed over 10km/h (electronic control unit reactivated).
Electronic control unit control		Anti-lock brake system of front-axle right wheel disabled
Inspection item	Service data	02: Wheel speed FR
	Electronic control unit connector	03: Wheel speed sensor
	Electrical part	#329: Wheel speed sensor
	Wiring diagram	Wheel speed sensor (front-axle right-wheel) circuit
	Other	Rotor and wheel hub bearing (See Gr26.)

91: Fr Inlet Valve Broken Wire (Warning lamp: 9-7)

Code generation condition		"Control valve (front-axle right-wheel) open-circuited" is detected.
Resettability		System resets if normal signal is received with starter switch set OFF → ON (electronic control unit reactivated).
Electronic control unit control		Anti-lock brake control limited to front-axle right wheel
Inspection item	Actuator test	07: Inlet Valve Fr
	Electronic control unit connector	04: Control valve
	Electrical part	#589: Control valve
	Wiring diagram	Control valve (front-axle right-wheel; pressure holding side) circuit

92: Fr Inlet Valve Short LO (Warning lamp: 9-6)

Code generation condition		"Control valve (front-axle right-wheel; pressure holding side) short-circuited to – side" is detected.
Resettability		System resets if normal signal is received with starter switch set OFF → ON (electronic control unit reactivated).
Electronic control unit control		Anti-lock brake control limited to front-axle right wheel
Inspection item	Actuator test	07: Inlet Valve Fr
	Electronic control unit connector	04: Control valve
	Electrical part	#589: Control valve
	Wiring diagram	Control valve (front-axle right-wheel; pressure holding side) circuit

93: Fr Inlet Valve Short HI (Warning lamp: 9-5)

Code generation condition		"Control valve (front-axle right-wheel; pressure holding side) short-circuited to + side" is detected.
Resettability		System resets if normal signal is received with starter switch set OFF → ON (electronic control unit reactivated).
Electronic control unit control		Anti-lock brake system totally disabled
Inspection item	Actuator test	07: Inlet Valve Fr
	Electronic control unit connector	04: Control valve
	Electrical part	#589: Control valve
	Wiring diagram	Control valve (front-axle right-wheel; pressure holding side) circuit

9D: FR Valve Config Error (Warning lamp: 9-8)

Code generation condition		Electronic control unit error in recognition of appropriate control valve
Resettability		System resets if normal signal is received with starter switch set OFF → ON (electronic control unit reactivated).
Electronic control unit control		None
Inspection item	Other	Check to see if control valve is correctly connected.

A1: RL WSS Short or Broken Wire (Warning lamp: 4-6)

Code generation condition		"Wheel speed sensor (rear-axle left-wheel) open-circuited or short-circuited" is detected.
Resettability		System resets if normal signal is received with starter switch set OFF → ON and vehicle run at a speed over 10 km/h (electronic control unit reactivated).
Electronic control unit control		Anti-lock brake system of rear-axle left wheel disabled
Inspection item	Service data	03: Wheel speed RL
	Electronic control unit connector	03: Wheel speed sensor
	Electrical part	#329: Wheel speed sensor
	Wiring diagram	Wheel speed sensor (rear-axle left-wheel) circuit
	Other	Rotor and wheel hub bearing (See Gr27.)

A5: RL WSS Bad Tooth Wheel (Warning lamp: 4-3)

Code generation condition		"Rotor tooth missing" is determined from wheel speed sensor (rear-axle left-wheel) when vehicle is running.
Resettability		System resets if normal signal is received with starter switch set OFF → ON and vehicle run at a speed over 10 km/h (electronic control unit reactivated).
Electronic control unit control		Anti-lock brake system of rear-axle left wheel disabled
Inspection item	Service data	03: Wheel speed RL
	Electronic control unit connector	03: Wheel speed sensor
	Electrical part	#329: Wheel speed sensor
	Wiring diagram	Wheel speed sensor (rear-axle left-wheel) circuit
	Other	Rotor and wheel hub bearing (See Gr27.)

A7: RL WSS Large Air Gap (Warning lamp: 4-1)

Code generation condition		"Air gap (vehicle signal input start signal) exceeding specified limit" is determined from wheel speed sensor (rear-axle left-wheel) signal.
Resettability		System resets if normal signal is received with starter switch set OFF → ON and vehicle runs at a speed over 10km/h (electronic control unit reactivated)
Electronic control unit control		Anti-lock brake system of rear-axle left wheel disabled
Inspection item	Service data	03: Wheel speed RL
	Electronic control unit connector	03: Wheel speed sensor
	Electrical part	#329: Wheel speed sensor
	Wiring diagram	Wheel seed sensor (rear-axle left-wheel) circuit
	Other	Rotor and wheel hub bearing (See Gr27.)

A8: RL WSS Drive Off (Warning lamp: 4-2)

Code generation condition		"No wheel speed signal (rear-axle left-wheel) input" continues for specified time after vehicle is started.
Resettability		System resets if normal signal is received with starter switch set OFF → ON and vehicle runs at a speed over 10km/h (electronic control unit reactivated)
Electronic control unit control		Anti-lock brake system of rear-axle left wheel disabled
Inspection item	Service data	03: Wheel speed RL
	Electronic control unit connector	03: Wheel speed sensor
	Electrical part	#329: Wheel speed sensor
	Wiring diagram	Wheel seed sensor (rear-axle left-wheel) circuit
	Other	Rotor and wheel hub bearing (See Gr27.)

A9: RL WSS Long Term Instability (Warning lamp: 4-4)

Code generation condition		"Wheel speed signal (rear-axle left-wheel) unstable" continues for specified time when vehicle is running.
Resettability		System resets if normal signal is received with starter switch set OFF → ON and vehicle runs at a speed over 10km/h (electronic control unit reactivated)
Electronic control unit control		Anti-lock brake system of rear-axle left wheel disabled
Inspection item	Service data	03: Wheel speed RL
	Electronic control unit connector	03: Wheel speed sensor
	Electrical part	#329: Wheel speed sensor
	Wiring diagram	Wheel seed sensor (rear-axle left-wheel) circuit
	Other	Rotor and wheel hub bearing (See Gr27.)

AA: RL WSS Loss of Sensor Signal (Warning lamp: 4-5)

Code generation condition		Abnormal deceleration is determined from wheel speed sensor (rear-axle left-wheel) signal.
Resettability		System resets if normal signal is received with starter switch set OFF → ON and vehicle runs at a speed over 10km/h (electronic control unit reactivated)
Electronic control unit control		Anti-lock brake system of rear-axle left wheel disabled
Inspection item	Service data	03: Wheel speed RL
	Electronic control unit connector	03: Wheel speed sensor
	Electrical part	#329: Wheel speed sensor
	Wiring diagram	Wheel seed sensor (rear-axle left-wheel) circuit
	Other	Rotor and wheel hub bearing (See Gr27.)

B1: RL Inlet Valve Broken Wire (Warning lamp: 10-7)

Code generation condition		"Control valve (rear-axle left-wheel; pressure holding side) open-circuited" is detected.
Resettability		System resets if normal signal is received with starter switch set OFF → ON (electronic control unit reactivated).
Electronic control unit control		Anti-lock brake control limited to rear-axle left wheel
Inspection item	Actuator test	09: Inlet Valve RL
	Electronic control unit connector	04: Control valve
	Electrical part	#589: Control valve
	Wiring diagram	Control valve (rear-axle left-wheel; pressure holding side) circuit

B2: RL Inlet Valve Short LO (Warning lamp: 10-6)

Code generation condition		"Control valve (rear-axle left-wheel; pressure holding side) short-circuited to – side" is detected.
Resettability		System resets if normal signal is received with starter switch set OFF → ON (electronic control unit reactivated).
Electronic control unit control		Anti-lock brake control limited to rear-axle left wheel
Inspection item	Actuator test	09: Inlet Valve RL
	Electronic control unit connector	04: Control valve
	Electrical part	#589: Control valve
	Wiring diagram	Control valve (rear-axle left-wheel; pressure holding side) circuit

B3: RL Inlet Valve Short HI (Warning lamp: 10-5)

Code generation condition		"Control valve (rear-axle left-wheel; pressure holding side) short-circuited to + side" is detected.
Resettability		System resets if normal signal is received with starter switch set OFF → ON (electronic control unit reactivated).
Electronic control unit control		Anti-lock brake system totally disabled
Inspection item	Actuator test	09: Inlet Valve RL
	Electronic control unit connector	04: Control valve
	Electrical part	#589: Control valve
	Wiring diagram	Control valve (rear-axle left-wheel; pressure holding side) circuit

B4: RL Valve Gnd Broken Wire (Warning lamp: 10-4)

Code generation condition		"Control valve (rear-axle left-wheel; ground side) or (rear-axle left-wheel; pressure holding/outlet side) open-circuited" is detected.
Resettability		System resets if normal signal is received with starter switch set OFF → ON (electronic control unit reactivated).
Electronic control unit control		Anti-lock brake control limited to rear-axle left wheel
Inspection item	Actuator test	08: Outlet Valve RL 09: Inlet Valve RL
	Electronic control unit connector	04: Control valve
	Electrical part	#589: Control valve
	Wiring diagram	Control valve (rear-axle left-wheel; pressure holding side) circuit

B5: RL Outlet Valve Broken Wire (Warning lamp: 10-3)

Code generation condition		"Control valve (rear-axle left-wheel; outlet side) open circuited" is detected.
Resettability		System resets if normal signal is received with starter switch set OFF → ON (electronic control unit reactivated).
Electronic control unit control		Anti-lock brake control limited to rear-axle left wheel
Inspection item	Actuator test	08: Outlet Valve RL
	Electronic control unit connector	04: Control valve
	Electrical part	#589: Control valve
	Wiring diagram	Control valve (rear-axle left-wheel; pressure holding side) circuit

B6: RL Outlet Valve Short LO (Warning lamp: 10-2)

Code generation condition		"Control valve (rear-axle left-wheel; outlet side) short-circuited to – side" is detected.
Resettability		System resets if normal signal is received with starter switch set OFF → ON (electronic control unit reactivated)
Electronic control unit control		Anti-lock brake control limited to rear-axle left wheel
Inspection item	Actuator test	08: Outlet Valve RL
	Electronic control unit connector	04: Control valve
	Electrical part	#589: Control valve
	Wiring diagram	Control valve (rear-axle left-wheel; outlet side) circuit

B7: RL Outlet Valve Short HI (Warning lamp: 10-1)

Code generation condition		"Control valve (rear-axle left-wheel; outlet side) short-circuited to + side" is detected.
Resettability		System resets if normal signal is received with starter switch set OFF → ON (electronic control unit reactivated)
Electronic control unit control		Anti-lock brake system totally disabled
Inspection item	Actuator test	08: Outlet Valve RL
	Electronic control unit connector	04: Control valve
	Electrical part	#589: Control valve
	Wiring diagram	Control valve (rear-axle left-wheel; outlet side) circuit

BD: RL Valve Config Error (Warning lamp: 10-8)

Code generation condition		Electronic control unit error in recognition of appropriate control valve
Resettability		System resets if normal signal is received with starter switch set OFF → ON (electronic control unit reactivated)
Electronic control unit control		None
Inspection item	Other	Check to see if control valve is correctly connected.

D0: WSS Failure in Pre Pow on Cycle (Warning lamp: 17-12)

Code generation condition		"Wheel speed sensor faulty last time starter switch set ON" is stored in memory.
Resettability		System resets if normal signal is received with starter switch in ON position.
Electronic control unit control		Anti-lock brake system disabled
Inspection item	Other	• Even if previous fault of sensor was remedied, display of the code D0 continues until vehicle is started. • Even if "Memory Clear" is executed, the code D0 is not deleted until normal signal at vehicle start is input.

D1: GND-ECU Broken Wire or Short LO (Warning lamp: 17-10)

Code generation condition		Electronic control unit ground circuit is open-circuited or shorted.
Resettability		System resets if normal signal is received with starter switch set OFF → ON (electronic control unit reactivated)
Electronic control unit control		Normal control
Inspection item	Wiring diagram	Electronic control unit ground circuit

D2: Tire Size Error, Front to Rear (Warning lamp: 17-5)

Code generation condition		Front and rear-wheel tires not of specified size (speed difference between wheels exceeds specified limit).
Resettability		System resets if normal signal is received with starter switch set OFF → ON (electronic control unit reactivated)
Electronic control unit control		Anti-lock brake system disabled
Inspection item	Service data	01: Wheel speed FL 02: Wheel speed FR 03: Wheel speed RL 04: Wheel speed RR
	Other	Inspection of tires (See Gr31.)

D4: WSS Mixed Up (Warning lamp: 17-13)

Code generation condition		Left- and right-wheel wheel speed sensors were installed at wrong positions.
Resettability		System resets if normal signal is received with starter switch set OFF → ON (electronic control unit reactivated)
Electronic control unit control		Anti-lock brake system disabled
Inspection item	Wiring diagram	Wheel speed sensor circuits

4. Multi-Use Tester Service Data

NOTE

- **Service data can be accessed while actuator test is being performed, and vice versa.**

No.	Item	Data	Diagnostic condition	Normal status
01	Wheel Speed FL	■■■. ■km/h	When vehicle running	Synchronized with speedometer
02	Wheel Speed FR	■■■. ■km/h

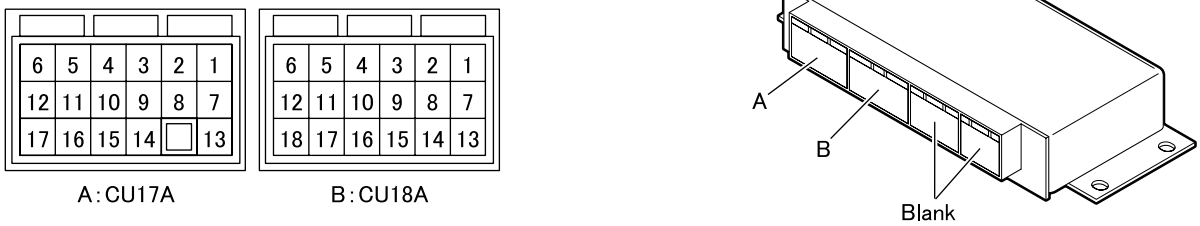
7. Inspection at Electronic Control Unit Connector

- As essential part of troubleshooting, this inspection is performed to ensure that various signals from the electronic control unit are duly transmitted via vehicle harnesses and connectors. Note that ⓫, ⓬... shown in the table are also found in “3. Inspection Based on Diagnosis Code” of this manual.

7.1 Electronic control unit connector terminal arrangement



P63464E

7.2 Inspection procedure

- Inspection is performed with connectors disconnected and otherwise, depending on the nature of check.

CAUTION ⚠

- **Never touch terminals not involved in the check being performed. Take particular care not let the tester cause a short circuit between terminals.**

Check item	Measurement
⓫ Electronic control unit power voltage	<Electronic control unit power supply> [Condition] • Vehicle harness connected (check to be performed at back side of connector) [Criteria] Between terminals (+) – (–): A17-A14 • Starter switch OFF: 0V • Starter switch ON: 11 to 16V <Control valve power supply> [Condition] • Vehicle harness connected (check to be performed at back side of connector). [Criteria] Between terminals (+) – (–): A1-A6; 11 to 16V
⓬ Anti-lock brake system auxiliary brake cut relay signal voltage	[Condition] • Starter switch ON • Vehicle harness connected (check to be performed at back side of connector) [Criteria] Between terminals (+) – (–): A7-A6 • Anti-lock brake system ON (relay activated): 0V • Anti-lock brake system OFF (relay not activated): 11 to 16V

Check item	Measurement
⓪③ Wheel speed sensor resistance	[Condition] • Starter switch OFF • Connector disconnected; check at vehicle-side connector [Criteria] <Front-axle left-wheel> Between terminals: B10-B11: 1400 ± 200 Ω (coil resistance) B10-A6: 1M Ω or higher (insulation resistance) <Front-axle right-wheel> Between terminals: B8-B9: 1400 ± 200 Ω (coil resistance) B8-A6: 1M Ω or higher (insulation resistance) <Rear-axle left-wheel> Between terminals: B13-B14: 1400 ± 200 Ω (coil resistance) B13-A6: 1M Ω or higher (insulation resistance) <Rear-axle right-wheel> Between terminals: A3-A9: 1400 ± 200 Ω (coil resistance) A9-A6: 1M Ω or higher (insulation resistance)
⓪④ Control valve resistance	[Condition] • Starter switch OFF • Connector disconnected; check at vehicle-side connector [Criteria] <Front-axle> Between terminals: B5-B18: 5.5 ± 0.35 Ω (pressure holding side) B12-B18: 5.5 ± 0.35 Ω (outlet side) <Rear-axle left-wheel> Between terminals: B1-B15: 5.5 ± 0.35 Ω (pressure holding side) B7-B15: 5.5 ± 0.35 Ω (outlet side) <Rear-axle right-wheel> Between terminals: B3-B16: 5.5 ± 0.35 Ω (pressure holding side) B2-B16: 5.5 ± 0.35 Ω (outlet side)

ON-VEHICLE INSPECTION AND ADJUSTMENT

1. Functional Check

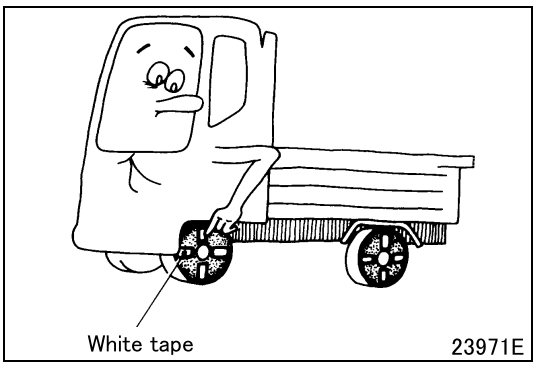
1.1 Inspection with vehicle in stationary state

- While pressing the brake pedal, check the control valves, brake pipes and connections for air leakage.
- If air is leaking from the control valve unit, replace it. Retighten air pipes and connections if leaky.

1.2 Inspection of anti-lock brake system operation while running vehicle

CAUTION ⚠

- **During this inspection, do not let any other vehicles and people in the test course.**

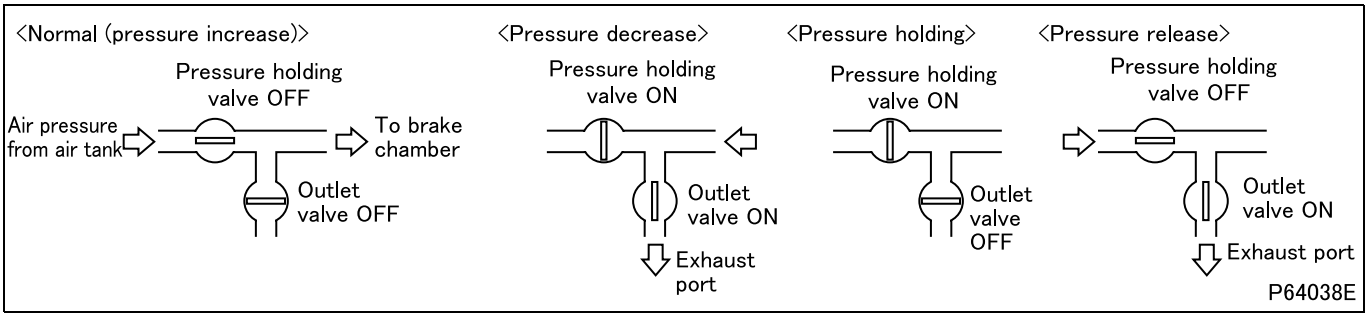


- Perform the inspection with the vehicle unloaded.
- Attach white tape to the wall of each tire to facilitate the observation of front and rear wheels.
- Turn the starter switch from OFF to ON. The warning lamp should be lit.
- The warning lamp should go out after 2 seconds.
- Run the vehicle at 20 to 30 km/h {12 to 19 mph} and apply the brakes. All the wheels should not lock up.

1.3 Operational inspection of control valve

(1) Outline

- The operational inspection of the control valve for each wheel is performed by effecting a train of relative workings of its outlet and pressure holding valves (to increase, decrease, hold and release pressure).
- The operation of the control valve is as depicted below. (For details, see “STRUCTURE AND OPERATION” in this manual.)



- For the inspection, use Multi-Use Tester actuator test procedures.
  - Actuator test No. 21 to 24 (anti-lock brake system valve test 1): Inspect the control valve by effecting false activation of the electronic control unit with pressure decreased, pressure held and pressure slowly increased (repetition of pressure increase and holding).
  - Actuator test No. 25 to 28 (anti-lock brake system valve test 2): Check for air exhaust noise and braking power by making the control valve operate (to release, increase, decrease and hold pressure).

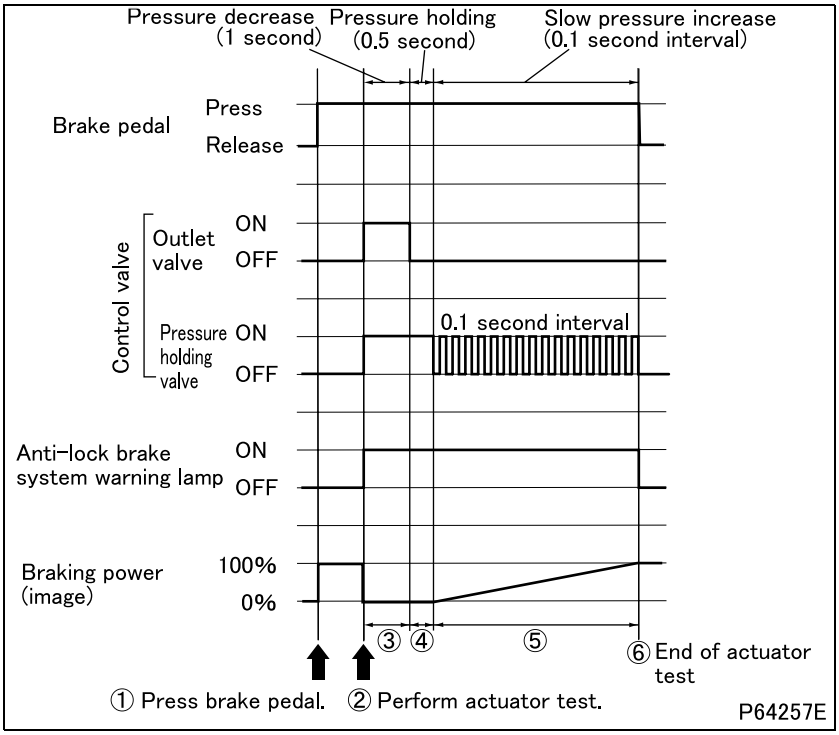
CAUTION ⚠

- **To avoid a brake failure due to wrong pipe connection, be sure to perform functional checks after the control valve is replaced or reinstalled.**

(2) Preparation

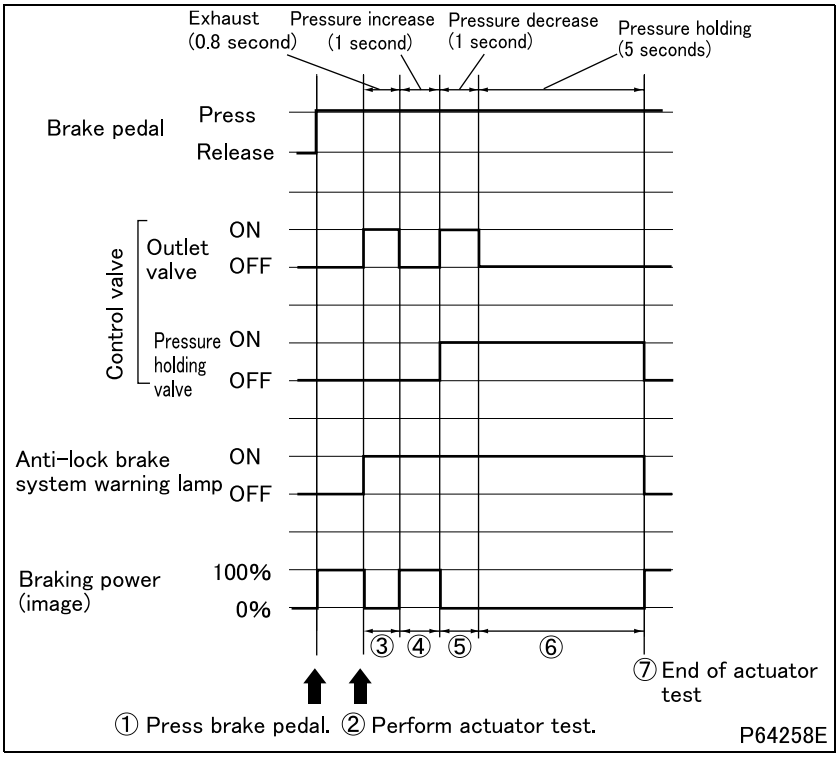
- Place the axle subjected to inspection on the brake tester.
- Before testing the front brake, apply the parking brake. For testing the rear brake, apply chocks to the front wheels to hold them in place.
- Check the brake tester rollers and tires dry. Protect them against water, etc. while they are checked.
- Release the parking brake, and read the drag force of the wheel under inspection.
- Connect the Multi-Use Tester. (See Gr00.)
- Make sure that the transmission is in neutral, then start the engine.

(3) Inspection with false activation of anti-lock brake system



- Hold the brake pedal down throughout the actuator test. (1)
- Perform Multi-Use Tester actuator test [anti-lock brake system valve test 1] on the wheel under inspection. (2)
- Both the outlet and pressure holding valves are activated (ON). Air pressure in the brake chamber is decreased (for 1 second). Verify by the brake tester that the pressure decrease results in a drop in braking power. (3)
- Air pressure in the brake chamber is held for 0.5 second with the outlet valve deactivated (OFF) and the outlet valve activated (ON). Braking power remains down. (4)
- The pressure holding valve minutely repeats a cycle of ON (pressure holding) and OFF (pressure increase). Braking power should gradually increase back to 100%. (5)
- The actuator test ends. Release the brake pedal. (6)
- If any abnormality is observed, inspect outlet and pressure holding valve workings of the control valve.

(4) Inspection of outlet and pressure holding valve workings of control valve



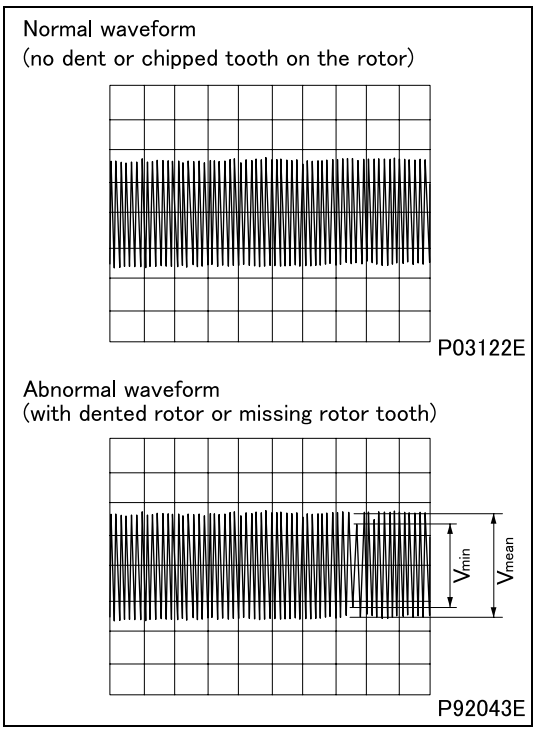
- Hold down the brake pedal throughout the test. (1)
- Perform Multi-Use Tester actuator test [anti-lock system valve test 2] on the wheel under inspection. (2)
- The outlet valve is activated (ON) and the pressure holding valve is deactivated (OFF). Air pressure from the brake chamber and air tank is let out (for 0.8 second). Braking power should drop with an air exhaust noise heard from the control valve. (3)
- Both the outlet and pressure holding valve are deactivated (OFF). Air pressure should be increased and braking power should be regained as a result. (4)
- Both the outlet and pressure holding valve are activated (ON). Air pressure in the brake chamber should be decreased and braking power would drop as a result. (5)
- The outlet valve is deactivated (OFF) and the pressure holding valve is activated (ON). Air pressure in the brake chamber is held (for 5 seconds). Braking power remains down. (6)
- The actuator test ends, with both the outlet valve and pressure holding valve deactivated (OFF). As the brake pedal remains pressed, braking power should be regained again. (7)

- If inspection finds faults described below, perform appropriate troubleshooting in accordance with the following table.

Symptom	Probable cause	Action
Brake pedal is pressed but no braking power is generated.	Brake line or brake related device except control valve faulty	See Gr35.
	Air line in control valve clogged	Replace control valve.
Braking power is not reduced or not regained after reduced.	Control valve air piping incorrect	Correct piping.
	Control valve faulty	Replace control valve.
	Control valve harness connection incorrect	Connect harness correctly.

2. Oscilloscopic Inspection through Wheel Speed Sensor Signal Waveform

- The tester is inappropriate to inspection for dented rotor or missing rotor tooth. Instead, use the oscilloscope function of the Multi-Use Tester or an oscilloscope capable of waveform recording.
- In many cases, dented rotor or missing rotor tooth results from the contact of the rotor press-fitted in the hub tip with the axle or elsewhere that can occur in the process of the hub and brake drum being assembled to the axle. Therefore, care should be taken so that the rotor does not touch other parts when the hub and brake drum are assembled to the axle.



2.1 Inspection

- Jack up the wheel under inspection. Disconnect the wheel speed sensor connector.
- Connect the oscilloscope terminals to the disconnected connector. Rotate the wheel at a certain speed and check oscilloscopic waveform for dented rotor or missing rotor tooth.
- If any wave is evidently smaller in width than others, there should be a dented rotor or missing rotor tooth. The standard wave width is as calculated below.

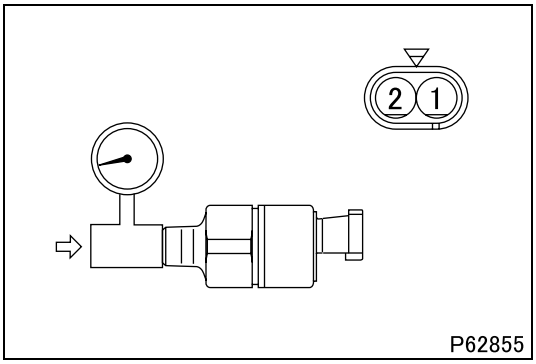
$$\frac{\text{Vmean} - \text{Vmin}}{\text{Vmean}} \times 100 \leq 20\%$$

where
Vmin: Minimum wave width
Vmean: Average of maximum wave widths

- If there is a wave more than 20% smaller in width than others, visually examine the rotor for the defect and replace if necessary. (See Gr26, 27.)

M E M O

INSPECTION OF ELECTRICAL COMPONENTS



#042 Inspection of stop lamp switch

- Perform the following checks. Replace the switch if faulty.

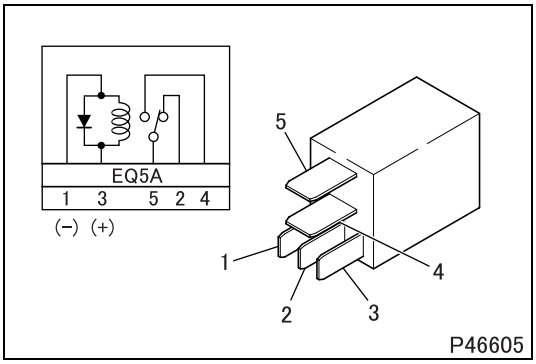
(1) Check without air pressure applied

- Check that there is no continuity between the terminals 1 and 2.

(2) Check with air pressure applied

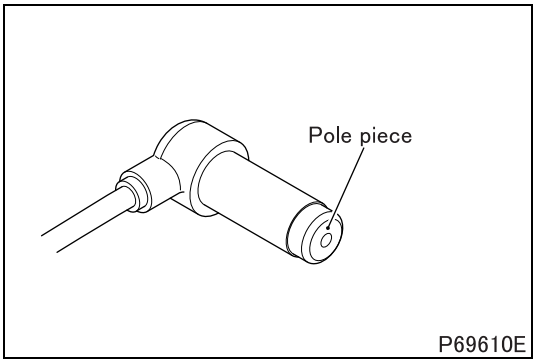
- Apply air pressure slowly, starting with 0 kPa {0 psi, 0 kgf/cm^2}.
- Check that air pressure is at the standard value when continuity is established between the terminals 1 and 2.

Standard value (working pressure)	29 ± 9.8 kPa {4.2 ± 1.4 psi, 0.3 ± 0.1 kgf/cm^2}



#180 Inspection of relay (normally open 5-pin relay)

- Check the relay for continuity and function. If faulty, replace the relay.

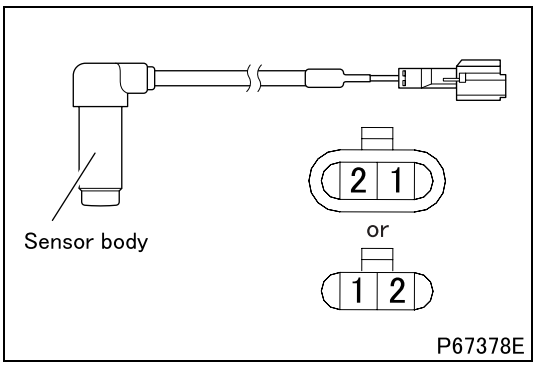


#329 Inspection of wheel speed sensor

- Perform the following checks. Replace the wheel speed sensor if faulty.

CAUTION ⚠

- **The pole piece is magnetized by the built-in magnet of the wheel speed sensor. Be careful not to let metal parts stick onto the pole piece.**



(1) Coil resistance

- Measure resistance between the terminals 1 and 2.

Standard value	1400 ± 200 Ω

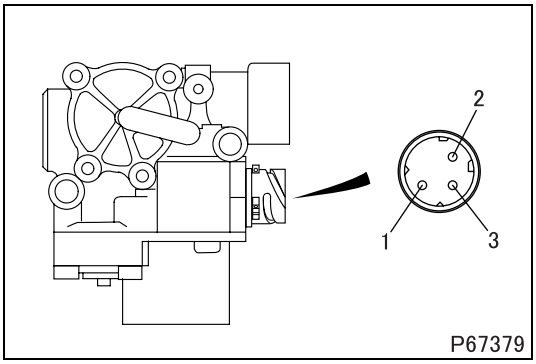
(2) Insulation resistance

- Measure resistance between the terminal 1 and vehicle body and between the terminal 2 and sensor body.

Standard value	1MΩ or above

(3) Open circuit

- Unclamp the harness loose, then bend and stretch it to determine whether or not a transient open circuit occurs. At the same time, check the connecting condition of connector terminals.



#589 Inspection of control valve

- Perform the following checks. Replace the valve if faulty.

(1) Coil resistance

Standard value	Pressure holding valve	1–3	5.5 ± 0.35 Ω
	Outlet valve	1–2	

(2) Insulation resistance

- Measure resistance between each terminal and the valve body.

Standard value	1MΩ or above

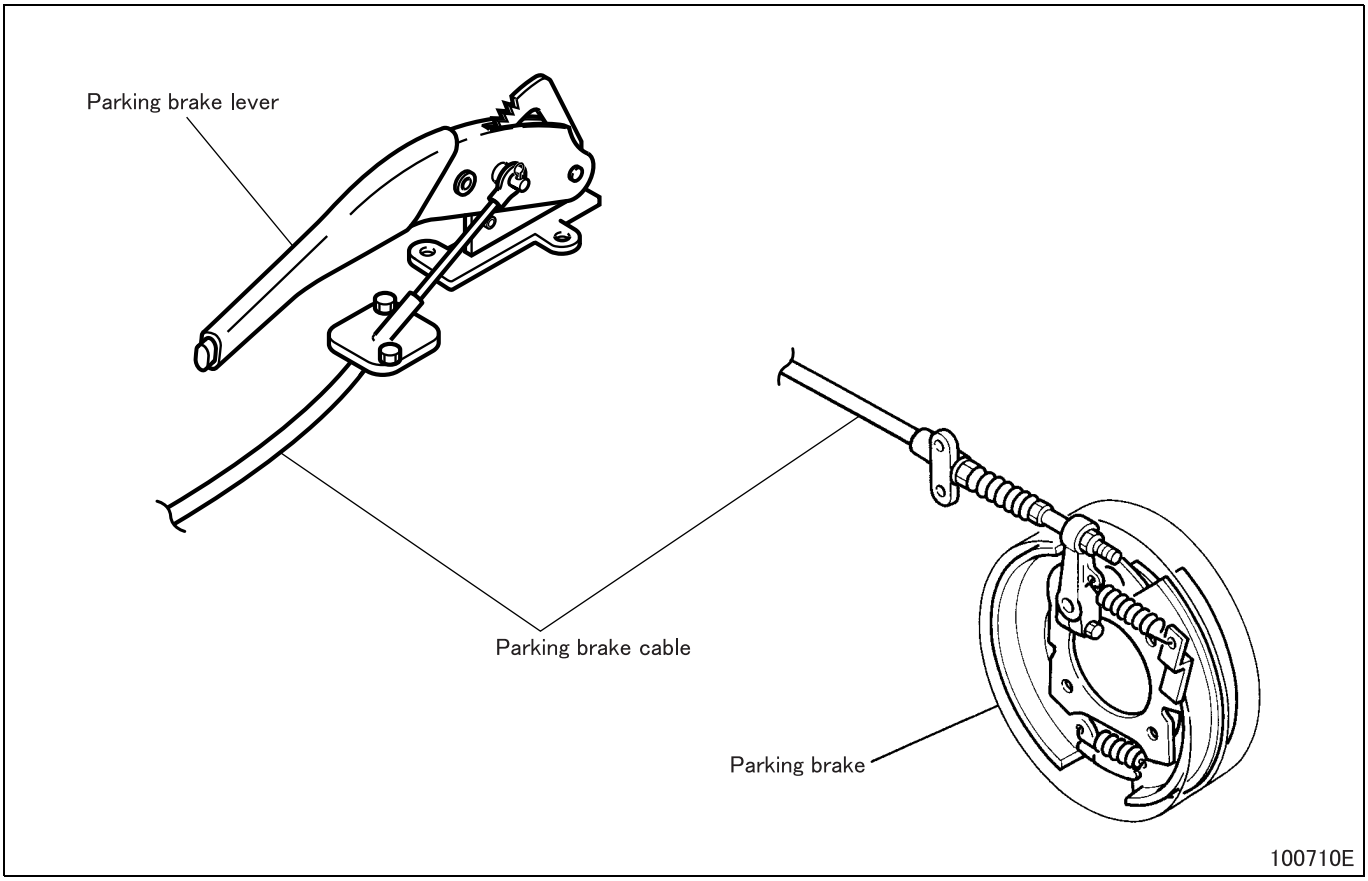
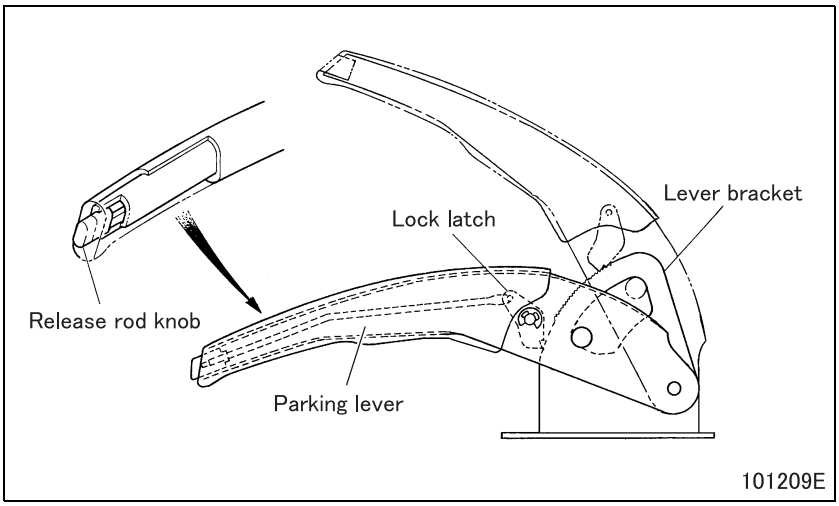
SPECIFICATIONS

Item		Specifications
Brake	Type	Internal expanding type acting on propeller shaft
		Air over hydraulic brake vehicle
	Operation type	Mechanical cable type
Parking brake	Type	Duo servo type
	Brake drum I.D. mm {in.}	ϕ254 {10}
	Lining width $\times$ thickness mm {in.}	60 $\times$ 5.8 {2.36 $\times$ 0.23}

1. Parking Brake System

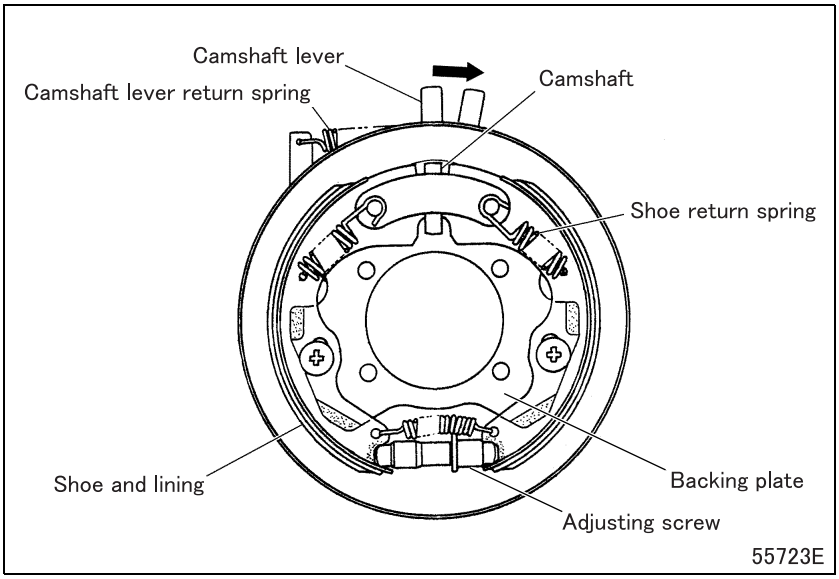


2. Parking Brake Lever



- Pulling the parking brake lever makes the parking brake work, at which point the lock latch engages with the lever bracket and the lever is locked.
- To release the parking brake lever, slightly pull it up while pushing the release rod knob. This disengages the lock latch from the lever bracket, allowing the parking brake lever to return to the released position.

3. Parking Brake



- The camshaft lever that actuates the shoe and lining is a built-in component of the parking brake.
- Pulling the parking brake lever pulls the parking brake cable, which in turn pull the camshaft lever.
- When the camshaft lever is pulled, it rotates the camshaft to expand the shoe and linings. At the same time the adjusting screw moves and both shoe and linings work as a leading shoe.
- When the parking brake lever (parking lever) is returned to the released position, the repercussive force of the shoe return spring releases the brake.

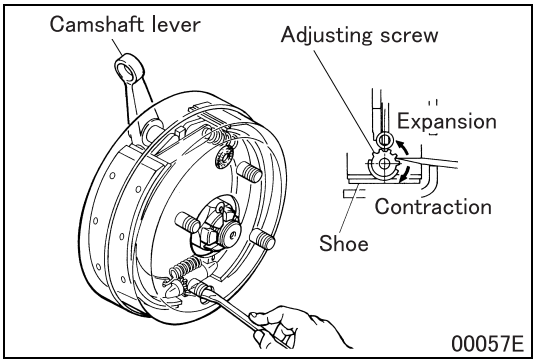
Possible causes / Symptoms		Parking brake does not work	Parking brake release not smooth (dragging)	Parking brake lever operating physical force insufficient	Parking brake lever operating physical force excessive	Reference Gr
Parking brake cable	Inner cable stretched or damaged	O	O	O	O	
	Inner cable improperly adjusted	O	O	O	O	
Parking brake lever	Lock latch and lever bracket pawl engaged improperly	O				
	Pulling stroke insufficient		O		O	
	Pulling stroke excessive	O		O		
Parking brake	Shoe clearance insufficient		O		O	
	Shoe clearance excessive	O		O		
	Parking brake drum inner surface deformed or warped	O		O		
	Lining worn unevenly	O		O		
	Brake drum inner surface greasy or oily	O				
	Lining surface greasy or oily	O				
	Camshaft lever return spring fatigued or fractured		O			
	Shoe return spring fatigued or fractured		O			

ON-VEHICLE INSPECTION AND ADJUSTMENT

1. Adjustment of Parking Brake Shoe Clearance

Service standards (Unit: mm {in.})

Location	Maintenance item	Standard value	Limit	Remedy
–	Brake shoe clearance	0.1 to 0.25 {0.0039 to 0.0098}	–	Adjust

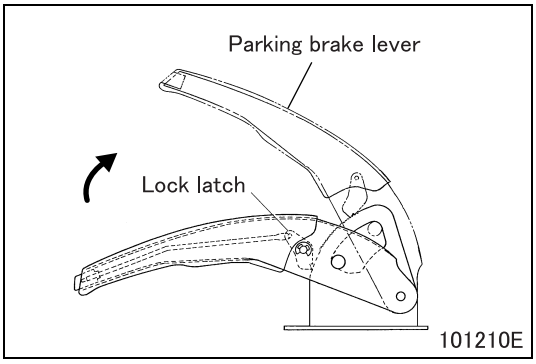


- Chock the front wheels and raise the rear wheels with a jack.
- Operate the parking brake lever to release the parking brake. (The parking lever is released from locking.)
- Using a standard screwdriver inserted through the shoe adjusting hole in the parking brake drum, turn the adjusting screw in the expansion direction shown to bring the shoe into close contact with the brake drum.
- Turn the adjusting screw 8 notches in the contraction direction shown from the position where the shoe is in close contact with the drum. The shoe clearance should be adjusted to the standard value.

2. Inspection and Adjustment of Parking Brake Lever

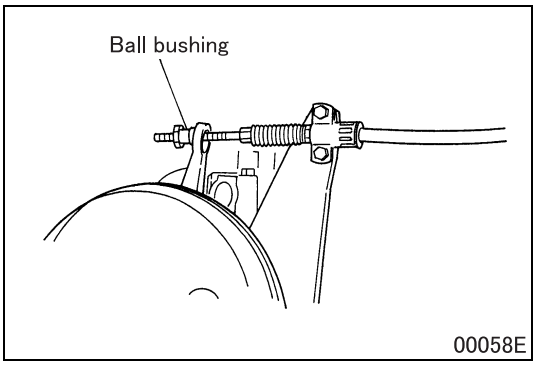
Service standards

Location	Maintenance item	Standard value	Limit	Remedy
–	Parking brake lever pulling stroke (with operating physical operating of 490 N {110 lbs, 50 kgf})	7 to 10 notches	–	Adjust or inspect



[Inspection]

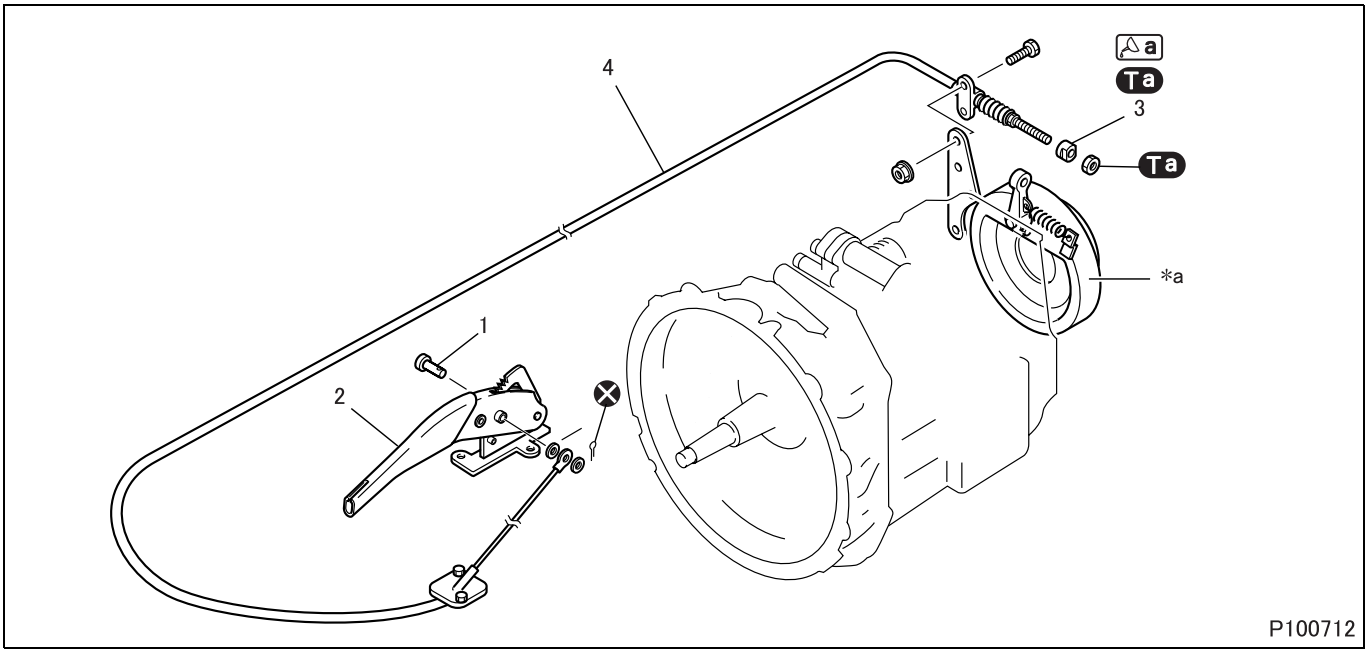
- Pull the parking brake lever from the released position with the specified operating physical force and count the number of cleared notches.
- If the count of notches deviates from the specified range of standard values, adjust the length of the parking brake cable.
- If the count of notches (pulling stroke) is still out of the specified range after cable length adjustment, check the parking brake shoe clearance.



[Adjustment]

- Turn the ball bushing to adjust the length of the parking brake cable.

PARKING BRAKE CONTROL



● **Removal sequence**

1 Clevis pin
2 Parking brake lever (See later section.)
3 Ball bushing
4 Parking brake cable

***a**: Parking brake or retarder and parking brake

● **Installation sequence**

Follow the removal sequence in reverse.

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Ball bushing and nut (parking brake cable mounting)	8 to 13 {5.9 to 9.6, 0.8 to 1.3}	–

Lubricant and/or sealant

Mark	Point of application	Specified lubricant and/or sealant	Quantity
a	Spherical surfaces of ball bushing	Chassis grease [NLGI No.1 (Li soap)]	As required

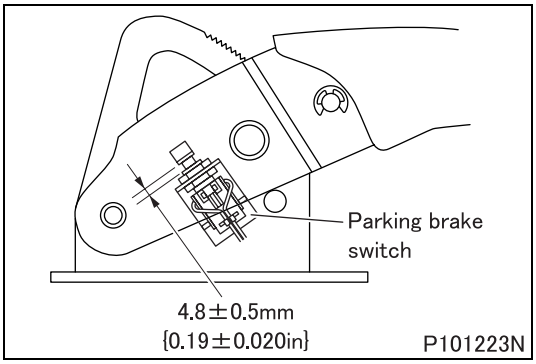
Lubricant and/or sealant

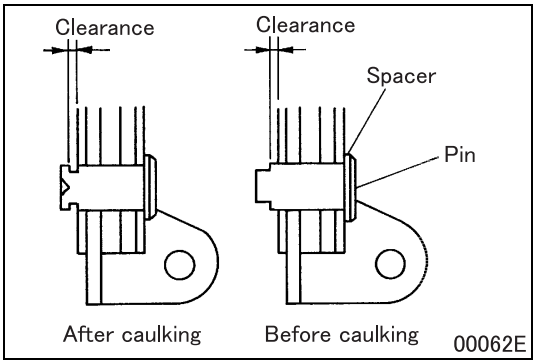
Mark	Point of application	Specified lubricant and/or sealant	Quantity
a	Rotating and sliding areas of pin	Chassis grease [NLGI No.1 (Li soap)]	As required
b	Release rod knob of release rod mounting thread	Cemedine 1500	As required

◆Installation procedure◆



■ Installation: Parking brake switch

- Install the parking brake switch to the illustrated dimension.

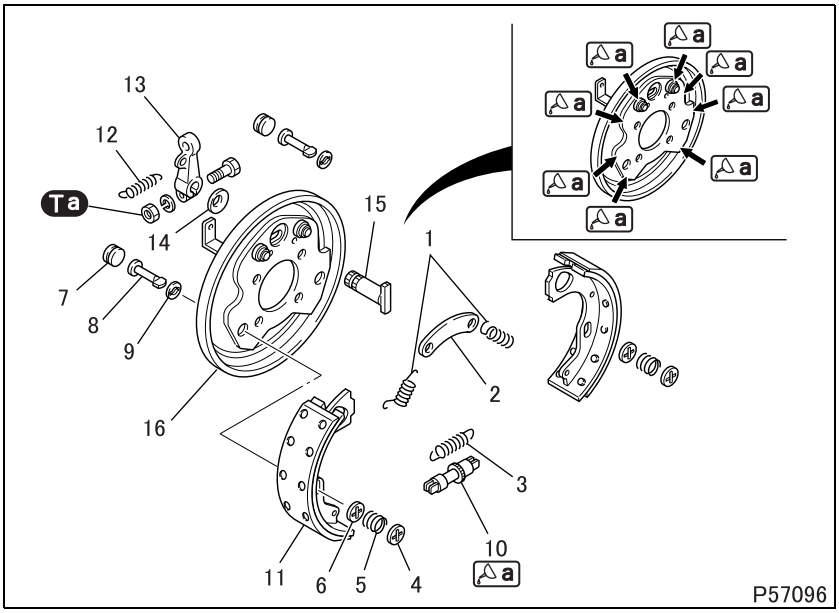


■ **Installation: Pin**

- Do not use a spacer if clearance before caulking is less than 0.6 mm {0.024 in.}. If the clearance is between 0.6 mm and 0.96 mm {0.024 and 0.038 in.}, adjust it with a spacer.
- Make sure that the clearance after caulking is as shown in the table below. Reassemble if the clearance is out of the dimensions shown in the table below.

	Without spacer	With spacer
Clearance after caulking	0.06 to 0.6 mm {0.0024 to 0.024 in.}	0 to 0.36 mm {0 to 0.014 in.}

PARKING BRAKE



- For removal and installation of the parking brake, see Gr23.

11 Shoe and lining
12 Camshaft lever return spring
13 Camshaft lever
14 Wave washer
15 Camshaft
16 Support plate and cover

● Assembly sequence

Follow the disassembly sequence in reverse.

CAUTION ⚠

- **To prevent poor working of the brake, do not smear the surface of the shoe and lining with grease or oil.**

- **When the shoe and lining has been placed with a new one, always check it for contact with the parking brake drum.**

Service standards (Unit: mm {in.})

Location	Maintenance item	Standard value	Limit	Remedy
1	Installed load of shoe return spring (installed length: 75 {2.95})	180 ± 18 N {41 ± 4.0 lbs, 18.5 ± 1.8 kgf}	145 N {33 lbs, 15 kgf}	Replace
3	Installed load of Adjusting wheel return spring (installed length: 85 {3.35})	105 ± 11 N {24 ± 2.4 lbs, 11 ± 1.1 kgf}	86 N {19 lbs, 8.8 kgf}	
5	Installed load of shoe holddown spring (installed length: 14 {0.55})	145 ± 15 N {33 ± 3.3 lbs, 15 ± 1.5 kgf}	115 N {26 lbs, 12 kgf}	
11	Brake lining thickness of shoe and lining	6.4 {0.25}	3.1 {0.12}	
12	Installed load of camshaft lever return spring (installed length: 85 {3.35})	62 ± 5.9 N {14 ± 1.3 lbs, 6.3 ± 0.6 kgf}	49 N {11 lbs, 5 kgf}	

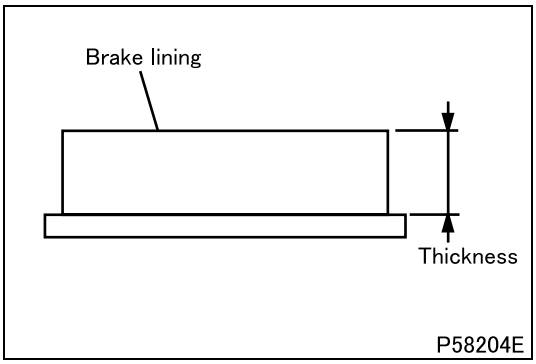
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Nut (camshaft lever mounting)	14 to 23 {10 to 17, 1.4 to 2.3}	–

Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Brake shoe contact surfaces on both ends of adjusting screw	Brake grease (AKB 100)	As required
	Brake shoe contact surfaces with support plate and cover		
	Brake shoe contact surfaces with anchor pin of support plate and cover		

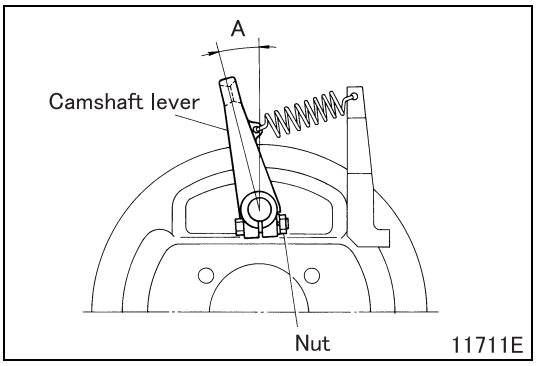
◆Inspection procedure◆



■ Inspection: Brake lining thickness of shoe and lining

- If the measured value is lower than the limit, replace the shoe and lining.

◆Installation procedure◆



■ Installation: Camshaft lever

- Align the camshaft lever with illustrated angle A and tighten the nut to the specified torque.

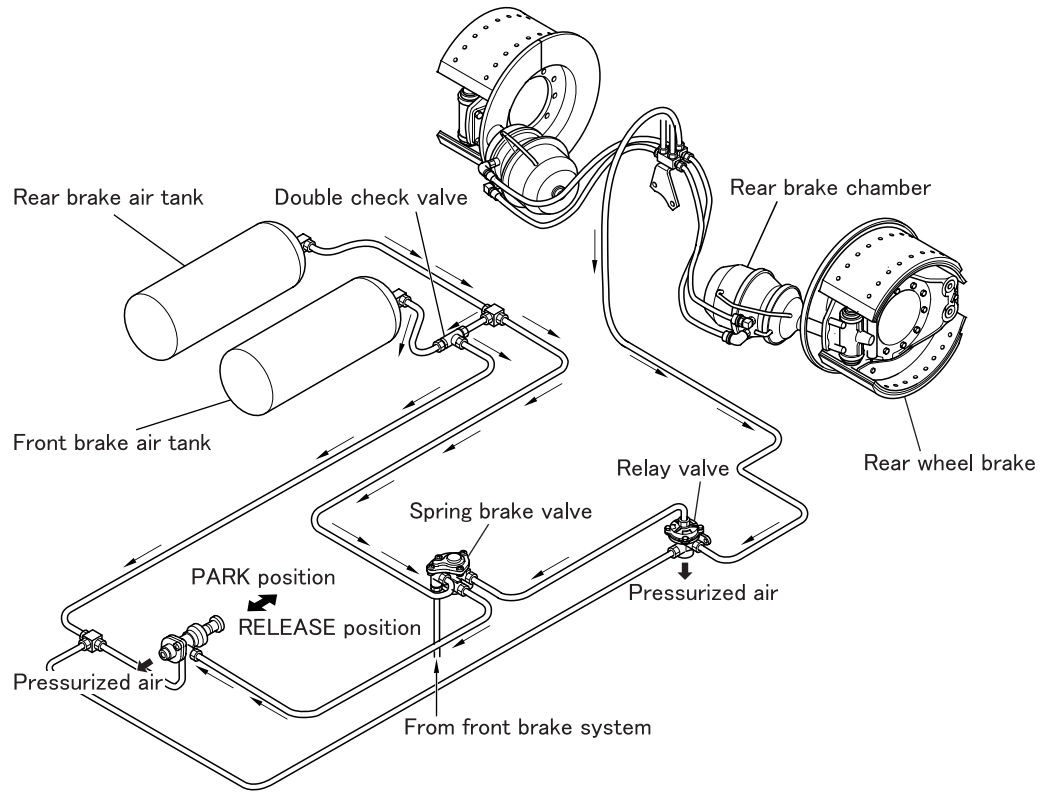
DOUBLE CHECK VALVE 36B-17

RELAY VALVE (WITH DOUBLE CHECK VALVE) 36B-18

1. Parking Brake System



- In the wheel parking brake system, operating parking brake control valve causes rear brake chamber, which contains a spring brake, to apply rear wheel brake, generating braking force.
- Pulling out the knob of parking brake control valve to the PARK position, feeds pressurized air from the parking brake control valve and spring brake valve to relay valve. This exhausts pressurized air in the spring brake in rear brake chamber through the exhaust port of the relay valve, causing the spring brake to generate braking force.
- Pushing in the knob of parking brake control valve to the RELEASE position, feeds pressurized air from rear brake air tank to relay valve via the parking brake control valve.
  Consequently in the separate air system, pressurized air from the rear brake air tank is fed to the spring brake of rear brake chamber via the relay valve, releasing the wheel parking brake.

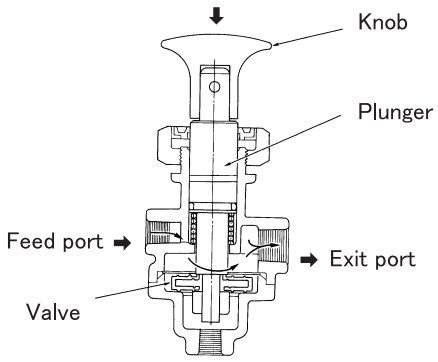
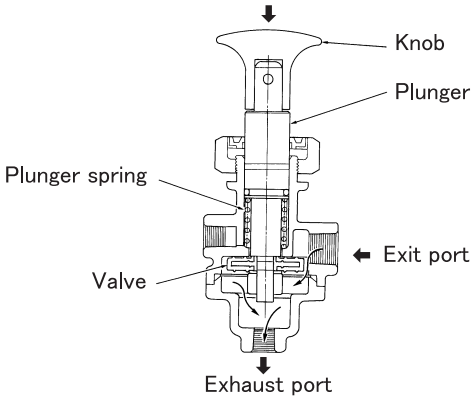
2.1 Feed action (RELEASE)



68109E

- When the air pressure at feed port reaches 420 kPa {61 psi, 4.3 kgf/cm^2} or higher, pushing in knob causes valve at the top of plunger to close the exhaust port, feeding pressurized air to exit port.

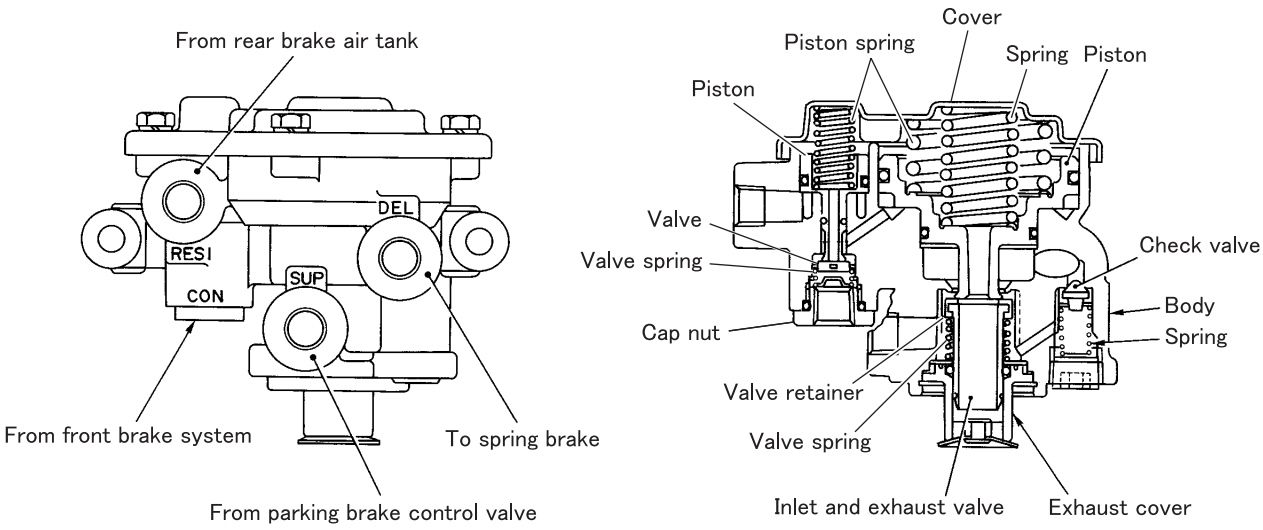
2.2 Exhaust action (PARK)



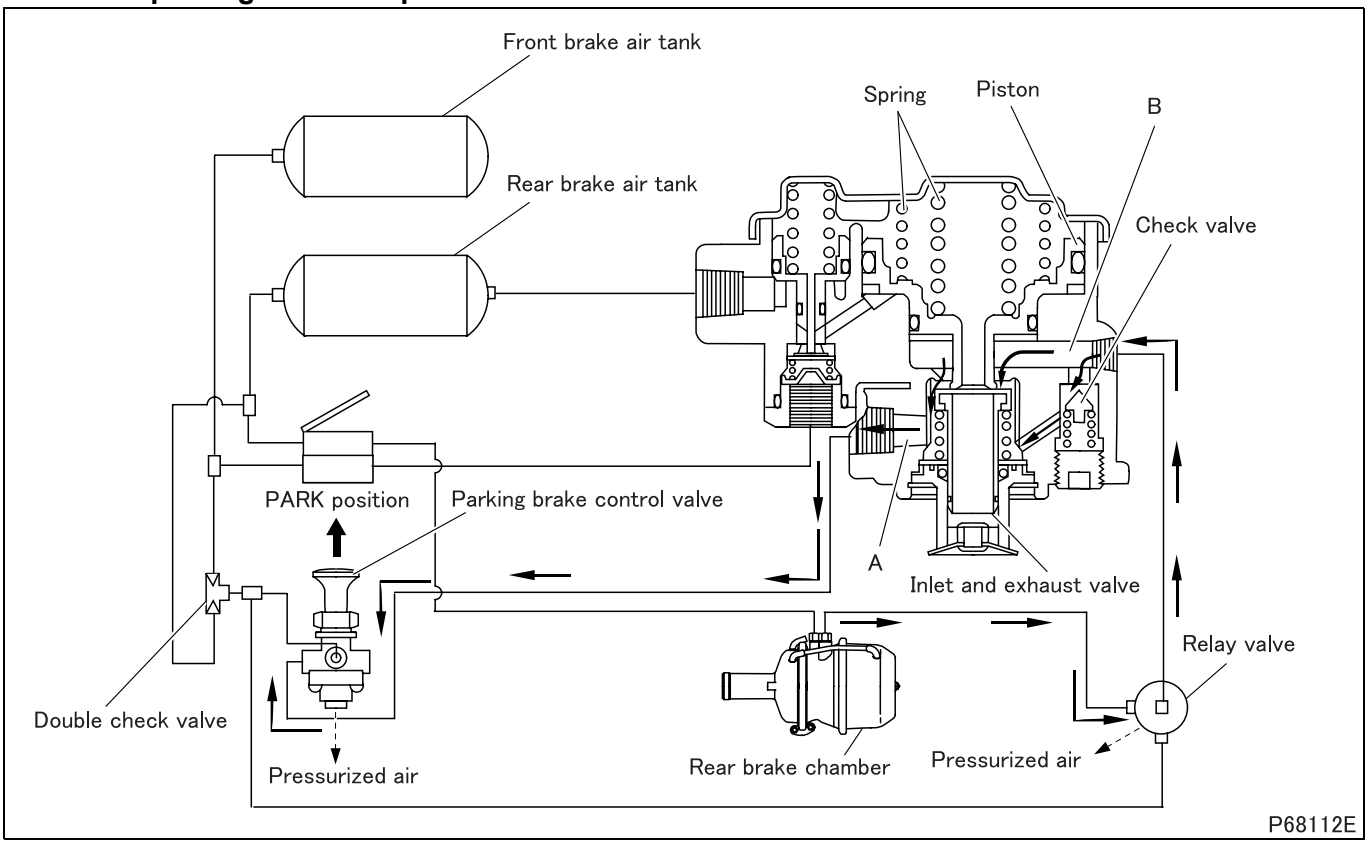
68110E

- Pulling out knob causes valve at the top of plunger to open exhaust port, and remains in that position, closing the feed port. This exhausts the air returned from exit port through the air exhaust port.
- When the air pressure at the supply port drops to 275 kPa {40 psi, 2.8 kgf/cm^2} or lower, the repercussive force of plunger spring overcomes the air pressure acting on valve pushing out knob automatically. This exhausts the air through exit port.

3. Spring Brake Valve

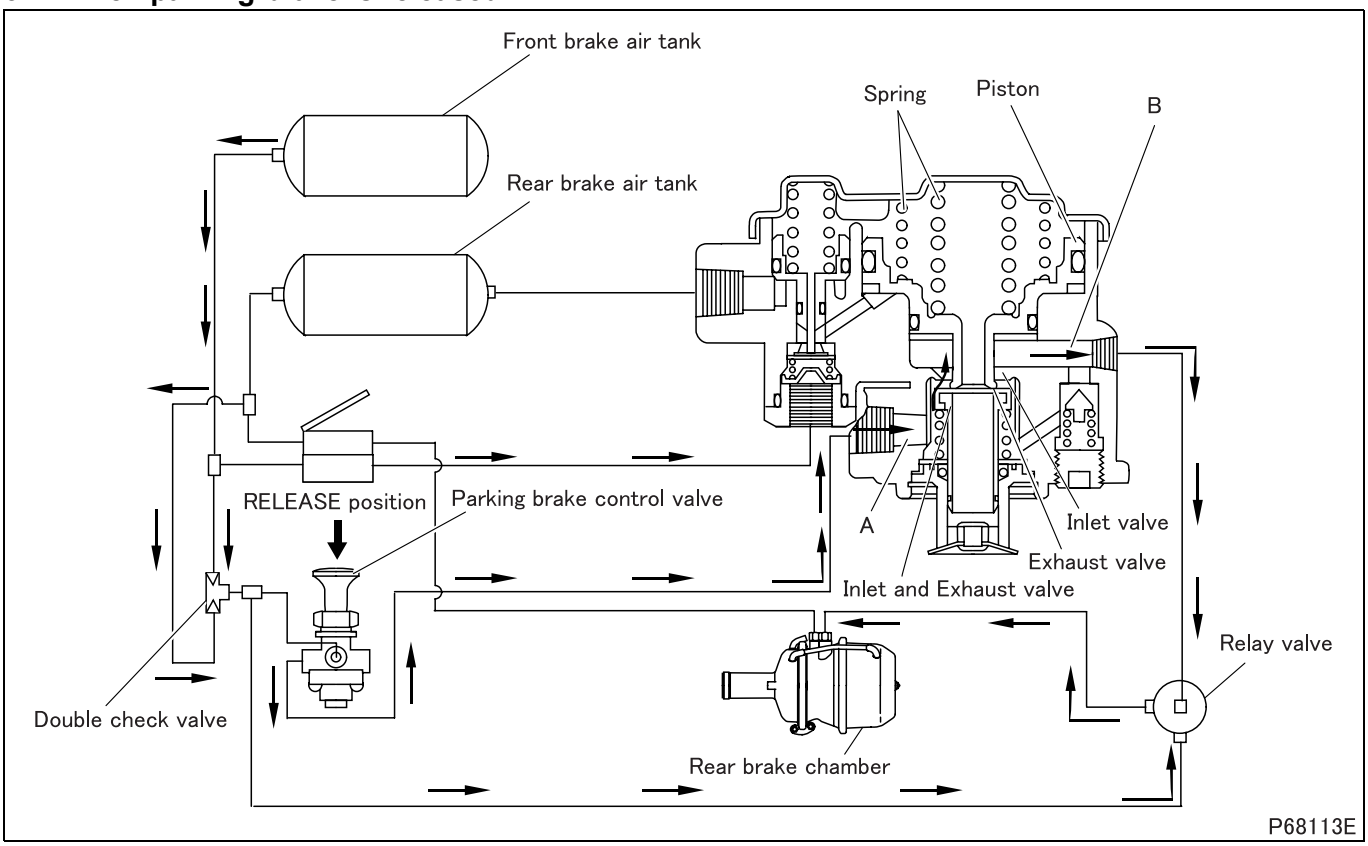


3.1 When parking brake is operated



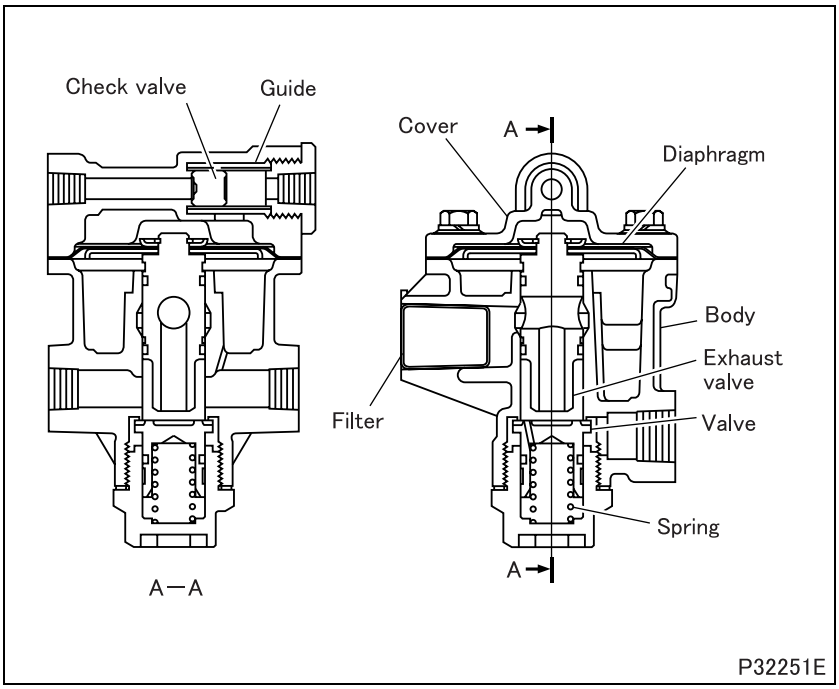
- Pulling out the knob of parking brake control valve to PARK position, exhausts the pressurized air in chamber A of the spring brake valve through the parking brake control valve. Then, the pressurized air in chamber B of the spring brake valve forces down check valve, passes through chamber A, and is exhausted through the parking brake control valve.
- When the air pressure in chamber B of the spring brake valve drops sufficiently, springs at the top of piston force the piston down, opening inlet and exhaust valve. This exhausts the pressurized air, which is fed to relay valve, from the spring brake valve.
- Relay valve exhausts the pressurized air from the spring brake in rear brake chamber through the exhaust port.
- The spring brake of rear brake chamber operates to generate braking force.

3.2 When parking brake is released

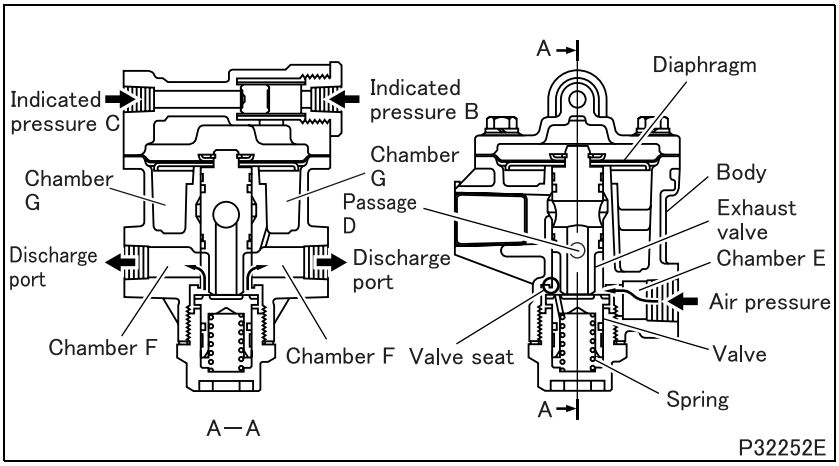


- Pushing in the knob of parking brake control valve to RELEASE position, causes the pressurized air to flow through chamber A of the spring brake valve to chamber B, then the pressurized air is fed to relay valve as air pressure.
- As the air pressure in chamber B rises further, the rising force of piston overcomes the repercussive force of springs. This closes exhaust valve of inlet and exhaust valve, and at the same time lifts the piston and the inlet and exhaust valve together.
- As piston and inlet and exhaust valve rise further, the inlet and exhaust valve closes inlet valve, isolating chambers A and B from each other, stopping the air flow between them.
- When it receives pressurized air, relay valve feeds pressurized air in the separate air system to the spring brake, releasing the wheel parking brake.

4. Relay Valve (With Double Check Valve)

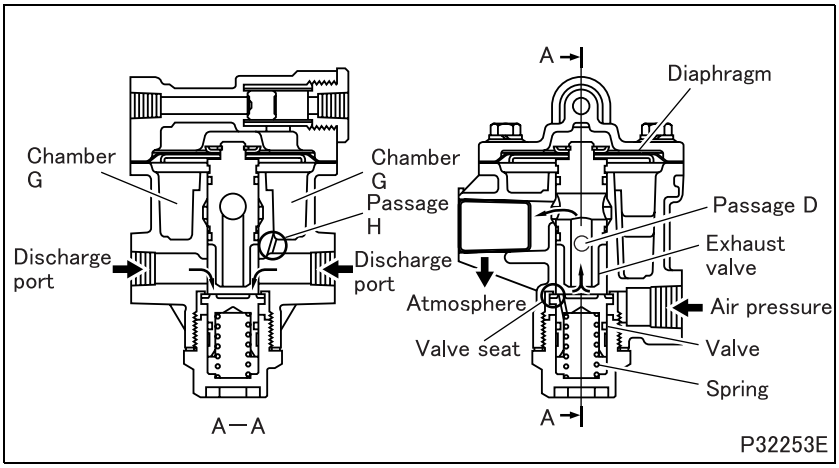


- The relay valve supplies air from the air tank to the brake system under indicated pressure.
- A check valve is incorporated in the cover for double check valve operation.



4.1 When operating

- When indicated pressure B or C comes in, the exhaust valve is forced downward together with the diaphragm.
- The exhaust valve is seated on the valve to close the passage D.
- The exhaust valve further presses the spring to compress and the valve leaves the valve seat as a result.
- Air pressure from the air tank flows into the chamber E, then the chamber F, and goes to the discharge port.



4.2 When releasing

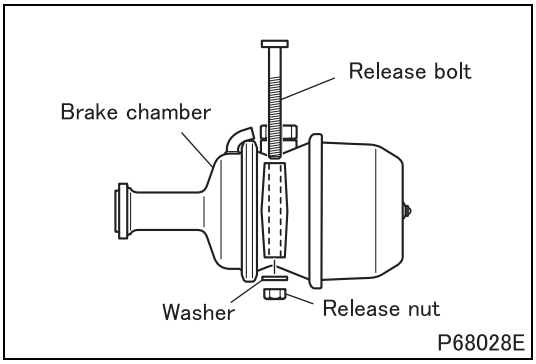
- When indicated B or C is lost, the valve is seated on the valve seat by the spring force to shut off air pressure.
- Air pressure from the discharge port is released into atmosphere from the exhaust port by way of the passage D of the exhaust valve.
- When pressure at the discharge port drops, air pressure in the chamber F is released into atmosphere by way of the passage H and discharge port.

Possible causes \ Symptoms		Parking brake does not work	Parking brake does not release	Reference Gr
Parking control valve	Malfunctioning	O	O	
Spring brake valve	Malfunctioning	O	O	
Brake chamber	Malfunctioning	O	O	Gr35B
Wheel brake	Malfunctioning	O	O	Gr35B
Air line	Air leaking		O	
	Air pressure low		O	

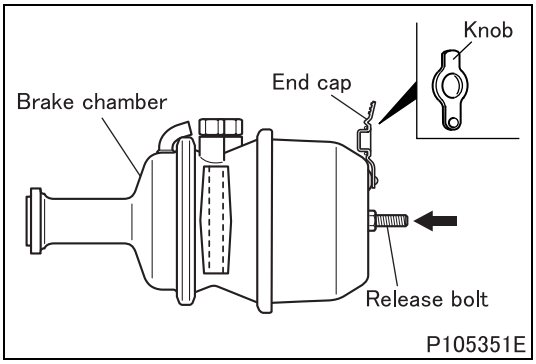
M E M O

1. Manual Release of Parking Brake

- When the parking brake is automatically engaged due to low compressed air pressure, the parking brake should be released again by following the procedure shown below.



- Release spring brake mechanically.
- Remove the release bolt, washer and release nut from the brake chamber.

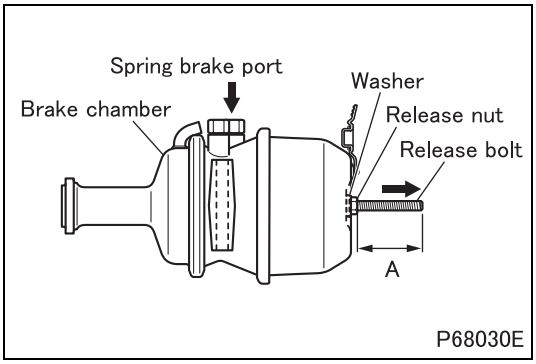


- Remove the end cap without failling to pull up its knob by hand or using a plier or other tools.

CAUTION ⚠

- **Never remove the end cap by inserting a screwdriver or other tools into the brake chamber and prying it to open the chamber. Failure to observe the above can cause the brake chamber to be damaged, allowing water to intrude into the brake chamber. The water can cause rust on spring, leading to breakage in the spring.**

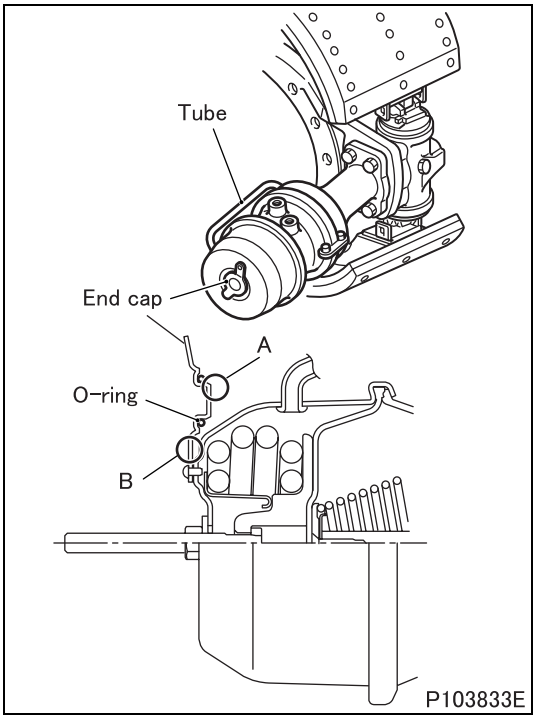
- Insert the release bolt deep into the chamber and turn it a quarter turn.
- Pull the release bolt to check that it does not come off the chamber.
- If the release bolt is pulled off, repeat the above procedure; insert the bolt deep into the chamber and turn it a quarter turn again.



- Attach the washer and the release nut.
- While applying an air pressure of 640 kPa {92 psi, 6.5 kgf/cm^2} into the spring brake port (by setting the hand control valve to the released position), turn the release nut until the threaded portion of the release bolt extends by the dimension A shown below.
  A: 82 mm {3.23 in.} <FK>
  76 mm {2.99 in.} <FM>

CAUTION ⚠

- **Avoid turning the release nut with a torque exceeding 68.6 N·m {51 ft.lbs, 7 kgf·m}. It can damage the brake chamber assembly.**



Cancellation of mechanical release of parking brake

- To cancel the mechanical release of parking brake, perform the mechanical release procedure in reverse while confirming the following items.
- Clean the end cap mounting position and confirm that there is no water or dust in that position.
- Confirm that an O-ring is attached to the end cap.
- Using a ϕ15 mm or thinner rod with a dull end such as a release bolt, push in the concave section at the center of the end cap squarely into the piggy back. A click is heard when the section A is securely seated into the piggy back.
- When seating the end cap, be careful not to bend or twist the section B.
- Confirm that there is no damage on the tube and the tube is installed securely.

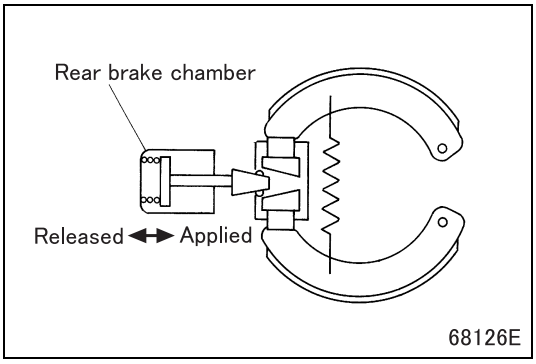
	O-ring groove and outer periphery of piston		
	Friction surfaces of body and piston		
	Periphery of O-ring		

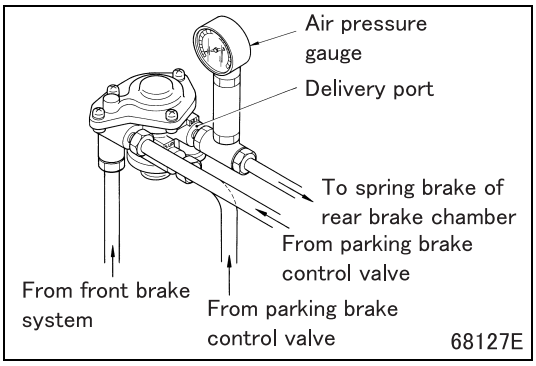
◆Inspection after assembly◆

■ Inspection: Spring brake valve

- Place wheel chocks at the rear wheels to prevent the vehicle from moving.
- Start the engine to raise the air pressure until the air pressure gauge reads 805^{+29}_{-20} kPa {$115^{+4.3}_{-2.8}$ psi, $8.2^{+0.3}_{-0.2}$ kgf/cm^2}.

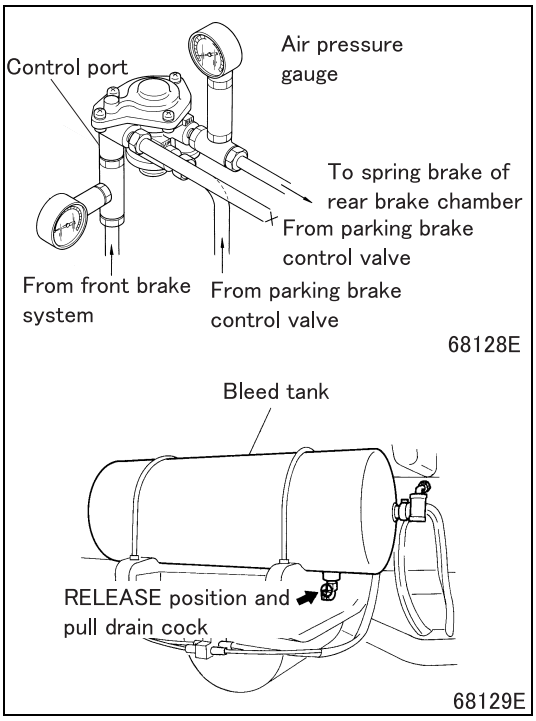


- Confirm that when the knob of the parking brake control valve is pulled out to the PARK position, rear brake chamber operates immediately, applying the wheel parking brake.
- Confirm that when the knob of the parking brake control valve is pushed in to the RELEASE position, rear brake chamber operates, releasing the wheel parking brake.

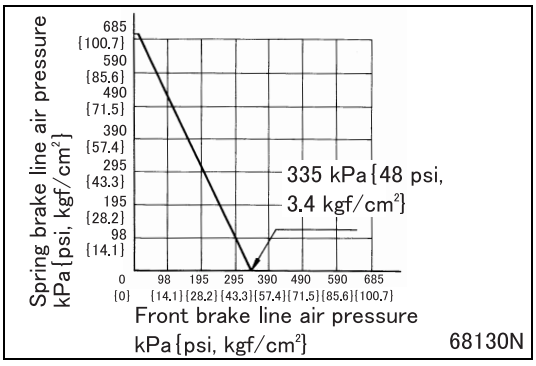


- Mount air pressure gauge on delivery port of the spring brake valve.
- Read air pressure gauge when the knob of the parking brake control valve is pushed to the RELEASE position.
  Specified value: 655 kPa {951 psi, 6.67 kgf/cm^2}

- Confirm that when the knob of the parking brake control valve is pulled out to the PARK position, the reading of air pressure gauge drops immediately to 0 kPa {0 psi, 0 kgf/cm^2}. If the air pressure gauge indicator needle drops slowly, replace check valve, since it is probably faulty.



- Mount air pressure gauge on control port.
- Push in the knob of the parking brake control valve to the RELEASE position and pull drain cock to completely bleed tank of the rear brake system.



- Have the brake pedal depressed several times and read the drop in the air pressure on both air pressure gauges every time the brake is pressed to confirm that each value conforms to the specified value indicated on the performance curve diagram.
- Press the brake pedal several times to compress the air until rear brake chamber operates on the wheel parking brake locking the rear wheels completely.

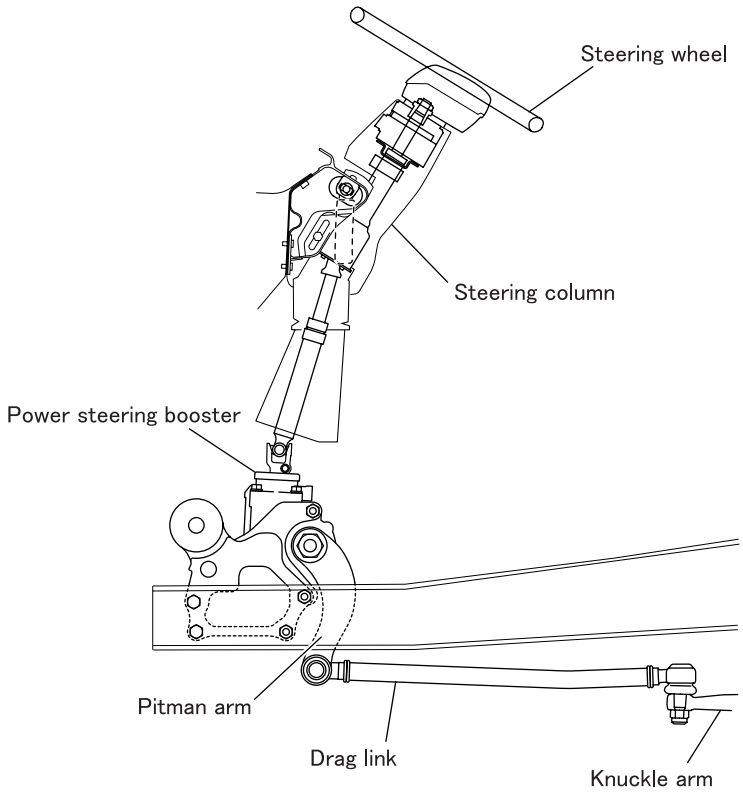
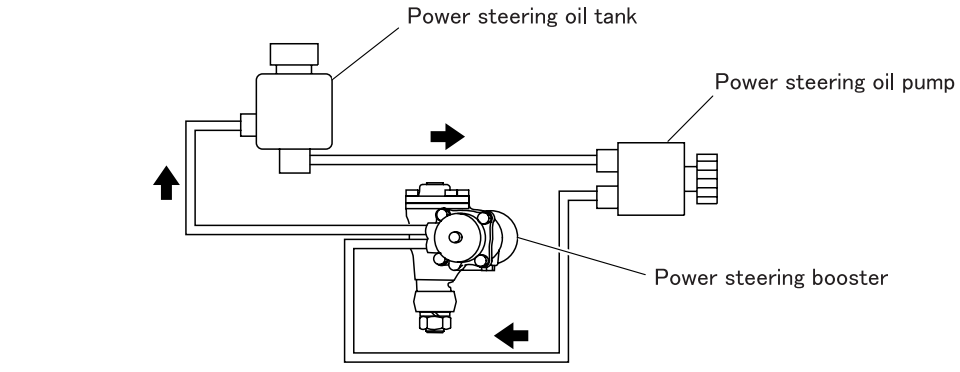
M E M O

1. Steering System



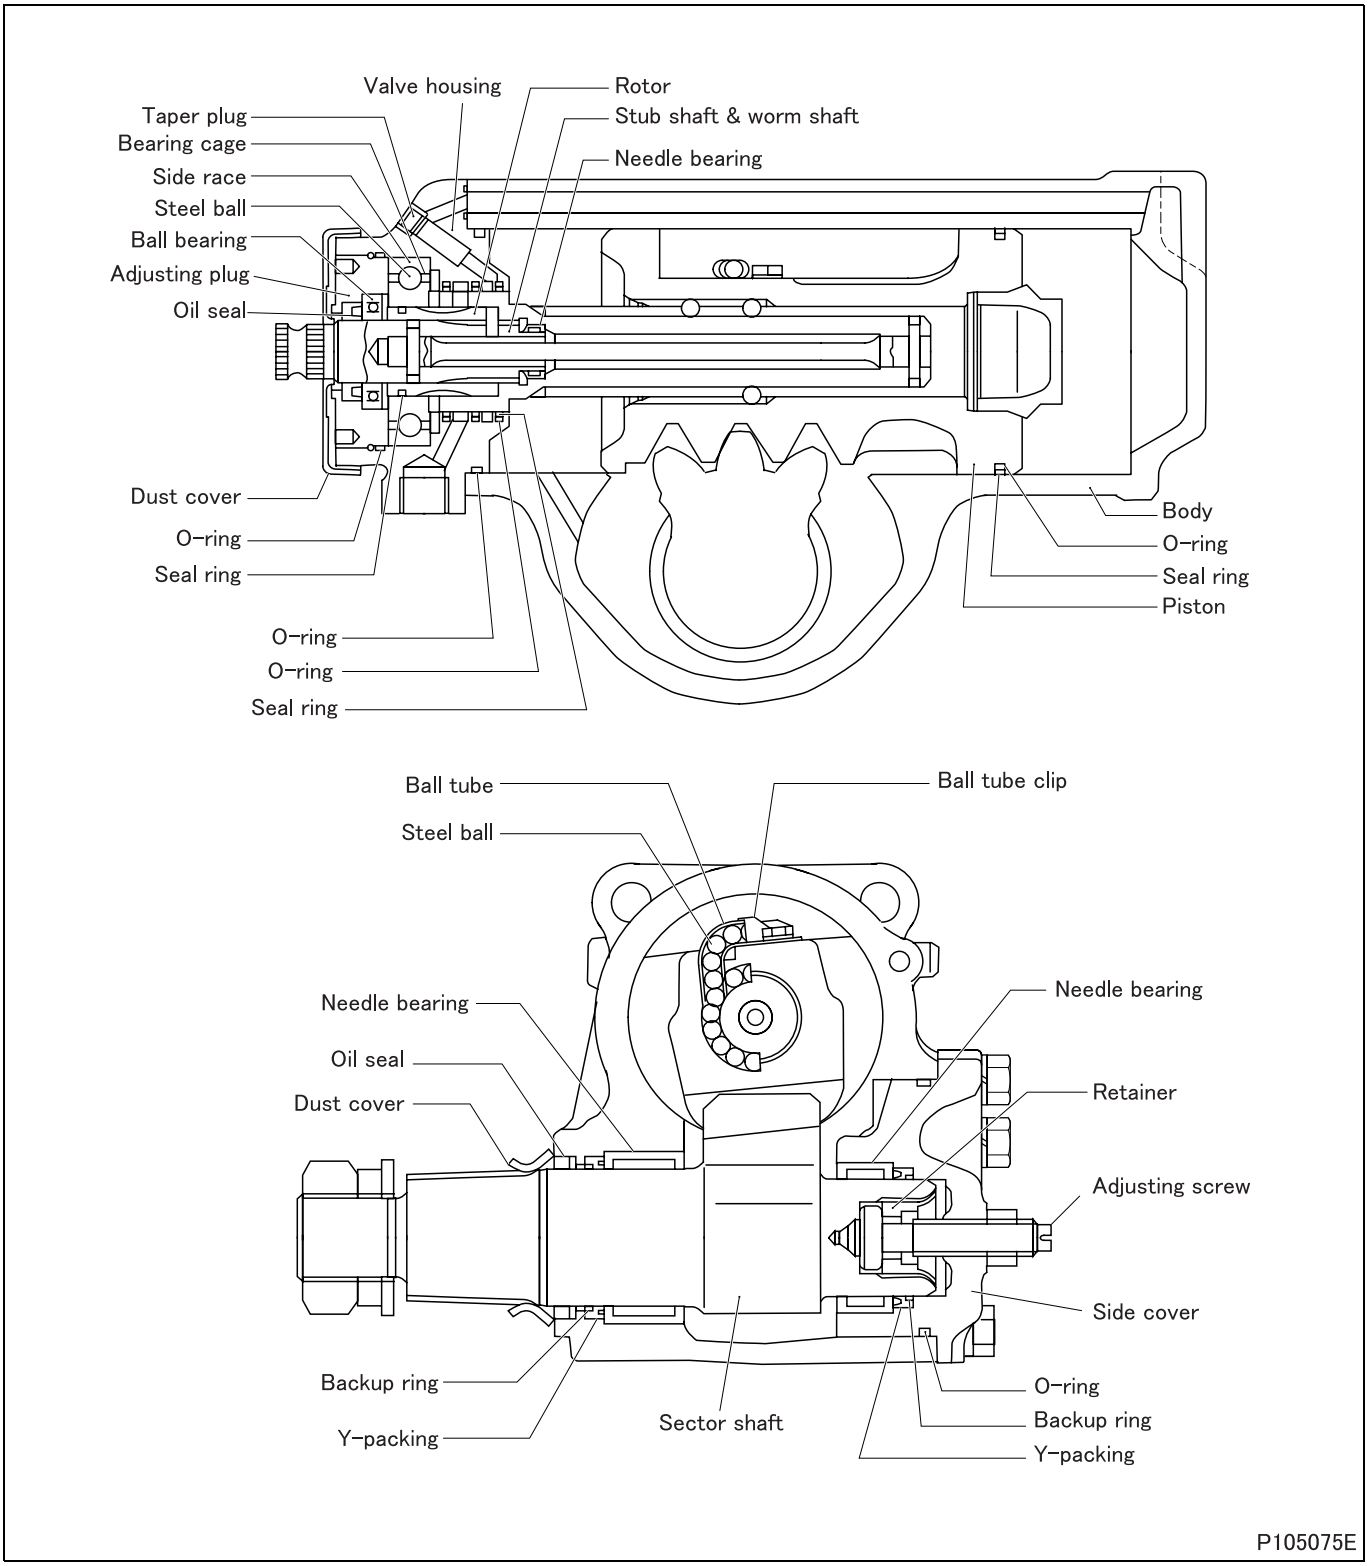
P101467E

2. Fluid Flow

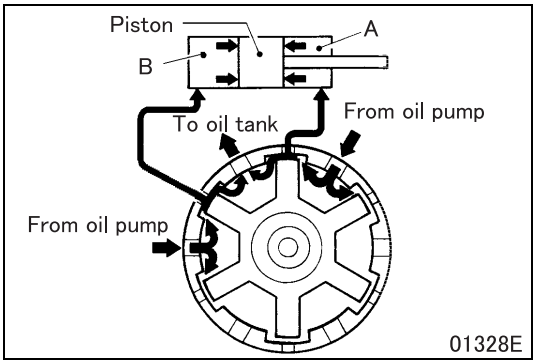


P57281E

3. Power Steering Booster

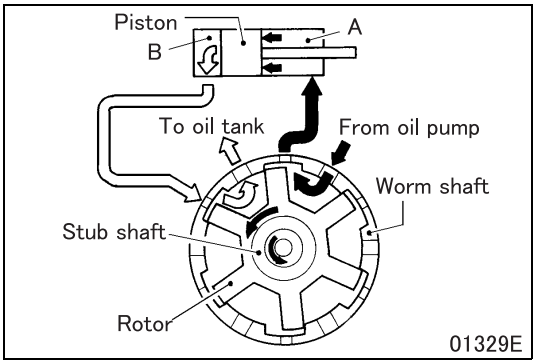


- A rotary valve is adopted for the valve, the center of the power steering. For steering reaction force and return of the valve, the valve operates lightly and smoothly at low speed by means of the torsion bar, and provides stable steering feel up to high speed.



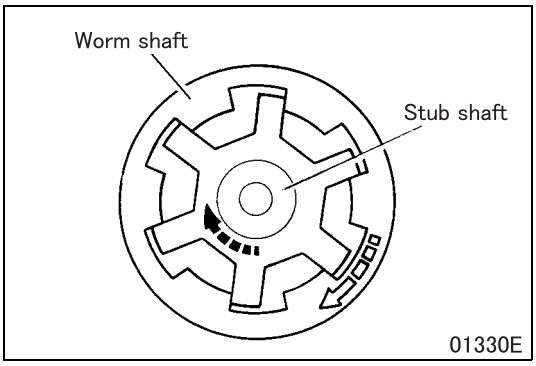
3.1 When moving straight forward

- As equal pressure is applied to cylinder chambers A and B on both sides of the piston, the piston is placed in neutral position.



3.2 When turning the steering wheel

- When the steering wheel is turned, the stub shaft is twisted, which causes the rotor to shut off oil supply passages to cylinder chamber B. As a result, pressure difference is caused between cylinder chamber A and cylinder chamber B, and the piston moves, facilitating rotation of the worm shaft.
  The illustration shows a condition when the steering wheel is turned to the left.

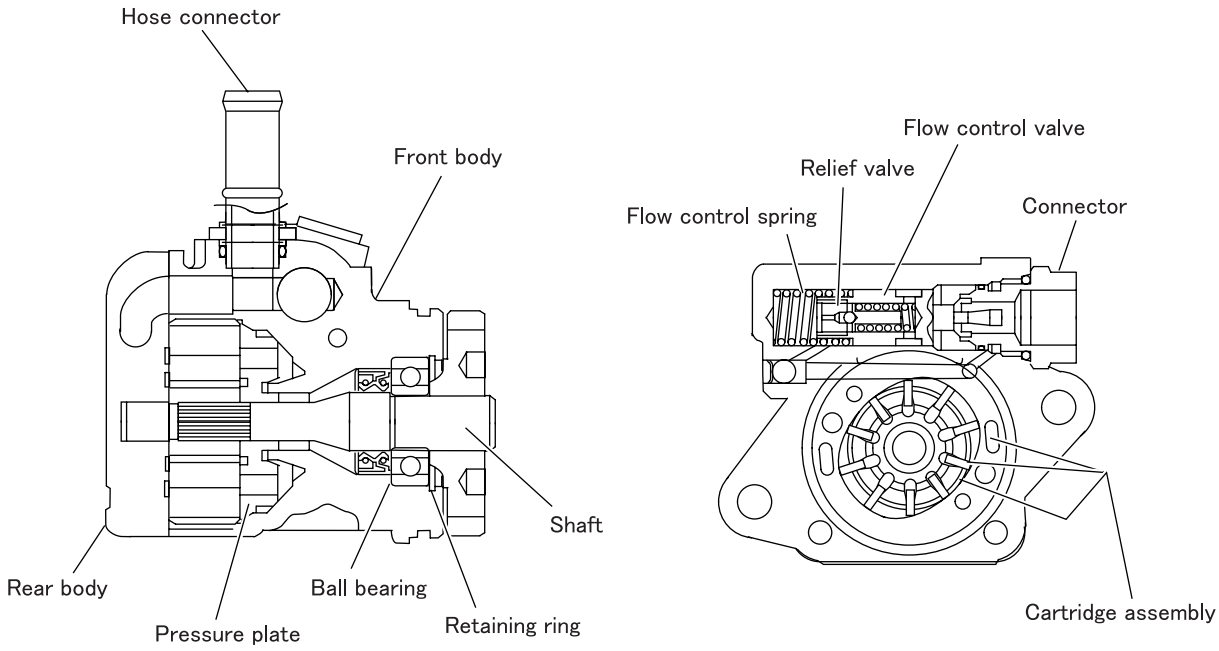


3.3 When hydraulic circuit fails

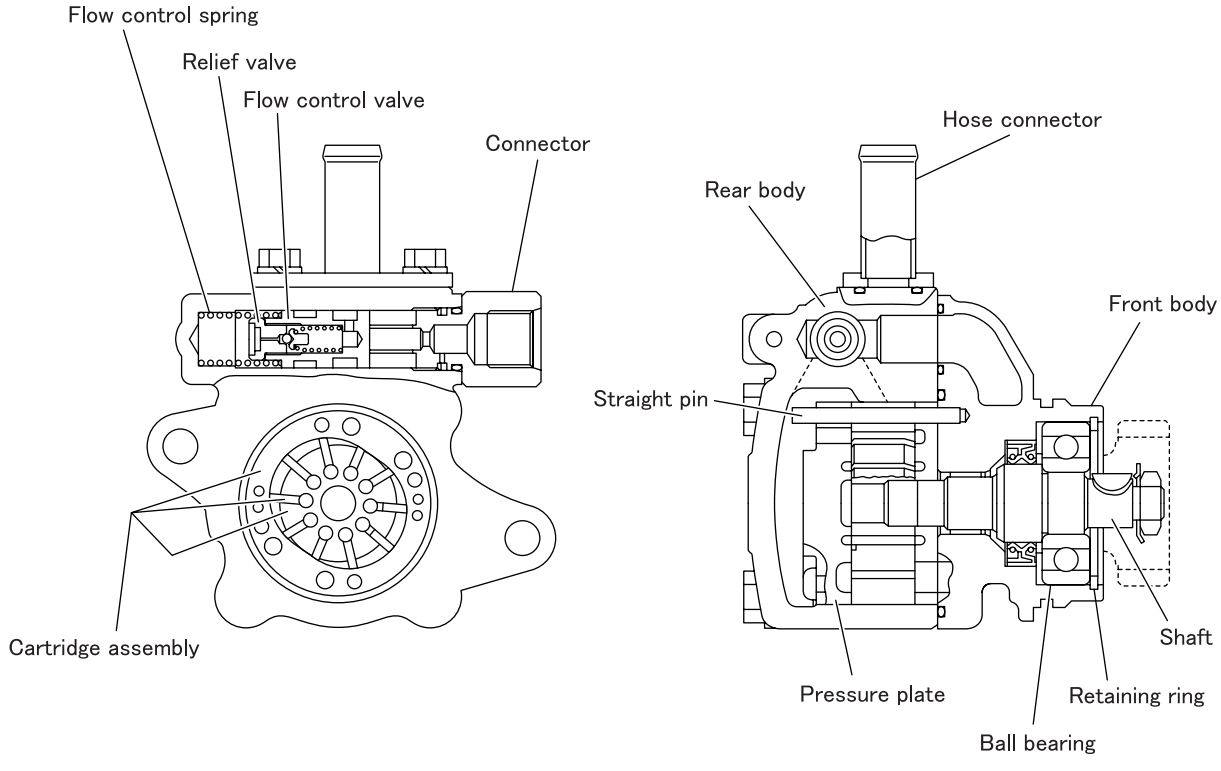
- The turning force of the stub shaft alone turns the worm shaft.

4. Power Steering Oil Pump

<FK>

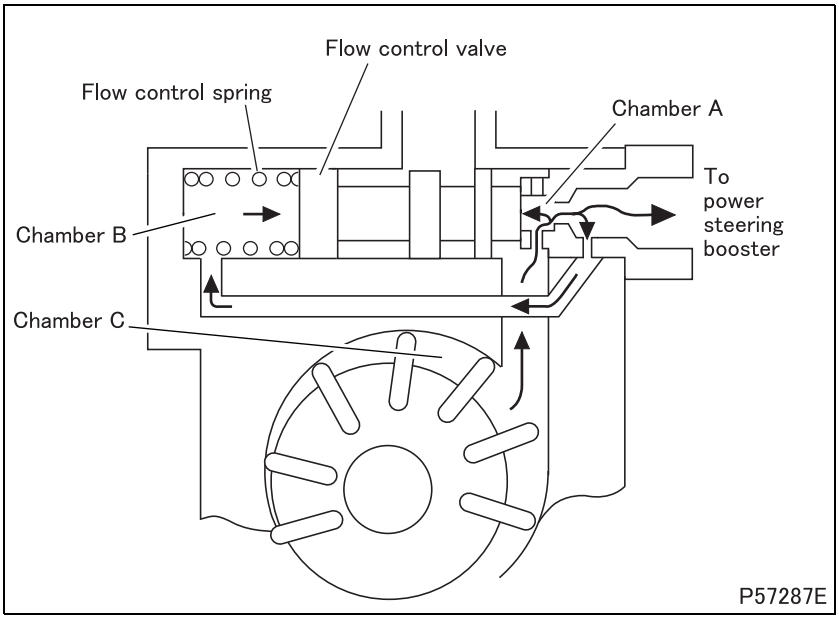


<FM>



P105076E

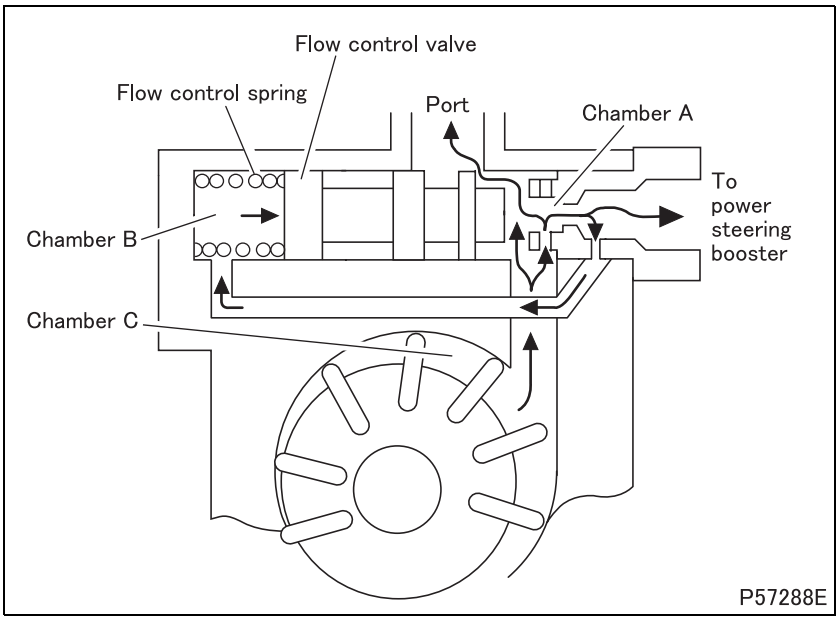
4.1 Flow control valve



(1) Operation of flow control valve assembly

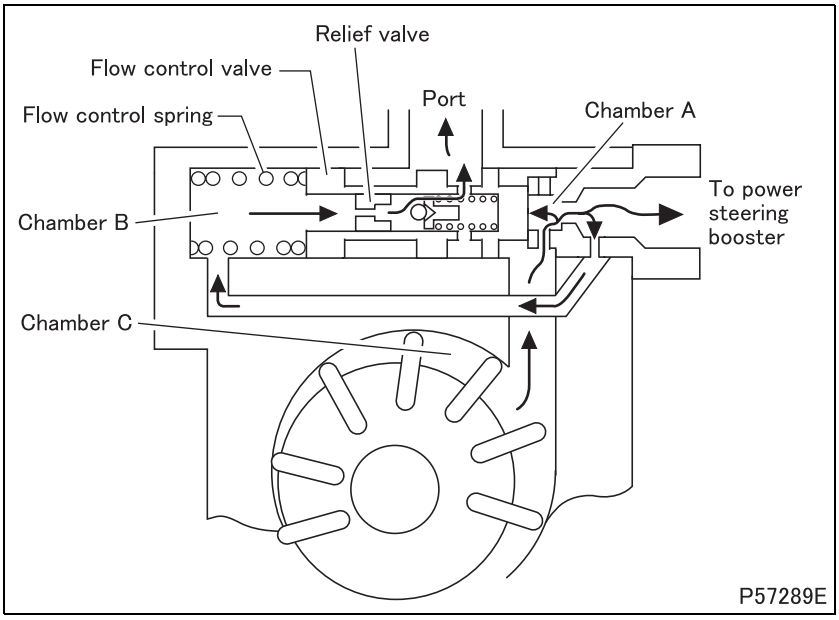
(1.1) When not functioning (oil pump in operation at low speed)

- Oil pressure in the chamber A is weaker than the combined force of oil pressure in the chamber B and tension of the flow control spring, and the flow control valve remains stationary.



(1.2) When functioning (oil pump in operation at middle to high speeds)

- Oil pressure in the chamber A overcomes the combined force of oil pressure in the chamber B and tension of the flow control spring, and the flow control valve is shifted.
- Port is made open to release oil pressure, and the flow rate from the chamber A is maintained constant.



(2) Operation of relief valve

- When the combined force of oil pressure in the chamber B and tension of the flow control spring overcomes oil pressure in the chamber A, the flow control valve is shifted. Further increased oil pressure in the chamber B pushes the relief valve to open port, thus preventing excessive oil pressure from going to the chamber C.

Possible causes \ Symptoms		Steering wheel heavy to operate	Steering wheel play excessive and unstable	Steering wheel pulled to one side	Steering shimmy	Steering wheel return not smooth	Steering wheel does not turn	Steering angle not enough or different between right and left	Oil leakage	Oil pump oil pressure abnormal	Noise from oil pump (grinding)	Noise from oil pump (squeaking)	Noise from oil pump (low whirring)	Reference Gr

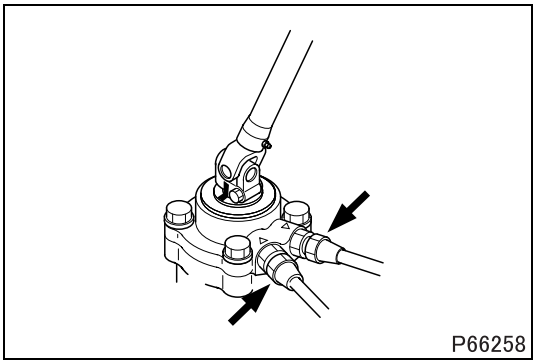
M E M O

ON-VEHICLE INSPECTION AND ADJUSTMENT

1. Change of Power Steering Fluid

Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
–	Power steering oil tank	Automatic transmission fluid (DEXRON II or DEXRON III type)	Between MIN and MAX of power steering oil tank



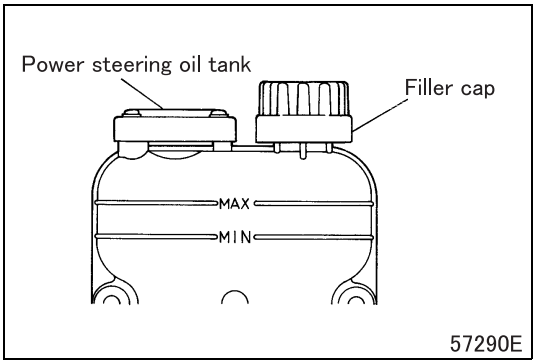
1.1 Draining

- Jack up the front wheels.
- Loosen feed and return pipes connected to the power steering booster.

CAUTION ⚠

- **When removing the feed pipe and return pipe, clean the port area to prevent ingress of dirt and dust.**

- Repeatedly turn the steering wheel fully left and right to drain the hydraulic fluid from the power steering booster, and then tighten the feed pipe and return pipe.



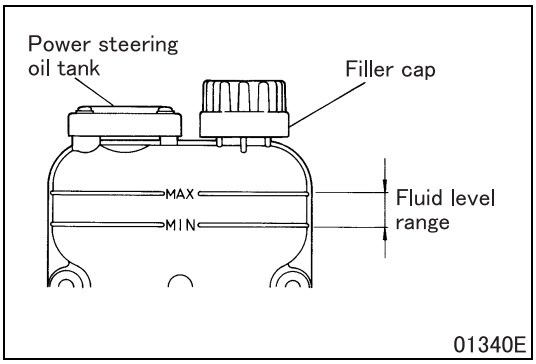
1.2 Filling

- Pour fluid into the power steering oil tank up to the bottom of the filler cap.
- Bleed the power steering system of air.

2. Bleeding of Power Steering System

Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
–	Power steering oil tank	Automatic transmission fluid (DEXRON II or DEXRON III type)	Between MIN and MAX of power steering oil tank



- Pour fluid to the power steering oil tank up to the bottom of the filler cap.
- With the engine stopped, jack up the front wheels.
- Repeatedly turn the steering wheel fully left and right. When the fluid level has dropped, add fluid enough to maintain the fluid level within the specified range.
- Start the engine to idle.
- When the fluid level has dropped, stop the engine and add fluid.
- Restart the engine. While checking for a drop in the fluid level, repeatedly replenish the hydraulic fluid until the fluid level is stabilized.

CAUTION ⚠

- **To avoid seizure of the power steering oil pump, do not keep the steering wheel turned fully to left or right for more than 15 seconds when the engine is running.**

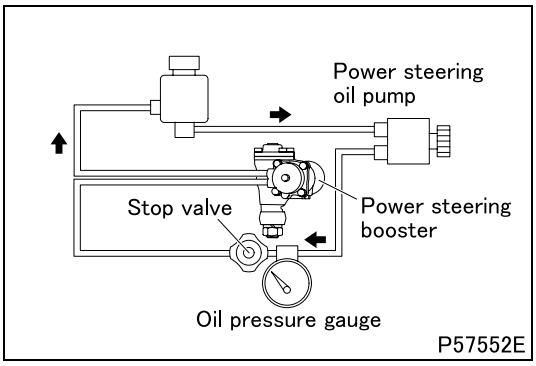
- If there is any abnormal noise or a fluid level fluctuation, air should be still trapped in the power steering system. Turn the steering wheel several times to raise the fluid temperature to approximately 60 to 80°C {140 to 176°F}.
- Stop the engine and wait for approximately five minutes.
- Lower the front wheels and turn the steering wheel several times. If there is no noise or fluid level fluctuation, the bleeding of the power steering system is completed.
- When air bleeding is completed, check the fluid level in the oil tank, and pipe and hose connections for fluid leaks.

3. Performance Verification Test of Power Steering System

Service standards

Location	Maintenance item		Standard value	Limit	Remedy
–	Power steering system fluid pressure (with hands off steering wheel)		490 kPa {71 psi, 5 kgf/cm^2} or less	–	Repair*a
–	Relief set pressure (measure with stop valve tightened at engine idle)	FK61	$13.7^{+0.5}_{-0.2}$ MPa {1990^{+71}_{-28} psi, 140^{+5}_{-2} kgf/cm^2}	–	Replace
		Except FK61	$12.3^{+0.5}_{-0.2}$ MPa {1780^{+71}_{-28} psi, 125^{+5}_{-2} kgf/cm^2}		

*a: Check the power steering booster and hydraulic circuit for clogging.



- Perform the tests with the following measuring conditions to verify normal operation of the power steering booster and power steering oil pump.
  - Install oil pressure gauge capable of measuring upward of 14.7 MPa {2130 psi, 150 kgf/cm^2} and stop valve between power steering oil pump and power steering booster, then bleed air.
  - Start engine to idle.
  - Turn steering wheel left and right several times to raise fluid temperature up to 50 to 60°C {122 to 140°F}.
  - With the engine idling, fully open stop valve.

CAUTION ⚠

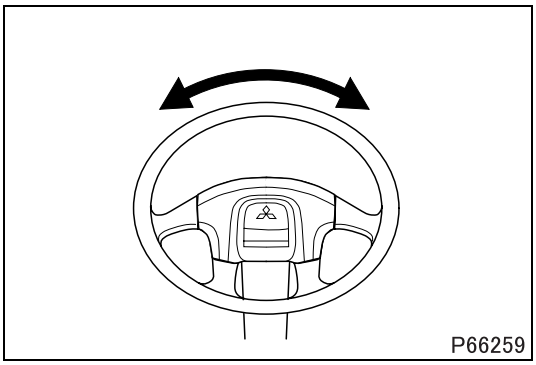
- **To avoid seizure of the power steering oil pump, never close the stop valve for more than 15 seconds.**

Test item	Test procedure	Judging standard
Verification of smooth operation	• Jack up front wheels and turn steering wheel fully left and right.	Smooth operation throughout test
Measurement of fluid pressure in power steering system	• Measure fluid pressure with hands off steering wheel.	Must be at specified value or less
Measurement of relief set pressure	• Measure maximum fluid pressure with the stop valve tightened at engine idle. • Do not close stop valve for longer than 15 seconds.	Must not be out of specified value

4. Steering Wheel Play

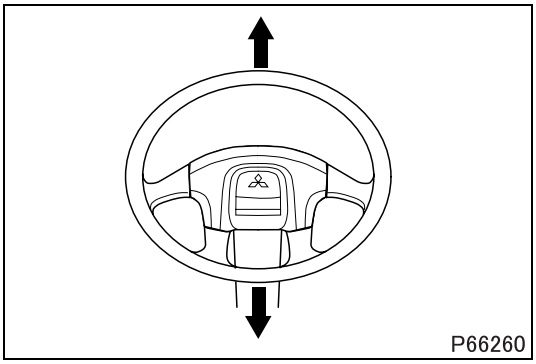
Service standards (Unit: mm {in.})

Location	Maintenance item	Standard value	Limit	Remedy
–	Steering wheel play	10 to 40 {0.39 to 1.57}	–	Adjust



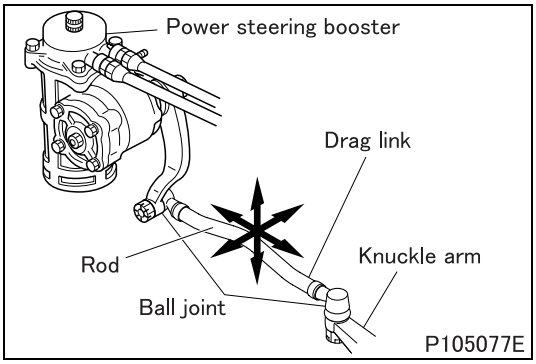
- With the vehicle placed straight forward, start the engine and gently turn the steering wheel right and left to measure its peripheral play.
- If the play deviates from the standard value, check tightening points and backlash of the power steering booster.

5. Steering Column Looseness



- Push and pull the steering wheel by hand to check the steering column for looseness.
- With the steering column tilted all the way forward, pull the steering wheel backward and check the steering column for looseness.
- If the steering column is loose, adjust the tilting and telescoping lever.

6. Inspection of Drag Link Ball Joint



(1) Backlash

- With the vehicle in the stationary state, hold the rod of the drag link and move it in the forward, backward, vertical and lateral directions of the vehicle and check for play at the ball joints. Be sure to check the power steering booster and ball joints on both sides of the knuckle arm.
- If play is excessive, replace the drag link.

(2) Dust cover

- Check the dust cover for wear, cracks and other damage.
- If there is any abnormality, replace the dust cover.

Tg	Nut (steering column mounting)	9 to 14 {6.6 to 10, 0.9 to 1.4}	–

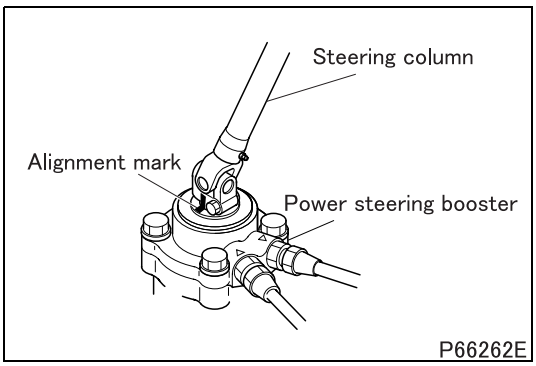
Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
△a	Horn contact ring on combination switch side	Wheel bearing grease [NLGI No. 2 (Li soap)]	As required

Special tools (Unit: mm)

Mark	Tool name and shape	Part No.	Application
⊂a	Steering wheel puller A: M10 × 1.25 B: M14 × 1.5  01344	MH062421	Removal of steering wheel

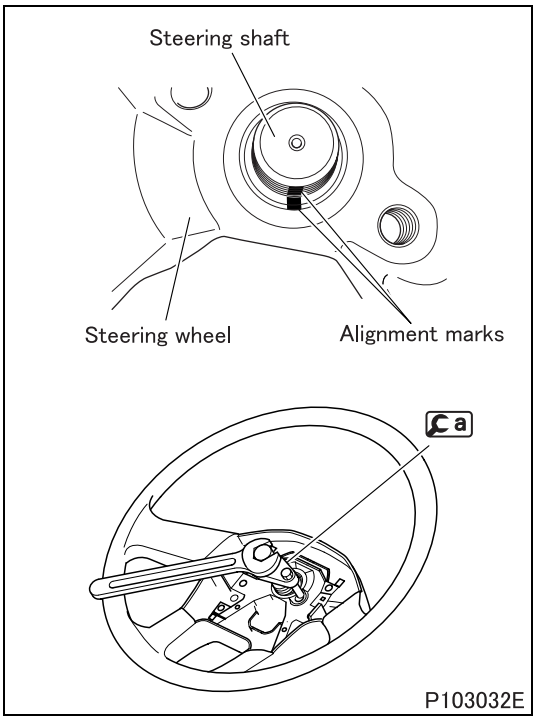
◆Work before removal◆



■ **Alignment mark: Steering column and power steering booster**

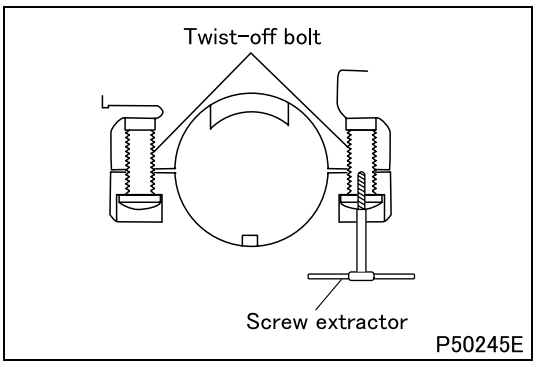
- Provide alignment marks on the steering column and power steering booster.

◆Removal procedure◆



■ **Removal: Steering wheel**

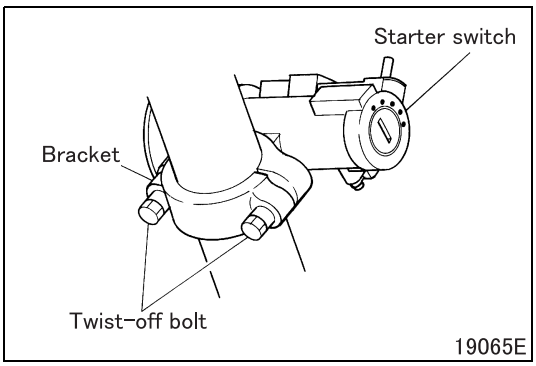
- After removing the steering wheel mounting nut, be sure to put alignment marks on the steering wheel and steering shaft.



■ **Removal: Starter switch**

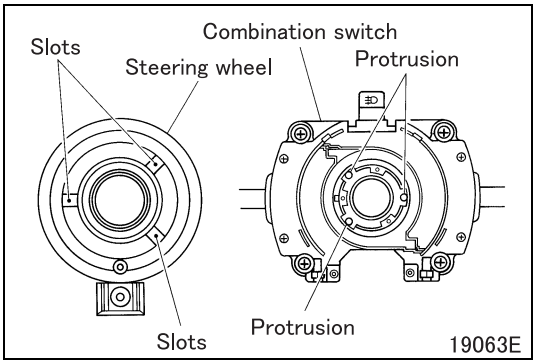
- Drill a hole of 5.5 to 6 mm {0.22 to 0.24 in.} in diameter to a depth of 10 to 15 mm {0.39 to 0.59 in.} in the twist-off bolt.
- Using the drilled hole, screw the screw extractor counterclockwise into the twist-off bolt and remove it.

◆Installation procedure◆



■ **Installation: Starter switch**

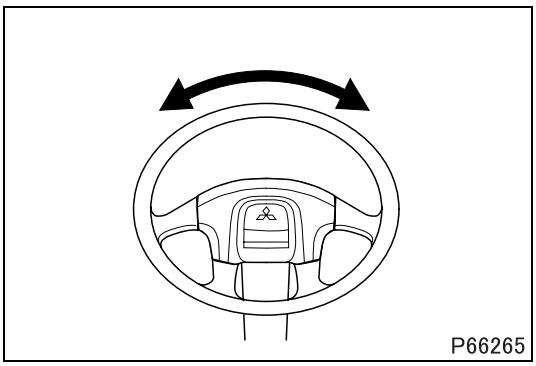
- Install the starter switch using new twist-off bolts.
- Twist off the bolt head of the twist-off bolt.
- Check for operation of the steering lock function of the starter switch.



■ **Installation: Steering wheel**

- Align slots in steering wheel with cancel cam protrusions of combination switch.

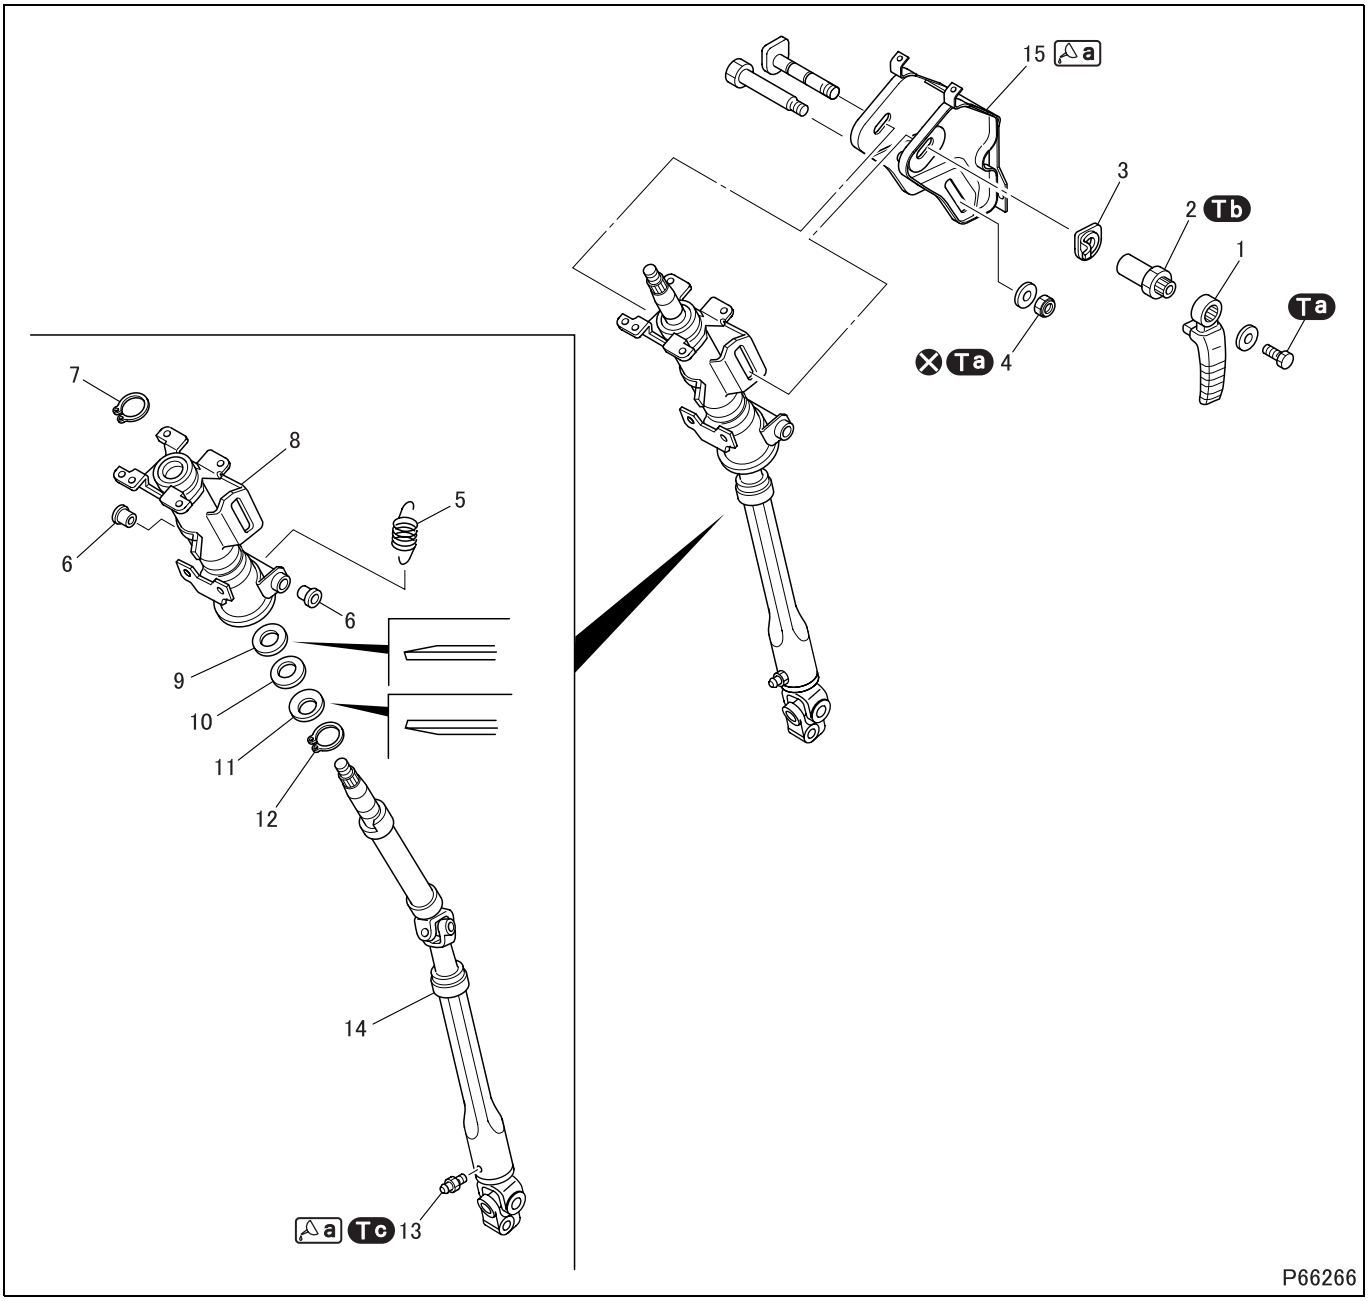
◆Inspection after installation◆



■ **Inspection: Noise from steering wheel**

- Lightly turn the steering wheel left and right and check for noise and other abnormalities.
- If any abnormality is found, disassemble the steering wheel, remove the cause and reinstall.

STEERING COLUMN



● **Disassembly sequence**

1 Lock lever
2 Nut
3 Washer and stopper set
4 Self-locking nut
5 Return spring
6 Bushing
7 Snap ring
8 Steering column
9 Stopper
10 Bearing spacer
11 Stopper
12 Snap ring
13 Grease nipple
14 Steering joint
15 Steering shaft bracket

⊗: Non-reusable parts

● **Assembly sequence**

Follow the disassembly sequence in reverse.

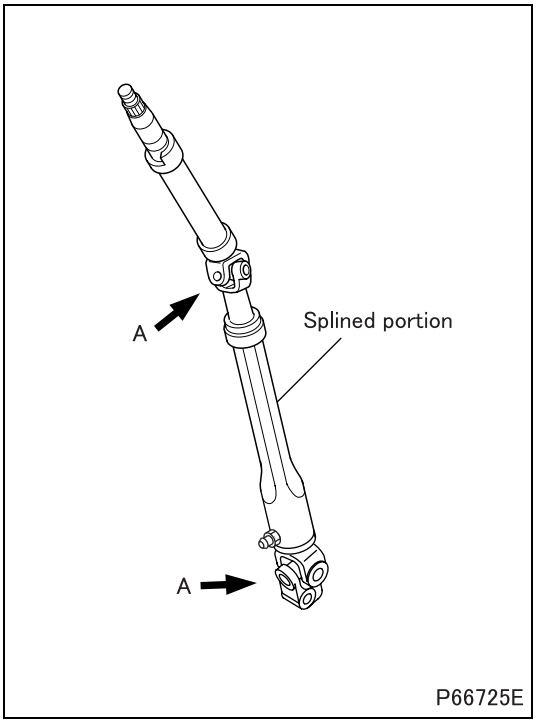
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Bolt (lock lever mounting)	9 to 14 {6.6 to 10, 0.9 to 1.4}	–
	Self-locking nut (steering column mounting)		
Tb	Nut (steering column mounting)	29 ± 2 {21 ± 1.5, 3 ± 0.2}	–
Tc	Grease nipple	3 to 5 {2.2 to 3.7, 0.3 to 0.5}	–

Lubricant and/or sealant

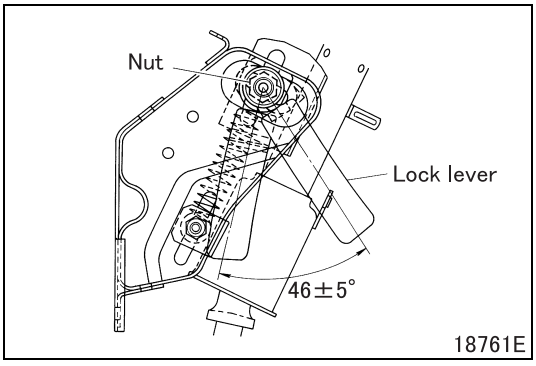
Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Sliding surface of steering shaft bracket with steering column	Wheel bearing grease [NLGI No. 2 (Li soap)]	As required
	Grease through grease nipple		

◆Installation procedure◆



■ Installation: Steering joint

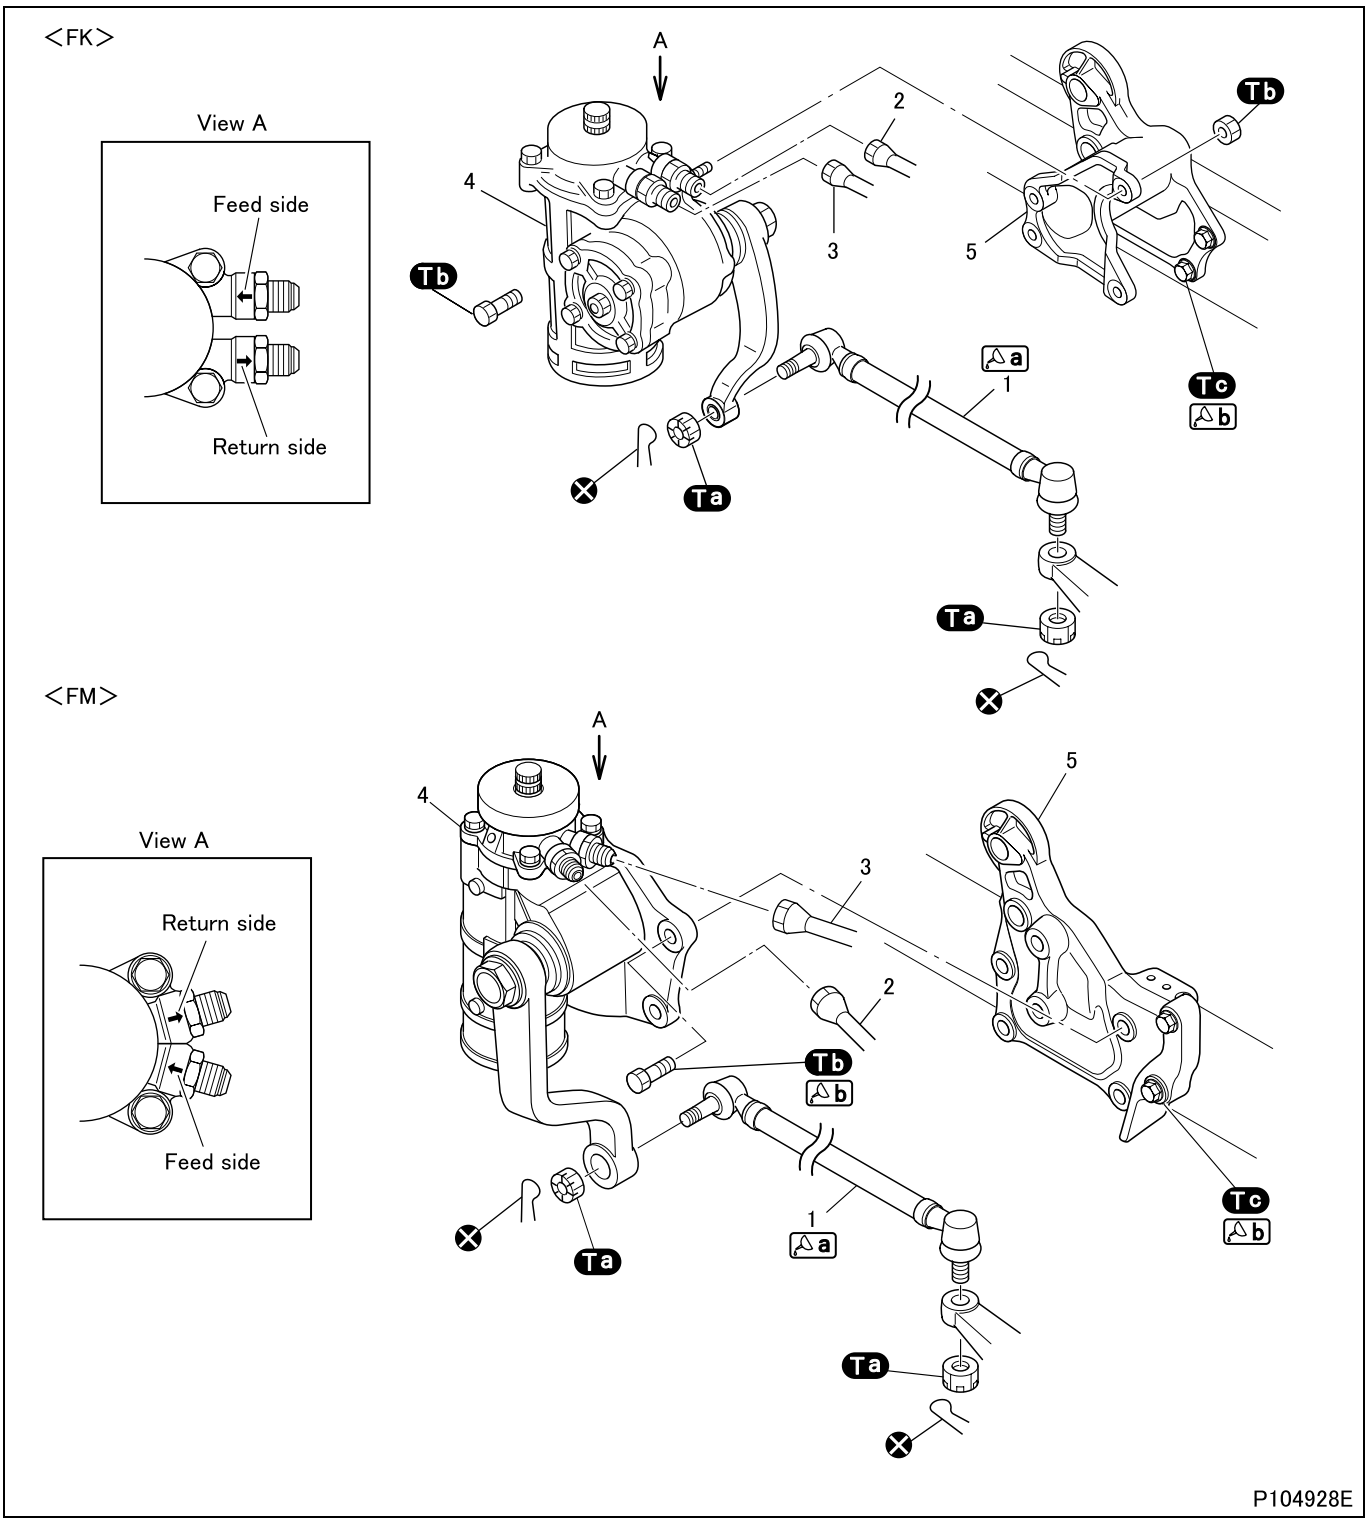
- When the steering joint has been separated at the splined portion, reconnect it so that the yokes of the upper and lower joints will face in the same direction (arrows A).



■ Installation: Lock lever

- Install the lock lever so that its operating range conforms to the angle indicated in the illustration.

POWER STEERING BOOSTER AND DRAG LINK



● **Removal sequence**

1 Drag link (See later section.)
2 Feed pipe
3 Return pipe
4 Power steering booster (See later section.)
5 Gear box bracket

CAUTION ⚠

- **When removing the drag link, use care not to deform or damage the dust cover.**
- **Do not attempt to disassemble the drag link because it is of a unit construction.**

● Installation sequence

Follow the removal sequence in reverse.

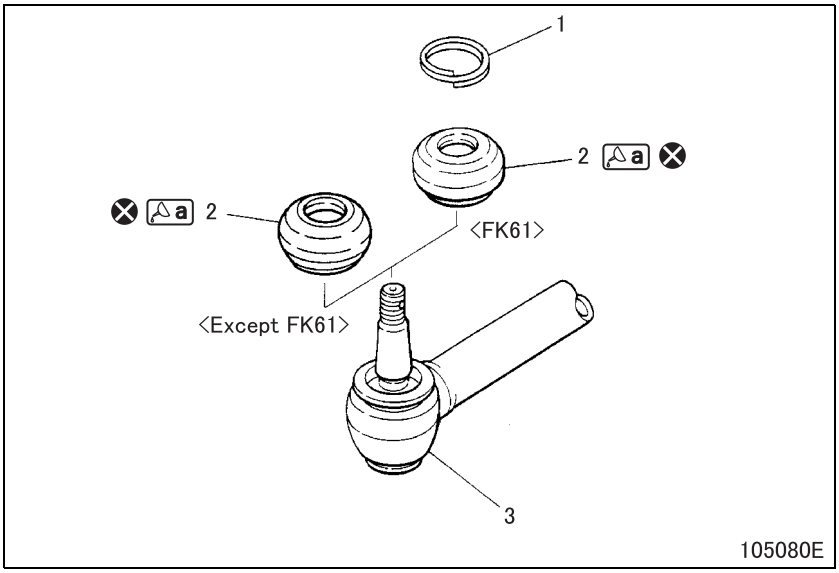
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened		Tightening torque	Remarks
Ta	Nut (drag link mounting)	FK	190 ± 47.5 {140 ± 35, 19.4 ± 4.85}	–
		FM	353 ± 88 {260 ± 65, 36.0 ± 9.0}	
Tb	Bolt or nut (power steering booster mounting)	FK	150 to 200 {110 to 145, 15.0 to 20.0}	–
		FM	235 to 305 {175 to 225, 24 to 31}	Wet
Tc	Bolt or nut (gear box bracket mounting)	FK	240 to 290 {175 to 215, 24 to 29}	Wet
		FM	345 to 415 {255 to 305, 35 to 42}	

Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Lip area of drag link ball joint dust cover	Molybdenum disulfide grease [NLGI No. 2 (Li soap)]	As required
b	Bolt or nut thread	Chassis grease [NLGI No. 1 (Li soap)]	As required

Drag Link



● **Disassembly sequence**

1 Clip <FK61>
2 Dust cover
3 Drag link

⊗: Non-reusable parts

CAUTION ⚠

- **Do not attempt to disassemble the drag link because it is of a unit construction.**

- Do not remove the dust cover unless it is in an abnormal condition.

● **Assembly sequence**

Follow the disassembly sequence in reverse.

Service standards (Unit: mm {in.})

Location	Maintenance item				Standard value	Limit	Remedy
3	Drag link ball joint	Play	Under load of ±2000 N {±450 lbs, ±204 kgf} <FK61>		0 to 0.2 {0 to 0.0079}	–	Replace
			Under load of 430 N {97 lbs, 44 kgf} <FK62, FK65>		–	0.7 {0.028}	
			Under load of 500 N {110 lbs, 51 kgf} <FM>				
		Turning torque		FK61	0.5 to 8 N·m {0.4 to 5.9 ft.lbs, 0.05 to 0.82 kgf·m}	–	Replace

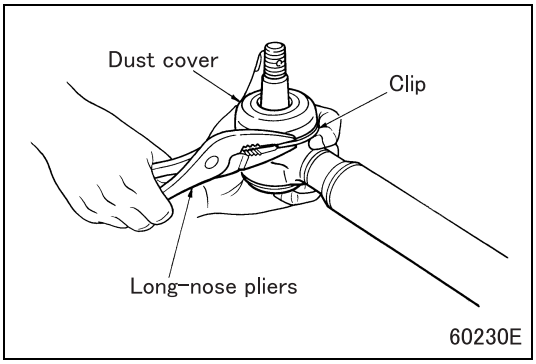
◆Removal procedure◆



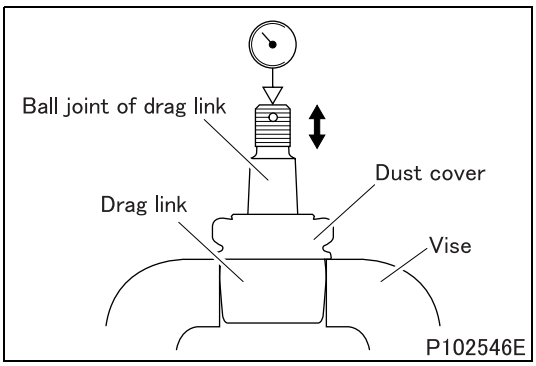
60230E

■ **Removal: Clip**

CAUTION ⚠

- **When removing the clip, take care not to deform or damage the clip and dust cover.**
- **Do not reuse the removed clip if it is deformed.**

◆Inspection procedure◆



■ **Inspection: Drag link**

(1) Play

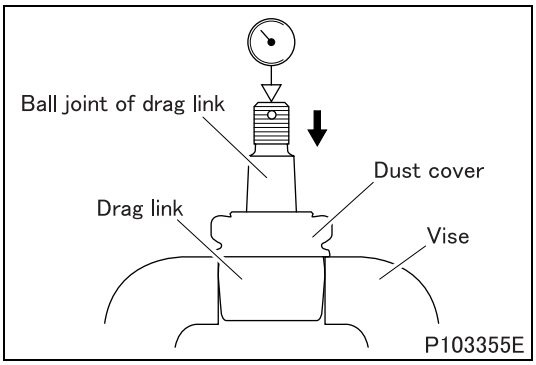
<FK61>

- Fix the drag link with a vise.

CAUTION ⚠

- **Take care not to deform or damage the dust cover when fixing it with a vise.**

- The position of the ball joint with applying no load is adjusted to standard position.
- Measure each play of the ball joint with applying the specified push and pull load from the standard position.
- Total each play and if the total deviates from standard value, replace the tie rod end.



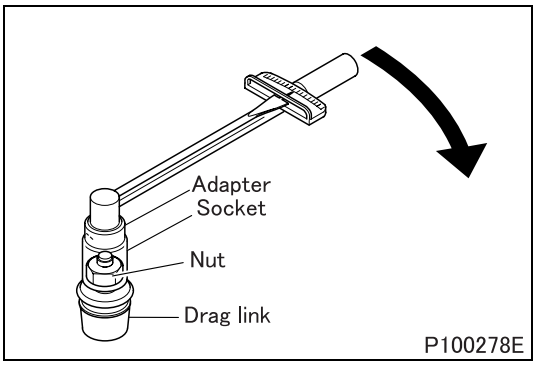
<Except FK61>

- Fix the drag link with a vise.

CAUTION ⚠

- **Take care not to deform or damage the dust cover when fixing it with a vise.**

- If measured value deviates from the standard value with applying the specified load (push) to the ball joint, replace the drag link.



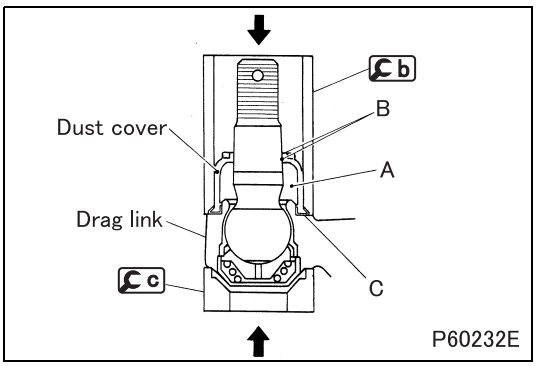
(2) Rotation torque

- Install the drag link mounting nut on the drag link.
- Install the socket, adapter and torque wrench to measure the rotation torque.
- If the measured value deviates from the standard value, replace the drag link.

(3) Dust cover

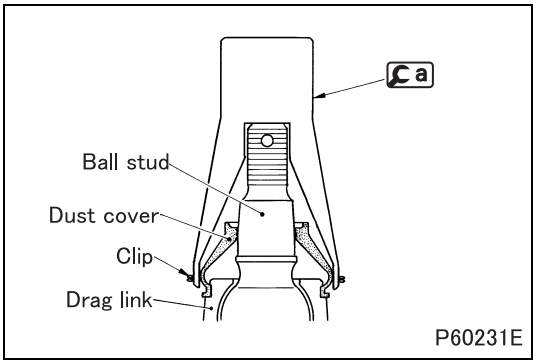
- Check that there are no wear, cracks or damage. There abnormalities can cause water to enter the ball joint, resulting in premature wear.
- If wear, crack, or damage is present, inspect traces of water entry and occurrence of rust in the ball joint. If any abnormality is found, replace the drag link. If no abnormality is found, replace the dust cover and reapply grease.

◆Installation procedure◆



■ **Installation: Dust cover <Except FK61>**

- Fill inside A with grease and apply grease to lip B of the dust cover.
- Pinch the dust cover with b and c and install reinforced collar C using a vise so that it is in close contact with the drag link.



■ **Installation: Clip**

- Set the ball stud so that it is vertical.
- Put a on the drag link.
- Install the clip in the dust cover groove.

CAUTION ⚠

- **Take care not to allow the tip of a to be caught in the dust cover.**
- **Install the clip carefully so as not to damage the dust cover with the tip of the clip.**

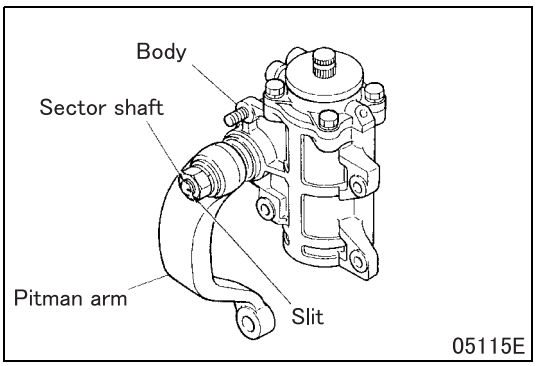
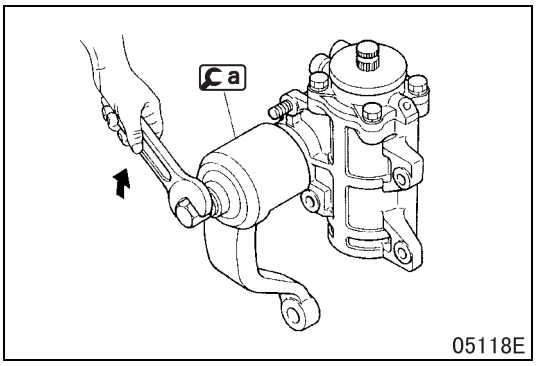
◆Work before removal◆



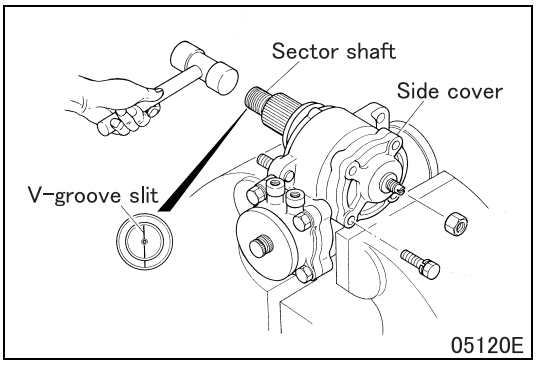
■ **Preparatory work: Setting of pitman arm at neutral position**

- Move the pitman arm and set the V-groove slit of the sector shaft at the center of the body to place gear engagement in neutral position.

◆Removal procedure◆

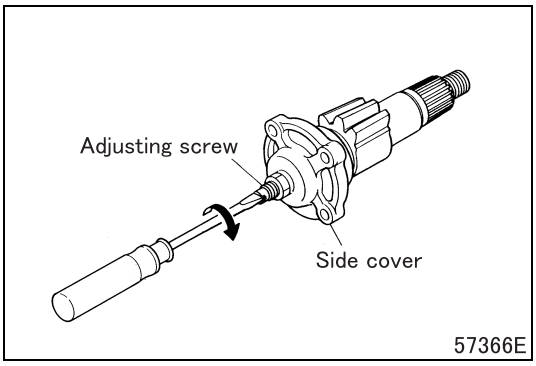


■ **Removal: Pitman arm**



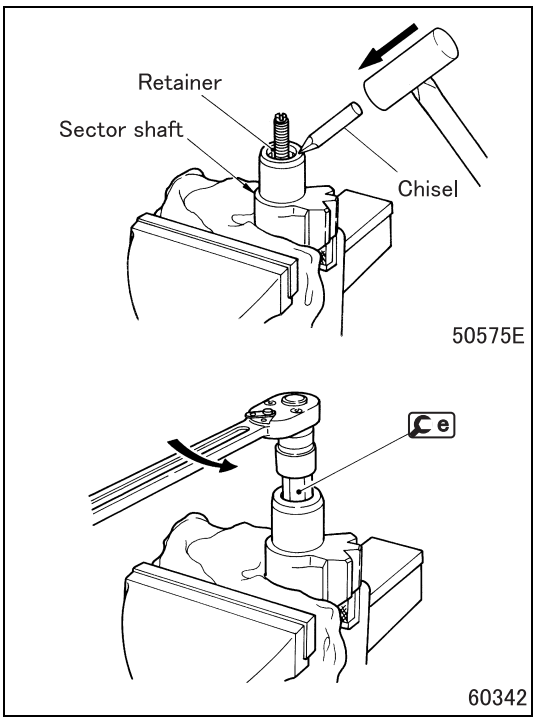
■ **Removal: Sector shaft and side cover**

- Make sure that the piston is at the neutral position (the V-groove slit of the end face of the sector shaft is in the center of the body).
- Tap the end face of the sector shaft to remove the sector shaft and side cover.



■ **Removal: Side cover**

- Remove the side cover by tightening the adjusting screw.

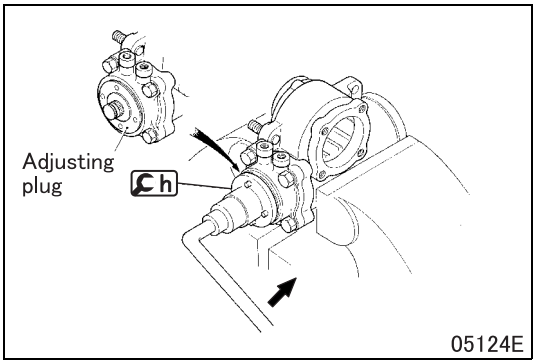


■ **Removal: Retainer**

- Raise the caulked areas (two locations) of the retainer with a chisel.

CAUTION ⚠

- **When pinching the sector shaft with a vise, be sure to apply cloth to it to prevent damage.**

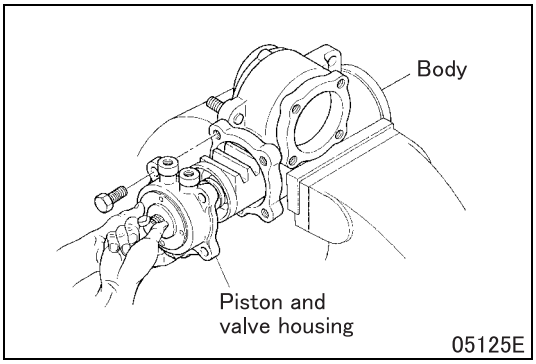


■ **Removal: Piston screw and valve housing**

- Before removing the piston and valve housing, return the adjusting valve by approximately 180° using h to loosen.

CAUTION ⚠

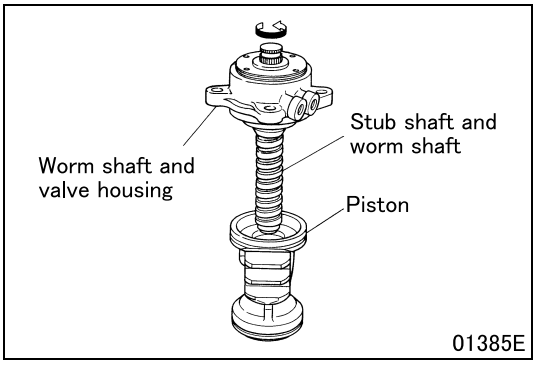
- **Only loosen the adjusting plug because removal of it may cause the bearing in the valve housing to jump out.**



- Remove the piston and valve housing from the body.

CAUTION ⚠

- **Take care not to allow the ball of the piston and valve housing to jump out.**
- **Take care not to damage the inside of the body and the piston.**

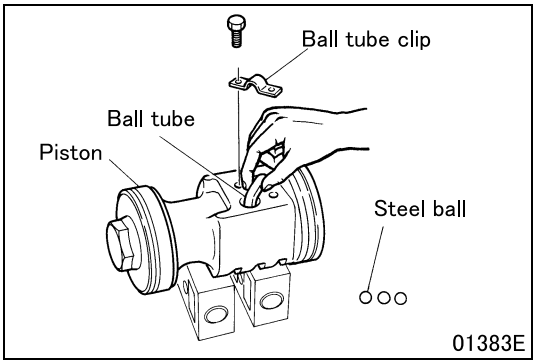


■ **Removal: Piston**

- Hold the worm shaft and valve housing with the piston facing downward, and turn the stub shaft and worm shaft to remove the piston.

CAUTION ⚠

- **Steel balls assembled into the race of the piston and stub shaft and worm shaft fall into the piston. Take care not to tumble the piston.**

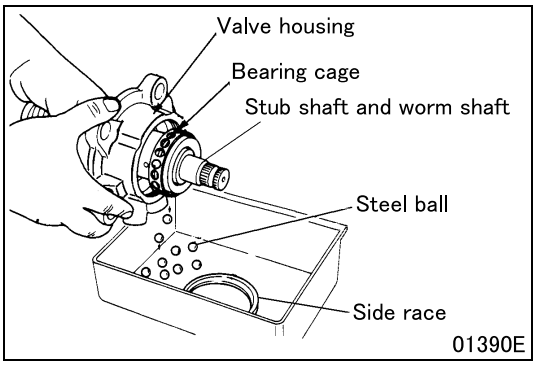


■ **Removal: Ball tube and steel ball**

- After removing the steel balls from the piston, remove the ball tube clip and pinch the ball tube with fingers and lightly move it to remove from the piston.

CAUTION ⚠

- **Take care not to lose steel balls (30 pieces <FK> 32 pieces <FM>).**



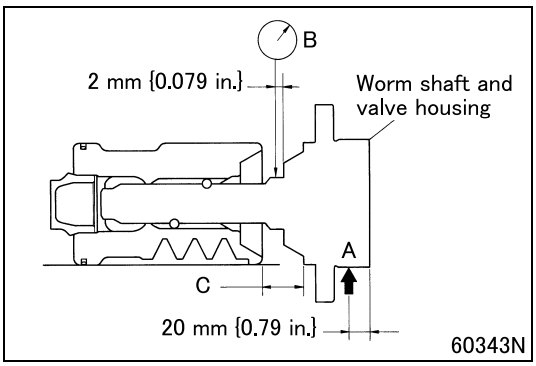
■ **Removal: Stub shaft and worm shaft**

- Press out the piston assembled side of the stub shaft and worm shaft to remove from the valve housing.

CAUTION ⚠

- **The side race, steel balls and bearing cage come apart. Prepare a receiver not to lose them.**

◆Inspection procedure◆

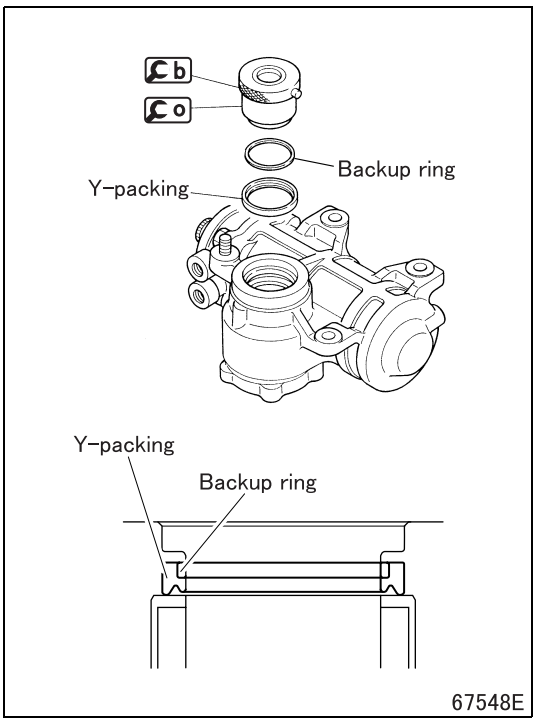


■ **Inspection: Looseness in piston and stub shaft and worm shaft**

- Pull the worm shaft and valve housing to the dimension C as illustrated.
- Measure looseness B of the worm shaft and valve housing in the radial direction when a force of 49 N {11 lbs, 5 kgf} is applied to illustrated area A.
- If the measured value exceeds the limit, replace the defective part(s).

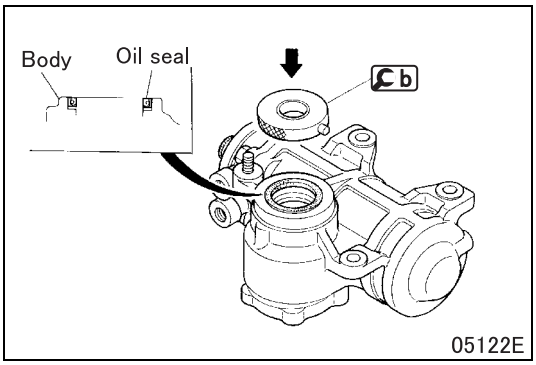
	C (mm {in.})
FK	30.45 {1.20}
FM	42.8 {1.69}

◆Installation procedure◆



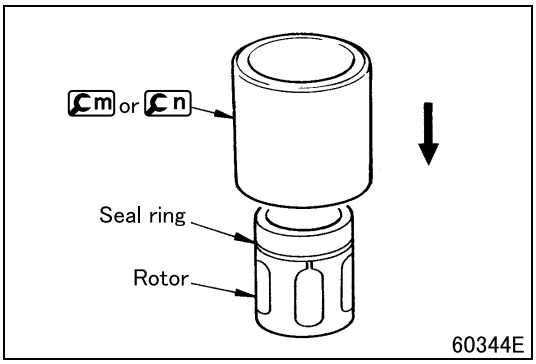
■ **Installation: Backup ring and Y-packing**

- Fill the Y-packing groove with grease and install it in the illustrated direction.
- The backup ring can be easily installed in the illustrated shape. After installation, form it with b and o.



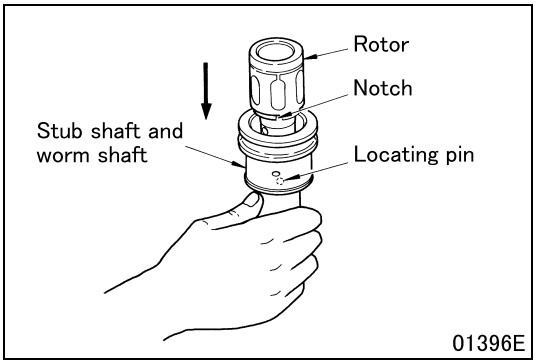
■ **Installation: Seal ring**

- Install the seal ring on the rotor.
- Form the seal ring with m or n.



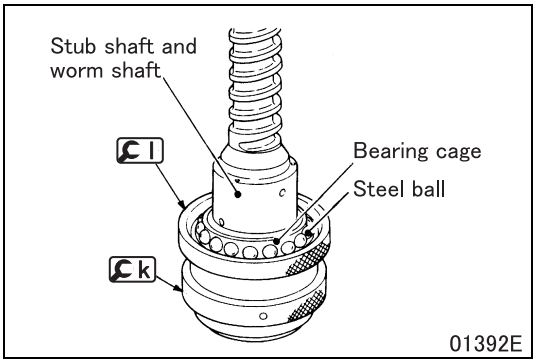
■ **Installation: Oil seal**

- Install the oil seal on the body in the illustrated direction.



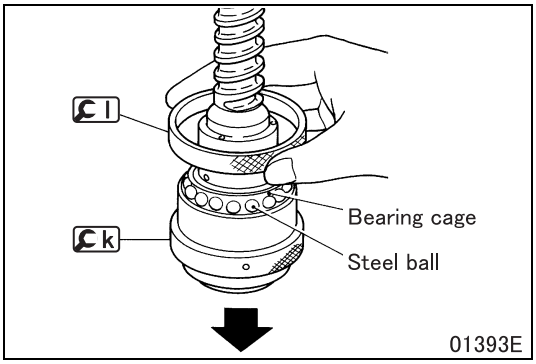
■ **Installation: Rotor**

- Install the notch of the rotor so that it is in alignment with the locating pin of the stub shaft and worm shaft.

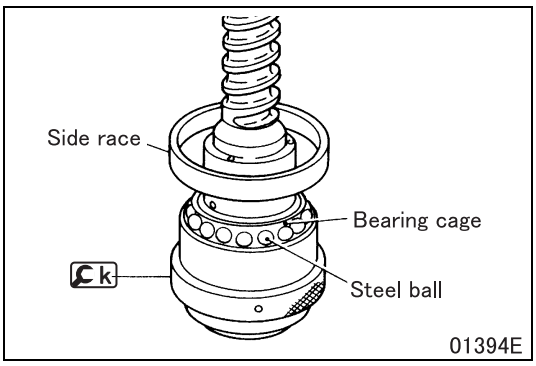


■ **Installation: Side race, steel ball and bearing cage**

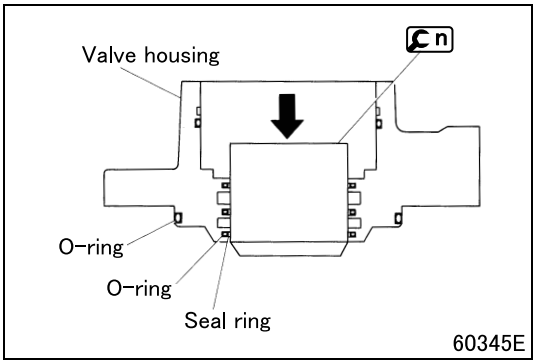
- Assemble ck onto cl and install the stub shaft and worm shaft in the illustrated direction.
- Install the bearing cage and steel balls onto the stub shaft and worm shaft.



- Hold cl by hand and slide ck downward to set the steel balls in place.

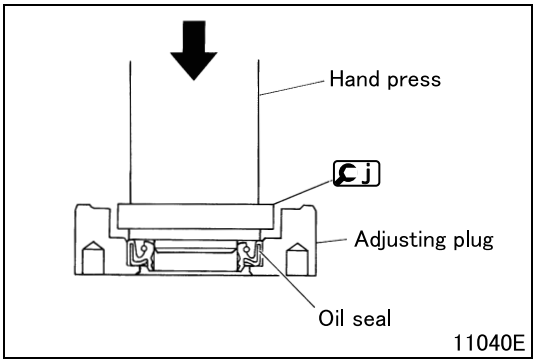


- Install the side race on the steel balls and bearing cage.



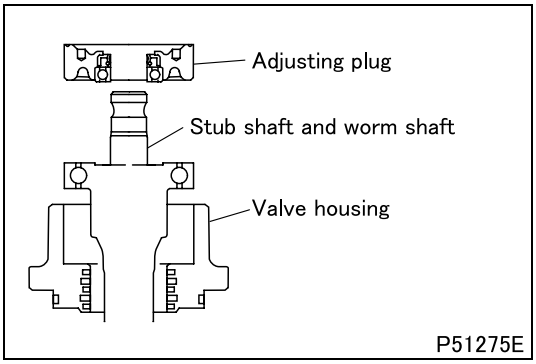
■ **Installation: Seal ring and O-ring**

- Install the seal ring and O-ring on the valve housing.
- Form the seal ring with n.



■ **Installation: Oil seal**

- Install the oil seal on the adjusting plug in the illustrated direction.

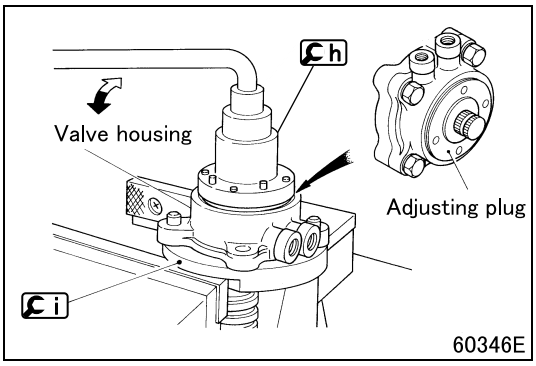


■ **Installation: Stub shaft and worm shaft**

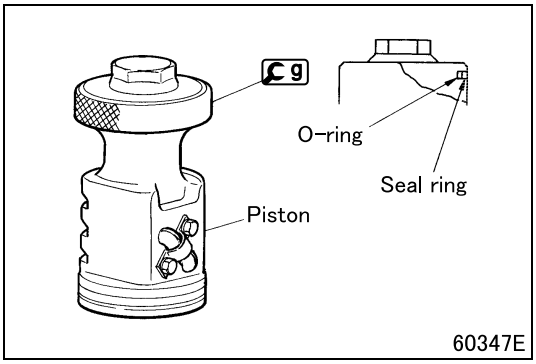
- Install the valve housing on the stub shaft and worm shaft and secure it with adjusting plugs.

CAUTION ⚠

- **Take care not to damage the seal ring with the ball race of the stub shaft and worm shaft.**

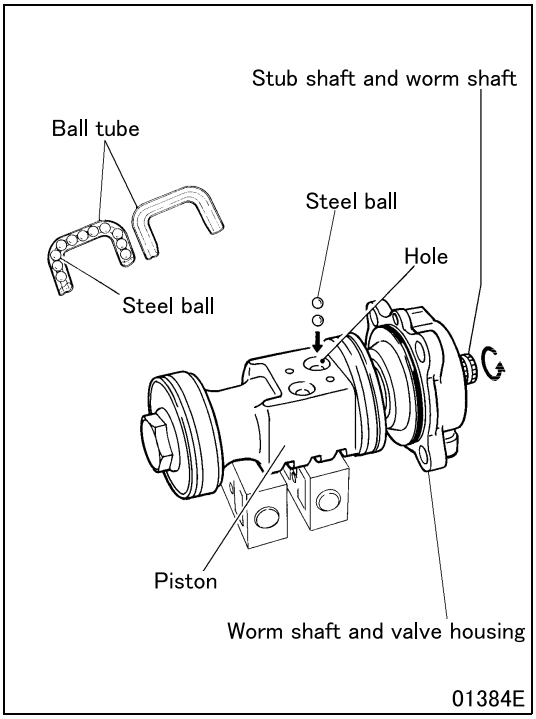


- Secure the valve housing to a vise using i.
- Tighten the adjusting plug to the specified torque with h, and then loosen it by approximately 180°.



■ **Installation: Seal ring and O-ring**

- Install the seal ring and O-ring on the outer surface groove of the piston and form the seal ring with g.

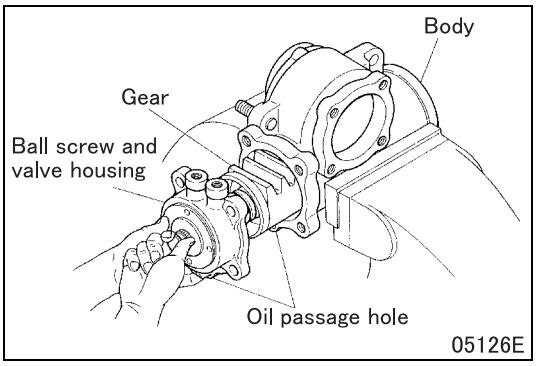


■ **Installation: Ball tube**

- Fill the inside of the ball tube with grease, place 10 to 11 steel balls, and lay another ball tube on top of the ball tube.
- Place the piston on a flat bench and align the assembled worm shaft and valve housing with the ball race position of the piston. While turning the stub shaft and worm shaft, drop steel balls from the ball tube hole.

CAUTION ⚠

- **Take care that steel balls may fall off the ball race if the worm shaft and valve housing is pulled out to the end face position.**

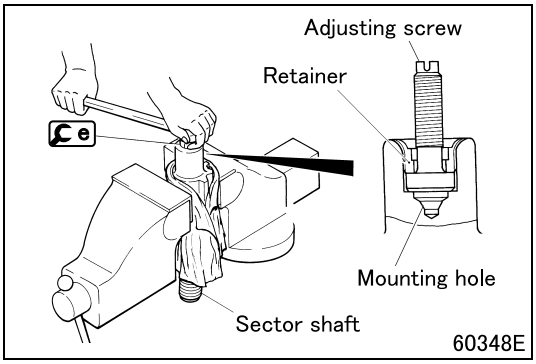


■ **Installation: Ball screw and valve housing**

- Face the gear of the ball screw and valve housing in the illustrated direction so that it can be engaged with the sector shaft.
- Install the gear on the body while lightly holding down the gear by hand to prevent it from turning. Align the ball screw and valve housing with the oil passage holes of the body to install.

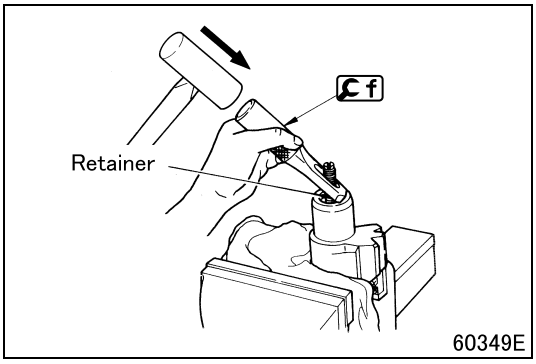
CAUTION ⚠

- **Take care not to damage the piston seal ring and the inside of the body.**

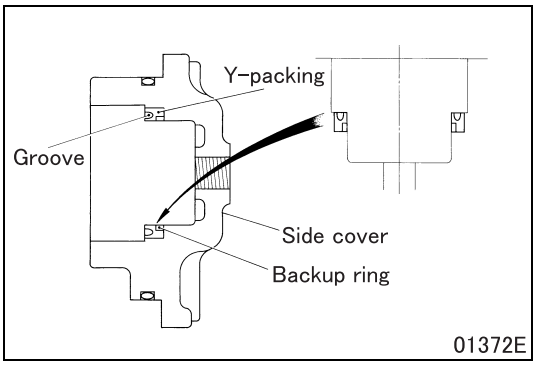


■ **Installation: Retainer**

- Fill the adjusting screw mounting hole of the sector shaft with grease.
- Install the adjusting screw on the sector shaft.
- Install the retainer on the sector shaft using e.
- After tightening, return the retainer by 180° once. Then, retighten it to the torque of 39 N·m {29 ft.lbs, 4 kgf·m} and return it by 20°.
- Make sure that the adjusting screw turns smoothly.

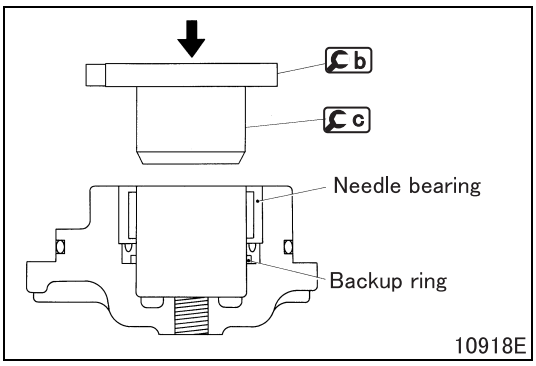


- Caulk caulked locations (two) of the retainer using f.

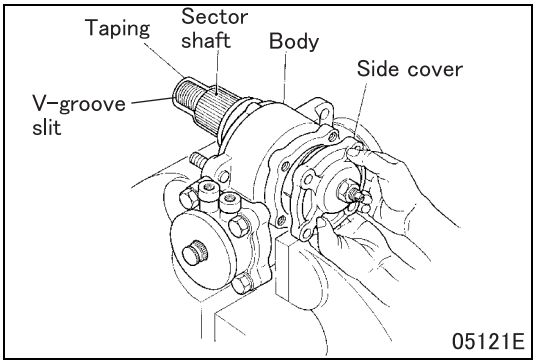


■ **Installation: Backup ring and Y-packing**

- Install the Y-packing on the side cover in the illustrated direction.
- After installing the backup ring, fill the Y-packing groove with grease.



- After installing the needle bearing, form the bend of the backup ring using b and c.

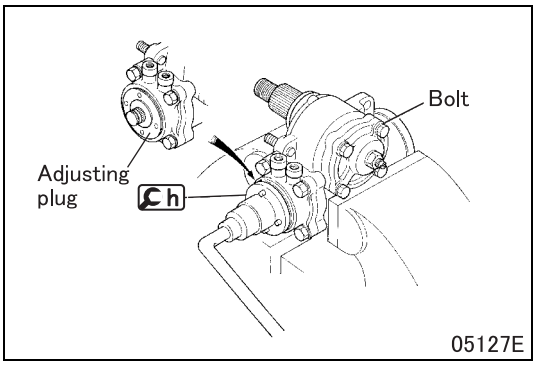


■ **Installation: Sector shaft**

- Set the V-groove slit of the sector shaft of the sector shaft and side cover at the center of the body, and install the sector shaft so that the gear of the piston is engaged with the gear of the sector shaft at their respective center.

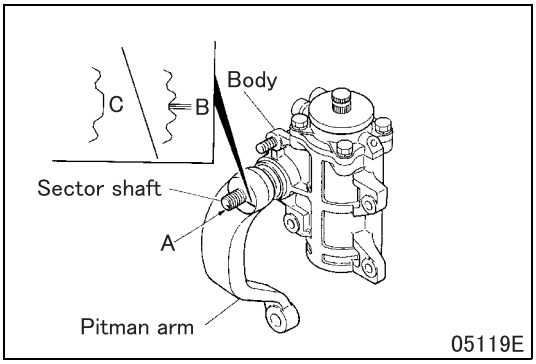
CAUTION ⚠

- **Tape the Y-packing to install to prevent it from being damaged by the sector shaft thread.**



■ **Tightening: Adjusting plug**

- After tightening the side cover mounting bolts to the specified torque, retighten the adjusting plugs to the specified torque using h.



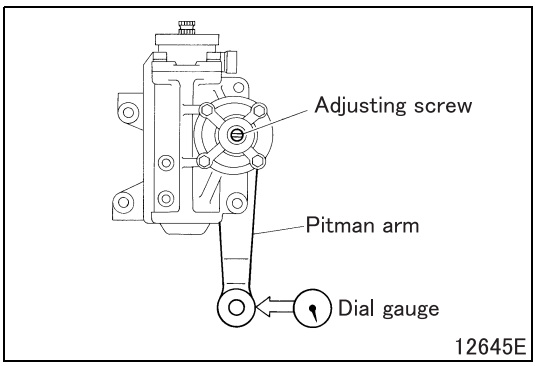
■ **Installation: Pitman arm**

- Set V-groove slit A of the sector shaft at the center of the body, and align V-groove slit B of the pitman arm or missing tooth position C of serration with slit A.

CAUTION ⚠

- **Make sure that the piston operates smoothly by letting the piston make a full stroke using the pitman arm.**

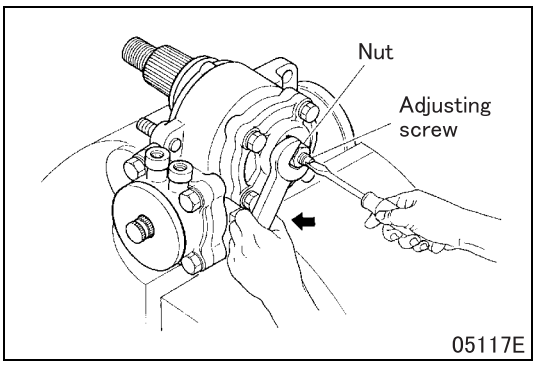
◆Adjustment after installation◆



■ **Adjustment: Backlash between sector shaft and piston**

- Measure runout of the tip of the pitman arm with a dial gauge with gear engagement placed in neutral position. Adjust using the adjusting screw so that the measurement is within the standard value.

  Measured load: ±15 N {3.4 lbs, 1.5 kgf} <FK>
  ±20 N {4.5 lbs, 2.0 kgf} <FM>



- After adjusting backlash, apply sealant to the adjusting screw threads. Tighten the nut to the specified torque while securing the adjusting screw with a screwdriver to prevent it from turning.

CAUTION ⚠

- **The flow control valve and body are of a unit construction.**
- **Do not remove the plug unless it is in an abnormal condition.**
- **See Gr11 for removal and installation of the power steering oil pump.**

● **Assembly sequence**

Follow the disassembly sequence in reverse.

Repair kit: Seal repair kit, cartridge assembly kit

Service standards (Unit: mm {in.})

Location	Maintenance item	Standard value	Limit	Remedy
9	Stepped wear of sliding area of cover rotor and vane	–	0.03 {0.0012}	Replace
13, 14	Clearance between vane and rotor	0.01 {0.00039}	0.06 {0.0024}	Replace
16	Stepped wear of sliding area of side plate rotor and vane	–	0.03 {0.0012}	Replace
21, 23	Clearance between flow control valve and body	0.01 to 0.02 {0.00039 to 0.00079}	0.03 {0.0012}	Replace
22	Free length of flow control spring	36.5 {1.44}	33.5 {1.32}	Replace

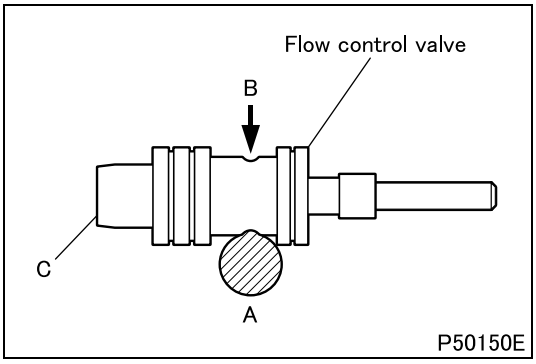
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Elbow	68 {50, 6.9}	–
Tb	Bolt (suction connector mounting)	7.8 to 11.8 {5.8 to 8.7, 0.8 to 1.2}	–
Tc	Plug	15 to 20 {11 to 15, 1.5 to 2.0}	–
Td	Bolt (cover mounting)	22 to 26 {16 to 19, 2.2 to 2.7}	–
Te	Connector	49 to 69 {36 to 51, 5.0 to 7.0}	–

Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Mating surfaces of connector and O-ring	Automatic transmission fluid (DEXRON II or DEXRON III type)	As required
	Mating surfaces of elbow and O-ring		
	O-ring		

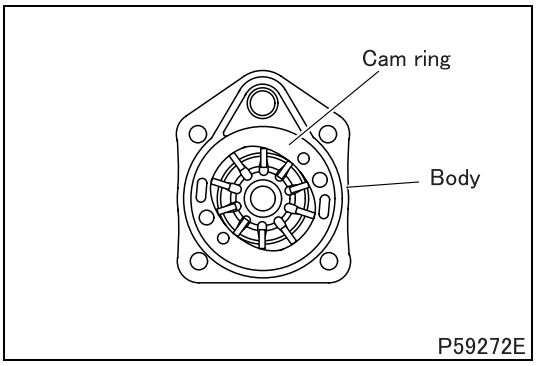
◆Inspection procedure◆



■ Inspection: Flow control valve

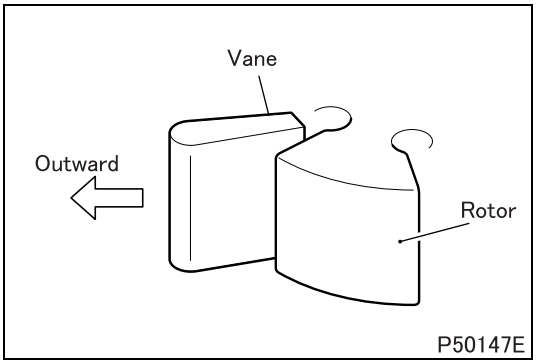
- Plug port A of the flow control valve by a finger.
- Apply air pressure (390 to 490 kPa {57 to 71 psi, 4 to 5 kgf/cm^2}) to port B.
- Check for any air leakage from port C.
- If there is any abnormality, replace the power steering oil pump.

◆Installation procedure◆



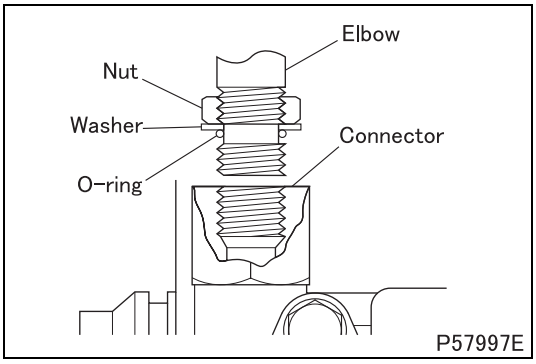
■ Installation: Cam ring

- Install the cam ring on the body in the illustrated direction.



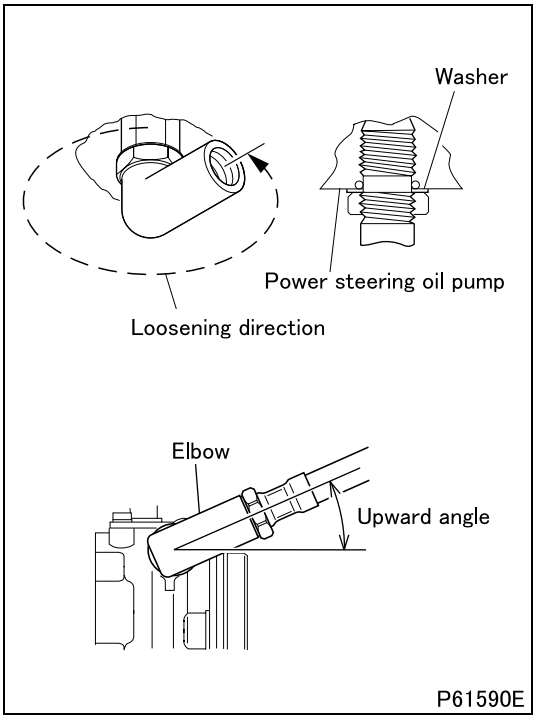
■ **Installation: Vane**

- Install the vane on the rotor with its rounded area facing outward.



■ **Installation: Elbow**

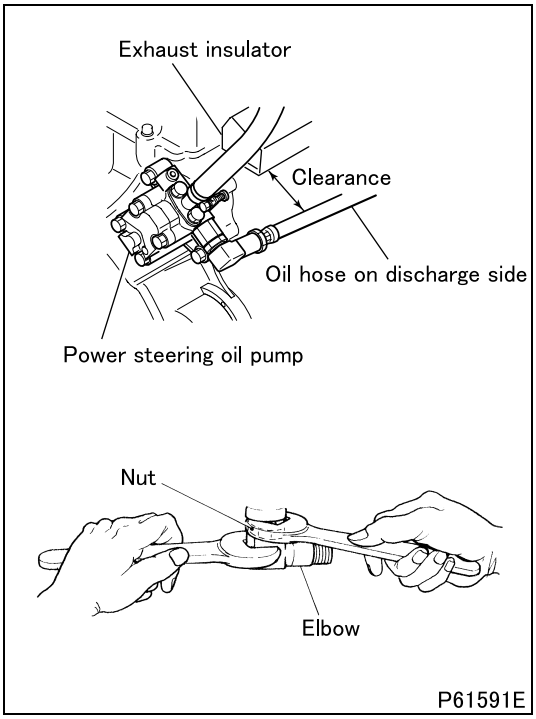
- Make sure that the nut and washer of the elbow and O-ring are correctly positioned.
- Clean the O-ring mount completely and apply power steering oil to it. When assembling the O-ring, apply automatic transmission fluid to it to prevent damage.



- Screw in the power steering oil pump by hand until the washer contacts the connector mounting surface. From that position, align the power steering oil pump with the upward angle of 20° from the horizontal direction of the body of the power steering oil pump in the loosening direction.

CAUTION ⚠

- **When returning the power steering oil pump to the specified position, do not turn it by more than 270°.**



■ **Installation: Oil hose (discharge side)**

- When installing the oil hose on the discharge side, provide sufficient clearance (approximately 50 mm {2.0 in.} or more) to the exhaust insulator.
- Hold down the elbow with a spanner to prevent displacement of the elbow position and tighten the nut to the specified torque.

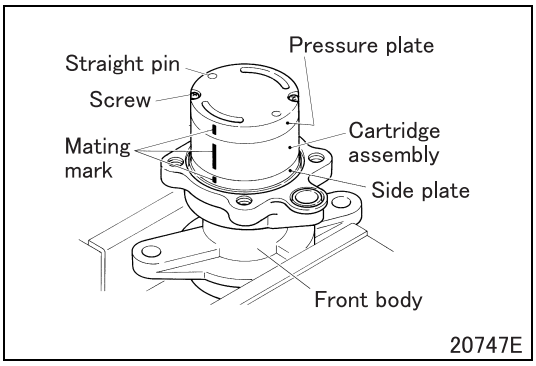
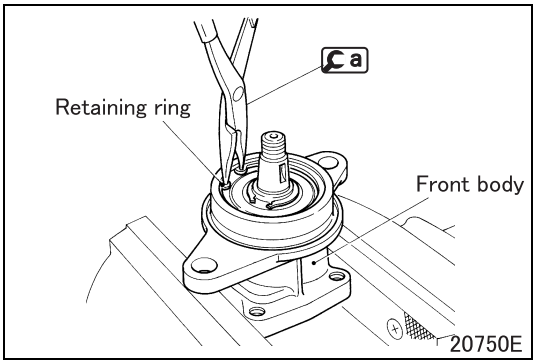
* Unisia JKC Steering System Part No.

◆Removal procedure◆

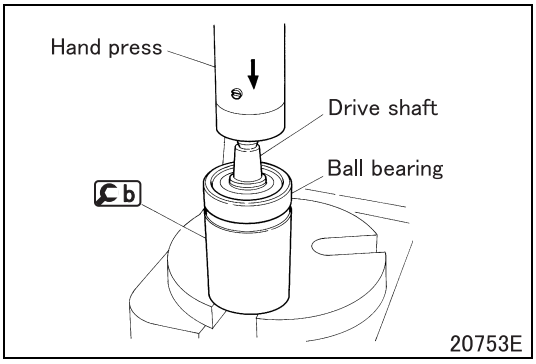


■ Removal: Cartridge assembly

- Put mating marks on the outer surfaces of the pressure plate, cartridge assembly and side plate.
- Remove the screw, and then, remove the pressure plate, cartridge assembly, side plate and straight pin as a set from the front body.

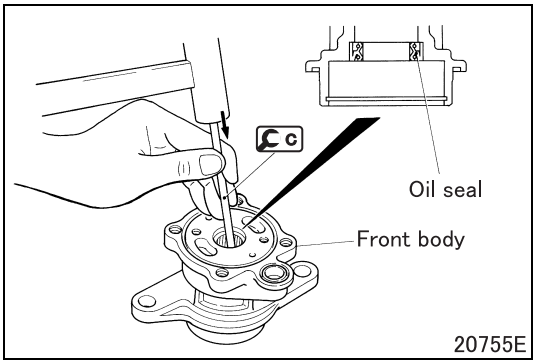


■ **Removal: Retaining ring**



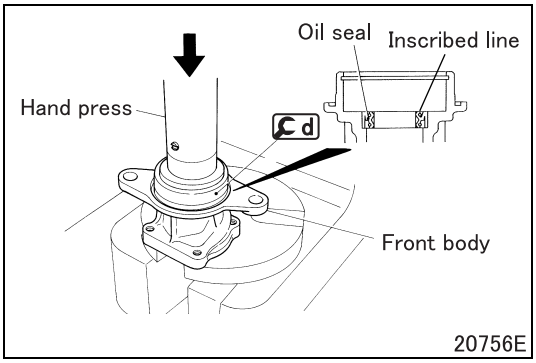
■ **Removal: Ball bearing**

- Remove the ball bearing toward the drive side (gear side) of the drive shaft.



■ **Removal: Oil seal**

◆**Installation procedure**◆

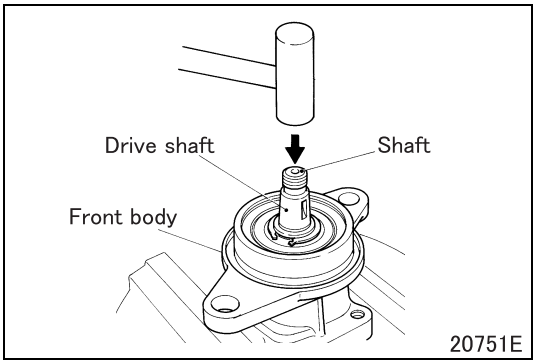


■ **Installation: Oil seal**

- Install the oil seal on the front body in the illustrated direction.

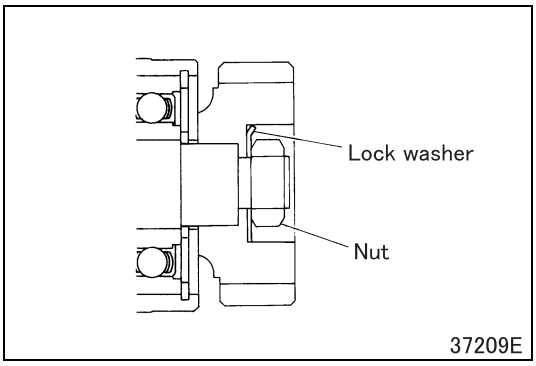
■ **Installation: Ball bearing**

- To install the ball bearing, follow the removal procedure in reverse. (See "■ **Removal: Ball bearing**".)



■ **Installation: Drive shaft**

- When installing the drive shaft into the front body, if it is not inserted into the normal position by hand, lightly tap the shaft with a plastic hammer to install.

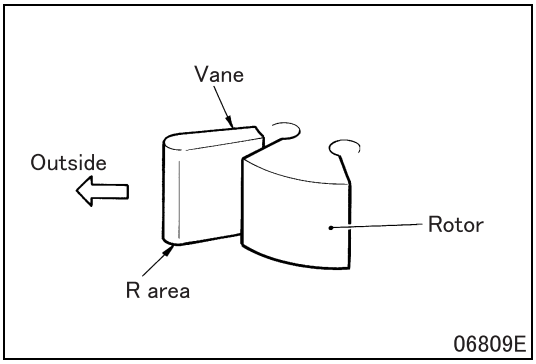


■ **Installation: Lock washer**

- After tightening the nut, bend one location on the circumference of the lock washer.

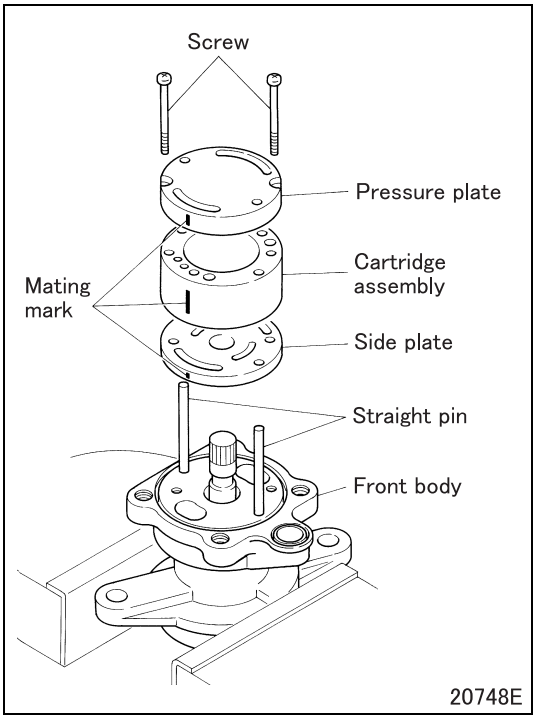
■ **Installation: Retaining ring**

- To install the retaining ring, follow the removal procedure. (See "■ **Removal: Retaining ring**".)



■ **Installation: Vane**

- Install the vane on the rotor with its R area facing outward, and make sure that the vane moves smoothly.
- If the vane is defective, replace the cartridge assembly.

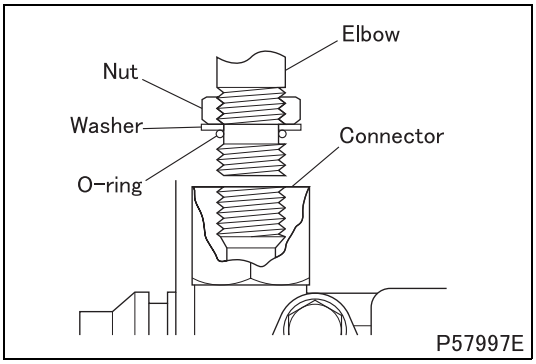


■ **Installation: Cartridge assembly**

- Install the straight pin on the front body.
- Install the side plate, cartridge assembly and pressure plate in alignment with mating marks put at the time of disassembly, and tighten screws to the specified torque.

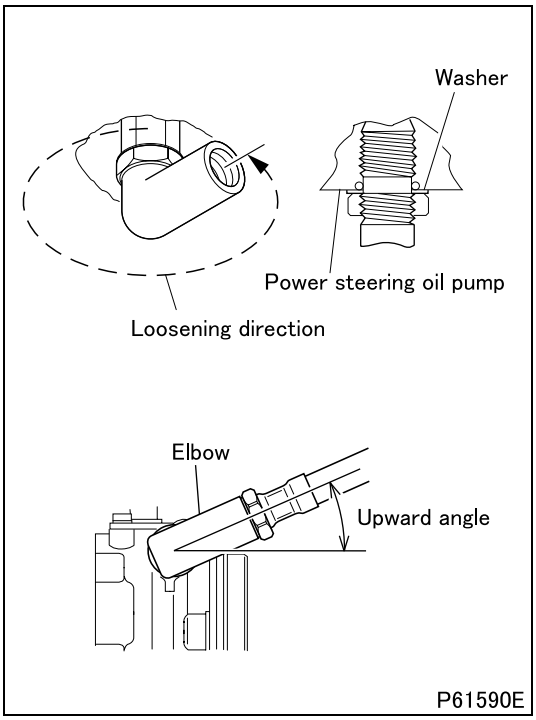
CAUTION ⚠

- **Do not mistake pin holes of each part when installing.**



■ **Installation: Elbow**

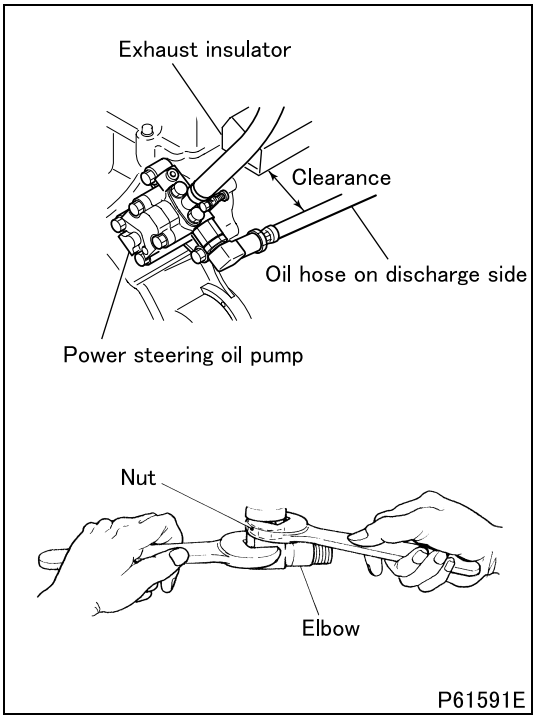
- Make sure that the nut and washer of the elbow and O-ring are correctly positioned.
- Clean the O-ring mount completely and apply power steering oil to it. When assembling the O-ring, apply automatic transmission fluid to it to prevent damage.



- Screw the elbow in the power steering oil pump by hand until the washer contacts the connector mounting surface. From that position, align the elbow with the upward angle of 20° from the horizontal direction of the body of the power steering oil pump in the loosening direction.

CAUTION ⚠

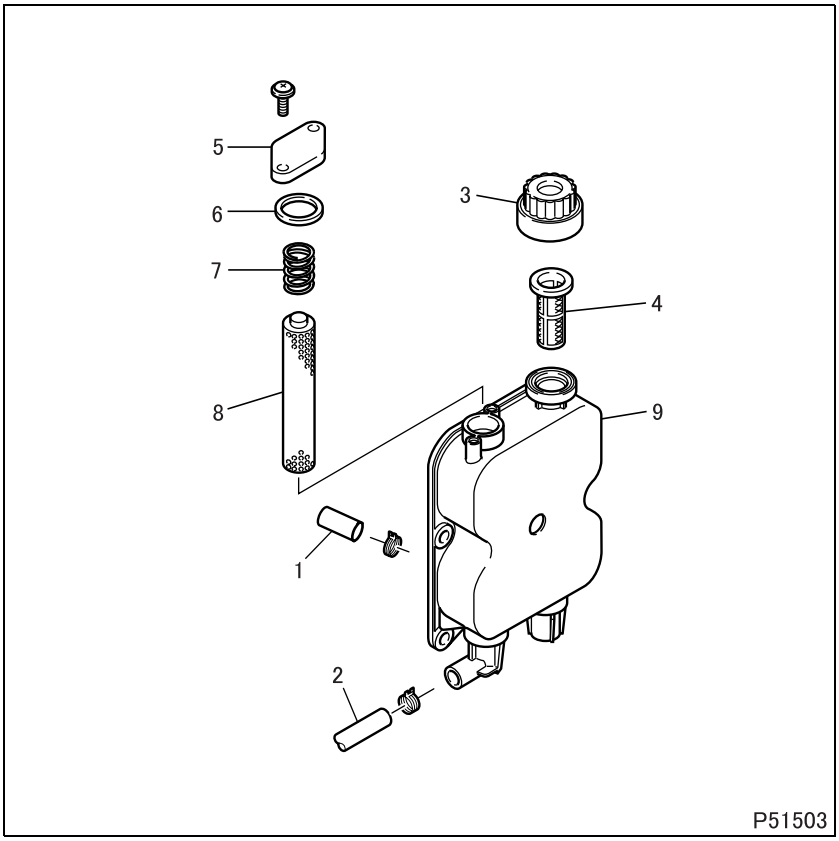
- **When returning the elbow to the specified position, do not turn it by more than 270°.**



■ **Installation: Oil hose (discharge side)**

- When installing the oil hose on the discharge side, provide sufficient clearance (approximately 50 mm {2.0 in.} or more) to the exhaust insulator.
- Hold down the elbow with a spanner to prevent displacement of the elbow position and tighten the nut to the specified torque.

POWER STEERING OIL TANK



● **Disassembly sequence**

1 Hose
2 Hose
3 Cap
4 Strainer
5 Filter cap
6 Packing
7 Spring
8 Filter
9 Tank body

● **Assembly sequence**

SPECIFICATIONS 41-2

STRUCTURE AND OPERATION
1. Frame 41-3

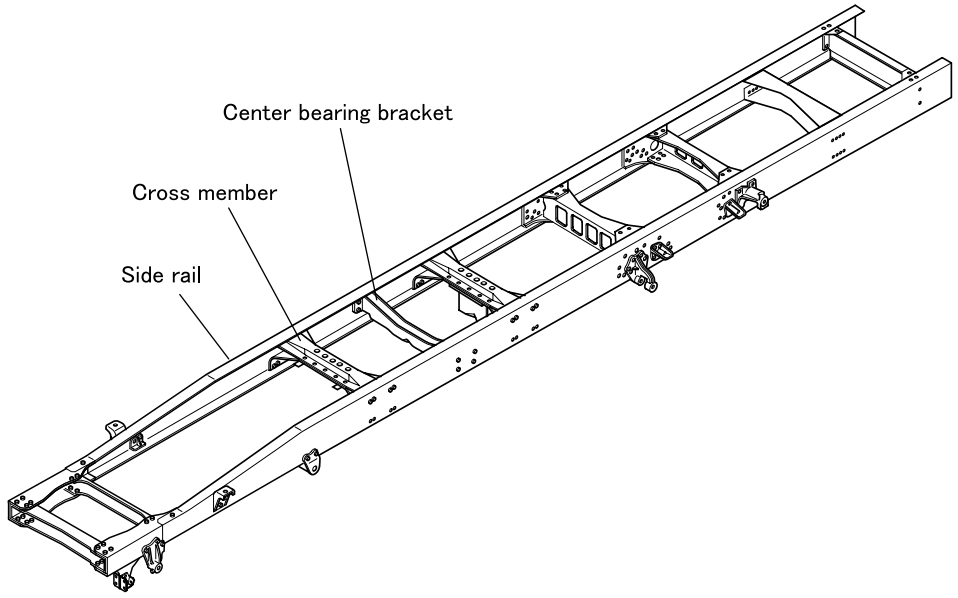
FRONT BUMPER 41-4

FRAME 41-6

SPECIFICATIONS

Item	Specifications
Frame type	Ladder type
Cross section configuration of side member	⊐ shaped (open) cross section

1. Frame



P104844E

- The frame has cross members fastened to the web of the side rails (lateral linkage) so that stress on the joints is minimal. This allows joint rivets to maintain tightness and ensures long-lasting high torsional rigidity.
- Unlike vertical linkage where cross members are fastened to the flange of side rails, no rivets appear on top of the frame, greatly facilitating body mounting.

	M12 nut	FM		
Tc	M10 nut		45 to 60 {33 to 44, 4.5 to 6.0}	–

◆Cleaning procedure◆

■ Cleaning: Frame

- Thoroughly remove mud, grease, rust etc. from the outer and inner surfaces of the frame.

◆Inspection procedure◆

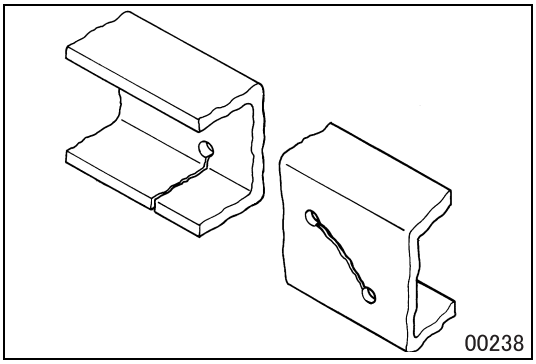
■ Inspection: Frame

(1) Inspection for deformation

- If deformation or any other defect is found, repair the frame.

(2) Inspection for cracks

- Remove paint from suspected areas and carefully inspect exposed surfaces for cracks.
- If visual inspection is difficult, perform dye check or any other suitable examination.
  If a crack is found, repair as follows.

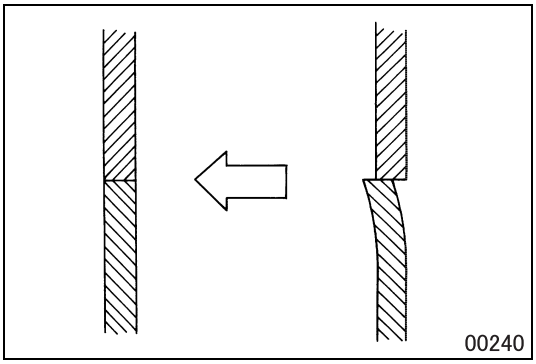


(3) Repair of crack in frame

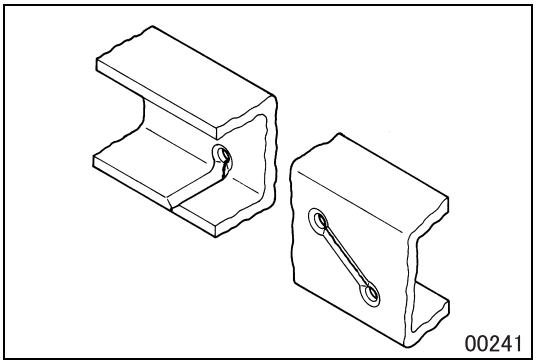
- With the vehicle unloaded, level the frame.
- Drill a hole with a diameter roughly twice the thickness of the frame plate, 10 mm {0.39 in.} from the inside end of the crack.

NOTE

- **If the crack is within the frame plate, drill holes at both ends of the crack.**



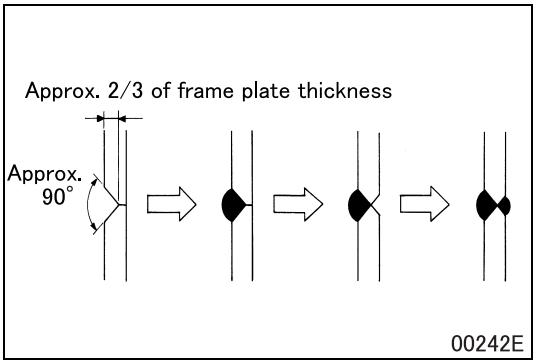
- If the edges of the crack are uneven, even them out.



- Using a grinder, cut a 90° V-channel at the crack to a depth of approximately 2/3 of the frame plate thickness, then fill the channel with filler metal by welding.

CAUTION ⚠

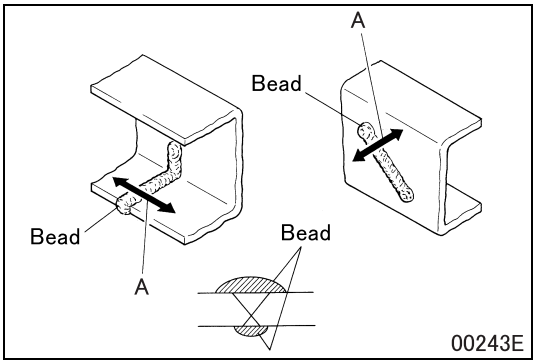
- **Avoid gas welding because heat embrittles the material of welded area. Be sure to use electric welding.**
- **Electric welding could allow the welding current to reverse through ground circuit and burn electrical components. To prevent this, be sure to disconnect negative cable from the battery and ground the welding machine at a point near the weld zone before work.**
- **For electric welding, follow other precautions given elsewhere. (See Gr00.)**
- **If there are any combustibles, such as pipeline, wiring harness, rubber part and fuel tank, near the weld zone, be sure to cover them for protection.**
- **Use low-hydrogen type coated CO_2 and arc welding electrodes for welding and check that there are no harmful defects such as undercut and blow hole after welding.**
- **Preheat the area around weld zone to approximately 50 to 350°C {120 to 660°F} before welding when the workshop temperature is below 0°C {32°F}.**
- **Be sure to protect mountings that may be affected by heat, such as main sills, using heat insulators or the like.**



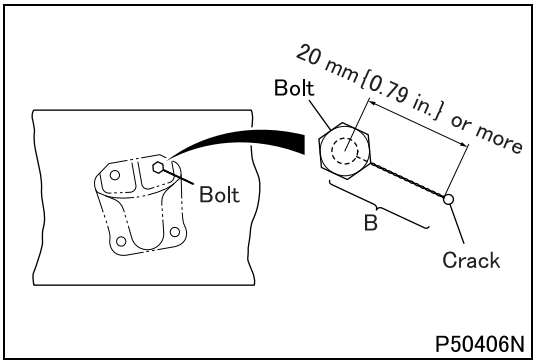
- Next, make a similar V-channel on the opposite side of the weld. At the same time, deposit metal to cover up the hole or holes at both ends of the crack by welding.

NOTE

- **In cold climates, heat the weld zone to approximately 200°C {390°F} after welding.**

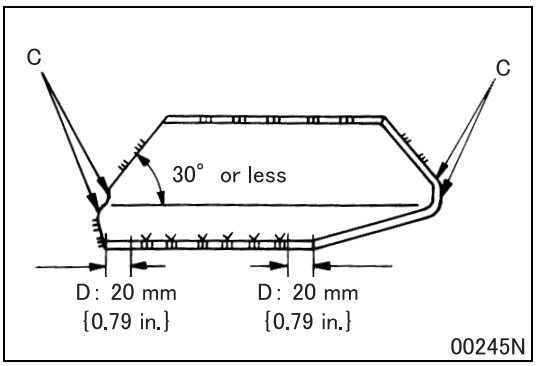


- After welding, run a grinder over the bead at right angles A.
- Remove the notched portion from the weld and finish the ground surfaces flat to a thickness equal to the original plate thickness.



[Repairing crack from rivet or bolt hole]

- To make the edges of the cracked hole even, temporarily tighten the bolt in the hole.
- First, weld to close the crack at a point at least 20 mm {0.79 in.} apart from the center of the bolt.
  For this welding, refer to the aforementioned welding procedures for crack repair.
- Remove the temporary bolt. After making hole edges even, weld to close the rest of the crack B. Simultaneously fill the hole with weld metal.
- Drill a hole at the location of original hole, and install a rivet or bolt in it.



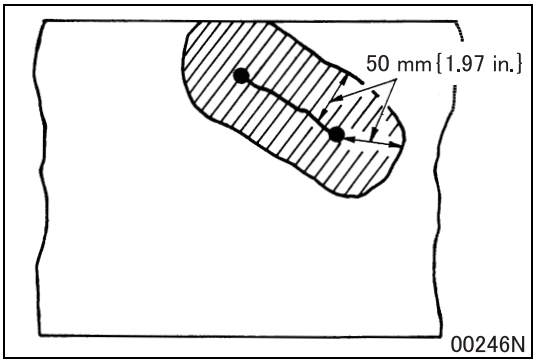
[Repairing using reinforcement plate]

- To prevent the concentration of welding stress at both ends C of the reinforcement plate, cut the ends at a bevel of 30° or less for welding. Do not weld at points D.
- The reinforcement plate must have enough to cover the cracked area.

NOTE

- **Reinforcement plate thickness: Equal to frame plate thickness**
- **Reinforcement plate material: As specified below or equivalent**

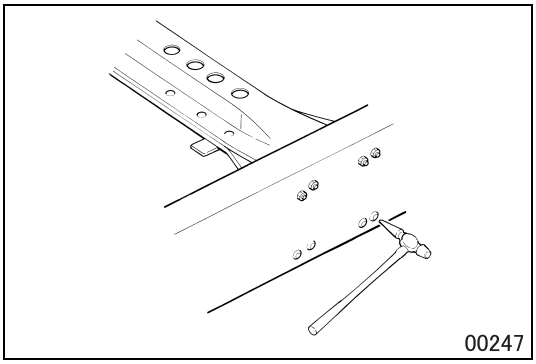
HTP540 (high-tensile steel sheet)



- After welding, heat the hatched area to 600 to 700°C {1110 to 1290°F}.

CAUTION ⚠

- **Be sure to protect mountings that may be affected by heat, such as main sills, using heat insulators or the like.**

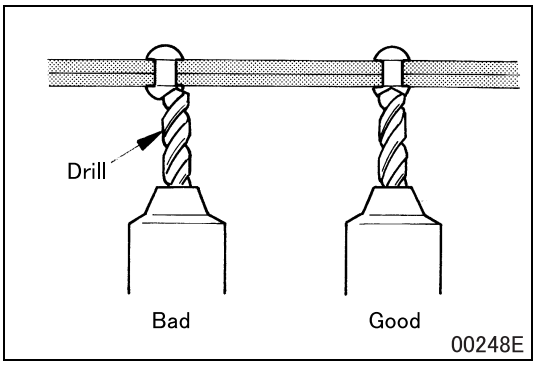


(4) Inspection of rivets for looseness

- Lightly tap the head of each rivet using an inspection hammer and feel or listen for the echo to determine if the rivet is loose.
- Rusting between rivet and frame plate is an indication of loosened rivet.

CAUTION ⚠

- **Be sure to replace loose rivets. They could break off or allow frame cracks to develop from the rivet holes, leading to an accident.**

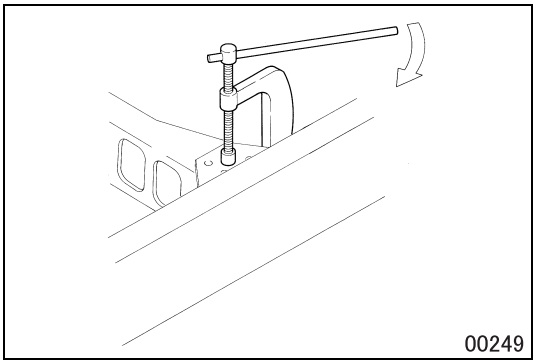


(5) Replacement of rivet

- To remove a rivet, make a dent in the middle of the loosened rivet's head with a punch, and then, eliminate its head using a drill or grinder.

NOTE

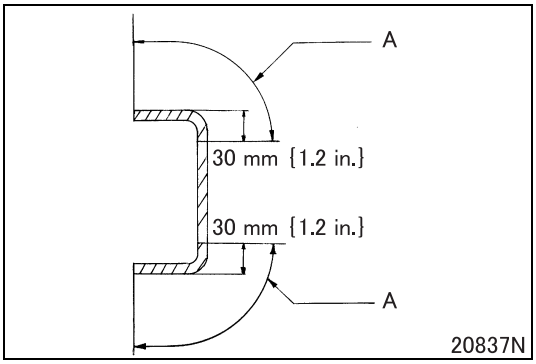
- **The rivet hole must be intact.**



- Before riveting, clamp the two plates closely together near the rivet hole using a C vice.
- Using a riveting machine, drive the rivet (cold rivet) into the rivet hole.
- If riveting is unfeasible, ream the rivet hole, drive a reamer bolt into the hole, fully tighten the nut, then weld it in place.
  For the reamer bolt and nut to be used, use a flange bolt and a flange nut.

(6) Inspection of bolts and nuts for looseness

- Inspect the mounting bolts of cross members for looseness. If any loose bolt is found, retighten it to specified torque.



(7) Drilling hole in frame

- When required to drill holes in the frame, heed the following warning.

CAUTION ⚠

- **When drilling holes in the side rail, avoid the illustrated ranges A to prevent cracking.**
- **Grind the edge of drilled hole smooth.**
- **Avoid drilling holes as much as possible in those areas that otherwise will radically alter the rigidity of the side rail, such as a joint with a cross member, the ends of a stiffener, and the areas around them.**
- **Drilled holes should be ϕ17 mm or less, and spacing between them should be as follows.**
  ϕ13 mm {0.51 in.} or less: 30 mm {1.18 in.} or more
  ϕ15 mm {0.59 in.} or less: 45 mm {1.77 in.} or more
  ϕ17 mm {0.67 in.} or less: 65 mm {2.56 in.} or more

Cab assembly

Item	Specifications
Type	Cab over type (forward control type)
Mass kg {lb}	Approximately 540 {1190}

Cab mounting

Item	Specifications	
	Front	Rear
Type	Semi-floating type	
Mountings	Liquid-filled rubber cushioned mountings	Rubber cushioned mounting

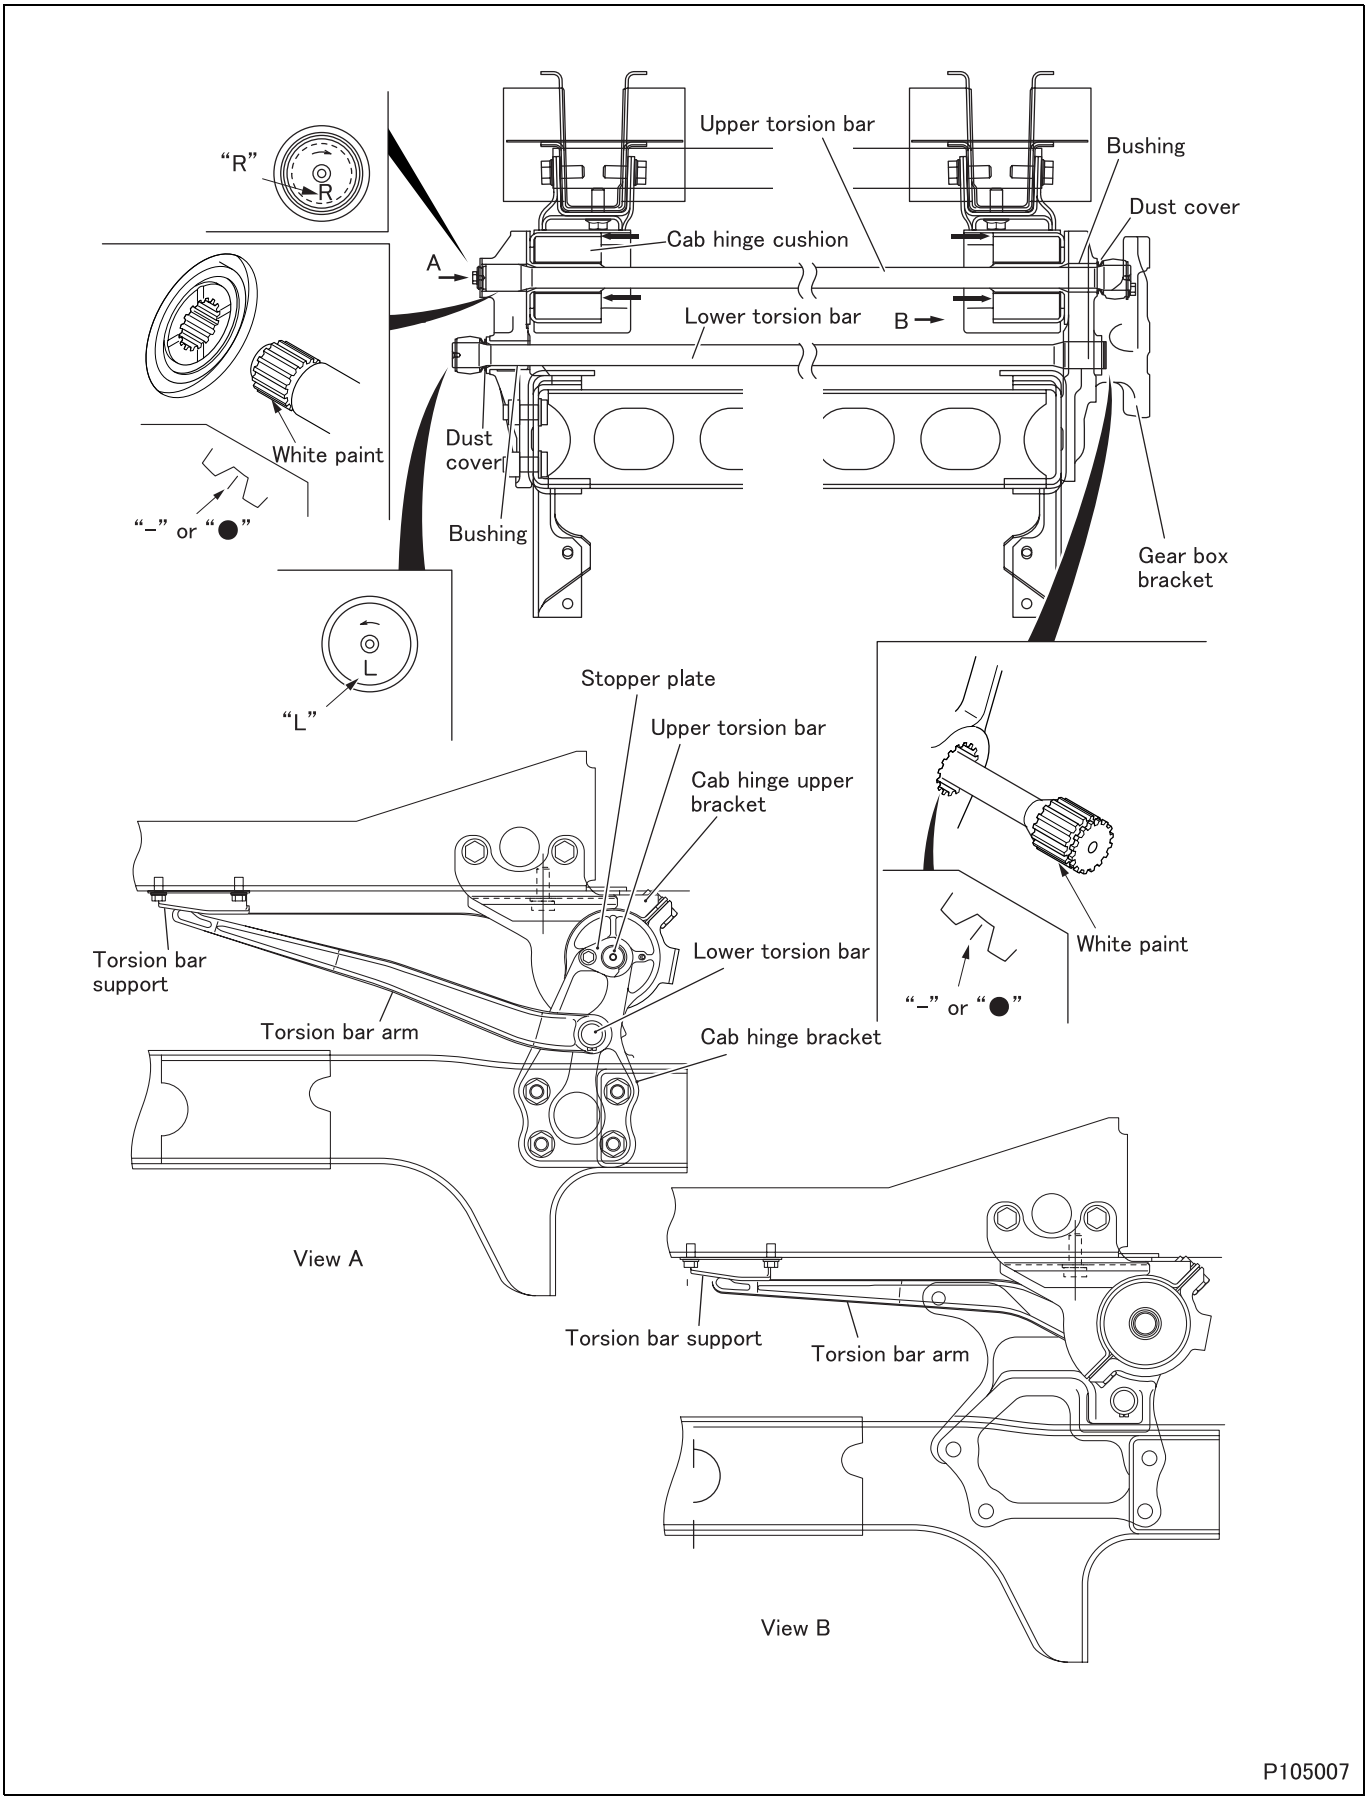
Cab tilt mechanism

Item	Specifications
Type	Torsion bar type
Tilt angle	44° *
Cab tilt lock	Manually operated hook type

*: The tilt angle is normally set to 44 degrees. But the angle is set to 49 degrees (over tilting) operating the cab stay to increase the torsion angle of the torsion bar when removing and installing the cab.

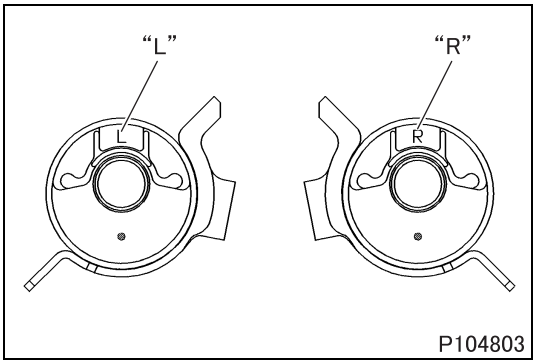
M E M O

1. Front Cab Mounting



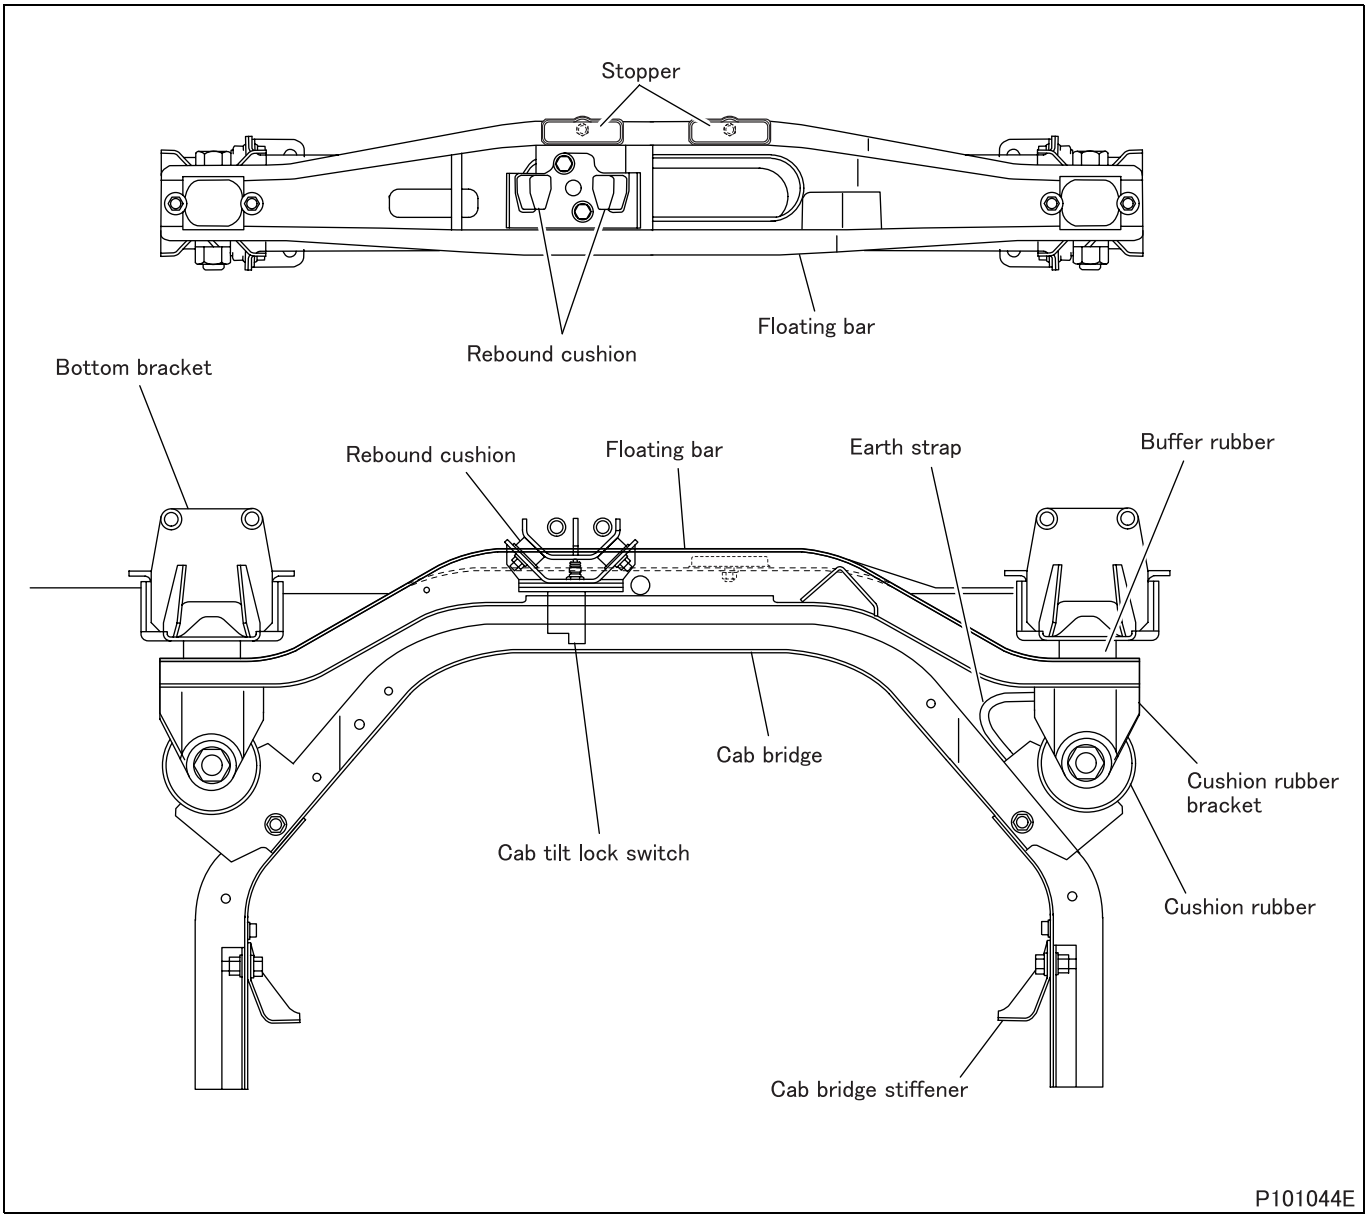
P105007

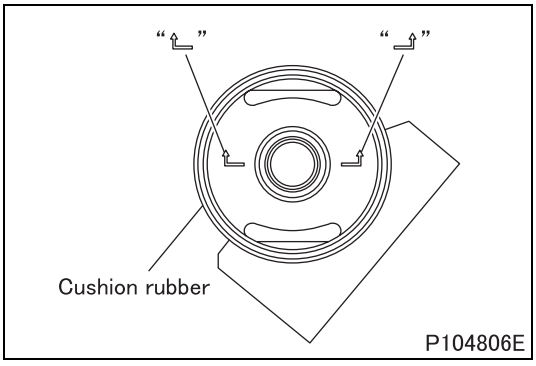
- Upper torsion bar and lower torsion bar have their particular torsional directions. To ensure that they are installed correctly, the upper and lower torsion bars have “L” or “R” indicating the direction of torsion stamped at the RH end faces.
- Upper torsion bar has alignment mark (white paint) which should be aligned with alignment mark “–” or “●” on cab hinge bracket.
- Lower torsion bar has alignment mark (white paint) which should be aligned with alignment mark “–” or “●” on gearbox bracket.



- Cab hinge cushion uses a liquid-filled rubber element.
- Cab hinge cushion has the identification mark “L” or “R”.

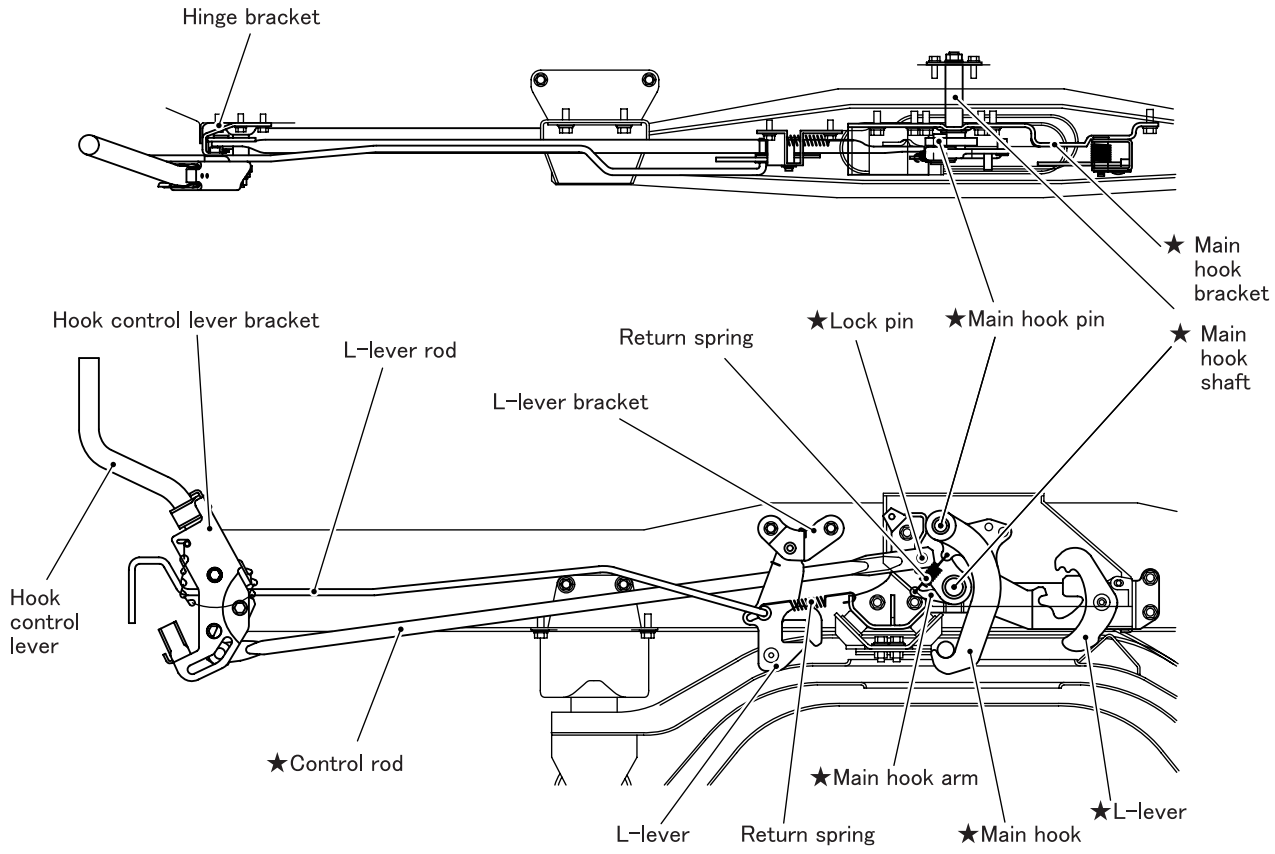
2. Rear Cab Mounting





- Cushion rubbers have the identification mark showing the installing direction.

3. Cab Tilt Link



- Lock pin, main hook pin and main hook shaft all have their heads caulked after installation. Therefore, the parts marked with "★" which form a main hook assembly cannot be disassembled.

Cabs in general

Possible causes \ Symptoms			Cab shimmy (vibration accompanying pitching and rolling motions)	High-frequency vibration (above 20 Hz) and noise in cab and steering wheel	Reference Gr
Cab-related problems	Front cab mounting	Looseness and play in cab hinge caps, cab hinge brackets and attaching parts	O	O	
		Deterioration of cab hinge cushions	O		
	Rear cab mounting	Deterioration of buffer rubbers		O	
		Deterioration of cushion rubbers	O

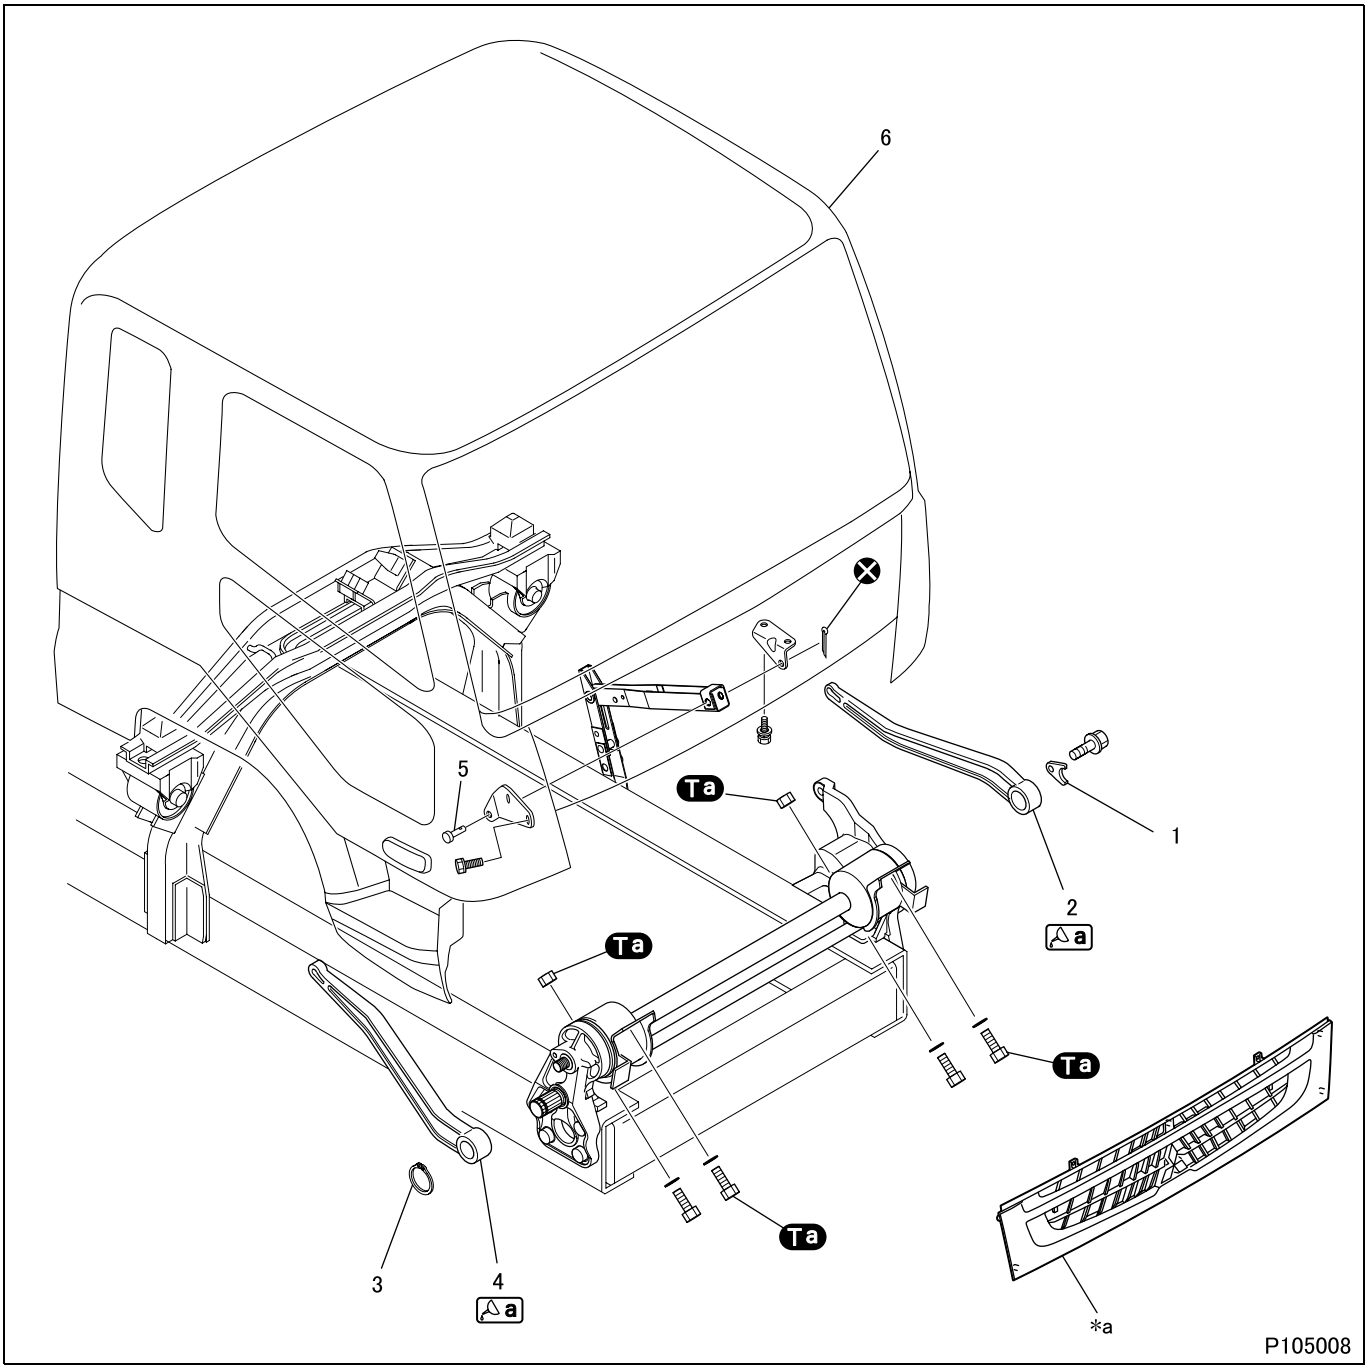
REMOVAL AND INSTALLATION OF CAB



● **Removal sequence**

1 Stopper plate
2 Torsion bar arm, left-hand
3 Snap ring
4 Torsion bar arm, right-hand
5 Clevis pin
6 Cab

***a:** Front grille
⊗: Non-reusable parts

WARNING ⚠

- **During removal and installation of the cab, the parking brake is not available for holding the vehicle at a standstill. Therefore, be sure to apply chocks to the tires to ensure that the vehicle does not move.**
- **Never remove the chocks until all the operations are completed.**

CAUTION ⚠

- **During removal and installation of the cab, the cab stay should be set to over tilting state. Be sure to remove the radiator grille before the work to prevent damage to it.**

● Installation sequence

Follow the removal sequence in reverse.

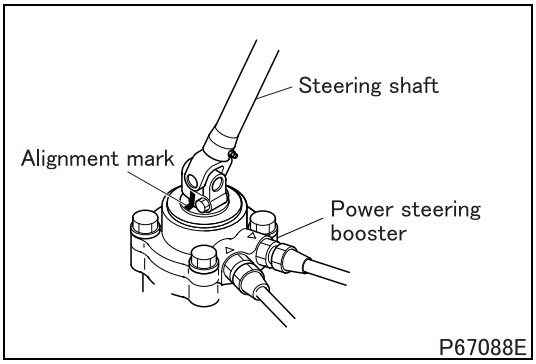
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Bolt (cab hinge cap installation)	120 to 170 {89 to 125, 12.0 to 17.0}	–
	Nut (cab hinge cap installation)		

Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Areas of torsion bar arms and torsion bar supports which make contact with each other	Chassis grease [NLGI No. 1 (Li soap)]	As required

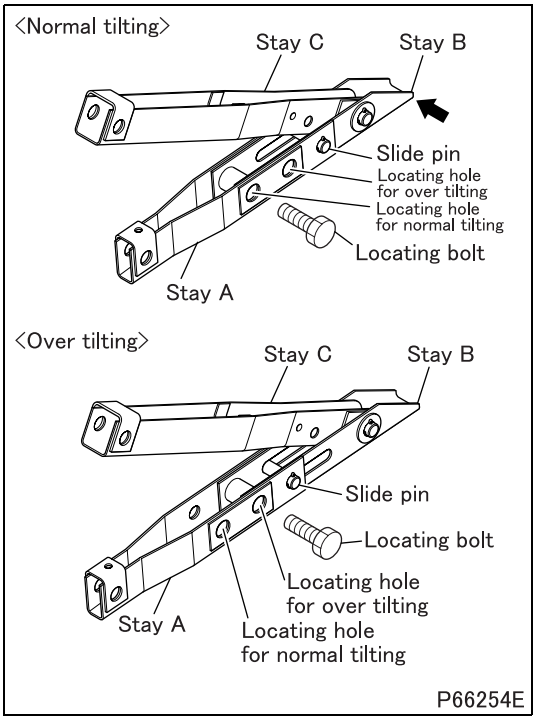
◆Work before removal◆



■ Alignment marks: Steering shaft and power steering booster

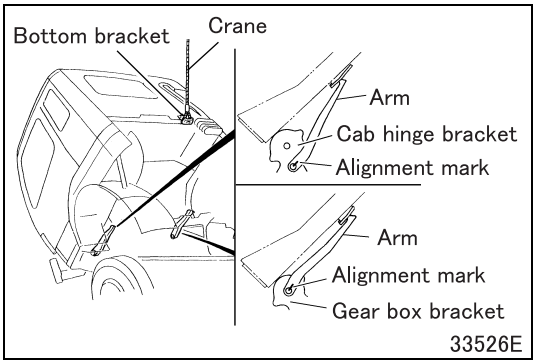
- With the cab tilted up in the normal tilting state, provide alignment marks on the steering shaft and power steering booster.
- Remove the steering shaft and bind it to the cab with a string or the like.

◆Removal procedure◆



■ Removal: Cab

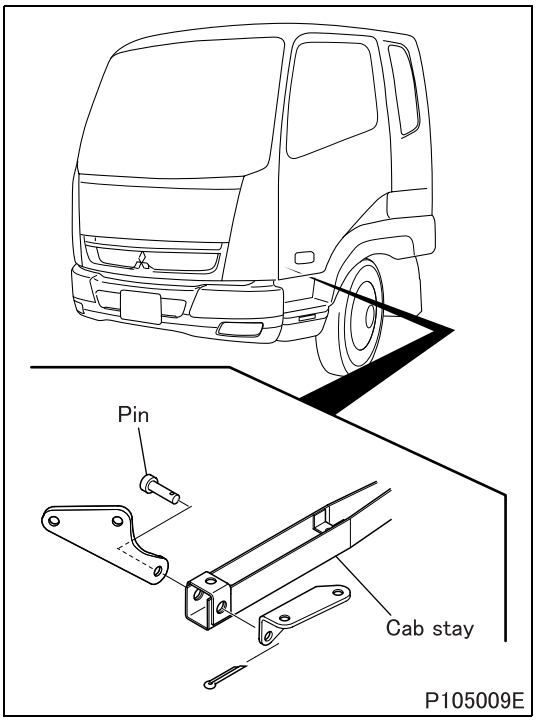
- Without the cab tilted up, change the state of the cab stays from normal tilting to over tilting by the following procedure.
  - Remove the locating bolt.
  - Slide the stay B by force in the illustrated direction.
  - Install the locating bolt in the locating hole for over tilting.



- With the cab tilted up, attach the wire rope to bottom bracket securely to enable the cab to be tilted down while being supported by crane.
- Make alignment marks on torsion bar arms, gear box bracket and cab hinge bracket, then remove the torsion bar arms.

WARNING ⚠

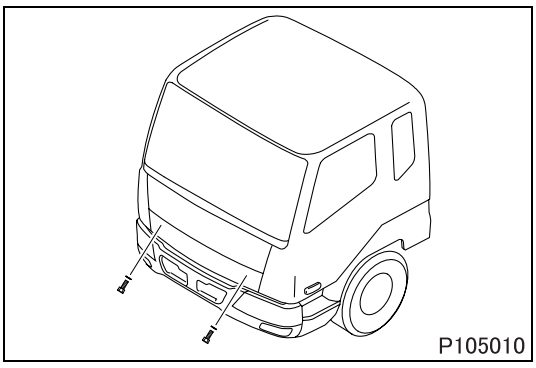
- **After torsion bar arms have been removed, be extremely careful as there is a risk of the cab falling down under its own weight.**



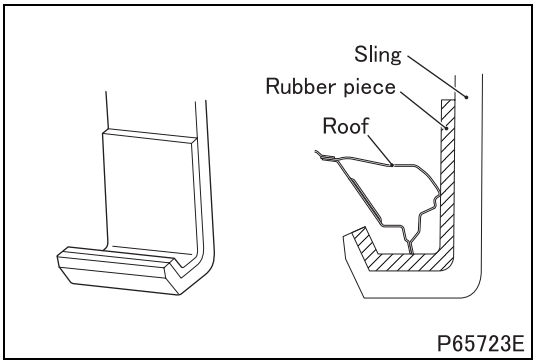
- Tilt down cab slowly while supporting it by the crane.
- Remove clevis pin to separate cab stay and cab.

WARNING ⚠

- **Never tilt up cab after clevis pin has been removed. Doing so is extremely dangerous as the cab will fall forward and down.**



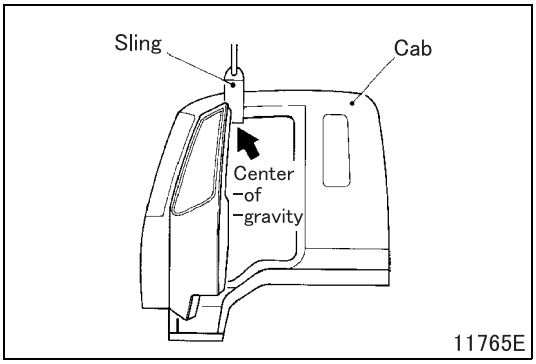
- From the front of the cab, remove the bolts attaching the cab hinge cushion.



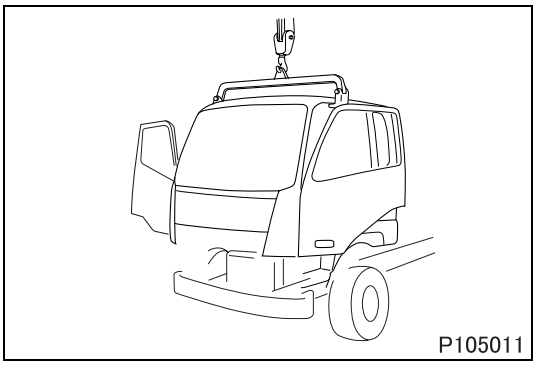
- Have ready cab sling like a one shown in the drawing.

CAUTION ⚠

- **Get ready a sling rigid enough to support the mass.**
- **Sling must be lined with rubber piece to prevent deformation of roof of the cab when the cab is lifted.**



- Install sling at center-of-gravity of cab. To check the sling position, slightly lift the cab and see whether the cab remains horizontal. If necessary, adjust the sling position.

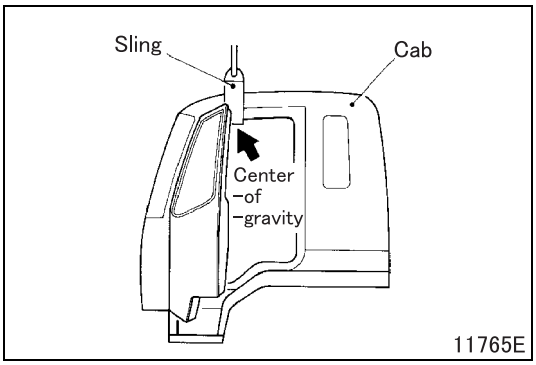


- Slowly lift the cab straight up.

WARNING ⚠

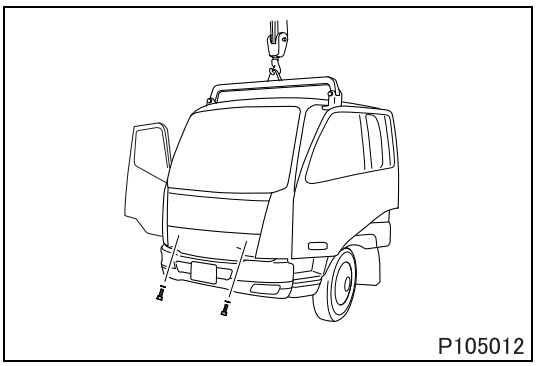
- **When cab is lifted, never get used under the cab.**
- **After cab has been slightly lifted, check to ensure that all the parts such as wires, cables and hoses have been completely disconnected.**

◆Installation procedure◆



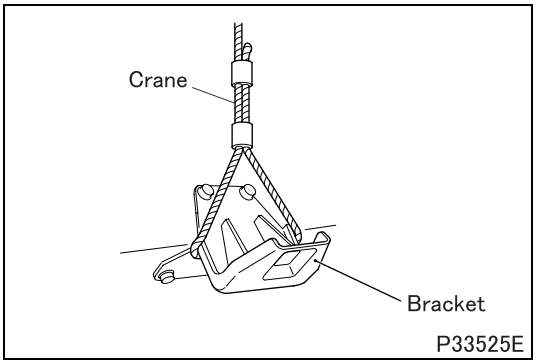
■ Installation: Cab

- Install sling at the center-of-gravity of cab.



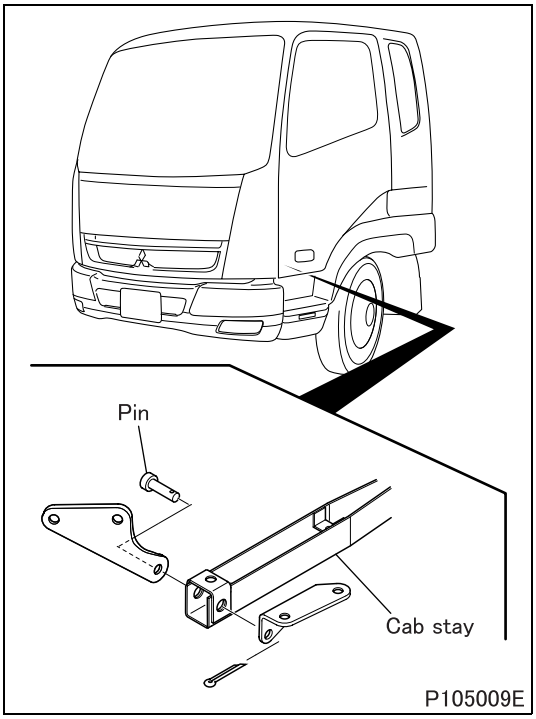
P105012

- Slowly lower cab further down until it is seated on the cab hinges. At this point, check for lateral alignment of the cab at the right and left cab hinges. If necessary, make adjustments for proper seating of the cab.
- Hold the cab hinge cushions with the bolts then remove the sling.



P33525E

- Attach the wire rope to bottom bracket securely to enable the cab to be tilted up in the later step using crane.

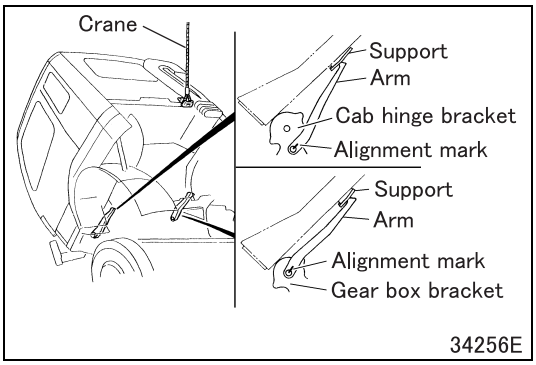


P105009E

- Link cab to cab stay by installing clevis pin. Install the cab stay in over tilting state.

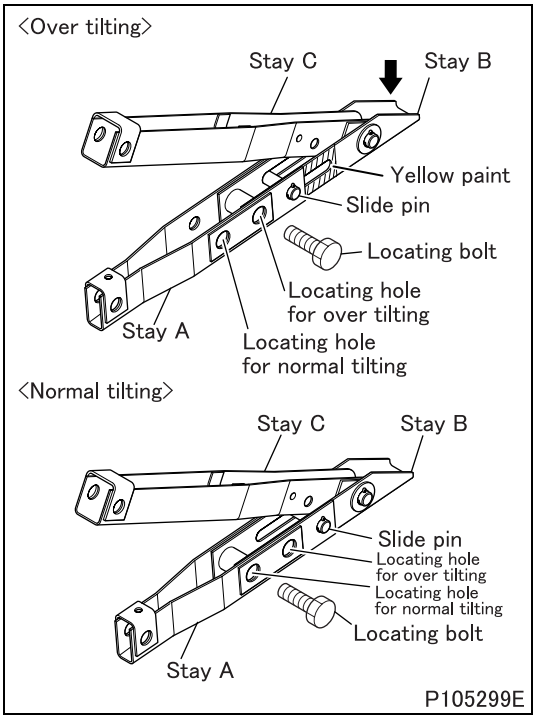
WARNING ⚠

- **When cab is tilted using crane, be careful not to tilt more than necessary. Doing so is extremely dangerous as the cab will fall down forward.**



34256E

- Slowly tilt up cab using crane.
- Slowly tilt the cab fully down and securely lock the cab stay.
- Install torsion bar arms while aligning mating marks on them with those on cab hinge bracket and gear box bracket.
  If torsion bar supports were removed, install them after the torsion bar arms have been installed.
- Detach crane from the cab.

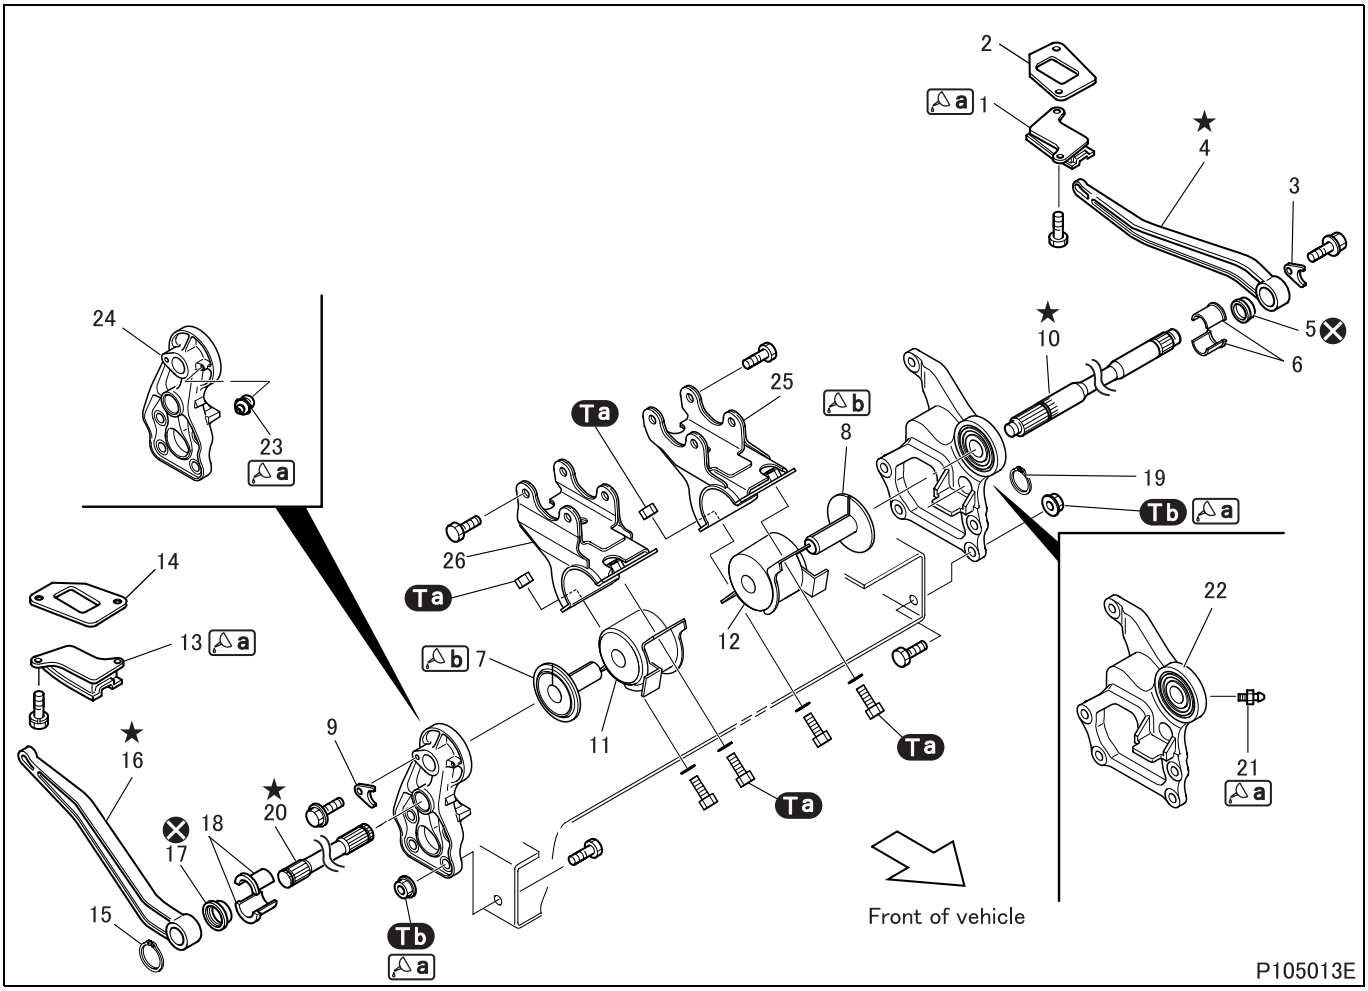


- With the cab tilted down, change the state of the cab stays from over tilting to normal tilting by the following procedure.
  - Remove the locating bolt.
  - Slide the stay B by force in the illustrated direction.
  - Install the locating bolt in the locating hole for normal tilting.
- Tilt up the cab in the normal tilting state. With their alignment marks in line, install the steering shaft to the power steering booster.

CAUTION ⚠

- **Never drive the vehicle with the cab stay in the over tilt position (yellow paint appears).**

FRONT CAB MOUNTING



- Parts marked with "★" should be mounted when installing the cab. For assembly, see removal and installation of cab.

● Disassembly sequence

1 Torsion bar support
2 Shim
3 Stopper plate
4 Torsion bar arm, left-hand
5 Dust cover
6 Bushing
7 Cab hinge bushing
8 Cab hinge bushing
9 Stopper plate
10 Upper torsion bar
11 Cab hinge cushion
12 Cab hinge cushion
13 Torsion bar support
14 Shim
15 Snap ring
16 Torsion bar arm, right-hand
17 Dust cover
18 Bushing
19 Snap ring
20 Lower torsion bar
21 Grease nipple
22 Gear box bracket
23 Grease nipple
24 Cab hinge bracket
25 Cab hinge upper bracket
26 Cab hinge upper bracket

⊗: Non-reusable parts

- Shims may not have been installed.

● Assembly sequence

Follow the disassembly sequence in reverse.

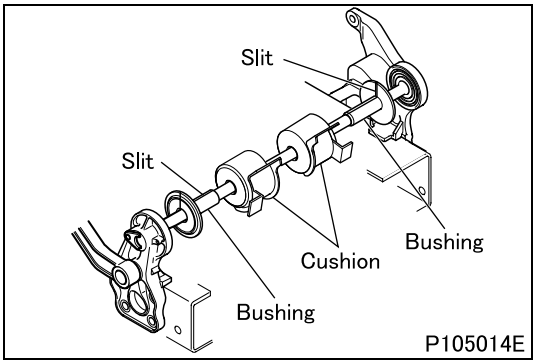
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Bolt (cab hinge cushion installation)	120 to 170 {89 to 125, 12.0 to 17.0}	–
	Nut (cab hinge cushion installation)		
Tb	Nut (gear box bracket installation)	240 to 290 {175 to 215, 24.0 to 30.0}	Wet
	Nut (cab hinge bracket installation)		

Lubricant and/or sealant

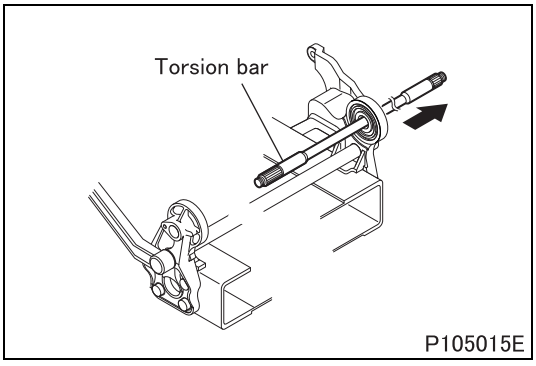
Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Torsion bar arm bearing surface of torsion bar support	Chassis grease [NLGI No. 1 (Li soap)]	As required
	Thread area of nut		
	Through grease nipple		
b	Connecting section of cab hinge bushing and cab hinge cushion	Rubber grease	

◆Removal procedure◆



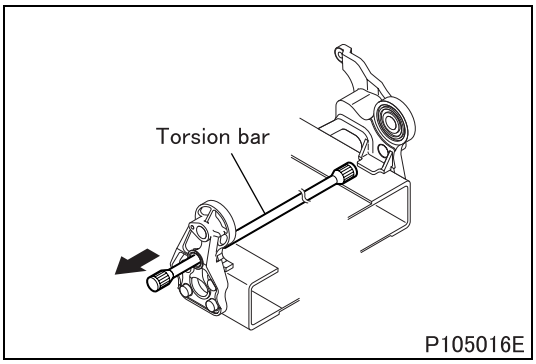
■ Removal: Cab hinge bushings

- Slide the cab hinge bushings to the center of the vehicle. Open the slits and remove the cab hinge bushings.



■ Removal: Upper torsion bar

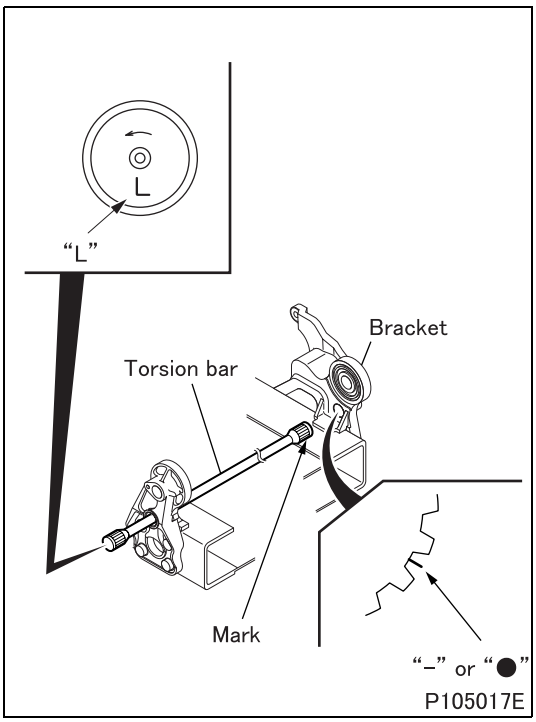
- Remove upper torsion bar in the direction shown.



■ Removal: Lower torsion bar

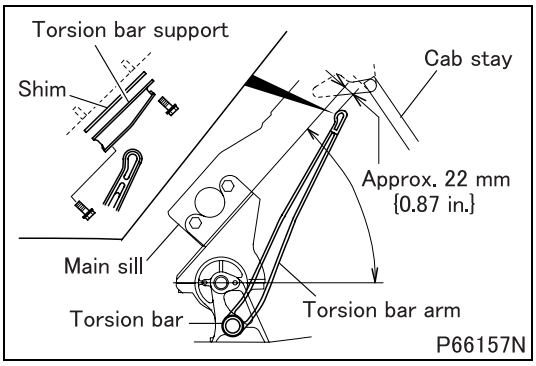
- Remove lower torsion bar in the direction shown.

◆Installation procedure◆



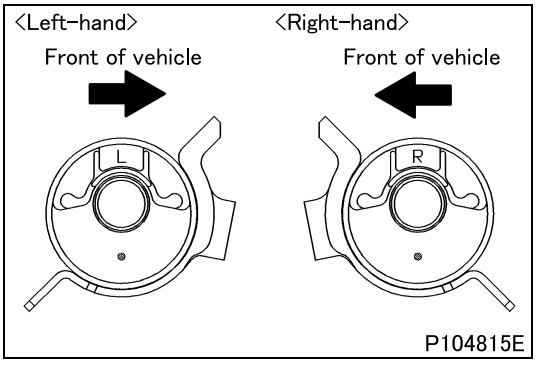
■ **Installation: Lower torsion bar**

- Install lower torsion bar onto gearbox bracket in the illustrate direction. Make sure that mark (white paint) on the bar is aligned with "–" or "● " mark on the gearbox bracket.



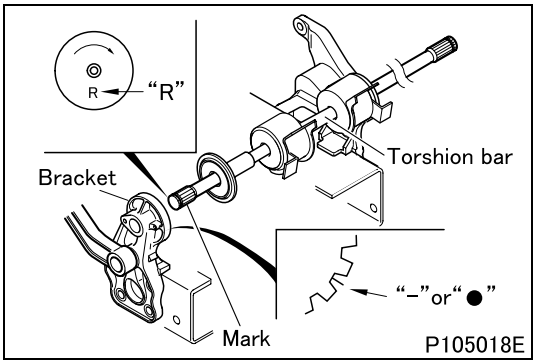
■ **Installation: Torsion bar arm, right-hand**

- Tilt the cab and support it with cab stay.
- Install torsion bar arm onto lower torsion bar such that clearance between the arm and cab main sill is as specified in the illustration.
- If the specified clearance cannot be obtained, adjust it using shim. Insert the shim between the cab main sill and torsion bar support when installing the support onto the sill.



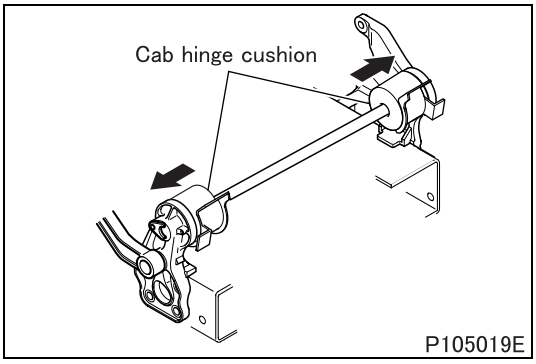
■ **Installation: Cab hinge cushion**

- Install cab hinge cushions in the illustrated direction after ensuring that there is no fluid leak.



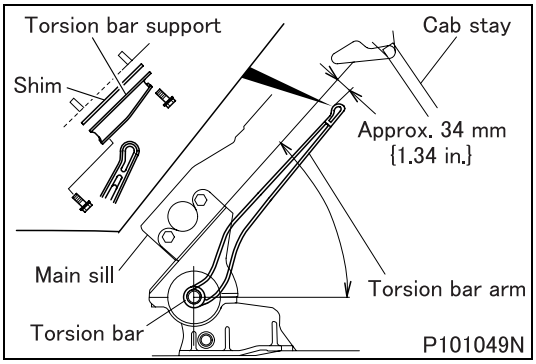
■ **Installation: Upper torsion bar**

- Install upper torsion bar onto cab hinge bracket in the illustrated direction. Make sure that mark (white paint) on the bar is aligned with "–" or "●" mark on the cab hinge bracket.



■ **Installation: Cab hinge cushion**

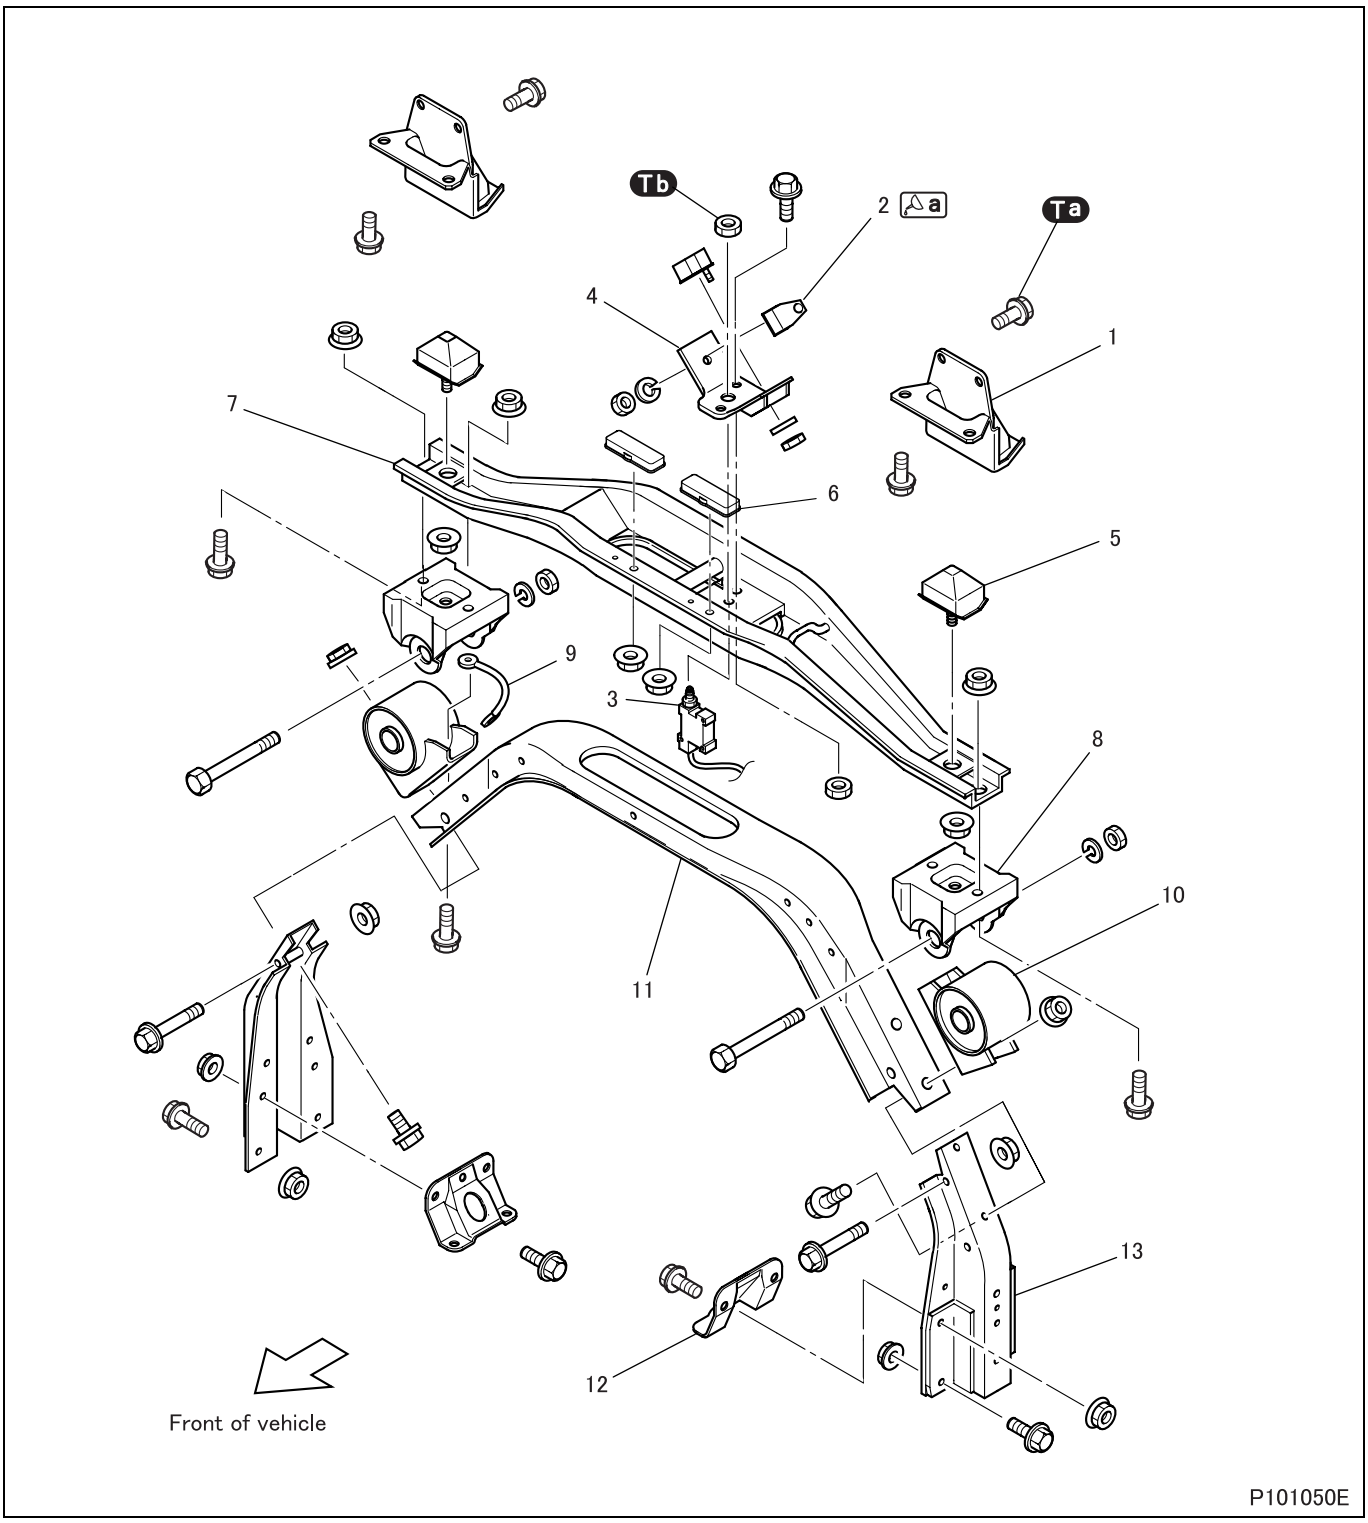
- Install the cab hinge cushions with pressing them against the outside of the vehicle.



■ **Installation: Torsion bar arm, left-hand**

- Tilt the cab and support it with cab stay.
- Install torsion bar arm onto upper torsion bar such that clearance between the arm and cab main sill is as specified in the illustration.
- If the specified clearance cannot be obtained, adjust it using shim. Insert the shim between the cab main sill and torsion bar support when installing the support onto the sill.

REAR CAB MOUNTING



● **Disassembly sequence**

1 Bottom bracket
2 Rebound cushion
3 Cab tilt switch (See Gr54.)
4 Rebound cushion bracket
5 Buffer rubber
6 Stopper
7 Floating bar
8 Cushion rubber bracket
9 Earth strap
10 Cushion rubber
11 Center bridge
12 Cab bridge stiffener
13 Side bridge

● **Assembly sequence**

Follow the disassembly sequence in reverse.

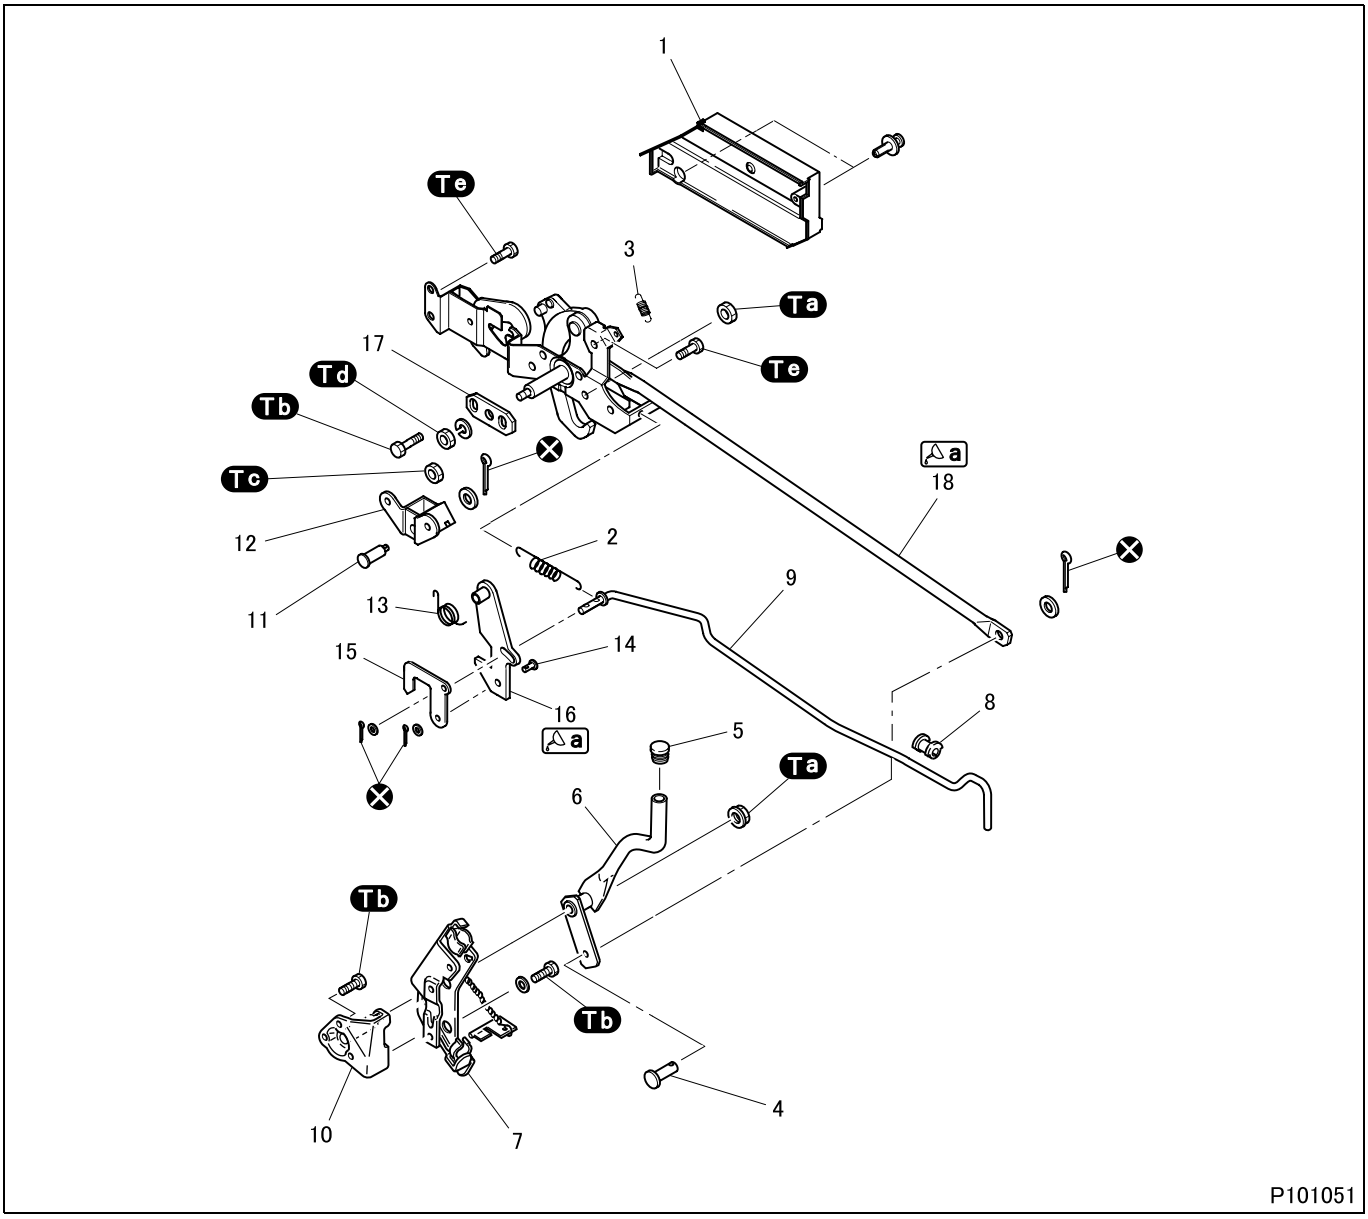
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Bolt (bottom bracket attaching)	34 to 54 {25 to 40, 3.5 to 5.3}	–
Tb	Nut (cab tilt switch attaching)	9.8 ± 2.0 {7.2 ± 1.5, 1.0 ± 0.2}	–

Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Contact surface with main hook of rebound cushion	Chassis grease [NLGI No. 1 (Li soap)]	As required

CAB TILT LINK



● **Disassembly sequence**

1 Main hook cover
2 Return spring
3 Return spring
4 Clevis pin
5 Plug
6 Hook control lever
7 Hook control lever bracket
8 Rubber sleeve
9 L-lever rod
10 Hinge bracket
11 Shaft
12 L-lever bracket
13 Return spring
14 Clevis pin
15 L-lever
16 L-lever
17 Holder plate
18 Main hook

⊗: Non-reusable parts

● **Assembly sequence**

Follow the disassembly sequence in reverse.

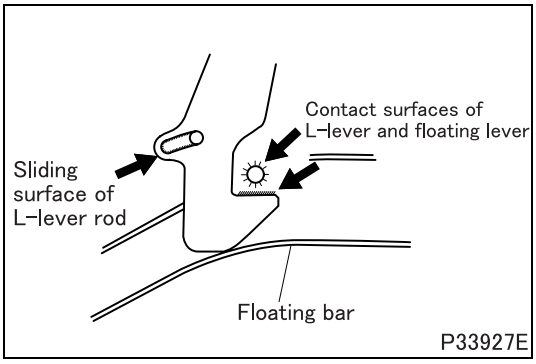
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Nut (hook control lever attaching)	21 to 30 {15 to 22, 2.1 to 3.1}	–
	Nut (main hook attaching)		
Tb	Bolt (hook control lever bracket attaching)	9 to 14 {6.6 to 10, 0.9 to 1.4}	–
	Bolt (hinge bracket attaching)		
	Bolt (holder plate attaching)		
Tc	Nut (L-lever bracket attaching)	10 to 15 {74 to 11, 1 to 1.5}	–
Td	Nut (main hook attaching)	33 to 49 {24 to 36, 3.4 to 5}	–
Te	Bolt (main hook attaching)	34 to 54 {25 to 40, 3.5 to 5.5}	–

Lubricant and/or sealant

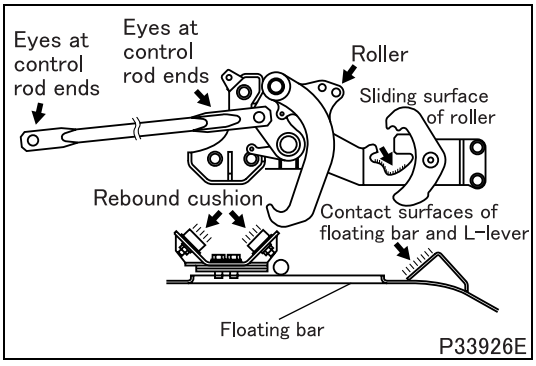
Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Contact surfaces of L-lever	Chassis grease [NLGI No. 1 (Li soap)]	As required
	Sliding surfaces of L-lever and L-lever rod		
	Main hook roller, sliding surface of main hook roller		
	Eyes at both ends of main hook control rod		
	Contact surfaces of main hook L-lever		

◆Inspection procedure◆



■ Inspection: Greasing of L-lever

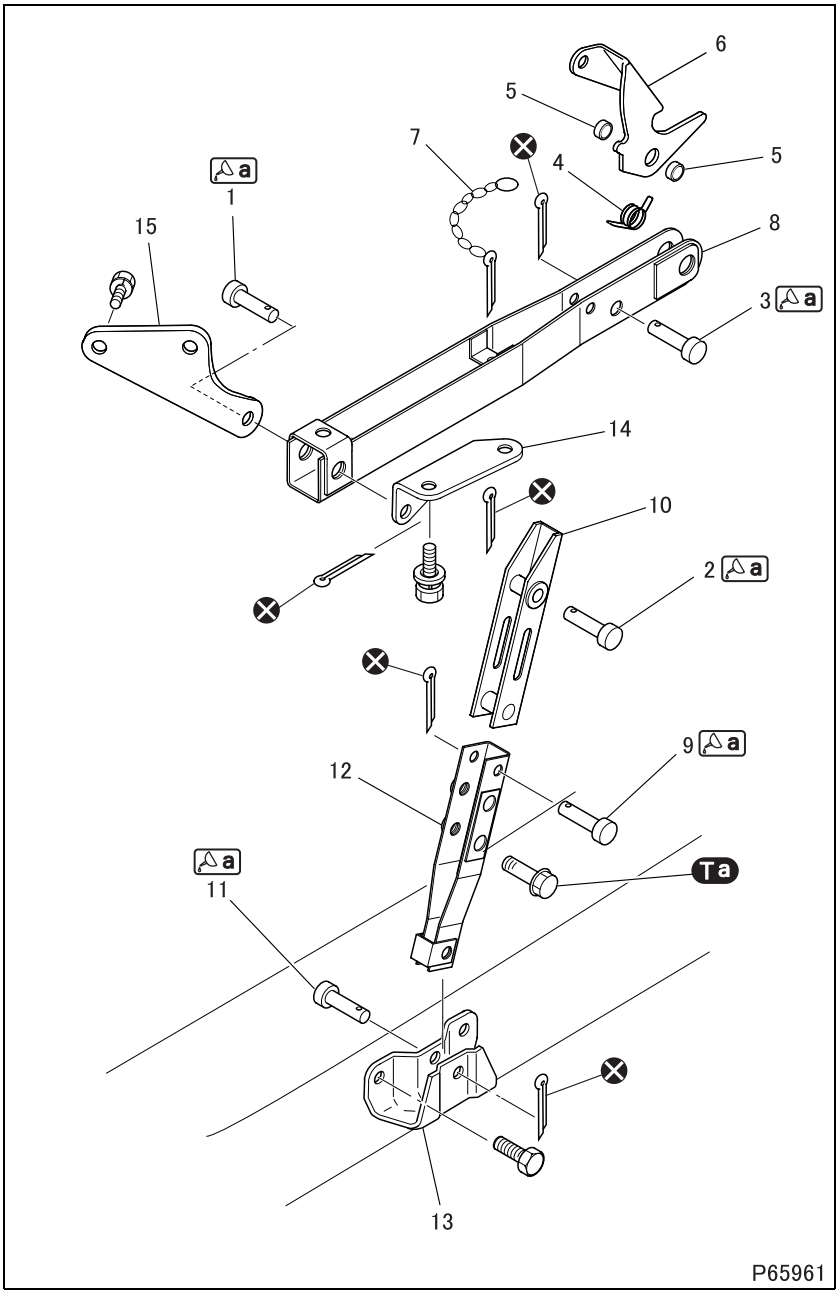
- Carry out the inspection at the points shown in the illustration. If the greasing is insufficient, apply grease.



■ Inspection: Greasing of main hook

- Carry out the inspection at the points shown in the illustration. If the greasing is insufficient, apply grease.

CAB STAY



● **Disassembly sequence**

1 Clevis pin
2 Clevis pin
3 Clevis pin
4 Return spring
5 Spacer
6 Lock latch
7 Chain
8 Stay C
9 Clevis pin
10 Stay B
11 Clevis pin
12 Stay A
13 Lower bracket
14 Upper bracket
15 Upper bracket

⊗: Non-reusable parts

WARNING ⚠

- **Never remove the cab stay unless the cab is prevented from falling down by properly supporting it with a crane or other proper means.**

● **Assembly sequence**

Follow the disassembly sequence in reverse.

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Bolt (stay B installation)	20 to 30 {15 to 22, 2.0 to 3.1}	–

Lubricant and/or sealant

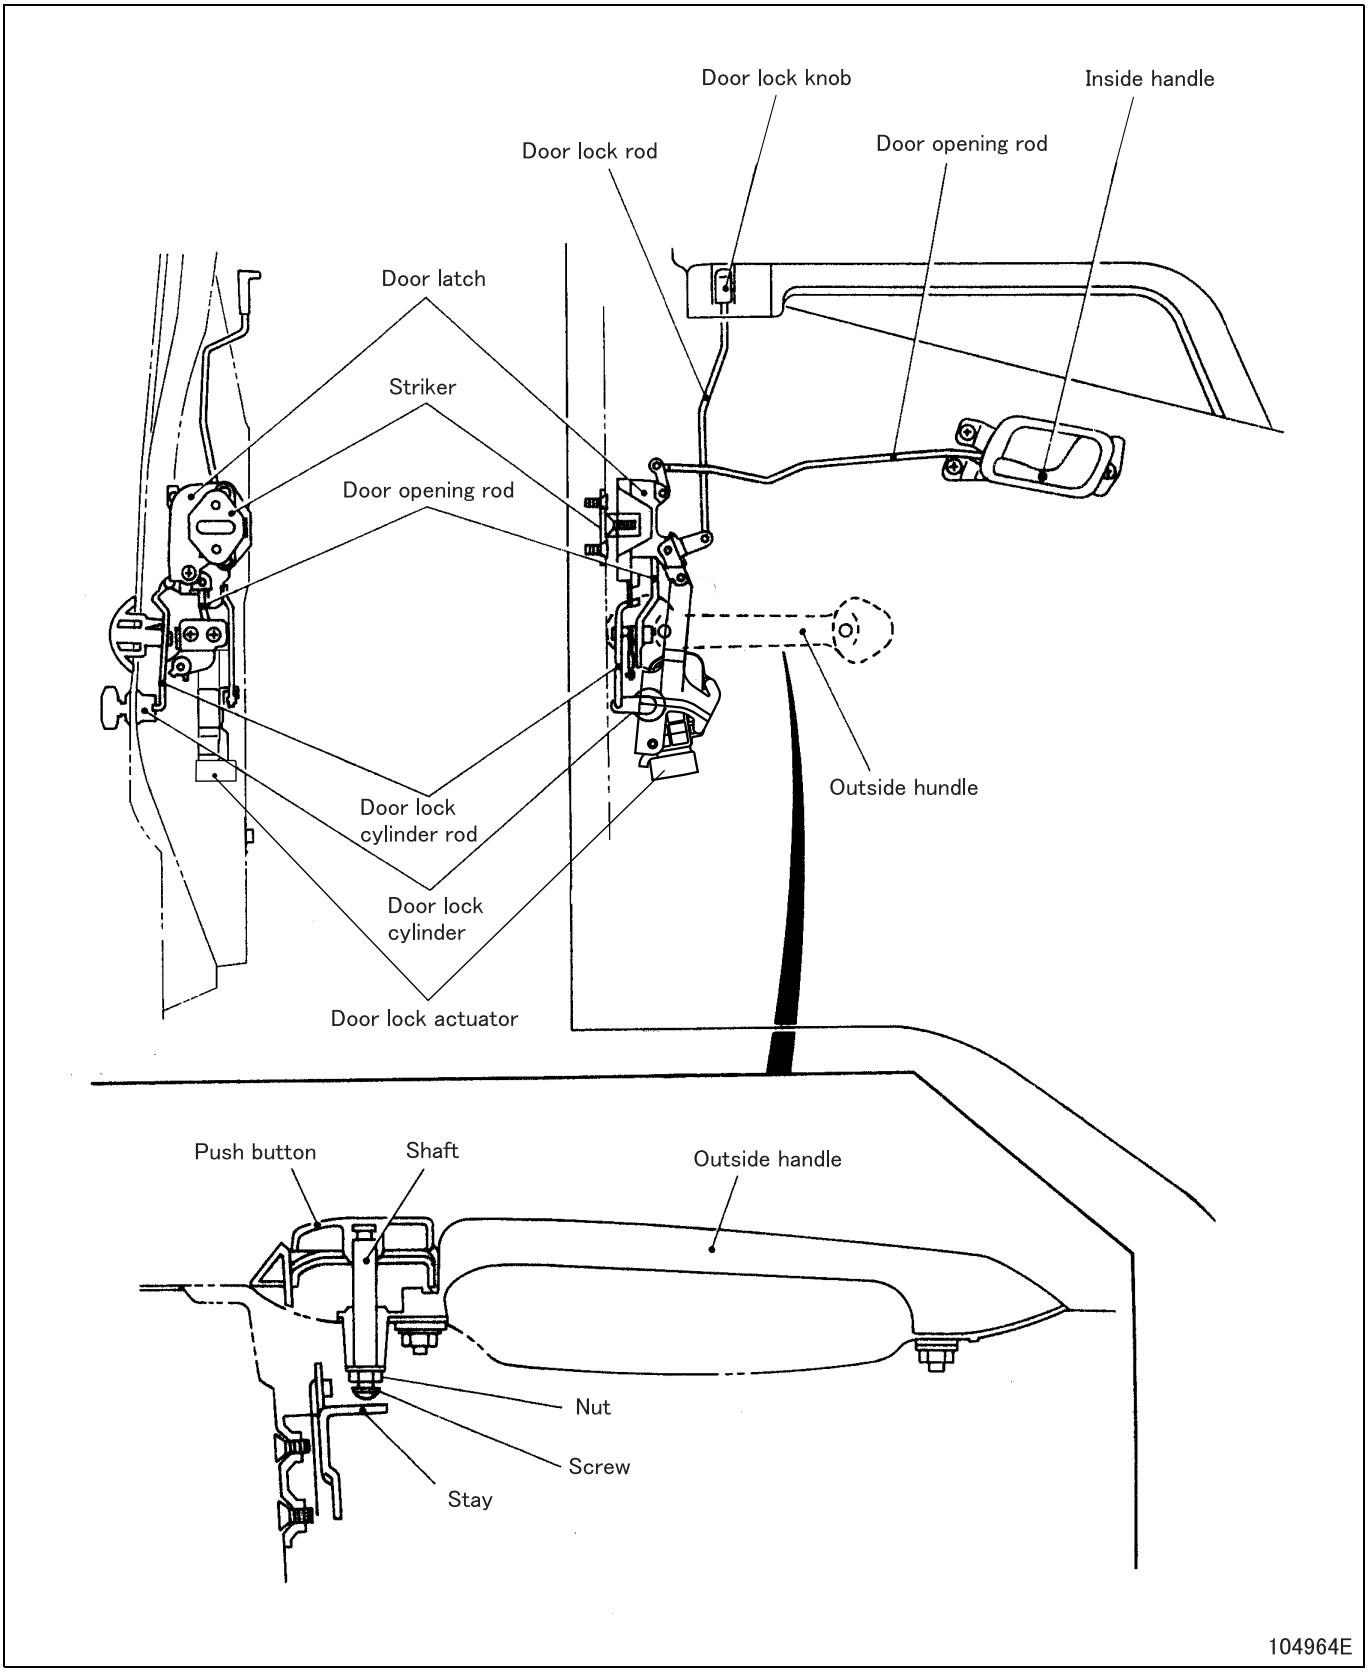
DOOR 43-10

SPECIFICATIONS

Item		Specifications
Door	Door glass opening mechanism	Electrical control type
	Door lock type	Central door lock system

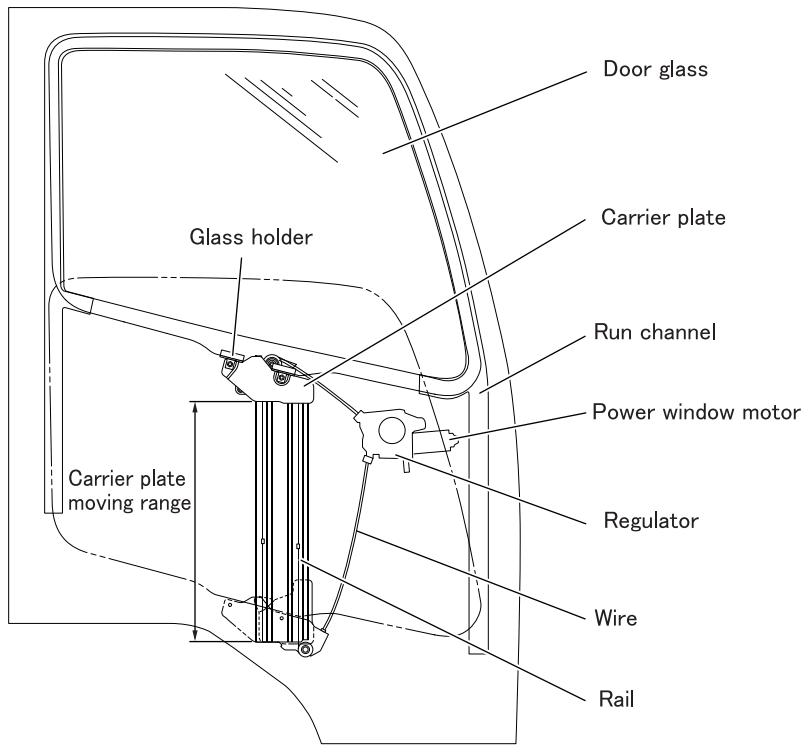
M E M O

1. Door Locking System



- Push button stroke of outside handle can be adjusted to optimize opening and closing of the door.
- To adjust the stroke, turn screw on shaft.
- The head of screw pushes stay, and this moves door opening rod, releasing door latch.

2. Door Glass Opening System



- Regulator is so constructed that it is interlocked with power window motor and carrier plate through wire.
- When power window motor is rotated, carrier plate is wound up or down by wire to raise or lower door glass.

Door Lock

Symptoms / Possible causes		Inside handle can not open door	Inside handle heavy to operate	Outer handle can not open door	Outer handle heavy to operate	Door does not open and close smoothly	Auto door lock system does not operate			Reference Gr
							Procedure by key	Procedure by door lock knob	Procedure by auto door lock switch	
Door setting out of adjustment			O		O	O				
Each door rod	Rod deformed		O		O					
	Rod out of position	O		O			O	O	O	
	Rod interference		O		O					
Door lock cylinder deformed or damaged							O

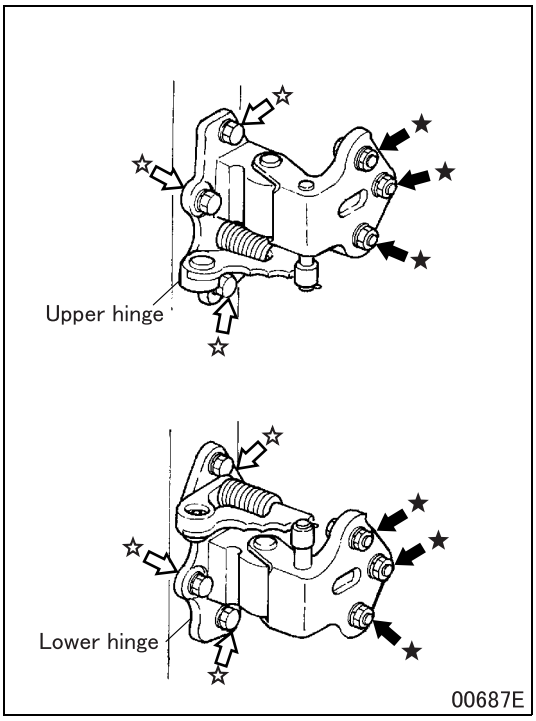
ON-VEHICLE INSPECTION AND ADJUSTMENT

1. Adjustment of Door Alignment

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

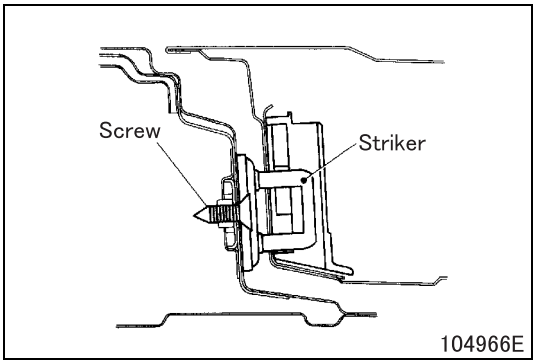
Mark	Parts to be tightened	Tightening torque	Remarks
–	Bolt (upper and lower hinge mounting)	17 to 26 {13 to 19, 1.7 to 2.6}	–
	Screw (striker mounting)	9 to 14 {6.6 to 10, 0.9 to 1.4}	–

- Door alignment is adjusted by changing the positions of the upper and lower hinges and striker.



1.1 Adjustment of hinge positions

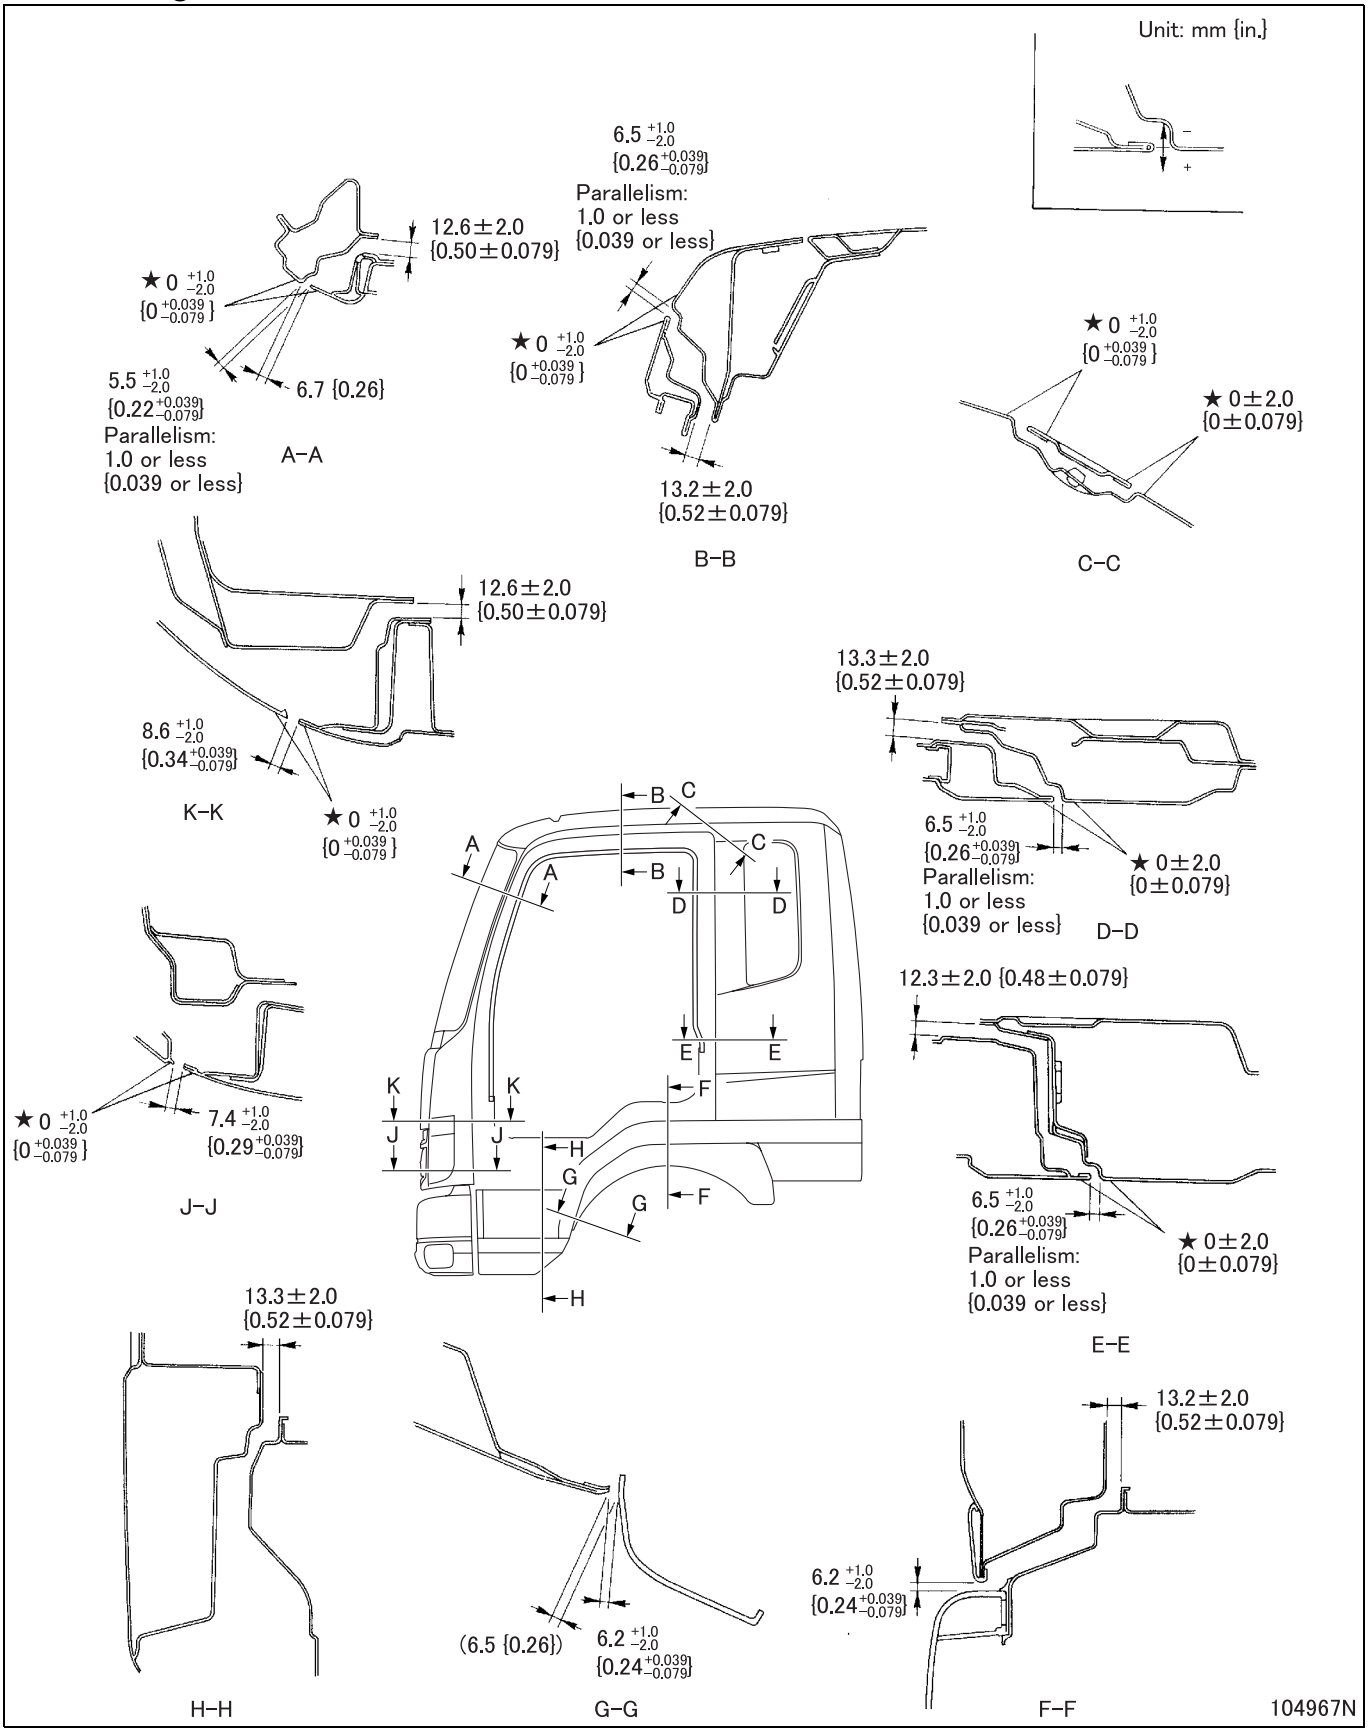
- Use ★ marked bolts to adjust gap.
- Use ☆ marked bolts to adjust flushness.



1.2 Adjustment of striker position

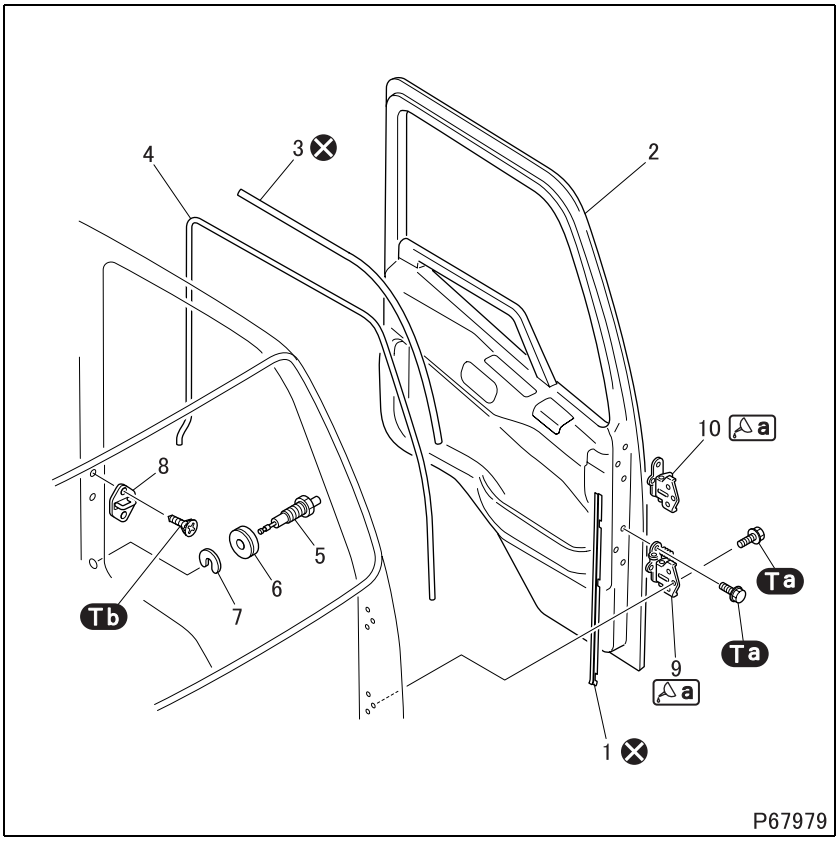
- Use mounting screw to make the adjustment.

1.3 Door alignment dimensions



"★" shows step dimensions (shows a tolerance direction of step dimensions, + indicating the outside dimension and - indicating the inside dimension).
The figure inside the parentheses is a reference value.

Door Hinge and Striker



●Removal sequence

1 Outer weatherstrip
2 Door
(See later section.)
3 Roof side weatherstrip
4 Door opening inner weatherstrip
5 Door switch
6 Door switch cover
7 Shim
8 Striker
9 Lower hinge
10 Upper hinge

⊗: Non-reusable part

●Installation sequence

Follow the removal sequence in reverse.

- Adjust front door alignment after installation. (See ON-VEHICLE INSPECTION AND ADJUSTMENT.)

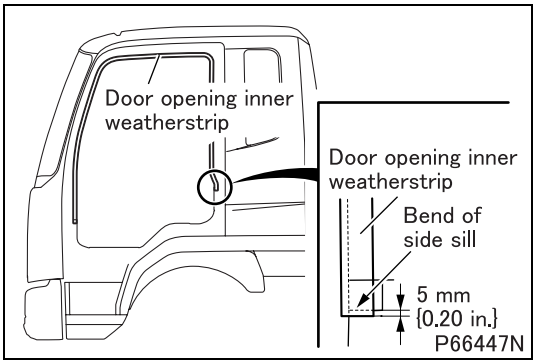
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Bolt (door mounting)	17 to 26 {13 to 19, 1.7 to 2.6}	–
	Bolt (upper and lower hinge mounting)		
Tb	Screw (striker mounting)	9 to 14 {6.6 to 10, 0.9 to 1.4}	–

Lubricant and/or sealant

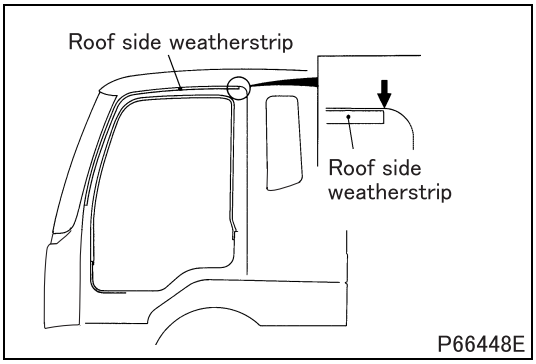
Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Rotating contact parts of upper and lower hinges	Chassis grease [NLGI No. 1 (Li soap)]	As required

◆Installation procedure◆



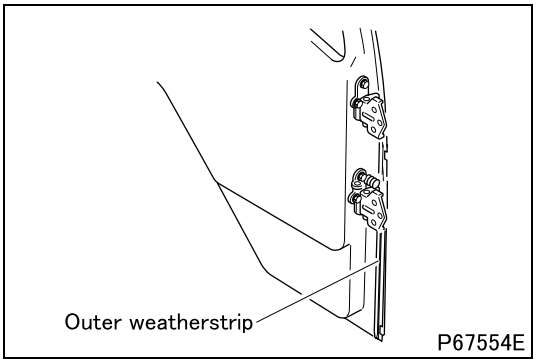
■Installation: Door opening inner weatherstrip

- Install the door opening inner weatherstrip to the cab starting from the position shown in the drawing (5 mm downward from the bend of side sill).



■**Installation: Roof side weatherstrip**

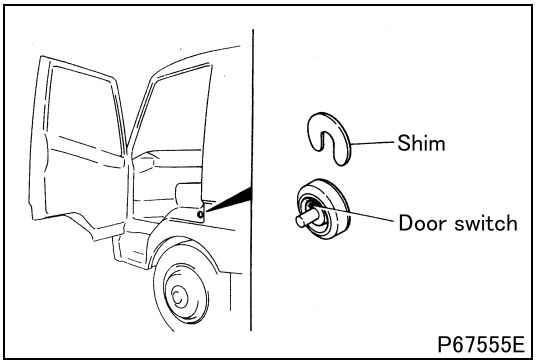
- Install the roof side weatherstrip to the cab starting from the arrow-marked position in the drawing.



■**Installation: Outer weatherstrip**

- Install outer weatherstrip on the door starting from its bottom end.

◆**Adjustment after installation**◆

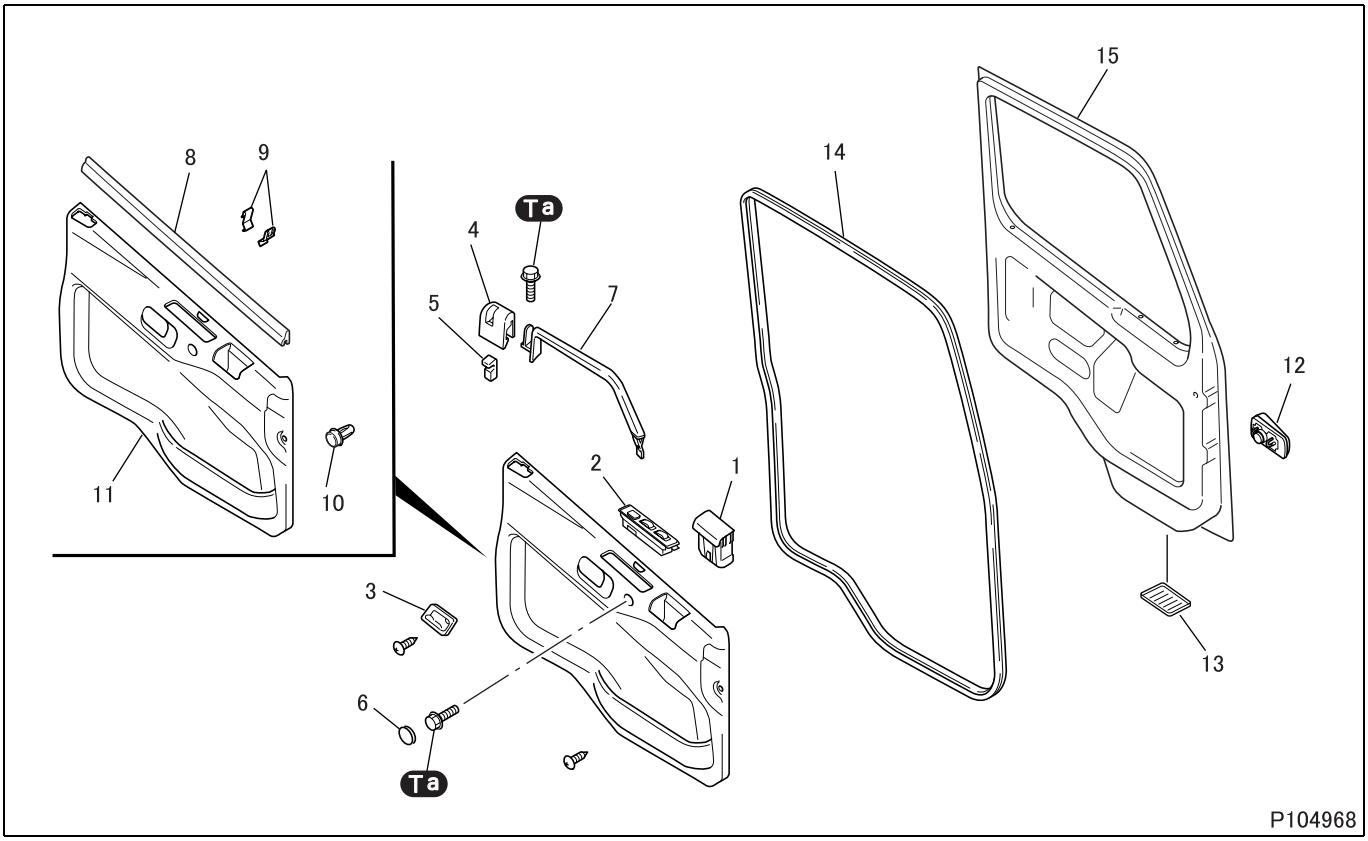


■**Adjustment: Door switch**

- If the door ajar warning lamp does not illuminate with the door opened ajar, reduce the number of shims to make the adjustment.
- If the door ajar warning lamp illuminates with the door fully closed, increase the number of shims to make the adjustment.
  Thickness of shim: 0.6 mm {0.024 in.}/piece

DOOR

Door



● **Disassembly sequence**

1 Ashtray
2 Power window switch
3 Inside handle cover
4 Door lock knob cover
5 Door lock knob
6 Plug
7 Door bar
8 Weatherstrip
9 Spring
10 Clip
11 Door trim
12 Front side turn signal lamp
13 Plug
14 Weatherstrip
15 Door panel (See later section.)

CAUTION ⚠

- **Do not remove weatherstrip unless abnormalities are found.**

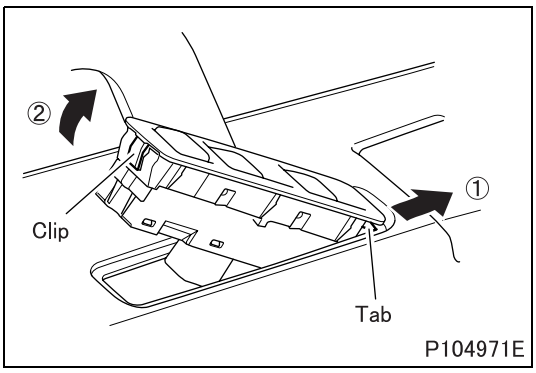
● **Assembly sequence**

Follow the disassembly sequence in reverse.

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

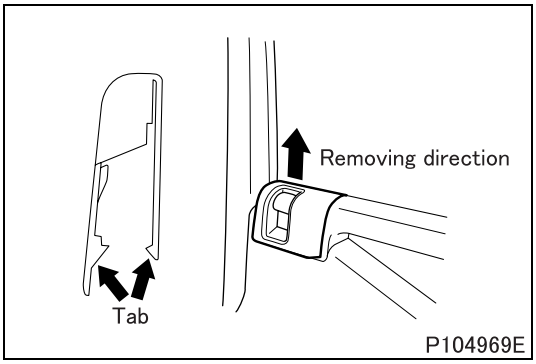
Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Bolt (door bar mounting)	9 to 14 {6.6 to 10, 0.9 to 1.4}	–

◆Removal procedure◆

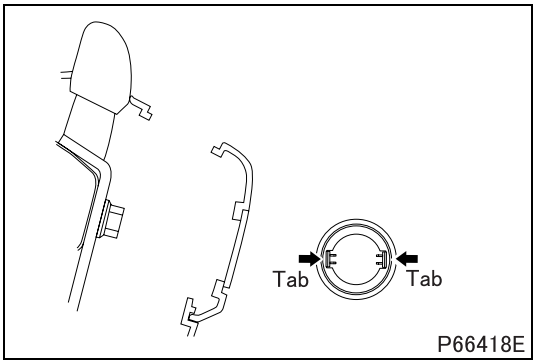


■**Removal: Power window switch**

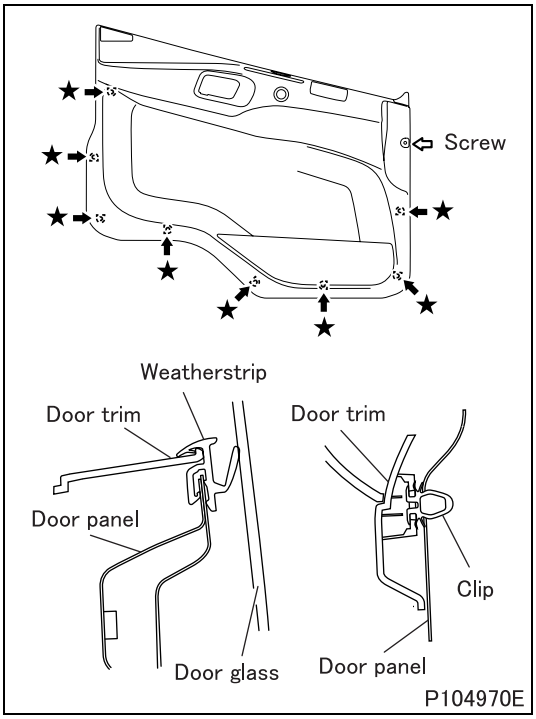
- While pushing the power window switch toward the front 1 of the vehicle, raise 2 the rear end of the power window switch to remove.



■**Removal: Door lock knob cover**



■**Removal: Plug**



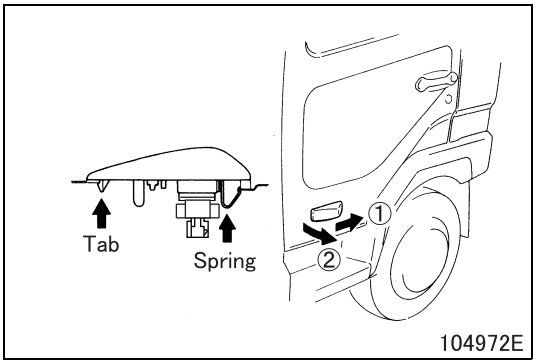
■**Removal: Door trim**

- Remove the screw (1 place).
- The door trim, which has clips on the back, is secured to the door panel in the illustrated position (8 places).
  Pull the area near these clips toward you by hand to remove the door trim from the door panel.

CAUTION ⚠

- **Be sure to pull the area near the clips toward you. Otherwise, it may damage the clip mounting portion of the door trim.**

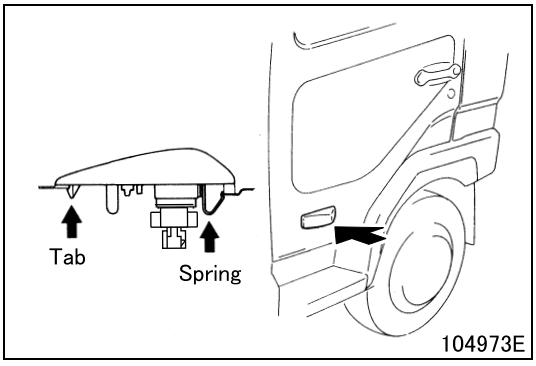
- The door panel is fitted into the weatherstrip on the upper part. Remove the door trim while pushing it up.



■**Removal: Front side turn signal lamp**

- Remove the front side turn signal lamp by pulling its front side in the direction 2 (toward you) while lifting it up in the direction 1 (rear of the vehicle).

◆**Installation procedure**◆



■**Installation: Front side turn signal lamp**

- Install the front side turn signal lamp with its tab engaged with the door panel and tapping on its spring side (rear of the vehicle) lightly to fit it into place.

■**Installation: Door trim**

- To install the door trim, follow the removal sequence in reverse. (See "■ **Removal: Door trim**".)

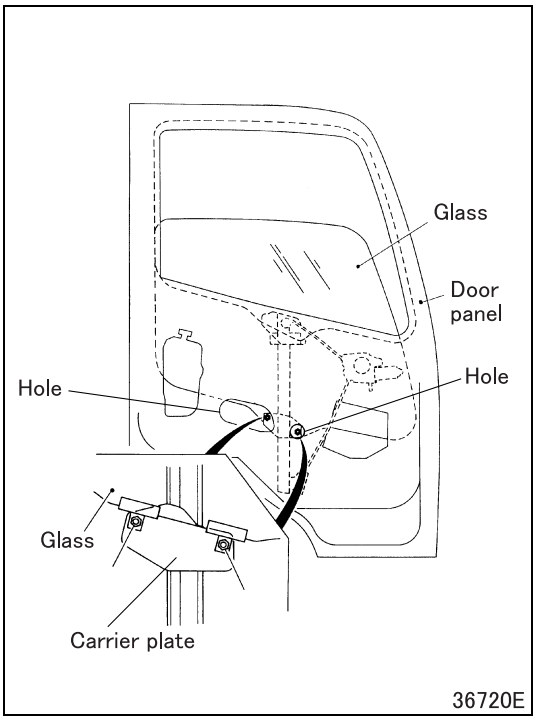
P59674

◆Removal procedure◆

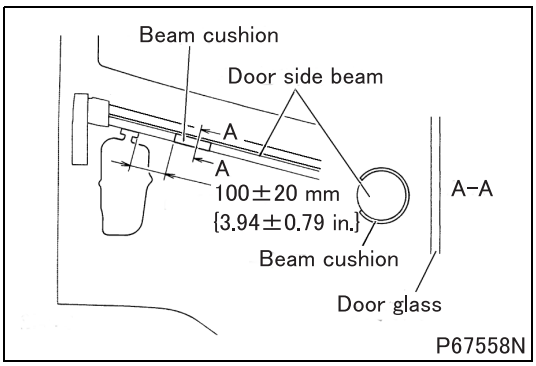


36720E

■ Removal: Door glass

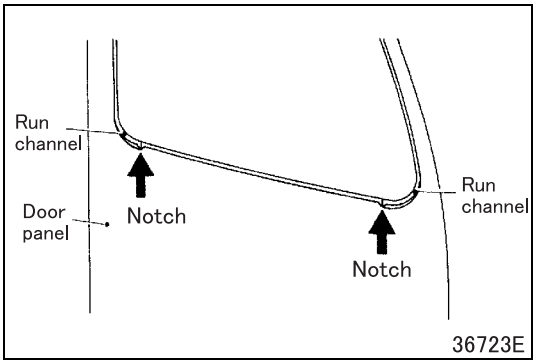
- Move door glass until bolts of the door glass become visible through holes in the door panel.
- While supporting door glass by hand, remove bolts of carrier plate.
- Remove door glass through the open space in the door.

◆Installation procedure◆



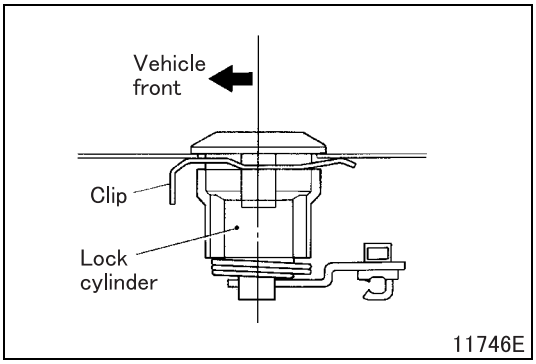
■ Installation: Beam cushion

- Install the beam cushion on the lower door side beam in the door panel in the illustrated direction.



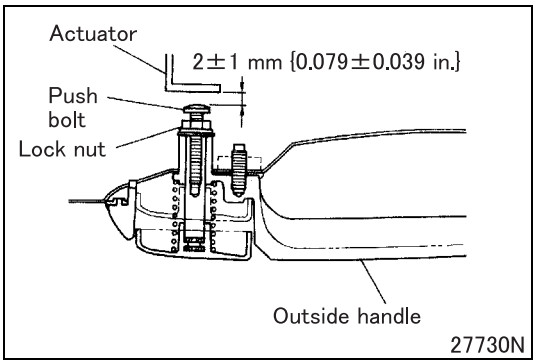
■ Installation: Run channel

- Install run channel by aligning it with notches on door panel.



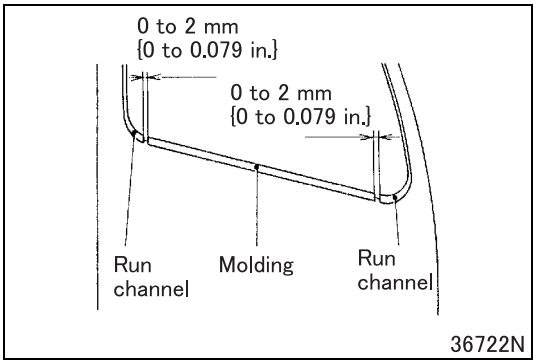
■ Installation: Door lock cylinder

- Install door lock cylinder with clip in the direction indicated in the illustration.



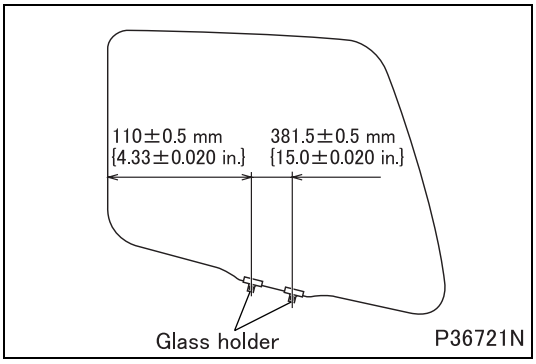
■ Installation: Outside handle

- Turn push bolt of outside handle to adjust the gap between the push bolt and door actuator as indicated in the illustration.



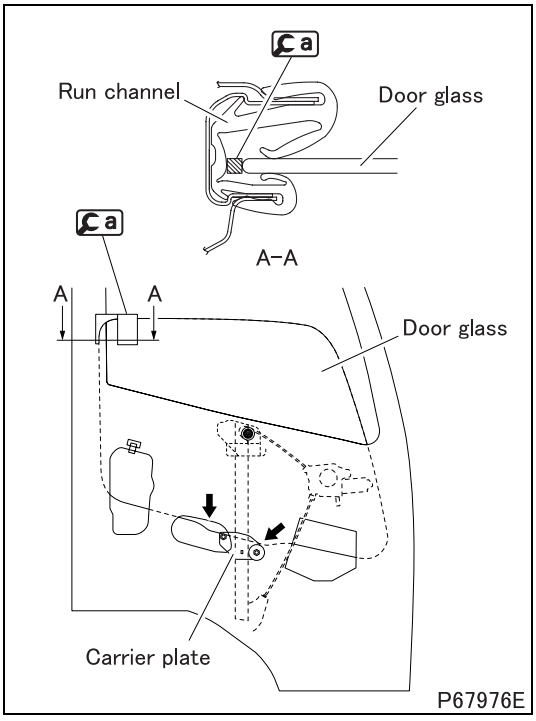
■ **Installation: Door belt line molding**

- Install door belt line molding so that gaps between the molding and run channel are as indicated in the illustration.



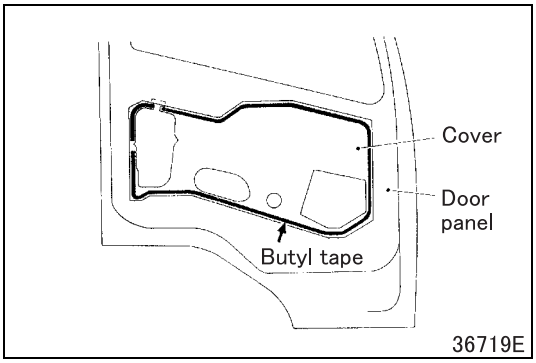
■ **Installation: Glass holder**

- Install glass holder to door glass at the location indicated in the illustration.



■ **Installation: Door glass**

- Move the carrier plate to the position where the door glass mount can be seen from the door panel holes (2 places indicated by arrow).
- Temporarily fasten the door glass to the carrier plate with bolts.
- Install [a] in the illustrated position of the door glass.
- Lightly push the door glass toward the rear of the vehicle and tighten the bolts to the specified torque while keeping door glass, [a] and run channel in close contact.



■ **Installation: Waterproof cover**

- Apply butyl tape to door panel, as indicated in the illustration.
- Install waterproof cover by pasting onto butyl tape.

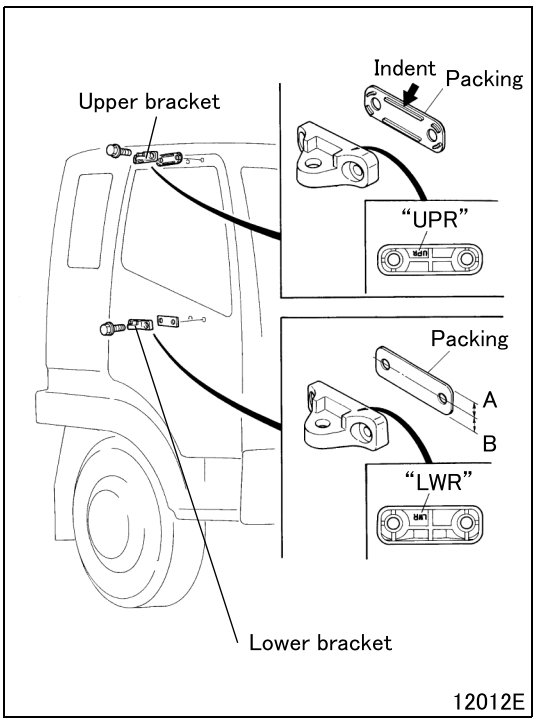
8 Mirror stay upper bracket
9 Packing
10 Mirror stay lower bracket
11 Packing

⊗: Non-reusable parts

● Installation sequence

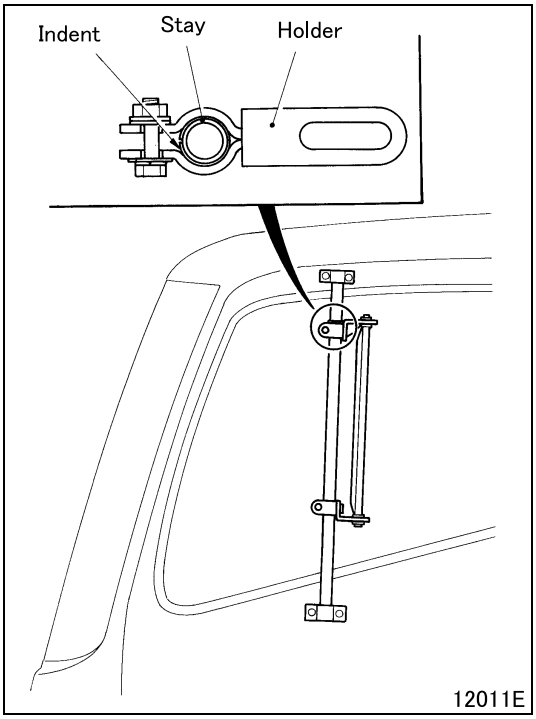
Follow the removal sequence in reverse.

◆Installation procedure◆



■Installation: Mirror stay bracket and packing

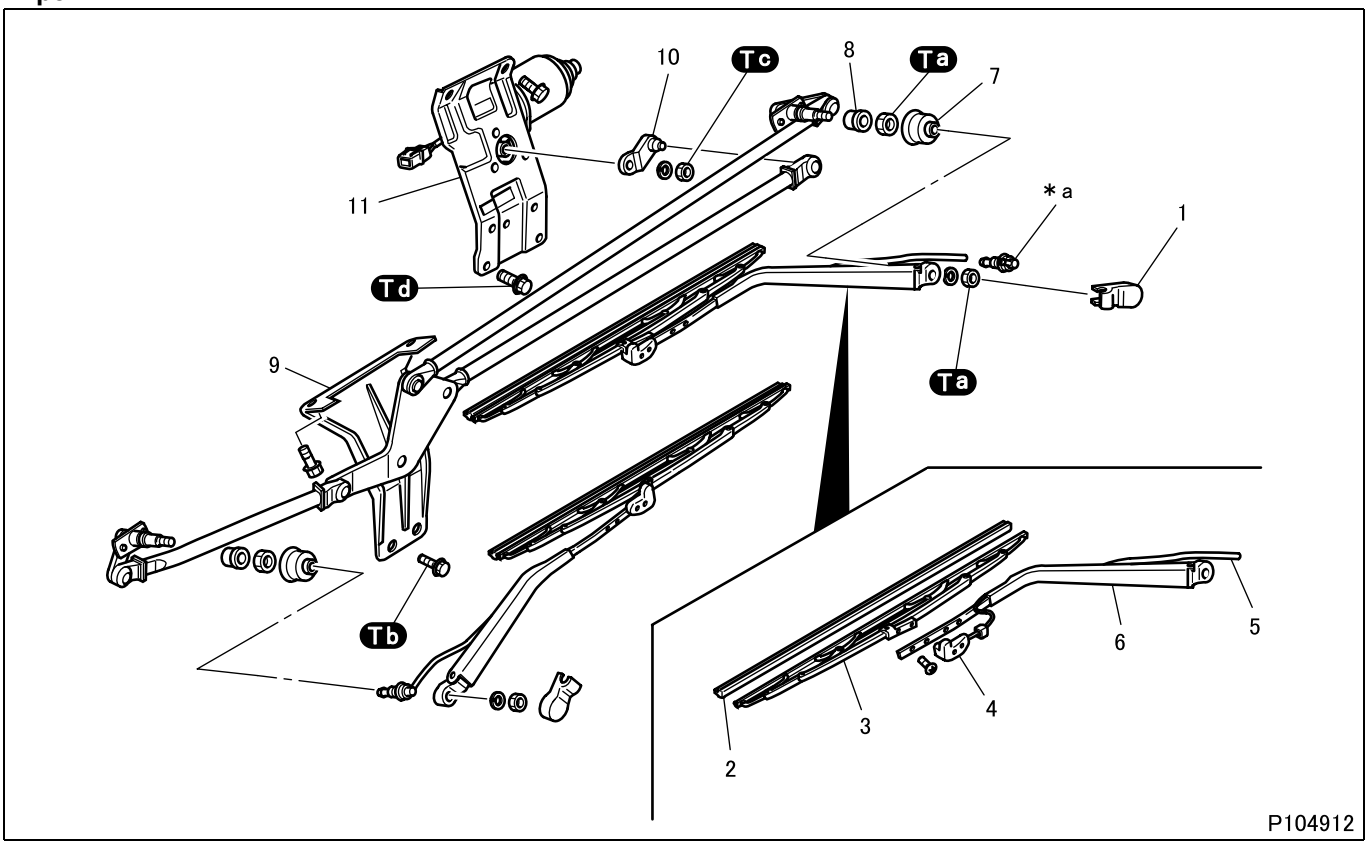
- "UPR" and "LWR" identification marks are marked on mirror stay upper bracket and mirror stay lower bracket respectively.
- Install indent on packing, facing mirror stay upper bracket.
- Installation hole is offset on packing.
  A: 13.8 mm {0.54 in.}
  B: 17.2 mm {0.68 in.}



■Installation: Mirror holder

- Install mirror holder onto mirror stay in the direction as illustrated.

Wiper



●Removal sequence

1 Head cover
2 Blade rubber
3 Wiper blade
4 Washer nozzle
5 Washer hose
6 Wiper arm
7 Pivot cap
8 Collar
9 Wiper link
10 Crank arm
11 Wiper motor and bracket

***a**: Hose joint (See later section.)

CAUTION ⚠

- **Do not remove crank arm unless it is defective. The crank arm is installed in a position precisely adjusted to the park position of wiper motor and bracket.**

●Installation sequence

Follow the removal sequence in reverse.

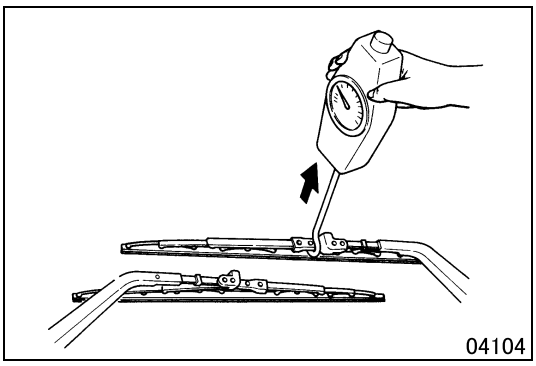
Service standards

Location	Maintenance item	Standard value	Limit	Remedy
7	Wiping force of wiper arm	7.65 ± 0.49 N {1.72 ± 0.11 lbs, 0.78 ± 0.05 kgf}	–	Replace

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Nut (wiper arm and blade installation)	17 to 23 {12.3 to 16.6, 1.7 to 2.3}	–
	Nut (pivot of wiper link mounting)		
Tb	Bolt (wiper link installation)	10 to 15 {7.2 to 10.8, 1.0 to 1.5}	–
Tc	Nut (crank arm installation)	14.7 to 19.6 {11 to 14, 1.5 to 2.0}	–
Td	Bolt (wiper motor and bracket installation)	9 to 14 {6.5 to 10.1, 0.9 to 1.4}	–

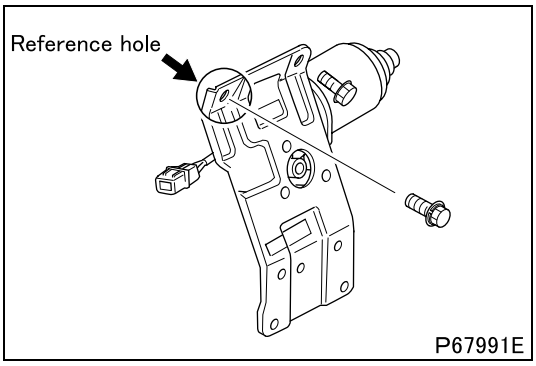
◆Inspection procedure◆



■Inspection: Wiper arm pressing force

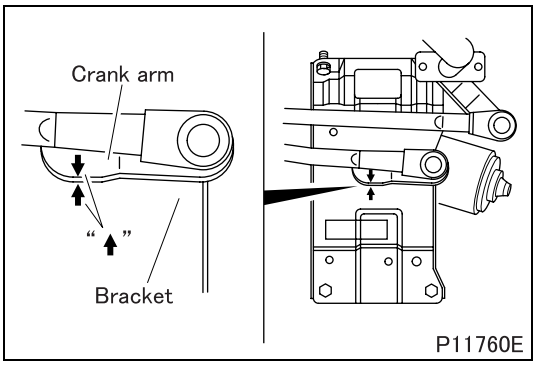
- If the measured value is out of the standard, replace the wiper arm.

◆Installation procedure◆



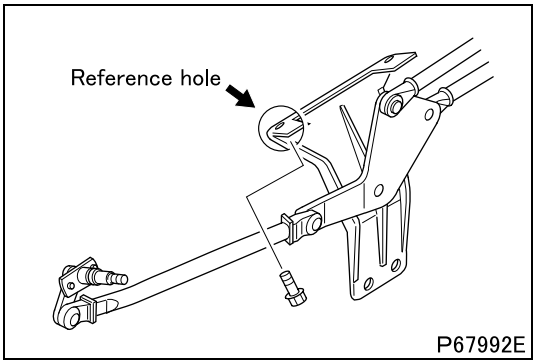
■Installation: Wiper motor and bracket

- Wiper motor and bracket has a reference hole for installation.
- Tighten bolt starting with the location identified by the reference hole.



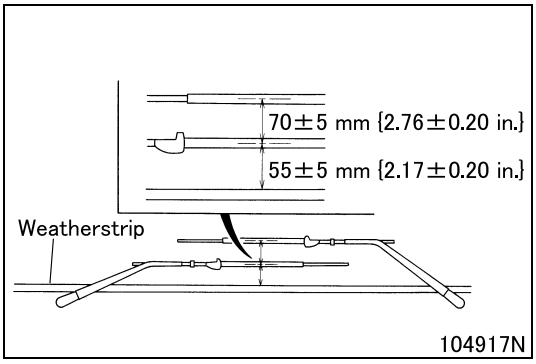
■Installation: Crank arm

- Align wiper motor and bracket with mating mark "⬆" of crank arm to install.



■**Installation: Wiper link**

- Wiper link has a reference hole for installation.
- Tighten bolt starting with the location identified by the reference hole.



■**Installation: Wiper arm and blade**

- Install wiper arm and blade to wiper link from the end face of weatherstrip to the dimension shown in illustration.

● **Installation sequence**

Follow the removal sequence in reverse.

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
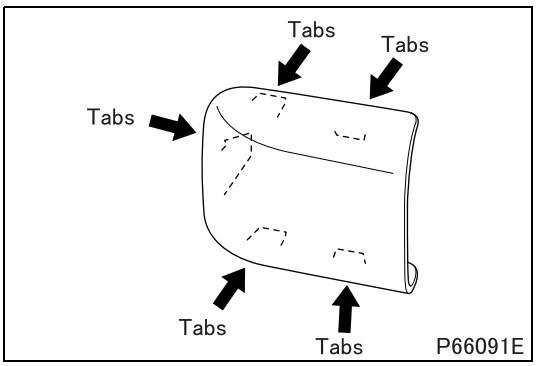
Ta	Striker	11.2 {8.3, 1.1}	–
Tb	Resin nut of front panel opener cable	1.5 to 2.5 {11 to 1.8, 0.15 to 0.25}	–

Lubricant and/or sealant

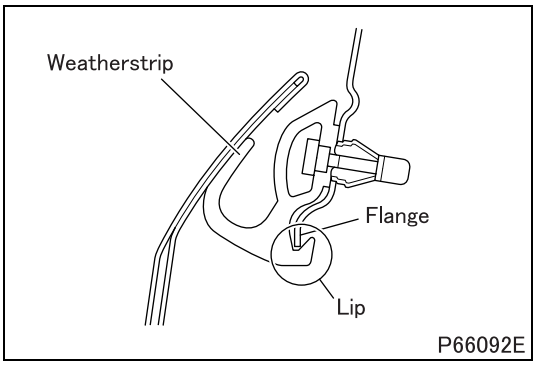
Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Striker contacting portion of front panel latch, and spring	Wheel bearing grease [NLGI No.2 (Li soap)]	As required

◆Removal procedure◆



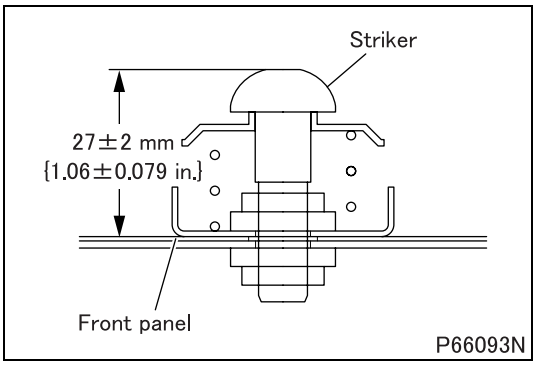
■**Removal: Cover**

◆Installation procedure◆



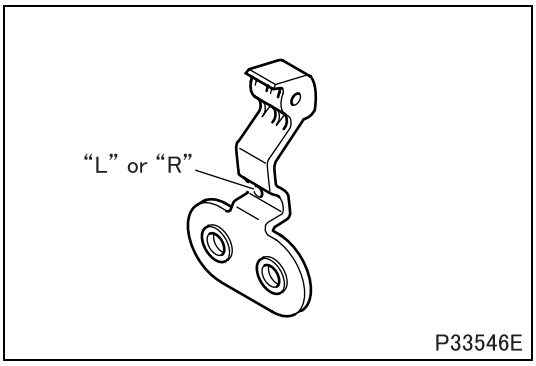
■**Installation: Weatherstrip**

- Install the weatherstrip securely by fitting the lip into the flange.



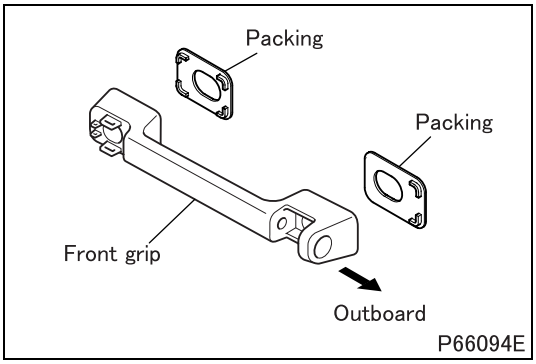
■**Installation: Striker**

- Adjust until the gap dimension between the front panel and striker shown in the illustration is obtained. Install the striker.



■**Installation: Front panel hinge**

- Front panel hinges are marked with a letter (“L” or “R”) indicating the installation position. Be sure to install them on the specified side according to the identification mark.

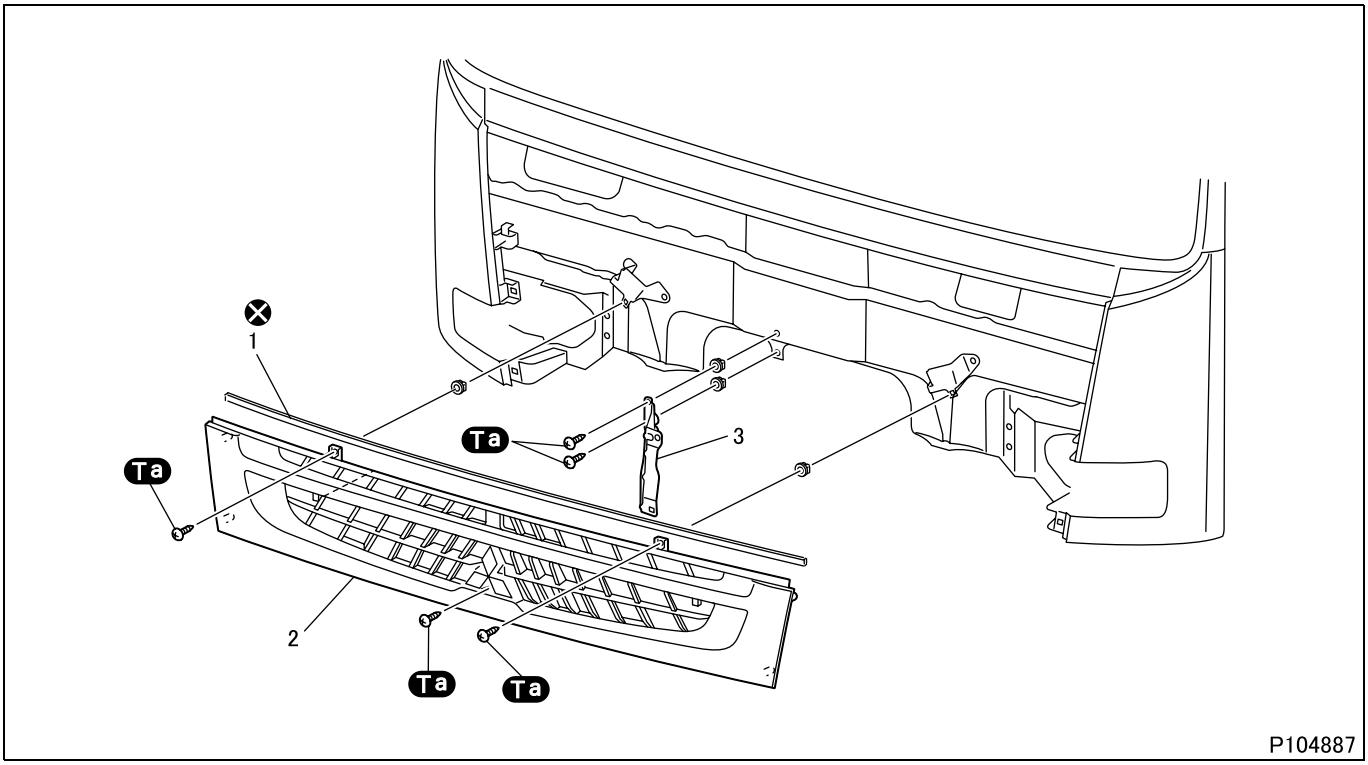


■**Installation: Packing**

- Install packings in the illustrated direction.

M E M O

FRONT GRILLE



● **Removal sequence**

1 Front grille weatherstrip
2 Front grille
3 Grille stay center
⊗: Non-reusable parts

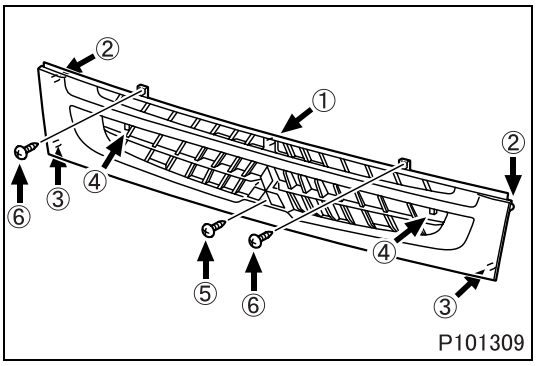
● **Installation sequence**

Follow the removal sequence in reverse.

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Screw (front grille installation)	1.57 {1.2, 0.16} or less	–
	Screw (grille stay center installation)		

◆ **Installation procedure** ◆

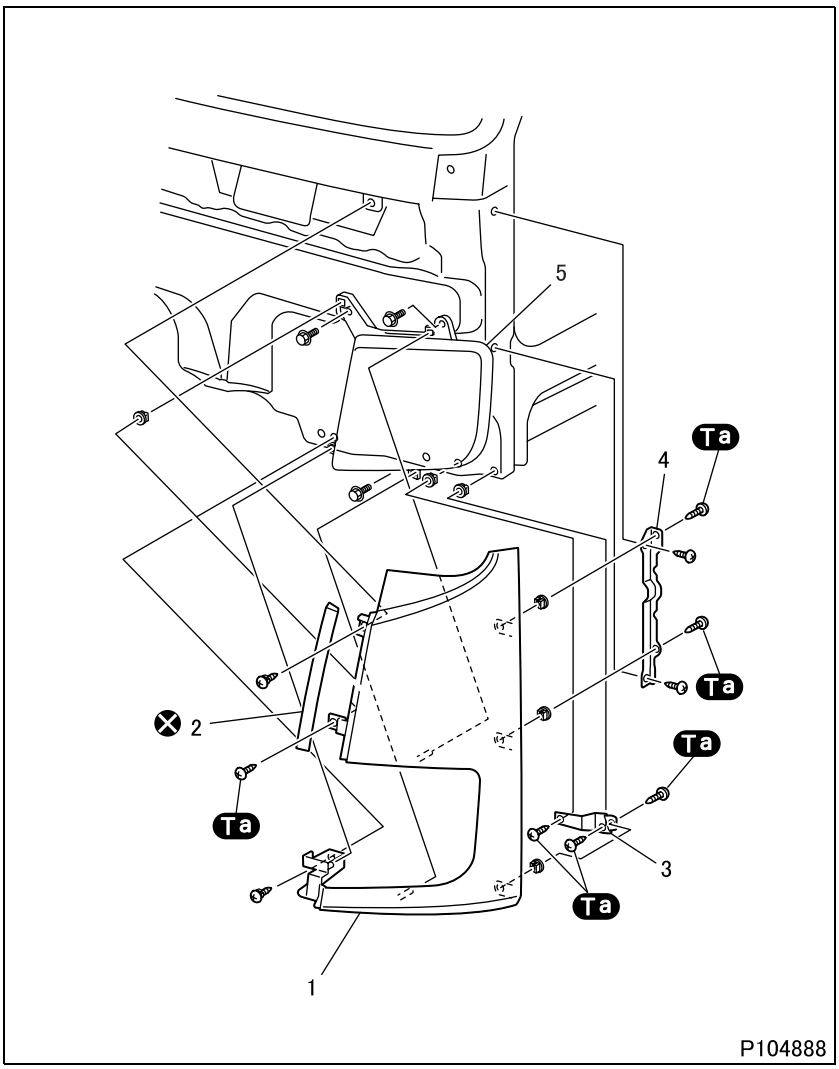


■ **Installation: Front grille**

- Install the front grille by following the sequence shown in the illustration.

M E M O

CORNER PANEL



● **Removal sequence**

1 Corner panel
2 Corner panel weatherstrip
3 Corner panel lower bracket
4 Corner panel bracket
5 Headlamp and front turn signal lamp

⊗: Non-reusable parts

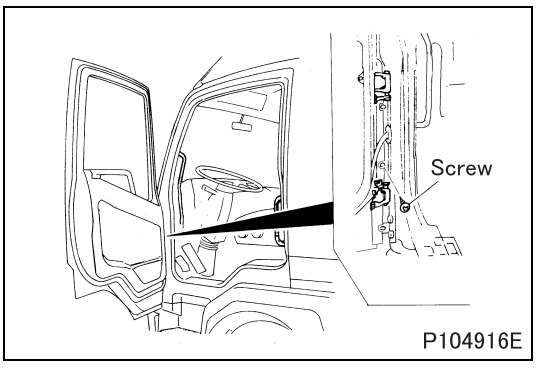
● **Installation sequence**

Follow the removal sequence in reverse.

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Screw (corner panel installation)	1.57 {1.2, 0.16} or less	–
	Screw (corner panel lower bracket installation)		

◆Removal procedure◆



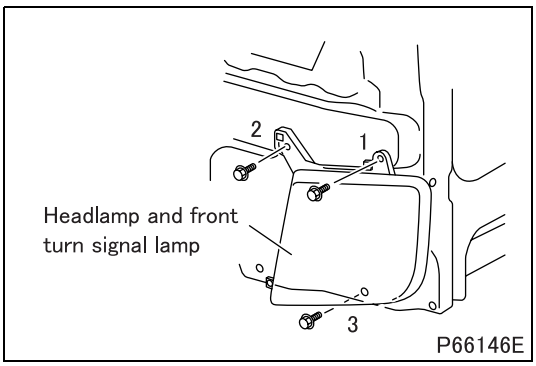
■**Removal: Corner panel**

- Open the door. Remove the three screws through the gap.
- Close the door. Remove the three screws from the front of the cab.
- Remove the corner panel by pulling it away from the vehicle.

CAUTION ⚠

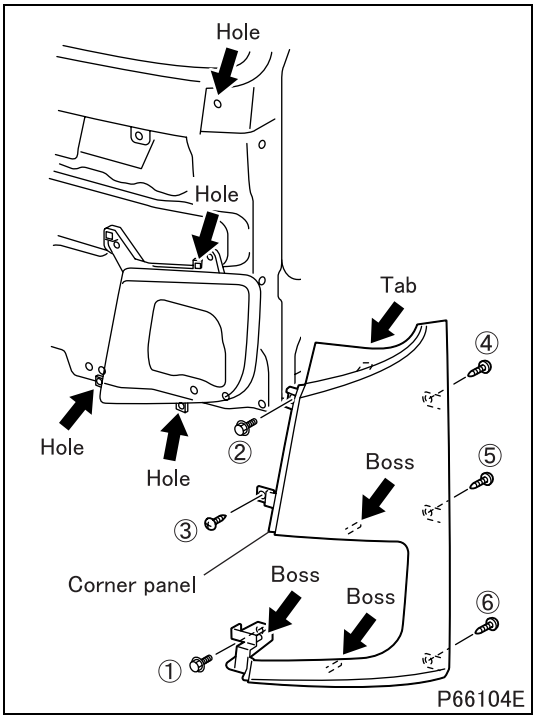
- **If you open the door while the corner panel is protruding from the vehicle, the corner panel and door may make contact, resulting in deformation and other damage.**

◆Installation procedure◆



■Installation: Headlamp and front turn signal lamp

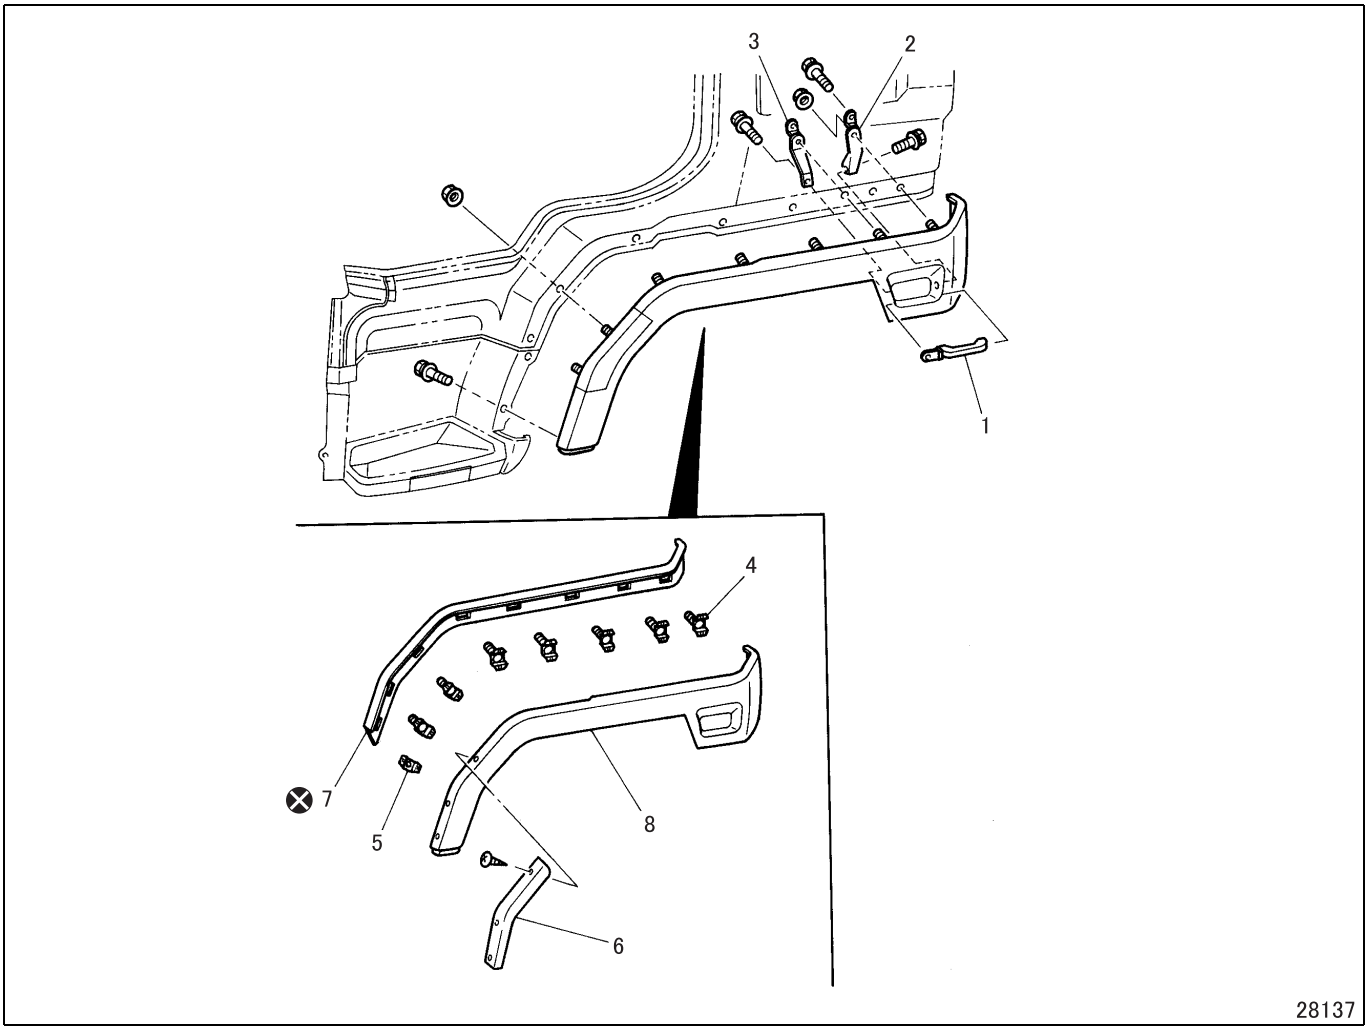
- Install the headlamp and front turn signal lamp by following the sequence shown in the illustration.



- Hook the tab of the corner panel onto holes on the cab side.
- Insert the bosses of the corner panel to the hole of headlamp.
- Install the corner panel by following the sequence shown in the illustration.

FENDER

<FK61>



● Disassembly sequence

1 Cab tilt grip
2 Cab tilt grip rear stay
3 Cab tilt grip front stay
4 Bolt plate
5 Nut plate

Follow the disassembly sequence in reverse.

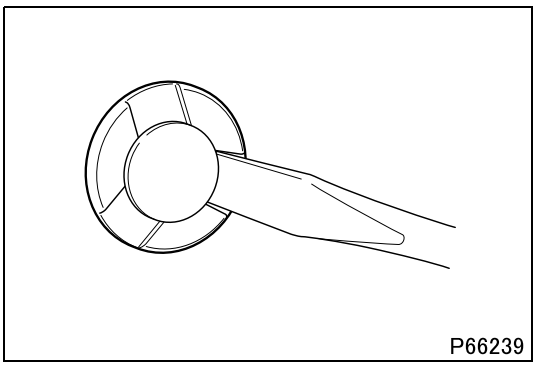
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Nut (lower apron installation)	3.9 {2.9, 0.4}	–

◆Removal procedure◆



■Removal: Clip

- To remove a clip, unlock it by prying up as shown with a screwdriver.

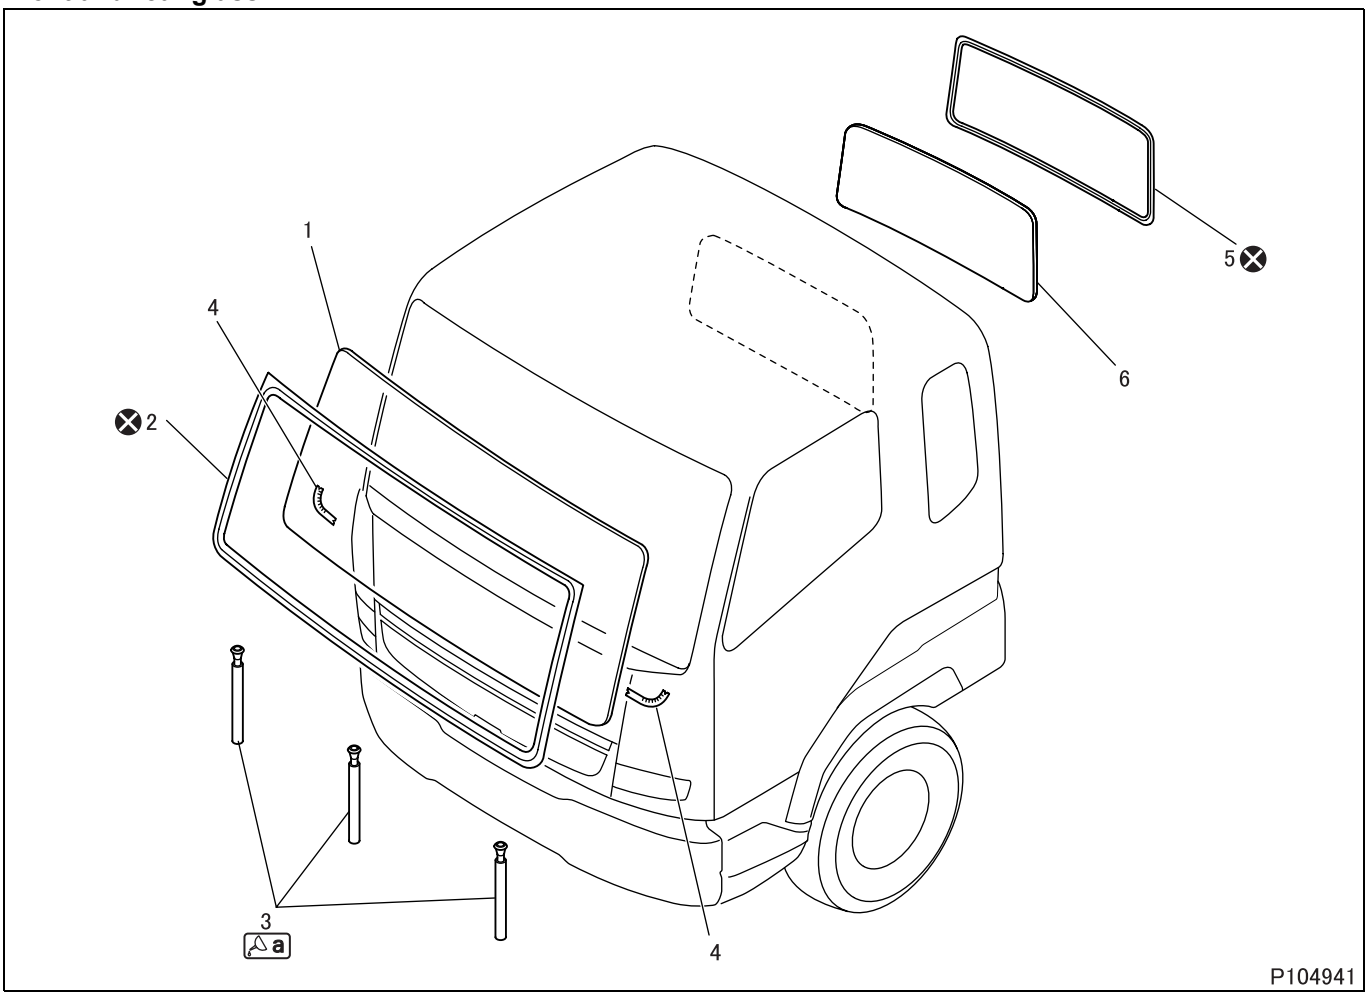
WINDOW GLASS

Front and rear glass



● **Removal sequence**

1 Windshield glass
2 Windshield weatherstrip
3 Drain hose
4 Seal tape
5 Rear window weatherstrip
6 Rear window glass

⊗: Non-reusable parts

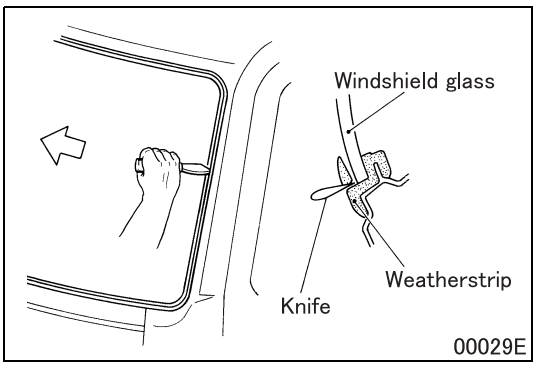
● **Installation sequence**

Follow the removal sequence in reverse.

Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Fill the area around the drain hose mounting flange on cab	CEMEDINE 3061-D	As required

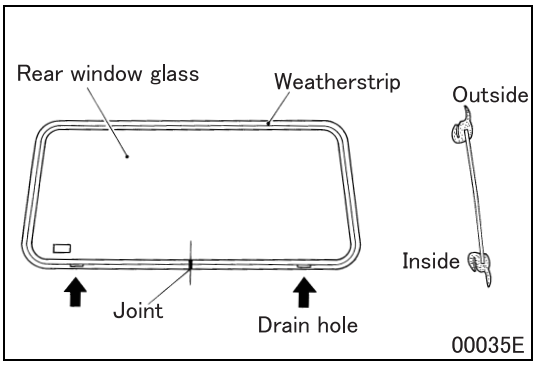
◆Removal procedure◆



■Removal: Windshield glass

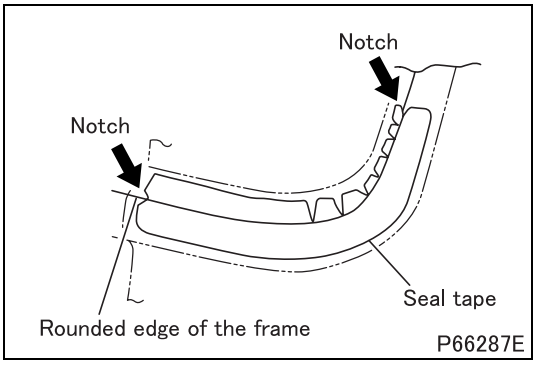
- Cut weatherstrip with knife at the area as illustrated.
- Support windshield glass, and remove by pressing it from inside the cab.

◆Installation procedure◆



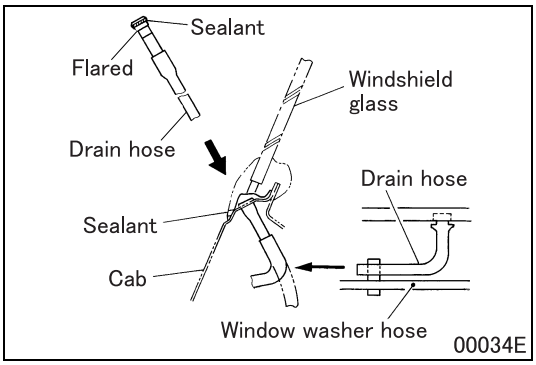
■Installation: Rear window weatherstrip and rear window glass

- Fit the rear of the window weatherstrip round the rear window glass so that the joint of weatherstrip comes at the bottom of the glass.
- Except for the point mentioned above, install the rear window glass in the same manner as the windshield glass.



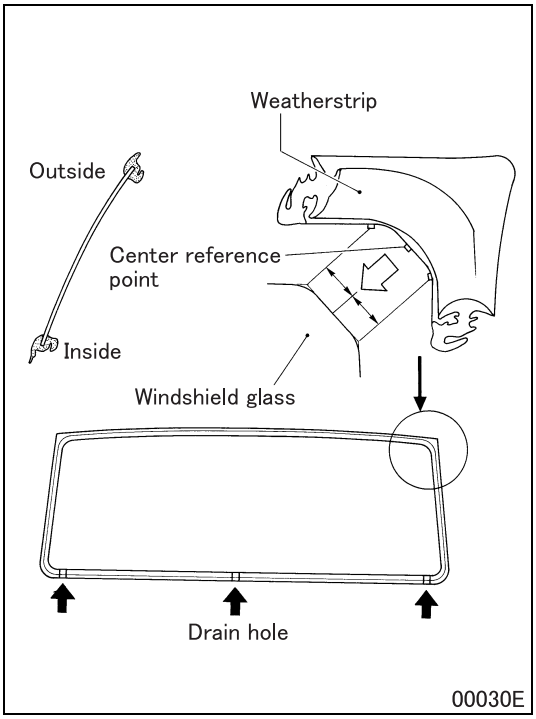
■Installation: Seal tape

- Peel off the liner paper only from the upper half of the seal tape.
- Holding the lower half of the seal tape, align the notches with the rounded edge of the frame and attach the upper half to the frame.
- Peel off the liner paper from the lower half of the seal tape. Attach the lower half to the frame while taking care not to make creases.



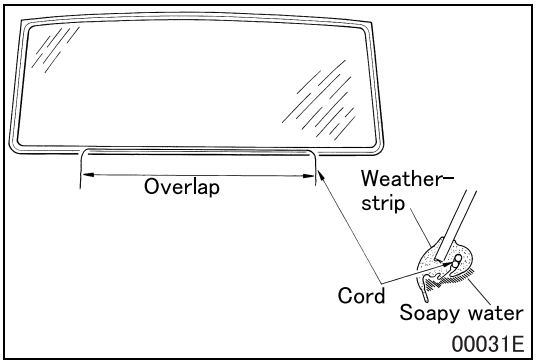
■Installation: Drain hose

- Fill the area around the flange of drain hose with sealant, and press the drain hose in until its flared area fits into cab. Carefully smooth down excess sealant that is squeezed out so that the hose opening is not clogged.
- Secure drain hose at the middle of the vehicle together with windshield washer hose.

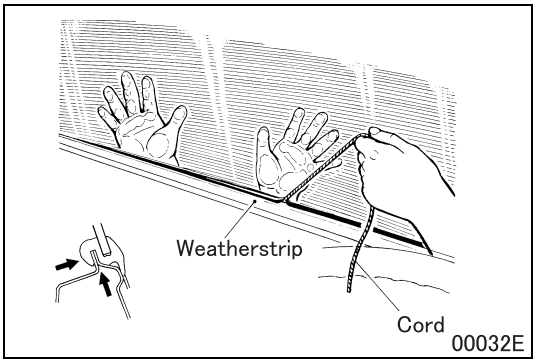


■Installation: Windshield weatherstrip and windshield glass

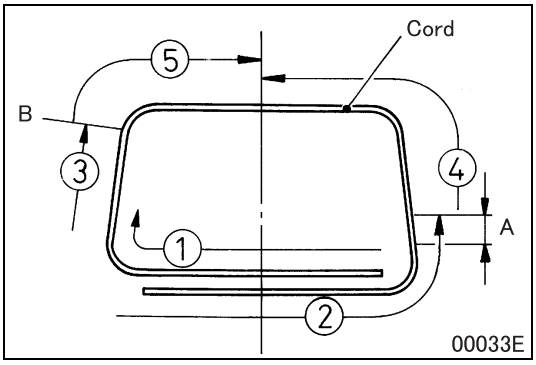
- Install the weatherstrip with its center reference point aligned with the center of the cut at each corner of the glass.



- Put a piece of strong cord in the cab flange fitting groove in the weatherstrip with its end portions overlapped.
- Apply soapy water to weatherstrip.

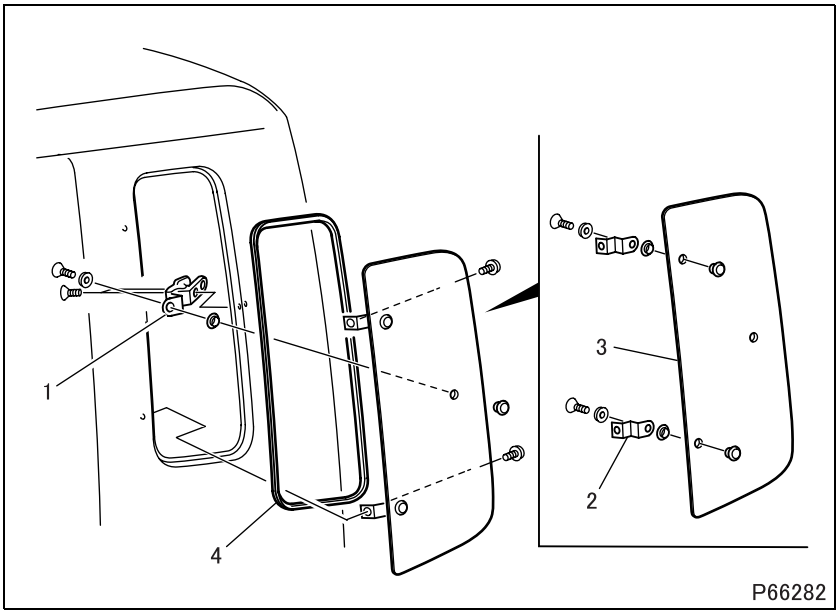


- With the glass strongly pushed from outside, pull out the cord by its ends from inside the cab to gradually fit the flange of the cab in the inner groove of the weatherstrip.



- Pull the cord in the numerical order of steps as shown. At the same time, while tapping with a rubber-headed mallet from outside the cab, settle the windshield glass in place in the weatherstrip.
  A: Approx. 100 mm from the beginning of straight portion
  B: Up to the end of straight portion

Side window glass



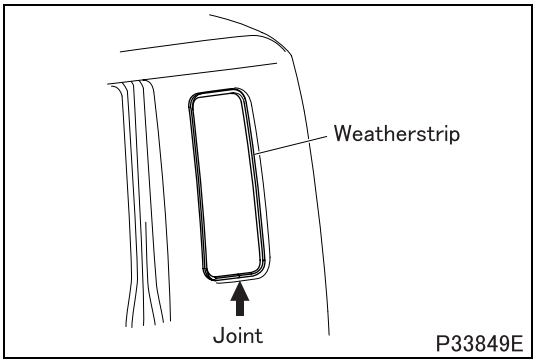
● Removal sequence

1 Side window link
2 Side window hinge
3 Side window glass
4 Side window weatherstrip

● Installation sequence

Follow the removal sequence in reverse.

◆Installation procedure◆



■Installation: Weatherstrip

- Install the weatherstrip such that its joint is positioned at the bottom-center of the glass.

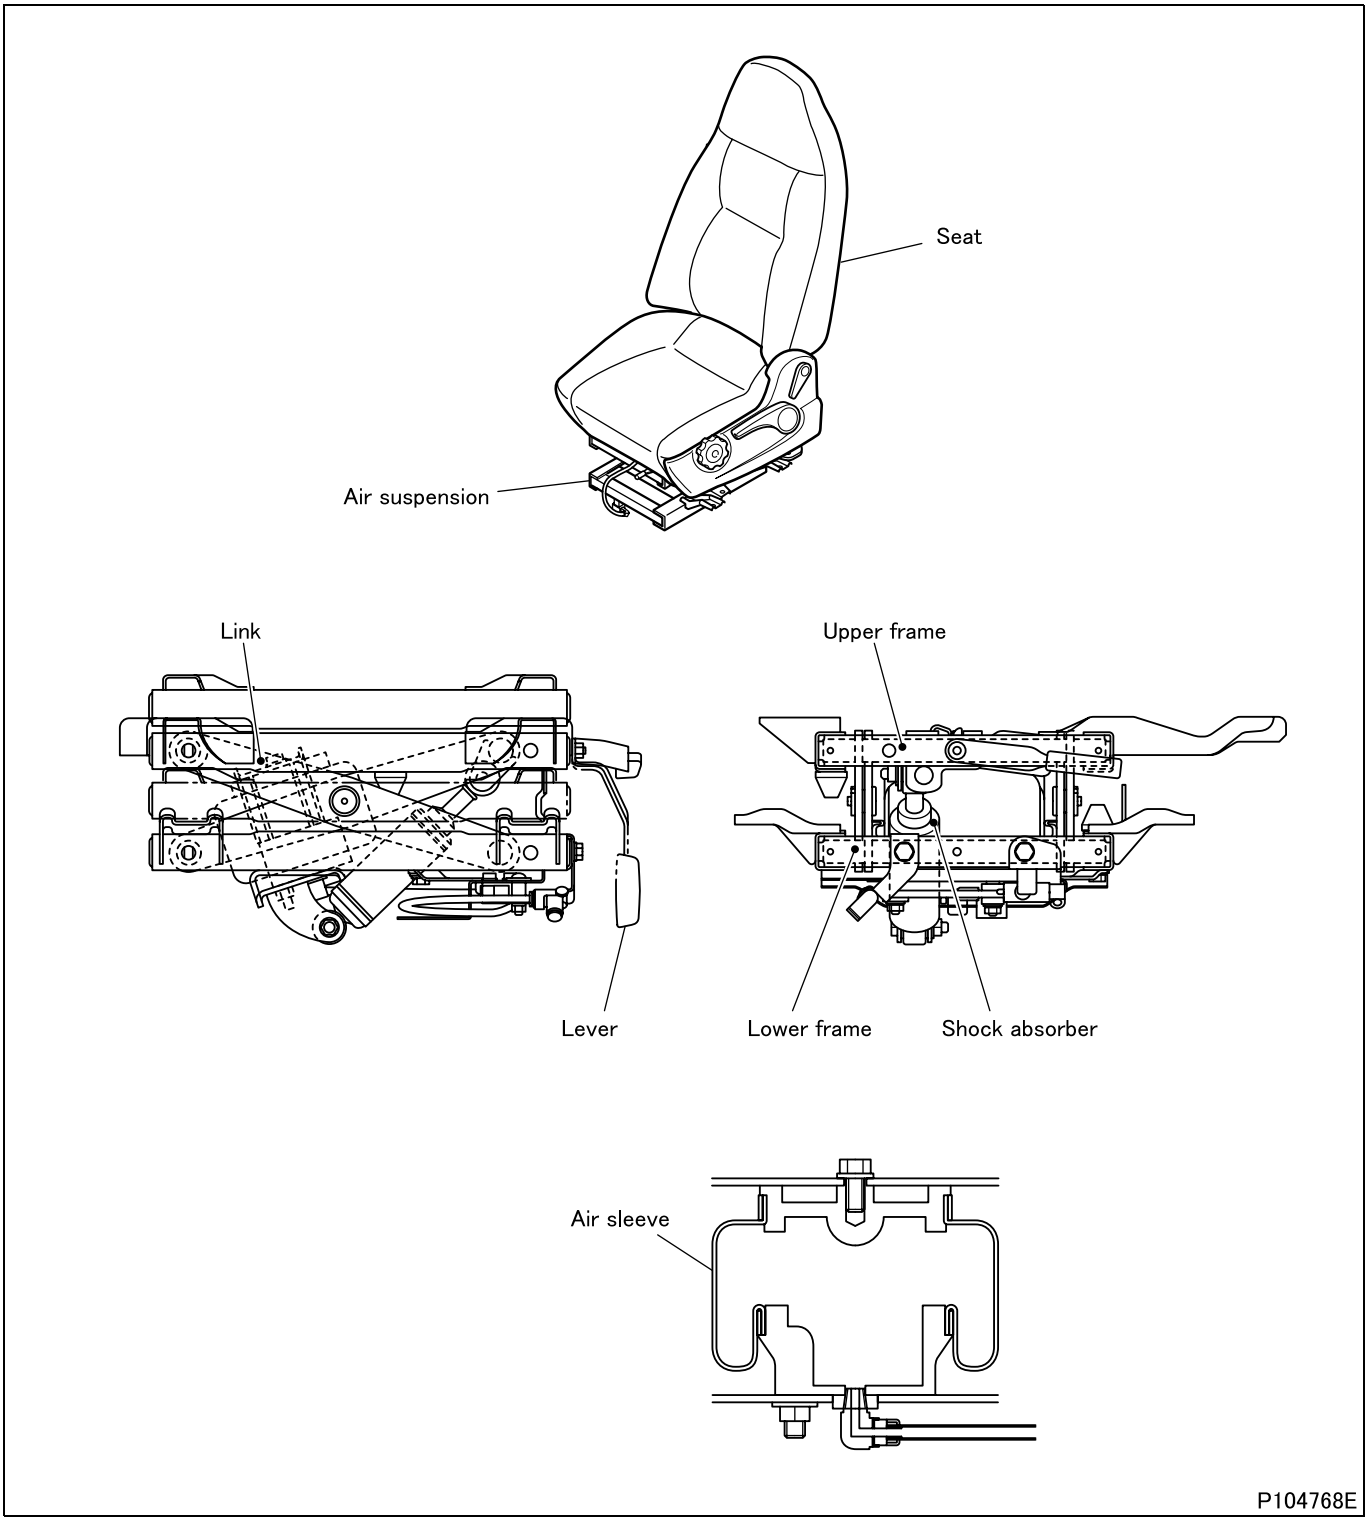
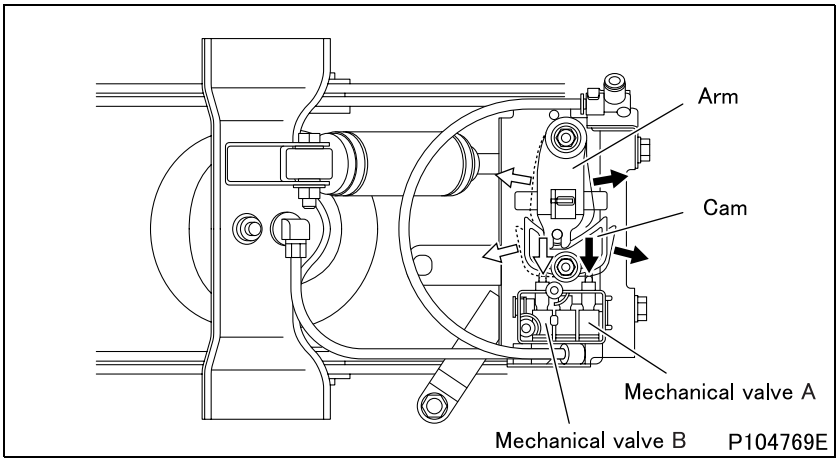
M E M O

1. Air Suspension Seat

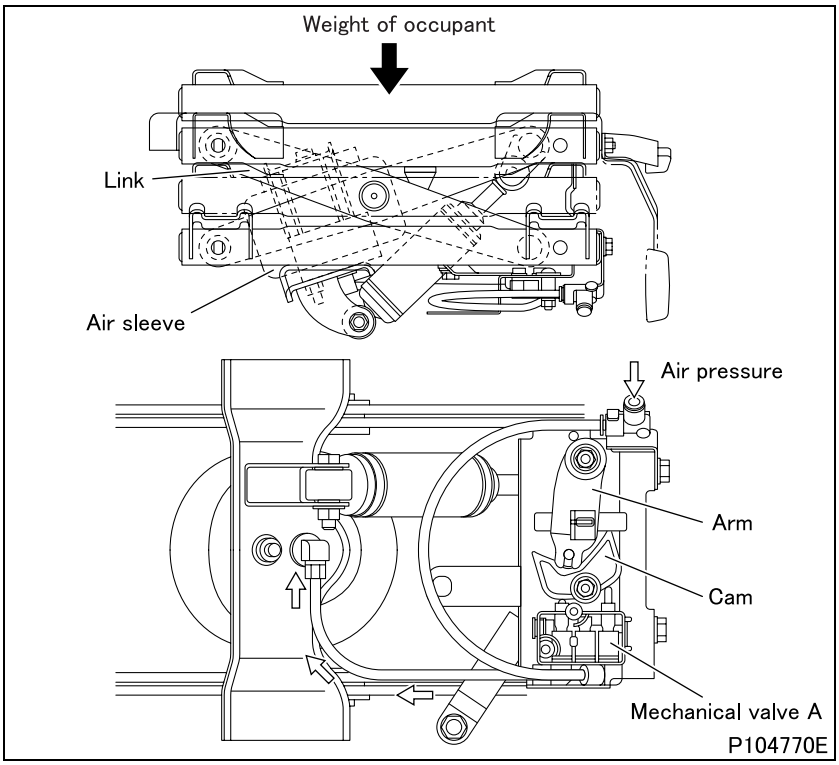


- The air suspension seat maintains the seat cushion height constant irrespective of the weight of occupants. It is provided with a mechanism which consists of cam, mechanical valves, etc. and supplies air pressure to the air sleeve automatically for constant seat cushion height.



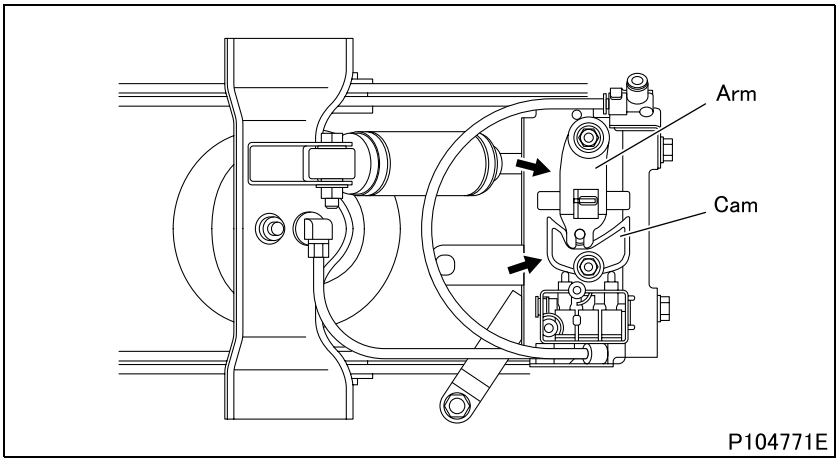
1.1 Operation of mechanical valves

- The air passage of the mechanical valves A and B opens or closes depending on the movement of the arm and the cam.



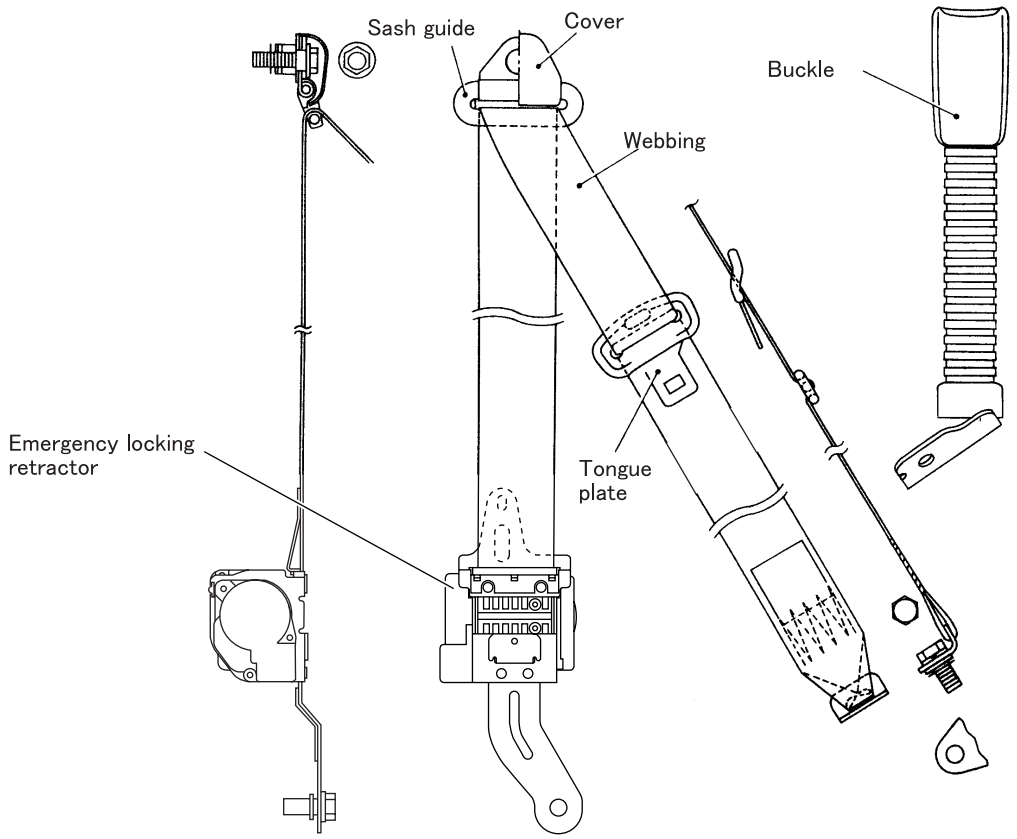
1.2 Operation of air suspension when seat is occupied

- When the weight of an occupant is applied on the seat, the link is pressed down. This allows the arm to rotate the cam slightly, opening the air passage through the valve.
- Then, air pressure is supplied and the link is raised.



- When the link is raised, the cam is pushed back. Thus, the seat cushion returns to the original position.

2. Emergency Locking Retractor Type Seat Belt



Seat Belt

Symptoms / Possible causes	Seat belt cannot be pulled out.	Seat belt fails to be retracted.	Seat belt often locks.	Tongue fails to fasten to buckle.	Shoulder anchor angle cannot be adjusted.	Reference Gr

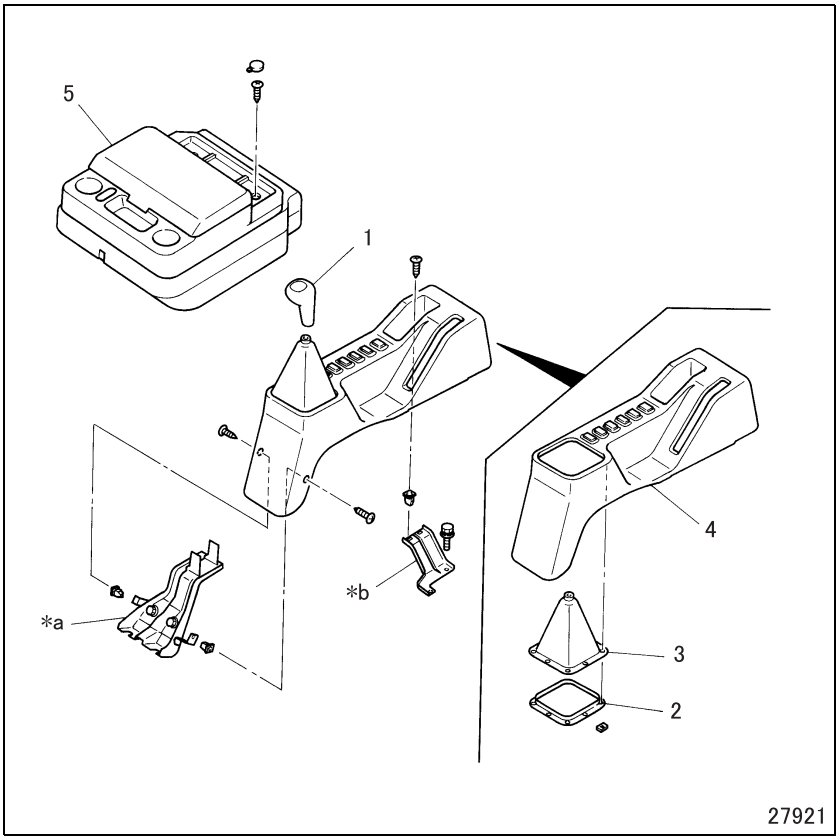
11 Upper center instrument panel frame
12 Lower center instrument panel frame
13 Lower driver instrument panel support
14 Reinforcement
15 Side bracket, left-hand
16 Driver instrument panel frame

● Assembly sequence

Follow the disassembly sequence in reverse.



● Incidental work on removal and installation

Removal and installation of parking brake cable

● Removal sequence

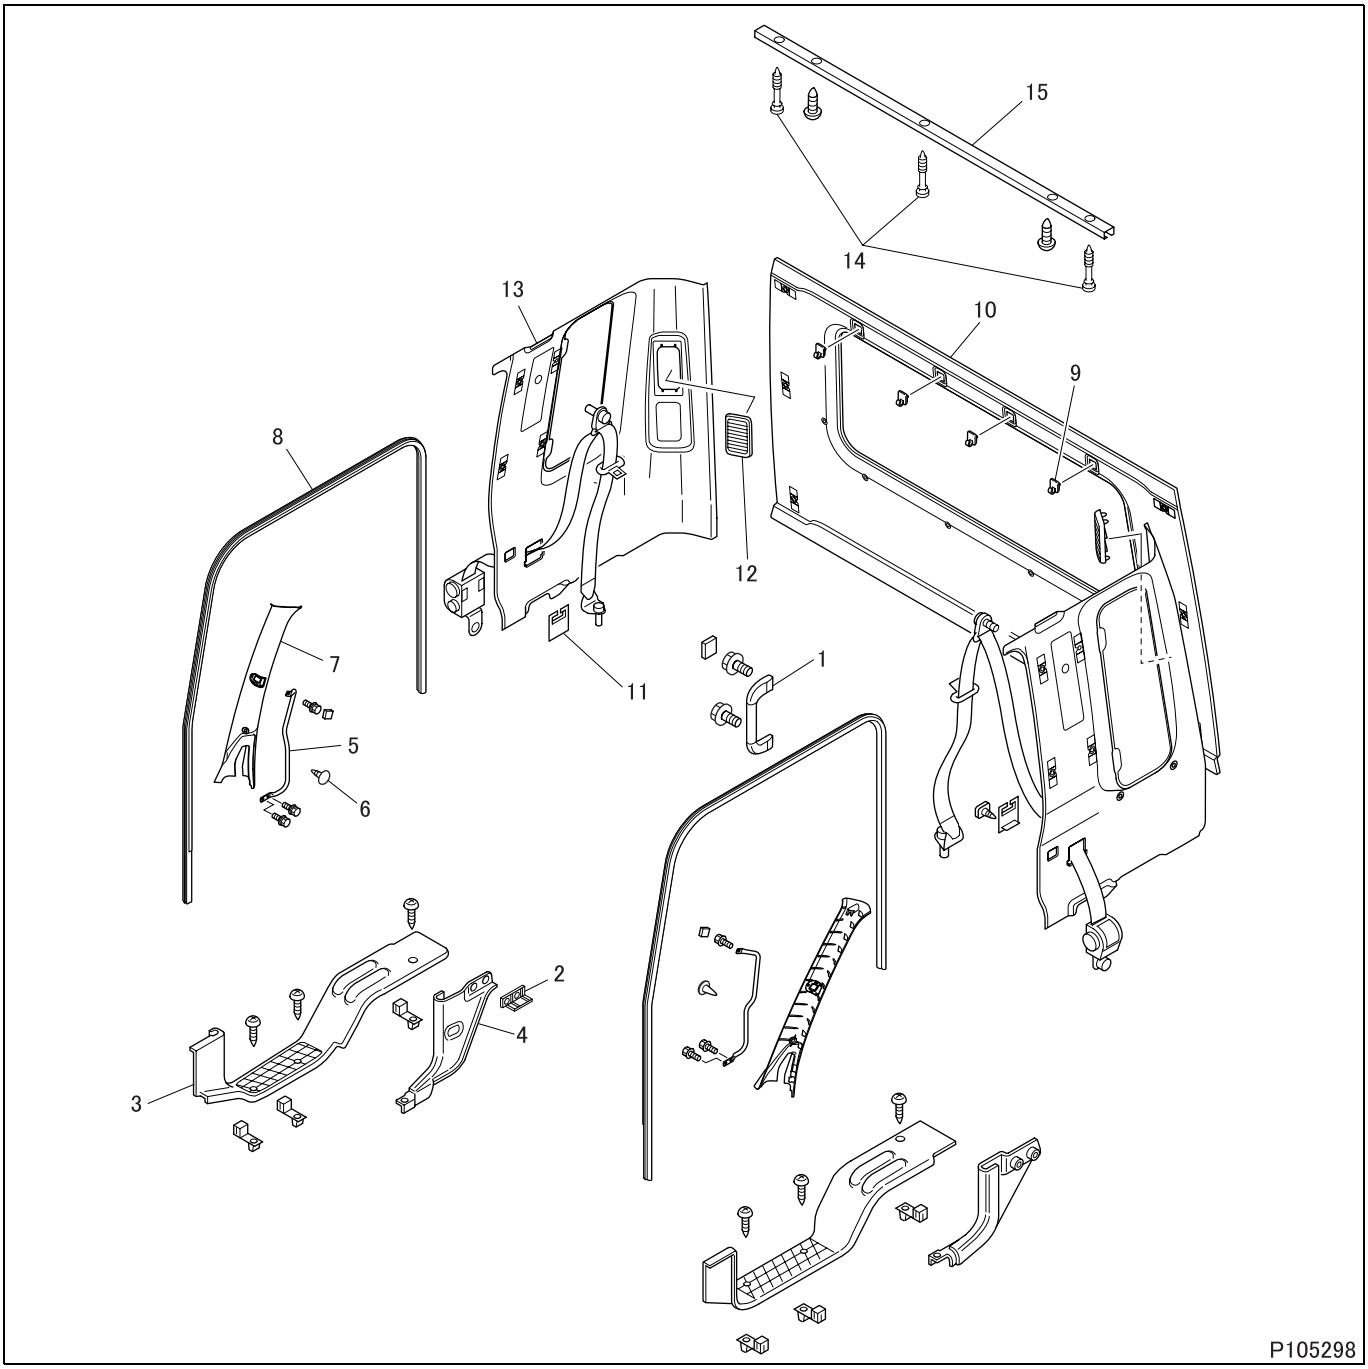
1 Shift lever knob
2 Boots holder
3 Shift lever boots
4 Shift lever console
5 Center seat console

***a**: Set board (See Gr22.)
***b**: Bracket B

● Installation sequence

Follow the removal sequence in reverse.

SCUFF PLATES, TRIM



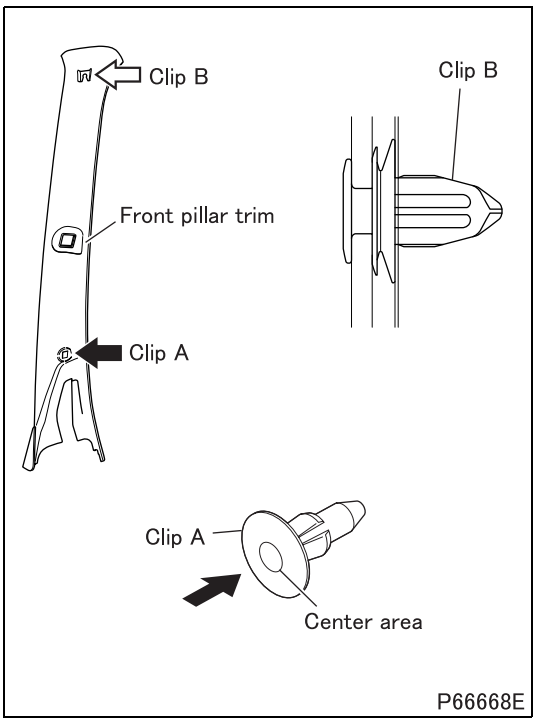
● **Removal sequence**

1 Rear pillar grip, left-hand
2 Bed side support
3 Front scuff plate
4 Rear scuff plate
5 Front pillar grip
6 Clip
7 Front pillar trim
8 Weatherstrip
9 Coat hanger
10 Rear trim
11 Seatbelt guide
12 Inside air outlet garnish
13 Rear side trim
14 Rail pin
15 Rear curtain rail

● **Installation sequence**

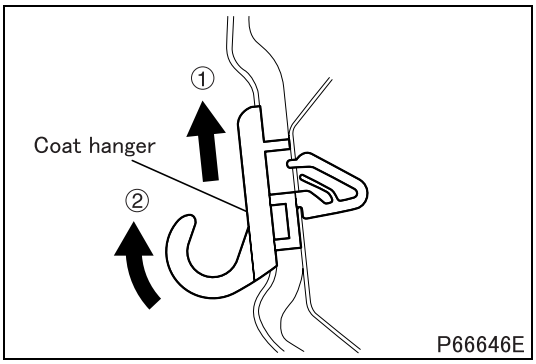
Follow the removal sequence in reverse.

◆Removal procedure◆



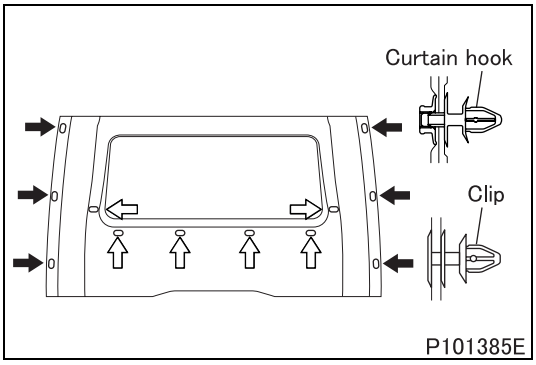
■ **Removal: Front pillar trim**

- Push at center area of clip A to remove clips A from front pillar trim.
- To unclip the front pillar trim, put your hands under the trim near at the clips B and pull it carefully toward you so as not to damage it.



■ **Removal: Coat hanger**

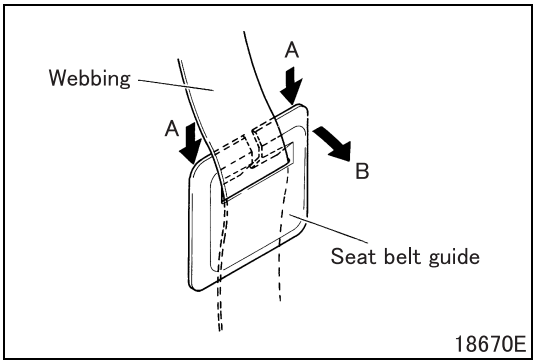
- To detach the coat hanger from the rear trim, pull it in direction 2 while pushing it up in direction 1.



■ **Removal: Rear trim**

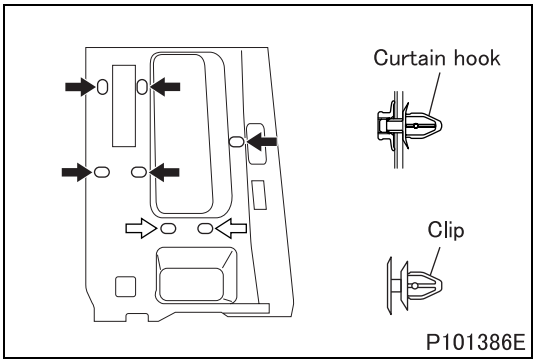
⬅ : Clip
⇦ : Curtain hook

- When removing clips and curtain hooks, put your hands under the rear trim near at the clips and pull it carefully toward you so as not to damage it.



■ **Removal: Seat belt guide**

- To detach the seat belt guide, pull the top of the guide toward you in direction B while holding it down in direction A.

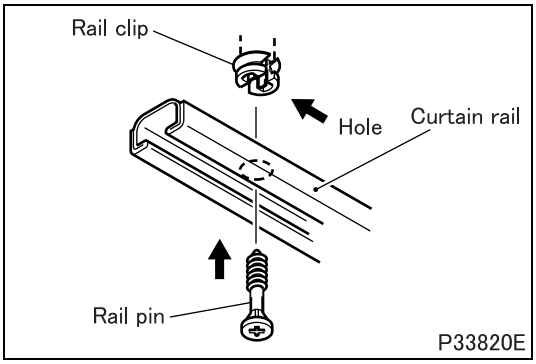


■ **Removal: Rear side trim**

◀ : Clip
⇦ : Curtain hook

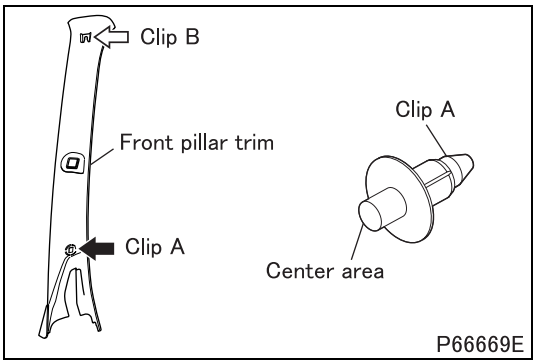
- When removing clips and curtain hooks, put your hands under the rear side trim near at the clips and pull it carefully toward you so as not to damage it.

◆Installation procedure◆



■ **Installation: Curtain rail**

- Fit the rail pin by pushing it into the hole of the rail clip to install the curtain rail.



■ **Installation: Front pillar trim**

- Install the front pillar trim by pushing the center area of clip A as shown in the drawing.

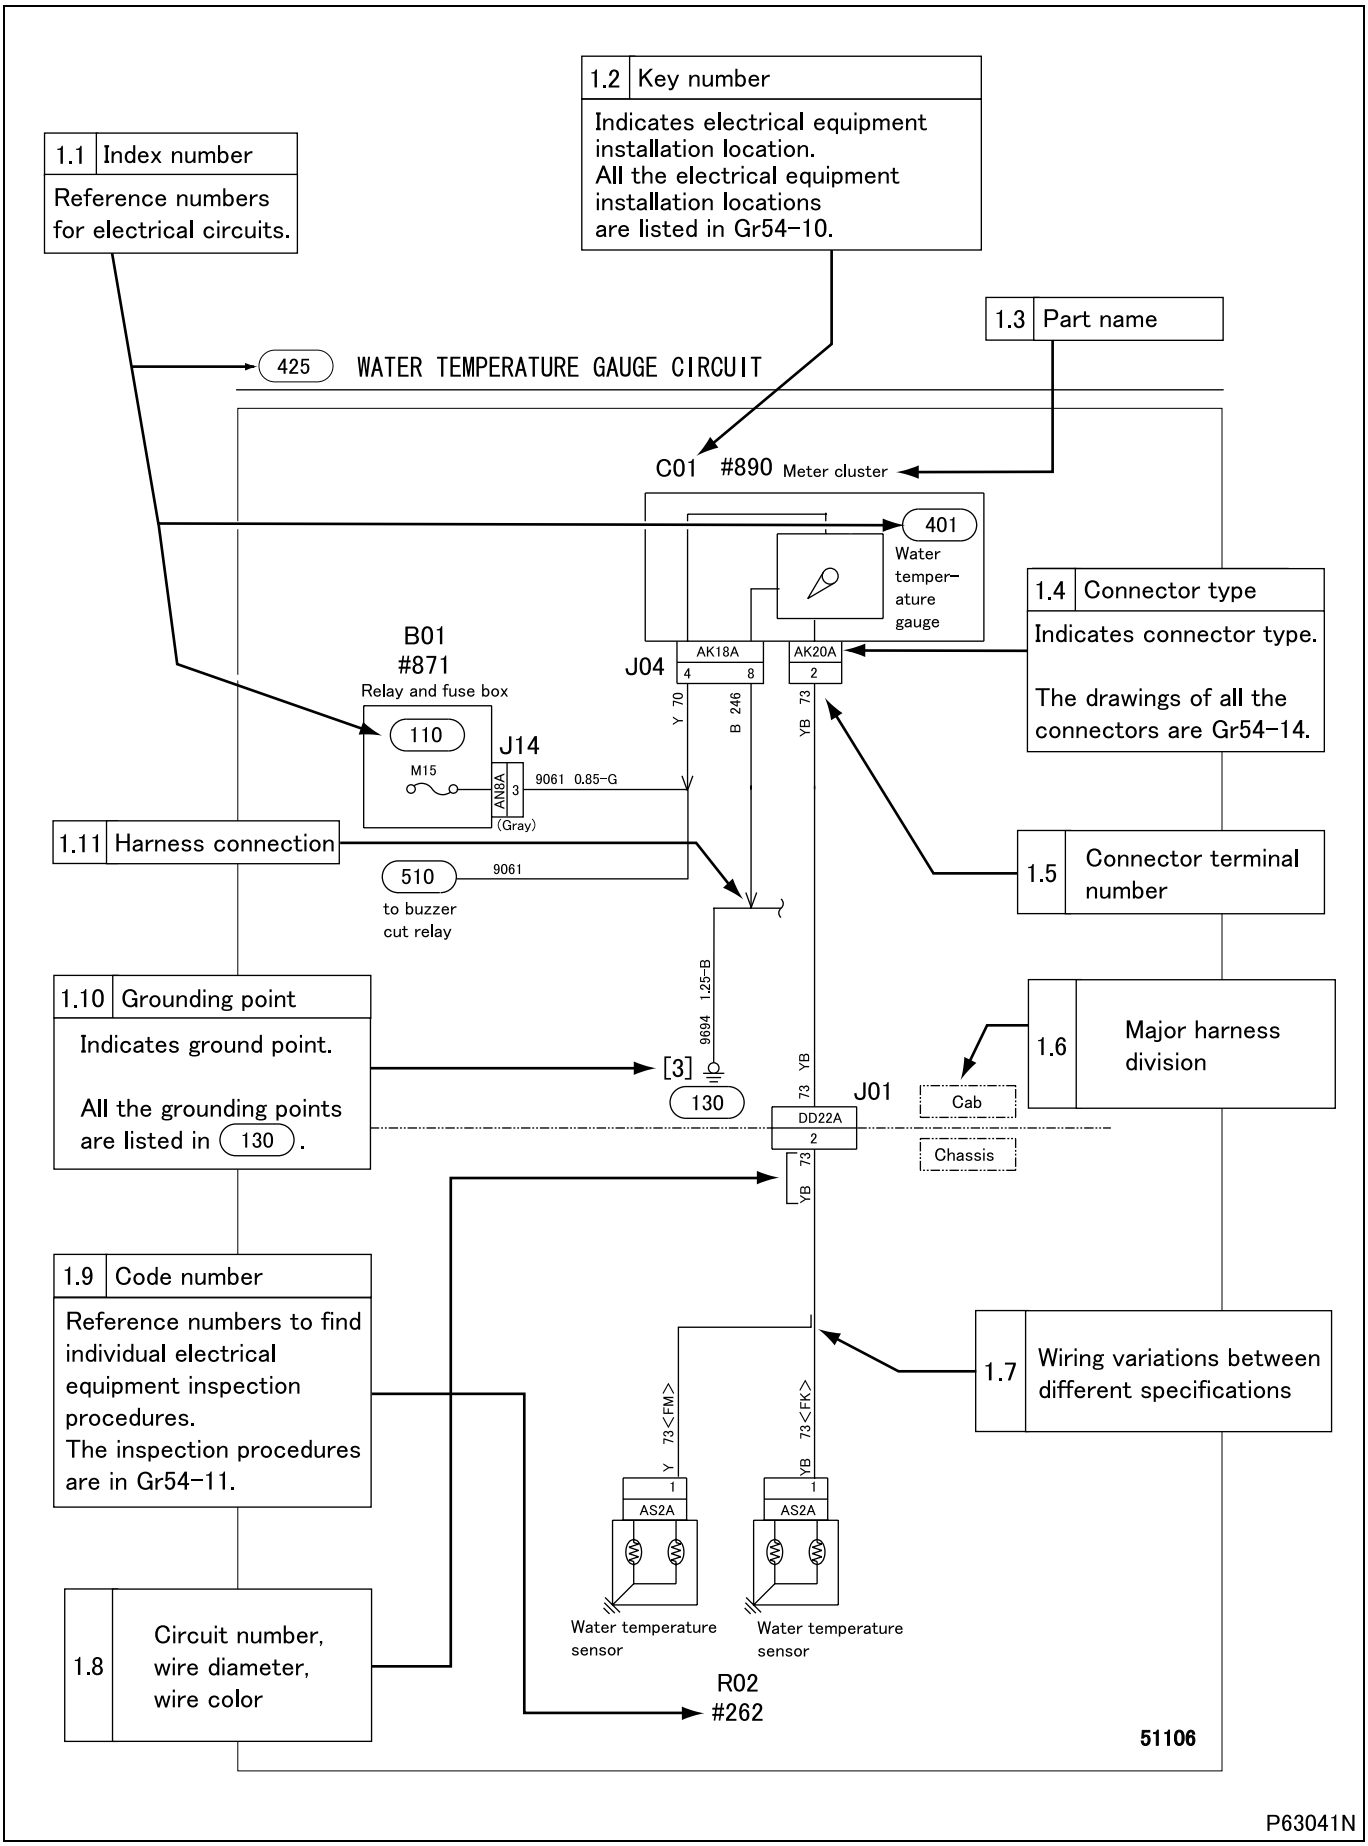
54-14 CONNECTOR CONFIGURATION CHART

CONNECTOR CONFIGURATION CHART 54-14-2

HOW TO READ THIS GROUP

HOW TO READ CIRCUITS (ELECTRICAL)



1.1 Index number: (100) to (999)

- Index numbers are used as reference numbers for electrical circuits. Each electrical circuit has been assigned its own index number.

1.2 Key number: A01 to Z99

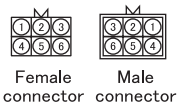
- Key numbers indicate parts installation locations. The installation location of a part can be easily found using its key number shown in a circuit diagram.
  All of the electrical equipment installation locations are listed in Gr54-10.

1.3 Part name

1.4 Connector type (type indication)

- A list of the connectors used is included in Gr54-14.

1.5 Connector terminal number



Connector terminal numbering starts with the upper left corner for female connectors and with the upper right corner for male connectors.

P50678E

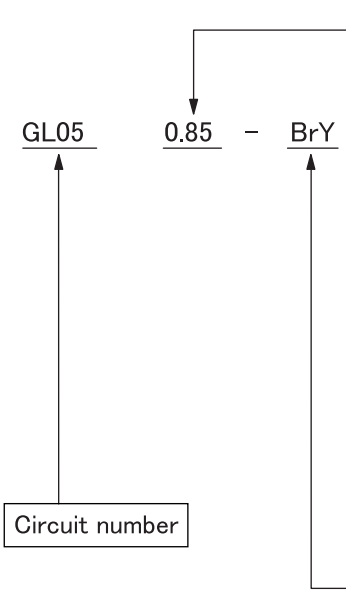
1.6 Major harness division

- Major harness divisions are shown.

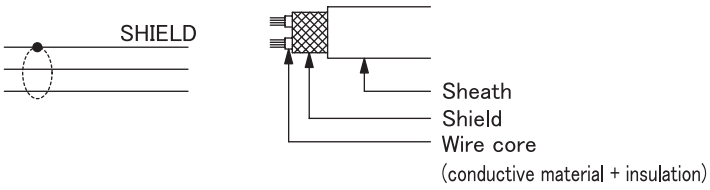
1.7 Wiring variations between different specifications

- Variations in wiring/circuit between different vehicle specifications are clearly indicated as shown.

1.8 Circuit number, wire diameter, wire color



"Wire diameter" represents the cross section of the wire's conductive material. For example, "0.85" corresponds to 0.85 mm^2. On the circuit diagrams, the unit "mm^2" is omitted. Wires with a conductive cross section of 0.5 mm^2 are shown without the wire diameter or unit. As indicated below, shielding wires are marked with "SHIELD," and shielded wires are circled by a dotted line.



On the circuit drawings, twisted wires are indicated as shown below.

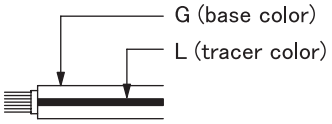
Wire colors are represented by the first letter of the color.
Colors that all start with the letter "B" are indicated as follows.

- BLACK → B
- BLUE → L
- BROWN → Br

Wires that have both base and tracer colors are indicated by two letters.

RY (Yellow tracer on Red base)

GL (Blue tracer on Green base)



P50680E

1.9 Code number: #001 to #999

- Code numbers are reference numbers to find individual electrical equipment inspection procedures. The inspection procedure for an electrical equipment can be found using its code number shown in a circuit diagram.

HOW TO READ THIS GROUP

1.10 Grounding point: [1] to [99]

- Locations where wires are grounded to the vehicle. All of the grounding points are listed in (130).

1.11 Harness connection

- The arrow in the wiring diagram indicates where harnesses are connected, and NOT the flow of electricity.

Wire color

Wire color		Base color + tracer											
B	Black	BW	Black/ white	BY	Black/ yellow	BR	Black/red	BG	Black/ green	BL	Black/ blue		
Br	Brown	BrW	Brown/ white	BrB	Brown/ black	BrY	Brown/ yellow	BrR	Brown/ red	BrG	Brown/ green

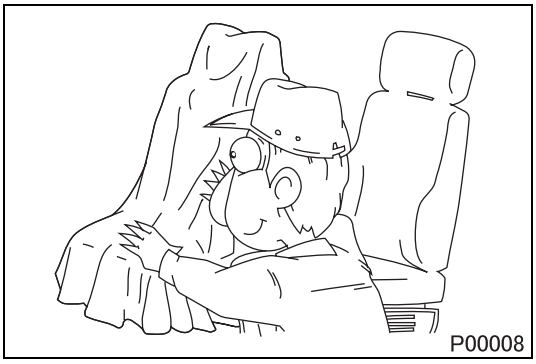
		YP	Yellow/ pink	YV	Yellow/ violet								

54-00A GENERAL

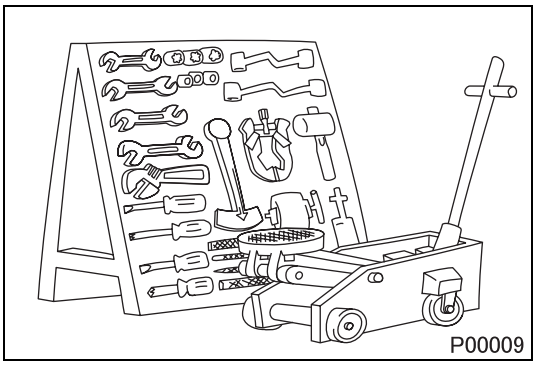
PRECAUTIONS FOR MAINTENANCE OPERATION

- Before performing service operations, inquire into the customer's complaints and ascertain the condition by checking the total distance travelled, the conditions under which the vehicle is operated, and other relevant factors about the vehicle. And note the necessary information. This information will help you to service the vehicle efficiently.
- Check the location of the fault, and identify its cause. Based on your findings, determine whether parts must be removed or disassembled. Then, follow the service procedure given in this manual.



P00008

- Perform service operations on a level surface. Before starting, take the following preparatory steps:
  - To prevent soiling and damage, place covers over the seats, trim and floor in the cab and over the paintwork of the body.

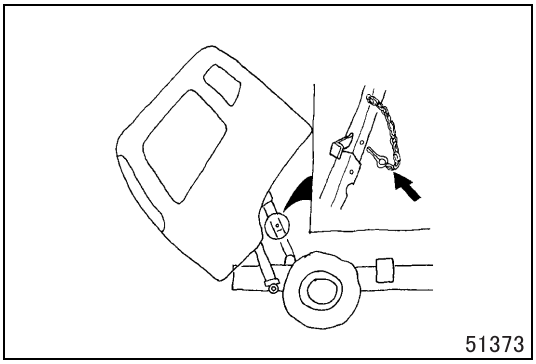


P00009

- Prepare all the general and special tools necessary for the job.

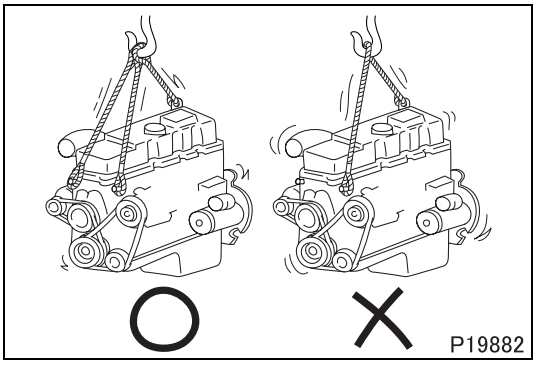
WARNING ⚠

- **Special tools must be used wherever specified in this manual. Do not attempt to use other tools since they could cause injuries and/or vehicle damage.**



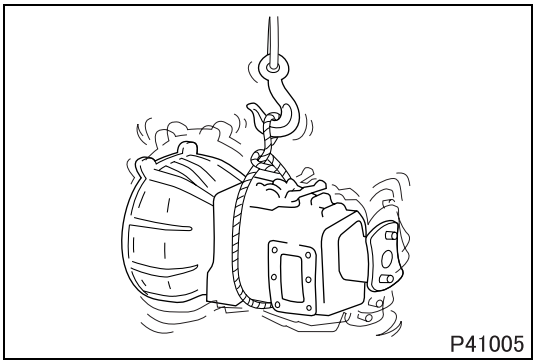
51373

- After tilting the manual tilt type cab, be sure to engage the stopper with the lock lever to lock the cab stay securely.

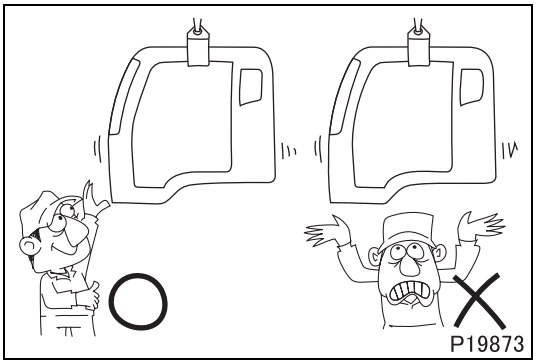


P19882

- Take extreme care when removing/installing heavy items such as engine, transmission and axle. When lifting heavy items using a cable etc., observe the following precautions.
  - Identify the mass of the item being lifted. Use the cable that is strong enough to support the mass.

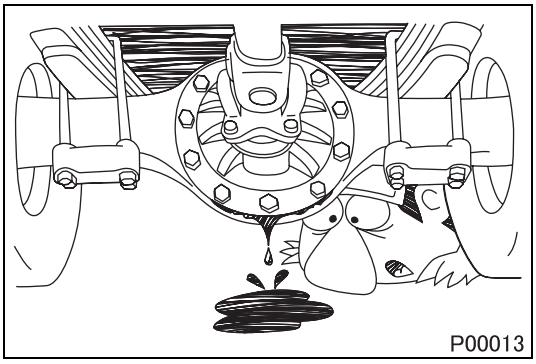


- If lifting eyes are not provided on the item being lifted, tie a cable around the item taking into account the item's center of gravity.

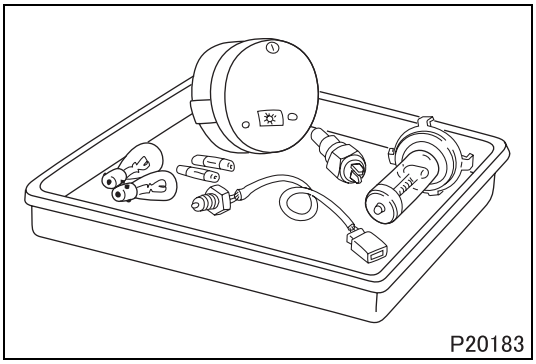


- Do not allow anyone to pass or stay under a lifted item which may possibly fall.

- Never work in shoes that have oily soles.
  When working with a partner or in a group, use pre-arranged signals and pay constant attention to safety. Be careful not to touch switches and levers unintentionally.

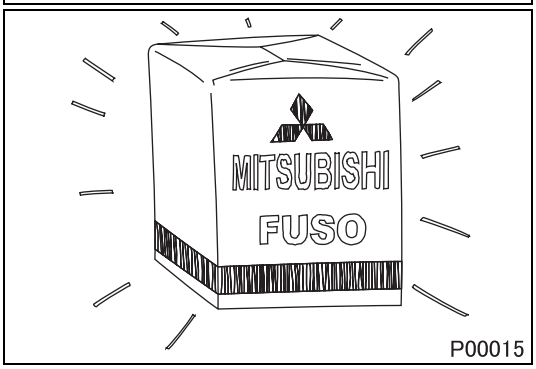


- Inspect for oil leakage etc. before washing the vehicle. If the order is reversed, any oil leakage or fault that may exist could go unnoticed during inspection.



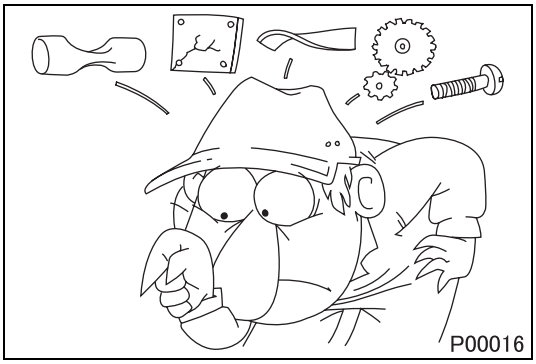
P20183

- Prepare replacement parts ready for installation.



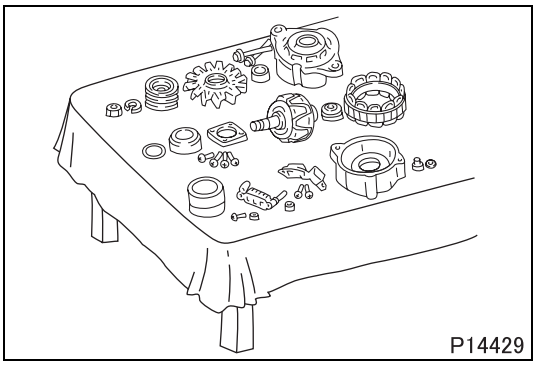
P00015

- Oil seals, packings, O-rings and other rubber parts, gaskets, and split pins must be replaced with new ones after removal. Use only genuine MITSUBISHI replacement parts.



P00016

- When disassembling parts, visually check them for wear, cracks, damage, deformation, deterioration, rust, corrosion, defective rotation, fatigue, clogging and any other possible defect.

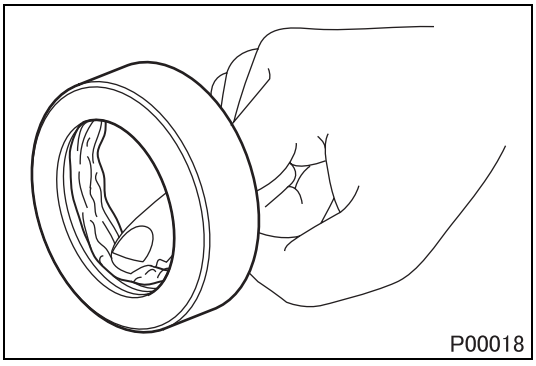


P14429

- To facilitate correct reassembly of parts, make alignment marks on them before disassembly and arrange disassembled parts neatly. Make punch marks and other alignment marks where they will not detract from parts' functionality and appearance.
- After removing parts from the vehicle, cover the area to keep it free of dust.

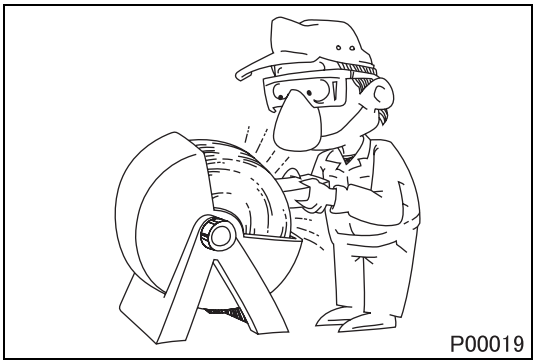
CAUTION ⚠

- **Be careful not to mix up identical parts, similar parts and parts that have left/right alignments.**
- **Keep new replacement parts and original (removed) parts separately.**



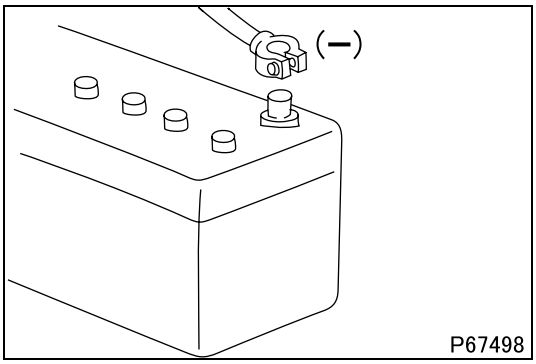
P00018

- Apply the specified oil or grease to U-seals, oil seals, dust seals and bearings before reassembly.
- Always use the specified oils and greases when performing inspection or replacement. Immediately wipe away any excess oil or grease with a rag.



P00019

- Wear safety goggles when using a grinder or welder. Wear gloves when necessary, and watch out for sharp edges and other items that might wound your hands.

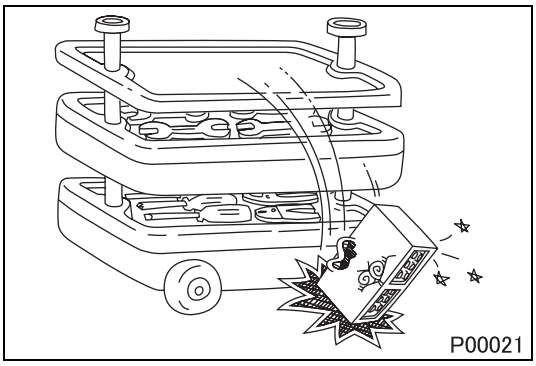


P67498

- Before working on the electrical system, disconnect the (–) battery cable to prevent short circuits.

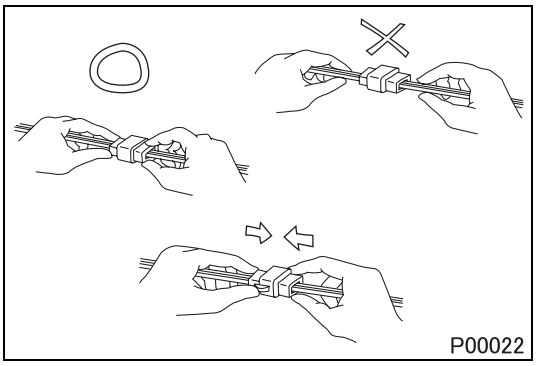
CAUTION ⚠

- **Make sure the starter switch and lighting switches are OFF before disconnecting or connecting battery cable. Semiconductor components may otherwise be damaged.**



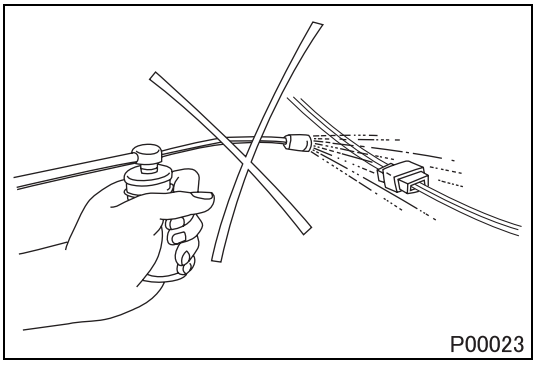
P00021

- Carefully handle sensors relays, and other items that are sensitive to shock and heat. Do not remove or paint the cover of any control unit.



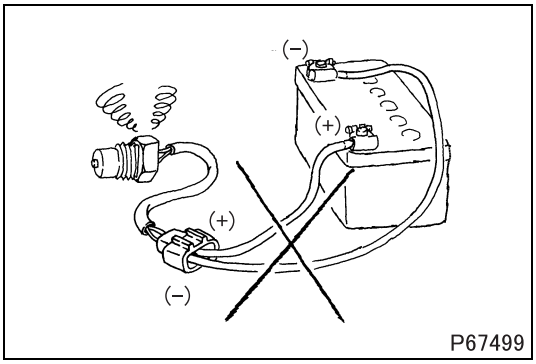
P00022

- When separating connectors, grasp the connectors themselves rather than the harnesses.
- To separate locking connectors, first push them in the direction of the arrows. To reconnect locking connectors, push them together until they click.



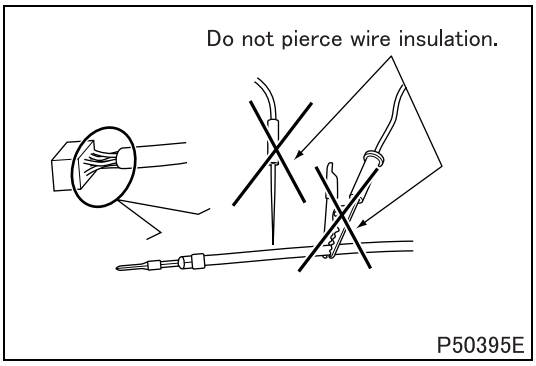
P00023

- Before washing the vehicle, cover electrical parts to keep them dry. (Use plastic sheets or the like.) Keep water away from harness connectors and sensors and immediately wipe off any water that gets on them.



- When applying a voltage to a part for inspection purposes, check that the (+) and (–) cables are connected properly then gradually increase the voltage from zero. Do not exceed the specified voltage.
  Remember that control units and sensors do not necessarily operate on the battery voltage.

1. Handling Precautions for Electric Circuits



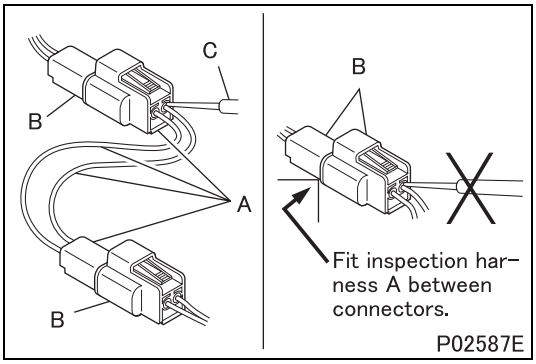
CAUTION ⚠

- **Do not pierce wire insulation with test probes or alligator clips when performing electrical inspections. Doing so can, particularly with the chassis harness, hasten corrosion.**

1.1 Inspection of harnesses

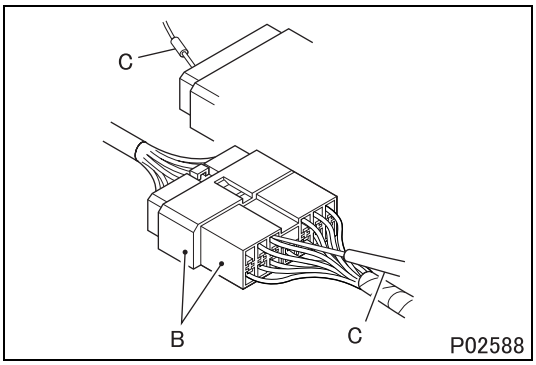
(1) Inspections with connectors fitted together

(1.1) Waterproof connectors



- Connect an inspection harness and connector A between the connectors B of the circuit to be inspected. Perform the inspection by applying a test probe C to the connectors of the inspection harness. Do not insert the test probe C into the wire-entry sides of the waterproof connectors since this would damage their waterproof seals and lead to rust.

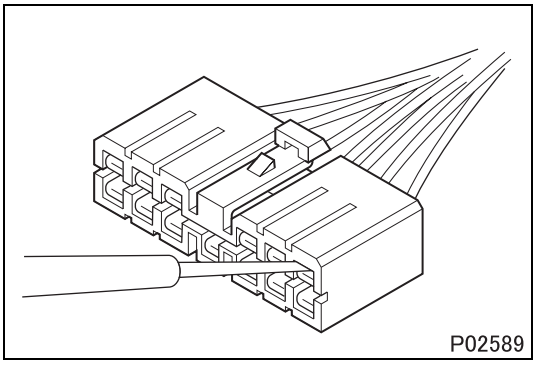
(1.2) Non-waterproof connectors



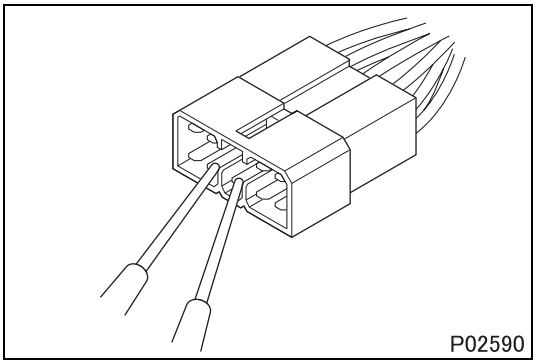
- Perform the inspection by inserting a test probe C into the wire-entry sides of the connectors. An extra-narrow probe is required for control unit connectors, which are smaller than other types of connector. Do not force a regular-size probe into control unit connectors since this would cause damage.

(2) Inspections with connectors separated

(2.1) Inspections on female terminals



- Perform the inspection by carefully inserting a test probe into the terminals. Do not force the test probe into the terminals since this could deform them and cause poor connections.



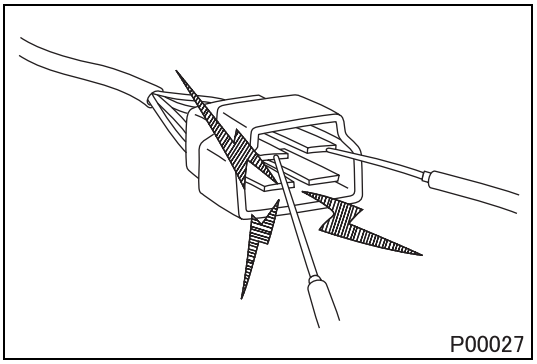
P02590

(2.2) Inspections on male terminals

- Perform the inspection by applying test probes directly to the pins.

CAUTION ⚠

- **Be careful not to short-circuit pins together with the test probes. With control unit connectors, short-circuiting of pins can cause damage to the control unit's internal circuitry.**

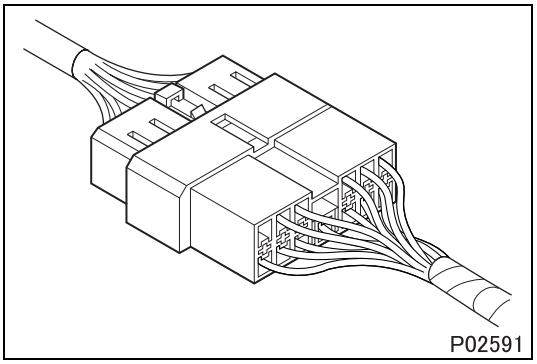


P00027

- When using a multimeter to check continuity, do not allow the test probes to touch the wrong terminals.

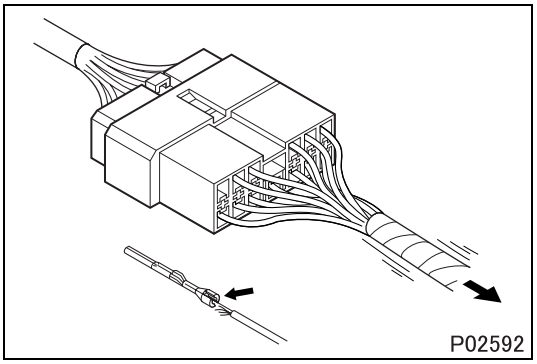
1.2 Inspection of connectors

(1) Visual inspection



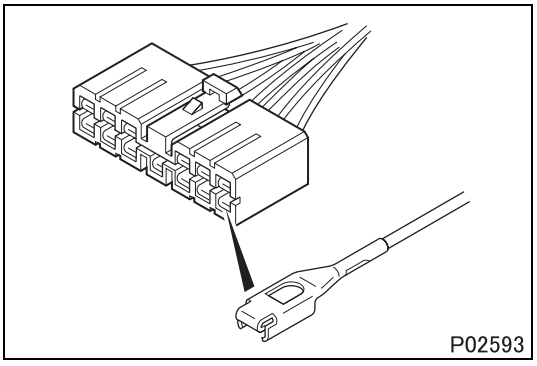
P02591

- Check that the connectors are fitted together securely.



P02592

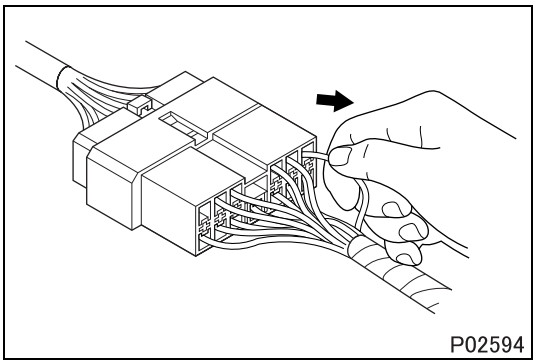
- Check whether wires have been separated from their terminals due to pulling of the harness.



P02593

- Check that male and female terminals fit together tightly.

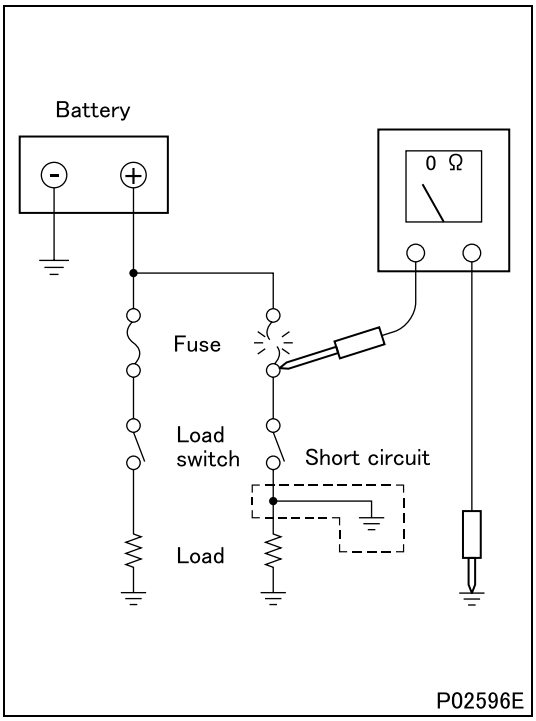
- Check for defective connections caused by loose terminals, by rust on terminals, or by contamination of terminals by foreign substances.



P02594

(2) Checking for loose terminals

- If connector terminal retainers become damaged, male and female terminals may not mate with each other when the connector bodies are fitted together. To check for such terminals, gently pull each wire and see whether any terminals slip out of their connector housings.

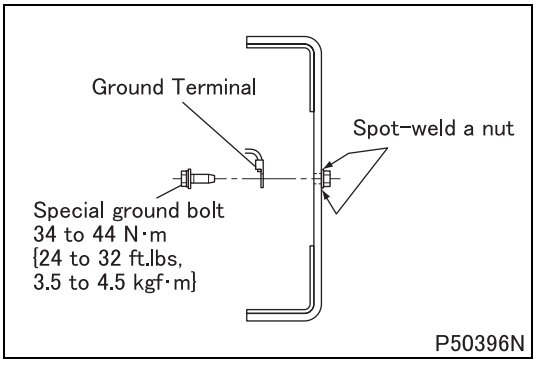


P02596E

1.3 Inspections when a fuse blows

- Remove the fuse, then measure the resistance between ground and the fuse's load side.
  Next, close the switch of each circuit connected to the fuse. If the resistance measurement between any switch and ground is zero, there is a short circuit between the switch and the load. If the resistance measurement is not zero, the circuit is not currently short-circuited; the fuse probably blew due to a momentary short circuit.

- The main causes of short circuits are as follows:
  - Harnesses trapped between chassis parts
  - Harness insulation damage due to friction or heat
  - Moisture in connectors or circuitry
  - Human error (accidental short-circuiting of components)

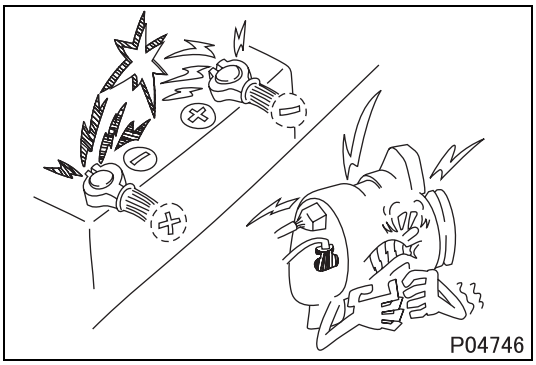


P50396N

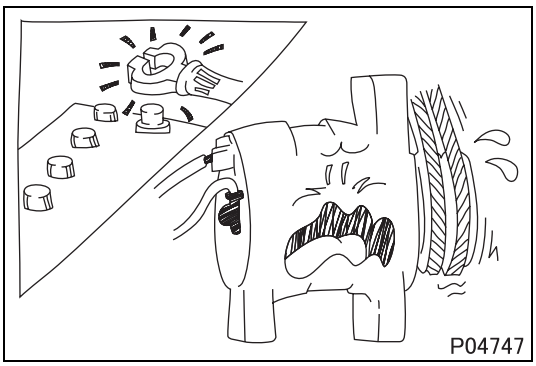
1.4 Inspection of chassis ground

- A special ground bolt is used to tighten a ground terminal. When servicing the ground point, be sure to follow the procedures described below:
  - When reinstalling the ground bolt
    Tighten the ground bolt to the specified torque.
  - When relocating the ground point
    A special ground bolt must be used. Spot-weld a nut to a frame and tighten the ground bolt to the specified torque. Be sure to apply touch-up paint to the welded point.

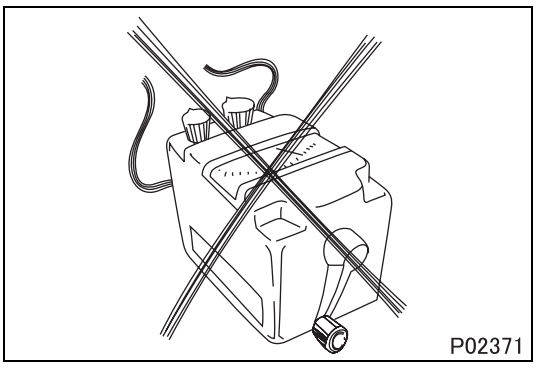
2. Service Precautions for Alternators



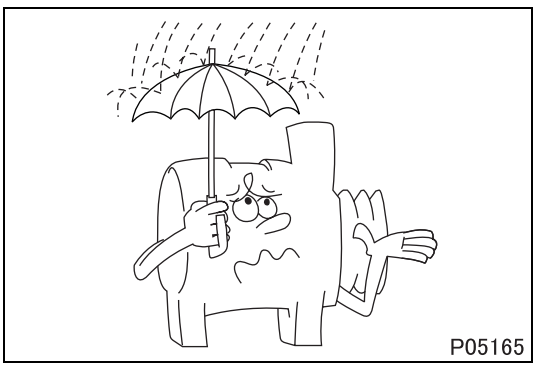
- When servicing alternators, observe the following precautions:
  - Never reverse the polarity of battery connections.
    If the polarity of the battery connections were to be reversed, a large current would flow from the battery to the alternator, damaging the diodes and regulator.



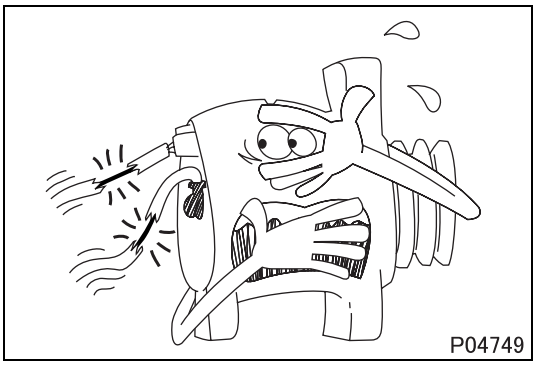
- Never disconnect the battery cables with the engine running.
  Disconnection of the battery cables during engine operation would cause a surge voltage, leading to deterioration of the diodes and regulator.



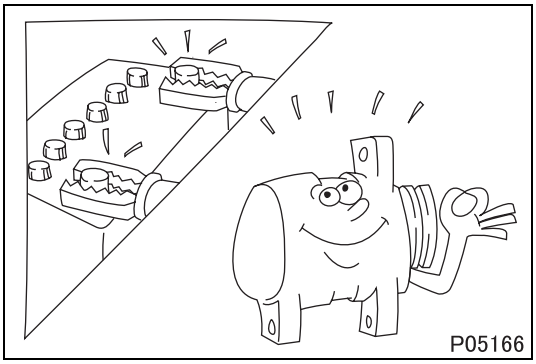
- Never perform inspections using a high-voltage multimeter.
  The use of a high-voltage multimeter could damage the diodes and regulator.



- Keep alternators dry.
  Water on alternators can cause internal short circuits and damage.

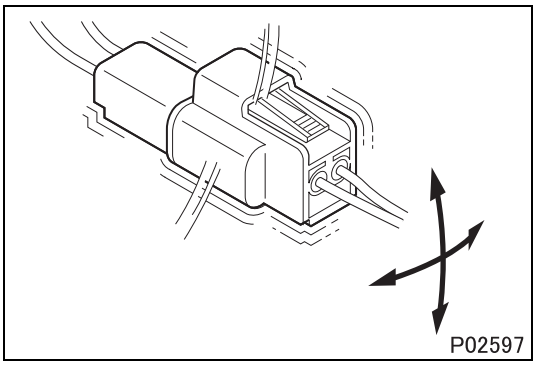


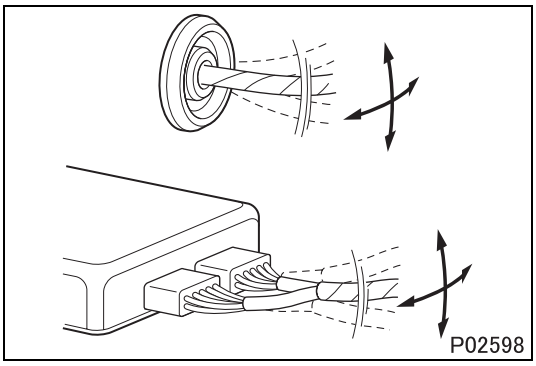
- Never operate an alternator with the B and L terminals short-circuited. Operation with the B and L terminals connected together would damage the diode trio.

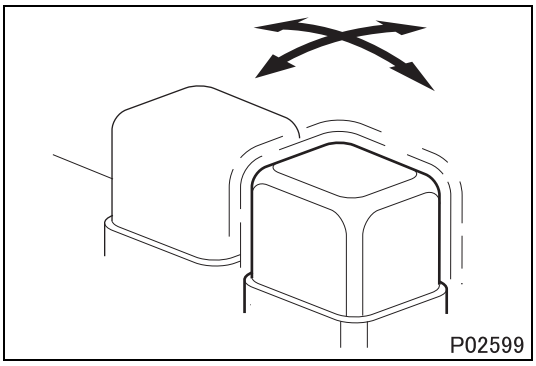


- Disconnect the battery cables (+) and (–) before quick-charging the battery with a quick charger.
  Unless the battery cables are disconnected, quick-charging can damage the diodes and regulator.

3. Intermittent Faults





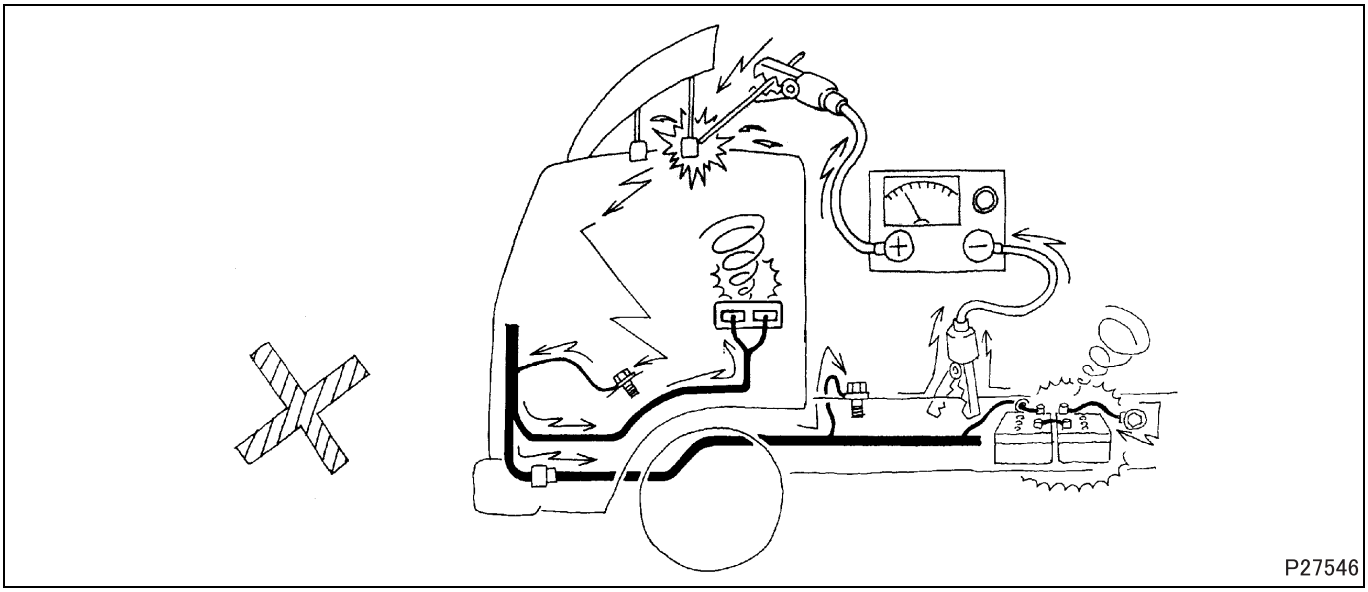


- An intermittent fault typically occurs only under certain operating conditions. Once these conditions have been identified, the cause of the intermittent fault can be ascertained easily. First, ask the customer about the vehicle operating conditions and weather conditions under which the fault occurs. Also ask about the frequency with which the fault occurs and about the fault symptoms. Then, reproduce the fault based on this information.
  In accordance with the conditions under which the fault occurs, determine whether the fault is caused by vibration, heat or other factors. If vibration is a possible factor, see if the fault can be reproduced by performing the following checks on individual connectors and other parts:
  - Gently move connectors up and down and to left and right.
  - Gently move wiring harnesses up and down and to left and right.
  - Gently wiggle sensors and other devices by hand.
  - Gently wiggle wiring harnesses on suspension systems and other moving parts.

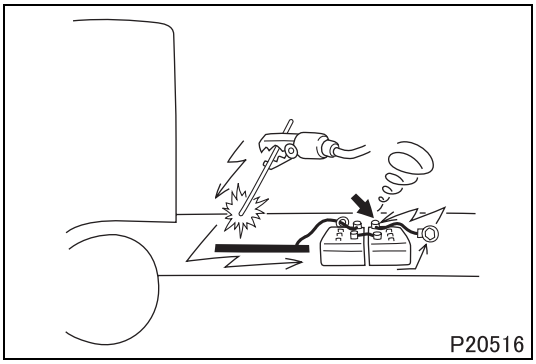
- Connectors and other parts to be checked are those included or given as likely fault locations in inspection procedures corresponding to diagnosis codes and/or fault symptoms.

4. Precautions for Arc Welding

- When arc welding is performed, current from the welder flows to ground via the vehicle's metal parts. Unless appropriate steps are taken, this current can damage control units, other electrical devices and wiring harnesses. And any electrical device near the point on the vehicle to which the (–) cable of the welder is connected, might be largely damaged.



- Current flows backward as shown below.



4.1 From battery (–) cable

To prevent damage to the battery and to electrical devices that are connected directly to the battery, it is essential to disconnect the battery's (–) cable.

4.2 Procedure

- Turn the starter switch to the LOCK position.
- Disconnect the battery's (–) cable.
- Cover all parts of the vehicle that may be damaged by welding sparks.
- Connect the welder's (–) cable to the vehicle as close as possible to the area being welded. Do not connect the welder's (–) cable to the cab if the frame is being welded, and vice versa.
- Set the welding current in accordance with the part being welded.

54-00B SPECIFICATIONS

SPECIFICATIONS

Battery

Item		Specifications
Model		115E41R
Voltage × quantity	V	12 × 2 (parallel connection)
Capacity (5-hour rating)	Ah	88

Alternator

Item		Specifications
Manufacturer		DENSO CORPORATION
Type		Alternator with built-in regulator
		Brushless type
		External fan
Model		101210-9550
Output	V-A	12–100

Engine starter, Glow

Item			Specifications
Starter	Manufacturer		MITSUBISHI ELECTRIC
	Reduction gear mechanism		Planetary gears
	Model		M009T50371
	Output	V-kW	12–5
	Magnetic switch operating voltage	V	8 or less
Starter relay	Model		U001X11972
	Excitation current	V-A	12–4
	Closing voltage	V	8 or less
	Opening voltage	V	3.5 or less
	Allowable cutoff current	A	200
Glow plug	Model		Seathed type
	Rated voltage current	V-A	11–3.8
Glow relay	Model		U001T11872
	Excitation current	V-A	12–4
	Closing voltage	V	8 or less
	Opening voltage	V	3.5 or less
	Allowable cutoff current	A	60
	Temperature fuse capacity	A	127

Lighting

Item			Specifications
Headlamp	Model		Rectangular, 2-lamp system, semi-sealed beam
	Type		Reflector type
	Upper beam (HIGH)	W	halogen 60
	Lower beam (LOW)	W	halogen 55
	Parking lamp	W	5
	Front turn	W	21
Front side turn signal lamp (serving also as hazard warning lamp)		W	10
Side turn signal lamp (serving also as hazard warning lamp)		W	10
Clearance and side marker lamp		W	7.5
Rear combination lamp	Stop/tail lamp	W	21/5
	Backup lamp	W	21
	Turn signal lamp (serving also as hazard warning lamp)	W	21
Personal lamp		W	10
Identification lamp		W	7.5
License plate lamp		W	7.5

All bulbs of the lamps shown above voltage rating of 12 V.

Meter

Item			Specifications
Meter cluster	Manufacturer		YAZAKI
	Voltage	V	12
	Speedometer indicating range	MPH {km/h}	0 to 90 ($^{+2.5}_{0}$ at 40) {0 to 140 ($^{+3.5}_{0}$ at 60)}
	Tachometer indicating range	rpm	0 to 3500 (± 75 at 3000)
	Water temperature gauge indicating range		 P104002N
	Meter warning buzzer — Rated current	mA	50 or less
	Meter warning buzzer — Sound pressure	dB	65 $^{+6}_{0}$ (at 1 m {3.3 ft.})

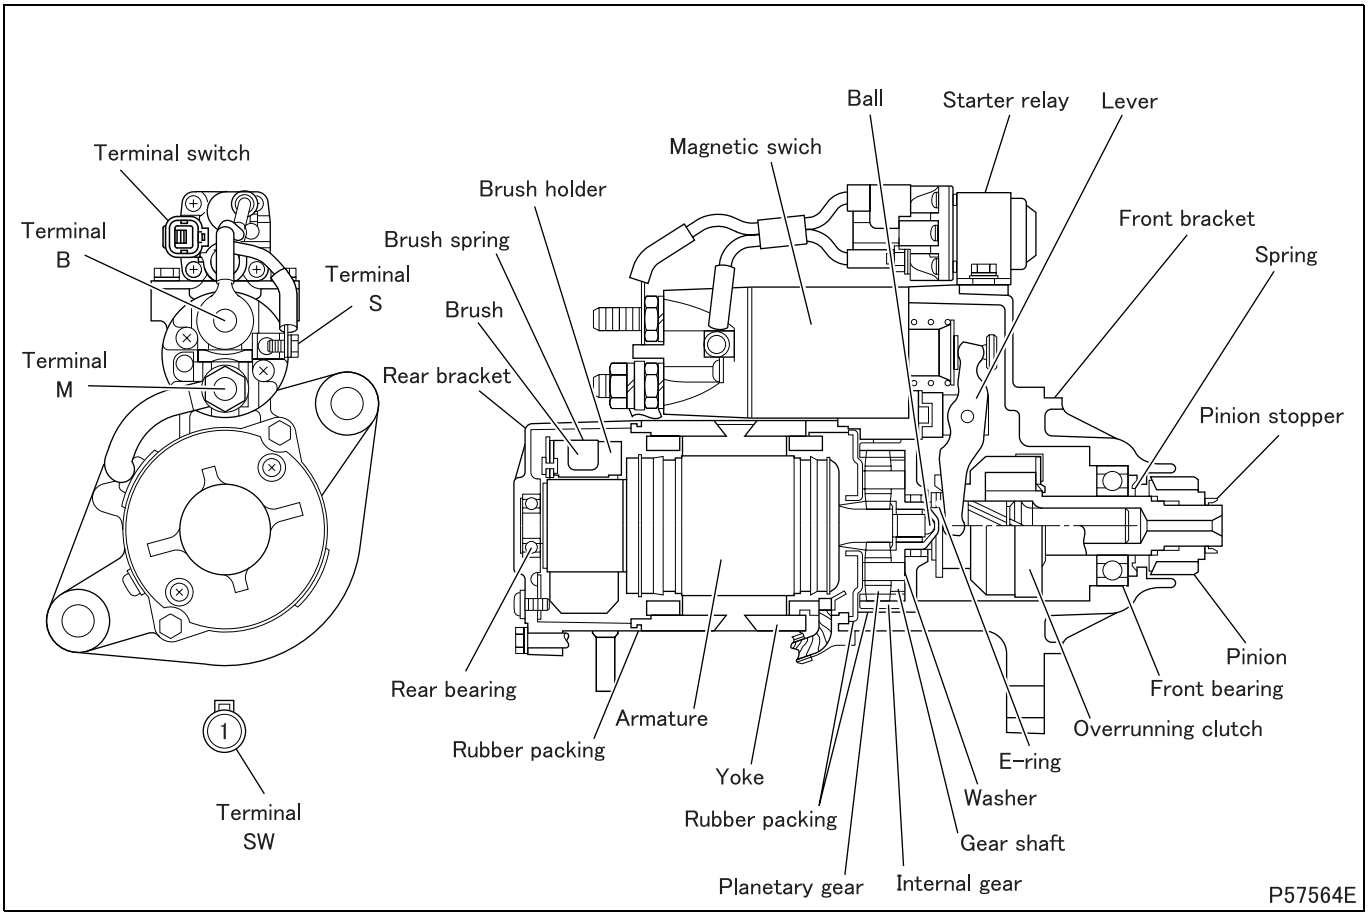
SPECIFICATIONS

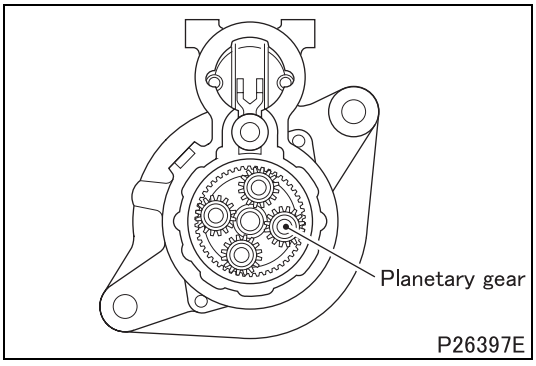
Relay, Motor, Horn, Buzzer

Item			Specifications
Relay	Rated voltage	V	12
	Minimum operating voltage	V	8 or less
Speaker	Rated input	W	15
	Maximum input	W	25
	Impedance	Ω	4 ± 0.6
Power window motor	Rated voltage	V	13.5
	Rated current	A	9 or less <Up>, 7 or less <Down>
Door lock actuator	Rated voltage	V	12
	Bound current	A	5 or less
Air horn	Rated voltage	V	12
	Current consumption	A	3.2 or less
	Sound pressure	dB	104 (at 2 m {6.6 ft.})
Wiper motor	Rated voltage	V	12
	Non-load current	A	6 or less
	Bound current	A	40 or less
Windshield washer motor	Rated voltage	V	12
	Rated current	A	3.8 or less
Back buzzer (outside)	Rated voltage	V	12
	Rated current	mA	50 or less
	Sound pressure	dB	85 ± 10 (at 1 m {3.3 ft.})
	Intermittent frequency frequency per minute		85 ± 15
Low air pressure buzzer	Rated voltage	V	12
	Rated current	mA	100 or less
	Sound pressure	dB	$75\ ^{+15}_{0}$ (at 1 m {3.3 ft.})

54-00C STRUCTURE AND OPERATION

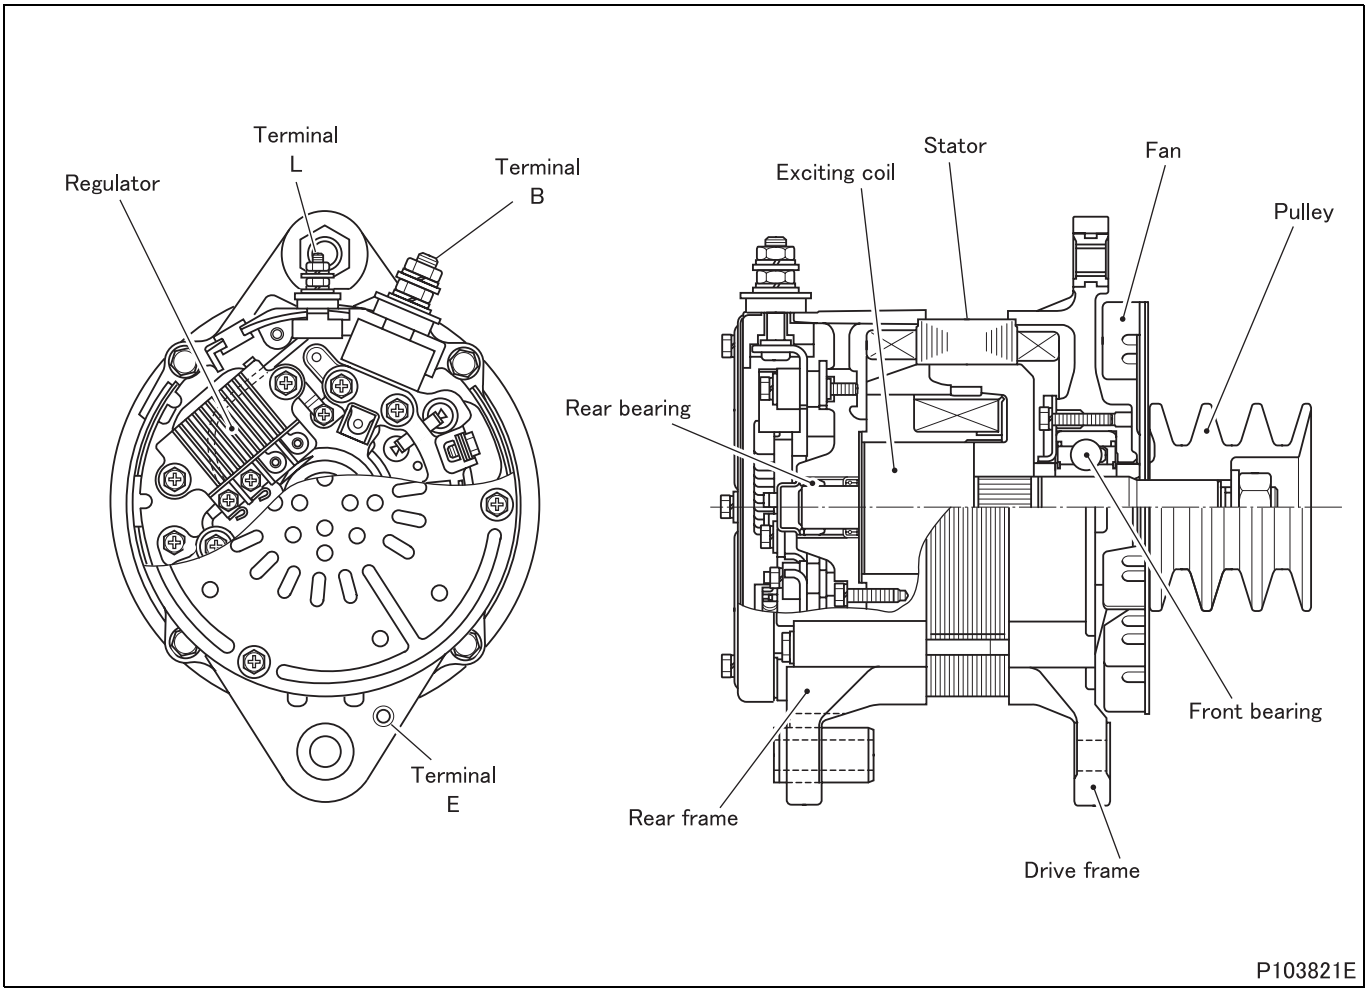
1. Starter



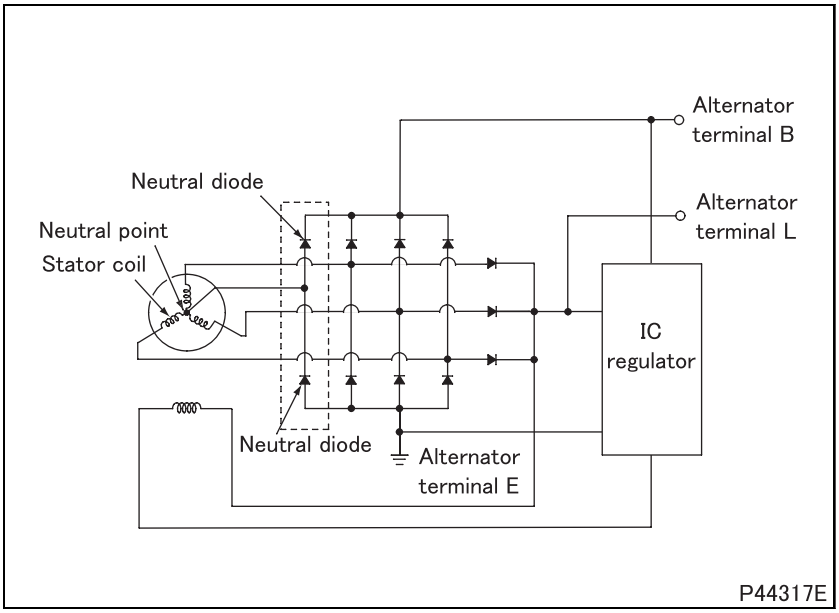


- This starter uses planetary gears as its reduction gearing mechanism.

2. Alternator

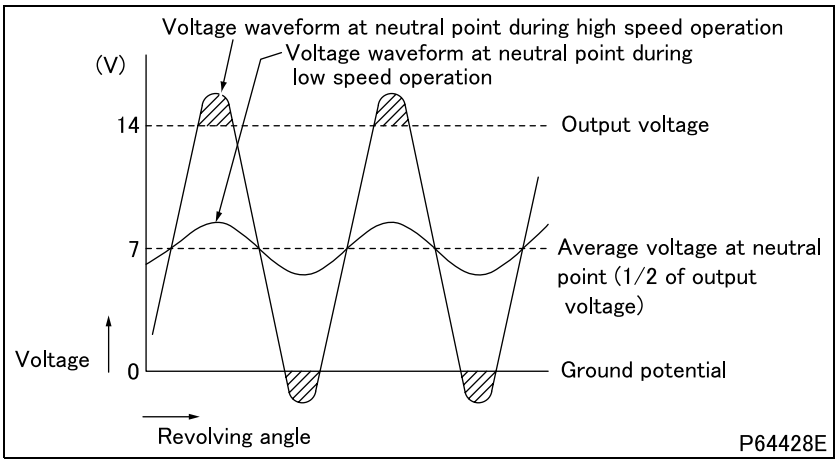


2.1 Alternator with neutral diodes



(1) Features

- The alternator is the same as the current alternator except that neutral diodes have been added.
- These neutral diodes enable this alternator to provide higher DC output during operation at high speeds than the alternator without neutral diodes.

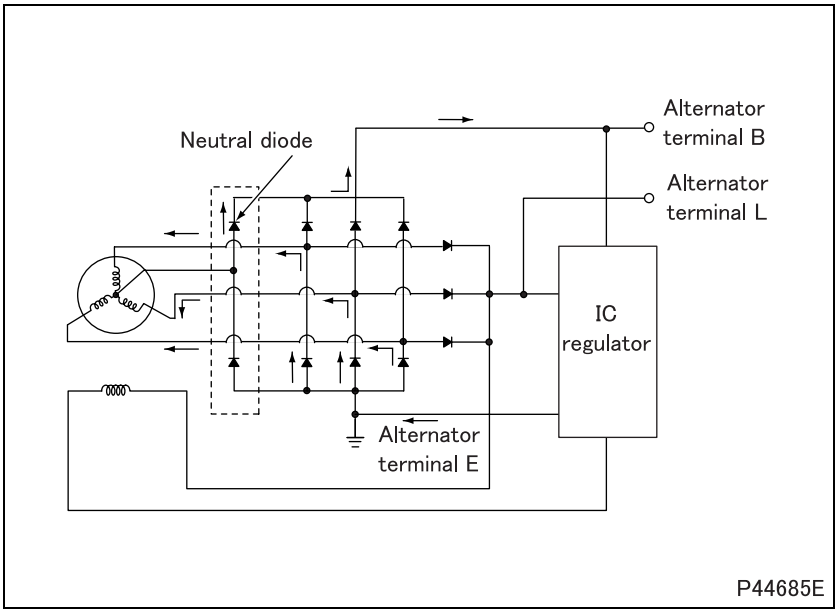


(2) Variations of voltage at neutral point and operation of neutral diodes

- The potential at the neutral point varies up and down with the neutral point DC voltage (1/2 of output voltage) as a center as shown.
- When the alternator is operated at high speeds, the voltage at the neutral point can increase to exceed the output voltage (14 V) and decrease to become lower than the ground voltage (0 V). To adjust these over-voltage and under-voltage (shaded portions of diagram) the current from the excess voltages is taken by neutral diodes and added to the DC output.

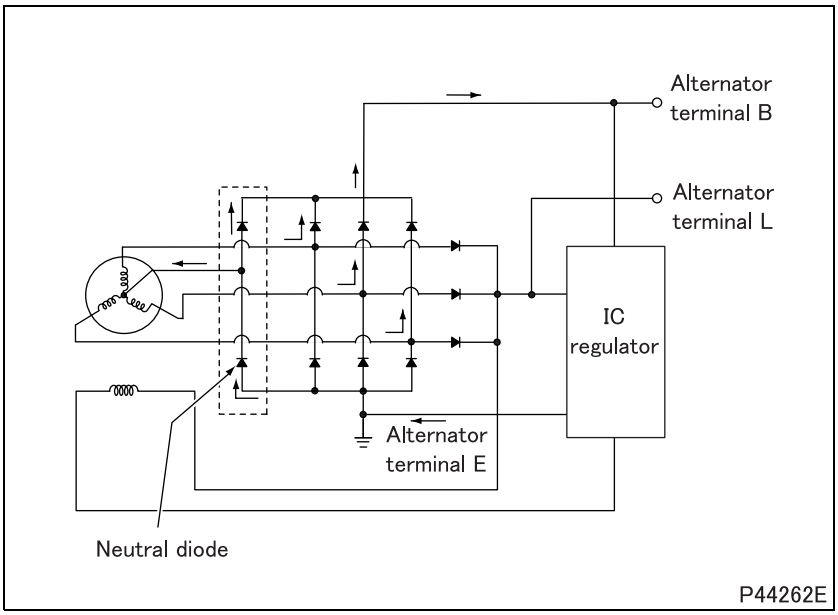
The operation of neutral diodes for each voltage and potential is as follows.

- When the voltage at neutral point is in the range from 0 to 14 V, the other six diodes are operated. Neutral diodes are not operated.



(3) When the voltage at neutral point exceeds 14 V

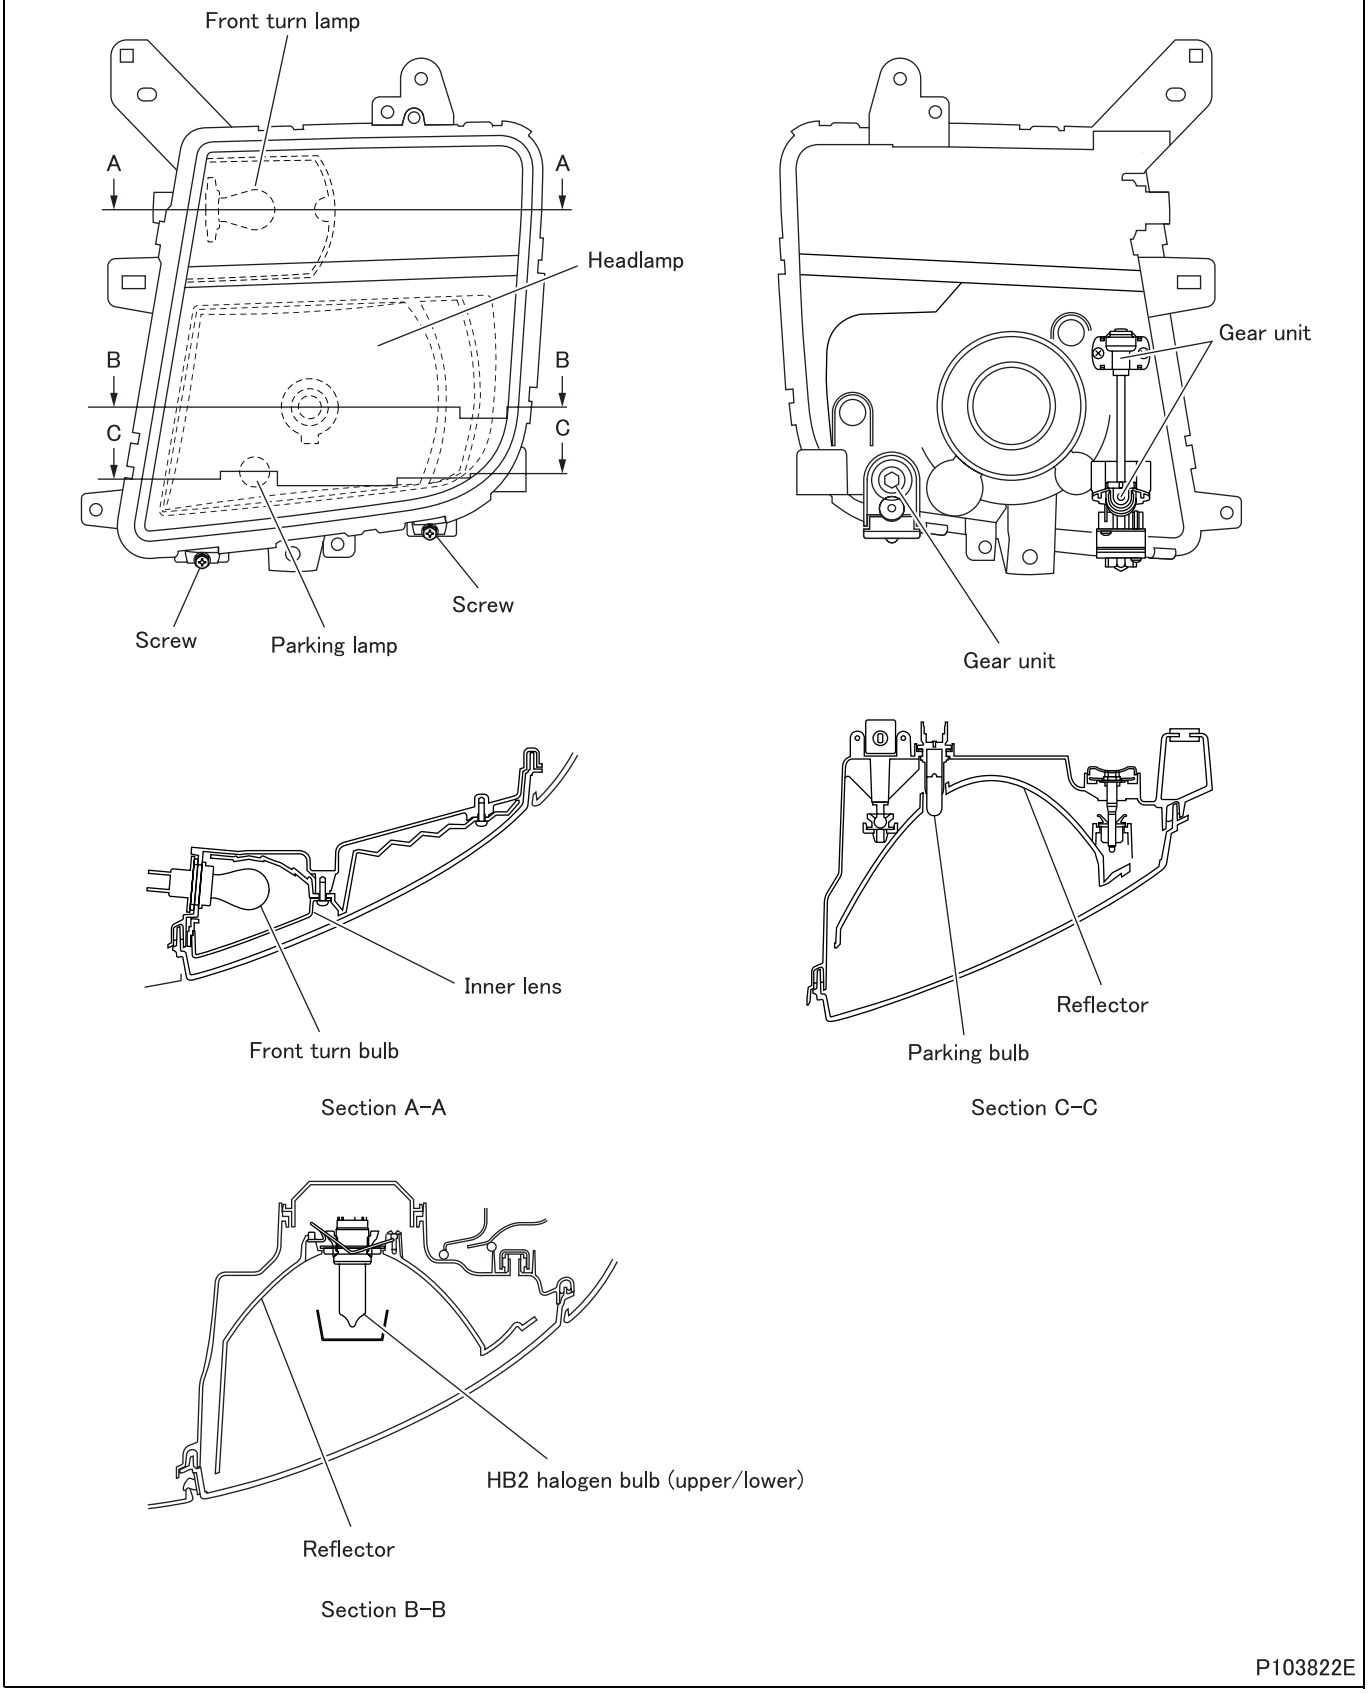
- The positive neutral diode adds extra output to the DC output for supply to each electric equipment.



(4) When the voltage at neutral point drops below 0 V

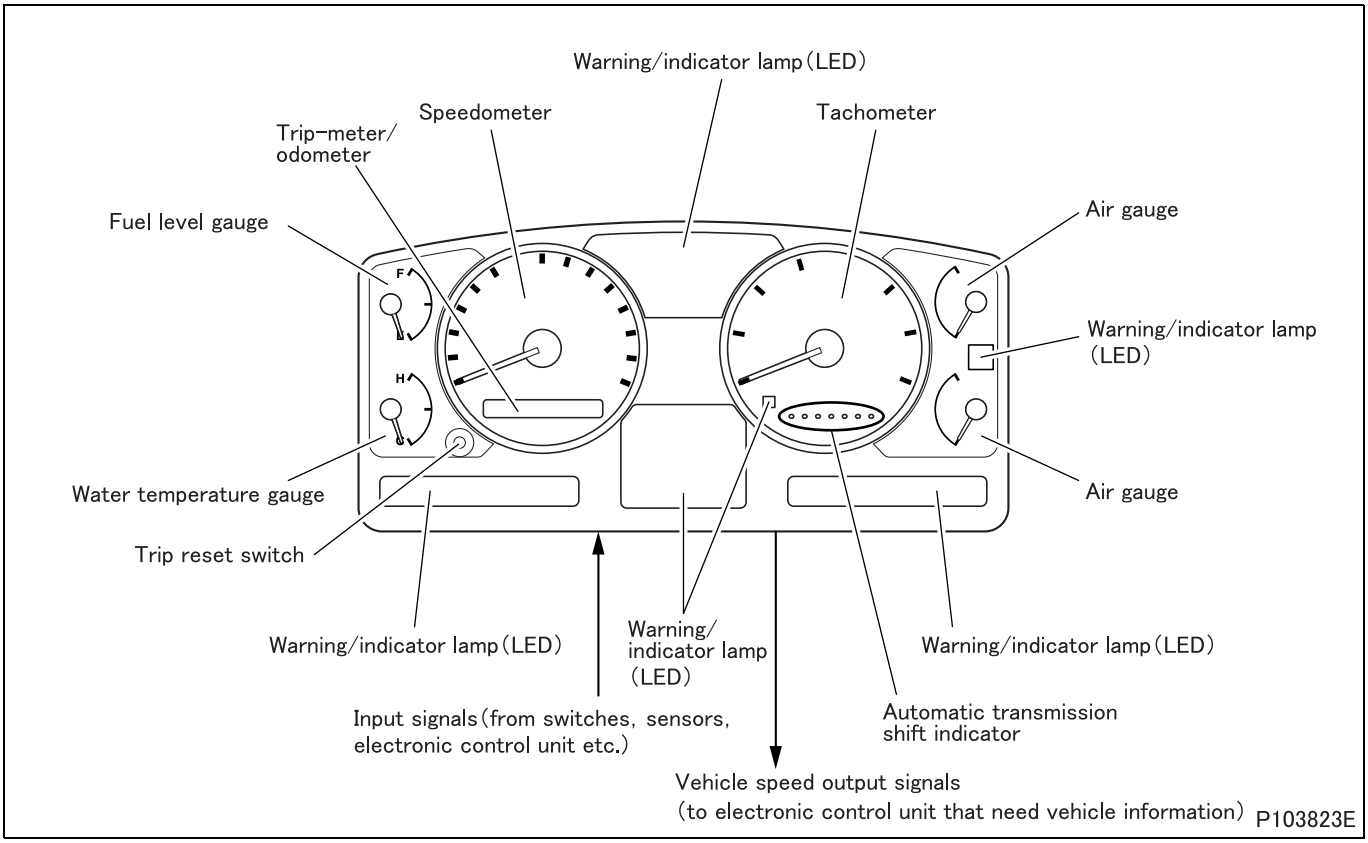
- The negative neutral diode supplies the output from neutral point through other three diodes.

3. Headlamp



(The drawings show the parts for the left-hand side headlamp.)

4. Meter Cluster



- The meter cluster incorporates a CPU, which contains the following functions.
  - The instrument drive function.
  - The lighting and alarm control (LAC) function.
  - The indicator and warning lamp indication warning function.
  - The buzzer sounding function.
- The meter cluster incorporates a pulse divider, which outputs signals from the speed sensor to each electronic control unit.

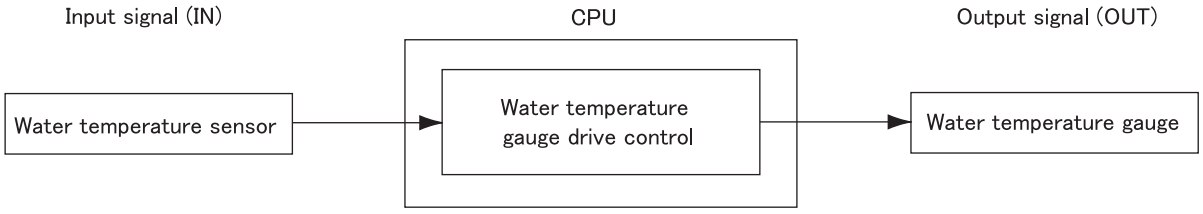
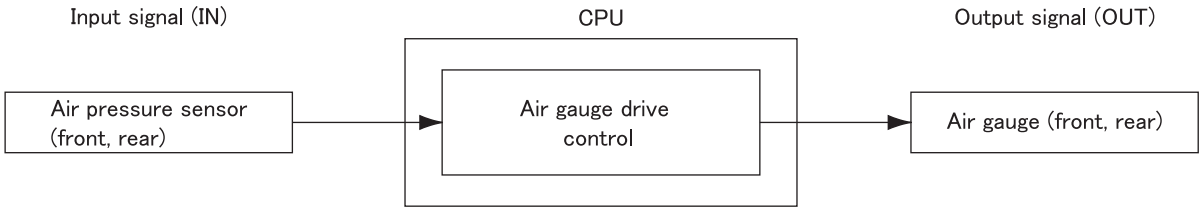
P57492E

(4) Water temperature gauge



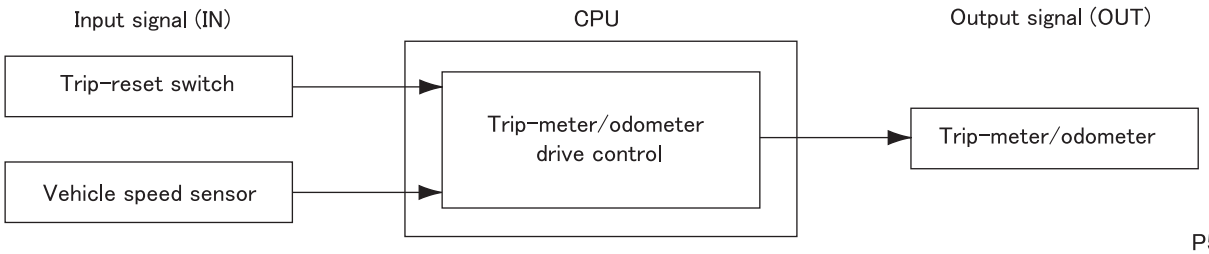
P57493E

(5) Air gauge



P105411E

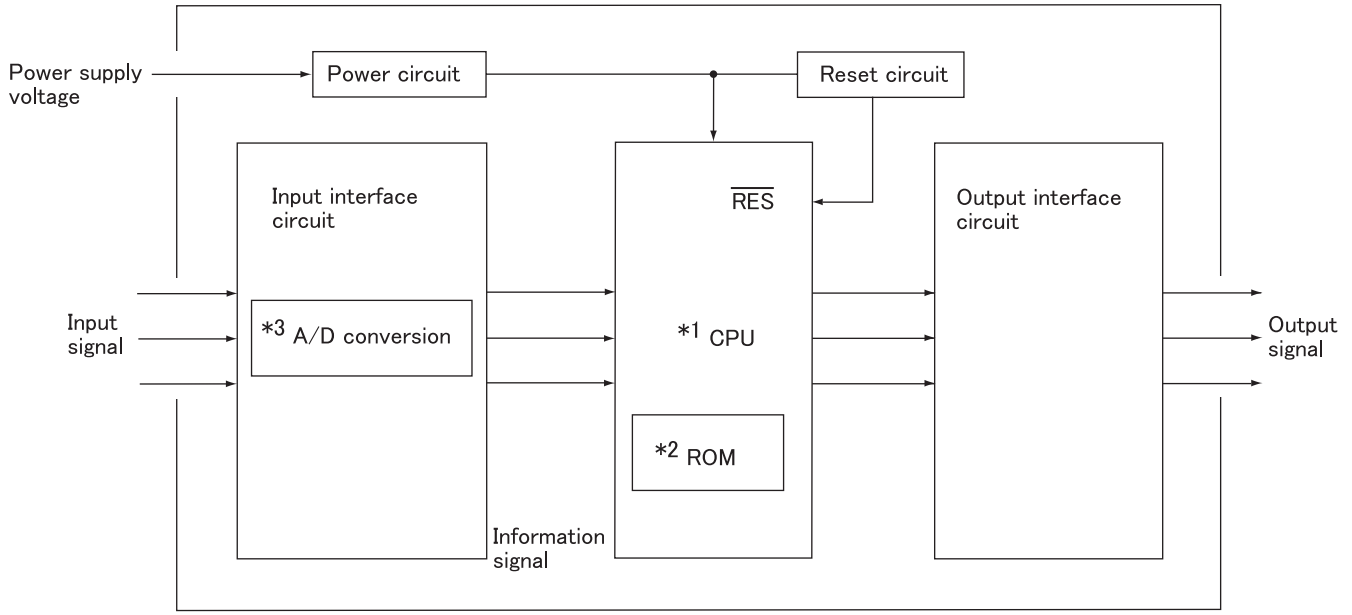
(6) Trip-meter/odometer



P57489E

4.3 Lighting and alarm control (LAC) function

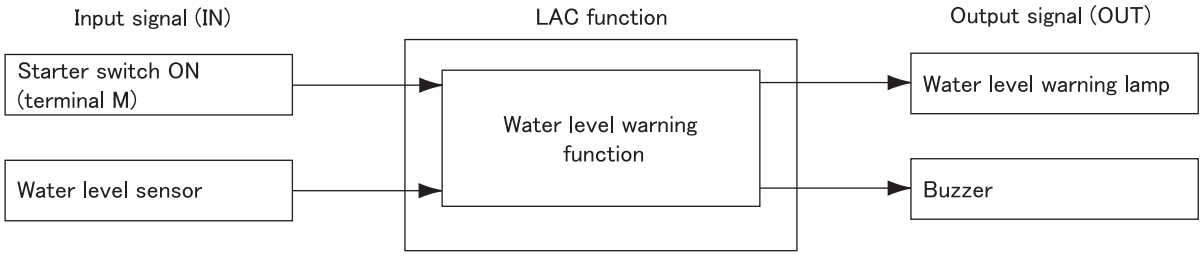
(1) Internal structure of LAC



P57494E

- Internally, the LAC is essentially made up of the input interface circuit, *1CPU, *2ROM, and output interface circuit.
  - *1CPU:
    An abbreviation for Central Processing Unit. It compares the input information and the information stored in the ROM, makes a decision and sends commands to the outputs.
  - *2ROM:
    An abbreviation for Read-Only Memory. Its contents are only for reading. It stores fixed data and programs, and such retained information is not deleted even after power is cut off.
- Information sources such as the sensor and switch send input signals to the input interface circuit.
- The input interface circuit performs *3A/D conversion of the input signals, and the converted signals are transmitted to the CPU as information signals.
  - *3A/D conversion:
    An abbreviation for Analog/Digital conversion. It converts analog signals to digital signals. This conversion enables calculation to be made in the CPU.
- The CPU compares the received signals with the data in the ROM, makes a decision, and sends the results to the output interface circuit.
- The output interface circuit transmits these results to each system as output signals to instruct operations.
- Performing these series of operations continuously enables optimum control of each function.

(2) LAC function system block diagram

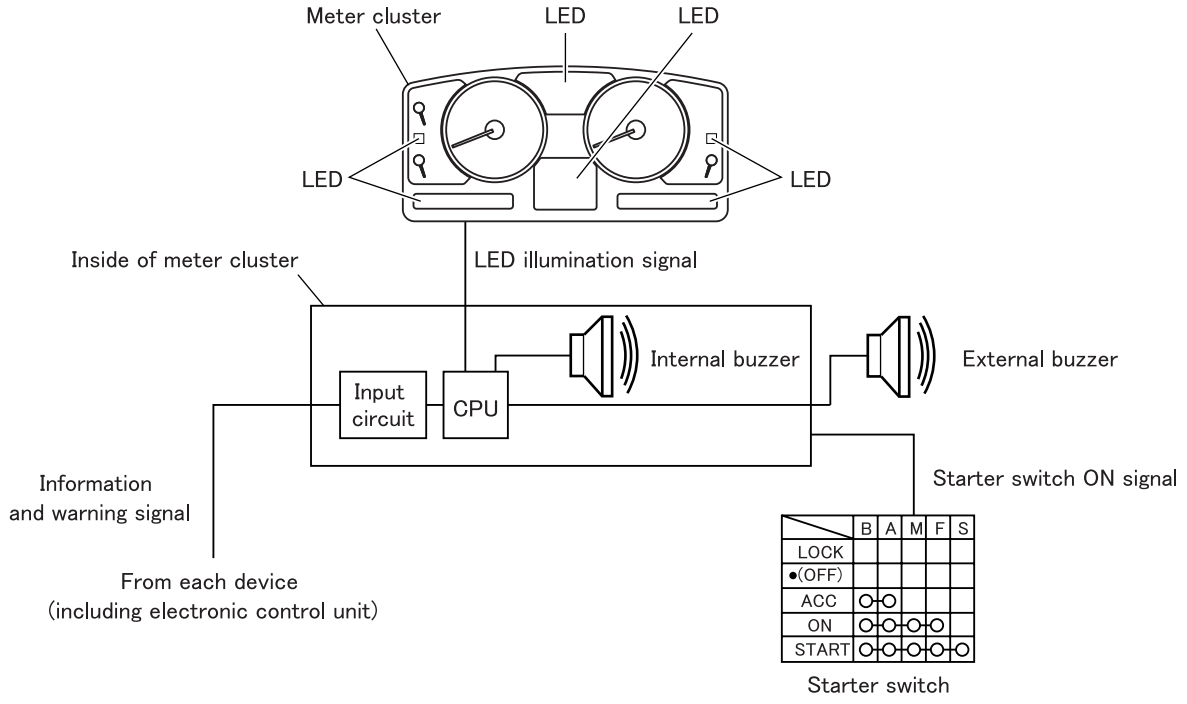


P104464E

(3) Water level warning function

- The LAC function determines ON or OFF state of the water level sensor and causes the water level warning lamp to turn on if necessary.

4.4 Indicator and warning lamp indication warning function



- The indicator and warning lamp indication warning function is intended to advise the driver of necessary vehicle information adequately through symbols and buzzers.
- Information signals from various systems are sent to the central processing unit (CPU) in the meter cluster. The some signals are sent from CPU to appropriate LEDs in the meter cluster for character display and other signals are provided for the internal buzzer in the meter cluster or external buzzer for aural warning.

(2) When LED turns ON

LED display	Warning buzzer location		Denotation of display and condition for indication	Remarks
	Inside meter cluster	External		
CHECK ENGINE (Red)	–	–	Electronically controlled fuel system faulty (impossible to drive)	See Gr13EA.
CHECK ENGINE (Orange)	–	–	Electronically controlled fuel system faulty (functionality reduced) (possible to drive)	See Gr13EA.
AUTO	–	–	Vehicle driving with the cruise control engaged	See Gr13EB.
MVCU	–	–	MVCU (multifunction vehicle control unit) faulty	See Gr13EB.
	–	–	DPF (diesel particulate filter) cleaning being requested	See Gr13EA.
	–	–	Automatic transmission system faulty	See Gr23A, B.
T/MOIL TEMP	–	–	Extreme high ATF (automatic transmission fluid) temperature	See Gr23A, B.
OD OFF	–	–	Overdrive OFF	See Gr23A, B.
ABS	–	–	Anti-lock brake system electric system faulty	See Gr35E.
	–	–	Charging system faulty	See (125).
	–	–	Engine preheating system in operation	See (220).
	–	–	Headlamp high beam ON	See (310).
	–	–	Daytime running light being lit	See (313).

LED display	Warning buzzer location		Denotation of display and condition for indication	Remarks
	Inside meter cluster	External		
	–	–	Turn signal lamp/hazard warning lamp ON	See (330).
	–	–	Door not completely closed	See (345).
OVER RUN	O	–	Engine speed exceeding 3400 ± 100 rpm	See (410).
PARK BRAKE	–	–	Parking brake engaged	See (510).
BRAKE FLUID	–	O	Low brake fluid • When brake fluid level switch is turned on. (buzzer sounds continuously)	See (515).
BRAKE AIR	–	O	Low air system pressure • When air pressure drops below 500 ± 30 kPa {73 ± 4.4 psi, 5.1 ± 0.3 kgf/cm^2} (buzzer sounds continuously)	See (515).
	–	O	Overheated (even when engine coolant level is normal) Low engine coolant level	See (530).
	–	–	Low engine oil level	See (535).
(Red)	–	O	Low engine oil pressure	See (536).
(Orange)	–	–	Engine oil filter clogged	See (538).
	–	–	• Cab tilt in progress • Cab tilt locked incompletely	See (550).
	–	–	Water level in the fuel filter rises above the specified limit	See (566).
	–	–	Exhaust brake working	See (710).
	–	–	Transmission power take-off working	See (850).

(3) When buzzer only sounds

- These are an internal buzzer in the meter cluster and an external buzzer, either of which is sounded or both, depending on the type of warning.

Buzzer name	Buzzer location		Condition for sounding	Remarks
	Inside meter cluster	External		
Back buzzer	O <Only automatic transmission>	O	When all conditions shown below are met: • Starter switch ON • Shift lever in “R” position	Sounded intermittently 85 ± 25 times a minute.
Inhibitor warning buzzer <Automatic transmission>	O	–	When all conditions shown below are met: • Starter switch ON • Inhibitor indicator activated	Remains continuously sounding.

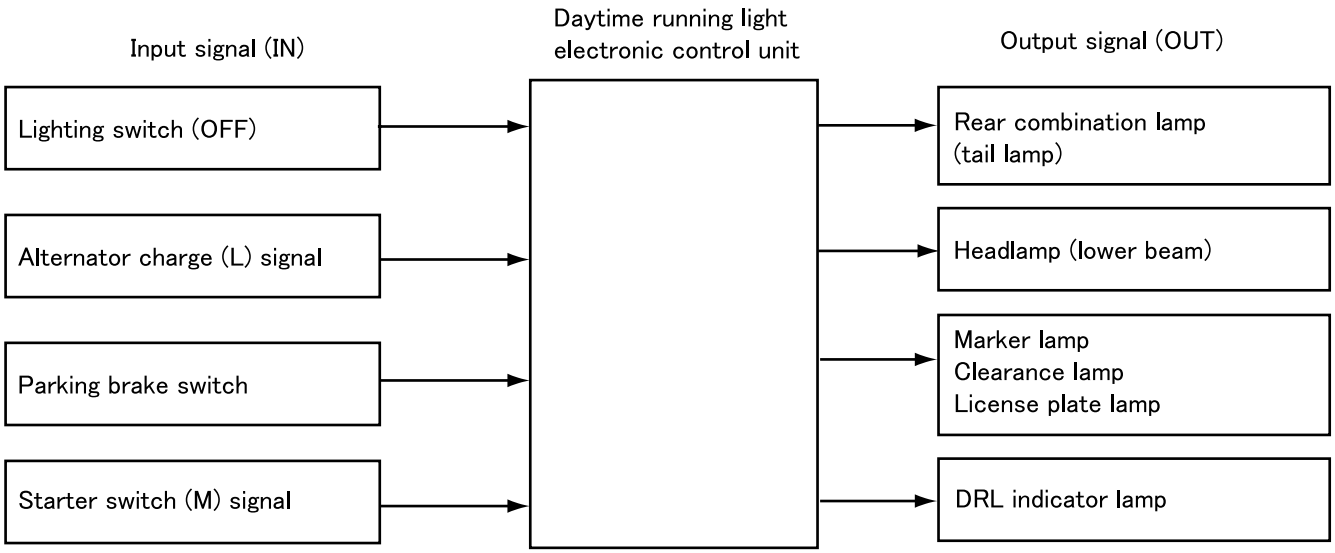
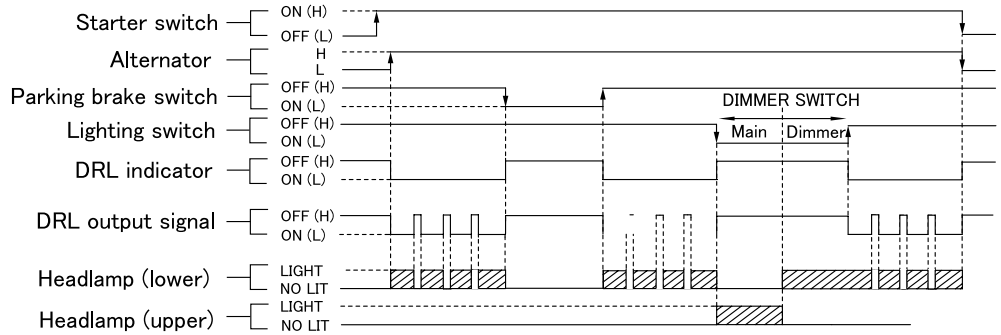
5. Daytime Running Light (DRL) System



- In a daytime running light (DRL) system, regardless the position of lighting switch while engine is running, the dipped beam of the headlamp and the tail lamp of the rear combinations, position lamp, license plate lamp will light on.
- Except for that the lighting switch is OFF or when the passing switch is ON, the same lamps as usual switch operation will light.

5.1 Timing chart

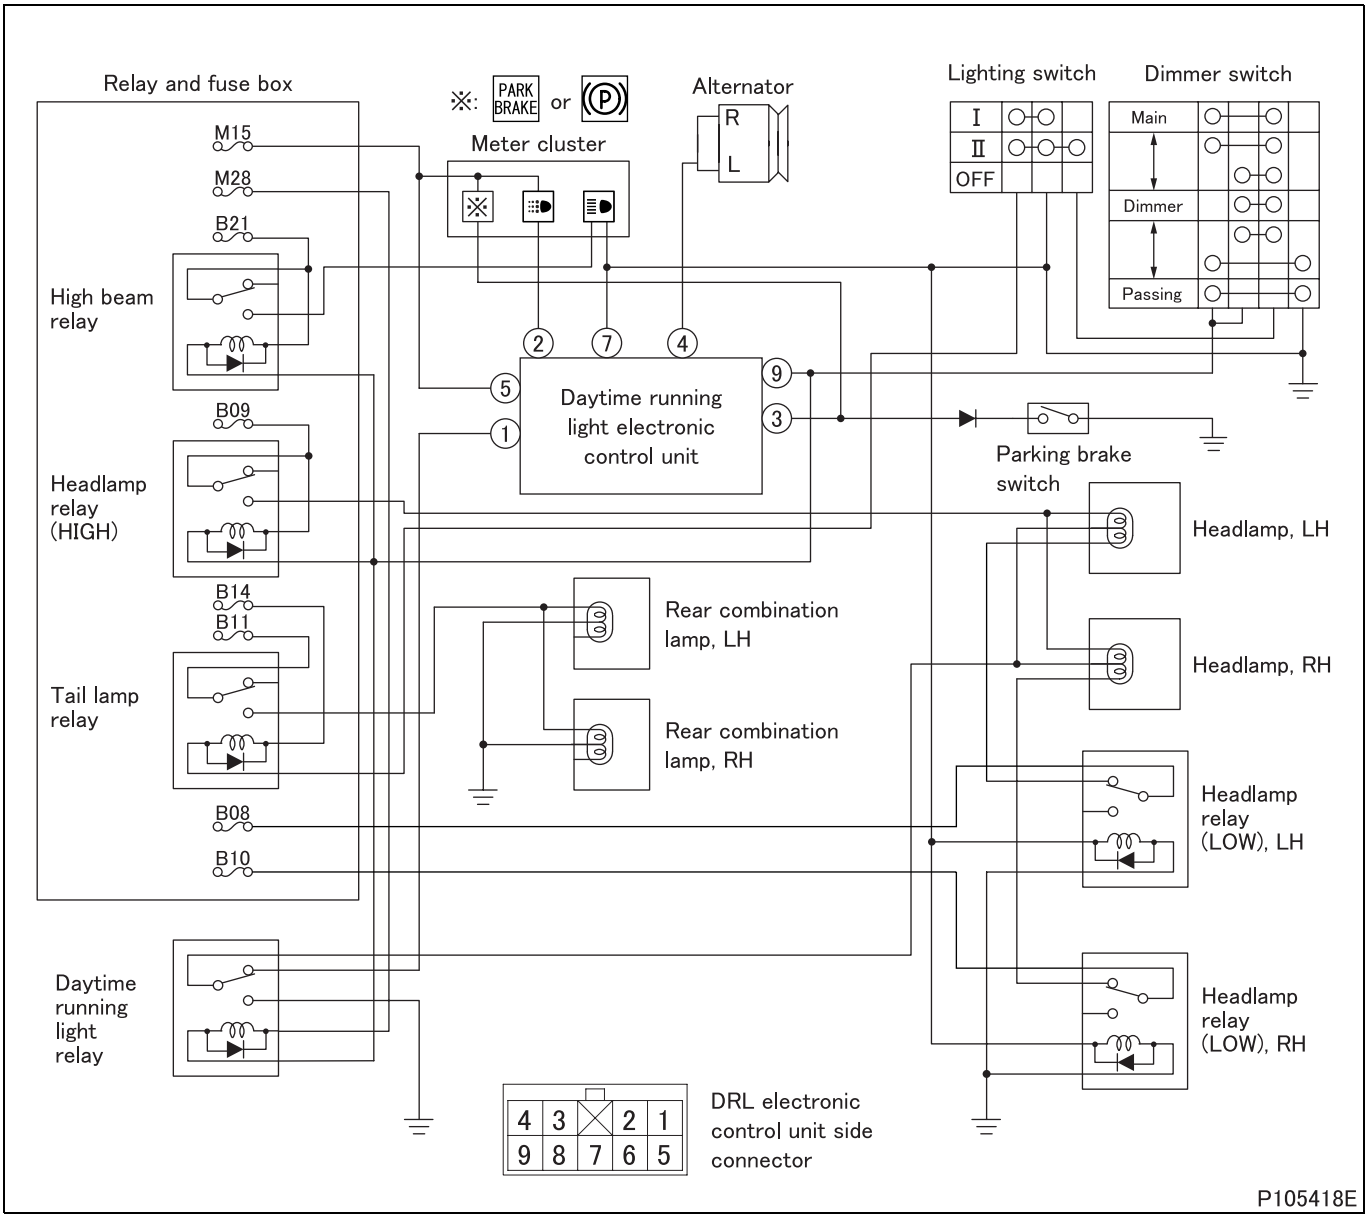


Headlamps repeat ON/OFF operations at 120 Hz according to the above timing chart. Because of the cyclic ON/OFF operations, the headlamps are dimmer than when the headlamp switch is ON.

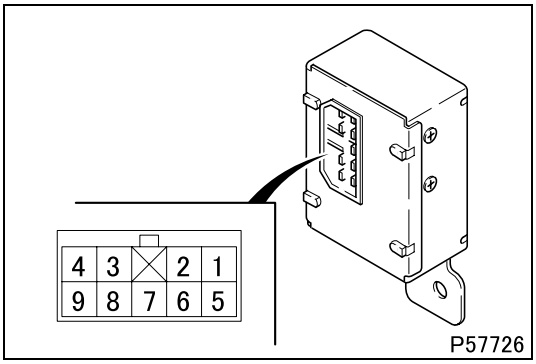
Explanation of timing chart

- After the engine starts, when alternator begins generating electricity with starter switch in the ON position, headlamps light.
- When parking brake switch is ON, the DRL turns off to switch off the headlamps.

5.2 Daytime running light electronic control unit circuit diagram



5.3 Daytime running light electronic control unit



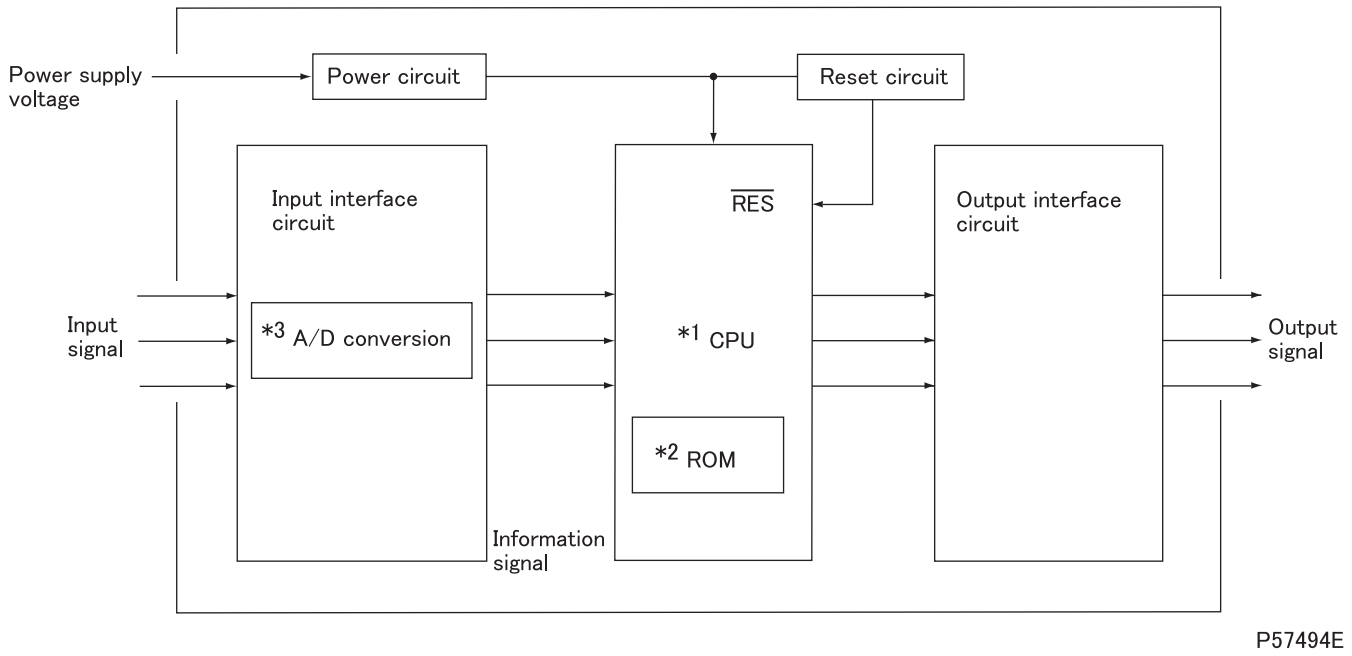
Terminal No.	Connecting destinations	Terminal No.	Connecting destinations
1	DRL relay	6	–
2	DRL indicator lamp	7	Ground
3	Parking brake switch	8	–
4	Alternator L terminal	9	Lighting switch
5	Starter switch M terminal	–	–

6. MUTIC (Multipurpose Timing Control Unit)

6.1 Outline

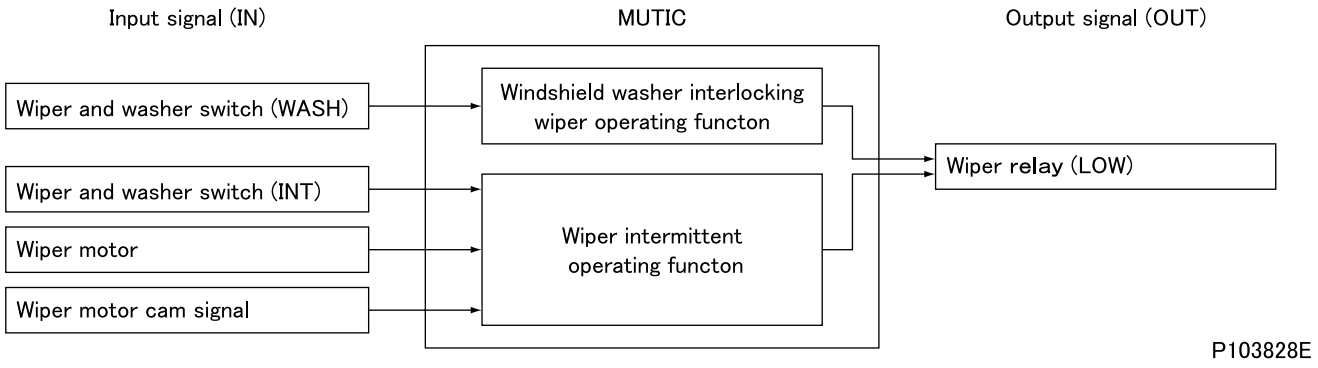
- This control unit is an integrated control unit for controlling the following functions.
- Windshield washer interlocking wiper-operating function
- Wiper intermitted operation function
- For controlling each function, sensors and switches are needed as sources of information, and they are provided for respective systems.
- Based on the information provided by the sensors and switches, the MUTIC controls above functions by means of the circuits inside itself.

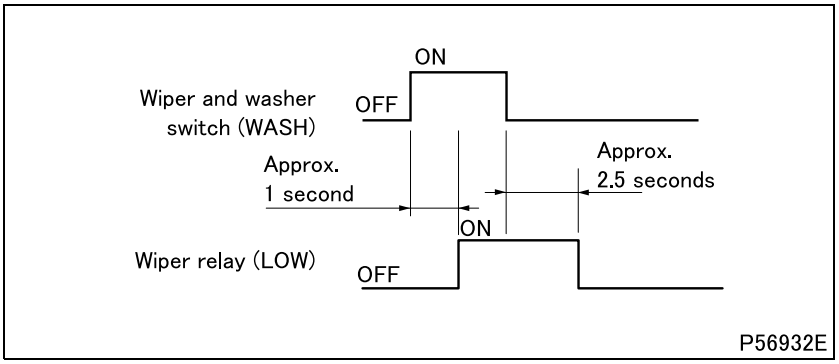
(1) Internal structure of MUTIC

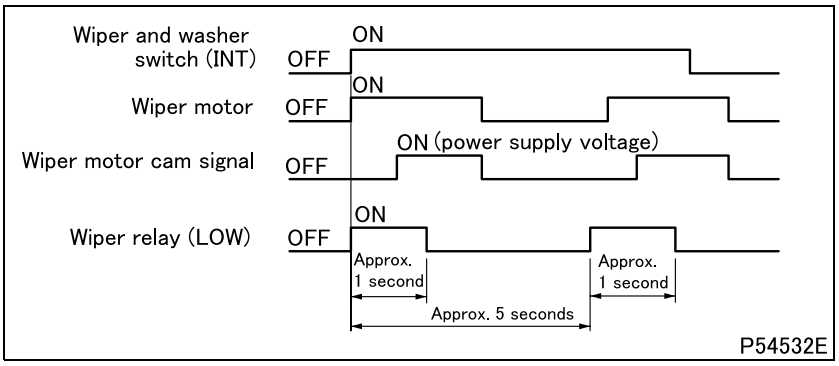


- Internally, the MUTIC is essentially made up of the input interface circuit, *1CPU, *2ROM, and output interface circuit.
  - *1CPU:
    An abbreviation for Central Processing Unit. It compares the input information and the information stored in the ROM, makes a decision and sends commands to the outputs.
  - *2ROM:
    An abbreviation for Read-Only Memory. Its contents are only for reading. It stores fixed data and programs, and such retained information is not deleted even after power is cut off.
- Information sources such as the sensor and switch send input signals to the input interface circuit.
- The input interface circuit performs *3A/D conversion of the input signals, and the converted signals are transmitted to the CPU as information signals.
  - *3A/D conversion:
    An abbreviation for Analog/Digital conversion. It converts analog signals to digital signals. This conversion enables calculation to be made in the CPU.
- The CPU compares the received signals with the data in the ROM, makes a decision, and sends the results to the output interface circuit.
- The output interface circuit transmits these results to each system as output signals to instruct operations.
- Performing these series of operations continuously enables optimum control of each function.

(2) System function schematic







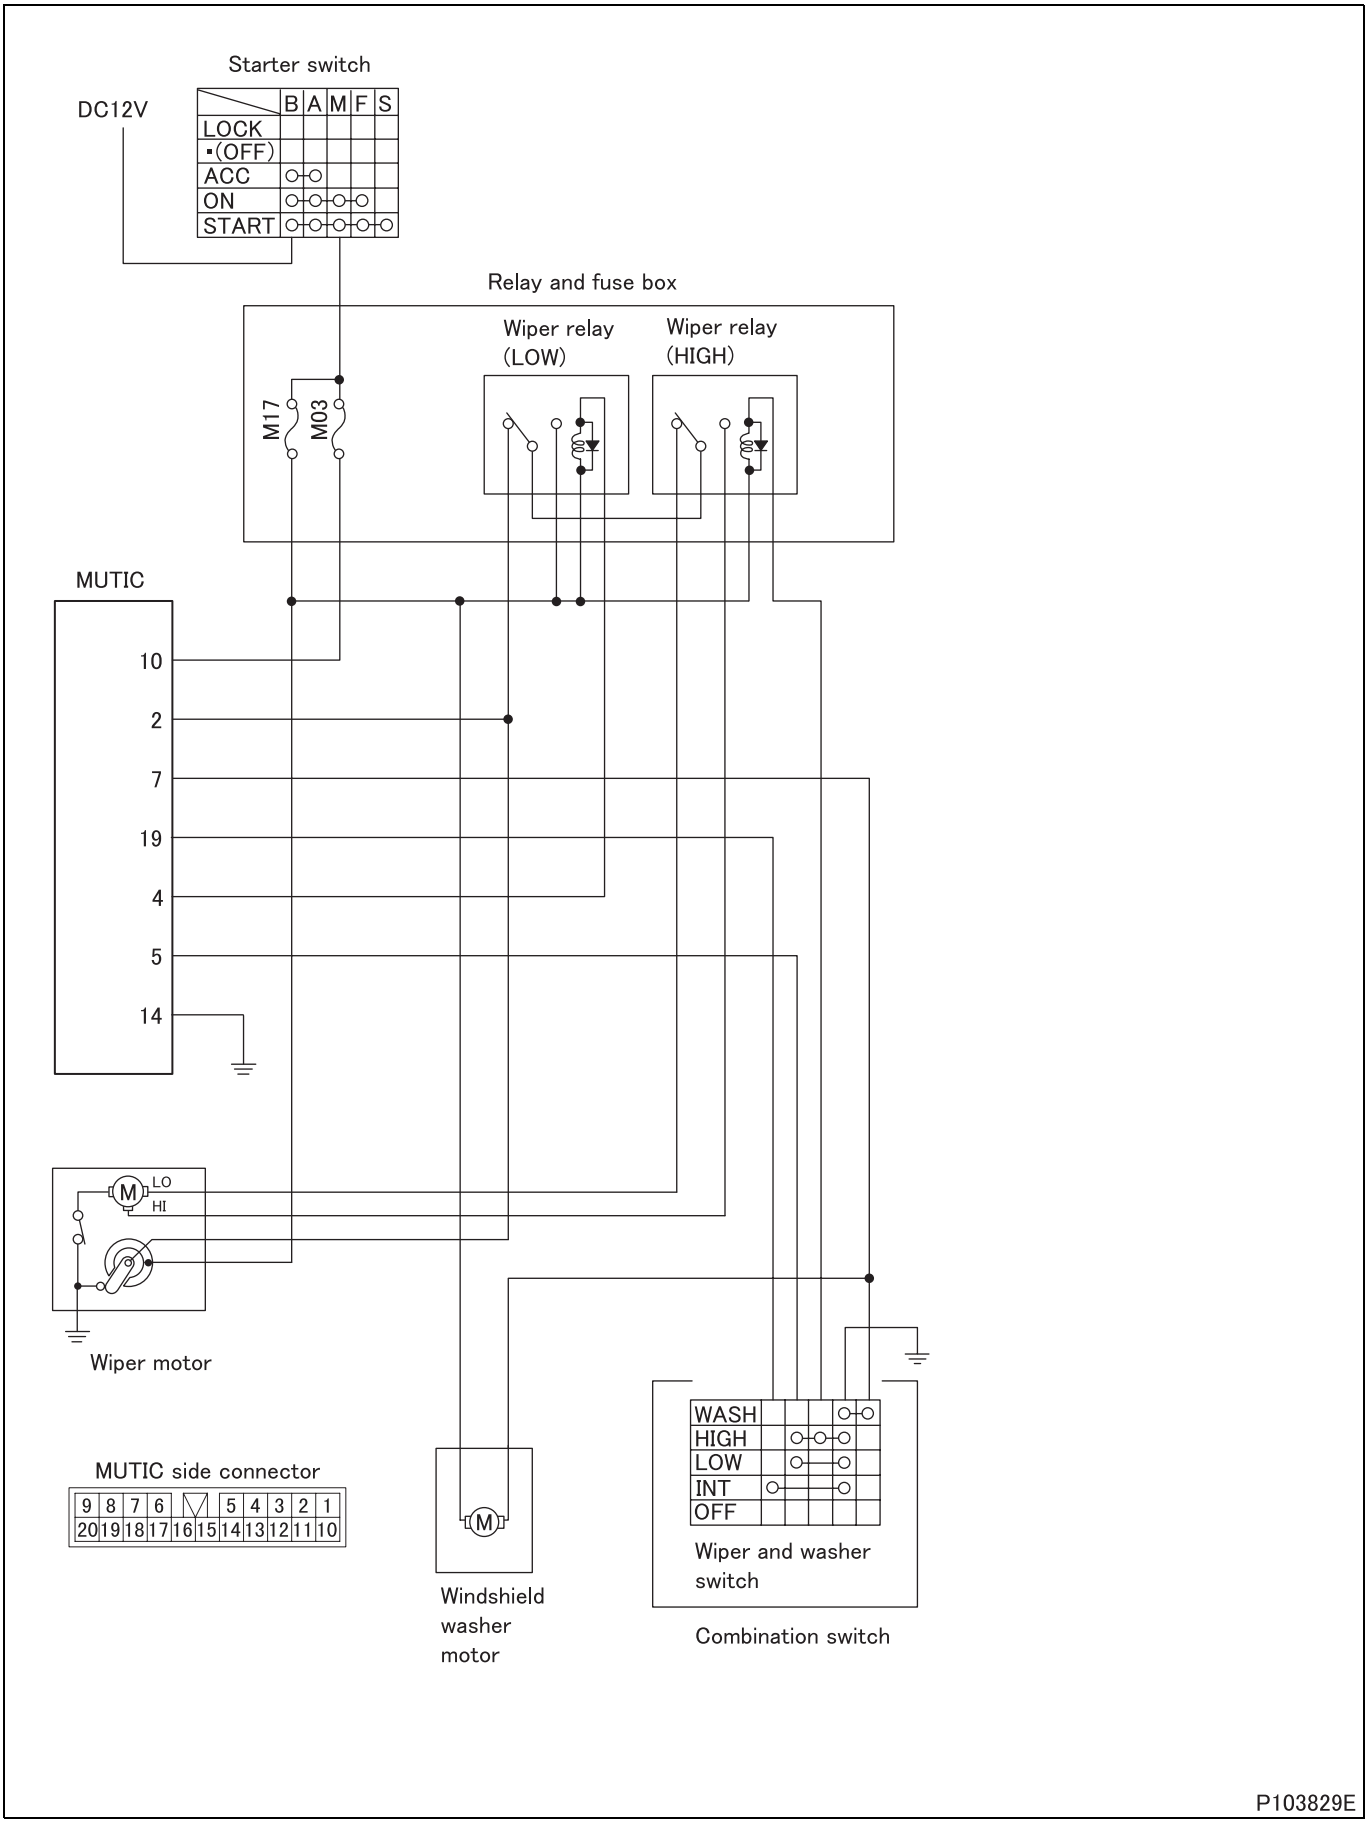
6.2 Windshield washer interlocking wiper operating function

- This function causes the windshield wipers to operate a few times at low speed when the windshield washer switch is turned ON.
- As shown in the drawing, the MUTIC introduces a short delay between detecting the ON condition of the wiper and washer switch (washer switch) and activating the wiper relay.

6.3 Wiper intermittent operating function

- MUTIC control causes intermittent wiper operation to take place as shown in the drawing.

6.4 MUTIC connection diagram

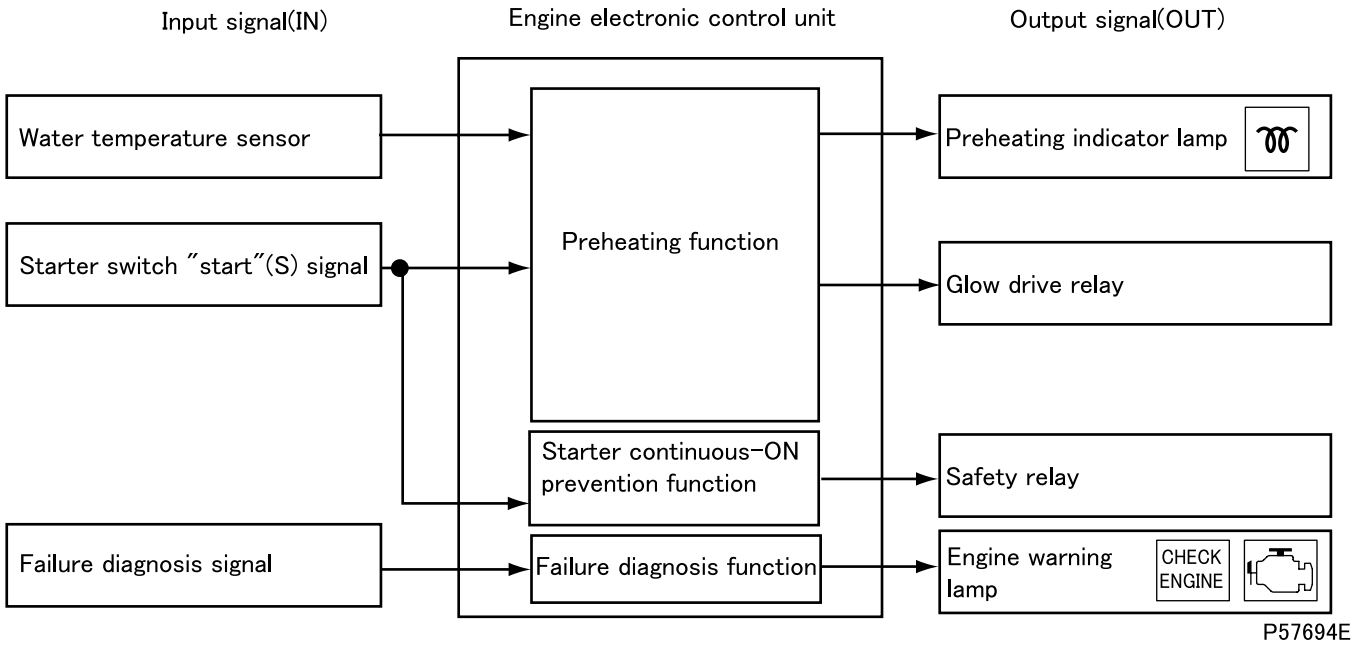


7. Starter Continuous Energizing Preventing Function and Preheating Function

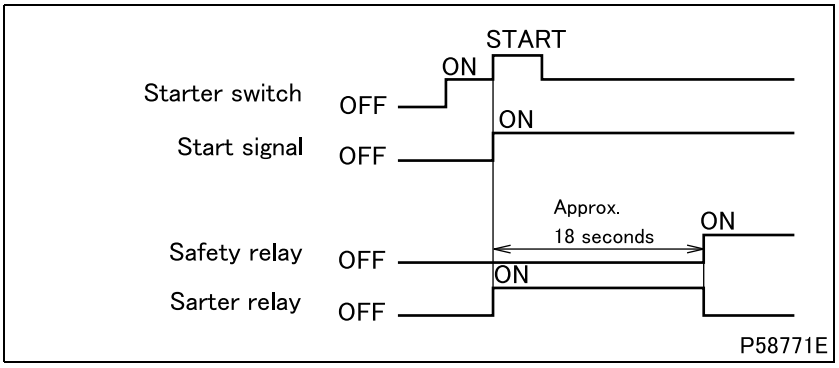
7.1 Outline

- These functions are controlled by the engine electronic control unit.

(1) System function schematic



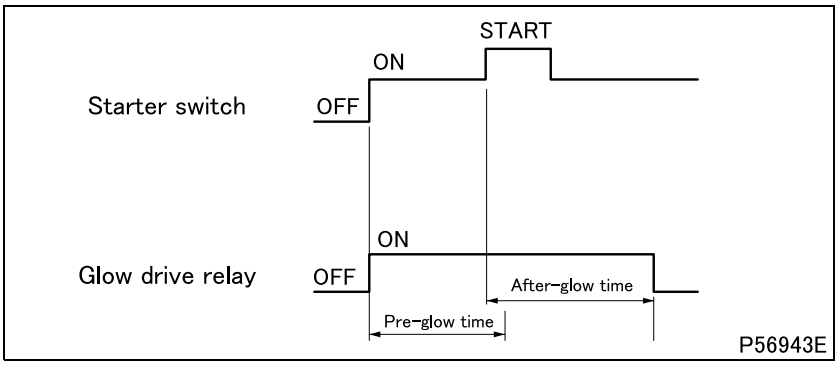
7.2 Starter continuous energizing preventing function



- This function is provided to prevent starter over-run.
- If the starter operates for longer than a predetermined period following engine startup, the engine electronic control unit deems that it has been energized continuously for too long. The engine electronic control unit then stops the flow of current to the starter and starter relay, thereby preventing the starter from seizing.
- If the engine electronic control unit determines, based on the engine speed signal it receives, that the engine has run at or above the specified speed for longer than the specified time period after start-up, the unit trips the safety relay open.

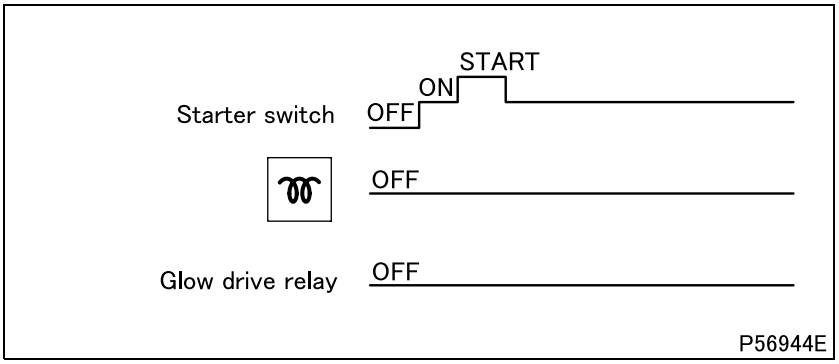
7.3 Preheating function

- This preheating function aims to enhance the engine start up when the engine coolant is low in cold weather or temperature.



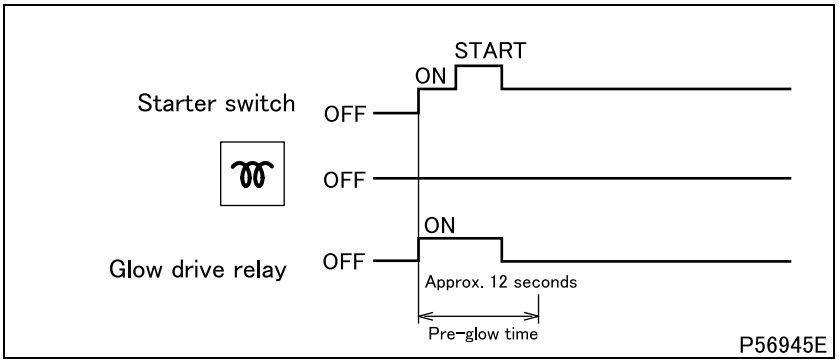
(1) Pre-glow and after-glow

The preheating is operated with a pre-glow before the engine starts and an after-glow after the engine starts. They are controlled by the starter switch (S terminal) signal, engine water temperature signal and the engine rotation signal.

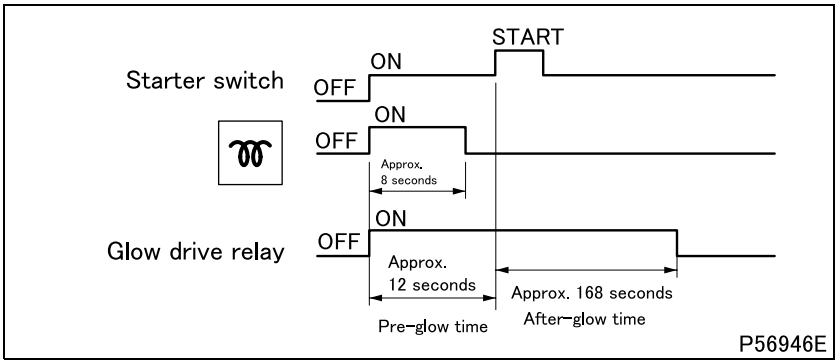


(2) Operation mode

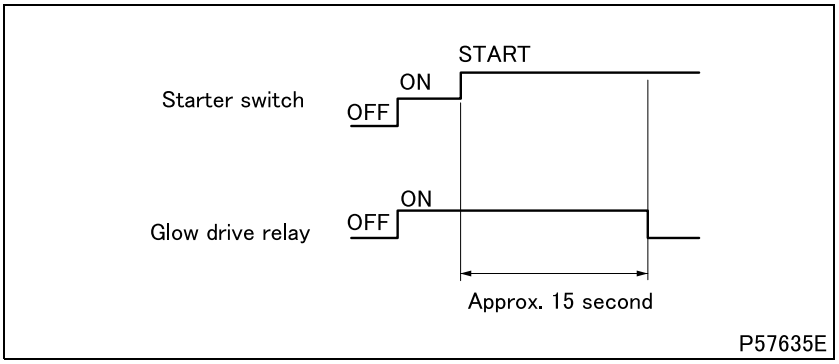
- When the engine coolant temperature is 60°C {140°F} or more.



- When the engine coolant temperature is 0 to 60°C {32 to 140°F}.



- When the engine coolant temperature is 0°C {32°F} or less.



(3) Fail-Safe

- In case the contact point operating the glow relay in engine electronic control unit has melted, the preheating indicator lamp flashes to warn this abnormality.
- Operation mode turns glow relay activation signal to OFF only after all the following conditions are met.
  - Where the engine coolant temperature is 60°C {140°F} or less.
  - Starter switch signal is ON for 15 seconds continuously.
  - Starter switch (S terminal) signal is ON.

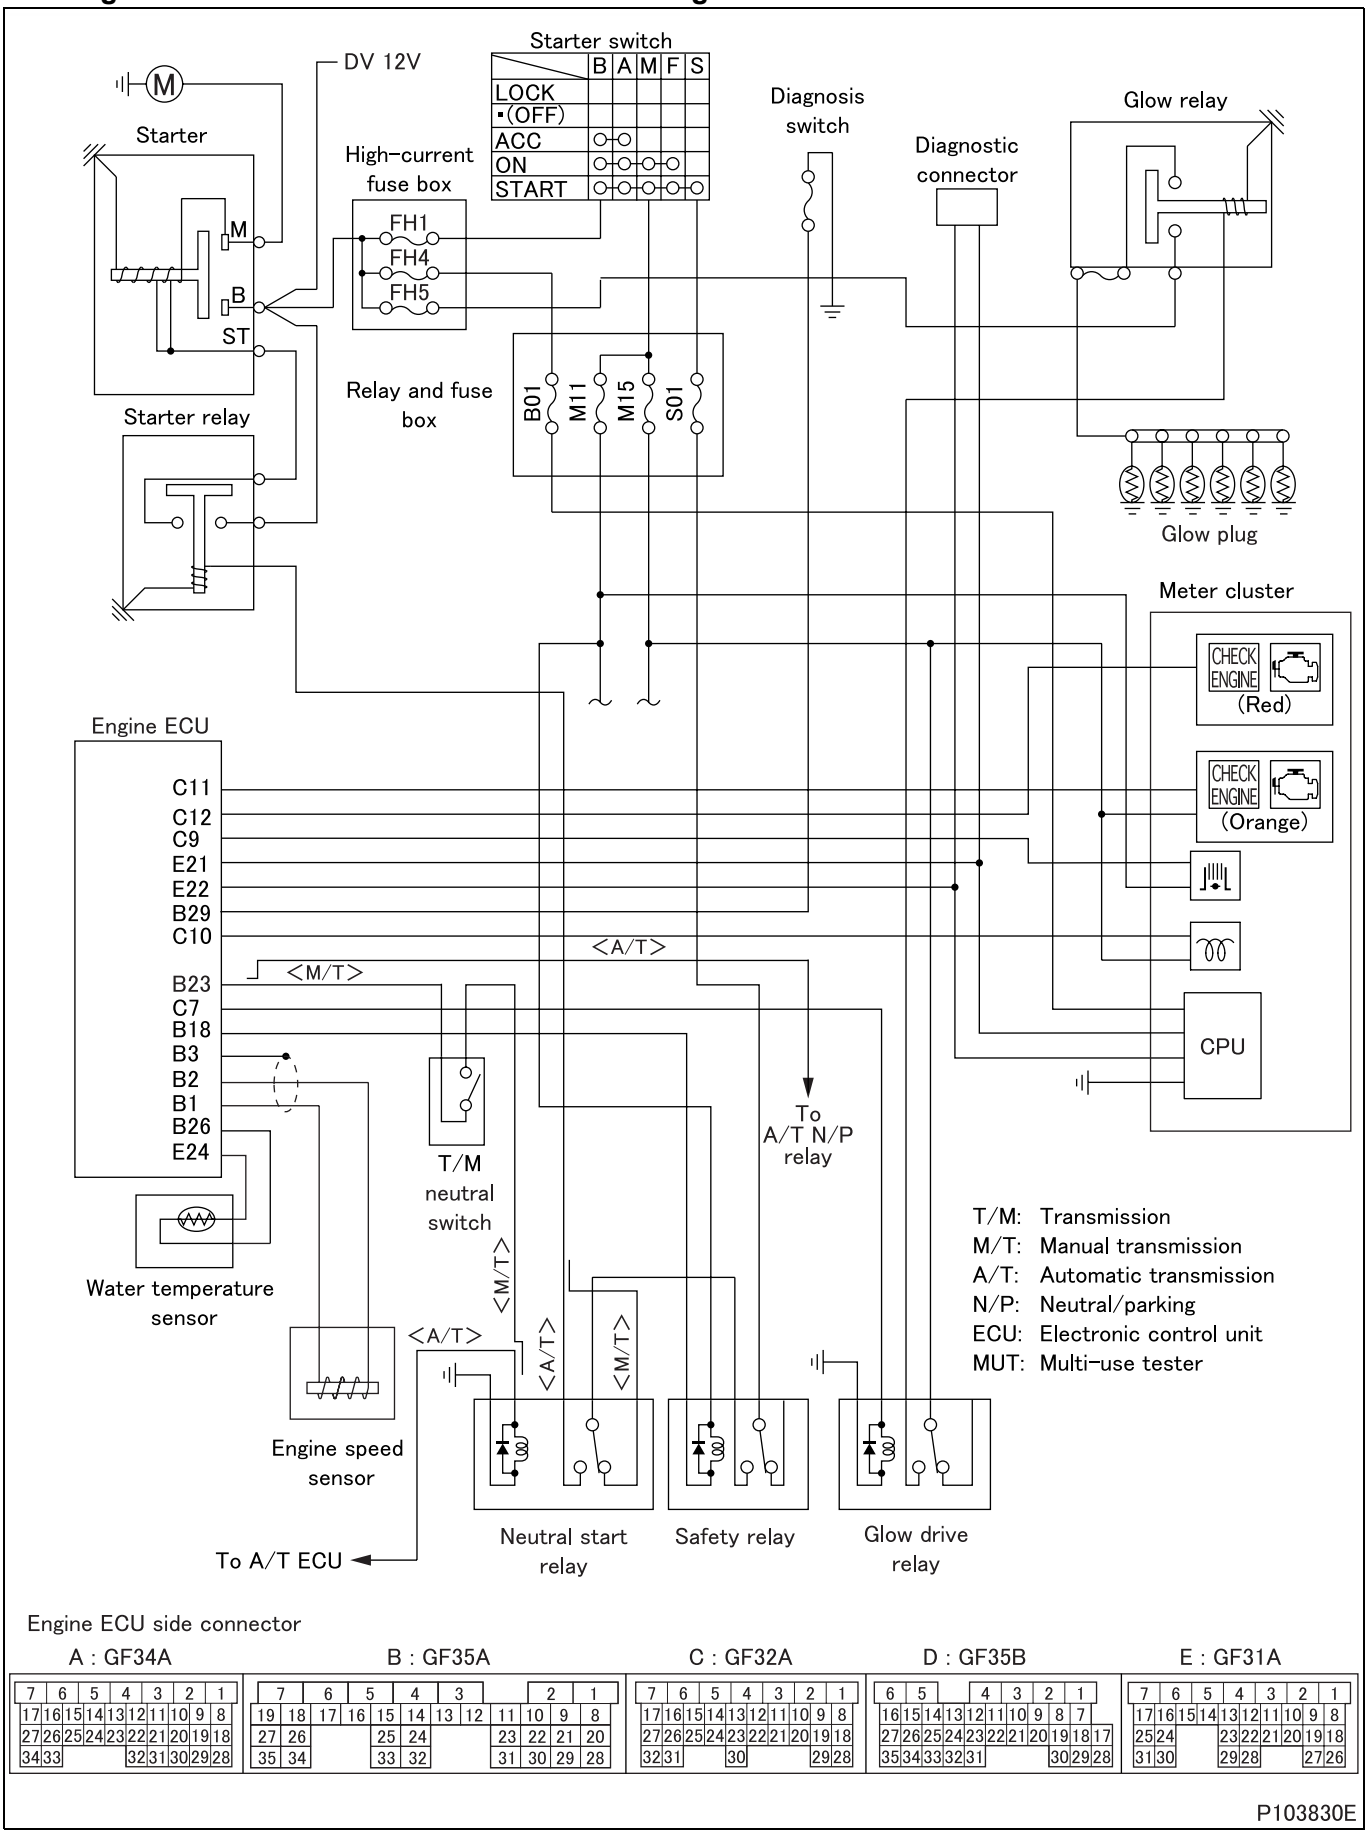
7.4 Fault diagnosis function

- While the starter switch is in the ON position, the sensors and other components are continuously monitored for faults. In the event that a component is found faulty, an indication is made in the meter cluster to alert the driver, the fault location is memorized in the form of a diagnosis code, and backup control necessitated by the fault is initiated.
- While the backup control is taking place, the system's functionality is limited to ensure vehicle and driver safety. It is possible to read the memorized diagnosis code using a Multi-Use Tester or from flashing of the warning lamp.

NOTE

- **Diagnosis codes shown by the Multi-Use Tester and those indicated by flashing of the warning lamp are different.**
- **The Multi-Use Tester is capable of showing more detailed diagnosis codes.**

7.5 Engine electronic control unit connection diagram



54-00D TROUBLESHOOTING

1. Power and Charging

Symptoms / Possible causes		Battery electrolyte decreases too early.	Battery overheating.	Battery is normal but over-discharged.	Charge warning lamp does not light when starter switch is turned ON, with engine stopped.	Alternator is normal but battery over-discharged.	Reference Gr
Connector connection faulty, harness broken, grounding faulty				O		O	
Fuse blown				O	O	O	
Belts loose				O		O	Gr14
Belts damaged				O		O	Gr14
Battery faulty		O				O	
Alternator	Stator coil broken			O			
	Stator coil short-circuited with core			O			
	Exciting coil broken			O			
	Rectifier faulty			O			
	Regulator faulty		O	O	O		
	Wiring faulty			O			
Meter cluster faulty					O		

2. Engine Starting, Stopping and Preheating

Symptoms / Possible causes		Starter does not operate.	Starter operates but engine does not start			Engine does not stop.	Engine cannot be preheated.	Engine is hard to start.	Engine warm-up function does not operate.	Reference Gr
			Pinion does not engage with ring gear.	Pinion engages with ring gear but does not rotate.	Flywheel rotates but engine does not start.					
Connector connection faulty, harness broken, grounding faulty		O			O	O	O		O	
High-current fuse blown		O								
Fuse blown		O				O	O		O	
Battery voltage insufficient		O		O						
Starter	Magnetic switch contacts stuck or fused together	O								
	Open circuit in magnetic switch coil	O								
	Overrunning clutch malfunctioning			O						
	Pinion worn or damaged		O							
Starter relay faulty		O								
Starter switch faulty		O				O				
Flywheel ring gear worn or damaged			O							Gr11

	Vehicle speed sensor improperly mounted	O	O	O			
	Pulse converter faulty	O	O	O			
	Specified tires not used			O			Gr31
	Tires worn or inflation pressure incorrect			O			Gr31
	Specified speedometer gear of transmission not used (difference in gear ratio)			O			Gr22
	Installation angle of speedometer gear bushing on transmission incorrect (not set at correct gear ratio position)			O			Gr22
	Speedometer faulty	O	O	O	O		
Water temperature gauge	Water temperature sensor faulty	O		O			
	Water temperature gauge faulty	O		O			
	Thermostat does not close	O					Gr14
	Engine electronic control unit faulty	O	O	O			Gr13EA
Fuel gauge	Fuel level sensor faulty	O		O			
	Fuel gauge faulty	O		O			
Air gauge	Air pressure sensor faulty	O	O	O			

5. Cigarette Lighter

Symptoms / Possible causes	Cigarette lighter		Audio						Reference Gr
	Does not glow.	Does not return.	Radio does not work.	Specific frequency band does not work.	Spurious noise generated.	Sound quality poor.	Sound from one side only.	Left and right volume different.	
Connector connection faulty, harness broken, grounding faulty	O		O		O		O		
Fuse blown	O		O						
Cigarette lighter faulty	O	O							
Antenna and antenna cable connection faulty			O		O				
Radio amplifier faulty			O						
Radio tuner faulty			O						
Speaker faulty			O	O	O	O	O	O	
Left and right speaker impedance different								O	

6. Accessory Noise Generation Source

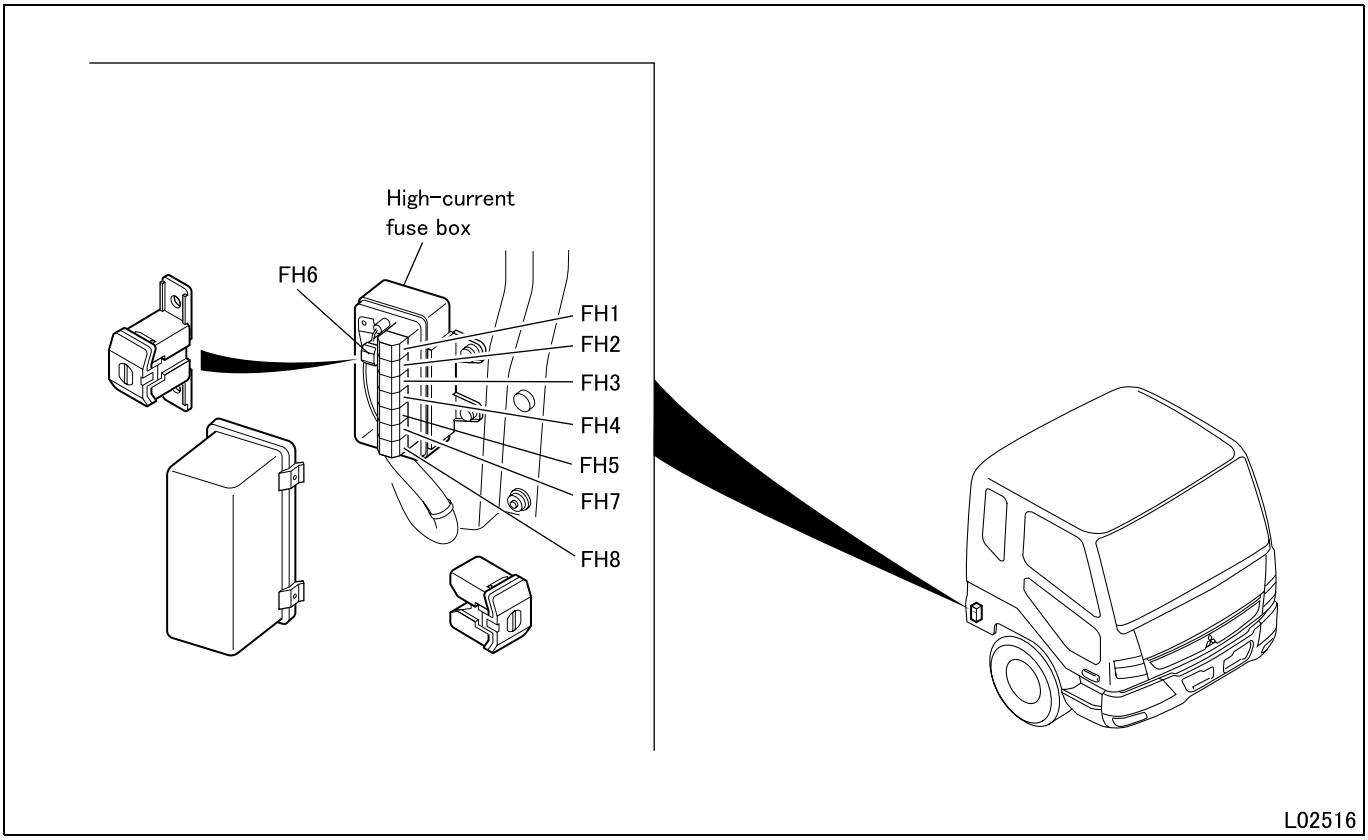
Accessory	Noise	Symptoms
Alternator	Whistling	High pitch sound when accelerator pedal suddenly pressed (Stops soon after engine stopped)
Water temperature gauge	Scratching	Occurs when engine running (Continues for a while after engine stops)
Engine oil pressure switch	Rattling	Depends on engine speed (Does not occur during idling)
Fuel level sensor	Scratching	Occurs when engine suddenly revved, while running on rough roads, or starter switch turned ON
Flasher unit	Banging	When turn signal blinks
Horn	Hissing	Occurs when horn button pressed or released
Wiper motor	Whining	Depends on windshield wiper speed
Washer motor	Whining	When windshield washer operates

7. Horn

Symptoms / Possible causes	Horn				Reference Gr
	No sound.	Continuous sound.	Small sound.	Sound quality poor.	
Connector connection faulty, harness broken, grounding faulty	O				
Fuse blown	O				
Horn switch faulty	O	O			
Horn faulty	O		O	O	
Horn stay warped			O	O	
Battery voltage insufficient	O		O		
Air leaking from air system	O		O	O	

54-01 POWER, CHARGE AND GROUND CIRCUIT

HIGH-CURRENT FUSE BOX



CAUTION ⚠

- **To prevent possible injury, be sure to disconnect the negative (–) cable of the battery and insulate it with tape before removing high-current fuses.**
- **With the negative (–) cable of the battery connected, some high-current fuses are always under battery voltage. An arc will be generated when any of these high-current fuses is replaced without disconnecting the battery negative cable, and this could cause the related electric devices to be damaged.**
- **If a fuse blows out, identify and remedy the cause, then replace the fuse.**
- **Be sure to use the fuse with the specified ampere.**

High-current fuse box

X04 Air dryer

ABS : Anti-lock brake system

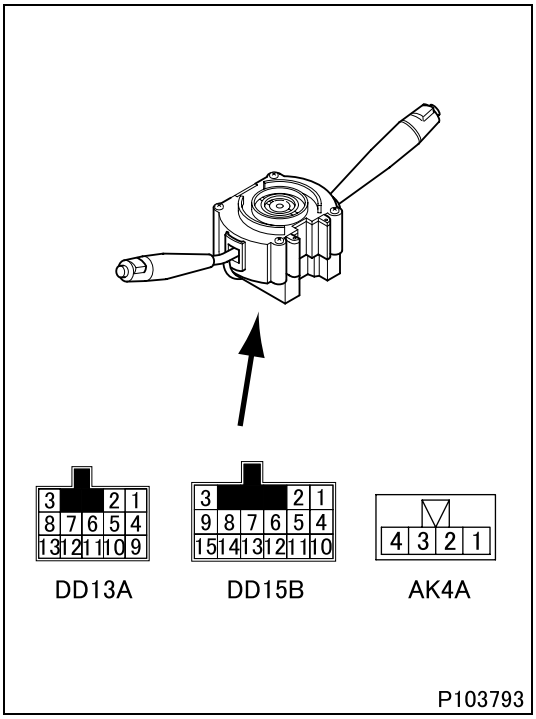
L02511

54-11 INSPECTION OF ELECTRICAL EQUIPMENT

#001 to #179 SWITCH



#001 Inspection of combination switch

AK4A connector connection table <Auto cruise>

Switch position		Continuity terminal
Set and resume switch and cancel switch	Set	1–3
	Cancel	3–4
	OFF	–
	Resume	2–3

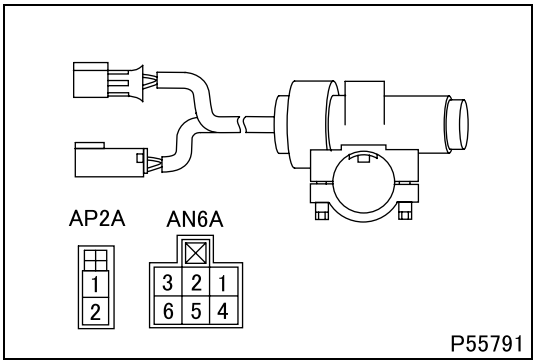
DD15B connector connection table

Switch position			Continuity terminal
Lighting switch	OFF		–
	I		7–13
	II	Main	5–7–8–13
		Dimmer	5–6–7–13
Dimmer switch	Passing		7–8
Turn signal lamp switch	LH		2–9
	N (neutral)		–
	RH		3–9
Horn switch	OFF		–
	ON		1–Body ground

DD13A connector connection table

Switch position		Continuity terminal
Wiper and washer switch	OFF	–
	INT (interval)	10–13
	LO (low)	10–12
	HI (high)	10–11–12
	WASH (washer)	9–10
Exhaust brake switch	OFF	–
	ON	1–4
Hazard switch	OFF	–
	ON	5–6–7–8

- If any fault is found, replace the switch. (See Gr37.)

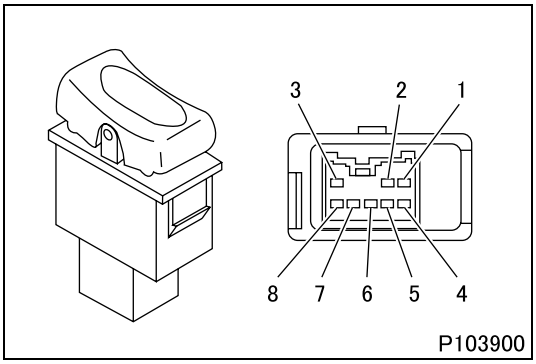


#002 Inspection of starter switch

AP2A, AN6A connector connection table

Switch position		Continuity terminal
LOCK	Without key	–
	With key	4–5
• (OFF)		4–5
ACC		(2)–2, 4–5
ON		(1)–(2)–2–3, 4–5
START		(1)–(2)–1–2–3, 4–5

- Terminal numbers within parentheses ( ) show terminals of AP2A.
- If any fault is found, replace the switch. (See Gr37.)



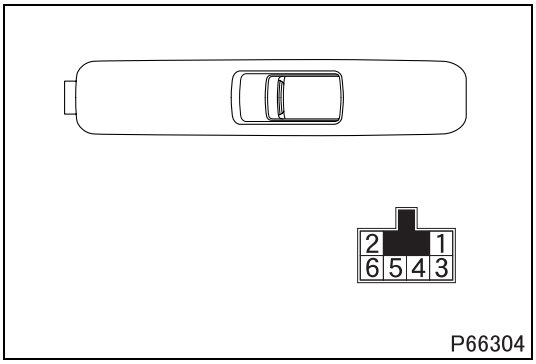
#007 Inspection of cruise control main switch

Switch position	Continuity terminal	Indicator light
OFF	–	–
N (neutral)	3–5	–
ON	3–5, 7–8	(+) 4–1 (–)

- If any fault is found, replace the switch.

#011 Inspection of rheostat switch

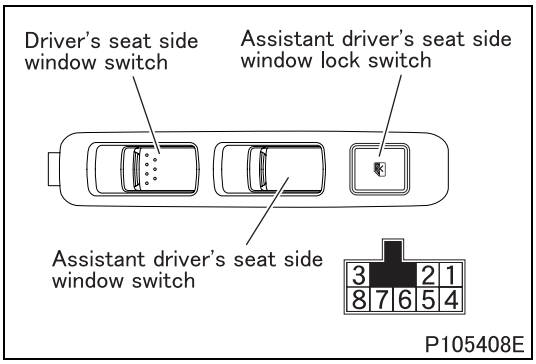
- The rheostat switch contains a control circuit, because of this it is difficult to inspect the rheostat switch independently, therefore you should inspect the rheostat switch indirectly by inspecting the system harness and the related parts.
- If no fault is found in the related parts but the system is faulty, replace the switch.



#026 Inspection of power window switch (assistant driver's seat side)

Switch position	Continuity terminal
UP	1–4
OFF	–
DOWN	1–5

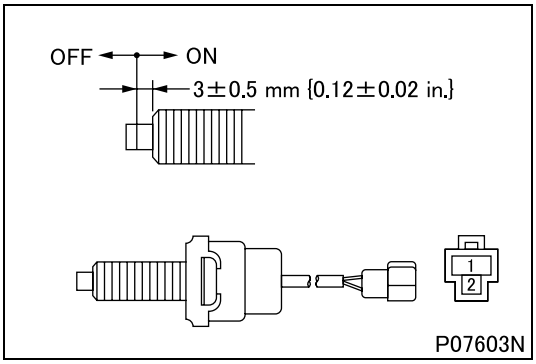
- If any fault is found, replace the switch. (See Gr43.)



#027 Inspection of power window switch (driver's seat side)

Switch position			Continuity terminal
Driver's seat side window switch		UP	1–4
		OFF	–
		DOWN	1–5
Assistant driver's seat side window switch	UN-LOCK	UP	1–6
		OFF	–
		DOWN	1–7
	LOCK	UP	1–2–6
		OFF	–
		DOWN	1–2–7

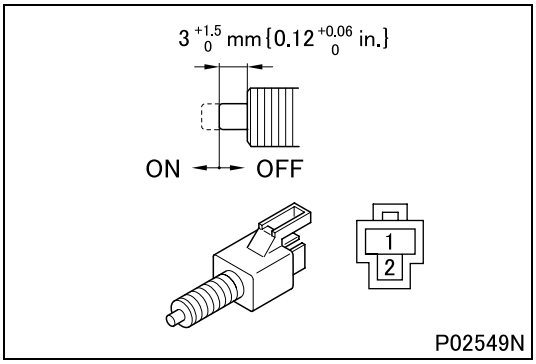
- If any fault is found, replace the switch. (See Gr43.)



#029 Inspection of accelerator switch

Switch position	Continuity terminal
OFF	–
ON	1–2

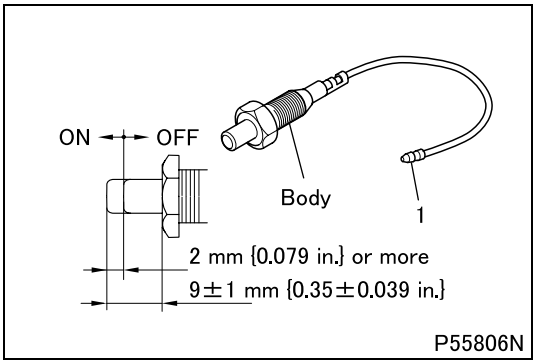
- If any fault is found, replace the switch.



#031 Inspection of clutch switch

Switch position	Continuity terminal
OFF	–
ON	1–2

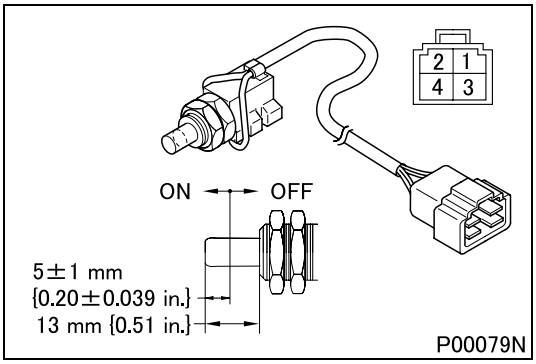
- If any fault is found, replace the switch. (See Gr21.)



#035 Inspection of door switch

Switch position	Continuity terminal
OFF	–
ON	1–body

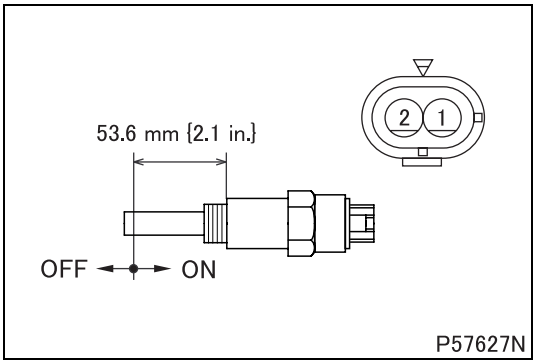
- If any fault is found, replace the switch. (See Gr43.)



#038 Inspection of parking brake switch

Switch position	Continuity terminal
OFF (DRIVE)	1–3
ON (PARK)	2–4

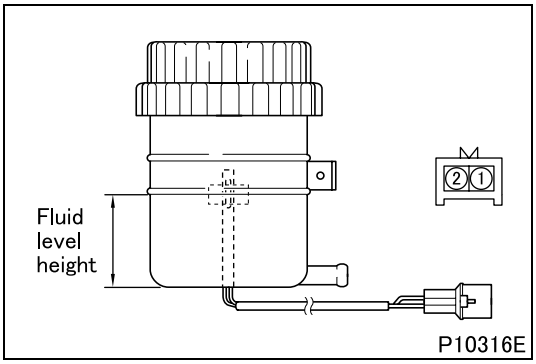
- If any fault is found, replace the switch. (See Gr36A.)



#040 Inspection of brake booster stroke switch

Switch position	Continuity terminal
OFF	–
ON	1–2

- If any fault is found, replace the switch. (See Gr35A.)



#041 Inspection of brake fluid level switch

- Gradually drain brake fluid from the brake fluid tank.

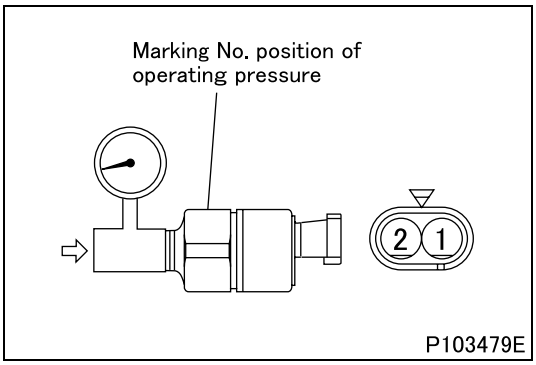
CAUTION ⚠

- **Brake fluid contains ingredients that dissolve paint on the bodywork of a vehicle. Quickly wipe off brake fluid when it is spilled.**

- Measure the fluid level when continuity is established between terminals 1 and 2.

Standard value	$57\ ^{+3.5}_{-0.5}$ mm {$2.24\ ^{+0.14}_{-0.02}$ in.} (equivalent to 345 cm^2 {21.1 cu.in., 0.345 L})

- If the measured value deviates from the standard value, replace the brake fluid tank. (See Gr35A.)



#042 Inspection of stop lamp switch

- Perform the following checks, and if any fault is found, replace the switch.

<In the case of marking No. 0.3 of operating pressure>

(1) Inspection without applying air pressure

- Check that there is no continuity between terminals 1 and 2.

(2) Inspection by applying air pressure

- Gradually apply air pressure to the switch starting from 0 kPa {0 psi, 0 kgf/cm^2}.
- Measure the degree of air pressure at the moment when continuity is detected between terminals 1 and 2, and make sure to confirm if the value meets the standard.

Standard value (operating pressure)	29 ± 9.8 kPa {4.3 ± 1.4 psi, 0.3 ± 0.1 kgf/cm^2}

<In the case of marking No. 5.0 of operating pressure>

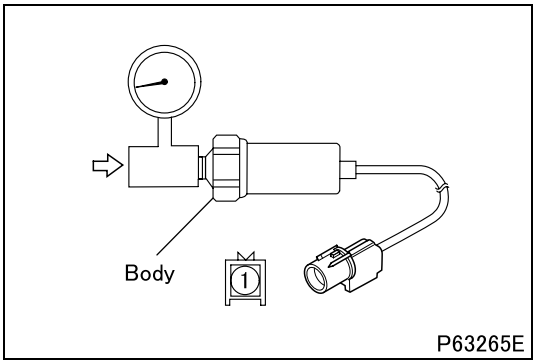
(1) Inspection without applying air pressure

- Check that there is continuity between terminals 1 and 2.

(2) Inspection by applying air pressure

- Gradually apply air pressure to the switch starting from 0 kPa {0 psi, 0 kgf/cm^2}.
- Gradually decrease the pressure with air pressure applied.
- Measure the degree of air pressure at the moment when continuity is detected between terminals 1 and 2, and make sure to confirm if the value meets the standard.

Standard value (operating pressure)	490 ± 19.6 kPa {71 ± 2.8 psi, 5.0 ± 0.2 kgf/cm^2}



#044 Inspection of engine oil pressure switch

- Perform the following checks, and if any fault is found, replace the switch.

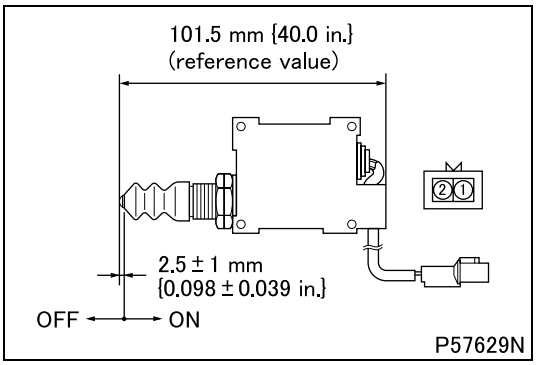
(1) Inspection without applying air pressure

- Check that there is continuity between terminal 1 and body.

(2) Inspection by applying air pressure

- Gradually apply air pressure to the switch starting from 0 kPa {0 psi, 0 kgf/cm^2}.
- Measure the degree of air pressure at the moment when continuity is detected between terminals 1 and body, and make sure to confirm if the value meets the standard.

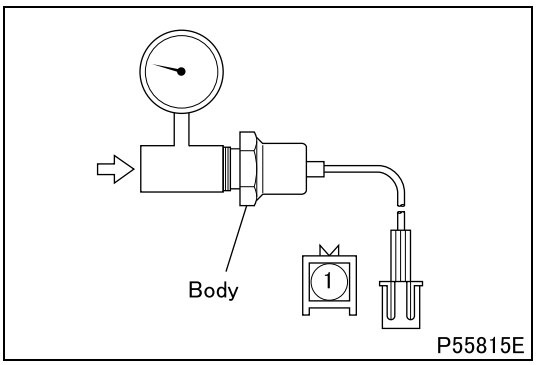
Standard value (operating pressure)	49 ± 9.8 kPa {7.1 ± 1.4 psi, 0.5 ± 0.1 kgf/cm^2}



#045 Inspection of cab tilt lock switch

Switch position	Continuity terminal
OFF	–
ON	1–2

- If any fault is found, replace the switch. (See Gr42.)



#053 Inspection of engine oil bypass alarm switch

- Perform the following checks, and if any fault is found, replace the switch. (See Gr12.)

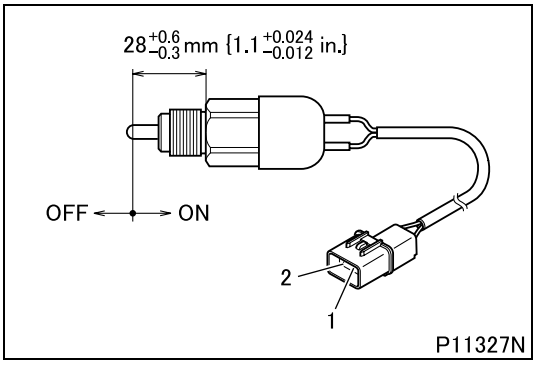
(1) Inspection without applying air pressure

- Check that there is no continuity between terminal 1 and body.

(2) Inspection by applying air pressure

- Gradually apply air pressure to the switch starting from 0 kPa {0 kgf/cm^2}.
- Measure the degree of air pressure at the moment when continuity is detected between terminals 1 and body, and make sure to confirm if the value meets the standard.

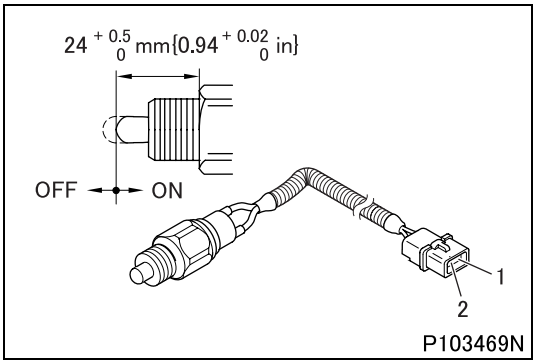
Standard value (ON pressure)	185 $^{+49}_{0}$ kPa {27 $^{+7.1}_{0}$ psi, 1.9 $^{+0.5}_{0}$ kgf/cm^2}



#054 Inspection of backup lamp switch

Switch position	Continuity terminal
OFF	–
ON	1–2

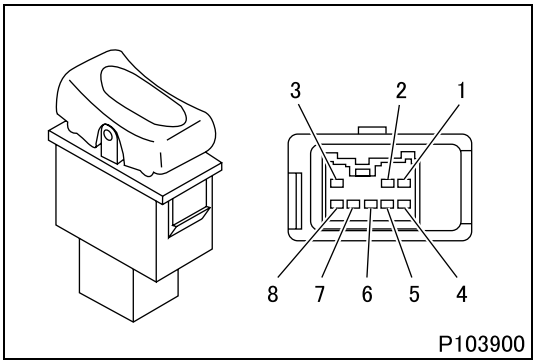
- If any fault is found, replace the switch. (See Gr22A.)



#056 Inspection of transmission neutral switch

Switch position	Continuity terminal
OFF	–
ON	1–2

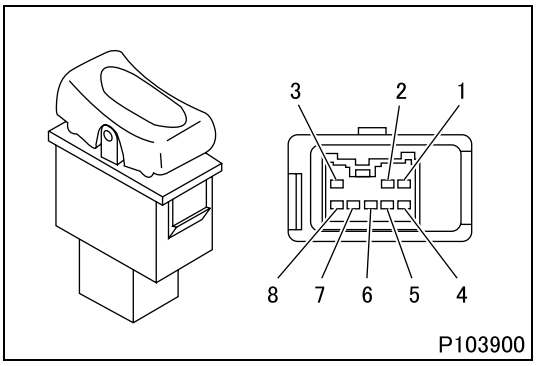
- If any fault is found, replace the switch. (See Gr22A.)



#063 Inspection of height control switch

Switch position	Continuity terminal	Indicator light
OFF	2–7	–
N (Neutral)	–	
DOWN	7–8	(+) 4–1 (–)

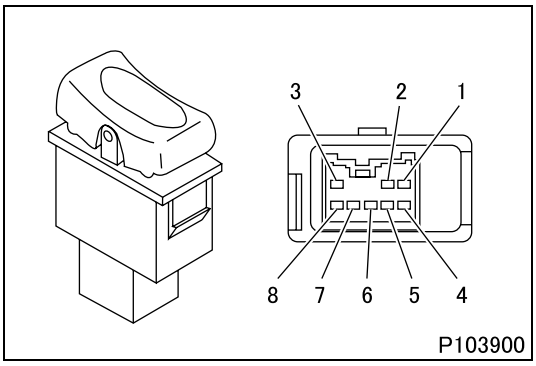
- If any fault is found, replace the switch.



#087 Inspection of switch

- Perform the following checks, and if any fault is found, replace the switch.
- Van body dome light switch
- Power mode switch

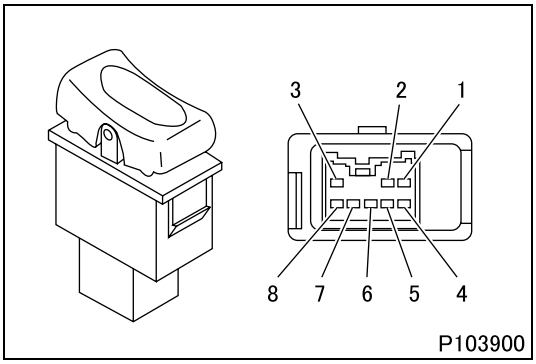
Switch position	Continuity terminal	Indicator light
OFF	2–7	(+) 4–1 (–)
ON	7–8	



#092 Inspection of engine oil level check switch

Switch position	Continuity terminal
–	2–7
CHK	7–8

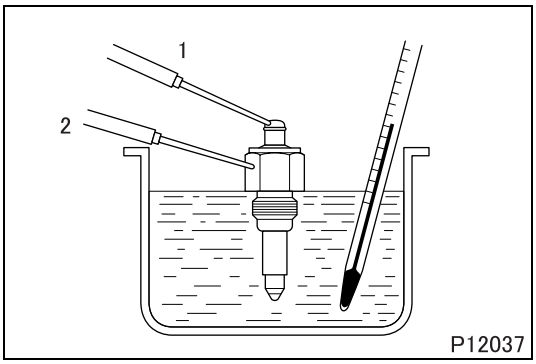
- If any fault is found, replace the switch.



#094 Inspection of door lock switch

Switch position	Continuity terminal
LOCK	7–8
N (neutral)	–
UNLK	2–7

- If any fault is found, replace the switch.

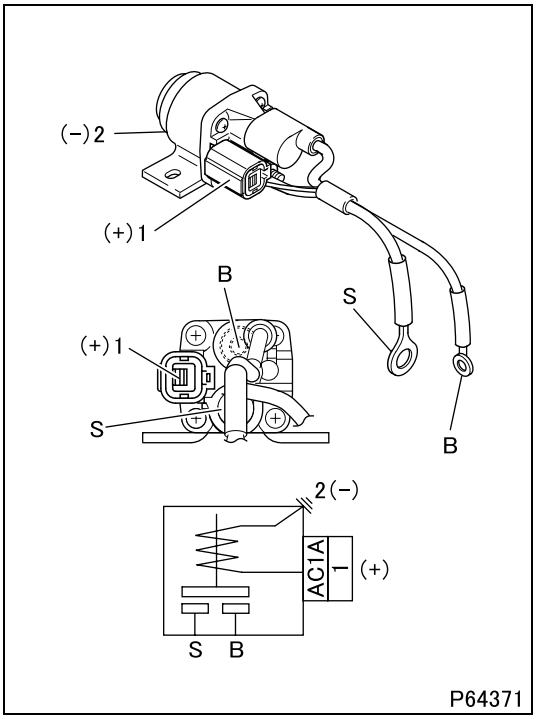


#160 Inspection of overheating switch

- Dip the switch in a container filled with engine oil.
- Raise the oil temperature to the specified values and stir the oil.
- Measure the operating temperature between terminals 1 and 2 (body) respectively.

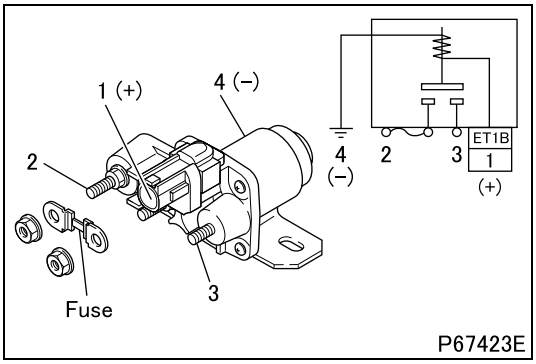
Standard Value	When temperature increase (OFF→ON)	110 ± 2.5°C {230 ± 4.5°F}
	When temperature decrease (ON→OFF)	99.5 to 112.5°C {211 to 235°F}

- If the measured value deviates from the standard value, replace the switch. (See Gr14.)



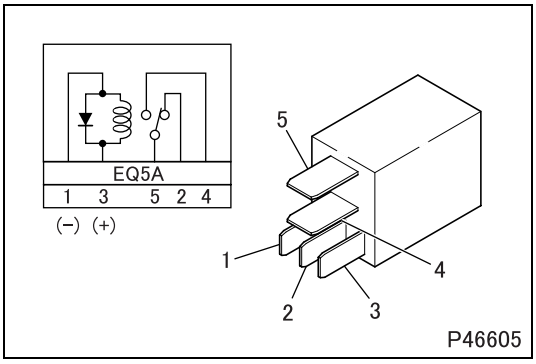
#187 Inspection of starter relay

- Perform continuity check and operation check, and if any fault is found, replace the relay.



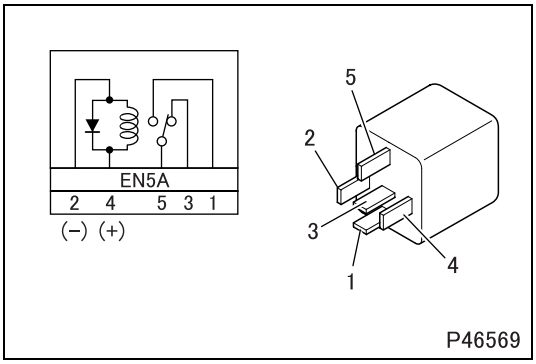
#195 Inspection of glow relay

- Perform continuity check and operation check, and if any fault is found, replace the relay.



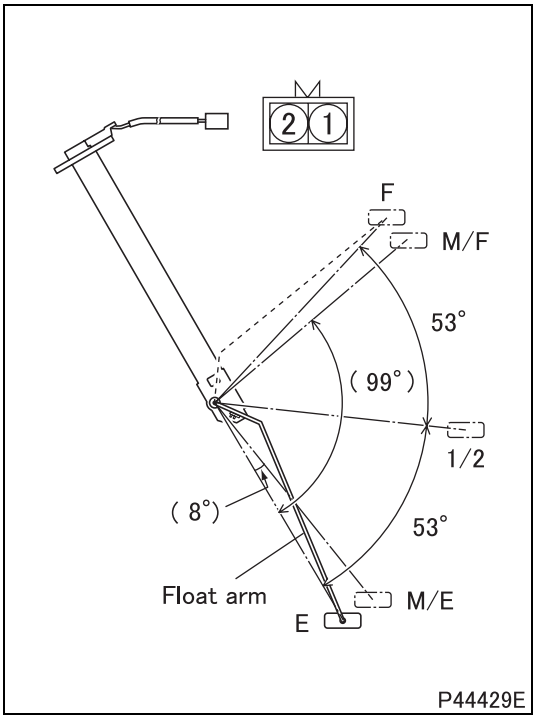
#201 Inspection of relay (normally-open type, 5-pin)

- Perform continuity check and operation check, and if any fault is found, replace the relay.



#202 Inspection of relay (normally-open type, 5-pin)

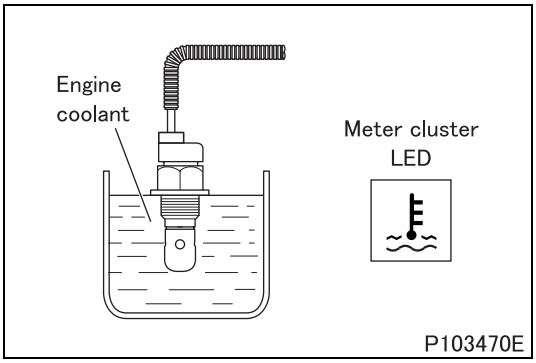
- Perform continuity check and operation check, and if any fault is found, replace the relay.



#258 Inspection of fuel level sensor

- Perform the following checks, and if any fault is found, replace the sensor. (See Gr13A.)
- Measure the resistance between terminals 1 and 2 with the float arm at FULL, MIDDLE FULL, 1/2, MIDDLE EMPTY and EMPTY positions.

Standard value	F (FULL)	0 Ω
	M/F (MIDDLE FULL)	4 Ω
	1/2	50 ± 3 Ω
	M/E (MIDDLE EMPTY)	135 Ω
	E (EMPTY)	150 ± 10 Ω

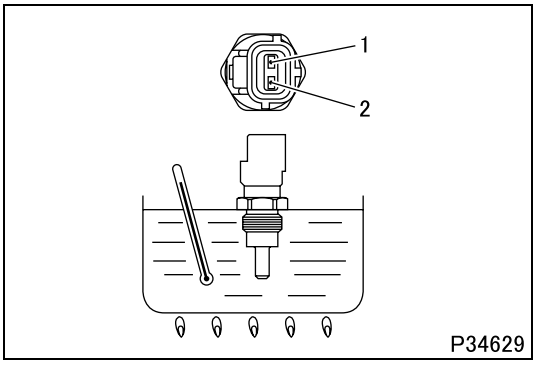


#259 Inspection of water level sensor

- Remove the water level sensor from the radiator.
- Turn the starter switch ON.
- Dip the water level sensor in a container filled with engine coolant, and check that the meter cluster warning lamp goes on and out under the following conditions.

Condition	Meter cluster LED
When water level sensor is out of the water	ON
When water level sensor is in the water	OFF

- If any fault is found, replace the sensor. (See Gr14.)

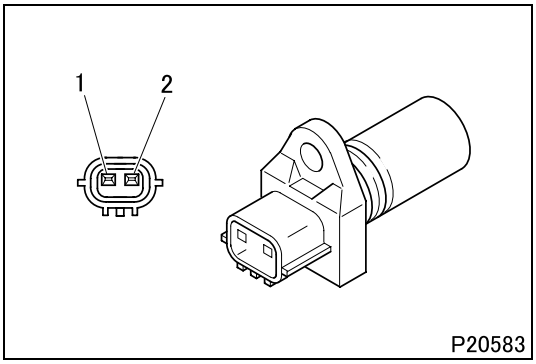


#262 Inspection of water temperature sensor

- Dip the sensor in a container filled with engine oil.
- Raise the oil temperature to the specified one while stirring the oil.
- Measure the resistance between terminals 1 and 2.

Standard value	20°C {68°F}	2.45 ± 0.14 kΩ
	80°C {176°F}	0.32 kΩ (reference)
	110°C {230°F}	147.1 ± 2 Ω

- If the measured value deviates from the standard value, replace the sensor. (See Gr14.)

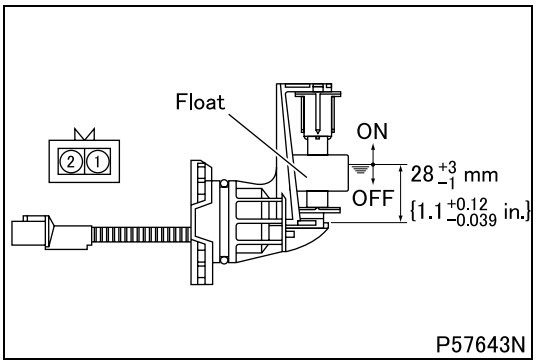


#263 Inspection of engine speed sensor

- Measure the resistance between terminals 1 and 2.

Standard value (at 20°C {68°F})	125.5 ± 17 Ω

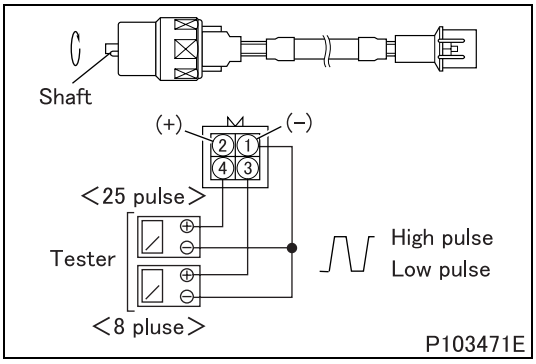
- If the measured value deviates from the standard value, replace the sensor. (See Gr11.)



#264 Inspection of engine oil level sensor

Switch position	Continuity terminal
OFF	–
ON	1–2

- If any fault is found, replace the sensor. (See Gr12.)

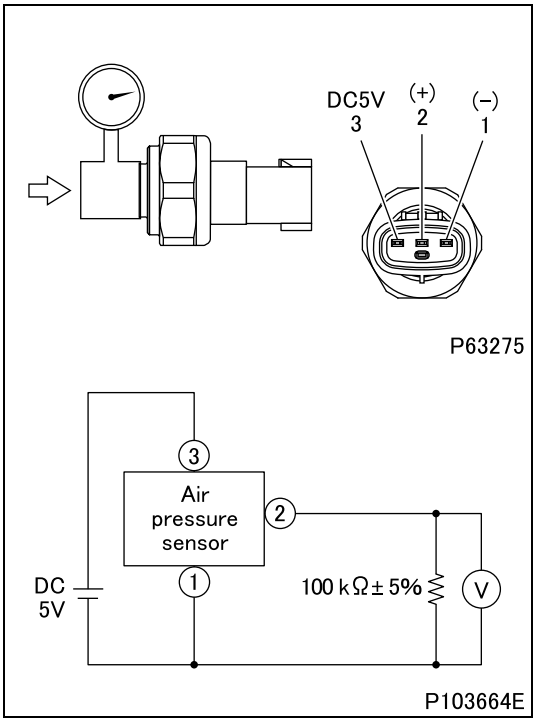


#265 Inspection of vehicle speed sensor

- Rotate the sensor shaft with the 12 Volts DC applied between terminals 1 and 2.
- Measure the maximum value (high pulse voltage) and the minimum value (low pulse voltage) of the voltage generated at each terminals.

Standard value	Between terminals 1 and 3 of 8-pulse output	Low pulse voltage	1.5 V or less
		High pulse voltage	11.5 V or more
	Between terminals 1 and 4 of 25-pulse output	Low pulse voltage	0.5 V or less
		High pulse voltage	8 ± 1 V

- If the measurement is not within the range of the standard value, replace the sensor. (See Gr22A, B and 23A, B.)

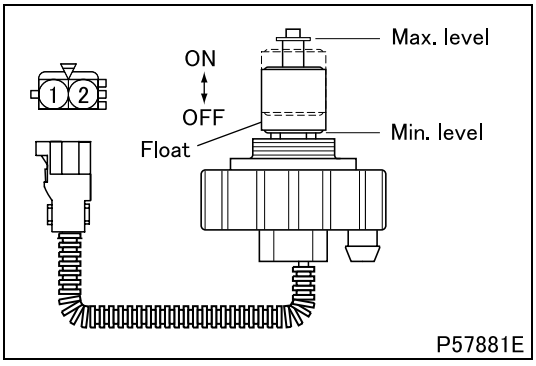


#269 Inspection of air pressure sensor

- Apply air pressure to the air pressure sensor with 5 Volts DC applied between the terminals 1 and 3.
- Measure voltage between the terminals 1 and 2 at each air pressure.

Standard value	0 MPa {0 psi, 0 kgf/cm^2}	0.5 V
	1.47 MPa {215 psi, 15 kgf/cm^2}	4.5 V

- If measured value deviated from the standard value, replace the sensor.



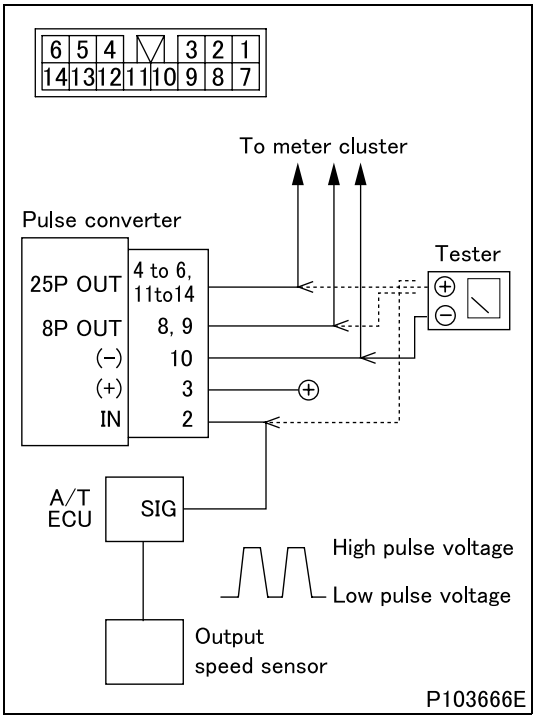
#274 Inspection of water separator sensor

Float position	Continuity terminal
ON (water quantity approx. 100 ml or higher)	1–2
OFF	–

- If any fault is found, replace the sensor. (See Gr13A.)

#350 Inspection of control unit and other units

- Since the units alone cannot be readily checked in the off-vehicle state, check the harness, switch and other related parts in each system.
- If any fault is not found in the related parts, and the problem still remains in the system, replace the control units or other units.



#352 Inspection of pulse converter

- Check the pulse converter and automatic transmission electronic control unit in the on-vehicle state.
- Slowly rotate the wheels using a chassis dynamo, etc. in the state of starter switch ON.
- Measure the maximum voltage (high pulse voltage) and the minimum voltage (low pulse voltage) in each of the output terminals of the pulse converter.

(1) Output measurement

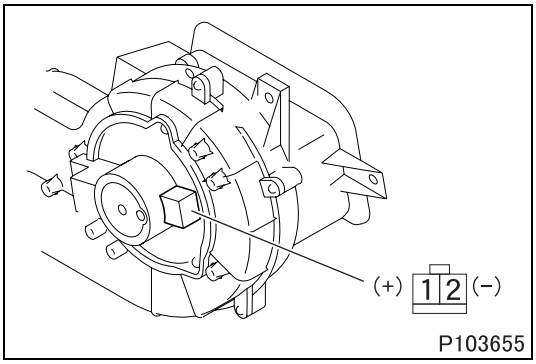
Standard value	Between 8 pulse output terminals (8, 9) and 10	Low pulse voltage	1.5 V or less
		High pulse voltage	12 V or more
	Between 25 pulse output terminals (4 to 6, 11 to 14) and 10	Low pulse voltage	0.5 V or less
		High pulse voltage	$8^{+1.5}_{-1.0}$ V

- If the measurement deviates from the standard value, replace the pulse converter.

(2) Input measurement

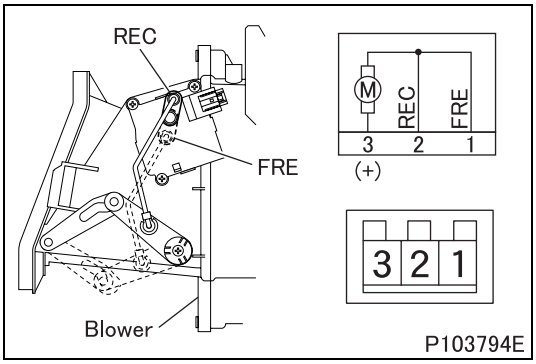
Standard value Between 25 pulse input terminal 2 and 10	Low pulse voltage	0.5 V or less
	High pulse voltage	8 ± 1 V

- If the measurement complies with the standard value, replace the pulse converter as the signal from the automatic transmission electronic control unit is judged to be normal.
- If the measurement deviates from the standard value, check the automatic transmission. (See Gr23A, B.)



#411 Inspection of blower motor

- Make sure that the motor operates when battery voltage is applied between terminals 1 and 2.
- If any fault is found, replace the motor. (See Gr55.)



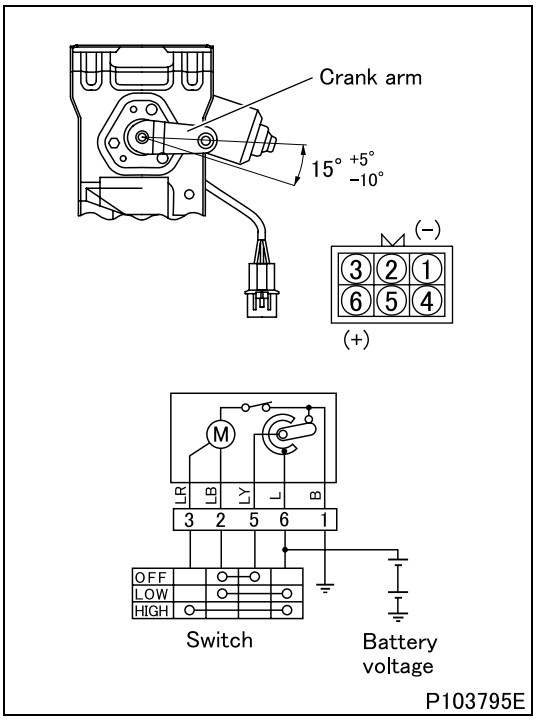
#415 Inspection of fresh/recirculation changeover motor

- Perform the following checks, and if any fault is found, replace the motor. (See Gr55.)
- Make sure that the motor operates when DC12V is applied between each terminal.

Lever position	Terminal
REC (inside air)	(+) 3–2 (–)
FRE (outside air)	(+) 3–1 (–)

CAUTION ⚠

- **Stop applying DC12V if the lever stops spontaneously at the REC or FRE position.**



#422 Inspection of wiper motor

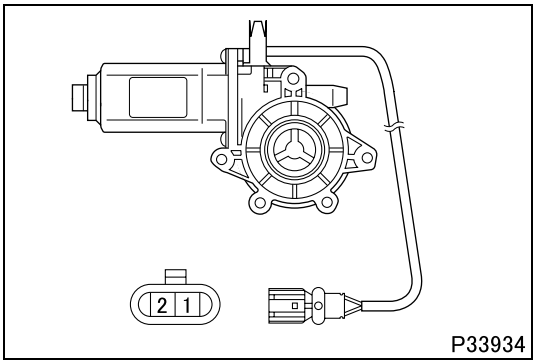
- Connect a switch to wiper motor as shown.
- Check the motor for correct operation as follows. If any fault is found, replace the motor. (See Gr51.)

(1) Inspection of motor operation

- Set switch to HIGH position to check that the motor rotates at high speed.
- Set switch to LOW position to check that the motor rotates at low speed.

(2) Inspection of automatic stop position

- Set switch to LOW position to let the motor rotate at low speed.
- When the crank arm is in a position other than automatic stop position (outside the angles shown), set switch to OFF position.
- Check to see that the crank arm stops at the automatic stop position (within the angles range shown).

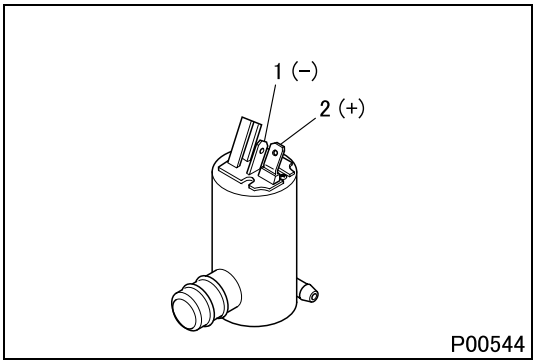


#423 Inspection of power window motor

- Make sure that the motor operates when battery voltage is applied between terminals 1 and 2.

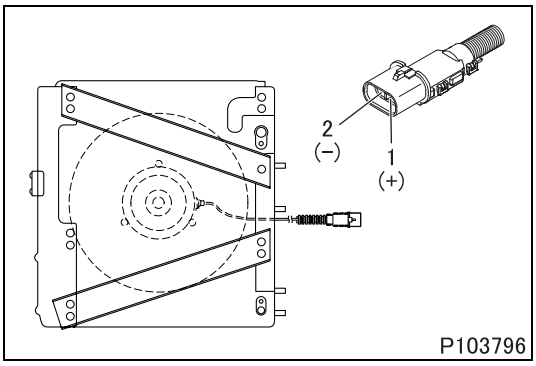
Turning direction	Terminal
Left	(+) 1–2 (–)
Right	(+) 2–1 (–)

- If any fault is found, replace the motor. (See Gr43.)



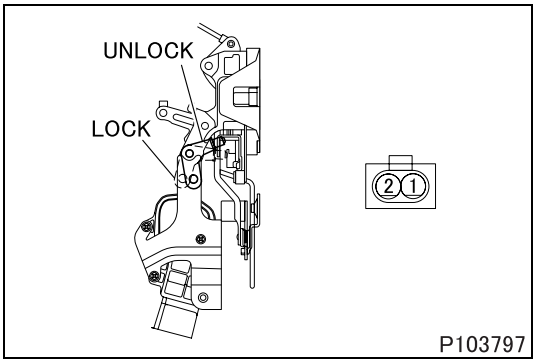
#428 Inspection of windshield washer motor

- Make sure that the motor operates when battery voltage is applied between each terminals.
- If any fault is found, replace the motor. (See Gr51.)



#431 Inspection of condenser fan motor

- Make sure that the motor operates when battery voltage is applied between terminals 1 and 2.
- If any fault is found, replace the condenser. (See Gr55.)

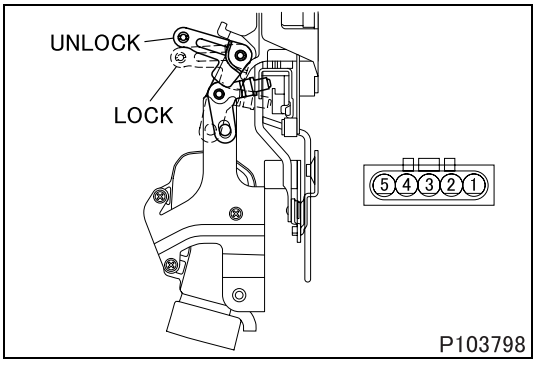


#510 Inspection of door lock actuator (on assistant driver's seat side)

- Apply battery voltage between terminals 1 and 2 and confirm that the actuator operates.

Switch position	Terminal
LOCK	(+) 2–1 (–)
UNLOCK	(+) 1–2 (–)

- If any fault is found, replace the actuator. (See Gr43.)

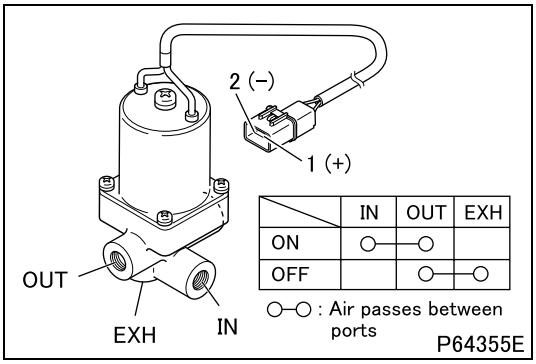


#511 Inspection of door lock actuator (on driver's seat side)

- Apply battery voltage between terminals 4 and 5 and confirm that the actuator operates.

Switch position	Terminal	Continuity terminal
LOCK	(+) 3–2 (–)	1–5
UNLOCK	(+) 2–3 (–)	4–5

- If any fault is found, replace the actuator. (See Gr43.)



#565 Inspection of 3-way magnetic valve

<Type-1>

- Perform the following checks, and if any fault is found, replace the 3-way magnetic valve.

(1) Operation check

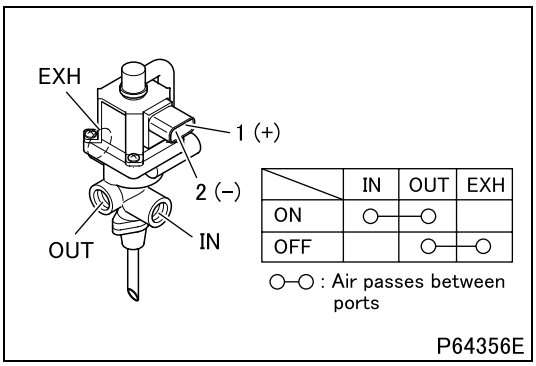
- Gradually apply DC current between terminals 1 and 2 starting from 0 V.

Measure the voltage at which the 3-way magnetic valve operates. (Determine ON/OFF of the magnetic valve by operating noises.)

Standard value (minimum operating voltage)	10 V or lower

(2) Inspection of continuity and air tightness

- Air pressure when inspected: 981 kPa {140 psi, 10 kgf/cm^2}



<Type-2>

- Perform the following checks, and if any fault is found, replace the 3-way magnetic valve.

(1) Operation check

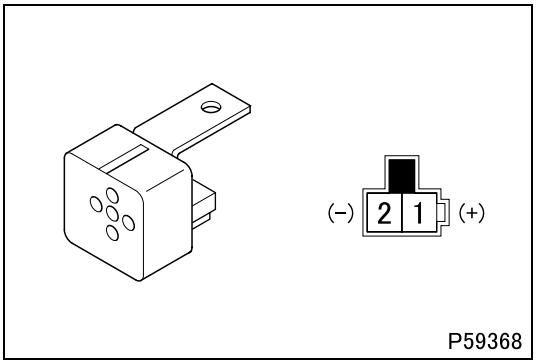
- Gradually apply DC current between terminals 1 and 2 starting from 0 V.

Measure the voltage at which the 3-way magnetic valve operates. (Determine ON/OFF of the magnetic valve by operating noises.)

Standard value (minimum operating voltage)	10 V or lower

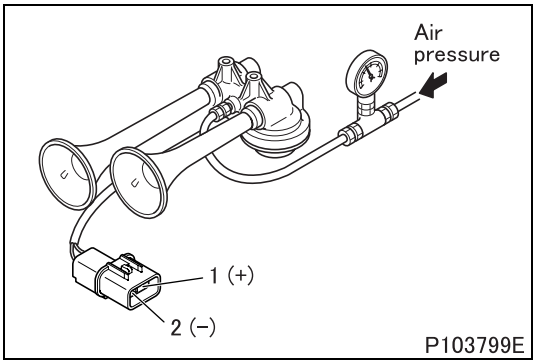
(2) Inspection of continuity and air tightness

- Air pressure when inspected: 981 kPa {140 psi, 10 kgf/cm^2}



#611 Inspection of warning buzzer

- Make sure that the buzzer sounds when battery voltage is applied between terminals 1 and 2.
- If any fault is found, replace the buzzer.



#612 Inspection of air horn

- Perform the following check. If any fault is found, replace the horn.

(1) Minimum operating voltage of air horn valve

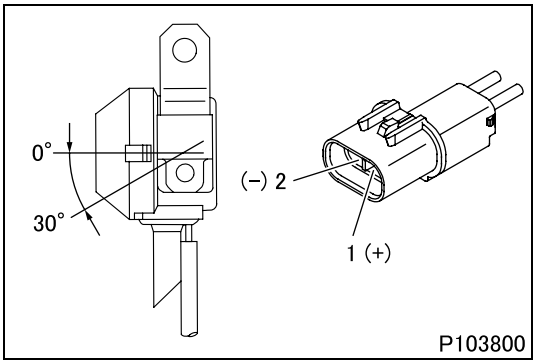
- Apply air pressure of 785 kPa {115 psi, 8 kgf/cm^2} to the horn.
- Gradually apply DC voltage between terminals 1 and 2 starting from 0 V.
- Measure the voltage when the horn sounds.

Standard value	20 V or lower

(2) Operating air pressure of horn

- Apply DC voltage between terminals 1 and 2.
- Gradually apply air pressure to the horn starting from 0 kPa {0 psi, 0 kgf/cm^2}.
- Measure the air pressure when the horn sounds.

Standard value	195 to 980 kPa {28 to 142 psi, 2 to 10 kgf/cm^2}



#614 Inspection of back buzzer

[Inspection]

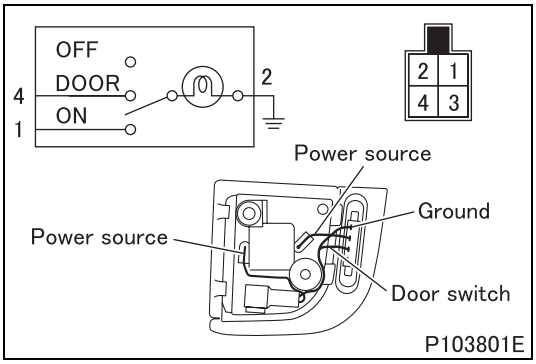
- Make sure to confirm if the buzzer intermittently sounds by applying the battery voltage between terminals 1 and 2.
- If any fault is found, replace the buzzer.

[Installation]

- Install the back buzzer to the frame in the range of angles as illustrated.

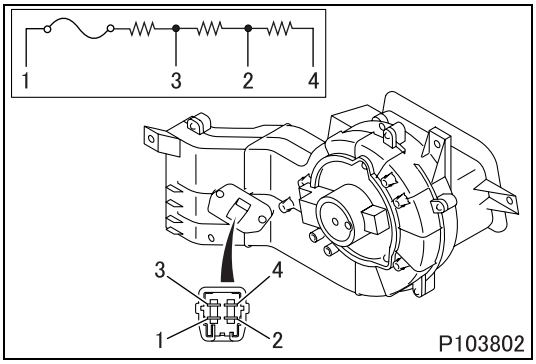
CAUTION ⚠

- **Beware that if the installed angle of the buzzer is out of the range as illustrated, water in the buzzer will not be drained normally.**



#652 Inspection of personal lamp

- If any fault is found, replace the lamp.
- Shown in the illustration is the back side of the driver's seat side lamp.
  The assistant driver's seat side lamp is symmetrical to driver's seat side lamp.

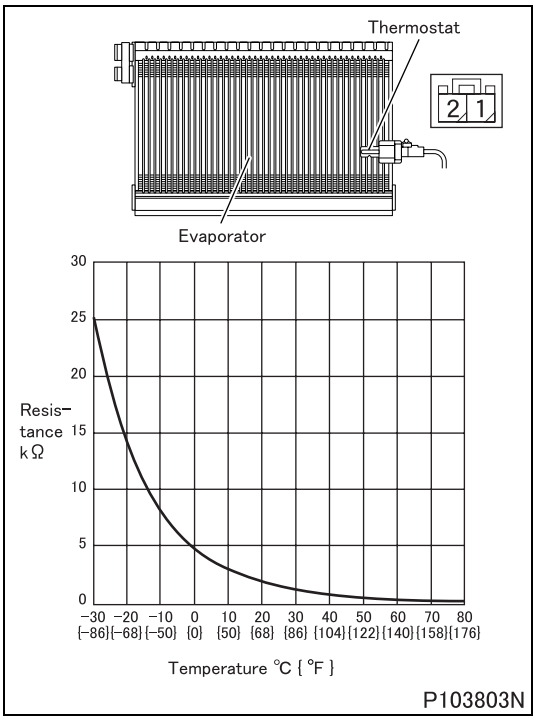


#750 Inspection of blower resistor

- Measure resistance values between each terminals.

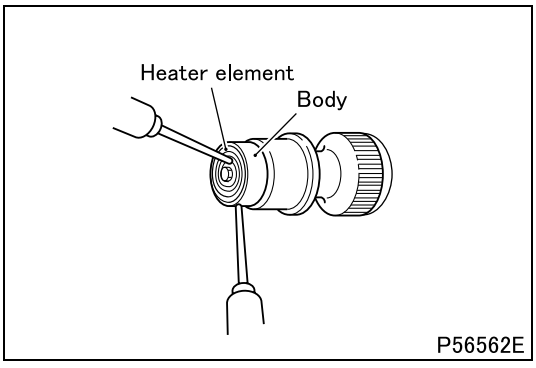
Fan speed	Terminal	Standard value
LOW	1–4	Approx. 1.89 Ω
MEDIUM LOW	1–2	Approx. 0.89 Ω
MEDIUM HIGH	1–3	Approx. 0.33 Ω

- If the measured value deviates from the standard value, replace the blower resistor. (See Gr55.)



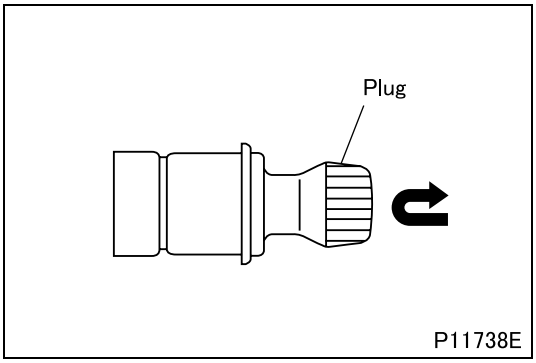
#751 Inspection of thermostat

- Change surrounding temperatures of the thermostat and measure resistance between the terminals 1 and 2.
- If measured value deviates from the temperature characteristic curve shown at the left, replace the thermostat.
  (Standard resistance: 4.852 kΩ at 0°C) (See Gr55.)



#754 Inspection of cigarette lighter

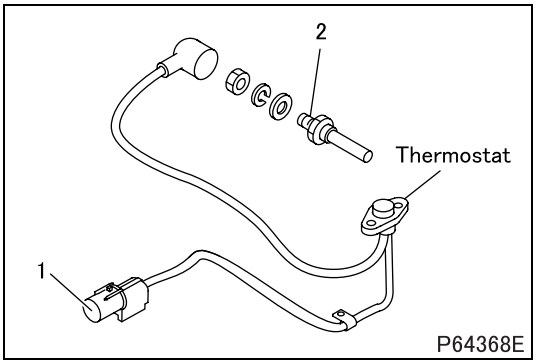
- Perform the following checks, and if any fault is found, replace the cigarette lighter.
- Make sure that there is continuity between heater element and body.



- Make sure that when plug is pushed in by hand, it immediately returns to its original position.
- Place the starter switch at ACC or ON position.
- Push plug into the socket in the cab.
- Measure the time required for plug to automatically return.

Standard value	15 ± 5 seconds

- Check to see that heater element is red-hot.

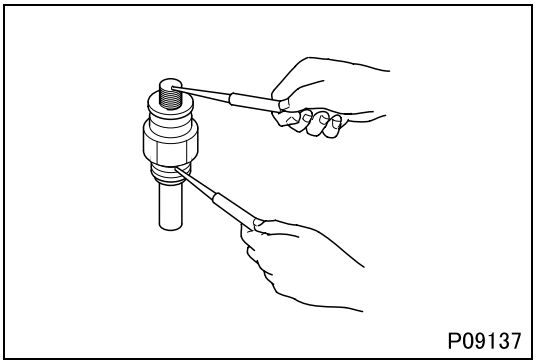


#758 Inspection of air dryer

(1) Inspection of thermostat

- Perform the following check. If any fault is found, replace the thermostat. (See Gr35A, B.)
- While varying the temperature around the thermostat, measure the temperatures when the continuity is established and is lost between terminals 1 and 2.

Standard value	Lowering the temperature	Temperature when continuity is established (ON temperature)	4 ± 4°C {39 ± 39°F}
	Raising the temperature	Temperature when continuity is lost (OFF temperature)	20°C {68°F} or lower

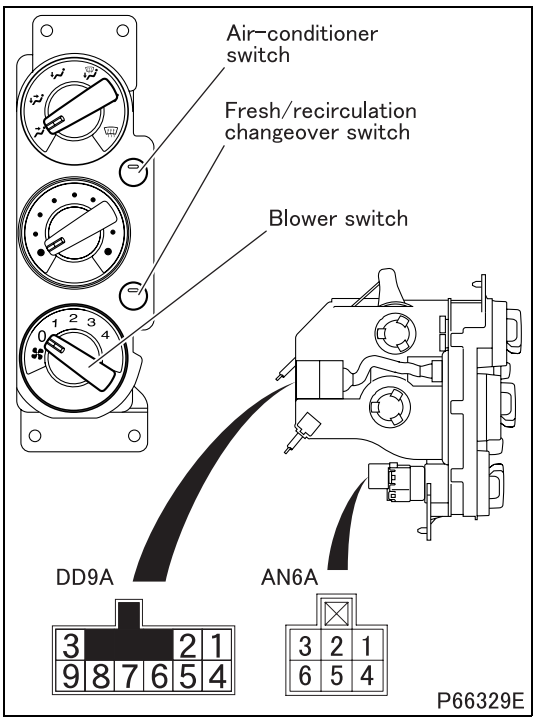


(2) Inspection of heater

- Measure the resistance of heater as shown.

Standard value	8.2 Ω or less

- If the measured value is out of the standard value, replace the heater. (See Gr35A, B.)



#763 Inspection of heater control panel

- Perform the following checks, and if any fault is found, replace the heater control panel. (See Gr55.)

(1) Blower switch <AN6A connector>

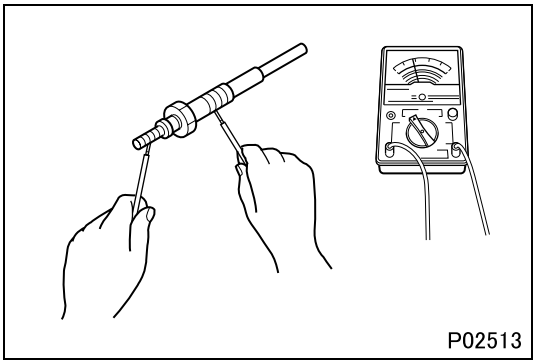
Switch position	Continuity terminal
0: OFF	–
1: LO (LOW)	4–5–6
2: ML (MEDIUM LOW)	1–5–6
3: MH (MEDIUM HIGH)	2–5–6
4: HI (HIGH)	3–5–6

(2) Fresh/recirculation changeover switch <DD9A connector>

Switch position	Continuity terminal	Operation illumination	Night illumination
OFF: Fresh air	3–7	–	(+) 9–4 (–)
ON: Recirculation air	3–8	(+) 6–3 (–)	

(3) Air-conditioner switch <DD9A connector>

Switch position	Continuity terminal	Operation illumination	Night illumination
OFF	–	–	(+) 9–4 (–)
ON	1–2–5	(+) 5–2 (–)	



#764 Inspection of glow plug

- Measure resistance value of glow plug as shown.

Standard value (cold resistance of glow plug)	Approx. 1.1 Ω

- If the measured value deviates from the standard value, replace the glow plug. (See Gr11.)

DANGER ⚠

- **Since flammable hydrogen gas is generated by the battery be sure to obey the following warnings:**
  - **Do not short-circuit the (+) and (–) terminals on the battery.**
  - **Keep sparks and lit cigarettes away from the battery.**
  - **Do not wear metal objects on your arms and lean over battery.**
- **Because the battery electrolyte is made of diluted sulfuric acid and is corrosive, when handling battery wear safety glasses and rubber gloves to protect the eyes and hands.**

WARNING ⚠

- **Make sure that you disconnect battery cable (–) first when you disconnect battery cables.**

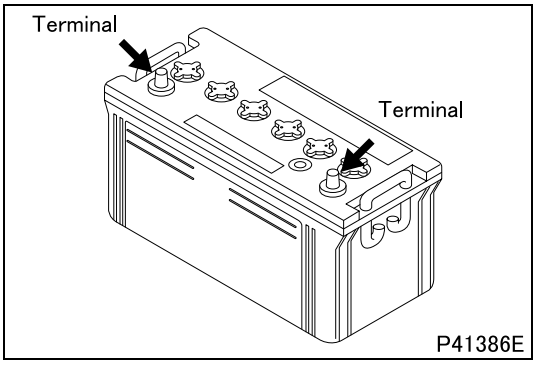
CAUTION ⚠

- **Make sure that all electrical switches of the vehicle are OFF before connecting battery cables.**
- **Make sure that you connect battery cable (+) before you connect battery cable (–).**
- **To prevent a short-circuit be sure that disconnected battery cables do not accidentally touch the battery terminals.**

Service standards

Location	Maintenance item	Standard value	Limit	Remedy
–	Specific gravity of battery electrolyte (20°C {68°F})	1.280	1.220	Charge or replace

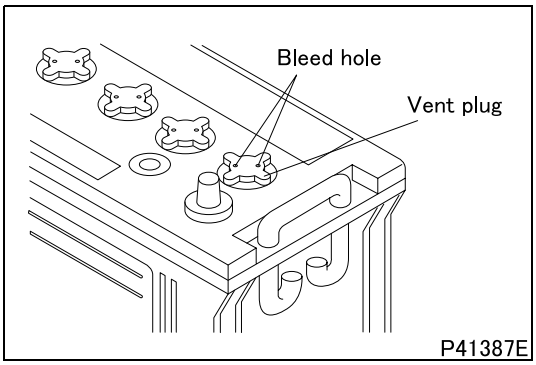
◆Service procedure◆



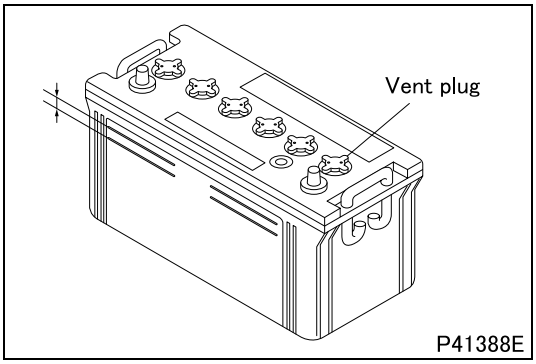
Inspection of battery

(1) Visual inspection

- If terminal is corroded, scrub off the corrosion from it using a wire brush.
- If cracks or defects are found on battery, replace it since the cracks or defects can cause liquid spills.

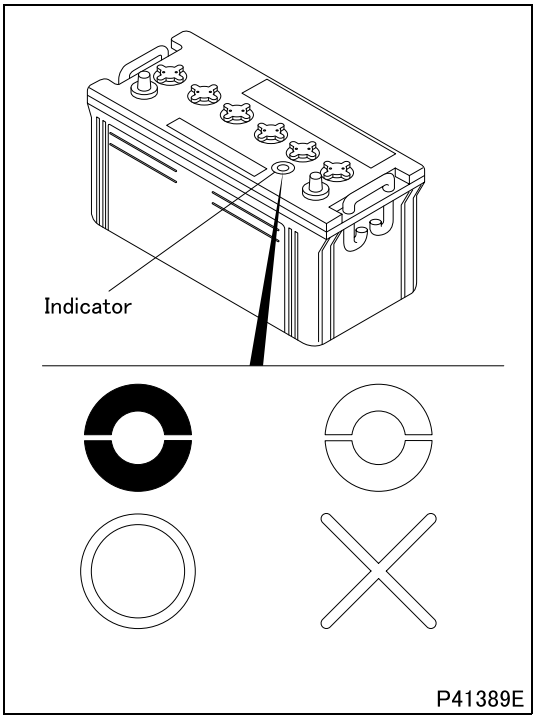


- If bleed hole of vent plug is clogged, clean the hole.



(2) Inspection of fluid level

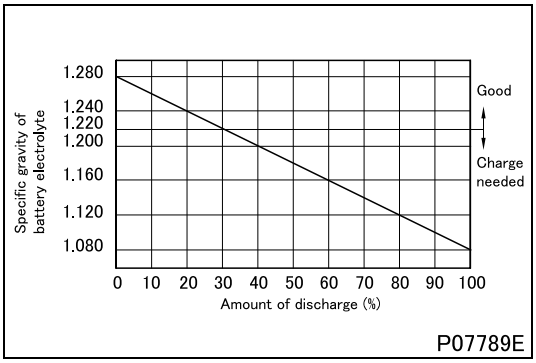
- Make sure that the battery electrolyte level is between UPPER and LOWER.
- If the level is below LOWER, remove vent plug and fill the battery with distilled water or battery replenisher to UPPER.



(3) Measurement of specific gravity

You can tell the specific gravity of the battery electrolyte by the color shown in indicator.

Blue : Good
White : Charge or replace



(4) Charging

- Although, as a rule, battery charging should be done with the battery removed from the vehicle, if you have to charge the battery while it is on the vehicle, make sure that you stop the engine and disconnect battery cable (–).
- Remove vent plug before charging the battery.
- For the recommended charge time and current, see the following table to avoid overcharging.

	Charge current (A)	Charge time (H)	Upper limit of fluid temperature (°C {°F})
Normal charge	Value of 5-hour rating capacity / 10	*Amount of discharge (Ah) / Charge current (A) × 1.2 (to 1.5)	45 {113}
Quick charge	Value of 5-hour rating capacity / 1.5	0.5	55 {131}

* Amount of discharge (Ah) =

$$\text{5-hour rating capacity (Ah)} \times \frac{\text{Amount of discharge (\%)}}{100}$$

- Use the graph shown on the left to calculate the amount of discharge (%).
- Use diluted sulfuric acid, made up of sulfuric acid and refined or distilled water, as the battery electrolyte.

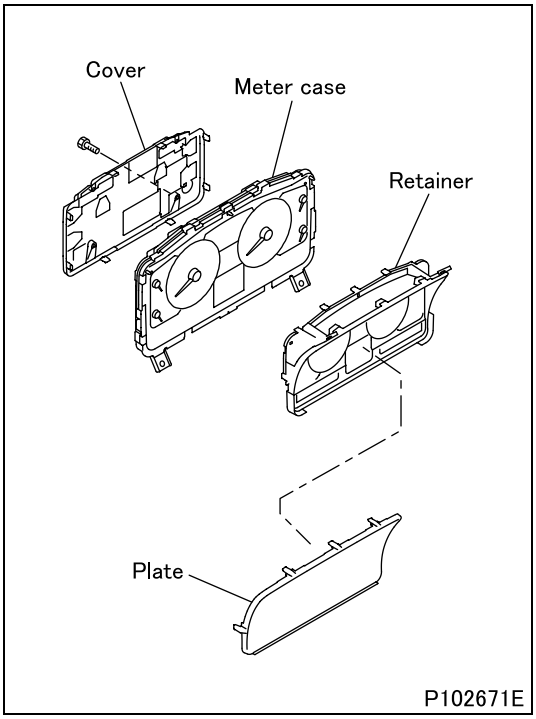
DANGER ⚠

- **Keep naked light away from the battery while charging to prevent explosion.**
- **It is dangerous to generate sparks while charging the battery.**
- **Do not charge battery if the electrolyte level is below LOWER LEVEL, since it can cause early deterioration, heating, or explosion. Make sure to add the fluid to the specified level before charging.**

WARNING ⚠

- **Do not let the battery electrolyte level rise and overflow while charging the battery.**
- **After charging the battery, tighten vent plug, wash away sulfuric acid from the battery using water, and dry the surface.**

#890 METER

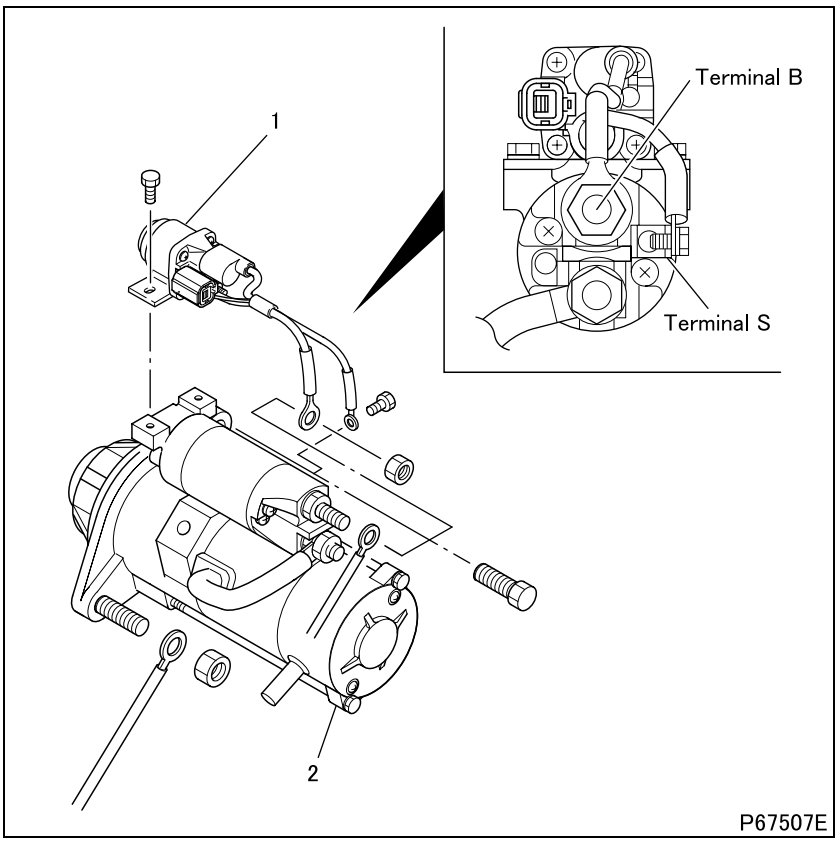


#890 Meter cluster

- Each sensor signal is converted into digital signal in the meter cluster and then the value is indicated by the corresponding meter on the cluster. Therefore, a signal meter inspection cannot be performed.
  Each meter should be checked indirectly by checking its related harnesses and parts.
- If the related harnesses and parts are normal but the meter indication is faulty, replace the meter cluster.

54-12 STARTER AND ALTERNATOR

#930 STARTER



● **Removal sequence**

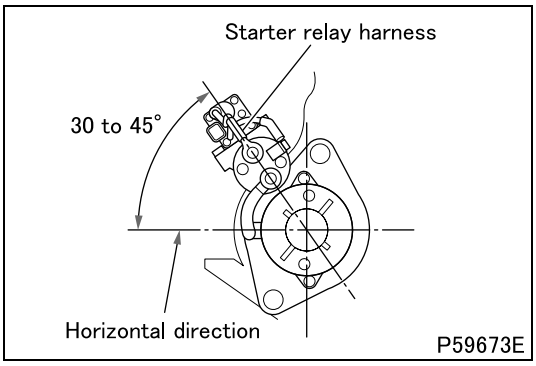
1 Starter relay
2 Starter

WARNING ⚠

- **Before removing the starter, disconnect the (–) battery cable and insulate the cable and the (–) battery terminal with tape.**
- **It is dangerous to leave the (–) battery cable connected since the battery voltage is always present at terminal B.**

● **Installation sequence**

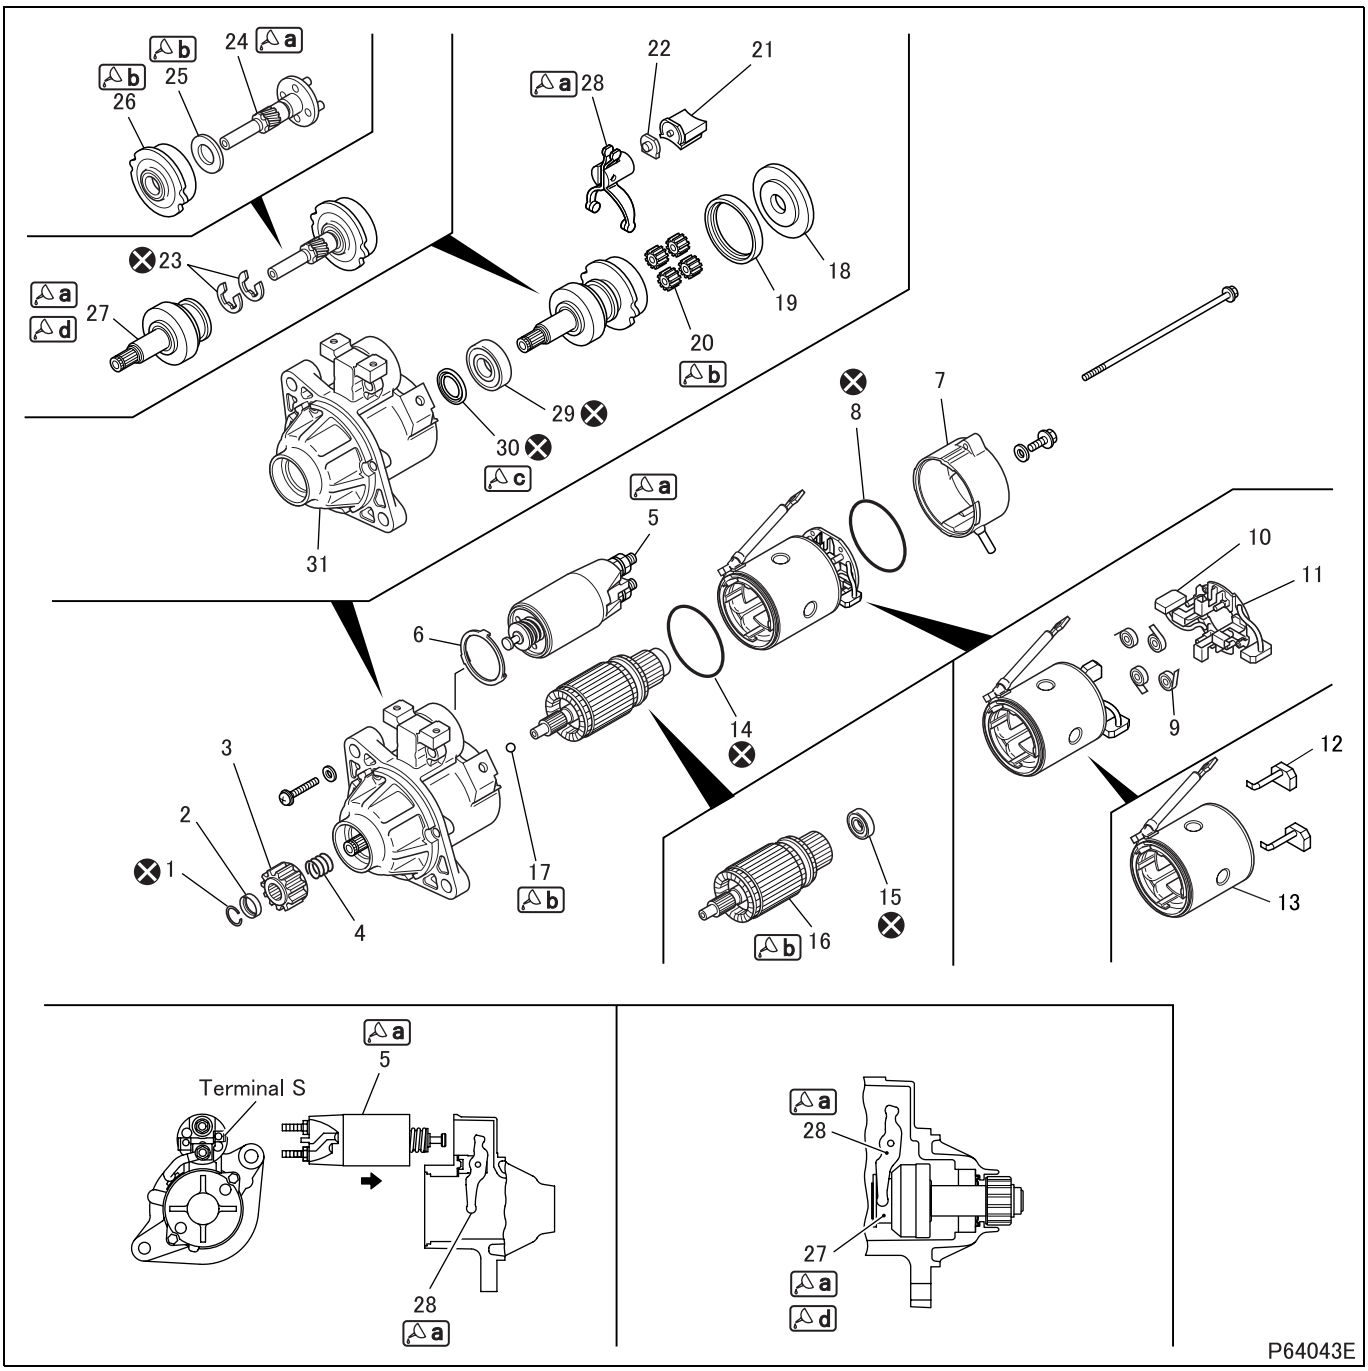
Follow the removal sequence in reverse.



- To prevent the interference with the air intake hose, route the starter relay harness within the range shown in the drawing.

M E M O

#930 STARTER



● **Disassembly sequence**

1 Stopper ring
2 Pinion stopper
3 Pinion
4 Spring
5 Magnetic switch
6 Shim
7 Rear bracket
8 Packing
9 Brush spring
10 Brush (–)
11 Brush holder
12 Brush (+)

14 Packing
15 Rear bearing
16 Armature
17 Ball
18 Cover
19 Rubber packing
20 Planetary gear
21 Rubber packing
22 Plate
23 E-ring
24 Gear shaft
25 Washer
26 Internal gear
27 Overrunning clutch
28 Lever
29 Front bearing
30 Oil seal
31 Front bracket

⊗: Non-reusable parts

CAUTION ⚠

- **When the armature is removed, the ball may come out with it. Take care not to lose the ball.**

- Do not remove the rear bearing unless defects are evident.
- It is not necessary to remove the pinion when only the motor section needs to be disassembled for inspection, like when inspecting brushes and related parts.
- Be sure to remove the pinion before disassembling any other parts.

● Assembly sequence

Follow the disassembly sequence in reverse.

- Whenever the magnetic switch is replaced, the pinion gap must be adjusted.
- The rubber packing is serviceable if any defect is not found.

Service standards (Unit: mm {in.})

Location	Maintenance item			Standard value	Limit	Remedy
–	Pinion gap			0.5 to 2.0 {0.02 to 0.079}	–	Adjust
–	No-load characteristics	With 11 V applied	Current	230 A or less	–	Correct or replace
			Rotation speed	3400 rpm or higher	–	
9	Brush spring pressure			33 to 45 N {7.5 to 10 lbs, 3.4 to 4.6 kgf}	17.7 N {4 lbs, 1.8 kgf}	Replace
10, 12	Brush length			18 {0.71}	11 {0.43}	Replace
17	Commutator outside diameter			38.7 {1.52}	38.1 {1.50}	Replace
	Runout of commutator periphery			–	0.1 {0.0039} or higher	
	Mold depth between segments			0.5 to 0.8	0.2 {0.0079} or less	Correct or replace

Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Lever contact surface of magnetic switch	Multipurpose grease [NLGI No. 2 (Li soap)]	As required
	Sliding surfaces of gear shaft and overrunning clutch		
	Sliding surfaces of lever and overrunning clutch

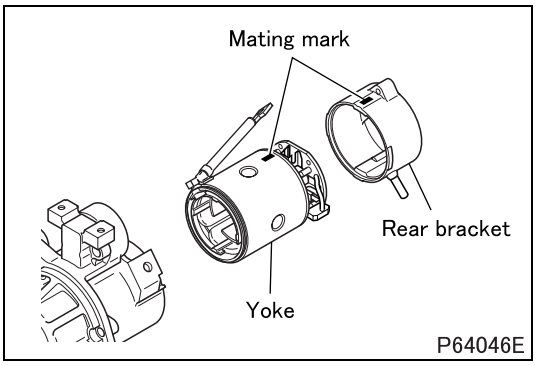
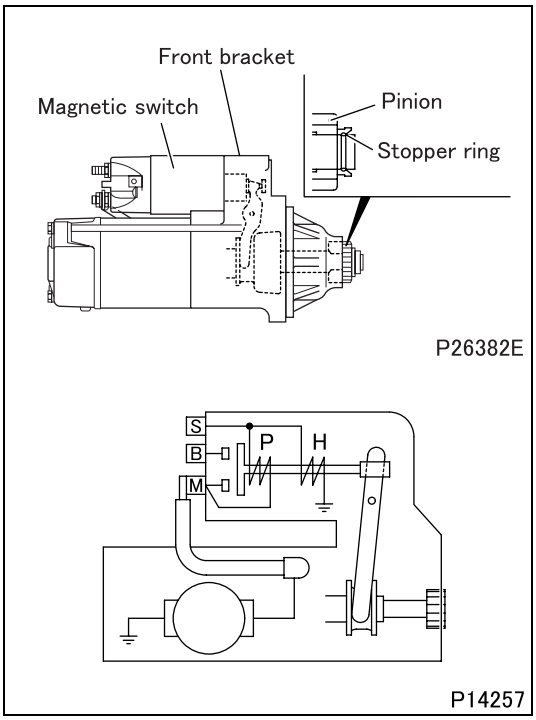
◆Work before disassembly◆



P64046E

■ **Mating mark: Rear bracket and yoke**

◆Disassembly procedure◆



P26382E

P14257

■ **Disassembly: Pinion**

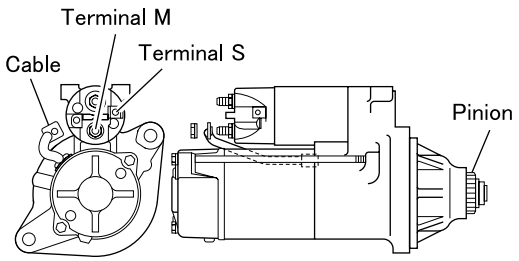
- For removal of the pinion, current must be supplied to the starter such that the pinion springs out.

WARNING ⚠

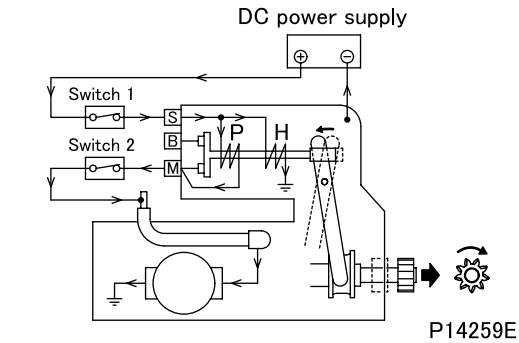
- **When the starter is energized, the pinion will spring out and rotate. Be careful not to touch it with your hands.**
- **The magnetic switch may become very hot during inspections. Be careful when touching it.**

CAUTION ⚠

- **Do not energize the pull-in coil P for longer than 10 seconds, and do not energize the holding coil H for longer than 30 seconds. If these periods are exceeded, the coils may overheat and burn out.**
- **To make the pinion spring out, be sure to energize the starter such that its parts are positioned correctly. If the starter is not energized and the lever is pulled to make the pinion come out, the front bracket and/or lever may be damaged by the shock inflicted upon them when the stopper ring is removed.**
- **When current is supplied to the starter, a large current (100 A or higher) will flow. For inspection purposes, use booster cables or similarly thick cables. It is also important to ensure that all connections are secure.**

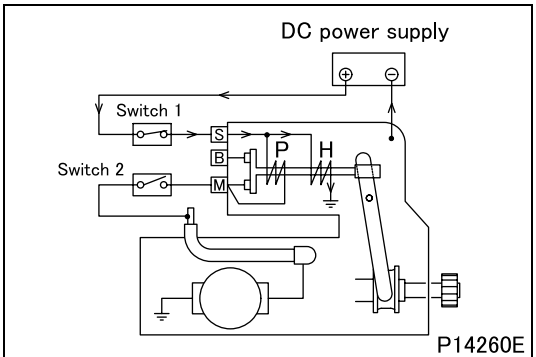


P26380E



P14259E

- Connect the starter as illustrated.
- The following operations are performed with current supplied to the starter. Thus, the entire procedure for removal of the pinion must be completed within 30 seconds.
  - Turn ON switches 1 and 2 to supply current to the starter. The pinion will spring out and rotate.

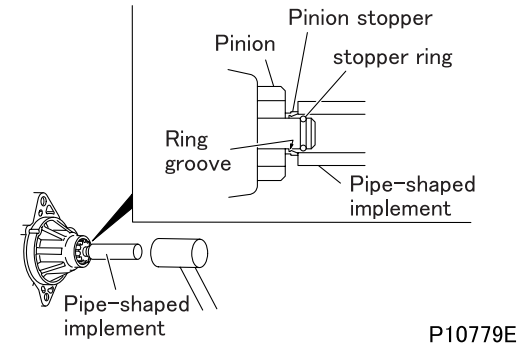


P14260E

- After the pinion starts to rotate, quickly (within five seconds) turn OFF switch 2 to stop the pinion's rotation.

CAUTION ⚠

- **When switches 1 and 2 are turned ON, the pull-in coil P and holding coil H are both energized. The circuit is connected such that no voltage is applied to starter terminal B, so current flows to the pull-in coil while the pinion rotates. To prevent the pull-in coil from burning out, it is essential to turn OFF switch 2 quickly (within five seconds) after the pinion starts to rotate.**

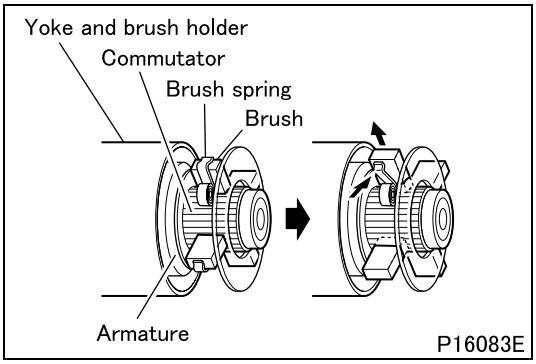


P10779E

- Apply a pipe-shaped implement to the pinion stopper.
- Using a hammer, lightly tap the pipe-shaped implement to remove the stopper ring from the ring groove of the pinion stopper.
- Remove the stopper ring and pinion.
- Turn OFF switch 1 to de-energize the starter.

CAUTION ⚠

- **When the starter is de-energized, the mechanism will attempt to pull in the pinion. Thus, the stopper ring may slip back into the ring groove of the pinion stopper. If this happens, energize the starter and go through the pinion removal procedure again.**



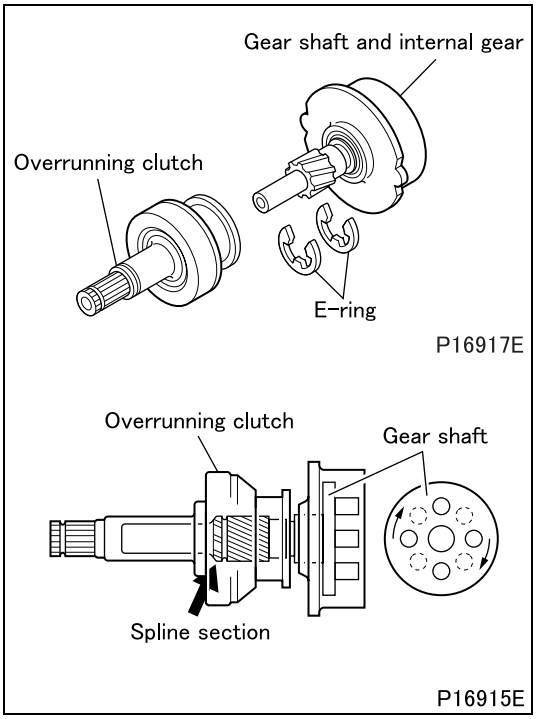
■ **Disassembly: Yoke and brush holder**

- Use the following method to remove the yoke and brush holder in order to prevent the commutator of the armature from being damaged by the brushes.
  - Lift the brushes away from the commutator and hold them lifted by applying the brush springs against the sides of the brush springs.

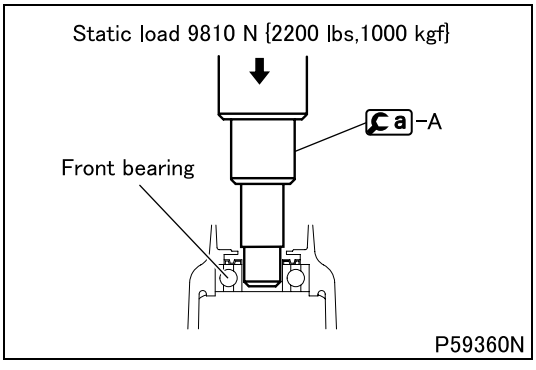
  - Pull part A of each brush spring and pull up the brushes.
  - Hold the brushes in position with the brush springs as illustrated.
  - Remove the yoke and brush holder.

■ **Disassembly: Gear shaft and internal gear**

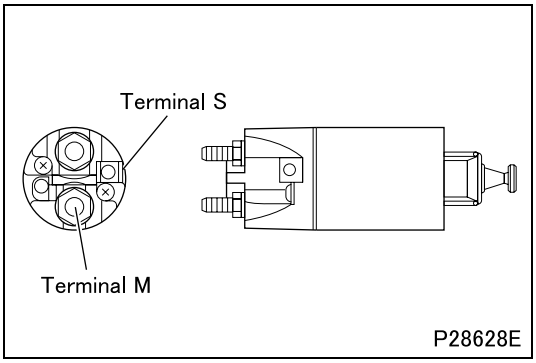
- Remove the E-rings and then the gear shaft and internal gear from the overrunning clutch.
  Proceed as follows if the gear shaft cannot be removed due to interference of the splined section of gear shaft with internal parts of the overrunning clutch.
  - Press the gear shaft against the overrunning clutch.
  - Turn the gear shaft approx. 1/8 of a turn to change the position of splined section.



■ **Disassembly: Front bearing**



◆Inspection procedure◆

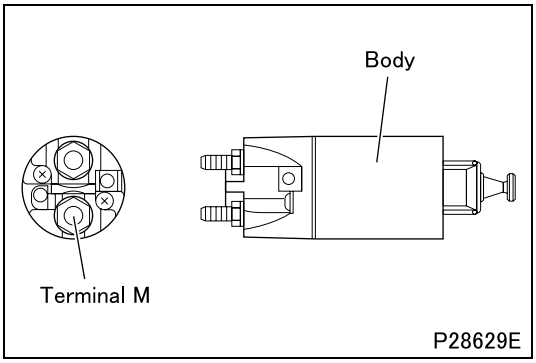


■ **Inspection: Magnetic switch**

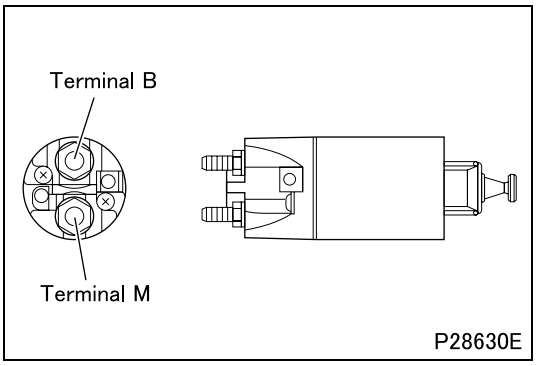
- Perform the following checks, and if any fault is found, replace the switch.

(1) Test for coil open circuit

- Check that continuity exists between terminals S and M.

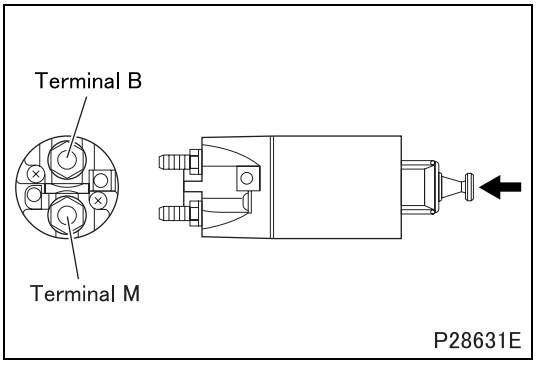


- Check that continuity exists between terminal M and the body.



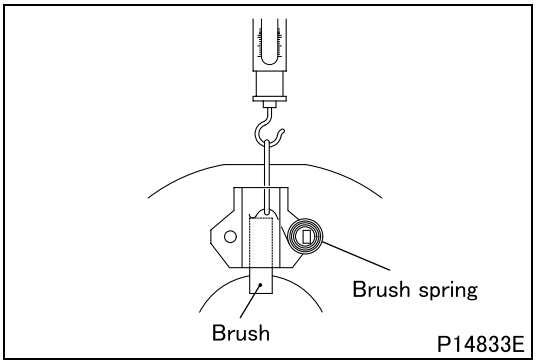
(2) Test for fused-together contacts

- Check that continuity does not exist between terminals B and M.



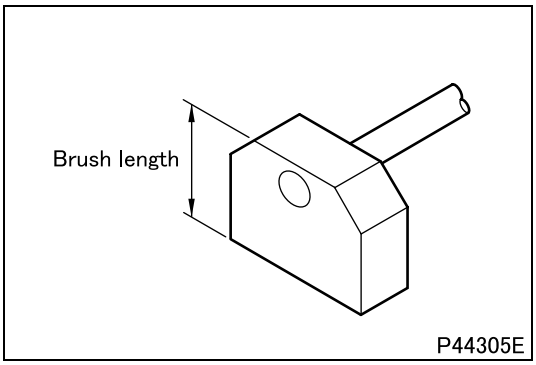
(3) Test for contact-to-contact continuity

- Push in the end of the magnetic switch to close the internal contacts. Then, check that continuity exists between terminals B and M.



■ **Inspection: Brush spring pressure**

- Using new brushes, measure the load required to separate each brush spring from its brush.
- If either measurement is lower than the specified limit, replace the brush springs.



■ **Inspection: Brush (–)**

(1) Brush length

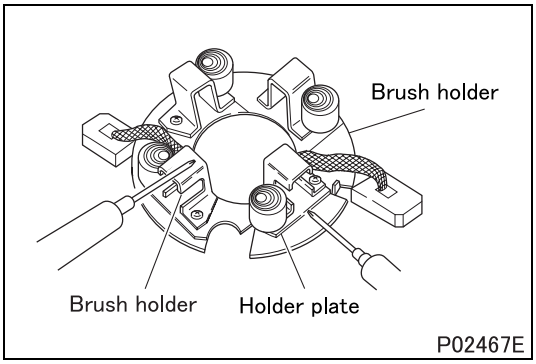
- If either brush (–) is shorter than the limit, it must be replaced.

CAUTION ⚠

- **Brush (–) must be replaced together with the brush holder.**

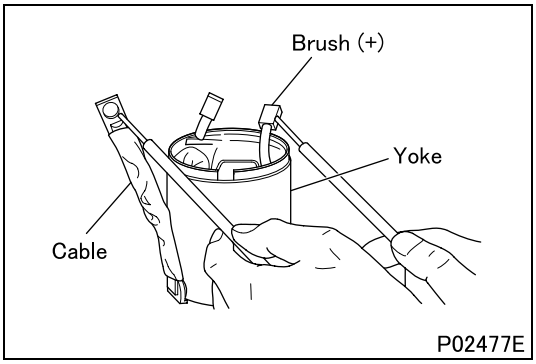
(2) Armature commutator contact surface of brush

- If the commutator contact surface of either brush is rough or unevenly worn, rectify it with emery paper (#300 to 500).



■ **Inspection: Brush holder**

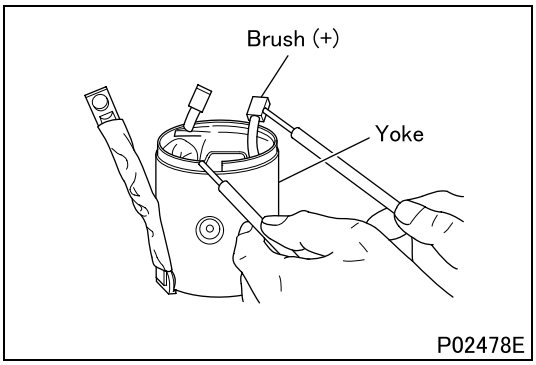
- Thoroughly clean the (+) brush holder and the (–) holder plate, then, check that continuity does not exist between them.
- If continuity exists, there is a short circuit and the brush holder must be replaced.



■ **Inspection: Yoke**

(1) Test for coil open circuit

- Check that continuity exists between the cable and the (+) brush.
- If there is no continuity, there is an open circuit and the yoke or (+) brush must be replaced.

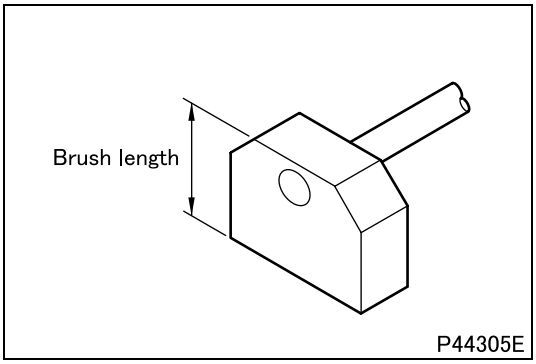


(2) Test for coil grounding

- Check that continuity does not exist between the yoke and the (+) brush.
- If continuity exists, the coil is grounded. Inspect the insulation, and replace the yoke and the (+) brush if the insulation cannot be rectified.

CAUTION ⚠

- **The coil may be grounded to the yoke due to the accumulation of worn-off metal particles from the brushes and/or armature.**



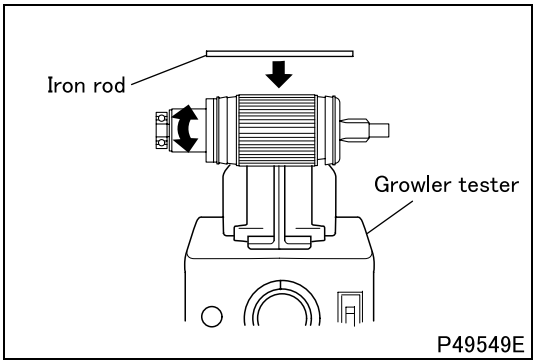
■ **Inspection: Brush (+)**

(1) Brush length

- If either brush (+) is shorter than the limit, it must be replaced.

(2) Armature commutator contact surface of brush

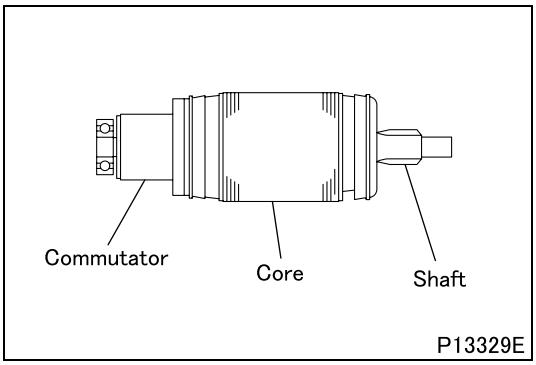
- If the commutator contact surface of either brush is rough or unevenly worn, rectify it with emery paper (#300 to 500).



■ **Inspection: Armature**

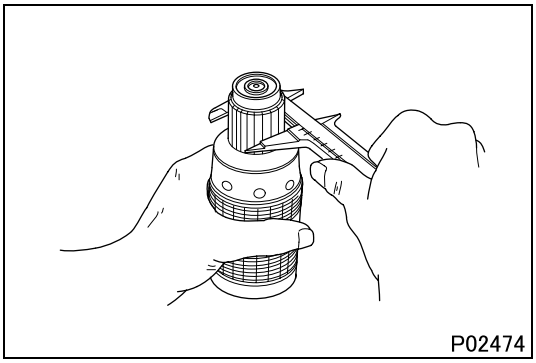
(1) Test for coil short circuit

- Hold an iron rod parallel with the armature.
- Slowly rotate the armature by hand.
- If the iron rod vibrates or is pulled toward the armature, the coil is short-circuited and the armature must be replaced.



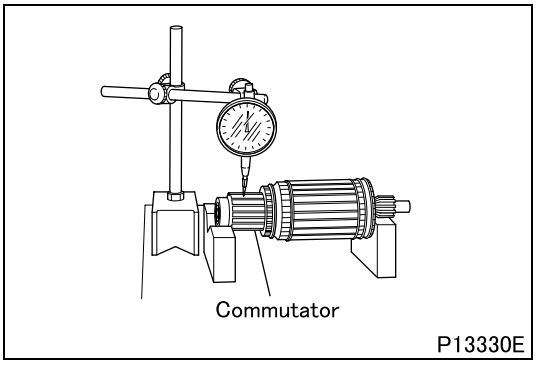
(2) Test for coil grounding

- Check that continuity does not exist between the commutator and the core (or shaft).
- If continuity exists, the coil is grounded and the armature must be replaced.



(3) Commutator outside diameter

- If the measurement is out of specification, replace the armature.

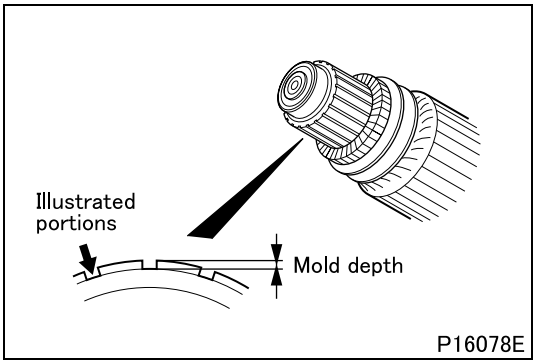


(4) Runout of commutator periphery

- If the reading exceeds the specified limit, rectify the commutator of the armature, making sure the outside diameter stays within specification.

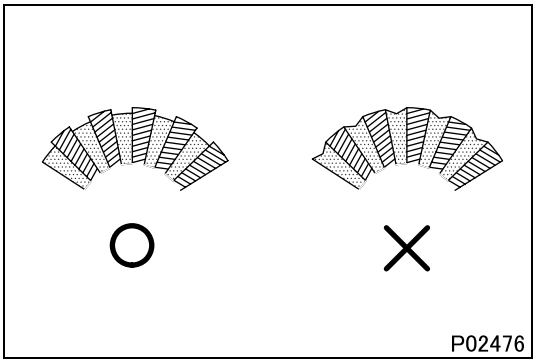
(5) Condition of commutator surface

- If the surface is rough or has stepped wear, rectify it with emery paper (#300 to 500).
- After rectifying the surface, check the extent of commutator runout.



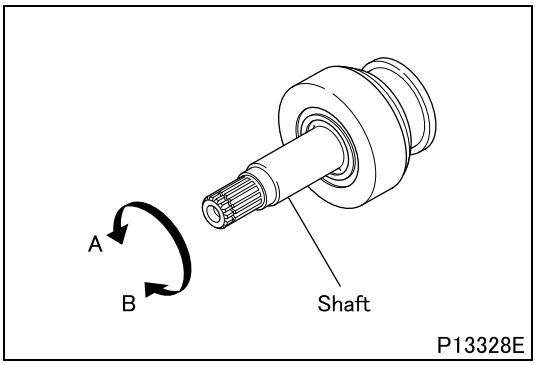
(6) Mold depth between segments

- If the measurement is lower than the specified limit, rectify or replace the armature.
- To rectify the armature, grind the illustrated portions.



- If the mold is worn as illustrated, rectify or replace the armature.

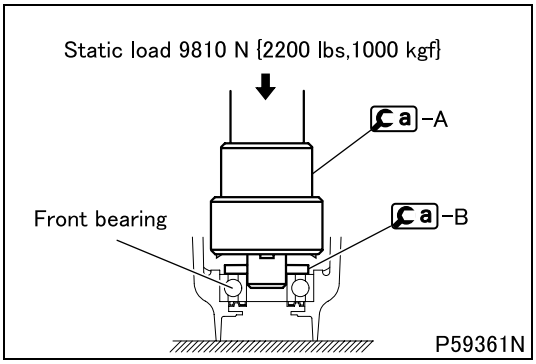
○: Acceptable
×: Unacceptable



■ Inspection: Overrunning clutch

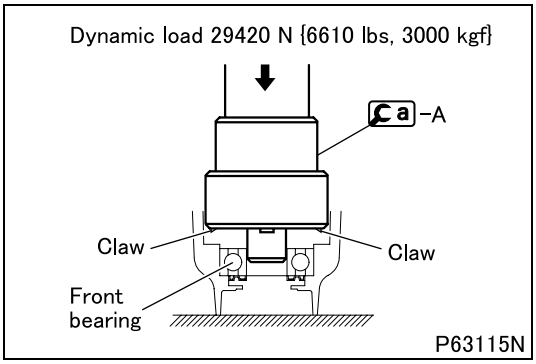
- If the following inspections reveal any abnormality, replace the overrunning clutch.
- Turn the shaft in direction B and check that it rotates smoothly.
- Turn the shaft in direction A and check that it locks.

◆Assembly procedure◆



■ Assembly: Front bearing

- Press-fit the front bearing using Ca-A and Ca-B.



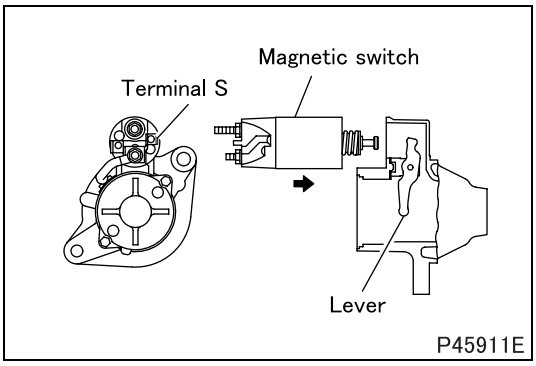
- After the press fitting, caulk the front bearing using the claws on Ca -A.

CAUTION ⚠

- **Avoid re-caulking previously caulked points.**

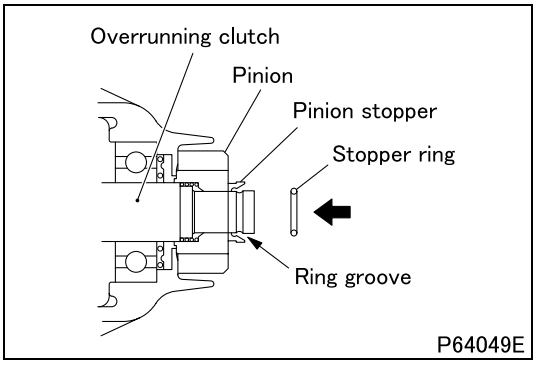
■ Assembly: Yoke and brush holder

- To install the yoke and brush holder, follow the removal sequence in reverse.
  (See "■ **Disassembly: Yoke and brush holder**".)



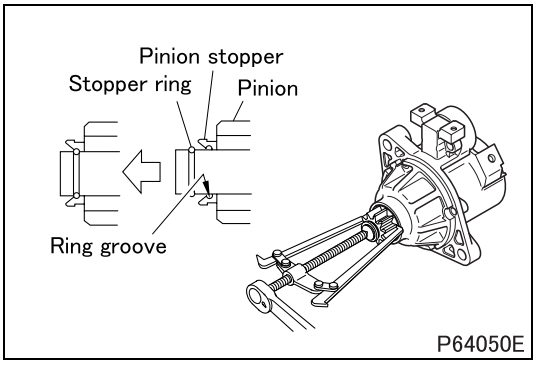
■ Assembly: Magnetic switch

- Fit the magnetic switch onto the lever with terminal S aligned as illustrated.



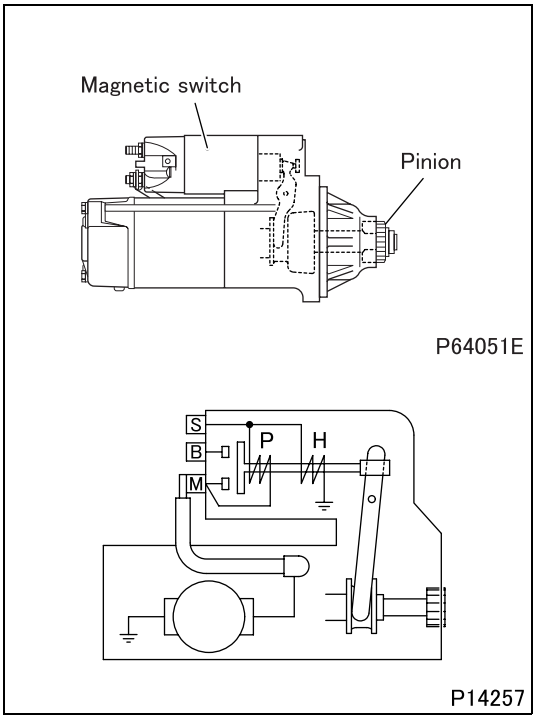
■ Assembly: Pinion

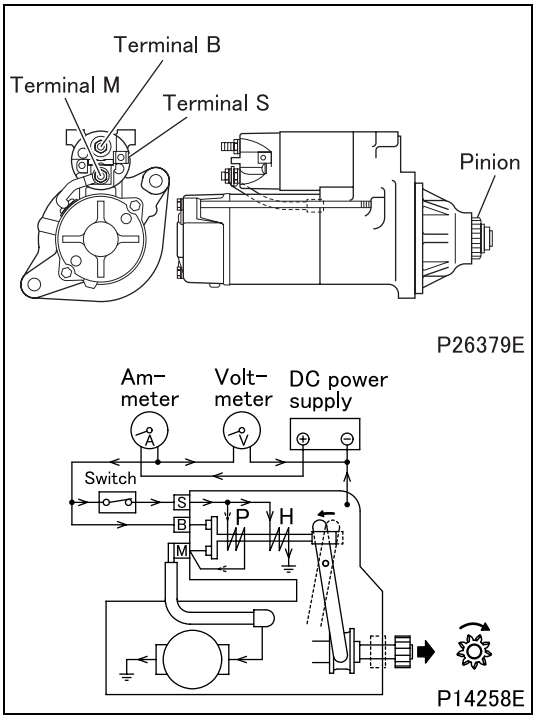
- For installation of the pinion, it is not necessary to supply current to the starter.
  - Fit the pinion stopper and pinion onto the overrunning clutch, making sure they are oriented as illustrated.
  - Fit the stopper ring into the ring groove of the overrunning clutch.



- Pull the pinion hard and securely fit the stopper ring into the ring groove of the pinion stopper.

◆Inspection after assembly◆





■ **Inspection: Performance and pinion gap**

- After assembling the starter, perform inspections with current supplied to it.

WARNING ⚠

- **When the starter is energized, the pinion will spring out and rotate. Be careful not to touch it with your hands.**
- **The magnetic switch may become very hot during inspections. Be careful when touching it.**

CAUTION ⚠

- **Do not energize the pull-in coil P for longer than 10 seconds, and do not energize the holding coil H for longer than 30 seconds. If these periods are exceeded, the coils may overheat and burn out.**
- **When current is supplied to the starter, a large current (100 A or higher) will flow. For inspection purposes, booster cables or similarly thick cables must therefore be used. It is also important to ensure that all connections are secure.**

(1) Performance test

- Connect the starter as illustrated.
- Set the voltage to 11 Volts DC.

CAUTION ⚠

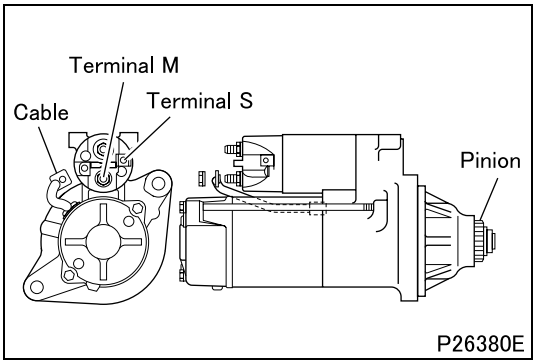
- **The voltage applied must not exceed 12 V.**

- The following operations are performed with current supplied to the starter. Thus, the entire test (consisting of measurement of the current flowing through the starter and measurement of the starter's rotational speed) must be completed within 30 seconds.
  - Turn ON the switch to supply current to the starter. The pinion will spring out and rotate.

CAUTION ⚠

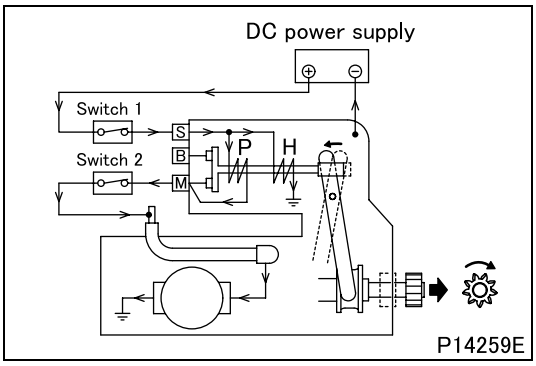
- **When the switch is turned ON, the pull-in coil P and holding coil H are both energized. When the large current from the DC power supply flows from terminal B to terminal M, the supply of current to the pull-in coil P is cut; only the holding coil H remains energized. To prevent the holding coil from burning out, it is essential to complete all operations within 30 seconds.**

  - Measure the current and the starter's rotational speed. To measure the rotational speed, shine a stroboscope on the pinion.
  - Turn OFF the switch to de-energize the starter.
- If either measurement is out of specification, disassemble and inspect the starter again.



(2) Pinion gap

- Connect the starter as illustrated.



- The following operations are performed with current supplied to the starter. Thus, the entire procedure for measurement of the pinion gap must be completed within 30 seconds.
  - Turn ON switches 1 and 2 to supply current to the starter. The pinion will spring out and rotate.

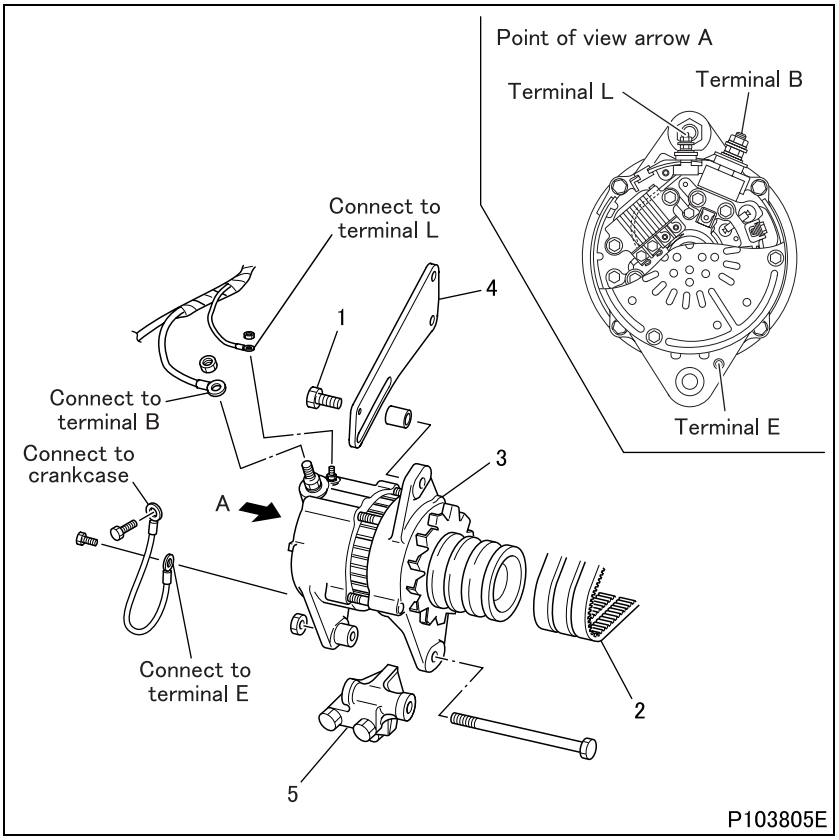
  - After the pinion starts to rotate, quickly (within five seconds) turn OFF switch 2 to stop the pinion's rotation.

CAUTION ⚠

- **When switches 1 and 2 are turned ON, the pull-in coil P and holding coil H are both energized. The circuit is connected such that no voltage is applied to starter terminal B, so current flows to the pull-in coil while the pinion rotates. To prevent the pull-in coil from burning out, it is essential to turn OFF switch 2 quickly (within five seconds) after the pinion starts to rotate.**

  - Pull out the end of the overrunning clutch and then lightly push in the end of the overrunning clutch and measure the amount of movement in the axial direction, i.e., the pinion gap.
  - Turn OFF switch 1 to de-energize the starter.
- If the measurement is out of specification, replace the lever.

#940 ALTERNATOR



● **Removal sequence**

1 Adjusting bolt
2 Belt
3 Alternator
4 Adjusting plate
5 Bracket

WARNING ⚠

- **Before removing the alternator, disconnect the (–) battery cable and insulate the cable and the (–) battery terminal with tape.**
- **It is dangerous to leave the (–) battery cable connected since the battery voltage is always present at terminal B.**

● **Installation sequence**

Follow the removal sequence in reverse.

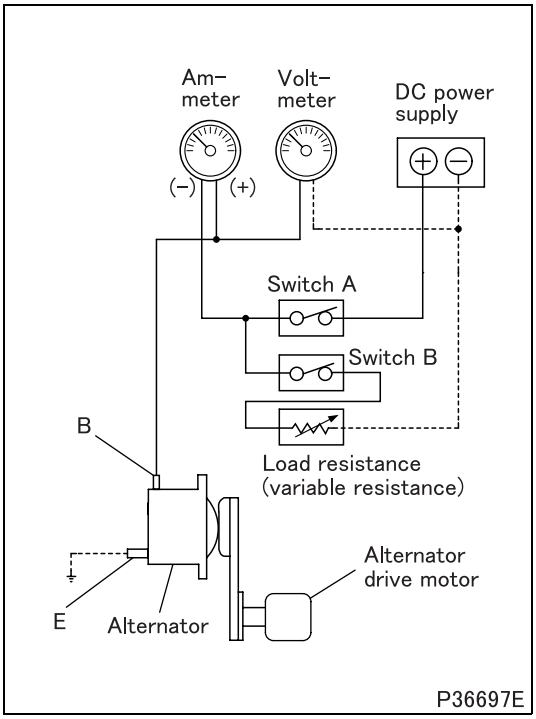
After installing the alternator, adjust the belt tension. (See Gr14.)

Service standards

Location	Maintenance item		Standard value	Limit	Remedy
3	Alternator output current (*when alternator is hot and producing 13.5 V)	At 1000 rpm	Approx. 20 A	–	Inspect
		At 2000 rpm	Approx. 80 A	–	
		At 3500 rpm	Approx. 100 A	–	
	Adjustment voltage of regulator (at 5000 rpm, 10 A is loaded)		14.2 ± 0.2 V	–	Replace

* The hot condition is that which occurs after the alternator has been running at normal ambient temperature with 5000 rpm and maximum output for 30 minutes.

◆Inspection procedure◆



■ Inspection: Alternator

(1) Alternator output current (bench test)

- Connect the alternator as illustrated.

CAUTION ⚠

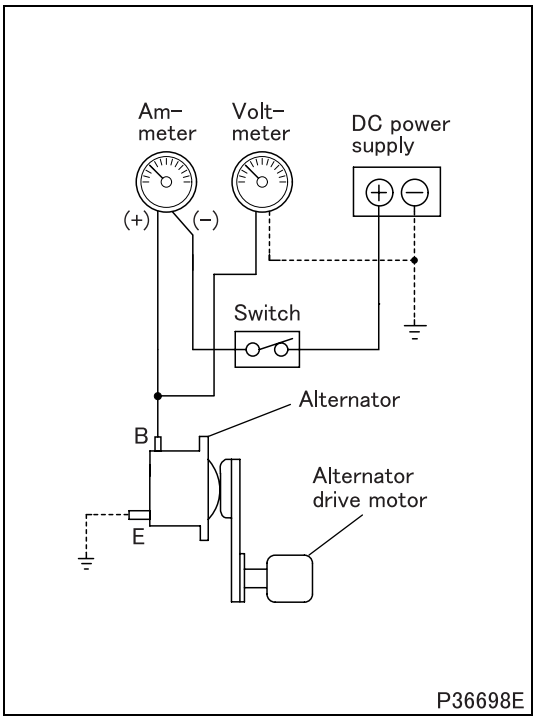
- **Wires with sufficient thickness should be used for wiring and each connection should be securely fastened.**

B: Terminal B
E: Terminal E

- Increase load resistance to the maximum (condition under which the load current hardly flows).
- Turn switch A and B ON.
- Run alternator at 5000 rpm for 30 minutes by adjusting load resistance so that electric current can conform to the following standard.
  Alternator nominal current

Current
Approx. 100 A

- Measure the current at each specified revolution of alternator.
- If the measured value is lower than the standard value, disassemble and check alternator.



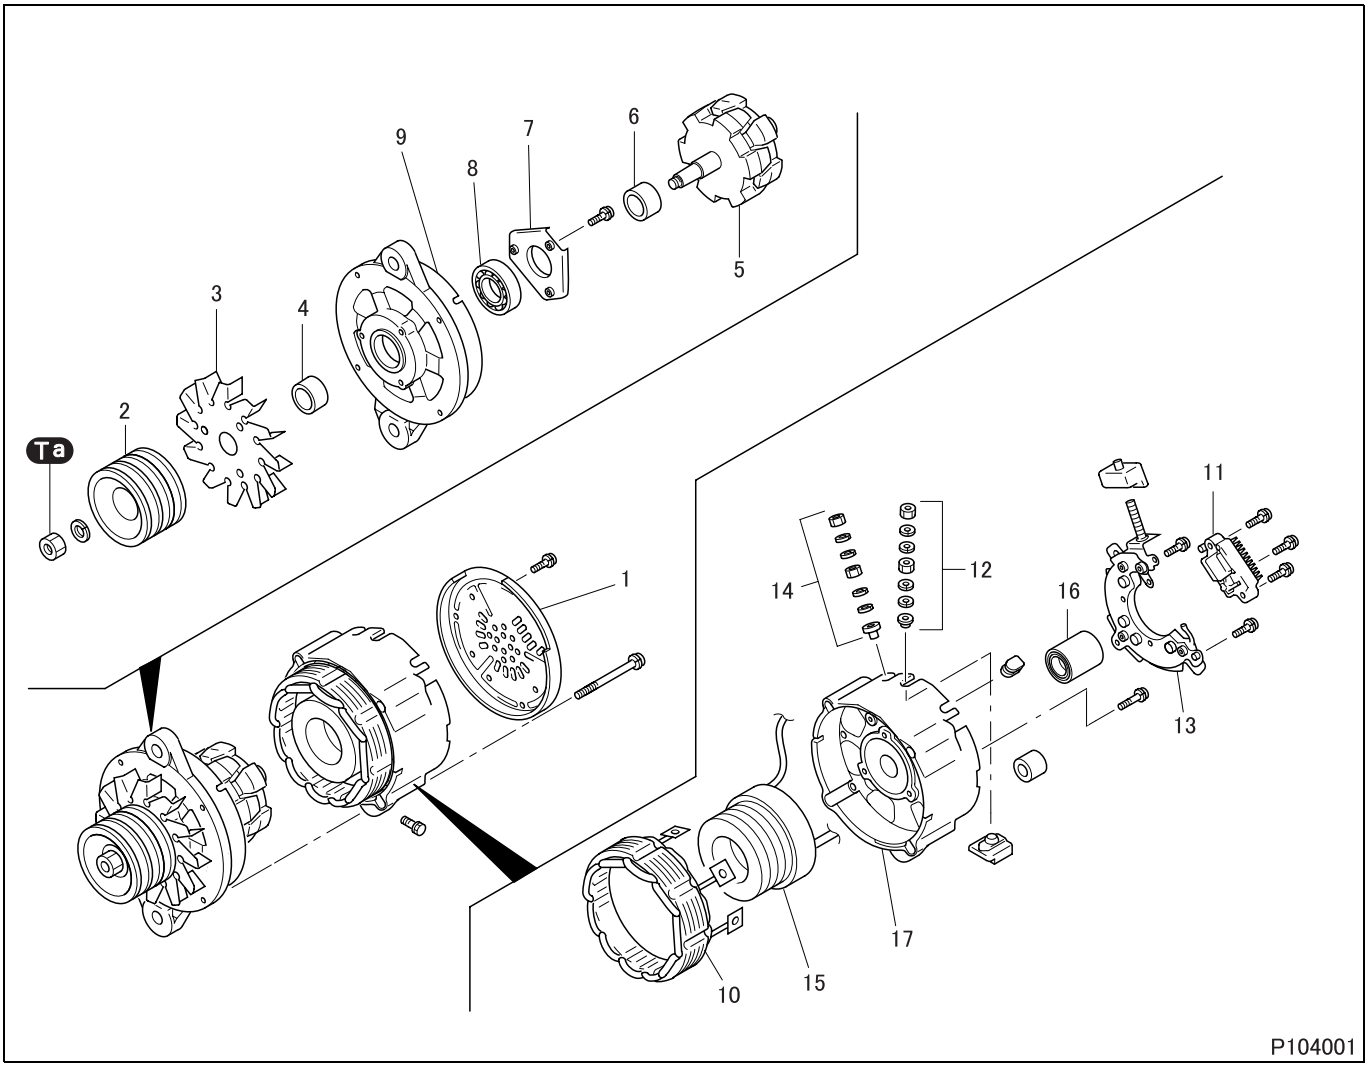
(2) Adjustment voltage of regulator (bench test)

- Connect the alternator as illustrated.

B: Terminal B
E: Terminal E

- Turn switch ON.
- Run alternator at low speeds.
- Increase the speed of alternator to 5000 rpm and measure the voltage (adjustment voltage) at this speed. At the same time, make sure that the current is 10 amperes or less at 5000 rpm.
- If the measured value deviates from the standard value, do as follows:
  - If higher than the standard value: Replace the regulator.
  - If lower than the standard value: Inspect the alternator related parts before replacing the regulator.

#940 ALTERNATOR



● **Disassembly sequence**

1 Rear cover
2 Pulley
3 Fan
4 Collar
5 Rotor
6 Collar
7 Bearing cover
8 Front bearing
9 Drive frame
10 Stator
11 Regulator
12 Terminal L
13 Rectifier
14 Terminal B
15 Exciting coil
16 Rear bearing
17 Rear frame

- Do not remove the front and rear bearing unless they are faulty.

● **Assembly sequence**

Follow the disassembly sequence in reverse.

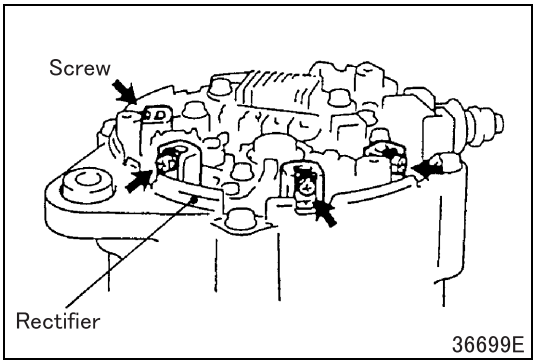
Service standards (Unit: mm {in.})

Location	Maintenance item	Standard value	Limit	Remedy
5	Outer diameter of the portion that presses into the front bearing	25.00 to 25.01 {0.9842 to 0.9846}	24.99 {0.9838}	Replace
	Outer diameter of the portion that presses into the rear bearing	16.99 to 17.00 {0.6689 to 0.6693}	16.98 {0.6685}	
	Outer diameter of the portion that joins with the pulley	22.189 to 22.202 {0.8735 to 0.8741}	22.18 {0.8732}	
10	Resistance between the coil outlet terminals	0.01 to 0.10 Ω	–	Replace
15	Resistance between the coil outlet terminal	2 to 3 Ω	–	Replace

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

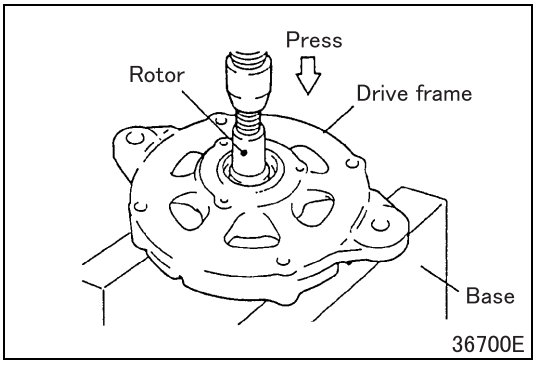
Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Nut (pulley mounting)	117.6 to 137.2 {26 to 31, 12 to 14}	–

◆Disassembly procedure◆



■ Disassembly: Drive frame

- Remove screw and separate the stator outlet terminal and the rectifier.

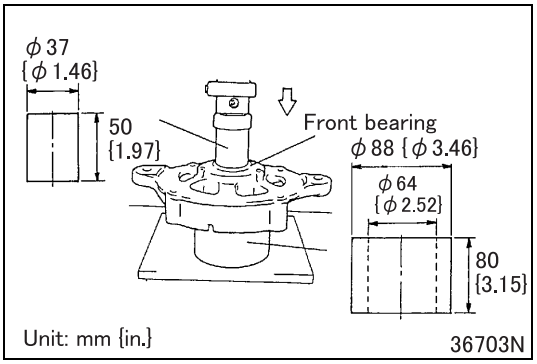


■ Disassembly: Rotor

- Using a press, remove the rotor from the drive frame.

CAUTION ⚠

- **Do not drop the rotor.**

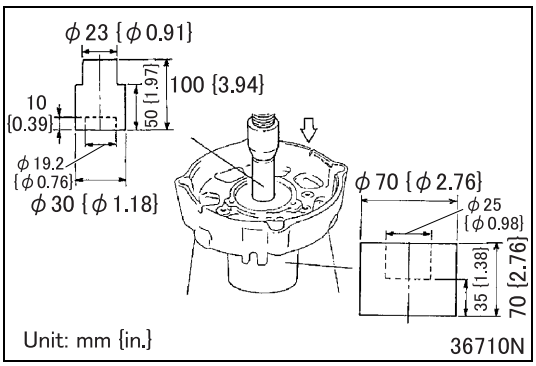


■ Disassembly: Front bearing

- Using a press, remove the front bearing from the drive frame.

CAUTION ⚠

- **Do not drop the front bearing.**



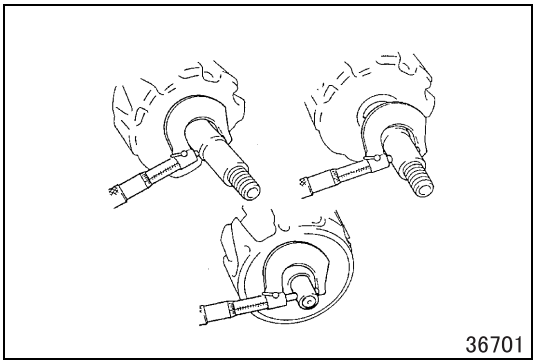
■ **Disassembly: Rear bearing**

- Using a press, remove the rear bearing from the rear frame.

CAUTION ⚠

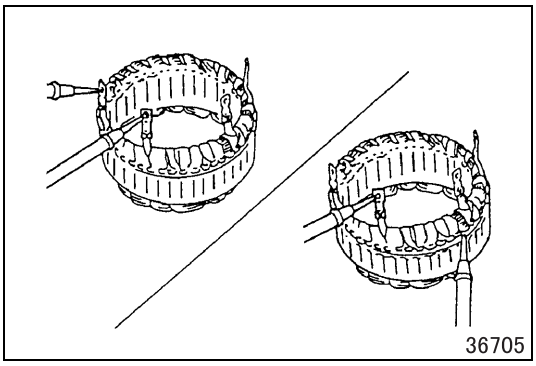
- **Do not drop the rear bearing.**

◆Inspection procedure◆



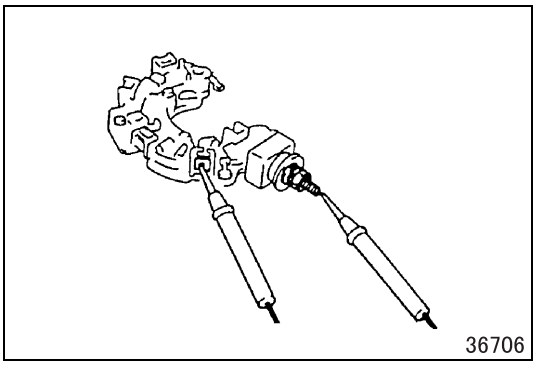
■ **Inspection: Rotor**

- Measure the outer diameter of the portion as shown.
- If the measured value deviates from the standard value, replace the rotor.



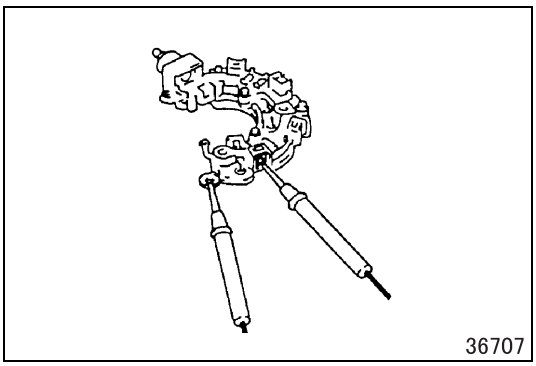
■ **Inspection: Stator**

- Measure the resistance between the coil outlet terminals. (using a circuit tester)
- Measure the resistance between the coil outlet terminal and core. (using a megger tester)
- If the measured value deviates from the standard value, replace the stator.

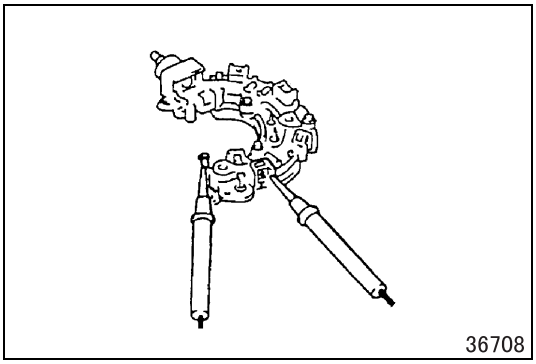


■ **Inspection: Rectifier**

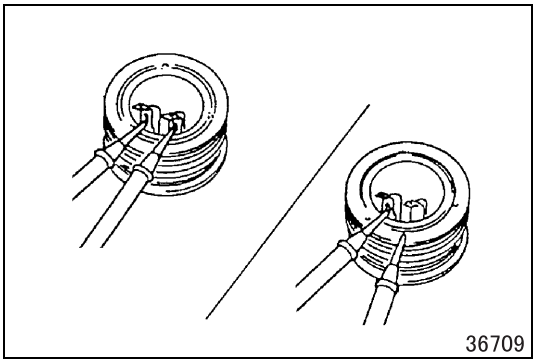
- Check for continuity between the terminal B and the heat sink.
- When polarity is changed, there is continuity in one direction but not in the opposite direction.



- Check for continuity between the terminal (–) and the heat sink.
- When polarity is changed, there is continuity in one direction but not in the opposite direction.



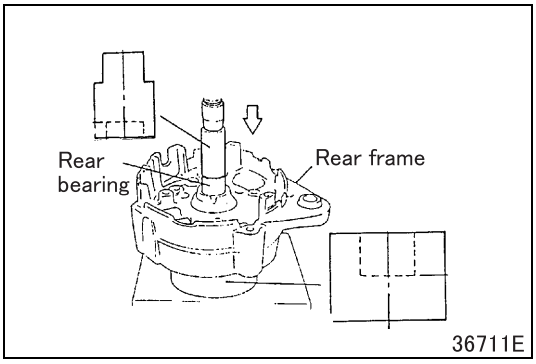
- Check for continuity between the auxiliary diode terminal and the heat sink.
- When polarity is changed, there is continuity in one direction but not in the opposite direction.



■ Inspection: Exciting coil

- Measure the resistance between the coil outlet terminal. (using a circuit tester)
- Measure the resistance between the coil outlet terminal and core.
- If the measured value deviates from the standard value, replace the exciting coil.

◆Assembly procedure◆

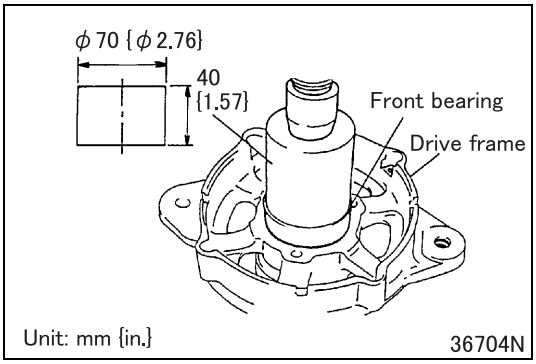


■ Assembly: Rear bearing

- Using a press, press a new rear bearing into the rear frame.

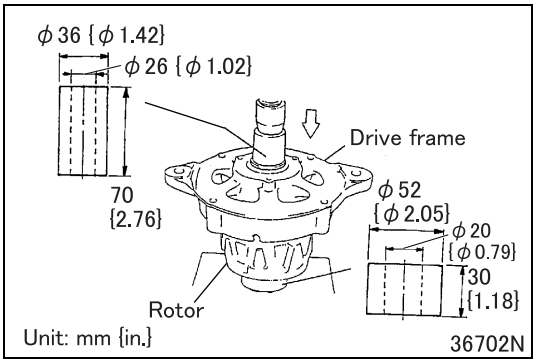
CAUTION ⚠

- **Once a bearing is removed, do not reuse it.**



■ **Assembly: Front bearing**

- Using a press, press the front bearing into the drive frame.



■ **Assembly: Rotor**

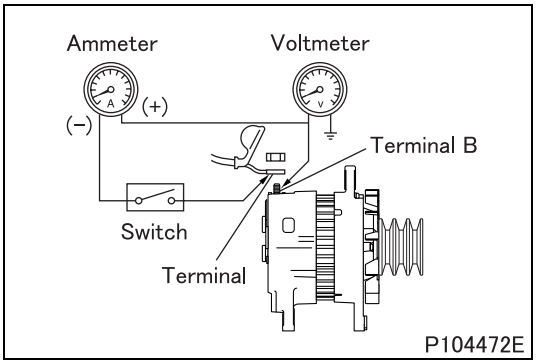
- Using a press, press the rotor into the bearing in the drive frame.

CAUTION ⚠

- **Press the rotor while making sure that the rotor's shaft is perpendicular to the bearing. During pressing, make sure not to damage the portion of the rotor that presses into the rear bearing.**

54-13 ON-VEHICLE INSPECTION AND ADJUSTMENT

#950 INSPECTION OF ALTERNATOR



Performance test

- The on-vehicle inspection is only a simplified check. Use a test bench for accurate checking.
- Connect the meters to the alternator as shown.

WARNING ⚠

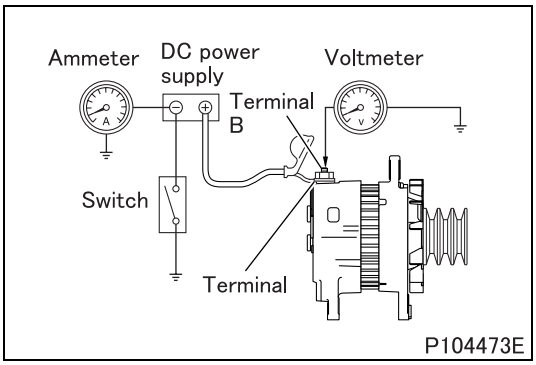
- **To prevent possible injury, be sure to disconnect the negative battery cable and insulate the cable and the negative battery terminal with tape before working on the wiring. With the negative (–) battery cable connected, battery voltage is always applied to terminal B.**
- **To connect to switch, use a lead wire with the same or larger diameter than that of the chassis harness connected to terminal B.**

- Turn on switch and make sure that voltmeter indicates battery voltage.
- Start the engine.
- Immediately turn on the switches for all lamps on the vehicle.
- Immediately accelerate the engine to the speed indicated below and measure the alternator's output current.
  Approx. 2400 rpm
- The alternator is considered to be good if the measured value is 70% or more of the nominal output current.
  Alternator nominal output

Voltage	Output current
12 V	100 A

Service standards

Location	Maintenance item	Standard value	Limit	Remedy
–	Adjusting voltage	14.2 ± 0.2 V	–	Replace



- Connect the meters to the alternator as shown.

WARNING ⚠

- **To prevent possible injury, be sure to disconnect the negative battery cable and insulate the cable and the negative battery terminal with tape before working on the wiring. With the negative (–) battery cable connected, battery voltage is always applied to terminal B.**
- **To connect to switch, use a lead wire with the same or larger diameter than that of the chassis harness connected to terminal B.**

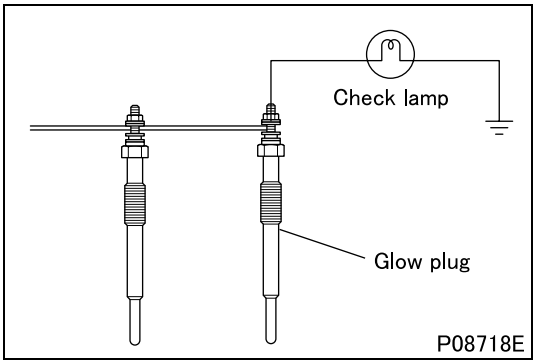
- Turn off the switches for lamps, heater, etc. so that electric loads may not be applied during the inspection.
- Turn on switch and then start the engine.
- If the output current is 5 amperes or less when the engine speed is raised to the appropriate speed indicated below, then measure the voltage at terminal B.
  Approx. 2400 rpm
- If the output current is 10 amperes or more, do one of the following:
  - Run the engine for a while to charge the battery.
  - Replace the battery with a fully-charged one.
- If the measured value deviates from the standard value, conduct checking again on the test bench.

#955 INSPECTION OF PREHEATING SYSTEM

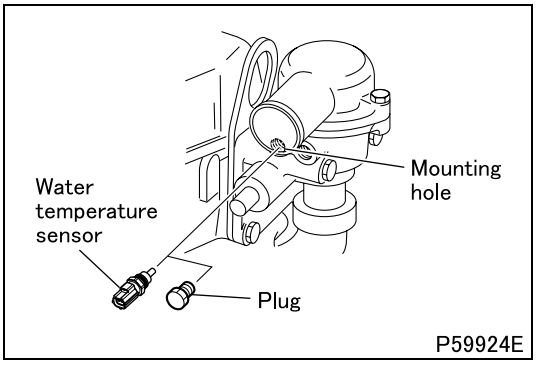
1. Preparation for inspection

Service standards

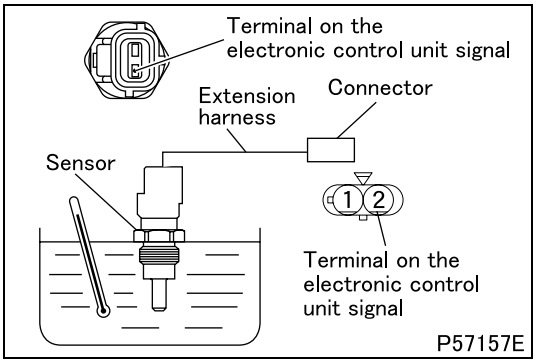
Location	Maintenance item			Standard value	Limit	Remedy
–	Coolant temperature	Pre-glow time	60°C {140°F} or higher	No pre-glow operation	–	Inspect
			0 to 60°C {32 to 140°F}	About 12 seconds	–	
			0°C {32°F} or below	About 12 seconds	–	
		After-glow time	60°C {140°F} or higher	No after-glow operation	–	
			0 to 60°C {32 to 140°F}	No after-glow operation	–	
			0°C {32°F} or below	About 20 seconds	–	
		Indicator lamp ON time	60°C {140°F} or higher	No illumination	–	
			0 to 60°C {32 to 140°F}	No illumination	–	
			0°C {32°F} or below	About 8 seconds	–	



- Turn the starter switch to OFF.
- Connect a check lamp to the glow plug.



- Remove the water temperature sensor from the engine, and close the sensor mounting hole with the plug (M16 × 1.5 mm).



- Connect the extension harness between the water temperature sensor and connector.
- Place the water temperature sensor in a container of water.
- Conduct the following test while changing the temperature of water in the container. If anything abnormal is found, check relevant components.

(1) Pre-glow time and indicator lamp ON time checking

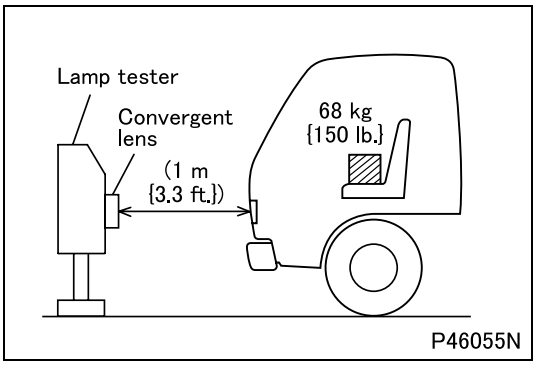
- Turn the starter switch to ON (without starting the engine), and confirm that the pre-glow time and indicator lamp ON time at each water temperature conform with standard values.
- Measure the illuminating time of the check lamp to measure the pre-glow time.
- Measure the meter cluster glow lamp illuminating time to measure the indicator lamp ON time.

(2) After-glow time checking

- Start the engine, and measure how long the illumination of check lamp lasts after the glow lamp on the meter cluster goes out to ensure that the after-glow time conforms with the standard value.

#960 HEADLAMP AIMING

1. Preparation before Adjustment

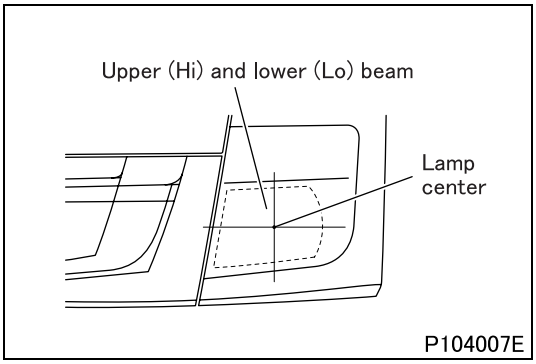


- Park the vehicle on a level place.

WARNING ⚠

- **Be sure to put tire chocks securely in place.**

- Unload the vehicle and make sure no one is in it.
- Inflate the tires to the specified pressure. (See Gr31.)
- Seat one person of an equivalent mass (68 kg {150 lb.}) in the vehicle.
- Start the engine and check that the battery is being charged.
- Place convergent lamp tester and the vehicle facing each other as shown in the drawing.
- Align the center of headlamp bulb and the center of convergent lens of convergent lamp tester. (The drawing shows the left-hand headlamp.)

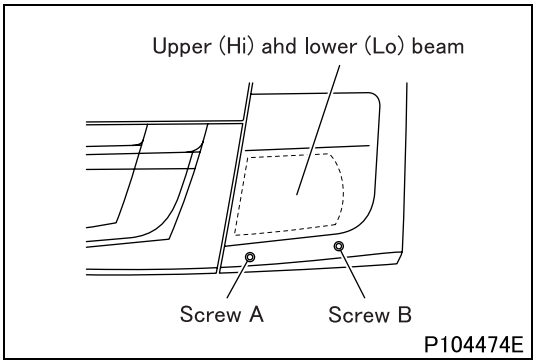


2. Adjustment

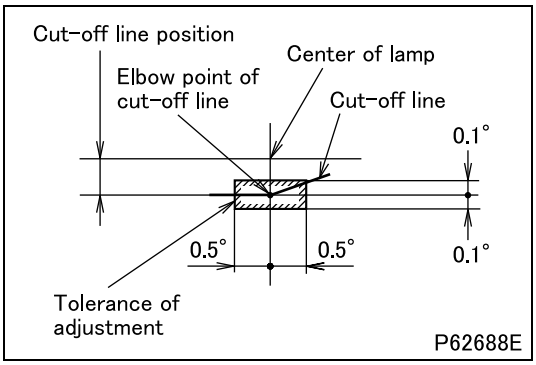
WARNING ⚠

- **Do not mask a lit headlamp for more than 10 minutes or the heat generated might cause a fire.**

2.1 Adjustment of lower beam



- Turn on lower beam.
- Make adjustment by the following procedure so that the elbow point of lower beam cut-off line is in the illustrated position.
- Vertical adjustment: Adjust by turning screws A and B in this order by the same amount.
- Horizontal adjustment: Turn screw B.



- Adjust the optical axes of the lower beams so that the cut-off line position can conform to the standard value.

	Standard value
Cut-off line position	0.69° <FK (leaf suspension)> 0.57° <FK (air suspension)> 0.86° <FM>

Adjusting direction for optical axis

<Left-hand headlamp>

	Upward	Downward	Leftward	Rightward
Screw A	Counter-clockwise	Clockwise	–	–
Screw B	Counter-clockwise	Clockwise	Clockwise	Counter-clockwise

<Right-hand headlamp>

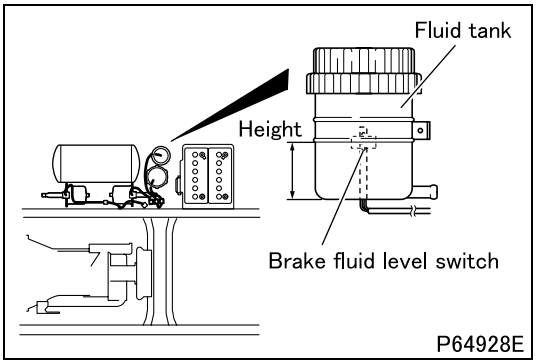
	Upward	Downward	Leftward	Rightward
Screw A	Counter-clockwise	Clockwise	–	–
Screw B	Counter-clockwise	Clockwise	Counter-clockwise	Clockwise

#965 INSPECTION OF BRAKE FLUID LEVEL SWITCH

<Center parking>

Service standards (Unit: mm {in.})

Location	Maintenance item	Standard value	Limit	Remedy
–	Warning lamp lighting position for brake fluid level switch	$57^{+3.5}_{-0.5}$ $\{2.24^{+0.14}_{-0.02}\}$	–	Replace



- Start engine.
- Drain the brake fluid gradually from fluid tank.

CAUTION ⚠

- **If brake fluid is spilt on any part of the vehicle, wipe it off immediately, since the solvent in the fluid can damage the paintwork.**

- Measure height of brake fluid level switch when warning lamp within the meter cluster lights.
- If the measured value deviates from the standard value, remove and check fluid tank.
- Removal, installation (See Gr35A.)
- Inspection (See #041.)

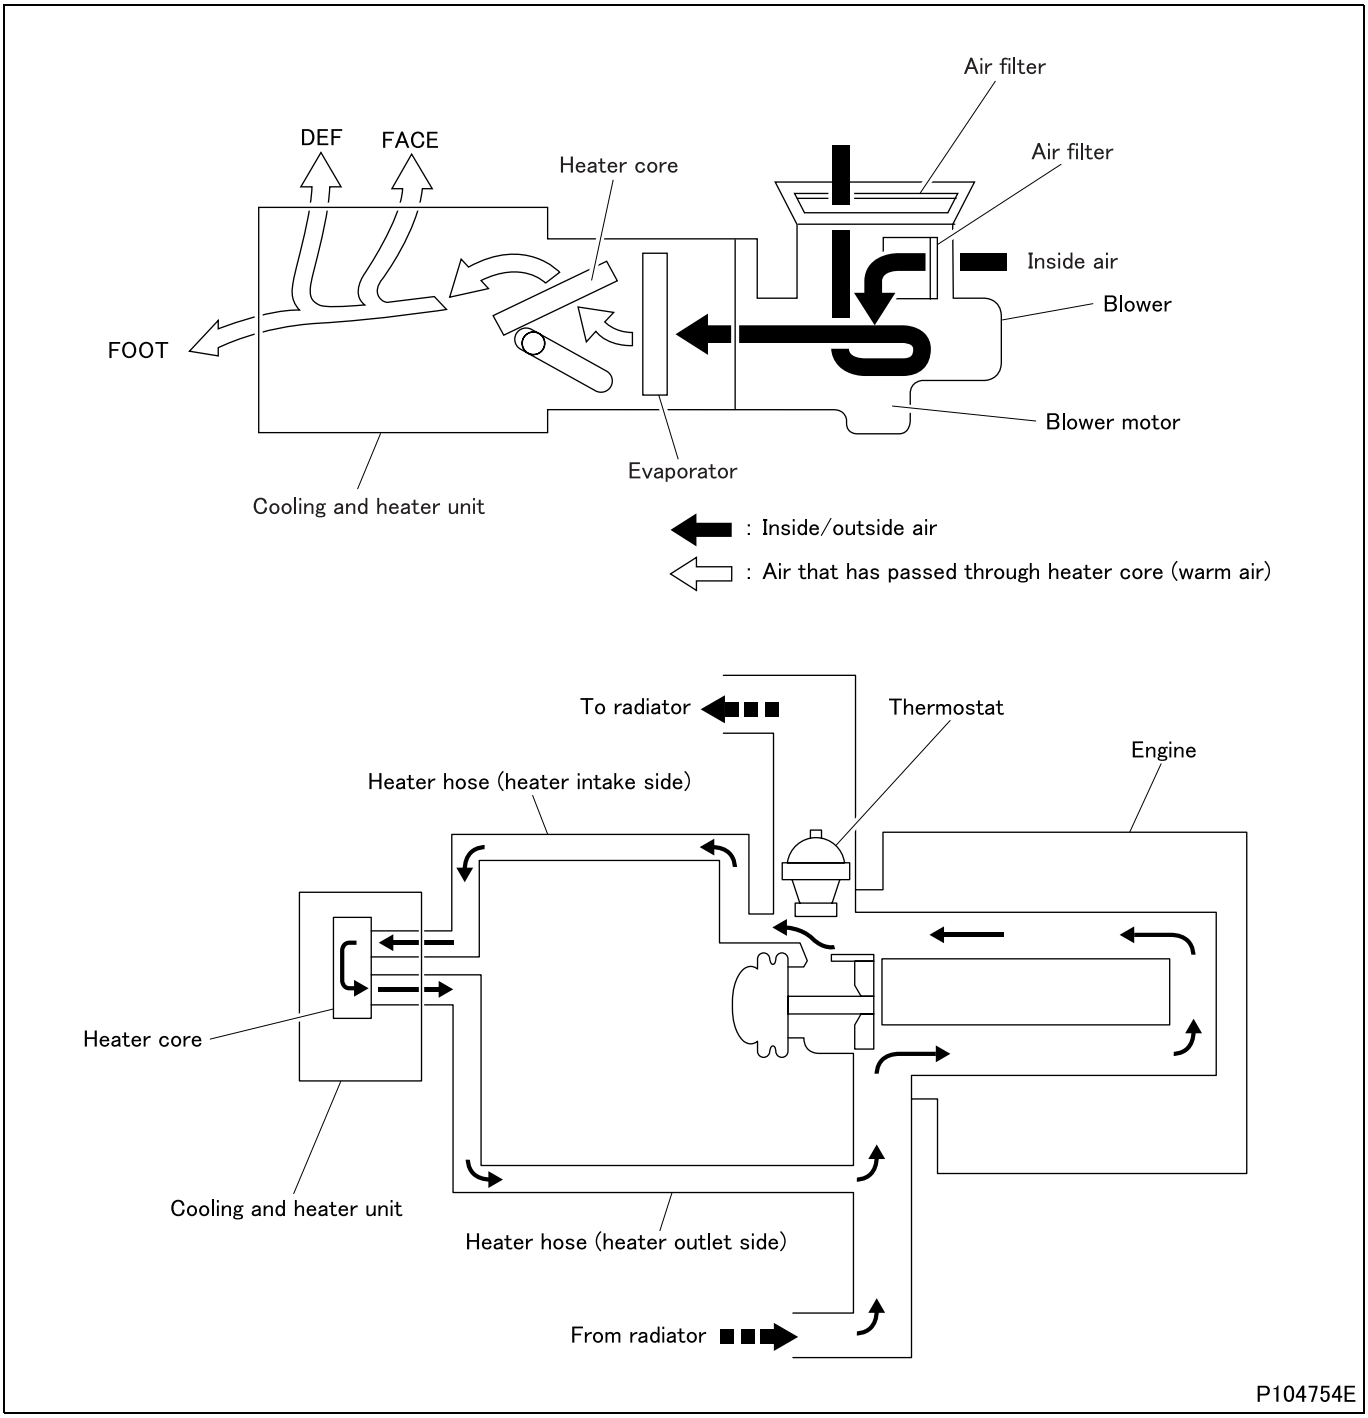
COOLING AND HEATER UNIT, BLOWER 55-28

SPECIFICATIONS

Item				Specifications
System	Refrigerant	Type		HFC134a
		Charged quantity g {oz}		350 {12.3}
	Damper change-over system	Mode selection		Manual cable type
		Air mixing		Manual cable type
		Ventilation/recirculation selection		Servomotor type
Servomotor rated voltage V				12
Cooling and heater unit		Manufacturer		DENSO
		Cooling capacity W {kcal/h}		4400 ± 440 {3780 ± 380}
		Heating capacity W {kcal/h}		5550 ± 555 {4773 ± 477}
		Temperature control system		Air mixing type
Blower		Manufacturer		DENSO
		Rated voltage V		12
Compressor		Manufacturer		DENSO
		Model		10S13C
		Discharge cm^3 {cu.in.}/1 rotation		138.3 {8.44}
		Lubricant	Type	ND-OIL8
			Quantity cm^3 {cu.in.}	$100\ ^{+15}_{0}$ {$6.10\ ^{+0.92}_{0}$}
Side condenser		Manufacturer		DENSO
		Rated voltage V		12
		Rated current A		6.5 ± 2

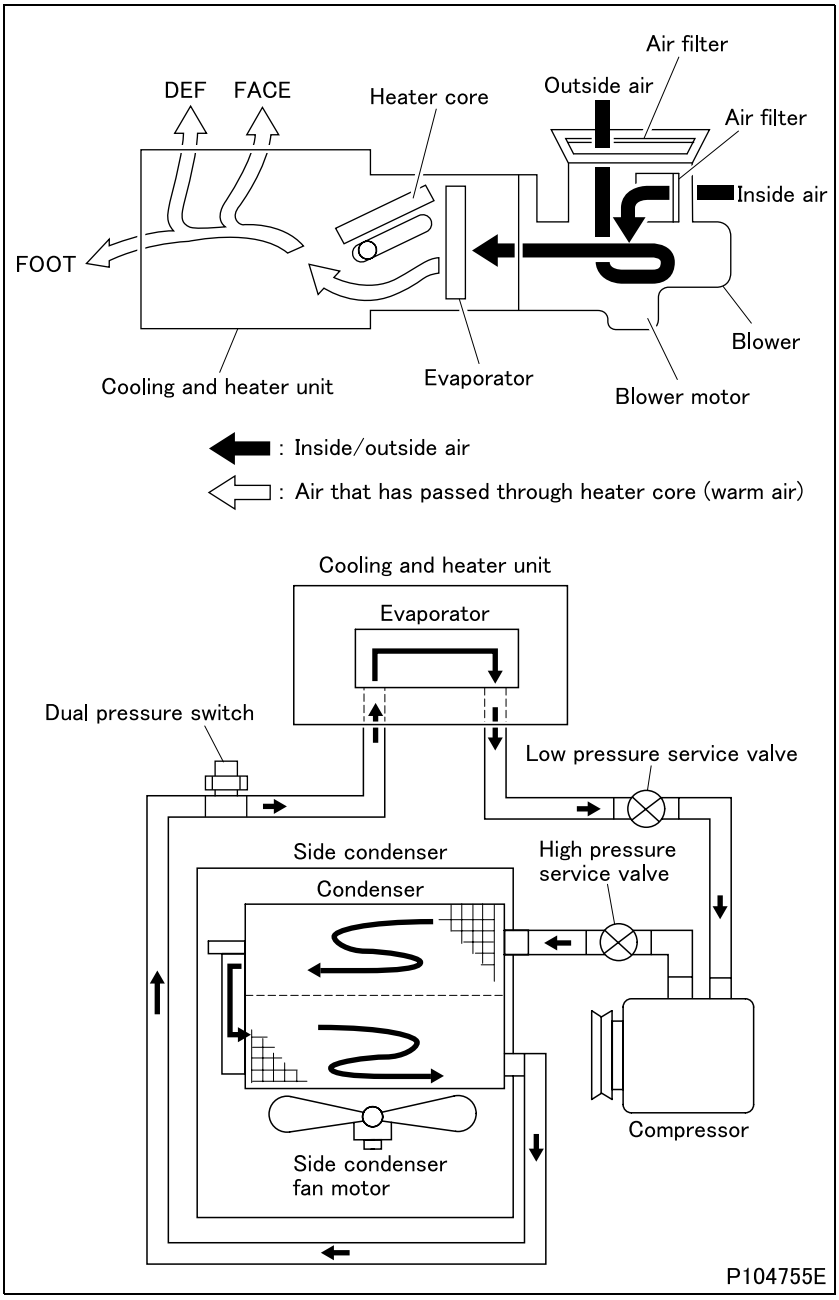
M E M O

1. Heater

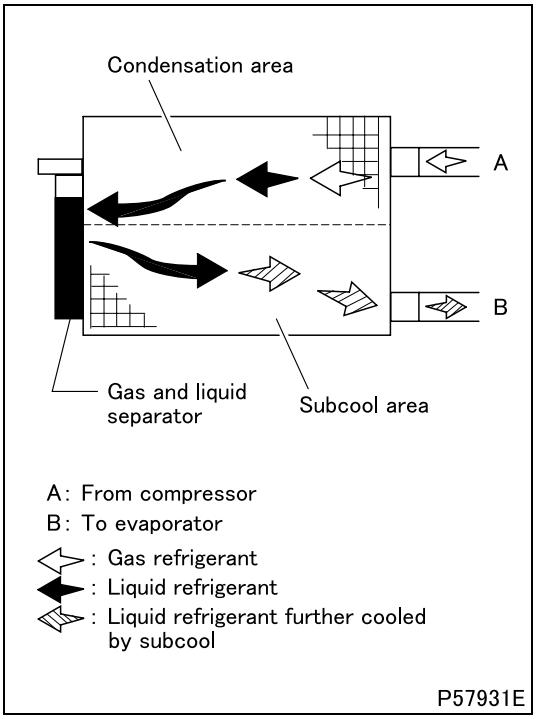


- The blower sends air to the cooling and heater unit, where the air is heated by the heater core (heat exchanger). The warmed-up air is then sent through the ducts into the cab.
- Water (engine coolant) warmed up by the heat from the engine circulates permanently through the heater core, irrespective of whether the thermostat is open or closed.

2. Air Conditioner



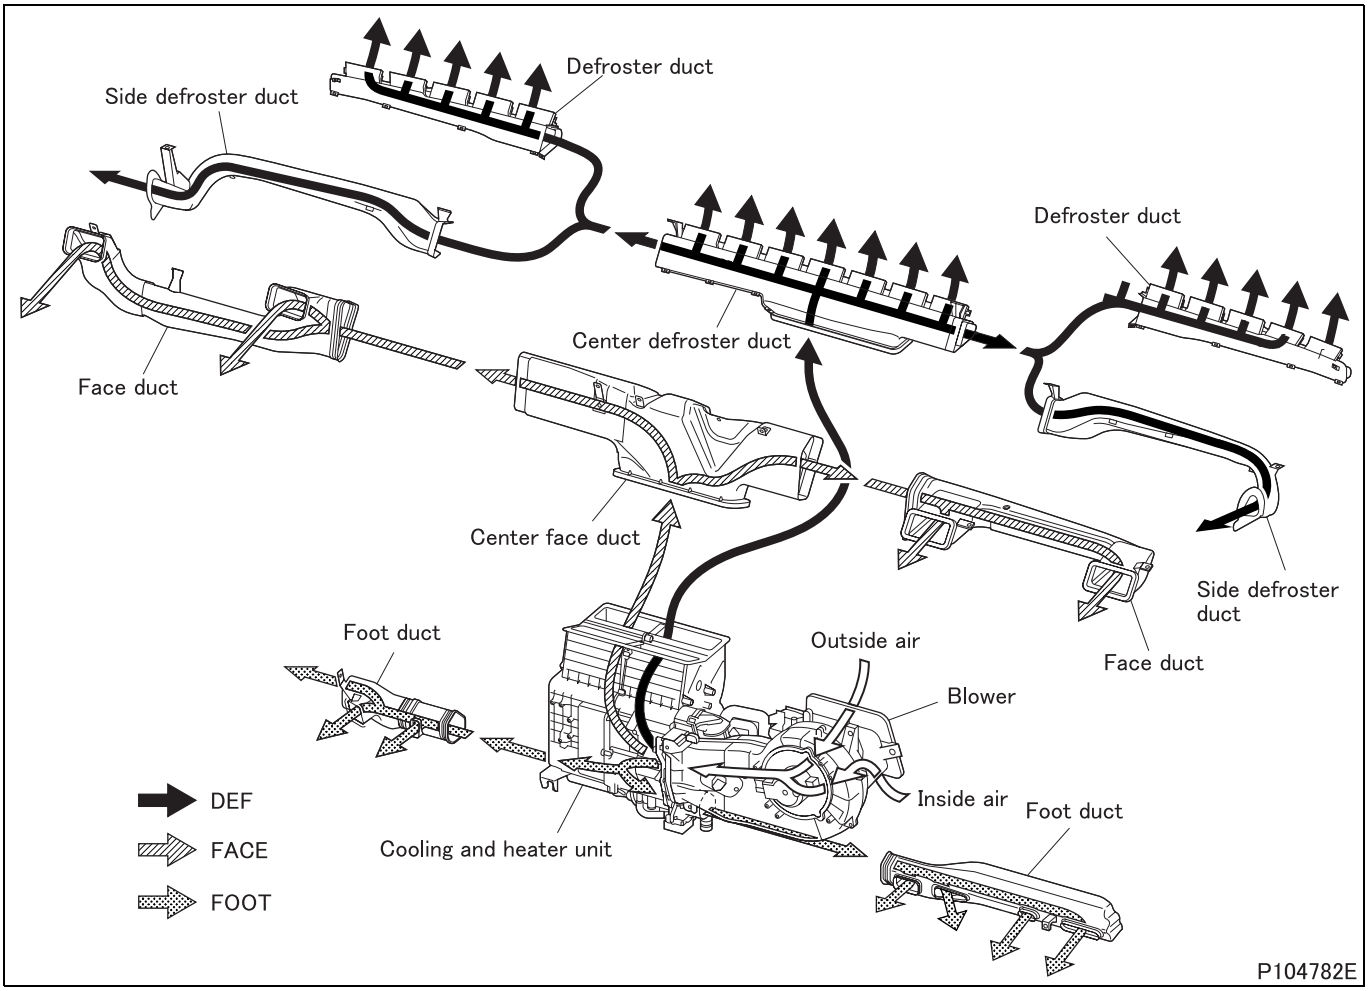
- The blower sends air to the cooling and heater unit, where the air is cooled by the evaporator. The cooled air is then sent through the ducts into the cab.
- Refrigerant in gas form is compressed by the compressor. The compressed gas is then sent to the side condenser, where it is cooled by outside air and condenses into liquid form.
- The liquid refrigerant is sprayed into the evaporator, where it quickly evaporates into gas form while at the same time absorbing heat from the surrounding air.
- The refrigerant in gas form is again sent to the compressor and is compressed there.
- When the refrigerant pressure in the high pressure line reaches the specified limit, the dual pressure switch senses this and turns itself OFF. At the same time, the magnet clutch of the compressor is turned OFF.



2.1 Subcool type side condenser

- This condenser is divided into the condensation area, gas and liquid separator (modulator tank) and subcool area. A normal condensed gas refrigerant is converted into a liquid refrigerant by cooling and remains in the gas and liquid separator (modulator tank). The subcool area further subcools the liquid refrigerant remaining in the gas and liquid separator (modulator tank) to improve the efficiency of the refrigeration cycle.

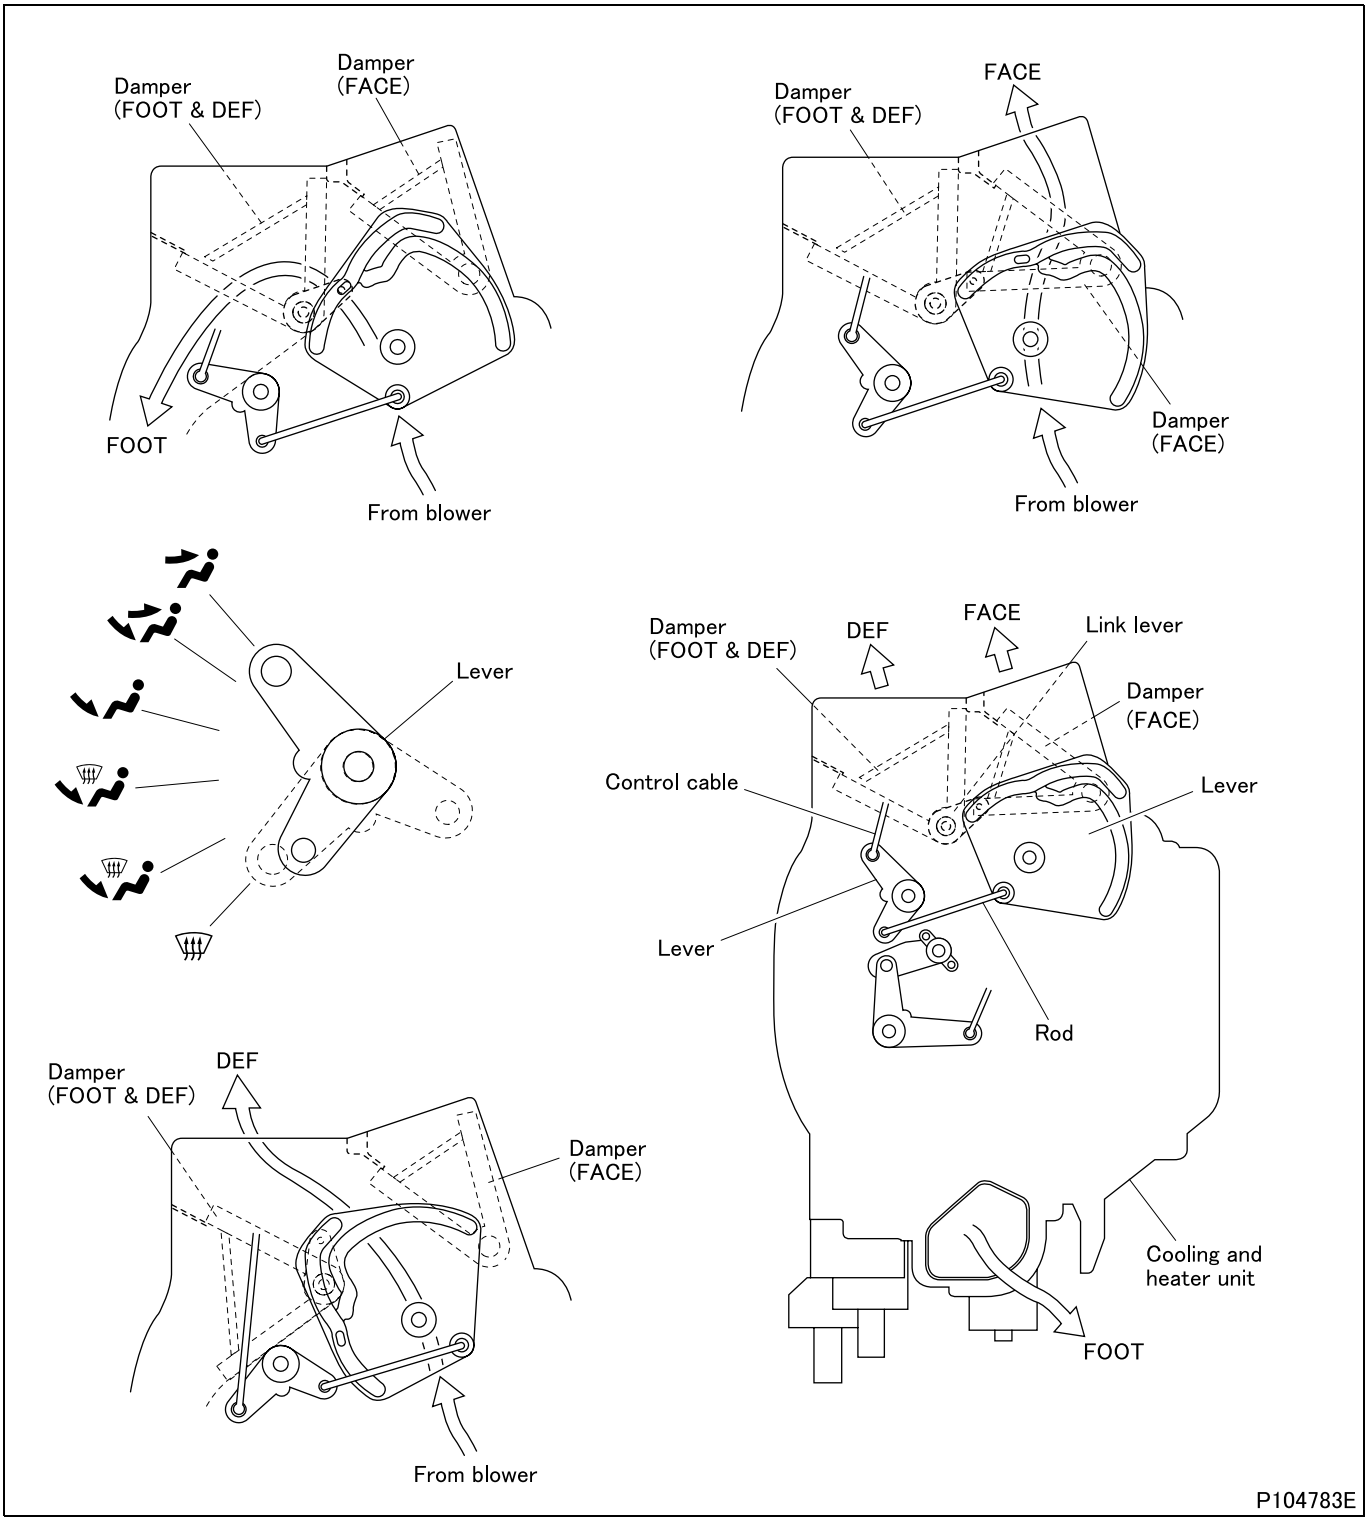
3. Air Duct



- The blower sends outside air or inside air through the cooling and heater unit to the ducts. The flow of air is dependent on the open/closed positions of the various dampers.

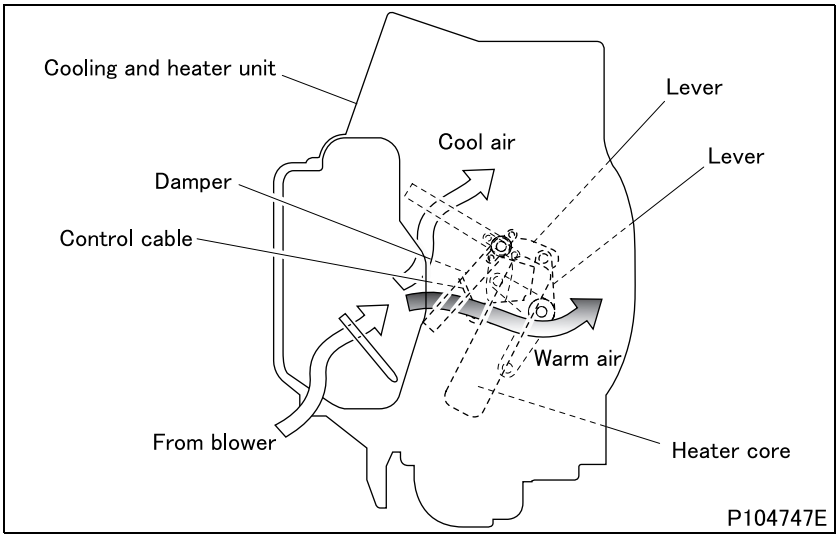
4. Air-conditioner Control

4.1 Mode selection



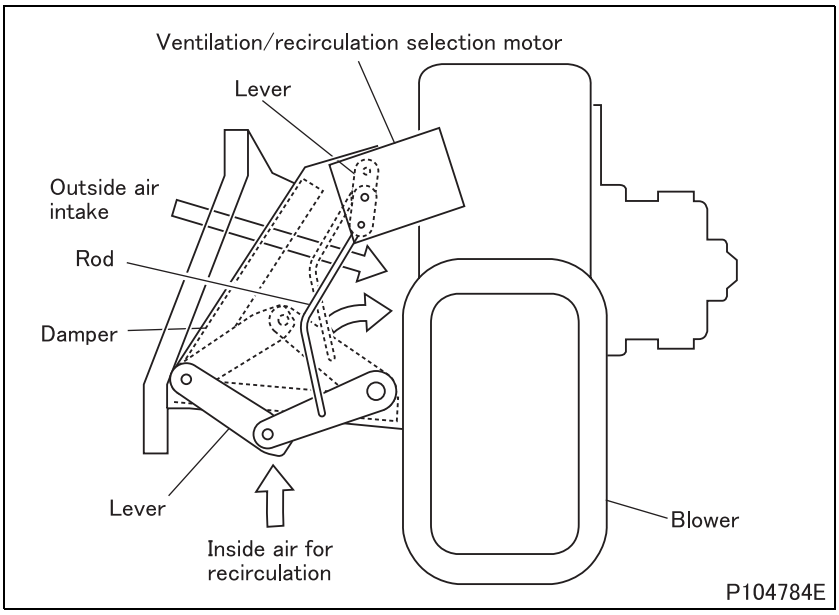
- Mode selection (opening and closing of damper) is performed by transmission of the movement of the mode selection control cable to all parts.

4.2 Air mixing control



- Air mixing control is performed by changing the degree of opening of the damper with the movement of the air mix control cable to change the amount of warm air passing through the heater core and that of cool air not passing through the heater core.

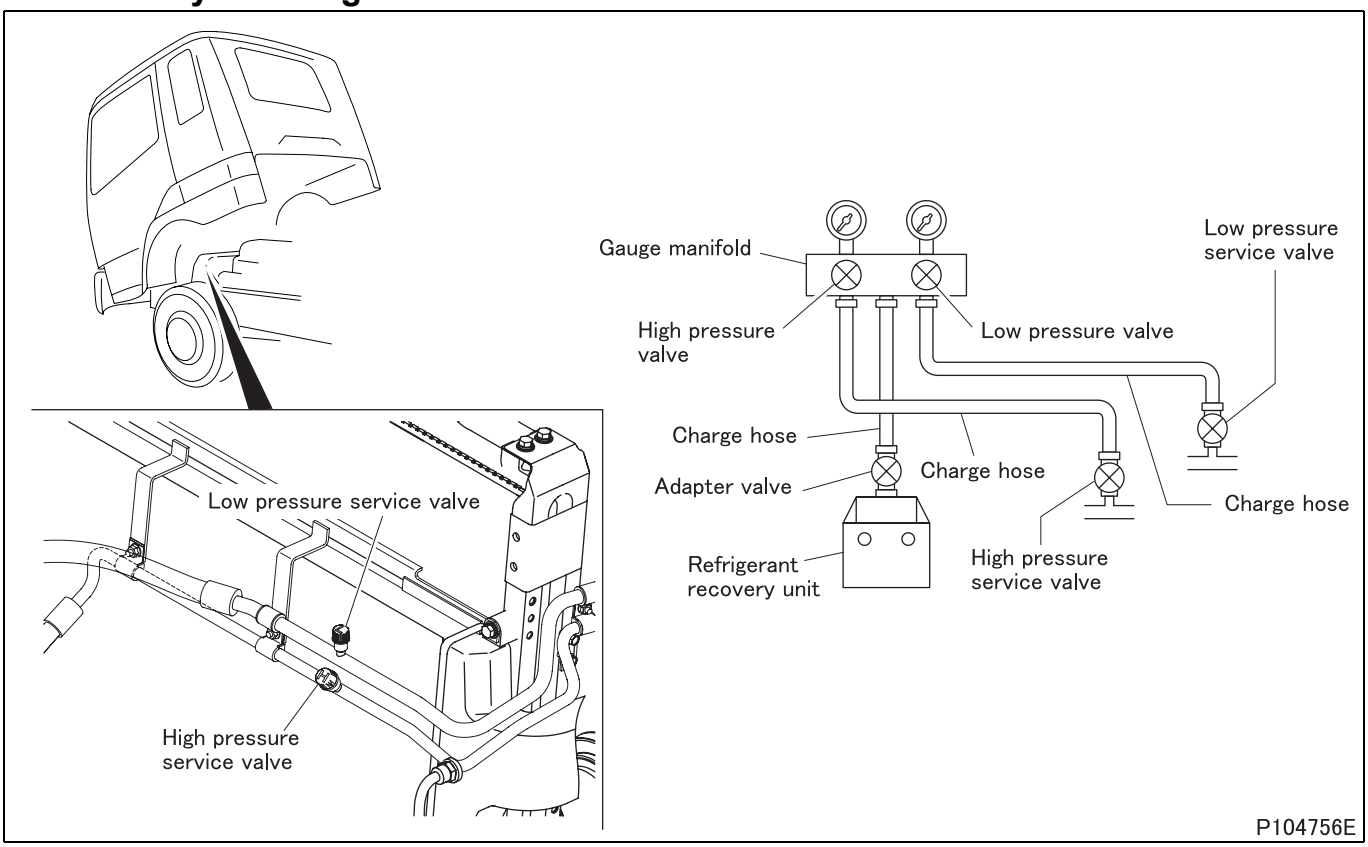
4.3 Ventilation/recirculation selection



- Ventilation/recirculation selection is performed by moving the damper with the ventilation/recirculation selection motor.

Symptoms / Possible causes	No air from vents	Poor cooling	Heater does not work	No mode selection	Draft from vents	No ventilation/recirculation selection	Air volume from vents unstable	Controls require too much effort	Reference Gr
Blower motor coil open, shorted	O								
Blower motor relay contacts stuck closed, coil open, shorted	O								Gr54
Blower resistor malfunction							O		
Compressor seized, malfunction		O							
Refrigerant charge low		O				O			
Air-conditioner relay contacts stuck closed, coil open, shorted		O							Gr54
Mode damper malfunction, not fully closed				O	O			O	
Ventilation/recirculation selection damper malfunction, not fully closed					O	O		O	
Side condenser fan motor coil open, shorted		O							
Side condenser relay contacts stuck closed, coil open, shorted		O							
Dual pressure switch malfunction		O							
Air-conditioner control malfunction	O	O		O	O	O			Gr54
Connector poor contact, harness open, faulty ground	O	O		O	O	O			
Fuse blown	O	O							
Air-conditioner piping clogged, loose, incorrectly connected		O							
Heater piping clogged, loose, incorrectly connected			O						
Duct incorrectly connected					O				
Cooling and heater unit clogged			O						
Side condenser clogged		O							
Side condenser core restricted, accumulation of foreign matter		O							
Evaporator clogged		O							
Control wire jammed, incorrectly installed				O	O	O		O	
Lever bent				O	O	O		O	
Lever sliding section worn, out of grease				O	O	O		O	

1. Recovery of Refrigerant



- Recover refrigerant from the air-conditioning system in accordance with the following flow chart.
  - Installation of the refrigerant recovery unit

↓

Close both the low pressure and high pressure valves.

↓

Connect the charge hose to the low pressure service valve.

↓

Connect the charge hose to the high pressure service valve.

↓

Connect the charge hose to the adapter valve.

↓

Open both the low pressure and high pressure valves.

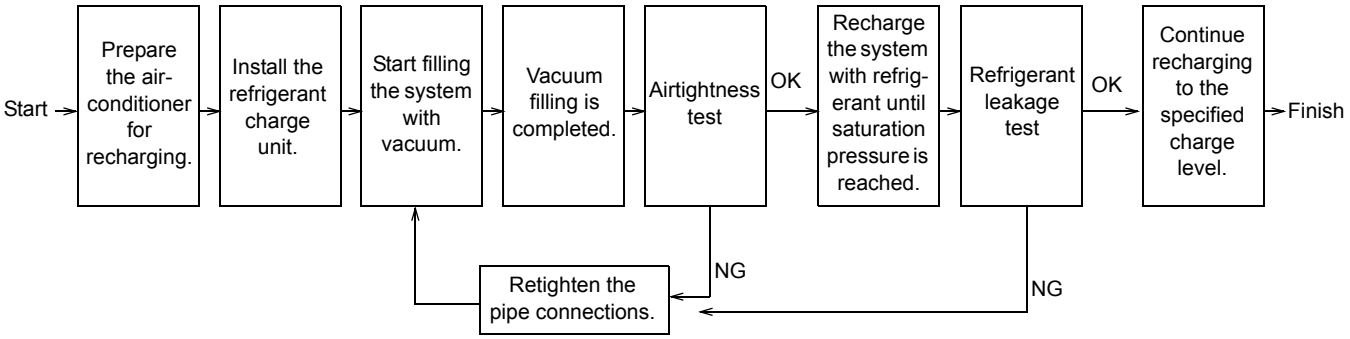
↓

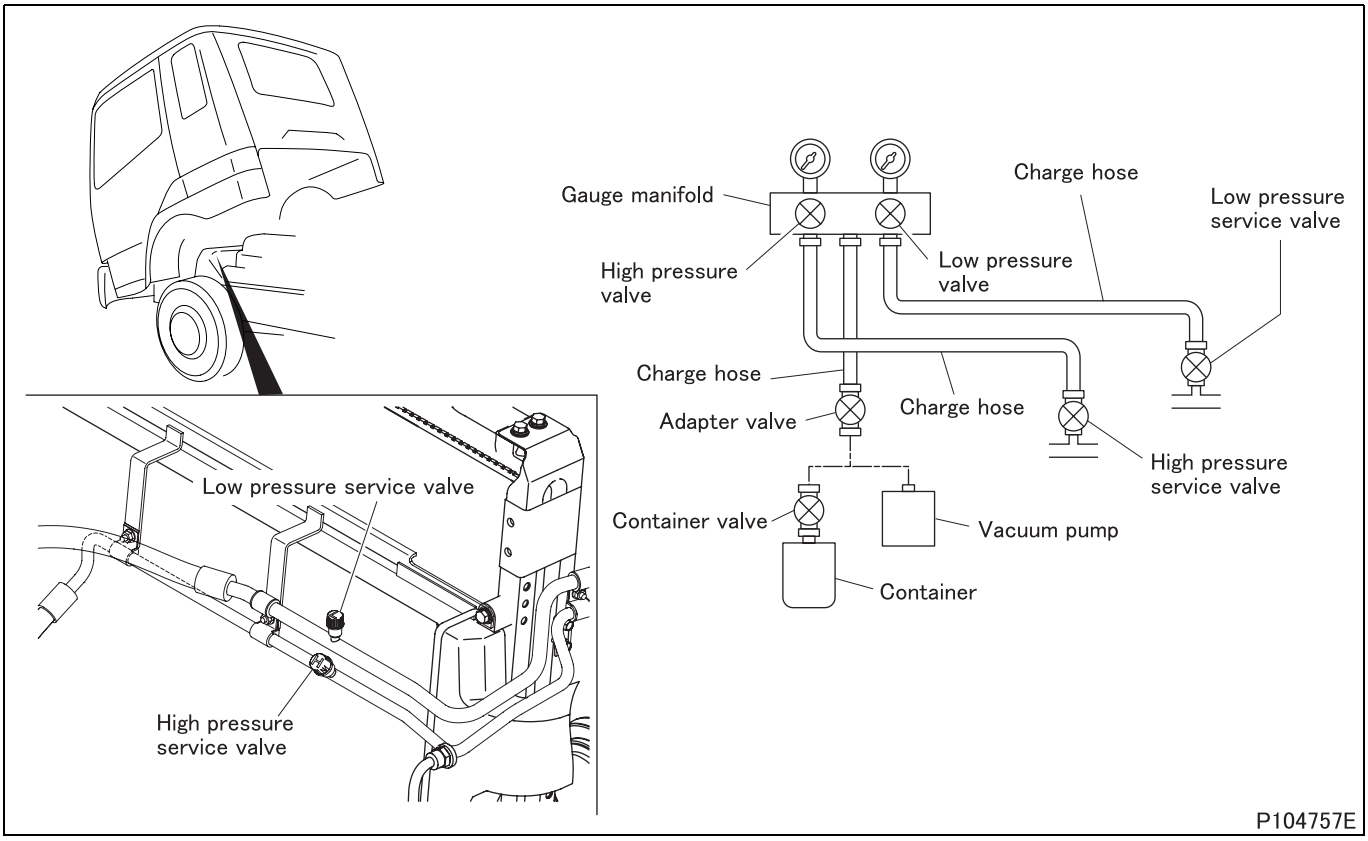
Open the adapter valve.

↓

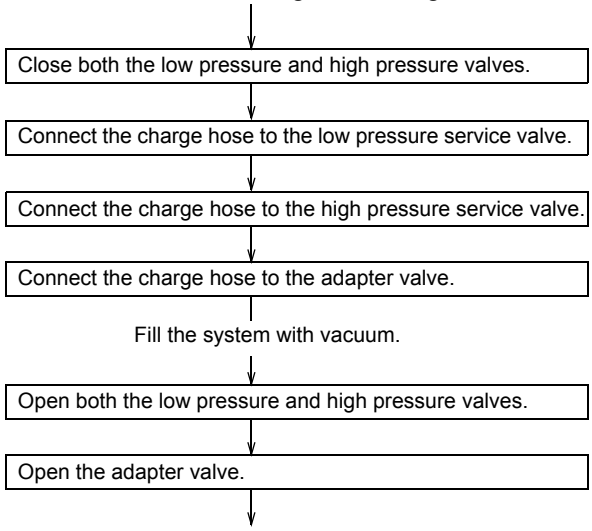
Run the recovery unit to collect the refrigerant.

2. Recharging the System with Refrigerant





- Recharge the system with refrigerant in accordance with the following flow chart.
  - Installation of the refrigerant charge unit



Run the vacuum pump.

Continue to run the pump for a minimum of 10 to 15 minutes. Close the adapter valve.

Stop the vacuum pump.

CAUTION ⚠

- **Make sure that the adapter valve is closed before stopping the vacuum pump.**

Close both the low pressure and high pressure valves.

Wait for 5 minutes. During this interval, the readings on the gauges installed on the gauge manifold should stay where they are and should not move towards zero.

Vacuum filling is now completed.

Recharging the system with refrigerant

With the adapter valve still closed, remove it from the vacuum pump. Connect the valve to the refrigerant container via the container valve.

Open the container valve and then the adapter valve.

Open the low pressure valve to fill refrigerant in gas form.

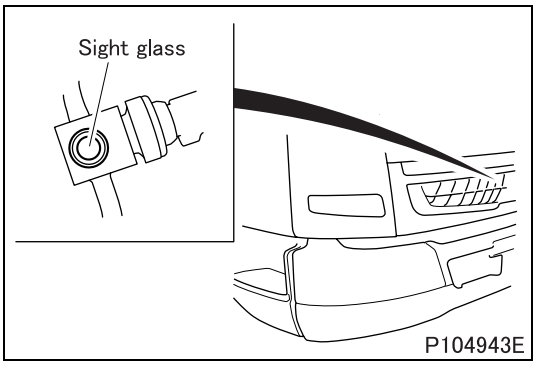
CAUTION ⚠

- **Filling refrigerant into the system in liquid form may damage the compressor. To prevent this, keep the refrigerant container in the upright position so that refrigerant is filled in gas form.**

When the refrigerant container is empty, close the adapter valve and install a new container. Continue filling the system.

When the air-conditioning system is saturated, start the engine. Turn on the air-conditioner to run the compressor, and continue recharging until the specified charge level is reached.

3. Checking Refrigerant Charge Level



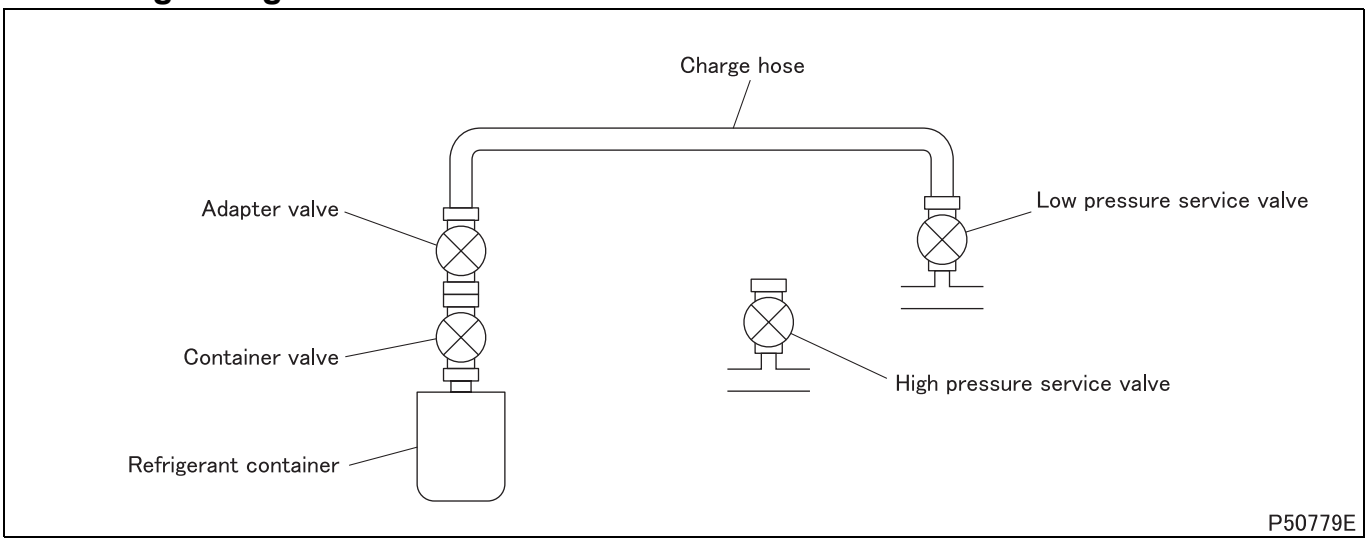
- To check the refrigerant charge level, observe the flow of refrigerant through the sight glass. If the visual inspection indicates a low charge level, add refrigerant.
- The visual check should be performed under the following conditions.
  - Engine speed: 1200 rpm
  - Air-conditioner switch: ON
  - Fan speed control dial: Maximum air volume
  - Ventilation/recirculation selection: Outside air
  - Doors: Fully open

CAUTION ⚠

- **When no or low level of refrigerant is checked, stop the air-conditioner immediately. Running it with this condition for long time causes the compressor to seize.**

	Normal level or no refrigerant	Low level	Low level
Sight glass	 P06552 The refrigerant is almost transparent. Air bubbles may be seen flowing, but they disappear when the engine is revved up and down.	 P06553 Air bubbles are seen flowing at all times. The refrigerant may be transparent or whitish.	P06554 With a careful look, something like mist can be seen flowing.
High/low pressure piping	Distinct temperature difference (normal level). No discernible temperature difference between high pressure and low pressure pipes (no refrigerant).	The high pressure piping is warm while the low pressure piping is slightly cold.	The high pressure piping is warm while the low pressure piping is slightly cold.

4. Adding Refrigerant



- Add refrigerant in accordance with the following flow chart.

With the adapter valve closed, connect the charge hose to the low pressure service valve.

CAUTION ⚠

- **If the charge hose is connected to the high pressure service valve, refrigerant may flow back, possibly damaging the refrigerant container and charge hose.**

Open and close the adapter valve to bleed air of the charge hose.
After air bleeding is completed, close the adapter valve.

Take the refrigerant container and valve assembly. With the container valve closed, connect the assembly to the adapter valve.

CAUTION ⚠

- **Filling refrigerant into the system in liquid form may damage the compressor. To prevent this, keep the refrigerant container in the upright position so that refrigerant is filled in gas form.**

Open the container valve and then the adapter valve.

Start the engine.

Set the temperature control to MAX COOL. Turn on the air-conditioner to run the compressor.

Continue adding refrigerant while observing the sight glass for charge level.

When “normal level” is confirmed through the sight glass, add refrigerant further 50 g {1.76 oz}.

When charging is completed, close the adapter and container valves. Remove the charge hose and the refrigerant container from the low pressure service valve.

If there is still some refrigerant in the container, keep it for the next opportunity. Be sure to keep the container valve closed.

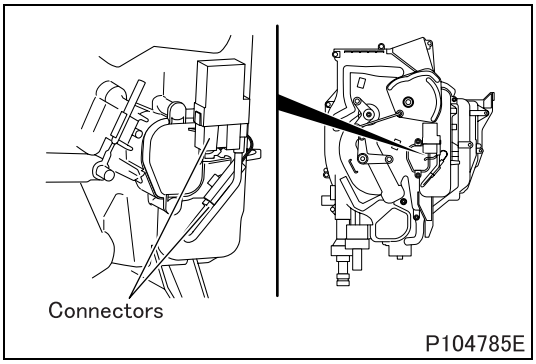
5. Cleaning and Replacement of Evaporator

Lubricant and/or sealant

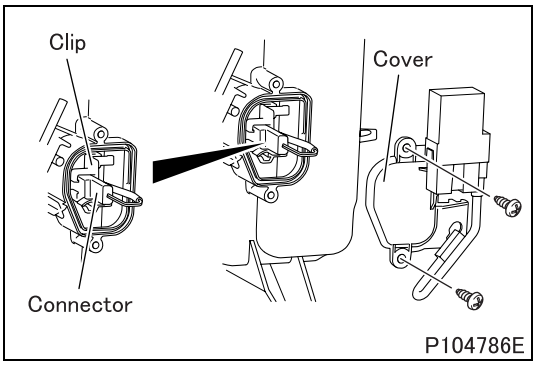
Mark	Points of application	Specified lubricant and/or sealant	Quantity
–	Expansion valve mounting surface of air-conditioner piping	Refrigerating machine oil ND-OIL8	As required
	Expansion valve mounting surface of evaporator		

[Removal]

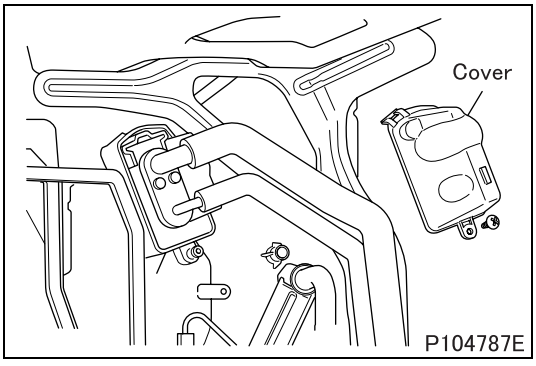
- Drain out the refrigerant. (See “1. Recovery of Refrigerant”.)
- Remove the passenger-side lower panel. (See Gr52.)
- Remove the blower. (See later section.)



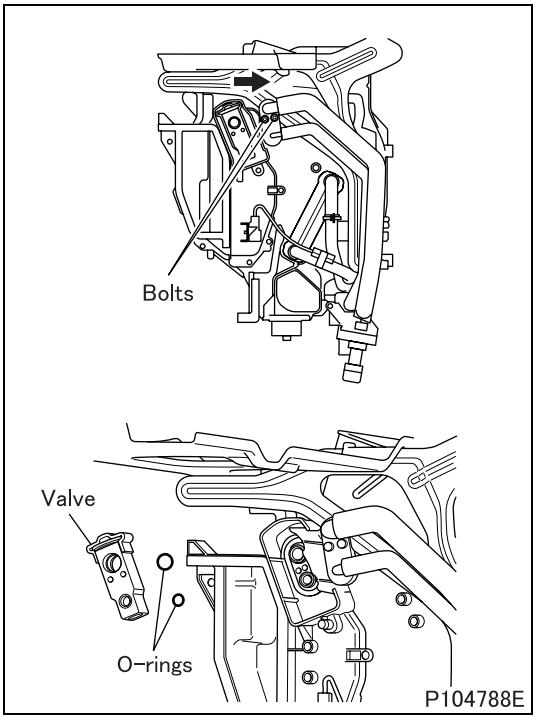
- Disconnect the connectors (2 places) at the illustrated position.



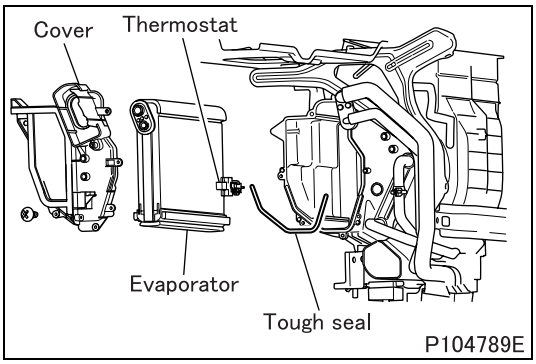
- Remove the cover.
- Temporarily joint the thermostat connector with clip of evaporator.



- Remove the expansion valve cover.



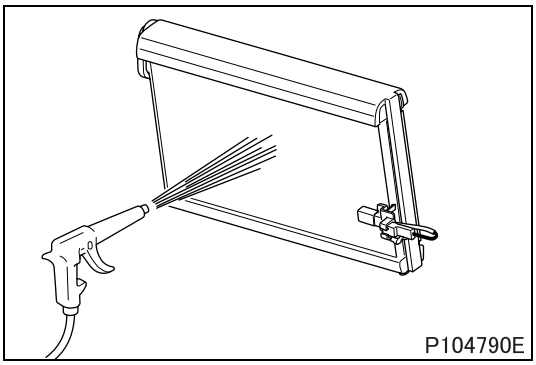
- Remove expansion valve mounting bolts and detach the connection of air-conditioner piping.
- Rotate air-conditioner piping in the direction shown to remove expansion valve.



- Remove evaporator cover, evaporator and tough seal.

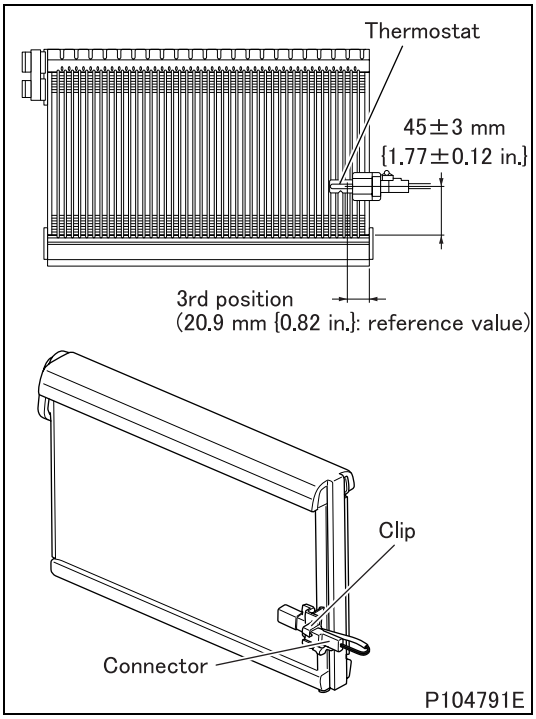
CAUTION ⚠

- **Do not remove the thermostat from the evaporator unless defects are evident. When the thermostat is replaced, always replace the evaporator.**



[Cleaning]

- Blow air against the fins of the evaporator to remove foreign matter.
- If air blowing is not enough, clean by hand using care not to damage the fins.



[Installation]

- Install the evaporator by following the removal sequence in reverse.
- When the thermostat is replaced with a new one, install the thermostat at the illustrated position and temporarily joint the thermostat connector with clip of evaporator.

CAUTION ⚠

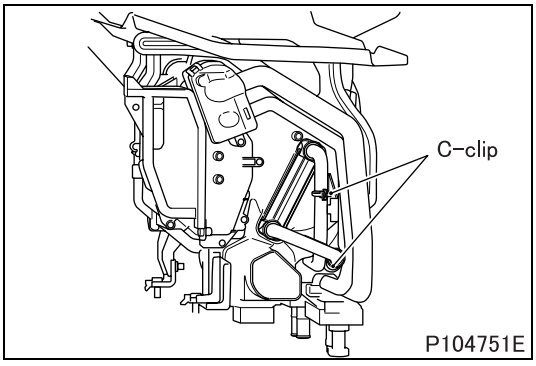
- **When the thermostat is replaced from the evaporator, always replace the evaporator with a new one.**

- Always replace the tough seal and O-ring with a new one.

6. Cleaning and Replacement of Heater Core

[Removal]

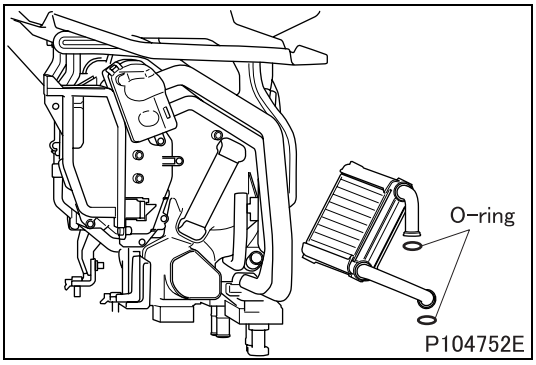
- Drain out the engine coolant. (See Gr14.)
- Remove the passenger-side lower panel. (See Gr52.)
- Remove the blower. (See later section.)
- Remove the washer tank. (See Gr51.)
- Remove the foot duct. (See later section.)



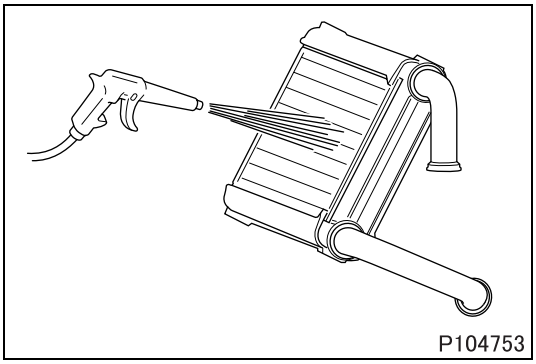
- Remove the C-clips to disassemble the joint of the heater piping.

NOTE

- **The heater piping is made of soft material and easy to deform. Handle it with care.**



- Remove the heater core.



[Cleaning]

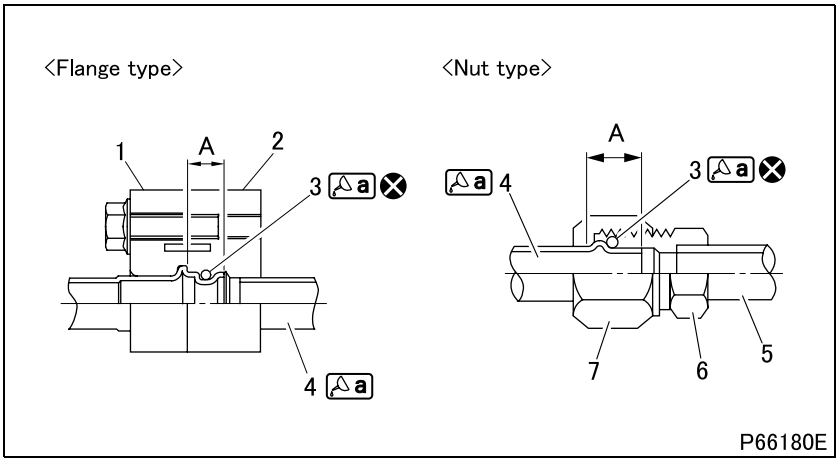
- Blow air against the fins of the heater core to remove foreign matter.
- If air blowing is not enough, clean by hand using care not to damage the fins.
- For cleaning inside the heater core, see Gr14.

[Installation]

- Install the heater core by following the removal sequence in the reverse.
- Be sure to replace the O-rings and C-clips with new parts.

M E M O

CONNECTING AIR-CONDITIONER PIPING



1 Flange (pipe end) <Flange type>
2 Flange (mating end) <Flange type>
3 O-ring
4 Pipe
5 Pipe <Nut type>
6 Union <Nut type>
7 Nut <Nut type>

A: Refrigerating machine oil application area
⊗: Non-reusable parts

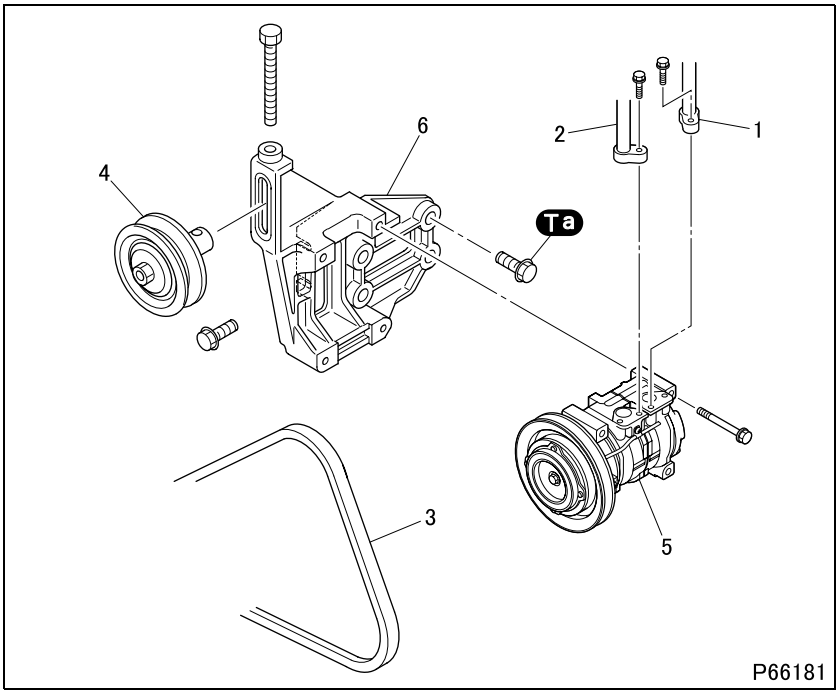
Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	O-ring	Refrigerating machine oil ND-OIL8	As required
	Outer periphery of pipe end (area A)		

- There are 2 types of air-conditioner pipe/hose connections: flange type and nut type. When connecting/tightening the connections, observe the following precautions.

CAUTION ⚠

- **The connected parts are sealed by the O-ring. Be careful not to damage the O-ring, such as by twisting.**
- **The O-rings are exclusively designed for HFC-134a refrigerant and are not reusable. The O-rings are available at the MITSUBISHI HEAVY INDUSTRIES, LTD. service stations.**
- **Never tighten the nut-type connection by rotating the union. This will deform the piping, allowing refrigerant to leak out. Tighten by rotating the nut while holding the union in position.**



● Removal sequence

1 Discharge hose (high pressure side) (See the CONNECTING AIR-CONDITIONER PIPING section.)
2 Suction hose (low pressure side) (See the CONNECTING AIR-CONDITIONER PIPING section.)
3 V-belt
4 Pulley
5 Compressor
6 Compressor bracket

- Discharge refrigerant before disconnecting the discharge hose and suction hose. (See “Recovery of Refrigerant”.)

● Installation sequence

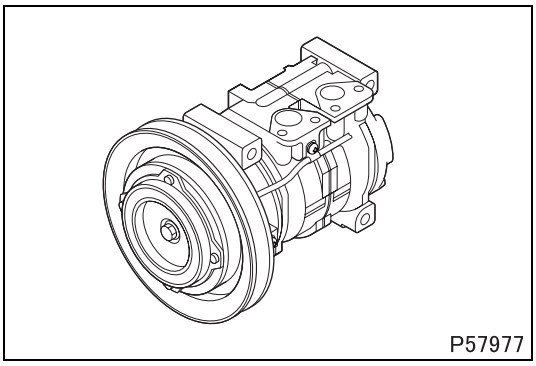
Follow the removal sequence in reverse.

- After installation, tension the V-belt to specification. (See Gr14.)

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Bolt (compressor bracket mounting)	45 to 65 {33 to 48, 4.6 to 6.6}	–

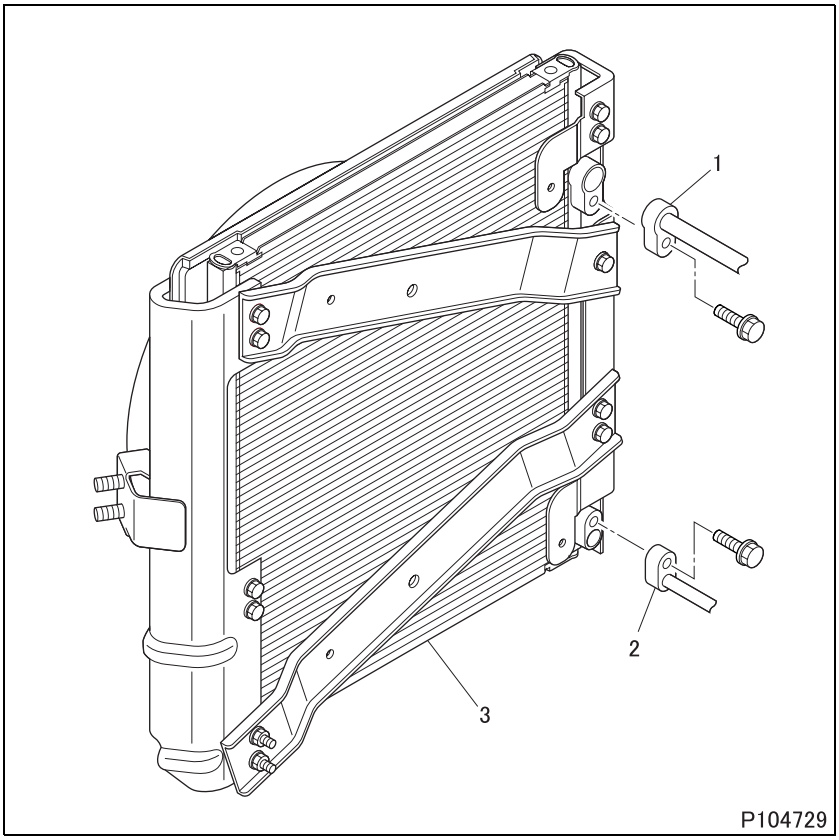
◆Inspection procedure◆



■ Inspection: Compressor

- Check the compressor proper for malfunction and oil leakage.
- If there is anything wrong with the compressor, replace it or have it overhauled at a nearest MITSUBISHI HEAVY INDUSTRIES, LTD. service station.

CONDENSER



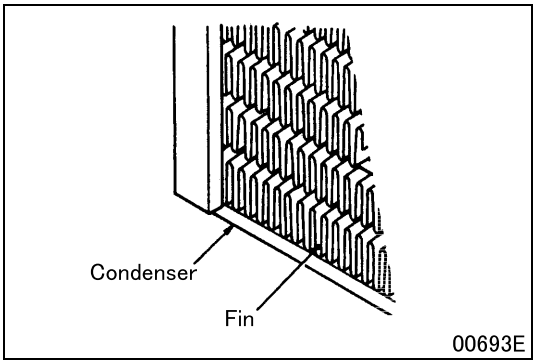
● **Removal sequence**

1. Discharge hose (compressor end) (See the CONNECTING AIR-CONDITIONER PIPING section.)
2. Liquid hose (cooling unit end) (See the CONNECTING AIR-CONDITIONER PIPING section.)
3. Condenser

● **Installation sequence**

Follow the removal sequence in reverse.

◆**Inspection procedure**◆

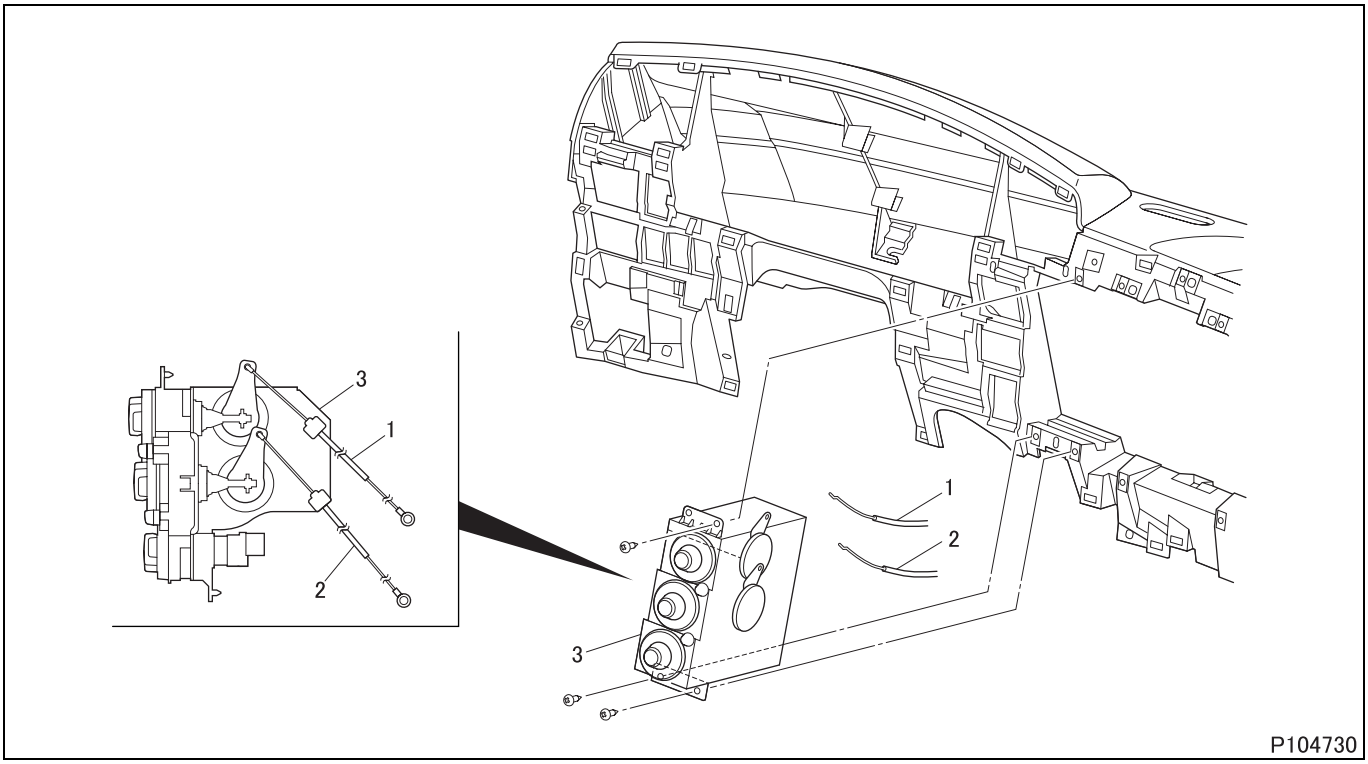


■ **Inspection: Condenser**

- If the condenser fins are clogged with dirt, dust or other foreign matter, wash it out. Any deformed fins should be straightened using a spatula or the like.

M E M O

AIR-CONDITIONER CONTROL



● **Removal sequence**

1 Mode selection control cable
2 Air mixing control cable
3 Air-conditioner control

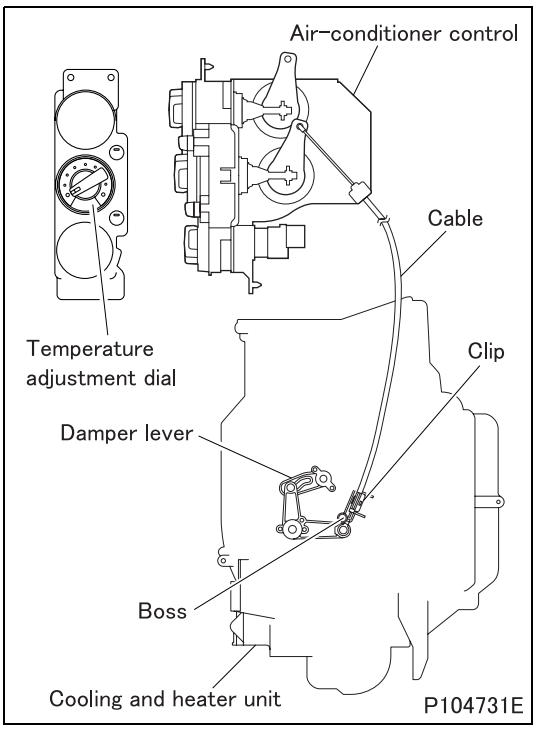
CAUTION ⚠

- **Do not disconnect the cable from air-conditioner or ventilation control except for replacement of the cable to prevent deformation of clip tab of air-conditioner or ventilation control.**

● **Installation sequence**

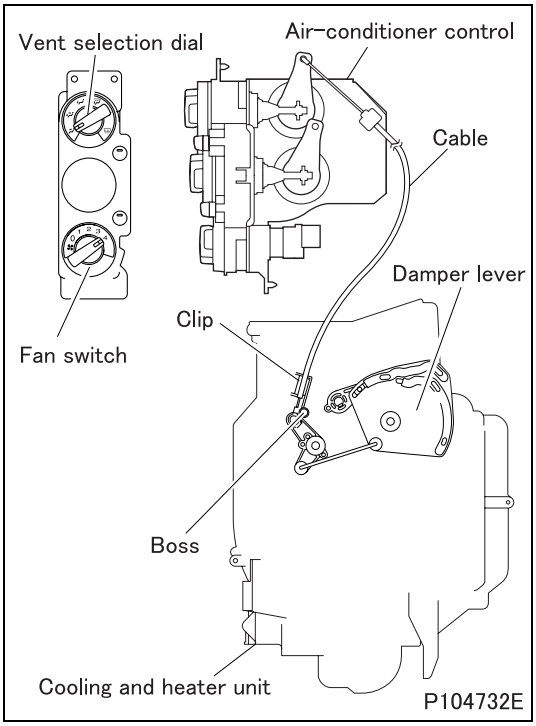
Follow the removal sequence in reverse.

◆Installation procedure◆



■Installation: Air mix control cable

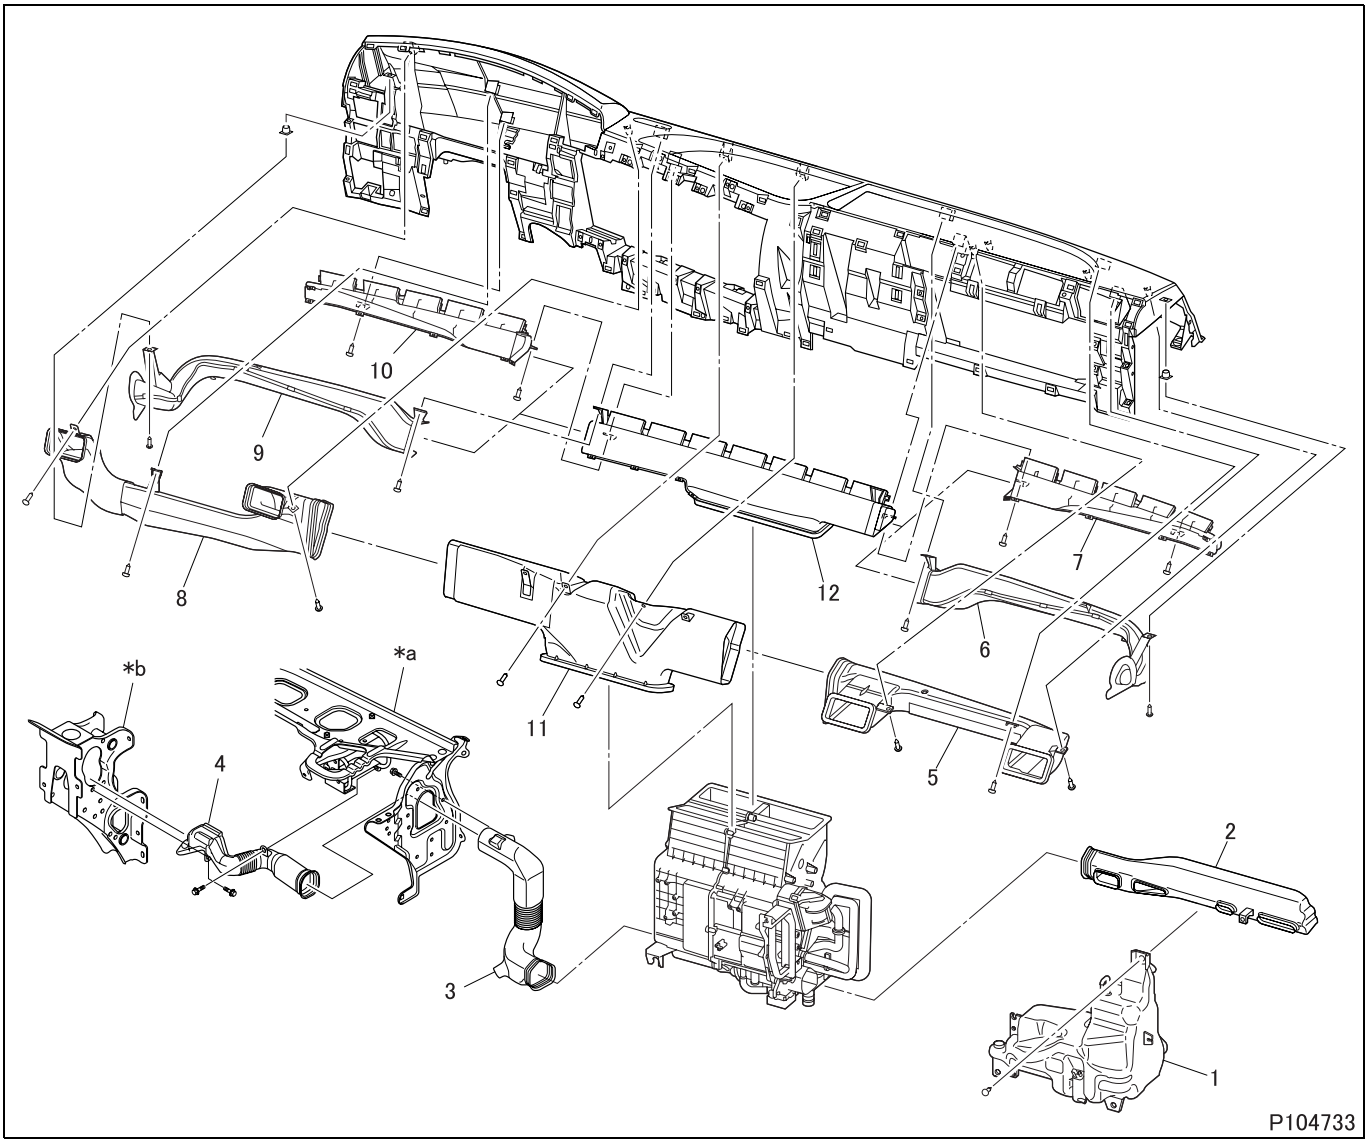
- Fully turn the temperature adjusting dial to the left to set to the MAX COOL position.
- Install the air mix control cable on the air mix damper lever of the cooling and heater unit.
- Lightly pull the air mix control cable. Securely fix it with a clip at the position where the air mix damper lever of the cooling and heater unit comes into contact with the locating boss.



■Installation: Mode selection control cable

- Set the vent selection dial of air-conditioner control to FACE position.
- Install the mode selection control cable on the mode selection damper lever of the cooling and heater unit.
- Lightly pull the mode selection control cable. Securely fix it with a clip at the position where the mode selection damper lever of the cooling and heater unit comes into contact with the locating boss.
- After installing mode selection control cable, set the fan switch to the 4th position and be sure to turn the vent selection dial to check the operation.

AIR DUCT



● **Removal sequence**

1 Washer tank
2 Foot duct
3 Foot duct
4 Foot duct
5 Face duct
6 Side defroster duct
7 Defroster duct
8 Face duct
9 Side defroster duct
10 Defroster duct
11 Center face duct
12 Center defroster duct

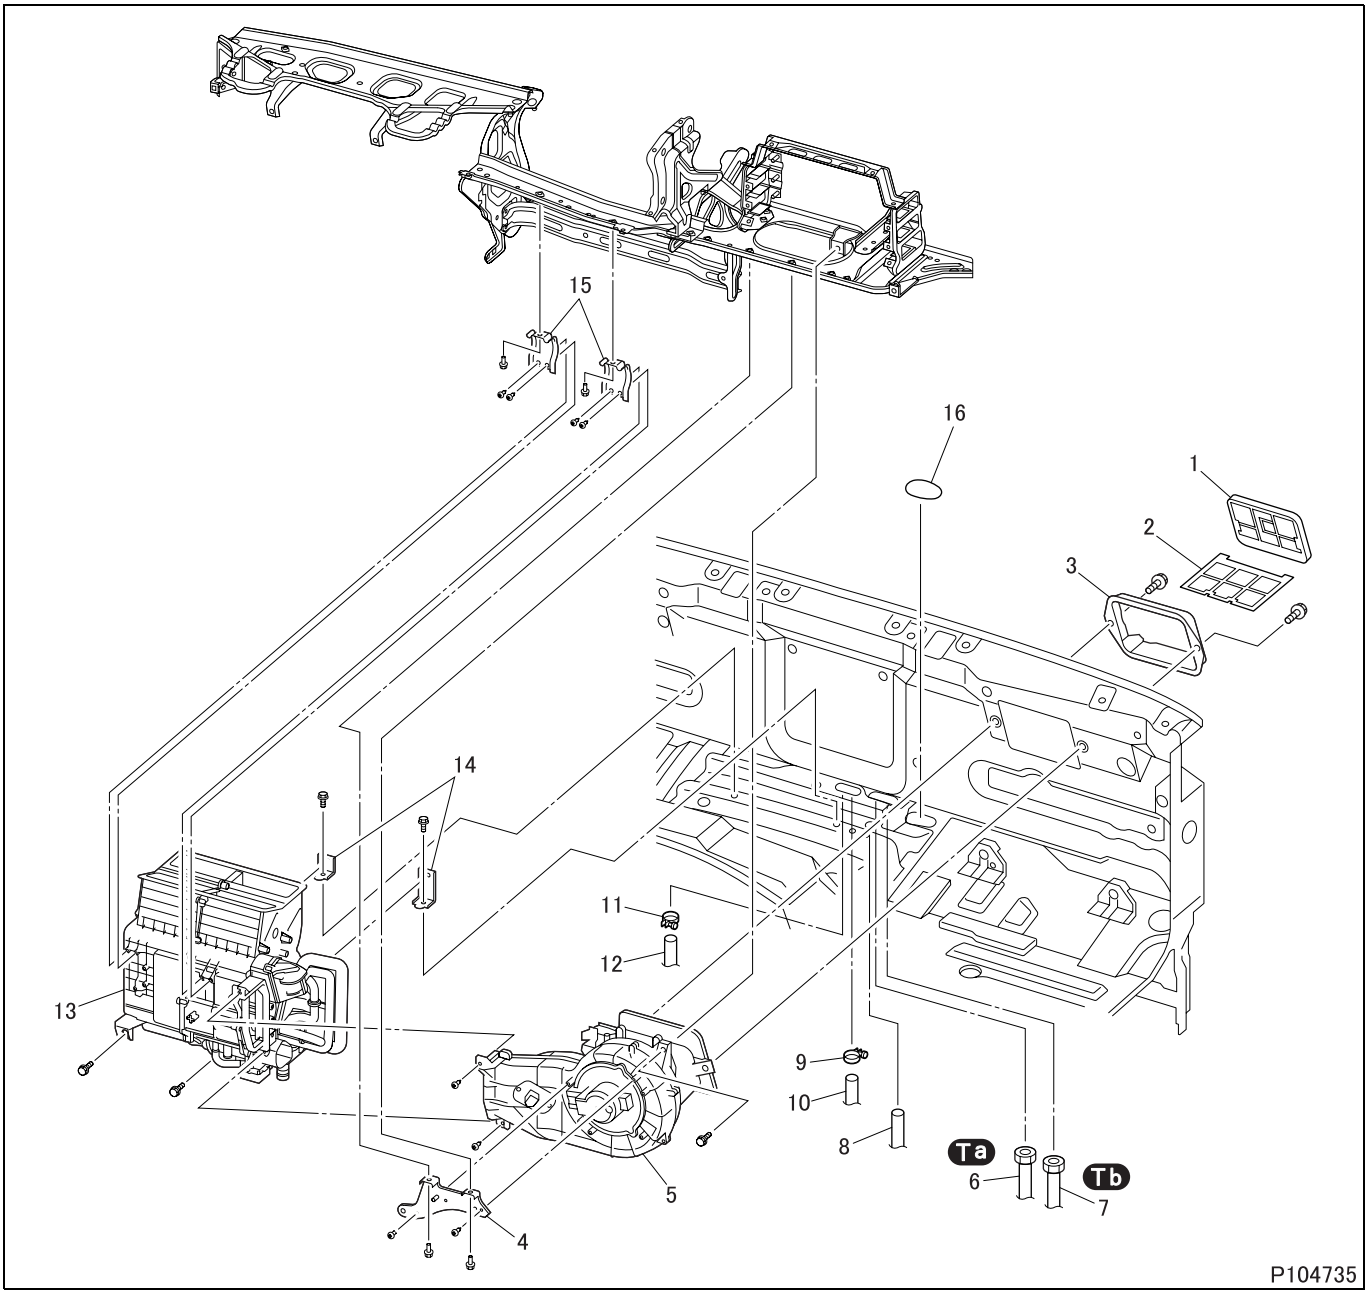
***a**: Instrument panel frame
***b**: Steering column bracket

● **Installation sequence**

Follow the removal sequence in reverse.

M E M O

COOLING AND HEATER UNIT, BLOWER



● **Removal sequence**

1 Air filter
2 Air filter
3 Air intake duct
4 Rear blower bracket
5 Blower
6 Air-conditioner hose (high pressure side)
7 Air-conditioner hose (low pressure side)
8 Drain hose
9 Hose clamp
10 Heater hose
11 Hose clamp
12 Heater hose
13 Cooling and heater unit
14 Heater lower bracket
15 Heater bracket
16 Plug <Without air-conditioner>

• Discharge refrigerant before disconnecting air-conditioner hose. (See “Recovery of Refrigerant”.)

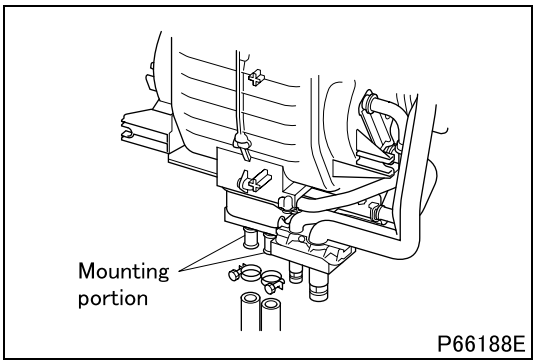
● **Installation sequence**

Follow the removal sequence in reverse.

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Air-conditioner hose (high pressure side)	21 to 25 {15 to 18, 2.1 to 2.5}	–
Tb	Air-conditioner hose (low pressure side)	30 to 34 {22 to 25, 3.1 to 3.5}	–

◆Removal procedure◆

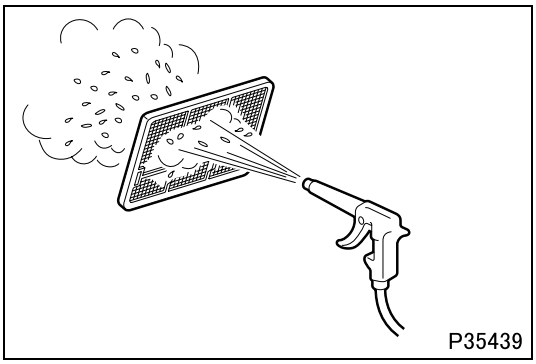


■ Removal: Hose clamp and heater hose

NOTE

- **Remove the hose clamp and heater hose, taking care not to damage the hose mounting portion of the heater unit.**

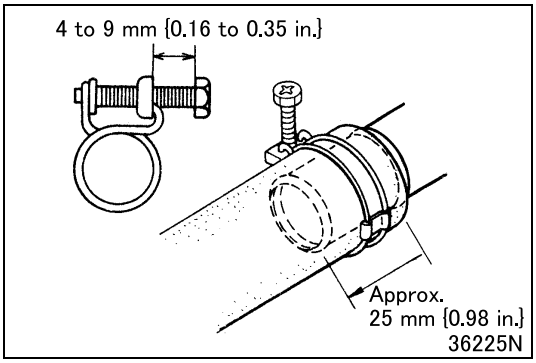
◆Cleaning procedure◆



■ Cleaning: Air filter

- After removing the air filter, blow water or air to it to remove dust and dirt.

◆Installation procedure◆



■ Installation: Heater hose
