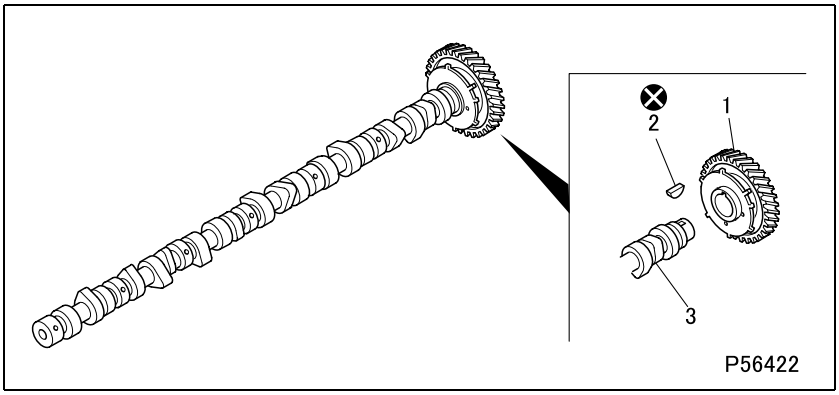
- Assemble the bushing onto the rocker such that the oil holes are aligned as shown in the illustration.
- After assembly, recheck the clearance.
- If the measurement is less than the standard value, ream the bushing.

Camshaft



● Disassembly sequence

1 Camshaft gear
2 Key
3 Camshaft

⊗: Non-reusable parts

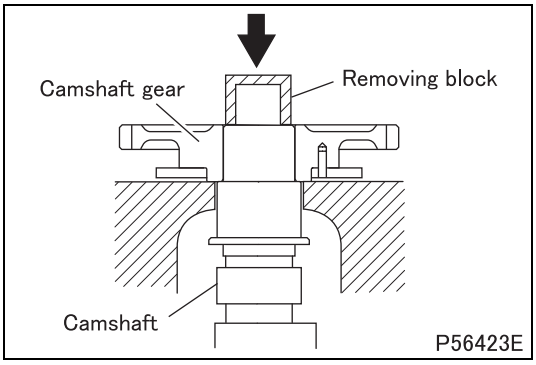
● Assembly sequence

Follow the disassembly sequence in reverse.

Service standards (Unit: mm {in.})

Location	Maintenance item				Standard value	Limit	Remedy
1, 3	Interference between camshaft gear and camshaft				0.017 to 0.062 {0.00067 to 0.0024}	–	Replace
3	Camshaft	Cam lift	Intake	Lobe diameter : 45.110 {1.775} Base circle diameter : 40.087 {1.578}	5.023 {0.197}	4.973 {0.195}	Replace
			Exhaust	Lobe diameter : 47.370 {1.864} Base circle diameter : 40.286 {1.586}	7.084 {0.278}	7.034 {0.276}	
		Bend			0.02 {0.00079}	0.04 {0.0016}	Replace
		Oil clearance at journal			0.075 to 0.12 {0.0030 to 0.0047}	0.25 {0.0098}	Replace

◆Removal procedure◆



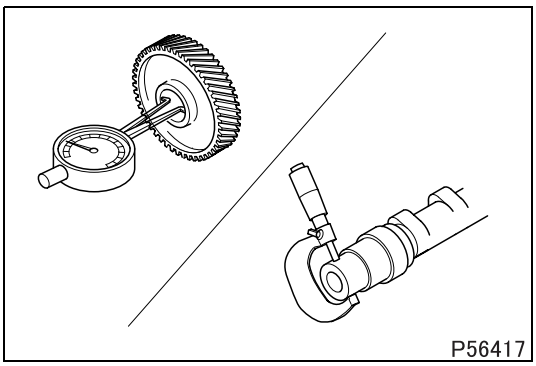
■ Removal: Camshaft gear

- Remove the camshaft gear by pushing on the end of the camshaft with a press or other similar tool.

CAUTION ⚠

- **Do not attempt to remove the camshaft gear with a hammer as damage will result. Use a press or other similar tool.**

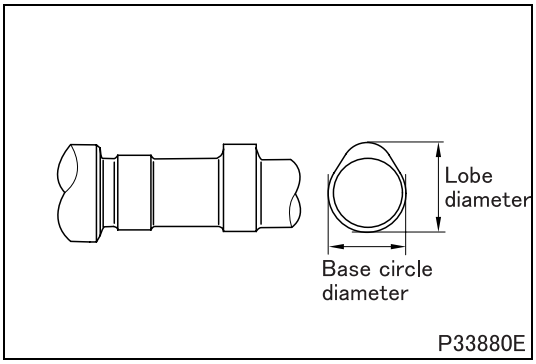
◆Inspection procedure◆



P56417

■ **Inspection: Interference between camshaft gear and camshaft**

- If the measurement deviates from the standard value, replace the defective part(s).

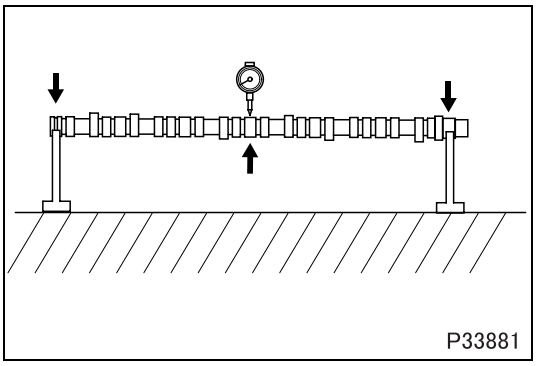


P33880E

■ **Inspection: Camshaft**

(1) Cam lift

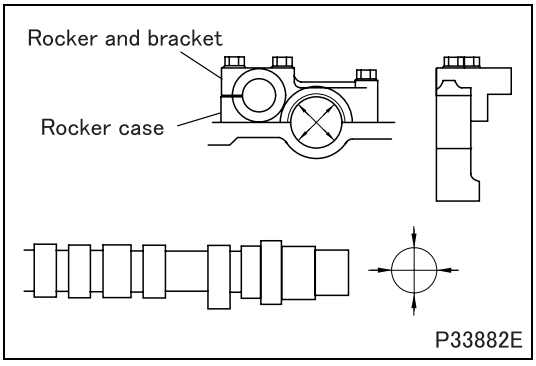
- If the measurement (difference between lobe diameter and base circle diameter) is less than the limit, replace the camshaft.



P33881

(2) Bend

- Place supports under the journals at the ends of the camshaft and measure the bend of the camshaft at the central journal. The amount of camshaft bend is obtained by giving the camshaft one turn and dividing the dial gauge reading by two.
- If the measurement exceeds the specified limit, replace the camshaft.



P33882E

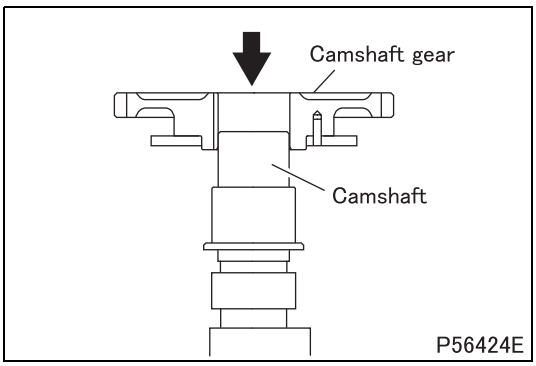
(3) Oil clearance at journal

- If the measurement exceeds the limit, replace the defective part(s).

CAUTION ⚠

- **The rocker case and the brackets of the rocker and bracket assembly have been machined together, which means that they all must be replaced together.**

◆Installation procedure◆



■ **Installation: Camshaft gear**

- Heat the camshaft gear to approximately 150°C {300°F} using a gas burner.

WARNING ⚠

- **The camshaft is extremely hot. Be careful not to touch it.**

- While facing the camshaft gear as shown in the illustration, press it onto the camshaft until it seats snugly on the camshaft.

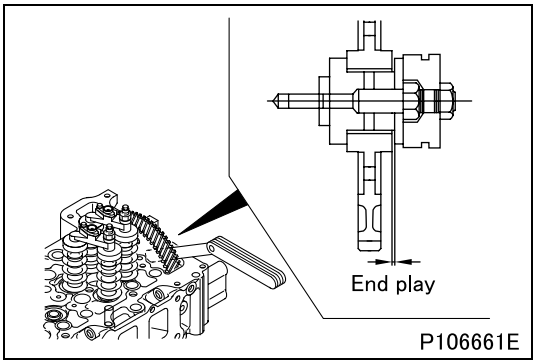
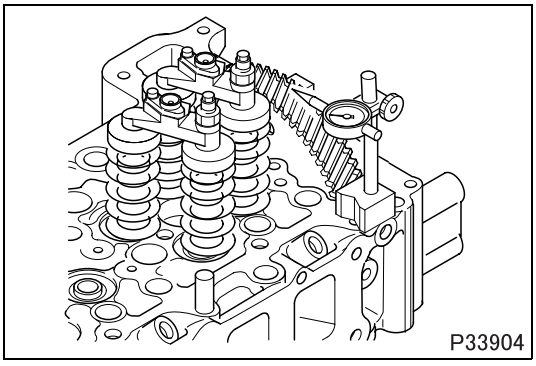
◆Work before removal◆



P106661E

■ **Inspection: End play of No. 3 idler gear**

- If the measurement exceeds the limit, replace the defective part(s).

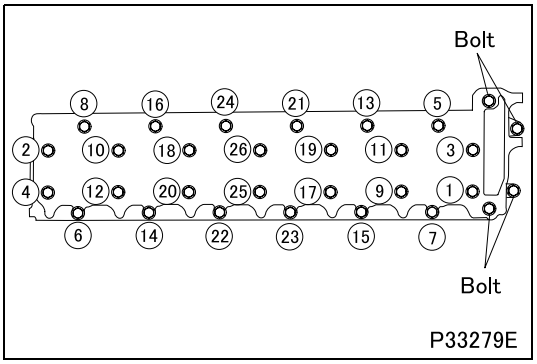


P33904

■ **Inspection: Backlash between No. 2 and No. 3 idler gears**

- If the measurement exceeds the limit, replace the defective part(s).

◆Removal procedure◆



■ Removal: Cylinder head

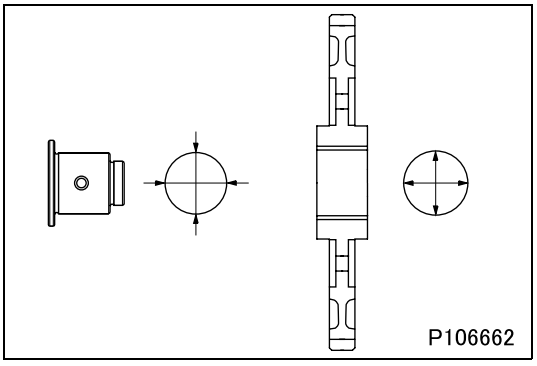
- Remove the bolts (× 4).
- Progressively loosen the cylinder head bolts in the order shown in the illustration, going over them several times, before eventually removing them.

■ Removal: Cylinder head gasket

CAUTION ⚠

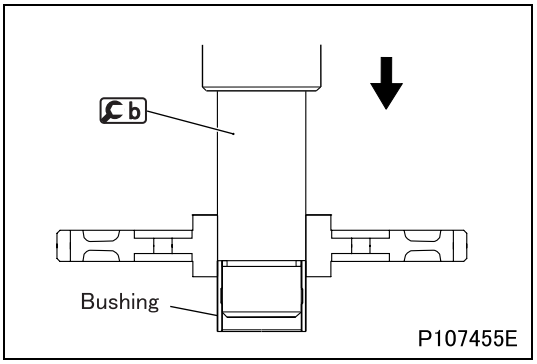
- **Be careful not to scratch the cylinder head, crankcase and flywheel housing when removing the cylinder head gasket.**

◆Inspection procedure◆

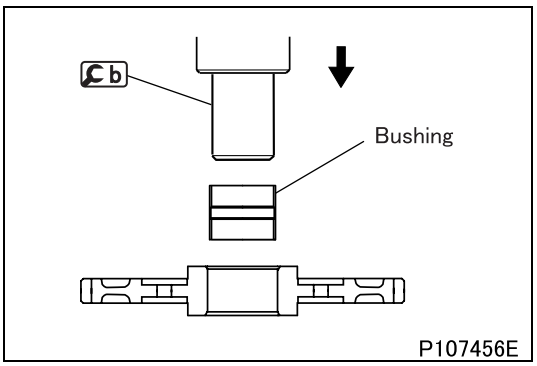


■ Inspection: Clearance between No. 3 idler shaft and No. 3 idler gear bushing

- If the measurement exceeds the limit, replace the bushing.



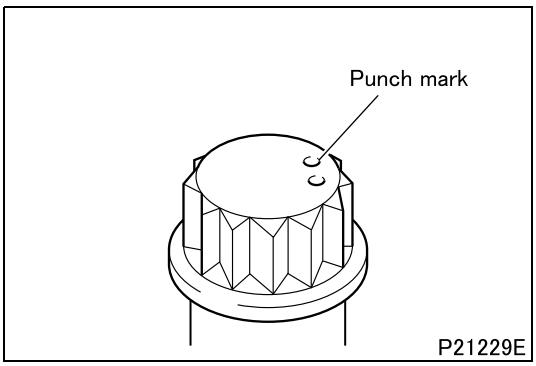
Replacement of No. 3 idler gear bushing
[Removal]

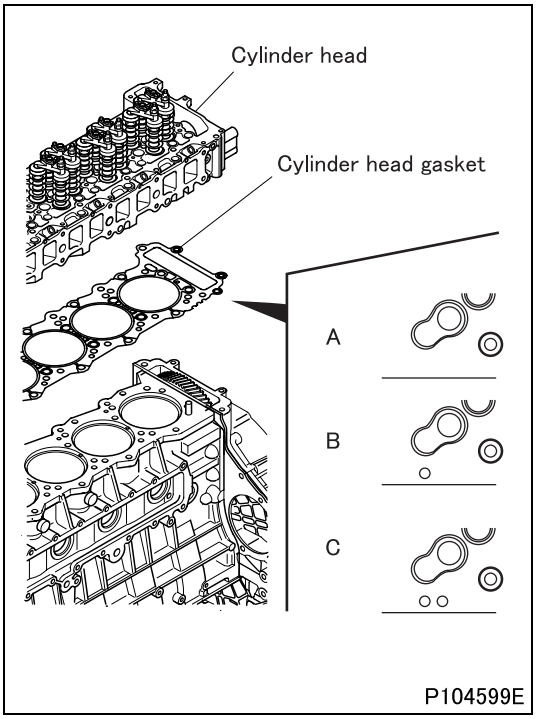


[Installation]

- Using b, press in the bushing until b contacts the No. 3 idler gear.
- After installation, measure the clearance again.
- If the measurement is less than the standard valve, ream the bushing.

◆Installation procedure◆





■ **Installation: Cylinder head**

CAUTION ⚠

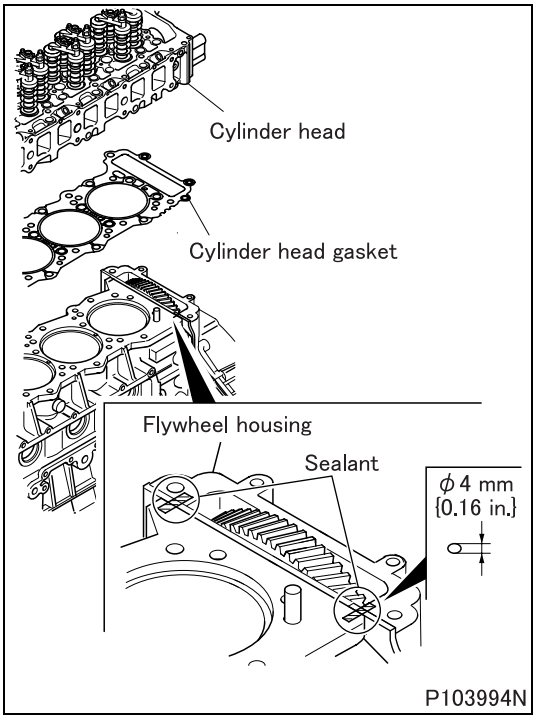
- **Before fitting the cylinder head bolts, check the punch marks on each bolt's head. Do not use the bolt if there are three punch marks.**
  The punch marks indicate the number of times each bolt has been tightened using the torque-turn tightening method. Any bolt that already has three punch marks must be replaced.

- The cylinder head gasket comes in three sizes. Choose the gasket appropriate for the cylinder head by the following procedure.
  - Measure the amount of piston projection for every cylinder. (See the PISTONS, CONNECTING RODS AND CYLINDER LINERS section.)
  - Select a cylinder head gasket with the appropriate thickness for the average of the piston projection measurements from the table below.
  - If any of the piston projection measurements is more than 0.05 mm {0.0020 in.} larger than the average value, than use the gasket one class higher than that class (A→B, B→C).

Unit: mm {in.}

Piston projection	Cylinder head gasket	
	Size	Thickness when tightened
0.804 to 0.872 {0.032 to 0.034}	"A"	1.70 ± 0.05 {0.067 ± 0.0020}
0.873 to 0.941 {0.035 to 0.037}	"B"	1.75 ± 0.05 {0.069 ± 0.0020}
0.942 to 1.011 {0.038 to 0.040}	"C"	1.80 ± 0.05 {0.071 ± 0.0020}

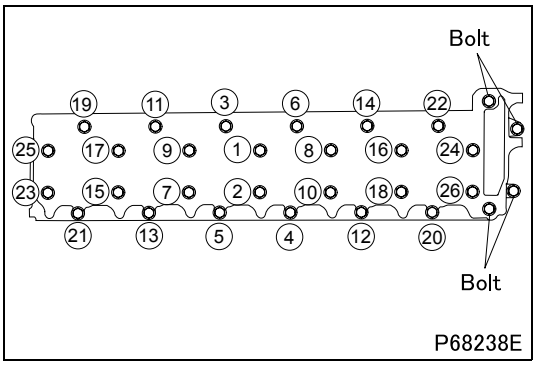
- The size class of the cylinder head gasket can be determined from the size mark or the shape of the notches cut on the gasket edge.



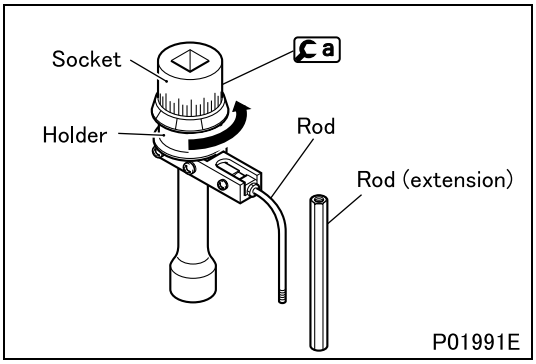
- Apply sealant onto the areas (shown in the illustration) on the top surfaces of the flywheel housing and crankcase.
- Within three minutes following the application, install the cylinder head onto the crankcase using the cylinder head bolts and a cylinder head gasket.
  Ensure that the gasket is faced as shown in the illustration.

CAUTION ⚠

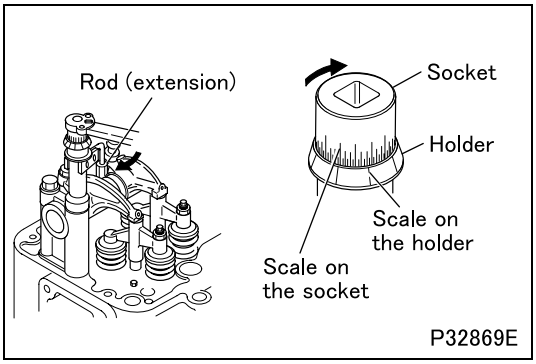
- **Remove oil or any other contamination from the surfaces where sealant is to be applied.**
- **Take care not to spread the sealant beyond the application areas during installation.**
- **Do not start the engine for at least an hour after installation.**
- **Whenever the cylinder head bolts are subsequently loosened or removed, the cylinder head gasket must be replaced and sealant reapplied upon reassembly.**
- **The gasket being used must have a thickness appropriate for the protrusion of the pistons. If pistons, connecting rods or other relevant parts are replaced, check the pistons for any change in protrusion and select the correct gasket.**



- Tighten the cylinder head bolts to a torque of 78 N·m {58 ft.lbs, 8 kgf·m} in the order shown in the illustration.
- Install the four bolts.
- Further tighten the bolts, in the order shown and as follows.



- Turn the holder of a counterclockwise to pretension the internal spring.



- Set [Ca] such that the rod (extension) is pressed against the rocker shaft bracket by the force of the spring.
- Align any line on the holder scale with any line on the socket scale. (This will be used as the reference point = 0°.)
- From the reference point, turn the socket by $90° \, {}^{+5°}_{0}$ in the direction shown. Each division on the holder scale represents 5°.
- Further turn the socket by $90° \, {}^{+5°}_{0}$.
- After tightening the cylinder head bolts within the plastic region, punch a mark on the bolt heads to record the number of times that they have been tightened.

CAUTION ⚠

- **Cylinder head bolts that have been tightened using the torque-turn method must never be additionally tightened after the final angular tightening.**

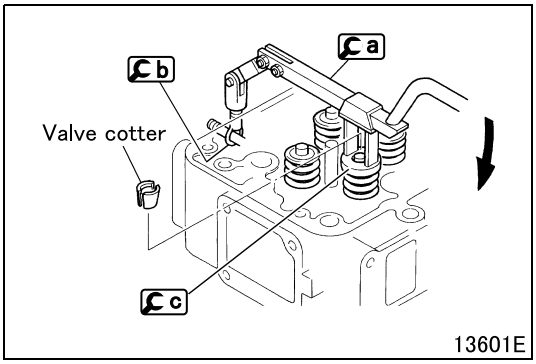
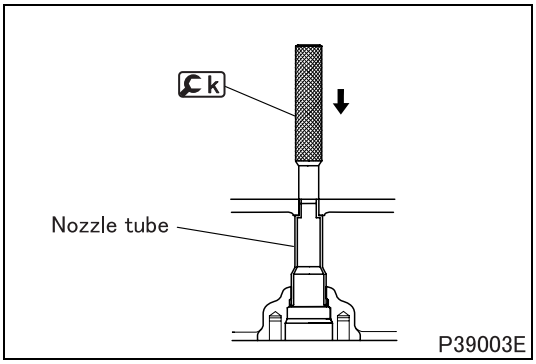
◆Removal procedure◆



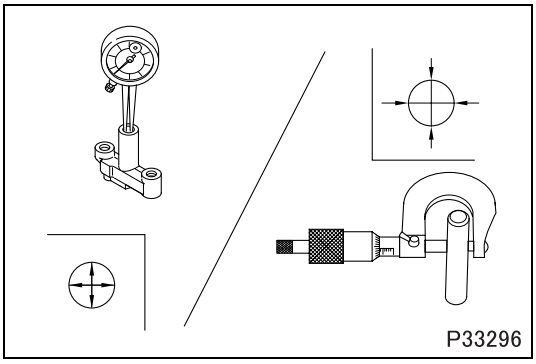
■ **Removal: Valve cotters**

- Using Ca, Cb and Cc, remove the valve cotter while compressing the valve spring(s) evenly.



■ **Removal: Nozzle tube**

◆Inspection procedure◆



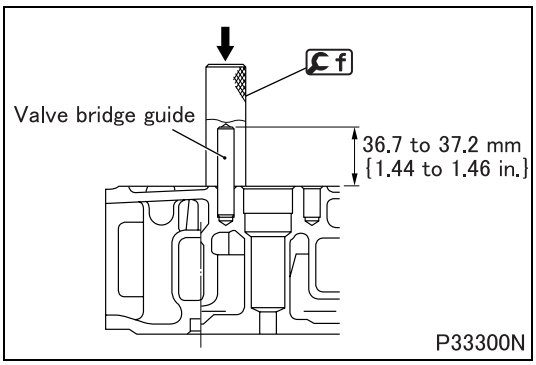
■ **Inspection: Valve bridge and valve bridge guide**

(1) Valve bridge-to-guide clearance

- If the measurement exceeds the limit, replace the defective part(s).

(2) Outside diameter of valve bridge guide

- If the measurement is less than the limit or the valve bridge guide is worn extremely unevenly, replace the valve bridge guide.

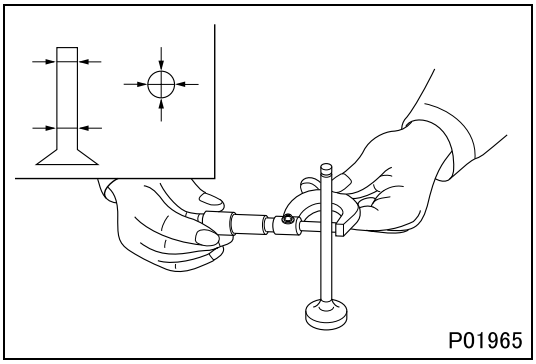


Replacement of valve bridge guide
[Installation]

- Using Cf, install the valve bridge guide until Cf comes into positive contact with the cylinder head.

CAUTION ⚠

- **The valve bridge guide must be installed to the specified depth of the cylinder head. Correct installation can only be possible by using Cf.**
- **Before installation, ensure that no water, oil or other foreign matter is in the installation hole.**

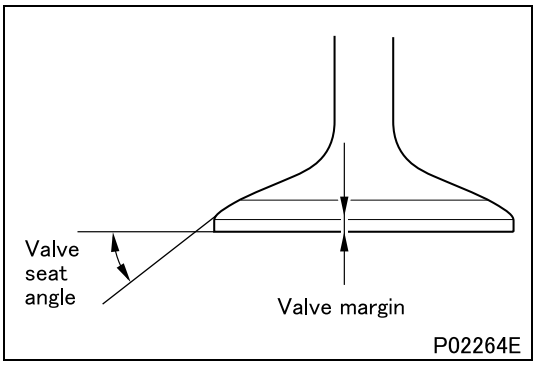


■ **Inspection: Intake and exhaust valve**

- If a valve is corrected or replaced with a new one as a result of the following inspection, make sure to lap the valve and valve seat.

(1) Valve stem outside diameter

- Replace the valve if the stem's outside diameter is below the limit or is severely worn.

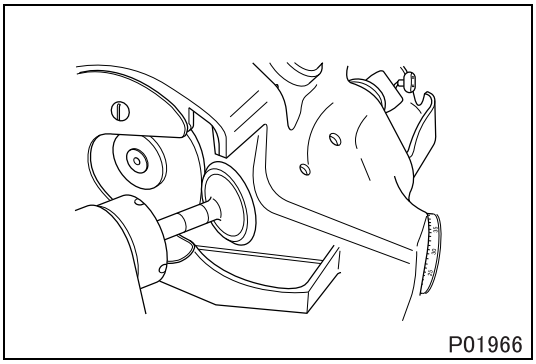


(2) Valve seat angle

- Reface the valve if the measured valve is not within the standard valve range.

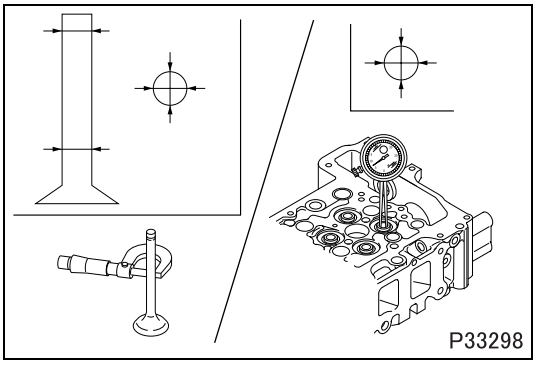
(3) Valve margin

- Reface or replace the valve if the measured valve exceeds the specified limit.



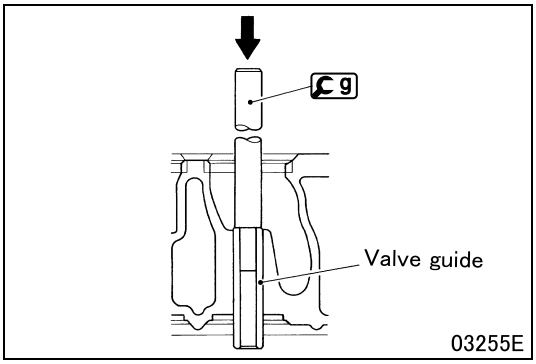
Refacing

- Limit grinding to a necessary minimum.
- If the valve margin is below the limit after grinding, replace the valve.
- After grinding, make sure to lap the valve and valve seat.

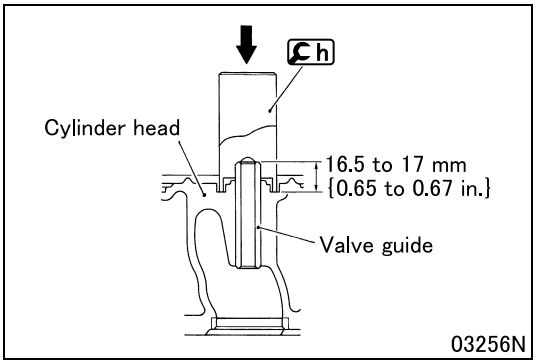


■ **Inspection: Valve-to-valve guide clearance**

- If the clearance exceeds the specified limit, replace the defective part(s).



Replacement of valve guides
[Removal]

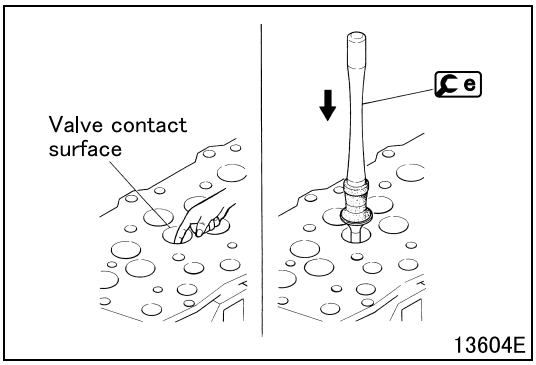


[Installation]

- Install the valve guide until h sits snugly on the cylinder head.

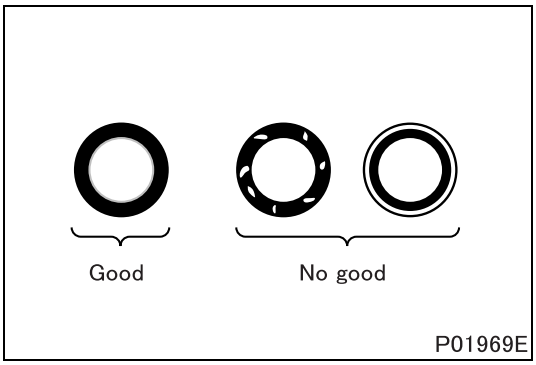
CAUTION ⚠

- **The valve guide must protrude from the cylinder head by the specified amount. Correct installation can only be possible by using h.**
- **The valve guides for the exhaust valves are longer than the valve guides for the inlet valves.**



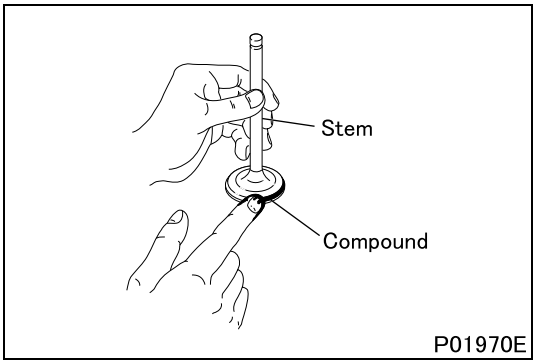
■ Inspection: Contact between valve and valve seat

- Before starting inspection, check that the valve and valve guide are intact.
- Apply an even coat of red lead to the valve contact surface of the valve seat.
- Strike the valve once against the valve seat. Do not rotate the valve during this operation.



- If the red lead deposited on the valve indicates a poor contact pattern, take either of the following corrective actions.

Contact pattern	Corrective action
Minor defect	Lapping
Serious defect	Reface or replace valve and valve seat

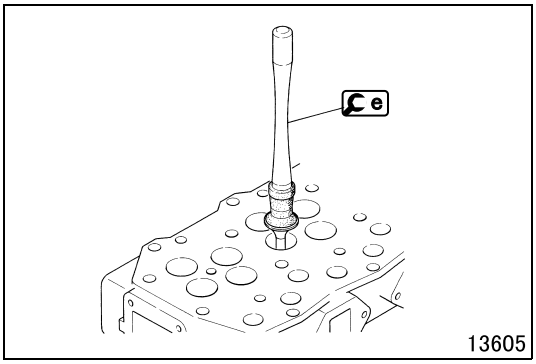


Lapping

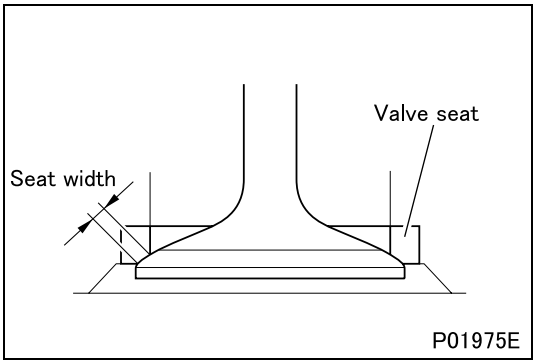
- Lap the valve in the following sequence.
- Apply a thin coat of lapping compound to the seat contact surface of the valve.
- Start with an intermediate-grit compound (120 to 150 grit) and finish with a fine-grit compound (200 grit or more).
- Adding a small amount of engine oil to the lapping compound can facilitate even application.

CAUTION ⚠

- **Do not put any compound on the stem.**



- Strike the valve several times against the valve seat while rotating the valve a little at a time.
- Wash away the compound with diesel fuel.
- Apply engine oil to the valve contact surface of the valve seat and rub in the valve and seat well.
- Inspect the contact pattern of the valve and valve seat again.
- If the contact pattern is still defective, replace the valve seat.

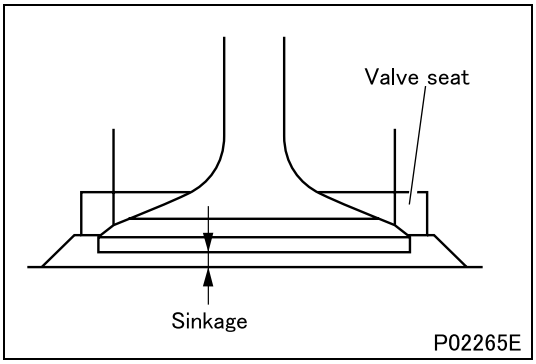


■ Inspection: Valve seats

- If a valve is corrected or replaced with a new one as a result of the following inspection, make sure to lap the valve and valve seat.

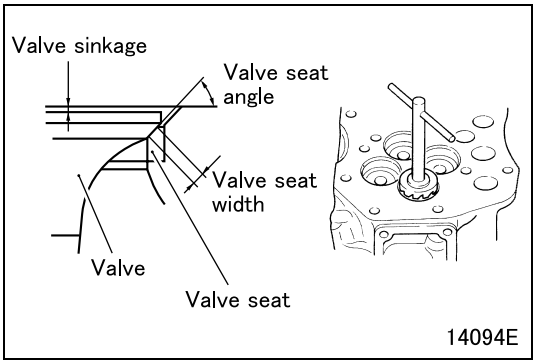
(1) Valve seat width

- If the measurement exceeds the limit, reface or replace the valve seat.



(2) Valve sinkage from cylinder head bottom surface

- Perform measurement keeping the valve in close contact with the valve seat.
- If the measurement exceeds the limit, adjust or replace the defective part(s).



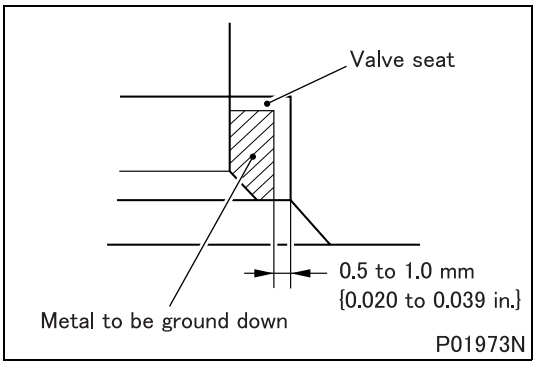
Refacing the valve seat

- Grind the valve seat using a valve seat cutter or valve seat grinder.
- Place a piece of sandpaper of approximately #400 between the cutter and valve seat and grind the valve seat lightly.
- Use a 15° or 75° cutter to cut the valve seat to a width within the standard range.

CAUTION ⚠

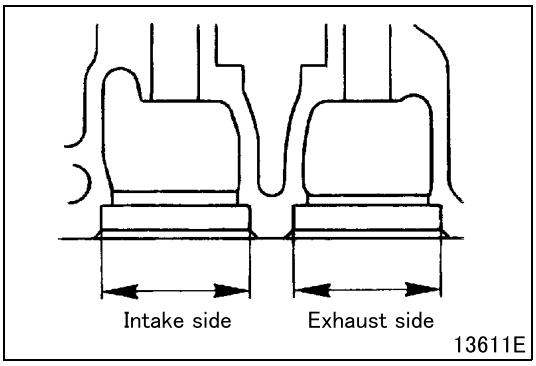
- **Make sure that the valve seat refacing does not cause the valve sinkage to exceed the specified limit.**

- After refacing, lap the valve and valve seat.



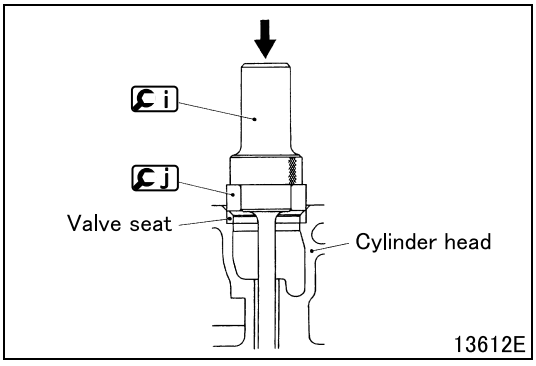
Replacement of valve seat
[Removal]

- The valve seats are installed by expansion fitting. To remove a valve seat, grind inside the metal stock to reduce the wall thickness, then remove the valve seat at room temperature.

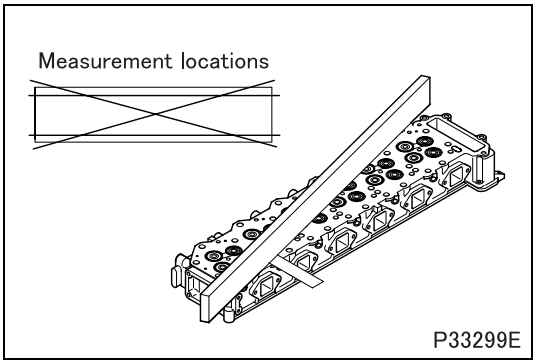


[Installation]

- Measure the diameter of the valve seat hole in the cylinder head.
- If the measurement deviates from the standard valve, replace the cylinder head.



- Chill the valve seat thoroughly by immersing in it in liquid nitrogen.
- Install the valve seat in the cylinder head using i and j.
- Lap the valve seat and valve.



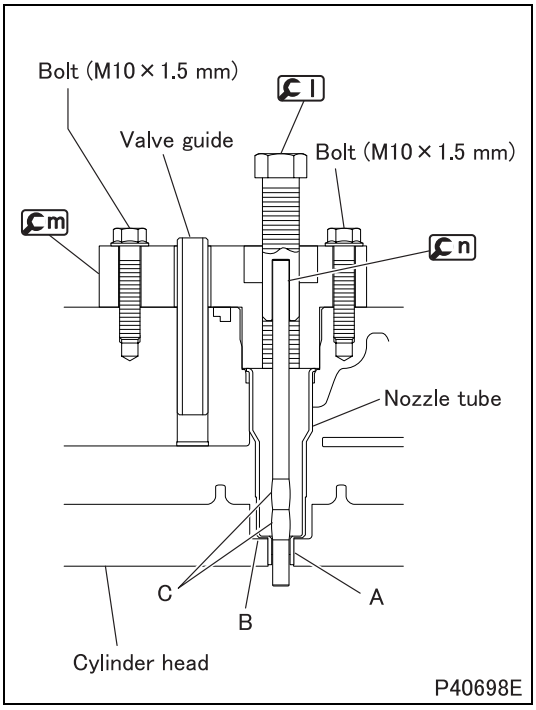
■ **Inspection: Cylinder head bottom surface distortion**

- If the distortion exceeds the specified limit, rectify it using a surface grinder.

CAUTION ⚠

- **Make sure that the height of the cylinder head from the top surface to the bottom surface is not reduced to a value below the specified limit.**

◆Installation procedure◆

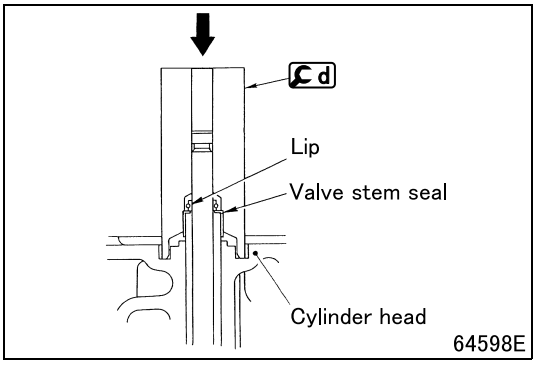


■ **Installation: Nozzle tube**

- Clean the mounting holes of the nozzle tube on the cylinder head.
- Apply a sealant to the perimeter A of the tip of the nozzle tube.
- Push in the nozzle tube by hand until it contacts surface B of the cylinder head.
- Tighten [m] with the bolt and press the nozzle tube onto surface B of the cylinder head.
- Apply engine oil to section C of [n].
- Screw in [l] until [n] can be pulled out from the bottom of the cylinder head.

CAUTION ⚠

- **When installing the nozzle tube, be sure to perform a leak test to check for airtightness.**

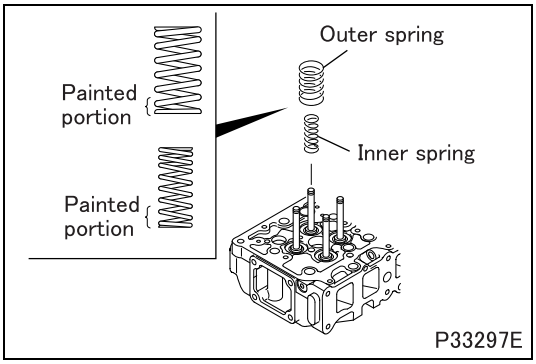


■ **Installation: Valve stem seal**

- Apply engine oil to the lip of the valve stem seal.
- Install the valve stem seal until [d] sits snugly on the cylinder head.

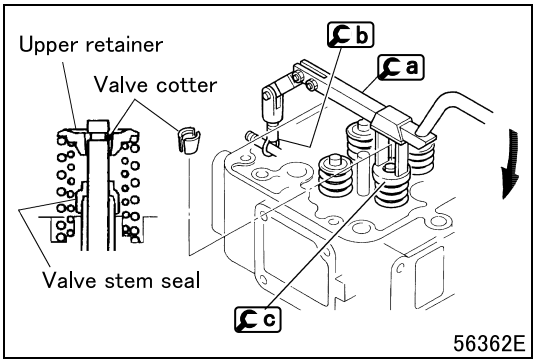
CAUTION ⚠

- **After installing the valve stem seal, check that its spring is not deformed or damaged.**



■ **Installation: Valve spring**

- Install the outer and inner valve springs onto the cylinder head while facing them as shown in the illustration.



■ **Installation: Valve cotter**

- Using a, b and c, install the valve cotter while compressing the valve spring(s) evenly.

CAUTION ⚠

- **Do not compress the valve spring(s) too much, or the upper retainer will contact the valve stem seal and damage will result.**

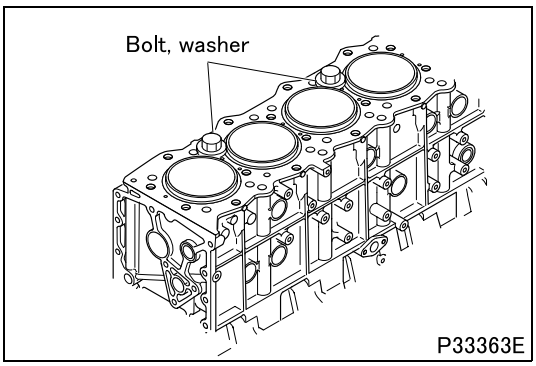
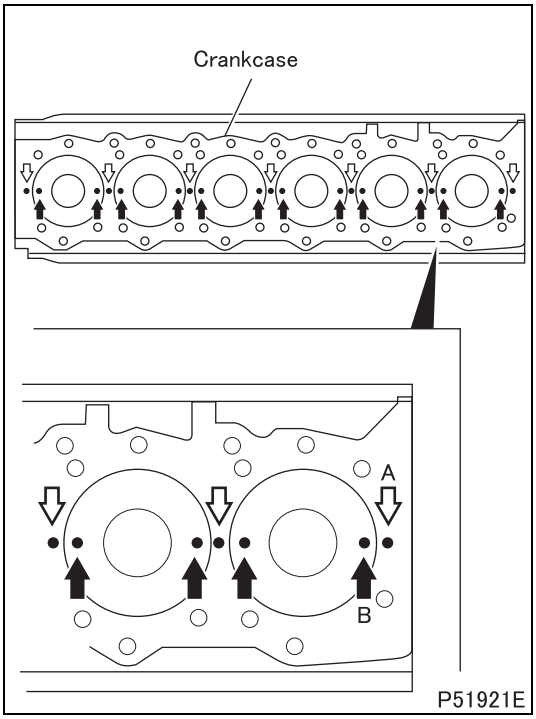
◆Inspection before removal◆



P33363E

■ Retaining cylinder liners

- The cylinder liners may move up when the crankcase is turned over, or the crankshaft is rotated after the pistons are installed. To prevent this, retain the cylinder liners by holding their flanges with bolts and washers.

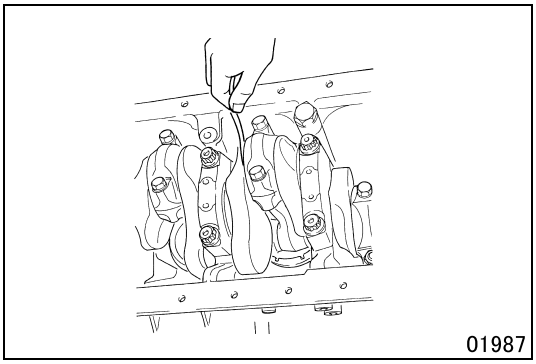


■ **Inspection: Piston projection from crankcase top surface**

CAUTION ⚠

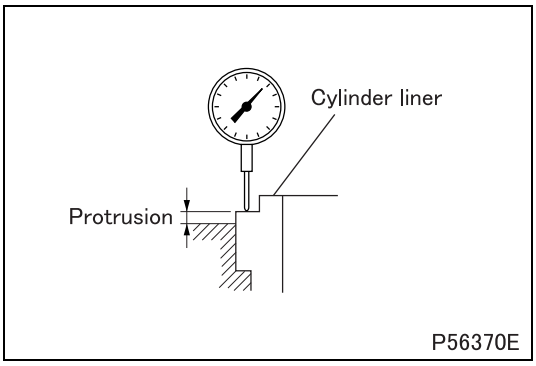
- **The amount of piston projection affects engine performance and must therefore be inspected without fail.**

- Set the piston at the top dead center.
- Mark reference points A (seven points in total) on the top surface of the crankcase as shown in the illustration. Using each of the marks as a zero point, measure the amount of piston projection relative to the zero point (height of measurement point B – height of reference point A).
- Make the measurements at the two measurement points B for each cylinder (twelve points in total) using the reference point A nearest to each measurement point, and calculate the average value of all the measurements.
- If the average value is out of the standard value range, check the clearances between all relevant parts.
- Select and use a cylinder head gasket that can accommodate the average piston projection (average value of the twelve measurements).



■ **Inspection: Connecting rod end play**

- Measure the end play for every connecting rod.
- If any measurement exceeds the specified limit, replace the defective part(s).



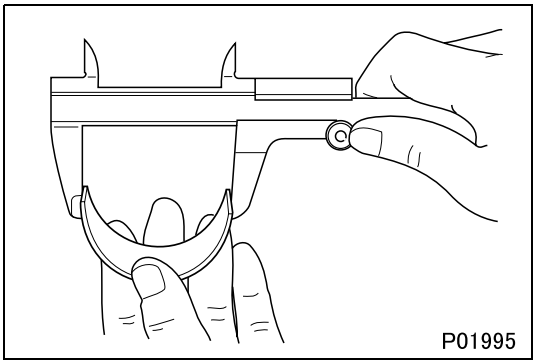
■ **Inspection: Cylinder liner flange projection**

- If the measurement deviates from the standard value, inspect the installation and replace the defective part(s).

CAUTION ⚠

- **If the cylinder liner flange protrusion is less than the specified value, the contact pressure of the cylinder head gasket against the bore of the cylinder will not be high enough to prevent gas leakage.**

◆Inspection procedure◆

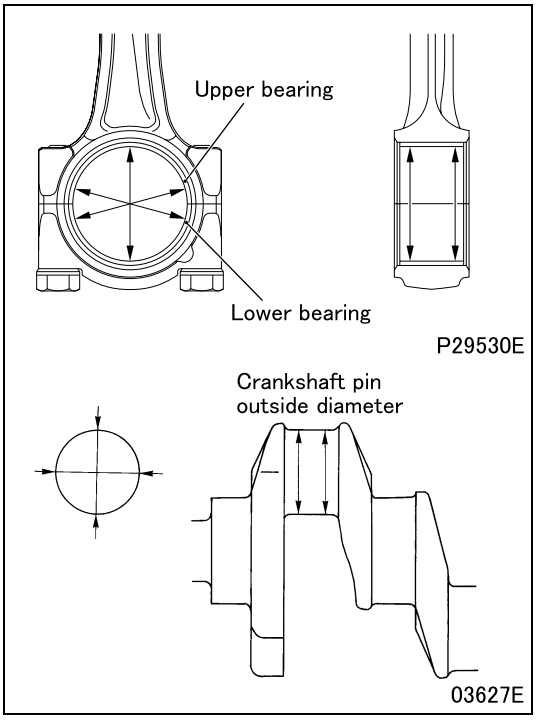


■ **Inspection: Connecting rod bearing span when free**

CAUTION ⚠

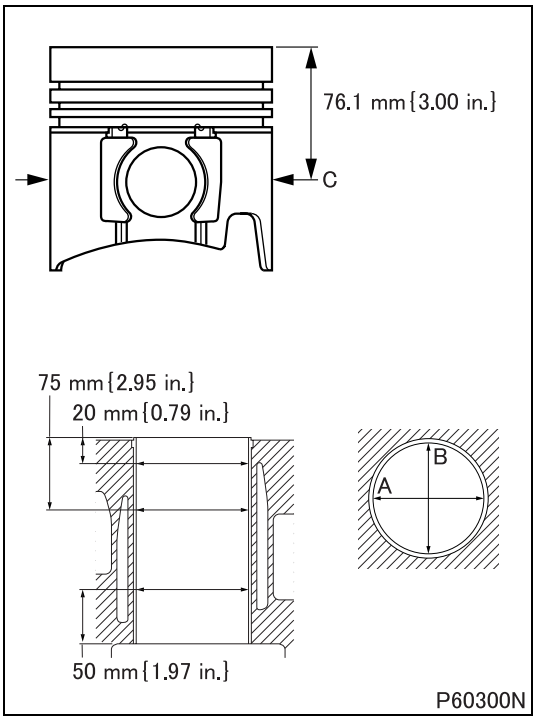
- **Do not attempt to manually expand the bearings.**

- If the measurement is less than the limit, replace upper and lower bearings as a set.



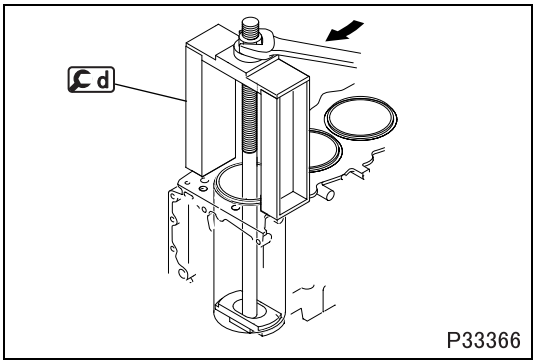
■ **Inspection: Connecting rod bearing-to-crankshaft oil clearance**

- Fit the lower bearing to the connecting rod cap and the upper bearing to the connecting rod, then tighten the nut to a torque of 29 N·m {21 ft.lbs, 3 kgf·m}.
- Measure the inside diameter of the bearing and the outside diameter of the crankshaft pin.
- If the clearance exceeds the limit, replace the defective part(s).
- If a bearing has to be replaced with an undersized one, machine the crankshaft pin to the specified undersize diameter.



■ **Inspection: Clearance between piston and cylinder sleeve**

- If the measurement deviates from the standard value, replace the defective part(s).
  A: Measuring point on the crankcase (in direction of the crankcase axis).
  B: Measuring point on the crankcase (vertical to the crankcase axis).
  C: Measuring point on the piston outer diameter (vertical to the piston pin hole).

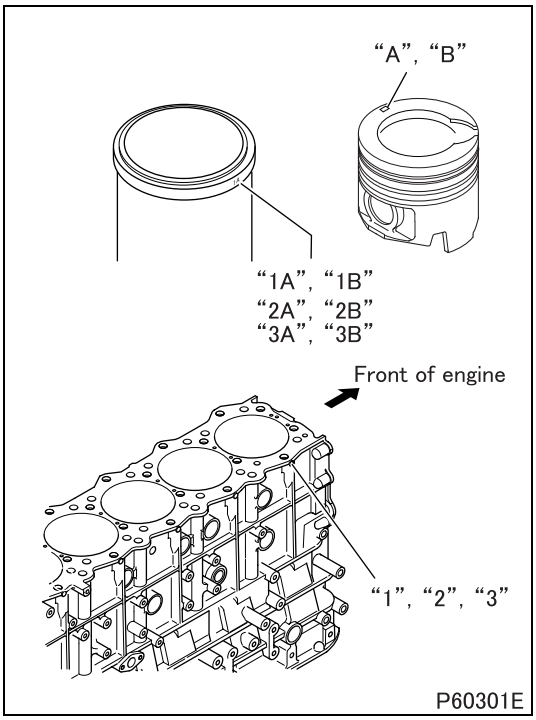


Replacement of cylinder liner

[Removal]

CAUTION ⚠

- **If the cylinder liners will need to be reused for some reason or other, make countermarks to ensure correct reassembly.**



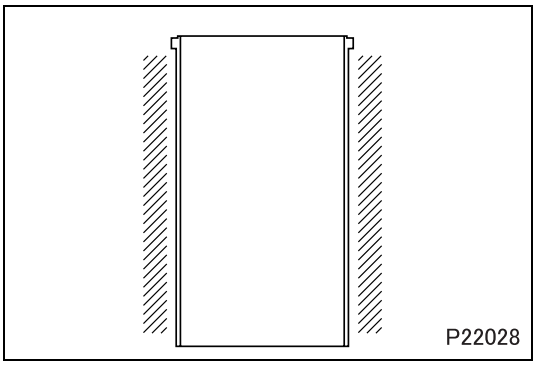
[Installation]

- When replacing cylinder liners, select the cylinder liners which correspond to the size marks on the crankcase and the piston.

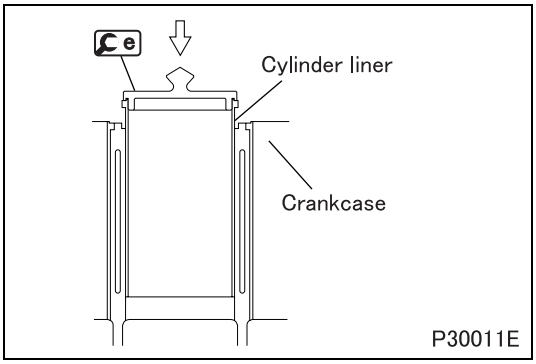
Size mark on crankcase	Size mark on cylinder liner	Size mark on piston
"1"	"1A"	"A"
	"1B"	
"2"	"2A"	
	"2B"	"B"
"3"	"3A"	
	"3B"	

CAUTION ⚠

- **Make sure to use pistons and cylinder liners of the same size. Failure to do may result in seizures in the engine.**



- Apply a thin coat of engine oil onto the outside periphery (hatched area) of the cylinder liner.

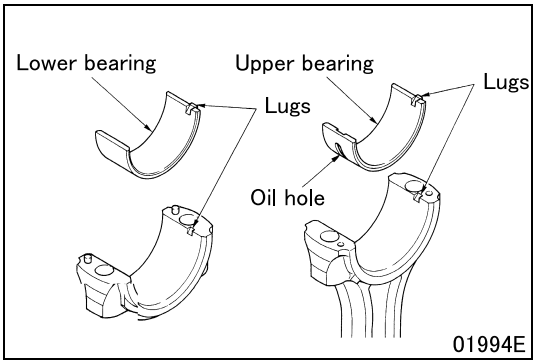


- While pushing the top surface of e evenly with hands, gently insert the cylinder liner into the crankcase.

CAUTION ⚠

- **Cylinder liners are thinly structured. Therefore, they must be handled with extreme care.**

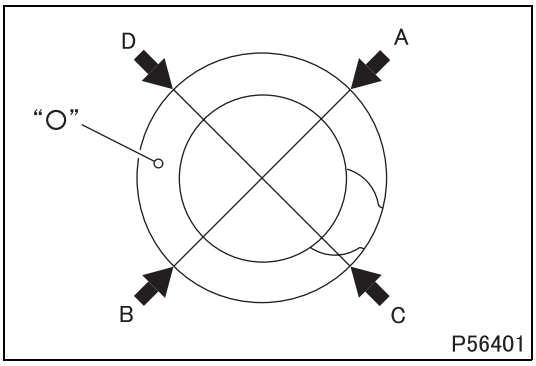
◆Installation procedure◆



■ Installation: Connecting rod bearings

CAUTION ⚠

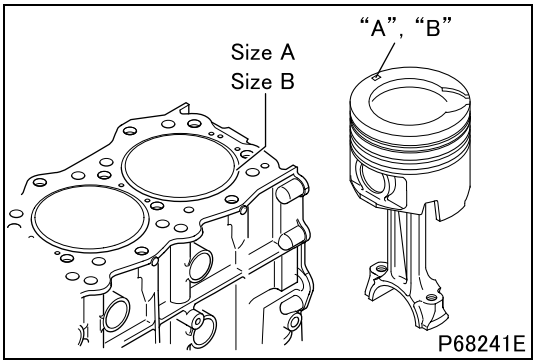
- **Do not reverse the positions of the lower bearing and the upper bearing (with oil hole) when installing, as this may cause seizure in the engine.**



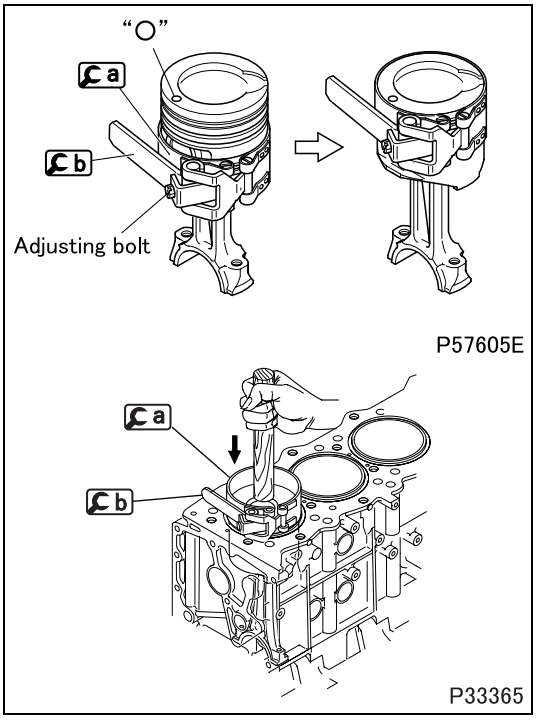
■ Installation: Piston and connecting rod

- Check that the piston ring end gaps are in their correct positions.
  A: 1st compression ring gap
  B: 2nd compression ring gap
  C: Oil ring gap
  D: Oil ring expander spring gap

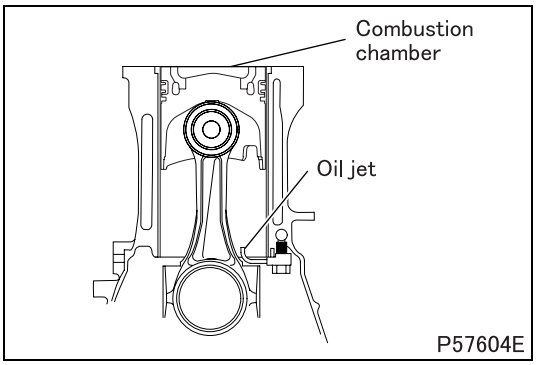
"O": Front mark on piston



- Ensure that the size mark ("A", "B") on the piston is the same as that on the cylinder liner.
- Install the piston and connecting rod, taking care not to damage the inside surface of the cylinder liner or the crank pin with the connecting rod.

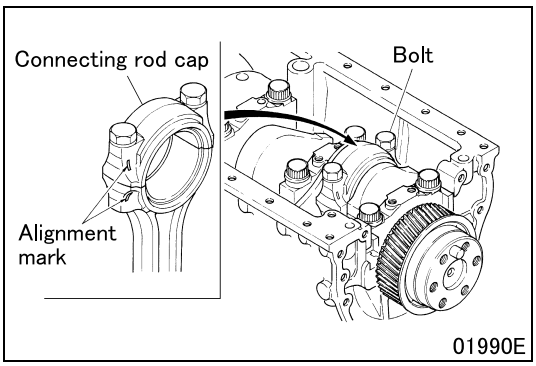


- Face the front mark "○" of the piston toward the front of the engine.
- With a and b installed around the piston skirt, tighten the adjusting bolt of b until the inside diameter of a matches the outside diameter of the piston skirt.
- Remove a and b from the piston. Apply engine oil to the following areas. Then, install a and b over the rings of the piston.
  - Outside surface of piston
  - Inside surface of a
  - Cylinder liner inside surface

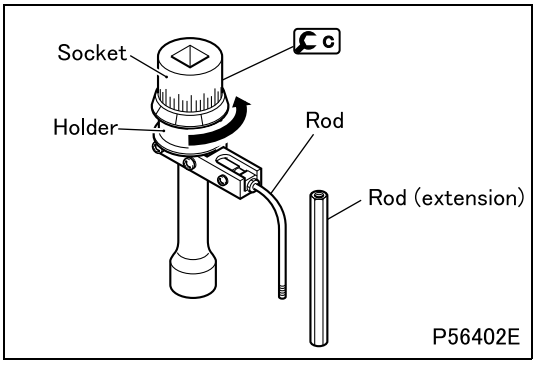


CAUTION ⚠

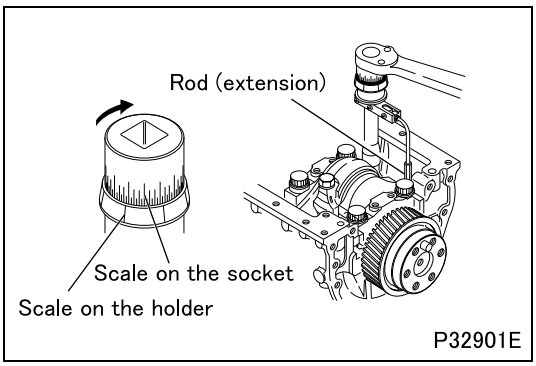
- **Be careful not to scratch or damage head of the piston (a part of the combustion chamber).**
- **Make sure that the connecting rod does not hit oil jet.**



- After the piston and connecting rod have been installed, install the connecting rod cap onto the connecting rod, ensuring that the alignment marks are aligned. Tighten the bolts alternately as follows.
  - Tighten the bolts to a torque of 29 N·m {21 ft.lbs, 3 kgf·m}.
  - Further tighten the bolts in the following sequence.



- Turn the holder of c counterclockwise to preload the built-in spring.



- Set [C] such that the rod (extension) is pressed against the crankshaft by the force of the spring.
- Align any line on the holder scale with any line on the socket scale. (This will be used as the reference point = 0°.)
- From the reference point, turn the socket by 90° ± 5° in the direction shown. Each division on the socket scale represents 5°.
- With the connecting rod cap installed, check the following items.
  - Connecting rod end play
  - Piston protrusion

Service standards (Unit: mm {in.})

Location	Maintenance item		Standard value	Limit	Remedy
1 to 3	Piston ring end gap	1st compression ring	$0.45\ ^{+0.05}_{-0.10}$ {$0.018\ ^{+0.0020}_{-0.0039}$}	1.5 {0.059}	Replace
		2nd compression ring			
		Oil ring	0.30 to 0.55 {0.012 to 0.022}		
1 to 3, 8	Piston ring side clearance in piston groove	1st compression ring	0.13 to 0.18 {0.0051 to 0.0071}	0.2 {0.0079}	Replace
		2nd compression ring	0.065 to 0.105 {0.0026 to 0.0041}	0.15 {0.059}	
		Oil ring	0.025 to 0.065 {0.00098 to 0.0026}		
5, 6	Piston pin-to-connecting rod bushing clearance		0.02 to 0.05 {0.00079 to 0.0020}	0.1 {0.0039}	Replace
5, 8	Piston pin-to-piston clearance		0.004 to 0.022 {0.00016 to 0.000079}	0.05 {0.0020}	Replace
7	Connecting rod	Bend	–	0.05 {0.0020}	Replace
		Twist	–	0.1 {0.0039}	

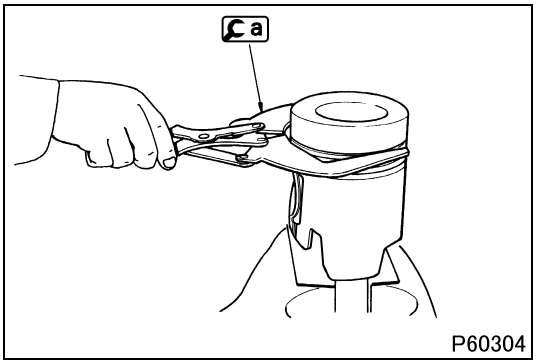
Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Piston pin outside surface	Engine oil	As required
	Connecting rod bushing outside surface		
	Connecting rod bushing fitting surface of connecting rod		

Special tools

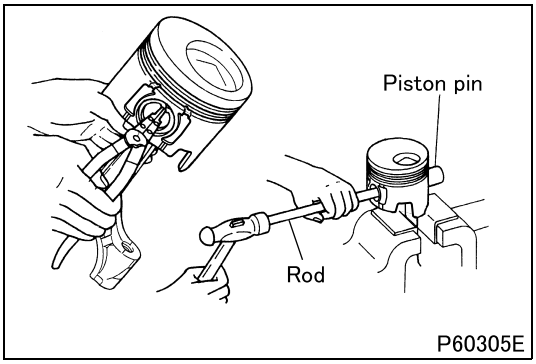
Mark	Tool name and shape	Part No.	Application
a	Piston ring tool  P02013	30091-07100	Removal and installation of piston rings
b	Connecting rod bushing puller kit  P02015	MH062556	Removal and installation of connecting rod bushings

◆Removal procedure◆



P60304

■ **Removal: Piston ring**

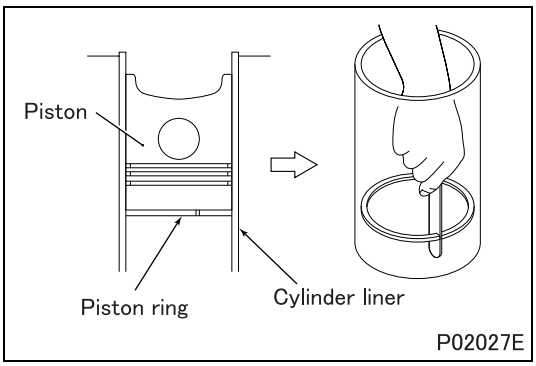


P60305E

■ **Removal: Piston pin**

- Remove the piston pin by striking it with a rod and hammer.
- If the piston pin is difficult to remove, first heat the piston in hot water or with a piston heater.

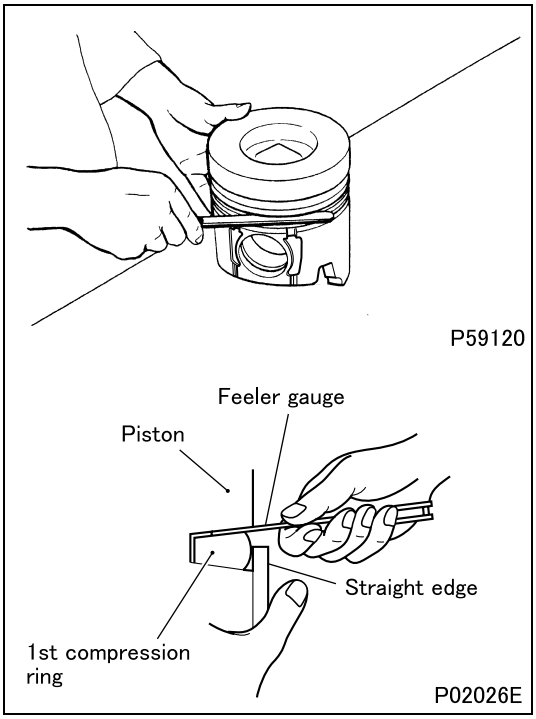
◆Inspection procedure◆



P02027E

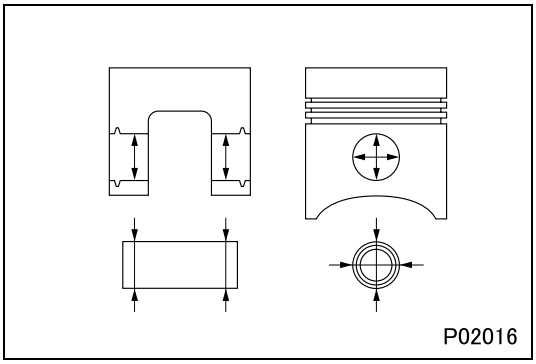
■ **Inspection: Piston ring end gap**

- Using the crown of a piston, push the piston ring horizontally into a cylinder in the crankcase until it reaches the lower part of the cylinder liner, where there is relatively small wear.
- Taking care not to move the piston ring, measure the end gap.
- If any of the rings has a gap exceeding the specified limit, replace all the piston rings as a set.



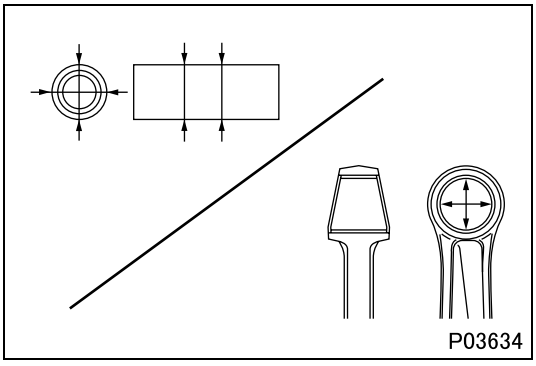
■ **Inspection: Piston ring side clearance in piston groove**

- Remove any carbon deposits from the ring groove in the piston.
- Measure the side clearance of each ring around the piston's entire periphery.
- If any of the measurements exceeds the specified limit, replace the defective part(s). If any of the piston rings is defective, replace all the rings on the piston as a set.
- The side clearance of the 1st compression ring must be measured using a feeler gauge while holding the ring against the piston ring groove with a straight edge.



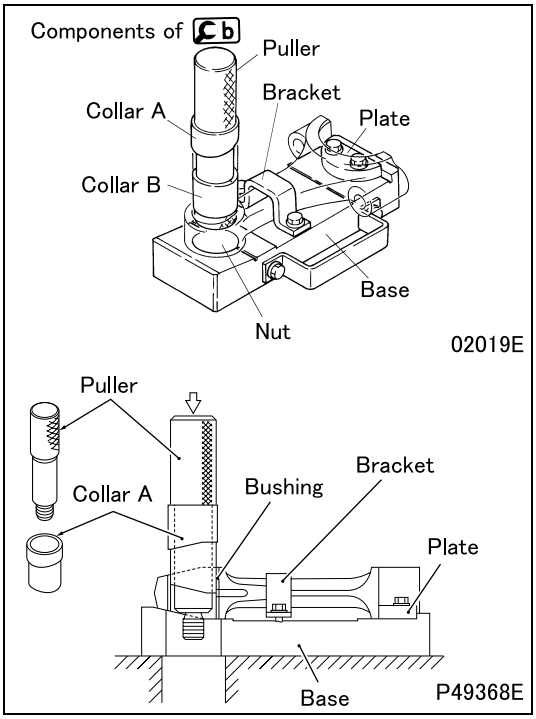
■ **Inspection: Piston pin-to-piston clearance**

- If the measurement exceeds the specified limit, replace the defective part(s).



■ **Inspection: Piston pin-to-connecting rod bushing clearance**

- If any of the measurements exceeds the specified limit, replace the bushing.

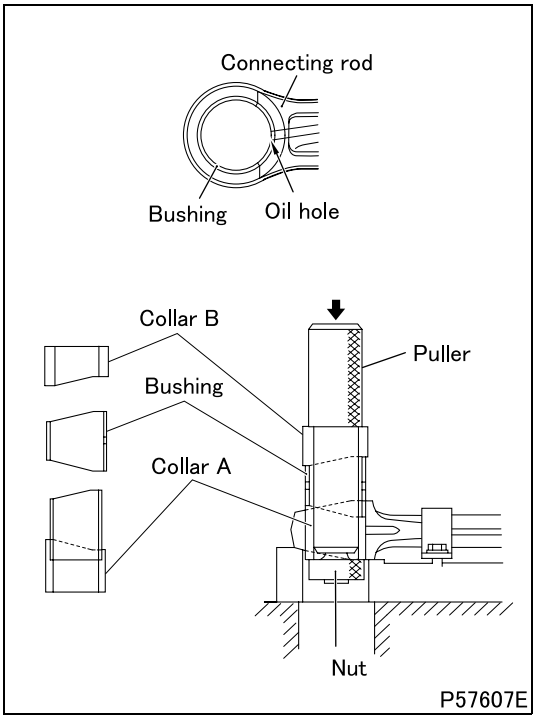


Replacement of connecting rod bushing

- Replace the connecting rod bushing using b.

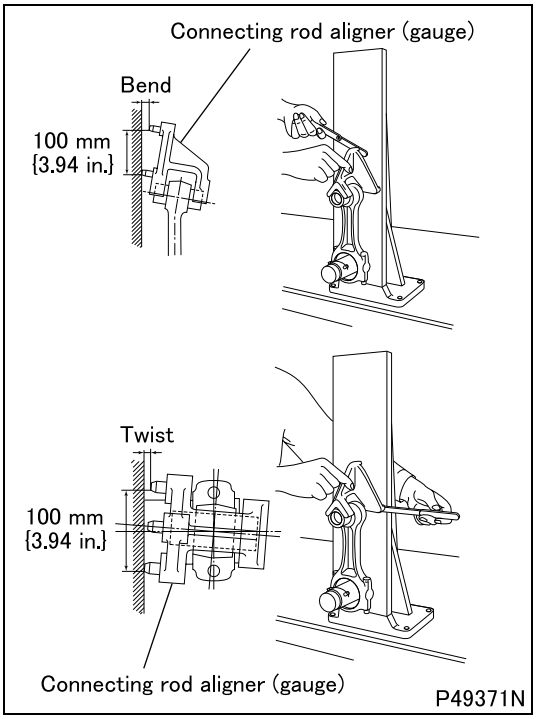
[Removal]

- Remove the upper bearing (if fitted) from the large end of the connecting rod.
- Mount the connecting rod on the base and lock it in position with the bracket and plate.
- Fit collar A over the puller with its ends facing in the illustrated directions. Then, slowly apply a pressure of approximately 49 kN {11020 lbs, 5,000 kgf} to the puller with a press to force out the connecting rod bushing.



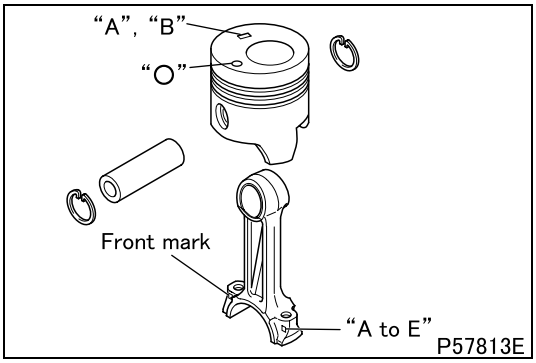
[Installation]

- Apply engine oil to the outside surface of the connecting rod bushing and the bushing fitting surface of the connecting rod.
- Fit collar B, the bushing, and collar A over the puller in the illustrated directions and lock this arrangement together with the nut.
- Align the oil holes in the connecting rod bushing and the connecting rod. Then, use a press to slowly apply a pressure of approximately 49 kN {11020 lbs, 5,000 kgf} to the puller until the bushing is forced into place.
- After press-fitting the connecting rod bushing, measure the clearance between the piston pin and connecting rod bushing.
- If the measurement is less than the standard clearance range, ream the bushing.



■ **Inspection: Connecting rod bend and twist**

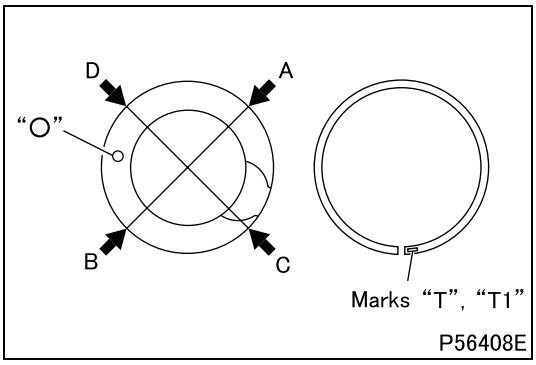
- Mount the connecting rod on the connecting rod aligner. Also mount the connecting rod bearings, piston pin, and connecting rod cap to create the same conditions as are expected when the connecting rod is mounted on a crankshaft. Tighten the nuts of the connecting rod bearing cap to a torque of 29 N·m {21 ft.lbs, 3 kgf·m}.
- Measure the extent of bend and twist in the connecting rod.
- If either measurement exceeds the specified limit, replace the connecting rod.



■ **Installation: Piston to connecting rod**

- Install pistons and connecting rods as follows when replacing them.
  - All connecting rods used in the same engine must be of the same weight size mark.
    Weight mark: "A" to "E"
  - Apply engine oil to the piston pin, and assemble the piston and connecting rod with their marks facing in the illustrated directions.

  "O": Front mark
  - If the piston pin is difficult to insert, heat the piston in hot water or with a piston heater.



■ **Installation: Piston rings**

- With the manufacturer's marks (found near the piston ring end gaps) facing up, install the piston rings so that the end gap of each ring is positioned as illustrated.
  A: 1st compression ring end gap
  B: 2nd compression ring end gap
  C: Oil ring end gap
  D: Oil ring's expander spring end gap

"O": Front mark on piston
The manufacturer's marks are present only on the 1st ("T") and 2nd ("T1") compression rings.

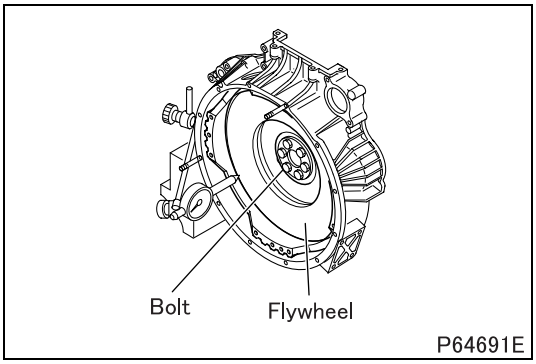
◆Inspection before removal◆

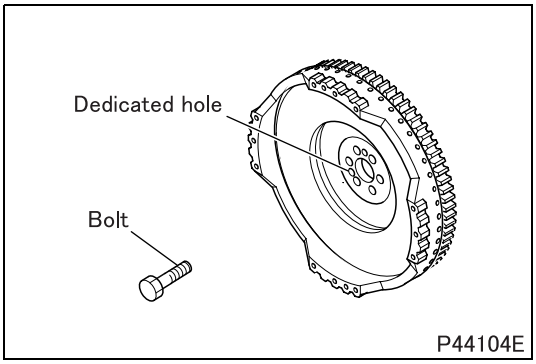


P64691E

■ **Inspection: Flywheel friction surface runout when fitted**

- If the measurement exceeds the limit, check if the bolts are correctly tightened as well as the crankshaft mounting surface. Correct or replace the flywheel as required.

◆Removal procedure◆



P44104E

■ **Removal: Flywheel**

- To remove the flywheel, use bolts inserted into the dedicated holes in the flywheel.

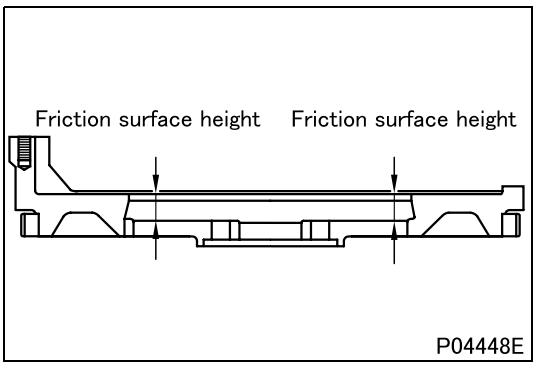
■ **Removal: Ring gear**

- Heat the ring gear evenly with a gas burner or the like until it reaches approximately 200°C {390°F}, then remove it from the flywheel.

WARNING ⚠

- **You may burn yourself if you touch the heated ring gear.**

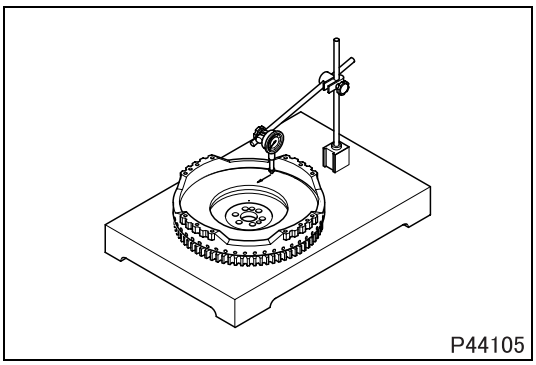
◆Inspection procedure◆



■ **Inspection: Flywheel**

(1) Friction surface height

- If the height is less than the limit, replace the flywheel.

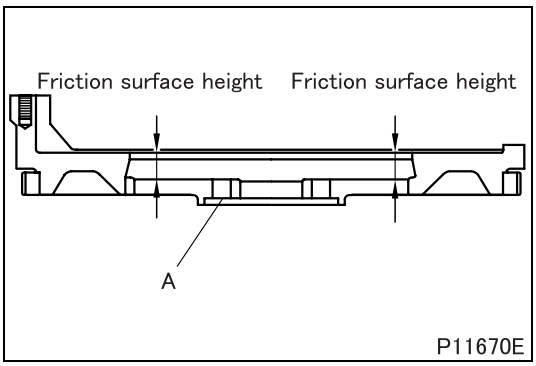


(2) Friction surface distortion

- If the measurement exceeds the limit, rectify or replace the flywheel.

NOTE

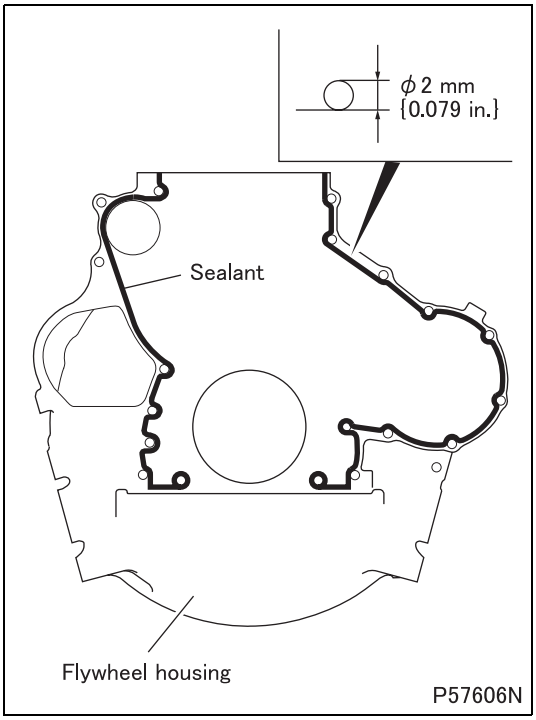
- **If the ring gear is evidently defective, replace the ring gear before inspecting the friction surface for distortion.**



Rectification of friction surface

- Rectify the friction surface so that its height is not below the specified limit, and it is parallel with surface A within specification.

◆Installation procedure◆



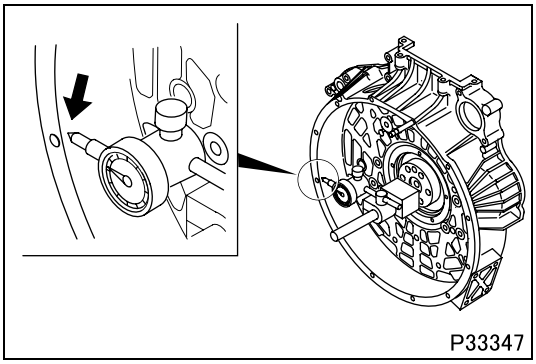
■ **Installation: Flywheel housing**

[Installation]

- Apply an even and continuous bead of sealant onto the flywheel housing surface where the crankcase is to be mounted.
- Install the flywheel housing onto the crankcase within 3 minutes following the application.

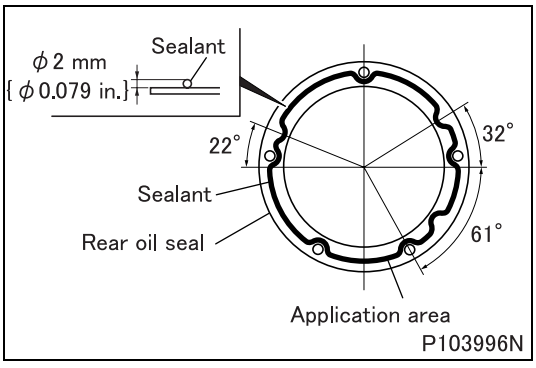
CAUTION ⚠

- **Clean the flywheel housing surface where sealant is to be applied.**
- **When installing the flywheel housing, take care not to spread the sealant beyond the application area.**
- **Do not start the engine at least for an hour after the flywheel housing has been installed.**
- **If the flywheel housing mounting bolts are subsequently loosened, be sure to apply sealant again upon reassembly.**



[Inspection]

- While turning the crankshaft, measure the flywheel housing for any eccentricity at the location indicated in the illustration.
- If the eccentricity exceeds the limit, reassemble the flywheel.
- If the eccentricity still exceeds the limit after reassembly, replace the defective part(s).

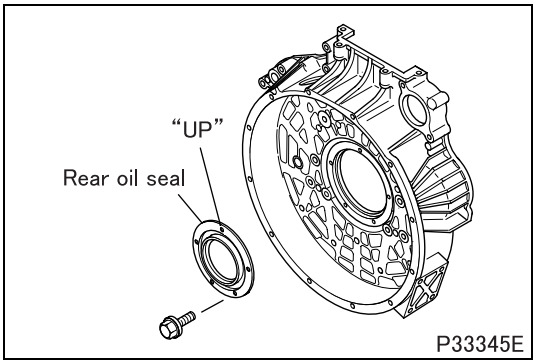


■ **Installation: Rear oil seal**

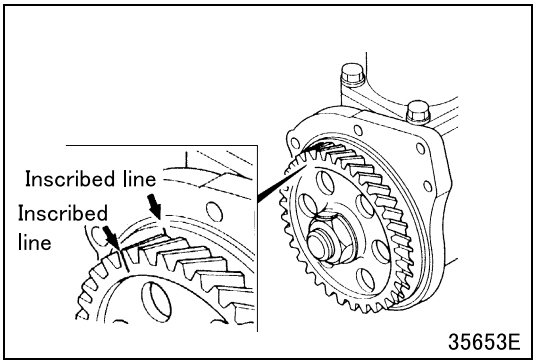
- Apply an even and continuous bead of sealant on the rear oil seal as shown in the illustration.
- Install the rear oil seal onto the flywheel housing within 3 minutes following the application.

CAUTION ⚠

- **Clean the rear oil seal surface where sealant is to be applied.**
- **When installing the rear oil seal, take care not to spread the sealant beyond the application area.**
- **Do not start the engine at least for an hour after the rear oil seal has been installed.**
- **If the rear oil seal mounting bolts are subsequently loosened, be sure to apply sealant again upon reassembly.**

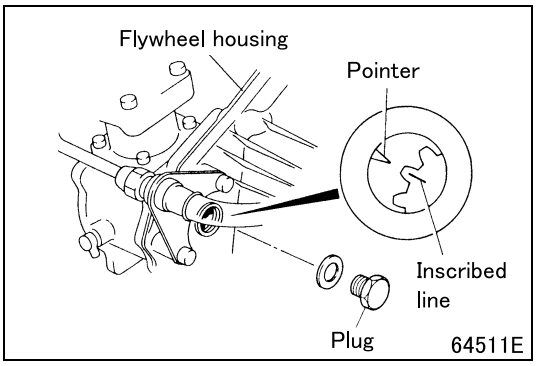


- Apply engine oil to the rear oil seal lip.
- Install the rear oil seal onto the flywheel housing ensuring that the seal is faced in the illustrated direction.

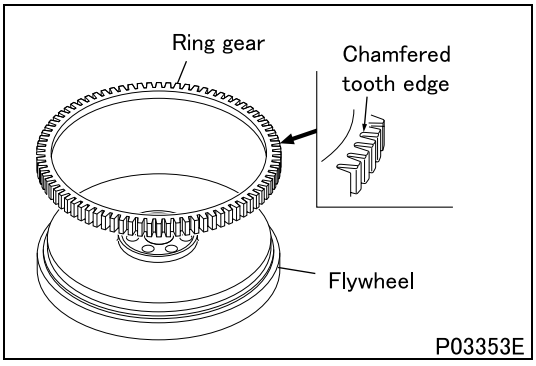


■ Installation: Air compressor

- Bring the No. 1 cylinder of the engine to top dead center of the compression stroke.
- After aligning inscribed lines with each other, install the air compressor to the flywheel housing.



- Remove the inspection plug and check if the inscribed line is aligned with the pointer.
- If not aligned, remove and refit the air compressor.



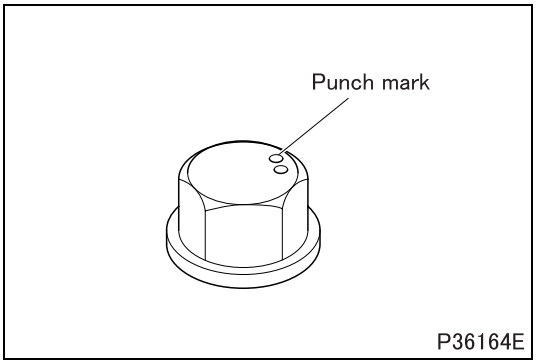
■ Installation: Ring gear

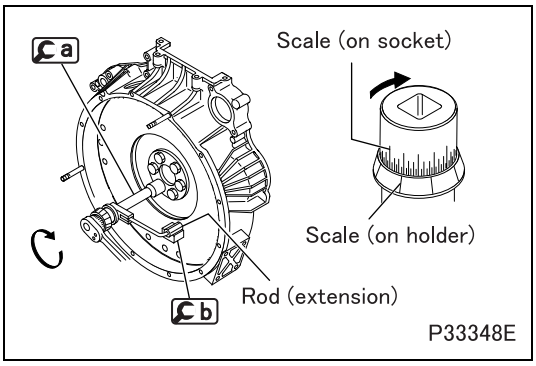
- Heat the ring gear evenly with a gas burner or the like until it reaches approximately 200°C {390°F}.

WARNING ⚠

- **You may burn yourself if you touch the heated ring gear.**

- Fit the ring gear with the side having non-chamfered tooth edges toward the flywheel.





■ **Installation: Flywheel**

CAUTION ⚠

- **Before installing a bolt, check the number of punch marks on the bolt head. (Bolts with up to two punch marks can be reused.)**
  The number of punch marks indicates the number of times the bolt has been tightened in the past within the plastic region. If there are three punch marks (tightened three times in the past), replace the bolt.

- Tighten the flywheel mounting bolts to a torque of 98 N·m {72 ft.lbs, 10 kgf·m}.
- Further tighten the bolts in the following procedure.
  - Turn the holder of [a] counterclockwise to preload the built-in spring.
  - Set [a] such that the rod (extension) is pressed against [b] by the force of the spring.
  - Align any line on the holder scale with any line on the socket scale. (This will be used as the reference point = 0°.)
  - From the reference point, turn the socket by $150^{\circ}\ ^{+10^{\circ}}_{0^{\circ}}$ clockwise. Each division on the socket scale represents 5°.
  - After tightening the bolt within the plastic region, make a punch mark on the bolt head for subsequent identification.

CAUTION ⚠

- **The bolts should be tightened within the plastic region. Never tighten them further than the specified angle.**

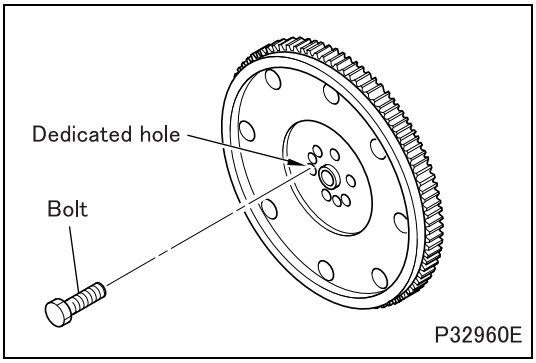
◆Removal procedure◆



■ Removal: Flywheel

- To remove the flywheel, use bolts inserted into the dedicated holes in the flywheel.

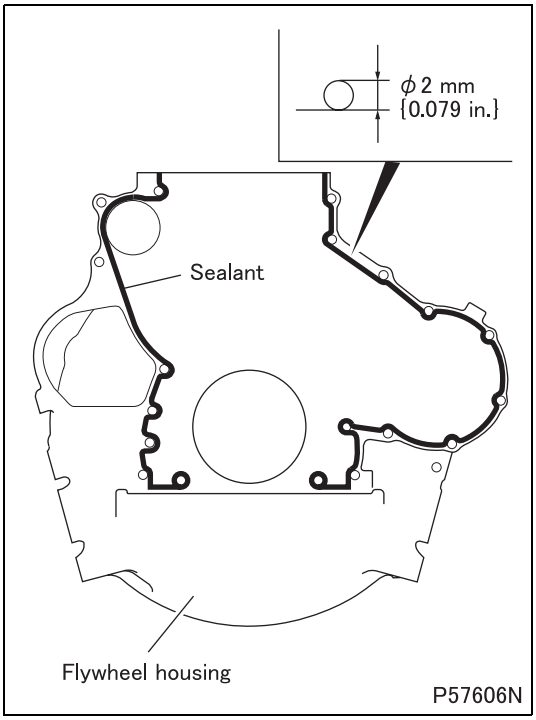
■ Removal: Ring gear

- Heat the ring gear evenly with a gas burner or the like until it reaches approximately 200°C {390°F}, then remove it from the flywheel.

WARNING ⚠

- **You may burn yourself if you touch the heated ring gear.**

◆Installation procedure◆



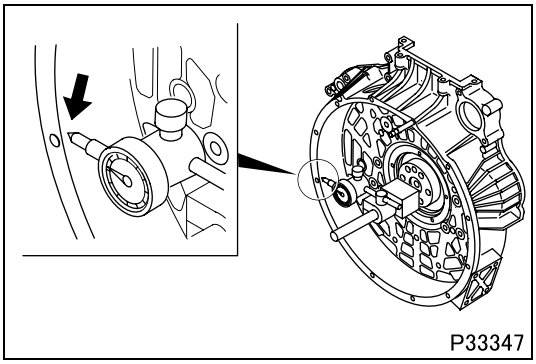
■Installation: Flywheel housing

[Installation]

- Apply an even and continuous bead of sealant onto the flywheel housing surface where the crankcase is to be mounted.
- Install the flywheel housing onto the crankcase within 3 minutes following the application.

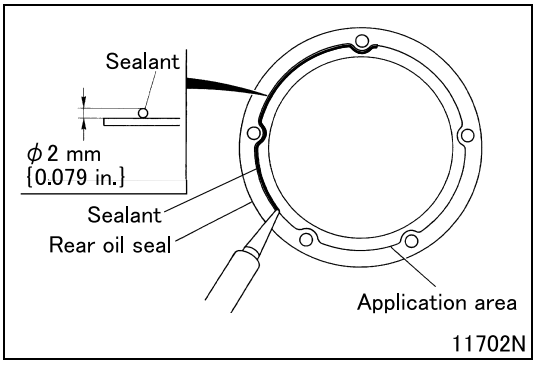
CAUTION ⚠

- **Clean the flywheel housing surface where sealant is to be applied.**
- **When installing the flywheel housing, take care not to spread the sealant beyond the application area.**
- **Do not start the engine at least for an hour after the flywheel housing has been installed.**
- **If the flywheel housing mounting bolts are subsequently loosened, be sure to apply sealant again upon reassembly.**



[Inspection]

- While turning the crankshaft, measure the flywheel housing for any eccentricity at the location indicated in the illustration.
- If the eccentricity exceeds the limit, reassemble the flywheel.
- If the eccentricity still exceeds the limit after reassembly, replace the defective part(s).

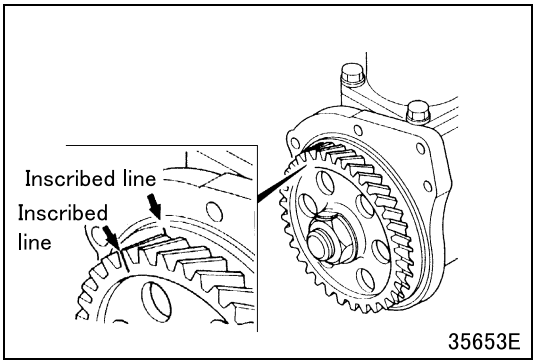


■ Installation: Rear oil seal

- Apply an even and continuous bead of sealant on the rear oil seal as shown in the illustration.
- Install the rear oil seal onto the flywheel housing within 3 minutes following the application.

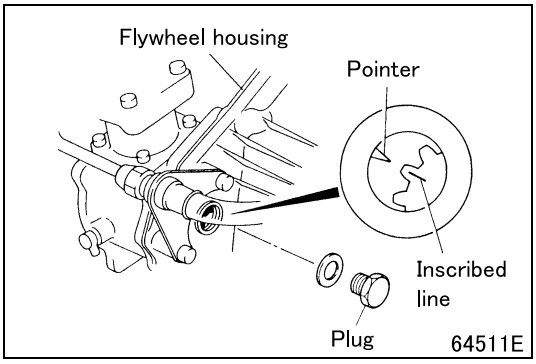
CAUTION ⚠

- **Clean the rear oil seal surface where sealant is to be applied.**
- **When installing the rear oil seal, take care not to spread the sealant beyond the application area.**
- **Do not start the engine at least for an hour after the rear oil seal has been installed.**
- **If the rear oil seal mounting bolts are subsequently loosened, be sure to apply sealant again upon reassembly.**

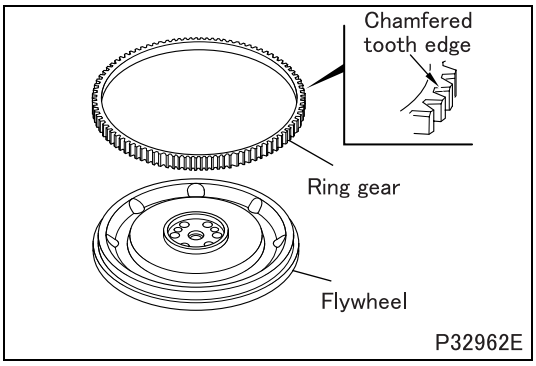


■ **Installation: Air compressor**

- Bring the No. 1 cylinder of the engine to top dead center of the compression stroke.
- After aligning inscribed lines with each other, install the air compressor to the flywheel housing.



- Remove the inspection plug and check if the inscribed line is aligned with the pointer.
- If not aligned, remove and refit the air compressor.



■ **Installation: Ring gear**

- Heat the ring gear evenly with a gas burner or the like until it reaches approximately 200°C {390°F}.

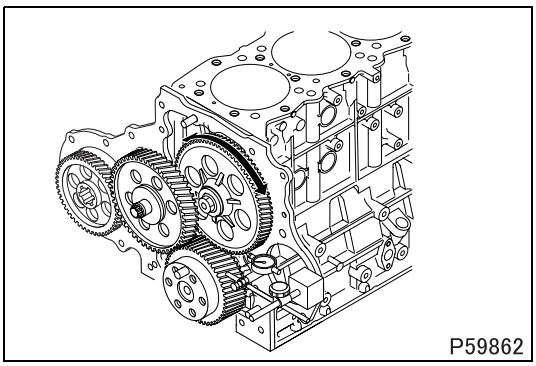
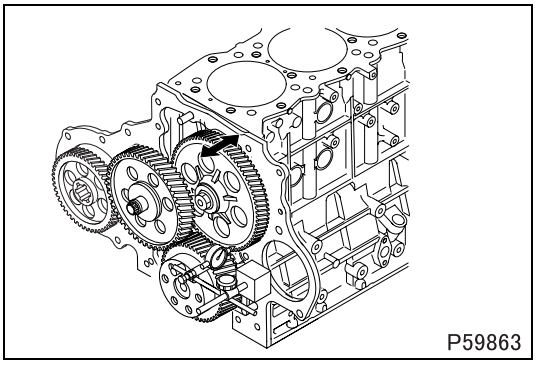
b	Idler gear push-puller A: ϕ 37 {1.46} B: ϕ 40 {1.57}  P02066	MH062601	Removal and installation of No. 1 and No. 2 idler gear bushings
c	No. 2 idler shaft puller A: M12 × 1.25 B: M10 × 1.5  P36309	MH062562	Removal of No. 2 idler gear shaft

◆Inspection before removal◆



■ **Inspection: Backlash between gears**

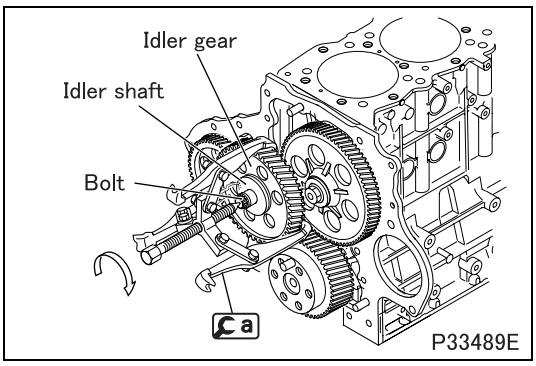
- For each pair of gears, measure the backlash at more than three teeth.
- If any of the measurements exceeds the specified limit, replace the defective part(s).



■ **Inspection: Idler gear end play**

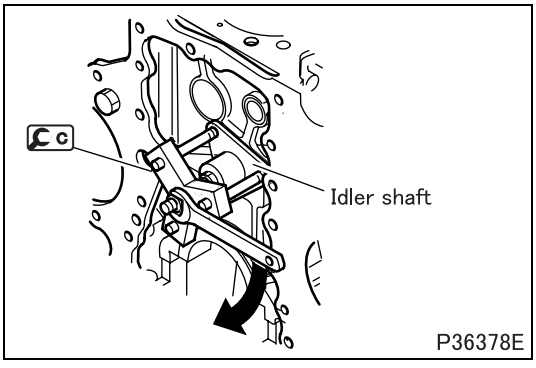
- If the measurement exceeds the specified limit, replace the defective part(s).

◆Removal procedure◆



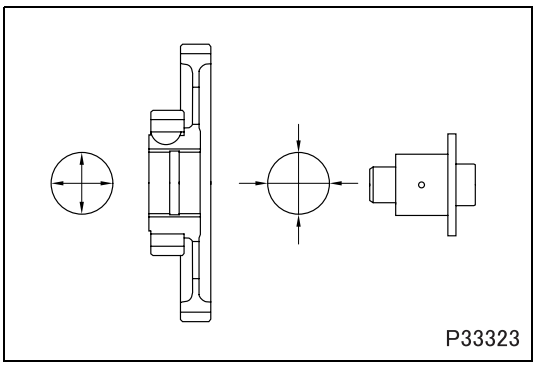
■ **Removal: No. 1 idler shaft and No. 1 idler gear**

- With the bolt loosened by approximately 15 mm {0.59 in.}, pull out the No. 1 idler shaft from the crankcase using a.
- Remove the bolt. Remove the No. 1 idler shaft and No. 1 idler gear.



■ **Removal: No. 2 idler shaft**

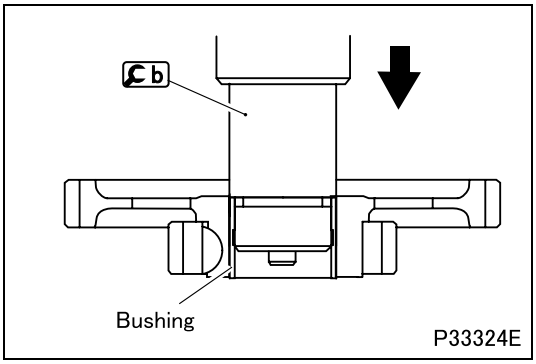
◆Inspection procedure◆



■ **Inspection: Clearance between No. 1 idler shaft and No. 1 idler gear bushing**

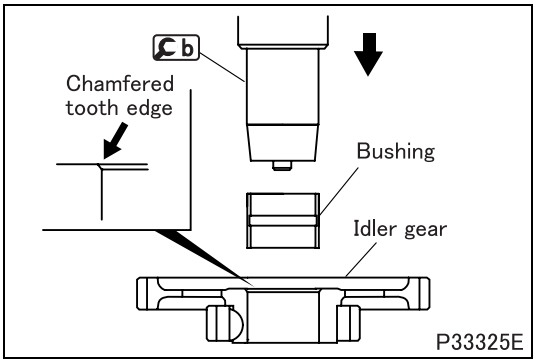
[Inspection]

- If the measurement exceeds the limit, replace the bushing.



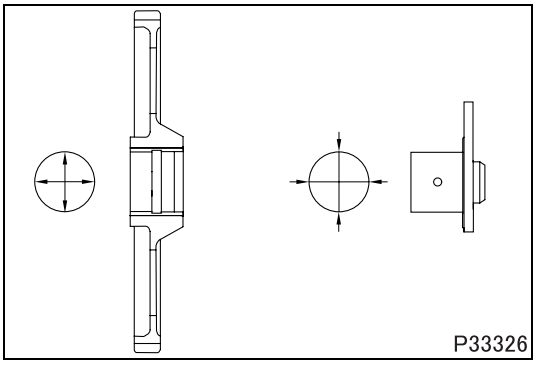
Replacement of No. 1 idler gear bushing

[Removal]



[Installation]

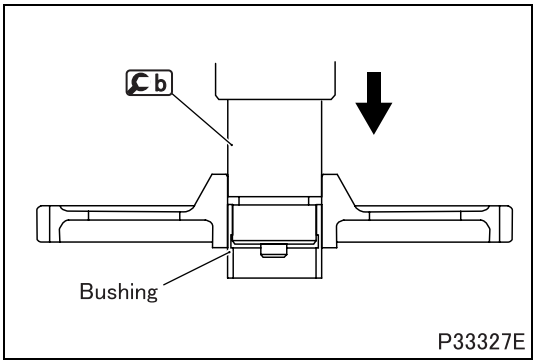
- Place the No. 1 idler gear as shown in the illustration. Using b, insert the bushing until b contacts the chamfered tooth edge of the gear.
- After installation, measure the clearance again.
- If the measurement is less than the standard value, ream the bushing.



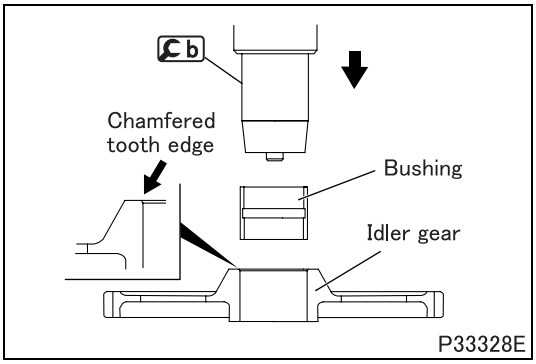
■ **Inspection: Clearance between No. 2 idler gear bushing and No. 2 idler shaft**

[Inspection]

- If the measurement exceeds the limit, replace the bushing.

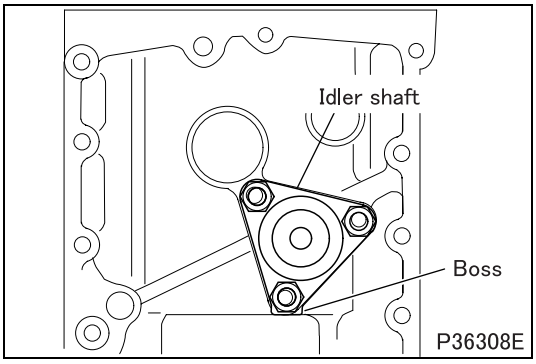


Replacement of No. 2 idler gear bushing
[Removal]



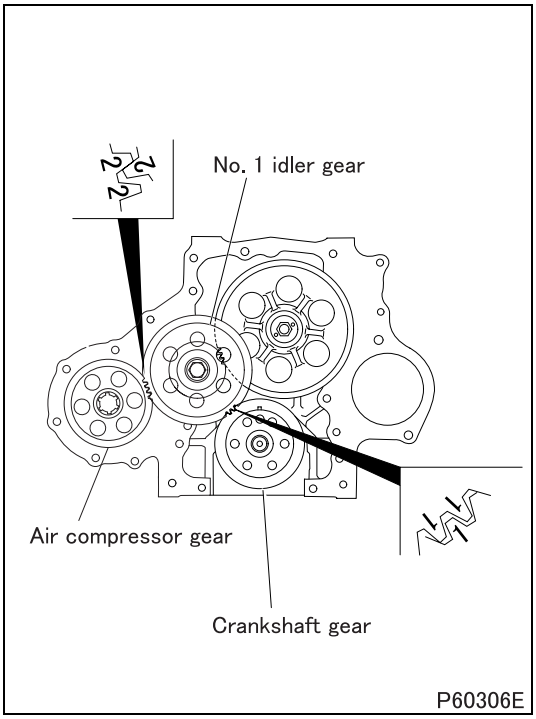
[Installation]

- Place the No. 2 idler gear as shown in the illustration. Using b, insert the bushing until b contacts the chamfered tooth edge of the gear.
- After installation, measure the clearance again.
- If the measurement is less than the standard value, ream the bushing.



■ Installation: No. 2 idler shaft

- Install the No. 2 idler shaft onto the crankcase ensuring that the boss of the shaft faces down.

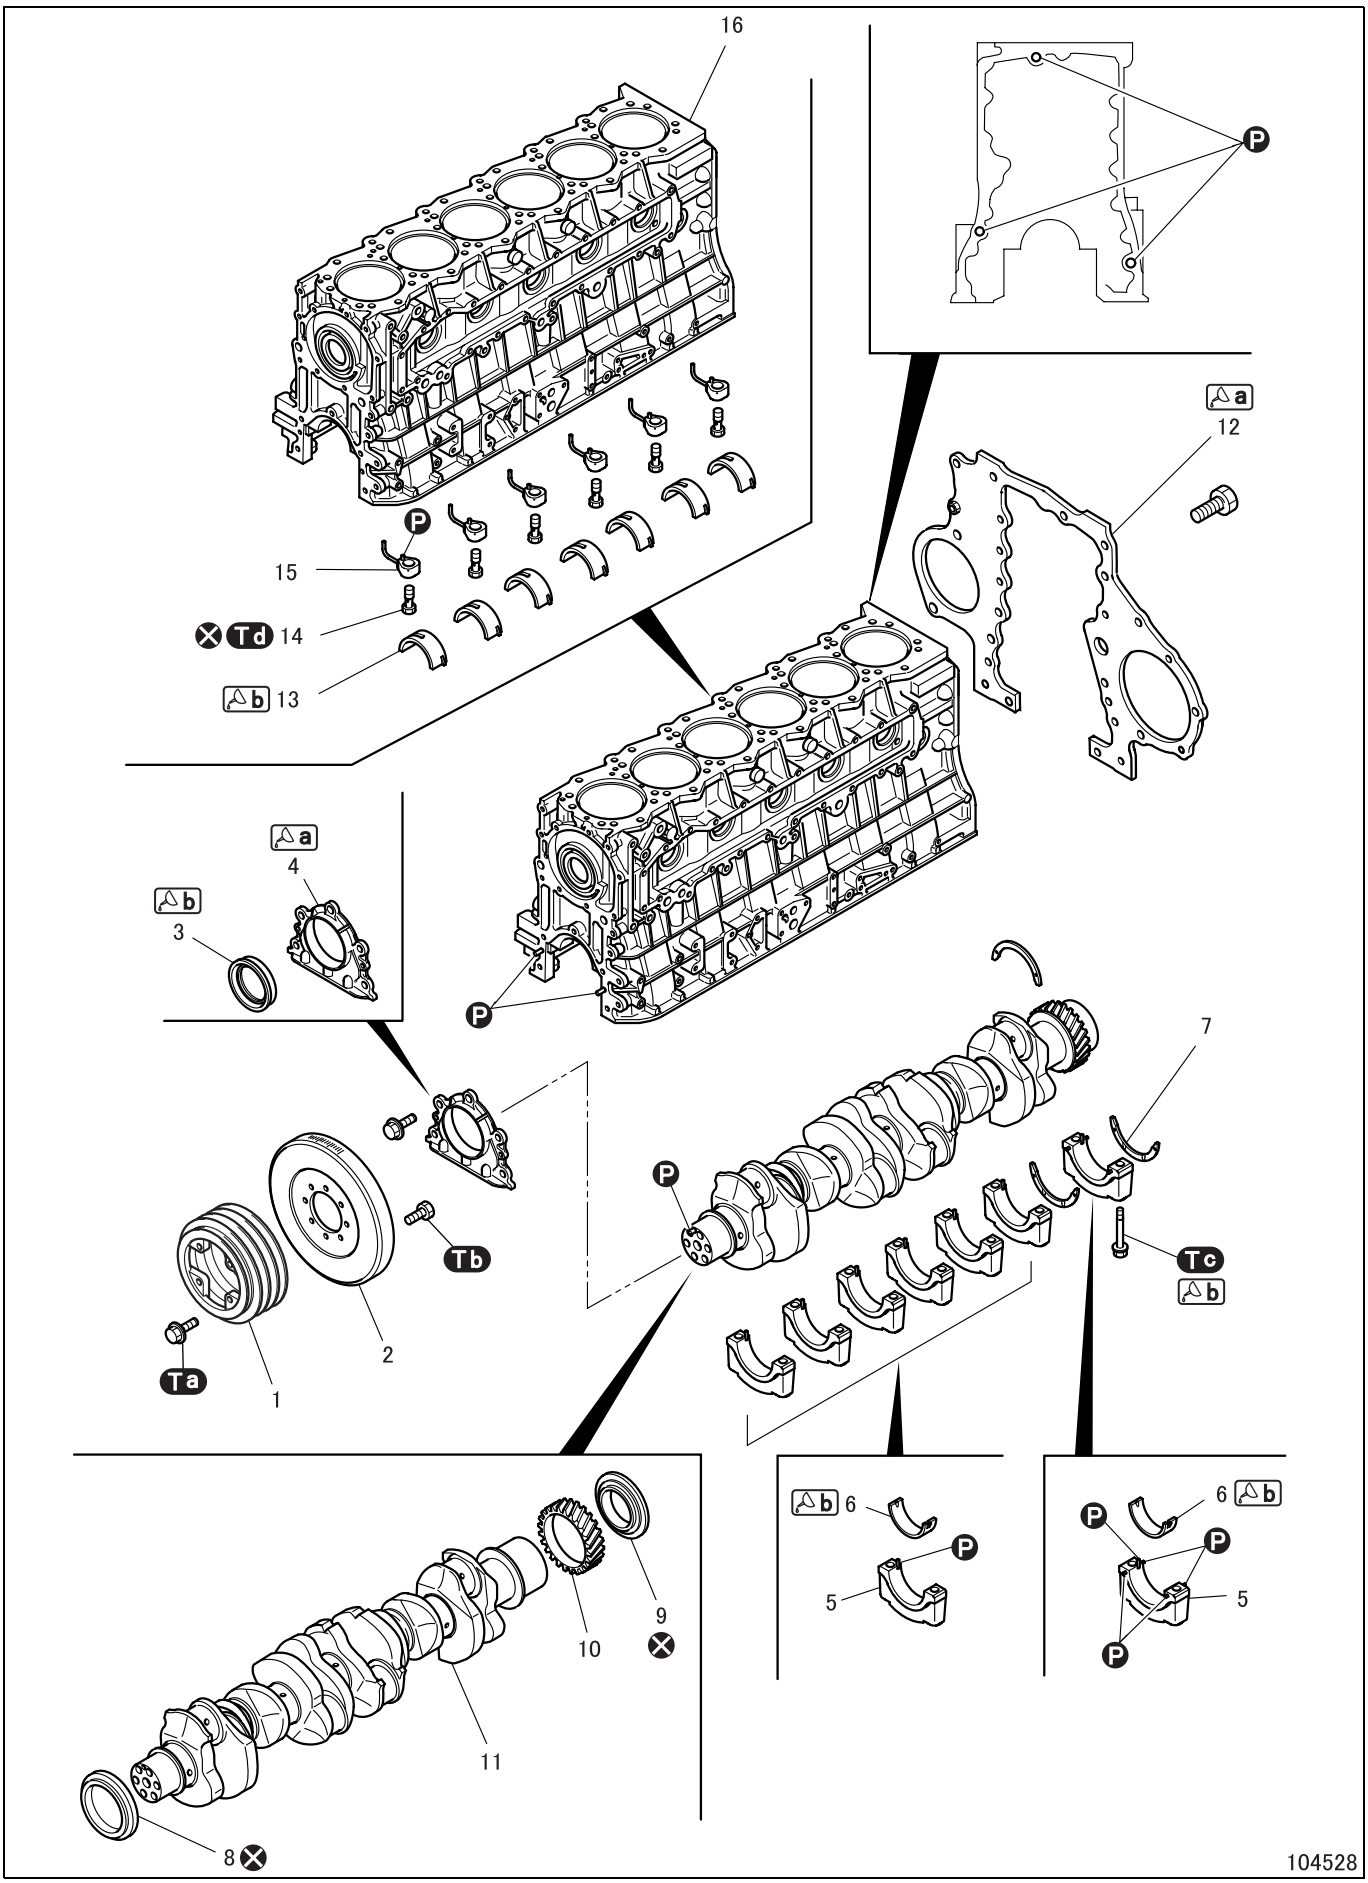


■ Installation: No. 1 idler gear

- Install the No. 1 idler gear such that the alignment mark “2” on the gear is aligned with the alignment mark “2 2” on the air compressor gear.
- When installing the No. 1 idler gear, also ensure that the alignment mark “1 1” on the gear is aligned with the alignment mark “1” on the crankshaft gear.

M E M O

CRANKSHAFT AND CRANKCASE



● Disassembly sequence

1 Crankshaft pulley
2 Torsional damper
3 Front oil seal
4 Front cover
5 Main bearing cap
6 Lower main bearing
7 Thrust plate
8 Front oil seal slinger
9 Rear oil seal slinger

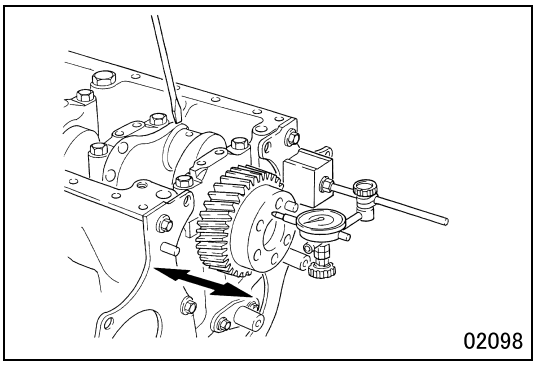
◆Inspection before removal◆

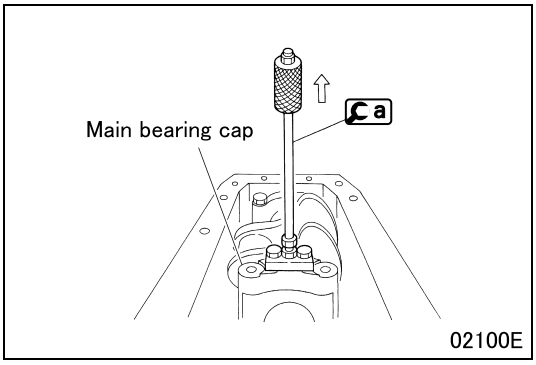


02098

■ **Inspection: Crankshaft end play**

- If the measurement exceeds the specified limit, replace the thrust plates with oversized ones.

◆Removal procedure◆



02100E

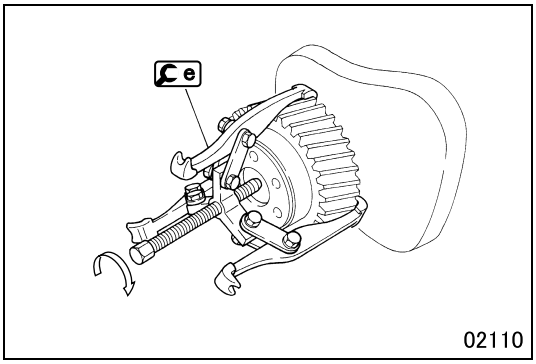
■ **Removal: Main bearing caps**

■ **Removal: Front oil seal slinger**

- Taking care not to damage the crankshaft, split the rear oil seal slinger using a chisel or a similar tool.

■ **Removal: Rear oil seal slinger**

- Taking care not to damage the crankshaft, split the rear oil seal slinger using a chisel or a similar tool.



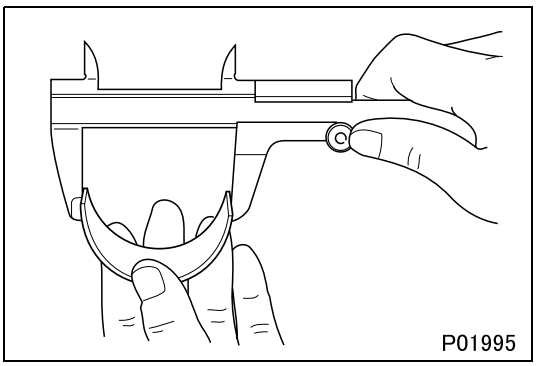
02110

■ **Removal: Crankshaft gear**

CAUTION ⚠

- **Do not tap off the crankshaft gear as this can damage it.**

◆Inspection procedure◆

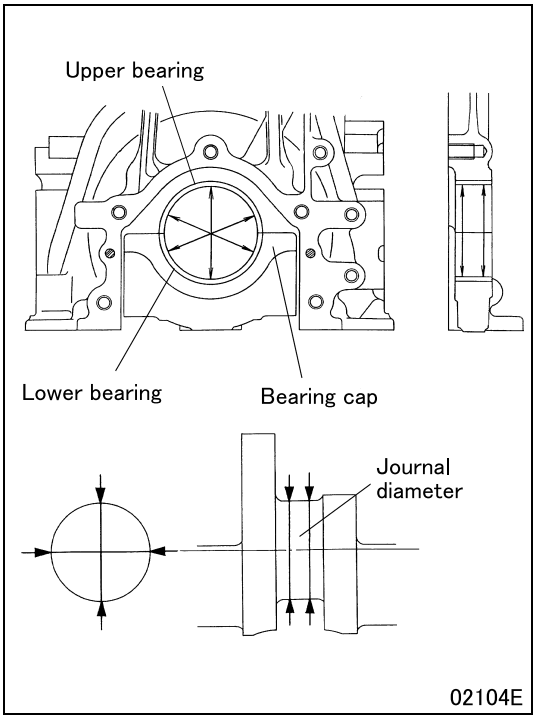


■ **Inspection: Main bearing span when free**

- If the measurement is less than the limit, replace upper and lower bearings as a set.

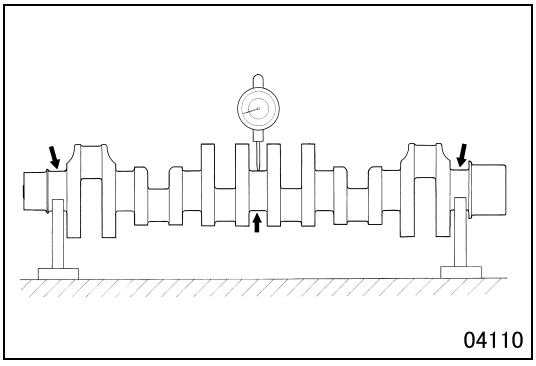
CAUTION ⚠

- **Do not attempt to manually expand the bearings.**



(2) Main bearing-to-crankshaft oil clearance

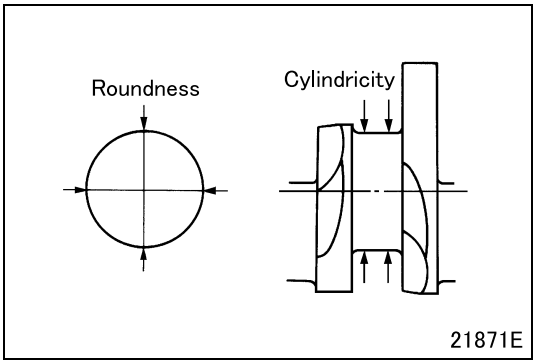
- Fit the upper main bearing into the crankcase and the lower main bearing into the main bearing cap.
- Tighten the main bearing cap bolts to a torque of 78 N·m {58 ft.lbs, 8 kgf·m}.
- Measure the inside diameter of the main bearing and the diameter of the corresponding crankshaft journal.
- If the difference between the measurements exceeds the specified limit, machine the crankshaft journal to one of the specified undersize dimensions.



■ **Inspection: Crankshaft**

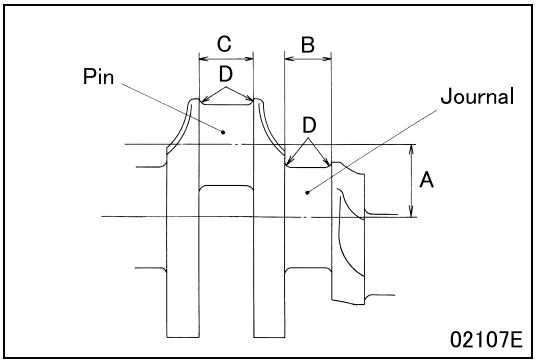
(1) Bend

- Place supports under the journals at the ends of the crankshaft end measure the bend of the crankshaft at the center journal. The amount of crankshaft bend is obtained by giving the crankshaft one turn and dividing the dial gauge reading by two.
- If the measurement exceeds the specified limit, replace the crankshaft.



(2) Roundness and cylindricity of crankshaft journals and pins

- If any of the measurements exceeds the specified limits, grind the crankshaft journal(s) and/or pin(s) to undersize(s) or replace the crankshaft.



Grinding of crankshaft

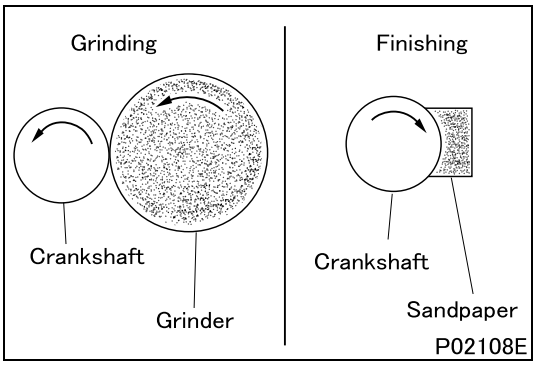
CAUTION ⚠

- **If the crankshaft pins and journals are ground to undersizes, be sure to use bearings of corresponding undersizes.**

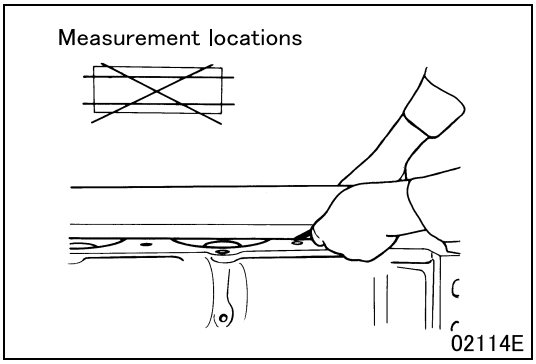
- Confirm the dimension of each position from the service standards table and rectify the crankshaft while observing the following procedures.
- Do not change the center-to-center distance A between the journal and pin.
- Do not change the journal width B and the pin width C.
- Finish the fillets D smoothly.
- Carry out a magnetic inspection to check for cracks possibly caused by grinding. Also, check that the hardness of the surface has not dropped below Shore hardness number (Hs) 75.
- Replace the crankshaft if defects are evident.

Crankshaft undersize dimensions (Unit: mm {in.})

	Undersizes			
	0.25 {0.0098}	0.50 {0.020}	0.75 {0.030}	1.00 {0.039}
Finished journal outside diameter	83.685 to 83.705 {3.294 to 3.295}	83.435 to 83.455 {3.284 to 3.285}	83.185 to 83.205 {3.274 to 3.275}	82.935 to 82.955 {3.2651 to 3.2659}
Finished pin outside diameter	69.67 to 69.69 {2.742 to 2.743}	69.42 to 69.44 {2.7330 to 2.7338}	69.17 to 69.19 {2.723 to 2.724}	68.92 to 68.94 {2.713 to 2.714}
Out-of-roundness	0.01 {0.00039} or less			
Taper	0.006 {0.00024} or less			



- When grinding, turn both the crankshaft and the grinder counterclockwise as viewed from the crankshaft front end.
- When finishing the crankshaft with westone or sandpaper, rotate the crankshaft clockwise.



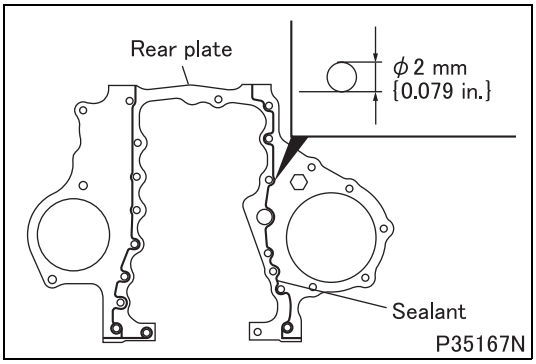
■ **Inspection: Distortion of crankcase top surface**

- If the measurement exceeds the limit, correct the crankcase top surface with a surface grinder.

CAUTION ⚠

- **Do not grind the crankcase top surface so much as to compromise the correct piston projection.**

◆Installation procedure◆

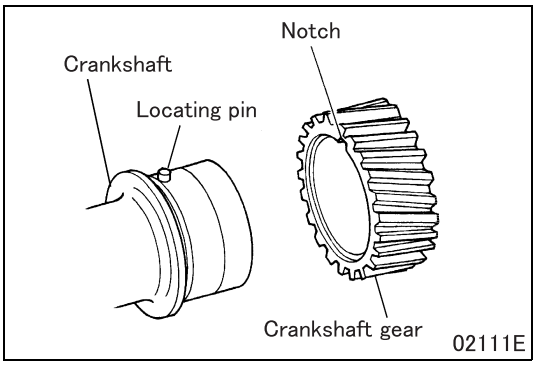


■ **Installation: Rear plate**

- Apply an even and continuous bead of sealant onto the rear plate surface where the crankcase is to be mounted.
- Install the rear plate onto the crankcase within 3 minutes following the application.

CAUTION ⚠

- **Clean the rear plate surface where sealant is to be applied.**
- **When installing the rear plate, take care not to spread the sealant beyond the application area.**
- **Do not start the engine at least for an hour after the rear plate has been installed.**
- **If the rear plate mounting bolts are subsequently loosened, be sure to apply sealant again upon reassembly.**



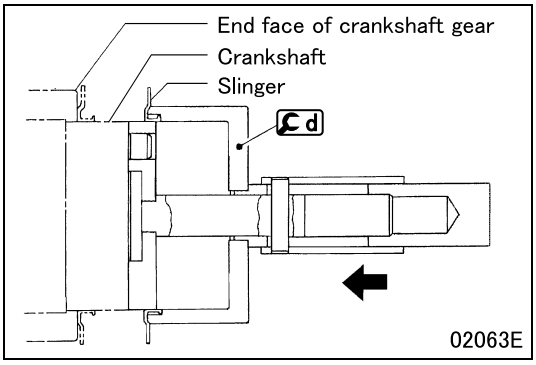
■ **Installation: Crankshaft gear**

- Heat the crankshaft gear to approximately 100°C {212°F} with a burner or the like.

WARNING ⚠

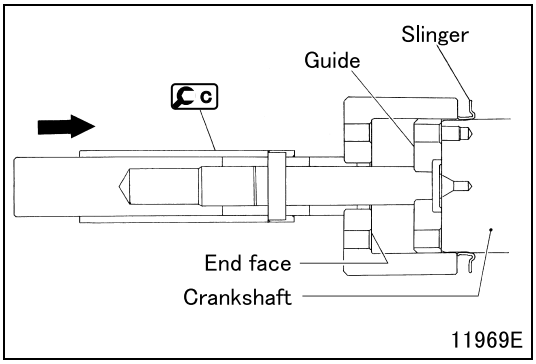
- **Be careful not to get burned.**

- Align the key fitted in the crankshaft with the slot in the crankshaft gear. Drive the gear into position by lightly striking its end face with a plastic hammer.



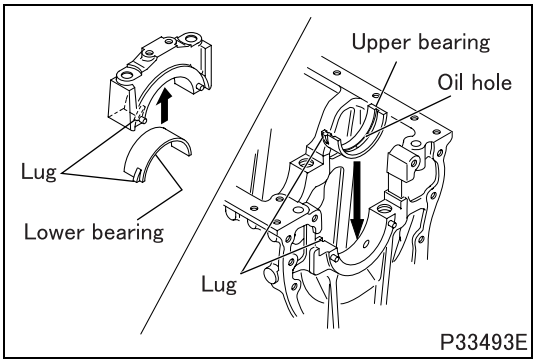
■ **Installation: Rear oil seal slinger**

- Using Cd, install the rear oil seal slinger onto the crankshaft until Cd comes into positive contact with the end face of the crankshaft gear.



■ **Installation: Front oil seal slinger**

- Using C, install the front oil seal slinger onto the crankshaft until the end face of C comes into positive contact with the guide.

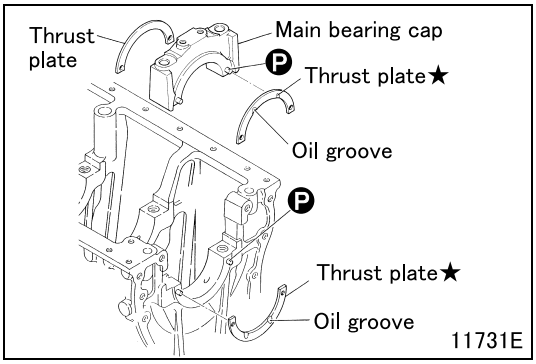


■ **Installation: Main bearing**

- Install the main bearings with their lugs aligned as shown in the illustration. When the crankshaft journals have been ground to an undersize, use undersized main bearings.
  Available main bearing undersizes: 0.25 mm {0.0098 in.}, 0.50 mm {0.020 in.}, 0.75 mm {0.030 in.}, 1.00 mm {0.039 in.}

CAUTION ⚠

- **The upper main bearing has an oil hole. The lower main bearing has no oil hole. Do not confuse the upper and lower bearings, as this can cause seizure in the engine.**



■ **Installation: Thrust plate**

- Install trust plates on both sides of the main bearing cap and the rear end of the crankcase, ensuring that the oil grooves face outside.

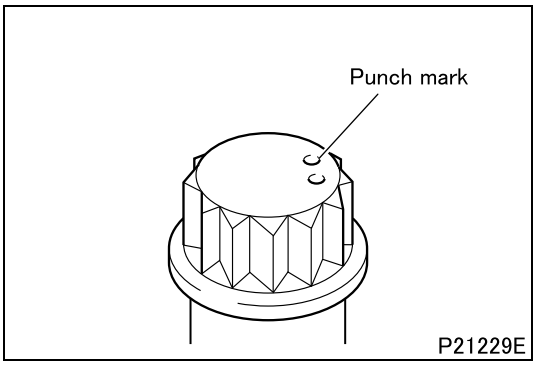
P: Locating pin

NOTE

- **If oversized thrust plates are to be used, those with a ★ mark must be the same in size. Oversized thrust plates are available in the following sizes: 2.6 mm {0.102 in.}, 2.75 mm {0.108 in.} and 2.9 mm {0.114 in.}.**

CAUTION ⚠

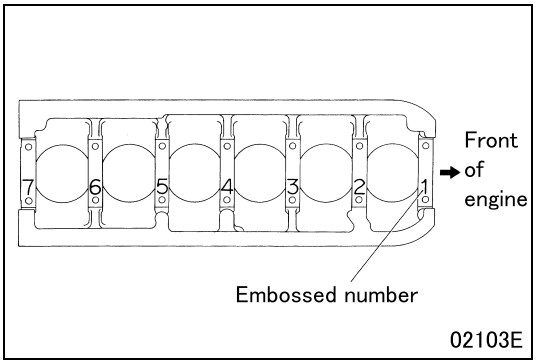
- **If thrust plates are installed with the oil grooves facing inside, the engine may seize.**



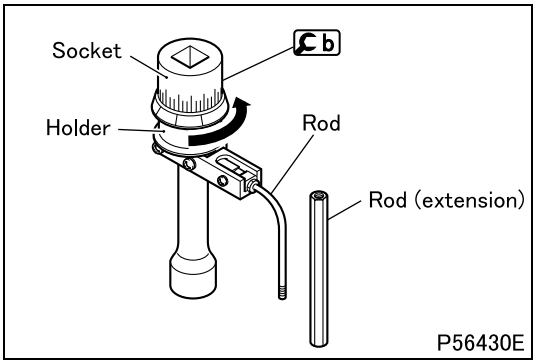
■ **Installation: Main bearing cap**

CAUTION ⚠

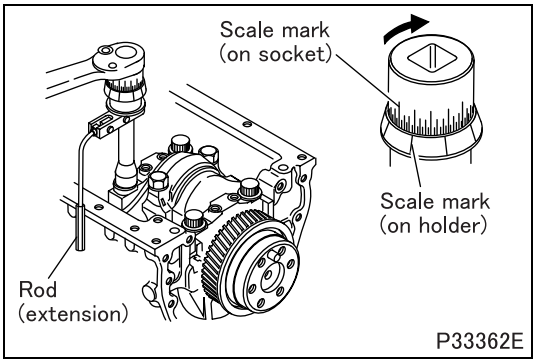
- **Before installing the main bearing cap bolts, check the number of punch marks on the head of each bolt. (A bolt with two or less marks is reusable.)**
- **The number of punch marks corresponds with the number of times the main cap bolt has been tightened using the torque-turn tightening method. Any bolt that has three marks (i.e. that has been used three times) must be replaced.**



- Starting at the front of the engine, fit the main bearing caps in the order of the embossed numbers facing the illustrated direction.



- Tighten all the bolts to 78 N·m {58 ft.lbs, 8 kgf·m}, then additionally tighten them according to the following procedure.
- Turn the holder of b counterclockwise to pretension the internal spring.

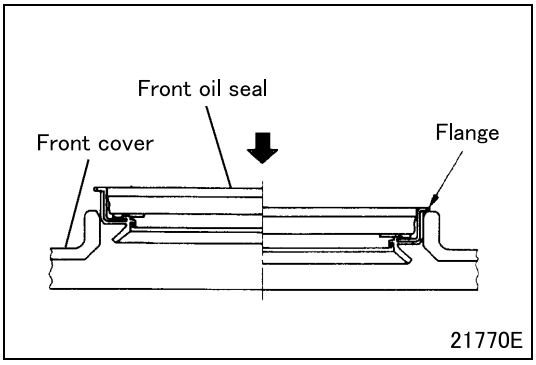


- Set b such that the rod (extension) is pressed against the crankshaft by the force of the spring.
- Align a scale mark on the socket with a scale mark on the holder. (This point will be the point of reference, or the 0° point.)
- Starting with this point of reference, turn the socket with a wrench in the illustrated direction until the scale on the socket indicates 90°.
  One graduation on the socket-side scale represents 5°.
- After tightening the bolts using the above torque-turn tightening method, make a punch mark on the head of each bolt to indicate the number of times that it has been used.

CAUTION ⚠

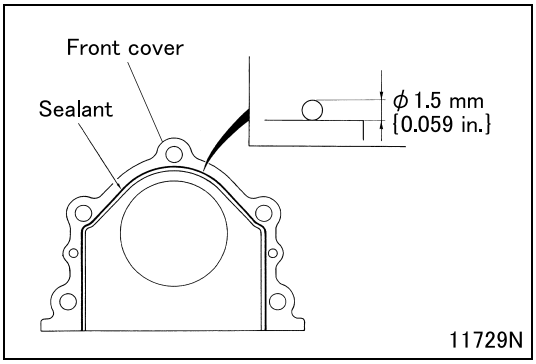
- **The bolts that have been tightened using the torque-turn method must never be additionally tightened after the final angular tightening.**

- After installing the main bearing cap, rotate the crankshaft by hand. If it cannot be rotated smoothly, inspect the main bearing caps for correct installation.



■ Installation: Front oil seal

- Install the front oil seal onto the front cover while pressing the seal's entire periphery evenly to prevent it from tilting.
- Install the front oil seal until its flange comes into positive contact with the front cover.



■ **Installation: Front cover**

- Apply an even and continuous bead of sealant onto the front cover surface where the crankcase is to be mounted.
- Install the front cover onto the crankcase within 3 minutes following the application.

CAUTION ⚠

- **Clean the front cover surface where sealant is to be applied.**
- **When installing the front cover, take care not to spread the sealant beyond the application area.**
- **Do not start the engine at least for an hour after the front cover has been installed.**
- **If the front cover mounting bolts are subsequently loosened, be sure to apply sealant again upon reassembly.**

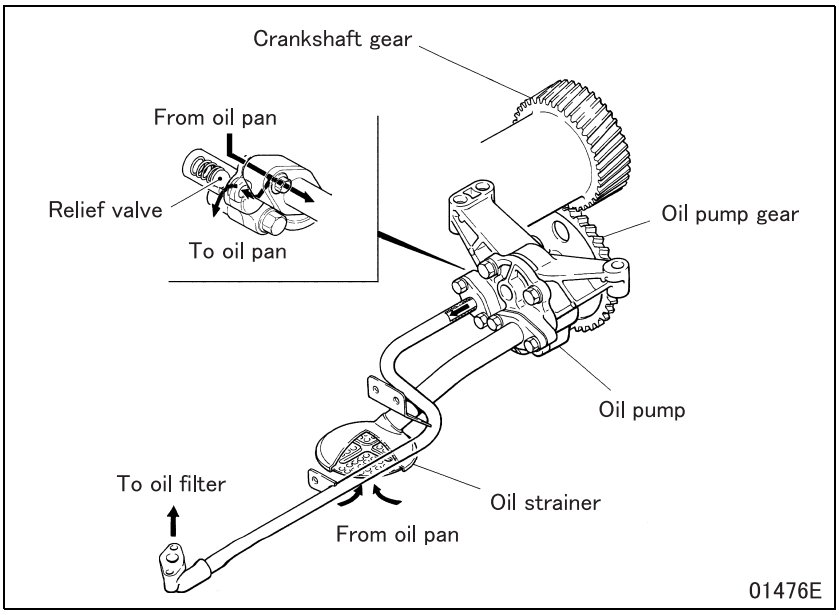
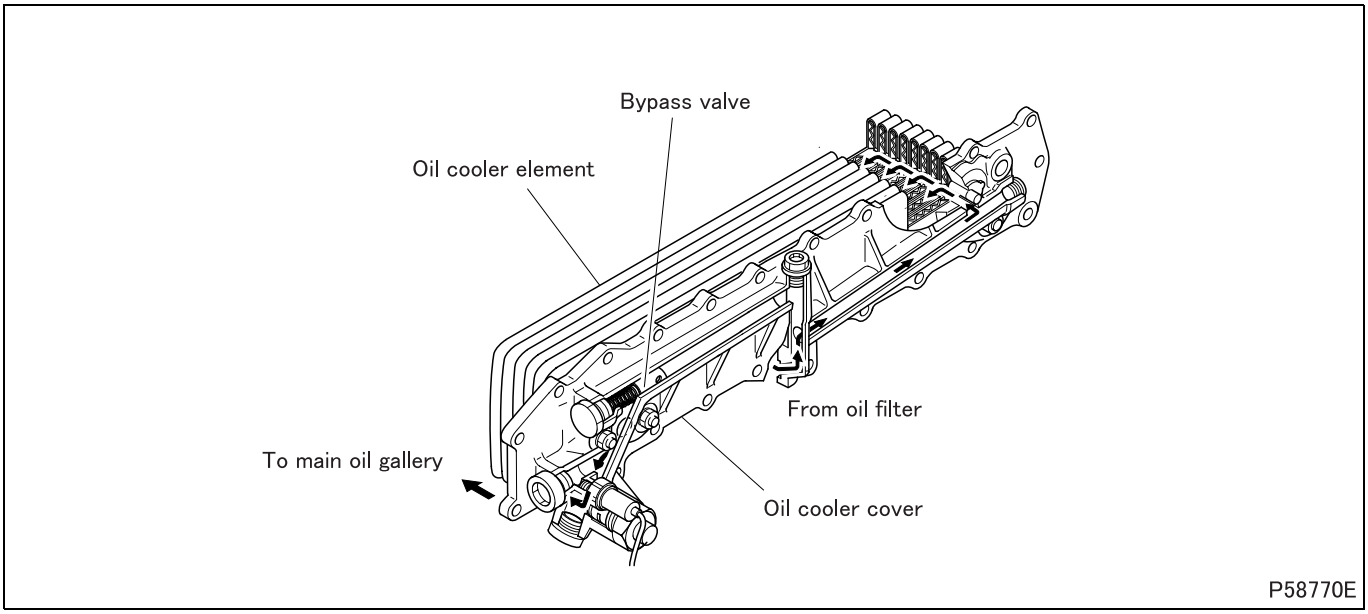
26 Turbocharger
27 Oil pan

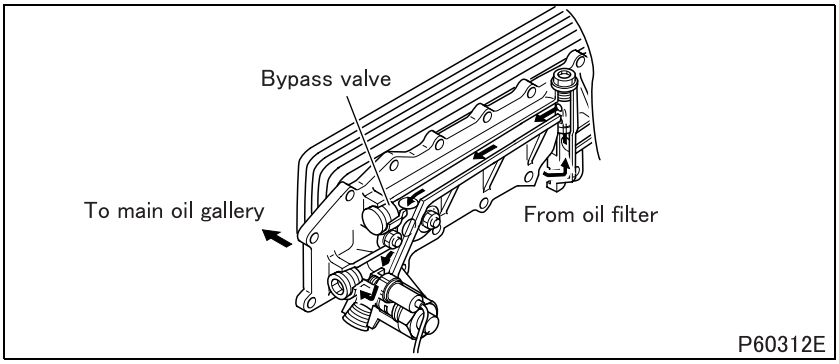
2. Oil Pump



- This engine uses a gear-type oil pump driven by the rotation of the crankshaft transmitted through the engagement of the crankshaft gear and the oil pump gear.
- The oil pump has a relief valve, which prevents excessive pressure from building up inside the lubricating system by allowing part of the engine oil to escape to the oil pan when the oil pressure exceeds a specified level.

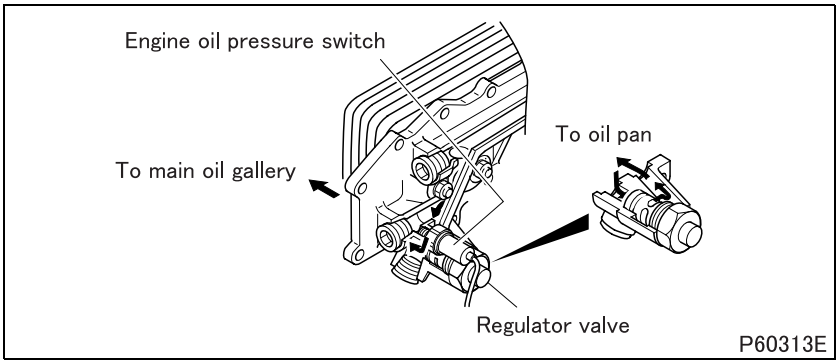
3. Oil Cooler





3.1 Bypass valve

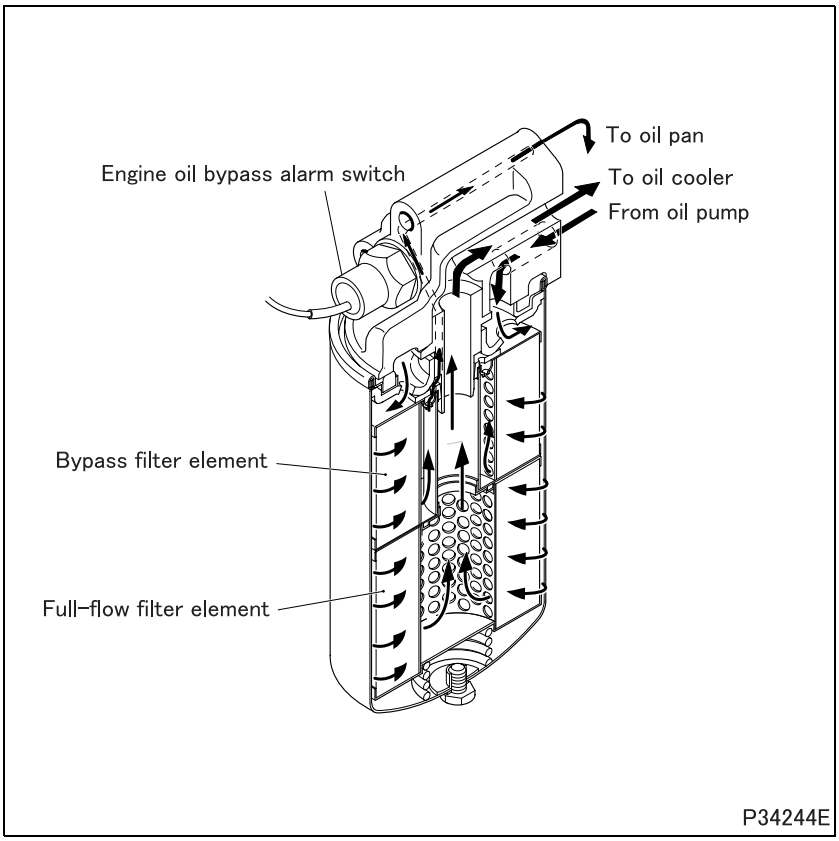
- When the engine oil is cool and its viscosity is high, or when the oil cooler element becomes clogged and restricts the flow of the engine oil, the bypass valve opens to let the engine oil bypass the oil cooler and flow directly to the oil filter.



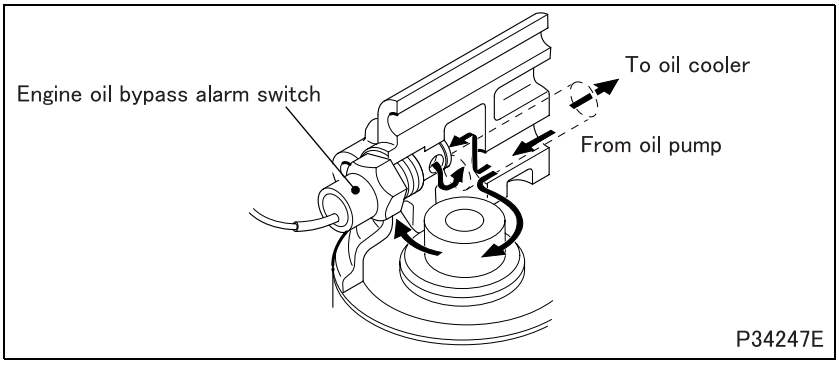
3.2 Engine oil pressure switch and regulator valve

- When the pressure of the engine oil to the main oil gallery drops below the specified level, an electrical contact inside the engine oil pressure switch closes. This causes a warning lamp on the meter cluster to illuminate and notify the operator of the excessive pressure drop.
- When the oil pressure in the main oil gallery exceeds the specified level, the regulator valve opens to adjust the oil pressure by allowing part of the engine oil to escape to the oil pan.

4. Oil Filter



- This oil filter is a spin-on paper-filter type that incorporates both a full-flow filter and a bypass filter.



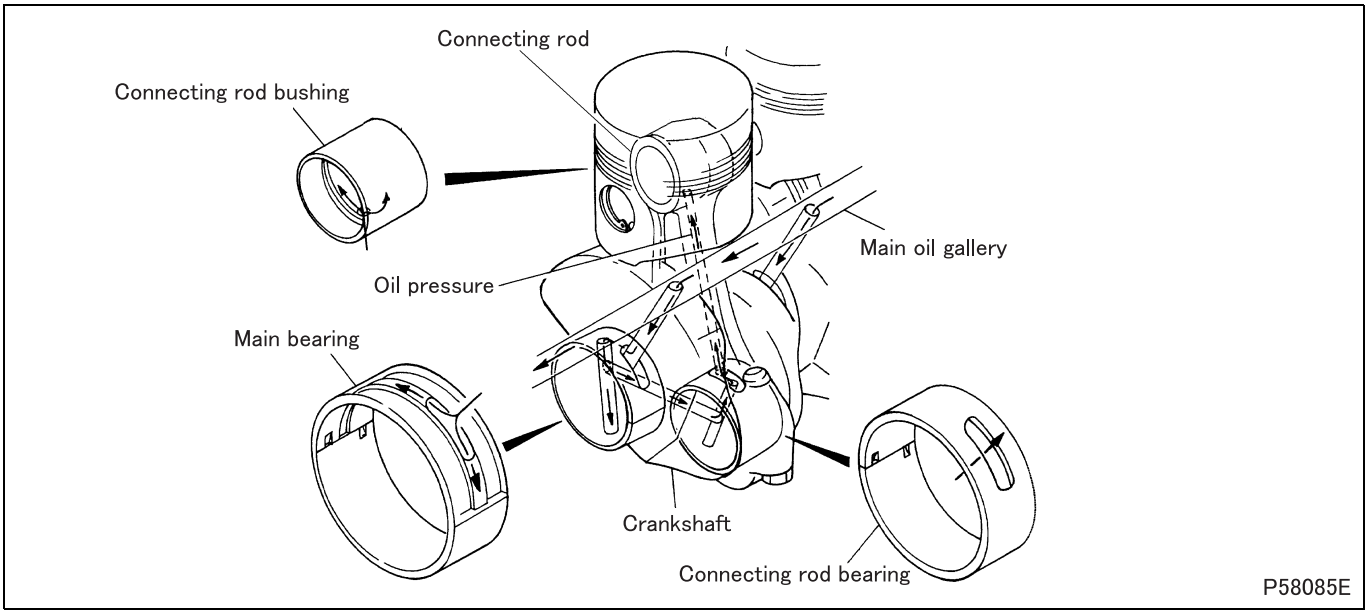
4.1 Engine oil bypass alarm switch

- If the oil filter elements clog up, this will restrict the flow of engine oil, causing the engine to seize. To prevent this, the oil filter is provided with the engine oil bypass alarm switch.
- If the oil filter clogs up, the engine oil bypass alarm switch trips in such a way as to direct the engine oil straight on to the oil cooler, bypassing the full-flow and bypass filter elements. When the switch trips, the relevant warning lamp illuminates to alert the operator to the clogged oil filter.

5. Lubrication of Engine Components

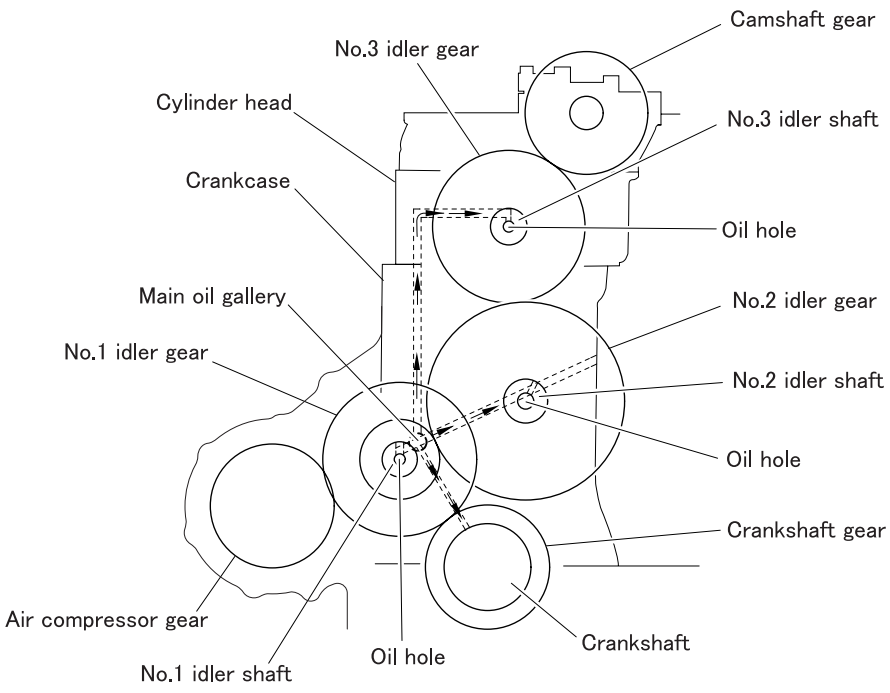
- The engine oil in the main oil gallery lubricates the engine components in the following ways.

5.1 Main bearing and connecting rod bearing



- Engine oil supplied through an oil passage in the crankshaft lubricates the big end (connecting rod bearing) of each connecting rod. Simultaneously, engine oil supplied through an oil passage in the connecting rod lubricates the connecting rod's small end.

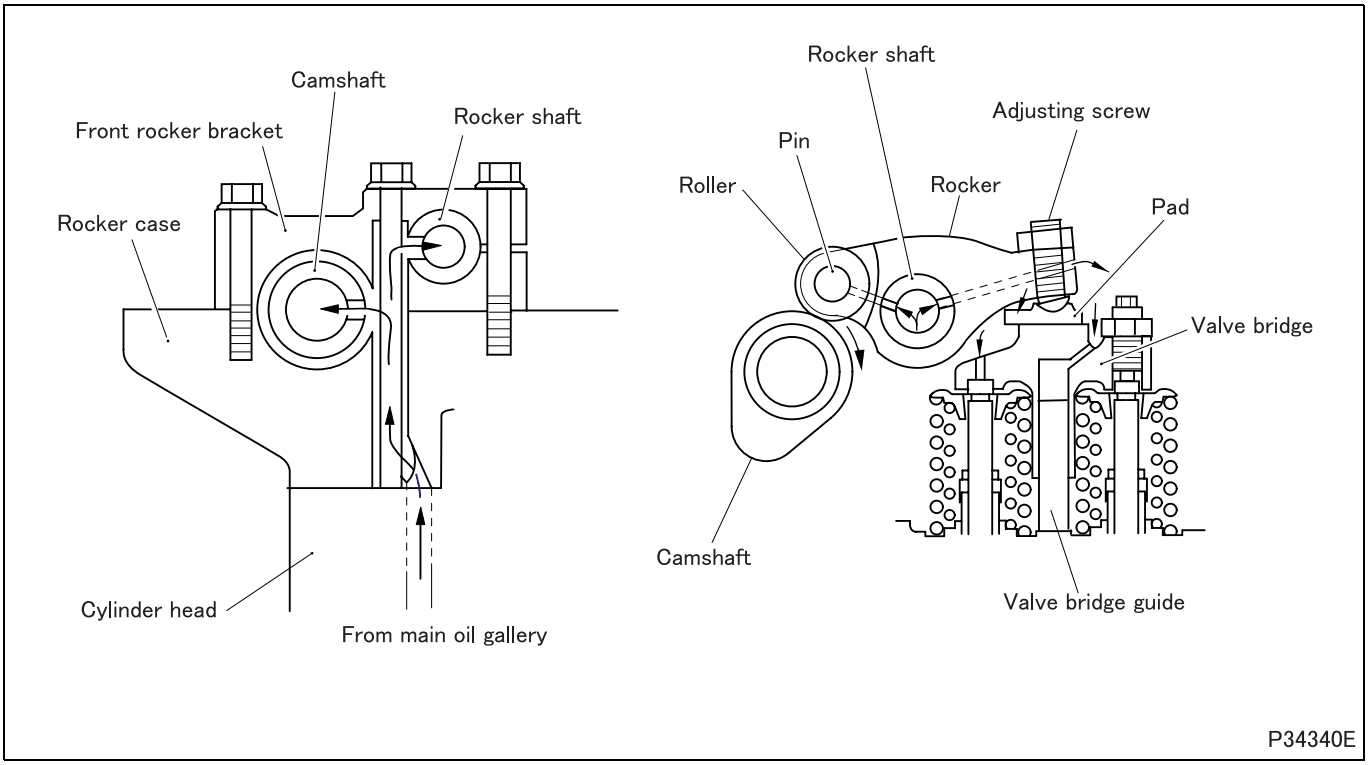
5.2 Timing gears



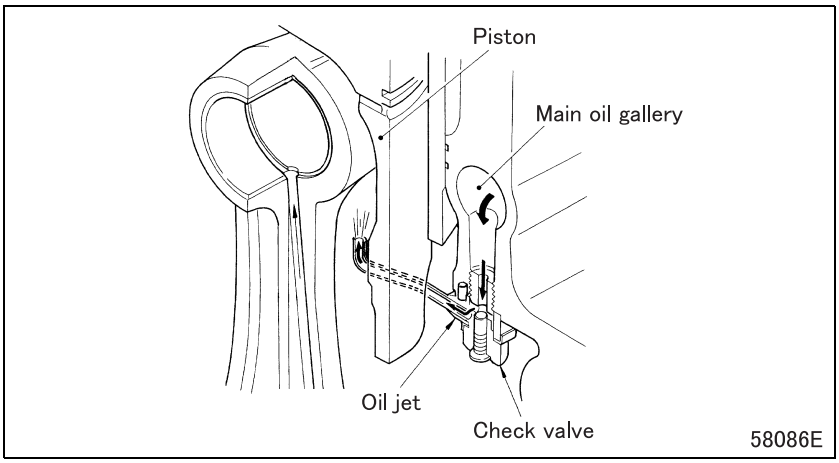
P60271E

- Engine oil in the main oil gallery is directed through the oil passages in the crankcase and cylinder head and is used to lubricate the various gear shafts. After lubricating the gear shafts, the oil is used to lubricate the gears before returning the oil pan.

5.3 Valve mechanism

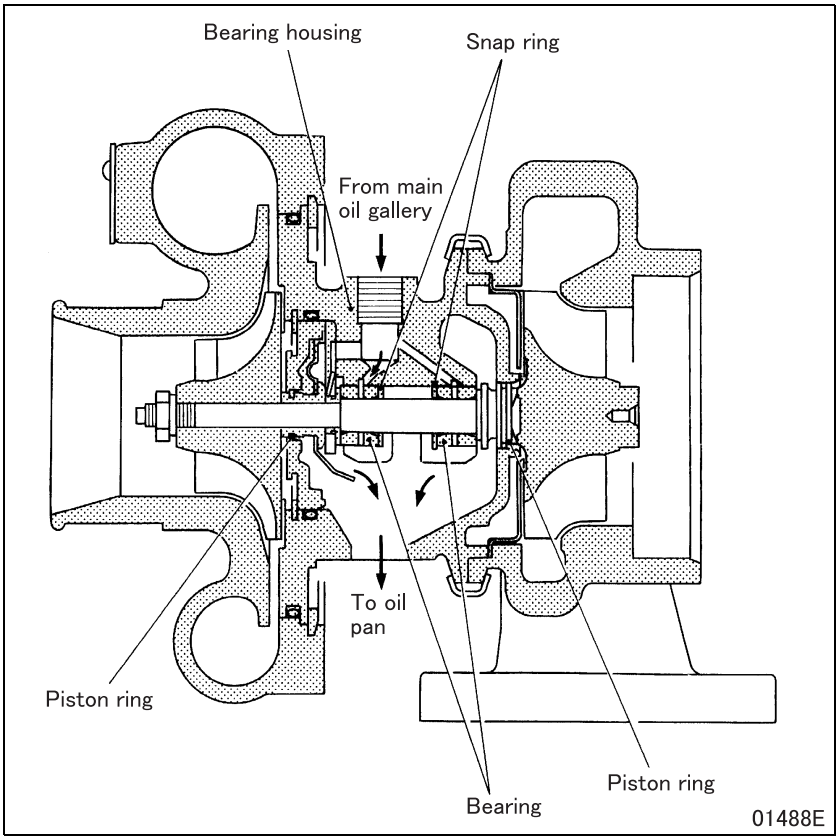


- Engine oil in the main oil gallery is directed through the oil passages in the cylinder head, rocker case and front rocker bracket. The oil is then supplied through the camshaft and rocker shaft. The oil flowing through the camshaft also lubricates the camshaft journals. The oil flowing through the rocker shaft also lubricates the rockers. The oil flowing to the adjusting screws on the rockers also lubricates the valve bridges. After lubricating the various parts, the oil returns to the oil pan.



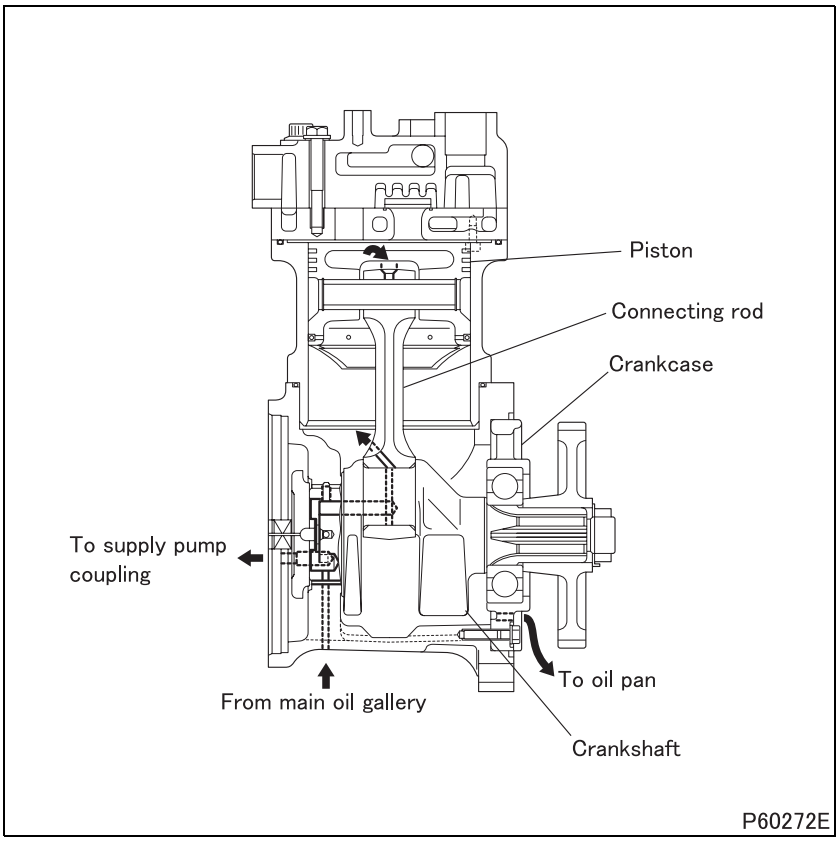
5.4 Check valves and oil jets

- An oil jet is fitted in the lower part of the main oil gallery for each cylinder.
- Engine oil is sprayed out of the oil jet into the piston to cool the piston.
- Each oil jet is fitted with a check valve that opens and closes at predetermined oil pressure levels. At low engine speeds, the check valve closes to maintain the required volume of oil in the lubrication system and prevent reductions in oil pressure.



5.5 Turbocharger

- Engine oil in the main oil gallery is directed through a pipe to the bearing housing to lubricate the inner components.
- A piston ring is provided on each end of the turbine wheel shaft. The rings function as oil sealing.



5.6 Air compressor

- Engine oil in the main oil gallery is directed through a passage in the crankshaft to the supply pump coupling and also to the big ends of the connecting rods to lubricate these parts.
  At the same time, the pistons and the small ends of the connecting rods are splash-lubricated with engine oil by the rotating crankshaft.

Possible causes \ Symptoms		Engine is difficult to start	Overheating	Low oil pressure	Excessive oil consumption (oil leakage)	Reference Gr

ON-VEHICLE INSPECTION AND ADJUSTMENT

1. Oil Filter Replacement

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
–	Oil filter drain plug	7.8 ± 2.0 {5.8 ± 1.5, 0.8 ± 0.2}	–

Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
–	Oil filter	Engine oil API classification CJ-4	Approx. 2.3 L {2.4 qts}

Special tools

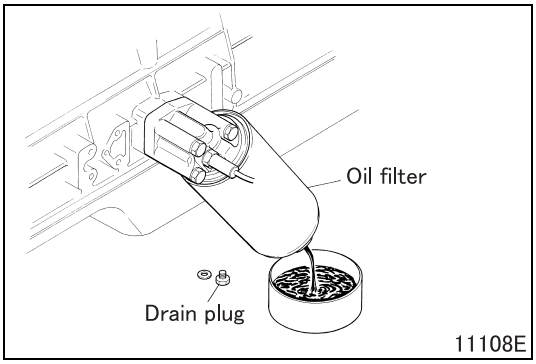
Mark	Tool name and shape	Part No.	Application
a	Oil filter wrench  01503	MH061537	Removal of oil filter

WARNING ⚠

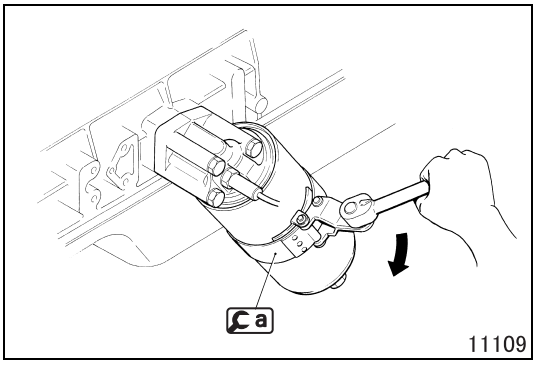
- **Wipe up any spilled engine oil, as it can cause fires.**

CAUTION ⚠

- **Make sure not to put any engine oil on the belt when working on the oil filter. Belts soiled with oil or grease may easily slip, resulting in deteriorated performance of the cooling system.**



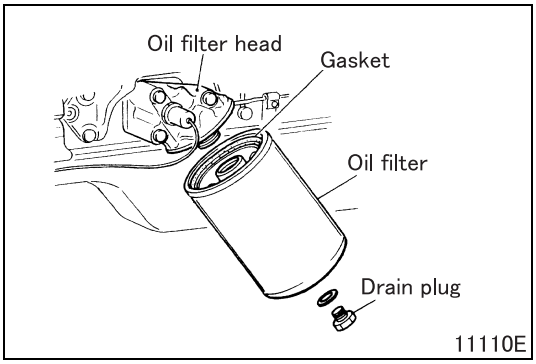
11108E



11109

[Removal]

- Remove the drain plug and drain the oil out of the oil filter.



[Installation]

- Clean the surface of the oil filter head where the oil filter is to be mounted.
- Apply a thin coat of engine oil onto the oil filter gasket.
- Screw in the oil filter by hand until the gasket contacts the oil filter head. Tighten further by 1 1/8 to 1 3/8 of a turn.
- Install the drain plug.
- With the oil filter installed, start the engine and ensure that there is no oil leakage through the gasket.
- If oil is leaking, remove and reinstall the oil filter.
- Stop the engine and check the engine oil level.
- Add engine oil if the engine oil level is low.

2. Engine Oil Replacement

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
–	Drain plug (oil filter)	7.8 ± 2.0 {5.8 ± 1.5, 0.8 ± 0.2}	–
–	Drain plug (oil pan)	69 {51, 7}	–

Lubricant and/or sealant

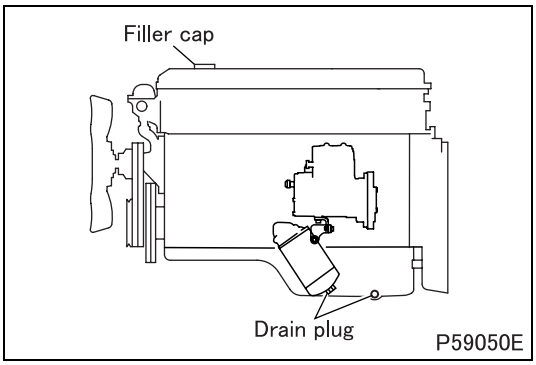
Mark	Points of application	Specified lubricant and/or sealant	Quantity
–	Oil filter	Engine oil API classification CJ-4	Approx. 2.3 L {2.4 qts}
–	Oil pan		Approx. 11 L {12 qts}

WARNING ⚠

- **Wipe up any spilled engine oil, as it can cause fires.**

CAUTION ⚠

- **Make sure not to put any engine oil on the belt when working on the oil filter. Belts soiled with oil or grease may easily slip, resulting in deteriorated performance of the cooling system.**



[Draining]

- Remove the filler cap.
- Remove the drain plugs of the oil filter or oil pan to drain out the engine oil.

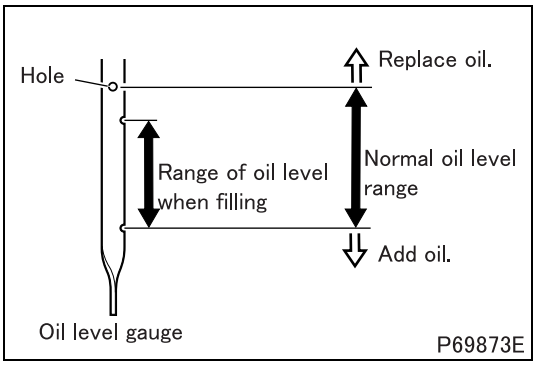
[Refilling]

- Tighten the drain plug to the specified torque, then pour a specified amount of new engine oil into the engine.
- Stop the engine and check the engine oil level.
- Add engine oil if the engine oil level is low.

CAUTION ⚠

- **Do not add engine oil too much. An excessive oil level can only lead to increased oil consumption or make the positive crankcase ventilation system less efficient.**

3. Engine Oil Level Inspection



- When regenerating the DPF (diesel particulate filter), a part of the injected fuel may mix into the engine oil and may increase the quantity of oil.
- If the oil level is out of the normal range, add or replace the engine oil.

CAUTION ⚠

- **If the engine oil level exceeds the hole on the oil level gauge, replace the engine oil immediately as the oil has deteriorated and may cause seizure.**

- If remarkable increase of the engine oil is observed, check the following even the oil level is within the normal range.
  - Seizure of piston ring and piston
  - Excessive clearance between piston and cylinder liner

4. Oil Pressure Measurement

Service standards

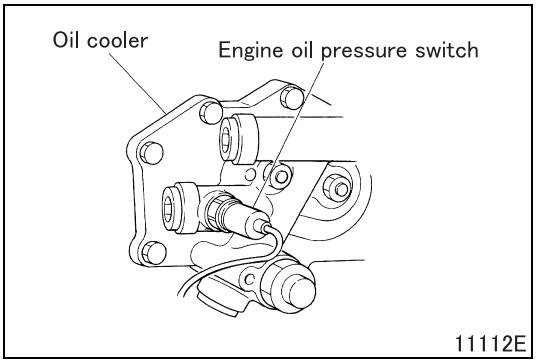
Location	Maintenance item		Standard value	Limit	Remedy
–	Oil pressure (oil temperature at 70 to 90°C, {158 to 194°F})	No-load minimum speed	145 to 295 kPa {21 to 43 psi, 1.5 to 3 kgf/cm^2}	49 kPa {7.1 psi, 0.5 kgf/cm^2}	Inspect
		No-load maximum speed	295 to 490 kPa {43 to 71 psi, 3 to 5 kgf/cm^2}	195 kPa {28 psi, 2 kgf/cm^2}	

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

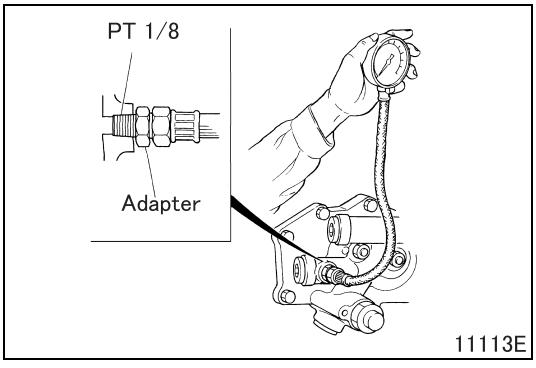
Mark	Parts to be tightened	Tightening torque	Remarks
–	Engine oil pressure switch	15 to 22 {11 to 16, 1.5 to 2.2}	Sealant With cold engine

Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
–	Engine oil pressure switch threads	Teflon tape	3 1/2 turns



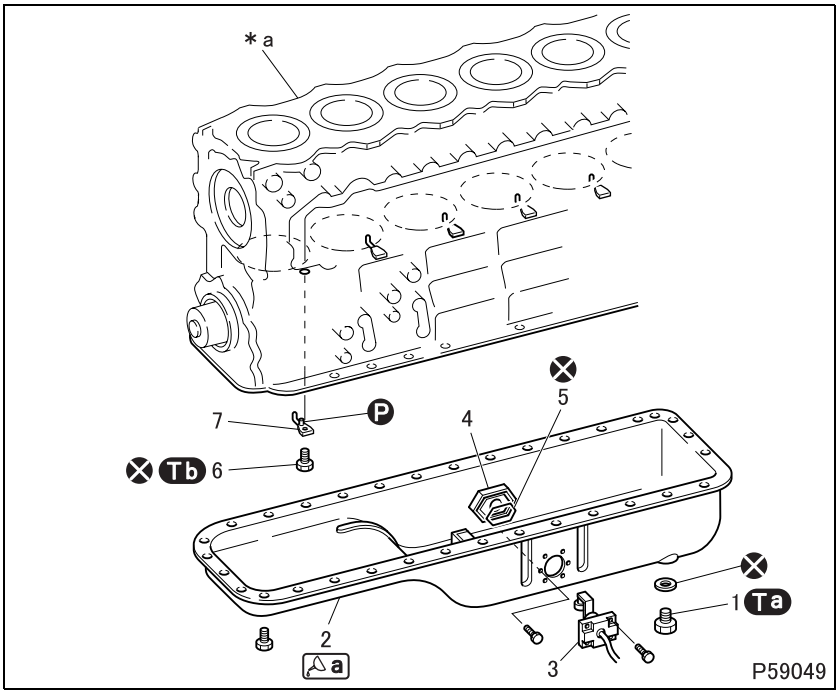
- Remove the engine oil pressure switch.



- Using an adapter, connect an oil pressure gauge to the engine oil pressure switch mounting hole.
- Warm up the engine until the oil temperature reaches 70 to 90°C {158 to 194°F}.
- Measure the oil pressure while running the engine at a minimum speed and then at maximum speed, both under no load.
- If the measurements are below the specified limits, overhaul the lubrication system.
- After taking the measurements, wrap the threads of the engine oil pressure switch with teflon tape and then tighten the switch to the specified torque.

CAUTION ⚠

- **Reinstall the oil pressure switch only when the engine is cold.**



● **Disassembly sequence**

1. Drain plug
2. Oil pan
3. Engine oil level sensor
4. Retainer
5. O-ring
6. Check valve
7. Oil jet

***a**: Crankcase
Ⓟ: Locating pin
⊗: Non-reusable parts

● **Assembly sequence**

Follow the disassembly sequence in reverse.

CAUTION ⚠

- **If overtightened, the check valve will not operate properly, leading to engine seizure. Be sure to tighten the check valve to the specified torque.**

The oil pan shown in the illustration is designed for the FK model.

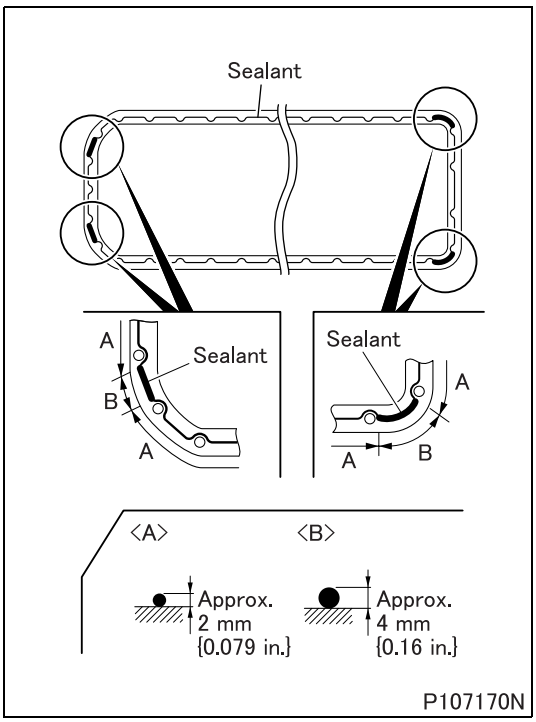
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Drain plug	69 {51, 7}	–
Tb	Check valve	34 {25, 3.5}	–

Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Crankcase mounting surface of oil pan	ThreeBond 1217H	As required

◆Installation procedure◆



■ **Installation: Oil pan**

- Clean the mating surfaces of each part.
- Apply a bead of sealant to the mating surface of the oil pan evenly and without any breaks.
- Apply amount B of the sealant to the 4 corners and amount A to the other places as shown in the illustration.
- Mount the oil pan within three minutes of applying the sealant. Make sure that the sealant stays in place.

CAUTION ⚠

- **Do not start the engine less than an hour after installation. If the oil pan mounting bolts were loosened or removed, be sure to reapply sealant.**

M E M O

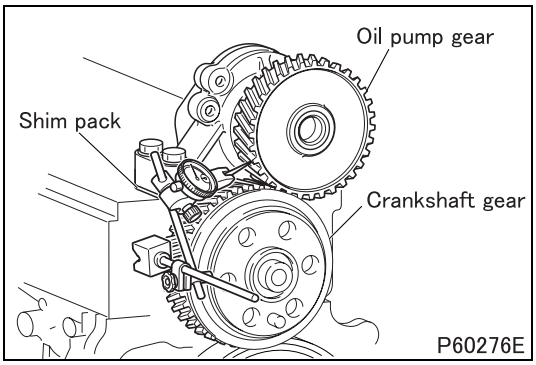
Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Bolt (oil pump cover mounting)	25 ± 4.9 {18 ± 3.6, 2.5 ± 0.5}	–
Tb	Bolt (oil strainer, oil pipe mounting)	24 {18, 2.4}	–

◆Inspection before removal◆



■ Inspection: Backlash between oil pump gear and crankshaft gear

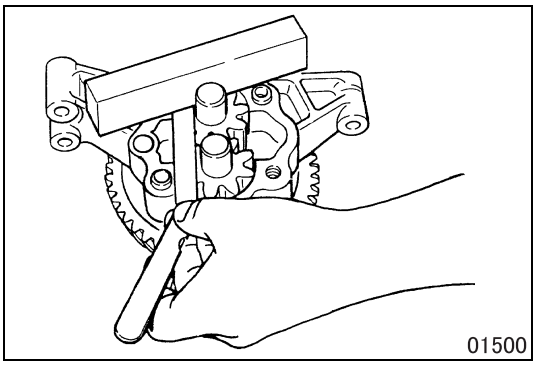
- If the measurement exceeds the limit, adjust by shimming.

Shim thickness	Change in backlash
0.1 mm {0.0039 in.}	0.073 mm {0.0029 in.}
0.2 mm {0.0079 in.}	0.146 mm {0.0057 in.}

CAUTION ⚠

- **Perform shimming such that the shim packs on both sides will have the same thickness.**

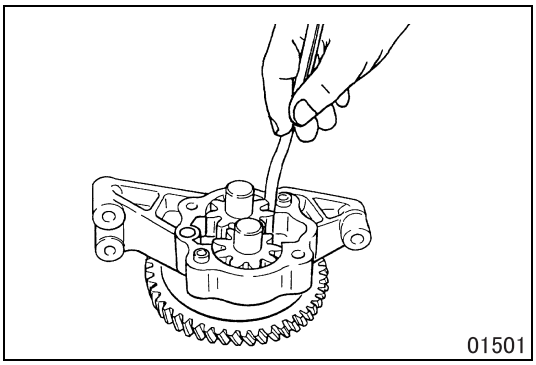
◆Inspection procedure◆



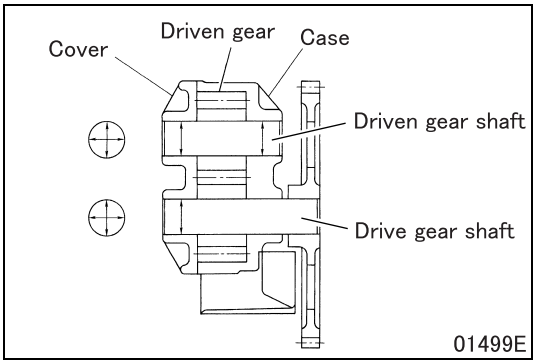
■ Inspection: Driven gear, gear and case assembly

- Perform the following inspections. Replace the defective part(s) as required.

(1) Difference between case depth and height of each gear

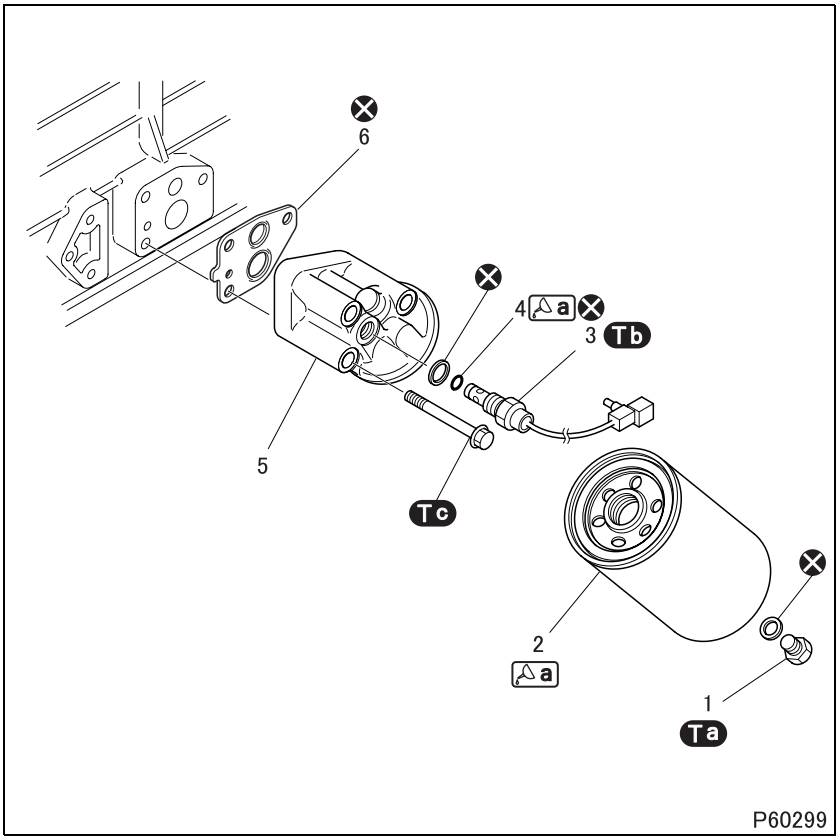


(2) Clearance between case and tooth tips of each gear



(3) Clearance between drive gear shaft and cover

(4) Clearance between driven gear shaft and case, and that between the shaft and cover



● **Removal sequence**

1 Drain plug
2 Oil filter
3 Engine oil bypass alarm switch
4 O-ring
5 Oil filter head
6 Gasket

⊗: Non-reusable parts

● **Installation sequence**

Follow the removal sequence in reverse.

WARNING ⚠

- **Wipe up any spilled engine oil, as it can cause fires.**
- **To avoid any risk of burns, take care not to touch the engine oil when the engine is hot.**

CAUTION ⚠

- **When adding engine oil, be careful not to allow engine oil to smear the belt. A belt smeared with oil will slip, resulting in reduced cooling efficiency.**

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

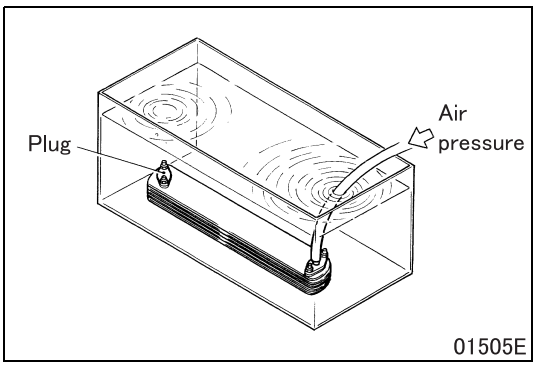
Mark	Points of application	Lubricant and/or sealant	Quantity
a	Engine oil pressure switch threads	Teflon tape	3 1/2 turns
b	O-ring	Engine oil	As required

◆Inspection procedure◆



■ Inspection: Oil cooler element

- Plug the outlet of the oil cooler element and connect a hose to the engine oil inlet port. Then, immerse the oil cooler element in a tank of water.
- Apply a specified air pressure for 15 seconds through the hose, and check for any air leaks.
- Replace the element if it leaks air.

REGULATOR VALVE

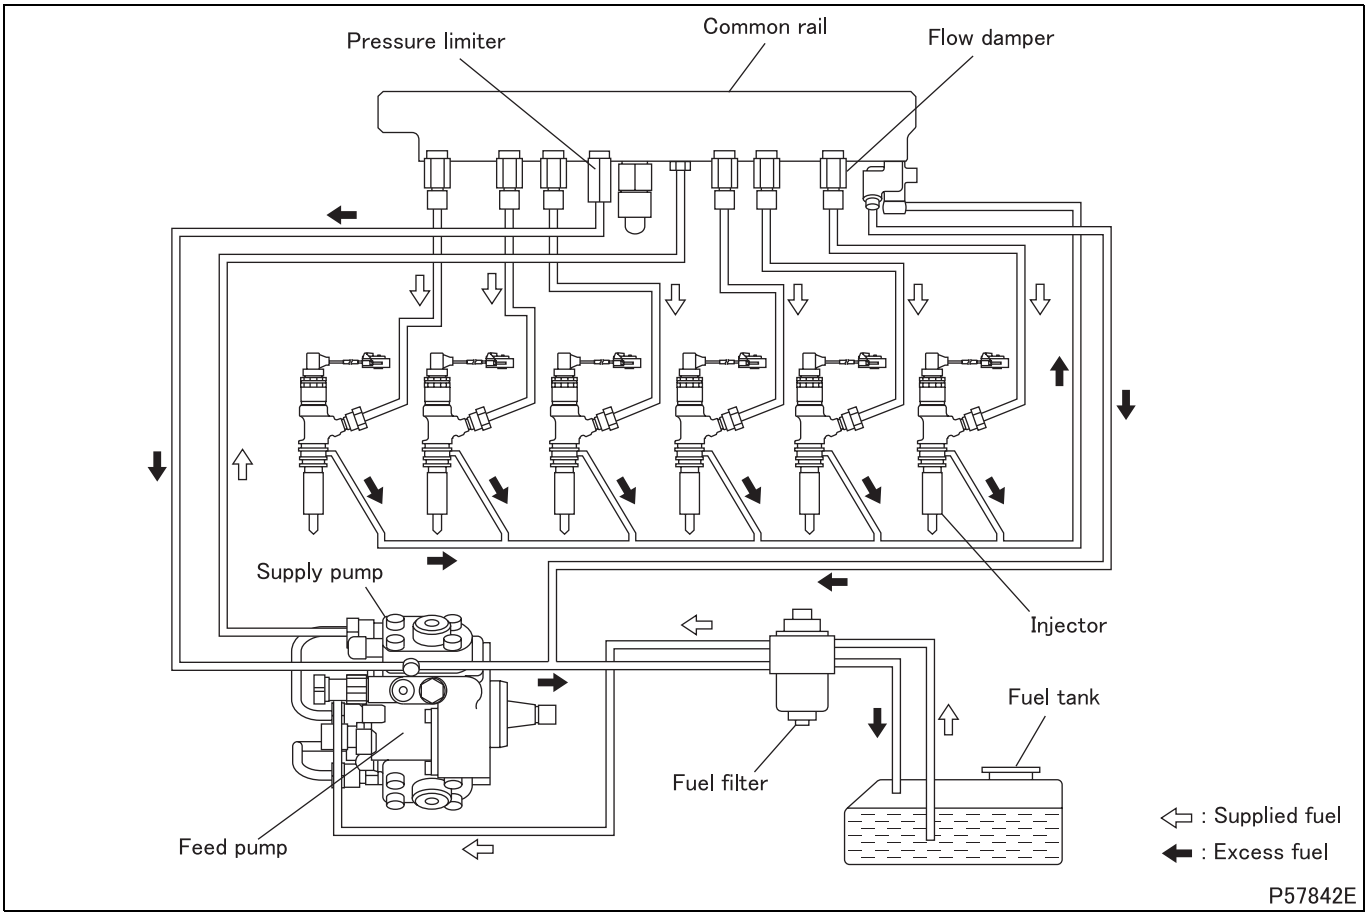
SPECIFICATIONS

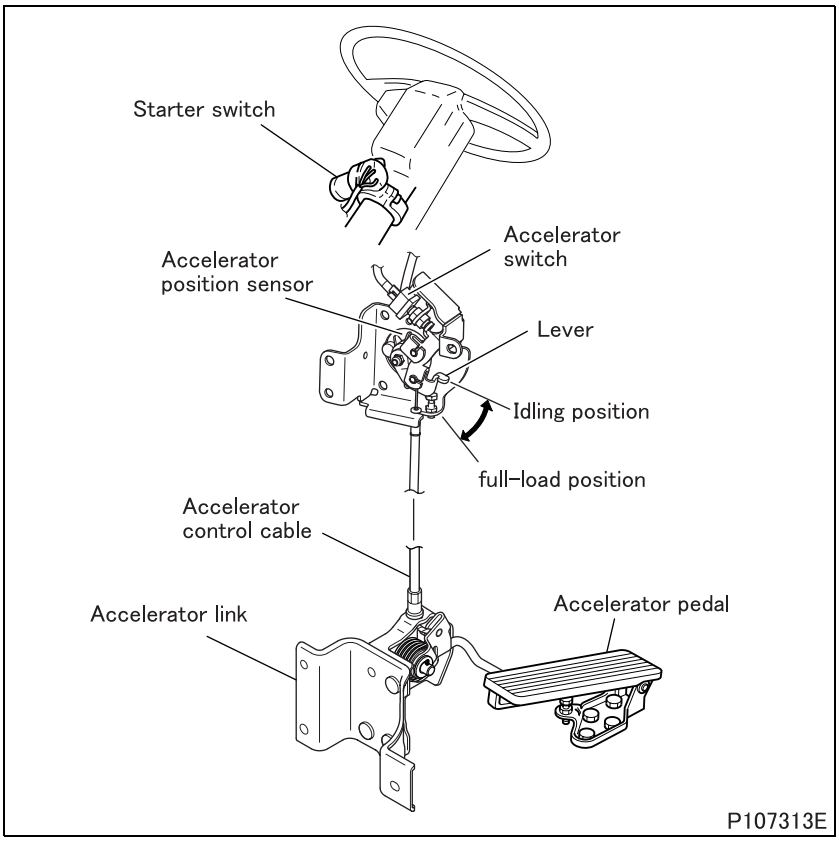
Item		Specifications
Supply pump	Manufacturer	DENSO
	Control system	Electronically-controlled pump
	Type	HP-4
	Feed pump type	Trochoid pump
Common rail system	Manufacturer	DENSO
	Common rail capacity cm^3 {cu. in}	26 {1.56}
	Pressure limiter valve opening pressure MPa {psi, kgf/cm^2}	221 ± 9 {32050 ± 1310, 2253 ± 92}
	Common rail pressure sensor supply voltage V	5
Injector	Manufacturer	DENSO
	Control system	Electronically controlled
	Maximum injection pressure MPa {psi, kgf/cm^2}	170 {24890, 1750}

1. Fuel System (Flow of Fuel)



- Fuel in the fuel tank is sucked up by the feed pump, which is driven by the pump camshaft within the supply pump, and is fed through the fuel filter where foreign matter is filtered out.
- The filtered fuel is sent to the supply pump where it is pressurized, and then is accumulated in the common rail. The accumulated fuel is then delivered through the injectors into the combustion chambers.
- If fuel leakage occurs through any of the fuel line connections between the common rail and injectors, the relevant flow damper(s) will close, shutting off fuel supply and thus preventing any further fuel leakage out of the system.
- If the pressure of fuel in the common rail rises above the specified level, the pressure limiter valve opens to allow fuel to return to the fuel tank.
- If the pressure of fuel in the supply pump rises above the specified limit, fuel is allowed to returned to the fuel tank.

2. Engine Control



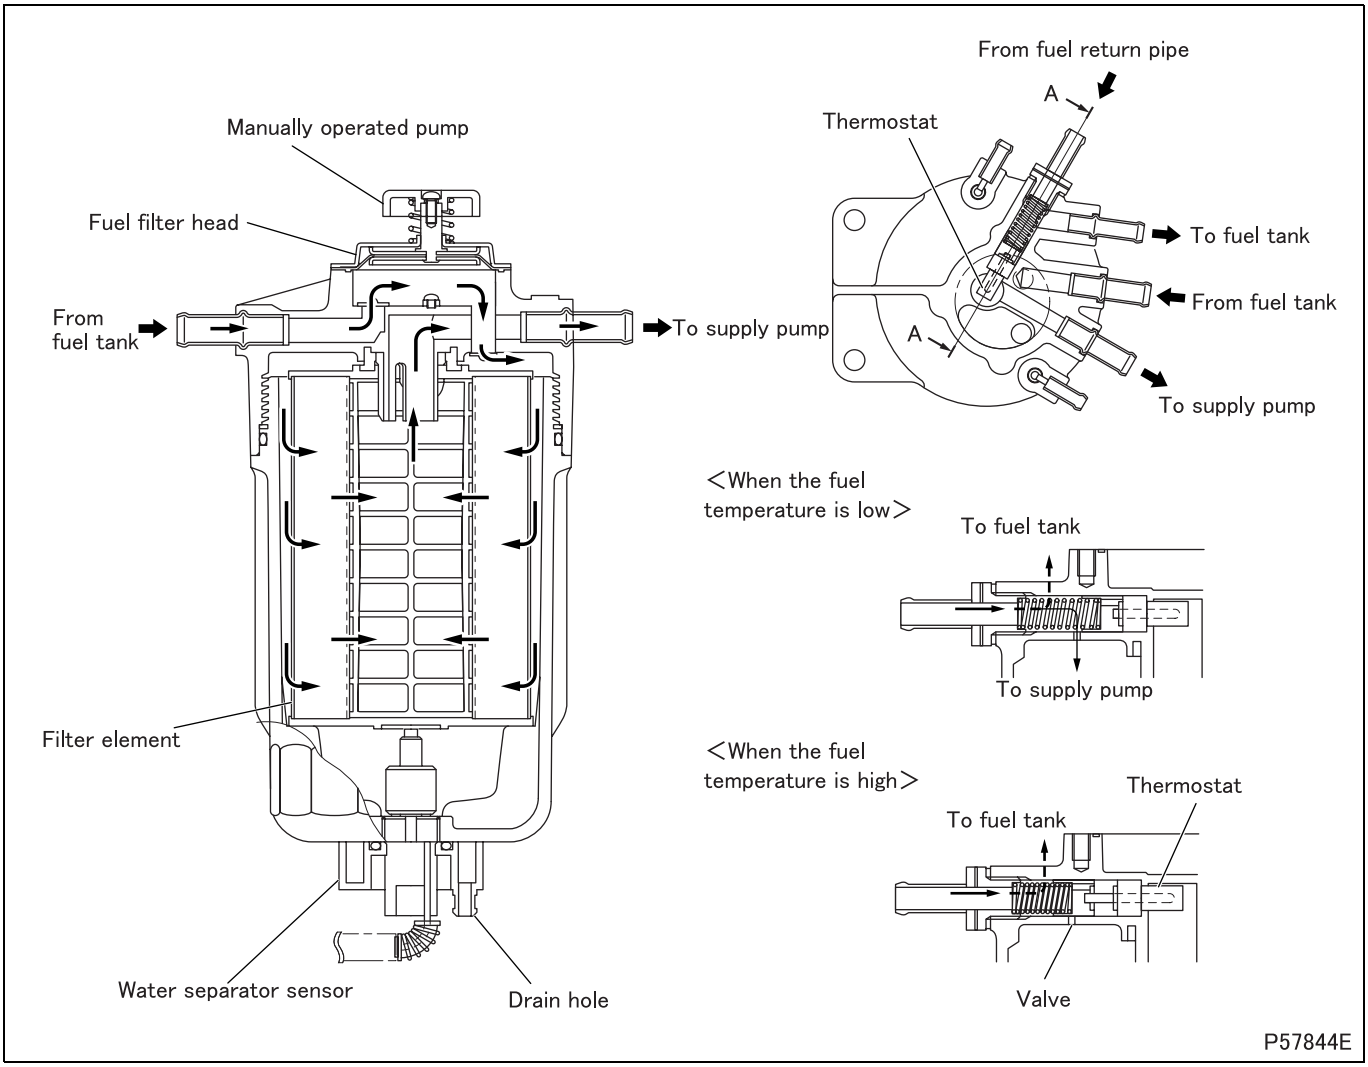
2.1 Accelerator switch

- The accelerator pedal switch is used to monitor whether or not the accelerator pedal is pressed.

2.2 Accelerator position sensor

- The accelerator position sensor monitors for change in the position of the accelerator pedal and sends relevant electric signals to the common rail electronic control unit. The lever is constantly pulled towards the idling position by a return spring.

3. Fuel Filter



- The fuel filter removes foreign matter from fuel via the filter element. The fuel filter also incorporates a water separator which separates any water from fuel.
- Water separated from fuel accumulates at the bottom of the fuel filter assembly. When water has accumulated to a certain level, this is detected by the water separator sensor, provided on the fuel filter assembly, which then illuminates a warning lamp on the meter cluster.
- The water which has collected in the water separator can be drained through the drain hole by loosening the water separator sensor.
- To bleed air from the fuel system, a manually operated pump is provided on the fuel filter head.
- When fuel is hot, the thermostat expands, closing the valve in the fuel filter head. As a result, the entire amount of hot fuel returning from the fuel return pipe is directed straight on to the fuel tank.
- When fuel is cold, the thermostat will not expand, leaving open the valve in the fuel filter head. As a result, hot fuel returning from the fuel return pipe flows through the valve and mixes with, and warms up, the fuel in the outer periphery of the filter element. This melts any paraffin that may have precipitated in the cold fuel, thus preventing the filter element from clogging up.

ON-VEHICLE INSPECTION AND ADJUSTMENT

1. Inspecting No-load Minimum and Maximum Speeds

Service standards

Location	Maintenance item	Standard value	Limit	Remedy
–	No-load minimum speed (idling speed)	600 ± 25 rpm	–	Inspect
–	No-load maximum speed	3210 ± 30 rpm	–	Inspect

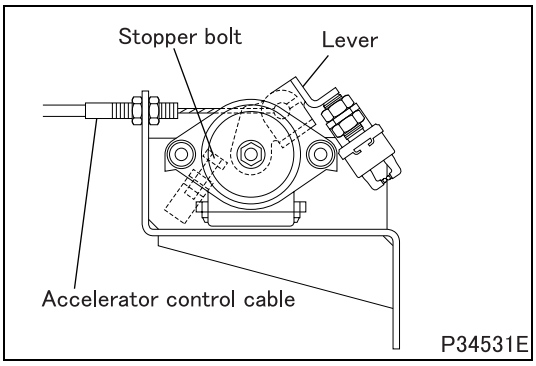
[Work before inspection]

- Before starting the inspection and adjustment, carry out the following preparatory steps:
- Warm up the engine until the engine coolant temperature is approximately 80 to 95°C {176 to 203°F};
- Turn off all lamps and accessories;
- Put the transmission in neutral (Put the automatic transmission in P range.)
- Turn the steering wheel in neutral position.
- Set the tachometer.

[Inspection]

(1) No-load minimum speed

- With the accelerator pedal released, measure the engine speed.
- If the measurement deviates from the standard value, check the accelerator position sensor and accelerator switch. (See Gr13EA.)
- If the sensor and switch are found to be normal, check for fuel system diagnosis codes as well as inspecting the supply pump and electronic control unit. (See Gr13EA.)



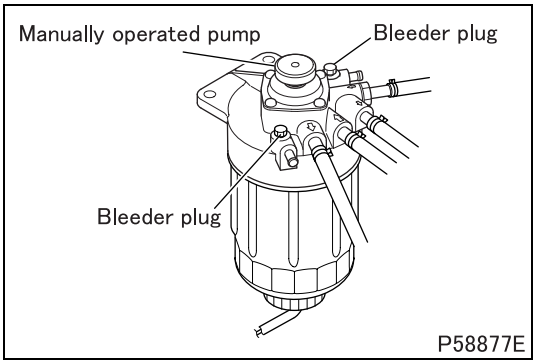
(2) No-load maximum speed

- Fully press the accelerator pedal.
- With the accelerator lever pressed against the stop bolt, measure the engine speed.
- If the measurement deviates from the standard value, check the accelerator position sensor and accelerator switch. (See Gr13EA.)
- If the sensor and switch are found to be normal, check for fuel system diagnosis codes as well as inspecting the supply pump and electronic control unit. (See Gr13EA.)

2. Air-bleeding of Fuel System

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
–	Plug	10 ± 2 {7.4 ± 1.5, 1 ± 0.2}	–



- Loosen one of the bleeder plugs on the fuel filter.
- Feed the system with fuel by manually operating the pump up and down.
- Continue pumping until fuel with no bubbles of air comes out of the bleeder plug.
- With no air bubbles coming out with fuel, tighten the bleeder plug to the specified torque.
- Continue operating the pump until there is strong pumping resistance.

CAUTION ⚠

- **If the fuel is cold, pumping resistance may not become strong. Even if this is the case, be sure to cycle the pump several times.**

- Wipe up all spilled fuel, then start the engine.
- Check that no fuel leakage occurs.

WARNING ⚠

- **Fuel is highly flammable. Keep it away from flames and sources of heat.**
- **Be sure to wipe up all spilled fuel. Unless it is wiped up, it could catch fire.**

3. Fuel Filter Replacement

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

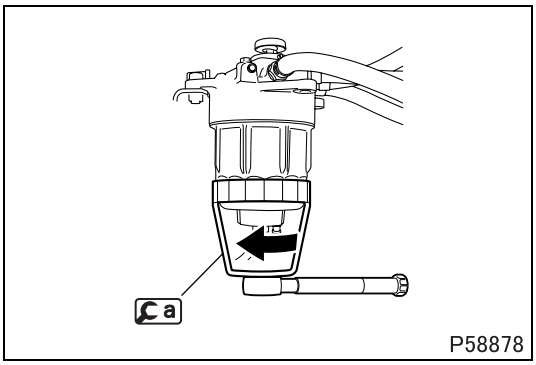
Mark	Parts to be tightened	Tightening torque	Remarks
–	Water separator sensor	5 ± 1 {3.7 ± 0.7, 0.5 ± 0.1}	–
–	Case	30 ± 2 {22 ± 1.5, 3.1 ± 0.2}	–

Lubricant and/or sealant

Location	Points of application	Specified lubricant and/or sealant	Quantity
–	O-ring	Engine oil	As required

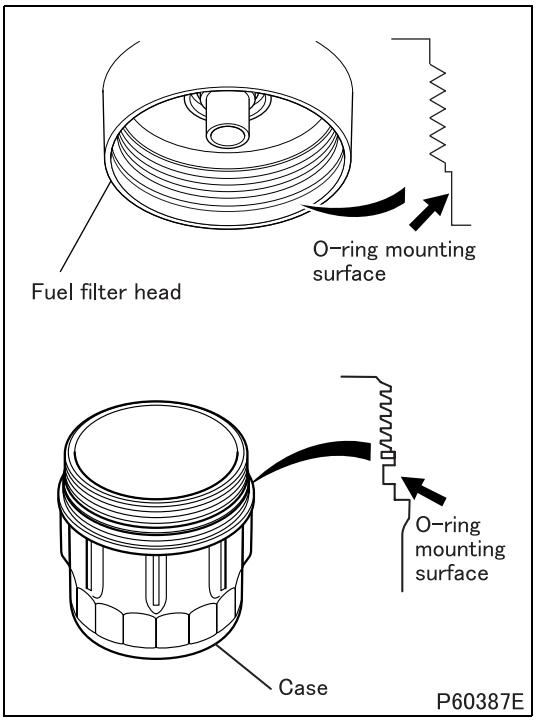
Special tools

Mark	Tool name and shape	Part No.	Application
a	Filter wrench  P57179	MH063203	Removal and installation of case



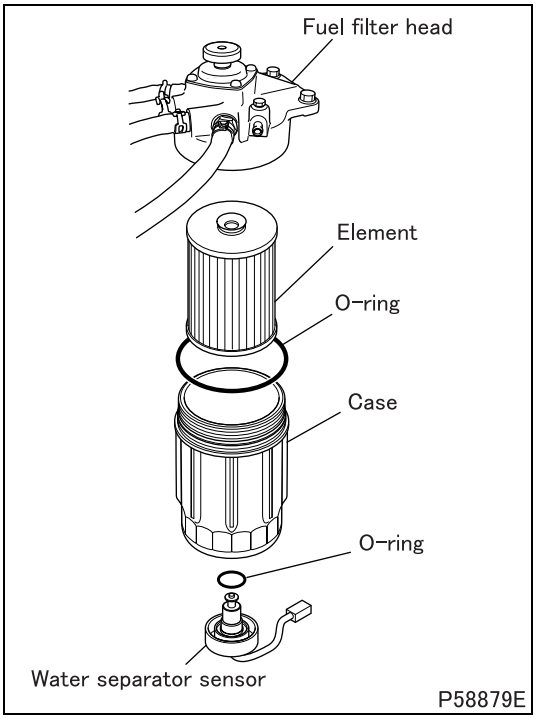
[Removal]

- Drain fuel from the case by loosening the water separator sensor.
- Using a, remove the case.



[Installation]

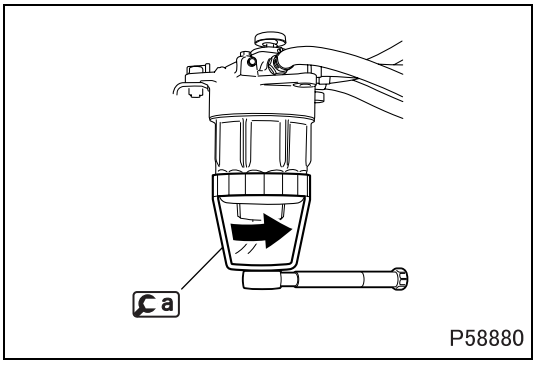
- Clean the surface of the fuel filter head and case where the O-ring is to be mounted.



- Replace the filter element and O-rings with new parts.
- Apply a thin coat of engine oil to the O-rings. Install the O-rings onto the case and water separator sensor.

CAUTION ⚠

- **The use of non-genuine filter elements will lead to engine problems. Be sure to use only genuine parts.**
- **To help prevent fuel injection problems, keep the fuel filter and hoses free from contamination.**



- Using a, tighten the case to the specified torque.
- Tighten the water separator sensor to the specified torque. With the sensor correctly installed, bleed air from the fuel system.
- Start the engine and ensure that there is no fuel leakage.
- If there is fuel leakage, remove and install the fuel filter correctly.

FUEL TANK

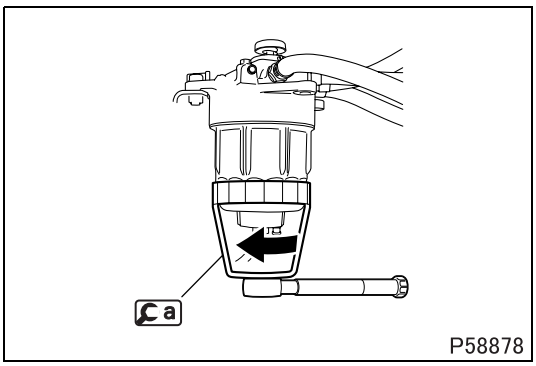
FUEL FILTER

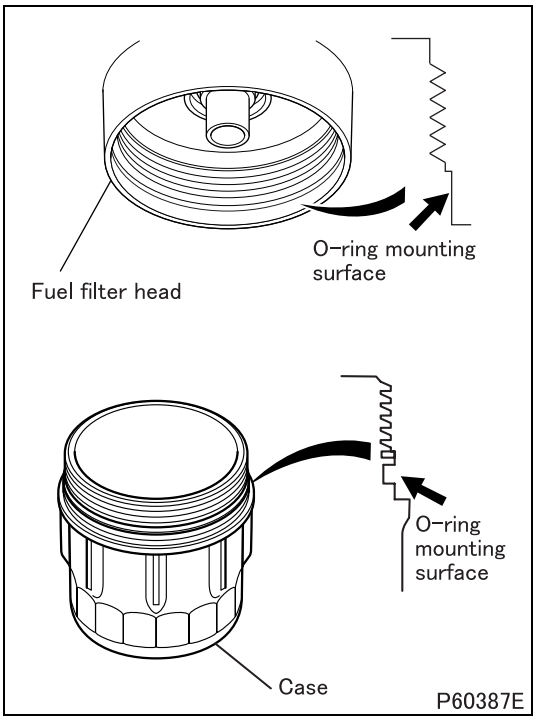
◆Removal procedure◆



■**Removal: Case**

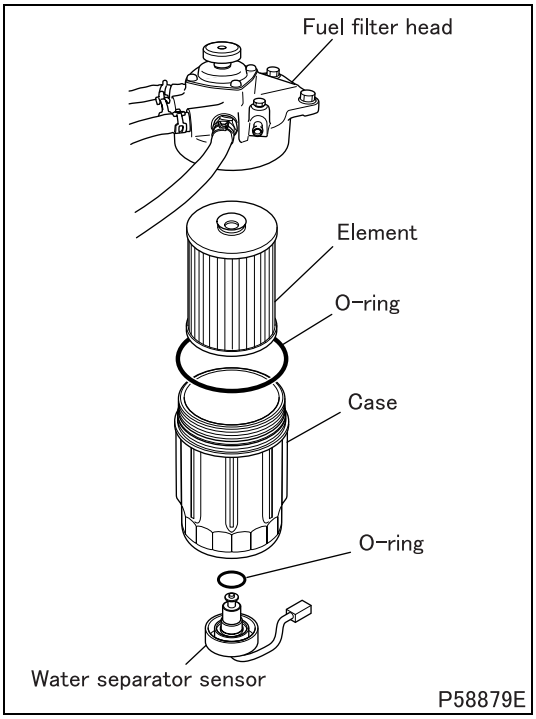
- Drain fuel from the case by loosening the water separator sensor.
- Using a, remove the case.

◆Installation procedure◆



■ **Installation: Case**

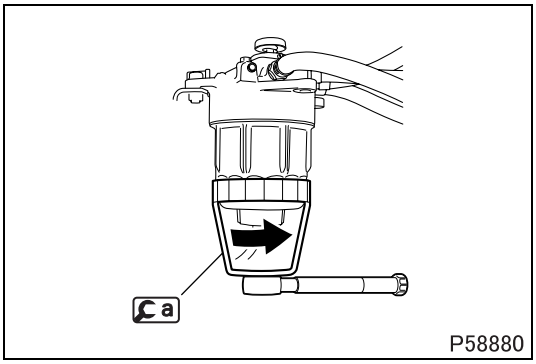
- Clean the surface of the fuel filter head and case where the O-ring is to be mounted.



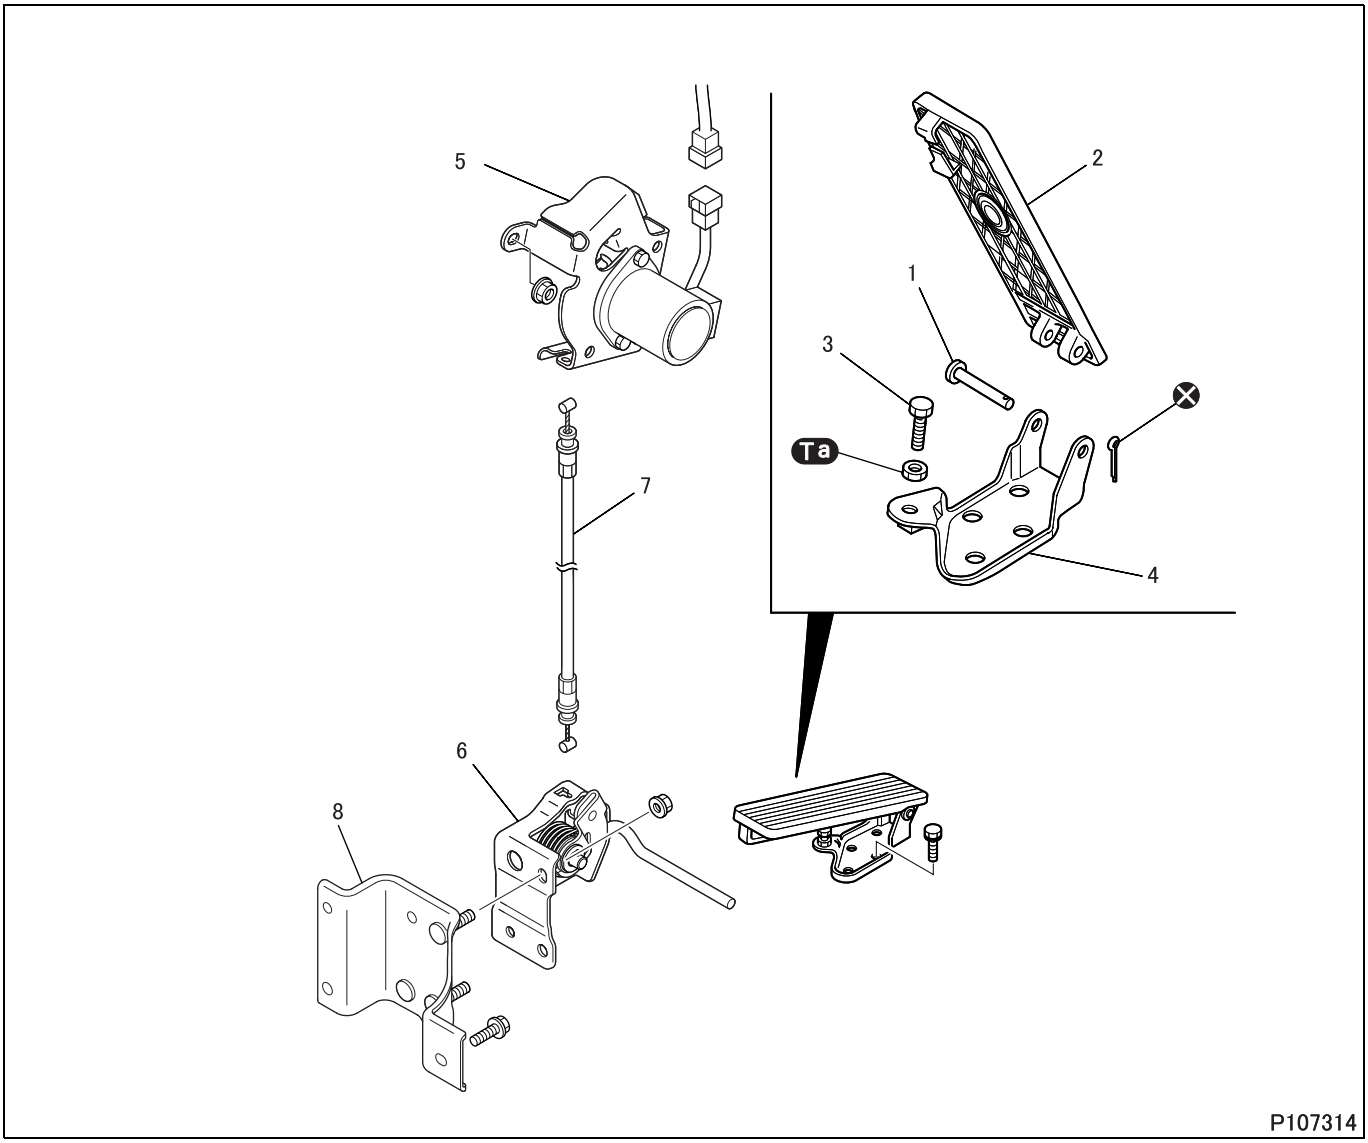
- Replace the filter element and O-rings with new parts.
- Apply a thin coat of engine oil to the O-rings. Install the O-rings onto the case and water separator sensor.

CAUTION ⚠

- **The use of non-genuine filter elements will lead to engine problems. Be sure to use only genuine parts.**
- **To help prevent fuel injection problems, keep the fuel filter and hoses free from contamination.**



- Using a, tighten the case to the specified torque.
- Tighten the water separator sensor to the specified torque. With the sensor correctly installed, bleed air from the fuel system.
- If there is fuel leakage, remove and install the fuel filter correctly.



● **Disassembly sequence**

1 Accelerator pedal pin
2 Accelerator pedal
3 Stopper bolt
4 Accelerator pedal bracket
5 Accelerator position sensor and link assembly (See later section.)
6 Accelerator link assembly (See later section.)
7 Accelerator control cable
8 Accelerator link bracket

⊗: Non-reusable parts

CAUTION ⚠

- **Do not attempt to disassemble the accelerator link assembly because it is of a unit construction.**

● **Assembly sequence**

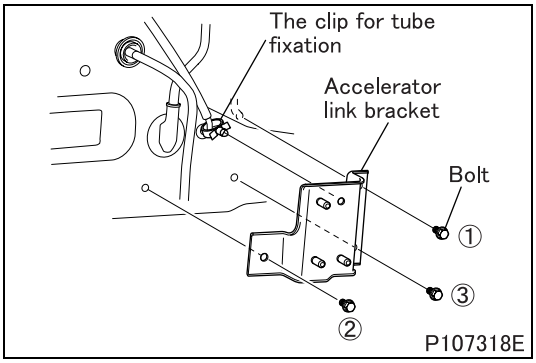
Follow the disassembly sequence in reverse.

- After the installation, check the no-load minimum speed and no-load maximum speed for normal state and adjust them if required. (See ON-VEHICLE INSPECTION AND ADJUSTMENT.)
- After assembly, press the accelerator pedal and make sure that the pedal moves smoothly.

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

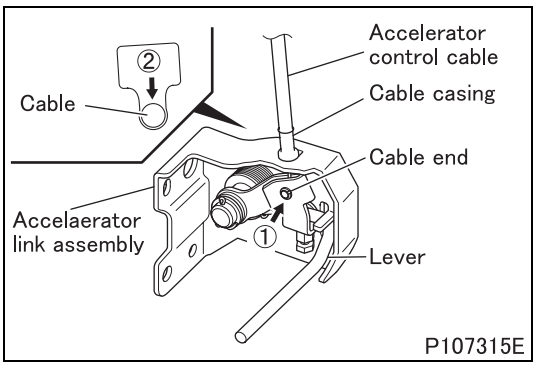
Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Lock nut	4 to 6 {0.9 to 1.3, 0.4 to 0.6}	–

◆Installation procedure◆



■ Installation: Accelerator link bracket

- Insert the accelerator link bracket to the clip for tube fixation.
- Install the accelerator link bracket by tightening the bolts in the order shown in the illustration.



■ Installation: Accelerator control cable

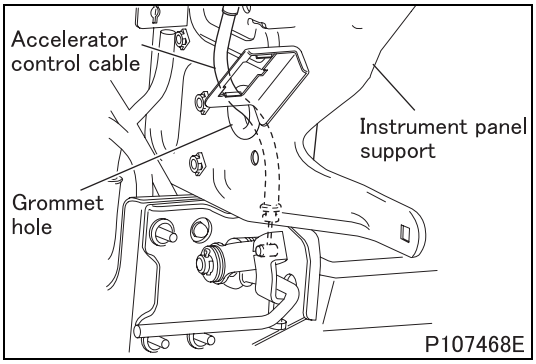
- Install the accelerator control cable to the accelerator link assembly as follows:

① Insert the accelerator control cable end into the lever of the accelerator link assembly. Do not bend the cable. (minimum bending radius: 30 mm)

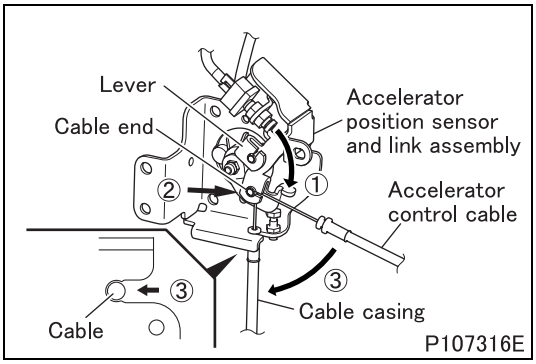
② Insert the accelerator control cable casing into the slit in the bracket of the accelerator link assembly until it clicks and is secured in position.

CAUTION ⚠

- **Insert the cable casing firmly into the slit. Otherwise the cable may bend, resulting in stiffness, jamming, or breakage of the cable.**



- Pass the accelerator control cable through the grommet-mounted hole in the instrument panel support.



- Install the accelerator control cable to the accelerator position sensor and link assembly as follows:

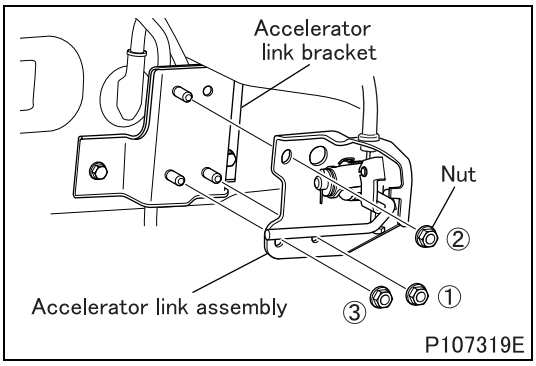
① Bring the lever of the accelerator position sensor and link assembly into the state of full stroke.

② Insert the accelerator control cable end into the lever of the accelerator position sensor and link assembly.

③ Insert the accelerator control cable casing into the slit in the bracket of the accelerator position sensor and link assembly until it clicks and is secured in position.

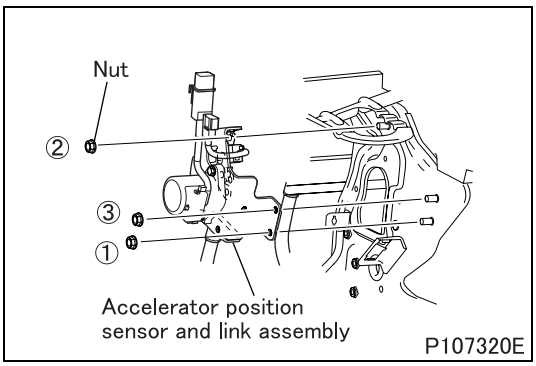
CAUTION ⚠

- **Insert the cable casing firmly into the slit. Otherwise the cable may bend, resulting in stiffness, jamming, or breakage of the cable.**



■ Installation: Accelerator link assembly

- Install the accelerator link assembly by tightening the nuts in the order shown in the illustration.



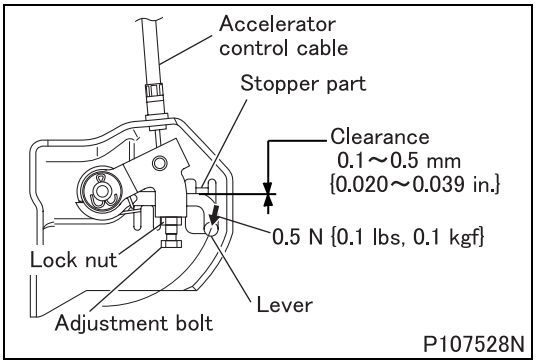
■ Installation: Accelerator position sensor and link assembly

- Install the accelerator position sensor and link assembly by tightening the nuts in the order shown in the illustration.

◆Inspection after installation◆

■ Inspection: Movement of accelerator pedal

- Check if the accelerator pedal satisfies the following conditions. If any abnormality is found, check the installation condition of the parts and replace any faulty part(s).
  - The accelerator pedal operates smoothly from the released position to the full stroke position without stiffness or jamming.
  - The accelerator pedal surely returns to its original (released) position when the pedal is released at any position.
  - There is no harness or other parts within 20 mm {0.79 in.} from any movable sections of the accelerator position sensor and link assembly and the accelerator link assembly.



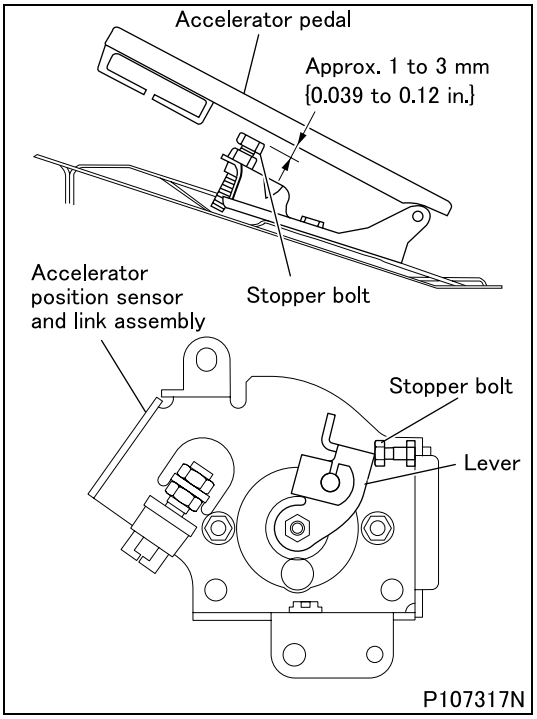
■ Adjustment: Play of accelerator control cable

[Inspection]

- Press down the lever of the accelerator link assembly with a force of 0.5 N {0.1 lbs, 0.1 kgf} and measure the clearance between the lever and the stopper. If the clearance is out of the value specified in the drawing, adjust the play.

[Adjustment]

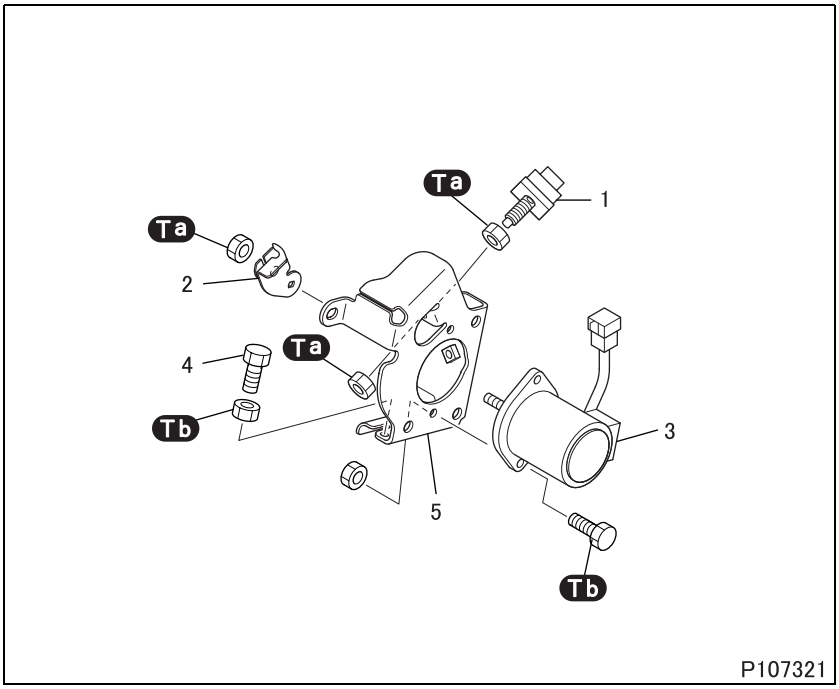
- Loosen the lock nut.
- Adjust the clearance to the value specified in the drawing with the adjustment bolt. (Turning the bolt clockwise reduces the clearance.)
- After adjustment, tighten the lock nut.



■ Adjustment: Clearance between the accelerator pedal and stopper bolt

- Press the accelerator pedal to contact the lever of the accelerator position sensor and link assembly with the stopper bolt. In this condition, adjust the clearance between the accelerator pedal and the stopper bolt under the pedal to the value specified in the drawing by adjusting the stopper bolt height.

Accelerator position sensor and link assembly



● Disassembly sequence

1 Accelerator position switch
2 Accelerator position sensor lever
3 Accelerator position sensor
4 Stopper bolt
5 Accelerator position sensor bracket

● Assembly sequence

Follow the disassembly sequence in reverse.

- After assembly, make sure that the accelerator position sensor lever moves smoothly.
- After assembly, adjust the installed position of the accelerator position switch and accelerator position sensor. (See Gr13EA.)

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Nut (accelerator position switch installation)	9.81 to 13.7 {7.2 to 10, 1.0 to 1.4}	–
	Nut (accelerator position sensor lever installation)		
Tb	Bolt (accelerator position sensor installation)	4 to 6 {3.0 to 4.4, 0.4 to 0.6}	–

3 Eyebolt
4 Fuel return pipe
5 Connector
6 Eyebolt
7 Fuel overflow pipe
8 Fuel pipe
9 Injection pipe
10 Common rail

***a**: Crankcase
⊗: Non-reusable parts

WARNING ⚠

- **Fuel is highly flammable. Do not handle it near flames or heat.**
- **Spilled fuel may catch fire and therefore, must be wiped off completely.**

CAUTION ⚠

- **Any contamination of the common rail, even if it is minor, will greatly affect the performance of the engine. After removing pipes or other parts, plug the openings with covers. Wash eyebolts and gaskets in light oil and keep them away from contaminants.**

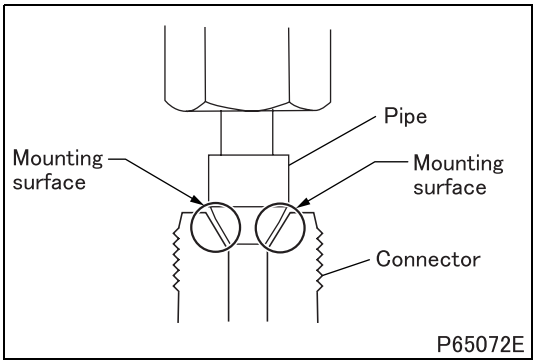
● **Assembly sequence**

Follow the disassembly sequence in reverse.

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Fuel temperature sensor	17.6 to 21.5 {13 to 16, 1.8 to 2.2}	–
Tb	Eyebolt (for fuel return pipe mounting)	25 {18, 2.6}	–
Tc	Eyebolt (for fuel overflow pipe mounting)	17.7 to 22.6 {13 to 17, 1.8 to 2.3}	–
Td	Fuel pipe	49 to 58.8 {36 to 43, 5.0 to 6.0}	–
Te	Injection pipe	39.2 to 49 {29 to 36, 4.0 to 5.0}	–

◆Installation procedure◆



■ **Installation: Injection pipe and fuel pipe**

- Ensure that the pipe and mounting surfaces of the connector are flat and free from damage.
- Bring the pipe into intimate contact with mounting surfaces of the connector evenly, and temporarily tighten it without applying an excessive force.
- Tighten it to the specified torque after temporary tightening.

SUPPLY PUMP

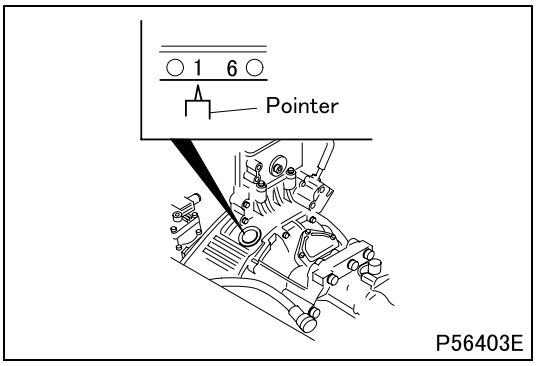
Lubricant and/or sealant

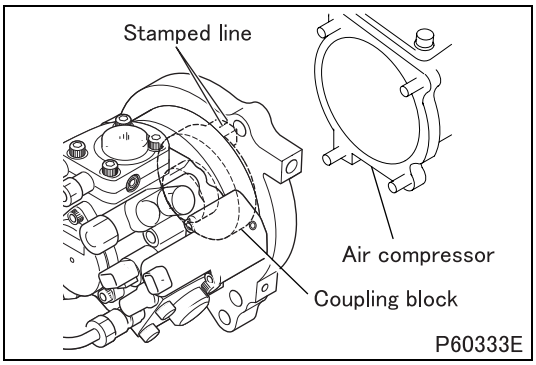
Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	O-ring	Engine oil	As required

◆Installation procedure◆

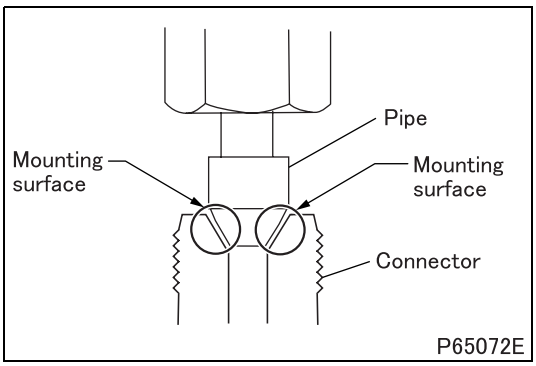


■ Installation: Supply pump

- Position the No. 1 piston to the top dead center in the compression stroke in the following manner.
  - Crank the engine to align the pointer with the "1 6" mark on the flywheel.
  - This will bring either the No. 1 piston or the No. 6 piston to the top dead center in the compression stroke. If both the inlet and exhaust rockers can be moved by hand by the amount of valve clearance, that cylinder is at the top dead center in the compression stroke. From that position, every turn of the crankshaft will alternately bring the No. 1 and No. 6 pistons to the top dead center in the compression stroke. (See Gr11.)



- Install the supply pump while ensuring that the stamped line on the supply pump timing cover is aligned with the stamped line on the coupling block.



■ Installation: Fuel pipe

- Ensure that the pipe and mounting surfaces of the connector are flat and free from damage.
- Bring the pipe into intimate contact with mounting surfaces of the connector evenly, and temporarily tighten it without applying an excessive force.
- Tighten it to the specified torque after temporary tightening.

9 Nozzle tip gasket
10 Eyebolt
11 Fuel return pipe

⊗: Non-reusable parts

WARNING ⚠

- **Before attempting to remove the injectors, turn the starter switch to the LOCK position.**
- **Spilled fuel may catch fire and therefore, must be wiped off completely.**

CAUTION ⚠

- **When removing the injector, be careful not to inadvertently hit the two-way electromagnetic valve with tools etc.**
- **To eliminate fuel injection and other problems, protect the injectors and pipes, that have been removed, from the ingress of contaminants.**

- Contact DENSO Service Station for any service needs of the injector.

● **Assembly sequence**

Follow the disassembly sequence in reverse.

CAUTION ⚠

- **Do not attempt to clean the nozzle hole with a wire brush or other similar tools, or the hole can be damaged.**
- **Be sure to tighten the nozzle bridge bolts to the specified torque. Overtightening the bolts can deform the injectors, resulting in incorrect fuel injection.**
- **If an injector is replaced with a new one, the injector correction data must be written in the engine electronic control unit.**
- **For the data writing work, consult your nearest MITSUBISHI FUSO dealer or MITSUBISHI FUSO TRUCK OF AMERICA, Inc.**

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Bolt (for mounting nozzle bridge)	33 to 38 {24 to 28, 3.4 to 3.9}	–
Tb	Injection pipe	39.2 to 49 {29 to 36, 4.0 to 5.0}	–
Tc	Eyebolt (for mounting fuel return pipe)	18 to 23 {13 to 17, 1.8 to 2.3}	–

Lubricant and/or sealant

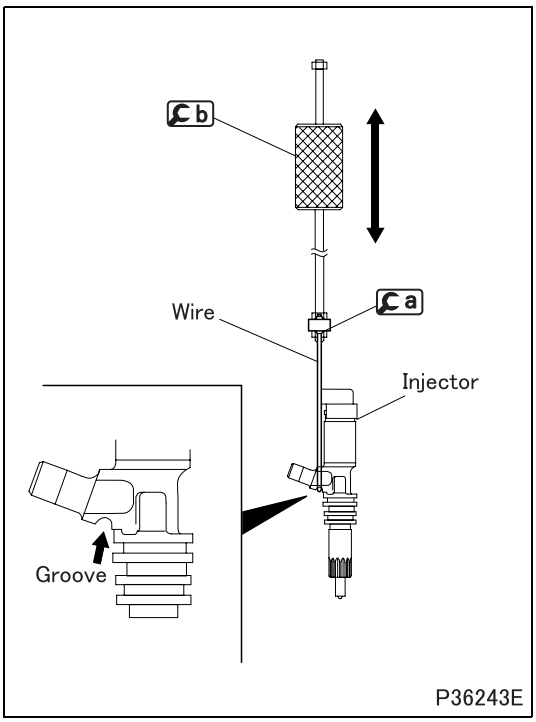
Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	O-ring	Engine oil	As required

Special tools (Unit: mm)

Mark	Tool name and shape	Part No.	Application
a	Injector extractor adapter  P36242	MH062560	Removing injector (to be used in combination)
b	Nozzle extractor  P13523	MH061071	

A
M8 × 1.25

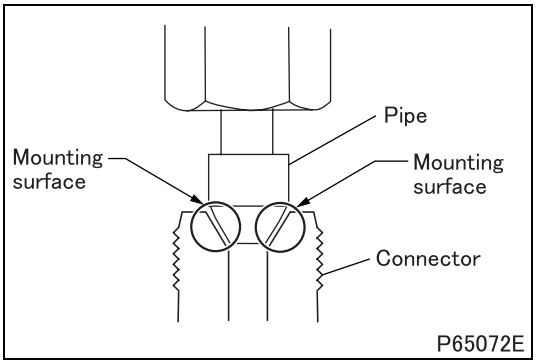
◆Removal procedure◆



■**Removal: Injector**

- Using a and b and with the wire of a engaged in the groove on the injector, remove the injector.

◆Installation procedure◆



■ **Installation: Injection pipe**

- Ensure that the pipe and mounting surfaces of the connector are flat and free from damage.
- Bring the pipe into intimate contact with mounting surfaces of the connector evenly, and temporarily tighten it without applying an excessive force.
- Tighten it to the specified torque after temporary tightenin

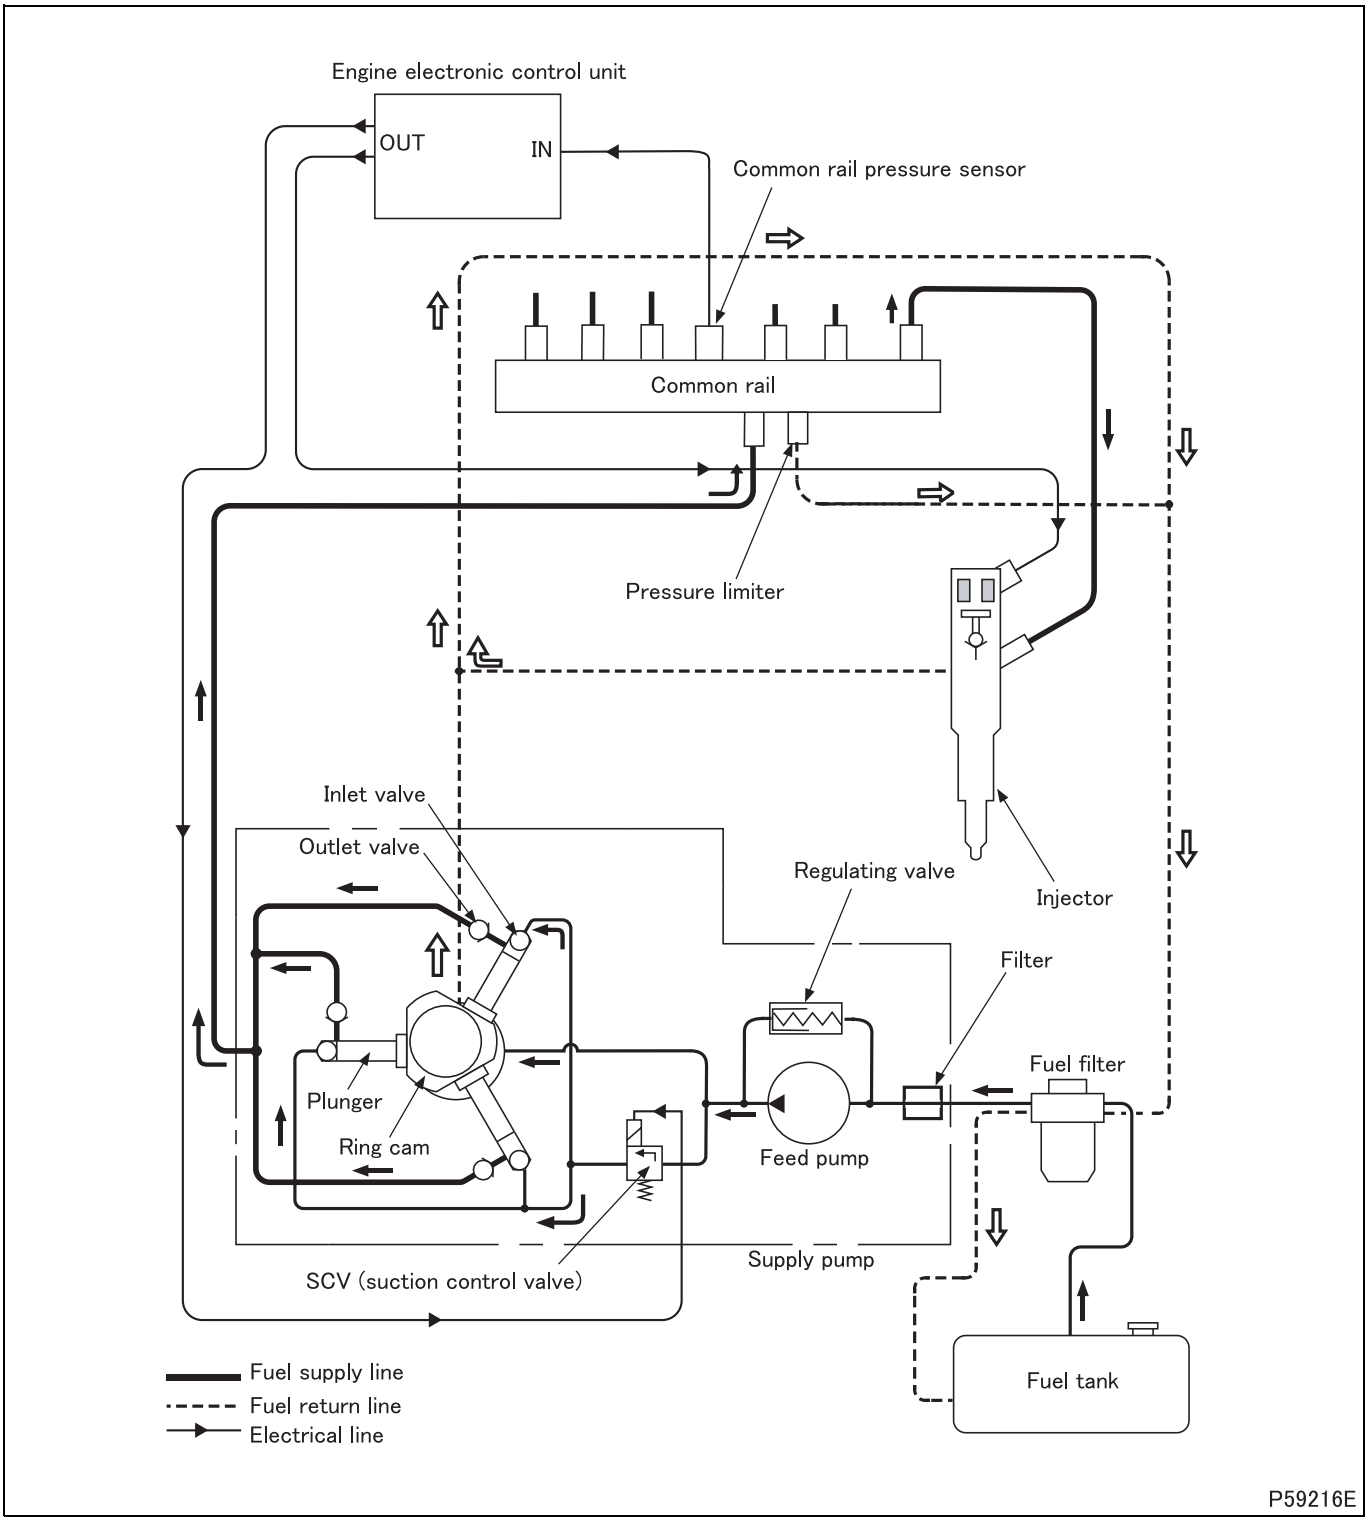
Common rail electronic control unit	Manufacturer		DENSO
	Rated voltage	V	12

M E M O

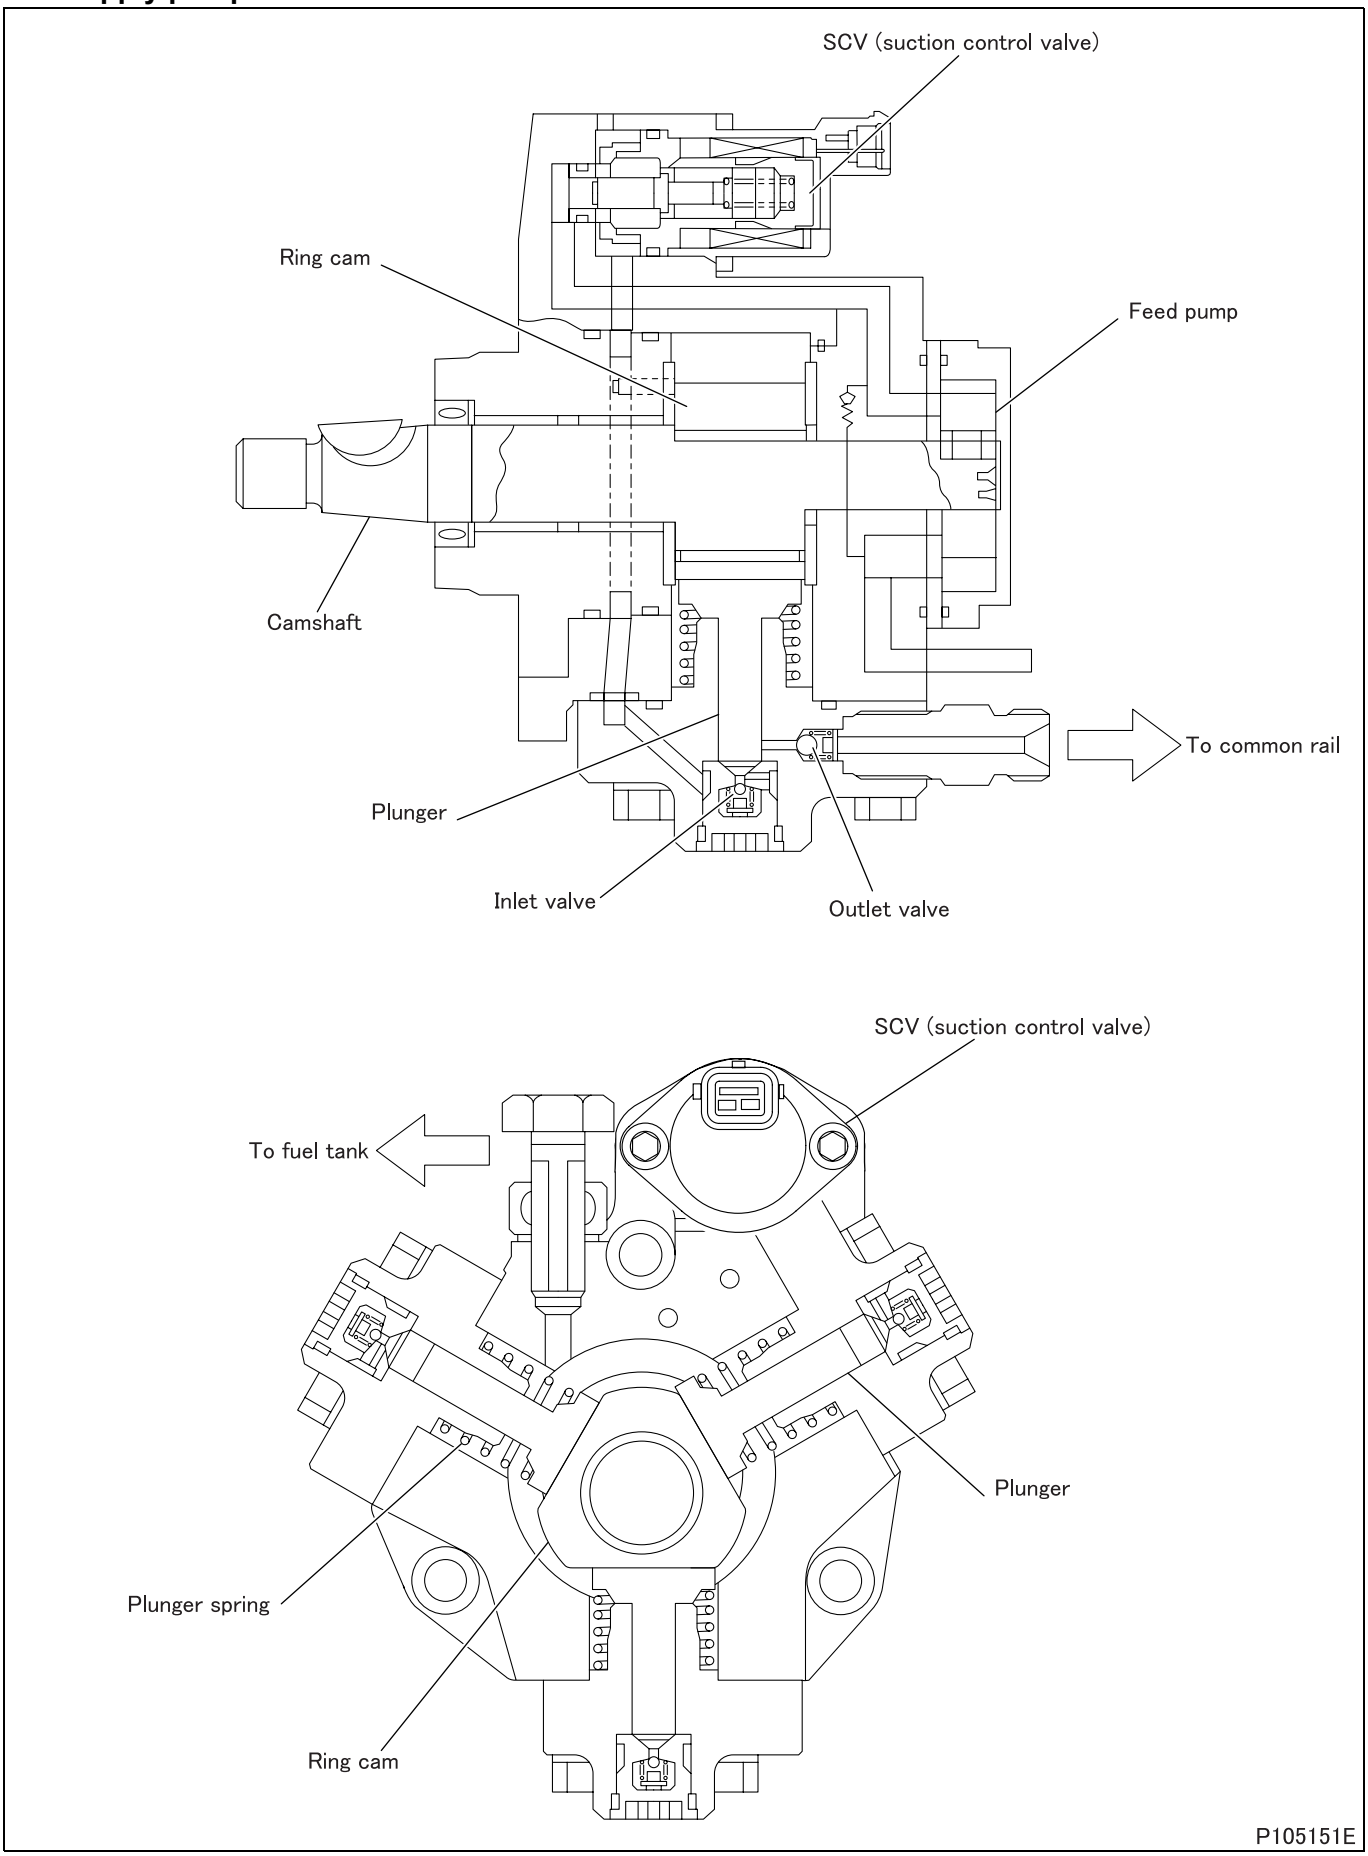
1. Overview

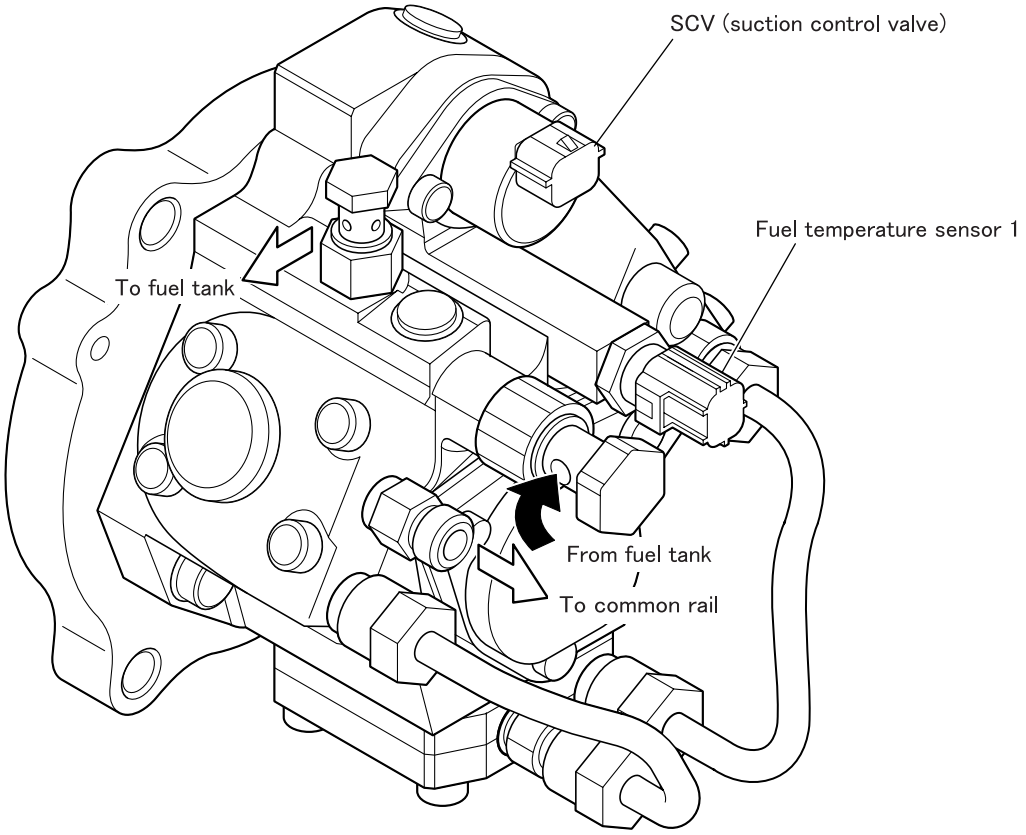
- In the common rail system, an electronic control unit monitors various aspects of the engine (engine speed, throttle opening, coolant temperature, etc.) using information from sensors. In accordance with these data, the electronic control unit effects control over the fuel injection quantity, fuel injection timing, and fuel injection pressure in order to optimize the engine's operation.
- The electronic control unit has a diagnosis function that enables it to recognize abnormalities in the common rail system's major components and alert the driver to them.
- The common rail system consists mainly of an electronically controlled supply pump; injectors; a common rail; and the electronic control unit and sensors that are used to control the other components.



- When the engine is cranked by means of the starter switch, the feed pump (this is located inside the supply pump) simultaneously draws fuel from the fuel tank and feeds it via the fuel filter to the SCV (suction control valve). A quantity of fuel metered by the SCV (suction control valve) is supplied via the inlet valves to the plunger chambers.
- The fuel in the plunger chambers is pressurized. The outlet valves are then opened, and the fuel is fed under pressure to the common rail.
- The pressurized fuel is held in the common rail and then uniformly fed to the injectors.
- In response to signals from the engine electronic control unit, a solenoid valve in each injector causes the injector to inject fuel into the relevant combustion chamber at the optimal timing and in the optimal quantity.

1.1 Supply pump



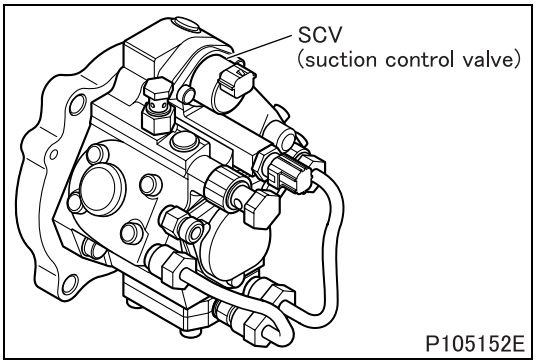


P104028E

CAUTION ⚠

- **Be sure to connect the SCV (suction control valve) connector to the engine harness before starting the engine. If the engine were started with the SCV (suction control valve) connector not connected, control of the supply pump by the engine electronic control unit would not be possible and a fault would ensue.**

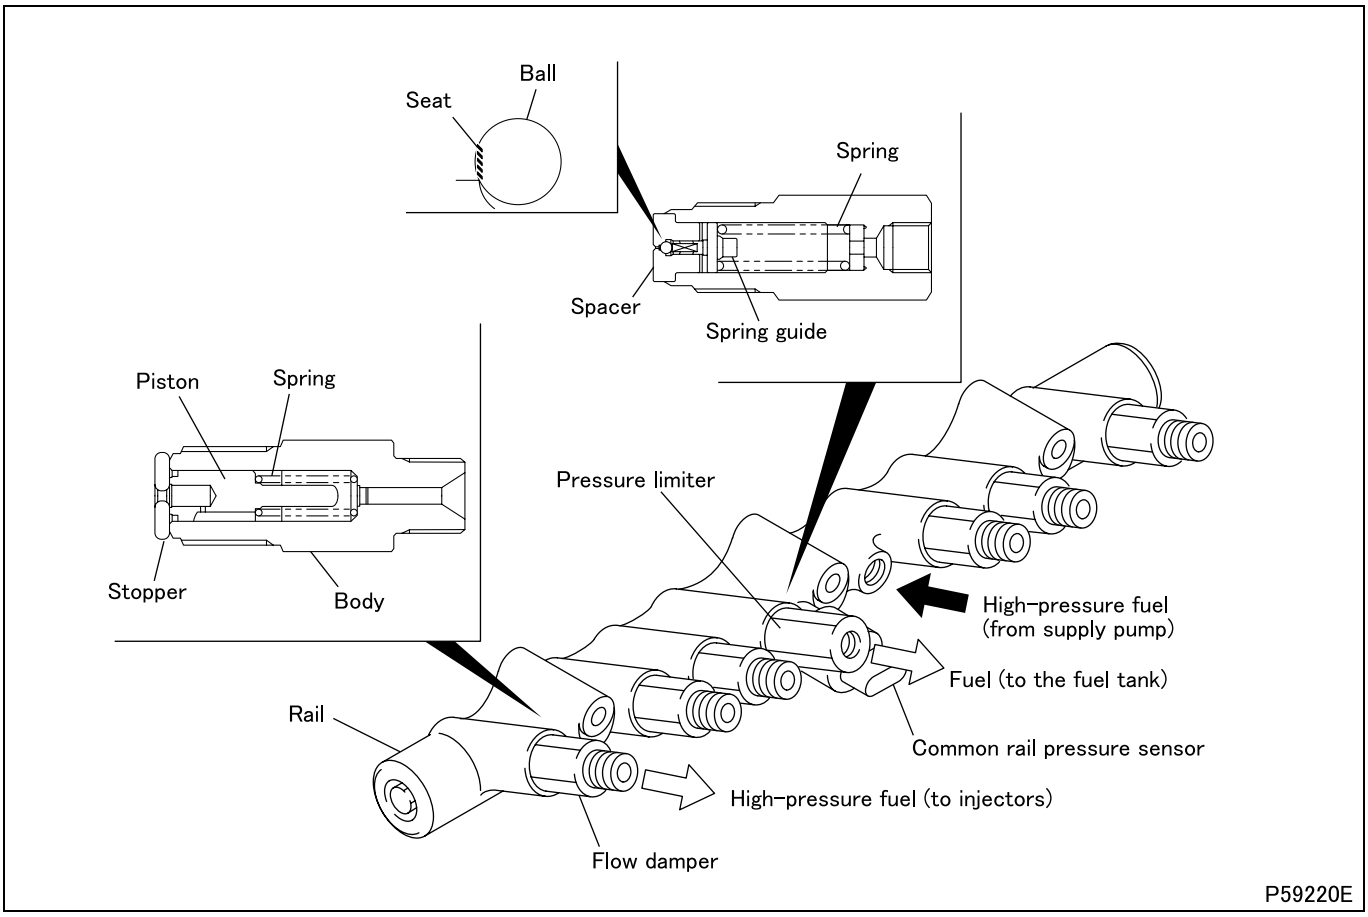
- The supply pump pressurizes fuel and supplies it in a highly pressurized state.
- Fuel drawn from the fuel tank by the feed pump is not supplied directly to the plungers. It is supplied first to the common rail pressure solenoid valve, which controls the amount of fuel reaching the plungers.
- If the fuel pressure exceeds a certain level, the regulating valve returns fuel to the inlet side of the feed pump. This operation keeps the fuel pressure constant.
- Rotation of the camshaft causes (via the ring cam) up-down movement of the plungers. Fuel in the plunger chambers is thus highly pressurized.



(1) SCV (suction control valve)

- The SCV (suction control valve) receives fuel from the feed pump and feeds fuel toward the plungers of the supply pump in such a quantity that the fuel pressure corresponds to that required by the engine electronic control unit.
- When the SCV (suction control valve) is not operating, i.e., when current is not flowing, fuel flows at its maximum rate. When current flows, the piston in the common rail pressure solenoid valve is pressed down such that fuel is not fed toward the plungers.

1.2 Common rail



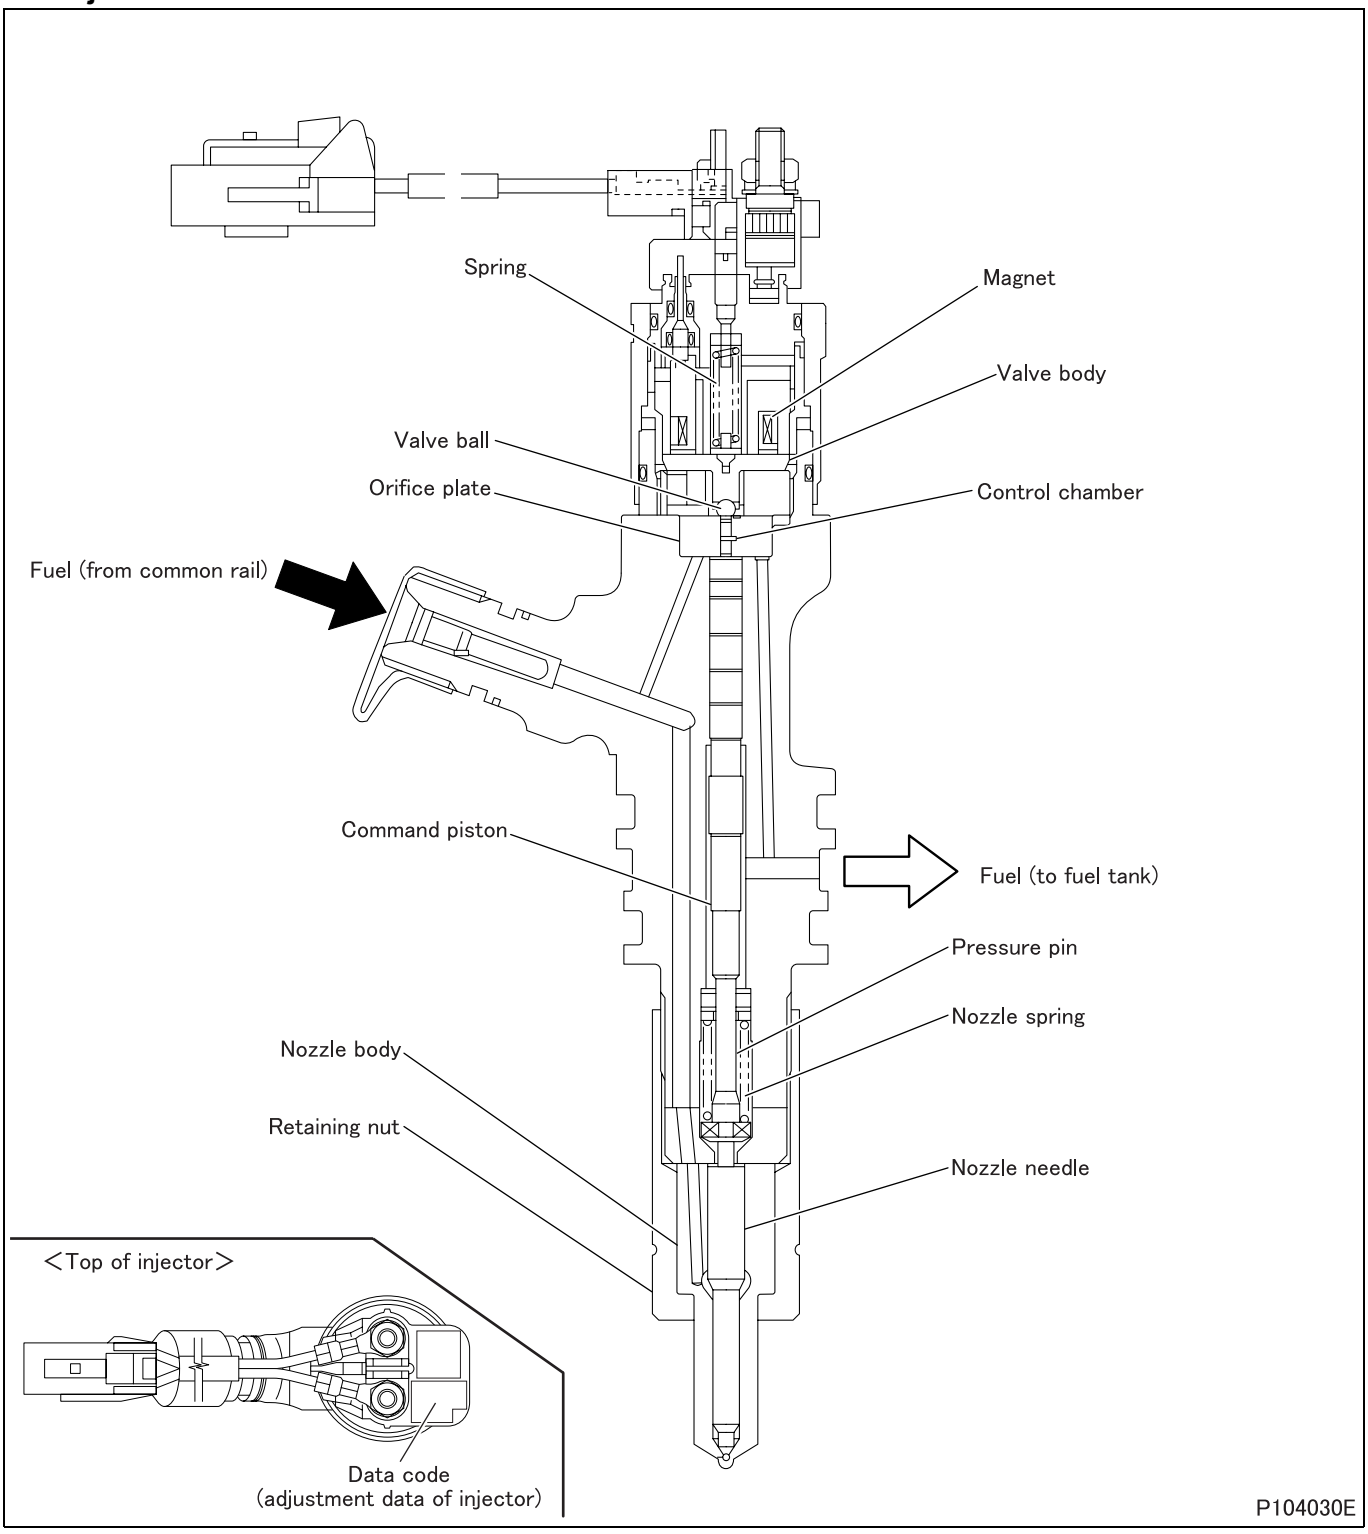
- The common rail distributes to the injectors high-pressure fuel that has been fed from the supply pump.
- Each flow damper prevents an abnormal outflow of fuel. It does so by blocking the fuel passage in the event of fuel leakage from the injection pipe or excessive injection of fuel from the injector.
- The common rail pressure sensor is used in feedback control. It senses the fuel pressure inside the common rail and feeds a corresponding signal to the electronic control unit.
- If the fuel pressure in the common rail exceeds a certain, set level, the piston in the pressure limiter pushes and compresses the spring such that fuel is able to escape. The pressure limiting valve thus prevents the fuel pressure from becoming higher than the set pressure.

Flow damper

- During normal operation, the piston moves (thus pushing and compressing the spring) to the extent necessary for one injection quantity to pass through. The piston does not make contact with the seat at this time. When injection is complete, the piston is returned to its initial position by the spring.

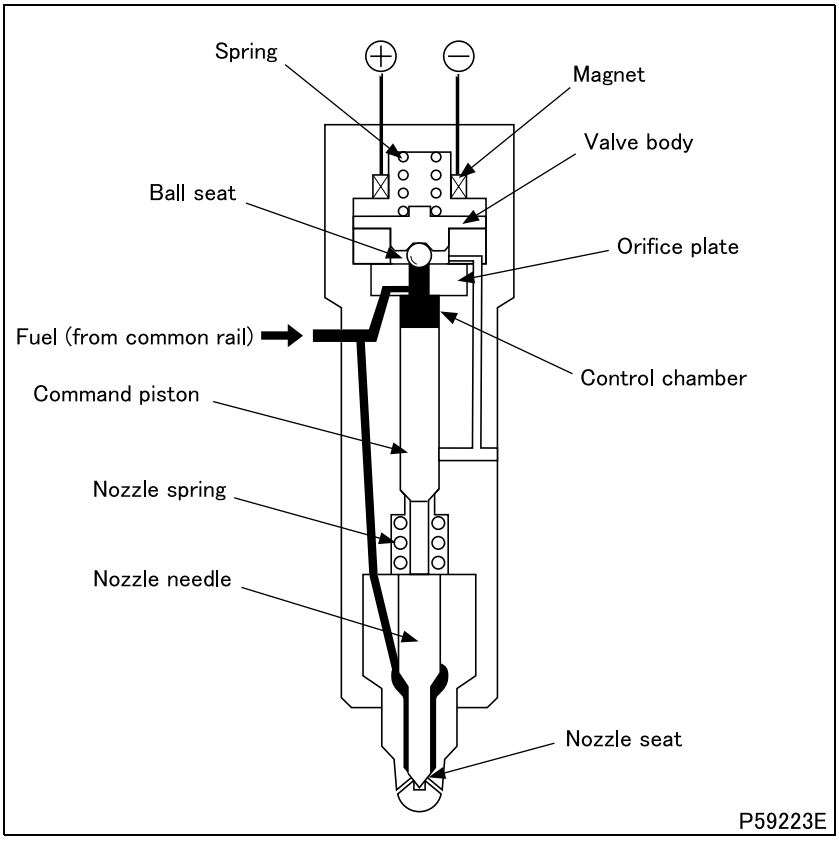
- If the amount of fuel passing through the flow damper becomes excessively great, the piston presses against the seat, thereby closing the fuel passage and preventing an abnormal outflow of fuel.
  When the piston has pressed against the seat, it does not return to its original position until the engine has been stopped and the pressure in the common rail has come down.

1.3 Injector



- In accordance with electrical signals from the engine electronic control unit, each injector supplies high-pressure fuel from the common rail to the relevant combustion chamber of the engine at the optimal timing and in the optimal quantity.

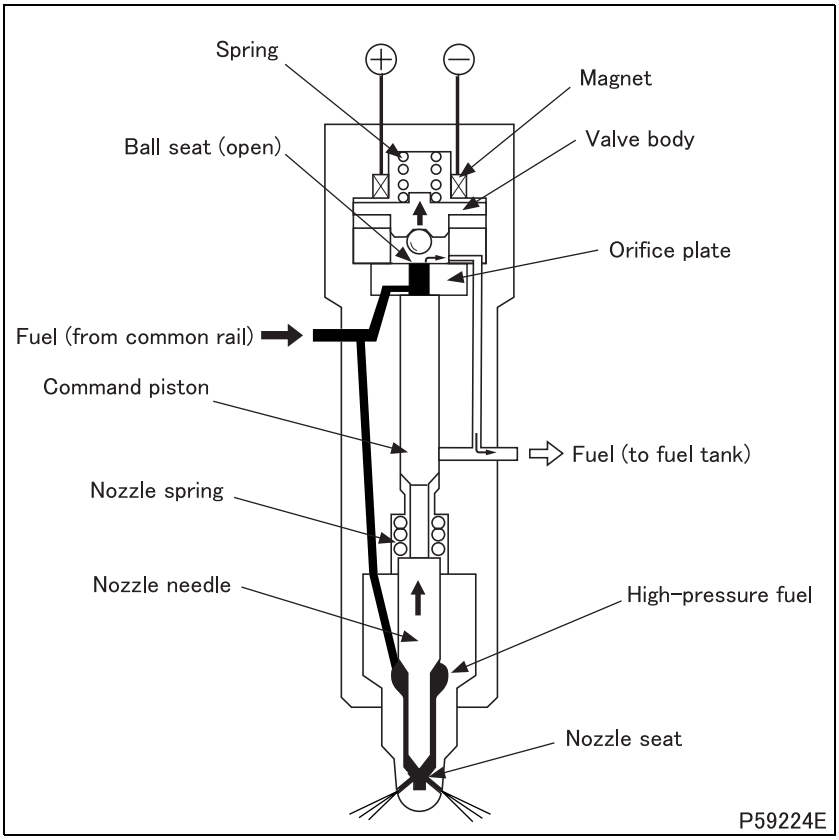
- The injector is divided into the control section and injector section.
  - The control section consists of the control chamber, magnet, spring, valve body, valve ball, pressure pin, command piston, and orifice plate. The pressure pin is located between the control section and the injection section.
  - The injection section consists of the nozzle body, nozzle needle, nozzle spring, and retaining nut.
- On the top of the injector is marked the data code (adjustment data of injector) for entry of injector correction data into the engine electronic control unit.
- This data code is intended to restrain the fluctuation of injection quantity by each injector with it registered in the engine electronic control unit.



(1) Operation

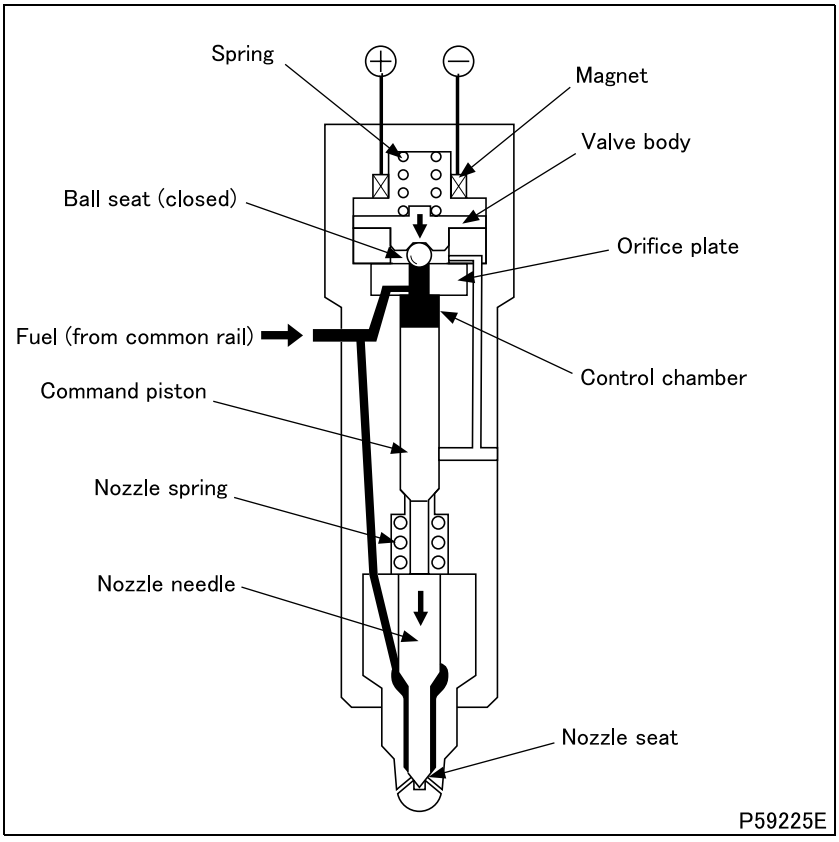
(1.1) Injection not taking place

- With the magnet not energized, the valve body, is pushed up by the spring in the magnet such that the ball seat is closed.
- The high-pressure fuel acts upon the control chamber via orifice plate. The same pressure acts upon the nozzle needle.
- The fuel pressure acting on the nozzle needle cannot overcome the command piston and nozzle spring, so the nozzle needle stays in its downward-pushed position and injection does not take place.



(1.2) Start of injection

- When the magnet is energized, the resulting electromagnetic force draws the valve body upward, causing the ball seat to open.
- Fuel in the control chamber passes through the ball seat and orifice plate and flows to the fuel tank.
- With the pressure in the control chamber reduced, the fuel acting on the nozzle needle overcomes the command piston and nozzle spring, pushing up the nozzle needle such that injection starts.
- If the magnet remains energized, the injection rate reaches its maximum level.

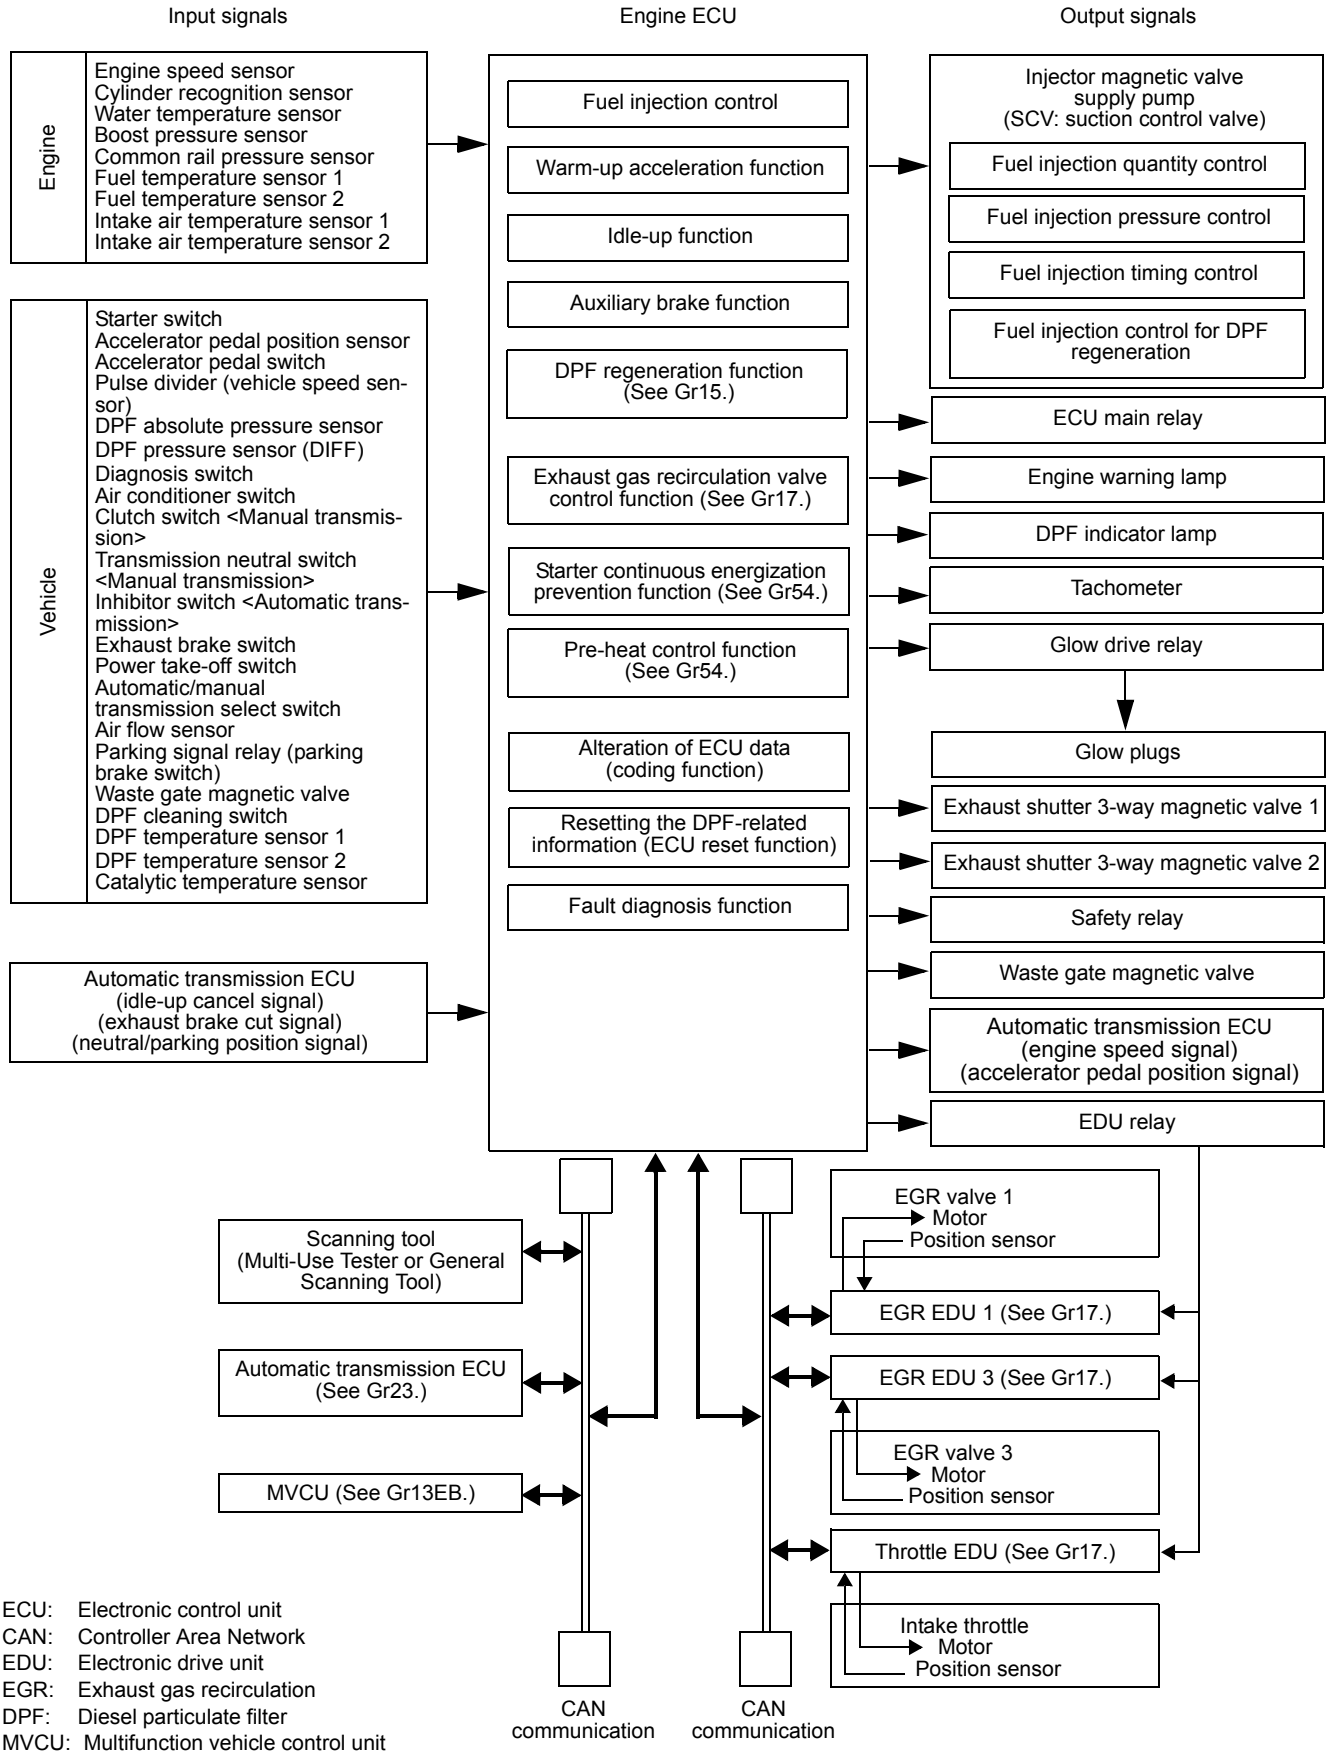


(1.3) End of injection

- When energization of the magnet is stopped, the valve body is pushed downward by the spring in the magnet such that the ball seat closes. At this time, fuel flows into the control chamber via orifice plate, pushing down the command piston and nozzle needle such that injection finishes.

2. Electronic Control System

2.1 System block diagram

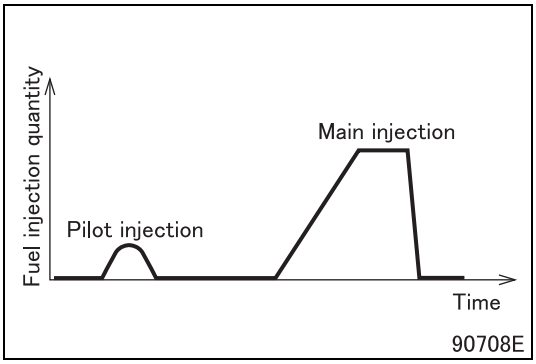


ECU: Electronic control unit
CAN: Controller Area Network
EDU: Electronic drive unit
EGR: Exhaust gas recirculation
DPF: Diesel particulate filter
MVCU: Multifunction vehicle control unit

Part	Main function/operation
Engine speed sensor	Sensing of engine speed
Cylinder recognition sensor	Cylinder recognition
Starter switch	Senses that the engine is in starting condition with the starter switch in START position.
Water temperature sensor	Sensing of coolant temperature
Accelerator pedal position sensor	Sensing of extent of accelerator pedal depression
Accelerator pedal switch	Sensing of released/depressed condition of accelerator pedal (OFF with pedal depressed)
Clutch switch <Manual transmission>	Sensing of released/depressed condition of clutch pedal (OFF with pedal released)
Transmission neutral switch <Manual transmission>	Detection of transmission neutral condition (OFF with transmission in neutral)
Inhibitor switch <Automatic transmission>	Detection of transmission 'N' range
Pulse divider (vehicle speed sensor)	Sensing of vehicle speed
DPF absolute pressure sensor	Sensing of DPF absolute pressure value
DPF pressure sensor (DIFF)	Sensing of DPF filter differential pressure
Fuel temperature sensor	Sensing of fuel temperature
Exhaust brake switch	Operation of auxiliary brake
Diagnosis switch	Output of diagnosis codes
Air conditioner switch	ON when air conditioner is operating
Boost pressure sensor	Sensing of boost pressure
Intake air temperature sensor 1	Sensing of intake air temperature
Intake air temperature sensor 2	Sensing of boost air temperature
Multi-Use Tester connector	Communication between Multi-Use Tester and common rail system
Common rail pressure sensor	Sensing of common rail pressure
Power take-off switch	Operation of power take-off
Automatic/manual transmission select switch	On automatic transmission vehicles, wire connection is made (no wire connection on M/T vehicles)
Air flow sensor	Sensing of intake air flow rate
Parking signal relay (parking brake switch)	Detection of parking condition (turns ON when the parking brake is applied)
Waste gate magnetic valve	Switching ON/OFF pressure to the turbocharger
DPF cleaning switch	ON/OFF changeover of DPF manual regeneration
DPF temperature sensor 1	Detection of ceramic filter inlet temperature
DPF temperature sensor 2	Detection of ceramic filter outlet temperature
Catalytic temperature sensor	Detection of front oxidation catalyst inlet temperature
Injector magnetic valve	Control of fuel injection rate, fuel injection quantity, and fuel injection timing
SCV (suction control valve)	Control of fuel injection pressure
Electronic control unit main relay	Power on/off of electronic control unit
Engine warning lamp	Indication of system abnormalities
DPF indicator lamp	Illuminates when the particulate matter accumulates in the DPF ceramic filter
Exhaust shutter 3-way magnetic valve	ON/OFF control of exhaust brake valve
Glow drive relay	ON/OFF control of glow plugs
Tachometer	Indication of engine speed (in meter cluster)
Safety relay	Control of starter continuous energization prevention function

Part		Main function/operation
Automatic transmission ECU	Idle-up cancel signal	Releasing the idle-up except N range
	Engine speed signal	Output of the engine speed for automatic transmission control
	Neutral/Parking position signal	Detection of Neutral (N range) and Parking (P range) in the automatic transmission
Automatic transmission ECU (engine speed signal)		Output of signals corresponding to engine speed for automatic transmission control
Automatic transmission ECU (accelerator pedal position signal)		Output of signals corresponding to extent of accelerator pedal depression for automatic transmission control
CAN communication (EGR EDU, throttle EDU)		Engine data recognized by the engine ECU are outputted to the CAN bus to enable systems to obtain data that they need for control. Each system's EDU issues signals to the engine ECU to enable it to effect engine control appropriate to control of the system. (See Gr17 for EGR EDU and throttle EDU control.)
CAN communication (A/T ECU, MVCU)		Engine data recognized by the engine ECU are outputted to the CAN bus to enable systems to obtain data that they need for control. The A/T ECU and MVCU issue signals to the engine ECU to enable it to effect engine control appropriate to control of the system. (See Gr23 for A/T ECU.) (See Gr13EB for MVCU.)
CAN communication (scanning tool)		Indicating and erasing fault codes and obtaining the vehicle data of the ECU

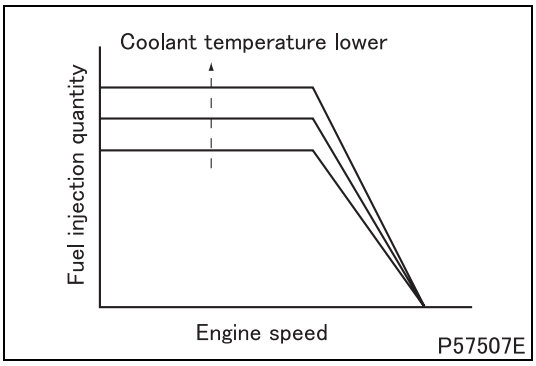
M E M O



2.2 Fuel injection control

(1) Pilot injection

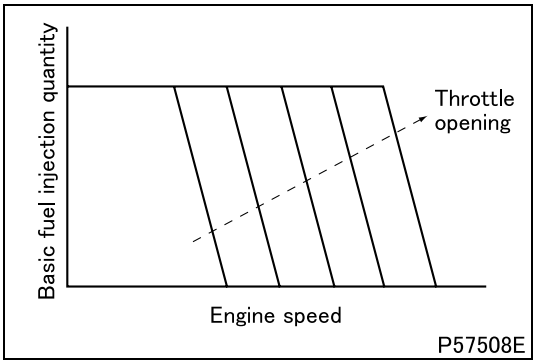
- Pilot injection entails the injection of an extremely small amount of fuel ahead of the main injection.
- Pilot injection suppresses heat generation early in the injection cycle and thus suppresses NOx generation and noise at the start of combustion.



2.3 Fuel injection quantity control

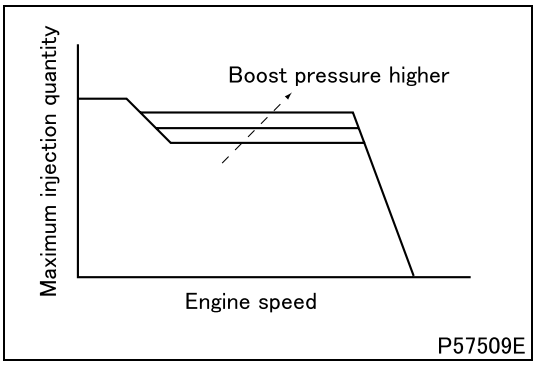
(1) Fuel injection quantity during engine startup

- During engine startup, the fuel injection quantity is determined in accordance with the engine speed and coolant temperature.



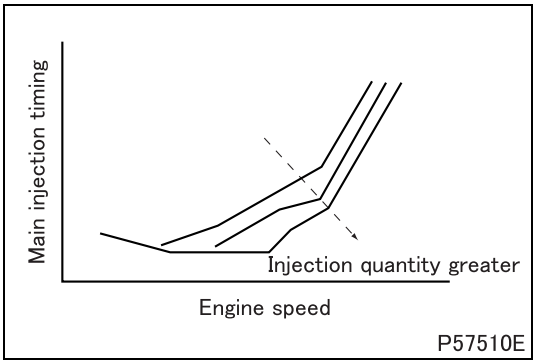
(2) Basic fuel injection quantity

- The basic fuel injection quantity is determined in accordance with the engine speed and throttle opening.



(3) Maximum injection quantity

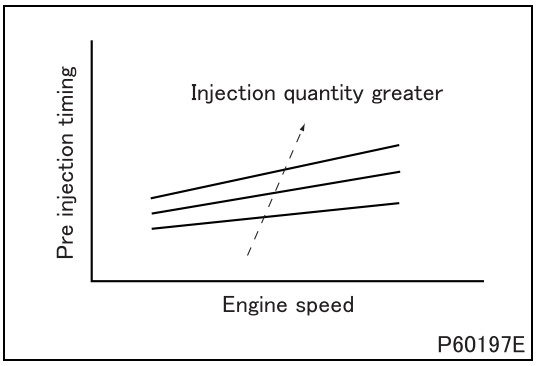
- The maximum injection quantity is calculated from the engine speed and boost pressure.



2.4 Fuel injection timing control

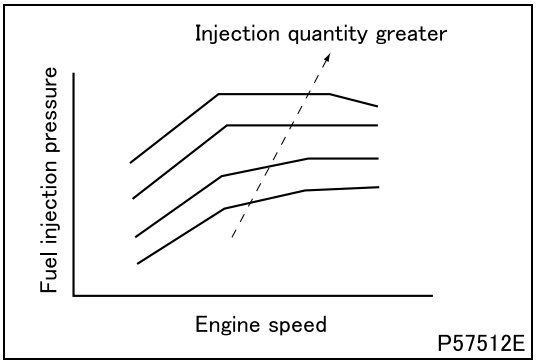
(1) Main injection timing

- The main injection timing is calculated from the fuel injection quantity and engine speed.



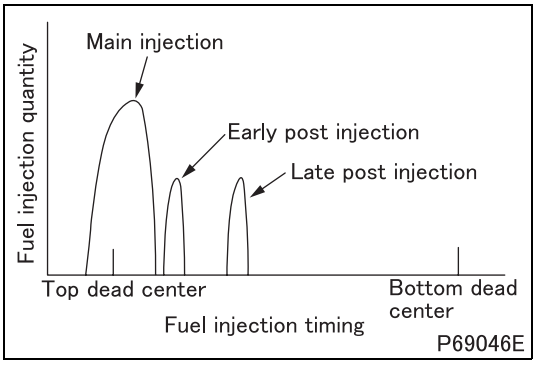
(2) Pre injection timing

- The pre injection timing is calculated from the fuel injection quantity and engine speed.



2.5 Fuel injection timing control

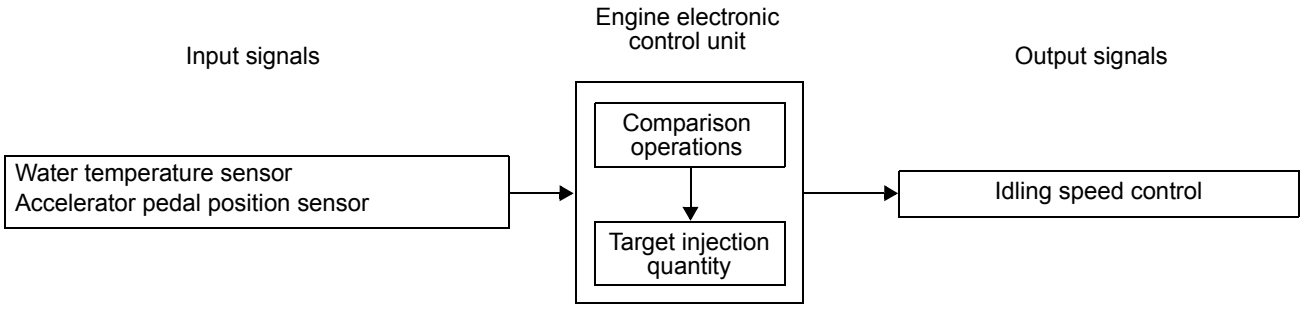
- The fuel injection pressure is calculated from the fuel injection quantity and engine speed.



2.6 Fuel injection control for DPF regeneration

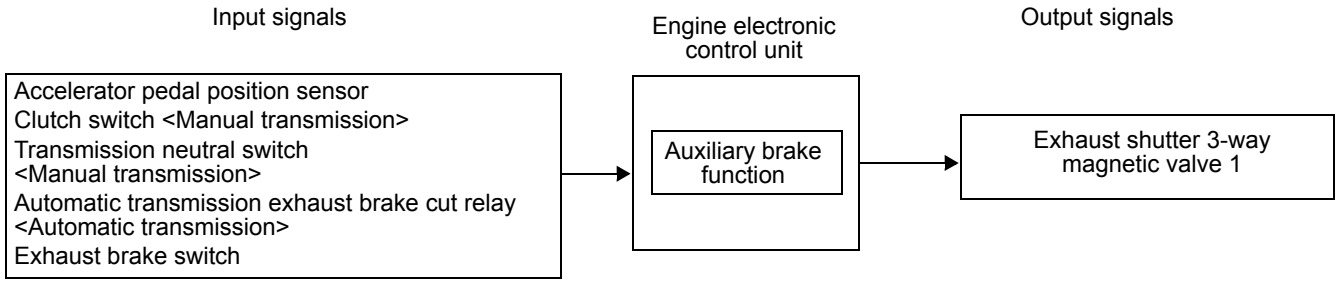
- Fuel injection control for diesel particular filter regeneration is performed in such a way, with early post injection and late post injection added after conventional fuel injection (main injection), exhaust gas temperature is increased to burn out particulate matter (PM) collected in the DPF.

2.7 Warm-up acceleration function



- The warm-up acceleration function accelerates engine warm-up by varying the engine's idling speed in accordance with the engine's coolant temperature.

2.8 Auxiliary brake function



- The auxiliary brake function activates or deactivates the exhaust shutter 3-way magnetic valve 1 according to the vehicle condition to control the exhaust brake.

2.9 Idle-up function

- The idle-up function increases the engine idling speed when a load is applied to the engine by other system (such as air conditioner, PTO) or when the warm-up acceleration function and DPF regeneration are activated.

2.10 Alteration of electronic control unit data (coding function)

- Vehicle information and equipment specifications are registered in each engine electronic control unit as coded data (coding data).
- When an engine electronic control unit or some equipment is replaced, it is necessary to alter registered related data or register new related data using a Multi-Use Tester (for details, see REGISTRATION AND ALTERATION OF DATA IN ENGINE ELECTRONIC CONTROL UNIT).
- For data alteration/registration and data write operation, contact your nearest MITSUBISHI FUSO dealer or MITSUBISHI FUSO TRUCK OF AMERICA, Inc.

2.11 Resetting the diesel particulate filter related information (resetting electronic control unit)

- In the diesel particulate filter regeneration control system, the engine electronic control unit accumulates various information to control the diesel particulate filter regeneration as diesel particulate filter history.
- If the diesel particulate filter cleaning switch was used, these accumulated data are automatically initialized at diesel particulate filter cleaning for regeneration. In the case where the diesel particulate filter regeneration involved the replacement of ceramic filter, etc., however, the initialization of accumulated data is impossible and therefore it is necessary to reset diesel particulate filter related information (the electronic control unit) using a Multi-Use Tester. (For reset procedure, see Gr15.)
- It is necessary to reset diesel particulate filter related information (the electronic control unit) after the following operations are performed.
  - Replacement of diesel particulate filter ceramic filter
  - Cleaning of diesel particulate filter ceramic filter

2.12 Diagnostic Function

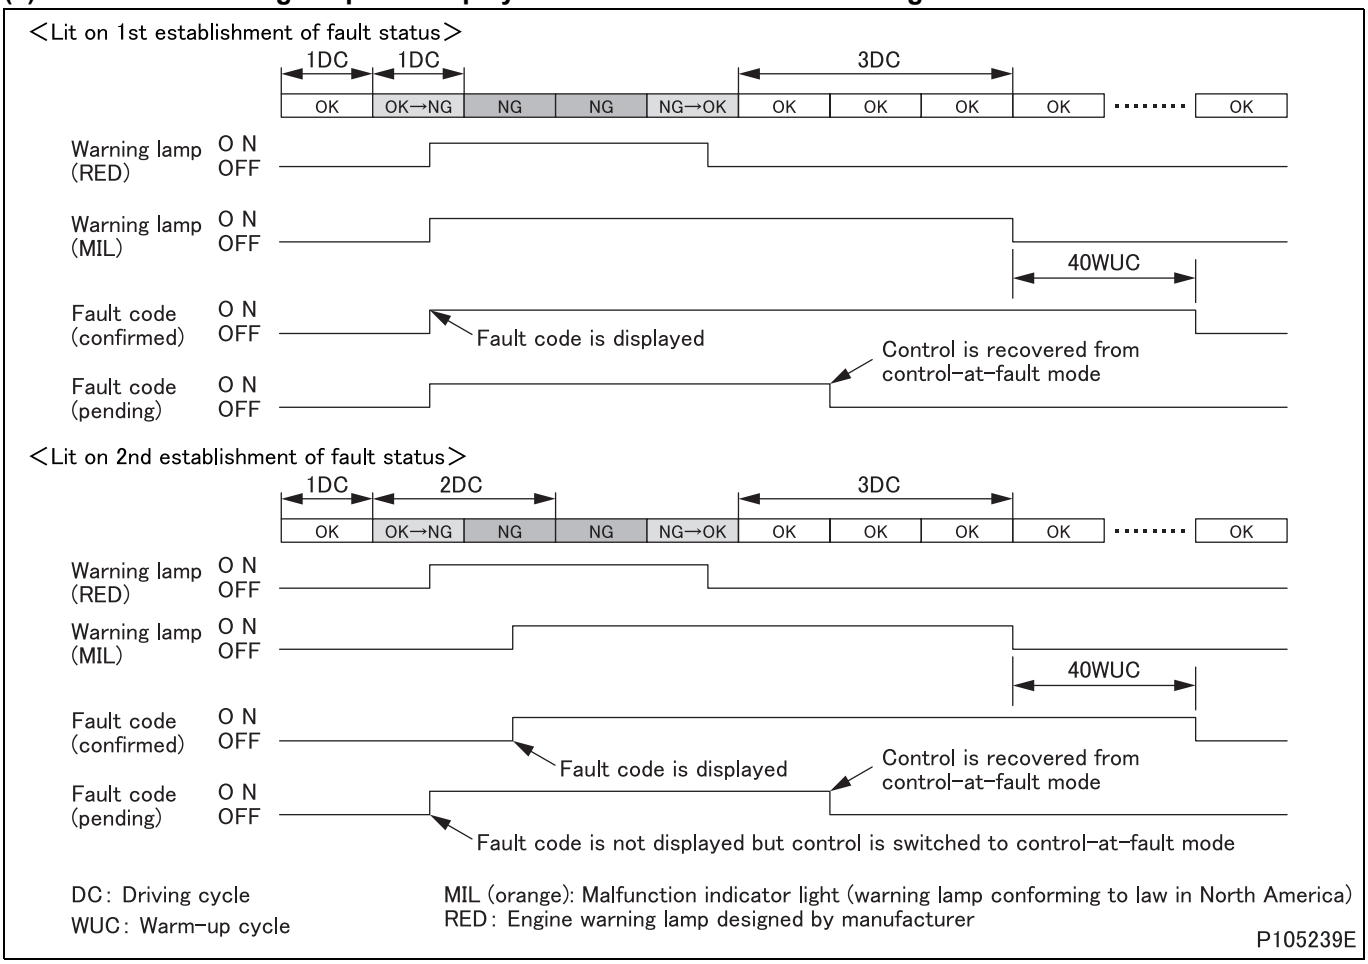
(1) Overview

- The system and associated sensors are constantly monitored for faults that can occur under different conditions. When the electronic control unit determines that a fault status is established, it issues the corresponding fault code and starts operation in the fault mode. The relevant warning lamp in the meter cluster is lit at the same time.
- When control is performed during a failure, the system function is limited to ensure the safety of the vehicle and driver.

(2) Reading fault code

- The electronic control unit stores fault codes in the memory, which can be read by use of a scanning tool (General Scanning Tool or Multi-Use Tester) or through the number of flashings of the warning lamp (flash code) in the meter cluster.
- Diagnosis codes shown by the scanning tool are more specific than fresh codes.

(3) ON/OFF of warning lamp and display/erase of fault code on scanning tool



- The lighting of warning lamp is effected in two ways depending on fault status as follows.
  - Lit on 1st establishment of fault status (when fault is determined during 1st driving cycle)
  - Lit on 2nd establishment of fault status (when fault is recognized during 1st driving cycle and determined on 2nd driving cycle)
- Warning lamp is extinguished on 4th driving cycle after the electronic control unit is back to normal control mode.
- Fault code on scanning tool is erased in two ways as follows.
  - Erased as desired by means of the scanning tool's (General Scanning Tool or Multi-Use Tester) memory clear function
  - Automatically erased by the electronic control unit on continuation of 40 warm-up cycles in normal condition after warning lamp OFF

- The driving cycle is (a period of a series of engine operations) from engine start-up with starter switch ON to storage of issued diagnosis code by the electronic control unit with starter switch OFF.
- The warm-up cycle is a period from rise to fall in engine coolant temperature (Next warm-up cycle begins on rise of engine coolant temperature after fall).

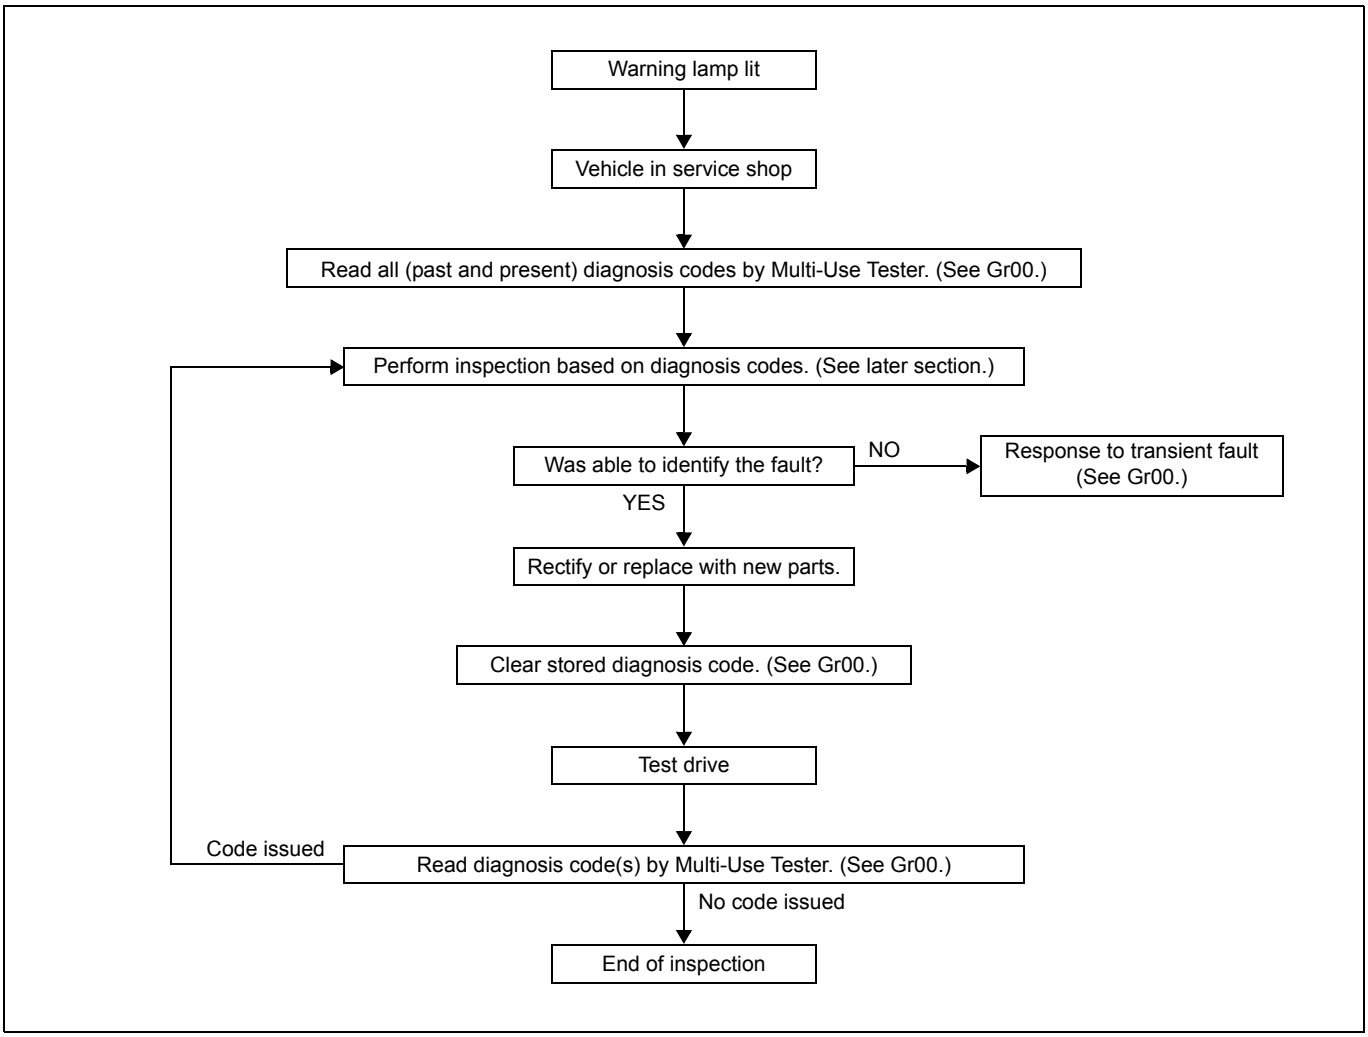
P107257E-2

1. Diagnosis Procedure

- Perform the inspection in accordance with the following flowchart.



2. Diagnostic Precautions

- Before measuring voltage, check the charge and specific gravity of the battery. If system inspection is performed with the battery uncharged or reduced in specific gravity, accurate measurements cannot be achieved.
- Before disconnecting battery cables, harnesses and connectors, set the starter switch to LOCK or OFF, then allow at least 20 seconds.
- To avoid having electrical parts damaged, set the starter switch and lighting switch to LOCK or OFF before reconnecting battery cables, harnesses and connectors.
- When performing measurement with the tester, internal circuit and other electrical parts of the electronic control unit could be damaged by the test bar. To avoid it, handle the test bar carefully not to cause a short-circuit failure between connector terminals or between connector and body.
- Resistance is affected by temperature. Determine the necessity of resistance measurement by reference to given temperature specification as a guide. Otherwise, use normal temperature (10 to 35°C {50 to 95°F}) as the measuring condition.
- To start the engine, be sure to connect the connector of the SCV (suction control valve) to the engine harness. If the engine is started without connecting the SCV (suction control valve) connector, the engine electronic control unit cannot control the supply pump and the fault of the engine may result.
- If the electronic control unit is replaced with a new one, some data must be registered in the new electronic control unit for proper engine control. This also applied to the case when replacing the electronic control unit with the one that has been used in other vehicle. (See “6. Registration and Alteration of Data in Engine Electronic Control Unit”.)

3. Inspections Based on Fault Codes

3.1 Fault code list

- Fault codes can be monitored through the scanning tool (General Scanning Tool or Multi-Use Tester) or the flashing of the warning lamp in the meter cluster.
- There are two kinds of fault codes, i.e., fault code displayed by the General Scanning Tool or Multi-Use Tester and flash code given by the flashing of the warning lamp.
- Scanning tool (General Scanning Tool or Multi-Use Tester) can display diagnosis codes that are more specific than flash codes.
- Diagnosis codes asterisked in the list differ in action of the warning light depending on the type of faults. (For details on fault diagnosis condition, see “Inspection against Each Diagnosis Code”.)

IMD: Immediate

DC [Driving cycle]: “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.

[Fault code]
Diagnosis code: P0016/Flash code: 64
[Monitor]
Asynchronism between both speed sensors (Engine speed sensor, Cylinder recognition sensor)
[Fault (outline)]
Gap phase shift
[Diagnosis check]
- Output signals of engine speed sensor and cylinder recognition sensor are compared for abnormality.

[Code generation condition]
- Abnormality is detected in the number of output pulses from the sensors.
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- Engine status: in operation (except during start, stop and stall)

[Control effected by electronic control unit during fault]
- Auto cruise control is stopped.
- ISS control is stopped.

[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and engine speed sensor
- Open-circuit or short-circuit of harness between electronic control unit and cylinder recognition sensor
- Abnormality of each connector
- Abnormality of engine speed sensor
- Abnormality of cylinder recognition sensor
- Abnormality of electronic control unit

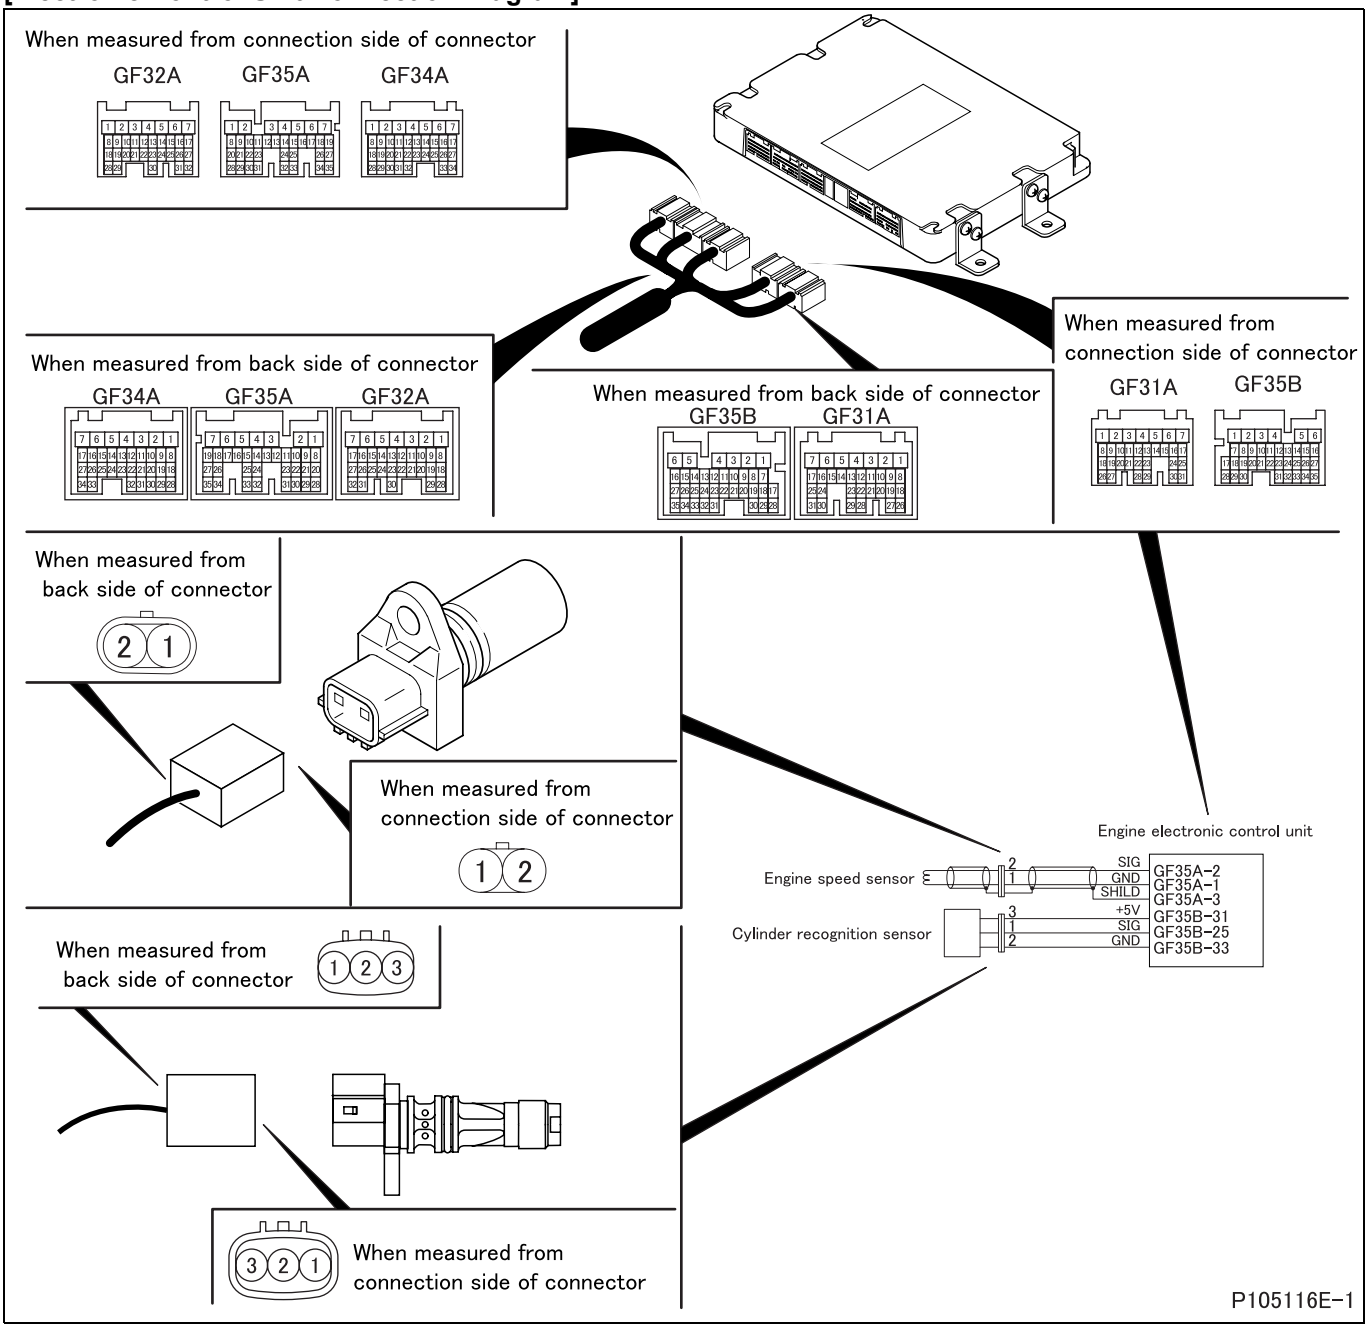
[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>
- Extinguished at 4th driving cycle after normal signal is input.

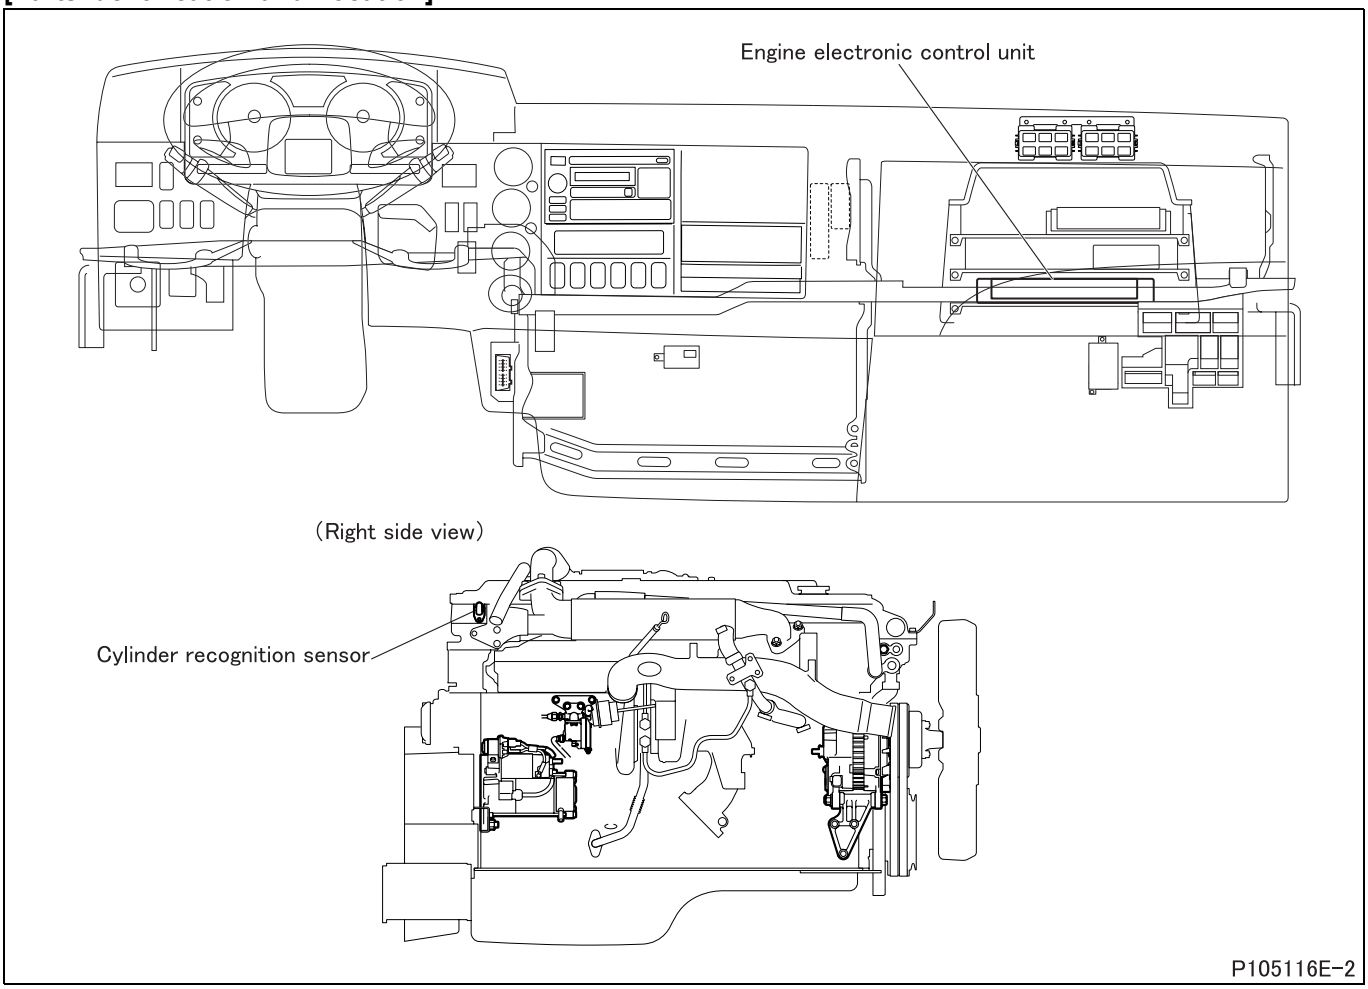
<Fault code>
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished. (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

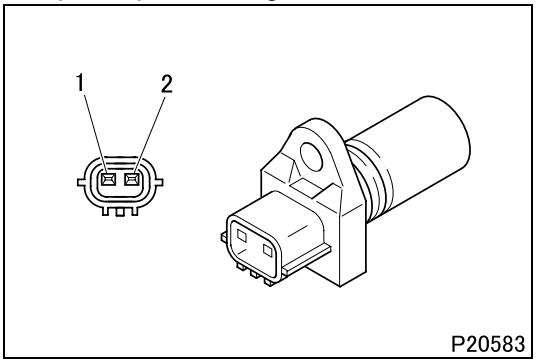
Step 1	Inspection items		Inspection by control data
	Maintenance item		**<General Scanning Tool used>** • Measure item “Ne”. **<Multi-Use Tester used>** • Measure item No. 01 “Engine Revolution” of Service Data.
	Inspection condition		–
	Requirements		Same indication as tachometer is given.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

Step 2	Inspection items		Inspection by electronic control unit connector (engine speed sensor)
	Maintenance item		Measure value of resistance between connector (GE35A) terminal No. 1 and 2.
	Inspection condition		Disconnect electronic control unit and harness, and measure from connection side of harness connector.
	Requirements		125.5 ± 17 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Go to step 3.

Step 3	Inspection items		Inspection of engine speed sensor connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	Modify connector.

Step 4	Inspection items		Inspection of engine speed sensor unit
	Maintenance item		Measure value of resistance between connector terminal No. 1 and 2.
	Inspection condition		–
	Requirements		125.5 ± 17 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Replacement of sensor

<Step 4 inspection diagram>



Step 5	Inspection items		Inspection of harness between electronic control unit and engine speed sensor (power supply)
	Maintenance item		Check circuit between sensor connector terminal No. 2 and electronic control unit connector (GF35A) terminal No. 2
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Modify harness.

Step 6	Inspection items		Inspection of harness between electronic control unit and engine speed sensor (ground)
	Maintenance item		Check circuit between sensor connector terminal No. 1 and electronic control unit connector (GF35A) terminal No. 1
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify harness.

Step 7	Inspection items		Inspection by electronic control unit connector (signal) (cylinder recognition sensor)
	Maintenance item		Measure value of voltage between connector (GF35B) terminal No. 25 (+) and 33 (–).
	Inspection condition		• Measure from back side of harness connector with each device connected to harness. • Starter switch: ON
	Requirements		1 V or more
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 10.
		NO	Go to step 8.

Step 8	Inspection items		Inspection by electronic control unit connector (power supply) (cylinder recognition sensor)
	Maintenance item		Measure value of voltage between connector (GF35B) terminal No. 31 (+) and 33 (–).
	Inspection condition		• Measure from back side of harness connector with each device connected to harness. • Starter switch: ON
	Requirements		5 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 9.
		NO	Go to step 10.

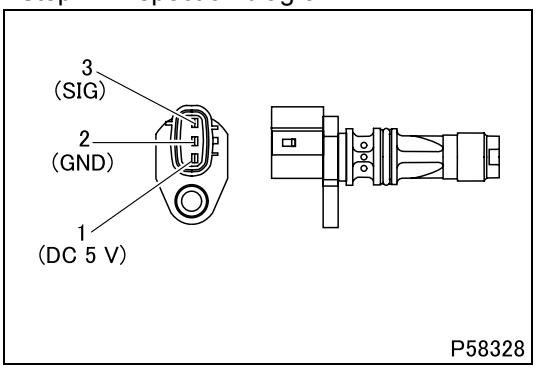
Step 9	Inspection items		Inspection by electronic control unit connector (ground) (cylinder recognition sensor)
	Maintenance item		Measure value of voltage between connector (GF35B) terminal No. 33 and (GF31A) 3.
	Inspection condition		• Measure from back side of harness connector with each device connected to harness. • Starter switch: ON
	Requirements		0 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 11.
		NO	Go to step 10.

Step 10	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 17.
		NO	Modify connector.

Step 11	Inspection items		Inspection of cylinder recognition sensor connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 12.
		NO	Modify connector.

Step 12	Inspection items		Inspection of cylinder recognition sensor unit
	Maintenance item		Measure value of resistance between connector terminal No. 2 and 3.
	Inspection condition		–
	Requirements		200 to 1800 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 13.
		NO	Replacement of sensor

<Step 12 inspection diagram>



Step 13	Inspection items		Inspection of harness between electronic control unit and cylinder recognition sensor (power supply)
	Maintenance item		Measure value of voltage between sensor connector terminal No. 3 (+) and 2 (–).
	Inspection condition		• Remove connector and measure from harness side. • Starter switch: ON
	Requirements		5 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 15.
		NO	Go to step 14.

Step 14	Inspection items		Inspection of harness between electronic control unit and cylinder recognition sensor (power supply)
	Maintenance item		Check circuit between sensor connector terminal No. 3 and electronic control unit connector (GF35B) terminal No. 31
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 17.
		NO	Modify harness.

Step 15	Inspection items		Inspection of harness between electronic control unit and cylinder recognition sensor (ground)
	Maintenance item		Check circuit between sensor connector terminal No. 2 and electronic control unit connector (GF35B) terminal No. 33
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 16.
		NO	Modify harness.

Step 16	Inspection items		Inspection of harness between electronic control unit and cylinder recognition sensor (signal)
	Maintenance item		Check circuit between sensor connector terminal No. 1 and electronic control unit connector (GF35B) terminal No. 25
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 17.
		NO	Modify harness.

Step 17	Inspection items		Inspection by control data
	Maintenance item		**<General Scanning Tool used>** • Measure item “Ne”. **<Multi-Use Tester used>** • Measure item No. 01 “Engine Revolution” of Service Data.
	Inspection condition		–
	Requirements		Same indication as tachometer is given.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P0069/Flash code: 32
[Monitor]
Characteristic abnormality of boost pressure sensor
[Fault (outline)]
Gain and offset drift
[Diagnosis check]
- Values of atmospheric pressure sensor and boost pressure sensor are compared

[Code generation condition]
- Atmospheric pressure value remains higher than boost pressure value by 18 kPa {2.6 psi, 0.2 kgf/cm^2} for 5 consecutive seconds.
  (Warning lamp is lit and diagnosis code is displayed on second establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- Engine speed: less than 630 rpm
- Injection quantity: less than 20 mm^3/st
- Intake throttle opening: 95%
- Atmospheric pressure sensor: normal in output signal
- Boost pressure sensor: normal in output signal
- Intake throttle: nothing abnormal detected
- Battery voltage is normal.

[Control effected by electronic control unit during fault]
- Effects no special control.

[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and boost pressure sensor
- Abnormality of each connector
- Abnormality of boost pressure sensor
- Abnormality of electronic control unit

[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>
- Extinguished at 4th driving cycle after normal signal is input.

<Fault code>
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished. (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		Check if following diagnosis codes occur simultaneously. • P0234 “Overboost” • P0236 “Boost Press SNSR (Plausi)” • P0237 “Boost Press SNSR (Low)” • P0238 “Boost Press SNSR (High)” • P2228 “Atm Press SNSR (Low)” • P2229 “Atm Press SNSR (High)”
	Inspection condition		• Starter switch: ON • Engine start: At idle
	Requirements		No codes occur.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 2.
		NO	Inspect diagnosis code that is occurring.

Step 2	Inspection items		Inspection by control data
	Maintenance item		**<General Scanning Tool used>** • Measure item “Intake MAP”. **<Multi-Use Tester used>** • Measure item No. 38 “Atmospheric Pressure” of Service Data.
	Inspection condition		Starter switch ON (engine stationary) → After engine has started, press accelerator pedal.
	Requirements		Coincides with atmospheric pressure → Gradually increases
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P0087/Flash code: 11
[Monitor]
Abnormality of common rail pressure (pressure: low)
[Fault (outline)]
Rail pressure regulator adjustment saturated
[Diagnosis check]
- Pressure in common rail is detected as actual common rail pressure by common rail pressure sensor and compared with target common rail pressure for control by engine electronic control unit.

[Code generation condition]
- Actual common rail pressure remains lower than target common rail pressure by –15 MPa {–2180 psi, –150 kgf/cm^2} or less for 10 seconds (not reaching the target pressure).
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- Injector control mode: injection command available (except in injection stop mode)
- Injection quantity required: more than 0 mm^3/st
- Supply pump control mode: Normal control is effected.

[Control effected by electronic control unit during fault]
- Effects no special control.

[Probable cause of trouble]
- Abnormality of supply pump (overflow valve)
- Abnormality of pressure limiter
- Airtight abnormality of injector
- Plugged fuel system
- Fuel leakage
- Abnormality of common rail pressure sensor

[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>
- Extinguished at 4th driving cycle after normal signal is input.

<Fault code>
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished. (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		Check if following diagnosis codes occur simultaneously. • P0093 “CRS (Fuel Leak)” • P0148 “CRS (Fuel Delivery)” • P0191 “CRS Pressure SNSR (Plausibility)” • P0192 “CRS Pressure SNSR (Low)” • P0193 “CRS Pressure SNSR (High)” • P0201 “Injector M/V-Cylinder 1 (Load)” • P0202 “Injector M/V-Cylinder 2 (Load)” • P0203 “Injector M/V-Cylinder 3 (Load)” • P0204 “Injector M/V-Cylinder 4 (Load)” • P0205 “Injector M/V-Cylinder 5 (Load)” • P0206 “Injector M/V-Cylinder 6 (Load)” • P0562 “Power Supply Voltage (Low)” • P0563 “Power Supply Voltage (High)” • P0604 “ECU Hardware (RAM)” • P0605 “ECU System (Hardware)” • P0606 “ECU Hardware (Main CPU)” • P0607 “ECU System” • P062F “ECU System (EEPROM)” • P2146 “Injector Bank 1 (Plausibility)” • P2147 “Injector Bank 1 (Low)” • P2148 “Injector Bank 1 (High)” • P2149 “Injector Bank 2 (Plausibility)” • P2150 “Injector Bank 2 (Low)” • P2151 “Injector Bank 2 (High)” • P2153 “Injector Bank 3 (Low)” • P2154 “Injector Bank 3 (High)”
	Inspection condition		• Starter switch: ON • Do not start engine.
	Requirements		No codes occur.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 2.
		NO	Inspect diagnosis code that is occurring.

Step 2	Inspection items		Checking of engine appearance
	Maintenance item		Check fuel system for fuel leak.
	Inspection condition		Starter switch: OFF
	Requirements		There is no fuel leak.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Go to step 6.

Step 3	Inspection items		Inspection of low pressure piping (fuel tank – supply pump)
	Maintenance item		Check suction pipe or hose for bend.
	Inspection condition		Starter switch: OFF
	Requirements		There is no bend on pipe or hose.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	Correct and replace suction pipe or hose.

Step 4	Inspection items		Checking of air bleeding
	Maintenance item		Bleed air from fuel filter.
	Inspection condition		Starter switch: OFF
	Requirements		Problem is solved by bleeding air.
	Inspection result (Is the judging standard satisfied?)	YES	–
		NO	Go to step 5.

Step 5	Inspection items		Inspection of low pressure piping
	Maintenance item		Fuel filter
	Inspection condition		Starter switch: OFF
	Requirements		Problem is solved by replacing fuel filter.
	Inspection result (Is the judging standard satisfied?)	YES	–
		NO	Go to step 6.

Step 6	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. B9 “Fuel Leak Check”
	Inspection condition		Engine start: At idle
	Requirements		There is no leak from supply pump.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Replacement of supply pump

Step 7	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. B9 “Fuel Leak Check”
	Inspection condition		Engine start: At idle
	Requirements		There is no leak from fuel pipe between supply pump and rail.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Replacement of fuel pipe

Step 8	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. B9 “Fuel Leak Check”
	Inspection condition		Engine start: At idle
	Requirements		There is no leak from rail.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 9.
		NO	Replacement of rail

Step 9	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. B9 “Fuel Leak Check”
	Inspection condition		Engine start: At idle
	Requirements		There is no leak from fuel injection pipes (six) between injector and rail.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 10.
		NO	Replacement of injection pipe

Step 10	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. B9 “Fuel Leak Check”
	Inspection condition		Engine start: At idle
	Requirements		There is no leak from injectors (six).
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 11.
		NO	Replacement of injector

Step 11	Inspection items		Check inside of combustion chamber.
	Maintenance item		Check for fuel leak.
	Inspection condition		• After performing actuator test item No. B9 “Fuel Leak Check”, stop engine. • Remove glow plug, and check from glow plug mounting hole using bore scope.
	Requirements		Inside of combustion chamber is not wet.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 12.
		NO	Replacement of injector of object cylinder

Step 12	Inspection items		Replacement of rail (common rail pressure sensor, flow damper and pressure limiter abnormal)
	Maintenance item		–
	Inspection condition		–
	Requirements		Problem is solved by replacing rail.
	Inspection result (Is the judging standard satisfied?)	YES	–
		NO	Go to step 13.

Step 13	Inspection items		Replacement of supply pump
	Maintenance item		–
	Inspection condition		–
	Requirements		Problem is solved by replacing supply pump.
	Inspection result (Is the judging standard satisfied?)	YES	–
		NO	Replacement of injectors (six)

[Fault code]
Diagnosis code: P0088/Flash code: 11
[Monitor]
Abnormality of common rail pressure (pressure: high)
[Fault (outline)]
Plausibility
[Diagnosis check]
- Pressure in common rail is detected as actual common rail pressure by common rail pressure sensor and compared with target common rail pressure for control by engine electronic control unit.

[Code generation condition]
- Actual common rail pressure remains higher than target common rail pressure by 15 MPa {2180 psi, 150 kgf/cm^2} or more for 10 seconds (considerably exceeding the target value).
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- Injector control mode: injection command available (except in injection stop mode)
- Injection quantity required: more than 0 mm^3/st
- Supply pump control mode: Normal control is effected.

[Control effected by electronic control unit during fault]
- Effects no special control.

[Probable cause of trouble]
- Abnormality of supply pump (overflow valve)
- Abnormality of pressure limiter
- Airtight abnormality of injector
- Plugged fuel system
- Fuel leakage
- Abnormality of common rail pressure sensor

[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>
- Extinguished at 4th driving cycle after normal signal is input.

<Fault code>
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished. (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Fault diagnosis]

- Perform checks in the sequence of the following step.

Step 1	Inspection items		Inspection by control data
	Maintenance item		Check if following diagnosis codes occur simultaneously. • P0093 “CRS (Fuel Leak)” • P0148 “CRS (Fuel Delivery)” • P0191 “CRS Pressure SNSR (Plausibility)” • P0192 “CRS Pressure SNSR (Low)” • P0193 “CRS Pressure SNSR (High)” • P0201 “Injector M/V-Cylinder 1 (Load)” • P0202 “Injector M/V-Cylinder 2 (Load)” • P0203 “Injector M/V-Cylinder 3 (Load)” • P0204 “Injector M/V-Cylinder 4 (Load)” • P0205 “Injector M/V-Cylinder 5 (Load)” • P0206 “Injector M/V-Cylinder 6 (Load)” • P0562 “Power Supply Voltage (Low)” • P0563 “Power Supply Voltage (High)” • P0604 “ECU Hardware (RAM)” • P0605 “ECU System (Hardware)” • P0606 “ECU Hardware (Main CPU)” • P0607 “ECU System” • P062F “ECU System (EEPROM)” • P2146 “Injector Bank 1 (Plausibility)” • P2147 “Injector Bank 1 (Low)” • P2148 “Injector Bank 1 (High)” • P2149 “Injector Bank 2 (Plausibility)” • P2150 “Injector Bank 2 (Low)” • P2151 “Injector Bank 2 (High)” • P2153 “Injector Bank 3 (Low)” • P2154 “Injector Bank 3 (High)”
	Inspection condition		• Starter switch: ON • Do not start engine.
	Requirements		No codes occur.
	Inspection result (Is the judging standard satisfied?)	YES	Replacement of supply pump
		NO	Inspect diagnosis code that is occurring.

[Fault code]
Diagnosis code: P0089/Flash code: 63
[Monitor]
Abnormality of SCV (suction control valve)
[Fault (outline)]
Overload (valve stuck)
[Diagnosis check]
- Required pump discharge and difference between actual rail pressure and target rail pressure are monitored for operating problem with SCV (suction control valve).

[Code generation condition]
- SCV (suction control valve) remains overloaded as so detected for 20 seconds.
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- Battery voltage: normal
- Supply pump learning: completed
- Injector control: normal (injection command available)
- Supply pump control: normal
- Injection quantity: 3 mm^3/st or more

[Control effected by electronic control unit during fault]
- Injection quantity is limited.
- Main injection only is allowed.
- Common rail pressure is limited.
- Exhaust gas recirculation control is stopped.
- Throttle control is stopped.
- Diesel particulate filter regeneration (manual or automatic) is stopped.
- Auto cruise control is stopped.
- ISS control is stopped.

[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and SCV (suction control valve)
- Abnormality of each connector
- Abnormality of SCV (suction control valve)
- Abnormality of electronic control unit

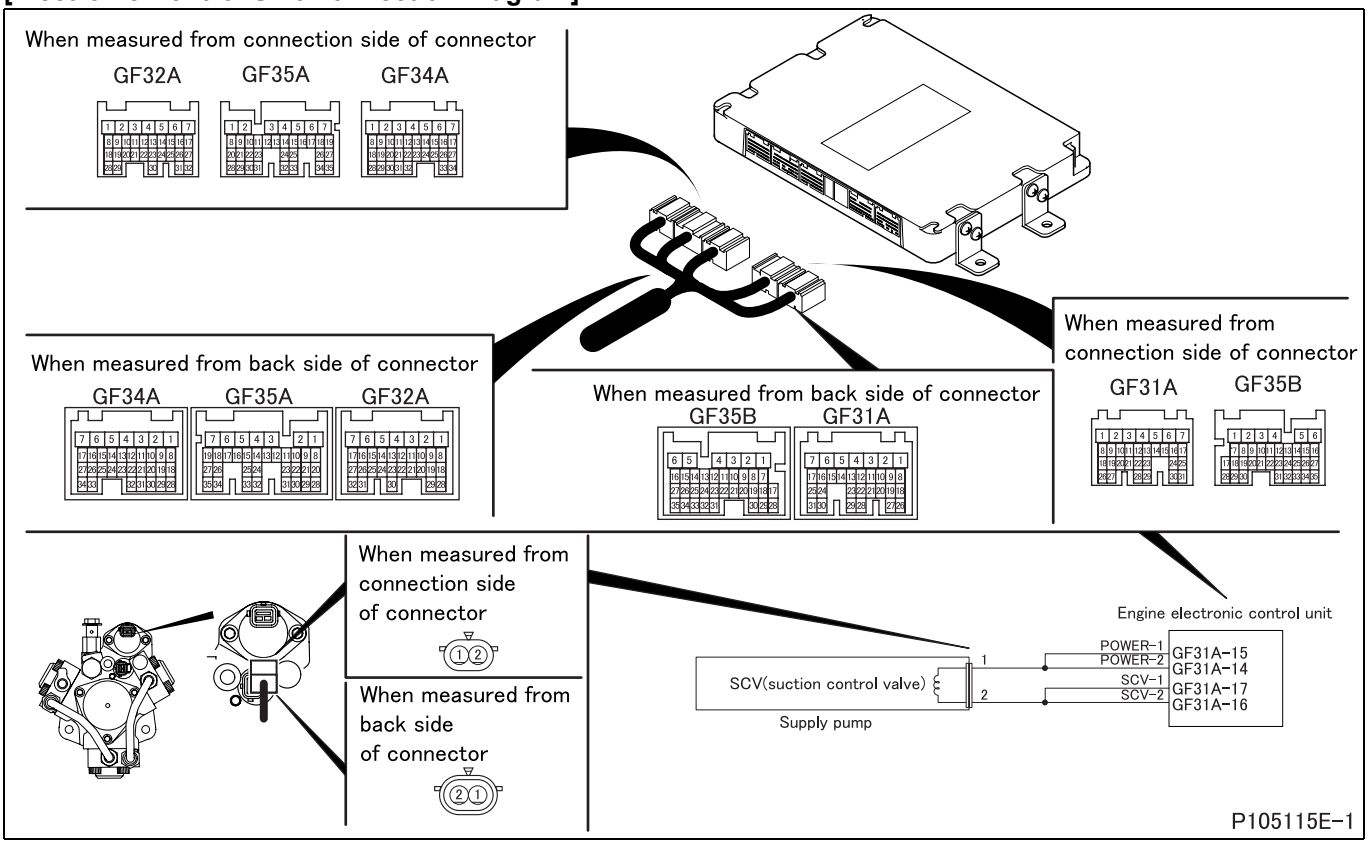
[Recoverability]
<Control during fault>
- Recovered if signal becomes normal when starter switch is turned OFF to ON (power supply resumed to electronic control unit).

<Warning lamp>
- Extinguished after input of normal signal.

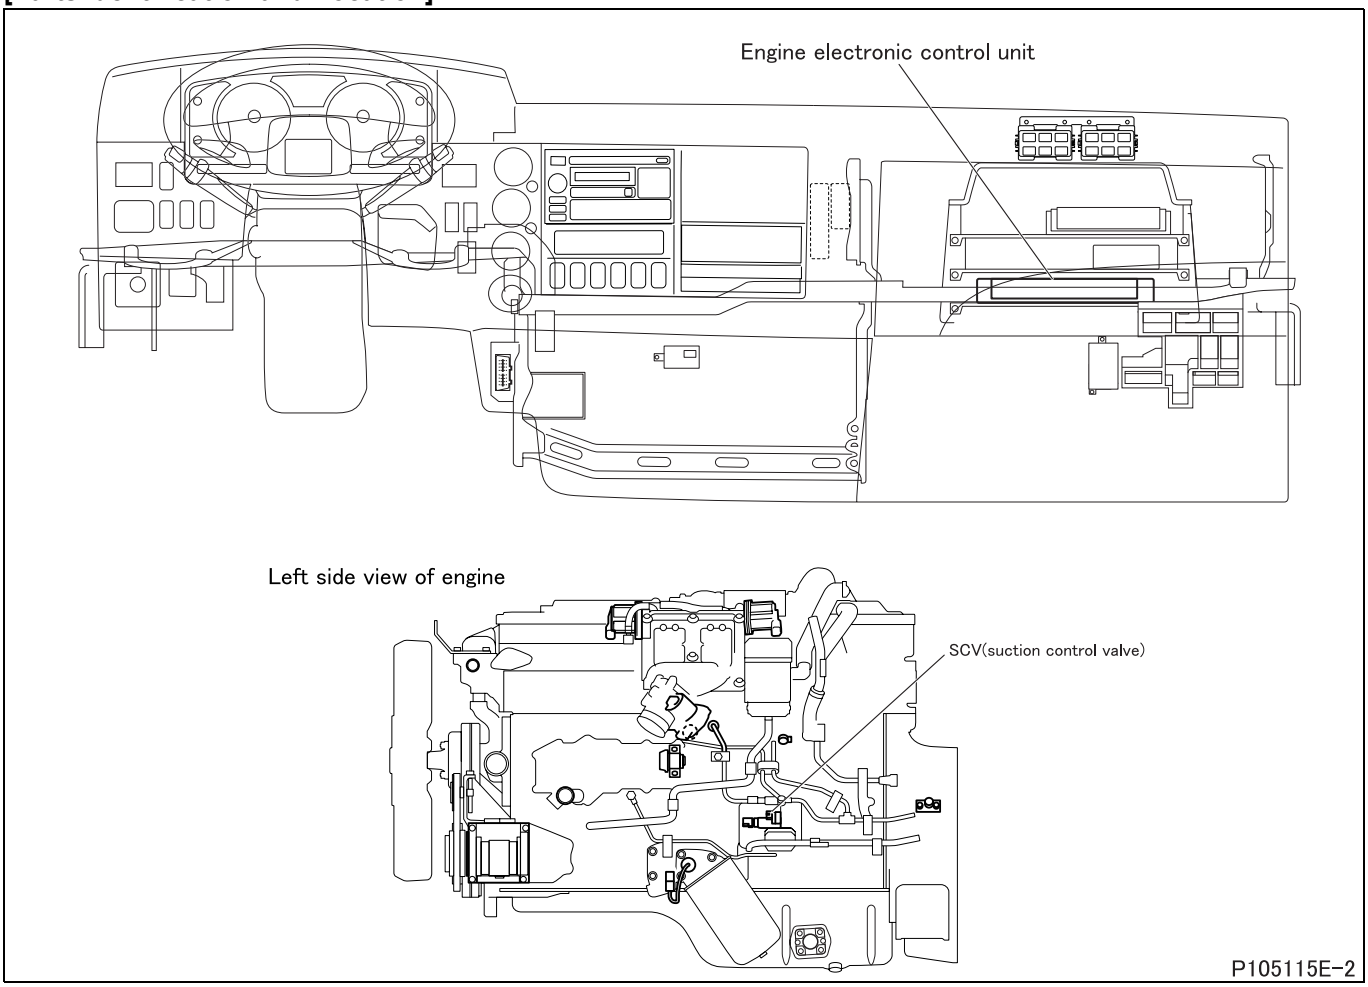
<Fault code>
- If code recovered to normal, automatically cleared at 40th warm up cycle after warning lamp is lit. (To clear as desired, erase from the memory.)

Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

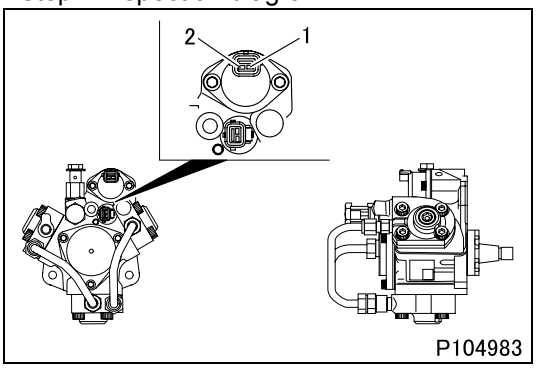
Step 1	Inspection items		Inspection by electronic control unit connector
	Maintenance item		Measure value of resistance between connector (GF31A) terminal No. 14 or No. 15 and No. 16 or No. 17.
	Inspection condition		Disconnect electronic control unit and harness, and measure from connection side of harness connector.
	Requirements		2.1 ± 0.2 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 2.
		NO	Go to step 3.

Step 2	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify connector.

Step 3	Inspection items		Inspection of SCV (suction control valve) connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	Modify connector.

Step 4	Inspection items		Inspection of SCV (suction control valve) unit
	Maintenance item		Check continuity across SCV (suction control valve) connector terminal No. 1 and 2.
	Inspection condition		–
	Requirements		2.1 ± 0.2 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Replacement of supply pump

<Step 4 inspection diagram>



Step 5	Inspection items		Inspection of harness between electronic control unit and SCV (suction control valve) (power supply)
	Maintenance item		Check circuit between SCV (suction control valve) connector terminal No. 1 and electronic control unit connector (GF31A) terminal No. 14 or No. 15.
	Inspection condition		–
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Modify harness.

Step 6	Inspection items		Inspection of harness between electronic control unit and SCV (suction control valve) (ground)
	Maintenance item		Check circuit between SCV (suction control valve) connector terminal No. 2 and electronic control unit connector (GF31A) terminal No. 16 or No. 17.
	Inspection condition		–
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify harness.

Step 7	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. B9 “Fuel Leak Check” under the following conditions.
	Inspection condition		• Vehicle: stationary (vehicle speed 0 km/h {0 MPH}) • Transmission: neutral
	Requirements		This diagnosis code is not displayed again.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P0091/Flash code: 63
[Monitor]
Abnormality of SCV (suction control valve)
[Fault (outline)]
- Short circuit ground (Circuit between suction control valve and electronic control unit is short-circuited to ground.)
- Open circuit (Circuit between suction control valve and electronic control unit is short-circuited to ground.)

[Diagnosis check]
- Engine electronic control unit internal function monitors SCV (suction control valve) for short-circuit to ground.

[Code generation condition]
- SCV (suction control valve) remains shorted to ground as detected for approx. 0.008 second.
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- Supply pump control: normal
- Battery voltage: normal
- Starter switch: ON

[Control effected by electronic control unit during fault]
- Injection quantity is limited.
- Main injection only is allowed.
- Common rail pressure is limited.
- Exhaust gas recirculation control is stopped.
- Throttle control is stopped.
- Diesel particulate filter regeneration (manual or automatic) is stopped.
- Auto cruise control is stopped.
- ISS control is stopped.

[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and SCV (suction control valve)
- Abnormality of each connector
- Abnormality of SCV (suction control valve)
- Abnormality of electronic control unit

[Recoverability]
<Control during fault>
- Recovered if signal becomes normal when starter switch is turned OFF to ON (power supply resumed to electronic control unit).

<Warning lamp>
- Extinguished at 4th driving cycle after normal signal is input.

<Fault code>
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished. (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

	Inspection condition		–
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify harness.

Step 7	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. B9 “Fuel Leak Check” under the following conditions.
	Inspection condition		• Vehicle: stationary (vehicle speed 0 km/h {0 MPH}) • Transmission: neutral
	Requirements		This diagnosis code is not displayed again.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P0093/Flash code: 36
[Monitor]
Abnormality of common rail pressure (fuel leakage)
[Fault (outline)]
Fuel leakage
[Diagnosis check]
- Common rail pressure is monitored for fuel leakage.

[Code generation condition]
- Fuel flow rates calculated from decrement of rail pressure and specified injection quantity are compared for fuel leakage. (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- Supply pump learning: completed
- Injector control: normal
- Common rail pressure sensor: normal
- Engine speed sensor: normal
- Engine speed: 500 rpm or more
- Supply pump control: normal

[Control effected by electronic control unit during fault]
- Injection quantity is limited.
- Exhaust gas recirculation control is stopped.
- Throttle control is stopped.
- Diesel particulate filter regeneration (manual or automatic) is stopped.

[Probable cause of trouble]
- Abnormality of supply pump
- Abnormality of pressure limiter
- Airtight abnormality of injector
- Plugged fuel system
- Fuel leakage
- Abnormality of common rail pressure sensor

[Recoverability]
<Control during fault>
- Recovered if signal becomes normal when starter switch is turned OFF to ON (power supply resumed to electronic control unit).

<Warning lamp>
- Extinguished after input of normal signal.

<Fault code>
- If code recovered to normal, automatically cleared at 40th warm up cycle after warning lamp is lit. (To clear as desired, erase from the memory.)

Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		Check if following diagnosis codes occur simultaneously. • P0093 “CRS (Fuel Leak)” • P0148 “CRS (Fuel Delivery)” • P0191 “CRS Pressure SNSR (Plausibility)” • P0192 “CRS Pressure SNSR (Low)” • P0193 “CRS Pressure SNSR (High)” • P0201 “Injector M/V-Cylinder 1 (Load)” • P0202 “Injector M/V-Cylinder 2 (Load)” • P0203 “Injector M/V-Cylinder 3 (Load)” • P0204 “Injector M/V-Cylinder 4 (Load)” • P0205 “Injector M/V-Cylinder 5 (Load)” • P0206 “Injector M/V-Cylinder 6 (Load)” • P0562 “Power Supply Voltage (Low)” • P0563 “Power Supply Voltage (High)” • P0604 “ECU Hardware (RAM)” • P0605 “ECU System (Hardware)” • P0606 “ECU Hardware (Main CPU)” • P0607 “ECU System” • P062F “ECU System (EEPROM)” • P2146 “Injector Bank 1 (Plausibility)” • P2147 “Injector Bank 1 (Low)” • P2148 “Injector Bank 1 (High)” • P2149 “Injector Bank 2 (Plausibility)” • P2150 “Injector Bank 2 (Low)” • P2151 “Injector Bank 2 (High)” • P2153 “Injector Bank 3 (Low)” • P2154 “Injector Bank 3 (High)”
	Inspection condition		• Starter switch: ON • Do not start engine.
	Requirements		No codes occur.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 2.
		NO	Inspect diagnosis code that is occurring.

Step 2	Inspection items		Checking of engine appearance
	Maintenance item		Check fuel system for fuel leak.
	Inspection condition		Starter switch: OFF
	Requirements		There is no fuel leak.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Go to step 6.

Step 3	Inspection items		Inspection of low pressure piping (fuel tank – supply pump)
	Maintenance item		Check suction pipe or hose for bend.
	Inspection condition		Starter switch: OFF
	Requirements		There is no bend on pipe or hose.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	Correct and replace suction pipe or hose.

Step 4	Inspection items		Checking of air bleeding
	Maintenance item		Bleed air from fuel filter.
	Inspection condition		Starter switch: OFF
	Requirements		Problem is solved by bleeding air.
	Inspection result (Is the judging standard satisfied?)	YES	–
		NO	Go to step 5.

Step 5	Inspection items		Inspection of low pressure piping
	Maintenance item		Fuel filter
	Inspection condition		Starter switch: OFF
	Requirements		Problem is solved by replacing fuel filter.
	Inspection result (Is the judging standard satisfied?)	YES	–
		NO	Go to step 6.

Step 6	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. B9 “Fuel Leak Check”
	Inspection condition		Engine start: At idle
	Requirements		There is no leak from supply pump.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Replacement of supply pump

Step 7	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. B9 “Fuel Leak Check”
	Inspection condition		Engine start: At idle
	Requirements		There is no leak from fuel pipe between supply pump and rail.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Replacement of fuel pipe

Step 8	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. B9 “Fuel Leak Check”
	Inspection condition		Engine start: At idle
	Requirements		There is no leak from rail.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 9.
		NO	Replacement of rail

Step 9	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. B9 “Fuel Leak Check”
	Inspection condition		Engine start: At idle
	Requirements		There is no leak from fuel injection pipes (six) between injector and rail.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 10.
		NO	Replacement of injection pipe

Step 10	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. B9 “Fuel Leak Check”
	Inspection condition		Engine start: At idle
	Requirements		There is no leak from injectors (six).
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 11.
		NO	Replacement of injector

Step 11	Inspection items		Check inside of combustion chamber.
	Maintenance item		Check for fuel leak.
	Inspection condition		• After performing actuator test item No. B9 “Fuel Leak Check”, stop engine. • Remove glow plug, and check from glow plug mounting hole using bore scope.
	Requirements		Inside of combustion chamber is not wet.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 12.
		NO	Replacement of injector of object cylinder

Step 12	Inspection items		Replacement of rail (common rail pressure sensor, flow damper and pressure limiter abnormal)
	Maintenance item		–
	Inspection condition		–
	Requirements		Problem is solved by replacing rail.
	Inspection result (Is the judging standard satisfied?)	YES	–
		NO	Go to step 13.

Step 13	Inspection items		Replacement of supply pump
	Maintenance item		–
	Inspection condition		–
	Requirements		Problem is solved by replacing supply pump.
	Inspection result (Is the judging standard satisfied?)	YES	–
		NO	Replacement of injectors (six)

[Fault code]
Diagnosis code: P0097/Flash code: 09
[Monitor]
Abnormality of intake air temperature sensor 2
[Fault (outline)]
Low signal range check
[Diagnosis check]
- Output voltage of intake air temperature sensor 2 is monitored.

[Code generation condition]
- Voltage of intake air temperature sensor 2 remains below 0.1 V for approx. 2.5 seconds.
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal
- Engine speed: 2500 rpm or more
- Intake air temperature sensor 1: 0°C {32°F} or above

[Control effected by electronic control unit during fault]
- Injection quantity is limited.
- Exhaust gas recirculation control is stopped.
- Throttle control is stopped.
- Diesel particulate filter regeneration (manual or automatic) is stopped.
- Particulate matter (PM) deposit computation is stopped.
- Control is carried out using backup value (80°C {176°F}).

[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and intake air temperature sensor 2
- Abnormality of each connector
- Abnormality of intake air temperature sensor 2
- Abnormality in electronic control unit

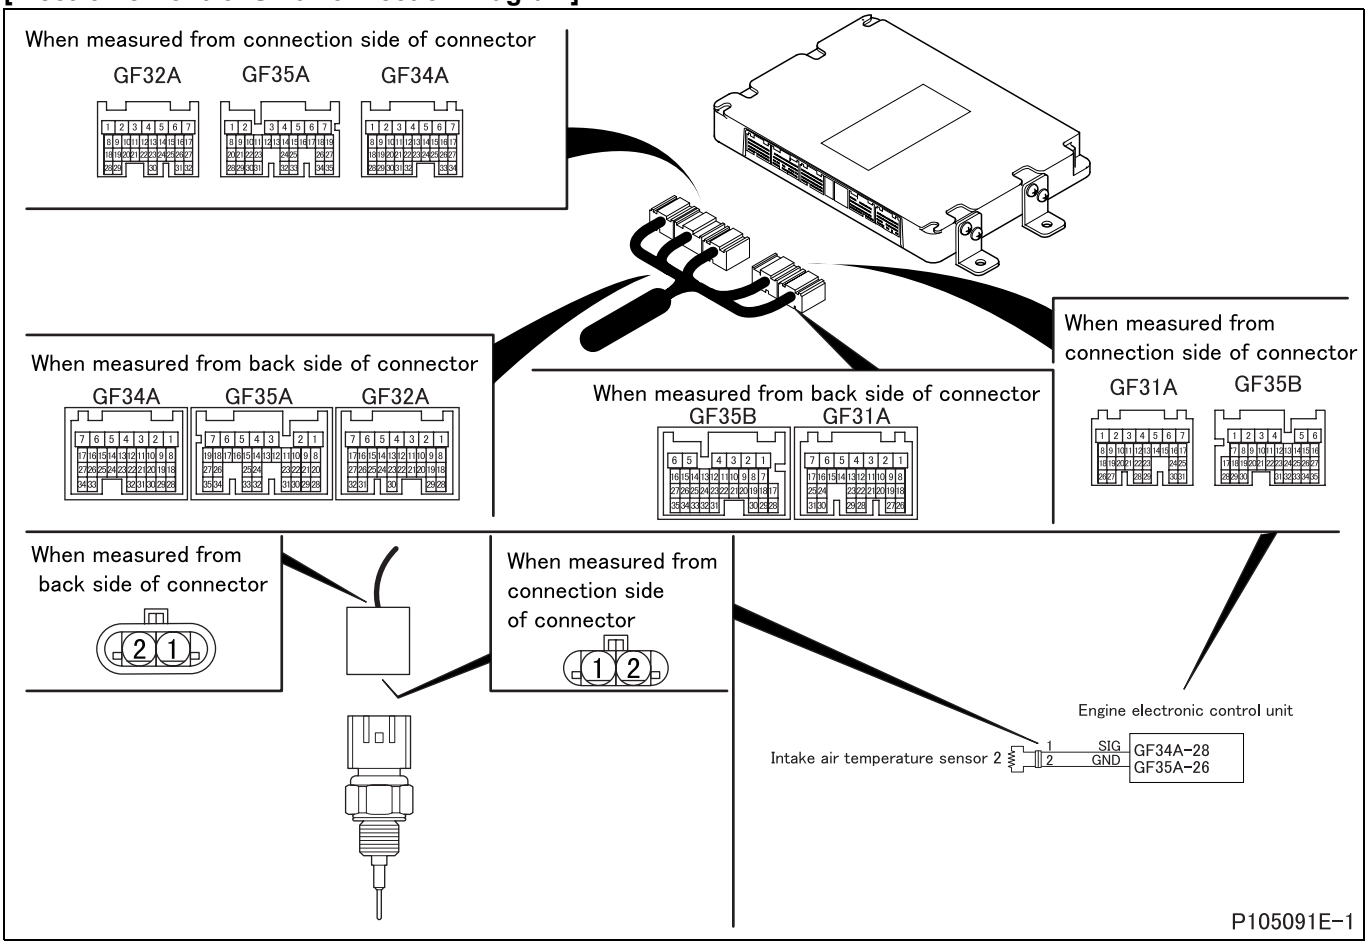
[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>
- Extinguished at 4th driving cycle after normal signal is input.

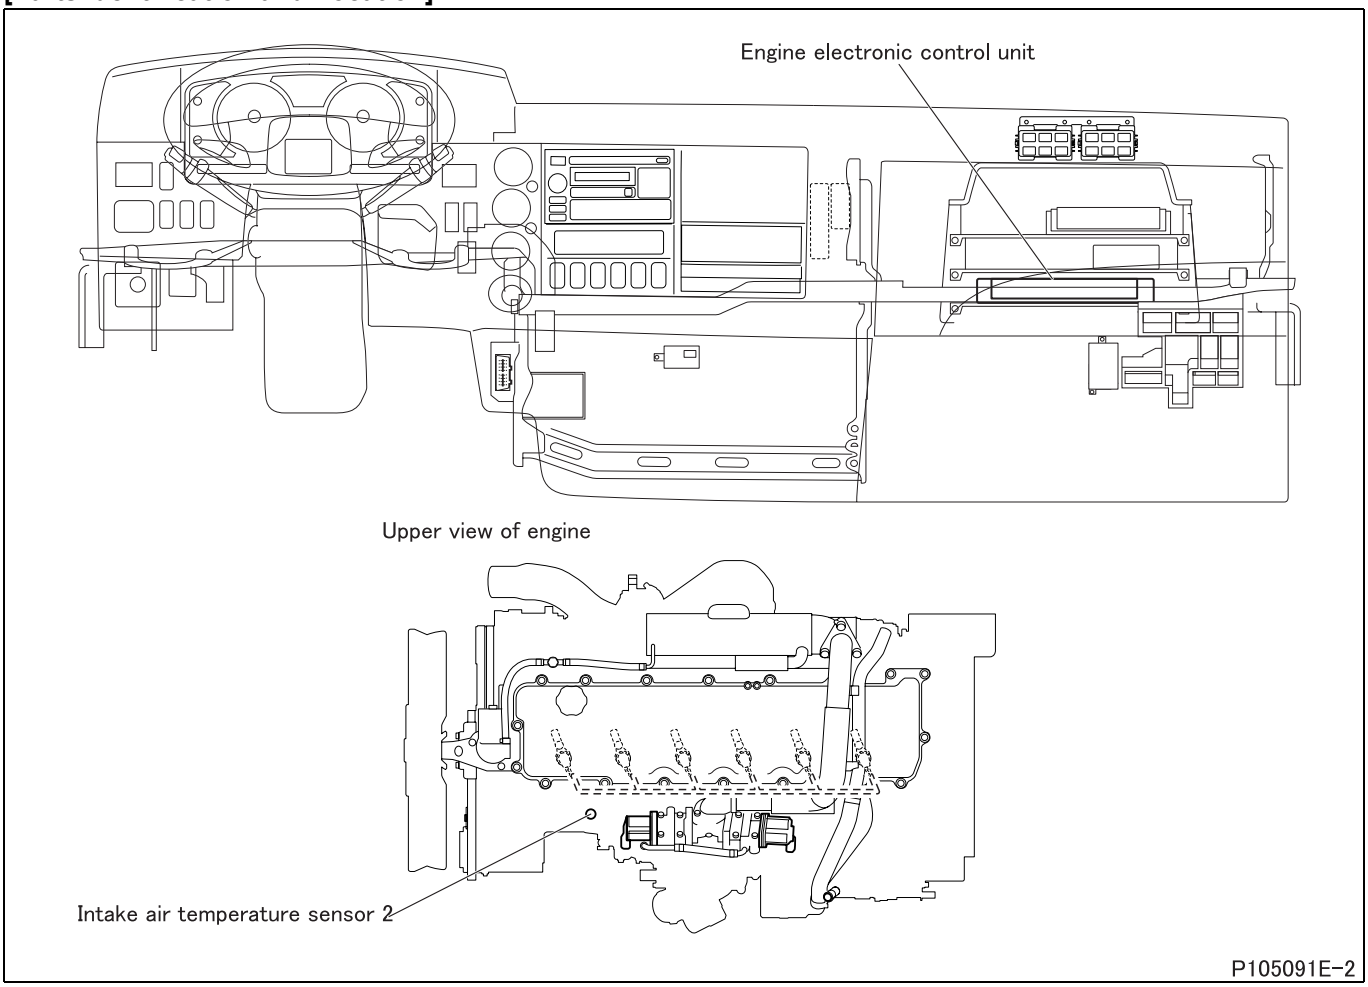
<Fault code>
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished. (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		**<General Scanning Tool used>** • Measure item “Intake Air Temperature”. **<Multi-Use Tester used>** • Measure item No. 28 “Intake Air Temperature (EGR)” of Service Data.
	Inspection condition		–
	Requirements		When engine is cold: Temperature is equivalent to outside temperature.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

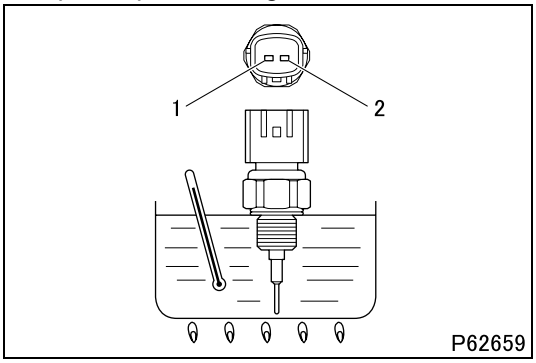
Step 2	Inspection items		Inspection by electronic control unit connector
	Maintenance item		Measure value of resistance between connector (GF34A) terminal No. 26 and 28.
	Inspection condition		Disconnect electronic control unit from harness and measure from connection side of harness connector.
	Requirements		• 0°C {32°F}: 162.3 $^{+48.8}_{-36.5}$ kΩ • 20°C {68°F}: 61.47 $^{+15.99}_{-12.35}$ kΩ • 80°C {176°F}: 6.120 $^{+1.095}_{-0.907}$ kΩ
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Go to step 4.

Step 3	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify connector.

Step 4	Inspection items		Inspection of intake air temperature sensor 2 connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Modify connector.

Step 5	Inspection items		Inspection of intake air temperature sensor 2 unit
	Maintenance item		Measure value of resistance between connector terminal No. 1 and 2.
	Inspection condition		• Put intake air temperature sensor 2 in vessel filled with engine oil. • Heat the oil to each of the specified temperatures. Stir the oil well while doing so.
	Requirements		• 0°C {32°F}: 162.3 $^{+48.8}_{-36.5}$ kΩ • 20°C {68°F}: 61.47 $^{+15.99}_{-12.35}$ kΩ • 80°C {176°F}: 6.120 $^{+1.095}_{-0.907}$ kΩ
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Replacement of sensor

<Step 5 inspection diagram>



Step 6	Inspection items		Inspection of harness between electronic control unit and sensor (power supply)
	Maintenance item		Check circuit between sensor connector terminal No. 1 and electronic control unit connector (GF34A) terminal No. 28.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify harness.

Step 7	Inspection items		Inspection of harness between electronic control unit and sensor (ground)
	Maintenance item		Check circuit between sensor connector terminal No. 2 and electronic control unit connector (GF35A) terminal No. 26.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify harness.

Step 8	Inspection items		Inspection by control data
	Maintenance item		**<General Scanning Tool used>** • Measure item “Intake Air Temperature”. **<Multi-Use Tester used>** • Measure item No. 28 “Intake Air Temperature (EGR)” of Service Data.
	Inspection condition		–
	Requirements		When engine is cold: Temperature is equivalent to outside temperature.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P0098/Flash code: 09
[Monitor]
Abnormality of intake air temperature sensor 2
[Fault (outline)]
High signal range check
[Diagnosis check]
- Output voltage of intake air temperature sensor 2 is monitored.

[Code generation condition]
- Voltage of intake air temperature sensor 2 remains over 4.9 V for approx. 2.5 seconds.
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- Engine speed: 500 rpm or more
- Intake air temperature 1: 0°C {32°F} or above
- Engine in operation
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal

[Control effected by electronic control unit during fault]
- Injection quantity is limited.
- Exhaust gas recirculation control is stopped.
- Throttle control is stopped.
- Diesel particulate filter regeneration (manual or automatic) is stopped.
- Particulate matter (PM) deposit computation is stopped.
- Control is carried out using backup value (80°C {176°F}).

[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and intake air temperature sensor 2
- Abnormality of each connector
- Abnormality of intake air temperature sensor 2
- Abnormality in electronic control unit

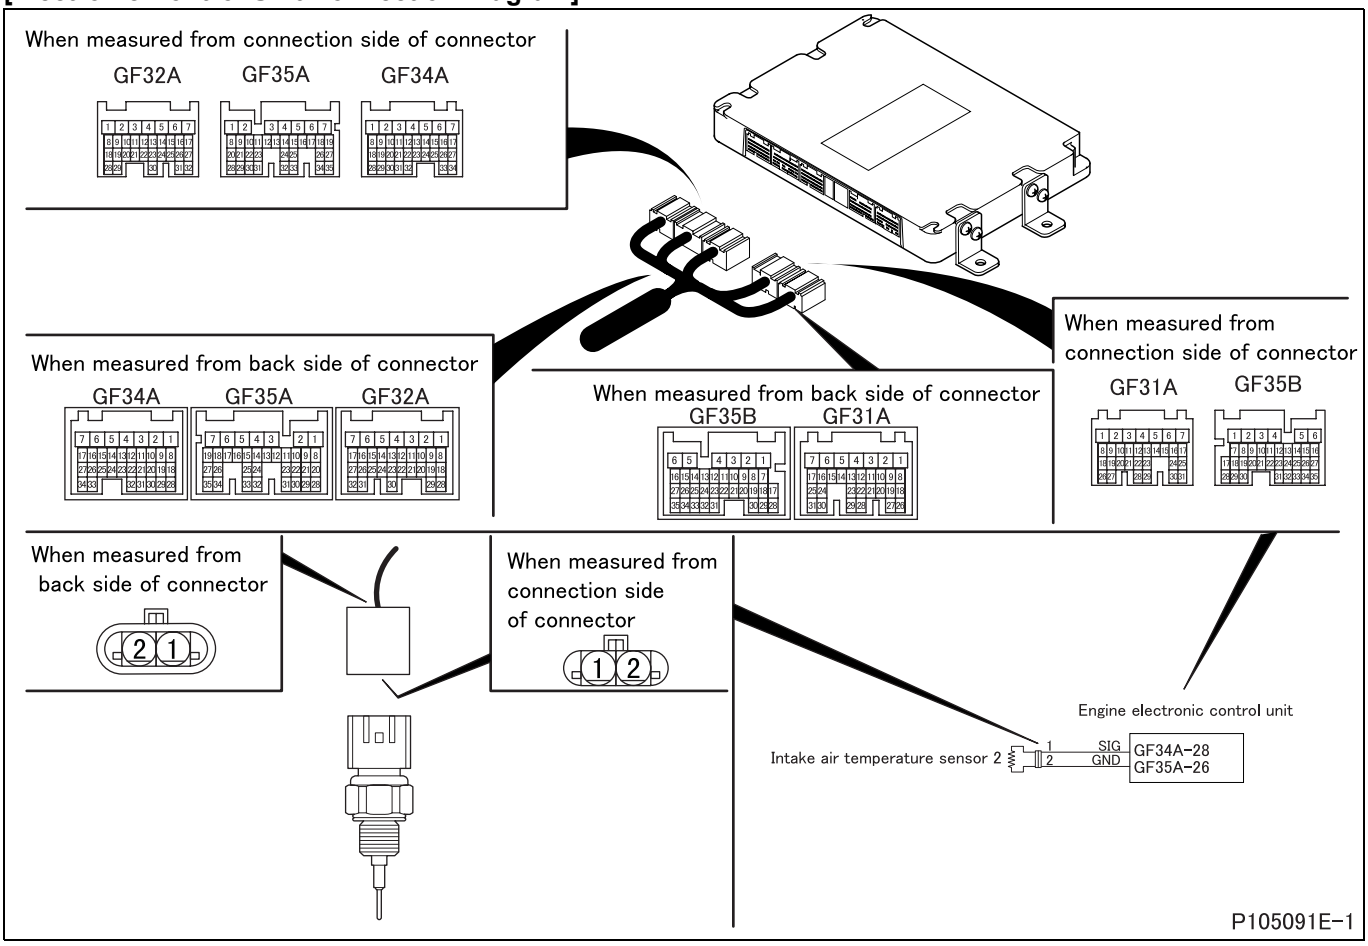
[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>
- Extinguished at 4th driving cycle after normal signal is input.

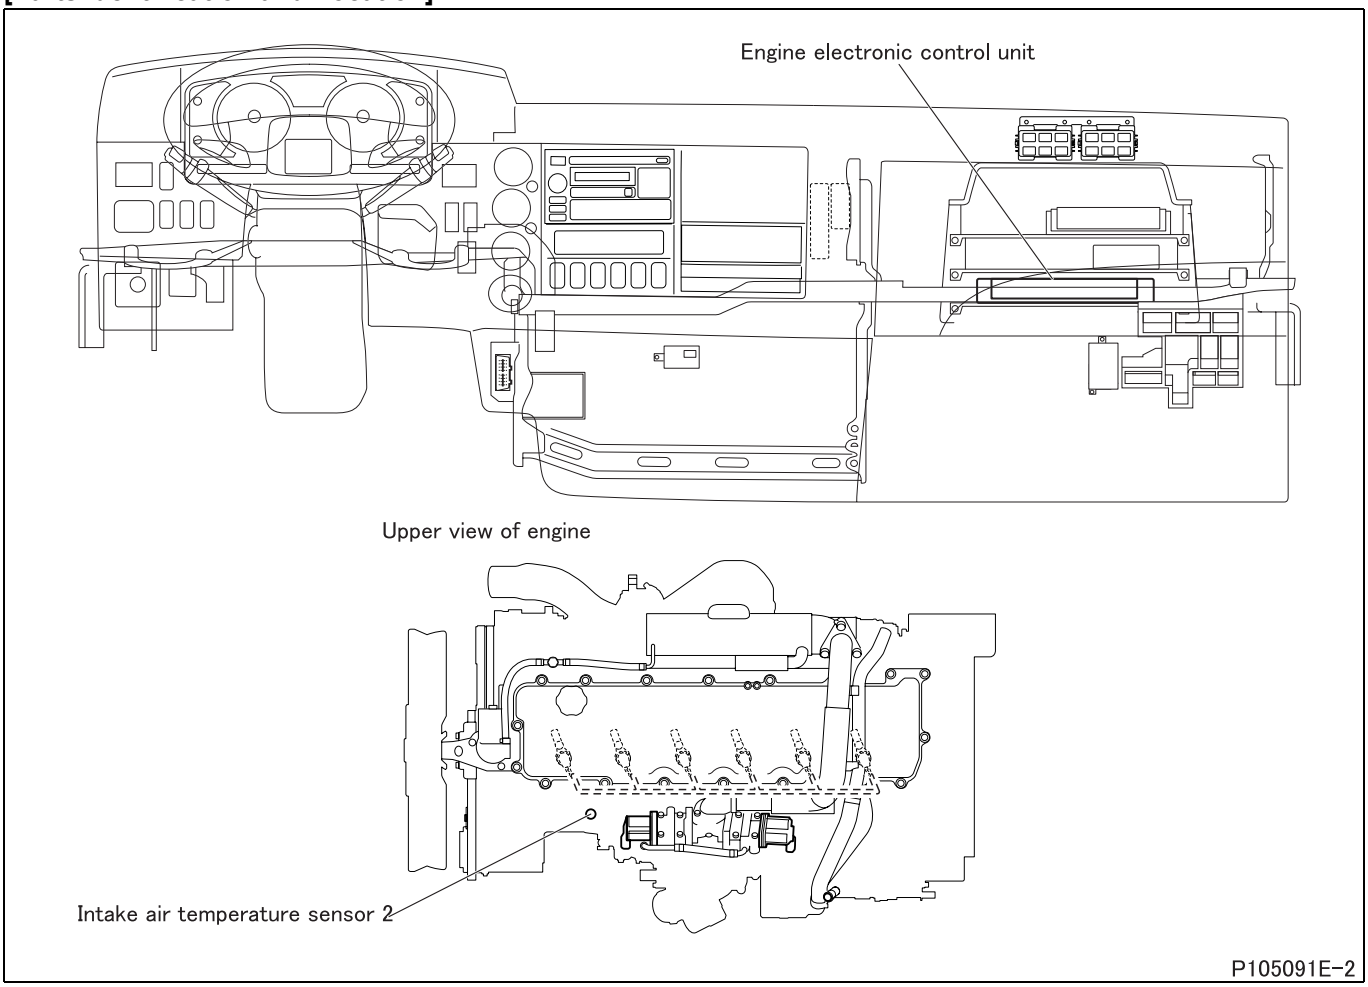
<Fault code>
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished. (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		**<General Scanning Tool used>** • Measure item “Intake Air Temperature”. **<Multi-Use Tester used>** • Measure item No. 28 “Intake Air Temperature (EGR)” of Service Data.
	Inspection condition		–
	Requirements		When engine is cold: Temperature is equivalent to outside temperature.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

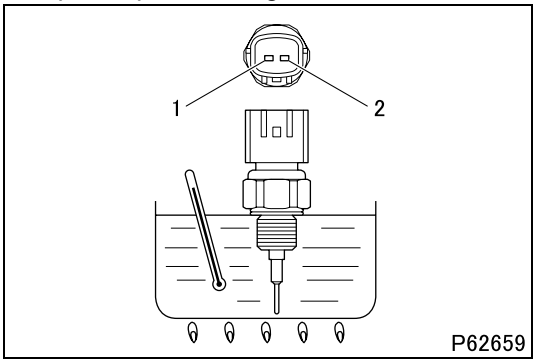
Step 2	Inspection items		Inspection by electronic control unit connector
	Maintenance item		Measure value of resistance between connector (GF34A) terminal No. 26 and 28.
	Inspection condition		Disconnect electronic control unit from harness and measure from connection side of harness connector.
	Requirements		• 0°C {32°F}: 162.3 $^{+48.8}_{-36.5}$ kΩ • 20°C {68°F}: 61.47 $^{+15.99}_{-12.35}$ kΩ • 80°C {176°F}: 6.120 $^{+1.095}_{-0.907}$ kΩ
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Go to step 4.

Step 3	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify connector.

Step 4	Inspection items		Inspection of intake air temperature sensor 2 connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Modify connector.

Step 5	Inspection items		Inspection of intake air temperature sensor 2 unit
	Maintenance item		Measure value of resistance between connector terminal No. 1 and 2.
	Inspection condition		• Put intake air temperature sensor 2 in vessel filled with engine oil. • Heat the oil to each of the specified temperatures. Stir the oil well while doing so.
	Requirements		• 0°C {32°F}: 162.3 $^{+48.8}_{-36.5}$ kΩ • 20°C {68°F}: 61.47 $^{+15.99}_{-12.35}$ kΩ • 80°C {176°F}: 6.120 $^{+1.095}_{-0.907}$ kΩ
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Replacement of sensor

<Step 5 inspection diagram>



Step 6	Inspection items		Inspection of harness between electronic control unit and sensor (power supply)
	Maintenance item		Check circuit between sensor connector terminal No. 1 and electronic control unit connector (GF34A) terminal No. 28.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify harness.

Step 7	Inspection items		Inspection of harness between electronic control unit and sensor (ground)
	Maintenance item		Check circuit between sensor connector terminal No. 2 and electronic control unit connector (GF35A) terminal No. 26.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify harness.

Step 8	Inspection items		Inspection by control data
	Maintenance item		**<General Scanning Tool used>** • Measure item “Intake Air Temperature”. **<Multi-Use Tester used>** • Measure item No. 28 “Intake Air Temperature (EGR)” of Service Data.
	Inspection condition		–
	Requirements		When engine is cold: Temperature is equivalent to outside temperature.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P0101/Flash code: 17
[Monitor]
Characteristic abnormality in air flow sensor
[Fault (outline)]
Gain and offset drift
[Diagnosis check]
- Air flow sensor output is checked to determine if it is within specified range under diagnosable conditions.

[Code generation condition]
- Air flow sensor output remains out of specified range for approx. 10 seconds.
  (Warning lamp is lit and diagnosis code is displayed on second establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- Water temperature: 75°C {167°F} or above
- Intake air temperature 1: 30°C {86°F} or above
- Atmospheric pressure: between 85 kPa {12 psi} and 107 kPa {16 psi}
- Exhaust shutter: not controlled
- Actual intake throttle position: 95% or more (WOT)
- Air flow sensor: normal in output signal
- Intake air temperature sensor 1: normal in output signal
- Water temperature sensor: normal in output signal
- Atmospheric pressure sensor: normal in output signal
- Intake air temperature sensor 1: normal in output signal
- Boost pressure sensor: normal in output signal
- Intake throttle: normal
- Battery voltage: normal

[Control effected by electronic control unit during fault]
- Effects no special control.

[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and air flow sensor
- Abnormality of each connector
- Abnormality of air flow sensor
- Abnormality in electronic control unit

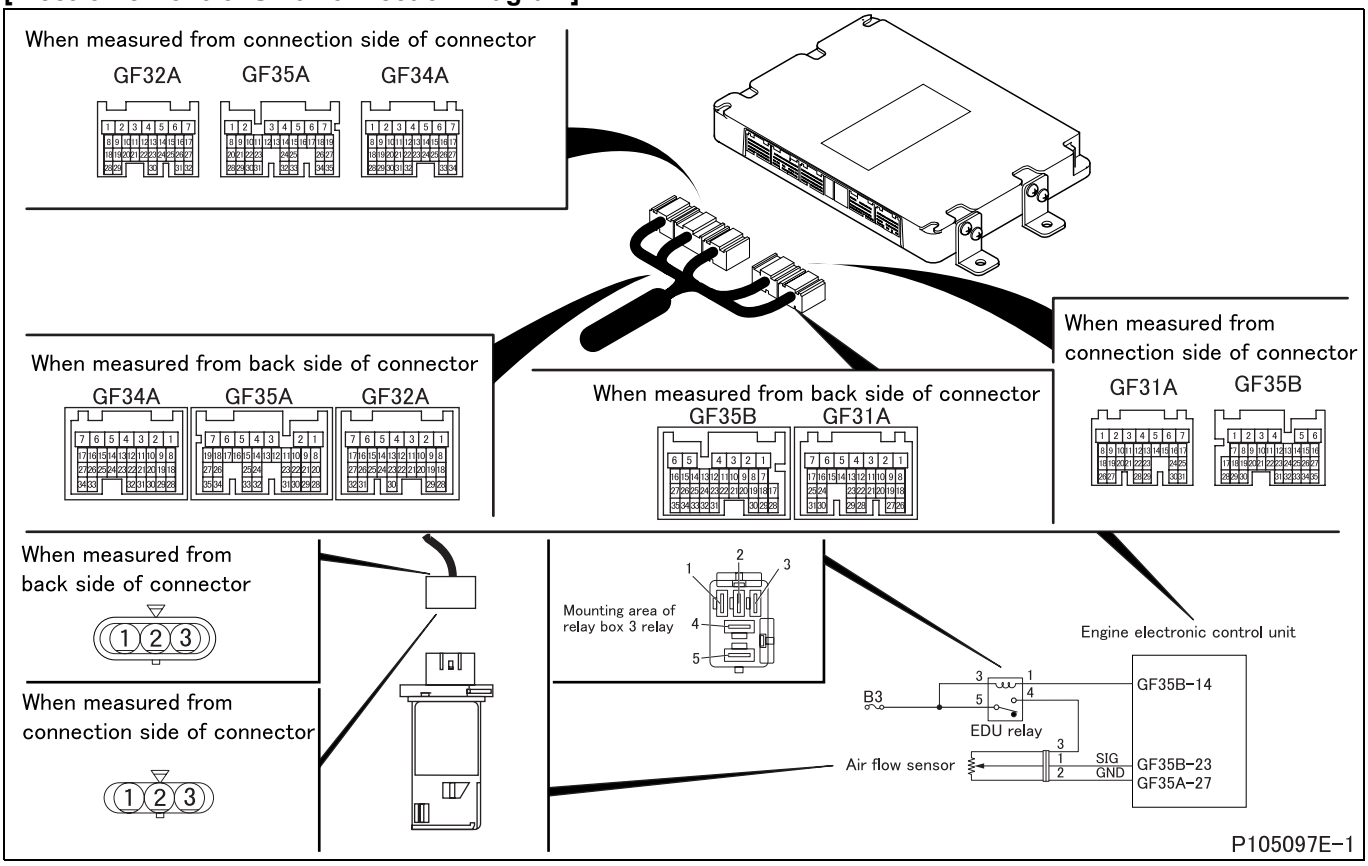
[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>
- Extinguished at 4th driving cycle after normal signal is input.

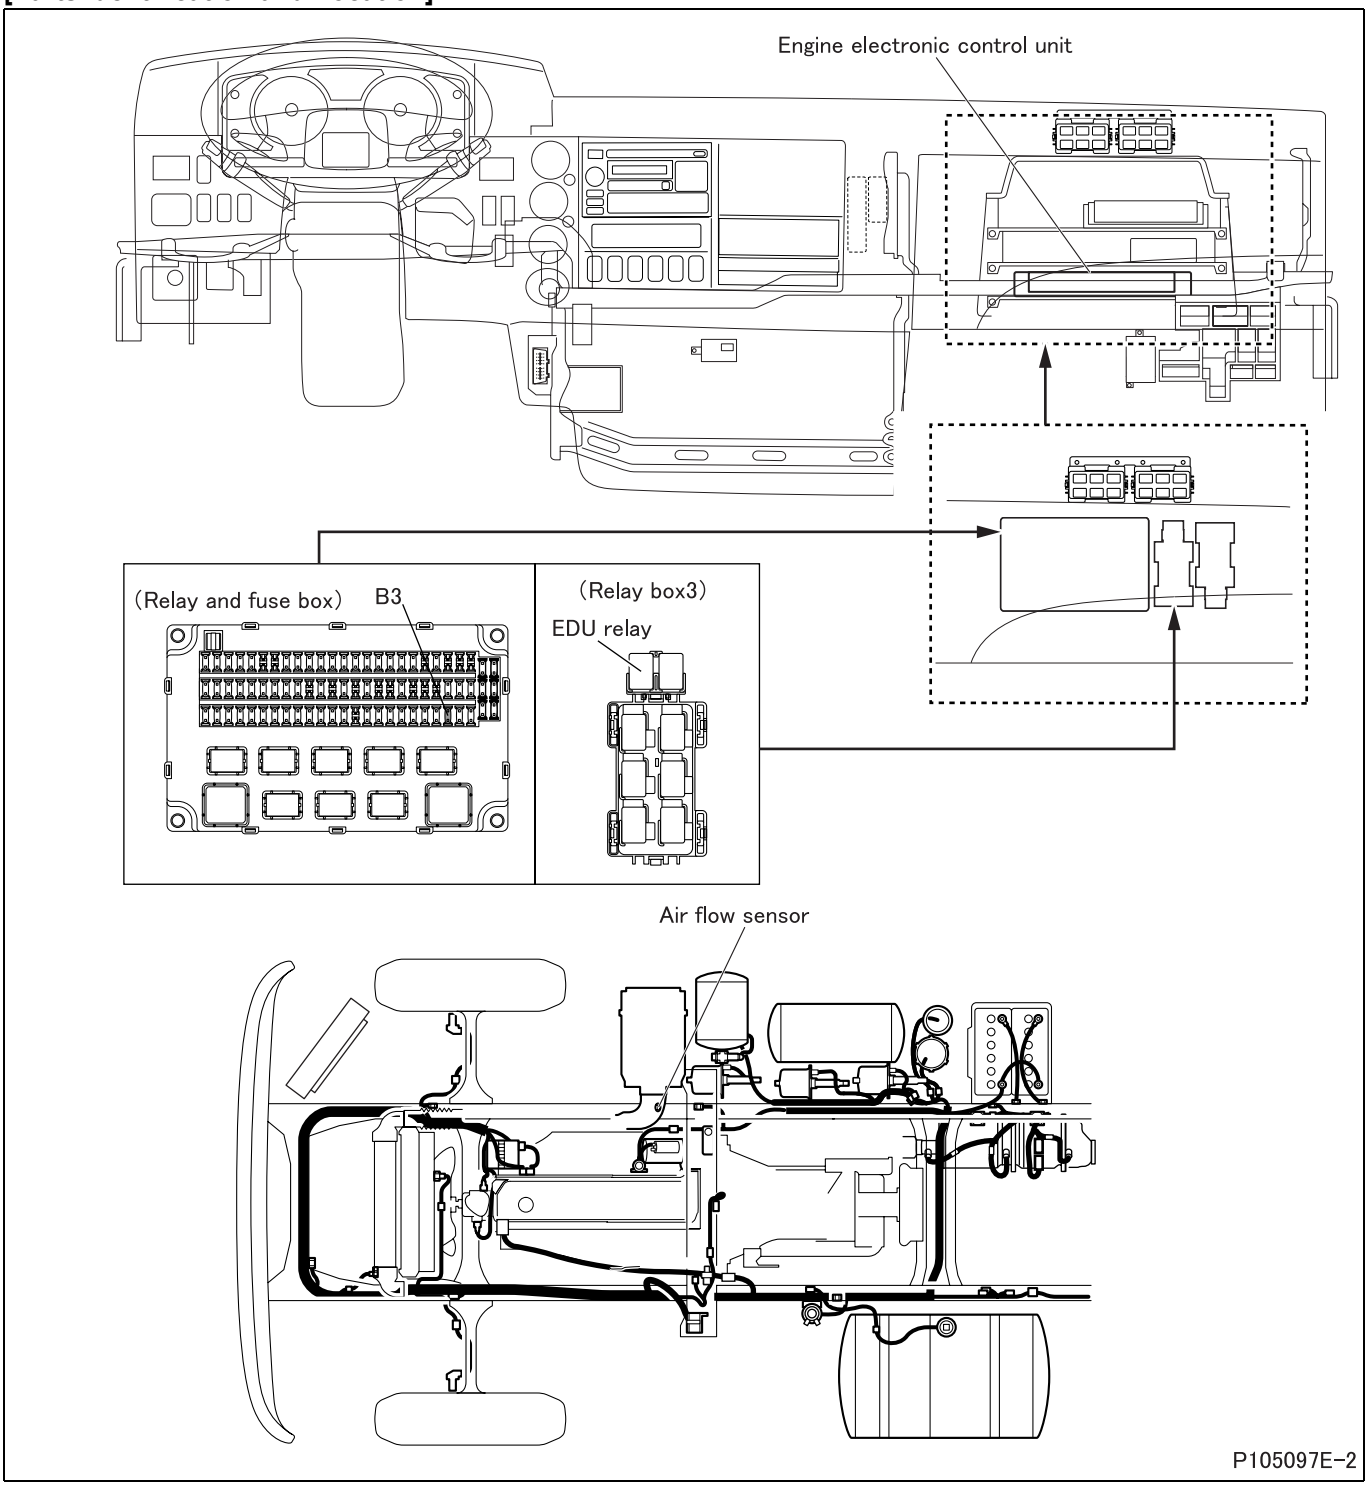
<Fault code>
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished. (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		Measure item No. 3A “Air Flow Sensor Output” of Service Data.
	Inspection condition		• Perform actuator test item No. A9 “EDU Relay” • Gradually press accelerator pedal.
	Requirements		The numeric value should gradually increase.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

Step 2	Inspection items		Inspection of sensor connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Modify connector.

Step 3	Inspection items		Inspection by sensor connector (power supply)
	Maintenance item		Measure value of voltage between connector terminal No. 3 (+) and 2 (–).
	Inspection condition		• Measure from back side of connector of harness with each device connected to harness. • Perform actuator test item No. A9 “EDU Relay”
	Requirements		12 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Go to step 4.

Step 4	Inspection items		Inspection of harness between electronic drive unit relay and sensor (power supply)
	Maintenance item		Check circuit between electronic drive unit relay connector terminal No. 4 and sensor connector terminal No. 3.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Modify harness.

Step 5	Inspection items		Inspection of harness between sensor and electronic control unit (ground)
	Maintenance item		Check circuit between sensor connector terminal No. 2 and electronic control unit connector (GF35A) terminal No. 27.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Modify harness.

Step 6	Inspection items		Inspection of harness between sensor and electronic control unit (signal)
	Maintenance item		Check circuit between sensor connector terminal No. 1 and electronic control unit connector (GF35B) terminal No. 23.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify harness.

Step 7	Inspection items		Inspection of sensor unit
	Maintenance item		Since inspection of single part is not easy, whether characteristics are deteriorated or not must be checked for the sensor mounted on the current vehicle by measuring and comparing the amount of sensor intake air of the sensor currently mounted on vehicle and that replaced with new one by the service data. **(1) Prepare for inspection** • Clean or replace air cleaner element. • Prepare a new air flow sensor. • Warm up the engine fully. **(2) Measure the intake air of current sensor** • Keep pressing the accelerator pedal until it bottom the stopper bolt from the idling state. (no load maximum rotation) • Measure the following items from among “Service data”. **<General Scanning Tool used>** • Engine speed: “Ne” (rpm) • Intake air flow rate: “Air Flow Rate from MAFS” (g/s) **<Multi-Use Tester used>** • Engine speed: 01 “Engine Revolution” (rpm) • Intake air flow rate: 3A “Air Flow Sensor Output” (g/hr) **(3) Measure the intake air of new sensor** • Replace the currently mounted sensor with a new sensor. • Keep pressing the accelerator pedal until it bottom the stopper bolt from the idling state. (no load maximum rotation) • Measure intake air flow at the same rpm as that of engine revolution in item (2) of “Service data”. **(4) Comparison whether characteristics are deteriorated** • Calculate the characteristics deterioration factor (%) by the following equation. • Characteristics deterioration factor (%) = (intake air of new item – current intake air) × 100/intake air of new item.
	Inspection condition		–
	Requirements		10% or less
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Replacement of sensor

Step 8	Inspection items		Inspection by control data
	Maintenance item		Measure item No. 3A “Air Flow Sensor Output” of Service Data.
	Inspection condition		• Perform actuator test item No. A9 “EDU Relay” • Gradually press accelerator pedal.
	Requirements		The numeric value should gradually increase.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P0102/Flash code: 17
[Monitor]
Abnormality of air flow sensor
[Fault (outline)]
Low signal range check
[Diagnosis check]
- Output voltage of air flow sensor is monitored.

[Code generation condition]
- Voltage of air flow sensor remains under 0.04 V for approx. 2.5 seconds.
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal

[Control effected by electronic control unit during fault]
- Injection quantity is limited.
- Exhaust gas recirculation control is stopped.
- Throttle control is stopped.
- Diesel particulate filter regeneration (manual or automatic) is stopped.
- Particulate matter (PM) deposit computation is stopped.

[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and electronic drive unit relay
- Open-circuit or short-circuit of harness between electronic control unit and air flow sensor
- Open-circuit or short-circuit of harness between fuse and electronic drive unit relay
- Abnormality of each connector
- Abnormality of air flow sensor
- Abnormality of electronic drive unit relay
- Abnormality in electronic control unit

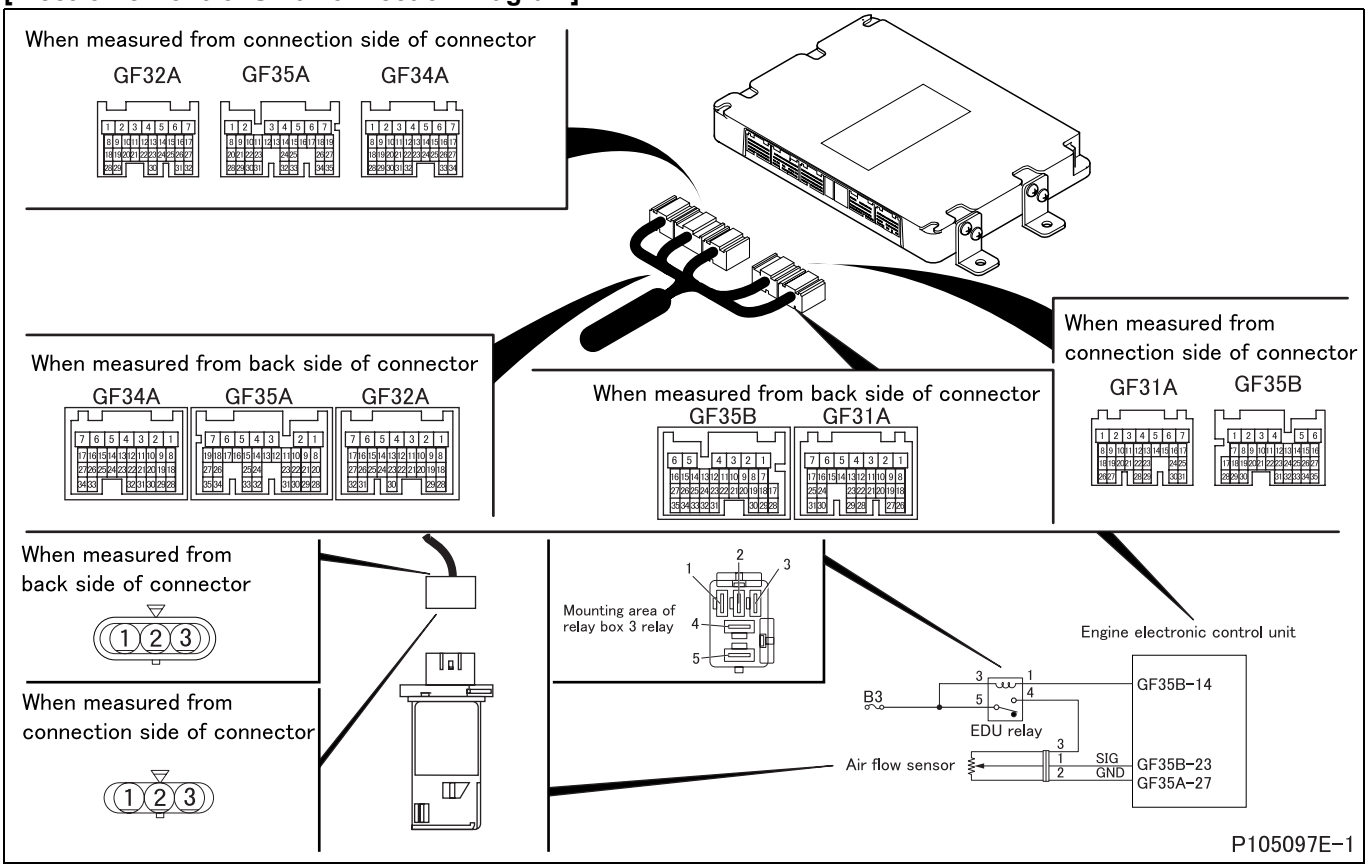
[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>
- Extinguished at 4th driving cycle after normal signal is input.

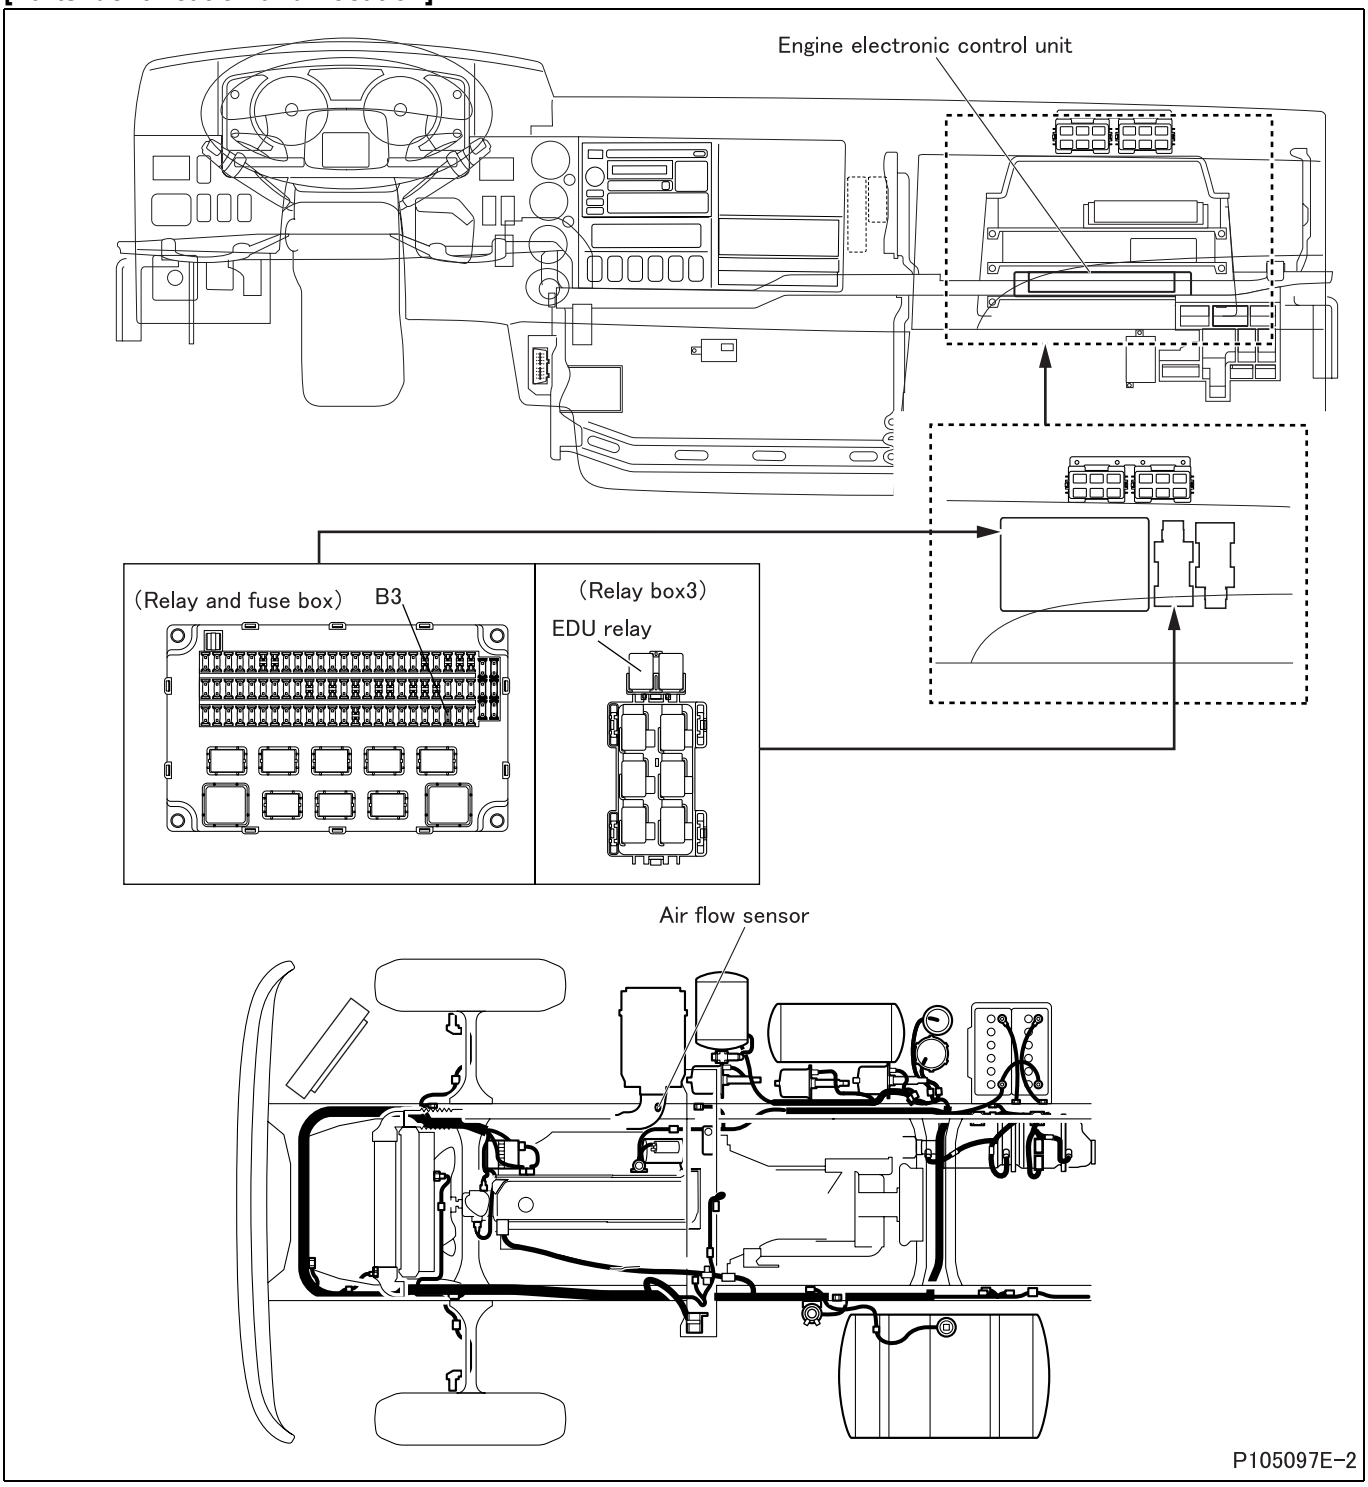
<Fault code>
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished. (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		Measure item No. 3A “Air Flow Sensor Output” of Service Data.
	Inspection condition		• Perform actuator test item No. A9 “EDU Relay” • Gradually press accelerator pedal.
	Requirements		The numeric value should gradually increase.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

Step 2	Inspection items		Inspection of sensor connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Modify connector.

Step 3	Inspection items		Inspection by sensor connector (power supply)
	Maintenance item		Measure value of voltage between connector terminal No. 3 (+) and 2 (–).
	Inspection condition		• Measure from back side of connector of harness with each device connected to harness. • Perform actuator test item No. A9 “EDU Relay”
	Requirements		12 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Go to step 4.

Step 4	Inspection items		Inspection of harness between electronic drive unit relay and sensor (power supply)
	Maintenance item		Check circuit between electronic drive unit relay connector terminal No. 4 and sensor connector terminal No. 3.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Modify harness.

Step 5	Inspection items		Inspection of harness between sensor and electronic control unit (ground)
	Maintenance item		Check circuit between sensor connector terminal No. 2 and electronic control unit connector (GF35A) terminal No. 27.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Modify harness.

Step 6	Inspection items		Inspection of harness between sensor and electronic control unit (signal)
	Maintenance item		Check circuit between sensor connector terminal No. 1 and electronic control unit connector (GF35B) terminal No. 23.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify harness.

Step 7	Inspection items		Inspection of sensor unit
	Maintenance item		Since inspection of single part is not easy, whether characteristics are deteriorated or not must be checked for the sensor mounted on the current vehicle by measuring and comparing the amount of sensor intake air of the sensor currently mounted on vehicle and that replaced with new one by the service data. **(1) Prepare for inspection** • Clean or replace air cleaner element. • Prepare a new air flow sensor. • Warm up the engine fully. **(2) Measure the intake air of current sensor** • Keep pressing the accelerator pedal until it bottom the stopper bolt from the idling state. (no load maximum rotation) • Measure the following items from among “Service data”. **<General Scanning Tool used>** • Engine speed: “Ne” (rpm) • Intake air flow rate: “Air Flow Rate from MAFS” (g/s) **<Multi-Use Tester used>** • Engine speed: 01 “Engine Revolution” (rpm) • Intake air flow rate: 3A “Air Flow Sensor Output” (g/hr) **(3) Measure the intake air of new sensor** • Replace the currently mounted sensor with a new sensor. • Keep pressing the accelerator pedal until it bottom the stopper bolt from the idling state. (no load maximum rotation) • Measure intake air flow at the same rpm as that of engine revolution in item (2) of “Service data”. **(4) Comparison whether characteristics are deteriorated** • Calculate the characteristics deterioration factor (%) by the following equation. • Characteristics deterioration factor (%) = (intake air of new item – current intake air) × 100/intake air of new item.
	Inspection condition		–
	Requirements		10% or less
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Replacement of sensor

Step 8	Inspection items		Inspection by control data
	Maintenance item		Measure item No. 3A “Air Flow Sensor Output” of Service Data.
	Inspection condition		• Perform actuator test item No. A9 “EDU Relay” • Gradually press accelerator pedal.
	Requirements		The numeric value should gradually increase.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P0103/Flash code: 17
[Monitor]
Abnormality of air flow sensor
[Fault (outline)]
High signal range check
[Diagnosis check]
- Output voltage of air flow sensor is monitored.

[Code generation condition]
- Voltage of air flow sensor remains over 4.8 V for approx. 2.5 seconds.
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal

[Control effected by electronic control unit during fault]
- Injection quantity is limited.
- Exhaust gas recirculation control is stopped.
- Throttle control is stopped.
- Diesel particulate filter regeneration (manual or automatic) is stopped.
- Particulate matter (PM) deposit computation is stopped.

[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and electronic drive unit relay
- Open-circuit or short-circuit of harness between electronic control unit and air flow sensor
- Open-circuit or short-circuit of harness between fuse and electronic drive unit relay
- Abnormality of each connector
- Abnormality of air flow sensor
- Abnormality of electronic drive unit relay
- Abnormality in electronic control unit

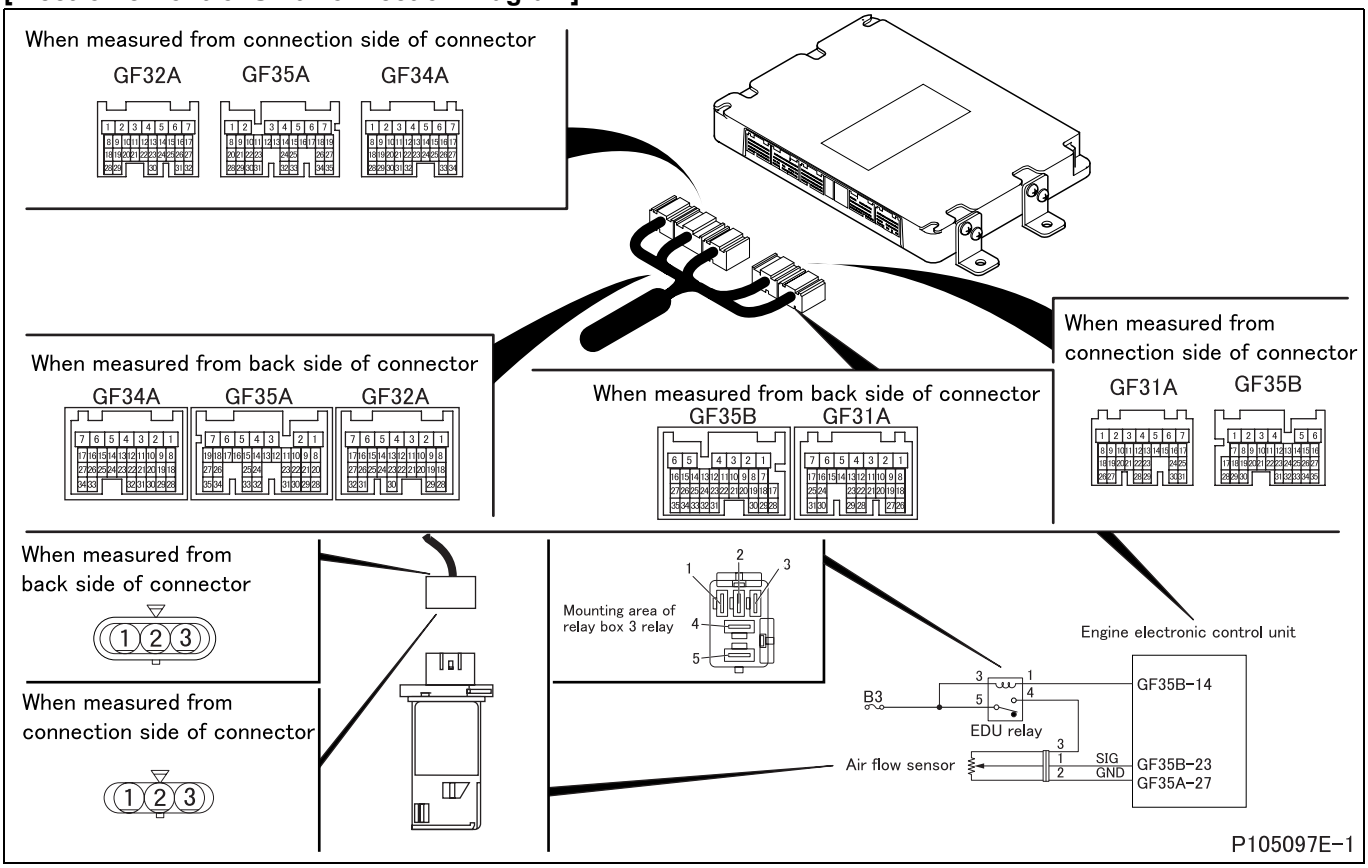
[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>
- Extinguished at 4th driving cycle after normal signal is input.

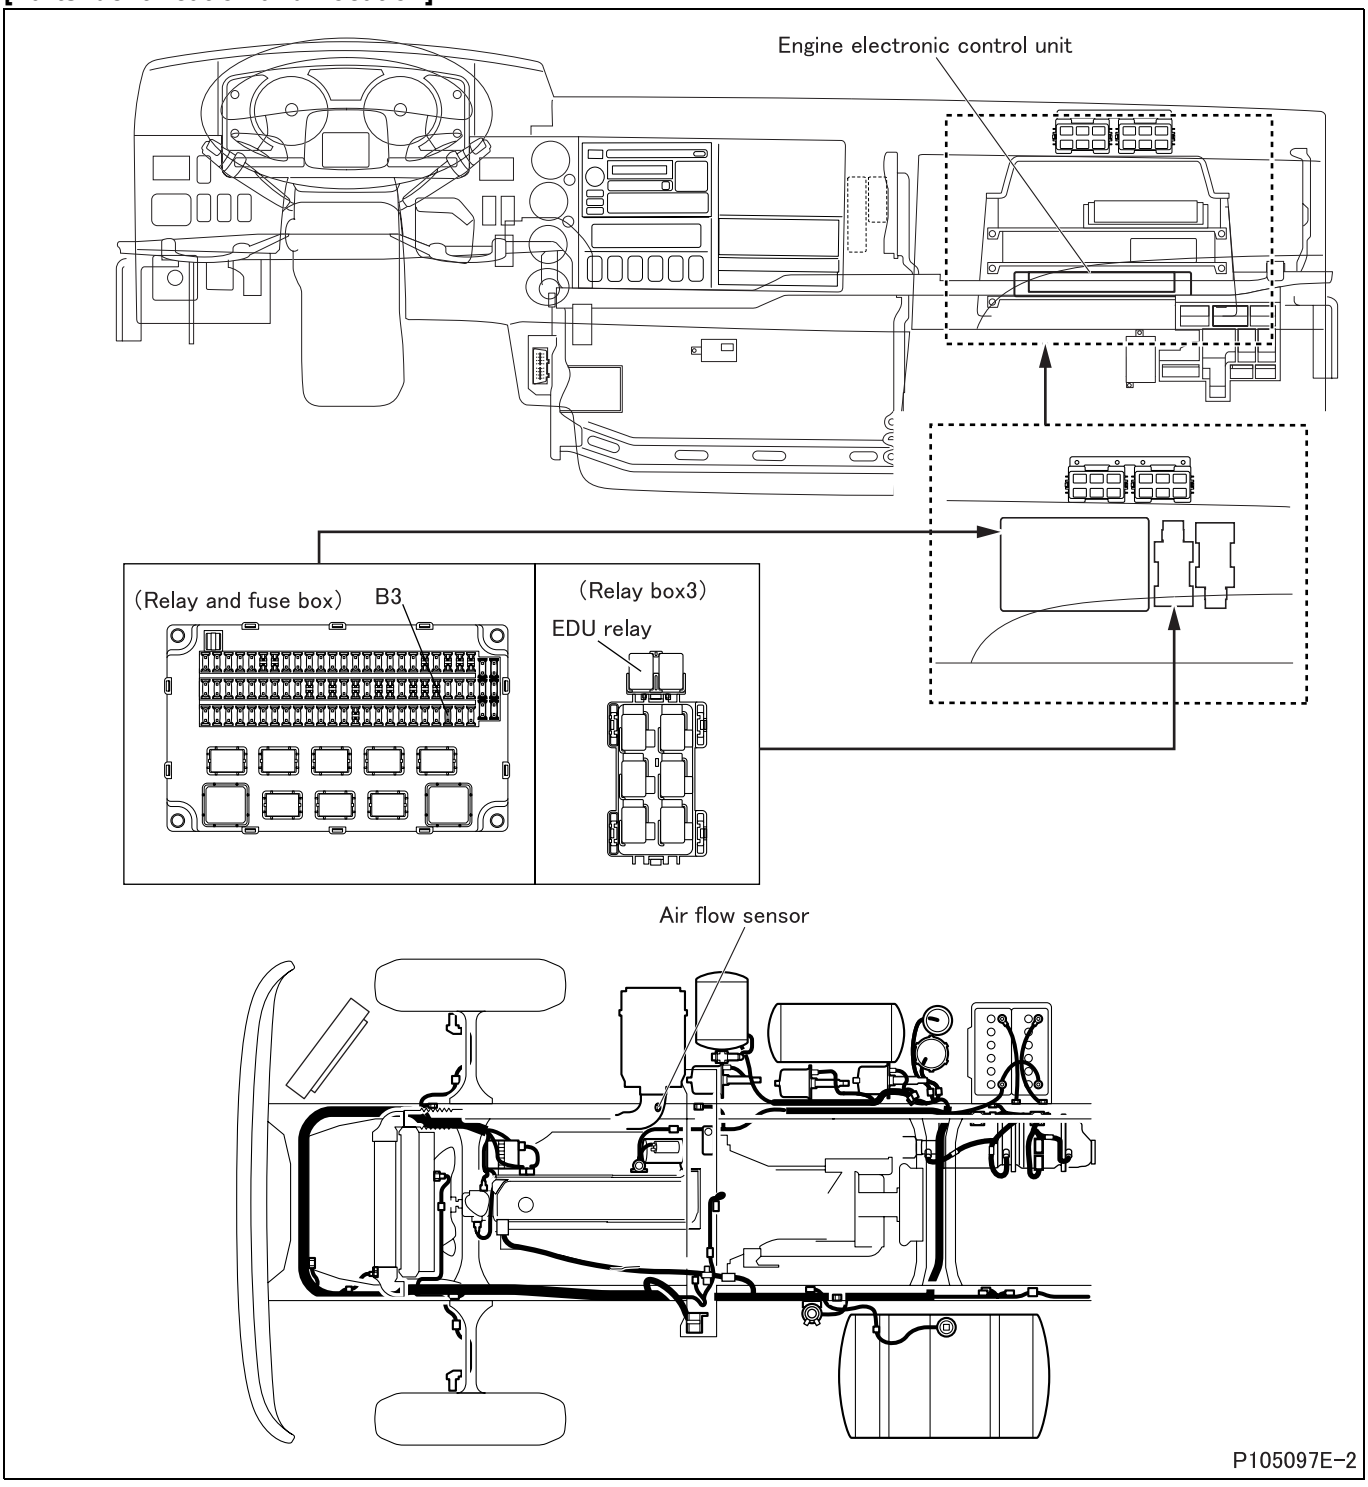
<Fault code>
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished. (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		Measure item No. 3A “Air Flow Sensor Output” of Service Data.
	Inspection condition		• Perform actuator test item No. A9 “EDU Relay” • Gradually press accelerator pedal.
	Requirements		The numeric value should gradually increase.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

Step 2	Inspection items		Inspection of sensor connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Modify connector.

Step 3	Inspection items		Inspection by sensor connector (power supply)
	Maintenance item		Measure value of voltage between connector terminal No. 3 (+) and 2 (–).
	Inspection condition		• Measure from back side of connector of harness with each device connected to harness. • Perform actuator test item No. A9 “EDU Relay”
	Requirements		12 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Go to step 4.

Step 4	Inspection items		Inspection of harness between electronic drive unit relay and sensor (power supply)
	Maintenance item		Check circuit between electronic drive unit relay connector terminal No. 4 and sensor connector terminal No. 3.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Modify harness.

Step 5	Inspection items		Inspection of harness between sensor and electronic control unit (ground)
	Maintenance item		Check circuit between sensor connector terminal No. 2 and electronic control unit connector (GF35A) terminal No. 27.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Modify harness.

Step 6	Inspection items		Inspection of harness between sensor and electronic control unit (signal)
	Maintenance item		Check circuit between sensor connector terminal No. 1 and electronic control unit connector (GF35B) terminal No. 23.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify harness.

Step 7	Inspection items		Inspection of sensor unit
	Maintenance item		Since inspection of single part is not easy, whether characteristics are deteriorated or not must be checked for the sensor mounted on the current vehicle by measuring and comparing the amount of sensor intake air of the sensor currently mounted on vehicle and that replaced with new one by the service data. **(1) Prepare for inspection** • Clean or replace air cleaner element. • Prepare a new air flow sensor. • Warm up the engine fully. **(2) Measure the intake air of current sensor** • Keep pressing the accelerator pedal until it bottom the stopper bolt from the idling state. (no load maximum rotation) • Measure the following items from among “Service data”. **<General Scanning Tool used>** • Engine speed: “Ne” (rpm) • Intake air flow rate: “Air Flow Rate from MAFS” (g/s) **<Multi-Use Tester used>** • Engine speed: 01 “Engine Revolution” (rpm) • Intake air flow rate: 3A “Air Flow Sensor Output” (g/hr) **(3) Measure the intake air of new sensor** • Replace the currently mounted sensor with a new sensor. • Keep pressing the accelerator pedal until it bottom the stopper bolt from the idling state. (no load maximum rotation) • Measure intake air flow at the same rpm as that of engine revolution in item (2) of “Service data”. **(4) Comparison whether characteristics are deteriorated** • Calculate the characteristics deterioration factor (%) by the following equation. • Characteristics deterioration factor (%) = (intake air of new item – current intake air) × 100/intake air of new item.
	Inspection condition		–
	Requirements		10% or less
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Replacement of sensor

Step 8	Inspection items		Inspection by control data
	Maintenance item		Measure item No. 3A “Air Flow Sensor Output” of Service Data.
	Inspection condition		• Perform actuator test item No. A9 “EDU Relay” • Gradually press accelerator pedal.
	Requirements		The numeric value should gradually increase.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P0112/Flash code: 44
[Monitor]
Abnormality of intake air temperature sensor 1
[Fault (outline)]
Low signal range check
[Diagnosis check]
- Output voltage of intake air temperature sensor 1 is monitored.

[Code generation condition]
- Voltage of intake air temperature sensor 1 remains under 0.2 V for approx. 2.5 seconds.
  (Warning lamp is lit and diagnosis code is displayed on second establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal

[Control effected by electronic control unit during fault]
- Intake air temperature 1 is fixed at –20°C {–4°F} at engine start and 25°C {77°F} when engine is running.

[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and intake air temperature sensor 1
- Abnormality of each connector
- Abnormality of intake air temperature sensor 1
- Abnormality in electronic control unit

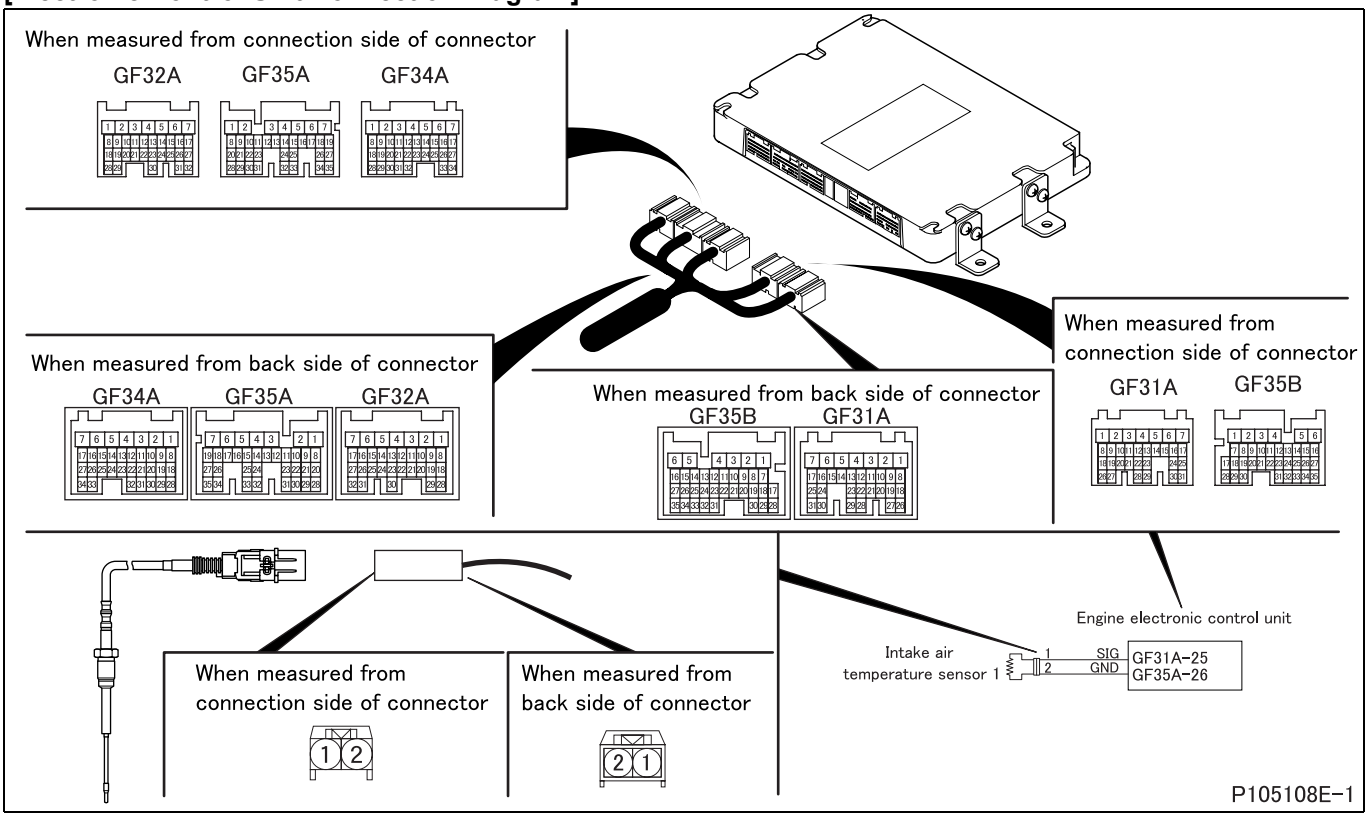
[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>
- Extinguished at 4th driving cycle after normal signal is input.

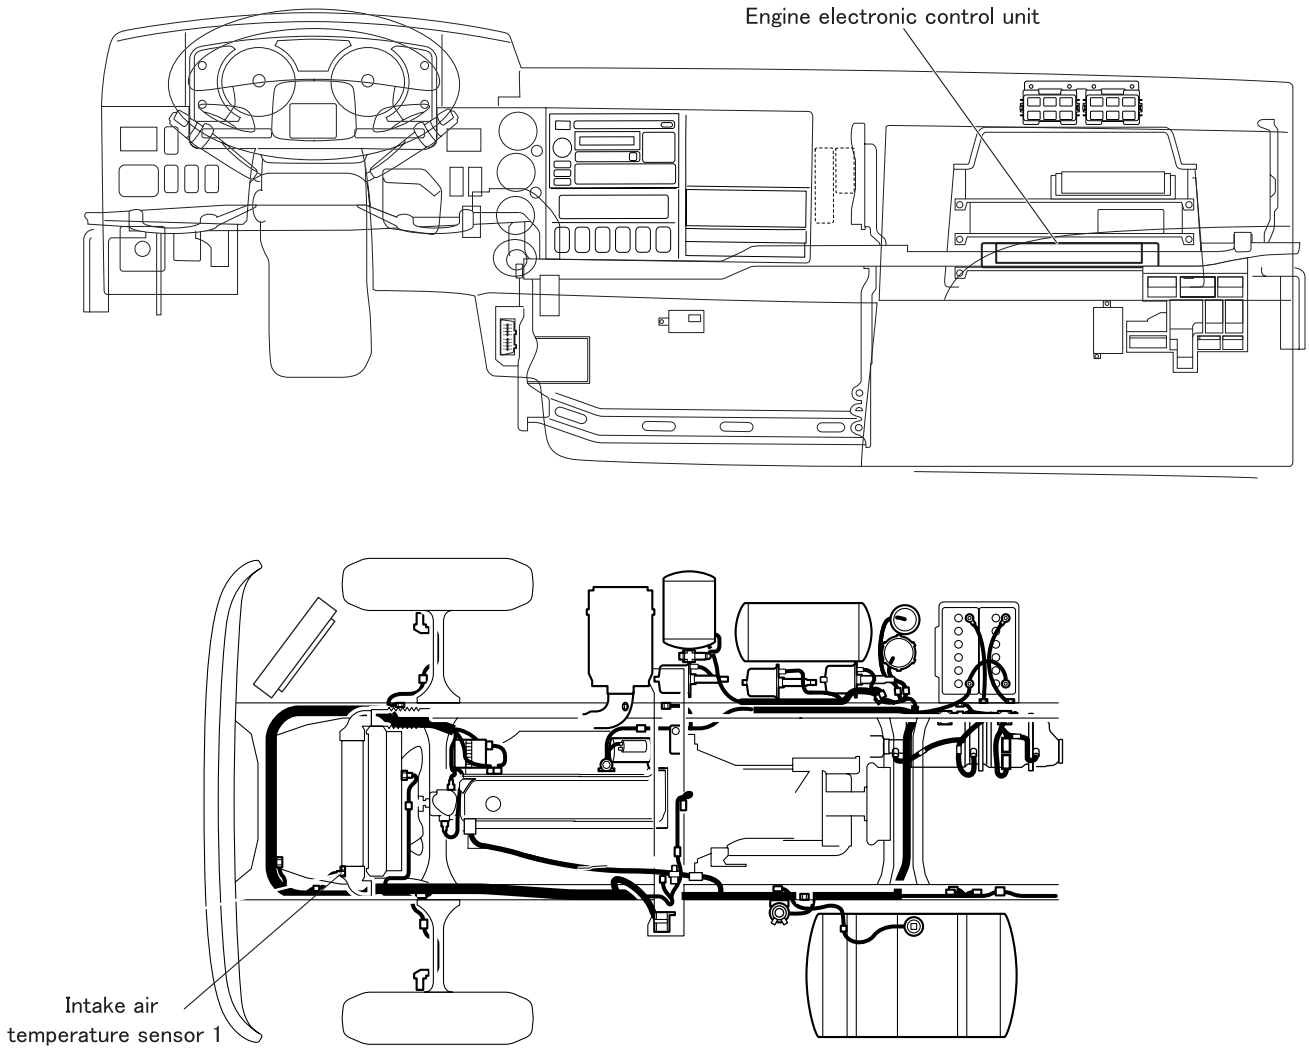
<Fault code>
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished. (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		**<General Scanning Tool used>** • Measure item “Intake Air Temperature” . **<Multi-Use Tester used>** • Measure item No. 27 “Intake Air Temperature” of Service Data.
	Inspection condition		–
	Requirements		When engine is cold: Temperature is equivalent to outside temperature.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

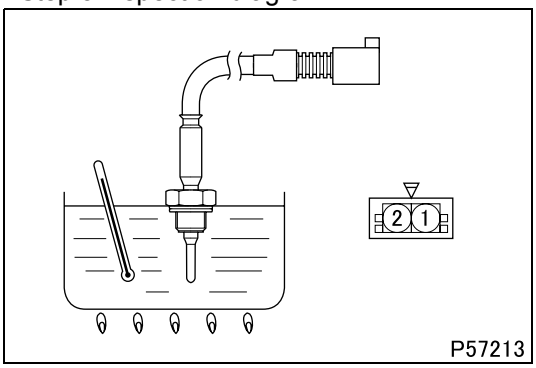
Step 2	Inspection items		Inspection by electronic control unit connector
	Maintenance item		Measure value of resistance between connector (GF31A) terminal No. 25 and (GF35A) terminal No. 26.
	Inspection condition		Disconnect electronic control unit from harness and measure from connection side of harness connector.
	Requirements		• 50°C {122°F}: 2.202 $^{+0.233}_{-0.208}$ kΩ • 100°C {212°F}: 508.1 $^{+41.3}_{-37.7}$ Ω • 150°C {302°F}: 160.4 $^{+10.3}_{-9.6}$ Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Go to step 4.

Step 3	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify connector.

Step 4	Inspection items		Inspection of intake air temperature sensor 1 connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Modify connector.

Step 5	Inspection items		Inspection of intake air temperature sensor 1 unit
	Maintenance item		Measure value of resistance between connector terminal No. 1 and 2.
	Inspection condition		• Put intake air temperature sensor 1 in vessel filled with engine oil. • Heat the oil to each of the specified temperatures. Stir the oil well while doing so.
	Requirements		• 50°C {122°F}: 2.202 $^{+0.233}_{-0.208}$ kΩ • 100°C {212°F}: 508.1 $^{+41.3}_{-37.7}$ Ω • 150°C {302°F}: 160.4 $^{+10.3}_{-9.6}$ Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Replacement of sensor

<Step 5 inspection diagram>



Step 6	Inspection items		Inspection of harness between electronic control unit and sensor (power supply)
	Maintenance item		Check circuit between sensor connector terminal No. 1 and electronic control unit connector (GF31A) terminal No. 25.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify harness.

Step 7	Inspection items		Inspection of harness between electronic control unit and sensor (ground)
	Maintenance item		Check circuit between sensor connector terminal No. 2 and electronic control unit connector (GF35A) terminal No. 26.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify harness.

Step 8	Inspection items		Inspection by control data
	Maintenance item		**<General Scanning Tool used>** • Measure item “Intake Air Temperature”. **<Multi-Use Tester used>** • Measure item No. 27 “Intake Air Temperature” of Service Data.
	Inspection condition		–
	Requirements		When engine is cold: Temperature is equivalent to outside temperature.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P0113/Flash code: 44
[Monitor]
Abnormality of intake air temperature sensor 1
[Fault (outline)]
High signal range check
[Diagnosis check]
- Output voltage of intake air temperature sensor 1 is monitored.

[Code generation condition]
- Voltage of intake air temperature sensor 1 remains over 4.9 V for approx. 2.5 seconds.
  (Warning lamp is lit and diagnosis code is displayed on second establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal

[Control effected by electronic control unit during fault]
- Intake air temperature 1 is fixed at –20°C {–4°F} at engine start and 25°C {77°F} when engine is running.

[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and intake air temperature sensor 1
- Abnormality of each connector
- Abnormality of intake air temperature sensor 1
- Abnormality in electronic control unit

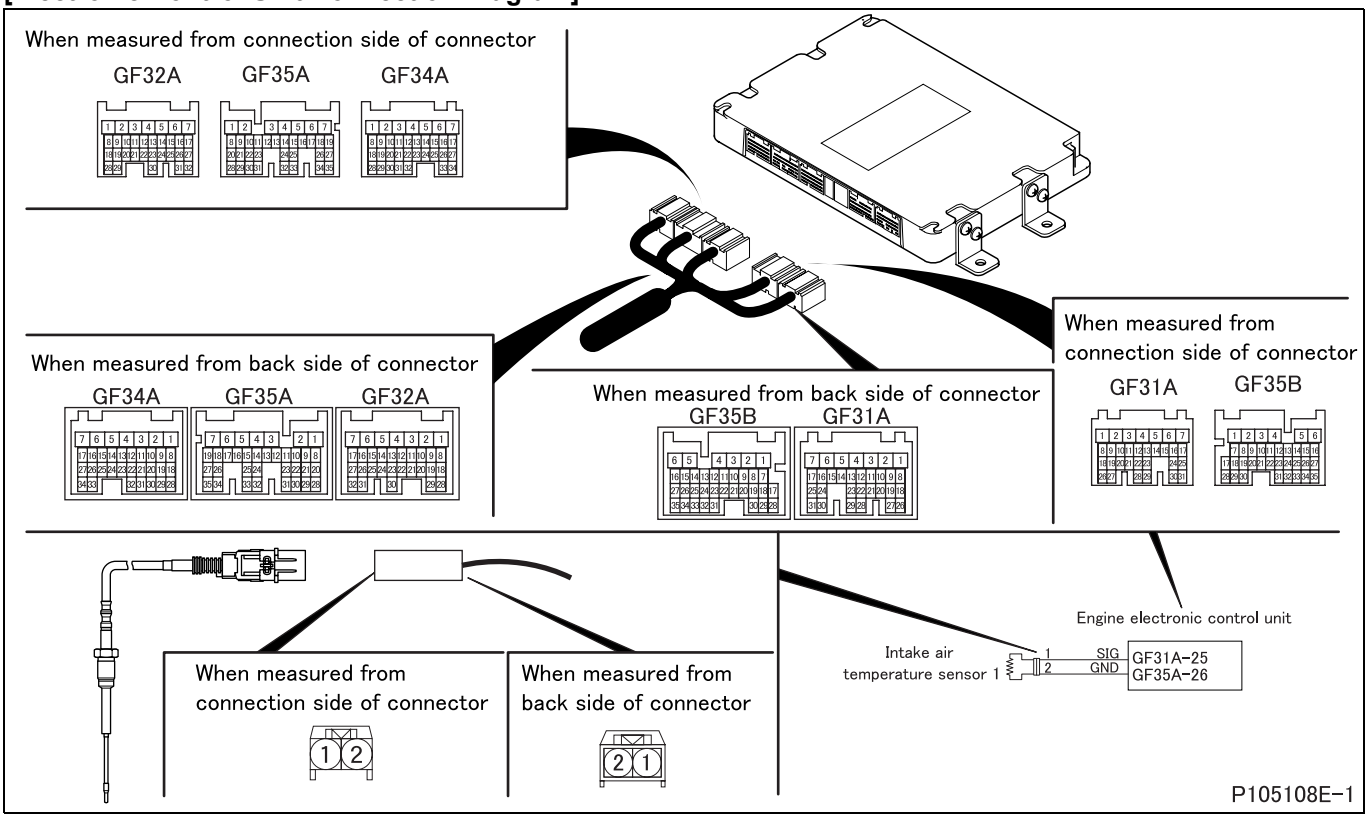
[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>
- Extinguished at 4th driving cycle after normal signal is input.

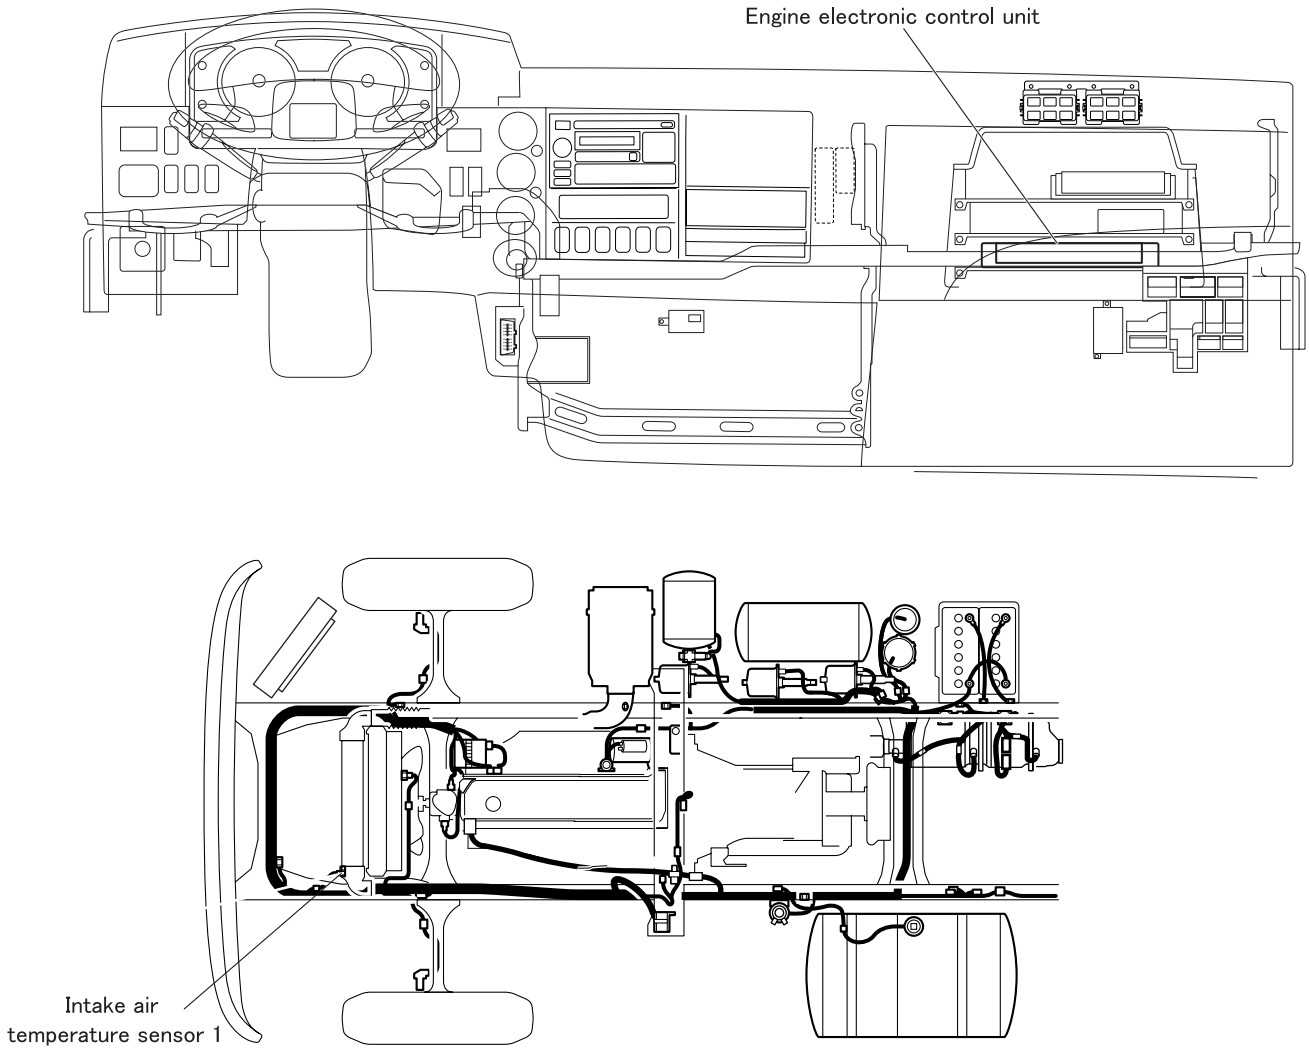
<Fault code>
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished. (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		**<General Scanning Tool used>** • Measure item “Intake Air Temperature” . **<Multi-Use Tester used>** • Measure item No. 27 “Intake Air Temperature” of Service Data.
	Inspection condition		–
	Requirements		When engine is cold: Temperature is equivalent to outside temperature.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

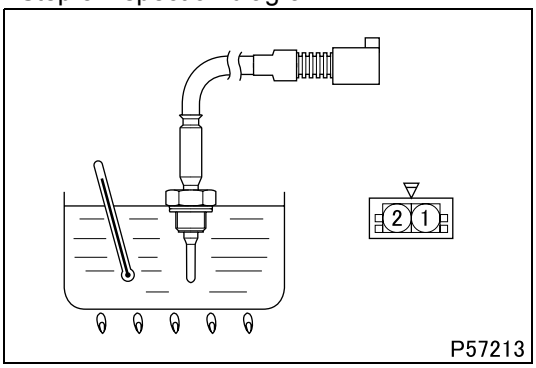
Step 2	Inspection items		Inspection by electronic control unit connector
	Maintenance item		Measure value of resistance between connector (GF31A) terminal No. 25 and (GF35A) terminal No. 26.
	Inspection condition		Disconnect electronic control unit from harness and measure from connection side of harness connector.
	Requirements		• 50°C {122°F}: 2.202 $^{+0.233}_{-0.208}$ kΩ • 100°C {212°F}: 508.1 $^{+41.3}_{-37.7}$ Ω • 150°C {302°F}: 160.4 $^{+10.3}_{-9.6}$ Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Go to step 4.

Step 3	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify connector.

Step 4	Inspection items		Inspection of intake air temperature sensor 1 connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Modify connector.

Step 5	Inspection items		Inspection of intake air temperature sensor 1 unit
	Maintenance item		Measure value of resistance between connector terminal No. 1 and 2.
	Inspection condition		• Put intake air temperature sensor 1 in vessel filled with engine oil. • Heat the oil to each of the specified temperatures. Stir the oil well while doing so.
	Requirements		• 50°C {122°F}: 2.202 $^{+0.233}_{-0.208}$ kΩ • 100°C {212°F}: 508.1 $^{+41.3}_{-37.7}$ Ω • 150°C {302°F}: 160.4 $^{+10.3}_{-9.6}$ Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Replacement of sensor

<Step 5 inspection diagram>



Step 6	Inspection items		Inspection of harness between electronic control unit and sensor (power supply)
	Maintenance item		Check circuit between sensor connector terminal No. 1 and electronic control unit connector (GF31A) terminal No. 25.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify harness.

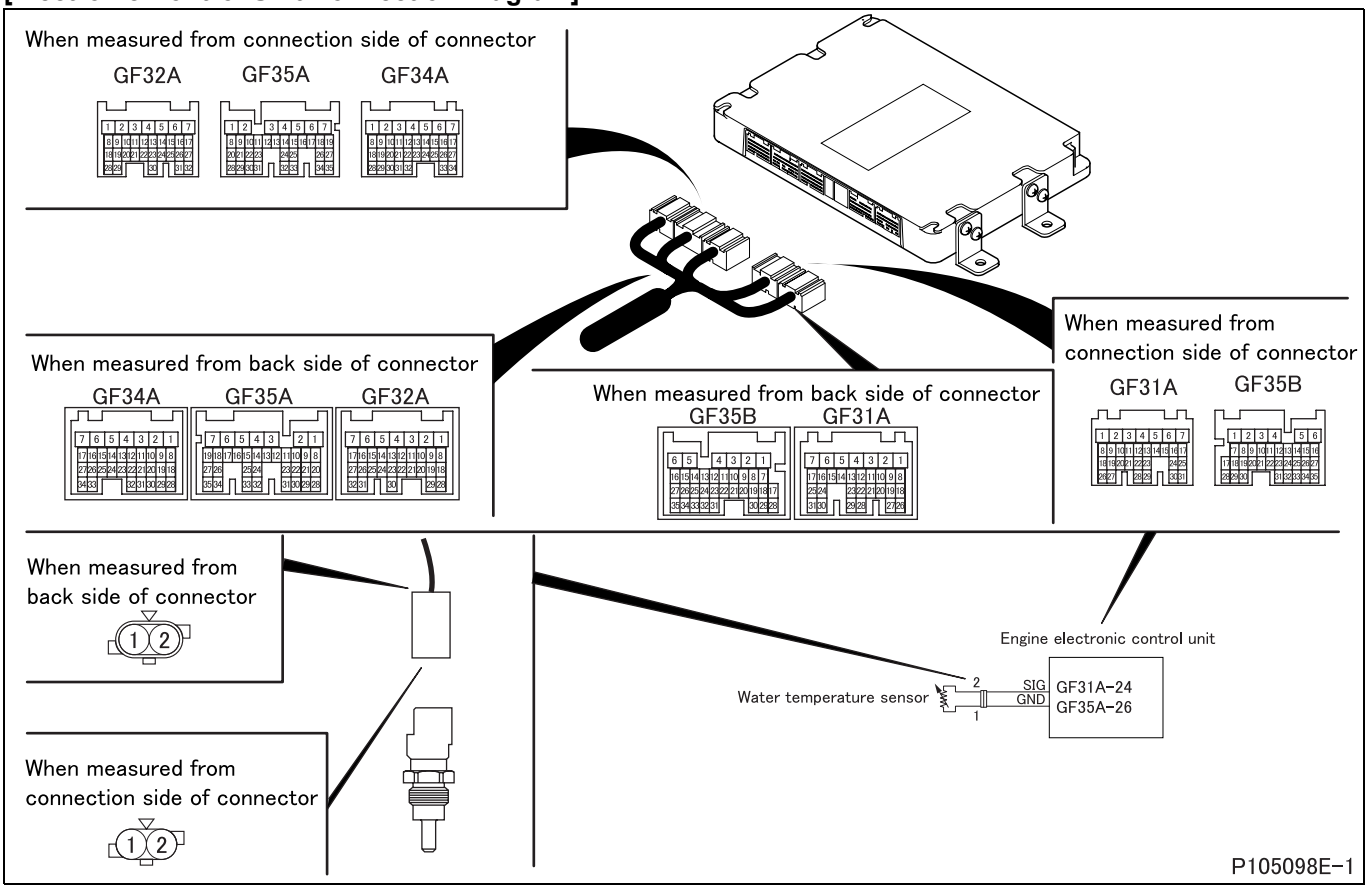
Step 7	Inspection items		Inspection of harness between electronic control unit and sensor (ground)
	Maintenance item		Check circuit between sensor connector terminal No. 2 and electronic control unit connector (GF35A) terminal No. 26.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify harness.

Step 8	Inspection items		Inspection by control data
	Maintenance item		**<General Scanning Tool used>** • Measure item “Intake Air Temperature”. **<Multi-Use Tester used>** • Measure item No. 27 “Intake Air Temperature” of Service Data.
	Inspection condition		–
	Requirements		When engine is cold: Temperature is equivalent to outside temperature.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic control unit

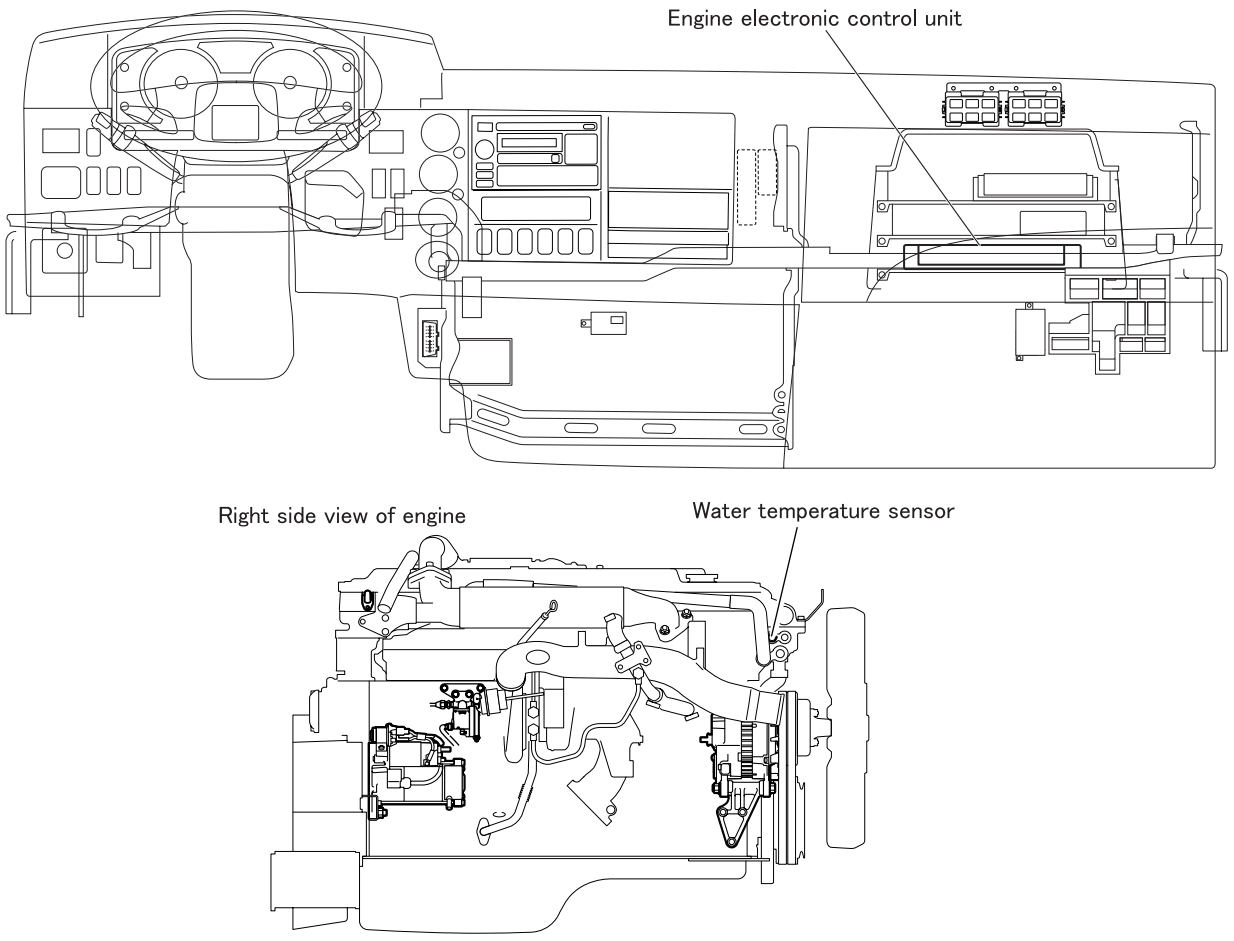
[Fault code]
Diagnosis code: P0116/Flash code: 21
[Monitor]
Characteristic abnormality of water temperature sensor
[Fault (outline)]
<Condition (1)>
• Gain Drift
<Condition (2)>
• Offset Drift
[Diagnosis check]
Perform the following checks.
<Condition (1)>
• Water temperature sensor output is checked to determine if it is within specified range under diagnosable conditions.
<Condition (2)>
• Check is performed if nothing abnormal is detected in condition (1).
• Water temperature after engine warm-up is checked to determine if it is within specified range.
[Code generation condition]
Diagnosis code is generated under either of the following conditions.
(Warning lamp is lit and diagnosis code is displayed on second establishment of code generation condition.)
<Condition (1)>
• Water temperature sensor output remains out of specified range for approx. 0.1 second.
<Condition (2)>
• Water temperature sensor output remains out of specified range for approx. 10 seconds.
[Diagnosis check timing]
• When code generation condition is established after starter switch ON
[Diagnostic requirement]
• Injection quantity: more than 40 mm^3/st
• Engine speed: more than 1000 rpm
• Time elapsed after engine start: more than 30 seconds
• Water temperature sensor: normal in output signal
• Intake air temperature sensor 1: normal in output signal (only condition (1))
• Battery voltage: normal
[Control effected by electronic control unit during fault]
• Effects no special control.
[Probable cause of trouble]
• Open-circuit or short-circuit of harness between electronic control unit and water temperature sensor
• Abnormality of each connector
• Abnormality of water temperature sensor
• Abnormality in electronic control unit
[Recoverability]
<Control during fault>
• Recovered if signal becomes normal with starter switch in ON position.
<Warning lamp>
• Extinguished at 4th driving cycle after normal signal is input.
<Fault code>
• Automatically cleared at 40th warm up cycle after warning lamp is extinguished. (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		**<General Scanning Tool used>** • Measure item “Engine Coolant Temperature”. **<Multi-Use Tester used>** • Measure item No. 35 “Water Temperature” of Service Data.
	Inspection condition		–
	Requirements		• When engine is cold: Temperature is equivalent to outside temperature. • While engine is warmed up: Temperature gradually rises up. • When engine is stopped after warm-up: Temperature gradually declines.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

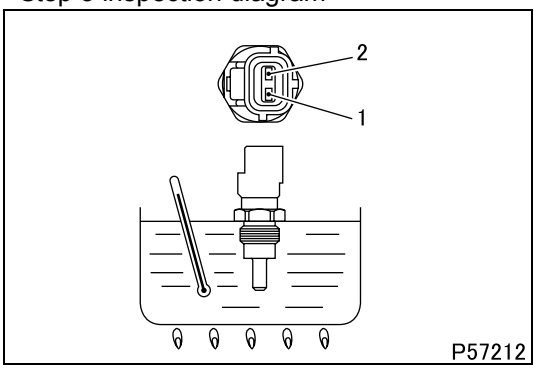
Step 2	Inspection items		Inspection by electronic control unit connector
	Maintenance item		Measure value of resistance between connector (GF31A) terminal No. 24 and (GF35A) terminal No. 26.
	Inspection condition		Disconnect electronic control unit from harness and measure from connection side of harness connector.
	Requirements		• 20°C {68°F}: 2.45 ± 0.14 kΩ • 80°C {176°F}: 0.32 kΩ (reference value) • 110°C {230°F}: 147.1 ± 2 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Go to step 4.

Step 3	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify harness.

Step 4	Inspection items		Inspection of water temperature sensor connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Modify connector.

Step 5	Inspection items		Inspection of water temperature sensor unit
	Maintenance item		Measure value of resistance between connector terminal No. 1 and 2.
	Inspection condition		• Put water temperature sensor in vessel filled with engine oil. • Heat the oil to each of the specified temperatures. Stir the oil well while doing so.
	Requirements		• 20°C {68°F}: 2.45 ± 0.14 kΩ • 80°C {176°F}: 0.32 kΩ (reference value) • 110°C {230°F}: 147.1 ± 2 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Replacement of sensor

<Step 5 inspection diagram>



Step 6	Inspection items		Inspection of harness between electronic control unit and sensor (power supply)
	Maintenance item		Check circuit between sensor connector terminal No. 2 and electronic control unit connector (GF31A) terminal No. 24.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify harness.

Step 7	Inspection items		Inspection of harness between electronic control unit and sensor (ground)
	Maintenance item		Check circuit between sensor connector terminal No. 1 and electronic control unit connector (GF35A) terminal No. 26.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify harness.

Step 8	Inspection items		Inspection by control data
	Maintenance item		**<General Scanning Tool used>** • Measure item “Engine Coolant Temperature”. **<Multi-Use Tester used>** • Measure item No. 35 “Water Temperature” of Service Data.
	Inspection condition		–
	Requirements		• When engine is cold: Temperature is equivalent to outside temperature. • While engine is warmed up: Temperature gradually rises up. • When engine is stopped after warm-up: Temperature gradually declines.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P0117/Flash code: 21
[Monitor]
Abnormality of water temperature sensor
[Fault (outline)]
Low signal range check
[Diagnosis check]
- Output voltage of water temperature sensor is monitored.

[Code generation condition]
- Voltage of water temperature sensor remains below 0.1 V for approx. 2.5 seconds.
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal

[Control effected by electronic control unit during fault]
- Water temperature is fixed at –20°C {–4°F} at engine start and 80°C {176°F} when engine is running (exhaust gas worsened).
- Injection quantity is limited.
- Exhaust gas recirculation control is stopped.
- Throttle control is stopped.
- Diesel particulate filter regeneration (manual or automatic) is stopped.

[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and water temperature sensor
- Abnormality of each connector
- Abnormality of water temperature sensor
- Abnormality in electronic control unit

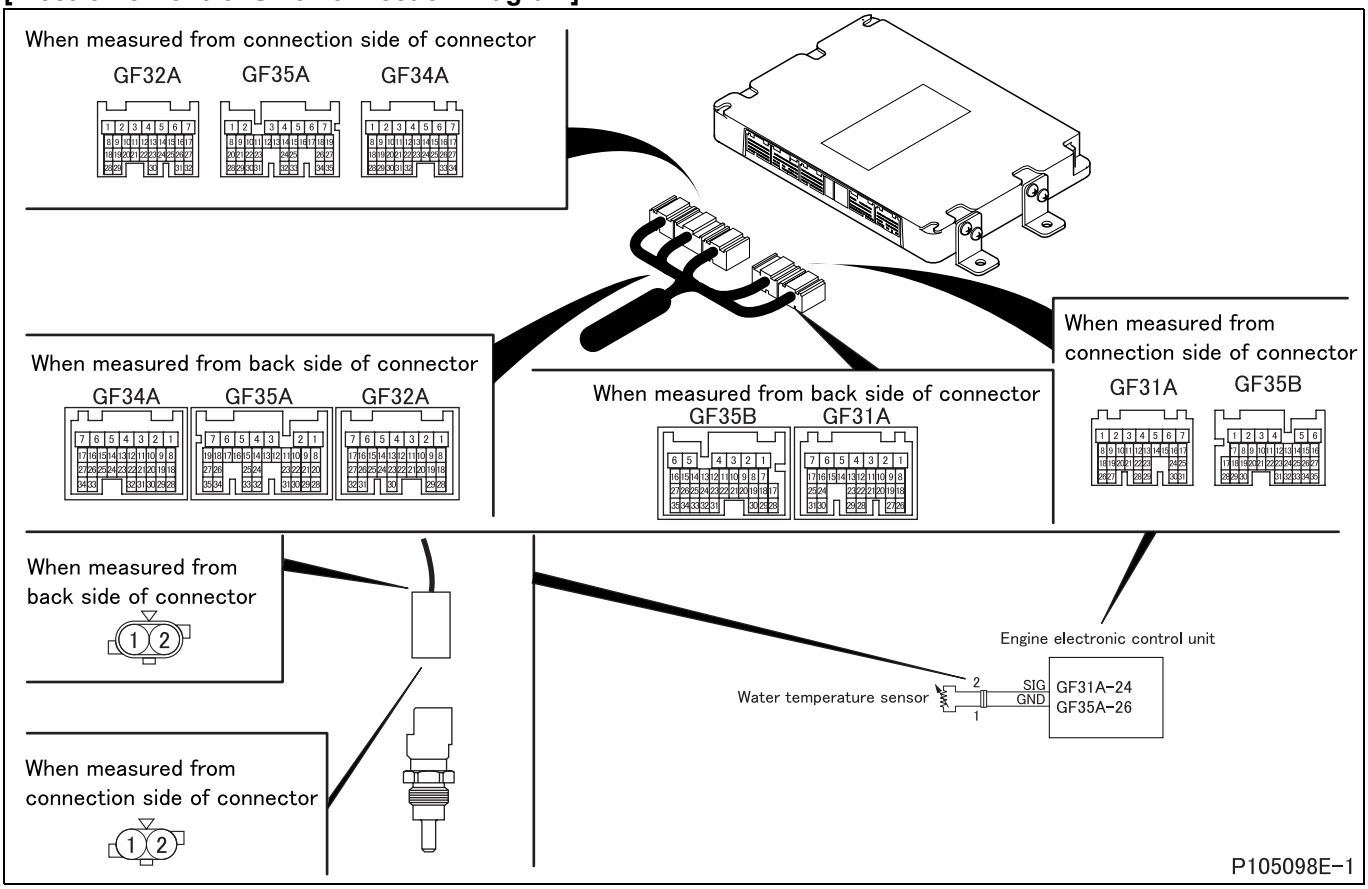
[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>
- Extinguished at 4th driving cycle after normal signal is input.

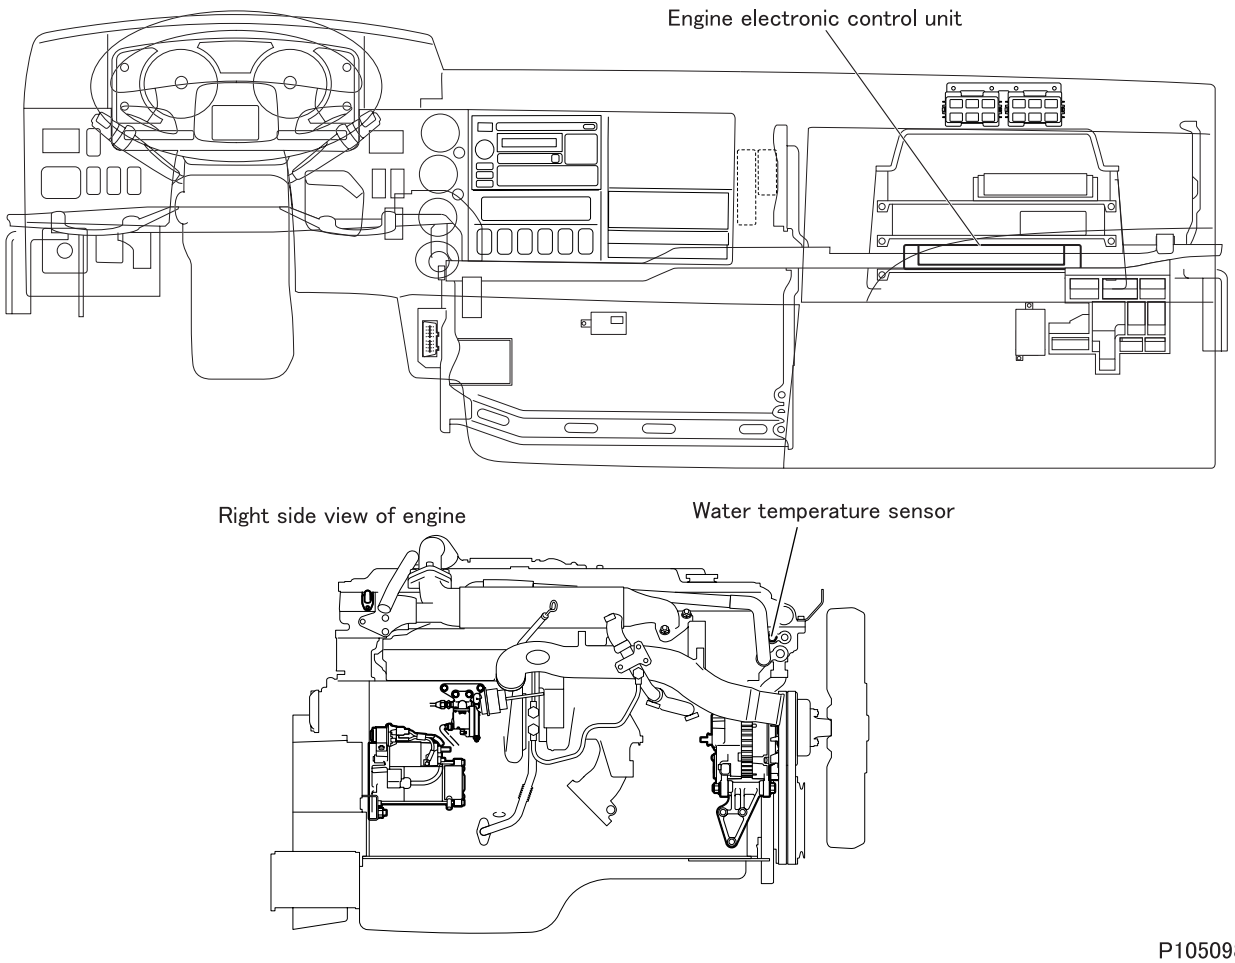
<Fault code>
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished. (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		**<General Scanning Tool used>** • Measure item “Engine Coolant Temperature”. **<Multi-Use Tester used>** • Measure item No. 35 “Water Temperature” of Service Data.
	Inspection condition		–
	Requirements		• When engine is cold: Temperature is equivalent to outside temperature. • While engine is warmed up: Temperature gradually rises up. • When engine is stopped after warm-up: Temperature gradually declines.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

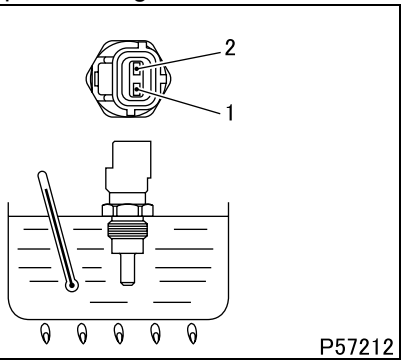
Step 2	Inspection items		Inspection by electronic control unit connector
	Maintenance item		Measure value of resistance between connector (GF31A) terminal No. 24 and (GF35A) terminal No. 26.
	Inspection condition		Disconnect electronic control unit from harness and measure from connection side of harness connector.
	Requirements		• 20°C {68°F}: 2.45 ± 0.14 kΩ • 80°C {176°F}: 0.32 kΩ (reference value) • 110°C {230°F}: 147.1 ± 2 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Go to step 4.

Step 3	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify harness.

Step 4	Inspection items		Inspection of water temperature sensor connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Modify connector.

Step 5	Inspection items		Inspection of water temperature sensor unit
	Maintenance item		Measure value of resistance between connector terminal No. 1 and 2.
	Inspection condition		• Put water temperature sensor in vessel filled with engine oil. • Heat the oil to each of the specified temperatures. Stir the oil well while doing so.
	Requirements		• 20°C {68°F}: 2.45 ± 0.14 kΩ • 80°C {176°F}: 0.32 kΩ (reference value) • 110°C {230°F}: 147.1 ± 2 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Replacement of sensor

<Step 5 inspection diagram>



Step 6	Inspection items		Inspection of harness between electronic control unit and sensor (power supply)
	Maintenance item		Check circuit between sensor connector terminal No. 2 and electronic control unit connector (GF31A) terminal No. 24.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify harness.

Step 7	Inspection items		Inspection of harness between electronic control unit and sensor (ground)
	Maintenance item		Check circuit between sensor connector terminal No. 1 and electronic control unit connector (GF35A) terminal No. 26.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify harness.

Step 8	Inspection items		Inspection by control data
	Maintenance item		**<General Scanning Tool used>** • Measure item “Engine Coolant Temperature”. **<Multi-Use Tester used>** • Measure item No. 35 “Water Temperature” of Service Data.
	Inspection condition		–
	Requirements		• When engine is cold: Temperature is equivalent to outside temperature. • While engine is warmed up: Temperature gradually rises up. • When engine is stopped after warm-up: Temperature gradually declines.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P0118/Flash code: 21
[Monitor]
Abnormality of water temperature sensor
[Fault (outline)]
High signal range check
[Diagnosis check]
- Output voltage of water temperature sensor is monitored.

[Code generation condition]
- Voltage of water temperature sensor remains over 4.8 V for approx. 2.5 seconds.
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal

[Control effected by electronic control unit during fault]
- Water temperature is fixed at –20°C {–4°F} at engine start and 80°C {176°F} when engine is running (exhaust gas worsened).
- Injection quantity is limited.
- Exhaust gas recirculation control is stopped.
- Throttle control is stopped.
- Diesel particulate filter regeneration (manual or automatic) is stopped.

[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and water temperature sensor
- Abnormality of each connector
- Abnormality of water temperature sensor
- Abnormality in electronic control unit

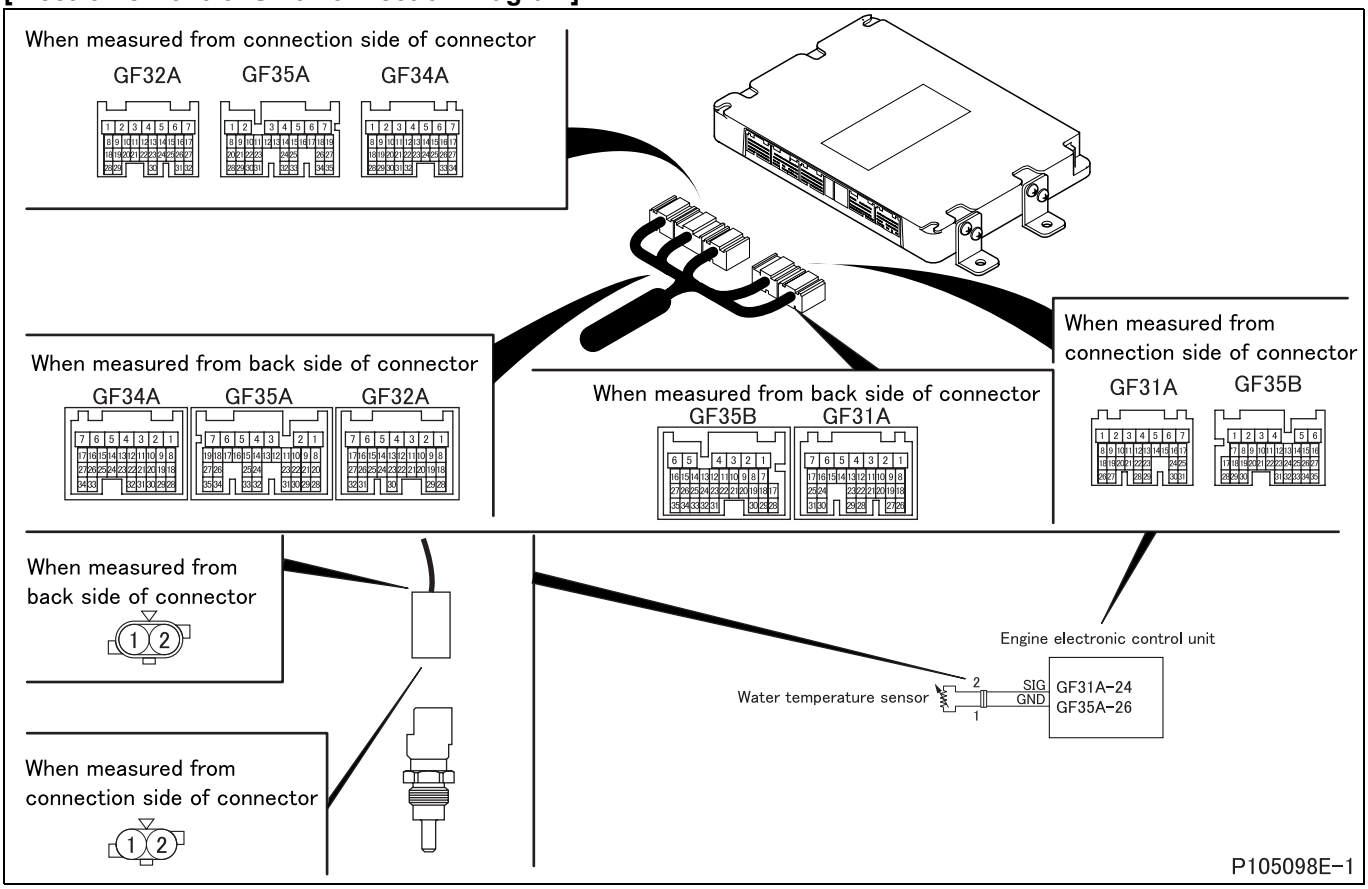
[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>
- Extinguished at 4th driving cycle after normal signal is input.

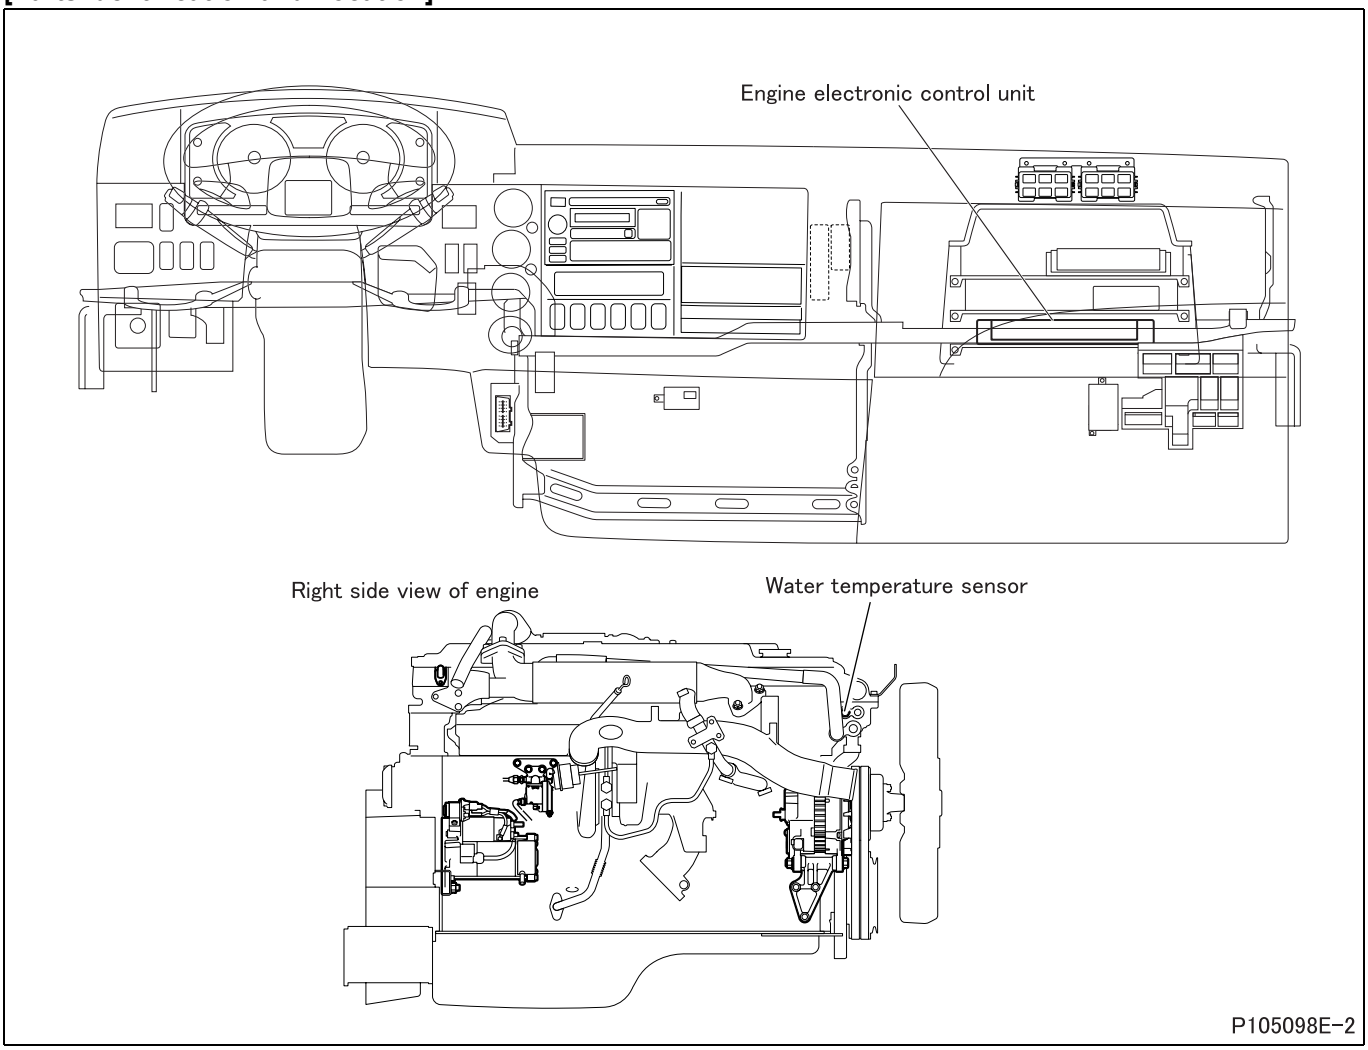
<Fault code>
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished. (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		**<General Scanning Tool used>** • Measure item “Engine Coolant Temperature”. **<Multi-Use Tester used>** • Measure item No. 35 “Water Temperature” of Service Data.
	Inspection condition		–
	Requirements		• When engine is cold: Temperature is equivalent to outside temperature. • While engine is warmed up: Temperature gradually rises up. • When engine is stopped after warm-up: Temperature gradually declines.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

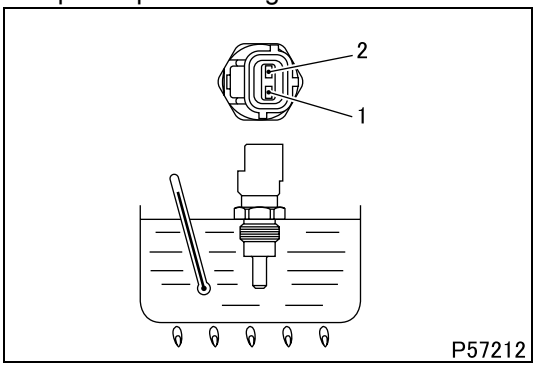
Step 2	Inspection items		Inspection by electronic control unit connector
	Maintenance item		Measure value of resistance between connector (GF31A) terminal No. 24 and (GF35A) terminal No. 26.
	Inspection condition		Disconnect electronic control unit from harness and measure from connection side of harness connector.
	Requirements		• 20°C {68°F}: 2.45 ± 0.14 kΩ • 80°C {176°F}: 0.32 kΩ (reference value) • 110°C {230°F}: 147.1 ± 2 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Go to step 4.

Step 3	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify harness.

Step 4	Inspection items		Inspection of water temperature sensor connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Modify connector.

Step 5	Inspection items		Inspection of water temperature sensor unit
	Maintenance item		Measure value of resistance between connector terminal No. 1 and 2.
	Inspection condition		• Put water temperature sensor in vessel filled with engine oil. • Heat the oil to each of the specified temperatures. Stir the oil well while doing so.
	Requirements		• 20°C {68°F}: 2.45 ± 0.14 kΩ • 80°C {176°F}: 0.32 kΩ (reference value) • 110°C {230°F}: 147.1 ± 2 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Replacement of sensor

<Step 5 inspection diagram>



Step 6	Inspection items		Inspection of harness between electronic control unit and sensor (power supply)
	Maintenance item		Check circuit between sensor connector terminal No. 2 and electronic control unit connector (GF31A) terminal No. 24.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify harness.

Step 7	Inspection items		Inspection of harness between electronic control unit and sensor (ground)
	Maintenance item		Check circuit between sensor connector terminal No. 1 and electronic control unit connector (GF35A) terminal No. 26.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify harness.

Step 8	Inspection items		Inspection by control data
	Maintenance item		**<General Scanning Tool used>** • Measure item “Engine Coolant Temperature”. **<Multi-Use Tester used>** • Measure item No. 35 “Water Temperature” of Service Data.
	Inspection condition		–
	Requirements		• When engine is cold: Temperature is equivalent to outside temperature. • While engine is warmed up: Temperature gradually rises up. • When engine is stopped after warm-up: Temperature gradually declines.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P0122/Flash code: 24
[Monitor]
Abnormality of accelerator pedal position sensor 1
[Fault (outline)]
Low signal range check
[Diagnosis check]
- Accelerator pedal position is monitored through accelerator pedal position sensor 1 to determine if it is within specified range.

[Code generation condition]
- Voltage of accelerator pedal position sensor 1 remains below 0.5 V for approx. 1 second.
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal

[Control effected by electronic control unit during fault]
- Control is carried out using output from accelerator pedal position sensor 2.
- When sensor 1 and 2 malfunctions, control is effected with accelerator pedal judged released from foot pressure.

[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and accelerator pedal position sensor 1
- Abnormality of each connector
- Abnormality in electronic control unit

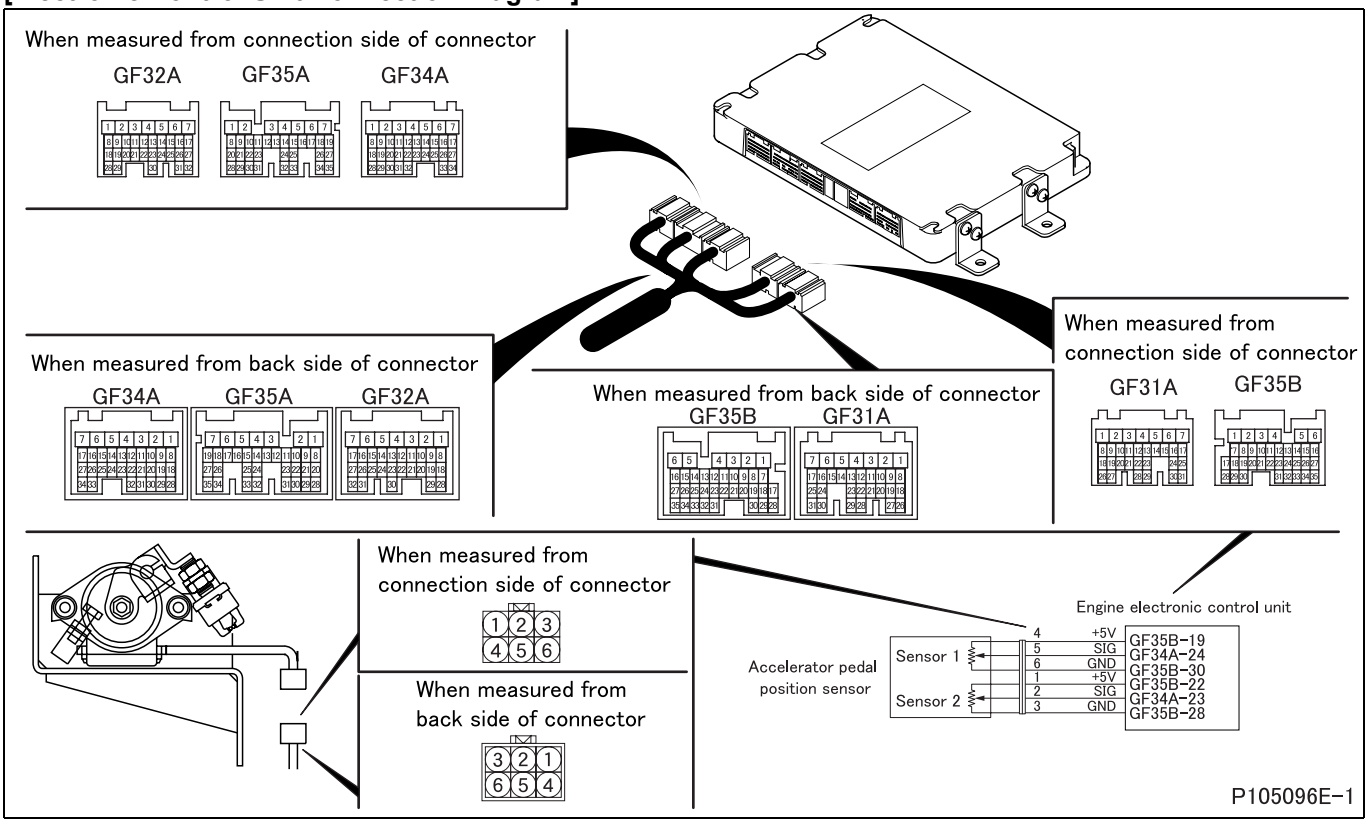
[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>
- Extinguished at 4th driving cycle after normal signal is input.

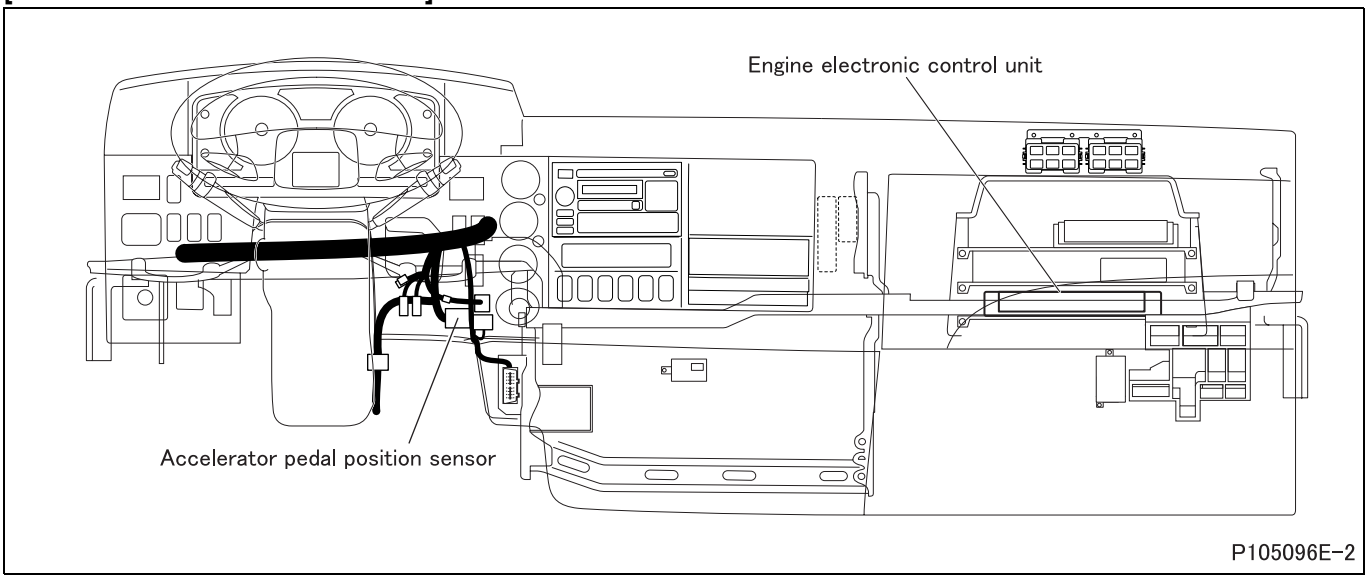
<Fault code>
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished. (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		**<General Scanning Tool used>** • Measure “Accelerator Pedal Position 1”. **<Multi-Use Tester used>** • Measure item No. 24 “Accelerator Pedal Sensor Voltage 1” of Service Data.
	Inspection condition		–
	Requirements		**<General Scanning Tool used>** • Accelerator pedal not pressed: 0% • Accelerator pedal pressed: 100% **<Multi-Use Tester used>** • Accelerator pedal not pressed: 0.85 ± 0.1 V • Accelerator pedal pressed: 4.15 ± 0.1 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

Step 2	Inspection items		Inspection by electronic control unit connector (signal)
	Maintenance item		Measure value of voltage between connector (GF34A) terminal No. 24 (+) and (GF35B) terminal No. 30 (–).
	Inspection condition		• Starter switch: ON • Engine is stopped. • Measure from back side of connector of harness with each device connected to harness.
	Requirements		• Accelerator pedal not pressed: 0.85 ± 0.1 V • Accelerator pedal pressed: 4.15 ± 0.1 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Go to step 3.

Step 3	Inspection items		Inspection by electronic control unit connector (power supply)
	Maintenance item		Measure value of voltage between connector (GF35B) terminal No. 19 (+) and No. 30 (–).
	Inspection condition		• Starter switch: ON • Engine is stopped. • Measure from back side of connector of harness with each device connected to harness.
	Requirements		5 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	Go to step 5.

Step 4	Inspection items		Inspection by electronic control unit connector (ground)
	Maintenance item		Measure value of voltage between connector (GF35B) terminal No. 30 (+) and (GF31A) terminal No. 3 (–).
	Inspection condition		• Starter switch: ON • Engine is stopped. • Measure from back side of connector of harness with each device connected to harness.
	Requirements		0 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Go to step 5.

Step 5	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 12.
		NO	Modify connector.

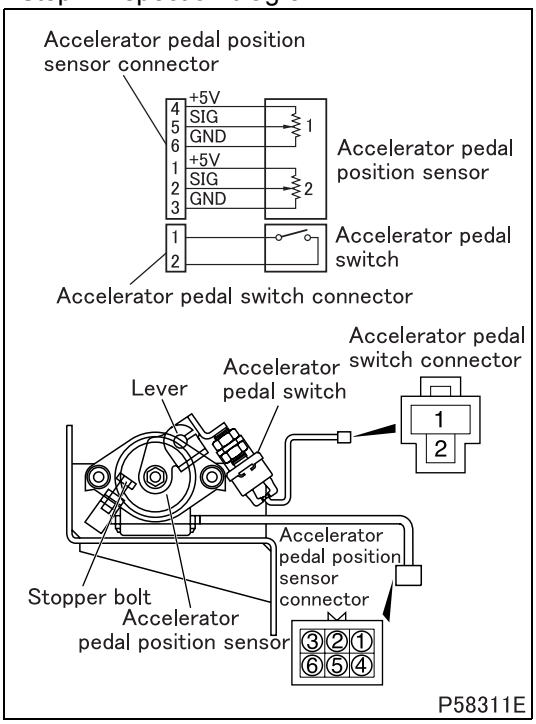
Step 6	Inspection items		Inspection of sensor connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify connector.

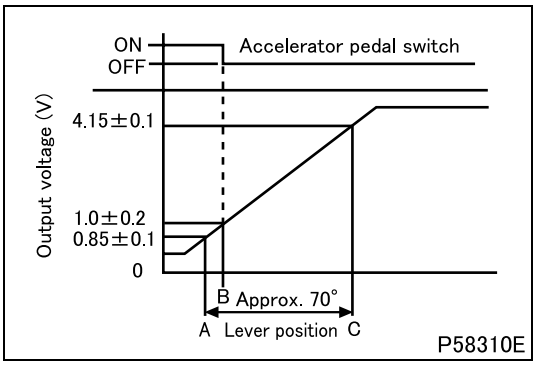
Step 7	Inspection items		Inspection of accelerator pedal position sensor 1 unit
	Maintenance item		Measure value of voltage between connector terminals No. 5 (+) and 6 (–).
	Inspection condition		Apply voltage DC 5 V across connector terminals No. 4 (+) and 6 (–).

	Requirements		• Idle position A: 0.85 ± 0.1 V
			• Accelerator pedal switch operating position B: 1.0 ± 0.2 V
			• Full load position C: 4.15 ± 0.1 V
			  • A: When accelerator lever fully presses accelerator pedal switch.
			  • B: When accelerator pedal is pressed until there is no continuity between accelerator pedal switch connector terminals 1 and 2.
			  • C: When accelerator lever is in contact with full load stopper bolt.

	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Adjustment of sensor (If the measurement deviates from the standard value after adjustment, replace the sensor.) (See “INSPECTION OF ELECTRICAL EQUIPMENT” – “Inspection of accelerator pedal position sensor”.)

<Step 7 inspection diagram>





Step 8	Inspection items		Inspection by sensor connector
	Maintenance item		Measure value of voltage between connector terminal No. 4 (+) and 6 (–).
	Inspection condition		• Starter switch: ON • Engine is stopped. • Measure from back side of connector of harness with each device connected to harness.
	Requirements		5 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 10.
		NO	Go to step 9.

Step 9	Inspection items		Inspection of harness between electronic control unit and sensor (power supply)
	Maintenance item		Check circuit between electronic control unit connector (GF35B) terminal No. 19 and sensor connector terminal No. 4.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 12.
		NO	Modify harness.

Step 10	Inspection items		Inspection of harness between electronic control unit and sensor (ground)
	Maintenance item		Check circuit between electronic control unit connector (GF35B) terminal No. 30 and sensor connector terminal No. 6.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 11.
		NO	Modify harness.

Step 11	Inspection items		Inspection of harness between electronic control unit and sensor (signal)
	Maintenance item		Check circuit between electronic control unit connector (GF34A) terminal No. 24 and sensor connector terminal No. 5.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 12.
		NO	Modify harness.

Step 12	Inspection items		Inspection by control data
	Maintenance item		**<General Scanning Tool used>** • Measure item “Accelerator Pedal Position 1”. **<Multi-Use Tester used>** • Measure item No. 24 “Accel Pedal Sensor Voltage 1” of Service Data.
	Inspection condition		–
	Requirements		**<General Scanning Tool used>** • Accelerator pedal not pressed: 0% • Accelerator pedal pressed: 100% **<Multi-Use Tester used>** • Accelerator pedal not pressed: 0.85 ± 0.1 V • Accelerator pedal pressed: 4.15 ± 0.1 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P0123/Flash code: 24
[Monitor]
Abnormality of accelerator pedal position sensor 1
[Fault (outline)]
High signal range check
[Diagnosis check]
- Output voltage of accelerator pedal position sensor 1 is monitored.

[Code generation condition]
- Voltage of accelerator pedal position sensor 1 remains over 4.5 V for approx. 1 second.
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal

[Control effected by electronic control unit during fault]
- Control is carried out using output from accelerator pedal position sensor 2.
- When sensor 1 and 2 malfunctions, control is effected with accelerator pedal judged released from foot pressure.

[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and accelerator pedal position sensor 1
- Abnormality of each connector
- Abnormality of accelerator pedal position sensor 1
- Abnormality in electronic control unit

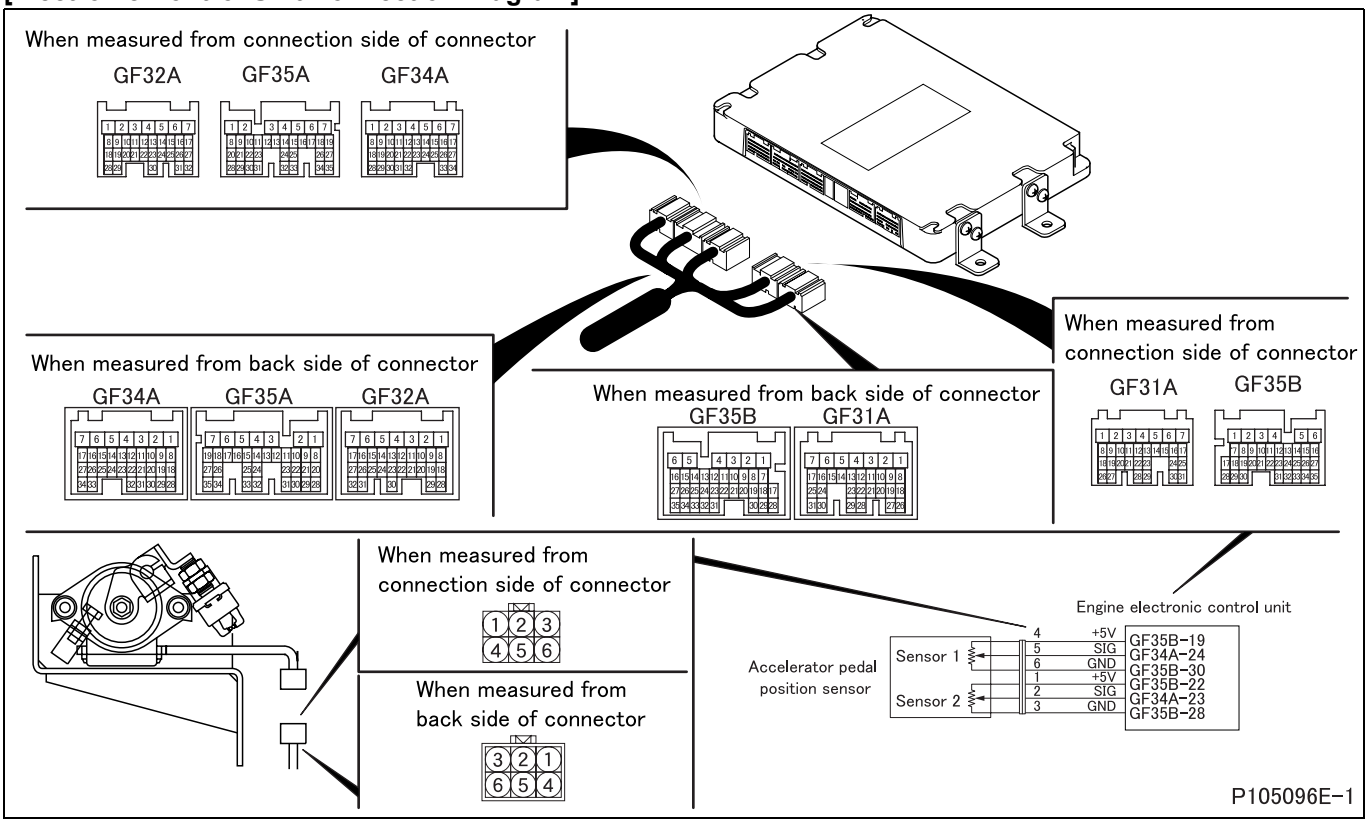
[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>
- Extinguished at 4th driving cycle after normal signal is input.

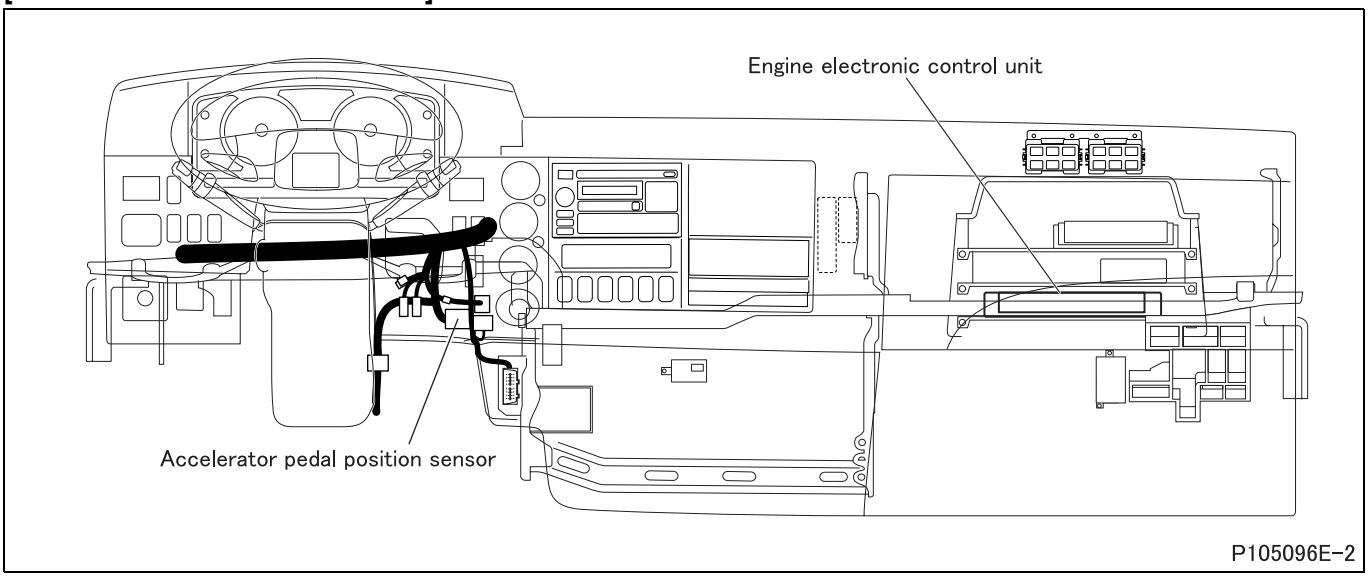
<Fault code>
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished. (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		**<General Scanning Tool used>** • Measure “Accelerator Pedal Position 1”. **<Multi-Use Tester used>** • Measure item No. 24 “Accelerator Pedal Sensor Voltage 1” of Service Data.
	Inspection condition		–
	Requirements		**<General Scanning Tool used>** • Accelerator pedal not pressed: 0% • Accelerator pedal pressed: 100% **<Multi-Use Tester used>** • Accelerator pedal not pressed: 0.85 ± 0.1 V • Accelerator pedal pressed: 4.15 ± 0.1 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

Step 2	Inspection items		Inspection by electronic control unit connector (signal)
	Maintenance item		Measure value of voltage between connector (GF34A) terminal No. 24 (+) and (GF35B) terminal No. 30 (–).
	Inspection condition		• Starter switch: ON • Engine is stopped. • Measure from back side of connector of harness with each device connected to harness.
	Requirements		• Accelerator pedal not pressed: 0.85 ± 0.1 V • Accelerator pedal pressed: 4.15 ± 0.1 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Go to step 3.

Step 3	Inspection items		Inspection by electronic control unit connector (power supply)
	Maintenance item		Measure value of voltage between connector (GF35B) terminal No. 19 (+) and No. 30 (–).
	Inspection condition		• Starter switch: ON • Engine is stopped. • Measure from back side of connector of harness with each device connected to harness.
	Requirements		5 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	Go to step 5.

Step 4	Inspection items		Inspection by electronic control unit connector (ground)
	Maintenance item		Measure value of voltage between connector (GF35B) terminal No. 30 (+) and (GF31A) terminal No. 3 (–).
	Inspection condition		• Starter switch: ON • Engine is stopped. • Measure from back side of connector of harness with each device connected to harness.
	Requirements		0 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Go to step 5.

Step 5	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 12.
		NO	Modify connector.

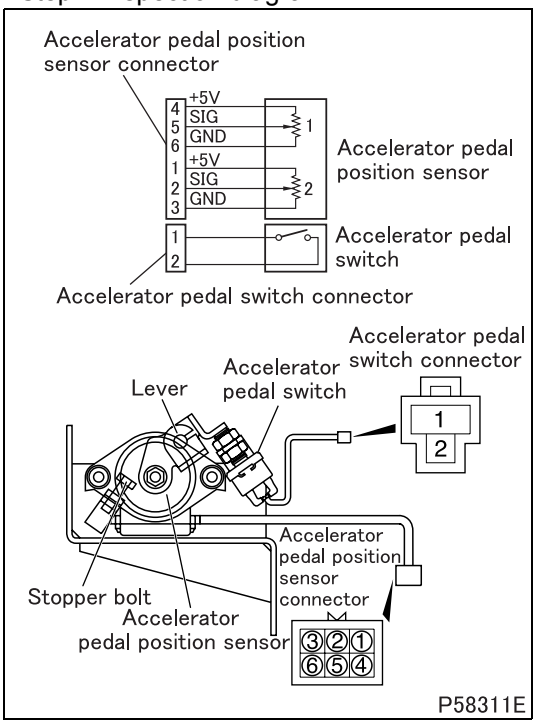
Step 6	Inspection items		Inspection of sensor connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify connector.

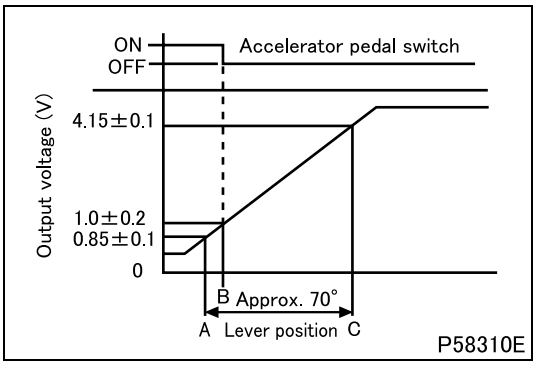
Step 7	Inspection items		Inspection of accelerator pedal position sensor 1 unit
	Maintenance item		Measure value of voltage between connector terminals No. 5 (+) and 6 (–).
	Inspection condition		Apply voltage DC 5 V across connector terminals No. 4 (+) and 6 (–).

	Requirements		• Idle position A: 0.85 ± 0.1 V
			• Accelerator pedal switch operating position B: 1.0 ± 0.2 V
			• Full load position C: 4.15 ± 0.1 V
			  • A: When accelerator lever fully presses accelerator pedal switch.
			  • B: When accelerator pedal is pressed until there is no continuity between accelerator pedal switch connector terminals 1 and 2.
			  • C: When accelerator lever is in contact with full load stopper bolt.

	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Adjustment of sensor (If the measurement deviates from the standard value after adjustment, replace the sensor.) (See “INSPECTION OF ELECTRICAL EQUIPMENT” – “Inspection of accelerator pedal position sensor”.)

<Step 7 inspection diagram>





Step 8	Inspection items		Inspection by sensor connector
	Maintenance item		Measure value of voltage between connector terminal No. 4 (+) and 6 (–).
	Inspection condition		• Starter switch: ON • Engine is stopped. • Measure from back side of connector of harness with each device connected to harness.
	Requirements		5 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 10.
		NO	Go to step 9.

Step 9	Inspection items		Inspection of harness between electronic control unit and sensor (power supply)
	Maintenance item		Check circuit between electronic control unit connector (GF35B) terminal No. 19 and sensor connector terminal No. 4.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 12.
		NO	Modify harness.

Step 10	Inspection items		Inspection of harness between electronic control unit and sensor (ground)
	Maintenance item		Check circuit between electronic control unit connector (GF35B) terminal No. 30 and sensor connector terminal No. 6.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 11.
		NO	Modify harness.

Step 11	Inspection items		Inspection of harness between electronic control unit and sensor (signal)
	Maintenance item		Check circuit between electronic control unit connector (GF34A) terminal No. 24 and sensor connector terminal No. 5.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 12.
		NO	Modify harness.

Step 12	Inspection items		Inspection by control data
	Maintenance item		**<General Scanning Tool used>** • Measure item “Accelerator Pedal Position 1”. **<Multi-Use Tester used>** • Measure item No. 24 “Accel Pedal Sensor Voltage 1” of Service Data.
	Inspection condition		–
	Requirements		**<General Scanning Tool used>** • Accelerator pedal not pressed: 0% • Accelerator pedal pressed: 100% **<Multi-Use Tester used>** • Accelerator pedal not pressed: 0.85 ± 0.1 V • Accelerator pedal pressed: 4.15 ± 0.1 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P0148/Flash code: 36
[Monitor]
Operation of pressure limiter
[Fault (outline)]
Excessive rail pressure
[Diagnosis check]
- Check is performed for fuel leakage (diagnosis code No. P0093) and excessive rail pressure (higher than specified) to determine rail pressure drop as consequence of pressure limiter activation.

[Code generation condition]
- Fuel leakage and excessive rail pressure are detected.
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- Starter switch: ON
- Battery voltage: normal

[Control effected by electronic control unit during fault]
- Injection quantity is limited.
- Exhaust gas recirculation control is stopped.
- Throttle control is stopped.
- Diesel particulate filter regeneration (manual or automatic) is stopped.

[Probable cause of trouble]
- Abnormality of supply pump
- Abnormality of pressure limiter
- Airtight abnormality of injector
- Plugged fuel system
- Fuel leakage
- Abnormality of common rail pressure sensor

[Recoverability]
<Control during fault>
- Recovered if signal becomes normal when starter switch is turned OFF to ON (power supply resumed to electronic control unit).

<Warning lamp>
- Extinguished after input of normal signal.

<Fault code>
- If code recovered to normal, automatically cleared at 40th warm up cycle after warning lamp is lit. (To clear as desired, erase from the memory.)

Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Fault diagnosis]
- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. B9 “Fuel Leak Check”.
	Inspection condition		• Vehicle: stationary (vehicle speed 0 km/h {0 MPH}) • Transmission: neutral • Engine start: At idle
	Requirements		There is no fuel leak.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (see Gr00.).
		NO	Go to step 2.

Step 2	Inspection items		Checking of engine appearance
	Maintenance item		Check fuel system for fuel leak.
	Inspection condition		Starter switch: OFF
	Requirements		There is no fuel leak.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Go to step 6.

Step 3	Inspection items		Inspection of low pressure piping (fuel tank – supply pump)
	Maintenance item		Check suction pipe or hose for blocking.
	Inspection condition		Starter switch: OFF
	Requirements		There is no blocking on pipe or hose.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	Correct and replace suction pipe or hose.

Step 4	Inspection items		Checking of air bleeding
	Maintenance item		Bleed air from fuel filter.
	Inspection condition		Starter switch: OFF
	Requirements		Problem is solved by bleeding air.
	Inspection result (Is the judging standard satisfied?)	YES	–
		NO	Go to step 5.

Step 5	Inspection items		Inspection of fuel filter
	Maintenance item		Fuel filter clogged
	Inspection condition		Starter switch: OFF
	Requirements		Problem is solved by replacing fuel filter.
	Inspection result (Is the judging standard satisfied?)	YES	–
		NO	Go to step 6.

Step 6	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. B9 “Fuel Leak Check”.
	Inspection condition		• Vehicle: stationary (vehicle speed 0 km/h {0 MPH}) • Transmission: neutral • Engine start: At idle
	Requirements		There is no leak from supply pump.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Inspection of supply pump (contact DENSO Service Station) or replace.

Step 7	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. B9 “Fuel Leak Check”.
	Inspection condition		• Vehicle: stationary (vehicle speed 0 km/h {0 MPH}) • Transmission: neutral • Engine start: At idle
	Requirements		There is no leak from fuel pipe between supply pump and rail.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Replacement of fuel pipe

Step 8	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. B9 “Fuel Leak Check”.
	Inspection condition		• Vehicle: stationary (vehicle speed 0 km/h {0 MPH}) • Transmission: neutral • Engine start: At idle
	Requirements		There is no leak from rail.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 9.
		NO	Inspection of rail (contact DENSO Service Station) or replace.

Step 9	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. B9 “Fuel Leak Check”.
	Inspection condition		• Vehicle: stationary (vehicle speed 0 km/h {0 MPH}) • Transmission: neutral • Engine start: At idle
	Requirements		There is no leak from fuel injection pipes (six) between injector and rail.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 10.
		NO	Replacement of injection pipe

Step 10	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. B9 “Fuel Leak Check”.
	Inspection condition		• Vehicle: statonary (vehicle speed 0 km/h {0 MPH}) • Transmission: neutral • Engine start: At idle
	Requirements		There is no leak from injectors (six).
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 11.
		NO	Inspection of injector (contact DENSO Service Station) or replace.

Step 11	Inspection items		Check inside of combustion chamber.
	Maintenance item		Check for fuel leak.
	Inspection condition		• After performing actuator test item No. B9 “Fuel Leak Check”, stop engine. • Remove glow plug, and check from glow plug mounting hole using bore scope.
	Requirements		Inside of combustion chamber is not wet.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 12.
		NO	Inspection of injector of object cylinder (contact DENSO Service Station) or replace.

Step 12	Inspection items		Inspection of rail (pressure limiter) (contact DENSO Service Station) or replace.
	Maintenance item		–
	Inspection condition		–
	Requirements		Problem is solved by repairing or replacing rail (pressure limiter).
	Inspection result (Is the judging standard satisfied?)	YES	–
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P0181/Flash code: 41
[Monitor]
Characteristic abnormality of fuel temperature sensor 1 and 2
[Fault (outline)]
Gain and offset drift
[Diagnosis check]
- Output difference between fuel temperature sensors 1 and 2 under given condition is checked to determine if it is within specified range.

[Code generation condition]
- Output difference between fuel temperature sensors 1 and 2 remains out of specified range for approx. 10 seconds.
  (Warning lamp is lit and diagnosis code is displayed on second establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- Engine running time: more than 900 seconds
- Fuel temperature sensor 1: normal in output signal
- Fuel temperature sensor 2: normal in output signal
- Common rail pressure sensor: normal in output signal

[Control effected by electronic control unit during fault]
- Effects no special control.

[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and fuel temperature sensor 1
- Abnormality of each connector
- Abnormality of fuel temperature sensor 1
- Abnormality in electronic control unit

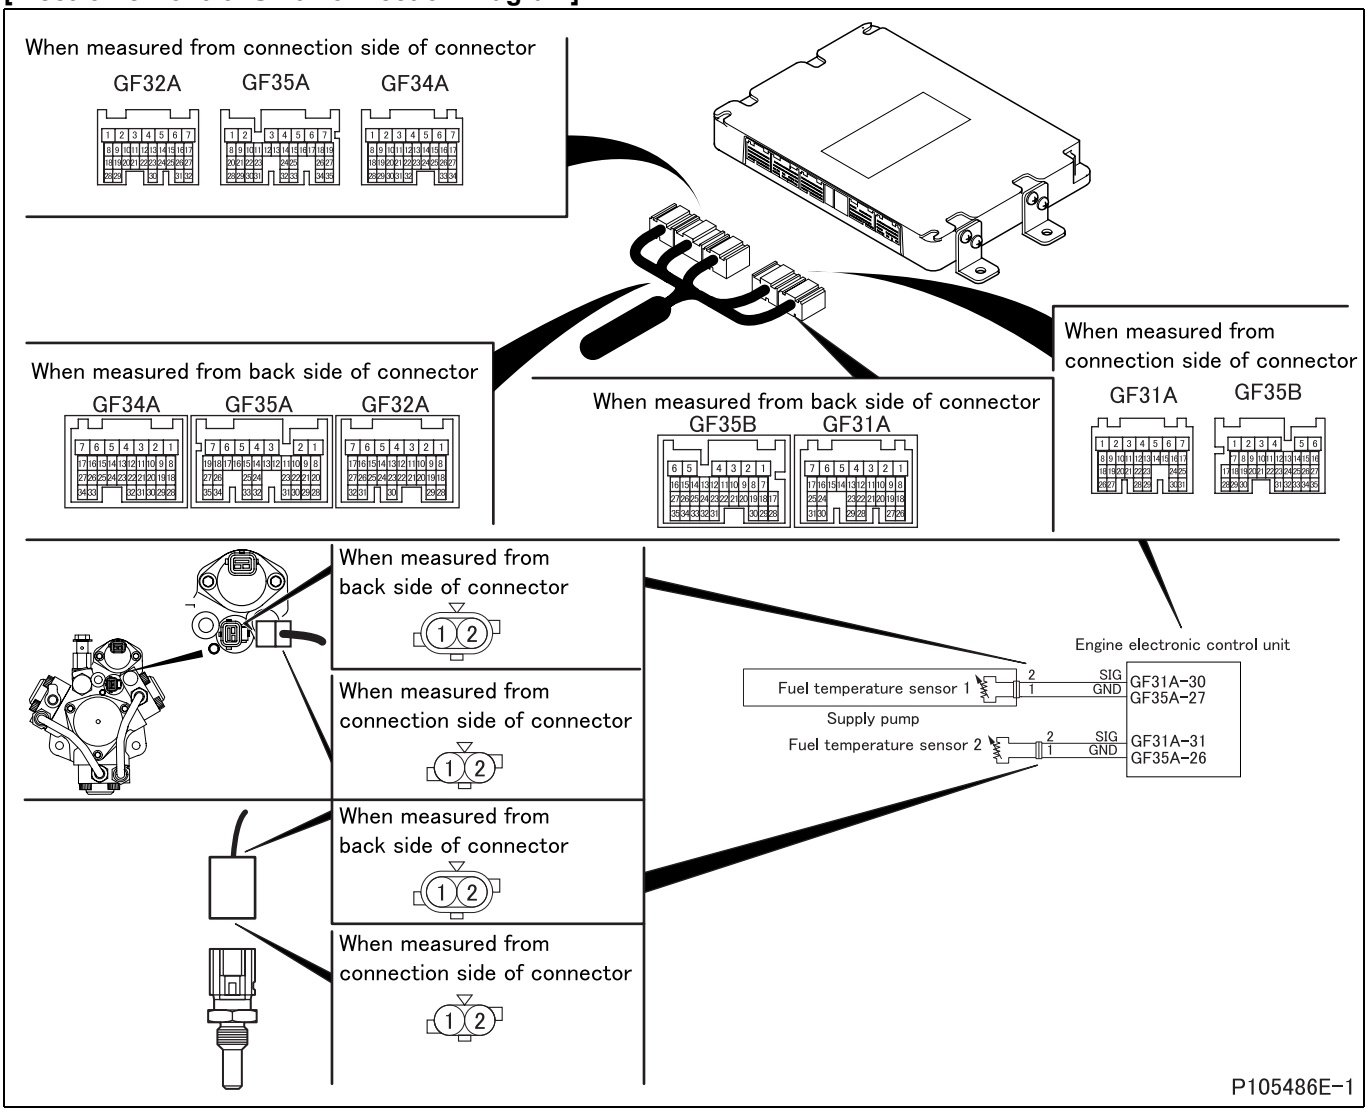
[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>
- Extinguished at 4th driving cycle after normal signal is input.

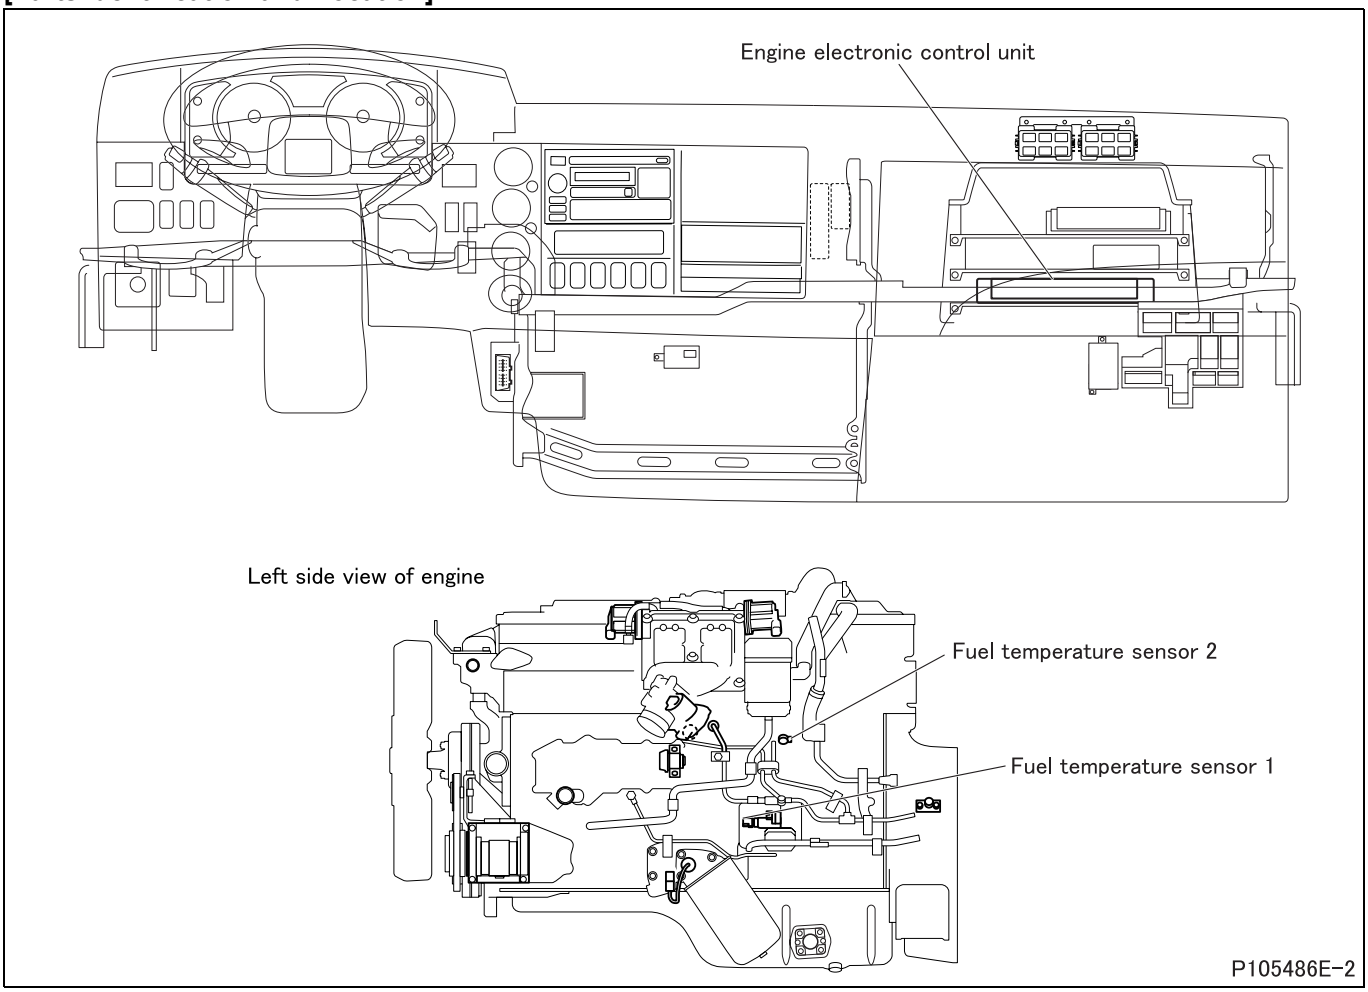
<Fault code>
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished. (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		Measure item No. 36 “Fuel Temperature (inlet)” of Service Data.
	Inspection condition		–
	Requirements		• When engine is cold: Temperature is equivalent to outside temperature. • While engine is warmed up: Temperature gradually rises up. • When engine is stopped after warm-up: Temperature rise up just after engine stopped, then gradually decline.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Go to step 2.

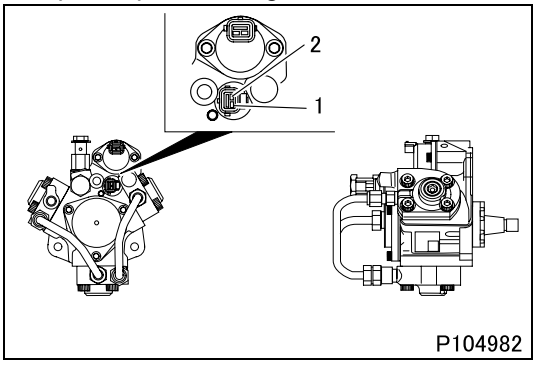
Step 2	Inspection items		Inspection by electronic control unit connector
	Maintenance item		Measure value of voltage between connector (GF31A) terminal No. 30 and (GF35A) terminal 27.
	Inspection condition		• Measure from back side of connector of harness with each device connected to harness. • Starter switch: ON
	Requirements		• –20°C {–4°F}: 15.0 ± 1.5 kΩ • 20°C {68°F}: 2.45 ± 0.24 kΩ • 80°C {176°F}: 0.318 ± 0.008 kΩ
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Go to step 4.

Step 3	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify connector.

Step 4	Inspection items		Inspection of sensor connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Modify connector.

Step 5	Inspection items		Inspection of fuel temperature sensor 1 unit
	Maintenance item		Measure value of resistance between connector terminal No. 1 and 2.
	Inspection condition		Put sensor in vessel filled with engine oil.
	Requirements		• –20°C {–4°F}: 15.0 ± 1.5 kΩ • 20°C {68°F}: 2.45 ± 0.24 kΩ • 80°C {176°F}: 0.318 ± 0.008 kΩ
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Replacement of sensor

<Step 5 inspection diagram>



Step 6	Inspection items		Inspection of harness between electronic control unit and sensor (power supply)
	Maintenance item		Check circuit between sensor connector terminal No. 2 and electronic control unit connector (GF31A) terminal No. 30.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify harness.

Step 7	Inspection items		Inspection of harness between electronic control unit and sensor (ground)
	Maintenance item		Check circuit between sensor connector terminal No. 1 and electronic control unit connector (GF35A) terminal No. 27.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify harness.

Step 8	Inspection items		Inspection by control data
	Maintenance item		Measure item No. 37 “Fuel Temperature (leak)” of Service Data.
	Inspection condition		–
	Requirements		• When engine is cold: Temperature is equivalent to outside temperature. • While engine is warmed up: Temperature gradually rises up. • When engine is stopped after warm-up: Temperature rise up just after engine stopped, then gradually decline.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 9.

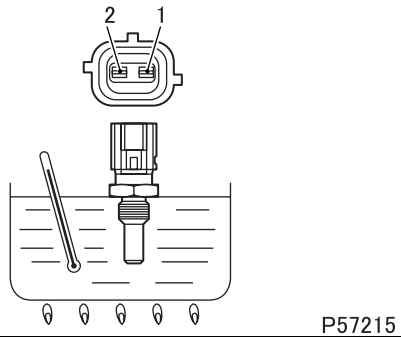
Step 9	Inspection items		Inspection by electronic control unit connector
	Maintenance item		Measure value of voltage between connector (GF31A) terminal No. 31 and (GF35A) terminal 26.
	Inspection condition		• Measure from back side of connector of harness with each device connected to harness. • Starter switch: ON
	Requirements		• 20°C {68°F}: 2.45 $^{+0.14}_{-0.13}$ kΩ • 80°C {176°F}: 0.318 ± 0.008 kΩ • 110°C {230°F}: 0.1417 ± 0.0018 kΩ
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 10.
		NO	Go to step 11.

Step 10	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 15.
		NO	Modify connector.

Step 11	Inspection items		Inspection of sensor connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 12.
		NO	Modify connector.

Step 12	Inspection items		Inspection of fuel temperature sensor 2 unit
	Maintenance item		Measure value of resistance between connector terminal No. 1 and 2.
	Inspection condition		Put sensor in vessel filled with engine oil.
	Requirements		• 20°C {68°F}: 2.45 $^{+0.14}_{-0.13}$ kΩ • 80°C {176°F}: 0.318 ± 0.008 kΩ • 110°C {230°F}: 0.1417 ± 0.0018 kΩ
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 13.
		NO	Replacement of sensor

<Step 12 inspection diagram>



Step 13	Inspection items		Inspection of harness between electronic control unit and sensor (power supply)
	Maintenance item		Check circuit between sensor connector terminal No. 2 and electronic control unit connector (GF31A) terminal No. 31.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 14.
		NO	Modify harness.

Step 14	Inspection items		Inspection of harness between electronic control unit and sensor (ground)
	Maintenance item		Check circuit between sensor connector terminal No. 1 and electronic control unit connector (GF35A) terminal No. 26.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 15.
		NO	Modify harness.

Step 15	Inspection items		Inspection by control data
	Maintenance item		Measure item No. 37 “Fuel Temperature (leak)” of Service Data.
	Inspection condition		–
	Requirements		• When engine is cold: Temperature is equivalent to outside temperature. • While engine is warmed up: Temperature gradually rises up. • When engine is stopped after warm-up: Temperature rise up just after engine stopped, then gradually decline.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P0182/Flash code: 41
[Monitor]
Abnormality of fuel temperature sensor 1
[Fault (outline)]
Low signal range check
[Diagnosis check]
- Output voltage of fuel temperature sensor 1 is monitored.

[Code generation condition]
- Voltage of fuel temperature sensor 1 remains below 0.1 V for approx. 2.5 seconds.
  (Warning lamp is lit and diagnosis code is displayed on second establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal

[Control effected by electronic control unit during fault]
- Fuel temperature is fixed at 40°C {104°F}.

[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and fuel temperature sensor 1
- Abnormality of each connector
- Abnormality of fuel temperature sensor 1
- Abnormality in electronic control unit

[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>
- Extinguished at 4th driving cycle after normal signal is input.

<Fault code>
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished. (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

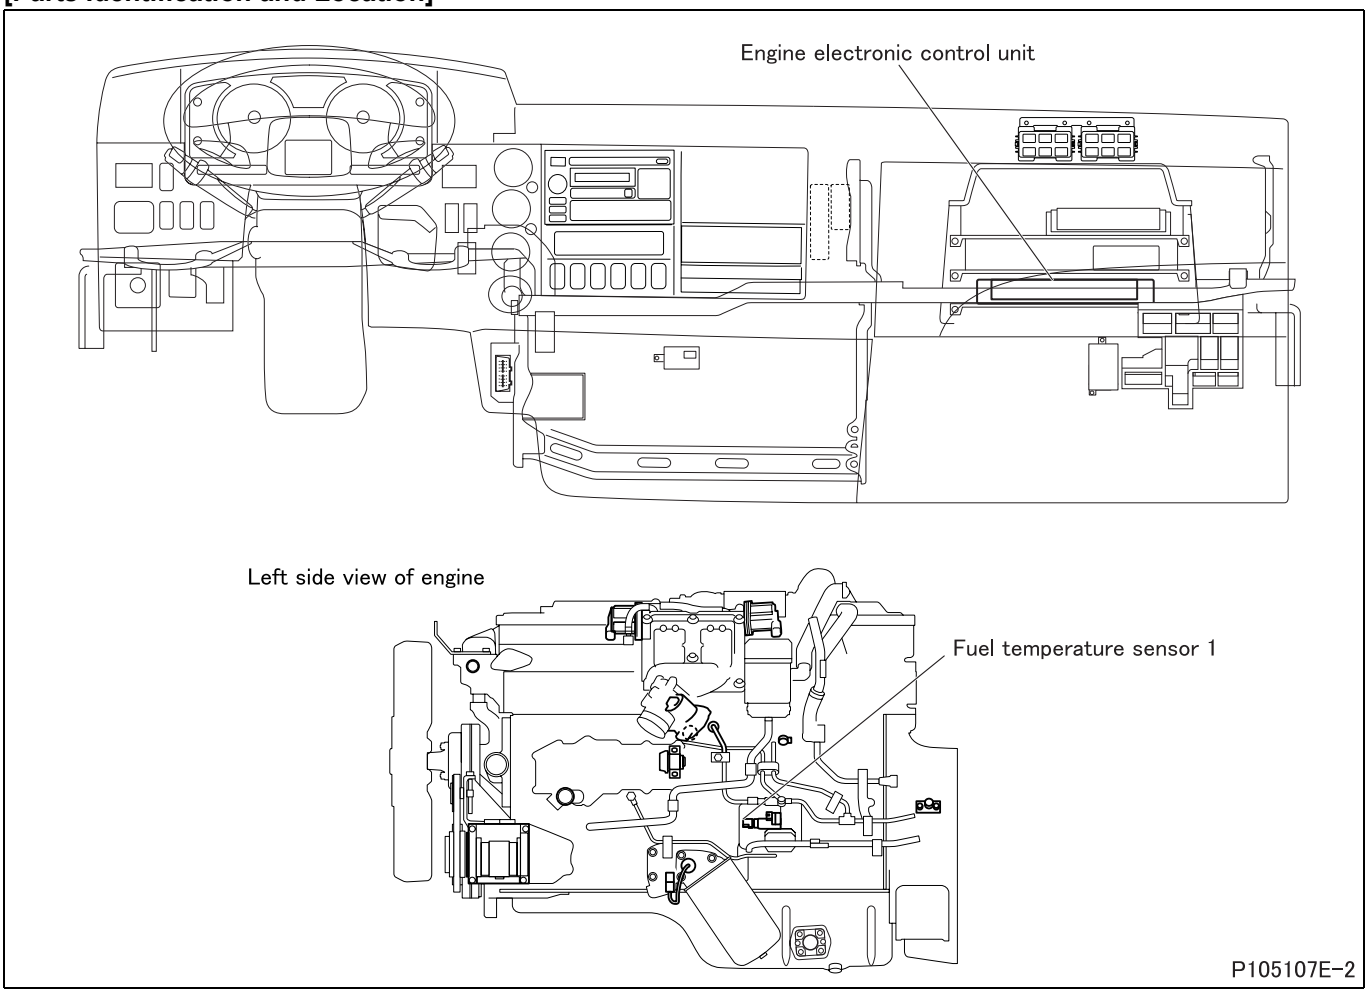
[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		Measure item No. 36 “Fuel Temperature (inlet)” of Service Data.
	Inspection condition		–
	Requirements		• When engine is cold: Temperature is equivalent to outside temperature. • While engine is warmed up: Temperature gradually rises up. • When engine is stopped after warm-up: Temperature rise up just after engine stopped, then gradually decline.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

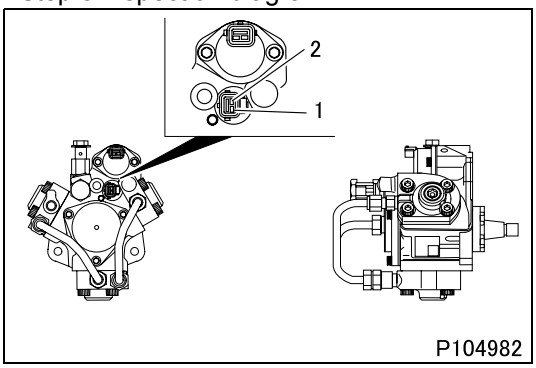
Step 2	Inspection items		Inspection by electronic control unit connector
	Maintenance item		Measure value of voltage between connector (GF31A) terminal No. 30 and (GF35A) terminal 27.
	Inspection condition		• Measure from back side of connector of harness with each device connected to harness. • Starter switch: ON
	Requirements		• –20°C {–4°F}: 15.0 ± 1.5 kΩ • 20°C {68°F}: 2.45 ± 0.24 kΩ • 80°C {176°F}: 0.318 ± 0.008 kΩ
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Go to step 4.

Step 3	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify connector.

Step 4	Inspection items		Inspection of sensor connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Modify connector.

Step 5	Inspection items		Inspection of fuel temperature sensor 1 unit
	Maintenance item		Measure value of resistance between connector terminal No. 1 and 2.
	Inspection condition		Put sensor in vessel filled with engine oil.
	Requirements		• –20°C {–4°F}: 15.0 ± 1.5 kΩ • 20°C {68°F}: 2.45 ± 0.24 kΩ • 80°C {176°F}: 0.318 ± 0.008 kΩ
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Replacement of sensor

<Step 5 inspection diagram>



Step 6	Inspection items		Inspection of harness between electronic control unit and sensor (power supply)
	Maintenance item		Check circuit between sensor connector terminal No. 2 and electronic control unit connector (GF31A) terminal No. 30.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify harness.

Step 7	Inspection items		Inspection of harness between electronic control unit and sensor (ground)
	Maintenance item		Check circuit between sensor connector terminal No. 1 and electronic control unit connector (GF35A) terminal No. 27.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify harness.

Step 8	Inspection items		Inspection by control data
	Maintenance item		Measure item No. 36 “Fuel Temperature (inlet)” of Service Data.
	Inspection condition		–
	Requirements		• When engine is cold: Temperature is equivalent to outside temperature. • While engine is warmed up: Temperature gradually rises up. • When engine is stopped after warm-up: Temperature rise up just after engine stopped, then gradually decline.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic control unit

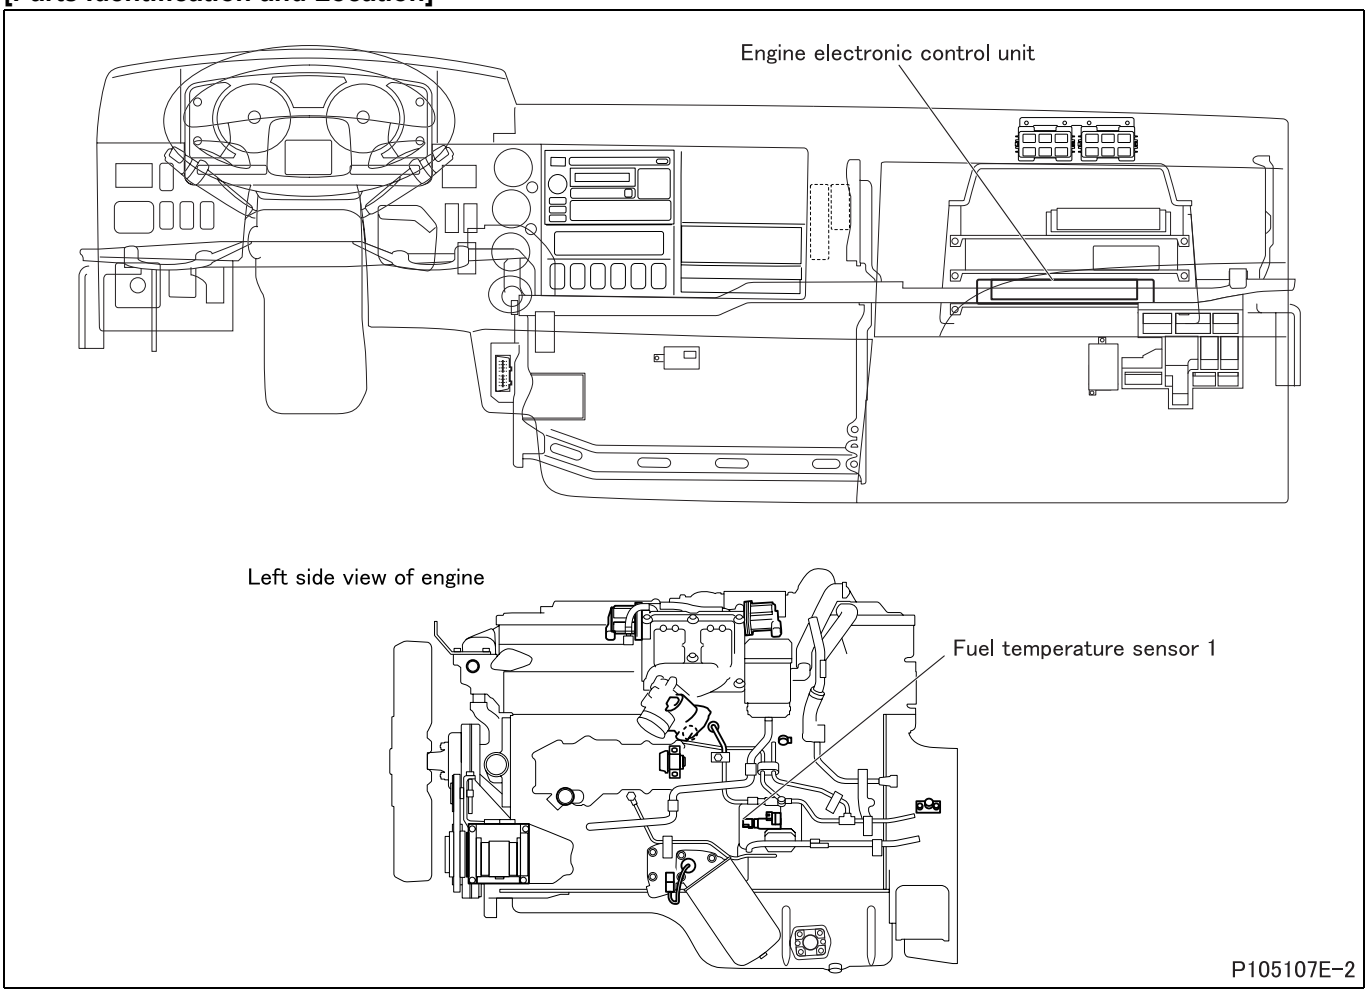
[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		Measure item No. 37 “Fuel Temperature (leak)” of Service Data.
	Inspection condition		–
	Requirements		• When engine is cold: Temperature is equivalent to outside temperature. • While engine is warmed up: Temperature gradually rises up. • When engine is stopped after warm-up: Temperature rise up just after engine stopped, then gradually decline.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

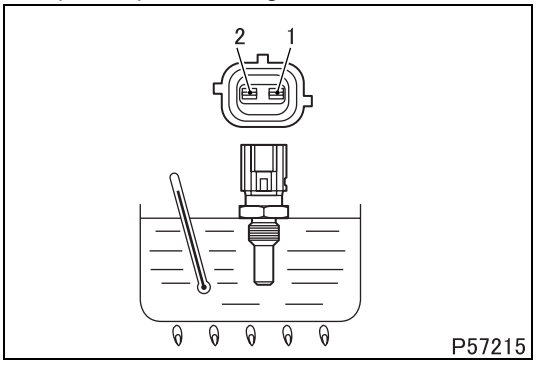
Step 2	Inspection items		Inspection by electronic control unit connector
	Maintenance item		Measure value of voltage between connector (GF31A) terminal No. 31 and (GF35A) terminal 26.
	Inspection condition		• Measure from back side of connector of harness with each device connected to harness. • Starter switch: ON
	Requirements		• 20°C {68°F}: 2.45 $^{+0.14}_{-0.13}$ kΩ • 80°C {176°F}: 0.318 ± 0.008 kΩ • 110°C {230°F}: 0.1417 ± 0.0018 kΩ
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Go to step 4.

Step 3	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify connector.

Step 4	Inspection items		Inspection of sensor connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Modify connector.

Step 5	Inspection items		Inspection of fuel temperature sensor 2 unit
	Maintenance item		Measure value of resistance between connector terminal No. 1 and 2.
	Inspection condition		Put sensor in vessel filled with engine oil.
	Requirements		• 20°C {68°F}: 2.45 $^{+0.14}_{-0.13}$ kΩ • 80°C {176°F}: 0.318 ± 0.008 kΩ • 110°C {230°F}: 0.1417 ± 0.0018 kΩ
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Replacement of sensor

<Step 5 inspection diagram>



Step 6	Inspection items		Inspection of harness between electronic control unit and sensor (power supply)
	Maintenance item		Check circuit between sensor connector terminal No. 2 and electronic control unit connector (GF31A) terminal No. 31.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify harness.

Step 7	Inspection items		Inspection of harness between electronic control unit and sensor (ground)
	Maintenance item		Check circuit between sensor connector terminal No. 1 and electronic control unit connector (GF35A) terminal No. 26.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify harness.

Step 8	Inspection items		Inspection by control data
	Maintenance item		Measure item No. 37 “Fuel Temperature (leak)” of Service Data.
	Inspection condition		–
	Requirements		• When engine is cold: Temperature is equivalent to outside temperature. • While engine is warmed up: Temperature gradually rises up. • When engine is stopped after warm-up: Temperature rise up just after engine stopped, then gradually decline.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic control unit

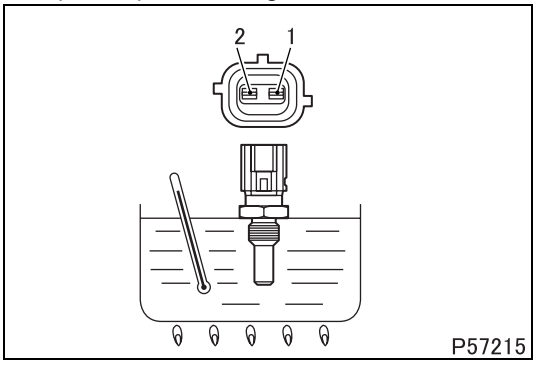
Step 2	Inspection items		Inspection by electronic control unit connector
	Maintenance item		Measure value of voltage between connector (GF31A) terminal No. 31 and (GF35A) terminal 26.
	Inspection condition		• Measure from back side of connector of harness with each device connected to harness. • Starter switch: ON
	Requirements		• 20°C {68°F}: 2.45 $^{+0.14}_{-0.13}$ kΩ • 80°C {176°F}: 0.318 ± 0.008 kΩ • 110°C {230°F}: 0.1417 ± 0.0018 kΩ
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Go to step 4.

Step 3	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify connector.

Step 4	Inspection items		Inspection of sensor connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Modify connector.

Step 5	Inspection items		Inspection of fuel temperature sensor 2 unit
	Maintenance item		Measure value of resistance between connector terminal No. 1 and 2.
	Inspection condition		Put sensor in vessel filled with engine oil.
	Requirements		• 20°C {68°F}: 2.45 $^{+0.14}_{-0.13}$ kΩ • 80°C {176°F}: 0.318 ± 0.008 kΩ • 110°C {230°F}: 0.1417 ± 0.0018 kΩ
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Replacement of sensor

<Step 5 inspection diagram>



Step 6	Inspection items		Inspection of harness between electronic control unit and sensor (power supply)
	Maintenance item		Check circuit between sensor connector terminal No. 2 and electronic control unit connector (GF31A) terminal No. 31.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify harness.

Step 7	Inspection items		Inspection of harness between electronic control unit and sensor (ground)
	Maintenance item		Check circuit between sensor connector terminal No. 1 and electronic control unit connector (GF35A) terminal No. 26.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify harness.

Step 8	Inspection items		Inspection by control data
	Maintenance item		Measure item No. 37 “Fuel Temperature (leak)” of Service Data.
	Inspection condition		–
	Requirements		• When engine is cold: Temperature is equivalent to outside temperature. • While engine is warmed up: Temperature gradually rises up. • When engine is stopped after warm-up: Temperature rise up just after engine stopped, then gradually decline.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P0191/Flash code: 11
[Monitor]
Characteristic abnormality of common rail pressure sensor
[Fault (outline)]
<Condition (1)>
- Offset

<Condition (2)>
- Output unchanged

[Diagnosis check]
- Output voltage of common rail pressure sensor is monitored.

[Code generation condition]
Check result by electronic control unit differs according to engine status.
(Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)
<Condition (1)>
- At engine start, signal voltage from common rail pressure sensor remains abnormally high (over 1.5 V) or low (below 0.7 V) for 0.25 second.

<Condition (2)>
- At engine start, rail pressure sensor output voltage remains zero for more than 0.5 second under given condition in engine speed and common rail pressure.
- When engine is in operation at 450 rpm up to 3300 rpm, output voltage of common rail pressure sensor remains unchanged (below 0.015 V) for more than 0.5 second.

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
<Condition (1)>
- Engine status: start of cranking
- Change of water temperature after drive cycle: 30°C {86°F} or more

<Condition (2)>
- Rail pressure sensor: more than specified
- Injection quantity: more than specified
- Fuel temperature: less than specified
- Supply pump: learning completed
- During cranking or in operation

[Control effected by electronic control unit during fault]
<Condition (1)>
- Effects no special control.

<Condition (2)>
- Injection quantity is limited.
- Main injection only is allowed.
- Common rail pressure is limited.
- Exhaust gas recirculation control is stopped.
- Throttle control is stopped.
- Diesel particulate filter regeneration (manual or automatic) is stopped.
- Auto cruise control is stopped.
- Control using common rail pressure sensor feedback data is stopped.

[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and common rail pressure sensor
- Abnormality of each connector
- Abnormality of common rail pressure sensor
- Abnormality in electronic control unit

[Recoverability]

Condition for recovery differs according to warning lamp colors.

<Control during fault>

[Warning lamp: MIL (Orange)]

- Recovered if signal becomes normal with starter switch in ON position.

[Warning lamp: Red]

- Recovered if signal becomes normal when starter switch is turned OFF to ON (power supply resumed to electronic control unit).

<Warning lamp>

[Warning lamp: MIL (Orange)]

- Extinguished at 4th driving cycle after normal signal is input.

[Warning lamp: Red]

- Extinguished on input of normal signal.

<Fault code>

[Warning lamp: MIL (Orange)]

- Automatically cleared at 40th warm up cycle after warning lamp is extinguished. (To clear as desired, erase from the memory.)

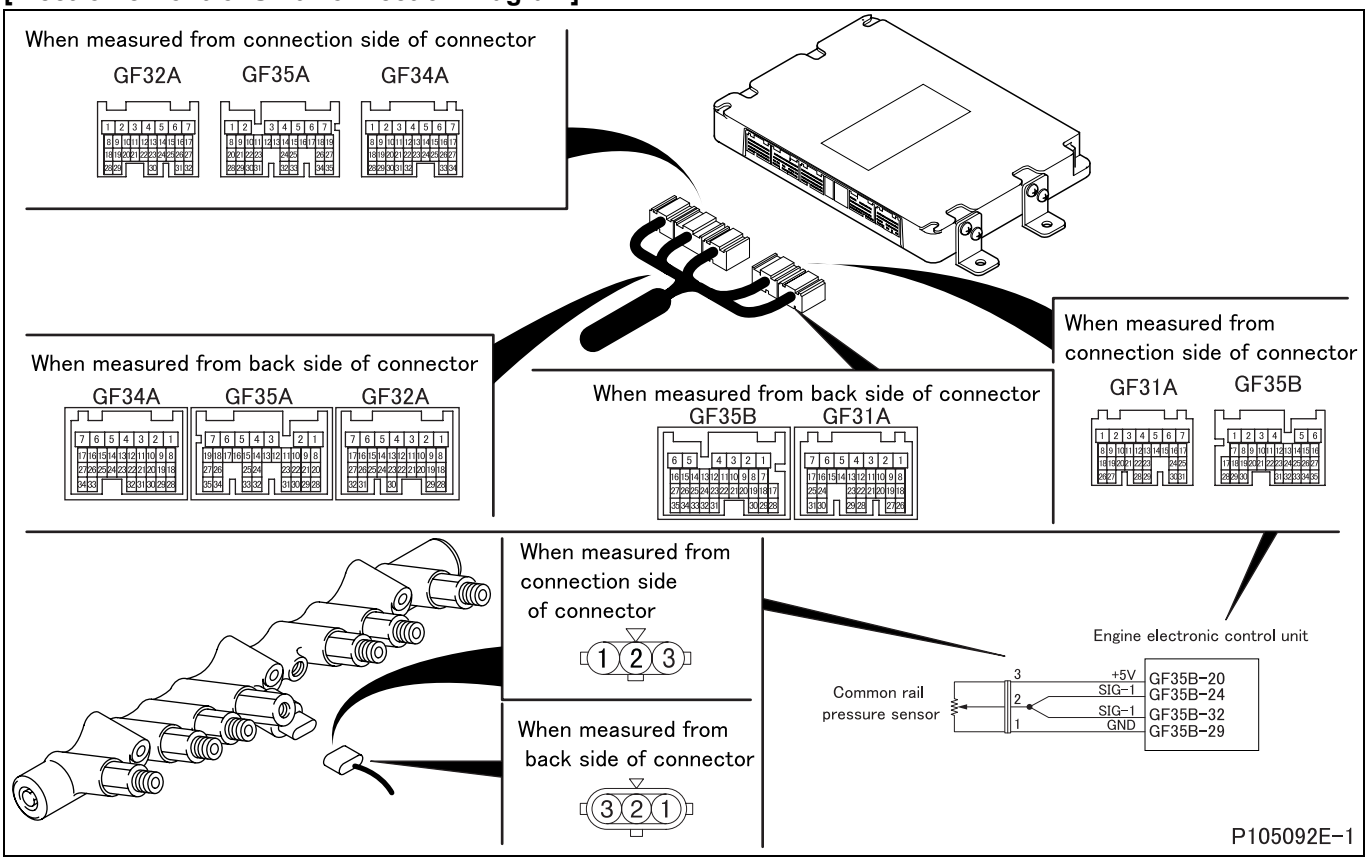
[Warning lamp: Red]

- Automatically cleared after warning lamp is extinguished. (To clear as desired, erase from the memory.)

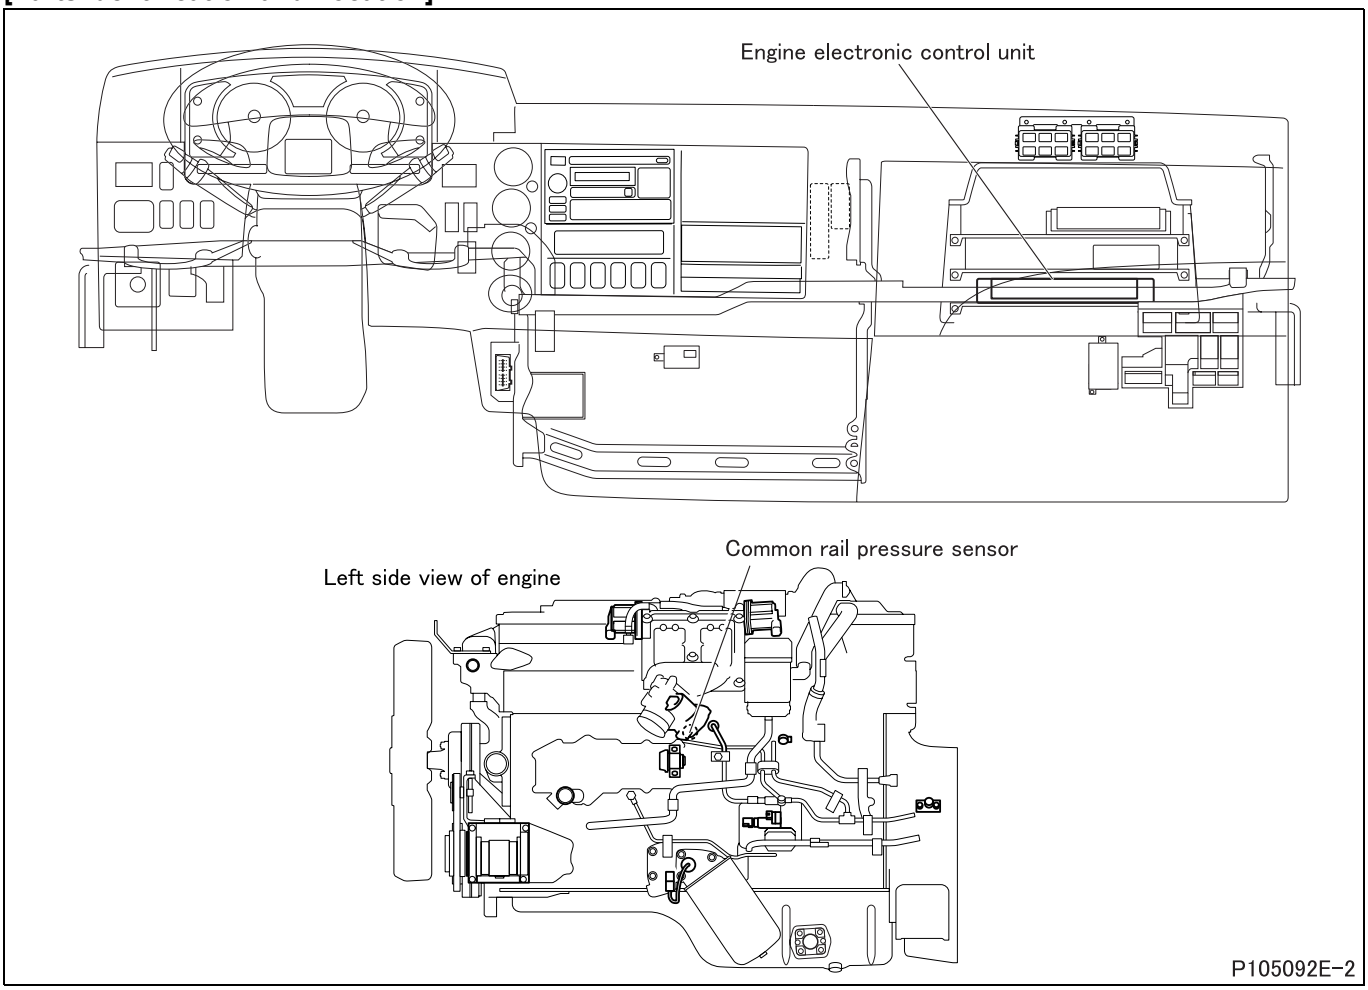
Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.

Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		Measure item No. 09 “Actual Common Rail Pressure” of Service Data.
	Inspection condition		Starter switch: ON
	Requirements		0%
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

Step 2	Inspection items		Inspection by electronic control unit connector (signal)
	Maintenance item		Measure value of voltage between connector (GF35B) terminal No. 24 or 32 (+) and No. 29 (–).
	Inspection condition		• Measure from back side of connector of harness with each device connected to harness. • Starter switch: ON
	Requirements		0.5 to 4.5 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Go to step 3.

Step 3	Inspection items		Inspection by electronic control unit connector (power supply)
	Maintenance item		Measure value of voltage between connector (GF35B) terminal No. 20 (+) and 29 (–).
	Inspection condition		• Measure from back side of connector of harness with each device connected to harness. • Starter switch: ON
	Requirements		5 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	Go to step 5.

Step 4	Inspection items		Inspection by electronic control unit connector (ground)
	Maintenance item		Measure value of voltage between connector (GF35B) terminal No. 29 (+) and (GF31A) terminal No. 3 (–).
	Inspection condition		• Measure from back side of connector of harness with each device connected to harness. • Starter switch: ON
	Requirements		0 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Go to step 5.

Step 5	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 11.
		NO	Modify connector.

Step 6	Inspection items		Inspection of sensor connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify connector.

Step 7	Inspection items		Inspection of harness between electronic control unit and sensor (power supply)
	Maintenance item		Measure value of voltage between connector terminal No. 3 (+) and 1 (–).
	Inspection condition		• Measure from back side of connector of harness with each device connected to harness. • Starter switch: ON
	Requirements		5 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 9.
		NO	Go to step 8.

Step 8	Inspection items		Inspection of harness between electronic control unit and sensor (power supply)
	Maintenance item		Check circuit between sensor connector terminal No. 3 and electronic control unit connector (GF35B) terminal No. 20.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 11.
		NO	Modify harness.

Step 9	Inspection items		Inspection of harness between electronic control unit and sensor (ground)
	Maintenance item		Check circuit between sensor connector terminal No. 1 and electronic control unit connector (GF35B) terminal No. 29.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 10.
		NO	Modify harness.

Step 10	Inspection items		Inspection of harness between electronic control unit and sensor (signal)
	Maintenance item		Check circuit between sensor connector terminal No. 2 and electronic control unit connector (GF35B) terminal No. 24 or 32.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	After replacement of sensor, go to step 11.
		NO	Modify harness.

Step 11	Inspection items		Inspection by control data
	Maintenance item		Measure item No. 09 “Actual Common Rail Pressure” of Service Data.
	Inspection condition		Starter switch: ON
	Requirements		0%
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of rail

[Fault code]
Diagnosis code: P0192/Flash code: 11
[Monitor]
Abnormality of common rail pressure sensor
[Fault (outline)]
Low signal range check
[Diagnosis check]
- Output voltage of common rail pressure sensor is monitored.

[Code generation condition]
- Voltage of common rail pressure sensor remains below 0.2 V for approx. 2.5 seconds.
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal

[Control effected by electronic control unit during fault]
- Injection quantity is limited.
- Main injection only is allowed.
- Common rail pressure is limited.
- Exhaust gas recirculation control is stopped.
- Throttle control is stopped.
- Diesel particulate filter regeneration (manual or automatic) is stopped.
- Auto cruise control is stopped.
- Control using common rail pressure sensor feedback data is stopped.

[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and common rail pressure sensor
- Abnormality of each connector
- Abnormality of common rail pressure sensor
- Abnormality in electronic control unit

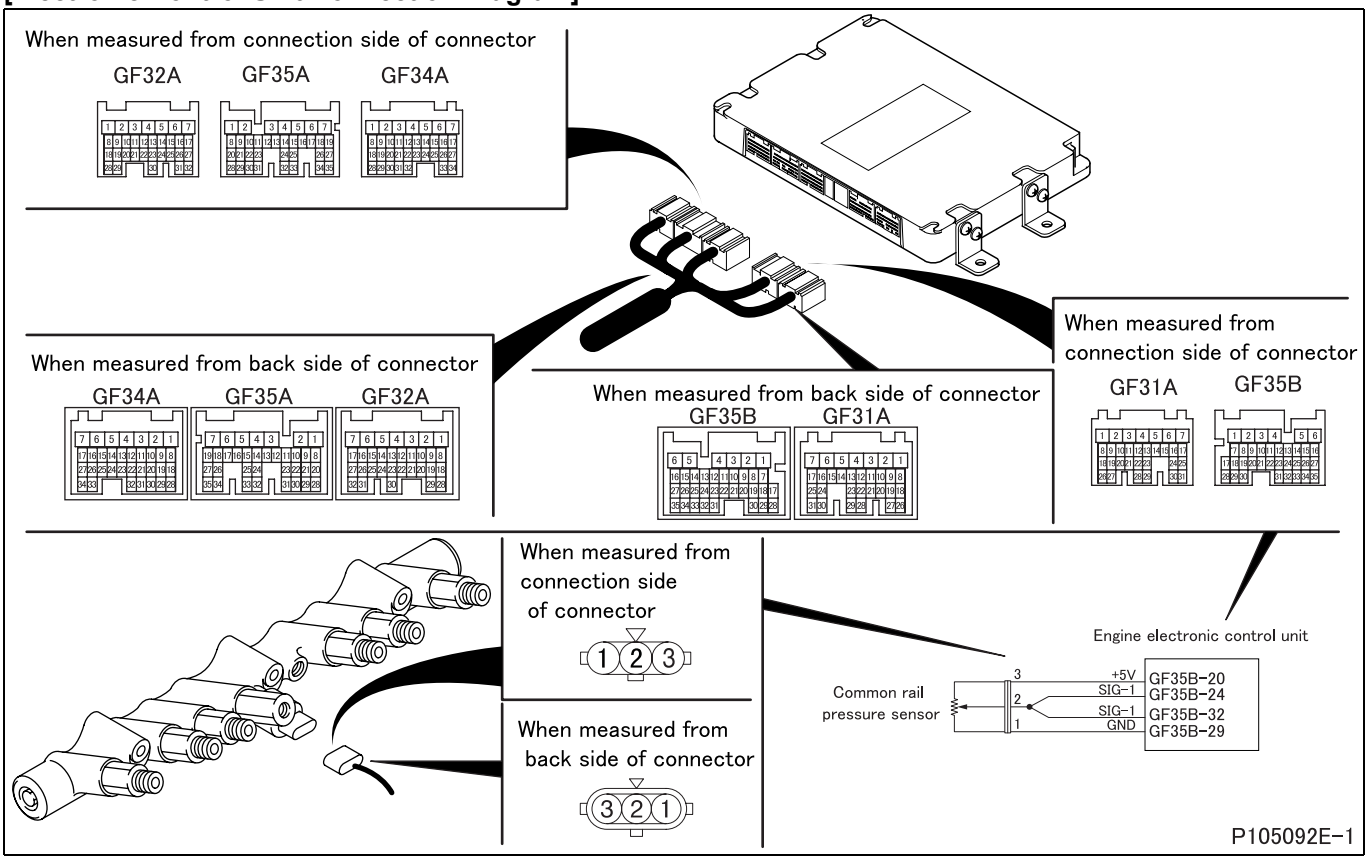
[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>
- Extinguished at 4th driving cycle after normal signal is input.

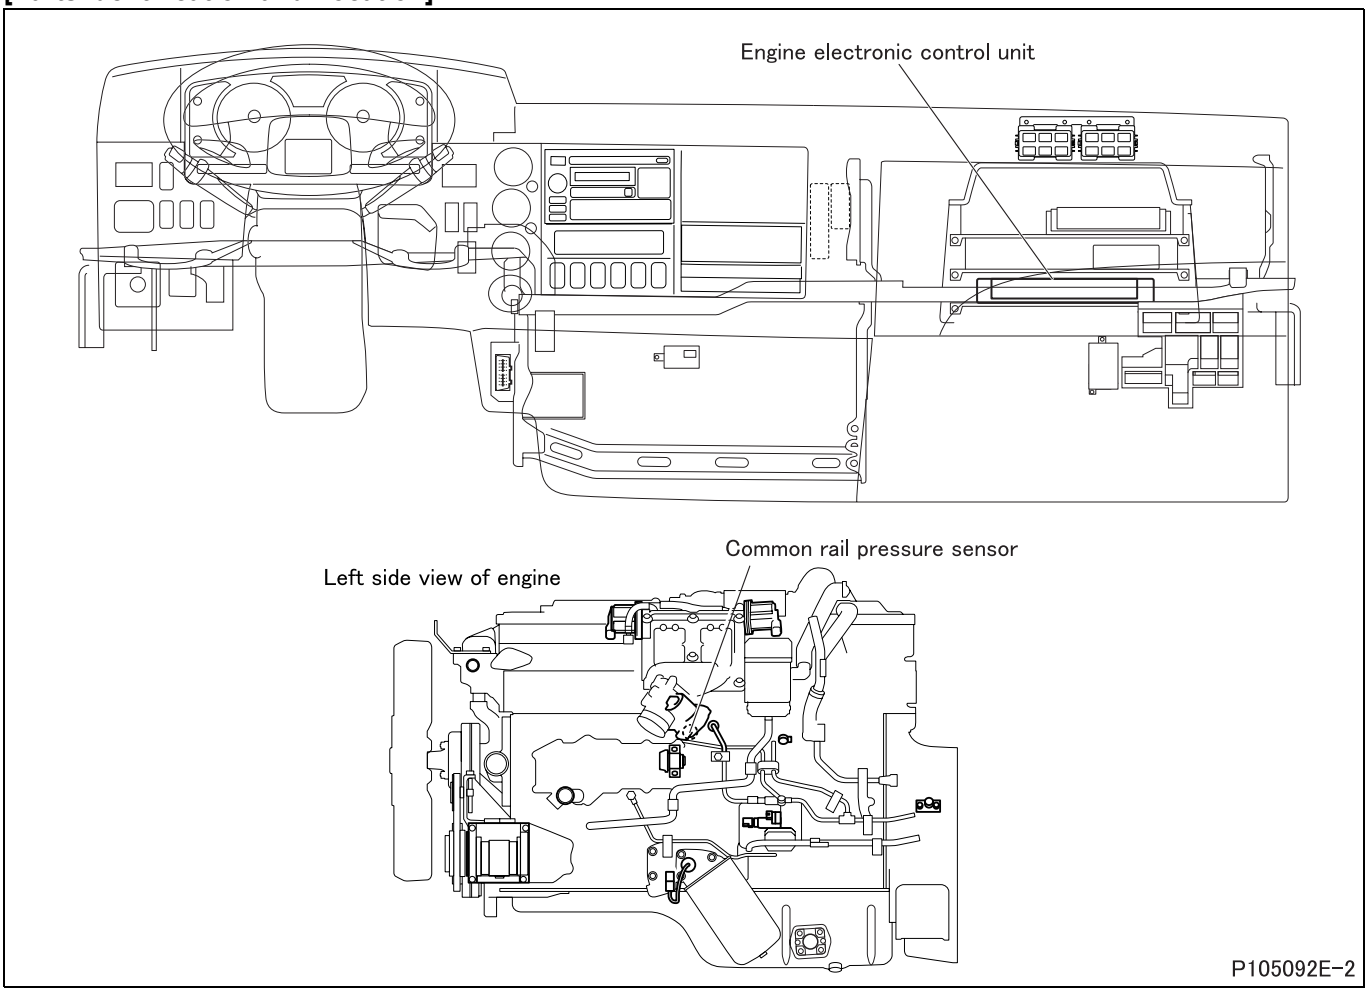
<Fault code>
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished. (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		Measure item No. 09 “Actual Common Rail Pressure” of Service Data.
	Inspection condition		Starter switch: ON
	Requirements		0%
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

Step 2	Inspection items		Inspection by electronic control unit connector (signal)
	Maintenance item		Measure value of voltage between connector (GF35B) terminal No. 24 or 32 (+) and No. 29 (–).
	Inspection condition		• Measure from back side of connector of harness with each device connected to harness. • Starter switch: ON
	Requirements		0.5 to 4.5 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Go to step 3.

Step 3	Inspection items		Inspection by electronic control unit connector (power supply)
	Maintenance item		Measure value of voltage between connector (GF35B) terminal No. 20 (+) and 29 (–).
	Inspection condition		• Measure from back side of connector of harness with each device connected to harness. • Starter switch: ON
	Requirements		5 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	Go to step 5.

Step 4	Inspection items		Inspection by electronic control unit connector (ground)
	Maintenance item		Measure value of voltage between connector (GF35B) terminal No. 29 (+) and (GF31A) terminal No. 3 (–).
	Inspection condition		• Measure from back side of connector of harness with each device connected to harness. • Starter switch: ON
	Requirements		0 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Go to step 5.

Step 5	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 11.
		NO	Modify connector.

Step 6	Inspection items		Inspection of sensor connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify connector.

Step 7	Inspection items		Inspection of harness between electronic control unit and sensor (power supply)
	Maintenance item		Measure value of voltage between connector terminal No. 3 (+) and 1 (–).
	Inspection condition		• Measure from back side of connector of harness with each device connected to harness. • Starter switch: ON
	Requirements		5 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 9.
		NO	Go to step 8.

Step 8	Inspection items		Inspection of harness between electronic control unit and sensor (power supply)
	Maintenance item		Check circuit between sensor connector terminal No. 3 and electronic control unit connector (GF35B) terminal No. 20.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 11.
		NO	Modify harness.

Step 9	Inspection items		Inspection of harness between electronic control unit and sensor (ground)
	Maintenance item		Check circuit between sensor connector terminal No. 1 and electronic control unit connector (GF35B) terminal No. 29.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 10.
		NO	Modify harness.

Step 10	Inspection items		Inspection of harness between electronic control unit and sensor (signal)
	Maintenance item		Check circuit between sensor connector terminal No. 2 and electronic control unit connector (GF35B) terminal No. 24 or 32.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	After replacement of sensor, go to step 11.
		NO	Modify harness.

Step 11	Inspection items		Inspection by control data
	Maintenance item		Measure item No. 09 “Actual Common Rail Pressure” of Service Data.
	Inspection condition		Starter switch: ON
	Requirements		0%
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of rail

[Fault code]
Diagnosis code: P0193/Flash code: 11
[Monitor]
Abnormality of common rail pressure sensor
[Fault (outline)]
High signal range check
[Diagnosis check]
- Output voltage of common rail pressure sensor is monitored.

[Code generation condition]
- Voltage of common rail pressure sensor remains over 4.8 V for approx. 2.5 seconds.
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal

[Control effected by electronic control unit during fault]
- Injection quantity is limited.
- Main injection only is allowed.
- Common rail pressure is limited.
- Exhaust gas recirculation control is stopped.
- Throttle control is stopped.
- Diesel particulate filter regeneration (manual or automatic) is stopped.
- Auto cruise control is stopped.
- Control using common rail pressure sensor feedback data is stopped.

[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and common rail pressure sensor
- Abnormality of each connector
- Abnormality of common rail pressure sensor
- Abnormality in electronic control unit

[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>
- Extinguished at 4th driving cycle after normal signal is input.

<Fault code>
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished. (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

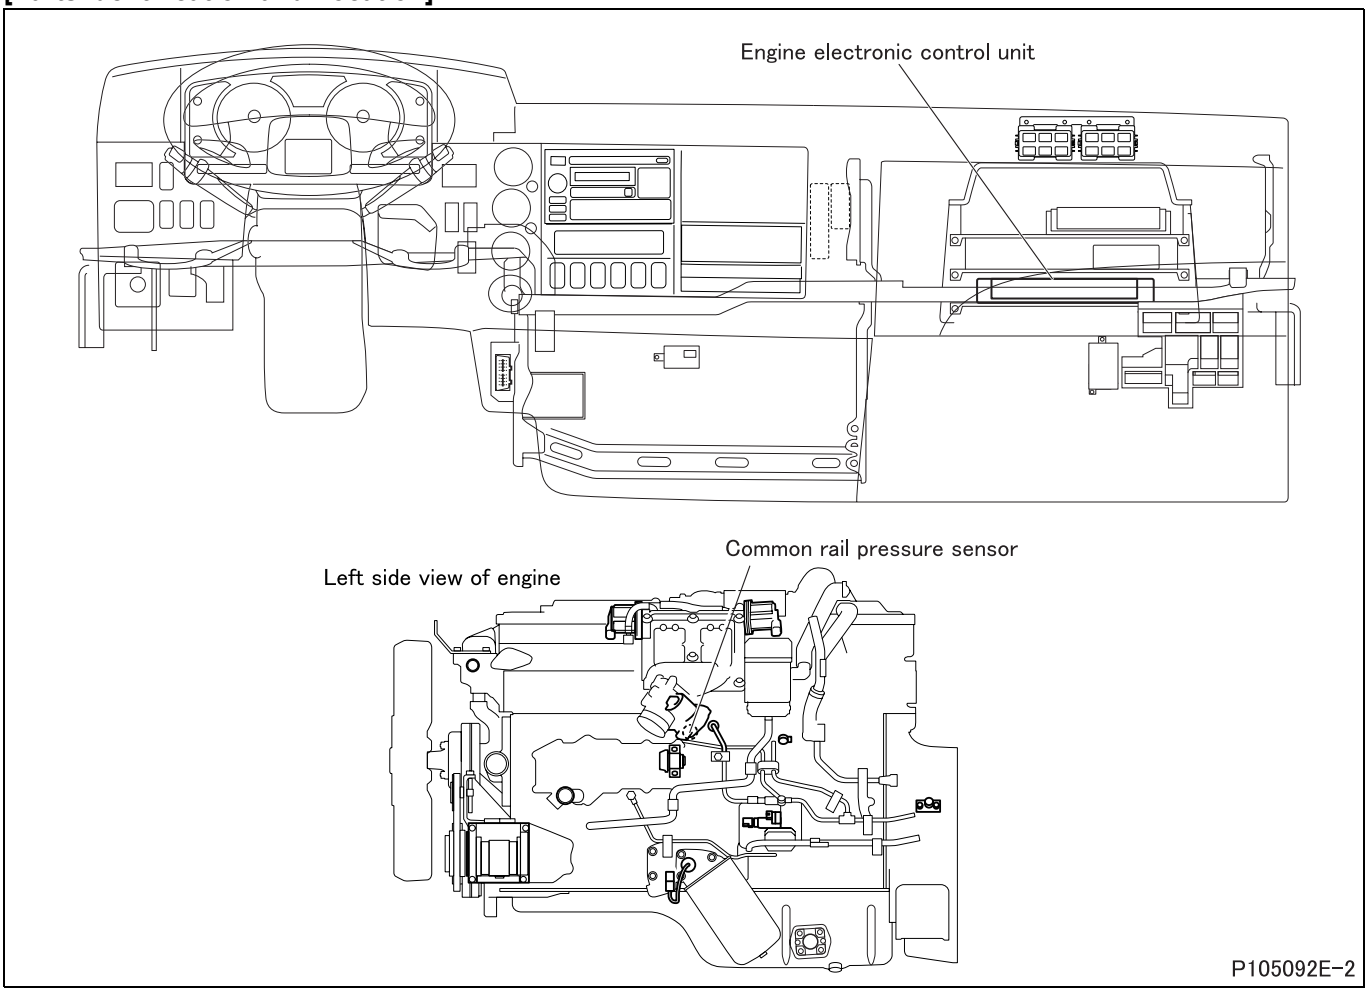
[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		Measure item No. 09 “Actual Common Rail Pressure” of Service Data.
	Inspection condition		Starter switch: ON
	Requirements		0%
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

Step 2	Inspection items		Inspection by electronic control unit connector (signal)
	Maintenance item		Measure value of voltage between connector (GF35B) terminal No. 24 or 32 (+) and No. 29 (–).
	Inspection condition		• Measure from back side of connector of harness with each device connected to harness. • Starter switch: ON
	Requirements		0.5 to 4.5 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Go to step 3.

Step 3	Inspection items		Inspection by electronic control unit connector (power supply)
	Maintenance item		Measure value of voltage between connector (GF35B) terminal No. 20 (+) and 29 (–).
	Inspection condition		• Measure from back side of connector of harness with each device connected to harness. • Starter switch: ON
	Requirements		5 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	Go to step 5.

Step 4	Inspection items		Inspection by electronic control unit connector (ground)
	Maintenance item		Measure value of voltage between connector (GF35B) terminal No. 29 (+) and (GF31A) terminal No. 3 (–).
	Inspection condition		• Measure from back side of connector of harness with each device connected to harness. • Starter switch: ON
	Requirements		0 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Go to step 5.

Step 5	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 11.
		NO	Modify connector.

Step 6	Inspection items		Inspection of sensor connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify connector.

Step 7	Inspection items		Inspection of harness between electronic control unit and sensor (power supply)
	Maintenance item		Measure value of voltage between connector terminal No. 3 (+) and 1 (–).
	Inspection condition		• Measure from back side of connector of harness with each device connected to harness. • Starter switch: ON
	Requirements		5 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 9.
		NO	Go to step 8.

Step 8	Inspection items		Inspection of harness between electronic control unit and sensor (power supply)
	Maintenance item		Check circuit between sensor connector terminal No. 3 and electronic control unit connector (GF35B) terminal No. 20.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 11.
		NO	Modify harness.

Step 9	Inspection items		Inspection of harness between electronic control unit and sensor (ground)
	Maintenance item		Check circuit between sensor connector terminal No. 1 and electronic control unit connector (GF35B) terminal No. 29.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 10.
		NO	Modify harness.

Step 10	Inspection items		Inspection of harness between electronic control unit and sensor (signal)
	Maintenance item		Check circuit between sensor connector terminal No. 2 and electronic control unit connector (GF35B) terminal No. 24 or 32.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	After replacement of sensor, go to step 11.
		NO	Modify harness.

Step 11	Inspection items		Inspection by control data
	Maintenance item		Measure item No. 09 “Actual Common Rail Pressure” of Service Data.
	Inspection condition		Starter switch: ON
	Requirements		0%
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of rail

[Fault code]
Diagnosis code: P0201/Flash code: 37
[Monitor]
Abnormality of injector magnetic valve (No. 1 cylinder)
[Fault (outline)]
Injector open circuit (No. 1 cylinder)
[Diagnosis check]
- Injector magnetic valve (No. 1 cylinder) circuit is monitored for fault.

[Code generation condition]
- Open-circuit of injector magnetic valve (No. 1 cylinder) is detected.
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal
- Injection time command: available
- Injector charge circuit: ON
- Post injection: none
- Engine speed sensor: normal
- Sub CPU in engine electronic control unit: normal

[Control effected by electronic control unit during fault]
- No injection in abnormal cylinder (other cylinders are limited in injection quantity)
- Exhaust gas recirculation control is stopped.
- Throttle control is stopped.
- Diesel particulate filter regeneration (manual or automatic) is stopped.
- Auto cruise control is stopped.
- Learning of FCCB (fuel control cylinder balance) is inhibited.

[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and injector magnetic valve (No. 1 cylinder)
- Abnormality of each connector
- Abnormality of injector magnetic valve (No. 1 cylinder)
- Abnormality in electronic control unit

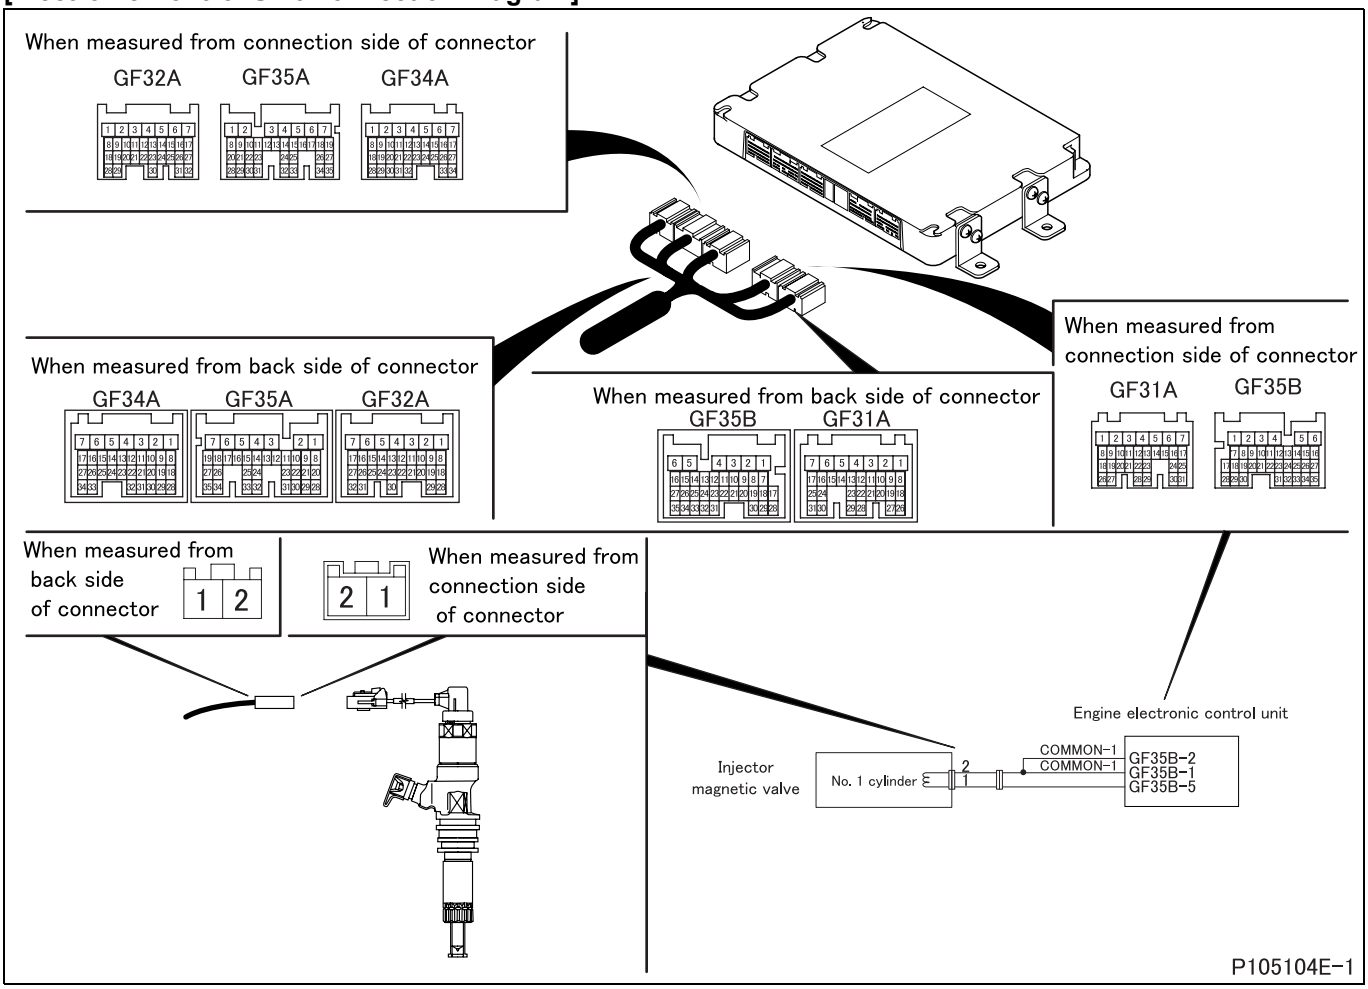
[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>
- Extinguished at 4th driving cycle after normal signal is input.

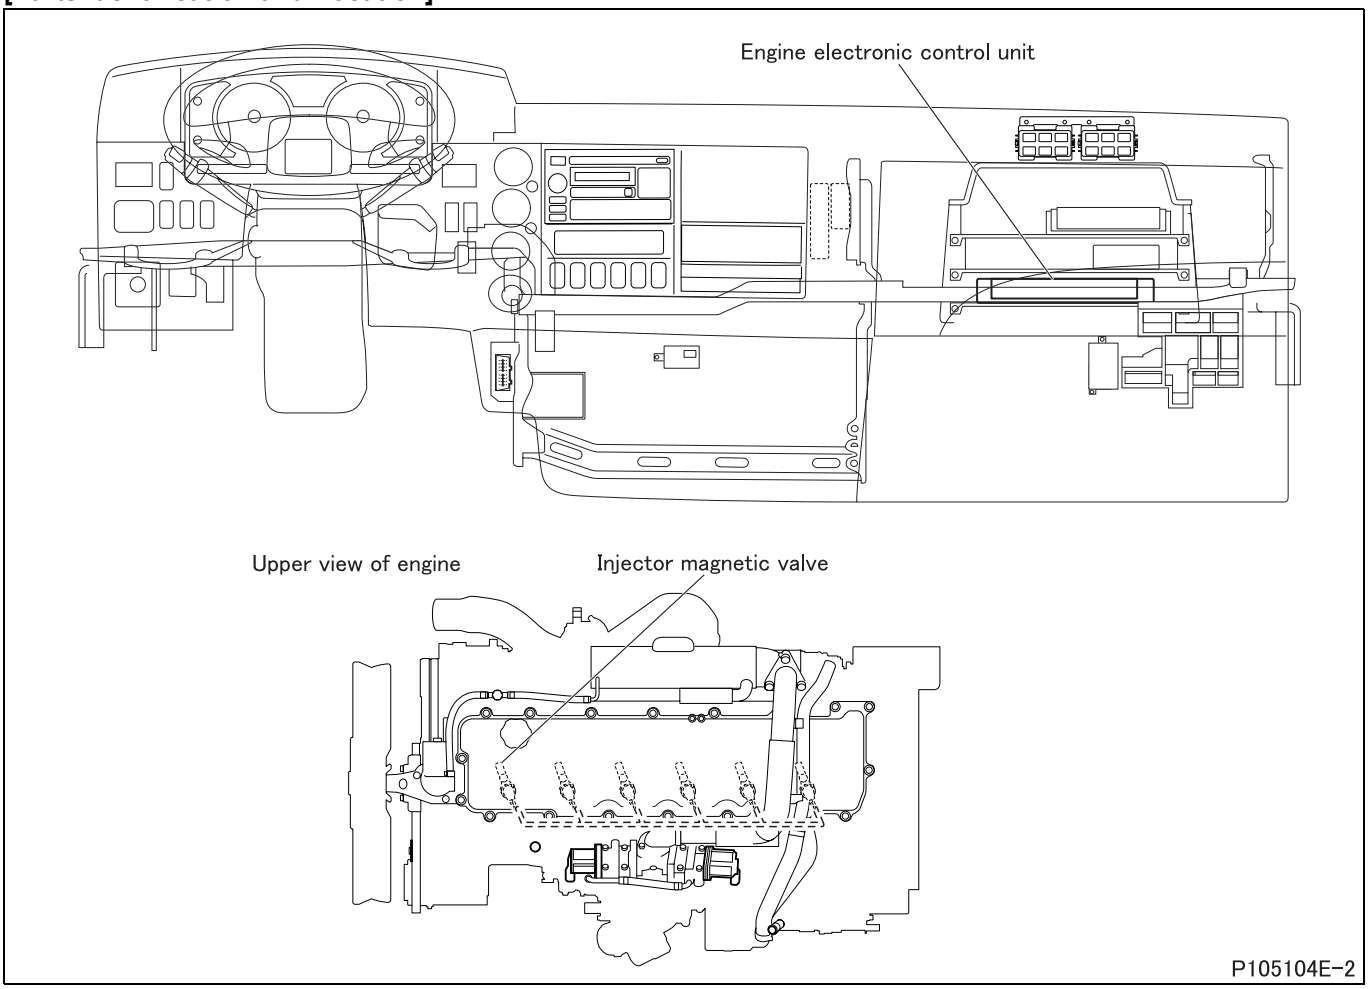
<Fault code>
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished. (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. BB “Injector Test 1”.
	Inspection condition		• Vehicle: stationary (vehicle speed 0 km/h {0 MPH}) • Engine start: At idle • Transmission: neutral • The current diagnosis code does not occur.
	Requirements		Injector (No. 1 cylinder) is stopped during actuator test with engine changed in operating condition (vibrating).
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

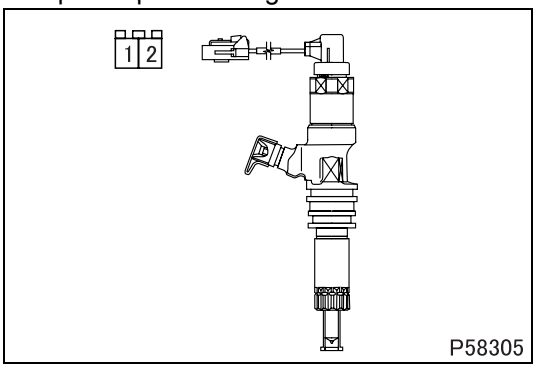
Step 2	Inspection items		Inspection by electronic control unit connector
	Maintenance item		Measure value of resistance between connector (GF35B) terminal No. 1 and 5 or No. 2 and 5.
	Inspection condition		• Disconnect electronic control unit from harness and measure from connection side of harness connector. • Starter switch: ON
	Requirements		0.45 ± 0.1 Ω (20°C {68°F})
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Go to step 4.

Step 3	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify connector.

Step 4	Inspection items		Inspection of injector magnetic valve connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Modify connector.

Step 5	Inspection items		Inspection of injector magnetic valve unit
	Maintenance item		Measure value of resistance between connector terminal No. 1 and 2.
	Inspection condition		–
	Requirements		0.45 ± 0.1 Ω (20°C {68°F})
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Replacement of injector

<Step 5 inspection diagram>



Step 6	Inspection items		Inspection of harness between injector magnetic valve and electronic control unit (power supply)
	Maintenance item		Check circuit between injector magnetic valve connector terminal No. 2 and electronic control unit connector (GF35B) terminal No. 1 or 2.
	Inspection condition		Disconnect electronic control unit from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify harness.

Step 7	Inspection items		Inspection of harness between injector magnetic valve and electronic control unit (ground)
	Maintenance item		Check circuit between injector magnetic valve connector terminal No. 1 and electronic control unit connector (GF35B) terminal No. 5.
	Inspection condition		Disconnect electronic control unit from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify harness.

Step 8	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. BB “Injector Test 1”.
	Inspection condition		• Vehicle: stationary (vehicle speed 0 km/h {0 MPH}) • Engine start: At idle • Transmission: neutral • The current diagnosis code does not occur.
	Requirements		Injector (No. 1 cylinder) is stopped during actuator test with engine changed in operating condition (vibrating).
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic control unit

[Monitor]
Abnormality of injector magnetic valve (No. 2 cylinder)
[Fault (outline)]
Injector open circuit (No. 2 cylinder)
[Diagnosis check]
- Injector magnetic valve (No. 2 cylinder) circuit is monitored for fault.

[Code generation condition]
- Open-circuit of injector magnetic valve (No. 2 cylinder) is detected.
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal
- Injection time command: available
- Injector charge circuit: ON
- Post injection: none
- Engine speed sensor: normal
- Sub CPU in engine electronic control unit: normal

[Control effected by electronic control unit during fault]
- No injection in abnormal cylinder (other cylinders are limited in injection quantity)
- Exhaust gas recirculation control is stopped.
- Throttle control is stopped.
- Diesel particulate filter regeneration (manual or automatic) is stopped.
- Auto cruise control is stopped.
- Learning of FCCB (fuel control cylinder balance) is inhibited.

[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and injector magnetic valve (No. 2 cylinder)
- Abnormality of each connector
- Abnormality of injector magnetic valve (No. 2 cylinder)
- Abnormality in electronic control unit

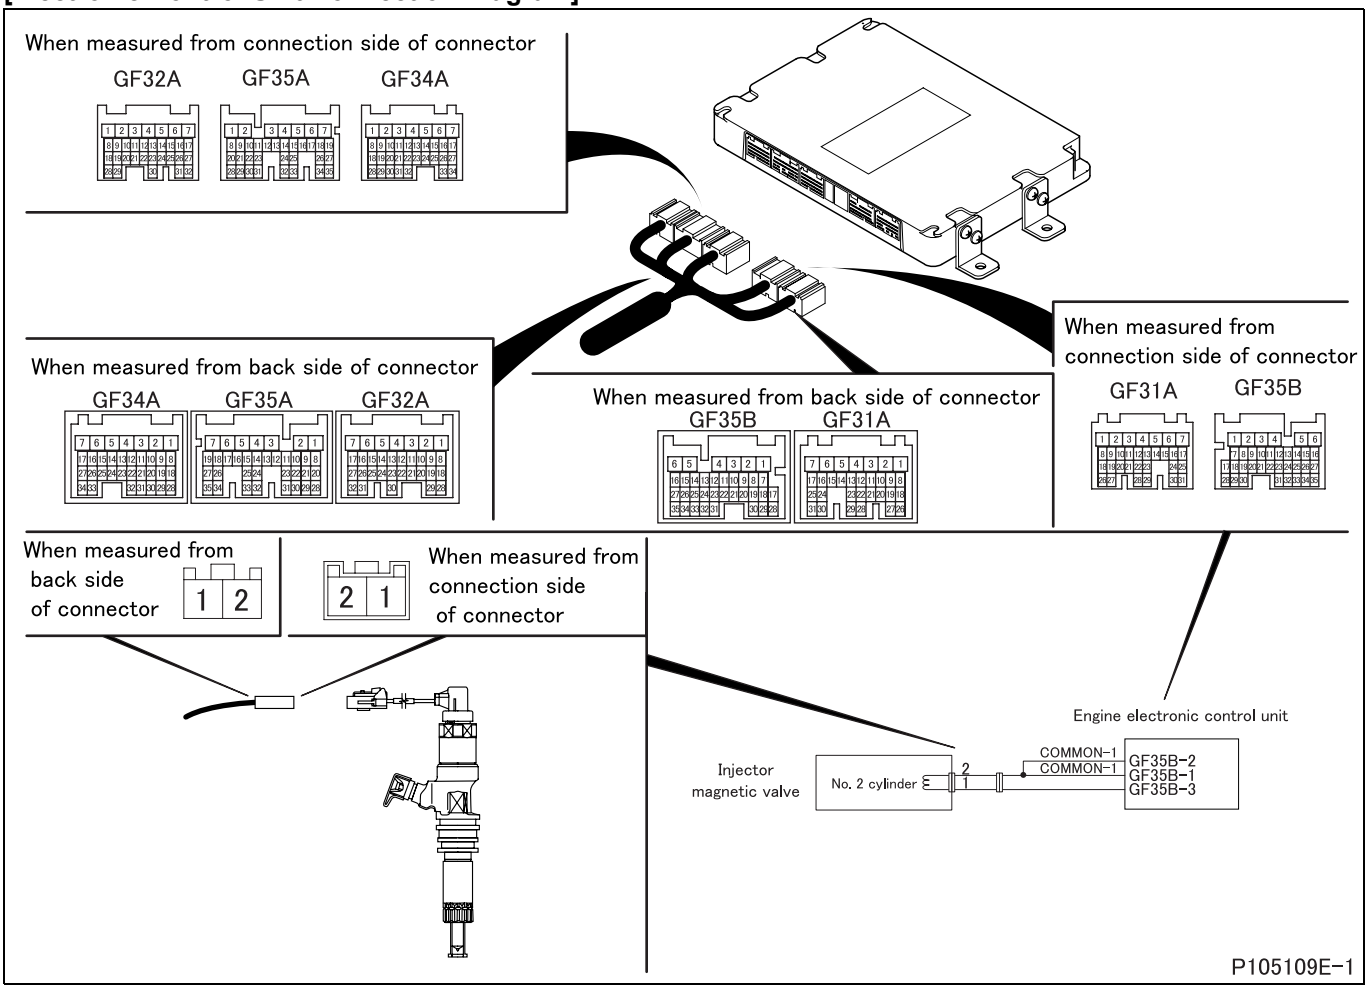
[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>
- Extinguished at 4th driving cycle after normal signal is input.

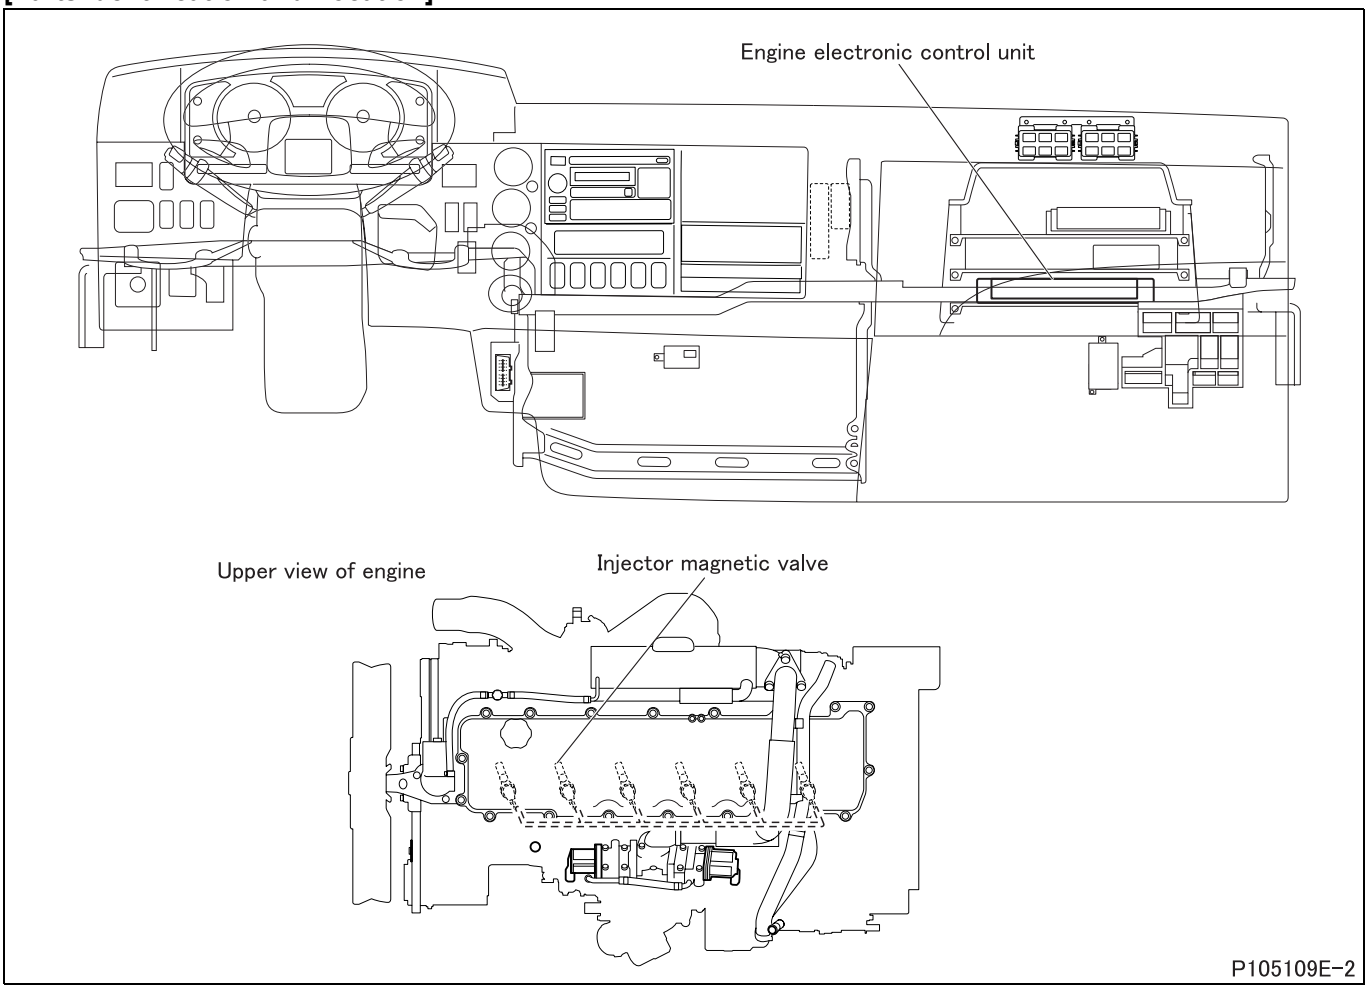
<Fault code>
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished. (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. BF “Injector Test 5”.
	Inspection condition		• Vehicle: stationary (vehicle speed 0 km/h {0 MPH}) • Engine start: At idle • Transmission: neutral • The current diagnosis code does not occur.
	Requirements		Injector (No. 2 cylinder) is stopped during actuator test with engine changed in operating condition (vibrating).
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

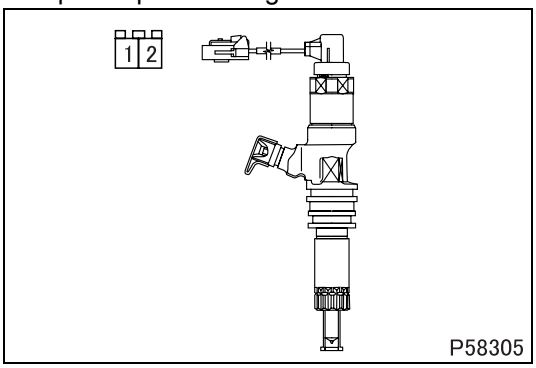
Step 2	Inspection items		Inspection by electronic control unit connector
	Maintenance item		Measure value of resistance between connector (GF35B) terminal No. 1 and 3 or No. 2 and 3.
	Inspection condition		• Disconnect electronic control unit from harness and measure from connection side of harness connector. • Starter switch: ON
	Requirements		0.45 ± 0.1 Ω (20°C {68°F})
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Go to step 4.

Step 3	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify connector.

Step 4	Inspection items		Inspection of injector magnetic valve connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Modify connector.

Step 5	Inspection items		Inspection of injector magnetic valve unit
	Maintenance item		Measure value of resistance between connector terminal No. 1 and 2.
	Inspection condition		–
	Requirements		0.45 ± 0.1 Ω (20°C {68°F})
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Replacement of injector

<Step 5 inspection diagram>



Step 6	Inspection items		Inspection of harness between injector magnetic valve and electronic control unit (power supply)
	Maintenance item		Check circuit between injector magnetic valve connector terminal No. 2 and electronic control unit connector (GF35B) terminal No. 1 or 2.
	Inspection condition		Disconnect electronic control unit from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify harness.

Step 7	Inspection items		Inspection of harness between injector magnetic valve and electronic control unit (ground)
	Maintenance item		Check circuit between injector magnetic valve connector terminal No. 1 and electronic control unit connector (GF35B) terminal No. 3.
	Inspection condition		Disconnect electronic control unit from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify harness.

Step 8	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. BF “Injector Test 5”.
	Inspection condition		• Vehicle: stationary (vehicle speed 0 km/h {0 MPH}) • Engine start: At idle • Transmission: neutral • The current diagnosis code does not occur.
	Requirements		Injector (No. 2 cylinder) is stopped during actuator test with engine changed in operating condition (vibrating).
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P0203/Flash code: 39
[Monitor]
Abnormality of injector magnetic valve (No. 3 cylinder)
[Fault (outline)]
Injector open circuit (No. 3 cylinder)
[Diagnosis check]
- Injector magnetic valve (No. 3 cylinder) circuit is monitored for fault.

[Code generation condition]
- Open-circuit of injector magnetic valve (No. 3 cylinder) is detected.
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal
- Injection time command: available
- Injector charge circuit: ON
- Post injection: none
- Engine speed sensor: normal
- Sub CPU in engine electronic control unit: normal

[Control effected by electronic control unit during fault]
- No injection in abnormal cylinder (other cylinders are limited in injection quantity)
- Exhaust gas recirculation control is stopped.
- Throttle control is stopped.
- Diesel particulate filter regeneration (manual or automatic) is stopped.
- Auto cruise control is stopped.
- Learning of FCCB (fuel control cylinder balance) is inhibited.

[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and injector magnetic valve (No. 3 cylinder)
- Abnormality of each connector
- Abnormality of injector magnetic valve (No. 3 cylinder)
- Abnormality in electronic control unit

[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>
- Extinguished at 4th driving cycle after normal signal is input.

<Fault code>
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished. (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

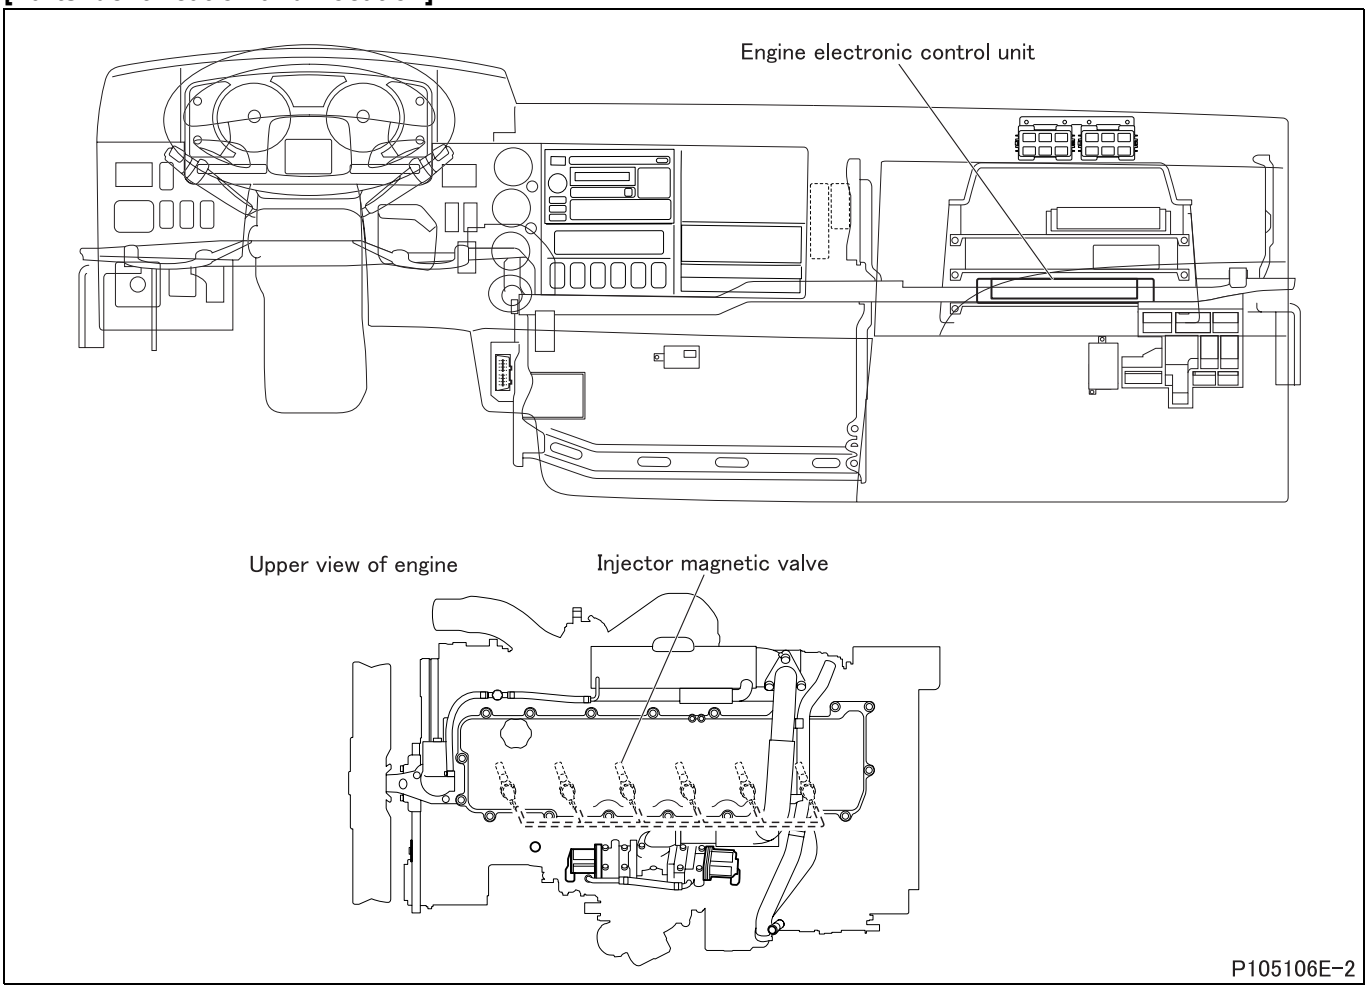
[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. BD “Injector Test 3”.
	Inspection condition		• Vehicle: stationary (vehicle speed 0 km/h {0 MPH}) • Engine start: At idle • Transmission: neutral • The current diagnosis code does not occur.
	Requirements		Injector (No. 3 cylinder) is stopped during actuator test with engine changed in operating condition (vibrating).
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

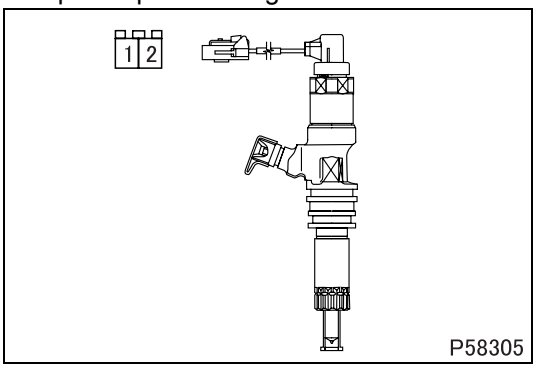
Step 2	Inspection items		Inspection by electronic control unit connector
	Maintenance item		Measure value of resistance between connector (GF35B) terminal No. 1 and 4 or No. 2 and 4.
	Inspection condition		• Disconnect electronic control unit from harness and measure from connection side of harness connector. • Starter switch: ON
	Requirements		0.45 ± 0.1 Ω (20°C {68°F})
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Go to step 4.

Step 3	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify connector.

Step 4	Inspection items		Inspection of injector magnetic valve connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Modify connector.

Step 5	Inspection items		Inspection of injector magnetic valve unit
	Maintenance item		Measure value of resistance between connector terminal No. 1 and 2.
	Inspection condition		–
	Requirements		0.45 ± 0.1 Ω (20°C {68°F})
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Replacement of injector

<Step 5 inspection diagram>



Step 6	Inspection items		Inspection of harness between injector magnetic valve and electronic control unit (power supply)
	Maintenance item		Check circuit between injector magnetic valve connector terminal No. 2 and electronic control unit connector (GF35B) terminal No. 1 or 2.
	Inspection condition		Disconnect electronic control unit from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify harness.

Step 7	Inspection items		Inspection of harness between injector magnetic valve and electronic control unit (ground)
	Maintenance item		Check circuit between injector magnetic valve connector terminal No. 1 and electronic control unit connector (GF35B) terminal No. 4.
	Inspection condition		Disconnect electronic control unit from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify harness.

Step 8	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. BD “Injector Test 3”.
	Inspection condition		• Vehicle: stationary (vehicle speed 0 km/h {0 MPH}) • Engine start: At idle • Transmission: neutral • The current diagnosis code does not occur.
	Requirements		Injector (No. 3 cylinder) is stopped during actuator test with engine changed in operating condition (vibrating).
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P0204/Flash code: 08
[Monitor]
Abnormality of injector magnetic valve (No. 4 cylinder)
[Fault (outline)]
Injector open circuit (No. 4 cylinder)
[Diagnosis check]
- Injector magnetic valve (No. 4 cylinder) circuit is monitored for fault.

[Code generation condition]
- Open-circuit of injector magnetic valve (No. 4 cylinder) is detected.
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON

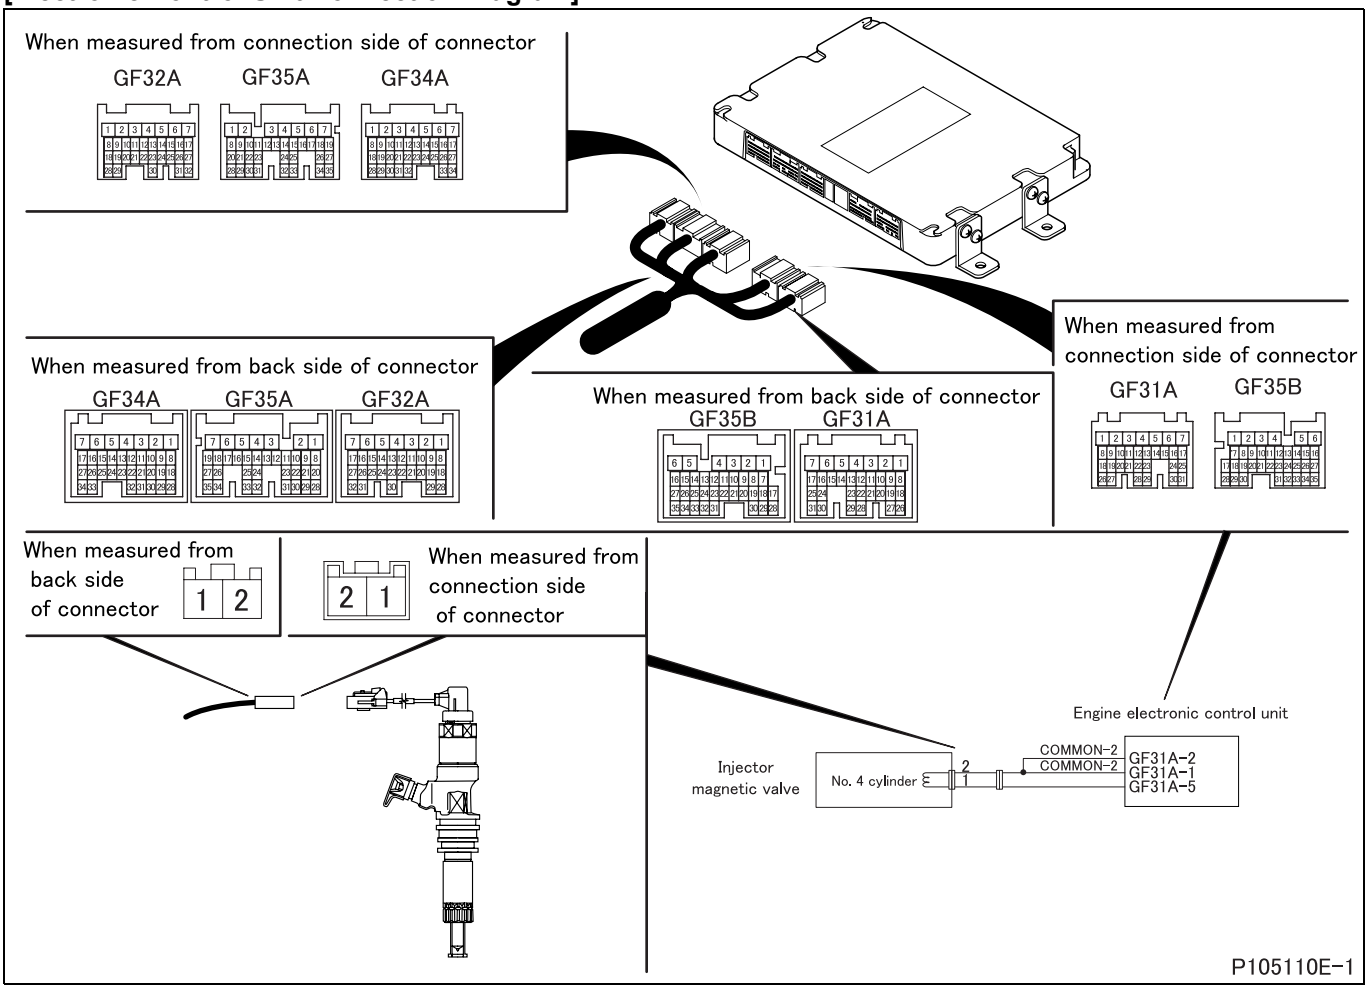
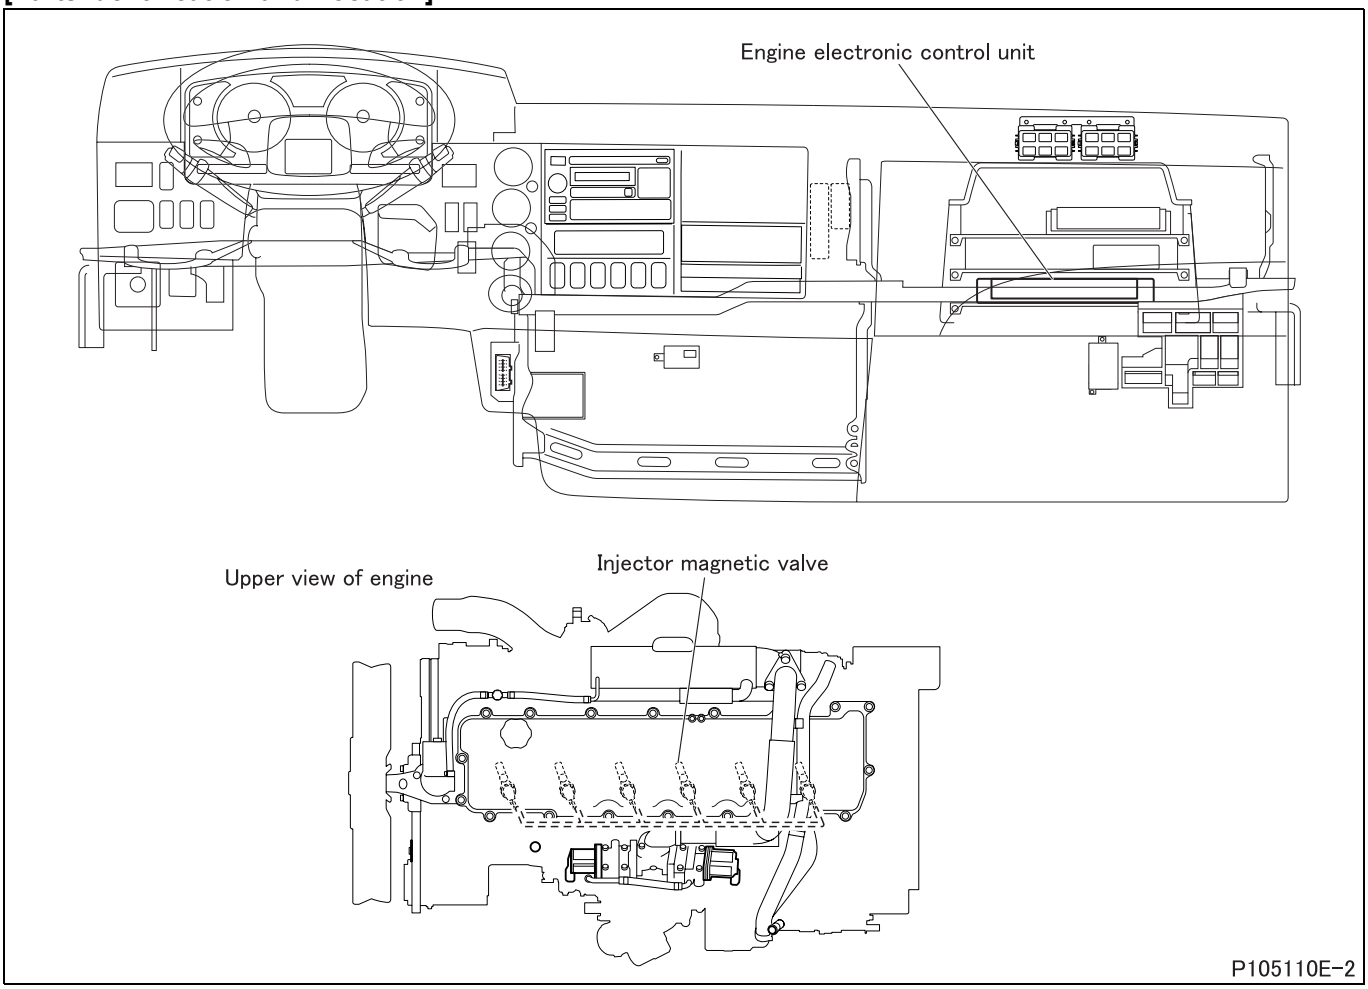
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished. (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		• Perform actuator test item No. C0 “Injector Test 6”.
	Inspection condition		• Vehicle: stationary (vehicle speed 0 km/h {0 MPH}) • Engine start: At idle • Transmission: neutral • The current diagnosis code does not occur.
	Requirements		Injector (No. 4 cylinder) is stopped during actuator test with engine changed in operating condition (vibrating).
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

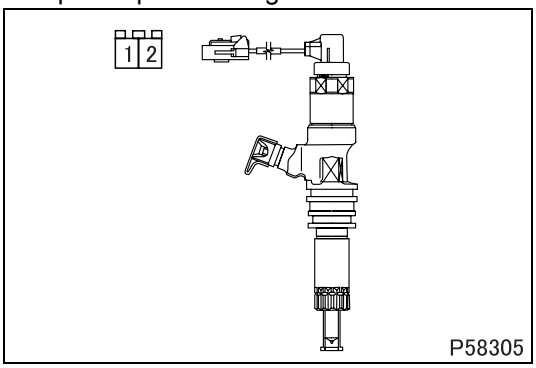
Step 2	Inspection items		Inspection by electronic control unit connector
	Maintenance item		Measure value of resistance between connector (GF31A) terminal No. 1 and 5 or No. 2 and 5.
	Inspection condition		• Disconnect electronic control unit from harness and measure from connection side of harness connector. • Starter switch: ON
	Requirements		0.45 ± 0.1 Ω (20°C {68°F})
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Go to step 4.

Step 3	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify connector.

Step 4	Inspection items		Inspection of injector magnetic valve connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Modify connector.

Step 5	Inspection items		Inspection of injector magnetic valve unit
	Maintenance item		Measure value of resistance between connector terminal No. 1 and 2.
	Inspection condition		–
	Requirements		0.45 ± 0.1 Ω (20°C {68°F})
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Replacement of injector

<Step 5 inspection diagram>



Step 6	Inspection items		Inspection of harness between injector magnetic valve and electronic control unit (power supply)
	Maintenance item		Check circuit between injector magnetic valve connector terminal No. 2 and electronic control unit connector (GF31A) terminal No. 1 or 2.
	Inspection condition		Disconnect electronic control unit from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify harness.

Step 7	Inspection items		Inspection of harness between injector magnetic valve and electronic control unit (ground)
	Maintenance item		Check circuit between injector magnetic valve connector terminal No. 1 and electronic control unit connector (GF31A) terminal No. 5.
	Inspection condition		Disconnect electronic control unit from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify harness.

Step 8	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. C0 “Injector Test 6”.
	Inspection condition		• Vehicle: stationary (vehicle speed 0 km/h {0 MPH}) • Engine start: At idle • Transmission: neutral • The current diagnosis code does not occur.
	Requirements		Injector (No. 4 cylinder) is stopped during actuator test with engine changed in operating condition (vibrating).
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P0205/Flash code: 46
[Monitor]
Abnormality of injector magnetic valve (No. 5 cylinder)
[Fault (outline)]
Injector open circuit (No. 5 cylinder)
[Diagnosis check]
- Injector magnetic valve (No. 5 cylinder) circuit is monitored for fault.

[Code generation condition]
- Open-circuit of injector magnetic valve (No. 5 cylinder) is detected.
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal
- Injection time command: available
- Injector charge circuit: ON
- Post injection: none
- Engine speed sensor: normal
- Sub CPU in engine electronic control unit: normal

[Control effected by electronic control unit during fault]
- No injection in abnormal cylinder (other cylinders are limited in injection quantity)
- Exhaust gas recirculation control is stopped.

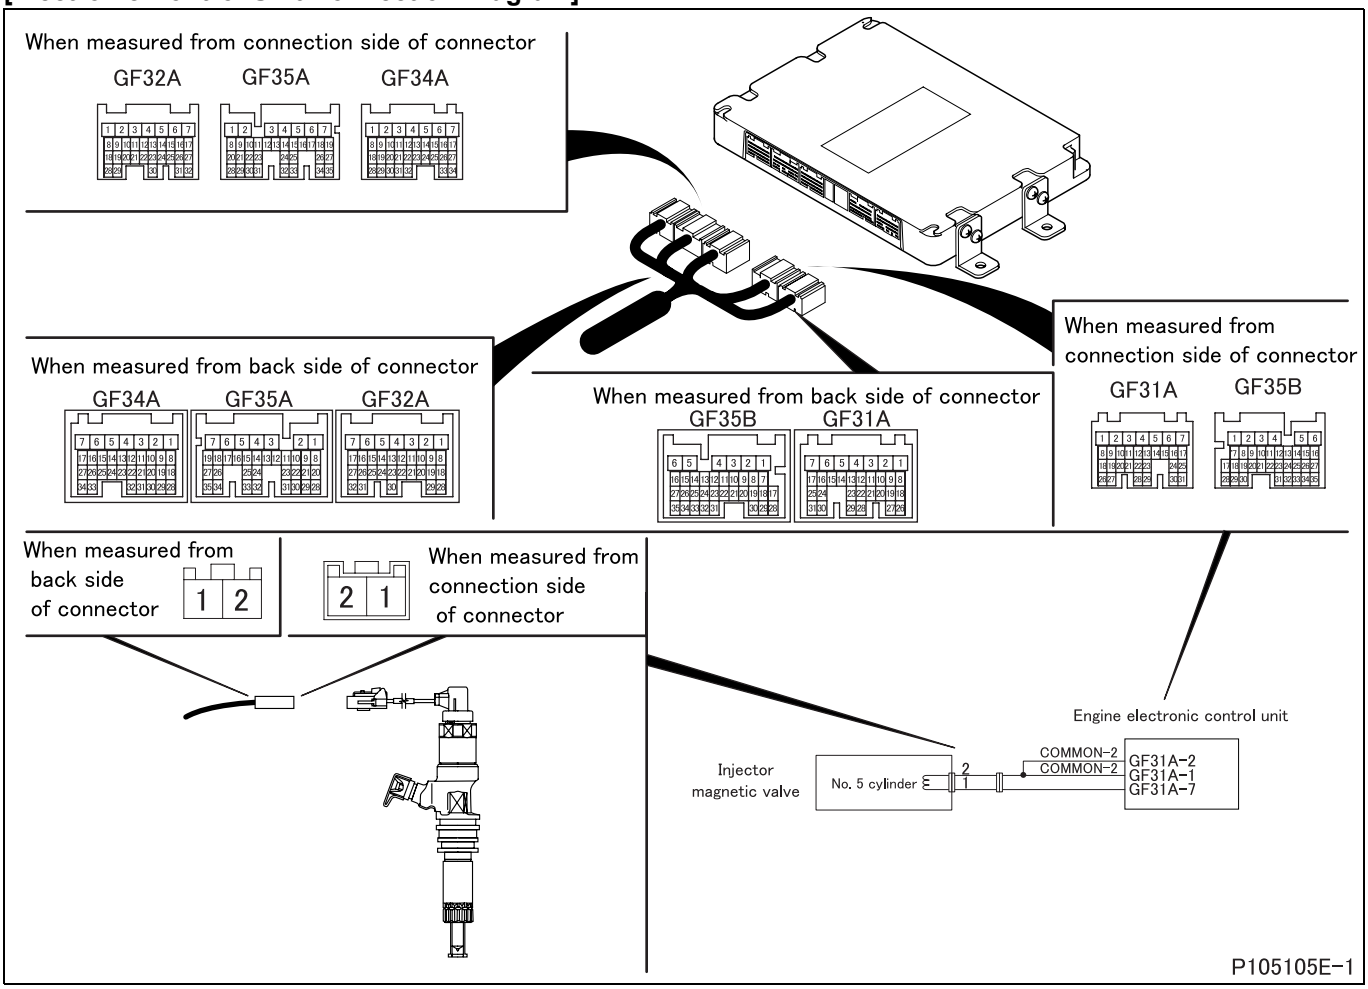
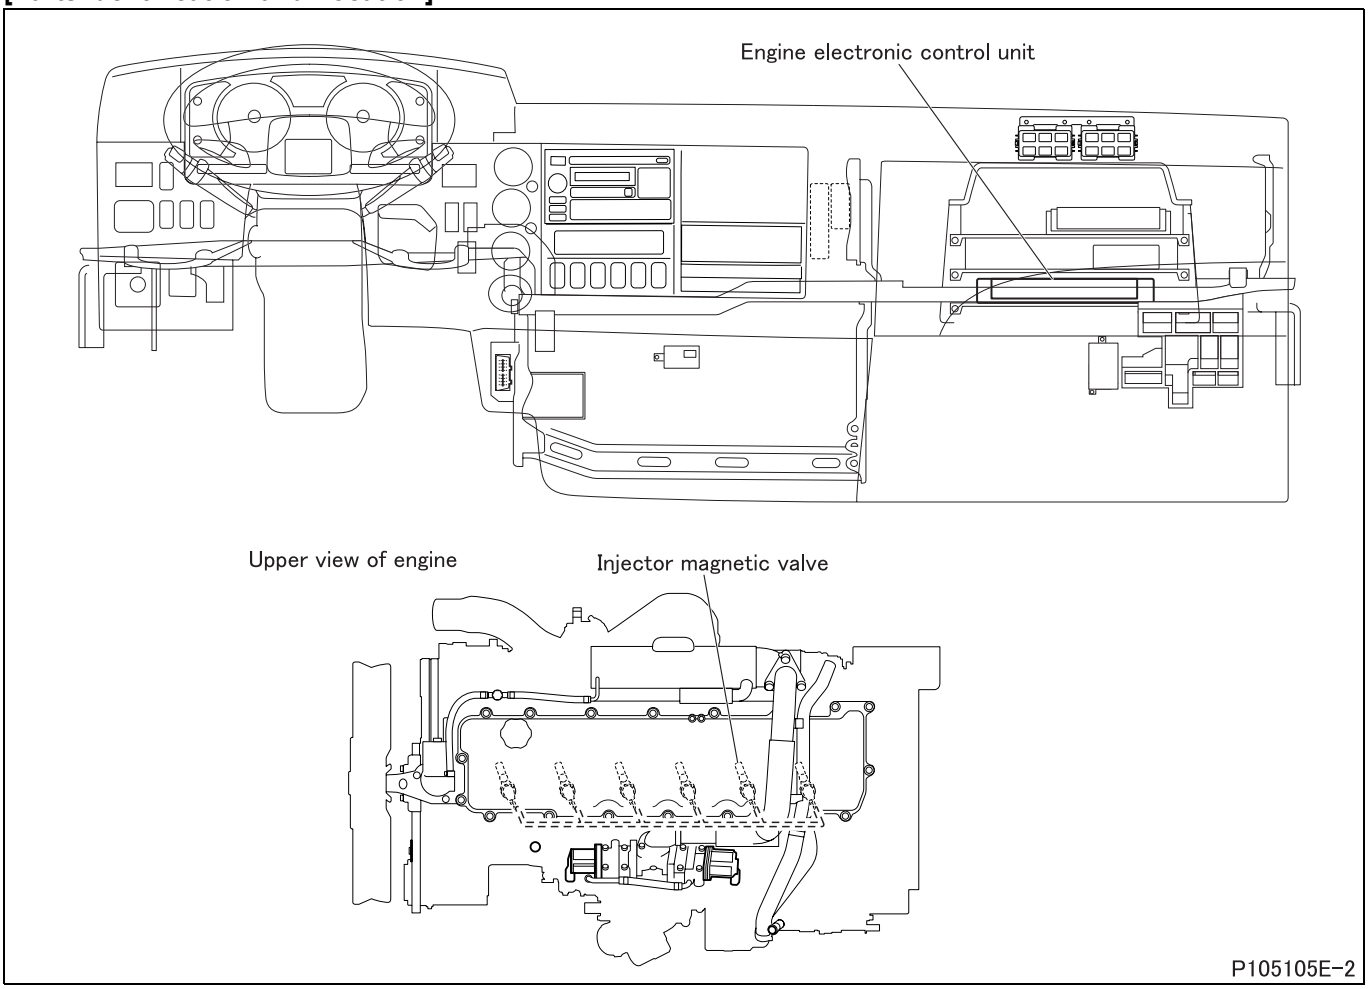
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished. (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. BC “Injector Test 2”.
	Inspection condition		• Vehicle: stationary (vehicle speed 0 km/h {0 MPH}) • Engine start: At idle • Transmission: neutral • The current diagnosis code does not occur.
	Requirements		Injector (No. 5 cylinder) is stopped during actuator test with engine changed in operating condition (vibrating).
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

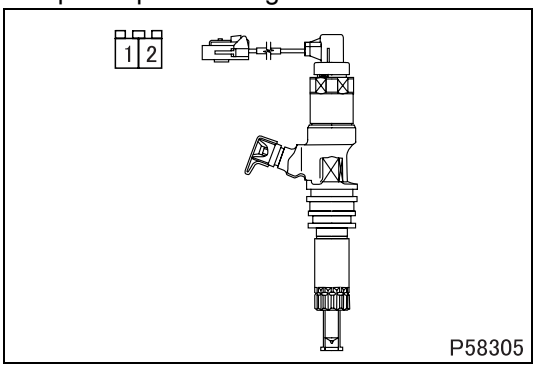
Step 2	Inspection items		Inspection by electronic control unit connector
	Maintenance item		Measure value of resistance between connector (GF31A) terminal No. 1 and 7 or No. 2 and 7.
	Inspection condition		• Disconnect electronic control unit from harness and measure from connection side of harness connector. • Starter switch: ON
	Requirements		0.45 ± 0.1 Ω (20°C {68°F})
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Go to step 4.

Step 3	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify connector.

Step 4	Inspection items		Inspection of injector magnetic valve connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Modify connector.

Step 5	Inspection items		Inspection of injector magnetic valve unit
	Maintenance item		Measure value of resistance between connector terminal No. 1 and 2.
	Inspection condition		–
	Requirements		0.45 ± 0.1 Ω (20°C {68°F})
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Replacement of injector

<Step 5 inspection diagram>



Step 6	Inspection items		Inspection of harness between injector magnetic valve and electronic control unit (power supply)
	Maintenance item		Check circuit between injector magnetic valve connector terminal No. 2 and electronic control unit connector (GF31A) terminal No. 1 or 2.
	Inspection condition		Disconnect electronic control unit from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify harness.

Step 7	Inspection items		Inspection of harness between injector magnetic valve and electronic control unit (ground)
	Maintenance item		Check circuit between injector magnetic valve connector terminal No. 1 and electronic control unit connector (GF31A) terminal No. 7.
	Inspection condition		Disconnect electronic control unit from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify harness.

Step 8	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. BC “Injector Test 2”.
	Inspection condition		• Vehicle: stationary (vehicle speed 0 km/h {0 MPH}) • Engine start: At idle • Transmission: neutral • The current diagnosis code does not occur.
	Requirements		Injector (No. 5 cylinder) is stopped during actuator test with engine changed in operating condition (vibrating).
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P0206/Flash code: 47
[Monitor]
Abnormality of injector magnetic valve (No. 6 cylinder)
[Fault (outline)]
Injector open circuit (No. 6 cylinder)
[Diagnosis check]
- Injector magnetic valve (No. 6 cylinder) circuit is monitored for fault.

[Code generation condition]
- Open-circuit of injector magnetic valve (No. 6 cylinder) is detected.
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal
- Injection time command: available
- Injector charge circuit: ON
- Post injection: none
- Engine speed sensor: normal
- Sub CPU in engine electronic control unit: normal

[Control effected by electronic control unit during fault]
- No injection in abnormal cylinder (other cylinders are limited in injection quantity)
- Exhaust gas recirculation control is stopped.
- Throttle control is stopped.
- Diesel particulate filter regeneration (manual or automatic) is stopped.
- Auto cruise control is stopped.
- Learning of FCCB (fuel control cylinder balance) is inhibited.

[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and injector magnetic valve (No. 6 cylinder)
- Abnormality of each connector
- Abnormality of injector magnetic valve (No. 6 cylinder)
- Abnormality in electronic control unit

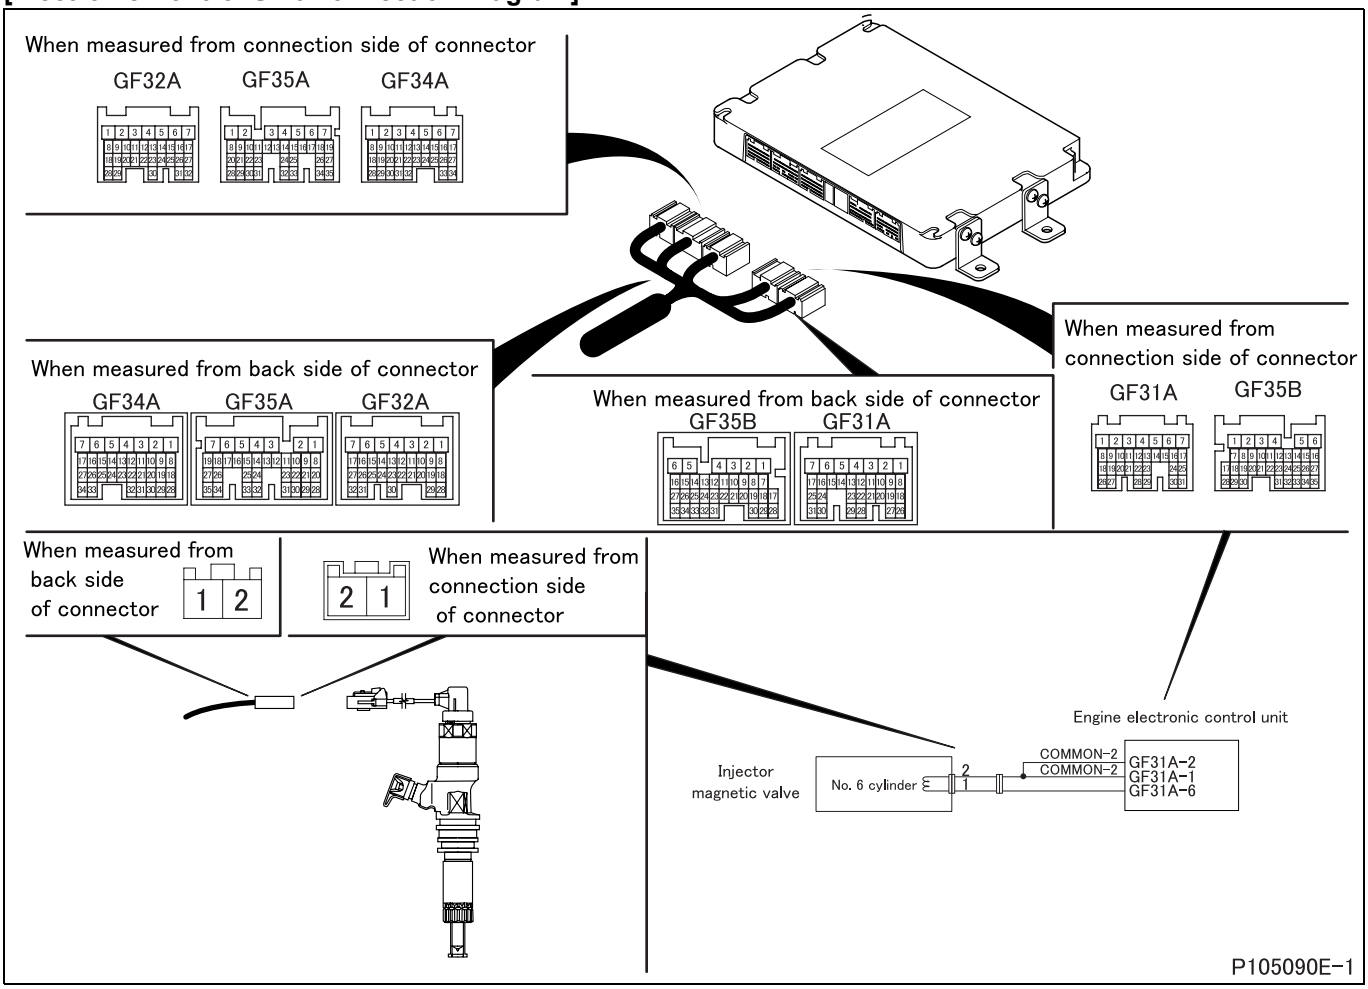
[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>
- Extinguished at 4th driving cycle after normal signal is input.

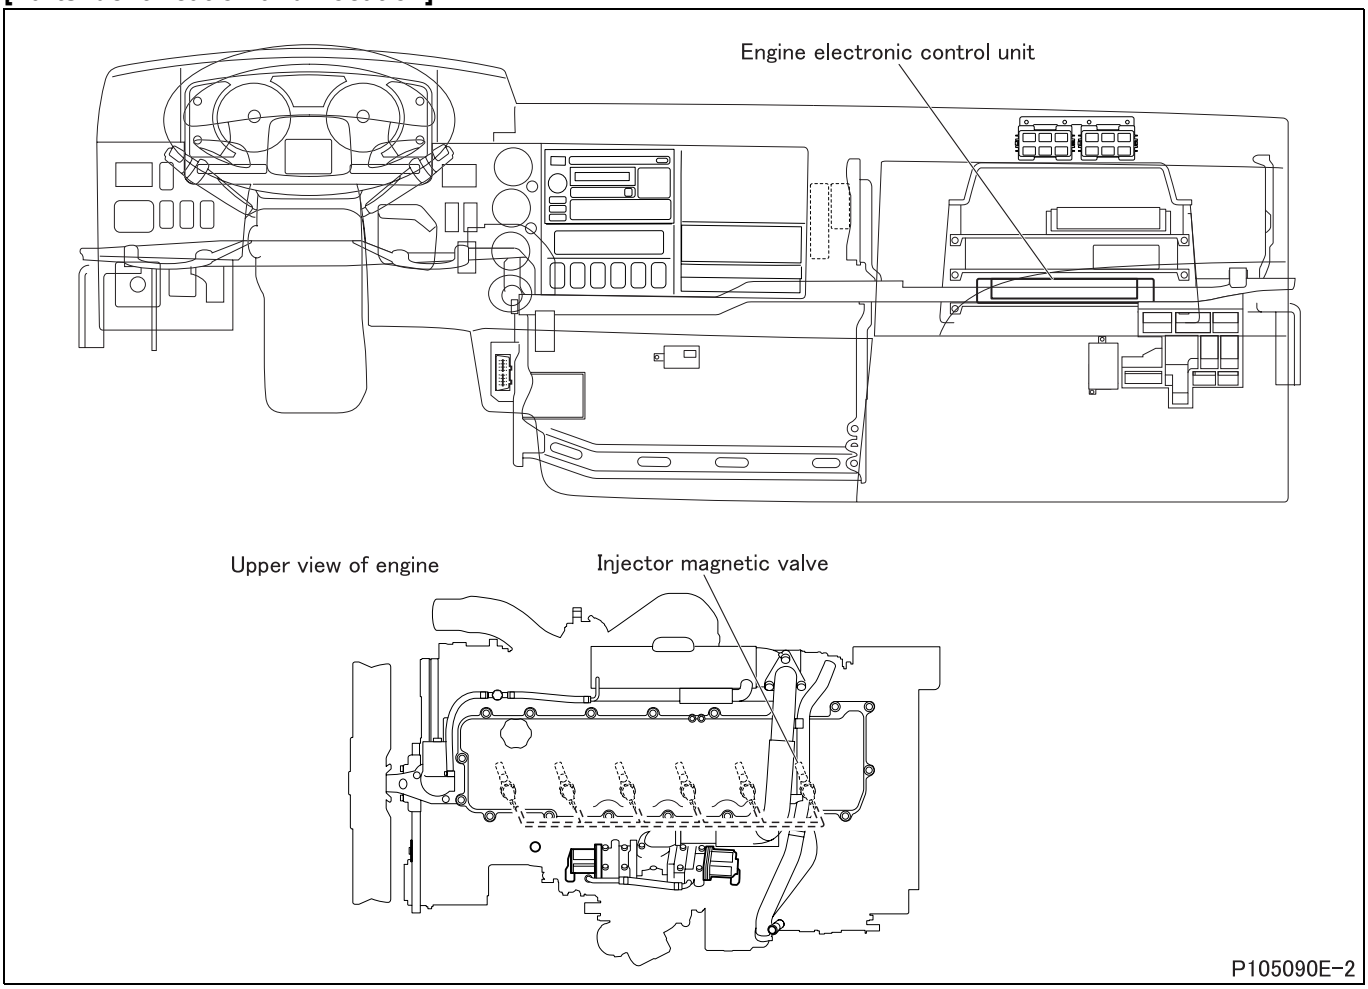
<Fault code>
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished. (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		• Perform actuator test item No. BE “Injector Test 4”.
	Inspection condition		• Vehicle: stationary (vehicle speed 0 km/h {0 MPH}) • Engine start: At idle • Transmission: neutral • The current diagnosis code does not occur.
	Requirements		Injector (No. 6 cylinder) is stopped during actuator test with engine changed in operating condition (vibrating).
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

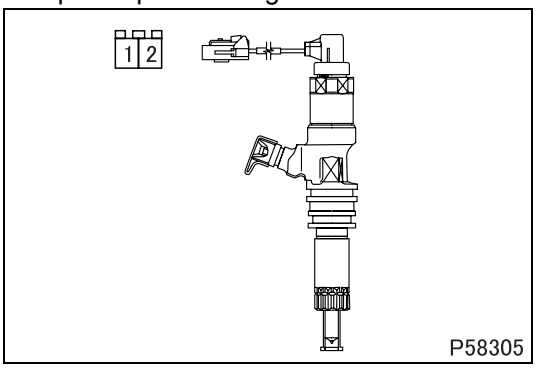
Step 2	Inspection items		Inspection by electronic control unit connector
	Maintenance item		Measure value of resistance between connector (GF31A) terminal No. 1 and 6 or No. 2 and 6.
	Inspection condition		• Disconnect electronic control unit from harness and measure from connection side of harness connector. • Starter switch: ON
	Requirements		0.45 ± 0.1 Ω (20°C {68°F})
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Go to step 4.

Step 3	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify connector.

Step 4	Inspection items		Inspection of injector magnetic valve connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Modify connector.

Step 5	Inspection items		Inspection of injector magnetic valve unit
	Maintenance item		Measure value of resistance between connector terminal No. 1 and 2.
	Inspection condition		–
	Requirements		0.45 ± 0.1 Ω (20°C {68°F})
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Replacement of injector

<Step 5 inspection diagram>



Step 6	Inspection items		Inspection of harness between injector magnetic valve and electronic control unit (power supply)
	Maintenance item		Check circuit between injector magnetic valve connector terminal No. 2 and electronic control unit connector (GF31A) terminal No. 1 or 2.
	Inspection condition		Disconnect electronic control unit from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify harness.

Step 7	Inspection items		Inspection of harness between injector magnetic valve and electronic control unit (ground)
	Maintenance item		Check circuit between injector magnetic valve connector terminal No. 1 and electronic control unit connector (GF31A) terminal No. 6.
	Inspection condition		Disconnect electronic control unit from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify harness.

Step 8	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. BE “Injector Test 4”.
	Inspection condition		• Vehicle: stationary (vehicle speed 0 km/h {0 MPH}) • Engine start: At idle • Transmission: neutral • The current diagnosis code does not occur.
	Requirements		Injector (No. 6 cylinder) is stopped during actuator test with engine changed in operating condition (vibrating).
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P0219/Flash code: 07
[Monitor]
Engine overrun
[Fault (outline)]
High signal range check
[Diagnosis check]
- Engine speed is monitored for abnormal increase (overrun).

[Code generation condition]
- Engine speed remains higher than 3400 rpm for approx. 0.064 second.
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- Starter switch: ON

[Control effected by electronic control unit during fault]
- Common rail system is stopped. (Injection quantity control is stopped.)

[Probable cause of trouble]
- Mistake of shifting
- Abnormality in electronic control unit

[Recoverability]
<Control during fault>
- Recovered if engine speed is 3250 rpm or less.

<Warning lamp>
- Extinguished after input of normal signal.

<Fault code>
- If code recovered to normal, automatically cleared at 40th warm up cycle after warning lamp is lit. (To clear as desired, erase from the memory.)

Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Fault diagnosis]
- Perform checks in the sequence of the following step.

Step 1	Inspection items		Inspection by control data
	Maintenance item		Check if this diagnosis code occurs except in red zone.
	Inspection condition		• Starter switch: ON • Engine start (condition except in red zone)
	Requirements		Replacement of electronic control unit (Electronic control unit is checked for engine revolution pulse recognition under code generation condition. In the case of erroneous recognition (overspeed recognition), it should be an impact of engine speed sensor. (Engine speed sensor gap is increased to determine its impact resulting in code generation.) Otherwise, electronic control unit is replaced.)
	Inspection result (Is the judging standard satisfied?)	YES	Replacement of electronic control unit
		NO	–

[Fault code]
Diagnosis code: P0222/Flash code: 16
[Monitor]
Abnormality of accelerator pedal position sensor 2
[Fault (outline)]
Low signal range check
[Diagnosis check]
- Output voltage of accelerator pedal position sensor 2 is monitored.

[Code generation condition]
- Voltage of accelerator pedal position sensor 2 remains below 0.5 V for approx. 1 second.
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal

[Control effected by electronic control unit during fault]
- Control is carried out using output from accelerator pedal position sensor 1.
- When sensor 1 and 2 malfunctions, control is effected with accelerator pedal judged released from foot pressure.

[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and accelerator pedal position sensor 2
- Abnormality of each connector
- Abnormality of accelerator pedal position sensor 2
- Abnormality in electronic control unit

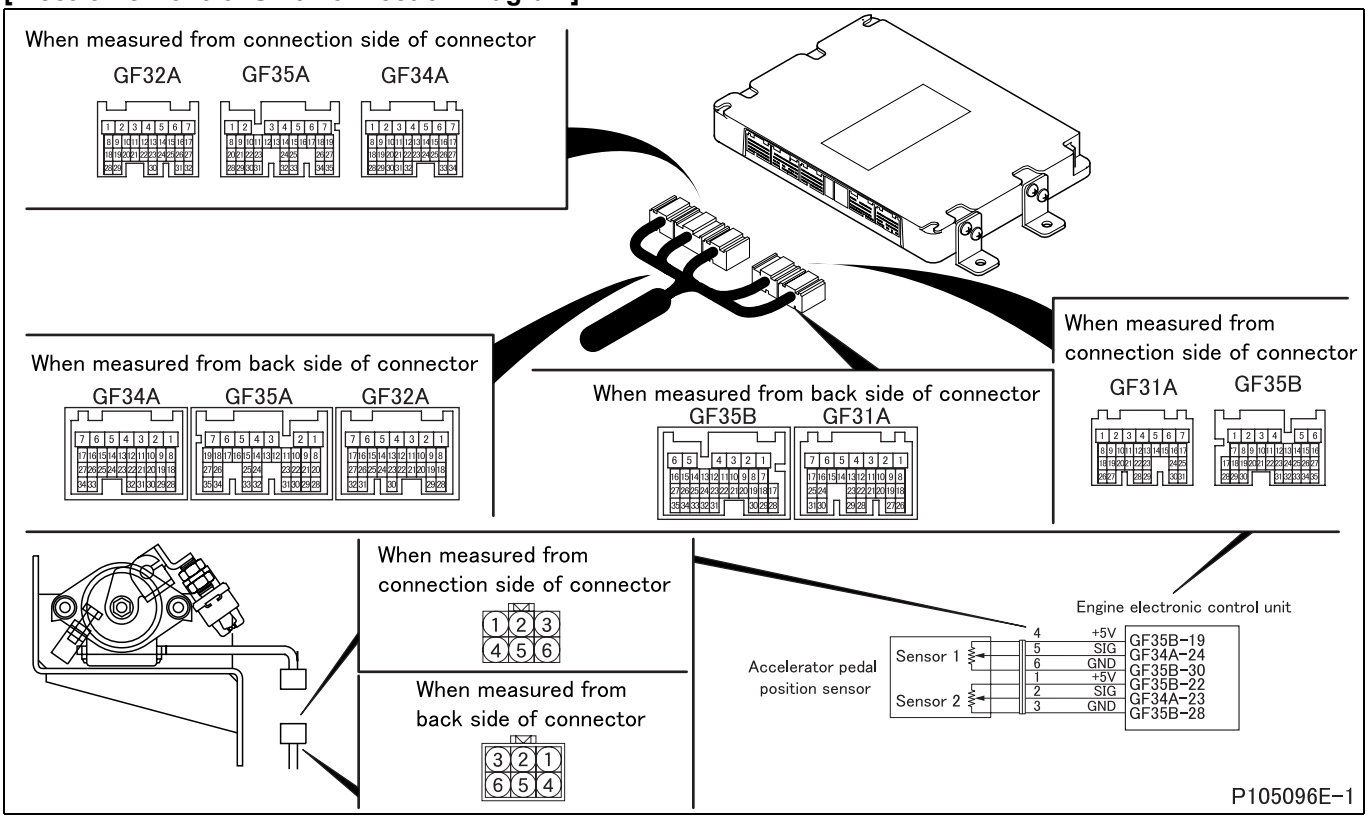
[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>
- Extinguished at 4th driving cycle after normal signal is input.

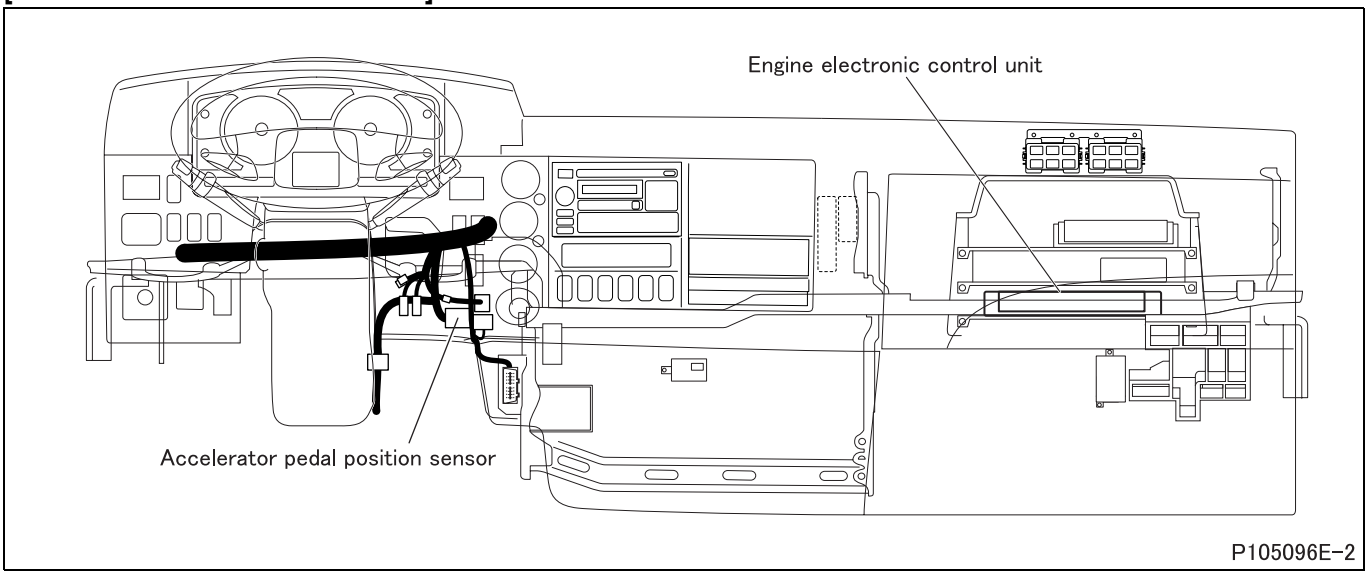
<Fault code>
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished. (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		**<General Scanning Tool used>** • Measure item “Accelerator Pedal Position 2”. **<Multi-Use Tester used>** • Measure item No. 25 “Accel Pedal Sensor Voltage 2” of Service Data.
	Inspection condition		–
	Requirements		**<General Scanning Tool used>** • Accelerator pedal not pressed: 0% • Accelerator pedal pressed: 100% **<Multi-Use Tester used>** • Accelerator pedal not pressed: 0.85 ± 0.1 V • Accelerator pedal pressed: 4.15 ± 0.1 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

Step 2	Inspection items		Inspection by electronic control unit connector (signal)
	Maintenance item		Measure value of voltage between connector (GF34A) terminal No. 23 (+) and (GF35B) terminal No. 28 (–).
	Inspection condition		• Starter switch: ON • Engine is stopped. • Measure from back side of connector of harness with each device connected to harness.
	Requirements		• Accelerator pedal not pressed: 0.85 ± 0.1 V • Accelerator pedal pressed: 4.15 ± 0.1 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Go to step 3.

Step 3	Inspection items		Inspection by electronic control unit connector (power supply)
	Maintenance item		Measure value of voltage between connector (GF35B) terminal No. 22 (+) and No. 28 (–).
	Inspection condition		• Starter switch: ON • Engine is stopped. • Measure from back side of connector of harness with each device connected to harness.
	Requirements		5 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	Go to step 5.

Step 4	Inspection items		Inspection by electronic control unit connector (ground)
	Maintenance item		Measure value of voltage between connector (GF35B) terminal No. 28 (+) and (GF31A) terminal No. 3 (–).
	Inspection condition		• Starter switch: ON • Engine is stopped. • Measure from back side of connector of harness with each device connected to harness.
	Requirements		0 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Go to step 5.

Step 5	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 12.
		NO	Modify connector.

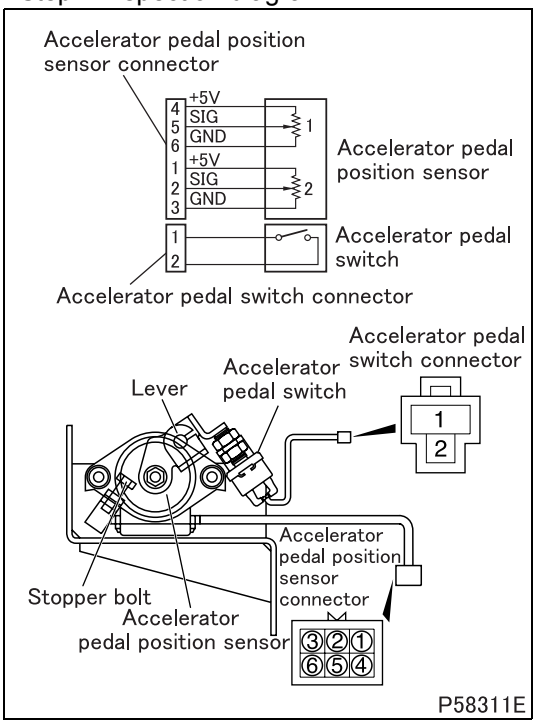
Step 6	Inspection items		Inspection of sensor connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify connector.

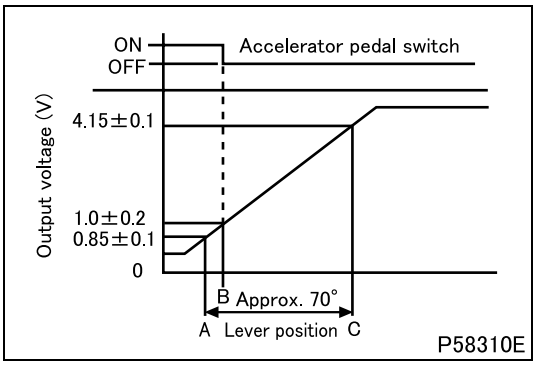
Step 7	Inspection items		Inspection of accelerator pedal position sensor 2 unit
	Maintenance item		Measure value of voltage between connector terminal No. 2 (+) and 3 (–).
	Inspection condition		Apply voltage DC 5 V across connector terminals No. 1 (+) and 3 (–).

	Requirements		• Idle position A: 0.85 ± 0.1 V
			• Accelerator pedal switch operating position B: 1.0 ± 0.2 V
			• Full load position C: 4.15 ± 0.1 V
			  • A: When accelerator lever fully presses accelerator pedal switch.
			  • B: When accelerator pedal is pressed until there is no continuity between accelerator pedal switch connector terminals 1 and 2.
			  • C: When accelerator lever is in contact with full load stopper bolt.

	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Adjustment of sensor (If the measurement deviates from the standard value after adjustment, replace the sensor.) (See “INSPECTION OF ELECTRICAL EQUIPMENT” – “Inspection of accelerator pedal position sensor”.)

<Step 7 inspection diagram>





Step 8	Inspection items		Inspection by sensor connector
	Maintenance item		Measure value of voltage between connector terminal No. 1 (+) and 3 (–).
	Inspection condition		• Starter switch: ON • Engine is stopped. • Measure from back side of connector of harness with each device connected to harness.
	Requirements		5 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 10.
		NO	Go to step 9.

Step 9	Inspection items		Inspection of harness between electronic control unit and sensor (power supply)
	Maintenance item		Check circuit between electronic control unit connector (GF35B) terminal No. 22 and sensor connector terminal No. 1.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 12.
		NO	Modify harness.

Step 10	Inspection items		Inspection of harness between electronic control unit and sensor (ground)
	Maintenance item		Check circuit between electronic control unit connector (GF35B) terminal No. 28 and sensor connector terminal No. 3.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 11.
		NO	Modify harness.

Step 11	Inspection items		Inspection of harness between electronic control unit and sensor (signal)
	Maintenance item		Check circuit between electronic control unit connector (GF34A) terminal No. 23 and sensor connector terminal No. 2.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 12.
		NO	Modify harness.

Step 12	Inspection items		Inspection by control data
	Maintenance item		**<General Scanning Tool used>** • Measure item “Accelerator Pedal Position 2”. **<Multi-Use Tester used>** • Measure item No. 25 “Accel Pedal Sensor Voltage 2” of Service Data.
	Inspection condition		–
	Requirements		**<General Scanning Tool used>** • Accelerator pedal not pressed: 0% • Accelerator pedal pressed: 100% **<Multi-Use Tester used>** • Accelerator pedal not pressed: 0.85 ± 0.1 V • Accelerator pedal pressed: 4.15 ± 0.1 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P0223/Flash code: 16
[Monitor]
Abnormality of accelerator pedal position sensor 2
[Fault (outline)]
High signal range check
[Diagnosis check]
- Output voltage of accelerator pedal position sensor 2 is monitored.

[Code generation condition]
- Voltage of accelerator pedal position sensor 2 remains over 4.5 V for approx. 1 second.
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal

[Control effected by electronic control unit during fault]
- Control is carried out using output from accelerator pedal position sensor 1.
- When sensor 1 and 2 malfunctions, control is effected with accelerator pedal judged released from foot pressure.

[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and accelerator pedal position sensor 2
- Abnormality of each connector
- Abnormality of accelerator pedal position sensor 2
- Abnormality in electronic control unit

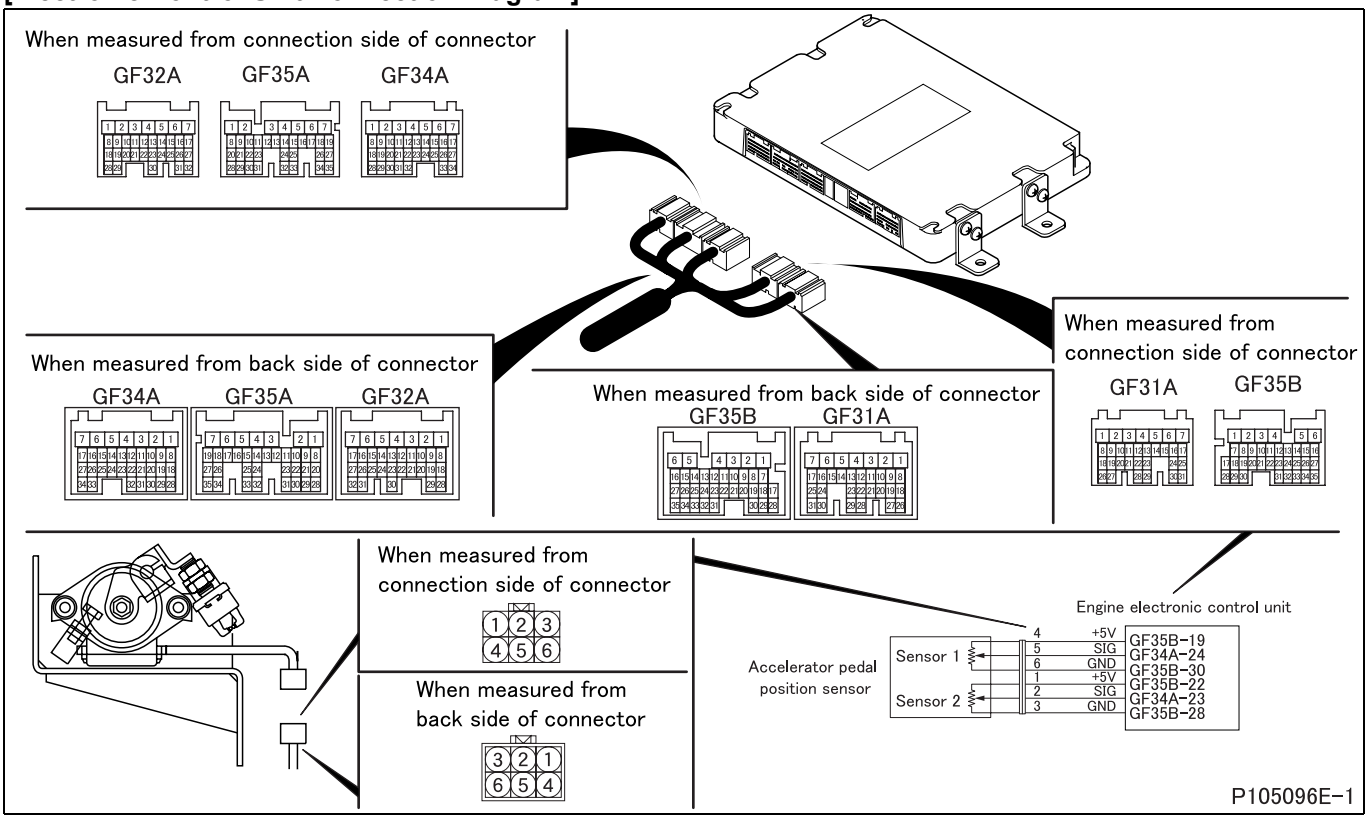
[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>
- Extinguished at 4th driving cycle after normal signal is input.

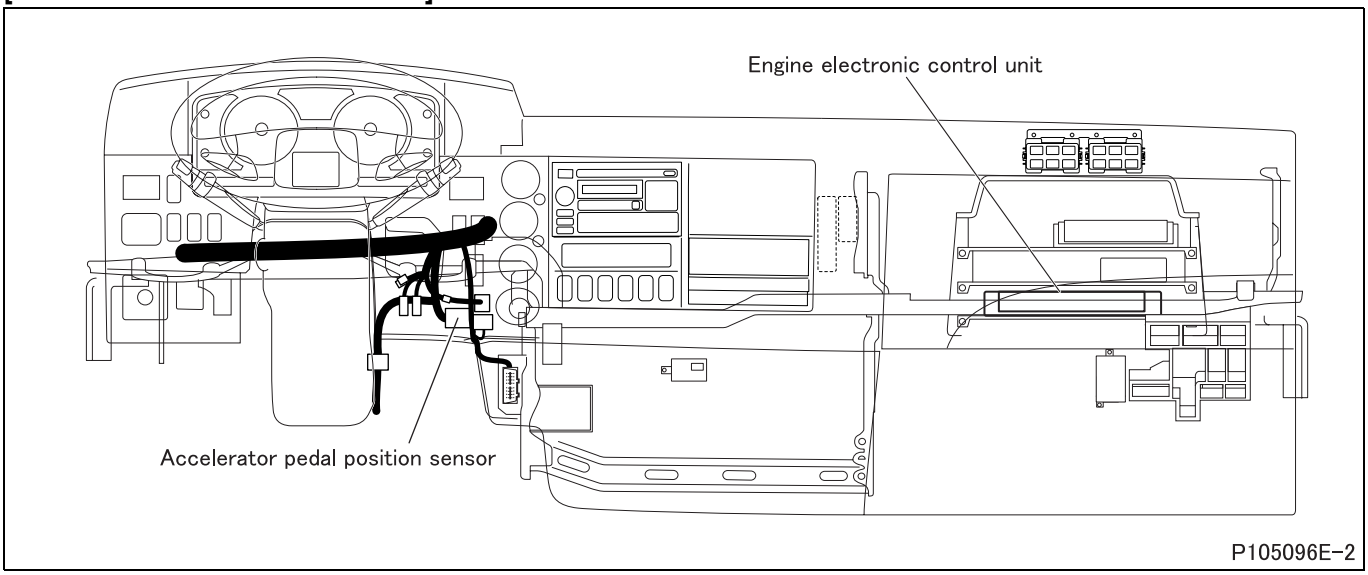
<Fault code>
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished. (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		**<General Scanning Tool used>** • Measure item “Accelerator Pedal Position 2”. **<Multi-Use Tester used>** • Measure item No. 25 “Accel Pedal Sensor Voltage 2” of Service Data.
	Inspection condition		–
	Requirements		**<General Scanning Tool used>** • Accelerator pedal not pressed: 0% • Accelerator pedal pressed: 100% **<Multi-Use Tester used>** • Accelerator pedal not pressed: 0.85 ± 0.1 V • Accelerator pedal pressed: 4.15 ± 0.1 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

Step 2	Inspection items		Inspection by electronic control unit connector (signal)
	Maintenance item		Measure value of voltage between connector (GF34A) terminal No. 23 (+) and (GF35B) terminal No. 28 (–).
	Inspection condition		• Starter switch: ON • Engine is stopped. • Measure from back side of connector of harness with each device connected to harness.
	Requirements		• Accelerator pedal not pressed: 0.85 ± 0.1 V • Accelerator pedal pressed: 4.15 ± 0.1 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Go to step 3.

Step 3	Inspection items		Inspection by electronic control unit connector (power supply)
	Maintenance item		Measure value of voltage between connector (GF35B) terminal No. 22 (+) and No. 28 (–).
	Inspection condition		• Starter switch: ON • Engine is stopped. • Measure from back side of connector of harness with each device connected to harness.
	Requirements		5 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	Go to step 5.

Step 4	Inspection items		Inspection by electronic control unit connector (ground)
	Maintenance item		Measure value of voltage between connector (GF35B) terminal No. 28 (+) and (GF31A) terminal No. 3 (–).
	Inspection condition		• Starter switch: ON • Engine is stopped. • Measure from back side of connector of harness with each device connected to harness.
	Requirements		0 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Go to step 5.

Step 5	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 12.
		NO	Modify connector.

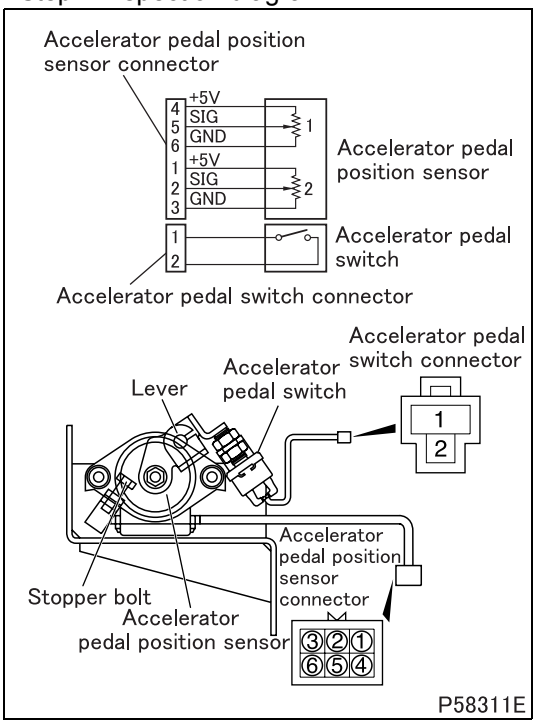
Step 6	Inspection items		Inspection of sensor connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify connector.

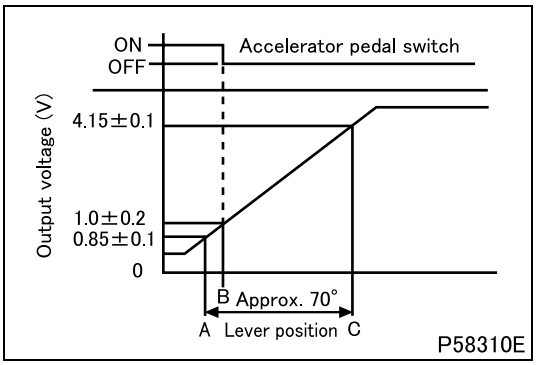
Step 7	Inspection items		Inspection of accelerator pedal position sensor 2 unit
	Maintenance item		Measure value of voltage between connector terminal No. 2 (+) and 3 (–).
	Inspection condition		Apply voltage DC 5 V across connector terminals No. 1 (+) and 3 (–).

	Requirements		• Idle position A: 0.85 ± 0.1 V
			• Accelerator pedal switch operating position B: 1.0 ± 0.2 V
			• Full load position C: 4.15 ± 0.1 V
			  • A: When accelerator lever fully presses accelerator pedal switch.
			  • B: When accelerator pedal is pressed until there is no continuity between accelerator pedal switch connector terminals 1 and 2.
			  • C: When accelerator lever is in contact with full load stopper bolt.

	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Adjustment of sensor (If the measurement deviates from the standard value after adjustment, replace the sensor.) (See “INSPECTION OF ELECTRICAL EQUIPMENT” – “Inspection of accelerator pedal position sensor”.)

<Step 7 inspection diagram>





Step 8	Inspection items		Inspection by sensor connector
	Maintenance item		Measure value of voltage between connector terminal No. 1 (+) and 3 (–).
	Inspection condition		• Starter switch: ON • Engine is stopped. • Measure from back side of connector of harness with each device connected to harness.
	Requirements		5 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 10.
		NO	Go to step 9.

Step 9	Inspection items		Inspection of harness between electronic control unit and sensor (power supply)
	Maintenance item		Check circuit between electronic control unit connector (GF35B) terminal No. 22 and sensor connector terminal No. 1.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 12.
		NO	Modify harness.

Step 10	Inspection items		Inspection of harness between electronic control unit and sensor (ground)
	Maintenance item		Check circuit between electronic control unit connector (GF35B) terminal No. 28 and sensor connector terminal No. 3.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 11.
		NO	Modify harness.

Step 11	Inspection items		Inspection of harness between electronic control unit and sensor (signal)
	Maintenance item		Check circuit between electronic control unit connector (GF34A) terminal No. 23 and sensor connector terminal No. 2.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 12.
		NO	Modify harness.

Step 12	Inspection items		Inspection by control data
	Maintenance item		**<General Scanning Tool used>** • Measure item “Accelerator Pedal Position 2”. **<Multi-Use Tester used>** • Measure item No. 25 “Accel Pedal Sensor Voltage 2” of Service Data.
	Inspection condition		–
	Requirements		**<General Scanning Tool used>** • Accelerator pedal not pressed: 0% • Accelerator pedal pressed: 100% **<Multi-Use Tester used>** • Accelerator pedal not pressed: 0.85 ± 0.1 V • Accelerator pedal pressed: 4.15 ± 0.1 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P0226/Flash code: 28
[Monitor]
Abnormality of intake throttle (position sensor)
[Fault (outline)]
- Abnormal position
- Abnormal ref voltage

[Diagnosis check]
- Throttle electronic drive unit monitors built-in position sensor of intake throttle for circuit fault and sends abnormality information to engine electronic control unit through controller area network communication.

[Code generation condition]
Diagnosis code is generated under either of the following conditions.
(Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)
- Voltage of position sensor remains out of specification (open: above 4.7 V, close: below 0.2 V) for 1 second.
- Power voltage of position sensor remains below 4.1 V for 1 second.

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal

[Control effected by electronic control unit during fault]
- Injection quantity is limited.
- Exhaust gas recirculation control is stopped.
- Throttle control is stopped.
- Diesel particulate filter regeneration (manual or automatic) is stopped.

[Probable cause of trouble]
- Open-circuit or short-circuit of harness between throttle electronic drive unit and throttle actuator
- Abnormality of each connector
- Abnormality of throttle motor (built in throttle actuator)
- Abnormality of throttle position sensor (built in throttle actuator)
- Abnormality of throttle electronic drive unit
- Abnormality in electronic drive unit relay

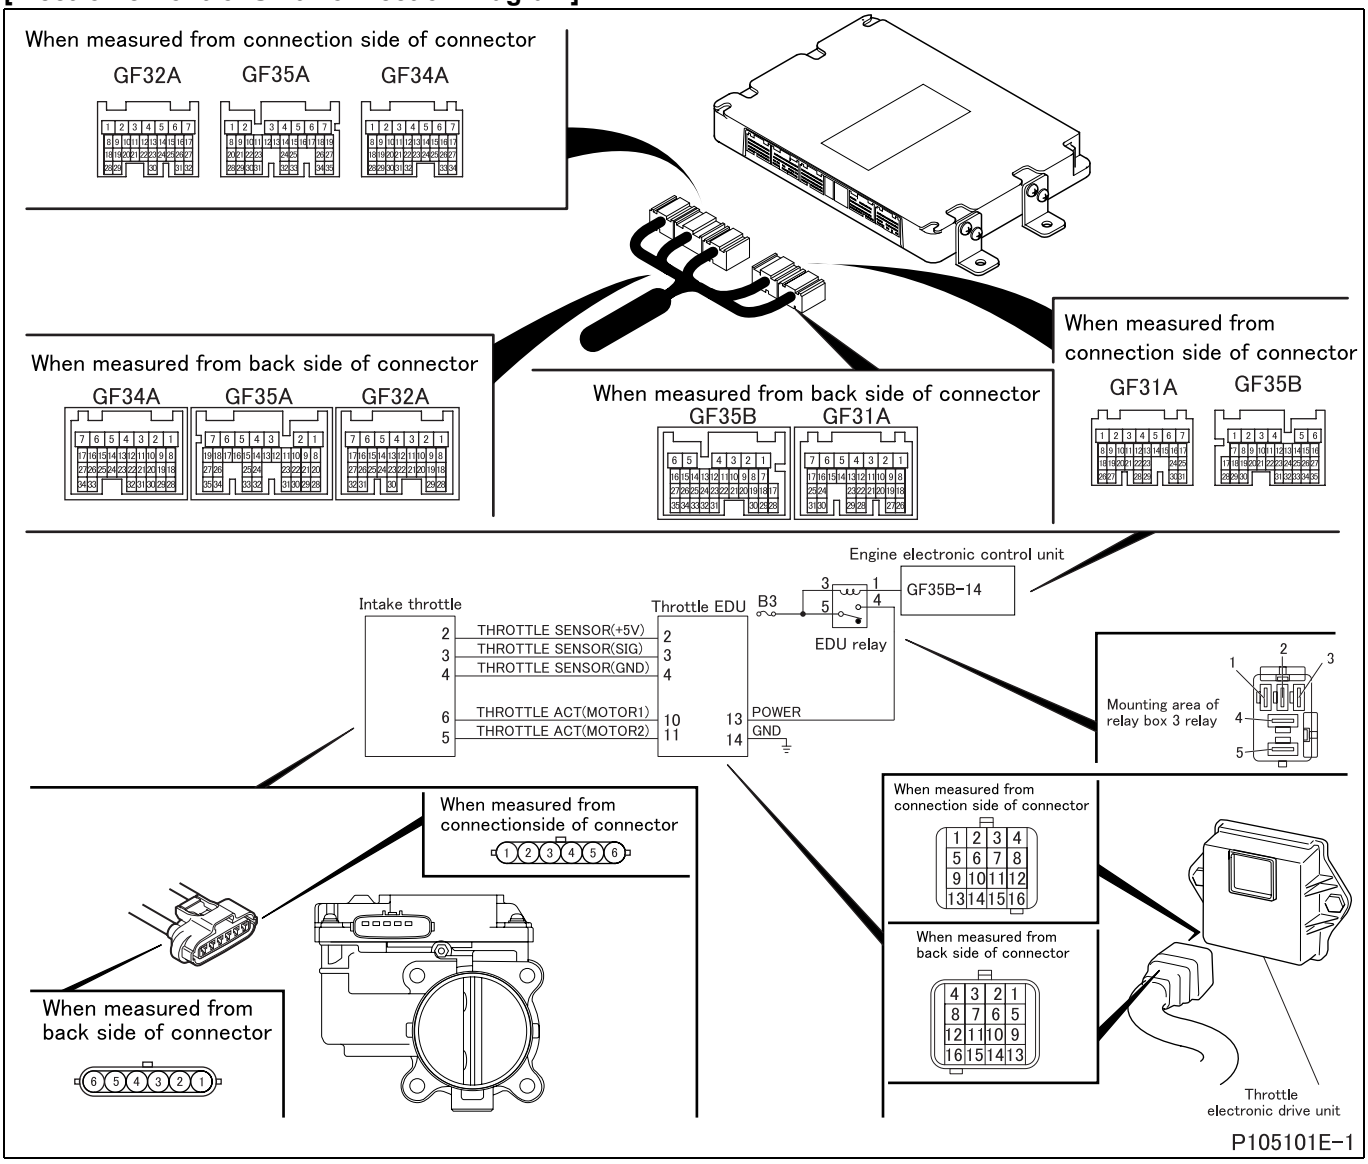
[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>
- Extinguished at 4th driving cycle after normal signal is input.

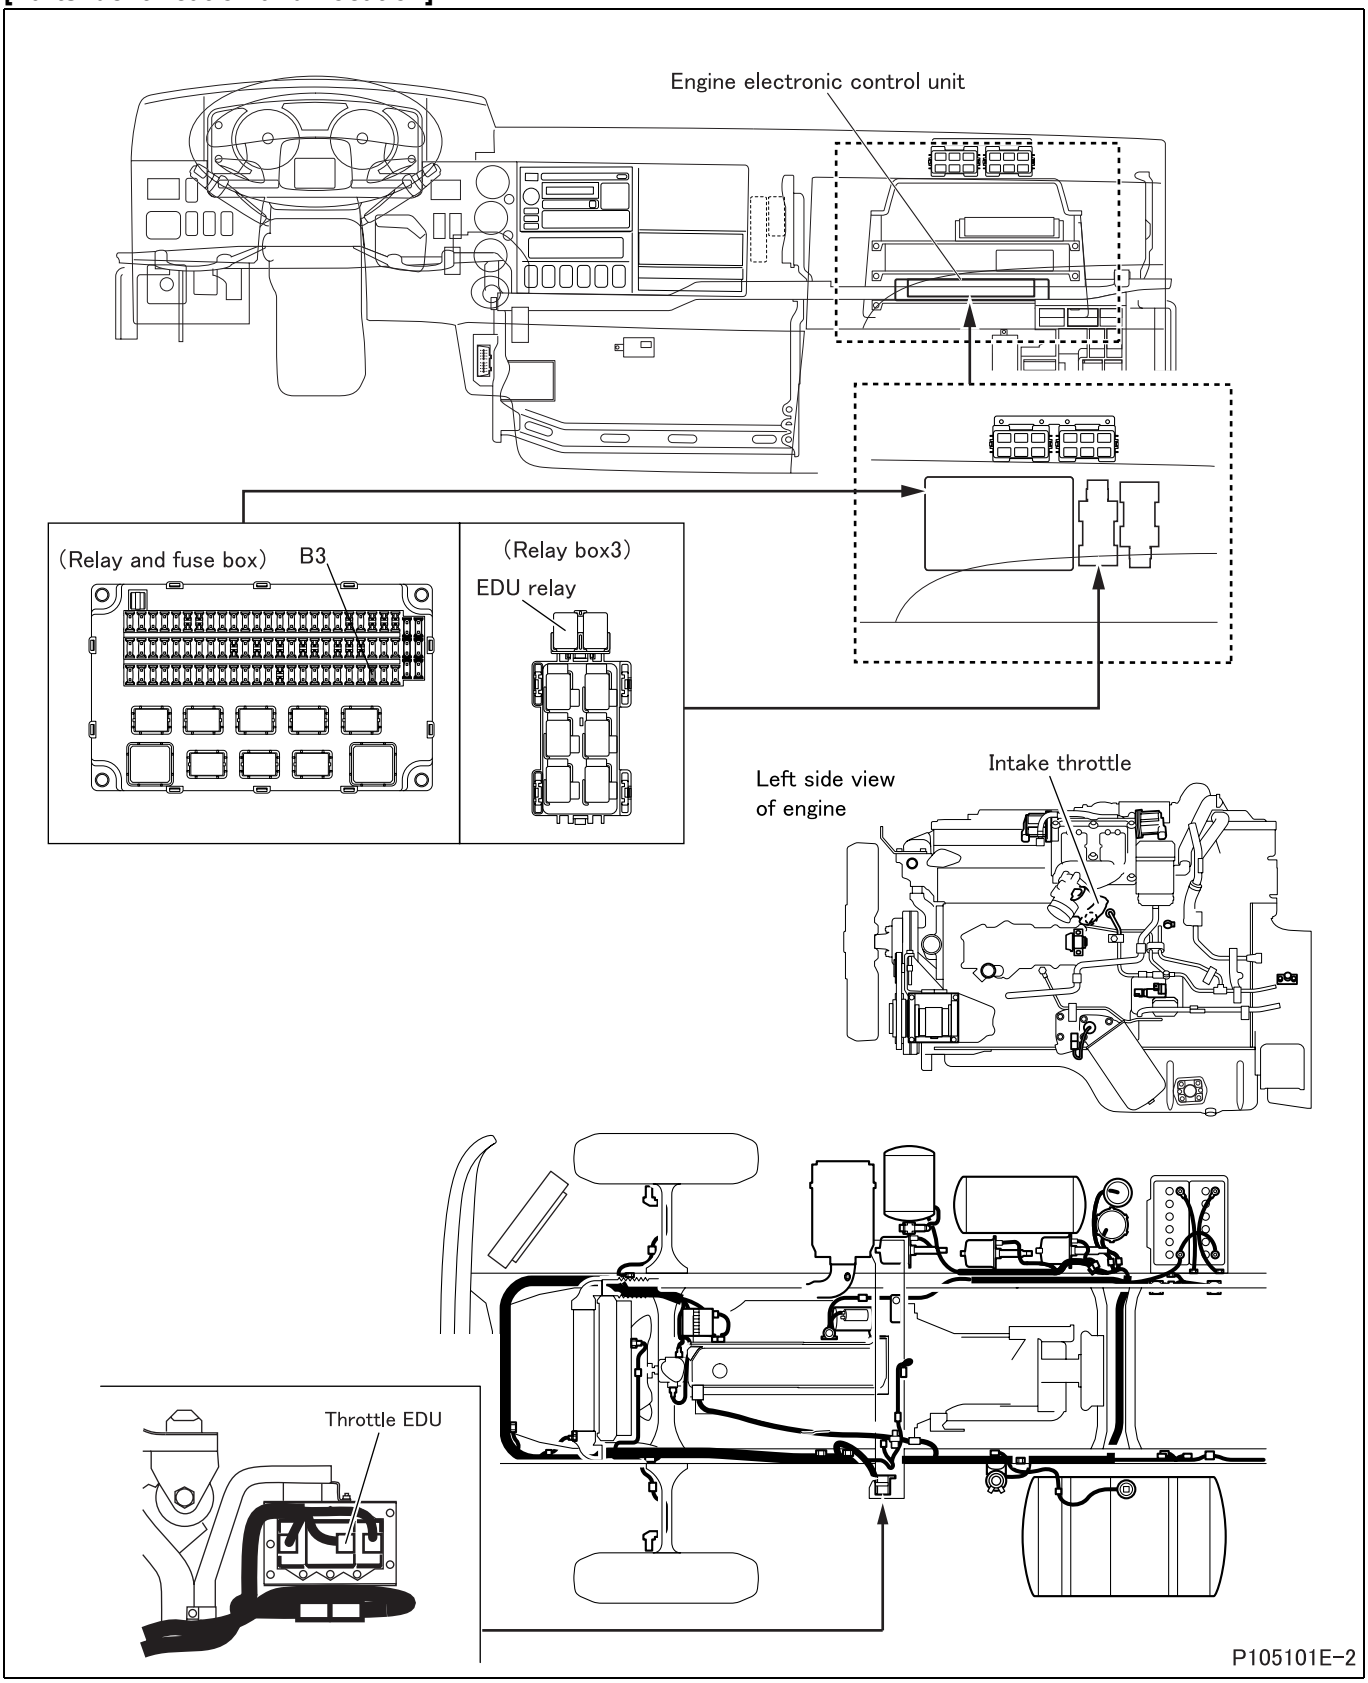
<Fault code>
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished. (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. A7 “Intake throttle 1”
	Inspection condition		• Vehicle: stationary (vehicle speed 0 km/h {0 MPH}) • Starter switch: ON (engine started) • Transmission: neutral
	Requirements		Actual position matches with target value set by Multi-Use Tester. (check with service data “20: Intake Throttle actual position”)
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

Step 2	Inspection items		Inspection of electronic drive unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Modify connector.

Step 3	Inspection items		Inspection of throttle actuator connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	Modify connector.

Step 4	Inspection items		Inspection by control data
	Maintenance item		Check if following diagnosis codes occur simultaneously. • P0685 “EDU Relay (Open)” • P0686 “EDU Relay (Low)” • P0687 “EDU Relay (High)” • P0688 “EDU Relay (Over Load)”
	Inspection condition		Starter switch: ON
	Requirements		Codes occur.
	Inspection result (Is the judging standard satisfied?)	YES	Inspect diagnosis code that is occurring.
		NO	Go to step 5.

Step 5	Inspection items		Inspection of electronic drive unit connector (power supply)
	Maintenance item		Measure value of voltage between connector terminal No. 13 (+) and 14 (–).
	Inspection condition		• Remove connector and measure from harness side. • Starter switch: ON • Perform actuator test item No. A9 “EDU Relay”
	Requirements		Same as battery voltage.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 10.
		NO	Go to step 6.

Step 6	Inspection items		Inspection of relay connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify connector.

Step 7	Inspection items		Inspection of harness between fuse and relay
	Maintenance item		Check circuit between fuse No. B3 and relay connector terminal No. 5
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify harness.

Step 8	Inspection items		Inspection of harness between relay and electronic drive unit
	Maintenance item		Check circuit between relay connector terminal No. 4 and electronic drive unit connecter terminal No. 13
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	After replacement of relay, go to step 9.
		NO	Modify harness.

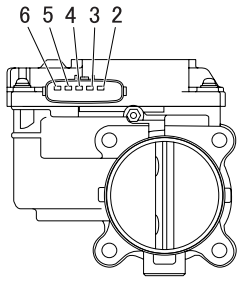
Step 9	Inspection items		Inspection of harness between electronic drive unit and ground
	Maintenance item		Check circuit between following electronic drive unit connector terminals • Electronic drive unit ground: terminal No. 14 - chassis ground • Sensor ground: terminal No. 4–14
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 10.
		NO	Modify harness.

Step 10	Inspection items		Inspection of electronic drive unit connector (motor)
	Maintenance item		Measure value of resistance between connector terminal No. 10 and 11.
	Inspection condition		Remove connector and measure from harness side.
	Requirements		0.3 to 80 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 13.
		NO	Go to step 11.

Step 11	Inspection items		Inspection of harness between electronic drive unit and throttle actuator (motor)
	Maintenance item		Check circuit between following connector terminals. • Motor (1): electronic drive unit connector terminal No. 10 - throttle actuator connector terminal No. 6 • Motor (2): electronic drive unit connector terminal No. 11 - throttle actuator connector terminal No. 5
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 12.
		NO	Modify harness.

Step 12	Inspection items		Inspection of throttle actuator unit (motor)
	Maintenance item		Measure value of resistance between connector terminal No. 5 and 6.
	Inspection condition		• Keep throttle actuator installed on vehicle. • Remove connector, and measure throttle actuator side.
	Requirements		0.3 to 80 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 13.
		NO	Replacement of throttle actuator

<Step 12 inspection diagram>



P104212

Step 13	Inspection items		Inspection of throttle actuator connector (position sensor: power supply)
	Maintenance item		Measure value of voltage between connector terminal No. 2 (+) and 4 (–).
	Inspection condition		• Measure from back side of connector of harness with each device connected to harness. • Starter switch: ON
	Requirements		5 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 14.
		NO	Go to step 15.

Step 14	Inspection items		Inspection of electronic drive unit connector (position sensor: signal)
	Maintenance item		Measure value of voltage between connector terminal No. 3 (+) and 4 (–).
	Inspection condition		• Measure from back side of connector of harness with each device connected to harness. • Starter switch: ON • Perform actuator test item No. A7 “Intake throttle 1”
	Requirements		• Valve fully closed: 0.5 V • Valve fully opened: 4.375 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 16.
		NO	Go to step 15.

Step 15	Inspection items		Inspection of harness between electronic drive unit and throttle actuator (position sensor)
	Maintenance item		Check circuit between following connector terminals. • Sensor (power supply): electronic drive unit connector terminal No. 2 - throttle actuator connector terminal No. 2 • Sensor (signal): electronic drive unit connector terminal No. 3 - throttle actuator connector terminal No. 3 • Sensor (ground): electronic drive unit connector terminal No. 4 - throttle actuator connector terminal No. 4
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	After replacement of throttle actuator, go to step 16.
		NO	Modify harness.

Step 16	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. A7 “Intake throttle 1”
	Inspection condition		• Vehicle: stationary (vehicle speed 0 km/h {0 MPH}) • Starter switch: ON (engine started) • Transmission: neutral
	Requirements		Actual position matches with target value set by Multi-Use Tester. (check with service data “20: Intake Throttle actual position”)
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic drive unit

[Fault code]
Diagnosis code: P0227/Flash code: 61
[Monitor]
Abnormality of auxiliary equipment load sensor
[Fault (outline)]
Low signal range check
[Diagnosis check]
- Output voltage of auxiliary equipment load sensor is monitored.

[Code generation condition]
- Voltage of auxiliary equipment load sensor remains below 0.1 V for approx. 1 second when power take-off switch is ON. (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal
- PTO SW: ON

[Control effected by electronic control unit during fault]
–
[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and auxiliary equipment load sensor
- Abnormality of each connector
- Abnormality of auxiliary equipment load sensor
- Abnormality in electronic control unit

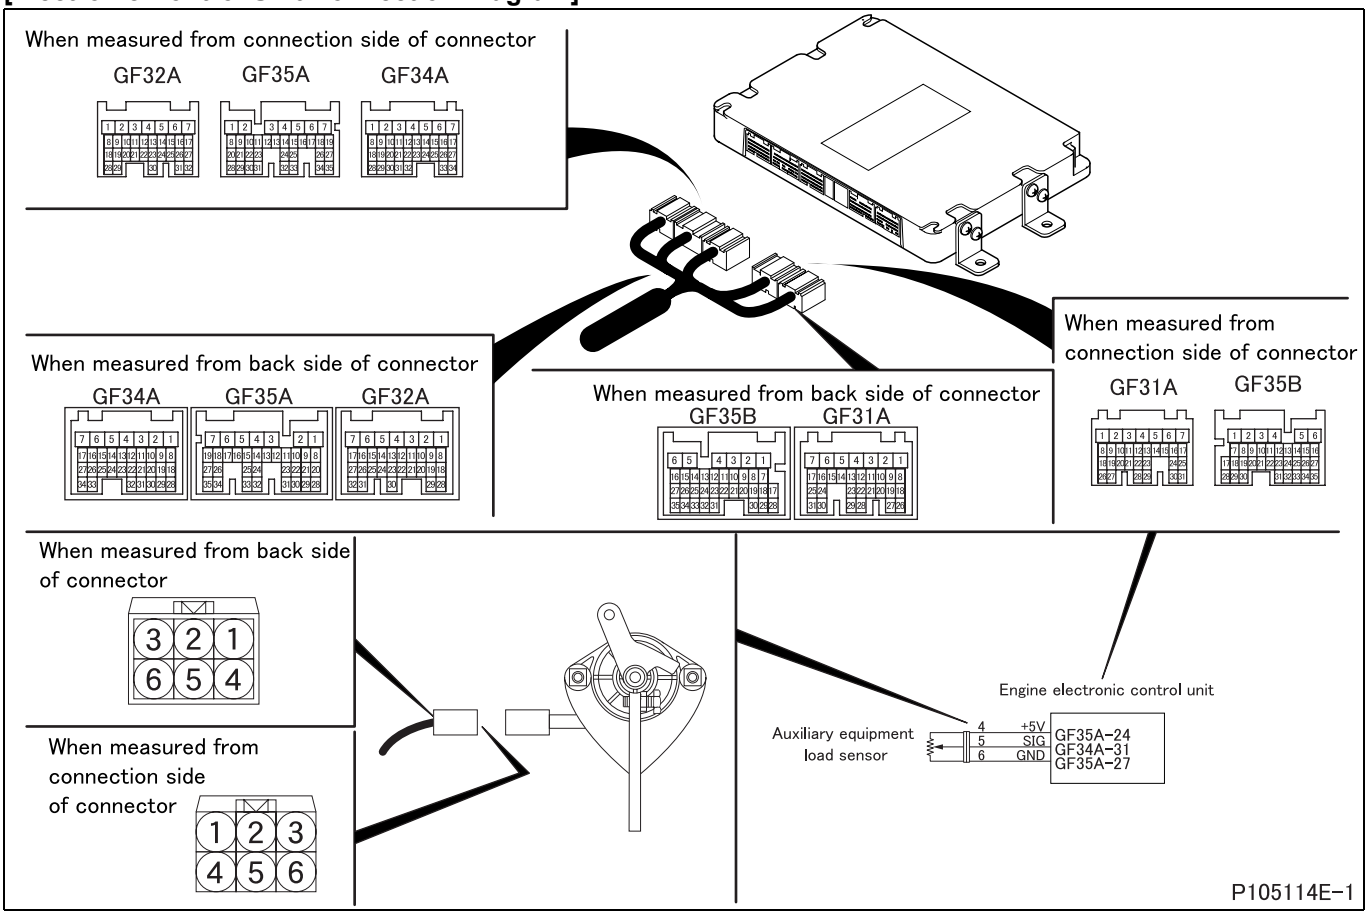
[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>
- Extinguished after input of normal signal.

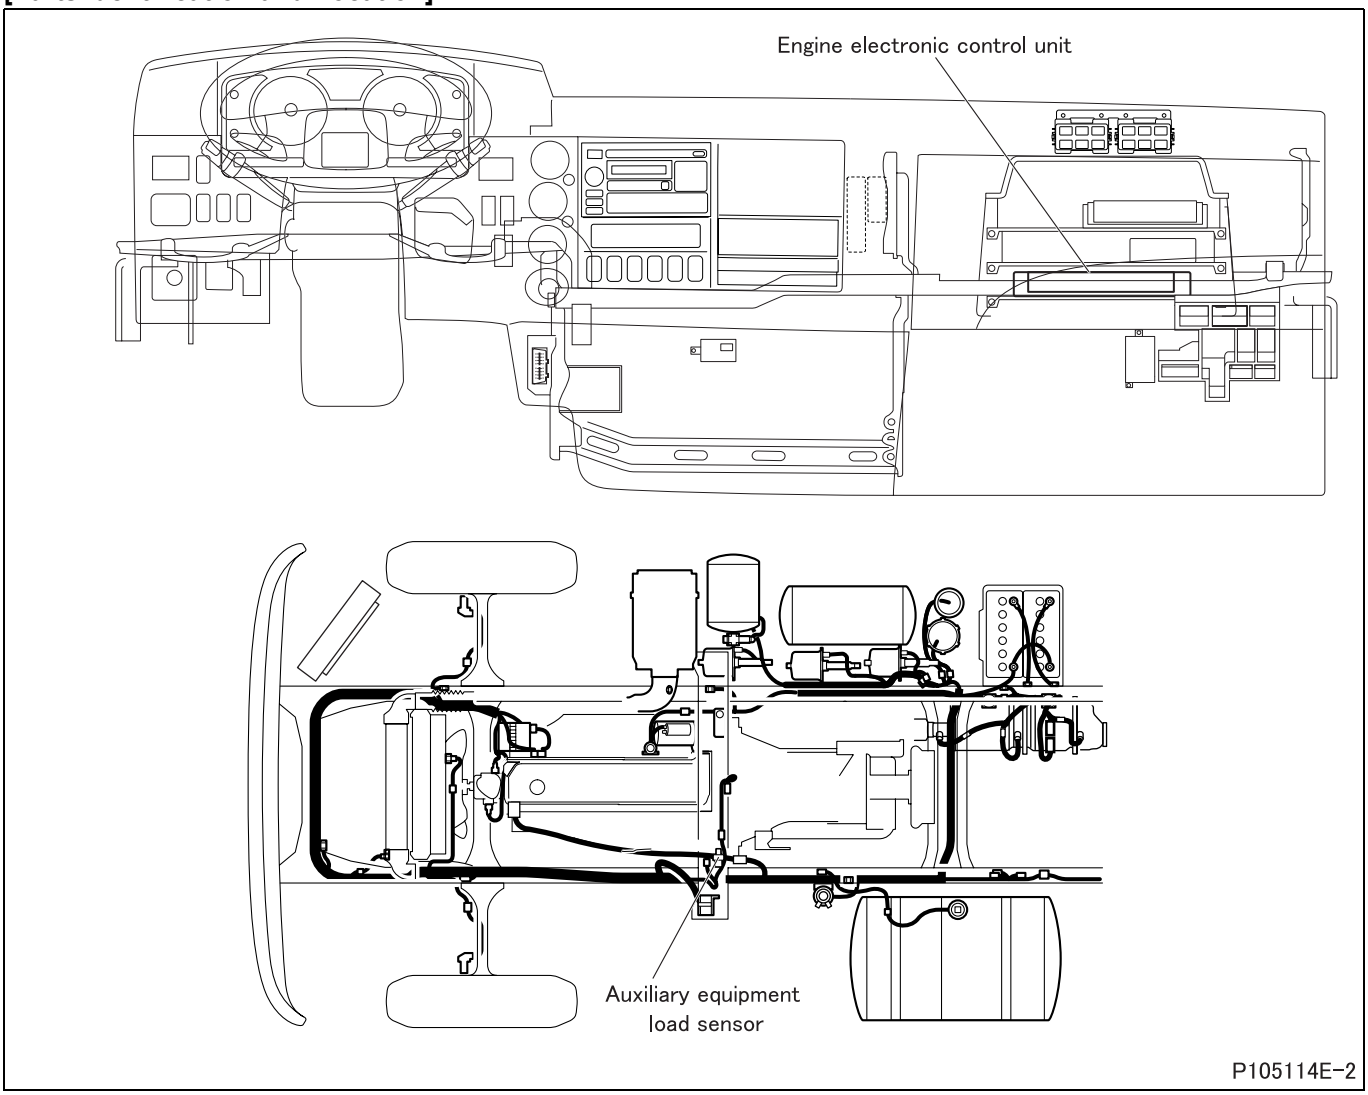
<Fault code>
- If code recovered to normal, automatically cleared at 40th warm up cycle after warning lamp is lit. (To clear as desired, erase from the memory.)

Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		• Measure item No. 3F “PTO Accel Position” of Service Data. • Measure item No. 40 “PTO Accel Sensor Voltage” of Service Data.
	Inspection condition		When power take-off is used.
	Requirements		**<Accelerator pedal position>** • MIN to MAX: 0 to 100% **<Sensor voltage>** • MIN to MAX: 1 to 3.0 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

Step 2	Inspection items		Inspection by electronic control unit connector (signal)
	Maintenance item		Measure value of voltage between connector (GF34A) terminal No. 31 (+) and (GF35A) terminal No. 27 (–).
	Inspection condition		• Starter switch: ON • Engine is stopped. • Measure from back side of harness connector with each device connected to harness.
	Requirements		• Idling position: 0.85 ± 0.1 V • Full-load position: 3.0 ± 0.1 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Go to step 3.

Step 3	Inspection items		Inspection by electronic control unit connector (power supply)
	Maintenance item		Measure value of voltage between connector (GF35A) terminal No. 24 (+) and (GF35A) terminal No. 27 (–).
	Inspection condition		• Starter switch: ON • Engine is stopped. • Measure from back side of harness connector with each device connected to harness.
	Requirements		5 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	Go to step 5.

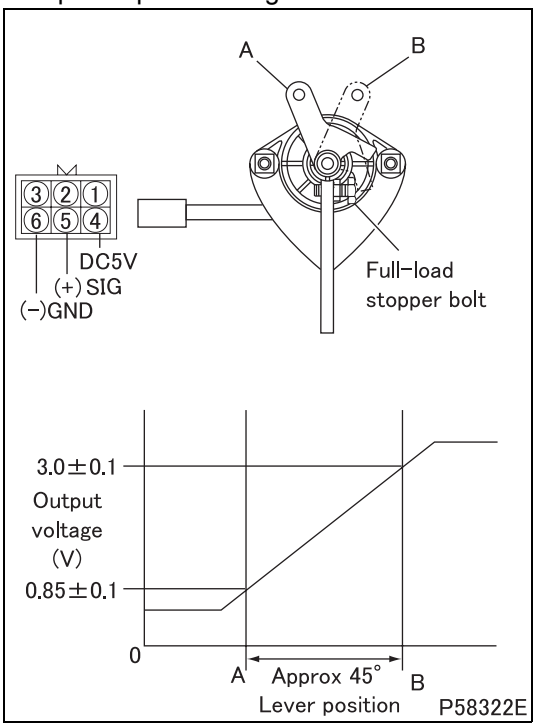
Step 4	Inspection items		Inspection by electronic control unit connector (ground)
	Maintenance item		Measure value of voltage between connector (GF35A) terminal No. 27 (+) and (GF31A) terminal No. 3 (–).
	Inspection condition		• Starter switch: ON • Engine is stopped. • Measure from back side of harness connector with each device connected to harness.
	Requirements		0 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Go to step 5.

Step 5	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 12.
		NO	Modify connector.

Step 6	Inspection items		Inspection of sensor connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify connector.

Step 7	Inspection items		Inspection of auxiliary equipment load sensor unit
	Maintenance item		Measure value of voltage between connector terminal No. 5 (+) and 6 (–).
	Inspection condition		Apply voltage DC 5 V across connector terminals No. 4 (+) and 6 (–).
	Requirements		• Idling position A: 0.85 ± 0.1 V • Full-load position B: 3.0 ± 0.1 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	• If measurement of idling position A deviates from standard value: replacement of sensor • If measurement of full-load position B deviates from standard value: adjustment of full load stopper bolt

<Step 7 inspection diagram>



Step 8	Inspection items		Inspection by sensor connector
	Maintenance item		Measure value of voltage between connector terminal No. 4 (+) and 6 (–).
	Inspection condition		• Starter switch: ON • Engine is stopped. • Measure from back side of harness connector with each device connected to harness.
	Requirements		5 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 10.
		NO	Go to step 9.

Step 9	Inspection items		Inspection of harness between electronic control unit and sensor (power supply)
	Maintenance item		Check circuit between electronic control unit connector (GF35A) terminal No. 24 and sensor connector terminal No. 4.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 12.
		NO	Modify harness.

Step 10	Inspection items		Inspection of harness between electronic control unit and sensor (ground)
	Maintenance item		Check circuit between electronic control unit connector (GF35A) terminal No. 27 and sensor connector terminal No. 6.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 11.
		NO	Modify harness.

Step 11	Inspection items		Inspection of harness between electronic control unit and sensor (signal)
	Maintenance item		Check circuit between electronic control unit connector (GF34A) terminal No. 31 and sensor connector terminal No. 5.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 12.
		NO	Modify harness.

Step 12	Inspection items		Inspection by control data
	Maintenance item		• Measure item No. 3F “PTO Accel Position” of Service Data. • Measure item No. 40 “PTO Accel Sensor Voltage” of Service Data.
	Inspection condition		When power take-off is used.
	Requirements		**<Accelerator pedal position>** • MIN to MAX: 0 to 100% **<Sensor voltage>** • MIN to MAX: 1 to 3.0 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P0228/Flash code: 61
[Monitor]
Abnormality of auxiliary equipment load sensor
[Fault (outline)]
High signal range check
[Diagnosis check]
- Output voltage of auxiliary equipment load sensor is monitored.

[Code generation condition]
- Voltage of auxiliary equipment load sensor remains over 3.5 V for approx. 1 second when power take-off switch is ON. (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal
- PTO SW: ON

[Control effected by electronic control unit during fault]
–
[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and auxiliary equipment load sensor
- Abnormality of each connector
- Abnormality of auxiliary equipment load sensor
- Abnormality in electronic control unit

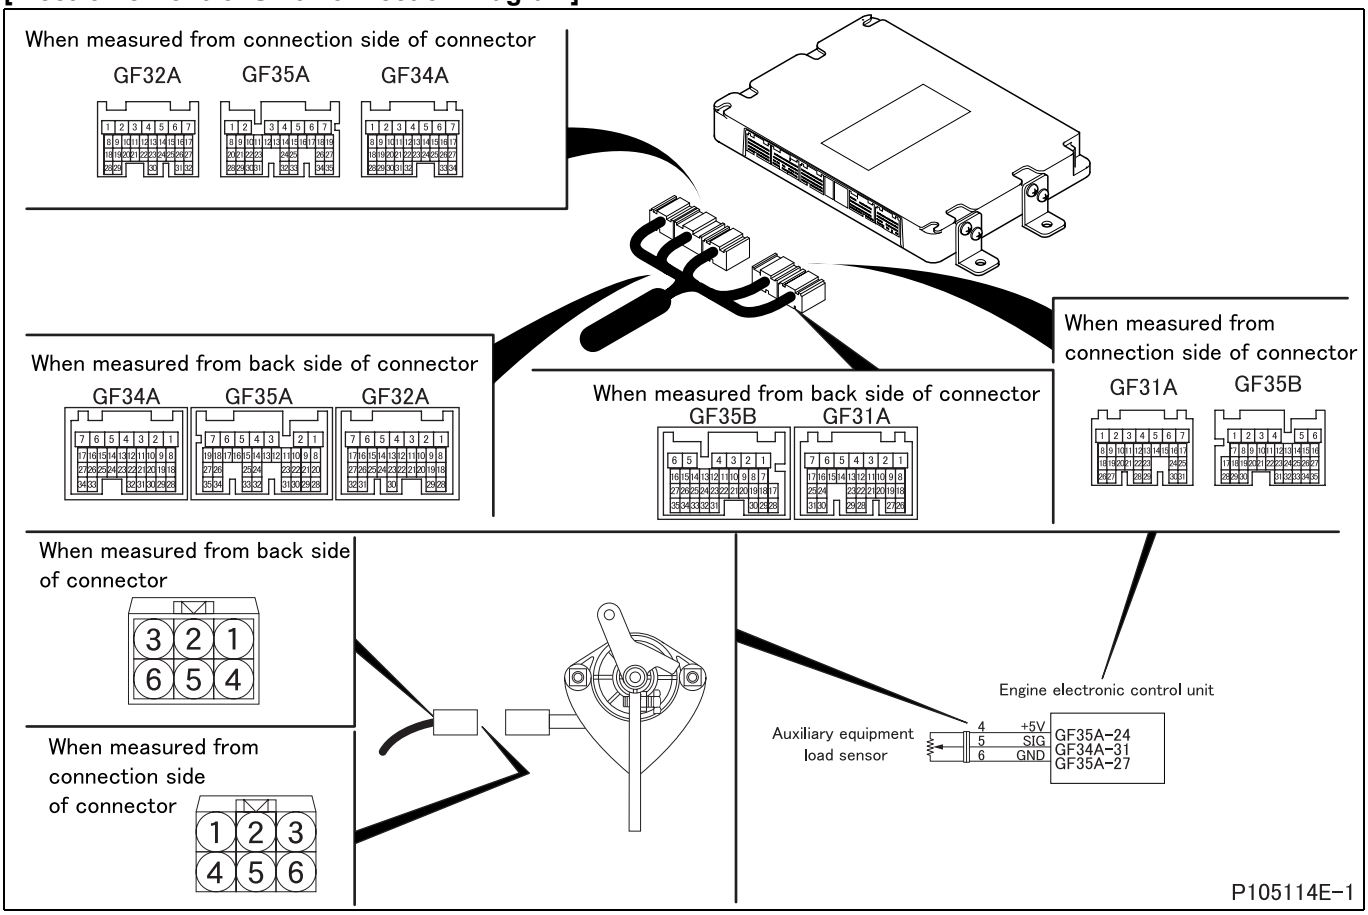
[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>
- Extinguished after input of normal signal.

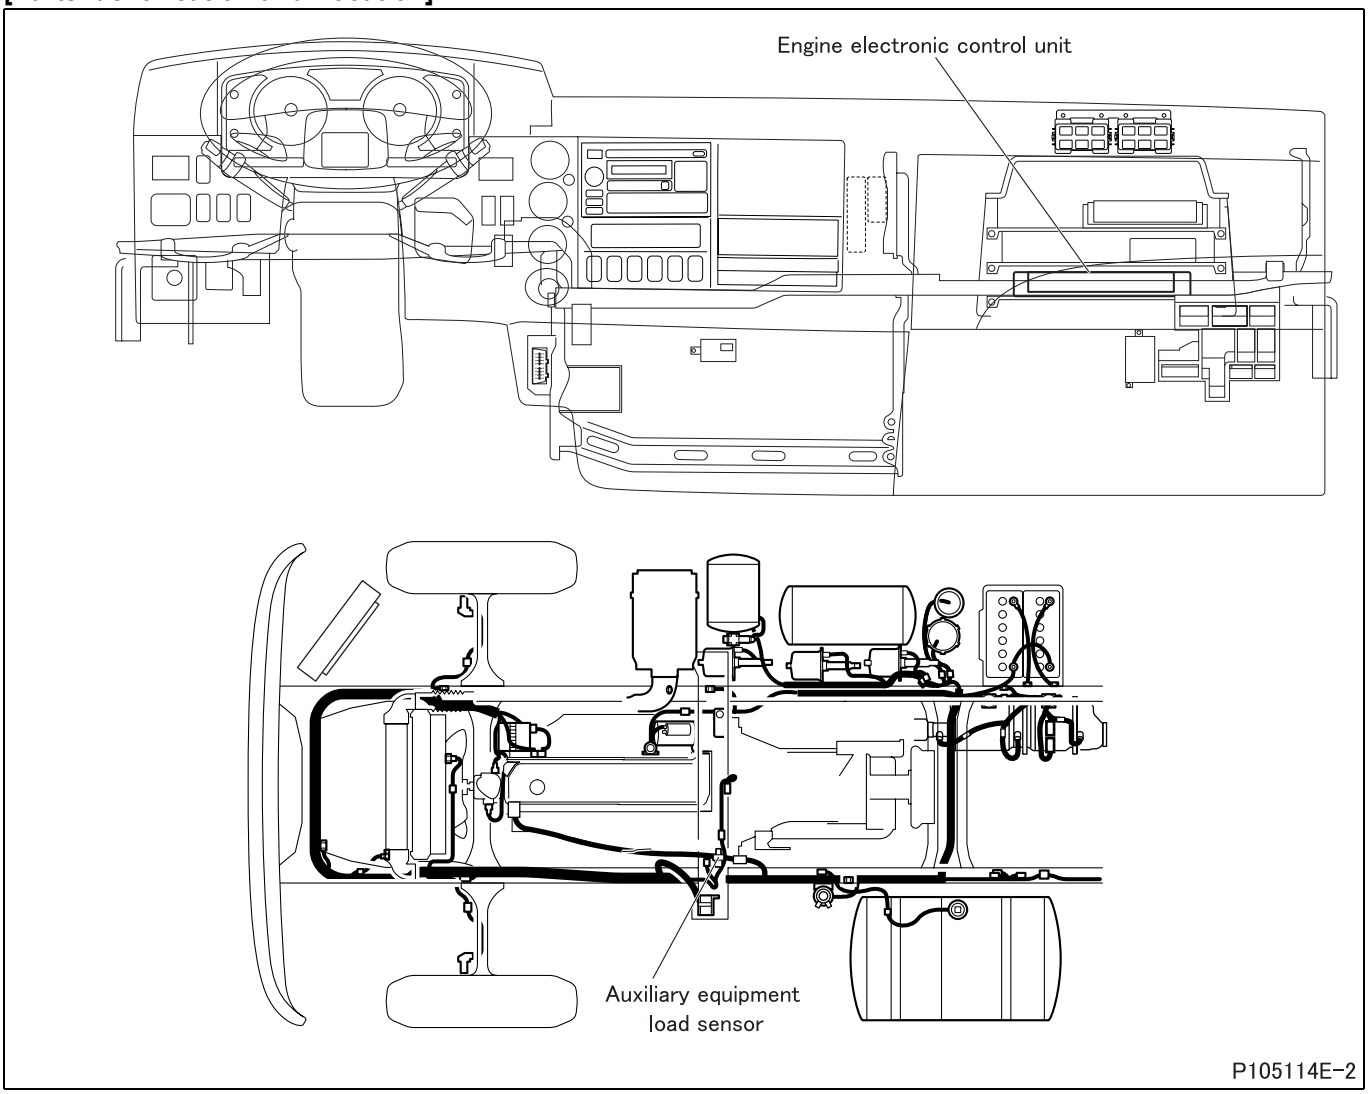
<Fault code>
- If code recovered to normal, automatically cleared at 40th warm up cycle after warning lamp is lit. (To clear as desired, erase from the memory.)

Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		• Measure item No. 3F “PTO Accel Position” of Service Data. • Measure item No. 40 “PTO Accel Sensor Voltage” of Service Data.
	Inspection condition		When power take-off is used
	Requirements		**<Accelerator pedal position>** • MIN to MAX: 0 to 100% **<Sensor voltage>** • MIN to MAX: 1 to 3.0 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

Step 2	Inspection items		Inspection by electronic control unit connector (signal)
	Maintenance item		Measure value of voltage between connector (GF34A) terminal No. 31 (+) and (GF35A) terminal No. 27 (–).
	Inspection condition		• Starter switch: ON • Engine is stopped. • Measure from back side of harness connector with each device connected to harness.
	Requirements		• Idling position: 0.85 ± 0.1 V • Full-load position: 3.0 ± 0.1 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Go to step 3.

Step 3	Inspection items		Inspection by electronic control unit connector (power supply)
	Maintenance item		Measure value of voltage between connector (GF35A) terminal No. 24 (+) and (GF35A) terminal No. 27 (–).
	Inspection condition		• Starter switch: ON • Engine is stopped. • Measure from back side of harness connector with each device connected to harness.
	Requirements		5 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	Go to step 5.

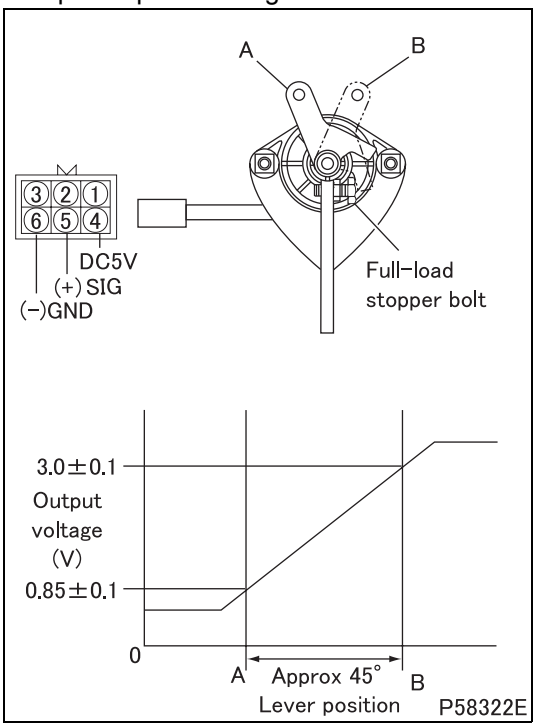
Step 4	Inspection items		Inspection by electronic control unit connector (ground)
	Maintenance item		Measure value of voltage between connector (GF35A) terminal No. 27 (+) and (GF31A) terminal No. 3 (–).
	Inspection condition		• Starter switch: ON • Engine is stopped. • Measure from back side of harness connector with each device connected to harness.
	Requirements		0 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Go to step 5.

Step 5	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 12.
		NO	Modify connector.

Step 6	Inspection items		Inspection of sensor connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify connector.

Step 7	Inspection items		Inspection of auxiliary equipment load sensor unit
	Maintenance item		Measure value of voltage between connector terminal No. 5 (+) and 6 (–).
	Inspection condition		Apply voltage DC 5 V across connector terminals No. 4 (+) and 6 (–).
	Requirements		• Idling position A: 0.85 ± 0.1 V • Full-load position B: 3.0 ± 0.1 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	• If measurement of idling position A deviates from standard value: replacement of sensor • If measurement of full-load position B deviates from standard value: adjustment of full-load stopper bolt

<Step 7 inspection diagram>



Step 8	Inspection items		Inspection by sensor connector
	Maintenance item		Measure value of voltage between connector terminal No. 4 (+) and 6 (–).
	Inspection condition		• Starter switch: ON • Engine is stopped. • Measure from back side of harness connector with each device connected to harness.
	Requirements		5 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 10.
		NO	Go to step 9.

Step 9	Inspection items		Inspection of harness between electronic control unit and sensor (power supply)
	Maintenance item		Check circuit between electronic control unit connector (GF35A) terminal No. 24 and sensor connector terminal No. 4.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 12.
		NO	Modify harness.

Step 10	Inspection items		Inspection of harness between electronic control unit and sensor (ground)
	Maintenance item		Check circuit between electronic control unit connector (GF35A) terminal No. 27 and sensor connector terminal No. 6.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 11.
		NO	Modify harness.

Step 11	Inspection items		Inspection of harness between electronic control unit and sensor (signal)
	Maintenance item		Check circuit between electronic control unit connector (GF34A) terminal No. 31 and sensor connector terminal No. 5.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 12.
		NO	Modify harness.

Step 12	Inspection items		Inspection by control data
	Maintenance item		• Measure item No. 3F “PTO Accel Position” of Service Data. • Measure item No. 40 “PTO Accel Sensor Voltage” of Service Data.
	Inspection condition		When power take-off is used
	Requirements		**<Accelerator pedal position>** • MIN to MAX: 0 to 100% **<Sensor voltage>** • MIN to MAX: 1 to 3.0 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P0234/Flash code: 54
[Monitor]
Abnormality of boost pressure
[Fault (outline)]
Overboost
[Diagnosis check]
- Actual boost pressure is detected by boost pressure sensor and compared with standard pressure recorded in engine electronic control unit.

[Code generation condition]
- Actual boost pressure remains over specified value for approx. 3 seconds.
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- Engine in operation

[Control effected by electronic control unit during fault]
- Injection quantity is limited.

[Probable cause of trouble]
- Mechanical abnormality of turbocharger unit

[Recoverability]
<Control during fault>
- Recovered if signal becomes normal when starter switch is turned OFF to ON (power supply resumed to electronic control unit).

<Warning lamp>
- Extinguished at 4th driving cycle after normal signal is input.

<Fault code>
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished. (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		Check if following diagnosis codes occur simultaneously. • P0069 “Boost Press SNSR (Correlation)” • P0236 “Boost Press SNSR (Plausi)” • P0237 “Boost Press SNSR (Low)” • P0238 “Boost Press SNSR (High)” • P0401 “EGR Flow (Insufficient)” • P0402 “EGR Flow (Excessive)” • P0403 “EGR1 (Actuator Circuit)” • P0404 “EGR System” • P0409 “EGR1 (Position Sensor)” • P0562 “Power Supply Voltage (Low)” • P0563 “Power Supply Voltage (High)” • P0600 “CAN Communication” • P0604 “ECU Hardware (RAM)” • P0605 “ECU System (Hardware)” • P0606 “ECU Hardware (Main CPU)” • P0607 “ECU System” • P062F “ECU System (EEPROM)” • P0685 “EDU Relay (Open)” • P0686 “EDU Relay (Low)” • P0687 “EDU Relay (High)” • P2002 “DPF MFF” • P2228 “Atm Press SNSR (Low)” • P2229 “Atm Press SNSR (High)” • P2413 “EGR System” • P2453 “DPF Diff SNSR (Plausi) & MFF” • P2454 “DPF Diff SNSR (Low) & MFF” • P2455 “DPF Diff SNSR (High) & MFF”
	Inspection condition		Starter switch: ON Do not start engine.
	Requirements		Codes occur.
	Inspection result (Is the judging standard satisfied?)	YES	Inspect diagnosis code that is occurring.
		NO	Go to step 2.

Step 2	Inspection items		Check of exhaust system
	Maintenance item		Front pipe, diesel particulate filter, tail pipe
	Inspection condition		Starter switch: OFF
	Requirements		Blocked
	Inspection result (Is the judging standard satisfied?)	YES	Clean or replace parts.
		NO	Go to step 3.

Step 3	Inspection items		Inspection of turbocharger
	Maintenance item		Inspection of turbocharger appearance • Waste gate actuator rod cracked or broken • Hose connected to waste gate actuator slipped off • Waste gate valve stuck • Turbocharger unit cracked, etc.
	Inspection condition		Starter switch: OFF
	Requirements		In order
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	Replacement of abnormal parts

Step 4	Inspection items		Inspection by control data
	Maintenance item		Measure item No. 26 “Boost Pressure” of Service Data.
	Inspection condition		After engine is completely warmed up
	Requirements		• Engine stationary: equivalent to atmospheric pressure • Engine speed at 3210 rpm (no-load maximum speed): 174 kPa {51.4 in.Hg}
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of turbocharger

[Fault code]
Diagnosis code: P0236/Flash code: 32
[Monitor]
Characteristic abnormality of boost pressure sensor
[Fault (outline)]
Gain and offset drift
[Diagnosis check]
- Output voltage of boost pressure sensor is monitored.

[Code generation condition]
Check result by electronic control unit differs according to boost pressure. (Warning lamp is lit and diagnosis code is displayed on second establishment of code generation condition.)
<Low speed operation>
- Boost pressure: Remains over 114 kPa {16.5 psi, 1.2 kgf/cm^2} for 5 seconds.

<High speed operation>
- Boost pressure: Remains below 120 kPa {17 psi, 1.2 kgf/cm^2} for 5 seconds.

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
Code generation condition is established if engine speed remains in L or H range below for more than 0.5 second.
- Intake throttle opening: L (40 to 60), H (90 to 100)%
- Exhaust gas recirculation valve opening: L (0 to 100), H (0 to 100)%
- Engine speed: L (550 to 650), H (1700 to 1900)
- Injection quantity: L (–20 to 15) and H (75 to 110)%

[Control effected by electronic control unit during fault]
- Effects no special control.

[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and boost pressure sensor
- Abnormality of each connector
- Abnormality of boost pressure sensor
- Abnormality in electronic control unit

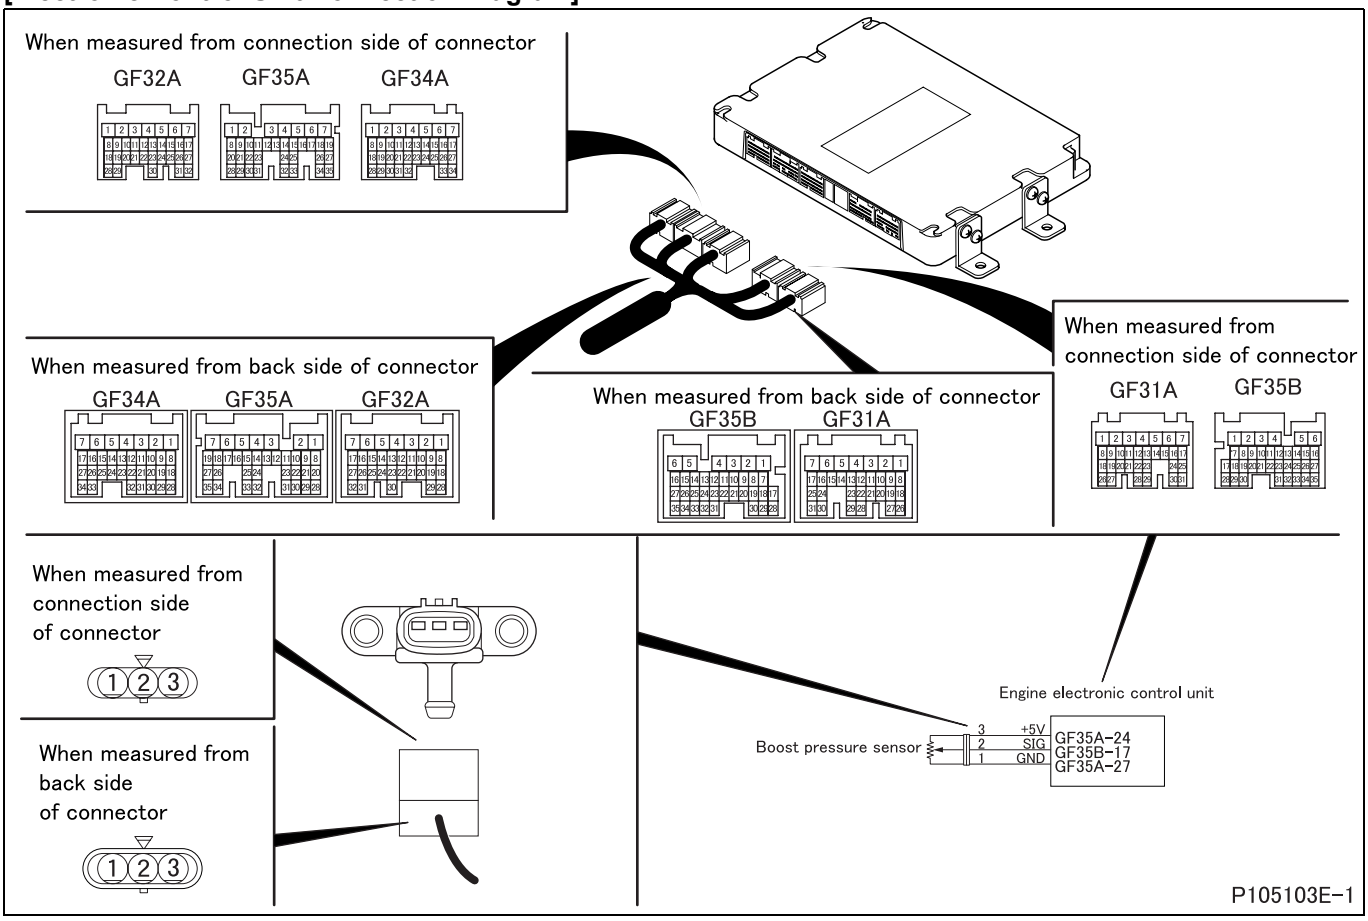
[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>
- Extinguished at 4th driving cycle after normal signal is input.

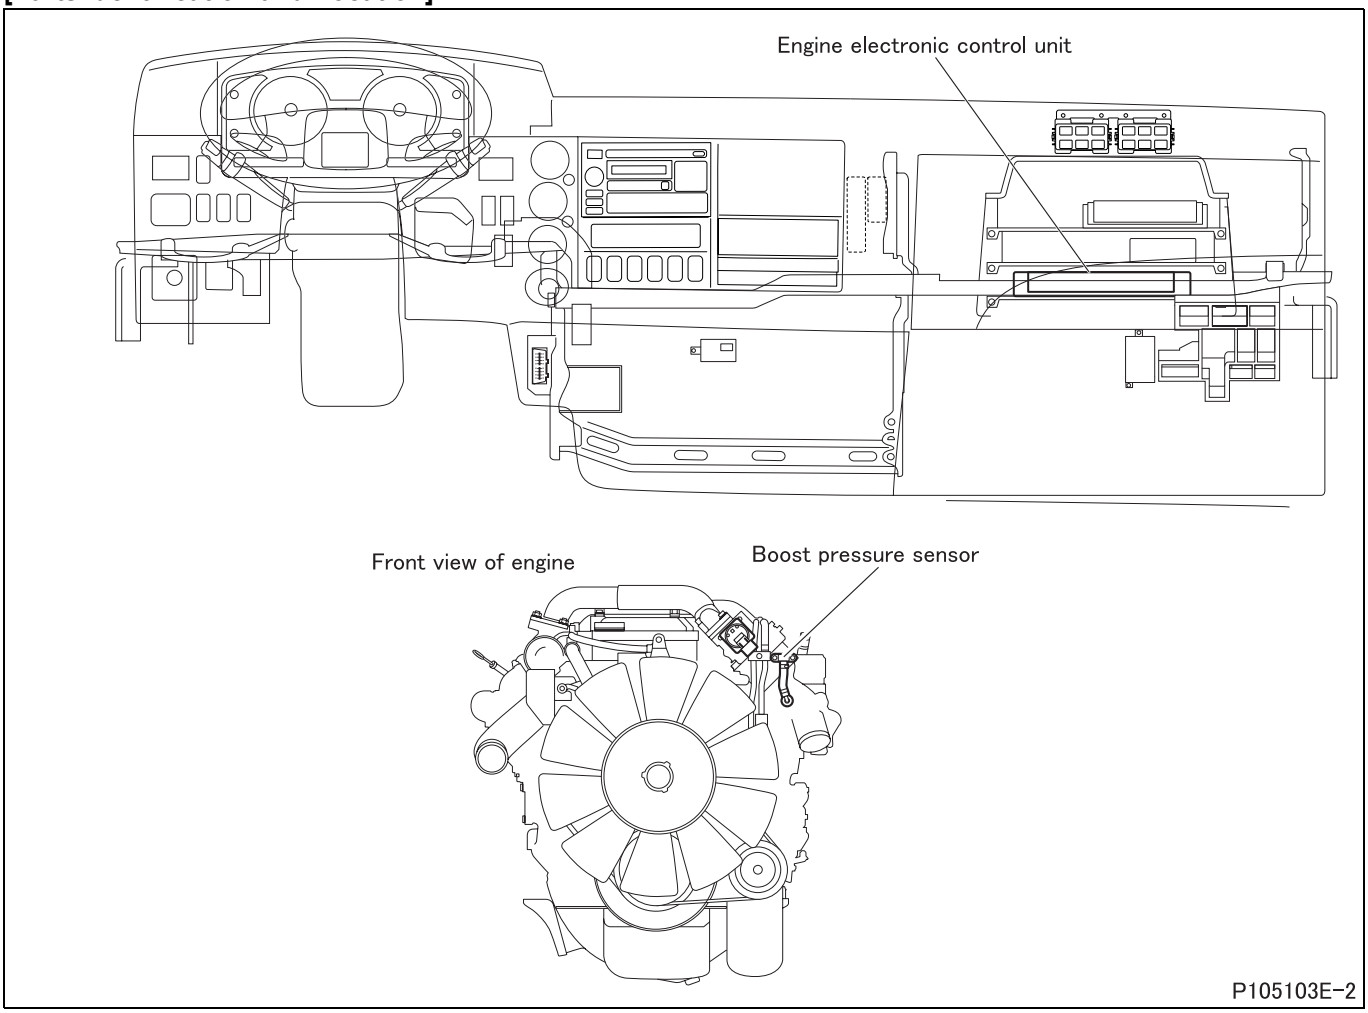
<Fault code>
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished. (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		**<General Scanning Tool used>** • Measure item “Intake MAP”. **<Multi-Use Tester used>** • Measure item No. 26 “Boost Pressure” of Service Data.
	Inspection condition		Starter switch ON (engine stationary) → After engine has started, press accelerator pedal.
	Requirements		Coincides with atmospheric pressure → Gradually increases
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

Step 2	Inspection items		Inspection by electronic control unit connector (signal)
	Maintenance item		Measure value of voltage between connector (GF35B) terminal No. 17 (+) and (GF35A) terminal No. 27 (–).
	Inspection condition		• Measure from back side of connector of harness with each device connected to harness. • Engine started
	Requirements		0.5 to 4.5 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Go to step 3.

Step 3	Inspection items		Inspection by electronic control unit connector (power supply)
	Maintenance item		Measure value of voltage between connector (GF35A) terminal No. 24 (+) and 27 (–).
	Inspection condition		• Measure from back side of connector of harness with each device connected to harness. • Starter switch: ON
	Requirements		5 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	Go to step 5.

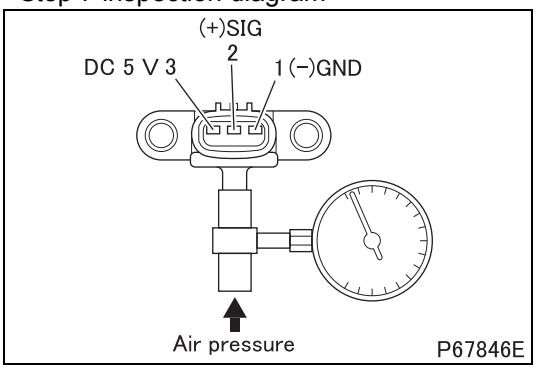
Step 4	Inspection items		Inspection by electronic control unit connector (ground)
	Maintenance item		Measure value of voltage between connector (GF35A) terminal No. 27 (+) and (GF31A) terminal No. 3 (–).
	Inspection condition		• Measure from back side of connector of harness with each device connected to harness. • Starter switch: ON
	Requirements		0 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Go to step 5.

Step 5	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 12.
		NO	Modify connector.

Step 6	Inspection items		Inspection of sensor connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify connector.

Step 7	Inspection items		Inspection of sensor unit
	Maintenance item		Measure voltage developing across connector terminal No. 2 (+) and 1 (–) when air pressure (gauge pressure) is gradually applied.
	Inspection condition		Apply voltage DC 5 V across connector terminals No. 3 (+) and 1 (–).
	Requirements		• 101.67 kPa {15 psi, 1.0 kgf/cm^2}: Approx. 3.2 V • 165.67 kPa {24 psi, 1.7 kgf/cm^2}: Approx. 4.5 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Replacement of sensor

<Step 7 inspection diagram>



Step 8	Inspection items		Inspection of harness between electronic control unit and sensor (power supply)
	Maintenance item		Measure value of voltage between connector terminal No. 3 (+) and 1 (–).
	Inspection condition		• Measure from back side of connector of harness with each device connected to harness. • Starter switch: ON
	Requirements		5 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 10.
		NO	Go to step 9.

Step 9	Inspection items		Inspection of harness between electronic control unit and sensor (power supply)
	Maintenance item		Check circuit between sensor connector terminal No. 3 and electronic control unit connector (GF35A) terminal No. 24.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 12.
		NO	Modify harness.

Step 10	Inspection items		Inspection of harness between electronic control unit and sensor (ground)
	Maintenance item		Check circuit between sensor connector terminal No. 1 and electronic control unit connector (GF35A) terminal No. 27.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 11.
		NO	Modify harness.

Step 11	Inspection items		Inspection of harness between electronic control unit and sensor (signal)
	Maintenance item		Check circuit between sensor connector terminal No. 2 and electronic control unit connector (GF35B) terminal No. 17.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 12.
		NO	Modify harness.

Step 12	Inspection items		Inspection by control data
	Maintenance item		**<General Scanning Tool used>** • Measure item “Intake MAP”. **<Multi-Use Tester used>** • Measure item No. 26 “Boost Pressure” of Service Data.
	Inspection condition		Starter switch ON (engine stationary) → After engine has started, press accelerator pedal.
	Requirements		Coincides with atmospheric pressure → Gradually increases
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P0237/Flash code: 32
[Monitor]
Abnormality of boost pressure sensor
[Fault (outline)]
Low signal range check
[Diagnosis check]
- Output voltage of boost pressure sensor is monitored.

[Code generation condition]
- Voltage of boost pressure sensor remains below 0.3 V for approx. 2.5 seconds.
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal
- Injection quantity: more than specified

[Control effected by electronic control unit during fault]
- Injection quantity is limited.
- Exhaust gas recirculation control is stopped.
- Throttle control is stopped.
- Diesel particulate filter regeneration (manual or automatic) is stopped.
- Particulate matter (PM) deposit computation is stopped.
- Boost pressure is locked at 101 kPa {1.03 kgf/cm^2}.

[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and boost pressure sensor
- Abnormality of each connector
- Abnormality of boost pressure sensor
- Abnormality in electronic control unit

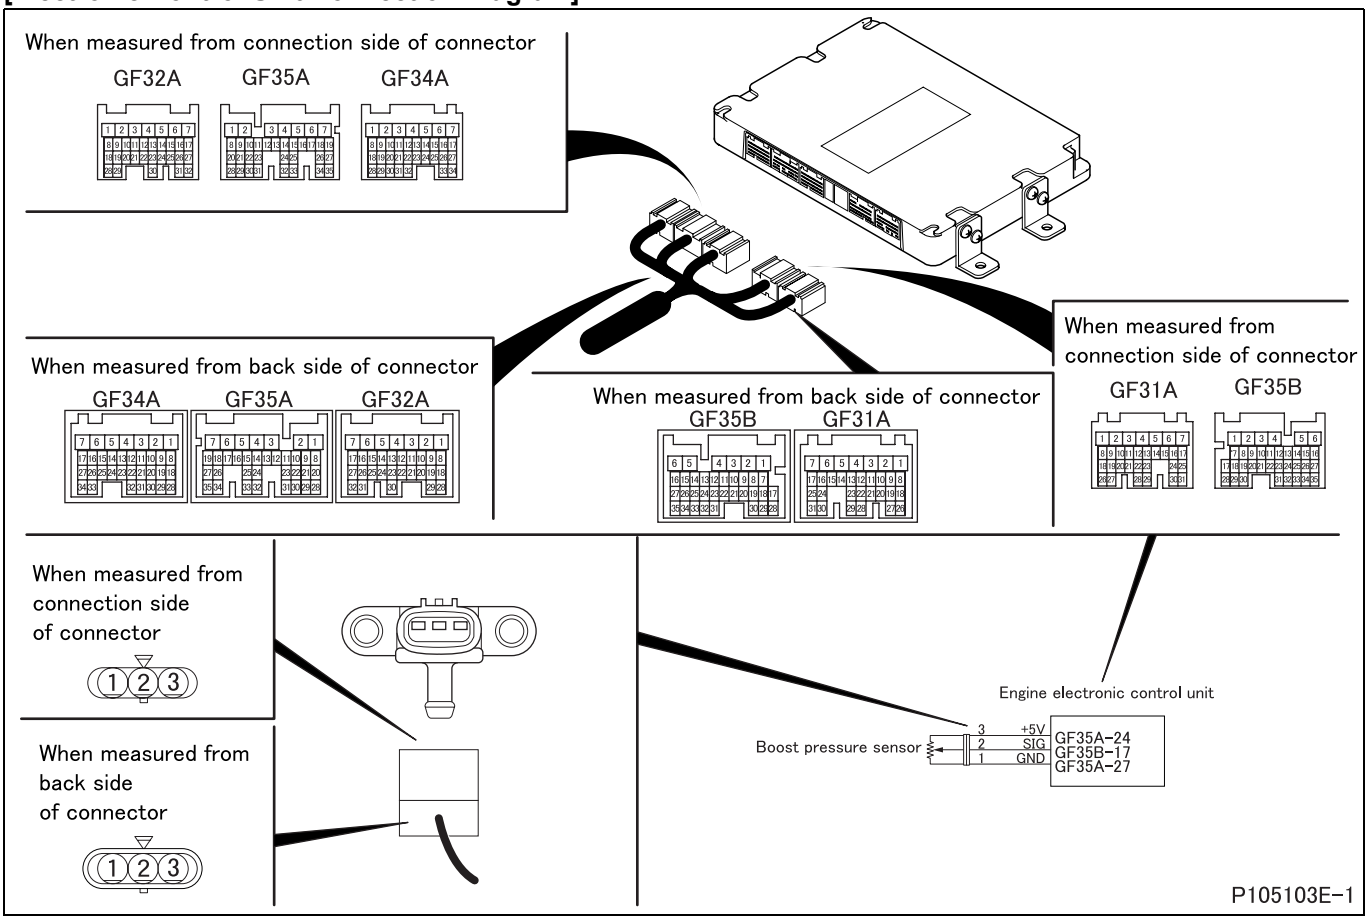
[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>
- Extinguished at 4th driving cycle after normal signal is input.

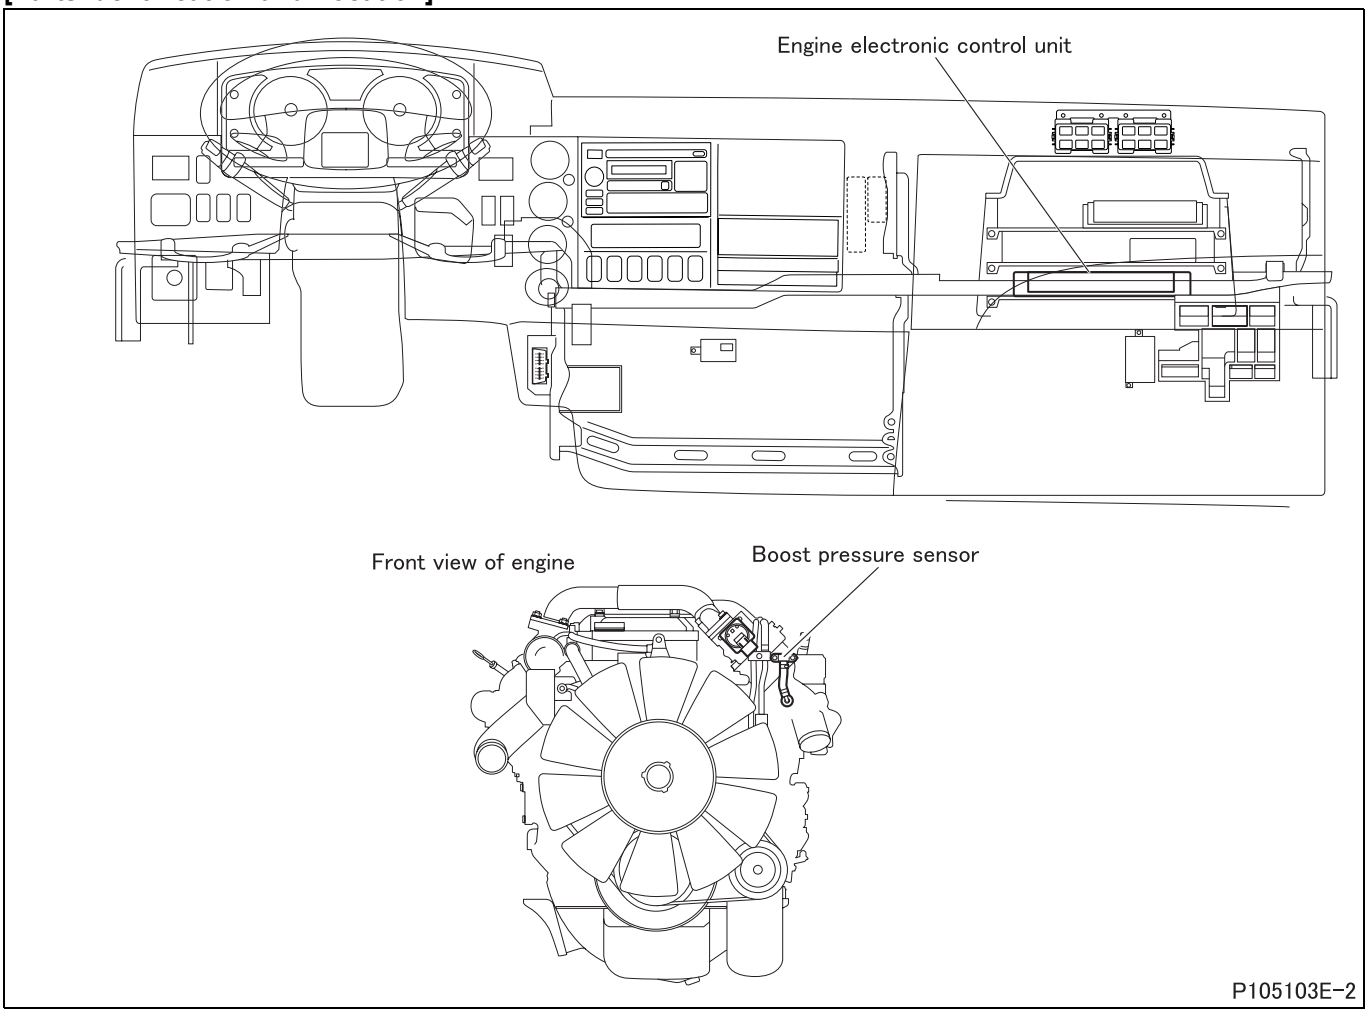
<Fault code>
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished. (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		**<General Scanning Tool used>** • Measure item “Intake MAP”. **<Multi-Use Tester used>** • Measure item No. 26 “Boost Pressure” of Service Data.
	Inspection condition		Starter switch ON (engine stationary) → After engine has started, press accelerator pedal.
	Requirements		Coincides with atmospheric pressure → Gradually increases
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

Step 2	Inspection items		Inspection by electronic control unit connector (signal)
	Maintenance item		Measure value of voltage between connector (GF35B) terminal No. 17 (+) and (GF35A) terminal No. 27 (–).
	Inspection condition		• Measure from back side of connector of harness with each device connected to harness. • Engine started
	Requirements		0.5 to 4.5 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Go to step 3.

Step 3	Inspection items		Inspection by electronic control unit connector (power supply)
	Maintenance item		Measure value of voltage between connector (GF35A) terminal No. 24 (+) and 27 (–).
	Inspection condition		• Measure from back side of connector of harness with each device connected to harness. • Starter switch: ON
	Requirements		5 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	Go to step 5.

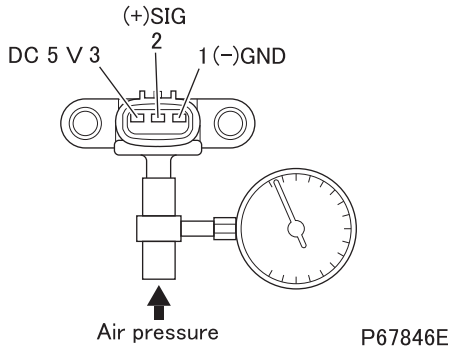
Step 4	Inspection items		Inspection by electronic control unit connector (ground)
	Maintenance item		Measure value of voltage between connector (GF35A) terminal No. 27 (+) and (GF31A) terminal No. 3 (–).
	Inspection condition		• Measure from back side of connector of harness with each device connected to harness. • Starter switch: ON
	Requirements		0 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Go to step 5.

Step 5	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 12.
		NO	Modify connector.

Step 6	Inspection items		Inspection of sensor connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify connector.

Step 7	Inspection items		Inspection of sensor unit
	Maintenance item		Measure voltage developing across connector terminal No. 2 (+) and 1 (–) when air pressure (gauge pressure) is gradually applied.
	Inspection condition		Apply voltage DC 5 V across connector terminals No. 3 (+) and 1 (–).
	Requirements		• 101.67 kPa {15 psi, 1.0 kgf/cm^2}: Approx. 3.2 V • 165.67 kPa {24 psi, 1.7 kgf/cm^2}: Approx. 4.5 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Replacement of sensor

<Step 7 inspection diagram>



Step 8	Inspection items		Inspection of harness between electronic control unit and sensor (power supply)
	Maintenance item		Measure value of voltage between connector terminal No. 3 (+) and 1 (–).
	Inspection condition		• Measure from back side of connector of harness with each device connected to harness. • Starter switch: ON
	Requirements		5 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 10.
		NO	Go to step 9.

Step 9	Inspection items		Inspection of harness between electronic control unit and sensor (power supply)
	Maintenance item		Check circuit between sensor connector terminal No. 3 and electronic control unit connector (GF35A) terminal No. 24.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 12.
		NO	Modify harness.

Step 10	Inspection items		Inspection of harness between electronic control unit and sensor (ground)
	Maintenance item		Check circuit between sensor connector terminal No. 1 and electronic control unit connector (GF35A) terminal No. 27.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 11.
		NO	Modify harness.

Step 11	Inspection items		Inspection of harness between electronic control unit and sensor (signal)
	Maintenance item		Check circuit between sensor connector terminal No. 2 and electronic control unit connector (GF35B) terminal No. 17.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 12.
		NO	Modify harness.

Step 12	Inspection items		Inspection by control data
	Maintenance item		**<General Scanning Tool used>** • Measure item “Intake MAP”. **<Multi-Use Tester used>** • Measure item No. 26 “Boost Pressure” of Service Data.
	Inspection condition		Starter switch ON (engine stationary) → After engine has started, press accelerator pedal.
	Requirements		Coincides with atmospheric pressure → Gradually increases
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P0238/Flash code: 32
[Monitor]
Abnormality of boost pressure sensor
[Fault (outline)]
High signal range check
[Diagnosis check]
- Output voltage of boost pressure sensor is monitored.

[Code generation condition]
- Voltage of boost pressure sensor remains over 4.7 V for approx. 2.5 seconds.
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal

[Control effected by electronic control unit during fault]
- Injection quantity is limited.
- Exhaust gas recirculation control is stopped.
- Throttle control is stopped.
- Diesel particulate filter regeneration (manual or automatic) is stopped.
- Particulate matter (PM) deposit computation is stopped.
- Boost pressure is locked at 101 kPa {1.03 kgf/cm^2}.

[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and boost pressure sensor
- Abnormality of each connector
- Abnormality of boost pressure sensor
- Abnormality in electronic control unit

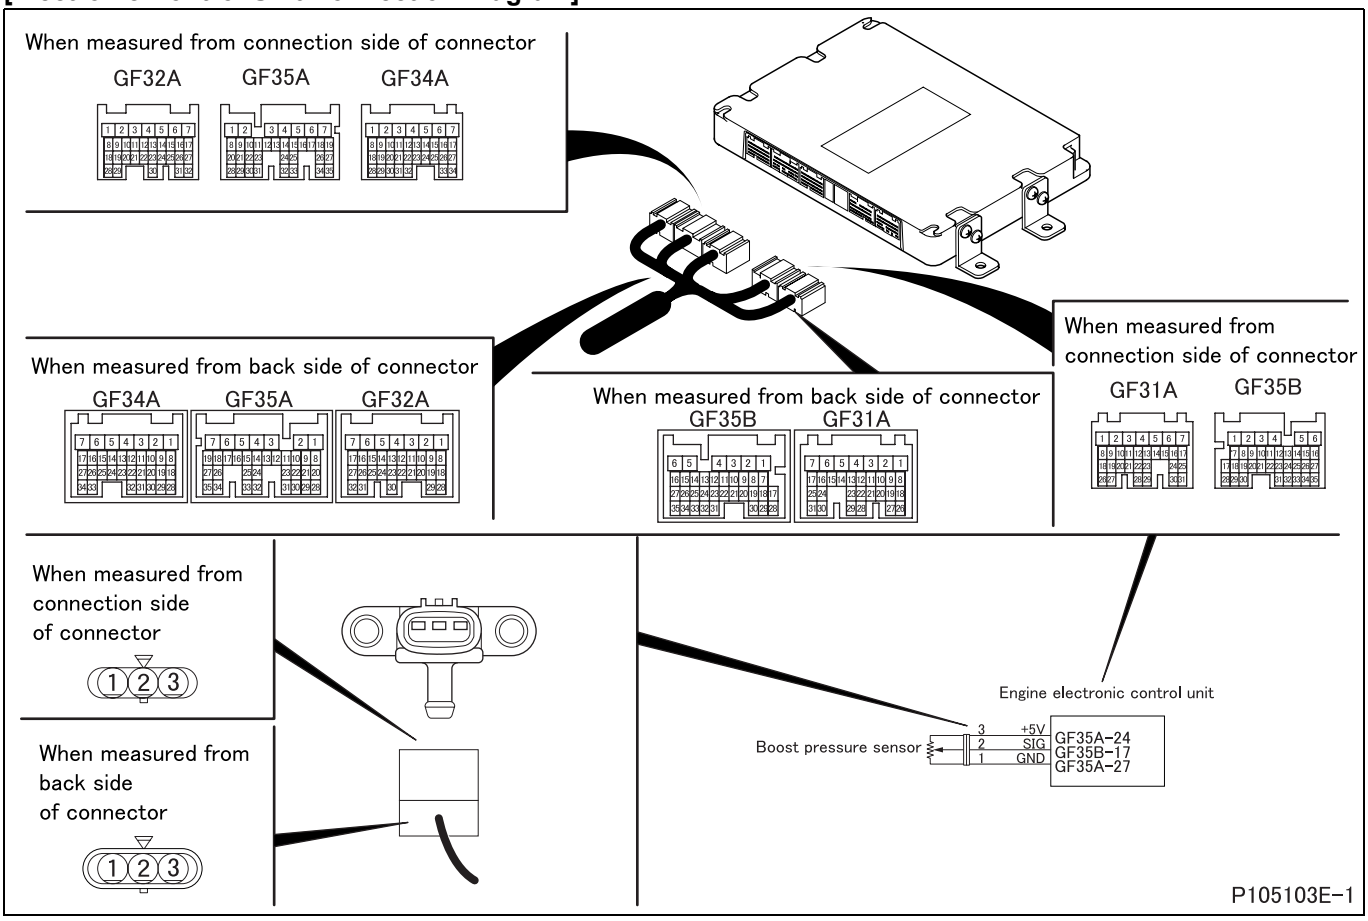
[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>
- Extinguished at 4th driving cycle after normal signal is input.

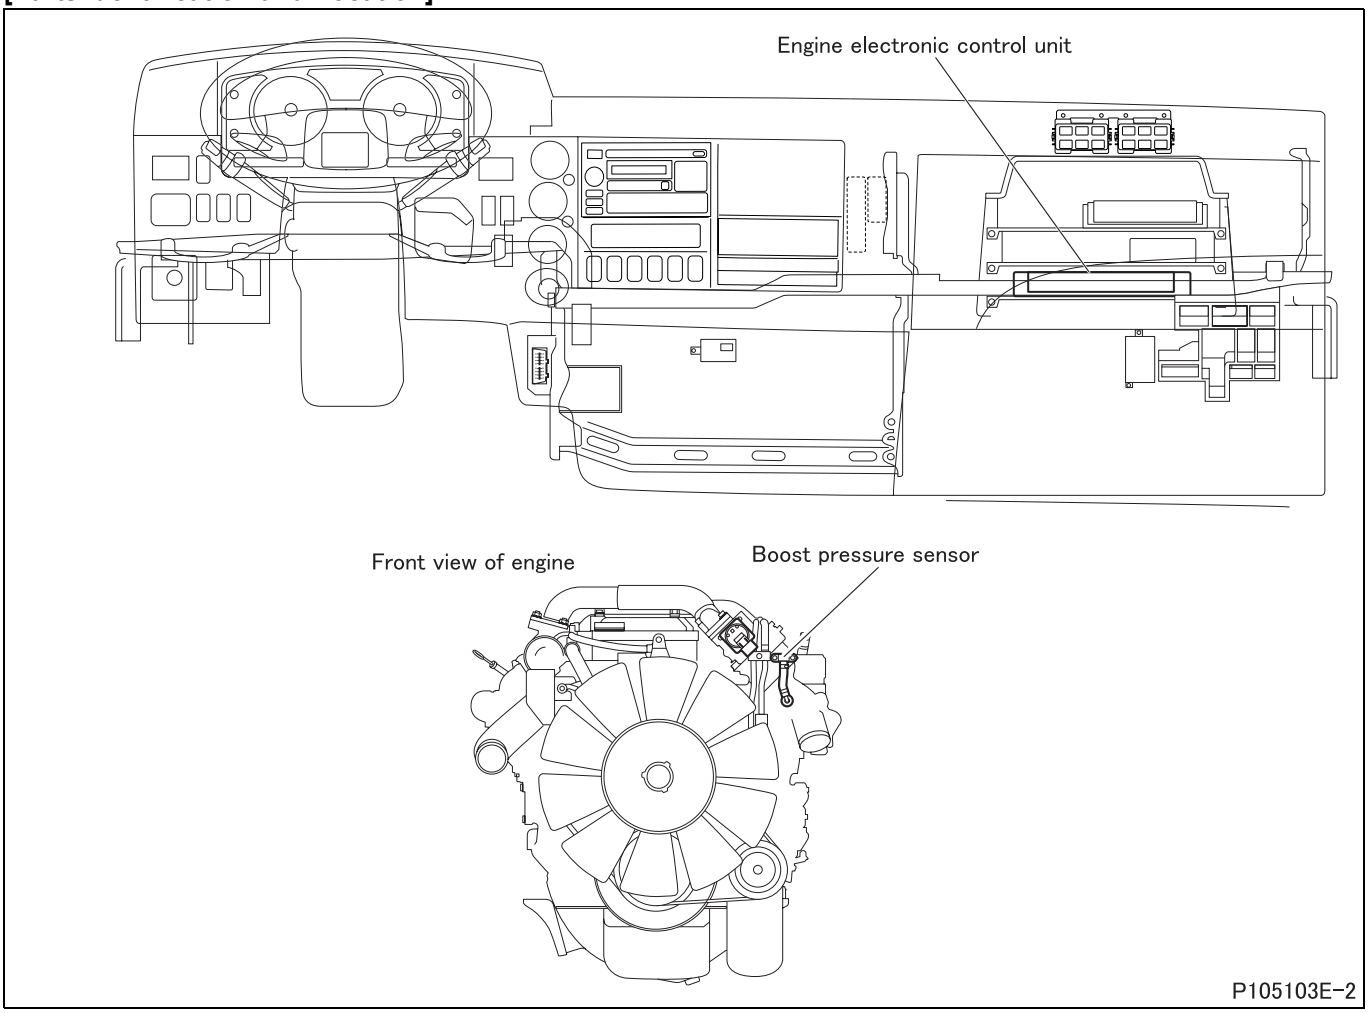
<Fault code>
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished. (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		**<General Scanning Tool used>** • Measure item “Intake MAP”. **<Multi-Use Tester used>** • Measure item No. 26 “Boost Pressure” of Service Data.
	Inspection condition		Starter switch ON (engine stationary) → After engine has started, press accelerator pedal.
	Requirements		Coincides with atmospheric pressure → Gradually increases
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

Step 2	Inspection items		Inspection by electronic control unit connector (signal)
	Maintenance item		Measure value of voltage between connector (GF35B) terminal No. 17 (+) and (GF35A) terminal No. 27 (–).
	Inspection condition		• Measure from back side of connector of harness with each device connected to harness. • Engine started
	Requirements		0.5 to 4.5 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Go to step 3.

Step 3	Inspection items		Inspection by electronic control unit connector (power supply)
	Maintenance item		Measure value of voltage between connector (GF35A) terminal No. 24 (+) and 27 (–).
	Inspection condition		• Measure from back side of connector of harness with each device connected to harness. • Starter switch: ON
	Requirements		5 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	Go to step 5.

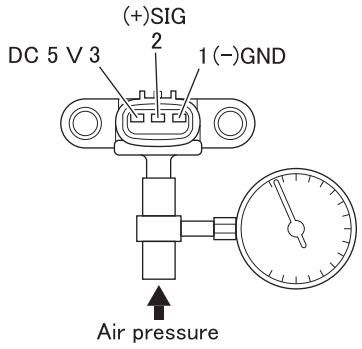
Step 4	Inspection items		Inspection by electronic control unit connector (ground)
	Maintenance item		Measure value of voltage between connector (GF35A) terminal No. 27 (+) and (GF31A) terminal No. 3 (–).
	Inspection condition		• Measure from back side of connector of harness with each device connected to harness. • Starter switch: ON
	Requirements		0 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Go to step 5.

Step 5	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 12.
		NO	Modify connector.

Step 6	Inspection items		Inspection of sensor connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify connector.

Step 7	Inspection items		Inspection of sensor unit
	Maintenance item		Measure value of voltage developing across connector terminal No. 2 (+) and 1 (–) when air pressure (gauge pressure) is gradually applied.
	Inspection condition		Apply voltage DC 5 V across connector terminals No. 3 (+) and 1 (–).
	Requirements		• 101.67 kPa {15 psi, 1.0 kgf/cm^2}: Approx. 3.2 V • 165.67 kPa {24 psi, 1.7 kgf/cm^2}: Approx. 4.5 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Replacement of sensor

<Step 7 inspection diagram>



Step 8	Inspection items		Inspection of harness between electronic control unit and sensor (power supply)
	Maintenance item		Measure value of voltage between connector terminal No. 3 (+) and 1 (–).
	Inspection condition		• Measure from back side of connector of harness with each device connected to harness. • Starter switch: ON
	Requirements		5 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 10.
		NO	Go to step 9.

Step 9	Inspection items		Inspection of harness between electronic control unit and sensor (power supply)
	Maintenance item		Check circuit between sensor connector terminal No. 3 and electronic control unit connector (GF35A) terminal No. 24.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 12.
		NO	Modify harness.

Step 10	Inspection items		Inspection of harness between electronic control unit and sensor (ground)
	Maintenance item		Check circuit between sensor connector terminal No. 1 and electronic control unit connector (GF35A) terminal No. 27.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 11.
		NO	Modify harness.

Step 11	Inspection items		Inspection of harness between electronic control unit and sensor (signal)
	Maintenance item		Check circuit between sensor connector terminal No. 2 and electronic control unit connector (GF35B) terminal No. 17.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 12.
		NO	Modify harness.

Step 12	Inspection items		Inspection by control data
	Maintenance item		**<General Scanning Tool used>** • Measure item “Intake MAP”. **<Multi-Use Tester used>** • Measure item No. 26 “Boost Pressure” of Service Data.
	Inspection condition		Starter switch ON (engine stationary) → After engine has started, press accelerator pedal.
	Requirements		Coincides with atmospheric pressure → Gradually increases
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P0244/Flash code: 51
[Monitor]
System monitor of waste gate
[Fault (outline)]
Waste gate system check
[Diagnosis check]
- Boost pressure is monitored for deviation from specified value when waste gate operates.

[Code generation condition]
- At valve opening, boost pressure remains higher than specified for 30 seconds.
- At valve closing, boost pressure remains lower than specified for 30 seconds.
  (Warning lamp is lit and diagnosis code is displayed on second establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal
- Water temperature: 70◦C {158◦F}
- Engine speed: more than 2000 rpm
- Intake throttle opening: more than 0%
- Exhaust gas recirculation valve opening: more than 0%
- Atmospheric pressure: more than 85 kPa {12 psi, 0.9 kgf/cm^2} (at 1500 m {5000 ft})
- Intake air temperature: more than 20◦C {68◦F}
- Intake air temperature sensor 1: normal in output signal
- Boost pressure sensor: normal in output signal
- Atmospheric pressure sensor: normal in output signal
- Water temperature sensor: normal in output signal
- Intake throttle: normal in output signal

[Control effected by electronic control unit during fault]
- Effects no special control.

[Probable cause of trouble]
- Short-circuit of harness between electronic control unit and waste gate magnetic valve
- Abnormality of each connector
- Abnormality of waste gate magnetic valve
- Abnormality in electronic control unit

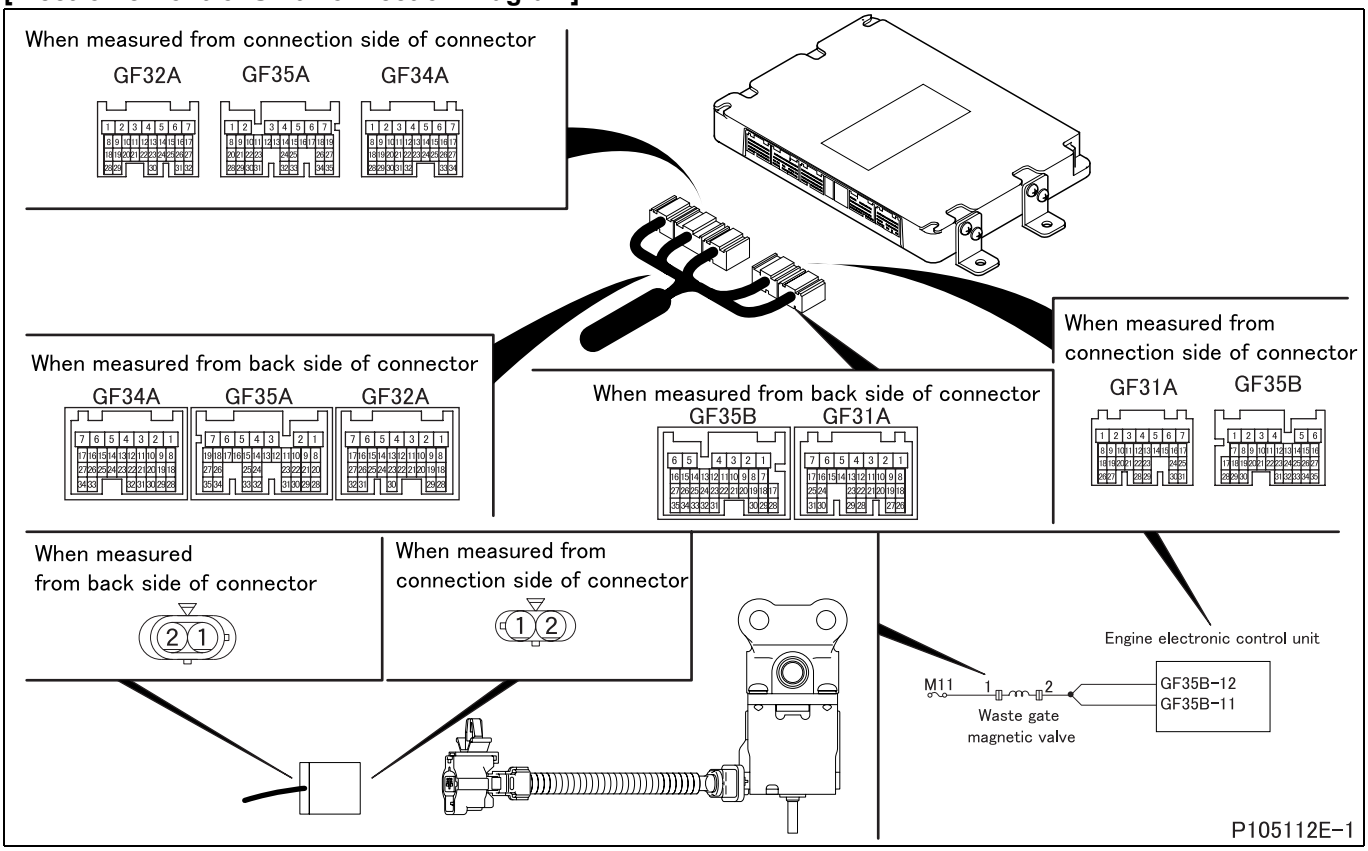
[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>
- Extinguished at 4th driving cycle after normal signal is input.

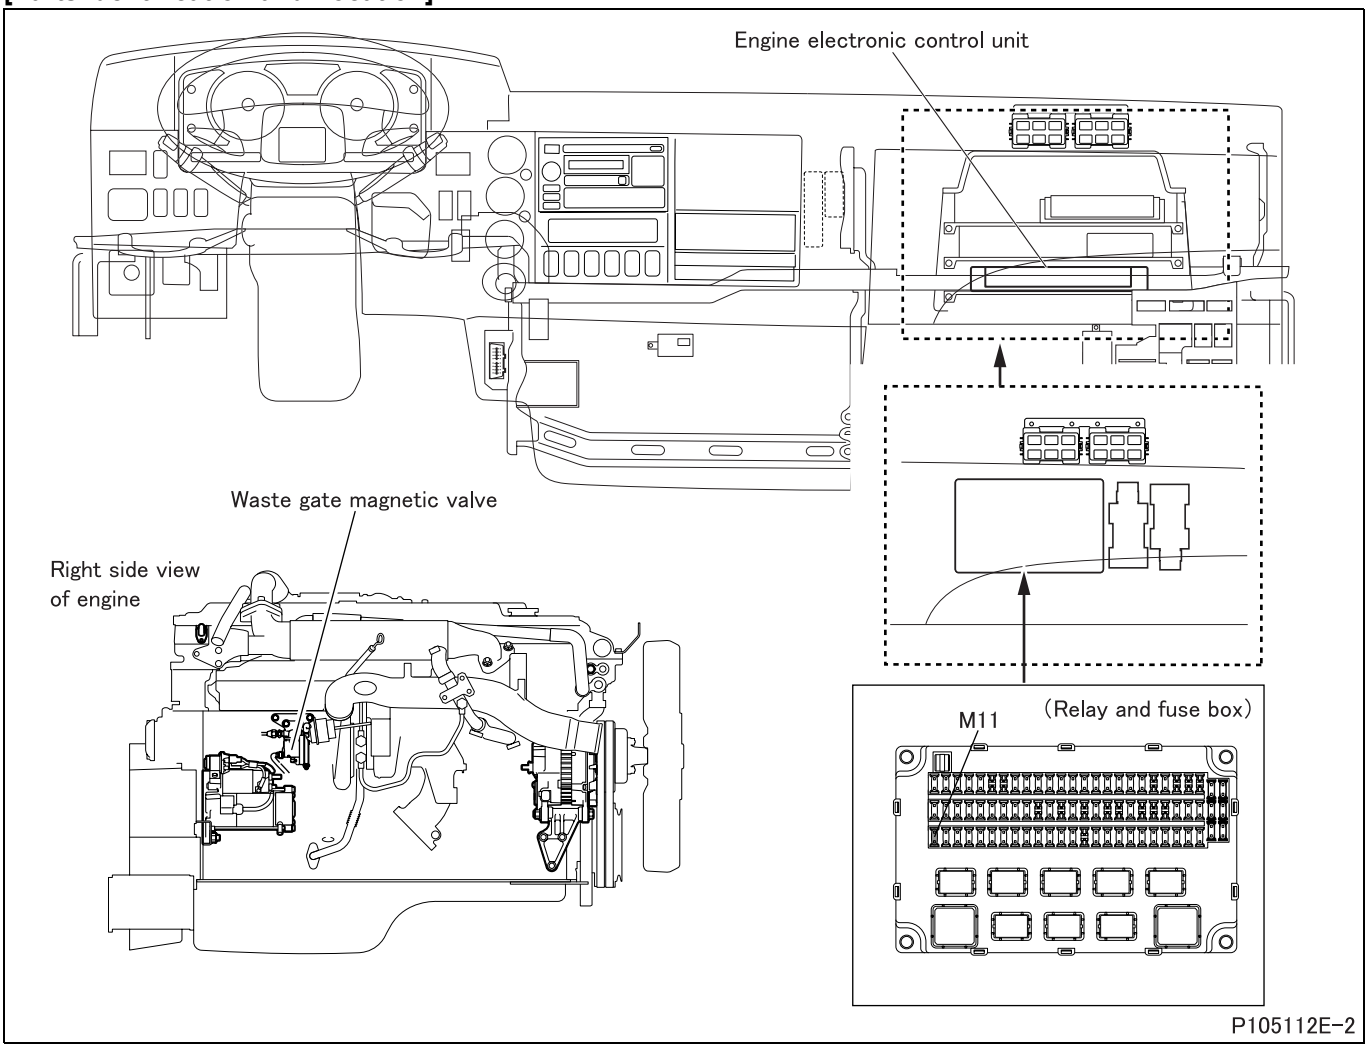
<Fault code>
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished. (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

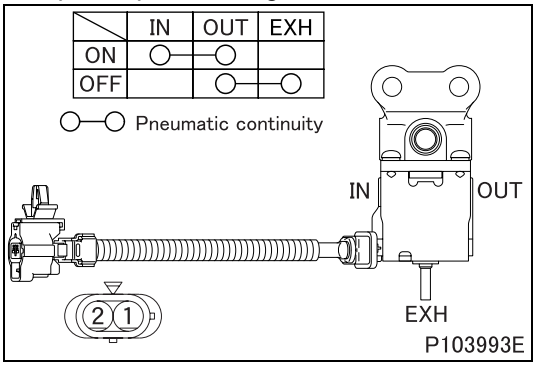
Step 1	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. A3 “W/G M/V”.
	Inspection condition		• Starter switch: ON • Engine start: At idle
	Requirements		Waste gate magnetic valve operation sound is noted (automatic reset after 15 seconds)
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (see Gr00.).
		NO	Go to step 2.

Step 2	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Modify connector.

Step 3	Inspection items		Inspection of waste gate magnetic valve connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	Modify connector.

Step 4	Inspection items		Inspection of waste gate magnetic valve unit
	Maintenance item		Measure minimum operating voltage when waste gate magnetic valve operates (judge by operation sound).
	Inspection condition		Gradually increase from zero the voltage applied to terminals No. 1 (+) and 2 (–).
	Requirements		9 V or less
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Replacement of waste gate magnetic valve

<Step 4 inspection diagram>



Step 5	Inspection items		Inspection of harness between waste gate magnetic valve and fuse
	Maintenance item		Check circuit between waste gate magnetic valve connector terminal No. 1 and fuse (M11).
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Modify harness.

Step 6	Inspection items		Inspection of harness between waste gate magnetic valve and electronic control unit
	Maintenance item		Check circuit between waste gate magnetic valve connector terminal No. 2 and electronic control unit connector (GF35B) terminal No. 11 or 12.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify harness.

Step 7	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. A3 “W/G M/V”.
	Inspection condition		• Starter switch: ON • Engine start: At idle
	Requirements		Waste gate magnetic valve operation sound is noted (automatic reset after 15 seconds)
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P0245/Flash code: 51
[Monitor]
Abnormality of waste gate magnetic valve
[Fault (outline)]
- Short circuit ground
- Open circuit

[Diagnosis check]
- Waste gate magnetic valve circuit is monitored for fault.

[Code generation condition]
- Waste gate magnetic valve circuit remains shorted to ground or open as detected for approx. 1 second. (Warning lamp is lit and diagnosis code is displayed on second establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal
- Waste gate magnetic valve: inactive

[Control effected by electronic control unit during fault]
- Automatic diesel particulate filter regeneration is stopped.

[Probable cause of trouble]
- Short-circuit of harness between electronic control unit and waste gate magnetic valve
- Abnormality of each connector
- Abnormality of waste gate magnetic valve
- Abnormality in electronic control unit

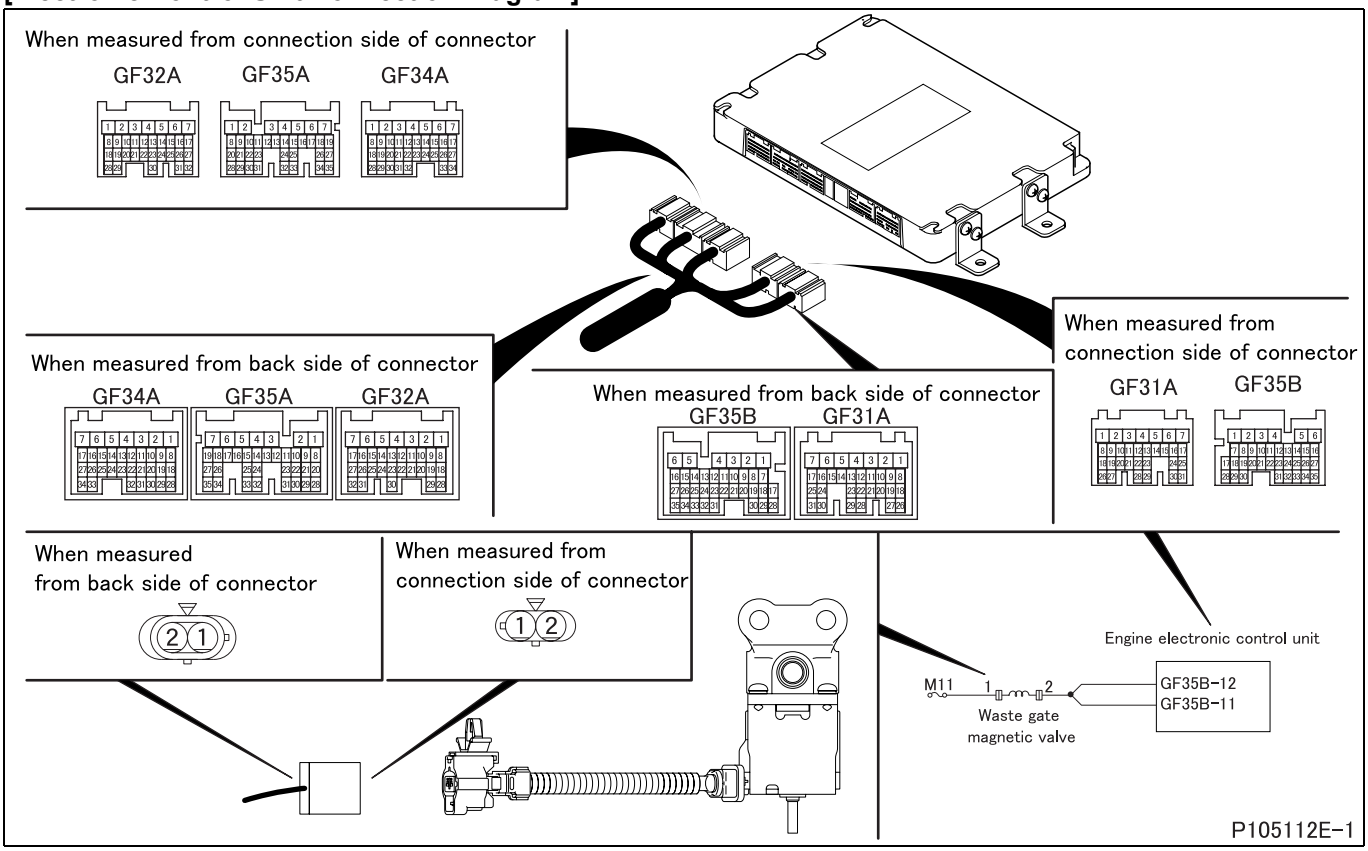
[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>
- Extinguished at 4th driving cycle after normal signal is input.

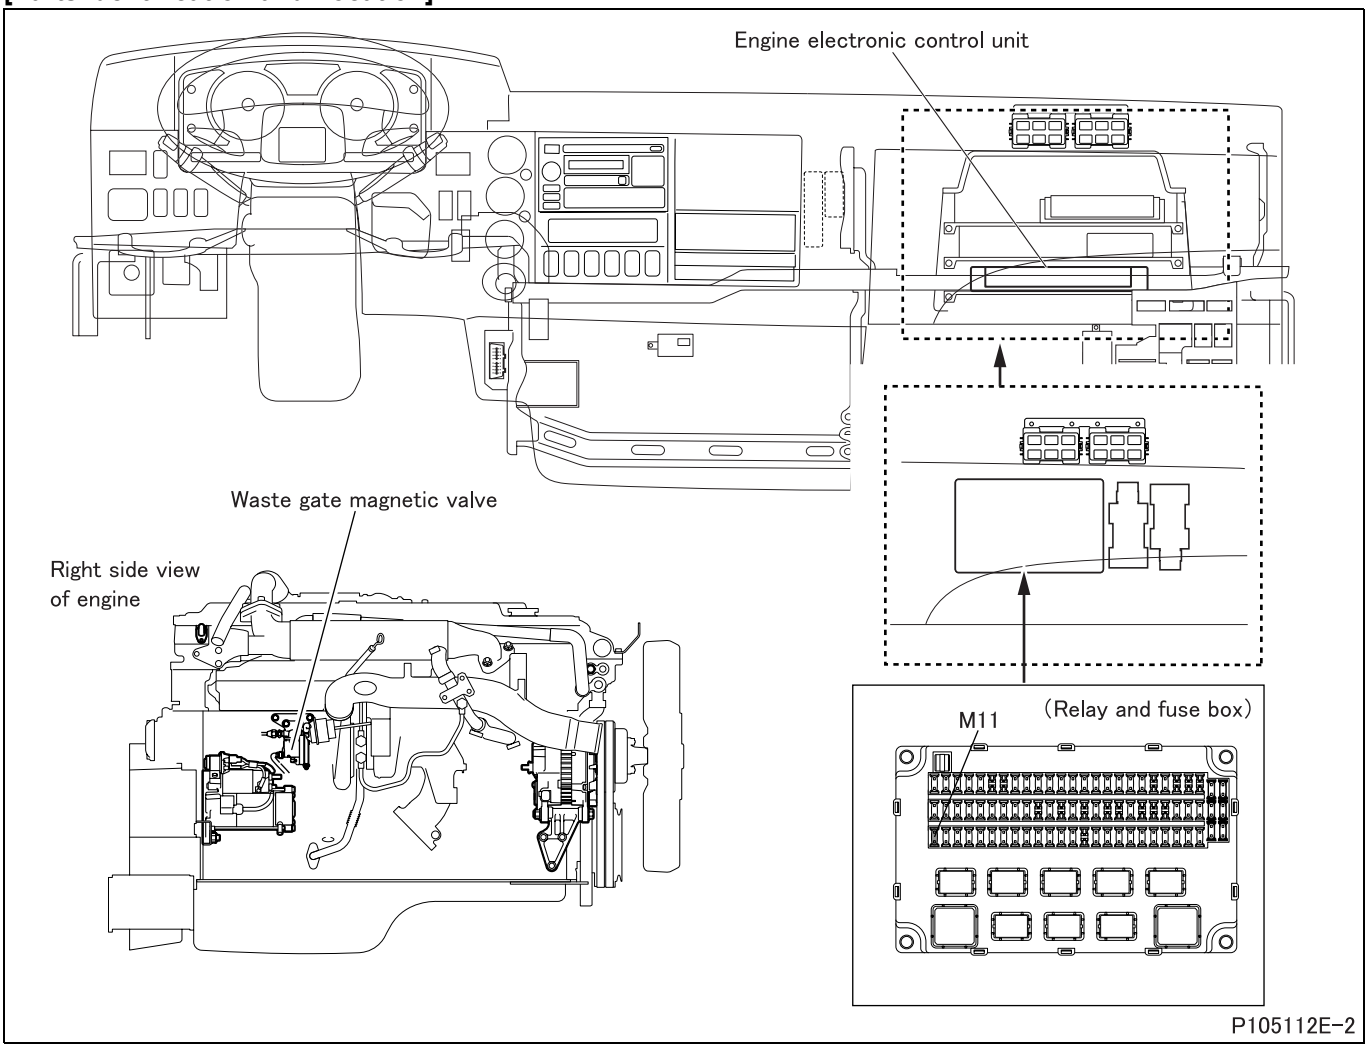
<Fault code>
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished. (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

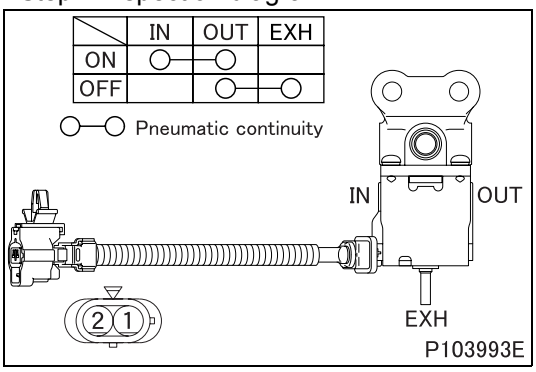
Step 1	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. A3 “W/G M/V”.
	Inspection condition		• Starter switch: ON • Engine start: At idle
	Requirements		Waste gate magnetic valve operation sound is noted (automatic reset after 15 seconds)
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (see Gr00.).
		NO	Go to step 2.

Step 2	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Modify connector.

Step 3	Inspection items		Inspection of waste gate magnetic valve connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	Modify connector.

Step 4	Inspection items		Inspection of waste gate magnetic valve unit
	Maintenance item		Measure minimum operating voltage when waste gate magnetic valve operates (judge by operation sound).
	Inspection condition		Gradually increase from zero the voltage applied to terminals No. 1 (+) and 2 (–).
	Requirements		9 V or less
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Replacement of waste gate magnetic valve

<Step 4 inspection diagram>



Step 5	Inspection items		Inspection of harness between waste gate magnetic valve and fuse
	Maintenance item		Check circuit between waste gate magnetic valve connector terminal No. 1 and fuse (M11).
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Modify harness.

Step 6	Inspection items		Inspection of harness between waste gate magnetic valve and electronic control unit
	Maintenance item		Check circuit between waste gate magnetic valve connector terminal No. 2 and electronic control unit connector (GF35B) terminal No. 11 or 12.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify harness.

Step 7	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. A3 “W/G M/V”.
	Inspection condition		• Starter switch: ON • Engine start: At idle
	Requirements		Waste gate magnetic valve operation sound is noted (automatic reset after 15 seconds)
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P0246/Flash code: 51
[Monitor]
Abnormality of waste gate magnetic valve
[Fault (outline)]
Short circuit battery
[Diagnosis check]
- Waste gate magnetic valve circuit is monitored for fault.

[Code generation condition]
- Waste gate magnetic valve circuit remains shorted to battery as detected for approx. 1 second.
  (Warning lamp is lit and diagnosis code is displayed on second establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal
- Waste gate magnetic valve: active

[Control effected by electronic control unit during fault]
- Waste gate magnetic valve control is stopped.
- Automatic diesel particulate filter regeneration is stopped.

[Probable cause of trouble]
- Short-circuit of harness between electronic control unit and waste gate magnetic valve
- Abnormality of each connector
- Abnormality of waste gate magnetic valve
- Abnormality in electronic control unit

[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>
- Extinguished at 4th driving cycle after normal signal is input.

<Fault code>
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished. (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Fault diagnosis]
- Perform checks in the sequence of the following steps.

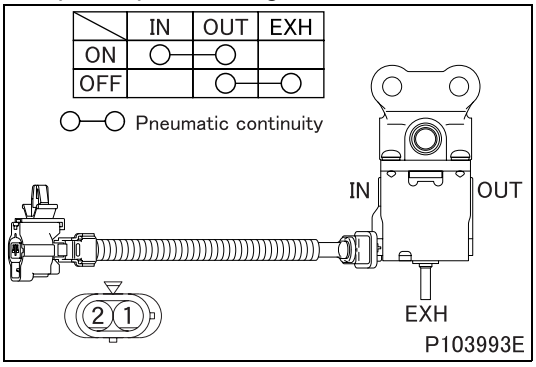
Step 1	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. A3 “W/G M/V”.
	Inspection condition		• Starter switch: ON • Engine start: At idle
	Requirements		Waste gate magnetic valve operation sound is noted (automatic reset after 15 seconds)
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (see Gr00.).
		NO	Go to step 2.

Step 2	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Modify connector.

Step 3	Inspection items		Inspection of waste gate magnetic valve connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	Modify connector.

Step 4	Inspection items		Inspection of waste gate magnetic valve unit
	Maintenance item		Measure minimum operating voltage when waste gate magnetic valve operates (judge by operation sound).
	Inspection condition		Gradually increase from zero the voltage applied to terminals No. 1 (+) and 2 (–).
	Requirements		9 V or less
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Replacement of waste gate magnetic valve

<Step 4 inspection diagram>



Step 5	Inspection items		Inspection of harness between waste gate magnetic valve and fuse
	Maintenance item		Check circuit between waste gate magnetic valve connector terminal No. 1 and fuse (M11).
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Modify harness.

Step 6	Inspection items		Inspection of harness between waste gate magnetic valve and electronic control unit
	Maintenance item		Check circuit between waste gate magnetic valve connector terminal No. 2 and electronic control unit connector (GF35B) terminal No. 11 or 12.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify harness.

Step 7	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. A3 “W/G M/V”.
	Inspection condition		• Starter switch: ON • Engine start: At idle
	Requirements		Waste gate magnetic valve operation sound is noted (automatic reset after 15 seconds)
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P0253/Flash code: 22
[Monitor]
Abnormality of common rail pressure
[Fault (outline)]
Too large rail pressure (too high)
[Diagnosis check]
- Common rail pressure is monitored.

[Code generation condition]
- Actual common rail pressure remains over 122.5% for approx. 0.3 second. (common rail pressure: over pressure limiter actuation level)
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal

[Control effected by electronic control unit during fault]
- Common rail system is stopped. (Engine is immediately stopped.)

[Probable cause of trouble]
- Abnormality of fuel pipe
- Abnormality of supply pump
- Abnormality of pressure limiter
- Abnormality of injector

[Recoverability]
<Control during fault>
- Recovered if actual common rail pressure becomes below 92.5% when starter switch is turned OFF to ON.

<Warning lamp>
- Extinguished after input of normal signal.

<Fault code>
- If code recovered to normal, automatically cleared at 40th warm up cycle after warning lamp is lit. (To clear as desired, erase from the memory.)

Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Fault diagnosis]
- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		Check if following diagnosis codes occur simultaneously. • P0191 “CRS Pressure SNSR (Plausibility)” • P0192 “CRS Pressure SNSR (Low)” • P0193 “CRS Pressure SNSR (High)” • P0253 “Common Rail Pressure Defect” • P0254 “Common Rail Pressure Defect” • P0256 “Common Rail Pressure High (Pump)” • P0257 “Common Rail Pressure Low (Pump)” • P0259 “Common Rail Pressure High (Pump)”
	Inspection condition		• Starter switch: ON • Engine not started
	Requirements		The diagnosis code does not occur.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 2.
		NO	Inspect diagnosis code that is occurring.

Step 2	Inspection items		Inspection of low pressure piping (fuel return pipe)
	Maintenance item		Check return pipe or hose for blocking.
	Inspection condition		Starter switch: OFF
	Requirements		There is no blocking on pipe or hose.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Correct and replace return pipe or hose.

Step 3	Inspection items		Inspection of rail (pressure limiter) (contact DENSO Service Station) or replace.
	Maintenance item		–
	Inspection condition		–
	Requirements		Problem is solved by repairing and replacing rail (pressure limiter).
	Inspection result (Is the judging standard satisfied?)	YES	–
		NO	Go to step 4.

Step 4	Inspection items		Replacement of supply pump
	Maintenance item		–
	Inspection condition		–
	Requirements		Problem is solved by replacing supply pump.
	Inspection result (Is the judging standard satisfied?)	YES	–
		NO	Replacement of injectors (six) (If there is any abnormality, replace electronic control unit.)

[Fault code]
Diagnosis code: P0254/Flash code: 23
[Monitor]
Abnormality of common rail pressure
[Fault (outline)]
Too large rail pressure (high)
[Diagnosis check]
- Common rail pressure is monitored.

[Code generation condition]
- Actual common rail pressure remains over 98.5% for approx. 0.3 second. (common rail pressure: below pressure limiter actuation level)
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal

[Control effected by electronic control unit during fault]
- Injection quantity is limited.
- Main injection only is allowed.
- Common rail pressure is limited.
- Exhaust gas recirculation control is stopped.
- Throttle control is stopped.
- Diesel particulate filter regeneration (manual or automatic) is stopped.
- Auto cruise control is stopped.

[Probable cause of trouble]
- Abnormality of fuel pipe
- Abnormality of supply pump
- Abnormality of common rail unit
- Abnormality of injector

[Recoverability]
<Control during fault>
- Recovered if signal becomes normal when starter switch is turned OFF to ON (power supply resumed to electronic control unit).

<Warning lamp>
- Extinguished after input of normal signal.

<Fault code>
- If code recovered to normal, automatically cleared at 40th warm up cycle after warning lamp is lit. (To clear as desired, erase from the memory.)

Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		Check if following diagnosis codes occur simultaneously. • P0191 “CRS Pressure SNSR (Plausibility)” • P0192 “CRS Pressure SNSR (Low)” • P0193 “CRS Pressure SNSR (High)” • P0253 “Common Rail Pressure Defect” • P0254 “Common Rail Pressure Defect” • P0256 “Common Rail Pressure High (Pump)” • P0257 “Common Rail Pressure Low (Pump)” • P0259 “Common Rail Pressure High (Pump)”
	Inspection condition		• Starter switch: ON • Engine not started
	Requirements		The diagnosis code does not occur.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 2.
		NO	Inspect diagnosis code that is occurring.

Step 2	Inspection items		Inspection of injection pipe
	Maintenance item		Check injection pipe for clogging.
	Inspection condition		Starter switch: OFF
	Requirements		Not clogged
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Cleaning of injection pipe.

Step 3	Inspection items		Inspection of rail (pressure limiter) (contact DENSO Service Station) or replace.
	Maintenance item		–
	Inspection condition		–
	Requirements		Problem is solved by repairing and replacing rail (pressure limiter).
	Inspection result (Is the judging standard satisfied?)	YES	–
		NO	Go to step 4.

Step 4	Inspection items		Replacement of supply pump
	Maintenance item		–
	Inspection condition		–
	Requirements		Problem is solved by replacing supply pump.
	Inspection result (Is the judging standard satisfied?)	YES	–
		NO	Replacement of injectors (six) (If there is any abnormality, replace electronic control unit.)

[Fault code]
Diagnosis code: P0256/Flash code: 23
[Monitor]
Supply pump signal out of serviceable range
[Fault (outline)]
Too large supply pump discharge pressure
[Diagnosis check]
- Supply pump discharge pressure is monitored according to rail pressure.

[Code generation condition]
Either of the following states caused by excessive rail pressure
(Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)
- Pump exceeds time allowed to operate in seizure range of service (approx. 10 seconds).
- Pump exceeds time allowed to operate in short-time range of service (approx. 6 minutes).

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- Rotation pulse input: available

[Control effected by electronic control unit during fault]
- Injection quantity is limited.
- Main injection only is allowed.
- Common rail pressure is limited.
- Exhaust gas recirculation control is stopped.
- Throttle control is stopped.
- Diesel particulate filter regeneration (manual or automatic) is stopped.
- Auto cruise control is stopped.

[Probable cause of trouble]
- Abnormality of fuel pipe
- Abnormality of supply pump
- Possibility is high that supply pump is damaged. Replace supply pump even if back to normal. Also, check high-pressure fuel piping for abnormality.

[Recoverability]
<Control during fault>
- Recovered if signal becomes normal when starter switch is turned OFF to ON (power supply resumed to electronic control unit).
  Possibility is high that supply pump is damaged when this diagnosis code occurs. Replace supply pump even if back to normal.

<Warning lamp>
- Extinguished after input of normal signal.

<Fault code>
- If code recovered to normal, automatically cleared at 40th warm up cycle after warning lamp is lit. (To clear as desired, erase from the memory.)

Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Fault code]
Diagnosis code: P0257/Flash code: 23
[Monitor]
Abnormality of delivery by supply pump
[Fault (outline)]
Abnormal supply pump discharge pressure (too rapid pressure change)
[Diagnosis check]
- Supply pump pressurizing section (cylinder) is checked for fracture.

[Code generation condition]
- Supply pump delivery rate in current cycle is significantly larger than that in the previous cycle (1.5 times). (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- Rotation pulse input: available

[Control effected by electronic control unit during fault]
- Injection quantity is limited.
- Main injection only is allowed.
- Common rail pressure is limited.
- Exhaust gas recirculation control is stopped.
- Throttle control is stopped.
- Diesel particulate filter regeneration (manual or automatic) is stopped.
- Auto cruise control is stopped.

[Probable cause of trouble]
- Inspection of supply pump for cause of abnormality (contact DENSO Service Station) or replace.

[Recoverability]
<Control during fault>
- Recovered if signal becomes normal when starter switch is turned OFF to ON (power supply resumed to electronic control unit).

<Warning lamp>
- Extinguished after input of normal signal.

<Fault code>
- If code recovered to normal, automatically cleared at 40th warm up cycle after warning lamp is lit. (To clear as desired, erase from the memory.)

Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Fault code]
Diagnosis code: P0259/Flash code: 23
[Monitor]
Supply pump signal out of serviceable range
[Fault (outline)]
Large supply pump discharge pressure
[Diagnosis check]
- Checking is made for time duration of supply pump staying in the range where seizure is more likely to occur as discharge pressure of supply pump is increased during operation at low speeds.

[Code generation condition]
- Pump exceeds time allowed to operate in seizure range of service (approx. 10 seconds).
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- Rotation pulse input: available

[Control effected by electronic control unit during fault]
- Injection quantity is limited.
- Main injection only is allowed.
- Common rail pressure is limited.
- Exhaust gas recirculation control is stopped.
- Throttle control is stopped.
- Diesel particulate filter regeneration (manual or automatic) is stopped.
- Auto cruise control is stopped.

[Probable cause of trouble]
- Abnormality of fuel pipe
- Abnormality of supply pump
- Possibility is high that supply pump is damaged. Replace supply pump even if back to normal. Also, check high-pressure fuel piping for abnormality.

[Recoverability]
<Control during fault>
- Recovered if signal becomes normal when starter switch is turned OFF to ON (power supply resumed to electronic control unit).

<Warning lamp>
- Extinguished after input of normal signal.

<Fault code>
- If code recovered to normal, automatically cleared at 40th warm up cycle after warning lamp is lit. (To clear as desired, erase from the memory.)

Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Fault code]
Diagnosis code: P0336/Flash code: 15
[Monitor]
Abnormality of engine speed sensor
[Fault (outline)]
- No pulse check
- Gap phase shift

[Diagnosis check]
- Output pulses from engine speed sensor during engine operation are counted.

[Code generation condition]
- No pulse is received from engine speed sensor with one revolution of engine.
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- Battery voltage: normal

[Control effected by electronic control unit during fault]
- Injection quantity is limited.
- Exhaust gas recirculation control is stopped.
- Throttle control is stopped.
- Diesel particulate filter regeneration (manual or automatic) is stopped.
- Auto cruise control is stopped.

[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and engine speed sensor
- Abnormality of each connector
- Abnormality of engine speed sensor
- Abnormality in electronic control unit

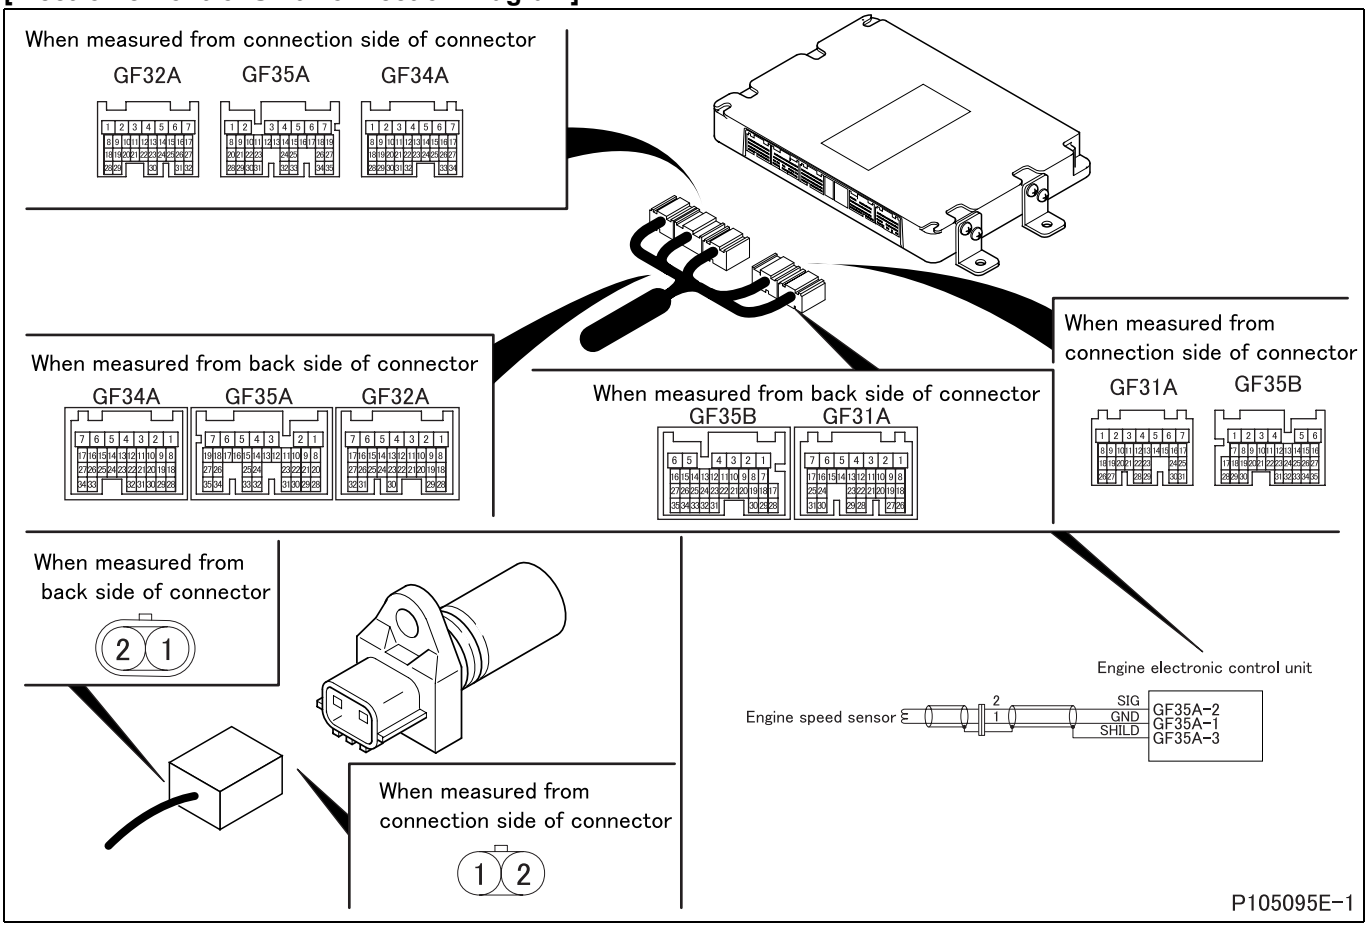
[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>
- Extinguished at 4th driving cycle after normal signal is input.

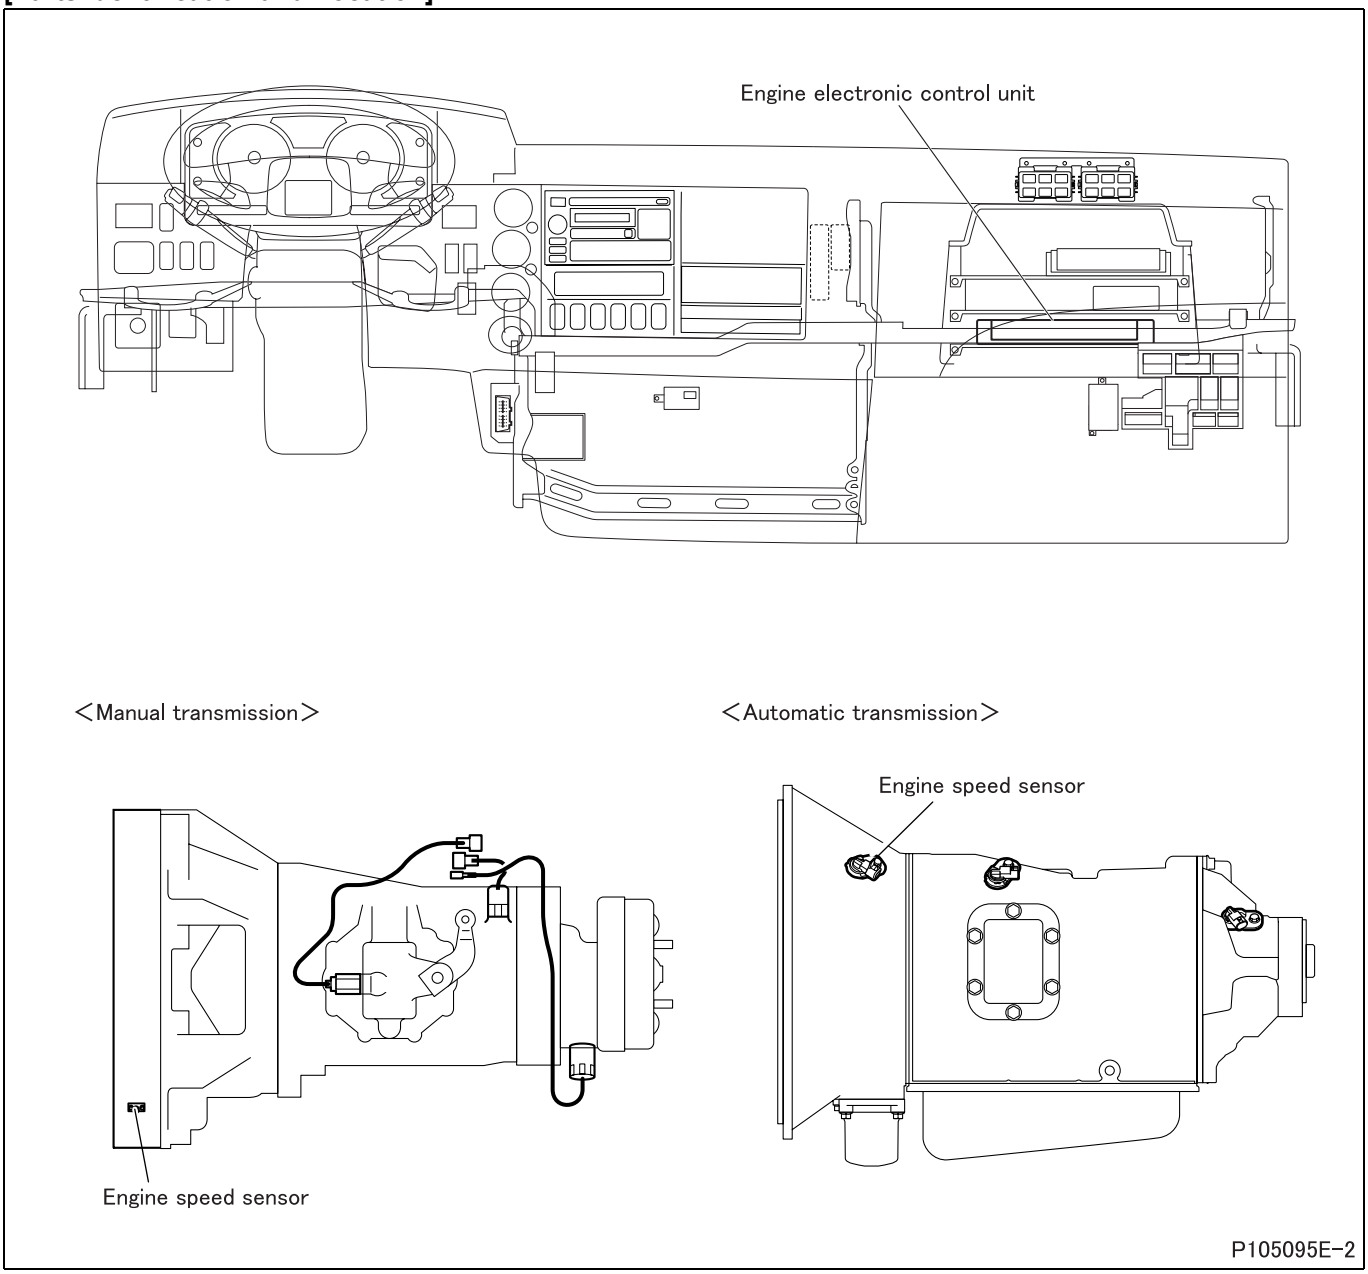
<Fault code>
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished. (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		**<General Scanning Tool used>** • Measure item “Ne”. **<Multi-Use Tester used>** • Measure item No. 01 “Engine Revolution” of Service Data.
	Inspection condition		–
	Requirements		Same indication as tachometer is given.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

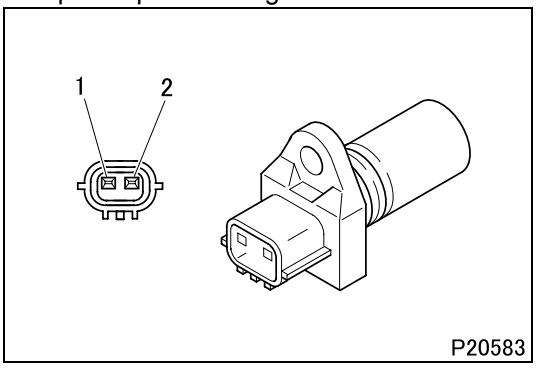
Step 2	Inspection items		Inspection by electronic control unit connector
	Maintenance item		Measure value of resistance between connector (GF35A) terminal No. 1 and 2.
	Inspection condition		Disconnect electronic control unit from harness and measure from connection side of harness connector.
	Requirements		125.5 ± 17 Ω (20°C {68°F})
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Go to step 4.

Step 3	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify connector.

Step 4	Inspection items		Inspection of engine speed sensor connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Modify connector.

Step 5	Inspection items		Inspection of engine speed sensor unit
	Maintenance item		Measure value of resistance between connector terminal No. 1 and 2.
	Inspection condition		–
	Requirements		125.5 ± 17 Ω (20°C {68°F})
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Replacement of sensor

<Step 5 inspection diagram>



Step 6	Inspection items		Inspection of harness between electronic control unit and sensor (power supply)
	Maintenance item		Check circuit between sensor connector terminal No. 2 and electronic control unit connector (GF35A) terminal No. 2.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify harness.

Step 7	Inspection items		Inspection of harness between electronic control unit and sensor (ground)
	Maintenance item		Check circuit between sensor connector terminal No. 1 and electronic control unit connector (GF35A) terminal No. 1.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify harness.

Step 8	Inspection items		Inspection by control data
	Maintenance item		**<General Scanning Tool used>** • Measure item “Ne”. **<Multi-Use Tester used>** • Measure item No. 01 “Engine Revolution” of Service Data.
	Inspection condition		–
	Requirements		Same indication as tachometer is given.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P0339/Flash code: 14
[Monitor]
Abnormality of engine speed sensor
[Fault (outline)]
Abnormal pulse count
[Diagnosis check]
- Output pulses from engine speed sensor during engine operation are counted.

[Code generation condition]
- Engine speed sensor input pulse count with one revolution of engine is not the same as last.
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- Battery voltage: normal
- Engine state: not in stalled condition (inputs available from engine speed sensor)
- Engine speed: more than 350 rpm

[Control effected by electronic control unit during fault]
- Injection quantity is limited.
- Exhaust gas recirculation control is stopped.
- Throttle control is stopped.
- Diesel particulate filter regeneration (manual or automatic) is stopped.
- Auto cruise control is stopped.

[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and engine speed sensor
- Abnormality of each connector
- Abnormality of engine speed sensor
- Abnormality in electronic control unit

[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>
- Extinguished at 4th driving cycle after normal signal is input.

<Fault code>
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished. (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		**<General Scanning Tool used>** • Measure item “Ne”. **<Multi-Use Tester used>** • Measure item No. 01 “Engine Revolution” of Service Data.
	Inspection condition		–
	Requirements		Same indication as tachometer is given.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

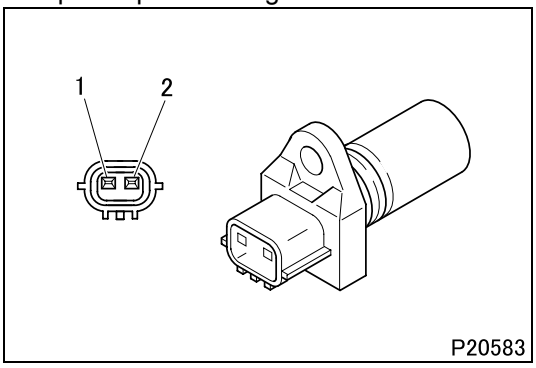
Step 2	Inspection items		Inspection by electronic control unit connector
	Maintenance item		Measure value of resistance between connector (GF35A) terminal No. 1 and 2.
	Inspection condition		Disconnect electronic control unit from harness and measure from connection side of harness connector.
	Requirements		125.5 ± 17 Ω (20°C {68°F})
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Go to step 4.

Step 3	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify connector.

Step 4	Inspection items		Inspection of engine speed sensor connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Modify connector.

Step 5	Inspection items		Inspection of engine speed sensor unit
	Maintenance item		Measure value of resistance between connector terminal No. 1 and 2.
	Inspection condition		–
	Requirements		125.5 ± 17 Ω (20°C {68°F})
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Replacement of sensor

<Step 5 inspection diagram>



Step 6	Inspection items		Inspection of harness between electronic control unit and sensor (power supply)
	Maintenance item		Check circuit between sensor connector terminal No. 2 and electronic control unit connector (GF35A) terminal No. 2.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify harness.

Step 7	Inspection items		Inspection of harness between electronic control unit and sensor (ground)
	Maintenance item		Check circuit between sensor connector terminal No. 1 and electronic control unit connector (GF35A) terminal No. 1.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify harness.

Step 8	Inspection items		Inspection by control data
	Maintenance item		**<General Scanning Tool used>** • Measure item “Ne”. **<Multi-Use Tester used>** • Measure item No. 01 “Engine Revolution” of Service Data.
	Inspection condition		–
	Requirements		Same indication as tachometer is given.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P0340/Flash code: 12
[Monitor]
Abnormality of cylinder recognition sensor
[Fault (outline)]
No pulse check
[Diagnosis check]
- Output pulses from cylinder recognition sensor during engine operation are counted.

[Code generation condition]
- No input pulse is received from cylinder recognition sensor with one revolution of engine.
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- Battery voltage: normal

[Control effected by electronic control unit during fault]
- Control is carried out using engine speed sensors (engine is stopped if engine speed sensor also malfunctions).
- Auto cruise control is stopped (normal running (engine is stopped if engine speed sensor also malfunctions), start-ability declines).
- Fault detection for controller area network communication is stopped.

[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and cylinder recognition sensor
- Abnormality of each connector
- Abnormality of cylinder recognition sensor
- Abnormality in electronic control unit

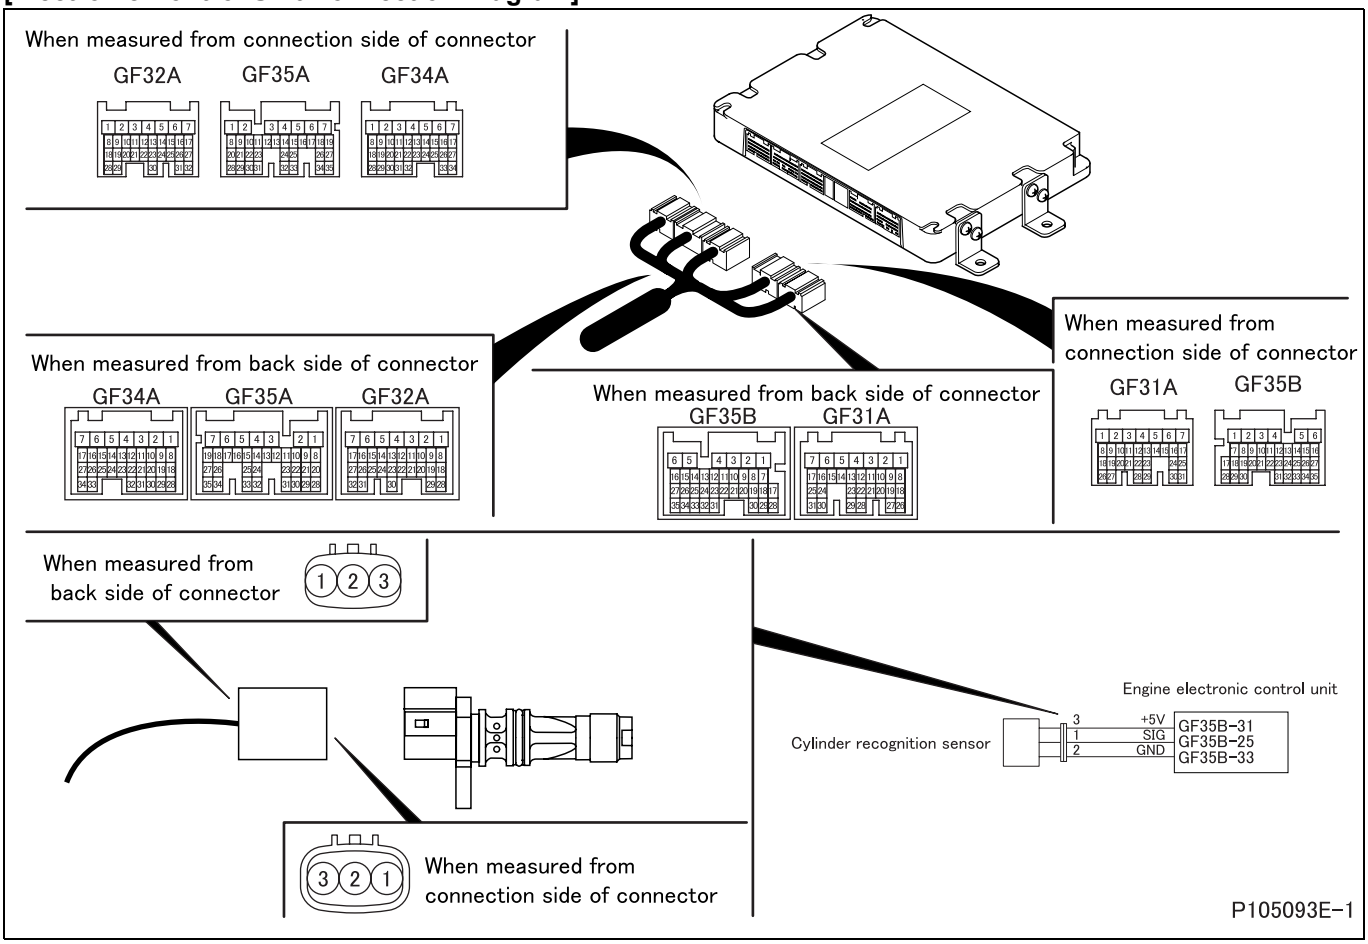
[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>
- Extinguished at 4th driving cycle after normal signal is input.

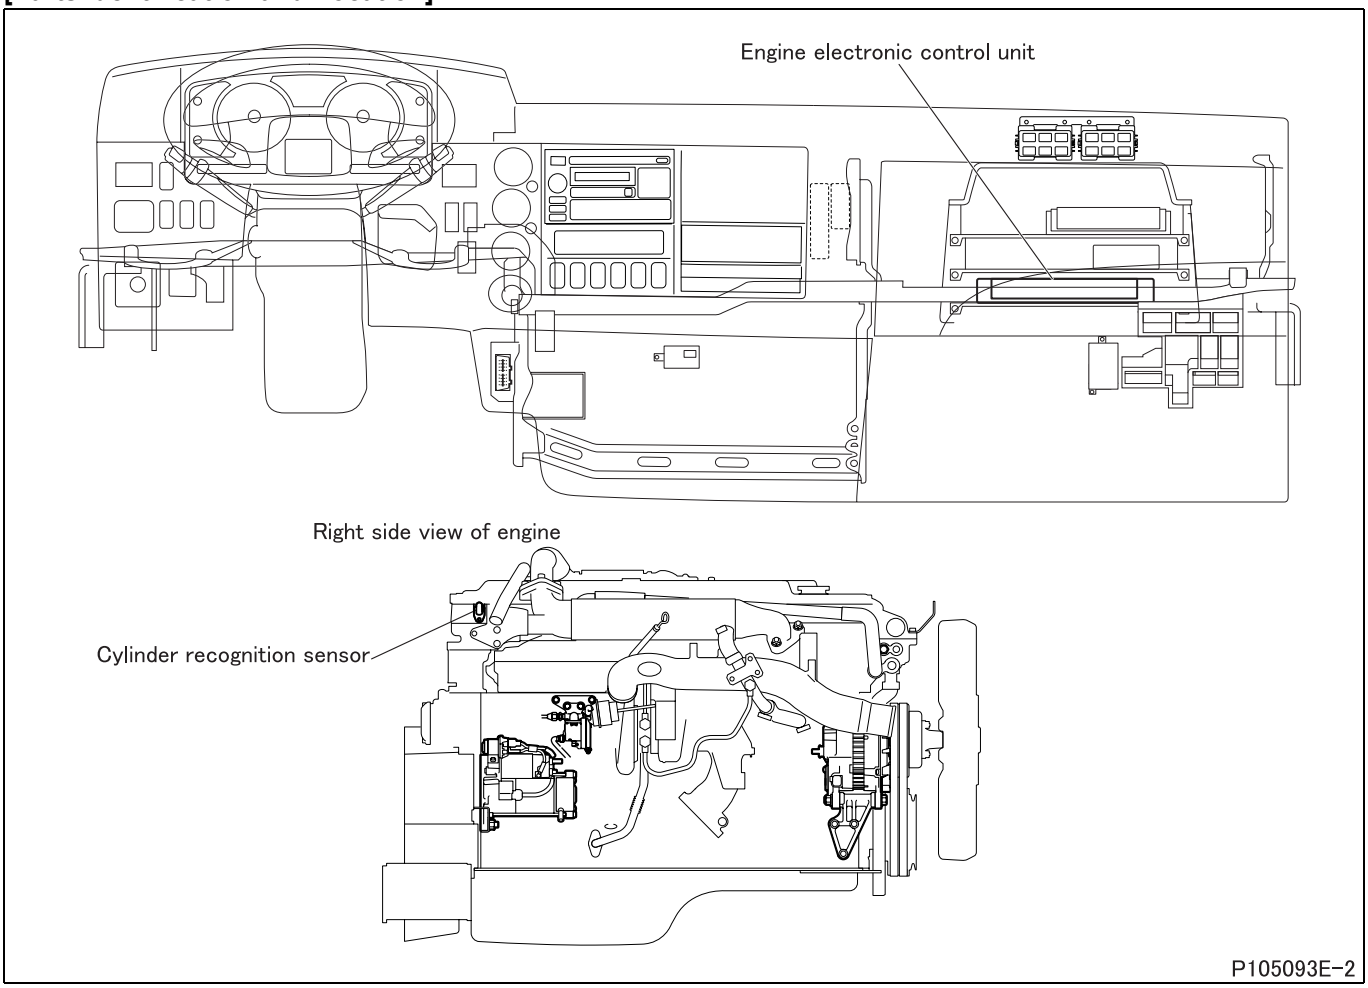
<Fault code>
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished. (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		**<General Scanning Tool used>** • Measure item “Ne”. **<Multi-Use Tester used>** • Measure item No. 01 “Engine Revolution” of Service Data.
	Inspection condition		–
	Requirements		Same indication as tachometer is given.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

Step 2	Inspection items		Inspection by electronic control unit connector (signal)
	Maintenance item		Measure value of voltage between connector (GF35B) terminal No. 25 (+) and 33 (–).
	Inspection condition		• Measure from back side of connector of harness with each device connected to harness. • Starter switch: ON
	Requirements		1 V or more
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Go to step 3.

Step 3	Inspection items		Inspection by electronic control unit connector (power supply)
	Maintenance item		Measure value of voltage between connector (GF35B) terminal No. 31 (+) and 33 (–).
	Inspection condition		• Measure from back side of connector of harness with each device connected to harness. • Starter switch: ON
	Requirements		5 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	Go to step 5.

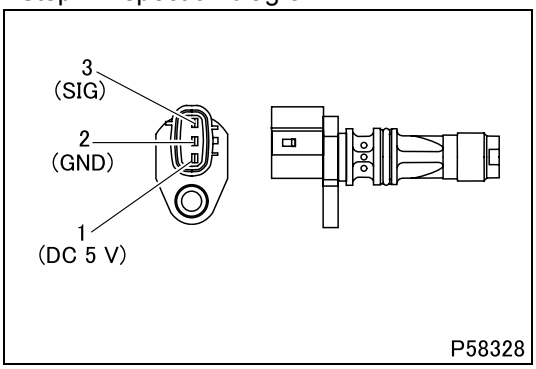
Step 4	Inspection items		Inspection by electronic control unit connector (ground)
	Maintenance item		Measure value of voltage between connector (GF35B) terminal No. 33 (+) and (GF31A) terminal No. 3 (–).
	Inspection condition		• Measure from back side of connector of harness with each device connected to harness. • Starter switch: ON
	Requirements		0 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Go to step 5.

Step 5	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 12.
		NO	Modify connector.

Step 6	Inspection items		Inspection of sensor connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify connector.

Step 7	Inspection items		Inspection of sensor unit
	Maintenance item		Measure value of resistance between connector terminal No. 1 and 2.
	Inspection condition		–
	Requirements		200 to 1800 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Replacement of sensor

<Step 7 inspection diagram>



Step 8	Inspection items		Inspection of harness between electronic control unit and sensor (power supply)
	Maintenance item		Measure value of voltage between sensor connector terminal No. 3 (+) and 2 (–).
	Inspection condition		• Remove connector and measure from harness side. • Starter switch: ON
	Requirements		5 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 10.
		NO	Go to step 9.

Step 9	Inspection items		Inspection of harness between electronic control unit and sensor (power supply)
	Maintenance item		Check circuit between sensor connector terminal No. 3 and electronic control unit connector (GF35B) terminal No. 31.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 12.
		NO	Modify harness.

Step 10	Inspection items		Inspection of harness between electronic control unit and sensor (ground)
	Maintenance item		Check circuit between sensor connector terminal No. 2 and electronic control unit connector (GF35B) terminal No. 33.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 11.
		NO	Modify harness.

Step 11	Inspection items		Inspection of harness between electronic control unit and sensor (signal)
	Maintenance item		Check circuit between sensor connector terminal No. 1 and electronic control unit connector (GF35B) terminal No. 25.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 12.
		NO	Modify harness.

Step 12	Inspection items		Inspection by control data
	Maintenance item		**<General Scanning Tool used>** • Measure item “Ne”. **<Multi-Use Tester used>** • Measure item No. 01 “Engine Revolution” of Service Data.
	Inspection condition		–
	Requirements		Same indication as tachometer is given.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P0344/Flash code: 64
[Monitor]
Abnormality of cylinder recognition sensor
[Fault (outline)]
Abnormal pulse count
[Diagnosis check]
- Output pulses from cylinder recognition sensor during engine operation are counted.

[Code generation condition]
- Number of pulses input from cylinder recognition sensor when engine makes a turn is not normal.
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- Battery voltage: normal
- Engine state: Not in stalled condition (inputs available from cylinder recognition sensor)
- Engine speed

[Control effected by electronic control unit during fault]
- Auto cruise control is stopped.

[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and cylinder recognition sensor
- Abnormality of each connector
- Abnormality of cylinder recognition sensor
- Abnormality in electronic control unit

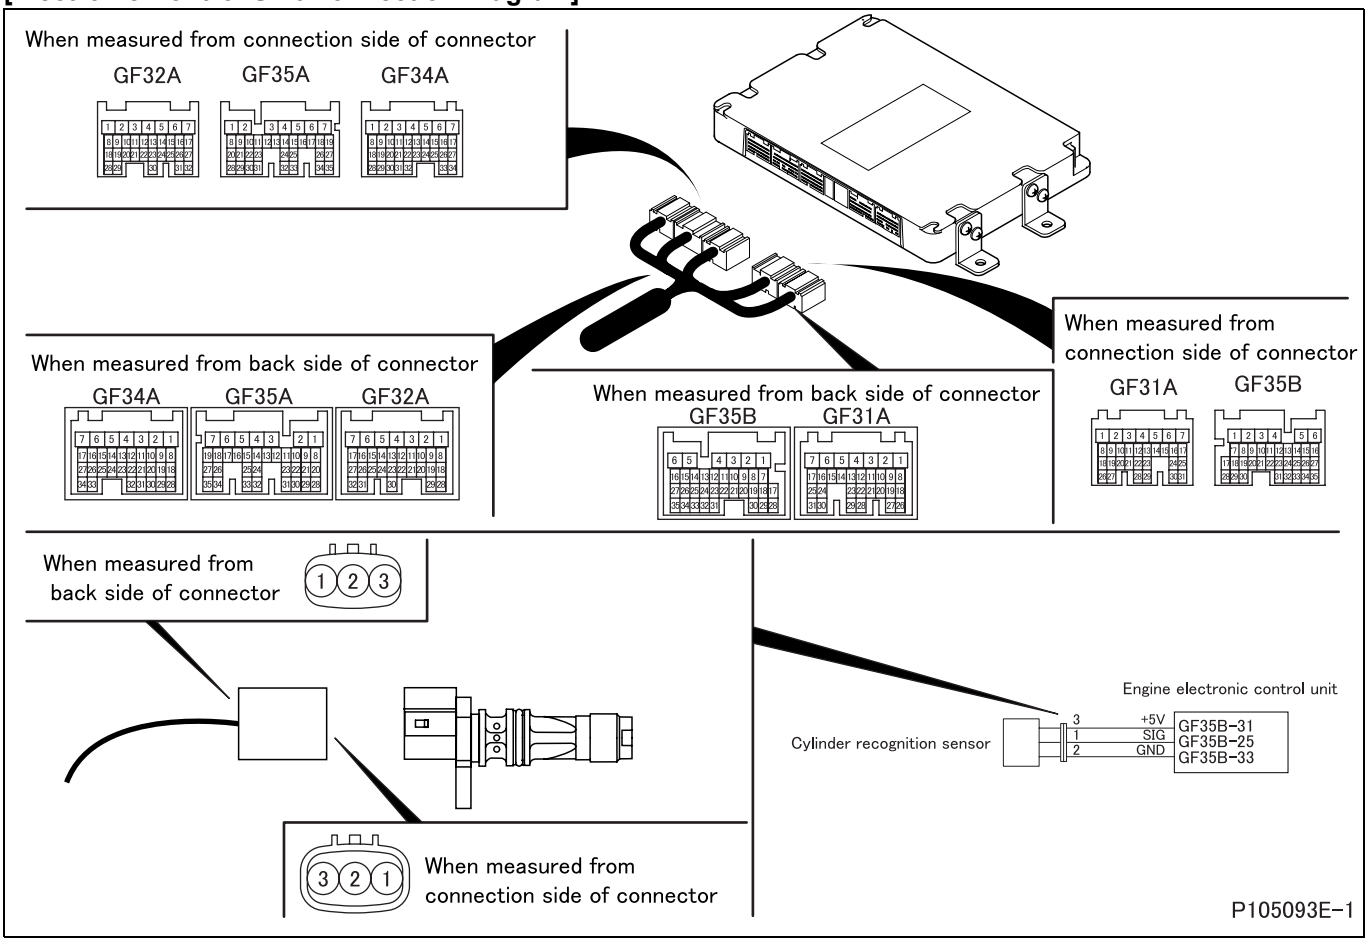
[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>
- Extinguished at 4th driving cycle after normal signal is input.

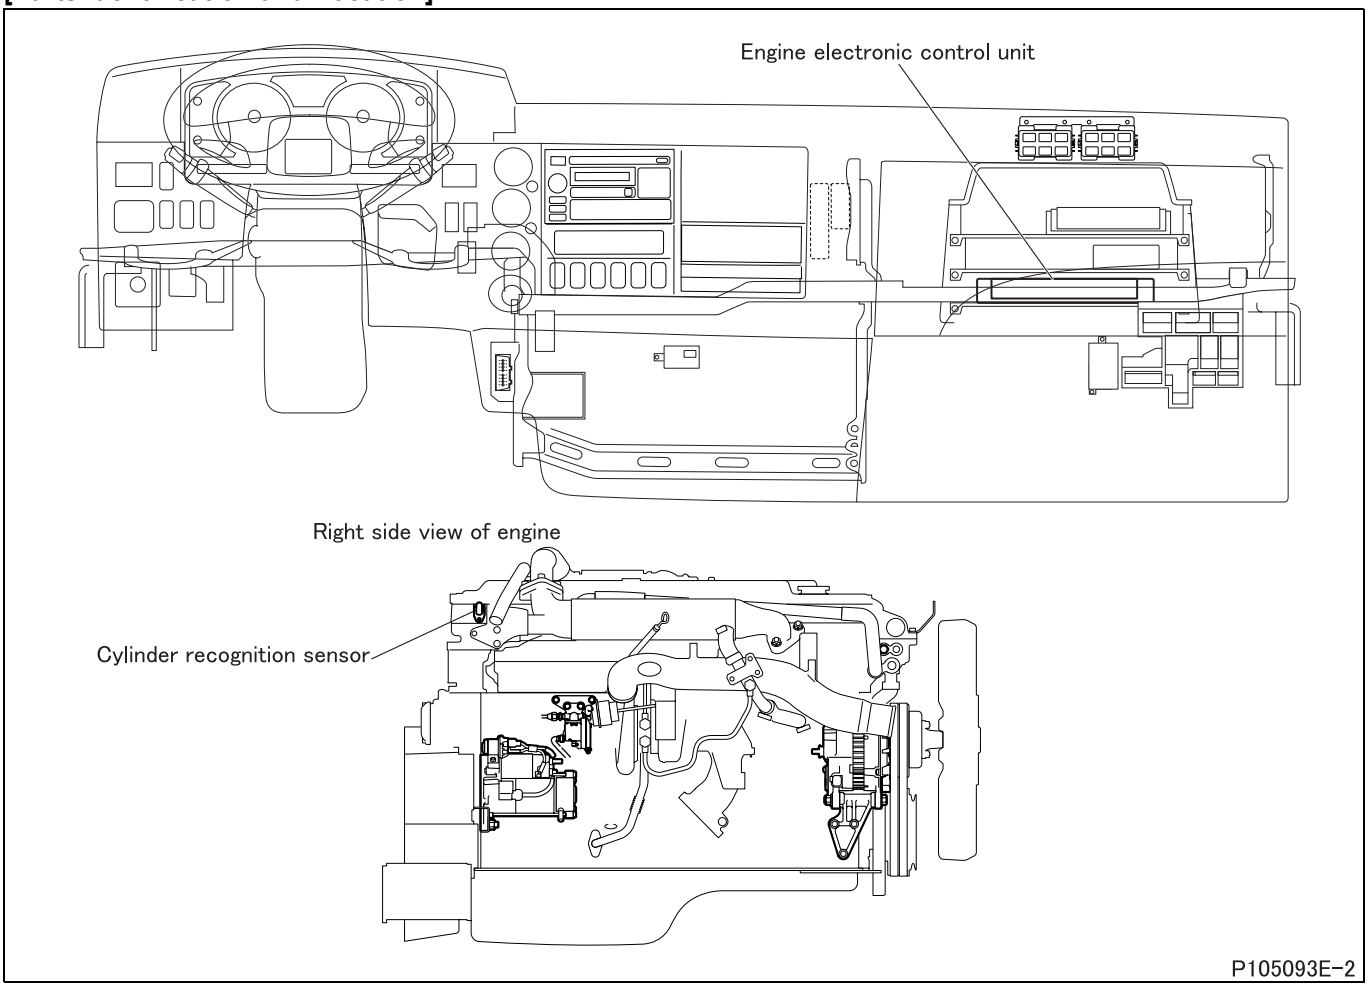
<Fault code>
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished. (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps

Step 1	Inspection items		Inspection by control data
	Maintenance item		**<General Scanning Tool used>** • Measure item “Ne”. **<Multi-Use Tester used>** • Measure item No. 01 “Engine Revolution” of Service Data.
	Inspection condition		–
	Requirements		Same indication as tachometer is given.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

Step 2	Inspection items		Inspection by electronic control unit connector (signal)
	Maintenance item		Measure value of voltage between connector (GF35B) terminal No. 25 (+) and 33 (–).
	Inspection condition		• Measure from back side of connector of harness with each device connected to harness. • Starter switch: ON
	Requirements		1 V or more
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Go to step 3.

Step 3	Inspection items		Inspection by electronic control unit connector (power supply)
	Maintenance item		Measure value of voltage between connector (GF35B) terminal No. 31 (+) and 33 (–).
	Inspection condition		• Measure from back side of connector of harness with each device connected to harness. • Starter switch: ON
	Requirements		5 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	Go to step 5.

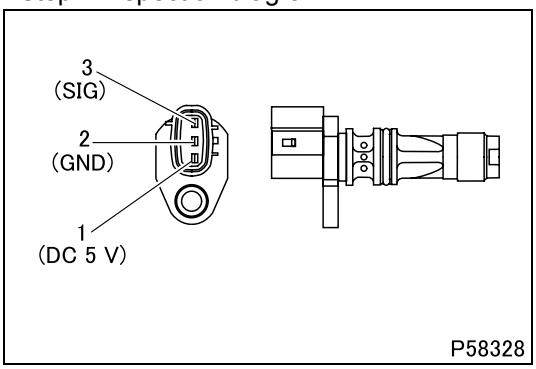
Step 4	Inspection items		Inspection by electronic control unit connector (ground)
	Maintenance item		Measure value of voltage between connector (GF35B) terminal No. 33 (+) and (GF31A) terminal No. 3 (–).
	Inspection condition		• Measure from back side of connector of harness with each device connected to harness. • Starter switch: ON
	Requirements		0 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Go to step 5.

Step 5	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 12.
		NO	Modify connector.

Step 6	Inspection items		Inspection of sensor connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify connector.

Step 7	Inspection items		Inspection of sensor unit
	Maintenance item		Measure value of resistance between connector terminal No. 1 and 2.
	Inspection condition		–
	Requirements		200 to 1800 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Replacement of sensor

<Step 7 inspection diagram>



Step 8	Inspection items		Inspection of harness between electronic control unit and sensor (power supply)
	Maintenance item		Measure value of voltage between sensor connector terminal No. 3 (+) and 2 (–).
	Inspection condition		• Remove connector and measure from harness side. • Starter switch: ON
	Requirements		5 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 10.
		NO	Go to step 9.

Step 9	Inspection items		Inspection of harness between electronic control unit and sensor (power supply)
	Maintenance item		Check circuit between sensor connector terminal No. 3 and electronic control unit connector (GF35B) terminal No. 31.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 12.
		NO	Modify harness.

Step 10	Inspection items		Inspection of harness between electronic control unit and sensor (ground)
	Maintenance item		Check circuit between sensor connector terminal No. 2 and electronic control unit connector (GF35B) terminal No. 33.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 11.
		NO	Modify harness.

Step 11	Inspection items		Inspection of harness between electronic control unit and sensor (signal)
	Maintenance item		Check circuit between sensor connector terminal No. 1 and electronic control unit connector (GF35B) terminal No. 25.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 12.
		NO	Modify harness.

Step 12	Inspection items		Inspection by control data
	Maintenance item		**<General Scanning Tool used>** • Measure item “Ne”. **<Multi-Use Tester used>** • Measure item No. 01 “Engine Revolution” of Service Data.
	Inspection condition		–
	Requirements		Same indication as tachometer is given.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P0383/Flash code: 26
[Monitor]
Abnormality of glow drive relay
[Fault (outline)]
Short circuit ground
[Diagnosis check]
- Glow drive relay circuit is monitored for fault.

[Code generation condition]
- Glow drive relay circuit remains shorted to ground or open as detected for approx. 1 second.
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal
- Glow drive relay: active

[Control effected by electronic control unit during fault]
- Glow drive relay is inactivated.

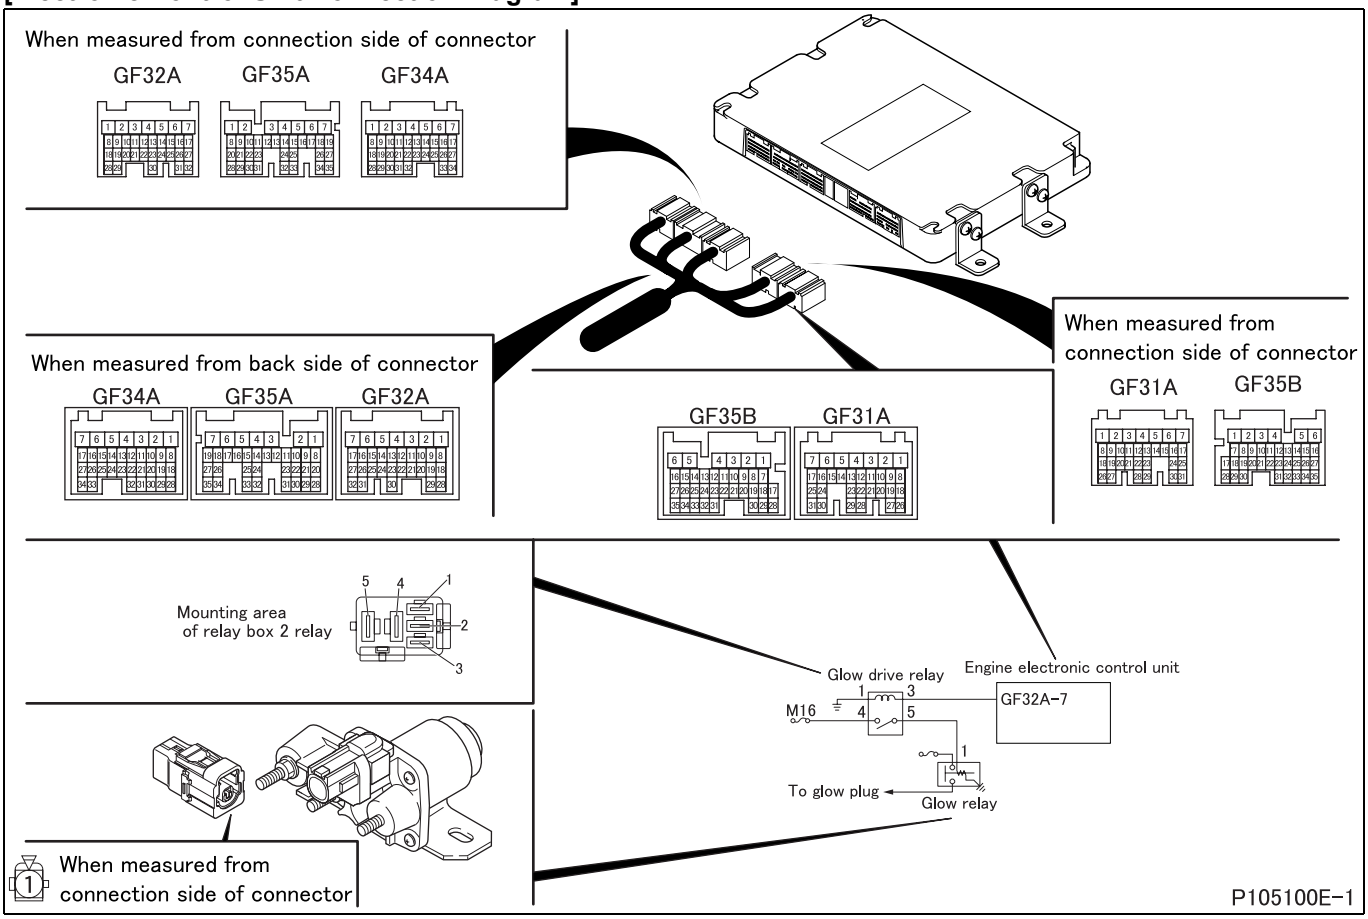
[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and glow drive relay
- Abnormality of each connector
- Abnormality of glow drive relay
- Abnormality in electronic control unit

[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

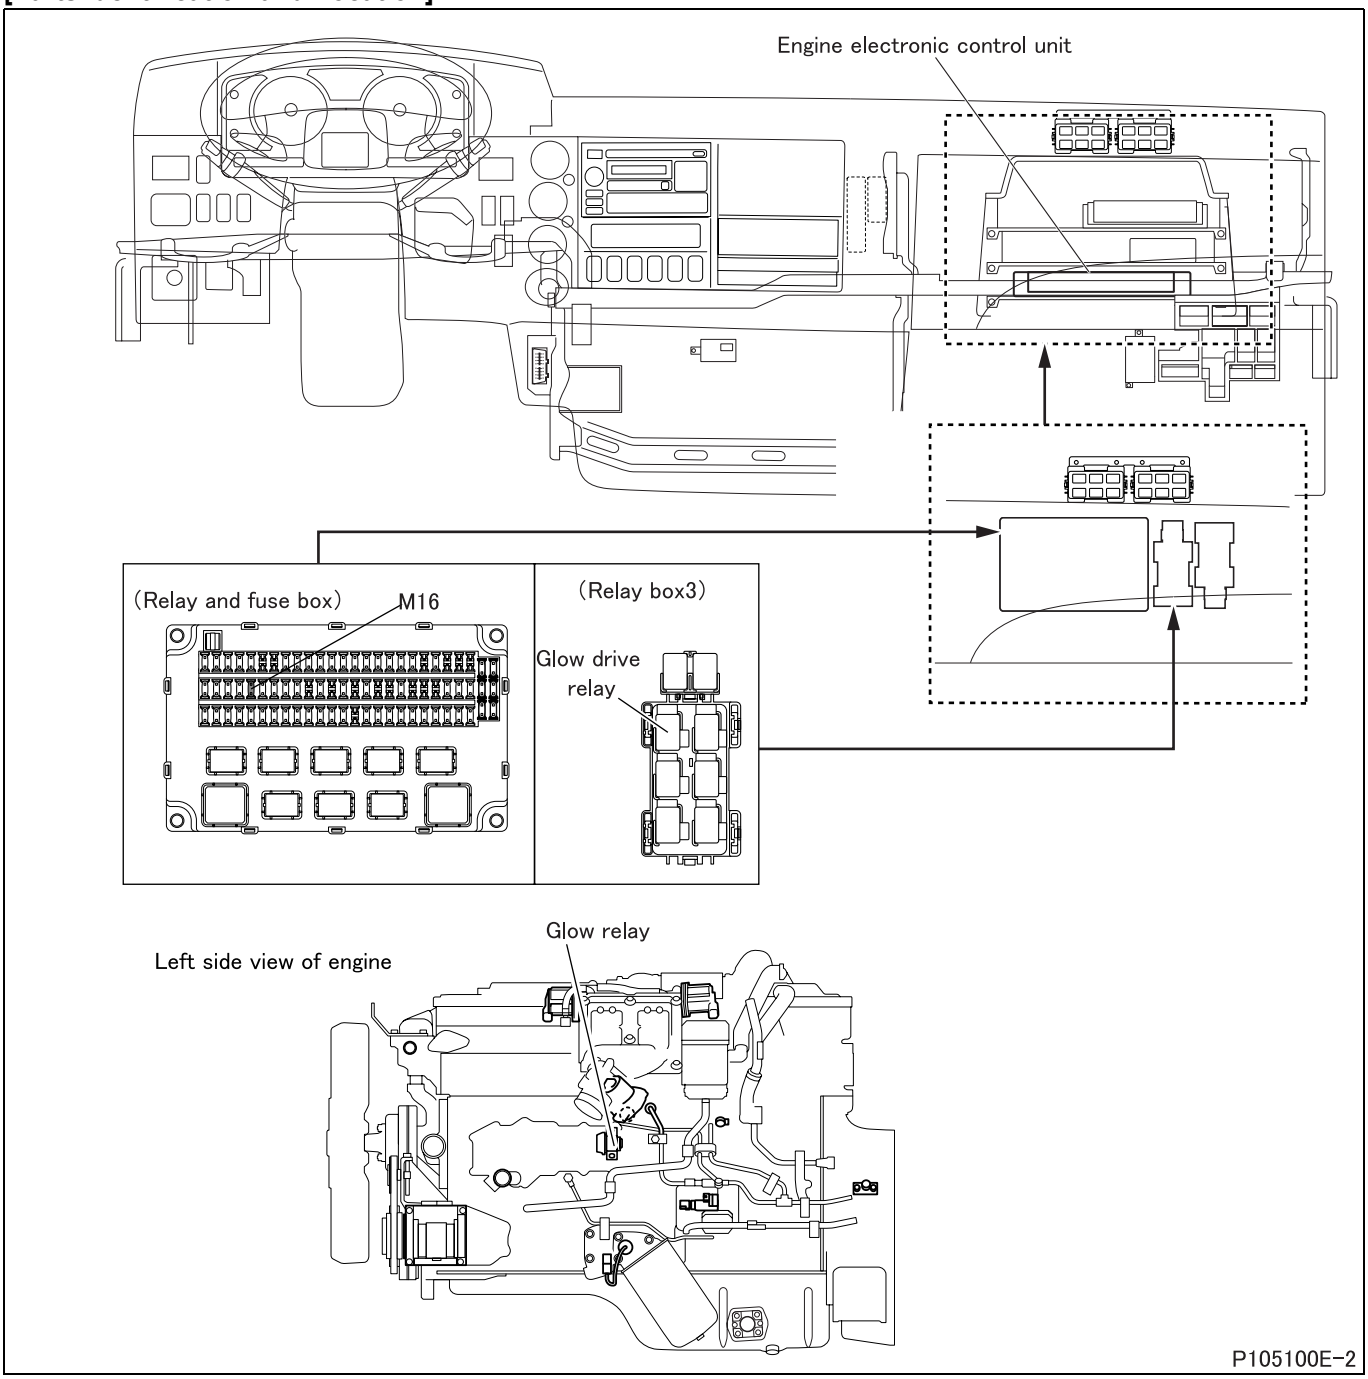
<Fault code>
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished. (To clear as desired, erase from the memory.)

Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

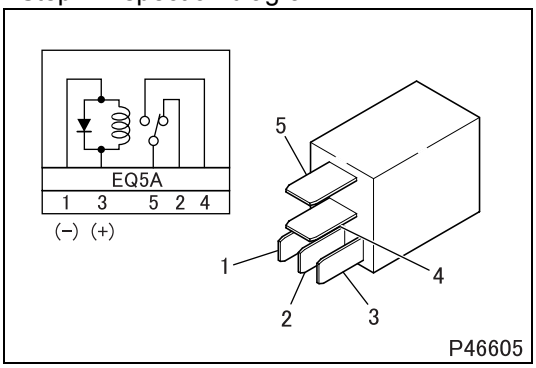
Step 1	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. AF “Relay for Glow Relay”.
	Inspection condition		–
	Requirements		Relay operation sound is noted (automatically reset after 6 seconds), or ON/OFF switching of Service Data: item No. 8D “Glow Relay” is effected.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

Step 2	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Modify connector.

Step 3	Inspection items		Inspection of relay connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	Modify connector.

Step 4	Inspection items		Inspection of relay unit
	Maintenance item		Measure continuity between terminals No. 4 and 5 when relay operates.
	Inspection condition		Apply battery voltage across terminals No. 3 (+) and 1 (–).
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Replacement of relay

<Step 4 inspection diagram>



Step 5	Inspection items		Inspection of harness between relay and electronic control unit (power supply)
	Maintenance item		Check circuit between relay connector terminal No. 3 and electronic control unit connector (GF32A) terminal No. 7.
	Inspection condition		Disconnect electronic control unit from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Modify harness.

Step 6	Inspection items		Inspection of harness between relay and electronic control unit (ground)
	Maintenance item		Check circuit between relay connector terminal No. 1 and cab ground.
	Inspection condition		Disconnect electronic control unit from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify harness.

Step 7	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. AF “Relay for Glow Relay”.
	Inspection condition		–
	Requirements		Relay operation sound is noted (automatically reset after 6 seconds), or ON/OFF switching of Service Data: item No. 8D “Glow Relay” is effected.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P0384/Flash code: 26
[Monitor]
Abnormality of glow drive relay
[Fault (outline)]
Short circuit battery
[Diagnosis check]
- Glow drive relay circuit is monitored for fault.

[Code generation condition]
- Glow drive relay circuit remains shorted to battery as detected for approx. 1 second.
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal
- Glow drive relay: inactive

[Control effected by electronic control unit during fault]
- Preheating control is stopped.
- Glow drive relay control is stopped.

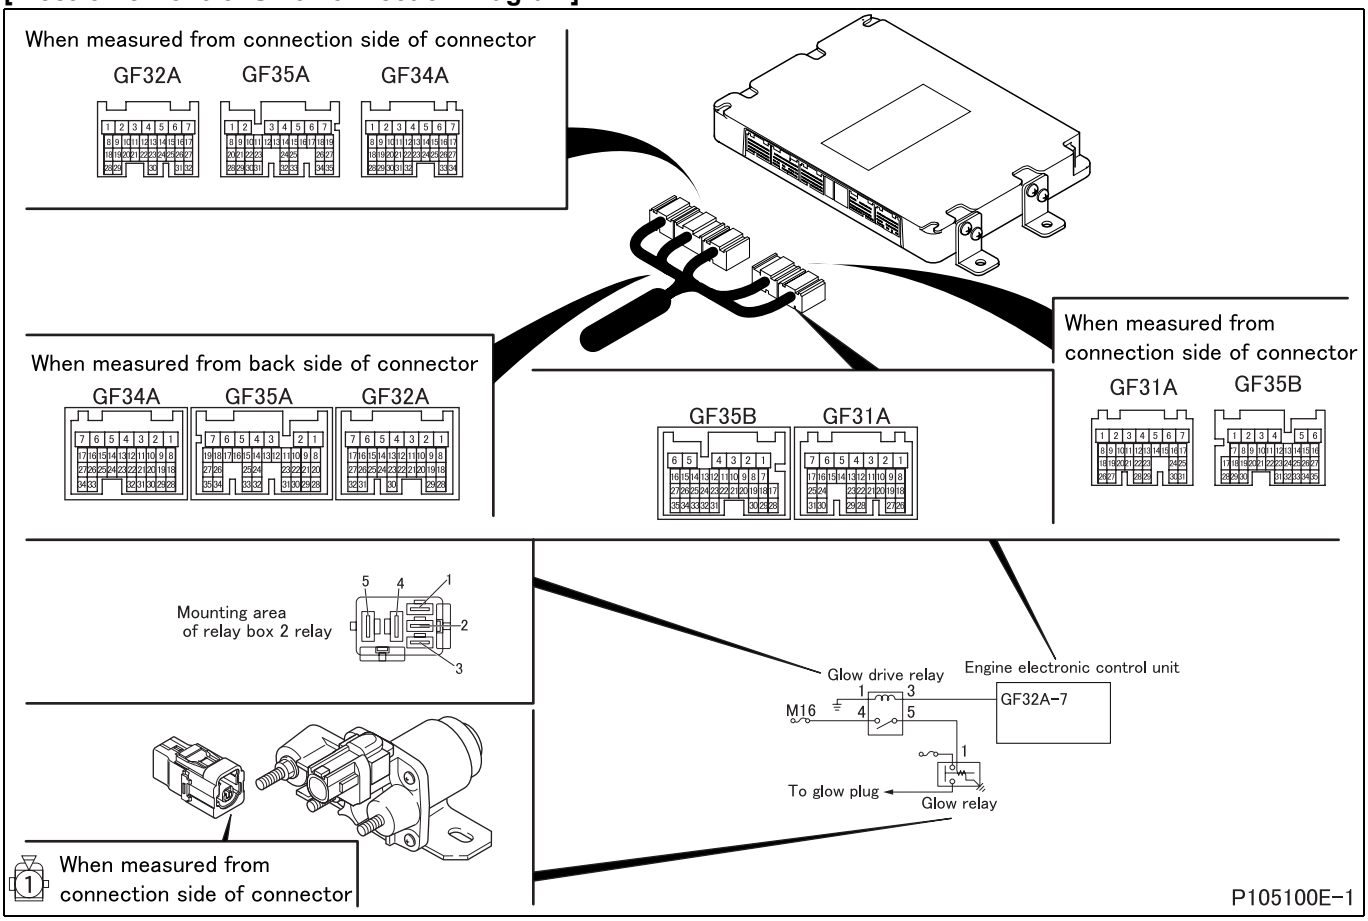
[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and glow drive relay
- Abnormality of each connector
- Abnormality of glow drive relay
- Abnormality in electronic control unit

[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

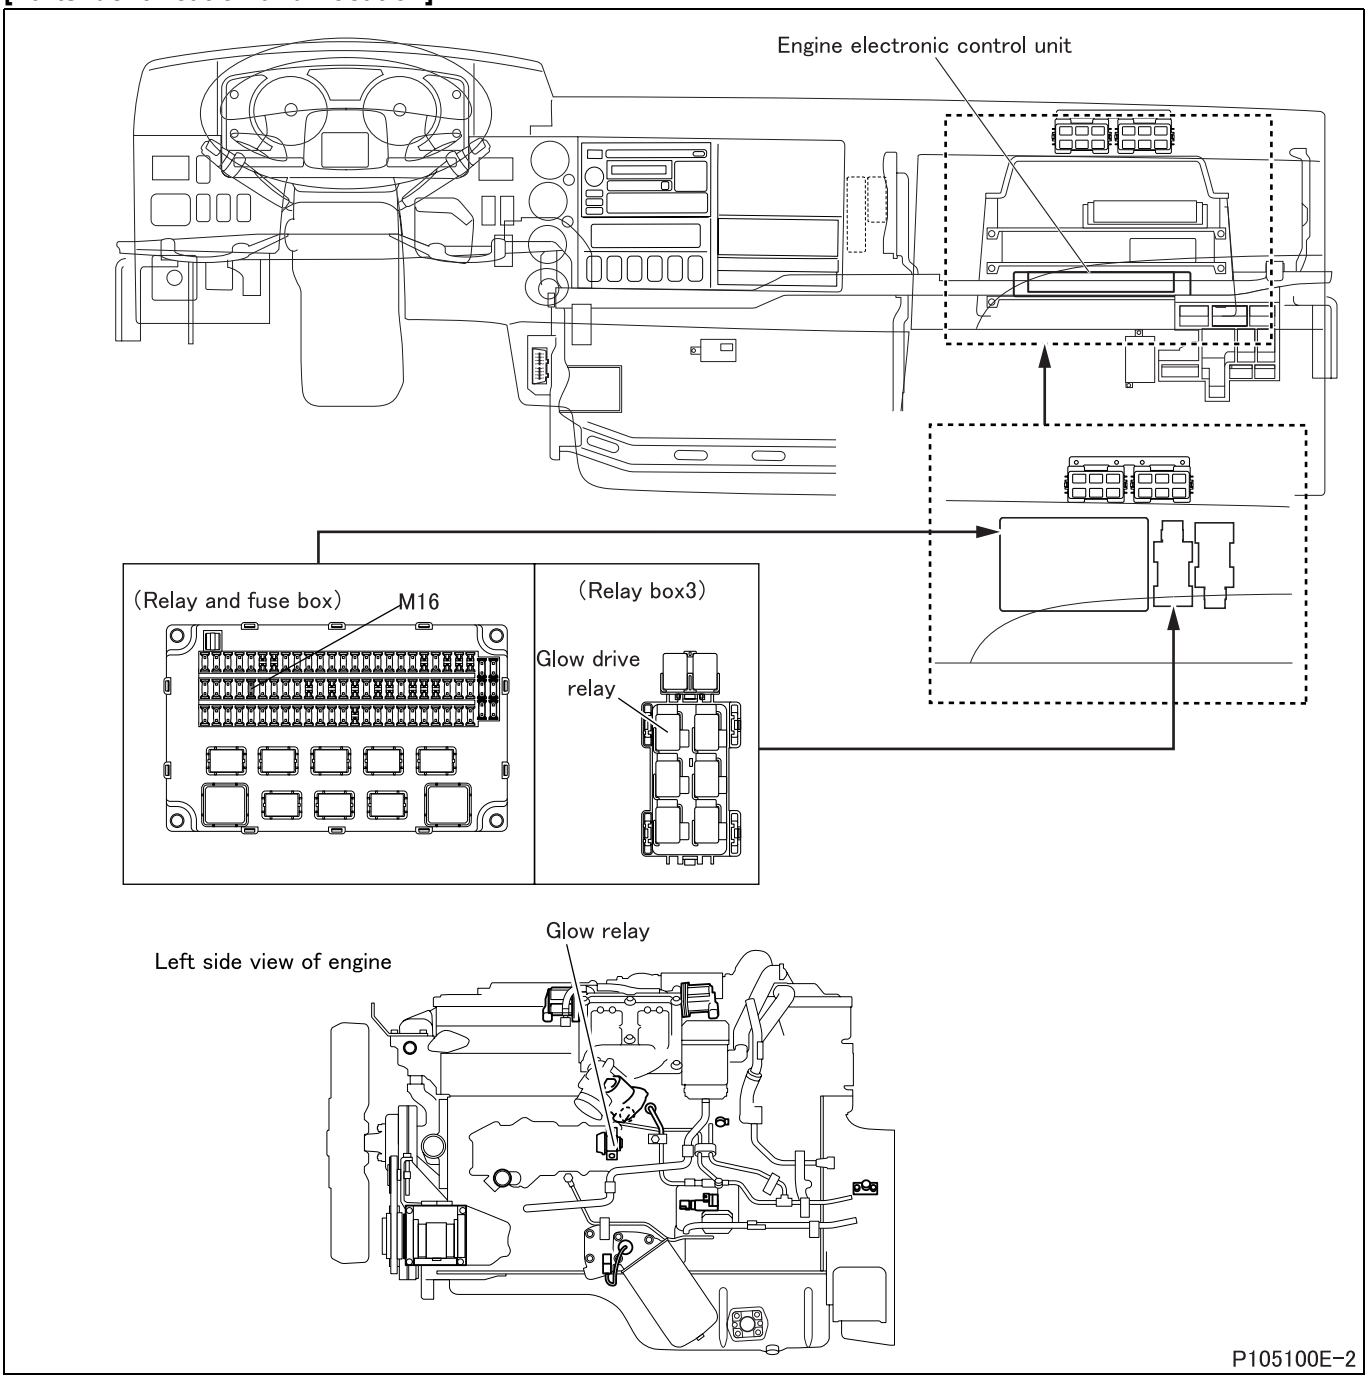
<Fault code>
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished. (To clear as desired, erase from the memory.)

Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

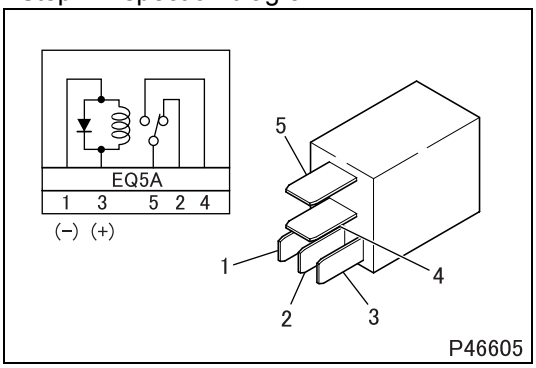
Step 1	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. AF “Relay for Glow Relay”.
	Inspection condition		–
	Requirements		Relay operation sound is noted (automatically reset after 6 seconds), or ON/OFF switching of Service Data: item No. 8D “Glow Relay” is effected.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

Step 2	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Modify connector.

Step 3	Inspection items		Inspection of relay connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	Modify connector.

Step 4	Inspection items		Inspection of relay unit
	Maintenance item		Measure continuity between terminals No. 4 and 5 when relay operates.
	Inspection condition		Apply battery voltage across terminals No. 3 (+) and 1 (–).
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Replacement of relay

<Step 4 inspection diagram>



Step 5	Inspection items		Inspection of harness between relay and electronic control unit (power supply)
	Maintenance item		Check circuit between relay connector terminal No. 3 and electronic control unit connector (GF32A) terminal No. 7.
	Inspection condition		Disconnect electronic control unit from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Modify harness.

Step 6	Inspection items		Inspection of harness between relay and electronic control unit (ground)
	Maintenance item		Check circuit between relay connector terminal No. 1 and cab ground.
	Inspection condition		Disconnect electronic control unit from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify harness.

Step 7	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. AF “Relay for Glow Relay”.
	Inspection condition		–
	Requirements		Relay operation sound is noted (automatically reset after 6 seconds), or ON/OFF switching of Service Data: item No. 8D “Glow Relay” is effected.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P0401/Flash code: 02
[Monitor]
Exhaust gas recirculation system (insufficient flow rate of exhaust gas recirculation gas)
[Fault (outline)]
Insufficient exhaust gas recirculation flow
[Diagnosis check]
Either of the following is monitored. (Warning lamp is lit and diagnosis code is displayed on second establishment of code generation condition.)
<Condition (1)>
- Excess air rate (λ) is calculated to determine whether exhaust gas recirculation gas flow rate is correct or not.

<Condition (2)>
- Insufficient flow rate of exhaust gas recirculation gas is calculated based on inputs from air flow, boost pressure and engine speed sensors.

[Code generation condition]
Either of the following is judged.
<Condition (1)>
- Difference between target λ value and computed λ value remains less than specified for 30 seconds.

<Condition (2)>
- Computed exhaust gas recirculation flow rate remains below specified value for 30 seconds.

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
<Condition (1)>
- Exhaust gas recirculation control status: closed loop
- Engine control map: normal
- Exhaust gas recirculation electronic drive unit: normal in output signal
- Air flow sensor: normal in output signal
- Boost pressure sensor: normal in output signal
- Check of boost temperature sensor: normal
- Atmospheric pressure sensor: normal in output signal
- Intake air temperature sensor 2: normal in output signal
- Intake air temperature sensor 1: normal in output signal
- Check of exhaust gas recirculation temperature: normal
- When prerequisites for exhaust gas recirculation control are all satisfied

<Condition (2)>
- Atmospheric temperature sensor: more than –30°C {–22°F} to 50°C {122°F}
- Atmospheric pressure: more than 85 kPa {12 psi, 0.9 kgf/cm^2} (at 1500 m {5000 ft})
- Water temperature: more than 70°C {158°F}
- Diesel particulate filter regeneration control: not effected
- Exhaust shutter: not controlled
- Exhaust gas recirculation electronic drive unit: normal
- Air flow sensor: normal in output signal
- Boost pressure sensor: normal in output signal
- Check of boost temperature sensor: normal
- Atmospheric pressure sensor: normal in output signal
- Intake air temperature sensor 2: normal in output signal
- Intake air temperature sensor 1: normal in output signal
- Check of exhaust gas recirculation temperature: normal
- When prerequisites for exhaust gas recirculation control are all satisfied

[Control effected by electronic control unit during fault]
- Effects no special control.

[Probable cause of trouble]

- Exhaust gas recirculation valve stuck (remains fully closed)
- Clogging of exhaust gas recirculation pipe and hose
- Exhaust gas recirculation cooler clogged

[Recoverability]

<Control during fault>

- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>

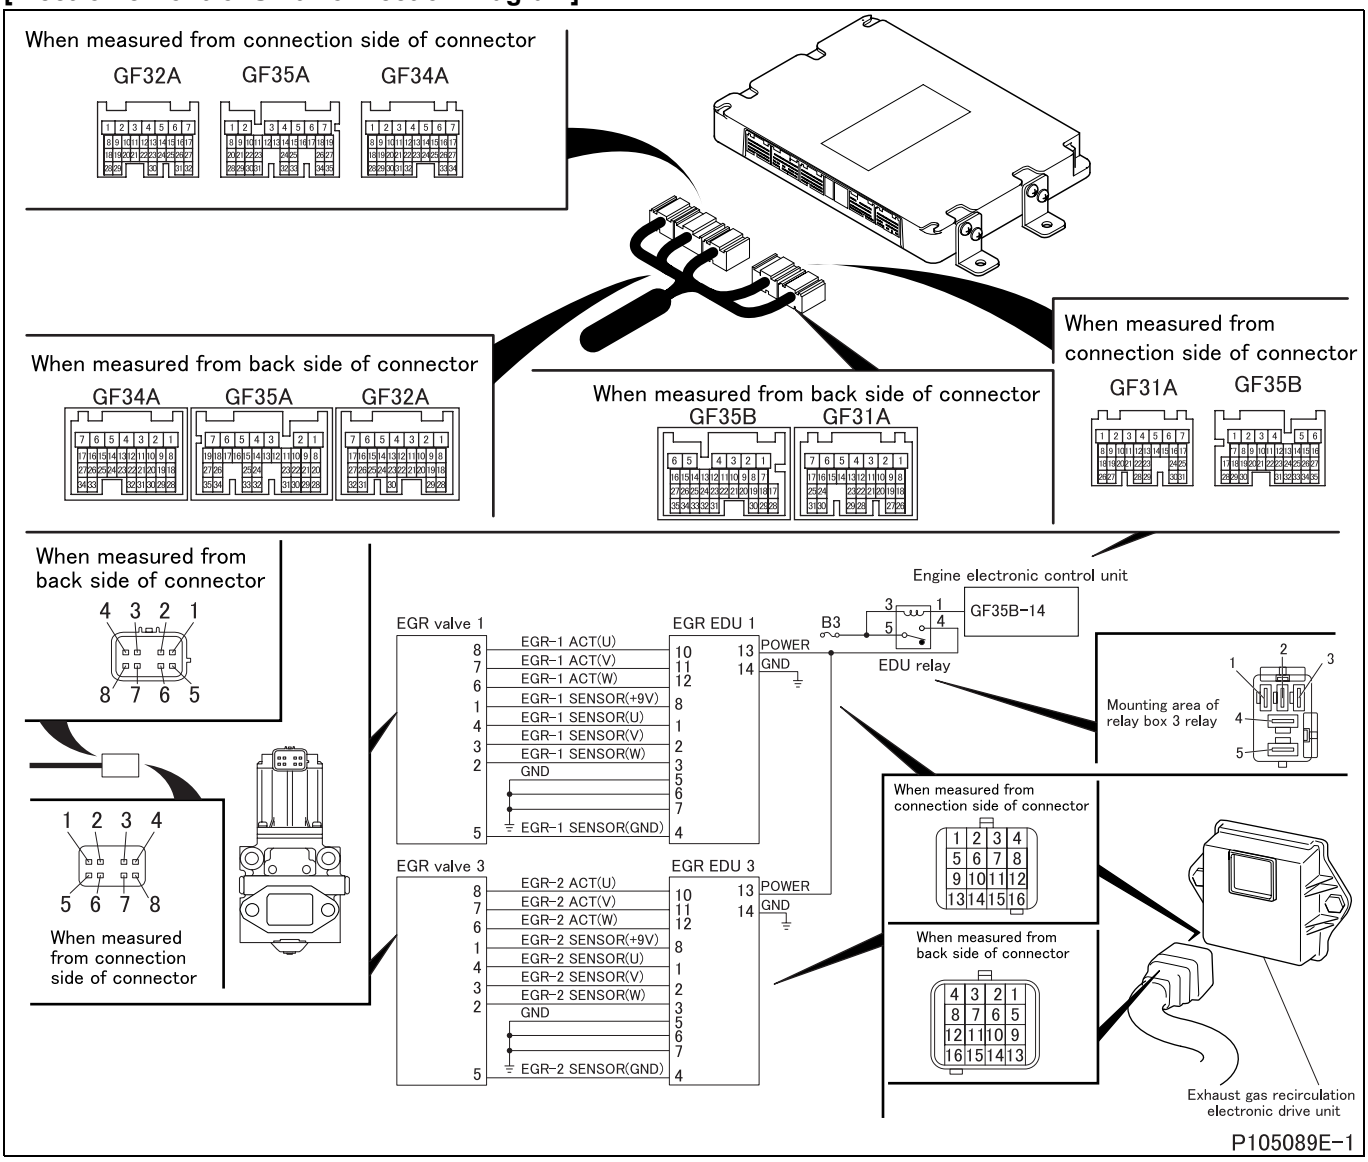
- Extinguished at 4th driving cycle after normal signal is input.

<Fault code>

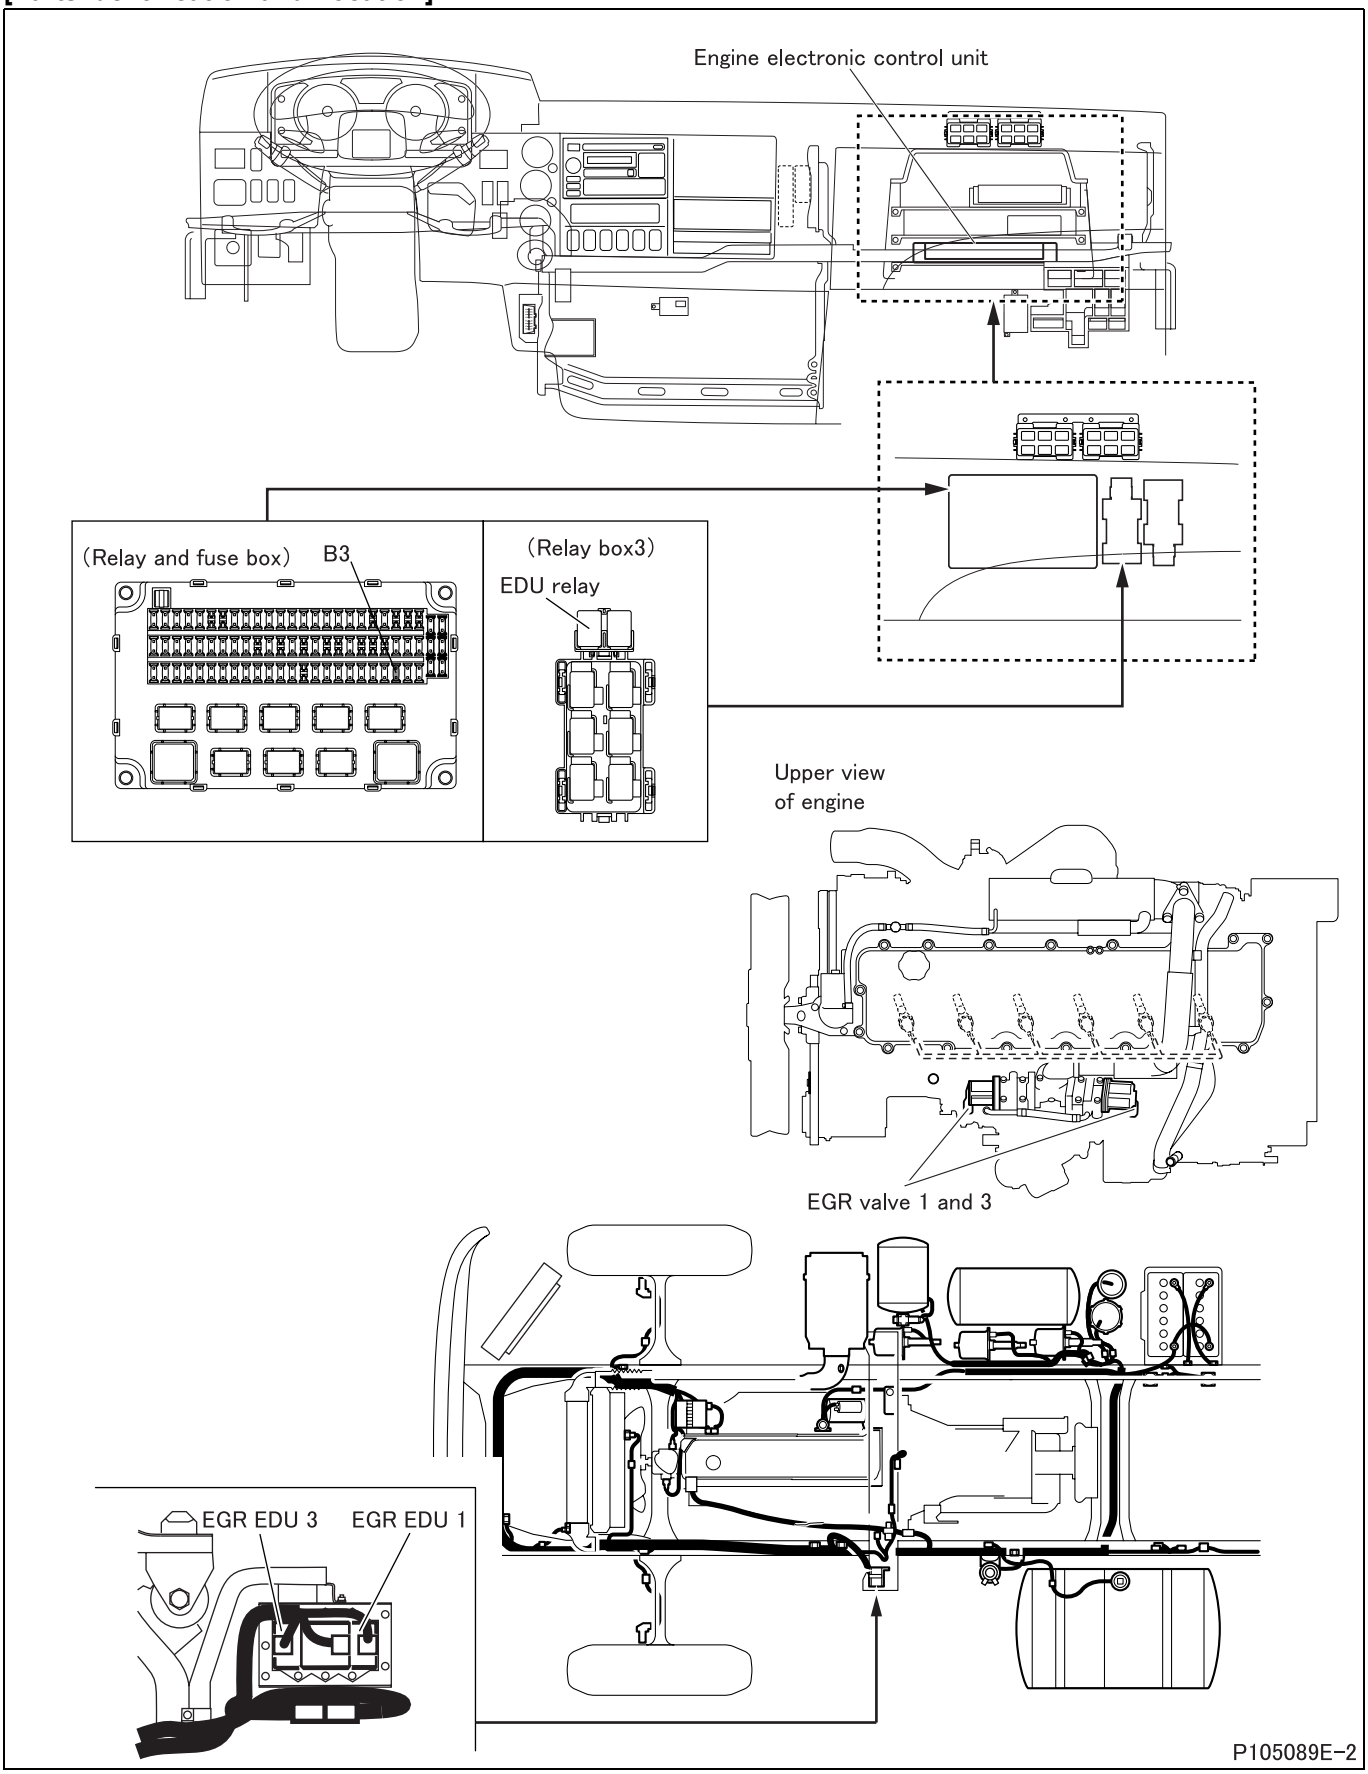
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished. (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following step.

Step 1	Inspection items		Inspection by control data
	Maintenance item		Check if following diagnosis codes occur simultaneously. • P0402 “EGR Flow (Excessive)” • P0403 “EGR1 (Actuator Circuit)” • P0404 “EGR System” • P0409 “EGR1 (Position Sensor)” • P0562 “Power Supply Voltage (Low)” • P0563 “Power Supply Voltage (High)” • P0600 “CAN Communication” • P0604 “ECU Hardware (RAM)” • P0605 “ECU System (Hardware)” • P0606 “ECU Hardware (Main CPU)” • P0607 “ECU System” • P062F “ECU System (EEPROM)” • P0685 “EDU Relay (Open)” • P0686 “EDU Relay (Low)” • P0687 “EDU Relay (High)” • P0688 “EDU Relay (Over Load)”
	Inspection condition		• Starter switch: ON • Do not start engine.
	Requirements		Codes occur.
	Inspection result (Is the judging standard satisfied?)	YES	Inspect diagnosis code that is occurring.
		NO	Inspection of exhaust gas recirculation system (exhaust gas recirculation pipe, exhaust gas recirculation cooler, exhaust gas recirculation valve)

[Fault code]
Diagnosis code: P0402/Flash code: 02
[Monitor]
Exhaust gas recirculation system (excessive flow rate of exhaust gas recirculation gas)
[Fault (outline)]
Excessive exhaust gas recirculation flow
[Diagnosis check]
Either of the following is monitored.
<Condition (1)>
• Excess air rate (λ) is calculated to determine whether exhaust gas recirculation gas flow rate is correct or not.
<Condition (2)>
• Excessive flow rate of exhaust gas recirculation gas is calculated based on inputs from air flow, boost pressure and engine speed sensors.
[Code generation condition]
Either of the following is judged. (Warning lamp is lit and diagnosis code is displayed on second establishment of code generation condition.)
<Condition (1)>
• Difference between target λ value and computed λ value remains more than specified for 30 seconds.
<Condition (2)>
• Computed exhaust gas recirculation flow rate remains more than specified value for 30 seconds.
[Diagnosis check timing]
• When code generation condition is established after starter switch ON
[Diagnostic requirement]
<Condition (1)>
• Exhaust gas recirculation control status: closed loop
• Engine control map: normal
• Exhaust gas recirculation electronic drive unit: normal in output signal
• Air flow sensor: normal in output signal
• Boost pressure sensor: normal in output signal
• Check of boost temperature sensor: normal
• Atmospheric pressure sensor: normal in output signal
• Intake air temperature sensor 2: normal in output signal
• Intake air temperature sensor 1: normal in output signal
• Check of exhaust gas recirculation temperature: normal
• When prerequisites for exhaust gas recirculation control are all satisfied
<Condition (2)>
• Atmospheric temperature sensor: more than –30°C {–22°F} to 50°C {122°F}
• Atmospheric pressure: more than 85 kPa {12 psi, 0.9 kgf/cm^2} (at 1500 m {5000 ft})
• Water temperature: more than 70°C {158°F}
• Diesel particulate filter regeneration control: not effected
• Exhaust shutter: not controlled
• Exhaust gas recirculation electronic drive unit: normal
• Air flow sensor: normal in output signal
• Boost pressure sensor: normal in output signal
• Check of boost temperature sensor: normal
• Atmospheric pressure sensor: normal in output signal
• Intake air temperature sensor 2: normal in output signal
• Intake air temperature sensor 1: normal in output signal
• Check of exhaust gas recirculation temperature: normal
• When prerequisites for exhaust gas recirculation control are all satisfied
[Control effected by electronic control unit during fault]
• Effects no special control.

[Probable cause of trouble]

- Exhaust gas recirculation valve stuck (remains fully open)
- Damage of exhaust gas recirculation pipe and hose
- Damage of exhaust gas recirculation cooler

[Recoverability]

<Control during fault>

- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>

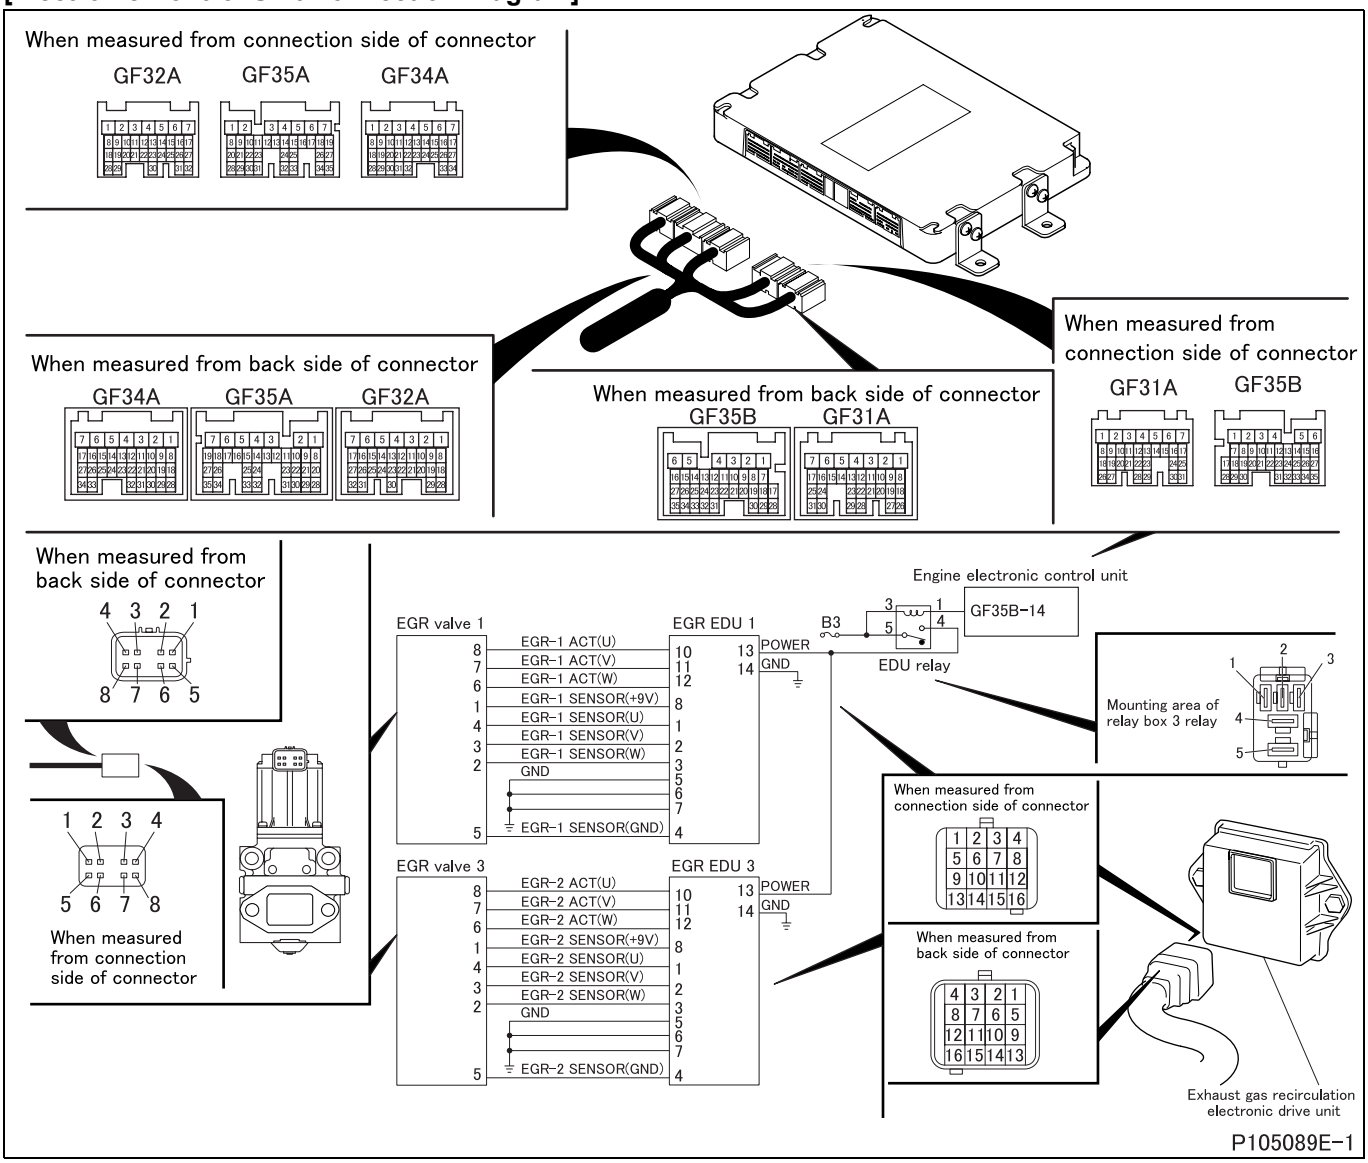
- Extinguished at 4th driving cycle after normal signal is input.

<Fault code>

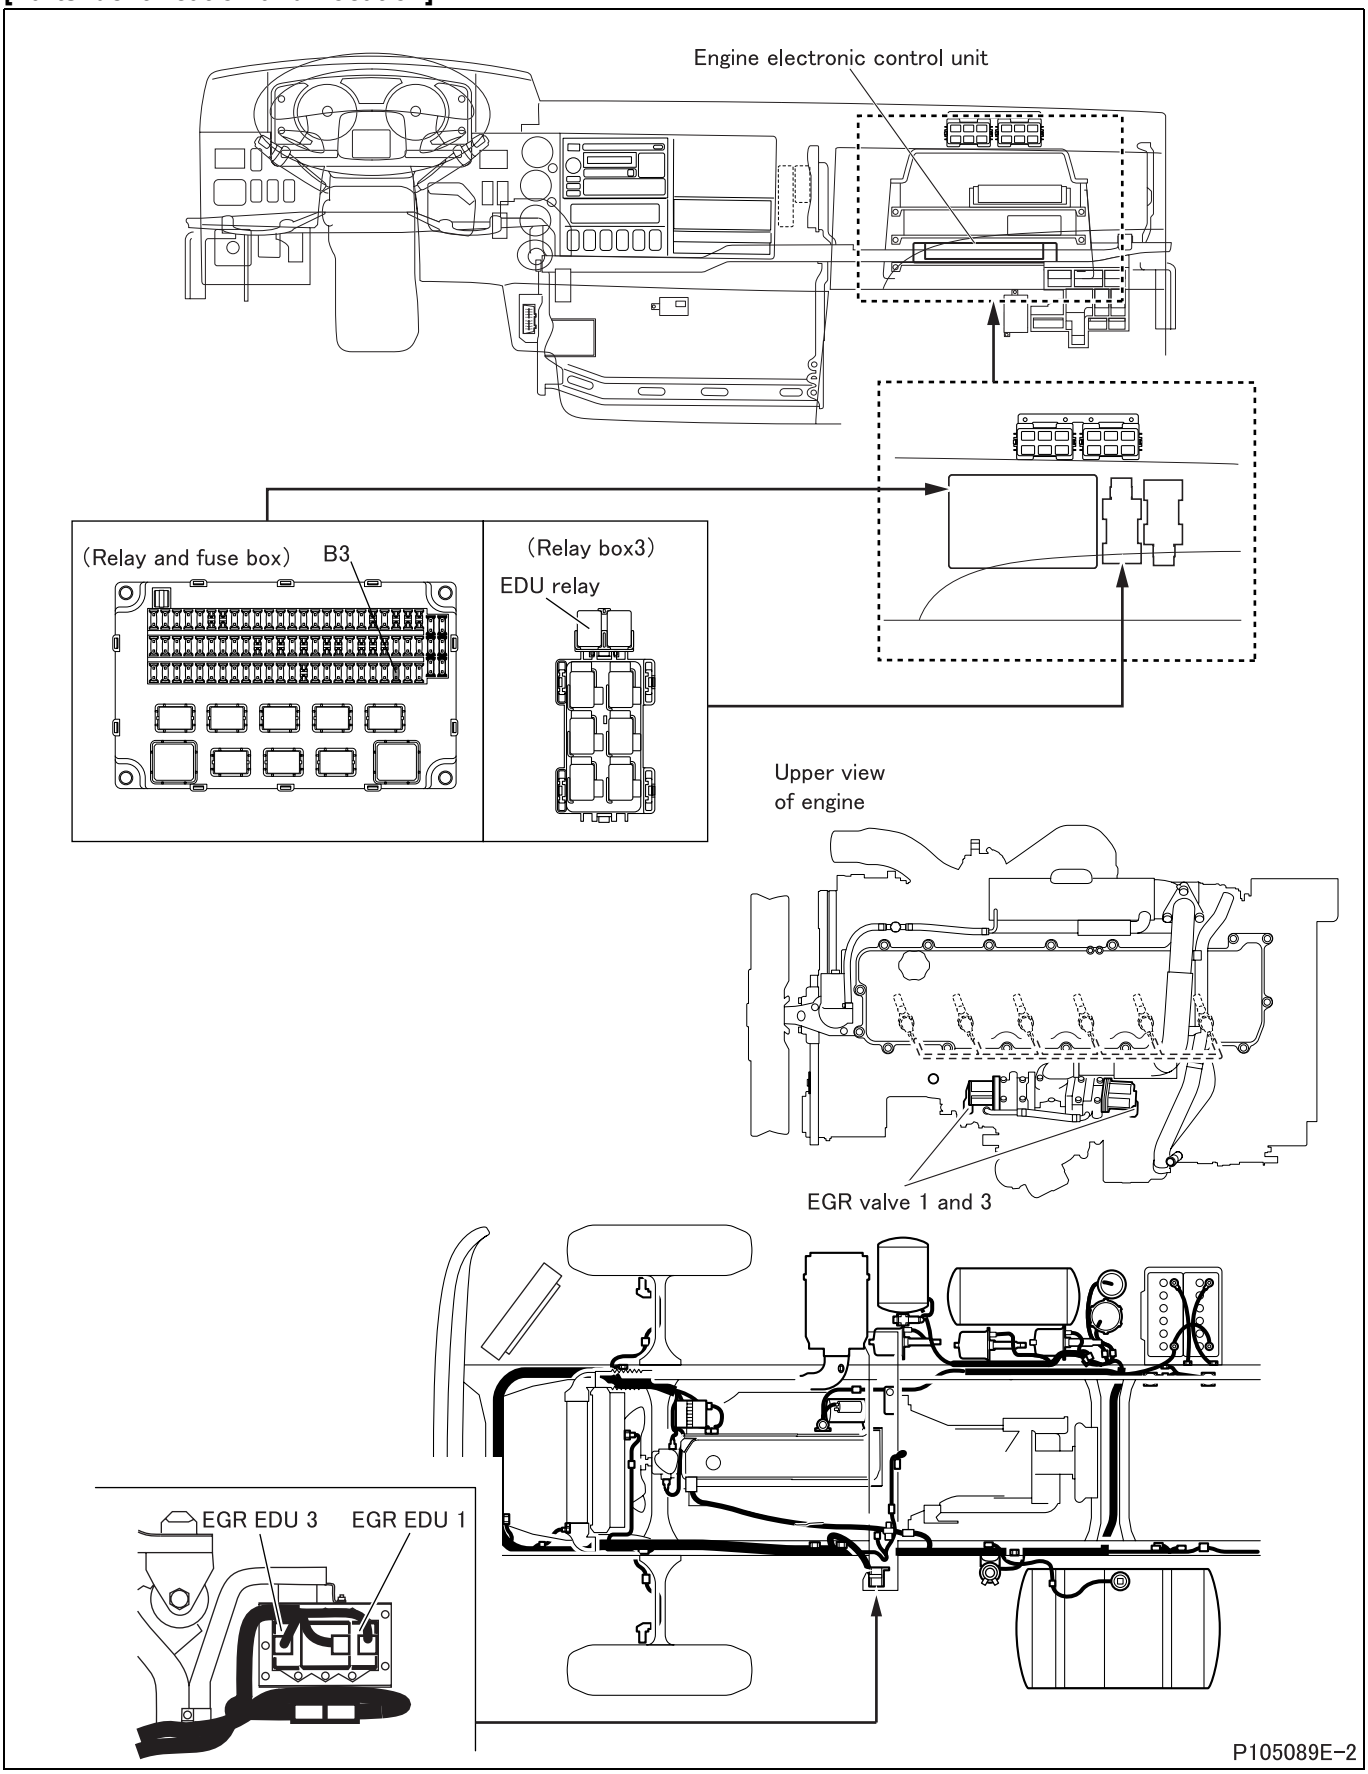
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished. (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following step.

Step 1	Inspection items		Inspection by control data
	Maintenance item		Check if following diagnosis codes occur simultaneously. • P0402 “EGR Flow (Excessive)” • P0403 “EGR1 (Actuator Circuit)” • P0404 “EGR System” • P0409 “EGR1 (Position Sensor)” • P0562 “Power Supply Voltage (Low)” • P0563 “Power Supply Voltage (High)” • P0600 “CAN Communication” • P0604 “ECU Hardware (RAM)” • P0605 “ECU System (Hardware)” • P0606 “ECU Hardware (Main CPU)” • P0607 “ECU System” • P062F “ECU System (EEPROM)” • P0685 “EDU Relay (Open)” • P0686 “EDU Relay (Low)” • P0687 “EDU Relay (High)” • P0688 “EDU Relay (Over Load)”
	Inspection condition		• Starter switch: ON • Do not start engine.
	Requirements		Codes occur.
	Inspection result (Is the judging standard satisfied?)	YES	Inspect diagnosis code that is occurring.
		NO	Inspection of exhaust gas recirculation system (exhaust gas recirculation pipe, exhaust gas recirculation cooler, exhaust gas recirculation valve)

[Fault code]
Diagnosis code: P0403/Flash code: 67
[Monitor]
Abnormality in exhaust gas recirculation valve (actuator)
[Fault (outline)]
- Actuator short circuit
- Actuator open circuit
- Power supply too high
- Power supply too low

[Diagnosis check]
- Exhaust gas recirculation electronic drive unit monitors exhaust gas recirculation valve driving motor and sends fault information to engine electronic control unit through controller area network communication.

[Code generation condition]
Diagnosis code is generated under either of the following conditions. (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)
- Motor circuit remains shorted or open as detected by exhaust gas recirculation electronic drive unit 1 or 3 for 1 second.
- Voltage of exhaust gas recirculation electronic drive unit 1 or 3 remains over 19 V for 5 seconds.
- Voltage of exhaust gas recirculation electronic drive unit 1 or 3 remains below 7 V for 13 seconds.
- From electronic drive unit is sent abnormal information the total reception time of which (through controller area network 2) exceeds 6 seconds.

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal

[Control effected by electronic control unit during fault]
- Injection quantity is limited.
- Exhaust gas recirculation control is stopped.
- Throttle control is stopped.
- Diesel particulate filter regeneration (manual or automatic) is stopped.

[Probable cause of trouble]
- Open-circuit or short-circuit of harness between exhaust gas recirculation electronic drive unit and exhaust gas recirculation valve
- Abnormality of each connector
- Abnormality of exhaust gas recirculation motor (built in exhaust gas recirculation valve)
- Abnormality of exhaust gas recirculation position sensor (built in exhaust gas recirculation valve)
- Abnormality of exhaust gas recirculation electronic drive unit
- Abnormality of electronic drive unit relay

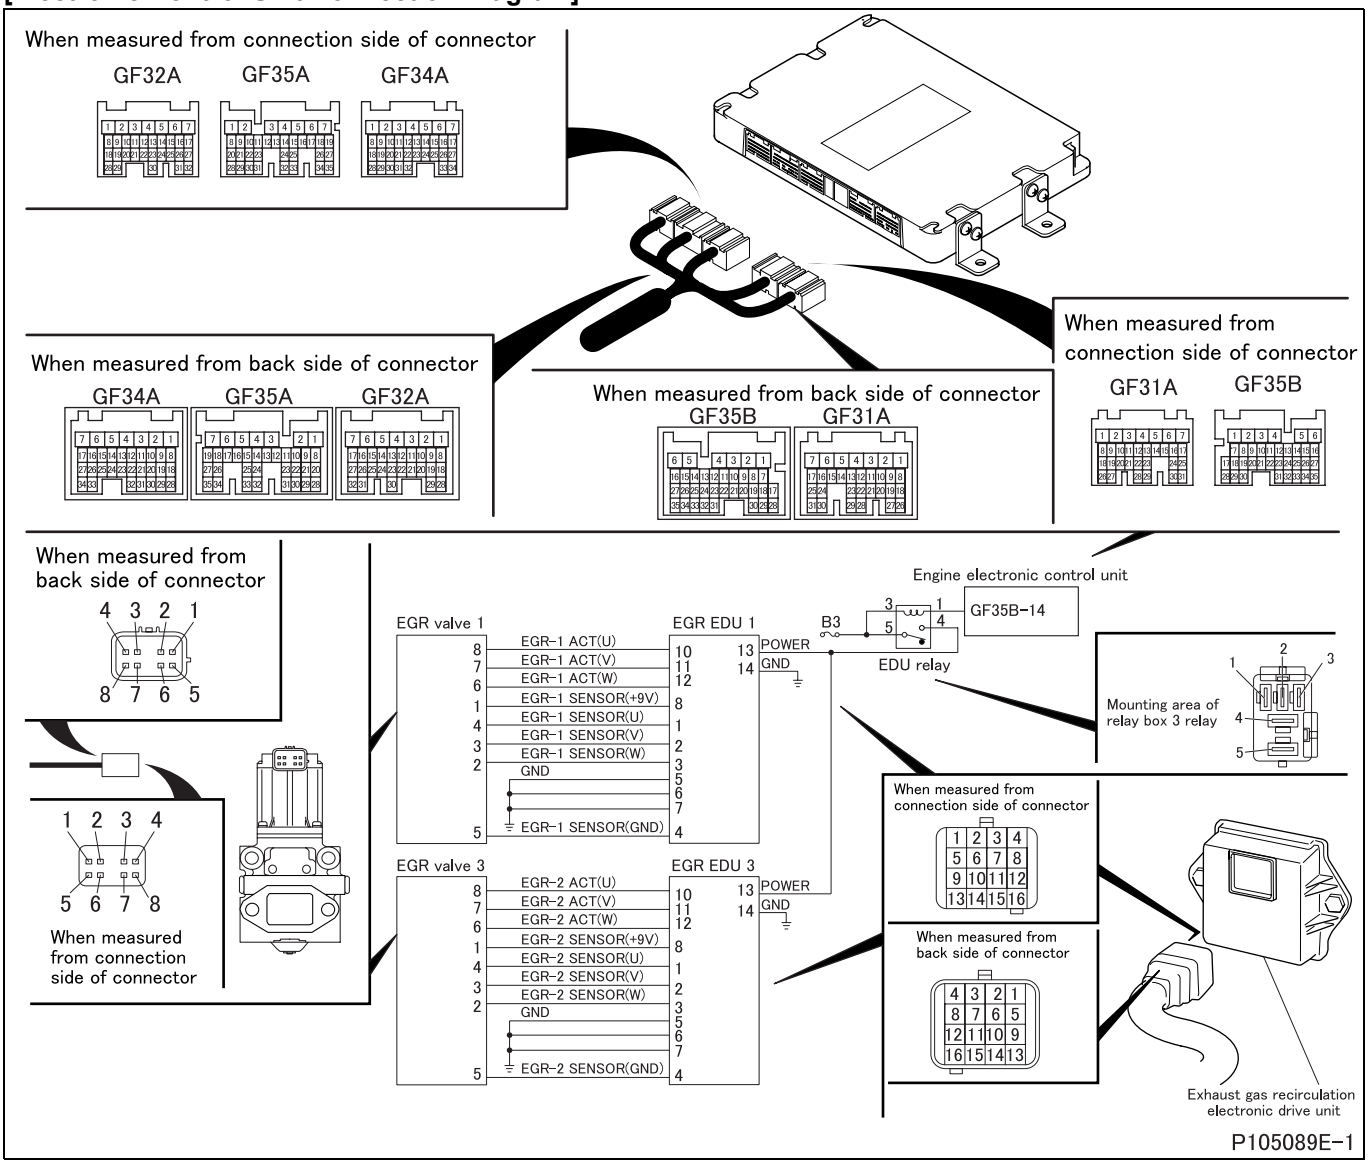
[Recoverability]
<Control during fault>
- Recovered if signal becomes normal when starter switch is turned OFF to ON.

<Warning lamp>
- Extinguished at 4th driving cycle after normal signal is input.

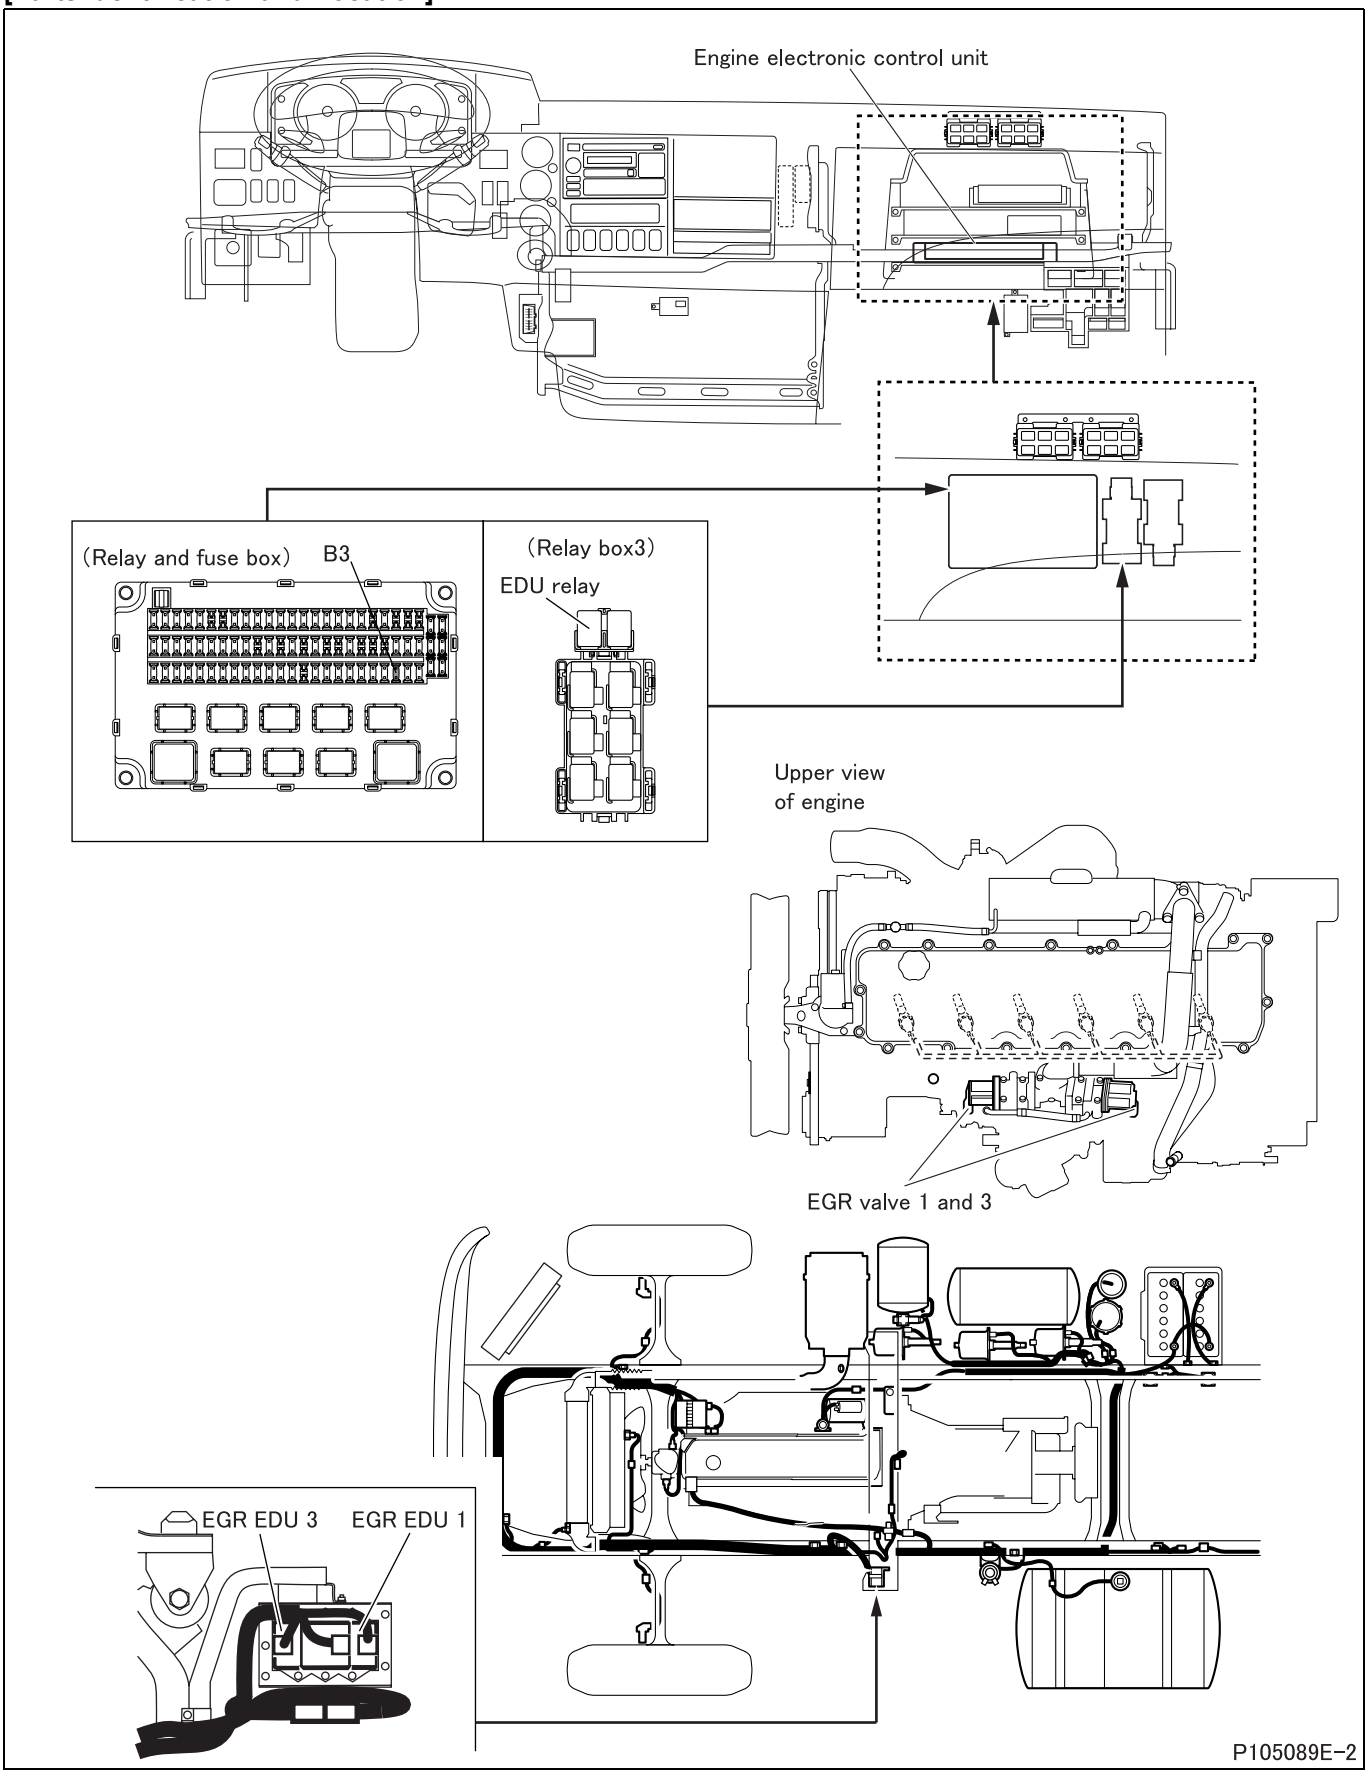
<Fault code>
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished. (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. A1 “EGR1, 3”. **NOTE** • **As initial operational check of exhaust gas recirculation valve is automatically effected immediately after starter switch is ON, perform actuator test by Multi-Use Tester after that check (approximately 5 seconds later).**
	Inspection condition		• Vehicle: stationary (vehicle speed 0 km/h {0 MPH}) • Starter switch: ON (engine started) • Transmission: neutral (parking satisfactory for automatic transmission)
	Requirements		Actual position matches with target value set by Multi-Use Tester (check with service data “0E: EGR1 Actual Position” and “0F: EGR3 Actual Position”).
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

Step 2	Inspection items		Inspection of electronic drive unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Modify connector.

Step 3	Inspection items		Inspection of exhaust gas recirculation valve connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	Modify connector.

Step 4	Inspection items		Inspection by control data
	Maintenance item		Check if following diagnosis codes occur simultaneously. • P0685 “EDU Relay (Open)” • P0686 “EDU Relay (Low)” • P0687 “EDU Relay (High)” • P0688 “EDU Relay (Over Load)”
	Inspection condition		Starter switch: ON
	Requirements		No codes occur.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Inspect diagnosis code that is occurring.

Step 5	Inspection items		Inspection of electronic drive unit connector (power supply)
	Maintenance item		Measure value of voltage between connector terminal No. 13 (+) and 14 (–).
	Inspection condition		• Remove connector and measure from harness side. • Starter switch: ON • Perform actuator test item No. A9 “EDU Relay”
	Requirements		Same as battery voltage.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 10.
		NO	Go to step 6.

Step 6	Inspection items		Inspection of relay connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify connector.

Step 7	Inspection items		Inspection of harness between fuse and relay
	Maintenance item		Check circuit between fuse No. B3 and relay connector terminal No. 5.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify harness.

Step 8	Inspection items		Inspection of harness between relay and electronic drive unit
	Maintenance item		Check circuit between relay connector terminal No. 4 and electronic drive unit connector terminal No. 13.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	After replacement of electronic drive unit relay, go to step 9.
		NO	Modify harness.

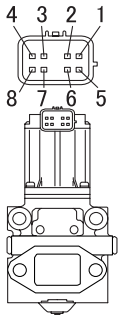
Step 9	Inspection items		Inspection of harness between electronic drive unit and ground
	Maintenance item		Check circuit between following electronic drive unit connector. • Electronic drive unit ground: terminal No. 14 - chassis ground • Sensor shield ground (U): terminal No. 5 - 14 • Sensor shield ground (V): terminal No. 6 - 14 • Sensor shield ground (W): terminal No. 7 - 14 • Sensor ground: terminal No. 4 - 14
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 10.
		NO	Modify harness.

Step 10	Inspection items		Inspection of electronic drive unit connector (motor)
	Maintenance item		Measure value of resistance between following connector terminals. • Between U - V: 10 - 11 • Between U - W: 10 - 12 • Between V - W: 11 - 12
	Inspection condition		–
	Requirements		2.1 ± 0.3 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 13.
		NO	Go to step 11.

Step 11	Inspection items		Inspection of harness between electronic drive unit and exhaust gas recirculation valve (motor)
	Maintenance item		Check circuit between following connector terminals. • Motor (U): electronic drive unit connector terminal No. 10 - exhaust gas recirculation valve connector terminal No. 8 • Motor (V): electronic drive unit connector terminal No. 11 - exhaust gas recirculation valve connector terminal No. 7 • Motor (W): electronic drive unit connector terminal No. 12 - exhaust gas recirculation valve connector terminal No. 6
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 12.
		NO	Modify harness.

Step 12	Inspection items		Inspection of exhaust gas recirculation valve unit (motor)
	Maintenance item		Measure value of resistance between following exhaust gas recirculation valve connector terminals. • Between U - V: 8 - 7 • Between U - W: 8 - 6 • Between V - W: 7 - 6
	Inspection condition		• Keep exhaust gas recirculation valve installed on vehicle. • Remove harness connector, and measure exhaust gas recirculation valve side.
	Requirements		2.1 ± 0.3 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 13.
		NO	Replacement of exhaust gas recirculation valve

<Step 12 inspection diagram>



P104214

Step 13	Inspection items		Inspection of exhaust gas recirculation valve connector (position sensor: power supply)
	Maintenance item		Measure value of voltage between connector terminal No. 1 (+) and 5 (–).
	Inspection condition		• Measure from back side of connector of harness with each device connected to harness. • Starter switch: ON
	Requirements		10 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 14.
		NO	Go to step 15.

Step 14	Inspection items		Inspection of electronic drive unit connector (position sensor: signal)
	Maintenance item		Measure value of voltage between following electronic drive unit connector terminals. • U signal output: terminal 1 (+) - 4 (–) • V signal output: terminal 2 (+) - 4 (–) • W signal output: terminal 3 (+) - 4 (–)
	Inspection condition		• Measure from back side of connector of harness with each device connected to harness. • Starter switch: ON • Perform actuator test item No. A9 “EDU Relay”
	Requirements		8 to 11 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 16.
		NO	Go to step 15.

Step 15	Inspection items		Inspection of harness between electronic drive unit and exhaust gas recirculation valve (position sensor)
	Maintenance item		Check circuit between following connector terminals. • Sensor (power supply): electronic drive unit connector terminal No. 8 - exhaust gas recirculation valve connector terminal No. 1 • Sensor (U): electronic drive unit connector terminal No. 1 - exhaust gas recirculation valve connector terminal No. 4 • Sensor (V): electronic drive unit connector terminal No. 2 - exhaust gas recirculation valve connector terminal No. 3 • Sensor (W): electronic drive unit connector terminal No. 3 - exhaust gas recirculation valve connector terminal No. 2 • Sensor (ground): electronic drive unit connector terminal No. 4 - exhaust gas recirculation valve connector terminal No. 5
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	After replacement of exhaust gas recirculation valve, go to step 16.
		NO	Modify harness.

Step 16	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. A1 “EGR1, 3”. **NOTE** • **As initial operational check of exhaust gas recirculation valve is automatically effected immediately after starter switch is ON, perform actuator test by Multi-Use Tester after that check (approximately 5 seconds later).**
	Inspection condition		• Vehicle: stationary (vehicle speed 0 km/h {0 MPH}) • Starter switch: ON (engine started) • Transmission: neutral • Diagnosis switch: OFF (fuse removed)
	Requirements		Actual position matches with target value set by Multi-Use Tester (check with service data “0E: EGR1 Actual Position” and “0F: EGR3 Actual Position”).
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic drive unit

[Fault code]
Diagnosis code: P0404/Flash code: 02, 67
[Monitor]
Abnormality in exhaust gas recirculation valve (actuator)
[Fault (outline)]
- Actuator stuck
- Initialization error
- Valve not close

[Diagnosis check]
- Exhaust gas recirculation electronic drive unit monitors exhaust gas recirculation valve driving motor and sends fault information to engine electronic control unit through controller area network communication.

[Code generation condition]
Diagnosis code is generated under either of the following conditions. (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)
- Motor remains stuck as detected by throttle electronic drive unit 1 or 3 for more than 13 seconds.
- The errors which indicate the exhaust gas recirculation valve initialization failed or valve abnormally closed condition are received from the exhaust gas recirculation electronic drive unit 1 or 3.
- From electronic drive unit is sent abnormal information the total reception time of which (through controller area network 2) exceeds 6 seconds.

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal

[Control effected by electronic control unit during fault]
- Injection quantity is limited.
- Exhaust gas recirculation control is stopped.
- Throttle control is stopped.
- Diesel particulate filter regeneration (manual or automatic) is stopped.

[Probable cause of trouble]
- Open-circuit or short-circuit of harness between exhaust gas recirculation electronic drive unit and exhaust gas recirculation valve
- Abnormality of each connector
- Abnormality of exhaust gas recirculation motor (built in exhaust gas recirculation valve)
- Abnormality of exhaust gas recirculation position sensor (built in exhaust gas recirculation valve)
- Abnormality of exhaust gas recirculation electronic drive unit
- Abnormality of electronic drive unit relay

[Recoverability]
[Abnormality in valve closing]
- Recovered if signal becomes normal with starter switch in ON position.

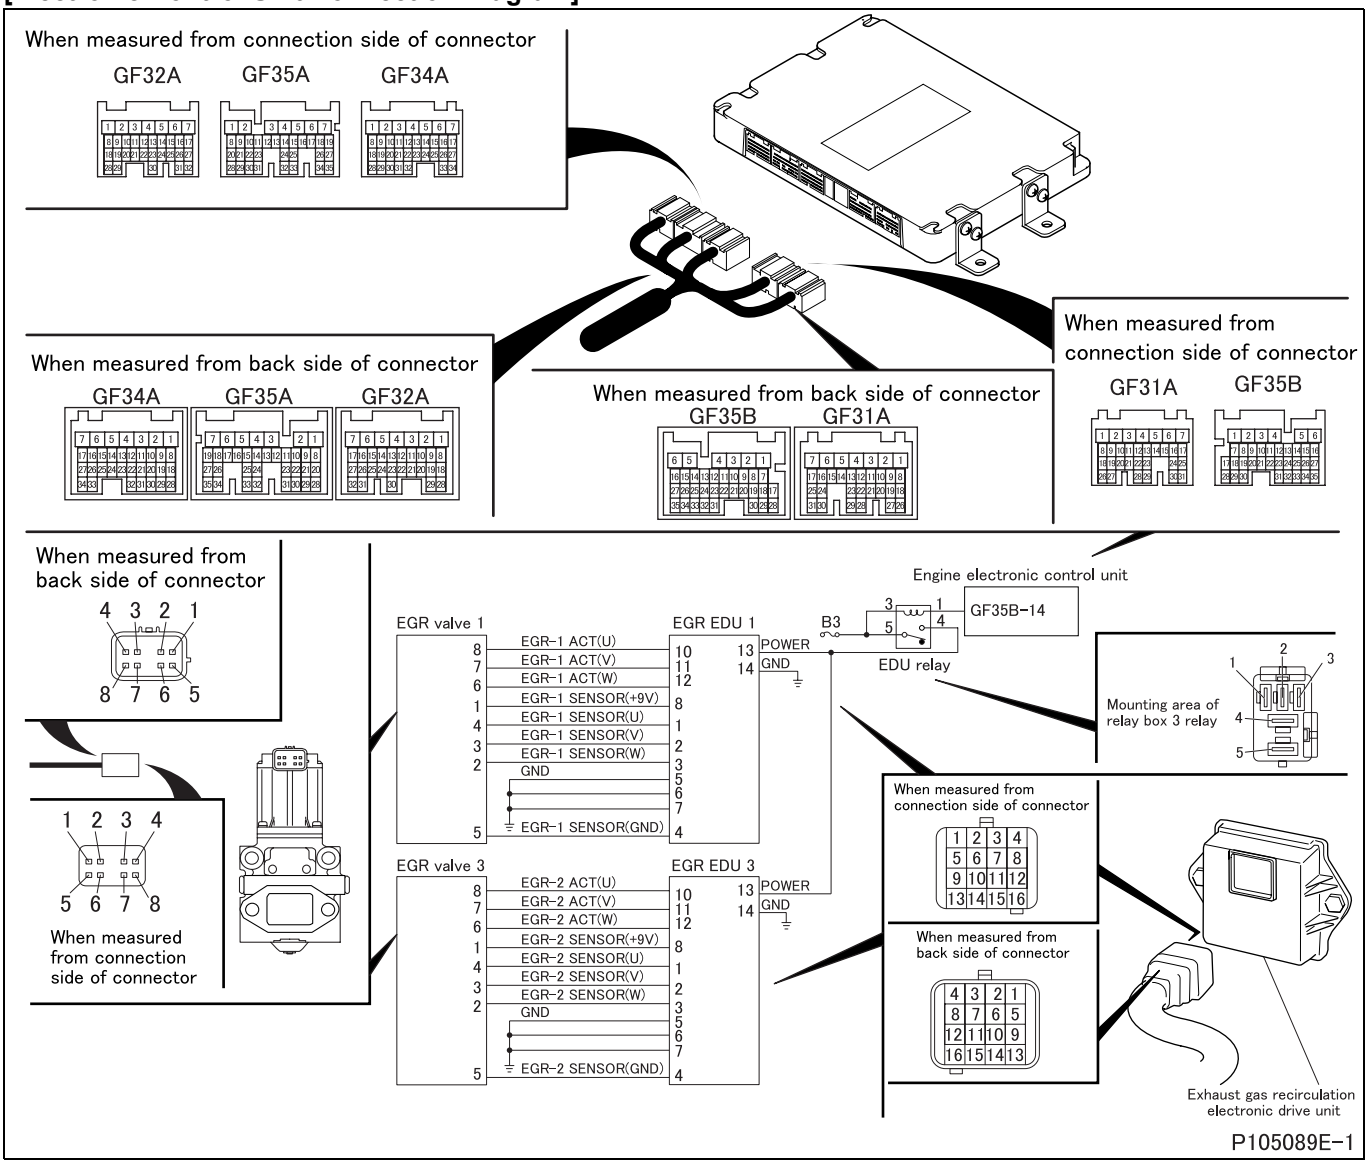
[Abnormality of actuator]
- Recovered if signal becomes normal when starter switch is turned OFF to ON (power supply resumed to electronic control unit).

<Warning lamp>
- Extinguished at 4th driving cycle after normal signal is input.

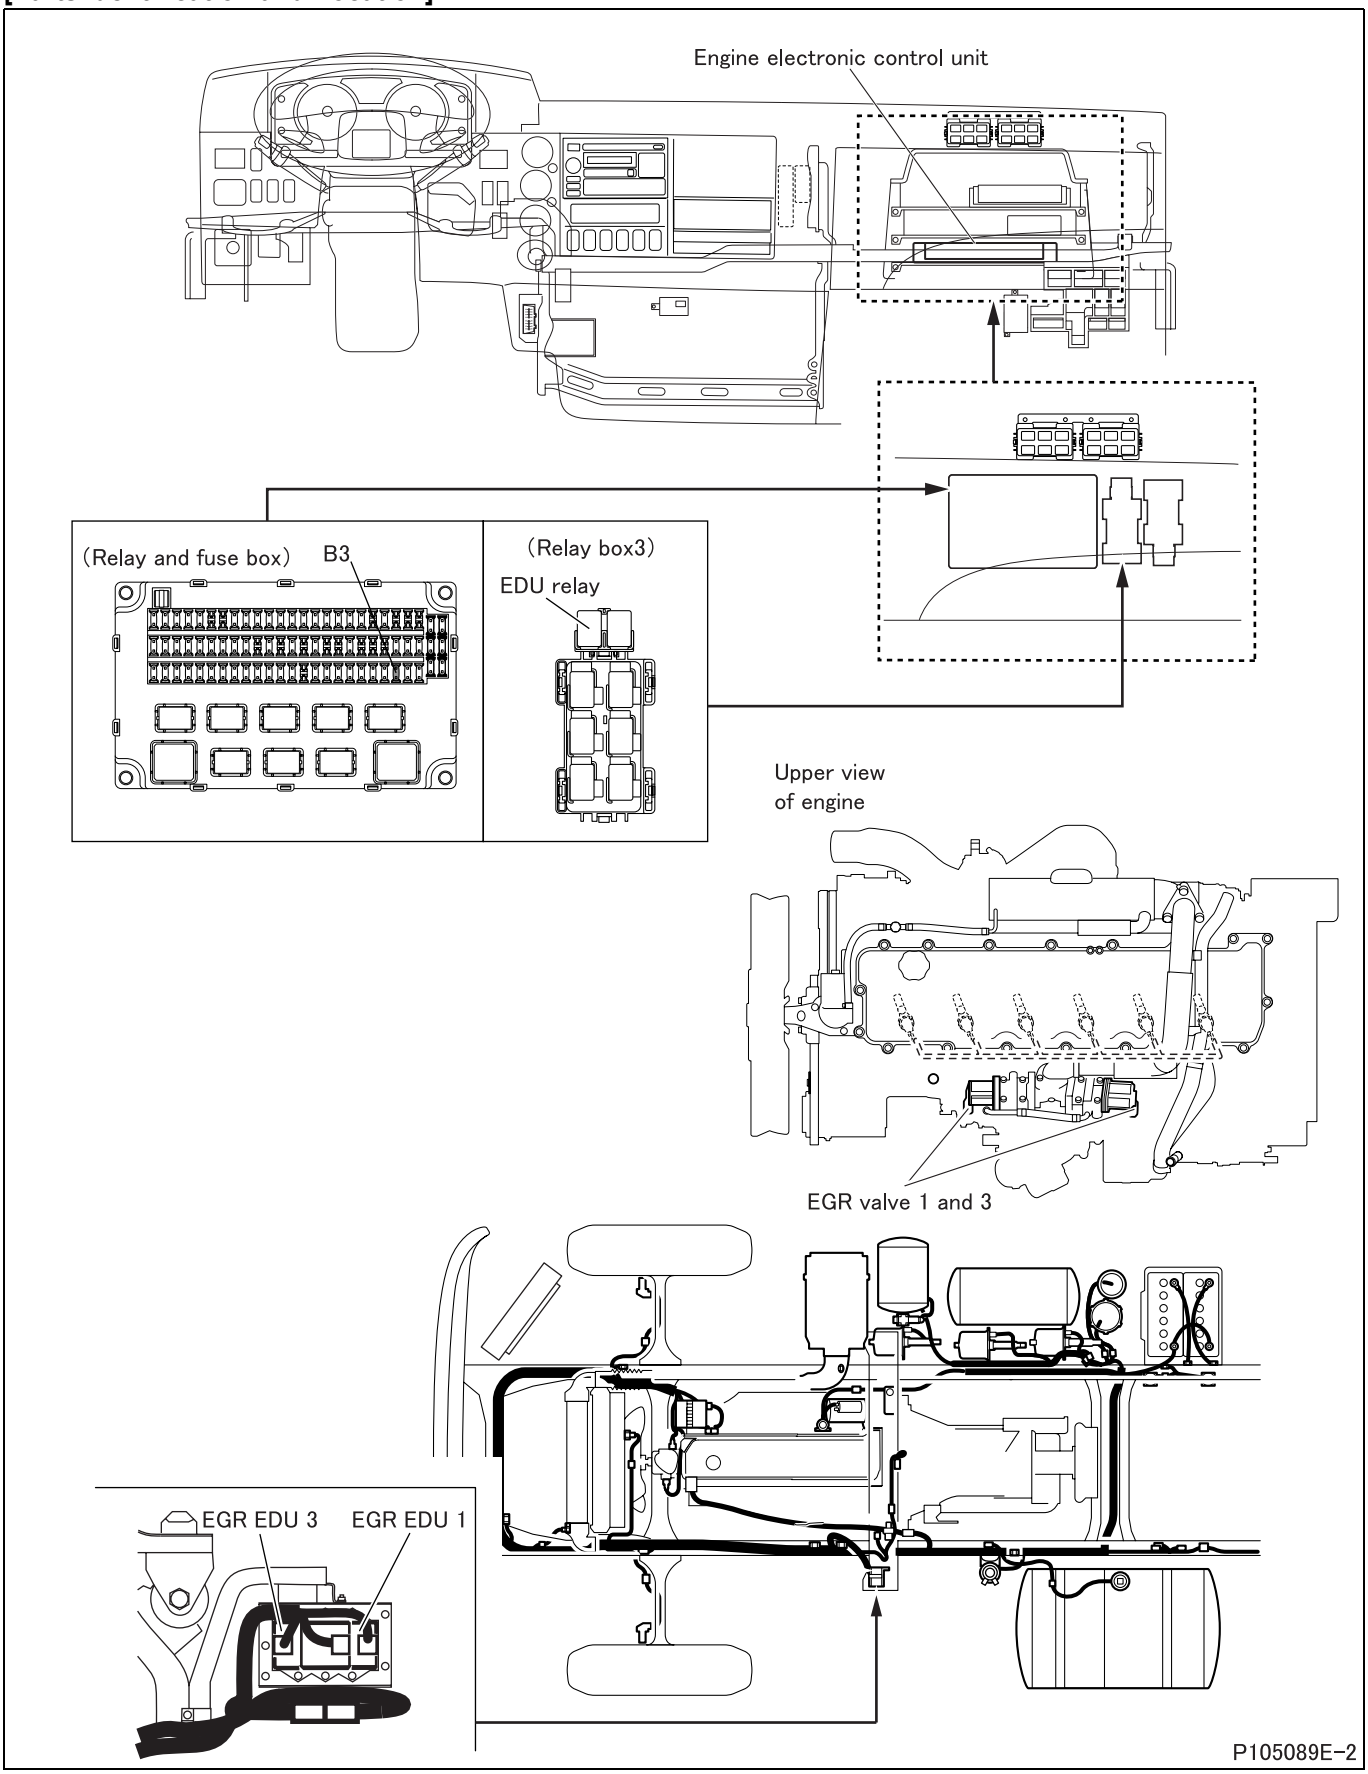
<Fault code>
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished. (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. A1 “EGR1, 3”. **NOTE** • **As initial operational check of exhaust gas recirculation valve is automatically effected immediately after starter switch is ON, perform actuator test by Multi-Use Tester after that check (approximately 5 seconds later).**
	Inspection condition		• Vehicle: stationary (vehicle speed 0 km/h {0 MPH}) • Starter switch: ON (engine started) • Transmission: neutral (parking satisfactory for automatic transmission)
	Requirements		Actual position matches with target value set by Multi-Use Tester (check with service data “0E: EGR1 Actual Position” and “0F: EGR3 Actual Position”).
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

Step 2	Inspection items		Inspection of electronic drive unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Modify connector.

Step 3	Inspection items		Inspection of exhaust gas recirculation valve connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	Modify connector.

Step 4	Inspection items		Inspection by control data
	Maintenance item		Check if following diagnosis codes occur simultaneously. • P0685 “EDU Relay (Open)” • P0686 “EDU Relay (Low)” • P0687 “EDU Relay (High)” • P0688 “EDU Relay (Over Load)”
	Inspection condition		Starter switch: ON
	Requirements		No codes occur.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Inspect diagnosis code that is occurring.

Step 5	Inspection items		Inspection of electronic drive unit connector (power supply)
	Maintenance item		Measure value of voltage between connector terminal No. 13 (+) and 14 (–).
	Inspection condition		• Remove connector and measure from harness side. • Starter switch: ON • Perform actuator test item No. A9 “EDU Relay”.
	Requirements		Same as battery voltage.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 10.
		NO	Go to step 6.

Step 6	Inspection items		Inspection of relay connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify connector.

Step 7	Inspection items		Inspection of harness between fuse and relay
	Maintenance item		Check circuit between fuse No. B3 and relay connector terminal No. 5.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify harness.

Step 8	Inspection items		Inspection of harness between relay and electronic drive unit
	Maintenance item		Check circuit between relay connector terminal No. 4 and electronic drive unit connector terminal No. 13.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	After replacement of electronic drive unit relay, go to step 9.
		NO	Modify harness.

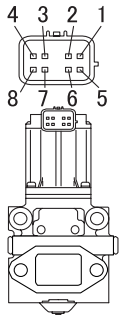
Step 9	Inspection items		Inspection of harness between electronic drive unit and ground
	Maintenance item		Check circuit between following electronic drive unit connector • Electronic drive unit ground: terminal No. 14 - chassis ground • Sensor shield ground (U): terminal No. 5 - 14 • Sensor shield ground (V): terminal No. 6 - 14 • Sensor shield ground (W): terminal No. 7 - 14 • Sensor ground: terminal No. 4 - 14
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 10.
		NO	Modify harness.

Step 10	Inspection items		Inspection of electronic drive unit connector (motor)
	Maintenance item		Measure value of resistance between following connector terminals. • Between U - V: 10 - 11 • Between U - W: 10 - 12 • Between V - W: 11 - 12
	Inspection condition		–
	Requirements		2.1 ± 0.3 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 13.
		NO	Go to step 11.

Step 11	Inspection items		Inspection of harness between electronic drive unit and exhaust gas recirculation valve (motor)
	Maintenance item		Check circuit between following connector terminals. • Motor (U): electronic drive unit connector terminal No. 10 - exhaust gas recirculation valve connector terminal No. 8 • Motor (V): electronic drive unit connector terminal No. 11 - exhaust gas recirculation valve connector terminal No. 7 • Motor (W): electronic drive unit connector terminal No. 12 - exhaust gas recirculation valve connector terminal No. 6
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 12.
		NO	Modify harness.

Step 12	Inspection items		Inspection of exhaust gas recirculation valve unit (motor)
	Maintenance item		Measure value of resistance between following exhaust gas recirculation valve connector terminals. • Between U - V: 8 - 7 • Between U - W: 8 - 6 • Between V - W: 7 - 6
	Inspection condition		• Keep exhaust gas recirculation valve installed on vehicle. • Remove harness connector, and measure exhaust gas recirculation valve side.
	Requirements		2.1 ± 0.3 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 13.
		NO	Replacement of exhaust gas recirculation valve

<Step 12 inspection diagram>



P104214

Step 13	Inspection items		Inspection of exhaust gas recirculation valve connector (position sensor: power supply)
	Maintenance item		Measure value of voltage between connector terminal No. 1 (+) and 5 (–).
	Inspection condition		• Measure from back side of connector of harness with each device connected to harness. • Starter switch: ON
	Requirements		10 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 14.
		NO	Go to step 15.

Step 14	Inspection items		Inspection of electronic drive unit connector (position sensor: signal)
	Maintenance item		Measure value of voltage between following electronic drive unit connector terminals • U signal output: terminal 1 (+) - 4 (–) • V signal output: terminal 2 (+) - 4 (–) • W signal output: terminal 3 (+) - 4 (–)
	Inspection condition		• Measure from back side of connector of harness with each device connected to harness. • Starter switch: ON • Perform actuator test item No. A9 “EDU Relay”
	Requirements		8 to 11 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 16.
		NO	Go to step 15.

Step 15	Inspection items		Inspection of harness between electronic drive unit and exhaust gas recirculation valve (position sensor)
	Maintenance item		Check circuit between following connector terminals. • Sensor (power supply): electronic drive unit connector terminal No. 8 - exhaust gas recirculation valve connector terminal No. 1 • Sensor (U): electronic drive unit connector terminal No. 1 - exhaust gas recirculation valve connector terminal No. 4 • Sensor (V): electronic drive unit connector terminal No. 2 - exhaust gas recirculation valve connector terminal No. 3 • Sensor (W): electronic drive unit connector terminal No. 3 - exhaust gas recirculation valve connector terminal No. 2 • Sensor (ground): electronic drive unit connector terminal No. 4 - exhaust gas recirculation valve connector terminal No. 5
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	After replacement of exhaust gas recirculation valve, go to step 16.
		NO	Modify harness.

Step 16	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. A1 “EGR1, 3”. **NOTE** • **As initial operational check of exhaust gas recirculation valve is automatically effected immediately after starter switch is ON, perform actuator test by Multi-Use Tester after that check (approximately 5 seconds later).**
	Inspection condition		• Vehicle: stationary (vehicle speed 0 km/h {0 MPH}) • Starter switch: ON (engine started) • Transmission: neutral • Diagnosis switch: OFF (fuse removed)
	Requirements		Actual position matches with target value set by Multi-Use Tester (check with service data “0E: EGR1 Actual Position” and “0F: EGR3 Actual Position”).
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic drive unit

[Fault code]
Diagnosis code: P0409/Flash code: 67
[Monitor]
Abnormality in exhaust gas recirculation valve (position sensor)
[Fault (outline)]
Abnormal position
[Diagnosis check]
- Exhaust gas recirculation electronic drive unit monitors position sensor of exhaust gas recirculation valve driving motor and sends abnormality information to engine electronic control unit through controller area network communication.

[Code generation condition]
- Voltage of position sensor remains out of specification (open: above 4.7 V, close: below 0.2 V) for 1 second. (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal

[Control effected by electronic control unit during fault]
- Injection quantity is limited.
- Exhaust gas recirculation control is stopped.
- Throttle control is stopped.
- Diesel particulate filter regeneration (manual or automatic) is stopped.

[Probable cause of trouble]
- Open-circuit or short-circuit of harness between exhaust gas recirculation electronic drive unit and exhaust gas recirculation valve
- Abnormality of each connector
- Abnormality of exhaust gas recirculation motor (built in exhaust gas recirculation valve)
- Abnormality of exhaust gas recirculation position sensor (built in exhaust gas recirculation valve)
- Abnormality of exhaust gas recirculation electronic drive unit
- Abnormality of electronic drive unit relay

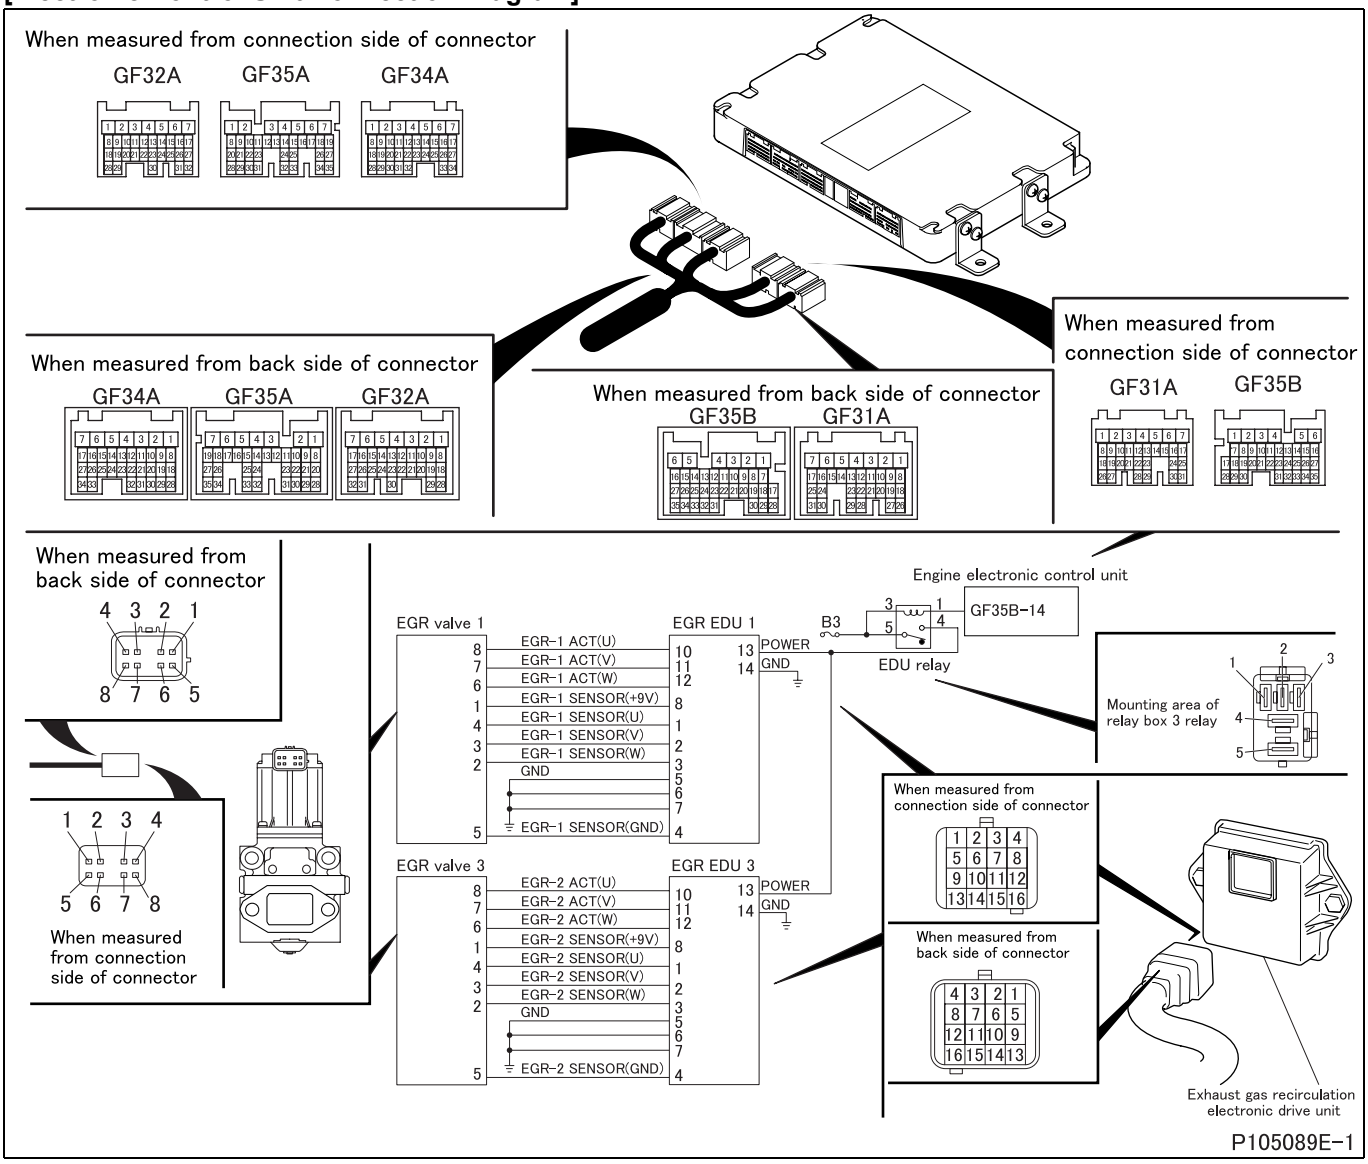
[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>
- Extinguished at 4th driving cycle after normal signal is input.

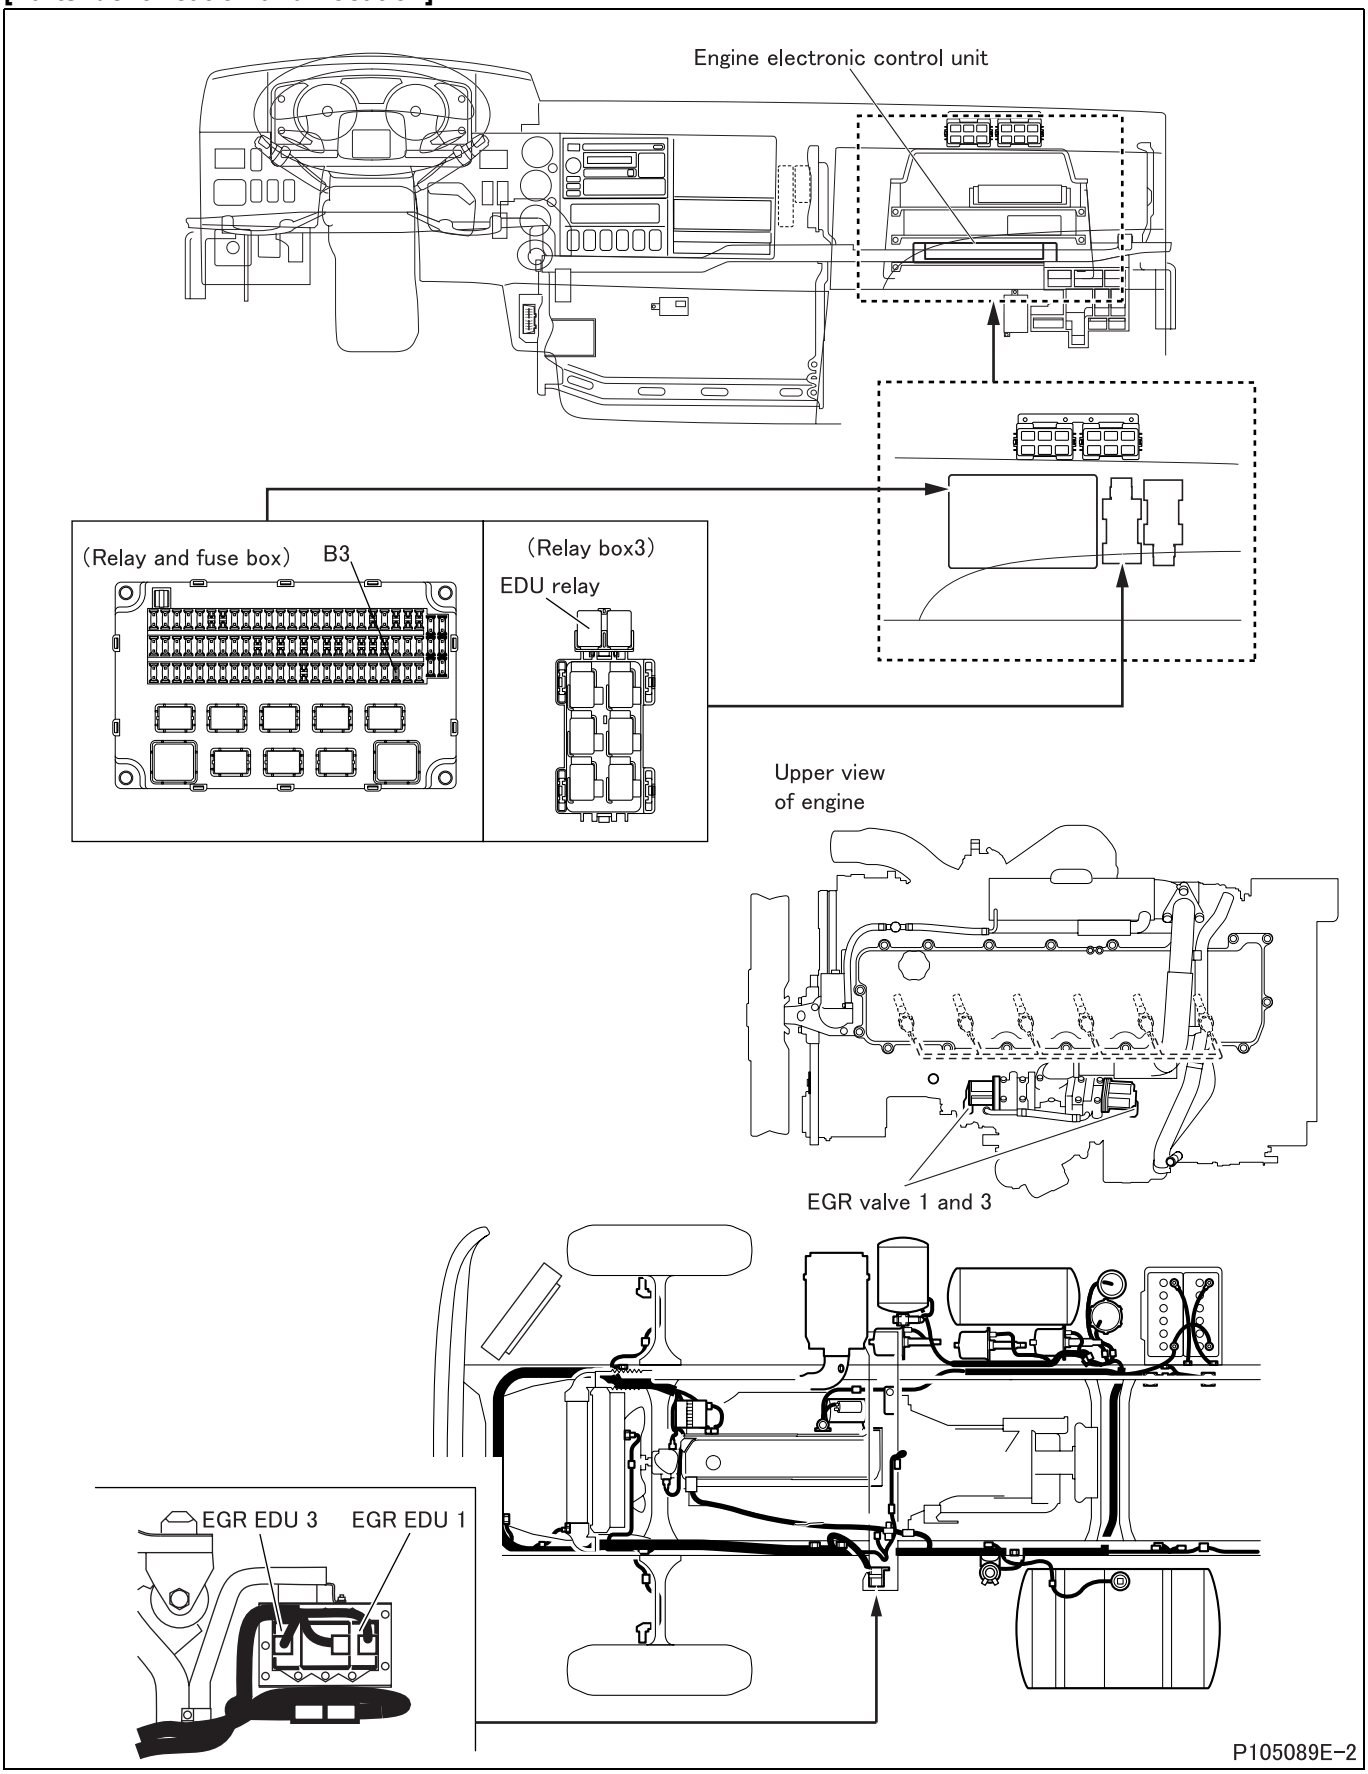
<Fault code>
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished. (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. A1 “EGR1, 3”. **NOTE** • **As initial operational check of exhaust gas recirculation valve is automatically effected immediately after starter switch is ON, perform actuator test by Multi-Use Tester after that check (approximately 5 seconds later).**
	Inspection condition		• Vehicle: stationary (vehicle speed 0 km/h {0 MPH}) • Starter switch: ON (engine started) • Transmission: neutral (parking satisfactory for automatic transmission)
	Requirements		Actual position matches with target value set by Multi-Use Tester (check with service data “0E: EGR1 Actual Position” and “0F: EGR3 Actual Position”).
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

Step 2	Inspection items		Inspection of electronic drive unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Modify connector.

Step 3	Inspection items		Inspection of exhaust gas recirculation valve connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	Modify connector.

Step 4	Inspection items		Inspection by control data
	Maintenance item		Check if following diagnosis codes occur simultaneously. • P0685 “EDU Relay (Open)” • P0686 “EDU Relay (Low)” • P0687 “EDU Relay (High)” • P0688 “EDU Relay (Over Load)”
	Inspection condition		Starter switch: ON
	Requirements		No codes occur.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Inspect diagnosis code that is occurring.

Step 5	Inspection items		Inspection of electronic drive unit connector (power supply)
	Maintenance item		Measure value of voltage between connector terminal No. 13 (+) and 14 (–).
	Inspection condition		• Remove connector and measure from harness side. • Starter switch: ON • Perform actuator test item No. A9 “EDU Relay”
	Requirements		Same as battery voltage.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 10.
		NO	Go to step 6.

Step 6	Inspection items		Inspection of relay connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify connector.

Step 7	Inspection items		Inspection of harness between fuse and relay
	Maintenance item		Check circuit between fuse No. B3 and relay connector terminal No. 5.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify harness.

Step 8	Inspection items		Inspection of harness between relay and electronic drive unit
	Maintenance item		Check circuit between relay connector terminal No. 4 and electronic drive unit connector terminal No. 13.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	After replacement of electronic drive unit relay, go to step 9.
		NO	Modify harness.

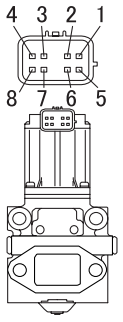
Step 9	Inspection items		Inspection of harness between electronic drive unit and ground
	Maintenance item		Check circuit between following electronic drive unit connector • Electronic drive unit ground: terminal No. 14 - chassis ground • Sensor shield ground (U): terminal No. 5 - 14 • Sensor shield ground (V): terminal No. 6 - 14 • Sensor shield ground (W): terminal No. 7 - 14 • Sensor ground: terminal No. 4 - 14
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 10.
		NO	Modify harness.

Step 10	Inspection items		Inspection of electronic drive unit connector (motor)
	Maintenance item		Measure value of resistance between following connector terminals. • Between U - V: 10 - 11 • Between U - W: 10 - 12 • Between V - W: 11 - 12
	Inspection condition		–
	Requirements		2.1 ± 0.3 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 13.
		NO	Go to step 11.

Step 11	Inspection items		Inspection of harness between electronic drive unit and exhaust gas recirculation valve (motor)
	Maintenance item		Check circuit between following connector terminals. • Motor (U): electronic drive unit connector terminal No. 10 - exhaust gas recirculation valve connector terminal No. 8 • Motor (V): electronic drive unit connector terminal No. 11 - exhaust gas recirculation valve connector terminal No. 7 • Motor (W): electronic drive unit connector terminal No. 12 - exhaust gas recirculation valve connector terminal No. 6
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 12.
		NO	Modify harness.

Step 12	Inspection items		Inspection of exhaust gas recirculation valve unit (motor)
	Maintenance item		Measure value of resistance between following exhaust gas recirculation valve connector terminals. • Between U - V: 8 - 7 • Between U - W: 8 - 6 • Between V - W: 7 - 6
	Inspection condition		• Keep exhaust gas recirculation valve installed on vehicle. • Remove harness connector, and measure exhaust gas recirculation valve side.
	Requirements		2.1 ± 0.3 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 13.
		NO	Replacement of exhaust gas recirculation valve

<Step 12 inspection diagram>



P104214

Step 13	Inspection items		Inspection of exhaust gas recirculation valve connector (position sensor: power supply)
	Maintenance item		Measure value of voltage between connector terminal No. 1 (+) and 5 (–).
	Inspection condition		• Measure from back side of connector of harness with each device connected to harness. • Starter switch: ON
	Requirements		10 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 14.
		NO	Go to step 15.

Step 14	Inspection items		Inspection of electronic drive unit connector (position sensor: signal)
	Maintenance item		Measure value of voltage between following electronic drive unit connector terminals. • U signal output: terminal 1 (+) - 4 (–) • V signal output: terminal 2 (+) - 4 (–) • W signal output: terminal 3 (+) - 4 (–)
	Inspection condition		• Measure from back side of connector of harness with each device connected to harness. • Starter switch: ON • Perform actuator test item No. A9 “EDU Relay”
	Requirements		8 to 11 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 16.
		NO	Go to step 15.

Step 15	Inspection items		Inspection of harness between electronic drive unit and exhaust gas recirculation valve (position sensor)
	Maintenance item		Check circuit between following connector terminals. • Sensor (power supply): electronic drive unit connector terminal No. 8 - exhaust gas recirculation valve connector terminal No. 1 • Sensor (U): electronic drive unit connector terminal No. 1 - exhaust gas recirculation valve connector terminal No. 4 • Sensor (V): electronic drive unit connector terminal No. 2 - exhaust gas recirculation valve connector terminal No. 3 • Sensor (W): electronic drive unit connector terminal No. 3 - exhaust gas recirculation valve connector terminal No. 2 • Sensor (ground): electronic drive unit connector terminal No. 4 - exhaust gas recirculation valve connector terminal No. 5
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	After replacement of exhaust gas recirculation valve, go to step 16.
		NO	Modify harness.

Step 16	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. A1 “EGR1, 3”. **NOTE** • **As initial operational check of exhaust gas recirculation valve is automatically effected immediately after starter switch is ON, perform actuator test by Multi-Use Tester after that check (approximately 5 seconds later).**
	Inspection condition		• Vehicle: stationary (vehicle speed 0 km/h {0 MPH}) • Starter switch: ON (engine started) • Transmission: neutral • Diagnosis switch: OFF (fuse removed)
	Requirements		Actual position matches with target value set by Multi-Use Tester (check with service data “0E: EGR1 Actual Position” and “0F: EGR3 Actual Position”).
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic drive unit

[Fault code]
Diagnosis code: P0427/Flash code: 13
[Monitor]
Abnormality of catalytic temperature sensor
[Fault (outline)]
Low signal range check
[Diagnosis check]
- Catalytic temperature sensor output voltage is monitored.

[Code generation condition]
- Voltage of DPF temperature sensor 1 remains under 0.2 V for approx. 2.5 seconds.
  (Warning lamp is lit and diagnosis code is displayed on second establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal
- Engine speed: more than 1200 rpm
- Injection quantity: more than 50 mm^3/st
- Water temperature: above –7°C {19°F}

[Control effected by electronic control unit during fault]
- Automatic diesel particulate filter regeneration is stopped.
- Control is carried out using backup value (200°C {392°F})

[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and catalytic temperature sensor
- Abnormality of each connector
- Abnormality of catalytic temperature sensor
- Abnormality in electronic control unit

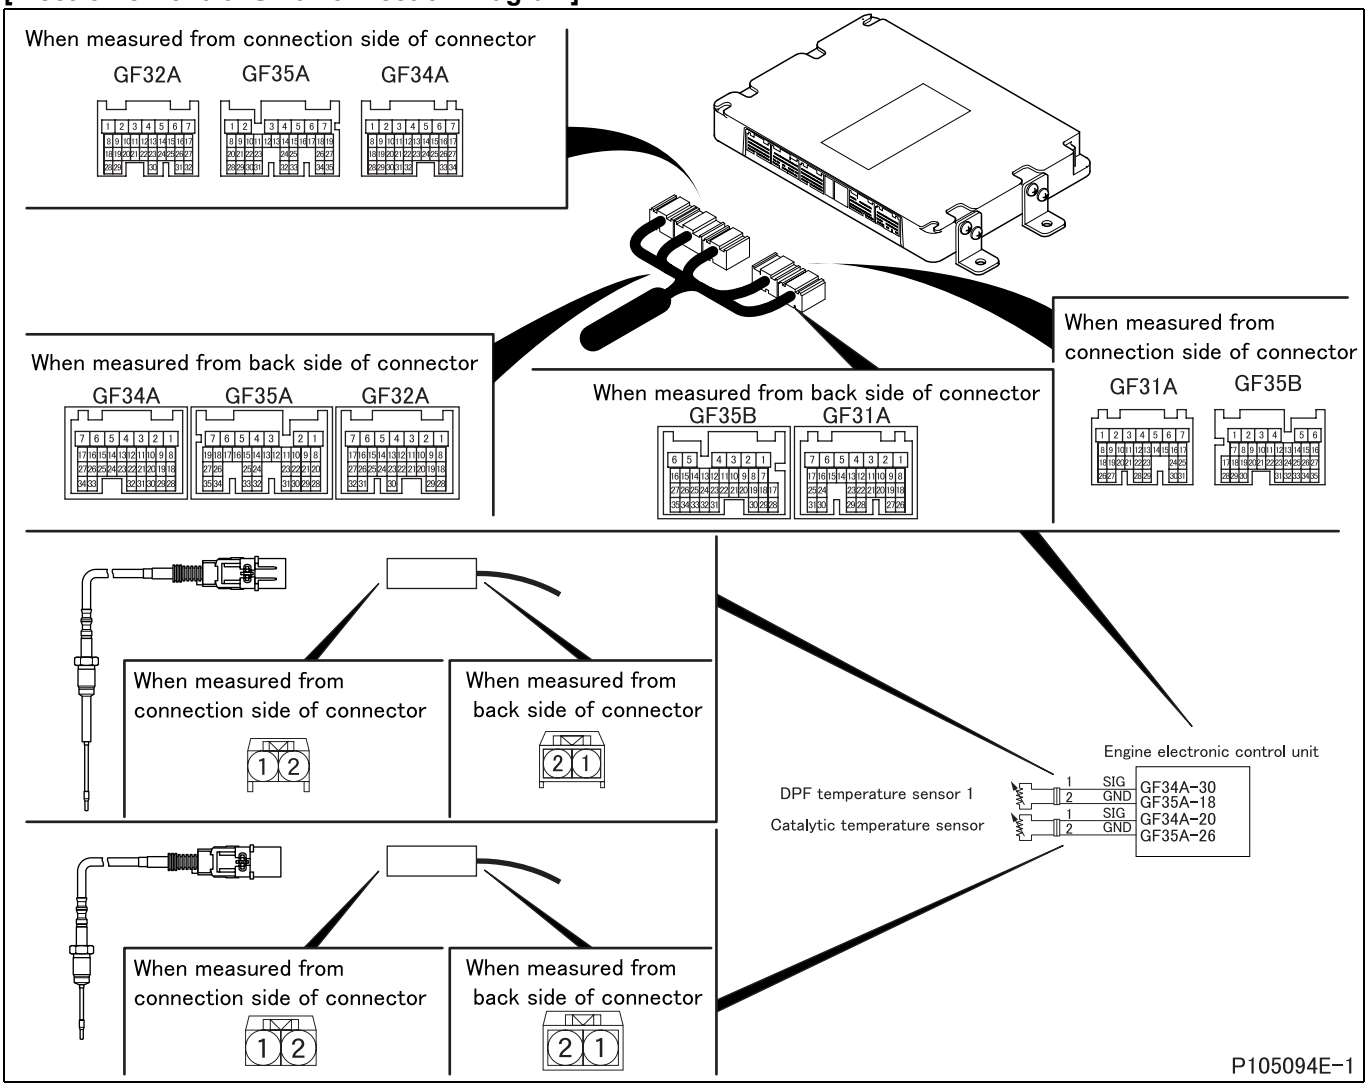
[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>
- Extinguished at 4th driving cycle after normal signal is input.

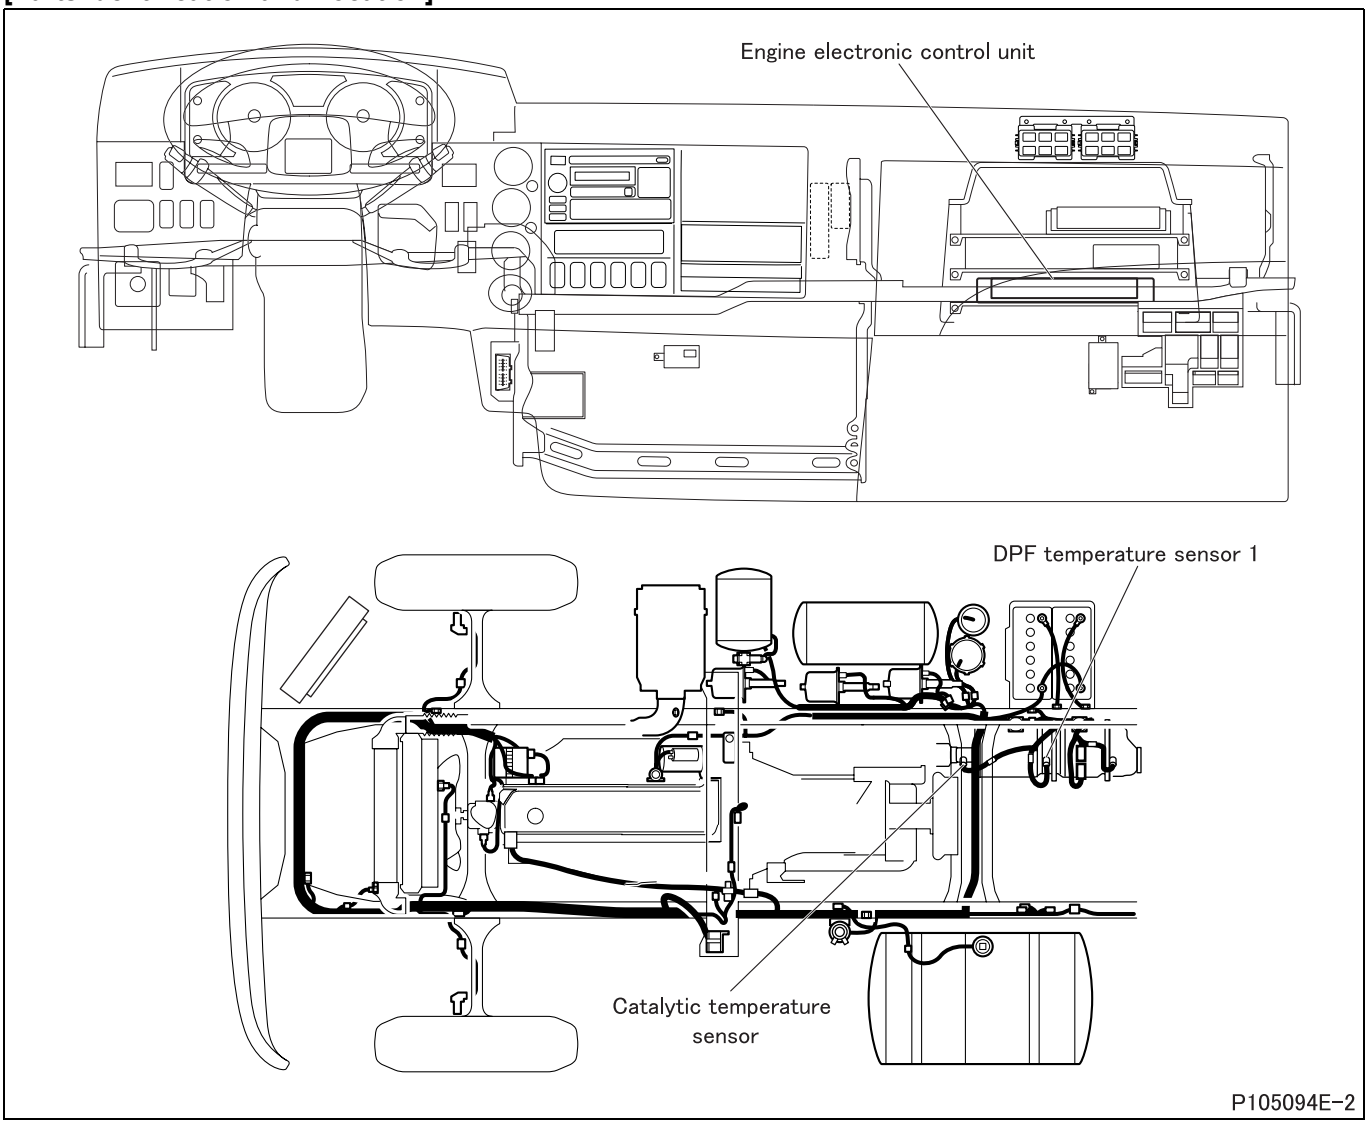
<Fault code>
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished. (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		**<General Scanning Tool used>** • Measure item “OXI CAT Temperature”. **<Multi-Use Tester used>** • Measure item No. 58 “Exhaust Gas Temperature” of Service Data.
	Inspection condition		While engine is warmed up
	Requirements		Temperature gradually rises up.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

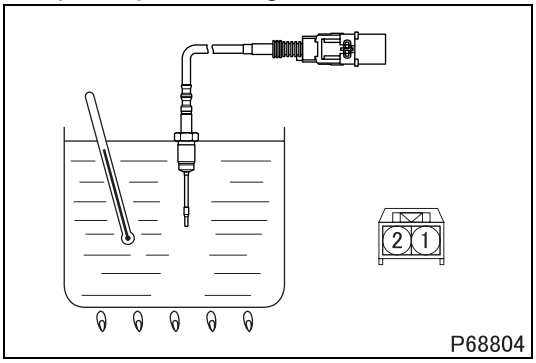
Step 2	Inspection items		Inspection by electronic control unit connector
	Maintenance item		Measure value of voltage between connector (GF34A) terminal No. 20 and (GF35A) terminal No. 26.
	Inspection condition		• Starter switch: OFF • Disconnect electronic control unit from harness and measure at vehicle-side connector half.
	Requirements		• 20°C {68°F} : 241.8 kΩ • 50°C {122°F} : 106.2 $^{+74.3}_{-41.8}$ kΩ • 100°C {212°F} : 33.56 $^{+17.60}_{-10.60}$ kΩ • 150°C {302°F} : 13.90 $^{+5.36}_{-3.60}$ kΩ • 200°C {392°F} : 6.896 $^{+2.064}_{-1.252}$ kΩ
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Go to step 4.

Step 3	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify connector.

Step 4	Inspection items		Inspection of sensor connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Modify connector.

Step 5	Inspection items		Inspection of catalytic temperature sensor unit
	Maintenance item		Measure value of resistance between connector terminal No. 1 and 2.
	Inspection condition		• Put catalytic temperature sensor in vessel filled with engine oil. • Heat the oil to each of the specified temperatures. Stir the oil well while doing so.
	Requirements		• 20°C {68°F} : 241.8 kΩ • 50°C {122°F} : 106.2 $^{+74.3}_{-41.8}$ kΩ • 100°C {212°F} : 33.56 $^{+17.60}_{-10.60}$ kΩ • 150°C {302°F} : 13.90 $^{+5.36}_{-3.60}$ kΩ • 200°C {392°F} : 6.896 $^{+2.064}_{-1.252}$ kΩ
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Replacement of sensor

<Step 5 inspection diagram>



Step 6	Inspection items		Inspection of harness between electronic control unit and sensor (power supply)
	Maintenance item		Check circuit between electronic control unit connector (GF34A) terminal No. 20 and sensor connector terminal No. 1.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify harness.

Step 7	Inspection items		Inspection of harness between electronic control unit and sensor (ground)
	Maintenance item		Check circuit between electronic control unit connector (GF35A) terminal No. 26 and sensor connector terminal No. 2.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify harness.

Step 8	Inspection items		Inspection by control data
	Maintenance item		**<General Scanning Tool used>** • Measure item “OXI CAT Temperature”. **<Multi-Use Tester used>** • Measure item No. 58 “Exhaust Gas Temperature” of Service Data.
	Inspection condition		While engine is warmed up
	Requirements		Temperature gradually rises up.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P0428/Flash code: 13
[Monitor]
Abnormality of catalytic temperature sensor
[Fault (outline)]
High signal range check
[Diagnosis check]
- Catalytic temperature sensor output voltage is monitored.

[Code generation condition]
- Voltage of DPF temperature sensor 1 remains over 4.96 V for approx. 1 second.
  (Warning lamp is lit and diagnosis code is displayed on second establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal
- Engine speed: more than 1200 rpm
- Injection quantity: more than 50 mm^3/st
- Water temperature: above –7°C {19°F}

[Control effected by electronic control unit during fault]
- Automatic diesel particulate filter regeneration is stopped.
- Control is carried out using backup value (200°C {392°F}).

[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and catalytic temperature sensor
- Abnormality of each connector
- Abnormality of catalytic temperature sensor
- Abnormality in electronic control unit

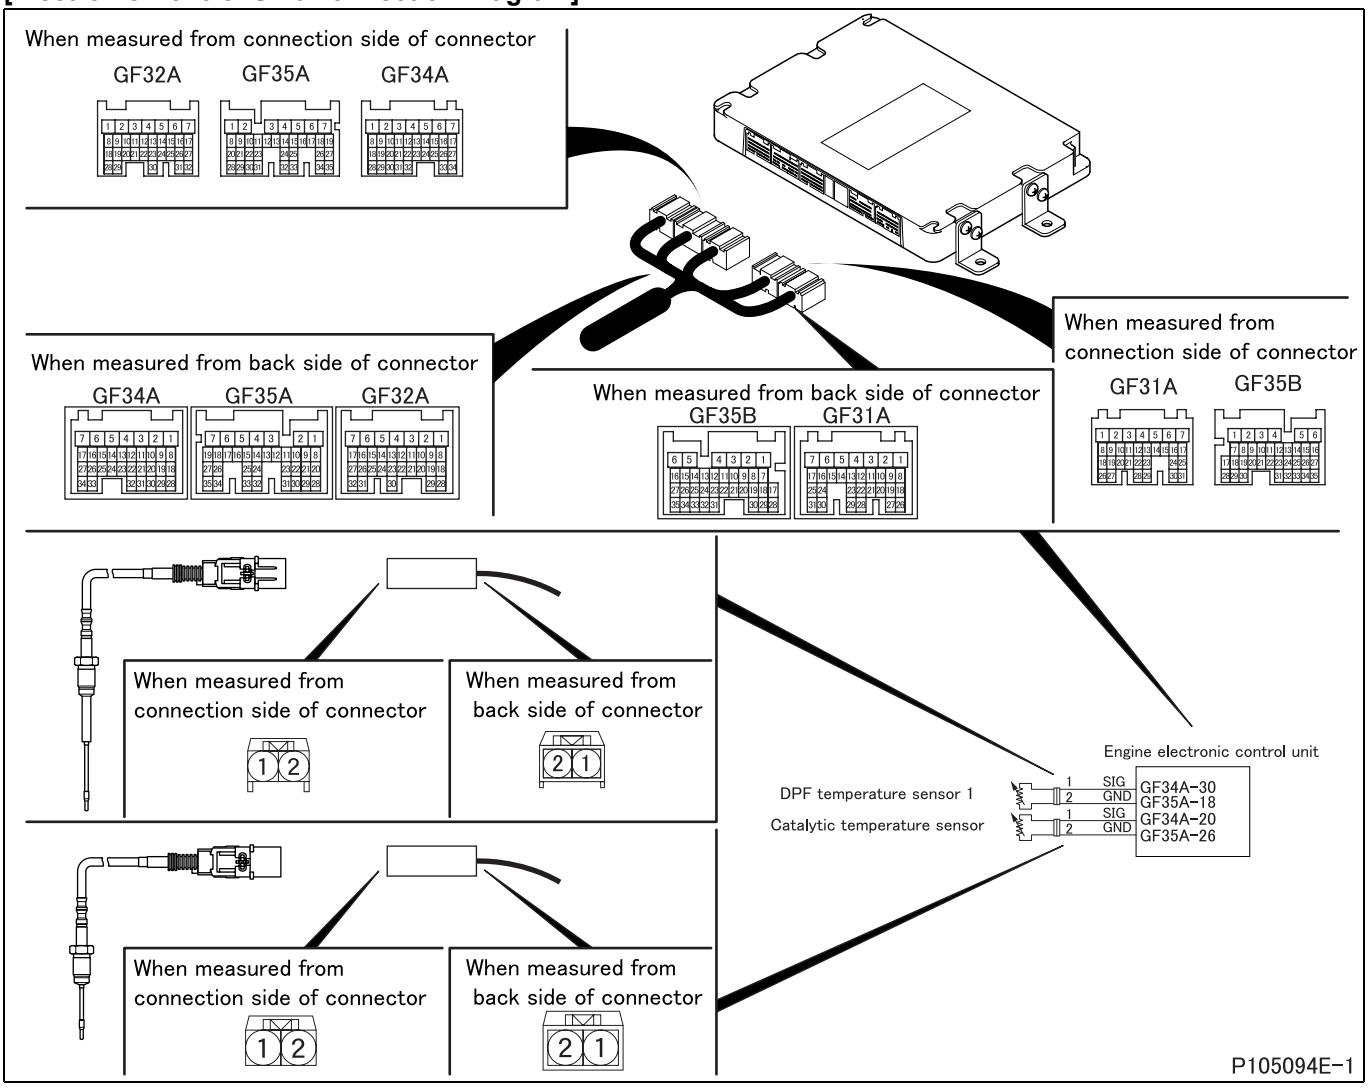
[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>
- Extinguished at 4th driving cycle after normal signal is input.

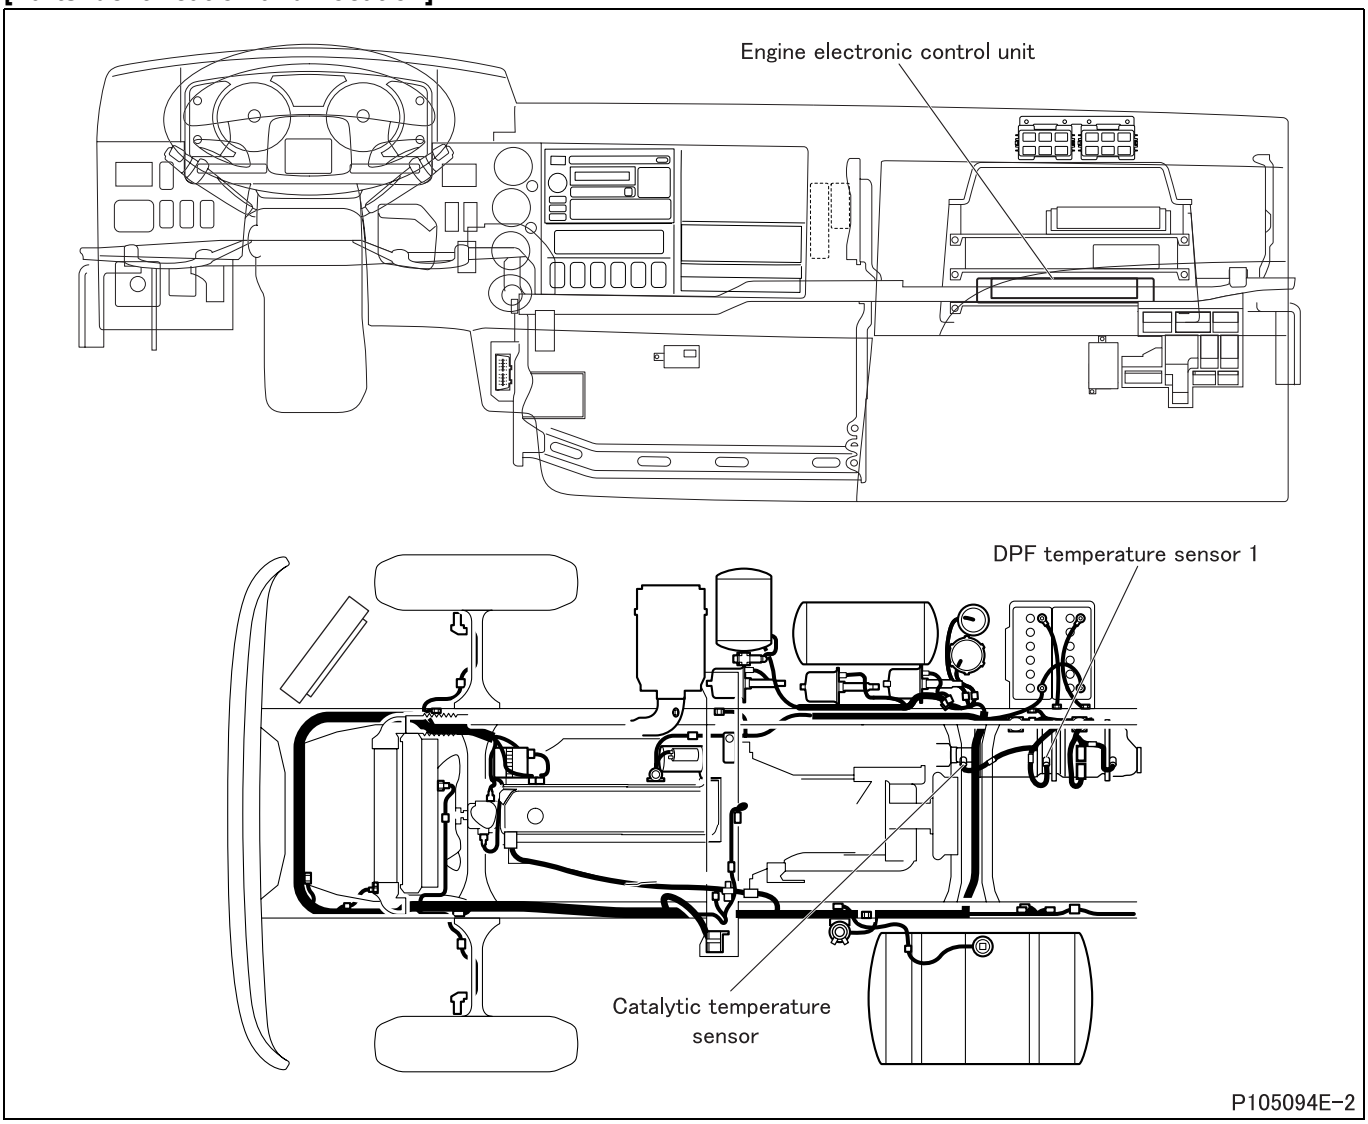
<Fault code>
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished. (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		**<General Scanning Tool used>** • Measure item “OXI CAT Temperature”. **<Multi-Use Tester used>** • Measure item No. 58 “Exhaust Gas Temperature” of Service Data.
	Inspection condition		While engine is warmed up
	Requirements		Temperature gradually rises up.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

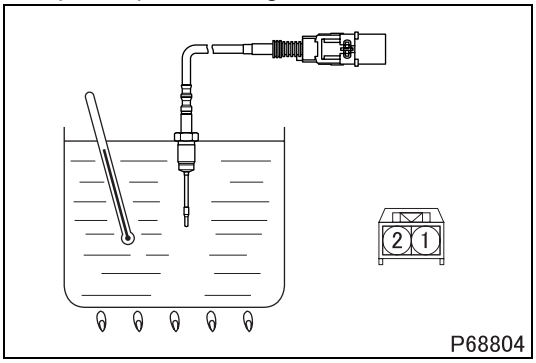
Step 2	Inspection items		Inspection by electronic control unit connector
	Maintenance item		Measure value of voltage between connector (GF34A) terminal No. 20 and (GF35A) terminal No. 26.
	Inspection condition		• Starter switch: OFF • Disconnect electronic control unit from harness and measure at vehicle-side connector half.
	Requirements		• 20°C {68°F} : 241.8 kΩ • 50°C {122°F} : 106.2 $^{+74.3}_{-41.8}$ kΩ • 100°C {212°F} : 33.56 $^{+17.60}_{-10.60}$ kΩ • 150°C {302°F} : 13.90 $^{+5.36}_{-3.60}$ kΩ • 200°C {392°F} : 6.896 $^{+2.064}_{-1.252}$ kΩ
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Go to step 4.

Step 3	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify connector.

Step 4	Inspection items		Inspection of sensor connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Modify connector.

Step 5	Inspection items		Inspection of catalytic temperature sensor unit
	Maintenance item		Measure value of resistance between connector terminal No. 1 and 2.
	Inspection condition		• Put catalytic temperature sensor in vessel filled with engine oil. • Heat the oil to each of the specified temperatures. Stir the oil well while doing so.
	Requirements		• 20°C {68°F} : 241.8 kΩ • 50°C {122°F} : 106.2 $^{+74.3}_{-41.8}$ kΩ • 100°C {212°F} : 33.56 $^{+17.60}_{-10.60}$ kΩ • 150°C {302°F} : 13.90 $^{+5.36}_{-3.60}$ kΩ • 200°C {392°F} : 6.896 $^{+2.064}_{-1.252}$ kΩ
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Replacement of sensor

<Step 5 inspection diagram>



Step 6	Inspection items		Inspection of harness between electronic control unit and sensor (power supply)
	Maintenance item		Check circuit between electronic control unit connector (GF34A) terminal No. 20 and sensor connector terminal No. 1.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify harness.

Step 7	Inspection items		Inspection of harness between electronic control unit and sensor (ground)
	Maintenance item		Check circuit between electronic control unit connector (GF35A) terminal No. 26 and sensor connector terminal No. 2.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify harness.

Step 8	Inspection items		Inspection by control data
	Maintenance item		**<General Scanning Tool used>** • Measure item “OXI CAT Temperature”. **<Multi-Use Tester used>** • Measure item No. 58 “Exhaust Gas Temperature” of Service Data.
	Inspection condition		While engine is warmed up
	Requirements		Temperature gradually rises up.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic control unit

Gain and offset drift
[Diagnosis check]
- Outputs from atmospheric pressure sensor and DPF absolute pressure sensor are compared to each other to determine if sensor outputs are normal or not.

[Code generation condition]
- Pressure difference between atmospheric pressure sensor and DPF absolute pressure sensor is more than 14.5 kPa {2.1 psi, 0.1 kgf/cm^2} and that condition lasts for approx. 5 seconds.
  (Warning lamp is lit and diagnosis code is displayed on second establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal
- Engine speed: less than 750 rpm
- Injection quantity: less than 20 mm^3/st
- Intake air temperature sensor 1: normal in output signal
- Boost temperature sensor: normal in output signal

[Control effected by electronic control unit during fault]
- Effects no special control.

[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and DPF absolute pressure sensor
- Abnormality of each connector
- Abnormality of DPF absolute pressure sensor
- Abnormality in electronic control unit

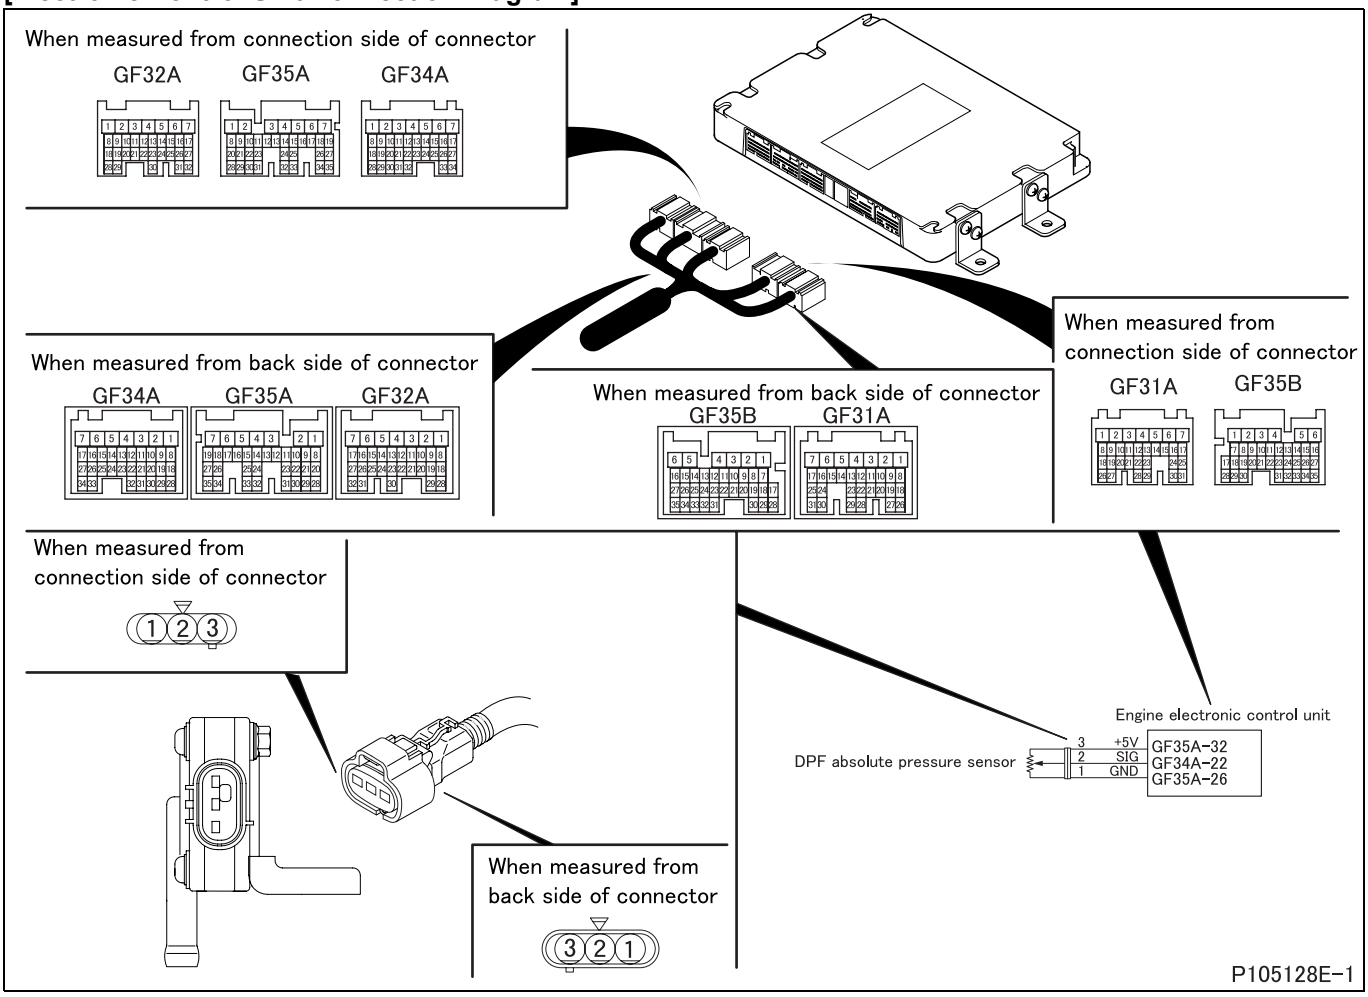
[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>
- Extinguished at 4th driving cycle after normal signal is input.

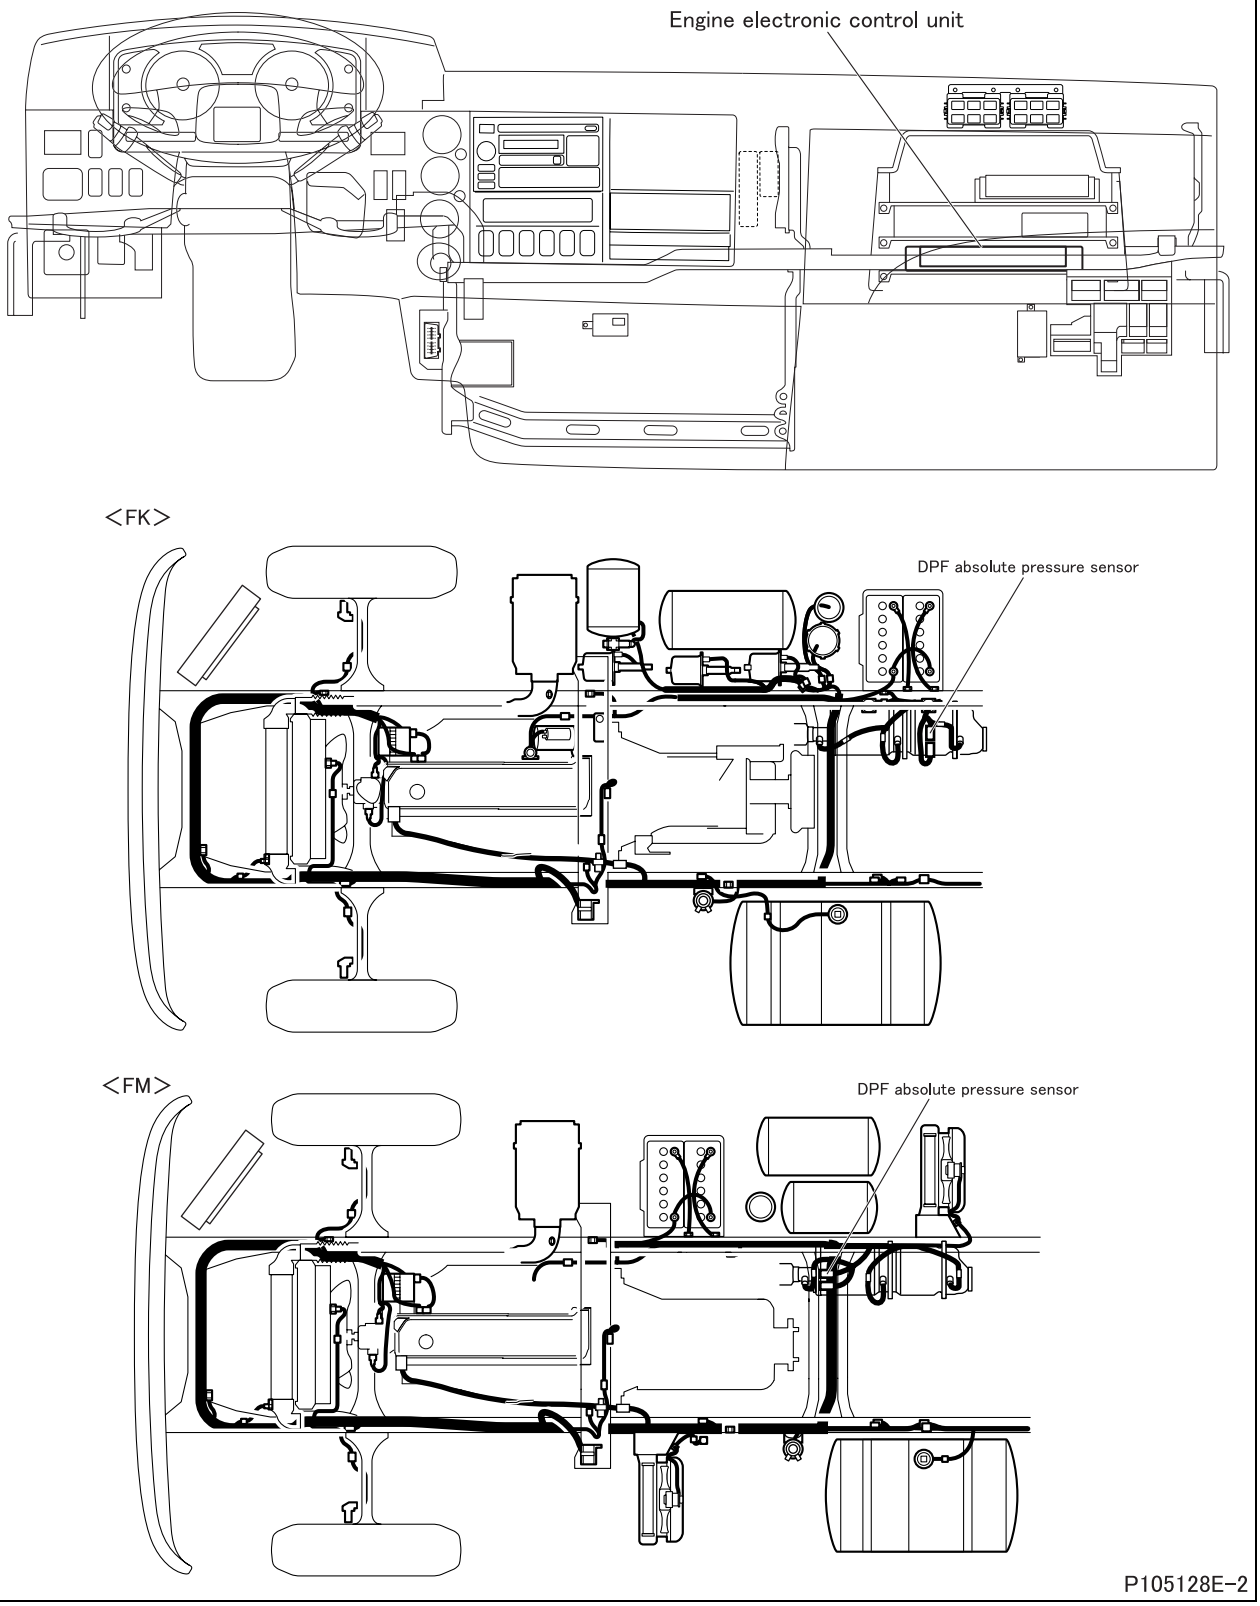
<Fault code>
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished. (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		Check if following diagnosis codes occur simultaneously. • P2453 “DPF Diff SNSR (Plausi) & MFF” • P2454 “DPF Diff SNSR (Low) & MFF” • P2455 “DPF Diff SNSR (High) & MFF”
	Inspection condition		• Starter switch: ON • Engine: stopped
	Requirements		Codes occur.
	Inspection result (Is the judging standard satisfied?)	YES	Inspect diagnosis code that is occurring.
		NO	Go to step 2.

Step 2	Inspection items		Inspection by control data
	Maintenance item		Measure item No. 33 “Exhaust gas pressure” of Service Data.
	Inspection condition		–
	Requirements		0 kPa {0 psi, 0 kgf/cm^2}
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 3.

Step 3	Inspection items		Inspection by electronic control unit connector (signal)
	Maintenance item		Measure value of voltage between connector (GF34A) terminal No. 22 (+) and (GF35A) terminal No. 26 (–).
	Inspection condition		• Starter switch: ON • Engine: stopped • Measure from back side of connector of harness with each device connected to harness.
	Requirements		1.875 to 4.5 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Go to step 4.

Step 4	Inspection items		Inspection by electronic control unit connector (power supply)
	Maintenance item		Measure value of voltage between connector (GF35A) terminal No. 32 (+) and 26 (–).
	Inspection condition		• Starter switch: ON • Engine: stopped • Measure from back side of connector of harness with each device connected to harness.
	Requirements		5 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Go to step 6.

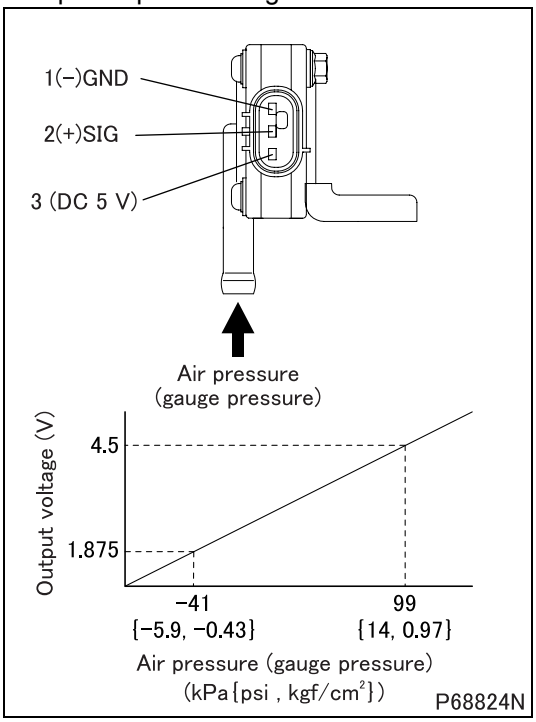
Step 5	Inspection items		Inspection by electronic control unit connector (ground)
	Maintenance item		Measure value of voltage between connector (GF35A) terminal No. 26 (+) and (GF31A) terminal No. 3 (–).
	Inspection condition		• Starter switch: ON • Engine: stopped • Measure from back side of connector of harness with each device connected to harness.
	Requirements		0 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Go to step 6.

Step 6	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 13.
		NO	Modify connector.

Step 7	Inspection items		Inspection of sensor connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify connector.

Step 8	Inspection items		Inspection of DPF absolute pressure sensor unit
	Maintenance item		Measure value of voltage between terminal No. 2 (+) and 1 (–).
	Inspection condition		• Apply voltage DC 5 V across connector terminals No. 3 (+) and 1 (–). • Gradually increase applied air pressure.
	Requirements		• –41 ± 3.2 kPa {–5.9 ± 0.5 psi, –0.43 ± 0.03 kgf/cm^2}: 1.875 V • 99 ± 3.2 kPa {14 ± 0.5 psi, 1.0 ± 0.03 kgf/cm^2}: 4.5 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 9.
		NO	Replacement of sensor

<Step 8 inspection diagram>



Step 9	Inspection items		Inspection by sensor connector
	Maintenance item		Measure value of voltage between terminal No. 3 (+) and 1 (–).
	Inspection condition		• Starter switch: ON • Engine: stopped • Measure from back side of connector of harness with each device connected to harness.
	Requirements		5 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 11.
		NO	Go to step 10.

Step 10	Inspection items		Inspection of harness between electronic control unit and sensor (power supply)
	Maintenance item		Check circuit between electronic control unit connector (GF35A) terminal No. 32 and sensor connector terminal No. 3.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 13.
		NO	Modify harness.

Step 11	Inspection items		Inspection of harness between electronic control unit and sensor (ground)
	Maintenance item		Check circuit between electronic control unit connector (GF35A) terminal No. 26 and sensor connector terminal No. 1.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 12.
		NO	Modify harness.

Step 12	Inspection items		Inspection of harness between electronic control unit and sensor (signal)
	Maintenance item		Check circuit between electronic control unit connector (GF34A) terminal No. 22 and sensor connector terminal No. 2.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 13.
		NO	Modify harness.

Step 13	Inspection items		Inspection by control data
	Maintenance item		Measure item No. 33 “Exhaust gas pressure” of Service Data.
	Inspection condition		–
	Requirements		0 kPa {0 psi, 0 kgf/cm^2}
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P0472/Flash code: 98
[Monitor]
Abnormality of DPF absolute pressure sensor
[Fault (outline)]
Low signal range check
[Diagnosis check]
- Output voltage of DPF absolute pressure sensor is monitored.

[Code generation condition]
- Voltage of DPF absolute pressure sensor remains under 0.2 V for approx. 2.5 seconds.
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal

[Control effected by electronic control unit during fault]
- Injection quantity is limited.
- Exhaust gas recirculation control is stopped.
- Throttle control is stopped.
- Diesel particulate filter regeneration (manual or automatic) is stopped.
- Control is carried out using backup value (101.3 kPa).

[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and DPF absolute pressure sensor
- Abnormality of each connector
- Abnormality of DPF absolute pressure sensor
- Abnormality in electronic control unit

[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>
- Extinguished at 4th driving cycle after normal signal is input.

<Fault code>
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished. (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		Check if following diagnosis codes occur simultaneously. • P2453 “DPF Diff SNSR (Plausi) & MFF” • P2454 “DPF Diff SNSR (Low) & MFF” • P2455 “DPF Diff SNSR (High) & MFF”
	Inspection condition		• Starter switch: ON • Engine: stopped
	Requirements		Codes occur.
	Inspection result (Is the judging standard satisfied?)	YES	Inspect diagnosis code that is occurring.
		NO	Go to step 2.

Step 2	Inspection items		Inspection by control data
	Maintenance item		Measure item No. 33 “Exhaust gas pressure” of Service Data.
	Inspection condition		–
	Requirements		0 kPa {0 psi, 0 kgf/cm^2}
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 3.

Step 3	Inspection items		Inspection by electronic control unit connector (signal)
	Maintenance item		Measure value of voltage between connector (GF34A) terminal No. 22 (+) and (GF35A) terminal No. 26 (–).
	Inspection condition		• Starter switch: ON • Engine: stopped • Measure from back side of connector of harness with each device connected to harness.
	Requirements		1.875 to 4.5 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Go to step 4.

Step 4	Inspection items		Inspection by electronic control unit connector (power supply)
	Maintenance item		Measure value of voltage between connector (GF35A) terminal No. 32 (+) and 26 (–).
	Inspection condition		• Starter switch: ON • Engine: stopped • Measure from back side of connector of harness with each device connected to harness.
	Requirements		5 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Go to step 6.

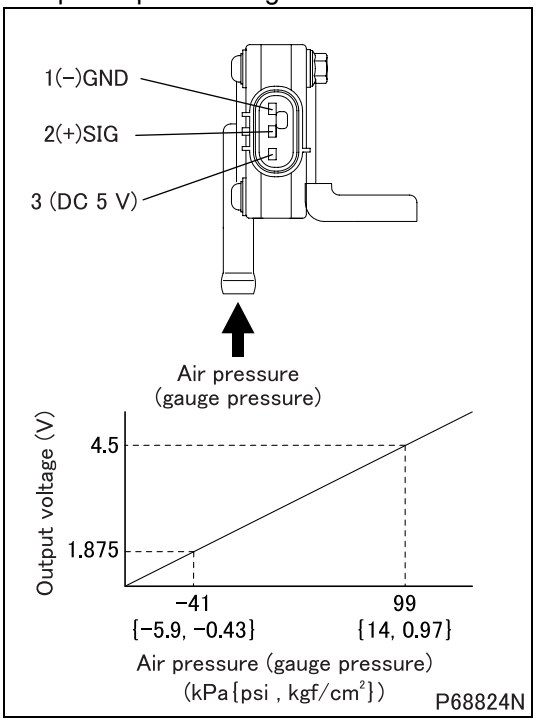
Step 5	Inspection items		Inspection by electronic control unit connector (ground)
	Maintenance item		Measure value of voltage between connector (GF35A) terminal No. 26 (+) and (GF31A) terminal No. 3 (–).
	Inspection condition		• Starter switch: ON • Engine: stopped • Measure from back side of connector of harness with each device connected to harness.
	Requirements		0 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Go to step 6.

Step 6	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 13.
		NO	Modify connector.

Step 7	Inspection items		Inspection of sensor connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify connector.

Step 8	Inspection items		Inspection of DPF absolute pressure sensor unit
	Maintenance item		Measure value of voltage between terminal No. 2 (+) and 1 (–).
	Inspection condition		• Apply voltage DC 5 V across connector terminals No. 3 (+) and 1 (–). • Gradually increase applied air pressure.
	Requirements		• –41 ± 3.2 kPa {–5.9 ± 0.5 psi, –0.43 ± 0.03 kgf/cm^2}: 1.875 V • 99 ± 3.2 kPa {14 ± 0.5 psi, 1.0 ± 0.03 kgf/cm^2}: 4.5 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 9.
		NO	Replacement of sensor

<Step 8 inspection diagram>



Step 9	Inspection items		Inspection by sensor connector
	Maintenance item		Measure value of voltage between terminal No. 3 (+) and 1 (–)
	Inspection condition		• Starter switch: ON • Engine: stopped • Measure from back side of connector of harness with each device connected to harness.
	Requirements		5 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 11.
		NO	Go to step 10.

Step 10	Inspection items		Inspection of harness between electronic control unit and sensor (power supply)
	Maintenance item		Check circuit between electronic control unit connector (GF35A) terminal No. 32 and sensor connector terminal No. 3.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 13.
		NO	Modify harness.

Step 11	Inspection items		Inspection of harness between electronic control unit and sensor (ground)
	Maintenance item		Check circuit between electronic control unit connector (GF35A) terminal No. 26 and sensor connector terminal No. 1.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 12.
		NO	Modify harness.

Step 12	Inspection items		Inspection of harness between electronic control unit and sensor (signal)
	Maintenance item		Check circuit between electronic control unit connector (GF34A) terminal No. 22 and sensor connector terminal No. 2.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 13.
		NO	Modify harness.

Step 13	Inspection items		Inspection by control data
	Maintenance item		Measure item No. 33 “Exhaust gas pressure” of Service Data.
	Inspection condition		–
	Requirements		0 kPa {0 psi, 0 kgf/cm^2}
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P0473/Flash code: 98
[Monitor]
Abnormality of DPF absolute pressure sensor
[Fault (outline)]
High signal range check
[Diagnosis check]
- Output voltage of DPF absolute pressure sensor is monitored.

[Code generation condition]
- Voltage of DPF absolute pressure sensor remains over 4.8 V for approx. 2.5 seconds.
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal

[Control effected by electronic control unit during fault]
- Injection quantity is limited.
- Exhaust gas recirculation control is stopped.
- Throttle control is stopped.
- Diesel particulate filter regeneration (manual or automatic) is stopped.
- Control is carried out using backup value (101.3 kPa).

[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and DPF absolute pressure sensor
- Abnormality of each connector

- Abnormality in electronic control unit

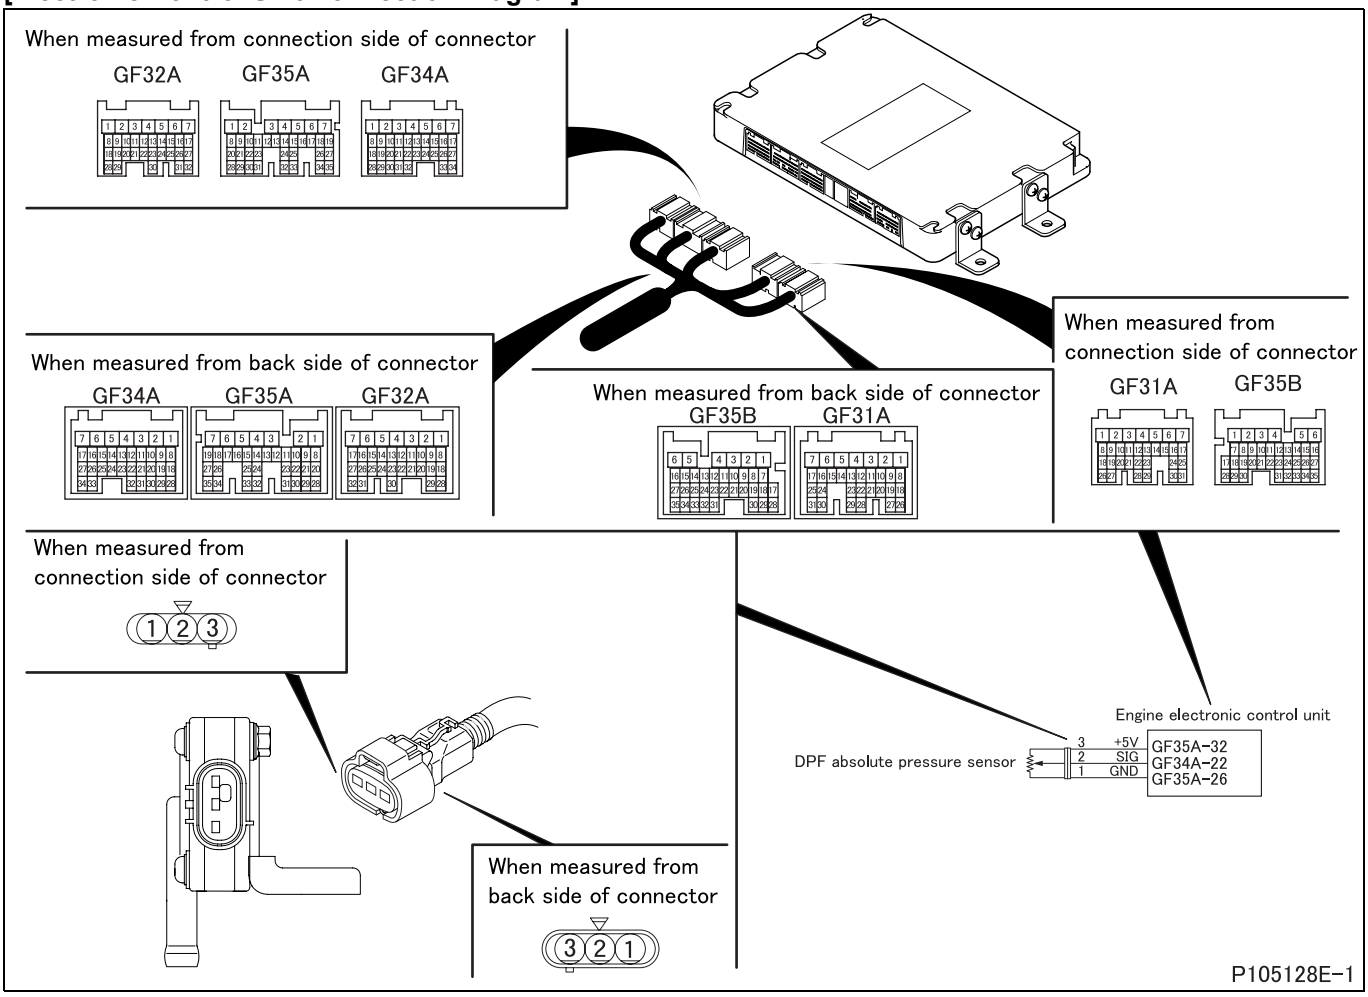
[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>
- Extinguished at 4th driving cycle after normal signal is input.

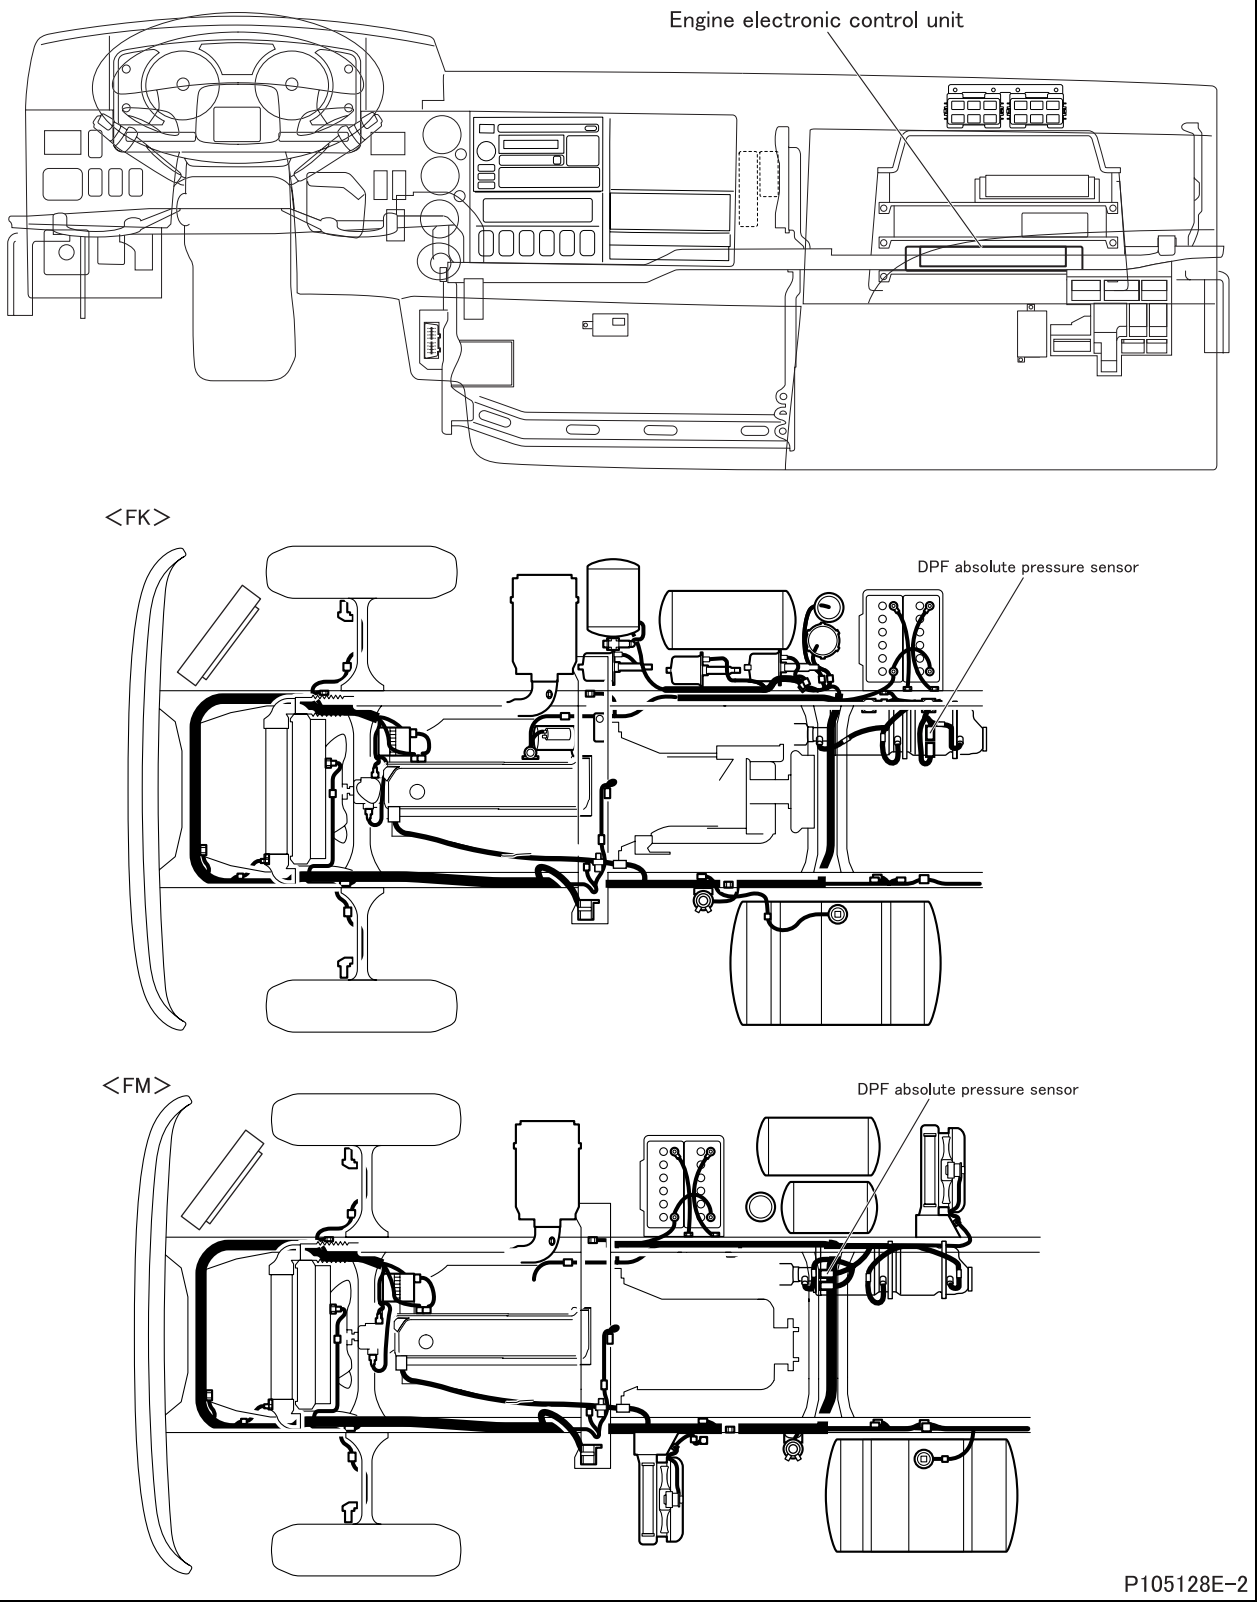
<Fault code>
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished. (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		Check if following diagnosis codes occur simultaneously. • P2453 “DPF Diff SNSR (Plausi) & MFF” • P2454 “DPF Diff SNSR (Low) & MFF” • P2455 “DPF Diff SNSR (High) & MFF”
	Inspection condition		• Starter switch: ON • Engine: stopped
	Requirements		Codes occur.
	Inspection result (Is the judging standard satisfied?)	YES	Inspect diagnosis code that is occurring.
		NO	Go to step 2.

Step 2	Inspection items		Inspection by control data
	Maintenance item		Measure item No. 33 “Exhaust gas pressure” of Service Data.
	Inspection condition		–
	Requirements		0 kPa {0 psi, 0 kgf/cm^2}
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 3.

Step 3	Inspection items		Inspection by electronic control unit connector (signal)
	Maintenance item		Measure value of voltage between connector (GF34A) terminal No. 22 (+) and (GF35A) terminal No. 26 (–).
	Inspection condition		• Starter switch: ON • Engine: stopped • Measure from back side of connector of harness with each device connected to harness.
	Requirements		1.875 to 4.5 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Go to step 4.

Step 4	Inspection items		Inspection by electronic control unit connector (power supply)
	Maintenance item		Measure value of voltage between connector (GF35A) terminal No. 32 (+) and 26 (–).
	Inspection condition		• Starter switch: ON • Engine: stopped • Measure from back side of connector of harness with each device connected to harness.
	Requirements		5 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Go to step 6.

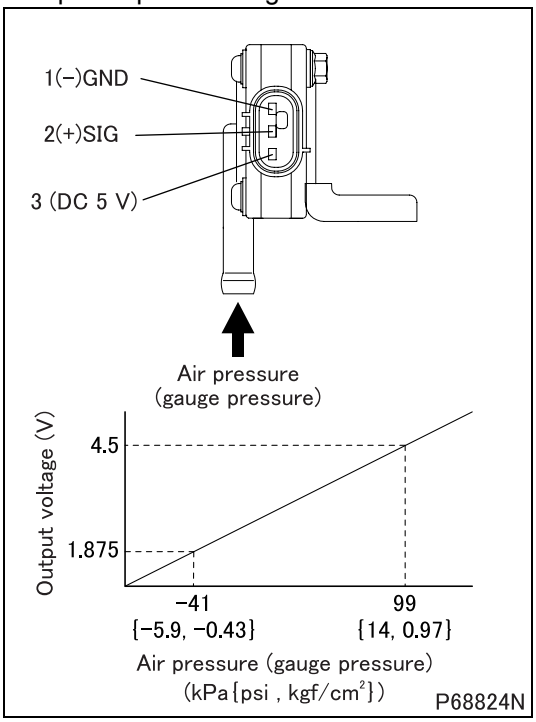
Step 5	Inspection items		Inspection by electronic control unit connector (ground)
	Maintenance item		Measure value of voltage between connector (GF35A) terminal No. 26 (+) and (GF31A) terminal No. 3 (–).
	Inspection condition		• Starter switch: ON • Engine: stopped • Measure from back side of connector of harness with each device connected to harness.
	Requirements		0 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Go to step 6.

Step 6	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 13.
		NO	Modify connector.

Step 7	Inspection items		Inspection of sensor connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify connector.

Step 8	Inspection items		Inspection of DPF absolute pressure sensor unit
	Maintenance item		Measure value of voltage between terminal No. 2 (+) and 1 (–).
	Inspection condition		• Apply voltage DC 5 V across connector terminals No. 3 (+) and 1 (–). • Gradually increase applied air pressure.
	Requirements		• –41 ± 3.2 kPa {–5.9 ± 0.5 psi, –0.43 ± 0.03 kgf/cm^2}: 1.875 V • 99 ± 3.2 kPa {14 ± 0.5 psi, 1.0 ± 0.03 kgf/cm^2}: 4.5 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 9.
		NO	Replacement of sensor

<Step 8 inspection diagram>



Step 9	Inspection items		Inspection by sensor connector
	Maintenance item		Measure value of voltage between terminal No. 3 (+) and 1 (–)
	Inspection condition		• Starter switch: ON • Engine: stopped • Measure from back side of connector of harness with each device connected to harness.
	Requirements		5 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 11.
		NO	Go to step 10.

Step 10	Inspection items		Inspection of harness between electronic control unit and sensor (power supply)
	Maintenance item		Check circuit between electronic control unit connector (GF35A) terminal No. 32 and sensor connector terminal No. 3.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 13.
		NO	Modify harness.

Step 11	Inspection items		Inspection of harness between electronic control unit and sensor (ground)
	Maintenance item		Check circuit between electronic control unit connector (GF35A) terminal No. 26 and sensor connector terminal No. 1.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 12.
		NO	Modify harness.

Step 12	Inspection items		Inspection of harness between electronic control unit and sensor (signal)
	Maintenance item		Check circuit between electronic control unit connector (GF34A) terminal No. 22 and sensor connector terminal No. 2.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 13.
		NO	Modify harness.

Step 13	Inspection items		Inspection by control data
	Maintenance item		Measure item No. 33 “Exhaust gas pressure” of Service Data.
	Inspection condition		–
	Requirements		0 kPa {0 psi, 0 kgf/cm^2}
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P0477/Flash code: 94
[Monitor]
Abnormality of exhaust shutter 3-way magnetic valve 2
[Fault (outline)]
- Short circuit ground
- Open circuit

[Diagnosis check]
- Exhaust shutter 3-way magnetic valve 2 circuit is monitored for fault.

[Code generation condition]
- Exhaust shutter 3-way magnetic valve 2 circuit remains shorted to ground or open as detected for approx. 1 second. (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal
- Exhaust shutter 3-way magnetic valve 2: inactive

[Control effected by electronic control unit during fault]
- Injection quantity is limited.
- Exhaust gas recirculation control is stopped.
- Throttle control is stopped.
- Diesel particulate filter regeneration (manual or automatic) is stopped.

[Probable cause of trouble]
- Short-circuit of harness between electronic control unit and exhaust shutter 3-way magnetic valve 2
- Abnormality of each connector
- Abnormality of exhaust shutter 3-way magnetic valve 2
- Abnormality in electronic control unit

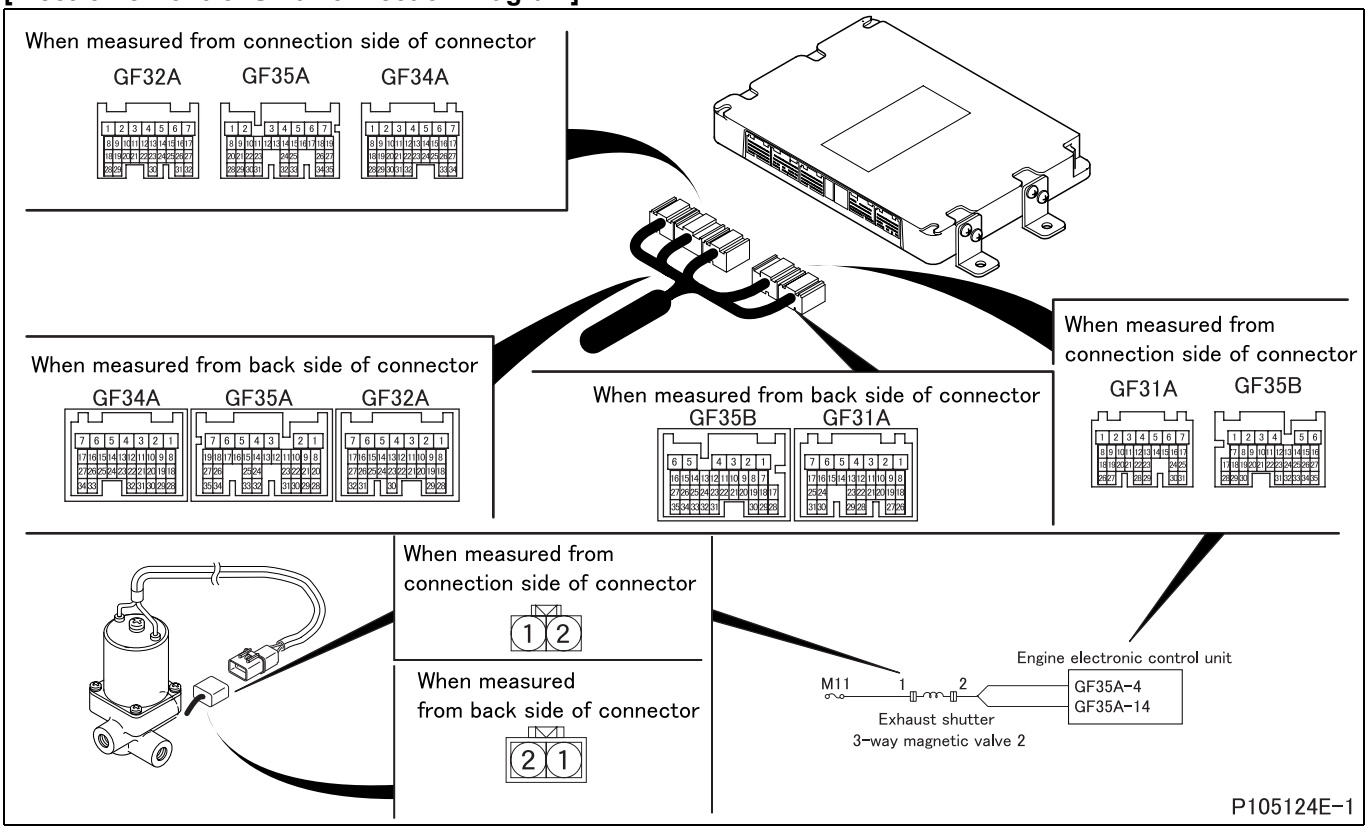
[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>
- Extinguished at 4th driving cycle after normal signal is input.

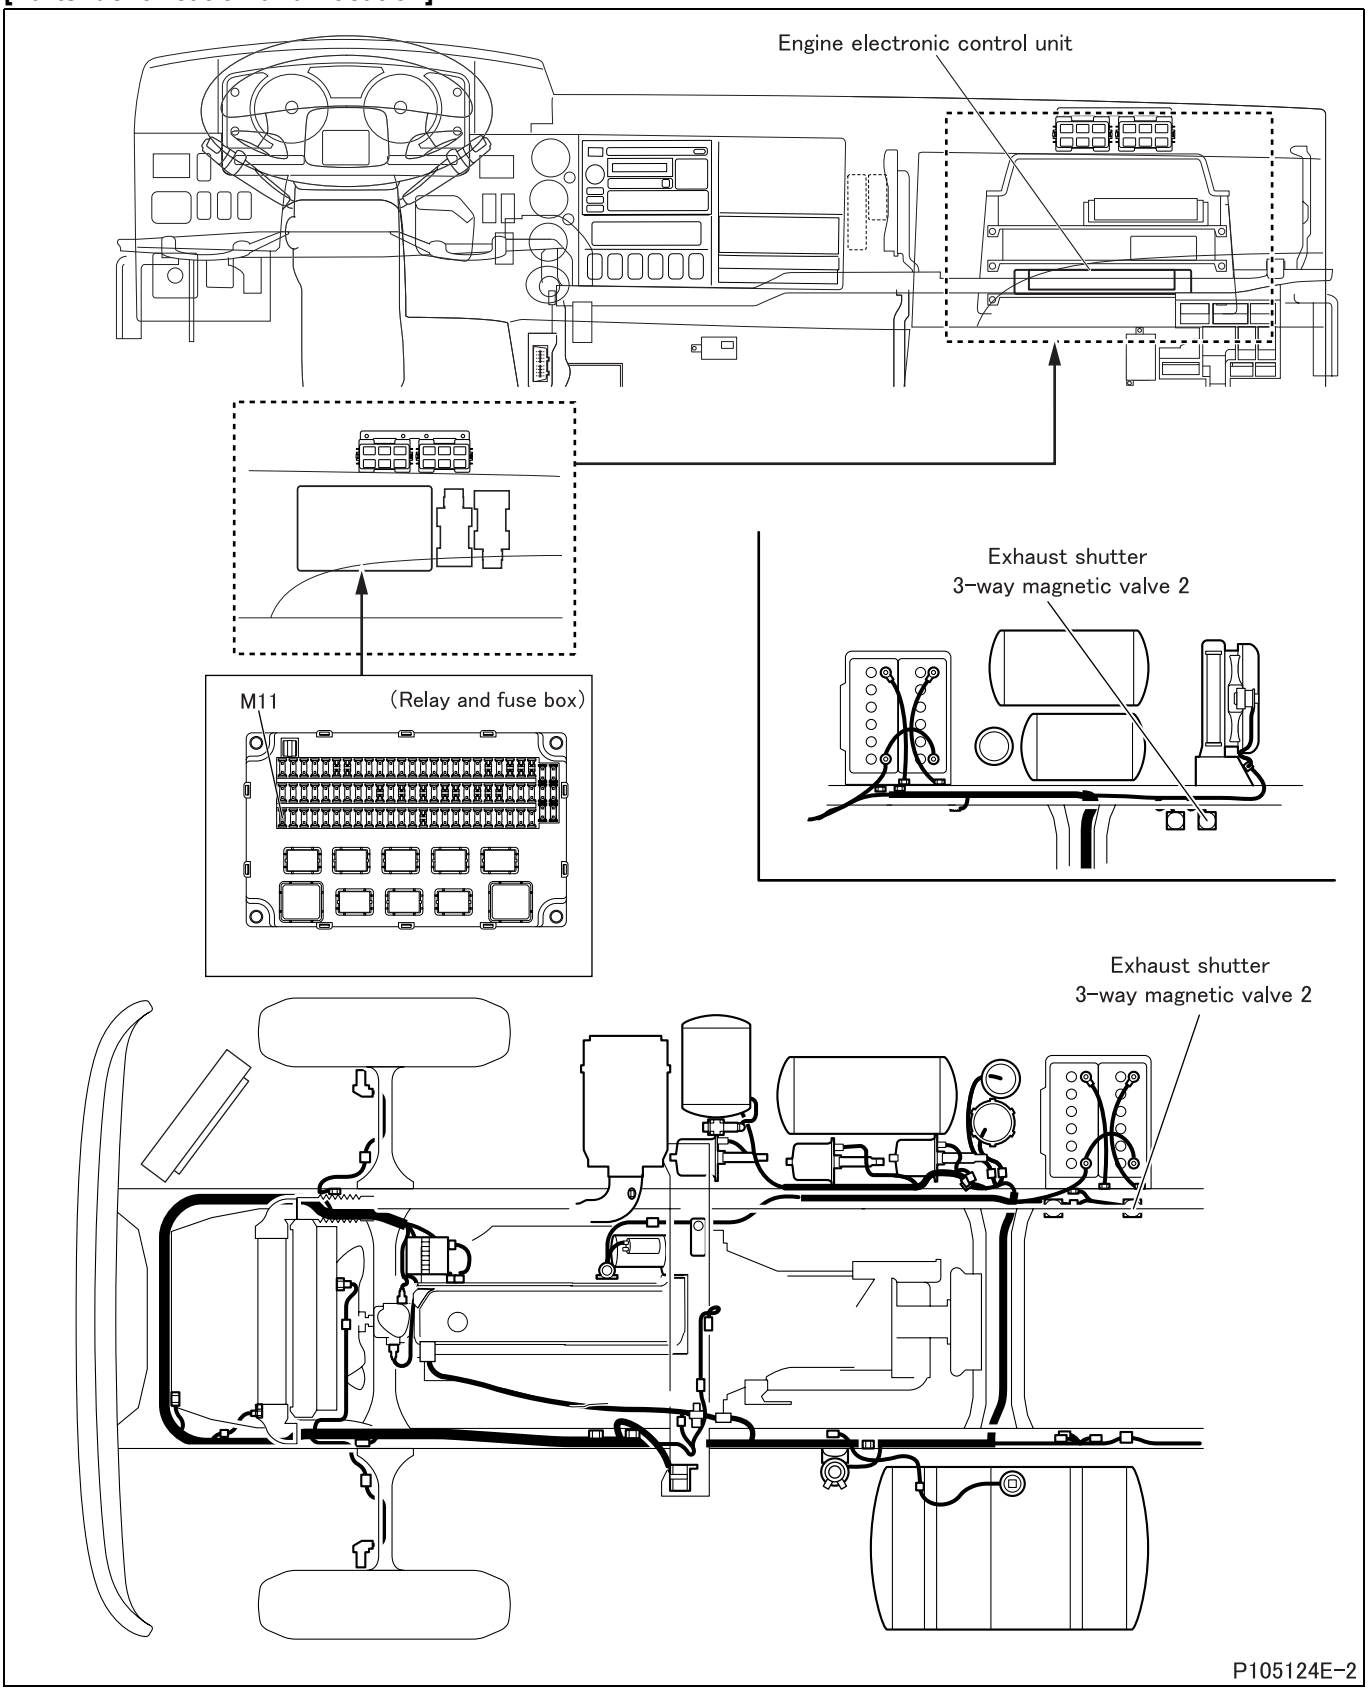
<Fault code>
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished. (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

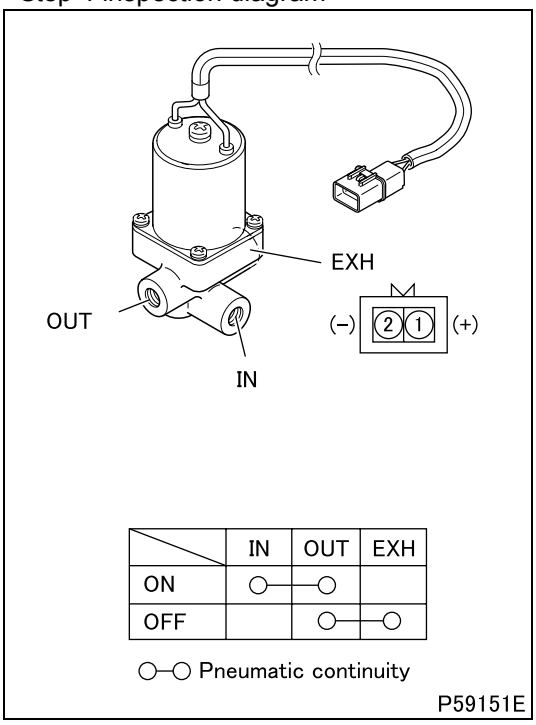
Step 1	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. AB “Exhaust Brake M/V1 + M/V2”.
	Inspection condition		Starter switch: ON
	Requirements		3-way magnetic valve operation sound is noted (automatically reset after 6 seconds), or ON/OFF switching of Service Data: item No. 88 “Exhaust M/V” is effected.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

Step 2	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Modify connector.

Step 3	Inspection items		Inspection of 3-way magnetic valve connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	Modify connector.

Step 4	Inspection items		Inspection of 3-way magnetic valve unit
	Maintenance item		Measure minimum operating voltage when 3-way magnetic valve operates (judge by operation sound).
	Inspection condition		Gradually increase from zero the voltage applied to terminals No. 1 (+) and 2 (–).
	Requirements		10 V or less
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Replacement of 3-way magnetic valve

<Step 4 inspection diagram>



Step 5	Inspection items		Inspection of harness between 3-way magnetic valve and electronic control unit (ground)
	Maintenance item		Check circuit between 3-way magnetic valve connector terminal No. 2 and electronic control unit connector (GF35A) terminal No. 4 or 14.
	Inspection condition		Disconnect electronic control unit from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Modify harness.

Step 6	Inspection items		Inspection of harness between 3-way magnetic valve and fuse (power supply)
	Maintenance item		Check circuit between 3-way magnetic valve connector terminal No. 1 and fuse (M11).
	Inspection condition		Disconnect electronic control unit from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify harness.

Step 7	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. AB “Exhaust Brake M/V1 + M/V2”
	Inspection condition		Starter switch: ON
	Requirements		3-way magnetic valve operation sound is noted (automatically reset after 6 seconds), or ON/OFF switching of Service Data: item No. 88 “Exhaust M/V” is effected.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P0478/Flash code: 94
[Monitor]
Abnormality of exhaust shutter 3-way magnetic valve 2
[Fault (outline)]
Short circuit battery
[Diagnosis check]
- Exhaust shutter 3-way magnetic valve 2 circuit is monitored for fault.

[Code generation condition]
- Exhaust shutter 3-way magnetic valve 2 circuit remains shorted to battery as detected for approx. 1 second. (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal
- Exhaust shutter 3-way magnetic valve 2: active

[Control effected by electronic control unit during fault]
- Injection quantity is limited.
- Exhaust gas recirculation control is stopped.
- Throttle control is stopped.
- Diesel particulate filter regeneration (manual or automatic) is stopped.

[Probable cause of trouble]
- Short-circuit of harness between electronic control unit and exhaust shutter 3-way magnetic valve 2
- Abnormality of each connector
- Abnormality of exhaust shutter 3-way magnetic valve 2
- Abnormality in electronic control unit

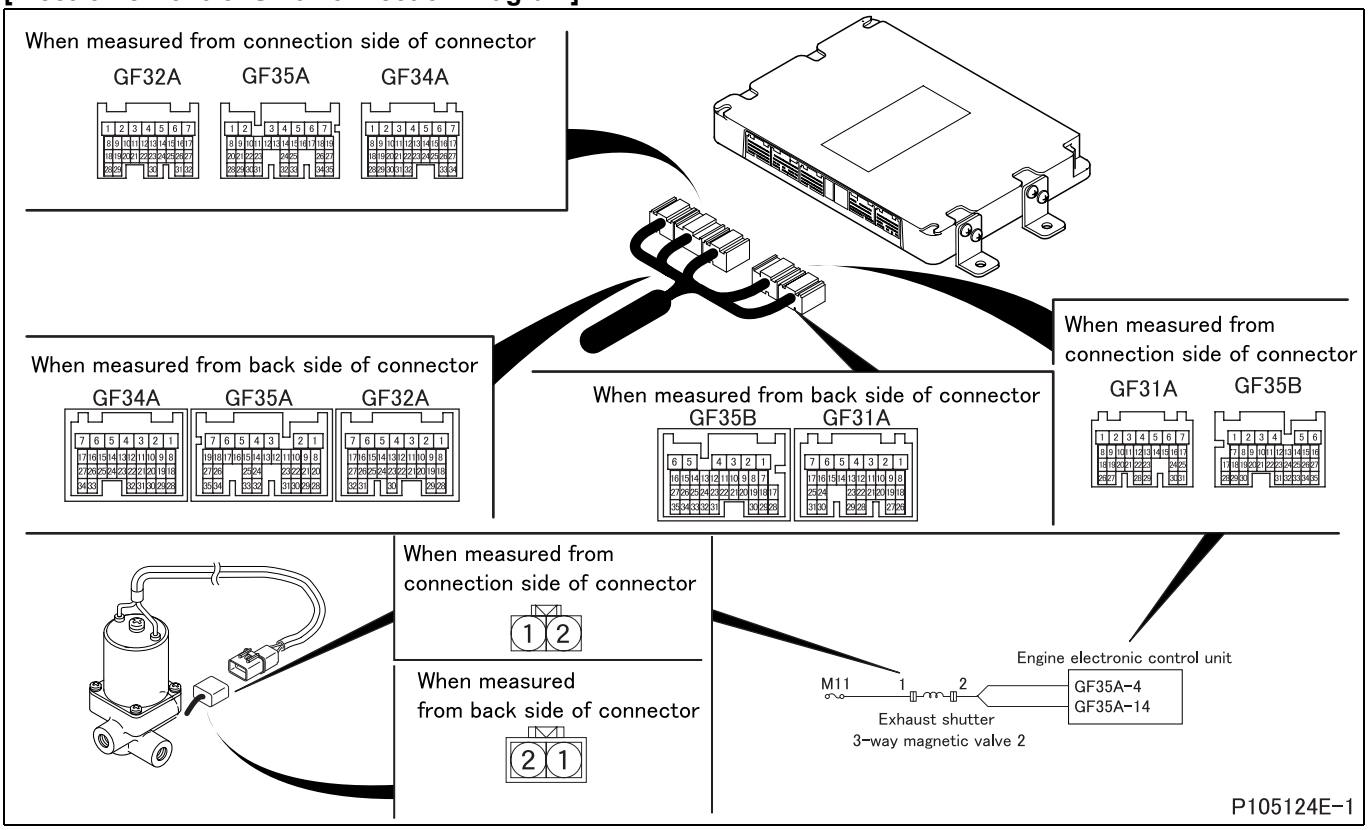
[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>
- Extinguished at 4th driving cycle after normal signal is input.

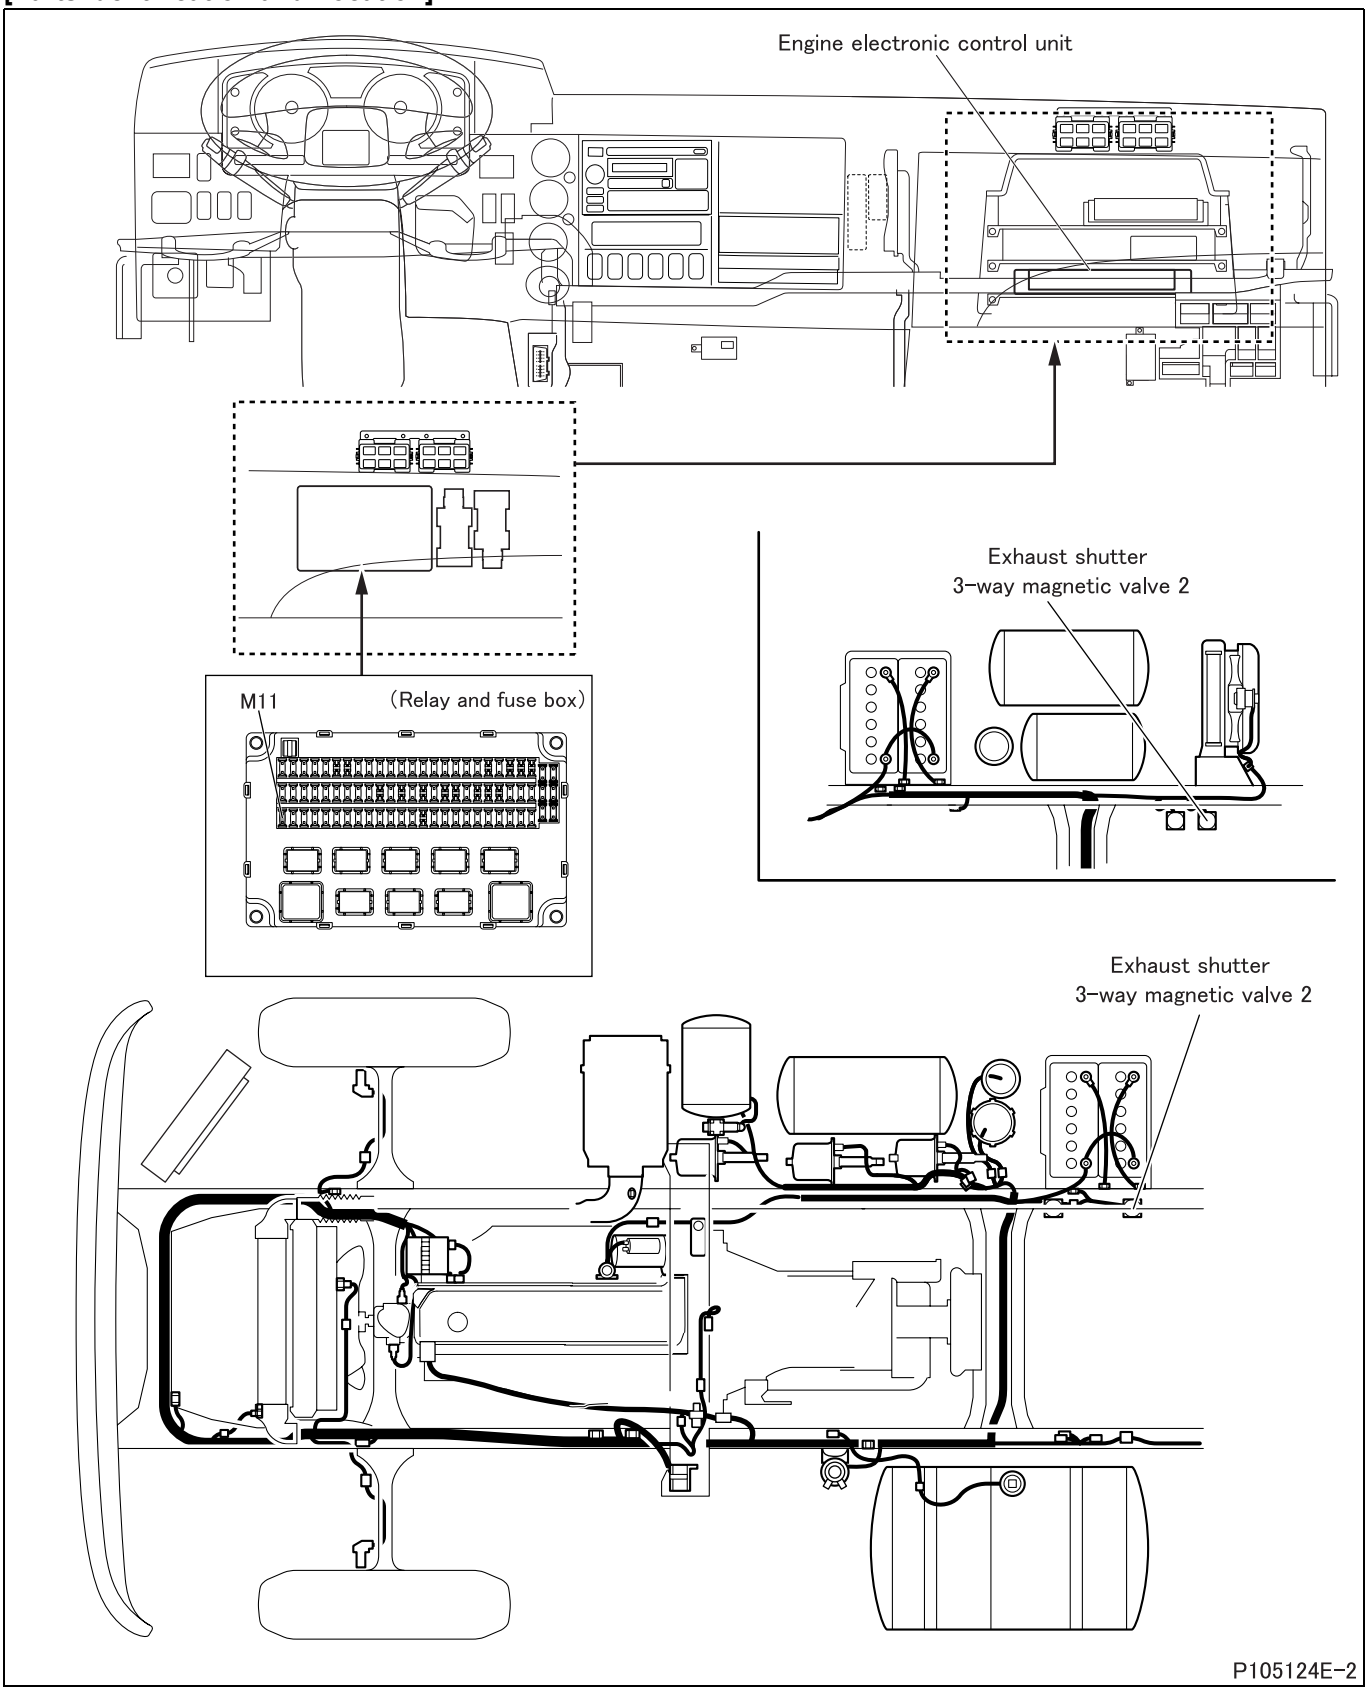
<Fault code>
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished. (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

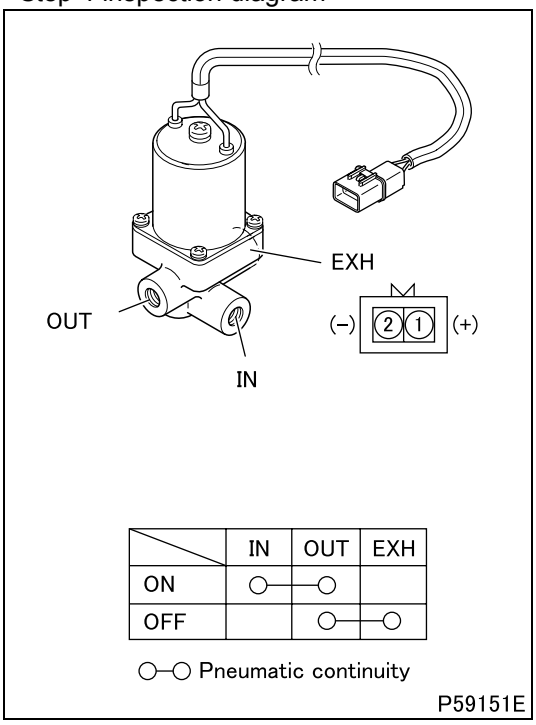
Step 1	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. AB “Exhaust Brake M/V1 + M/V2”.
	Inspection condition		Starter switch: ON
	Requirements		3-way magnetic valve operation sound is noted (automatically reset after 6 seconds), or ON/OFF switching of Service Data: item No. 88 “Exhaust M/V” is effected.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

Step 2	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Modify connector.

Step 3	Inspection items		Inspection of 3-way magnetic valve connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	Modify connector.

Step 4	Inspection items		Inspection of 3-way magnetic valve unit
	Maintenance item		Measure minimum operating voltage when 3-way magnetic valve operates (judge by operation sound).
	Inspection condition		Gradually increase from zero the voltage applied to terminals No. 1 (+) and 2 (–).
	Requirements		10 V or less
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Replacement of 3-way magnetic valve

<Step 4 inspection diagram>



Step 5	Inspection items		Inspection of harness between 3-way magnetic valve and electronic control unit (ground)
	Maintenance item		Check circuit between 3-way magnetic valve connector terminal No. 2 and electronic control unit connector (GF35A) terminal No. 4 or 14.
	Inspection condition		Disconnect electronic control unit from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Modify harness.

Step 6	Inspection items		Inspection of harness between 3-way magnetic valve and fuse (power supply)
	Maintenance item		Check circuit between 3-way magnetic valve connector terminal No. 1 and fuse (M11).
	Inspection condition		Disconnect electronic control unit from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify harness.

Step 7	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. AB “Exhaust Brake M/V1 + M/V2”
	Inspection condition		Starter switch: ON
	Requirements		3-way magnetic valve operation sound is noted (automatically reset after 6 seconds), or ON/OFF switching of Service Data: item No. 88 “Exhaust M/V” is effected.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P0500/Flash code: 25
[Monitor]
Abnormality of vehicle speed sensor
[Fault (outline)]
Signal invalid
[Diagnosis check]
- Output signal of vehicle speed sensor is monitored.

[Code generation condition]
- Abnormality of vehicle speed sensor signal (pulse inputs changing suddenly) during vehicle run remains as detected for approx. 5 seconds.
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal
- Engine in operation

[Control effected by electronic control unit during fault]
- Injection quantity is limited.
- Exhaust gas recirculation control is stopped.
- Throttle control is stopped.
- Diesel particulate filter regeneration (manual or automatic) is stopped.
- Auto cruise control is stopped.
- Vehicle speed limiting control is suspended.

[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and vehicle speed sensor
- Abnormality of each connector
- Abnormality of pulse divider
- Abnormality of vehicle speed sensor
- Abnormality in electronic control unit

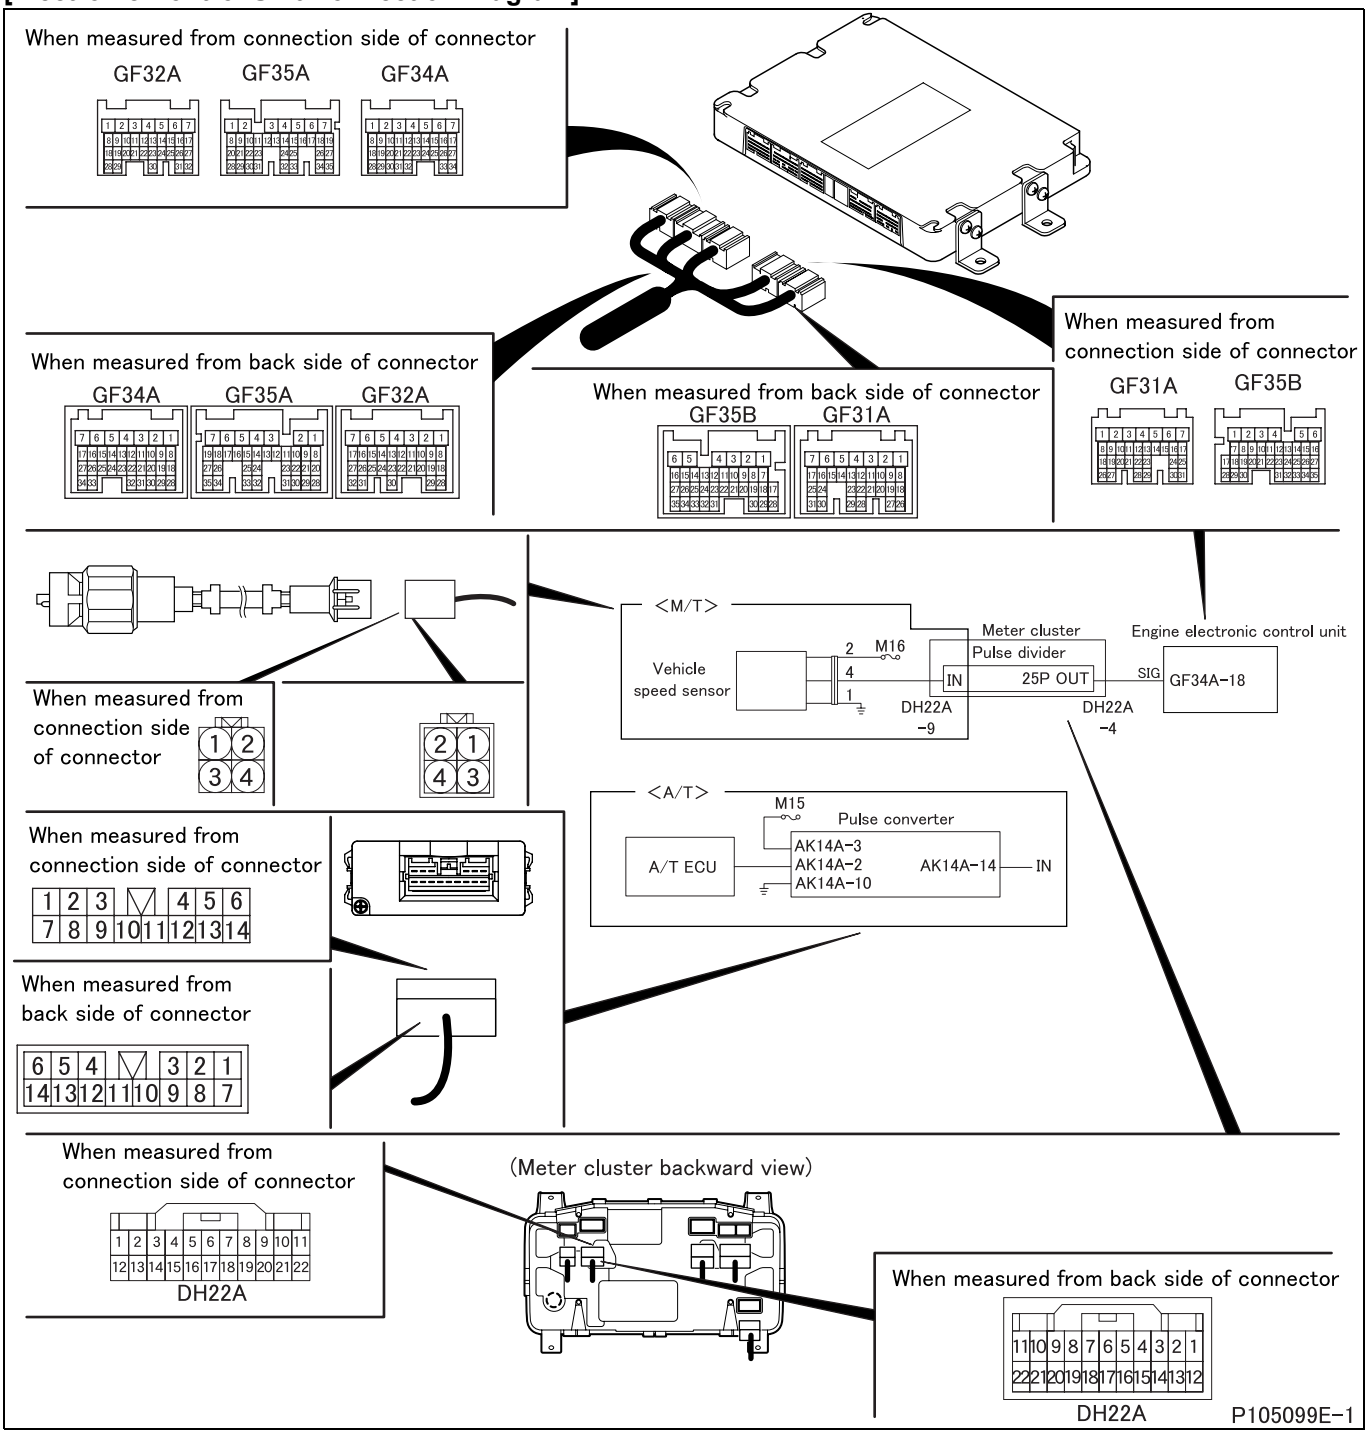
[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>
- Extinguished after input of normal signal.

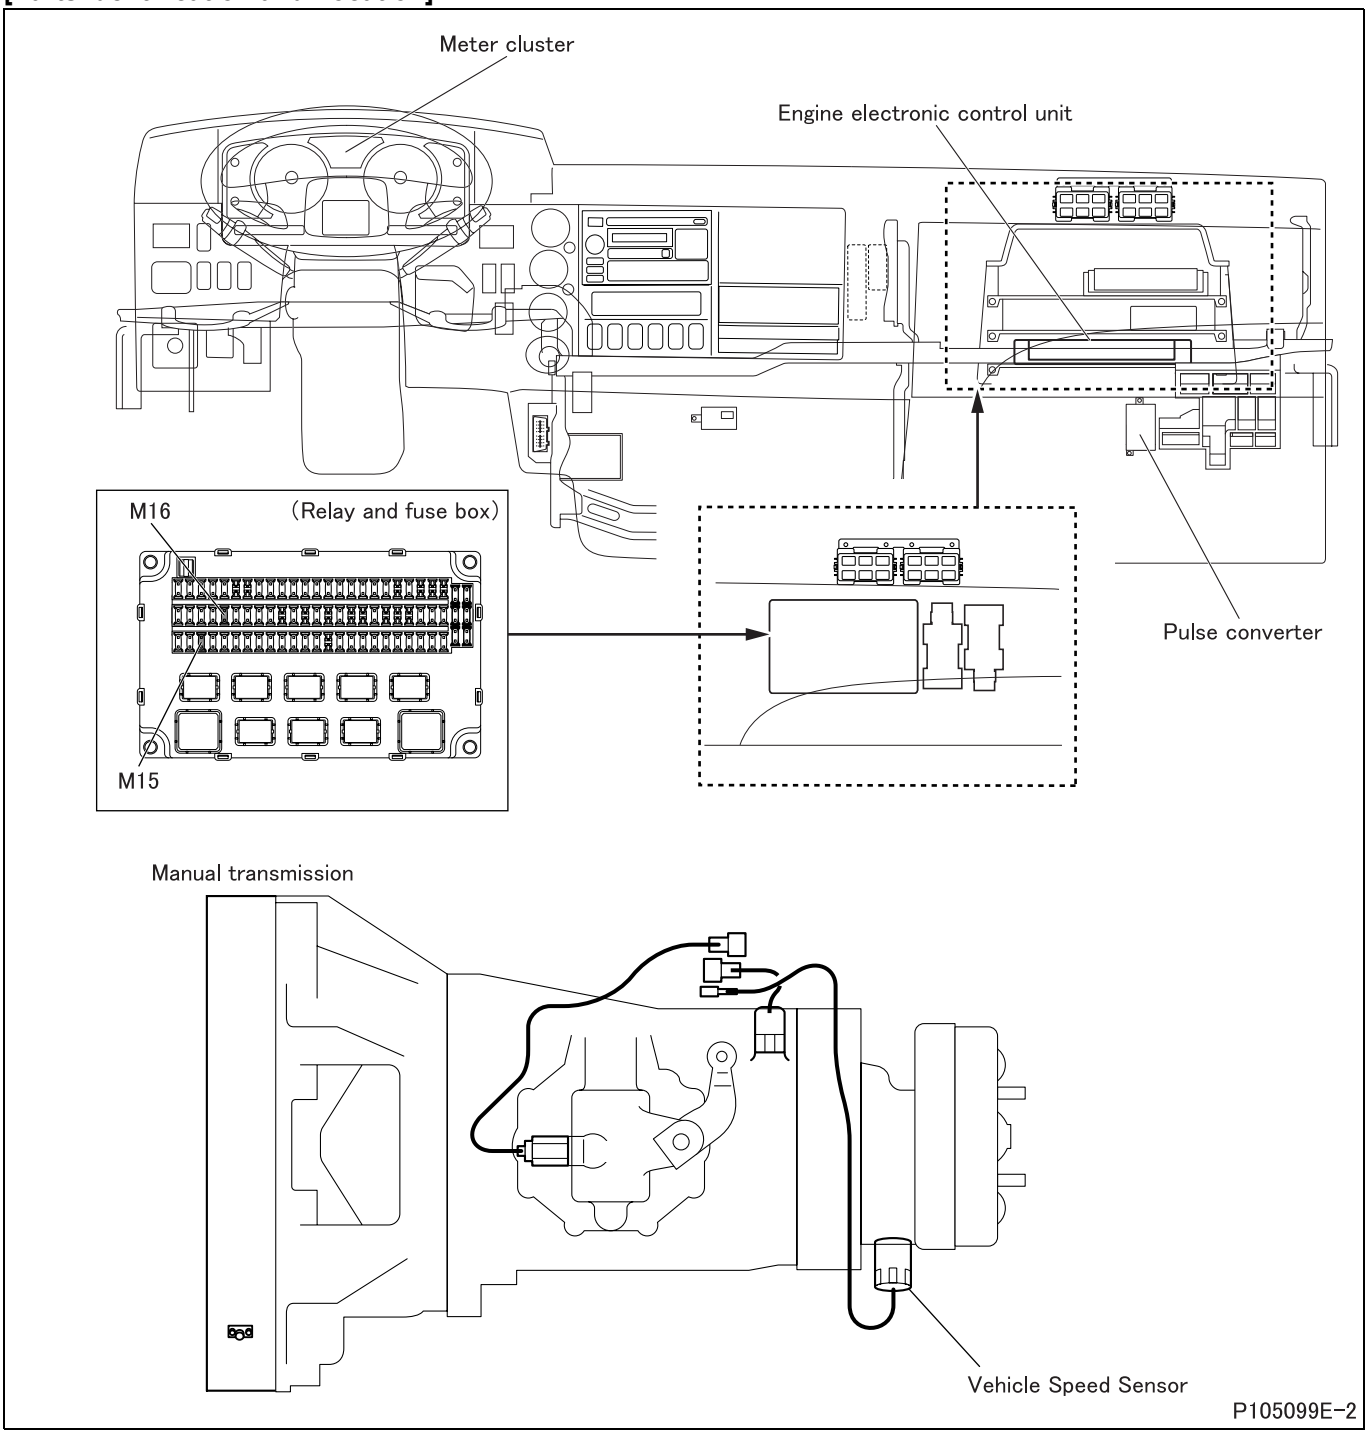
<Fault code>
- If code recovered to normal, automatically cleared at 40th warm up cycle after warning lamp is lit.
  (To clear as desired, erase from the memory.)

Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		**<General Scanning Tool used>** • Measure item “Vehicle Speed Sensor”. **<Multi-Use Tester used>** • Measure item No. 3C “Vehicle Speed” of Service Data.
	Inspection condition		During vehicle run
	Requirements		Same indication as speedometer is given.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

Step 2	Inspection items		Inspection by electronic control unit connector (signal)
	Maintenance item		Measure value of voltage between connector (GF34A) terminal No.18 (+) and (GF32A) terminal No.5 (–).
	Inspection condition		• Starter switch: ON • Measure from back side of harness connector with each device connected to harness. • Slowly turn the wheel using chassis dynamometer or the like.
	Requirements		• Low pulse: 0.5 V or less • High pulse: 8 ± 1 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Go to step 4.

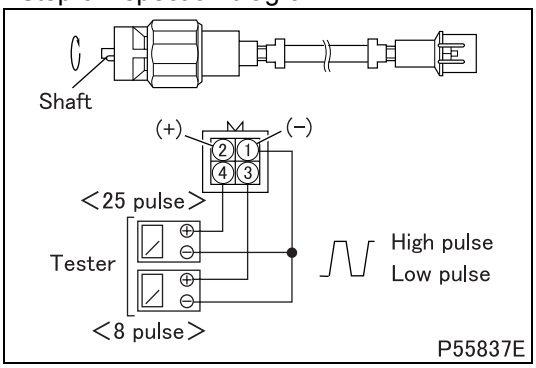
Step 3	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 12.
		NO	Modify connector.

Step 4	Inspection items		Inspection of harness between electronic control unit and pulse divider (built in meter cluster)
	Maintenance item		Check circuit between electronic control unit connector (GF34A) terminal No.18 and meter cluster connector (DH22A) terminal No.4.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Modify harness.

Step 5	Inspection items		Inspection by pulse divider (built in meter cluster) connector (input signal)
	Maintenance item		Measure value of voltage between connector (DH22A) terminal No.9 (+) and 12 (–).
	Inspection condition		• Starter switch: ON • Measure from back side of harness connector with each device connected to harness. • Slowly turn the wheel using chassis dynamometer or the like.
	Requirements		• Low pulse: 0.5 V or less • High pulse: 8 ± 1 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 12.
		NO	Go to step 6.

Step 6	Inspection items		Inspection of vehicle speed sensor unit (25 pulse output) <Manual transmission> For vehicles with automatic transmission, go to step 7.
	Maintenance item		Measure maximum value (high pulse voltage) and minimum value (low pulse voltage) of voltage generated between connector terminals No. 4 (+) and No. 1 (–).
	Inspection condition		Slowly turn sensor shaft with voltage DC 12 V applied between connector terminals No. 2 (+) and No. 1 (–).
	Requirements		• Low pulse: 0.5 V or less • High pulse: 8 ± 1 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Replacement of sensor

<Step 6 inspection diagram>



Step 7	Inspection items		Inspection of pulse converter (25 pulse output) <Automatic transmission> For vehicles with manual transmission, go to step 8.
	Maintenance item		Measure value of voltage between pulse converter connector terminal No.14 (+) and 10 (–).
	Inspection condition		• Starter switch: ON • Measure from back side of harness connector with each device connected to harness. • Slowly turn the wheel using chassis dynamometer or the like.
	Requirements		• Low pulse: 0.5 V or less • High pulse: 8 ± 1 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Replacement of pulse converter

Step 8	Inspection items		Inspection of sensor harness and fuse (power supply)
	Maintenance item		<Manual transmission> • Check circuit between vehicle speed sensor connector No. 2 and fuse (M16). <Automatic transmission> • Check circuit between pulse converter connector terminal No.3 and fuse (M15).
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 9.
		NO	Modify harness.

Step 9	Inspection items		Inspection of sensor harness (ground)
	Maintenance item		<Manual transmission> • Check circuit between vehicle speed sensor connector terminal No.1 and chassis ground. <Automatic transmission> • Check circuit between pulse converter connector terminal No.10 and chassis ground.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 10.
		NO	Modify harness.

Step 10	Inspection items		Inspection of sensor harness (signal)
	Maintenance item		<Manual transmission> • Check circuit between vehicle speed sensor connector terminal No. 4 and pulse divider (built in meter cluster) connector (DH22A) terminal No. 9. <Automatic transmission> • Check circuit between pulse converter connector terminal No. 14 and pulse divider (built in meter cluster) connector (DH22A) terminal No. 9.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 11.
		NO	Modify harness.

Step 11	Inspection items		Inspection by pulse divider (built in meter cluster) connector (output signal)
	Maintenance item		Measure value of voltage between connector (DH22A) terminal No.17 (+) and 12 (–).
	Inspection condition		• Starter switch: ON • Measure from back side of harness connector with each device connected to harness. • Slowly turn the wheel using chassis dynamometer or the like.
	Requirements		• Low pulse: 0.5 V or less • High pulse: 8 ± 1 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 12.
		NO	Replacement of pulse divider (meter cluster)

Step 12	Inspection items		Inspection by control data
	Maintenance item		**<General Scanning Tool used>** • Measure item “Vehicle Speed Sensor”. **<Multi-Use Tester used>** • Measure item No. 3C “Vehicle Speed” of Service Data.
	Inspection condition		During vehicle run
	Requirements		Same indication as speedometer is given.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P0502/Flash code: 25
[Monitor]
Abnormality of vehicle speed sensor
[Fault (outline)]
Too low
[Diagnosis check]
- Output signal of vehicle speed sensor is monitored.

[Code generation condition]
- Actual vehicle speed in running condition remains 0 km/h {0 MPH} for approx. 1 minute.
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal
- Transmission: in gear (except neutral)
- Engine in operation
- Water temperature: above 50°C {122°F}
- Clutch: in engagement
- Engine speed: more than 1000 rpm
- Injection quantity: more than 40 mm^3/st

[Control effected by electronic control unit during fault]
- Injection quantity is limited.
- Exhaust gas recirculation control is stopped.
- Throttle control is stopped.
- Diesel particulate filter regeneration (manual or automatic) is stopped.
- Auto cruise control is stopped.
- Vehicle speed limiting control is suspended.

[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and vehicle speed sensor
- Abnormality of each connector
- Abnormality of pulse divider
- Abnormality of vehicle speed sensor
- Abnormality in electronic control unit

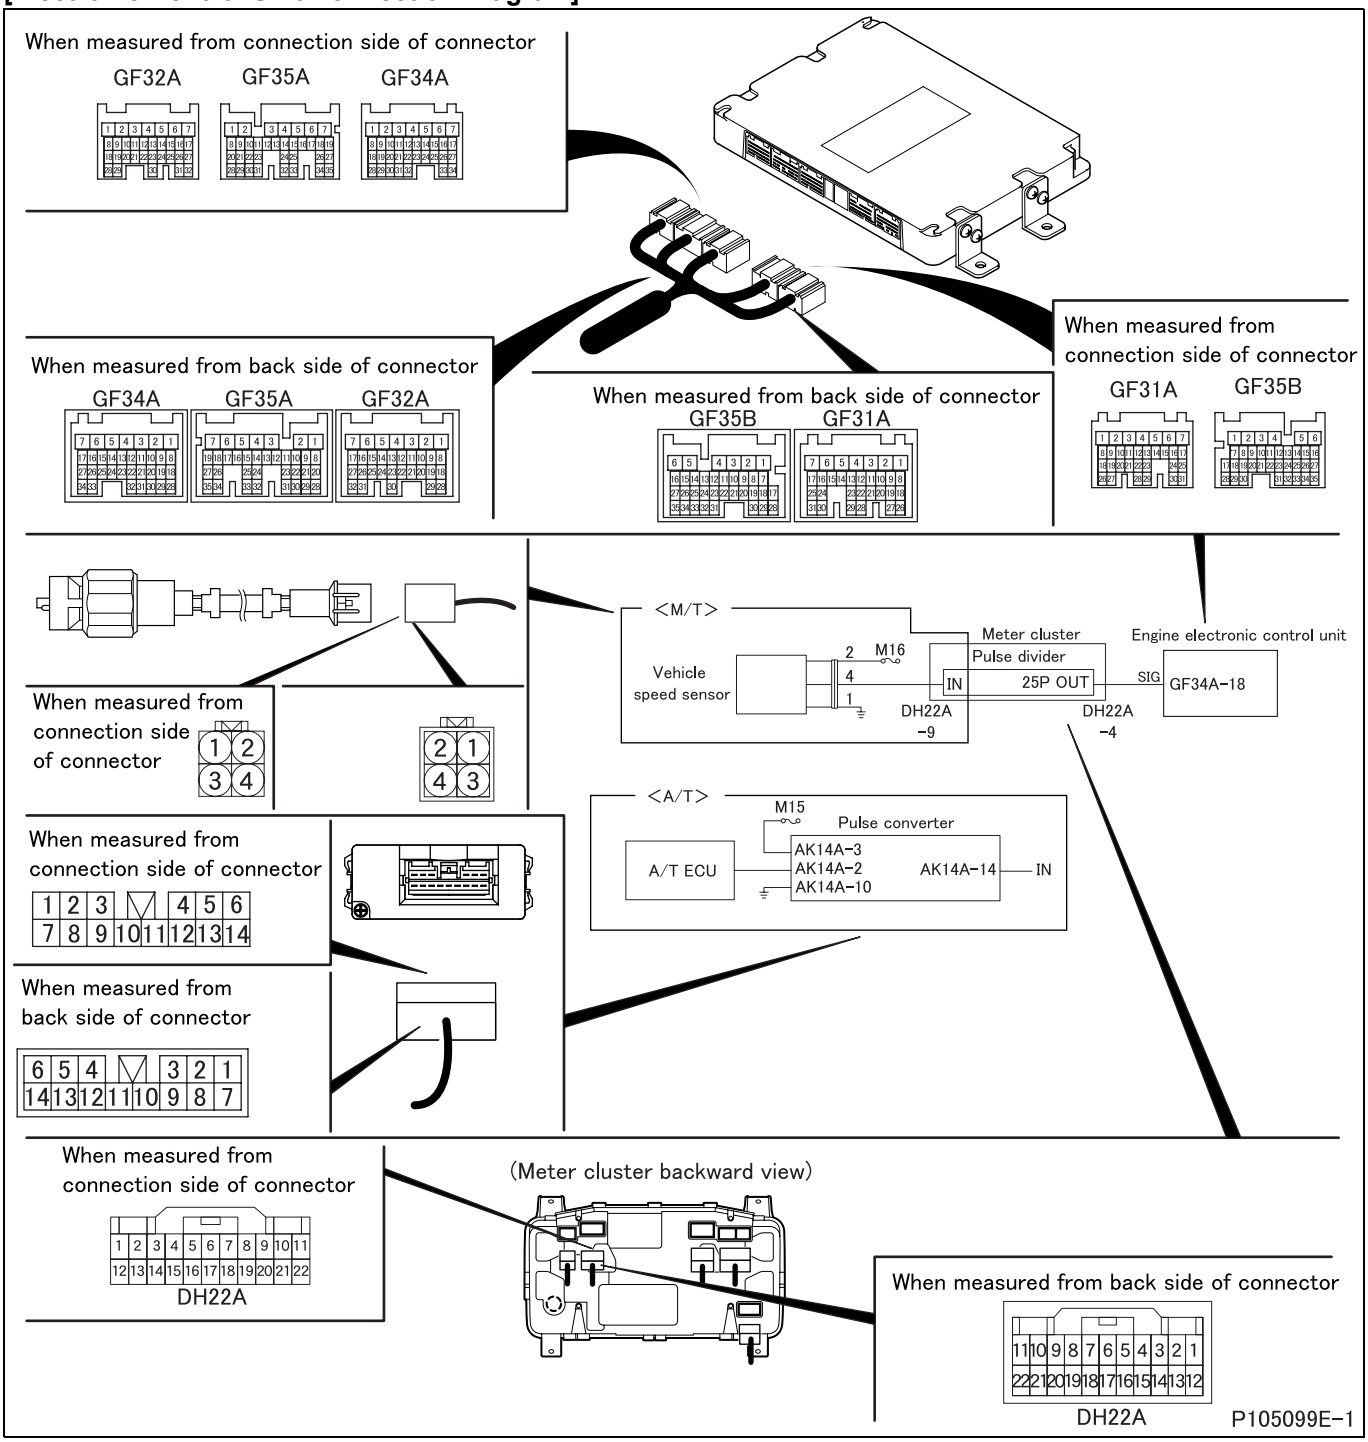
[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>
- Extinguished after input of normal signal.

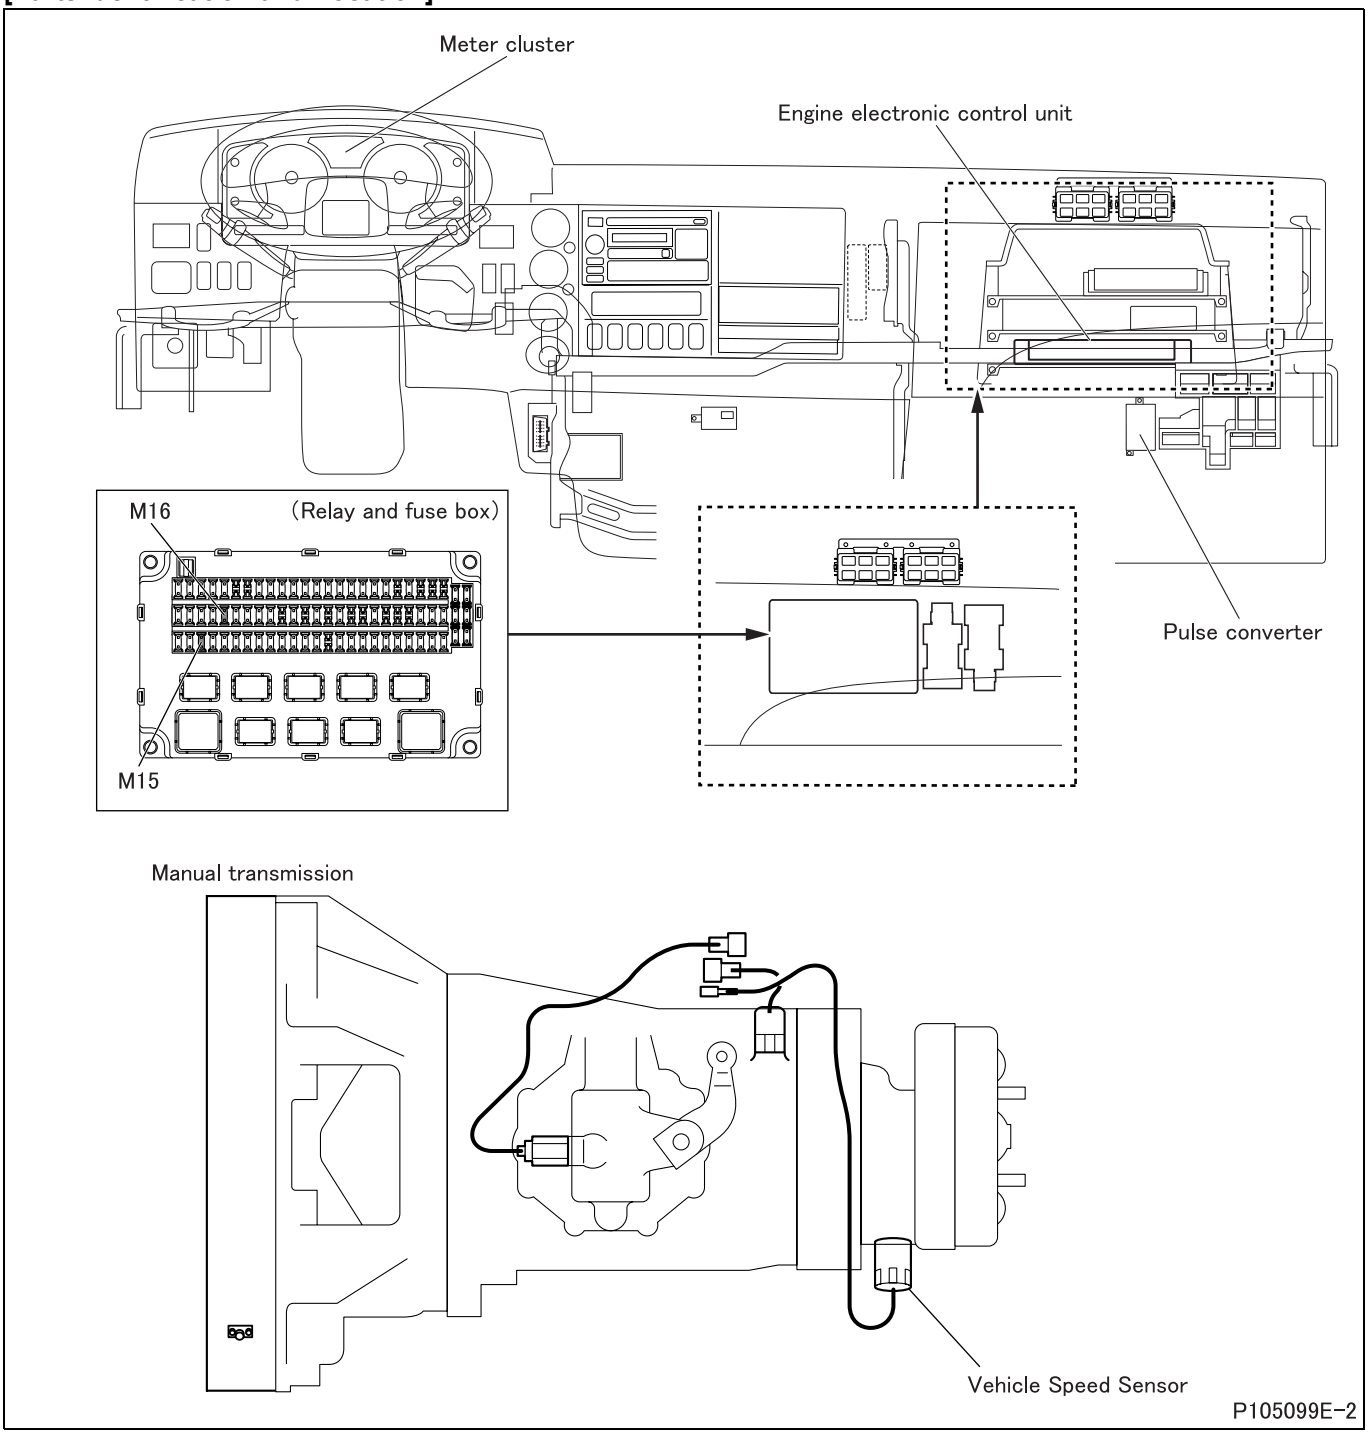
<Fault code>
- If code recovered to normal, automatically cleared at 40th warm up cycle after warning lamp is lit.
  (To clear as desired, erase from the memory.)

Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		**<General Scanning Tool used>** • Measure item “Vehicle Speed Sensor”. **<Multi-Use Tester used>** • Measure item No. 3C “Vehicle Speed” of Service Data.
	Inspection condition		During vehicle run
	Requirements		Same indication as speedometer is given.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

Step 2	Inspection items		Inspection by electronic control unit connector (signal)
	Maintenance item		Measure value of voltage between connector (GF34A) terminal No.18 (+) and (GF32A) terminal No.5 (–).
	Inspection condition		• Starter switch: ON • Measure from back side of harness connector with each device connected to harness. • Slowly turn the wheel using chassis dynamometer or the like.
	Requirements		• Low pulse: 0.5 V or less • High pulse: 8 ± 1 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Go to step 4.

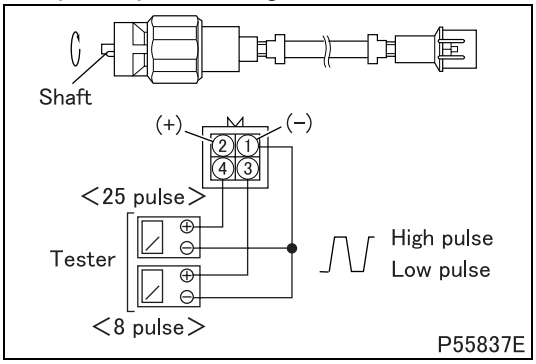
Step 3	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 12.
		NO	Modify connector.

Step 4	Inspection items		Inspection of harness between electronic control unit and pulse divider (built in meter cluster)
	Maintenance item		Check circuit between electronic control unit connector (GF34A) terminal No.18 and meter cluster connector (DH22A) terminal No.4.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Modify harness.

Step 5	Inspection items		Inspection by pulse divider (built in meter cluster) connector (input signal)
	Maintenance item		Measure value of voltage between connector (DH22A) terminal No.9 (+) and 12 (–).
	Inspection condition		• Starter switch: ON • Measure from back side of harness connector with each device connected to harness. • Slowly turn the wheel using chassis dynamometer or the like.
	Requirements		• Low pulse: 0.5 V or less • High pulse: 8 ± 1 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 12.
		NO	Go to step 6.

Step 6	Inspection items		Inspection of vehicle speed sensor unit (25 pulse output) <Manual transmission> For vehicles with automatic transmission, go to step 7.
	Maintenance item		Measure maximum value (high pulse voltage) and minimum value (low pulse voltage) of voltage generated between connector terminals No. 4 (+) and No. 1 (–).
	Inspection condition		Slowly turn sensor shaft with voltage DC 12 V applied between connector terminals No. 2 (+) and No. 1 (–).
	Requirements		• Low pulse: 0.5 V or less • High pulse: 8 ± 1 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Replacement of sensor

<Step 6 inspection diagram>



Step 7	Inspection items		Inspection of pulse converter (25 pulse output) <Automatic transmission> For vehicles with manual transmission, go to step 8.
	Maintenance item		Measure value of voltage between pulse converter connector terminal No.14 (+) and 10 (–).
	Inspection condition		• Starter switch: ON • Measure from back side of harness connector with each device connected to harness. • Slowly turn the wheel using chassis dynamometer or the like.
	Requirements		• Low pulse: 0.5 V or less • High pulse: 8 ± 1 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Replacement of pulse converter

Step 8	Inspection items		Inspection of sensor harness and fuse (power supply)
	Maintenance item		<Manual transmission> • Check circuit between vehicle speed sensor connector No. 2 and fuse (M16). <Automatic transmission> • Check circuit between pulse converter connector terminal No.3 and fuse (M15).
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 9.
		NO	Modify harness.

Step 9	Inspection items		Inspection of sensor harness (ground)
	Maintenance item		<Manual transmission> • Check circuit between vehicle speed sensor connector terminal No.1 and chassis ground. <Automatic transmission> • Check circuit between pulse converter connector terminal No.10 and chassis ground.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 10.
		NO	Modify harness.

Step 10	Inspection items		Inspection of sensor harness (signal)
	Maintenance item		<Manual transmission> • Check circuit between vehicle speed sensor connector terminal No. 4 and pulse divider (built in meter cluster) connector (DH22A) terminal No. 9. <Automatic transmission> • Check circuit between pulse converter connector terminal No. 14 and pulse divider (built in meter cluster) connector (DH22A) terminal No. 9.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 11.
		NO	Modify harness.

Step 11	Inspection items		Inspection by pulse divider (built in meter cluster) connector (output signal)
	Maintenance item		Measure value of voltage between connector (DH22A) terminal No.17 (+) and 12 (–).
	Inspection condition		• Starter switch: ON • Measure from back side of harness connector with each device connected to harness. • Slowly turn the wheel using chassis dynamometer or the like.
	Requirements		• Low pulse: 0.5 V or less • High pulse: 8 ± 1 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 12.
		NO	Replacement of pulse divider (meter cluster)

Step 12	Inspection items		Inspection by control data
	Maintenance item		**<General Scanning Tool used>** • Measure item “Vehicle Speed Sensor”. **<Multi-Use Tester used>** • Measure item No. 3C “Vehicle Speed” of Service Data.
	Inspection condition		During vehicle run
	Requirements		Same indication as speedometer is given.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P0503/Flash code: 25
[Monitor]
Abnormality of vehicle speed sensor
[Fault (outline)]
Too high
[Diagnosis check]
- Output signal of vehicle speed sensor is monitored.

[Code generation condition]
- Actual vehicle speed in engine idling condition remains 250 km/h {158.5 MPH} or more for approx. 1 minute. (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal
- Engine in operation
- Injection quantity: less than 30 mm^3/st

[Control effected by electronic control unit during fault]
- Injection quantity is limited.
- Exhaust gas recirculation control is stopped.
- Throttle control is stopped.
- Diesel particulate filter regeneration (manual or automatic) is stopped.
- Auto cruise control is stopped.
- Vehicle speed limiting control is suspended.

[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and vehicle speed sensor
- Abnormality of each connector
- Abnormality of pulse divider
- Abnormality of vehicle speed sensor
- Abnormality in electronic control unit

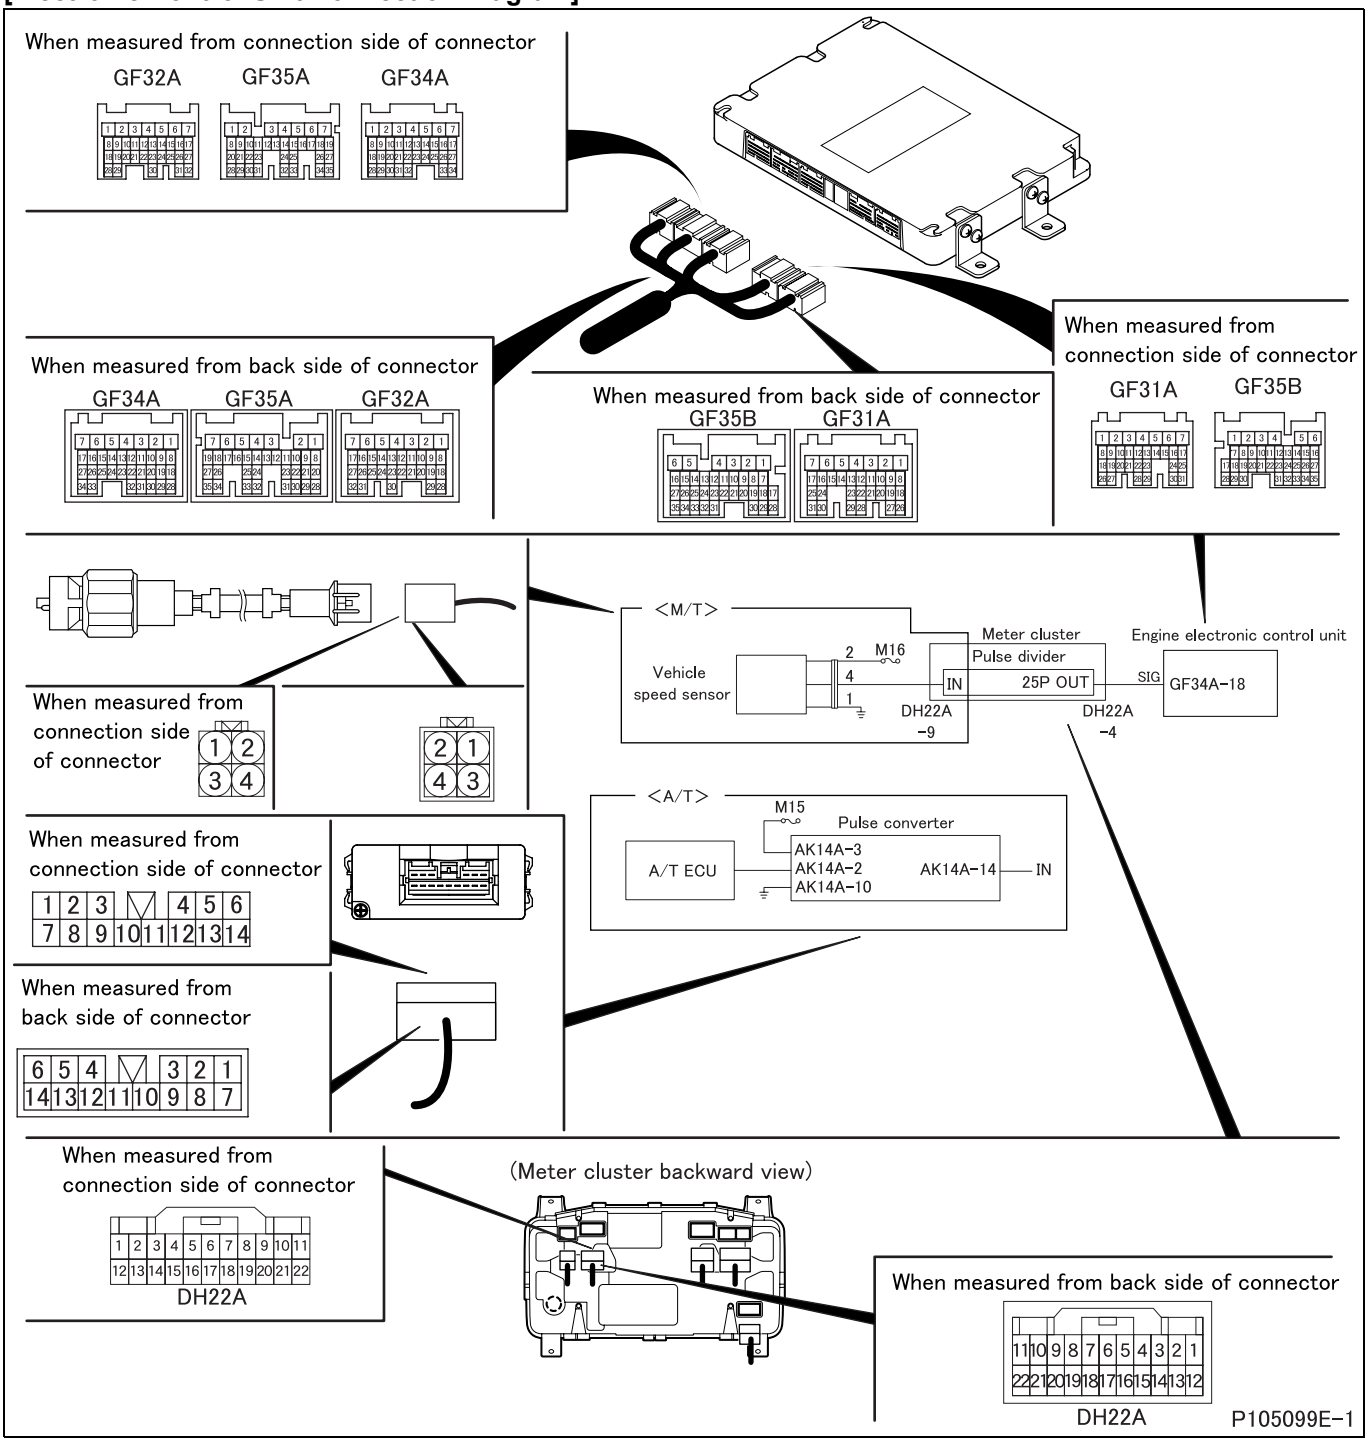
[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>
- Extinguished after input of normal signal.

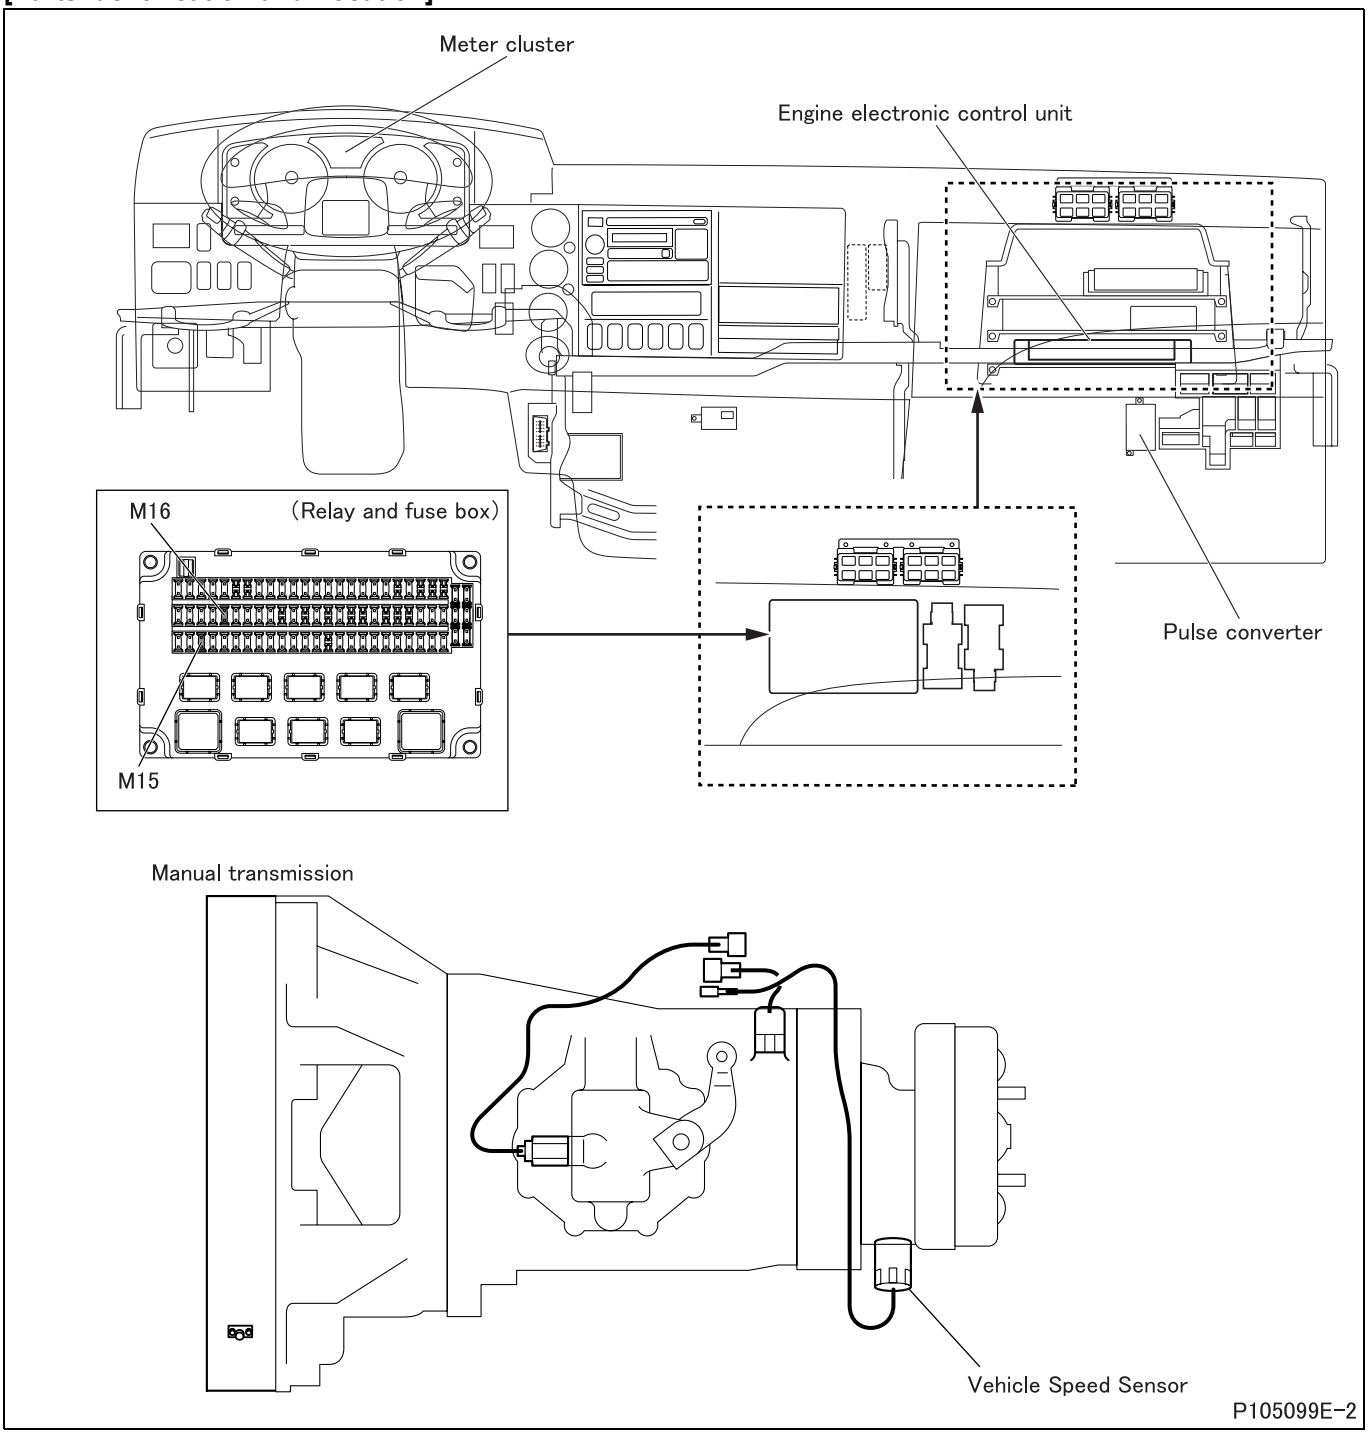
<Fault code>
- If code recovered to normal, automatically cleared at 40th warm up cycle after warning lamp is lit. (To clear as desired, erase from the memory.)

Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		**<General Scanning Tool used>** • Measure item “Vehicle Speed Sensor”. **<Multi-Use Tester used>** • Measure item No. 3C “Vehicle Speed” of Service Data.
	Inspection condition		During vehicle run
	Requirements		Same indication as speedometer is given.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

Step 2	Inspection items		Inspection by electronic control unit connector (signal)
	Maintenance item		Measure value of voltage between connector (GF34A) terminal No.18 (+) and (GF32A) terminal No.5 (–).
	Inspection condition		• Starter switch: ON • Measure from back side of harness connector with each device connected to harness. • Slowly turn the wheel using chassis dynamometer or the like.
	Requirements		• Low pulse: 0.5 V or less • High pulse: 8 ± 1 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Go to step 4.

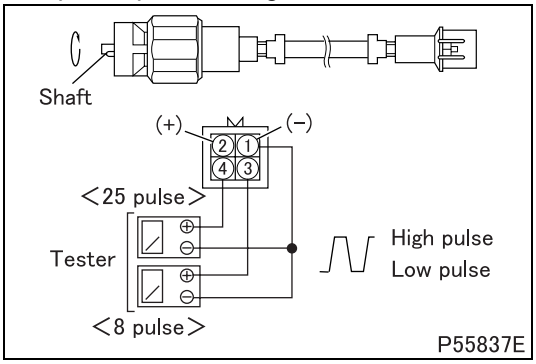
Step 3	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 12.
		NO	Modify connector.

Step 4	Inspection items		Inspection of harness between electronic control unit and pulse divider (built in meter cluster)
	Maintenance item		Check circuit between electronic control unit connector (GF34A) terminal No.18 and meter cluster connector (DH22A) terminal No.4.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Modify harness.

Step 5	Inspection items		Inspection by pulse divider (built in meter cluster) connector (input signal)
	Maintenance item		Measure value of voltage between connector (DH22A) terminal No.9 (+) and 12 (–).
	Inspection condition		• Starter switch: ON • Measure from back side of harness connector with each device connected to harness. • Slowly turn the wheel using chassis dynamometer or the like.
	Requirements		• Low pulse: 0.5 V or less • High pulse: 8 ± 1 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 12.
		NO	Go to step 6.

Step 6	Inspection items		Inspection of vehicle speed sensor unit (25 pulse output) <Manual transmission> For vehicles with automatic transmission, go to step 7.
	Maintenance item		Measure maximum value (high pulse voltage) and minimum value (low pulse voltage) of voltage generated between connector terminals No. 4 (+) and No. 1 (–).
	Inspection condition		Slowly turn sensor shaft with voltage DC 12 V applied between connector terminals No. 2 (+) and No. 1 (–).
	Requirements		• Low pulse: 0.5 V or less • High pulse: 8 ± 1 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Replacement of sensor

<Step 6 inspection diagram>



Step 7	Inspection items		Inspection of pulse converter (25 pulse output) <Automatic transmission> For vehicles with manual transmission, go to step 8.
	Maintenance item		Measure value of voltage between pulse converter connector terminal No.14 (+) and 10 (–).
	Inspection condition		• Starter switch: ON • Measure from back side of harness connector with each device connected to harness. • Slowly turn the wheel using chassis dynamometer or the like.
	Requirements		• Low pulse: 0.5 V or less • High pulse: 8 ± 1 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Replacement of pulse converter

Step 8	Inspection items		Inspection of sensor harness and fuse (power supply)
	Maintenance item		<Manual transmission> • Check circuit between vehicle speed sensor connector No. 2 and fuse (M16). <Automatic transmission> • Check circuit between pulse converter connector terminal No.3 and fuse (M15).
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 9.
		NO	Modify harness.

Step 9	Inspection items		Inspection of sensor harness (ground)
	Maintenance item		<Manual transmission> • Check circuit between vehicle speed sensor connector terminal No.1 and chassis ground. <Automatic transmission> • Check circuit between pulse converter connector terminal No.10 and chassis ground.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 10.
		NO	Modify harness.

Step 10	Inspection items		Inspection of sensor harness (signal)
	Maintenance item		<Manual transmission> • Check circuit between vehicle speed sensor connector terminal No. 4 and pulse divider (built in meter cluster) connector (DH22A) terminal No. 9. <Automatic transmission> • Check circuit between pulse converter connector terminal No. 14 and pulse divider (built in meter cluster) connector (DH22A) terminal No. 9.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 11.
		NO	Modify harness.

Step 11	Inspection items		Inspection by pulse divider (built in meter cluster) connector (output signal)
	Maintenance item		Measure value of voltage between connector (DH22A) terminal No.17 (+) and 12 (–).
	Inspection condition		• Starter switch: ON • Measure from back side of harness connector with each device connected to harness. • Slowly turn the wheel using chassis dynamometer or the like.
	Requirements		• Low pulse: 0.5 V or less • High pulse: 8 ± 1 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 12.
		NO	Replacement of pulse divider (meter cluster)

Step 12	Inspection items		Inspection by control data
	Maintenance item		**<General Scanning Tool used>** • Measure item “Vehicle Speed Sensor”. **<Multi-Use Tester used>** • Measure item No. 3C “Vehicle Speed” of Service Data.
	Inspection condition		During vehicle run
	Requirements		Same indication as speedometer is given.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P0512/Flash code: –
[Monitor]
Abnormality of starter switch
[Fault (outline)]
Short-circuited to battery
[Diagnosis check]
- Starter switch start signal is monitored.

[Code generation condition]
- Engine cranking command signal is detected when engine speed is 1200 rpm or more.
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- Battery voltage: normal
- Starter switch: ON
- Engine speed: more than 1200 rpm

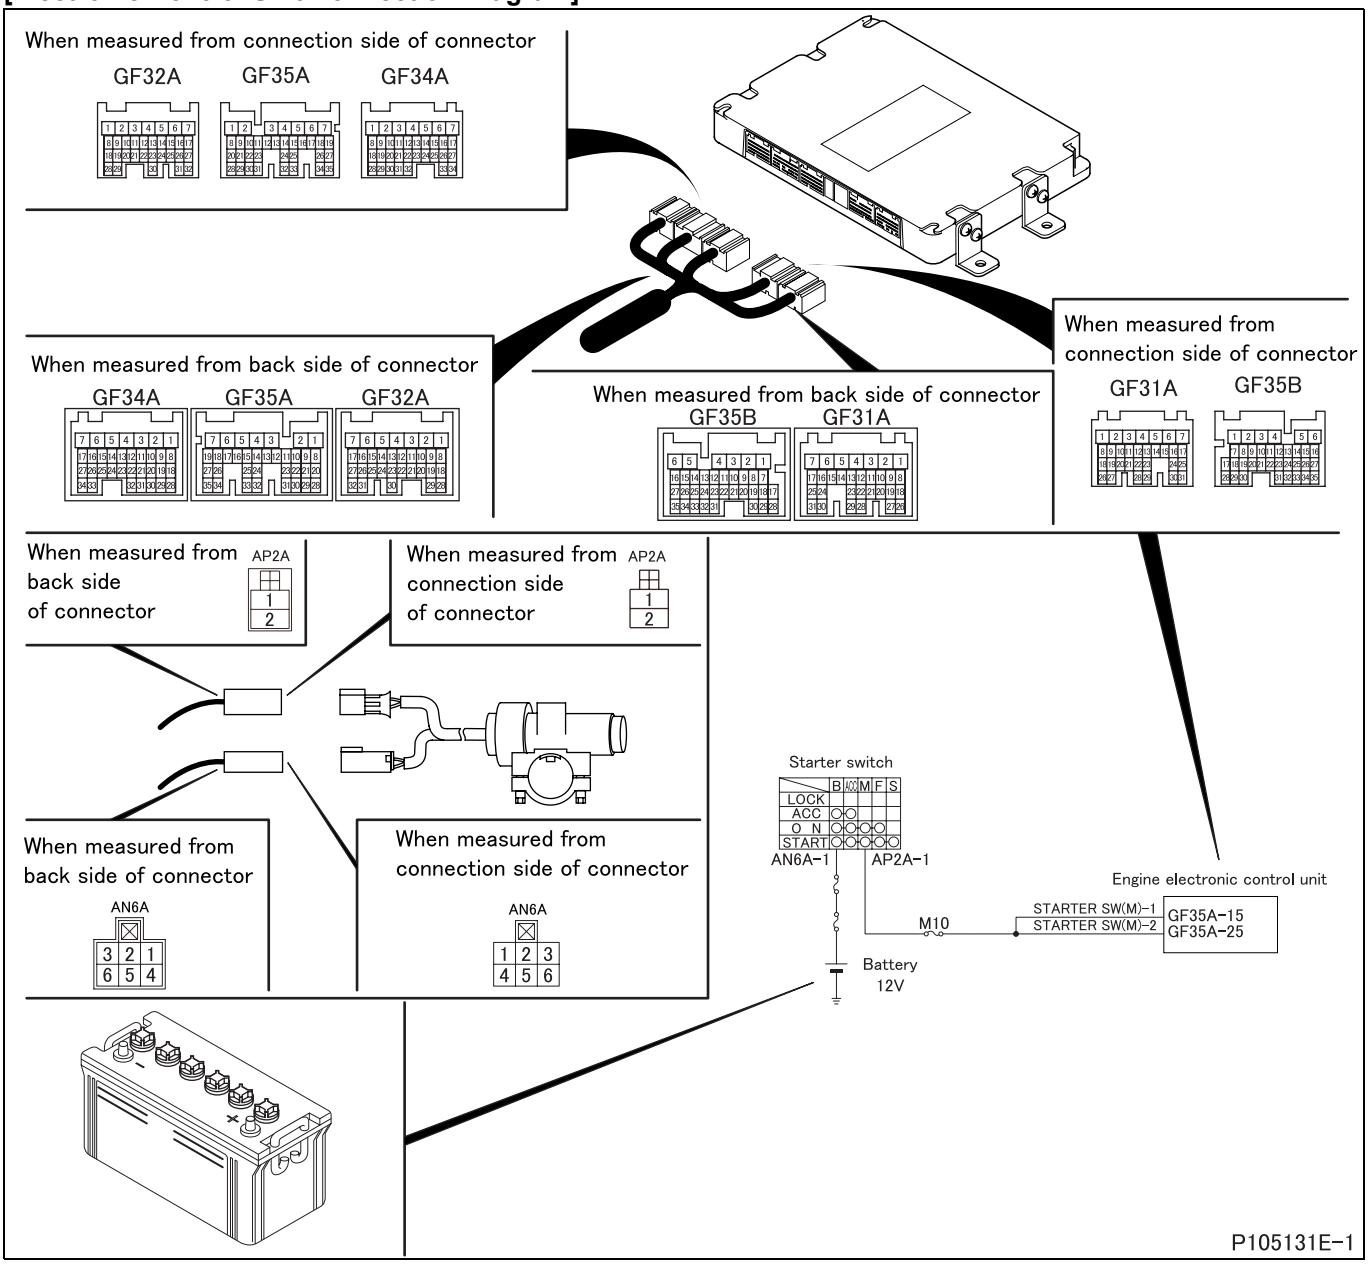
[Control effected by electronic control unit during fault]
- Effects no special control.

[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and starter switch
- Abnormality of each connector
- Abnormality of starter switch
- Abnormality in electronic control unit

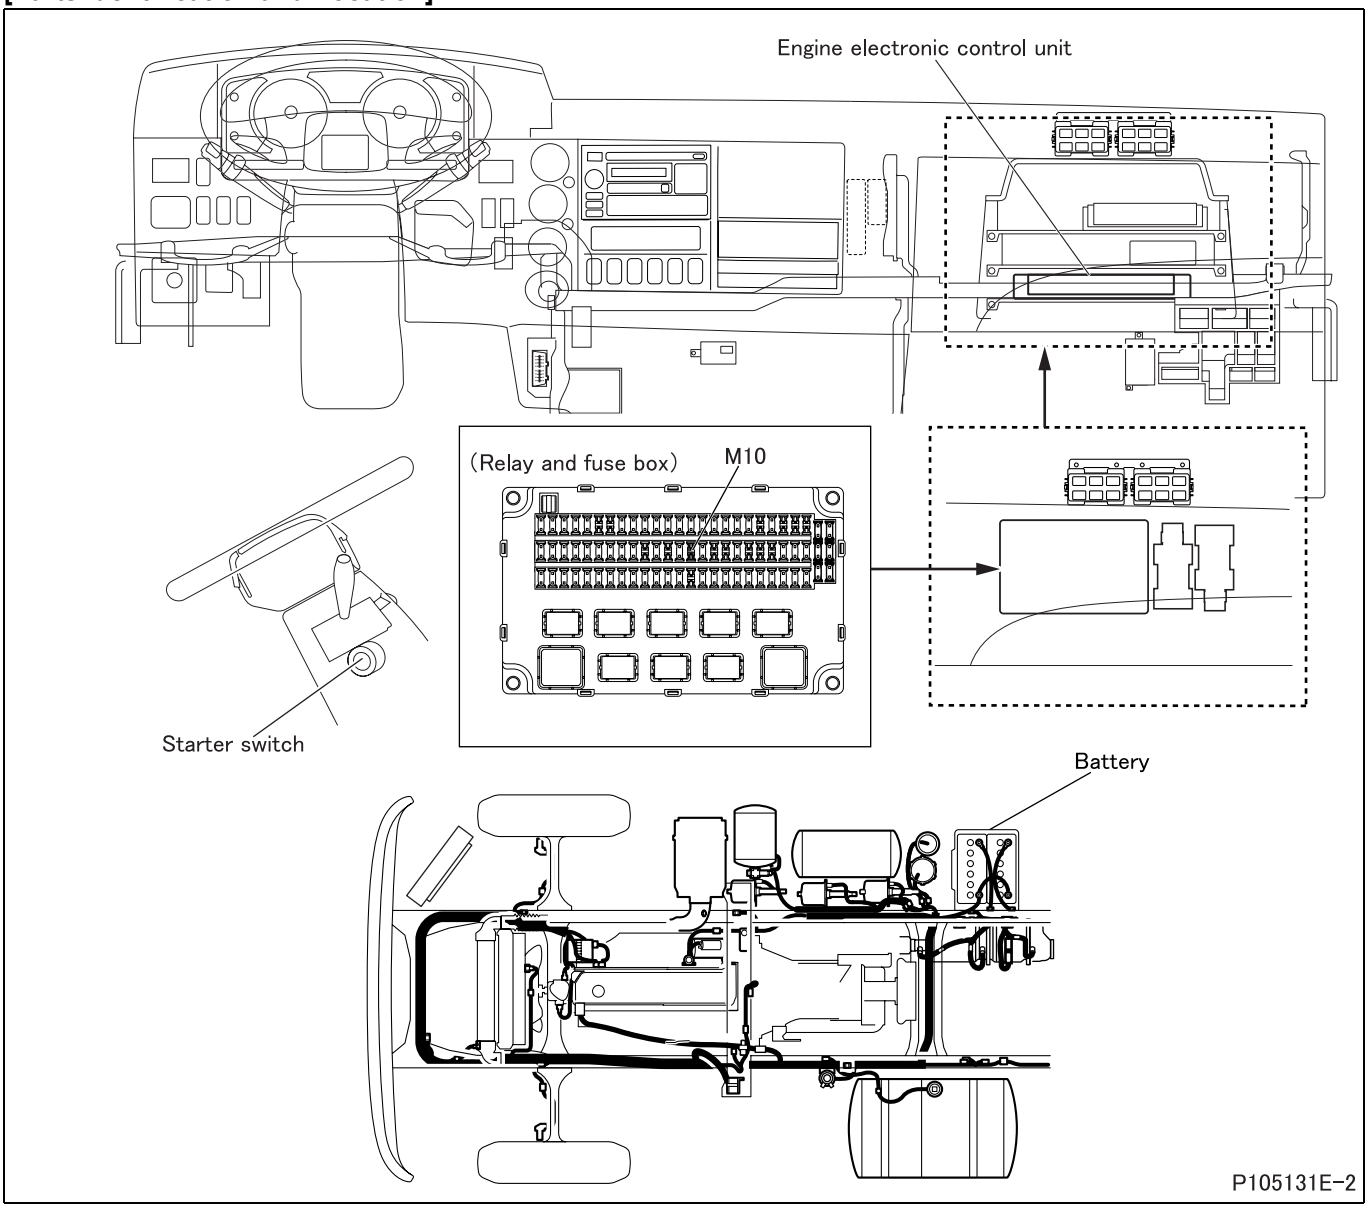
[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Fault code>
- To erase, execute Memory Clear.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

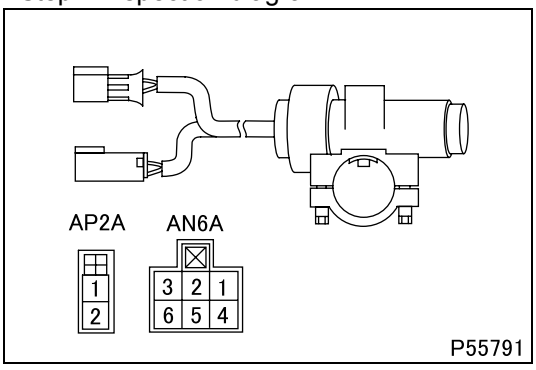
Step 1	Inspection items		Inspection by control data
	Maintenance item		Measure item No. 42 “Power Supply Voltage” of Service Data.
	Inspection condition		Starter switch: ON
	Requirements		Equivalent to battery voltage
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

Step 2	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Modify connector.

Step 3	Inspection items		Inspection of starter switch connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	Modify connector.

Step 4	Inspection items		Inspection of starter switch unit
	Maintenance item		Check continuity between connector terminals.
	Inspection condition		Check presence of continuity in each switch position.
	Requirements		• LOCK (without key): There is no continuity. • LOCK (with key): There is no continuity between 4 and 5. • OFF: There is no continuity between 4 and 5. • ACC: There is continuity between [2] and 2, and 4 and 5. • ON: There is continuity between [1], [2], 2 and 3, and 4 and 5. • START: There is continuity between [1], [2], 1, 2 and 3, and 4 and 5. Terminal No. with [ ] shows connector terminal of AP2A.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Replacement of starter switch

<Step 4 inspection diagram>



Step 5	Inspection items		Inspection of sensor harness (power supply: electronic control unit and fuse)
	Maintenance item		Check circuit between electronic control unit connector (GF35A) terminal No. 15 or 25 and fuse (M10).
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Modify harness.

Step 6	Inspection items		Inspection of sensor harness (power supply: fuse and starter switch)
	Maintenance item		Check circuit between fuse (M10) and starter switch connector (AP2A) terminal No. 1.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify harness.

Step 7	Inspection items		Inspection by control data
	Maintenance item		Measure item No. 42 “Power Supply Voltage” of Service Data.
	Inspection condition		Starter switch: ON
	Requirements		Equivalent to battery voltage
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P0545/Flash code: 87
[Monitor]
Abnormality of DPF temperature sensor 1
[Fault (outline)]
Low signal range check
[Diagnosis check]
- Output voltage of DPF temperature sensor 1 is monitored.

[Code generation condition]
- Voltage of DPF temperature sensor 1 remains under 0.2 V for approx. 2.5 seconds.
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal
- Injection quantity: 50 mm^3/st or more
- Engine speed: 1200 rpm or more
- Water temperature: –7°C {19°F} or above

[Control effected by electronic control unit during fault]
- Injection quantity is limited.
- Exhaust gas recirculation control is stopped.
- Throttle control is stopped.
- Diesel particulate filter regeneration (manual or automatic) is stopped.
- Control is carried out using backup value (200°C {392°F}).

[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and DPF temperature sensor 1
- Abnormality of each connector
- Abnormality of DPF temperature sensor 1
- Abnormality in electronic control unit

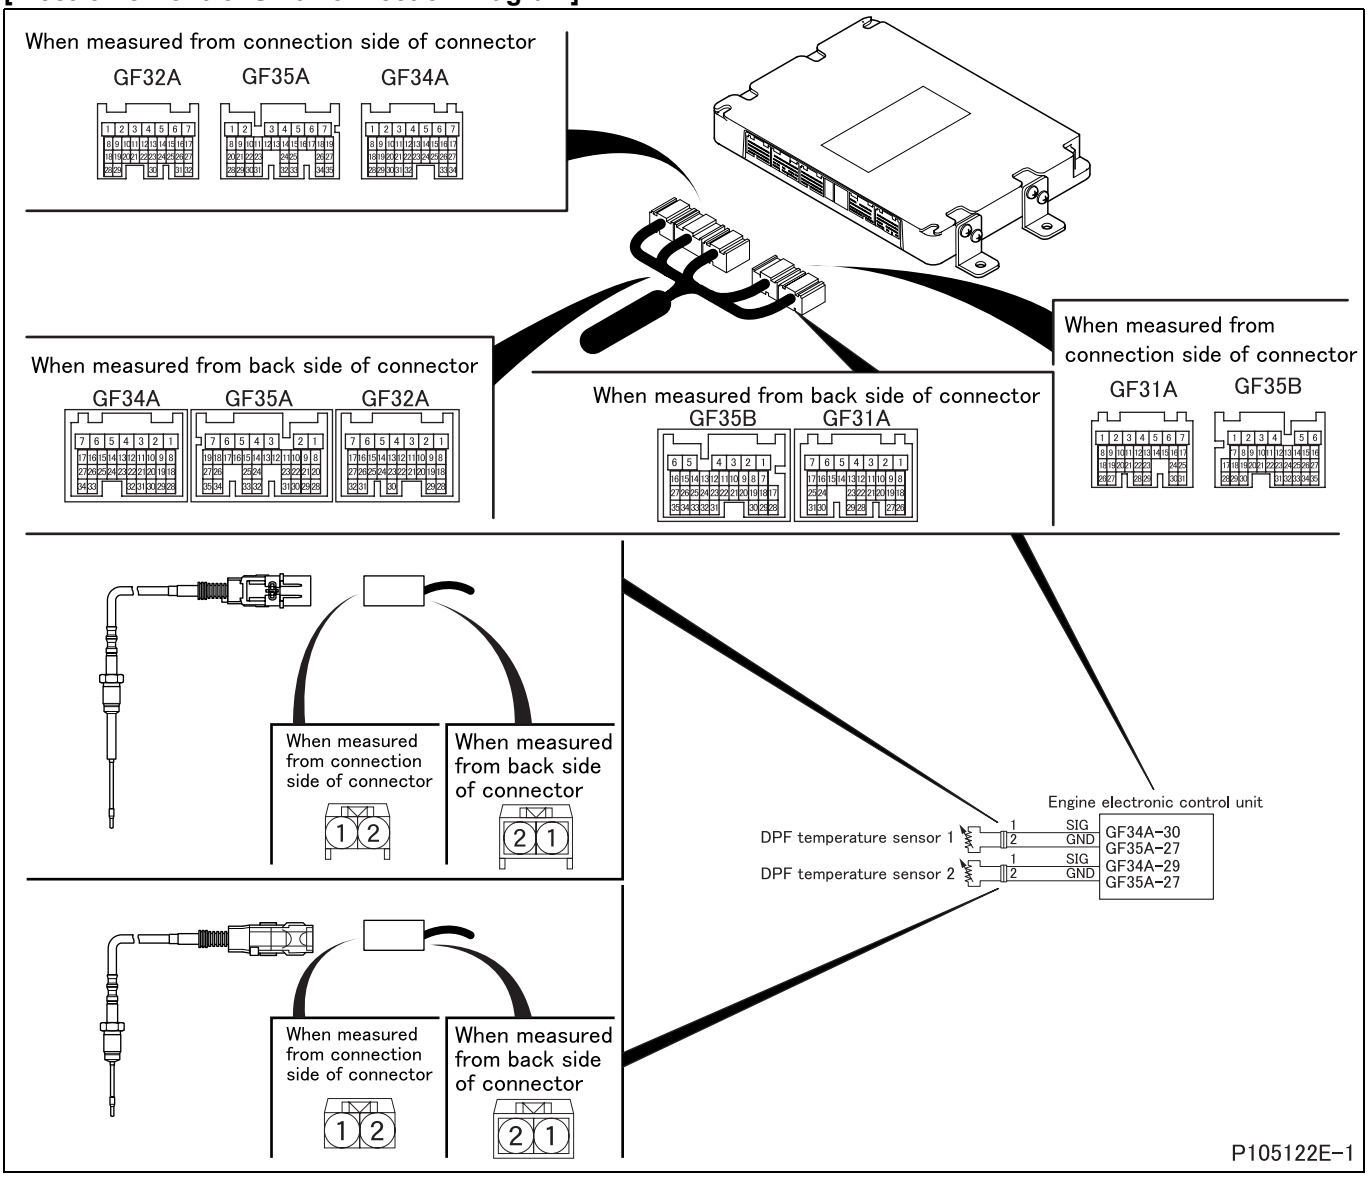
[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>
- Extinguished at 4th driving cycle after normal signal is input.

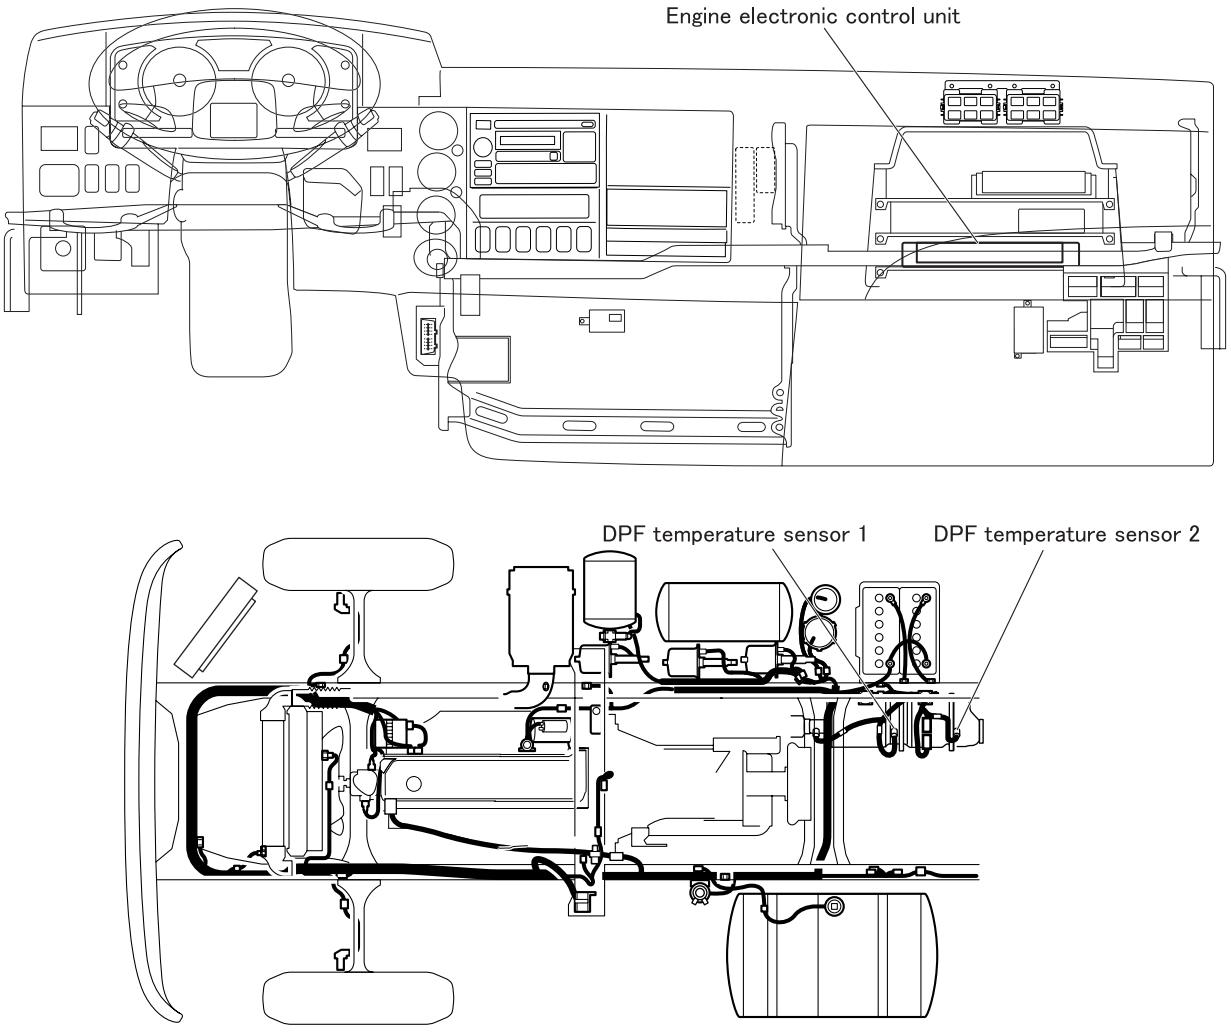
<Fault code>
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished.
  (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		Measure item No. 29 “DPF Temperature 1 (inlet)” of Service Data.
	Inspection condition		While engine is warmed up
	Requirements		Temperature gradually rises up.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

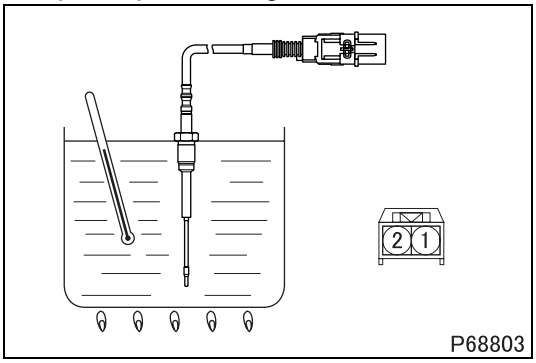
Step 2	Inspection items		Inspection by electronic control unit connector
	Maintenance item		Measure value of voltage between connector (GF34A) terminal No. 30 and (GF35A) terminal No. 27.
	Inspection condition		• Starter switch: OFF • Disconnect electronic control unit from harness and measure at vehicle-side connector half.
	Requirements		• 20°C {68°F} : 241.8 kΩ • 50°C {122°F} : 106.2 $^{+74.3}_{-41.8}$ kΩ • 100°C {212°F} : 33.56 $^{+17.60}_{-10.60}$ kΩ • 150°C {302°F} : 13.90 $^{+5.36}_{-3.60}$ kΩ • 200°C {392°F} : 6.896 $^{+2.064}_{-1.252}$ kΩ
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Go to step 4.

Step 3	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify connector.

Step 4	Inspection items		Inspection of sensor connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Modify connector.

Step 5	Inspection items		Inspection of DPF temperature sensor 1 unit
	Maintenance item		Measure value of resistance between connector terminal No. 1 and 2.
	Inspection condition		• Put DPF temperature sensor 1 in vessel filled with engine oil. • Heat the oil to each of the specified temperatures. Stir the oil well while doing so.
	Requirements		• 20°C {68°F}: 241.8 kΩ • 50°C {122°F}: 106.2 $^{+74.3}_{-41.8}$ kΩ • 100°C {212°F}: 33.56 $^{+17.60}_{-10.60}$ kΩ • 150°C {302°F}: 13.90 $^{+5.36}_{-3.60}$ kΩ • 200°C {392°F}: 6.896 $^{+2.064}_{-1.252}$ kΩ
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Replacement of sensor

<Step 5 inspection diagram>



Step 6	Inspection items		Inspection of harness between electronic control unit and sensor (power supply)
	Maintenance item		Check circuit between electronic control unit connector (GF34A) terminal No. 30 and sensor connector terminal No. 1.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify harness.

Step 7	Inspection items		Inspection of harness between electronic control unit and sensor (ground)
	Maintenance item		Check circuit between electronic control unit connector (GF35A) terminal No. 27 and sensor connector terminal No. 2.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify harness.

Step 8	Inspection items		Inspection by control data
	Maintenance item		Measure item No. 29 “DPF Temperature 1 (inlet)” of Service Data.
	Inspection condition		While engine is warmed up
	Requirements		Temperature gradually rises up.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P0546/Flash code: 87
[Monitor]
Abnormality of DPF temperature sensor 1
[Fault (outline)]
High signal range check
[Diagnosis check]
- Output voltage of DPF temperature sensor 1 is monitored.

[Code generation condition]
- Voltage of DPF temperature sensor 1 remains over 4.96 V for approx. 1 minute.
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal
- Engine in operation
- Engine speed: more than 1200 rpm
- Injection quantity: more than 50 mm^3/st
- Water temperature: more than –7°C {19°F}

[Control effected by electronic control unit during fault]
- Injection quantity is limited.
- Exhaust gas recirculation control is stopped.
- Throttle control is stopped.
- Diesel particulate filter regeneration (manual or automatic) is stopped.
- Control is carried out using backup value (200°C {392°F}).

[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and DPF temperature sensor 1
- Abnormality of each connector
- Abnormality of DPF temperature sensor 1
- Abnormality in electronic control unit

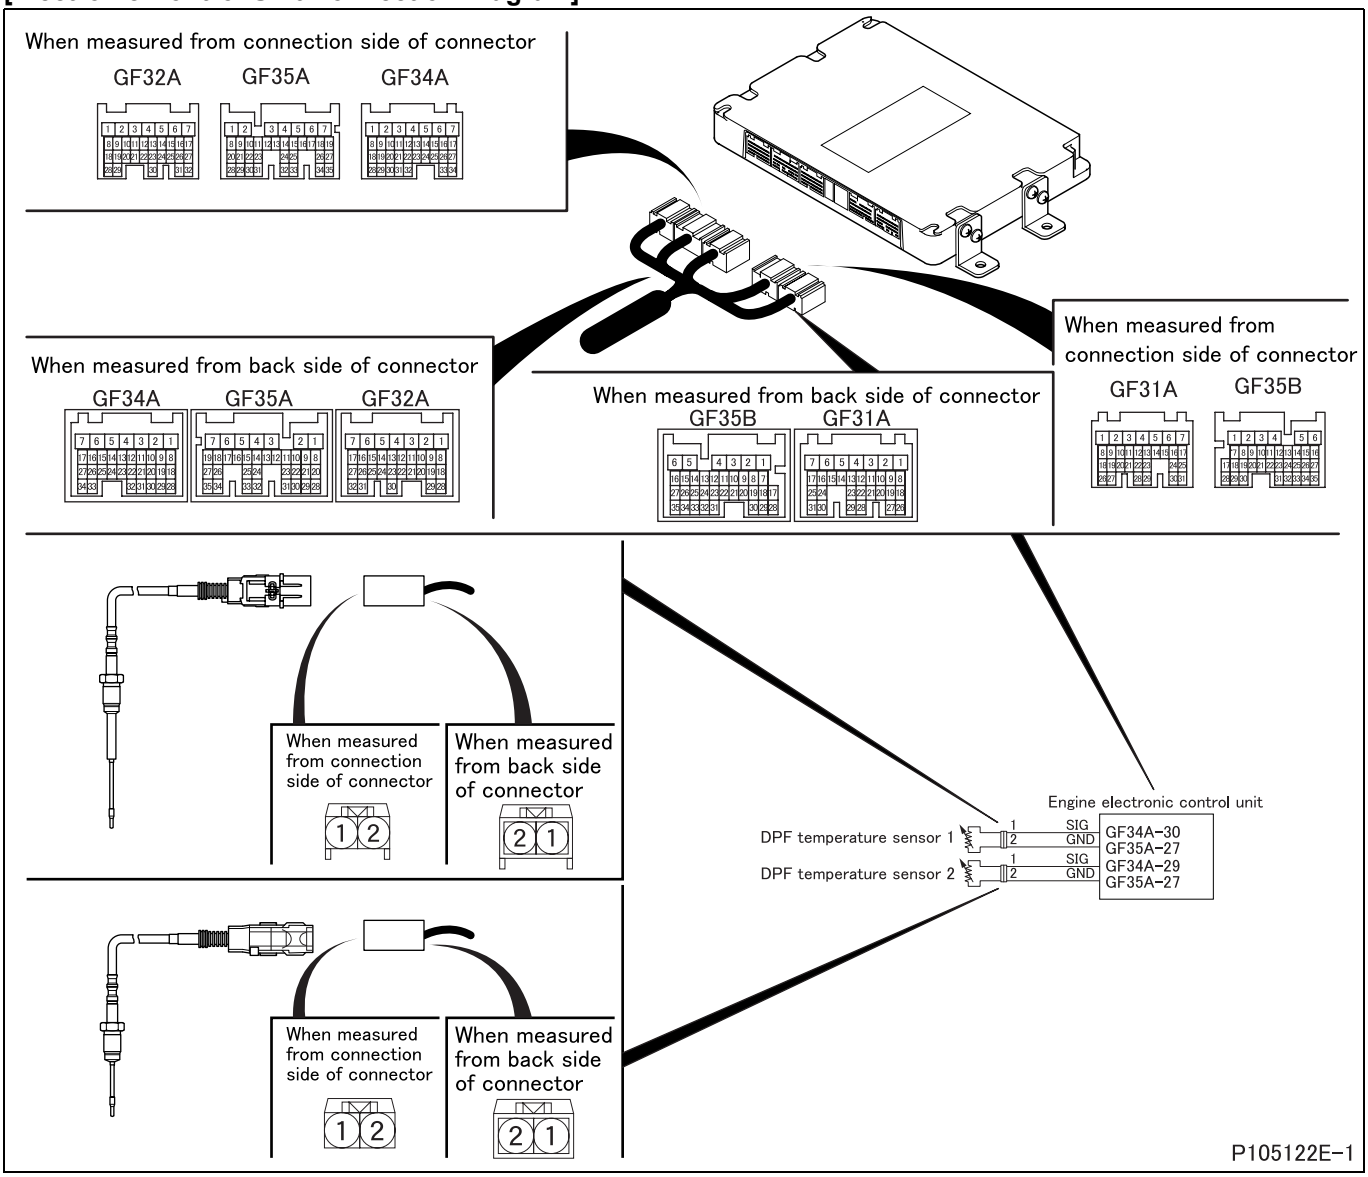
[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>
- Extinguished at 4th driving cycle after normal signal is input.

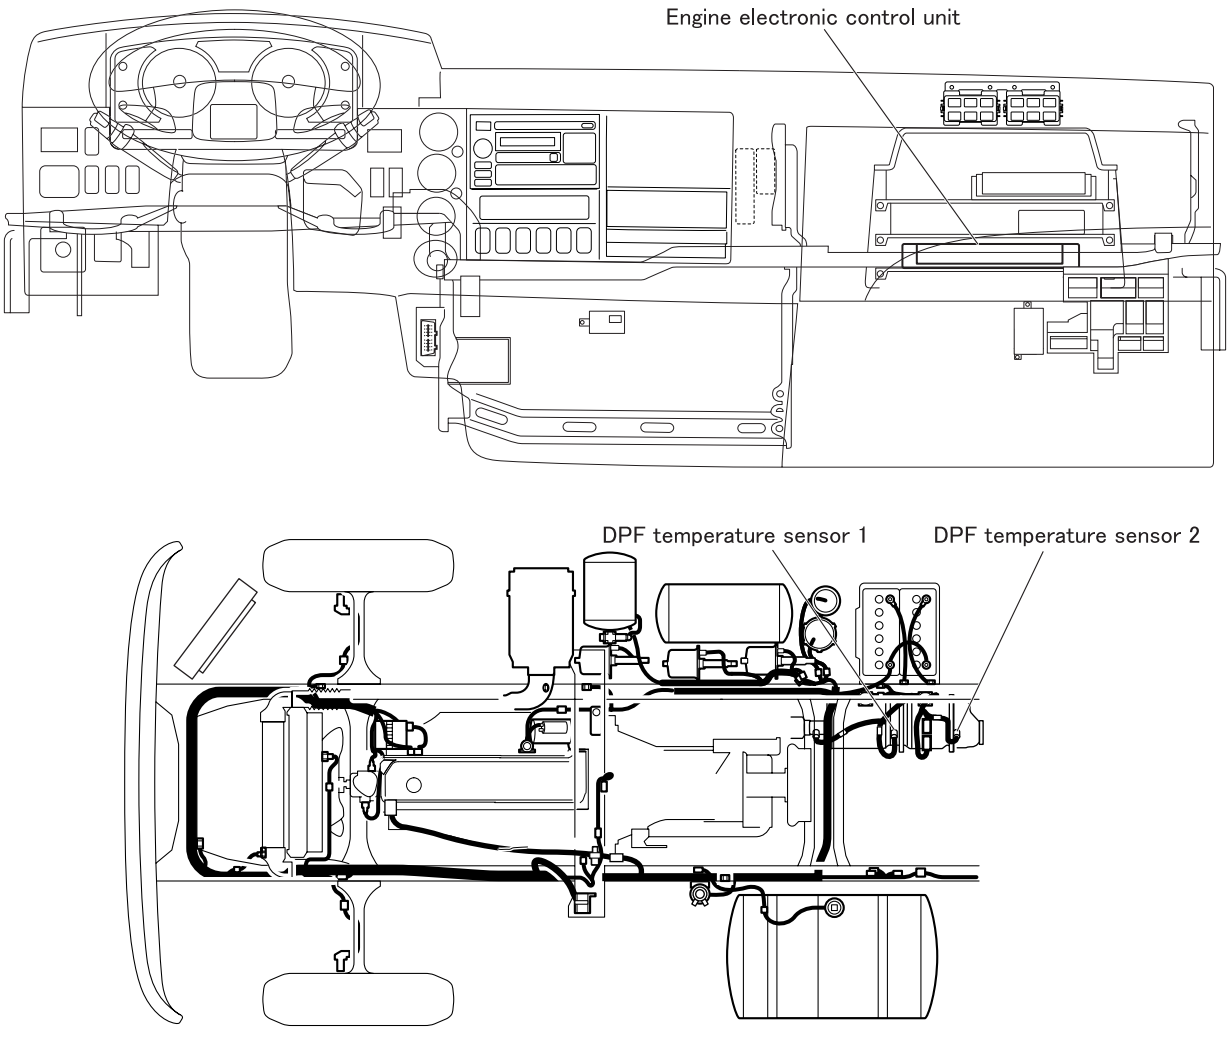
<Fault code>
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished.
  (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		Measure item No. 29 “DPF Temperature 1 (inlet)” of Service Data.
	Inspection condition		While engine is warmed up
	Requirements		Temperature gradually rises up.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

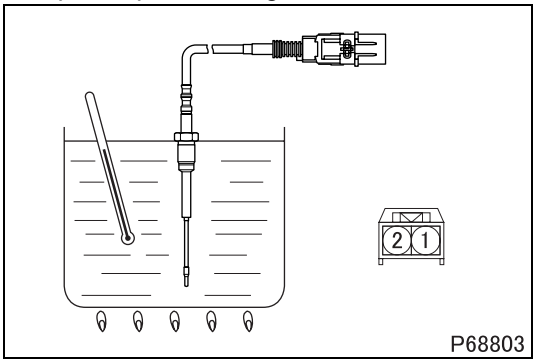
Step 2	Inspection items		Inspection by electronic control unit connector
	Maintenance item		Measure value of voltage between connector (GF34A) terminal No. 30 and (GF35A) terminal No.27.
	Inspection condition		• Starter switch: OFF • Disconnect electronic control unit from harness and measure at vehicle-side connector half.
	Requirements		• 20°C {68°F} : 241.8 kΩ • 50°C {122°F} : 106.2 $^{+74.3}_{-41.8}$ kΩ • 100°C {212°F} : 33.56 $^{+17.60}_{-10.60}$ kΩ • 150°C {302°F} : 13.90 $^{+5.36}_{-3.60}$ kΩ • 200°C {392°F} : 6.896 $^{+2.064}_{-1.252}$ kΩ
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Go to step 4.

Step 3	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify connector.

Step 4	Inspection items		Inspection of sensor connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Modify connector.

Step 5	Inspection items		Inspection of DPF temperature sensor 1 unit
	Maintenance item		Measure value of resistance between connector terminal No. 1 and 2.
	Inspection condition		• Put DPF temperature sensor 1 in vessel filled with engine oil. • Heat the oil to each of the specified temperatures. Stir the oil well while doing so.
	Requirements		• 20°C {68°F}: 241.8 kΩ • 50°C {122°F}: 106.2 $^{+74.3}_{-41.8}$ kΩ • 100°C {212°F}: 33.56 $^{+17.60}_{-10.60}$ kΩ • 150°C {302°F}: 13.90 $^{+5.36}_{-3.60}$ kΩ • 200°C {392°F}: 6.896 $^{+2.064}_{-1.252}$ kΩ
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Replacement of sensor

<Step 5 inspection diagram>



Step 6	Inspection items		Inspection of harness between electronic control unit and sensor (power supply)
	Maintenance item		Check circuit between electronic control unit connector (GF34A) terminal No. 30 and sensor connector terminal No. 1.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify harness.

Step 7	Inspection items		Inspection of harness between electronic control unit and sensor (ground)
	Maintenance item		Check circuit between electronic control unit connector (GF35A) terminal No. 27 and sensor connector terminal No. 2.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify harness.

Step 8	Inspection items		Inspection by control data
	Maintenance item		Measure item No. 29 “DPF Temperature 1 (inlet)” of Service Data.
	Inspection condition		While engine is warmed up
	Requirements		Temperature gradually rises up.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P0562/Flash code: 79
[Monitor]
Abnormality of battery voltage
[Fault (outline)]
Low signal range check
[Diagnosis check]
- Power supply voltage in engine electronic control unit is monitored.

[Code generation condition]
- Voltage remains under 0.96 V for approx. 2.5 seconds.
  (Warning lamp is lit and diagnosis code is displayed on second establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking

[Control effected by electronic control unit during fault]
–
[Probable cause of trouble]
- Abnormality in electronic control unit (replacement of electronic control unit), battery voltage below 8 V

[Recoverability]
- Recovered if signal becomes normal with starter switch in ON position.

[Fault code]
Diagnosis code: P0563/Flash code: 79
[Monitor]
Abnormality of battery voltage
[Fault (outline)]
High signal range check
[Diagnosis check]
- Power supply voltage in engine electronic control unit is monitored.

[Code generation condition]
- Voltage remains over 1.8 V for approx. 2.5 seconds.
  (Warning lamp is lit and diagnosis code is displayed on second establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking

[Control effected by electronic control unit during fault]
–
[Probable cause of trouble]
- Abnormality in electronic control unit (replacement of electronic control unit), battery voltage above 15 V

[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>
- Extinguished at 4th driving cycle after normal signal is input.

<Fault code>
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished.
  (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Fault code]
Diagnosis code: P0600/Flash code: 64
[Monitor]
Abnormality in controller area network 1 communication (speed limitation device)
[Fault (outline)]
- Controller area network
- Message timeout

[Diagnosis check]
- Controller area network communication between engine electronic control unit and multifunction vehicle control unit is monitored for abnormality.

[Code generation condition]
Diagnosis code is generated under either of the following conditions. (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)
- No controller area network signal is received from each multifunction vehicle control unit.
- Abnormal command controller are network signal is received from multifunction vehicle control unit.
- The combination of engine electronic control unit and multifunction vehicle control unit do not match.
- Abnormality of vehicle speed sensor

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal

[Control effected by electronic control unit during fault]
- Vehicle speed limiting control is suspended.

[Probable cause of trouble]
- Open-circuit or short-circuit of controller area network communication harness between engine electronic control unit and multifunction vehicle control unit
- Abnormality of each connector
- Abnormality of engine electronic control unit
- Abnormality of multifunction vehicle control unit
- Abnormality of controller area network resistor in engine electronic control unit
- Abnormality of controller area network resistor

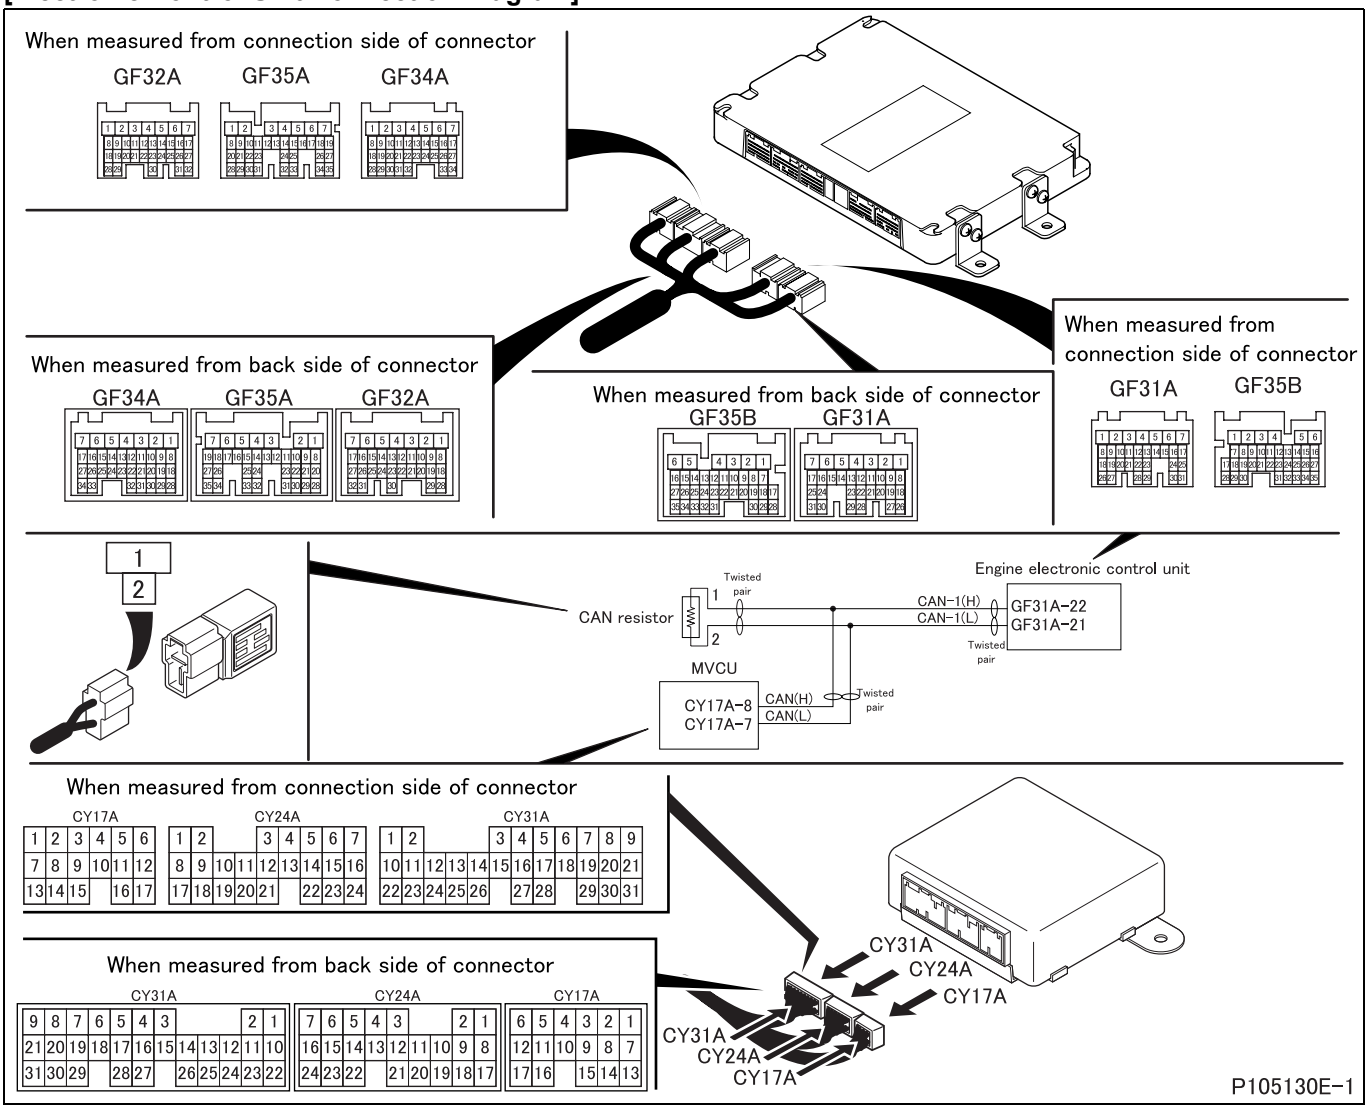
[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>
- Extinguished after input of normal signal.

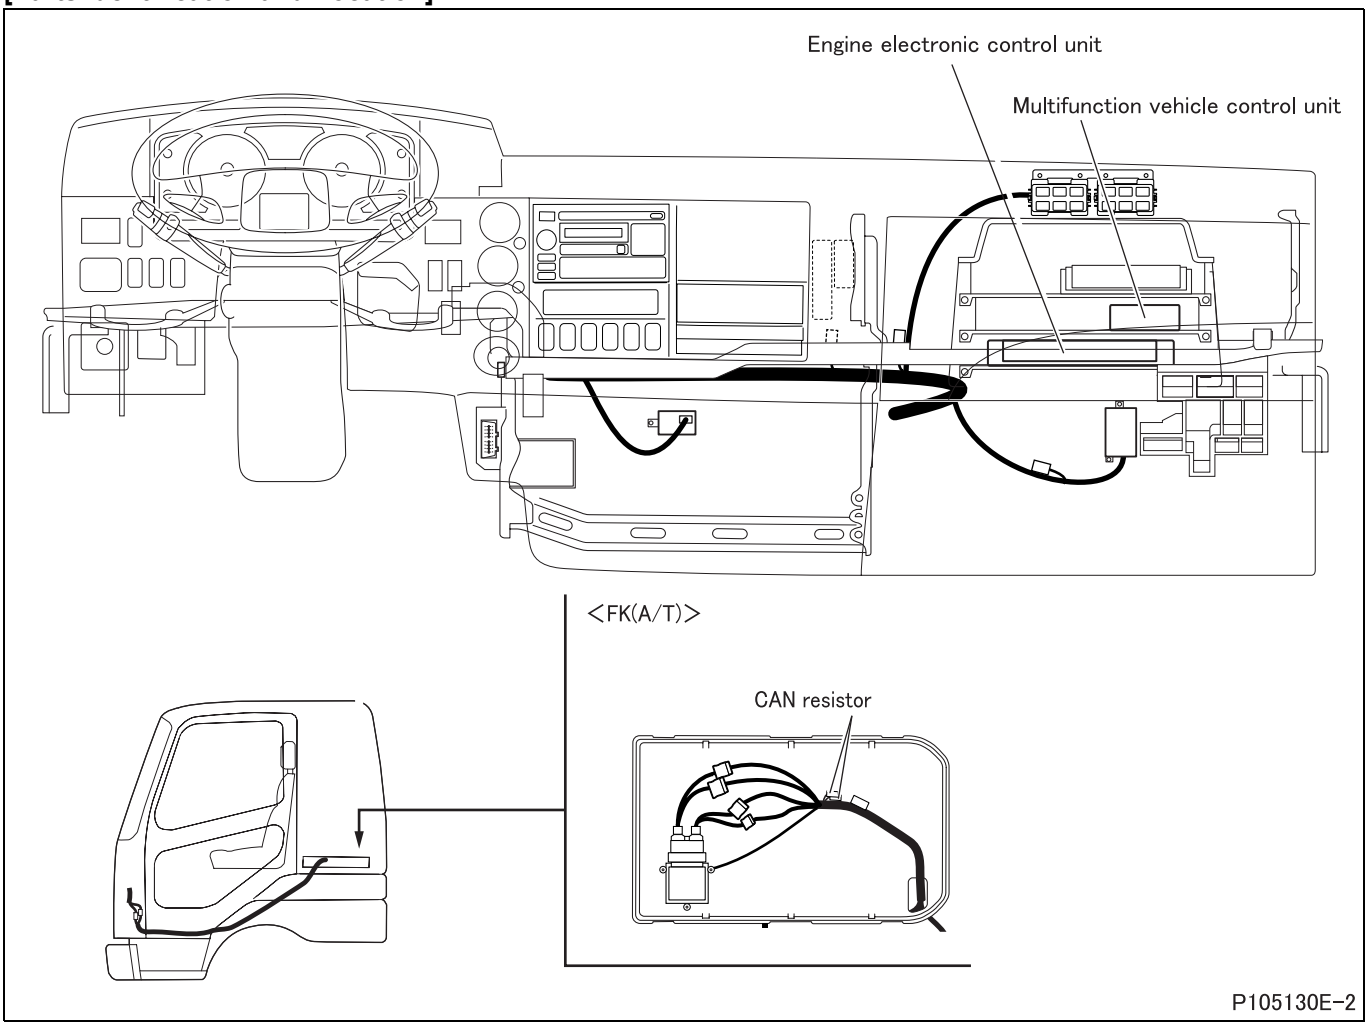
<Fault code>
- If code recovered to normal, automatically cleared at 40th warm up cycle after warning lamp is lit.
  (To clear as desired, erase from the memory.)

Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

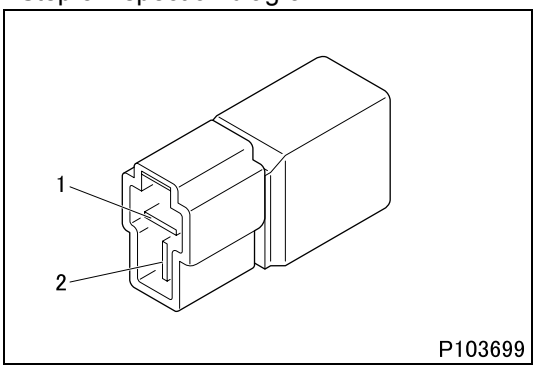
- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by engine electronic control unit connector
	Maintenance item		Measure value of resistance between engine electronic control unit connector (GF31A) terminal No. 21 and 22.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		120 ± 6 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Go to step 2.

Step 2	Inspection items		Inspection of controller area network resistor connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Modify connector.

Step 3	Inspection items		Inspection of controller area network resistor unit
	Maintenance item		Measure value of resistance between connector terminal No. 1 and 2.
	Inspection condition		Remove connector and measure resistance.
	Requirements		120 ± 6 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	Replacement of controller area network resistor

<Step 3 inspection diagram>



Step 4	Inspection items		Inspection of harness between engine electronic control unit and controller area network resistor (HIGH)
	Maintenance item		Check circuit between controller area network resistor connector terminal No. 1 and engine electronic control unit connector (GF31A) terminal No. 22.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Modify harness.

Step 5	Inspection items		Inspection of harness between engine electronic control unit and controller area network resistor (LOW)
	Maintenance item		Check circuit between controller area network resistor connector terminal No. 2 and engine electronic control unit connector (GF31A) terminal No. 21.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Modify harness.

Step 6	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 10.
		NO	Modify connector.

Step 7	Inspection items		Inspection of harness between multifunction vehicle control unit and controller area network resistor (HIGH)
	Maintenance item		Check circuit between controller area network resistor connector terminal No. 1 and multifunction vehicle control unit connector (CY17A) terminal No. 8.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify harness.

Step 8	Inspection items		Inspection of harness between multifunction vehicle control unit and controller area network resistor (LOW)
	Maintenance item		Check circuit between controller area network resistor connector terminal No. 2 and multifunction vehicle control unit connector (CY17A) terminal No. 7.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 9.
		NO	Modify harness.

Step 9	Inspection items		Inspection of multifunction vehicle control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Replace the engine electronic control unit as well if this diagnosis code occurs after the replacement of multifunction vehicle control unit.
		NO	Modify connector.

[Fault code]
Diagnosis code: P0604/Flash code: 33
[Monitor]
Abnormality in engine electronic control unit
[Fault (outline)]
Hardware check
[Diagnosis check]
- Data processing function in engine electronic control unit is monitored.

[Code generation condition]
- Engine electronic control unit internal memory (RAM) is malfunctioning.
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON (with power ON)

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal

[Control effected by electronic control unit during fault]
- Effects no special control.

[Probable cause of trouble]
- Abnormality in electronic control unit (replacement of electronic control unit)

[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>
- Extinguished at 4th driving cycle after normal signal is input.

<Fault code>
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished.
  (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Fault code]
Diagnosis code: P0605/Flash code: 33
[Monitor]
Abnormality in engine electronic control unit
[Fault (outline)]
Hardware check
[Diagnosis check]
- Data stored in engine electronic control unit is monitored for error.

[Code generation condition]
- Sum checking of Engine electronic control unit internal data is performed unsuccessfully.
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- Prerequisites for performing periodical sum checking are all met.

[Control effected by electronic control unit during fault]
- Common rail system is stopped (Engine is immediately stopped.).
- Fault detection for controller area network communication is stopped.

[Probable cause of trouble]
- Abnormality in electronic control unit (replacement of electronic control unit)

[Recoverability]
<Control during fault>
- Recovered if signal becomes normal when starter switch is turned OFF to ON (power supply resumed to electronic control unit).

<Warning lamp>
[Warning lamp: MIL (orange)]
- Extinguished at 4th driving cycle after normal signal is input.

[Warning lamp: Red]
- Extinguished on input of normal signal

<Fault code>
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished.
  (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Fault code]
Diagnosis code: P0606/Flash code: 33
[Monitor]
Abnormality in engine electronic control unit
[Fault (outline)]
Hardware check
[Diagnosis check]
- Main CPU is checked for abnormal function.

[Code generation condition]
- Any signal showing abnormal function of main CPU is issued. (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- Power: ON

[Control effected by electronic control unit during fault]
- Common rail system is stopped (Engine is immediately stopped.).
- Fault detection for controller area network communication is stopped.

[Probable cause of trouble]
- Abnormality in electronic control unit (replacement of electronic control unit)

[Recoverability]
<Control during fault>
- Recovered if signal becomes normal when starter switch is turned OFF to ON (power supply resumed to electronic control unit).

<Warning lamp>
- Extinguished after input of normal signal.

<Fault code>
- To erase, execute Memory Clear.

[Fault code]
Diagnosis code: P0607/Flash code: 33
[Monitor]
Abnormality in engine electronic control unit
[Fault (outline)]
Hardware check
[Diagnosis check]
- Sub-CPU (for monitoring main CPU) is checked for abnormal function.

[Code generation condition]
- Any signal showing abnormal function of sub-CPU is issued.
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- Power: ON

[Control effected by electronic control unit during fault]
- Common rail system is stopped (Engine is immediately stopped.).
- Fault detection for controller area network communication is stopped

[Probable cause of trouble]
- Abnormality in electronic control unit (replacement of electronic control unit)

[Recoverability]
<Control during fault>
- Recovered if signal becomes normal when starter switch is turned OFF to ON (power supply resumed to electronic control unit).

<Warning lamp>
- Extinguished after input of normal signal.

<Fault code>
- If code recovered to normal, automatically cleared at 40th warm up cycle after warning lamp is lit.
  (To clear as desired, erase from the memory.)

Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Fault code]
Diagnosis code: P0611/Flash code: 99
[Monitor]
Abnormality of injector adjustment data
[Fault (outline)]
Absence of code information
[Diagnosis check]
- Availability of stored injector adjustment data in engine electronic control unit is checked.

[Code generation condition]
- Injector adjustment data (absence of code information) remains missed for approx. 0.2 second.
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- Starter switch: ON
- Correction value: one stored in electronic control unit memory to be used

[Control effected by electronic control unit during fault]
–
[Probable cause of trouble]
- No injection correction data stored in engine electronic control unit
  (For data alteration/registration and data write operation, contact your nearest Mitsubishi FUSO Dealer or Mitsubishi FUSO Truck of America, Inc.)

[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>
- Extinguished after input of normal signal.

<Fault code>
- To erase, execute Memory Clear.

[Fault code]
Diagnosis code: P0616/Flash code: 48
[Monitor]
Abnormality of safety relay
[Fault (outline)]
Short circuit battery
[Diagnosis check]
- Safety relay circuit is monitored for fault.

[Code generation condition]
- Safety relay circuit remains shorted to ground or open as detected for approx. 1 second.
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- Starter switch: ON
- Safety relay: active

[Control effected by electronic control unit during fault]
- Fault detection for controller are network communication is stopped.
- Starter continuous energization prevention control is stopped.

[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and safety relay
- Abnormality of each connector
- Abnormality of safety relay
- Abnormality in electronic control unit

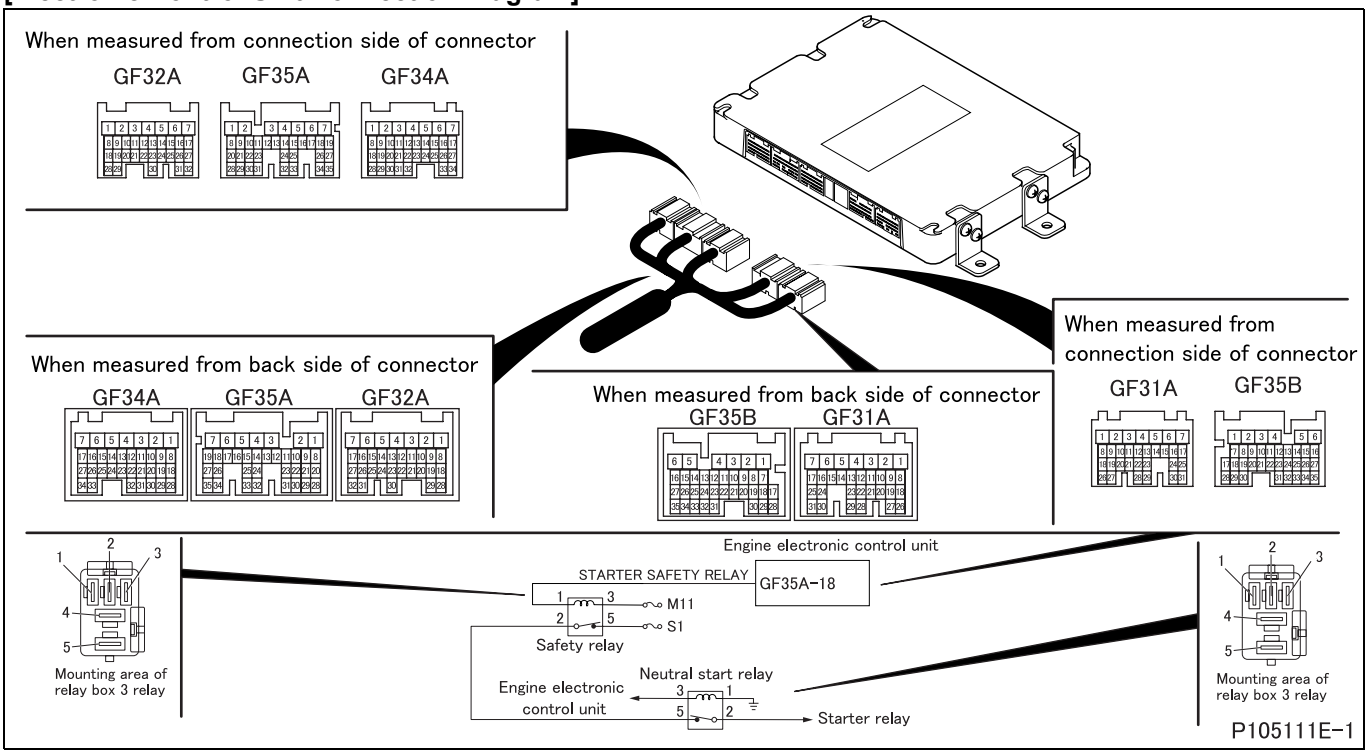
[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>
- Extinguished after input of normal signal.

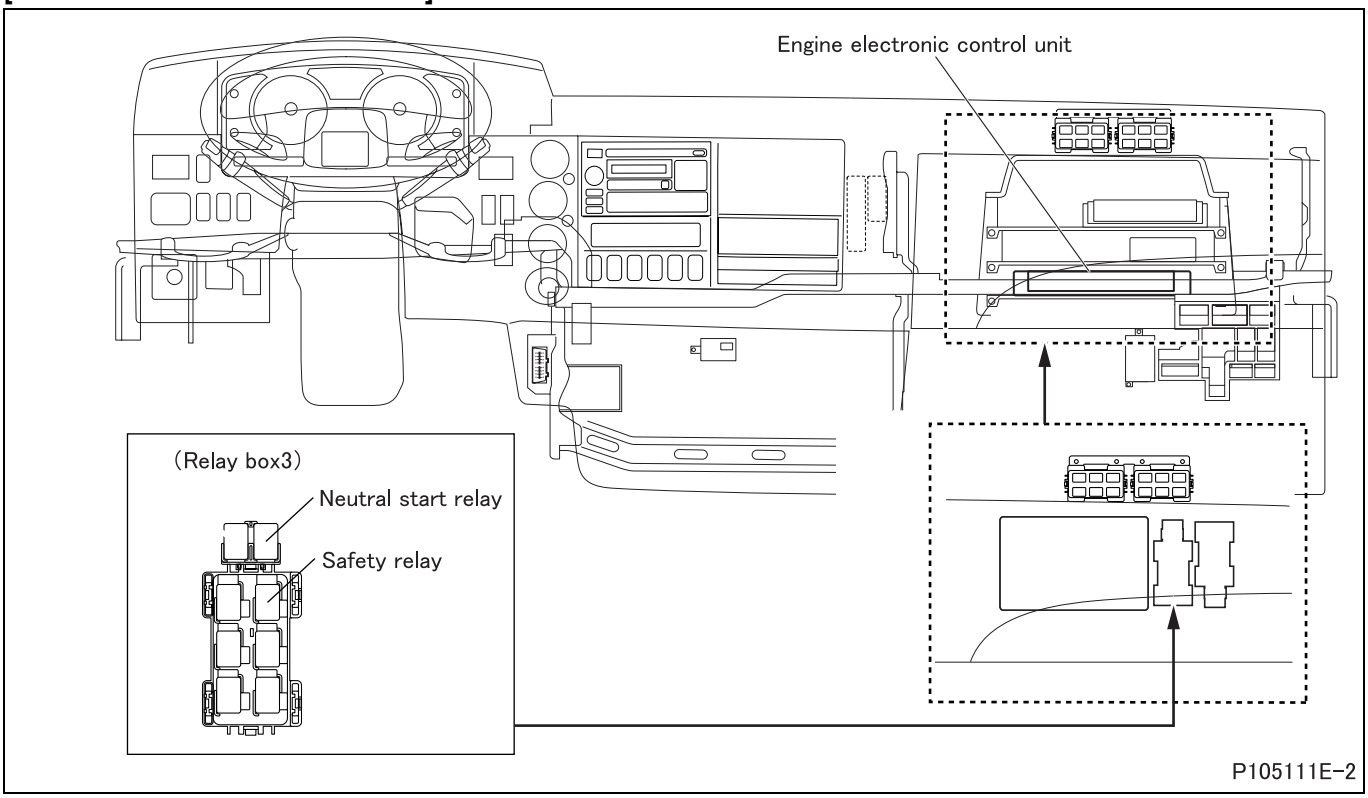
<Fault code>
- If code recovered to normal, automatically cleared at 40th warm up cycle after warning lamp is lit.
  (To clear as desired, erase from the memory.)

Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

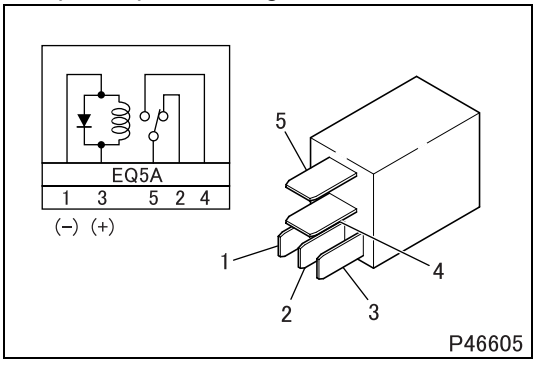
Step 1	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. B1 “Starter Safety Relay”.
	Inspection condition		Starter switch: ON
	Requirements		Relay operation sound is noted (automatically reset after 6 seconds), or ON/OFF switching of Service Data: item No. 8F “Starter Safety Relay” is effected.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

Step 2	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Modify connector.

Step 3	Inspection items		Inspection of relay connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	Modify connector.

Step 4	Inspection items		Inspection of relay unit
	Maintenance item		Measure continuity between terminals No. 2 and 5 when relay operates.
	Inspection condition		Apply battery voltage across connector terminals No. 3 (+) and 1 (–).
	Requirements		There is no continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Replacement of relay

<Step 4 inspection diagram>



Step 5	Inspection items		Inspection of harness between relay and electronic control unit (ground)
	Maintenance item		Check circuit between relay connector terminal No. 1 and electronic control unit connector (GF35A) terminal No. 18.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Modify harness.

Step 6	Inspection items		Inspection of harness between relay and electronic control unit (power supply)
	Maintenance item		Check circuit between relay connector terminal No. 3 and fuse (M11).
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify harness.

Step 7	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. B1 “Starter Safety Relay”.
	Inspection condition		Starter switch: ON
	Requirements		Relay operation sound is noted (automatically reset after 6 seconds), or ON/OFF switching of Service Data: item No. 8F “Starter Safety Relay” is effected.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P0617/Flash code: 48
[Monitor]
Abnormality of safety relay
[Fault (outline)]
- Short circuit ground
- Open circuit

[Diagnosis check]
- Safety relay circuit is monitored for fault.

[Code generation condition]
- Safety relay circuit remains shorted to battery as detected for approx. 1 second.
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal
- Safety relay: inactive

[Control effected by electronic control unit during fault]
- Fault detection for controller area network communication is stopped.

[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and safety relay
- Abnormality of each connector
- Abnormality of safety relay
- Abnormality in electronic control unit

[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>
- Extinguished after input of normal signal.

<Fault code>
- If code recovered to normal, automatically cleared at 40th warm up cycle after warning lamp is lit.
  (To clear as desired, erase from the memory.)

Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Fault diagnosis]

- Perform checks in the sequence of the following steps.

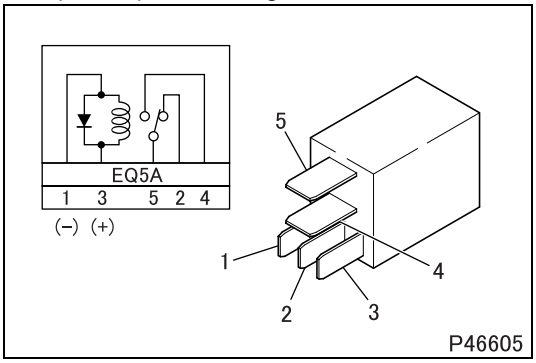
Step 1	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. B1 “Starter Safety Relay”.
	Inspection condition		Starter switch: ON
	Requirements		Relay operation sound is noted (automatically reset after 6 seconds), or ON/OFF switching of Service Data: item No. 8F “Starter Safety Relay” is effected.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

Step 2	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Modify connector.

Step 3	Inspection items		Inspection of relay connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	Modify connector.

Step 4	Inspection items		Inspection of relay unit
	Maintenance item		Measure continuity between terminals No. 2 and 5 when relay operates.
	Inspection condition		Apply battery voltage across connector terminals No. 3 (+) and 1 (–).
	Requirements		There is no continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Replacement of relay

<Step 4 inspection diagram>



Step 5	Inspection items		Inspection of harness between relay and electronic control unit (ground)
	Maintenance item		Check circuit between relay connector terminal No. 1 and electronic control unit connector (GF35A) terminal No. 18.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Modify harness.

Step 6	Inspection items		Inspection of harness between relay and electronic control unit (power supply)
	Maintenance item		Check circuit between relay connector terminal No. 3 and fuse (M11).
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify harness.

Step 7	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. B1 “Starter Safety Relay”.
	Inspection condition		Starter switch: ON
	Requirements		Relay operation sound is noted (automatically reset after 6 seconds), or ON/OFF switching of Service Data: item No. 8F “Starter Safety Relay” is effected.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P062B/Flash code: 99
[Monitor]
Abnormality of injector adjustment data
[Fault (outline)]
Error in code information (Adjustment point error)
[Diagnosis check]
- Availability of stored injector adjustment data in engine electronic control unit is checked.

[Code generation condition]
- Abnormality of injector adjustment data or improper adjustment point data (error in code information) remains as detected for approx. 0.2 second.
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- Starter switch: ON

[Control effected by electronic control unit during fault]
- Control is effected without injector adjustment data.

[Probable cause of trouble]
- No injection correction data stored in engine electronic control unit
  (For data alteration/registration and data write operation, contact your nearest Mitsubishi FUSO Dealer or Mitsubishi FUSO Truck of America, Inc.)

[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>
- Extinguished after input of normal signal.

<Fault code>
- If code recovered to normal, automatically cleared at 40th warm up cycle after warning lamp is lit.
  (To clear as desired, erase from the memory.)

Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Fault code]
Diagnosis code: P062F/Flash code: 33
[Monitor]
Abnormality in engine electronic control unit
[Fault (outline)]
Hardware check (EEPROM)
[Diagnosis check]
- Memory circuit inside engine electronic control unit is checked for abnormal function.

[Code generation condition]
- Any error is found in data read out from engine electronic control unit internal memory.

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal

[Control effected by electronic control unit during fault]
- Effects no special control.

[Probable cause of trouble]
- Abnormality in electronic control unit (replacement of electronic control unit)

[Recoverability]
<Control during fault>
- Recovered if signal becomes normal when starter switch is turned OFF to ON (power supply resumed to electronic control unit).

<Warning lamp>
- Extinguished at 4th driving cycle after normal signal is input.

<Fault code>
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished.
  (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Fault code]
Diagnosis code: P0642/Flash code: 81
[Monitor]
Abnormality of sensor supply voltage 1
[Fault (outline)]
Low signal range check
[Diagnosis check]
- Sensor supply voltage 1 in engine electronic control unit is monitored.
- Units served by sensor supply 1
  - Common rail pressure sensor
  - Accelerator pedal position sensor (sensor 1)
  - DPF absolute pressure sensor
  - DPF pressure sensor (DIFF)

[Code generation condition]
- Supply voltage to units remain below 4 V for 0.03 second.
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal

[Control effected by electronic control unit during fault]
- Effects no special control.

[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and each sensor
- Abnormality of each connector
- Abnormality of each sensor
- Abnormality in electronic control unit

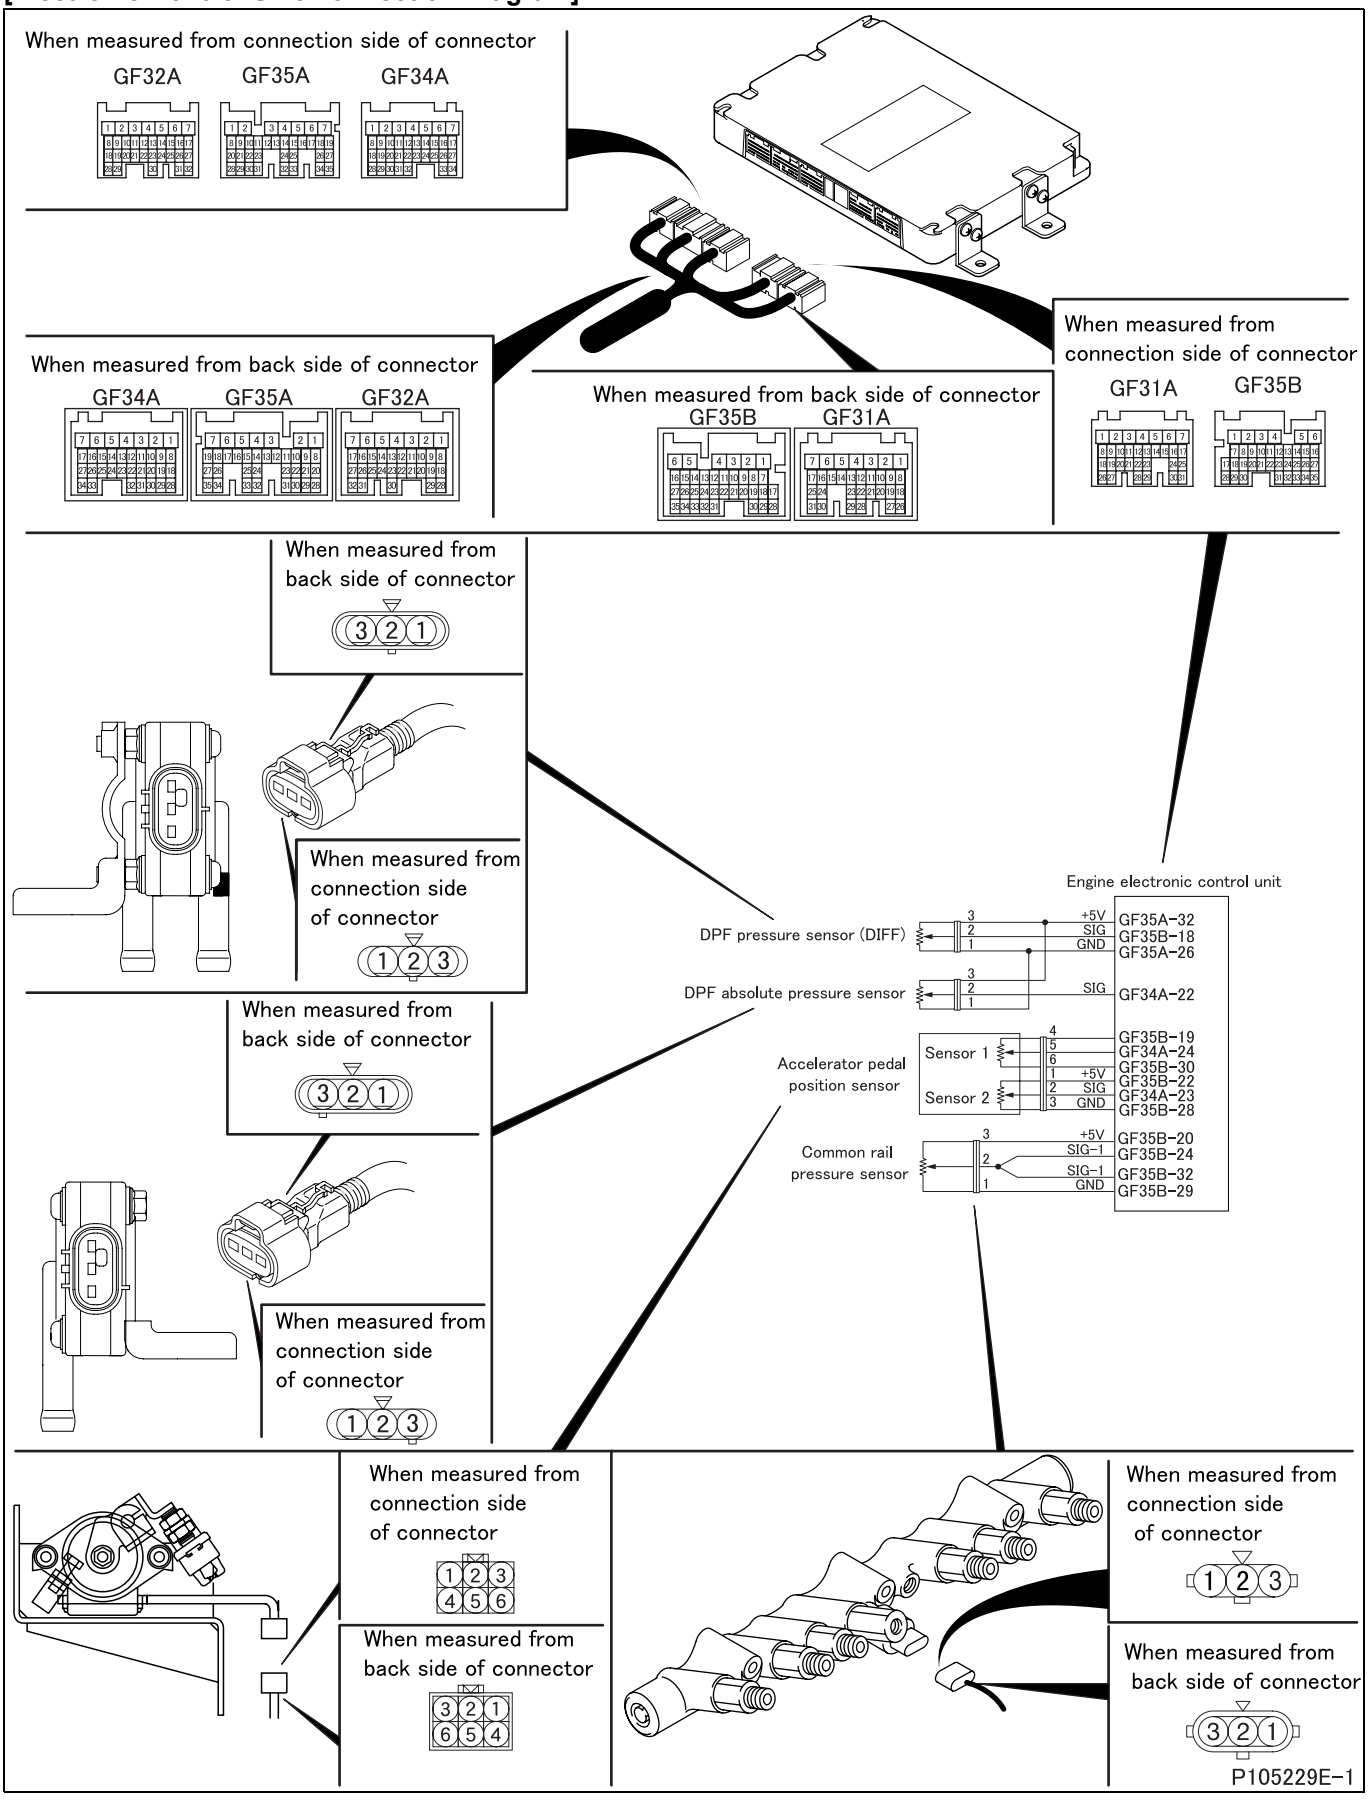
[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>
- Extinguished at 4th driving cycle after normal signal is input.

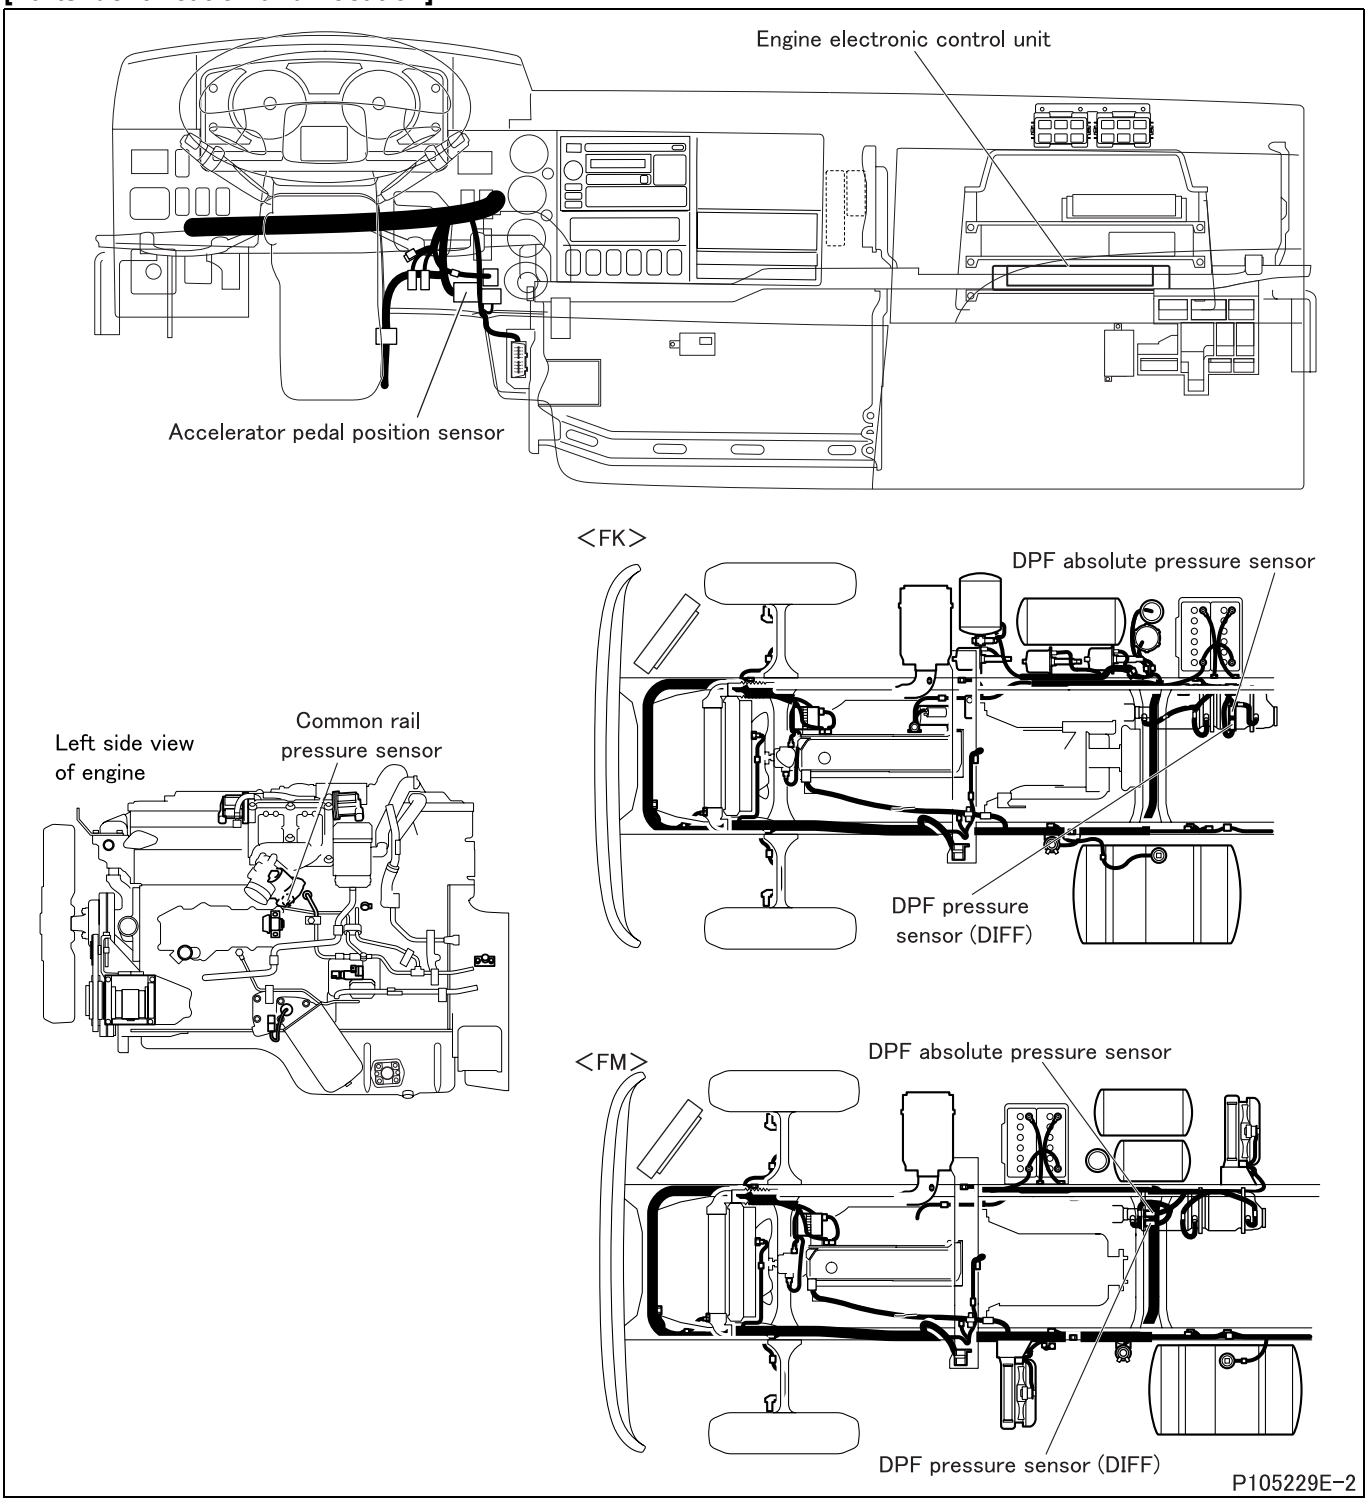
<Fault code>
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished.
  (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 2.
		NO	Modify connector.

Step 2	Inspection items		Inspection by electronic control unit connector (power supply): common rail pressure sensor
	Maintenance item		Measure value of voltage between connector (GF35B) terminal No. 20 (+) and No. 29 (–).
	Inspection condition		• Measure from back side of connector of harness with each device connected to harness. • Starter switch: ON
	Requirements		5 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Go to step 3.

Step 3	Inspection items		Inspection of common rail pressure sensor connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	Modify connector.

Step 4	Inspection items		Inspection of harness between electronic control unit and common rail pressure sensor (power supply)
	Maintenance item		Check circuit between common rail pressure sensor connector terminal No. 3 and electronic control unit connector (GF35B) terminal No. 20.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Modify harness.

Step 5	Inspection items		Inspection by electronic control unit connector (power supply): accelerator pedal position sensor (sensor 1)
	Maintenance item		Measure value of voltage between connector (GF35B) terminal No. 19 (+) and No. 30 (–).
	Inspection condition		• Measure from back side of connector of harness with each device connected to harness. • Starter switch: ON
	Requirements		5 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Go to step 6.

Step 6	Inspection items		Inspection of accelerator pedal position sensor (sensor 1) connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify connector.

Step 7	Inspection items		Inspection of harness between electronic control unit and accelerator pedal position sensor (sensor 1) (power supply)
	Maintenance item		Check circuit between accelerator pedal position sensor (sensor 1) connector terminal No. 4 and electronic control unit connector (GF35B) terminal No. 19.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify harness.

Step 8	Inspection items		Inspection by electronic control unit connector: DPF absolute pressure sensor
	Maintenance item		Measure value of voltage between connector (GF35A) terminal No. 32 (+) and No. 26 (–).
	Inspection condition		• Measure from back side of connector of harness with each device connected to harness. • Starter switch: ON
	Requirements		5 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 9.

Step 9	Inspection items		Inspection of DPF absolute pressure sensor connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 10.
		NO	Modify connector.

Step 10	Inspection items		Inspection of harness between electronic control unit and DPF absolute pressure sensor (power supply)
	Maintenance item		Check circuit between DPF absolute pressure sensor connector terminal No. 3 and electronic control unit connector (GF35A) terminal No. 32.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 11.
		NO	Modify harness.

Step 11	Inspection items		Inspection by electronic control unit connector: DPF pressure sensor (DIFF)
	Maintenance item		Measure value of voltage between connector (GF35A) terminal No. 32 (+) and No. 26 (–).
	Inspection condition		• Measure from back side of connector of harness with each device connected to harness. • Starter switch: ON
	Requirements		5 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 12.

Step 12	Inspection items		Inspection of DPF pressure sensor (DIFF) connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 13.
		NO	Modify connector.

Step 13	Inspection items		Inspection of harness between electronic control unit and DPF pressure sensor (DIFF) (power supply)
	Maintenance item		Check circuit between DPF pressure sensor (DIFF) connector terminal No. 3 and electronic control unit connector (GF35A) terminal No. 32.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Replacement of electronic control unit
		NO	Modify harness.

[Fault code]
Diagnosis code: P0643/Flash code: 81
[Monitor]
Abnormality of sensor supply voltage 1
[Fault (outline)]
High signal range check
[Diagnosis check]
- Sensor supply voltage 1 in engine electronic control unit is monitored.
- Units served by sensor supply 1
- Common rail pressure sensor
- Accelerator pedal position sensor (sensor 1)
- DPF absolute pressure sensor
- DPF pressure sensor (DIFF)

[Code generation condition]
- Supply voltage to units remain over 6 V for 0.03 second. (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal

[Control effected by electronic control unit during fault]

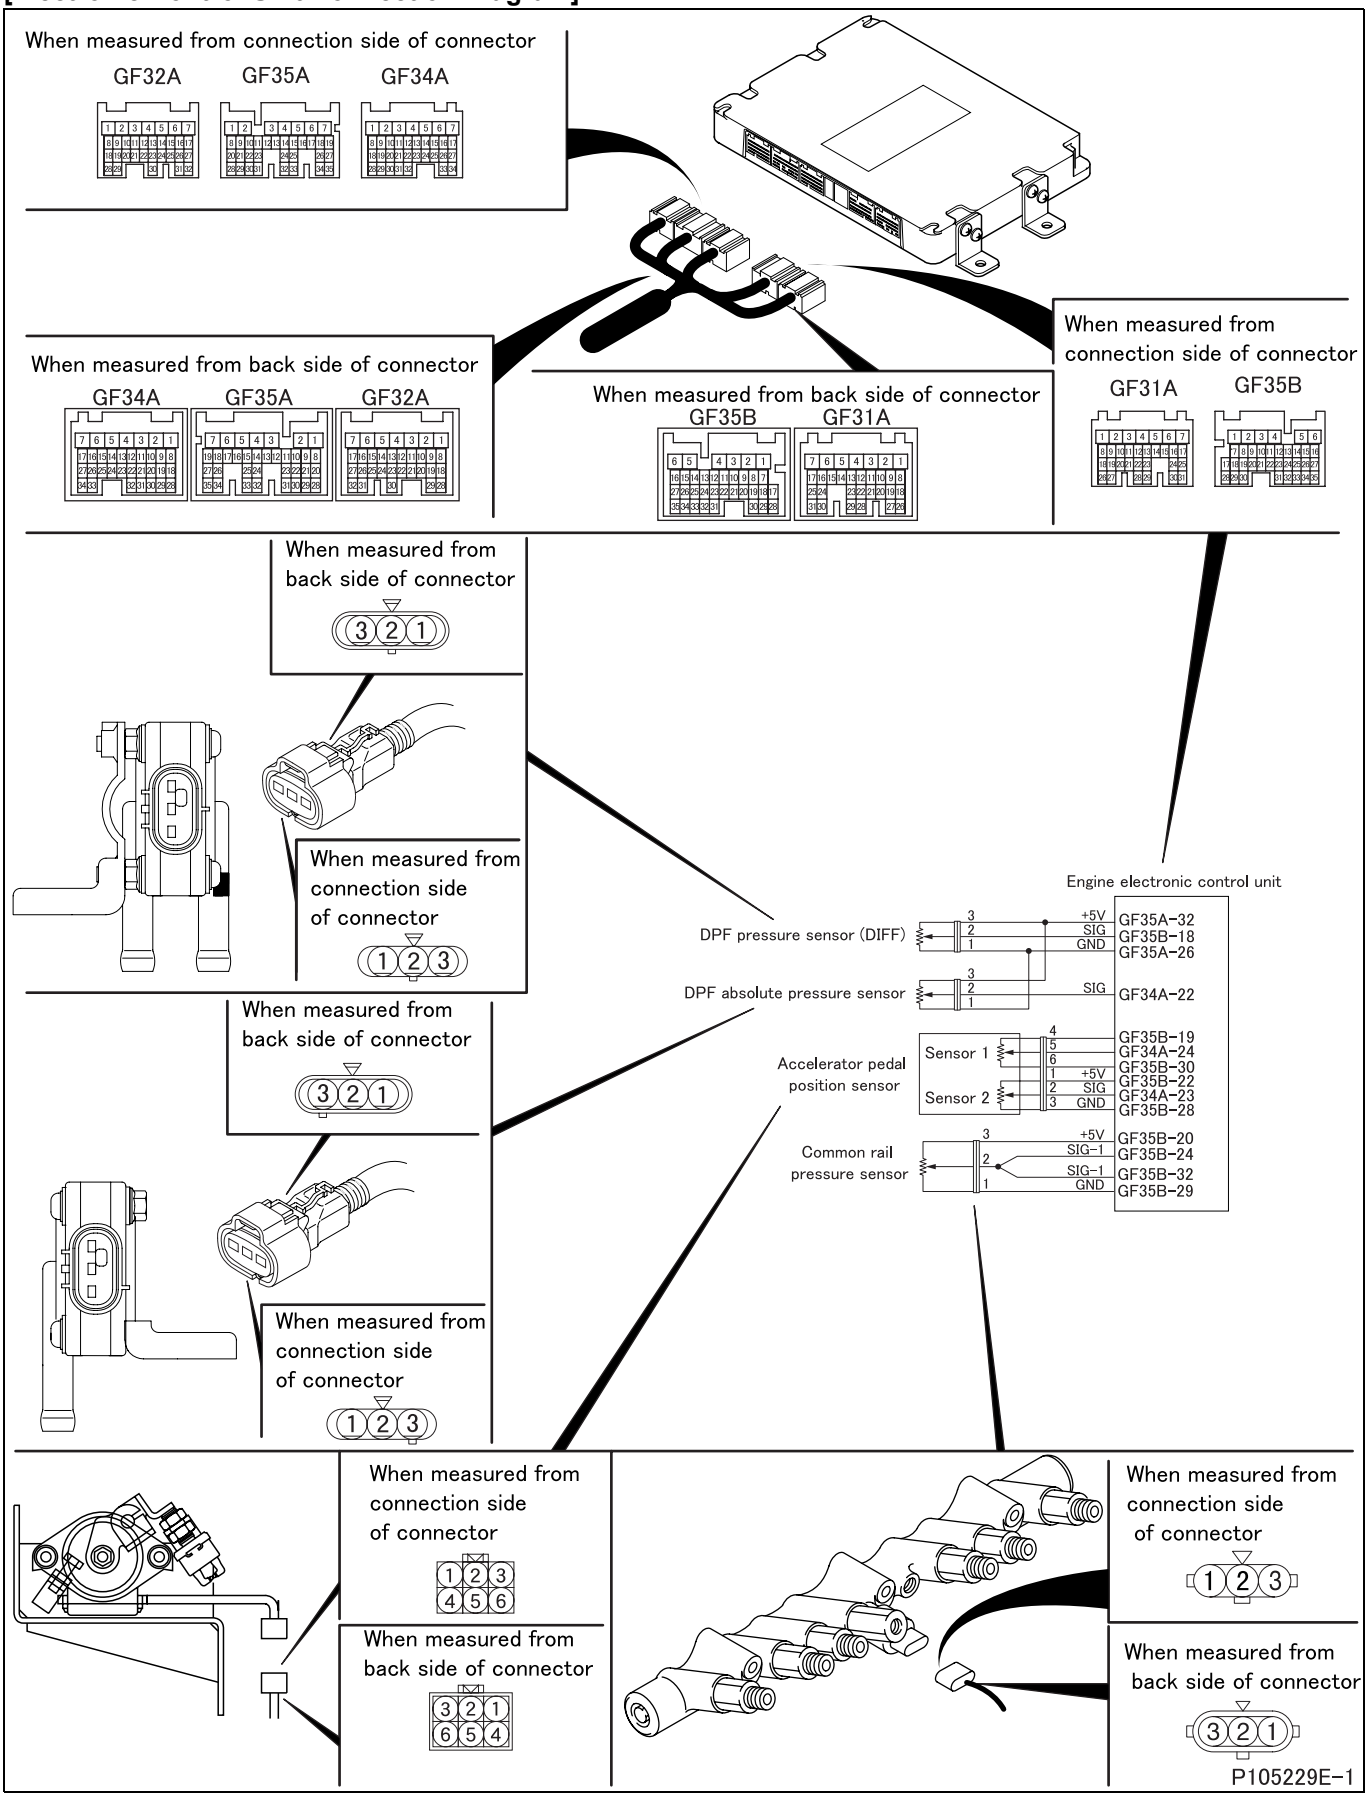
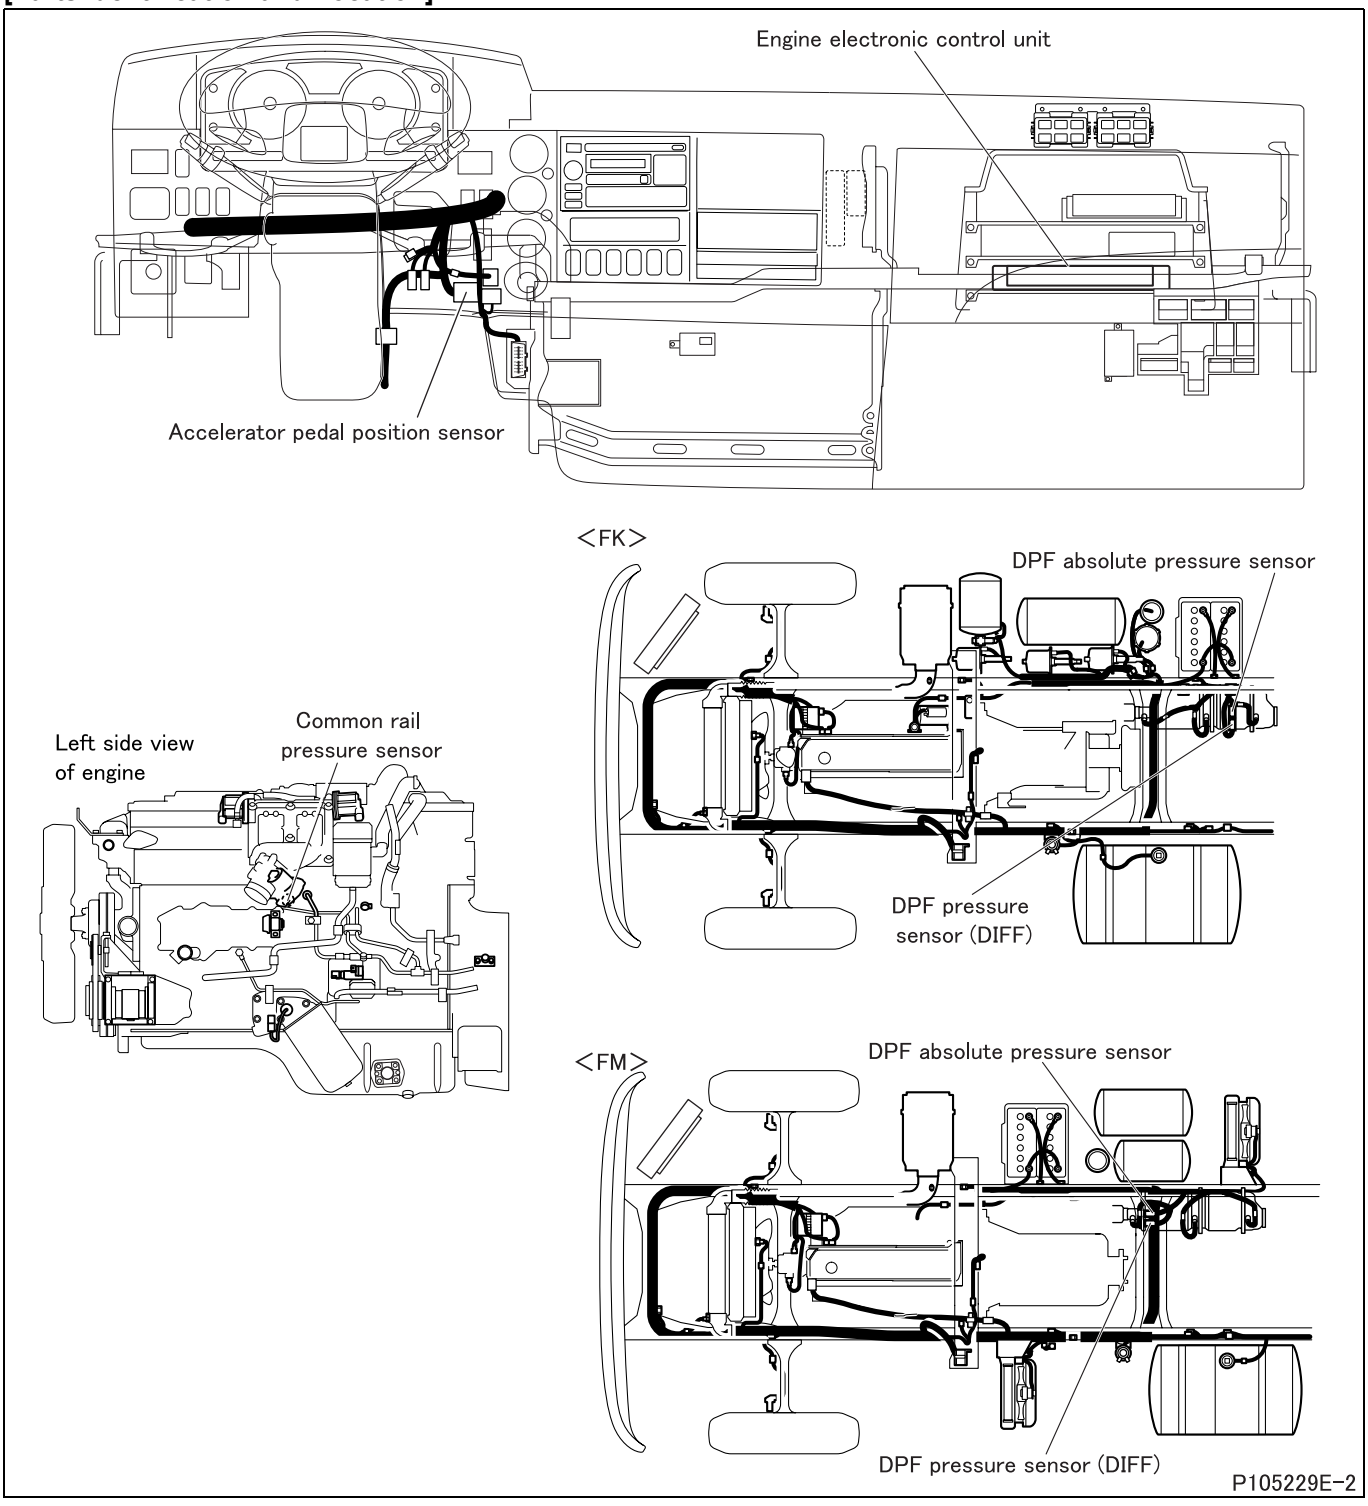
[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 2.
		NO	Modify connector.

Step 2	Inspection items		Inspection by electronic control unit connector (power supply): common rail pressure sensor
	Maintenance item		Measure value of voltage between connector (GF35B) terminal No. 20 (+) and No. 29 (–).
	Inspection condition		• Measure from back side of connector of harness with each device connected to harness. • Starter switch: ON
	Requirements		5 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Go to step 3.

Step 3	Inspection items		Inspection of common rail pressure sensor connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	Modify connector.

Step 4	Inspection items		Inspection of harness between electronic control unit and common rail pressure sensor (power supply)
	Maintenance item		Check circuit between common rail pressure sensor connector terminal No. 3 and electronic control unit connector (GF35B) terminal No. 20.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Modify harness.

Step 5	Inspection items		Inspection by electronic control unit connector (power supply): accelerator pedal position sensor (sensor 1)
	Maintenance item		Measure value of voltage between connector (GF35B) terminal No. 19 (+) and No. 30 (–).
	Inspection condition		• Measure from back side of connector of harness with each device connected to harness. • Starter switch: ON
	Requirements		5 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Go to step 6.

Step 6	Inspection items		Inspection of accelerator pedal position sensor (sensor 1) connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify connector.

Step 7	Inspection items		Inspection of harness between electronic control unit and accelerator pedal position sensor (sensor 1) (power supply)
	Maintenance item		Check circuit between accelerator pedal position sensor (sensor 1) connector terminal No. 4 and electronic control unit connector (GF35B) terminal No. 19.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify harness.

Step 8	Inspection items		Inspection by electronic control unit connector: DPF absolute pressure sensor
	Maintenance item		Measure value of voltage between connector (GF35A) terminal No. 32 (+) and No. 26 (–).
	Inspection condition		• Measure from back side of connector of harness with each device connected to harness. • Starter switch: ON
	Requirements		5 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 9.

Step 9	Inspection items		Inspection of DPF absolute pressure sensor connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 10.
		NO	Modify connector.

Step 10	Inspection items		Inspection of harness between electronic control unit and DPF absolute pressure sensor (power supply)
	Maintenance item		Check circuit between DPF absolute pressure sensor connector terminal No. 3 and electronic control unit connector (GF35A) terminal No. 32.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 11.
		NO	Modify harness.

Step 11	Inspection items		Inspection by electronic control unit connector: DPF pressure sensor (DIFF)
	Maintenance item		Measure value of voltage between connector (GF35A) terminal No. 32 (+) and No. 26 (–).
	Inspection condition		• Measure from back side of connector of harness with each device connected to harness. • Starter switch: ON
	Requirements		5 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 12.

Step 12	Inspection items		Inspection of DPF pressure sensor (DIFF) connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 13.
		NO	Modify connector.

Step 13	Inspection items		Inspection of harness between electronic control unit and DPF pressure sensor (DIFF) (power supply)
	Maintenance item		Check circuit between DPF pressure sensor (DIFF) connector terminal No. 3 and electronic control unit connector (GF35A) terminal No. 32.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Replacement of electronic control unit
		NO	Modify harness.

[Fault code]
Diagnosis code: P0652/Flash code: 81
[Monitor]
Abnormality of sensor supply voltage 2
[Fault (outline)]
Low signal range check
[Diagnosis check]
- Sensor supply voltage 2 in engine electronic control unit is monitored.
- Units served by sensor supply 2
  - Accelerator pedal position sensor (sensor 2)
  - Boost pressure sensor

[Code generation condition]
- Supply voltage to units remain below 4 V for 0.03 second.
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal

[Control effected by electronic control unit during fault]
- Effects no special control.

[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and each sensor
- Abnormality of each connector
- Abnormality of each sensor
- Abnormality in electronic control unit

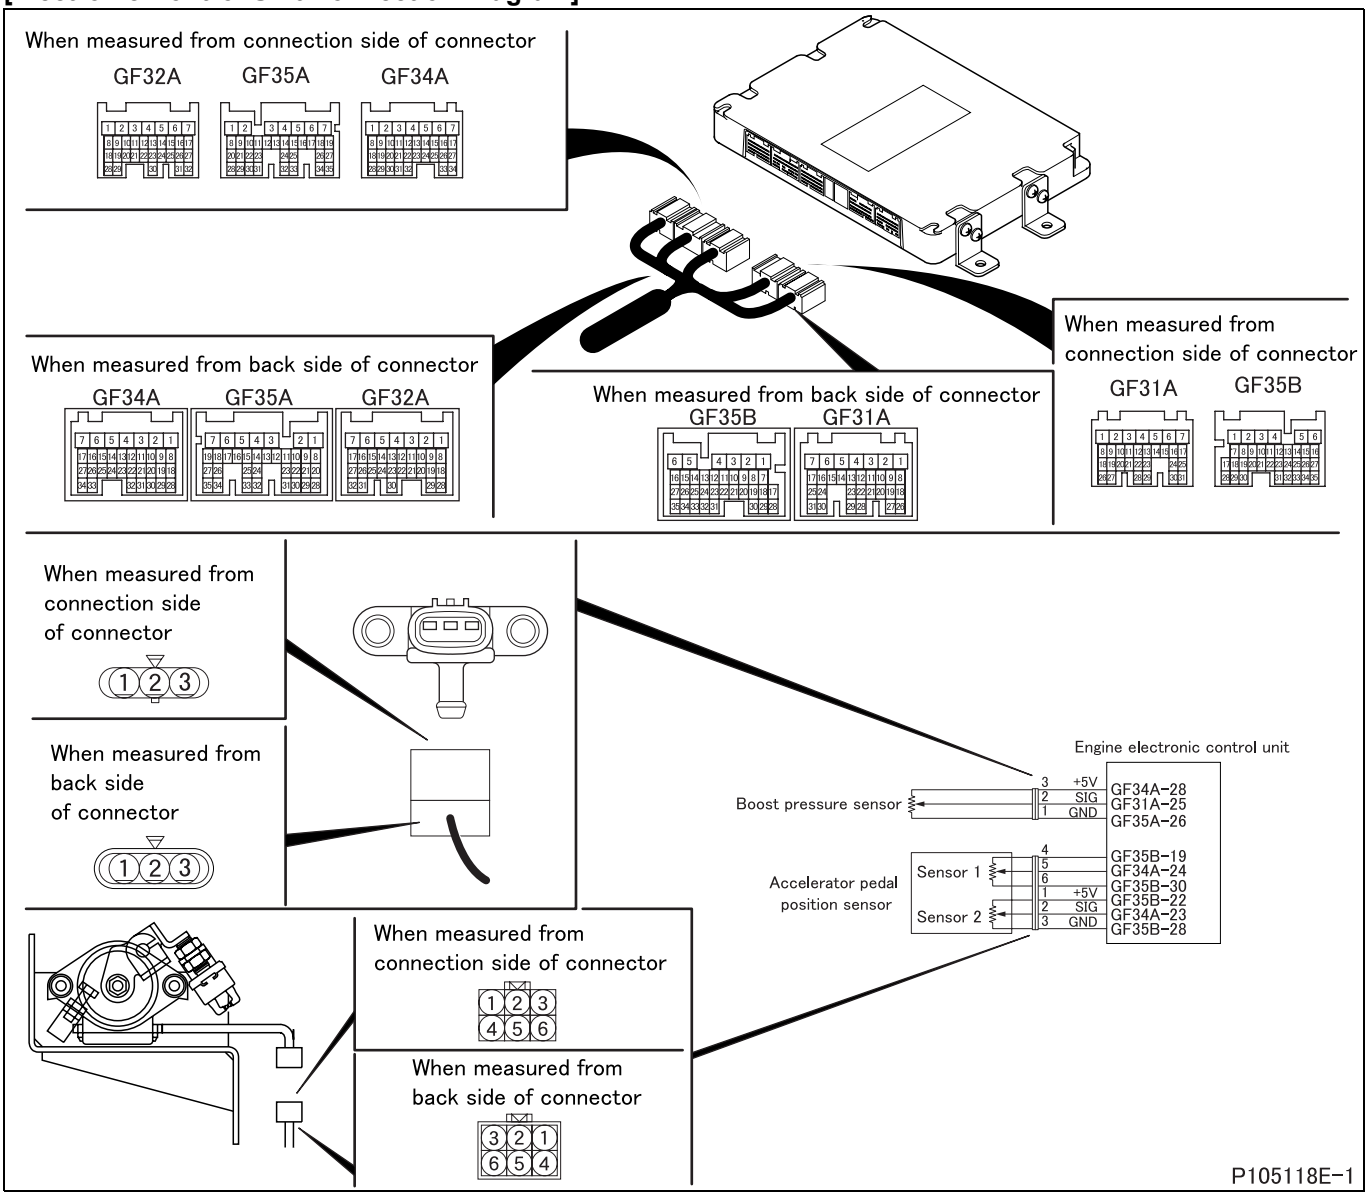
[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>
- Extinguished at 4th driving cycle after normal signal is input.

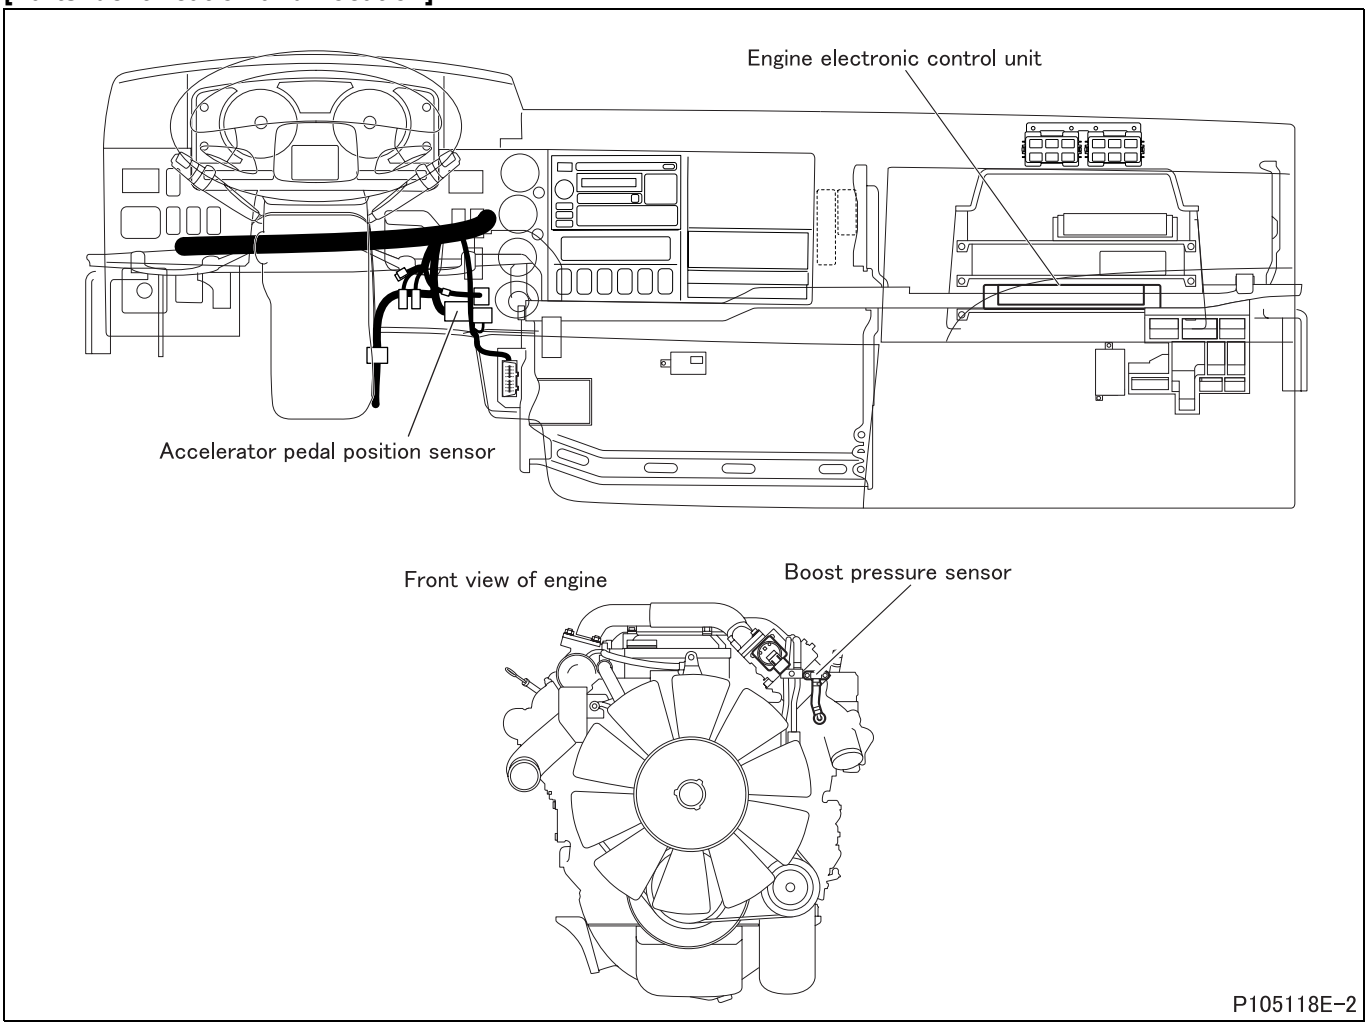
<Fault code>
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished.
  (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 2.
		NO	Modify connector.

Step 2	Inspection items		Inspection by electronic control unit connector (power supply): accelerator pedal position sensor (sensor 2)
	Maintenance item		Measure value of voltage between connector (GF35B) terminal No. 22 (+) and No. 28 (–).
	Inspection condition		• Measure from back side of connector of harness with each device connected to harness. • Starter switch: ON
	Requirements		5 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Go to step 3.

Step 3	Inspection items		Inspection of accelerator pedal position sensor (sensor 2) connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	Modify connector.

Step 4	Inspection items		Inspection of harness between electronic control unit and accelerator pedal position sensor (sensor 2) (power supply)
	Maintenance item		Check circuit between accelerator pedal position sensor (sensor 2) connector terminal No. 1 and electronic control unit connector (GF35B) terminal No. 22.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Modify harness.

Step 5	Inspection items		Inspection by electronic control unit connector: boost pressure sensor
	Maintenance item		Measure value of voltage between connector (GF35A) terminal No. 24 (+) and No. 27 (–).
	Inspection condition		• Measure from back side of connector of harness with each device connected to harness. • Starter switch: ON
	Requirements		5 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 6.

Step 6	Inspection items		Inspection of boost pressure sensor connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify connector.

Step 7	Inspection items		Inspection of harness between electronic control unit and boost pressure sensor (power supply)
	Maintenance item		Check circuit between boost pressure sensor connector terminal No. 3 and electronic control unit connector (GF35A) terminal No. 24.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Replacement of electronic control unit
		NO	Modify harness.

[Fault code]
Diagnosis code: P0653/Flash code: 81
[Monitor]
Abnormality of sensor supply voltage 2
[Fault (outline)]
High signal range check
[Diagnosis check]
- Sensor supply voltage 2 in engine electronic control unit is monitored.
- Units served by sensor supply 2
  - Accelerator pedal position sensor (sensor 2)
  - Boost pressure sensor

[Code generation condition]
- Supply voltage to units remain over 6 V for 0.03 second.
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal

[Control effected by electronic control unit during fault]
- Effects no special control.

[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and each sensor
- Abnormality of each connector
- Abnormality of each sensor
- Abnormality in electronic control unit

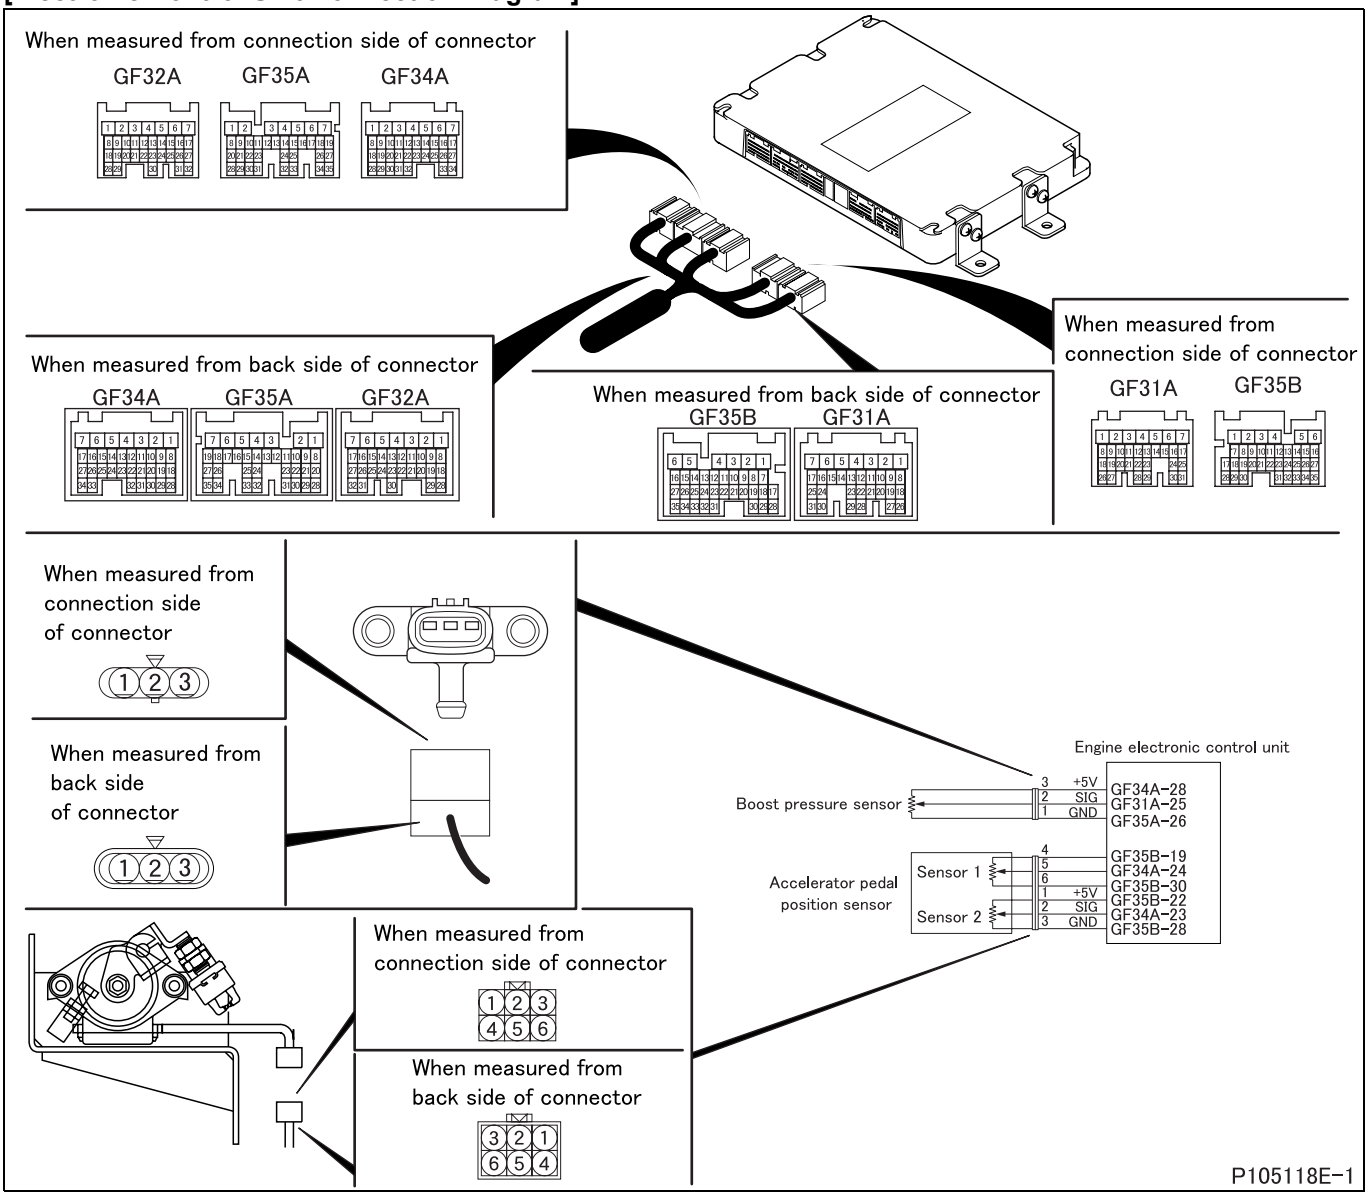
[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>
- Extinguished at 4th driving cycle after normal signal is input.

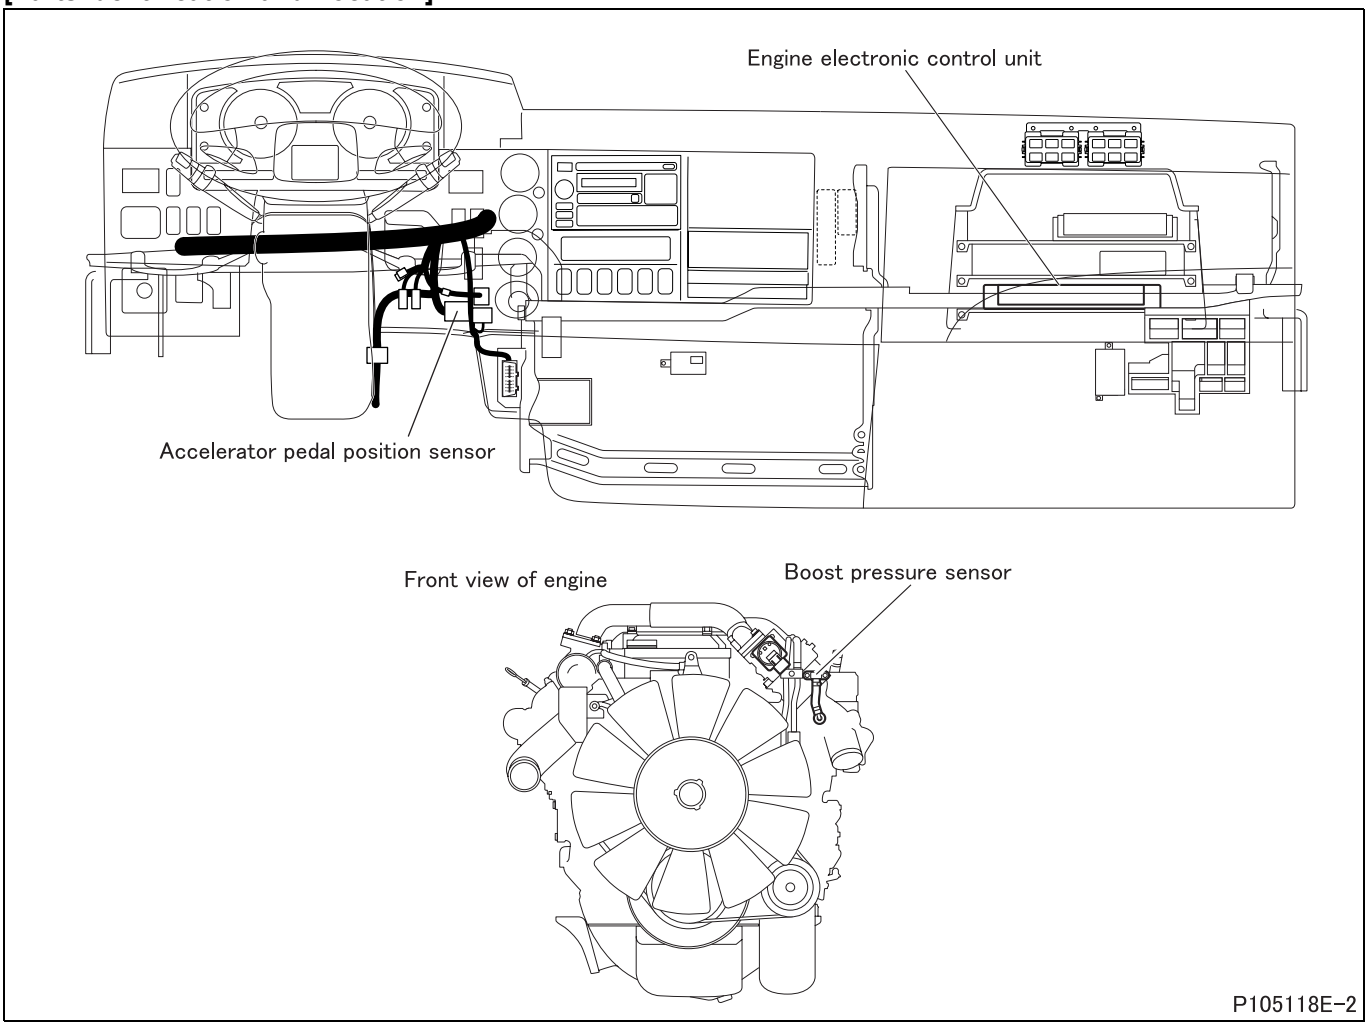
<Fault code>
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished.
  (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 2.
		NO	Modify connector.

Step 2	Inspection items		Inspection by electronic control unit connector (power supply): accelerator pedal position sensor (sensor 2)
	Maintenance item		Measure value of voltage between connector (GF35B) terminal No. 22 (+) and No. 28 (–).
	Inspection condition		• Measure from back side of connector of harness with each device connected to harness. • Starter switch: ON
	Requirements		5 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Go to step 3.

Step 3	Inspection items		Inspection of accelerator pedal position sensor (sensor 2) connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	Modify connector.

Step 4	Inspection items		Inspection of harness between electronic control unit and accelerator pedal position sensor (sensor 2) (power supply)
	Maintenance item		Check circuit between accelerator pedal position sensor (sensor 2) connector terminal No. 1 and electronic control unit connector (GF35B) terminal No. 22.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Modify harness.

Step 5	Inspection items		Inspection by electronic control unit connector: boost pressure sensor
	Maintenance item		Measure value of voltage between connector (GF35A) terminal No. 24 (+) and No. 27 (–).
	Inspection condition		• Measure from back side of connector of harness with each device connected to harness. • Starter switch: ON
	Requirements		5 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 6.

Step 6	Inspection items		Inspection of boost pressure sensor connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify connector.

Step 7	Inspection items		Inspection of harness between electronic control unit and boost pressure sensor (power supply)
	Maintenance item		Check circuit between boost pressure sensor connector terminal No. 3 and electronic control unit connector (GF35A) terminal No. 24.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Replacement of electronic control unit
		NO	Modify harness.

[Fault code]
Diagnosis code: P0685/Flash code: 84
[Monitor]
Abnormality of electronic drive unit relay
[Fault (outline)]
Electronic drive unit OFF with starter switch ON
[Diagnosis check]
- Electronic drive unit relay is checked for internal switch being stuck open.

[Code generation condition]
- Electronic drive unit relay circuit remains open as detected for 1 second. (No communication through controller area network 2)
  (Warning lamp is lit and diagnosis code is displayed on second establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal
- Electronic drive unit relay: active
- Exhaust gas recirculation: initialization process completed
- Controller area network 2 communication in order

[Control effected by electronic control unit during fault]
- Effects no special control.

[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and electronic drive unit relay
- Abnormality of each connector
- Abnormality of electronic drive unit relay
- Abnormality in electronic control unit

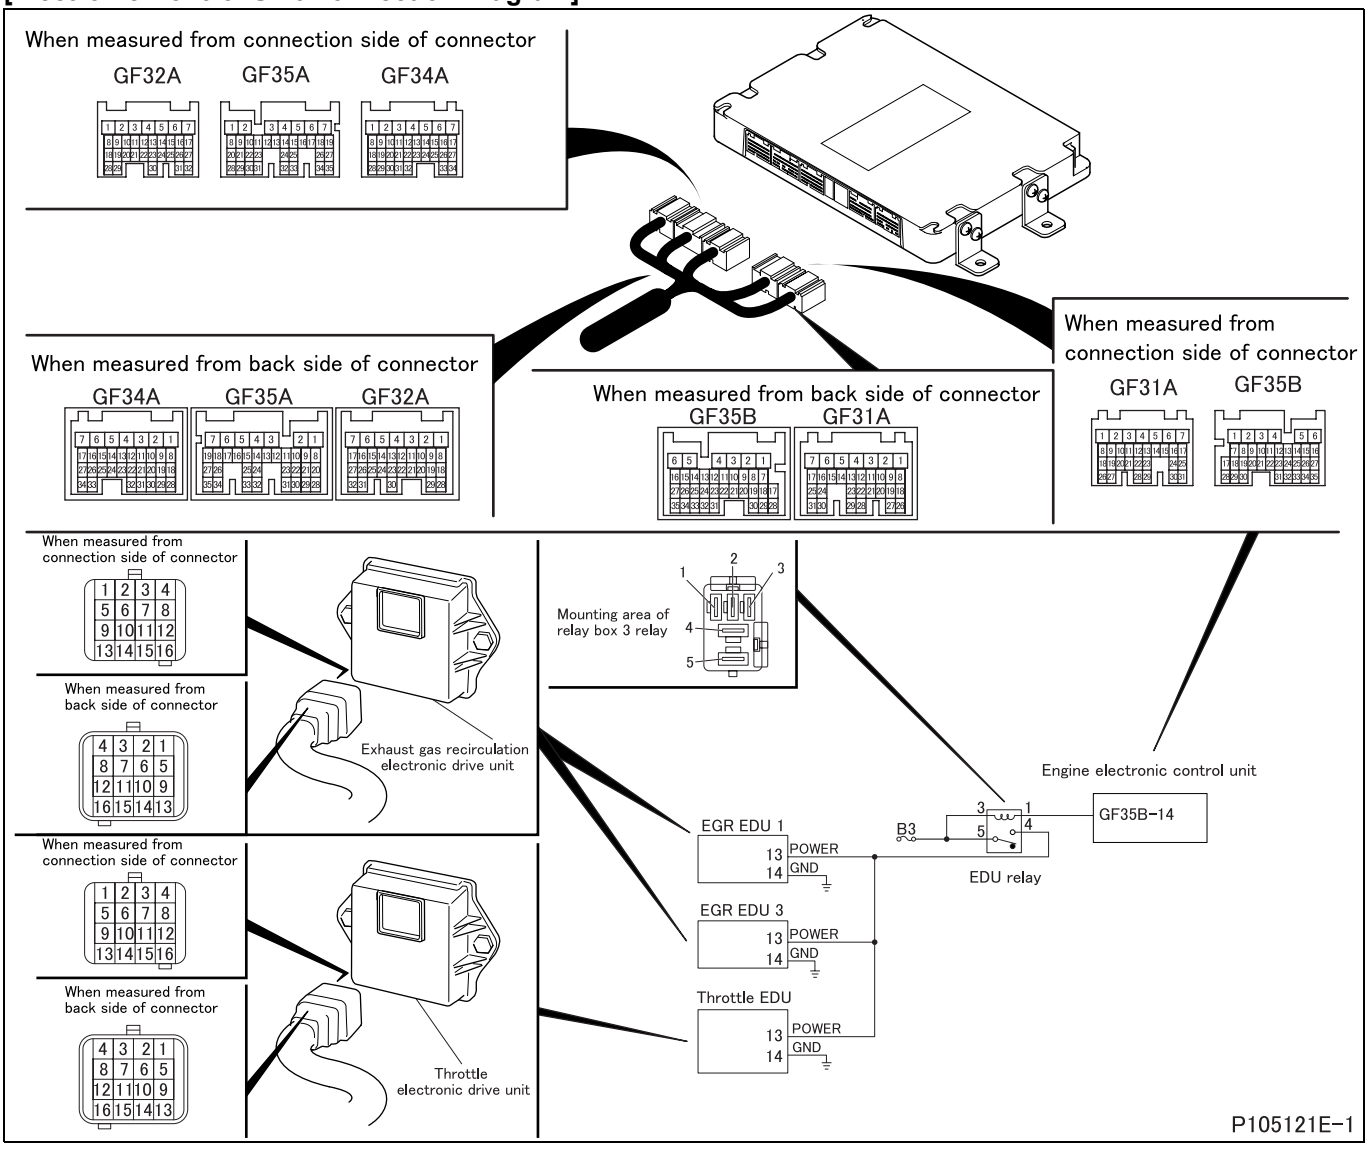
[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>
- Extinguished at 4th driving cycle after normal signal is input.

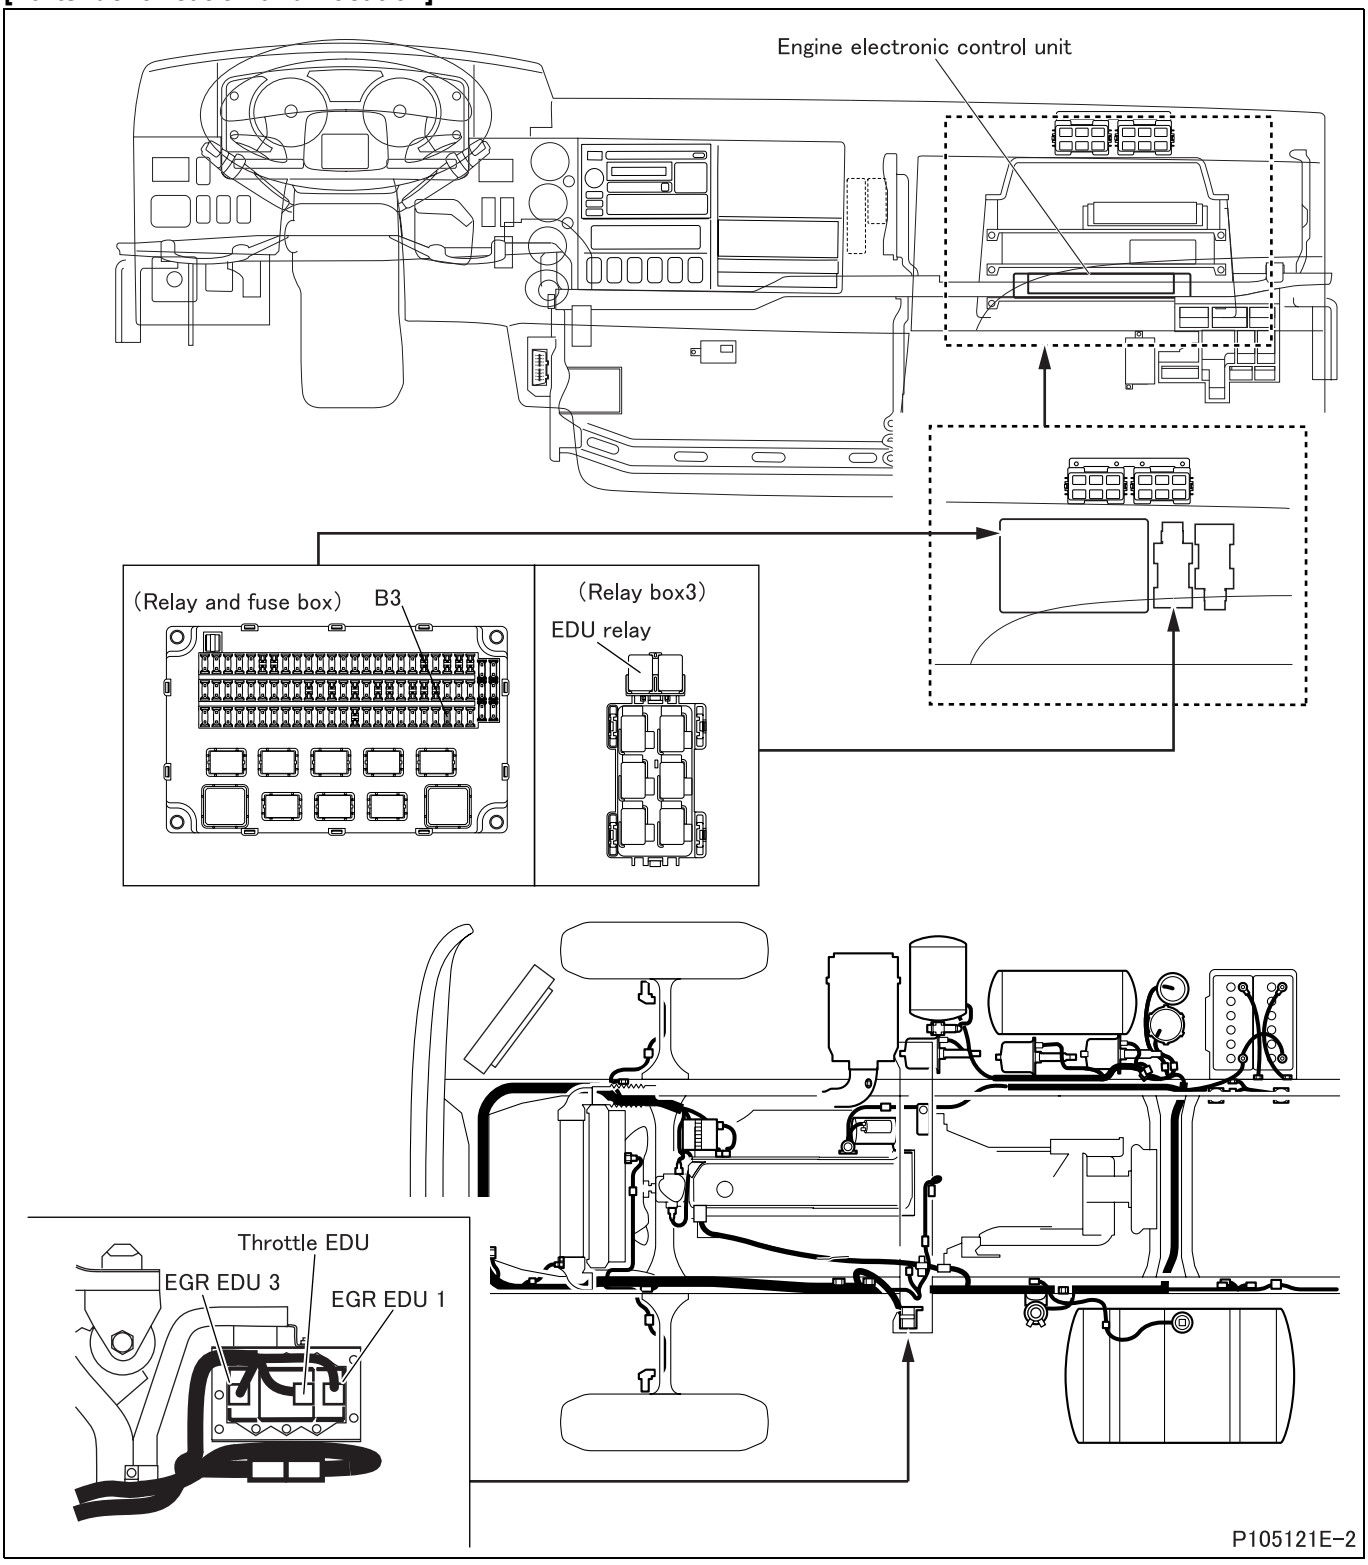
<Fault code>
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished.
  (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

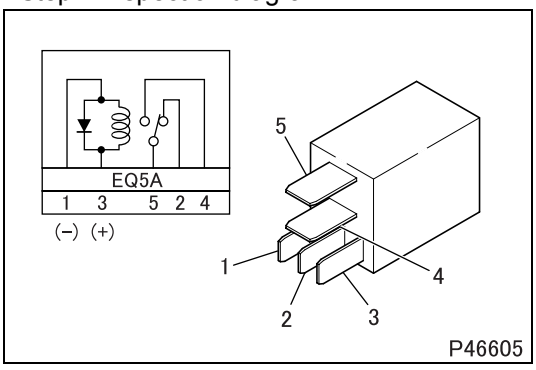
Step 1	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. A9 “EDU Relay”.
	Inspection condition		Starter switch: ON
	Requirements		Relay operation sound is noted (automatically reset after 6 seconds), or ON/OFF switching of Service Data: item No. 90 “EDU Relay” is effected.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

Step 2	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Modify connector.

Step 3	Inspection items		Inspection of relay connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	Modify connector.

Step 4	Inspection items		Inspection of relay unit
	Maintenance item		Measure continuity between terminals No. 2 and 5 when relay operates.
	Inspection condition		Apply battery voltage across connector terminals No. 3 (+) and 1 (–).
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Replacement of relay

<Step 4 inspection diagram>



Step 5	Inspection items		Inspection of harness between relay and electronic control unit (ground)
	Maintenance item		Check circuit between relay connector terminal No. 1 and electronic control unit connector (GF35B) terminal No. 14.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Modify harness.

Step 6	Inspection items		Inspection of harness between relay and electronic control unit (power supply)
	Maintenance item		Check circuit between relay connector terminal No. 3 and fuse (B3).
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify harness.

Step 7	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. A9 “EDU Relay”.
	Inspection condition		Starter switch: ON
	Requirements		Relay operation sound is noted (automatically reset after 6 seconds), or ON/OFF switching of Service Data: item No. 90 “EDU Relay” is effected.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P0686/Flash code: 84
[Monitor]
Abnormality of electronic drive unit relay
[Fault (outline)]
Short circuit ground
[Diagnosis check]
- Electronic drive unit relay (internal coil) monitored for short-circuit to ground.

[Code generation condition]
- Engine continues to operate for 1 second even if starter switch is turned to OFF, which may result from that communication (to electronic drive unit) through controller area network 2 is not interrupted because of short-circuit to ground in electronic drive unit relay (internal coil). (In such a case, trouble occurrence is reported to electronic control unit, and diagnosis code is indicated when starter switch is turned ON next time.)
  (Warning lamp is lit on second establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal
- Starter switch: OFF
- Engine status: after-run
- Electronic drive unit relay request signal: OFF
- Termination processing of each electronic drive unit: normal

[Control effected by electronic control unit during fault]
- Effects no special control.

[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and electronic drive unit relay
- Abnormality of each connector
- Abnormality of electronic drive unit relay
- Abnormality in electronic control unit

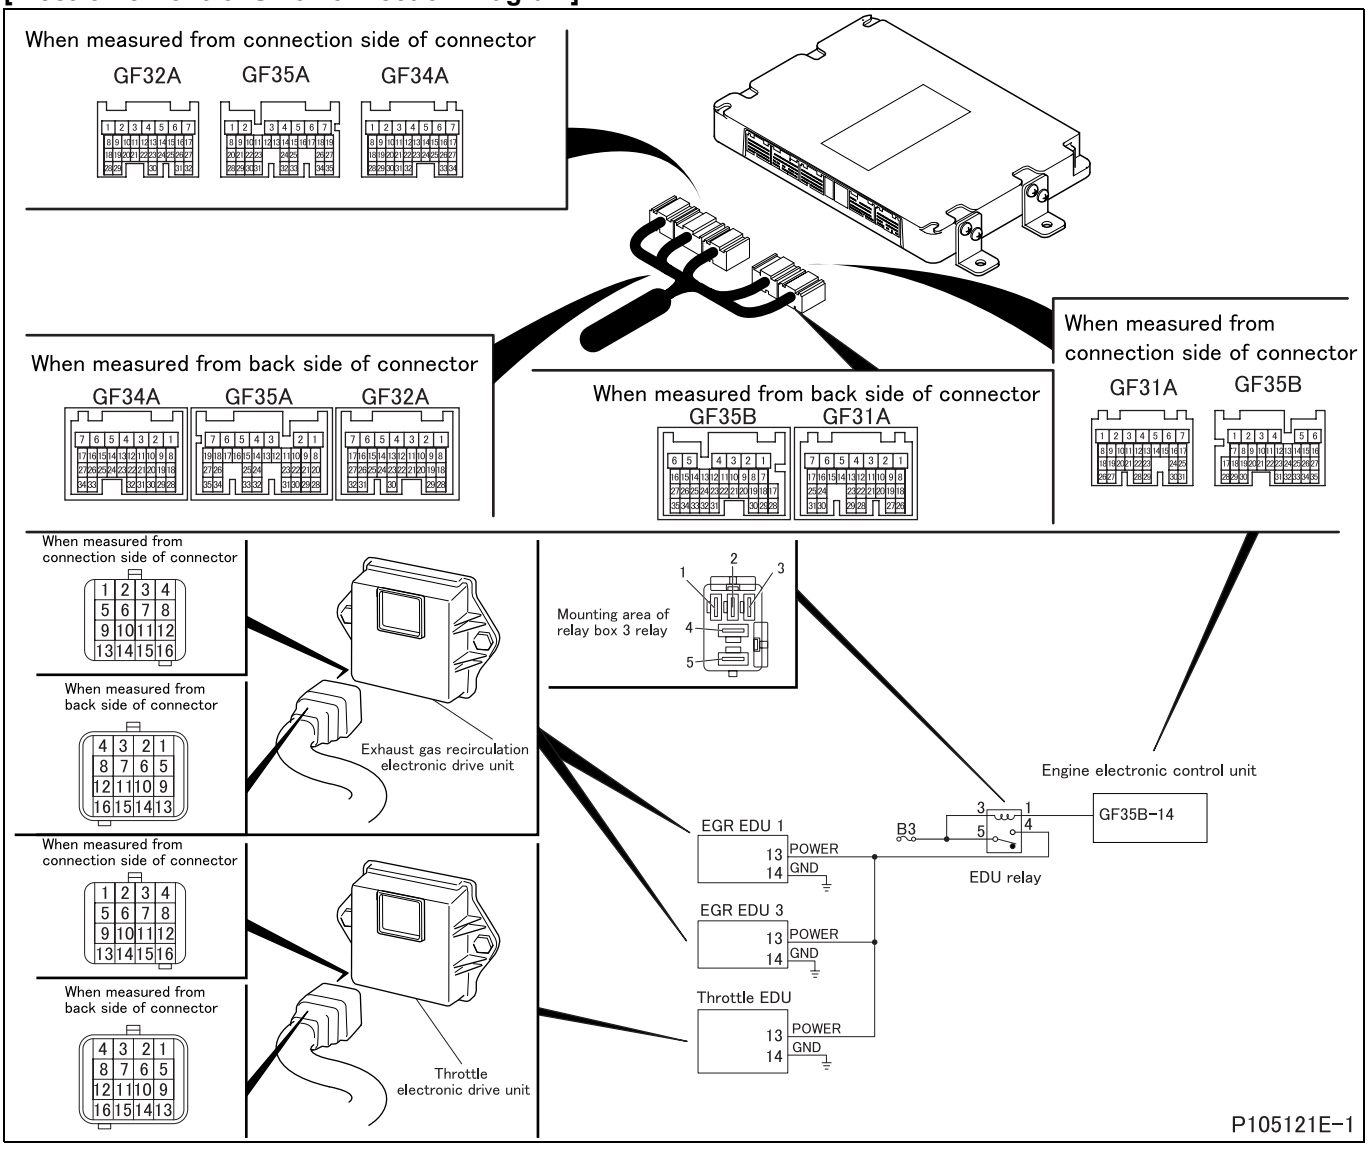
[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>
- Extinguished at 4th driving cycle after normal signal is input.

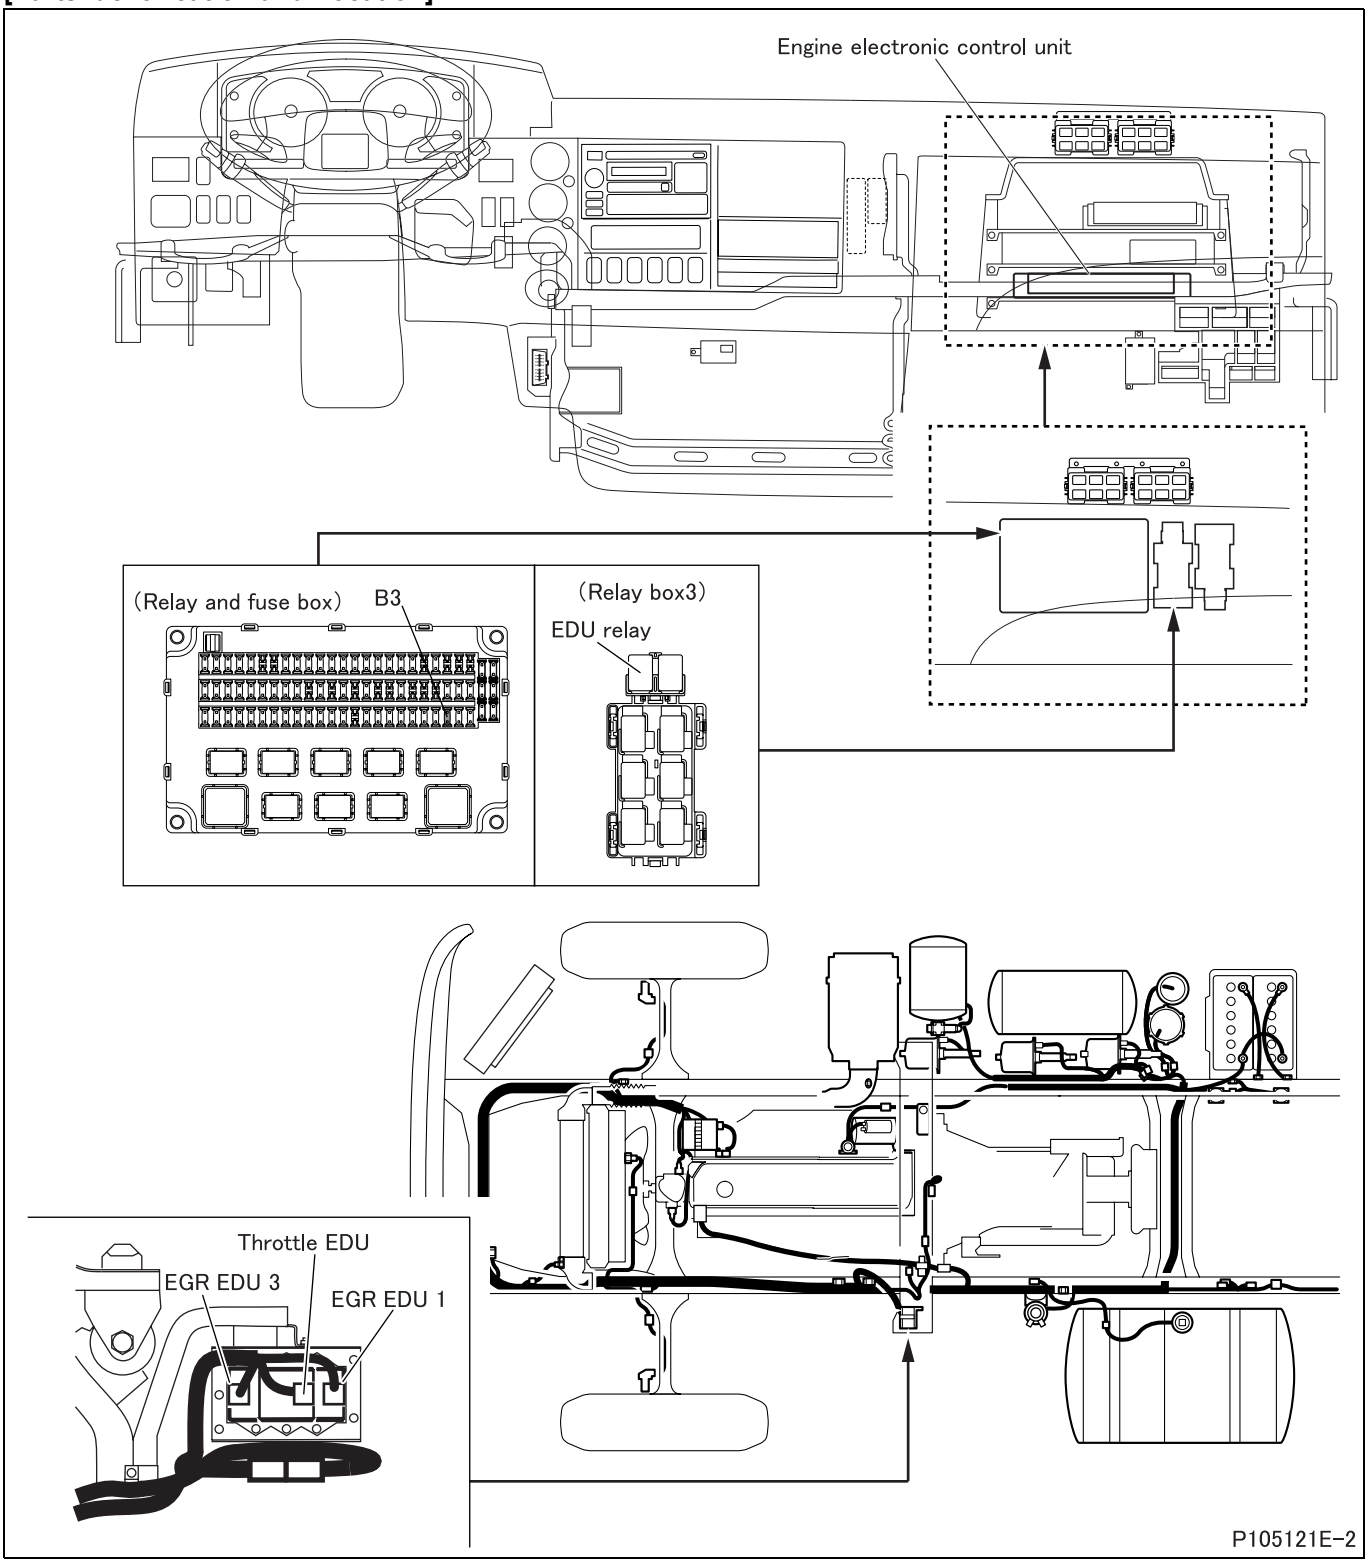
<Fault code>
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished.
  (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

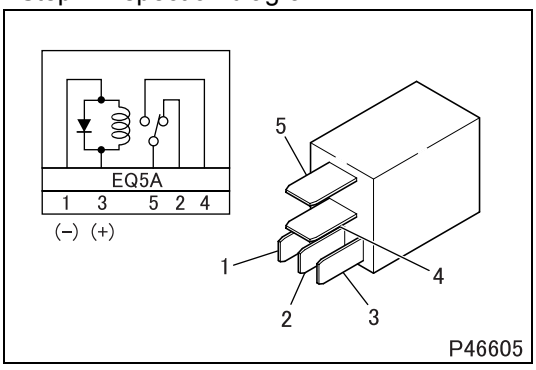
Step 1	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. A9 “EDU Relay”.
	Inspection condition		Starter switch: ON
	Requirements		Relay operation sound is noted (automatically reset after 6 seconds), or ON/OFF switching of Service Data: item No. 90 “EDU Relay” is effected.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

Step 2	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Modify connector.

Step 3	Inspection items		Inspection of relay connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	Modify connector.

Step 4	Inspection items		Inspection of relay unit
	Maintenance item		Measure continuity between terminals No. 2 and 5 when relay operates.
	Inspection condition		Apply battery voltage across connector terminals No. 3 (+) and 1 (–).
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Replacement of relay

<Step 4 inspection diagram>



Step 5	Inspection items		Inspection of harness between relay and electronic control unit (ground)
	Maintenance item		Check circuit between relay connector terminal No. 1 and electronic control unit connector (GF35B) terminal No. 14.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Modify harness.

Step 6	Inspection items		Inspection of harness between relay and electronic control unit (power supply)
	Maintenance item		Check circuit between relay connector terminal No. 3 and fuse (B3).
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify harness.

Step 7	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. A9 “EDU Relay”.
	Inspection condition		Starter switch: ON
	Requirements		Relay operation sound is noted (automatically reset after 6 seconds), or ON/OFF switching of Service Data: item No. 90 “EDU Relay” is effected.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P0687/Flash code: 84
[Monitor]
Abnormality of electronic drive unit relay
[Fault (outline)]
Short circuit battery
[Diagnosis check]
- Electronic drive unit relay (internal coil) monitored for short-circuit to battery.

[Code generation condition]
- Electronic drive unit relay circuit remains shorted to battery as detected for approx. 1 second. (No communication through controller area network 2)
  (Warning lamp is lit and diagnosis code is displayed on second establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal
- Electronic drive unit relay: active

[Control effected by electronic control unit during fault]
- Effects no special control.

[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and electronic drive unit relay
- Abnormality of each connector
- Abnormality of electronic drive unit relay
- Abnormality in electronic control unit

[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>
- Extinguished at 4th driving cycle after normal signal is input.

<Fault code>
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished.
  (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify harness.

Step 7	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. A9 “EDU Relay”.
	Inspection condition		Starter switch: ON
	Requirements		Relay operation sound is noted (automatically reset after 6 seconds), or ON/OFF switching of Service Data: item No. 90 “EDU Relay” is effected.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P0688/Flash code: 84
[Monitor]
Abnormality of electronic drive unit relay
[Fault (outline)]
Electronic drive unit ON with starter switch OFF
[Diagnosis check]
- Electronic drive unit relay is checked for internal switch being stuck close.

[Code generation condition]
- Engine continues to operate for 1 second even if starter switch is turned to OFF because of communication (to electronic drive unit) through controller area network 2 being not interrupted. (In such a case, trouble occurrence is reported to electronic control unit, and diagnosis code is indicated when starter switch is turned ON next time.) (Warning lamp is lit on second establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal
- Controller area network 2 communication: available
- Starter switch: to be turned OFF
- Exhaust gas recirculation: initialization process completed

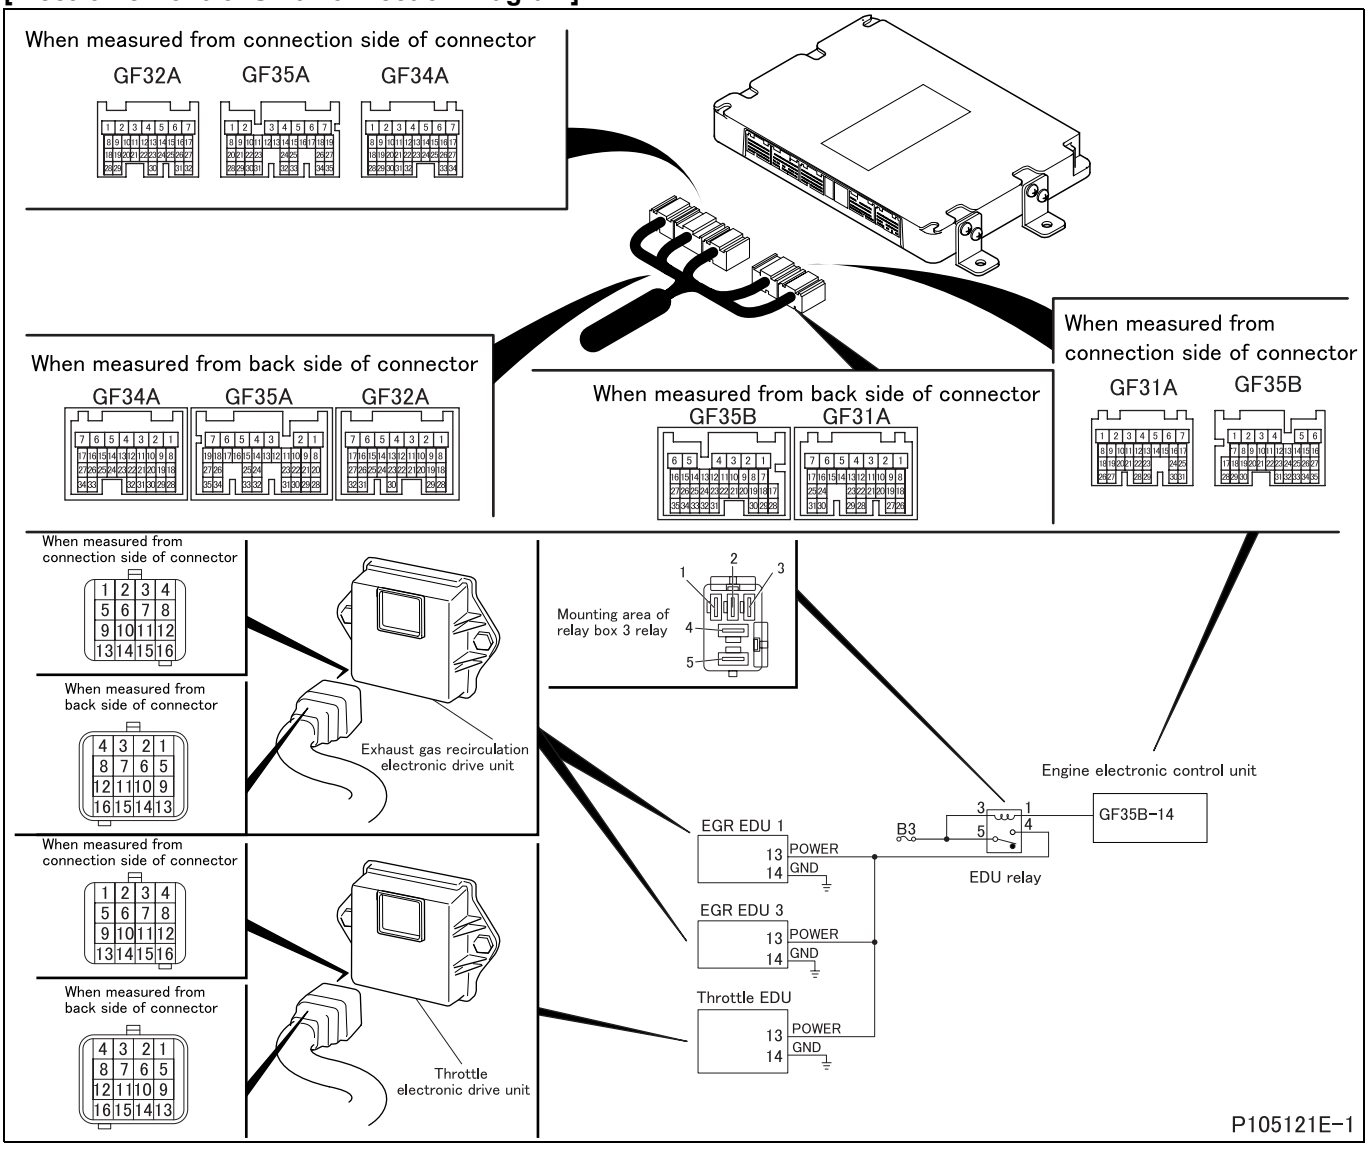
[Control effected by electronic control unit during fault]
- Effects no special control.

[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and electronic drive unit relay
- Abnormality of each connector
- Abnormality of electronic drive unit relay
- Abnormality in electronic control unit

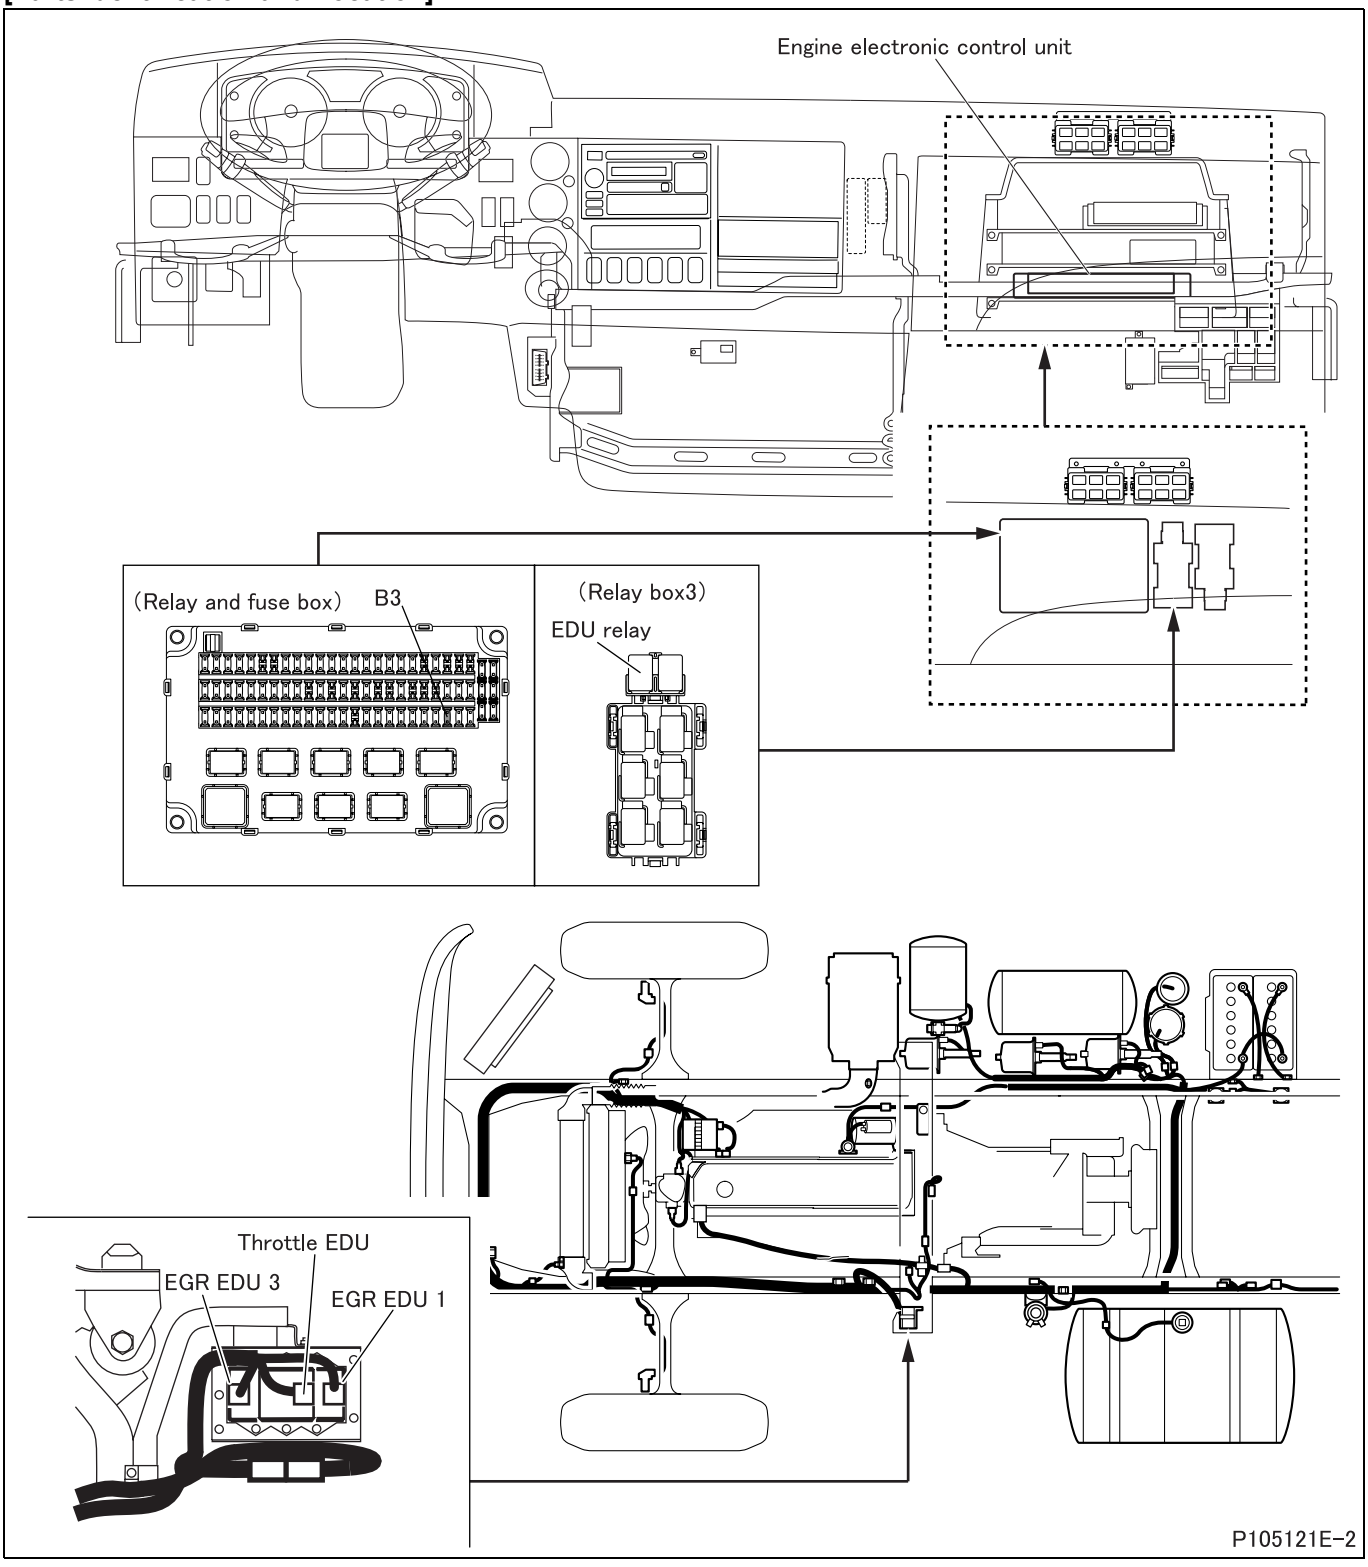
[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Fault code>
- To erase, execute Memory Clear.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

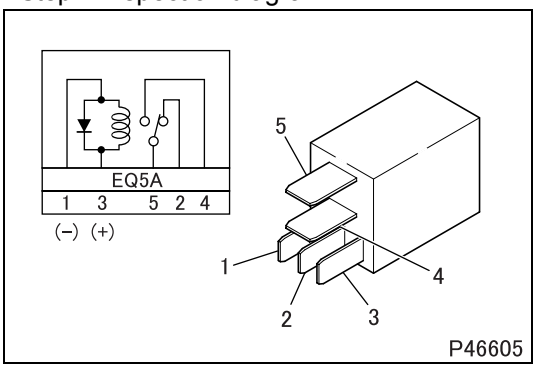
Step 1	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. A9 “EDU Relay”.
	Inspection condition		Starter switch: ON
	Requirements		Relay operation sound is noted (automatically reset after 6 seconds), or ON/OFF switching of Service Data: item No. 90 “EDU Relay” is effected.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

Step 2	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Modify connector.

Step 3	Inspection items		Inspection of relay connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	Modify connector.

Step 4	Inspection items		Inspection of relay unit
	Maintenance item		Measure continuity between terminals No. 2 and 5 when relay operates.
	Inspection condition		Apply battery voltage across connector terminals No. 3 (+) and 1 (–).
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Replacement of relay

<Step 4 inspection diagram>



Step 5	Inspection items		Inspection of harness between relay and electronic control unit (ground)
	Maintenance item		Check circuit between relay connector terminal No. 1 and electronic control unit connector (GF35B) terminal No. 14.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Modify harness.

Step 6	Inspection items		Inspection of harness between relay and electronic control unit (power supply)
	Maintenance item		Check circuit between relay connector terminal No. 3 and fuse (B3).
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify harness.

Step 7	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. A9 “EDU Relay”.
	Inspection condition		Starter switch: ON
	Requirements		Relay operation sound is noted (automatically reset after 6 seconds), or ON/OFF switching of Service Data: item No. 90 “EDU Relay” is effected.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P1170/Flash code: 99
[Monitor]
Abnormality of injection quantity adjustment data
[Fault (outline)]
Data abnormality in electronic control unit
[Diagnosis check]
- Checking is made to confirm that data for injection amount compensation is written in engine electronic control unit and they are correct.

[Code generation condition]
- Injection quantity adjustment data remains abnormal or unavailable for approx. 1 second.
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal

[Control effected by electronic control unit during fault]
- Control is carried out using injection quantity adjustment resistor No. 1. (Output is slightly reduced.)

[Probable cause of trouble]
- No injection quantity adjustment data stored in engine electronic control unit
  (For data alteration/registration and data write operation, contact your nearest Mitsubishi FUSO Dealer or Mitsubishi FUSO Truck of America, Inc.)

[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>
- Extinguished after input of normal signal.

<Fault code>
- If code recovered to normal, automatically cleared at 40th warm up cycle after warning lamp is lit.
  (To clear as desired, erase from the memory.)

Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Fault code]
Diagnosis code: P1240/Flash code: 71
[Monitor]
Abnormality of flow damper (No. 1 cylinder)
[Fault (outline)]
Faulty flow damper check
[Diagnosis check]
- Operation of flow damper is monitored.

[Code generation condition]
- Fuel control cylinder balance (FCCB) and engine speed variation time remain more than specified for approx. 1 minute.
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- Engine in operation
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal
- Engine speed sensor: normal in signal
- Post injection: none

[Control effected by electronic control unit during fault]
- Learning of FCCB (fuel control cylinder balance) is inhibited.

[Probable cause of trouble]
- Leakage and air are found in fuel system.
- Abnormality of flow damper (No. 1 cylinder)
- Abnormality of electronic control unit
- Abnormality of injector (No. 1 cylinder)

[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Fault code>
- To erase, execute Memory Clear.

[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. BB “Injector Test 1”.
	Inspection condition		• Engine start: At idle • Transmission: neutral • Vehicle speed: 0 km/h {0 MPH} • Other diagnosis codes do not occur.
	Requirements		Engine variation and status remain uncharged even if injector (No. 1 cylinder) is put in injection stopped state.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 2.
		NO	Go to step 3.

Step 2	Inspection items		Checking of air bleeding
	Maintenance item		Bleed air from fuel filter.
	Inspection condition		Starter switch: OFF
	Requirements		Air bleeding is effected to check if problem is solved (Item No. 61 “Flow Damper (#1)” is checked and if frequency of operation is not increased, problem is judged solved).
	Inspection result (Is the judging standard satisfied?)	YES	Transient fault due to trapped air
		NO	Replacement of injector

Step 3	Inspection items		Inspection by control data
	Maintenance item		Measurement of following service data • Item No. 5B “Pump Adjustment Value (Last Time)” • Item No. 5C “Pump Adjustment Value (This Time)”
	Inspection condition		Engine start: At idle
	Requirements		–200 to +200 mA
	Inspection result (Is the judging standard satisfied?)	YES	Replacement of injector
		NO	Go to step 4.

Step 4	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. C2 “Pump Adjustment Value Clear” to initialize pump learning value.
	Inspection condition		–
	Requirements		Problem is solved with learning value initialized (Item No. 61 “Flow Damper (#1)” is checked and if frequency of operation is not increased, problem is judged solved).
	Inspection result (Is the judging standard satisfied?)	YES	Transient fault due to improper pump learning value
		NO	Replacement of injector (rail is replaced if problem remains unsolved after injector replacement)

[Fault code]
Diagnosis code: P1241/Flash code: 72
[Monitor]
Abnormality of flow damper (No. 2 cylinder)
[Fault (outline)]
Faulty flow damper operation
[Diagnosis check]
- Operation of flow damper is monitored.

[Code generation condition]
- Fuel control cylinder balance (FCCB) and engine speed variation time remain more than specified for approx. 1 minute.
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- Engine in operation
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal
- Engine speed sensor: normal in signal
- Post injection: none

[Control effected by electronic control unit during fault]
- Learning of FCCB (fuel control cylinder balance) is inhibited.

[Probable cause of trouble]
- Leakage and air are found in fuel system.
- Abnormality of flow damper (No. 2 cylinder)
- Abnormality of electronic control unit
- Abnormality of injector (No. 2 cylinder)

[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Fault code>
- To erase, execute Memory Clear.

[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. BF “Injector Test 5”.
	Inspection condition		• Engine start: At idle • Transmission: neutral • Vehicle speed: 0 km/h {0 MPH} • Other diagnosis codes do not occur.
	Requirements		Engine variation and status remain uncharged even if injector (No. 2 cylinder) is put in injection stopped state.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 2.
		NO	Go to step 3.

Step 2	Inspection items		Checking of air bleeding
	Maintenance item		Bleed air from fuel filter.
	Inspection condition		Starter switch: OFF
	Requirements		Air bleeding is effected to check if problem is solved (Item No. 62 “Flow Damper (#2)” is checked and if frequency of operation is not increased, problem is judged solved).
	Inspection result (Is the judging standard satisfied?)	YES	Transient fault due to trapped air
		NO	Replacement of injector

Step 3	Inspection items		Inspection by control data
	Maintenance item		Measurement of following service data • Item No. 5B “Pump Adjustment Value (Last Time)” • Item No. 5C “Pump Adjustment Value (This Time)”
	Inspection condition		Engine start: At idle
	Requirements		–200 to +200 mA
	Inspection result (Is the judging standard satisfied?)	YES	Replacement of injector
		NO	Go to step 4.

Step 4	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. C2 “Pump Adjustment Value Clear” to initialize pump learning value.
	Inspection condition		–
	Requirements		Problem is solved with learning value initialized (Item No. 62 “Flow Damper (#2)” is checked and if frequency of operation is not increased, problem is judged solved).
	Inspection result (Is the judging standard satisfied?)	YES	Transient fault due to improper pump learning value
		NO	Replacement of injector (rail is replaced if problem remains unsolved after injector replacement)

[Fault code]
Diagnosis code: P1242/Flash code: 73
[Monitor]
Abnormality of flow damper (No. 3 cylinder)
[Fault (outline)]
Faulty flow damper check
[Diagnosis check]
- Operation of flow damper is monitored.

[Code generation condition]
- Fuel control cylinder balance (FCCB) and engine speed variation time remain more than specified for approx. 1 minute.
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- Engine in operation
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal
- Engine speed sensor: normal in signal
- Post injection: none

[Control effected by electronic control unit during fault]
- Learning of FCCB (fuel control cylinder balance) is inhibited.

[Probable cause of trouble]
- Leakage and air are found in fuel system.
- Abnormality of flow damper (No. 3 cylinder)
- Abnormality of electronic control unit
- Abnormality of injector (No. 3 cylinder)

[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Fault code>
- To erase, execute Memory Clear.

[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. BD “Injector Test 3”.
	Inspection condition		• Engine start: At idle • Transmission: neutral • Vehicle speed: 0 km/h {0 MPH} • Other diagnosis codes do not occur.
	Requirements		Engine variation and status remain uncharged even if injector (No. 3 cylinder) is put in injection stopped state.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 2.
		NO	Go to step 3.

Step 2	Inspection items		Checking of air bleeding
	Maintenance item		Bleed air from fuel filter.
	Inspection condition		Starter switch: OFF
	Requirements		Air bleeding is effected to check if problem is solved (Item No. 63 “Flow Damper (#3)” is checked and if frequency of operation is not increased, problem is judged solved).
	Inspection result (Is the judging standard satisfied?)	YES	Transient fault due to trapped air
		NO	Replacement of injector

Step 3	Inspection items		Inspection by control data
	Maintenance item		Measurement of following service data • Item No. 5B “Pump Adjustment Value (Last Time)” • Item No. 5C “Pump Adjustment Value (This Time)”
	Inspection condition		Engine start: At idle
	Requirements		–200 to +200 mA
	Inspection result (Is the judging standard satisfied?)	YES	Replacement of injector
		NO	Go to step 4.

Step 4	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. C2 “Pump Adjustment Value Clear” to initialize pump learning value.
	Inspection condition		–
	Requirements		Problem is solved with learning value initialized (Item No. 63 “Flow Damper (#3)” is checked and if frequency of operation is not increased, problem is judged solved).
	Inspection result (Is the judging standard satisfied?)	YES	Transient fault due to improper pump learning value
		NO	Replacement of injector (rail is replaced if problem remains unsolved after injector replacement)

[Fault code]
Diagnosis code: P1243/Flash code: 74
[Monitor]
Abnormality of flow damper (No. 4 cylinder)
[Fault (outline)]
Faulty flow damper check
[Diagnosis check]
- Operation of flow damper is monitored.

[Code generation condition]
- Fuel control cylinder balance (FCCB) and engine speed variation time remain more than specified for approx. 1 minute.
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- Engine in operation
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal
- Engine speed sensor: normal in signal
- Post injection: none

[Control effected by electronic control unit during fault]
- Learning of FCCB (fuel control cylinder balance) is inhibited.

[Probable cause of trouble]
- Leakage and air are found in fuel system.
- Abnormality of flow damper (No. 4 cylinder)
- Abnormality of electronic control unit
- Abnormality of injector (No. 4 cylinder)

[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Fault code>
- To erase, execute Memory Clear.

[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. C0 “Injector Test 6”.
	Inspection condition		• Engine start: At idle • Transmission: neutral • Vehicle speed: 0 km/h {0 MPH} • Other diagnosis codes do not occur.
	Requirements		Engine variation and status remain uncharged even if injector (No. 4 cylinder) is put in injection stopped state.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 2.
		NO	Go to step 3.

Step 2	Inspection items		Checking of air bleeding
	Maintenance item		Bleed air from fuel filter.
	Inspection condition		Starter switch: OFF
	Requirements		Air bleeding is effected to check if problem is solved (Item No. 64 “Flow Damper (#4)” is checked and if frequency of operation is not increased, problem is judged solved).
	Inspection result (Is the judging standard satisfied?)	YES	Transient fault due to trapped air
		NO	Replacement of injector

Step 3	Inspection items		Inspection by control data
	Maintenance item		Measurement of following service data • Item No. 5B “Pump Adjustment Value (Last Time)” • Item No. 5C “Pump Adjustment Value (This Time)”
	Inspection condition		Engine start: At idle
	Requirements		–200 to +200 mA
	Inspection result (Is the judging standard satisfied?)	YES	Replacement of injector
		NO	Go to step 4.

Step 4	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. C2 “Pump Adjustment Value Clear” to initialize pump learning value.
	Inspection condition		–
	Requirements		Problem is solved with learning value initialized (Item No. 64 “Flow Damper (#4)” is checked and if frequency of operation is not increased, problem is judged solved).
	Inspection result (Is the judging standard satisfied?)	YES	Transient fault due to improper pump learning value
		NO	Replacement of injector (rail is replaced if problem remains unsolved after injector replacement)

[Fault code]
Diagnosis code: P1244/Flash code: 75
[Monitor]
Abnormality of flow damper (No. 5 cylinder)
[Fault (outline)]
Faulty flow damper check
[Diagnosis check]
- Operation of flow damper is monitored.

[Code generation condition]
- Fuel control cylinder balance (FCCB) and engine speed variation time remain more than specified for approx. 1 minute.
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- Engine in operation
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal
- Engine speed sensor: normal in signal
- Post injection: none

[Control effected by electronic control unit during fault]
- Learning of FCCB (fuel control cylinder balance) is inhibited.

[Probable cause of trouble]
- Leakage and air are found in fuel system.
- Abnormality of flow damper (No. 5 cylinder)
- Abnormality of electronic control unit
- Abnormality of injector (No. 5 cylinder)

[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Fault code>
- To erase, execute Memory Clear.

[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. BC “Injector Test 2”.
	Inspection condition		• Engine start: At idle • Transmission: neutral • Vehicle speed: 0 km/h {0 MPH} • Other diagnosis codes do not occur.
	Requirements		Engine variation and status remain uncharged even if injector (No. 5 cylinder) is put in injection stopped state.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 2.
		NO	Go to step 3.

Step 2	Inspection items		Checking of air bleeding
	Maintenance item		Bleed air from fuel filter.
	Inspection condition		Starter switch: OFF
	Requirements		Air bleeding is effected to check if problem is solved (Item No. 65 “Flow Damper (#5)” is checked and if frequency of operation is not increased, problem is judged solved).
	Inspection result (Is the judging standard satisfied?)	YES	Transient fault due to trapped air
		NO	Replacement of injector

Step 3	Inspection items		Inspection by control data
	Maintenance item		Measurement of following service data • Item No. 5B “Pump Adjustment Value (Last Time)” • Item No. 5C “Pump Adjustment Value (This Time)”
	Inspection condition		Engine start: At idle
	Requirements		–200 to +200 mA
	Inspection result (Is the judging standard satisfied?)	YES	Replacement of injector
		NO	Go to step 4.

Step 4	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. C2 “Pump Adjustment Value Clear” to initialize pump learning value.
	Inspection condition		–
	Requirements		Problem is solved with learning value initialized (Item No. 65 “Flow Damper (#5)” is checked and if frequency of operation is not increased, problem is judged solved).
	Inspection result (Is the judging standard satisfied?)	YES	Transient fault due to improper pump learning value
		NO	Replacement of injector (rail is replaced if problem remains unsolved after injector replacement)

[Fault code]
Diagnosis code: P1245/Flash code: 76
[Monitor]
Abnormality of flow damper (No. 6 cylinder)
[Fault (outline)]
Faulty flow damper check
[Diagnosis check]
- Operation of flow damper is monitored.

[Code generation condition]
- Fuel control cylinder balance (FCCB) and engine speed variation time remain more than specified for approx. 1 minute.
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- Engine in operation
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal
- Engine speed sensor: normal in signal
- Post injection: none

[Control effected by electronic control unit during fault]
- Learning of FCCB (fuel control cylinder balance) is inhibited.

[Probable cause of trouble]
- Leakage and air are found in fuel system.
- Abnormality of flow damper (No. 6 cylinder)
- Abnormality of electronic control unit
- Abnormality of injector (No. 6 cylinder)

[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Fault code>
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished.
  (To clear as desired, erase from the memory.)

Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. BE “Injector Test 4”.
	Inspection condition		• Engine start: At idle • Transmission: neutral • Vehicle speed: 0 km/h {0 MPH} • Other diagnosis codes do not occur.
	Requirements		Engine variation and status remain uncharged even if injector (No. 6 cylinder) is put in injection stopped state.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 2.
		NO	Go to step 3.

Step 2	Inspection items		Checking of air bleeding
	Maintenance item		Bleed air from fuel filter.
	Inspection condition		Starter switch: OFF
	Requirements		Air bleeding is effected to check if problem is solved (Item No. 66 “Flow Damper (#6)” is checked and if frequency of operation is not increased, problem is judged solved).
	Inspection result (Is the judging standard satisfied?)	YES	Transient fault due to trapped air
		NO	Replacement of injector

Step 3	Inspection items		Inspection by control data
	Maintenance item		Measurement of following service data • Item No. 5B “Pump Adjustment Value (Last Time)” • Item No. 5C “Pump Adjustment Value (This Time)”
	Inspection condition		Engine start: At idle
	Requirements		–200 to +200 mA
	Inspection result (Is the judging standard satisfied?)	YES	Replacement of injector
		NO	Go to step 4.

Step 4	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. C2 “Pump Adjustment Value Clear” to initialize pump learning value.
	Inspection condition		–
	Requirements		Problem is solved with learning value initialized (Item No. 66 “Flow Damper (#6)” is checked and if frequency of operation is not increased, problem is judged solved).
	Inspection result (Is the judging standard satisfied?)	YES	Transient fault due to improper pump learning value
		NO	Replacement of injector (rail is replaced if problem remains unsolved after injector replacement)

[Fault code]
Diagnosis code: P1410/Flash code: 92
[Monitor]
Excessive exhaust pressure
[Fault (outline)]
Clogged diesel particulate filter
[Diagnosis check]
- Pressure before ceramic filter is monitored by DPF absolute pressure sensor for clogging of ceramic filter.

[Code generation condition]
- Pressure before ceramic filter remains over 163 kPa {24 psi, 1.7 kgf/cm^2} for approx. 3 seconds.
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal
- Diesel particulate filter: not in regeneration
- Exhaust gas recirculation control: active

[Control effected by electronic control unit during fault]
- Injection quantity is limited.
- Exhaust gas recirculation control is stopped.
- Throttle control is stopped.
- Diesel particulate filter regeneration (manual or automatic) is stopped.
- Auto cruise control is stopped.
- Fault detection for controller area network communication is stopped.

[Probable cause of trouble]
- Excessive smoke emission (due to malfunction of engine proper, common rail or exhaust gas recirculation system)
- Abnormality of waste gate hose and exhaust shutter hose
- Abnormality of air flow sensor
- Abnormality of DPF absolute pressure sensor
- Abnormality of DPF pressure sensor (DIFF)
- Abnormality of diesel particulate filter

[Recoverability]
<Control during fault>
- Recovered if signal becomes normal when starter switch is turned OFF to ON (power supply resumed to electronic control unit).

<Warning lamp>
- Extinguished after input of normal signal.

<Fault code>
- If code recovered to normal, automatically cleared at 40th warm up cycle after warning lamp is lit.
  (To clear as desired, erase from the memory.)

Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

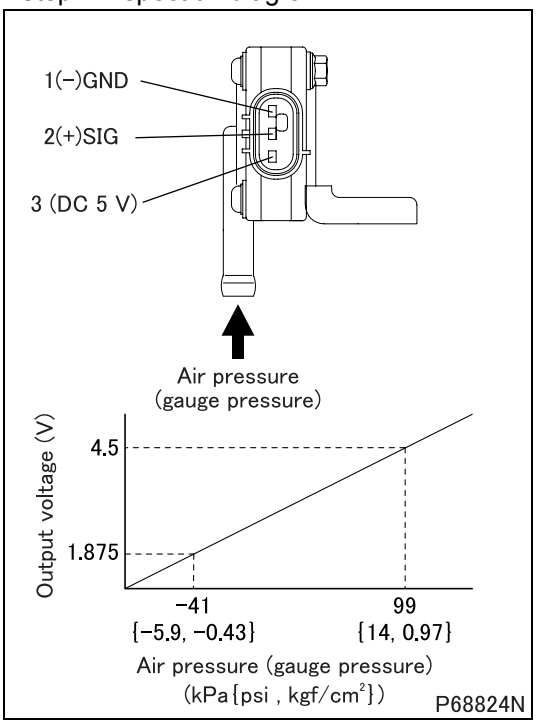
[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		Check if following diagnosis codes occur simultaneously. • P0101 “Airflow Sensor (Plausibility)” • P0102 “Airflow Sensor (Low)” • P0103 “Airflow Sensor (High)” • P0427 “EXH Gas Temp SNSR1 (Low)” • P0428 “EXH Gas Temp SNSR1 (High)” • P0545 “DPF Temp SNSR (upstream) Low” • P0546 “DPF Temp SNSR (upstream) High” • P1660 “DPF Lamp Control Circuit (Low)” • P1661 “DPF Lamp Control Circuit (High)” • P2032 “Exhaust Gas Temp (Low)” • P2033 “Exhaust Gas Temp (High)” • P2453 “DPF Diff SNSR (Plausi) & MFF” • P2454 “DPF Diff SNSR (Low) & MFF” • P2455 “DPF Diff SNSR (High) & MFF”
	Inspection condition		Ensure that each sensor mounting condition is free of abnormalities.
	Requirements		Codes occur.
	Inspection result (Is the judging standard satisfied?)	YES	After inspection of diagnosis code that is occurring, go to step 2.
		NO	Go to step 2.

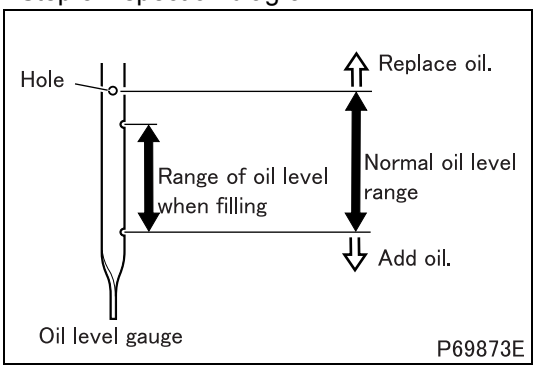
Step 2	Inspection items		Inspection of DPF absolute sensor unit
	Maintenance item		Measure value of voltage between connector terminal No. 2 (+) and 1 (–).
	Inspection condition		• Apply voltage DC 5V across terminals No. 3 (+) and 1 (–). • Gradually increase applied air pressure.
	Requirements		• –41 ± 3.2 kPa {–5.9 ± 0.5 psi, –0.43 ± 0.03 kgf/cm^2}: 1.875 V • 99 ± 3.2 kPa {14 ± 0.5 psi, 1.0 ± 0.03 kgf/cm^2}: 4.5 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Replacement of sensor

<Step 2 inspection diagram>



Step 3	Inspection items		Inspection of oil level
	Maintenance item		Inspection of engine oil level
	Inspection condition		Engine is stopped.
	Requirements		Oil level for inspection is not exceeded.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	After replacement of oil, go to step 4.

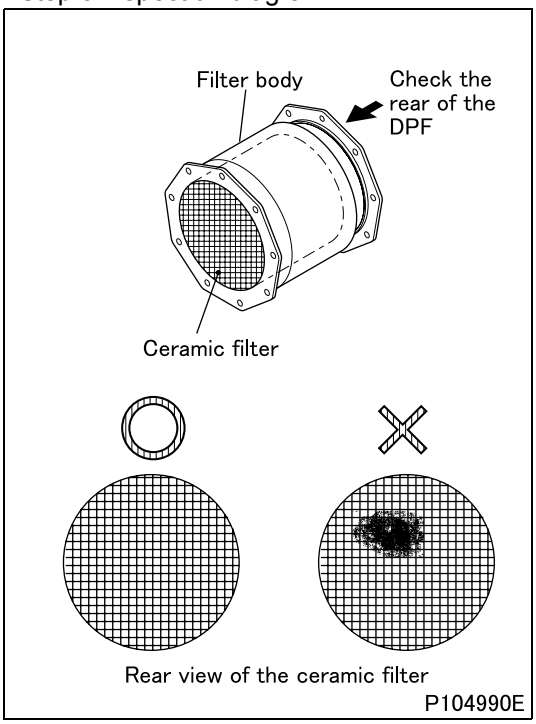
<Step 3 inspection diagram>



Step 4	Inspection items		Inspection of pressure hose
	Maintenance item		Check pressure hose of DPF absolute pressure sensor and DPF pressure sensor (DIFF) for connection and cracks.
	Inspection condition		–
	Requirements		Nothing abnormal detected
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Correction and replacement of hose

Step 5	Inspection items		Unit inspection of diesel particulate filter
	Maintenance item		Check the exhaust passage inside the diesel particulate filter for adhesion of soot in large quantity.
	Inspection condition		Remove diesel particulate filter.
	Requirements		No soot is deposited.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	After replacement of ceramic filter, perform resetting the DPF-related information and go to step 7.

<Step 5 inspection diagram>



Step 6	Inspection items		Inspection of diesel particulate filter unit for clogging and cleaning of the diesel particulate filter unit (Perform completely.)
	Maintenance item		See Gr15 “Diesel Particulate Filter Unit Inspection for Clogging and Cleaning the Diesel Particulate Filter Unit”.
	Inspection condition		Perform following preparatory works. • Place the transmission in neutral. (place the automatic transmission in P range) • Turn the steering wheel in neutral position and securely apply the parking brake. • Turn off air conditioner not to increase the engine speed. • Check diagnosis code of each electronic control system. If any fault exists, rectify it. • Resetting the DPF-related information (perform “History reset” of Multi-Use Tester) (See Gr15 “Resetting the DPF-related information”.) • Warm up the engine until the engine coolant has been heated to more than 70°C {158°F}. (verify from Service Data “Engine Coolant Temperature” or “35: Water Temperature”)
	Requirements		This diagnosis code does not occur again.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	After replacement of electronic control unit, go to step 7.

Step 7	Inspection items		Inspection of exhaust gas
	Maintenance item		Check of exhaust gas (Check whether abnormalities related to engine cause early clogging of diesel particulate filter and adhesion of soot in large quantity in outlet body of diesel particulate filter.)
	Inspection condition		Remove diesel particulate filter, each sensor, pipe and hose.
	Requirements		Exhaust gas is apparently white or black when engine is raced.
	Inspection result (Is the judging standard satisfied?)	YES	Inspect following places. • Common rail system • Exhaust gas recirculation system • Intake throttle control • Exhaust shutter • Air cleaner • Turbocharger • Boost pressure • Compression Pressure
		NO	End of inspection (Be sure to erase diagnosis codes after the end of inspection as engine warning lamp may illuminate by diagnostic function when sensors installed on diesel particulate filter are removed.)

[Fault code]
Diagnosis code: P1411/Flash code: 92
[Monitor]
Diesel particulate filter is overheated.
[Fault (outline)]
Plausibility
[Diagnosis check]
- Temperature after ceramic filter is monitored and regeneration is stopped if filter temperature excessively rises.

[Code generation condition]
- Pressure after ceramic filter remains over 900°C {1620°F} for approx. 3 seconds.
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal

[Control effected by electronic control unit during fault]
- Injection quantity is limited.
- Exhaust gas recirculation control is stopped.
- Throttle control is stopped.
- Diesel particulate filter regeneration (manual or automatic) is stopped.

[Probable cause of trouble]
- Excessive smoke emission (due to malfunction of engine proper, common rail or exhaust gas recirculation system)
- Abnormality of diesel particulate filter regeneration control
- Excessive particulate matter (PM) deposit
- Abnormality in electronic control unit

[Recoverability]
<Control during fault>
- Recovered if signal becomes normal when starter switch is turned OFF to ON (power supply resumed to electronic control unit).

<Warning lamp>
- Extinguished after input of normal signal.

<Fault code>
- If code recovered to normal, automatically cleared at 40th warm up cycle after warning lamp is lit.
  (To clear as desired, erase from the memory.)

Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

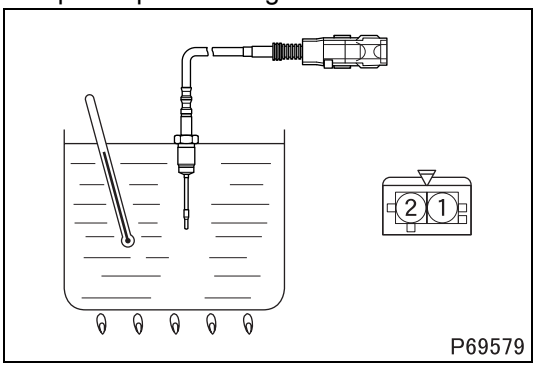
[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		Check if following diagnosis codes occur simultaneously. • P0101 “Airflow Sensor (Plausibility)” • P0102 “Airflow Sensor (Low)” • P0103 “Airflow Sensor (High)” • P0427 “EXH Gas Temp SNSR1 (Low)” • P0428 “EXH Gas Temp SNSR1 (High)” • P0545 “DPF Temp SNSR (upstream) Low” • P0546 “DPF Temp SNSR (upstream) High” • P1660 “DPF Lamp Control Circuit (Low)” • P1661 “DPF Lamp Control Circuit (High)” • P2032 “Exhaust Gas Temp (Low)” • P2033 “Exhaust Gas Temp (High)” • P2453 “DPF Diff SNSR (Plausi) & MFF” • P2454 “DPF Diff SNSR (Low) & MFF” • P2455 “DPF Diff SNSR (High) & MFF”
	Inspection condition		Ensure that each sensor mounting condition is free of abnormalities.
	Requirements		Codes occur.
	Inspection result (Is the judging standard satisfied?)	YES	After inspection of diagnosis code that is occurring, go to step 2.
		NO	Go to step 2.

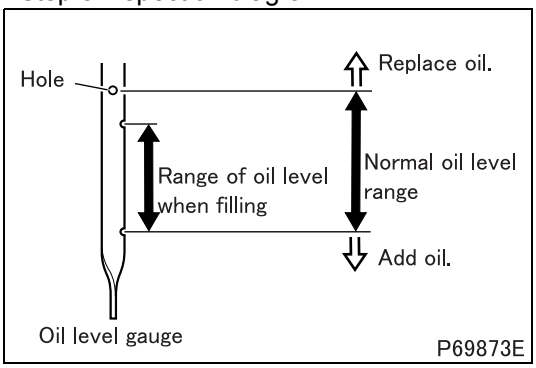
Step 2	Inspection items		Inspection of DPF temperature sensor 2 unit
	Maintenance item		Measure value of resistance between terminals No. 1 and 2.
	Inspection condition		• Put DPF temperature sensor 2 in vessel filled with engine oil. • Heat the oil to each of the specified temperatures. Stir the oil well while doing so.
	Requirements		• 20°C {68°F} : 241.8 kΩ • 50°C {122°F} : 106.2 $^{+74.3}_{-41.8}$ kΩ • 100°C {212°F} : 33.56 $^{+17.60}_{-10.60}$ kΩ • 150°C {302°F} : 13.90 $^{+5.36}_{-3.60}$ kΩ • 200°C {392°F} : 6.896 $^{+2.064}_{-1.252}$ kΩ
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Cleaning of sensor

<Step 2 inspection diagram>



Step 3	Inspection items		Inspection of oil level
	Maintenance item		Inspection of engine oil level
	Inspection condition		Engine is stopped.
	Requirements		Oil level for inspection is not exceeded.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	After replacement of oil, go to step 4.

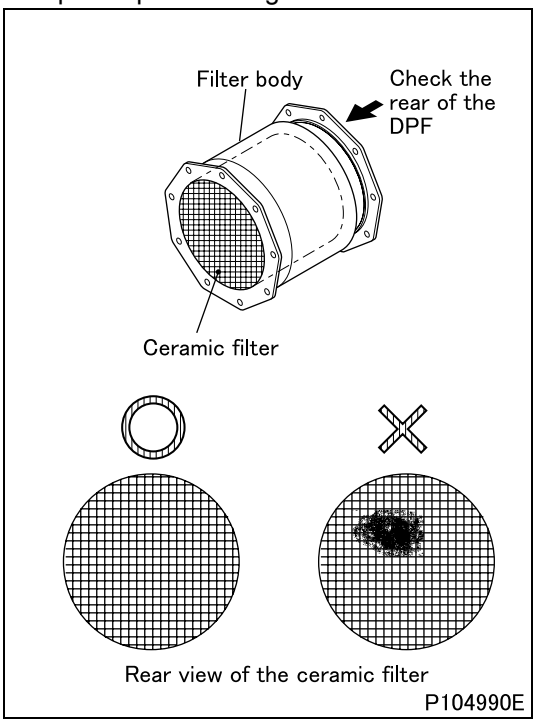
<Step 3 inspection diagram>



Step 4	Inspection items		Inspection of pressure hose
	Maintenance item		Check pressure hose of DPF absolute pressure sensor and DPF pressure sensor (DIFF) for connection and cracks.
	Inspection condition		–
	Requirements		Nothing abnormal detected
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	After correction and replacement of hose, go to step 5.

Step 5	Inspection items		Unit inspection of diesel particulate filter
	Maintenance item		Check the exhaust passage inside the diesel particulate filter for adhesion of soot in large quantity.
	Inspection condition		Remove diesel particulate filter.
	Requirements		No soot is deposited.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	After replacement of ceramic filter, perform resetting the DPF-related information and go to step 7.

<Step 5 inspection diagram>



Step 6	Inspection items		Inspection of diesel particulate filter unit for clogging and cleaning of the diesel particulate filter unit (Perform completely.)
	Maintenance item		See Gr15 “Diesel Particulate Filter Unit Inspection for Clogging and Cleaning the Diesel Particulate Filter Unit”.
	Inspection condition		Perform following preparatory works. • Place the transmission in neutral. (place the automatic transmission in P range) • Turn the steering wheel in neutral position and securely apply the parking brake. • Turn off air conditioner not to increase the engine speed. • Check diagnosis code of each electronic control system. If any fault exists, rectify it. • Resetting the DPF-related information (perform “History reset” of Multi-Use Tester) (See Gr15 “Resetting the DPF-related information”.) • Warm up the engine until the engine coolant has been heated to more than 70°C {158°F}. (verify from Service Data “Engine Coolant Temperature” or “35: Water Temperature”)
	Requirements		This diagnosis code does not occur again.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	After replacement of electronic control unit, go to step 7.

Step 7	Inspection items		Inspection of exhaust gas
	Maintenance item		Check of exhaust gas (Check whether abnormalities related to engine cause early clogging of diesel particulate filter and adhesion of soot in large quantity in outlet body of diesel particulate filter.)
	Inspection condition		Remove diesel particulate filter, each sensor, pipe and hose.
	Requirements		Exhaust gas is apparently white or black when engine is raced.
	Inspection result (Is the judging standard satisfied?)	YES	Inspect following places. • Common rail system • Exhaust gas recirculation system • Intake throttle control • Exhaust shutter • Air cleaner • Turbocharger • Boost pressure • Compression Pressure
		NO	End of inspection (Be sure to erase diagnosis codes after the end of inspection as engine warning lamp may illuminate by diagnostic function when sensors installed on diesel particulate filter are removed.)

[Fault code]
Diagnosis code: P1412/Flash code: 92
[Monitor]
Long lasting abnormality at 1st stage of automatic diesel particulate filter regeneration
[Fault (outline)]
Improperly performed automatic regeneration of diesel particulate filter
[Diagnosis check]
- Temperature before ceramic filter is monitored by DPF temperature sensor 1 for temperature status during automatic diesel particulate filter regeneration.

NOTE

- **This diagnosis code can occur depending on conditions under which vehicle is running even if engine has no abnormality.**

[Code generation condition]
- Diesel particulate filter temperature remains at 250°C {482°F} or lower even after driving for 5 km following start of automatic diesel particulate filter regeneration.
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal

[Control effected by electronic control unit during fault]
- Automatic diesel particulate filter regeneration is stopped.

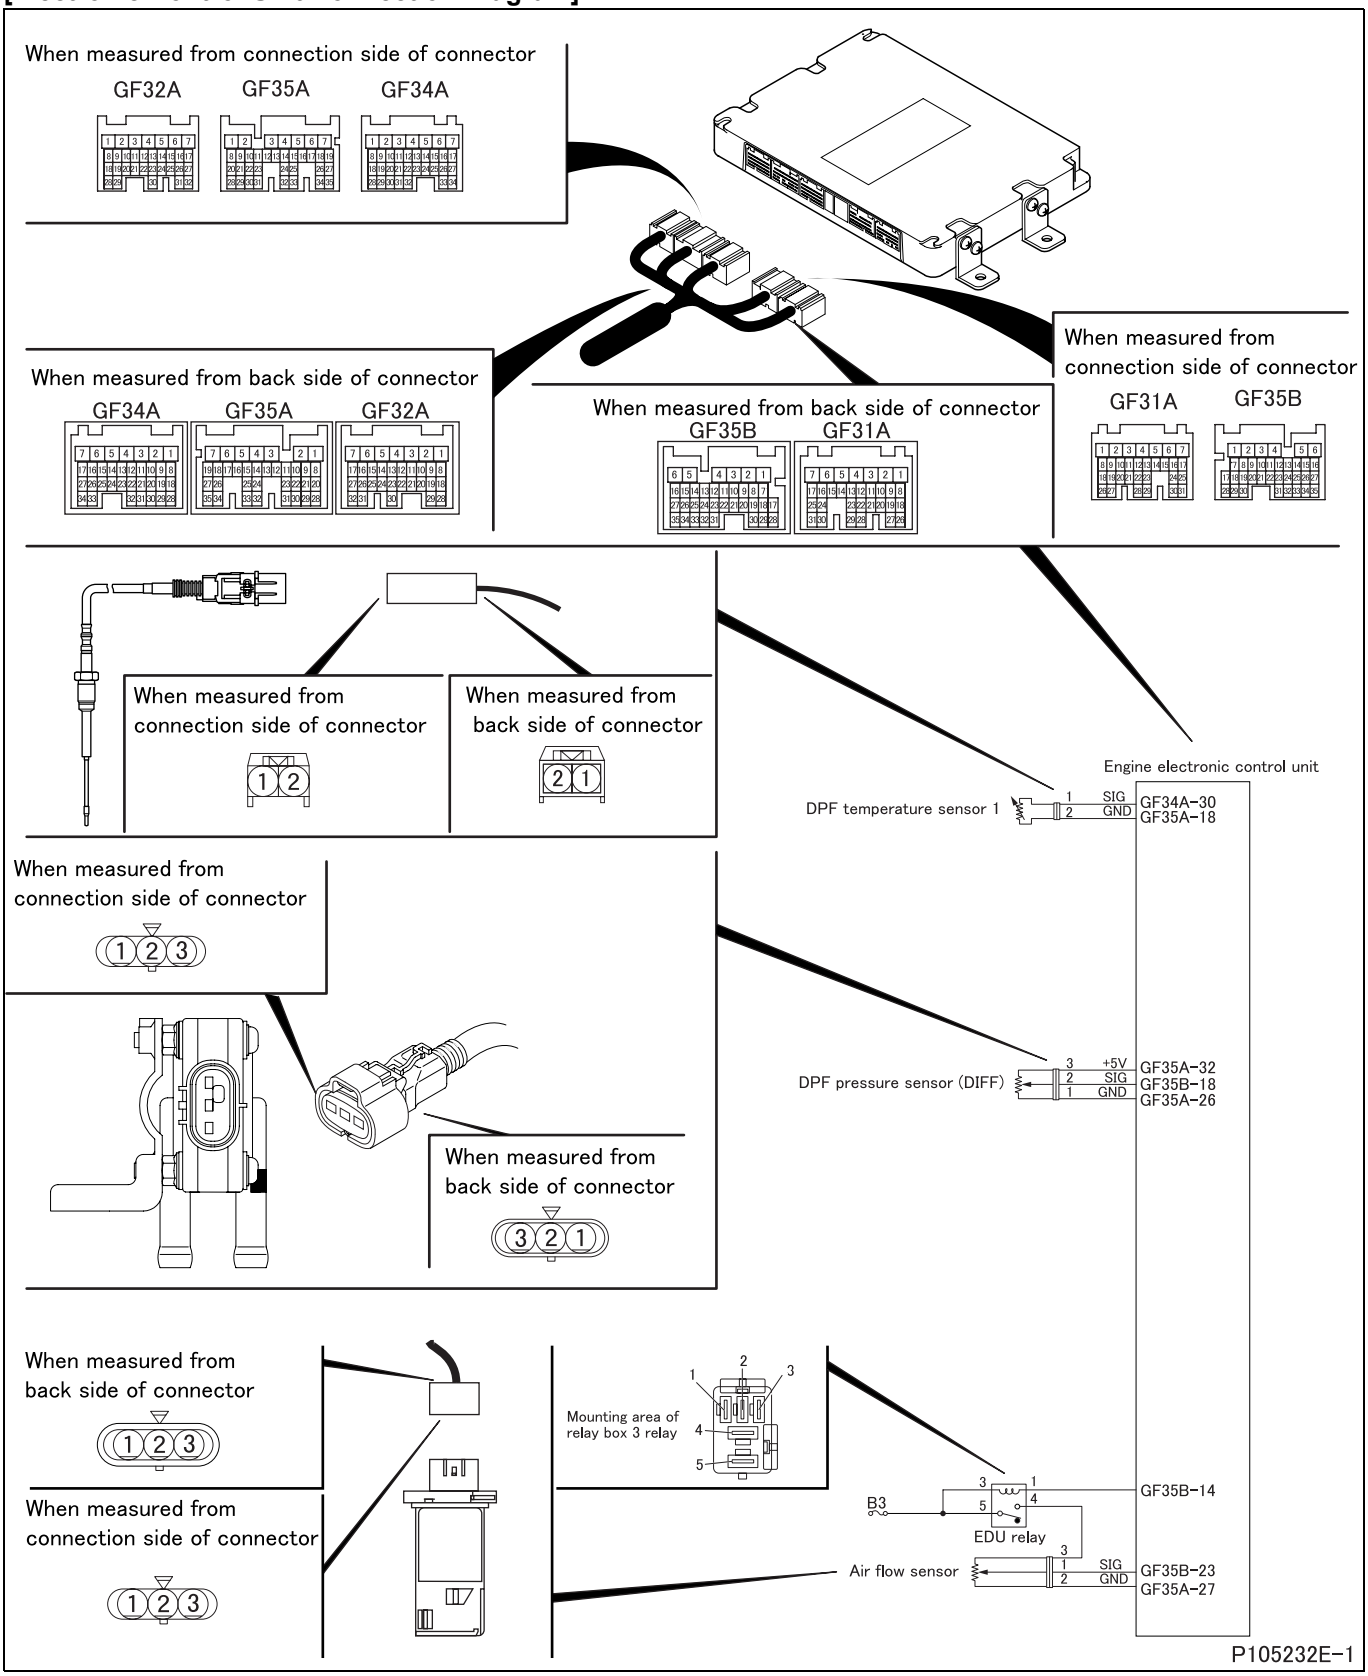
[Probable cause of trouble]
- Abnormality of diesel particulate filter regeneration control
- Abnormality of DPF temperature sensor 1
- Abnormality in electronic control unit
- Abnormality of common rail
- Abnormality of diesel particulate filter (front oxidation catalyst)

[Recoverability]
<Control during fault>
- Recovered after automatic regeneration after a certain time of interruption (about 10 minutes).

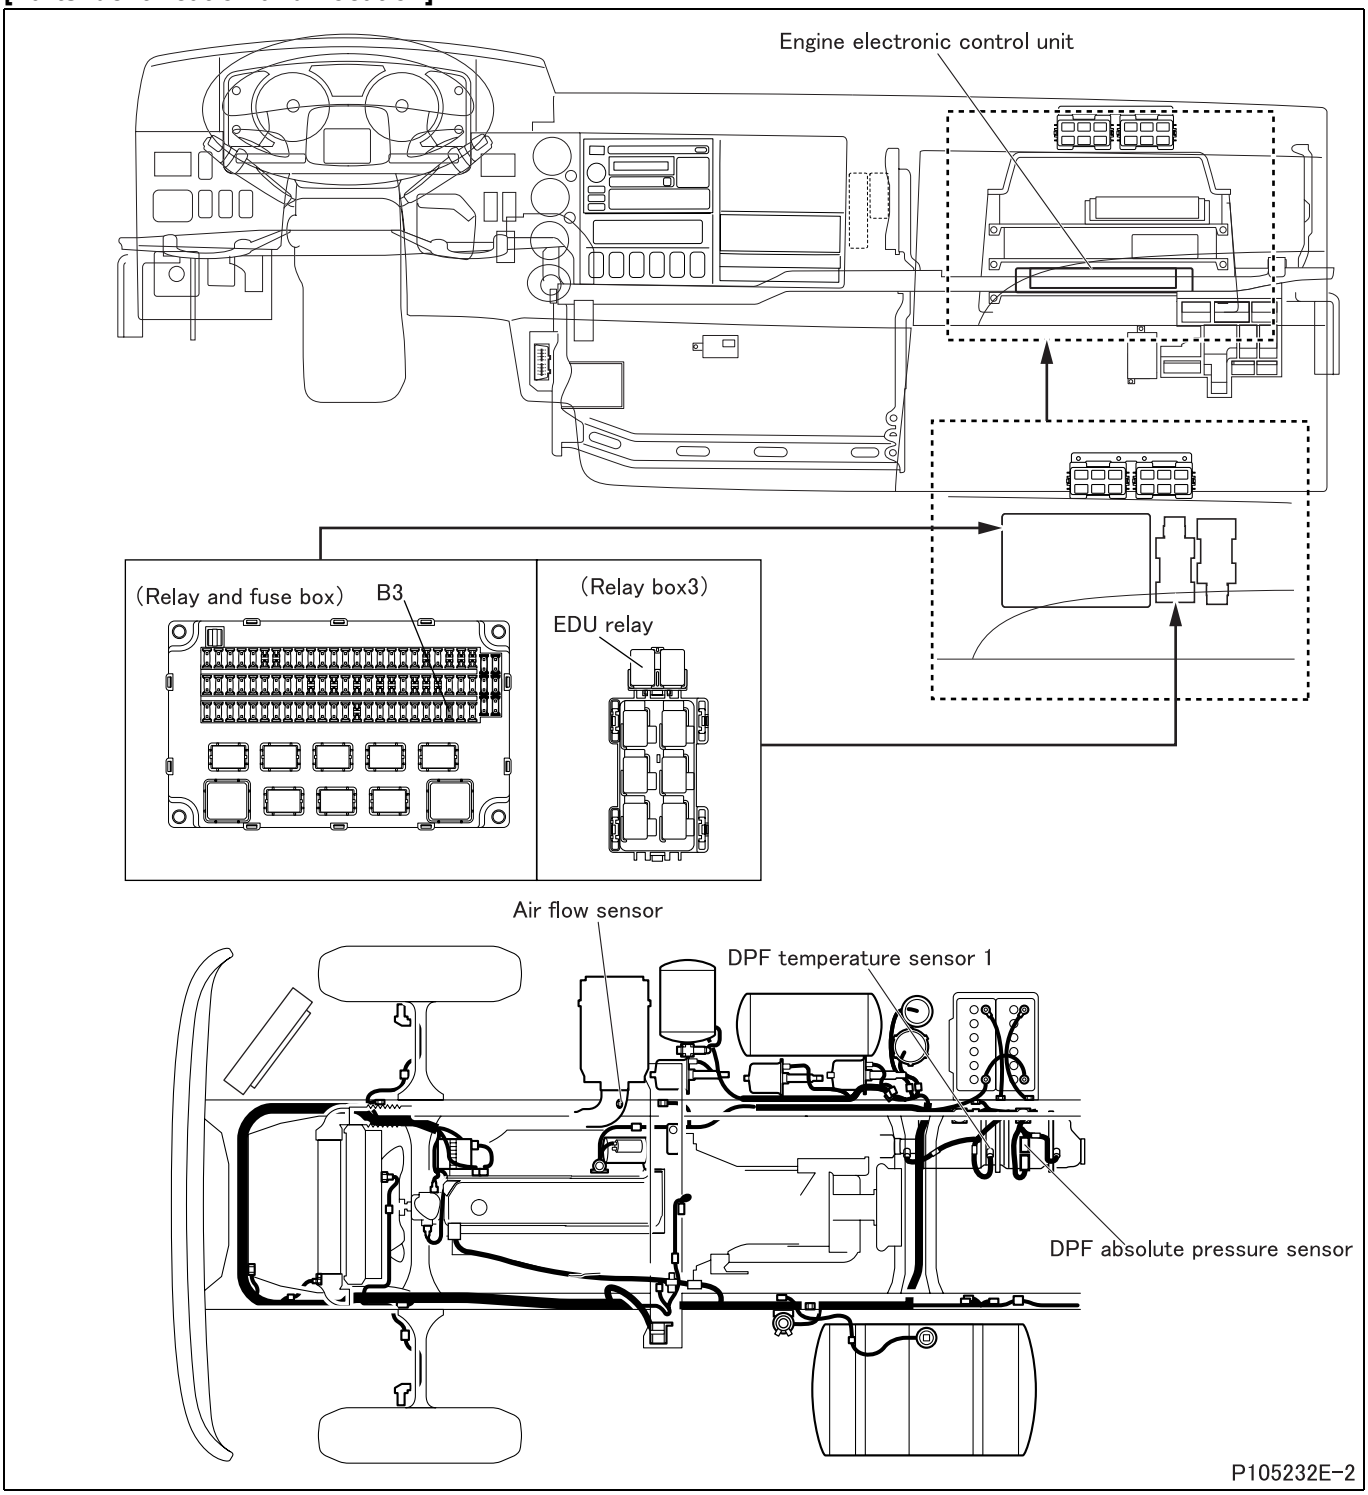
<Fault code>
- Automatically cleared at 40th warm up cycle after recovery of normal state.
  (To erase, execute Memory Clear.)

Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



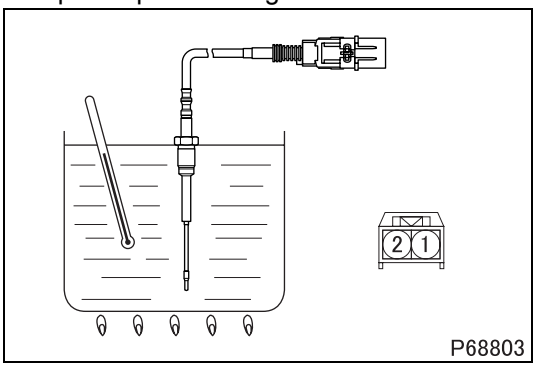
[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		Check if following diagnosis codes occur simultaneously. • P0101 “Airflow Sensor (Plausibility)” • P0102 “Airflow Sensor (Low)” • P0103 “Airflow Sensor (High)” • P0427 “EXH Gas Temp SNSR1 (Low)” • P0428 “EXH Gas Temp SNSR1 (High)” • P0545 “DPF Temp SNSR (upstream) Low” • P0546 “DPF Temp SNSR (upstream) High” • P1660 “DPF Lamp Control Circuit (Low)” • P1661 “DPF Lamp Control Circuit (High)” • P2032 “Exhaust Gas Temp (Low)” • P2033 “Exhaust Gas Temp (High)” • P2453 “DPF Diff SNSR (Plausi) & MFF” • P2454 “DPF Diff SNSR (Low) & MFF” • P2455 “DPF Diff SNSR (High) & MFF”
	Inspection condition		Ensure that each sensor mounting condition is free of abnormalities.
	Requirements		Codes occur.
	Inspection result (Is the judging standard satisfied?)	YES	After inspection of diagnosis code that is occurring, go to step 2.
		NO	Go to step 2.

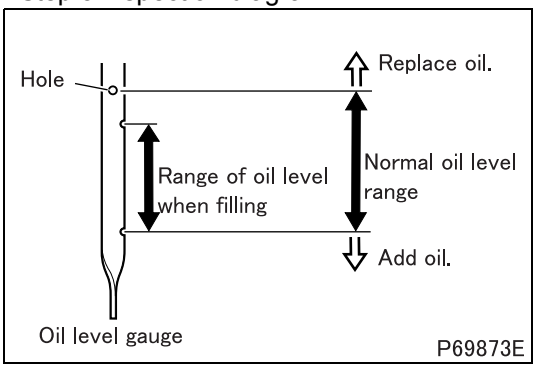
Step 2	Inspection items		Inspection of DPF temperature sensor 1 unit
	Maintenance item		Measure value of resistance between terminal No. 1 and 2.
	Inspection condition		• Put DPF temperature sensor 1 in vessel filled with engine oil. • Heat the oil to each of the specified temperatures. Stir the oil well while doing so.
	Requirements		• 20°C {68°F} : 241.8 kΩ • 50°C {122°F} : 106.2 $^{+74.3}_{-41.8}$ kΩ • 100°C {212°F} : 33.56 $^{+17.60}_{-10.60}$ kΩ • 150°C {302°F} : 13.90 $^{+5.36}_{-3.60}$ kΩ • 200°C {392°F} : 6.896 $^{+2.064}_{-1.252}$ kΩ
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Cleaning of sensor

<Step 2 inspection diagram>



Step 3	Inspection items		Inspection of oil level
	Maintenance item		Inspection of engine oil level
	Inspection condition		Engine is stopped.
	Requirements		Oil level for inspection is not exceeded.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	After replacement of oil, go to step 4.

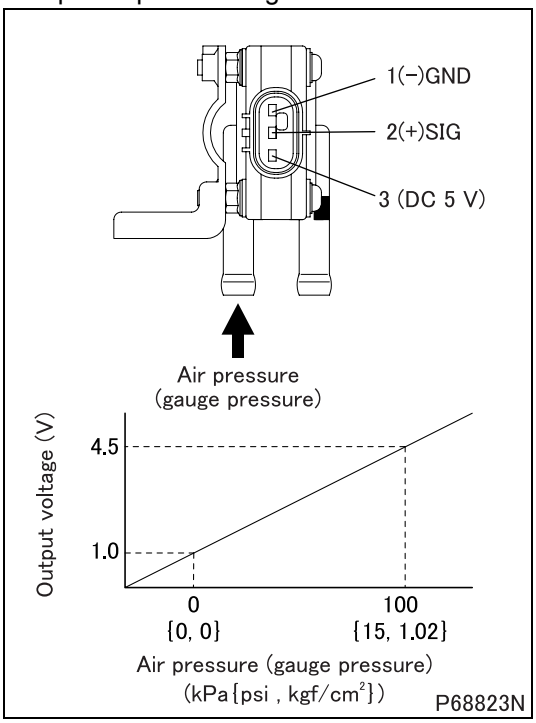
<Step 3 inspection diagram>



Step 4	Inspection items		Inspection of pressure hose
	Maintenance item		Check pressure hose of DPF absolute pressure sensor and DPF pressure sensor (DIFF) for connection and cracks.
	Inspection condition		–
	Requirements		Nothing abnormal detected
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Correction and replacement of hose

Step 5	Inspection items		Inspection of DPF pressure sensor (DIFF) unit
	Maintenance item		Measure value of voltage between connector terminal No. 2 (+) and 1 (–).
	Inspection condition		• Apply voltage DC 5 V across terminals No. 3 (+) and 1 (–). • Gradually increase applied air pressure.
	Requirements		• 0 ± 3.5 kPa {0 ± 0.5 psi, 0 ± 0.04 kgf/cm^2}: 1 V • 100 ± 3.5 kPa {15 ± 0.5 psi, 1.02 ± 0.04 kgf/cm^2}: 4.5 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Replacement of sensor

<Step 5 inspection diagram>



Step 6	Inspection items		Inspection of sensor unit
	Maintenance item		Since inspection of single part is not easy, whether characteristics are deteriorated or not must be checked for the sensor mounted on the current vehicle by measuring and comparing the amount of sensor intake air of the sensor currently mounted on vehicle and that replaced with new one by the service data. **(1) Prepare for inspection** • Clean or replace air cleaner element. • Prepare a new air flow sensor. • Warm up the engine fully. **(2) Measure the intake air of current sensor** • Keep pressing the accelerator pedal until it bottom the stopper bolt from the idling state. (no load maximum rotation) • Measure the following items from among “Service data”. **<General Scanning Tool used>** • Engine speed: “Ne” (rpm) • Intake air flow rate: “Air Flow Rate from MAFS” (g/s) **<Multi-Use Tester used>** • Engine speed: 01 “Engine Revolution” (rpm) • Intake air flow rate: 3A “Air Flow Sensor Output” (g/hr) **(3) Measure the intake air of new sensor** • Replace the currently mounted sensor with a new sensor. • Keep pressing the accelerator pedal until it bottom the stopper bolt from the idling state. (no load maximum rotation) • Measure intake air flow at the same rpm as that of engine revolution in item (2) of “Service data”. **(4) Comparison whether characteristics are deteriorated** • Calculate the characteristics deterioration factor (%) by the following equation. • Characteristics deterioration factor (%) = (intake air of new item – current intake air) × 100/intake air of new item.
	Inspection condition		–
	Requirements		10% or less
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Replacement of sensor

Step 7	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. B9 “Fuel Leak Check”.
	Inspection condition		Engine start: At idle
	Requirements		There is no leak from injectors (six).
	Inspection result (Is the judging standard satisfied?)	YES	Replacement of diesel particulate filter
		NO	Replacement of injector

[Fault code]
Diagnosis code: P1413/Flash code: 92
[Monitor]
Low temperature abnormality at 2nd stage of automatic diesel particulate filter regeneration
[Fault (outline)]
Improperly performed automatic regeneration of diesel particulate filter
[Diagnosis check]
- Temperature before ceramic filter is monitored by DPF temperature sensor 1 for temperature status during automatic diesel particulate filter regeneration.

NOTE
- **This diagnosis code can occur depending on conditions under which vehicle is running even if engine has no abnormality.**

[Code generation condition]
- Temperature of diesel particulate filter being automatically regenerated remains at 550°C {1022°F} or lower for 3 minutes.
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal

[Control effected by electronic control unit during fault]
- Automatic diesel particulate filter regeneration is stopped.

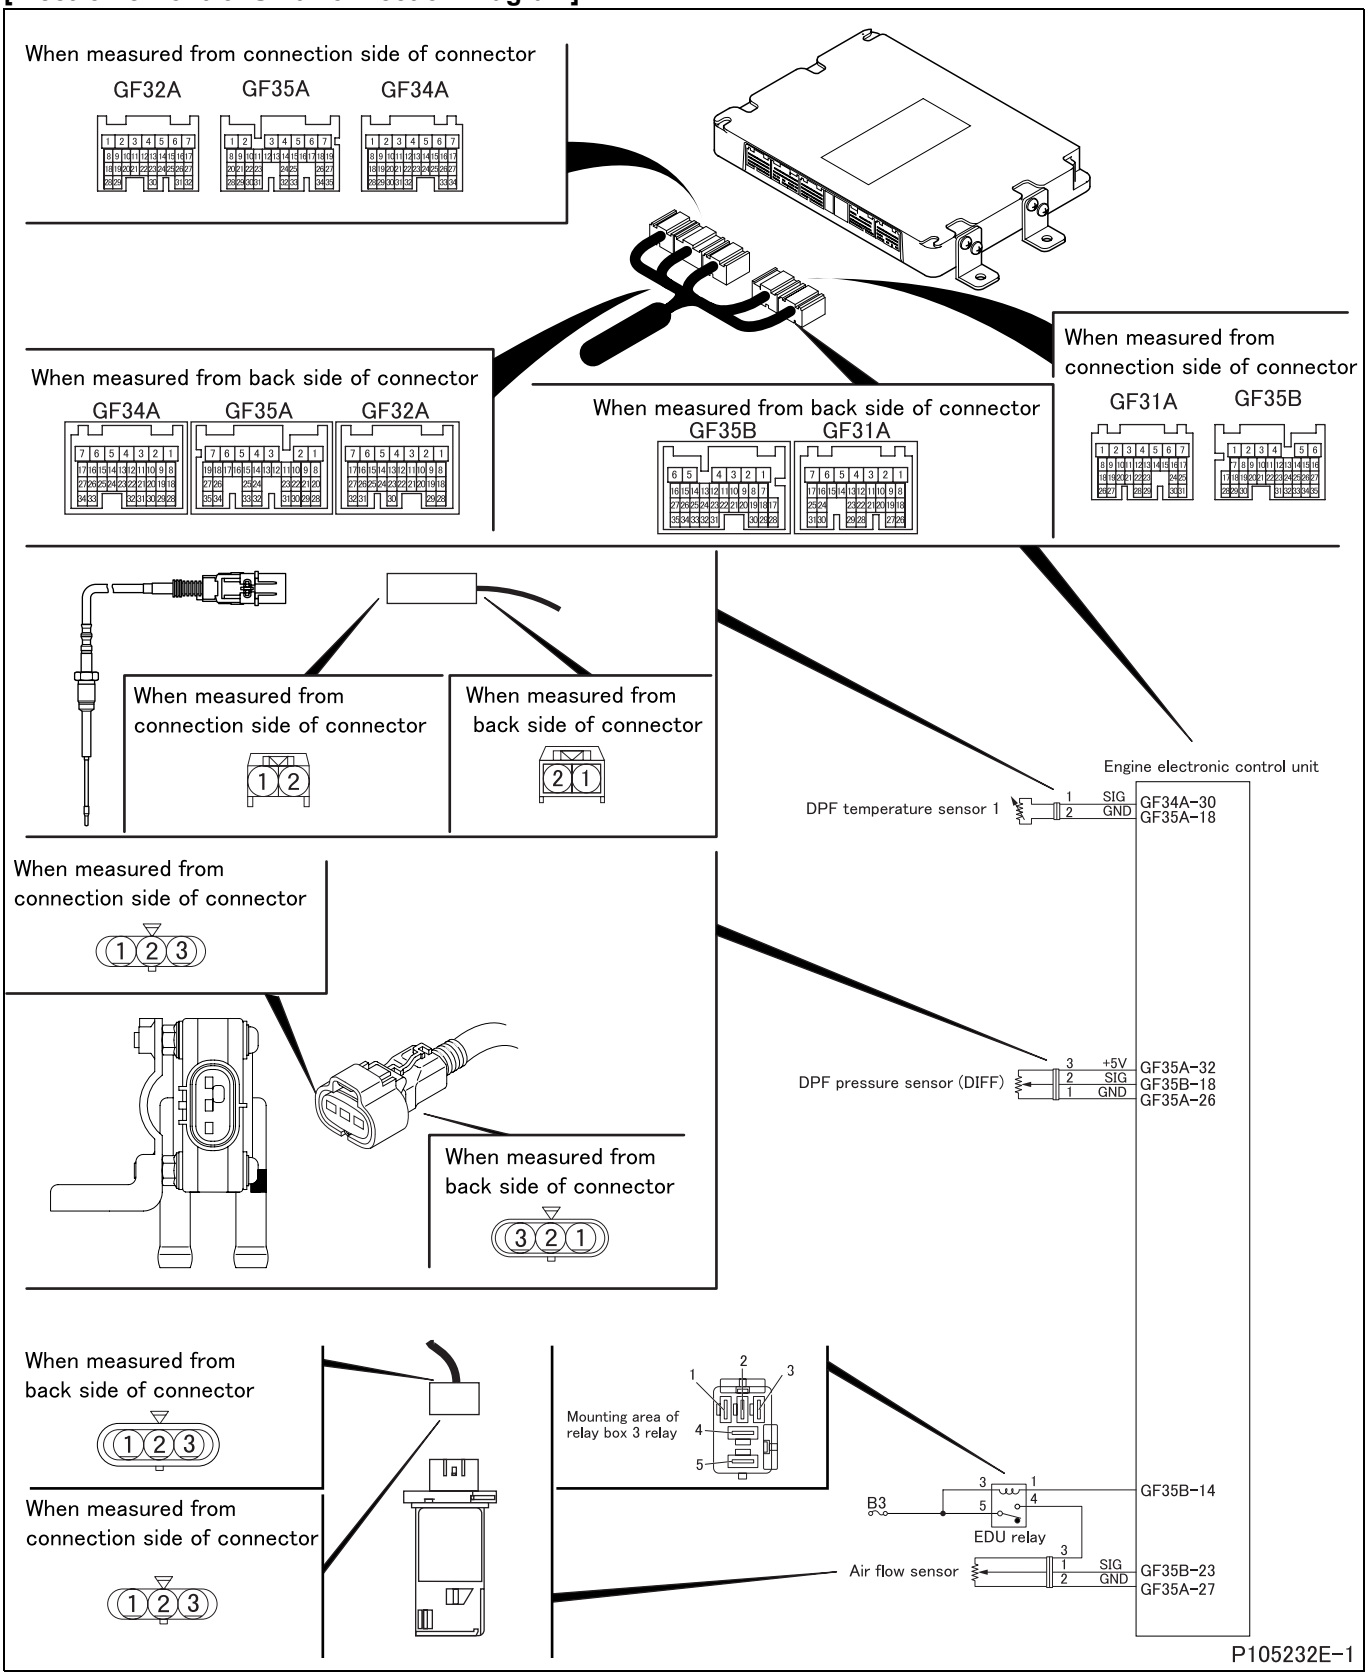
[Probable cause of trouble]
- Abnormality of diesel particulate filter regeneration control
- Abnormality of DPF temperature sensor 1
- Abnormality in electronic control unit
- Abnormality of common rail
- Abnormality of diesel particulate filter (front oxidation catalyst)

[Recoverability]
<Control during fault>
- Recovered after automatic regeneration after a certain time of interruption (about 10 minutes).

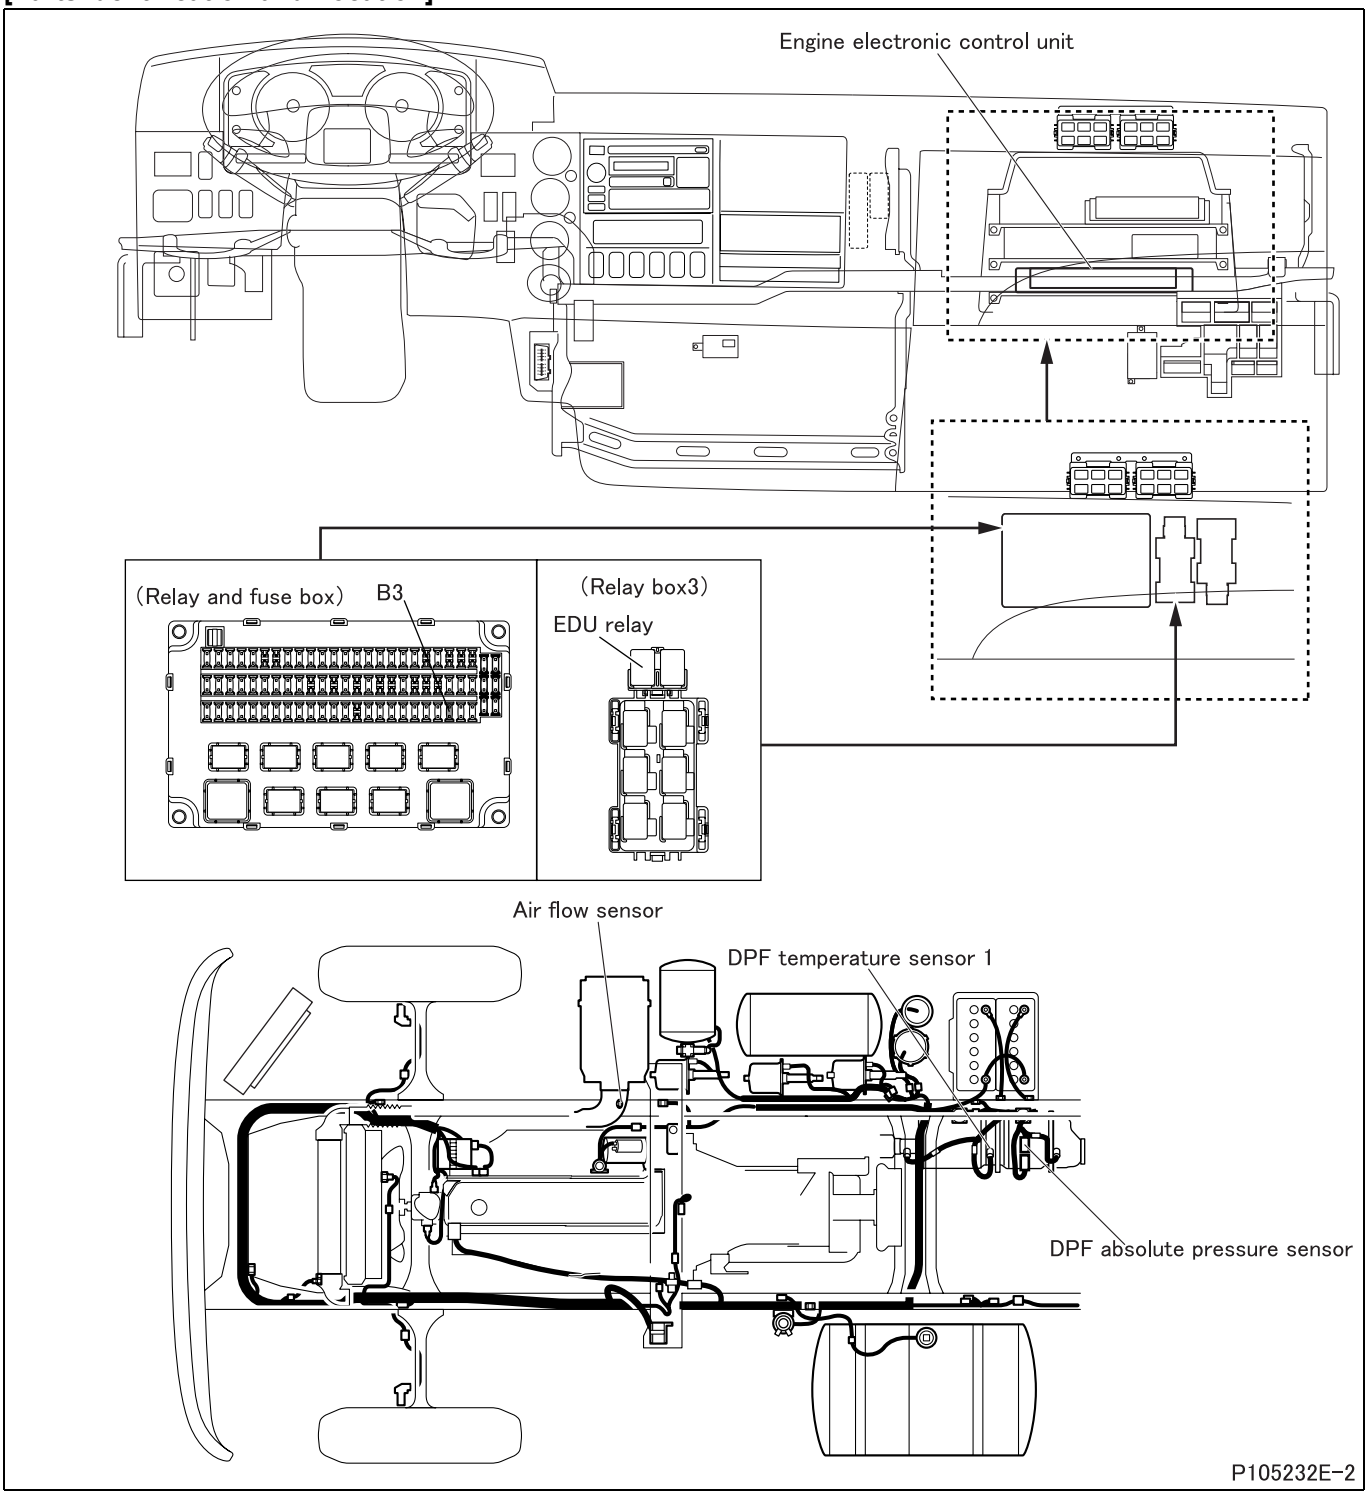
<Fault code>
- Automatically cleared at 40th warm up cycle after recovery of normal state.
  (To erase, execute Memory Clear.)

Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



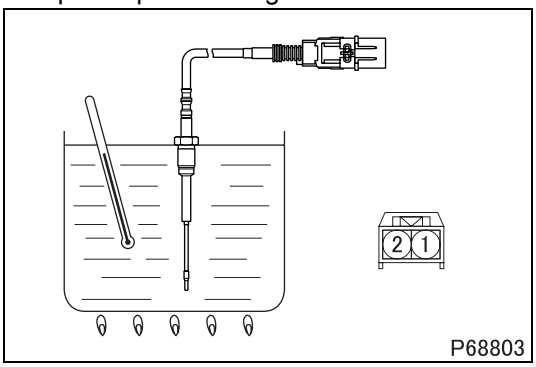
[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		Check if following diagnosis codes occur simultaneously. • P0101 “Airflow Sensor (Plausibility)” • P0102 “Airflow Sensor (Low)” • P0103 “Airflow Sensor (High)” • P0427 “EXH Gas Temp SNSR1 (Low)” • P0428 “EXH Gas Temp SNSR1 (High)” • P0545 “DPF Temp SNSR (upstream) Low” • P0546 “DPF Temp SNSR (upstream) High” • P1660 “DPF Lamp Control Circuit (Low)” • P1661 “DPF Lamp Control Circuit (High)” • P2032 “Exhaust Gas Temp (Low)” • P2033 “Exhaust Gas Temp (High)” • P2453 “DPF Diff SNSR (Plausi) & MFF” • P2454 “DPF Diff SNSR (Low) & MFF” • P2455 “DPF Diff SNSR (High) & MFF”
	Inspection condition		Ensure that each sensor mounting condition is free of abnormalities.
	Requirements		Codes occur.
	Inspection result (Is the judging standard satisfied?)	YES	After inspection of diagnosis code that is occurring, go to step 2.
		NO	Go to step 2.

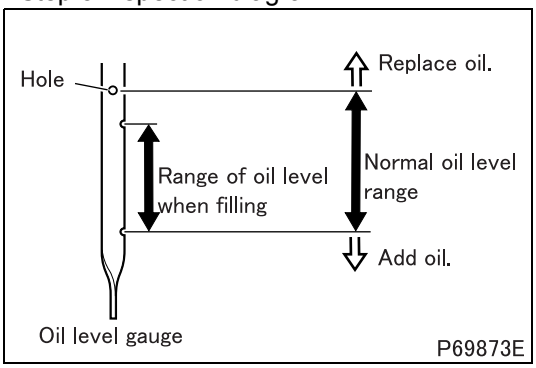
Step 2	Inspection items		Inspection of DPF temperature sensor 1 unit
	Maintenance item		Measure value of resistance between terminal No. 1 and 2.
	Inspection condition		• Put DPF temperature sensor 1 in vessel filled with engine oil. • Heat the oil to each of the specified temperatures. Stir the oil well while doing so.
	Requirements		• 20°C {68°F} : 241.8 kΩ • 50°C {122°F} : 106.2 $^{+74.3}_{-41.8}$ kΩ • 100°C {212°F} : 33.56 $^{+17.60}_{-10.60}$ kΩ • 150°C {302°F} : 13.90 $^{+5.36}_{-3.60}$ kΩ • 200°C {392°F} : 6.896 $^{+2.064}_{-1.252}$ kΩ
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Cleaning of sensor

<Step 2 inspection diagram>



Step 3	Inspection items		Inspection of oil level
	Maintenance item		Inspection of engine oil level
	Inspection condition		Engine is stopped.
	Requirements		Oil level for inspection is not exceeded.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	After replacement of oil, go to step 4.

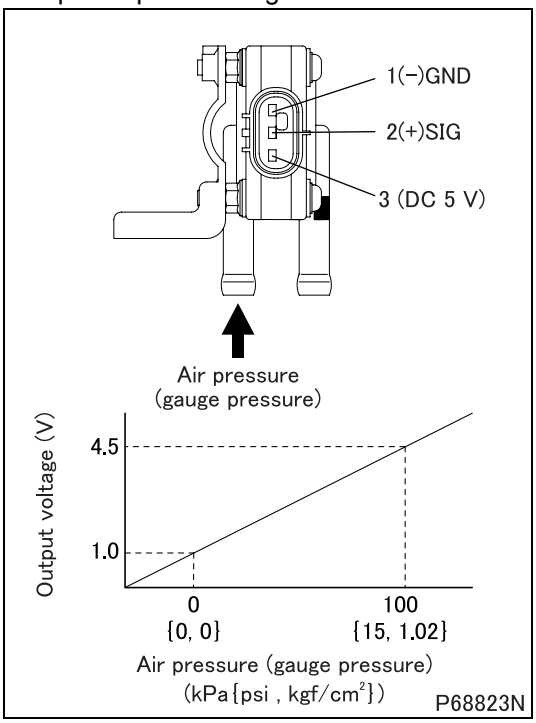
<Step 3 inspection diagram>



Step 4	Inspection items		Inspection of pressure hose
	Maintenance item		Check pressure hose of DPF absolute pressure sensor and DPF pressure sensor (DIFF) for connection and cracks.
	Inspection condition		–
	Requirements		Nothing abnormal detected
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Correction and replacement of hose

Step 5	Inspection items		Inspection of DPF pressure sensor (DIFF) unit
	Maintenance item		Measure value of voltage between connector terminal No. 2 (+) and 1 (–).
	Inspection condition		• Apply voltage DC 5 V across terminals No. 3 (+) and 1 (–). • Gradually increase applied air pressure.
	Requirements		• 0 ± 3.5 kPa {0 ± 0.5 psi, 0 ± 0.04 kgf/cm^2}: 1 V • 100 ± 3.5 kPa {15 ± 0.5 psi, 1.02 ± 0.04 kgf/cm^2}: 4.5 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Replacement of sensor

<Step 5 inspection diagram>



Step 6	Inspection items		Inspection of sensor unit
	Maintenance item		Since inspection of single part is not easy, whether characteristics are deteriorated or not must be checked for the sensor mounted on the current vehicle by measuring and comparing the amount of sensor intake air of the sensor currently mounted on vehicle and that replaced with new one by the service data. **(1) Prepare for inspection** • Clean or replace air cleaner element. • Prepare a new air flow sensor. • Warm up the engine fully. **(2) Measure the intake air of current sensor** • Keep pressing the accelerator pedal until it bottom the stopper bolt from the idling state. 	Inspection condition		–
	Requirements		10% or less
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Replacement of sensor

Step 7	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. B9 “Fuel Leak Check”.
	Inspection condition		Engine start: At idle
	Requirements		There is no leak from injectors (six).
	Inspection result (Is the judging standard satisfied?)	YES	Replacement of diesel particulate filter
		NO	Replacement of injector

[Fault code]
Diagnosis code: P1414/Flash code: 92
[Monitor]
High temperature abnormality at 2nd stage of automatic diesel particulate filter regeneration
[Fault (outline)]
Improperly performed automatic regeneration of diesel particulate filter
[Diagnosis check]
- Temperature before ceramic filter is monitored by DPF temperature sensor 1 for temperature status during automatic diesel particulate filter regeneration.

NOTE
- **This diagnosis code can occur depending on conditions under which vehicle is running even if engine has no abnormality.**

[Code generation condition]
- Temperature of diesel particulate filter being automatically regenerated remains at 633°C {1171°F} or higher for 10 minutes.
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal

[Control effected by electronic control unit during fault]

	Requirements		10% or less
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Replacement of sensor

Step 7	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. B9 “Fuel Leak Check”.
	Inspection condition		Engine start: At idle
	Requirements		There is no leak from injectors (six).
	Inspection result (Is the judging standard satisfied?)	YES	Replacement of diesel particulate filter
		NO	Replacement of injector

[Fault code]
Diagnosis code: P1415/Flash code: 92
[Monitor]
Long lasting abnormality of automatic diesel particulate filter regeneration
[Fault (outline)]
Improperly performed automatic regeneration of diesel particulate filter
[Diagnosis check]
- Duration of automatic diesel particulate filter regeneration is monitored.

[Code generation condition]
- Automatic diesel particulate filter regeneration is not terminated even after 90 minutes.
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal

[Control effected by electronic control unit during fault]
- Automatic diesel particulate filter regeneration is stopped.

[Probable cause of trouble]
- Abnormality of diesel particulate filter regeneration control
- Abnormality of DPF temperature sensor 1

(no load maximum rotation) • Measure intake air flow at the same rpm as that of engine revolution in item (2) of “Service data”. **(4) Comparison whether characteristics are deteriorated** • Calculate the characteristics deterioration factor (%) by the following equation. • Characteristics deterioration factor (%) = (intake air of new item – current intake air) × 100/intake air of new item.
	Inspection condition		–
	Requirements		10% or less
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Replacement of sensor

Step 7	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. B9 “Fuel Leak Check”.
	Inspection condition		Engine start: At idle
	Requirements		There is no leak from injectors (six).
	Inspection result (Is the judging standard satisfied?)	YES	Replacement of diesel particulate filter
		NO	Replacement of injector

[Fault code]
Diagnosis code: P1416/Flash code: 92
[Monitor]
Long lasting abnormality at 1st stage of manual diesel particulate filter regeneration
[Fault (outline)]
Plausibility
[Diagnosis check]
- Temperature before front oxidation catalyst and ceramic filter is monitored by DPF temperature sensor 1 for temperature status during manual diesel particulate filter regeneration.

[Code generation condition]
- Temperature of diesel particulate filter being manually regenerated remains at 250°C {482°F} or lower for 10 minutes.
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal

[Control effected by electronic control unit during fault]
- Injection quantity is limited.
- Exhaust gas recirculation control is stopped.
- Throttle control is stopped.
- Diesel particulate filter regeneration is stopped.

[Probable cause of trouble]
- Abnormality of diesel particulate filter regeneration control
- Abnormality of DPF temperature sensor 1
- Abnormality in electronic control unit
- Abnormality of common rail
- Abnormality of diesel particulate filter (front oxidation catalyst)

[Recoverability]
<Control during fault>
- Recovered if signal becomes normal when starter switch is turned OFF to ON (power supply resumed to electronic control unit).

NOTE
- **Recovery from a fault of this code requires “Resetting the DPF-related information”; troubleshooting steps on the following pages, therefore, must be completely performed.**

<Warning lamp>
- Extinguished after input of normal signal.

<Fault code>
- If code recovered to normal, automatically cleared at 40th warm up cycle after warning lamp is lit.
  (To clear as desired, erase from the memory.)

Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

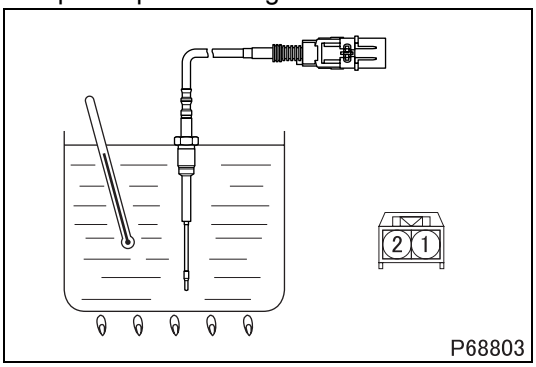
[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		Check if following diagnosis codes occur simultaneously. • P0101 “Airflow Sensor (Plausibility)” • P0102 “Airflow Sensor (Low)” • P0103 “Airflow Sensor (High)” • P0427 “EXH Gas Temp SNSR1 (Low)” • P0428 “EXH Gas Temp SNSR1 (High)” • P0545 “DPF Temp SNSR (upstream) Low” • P0546 “DPF Temp SNSR (upstream) High” • P1660 “DPF Lamp Control Circuit (Low)” • P1661 “DPF Lamp Control Circuit (High)” • P2032 “Exhaust Gas Temp (Low)” • P2033 “Exhaust Gas Temp (High)” • P2453 “DPF Diff SNSR (Plausi) & MFF” • P2454 “DPF Diff SNSR (Low) & MFF” • P2455 “DPF Diff SNSR (High) & MFF”
	Inspection condition		Ensure that each sensor mounting condition is free of abnormalities.
	Requirements		Codes occur.
	Inspection result (Is the judging standard satisfied?)	YES	After inspection of diagnosis code that is occurring, go to step 2.
		NO	Go to step 2.

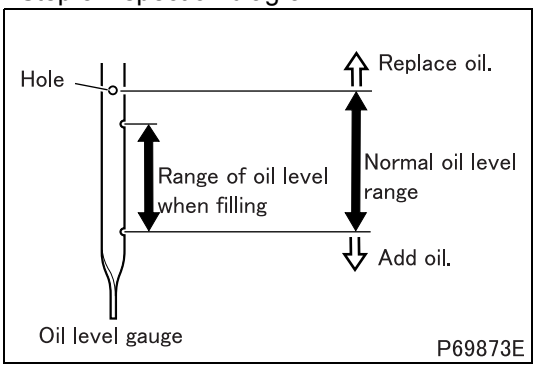
Step 2	Inspection items		Inspection of DPF temperature sensor 1 unit
	Maintenance item		Measure value of resistance between terminal No. 1 and 2.
	Inspection condition		• Put DPF temperature sensor 1 in vessel filled with engine oil. • Heat the oil to each of the specified temperatures. Stir the oil well while doing so.
	Requirements		• 20°C {68°F} : 241.8 kΩ • 50°C {122°F} : 106.2 $^{+74.3}_{-41.8}$ kΩ • 100°C {212°F} : 33.56 $^{+17.60}_{-10.60}$ kΩ • 150°C {302°F} : 13.90 $^{+5.36}_{-3.60}$ kΩ • 200°C {392°F} : 6.896 $^{+2.064}_{-1.252}$ kΩ
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	After cleaning of sensor, go to step 3.

<Step 2 inspection diagram>



Step 3	Inspection items		Inspection of oil level
	Maintenance item		Inspection of engine oil level
	Inspection condition		Engine is stopped.
	Requirements		Oil level for inspection is not exceeded.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	After replacement of oil, go to step 4.

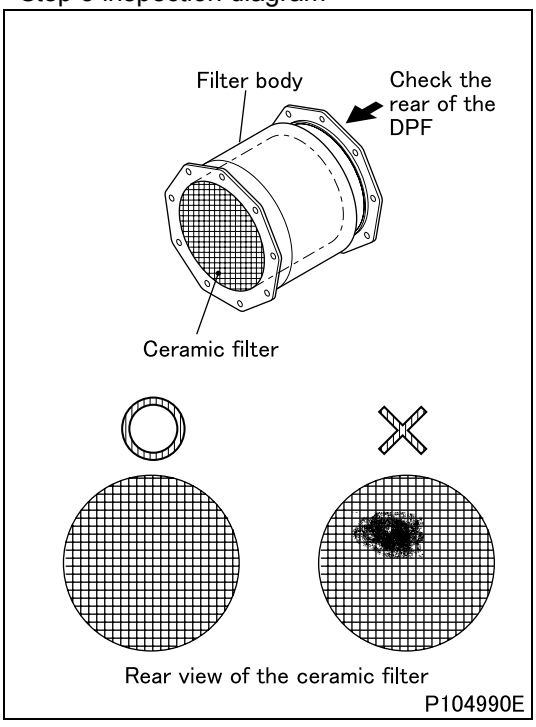
<Step 3 inspection diagram>



Step 4	Inspection items		Inspection of pressure hose
	Maintenance item		Check pressure hose of DPF absolute pressure sensor and DPF pressure sensor (DIFF) for connection and cracks.
	Inspection condition		–
	Requirements		Nothing abnormal detected
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	After correction and replacement of hose, go to step 5.

Step 5	Inspection items		Unit inspection of diesel particulate filter
	Maintenance item		Check the exhaust passage inside the diesel particulate filter for adhesion of soot in large quantity.
	Inspection condition		Remove diesel particulate filter.
	Requirements		No soot is deposited.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	After replacement of ceramic filter, perform resetting the DPF-related information. (See Gr15.)

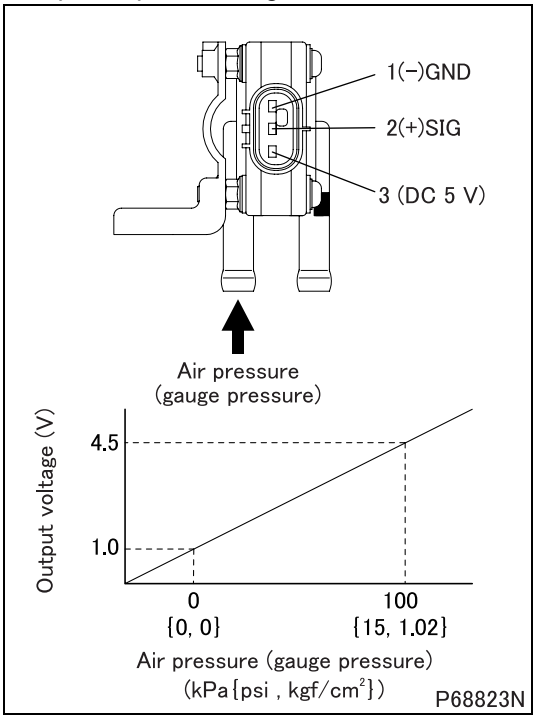
<Step 5 inspection diagram>



Step 6	Inspection items		Diesel Particulate Filter Unit Inspection for Clogging and Cleaning the Diesel Particulate Filter Unit
	Maintenance item		See Gr15 “Diesel Particulate Filter Unit Inspection for Clogging and Cleaning the Diesel Particulate Filter Unit”
	Inspection condition		Perform the following preparatory works. • Place the transmission in neutral (place the automatic transmission in P range). • Turn the steering wheel in neutral position and securely apply the parking brake. • Turn off air conditioner not to increase the engine speed. • Check diagnosis code of each electronic control system. If any fault exists, rectify it. • Resetting the DPF-related information (perform “History reset” of Multi-Use Tester) (See Gr15 “Resetting the DPF-related Information”.) • Warm up the engine until the engine coolant has been heated to more than 70°C {158°F} (verify from Service Data “Engine Coolant Temperature” or “35: Water Temperature”).
	Requirements		This diagnosis code does not occur again.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Replacement of electronic control unit

Step 7	Inspection items		Inspection of DPF pressure sensor (DIFF) unit
	Maintenance item		Measure value of voltage between connector terminal No. 2 (+) and 1 (–).
	Inspection condition		• Apply voltage DC 5 V across terminals No. 3 (+) and 1 (–). • Gradually increase applied air pressure.
	Requirements		• 0 ± 3.5 kPa {0 ± 0.5 psi, 0 ± 0.04 kgf/cm^2}: 1 V • 100 ± 3.5 kPa {15 ± 0.5 psi, 1.02 ± 0.04 kgf/cm^2}: 4.5 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Replacement of sensor

<Step 7 inspection diagram>



Step 8	Inspection items		Inspection of sensor unit
	Maintenance item		Since inspection of single part is not easy, whether characteristics are deteriorated or not must be checked for the sensor mounted on the current vehicle by measuring and comparing the amount of sensor intake air of the sensor currently mounted on vehicle and that replaced with new one by the service data. **(1) Prepare for inspection** • Clean or replace air cleaner element. • Prepare a new air flow sensor. • Warm up the engine fully. **(2) Measure the intake air of current sensor** • Keep pressing the accelerator pedal until it bottom the stopper bolt from the idling state. (no load maximum rotation) • Measure the following items from among “Service data”. **<General Scanning Tool used>** • Engine speed: “Ne” (rpm) • Intake air flow rate: “Air Flow Rate from MAFS” (g/s) **<Multi-Use Tester used>** • Engine speed: 01 “Engine Revolution” (rpm) • Intake air flow rate: 3A “Air Flow Sensor Output” (g/hr) **(3) Measure the intake air of new sensor** • Replace the currently mounted sensor with a new sensor. • Keep pressing the accelerator pedal until it bottom the stopper bolt from the idling state. (no load maximum rotation) • Measure intake air flow at the same rpm as that of engine revolution in item (2) of “Service data”. **(4) Comparison whether characteristics are deteriorated** • Calculate the characteristics deterioration factor (%) by the following equation. • Characteristics deterioration factor (%) = (intake air of new item – current intake air) × 100/intake air of new item.
	Inspection condition		–
	Requirements		10% or less
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 9.
		NO	Replacement of sensor

Step 9	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. B9 “Fuel Leak Check”.
	Inspection condition		Engine start: At idle
	Requirements		There is no leak from injectors (six).
	Inspection result (Is the judging standard satisfied?)	YES	Replacement of diesel particulate filter
		NO	Replacement of injector

[Fault code]
Diagnosis code: P1417/Flash code: 92
[Monitor]
Low temperature abnormality at 2nd stage of manual diesel particulate filter regeneration
[Fault (outline)]
Plausibility
[Diagnosis check]
- Temperature before front oxidation catalyst and ceramic filter is monitored by DPF temperature sensor 1 for temperature status during manual diesel particulate filter regeneration.

[Code generation condition]
- Exhaust gas temperature remains below specified level for approx. 0.2 second.
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal

[Control effected by electronic control unit during fault]
- Injection quantity is limited.
- Exhaust gas recirculation control is stopped.
- Throttle control is stopped.
- Diesel particulate filter regeneration is stopped.

[Probable cause of trouble]
- Abnormality of diesel particulate filter regeneration control
- Abnormality of DPF temperature sensor 1
- Abnormality in electronic control unit
- Abnormality of common rail
- Abnormality of diesel particulate filter (front oxidation catalyst)

[Recoverability]
<Control during fault>
- Recovered if signal becomes normal when starter switch is turned OFF to ON (power supply resumed to electronic control unit).

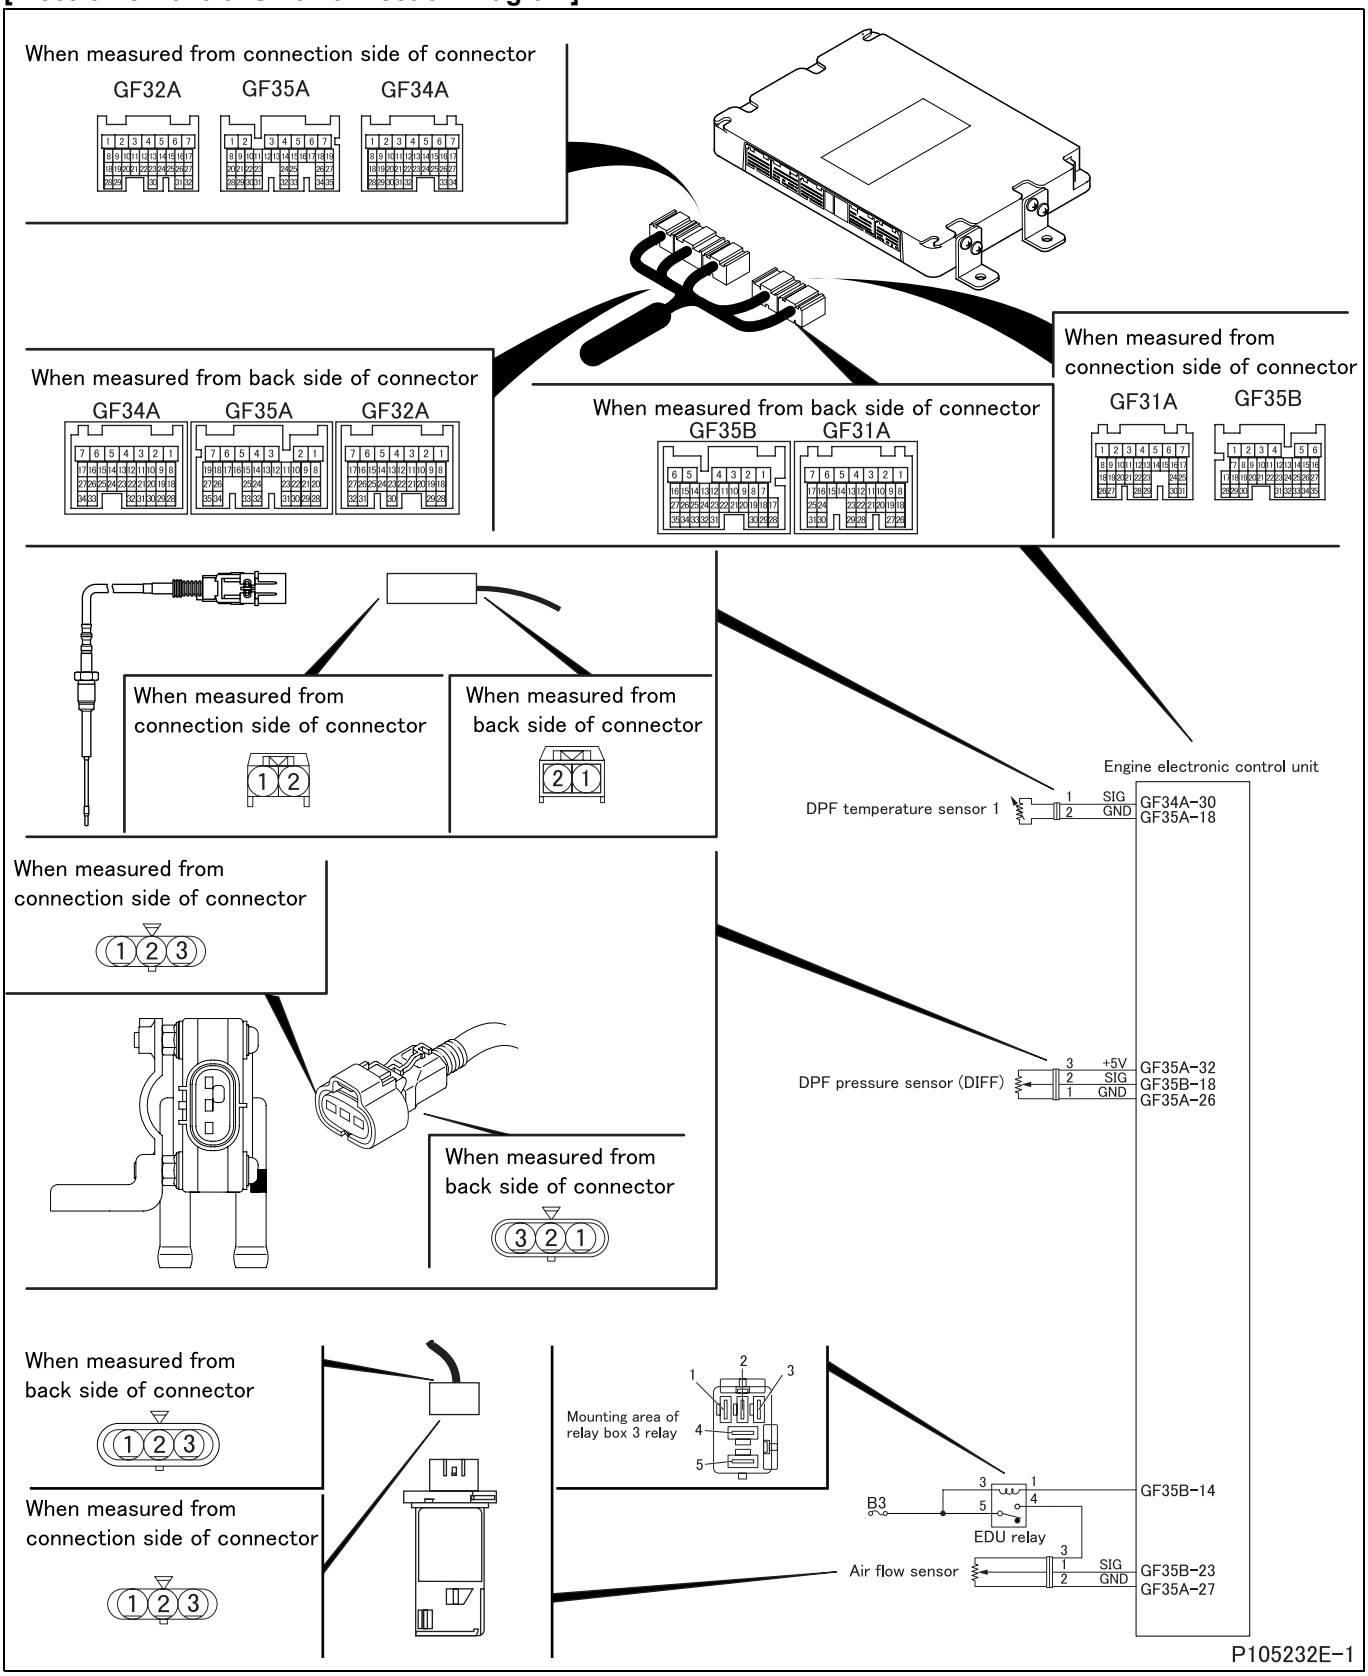
NOTE
- **Recovery from a fault of this code requires “Resetting the DPF-related information”; troubleshooting steps on the following pages, therefore, must be completely performed.**

<Warning lamp>
- Extinguished after input of normal signal.

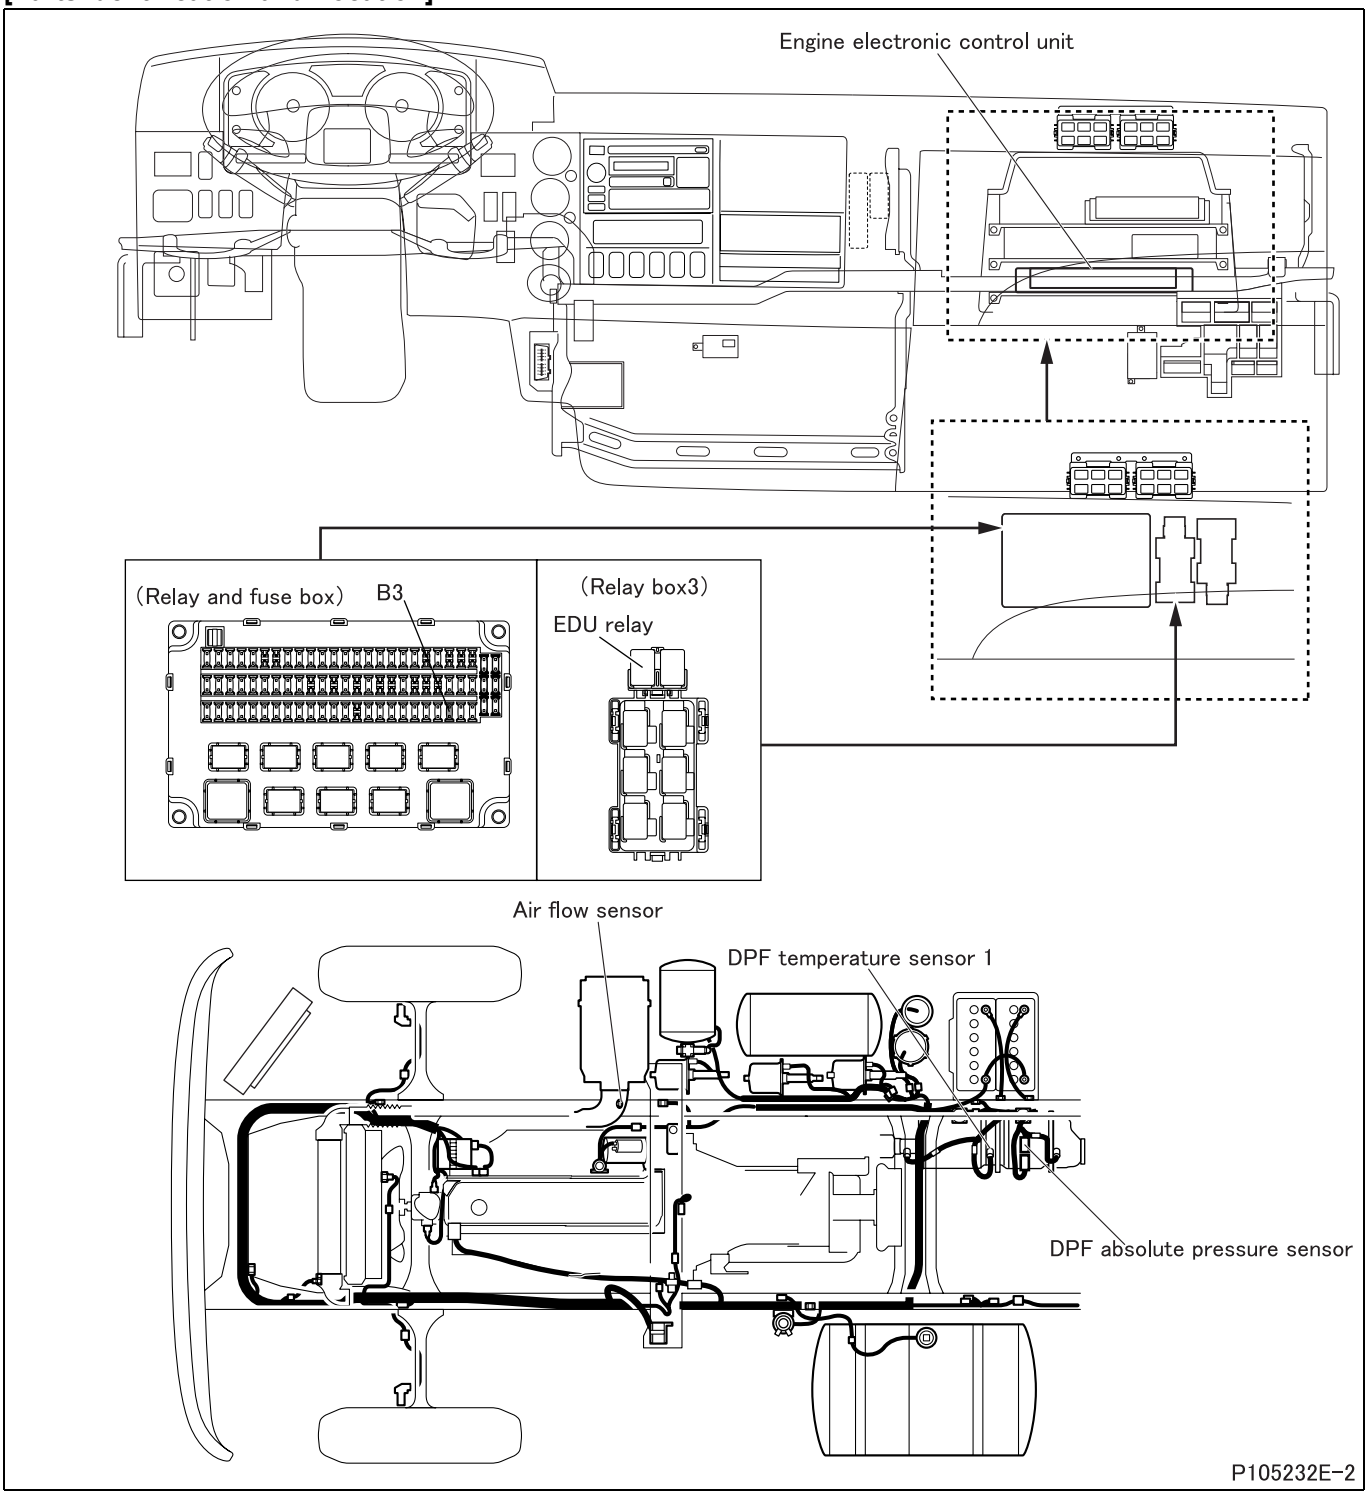
<Fault code>
- If code recovered to normal, automatically cleared at 40th warm up cycle after warning lamp is lit.
  (To clear as desired, erase from the memory.)

Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



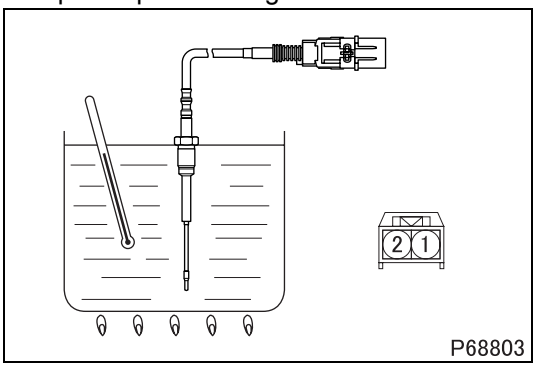
[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		Check if following diagnosis codes occur simultaneously. • P0101 “Airflow Sensor (Plausibility)” • P0102 “Airflow Sensor (Low)” • P0103 “Airflow Sensor (High)” • P0427 “EXH Gas Temp SNSR1 (Low)” • P0428 “EXH Gas Temp SNSR1 (High)” • P0545 “DPF Temp SNSR (upstream) Low” • P0546 “DPF Temp SNSR (upstream) High” • P1660 “DPF Lamp Control Circuit (Low)” • P1661 “DPF Lamp Control Circuit (High)” • P2032 “Exhaust Gas Temp (Low)” • P2033 “Exhaust Gas Temp (High)” • P2453 “DPF Diff SNSR (Plausi) & MFF” • P2454 “DPF Diff SNSR (Low) & MFF” • P2455 “DPF Diff SNSR (High) & MFF”
	Inspection condition		Ensure that each sensor mounting condition is free of abnormalities.
	Requirements		Codes occur.
	Inspection result (Is the judging standard satisfied?)	YES	After inspection of diagnosis code that is occurring, go to step 2.
		NO	Go to step 2.

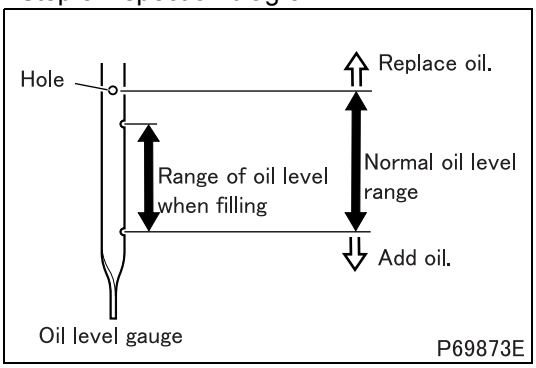
Step 2	Inspection items		Inspection of DPF temperature sensor 1 unit
	Maintenance item		Measure value of resistance between terminal No. 1 and 2.
	Inspection condition		• Put DPF temperature sensor 1 in vessel filled with engine oil. • Heat the oil to each of the specified temperatures. Stir the oil well while doing so.
	Requirements		• 20°C {68°F} : 241.8 kΩ • 50°C {122°F} : 106.2 $^{+74.3}_{-41.8}$ kΩ • 100°C {212°F} : 33.56 $^{+17.60}_{-10.60}$ kΩ • 150°C {302°F} : 13.90 $^{+5.36}_{-3.60}$ kΩ • 200°C {392°F} : 6.896 $^{+2.064}_{-1.252}$ kΩ
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Cleaning of sensor

<Step 2 inspection diagram>



Step 3	Inspection items		Inspection of oil level
	Maintenance item		Inspection of engine oil level
	Inspection condition		Engine is stopped.
	Requirements		Oil level for inspection is not exceeded.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	After replacement of oil, go to step 4.

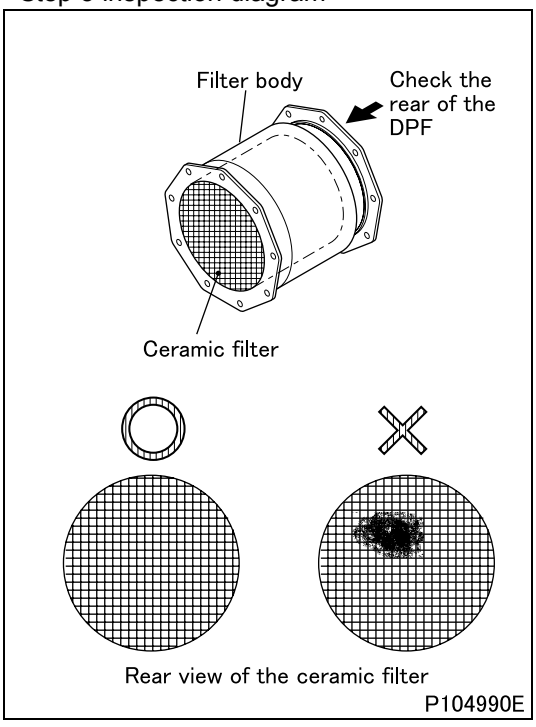
<Step 3 inspection diagram>



Step 4	Inspection items		Inspection of pressure hose
	Maintenance item		Check pressure hose of DPF absolute pressure sensor and DPF pressure sensor (DIFF) for connection and cracks.
	Inspection condition		–
	Requirements		Nothing abnormal detected
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	After correction and replacement of hose, go to step 5.

Step 5	Inspection items		Unit inspection of diesel particulate filter
	Maintenance item		Check the exhaust passage inside the diesel particulate filter for adhesion of soot in large quantity.
	Inspection condition		Remove diesel particulate filter.
	Requirements		No soot is deposited.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	After replacement of ceramic filter, perform resetting the DPF-related information. (See Gr15.)

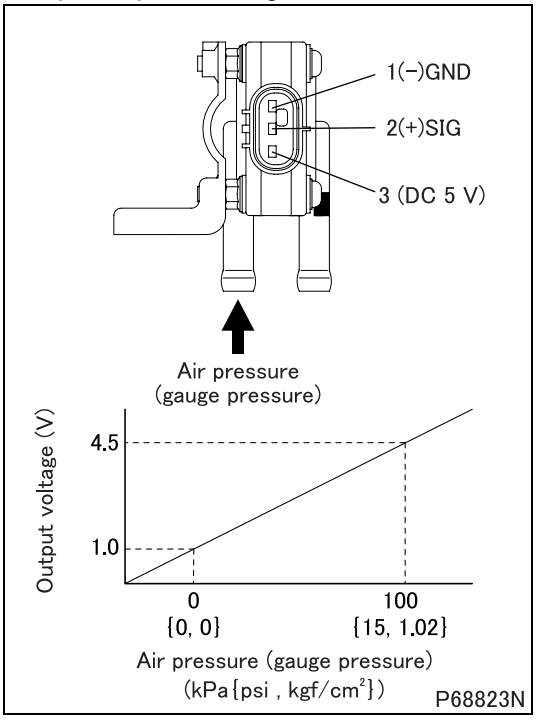
<Step 5 inspection diagram>



Step 6	Inspection items		Diesel Particulate Filter Unit Inspection for Clogging and Cleaning the Diesel Particulate Filter Unit (Perform completely.)
	Maintenance item		See Gr15 “Diesel Particulate Filter Unit Inspection for Clogging and Cleaning the Diesel Particulate Filter Unit”
	Inspection condition		Perform the following preparatory works. • Place the transmission in neutral (place the automatic transmission in P range). • Turn the steering wheel in neutral position and securely apply the parking brake. • Turn off air conditioner not to increase the engine speed. • Check diagnosis code of each electronic control system. If any fault exists, rectify it. • Resetting the DPF-related information (perform “History reset” of Multi-Use Tester) (See Gr15 “Resetting the DPF-related Information”.) • Warm up the engine until the engine coolant has been heated to more than 70°C {158°F} (verify from Service Data “Engine Coolant Temperature” or “35: Water Temperature”).
	Requirements		This diagnosis code does not occur again.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Replacement of electronic control unit

Step 7	Inspection items		Inspection of DPF pressure sensor (DIFF) unit
	Maintenance item		Measure value of voltage between connector terminal No. 2 (+) and 1 (–).
	Inspection condition		• Apply voltage DC 5 V across terminals No. 3 (+) and 1 (–). • Gradually increase applied air pressure.
	Requirements		• 0 ± 3.5 kPa {0 ± 0.5 psi, 0 ± 0.04 kgf/cm^2}: 1 V • 100 ± 3.5 kPa {15 ± 0.5 psi, 1.02 ± 0.04 kgf/cm^2}: 4.5 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Replacement of sensor

<Step 7 inspection diagram>



Step 8	Inspection items		Inspection of sensor unit
	Maintenance item		Since inspection of single part is not easy, whether characteristics are deteriorated or not must be checked for the sensor mounted on the current vehicle by measuring and comparing the amount of sensor intake air of the sensor currently mounted on vehicle and that replaced with new one by the service data. **(1) Prepare for inspection** • Clean or replace air cleaner element. • Prepare a new air flow sensor. • Warm up the engine fully. **(2) Measure the intake air of current sensor** • Keep pressing the accelerator pedal until it bottom the stopper bolt from the idling state. (no load maximum rotation) • Measure the following items from among “Service data”. **<General Scanning Tool used>** • Engine speed: “Ne” (rpm) • Intake air flow rate: “Air Flow Rate from MAFS” (g/s) **<Multi-Use Tester used>** • Engine speed: 01 “Engine Revolution” (rpm) • Intake air flow rate: 3A “Air Flow Sensor Output” (g/hr) **(3) Measure the intake air of new sensor** • Replace the currently mounted sensor with a new sensor. • Keep pressing the accelerator pedal until it bottom the stopper bolt from the idling state. (no load maximum rotation) • Measure intake air flow at the same rpm as that of engine revolution in item (2) of “Service data”. **(4) Comparison whether characteristics are deteriorated** • Calculate the characteristics deterioration factor (%) by the following equation. • Characteristics deterioration factor (%) = (intake air of new item – current intake air) × 100/intake air of new item.
	Inspection condition		–
	Requirements		10% or less
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 9.
		NO	Replacement of sensor

Step 9	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. B9 “Fuel Leak Check”.
	Inspection condition		Engine start: At idle
	Requirements		There is no leak from injectors (six).
	Inspection result (Is the judging standard satisfied?)	YES	Replacement of diesel particulate filter
		NO	Replacement of injector

[Fault code]
Diagnosis code: P1418/Flash code: 92
[Monitor]
High temperature abnormality at 2nd stage of manual diesel particulate filter regeneration
[Fault (outline)]
Plausibility
[Diagnosis check]
- Temperature before front oxidation catalyst and ceramic filter is monitored by DPF temperature sensor 1 for temperature status during manual diesel particulate filter regeneration.

[Code generation condition]
- Temperature of diesel particulate filter being manually regenerated remains at 670°C {1238°F} or higher for 10 minutes.
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal

[Control effected by electronic control unit during fault]
- Injection quantity is limited.
- Exhaust gas recirculation control is stopped.
- Throttle control is stopped.
- Diesel particulate filter regeneration is stopped.

[Probable cause of trouble]
- Abnormality of diesel particulate filter regeneration control
- Abnormality of DPF temperature sensor 1
- Abnormality in electronic control unit
- Abnormality of common rail
- Abnormality of diesel particulate filter (front oxidation catalyst)

[Recoverability]
<Control during fault>
- Recovered if signal becomes normal when starter switch is turned OFF to ON (power supply resumed to electronic control unit).

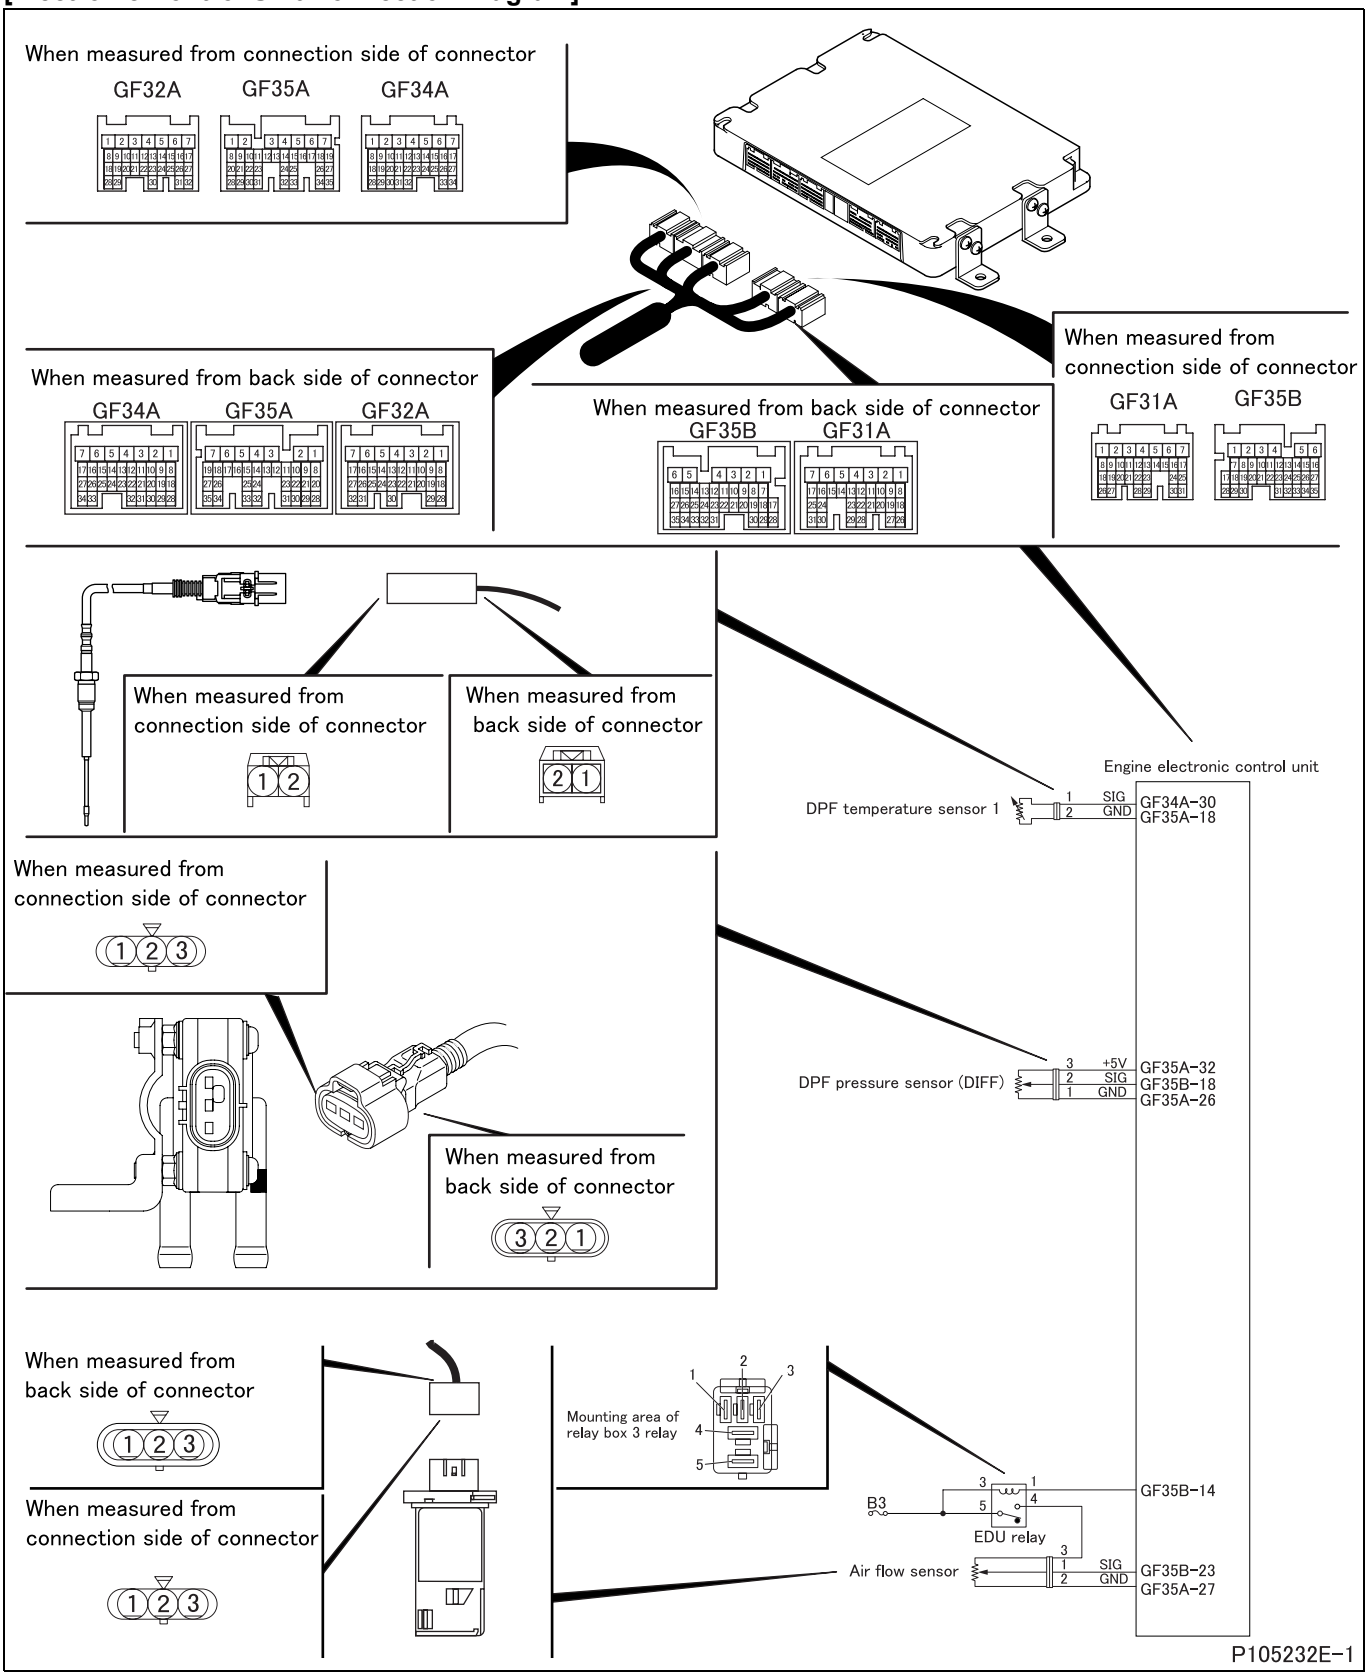
NOTE
- **Recovery from a fault of this code requires “Resetting the DPF-related information”; troubleshooting steps on the following pages, therefore, must be completely performed.**

<Warning lamp>
- Extinguished after input of normal signal.

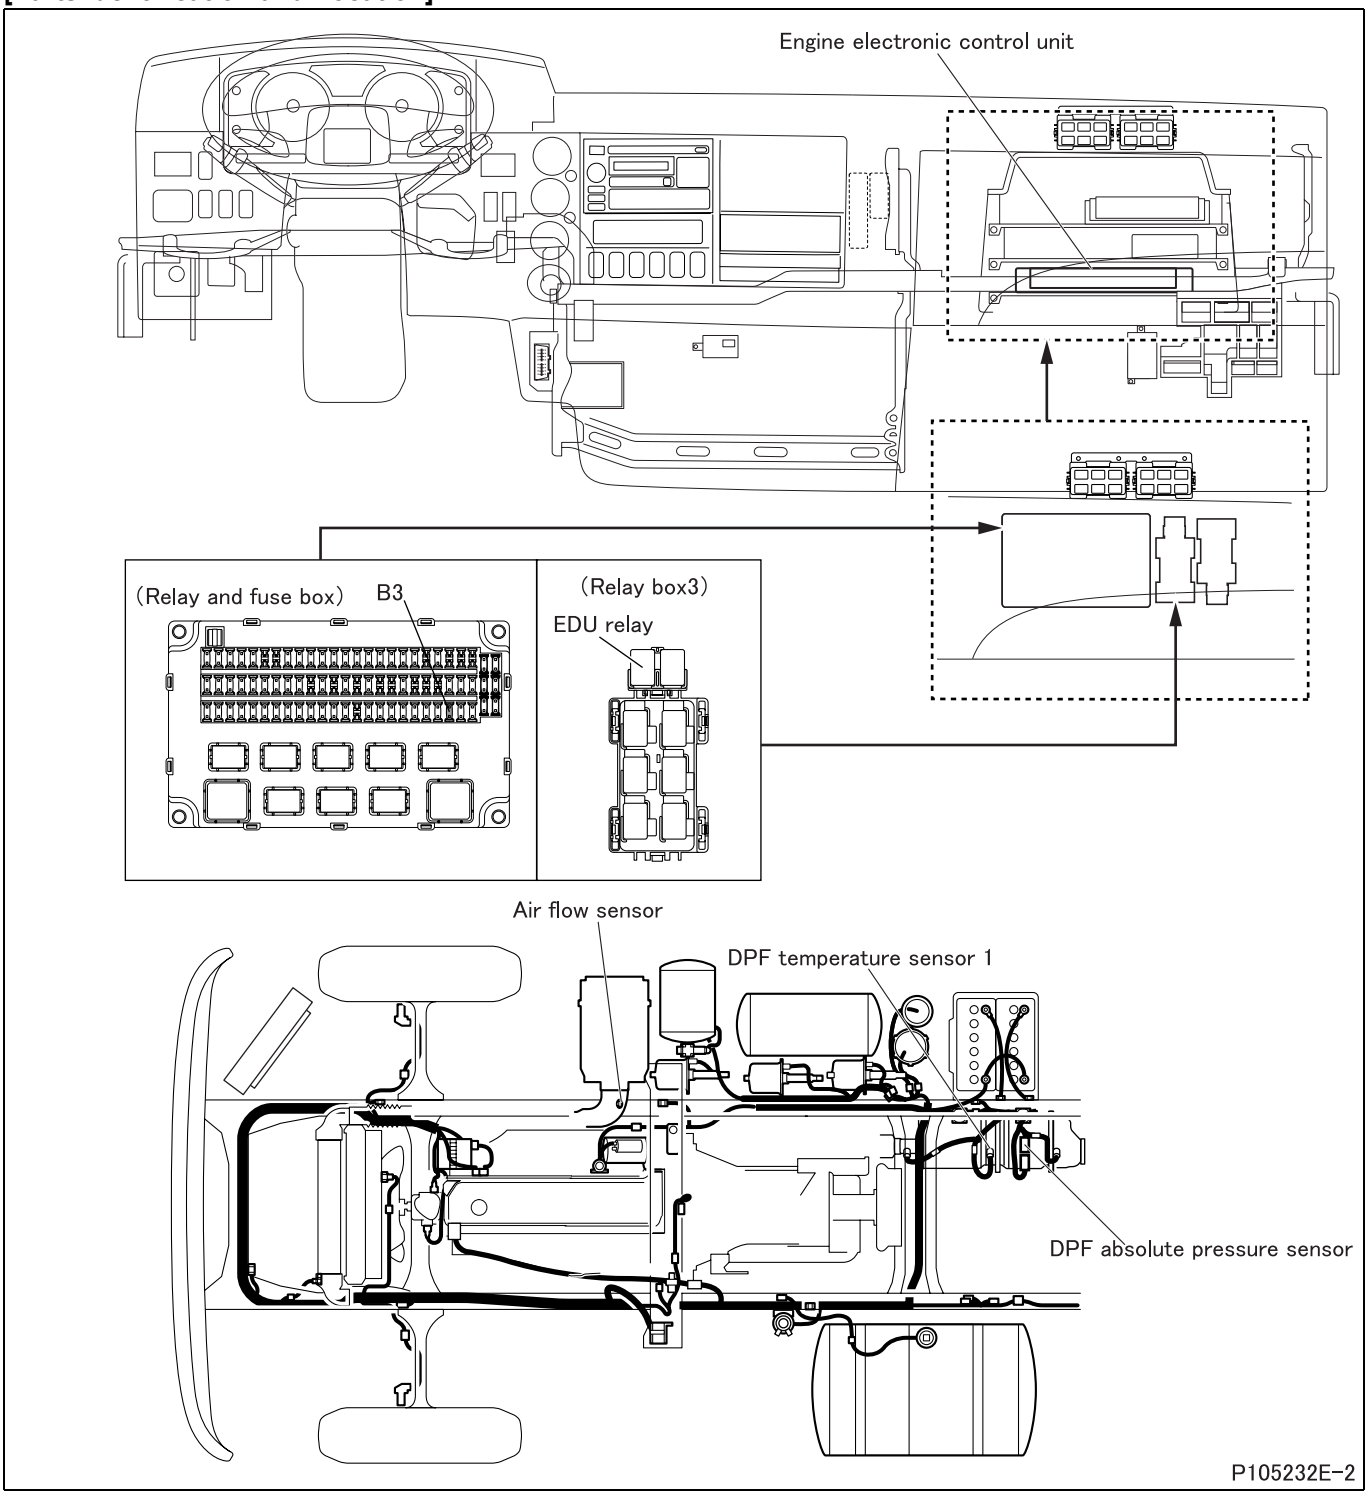
<Fault code>
- If code recovered to normal, automatically cleared at 40th warm up cycle after warning lamp is lit.
  (To clear as desired, erase from the memory.)

Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



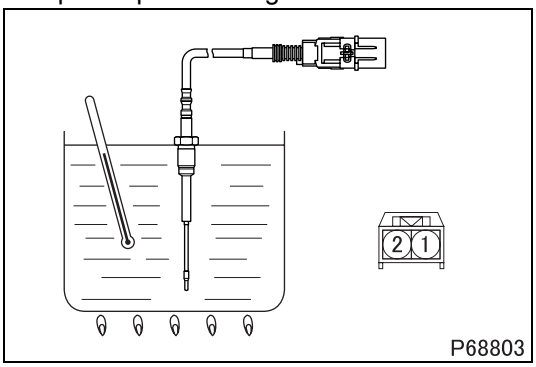
[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		Check if following diagnosis codes occur simultaneously. • P0101 “Airflow Sensor (Plausibility)” • P0102 “Airflow Sensor (Low)” • P0103 “Airflow Sensor (High)” • P0427 “EXH Gas Temp SNSR1 (Low)” • P0428 “EXH Gas Temp SNSR1 (High)” • P0545 “DPF Temp SNSR (upstream) Low” • P0546 “DPF Temp SNSR (upstream) High” • P1660 “DPF Lamp Control Circuit (Low)” • P1661 “DPF Lamp Control Circuit (High)” • P2032 “Exhaust Gas Temp (Low)” • P2033 “Exhaust Gas Temp (High)” • P2453 “DPF Diff SNSR (Plausi) & MFF” • P2454 “DPF Diff SNSR (Low) & MFF” • P2455 “DPF Diff SNSR (High) & MFF”
	Inspection condition		Ensure that each sensor mounting condition is free of abnormalities.
	Requirements		Codes occur.
	Inspection result (Is the judging standard satisfied?)	YES	After inspection of diagnosis code that is occurring, go to step 2.
		NO	Go to step 2.

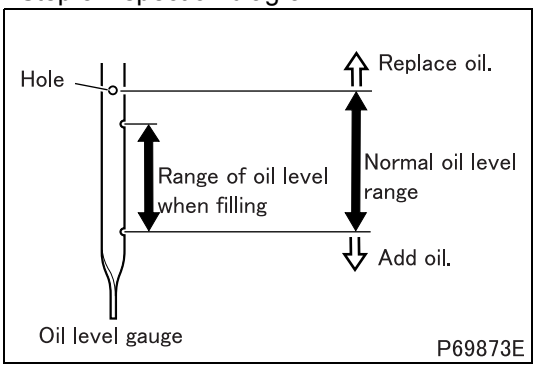
Step 2	Inspection items		Inspection of DPF temperature sensor 1 unit
	Maintenance item		Measure value of resistance between terminal No. 1 and 2.
	Inspection condition		• Put DPF temperature sensor 1 in vessel filled with engine oil. • Heat the oil to each of the specified temperatures. Stir the oil well while doing so.
	Requirements		• 20°C {68°F} : 241.8 kΩ • 50°C {122°F} : 106.2 $^{+74.3}_{-41.8}$ kΩ • 100°C {212°F} : 33.56 $^{+17.60}_{-10.60}$ kΩ • 150°C {302°F} : 13.90 $^{+5.36}_{-3.60}$ kΩ • 200°C {392°F} : 6.896 $^{+2.064}_{-1.252}$ kΩ
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Cleaning of sensor

<Step 2 inspection diagram>



Step 3	Inspection items		Inspection of oil level
	Maintenance item		Inspection of engine oil level
	Inspection condition		Engine is stopped.
	Requirements		Oil level for inspection is not exceeded.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	After replacement of oil, go to step 4.

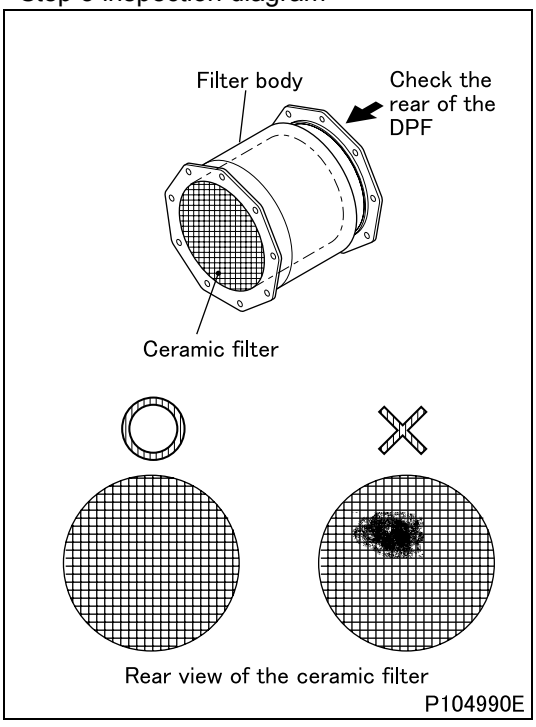
<Step 3 inspection diagram>



Step 4	Inspection items		Inspection of pressure hose
	Maintenance item		Check pressure hose of DPF absolute pressure sensor and DPF pressure sensor (DIFF) for connection and cracks.
	Inspection condition		–
	Requirements		Nothing abnormal detected
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	After correction and replacement of hose, go to step 5.

Step 5	Inspection items		Unit inspection of diesel particulate filter
	Maintenance item		Check the exhaust passage inside the diesel particulate filter for adhesion of soot in large quantity.
	Inspection condition		Remove diesel particulate filter.
	Requirements		No soot is deposited.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	After replacement of ceramic filter, perform resetting the DPF-related information. (See Gr15.)

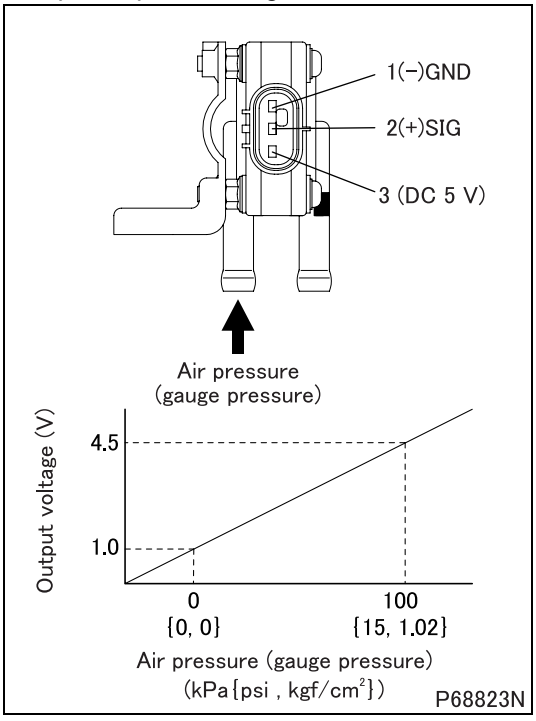
<Step 5 inspection diagram>



Step 6	Inspection items		Diesel Particulate Filter Unit Inspection for Clogging and Cleaning the Diesel Particulate Filter Unit (Perform completely.)
	Maintenance item		See Gr15 “Diesel Particulate Filter Unit Inspection for Clogging and Cleaning the Diesel Particulate Filter Unit”
	Inspection condition		Perform the following preparatory works. • Place the transmission in neutral (place the automatic transmission in P range). • Turn the steering wheel in neutral position and securely apply the parking brake. • Turn off air conditioner not to increase the engine speed. • Check diagnosis code of each electronic control system. If any fault exists, rectify it. • Resetting the DPF-related information (perform “History reset” of Multi-Use Tester) (See Gr15 “Resetting the DPF-related Information”.) • Warm up the engine until the engine coolant has been heated to more than 70°C {158°F} (verify from Service Data “Engine Coolant Temperature” or “35: Water Temperature”).
	Requirements		This diagnosis code does not occur again.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Replacement of electronic control unit

Step 7	Inspection items		Inspection of DPF pressure sensor (DIFF) unit
	Maintenance item		Measure value of voltage between connector terminal No. 2 (+) and 1 (–).
	Inspection condition		• Apply voltage DC 5 V across terminals No. 3 (+) and 1 (–). • Gradually increase applied air pressure.
	Requirements		• 0 ± 3.5 kPa {0 ± 0.5 psi, 0 ± 0.04 kgf/cm^2}: 1 V • 100 ± 3.5 kPa {15 ± 0.5 psi, 1.02 ± 0.04 kgf/cm^2}: 4.5 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Replacement of sensor

<Step 7 inspection diagram>



Step 8	Inspection items		Inspection of sensor unit
	Maintenance item		Since inspection of single part is not easy, whether characteristics are deteriorated or not must be checked for the sensor mounted on the current vehicle by measuring and comparing the amount of sensor intake air of the sensor currently mounted on vehicle and that replaced with new one by the service data. **(1) Prepare for inspection** • Clean or replace air cleaner element. • Prepare a new air flow sensor. • Warm up the engine fully. **(2) Measure the intake air of current sensor** • Keep pressing the accelerator pedal until it bottom the stopper bolt from the idling state. (no load maximum rotation) • Measure the following items from among “Service data”. **<General Scanning Tool used>** • Engine speed: “Ne” (rpm) • Intake air flow rate: “Air Flow Rate from MAFS” (g/s) **<Multi-Use Tester used>** • Engine speed: 01 “Engine Revolution” (rpm) • Intake air flow rate: 3A “Air Flow Sensor Output” (g/hr) **(3) Measure the intake air of new sensor** • Replace the currently mounted sensor with a new sensor. • Keep pressing the accelerator pedal until it bottom the stopper bolt from the idling state. (no load maximum rotation) • Measure intake air flow at the same rpm as that of engine revolution in item (2) of “Service data”. **(4) Comparison whether characteristics are deteriorated** • Calculate the characteristics deterioration factor (%) by the following equation. • Characteristics deterioration factor (%) = (intake air of new item – current intake air) × 100/intake air of new item.
	Inspection condition		–
	Requirements		10% or less
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 9.
		NO	Replacement of sensor

Step 9	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. B9 “Fuel Leak Check”.
	Inspection condition		Engine start: At idle
	Requirements		There is no leak from injectors (six).
	Inspection result (Is the judging standard satisfied?)	YES	Replacement of diesel particulate filter
		NO	Replacement of injector

[Fault code]
Diagnosis code: P1421/Flash code: 92
[Monitor]
High particulate matter deposit level 1
[Fault (outline)]
Plausibility
[Diagnosis check]
- Issue of diesel particulate filter regeneration request instruction for diesel particulate filter in non-regenerated state is monitored.

[Code generation condition]
- Particulate matter (PM) deposit is more than specified value (clogging level: low)
- Filter flow resistance coefficient derived from output of DPF pressure sensor (DIFF) exceeds threshold value. (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal

[Control effected by electronic control unit during fault]
- Injection quantity is limited.
- Exhaust gas recirculation control is stopped.
- Throttle control is stopped.

[Probable cause of trouble]
- Abnormality of diesel particulate filter indicator lamp
- Abnormality of diesel particulate filter cleaning switch
- Manual diesel particulate filter regeneration is not performed.
- Excessive smoke emission (due to malfunction of engine proper, common rail or exhaust gas recirculation system)
- Abnormality of air flow sensor
- Abnormality of DPF absolute pressure sensor
- Abnormality of DPF pressure sensor (DIFF)
- Abnormality of diesel particulate filter

[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch ON position.

NOTE

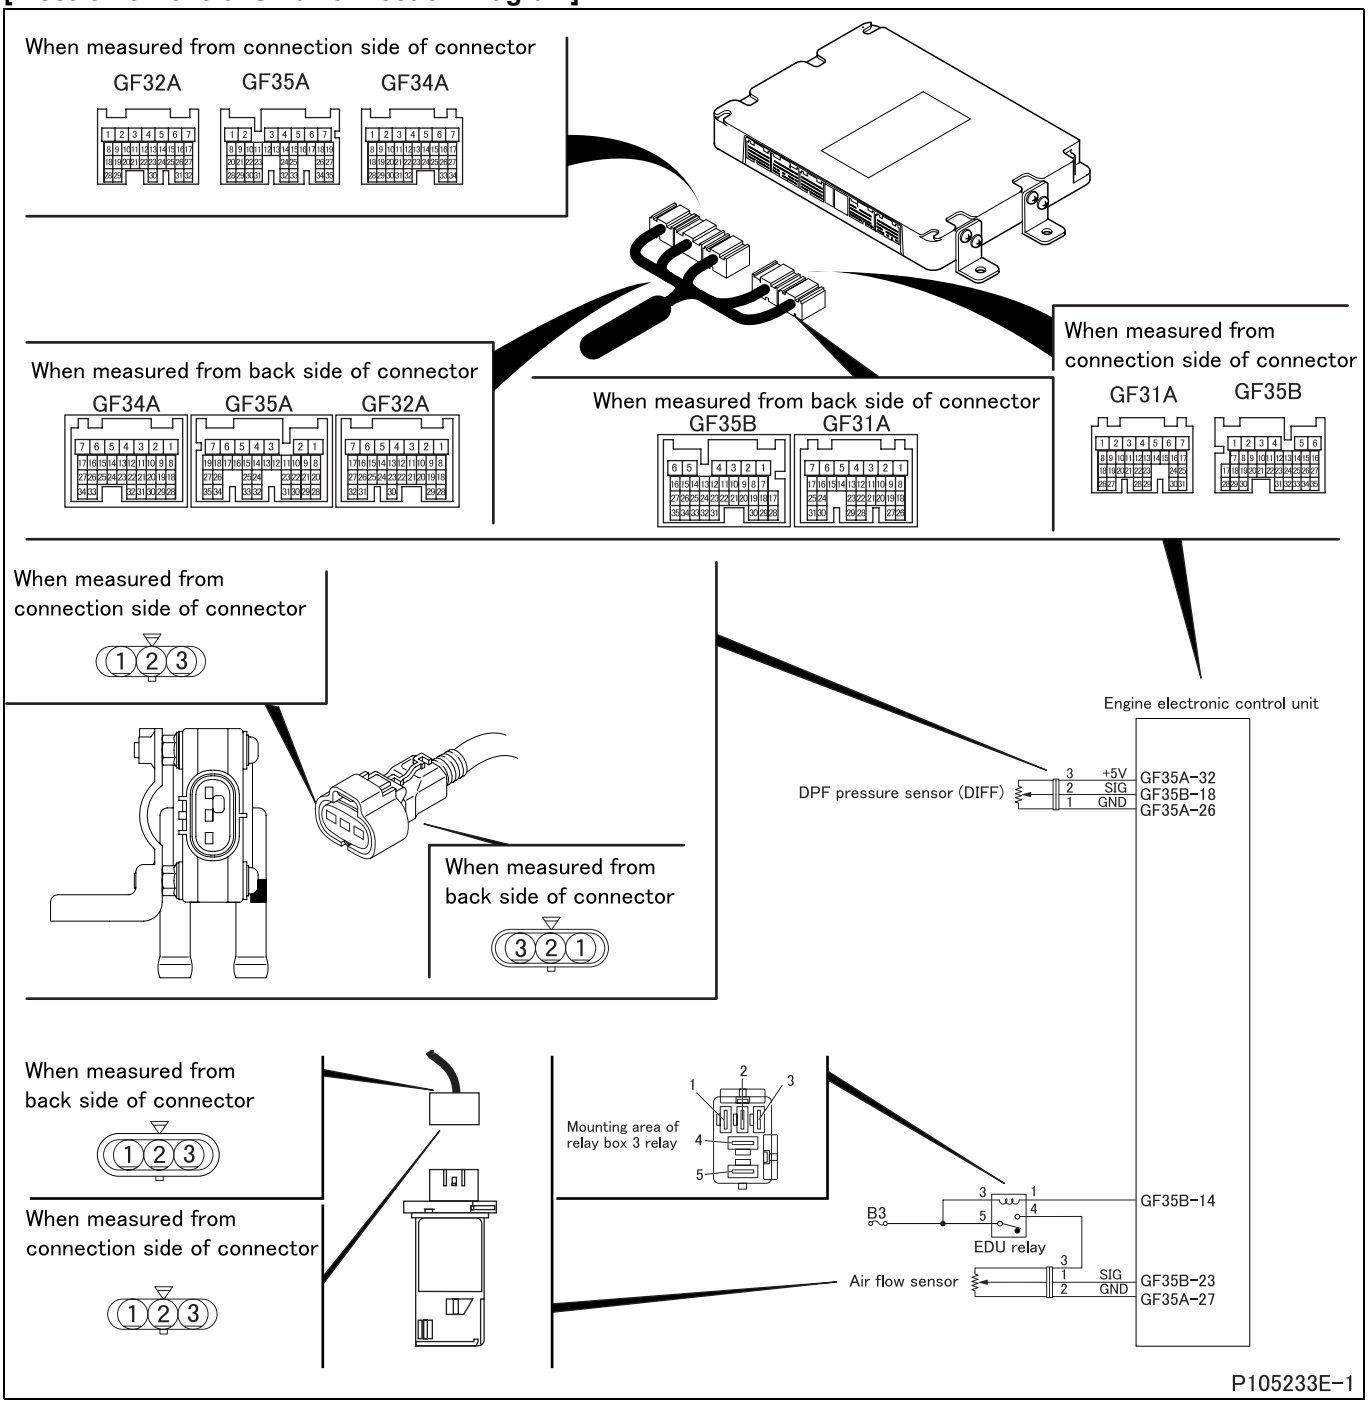
- **Recovery from a fault of this code requires to perform manual regeneration; be sure to perform it.**

<Warning lamp>
- Extinguished after input of normal signal.

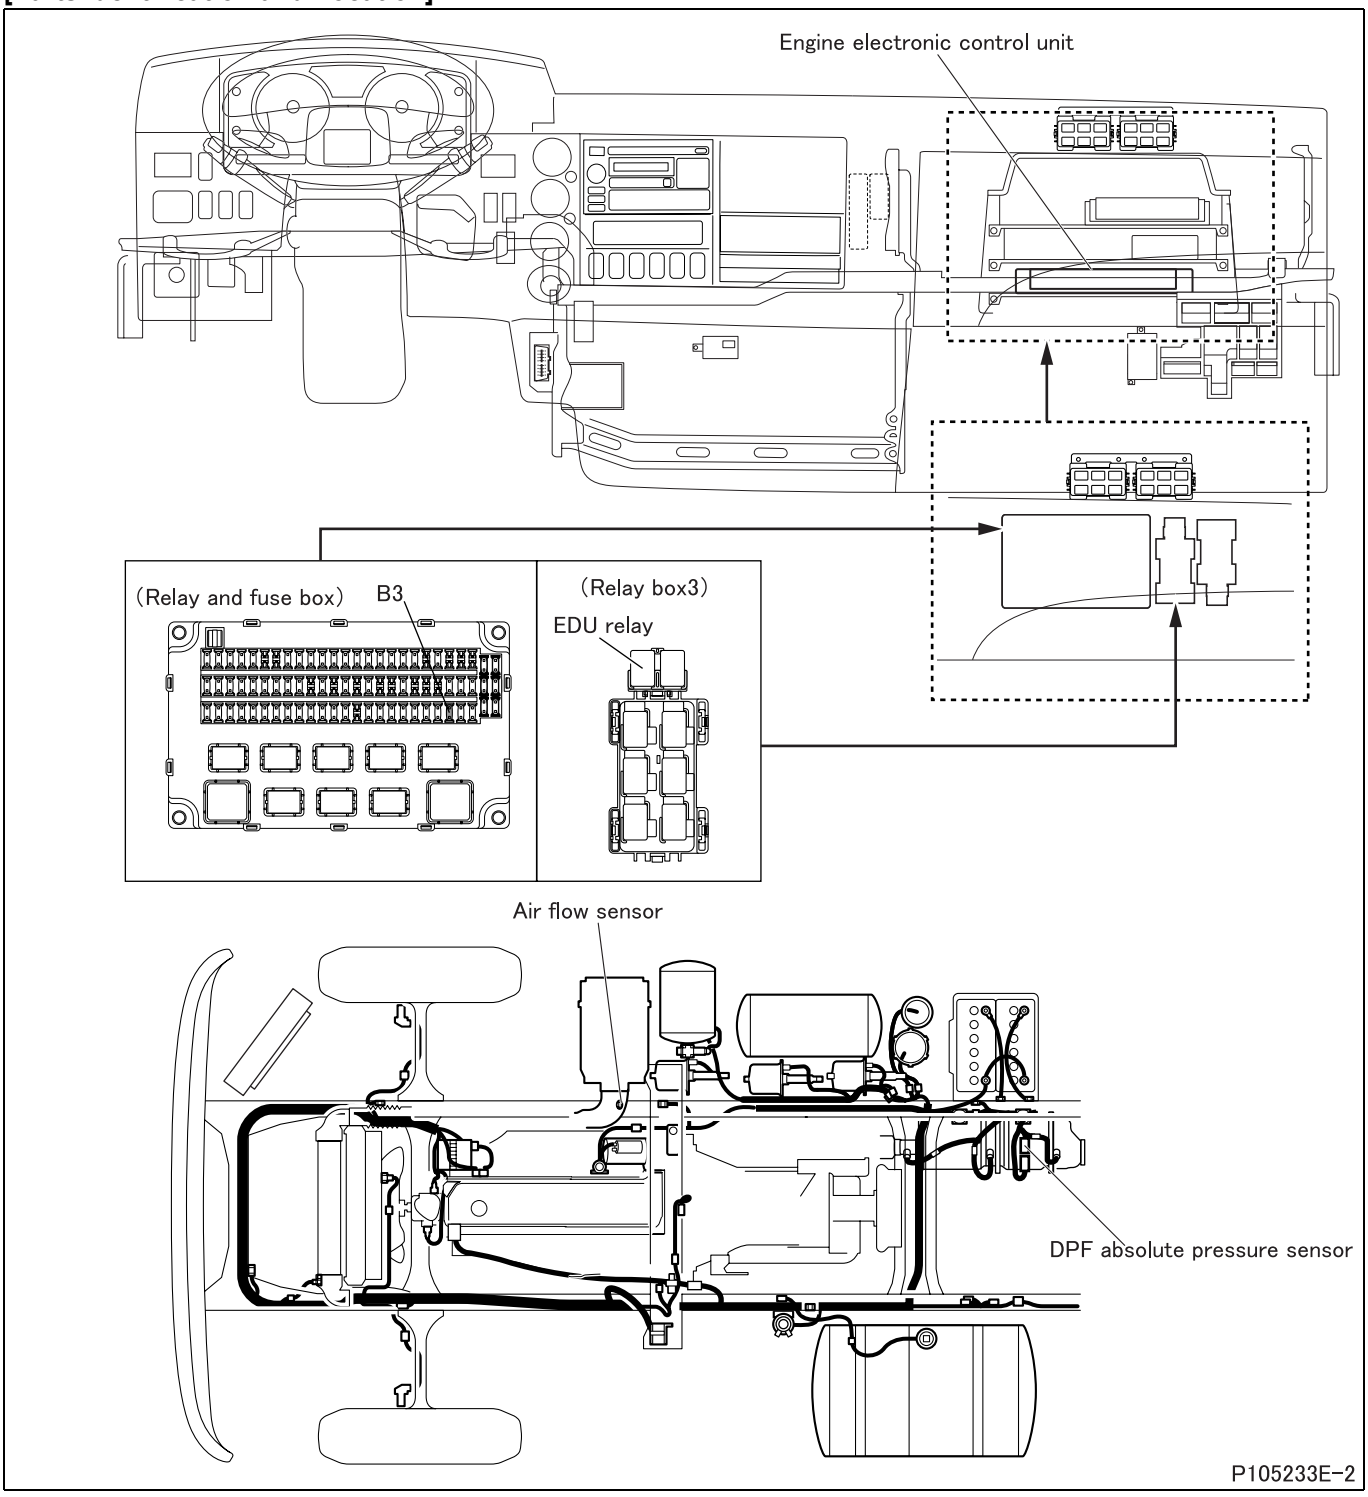
<Fault code>
- If code recovered to normal, automatically cleared at 40th warm up cycle after warning lamp is lit. (To clear as desired, erase from the memory.)

Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]

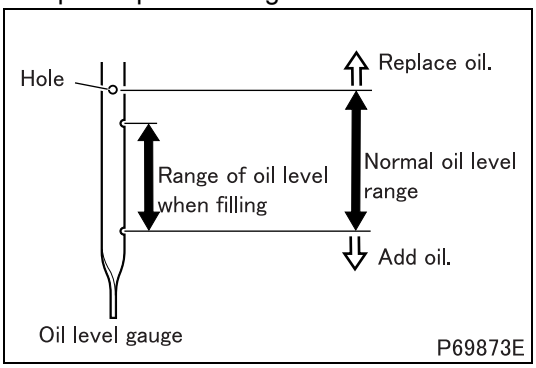


[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection of oil level
	Maintenance item		Inspection of engine oil level
	Inspection condition		Engine stopped
	Requirements		Oil level for inspection is not exceeded.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 2.
		NO	After replacement of oil, go to step 2.

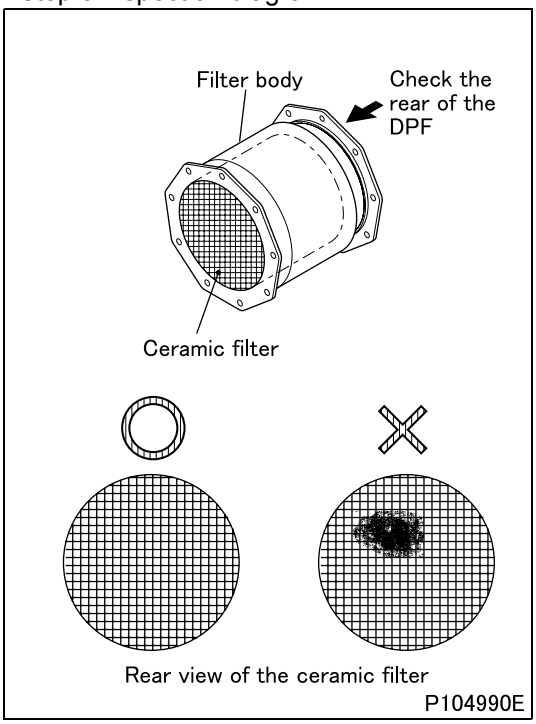
<Step 1 inspection diagram>



Step 2	Inspection items		Inspection by manual diesel particulate filter regeneration
	Maintenance item		Perform Multi-Use Tester actuator test item No. A5 “DPF Regeneration (Manual)”, and clean ceramic diesel particulate filter.
	Inspection condition		• Vehicle: stationary (vehicle speed 0 km/h {0 MPH}) • Starter switch: ON (engine started) • Engine start: At idle • Place the transmission in neutral. (place the automatic transmission in P range) • Parking brake: vehicle parked (parking brake switch: ON) • After engine warm-up
	Requirements		This diagnosis code does not occur again.
	Inspection result (Is the judging standard satisfied?)	YES	End of inspection
		NO	Go to step 3.

Step 3	Inspection items		Unit inspection of diesel particulate filter
	Maintenance item		Check the exhaust passage inside the diesel particulate filter for adhesion of soot in large quantity.
	Inspection condition		Remove diesel particulate filter.
	Requirements		No soot is deposited.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	After replacement of ceramic filter, perform resetting the DPF-related information. (See Gr15.)

<Step 3 inspection diagram>



Step 4	Inspection items		Inspection of diesel particulate filter unit for clogging and cleaning of the diesel particulate filter unit (Perform completely.)
	Maintenance item		See Gr15 “Diesel Particulate Filter Unit Inspection for Clogging and Cleaning the Diesel Particulate Filter Unit”
	Inspection condition		Perform the following preparatory works. • Place the transmission in neutral. (place the automatic transmission in P range) • Turn the steering wheel in neutral position and securely apply the parking brake. • Turn off air conditioner not to increase the engine speed. • Check diagnosis code of each electronic control system. If any fault exists, rectify it. • Resetting the DPF-related information (perform “History reset” of Multi-Use Tester) (See Gr15 “Resetting the DPF-related Information”.) • Warm up the engine until the engine coolant has been heated to more than 70°C {158°F}. (verify from Service Data “Engine Coolant Temperature” or “35: Water Temperature”)
	Requirements		This diagnosis code does not occur again.
	Inspection result (Is the judging standard satisfied?)	YES	End of inspection
		NO	Go to step 5.

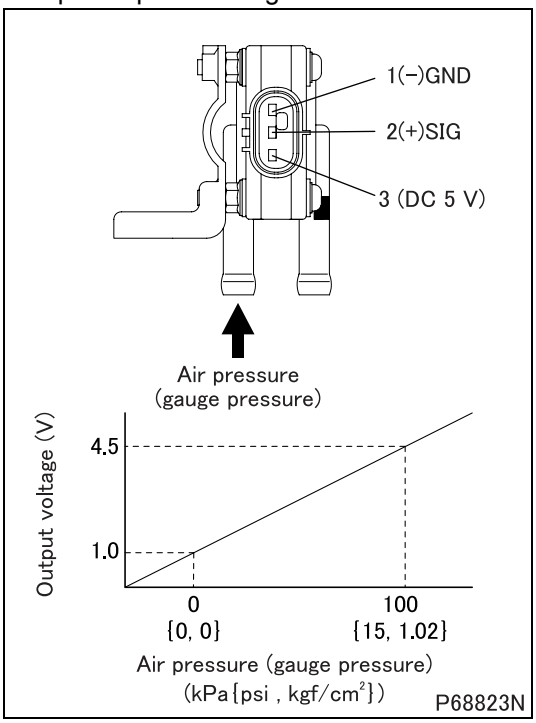
Step 5	Inspection items		Inspection by control data
	Maintenance item		Measure item No. 93 “DPF Lamp” of Service Data.
	Inspection condition		Perform Multi-Use Tester actuator test item No. A8 “DPF Lamp”.
	Requirements		Diesel particulate filter indicator lamp illuminates (automatic reset after 15 seconds)
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Replacement of engine electronic control unit

Step 6	Inspection items		Inspection by control data
	Maintenance item		Measure item No. 75 “DPF SW” of Service Data.
	Inspection condition		–
	Requirements		Press diesel particulate filter cleaning switch and check that “DPF SW” display switches from OFF to ON.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Replacement of diesel particulate filter cleaning switch or engine electronic control unit

Step 7	Inspection items		Inspection of pressure hose
	Maintenance item		Check pressure hose of DPF absolute pressure sensor and DPF pressure sensor (DIFF) for connection and cracks.
	Inspection condition		–
	Requirements		Nothing abnormal detected
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	After correction and replacement of hose, go to step 8.

Step 8	Inspection items		Inspection of DPF pressure sensor (DIFF)
	Maintenance item		Measure value of voltage between connector terminals No. 2 (+) and 1 (–).
	Inspection condition		• Apply voltage DC 5 V across terminals No. 3 (+) and 1 (–). • Gradually increase applied air pressure.
	Requirements		• 0 ± 3.5 kPa {0 ± 0.5 psi, 0 ± 0.04 kgf/cm^2}: 1 V • 100 ± 3.5 kPa {15 ± 0.5 psi, 1.02 ± 0.04 kgf/cm^2}: 4.5 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 9.
		NO	Replacement of DPF pressure sensor (DIFF)

<Step 8 inspection diagram>



Step 9	Inspection items		Inspection of air flow sensor unit
	Maintenance item		Since inspection of single part is not easy, whether characteristics are deteriorated or not must be checked for the sensor mounted on the current vehicle by measuring and comparing the amount of sensor intake air of the sensor currently mounted on vehicle and that replaced with new one by the service data. **(1) Prepare for inspection** • Clean or replace air cleaner element. • Prepare a new air flow sensor. • Warm up the engine fully. **(2) Measure the intake air of current sensor** • Keep pressing the accelerator pedal until it bottom the stopper bolt from the idling state. (no load maximum rotation) • Measure the following items from among “Service data”. **<General Scanning Tool used>** • Engine speed: “Ne” (rpm) • Intake air flow rate: “Air Flow Rate from MAFS” (g/s) **<Multi-Use Tester used>** • Engine speed: 01 “Engine Revolution” (rpm) • Intake air flow rate: 3A “Air Flow Sensor Output” (g/hr) **(3) Measure the intake air of new sensor** • Replace the currently mounted sensor with a new sensor. • Keep pressing the accelerator pedal until it bottom the stopper bolt from the idling state. (no load maximum rotation) • Measure intake air flow at the same rpm as that of engine revolution in item (2) of “Service data”. **(4) Comparison whether characteristics are deteriorated** • Calculate the characteristics deterioration factor (%) by the following equation. • Characteristics deterioration factor (%) = (intake air of new item – current intake air) × 100/intake air of new item.
	Inspection condition		–
	Requirements		10% or less
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 10.
		NO	Replacement of air flow sensor

Step 10	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. B9 “Fuel Leak Check”.
	Inspection condition		Engine start: At idle
	Requirements		There is no leak from injectors (six).
	Inspection result (Is the judging standard satisfied?)	YES	• Inspection of exhaust gas recirculation system (exhaust gas recirculation pipe, exhaust gas recirculation cooler, exhaust gas recirculation valve) • Inspection of engine
		NO	Replacement of injector

[Fault code]
Diagnosis code: P1422/Flash code: 92
[Monitor]
High particulate matter deposit level 2
[Fault (outline)]
Plausibility
[Diagnosis check]
- Diesel particulate filter is checked for clogging.

[Code generation condition]
- Particulate matter (PM) deposit is more than specified valve (clogging level: low to medium)
- Filter flow resistance coefficient derived from output of DPF pressure sensor (DIFF) exceeds threshold value. (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal

[Control effected by electronic control unit during fault]
- Injection quantity is limited.
- Exhaust gas recirculation control is stopped.
- Throttle control is stopped.
- Diesel particulate filter regeneration (manual or automatic) is stopped.
- Auto cruise control is stopped.
- Fault detection for controller area network communication is stopped.

[Probable cause of trouble]
- Abnormality of diesel particulate filter indicator lamp
- Abnormality of diesel particulate filter cleaning switch
- Manual diesel particulate filter regeneration is not performed.
- Excessive smoke emission (due to malfunction of engine proper, common rail or exhaust gas recirculation system)
- Abnormality of air flow sensor
- Abnormality of DPF absolute pressure sensor
- Abnormality of DPF pressure sensor (DIFF)
- Abnormality of diesel particulate filter

[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch ON position.

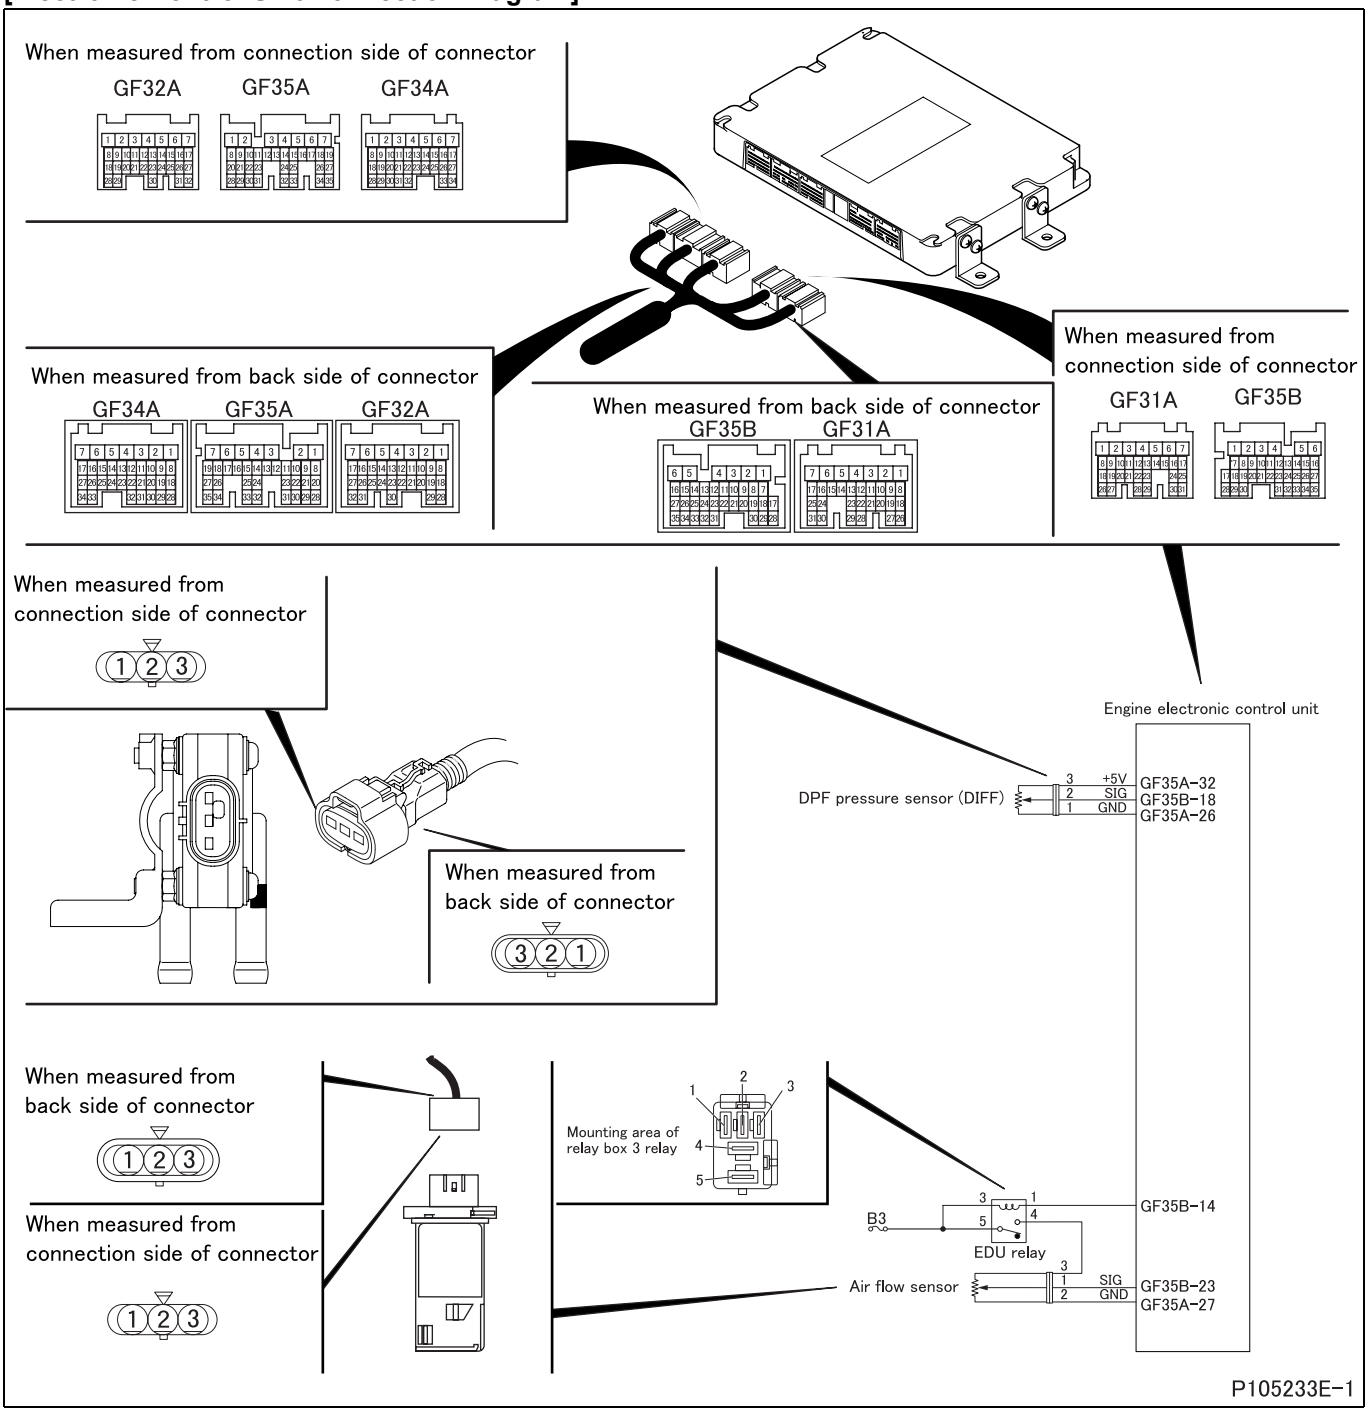
NOTE
- **Recovery from a fault of this code requires “Resetting the DPF-related information”; troubleshooting steps on the following pages, therefore, must be completely performed.**

<Warning lamp>
- Extinguished after input of normal signal.

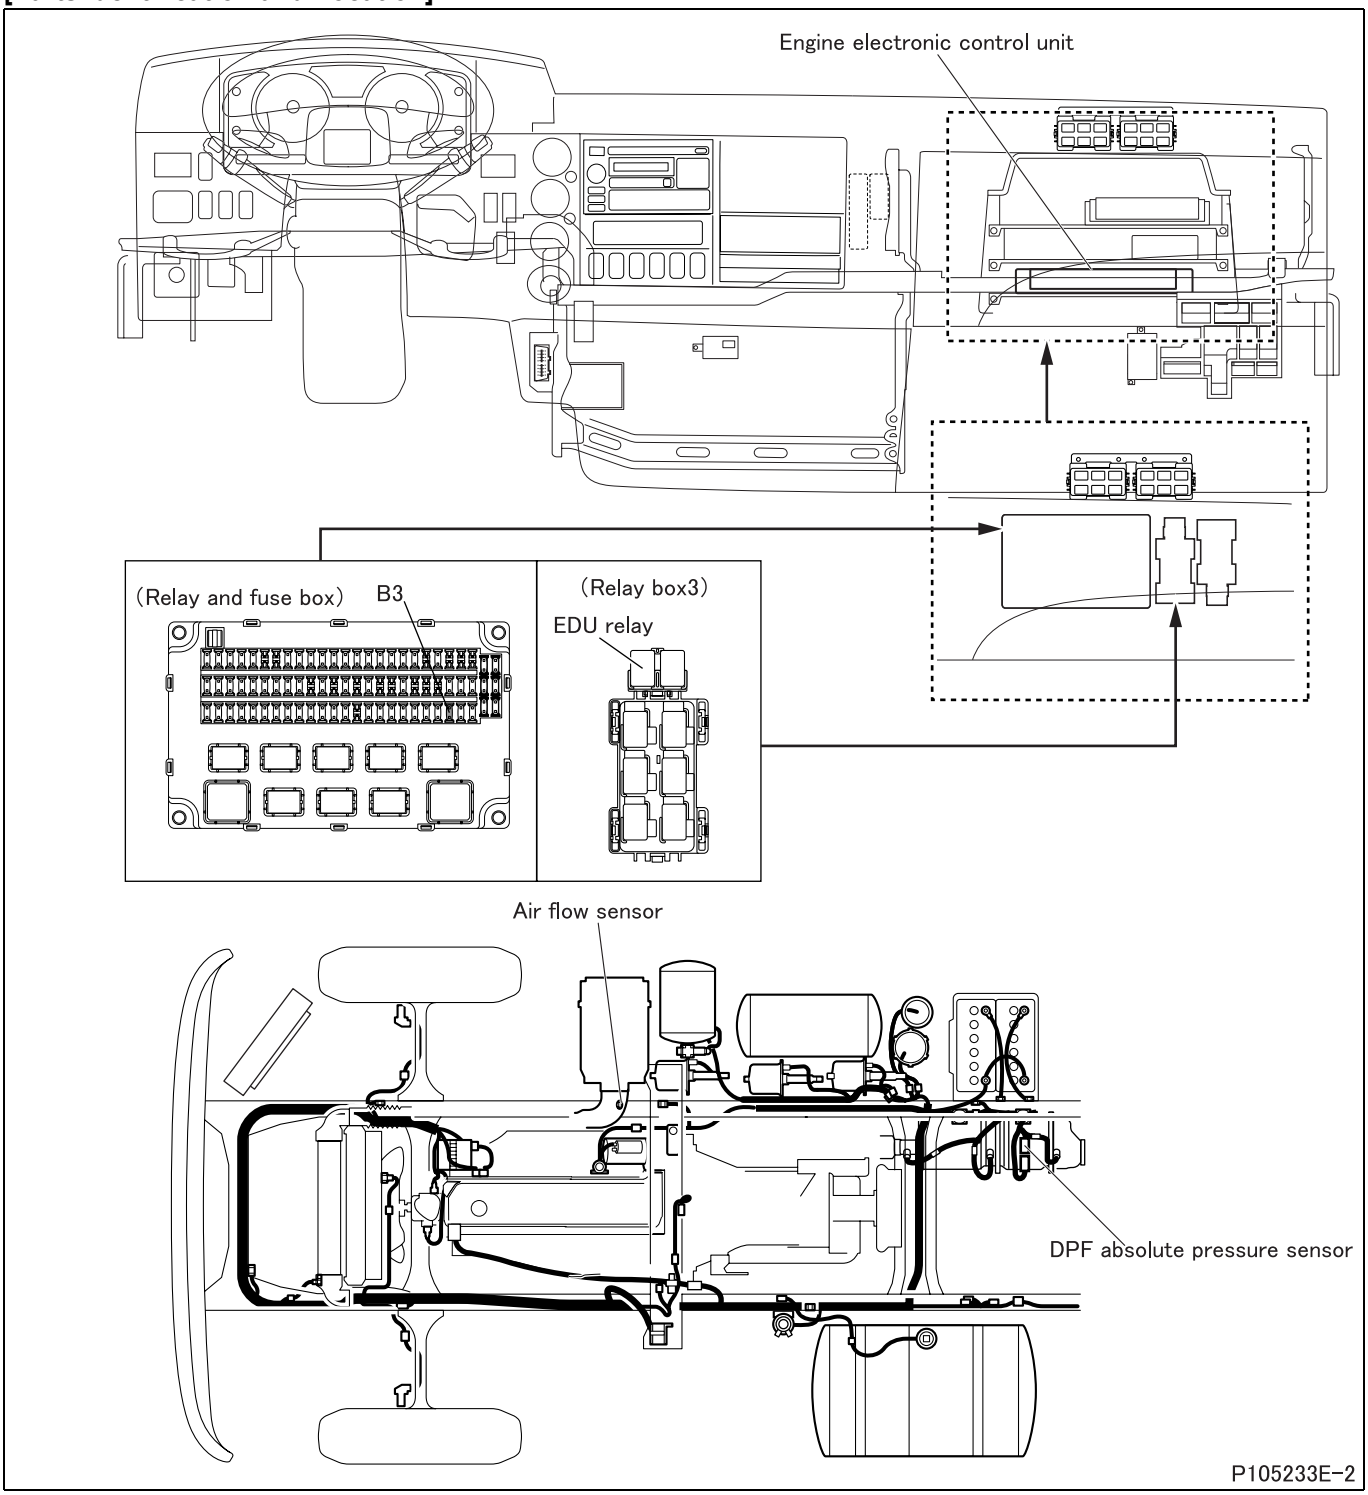
<Fault code>
- If code recovered to normal, automatically cleared at 40th warm up cycle after warning lamp is lit. (To clear as desired, erase from the memory.)

Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]

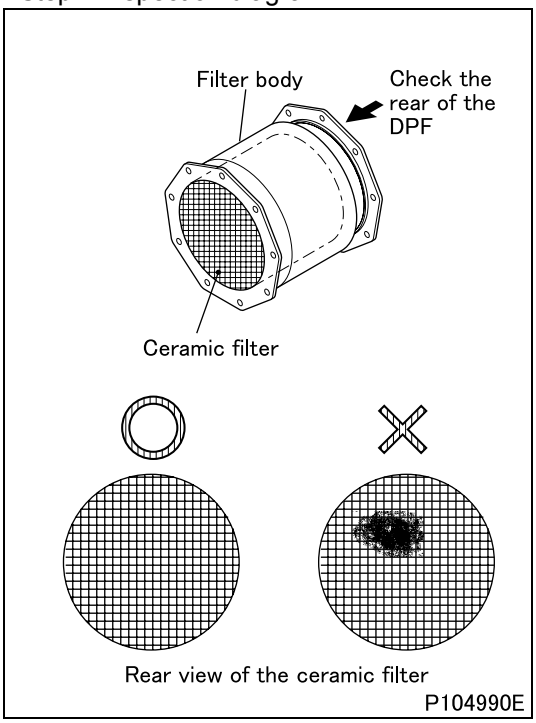


[Fault diagnosis]

Perform checks in the sequence of the following steps.

Step 1	Inspection items		Unit inspection of diesel particulate filter
	Maintenance item		Check the exhaust passage inside the diesel particulate filter for adhesion of soot in large quantity.
	Inspection condition		Remove diesel particulate filter.
	Requirements		No soot is deposited.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 2.
		NO	After replacement of ceramic filter, perform resetting the DPF-related information. (See Gr15.)

<Step 1 inspection diagram>



Step 2	Inspection items		Inspection of diesel particulate filter unit for clogging and cleaning of the diesel particulate filter unit (Perform completely.)
	Maintenance item		See Gr15 “Diesel Particulate Filter Unit Inspection for Clogging and Cleaning the Diesel Particulate Filter Unit”
	Inspection condition		Perform the following preparatory works. • Place the transmission in neutral. (place the automatic transmission in P range) • Turn the steering wheel in neutral position and securely apply the parking brake. • Turn off air conditioner not to increase the engine speed. • Check diagnosis code of each electronic control system. If any fault exists, rectify it. • Resetting the DPF-related information (perform “History reset” of Multi-Use Tester) (See Gr15 “Resetting the DPF-related information”.) • Warm up the engine until the engine coolant has been heated to more than 70°C {158°F}. (verify from Service Data “Engine Coolant Temperature” or “35: Water Temperature”)
	Requirements		This diagnosis code does not occur again.
	Inspection result (Is the judging standard satisfied?)	YES	End of inspection
		NO	Go to step 3.

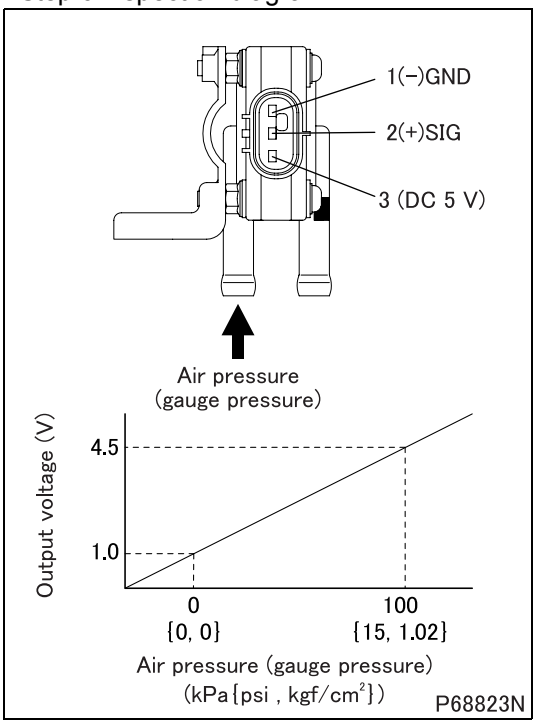
Step 3	Inspection items		Inspection by control data
	Maintenance item		Measure item No. 93 “DPF Lamp” of Service Data.
	Inspection condition		Perform Multi-Use Tester actuator test item No. A8 “DPF Lamp”.
	Requirements		Diesel particulate filter indicator lamp illuminates (automatic reset after 15 seconds)
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	Replacement of engine electronic control unit

Step 4	Inspection items		Inspection by control data
	Maintenance item		Measure item No. 75 “DPF SW” of Service Data.
	Inspection condition		–
	Requirements		Press diesel particulate filter cleaning switch and check that “DPF SW” display switches from OFF to ON.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Replacement of diesel particulate filter cleaning switch or engine electronic control unit

Step 5	Inspection items		Inspection of pressure hose
	Maintenance item		Check pressure hose of DPF absolute pressure sensor and DPF pressure sensor (DIFF) for connection and cracks.
	Inspection condition		–
	Requirements		Nothing abnormal detected
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	After correction and replacement of hose, go to step 6.

Step 6	Inspection items		Inspection of DPF pressure sensor (DIFF)
	Maintenance item		Measure value of voltage between connector terminals No. 2 (+) and 1 (–).
	Inspection condition		• Apply voltage DC 5 V across terminals No. 3 (+) and 1 (–). • Gradually increase applied air pressure.
	Requirements		• 0 ± 3.5 kPa {0 ± 0.5 psi, 0 ± 0.04 kgf/cm^2}: 1 V • 100 ± 3.5 kPa {15 ± 0.5 psi, 1.02 ± 0.04 kgf/cm^2}: 4.5 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Replacement of DPF pressure sensor (DIFF)

<Step 6 inspection diagram>



Step 7	Inspection items		Inspection of air flow sensor unit
	Maintenance item		Since inspection of single part is not easy, whether characteristics are deteriorated or not must be checked for the sensor mounted on the current vehicle by measuring and comparing the amount of sensor intake air of the sensor currently mounted on vehicle and that replaced with new one by the service data. **(1) Prepare for inspection** • Clean or replace air cleaner element. • Prepare a new air flow sensor. • Warm up the engine fully. **(2) Measure the intake air of current sensor** • Keep pressing the accelerator pedal until it bottom the stopper bolt from the idling state. (no load maximum rotation) • Measure the following items from among “Service data”. **<General Scanning Tool used>** • Engine speed: “Ne” (rpm) • Intake air flow rate: “Air Flow Rate from MAFS” (g/s) **<Multi-Use Tester used>** • Engine speed: 01 “Engine Revolution” (rpm) • Intake air flow rate: 3A “Air Flow Sensor Output” (g/hr) **(3) Measure the intake air of new sensor** • Replace the currently mounted sensor with a new sensor. • Keep pressing the accelerator pedal until it bottom the stopper bolt from the idling state. (no load maximum rotation) • Measure intake air flow at the same rpm as that of engine revolution in item (2) of “Service data”. **(4) Comparison whether characteristics are deteriorated** • Calculate the characteristics deterioration factor (%) by the following equation. • Characteristics deterioration factor (%) = (intake air of new item – current intake air) × 100/intake air of new item.
	Inspection condition		–
	Requirements		10% or less
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Replacement of air flow sensor

Step 8	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. B9 “Fuel Leak Check”.
	Inspection condition		Engine start: At idle
	Requirements		There is no leak from injectors (six).
	Inspection result (Is the judging standard satisfied?)	YES	• Inspection of exhaust gas recirculation system (exhaust gas recirculation pipe, exhaust gas recirculation cooler, exhaust gas recirculation valve) • Inspection of engine
		NO	Replacement of injector

[Fault code]
Diagnosis code: P1435/Flash code: 92
[Monitor]
Diesel particulate filter broken
[Fault (outline)]
Efficiency below threshold (blocked diesel particulate filter)
[Diagnosis check]
- Pressure value calculated based on outputs from DPF pressure sensor (DIFF) is compared to that obtained from exhaust gas flow to judge clogged condition of diesel particulate filter.

[Code generation condition]
- Deviation remains lower than specified limits for approx. 10 seconds.
  (Warning lamp is lit and diagnosis code is displayed on second establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- Air flow sensor: normal in output signal
- DPF temperature sensor 1: normal in output signal
- DPF pressure sensor (DIFF): normal in output signal
- DPF absolute pressure sensor: normal in output signall

[Control effected by electronic control unit during fault]
- Throttle control is stopped.
- Exhaust gas recirculation control is stopped.
- Injection quantity is limited.
- Diesel particulate filter regeneration is stopped.

[Probable cause of trouble]
- Abnormality of diesel particulate filter indicator lamp
- Abnormality of diesel particulate filter cleaning switch
- Manual diesel particulate filter regeneration is not performed.
- Excessive smoke emission (due to malfunction of engine proper, common rail or exhaust gas recirculation system)
- Abnormality of air flow sensor
- Abnormality of DPF absolute pressure sensor
- Abnormality of DPF pressure sensor (DIFF)
- Damage of ceramic filter

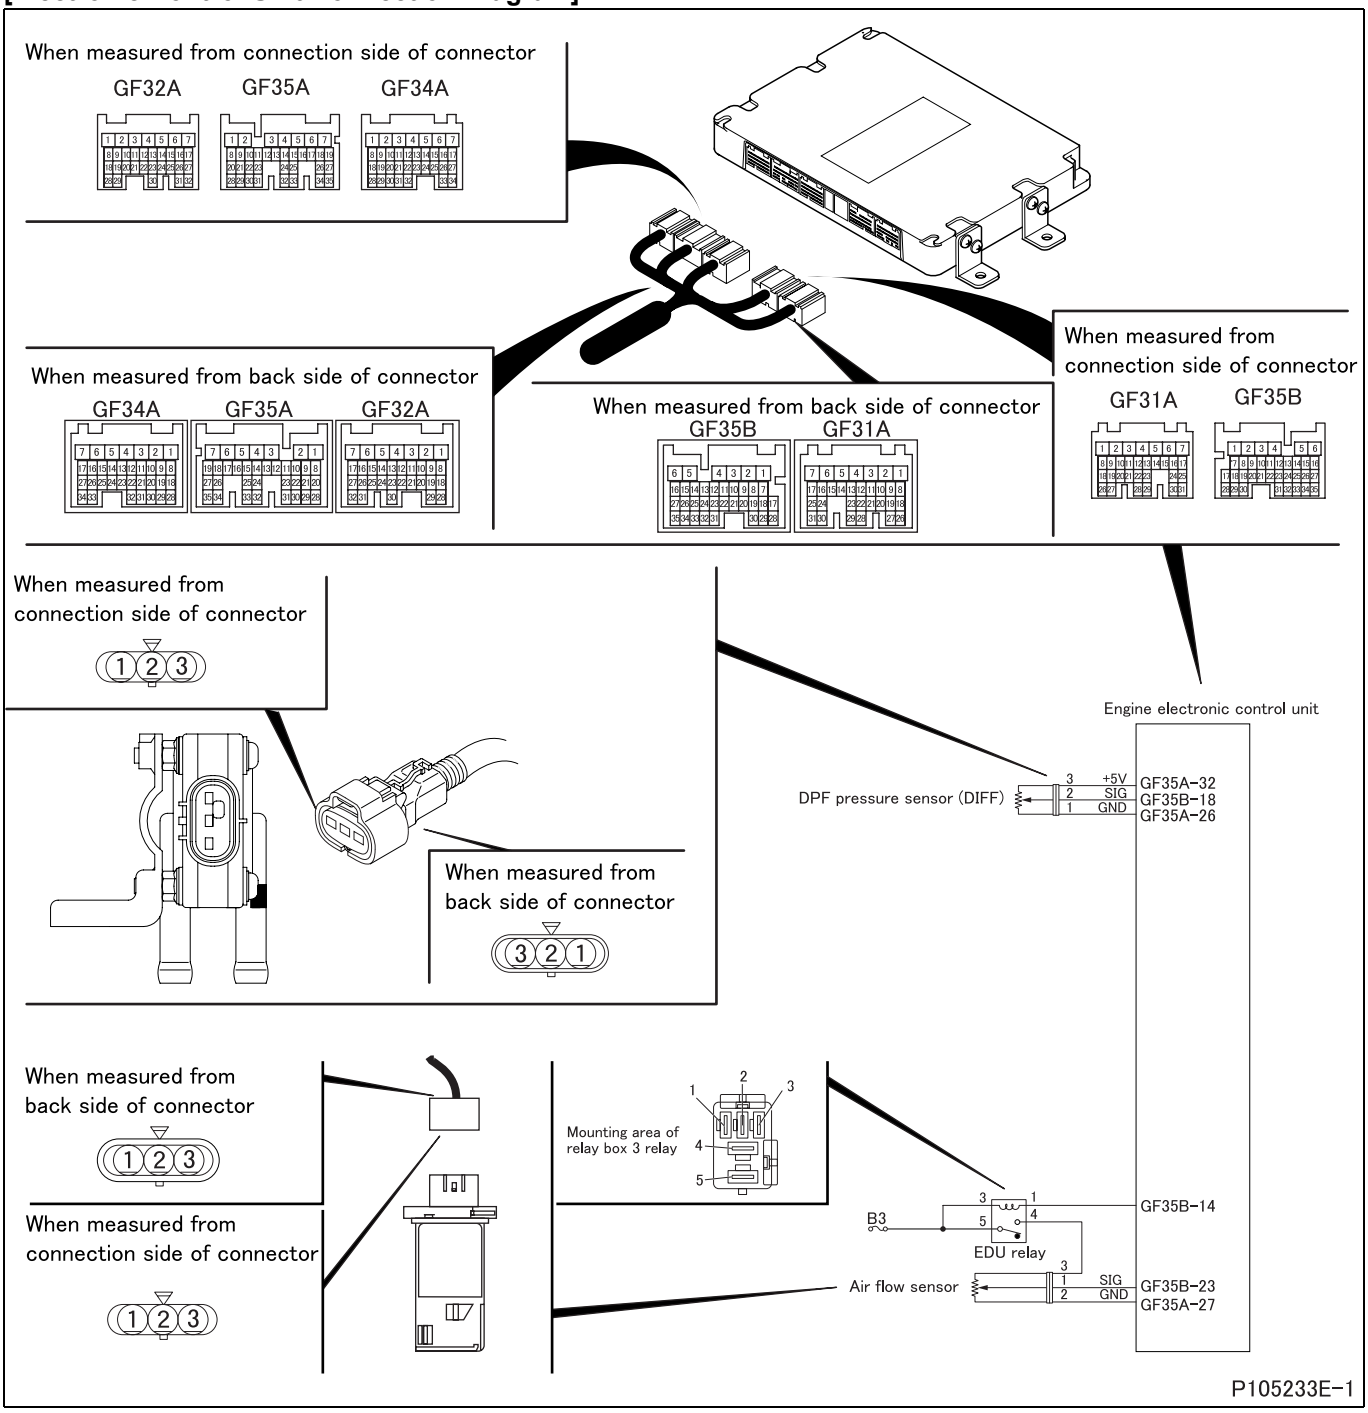
[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>
- Extinguished at 4th driving cycle after normal signal is input.

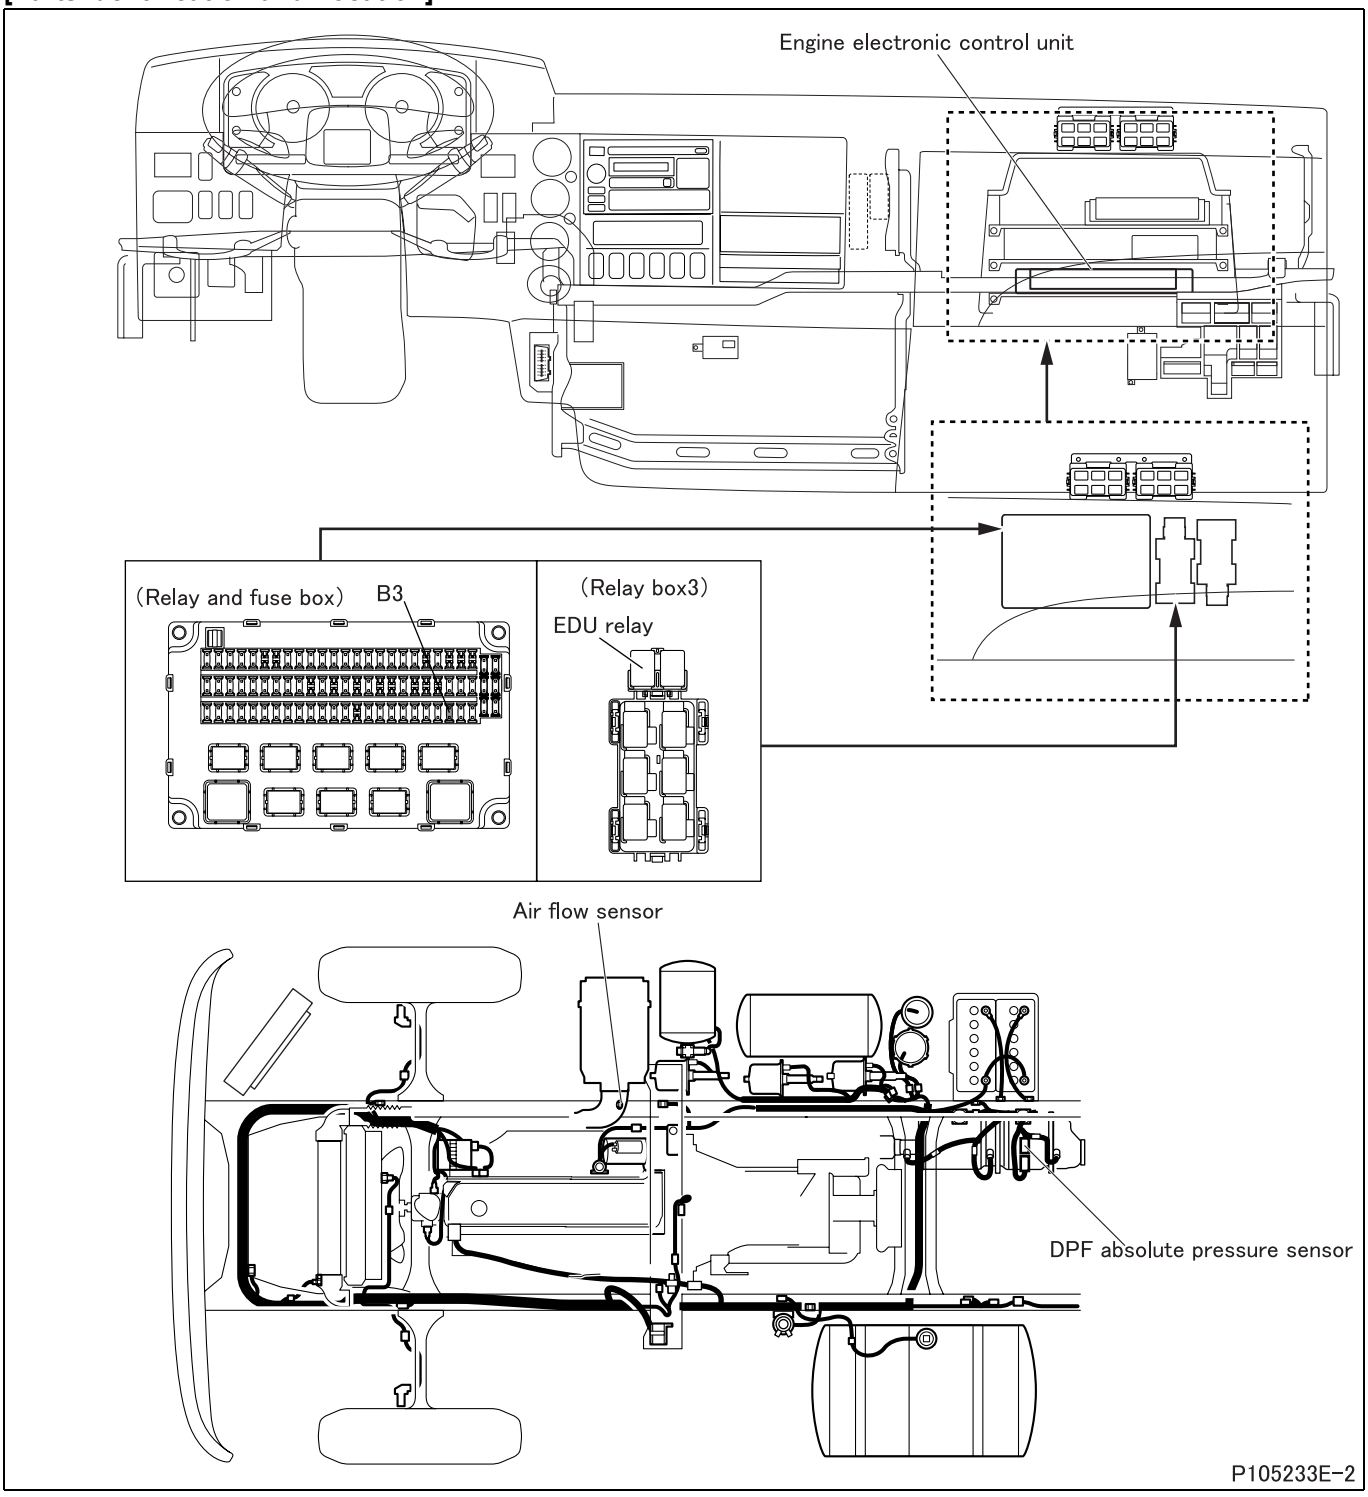
<Fault code>
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished.
  (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]

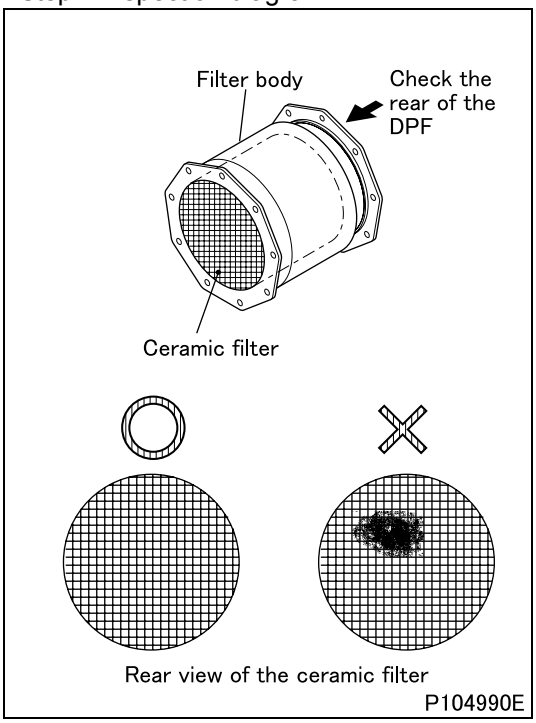


[Fault diagnosis]

Perform checks in the sequence of the following steps.

Step 1	Inspection items		Unit inspection of diesel particulate filter
	Maintenance item		Check the exhaust passage inside the diesel particulate filter for adhesion of soot in large quantity.
	Inspection condition		Remove diesel particulate filter.
	Requirements		No soot is deposited.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 2.
		NO	After replacement of ceramic filter, perform resetting the DPF-related information. (See Gr15.)

<Step 1 inspection diagram>



Step 2	Inspection items		Inspection of diesel particulate filter unit for clogging and cleaning of the diesel particulate filter unit (Perform completely.)
	Maintenance item		See Gr15 “Diesel Particulate Filter Unit Inspection for Clogging and Cleaning the Diesel Particulate Filter Unit”
	Inspection condition		Perform the following preparatory works. • Place the transmission in neutral. (place the automatic transmission in P range) • Turn the steering wheel in neutral position and securely apply the parking brake. • Turn off air conditioner not to increase the engine speed. • Check diagnosis code of each electronic control system. If any fault exists, rectify it. • Resetting the DPF-related information (perform “History reset” of Multi-Use Tester) (See Gr15 “Resetting the DPF-related information”.) • Warm up the engine until the engine coolant has been heated to more than 70°C {158°F}. (verify from Service Data “Engine Coolant Temperature” or “35: Water Temperature”)
	Requirements		This diagnosis code does not occur again.
	Inspection result (Is the judging standard satisfied?)	YES	End of inspection
		NO	Go to step 3.

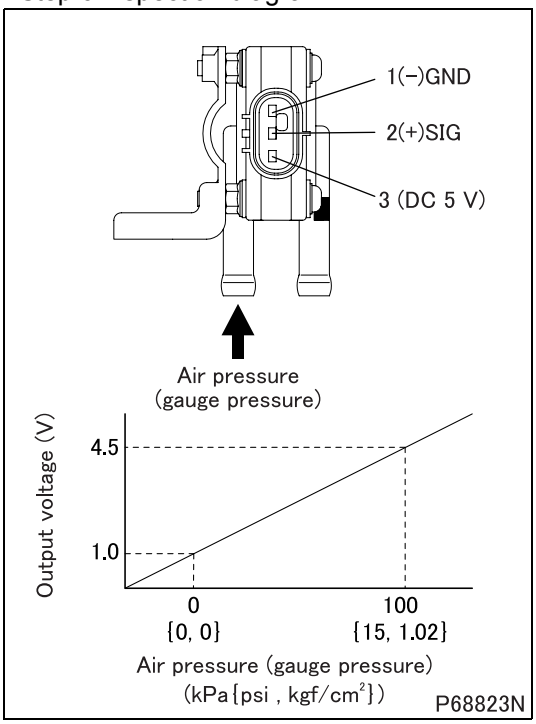
Step 3	Inspection items		Inspection by control data
	Maintenance item		Measure item No. 93 “DPF Lamp” of Service Data.
	Inspection condition		Perform Multi-Use Tester actuator test item No. A8 “DPF Lamp”.
	Requirements		Diesel particulate filter indicator lamp illuminates (automatic reset after 15 seconds)
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	Replacement of engine electronic control unit

Step 4	Inspection items		Inspection by control data
	Maintenance item		Measure item No. 75 “DPF SW” of Service Data.
	Inspection condition		–
	Requirements		Press diesel particulate filter cleaning switch and check that “DPF SW” display switches from OFF to ON.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Replacement of diesel particulate filter cleaning switch or engine electronic control unit

Step 5	Inspection items		Inspection of pressure hose
	Maintenance item		Check pressure hose of DPF absolute pressure sensor and DPF pressure sensor (DIFF) for connection and cracks.
	Inspection condition		–
	Requirements		Nothing abnormal detected
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	After correction and replacement of hose, go to step 6.

Step 6	Inspection items		Inspection of DPF pressure sensor (DIFF)
	Maintenance item		Measure value of voltage between connector terminals No. 2 (+) and 1 (–).
	Inspection condition		• Apply voltage DC 5 V across terminals No. 3 (+) and 1 (–). • Gradually increase applied air pressure.
	Requirements		• 0 ± 3.5 kPa {0 ± 0.5 psi, 0 ± 0.04 kgf/cm^2}: 1 V • 100 ± 3.5 kPa {15 ± 0.5 psi, 1.02 ± 0.04 kgf/cm^2}: 4.5 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Replacement of DPF pressure sensor (DIFF)

<Step 6 inspection diagram>



Step 7	Inspection items		Inspection of air flow sensor unit
	Maintenance item		Since inspection of single part is not easy, whether characteristics are deteriorated or not must be checked for the sensor mounted on the current vehicle by measuring and comparing the amount of sensor intake air of the sensor currently mounted on vehicle and that replaced with new one by the service data. **(1) Prepare for inspection** • Clean or replace air cleaner element. • Prepare a new air flow sensor. • Warm up the engine fully. **(2) Measure the intake air of current sensor** • Keep pressing the accelerator pedal until it bottom the stopper bolt from the idling state. (no load maximum rotation) • Measure the following items from among “Service data”. **<General Scanning Tool used>** • Engine speed: “Ne” (rpm) • Intake air flow rate: “Air Flow Rate from MAFS” (g/s) **<Multi-Use Tester used>** • Engine speed: 01 “Engine Revolution” (rpm) • Intake air flow rate: 3A “Air Flow Sensor Output” (g/hr) **(3) Measure the intake air of new sensor** • Replace the currently mounted sensor with a new sensor. • Keep pressing the accelerator pedal until it bottom the stopper bolt from the idling state. (no load maximum rotation) • Measure intake air flow at the same rpm as that of engine revolution in item (2) of “Service data”. **(4) Comparison whether characteristics are deteriorated** • Calculate the characteristics deterioration factor (%) by the following equation. • Characteristics deterioration factor (%) = (intake air of new item – current intake air) × 100/intake air of new item.
	Inspection condition		–
	Requirements		10% or less
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Replacement of air flow sensor

Step 8	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. B9 “Fuel Leak Check”.
	Inspection condition		Engine start: At idle
	Requirements		There is no leak from injectors (six).
	Inspection result (Is the judging standard satisfied?)	YES	• Inspection of exhaust gas recirculation system (exhaust gas recirculation pipe, exhaust gas recirculation cooler, exhaust gas recirculation valve) • Inspection of engine
		NO	Replacement of injector

[Fault code]
Diagnosis code: P1442/Flash code: 92
[Monitor]
Failure of automatic diesel particulate filter regeneration
[Fault (outline)]
Improperly performed automatic regeneration of diesel particulate filter
[Diagnosis check]
- Automatic regeneration is diagnosed as abnormal based on frequency of occurrence of diagnosis codes related to automatic DPF regeneration (P1412 to P1415).

[Code generation condition]
- Diagnose code (P1412 to P1415) occurs the specified number of times.
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal

[Control effected by electronic control unit during fault]
- Automatic diesel particulate filter regeneration is stopped.

[Probable cause of trouble]
- When any other diagnosis code is displayed, inspect for abnormality in engine control first because the code is caused by that problem.
- Engine oil level abnormal
- Abnormality of air tube
- Abnormality of exhaust shutter driving hose
- Abnormality of reducing valve
- Abnormality of exhaust shutter
- Abnormality of air flow sensor
- Diesel particulate filter unit (clogged)

[Recoverability]
<Control during fault>
- Recovered if manual diesel particulate filter regeneration normally ends.

<Fault code>
- To erase, execute Memory Clear.

[Fault code]
Diagnosis code: P1443/Flash code: 92
[Monitor]
Failure of manual diesel particulate filter regeneration (long-lasting abnormality)
[Fault (outline)]
Failed manual diesel particulate filter regeneration
[Diagnosis check]
- Manual regeneration is diagnosed as abnormal based on frequency of occurrence of diagnosis codes related to manual DPF regeneration (P1412 to P1415) or time taken for manual regeneration.

[Code generation condition]
- Failure of manual diesel particulate filter regeneration (diagnosis codes (P1416 to P1418) occur) or manual regenaration lasts for 60 minutes.
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

NOTE
- **P1433 occurs simultaneously with P1416 to P1418.**

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal

[Control effected by electronic control unit during fault]
- Injection quantity is limited.
- Exhaust gas recirculation control is stopped.
- Throttle control is stopped.
- Diesel particulate filter regeneration (manual or automatic) is stopped.

[Probable cause of trouble]
- When any other diagnosis code is displayed, inspect for abnormality in engine control first because the code is caused by that problem.
- Abnormality of engine oil level
- Abnormality of air tube
- Abnormality of exhaust shutter driving hose
- Abnormality of reducing valve
- Abnormality of exhaust shutter
- Abnormality of air flow sensor
- Diesel particulate filter unit (clogged)

[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

NOTE
- **Recovery from a fault of this code requires “Resetting the DPF-related information”; troubleshooting steps on the following pages, therefore, must be completely performed.**

<Warning lamp>
- Extinguished after input of normal signal.

<Fault code>
- If code recovered to normal, automatically cleared at 40th warm up cycle after warning lamp is lit.
  (To clear as desired, erase from the memory.)

Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Fault code]
Diagnosis code: P1445/Flash code: 92
[Monitor]
Time required for automatic diesel particulate filter regeneration
[Fault (outline)]
Time-out error
[Diagnosis check]
- Total time of automatic diesel particulate filter regeneration is monitored.

[Code generation condition]
- Automatic diesel particulate filter regeneration continues beyond given time.
  (Diagnosis codes P1445 and P1446 occur simultaneously.)
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal

[Control effected by electronic control unit during fault]
- Automatic diesel particulate filter regeneration is stopped.

[Probable cause of trouble]
- When any other diagnosis code is displayed, inspect for abnormality in engine control first because the code is caused by that problem.
- Abnormality of engine oil level
- Abnormality of air tube
- Abnormality of exhaust shutter driving hose
- Abnormality of reducing valve
- Abnormality of exhaust shutter
- Abnormality of air flow sensor
- Diesel particulate filter unit (clogged)

[Recoverability]
<Control during fault>
- Recovered if manual diesel particulate filter regeneration normally ends.

<Fault code>
- To erase, execute Memory Clear.

[Fault code]
Diagnosis code: P1446/Flash code: 92
[Monitor]
Time required for automatic diesel particulate filter regeneration
[Fault (outline)]
Abnormal number of time-out error occurrences
[Diagnosis check]
- Duration of automatic diesel particulate filter regeneration is monitored.

[Code generation condition]
- Automatic diesel particulate filter regeneration continues beyond given time.
  (Diagnosis codes P1445 and P1446 occur simultaneously.)
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal

[Control effected by electronic control unit during fault]
- Automatic diesel particulate filter regeneration is stopped.

[Probable cause of trouble]
- When any other diagnosis code is displayed, inspect for abnormality in engine control first because the code is caused by that problem.
- Abnormality of engine oil level
- Abnormality of air tube
- Abnormality of exhaust shutter driving hose
- Abnormality of reducing valve
- Abnormality of exhaust shutter
- Abnormality of air flow sensor
- Diesel particulate filter unit (clogged)

[Recoverability]
<Control during fault>
- Recovered if manual diesel particulate filter regeneration normally ends.

<Fault code>
- To erase, execute Memory Clear.

[Fault code]
Diagnosis code: P1464/Flash code: 55
[Monitor]
Exhaust brake blocking
[Fault (outline)]
Abnormality of exhaust brake opening
[Diagnosis check]
- Exhaust shutter valve opening is monitored during automatic diesel particulate filter regeneration.
  (Fault is detected for diagnosis code only with vehicle stop during automatic diesel particulate filter regeneration)

[Code generation condition]
Exhaust brake opening is determined to be abnormal if either of the following conditions is met while DPF is being automatically regenerated and exhaust shutter being used.
- Abnormally much fuel is injected.
- Engine idling speed drops.
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal

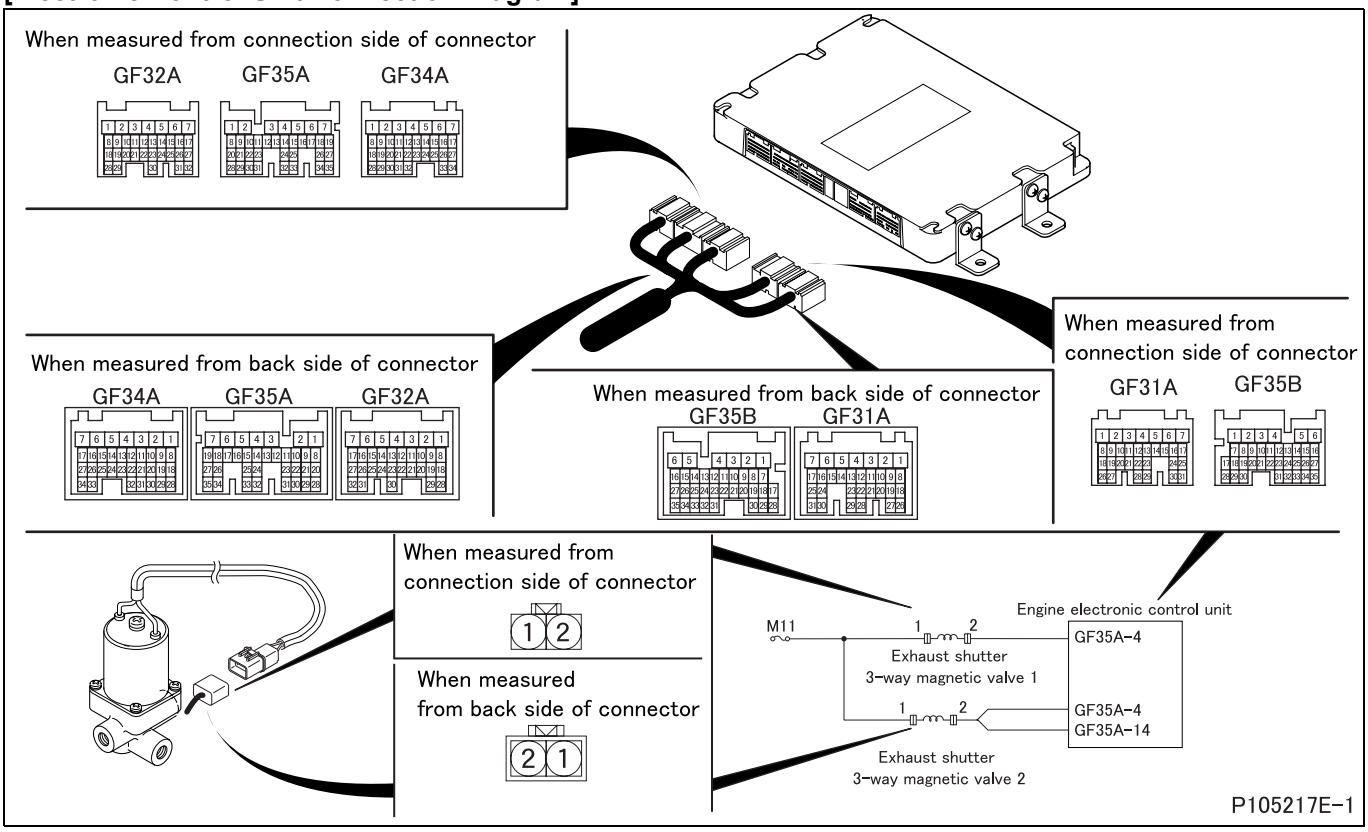
[Control effected by electronic control unit during fault]
- Automatic diesel particulate filter regeneration is stopped.

[Probable cause of trouble]
- Abnormality of exhaust shutter

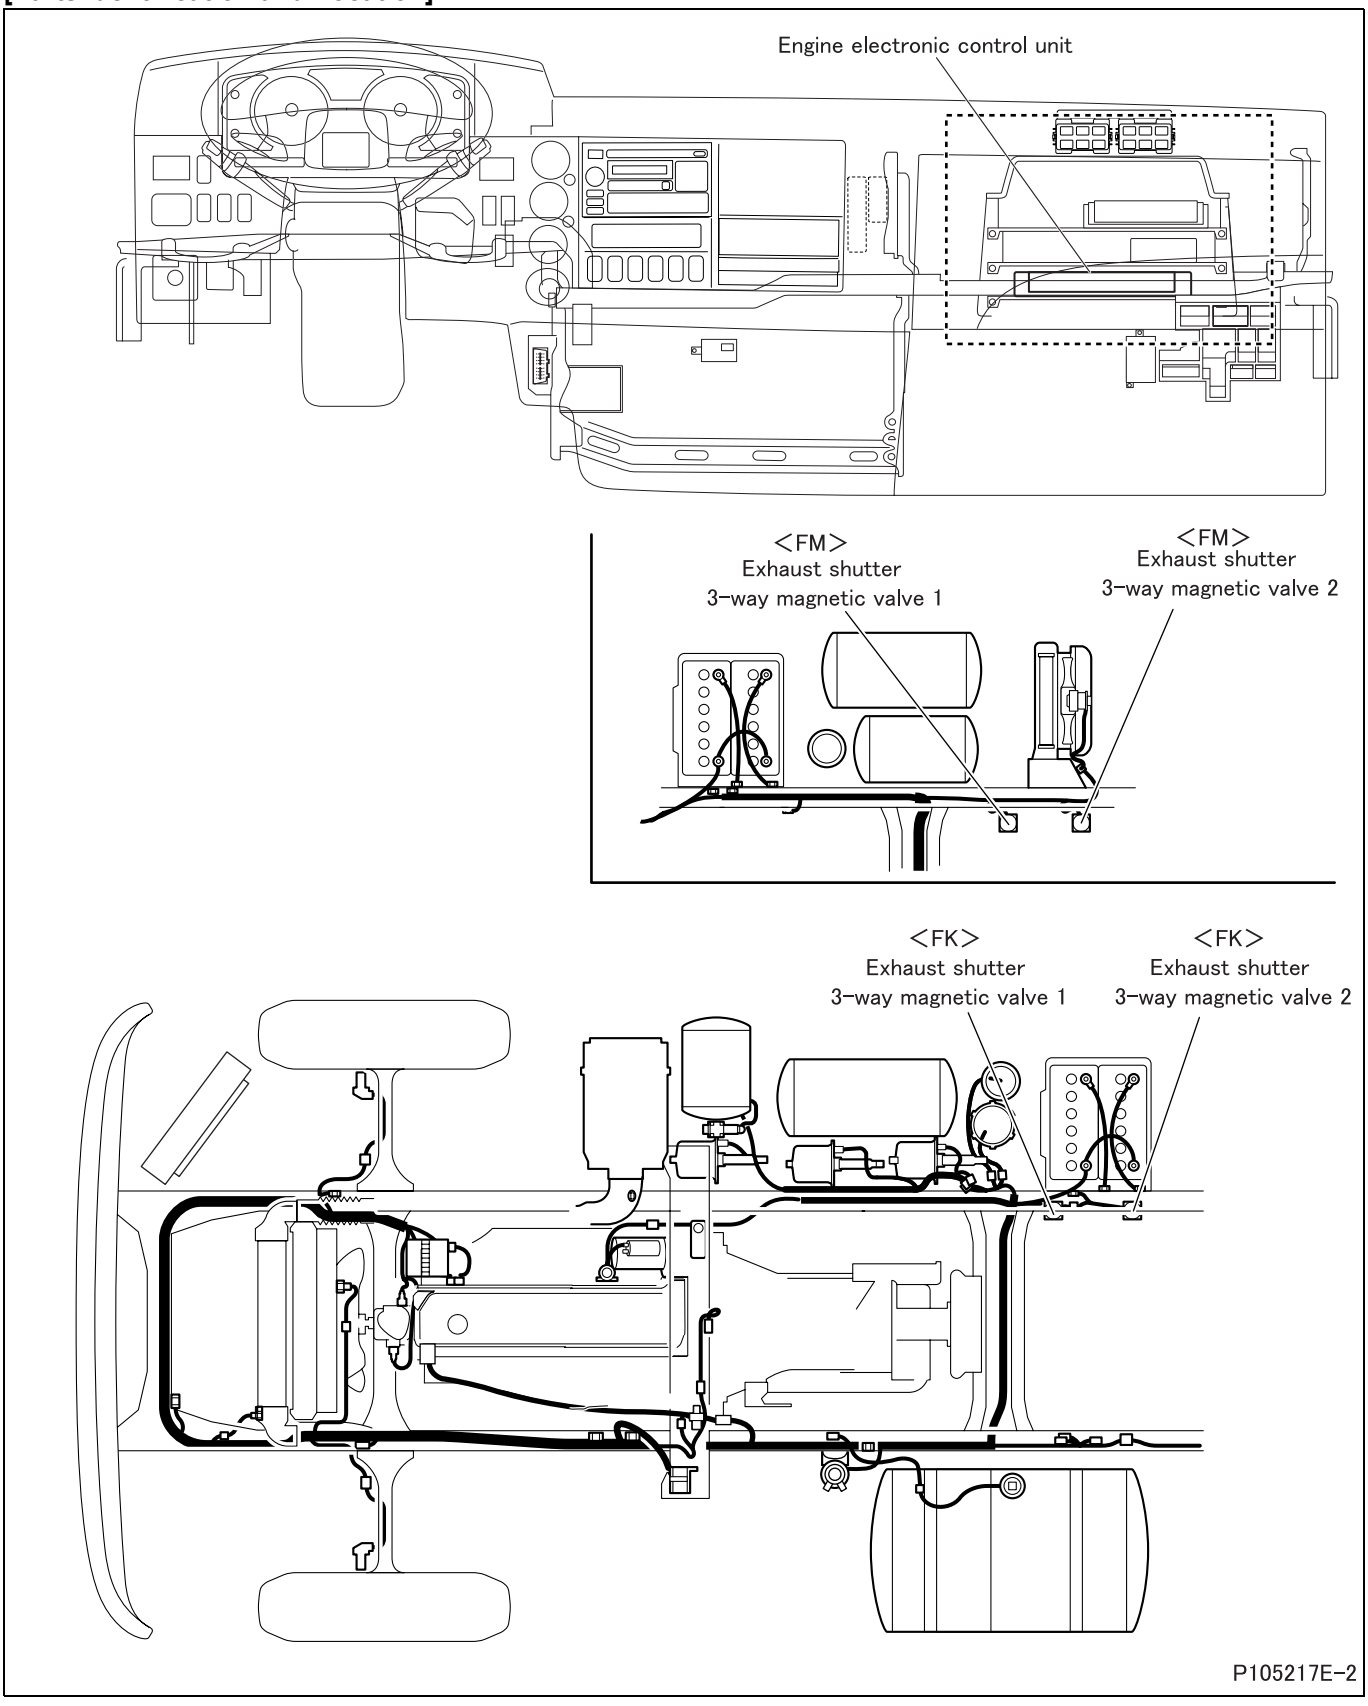
[Recoverability]
<Control during fault>
- Recovered if signal becomes normal when starter switch is turned OFF to ON (power supply resumed to electronic control unit).

<Fault code>
- To erase, execute Memory Clear.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

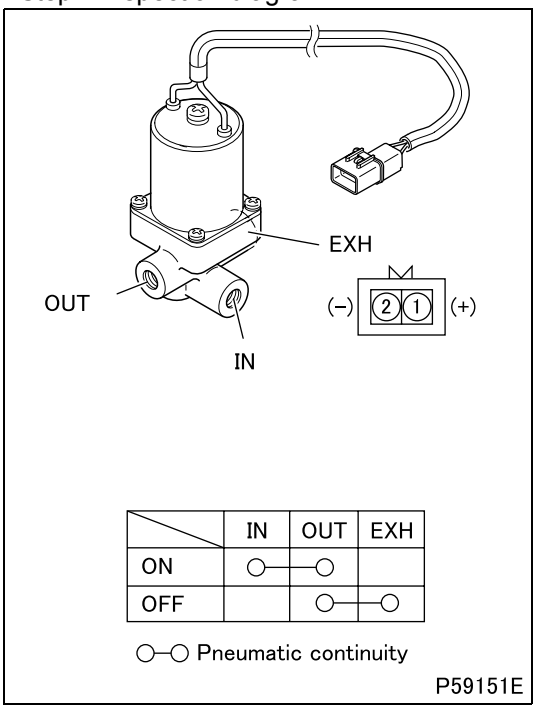
Step 1	Inspection items		Inspection by control data (Perform "■ **Inspection: Butterfly valve-to-body clearance**" before starting this inspection step. (See Gr15.))
	Maintenance item		Perform following actuator test item. • 3-Way M/V 1: No. AC "Auxiliary Brake M/V 1" • 3-Way M/V 2: No. AB "Exhaust Brake M/V1 + M/V2"
	Inspection condition		Starter switch: ON
	Requirements		3-way magnetic valve operation sound is noted (automatically reset after 6 seconds), or ON/OFF switching of Service Data: item No. 87 "Auxiliary Brake M/V1", No. 88 "Exhaust M/V" is effected.
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

Step 2	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Modify connector.

Step 3	Inspection items		Inspection of 3-way magnetic valve connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	Modify connector.

Step 4	Inspection items		Inspection of 3-way magnetic valve unit
	Maintenance item		Measure minimum operating voltage when 3-way magnetic valve operates (judge by operation sound).
	Inspection condition		Gradually increase from zero the voltage applied to terminals No. 1 (+) and 2 (–).
	Requirements		10 V or less
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Replacement of 3-way magnetic valve

<Step 4 inspection diagram>



Step 5	Inspection items		Inspection of harness between 3-way magnetic valve and electronic control unit (ground)
	Maintenance item		Check circuit between following connector terminals. • 3-way magnetic valve 1: 3-way magnetic valve 1 connector terminal No. 2 and electronic control unit connector (GF35B) terminal No. 13. • 3-way magnetic valve 2: 3-way magnetic valve 2 connector terminal No. 2 and electronic control unit connector (GF35A) terminal No. 4 or 14.
	Inspection condition		Disconnect electronic control unit from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Modify harness.

Step 6	Inspection items		Inspection of harness between 3-way magnetic valve and fuse (power supply)
	Maintenance item		Check circuit between following connector terminals. • 3-way magnetic valve 1: 3-way magnetic valve 1 connector terminal No. 1 and fuse (M11) • 3-way magnetic valve 2: 3-way magnetic valve 2 connector terminal No. 1 and fuse (M11)
	Inspection condition		Disconnect electronic control unit from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify harness.

Step 7	Inspection items		Inspection by control data
	Maintenance item		Perform following actuator test item. • 3-Way M/V 1: No. AC “Auxiliary Brake M/V 1” • 3-Way M/V 2: No. AB “Exhaust Brake M/V1 + M/V2”
	Inspection condition		Starter switch: ON
	Requirements		3-way magnetic valve operation sound is noted (automatically reset after 6 seconds), or ON/OFF switching of Service Data: item No. 87 “Auxiliary Brake M/V 1”, No. 88 “Exhaust M/V” is effected.
	Inspection result (Is the judging standard satisfied?)	YES	Replacement of exhaust shutter valve
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P1474/Flash code: 92
[Monitor]
Diesel particulate filter broken
[Fault (outline)]
Excessive Delta Pressure
[Diagnosis check]
- Pressure difference between before and after ceramic filter is monitored by DPF pressure sensor (DIFF) for clogging of ceramic filter.

[Code generation condition]
- Pressure difference between before and after ceramic filter remains under –30 kPa {–4 psi, –0.3 kgf/cm^2} for approx. 10 seconds.
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal
- Engine in operation

[Control effected by electronic control unit during fault]
- Injection quantity is limited.
- Exhaust gas recirculation control is stopped.
- Throttle control is stopped.
- Diesel particulate filter regeneration (manual or automatic) is stopped.

[Probable cause of trouble]
- Abnormality of diesel particulate filter indicator lamp
- Abnormality of diesel particulate filter cleaning switch
- Manual diesel particulate filter regeneration is not performed.
- Excessive smoke emission (due to malfunction of engine proper, common rail or exhaust gas recirculation system)
- Abnormality of air flow sensor
- Abnormality of DPF absolute pressure sensor
- Abnormality of DPF pressure sensor (DIFF)
- Abnormality of diesel particulate filter

[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>
- Extinguished after input of normal signal.

<Fault code>
- If code recovered to normal, automatically cleared at 40th warm up cycle after warning lamp is lit.
  (To clear as desired, erase from the memory.)

Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

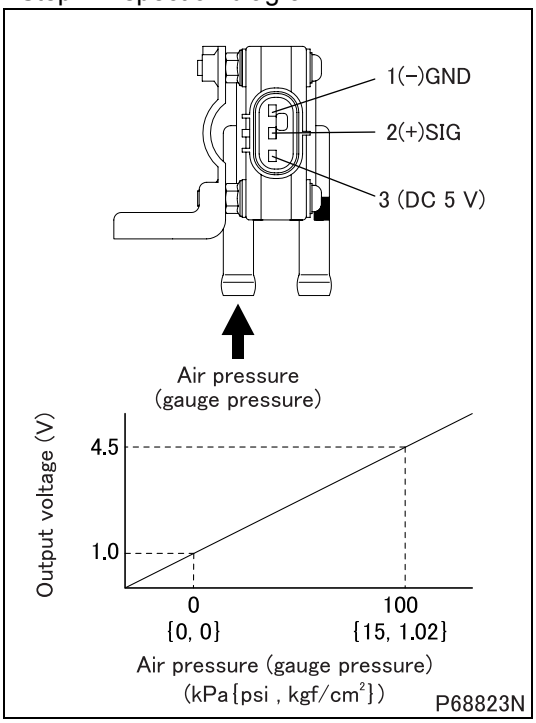
[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		Check if following diagnosis codes occur simultaneously. • P0101 Airflow Sensor (Plausibility) • P0102 Airflow Sensor (Low) • P0103 Airflow Sensor (High) • P0427 EXH Gas Temp SNSR1 (Low) • P0428 EXH Gas Temp SNSR1 (High) • P0545 DPF Temp SNSR (upstream) Low • P0546 DPF Temp SNSR (upstream) High • P1660 DPF Lamp Control Circuit (Low) • P1661 DPF Lamp Control Circuit (High) • P2032 Exhaust Gas Temp (Low) • P2033 Exhaust Gas Temp (High) • P2453 DPF Diff SNSR (Plausi) & MFF • P2454 DPF Diff SNSR (Low) & MFF • P2455 DPF Diff SNSR (High) & MFF
	Inspection condition		Ensure that each sensor mounting condition is free of abnormalities.
	Requirements		Codes occur.
	Inspection result (Is the judging standard satisfied?)	YES	After inspection of diagnosis code that is occurring, go to step 2.
		NO	Go to step 2.

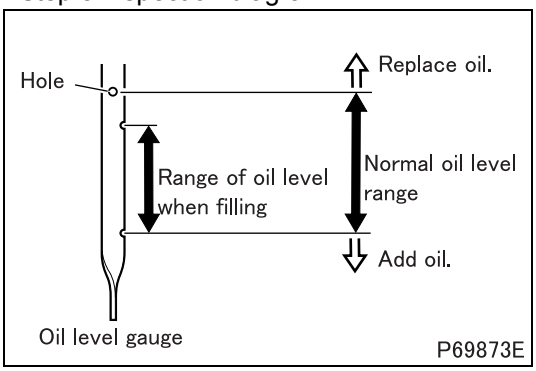
Step 2	Inspection items		Inspection of DPF pressure sensor (DIFF)
	Maintenance item		Measure value of voltage between connector terminals No. 2 (+) and 1 (–).
	Inspection condition		• Apply voltage DC 5 V across terminals No. 3 (+) and 1 (–). • Gradually increase applied air pressure.
	Requirements		• 0 ± 3.5 kPa {0 ± 0.5 psi, 0 ± 0.04 kgf/cm^2}: 1 V • 100 ± 3.5 kPa {15 ± 0.5 psi, 1.02 ± 0.04 kgf/cm^2}: 4.5 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Replacement of DPF pressure sensor (DIFF)

<Step 2 inspection diagram>



Step 3	Inspection items		Inspection of oil level
	Maintenance item		Inspection of engine oil level
	Inspection condition		Engine is stopped.
	Requirements		Oil level for inspection is not exceeded.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	After replacement of oil, go to step 4.

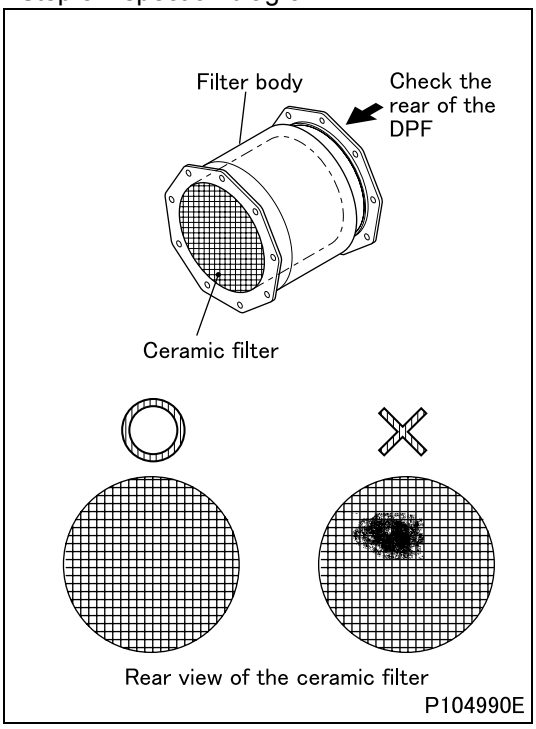
<Step 3 inspection diagram>



Step 4	Inspection items		Inspection of pressure hose
	Maintenance item		Check pressure hose of DPF absolute pressure sensor and DPF pressure sensor (DIFF) for connection and cracks.
	Inspection condition		–
	Requirements		Nothing abnormal detected
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	Correction and replacement of hose

Step 5	Inspection items		Unit inspection of diesel particulate filter
	Maintenance item		Check the exhaust passage inside the diesel particulate filter for adhesion of soot in large quantity.
	Inspection condition		Remove diesel particulate filter.
	Requirements		No soot is deposited.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	After replacement of ceramic filter, perform resetting the DPF-related information and go to step 7.

<Step 5 inspection diagram>



Step 6	Inspection items		Inspection of diesel particulate filter unit for clogging and cleaning of the diesel particulate filter unit
	Maintenance item		See Gr15 “Diesel Particulate Filter Unit Inspection for Clogging and Cleaning the Diesel Particulate Filter Unit”.
	Inspection condition		Perform following preparatory works. • Place the transmission in neutral. (place the automatic transmission in P range) • Turn the steering wheel in neutral position and securely apply the parking brake. • Turn off air conditioner not to increase the engine speed. • Check diagnosis code of each electronic control system. If any fault exists, rectify it. • Resetting the DPF-related information (perform “History reset” of Multi-Use Tester) (See Gr15 “Resetting the DPF-related information”.) • Warm up the engine until the engine coolant has been heated to more than 70°C {158°F}. (verify from Service Data “Engine Coolant Temperature” or “35: Water Temperature”)
	Requirements		This diagnosis code does not occur again.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	After replacement of electronic control unit, go to step 7

Step 7	Inspection items		Inspection of exhaust gas
	Maintenance item		Check of exhaust gas (Check whether abnormalities related to engine cause early clogging of diesel particulate filter and adhesion of soot in large quantity in outlet body of diesel particulate filter.)
	Inspection condition		Remove diesel particulate filter, each sensor, pipe and hose.
	Requirements		Exhaust gas is apparently white or black when engine is raced.
	Inspection result (Is the judging standard satisfied?)	YES	Inspect following places. • Common rail system • Exhaust gas recirculation system • Intake throttle control • Exhaust shutter • Air cleaner • Turbocharger • Boost pressure • Compression Pressure
		NO	End of inspection (Be sure to erase diagnosis codes after the end of inspection as engine warning lamp may illuminate by diagnostic function when sensors installed on diesel particulate filter are removed.)

[Fault code]
Diagnosis code: P1632/Flash code: 95
[Monitor]
Abnormality in controller area network 2 communication (exhaust gas recirculation electronic drive unit 1)
[Fault (outline)]
Message timeout
[Diagnosis check]
- Controller area network communication between engine electronic control unit and exhaust gas recirculation electronic drive unit 1 is monitored for abnormality.

[Code generation condition]
- No controller area network signals from exhaust gas recirculation electronic drive unit 1 are received for more than 6 seconds.
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal
- Controller area network 2 communication in order

[Control effected by electronic control unit during fault]
- Injection quantity is limited.
- Exhaust gas recirculation control is stopped.
- Throttle control is stopped.
- Diesel particulate filter regeneration (manual or automatic) is stopped.

[Probable cause of trouble]
- Open-circuit or short-circuit of harness between engine electronic control unit and exhaust gas recirculation electronic drive unit 1
- Abnormality of each connector
- Abnormality of engine electronic control unit
- Abnormality of exhaust gas recirculation electronic drive unit 1
- Abnormality of controller area network resistor

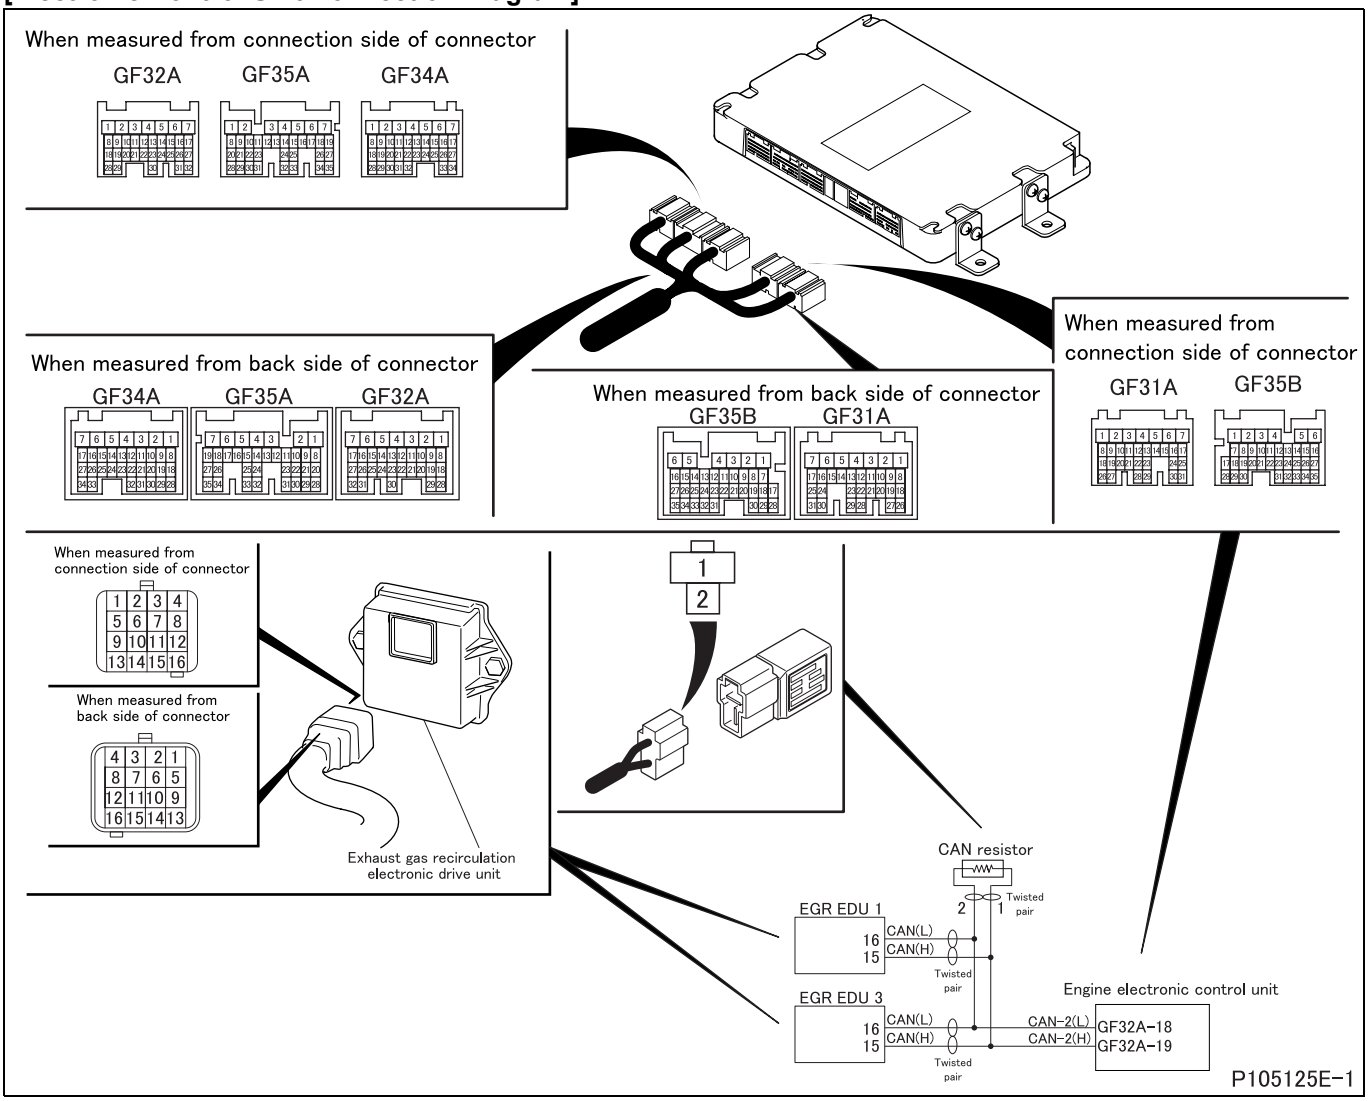
[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>
- Extinguished at 4th driving cycle after normal signal is input.

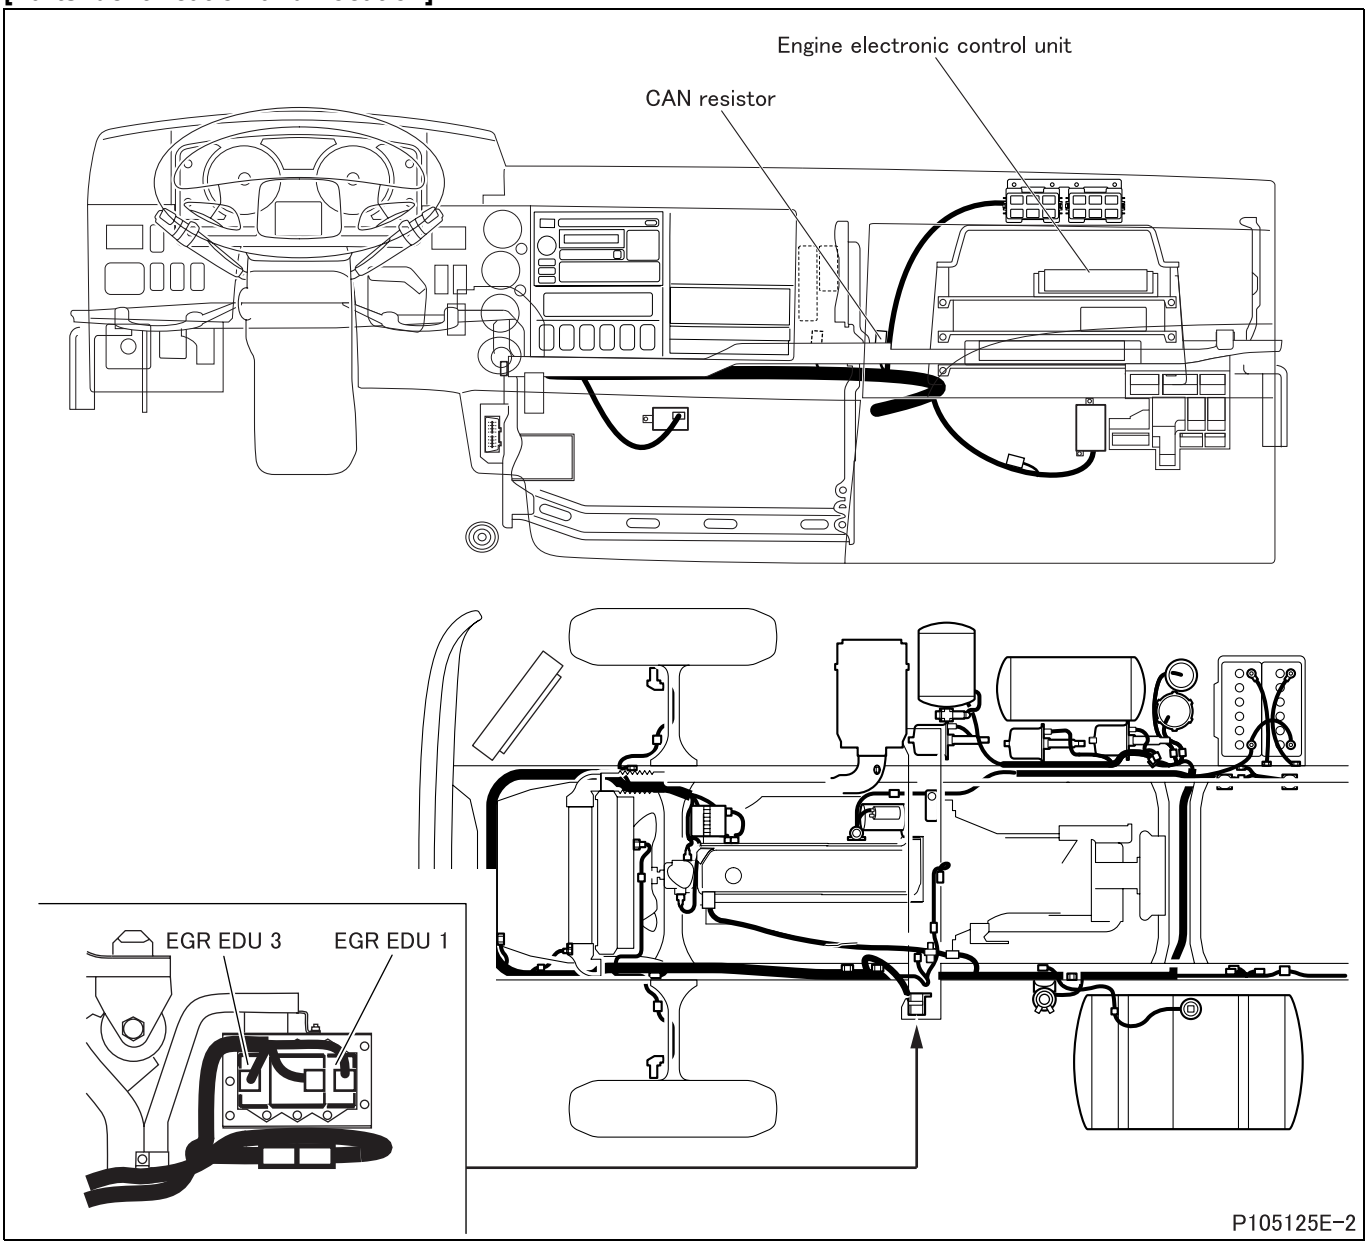
<Fault code>
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished.
  (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

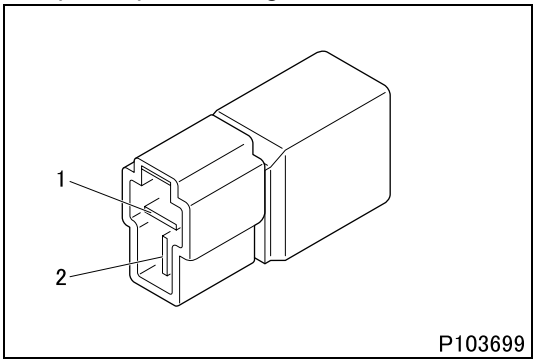
- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by engine electronic control unit connector
	Maintenance item		Measure value of resistance between engine electronic control unit connector (GF32A) terminals No. 18 and 19.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		120 ± 6 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Go to step 2.

Step 2	Inspection items		Inspection of controller area network resistor connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Modify connector.

Step 3	Inspection items		Inspection of controller area network resistor unit
	Maintenance item		Measure value of resistance between connector terminals No. 1 and 2.
	Inspection condition		Disconnect connector and measure resistor side.
	Requirements		120 ± 6 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	Replacement of controller area network resistor

<Step 3 inspection diagram>



Step 4	Inspection items		Inspection of harness between engine electronic control unit and controller area network resistor (HIGH)
	Maintenance item		Check circuit between controller area network resistor connector terminal No. 1 and engine electronic control unit connector (GF32A) terminal No. 19
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Modify harness.

Step 5	Inspection items		Inspection of harness between engine electronic control unit and controller area network resistor (LOW)
	Maintenance item		Check circuit between controller area network resistor connector terminal No. 2 and engine electronic control unit connector (GF32A) terminal No. 18
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Modify harness.

Step 6	Inspection items		Inspection of engine electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 10.
		NO	Modify connector.

Step 7	Inspection items		Inspection of harness between electronic drive unit and controller area network resistor (HIGH)
	Maintenance item		Check circuit between controller area network resistor connector terminal No. 1 and electronic drive unit connector terminal No. 15
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify harness.

Step 8	Inspection items		Inspection of harness between electronic drive unit and controller area network resistor (LOW)
	Maintenance item		Check circuit between controller area network resistor connector terminal No. 2 and electronic drive unit connector terminal No. 16
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 9.
		NO	Modify harness.

Step 9	Inspection items		Inspection of electronic drive unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Replace the engine electronic control unit as well if this diagnosis code occurs after the replacement of electronic drive unit.
		NO	Modify connector.

[Fault code]
Diagnosis code: P1634/Flash code: 95
[Monitor]
Abnormality in controller area network 2 communication (exhaust gas recirculation electronic drive unit 3)
[Fault (outline)]
Message timeout
[Diagnosis check]
- Controller area network communication between engine electronic control unit and exhaust gas recirculation electronic drive unit 3 is monitored for abnormality.

[Code generation condition]
- No controller area network signals from exhaust gas recirculation electronic drive unit 3 are received for more than 6 seconds.
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal
- Controller area network 2 communication in order

[Control effected by electronic control unit during fault]
- Injection quantity is limited.
- Exhaust gas recirculation control is stopped.
- Throttle control is stopped.
- Diesel particulate filter regeneration (manual or automatic) is stopped.

[Probable cause of trouble]
- Open-circuit or short-circuit of harness between engine electronic control unit and exhaust gas recirculation electronic drive unit 3
- Abnormality of each connector
- Abnormality of engine electronic control unit
- Abnormality of exhaust gas recirculation electronic drive unit 3
- Abnormality of controller area network resistor

[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>
- Extinguished at 4th driving cycle after normal signal is input.

<Fault code>
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished.
  (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

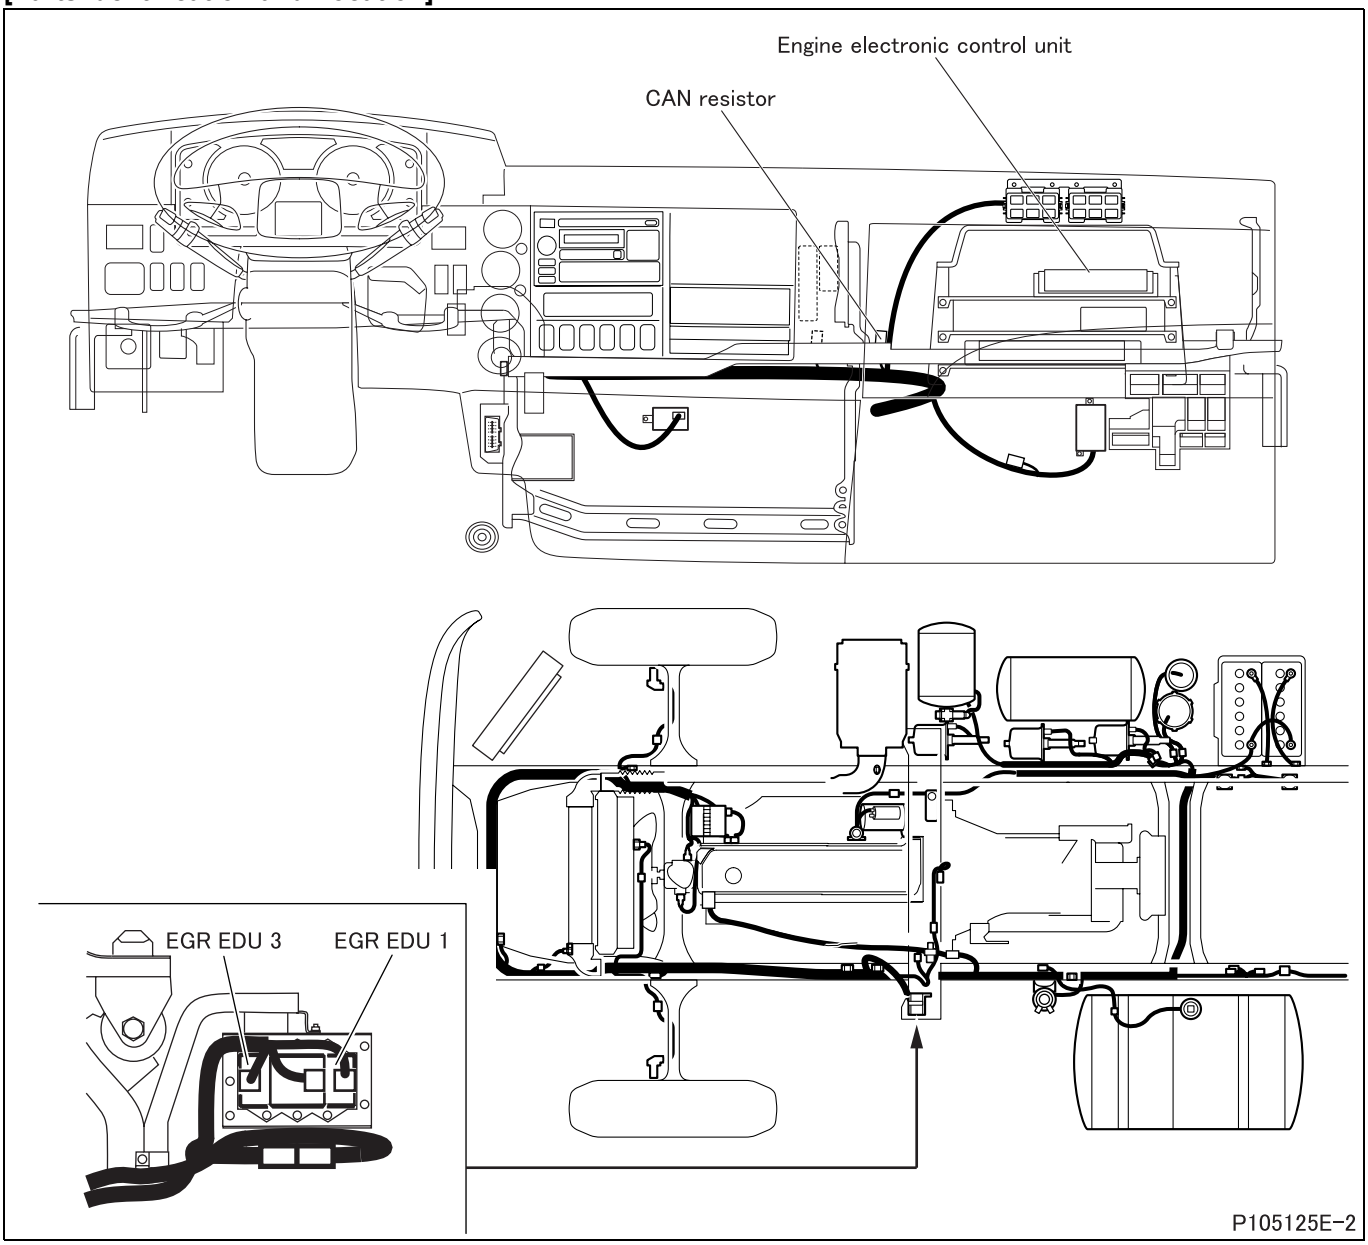
[Parts Identification and Location]



[Fault diagnosis]

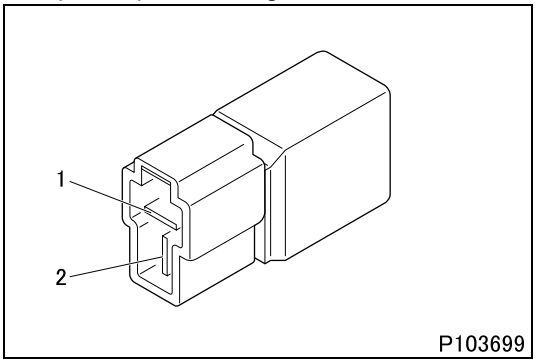
- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by engine electronic control unit connector
	Maintenance item		Measure value of resistance between engine electronic control unit connector (GF32A) terminals No. 18 and 19.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		120 ± 6 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Go to step 2.

Step 2	Inspection items		Inspection of controller area network resistor connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Modify connector.

Step 3	Inspection items		Inspection of controller area network resistor unit
	Maintenance item		Measure value of resistance between connector terminals No. 1 and 2.
	Inspection condition		Disconnect connector and measure resistor side.
	Requirements		120 ± 6 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	Replacement of controller area network resistor

<Step 3 inspection diagram>



Step 4	Inspection items		Inspection of harness between engine electronic control unit and controller area network resistor (HIGH)
	Maintenance item		Check circuit between controller area network resistor connector terminal No. 1 and engine electronic control unit connector (GF32A) terminal No. 19
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Modify harness.

Step 5	Inspection items		Inspection of harness between engine electronic control unit and controller area network resistor (LOW)
	Maintenance item		Check circuit between controller area network resistor connector terminal No. 2 and engine electronic control unit connector (GF32A) terminal No. 18
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Modify harness.

Step 6	Inspection items		Inspection of engine electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 10.
		NO	Modify connector.

Step 7	Inspection items		Inspection of harness between electronic drive unit and controller area network resistor (HIGH)
	Maintenance item		Check circuit between controller area network resistor connector terminal No. 1 and electronic drive unit connector terminal No. 15
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify harness.

Step 8	Inspection items		Inspection of harness between electronic drive unit and controller area network resistor (LOW)
	Maintenance item		Check circuit between controller area network resistor connector terminal No. 2 and electronic drive unit connector terminal No. 16
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 9.
		NO	Modify harness.

Step 9	Inspection items		Inspection of electronic drive unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Replace the engine electronic control unit as well if this diagnosis code occurs after the replacement of electronic drive unit.
		NO	Modify connector.

[Fault code]
Diagnosis code: P1635/Flash code: 96
[Monitor]
Abnormality in controller area network 2 communication (intake throttle)
[Fault (outline)]
Message timeout
[Diagnosis check]
- Controller area network communication between engine electronic control unit and throttle electronic drive unit is monitored for abnormality.

[Code generation condition]
- No controller area network signals from exhaust gas recirculation electronic drive unit are received for more than 6 seconds.
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal
- Controller area network 2 communication in order

[Control effected by electronic control unit during fault]
- Injection quantity is limited.
- Exhaust gas recirculation control is stopped.
- Throttle control is stopped.
- Diesel particulate filter regeneration (manual or automatic) is stopped.
- Fault detection for controller area network communication is stopped.

[Probable cause of trouble]
- Open-circuit or short-circuit of harness between engine electronic control unit and throttle electronic drive unit
- Abnormality of each connector
- Abnormality of engine electronic control unit
- Abnormality of throttle electronic drive unit
- Abnormality of controller area network resistor

[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>
- Extinguished at 4th driving cycle after normal signal is input.

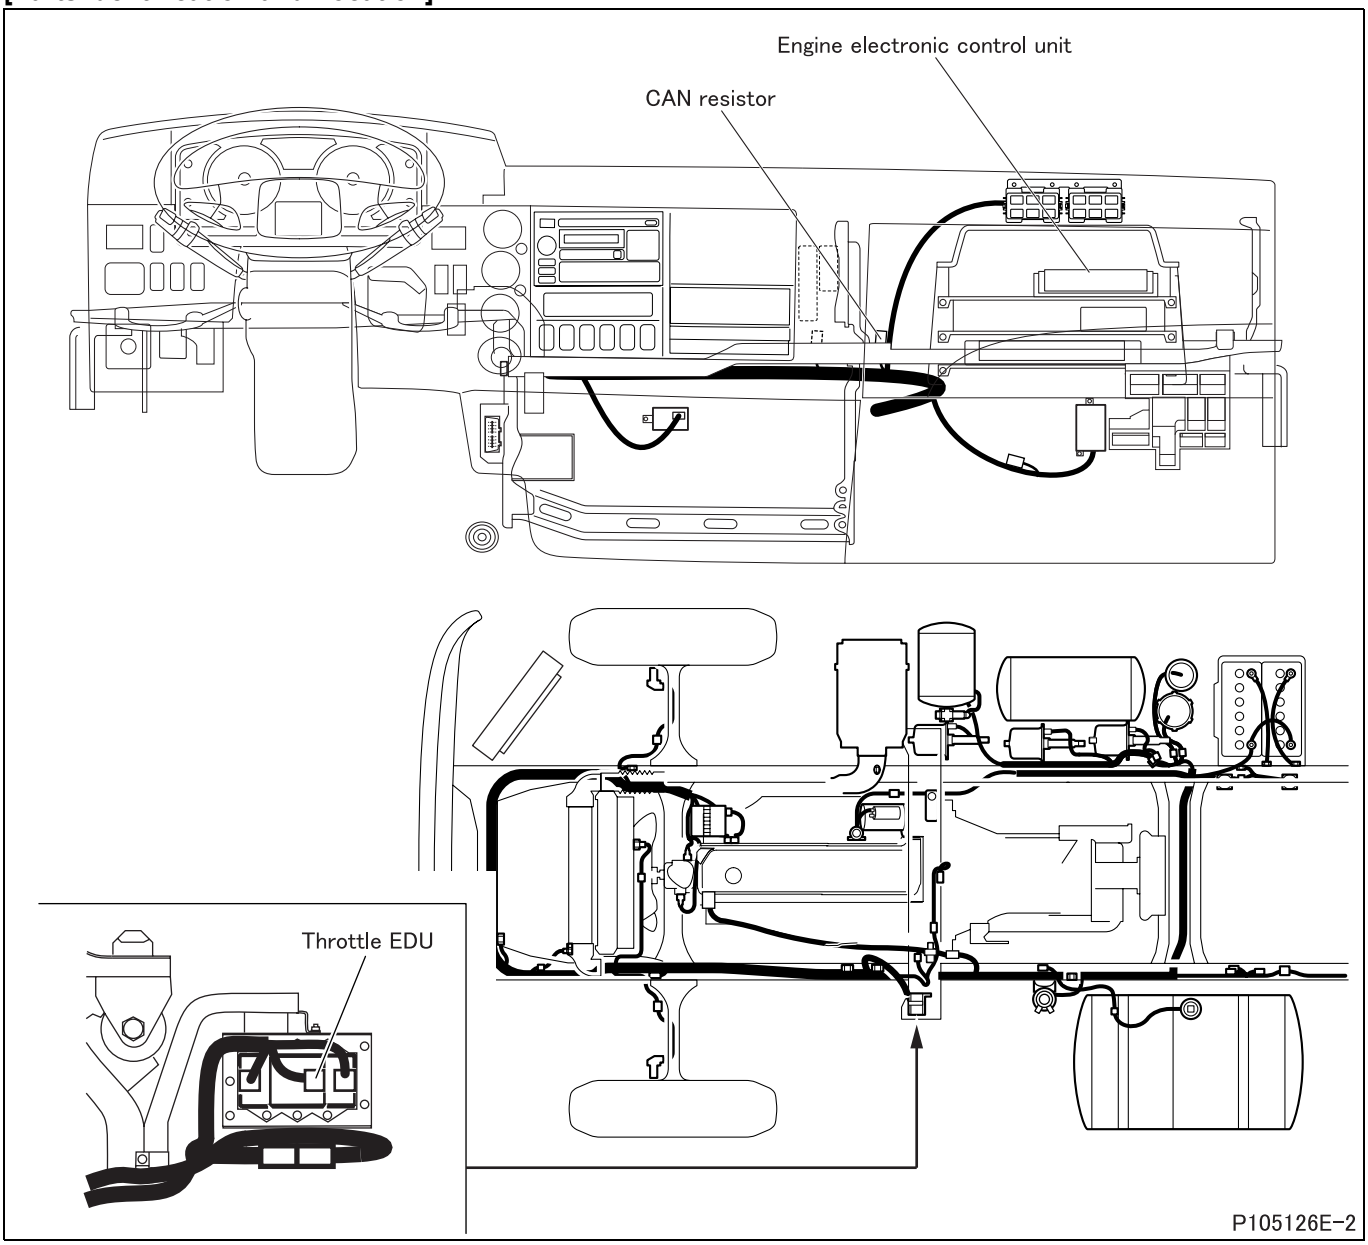
[Parts Identification and Location]



[Fault diagnosis]

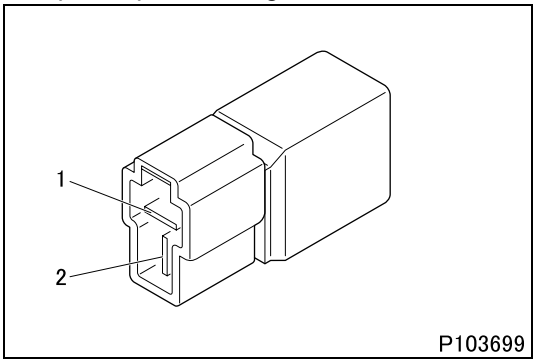
- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by engine electronic control unit connector
	Maintenance item		Measure value of resistance between engine electronic control unit connector (GF32A) terminals No. 18 and 19.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		120 ± 6 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Go to step 2.

Step 2	Inspection items		Inspection of controller area network resistor connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Modify connector.

Step 3	Inspection items		Inspection of controller area network resistor unit
	Maintenance item		Measure value of resistance between connector terminals No. 1 and 2.
	Inspection condition		Disconnect connector and measure resistor side.
	Requirements		120 ± 6 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	Replacement of controller area network resistor

<Step 3 inspection diagram>



Step 4	Inspection items		Inspection of harness between engine electronic control unit and controller area network resistor (HIGH)
	Maintenance item		Check circuit between controller area network resistor connector terminal No. 1 and engine electronic control unit connector (GF32A) terminal No. 19
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Modify harness.

Step 5	Inspection items		Inspection of harness between engine electronic control unit and controller area network resistor (LOW)
	Maintenance item		Check circuit between controller area network resistor connector terminal No. 2 and engine electronic control unit connector (GF32A) terminal No. 18
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Modify harness.

Step 6	Inspection items		Inspection of engine electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 10.
		NO	Modify connector.

Step 7	Inspection items		Inspection of harness between electronic drive unit and controller area network resistor (HIGH)
	Maintenance item		Check circuit between controller area network resistor connector terminal No. 1 and electronic drive unit connector terminal No. 15
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify harness.

Step 8	Inspection items		Inspection of harness between electronic drive unit and controller area network resistor (LOW)
	Maintenance item		Check circuit between controller area network resistor connector terminal No. 2 and electronic drive unit connector terminal No. 16
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 9.
		NO	Modify harness.

Step 9	Inspection items		Inspection of electronic drive unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Replace the engine electronic control unit as well if this diagnosis code occurs after the replacement of electronic drive unit.
		NO	Modify connector.

[Fault code]
Diagnosis code: P1660/Flash code: 29
[Monitor]
Abnormality of diesel particulate filter indicator lamp
[Fault (outline)]
- Short circuit ground
- Open circuit

[Diagnosis check]
- Diesel particulate filter indicator lamp circuit is monitored for fault. (Conformity between lamp ON command and terminal voltage is checked.)

[Code generation condition]
- Lamp is checked for lighting or otherwise when starter switch is turned ON through lamp check function in meter cluster.
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal
- Diesel particulate filter lamp ON command: not available

[Control effected by electronic control unit during fault]
- Effects no special control.

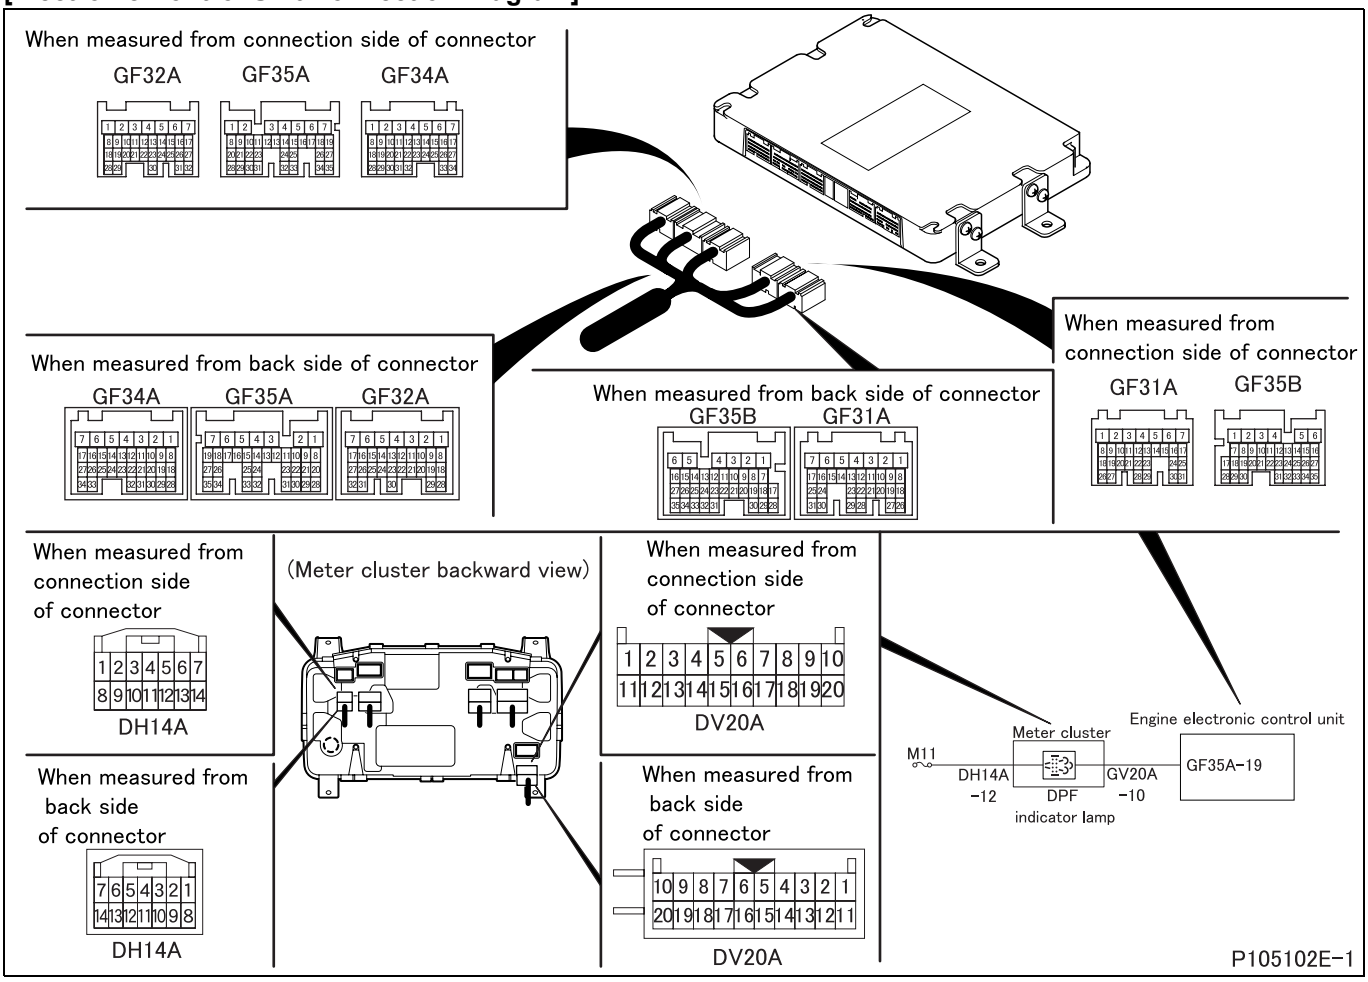
[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and diesel particulate filter indicator lamp
- Abnormality of each connector
- Abnormality of diesel particulate filter indicator lamp
- Abnormality in electronic control unit

[Recoverability]
<Control during fault>
- Not reset unless diagnosis code is erased.

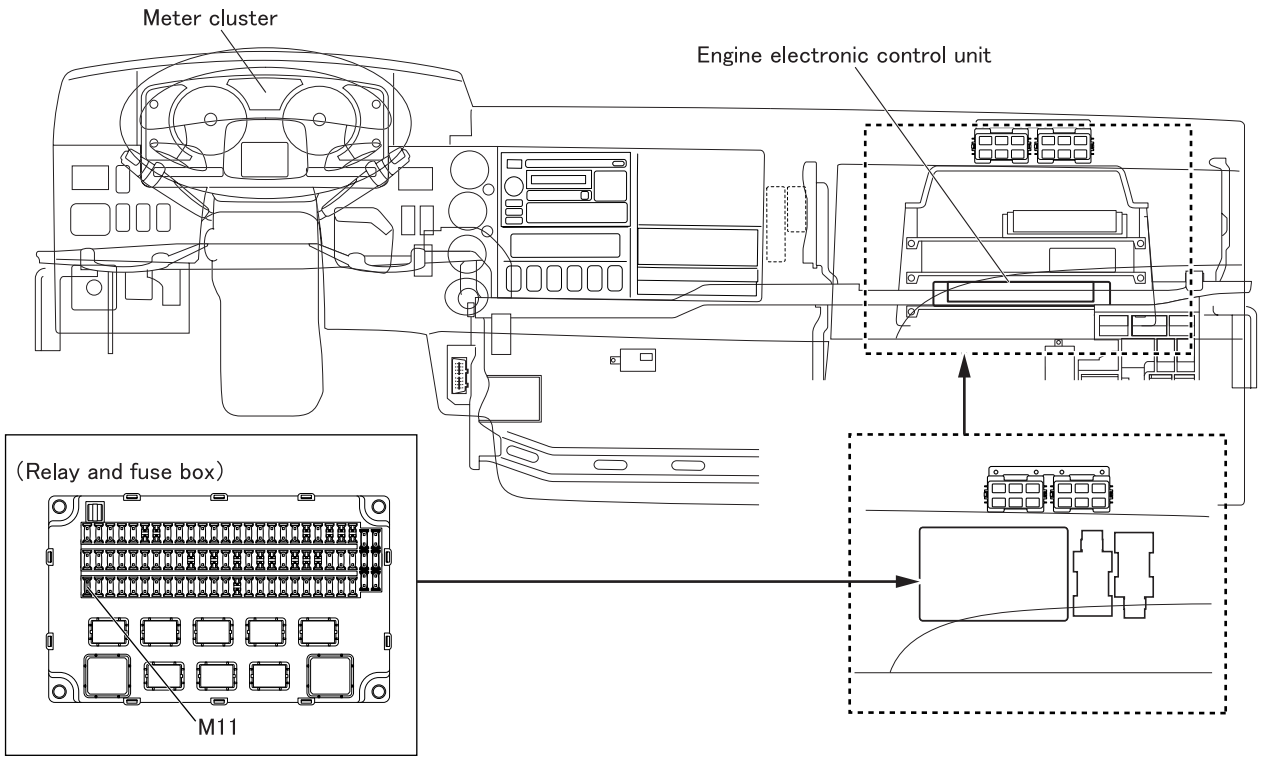
<Fault code>
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished.
  (To clear as desired, erase from the memory.)

Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		Measure item No. 93 “DPF Lamp” of Service Data.
	Inspection condition		Perform Multi-Use Tester actuator test item No. A8 “DPF Lamp”.
	Requirements		Diesel particulate filter indicator lamp lit (automatic reset after 15 seconds).
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

Step 2	Inspection items		Inspection by electronic control unit connector
	Maintenance item		Ground connector (GF35A) terminal No. 19.
	Inspection condition		It wires for the ground harness from the other side of the connector.
	Requirements		Diesel particulate filter indicator lamp illuminates.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Go to step 4.

Step 3	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	Modify connector.

Step 4	Inspection items		Inspection of harness between fuse and meter cluster
	Maintenance item		Check circuit between fuse (M11) and meter cluster connector (DH14A) terminal No. 12.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Modify harness.

Step 5	Inspection items		Inspection of harness between electronic control unit and meter cluster
	Maintenance item		Check circuit between electronic control unit connector (GF35A) terminal No. 19 and meter cluster connector (GV20A) terminal No. 10.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Modify harness.

Step 6	Inspection items		Inspection of meter cluster
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Replacement of meter cluster or lamp
		NO	Modify connector.

[Fault code]
Diagnosis code: P1661/Flash code: 29
[Monitor]
Abnormality of diesel particulate filter indicator lamp
[Fault (outline)]
- Short circuit battery
- Conformity between diesel particulate filter lamp ON command and electronic control unit terminal voltage is checked.

[Diagnosis check]
- Diesel particulate filter indicator lamp circuit is monitored for fault.

[Code generation condition]
- Lamp is checked for lighting or otherwise when starter switch is turned ON through lamp check function in meter cluster.
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON

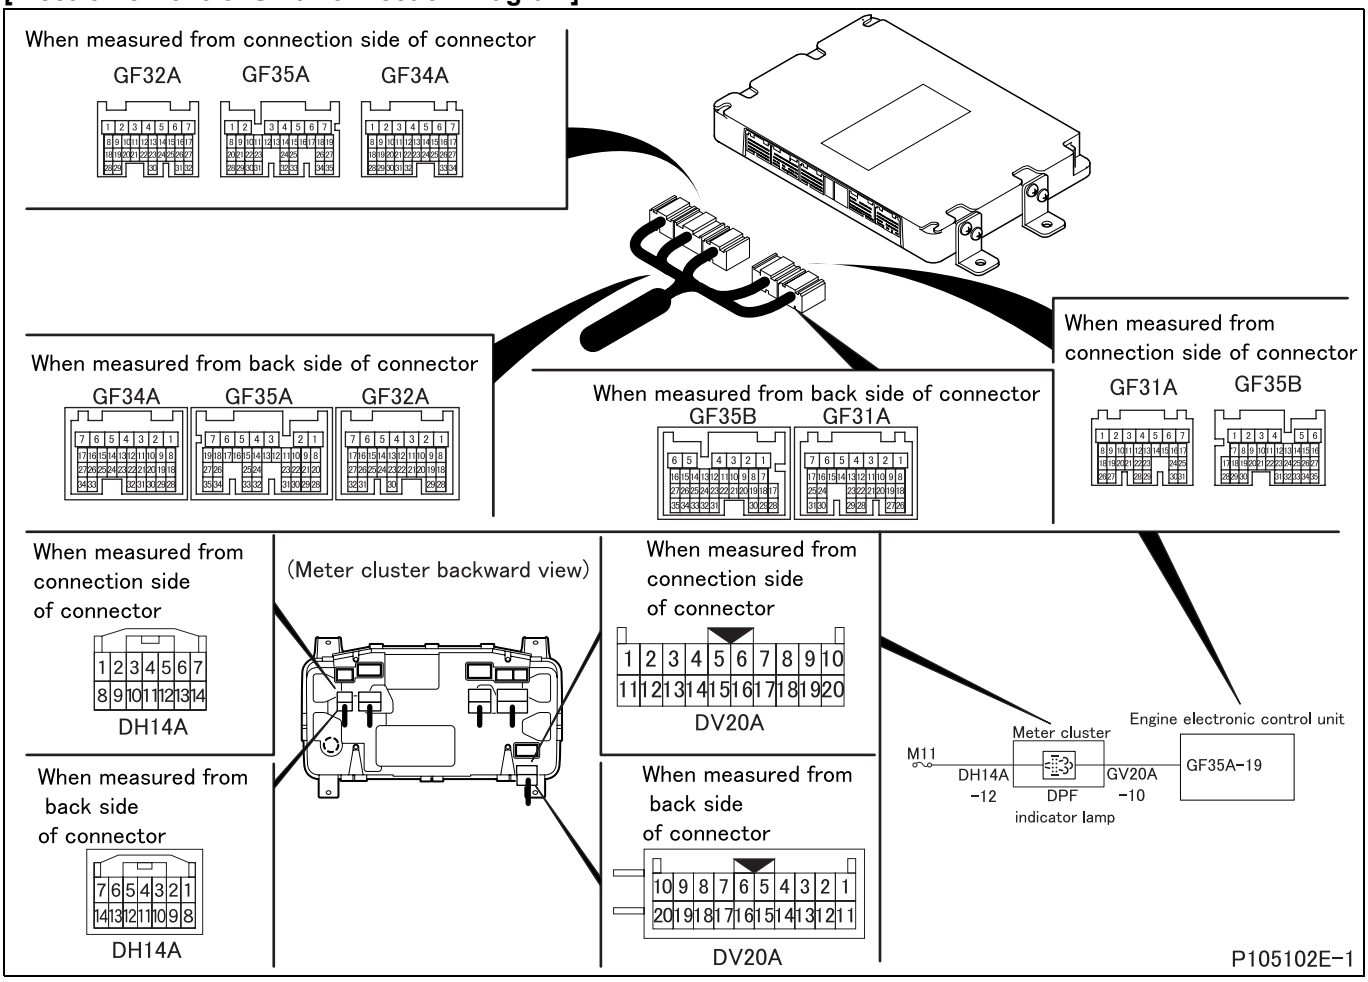
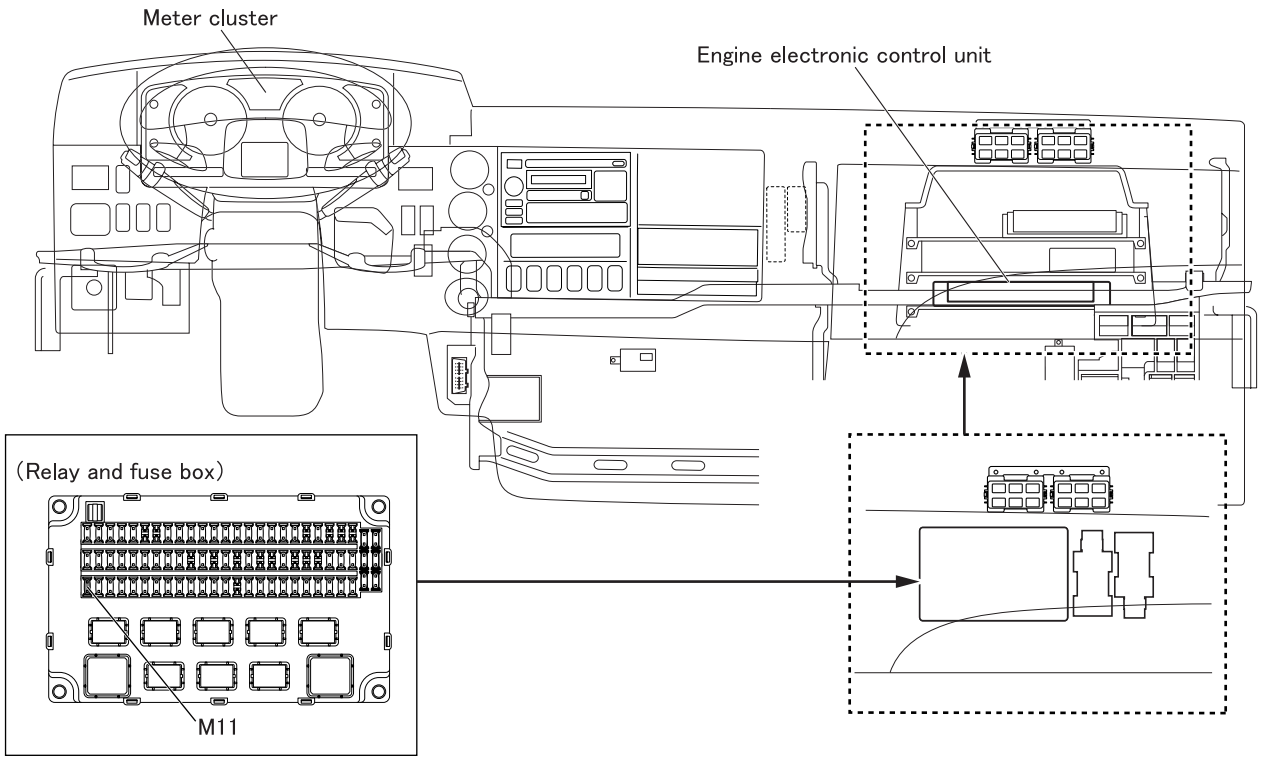
[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		Measure item No. 93 “DPF Lamp” of Service Data.
	Inspection condition		Perform Multi-Use Tester actuator test item No. A8 “DPF Lamp”.
	Requirements		Diesel particulate filter indicator lamp lit (automatic reset after 15 seconds).
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

Step 2	Inspection items		Inspection by electronic control unit connector
	Maintenance item		Ground connector (GF35A) terminal No. 19.
	Inspection condition		It wires for the ground harness from the other side of the connector.
	Requirements		Diesel particulate filter indicator lamp illuminates
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Go to step 4.

Step 3	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	Modify connector.

Step 4	Inspection items		Inspection of harness between fuse and meter cluster
	Maintenance item		Check circuit between fuse (M11) and meter cluster connector (DH14A) terminal No. 12.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Modify harness.

Step 5	Inspection items		Inspection of harness between electronic control unit and meter cluster
	Maintenance item		Check circuit between electronic control unit connector (GF35A) terminal No. 19 and meter cluster connector (GV20A) terminal No. 10.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Modify harness.

Step 6	Inspection items		Inspection of meter cluster
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Replacement of meter cluster or lamp
		NO	Modify connector.

[Fault code]
Diagnosis code: P2002/Flash code: 92
[Monitor]
Diesel particulate filter broken
[Fault (outline)]
Excessive delta pressure
[Diagnosis check]
- Pressure value calculated based on outputs from DPF pressure sensor (DIFF) is compared to that obtained from exhaust gas flow to judge if diesel particulate filter is broken or not.

[Code generation condition]
- Deviation remains less than specified limits for approx. 30 seconds.
  (Warning lamp is lit and diagnosis code is displayed on second establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- Exhaust gas recirculation flow rate: more than 1000 m^3/hr
- Intake air temperature sensor 2: normal in output signal
- Catalytic temperature sensor: normal in output signal
- Air flow sensor: normal in output signal
- DPF temperature sensor 1: normal in output signal
- Check of intake air temperature sensor 2: normal
- Check of DPF temperature sensor 1: normal
- Check of catalyst temperature sensor: normal

[Control effected by electronic control unit during fault]
- Effects no special control.

[Probable cause of trouble]
- Abnormality of diesel particulate filter indicator lamp
- Abnormality of diesel particulate filter cleaning switch
- Manual diesel particulate filter regeneration is not performed.
- Excessive smoke emission (due to malfunction of engine proper, common rail or exhaust gas recirculation system)
- Abnormality of air flow sensor
- Abnormality of DPF absolute pressure sensor
- Abnormality of DPF pressure sensor (DIFF)
- Abnormality of diesel particulate filter

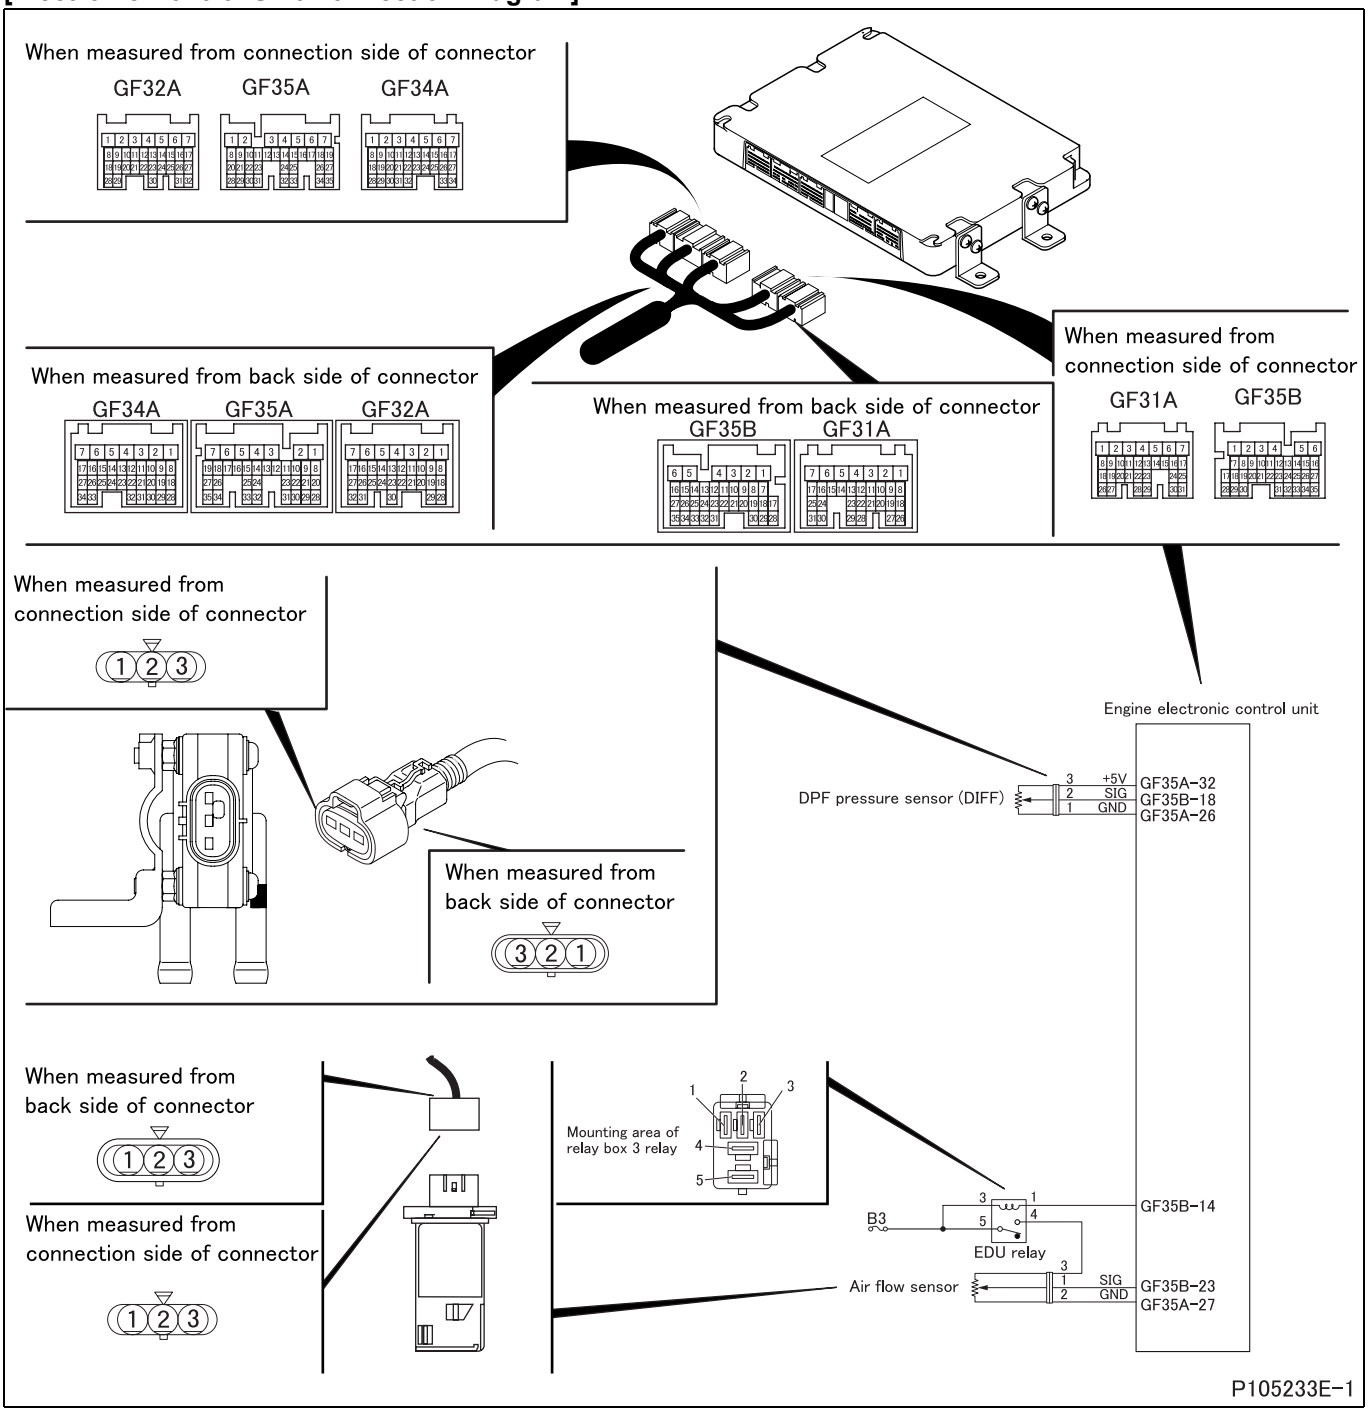
[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>
- Extinguished at 4th driving cycle after normal signal is input.

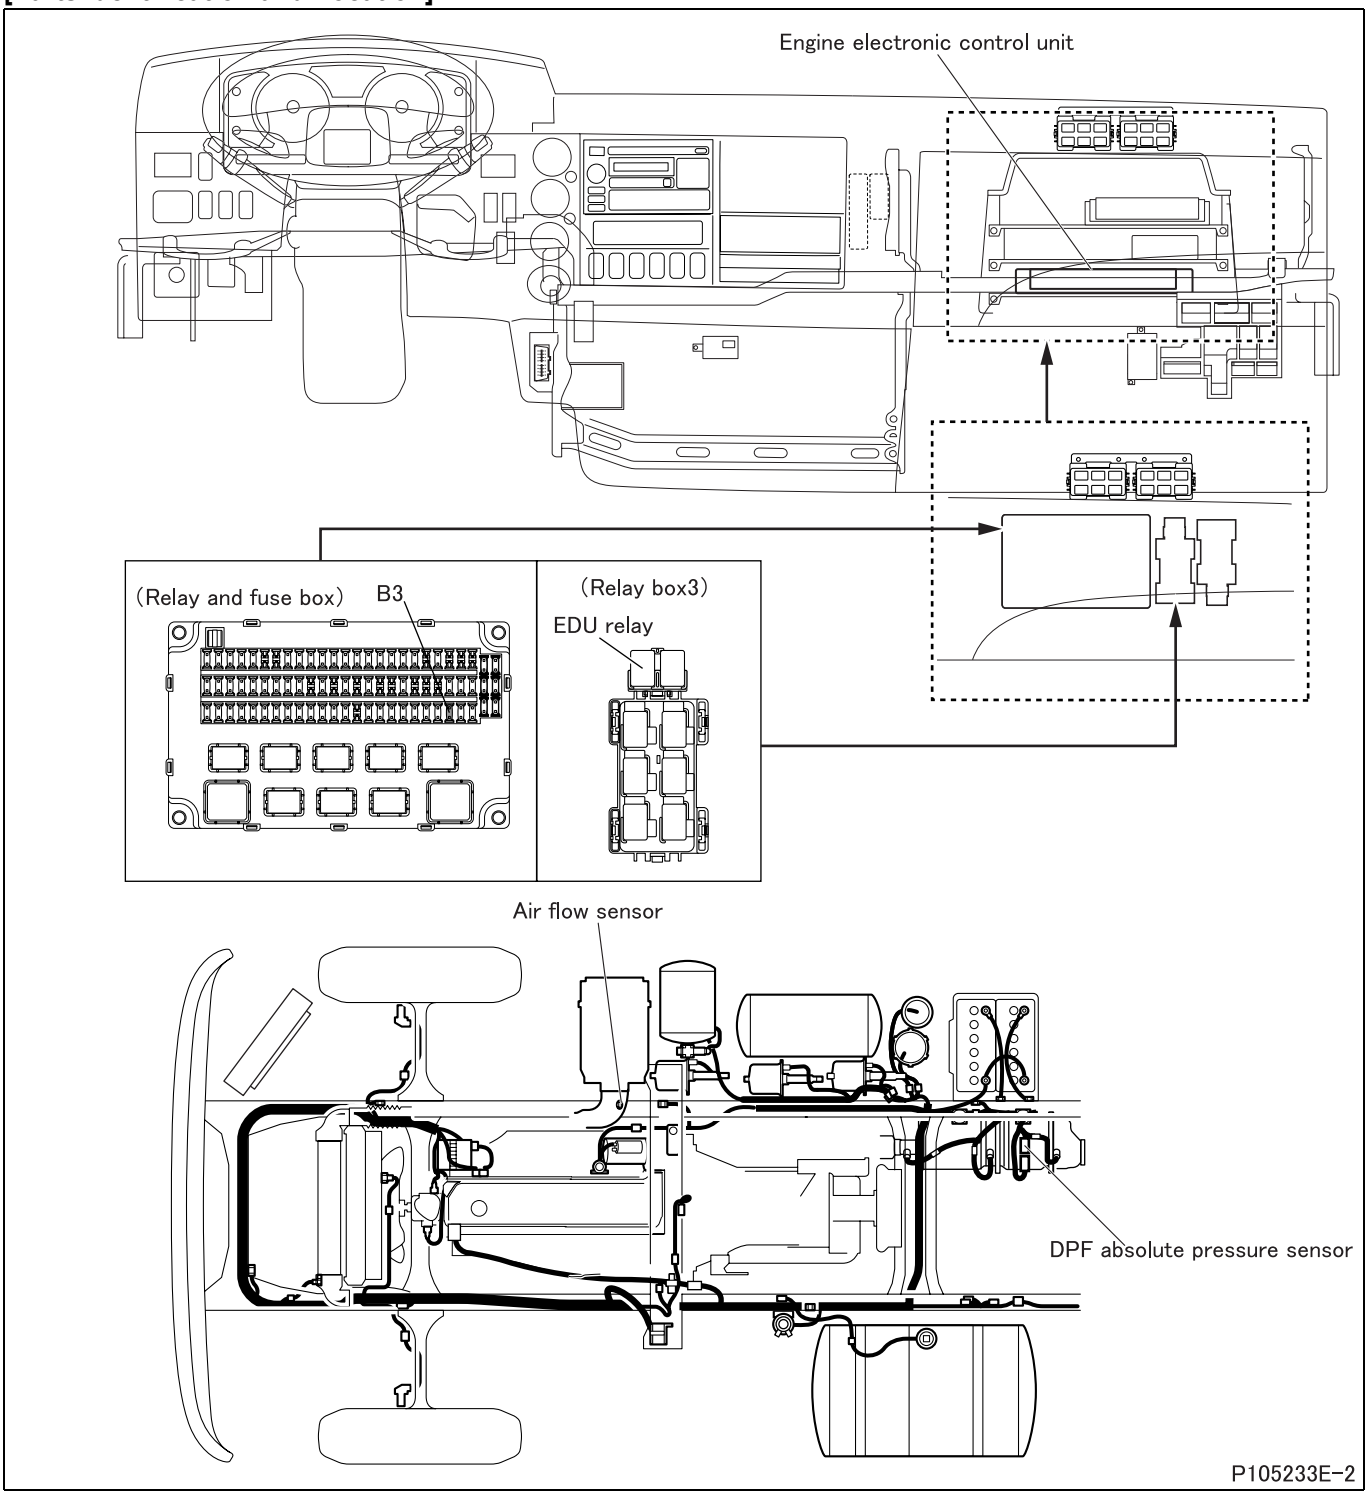
<Fault code>
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished.
  (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]

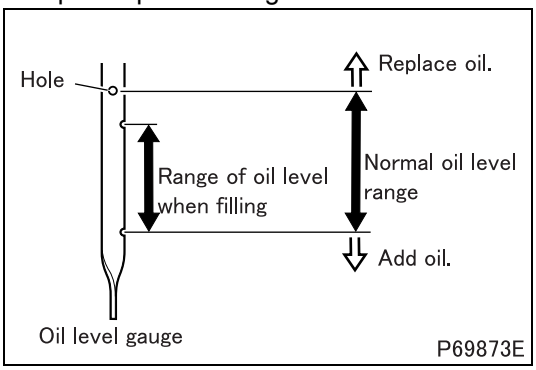


[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection of oil level
	Maintenance item		Inspection of engine oil level
	Inspection condition		Engine stopped
	Requirements		Oil level for inspection is not exceeded.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 2.
		NO	After replacement of oil, go to step 2.

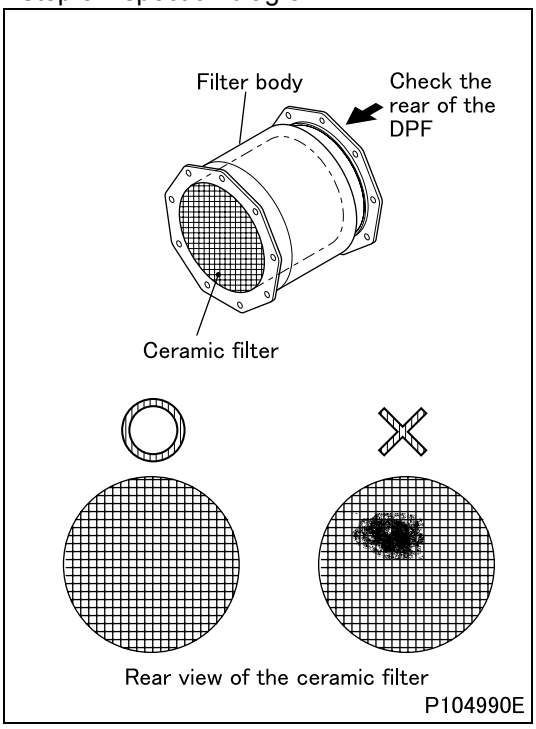
<Step 1 inspection diagram>



Step 2	Inspection items		Inspection by manual diesel particulate filter regeneration
	Maintenance item		Perform Multi-Use Tester actuator test item No. A5 “DPF Regeneration (Manual)”, and clean ceramic diesel particulate filter.
	Inspection condition		• Vehicle: stationary (vehicle speed 0 km/h {0 MPH}) • Starter switch: ON (engine started) • Engine start: At idle • Place the transmission in neutral. (place the automatic transmission in P range) • Parking brake: vehicle parked (parking brake switch: ON) • After engine warm-up
	Requirements		This diagnosis code does not occur again.
	Inspection result (Is the judging standard satisfied?)	YES	End of inspection
		NO	Go to step 3.

Step 3	Inspection items		Unit inspection of diesel particulate filter
	Maintenance item		Check the exhaust passage inside the diesel particulate filter for adhesion of soot in large quantity.
	Inspection condition		Remove diesel particulate filter.
	Requirements		No soot is deposited.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	After replacement of ceramic filter, perform resetting the DPF-related information.

<Step 3 inspection diagram>



Step 4	Inspection items		Inspection of diesel particulate filter unit for clogging and cleaning of the diesel particulate filter unit
	Maintenance item		See Gr15 “Diesel Particulate Filter Unit Inspection for Clogging and Cleaning the Diesel Particulate Filter Unit”
	Inspection condition		Perform the following preparatory works. • Place the transmission in neutral. (place the automatic transmission in P range) • Turn the steering wheel in neutral position and securely apply the parking brake. • Turn off air conditioner not to increase the engine speed. • Check diagnosis code of each electronic control system. If any fault exists, rectify it. • Resetting the DPF-related information (perform “History reset” of Multi-Use Tester) (See Gr15 “Resetting the DPF-related information”.) • Warm up the engine until the engine coolant has been heated to more than 70°C {158°F}. (verify from Service Data “Engine Coolant Temperature” or “35: Water Temperature”)
	Requirements		This diagnosis code does not occur again.
	Inspection result (Is the judging standard satisfied?)	YES	End of inspection
		NO	Go to step 5.

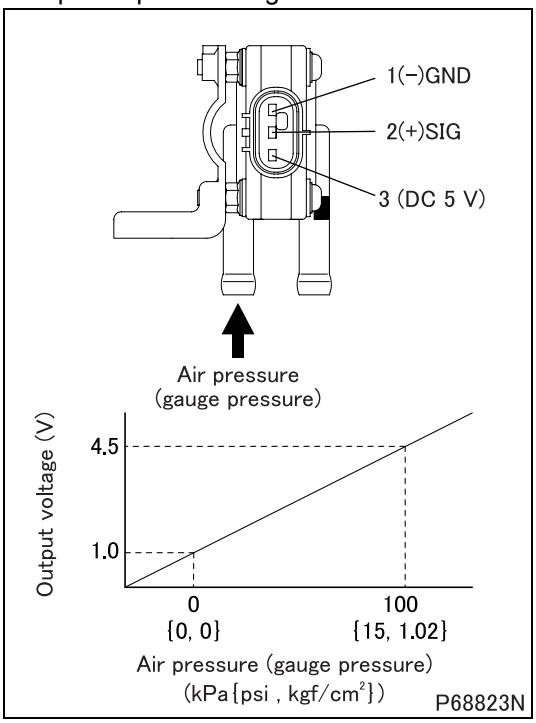
Step 5	Inspection items		Inspection by control data
	Maintenance item		Measure item No. 93 “DPF Lamp” of Service Data.
	Inspection condition		Perform Multi-Use Tester actuator test item No. A8 “DPF Lamp”.
	Requirements		Diesel particulate filter indicator lamp illuminates (automatic reset after 15 seconds)
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Replacement of engine electronic control unit

Step 6	Inspection items		Inspection by control data
	Maintenance item		Measure item No. 75 “DPF SW” of Service Data.
	Inspection condition		–
	Requirements		Press diesel particulate filter cleaning switch and check that “DPF SW” display switches from OFF to ON.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Replacement of diesel particulate filter cleaning switch or engine electronic control unit

Step 7	Inspection items		Inspection of pressure hose
	Maintenance item		Check pressure hose of DPF absolute pressure sensor and DPF pressure sensor (DIFF) for connection and cracks.
	Inspection condition		–
	Requirements		Nothing abnormal detected
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	After correction and replacement of hose, go to step 8.

Step 8	Inspection items		Inspection of DPF pressure sensor (DIFF)
	Maintenance item		Measure value of voltage between connector terminals No. 2 (+) and 1 (–).
	Inspection condition		• Apply voltage DC 5 V across terminals No. 3 (+) and 1 (–). • Gradually increase applied air pressure.
	Requirements		• 0 ± 3.5 kPa {0 ± 0.5 psi, 0 ± 0.04 kgf/cm^2}: 1 V • 100 ± 3.5 kPa {15 ± 0.5 psi, 1.02 ± 0.04 kgf/cm^2}: 4.5 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 9.
		NO	Replacement of DPF pressure sensor (DIFF)

<Step 8 inspection diagram>



Step 9	Inspection items		Inspection of air flow sensor unit
	Maintenance item		Since inspection of single part is not easy, whether characteristics are deteriorated or not must be checked for the sensor mounted on the current vehicle by measuring and comparing the amount of sensor intake air of the sensor currently mounted on vehicle and that replaced with new one by the service data. **(1) Prepare for inspection** • Clean or replace air cleaner element. • Prepare a new air flow sensor. • Warm up the engine fully. **(2) Measure the intake air of current sensor** • Keep pressing the accelerator pedal until it bottom the stopper bolt from the idling state. (no load maximum rotation) • Measure the following items from among “Service data”. **<General Scanning Tool used>** • Engine speed: “Ne” (rpm) • Intake air flow rate: “Air Flow Rate from MAFS” (g/s) **<Multi-Use Tester used>** • Engine speed: 01 “Engine Revolution” (rpm) • Intake air flow rate: 3A “Air Flow Sensor Output” (g/hr) **(3) Measure the intake air of new sensor** • Replace the currently mounted sensor with a new sensor. • Keep pressing the accelerator pedal until it bottom the stopper bolt from the idling state. (no load maximum rotation) • Measure intake air flow at the same rpm as that of engine revolution in item (2) of “Service data”. **(4) Comparison whether characteristics are deteriorated** • Calculate the characteristics deterioration factor (%) by the following equation. • Characteristics deterioration factor (%) = (intake air of new item – current intake air) × 100/intake air of new item.
	Inspection condition		–
	Requirements		10% or less
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 10.
		NO	Replacement of air flow sensor

Step 10	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. B9 “Fuel Leak Check”.
	Inspection condition		Engine start: At idle
	Requirements		There is no leak from injectors (six).
	Inspection result (Is the judging standard satisfied?)	YES	• Inspection of exhaust gas recirculation system (exhaust gas recirculation pipe, exhaust gas recirculation cooler, exhaust gas recirculation valve) • Inspection of engine
		NO	Replacement of injector

[Fault code]
Diagnosis code: P2032/Flash code: 88
[Monitor]
Abnormality of DPF temperature sensor 2
[Fault (outline)]
Low signal range check
[Diagnosis check]
- Output voltage of DPF temperature sensor 2 is monitored.

[Code generation condition]
- Voltage of DPF temperature sensor 2 remains under 0.2 V for approx. 2.5 seconds.
  (Warning lamp is lit and diagnosis code is displayed on second establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal
- Injection quantity: 50 mm^3/st or more
- Engine speed: 1200 rpm or more
- Water temperature: –7°C {19°F} or above

[Control effected by electronic control unit during fault]
- Control is carried out using backup value (200°C {392°F}).

[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and DPF temperature sensor 2
- Abnormality of each connector
- Abnormality of DPF temperature sensor 2
- Abnormality in electronic control unit

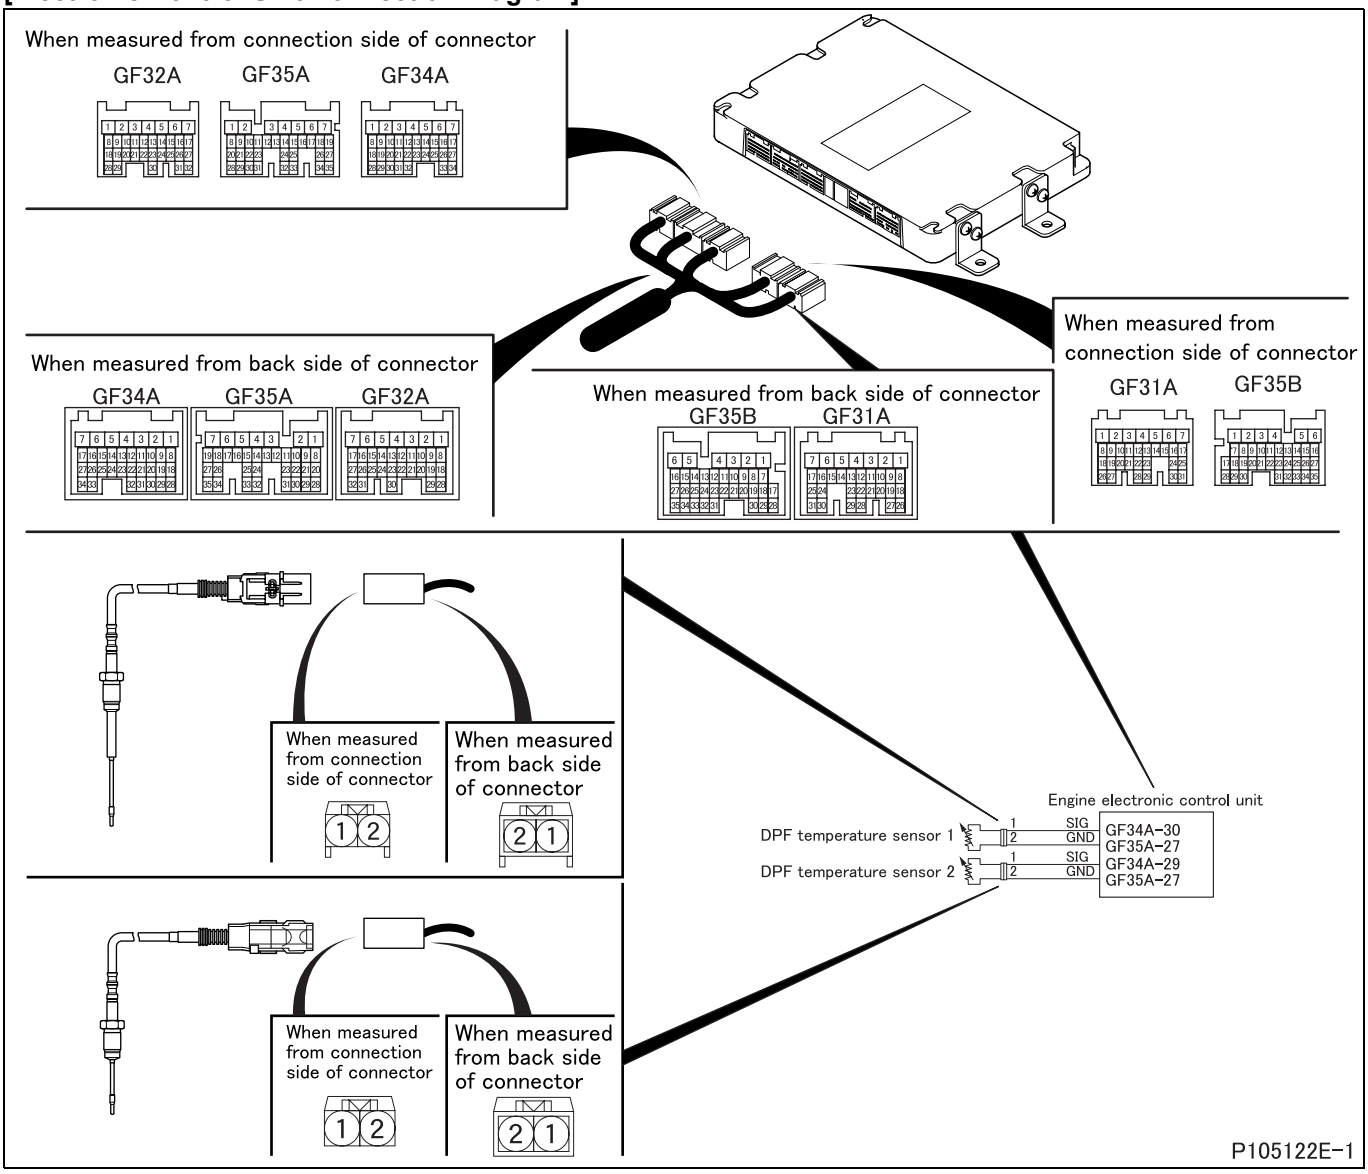
[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>
- Extinguished at 4th driving cycle after normal signal is input.

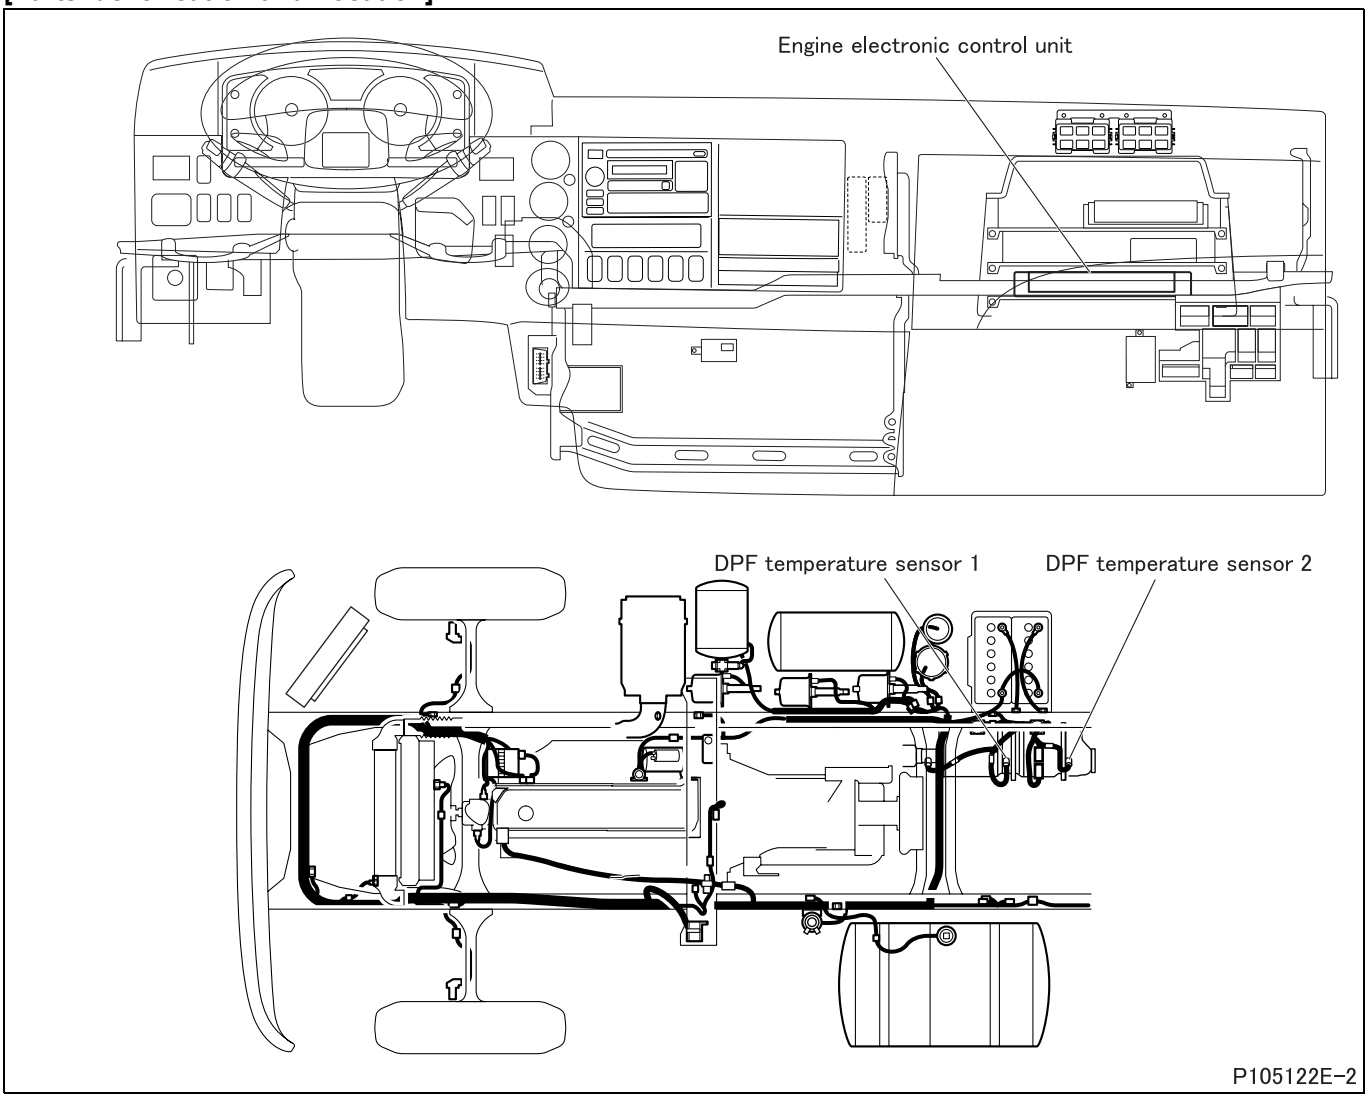
<Fault code>
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished.
  (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		Measure item No. 30 “DPF Temperature 2 (outlet)” of Service Data.
	Inspection condition		During warm-up
	Requirements		Gradually increased
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

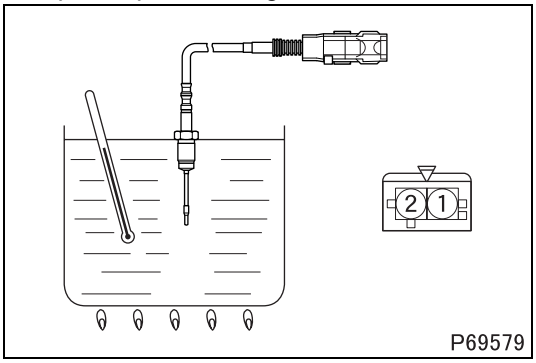
Step 2	Inspection items		Inspection by electronic control unit connector
	Maintenance item		Measure value of voltage between connector (GF34A) terminal No. 29 and (GF35A) terminal No. 27.
	Inspection condition		• Starter switch: OFF • Disconnect electronic control unit from harness and measure at vehicle side connector.
	Requirements		• 20°C {68°F} : 241.8 kΩ • 50°C {122°F} : 106.2 $^{+74.3}_{-41.8}$ kΩ • 100°C {212°F} : 33.56 $^{+17.60}_{-10.60}$ kΩ • 150°C {302°F} : 13.90 $^{+5.36}_{-3.60}$ kΩ • 200°C {392°F} : 6.896 $^{+2.064}_{-1.252}$ kΩ
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Go to step 4.

Step 3	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify connector.

Step 4	Inspection items		Inspection of sensor connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Modify connector.

Step 5	Inspection items		Inspection of DPF temperature sensor 2 unit
	Maintenance item		Measure value of resistance between connector terminals No. 1 and 2.
	Inspection condition		• Put DPF temperature sensor 2 in vessel filled with engine oil. • Heat the oil to each of the specified temperatures. Stir the oil well while doing so.
	Requirements		• 20°C {68°F} : 241.8 kΩ • 50°C {122°F} : 106.2 $^{+74.3}_{-41.8}$ kΩ • 100°C {212°F} : 33.56 $^{+17.60}_{-10.60}$ kΩ • 150°C {302°F} : 13.90 $^{+5.36}_{-3.60}$ kΩ • 200°C {392°F} : 6.896 $^{+2.064}_{-1.252}$ kΩ
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Replacement of sensor

<Step 5 inspection diagram>



Step 6	Inspection items		Inspection of harness between electronic control unit and sensor (power supply)
	Maintenance item		Check circuit between electronic control unit connector (GF34A) terminal No. 29 and sensor connector terminal No. 1.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify harness.

Step 7	Inspection items		Inspection of harness between electronic control unit and sensor (ground)
	Maintenance item		Check circuit between electronic control unit connector (GF35A) terminal No. 27 and sensor connector terminal No. 2.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify harness.

Step 8	Inspection items		Inspection by control data
	Maintenance item		Measure item No. 30 “DPF Temperature 2 (outlet)” of Service Data.
	Inspection condition		During warm-up
	Requirements		Gradually increased
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P2033/Flash code: 88
[Monitor]
Abnormality of DPF temperature sensor 2
[Fault (outline)]
High signal range check
[Diagnosis check]
- Output voltage of DPF temperature sensor 2 is monitored.

[Code generation condition]
- Voltage of DPF temperature sensor 2 remains over 4.96 V for approx. 3 minutes.
  (Warning lamp is lit and diagnosis code is displayed on second establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal
- Engine in operation
- Engine speed: more than 1200 rpm
- Injection quantity: more than 25 mm^3/st
- Water temperature: more than –7°C {19°F}

[Control effected by electronic control unit during fault]
- Control is carried out using backup value (200°C {392°F}).

[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and DPF temperature sensor 2
- Abnormality of each connector
- Abnormality of DPF temperature sensor 2
- Abnormality in electronic control unit

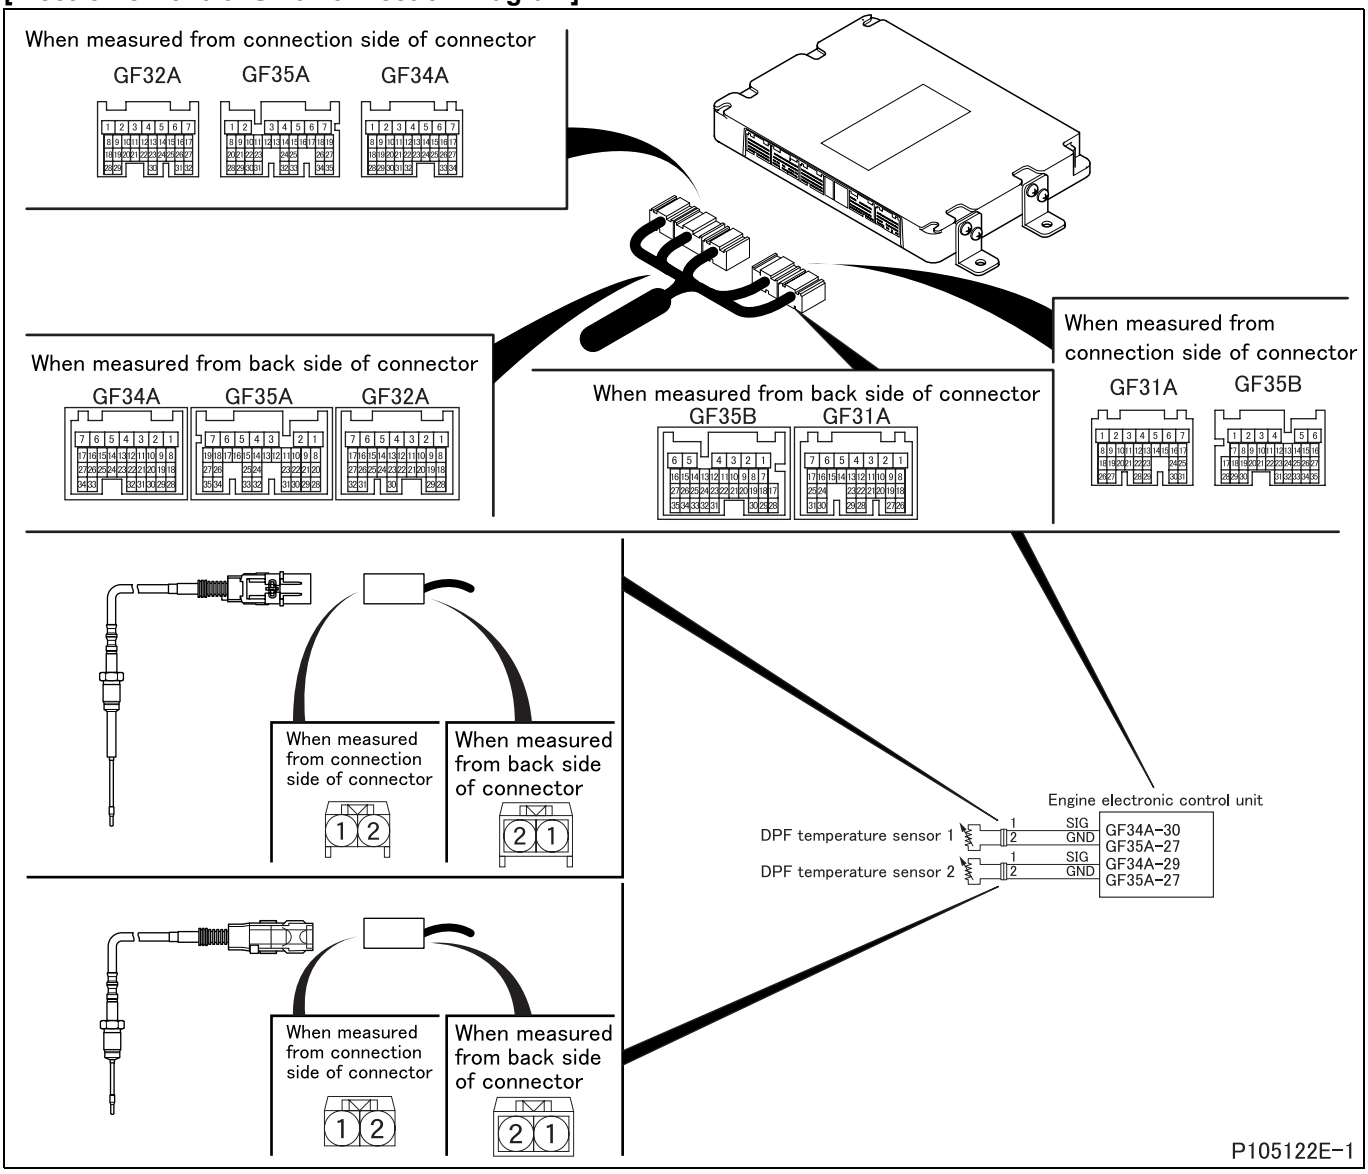
[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>
- Extinguished at 4th driving cycle after normal signal is input.

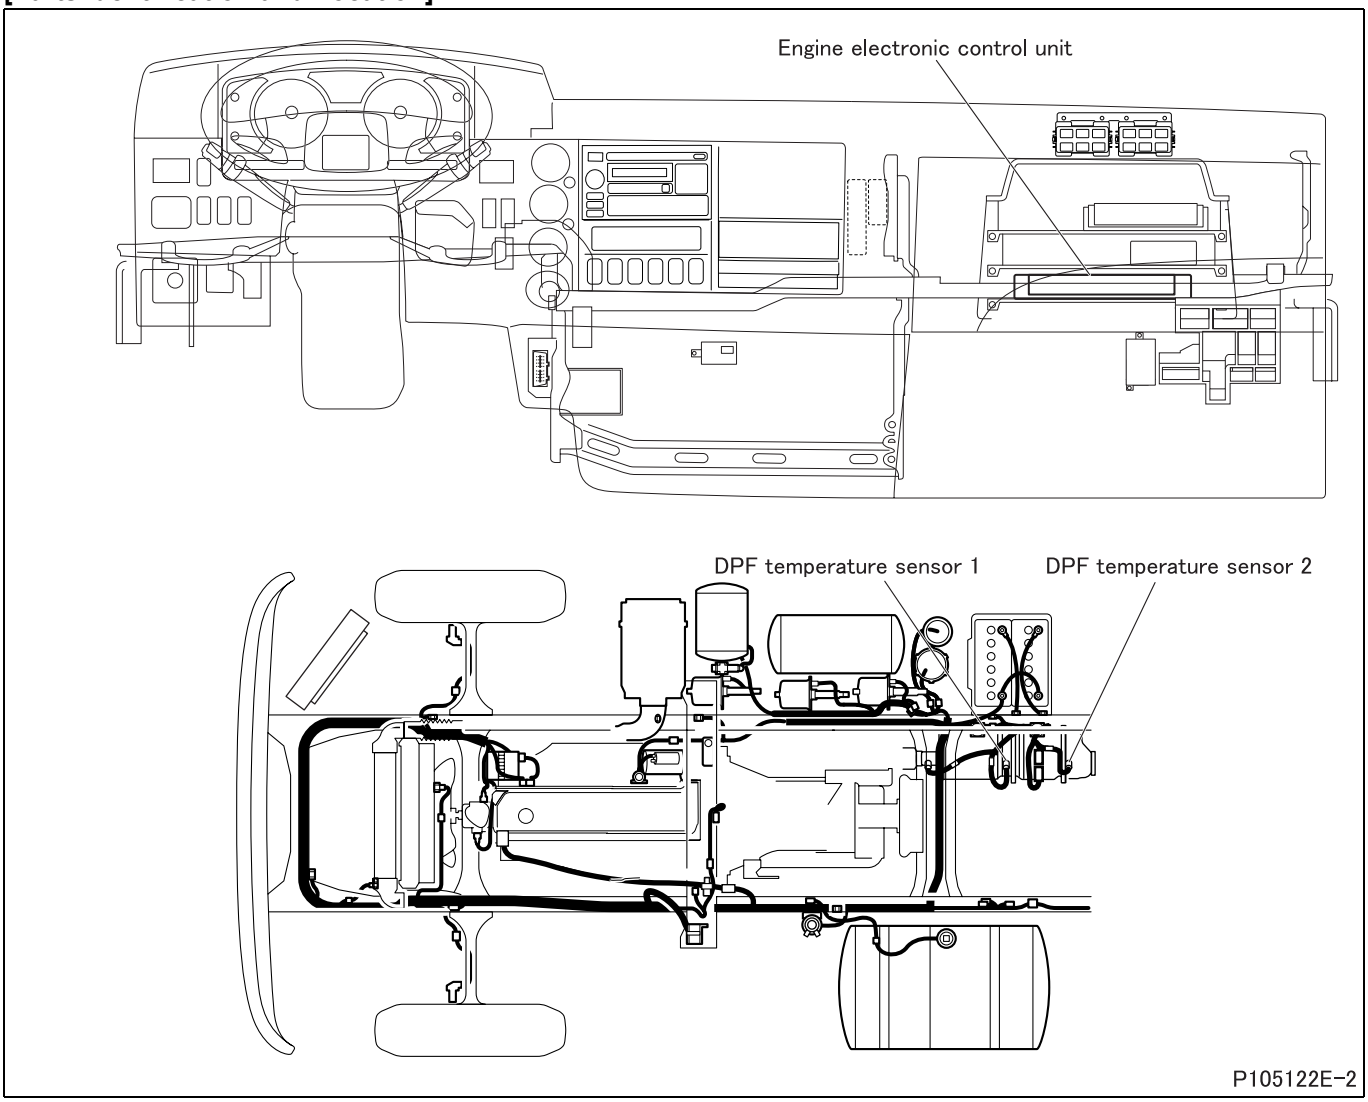
<Fault code>
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished.
  (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		Measure item No. 30 “DPF Temperature 2 (outlet)” of Service Data.
	Inspection condition		During warm-up
	Requirements		Gradually increased
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

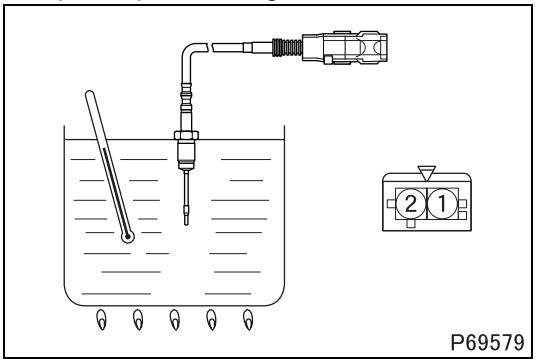
Step 2	Inspection items		Inspection by electronic control unit connector
	Maintenance item		Measure value of voltage between connector (GF34A) terminal No. 29 and (GF35A) terminal No. 27.
	Inspection condition		• Starter switch: OFF • Disconnect electronic control unit from harness and measure at vehicle side connector.
	Requirements		• 20°C {68°F} : 241.8 kΩ • 50°C {122°F} : 106.2 $^{+74.3}_{-41.8}$ kΩ • 100°C {212°F} : 33.56 $^{+17.60}_{-10.60}$ kΩ • 150°C {302°F} : 13.90 $^{+5.36}_{-3.60}$ kΩ • 200°C {392°F} : 6.896 $^{+2.064}_{-1.252}$ kΩ
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Go to step 4.

Step 3	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify connector.

Step 4	Inspection items		Inspection of sensor connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Modify connector.

Step 5	Inspection items		Inspection of DPF temperature sensor 2 unit
	Maintenance item		Measure value of resistance between connector terminals No. 1 and 2.
	Inspection condition		• Put DPF temperature sensor 2 in vessel filled with engine oil. • Heat the oil to each of the specified temperatures. Stir the oil well while doing so.
	Requirements		• 20°C {68°F} : 241.8 kΩ • 50°C {122°F} : 106.2 $^{+74.3}_{-41.8}$ kΩ • 100°C {212°F} : 33.56 $^{+17.60}_{-10.60}$ kΩ • 150°C {302°F} : 13.90 $^{+5.36}_{-3.60}$ kΩ • 200°C {392°F} : 6.896 $^{+2.064}_{-1.252}$ kΩ
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Replacement of sensor

<Step 5 inspection diagram>



Step 6	Inspection items		Inspection of harness between electronic control unit and sensor (power supply)
	Maintenance item		Check circuit between electronic control unit connector (GF34A) terminal No. 29 and sensor connector terminal No. 1.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify harness.

Step 7	Inspection items		Inspection of harness between electronic control unit and sensor (ground)
	Maintenance item		Check circuit between electronic control unit connector (GF35A) terminal No. 27 and sensor connector terminal No. 2.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify harness.

Step 8	Inspection items		Inspection by control data
	Maintenance item		Measure item No. 30 “DPF Temperature 2 (outlet)” of Service Data.
	Inspection condition		During warm-up
	Requirements		Gradually increased
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P2080/Flash code: 13
[Monitor]
Relative check between catalytic temperature sensor and DPF temperature sensor 1
[Fault (outline)]
Gain and offset drift
[Diagnosis check]
- Temperature detected by catalytic temperature sensor and DPF temperature sensor 1 during stop of diesel particulate filter regeneration function (with vehicle in normal condition) are compared for difference within specified limits.

[Code generation condition]
- Operation remains for approx. 20 seconds with temperature difference over 60°C {140°F}.
  (Warning lamp is lit and diagnosis code is displayed on second establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal
- Diesel particulate filter regeneration control: not effected
- Fuel injection status: normal
- Engine running time: more than 300 seconds
- Engine control map: normal
- Catalytic temperature sensor: normal in output signal
- DPF temperature sensor 1: normal in output signal
- Time during which judgment conditions are maintained: 35 seconds

[Control effected by electronic control unit during fault]
- Effects no special control.

[Probable cause of trouble]
<If diagnosis code P0284 was not recorded at the same time>
- Abnormality of catalytic temperature sensor

<If diagnosis code P0284 was recorded at the same time>
- Abnormality of DPF temperature sensor 1

[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>
- Extinguished at 4th driving cycle after normal signal is input.

<Fault code>
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished.
  (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Fault code]
Diagnosis code: P2084/Flash code: 87
[Monitor]
Relative check between DPF temperature sensor 1 and 2
[Fault (outline)]
Gain and offset drift
[Diagnosis check]
- Temperature detected by DPF temperature sensor 2 and DPF temperature sensor 1 during stop of diesel particulate filter regeneration function (with vehicle in normal condition) are compared for difference within specified limits.

[Code generation condition]
- Operation remains for approx. 10 seconds with temperature difference over 90°C {162°F}.
  (Warning lamp is lit and diagnosis code is displayed on second establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal
- Diesel particulate filter regeneration control: not effected (before elapse of 900 seconds)
- Fuel injection status: normal
- Engine control map: normal
- DPF temperature sensor 1: normal in output signal
- DPF temperature sensor 2: normal in output signal
- Time during which judgment conditions are maintained: longer than 300 seconds

[Control effected by electronic control unit during fault]
- Effects no special control.

[Probable cause of trouble]
<If diagnosis code P0284 was not recorded at the same time>
- Abnormality of DPF temperature sensor 1

<If diagnosis code P0284 was recorded at the same time>
- Abnormality of DPF temperature sensor 2

[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>
- Extinguished at 4th driving cycle after normal signal is input.

<Fault code>
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished.
  (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Fault code]
Diagnosis code: P2102/Flash code: 28
[Monitor]
Abnormality of intake throttle (actuator)
[Fault (outline)]
- Short circuit ground
- Open circuit
- Short circuit battery
- Actuator stuck

[Diagnosis check]
- Intake throttle driving motor is checked by throttle electronic drive unit, and sends abnormality information to engine electronic control unit through controller area network communication.

[Code generation condition]
Diagnosis code is generated under either of the following conditions.
(Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)
- Motor circuit remains shorted or open as detected by throttle electronic drive unit for 2 seconds.
- Motor remains stuck as detected by throttle electronic drive unit for 2 seconds.
- From electronic drive unit is sent abnormal information the total reception time of which (through controller area network 2) exceeds 6 seconds.

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal

[Control effected by electronic control unit during fault]
- Injection quantity is limited.
- Exhaust gas recirculation control is stopped.
- Throttle control is stopped.
- Diesel particulate filter regeneration (manual or automatic) is stopped.
- Fault detection for controller area network communication is stopped.

[Probable cause of trouble]
- Open-circuit or short-circuit of harness between throttle electronic drive unit and throttle actuator
- Abnormality of each connector
- Abnormality of throttle motor (built in throttle actuator)
- Abnormality of throttle position sensor (built in throttle actuator)
- Abnormality of throttle electronic drive unit
- Abnormality of electronic drive unit relay

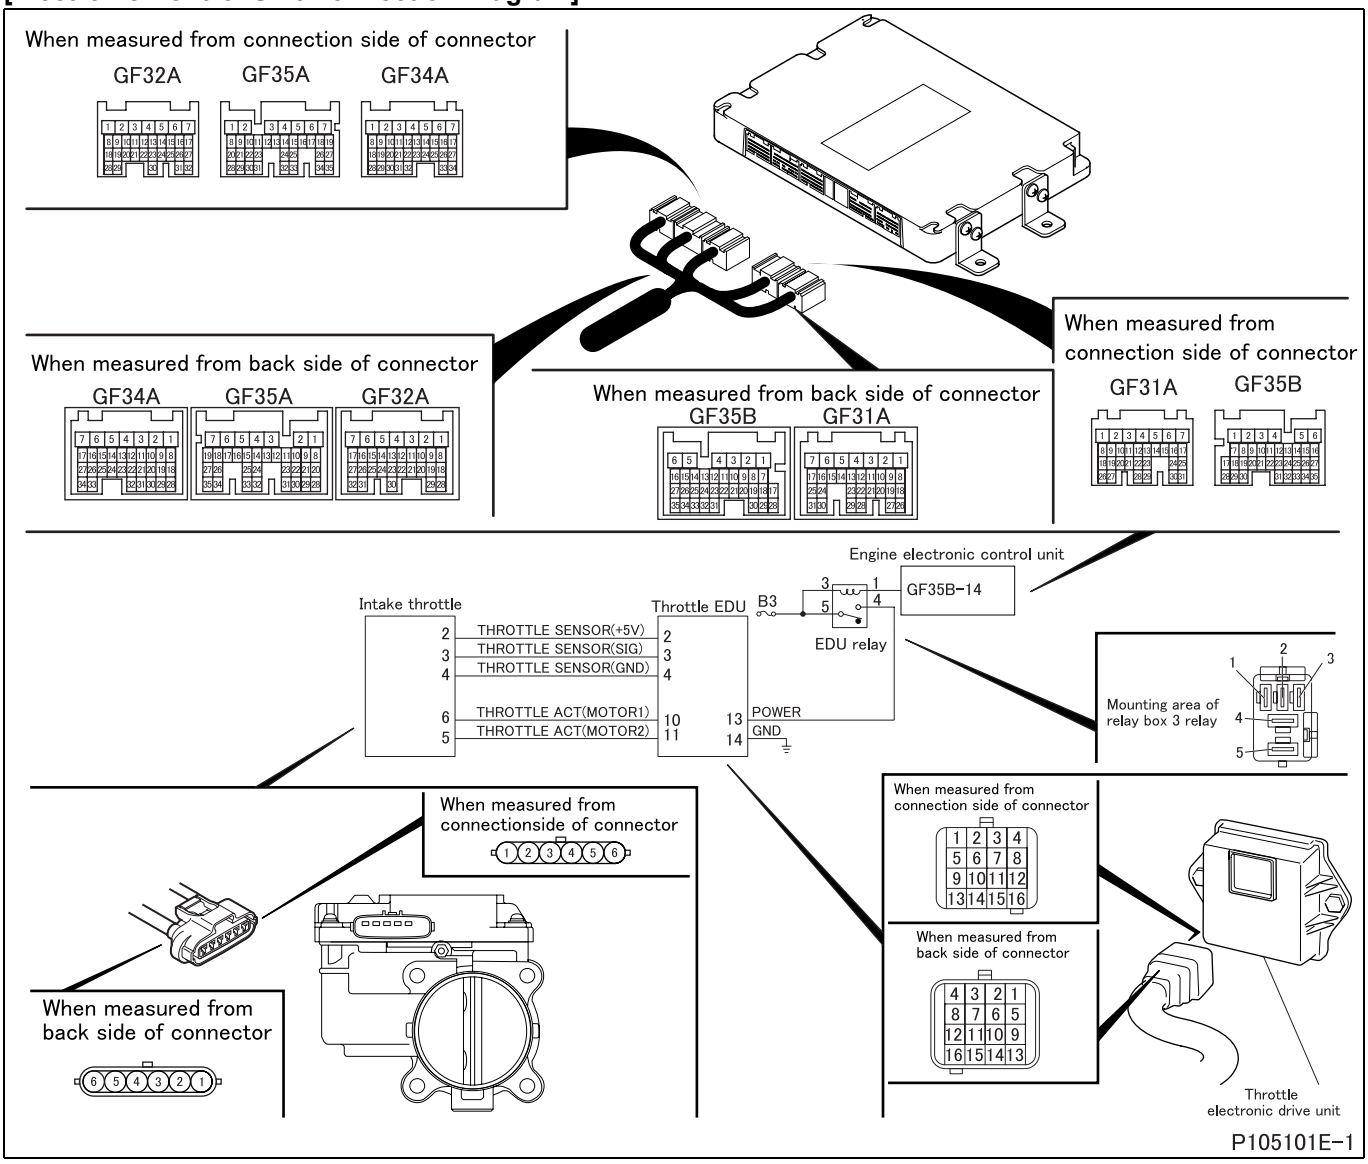
[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>
- Extinguished at 4th driving cycle after normal signal is input.

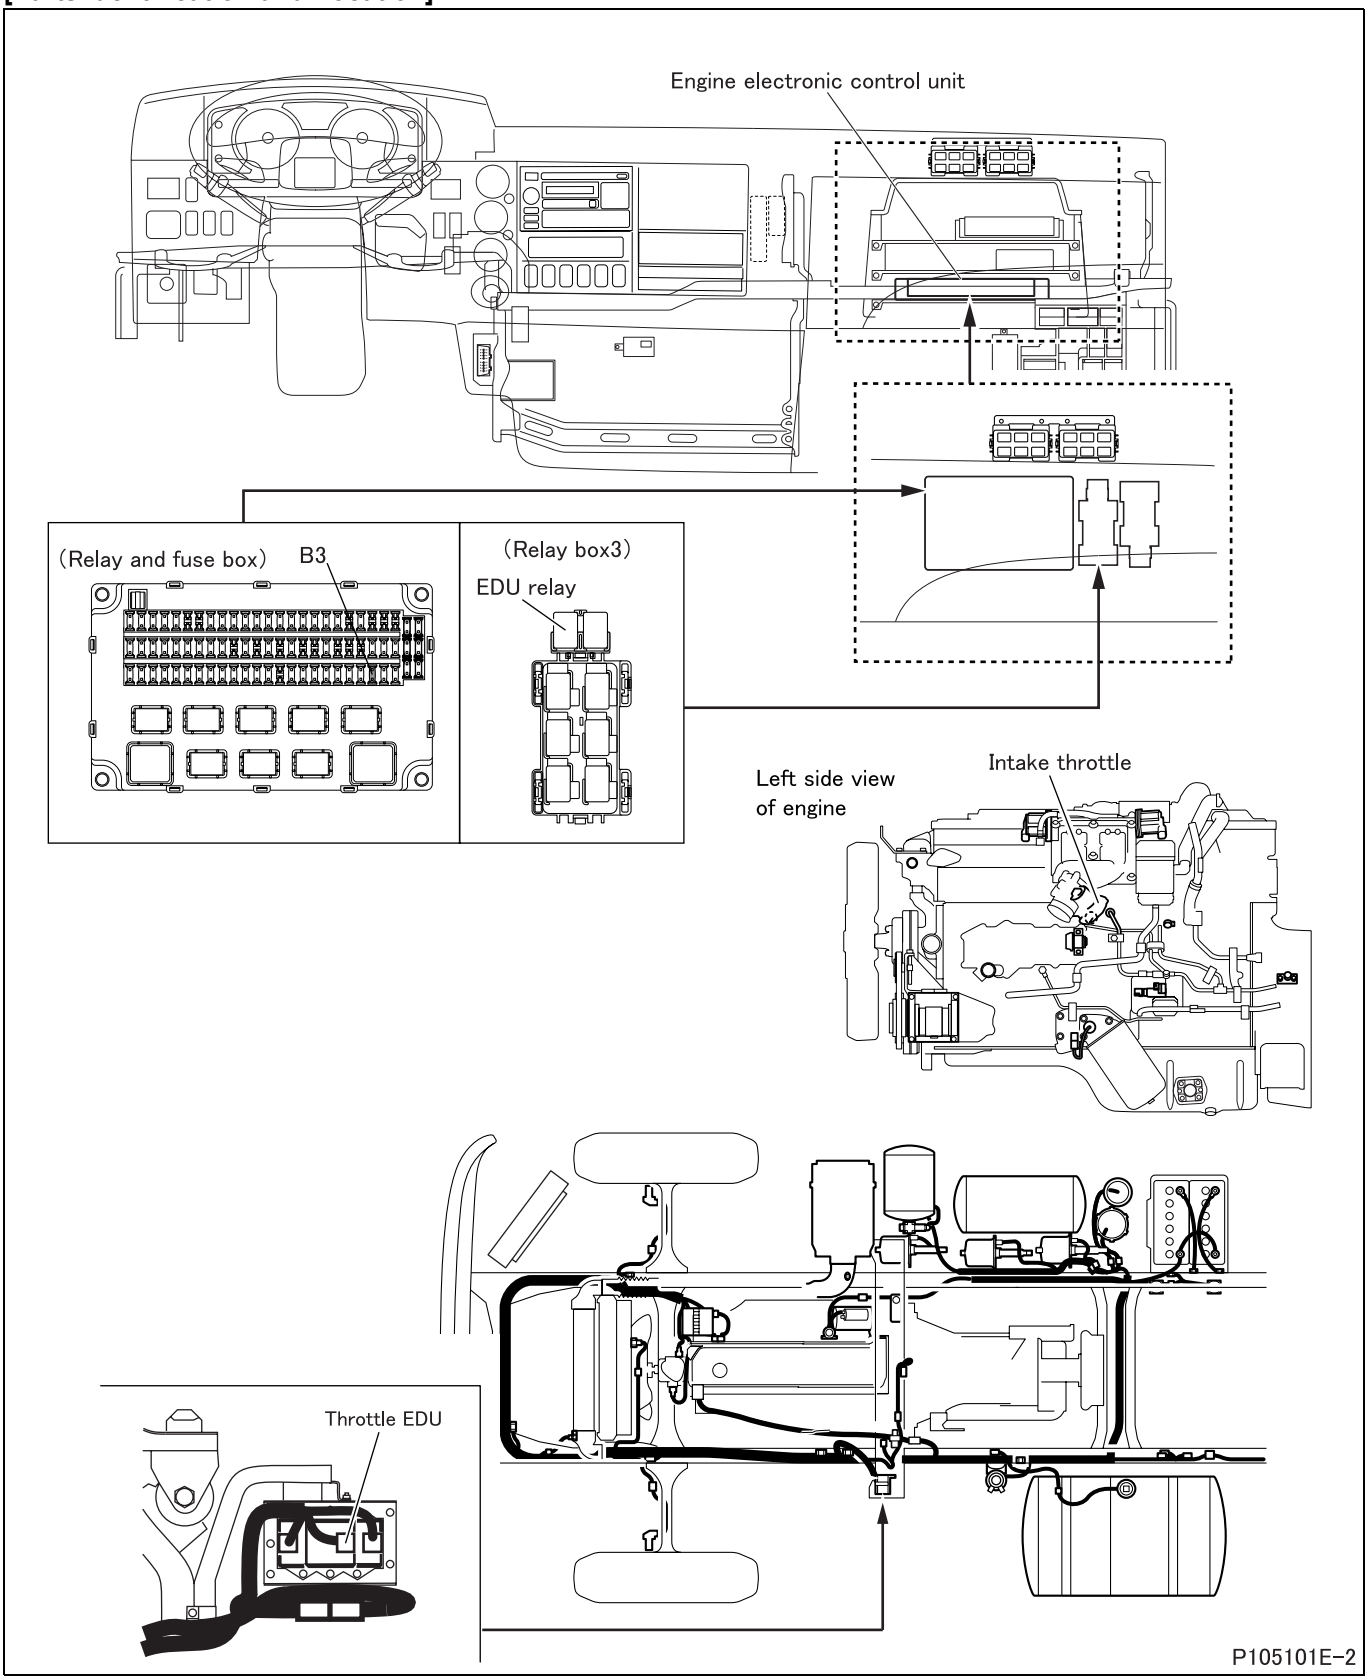
<Fault code>
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished.
  (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. A7 “Intake throttle 1”.
	Inspection condition		• Vehicle: stationary (vehicle speed 0 km/h {0 MPH}) • Starter switch: ON (engine started) • Transmission: neutral
	Requirements		Actual position matches with target value set by Multi-Use Tester (check with service data “20: Intake Throttle actual position”).
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

Step 2	Inspection items		Inspection of electronic drive unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Modify connector.

Step 3	Inspection items		Inspection of throttle actuator connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	Modify connector.

Step 4	Inspection items		Inspection by control data
	Maintenance item		Check if following diagnosis codes occur simultaneously. • P0685 “EDU Relay (Open)” • P0686 “EDU Relay (Low)” • P0687 “EDU Relay (High)” • P0688 “EDU Relay (Over Load)”
	Inspection condition		Starter switch: ON
	Requirements		Codes occur.
	Inspection result (Is the judging standard satisfied?)	YES	Inspect diagnosis code that is occurring.
		NO	Go to step 5.

Step 5	Inspection items		Inspection of electronic drive unit connector (power supply)
	Maintenance item		Measure value of voltage between connector terminal No. 13 (+) and 14 (–).
	Inspection condition		• Disconnect connector and measure from harness side. • Starter switch: ON • Perform actuator test item No. A9 “EDU Relay”.
	Requirements		Same as battery voltage.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 10.
		NO	Go to step 6.

Step 6	Inspection items		Inspection of relay connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify connector.

Step 7	Inspection items		Inspection of harness between fuse and relay
	Maintenance item		Check circuit between fuse No. B3 and relay connector terminal No. 5.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify harness.

Step 8	Inspection items		Inspection of harness between relay and electronic drive unit
	Maintenance item		Check circuit between relay connector terminal No. 4 and electronic drive unit connector terminal No. 13.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	After replacement of relay, go to step 9
		NO	Modify harness.

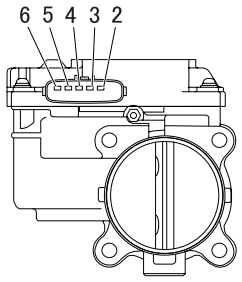
Step 9	Inspection items		Inspection of harness between electronic drive unit and ground
	Maintenance item		Check circuit between following electronic drive unit connector terminals. • Electronic drive unit ground: terminal No. 14 - chassis ground • Sensor ground: terminal No. 4 and 14
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 10.
		NO	Modify harness.

Step 10	Inspection items		Inspection of electronic drive unit connector (motor)
	Maintenance item		Measure value of resistance between connector terminal No. 10 and 11.
	Inspection condition		Disconnect connector and measure from harness side.
	Requirements		0.3 to 80 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 13.
		NO	Go to step 11.

Step 11	Inspection items		Inspection of harness between electronic drive unit and throttle actuator (motor)
	Maintenance item		Check circuit between following connector terminals. • Motor (1): electronic drive unit connector terminal No. 10 - throttle actuator connector terminal No. 6 • Motor (2): electronic drive unit connector terminal No. 11 - throttle actuator connector terminal No. 5
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 12.
		NO	Modify harness.

Step 12	Inspection items		Inspection of throttle actuator unit (motor)
	Maintenance item		Measure value of resistance between connector terminals No. 5 and 6.
	Inspection condition		• Keep throttle actuator installed on vehicle. • Disconnect connector and measure throttle actuator side.
	Requirements		0.3 to 80 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 13.
		NO	Replacement of throttle actuator

<Step 12 inspection diagram>



P104212

Step 13	Inspection items		Inspection of throttle actuator connector (position sensor: power supply)
	Maintenance item		Measure value of voltage between connector terminals No. 2 (+) and 4 (–).
	Inspection condition		• Measure from back side of harness connector with each device connected to harness. • Starter switch: ON
	Requirements		5 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 14.
		NO	Go to step 15.

Step 14	Inspection items		Inspection of electronic drive unit connector (position sensor: signal)
	Maintenance item		Measure value of voltage between connector terminals No. 3 (+) and 4 (–).
	Inspection condition		• Measure from back side of harness connector with each device connected to harness. • Starter switch: ON • Perform actuator test item No. A7 “Intake throttle 1”.
	Requirements		• Valve fully closed: 0.5 V • Valve fully opened: 4.375 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 16.
		NO	Go to step 15.

Step 15	Inspection items		Inspection of harness between electronic drive unit and throttle actuator (position sensor)
	Maintenance item		Check circuit between following connector terminals. • Sensor (power supply): electronic drive unit connector terminal No. 2 - throttle actuator connector terminal No. 2 • Sensor (signal): electronic drive unit connector terminal No. 3 - throttle actuator connector terminal No. 3 • Sensor (ground): electronic drive unit connector terminal No. 4 - throttle actuator connector terminal No. 4
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	After replacement of throttle actuator, go to step 16.
		NO	Modify harness.

Step 16	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. A7 “Intake throttle 1”.
	Inspection condition		• Vehicle: stationary (vehicle speed 0 km/h {0 MPH}) • Starter switch: ON (engine started) • Transmission: neutral
	Requirements		Actual position matches with target value set by Multi-Use Tester (check with service data “20: Intake Throttle actual position”).
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic drive unit

[Fault code]
Diagnosis code: P2108/Flash code: 96
[Monitor]
Abnormality of intake throttle (target abnormality)
[Fault (outline)]
Target out of range
[Diagnosis check]
- Opening of intake throttle butterfly valve is detected as actual stop opening by throttle electronic drive unit through throttle position sensor is compared with target opening for control by engine electronic control unit.

[Code generation condition]
- Target valve position calculated by throttle electronic drive unit remains deviating from specified limits (16 to 241) for 1 second.
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)
- From electronic drive unit is sent abnormal information the total reception time of which (through controller area network 2) exceeds 6 seconds.

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal

[Control effected by electronic control unit during fault]
- Injection quantity is limited.
- Exhaust gas recirculation control is stopped.
- Throttle control is stopped.
- Diesel particulate filter regeneration (manual or automatic) is stopped.

[Probable cause of trouble]
- Open-circuit or short-circuit of harness between throttle electronic drive unit and throttle actuator
- Abnormality of each connector
- Abnormality of throttle motor (built in throttle actuator)
- Abnormality of throttle position sensor (built in throttle actuator)
- Abnormality of throttle electronic drive unit
- Abnormality of electronic drive unit relay

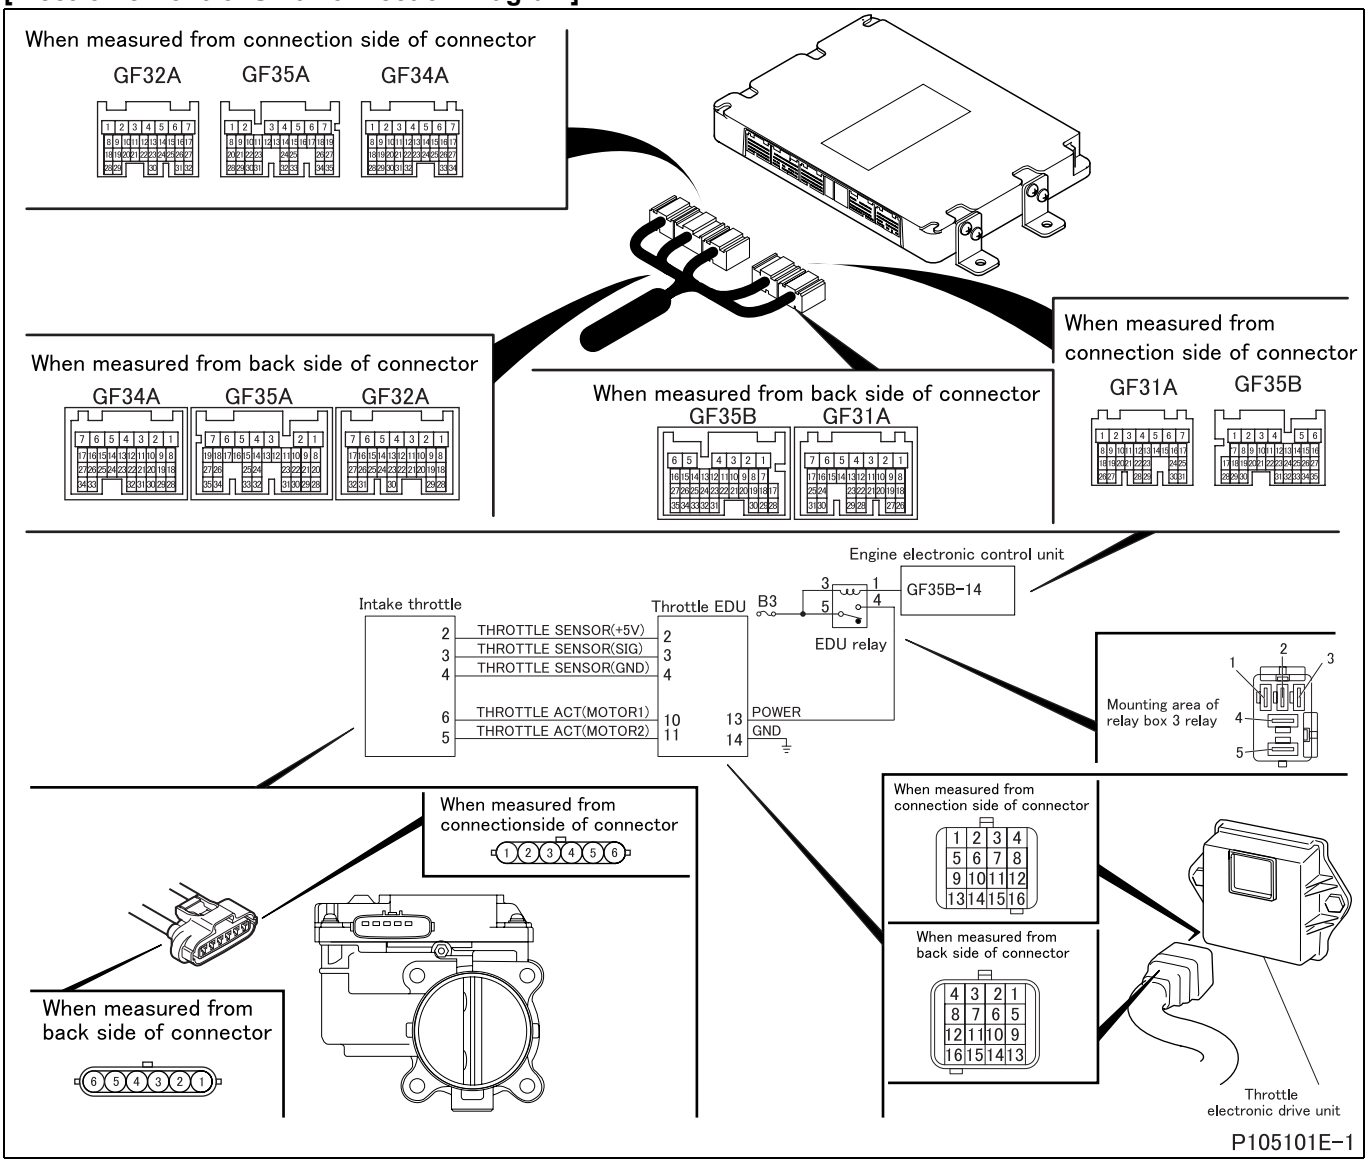
[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>
- Extinguished at 4th driving cycle after normal signal is input.

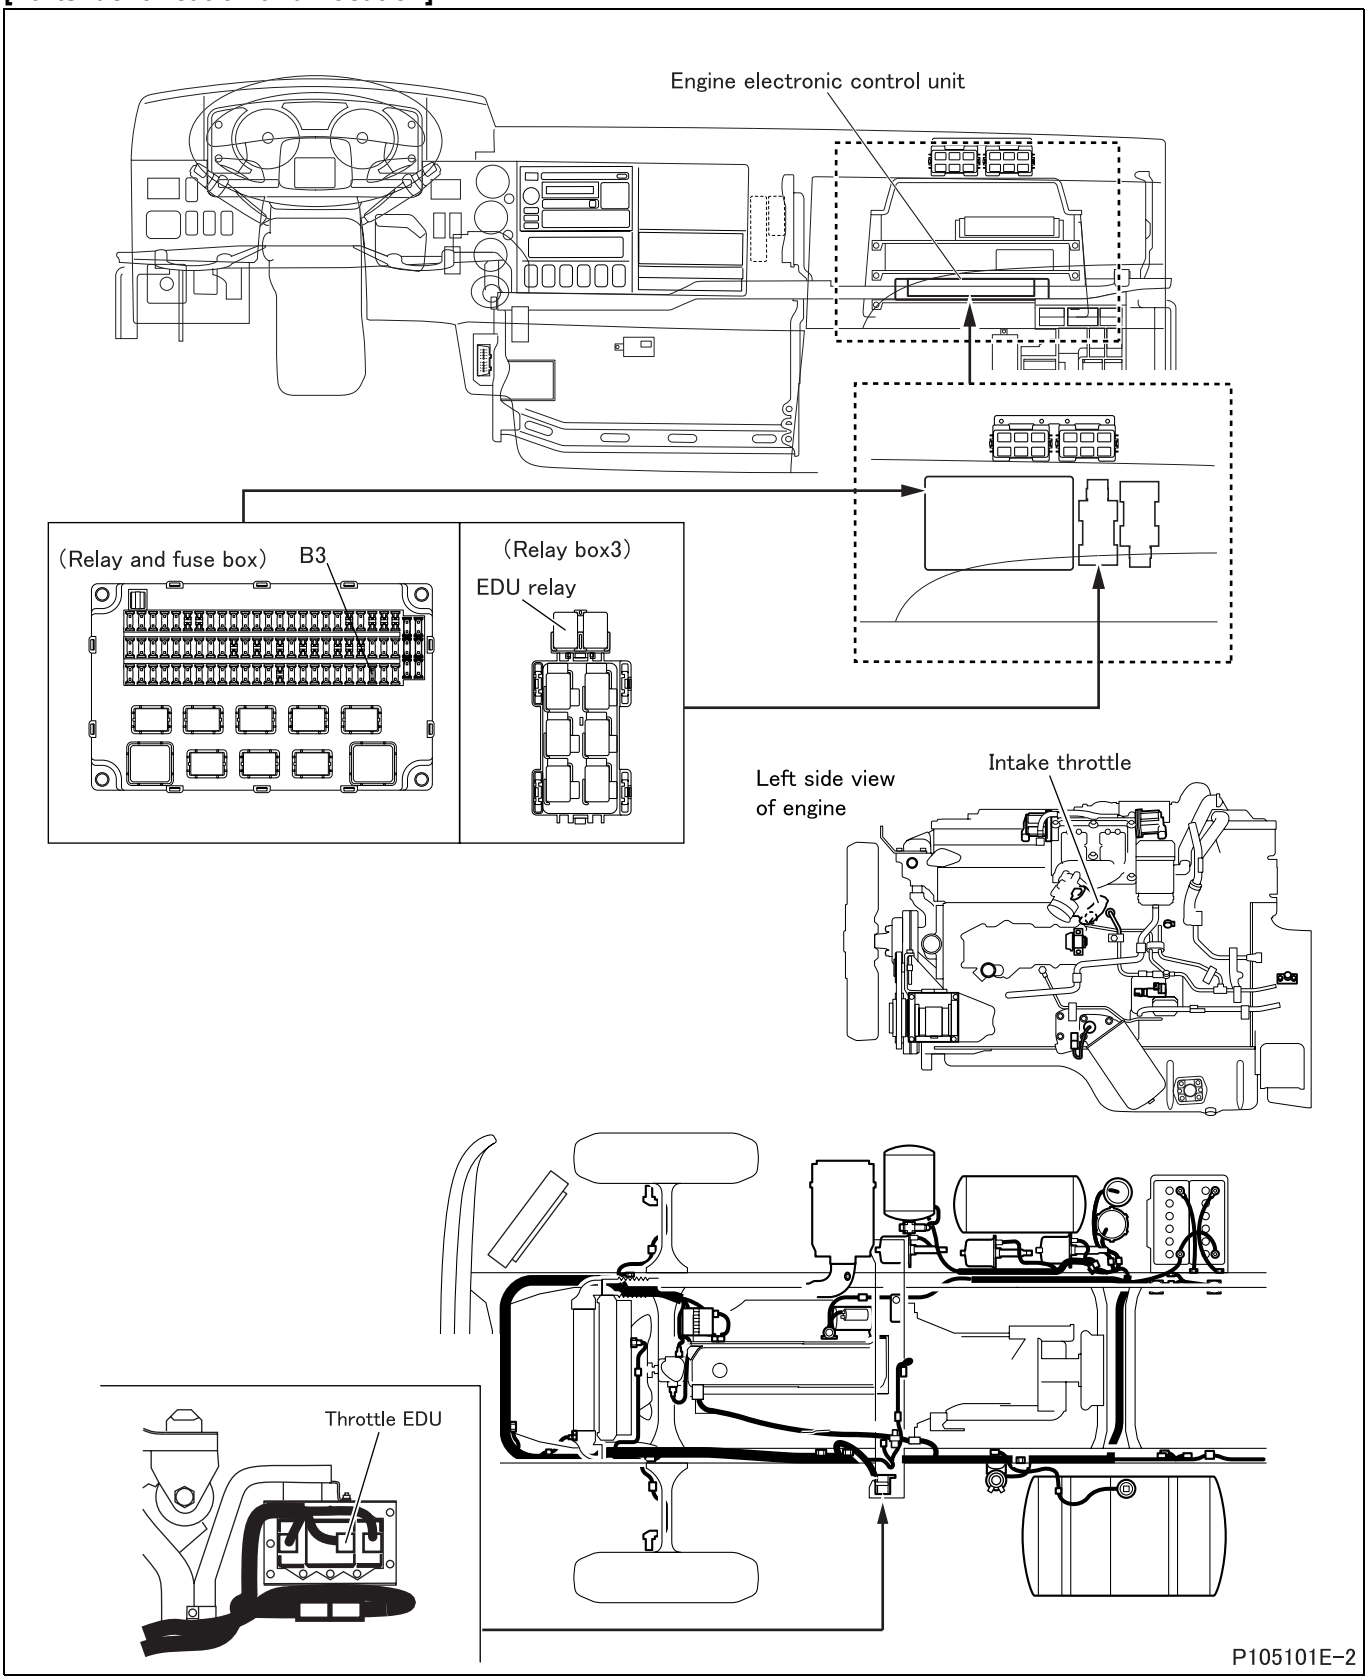
<Fault code>
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished.
  (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. A7 “Intake throttle 1”.
	Inspection condition		• Vehicle: stationary (vehicle speed 0 km/h {0 MPH}) • Starter switch: ON (engine started) • Transmission: neutral
	Requirements		Actual position matches with target value set by Multi-Use Tester (check with service data “20: Intake Throttle actual position”).
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

Step 2	Inspection items		Inspection of electronic drive unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Modify connector.

Step 3	Inspection items		Inspection of throttle actuator connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	Modify connector.

Step 4	Inspection items		Inspection by control data
	Maintenance item		Check if following diagnosis codes occur simultaneously. • P0685 “EDU Relay (Open)” • P0686 “EDU Relay (Low)” • P0687 “EDU Relay (High)” • P0688 “EDU Relay (Over Load)”
	Inspection condition		Starter switch: ON
	Requirements		Codes occur.
	Inspection result (Is the judging standard satisfied?)	YES	Inspect diagnosis code that is occurring.
		NO	Go to step 5.

Step 5	Inspection items		Inspection of electronic drive unit connector (power supply)
	Maintenance item		Measure value of voltage between connector terminal No. 13 (+) and 14 (–).
	Inspection condition		• Disconnect connector and measure from harness side. • Starter switch: ON • Perform actuator test item No. A9 “EDU Relay”.
	Requirements		Same as battery voltage.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 10.
		NO	Go to step 6.

Step 6	Inspection items		Inspection of relay connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify connector.

Step 7	Inspection items		Inspection of harness between fuse and relay
	Maintenance item		Check circuit between fuse No. B3 and relay connector terminal No. 5.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify harness.

Step 8	Inspection items		Inspection of harness between relay and electronic drive unit
	Maintenance item		Check circuit between relay connector terminal No. 4 and electronic drive unit connector terminal No. 13.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	After replacement of relay, go to step 9.
		NO	Modify harness.

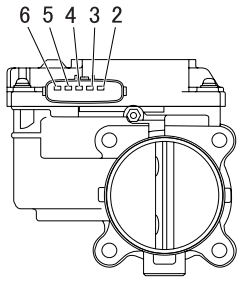
Step 9	Inspection items		Inspection of harness between electronic drive unit and ground
	Maintenance item		Check circuit between following electronic drive unit connector terminals. • Electronic drive unit ground: terminal No. 14 - chassis ground • Sensor ground: terminal No. 4 and 14
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 10.
		NO	Modify harness.

Step 10	Inspection items		Inspection of electronic drive unit connector (motor)
	Maintenance item		Measure value of resistance between connector terminal No. 10 and 11.
	Inspection condition		Disconnect connector and measure from harness side.
	Requirements		0.3 to 80 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 13.
		NO	Go to step 11.

Step 11	Inspection items		Inspection of harness between electronic drive unit and throttle actuator (motor)
	Maintenance item		Check circuit between following connector terminals. • Motor (1): electronic drive unit connector terminal No. 10 - throttle actuator connector terminal No. 6 • Motor (2): electronic drive unit connector terminal No. 11 - throttle actuator connector terminal No. 5
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 12.
		NO	Modify harness.

Step 12	Inspection items		Inspection of throttle actuator unit (motor)
	Maintenance item		Measure value of resistance between connector terminals No. 5 and 6.
	Inspection condition		• Keep throttle actuator installed on vehicle. • Disconnect connector and measure throttle actuator side.
	Requirements		0.3 to 80 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 13.
		NO	Replacement of throttle actuator

<Step 12 inspection diagram>



P104212

Step 13	Inspection items		Inspection of throttle actuator connector (position sensor: power supply)
	Maintenance item		Measure value of voltage between connector terminal No. 2 (+) and 4 (–).
	Inspection condition		• Measure from back side of harness connector with each device connected to harness. • Starter switch: ON
	Requirements		5 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 14.
		NO	Go to step 15.

Step 14	Inspection items		Inspection of electronic drive unit connector (position sensor: signal)
	Maintenance item		Measure value of voltage between connector terminals No. 3 (+) and 4 (–).
	Inspection condition		• Measure from back side of harness connector with each device connected to harness. • Starter switch: ON • Perform actuator test item No. A7 “Intake throttle 1”.
	Requirements		• Valve fully closed: 0.5 V • Valve fully opened: 4.375 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 16.
		NO	Go to step 15.

Step 15	Inspection items		Inspection of harness between electronic drive unit and throttle actuator (position sensor)
	Maintenance item		Check circuit between following connector terminals. • Sensor (power supply): electronic drive unit connector terminal No. 2 - throttle actuator connector terminal No. 2 • Sensor (signal): electronic drive unit connector terminal No. 3 - throttle actuator connector terminal No. 3 • Sensor (ground): electronic drive unit connector terminal No. 4 - throttle actuator connector terminal No. 4
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	After replacement of throttle actuator, go to step 16.
		NO	Modify harness.

Step 16	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. A7 “Intake throttle 1”.
	Inspection condition		• Vehicle: stationary (vehicle speed 0 km/h {0 MPH}) • Starter switch: ON (engine started) • Transmission: neutral
	Requirements		Actual position matches with target value set by Multi-Use Tester (check with service data “20: Intake Throttle actual position”).
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic drive unit

[Fault code]
Diagnosis code: P2120/Flash code: 65
[Monitor]
Abnormality of accelerator pedal switch
[Fault (outline)]
Plausibility
[Diagnosis check]
- Pedal pressing angle output from accelerator pedal position sensor is monitored for abnormality in ON/OFF status of accelerator pedal switch.

[Code generation condition]
- Recognition by accelerator pedal switch remains “pedal released” when accelerator pedal pressing angle output becomes 20%.
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal
- Accelerator switch is off (0%), or pedal depression angle registered by accelerator position sensors 1 and 2 is larger than 20%.

[Control effected by electronic control unit during fault]
- Effects no special control. (Accelerator pedal position sensor is used as usual.)

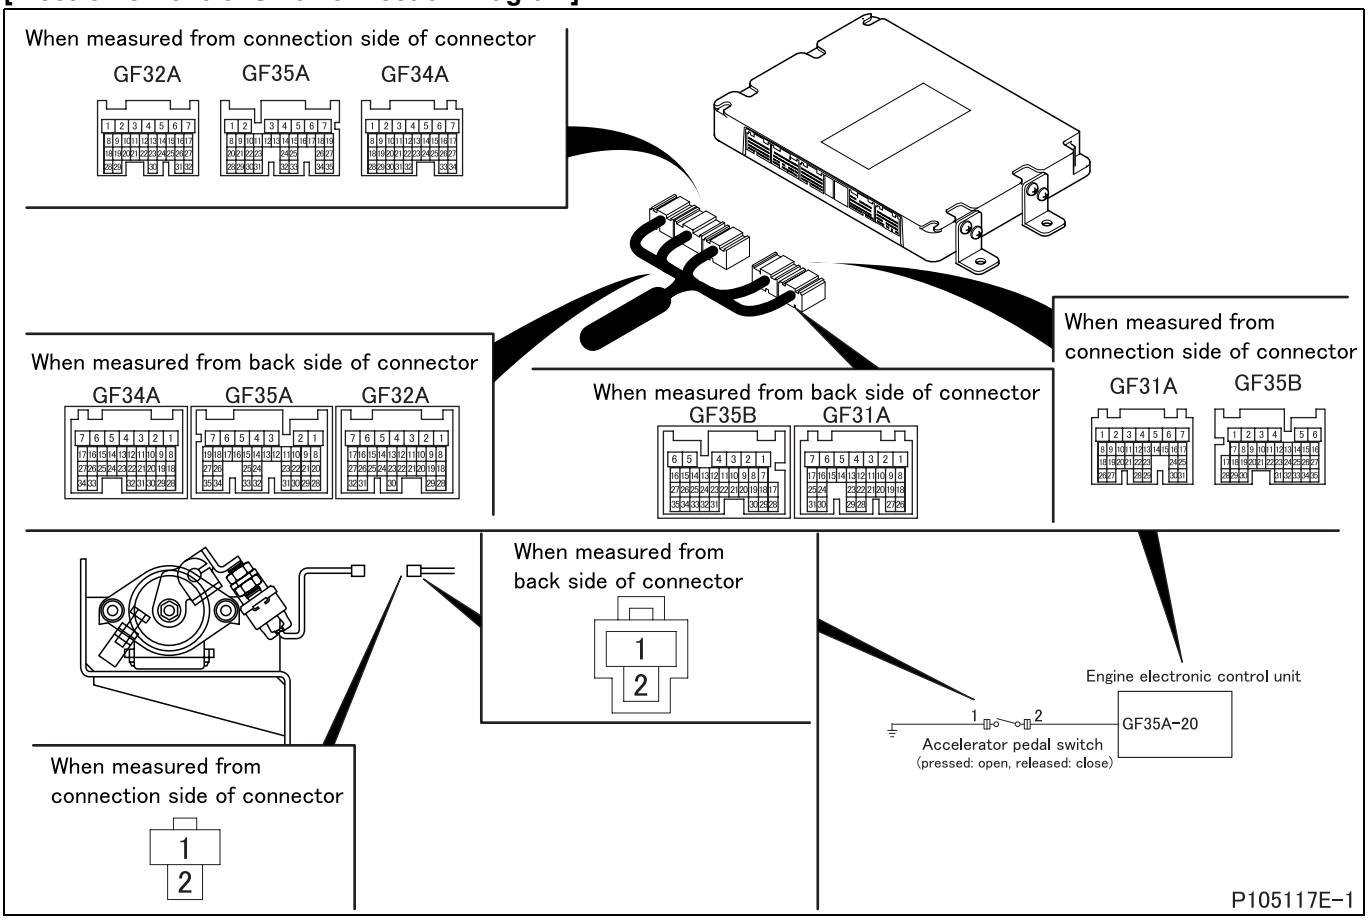
[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and accelerator pedal switch
- Abnormality of each connector
- Abnormality of accelerator pedal switch
- Abnormality in electronic control unit

[Recoverability]
<Control during fault>
- Recovered if signal becomes normal when accelerator pedal is pressed.

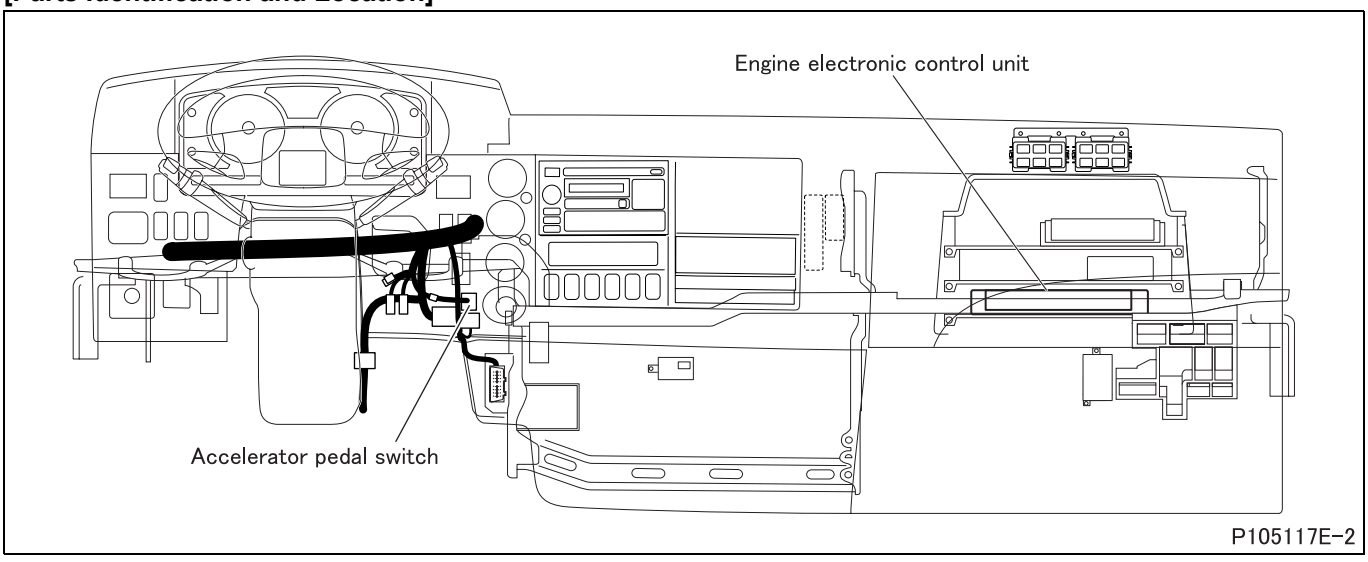
<Fault code>
- Automatically cleared at 40th warm up cycle as counted from error occurrence time.
  (To clear as desired, erase from the memory.)

Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		Measure item No. 73 “Accel SW” of Service Data.
	Inspection condition		–
	Requirements		• Accelerator pedal pressed: ON • Accelerator pedal released: OFF
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

Step 2	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Modify connector.

Step 3	Inspection items		Inspection of accelerator pedal switch connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	Modify connector.

Step 4	Inspection items		Inspection of accelerator pedal switch unit
	Maintenance item		Check continuity between connector terminal No. 1 and 2.
	Inspection condition		Disconnect connector and measure switch side.
	Requirements		• Accelerator pedal released: There is continuity. • Accelerator pedal pressed: There is no continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Replacement of accelerator pedal switch.

Step 5	Inspection items		Inspection of harness between pedal switch and electronic control unit (power supply)
	Maintenance item		Check circuit between accelerator pedal switch connector terminal No. 2 and electronic control unit connector (GF35A) terminal No. 20.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Modify harness.

Step 6	Inspection items		Inspection of harness between switch and electronic control unit (ground)
	Maintenance item		Check circuit between accelerator pedal switch connector terminal No. 1 and cab ground.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify harness.

Step 7	Inspection items		Inspection by control data
	Maintenance item		Measure item No. 73 “Accel SW” of Service Data.
	Inspection condition		–
	Requirements		• Accelerator pedal pressed: ON • Accelerator pedal released: OFF
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P2135/Flash code: 58
[Monitor]
Relative check of accelerator pedal position sensors (1 and 2)
[Fault (outline)]
There is too large difference between sensor 1 and 2.
[Diagnosis check]
- Difference in opening output between accelerator pedal position sensors 1 and 2 is compared for deviation from specified value.

[Code generation condition]
- Value of opening output remains 70% or more apart between two sensors for approx. 1 second.
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal

[Control effected by electronic control unit during fault]
- Controller area network communication
- When sensors 1 and 2 malfunction, control is effected with accelerator pedal opening selected as minimum.

[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and accelerator pedal position sensors (1 and 2)
- Abnormality of each connector
- Abnormality of accelerator pedal position sensors (1 and 2)
- Abnormality in electronic control unit

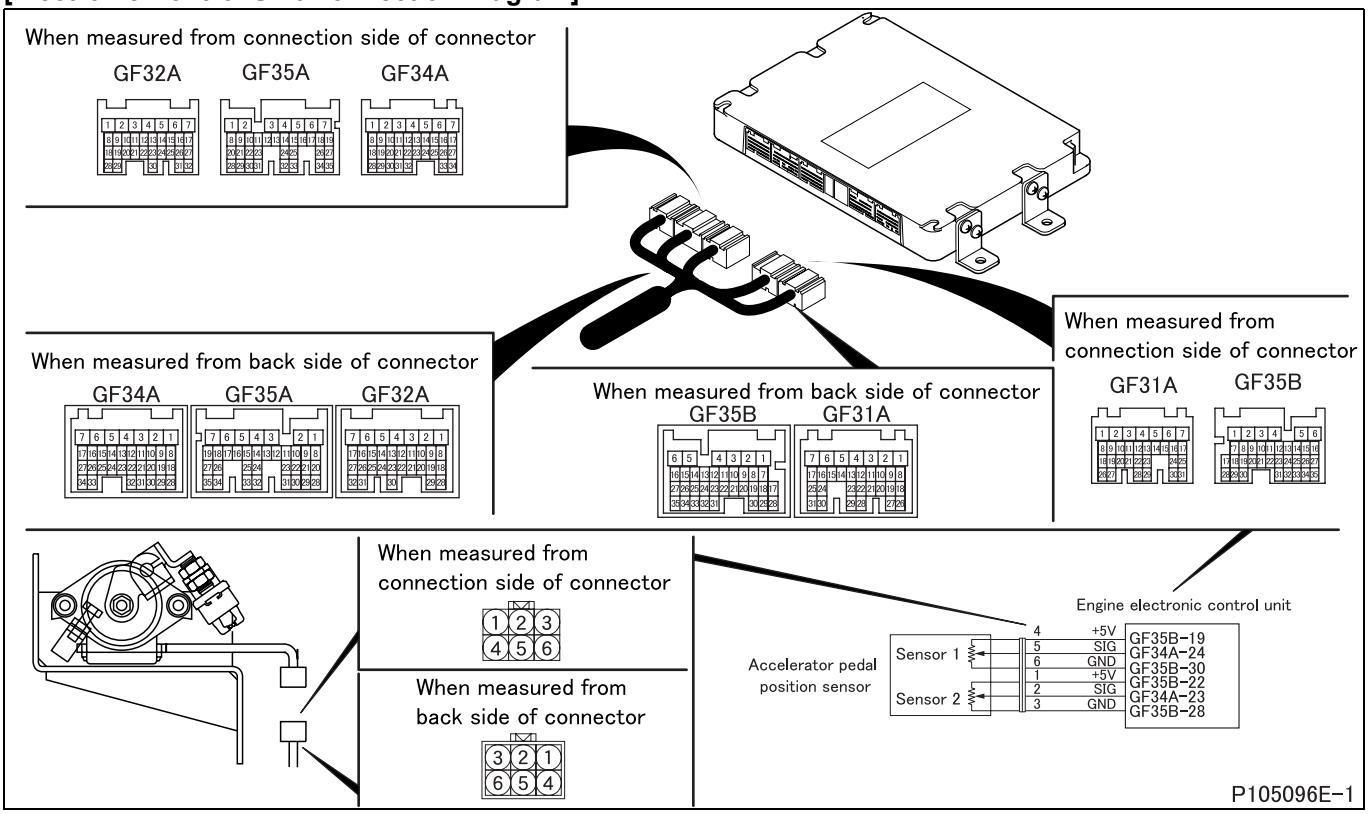
[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>
- Extinguished at 4th driving cycle after normal signal is input.

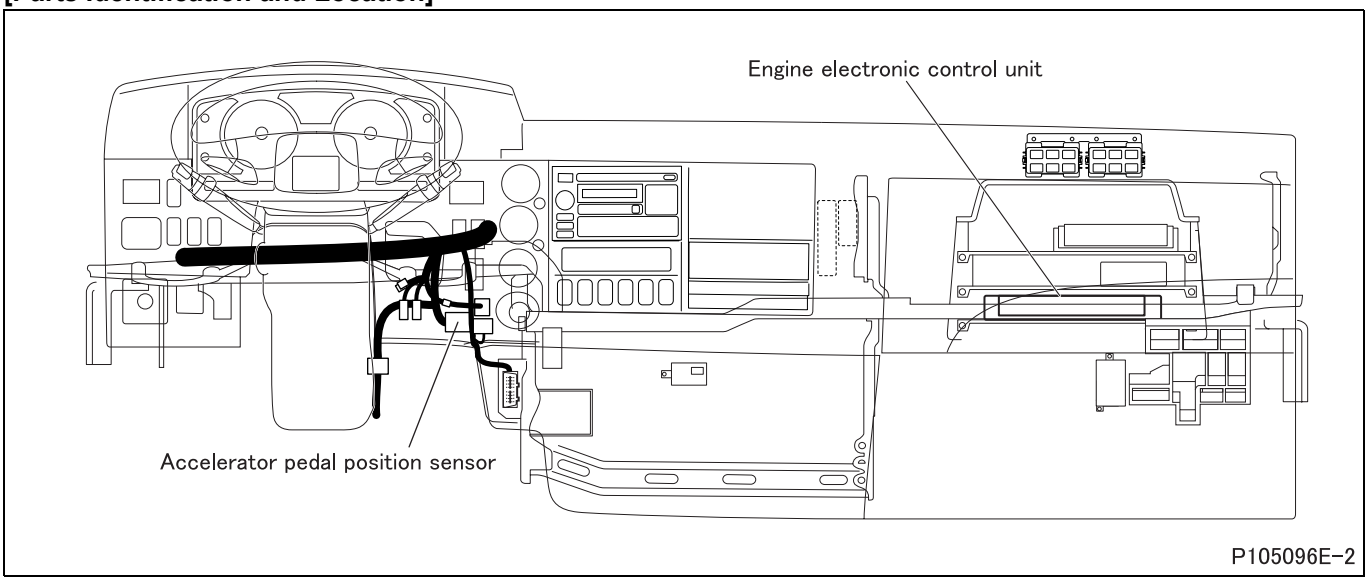
<Fault code>
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished.
  (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		**<General Scanning Tool used>** Measurement of following service data • Sensor 1: Item “Accelerator Pedal Position 1” • Sensor 2: Item “Accelerator Pedal Position 2” **<Multi-Use Tester used>** Measurement of following service data • Sensor 1: Item No. 24 “Accel Pedal Sensor Voltage 1”. • Sensor 2: Item No. 25 “Accel Pedal Sensor Voltage 2”.
	Inspection condition		–
	Requirements		**<General Scanning Tool used>** • Accelerator pedal released: 0% • Accelerator pedal pressed: 100% **<Multi-Use Tester used>** • Accelerator pedal released: 0.85 ± 0.1 V • Accelerator pedal pressed: 4.15 ± 0.1 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

Step 2	Inspection items		Inspection by electronic control unit connector (signal)
	Maintenance item		Measure values of voltage between following connector terminals • Sensor 1: (GF34A) terminal No. 24 (+) and (GF35B) terminal No. 30 (–). • Sensor 2: (GF34A) terminal No. 23 (+) and (GF35B) terminal No. 28 (–).
	Inspection condition		• Measure from back side of harness connector with each device connected to harness. • Starter switch: ON
	Requirements		• Accelerator pedal released: 0.85 ± 0.1 V • Accelerator pedal pressed: 4.15 ± 0.1 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Go to step 3.

Step 3	Inspection items		Inspection by electronic control unit connector (power supply)
	Maintenance item		Measure values of voltage between following connector (GF35B) terminals • Sensor 1: 19 (+) - 30 (–) • Sensor 2: 22 (+) - 28 (–)
	Inspection condition		• Measure from back side of harness connector with each device connected to harness. • Starter switch: ON
	Requirements		5 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	Go to step 5.

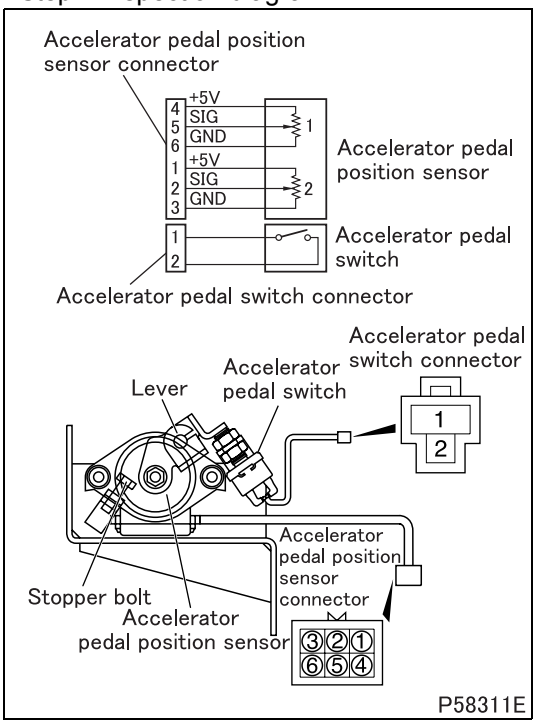
Step 4	Inspection items		Inspection by electronic control unit connector (ground)
	Maintenance item		Measure values of voltage between following connector terminals • Sensor 1: (GF35B) terminal No. 30 (+) and (GF31A) terminal No. 3 (–). • Sensor 2: (GF35B) terminal No. 28 (+) and (GF31A) terminal No. 3 (–).
	Inspection condition		• Measure from back side of harness connector with each device connected to harness. • Starter switch: ON
	Requirements		0 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Go to step 5.

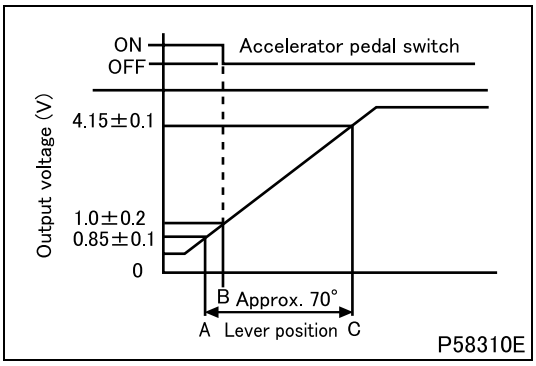
Step 5	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 12.
		NO	Modify connector.

Step 6	Inspection items		Inspection of sensor connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify connector.

Step 7	Inspection items		Inspection of accelerator pedal position sensor unit.
	Maintenance item		Measure values of voltage between the following connector terminals. • Sensor 1: 5 (+) - 6 (–) • Sensor 2: 6 (+) - 3 (–)
	Inspection condition		Apply voltage DC 5 V across connector terminals. • Sensor 1: 4 (+) - 6 (–) • Sensor 2: 1 (+) - 3 (–)
	Requirements		• Idling position A: 0.85 ± 0.1 V • Accelerator switch operating position B: 1.0 ± 0.2 V • Full-load position C: 4.15 ± 0.1 V A: When accelerator lever fully presses accelerator switch. B: When accelerator pedal is pressed until there is no continuity between terminals 1 and 2. C: When accelerator lever is in contact with full-load stopper bolt.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Adjustment of sensor (If the measurement deviates from the standard value after adjustment, replace the sensor.) (See “INSPECTION OF ELECTRICAL EQUIPMENT” - “Inspection of accelerator pedal position sensor”.)

<Step 7 inspection diagram>





Step 8	Inspection items		Inspection of harness between electronic control unit and sensor (power supply)
	Maintenance item		Measure values of voltage between the following connector terminals • Sensor 1: 4 (+) - 6 (–) • Sensor 2: 1 (+) - 3 (–)
	Inspection condition		• Measure from back side of harness connector with each device connected to harness. • Starter switch: ON
	Requirements		5 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 10.
		NO	Go to step 9.

Step 9	Inspection items		Inspection of harness between electronic control unit and sensor (power supply)
	Maintenance item		Check circuit between following connector terminals. • Sensor 1: sensor connector terminal No. 4 - electronic control unit connector (GF35B) terminal No. 19 • Sensor 2: sensor connector terminal No. 1 - electronic control unit connector (GF35B) terminal No. 22
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 12.
		NO	Modify harness.

Step 10	Inspection items		Inspection of harness between electronic control unit and sensor (ground)
	Maintenance item		Check circuit between following connector terminals. • Sensor 1: sensor connector terminal No. 6 - electronic control unit connector (GF35B) terminal No. 30 • Sensor 2: sensor connector terminal No. 3 - electronic control unit connector (GF35B) terminal No. 28
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 11.
		NO	Modify harness.

Step 11	Inspection items		Inspection of harness between electronic control unit and sensor (signal)
	Maintenance item		Check circuit between following connector terminals. • Sensor 1: sensor connector terminal No. 5 - electronic control unit connector (GF34A) terminal No. 24 • Sensor 2: sensor connector terminal No. 2 - electronic control unit connector (GF34A) terminal No. 23
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 12.
		NO	Modify harness.

Step 12	Inspection items		Inspection by control data
	Maintenance item		**<General Scanning Tool used>** Measurement of following service data • Sensor 1: Item “Accel Pedal Position 1” • Sensor 2: Item “Accel Pedal Position 2” **<Multi-Use Tester used>** Measurement of following service data • Sensor 1: Item No. 24 “Accel Pedal Sensor Voltage 1”. • Sensor 2: Item No. 25 “Accel Pedal Sensor Voltage 2”.
	Inspection condition		–
	Requirements		**<General Scanning Tool used>** • Accelerator pedal released: 0% • Accelerator pedal pressed: 100% **<Multi-Use Tester used>** • Accelerator pedal released: 0.815 ± 0.06 V • Accelerator pedal pressed: 4.15 ± 0.1 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P2146/Flash code: 82
[Monitor]
Abnormality of injector magnetic valve power supply circuit (No. 1, 3 and 5 cylinders)
[Fault (outline)]
Open circuit (No. 1, 3 and 5 cylinders)
[Diagnosis check]
- Injector magnetic valve (No. 1, 3 and 5 cylinders) circuit is monitored for fault.

[Code generation condition]
- Open circuit of injector magnetic valve (No. 1, 3 or 5 cylinders) is detected.
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal
- Injection time command: available
- Engine speed sensor: normal
- Sub-CPU: in order
- Injector charge circuit: ON
- Post injection: none

[Control effected by electronic control unit during fault]
- Injection quantity is limited.
- Exhaust gas recirculation control is stopped.
- Throttle control is stopped.
- Diesel particulate filter regeneration (manual or automatic) is stopped.
- Auto cruise control is stopped.
- Learning of FCCB (fuel control cylinder balance) is inhibited.
- 3-cylinder operation (No. 2, 4 and 6 cylinders)

[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and injector magnetic valve (No. 1, 3 and 5 cylinders)
- Abnormality of each connector
- Abnormality of injector magnetic valve (No. 1, 3 and 5 cylinders)
- Abnormality in electronic control unit

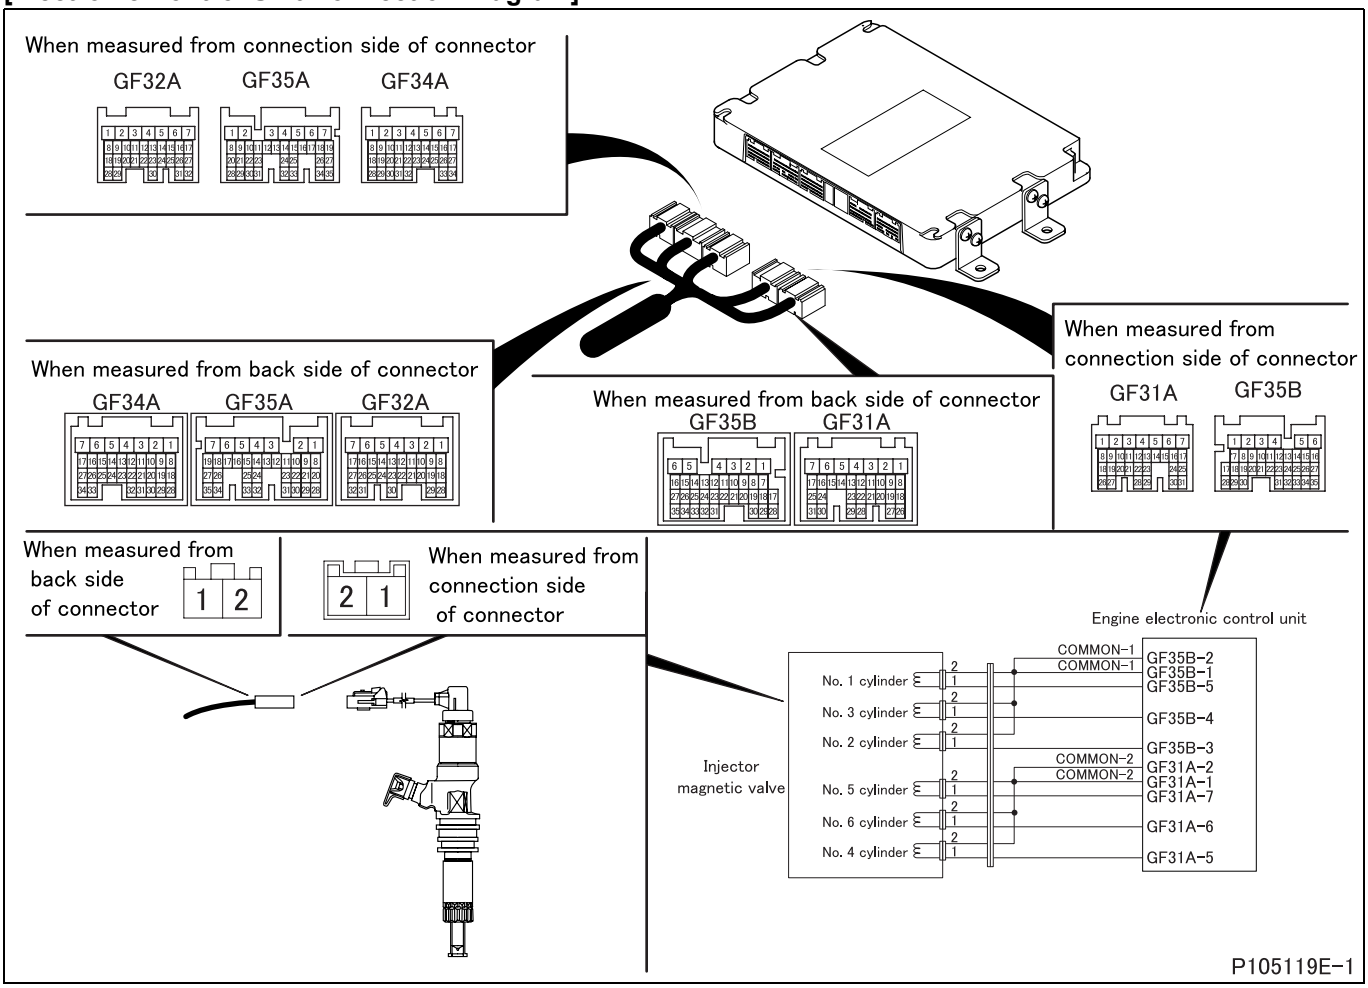
[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>
- Extinguished at 4th driving cycle after normal signal is input.

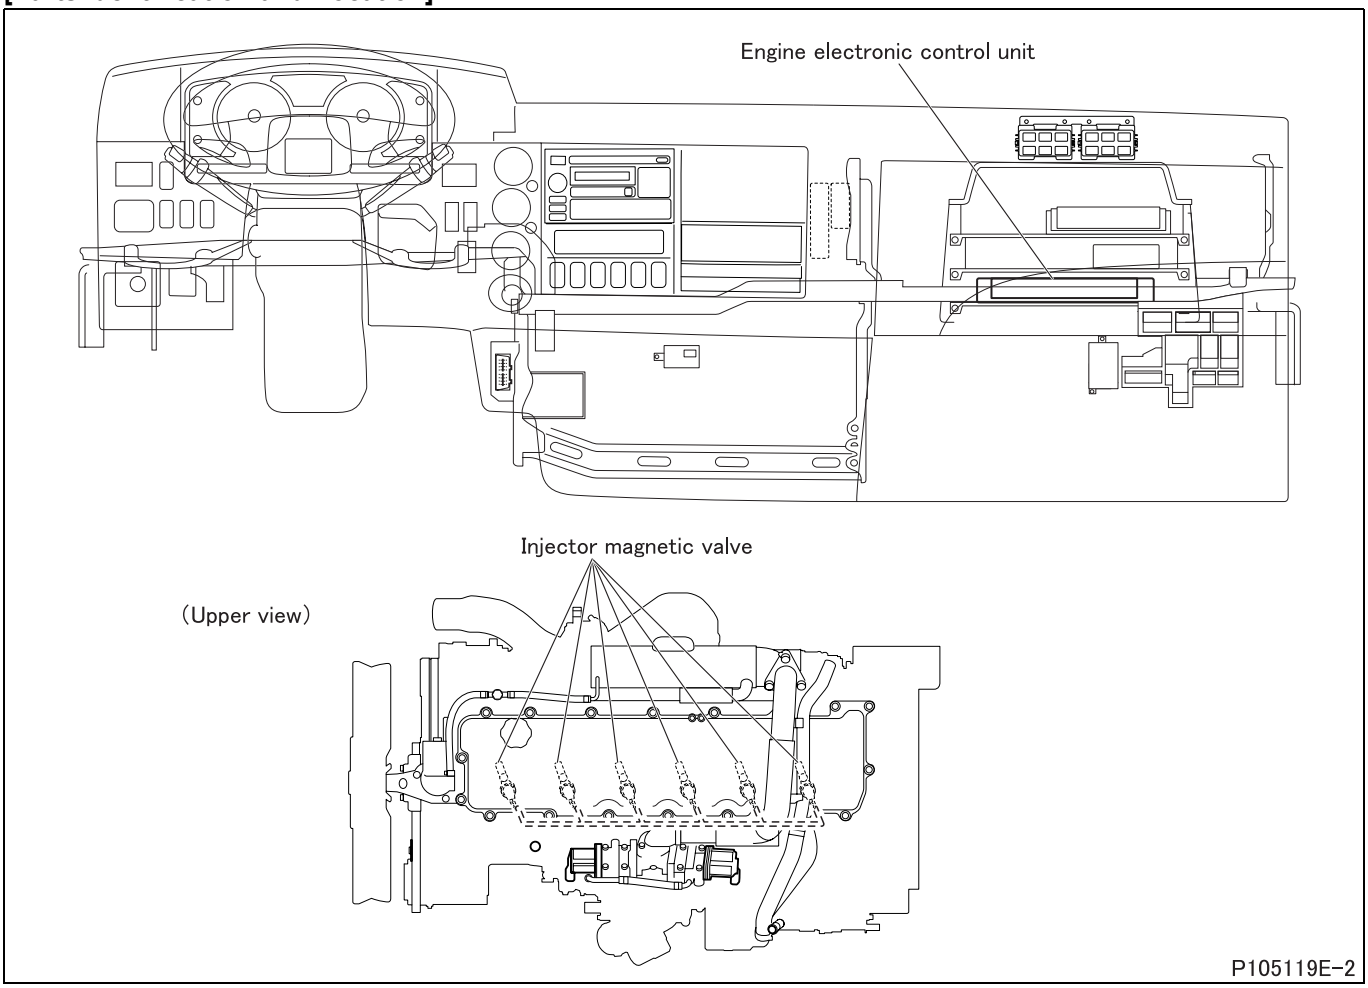
<Fault code>
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished.
  (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		Perform following actuator test. • Injector magnetic valve (No. 1 cylinder): perform item No. BB “Injector Test 1.” • Injector magnetic valve (No. 3 cylinder): perform item No. BD “Injector Test 3.” • Injector magnetic valve (No. 5 cylinder): perform item No. BC “Injector Test 2.”
	Inspection condition		• Vehicle: stationary (vehicle speed 0 km/h {0 MPH}) • Engine start: At idle • Transmission: neutral • The current diagnosis code does not occur.
	Requirements		Injector is stopped during actuator test with engine changed in operating condition (vibrating).
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

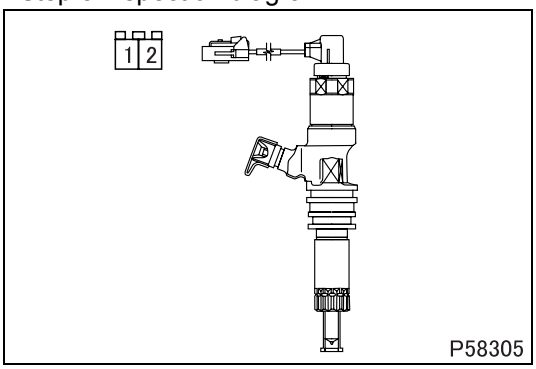
Step 2	Inspection items		Inspection by electronic control unit connector
	Maintenance item		Measure values of voltage between following connector terminals • Injector magnetic valve (No. 1 cylinder): (GF35B) terminal No. 1 or 2 (+) and (GF35B) terminal No. 5 (–). • Injector magnetic valve (No. 3 cylinder): (GF35B) terminal No. 1 or 2 (+) and (GF35B) terminal No. 4 (–). • Injector magnetic valve (No. 5 cylinder): (GF31A) terminal No. 1 or 2 (+) and (GF31A) terminal No. 7 (–).
	Inspection condition		Disconnect electronic control unit from harness and measure from connection side of harness connector.
	Requirements		0.45 ± 0.1 Ω (20°C {68°F})
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Go to step 4.

Step 3	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify connector.

Step 4	Inspection items		Inspection of injector magnetic valve connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Modify connector.

Step 5	Inspection items		Inspection of injector magnetic valve unit
	Maintenance item		Measure value of resistance between connector terminal No. 1 and 2.
	Inspection condition		–
	Requirements		0.45 ± 0.1 Ω (20°C {68°F})
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Replacement of injector

<Step 5 inspection diagram>



Step 6	Inspection items		Inspection of harness between injector magnetic valve and electronic control unit (power supply)
	Maintenance item		Check circuit between following connector terminals. • Injector magnetic valve (No. 1 cylinder): injector magnetic valve connector terminal No. 2 - electronic control unit connector (GF35B) terminal No. 1 or 2 • Injector magnetic valve (No. 3 cylinder): injector magnetic valve connector terminal No. 2 - electronic control unit connector (GF35B) terminal No. 1 or 2 • Injector magnetic valve (No. 5 cylinder): injector magnetic valve connector terminal No. 2 - electronic control unit connector (GF31A) terminal No. 1 or 2.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify harness.

Step 7	Inspection items		Inspection of harness between injector magnetic valve and electronic control unit (ground)
	Maintenance item		Check circuit between following connector terminals. • Injector magnetic valve (No. 1 cylinder): injector magnetic valve connector terminal No. 1 - electronic control unit connector (GF35B) terminal No. 5 • Injector magnetic valve (No. 3 cylinder): injector magnetic valve connector terminal No. 1 - electronic control unit connector (GF35B) terminal No. 4 • Injector magnetic valve (No. 5 cylinder): injector magnetic valve connector terminal No. 1 - electronic control unit connector (GF31A) terminal No. 7
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify harness.

Step 8	Inspection items		Inspection by control data
	Maintenance item		Perform following actuator test. • Injector magnetic valve (No. 1 cylinder): Perform item No. BB “Injector Test 1.” • Injector magnetic valve (No. 3 cylinder): Perform item No. BD “Injector Test 3.” • Injector magnetic valve (No. 5 cylinder): Perform item No. BC “Injector Test 2.”
	Inspection condition		• Vehicle: stationary (vehicle speed 0 km/h {0 MPH}) • Engine start: At idle • Transmission: neutral • The current diagnosis code does not occur.
	Requirements		Injector is stopped during actuator test with engine changed in operating condition (vibrating).
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P2147/Flash code: 82
[Monitor]
Injector magnetic valve (No. 1, 3 and 5 cylinders)
[Fault (outline)]
- Injector short circuit ground
- Injector open circuit
  (No. 1, 3 and 5 cylinders)

[Diagnosis check]
- Injector magnetic valve (No. 1, 3 and 5 cylinders) circuit is monitored for fault.

[Code generation condition]
- Short-circuit to ground of injector magnetic valve (No. 1, 3 and 5 cylinders) is detected.
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal
- Post injection: none
- Engine speed sensor: normal

[Control effected by electronic control unit during fault]
- Injection quantity is limited.
- Main injection only is allowed.
- Common rail pressure is limited.
- Exhaust gas recirculation control is stopped.
- Throttle control is stopped.
- Diesel particulate filter regeneration (manual or automatic) is stopped.
- Auto cruise control is stopped.
- Learning of FCCB (fuel control cylinder balance) is inhibited.
- 3-cylinder operation (No. 1, 3 and 5 cylinders)

[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and injector magnetic valve (No. 1, 3 and 5 cylinders)
- Abnormality of each connector
- Abnormality of injector magnetic valve (No. 1, 3 and 5 cylinders)
- Abnormality in electronic control unit

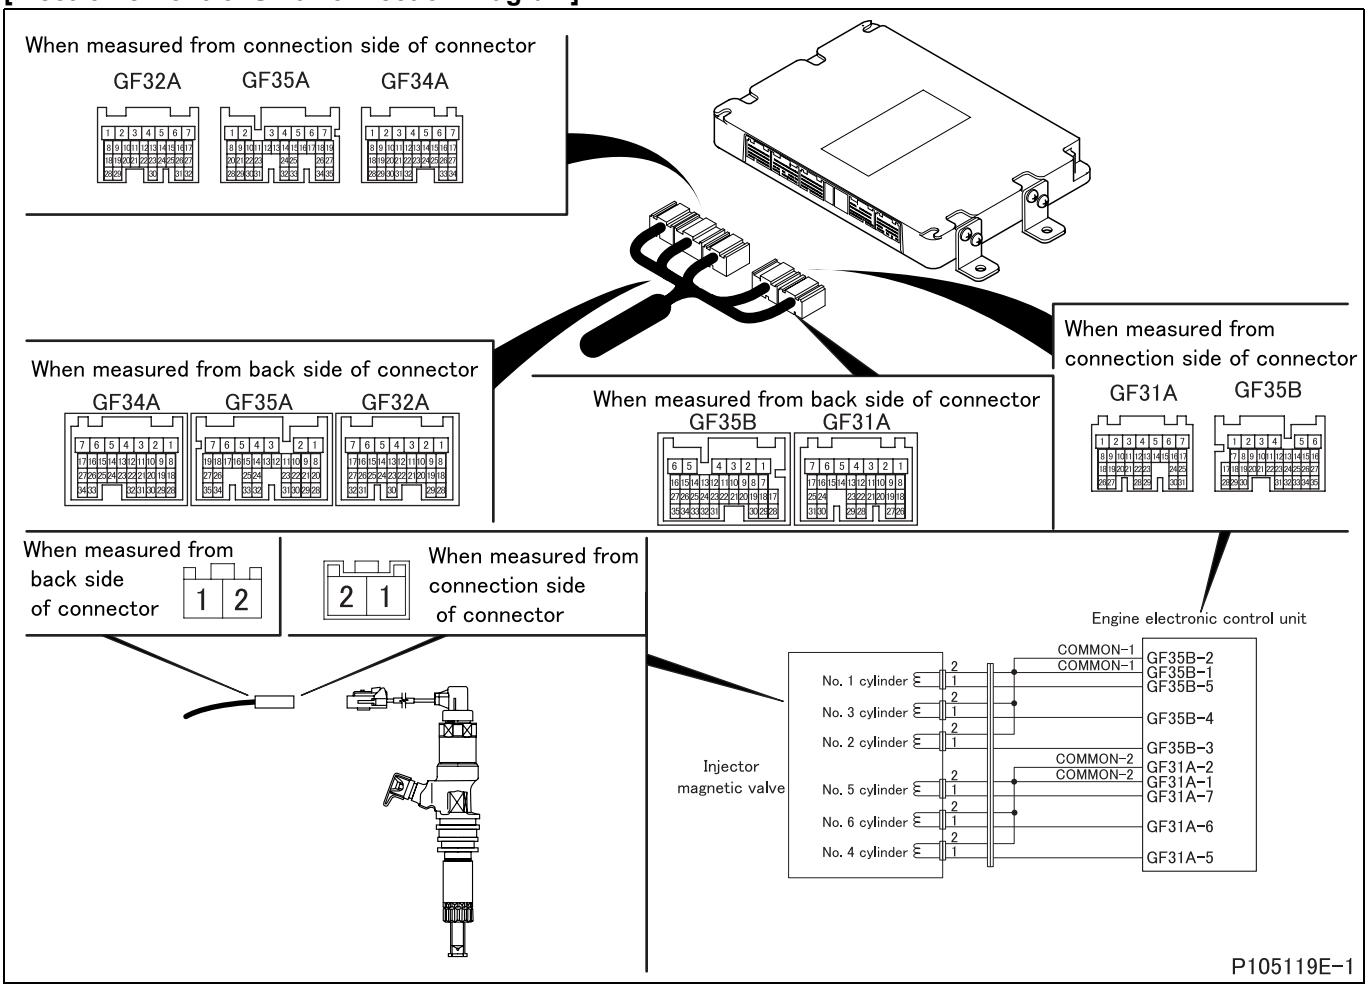
[Recoverability]
<Control during fault>
- Recovered if signal becomes normal when starter switch is turned OFF to ON (power supply resumed to electronic control unit).

<Warning lamp>
- Extinguished at 4th driving cycle after normal signal is input.

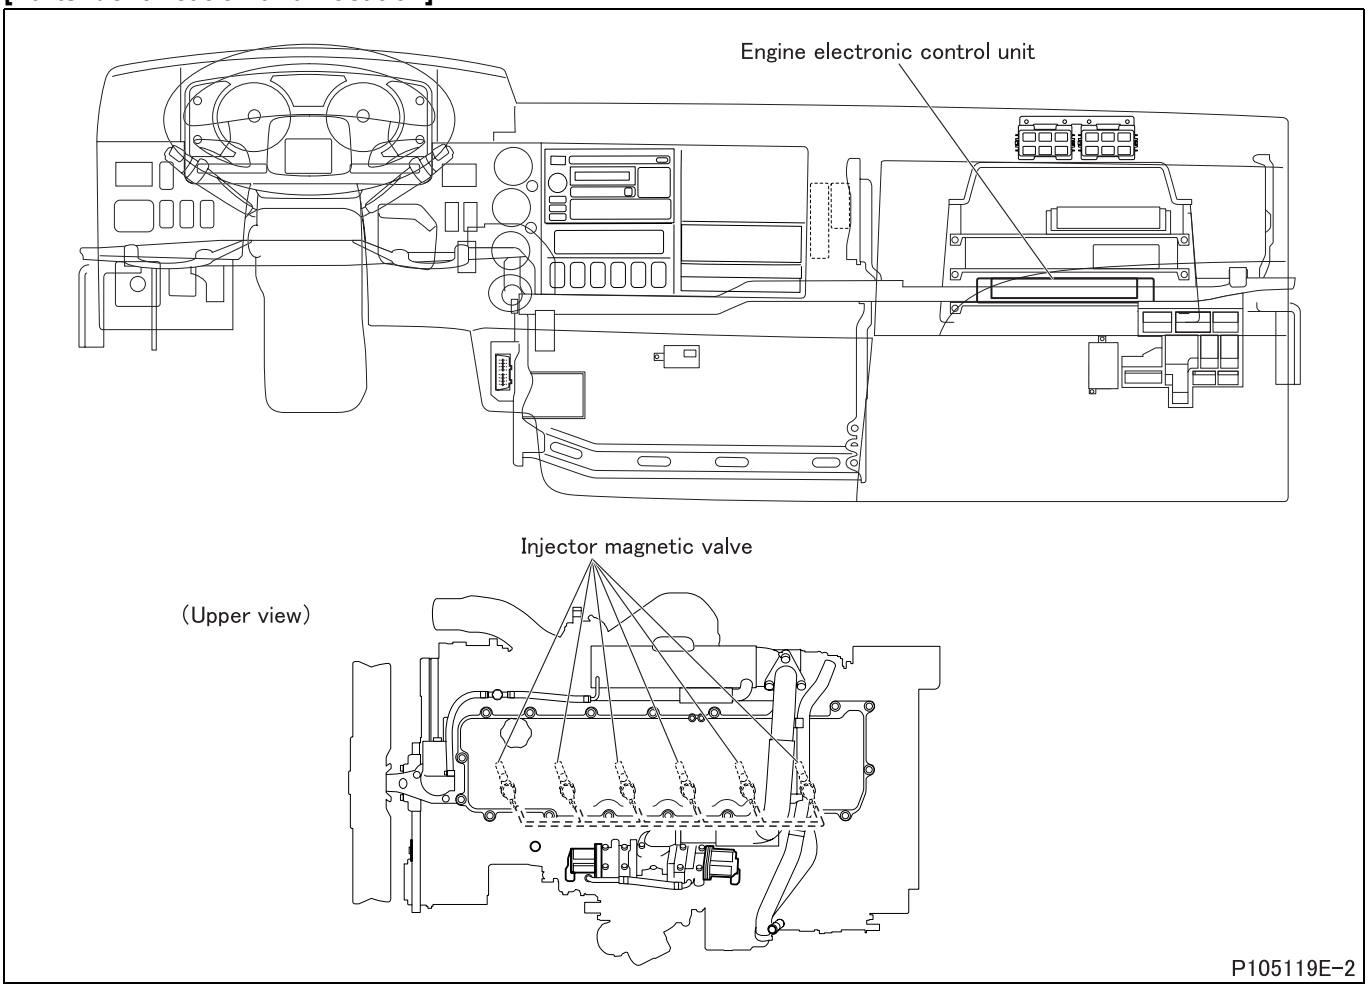
<Fault code>
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished.
  (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		Perform following actuator test. • Injector magnetic valve (No. 1 cylinder): perform item No. BB “Injector Test 1.” • Injector magnetic valve (No. 3 cylinder): perform item No. BD “Injector Test 3.” • Injector magnetic valve (No. 5 cylinder): perform item No. BC “Injector Test 2.”
	Inspection condition		• Vehicle: stationary (vehicle speed 0 km/h {0 MPH}) • Engine start: At idle • Transmission: neutral • The current diagnosis code does not occur.
	Requirements		Injector is stopped during actuator test with engine changed in operating condition (vibrating).
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

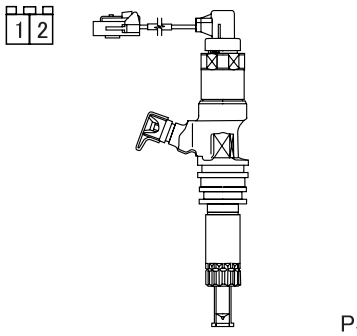
Step 2	Inspection items		Inspection by electronic control unit connector
	Maintenance item		Measure values of voltage between following connector terminals • Injector magnetic valve (No. 1 cylinder): (GF35B) terminal No. 1 or 2 (+) and (GF35B) terminal No. 5 (–). • Injector magnetic valve (No. 3 cylinder): (GF35B) terminal No. 1 or 2 (+) and (GF35B) terminal No. 4 (–). • Injector magnetic valve (No. 5 cylinder): (GF31A) terminal No. 1 or 2 (+) and (GF31A) terminal No. 7 (–).
	Inspection condition		Disconnect electronic control unit from harness and measure from connection side of harness connector.
	Requirements		0.45 ± 0.1 Ω (20°C {68°F})
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Go to step 4.

Step 3	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify connector.

Step 4	Inspection items		Inspection of injector magnetic valve connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Modify connector.

Step 5	Inspection items		Inspection of injector magnetic valve unit
	Maintenance item		Measure value of resistance between connector terminal No. 1 and 2.
	Inspection condition		–
	Requirements		0.45 ± 0.1 Ω (20°C {68°F})
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Replacement of injector

<Step 5 inspection diagram>



Step 6	Inspection items		Inspection of harness between injector magnetic valve and electronic control unit (power supply)
	Maintenance item		Check circuit between following connector terminals. • Injector magnetic valve (No. 1 cylinder): injector magnetic valve connector terminal No. 2 - electronic control unit connector (GF35B) terminal No. 1 or 2 • Injector magnetic valve (No. 3 cylinder): injector magnetic valve connector terminal No. 2 - electronic control unit connector (GF35B) terminal No. 1 or 2 • Injector magnetic valve (No. 5 cylinder): injector magnetic valve connector terminal No. 2 - electronic control unit connector (GF31A) terminal No. 1 or 2.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify harness.

Step 7	Inspection items		Inspection of harness between injector magnetic valve and electronic control unit (ground)
	Maintenance item		Check circuit between following connector terminals. • Injector magnetic valve (No. 1 cylinder): injector magnetic valve connector terminal No. 1 - electronic control unit connector (GF35B) terminal No. 5 • Injector magnetic valve (No. 3 cylinder): injector magnetic valve connector terminal No. 1 - electronic control unit connector (GF35B) terminal No. 4 • Injector magnetic valve (No. 5 cylinder): injector magnetic valve connector terminal No. 1 - electronic control unit connector (GF31A) terminal No. 7
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify harness.

Step 8	Inspection items		Inspection by control data
	Maintenance item		Perform following actuator test. • Injector magnetic valve (No. 1 cylinder): Perform item No. BB “Injector Test 1.” • Injector magnetic valve (No. 3 cylinder): Perform item No. BD “Injector Test 3.” • Injector magnetic valve (No. 5 cylinder): Perform item No. BC “Injector Test 2.”
	Inspection condition		• Vehicle: stationary (vehicle speed 0 km/h {0 MPH}) • Engine start: At idle • Transmission: neutral • The current diagnosis code does not occur.
	Requirements		Injector is stopped during actuator test with engine changed in operating condition (vibrating).
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P2148/Flash code: 82
[Monitor]
Injector magnetic valve (No. 1, 3 and 5 cylinders)
[Fault (outline)]
Injector short circuit battery (No. 1, 3 and 5 cylinders)
[Diagnosis check]
- Injector magnetic valve (No. 1, 3 and 5 cylinders) circuit is monitored for fault.

[Code generation condition]
- Short circuit to battery of injector magnetic valve (No. 1, 3 and 5 cylinders) is detected.
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal
- Post injection: none
- Engine speed sensor: normal

[Control effected by electronic control unit during fault]
- Injection quantity is limited.
- Main injection only is allowed.
- Common rail pressure is limited.
- Exhaust gas recirculation control is stopped.
- Throttle control is stopped.
- Diesel particulate filter regeneration (manual or automatic) is stopped.
- Auto cruise control is stopped.
- Fault detection for controller area network communication is stopped.
- Learning of FCCB (fuel control cylinder balance) is inhibited.
- 3-cylinder operation (No. 1, 3 and 5 cylinders)

[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and injector magnetic valve (No. 1, 3 and 5 cylinders)
- Abnormality of each connector
- Abnormality of injector magnetic valve (No. 1, 3 and 5 cylinders)
- Abnormality in electronic control unit

[Recoverability]
<Control during fault>
- Recovered if signal becomes normal when starter switch is turned OFF to ON (power supply resumed to electronic control unit).

<Warning lamp>
- Extinguished at 4th driving cycle after normal signal is input.

<Fault code>
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished.
  (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

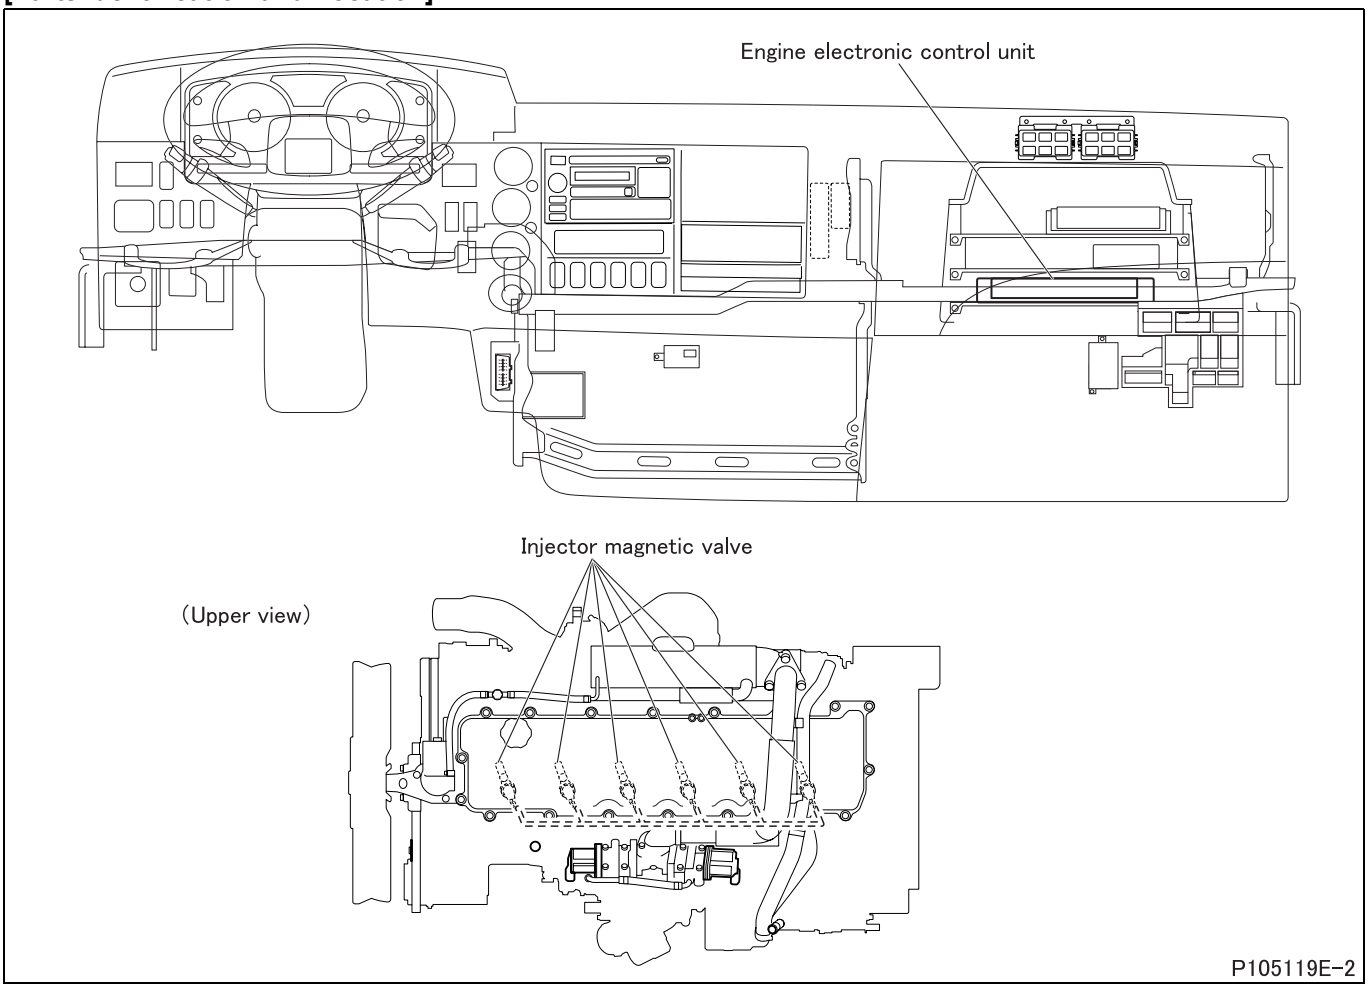
[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		Perform following actuator test. • Injector magnetic valve (No. 1 cylinder): perform item No. BB “Injector Test 1.” • Injector magnetic valve (No. 3 cylinder): perform item No. BD “Injector Test 3.” • Injector magnetic valve (No. 5 cylinder): perform item No. BC “Injector Test 2.”
	Inspection condition		• Vehicle: stationary (vehicle speed 0 km/h {0 MPH}) • Engine start: At idle • Transmission: neutral • The current diagnosis code does not occur.
	Requirements		Injector is stopped during actuator test with engine changed in operating condition (vibrating).
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

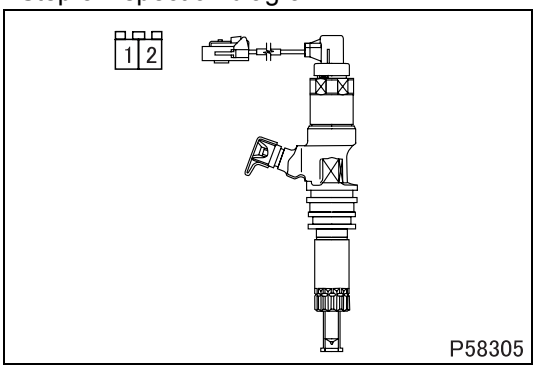
Step 2	Inspection items		Inspection by electronic control unit connector
	Maintenance item		Measure values of voltage between following connector terminals • Injector magnetic valve (No. 1 cylinder): (GF35B) terminal No. 1 or 2 (+) and (GF35B) terminal No. 5 (–). • Injector magnetic valve (No. 3 cylinder): (GF35B) terminal No. 1 or 2 (+) and (GF35B) terminal No. 4 (–). • Injector magnetic valve (No. 5 cylinder): (GF31A) terminal No. 1 or 2 (+) and (GF31A) terminal No. 7 (–).
	Inspection condition		Disconnect electronic control unit from harness and measure from connection side of harness connector.
	Requirements		0.45 ± 0.1 Ω (20°C {68°F})
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Go to step 4.

Step 3	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify connector.

Step 4	Inspection items		Inspection of injector magnetic valve connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Modify connector.

Step 5	Inspection items		Inspection of injector magnetic valve unit
	Maintenance item		Measure value of resistance between connector terminal No. 1 and 2.
	Inspection condition		–
	Requirements		0.45 ± 0.1 Ω (20°C {68°F})
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Replacement of injector

<Step 5 inspection diagram>



Step 6	Inspection items		Inspection of harness between injector magnetic valve and electronic control unit (power supply)
	Maintenance item		Check circuit between following connector terminals. • Injector magnetic valve (No. 1 cylinder): injector magnetic valve connector terminal No. 2 - electronic control unit connector (GF35B) terminal No. 1 or 2 • Injector magnetic valve (No. 3 cylinder): injector magnetic valve connector terminal No. 2 - electronic control unit connector (GF35B) terminal No. 1 or 2 • Injector magnetic valve (No. 5 cylinder): magnetic valve connector terminal No. 2 - electronic control unit connector (GF31A) terminal No. 1 or 2
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify harness.

Step 7	Inspection items		Inspection of harness between injector magnetic valve and electronic control unit (ground)
	Maintenance item		Check circuit between following connector terminals. • Injector magnetic valve (No. 1 cylinder): injector magnetic valve connector terminal No. 1 - electronic control unit connector (GF35B) terminal No. 5 • Injector magnetic valve (No. 3 cylinder): injector magnetic valve connector terminal No. 1 - electronic control unit connector (GF35B) terminal No. 4 • Injector magnetic valve (No. 5 cylinder): injector magnetic valve connector terminal No. 1 - electronic control unit connector (GF31A) terminal No. 7
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify harness.

Step 8	Inspection items		Inspection by control data
	Maintenance item		Perform following actuator test. • Injector magnetic valve (No. 1 cylinder): Perform item No. BB “Injector Test 1.” • Injector magnetic valve (No. 3 cylinder): Perform item No. BD “Injector Test 3.” • Injector magnetic valve (No. 5 cylinder): Perform item No. BC “Injector Test 2.”
	Inspection condition		• Vehicle: stationary (vehicle speed 0 km/h {0 MPH}) • Engine start: At idle • Transmission: neutral • The current diagnosis code does not occur.
	Requirements		Injector is stopped during actuator test with engine changed in operating condition (vibrating).
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P2149/Flash code: 82
[Monitor]
Injector magnetic valve (No. 2, 4 and 6 cylinders)
[Fault (outline)]
Open circuit (No. 2, 4 and 6 cylinders)
[Diagnosis check]
- Injector magnetic valve (No. 2, 4 and 6 cylinders) circuit is monitored for fault.

[Code generation condition]
- Open-circuit of injector magnetic valve (No. 2, 4 and 6 cylinders) is detected.
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal
- Injection time command: available
- Engine speed sensor: normal
- Sub-CPU: in order
- Injector charge circuit: ON
- Post injection: none

[Control effected by electronic control unit during fault]
- Exhaust gas recirculation control is stopped.
- Throttle control is stopped.
- Diesel particulate filter regeneration (manual or automatic) is stopped.
- Auto cruise control is stopped.
- Learning of FCCB (fuel control cylinder balance) is inhibited.
- 3-cylinder operation (No. 1, 3 and 5 cylinders)

[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and injector magnetic valve (No. 2, 4 and 6 cylinders)
- Abnormality of each connector
- Abnormality of injector magnetic valve (No. 2, 4 and 6 cylinders)
- Abnormality in electronic control unit

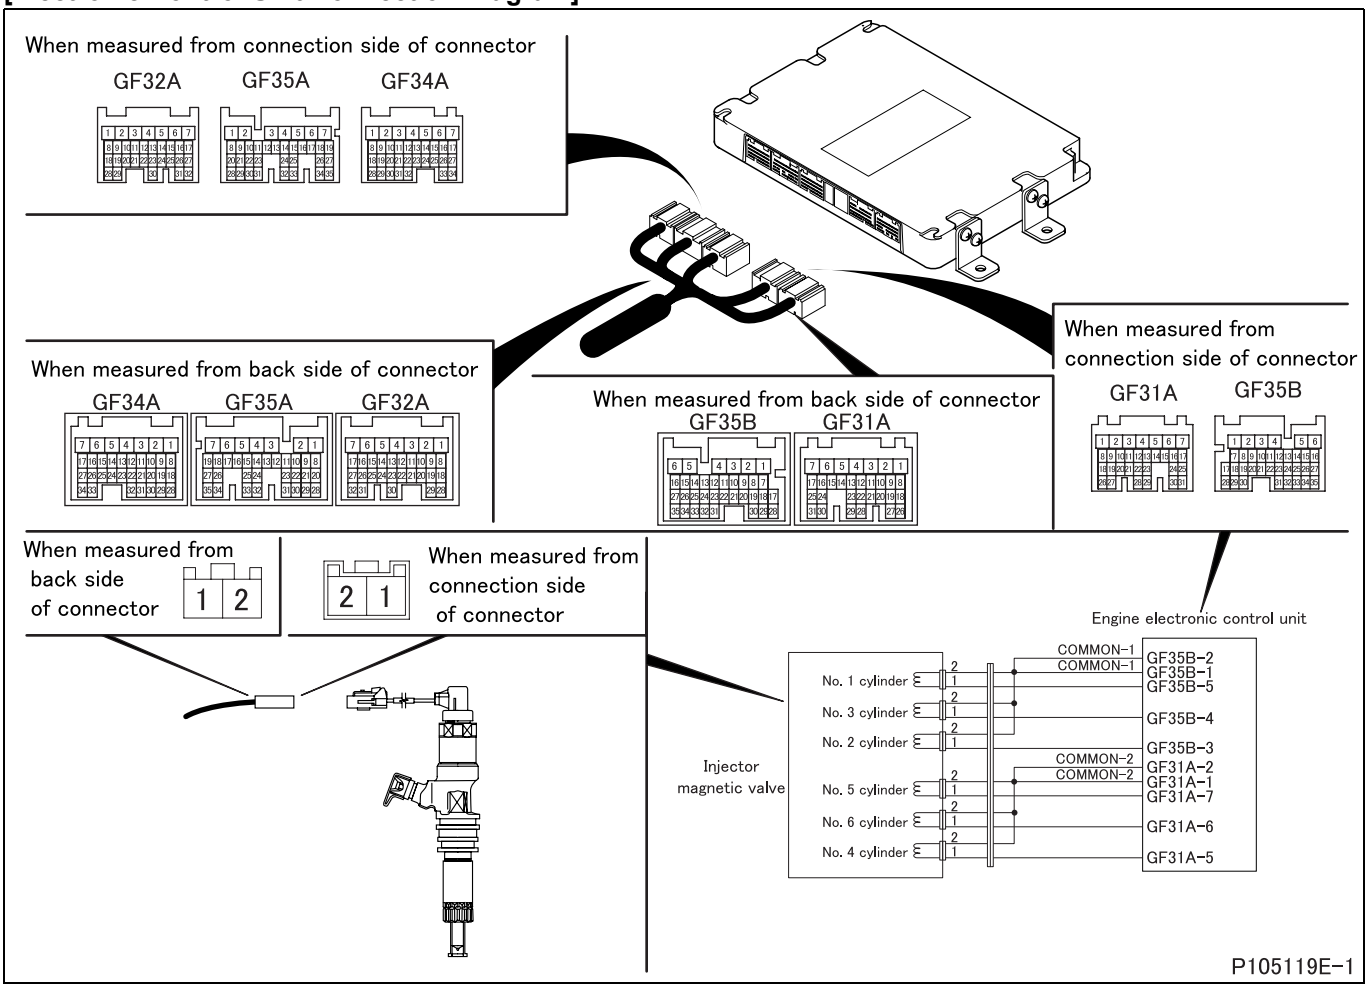
[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>
- Extinguished at 4th driving cycle after normal signal is input.

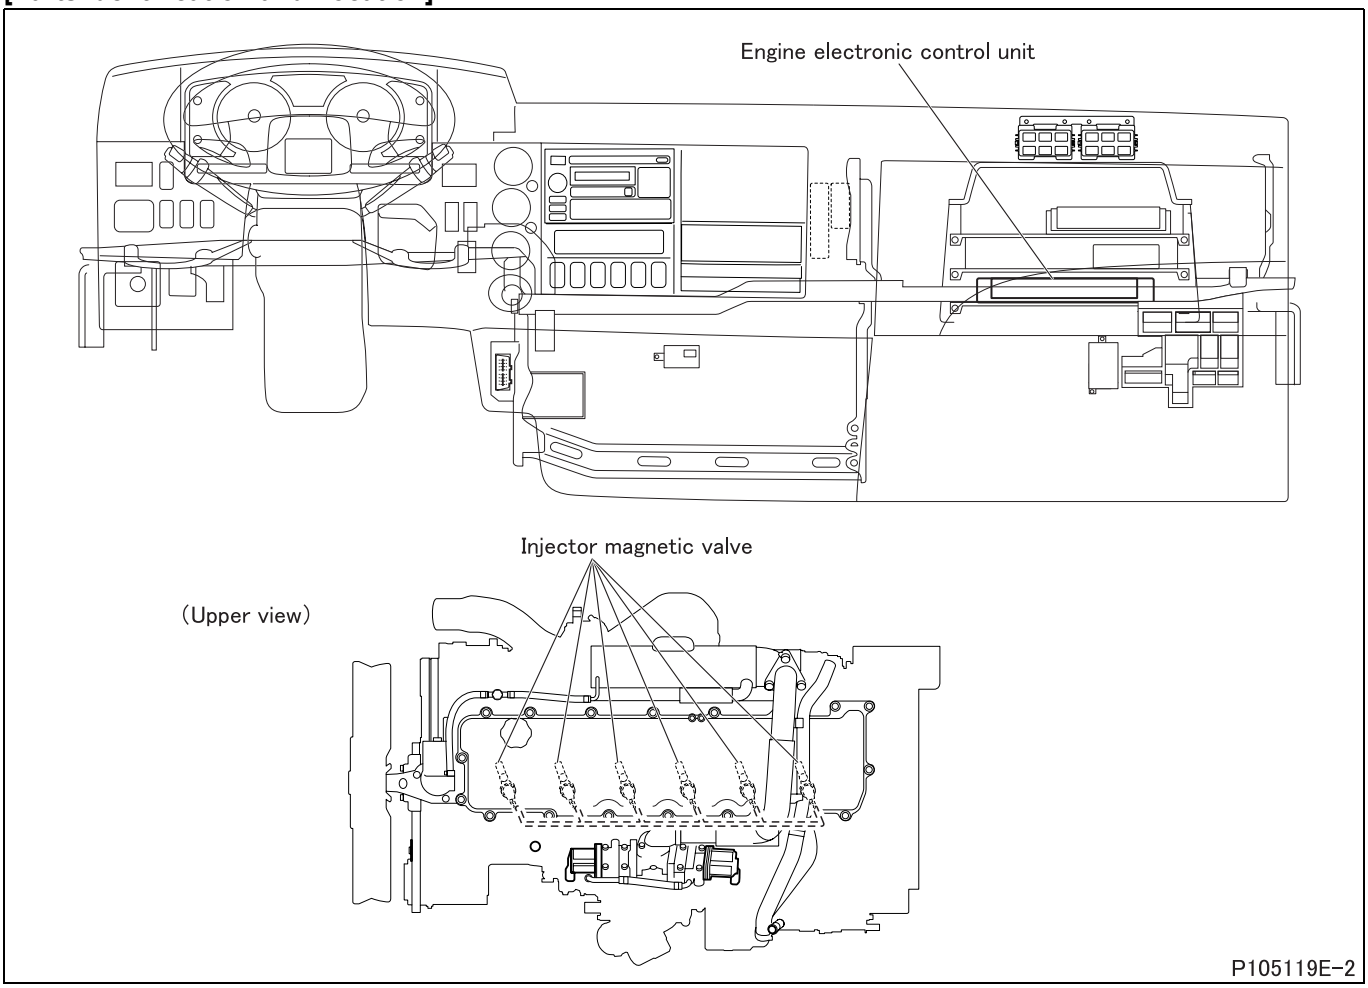
<Fault code>
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished.
  (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		Perform following actuator test. • Injector magnetic valve (No. 2 cylinder): Perform item No. BF “Injector Test 5”. • Injector magnetic valve (No. 4 cylinder): Perform item No. C0 “Injector Test 6”. • Injector magnetic valve (No. 6 cylinder): Perform item No. BE “Injector Test 4”.
	Inspection condition		• Vehicle: stationary (vehicle speed 0 km/h {0 MPH}) • Engine start: At idle • Transmission: neutral • The current diagnosis code does not occur.
	Requirements		Injector is stopped during actuator test with engine changed in operating condition (vibrating).
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

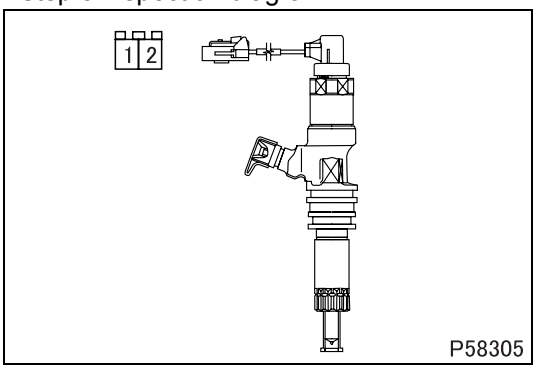
Step 2	Inspection items		Inspection by electronic control unit connector
	Maintenance item		Measure values of voltage between following connector terminals • Injector magnetic valve (No. 2 cylinder): (GF35B) terminal No. 1 or 2 (+) and (GF35B) terminal No. 3 (–) • Injector magnetic valve (No. 4 cylinder): (GF31A) terminal No. 1 or 2 (+) and (GF31A) terminal No. 5 (–) • Injector magnetic valve (No. 6 cylinder): (GF31A) terminal No. 1 or 2 (+) and (GF31A) terminal No. 6 (–)
	Inspection condition		Disconnect electronic control unit from harness and measure from connection side of harness connector.
	Requirements		0.45 ± 0.1 Ω (20°C {68°F})
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Go to step 4.

Step 3	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify connector.

Step 4	Inspection items		Inspection of injector magnetic valve connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Modify connector.

Step 5	Inspection items		Inspection of injector magnetic valve unit
	Maintenance item		Measure value of resistance between connector terminal No. 1 and 2.
	Inspection condition		–
	Requirements		0.45 ± 0.1 Ω (20°C {68°F})
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Replacement of injector

<Step 5 inspection diagram>



Step 6	Inspection items		Inspection of harness between injector magnetic valve and electronic control unit (power supply)
	Maintenance item		Check circuit between following connector terminals. • Injector magnetic valve (No. 2 cylinder): injector magnetic valve connector terminal No. 2 - electronic control unit connector (GF35B) terminal No. 1 or 2 • Injector magnetic valve (No. 4 cylinder): injector magnetic valve connector terminal No. 2 - electronic control unit connector (GF31A) terminal No. 1 or 2 • Injector magnetic valve (No. 6 cylinder): injector magnetic valve connector terminal No. 2 - electronic control unit connector (GF31A) terminal No. 1 or 2
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify harness.

Step 7	Inspection items		Inspection of harness between injector magnetic valve and electronic control unit (ground)
	Maintenance item		Check circuit between following connector terminals. • Injector magnetic valve (No. 2 cylinder): injector magnetic valve connector terminal No. 1 - electronic control unit connector (GF35B) terminal No. 3 • Injector magnetic valve (No. 4 cylinder): injector magnetic valve connector terminal No. 1 - electronic control unit connector (GF31A) terminal No. 5 • Injector magnetic valve (No. 6 cylinder): injector magnetic valve connector terminal No. 1 - electronic control unit connector (GF31A) terminal No. 6
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify harness.

Step 8	Inspection items		Inspection by control data
	Maintenance item		Perform following actuator test. • Injector magnetic valve (No. 2 cylinder): Perform item No. BF “Injector Test 5”. • Injector magnetic valve (No. 4 cylinder): Perform item No. C0 “Injector Test 6”. • Injector magnetic valve (No. 6 cylinder): Perform item No. BE “Injector Test 4”.
	Inspection condition		• Vehicle: stationary (vehicle speed 0 km/h {0 MPH}) • Engine start: At idle • Transmission: neutral • The current diagnosis code does not occur.
	Requirements		Injector is stopped during actuator test with engine changed in operating condition (vibrating).
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P2150/Flash code: 82
[Monitor]
Injector magnetic valve (No. 2, 4 and 6 cylinders)
[Fault (outline)]
- Injector short circuit ground
- Injector open circuit
  (No. 2, 4 and 6 cylinders)

[Diagnosis check]
- Injector magnetic valve (No. 2, 4 and 6 cylinders) circuit is monitored for fault.

[Code generation condition]
- Short-circuit to ground of injector magnetic valve (No. 2, 4 and 6 cylinders) is detected.
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]

[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		Perform following actuator test. • Injector magnetic valve (No. 2 cylinder): perform item No. BF “Injector Test 5”. • Injector magnetic valve (No. 4 cylinder): perform item No. C0 “Injector Test 6”. • Injector magnetic valve (No. 6 cylinder): perform item No. BE “Injector Test 4”.
	Inspection condition		• Vehicle: stationary (vehicle speed 0 km/h {0 MPH}) • Engine start: At idle • Transmission: neutral • The current diagnosis code does not occur.
	Requirements		Injector is stopped during actuator test with engine changed in operating condition (vibrating).
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

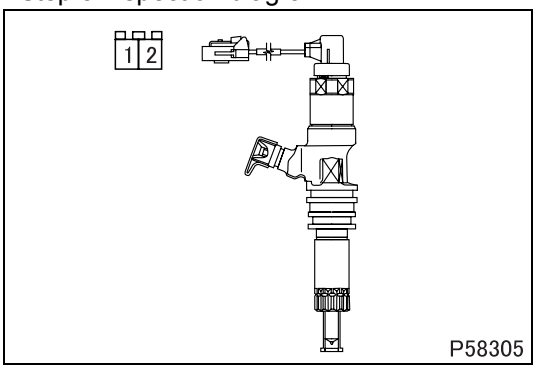
Step 2	Inspection items		Inspection by electronic control unit connector
	Maintenance item		Measure values of voltage between following connector terminals • Injector magnetic valve (No. 2 cylinder): (GF35B) terminal No. 1 or 2 (+) and (GF35B) terminal No. 3 (–) • Injector magnetic valve (No. 4 cylinder): (GF31A) terminal No. 1 or 2 (+) and (GF31A) terminal No. 5 (–) • Injector magnetic valve (No. 6 cylinder): (GF31A) terminal No. 1 or 2 (+) and (GF31A) terminal No. 6 (–)
	Inspection condition		Disconnect electronic control unit from harness and measure from connection side of harness connector.
	Requirements		0.45 ± 0.1 Ω (20°C {68°F})
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Go to step 4.

Step 3	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify connector.

Step 4	Inspection items		Inspection of injector magnetic valve connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Modify connector.

Step 5	Inspection items		Inspection of injector magnetic valve unit
	Maintenance item		Measure value of resistance between connector terminal No. 1 and 2.
	Inspection condition		–
	Requirements		0.45 ± 0.1 Ω (20°C {68°F})
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Replacement of injector

<Step 5 inspection diagram>



Step 6	Inspection items		Inspection of harness between injector magnetic valve and electronic control unit (power supply)
	Maintenance item		Check circuit between following connector terminals. • Injector magnetic valve (No. 2 cylinder): injector magnetic valve connector terminal No. 2 - electronic control unit connector (GF35B) terminal No. 1 or 2 • Injector magnetic valve (No. 4 cylinder): injector magnetic valve connector terminal No. 2 - electronic control unit connector (GF31A) terminal No. 1 or 2 • Injector magnetic valve (No. 6 cylinder): injector magnetic valve connector terminal No. 2 - electronic control unit connector (GF31A) terminal No. 1 or 2
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify harness.

Step 7	Inspection items		Inspection of harness between injector magnetic valve and electronic control unit (ground)
	Maintenance item		Check circuit between following connector terminals. • Injector magnetic valve (No. 2 cylinder): injector magnetic valve connector terminal No. 1 - electronic control unit connector (GF35B) terminal No. 3 • Injector magnetic valve (No. 4 cylinder): injector magnetic valve connector terminal No. 1 - electronic control unit connector (GF31A) terminal No. 5 • Injector magnetic valve (No. 6 cylinder): injector magnetic valve connector terminal No. 1 - electronic control unit connector (GF31A) terminal No. 6
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify harness.

Step 8	Inspection items		Inspection by control data
	Maintenance item		Perform following actuator test. • Injector magnetic valve (No. 2 cylinder): Perform item No. BF “Injector Test 5”. • Injector magnetic valve (No. 4 cylinder): Perform item No. C0 “Injector Test 6”. • Injector magnetic valve (No. 6 cylinder): Perform item No. BE “Injector Test 4”.
	Inspection condition		• Vehicle: stationary (vehicle speed 0 km/h {0 MPH}) • Engine start: At idle • Transmission: neutral • The current diagnosis code does not occur.
	Requirements		Injector is stopped during actuator test with engine changed in operating condition (vibrating).
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P2151/Flash code: 82
[Monitor]
Injector magnetic valve (No. 2, 4 and 6 cylinders)
[Fault (outline)]
Injector short circuit battery (No. 2, 4 and 6 cylinders)
[Diagnosis check]
- Injector magnetic valve (No. 2, 4 and 6 cylinders) circuit is monitored for fault.

[Code generation condition]
- Short-circuit to battery of injector magnetic valve (No. 2, 4 and 6 cylinders) is detected.
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal
- Post injection: none
- Engine speed sensor: normal

[Control effected by electronic control unit during fault]
- Injection quantity is limited.
- Main injection only is allowed.
- Common rail pressure is limited.
- Exhaust gas recirculation control is stopped.
- Throttle control is stopped.
- Diesel particulate filter regeneration (manual or automatic) is stopped.
- Auto cruise control is stopped.
- Learning of FCCB (fuel control cylinder balance) is inhibited.
- 3-cylinder operation (No. 1, 3 and 5 cylinders)

[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and injector magnetic valve (No. 2, 4 and 6 cylinders)
- Abnormality of each connector
- Abnormality of injector magnetic valve (No. 2, 4 and 6 cylinders)
- Abnormality in electronic control unit

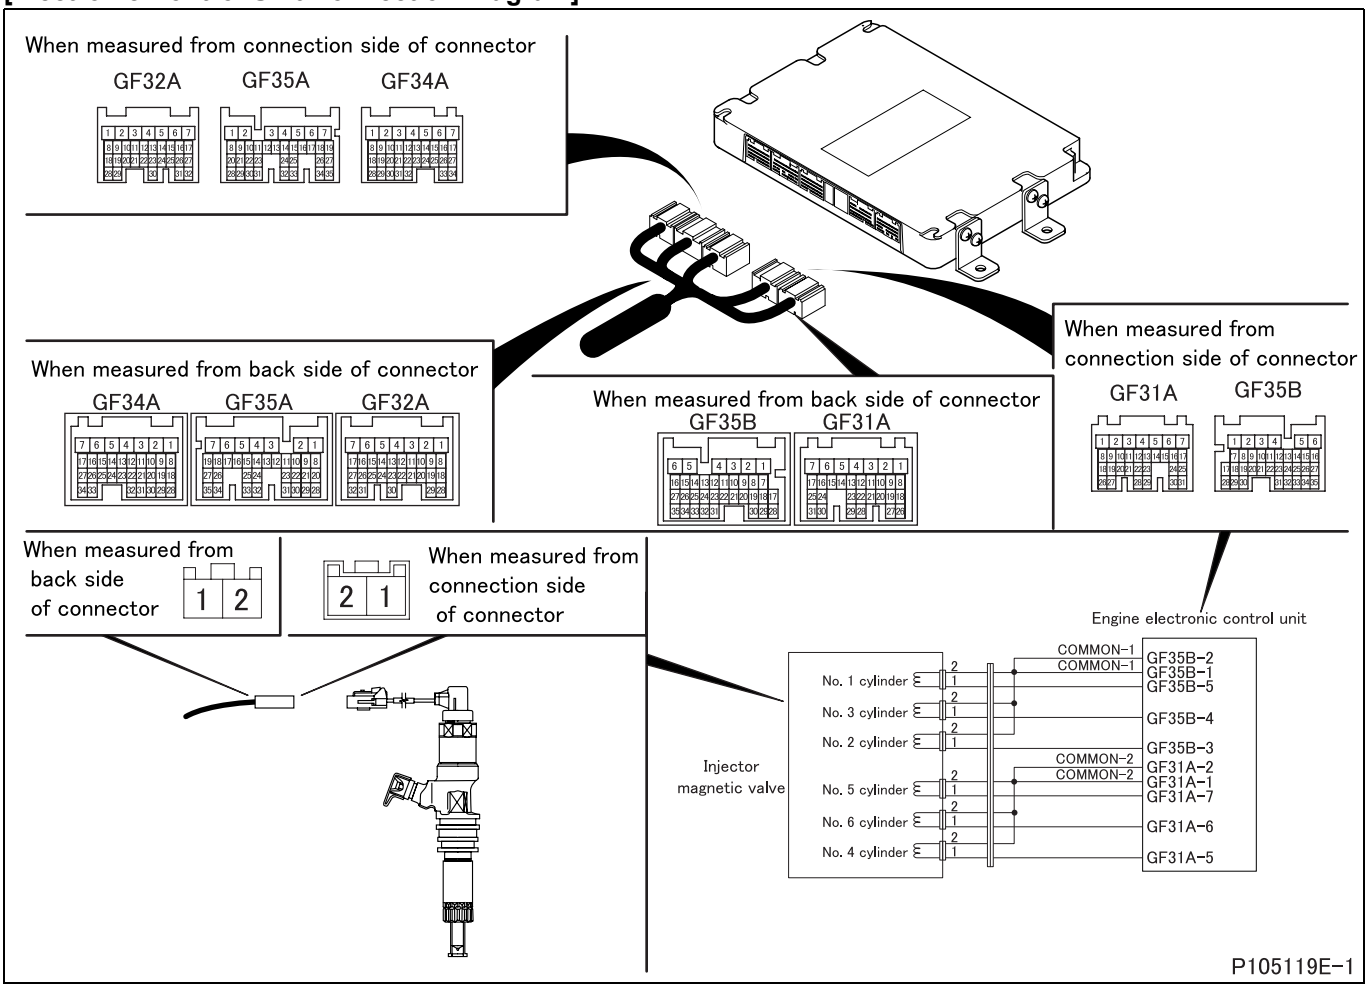
[Recoverability]
<Control during fault>
- Recovered if signal becomes normal when starter switch is turned OFF to ON (power supply resumed to electronic control unit).

<Warning lamp>
- Extinguished at 4th driving cycle after normal signal is input.

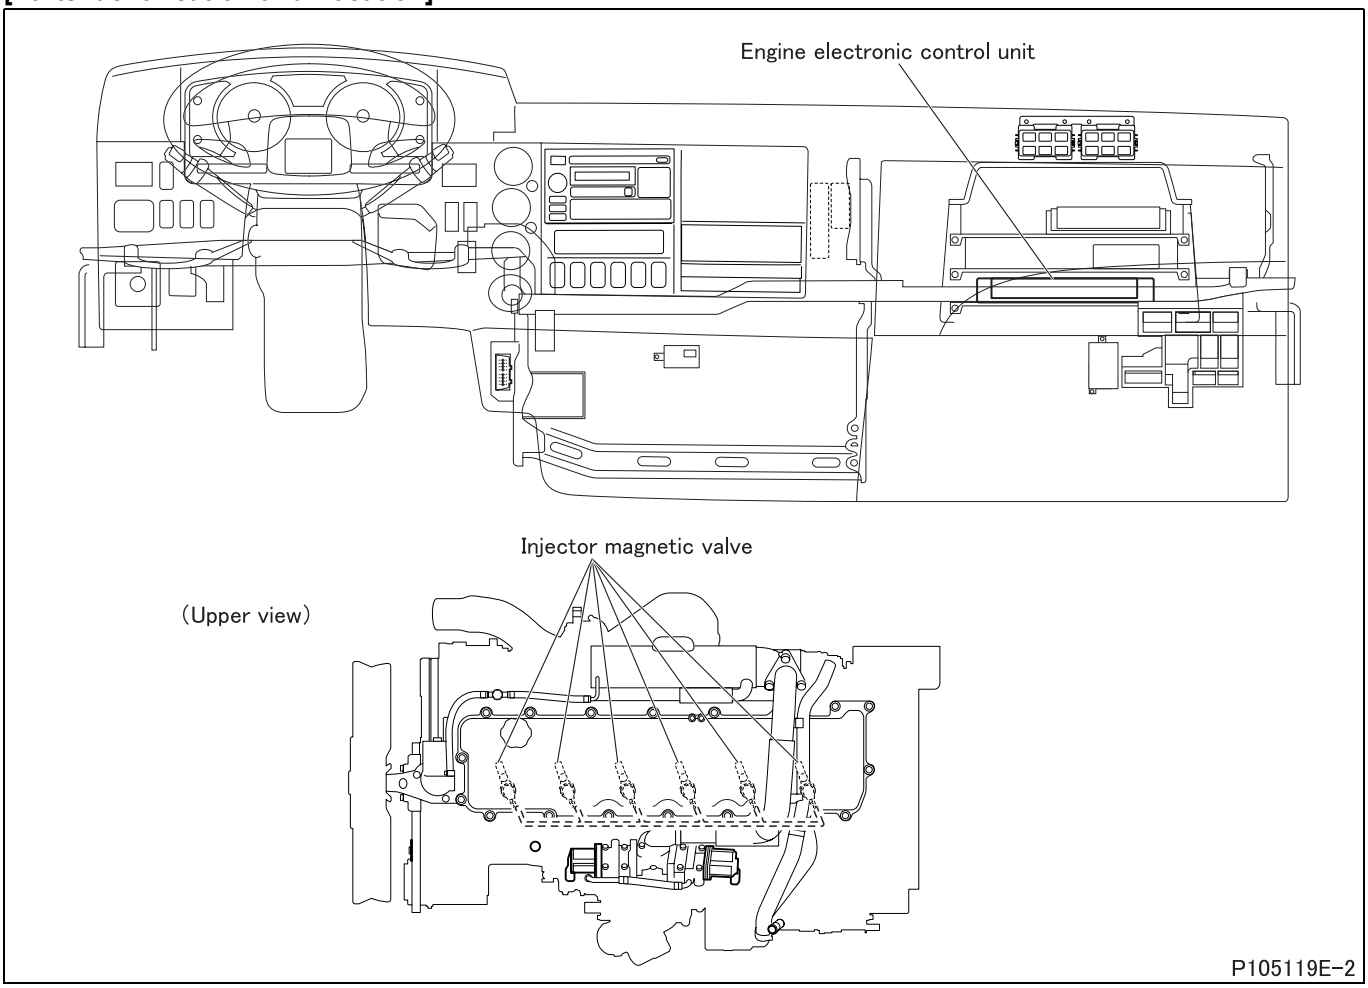
<Fault code>
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished.
  (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		Perform following actuator test. • Injector magnetic valve (No. 2 cylinder): Perform item No. BF “Injector Test 5”. • Injector magnetic valve (No. 4 cylinder): Perform item No. C0 “Injector Test 6”. • Injector magnetic valve (No. 6 cylinder): Perform item No. BE “Injector Test 4”.
	Inspection condition		• Vehicle: stationary (vehicle speed 0 km/h {0 MPH}) • Engine start: At idle • Transmission: neutral • The current diagnosis code does not occur.
	Requirements		Injector is stopped during actuator test with engine changed in operating condition (vibrating).
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

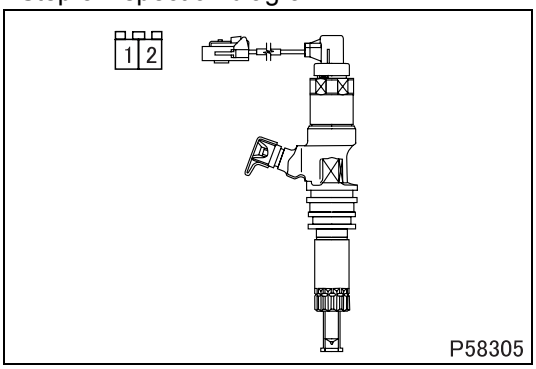
Step 2	Inspection items		Inspection by electronic control unit connector
	Maintenance item		Measure values of voltage between following connector terminals • Injector magnetic valve (No. 2 cylinder): (GF35B) terminal No. 1 or 2 (+) and (GF35B) terminal No. 3 (–) • Injector magnetic valve (No. 4 cylinder): (GF31A) terminal No. 1 or 2 (+) and (GF31A) terminal No. 5 (–) • Injector magnetic valve (No. 6 cylinder): (GF31A) terminal No. 1 or 2 (+) and (GF31A) terminal No. 6 (–)
	Inspection condition		Disconnect electronic control unit from harness and measure from connection side of harness connector.
	Requirements		0.45 ± 0.1 Ω (20°C {68°F})
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Go to step 4.

Step 3	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify connector.

Step 4	Inspection items		Inspection of injector magnetic valve connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Modify connector.

Step 5	Inspection items		Inspection of injector magnetic valve unit
	Maintenance item		Measure value of resistance between connector terminal No. 1 and 2.
	Inspection condition		–
	Requirements		0.45 ± 0.1 Ω (20°C {68°F})
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Replacement of injector

<Step 5 inspection diagram>



Step 6	Inspection items		Inspection of harness between injector magnetic valve and electronic control unit (power supply)
	Maintenance item		Check circuit between following connector terminals. • Injector magnetic valve (No. 2 cylinder): injector magnetic valve connector terminal No. 2 - electronic control unit connector (GF35B) terminal No. 1 or 2 • Injector magnetic valve (No. 4 cylinder): injector magnetic valve connector terminal No. 2 - electronic control unit connector (GF31A) terminal No. 1 or 2 • Injector magnetic valve (No. 6 cylinder): injector magnetic valve connector terminal No. 2 - electronic control unit connector (GF31A) terminal No.1 or 2.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify harness.

Step 7	Inspection items		Inspection of harness between injector magnetic valve and electronic control unit (ground)
	Maintenance item		Check circuit between following connector terminals. • Injector magnetic valve (No. 2 cylinder): injector magnetic valve connector terminal No. 1 - electronic control unit connector (GF35B) terminal No. 3 • Injector magnetic valve (No. 4 cylinder): injector magnetic valve connector terminal No. 1 - electronic control unit connector (GF31A) terminal No. 5 • Injector magnetic valve (No. 6 cylinder): injector magnetic valve connector terminal No. 1 - electronic control unit connector (GF31A) terminal No. 6.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify harness.

Step 8	Inspection items		Inspection by control data
	Maintenance item		Perform following actuator test. • Injector magnetic valve (No. 2 cylinder): Perform item No. BF “Injector Test 5”. • Injector magnetic valve (No. 4 cylinder): Perform item No. C0 “Injector Test 6”. • Injector magnetic valve (No. 6 cylinder): Perform item No. BE “Injector Test 4”.
	Inspection condition		• Vehicle: stationary (vehicle speed 0 km/h {0 MPH}) • Engine start: At idle • Transmission: neutral • The current diagnosis code does not occur.
	Requirements		Injector is stopped during actuator test with engine changed in operating condition (vibrating).
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P2153/Flash code: 82
[Monitor]
Abnormality in injector magnetic valve driving circuit charge voltage
[Fault (outline)]
Charge rate inadequate
[Diagnosis check]
- Injector magnetic valve driving circuit charge voltage in engine electronic control unit is monitored.

[Code generation condition]
- Charge voltage is judged insufficient.
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- Battery voltage: normal
- Sub-CPU: in order
- Charge circuit: active

[Control effected by electronic control unit during fault]
- Common rail pressure is limited.
- Fault detection for controller area net work communication is stopped.
- Idle up control is stopped.
- Learning of FCCB (fuel control cylinder balance) is inhibited.
- Idle up speed is controlled to backup value (800 rpm).

[Probable cause of trouble]
- Abnormality in electronic control unit (replacement of electronic control unit)

[Recoverability]
<Control during fault>
- Recovered if signal becomes normal when starter switch is turned OFF to ON (power supply resumed to electronic control unit).

<Warning lamp>
- Extinguished at 4th driving cycle after normal signal is input.

<Fault code>
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished.
  (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Fault code]
Diagnosis code: P2154/Flash code: 82
[Monitor]
Abnormality in injector magnetic valve driving circuit charge voltage
[Fault (outline)]
Charge rate excessive
[Diagnosis check]
- Injector magnetic valve driving circuit charge voltage in engine electronic control unit is monitored.

[Code generation condition]
- Charge voltage is judged excessive.
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- Battery voltage: normal
- Sub-CPU: in order
- Charge circuit: active

[Control effected by electronic control unit during fault]
- Common rail system is stopped. (Engine is immediately stopped)
- Learning of FCCB (fuel control cylinder balance) is inhibited.

[Probable cause of trouble]
- Abnormality in electronic control unit (replacement of electronic control unit)

[Recoverability]
<Control during fault>
- Recovered if signal becomes normal when starter switch is turned OFF to ON (power supply resumed to electronic control unit).

<Warning lamp>
[Warning lamp: MIL (orange)]
- Extinguished at 4th driving cycle after normal signal is input.

[Warning lamp: red]
- Extinguished at next driving cycle after normal signal is input.

<Fault code>
[Warning lamp: MIL (orange)]
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished.
  (To clear as desired, erase from the memory.)

[Warning lamp: red]
- Automatically cleared after warning lamp is extinguished.
  (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[[Fault code]
Diagnosis code: P2170/Flash code: 93
[Monitor]
Abnormality of exhaust shutter 3-way magnetic valve 1
[Fault (outline)]
- Short circuit ground
- Open circuit

[Diagnosis check]
- Exhaust shutter 3-way magnetic valve 1 circuit is monitored for fault.

[Code generation condition]
- Exhaust shutter 3-way magnetic valve 1 circuit remains shorted to ground as detected for approx. 1 second. (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal
- Magnetic valve 1: inactive

[Control effected by electronic control unit during fault]
- Injection quantity is limited.
- Exhaust gas recirculation control is stopped.
- Throttle control is stopped.
- Diesel particulate filter regeneration (manual or automatic) is stopped.
- Auxiliary brake indicator lamp control is stopped.

[Probable cause of trouble]
- Short-circuit of harness between electronic control unit and exhaust shutter 3-way magnetic valve 1
- Abnormality of each connector
- Abnormality of exhaust shutter 3-way magnetic valve 1
- Abnormality in electronic control unit

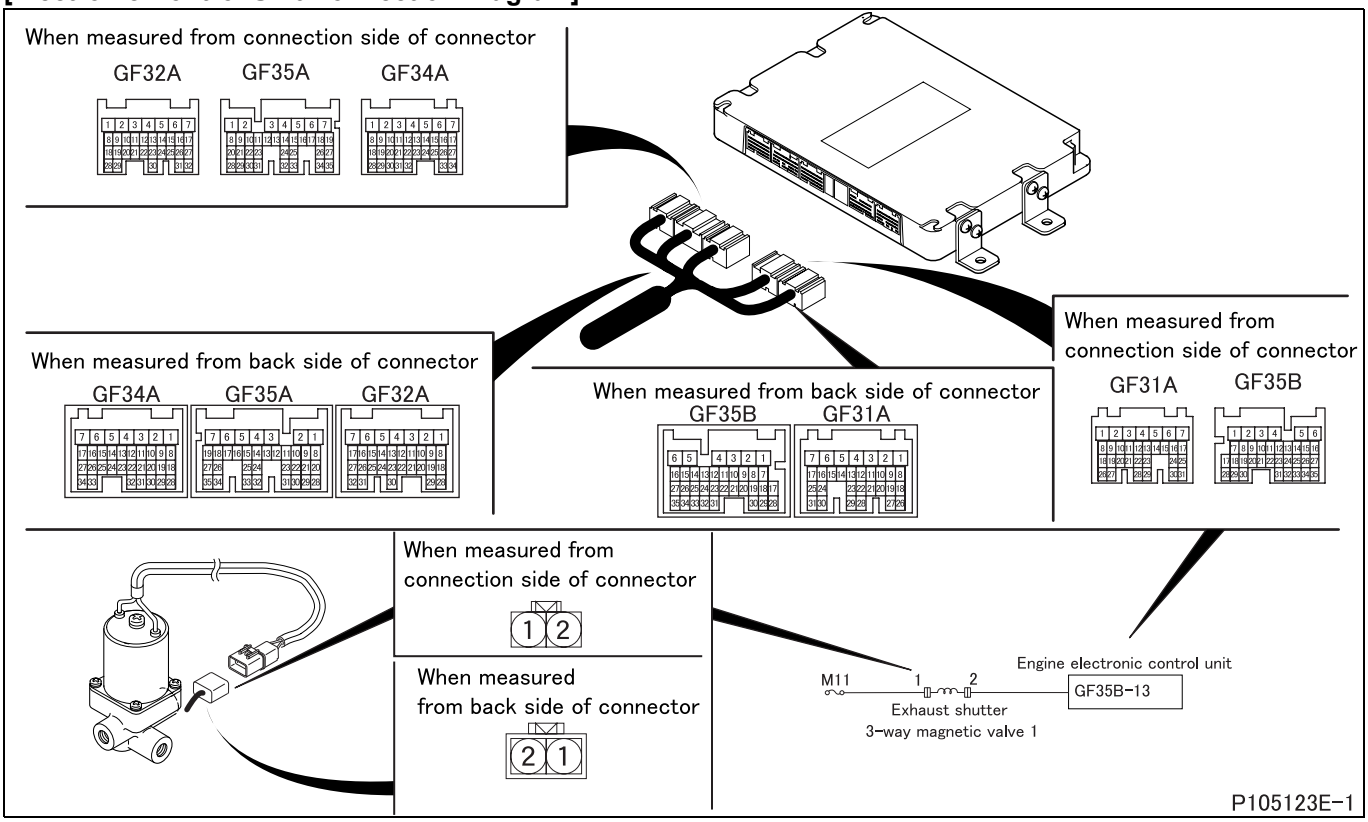
[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>
- Extinguished at 4th driving cycle after normal signal is input.

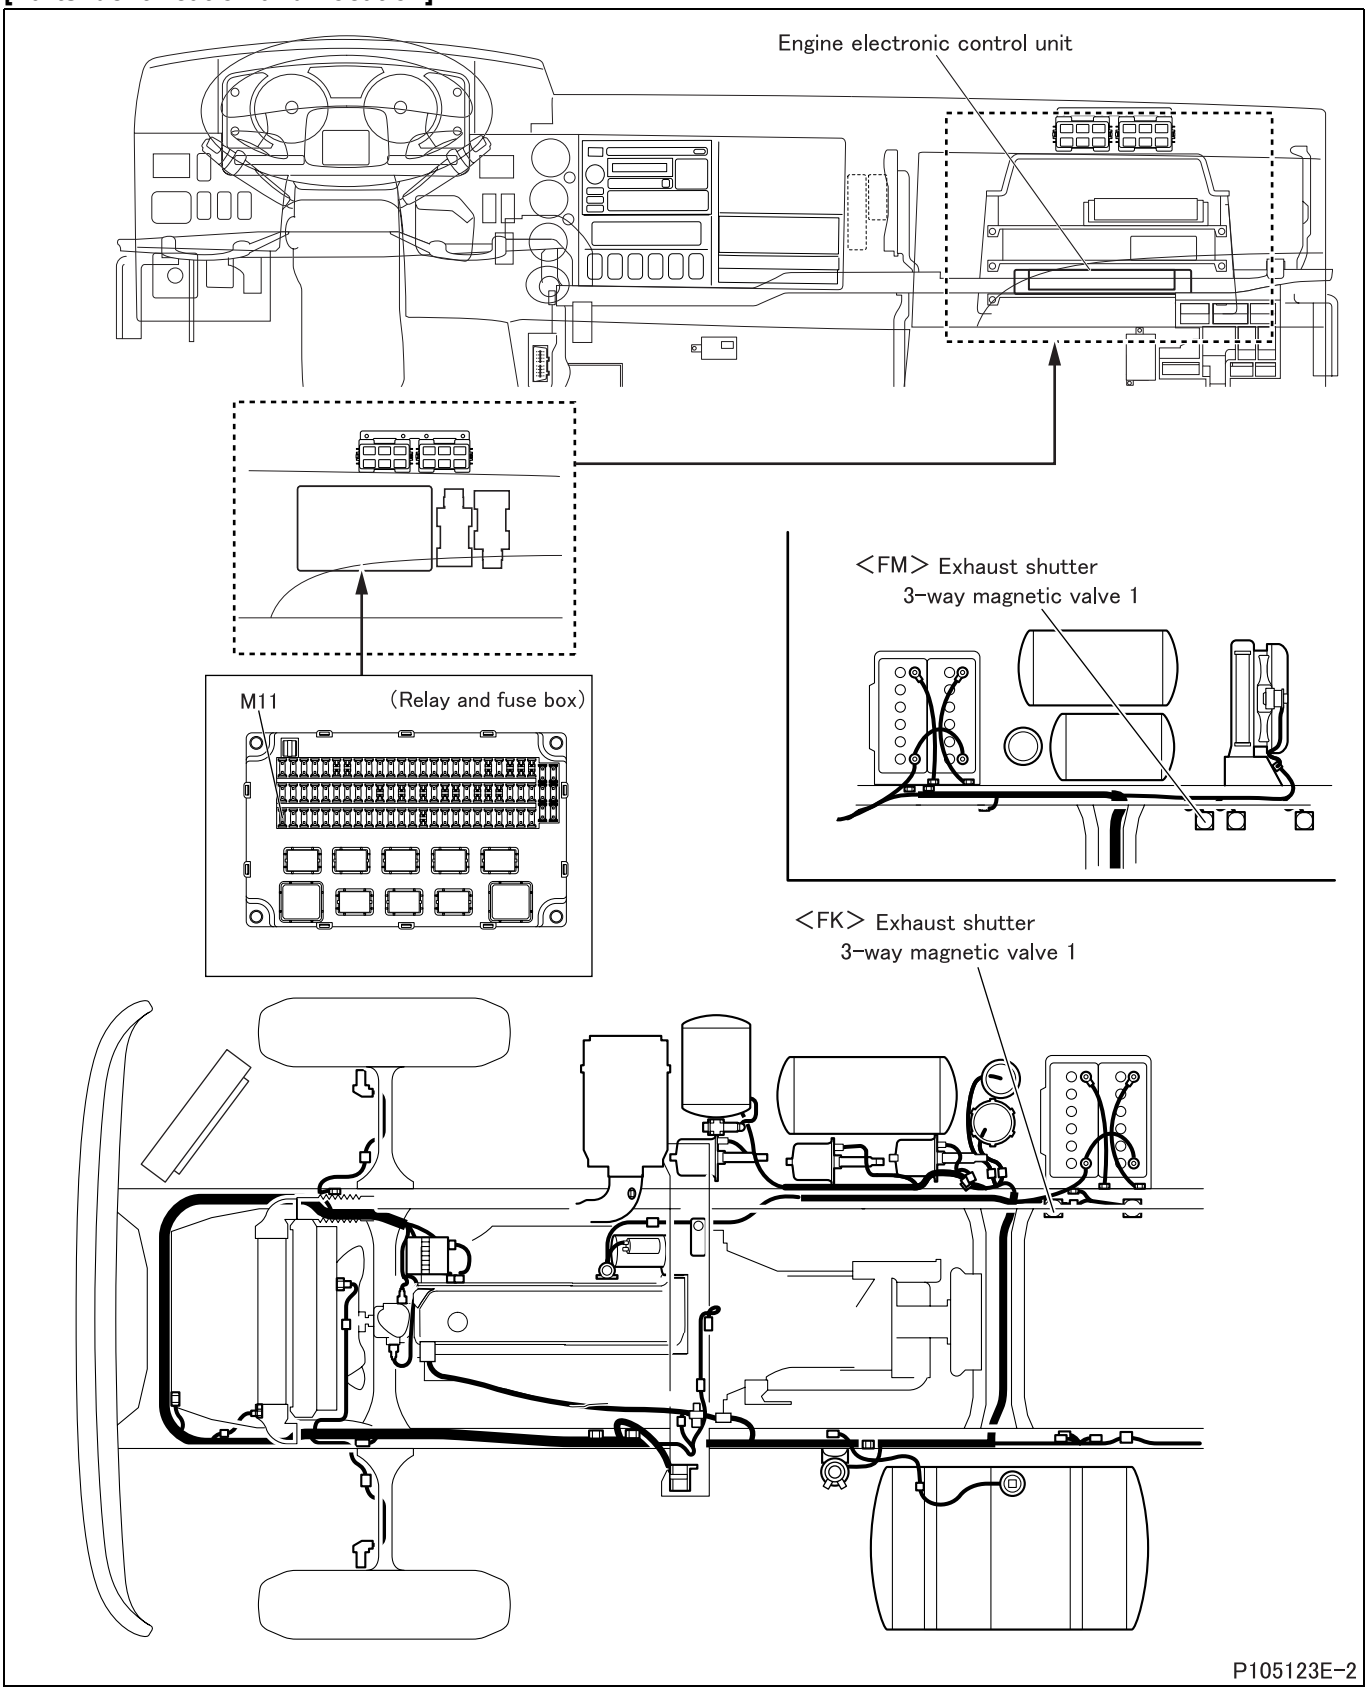
<Fault code>
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished. (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. AC “Auxiliary Brake M/V 1”.
	Inspection condition		Starter switch: ON
	Requirements		3-way magnetic valve operation sound is noted (automatically reset after 6 seconds), or ON/OFF switching of Service Data: item No. 87 “Auxiliary Brake M/V 1” is effected
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

Step 2	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Modify connector.

Step 3	Inspection items		Inspection of 3-way magnetic valve connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	Modify connector.

Step 4	Inspection items		Inspection of 3-way magnetic valve unit
	Maintenance item		Measure minimum operating voltage when 3-way magnetic valve operates (judge by operation sound).
	Inspection condition		Gradually increase from zero the voltage applied to terminals No. 1 (+) and 2 (–).
	Requirements		10 V or less
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Replacement of 3-way magnetic valve

<Step 4 inspection diagram>

	IN	OUT	EXH
ON	○—○		
OFF		○—○	

○—○ Pneumatic continuity

P59151E

Step 5	Inspection items		Inspection of harness between 3-way magnetic valve and electronic control unit (ground)
	Maintenance item		Check circuit between 3-way magnetic valve connector terminal No. 2 and electronic control unit connector (GF35B) terminal No. 13.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Modify harness.

Step 6	Inspection items		Inspection of harness between 3-way magnetic valve and fuse (power supply)
	Maintenance item		Check circuit between 3-way magnetic valve connector terminal No. 1 and fuse (M11).
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is no continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify harness.

Step 7	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. AC “Auxiliary Brake M/V 1”.
	Inspection condition		Starter switch: ON
	Requirements		3-way magnetic valve operation sound is noted (automatically reset after 6 seconds), or ON/OFF switching of Service Data: item No. 87 “Auxiliary Brake M/V 1” is effected
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic control unit.

[Fault code]
Diagnosis code: P2171/Flash code: 93
[Monitor]
Failure of exhaust shutter 3-way magnetic valve 1
[Fault (outline)]
Short circuit battery
[Diagnosis check]
- Exhaust shutter 3-way magnetic valve 1 circuit is monitored for fault.

[Code generation condition]
- Exhaust shutter 3-way magnetic valve 1 circuit remains shorted to battery as detected for approx.1 second. (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal
- Magnetic valve 1: active

[Control effected by electronic control unit during fault]
- Injection quantity is limited.
- Exhaust gas recirculation control is stopped.
- Throttle control is stopped.
- Diesel particulate filter regeneration (manual or automatic) is stopped.
- Auxiliary brake control is stopped.
- Auxiliary brake indicator lamp control is stopped.

[Probable cause of trouble]
- Short-circuit of harness between electronic control unit and exhaust shutter 3-way magnetic valve 1
- Abnormality of each connector
- Abnormality of exhaust shutter 3-way magnetic valve 1
- Abnormality in electronic control unit

[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>
- Extinguished at 4th driving cycle after normal signal is input.

<Fault code>
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished. (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify harness.

Step 7	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. AC “Auxiliary Brake M/V 1”.
	Inspection condition		Starter switch: ON
	Requirements		3-way magnetic valve operation sound is noted (automatically reset after 6 seconds), or ON/OFF switching of Service Data: item No. 87 “Auxiliary Brake M/V 1” is effected
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic control unit.

[Fault code]
Diagnosis code: P2199/Flash code: 09
[Monitor]
Characteristic abnormality of intake air temperature sensor 2
[Fault (outline)]
Gain and offset drift
[Diagnosis check]
Exhaust gas recirculation gas temperature derived from output data of intake air temperature sensor 1 is compared to exhaust gas recirculation gas temperature actually measured by intake air temperature sensor 2 to determine whether it is within the specified range.
[Code generation condition]
- Operation is continued for approx. 5 seconds with actual measurement of exhaust gas recirculation gas temperature out of specification.
  (Warning lamp is lit and diagnosis code is displayed on second establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- Preoperation time of engine: more than 300 seconds
- Intake throttle: open
- Atmospheric pressure sensor: normal in output signal
- Intake air temperature sensor 2: normal in output signal
- Intake air temperature sensor 1: normal in output signal
- Check of intake air temperature sensor 1: normal
- Air flow sensor: normal in output signal
- Intake throttle: normal in output signal
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal
- Sensor power supply voltage: normal
- Boost pressure sensor: normal

[Control effected by electronic control unit during fault]
- Effects no special control.

[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and intake air temperature sensor 2
- Abnormality of each connector
- Abnormality of intake air temperature sensor 2
- Abnormality in electronic control unit

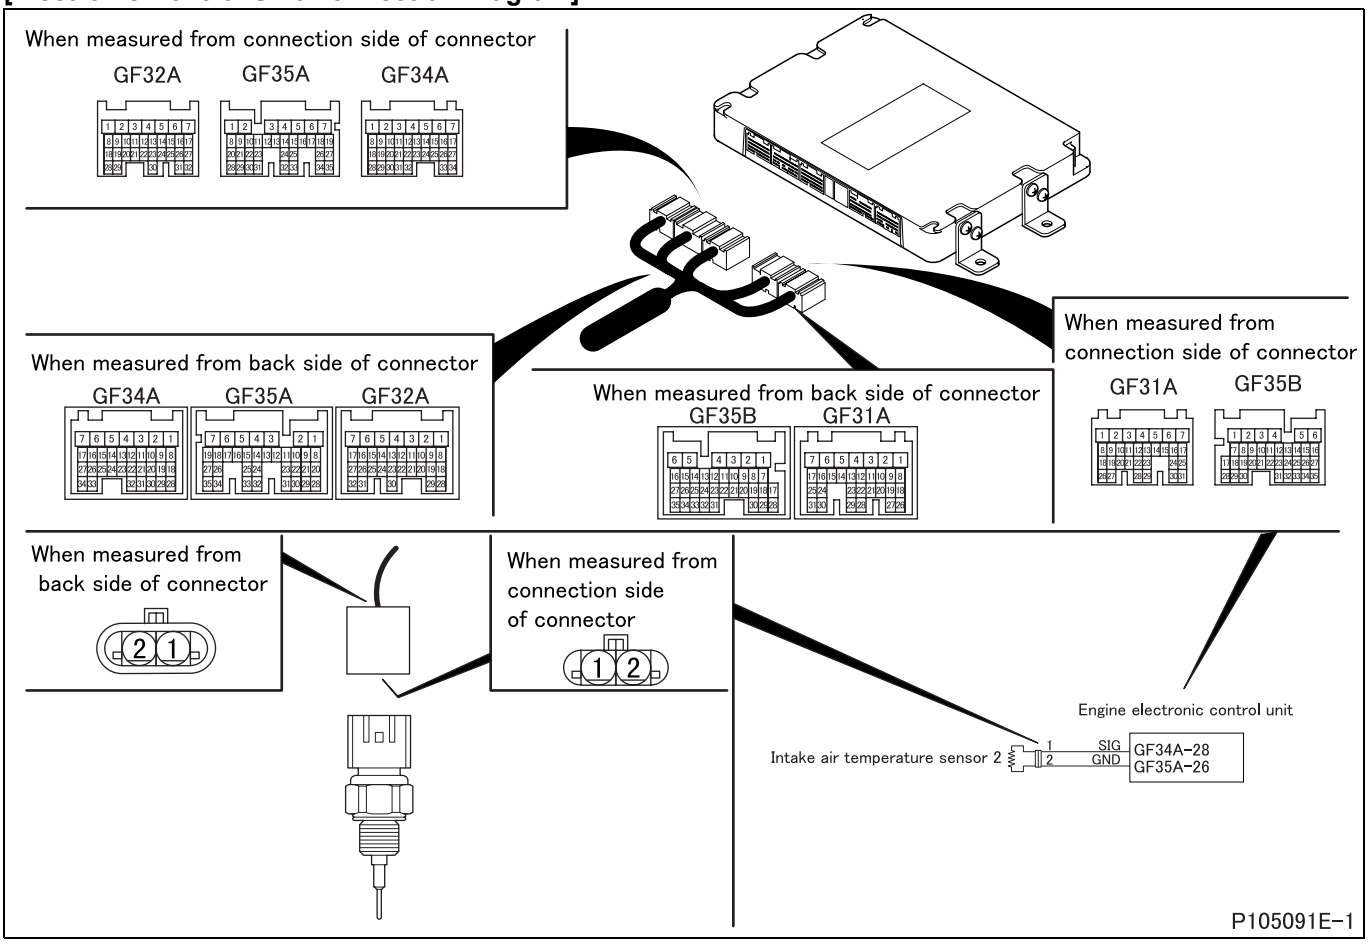
[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>
- Extinguished at 4th driving cycle after normal signal is input.

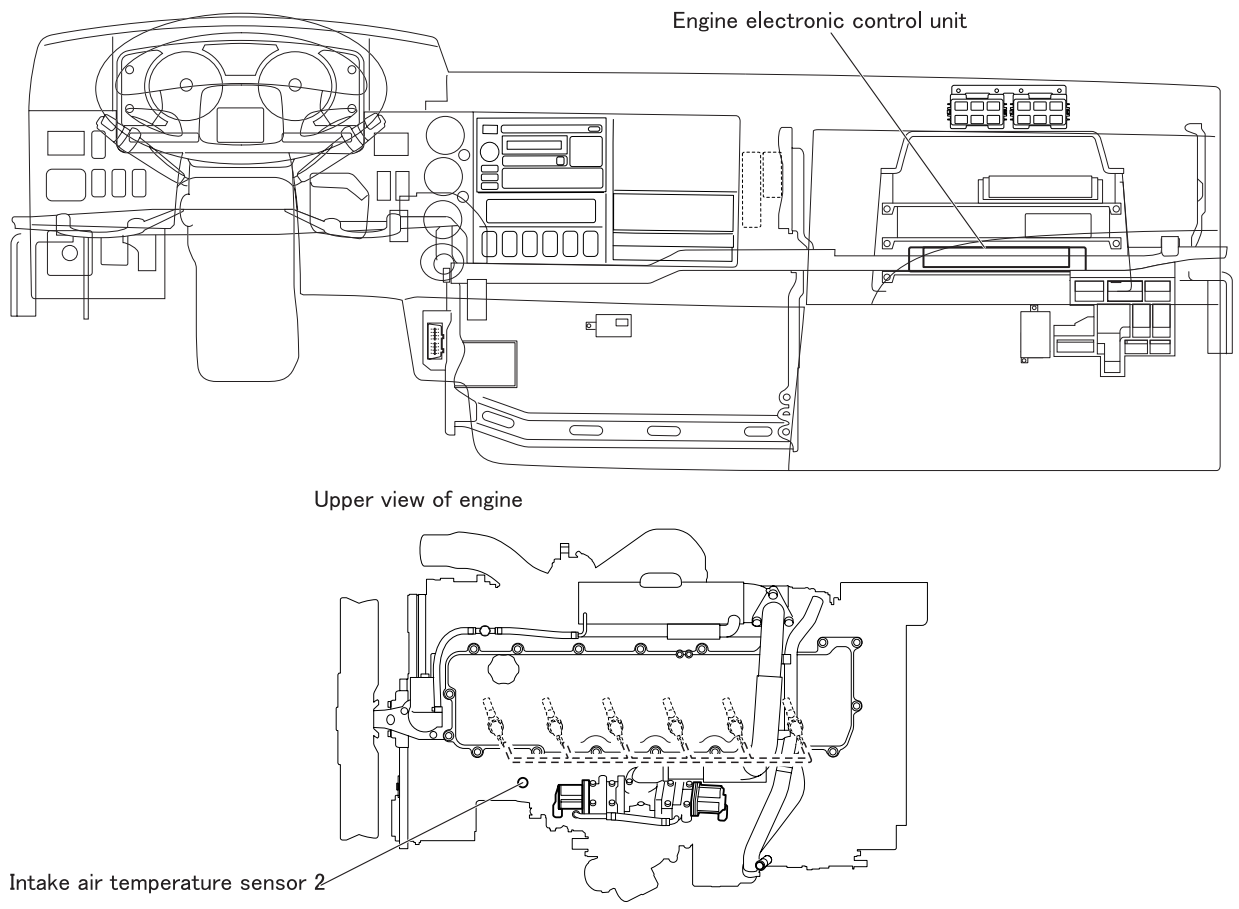
<Fault code>
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished.
  (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



P105091E-2

[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		**<General Scanning Tool used>** • Measure item “Intake Air Temperature”. **<Multi-Use Tester used>** • Measure item No. 28 “Intake Air Temperature (EGR)” of Service Data.
	Inspection condition		–
	Requirements		Cold engine: Proportionate to outside air temperature
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

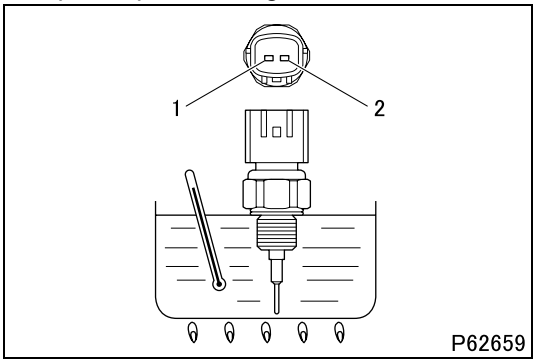
Step 2	Inspection items		Inspection by electronic control unit connector
	Maintenance item		Measure value of resistance between connector (GF34A) terminal No. 26 and 28.
	Inspection condition		Disconnect electronic control unit from harness and measure from connection side of harness connector.
	Requirements		• 0°C {32°F}: 162.3 $^{+48.8}_{-36.5}$ kΩ • 20°C {68°F}: 61.47 $^{+15.99}_{-12.35}$ kΩ • 80°C {176°F}: 6.120 $^{+1.095}_{-0.907}$ kΩ
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Go to step 4.

Step 3	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify connector.

Step 4	Inspection items		Inspection of intake air temperature sensor 2 connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Modify connector.

Step 5	Inspection items		Inspection of intake air temperature sensor 2 unit
	Maintenance item		Measure value of resistance between connector terminal No. 1 and No. 2.
	Inspection condition		• Put intake air temperature sensor 2 in vessel filled with engine oil. • Heat the oil to each of the specified temperatures. Stir the oil well while doing so.
	Requirements		• 0°C {32°F}: 162.3 $^{+48.8}_{-36.5}$ kΩ • 20°C {68°F}: 61.47 $^{+15.99}_{-12.35}$ kΩ • 80°C {176°F}: 6.120 $^{+1.095}_{-0.907}$ kΩ
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Replacement of sensor

<Step 5 inspection diagram>



Step 6	Inspection items		Inspection of harness between electronic control unit and sensor (power supply)
	Maintenance item		Check circuit between sensor connector terminal No. 1 and electronic control unit connector (GF34A) terminal No. 28.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify harness.

Step 7	Inspection items		Inspection of harness between electronic control unit and sensor (ground)
	Maintenance item		Check circuit between sensor connector terminal No. 2 and electronic control unit connector (GF35A) terminal No. 26.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify harness.

Step 8	Inspection items		Inspection by control data
	Maintenance item		**<General Scanning Tool used>** • Measure item “Intake Air Temperature”. **<Multi-Use Tester used>** • Measure item No. 28 “Intake Air Temperature (EGR)” of Service Data.
	Inspection condition		–
	Requirements		Cold engine: Proportionate to outside air temperature
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P2228/Flash code: 19
[Monitor]
Abnormality of atmospheric pressure sensor (built into engine electronic control unit)
[Fault (outline)]
Low signal range check
[Diagnosis check]
- Output voltage of atmospheric pressure sensor (built in engine electronic control unit) is monitored.

[Code generation condition]
- Voltage of atmospheric pressure sensor remains under 1.9 V for approx. 2.5 seconds.
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal

[Control effected by electronic control unit during fault]
- Injection quantity is limited.
- Exhaust gas recirculation control is stopped.
- Throttle control is stopped.
- Diesel particulate filter regeneration (manual or automatic) is stopped.
- Control is carried out using backup value (101 kPa).

[Probable cause of trouble]
- Abnormality of atmospheric pressure sensor (built into engine electronic control unit)

[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>
- Extinguished at 4th driving cycle after normal signal is input.

<Fault code>
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished.
  (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Fault diagnosis]
- Perform checks in the sequence of the following step.

Step 1	Inspection items		Inspection by control data
	Maintenance item		**<General Scanning Tool used>** • Measure item “Barometric Pressure”. **<Multi-Use Tester used>** • Measure item No. 38 “Atmospheric Pressure” of Service Data.
	Inspection condition		–
	Requirements		Standard atmospheric pressure (around 101.3 kPa {15 psi, 1.0 kgf/cm^2})
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P2229/Flash code: 19
[Monitor]
Abnormality of atmospheric pressure sensor (built into engine electronic control unit)
[Fault (outline)]
High signal range check
[Diagnosis check]
- Output voltage of atmospheric pressure sensor (built in engine electronic control unit) is monitored.

[Code generation condition]
- Voltage of atmospheric pressure sensor remains over 4.7 V for approx. 2.5 seconds.
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal

[Control effected by electronic control unit during fault]
- Injection quantity is limited.
- Exhaust gas recirculation control is stopped.
- Throttle control is stopped.
- Diesel particulate filter regeneration (manual or automatic) is stopped.
- Control is carried out using backup value (101 kPa).

[Probable cause of trouble]
- Abnormality of atmospheric pressure sensor (built into engine electronic control unit)

[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>
- Extinguished at 4th driving cycle after normal signal is input.

<Fault code>
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished.
  (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Fault diagnosis]
- Perform checks in the sequence of the following step.

Step 1	Inspection items		Inspection by control data
	Maintenance item		**<General Scanning Tool used>** • Measure item “Barometric Pressure”. **<Multi-Use Tester used>** • Measure item No. 38 “Atmospheric Pressure” of Service Data.
	Inspection condition		–
	Requirements		Standard atmospheric pressure (around 101.3 kPa {15 psi, 1.0 kgf/cm^2})
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P2413/Flash code: 95
[Monitor]
Abnormality in exhaust gas recirculation valve (target abnormality)
[Fault (outline)]
Target out of range
[Diagnosis check]
- In this code exhaust gas recirculation electronic drive unit detects exhaust gas recirculation valve position as actual position through position sensor and compares it with target position for control by engine electronic control unit.

[Code generation condition]
- Operation remains for 1 second after exhaust gas recirculation electronic drive unit judged that valve was not positioned within target range.
- Exhaust gas recirculation valve remains out of target position as detected by exhaust gas recirculation electronic drive unit for approx. 6 seconds.
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal

[Control effected by electronic control unit during fault]
- Injection quantity is limited.
- Exhaust gas recirculation control is stopped.
- Throttle control is stopped.
- Diesel particulate filter regeneration (manual or automatic) is stopped.

[Probable cause of trouble]
- Open-circuit or short-circuit of harness between exhaust gas recirculation electronic drive unit and exhaust gas recirculation valve
- Abnormality of each connector
- Abnormality of exhaust gas recirculation motor (built in exhaust gas recirculation valve)
- Abnormality of exhaust gas recirculation position sensor (built in exhaust gas recirculation valve)
- Abnormality of exhaust gas recirculation electronic drive unit
- Abnormality of electronic drive unit relay

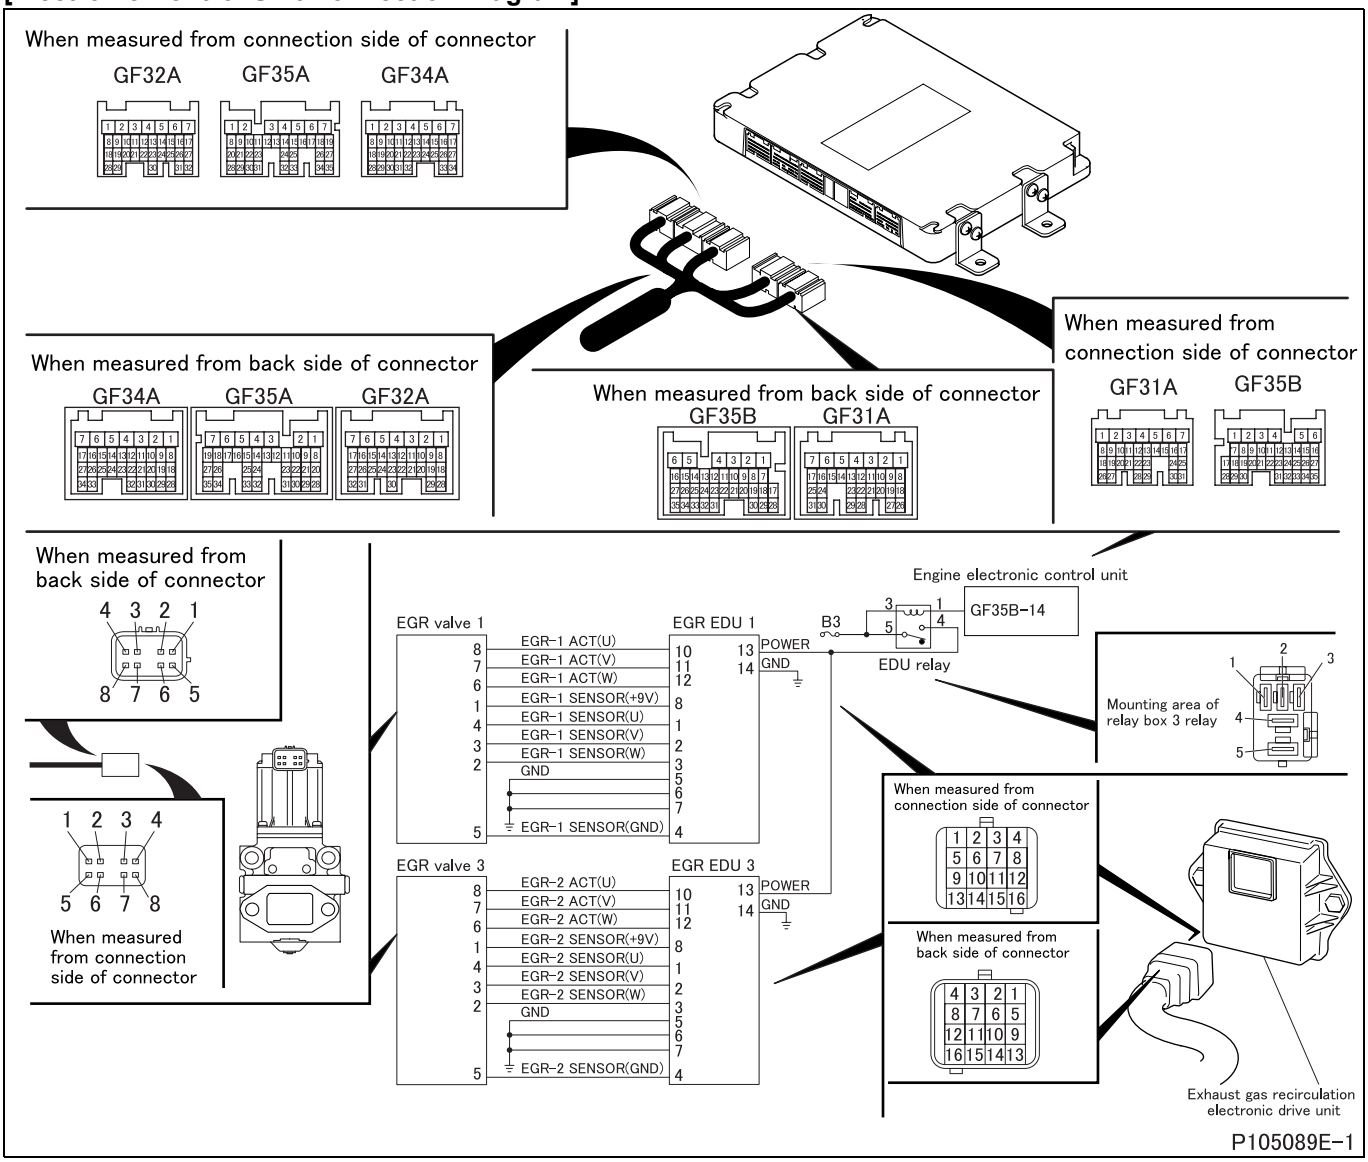
[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>
- Extinguished at 4th driving cycle after normal signal is input.

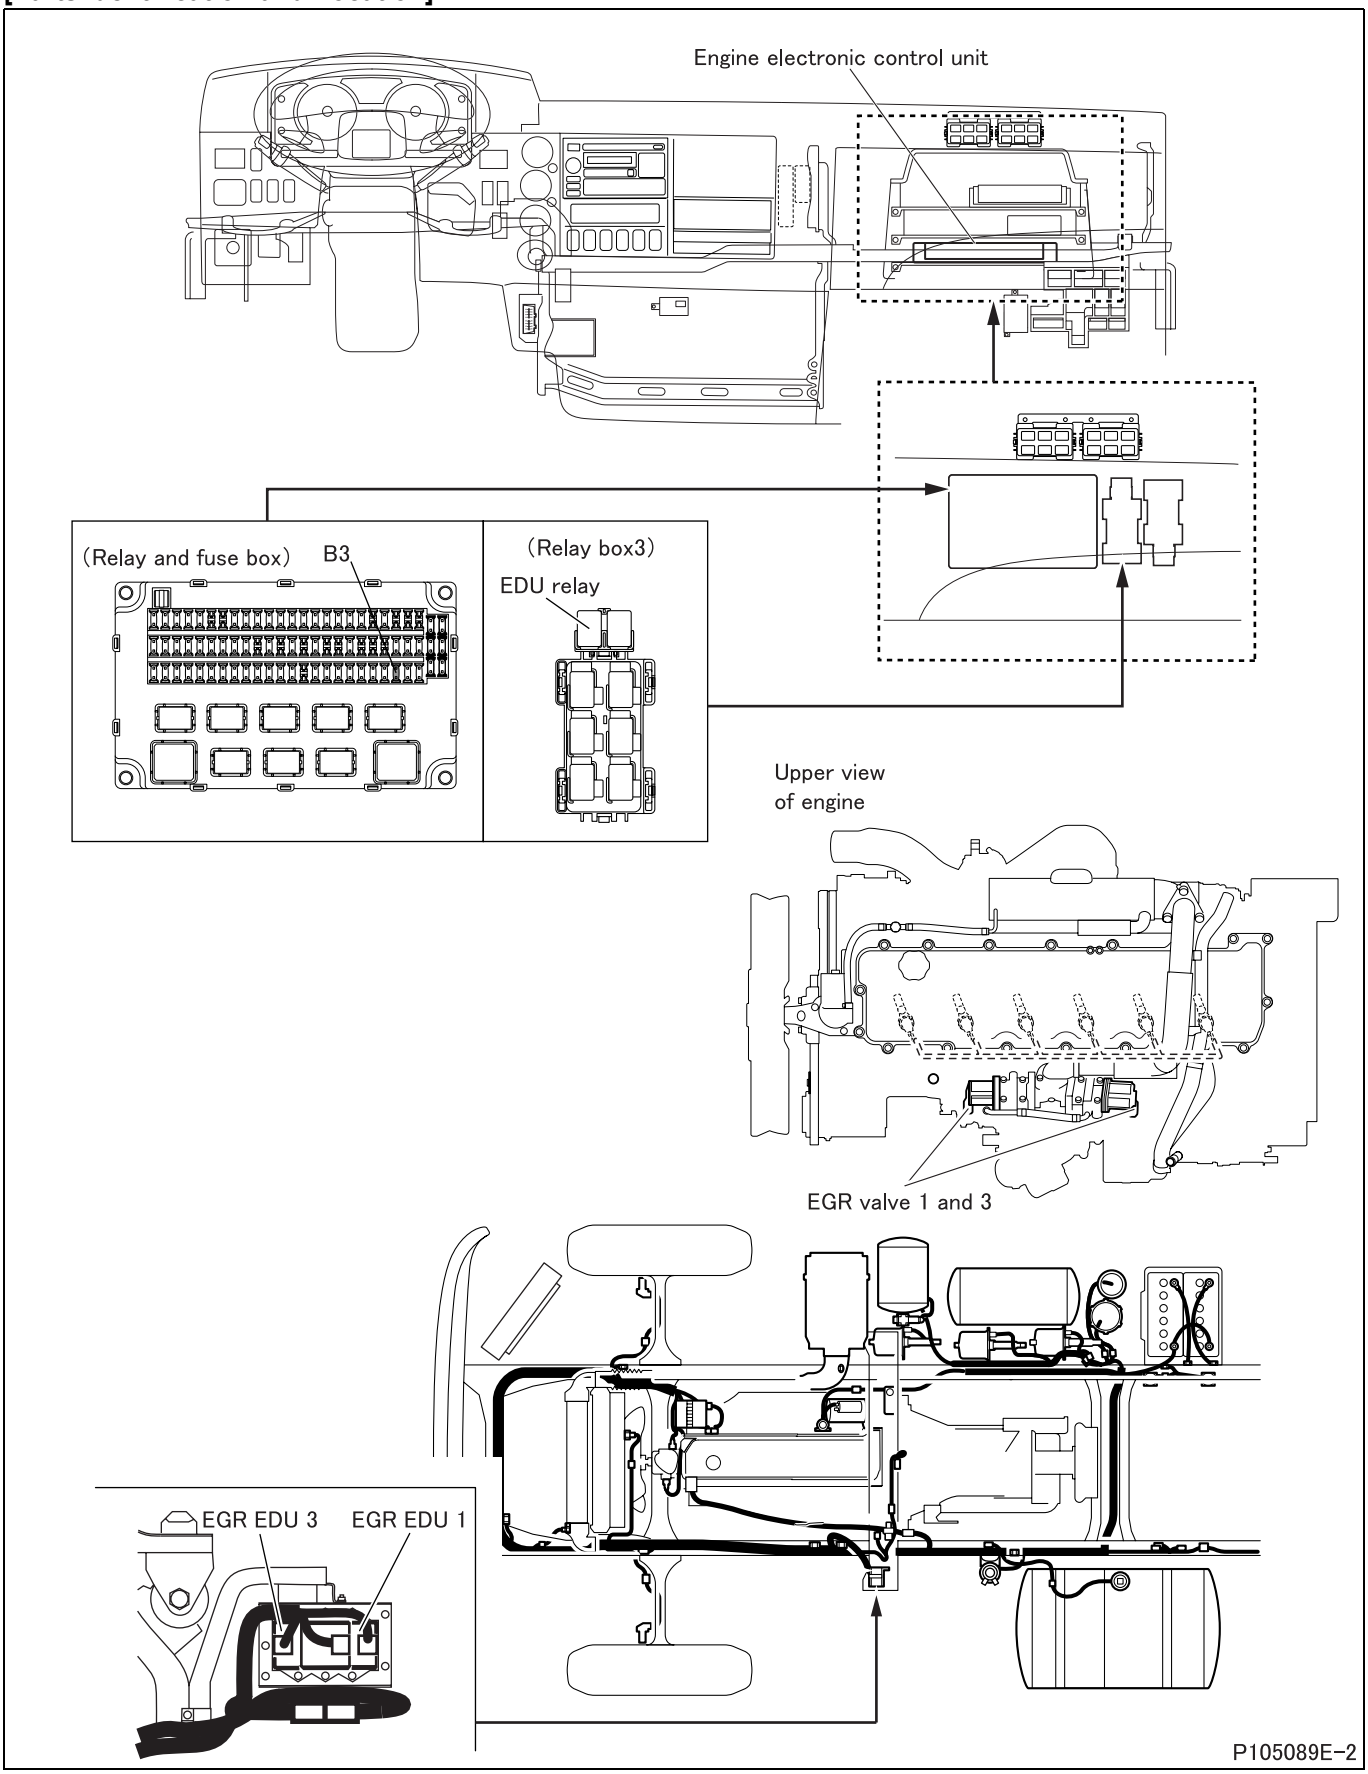
<Fault code>
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished.
  (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. A1 “EGR1, 3”. **NOTE** • **As initial operational check of exhaust gas recirculation valve is automatically effected immediately after starter switch is ON, perform actuator test by Multi-Use Tester after that check (approximately 5 seconds later).**
	Inspection condition		• Vehicle: stationary (vehicle speed 0 km/h {0 MPH}) • Starter switch: ON (engine started) • Transmission: neutral (parking satisfactory for automatic transmission)
	Requirements		Actual position matches with target value set by Multi-Use Tester (check with service data “0E: EGR1 Actual Position”, “0F: EGR3 Actual Position”).
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

Step 2	Inspection items		Inspection of electronic drive unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Modify connector.

Step 3	Inspection items		Inspection of exhaust gas recirculation valve connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	Modify connector.

Step 4	Inspection items		Inspection by control data
	Maintenance item		Check if following diagnosis codes occur simultaneously. • P0685 “EDU Relay (Open)” • P0686 “EDU Relay (Low)” • P0687 “EDU Relay (High)” • P0688 “EDU Relay (Over Load)”
	Inspection condition		Starter switch: ON
	Requirements		No codes occur.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Inspect diagnosis code that is occurring.

Step 5	Inspection items		Inspection of electronic drive unit connector (power supply)
	Maintenance item		Measure value of voltage between connector terminal No. 13 (+) and 14 (–).
	Inspection condition		• Disconnect connector and measure from harness side. • Starter switch: ON • Perform actuator test item No. A9 “EDU Relay”.
	Requirements		Same as battery voltage.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 10.
		NO	Go to step 6.

Step 6	Inspection items		Inspection of relay connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify connector.

Step 7	Inspection items		Inspection of harness between fuse and relay
	Maintenance item		Check circuit between fuse No. B3 and relay connector terminal No. 5.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify harness.

Step 8	Inspection items		Inspection of harness between relay and electronic drive unit
	Maintenance item		Check circuit between relay connector terminal No. 4 and electronic drive unit connector terminal No. 13.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	After replacement of electronic drive unit relay, go to step 9.
		NO	Modify harness.

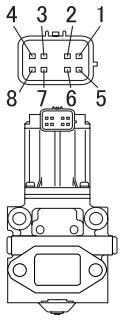
Step 9	Inspection items		Inspection of harness between electronic drive unit and ground
	Maintenance item		Check circuit between following electronic drive unit connector terminals. • Electronic drive unit ground: terminal No. 14 - chassis ground • Sensor shield ground (U): terminal No. 5 - 14 • Sensor shield ground (V): terminal No. 6 - 14 • Sensor shield ground (W): terminal No. 7 - 14 • Sensor ground: terminal No. 4 - 14
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 10.
		NO	Modify harness.

Step 10	Inspection items		Inspection of electronic drive unit connector (motor)
	Maintenance item		Measure value of resistance between following connector terminals • Between U - V: 10 - 11 • Between U - W: 10 - 12 • Between V - W: 11 - 12
	Inspection condition		–
	Requirements		2.1 ± 0.3 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 13.
		NO	Go to step 11.

Step 11	Inspection items		Inspection of harness between electronic drive unit and exhaust gas recirculation valve (motor)
	Maintenance item		Check circuit between following connector terminals. • Motor (U): electronic drive unit connector terminal No. 10 - exhaust gas recirculation valve connector terminal No. 8 • Motor (V): electronic drive unit connector terminal No. 11 - exhaust gas recirculation valve connector terminal No. 7 • Motor (W): electronic drive unit connector terminal No. 12 - exhaust gas recirculation valve connector terminal No. 6
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 12.
		NO	Modify harness.

Step 12	Inspection items		Inspection of exhaust gas recirculation valve unit (motor)
	Maintenance item		Measure value of resistance between following exhaust gas recirculation valve connector terminals • Between U - V: 8 - 7 • Between U - W: 8 - 6 • Between V - W: 7 - 6
	Inspection condition		• Keep exhaust gas recirculation valve installed on vehicle. • Remove harness connector and measure exhaust gas recirculation valve side.
	Requirements		2.1 ± 0.3 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 13.
		NO	Replacement of exhaust gas recirculation valve

<Step 12 inspection diagram>



P104214

Step 13	Inspection items		Inspection of exhaust gas recirculation valve connector (position sensor: power supply)
	Maintenance item		Measure value of voltage between connector terminal No. 1 (+) and 5 (–).
	Inspection condition		• Measure from back side of harness connector with each device connected to harness. • Starter switch: ON
	Requirements		10 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 14.
		NO	Go to step 15.

Step 14	Inspection items		Inspection of electronic drive unit connector (position sensor: signal)
	Maintenance item		Measure values of voltage between the following electronic drive unit connector terminals. • U signal output: terminal 1 (+) - 4 (–) • V signal output: terminal 2 (+) - 4 (–) • W signal output: terminal 3 (+) - 4 (–)
	Inspection condition		• Measure from back side of harness connector with each device connected to harness. • Starter switch: ON • Perform actuator test item No. A1 “EGR 1, 3”.
	Requirements		8 to 11 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 16.
		NO	Go to step 15.

Step 15	Inspection items		Inspection of harness between electronic drive unit and exhaust gas recirculation valve (position sensor)
	Maintenance item		Check circuit between following connector terminals. • Sensor (power supply): electronic drive unit connector terminal No. 8 - exhaust gas recirculation valve connector terminal No. 1 • Sensor (U): electronic drive unit connector terminal No. 1 - exhaust gas recirculation valve connector terminal No. 4 • Sensor (V): electronic drive unit connector terminal No. 2 - exhaust gas recirculation valve connector terminal No. 3 • Sensor (W): electronic drive unit connector terminal No. 3 - exhaust gas recirculation valve connector terminal No. 2 • Sensor (ground): electronic drive unit connector terminal No. 4 - exhaust gas recirculation valve connector terminal No. 5
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	After replacement of exhaust gas recirculation, go to step 16.
		NO	Modify harness.

Step 16	Inspection items		Inspection by control data
	Maintenance item		Perform actuator test item No. A1 “EGR1, 3”. **NOTE** • **As initial operational check of exhaust gas recirculation valve is automatically effected immediately after starter switch is ON, perform actuator test by Multi-Use Tester after that check (approximately 5 seconds later).**
	Inspection condition		• Vehicle: stationary (vehicle speed 0 km/h {0 MPH}) • Starter switch: ON (engine started) • Transmission: neutral • Diagnosis switch: OFF (fuse removed)
	Requirements		Actual position matches with target value set by Multi-Use Tester (check with service data “0E: EGR1 Actual Position”, “0F: EGR3 Actual Position”).
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic drive unit

[Fault code]
Diagnosis code: P2453/Flash code: 97
[Monitor]
Characteristic abnormality of DPF pressure sensor (DIFF)
[Fault (outline)]
Gain and offset drift
[Diagnosis check]
- Filter differential pressure detected by DPF pressure sensor (DIFF) is compared with filter differential pressure calculated by engine electronic control unit for deviation within specified limits.

[Code generation condition]
- Actual filter differential pressure remains over specified value for approx. 5 seconds.
  (Warning lamp is lit and diagnosis code is displayed on second establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- Air flow sensor: normal in output signal
- DPF temperature sensor 1: normal in output signal
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal
- DPF absolute pressure sensor: in order
- DPF pressure sensor (DIFF): in order
- Atmospheric pressure sensor: in order

[Control effected by electronic control unit during fault]
- Effects no special control.

[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and DPF pressure sensor (DIFF)
- Abnormality of each connector
- Abnormality of DPF pressure sensor (DIFF)
- Abnormality in electronic control unit

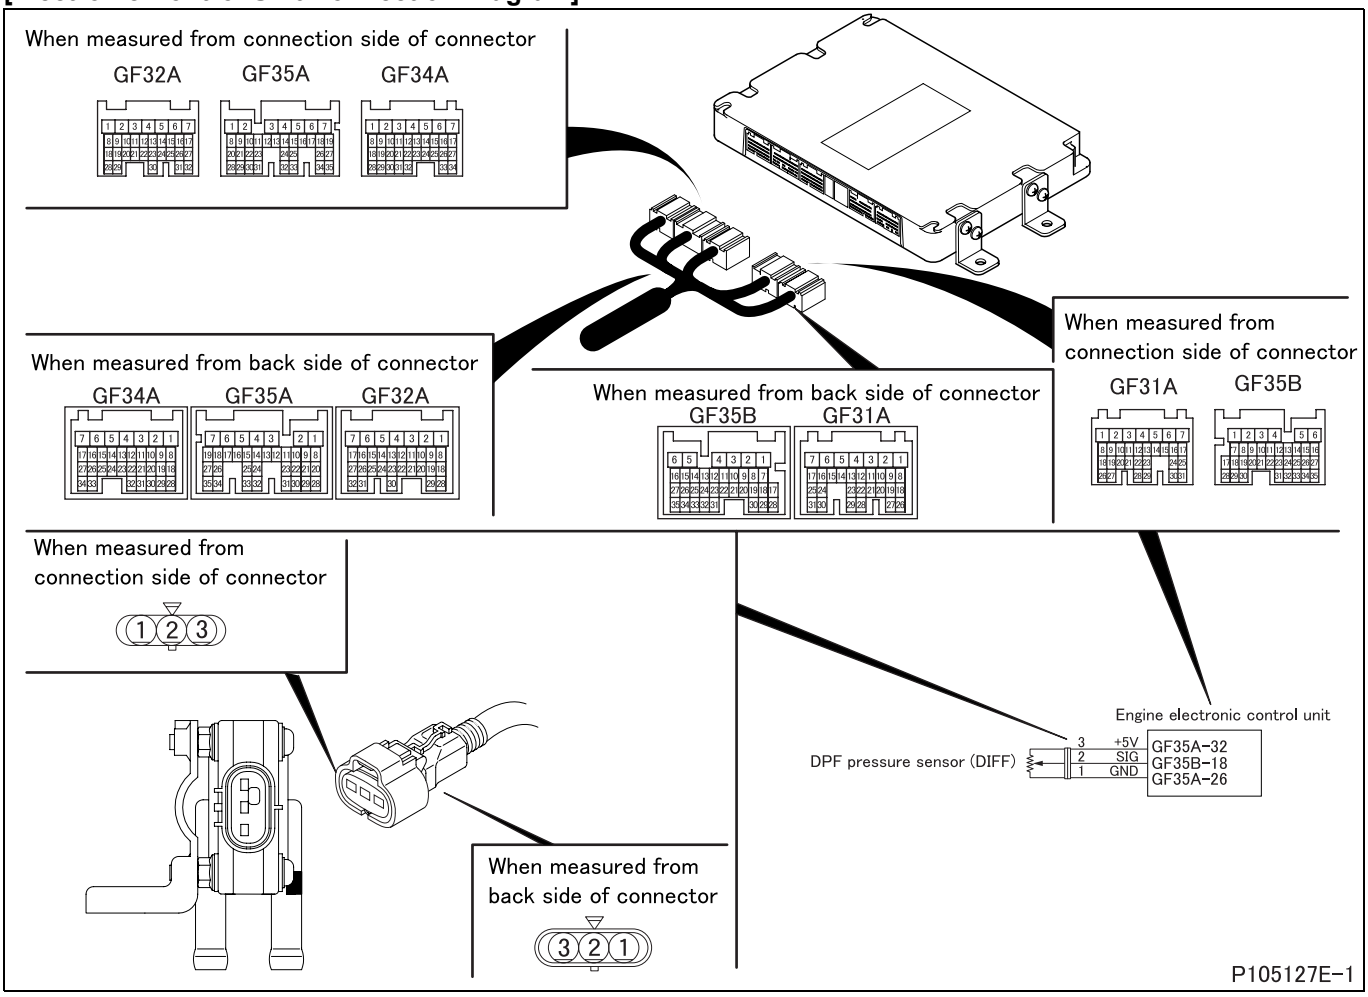
[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>
- Extinguished at 4th driving cycle after normal signal is input.

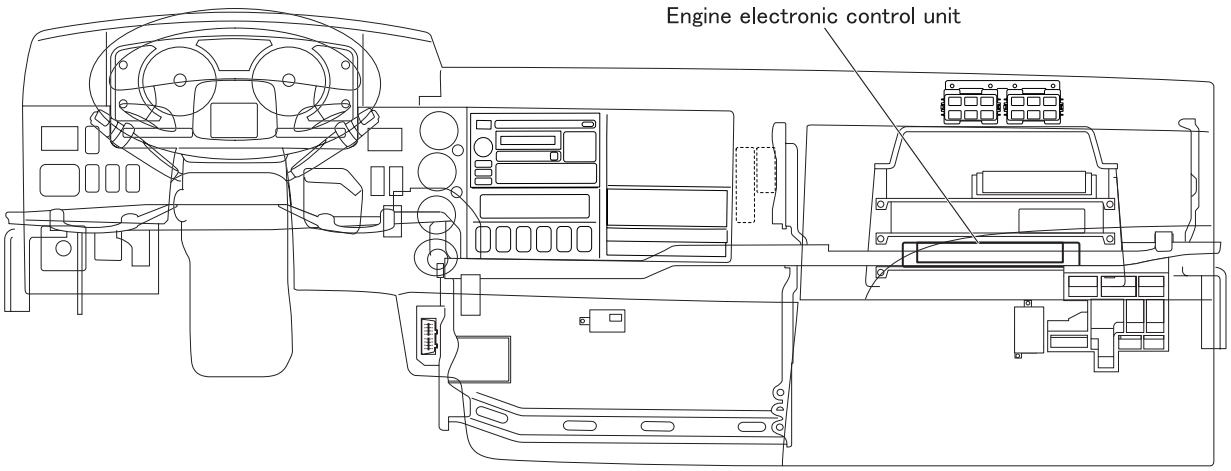
<Fault code>
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished.
  (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

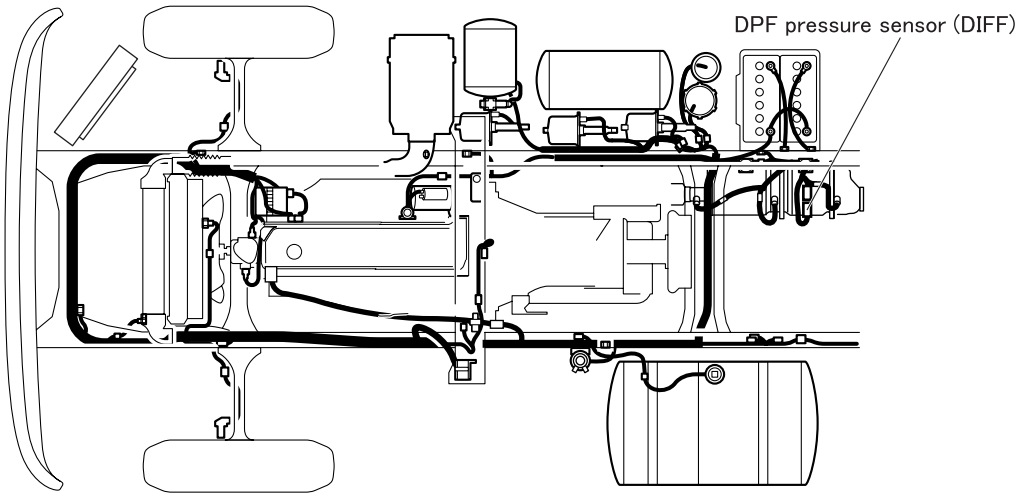
[Electronic Control Unit Connection Diagram]



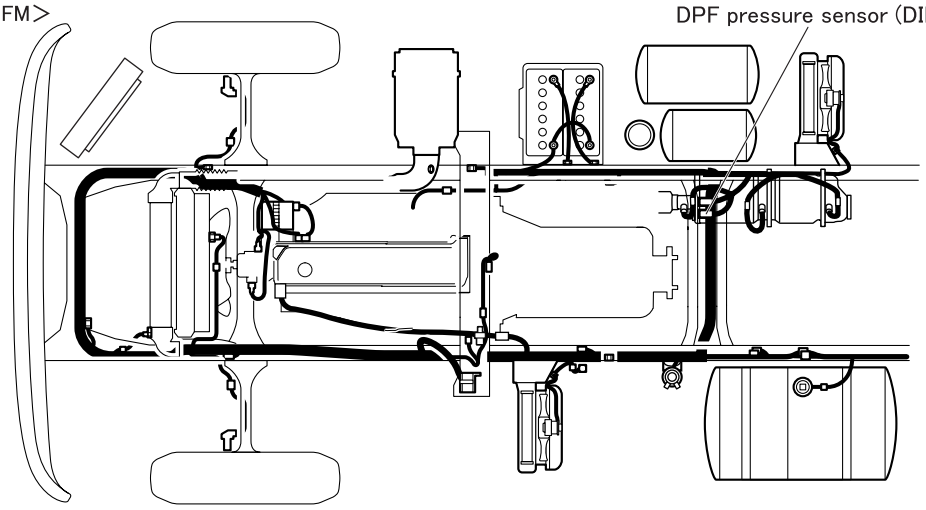
[Parts Identification and Location]



<FK>



<FM>



P105127E-2

[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		Measure item No. 32 “DPF relative pressure” of Service Data.
	Inspection condition		Past failures include diesel particulate filter pressure sensor, while the current failures do not include diesel particulate filter pressure sensor.
	Requirements		When engine is stationary: 0 kPa {0 psi, 0 kgf/cm^2}
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

Step 2	Inspection items		Inspection by electronic control unit connector (signal)
	Maintenance item		Measure value of voltage between connector (GF35B) terminal No. 18 (+) and (GF35A) terminal No. 26 (–).
	Inspection condition		• Measure from back side of harness connector with each device connected to harness. • Starter switch: ON
	Requirements		1 to 4.5 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Go to step 3.

Step 3	Inspection items		Inspection by electronic control unit connector (power supply)
	Maintenance item		Measure value of voltage between connector (GF35A) terminal No. 32 (+) and 26 (–).
	Inspection condition		• Measure from back side of harness connector with each device connected to harness. • Starter switch: ON
	Requirements		5 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	Go to step 5.

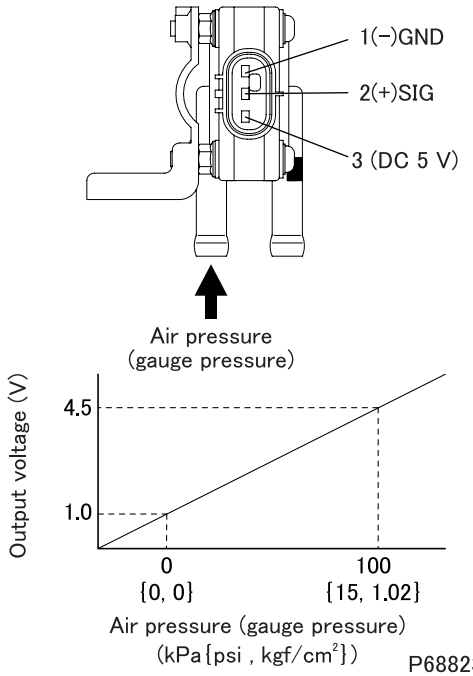
Step 4	Inspection items		Inspection by electronic control unit connector (ground)
	Maintenance item		Measure value of voltage between connector (GF35A) terminal No. 26 (+) and (GF32A) terminal No. 5 (–).
	Inspection condition		• Measure from back side of harness connector with each device connected to harness. • Starter switch: ON
	Requirements		0 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Go to step 5.

Step 5	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 12.
		NO	Modify connector.

Step 6	Inspection items		Inspection of sensor connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify connector.

Step 7	Inspection items		Inspection of sensor unit
	Maintenance item		Measure value of voltage between connector terminal No. 2 (+) and 1 (–).
	Inspection condition		• Apply voltage DC 5 V across terminals No. 3 (+) and 1 (–). • Gradually increase applied air pressure.
	Requirements		• 0 ± 3.5 kPa {0 ± 0.5 psi, 0 ± 0.04 kgf/cm^2}: 1 V • 100 ± 3.5 kPa {15 ± 0.5 psi, 1.02 ± 0.04 kgf/cm^2}: 4.5 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Replacement of sensor

<Step 7 inspection diagram>



Step 8	Inspection items		Inspection of harness between electronic control unit and sensor (power supply)
	Maintenance item		Measure value of voltage between connector terminal No. 3 (+) and 1 (–).
	Inspection condition		• Measure from back side of harness connector with each device connected to harness. • Starter switch: ON
	Requirements		5 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 10.
		NO	Go to step 9.

Step 9	Inspection items		Inspection of harness between electronic control unit and sensor (power supply)
	Maintenance item		Check circuit between sensor connector terminal No. 3 and electronic control unit connector (GF35A) terminal No. 32.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 12.
		NO	Modify harness.

Step 10	Inspection items		Inspection of harness between electronic control unit and sensor (ground)
	Maintenance item		Check circuit between sensor connector terminal No. 1 and electronic control unit connector (GF35A) terminal No. 26.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 11.
		NO	Modify harness.

Step 11	Inspection items		Inspection of harness between electronic control unit and sensor (signal)
	Maintenance item		Check circuit between sensor connector terminal No. 2 and electronic control unit connector (GF35B) terminal No. 18.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 12.
		NO	Modify harness.

Step 12	Inspection items		Inspection by control data
	Maintenance item		Measure item No. 32 “DPF relative pressure”
	Inspection condition		Past failures include diesel particulate filter pressure sensor, while the current failures do not include diesel particulate filter pressure sensor.
	Requirements		When engine is stationary: 0 kPa {0 psi, 0 kgf/cm^2}
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic control unit

[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		Measure item No. 32 “DPF relative pressure” of Service Data.
	Inspection condition		Past failures include diesel particulate filter pressure sensor, while the current failures do not include diesel particulate filter pressure sensor.
	Requirements		When engine is stationary: 0 kPa {0 psi, 0 kgf/cm^2}
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

Step 2	Inspection items		Inspection by electronic control unit connector (signal)
	Maintenance item		Measure value of voltage between connector (GF35B) terminal No. 18 (+) and (GF35A) terminal No. 26 (–).
	Inspection condition		• Measure from back side of harness connector with each device connected to harness. • Starter switch: ON
	Requirements		1 to 4.5 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Go to step 3.

Step 3	Inspection items		Inspection by electronic control unit connector (power supply)
	Maintenance item		Measure value of voltage between connector (GF35A) terminal No. 32 (+) and 26 (–).
	Inspection condition		• Measure from back side of harness connector with each device connected to harness. • Starter switch: ON
	Requirements		5 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	Go to step 5.

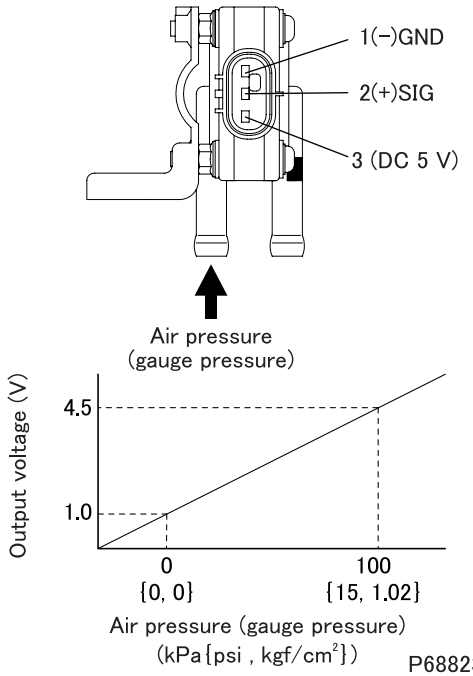
Step 4	Inspection items		Inspection by electronic control unit connector (ground)
	Maintenance item		Measure value of voltage between connector (GF35A) terminal No. 26 (+) and (GF32A) terminal No. 5 (–).
	Inspection condition		• Measure from back side of harness connector with each device connected to harness. • Starter switch: ON
	Requirements		0 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Go to step 5.

Step 5	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 12.
		NO	Modify connector.

Step 6	Inspection items		Inspection of sensor connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify connector.

Step 7	Inspection items		Inspection of sensor unit
	Maintenance item		Measure value of voltage between connector terminal No. 2 (+) and 1 (–).
	Inspection condition		• Apply voltage DC 5 V across terminals No. 3 (+) and 1 (–). • Gradually increase applied air pressure.
	Requirements		• 0 ± 3.5 kPa {0 ± 0.5 psi, 0 ± 0.04 kgf/cm^2}: 1 V • 100 ± 3.5 kPa {15 ± 0.5 psi, 1.02 ± 0.04 kgf/cm^2}: 4.5 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Replacement of sensor

<Step 7 inspection diagram>



Step 8	Inspection items		Inspection of harness between electronic control unit and sensor (power supply)
	Maintenance item		Measure value of voltage between connector terminal No. 3 (+) and 1 (–).
	Inspection condition		• Measure from back side of harness connector with each device connected to harness. • Starter switch: ON
	Requirements		5 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 10.
		NO	Go to step 9.

Step 9	Inspection items		Inspection of harness between electronic control unit and sensor (power supply)
	Maintenance item		Check circuit between sensor connector terminal No. 3 and electronic control unit connector (GF35A) terminal No. 32.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 12.
		NO	Modify harness.

Step 10	Inspection items		Inspection of harness between electronic control unit and sensor (ground)
	Maintenance item		Check circuit between sensor connector terminal No. 1 and electronic control unit connector (GF35A) terminal No. 26.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 11.
		NO	Modify harness.

Step 11	Inspection items		Inspection of harness between electronic control unit and sensor (signal)
	Maintenance item		Check circuit between sensor connector terminal No. 2 and electronic control unit connector (GF35B) terminal No. 18.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 12.
		NO	Modify harness.

Step 12	Inspection items		Inspection by control data
	Maintenance item		Measure item No. 32 “DPF relative pressure”
	Inspection condition		Past failures include diesel particulate filter pressure sensor, while the current failures do not include diesel particulate filter pressure sensor.
	Requirements		When engine is stationary: 0 kPa {0 psi, 0 kgf/cm^2}
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P2455/Flash code: 97
[Monitor]
Abnormality of DPF pressure sensor (DIFF)
[Fault (outline)]
High signal range check
[Diagnosis check]
- Output voltage of DPF pressure sensor (DIFF) is monitored.

[Code generation condition]
- Voltage of DPF pressure sensor (DIFF) remains over 4.8 V for approx. 2.5 seconds.
  (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal

[Control effected by electronic control unit during fault]
- Injection quantity is limited.
- Exhaust gas recirculation control is stopped.
- Throttle control is stopped.
- Diesel particulate filter regeneration (manual or automatic) is stopped.
- Control is carried out using backup value (0 kPa).

[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and DPF pressure sensor (DIFF)
- Abnormality of each connector
- Abnormality of DPF pressure sensor (DIFF)
- Abnormality in electronic control unit

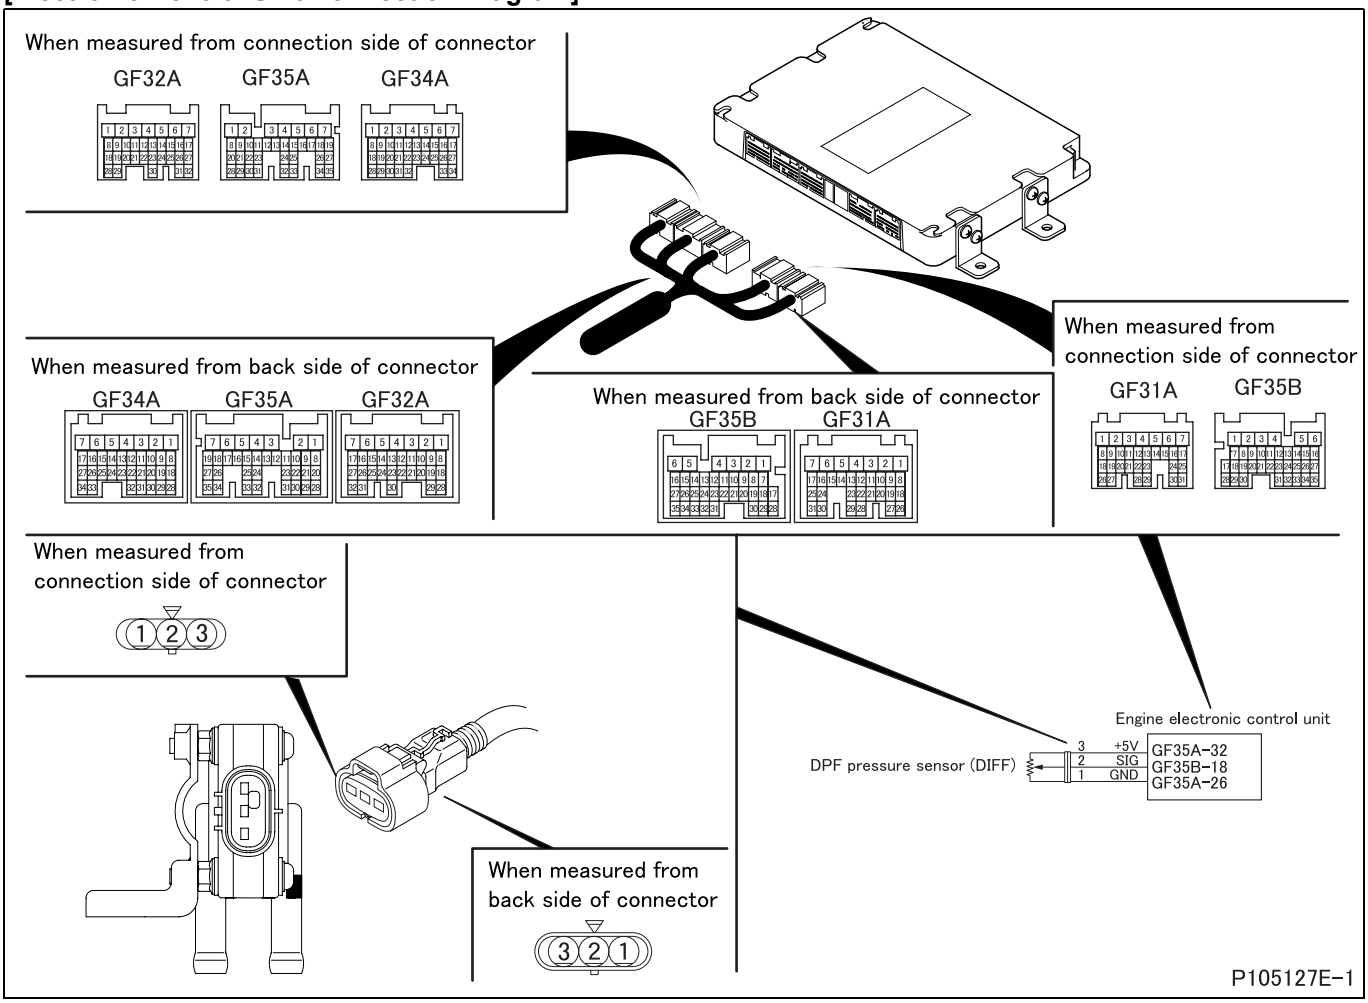
[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>
- Extinguished at 4th driving cycle after normal signal is input.

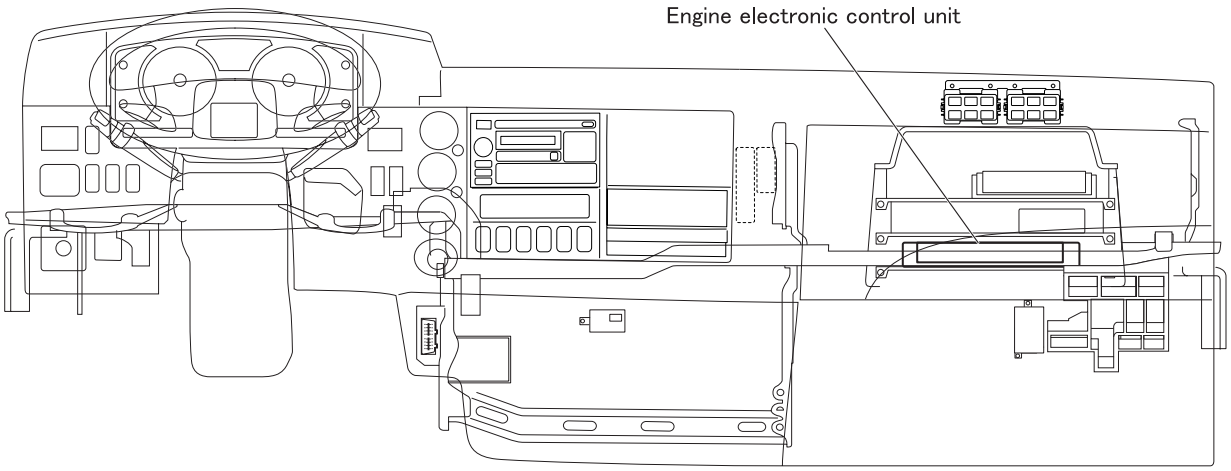
<Fault code>
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished.
  (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

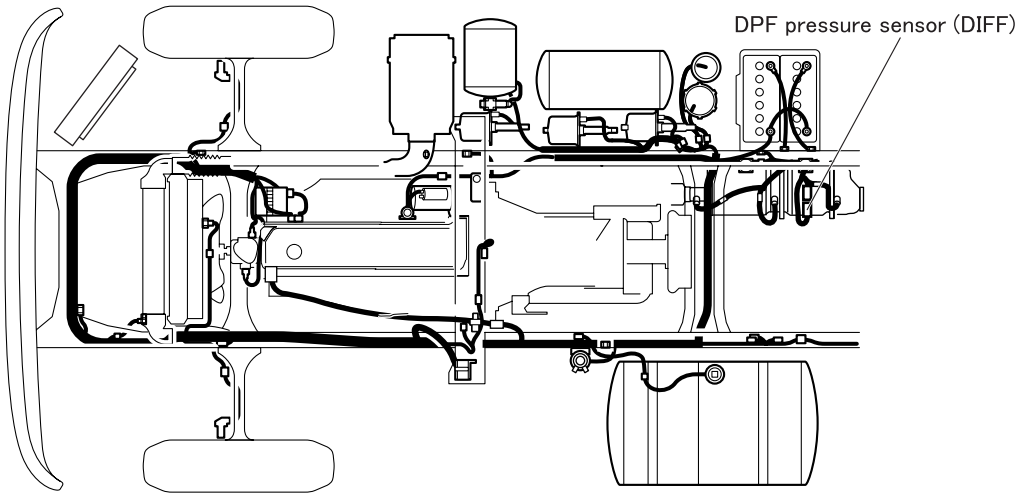
[Electronic Control Unit Connection Diagram]



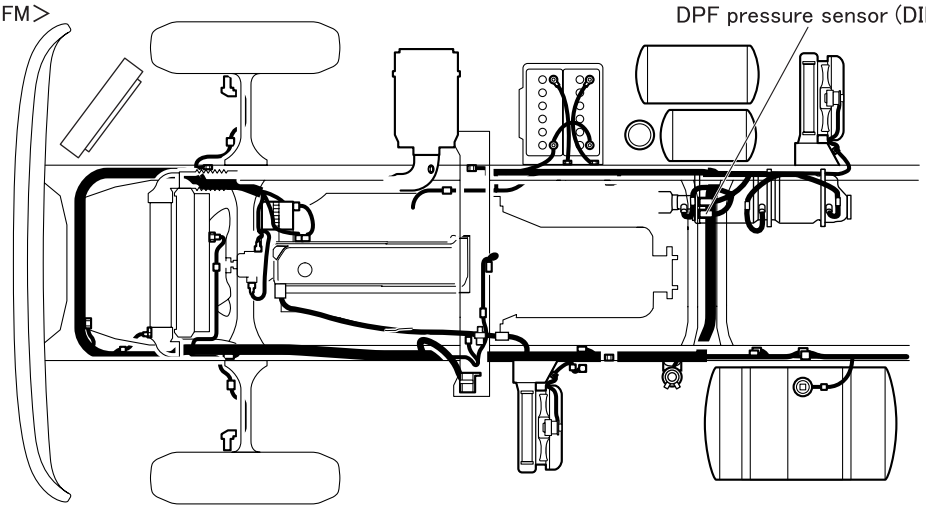
[Parts Identification and Location]



<FK>



<FM>



P105127E-2

[Fault diagnosis]

- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by control data
	Maintenance item		Measure item No. 32 “DPF relative pressure” of Service Data.
	Inspection condition		Past failures include diesel particulate filter pressure sensor, while the current failures do not include diesel particulate filter pressure sensor.
	Requirements		When engine is stationary: 0 kPa {0 psi, 0 kgf/cm^2}
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Go to step 2.

Step 2	Inspection items		Inspection by electronic control unit connector (signal)
	Maintenance item		Measure value of voltage between connector (GF35B) terminal No. 18 (+) and (GF35A) terminal No. 26 (–).
	Inspection condition		• Measure from back side of harness connector with each device connected to harness. • Starter switch: ON
	Requirements		1 to 4.5 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Go to step 3.

Step 3	Inspection items		Inspection by electronic control unit connector (power supply)
	Maintenance item		Measure value of voltage between connector (GF35A) terminal No. 32 (+) and 26 (–).
	Inspection condition		• Measure from back side of harness connector with each device connected to harness. • Starter switch: ON
	Requirements		5 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	Go to step 5.

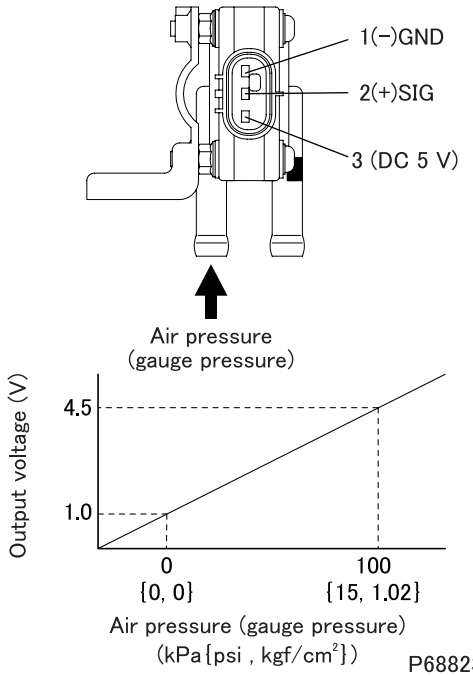
Step 4	Inspection items		Inspection by electronic control unit connector (ground)
	Maintenance item		Measure value of voltage between connector (GF35A) terminal No. 26 (+) and (GF32A) terminal No. 5 (–).
	Inspection condition		• Measure from back side of harness connector with each device connected to harness. • Starter switch: ON
	Requirements		0 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Go to step 5.

Step 5	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 12.
		NO	Modify connector.

Step 6	Inspection items		Inspection of sensor connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify connector.

Step 7	Inspection items		Inspection of sensor unit
	Maintenance item		Measure value of voltage between connector terminal No. 2 (+) and 1 (–).
	Inspection condition		• Apply voltage DC 5 V across terminals No. 3 (+) and 1 (–). • Gradually increase applied air pressure.
	Requirements		• 0 ± 3.5 kPa {0 ± 0.5 psi, 0 ± 0.04 kgf/cm^2}: 1 V • 100 ± 3.5 kPa {15 ± 0.5 psi, 1.02 ± 0.04 kgf/cm^2}: 4.5 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Replacement of sensor

<Step 7 inspection diagram>



Step 8	Inspection items		Inspection of harness between electronic control unit and sensor (power supply)
	Maintenance item		Measure value of voltage between connector terminal No. 3 (+) and 1 (–).
	Inspection condition		• Measure from back side of harness connector with each device connected to harness. • Starter switch: ON
	Requirements		5 V
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 10.
		NO	Go to step 9.

Step 9	Inspection items		Inspection of harness between electronic control unit and sensor (power supply)
	Maintenance item		Check circuit between sensor connector terminal No. 3 and electronic control unit connector (GF35A) terminal No. 32.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 12.
		NO	Modify harness.

Step 10	Inspection items		Inspection of harness between electronic control unit and sensor (ground)
	Maintenance item		Check circuit between sensor connector terminal No. 1 and electronic control unit connector (GF35A) terminal No. 26.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 11.
		NO	Modify harness.

Step 11	Inspection items		Inspection of harness between electronic control unit and sensor (signal)
	Maintenance item		Check circuit between sensor connector terminal No. 2 and electronic control unit connector (GF35B) terminal No. 18.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 12.
		NO	Modify harness.

Step 12	Inspection items		Inspection by control data
	Maintenance item		Measure item No. 32 “DPF relative pressure”
	Inspection condition		Past failures include diesel particulate filter pressure sensor, while the current failures do not include diesel particulate filter pressure sensor.
	Requirements		When engine is stationary: 0 kPa {0 psi, 0 kgf/cm^2}
	Inspection result (Is the judging standard satisfied?)	YES	Go to transient fault (See Gr00.).
		NO	Replacement of electronic control unit

[Fault code]
Diagnosis code: P2510/Flash code: 83
[Monitor]
Abnormality in electronic control unit main relay
[Fault (outline)]
Main relay fault over
[Diagnosis check]
- Electronic control unit main relay operation is monitored.

[Code generation condition]
Either of the following is monitored.
<Condition (1): In case that operation is terminated with excitation failure registered>
- If operation is finished normally in accordance with main relay OFF command from exhaust gas recirculation, the fact is recorded in exhaust gas recirculation memory, and judgment of the fact is made when starter switch is turned ON next time. (Trouble is registered at first occurrence but diagnosis code is not generated because counting up the number of times of trouble occurrence is impossible if operation is finished. It is generated when engine shutdown in such a condition is experienced twice in succession.)

<Condition (2): In case that relay is stuck ON>
- This trouble is recognized when main relay does not stop its operation even when main relay OFF command is issued from ECU. In such a case, recording the fact in ECU memory is performed, and diagnosis code is generated when starter switch is turned ON next time (Warning lamp is lit on second establishment of code generation condition).

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
<Conditions (1)>
- 2 seconds passed after starter switch ON
- 2 seconds passed after cranking
- Battery voltage: normal

<Conditions (1) and (2)>
- Electronic control unit main relay: normal
- Electronic control unit main relay start: normal

[Control effected by electronic control unit during fault]
- Effects no special control.

[Probable cause of trouble]
- Open-circuit or short-circuit of harness between electronic control unit and electronic control unit main relay
- Abnormality of each connector
- Abnormality in electronic control unit main relay
- Abnormality in electronic control unit

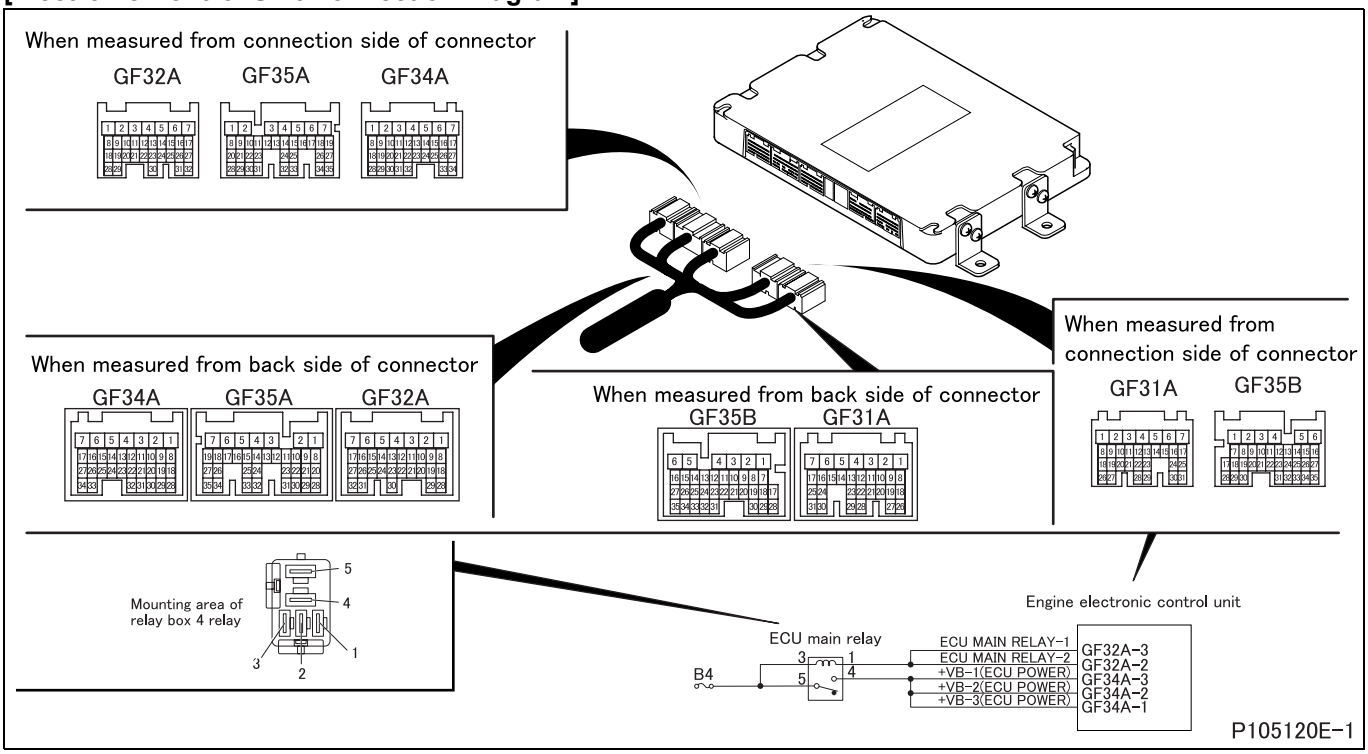
[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>
- Extinguished at 4th driving cycle after normal signal is input.

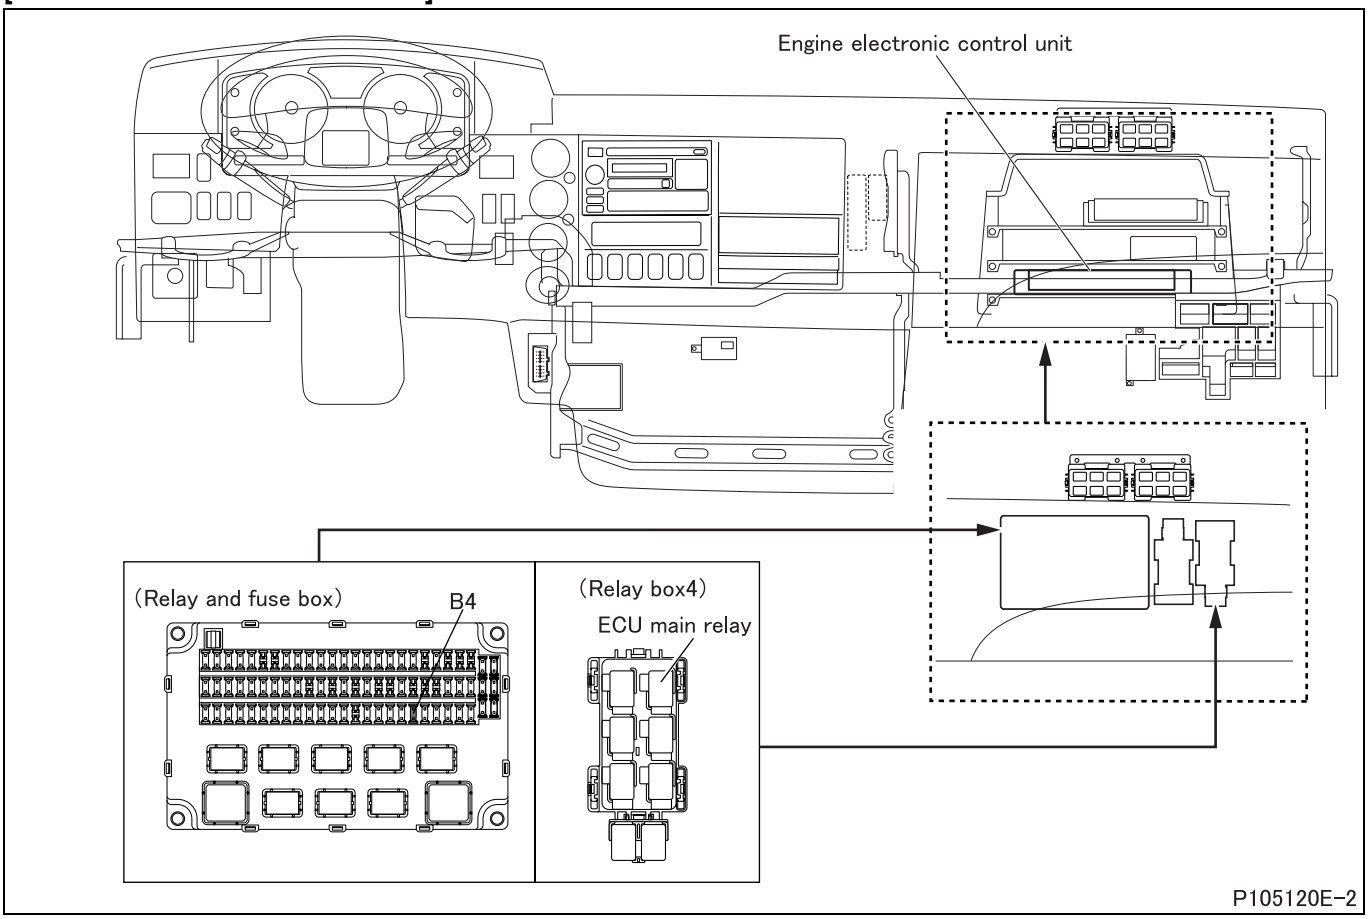
<Fault code>
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished.
  (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

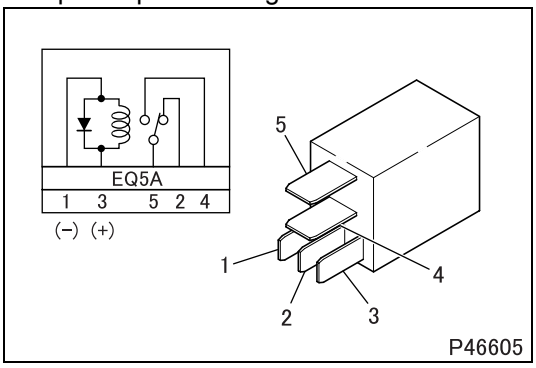
- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection of electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 2.
		NO	Modify connector.

Step 2	Inspection items		Inspection of relay connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Modify connector.

Step 3	Inspection items		Inspection of relay unit
	Maintenance item		Measure continuity between terminal No. 4 (+) and 5 (–) when relay operates.
	Inspection condition		Apply battery voltage between terminals No. 3 (+) and 1 (–).
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	Replacement of relay

<Step 3 inspection diagram>



Step 4	Inspection items		Inspection of harness between relay (coil side) and electronic control unit
	Maintenance item		Check circuit between relay connector terminal No. 1 and electronic control unit connector (GF32A) terminal No. 2 or 3.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Modify harness.

Step 5	Inspection items		Inspection of harness between relay (contact side) and electronic control unit
	Maintenance item		Check circuit between relay connector terminal No. 4 and electronic control unit connector (GF34A) terminal No. 1, 2 or 3.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Modify harness.

Step 6	Inspection items		Inspection of harness between fuse (B4) and relay
	Maintenance item		Check circuit between fuse (B4) and relay connector terminal No. 3 or 5.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Replacement of electronic control unit
		NO	Modify harness.

[Fault code]
Diagnosis code: U0002/Flash code: –
[Monitor]
Abnormality in controller area network 2 communication (electronic drive unit)
[Fault (outline)]
Controller area network bus OFF
[Diagnosis check]
- Controller area network 2 between engine electronic control unit and each electronic drive unit is monitored for abnormality.

[Code generation condition]
- Controller area network communication remains disabled for 0.2 second even after 3 seconds of starter switch ON. (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 3 seconds passed after starter switch ON

[Control effected by electronic control unit during fault]
- Effects no special control.

[Probable cause of trouble]
- Open-circuit or short-circuit of harness between engine electronic control unit and each electronic drive unit (exhaust gas recirculation, intake throttle)
- Abnormality of each connector
- Abnormality of engine electronic control unit
- Abnormality of exhaust gas recirculation electronic drive unit
- Abnormality of throttle electronic drive unit
- Abnormality of controller area network resistor in engine electronic control unit
- Abnormality of controller area network resistor

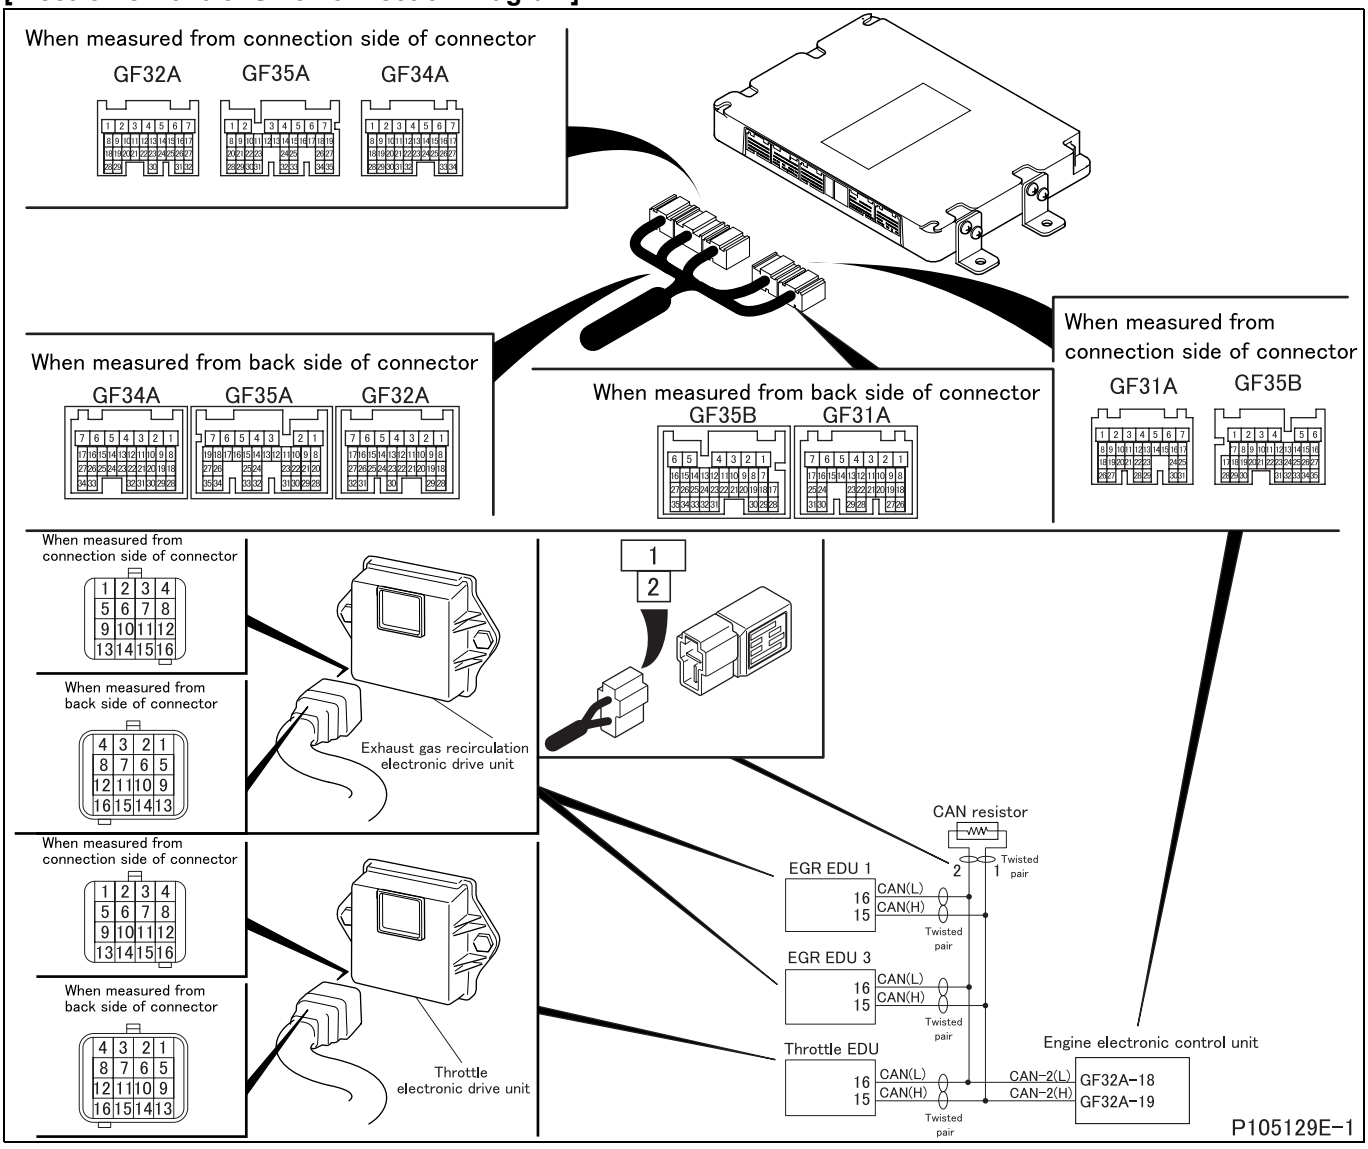
[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>
- Extinguished at 4th driving cycle after normal signal is input.

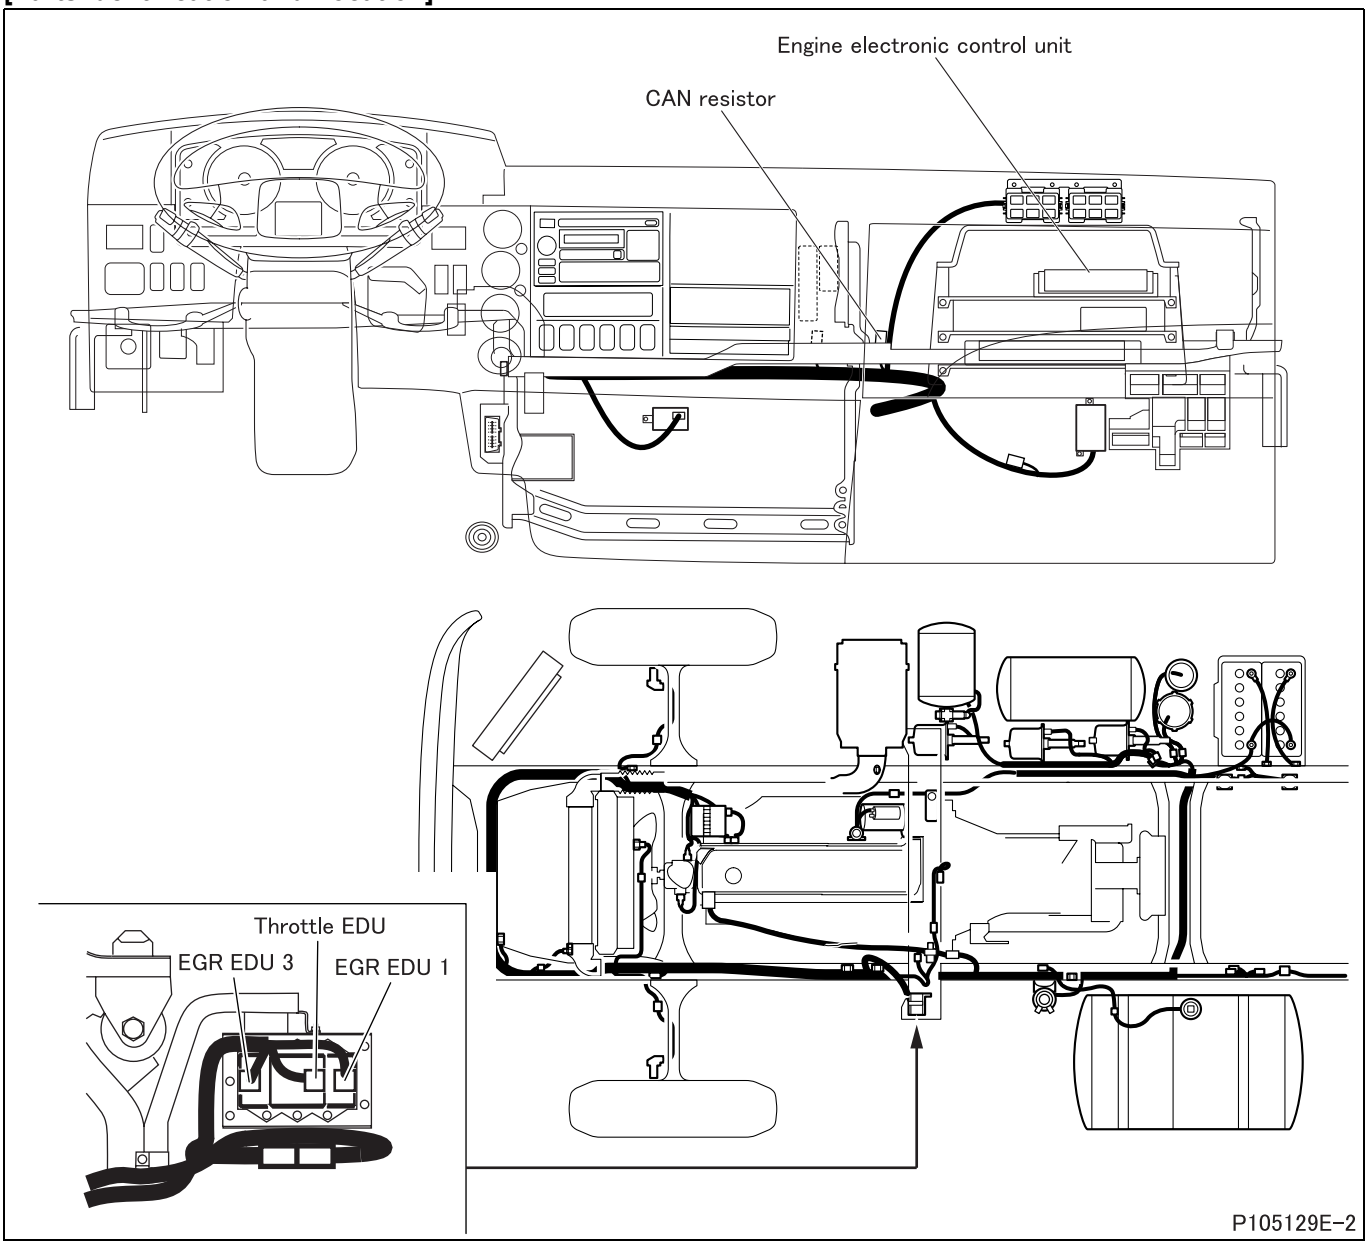
<Fault code>
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished.
  (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

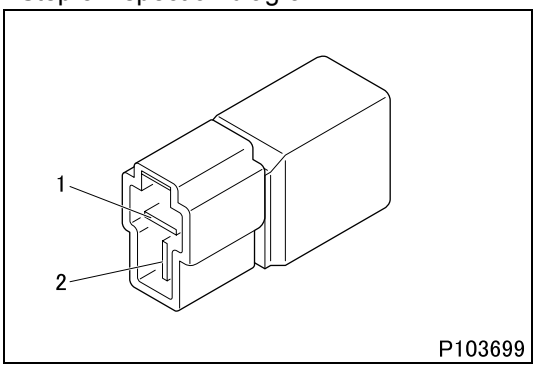
- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by engine electronic control unit connector
	Maintenance item		Measure value of resistance between engine electronic control unit connector (GF32A) terminal No. 18 and 19.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		120 ± 6 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Go to step 2.

Step 2	Inspection items		Inspection of controller area network resistor connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Modify connector.

Step 3	Inspection items		Inspection of controller area network resistor unit
	Maintenance item		Measure value of resistance between connector terminal No. 1 and No. 2.
	Inspection condition		Disconnect connector and measure resistor side.
	Requirements		120 ± 6 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	Replacement of controller area network resistor

<Step 3 inspection diagram>



Step 4	Inspection items		Inspection of harness between engine electronic control unit and controller area network resistor (HIGH)
	Maintenance item		Check circuit between controller area network resistor connector terminal No. 1 and engine electronic control unit connector (GF32A) terminal No. 19.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Modify harness.

Step 5	Inspection items		Inspection of harness between engine electronic control unit and controller area network resistor (LOW)
	Maintenance item		Check circuit between controller area network resistor connector terminal No. 2 and engine electronic control unit connector (GF32A) terminal No. 18.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Modify harness.

Step 6	Inspection items		Inspection of engine electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify connector.

Step 7	Inspection items		Inspection of harness between electronic drive unit and controller area network resistor (HIGH)
	Maintenance item		Check circuit between controller area network resistor connector terminal No. 1 and electronic drive unit connector terminal No. 15.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify harness.

Step 8	Inspection items		Inspection of harness between electronic drive unit and controller area network resistor (LOW)
	Maintenance item		Check circuit between controller area network resistor connector terminal No. 2 and electronic drive unit connector terminal No. 16.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 9.
		NO	Modify harness.

Step 9	Inspection items		Inspection of electronic drive unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Replace the engine electronic control unit as well if this diagnosis code occurs after the replacement of one of electronic drive unit.
		NO	Modify connector.

[Fault code]
Diagnosis code: U0029/Flash code: –
[Monitor]
Abnormality in controller area network 1 communication (electronic control unit)
[Fault (outline)]
Controller area network bus OFF
[Diagnosis check]
- Controller area network communication 1 between engine electronic control unit and each electronic control unit is monitored for abnormality.

[Code generation condition]
- Controller area network communication remains disabled for 0.2 second even after 3 seconds of starter switch ON. (Warning lamp is lit and diagnosis code is displayed on first establishment of code generation condition.)

[Diagnosis check timing]
- When code generation condition is established after starter switch ON

[Diagnostic requirement]
- 3 seconds passed after starter switch ON

[Control effected by electronic control unit during fault]
- Effects no special control.

[Probable cause of trouble]
- Open-circuit or short-circuit of controller area network communication harness between engine electronic control unit and multifunction vehicle control unit
- Abnormality of each connector
- Abnormality of engine electronic control unit
- Abnormality of multifunction vehicle control unit
- Abnormality of controller area network resistor in engine electronic control unit
- Abnormality of controller area network resistor

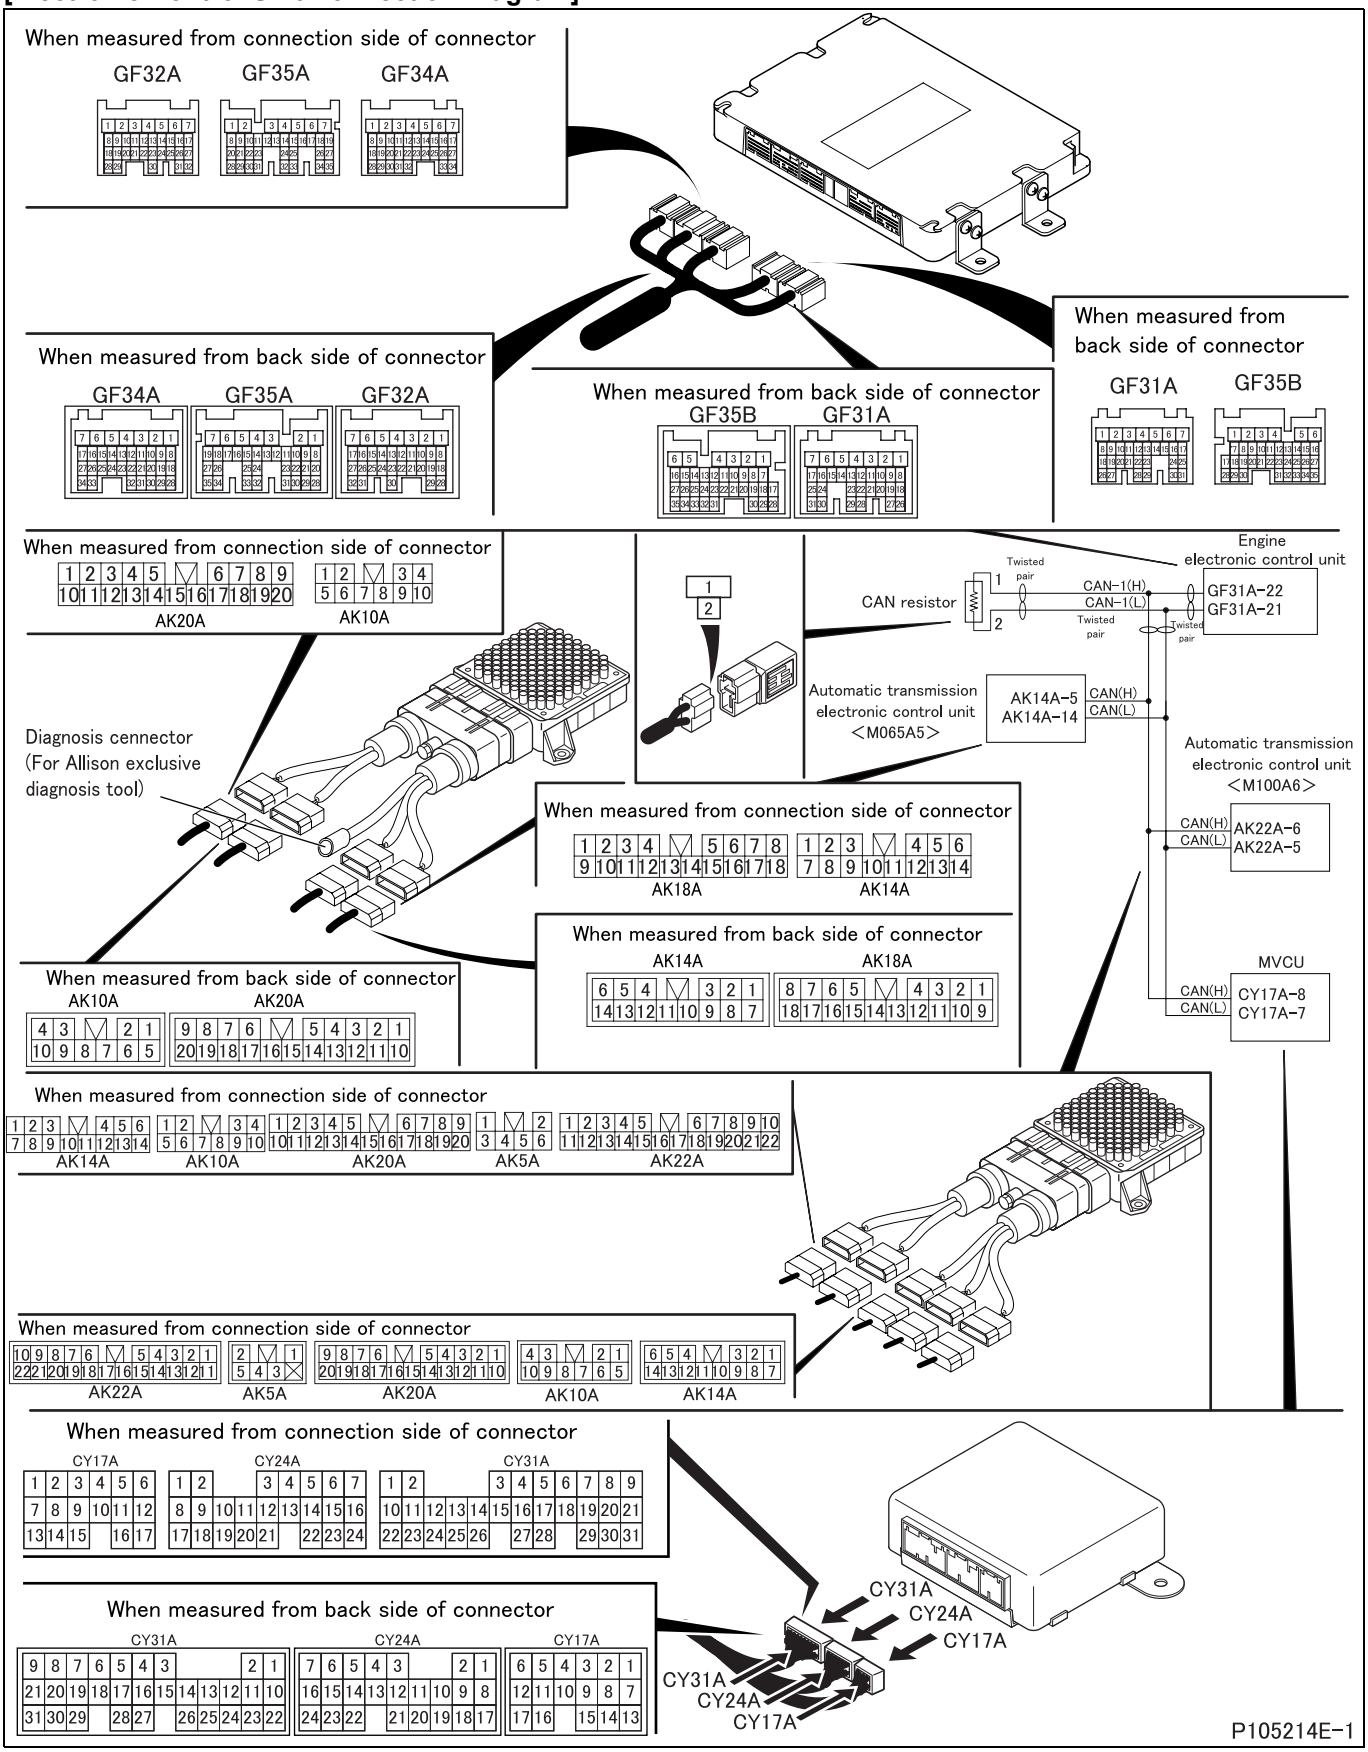
[Recoverability]
<Control during fault>
- Recovered if signal becomes normal with starter switch in ON position.

<Warning lamp>
- Extinguished at 4th driving cycle after normal signal is input.

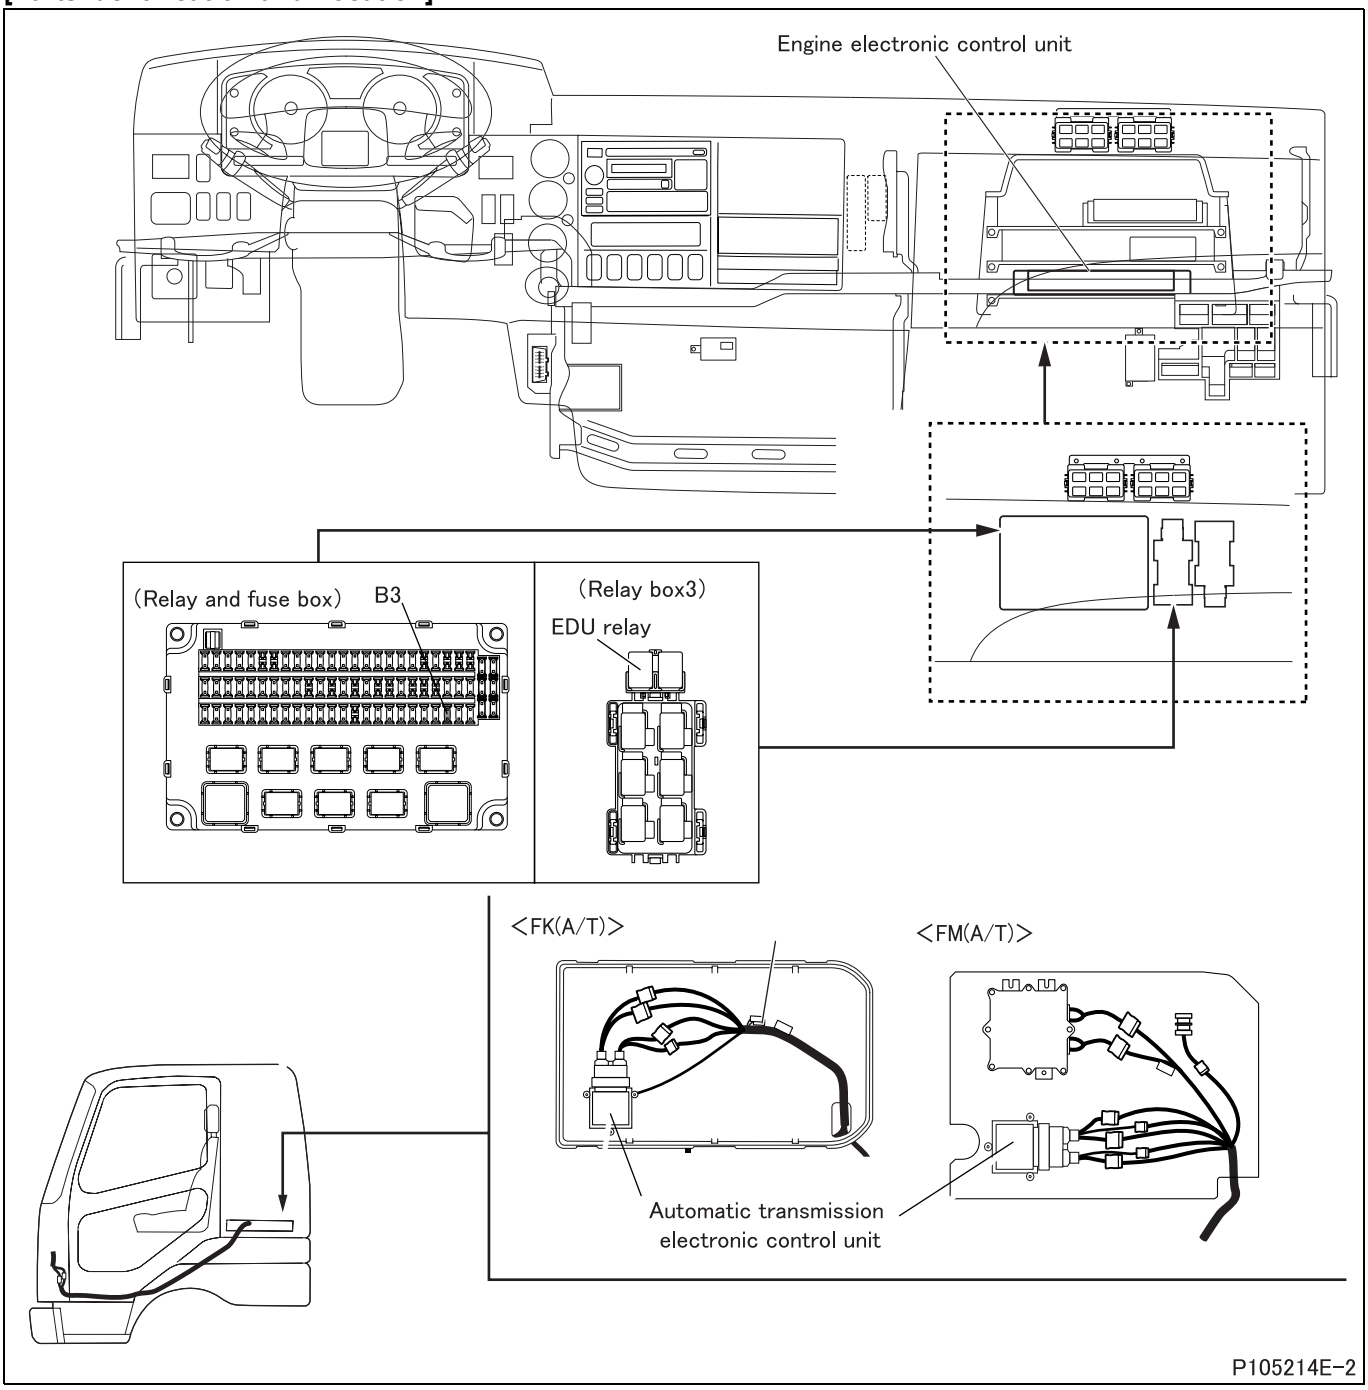
<Fault code>
- Automatically cleared at 40th warm up cycle after warning lamp is extinguished.
  (To clear as desired, erase from the memory.)

Driving cycle : “Starter switch ON to start engine till starter switch OFF” constitutes 1 driving cycle.
Warm up cycle : “Starter switch ON to start engine till starter switch OFF after coolant temperature increased and engine warmed up” constitutes 1 warm up cycle.

[Electronic Control Unit Connection Diagram]



[Parts Identification and Location]



[Fault diagnosis]

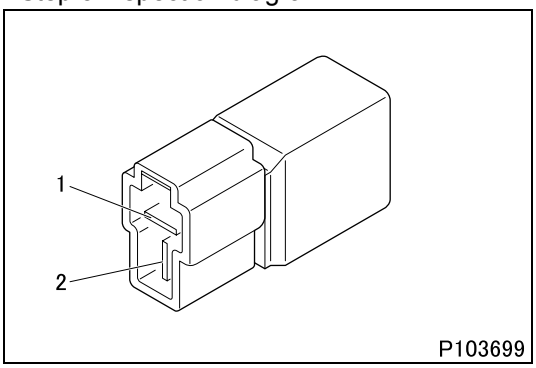
- Perform checks in the sequence of the following steps.

Step 1	Inspection items		Inspection by engine electronic control unit connector
	Maintenance item		Measure value of resistance between engine electronic control unit connector (GF31A) terminal No. 21 and 22.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		120 ± 6 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Go to step 2.

Step 2	Inspection items		Inspection of controller area network resistor connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 3.
		NO	Modify connector.

Step 3	Inspection items		Inspection of controller area network resistor unit
	Maintenance item		Measure value of resistance between connector terminal No. 1 and No. 2.
	Inspection condition		Disconnect connector and measure resistor side.
	Requirements		120 ± 6 Ω
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 4.
		NO	Replacement of controller area network resistor

<Step 3 inspection diagram>



Step 4	Inspection items		Inspection of harness between engine electronic control unit and controller area network resistor (HIGH)
	Maintenance item		Check circuit between controller area network resistor connector terminal No. 1 and engine electronic control unit connector (GF31A) terminal No. 22.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 5.
		NO	Modify harness.

Step 5	Inspection items		Inspection of harness between engine electronic control unit and controller area network resistor (LOW)
	Maintenance item		Check circuit between controller area network resistor connector terminal No. 2 and engine electronic control unit connector (GF31A) terminal No. 21.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 6.
		NO	Modify harness.

Step 6	Inspection items		Inspection of engine electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 7.
		NO	Modify connector.

Step 7	Inspection items		Inspection of harness between multifunction vehicle control unit and controller area network resistor (HIGH)
	Maintenance item		Check circuit between controller area network resistor connector terminal No. 1 and multifunction vehicle control unit connector (CY17A) terminal No. 8.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 8.
		NO	Modify harness.

Step 8	Inspection items		Inspection of harness between multifunction vehicle control unit and controller area network resistor (LOW)
	Maintenance item		Check circuit between controller area network resistor connector terminal No. 2 and multifunction vehicle control unit connector (CY17A) terminal No. 7.
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 9.
		NO	Modify harness.

Step 9	Inspection items		Inspection of multifunction vehicle control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 10.
		NO	Modify connector.

Step 10	Inspection items		Inspection of harness between automatic transmission electronic control unit and controller area network resistor (HIGH)
	Maintenance item		Check circuit between the following connector terminals M065A5: controller area network resistor connector terminal No. 1 and automatic transmission electronic control unit connector (AK14A) terminal No. 5 M100A6: controller area network resistor connector terminal No. 1 and automatic transmission electronic control unit connector (AK22A) terminal No. 6
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 11.
		NO	Modify harness.

Step 11	Inspection items		Inspection of harness between automatic transmission electronic control unit and controller area network resistor (LOW)
	Maintenance item		Check circuit between the following connector terminals M065A5: controller area network resistor connector terminal No. 2 and automatic transmission electronic control unit connector (AK14A) terminal No. 14 M100A6: controller area network resistor connector terminal No. 2 and automatic transmission electronic control unit connector (AK22A) terminal No. 5
	Inspection condition		Disconnect each device from harness and measure from connection side of harness connector.
	Requirements		There is continuity.
	Inspection result (Is the judging standard satisfied?)	YES	Go to step 12.
		NO	Modify harness.

Step 12	Inspection items		Inspection of automatic transmission electronic control unit connector
	Maintenance item		Inspection of connector
	Inspection condition		–
	Requirements		• Connector is properly connected. • No trace of water entry is found. • No corrosion is found in terminal. • Connection to terminal is appropriate.
	Inspection result (Is the judging standard satisfied?)	YES	Replace the engine electronic control unit as well if this diagnosis code occurs after the replacement of either multifunction vehicle control unit or automatic transmission electronic control unit.
		NO	Modify connector.

4. Multi-Use Tester Service Data

NOTE

- **It is possible to see service data and actuator tests simultaneously.**

No.	Item	Data	Inspection condition	Requirement
01	Engine Revolution	■■■.r/min	Idling	Approx. 600 rpm
			Racing (engine running)	Changes in sync with the tachometer reading
02	Reference Injection Quantity	■■■. ■%	Starter switch ON	0%
05	Gas-flow Resistance of Filter	■■■. ■	High idle	0 to 0.085
07	Reference Common Rail Pressure	■■■. ■%	Starter switch ON	0%
09	Actual Common Rail Pressure	■■■. ■%	Starter switch ON	0%
0A	EGR Reference Position	■■■. ■%	–	0 to 100%
0C	Difference Common Rail Pressure	■■■. ■%	Idling	0% (The value rises up to approx. 7.5% depending on the vehicle conditions.)
0E	EGR1 Actual Position	■■. ■■%	Perform actuator test	The actuator shall move to a position as indicated in the actuator test.
			[Actuator test] A1: EGR1, 3	
0F	EGR3 Actual Position	■■. ■■%	Perform actuator test	The actuator shall move to a position as indicated in the actuator test.
			[Actuator test] A1: EGR1, 3	
11	Regeneration Interruption Flag	■■■■.	Automatic diesel particulate filter regeneration in progress	0 to 1
			Manual diesel particulate filter regeneration in progress	0 to 1
13	DPF Regeneration Request Value	■■■■.	–	0 to 5
14	2ND Stage Lapse Time	■■■■.min	The elapsed time of diesel particulate filter regeneration (ceramic filter temperature rise controlled) is displayed.	
16	Post Injection Quantity (REG)	■■■. ■	Automatic diesel particulate filter regeneration in progress	Value gradually increases
			Manual diesel particulate filter regeneration in progress	Value gradually increases
1F	Intake Throttle Target Position	■■■■.%	–	0 to 100%
20	Intake Throttle actual position	■■■. ■%	Perform actuator test	The throttle shall move to a position as indicated in the actuator test.
			[Actuator test] A7: Intake throttle1	
21	WG valve reference position	■■■. ■%	Idling	0
22	Accel Pedal Position (unfiltered)	■■■. ■%	Accelerator pedal not pressed	0%
			Accelerator pedal gradually pressed	Value gradually increases
			Accelerator pedal fully pressed	100%
23	Accel Pedal Position (filtered)	■■■. ■%	Accelerator pedal not pressed	0%
			Accelerator pedal gradually pressed	Value gradually increases
			Accelerator pedal fully pressed	100%
24	Accel Pedal Sensor Voltage 1	■. ■■■V	Accelerator pedal gradually pressed from released position	0.85 to 4.15 V
25	Accel Pedal Sensor Voltage 2	■. ■■■V	Accelerator pedal gradually pressed from released position	0.85 to 4.15 V
26	Boost Pressure	■■■. ■psi	Engine speed: 3210 rpm	28 psi

No.	Item	Data	Inspection condition	Requirement
27	Intake Air Temperature	■■■. ■°F	Engine cold	Value corresponds to ambient temperature
28	Intake Air Temperature (EGR)	■■■. ■°F	Engine cold	Value corresponds to ambient temperature
29	DPF Temperature 1 (inlet)	■■■■. °F	Engine in process of warming up	Value gradually increases

5. Actuator Tests Performed Using Multi-Use Tester

NOTE

- **It is possible to see service data and actuator tests simultaneously.**

No.	Item	Explanation	Confirmation method
A1	EGR1, 3	Hold the exhaust gas recirculation valves 1 and 3 in a position as displayed in the Multi-Use Tester. [Can be executed under the following conditions] • Vehicle: stopped (vehicle speed 0 km/h {0 MPH}) • Starter switch: ON • Engine: stopped	The target values as indicated in the actuator test agree with the actual position of the service data. [Service data] 0E: EGR1 Actual Position 0F: EGR3 Actual Position
A3	W/G M/V	Switch ON/OFF waste gate magnetic valve [Can be executed under the following conditions] • Vehicle: stopped (vehicle speed 0 km/h {0 MPH}) • Starter switch: ON • Transmission: neutral • Engine: idling	Operating sound of waste gate magnetic valve when turned ON/OFF [Service data] 94: W/G M/V
A5	DPF Regeneration (Manual)	Send out the manual diesel particulate filter regeneration request. [Can be executed under the following conditions] • Vehicle: stopped (vehicle speed 0 km/h {0 MPH}) • Starter switch: ON (engine starts) • Transmission: neutral • Parking brake: engaged (parking brake switch: ON) • The warm-up ends.	Check to see that the diesel particulate filter warning lamp blinks. The manual diesel particulate filter regeneration starts and engine speed increases when the diesel particulate filter warning switch is turned on. [Service data] 75: DPF SW
A7	Intake throttle 1	Hold the intake throttle in a position as displayed in the Multi-Use Tester. [Can be executed under the following conditions] • Vehicle: stopped (vehicle speed 0 km/h {0 MPH}) • Starter switch: ON • Engine: stopped	The target values as indicated in the actuator test agree with the actual position of the service data. [Service data] 20: Intake Throttle actual position
A8	DPF Lamp	Switch ON/OFF diesel particulate filter warning lamp [Can be executed under the following conditions] • Vehicle: stopped (vehicle speed 0 km/h {0 MPH}) • Starter switch: ON • Transmission: neutral • Engine: idling	ON/OFF condition of diesel particulate filter warning lamp [Service data] 93: DPF Lamp
A9	EDU Relay	Switch ON/OFF electronic drive unit relay [Can be executed under the following conditions] • Vehicle: stopped (vehicle speed 0 km/h {0 MPH}) • Starter switch: ON • Transmission: neutral • Engine: stopped	Operating sound of electronic drive unit relay when turned ON/OFF [Service data] 90: EDU Relay
AB	Exhaust Brake M/V1 + M/V2	Switch ON/OFF exhaust shutter 3-way magnetic valve 1, 2 [Can be executed under the following conditions] • Vehicle: stopped (vehicle speed 0 km/h {0 MPH}) • Starter switch: ON • Transmission: neutral • Engine: stopped	Operating sound of exhaust shutter 3-way magnetic valve 1, 2 when turned ON/OFF [Service data] 88: Exhaust M/V

No.	Item	Explanation	Confirmation method
AC	Auxiliary Brake M/V 1	Switch ON/OFF exhaust shutter 3-way magnetic valve 1 [Can be executed under the following conditions] • Vehicle: stopped (vehicle speed 0 km/h {0 MPH}) • Starter switch: ON • Transmission: neutral • Engine: stopped	Operating sound of exhaust shutter 3-way magnetic valve 1 when turned ON/OFF [Service data] 87: Auxiliary Brake M/V 1
AE	Auxiliary Brake Indicator Lamp	Switch ON/OFF exhaust shutter indicator lamp [Can be executed under the following conditions] • Vehicle: stopped (vehicle speed 0 km/h {0 MPH}) • Starter switch: ON • Transmission: neutral • Engine: stopped	ON/OFF condition of indicator lamp [Service data] 8C: Auxiliary Brake Indicator Lamp
AF	Relay for Glow Relay	ON/OFF switchover of glow drive relay [Can be executed under the following conditions] • Vehicle: stationary (vehicle speed 0 km/h {0 MPH}) • Starter switch: ON • Engine: stopped	Relay operating sound [Service data] 8D: Glow Relay
B0	Glow Indicator Lamp	Glow indicator lamp driving signal [Can be executed under the following conditions] • Vehicle: stationary (vehicle speed 0 km/h {0 MPH}) • Starter switch: ON • Engine: stopped	Check that indicator lamp is turned ON/OFF [Service data] 8E: Glow Relay Indicator Lamp
B1	Starter Safety Relay	ON/OFF switchover of starter continuous power-on preventive relay (safety relay) [Can be executed under the following conditions] • Vehicle: stationary (vehicle speed 0 km/h {0 MPH}) • Starter switch: ON • Engine: stopped	Relay operating sound [Service data] 8F: Starter Safety Relay
B3	MIL Lamp	Switch ON/OFF engine warning lamp (orange) [Can be executed under the following conditions] • Vehicle: stopped (vehicle speed 0 km/h {0 MPH}) • Starter switch: ON • Engine: stopped	ON/OFF condition of warning lamp (orange) [Service data] 91: MIL Lamp
B4	Diagnosis Lamp	Switch ON/OFF engine warning lamp (red) [Can be executed under the following conditions] • Vehicle: stopped (vehicle speed 0 km/h {0 MPH}) • Starter switch: ON • Engine: stopped	ON/OFF condition of warning lamp (red) [Service data] 92: Diagnosis Lamp
B6	Air Conditioner SW1	Switch to air conditioner operation condition (idling up control) [Can be executed under the following conditions] • Vehicle: stopped (vehicle speed 0 km/h {0 MPH}) • Transmission: neutral • Engine: idling	Increase/decrease of engine RPM [Service data] 7C: Air Conditioner SW1
B8	Idle Up Cancel SW	Switch to idle up cancel condition [Can be executed under the following conditions] • Vehicle: stopped (vehicle speed 0 km/h {0 MPH}) • Transmission: neutral	Idling speed low idle [Service data] 7B: Idle Up Cancel SW

No.	Item	Explanation	Confirmation method
B9	Fuel Leak Check	Increase rail pressure for a specified period of time [Can be executed under the following conditions] • Vehicle: stopped (vehicle speed 0 km/h {0 MPH}) • Transmission: neutral • Diagnosis switch: OFF (removal of fuse)	Check that no fuel leaks from fuel system (pipe, hose)
BB	Injector Test 1	Force the selected injector magnetic valve to be deactivated. [Can be executed under the following conditions] • Vehicle: stopped (vehicle speed 0 km/h {0 MPH}) • Transmission: neutral • No present diagnosis codes generated	Injector magnetic valve (No. 1 cylinder) should stop.
BC	Injector Test 2		Injector magnetic valve (No. 5 cylinder) should stop.
BD	Injector Test 3		Injector magnetic valve (No. 3 cylinder) should stop.
BE	Injector Test 4		Injector magnetic valve (No. 6 cylinder) should stop.
BF	Injector Test 5		Injector magnetic valve (No. 2 cylinder) should stop.
C0	Injector Test 6		Injector magnetic valve (No. 4 cylinder) should stop.
C2	Pump Adjustment Value Clear	Delete the compensation information (pump learning condition) in engine electronic control unit	The service data “4D: Pump Adjustment State” displays “Unlearned”

6. Registration and Alteration of Data in Engine Electronic Control Unit

6.1 Operation at electronic control unit replacement

- Vehicle information and equipment specifications are registered in each engine electronic control unit as coded data (coding data).
- Given in the chart below are the items on which registered data in the engine electronic control unit are necessary to alter or new data are necessary to register with the disposition of equipment.
- If the electronic control unit is left initialized with no necessary data registered, it is not capable of proper engine control.
- For data alteration/registration and data write operation, contact your nearest MITSUBISHI FUSO dealer or MITSUBISHI FUSO TRUCK OF AMERICA, Inc.

Disposition of equipment \ Engine electronic control unit data		VIN (Vehicle Identification Number)	Injector correction	Injection quantity correction	PTO idling speed	Remarks
Engine electronic control unit	Replaced with new unit	O	O	O	O	
	Relocated from other vehicle	O	O	O	O	
	Erasure of diagnosis codes					No action is required.
Replacement of injector			O			Data code differs from injector to injector and is necessary to change.
Replacement of air flow sensor						Data is not necessary to change if the replacement is identical.
Change of PTO idling speed					O	

O : Denotes the necessity of data being updated or registered.

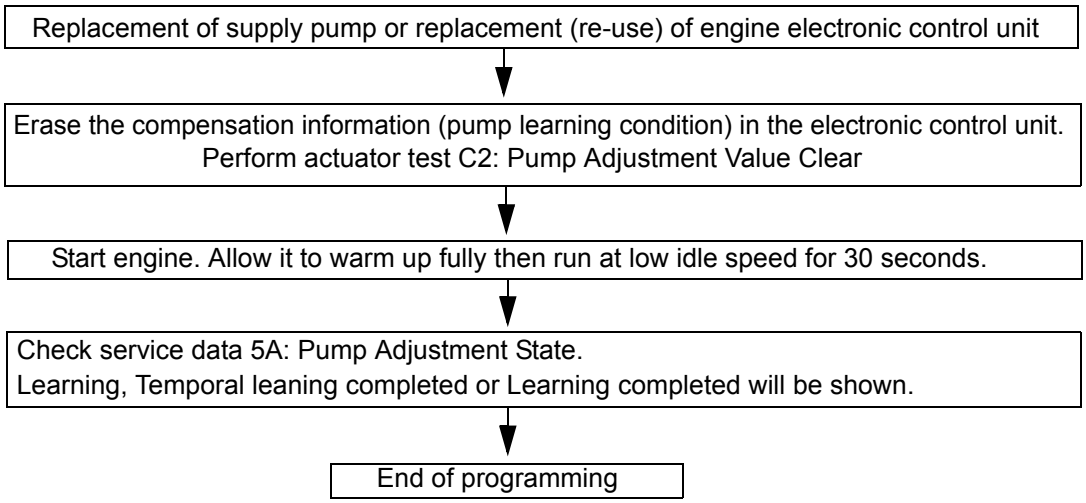
6.2 Resetting the diesel particulate filter related information (resetting electronic control unit)

- On the regeneration control type as diesel particulate filter system, the engine electronic control unit stores many diesel particulate filter related information to control the diesel particulate filter regeneration as diesel particulate filter history.
- If the ceramic filter is replaced or cleaned without regeneration, reset the history of diesel particulate filter using Multi-Use Tester. (For reset procedure, see Gr15.)
- In the case of diesel particulate filter regeneration by use of the diesel particulate filter cleaning switch, however, history reset with a Multi-Use Tester is not required because the history is automatically reset by engine electronic control unit.

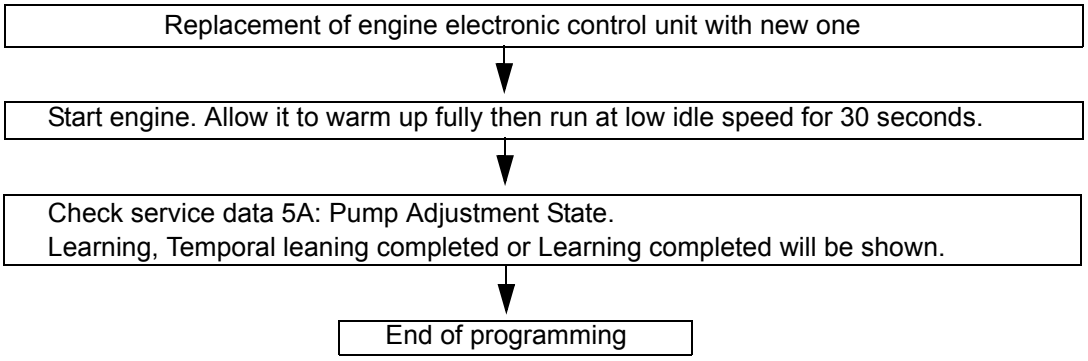
7. Initialization of Supply Pump Unit Difference Learning Value in Engine Electronic Control Unit

Following replacement of the supply pump, this item is used to erase the adjustment value (learning value) in the engine electronic control unit and program the current supply pump data into the engine electronic control unit.
Also following replacement of the engine electronic control unit with a new one, it is necessary to program in the current supply pump data.

7.1 After replacement of supply pump or replacement (re-use) of engine electronic control unit

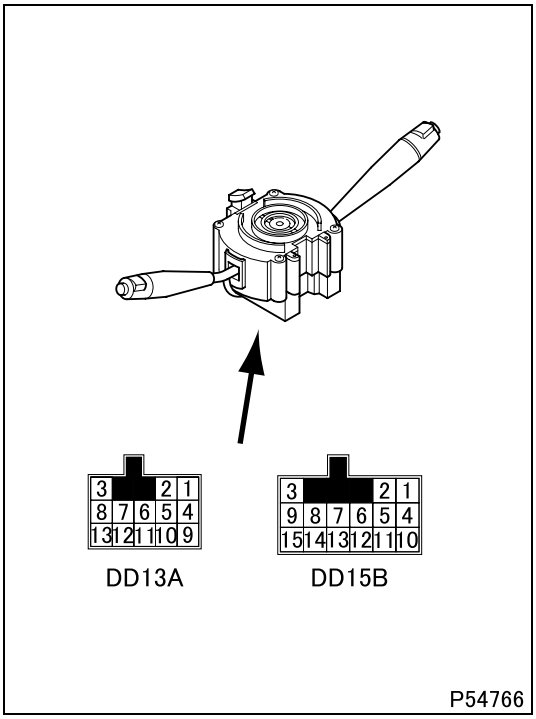


7.2 After replacement of engine electronic unit with new one



7.3 Check after engine electronic control unit programming

If the measurement values (which show the learning values) shown by service data 5B: Pump Adjustment Value (Last Time) and 5C: Pump Adjustment Value (This Time) are out of specification, a defect in the supply pump or in the engine electronic control unit is conceivable so you must replace the supply pump or engine electronic control unit. (Initialize the engine electronic control unit again after replacing the supply pump or engine electronic control unit.)

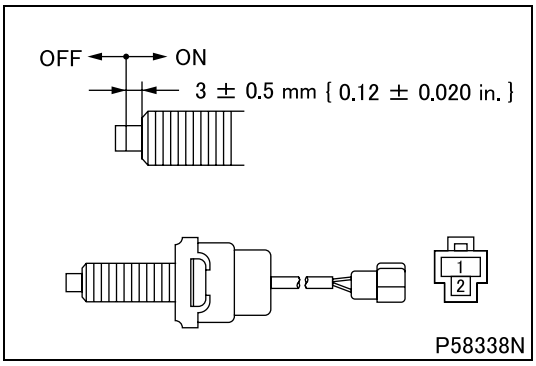


#001 Inspection of combination switch

DD13A connector connection table

Switch position		Terminals with continuity
Exhaust brake switch	OFF	–
	ON	1–4

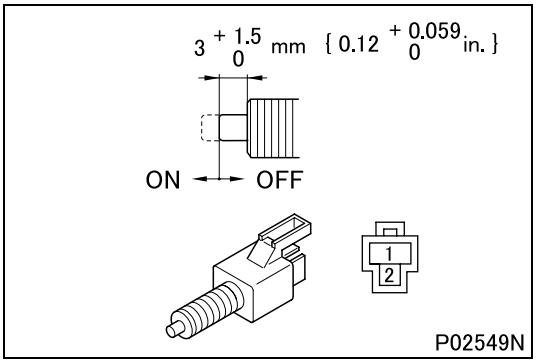
- If there is any abnormality, replace the switch.



#029 Inspection of accelerator pedal switch

Switch position	Terminals with continuity
OFF	–
ON	1–2

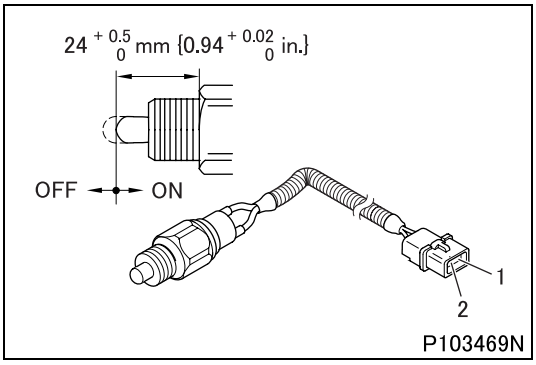
- If there is any abnormality, replace the switch.



#031 Inspection of clutch switch

Switch position	Terminals with continuity
OFF	–
ON	1–2

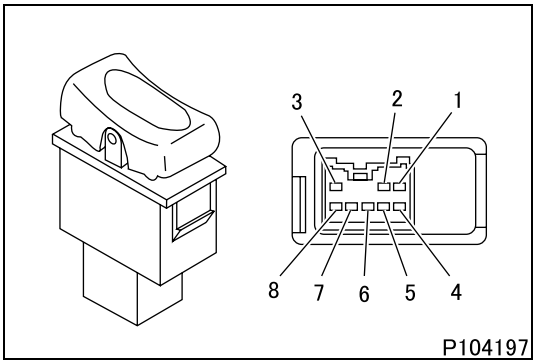
- If there is any abnormality, replace the switch.



#056 Inspection of transmission neutral switch

Switch position	Terminals with continuity
OFF	–
ON	1–2

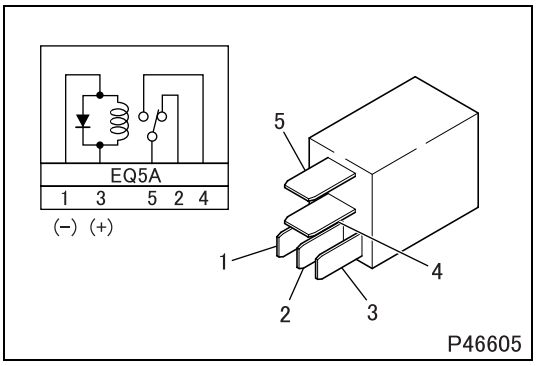
- If there is any abnormality, replace the switch.



#089 Inspection of DPF cleaning switch

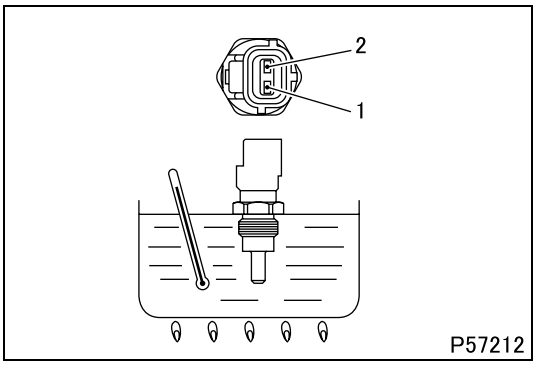
Switch position	Terminals with continuity
–	7–2
ON	7–8

- If there is any abnormality, replace the switch.



#182 Inspection of relay (normally open type with 6 pins)

- Test for continuity and proper operation. If there is any abnormality, replace the relay.

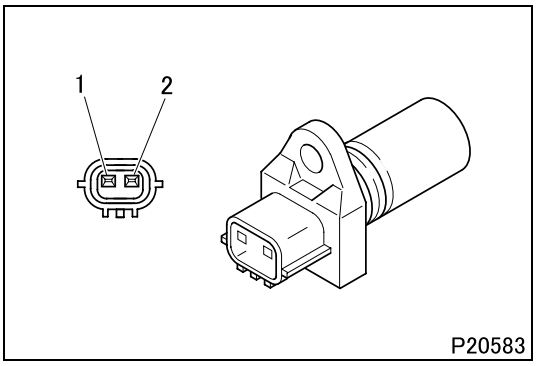


#262 Inspection of water temperature sensor

- Place the water temperature sensor in a container filled with engine oil.
- Heat the oil to each of the specified temperatures. Stir the oil well while doing so.
- Measure the resistance between terminals 1 and 2.

Standard value	20°C {68°F}	2.45 ± 0.14 kΩ
	80°C {176°F}	0.32 kΩ (reference value)
	110°C {230°F}	147.1 ± 2 Ω

- If either measurement is out of specification, replace the sensor.

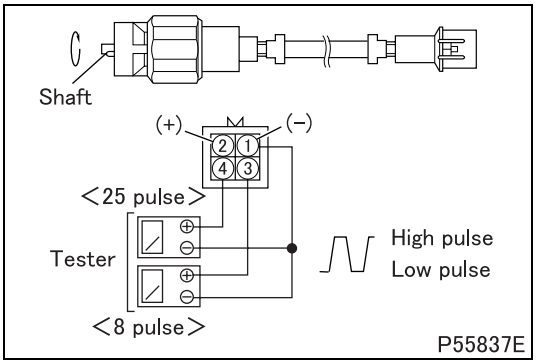


#263 Inspection of engine speed sensor

- Measure the resistance between terminals 1 and 2.

Standard value (at 20°C {68°F})	125.5 ± 17 Ω

- If the measurement is out of specification, replace the sensor.

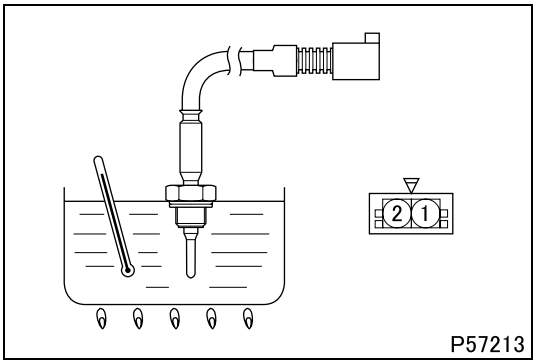


#265 Inspection of vehicle speed sensor

- With the battery voltage applied to terminals 1 and 2, slowly turn the shaft of the sensor.
- Measure the maximum voltage (high pulse voltage) and minimum voltage (low pulse voltage) occurring at each specified pair of terminals.

Terminals	Inspection condition	Standard value
8-pulse output: terminals 1 and 3	Low pulse voltage	1.5 V or lower
	High pulse voltage	23.5 V or more
25-pulse output: terminals 1 and 4	Low pulse voltage	0.5 V or lower
	High pulse voltage	8 ± 1 V

- If any measurement is out of specification, replace the sensor.



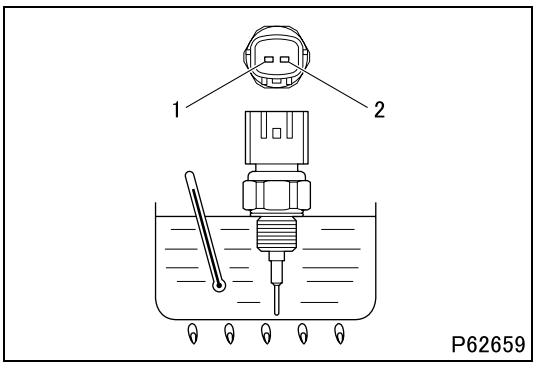
#305 Inspection of intake air temperature sensor

<Intake air temperature sensor 1>

- The intake air temperature sensor 1 may output false signals if its tip is contaminated. Clean it if necessary. (See Gr15.)
- Place the sensor in a container filled with engine oil.
- Heat the oil to each of the specified temperatures. Stir the oil well while doing so.
- Measure the resistance between terminals 1 and 2.

Standard value	50°C {122°F}	$2.202\ ^{+0.233}_{-0.208}$ kΩ
	100°C {212°F}	$508.1\ ^{+41.3}_{-37.7}$ Ω
	150°C {302°F}	$160.4\ ^{+10.3}_{-9.6}$ Ω

- If either measurement is out of specification, replace the sensor.

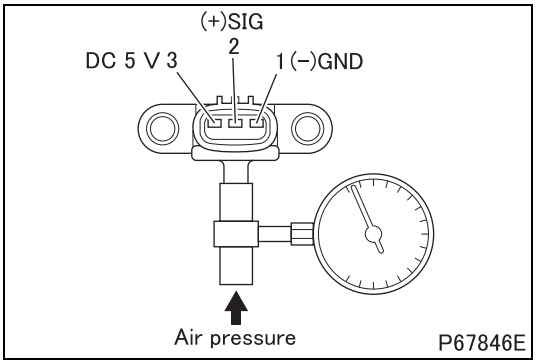


<Intake air temperature sensor 2>

- The intake air temperature sensor 2 may output false signals if its tip is contaminated. Clean it if necessary. (See Gr15.)
- Place the sensor in a container filled with engine oil.
- Heat the oil to each of the specified temperatures. Stir the oil well while doing so.
- Measure the resistance between terminals 1 and 2.

Standard value	0°C {32°F}	$162.3\ ^{+48.8}_{-36.5}$ kΩ
	20°C {68°F}	$61.47\ ^{+15.99}_{-12.35}$ kΩ
	80°C {176°F}	$6.120\ ^{+1.095}_{-0.907}$ kΩ

- If the measurement is out of specification, replace the sensor.



#318 Inspection of boost pressure sensor

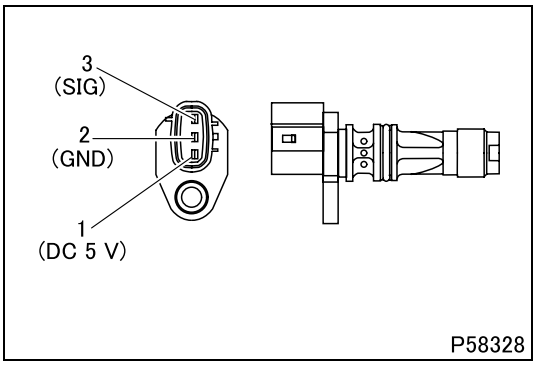
- Apply DC 5 V to terminals 3 and 1.
- Apply air pressure. Gradually increase it and, while doing so, measure the output voltage occurring at terminals 2 and 1 (see the diagram on the left).

	Air pressure (gauge pressure)	Voltage
Standard value	101.67 kPa {15 psi, 1.0 kgf/cm^2}	Approx. 3.2 V
	165.67 kPa {24 psi, 1.7 kgf/cm^2}	Approx. 4.5 V

- If any measurement is out of specification, replace the sensor.

#319 Inspection of common rail pressure sensor

- The sensor cannot easily be inspected in isolation, so you must evaluate it indirectly by inspection of system harnesses and related parts.
- If there is no abnormality in any related part but the system is abnormal, replace the common rail pressure sensor.

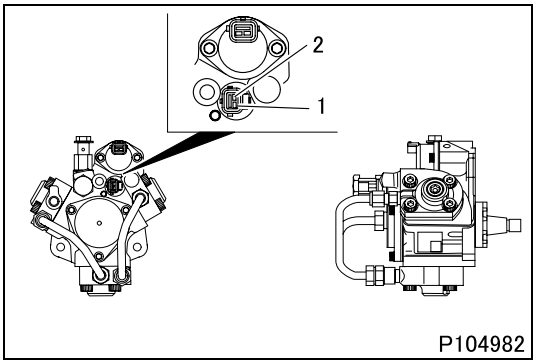


#320 Inspection of cylinder recognition sensor

- Measure the resistance between terminals 1 and 2. (The resistance serves as a rough indication only. A pulse output monitor is needed for confirmation of functionality.)

Standard value	200 to 1800 Ω

- If the measurement is out of specification, replace the sensor.



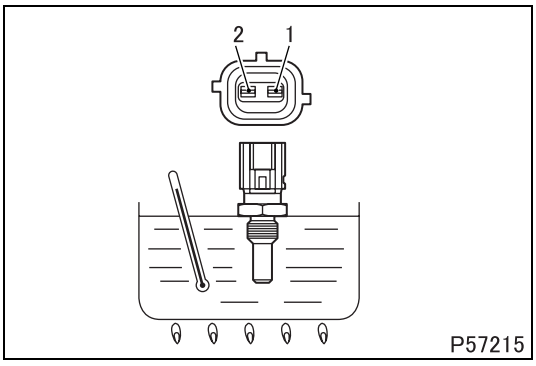
#323 Inspection of fuel temperature sensor

<Fuel temperature sensor 1>

- Measure the resistance between terminals 1 and 2.

Standard value	–20°C {–4°F}	15.0 ± 1.5 kΩ
	20°C {68°F}	2.45 ± 0.24 kΩ
	80°C {176°F}	0.318 ± 0.008 kΩ

- If any measurement is out of specification, replace the supply pump.

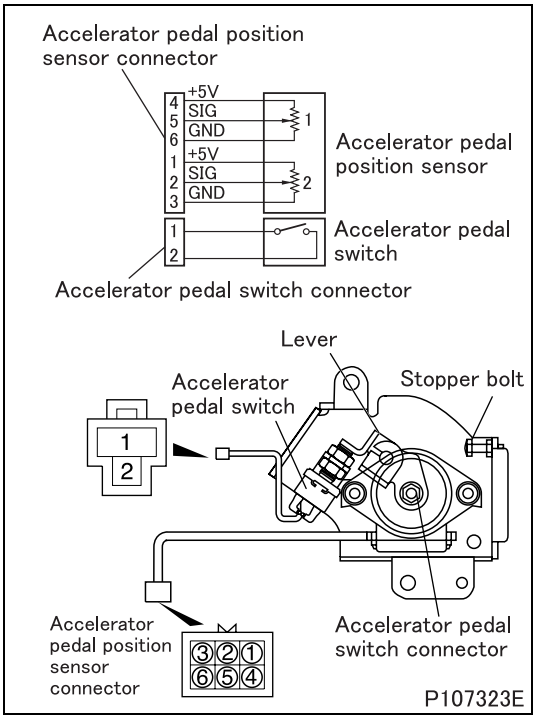


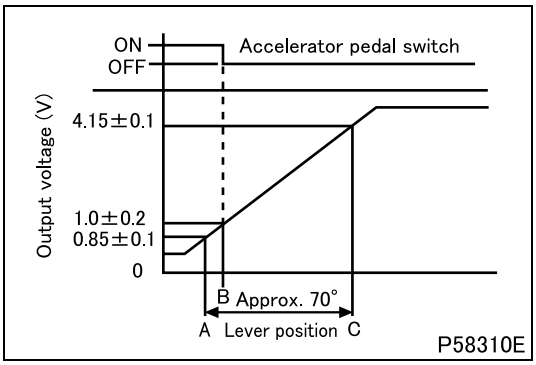
<Fuel temperature sensor 2>

- Measure the resistance between terminals 1 and 2.

Standard value	20°C {68°F}	$2.45^{+0.14}_{-0.13}$ kΩ
	80°C {176°F}	0.318 ± 0.01 kΩ
	110°C {230°F}	0.1417 ± 0.0018 kΩ

- If any measurement is out of specification, replace the sensor.





#324 Inspection of accelerator pedal position sensor

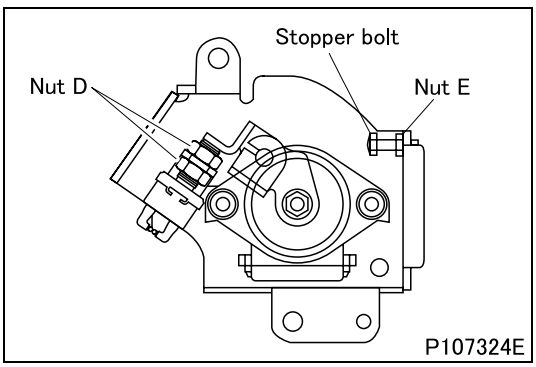
[Inspection]

- Apply DC 5 V to terminals 4 and 6 and terminals 1 and 3 of the accelerator pedal position sensor connector.
- Measure the output voltage at terminals 5 and 6 (sensor 1) and the output voltage at terminals 2 and 3 (sensor 2) with the lever in each specified position.

	Lever position	Output voltage
Standard value	Idling position A	0.85 ± 0.1 V
	Accelerator pedal switch operating position B	1.0 ± 0.2 V
	Full load position C	4.15 ± 0.1 V

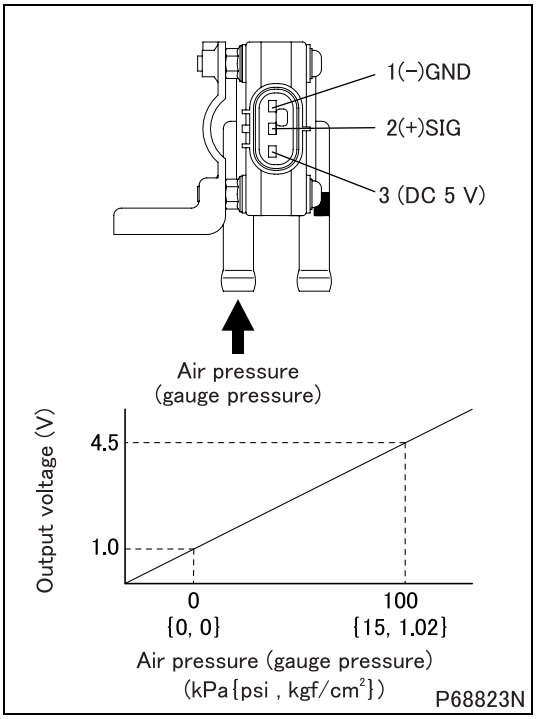
A: Position in which accelerator pedal switch is fully pushed in by lever
B: Position at which continuity between terminals 1 and 2 of accelerator pedal switch connector disappears as accelerator pedal is pushed downward
C: Position in which lever is touching stopper bolt

- If any output voltage is out of specification, make an adjustment.
- If any output voltage is still out of specification when you have made an adjustment, replace the sensor.



[Adjustment]

- To adjust the output voltage for the accelerator pedal switch operating position A, use nut D.
- To adjust the output voltage for the full load position C, loosen nut E and make the adjustment using the stopper bolt.
- After making the adjustment, lock the stopper bolt in position with the nut.



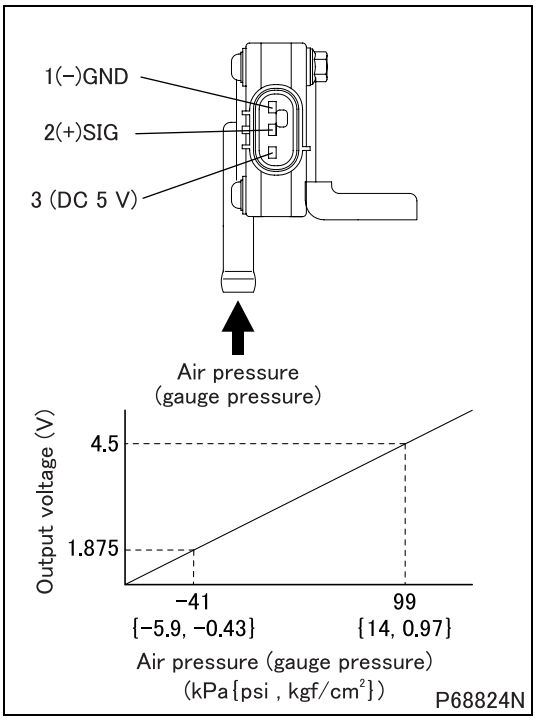
#334 Inspection of DPF pressure sensor

<DPF pressure sensor (DIFF)>

- Apply DC 5 V to terminals 3 and 1.
- Apply air pressure (gauge pressure) and measure the output voltage occurring at terminals 2 and 1 (left figure).

Standard value	0 ± 3.5 kPa {0 ± 0.5 psi, 0 ± 0.04 kgf/cm^2}	1 V
	100 ± 3.5 kPa {15 ± 0.5 psi, 1.02 ± 0.04 kgf/cm^2}	4.5 V

- If the measurement is out of specification, replace the sensor.

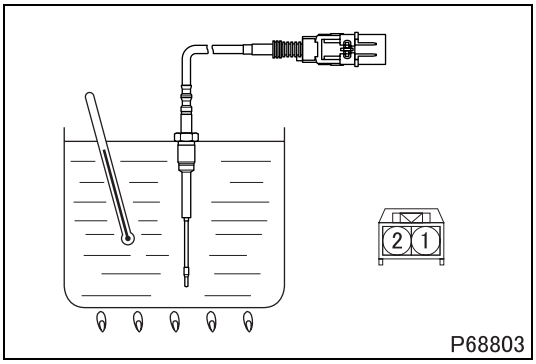


<DPF absolute pressure sensor>

- Apply DC 5 V to terminals 3 and 1.
- Apply air pressure (gauge pressure) and measure the output voltage occurring at terminals 2 and 1 (left figure).

Standard value	−41 ± 3.2 kPa {−5.9 ± 0.5 psi, −0.43 ± 0.03 kgf/cm^2}	1.875 V
	99 ± 3.2 kPa {14 ± 0.5 psi, 1.0 ± 0.03 kgf/cm^2}	4.5 V

- If the measurement is out of specification, replace the sensor.



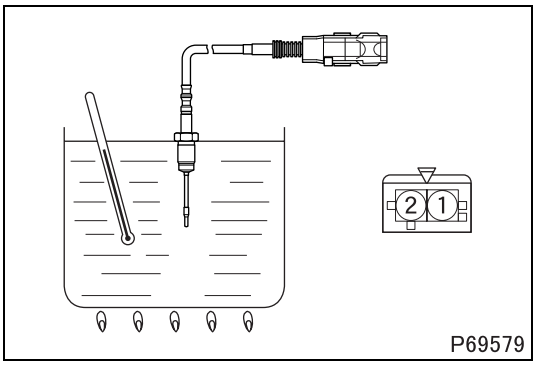
#336 DPF temperature sensor

<DPF temperature sensor 1>

- The DPF temperature sensor 1 may output false signals if its tip is contaminated. Clean it if necessary. (See Gr15.)
- Place the sensor in a container filled with engine oil.
- Heat the oil to each of the specified temperatures. Stir the oil well while doing so.
- Measure the resistance between terminals 1 and 2.

Standard value	20°C {68°F}	241.8 kΩ
	50°C {122°F}	$106.2^{+74.3}_{-41.8}$ kΩ
	100°C {212°F}	$33.56^{+17.60}_{-10.60}$ kΩ
	150°C {302°F}	$13.90^{+5.36}_{-3.60}$ kΩ
	200°C {392°F}	$6.896^{+2.064}_{-1.252}$ kΩ

- If the measurement is out of specification, replace the sensor.

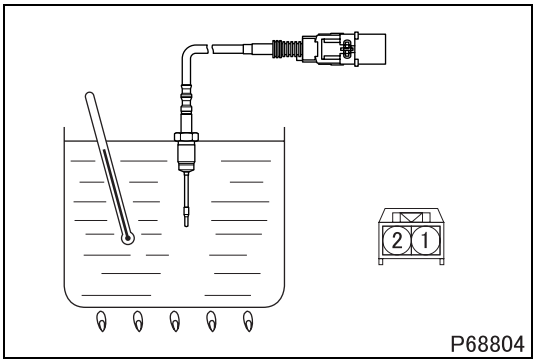


<DPF temperature sensor 2>

- The DPF temperature sensor 2 may output false signals if its tip is contaminated. Clean it if necessary. (See Gr15.)
- Place the sensor in a container filled with engine oil.
- Heat the oil to each of the specified temperatures. Stir the oil well while doing so.
- Measure the resistance between terminals 1 and 2.

Standard value	20°C {68°F}	241.8 kΩ
	50°C {122°F}	$106.2^{+74.3}_{-41.8}$ kΩ
	100°C {212°F}	$33.56^{+17.60}_{-10.60}$ kΩ
	150°C {302°F}	$13.90^{+5.36}_{-3.60}$ kΩ
	200°C {392°F}	$6.896^{+2.064}_{-1.252}$ kΩ

- If the measurement is out of specification, replace the sensor.

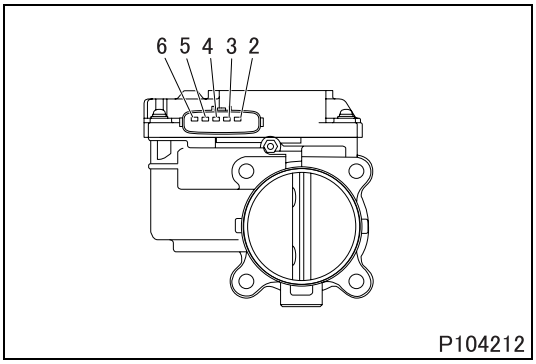


#338 Inspection of catalytic temperature sensor

- The catalytic temperature sensor may output false signals if its tip is contaminated. Clean it if necessary. (See Gr15.)
- Place the sensor in a container filled with engine oil.
- Heat the oil to each of the specified temperatures. Stir the oil well while doing so.
- Measure the resistance between terminals 1 and 2.

Standard value	20°C {68°F}	241.8 kΩ
	50°C {122°F}	$106.2^{+74.3}_{-41.8}$ kΩ
	100°C {212°F}	$33.56^{+17.60}_{-10.60}$ kΩ
	150°C {302°F}	$13.90^{+5.36}_{-3.60}$ kΩ
	200°C {392°F}	$6.896^{+2.064}_{-1.252}$ kΩ

- If the measurement is out of specification, replace the sensor.



#529 Inspection of intake throttle

- Perform the following checks. If there is any abnormality, replace the intake throttle.

(1) Coil resistance of motor

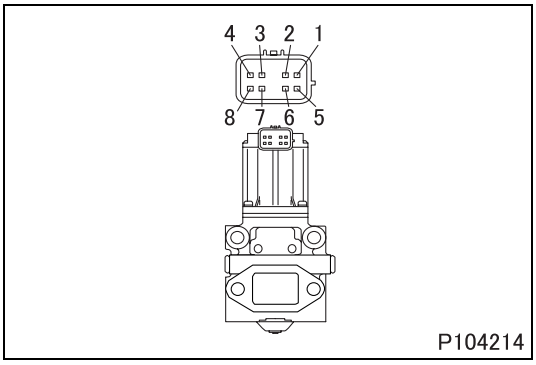
- Measure the resistance between terminals 5 and 6.

Standard value	0.3 to 80 Ω

- If the measurement is out of specification, manually operate the butterfly valve to the open and closed positions 5 times and measure the resistance again.

(2) Position sensor

- The sensor cannot easily be inspected, so you must evaluate it indirectly by inspection of system harnesses and related parts.
- If there is no abnormality in any related part but the system is abnormal, replace the intake throttle.



#530 Inspection of EGR valve

- Perform the following checks. If there is any abnormality, replace the EGR valve.

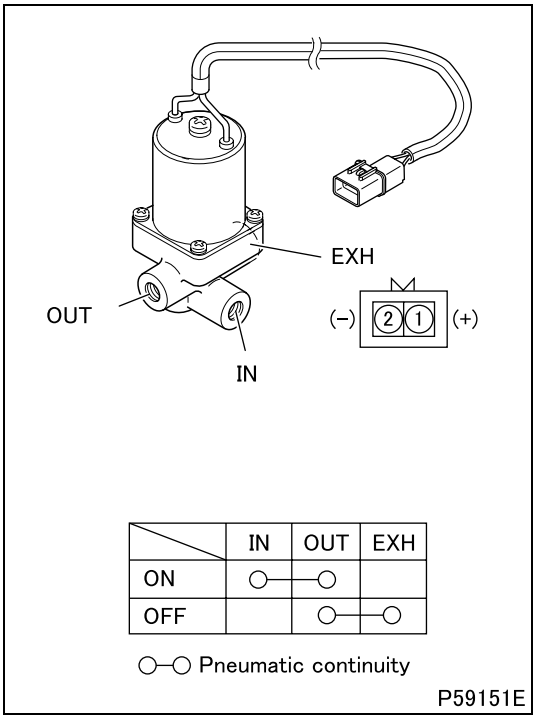
(1) Coil resistance of motor

- Measure the resistance between terminals 8 and 7, 8 and 6, and 7 and 6.

Standard value	2.1 ± 0.3 Ω

(2) Position sensor

- The sensor cannot easily be inspected, so you must evaluate it indirectly by inspection of system harnesses and related parts.
- If there is no abnormality in any related part but the system is abnormal, replace the EGR valve.



#565 Inspection of 3-way magnetic valve

- Perform the following checks. If there is any abnormality, replace the 3-way magnetic valve.

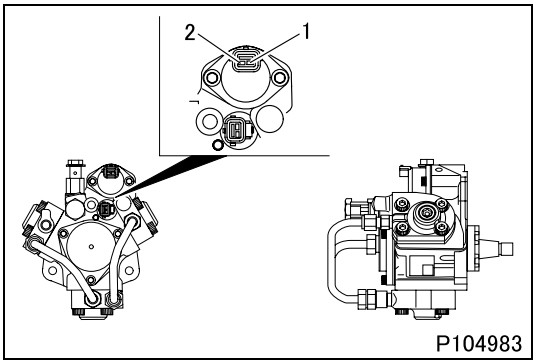
(1) Check of operation

- Gradually increase from zero the voltage applied to terminals 1 and 2.
- Observe the voltage when the 3-way magnetic valve operates. (Determine the magnetic valve's OFF-ON operation from the operating sound.)

Standard value (min. operating voltage)	10 V or lower

(2) Check of continuity and airtightness

- Air pressure applied during check: 981 kPa {140 psi, 10 kgf/cm^2}

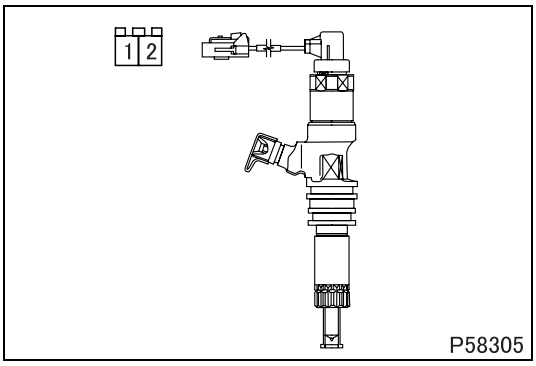


#574 Inspection of SCV (suction control valve)

- Measure the resistance between terminals 1 and 2.

Standard value	2.1 ± 0.2 Ω

- If the measurement is out of specification, replace the supply pump.

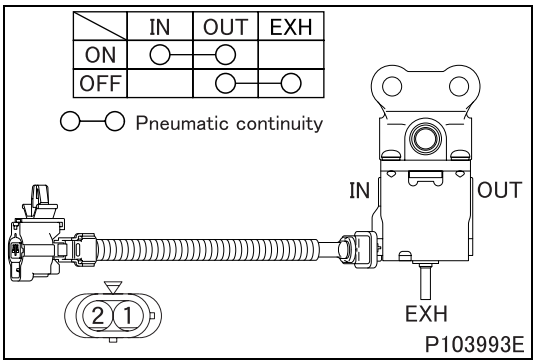


#582 Inspection of injector

- Measure the resistance between terminals 1 and 2.

Standard value (at 20°C {68°F})	0.45 ± 0.1 Ω

- If the measurement is out of specification, replace the injector.



#601 Inspection of waste gate magnetic valve

- Perform the following checks. If there is any abnormality, replace the waste gate magnetic valve.

(1) Check of operation

- Gradually increase from zero the voltage applied to terminals 1 and 2.
- Observe the voltage when the waste gate magnetic valve operates.
  (Determine the magnetic valve's OFF-ON operation from the operating sound.)

Standard value (min. operating voltage)	9 V or lower

(2) Check of continuity and airtightness

- Air pressure applied during check: 300 kPa {44 psi, 3.1 kgf/cm^2}

ELECTRIC CIRCUIT DIAGRAM 13EB-24

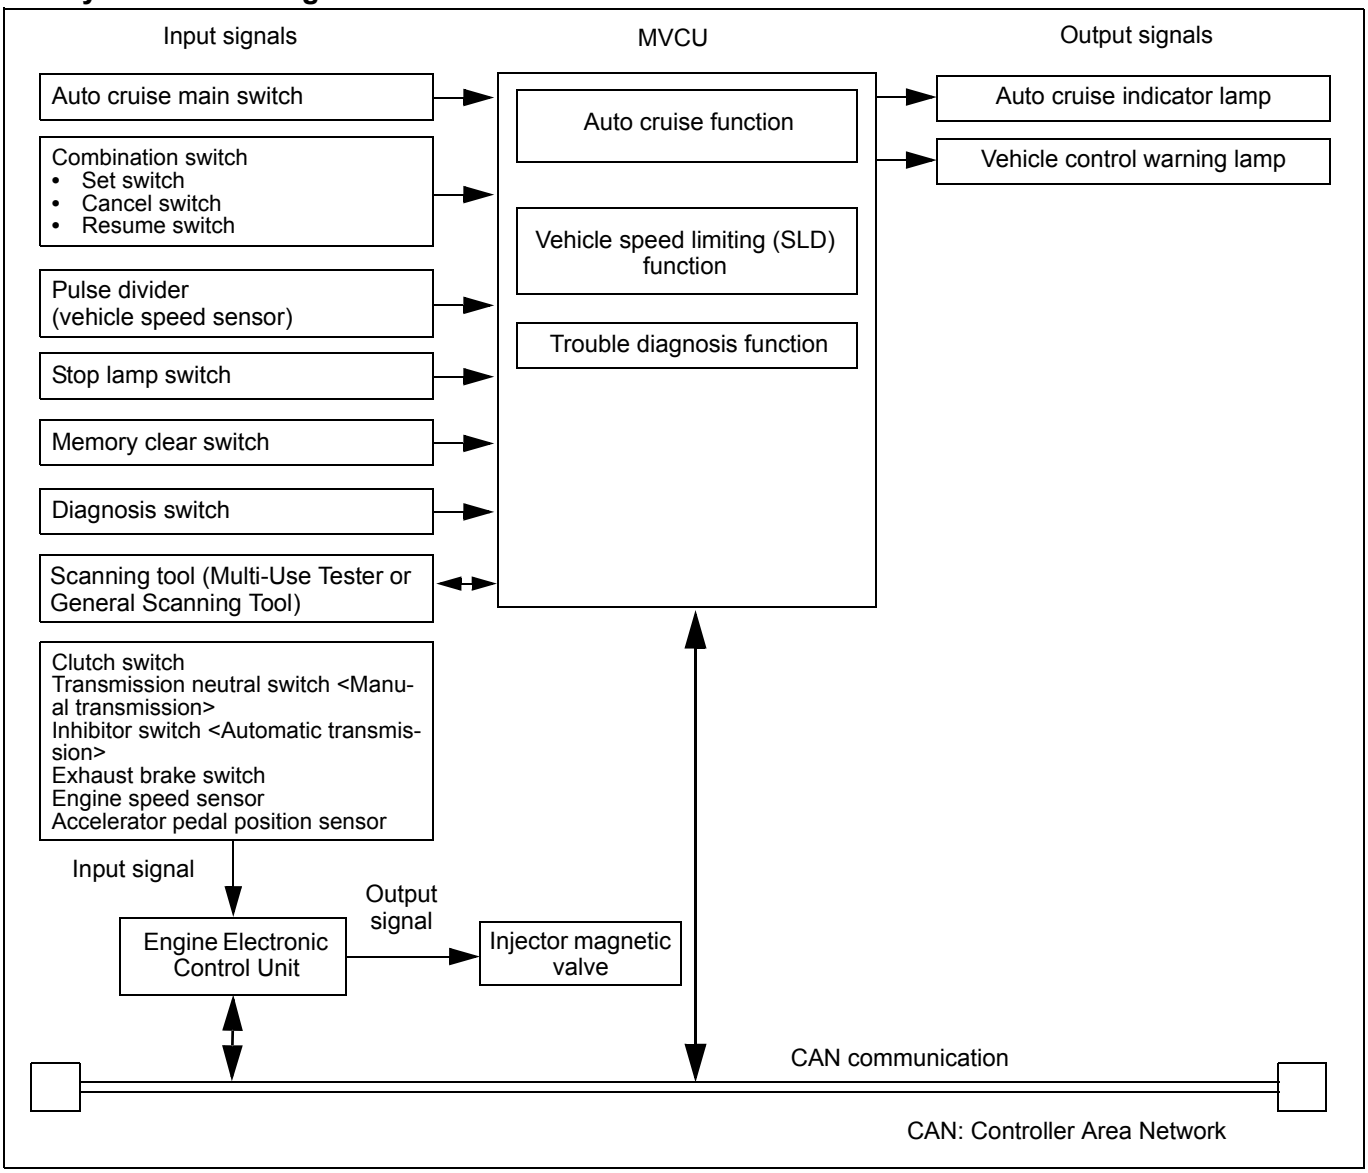
STRUCTURE AND OPERATION

1. General Description

- The MVCU (Multifunction Vehicle Control Unit) is an integrated electronic control unit which has the following functions:
  - Auto cruise function
  - Vehicle speed limiting (SLD) function
- For these functions, MVCU receives the sensor and switch information from other ECUs via CAN communication system.
- In the auto cruise function, the target vehicle speed is set using the main switch, set switch and resume switch, and the MVCU maintains the set speed by controlling the engine.
- The vehicle speed limiting (SLD) function is designed to send output signals to the engine ECU to restrict the maximum vehicle speed to a preset speed limit regardless of the accelerator pedal operation when the vehicle speed reaches the speed limit on flat or uphill road.
- The MVCU also has the self-diagnosis function to diagnose major components and warns the driver if any abnormality is found.

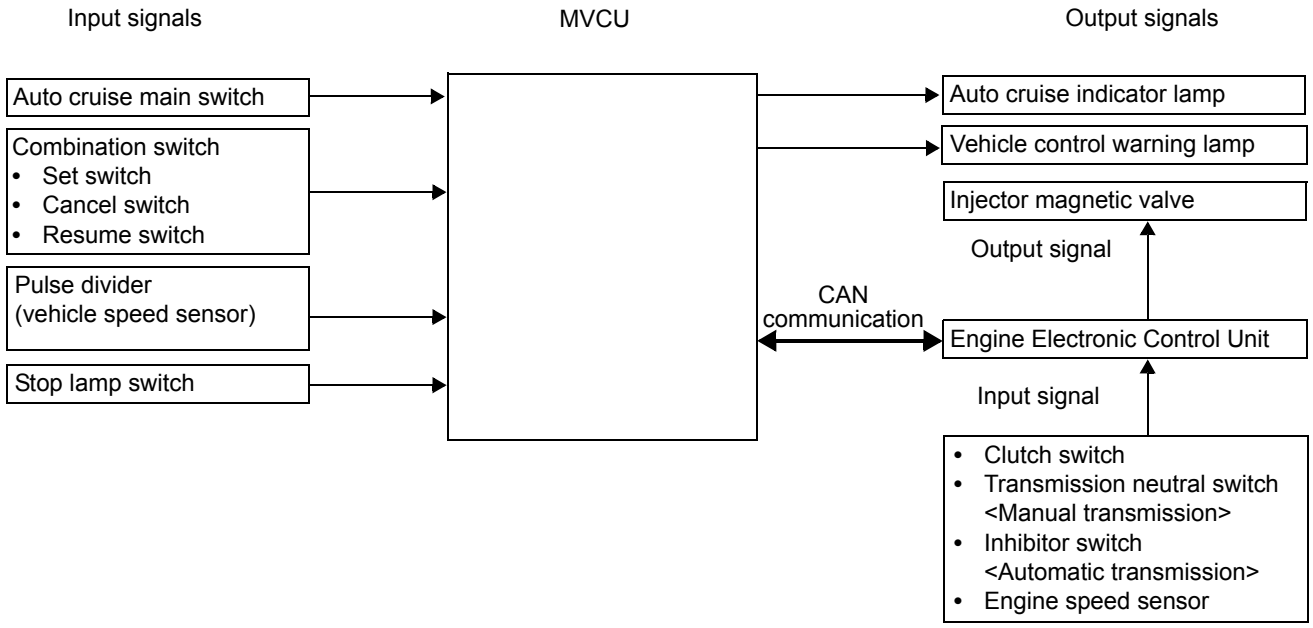
2. Electronic Control System

2.1 System block diagram



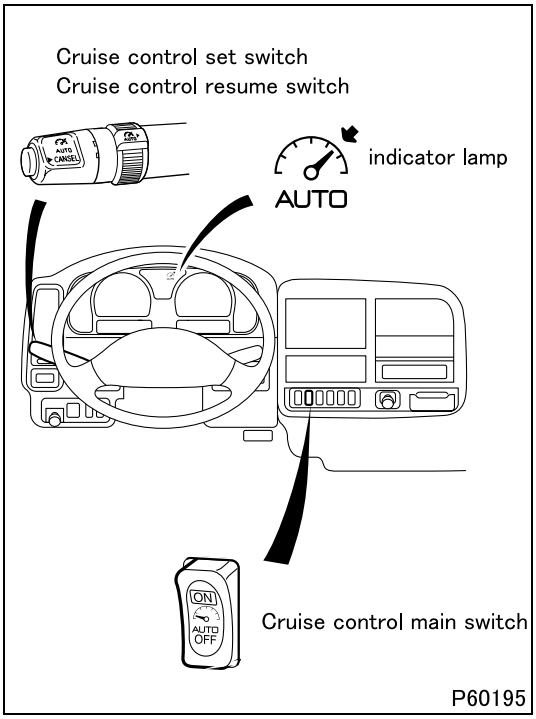
Part name	Function/operation
Auto cruise main switch	ON-OFF control of auto cruise system
Set switch	Selection and change of desired cruising speed
Cancel switch	Cancellation of current cruising speed
Resume switch	Resumption and change of canceled cruising speed
Pulse divider (vehicle speed sensor)	Detection of vehicle speed
Stop lamp switch	Detection of brake pedal depression (lamp lit on pedal being pressed)
Memory clear switch	Clearing of existing diagnosis code, output of earlier diagnosis codes
Diagnosis switch	Output of diagnosis codes
Scanning tool (Multi-Use Tester or General Scanning Tool)	Communication between Scanning tool (Multi-Use Tester or General Scanning Tool)
Auto cruise indicator lamp	Indication of system in operation
Vehicle control warning lamp	Indication of system failure
CAN communication (engine electronic control unit)	MVCU outputs recognized vehicle data on CAN so that engine electronic control unit receives necessary data for control. Engine electronic control unit outputs necessary signals to MVCU for appropriate control of individual systems.

2.2 Auto cruise function



- In the auto cruise function, the target vehicle speed is set using the main switch, set switch and resume switch, and the MVCU maintains the set speed by controlling the engine.

(1) Setting the auto cruise function



- The operation of the auto cruise function using the set switch and the resume switch as follows:

(1.1) Setting condition

- To activate the auto cruise function, the following conditions should be met:
  - Shift lever is in 4th or higher gear position.
  - Vehicle speed is increased to approx. 40 km/h {25 MPH} or higher.
  - The auto cruise main switch is in ON position.
  - The clutch and brake pedals are released.

(1.2) Set/resume switch turned to SET position

By turning the set/resume switch to the SET position, the driver can set a desired speed or change the existing set speed to another.

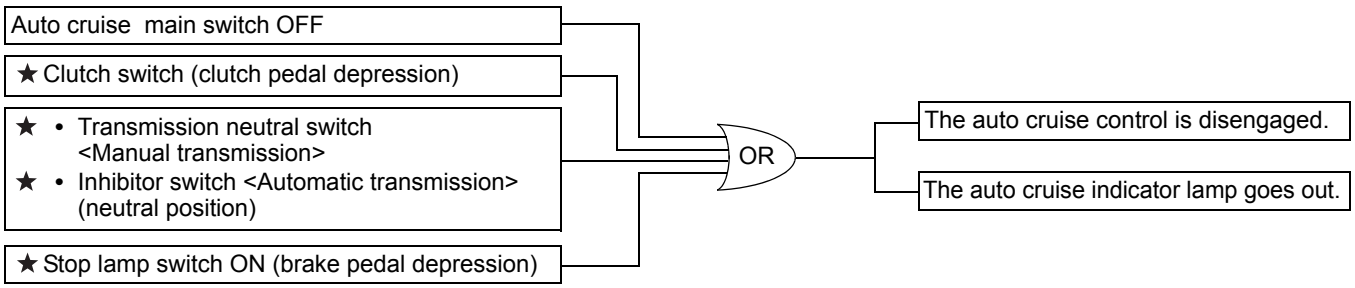
- To set a speed
  - Accelerate or decelerate the vehicle to a desired speed using the accelerator pedal.
  - Turn set/resume switch to the SET position, then release the switch. The speed is set at the moment the switch is released and indicator lamp illuminates.
- To decrease the set speed
  While driving at the set speed, turn set/resume switch to the SET position. The speed will decrease continuously as long as the switch is held in the SET position. When the desired speed is reached, release the switch; now the new lower speed is set.
- To increase the set speed
  Press the accelerator pedal. When the desired speed is reached, turn set/resume switch to the SET position and release it; now the new higher speed is set.

(1.3) Set/resume switch turned to RESUME position

By turning the set/resume switch to the RESUME position, the driver can resume the previously set speed or change the set speed to another.

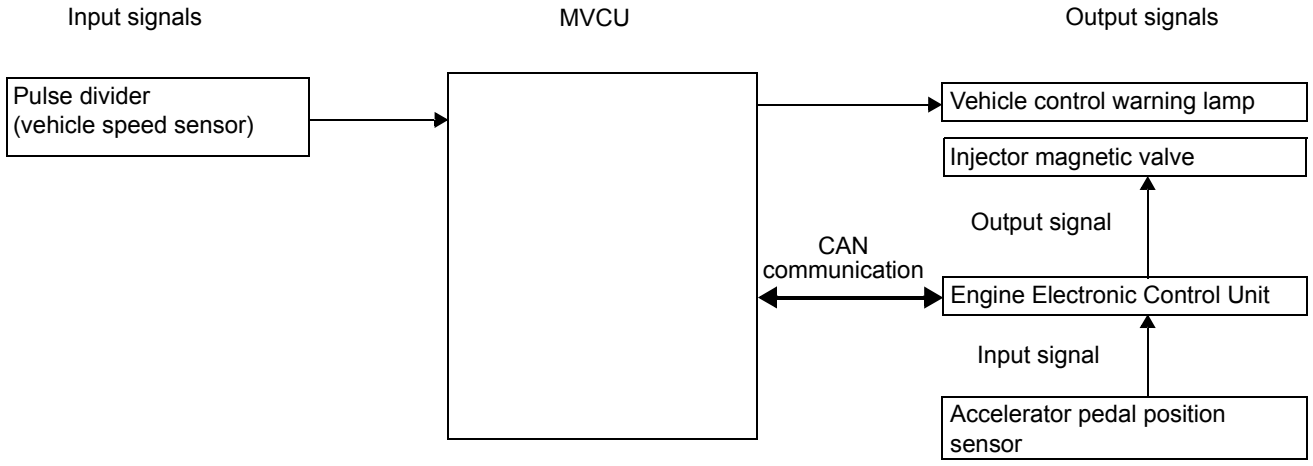
- To resume the set speed
  If the cruise control is temporarily deactivated due to deceleration using the brake pedal, for example, the driver can resume the previously set speed by turning set/resume switch to the RESUME position and releasing it. As soon as the switch is released, the cruise control is reactivated and keeps the resumed constant speed.
- To increase the set speed
  While driving at the set speed, turn set/resume switch to the RESUME position. The vehicle will accelerate. When the desired speed is reached, release the switch; now the new higher speed is set.

(2) Disengaging the auto cruise control



The condition marked ★ disengages the auto cruise control temporarily.

2.3 Vehicle speed limiting (SLD) function

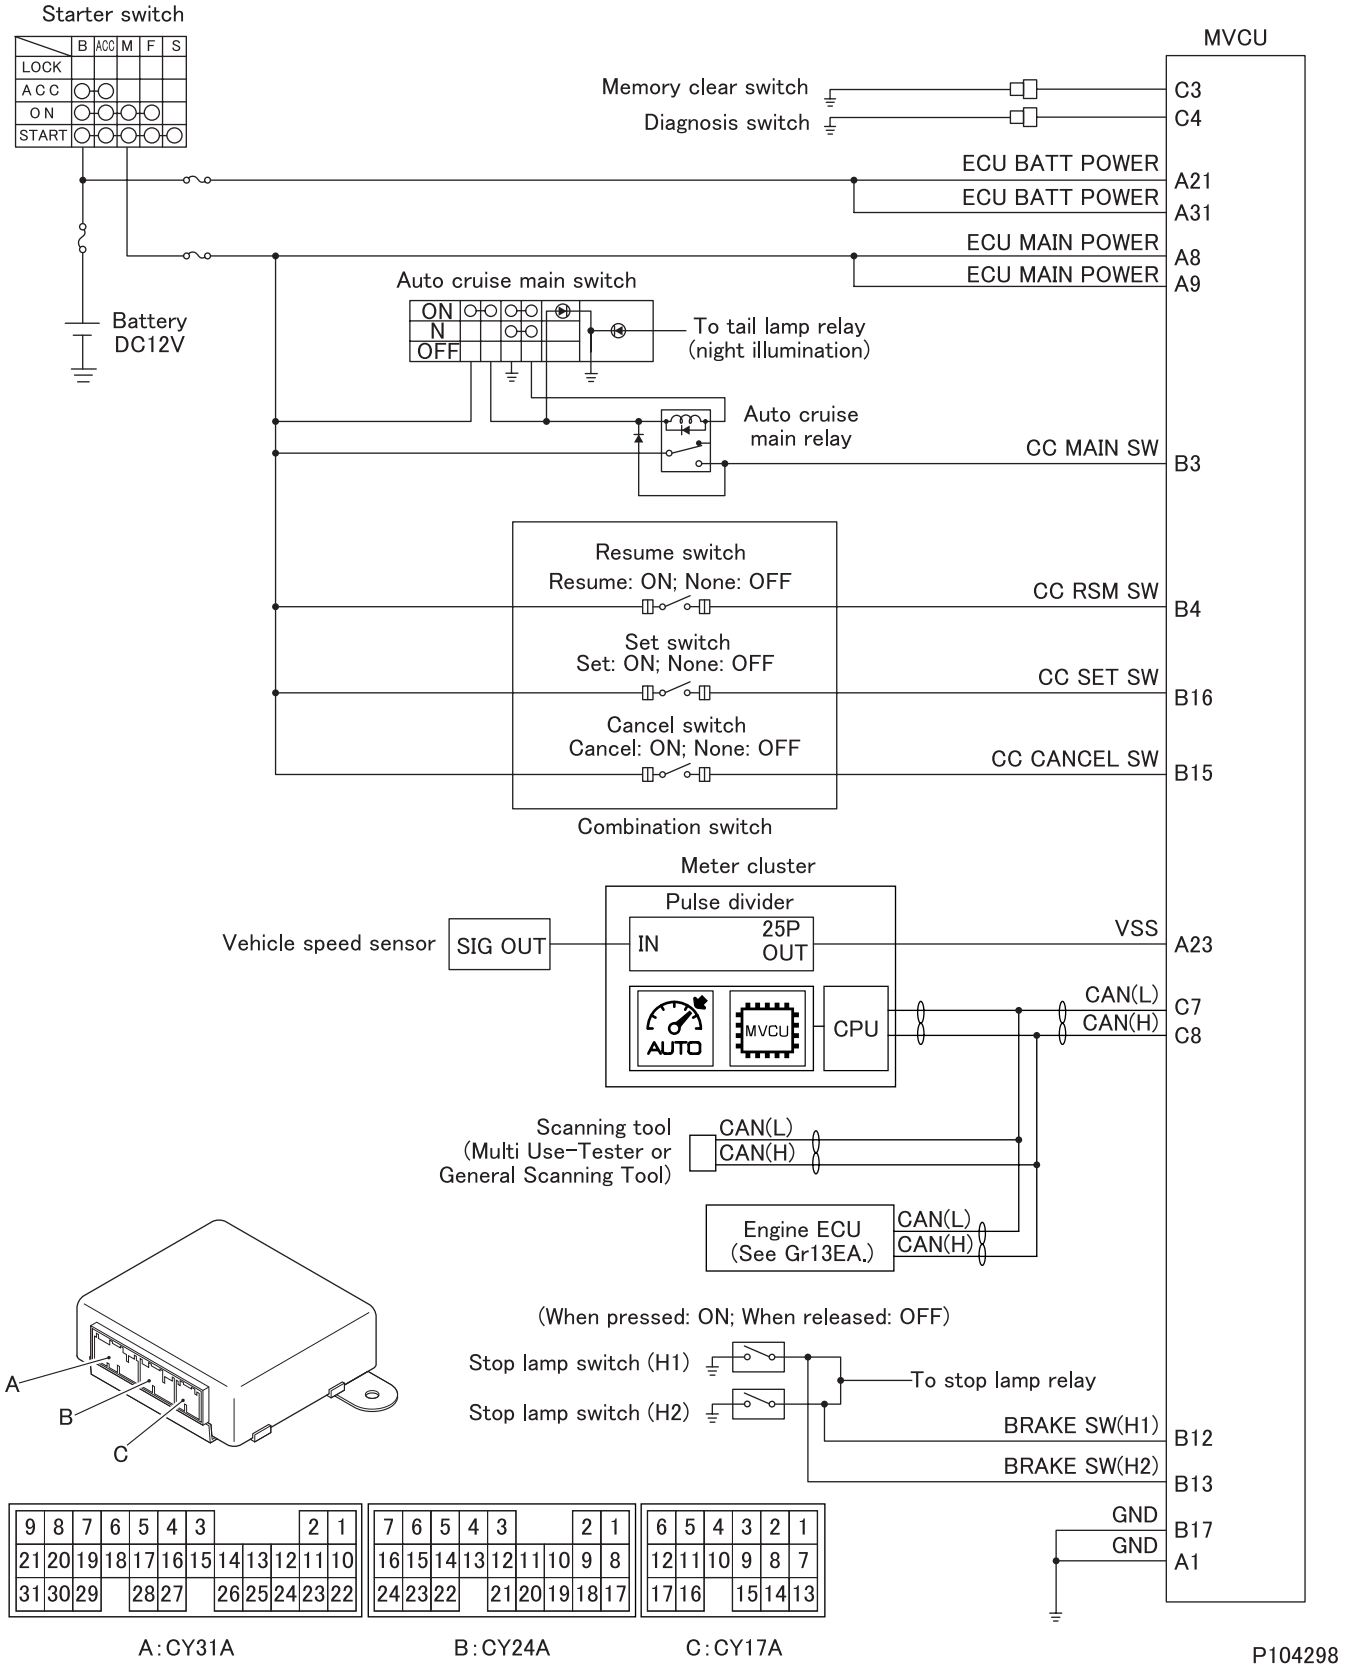


- The vehicle speed limiting (SLD) function is designed to send output signals to the engine ECU to restrict the maximum vehicle speed to a preset speed limit regardless of the accelerator pedal operation when the vehicle speed reaches the speed limit on flat or uphill road.

2.4 Trouble diagnosis function

- The system constantly performs trouble diagnosis to determine if various sensors, etc. malfunction when the starter switch is ON. When a failure is detected, trouble information is indicated on the meter cluster to inform the driver to that effect. At the same time, the location of the trouble is stored in memory as a diagnosis code to start restricted in-trouble control.
- While in trouble, the system's control functions are restricted to ensure safety of the vehicle and its driver. Diagnosis codes stored in memory can be retrieved on the Multi-Use Tester or through blinking warning lamp.
- Diagnosis codes are different in kind between the Multi-Use Tester and blinking warning lamp.

3. Electronic Control Unit Connection Diagram

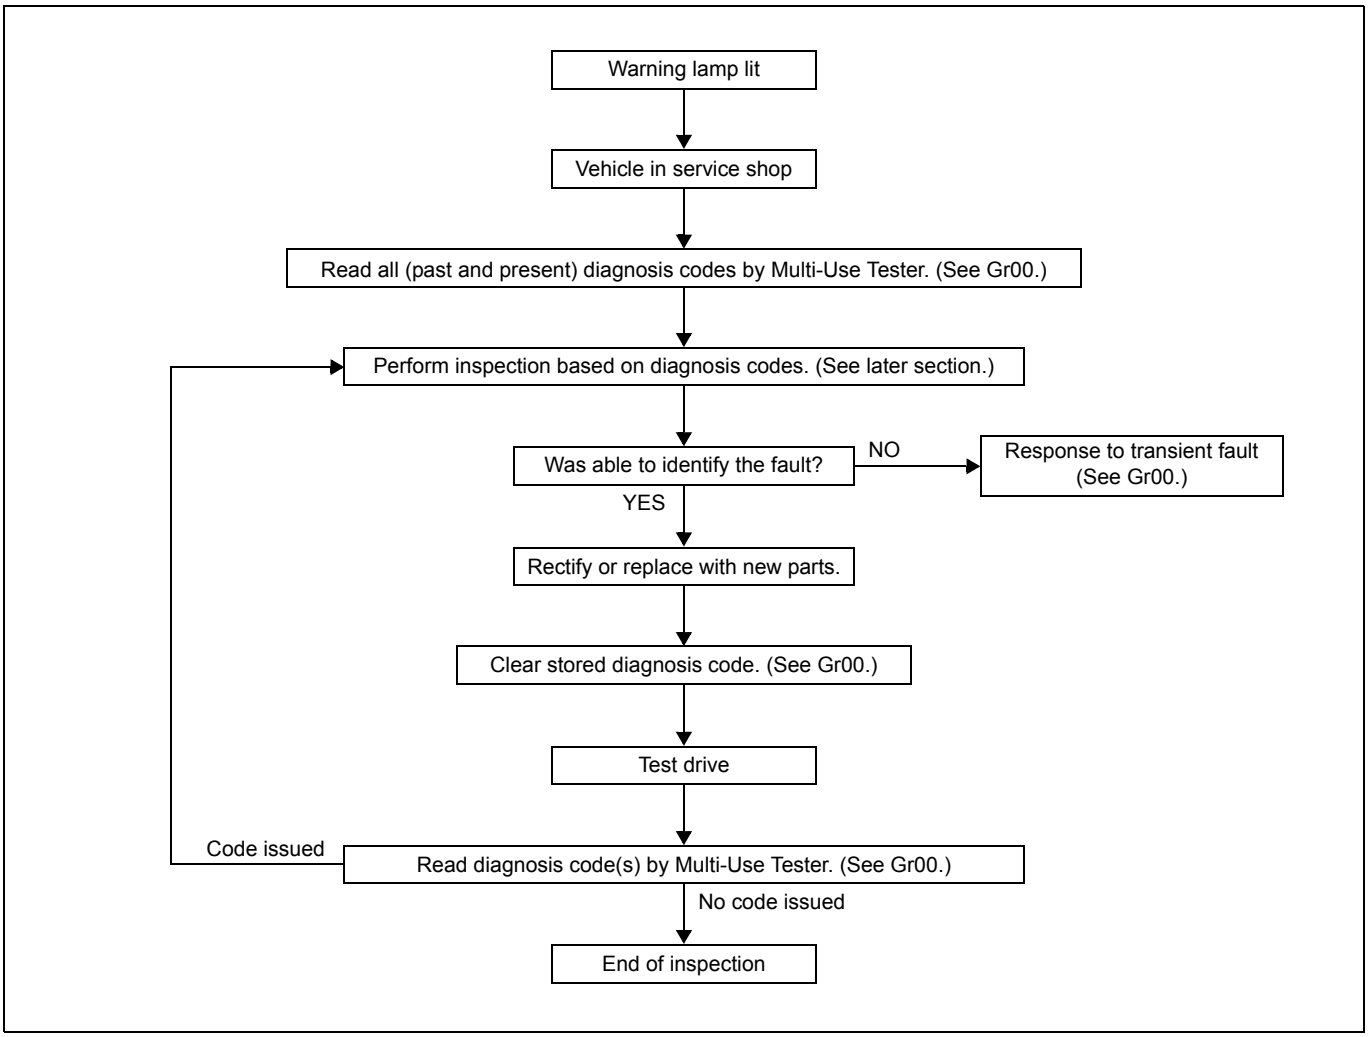


M E M O

TROUBLESHOOTING

1. Diagnosis Procedure

- Perform the inspection in accordance with the following flowchart.



2. Diagnostic Precautions

- Before measuring voltage, check the charge and specific gravity of the battery. If system inspection is performed with the battery uncharged or reduced in specific gravity, accurate measurements cannot be achieved.
- Before disconnecting battery cables, harnesses and connectors, set the starter switch to LOCK or OFF, then allow at least 20 seconds.
- To avoid having electrical parts damaged, set the starter switch and lighting switch to LOCK or OFF before reconnecting battery cables, harnesses and connectors.
- When performing measurement with the tester, internal circuit and other electrical parts of the electronic control unit could be damaged by the test bar. To avoid it, handle the test bar carefully not to cause a short-circuit failure between connector terminals or between connector and body.
- Resistance is affected by temperature. Determine the necessity of resistance measurement by reference to given temperature specification as a guide. Otherwise, use normal temperature (10 to 35°C {50 to 95°F}) as the measuring condition.
- If the MVCU is replaced with a new one, some data must be registered in the new MVCU for proper engine control. This also applied to the case when replacing the MVCU with the one that has been used in other vehicle. (See “6. Works Required When Replacing the Multifunction Vehicle Control Unit (MVCU)”.)

3. Inspection Based on Diagnosis Codes

3.1 List of diagnosis codes

NOTE

- **Diagnosis codes are different in kind between the Multi-Use Tester and blinking warning lamp.**
- **The Multi-Use Tester issues diagnosis codes that tell more in detail.**

Code	Message	Warning lamp blinking
–	OK	01
P0500	Vehicle Speed Sensor	06
P0504	Brake SW	11
P1002	Battery Voltage	02
P1003	Battery Terminal	03
P1004	Main Voltage	04
P1007	MVCU	07
P1008	Vehicle Identification	08
P1009	Non Coding	09
P1016	Cruise Variation Identify	16
U0100	CAN Communication	05
U1013	Engine ECU Cruise Control	13
U1031	Engine ECU Speed Limiting	31

3.2 Diagnosis code generation conditions and inspection items

P0500: Vehicle Speed Sensor (Warning lamp: 06)

Generation condition		Engine speed at 1000 rpm or higher, clutch pedal released, transmission neutral switch in ON position and the vehicle speed at 0.75 km/h {0.47 MPH} or lower.
Recoverability		System recovers (power is re-supplied to electronic control unit) if signal becomes normal when starter switch is turned OFF → ON.
Control effected by electronic control unit		• Auto cruise control and vehicle speed limiting (SLD) control is suspended. • Occurrence of trouble with vehicle speed limiting function sent through CAN bus.
Inspection	Service data	03: Vehicle Speed
	Electronic control unit connector	01: Vehicle speed sensor
	Electrical equipment	#265: Vehicle speed sensor
	Electric circuit diagram	Vehicle sensor system

P0504: Brake SW (Warning lamp: 11)

Generation condition		Stop lamp switch (H1, H2) signals are not identical.
Recoverability		System recovers (power is re-supplied to electronic control unit) if signal becomes normal when starter switch is turned OFF → ON.
Control effected by electronic control unit		• Auto cruise control is suspended. • Vehicle speed limiting (SLD) control is continued.
Inspection	Service data	24: Brake SW 1, 25: Brake SW 2
	Electronic control unit connector	02: Stop lamp switch
	Electrical equipment	#042: Stop lamp switch
	Electric circuit diagram	Stop lamp system

P1002: Battery Voltage (Warning lamp: 02)

Generation condition		MVCU power terminal (direct from battery) voltage is lower than 10 V for approx. 10 seconds.
Control effected by electronic control unit		Auto cruise control and vehicle speed limiting (SLD) control is continued.
Inspection	Service data	01: Power Supply Voltage (BATTERY)
	Electric circuit diagram	Power supply system
	Other	• Battery (See Gr54.) • Alternator (See Gr54.)

P1003: Battery Terminal (Warning lamp: 03)

Generation condition		MVCU power terminal (direct from battery) voltage is lower than 4 V for approx. 5 seconds.
Control effected by electronic control unit		Auto cruise control and vehicle speed limiting (SLD) control is continued.
Inspection	Service data	01: Power Supply Voltage (BATTERY)
	Electric circuit diagram	MVCU connector (CY31A) terminal No. 21 and No. 31 system
	Other	Battery (See Gr54.)

P1004: Main Voltage (Warning lamp: 04)

Generation condition		MVCU power terminal (starter switch ON) voltage is lower than 10 V for approx. 10 seconds.
Control effected by electronic control unit		Auto cruise control and vehicle speed limiting (SLD) control is continued.
Inspection	Service data	02: Power Supply Voltage (MAIN)
	Electric circuit diagram	Starter switch (M terminal) system
	Other	• Battery (See Gr54.) • Alternator (See Gr54.)

P1007: MVCU (Warning lamp: 07)

Generation condition		Faulty CPU (processor) in MVCU
Recoverability		System recovers (power is re-supplied to electronic control unit) if signal becomes normal when starter switch is turned OFF → ON.
Control effected by electronic control unit		• Auto cruise control and vehicle speed limiting (SLD) control is suspended. • Occurrence of trouble with vehicle speed limiting function sent through CAN bus.
Inspection	Other	Malfunction vehicle control unit proper

P1008: Vehicle Identification (Warning lamp: 08)

Generation condition		Identification start condition continued for predetermined time after starting the vehicle identification but the vehicle identification remained unidentified.
Recoverability		System recovers (power is re-supplied to electronic control unit) if signal becomes normal when starter switch is turned OFF → ON.
Control effected by electronic control unit		• Auto cruise control and vehicle speed limiting (SLD) control is suspended. • Occurrence of trouble with vehicle speed limiting function sent through CAN bus.
Inspection	Service data	13: Cruise Variation Number
	Electric circuit diagram	Write data in MVCU. (Refer to “Works Required When Replacing the Multifunction Vehicle Control Unit (MVCU)”.)

P1009: Non Coding (Warning lamp: 09)

Generation condition		Data has not written in MVCU.
Recoverability		System recovers after writing data in MVCU.
Control effected by electronic control unit		• Auto cruise control and vehicle speed limiting (SLD) control is suspended. • Occurrence of trouble with vehicle speed limiting function sent through CAN bus.
Inspection	Other	Write data in MVCU. (Refer to “Works Required When Replacing the Multifunction Vehicle Control Unit (MVCU)”.)

P1016: Cruise Variation Identify (Warning lamp: 16)

Generation condition		The vehicle identification and auto cruise control do not match.
Recoverability		System recovers (power is re-supplied to electronic control unit) if signal becomes normal when starter switch is turned OFF → ON.
Control effected by electronic control unit		• Auto cruise control is suspended. • Vehicle speed limiting (SLD) control is continued.
Inspection	Service data	13: Cruise Variation Number
	Other	Write data in MVCU. (Refer to “Works Required When Replacing the Multifunction Vehicle Control Unit (MVCU)”.)

U0100: CAN Communication (Warning lamp: 05)

Generation condition		No CAN data is received from the engine electronic control unit for approx. 2 seconds.
Recoverability		System recovers (power is re-supplied to electronic control unit) if signal becomes normal when starter switch is turned OFF → ON.
Control effected by electronic control unit		• Auto cruise control and vehicle speed limiting (SLD) control is suspended. • Occurrence of trouble with vehicle speed limiting function sent through CAN bus.
Inspection	Electrical equipment	CAN communication system

U1013: Engine ECU Cruise Control (Warning lamp: 13)

Generation condition		When either condition is met. ① : The vehicle speeds recognized by Multifunction Vehicle Control Unit (MVCU) and by engine electronic control unit do not match for 2 seconds. ② : Faulty auto cruise control function under the engine electronic control unit is noticed through CAN communication.
Recoverability		System recovers (power is re-supplied to electronic control unit) if signal becomes normal when starter switch is turned OFF → ON.
Control effected by electronic control unit		• Auto cruise control is suspended. • Vehicle speed limiting (SLD) control is continued.
Inspection	Electronic control unit connector	01: Vehicle speed sensor
	Electrical equipment	#265: Vehicle speed sensor
	Electric circuit diagram	Engine electronic control unit and Multifunction Vehicle Control Unit (MVCU) CAN communication system
	Other	Engine electronic control unit

U1031: Engine ECU SPEED Limiting (Warning lamp: 31)

Generation condition		When either condition is met. ① : The vehicle speeds recognized by Multifunction Vehicle Control Unit (MVCU) and by engine electronic control unit do not match for 2 seconds. ② : Faulty vehicle speed limiting function under the engine electronic control unit is noticed through CAN communication.
Recoverability		System recovers (power is re-supplied to electronic control unit) if signal becomes normal when starter switch is turned OFF → ON.
Control effected by electronic control unit		• Auto cruise control is continued. • Vehicle speed limiting (SLD) control is suspended. • Occurrence of trouble with vehicle speed limiting function sent through CAN bus.
Inspection	Electronic control unit connector	01: Vehicle speed sensor
	Electrical equipment	#265: Vehicle speed sensor
	Electric circuit diagram	Engine electronic control unit and Multifunction Vehicle Control Unit (MVCU) CAN communication system
	Other	Engine electronic control unit

4. Multi-Use Tester Service Data

NOTE

- **Both service data and actuator test results are indicated at the same time.**

No.	Item	Data	Inspection condition	Criterion for normality
01	Power Supply Voltage (BATTERY)	■■.■■ V	Starter switch in ON position	8 to 16 V
02	Power Supply Voltage (MAIN)	■■.■■ V	Starter switch in ON position	8 to 16 V
03	Vehicle Speed	■■■■.MPH	When driving	Synchronous with speedometer
04	Vehicle Speed (Engine Electronic Control Unit)	■■■■.MPH	When driving	Synchronous with speedometer
05	Accel Pedal Position	■■■.■ %	Released	0%
			Gradually pressed	Gradually rising
			Fully pressed	100%
06	Engine Speed	■■■■.rpm	Racing (with engine running)	Synchronous with tachometer
07	Engine Variation ID	■■■■.	Starter switch in ON position	200: 4M50T7 205: 4M50T8
08	Cruise Control Set Speed	■■■■.MPH	During auto cruise driving on a flat road	Equal to vehicle speed in auto cruise mode
12	Limit Vehicle Speed	■■■■.MPH	Vehicle speed limiting function activates with the accelerator pedal pressed	Around limit speed
13	Cruise Variation Number	1/2/3/4/5/6/7/8/9/10/11/12/NON	Starter switch in ON position	Recognized as “2” (with auxiliary brake non-linked cruise function) through the information record feature of MVCU
21	Neutral SW	Neutral/shift	Transmission in neutral	Neutral
			Transmission in other gear than neutral	Shift
22	Clutch SW	ON/OFF	Clutch pedal pressed	ON
			Clutch pedal released	OFF
24	Brake SW 1	ON/OFF	Brake pedal pressed	ON
			Brake pedal released	OFF
25	Brake SW 2	ON/OFF	Brake pedal pressed	ON
			Brake pedal released	OFF
29	Cruise Main SW	ON/OFF	Cruise control main switch ON	ON
			Cruise control main switch OFF	OFF
30	Cruise Set SW	ON/OFF	Set and resume switch SET	ON
			Set and resume switch OFF	OFF
31	Cruise Resume SW	ON/OFF	Set and resume switch RESUME	ON
			Set and resume switch OFF	OFF
34	Diagnosis SW	ON/OFF	Diagnosis switch ON (connector connected)	ON
			Diagnosis switch OFF (connector disconnected)	OFF

No.	Item	Data	Inspection condition	Criterion for normality
35	Memory Clear SW	ON/OFF	Memory clear switch ON (connector connected)	ON
			Memory clear switch OFF (connector disconnected)	OFF
41	Cruise Lamp	ON/OFF	Auto cruise mode	ON
			Normal driving	OFF
			[Actuator test] 51: Cruise Lamp ON 52: Cruise Lamp OFF	
43	System Warning Lamp	ON/OFF	Starter switch in ON position (engine not started)	ON for some seconds
			[Actuator test] 55: System Warning Lamp ON 56: System Warning Lamp OFF	

5. Actuator Tests Performed Using Multi-Use Tester

NOTE

- **Both service data and actuator test results are indicated at the same time.**

No.	Item	Description	Check method
51	Cruise Lamp ON	Auto cruise indicator lamp drive signal	Lighting status of auto cruise indicator lamp [Service data] 41: Cruise Lamp
52	Cruise Lamp OFF		
55	System Warning Lamp ON	Vehicle control warning lamp drive signal	Lighting status of vehicle control warning lamp [Service data] 43: System Warning Lamp
56	System Warning Lamp OFF		

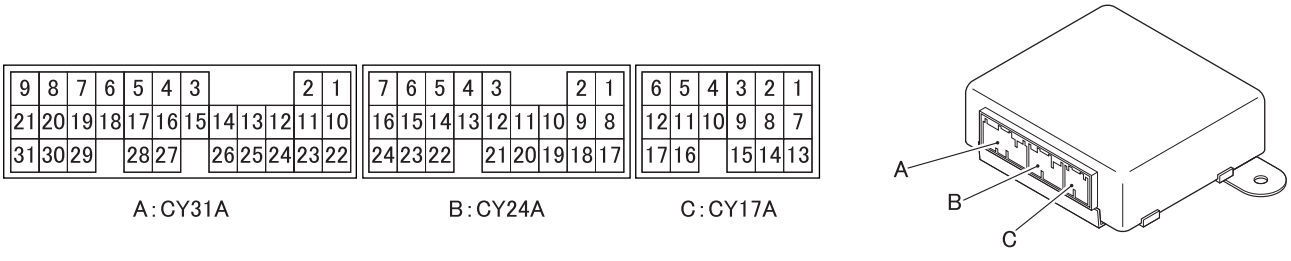
6. Works Required When Replacing the Multifunction Vehicle Control Unit (MVCU)

- When replacing the MVCU with a new one, it is necessary to write the vehicle specification identification data and necessary control parameters for softwares in the new MVCU. Otherwise the system cannot operate correctly, resulting in faulty system.
- For data writing operation, ask your nearest MITSUBISHI FUSO dealer or MITSUBISHI FUSO TRUCK OF AMERICA, Inc.

7. Inspections Performed at Electronic Control Unit Connectors

- These inspections aid troubleshooting by enabling you to check whether electronic control unit signals are being correctly transmitted via the vehicle harness and connectors.
  The white-on-black numbers (01, 02 and so on) correspond to the similarly printed reference numbers in section "**3. Inspection Based on Diagnosis Codes**".

7.1 Electronic control unit connector terminal arrangement



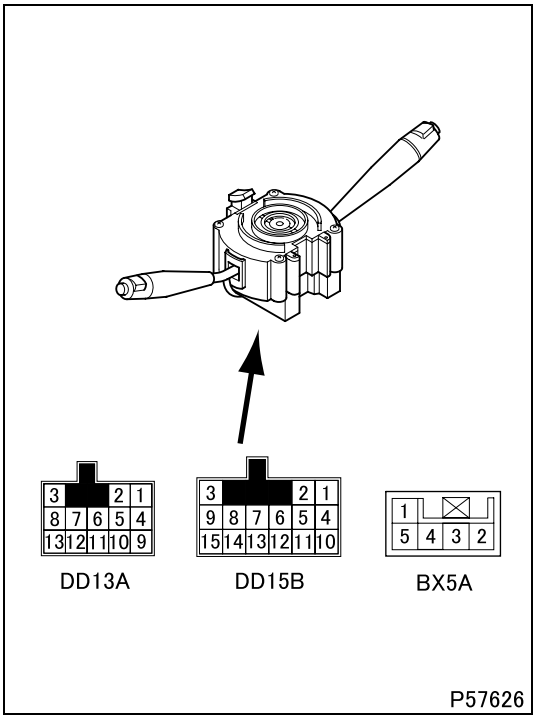
P101774

7.2 Inspection procedure

CAUTION ⚠

- **Depending on check items, checking is performed with connector disconnected or left connected.**
- **Be sure to not touch any other connector terminal than involved in the check. Use extra care so that connector terminals are not shorted by the tester.**

Check item	Check method
01 Vehicle speed sensor signal voltage	[Conditions] • Starter switch is in ON position. • Vehicle-side harness is left connected (checked from behind the connector.) • Wheels are slowly rotated using chassis dynamo or the like. [Criteria] Between terminals (+) - (–): A23-chassis grounding • High pulse voltage: Approx. 8 ± 1 V • Low pulse voltage: 0.5 V or less
02 Stop lamp switch continuity	[Conditions] • Starter switch in OFF position. • Connector disconnected; check at vehicle-side connector [Criteria] Between terminals: B12 or B13-chassis grounding • When brake pedal pressed: Continuity established • When brake pedal released: No continuity

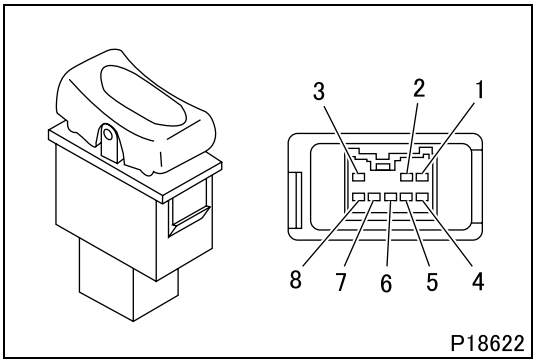


#001 Combination switch inspection

BX5A connector connection table

Switch position		Terminal continuity
Set & resume switch and cancel switch	SET	2 – 3
	CANCEL	3 – 5
	OFF	–
	RESUME	3 – 4

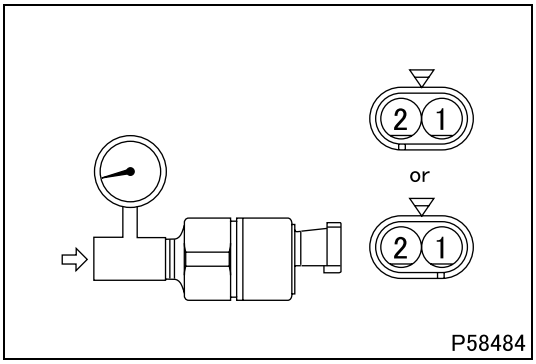
- Replace the switch if found abnormal.



#007 Auto cruise main switch inspection

Switch position	Terminal continuity	Operational illumination
ON	3 – 5, 7 – 8	(+) 4 – 1 (–)
N (Neutral)	3 – 5	–
OFF	–	–

- Replace the switch if found abnormal.



#042 Stop lamp switch

- Inspect the switch as follows, and replace it if found abnormal.

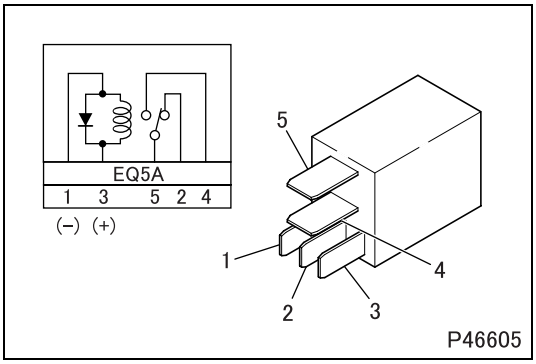
(1) Inspection without air pressure applied

- Check that there is no continuity between terminals 1 and 2.

(2) Inspection with air pressure applied

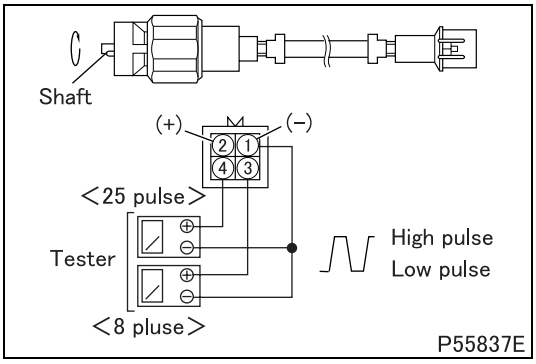
- Apply air pressure slowly increasing from 0 kPa {0 psi, 0 kgf/cm^2}.
- Measure air pressure at the point of continuity being established between terminals 1 and 2, to see if it is within the specified limit of standard value.

Standard value (operating pressure)	29 ± 9.8 kPa {4.3 ± 1.4 psi, 0.3 ± 0.1 kgf/cm^2}



#201 Relay inspection (normally open 5-pin)

- Check the relay for continuity and function. Replace the relay if found abnormal.



#265 Vehicle speed sensor inspection

- Slowly rotate the shaft of the vehicle speed sensor with battery voltage applied between terminals 1 and 2 of the sensor.
- Measure maximum value (high pulse voltage) and minimum value (low pulse voltage) of the voltage generated at each terminal.

Standard value	Between 8-pulse output terminals 1 and 3	Low pulse voltage	1.5 V or less
		High pulse voltage	Input voltage (battery): –0.5 V or more
	Between 25-pulse output terminals 1 and 4	Low pulse voltage	0.5 V or less
		High pulse voltage	8 ± 1 V

- If measurements deviate from the specified standard values, replace the sensor.

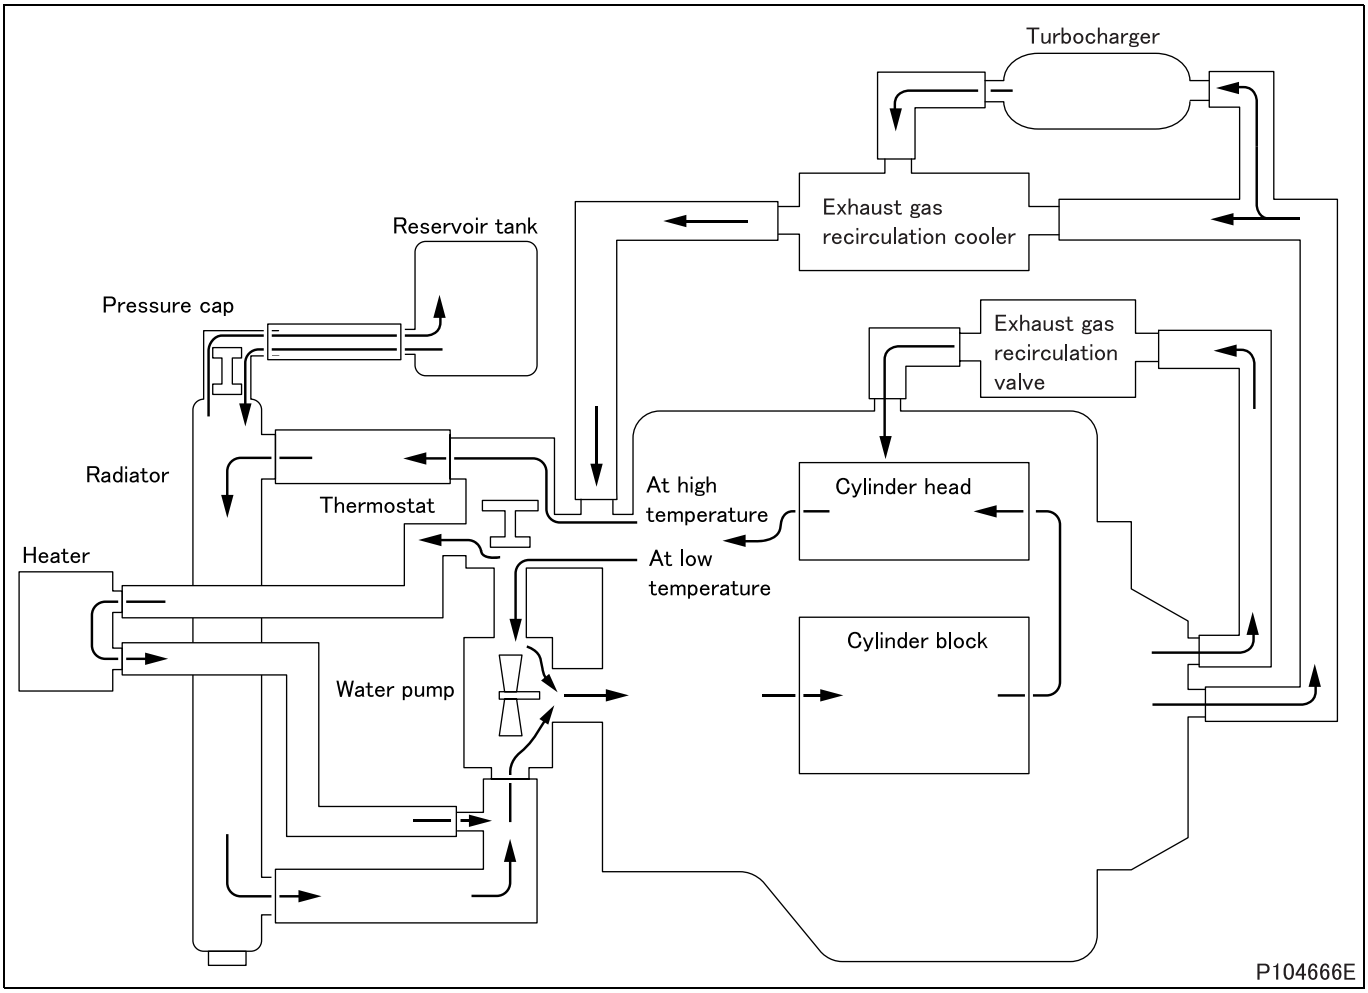
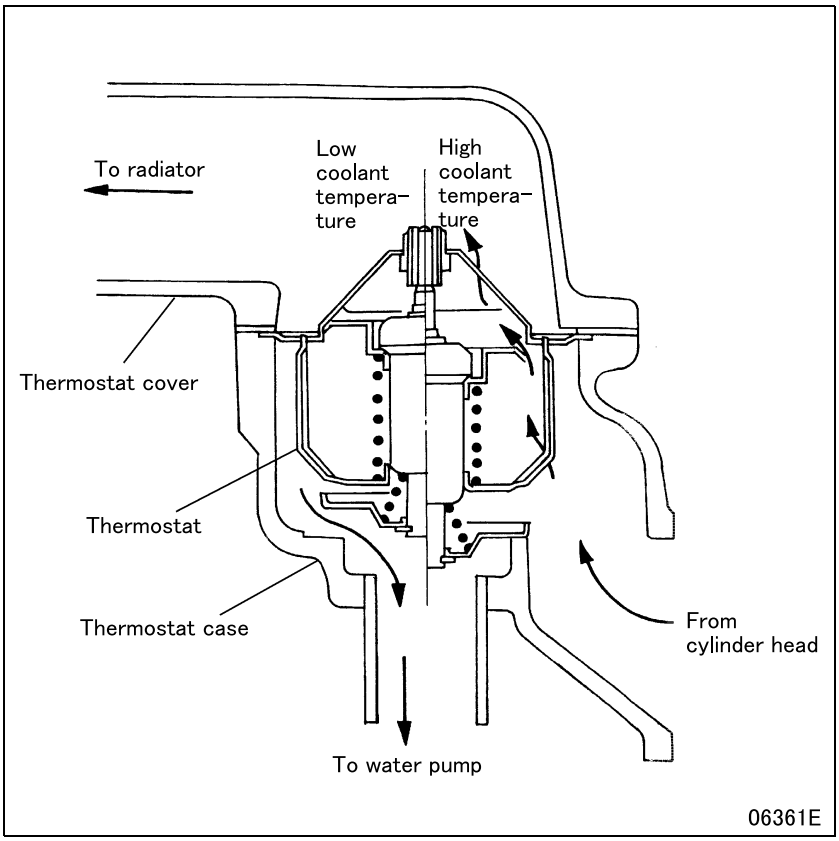
SPECIFICATIONS

Item	Specifications
Cooling system	Forced water circulation system
Water pump	Belt-driven type
Thermostat	Wax pellet, bottom bypass type (with jiggle valve)
Automatic cooling fan coupling	Continuous control type
Radiator	Tube and corrugated fin type
Coolant capacity L {qts}	25 {26}

1. Cooling System (Flow of Coolant)

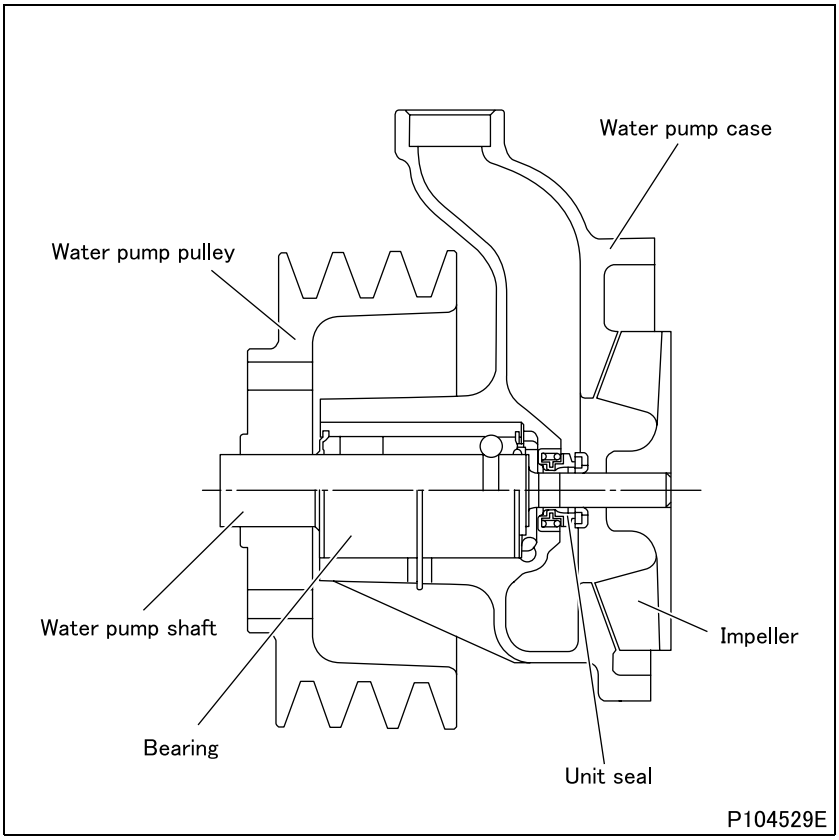


2. Thermostat



- The thermostat is a bottom bypass type that uses a wax-filled pellet as its flow-regulating element. When the wax is heated, it melts from solid to liquid, changing its total volume. This allows the valve to open or close in accordance with the coolant temperature, regulating and adjusting the flow of coolant to the radiator and to the water pump (bypassing the radiator).

3. Water Pump



- The water pump has a drain hole to prevent coolant from entering the unit bearing in case of a defect in the unit seal.

Possible causes \ Symptoms		Overheating (poor cooling)	Overcooling	Abnormal noise	Excessive coolant loss	Reference Gr
Belt	Loose or damaged	O		O		
	Excessive tension			O		
	Oil on belt	O				
Water pump	Incorrectly mounted water pump	O			O	
	Defective gasket	O			O	
	Defective unit bearing	O		O		
	Defective impeller	O				
	Defective unit seal	O			O	
	Fit of unit bearing on flange and impeller too loose	O		O		
Thermostat	Incorrectly mounted case	O			O	
	Defective gasket	O			O	
	Valve opening temperature too high (valve remains closed)	O				
	Valve opening temperature too low (valve remains open)		O			
Radiator	Clogged core	O				
	Cracked core and/or separation in welds	O			O	
Automatic cooling fan coupling	Defective bearing	O		O		
	Damaged bimetal	O				
	Contaminated bimetal	O	O			
	Silicon oil leakage	O		O		
Oil cooler	Incorrectly mounted oil cooler	O			O	Gr12
	Defective gasket	O			O	
Cylinder head	Incorrectly mounted cylinder head	O			O	Gr11
	Defective gasket	O			O	
Poorly airtight pressure cap		O				
Water leaking from water level sensor		O			O	
Coolant quantity insufficient and/or coolant dirty		O				
Coolant passages dirty and/or clogged		O				
Hoses fitted poorly		O			O	
Ambient temperature extremely low			O			

ON-VEHICLE INSPECTION AND ADJUSTMENT

1. Inspection and Adjustment of Belt Tension

CAUTION ⚠

- **Make sure that there is no oil or grease on the belts. Belts soiled with oil or grease may easily slip, resulting in deteriorated performance of the cooling system.**

Service standards (Unit: mm {in.})

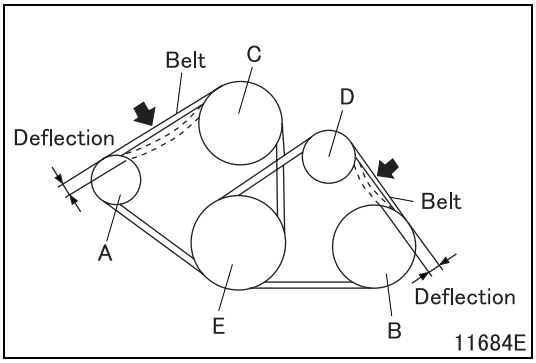
Location	Maintenance item		Standard value	Limit	Remedy
–	Belt tension	for air conditioner	7 to 10 {0.28 to 0.39}	–	Adjust
		for fan	10 to 15 {0.39 to 0.59}		

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
–	Bolt (alternator mounting)	50 {37, 5.1}	–
–	Nut (tension pully mounting)	90 {66, 9.2}	–

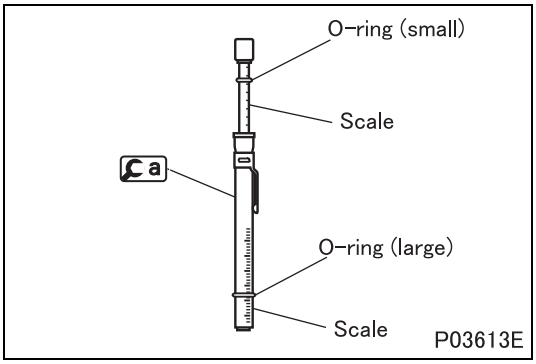
Special tools

Mark	Tool name and shape	Part No.	Application
ⓒa	Belt tension gauge P03612	MH062345	Measurement of tension of belt

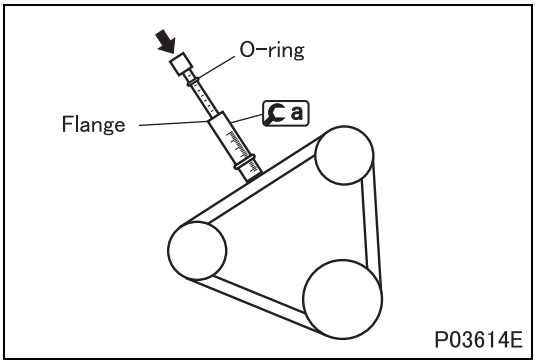


[Inspection]

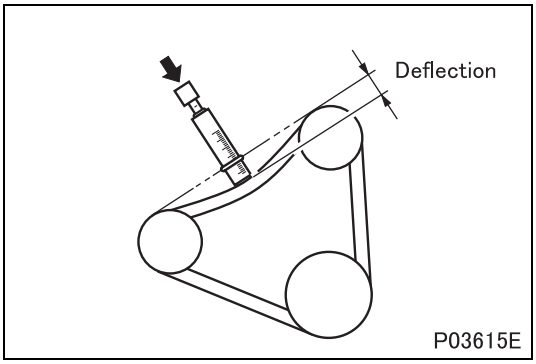
- Press each belt at a central portion between pulleys with a force of approximately 98 N {72 lbs, 10 kgf} as shown in the illustration and measure the amount of deflection of the belt.
  - A: Alternator pulley
  - B: Air conditioner compressor pulley
  - C: Water pump pulley
  - D: Tension pulley
  - E: Crankshaft pulley



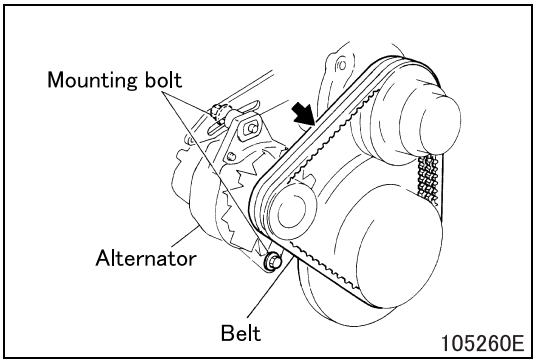
- Place the small O-ring on ⓒa at the scale mark corresponding to 98 N {72 lbs, 10 kgf} (press force).
- Place the large O-ring on ⓒa at the scale mark corresponding to the maximum permissible deflection value specified for the belt.



- Place a at a central portion between pulleys of the belt and push the handle (indicated by the arrow in the illustration) until the O-ring touches the flange.



- Measure the amount of deflection of the belt.
- If the measured value deviates from the standard value range, adjust the tension of the belt as follows.



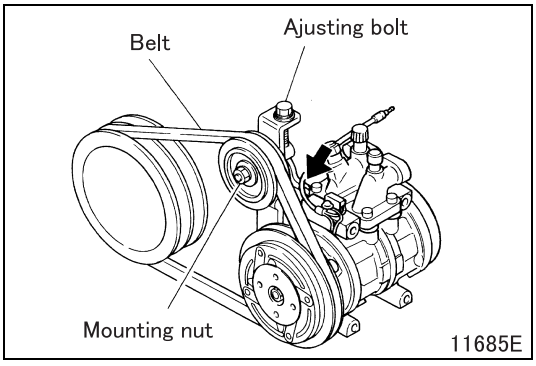
[Adjustment]

(1) Vehicles with air conditioner

- Loosen the alternator mounting bolts (2 locations) and adjust the tension of the belt by tightening or loosening the adjustment bolt.
- After the adjustment is completed, retighten the mounting bolts firmly.

CAUTION ⚠

- **Excessive tension in the belt may damage not only the belt itself but also the bearings of the related components.**



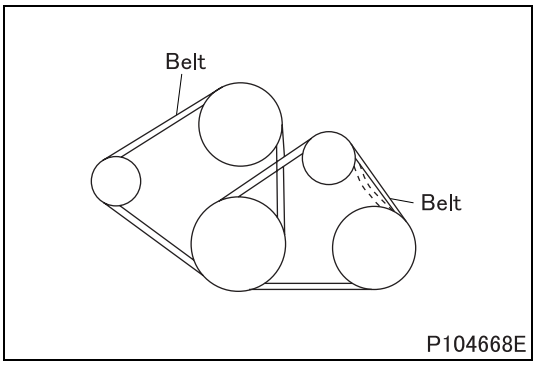
(2) Vehicles without air conditioner

- Loosen the tension pulley mounting nut and adjust the tension of the belt with the adjusting bolt.
- After adjustment, be sure to tighten the bolt and nut.

CAUTION ⚠

- **Excessive tension in the belt may damage not only the belt itself but also the bearings of the related components.**

2. Inspection of Cracks or Damage of the Belt



- Visually check the belts for possible cracks and damage.
- If any faults are found, replace the belts.

Belt condition	Remaining service life (reference)
 P69698E	• The driving distance over the which the belt can still be used is at least as long as that over which the belt has been used since the vehicle was new or since the belt was replaced (whichever is more recent).
 P69699E	• The driving distance over the which the belt can still be used is about half of that over which the belt has been used since the vehicle was new or since the belt was replaced (whichever is more recent).
 P69700E	• The driving distance over the which the belt can still be used is about a quarter of that over which the belt has been used since the vehicle was new or since the belt was replaced (whichever is more recent).
 P69701E  P69702E	• The belt has reached the end of its service life and must be replaced.

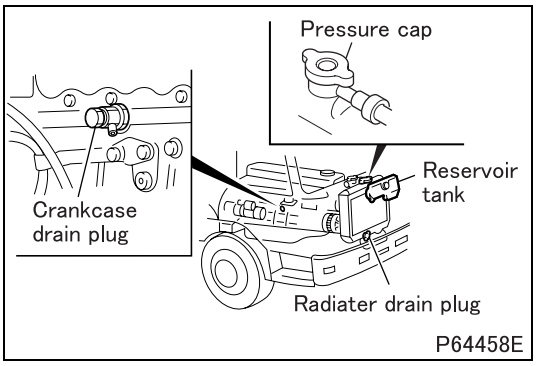
3. Coolant Replacement and Cleaning of Cooling System

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
–	Radiator drain plug	2.0 {1.4, 0.2}	–
–	Crankcase drain plug	7 {5.2, 0.7}	–

- Using the radiator for extended periods of time without cleaning can increase chance of rust and scale formation, which may cause engine overheating. The cooling system must be cleaned periodically.

3.1 Draining of coolant



- Before draining the coolant, loosen the pressure cap to reduce the pressure in the cooling system. Remember to drain the coolant out of the reservoir tank as well.

WARNING ⚠

- **Drain the coolant only after it has cooled sufficiently to avoid getting scalded.**
- **Opening the pressure cap while the coolant temperature is still high can cause hot coolant to spray out. Cover the pressure cap with a cloth, and loosen it slowly to let the pressure out before opening it fully.**

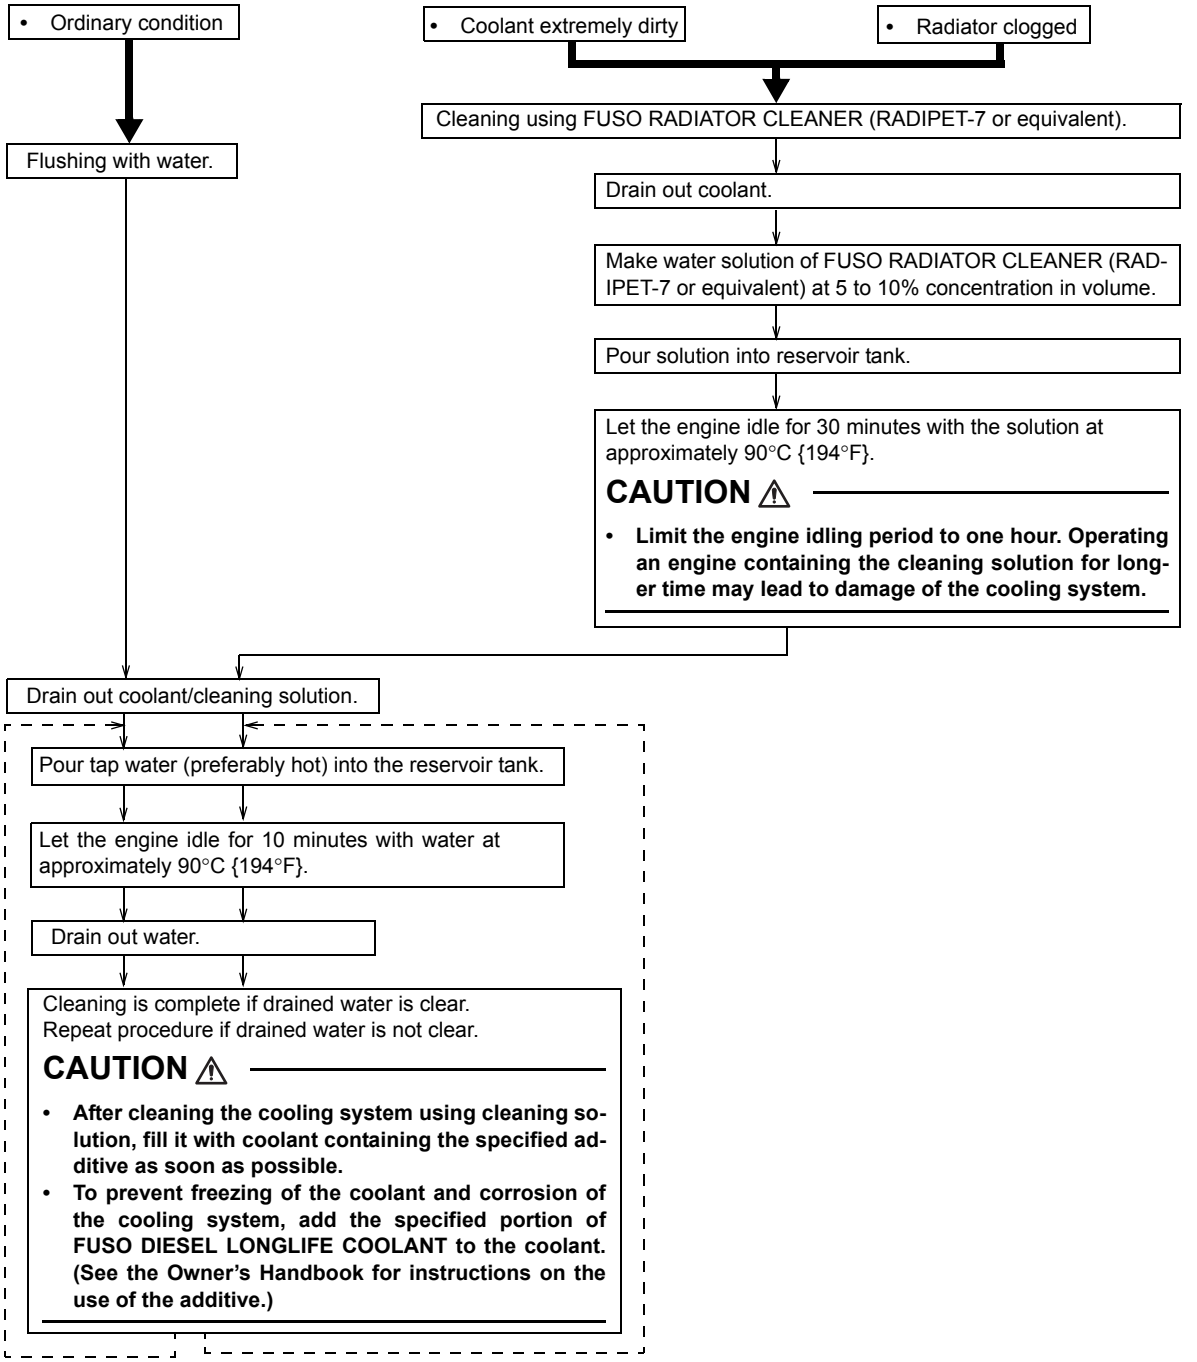
3.2 Cleaning procedure

CAUTION ⚠

- **Water used for flushing the cooling system must be soft water that has a property meeting the requirements indicated below. Using hard water will cause scale and rust to form in the system.**
  Total hardness ..... 300 ppm or less
  Sulfate SO_4^- ..... 100 ppm or less
  Chloride Cl^- ..... 100 ppm or less
  Total dissolved solids ..... 500 ppm or less
  pH ..... 6 to 8

- Keep the coolant temperature at approximately 90°C {194°F} so that the thermostat valve remains open and the coolant continues to circulate in the radiator.
- For the sake of convenience you can raise the coolant temperature quickly by covering the front of the radiator with corrugated cardboard or something similar.
- In cases where a great amount of rust has accumulated it is common for the radiator to leak as a result of cleaning. Conduct a thorough check for leakage after cleaning.

- Select an appropriate cleaning method according to the condition of the cooling system as shown below.



DANGER

- **If you accidentally splash FUSO DIESEL LONGLIFE COOLANT, FUSO ANTIFREEZE, or RADIATOR ANTIRUST (RADIPET 9) in your eyes, wash it out immediately with water and seek medical attention.**

WARNING

- **FUSO DIESEL LONGLIFE COOLANT is flammable. Keep them away from heat and flames.**

4. Air Bleeding of Cooling System

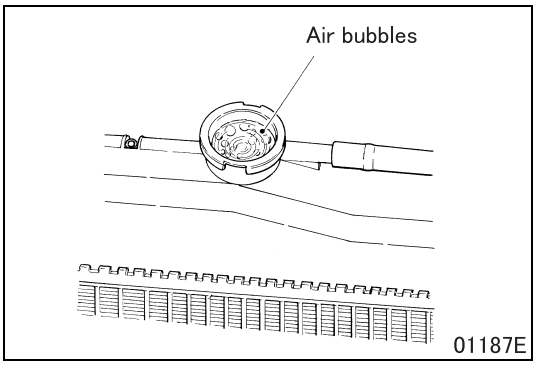
- With the pressure cap removed and the coolant temperature at 90°C {194°F}, let the engine idle in order to bleed air completely out of the cooling system.
- After air bleeding is completed, refill the reservoir tank with coolant as needed.

5. Gas Leakage Test

- Presence of air or exhaust gas in coolant accelerates corrosion of the cooling system components. To prevent this, carry out air/gas leakage tests in accordance with the following procedure.
- Remove the pressure cap.

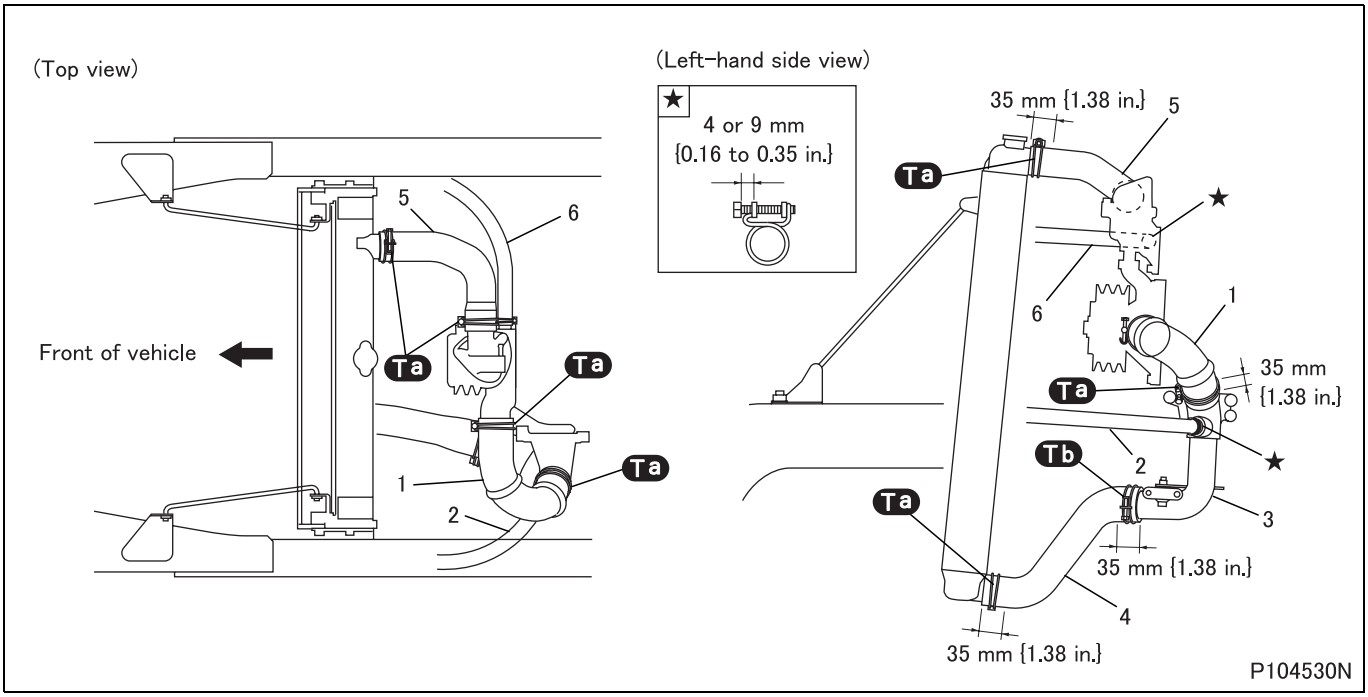
WARNING ⚠

- **If the engine is hot, boiling coolant may spurt out from the filler port when the pressure cap is loosened. To avoid burning yourself, make sure to remove the pressure cap only when the coolant is cold.**



- Run the engine until the coolant temperature rises to approximately 90°C {194°F}.
- If air bubbles appear continuously through the filler port, there is air or exhaust gas penetrating into the cooling system.
- Presence of air in coolant can be an indication of loose cylinder head bolts, loose water pump mounting bolts, loose hose connections, and/or a damaged hose.
- Presence of exhaust gas in coolant can be an indication of a damaged cylinder head gasket and/or cracks in the cylinder head.

Periphery of Radiator



● **Removal sequence**

1 Inlet hose
2 Heater hose
3 Inlet pipe
4 Outlet hose
5 Supply hose
6 Heater hose

● **Installation sequence**

Follow the removal sequence in reverse.

CAUTION ⚠

- **Install each hose clamp to the angle indicated in the illustration so that sufficient clearance is assured between the hose clamp and its surrounding parts.**

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Hose clamp	3.9 ± 0.6 {2.9 ± 0.4, 0.4 ± 0.06}	–

16 Core

⊗: Non-reusable parts

CAUTION ⚠

- **Do not disassemble radiator assembly unless there is an abnormality.**
- **Gently handle upper tank and lower tank, since they are made of a resin that can break on impact.**
- **If there are two paint marks on the joint between the core and upper tank or on the joint between the core and lower tank (which indicates that the tank retaining tabs have been crimped twice before), replace the core with a new part.**

● **Assembly sequence**

Follow the disassembly sequence in reverse.

Service standards

Location	Maintenance item	Standard value	Limit	Remedy
10	Pressure cap opening pressure	69 ± 15 kPa {10 ± 2.2 psi, 0.7 ± 0.15 kgf/cm^2}	–	Replace
16	Air leakage from radiator (air pressure: 150 kPa {21 psi, 1.5 kgf/cm^2})	0 cm^3 {0 cu.in., 0 mL}	–	Repair or replace

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

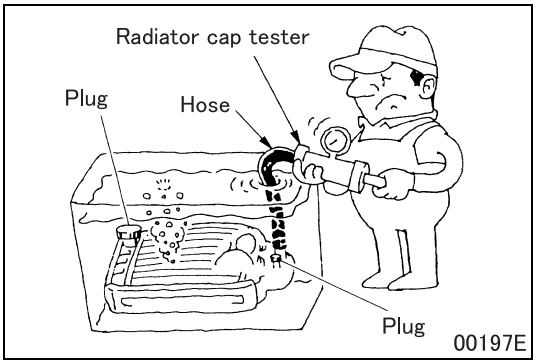
Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Water level sensor	2.9 to 3.9 {2.1 to 2.9, 0.3 to 0.4}	–
Tb	Drain cock	2 {1.5, 0.2}	–
Tc	Bolt (side member mounting)	12.7 ± 2 {9.4 ± 1.5, 1.3 ± 0.2}	–

Special tools

Mark	Tool name and shape	Part No.	Application
Ca	Lock-and-break tool	J94-Z013 -10000	Removal of upper and lower tanks

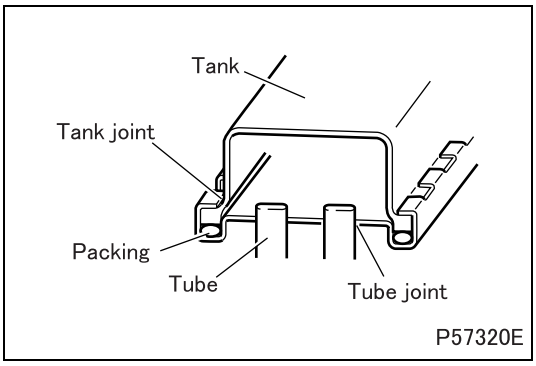
The indicated part number is T.RAD's part number.

◆Inspection before removal◆



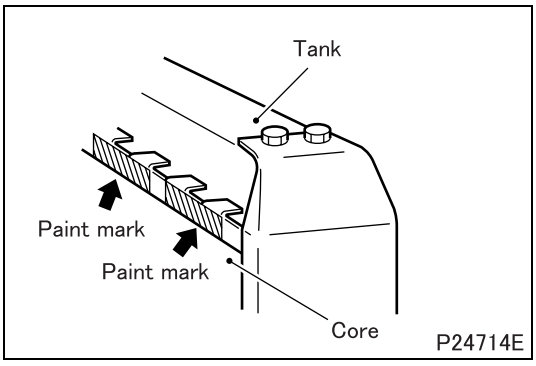
■ Inspection: Air leaking of radiator

- Install hose and radiator cap tester and plug to upper tank.
- Insert plug in lower tank, and immerse the entire body of the radiator in water.
- Apply a specified air pressure using radiator cap tester, and check for any air leakage.
- If any leakage is found, repair or replace radiator.



- Replace the following parts according to the leakage location.

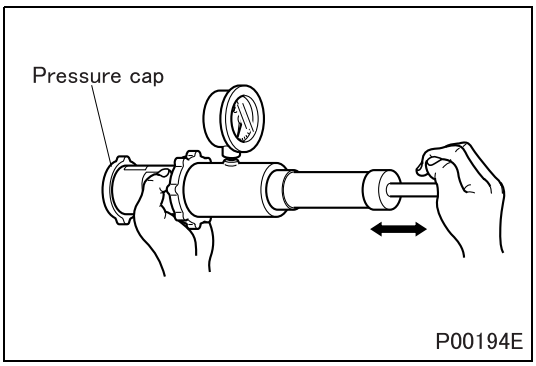
Area of leakage		Cause
Upper tank Lower tank	Tank	Cracked tank
	Tank joint	Defective crimping Defective packing Cracked tank
Tube, tube joint		Cracked tube



CAUTION ⚠

- **If there are two paint marks on the joint between the core and upper tank or on the joint between the core and lower tank (which indicates that the tank retaining tabs have been crimped twice before), replace the core with a new part.**
- **The number of paint marks on the upper tank joint or the lower tank joint corresponds to the number of repairs performed on that joint.**

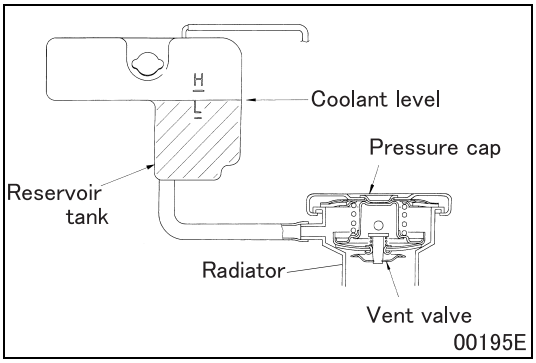
◆Inspection procedure◆



■ **Inspection: Pressure cap**

(1) Pressure valve opening pressure

- If the measurement does not conform to the standard value, replace the pressure cap.



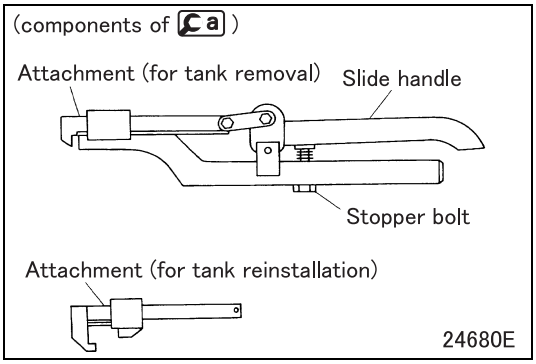
(2) Inspection of vent valve

- Note the coolant level in the reservoir tank.
- Start the engine and run it at high speed until the coolant level in the reservoir tank has risen to a certain degree. Stop the engine.
- Allow the system to cool down. When the coolant temperature has dropped to the atmospheric temperature, check if the coolant level in the reservoir tank has subsided to the original level noted earlier.
- If not, the vent valve is deemed faulty. Replace the pressure cap.

CAUTION ⚠

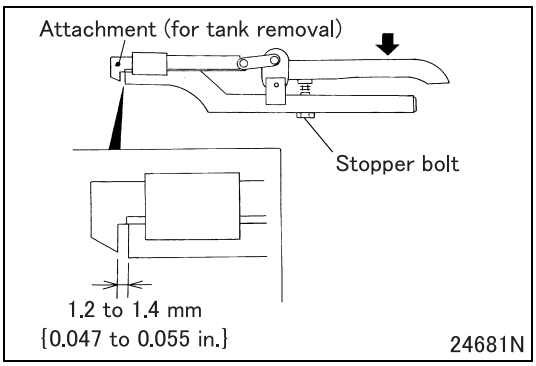
- **If the pressure cap is opened before the coolant temperature drops to the atmospheric temperature, the negative pressure in the radiator is canceled out. As a result, it is no longer possible for coolant to flow into the reservoir tank. Ensure that this does not happen.**

◆Removal procedure◆



■ **Removal: Upper tank and lower tank**

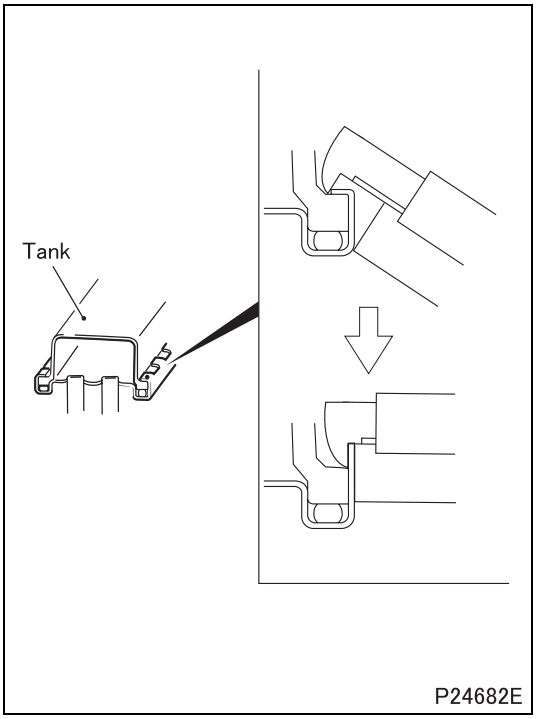
- Use Ca for removal and reinstallation of the tanks.



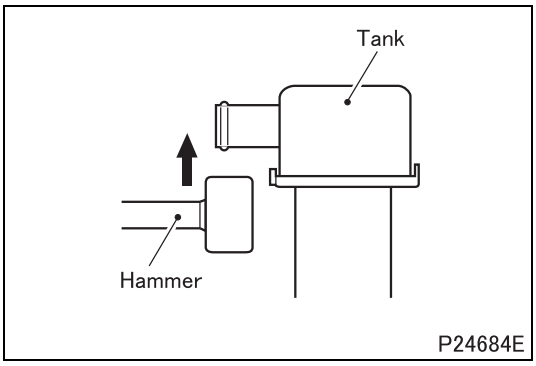
- Adjust the stopper bolt until the gap dimension shown in the illustration is obtained on the attachment of Ca.

CAUTION ⚠

- **Before using Ca, be sure to set the gap to the specified dimension by adjusting the stopper bolt. Otherwise, Ca will become damaged.**



- Use [Ca] to bend open tabs of retain tank in place.
- After tabs are bent open, squeeze the handle of [Ca] to straighten tabs as illustrated.
- After straightening all tabs in the perimeter, hold the pipes connected to the inlet/outlet, and remove tank.

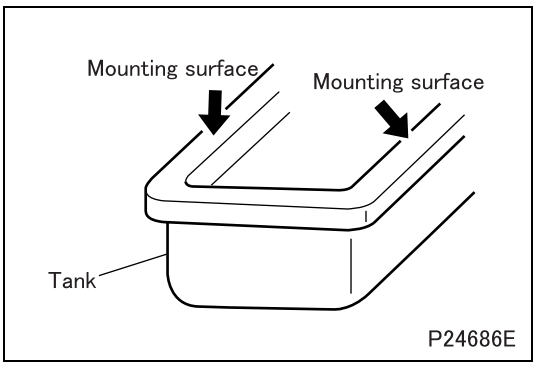


- If it is difficult to remove tank lightly hit with rubber hammer (or plastic hammer) to remove.

CAUTION ⚠

- **Gently handle tanks, since they are made of a resin that can break on impact.**

◆Inspection procedure◆

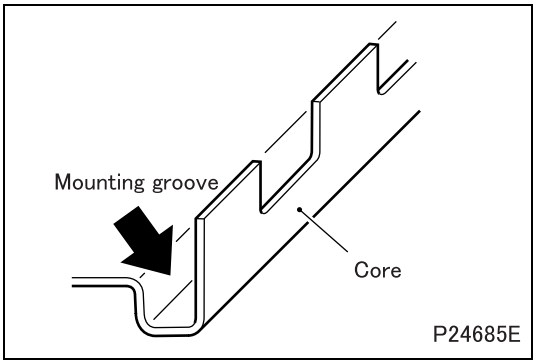


■ Inspection: Tank surface where core is to be mounted

- Check the tank surface where the core is to be mounted for cleanliness, damage, etc. Clean the surface.
- If an abnormality is found on the surface, replace the tank.

CAUTION ⚠

- **To prevent adhesion of foreign substances on mounting surface, conduct work with bare hands.**

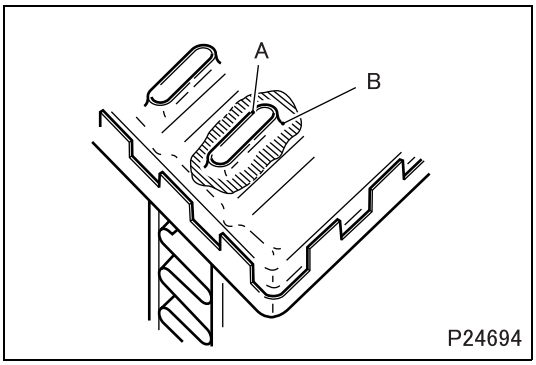


■ **Inspection: Core groove where tank is to be mounted**

- Check the groove on the core where the tank is to be mounted for adhesion of foreign substances or cracks.
- If foreign substances are found, rub the area with #1000 sandpaper or a like gently so as to avoid scratching the surface, or use compressed air to remove them.
- If there are cracks in the groove, repair or replace.

CAUTION ⚠

- **If the packing and tank are installed onto the core without removing foreign substances from the groove, coolant leakage will result. Be sure to inspect and clean the tank mounting groove along the entire periphery (even a hair can cause leakage).**

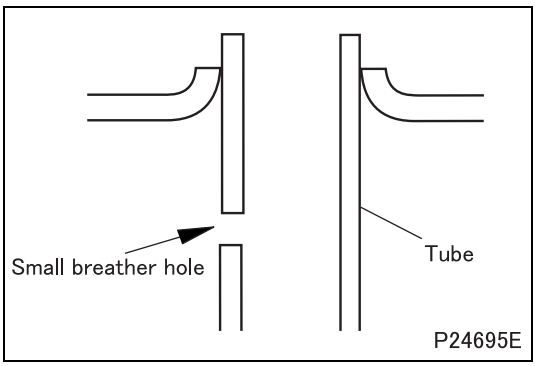


Repairing core

CAUTION ⚠

- **The core is repaired by means of tungsten inert-gas arc welding (TIG welding), which should only be performed by a skilled welder.**
- **It is extremely dangerous to weld on a wet core. Before welding, ensure that the core is completely dry.**

- Using a stainless wire brush, brush both ends A of the leaky tube and the areas B around the tube ends until the base aluminum is exposed.
- Before closing the tube at both ends by welding, drill a small breather hole in the tube.



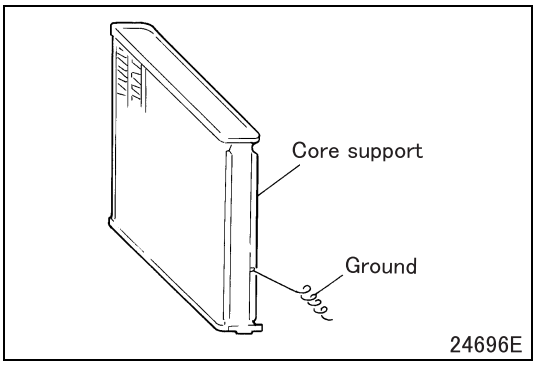
CAUTION ⚠

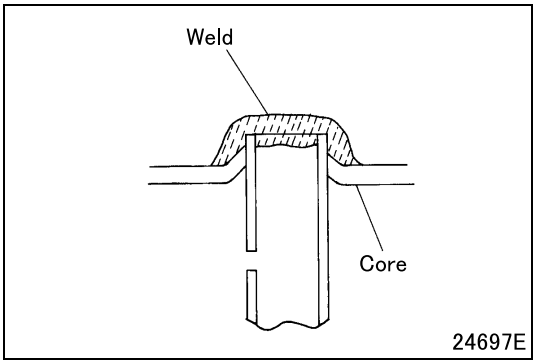
- **If a breather hole is not provided, the tube may develop small pinholes due to escaping air.**

- Ground the core at the support.

CAUTION ⚠

- **If welding is performed without the core properly grounded, this can lead to short-circuit where the base metal may melt.**



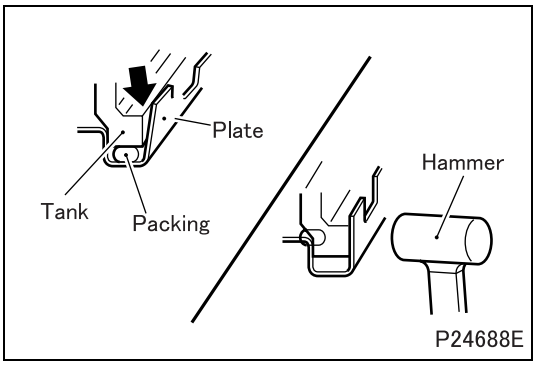


- Close both end of the tube by tungsten inert-gas arc welding (TIG welding).
  Welding conditions
  - Welding rod: A4043 (approx. ϕ2 mm {0.079 in.})
  - Welding current: AC80A
- After welding, check for the following problems. If any of them exist, repair again or replace the core.
  - Undercut
  - Bead crack
  - Base metal crack

CAUTION ⚠

- **Improper weld can lead to recurrence of coolant leakage.**

◆Installation procedure◆

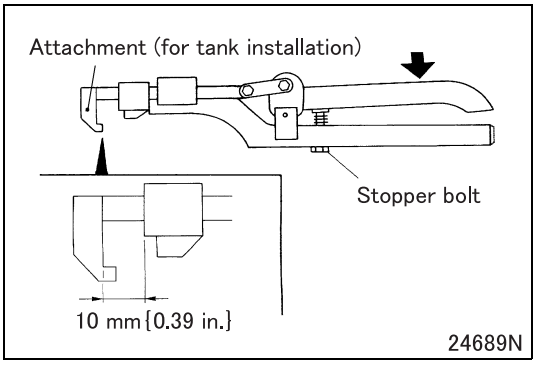


■ Installation: Upper tank, lower tank

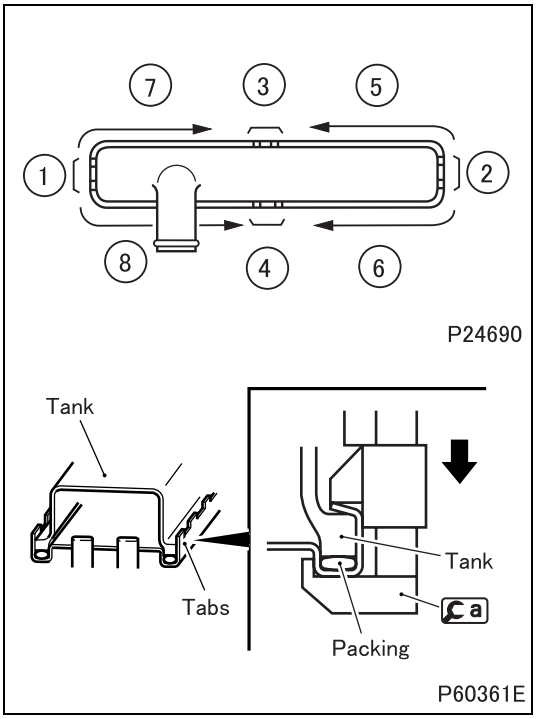
- With the tank installed, eliminate any clearance between the tank and core plate by tapping with a rubber (or plastic) hammer.

CAUTION ⚠

- **To prevent adhesion of foreign matter, use bare hands to install the packing and tank.**



- Adjust the stopper bolt until the gap dimension shown in the illustration is obtained on the attachment of [Ca].

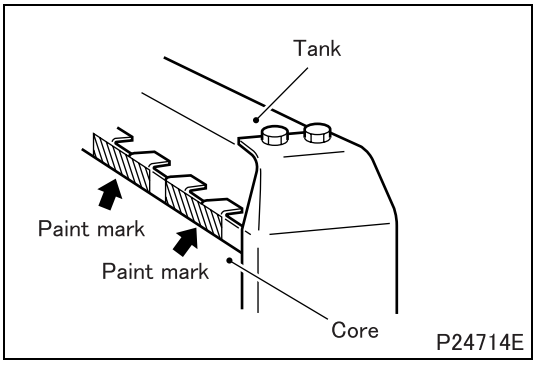


- Following the sequence shown in the diagram, bend tabs for caulking tank.
  1 to 4: Bend two tabs at the center.
  5 to 8: Bend other tabs following the direction of the arrow.

NOTE

- **Since a cannot be used to caulk sides 1 and 2, use pliers with the tips wrapped in vinyl tape.**

- After crimping the tabs onto the tank, check for coolant leakage.



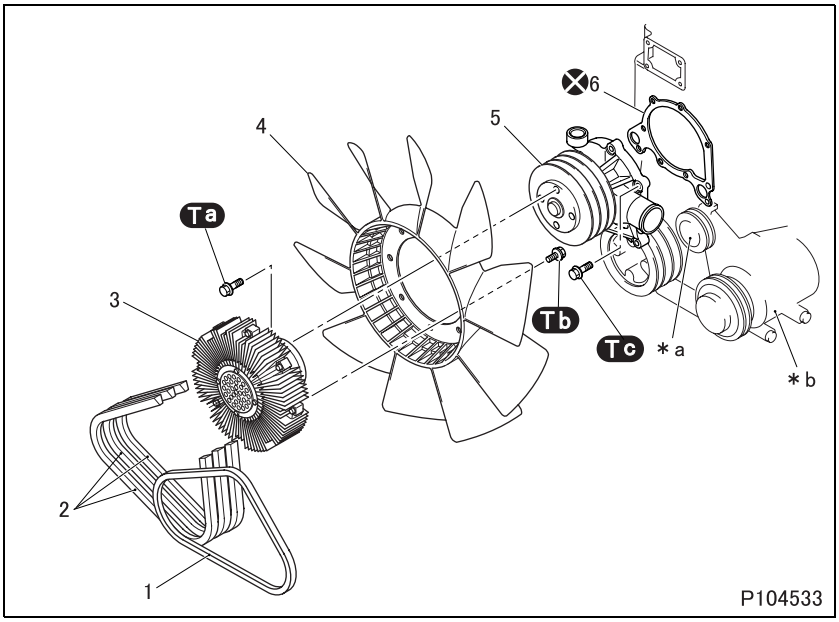
- Paint a mark on the core where it can be easily noticed to indicate that the core has been crimped.

CAUTION ⚠

- **Paint a mark for each repair performed on either the upper or lower tank.**

M E M O

COOLING FAN, BELT AND WATER PUMP



● Disassembly sequence

1 Belt (for air conditioner)
2 Belt (for fan)
3 Automatic cooling fan coupling
4 Cooling fan
5 Water pump
6 Water pump gasket

***a**: Tension pulley (See Gr55.)
***b**: Compressor (for air conditioner) (See Gr55.)
⊗: Non-reusable parts

● Assembly sequence

Follow the disassembly sequence in reverse.

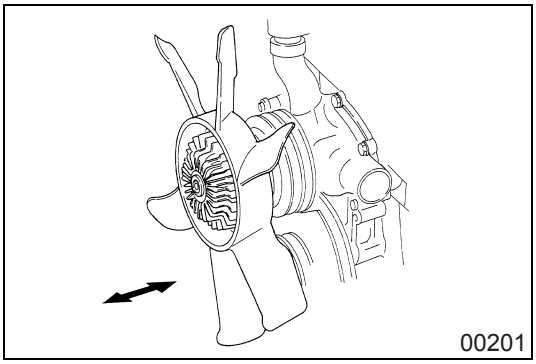
CAUTION ⚠

- **The automatic cooling fan coupling cannot be disassembled. If it is found faulty, replace the whole assembly.**

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

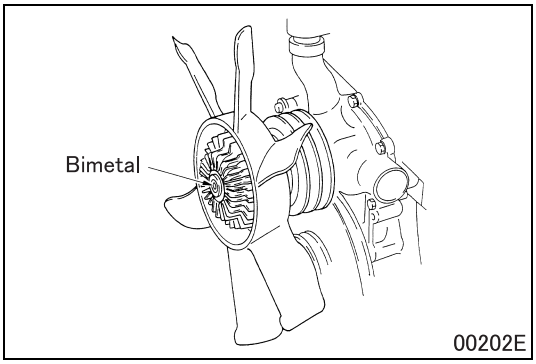
Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Bolt (for automatic cooling fan coupling)	34 {25, 3.5}	–
Tb	Bolt (for cooling fan installation)	53.9 {40, 5.4}	–
Tc	Bolt (water pump mounting)	24 {18, 2.4}	–

◆Inspection and cleaning procedure◆



■ Inspection: Automatic cooling fan coupling

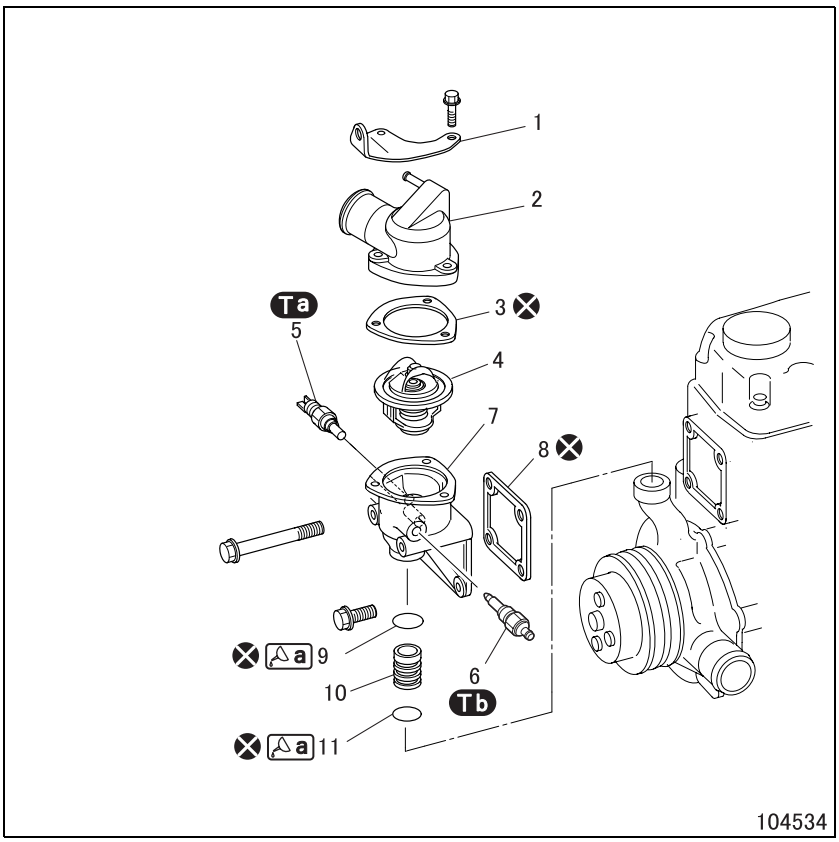
- Inspect the automatic cooling fan coupling in accordance with the following procedure. If any defect is apparent, replace the unit.
  - Check for leakage of oil from the coupling body.
  - Rotate the automatic cooling fan coupling by hand and check for irregular movement or abnormal noise caused by a defect in the bearing.
  - Check for excessive axial play in the automatic cooling fan coupling when the engine is cool.



■ **Cleaning: Automatic cooling fan coupling**

- If any foreign particles have adhered to the bimetal, remove them carefully without applying excessive force.

THERMOSTAT



● **Disassembly sequence**

1 Fan shroud stay
2 Thermostat cover
3 Gasket
4 Thermostat
5 Water temperature sensor
6 Overheat alarm switch
7 Thermostat case
8 Gasket
9 O-ring
10 Joint
11 O-ring

⊗: Non-reusable parts

CAUTION ⚠

- **Do not remove the thermostat case unless it has a water leak or any other defect.**

● **Assembly sequence**

Follow the disassembly sequence in reverse.

NOTE

- **Refer to the previous section "DISCONNECTION AND CONNECTION OF HOSES AND PIPES" for the correct insertion depth of thermostat cover and case hoses into the pump as well as the correct tightening torque of clamps.**

Service standards (Unit: mm {in.})

Location	Maintenance item		Standard value	Limit	Remedy
4	Thermostat	Valve opening temperature	82 ± 2°C {180 ± 3.6°F}	–	Replace
		Valve lift/temperature	10 {0.39} or more/ 95°C {205°F}	–	

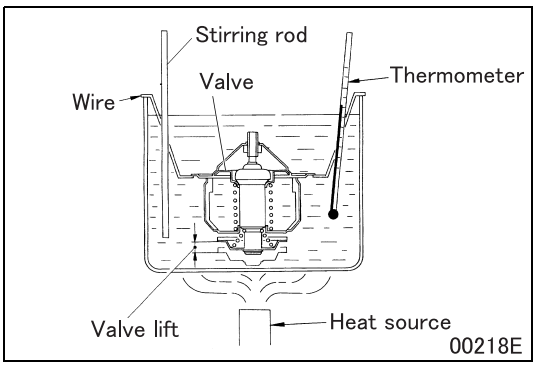
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Water temperature sensor (for thermometer)	35 ± 7 {26 ± 5.2, 3.6 ± 0.7}	–
Tb	Overheat alarm switch	39 to 59 {29 to 44, 4 to 6}	–

Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	O-ring	Soapy water	As required

◆Inspection procedure◆



■ **Inspection: Thermostat**

- Stir the water using a stirring rod to maintain an even water temperature in the container, then conduct the tests indicated below.
- If the measured values deviate from the standard value ranges, replace the thermostat.

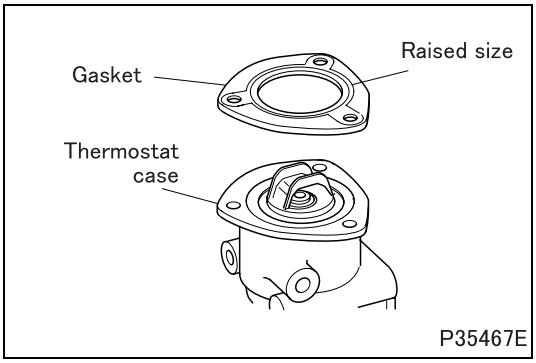
(1) Valve opening temperature

- Hold the thermostat with wire to keep it away from the heat source.
- Heat the water gradually to the valve opening temperature.
- Maintain this temperature for five minutes and make sure that the valve is completely open.
- Make sure that the valve closes completely when the water temperature drops below 65°C {149°F}.

(2) Valve lift

- Heat the water to a temperature slightly higher than the valve opening temperature. Maintain this temperature for five minutes and measure the valve lift.

◆Installation procedure◆



■ **Installation: Gasket**

- Fit the gasket onto the thermostat case in the illustrated direction.

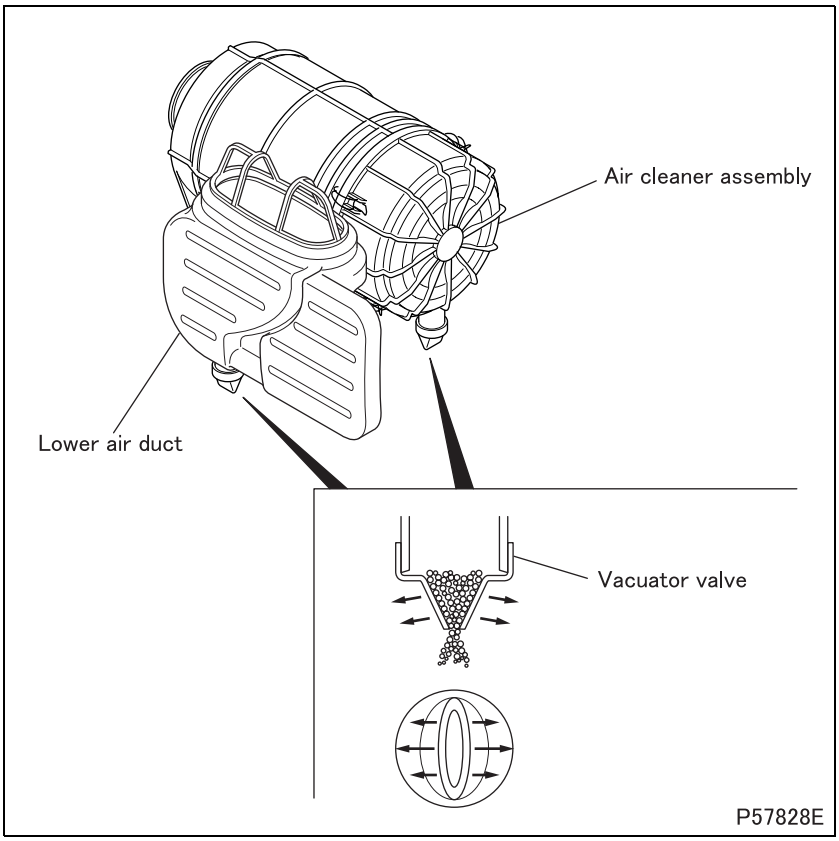
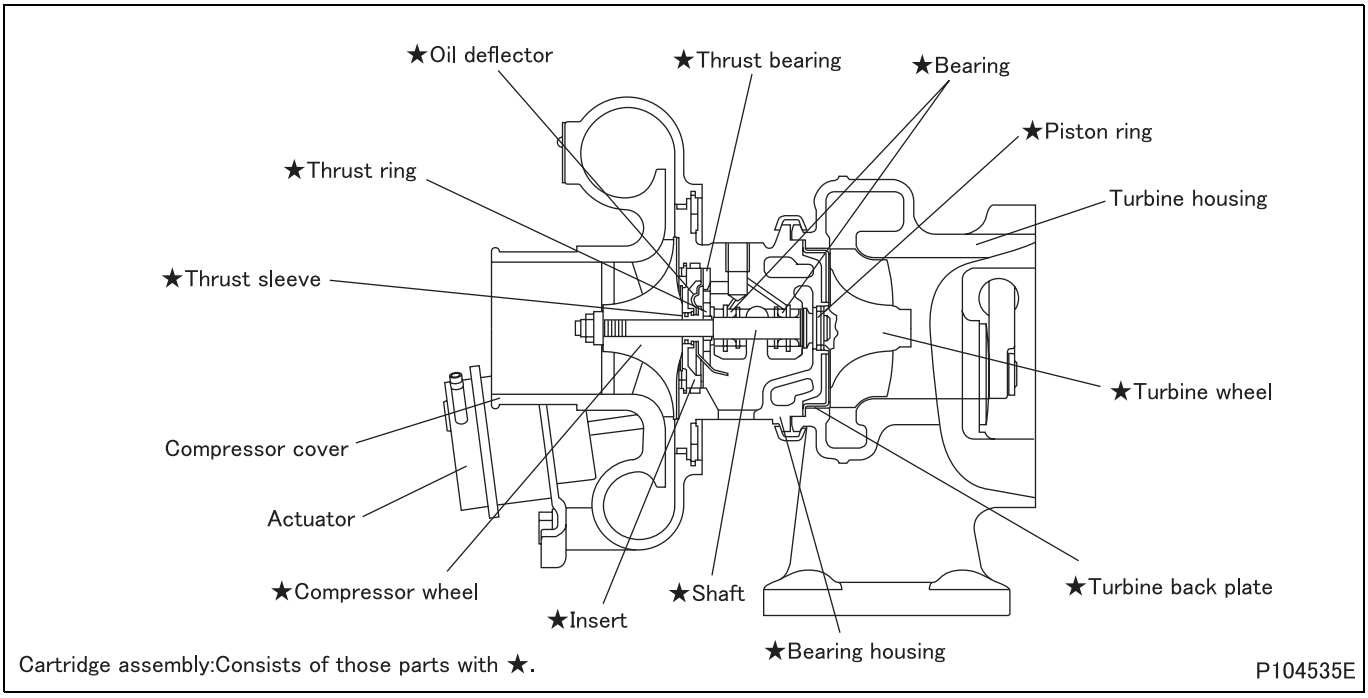
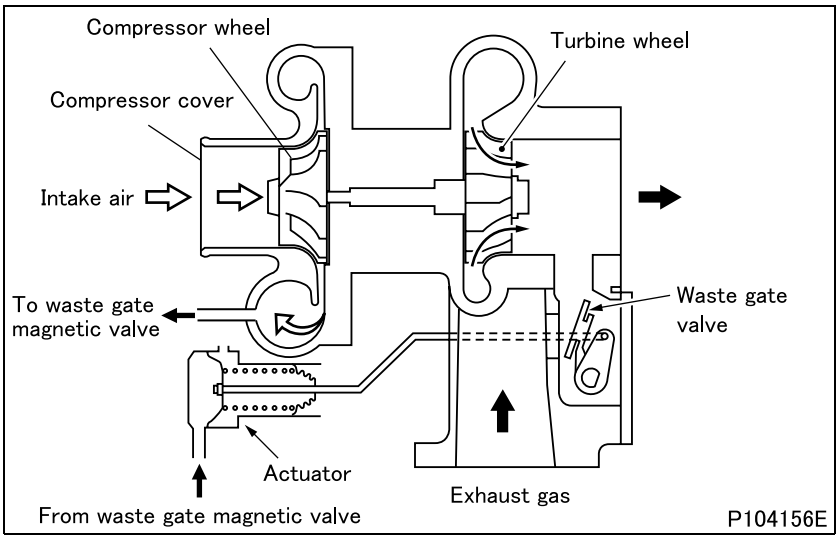
1. Air Cleaner



- The air cleaner assembly utilizes single element.
- The lower air duct and air cleaner assembly incorporate a vacuator valve each.
- The vacuator valve automatically works in such a way that when the engine speed drops below a specified level, the valve's rubber boot which is usually subdued by internal vacuum is allowed to spring back and accumulated dust and dirt are discharged as a result.

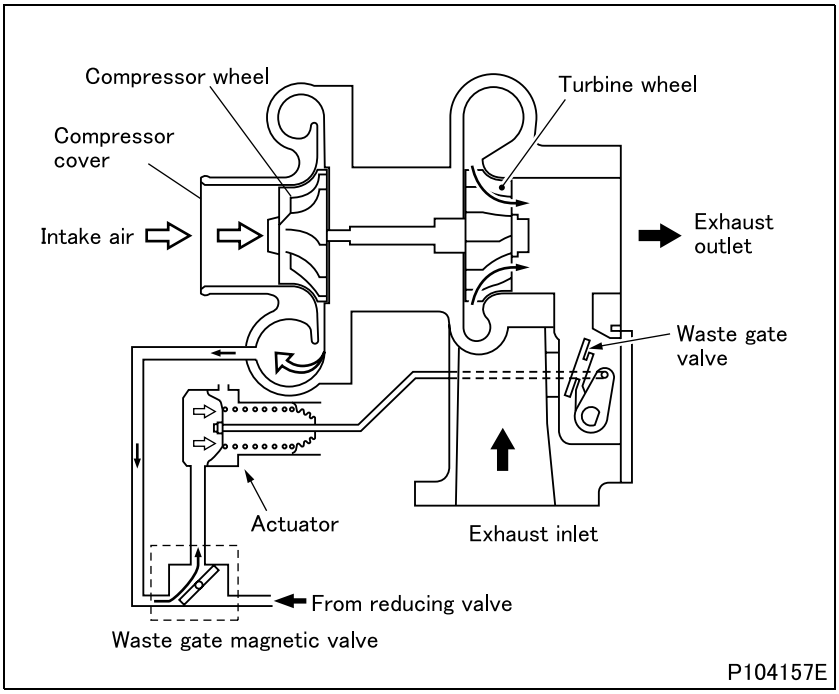
2. Turbocharger





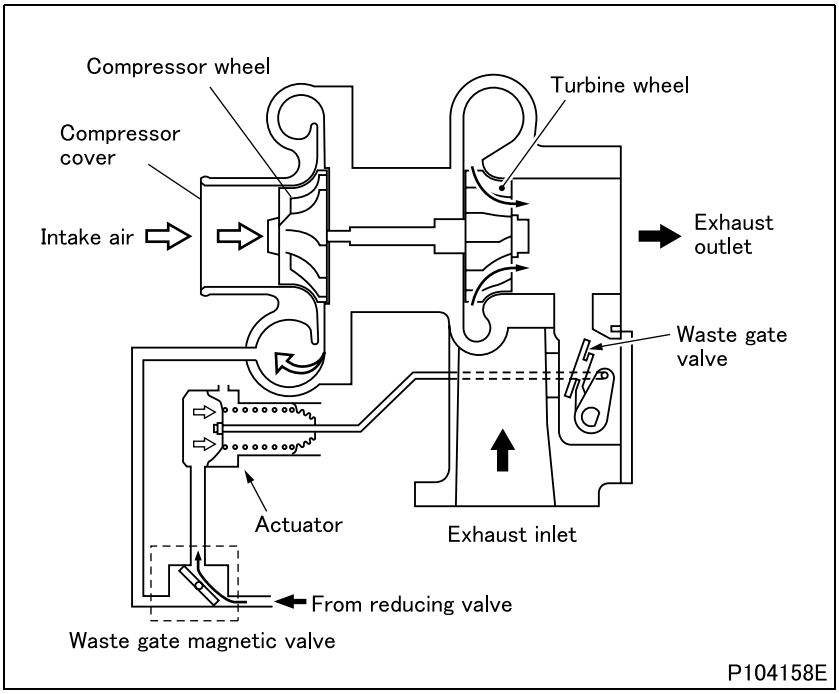
2.1 Waste gate mechanism

- The waste gate mechanism, which is operated by an actuator, is designed to let excess exhaust gas bypass the turbocharger, thereby preventing the turbocharger from overrunning and the intake manifold pressure from rising excessively. This ensures that the boost pressure is properly controlled.
- There are two ways of actuator operation of the waste gate mechanism, i.e., a normal control mode in which the waste gate valve is opened by means of pressure in the compressor cover and a diesel particulate filter regeneration control mode in which the waste gate valve is forced to open by air pressure from the air tank in response to a signal from the engine electronic control unit for diesel particulate filter regeneration.



2.2 Normal control mode

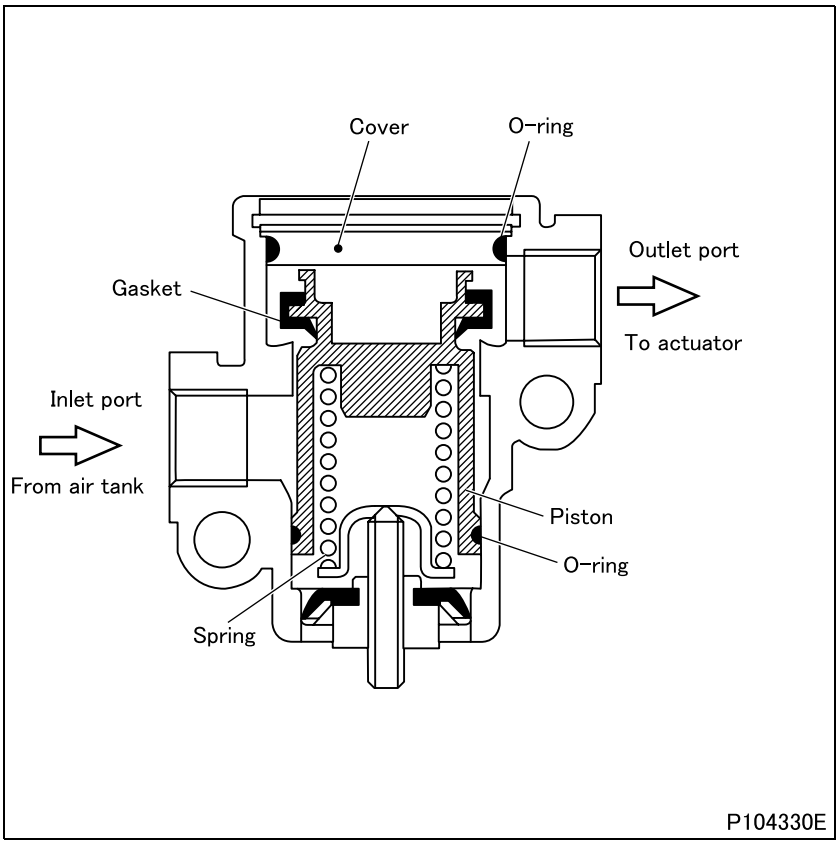
- Normally, as the waste gate magnetic valve is inactive, air pressure from the compressor wheel acts on the actuator to open the waste gate valve.
- With the opening of the waste gate valve, exhaust gas fed against the turbine wheel is reduced. This decreases the compressor wheel speed and the boost pressure is lowered as a result.



2.3 Diesel particulate filter regeneration control mode

- When this mode is selected, the waste gate magnetic valve is activated, and air pressure from the air tank reduced by the reducing valve acts on the actuator to open the waste gate valve.

3. Reducing Valve



- The reducing valve is designed to reduce air pressure fed from the inlet port to the outlet port to the preset level.

4. Diesel Particulate Filter Regeneration Control System

4.1 General

- The diesel particulate filter regeneration control system burns and removes the particulate matter (PM) in the ceramic filter using high temperature exhaust gas to prevent excessive accumulation of particulate matter in the ceramic filter. Thus the diesel particulate filter is regenerated.
- The regeneration is divided into two types. One is the continuous regeneration utilizing high temperature exhaust gas during high-speed or high-load operations. The other is the automatic or manual regeneration which uses high temperature exhaust gas created by the regeneration control by the engine electronic control unit.
- For automatic or manual regeneration, the engine electronic control unit estimates the accumulated amount of particulate matter from the vehicle operating hours, driving distance and the engine condition during driving, and the regeneration is performed by controlling the fuel injection (amount and timing), turbocharger, exhaust shutter and intake throttle to make high temperature exhaust gas.

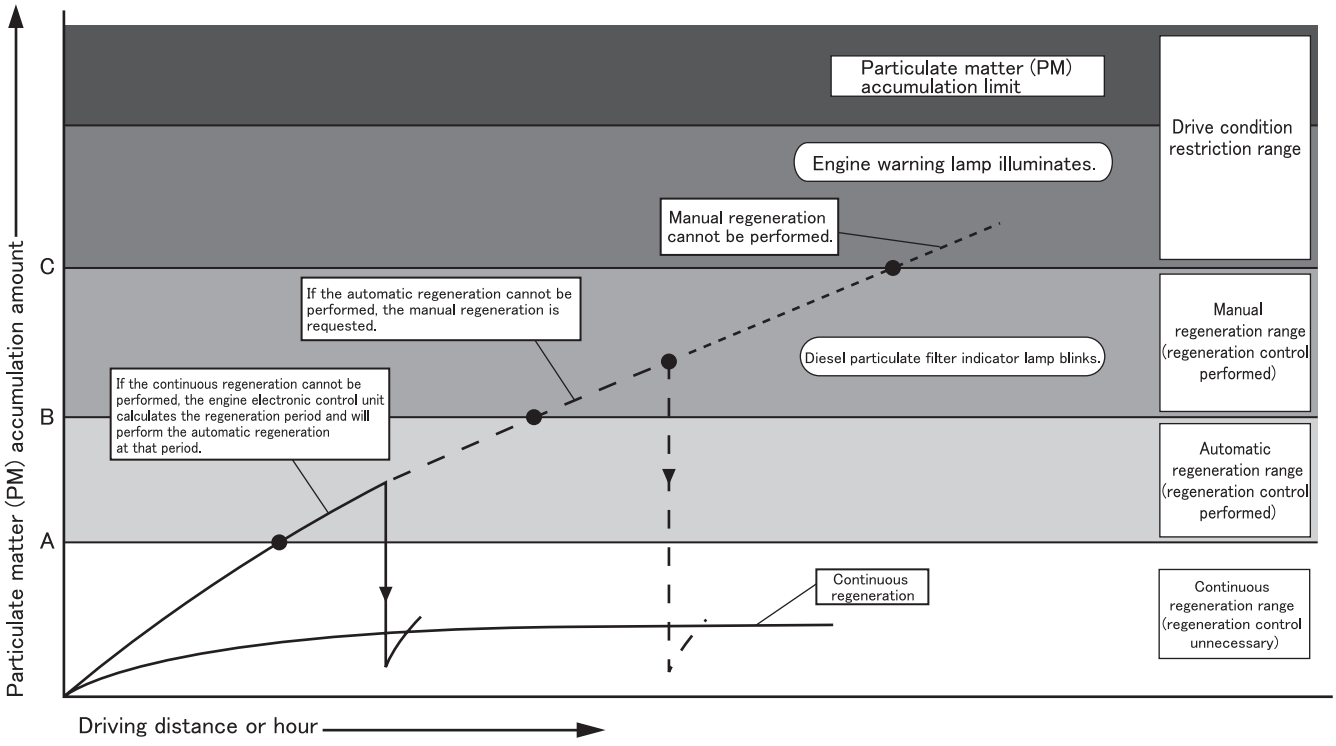
4.2 Continuous regeneration and regeneration control



- The above diagram shows the relations between the driving distance or hours and the particulate matter accumulation amount, and the range of each diesel particulate filter regeneration operation.
- The particulate matter accumulation amount increases as the driving distance or hours increase. However, by conducting the regeneration operation that matches the vehicle operating condition and the particulate matter accumulation amount, the particulate matter accumulation amount is reduced to keep the performance of the diesel particulate filter.
- The regeneration is divided into two types - the continuous regeneration utilizing exhaust gas during normal driving operation and the automatic or manual regeneration which uses exhaust gas created by the regeneration control.

(1) Continuous regeneration

- When exhaust gas temperature is high during high-speed or high-load operation, NO_2 created by the action of the front oxidation catalyst continuously burns the particulate matter accumulated in the ceramic filter.

(2) Regeneration control

(2.1) Automatic regeneration

- When the particulate matter accumulation level is between A and B on the diagram, the engine electronic control unit decides the regeneration period and the automatic regeneration will be performed at an appropriate period. During regeneration, the unburnt fuel (HC) supplied by the post injection is oxidized by the front oxidation catalyst, and the oxidation heat from that reaction burns the particulate matter accumulated in the ceramic filter.

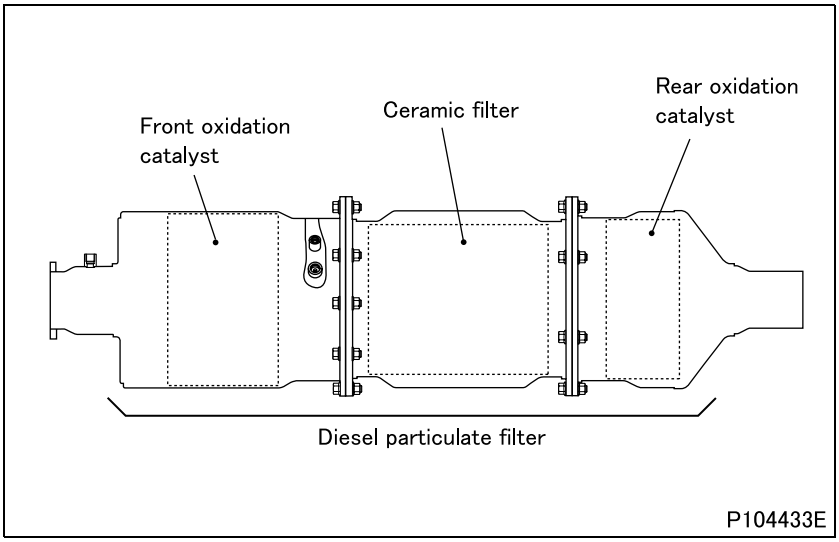
(2.2) Manual regeneration

- When the particulate matter accumulation level is between B and C on the diagram, the engine electronic control unit makes the diesel particulate filter indicator lamp blink. If the diesel particulate filter cleaning switch is turned on by the driver when the following conditions are met, the manual regeneration will take place.
  - Engine has warmed up (coolant temperature: 70°C {158°F} or higher)
  - Diesel particulate filter cleaning switch: ON (Press the switch until the diesel particulate filter indicator stays on.)
  - Accelerator pedal released (accelerator pedal position sensor: 0%)
  - Parking brake applied (parking brake switch: ON)
  - Transmission in neutral position (transmission neutral switch: OFF)
  - Clutch pedal released (clutch pedal switch: ON)
  - Power take-off inactive (power take-off switch: OFF)
- During regeneration, the diesel particulate filter indicator lamp blinks in two intervals (slow and fast) in accordance with the particulate matter accumulation amount.
- The exhaust gas temperature increase procedure and the particulate matter burning procedure are the same as that for the automatic regeneration.

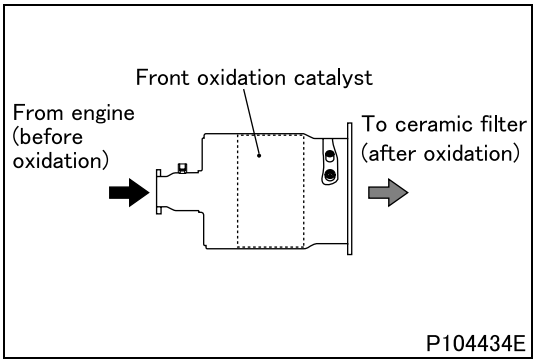
(2.3) Restriction on drive conditions

- When the particulate matter accumulation level exceeds C on the diagram, the engine warning lamp illuminates and some restrictions are applied to the driving conditions.

4.3 Diesel particulate filter unit

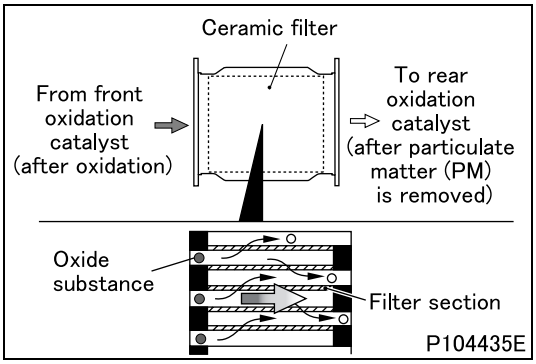


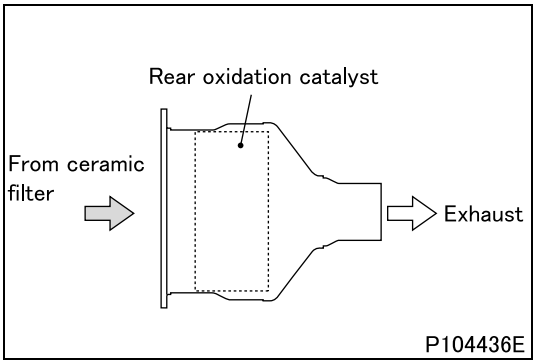
- Diesel particulate filter unit consists of the front oxidation catalyst, ceramic filter and rear oxidation catalyst.



(1) Front oxidation catalyst

- In normal driving condition, unburnt fuel (HC) and part of the particulate matter in the exhaust gas from the engine is purified by this catalyst.
- During filter regeneration, the unburnt fuel (HC) supplied by the post injection is oxidized by the front oxidation catalyst, and the oxidation heat raises exhaust gas temperature.





(2) Ceramic filter

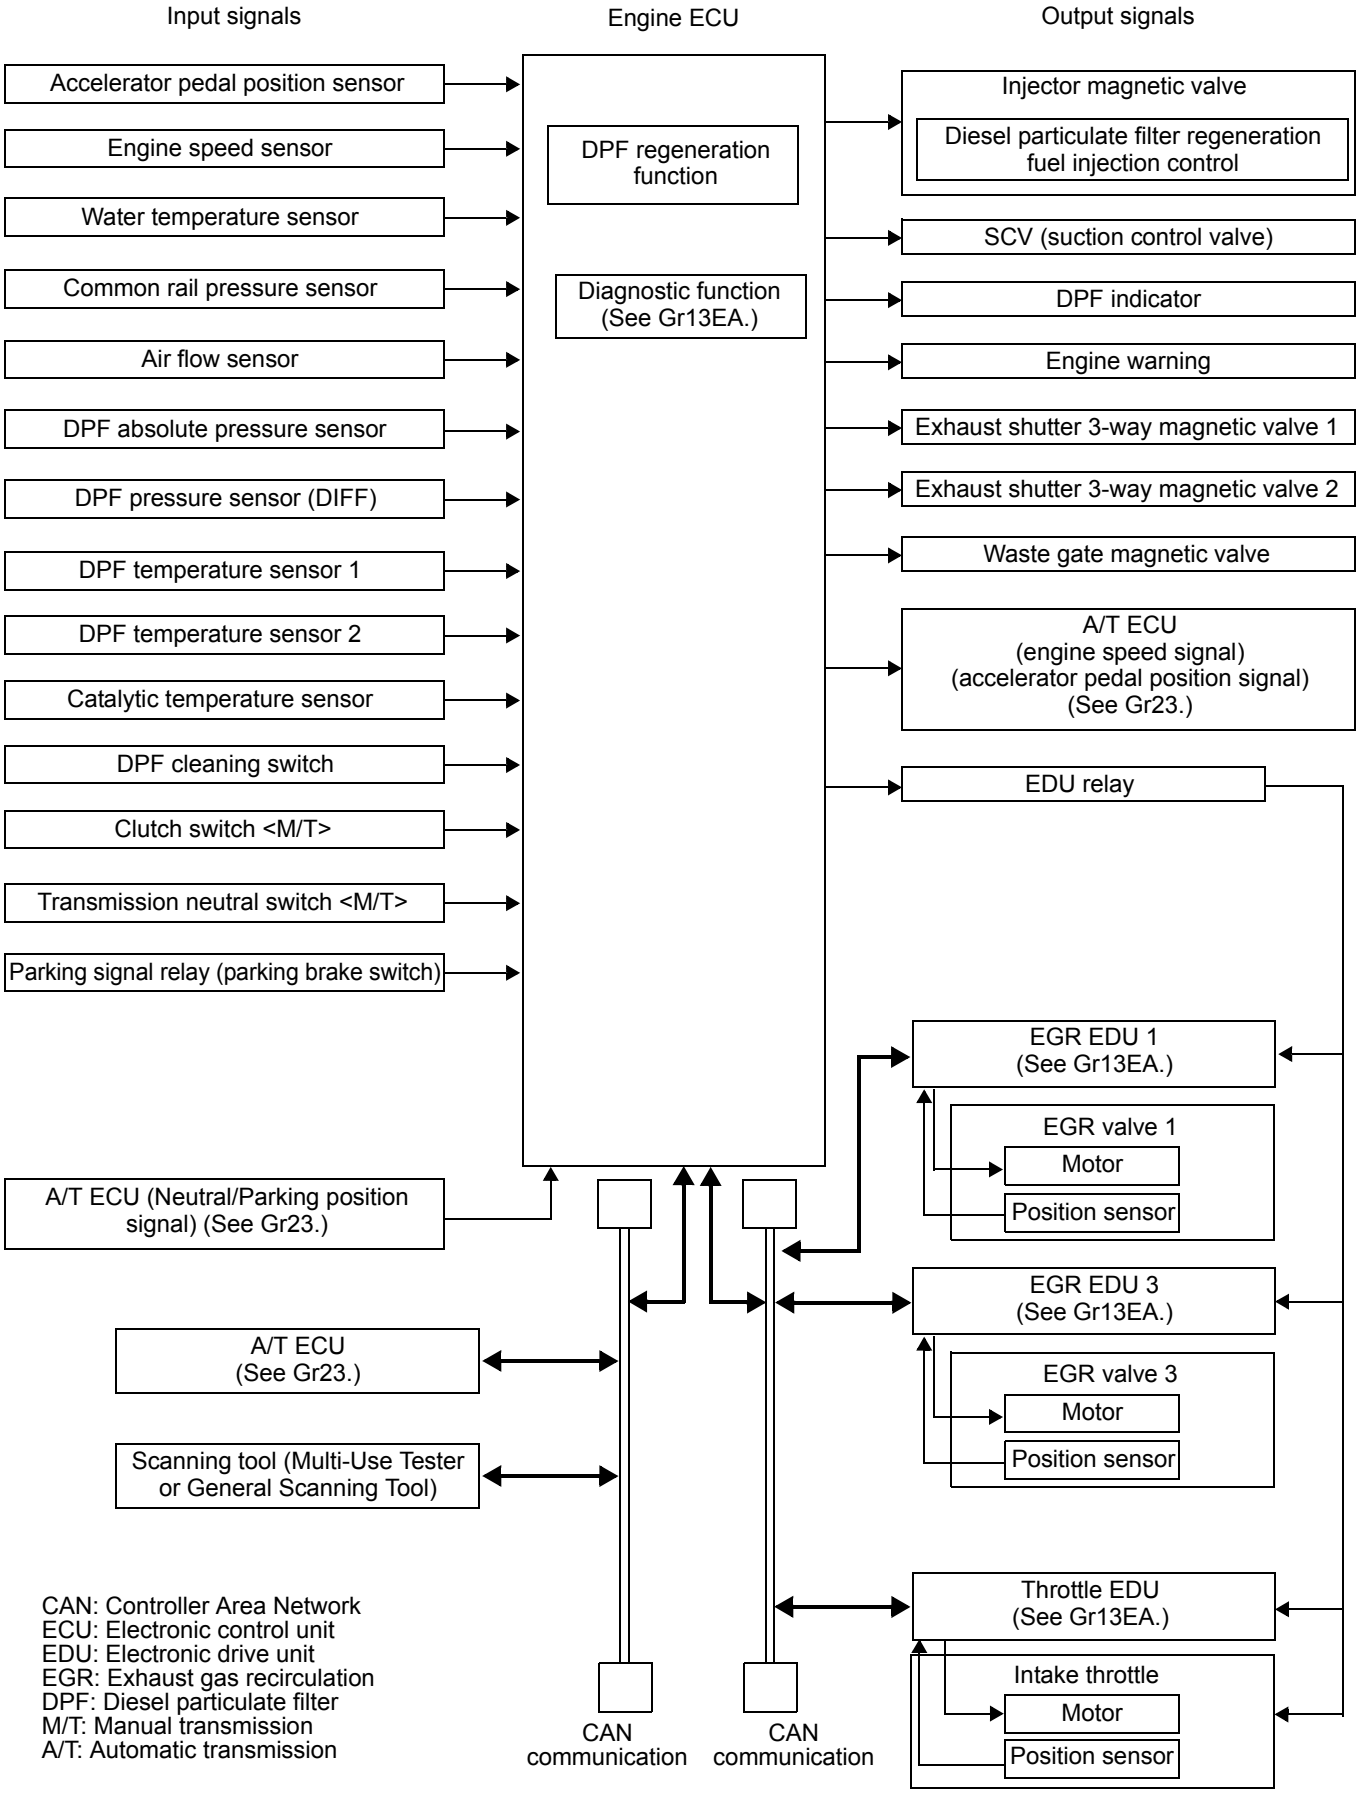
- The ceramic filter is an aggregate of thin tubes, and these tubes are closed at either end alternatively. During normal operation, particulate matter is trapped when the exhaust gas enters a tube and passes through the wall of the tube (filter section) to the adjacent tube.
- During regeneration, the particulate matter accumulated in the filter is cleared by burning at high temperature. This, however, cannot remove the calcium (ash) contained in the engine oil and the ash will accumulate in the filter. The excessively accumulated ash may cause early clogging of the ceramic filter. Therefore, the ceramic filter must be cleaned periodically.

(3) Rear oxidation catalyst

- The rear oxidation catalyst oxidize and remove the components (HC and CO) which remain untreated through the diesel particulate filter.

4.4 Electronic control system

(1) System block diagram



Part	Main function/operation
Accelerator pedal position sensor	Detection of extent of accelerator pedal depression
Engine speed sensor	Detection of engine speed
Water temperature sensor	Detection of coolant temperature
Common rail pressure sensor	Sensing of common rail pressure
Air flow sensor	Detection of intake air flow rate
DPF absolute pressure sensor	Detection of DPF absolute pressure
DPF pressure sensor (DIFF)	Detection of DPF differential pressure
DPF temperature sensor 1	Detection of ceramic filter inlet temperature
DPF temperature sensor 2	Detection of ceramic filter outlet temperature
Catalytic temperature sensor	Detection of front catalyst inlet temperature
DPF cleaning switch	ON/OFF changeover of DPF manual regeneration
Clutch switch <M/T>	Detection of released/pressed condition of clutch pedal (OFF with pedal released)
Transmission neutral switch <M/T>	Detection of transmission neutral condition (OFF with transmission in neutral)
Parking signal relay (parking brake switch)	Detection of parking condition (turns ON when the parking brake is applied)
Injector magnetic valve	DPF regeneration fuel injection control
SCV (suction control valve)	Control of fuel injection pressure
Waste gate magnetic valve	Control of boost pressure
DPF indicator	Illuminates when the particulate matter accumulation in the DPF exceeds a certain value.
Engine warning	Indication of system abnormalities Illuminates when the particulate matter accumulation in the DPF is excessive.
Exhaust shutter 3-way magnetic valve 1	Control of exhaust brake (energizing magnetic valve 1 causes the butterfly valve to fully close.)
Exhaust shutter 3-way magnetic valve 2	Control of DPF regerenration (energizing magnetic valves 1 and 2 causes the butterfly valve to close partway.)
A/T ECU (engine speed data for automatic transmission control)	Output of engine speed for A/T control
A/T ECU (accelerator pedal position for automatic transmission control)	Output of extent of accelerator pedal depression for A/T control
EDU relay	Switching ON/OFF supply of power to EGR EDU and throttle EDU
A/T ECU (Neutral/Parking position signal)	Detection of Neutral (N range) and Parking (P range)
CAN communication (A/T ECU)	• Engine data recognized by the ECU are outputted to the CAN bus to enable systems to obtain data that they need for control. • Each A/T ECU issues signals to the engine ECU to enable it to effect engine control appropriate for each type of system control. (See Gr23 for control of A/T ECU)
CAN communication (throttle EDU and EGR EDU)	• Engine data recognized by the engine ECU are outputted to the CAN bus to enable systems to obtain data that they need for control. • Each EDU opens/closes the valves to increase exhaust gas temperature for DPF regeneration. (See Gr13EA for control of throttle EDU and EGR EDU)

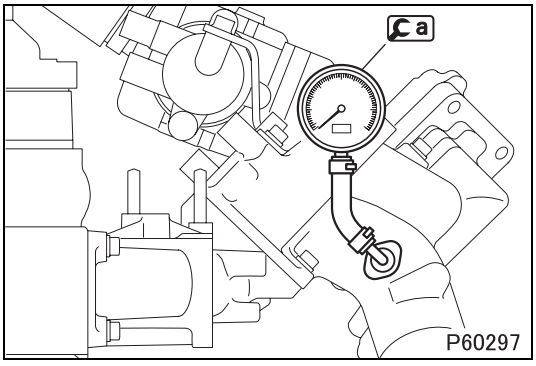
1. Measurement of Turbocharger Boost Pressure

Service standards

Location	Maintenance item		Standard value	Limit	Remedy
–	Boost pressure (at ambient temperature of 20°C {68°F} and atmospheric pressure of 100 kPa {29.9 in.Hg, 760 mmHg})	Boost pressure gauge reading	–	95 kPa {28.1 in.Hg, 710 mmHg} /3210 rpm	Inspect or adjust
		Multi-Use Tester reading (See Gr13EA.)	–	28 psi /3210 rpm	

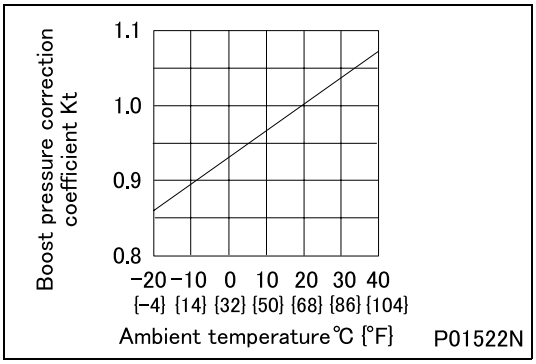
Special tools

Mark	Tool name and shape	Part No.	Application
ⓐ	Boost pressure gauge  P01524	MH061366	Measurement of boost pressure



P60297

- Before measuring the boost pressure, clean or replace the air cleaner element.
- Remove the connector from ⓐ.
- Remove the boost hose. Install ⓐ onto the nipple.
- Warm up the engine completely. Then, with the engine running at the no-load maximum speed, measure the boost pressure. At the same time, note down the engine speed and ambient temperature at that time.

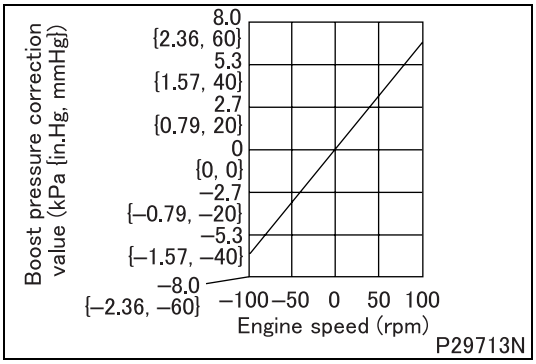


P01522N

- The boost pressure measured above is not the true boost pressure. The measurement needs to be corrected as described below.

[Correction for ambient temperature]

- From the graph, determine the boost pressure correction coefficient Kt for the ambient temperature.



[Correction for engine speed]

- Subtract the no-load median maximum speed from the engine speed noted during the boost pressure measurement. Using the graph shown on the left, obtain the boost pressure correction value Pa that corresponds to the difference obtained from the subtraction.
- No-load median maximum speed: 3180 rpm

[Calculation of corrected boost pressure]

- If the measured boost pressure is P, the corrected boost pressure Pb is determined as follows:

Pb = KtP + Pa

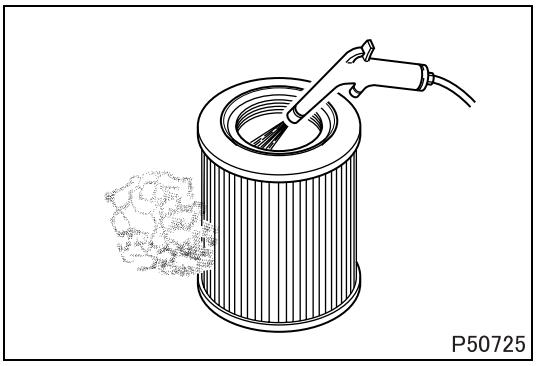
Kt: Boost pressure correction coefficient for ambient temperature

P: Measured boost pressure

Pa: Boost pressure correction value

- If Pb is out of specification, the turbocharger must be inspected and adjusted.

2. Cleaning and Inspection of Air Cleaner Element



P50725

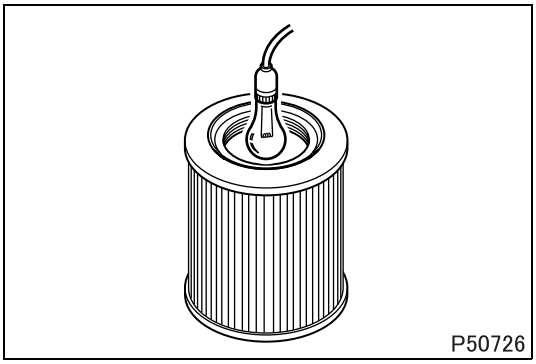
■ **Cleaning: Filter element**

- Blow a jet of compressed air at a pressure not higher than 685 kPa {100 psi, 7 kgf/cm^2} against the inside surfaces of the element.
- Move the compressed air jet up and down along all pleats of the filter paper element.

CAUTION ⚠

- **Do not strike the element or hit it against another object to remove dust.**
- **Do not blow compressed air against outside surfaces of the element.**

◆Inspection procedure◆

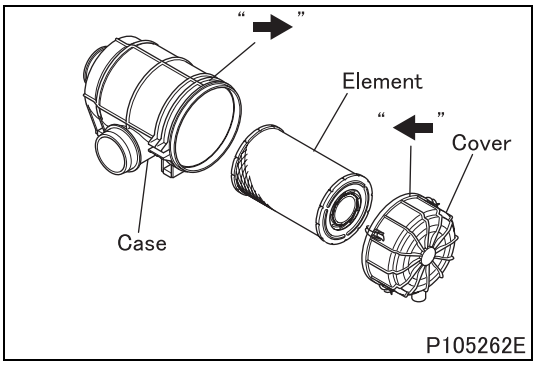


P50726

■ **Inspection: Element**

- Shine some electric light inside the element.
- Replace the element if thin spots or broken parts are evident in the filter paper, or if the packing at the top of the element is damaged.
  Also replace the element if the dust on the element is damp with oily smoke or soot, regardless of the replacement schedule.

◆Installation procedure◆



P105262E

■ **Installation: Air cleaner cap**

➡: Alignment mark

3. Diesel Particulate Filter Unit Inspection for Clogging and Cleaning the Diesel Particulate Filter Unit

CAUTION ⚠

- **Diesel particulate filter has become very hot after the operation of engine. Cool down the diesel particulate filter sufficiently so as not to get burnt.**
- **The ceramic filter must be cleaned at first 320,000 km {200,000 miles} of driving, and then every 240,000 km {150,000 miles} of driving. Otherwise, ash will accumulate in the filter and the filter may be damaged.**

Service standards

Location	Maintenance item	Standard value	Limit	Remedy
–	Diesel particulate filter differential pressure (after regeneration and cleaning, at no-load max. speed)	Less than 10 kPa {1.5 psi, 0.1 kgf/cm^2}	10 kPa or higher {1.5 psi, 0.1 kgf/cm^2}	Replace

Special tools

Mark	Tool name and shape	Part No.	Application
a	*Pulse cleaner	(*X007954)	Washing of ceramic filter
b	Flange nut (M10) (not used by Donaldson)	MF434105	
c	Drain plug (M12 × 1.25)	MF665003	
d	Drain plug (M14 × 1.5)	MF665004	
e	Gasket (M12)	MF665004	
f	Gasket (M14)	MF660065	

*: Recommend Donaldson “Heavy Duty Diesel Engine DPF Pulse Cleaner” to cleaning the DPF filter soot.
( ): reference No.

3.1 Preparation

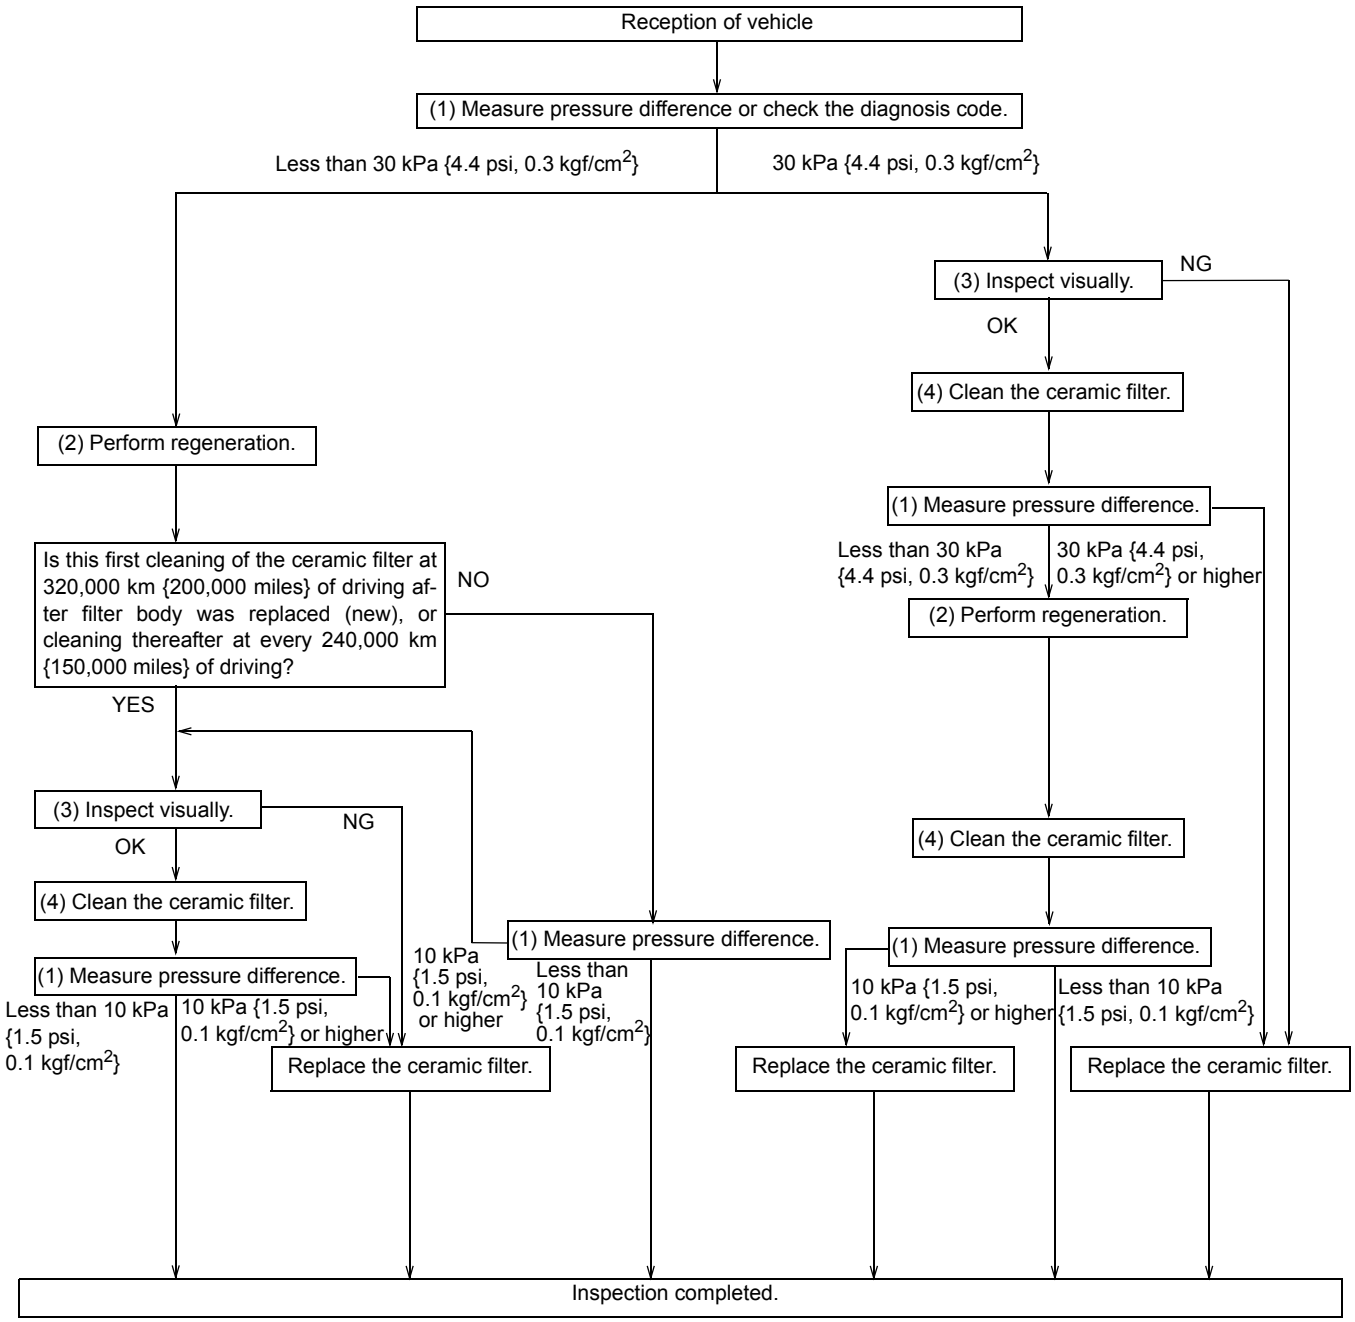
- Place the transmission to neutral position.
- Turn the steering wheel in neutral position. Apply the parking brake securely.
- Turn off the air conditioner not to increase the engine speed.
- Connect the Multi-Use Tester. (See Gr00.)
- Check if there is any diagnosis code stored in the memories of the electronic control units. Repair if any fault is found.
- Warm up the engine until the coolant temperature becomes 70°C {158°F}. (Check this by Multi-Use Tester service data “35: coolant temperature”.)

3.2 Inspection procedure

- Perform the inspection in accordance with the following flowchart.

CAUTION ⚠

- **The differential pressure of diesel particulate filter, that is, the pressure difference between the inlet and outlet of the diesel particulate filter, may exceed 30 kPa {4.4 psi, 0.3 kgf/cm^2} due to the clogging of the ceramic filter. If the diesel particulate filter regeneration is performed using Multi-Use Tester actuator test "DPF regeneration (park)", the abnormal combustion of the particulate matter may make the diesel particulate filter excessively high temperature, resulting in damage of the diesel particulate filter. Before performing the diesel particulate filter regeneration, therefore, be sure to check that the diesel particulate filter differential pressure is less than 30 kPa {4.4 psi, 0.3 kgf/cm^2}.**
- **When replacing the electronic control unit to a new one, current ash accumulation data must be copied to the new electronic control unit.**
- **For data copying procedure, consult your nearest MITSUBISHI FUSO dealer or MITSUBISHI FUSO TRUCK OF AMERICA, Inc.**



(1) Measurement of pressure difference

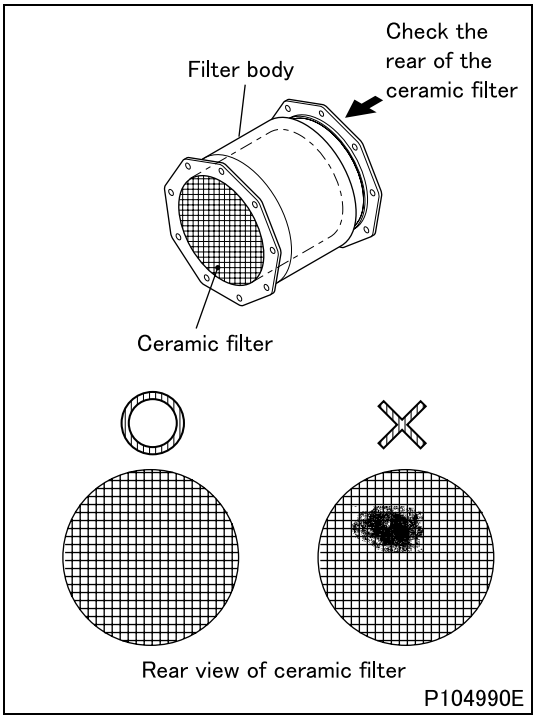
- Measure the pressure difference with the accelerator pedal fully pressed.
- Measurement can be performed using Multi-Use Tester service data “32: DPF pressure difference”.

(2) Regeneration

- Perform Multi-Use Tester actuator test “A5: DPF regeneration (parked)”.

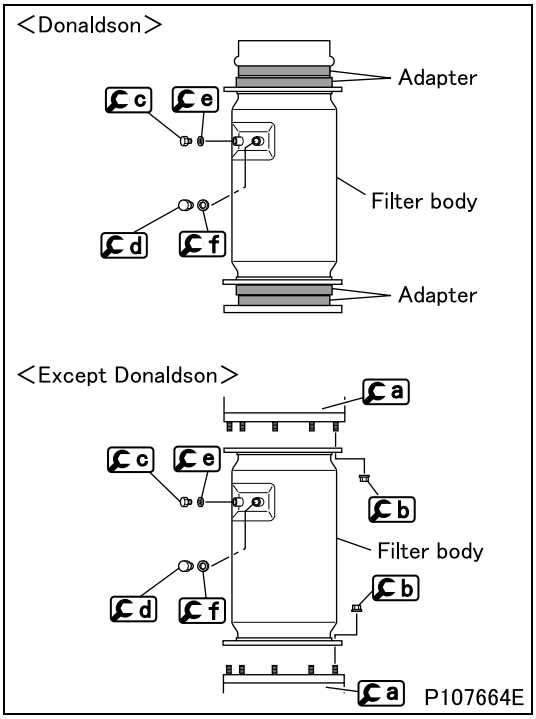
CAUTION ⚠

- **The exhaust gas during regeneration is extremely hot. Be sure to confirm that there is no flammables around the rear of the vehicle.**



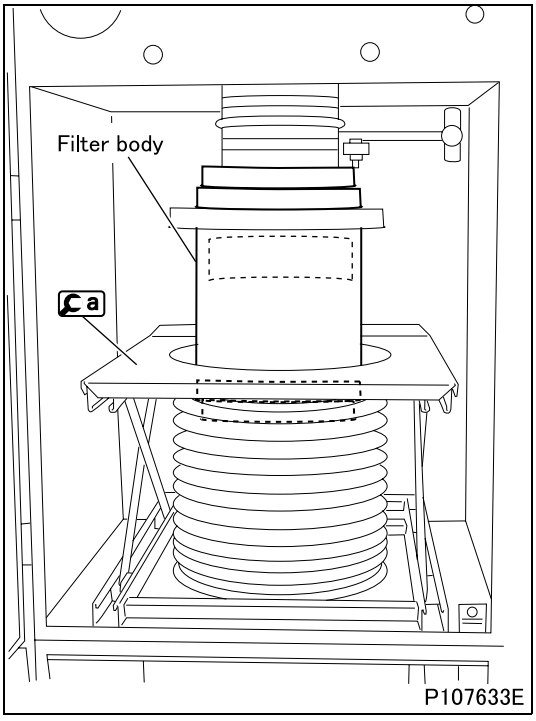
(3) Visual inspection

- Disassemble the diesel particulate filter and check the following.
  - Check if a large amount of soot adheres inside the ceramic filter.
  - Damage in the rear of the ceramic filter.
- If a large amount of soot adheres inside the ceramic filter or if a damage is found on the ceramic filter, engine-related fault may be suspected. Replace the diesel particulate filter.



(4) Cleaning

- Fit the adapter to the filter body. <Donaldson>
- Fit [a] to the filter body with [b] and tighten [b] to the specified torque (43 N·m {32 ft.lbs, 4.4 kgf·m}). <Except Donaldson>
- Fit [c] and [e] to the sensor mounting hole on the filter body and tighten them to the specified torque (30 N·m {22 ft.lbs, 3.1 kgf·m}).
- Fit [d] and [f] to the sensor mounting hole on the filter body and tighten them to the specified torque (40 N·m {30 ft.lbs, 4.1 kgf·m}).



- Set the filter body in [a] with its rear of the filter body side (outlet body installation side) upward.
- Be sure to fit [a] and the filter body with no air leaks between them.
- Set the air pressure. (refer to its instruction manual)
- Set the timer to about 15 minutes (refer to its instruction manual) and perform cleaning.
- For the handling procedure of [a], refer to its instruction manual.

4. Resetting the DPF-related Information (Resetting Electronic Control Unit)

- On the regeneration control type as diesel particulate filter system, the engine electronic control unit stores many DPF-related information to control the diesel particulate filter regeneration as diesel particulate filter history.
- This history is automatically reset by the engine electronic control unit when the diesel particulate filter regeneration is performed.
- If the ceramic filter is replaced or cleaned without regeneration, reset the DPF history using Multi-Use Tester as follows.

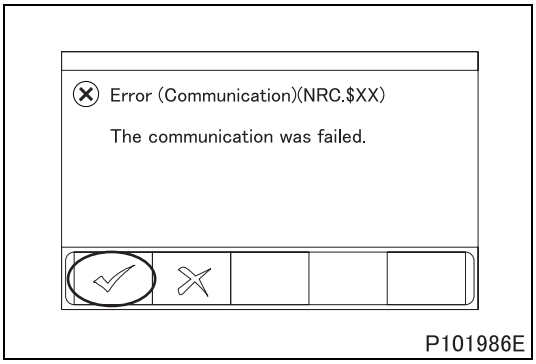
4.1 Preparation

- This operation should be performed under the following conditions.
  - Starter switch: ON (but do not start the engine)
  - Vehicle parked
  - Diagnosis switch: ON (fuse installed)
  - Transmission: Neutral (or P position for automatic transmission)

4.2 Resetting procedure

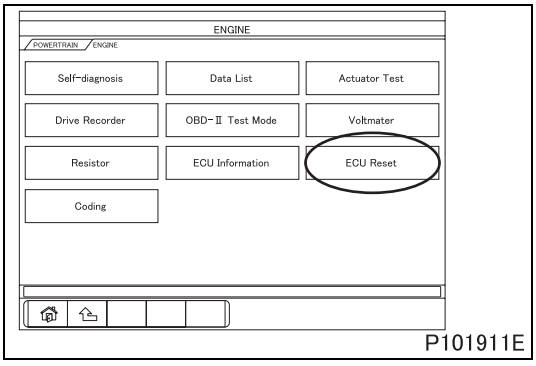
(1) Error while operating the Multi-Use Tester

[Communication error] screen



- This screen will appear when a reject response signal is sent from the engine electronic control unit to the Multi-Use Tester while performing any operation.
- In this case, check if the conditions for the execution of the procedure are satisfied and retry from the beginning.
- Click “OK”.

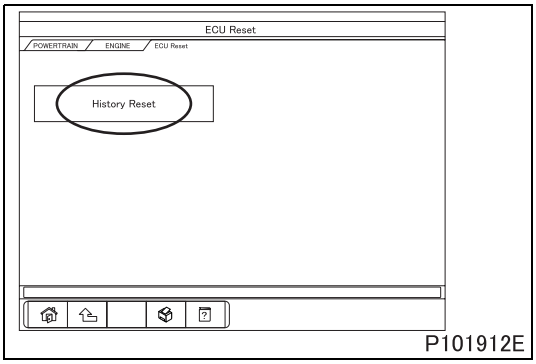
(2) System selection



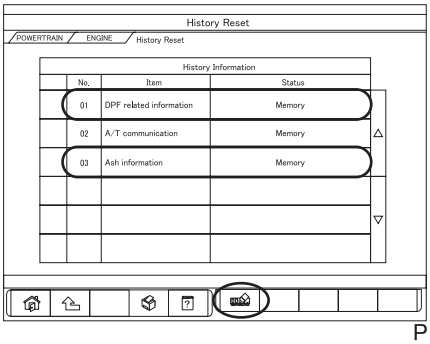
- From the System selection menu, select “Engine/Transmission”. The engine control-related menu will appear.
- Select “ECU Reset”.

(3) ECU reset function selection

[ECU reset] screen



- Select “History Reset”.

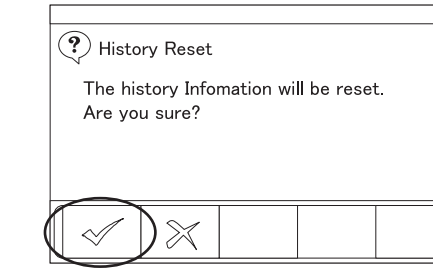


P101913E

(4) History reset

[History reset] screen

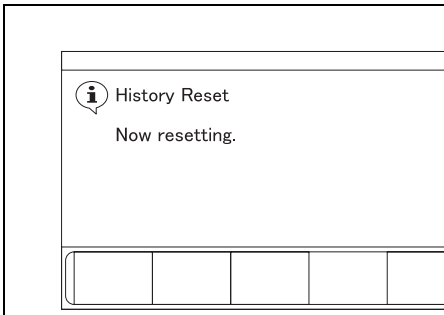
- Depending on the action performed on the ceramic filter, the contents of resetting differ.
  Filter replacement: 01 “DPF-related information”
  Filter cleaning: 03 “Ash information”
- Click “Reset” button.
  If the status column shows “No memory stored”, no resetting action required. Finish this procedure.



P102065E

[History reset confirmation] screen

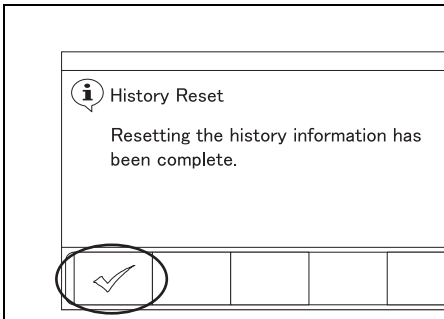
- Click “OK” button.



P102066E

[History resetting] screen

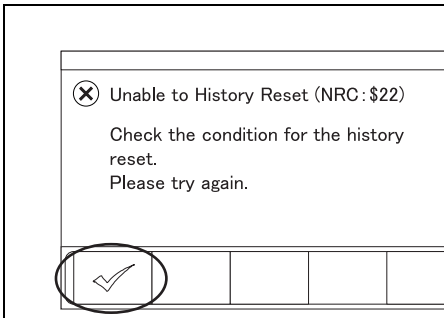
- During resetting, do nothing and wait for a while.



P102067E

[History reset completed] screen

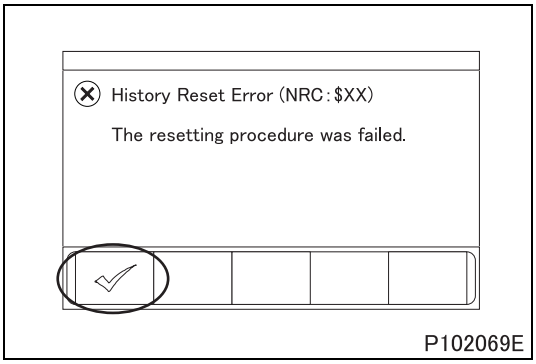
- This screen will appear when resetting of the history has finished. Click “OK” button and return to [History reset] screen.



P102068E

[History reset condition error] screen

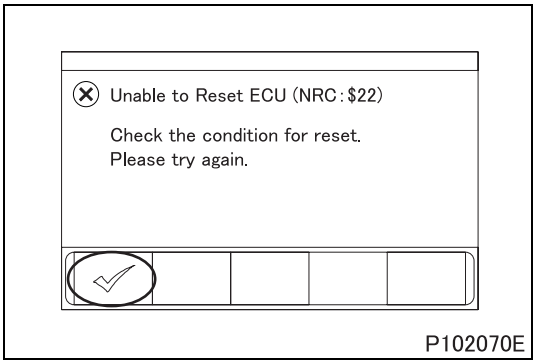
- This screen will appear when a failure signal is sent from the engine electronic control unit to the Multi-Use Tester during resetting.
- In this case, check if the Multi-Use Tester and the vehicle (engine electronic control unit) is connected correctly and if the conditions for the execution of this procedure are satisfied. Then click “OK” to return to the [History reset] screen.



P102069E

[History reset failed] screen

- This screen will appear when the communication error between Multi-Use Tester and the engine electronic control unit or the resetting error occurs.
- In this case, check if the Multi-Use Tester and the vehicle (engine electronic control unit) is connected correctly and if the conditions for the execution of this procedure are satisfied. Then click “OK” to return to the [History reset] screen.



P102070E

[ECU reset condition error] screen

- This screen will appear when an execution failure signal is sent from the engine electronic control unit to the Multi-Use Tester during resetting.
- In this case, recheck the conditions of the vehicle and retry from the beginning.
- Click “OK” to return to the [History reset] screen.

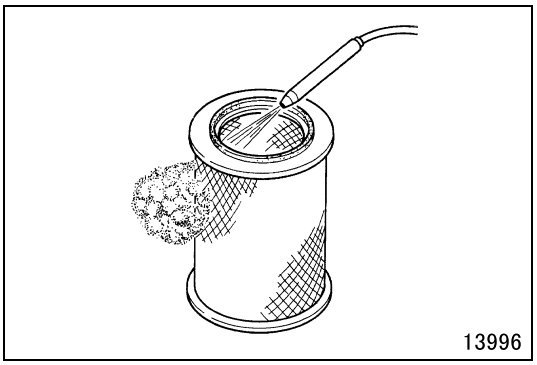
Service standards

Location	Maintenance item	Standard value	Limit	Remedy
16	Operation of dust indicator under specified negative pressure	7.47 ± 0.57 kPa {2.21 ± 0.17 in.Hg, 762 ± 58 mmH_2O}	–	Replace

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Clamp	4.0 to 5.0 {3.0 to 3.7, 0.4 to 0.5}	–
Tb	Clamp	3.0 to 3.5 {2.2 to 2.6, 0.3 to 0.35}	–
Tc	Bolt (air flow sensor mounting)	1.2 to 1.8 {0.9 to 1.3, 0.12, 0.18}	–

◆Cleaning procedure◆



13996

■ Cleaning: Element

- Blow a jet of compressed air at a pressure not higher than 685 kPa {100 psi, 7 kgf/cm^2} against the inside surfaces of the element.
- Move the compressed air jet up and down along all pleats of the filter paper element.

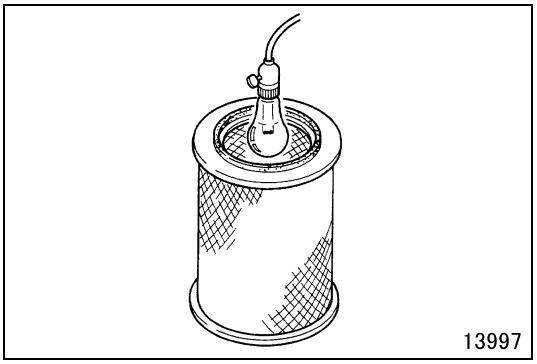
CAUTION ⚠

- **For element cleaning intervals, see the Maintenance Manual. More frequent cleaning than necessary could damage the element or contaminate the engine inside with dust and foreign matter.**
- **Do not strike the element or hit it against another object to remove dust.**
- **Do not blow compressed air against outside surfaces of the element.**

■ Cleaning: Air flow sensor mesh

- If the mesh of the air flow sensor is contaminated or clogged, clean it by using compressed air or a cleaning agent.
- After cleaning, fully dry the air flower sensor mesh.

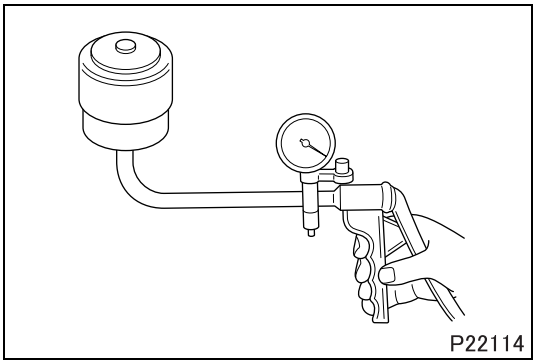
◆Inspection procedure◆



13997

■ Inspection: Element

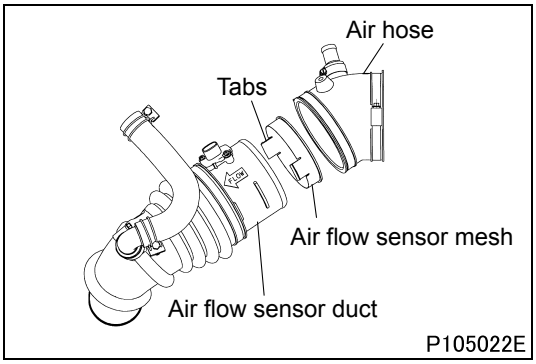
- Shine some electric light inside the element.
- Replace the element if there are broken or thinned out spots in the filter paper, or if seal is damaged between the element and case contact surface.
  Also, replace the element whenever dust on the element is found damp with lampblack or soot, irrespective of replacement interval.



■ **Inspection: Operation of dust indicator under specified negative pressure**

- Apply negative pressure to the dust indicator, and take the reading when the red signal appears in the dust indicator window.
- If the measurement deviates from the standard value, replace the dust indicator.

◆Installation procedure◆



■ **Installation: Air flow sensor mesh**

- Insert tabs of the air flow sensor mesh into the inside slots of the air flow sensor duct.

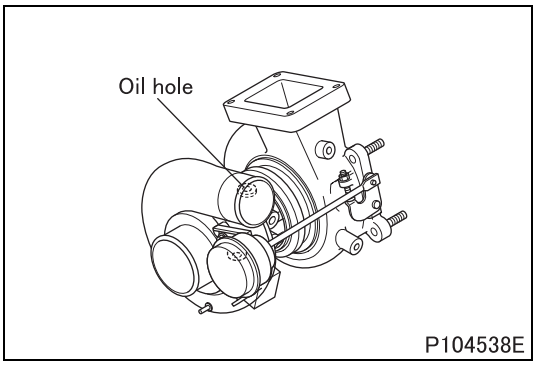
Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Turbocharger (to be filled with engine oil)	Engine oil	As required

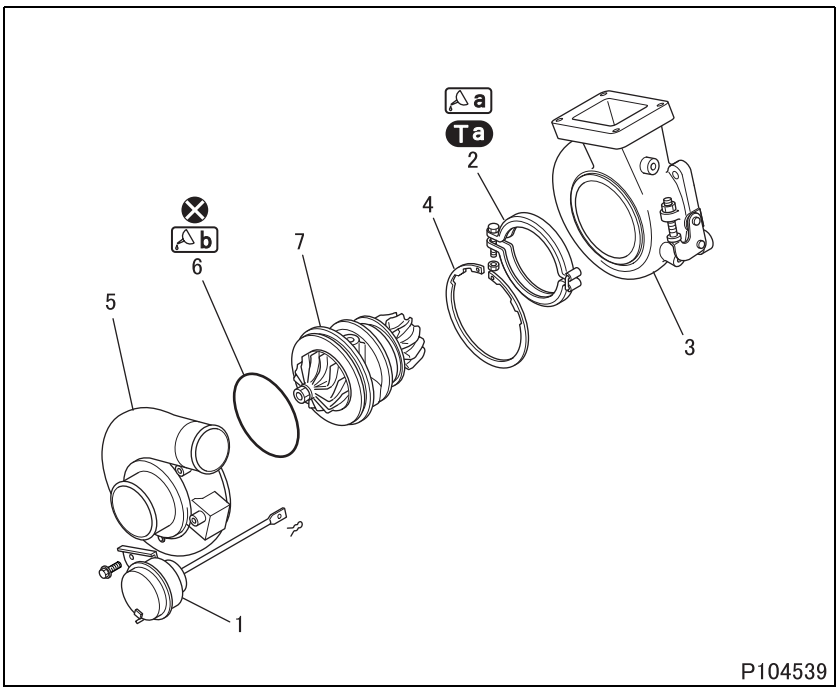
◆Installation procedure◆



■ Installation: Turbocharger

- Before installing the turbocharger assembly, pour engine oil into the oil hole to ensure smooth operation of the internal parts.

Turbocharger



● Disassembly sequence

1 Actuator
2 Coupling
3 Turbine housing
4 Snap ring
5 Compressor cover
6 O-ring
7 Cartridge assembly

⊗: Non-reusable parts

● Assembly sequence

Follow the disassembly sequence in reverse.

CAUTION ⚠

- **The cartridge assembly cannot be taken to pieces. Replace the whole assembly if the turbine wheel or compressor wheel is damaged and when the cartridge does not rotate smoothly.**

Service standards (Unit: mm {in.})

Location	Maintenance item			Standard value	Limit	Remedy
7	Cartridge assembly	Play in axial direction of shaft		0.05 to 0.09 {0.0020 to 0.0035}	0.1 {0.0039}	Replace
		Play perpendicular to axis of shaft	Turbine wheel end	0.40 to 0.53 {0.016 to 0.021}	0.58 {0.023}	Replace
			Compressor wheel end	0.55 to 0.66 {0.022 to 0.026}	0.72 {0.028}	Replace

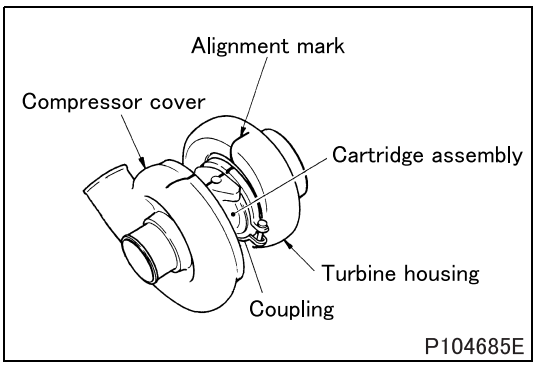
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Bolt (coupling tightening)	3.9 to 4.9 {2.9 to 3.6, 0.4 to 0.5}	Wet

Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Thread of bolts	Molybdenum disulfide grease [NLGI No.2 (Li soap)]	As required
b	O-ring	Engine oil	As required

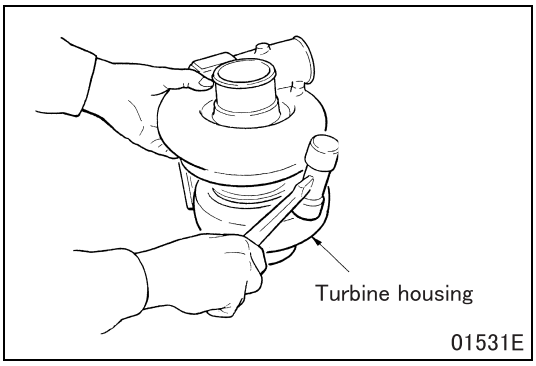
◆Work before removal◆



■ **Alignment mark**

- Put alignment marks on the coupling, turbine housing, compressor cover and cartridge assembly.

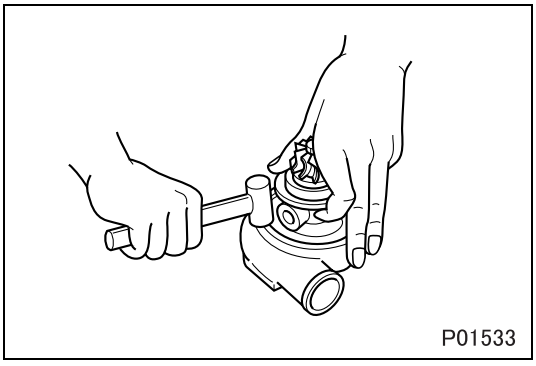
◆Removal procedure◆



■ **Removal: Turbine housing**

CAUTION ⚠

- **Lightly tap around the entire periphery of the turbine housing with a rubber-faced hammer, taking care not to cause damage.**
- **The blades on the cartridge assembly are easily bent. Make sure that they do not strike the turbine housing.**

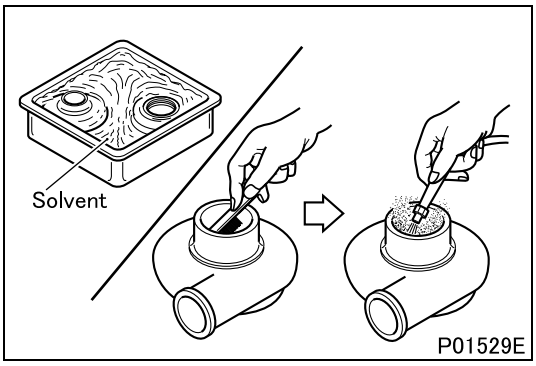


■ **Removal: Compressor cover**

CAUTION ⚠

- **Lightly tap around the entire periphery of the compressor cover with a rubber-faced hammer, taking care not to cause damage.**
- **The blades on the cartridge assembly are easily bent. Make sure that they do not strike the compressor cover.**

◆Work after disassembly◆



■ **Cleaning**

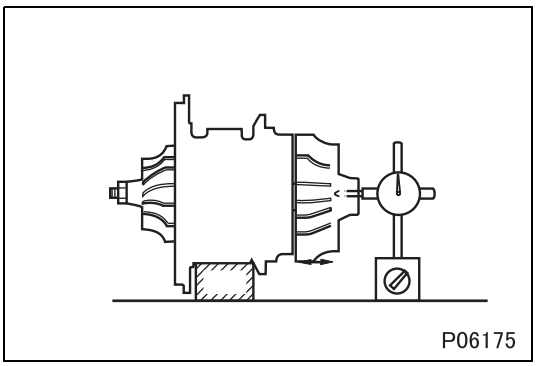
- Before cleaning the parts, carry out a visual inspection for any marks of burns or wear that may become difficult to find after the cleaning. If any defects are evident, replace the part(s).
- Immerse the disassembled parts in an inflammable solvent (add four to nine parts of water to New Hope's Oil Clean). Take out the parts from the solvent and dry them with compressed air.
  If there is any solid matter remaining on the parts, remove them with a plastic scraper or a bristle brush.

CAUTION ⚠

- **Do not immerse the cartridge assembly in the solvent. If doing so, O-rings in the cartridge assembly will swell and may adversely affect to the function of the turbocharger.**

- Reimmerse the parts in the solvent.
- Dry each part with compressed air.

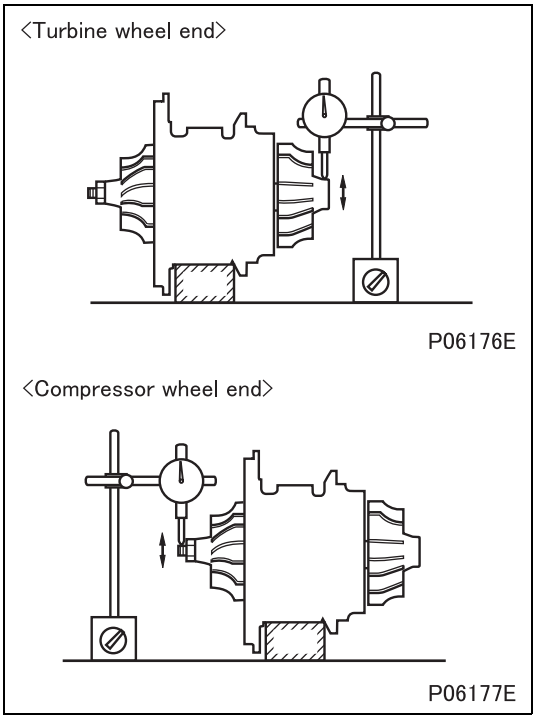
◆Inspection procedure◆



■Inspection: Cartridge assembly

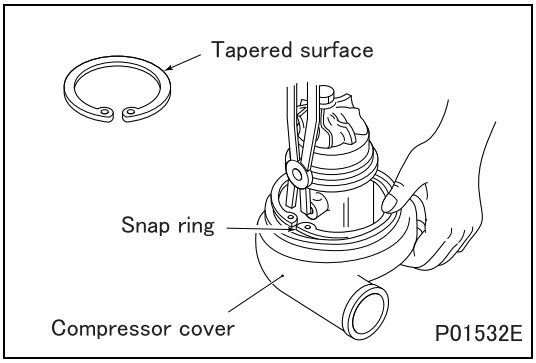
- If the measurement exceeds the specified limit, replace the cartridge assembly.

(1) Play in axial direction of shaft



(2) Play perpendicular to axis of shaft

◆Installation procedure◆



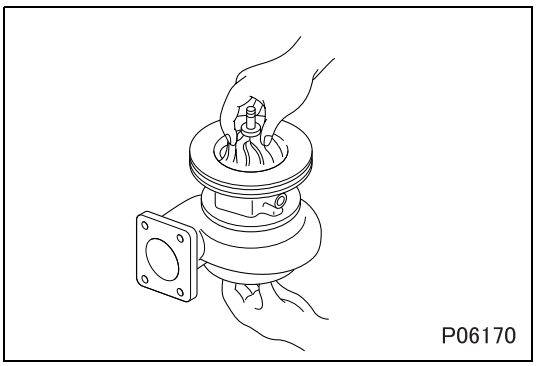
■ Installation: Snap ring

- With the tapered surface facing up, install the snap ring into the compressor cover.

CAUTION ⚠

- **Fit the snap ring into place using hands not to let it spring away.**

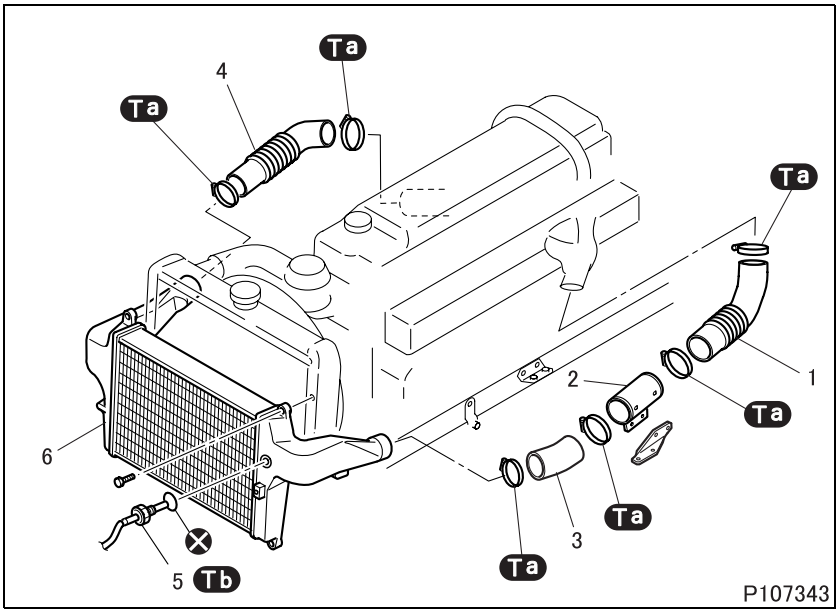
◆Work after installation◆



■ **Inspection: Free rotation of cartridge assembly**

- Turn the wheels of the cartridge assembly. They should turn freely without binding.
- If not, disassemble again and correct.

INTERCOOLER



●Removal sequence

1 Air outlet hose
2 Air outlet pipe
3 Air outlet duct
4 Air inlet hose
5 Intake air temperature sensor 1
6 Intercooler

⊗: Non-reusable parts

●Installation sequence

Follow the removal sequence in reverse.

CAUTION ⚠

- **When removing the air inlet hose, do not try to pry it off with strong force using a screwdriver or other similar tools. Doing that can damage the fluorolayer on the inner surface of the hose, possibly compromising the oil resistance of the hose.**

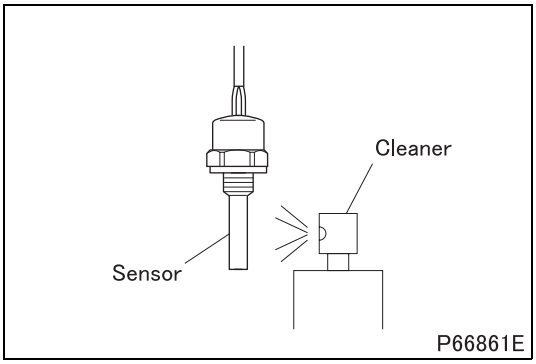
Service standards

Location	Maintenance item	Standard value	Limit	Remedy
6	Intercooler air leakage (at air pressure of 150 kPa {22 psi, 1.5 kgf/cm^2}	0 cm^3 {0 cu.in.}	–	Replace

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Clamp	8 to 9 {5.9 to 6.6, 0.8 to 0.9}	–
Tb	Intake air temperature sensor	19.6 ± 4.9 {14 ± 3.6, 2.0 ± 0.5}	–

◆Inspection procedure◆



■ Inspection: Intake air temperature sensor 1

- Check that the sensor portion is free of soot, oily substance, etc.
- If not, clean the sensor portion as follows.
- Spray a cleaner on the sensor portion from 2 or 3 cm {0.79 to 1.18 in.} away.

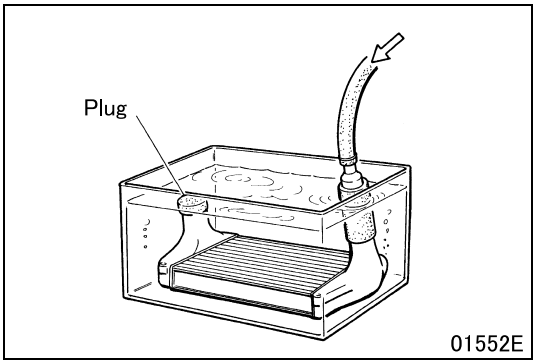
Recommended cleaners:
Nonchlorinated solvent

- In 20 to 30 seconds after spraying, wipe the sensor portion clear of the sprayed cleaner using a soft waste cloth or the like.

CAUTION ⚠

- **Be sure to wait for 20 or 30 seconds before wiping. It takes the cleaner that long to dissolve foreign matter.**

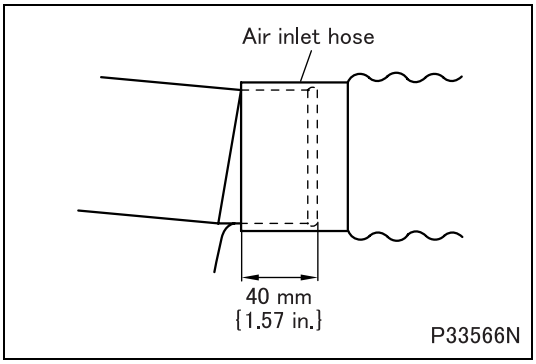
- If the sensor portion is fouled excessively, the positive crankcase ventilation (PCV) may be faulty. Inspect the PCV valve and filter to locate the cause and remove it.



■ **Inspection: Intercooler**

- Plug one of the air ports of the intercooler and immerse it in a tank of water. Apply the specified air pressure to the intercooler through the other air port.
- If leakage is apparent, replace the intercooler.

◆Installation procedure◆



■ **Installation: Air inlet hose**

- Fit each air inlet hose in the direction shown in the illustration.

INTAKE MANIFOLD

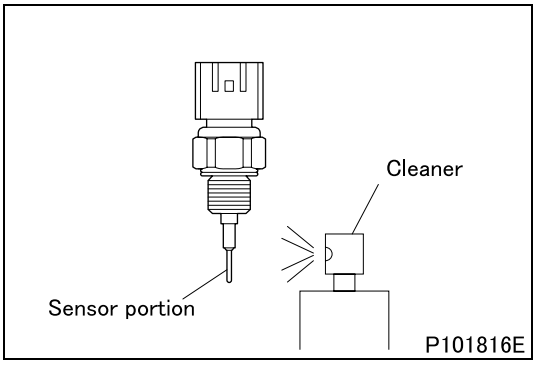
◆Inspection procedure◆



■ **Inspection: Intake air temperature sensor 2**

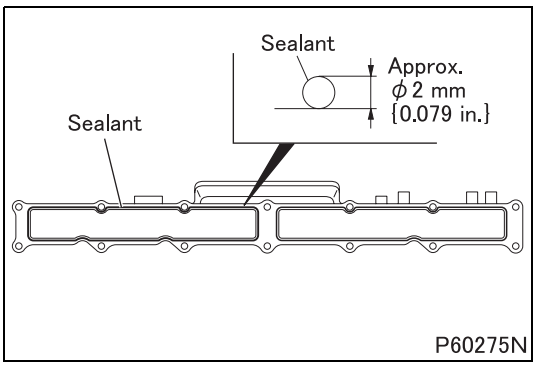
- Check that the sensor portion is free of soot, oily substance, etc.
- If not, clean the sensor portion as follows.
- Spray a cleaner on the sensor portion from 2 or 3 cm {0.79 to 1.18 in.} away.
  Recommended cleaners:
  Nonchlorinated solvent
- In 20 to 30 seconds after spraying, wipe the sensor portion clear of the sprayed cleaner using a soft waste cloth the like.

CAUTION ⚠

- **Be sure to wait for 20 to 30 seconds before wiping. It takes the cleaner that long to dissolve foreign matter.**

- If the sensor portion is fouled excessively, the positive crankcase ventilation (PCV) may be faulty. Inspect the PCV valve and filter to locate the cause and remove it.

◆Installation procedure◆



■ **Installation: Intake manifold**

- Clean the sealing surfaces of the intake manifold and cylinder head where they are to be mated with each other.
- Apply an even and continuous bead of sealant onto the intake manifold surface where the cylinder head is to be mounted.
- Install the intake manifold onto the cylinder head within 3 minutes following the application while taking care not to spread the sealant beyond the application area.

CAUTION ⚠

- **Do not start the engine at least for an hour after the intake manifold has been installed.**
- **If the intake manifold mounting bolts are subsequently loosened or removed, be sure to apply sealant again upon reassembly.**

Follow the disassembly sequence in reverse.

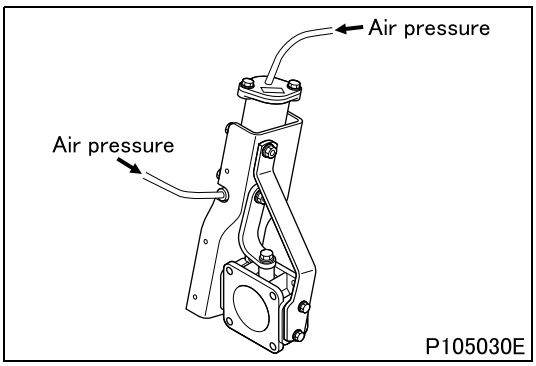
Service standards (Unit: mm {in.})

Location	Maintenance item		Standard value	Limit	Remedy
2	Air leakage from control cylinder (air pressure: 0.64 ± 0.05 MPa {93 ± 7.3 psi, 6.5 ± 0.5 kgf/cm^2})		0 cm^3 {0 cu.in., 0 ml}	–	Replace
	Butterfly valve-to-body minimum clearance (air pressure: 0.64 ± 0.05 MPa {93 ± 7.3 psi, 6.5 ± 0.5 kgf/cm^2})		0.1 or more {0.0039 or more}	–	Replace
	Clearance between butterfly valve and body (average of upper and lower clearances)	When butterfly valve fully closed (air pressure: 0.64 ± 0.05 MPa {93 ± 7.3 psi, 6.5 ± 0.5 kgf/cm^2}	0.2 to 0.4 {0.0079 to 0.016}	–	
		When butterfly valve half closed (air pressure: 0.64 ± 0.05 MPa {93 ± 7.3 psi, 6.5 ± 0.5 kgf/cm^2)	1.5 ± 0.15 {0.059 to 0.0059}	–	

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

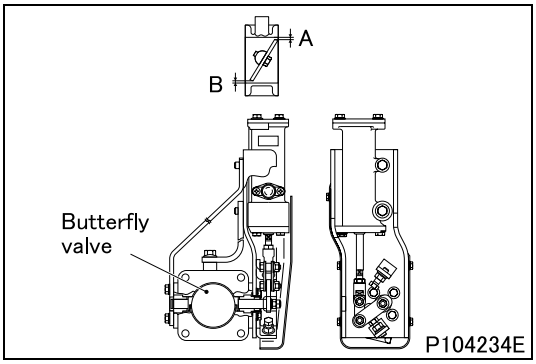
Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Bolt (cover mounting)	8.8 to 11.9 {6.5 to 8.8, 0.9 to 1.2}	–

◆Inspection procedure◆



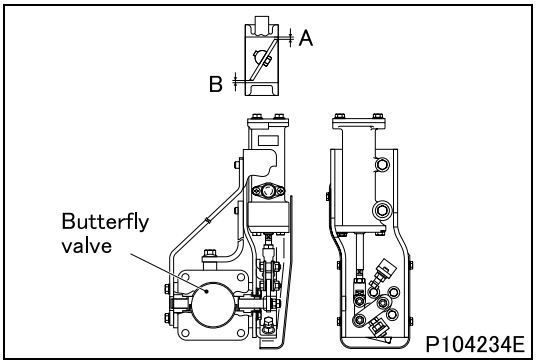
■ Inspection: Air leakage from control cylinder

- Introduce the specified air pressure into the control cylinder and check it for air leaks.
- If there is an air leakage, replace the exhaust shutter valve.



■ Inspection: Butterfly valve-to-body minimum clearance

- Apply a specified level of air pressure to the port 1 of the control cylinder. With the butterfly valve fully closed, measure upper clearance A and lower clearance B between the butterfly valve and body.
- If the measurement deviates from the standard value, replace the exhaust shutter valve.



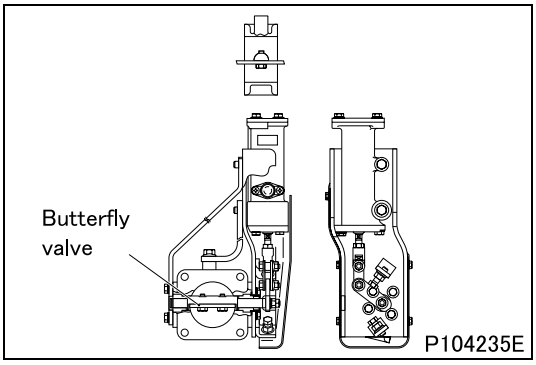
■Inspection: Butterfly valve-to-body clearance (average of upper and lower clearances)

- Perform clearance checks as described below. Replace the exhaust shutter if found defective.

(1) When butterfly valve is fully closed

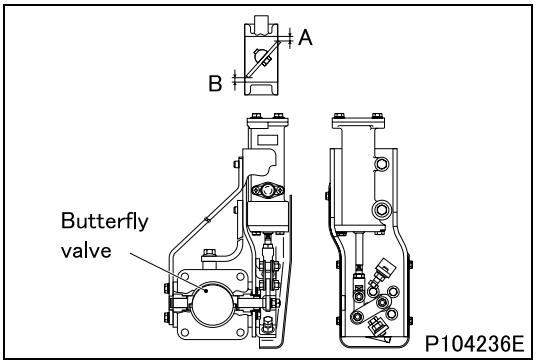
- Apply a specified level of air pressure to the port 1 of the control cylinder. With the butterfly valve fully closed, measure upper clearance A and lower clearance B between the butterfly valve and body. Average the measured values to obtain the butterfly valve-to-body clearance for service.

$$\text{Average clearance} = \frac{(A + B)}{2}$$



(2) When butterfly valve is fully opened

- Check that the butterfly valve is in its fully open state with no clearance between the lever and adjusting bolt.



(3) When butterfly valve is half closed

- Apply a specified level of air pressure to the ports 1 and 2 of the control cylinder. With the butterfly valve half closed, measure upper clearance A and lower clearance B between the butterfly valve and body. Average the measured vales to obtain the butterfly valve-to-body clearance for service.

  Average clearance = $\frac{(A + B)}{2}$

CAUTION ⚠

- **When inspecting the butterfly valve, be sure to operate the butterfly valve not from its fully closed state but from its fully open state to half closed state.**

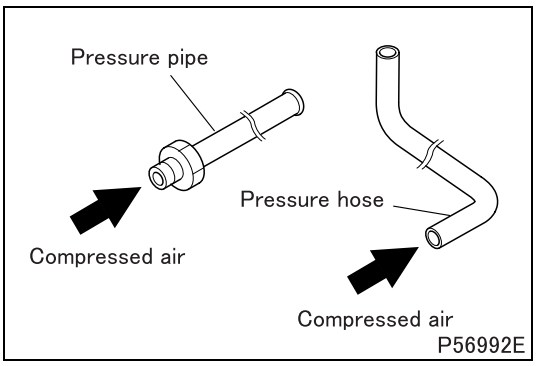
	Exhaust gas temperature sensor 1		
	Exhaust gas temperature sensor 2		

◆Inspection procedure◆

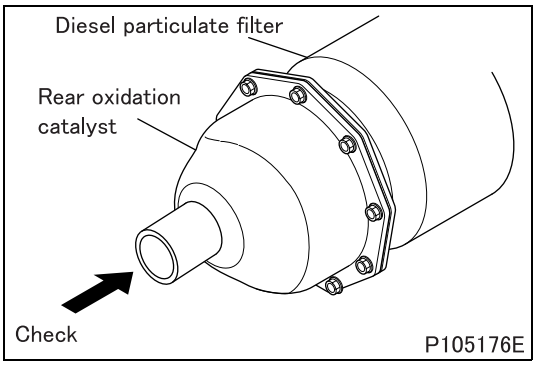


■ Inspection: Pressure pipe and hose

- Check the pressure pipe and hose for clogging by blowing compressed air into the pipe and hose.

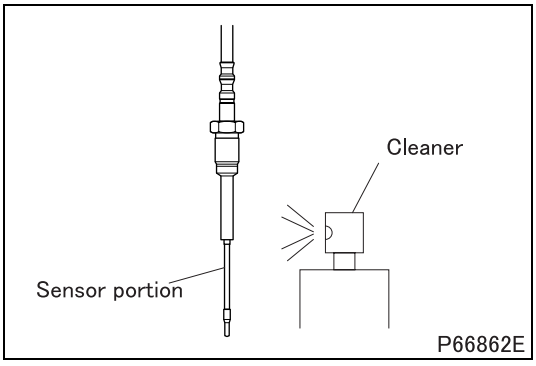
CAUTION ⚠

- **Inspection must be performed on an individual pressure pipe or hose.**
- **If compressed air is blown into the pressure pipe or hose with diesel particulate filter pressure sensor still installed, the sensor may become damaged.**



■ Inspection: Diesel particulate filter

- Check the inside of the rear oxidation catalyst and the diesel particulate filter for adhesion of soot.
- If a large amount of soot is adhered, replace the ceramic filter as it may be damaged.



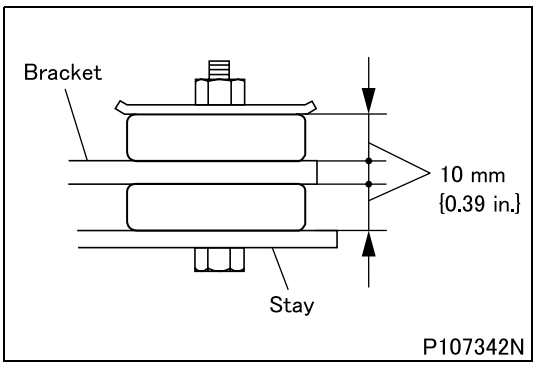
■ Inspection: Temperature sensor

- Check that the sensor portion is free of soot, oily substance, etc.
- If not, clean the sensor portion as follows.
- Spray a cleaner on the sensor portion from 2 or 3 cm {0.79 or 1.18 in.} away.
  Recommended cleaners:
  Nonchlorinated solvent
- In 20 to 30 seconds after spraying, wipe the sensor portion clear of the sprayed cleaner using a soft waste cloth the like.

CAUTION ⚠

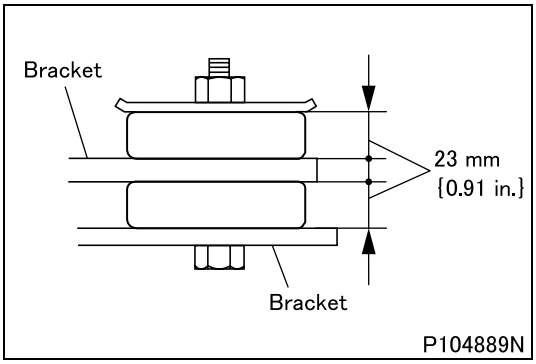
- **Be sure to wait for 20 to 30 seconds before wiping. It takes the cleaner that long to dissolve foreign matter.**

◆Installation procedure◆



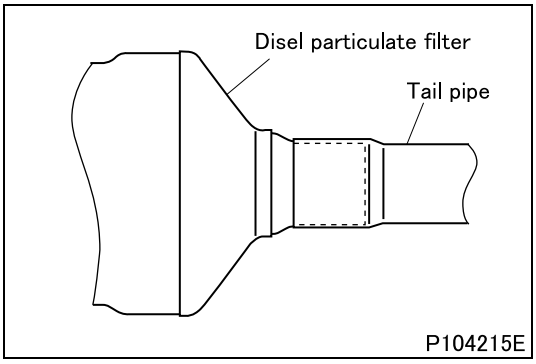
■Installation: Cushion rubber (tail pipe)

- Compress the cushion rubber until the dimensions shown in the illustration are achieved.



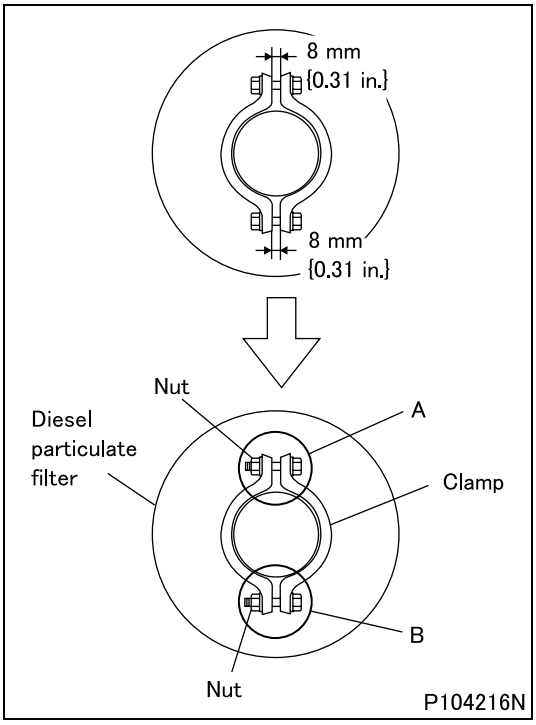
■Installation: Cushion rubber (diesel particulate filter)

- Compress the cushion rubber until the dimensions shown in the illustration are achieved.



■Installation: Tail pipe

- Insert the tail pipe onto the diesel particulate filter until the larger diameter portion of the pipe contacts the pipe at the rear of the filter.



■ **Installation: Clamp**

- Install the clamp and temporarily tighten nuts until the dimensions shown in the illustration are achieved.
- After the tightening, retighten the nut in the section A to the specified torque.
  Then, tighten the nut in the section B to the specified torque.

DIESEL PARTICULATE FILTER

Diesel particulate filter

STRUCTURE AND OPERATION
1. Exhaust Gas Recirculation System 17-2
2. Blowby Gas Return System 17-7

ON-VEHICLE INSPECTION AND ADJUSTMENT
1. Replacement of PCV Valve Element 17-8

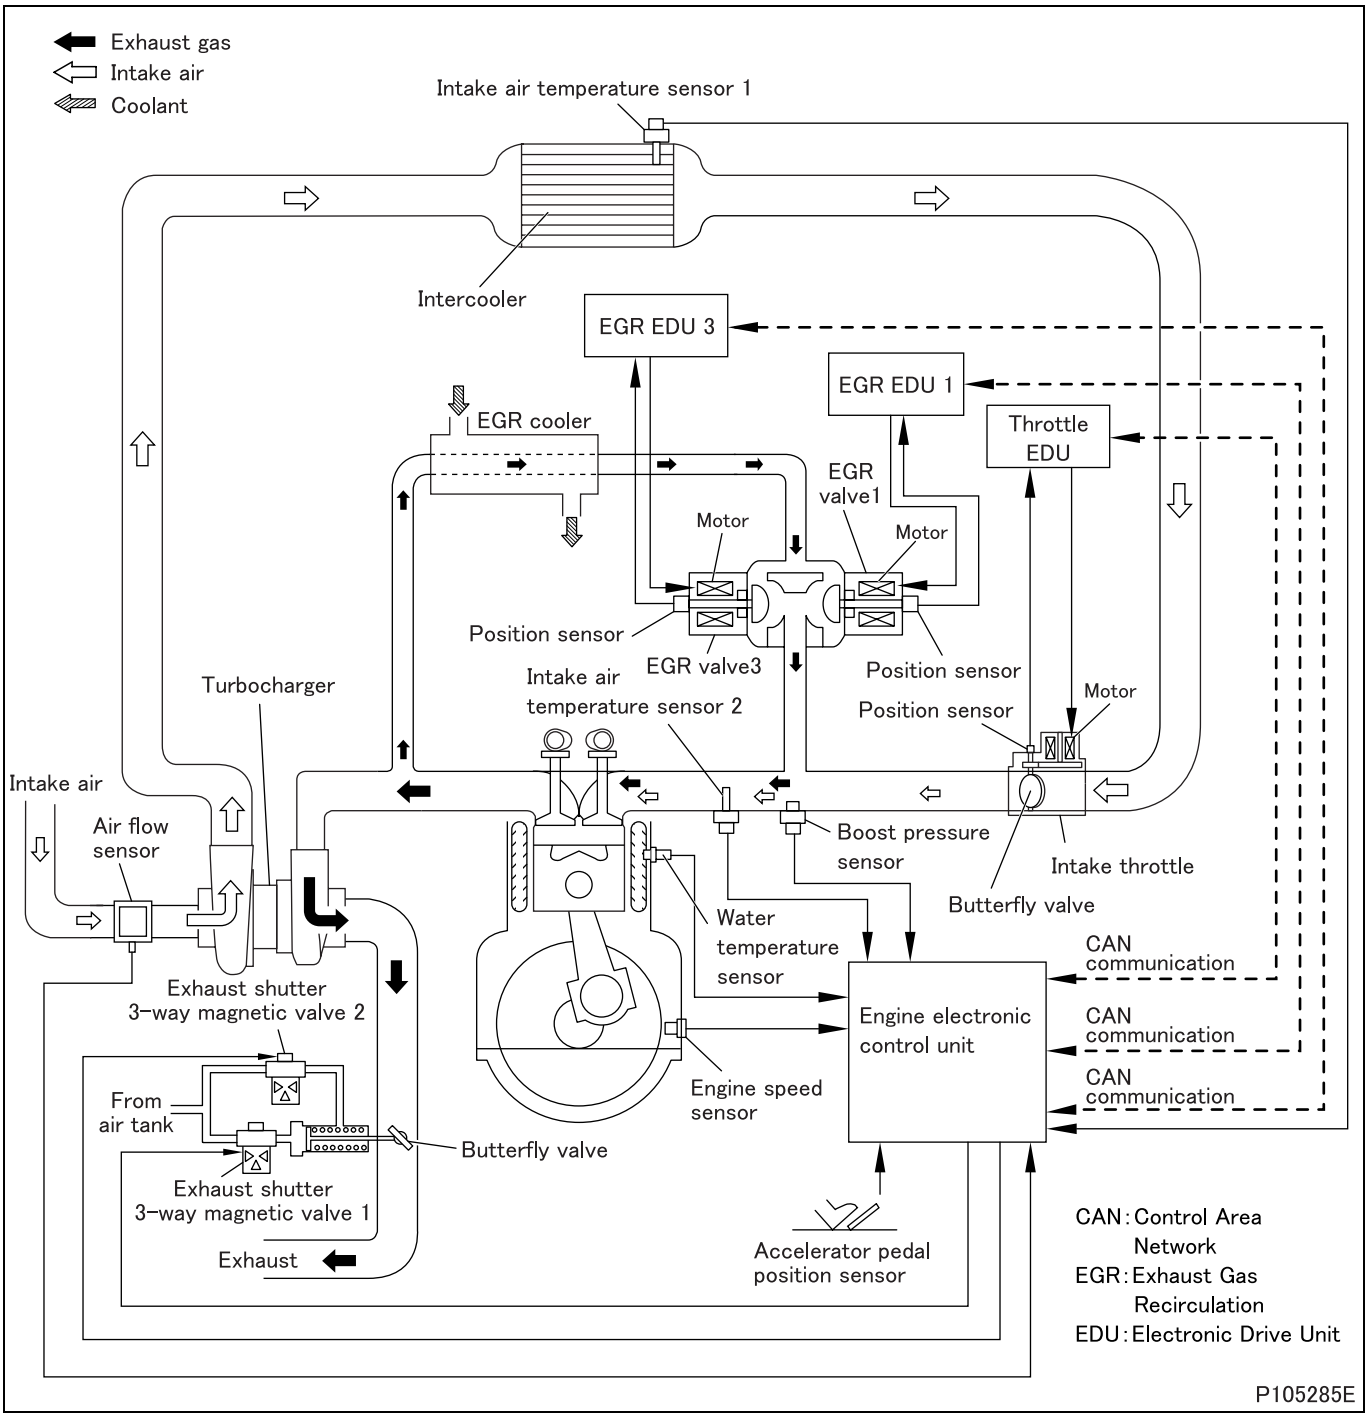
EGR VALVE, EGR PIPE AND EGR COOLER 17-10

BLOWBY GAS RETURN SYSTEM 17-12

1. Exhaust Gas Recirculation System

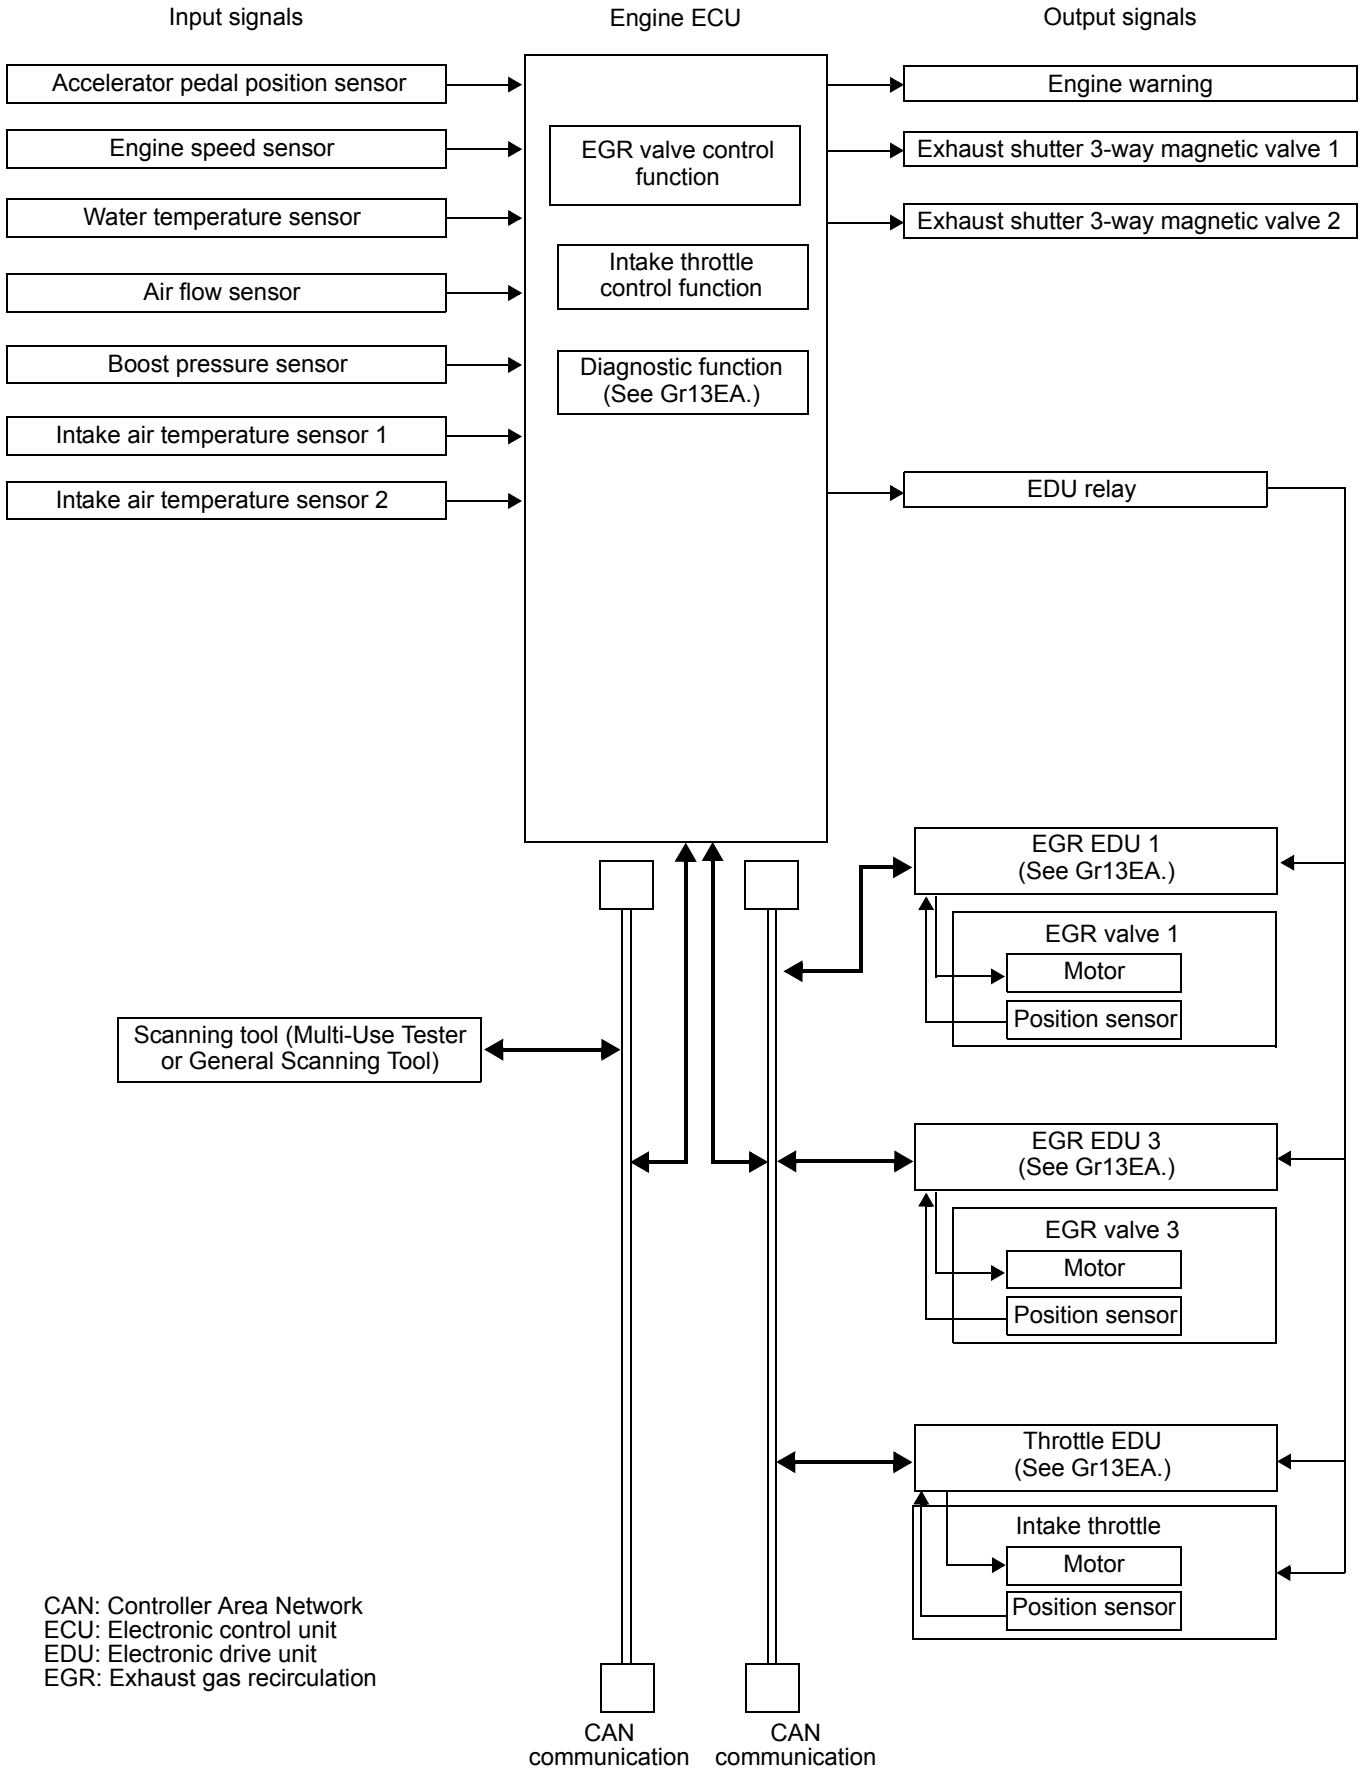
1.1 Overview

- In the exhaust gas recirculation system, the engine electronic control unit controls the exhaust gas recirculation magnetic valve in accordance with information from sensors on various aspects of the engine (engine speed, coolant temperature, throttle opening, etc.).
- Exhaust gas recirculation involves the introduction of inert gases in the post-combustion exhaust emissions into the intake manifold. By reducing the combustion temperature, it reduces the amount of nitrogen oxides (NOx), which are harmful, in the exhaust emissions. Further, an exhaust gas recirculation cooler cools the recirculated exhaust emissions, thereby reducing the peak combustion temperature.



1.2 Electronic control system

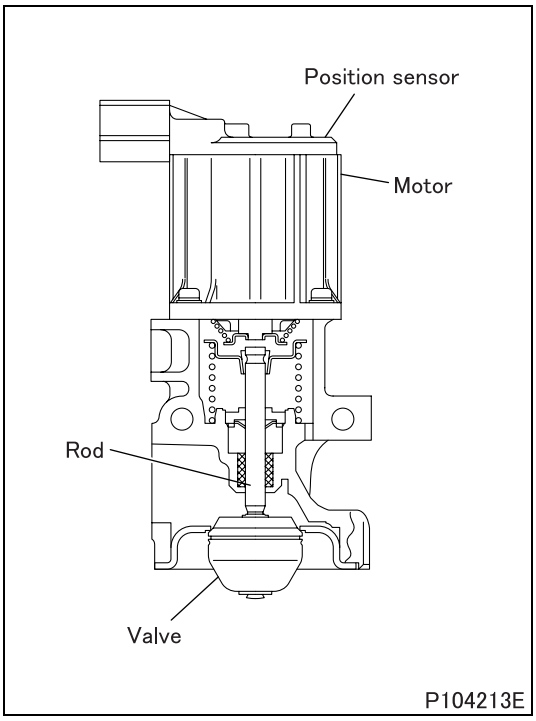
(1) System block diagram



CAN: Controller Area Network
ECU: Electronic control unit
EDU: Electronic drive unit
EGR: Exhaust gas recirculation

(2) Exhaust gas recirculation valve control function

- In accordance with data from sensors, the engine electronic control unit determines the exhaust gas recirculation valve opening that suits the operating condition and sends a control signal (this indicates the target exhaust gas recirculation valve opening) to the exhaust gas recirculation electronic drive unit.
  When necessary to prevent black smoke emissions and engine speed instability (for example, when the engine is heavily loaded, when the engine is lightly loaded, and when the exhaust brake is operating), the engine electronic control unit stops exhaust gas recirculation valve control.
- The exhaust gas recirculation electronic drive unit activates the exhaust gas recirculation valve motor. At the same time, it monitors the extent of valve lift using a position sensor and sends this information (this indicates the actual exhaust gas recirculation valve opening) to the engine electronic control unit.
  This operation makes it possible for the target exhaust gas recirculation valve opening indicated by the engine electronic control unit to be precisely maintained.

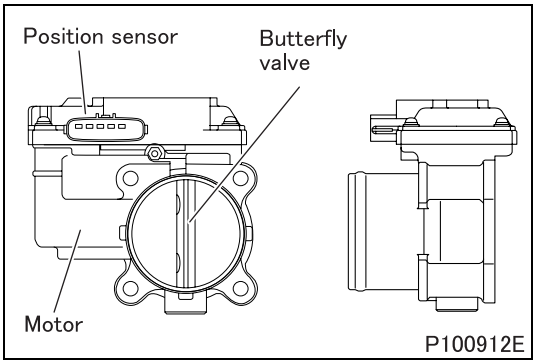


(2.1) Exhaust gas recirculation valve

- A motor in the exhaust gas recirculation valve is driven by control signals from the exhaust gas recirculation electronic drive unit. Via a rod, the motor's operation opens and closes the valve.

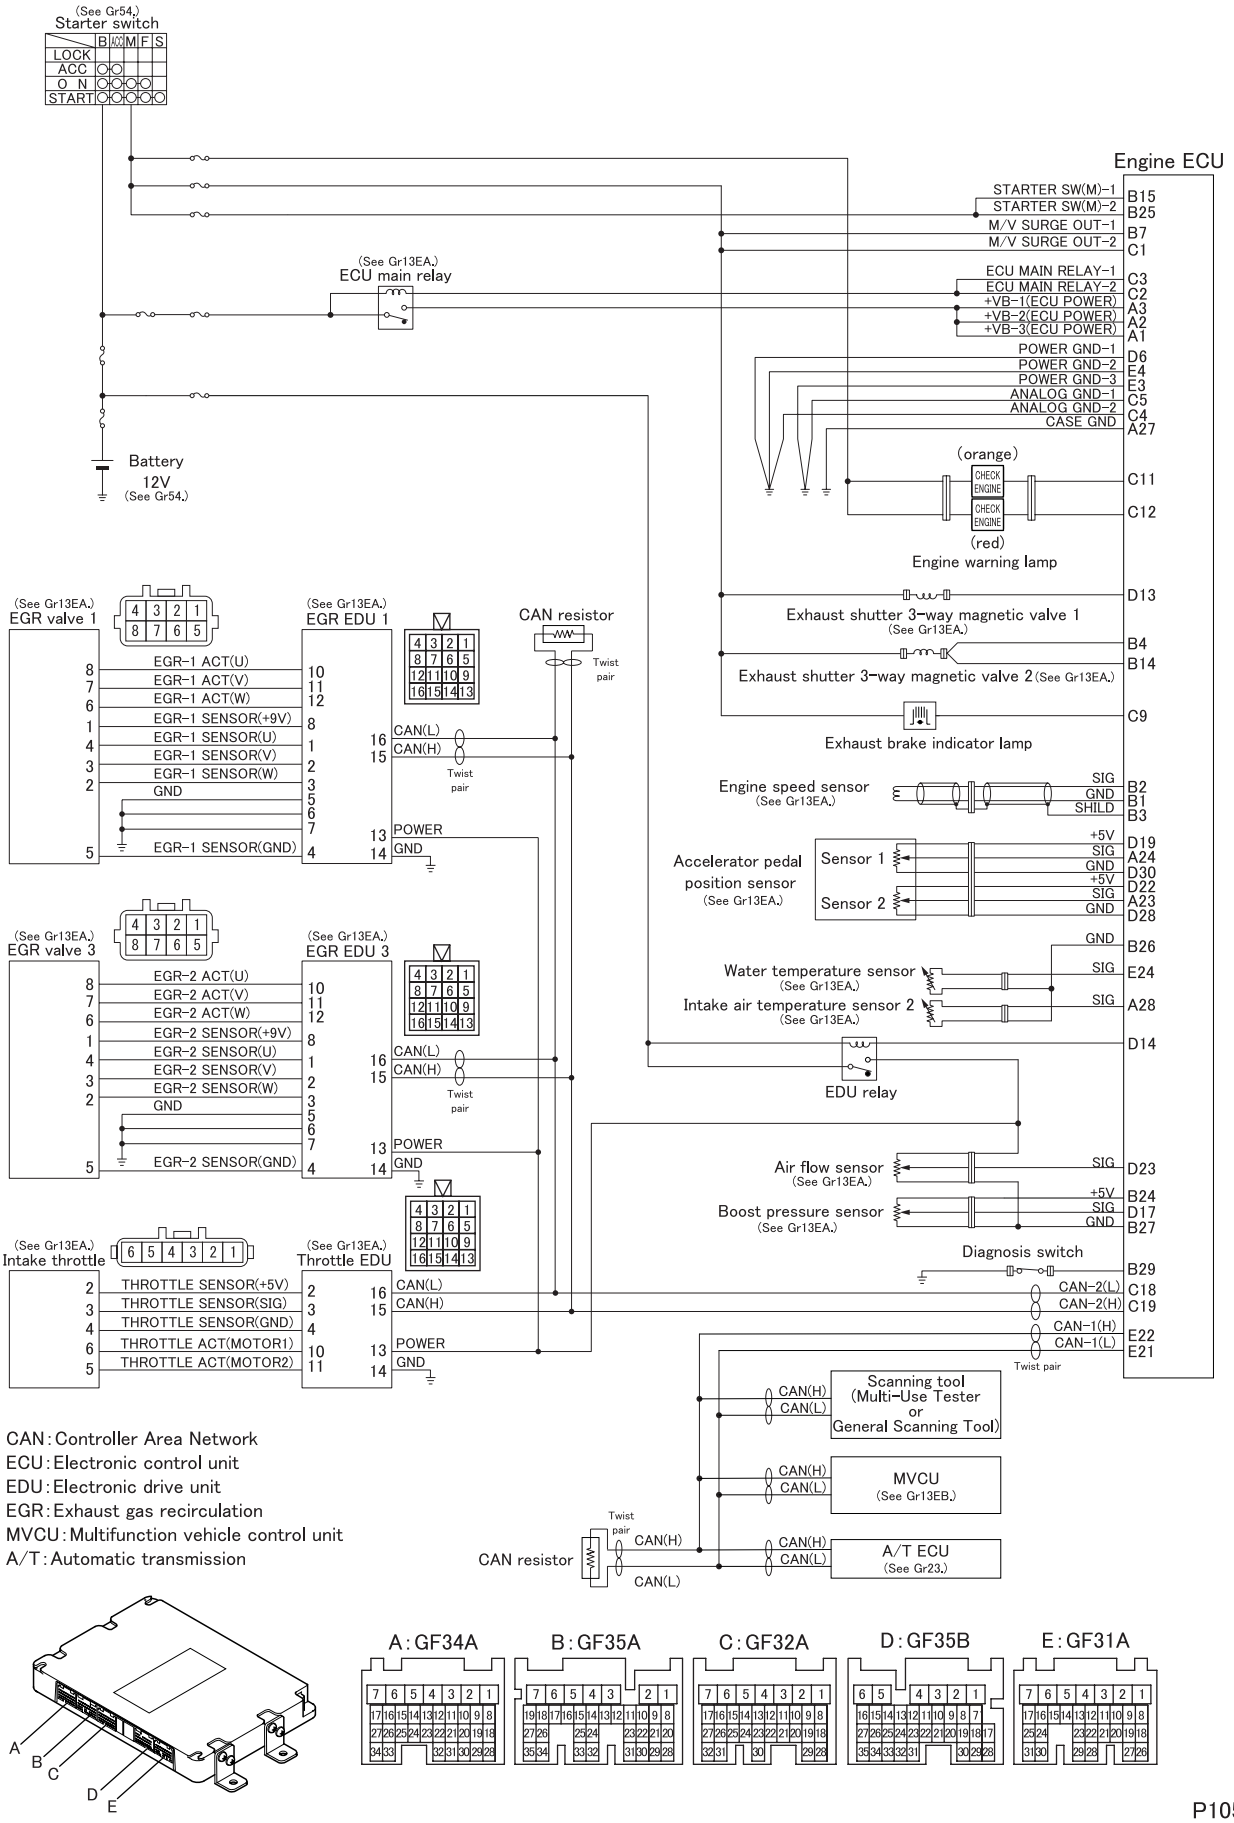
(3) Intake throttle control function

- When the engine electronic control unit determines from sensor data on the engine speed and engine loading that the vacuum pressure in the intake manifold is low, it increases the amount of exhaust emissions introduced into the intake manifold by determining an appropriate butterfly valve opening and by sending corresponding control signals (these indicate the target throttle opening) to the throttle electronic drive unit.
- The throttle electronic drive unit activates the valve motor. At the same time, it monitors the valve opening using a position sensor and sends this information (this indicates the actual throttle opening) to the engine electronic control unit.
  This operation makes it possible for the target throttle opening indicated by the engine electronic control unit to be precisely maintained.



(3.1) Intake throttle

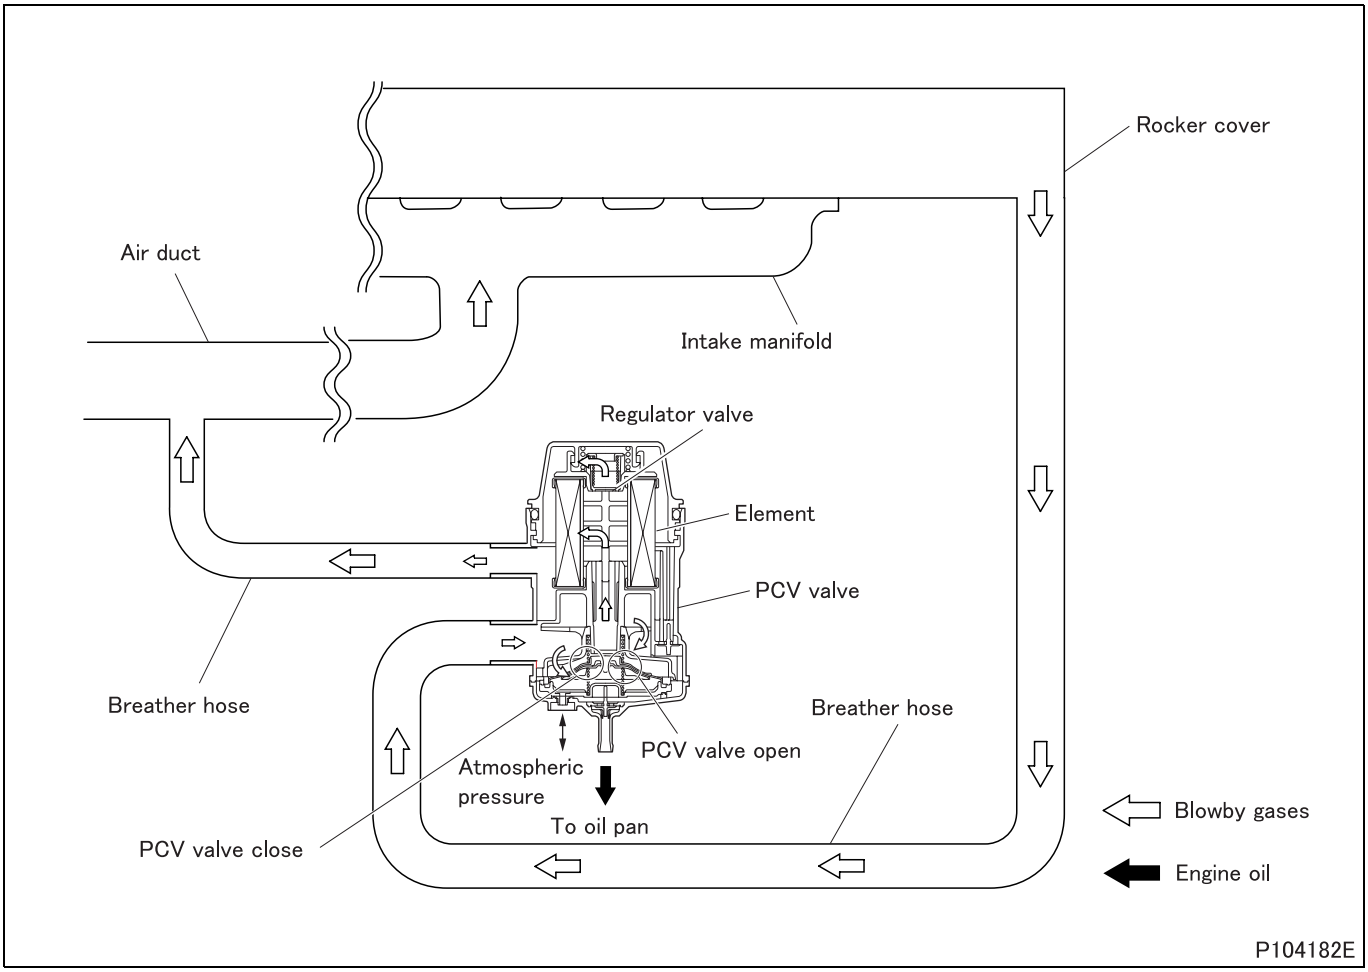
- In accordance with signals from the throttle electronic drive unit, the motor opens and closes the butterfly valve, thereby adjusting the intake air amount such that the effectiveness of exhaust gas recirculation is maximized.



CAN : Controller Area Network
ECU : Electronic control unit
EDU : Electronic drive unit
EGR : Exhaust gas recirculation
MVCU : Multifunction vehicle control unit
A/T : Automatic transmission

P105291E

2. Blowby Gas Return System



PCV: Positive Crankcase Ventilation

- The blowby gas return system returns blowby gases to an air duct to prevent them from being released to the outside air.
- The PCV valve keeps constant the pressure inside the crankcase.
- The oil in the blowby gas is separated by the wire mesh and the element in the PCV valve and is returned to the oil pan.
- When the element is clogged, the regulator valve opens and the blowby gas is returned to the breather hose.

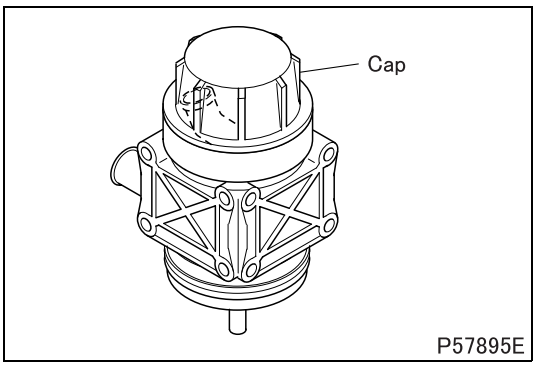
1. Replacement of PCV Valve Element

Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
–	O-ring (entire periphery)	Engine oil	As required

CAUTION ⚠

- **For information on the element replacement interval, refer to the element instruction manual. If the element is used beyond its replacement interval, it may become clogged, causing the pressure inside the engine to increase such that oil leakage occurs.**
- **Be sure to remove and install the cap by hand. Using tools could result in damage.**

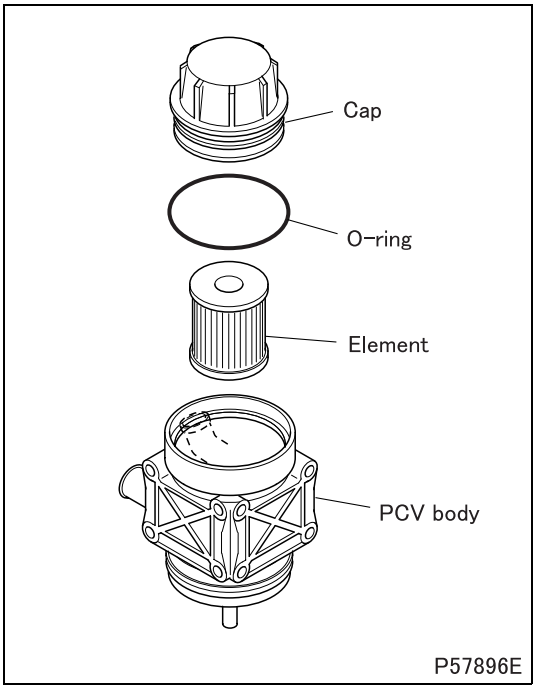


[Removal]

- Loosen the cap by hand.

CAUTION ⚠

- **Do not use any tools to loosen the cap. Otherwise, the cap may become damaged.**



[Installation]

- Clean the thread on the cap.
- Lightly smear the O-ring with engine oil and fit it on the cap.
- Securely tighten the cap until it stops slightly above the PCV body.

CAUTION ⚠

- **Be sure to use a genuine Mitsubishi Fuso element. Using an inappropriate element could result in engine trouble.**
- **When replacing the element, be sure to replace the O-ring also.**

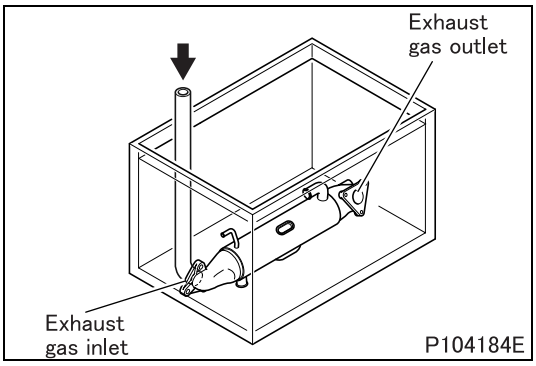
◆Inspection procedures◆

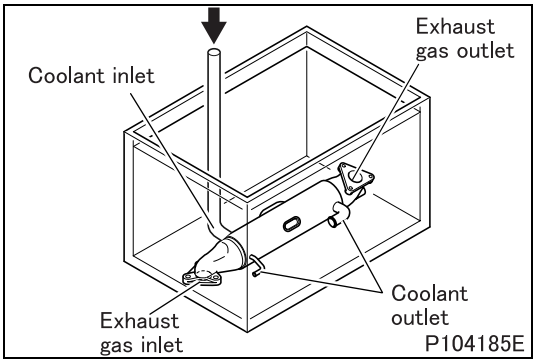


■ Inspection: Exhaust gas recirculation cooler

- Perform the following inspection. If any abnormality is found, replace the exhaust gas recirculation cooler.

(1) Exhaust gas passage side

- Fit a cover over the exhaust gas outlet of the exhaust gas recirculation cooler, and connect a hose to the exhaust gas inlet. Then, submerge the exhaust gas recirculation cooler in a container of water. Make sure the coolant passage is full of water.
- Apply specified air pressure through the hose. Check that air does not leak from any part of the exhaust gas recirculation cooler.



(2) Coolant passage side

- Fit covers over the exhaust gas recirculation cooler's exhaust gas inlet, exhaust gas outlet, and coolant outlet, and connect a hose to the coolant inlet. Then, submerge the exhaust gas recirculation cooler in a container of water.
- Apply air pressure of 300 kPa {44 psi, 3 kgf/cm^2} through the hose. Check that air does not leak from any part of the exhaust gas recirculation cooler.

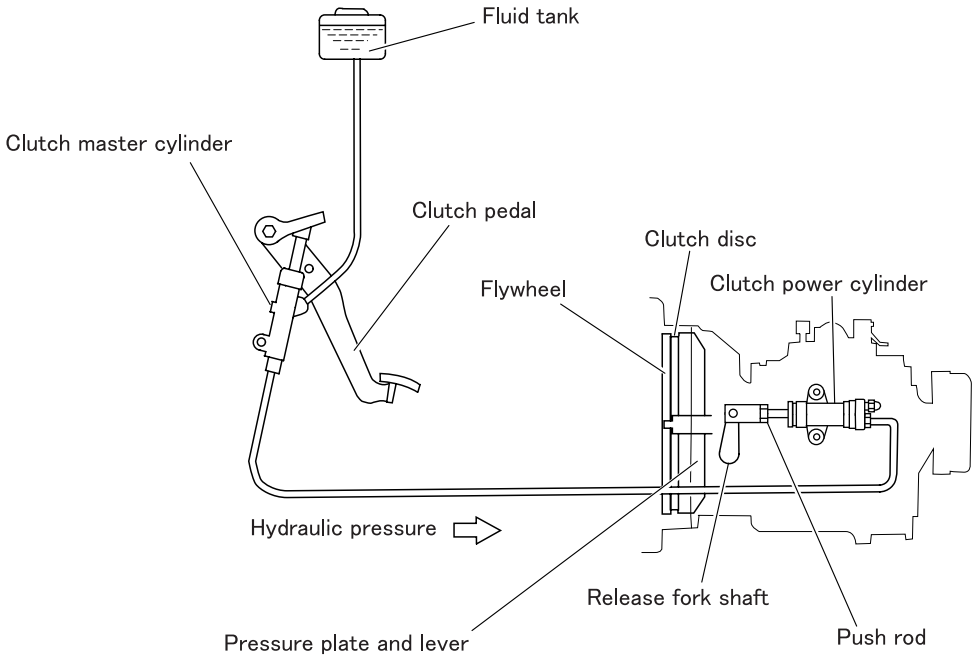
SPECIFICATIONS

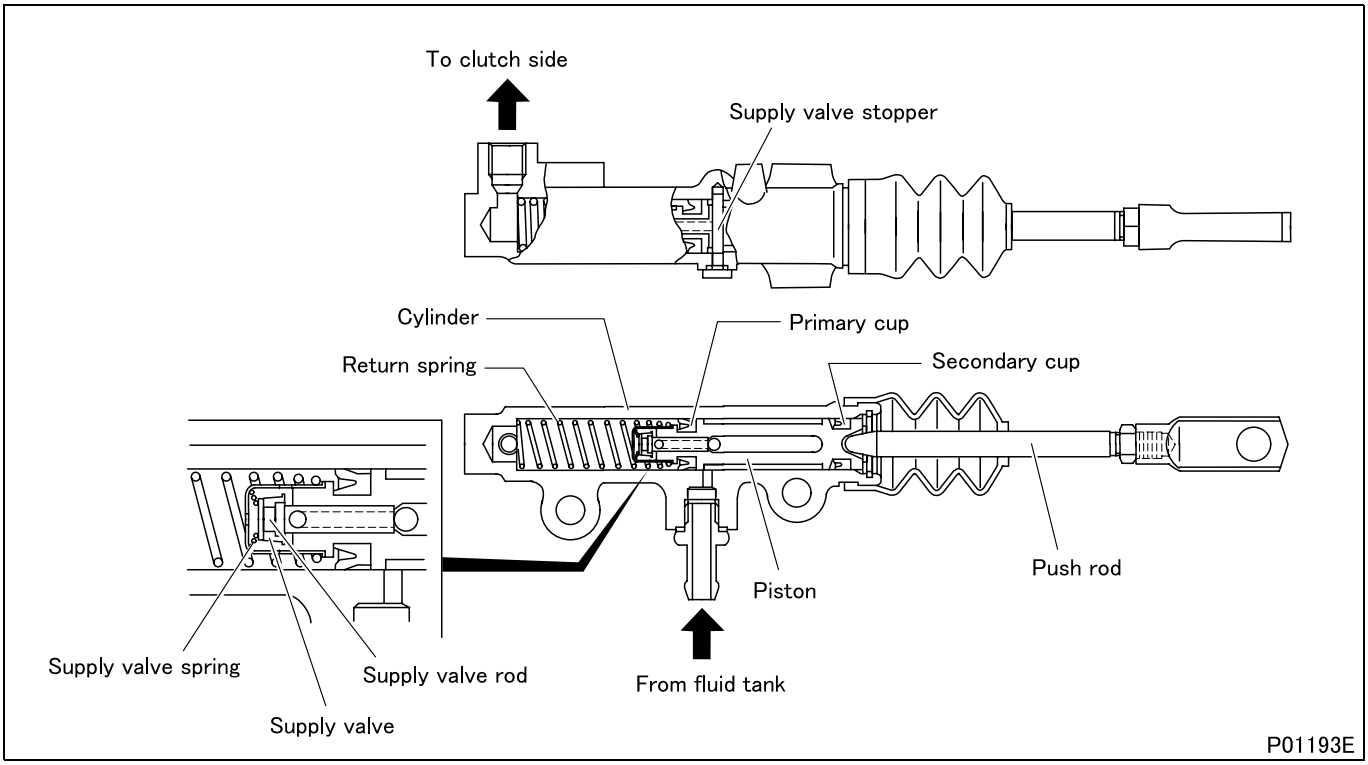
Item		Specifications
Clutch model	Type	C7M38
Drive type		Strap drive
Clutch disc	Type	Dry, single plate type
Pressure plate	Type	Coil spring type
Control system		Hydraulic pressure type
Clutch master cylinder	Manufacturer	NABCO
Clutch power cylinder	Manufacturer	NABCO

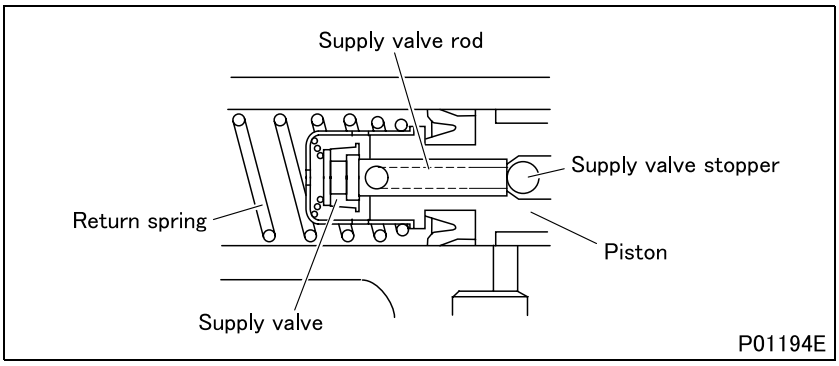
1. Clutch Control

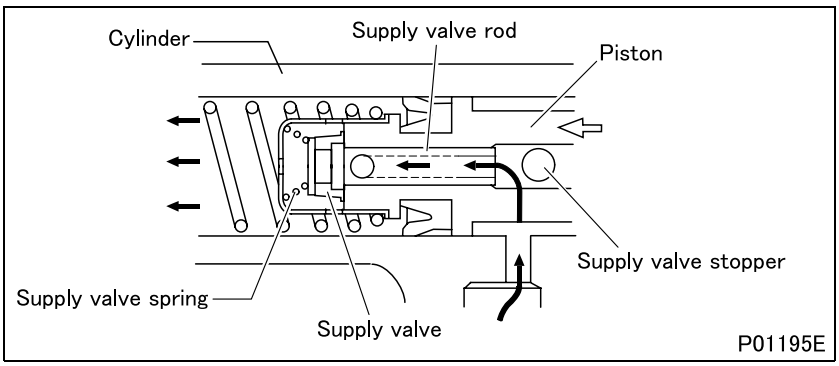


- Hydraulic pressure is used to control the clutch operation.
- When the clutch pedal is pressed, a force is applied to the clutch master cylinder, pushing the push rod in the clutch master cylinder. As a result, hydraulic pressure is generated, activating the clutch power cylinder or the clutch booster and disengaging the clutch.

2. Clutch Master Cylinder





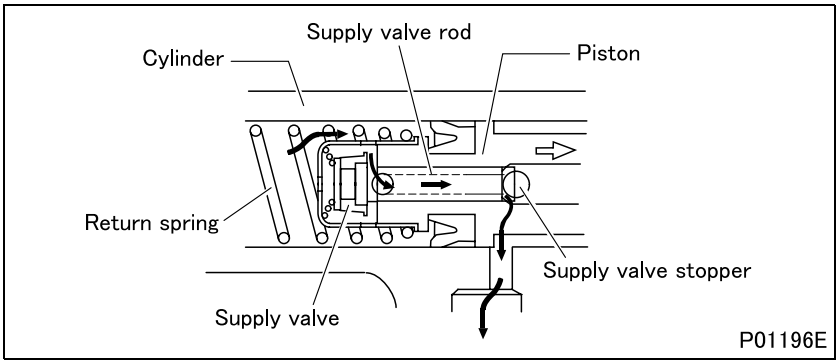


2.1 Before clutch pedal is pressed

- Because the piston is pushed against the push rod by the return spring, the supply valve rod contacts the supply valve stopper, leaving the supply valve open.
- As a result, the fluid passage on the fluid tank side is connected to the fluid passage on the clutch side.

2.2 When clutch pedal is pressed

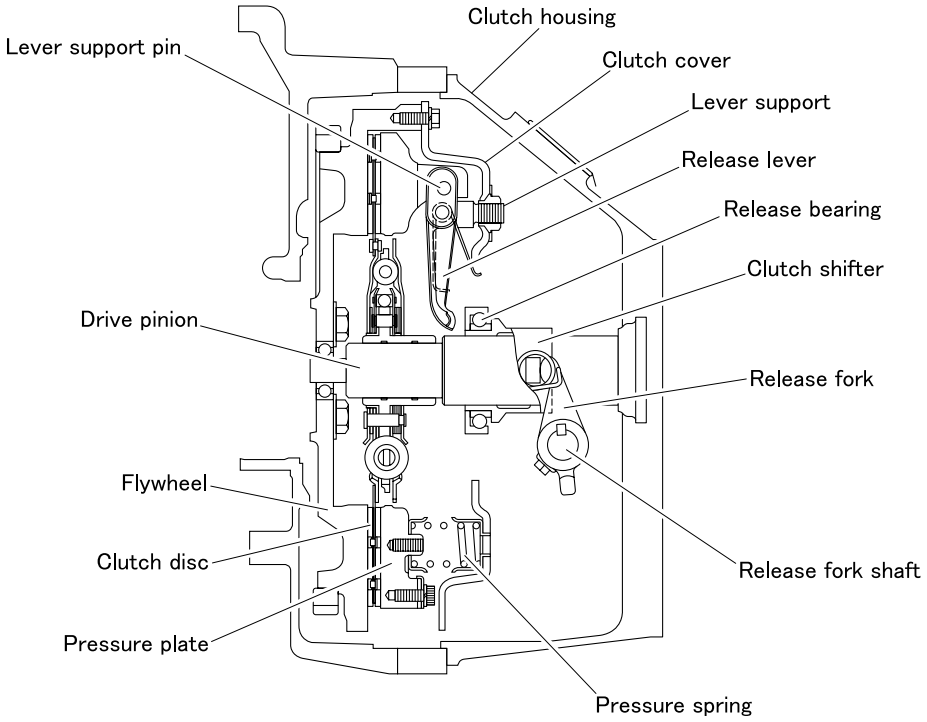
- When the push rod pushes the piston, the supply valve rod leaves the supply valve stopper, and at the same time, the spring force of the supply valve spring closes the supply valve.
- When the piston is further pushed, the hydraulic pressure is generated in the cylinder, which activates the clutch booster or clutch power cylinder.
- As a result, the fluid is supplied by the movement amount of the piston.

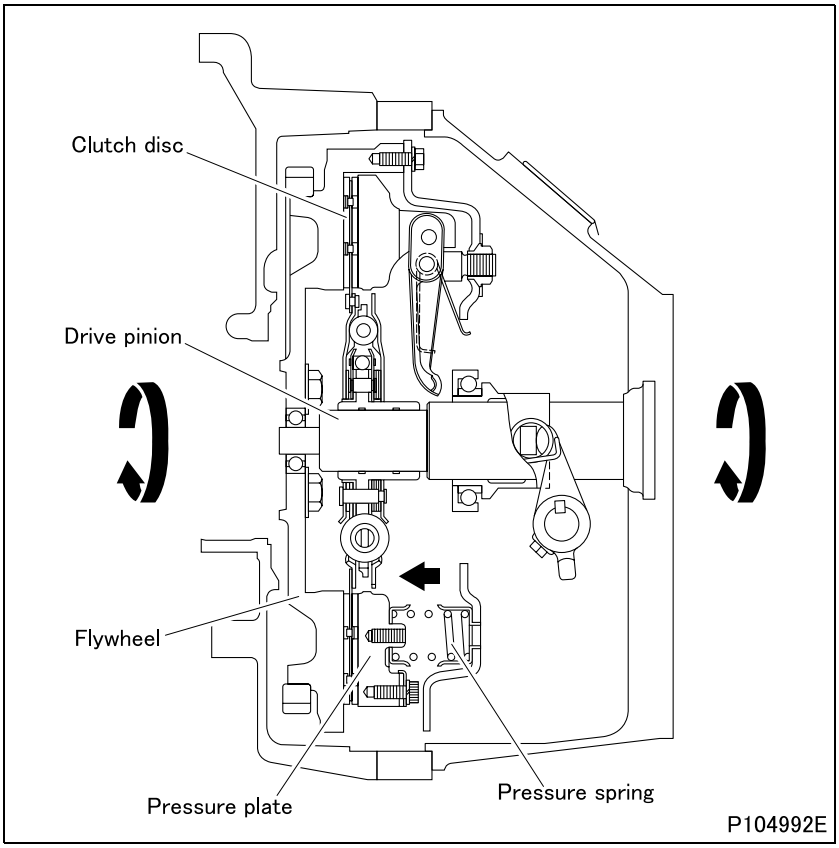


2.3 When clutch pedal is released

- When the piston is pushed back by the hydraulic pressure in the cylinder and the return spring, the supply valve rod contacts the stopper, opening the supply valve.
- As a result, the fluid on the clutch side returns to the fluid tank, and hydraulic pressure is lost.

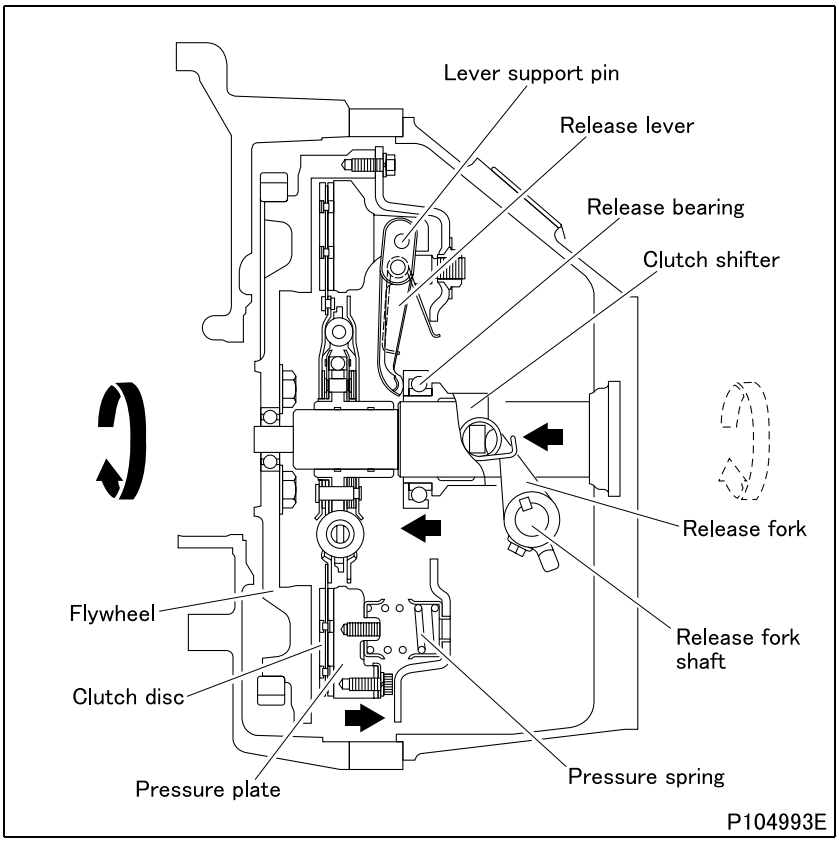
3. Clutch Proper





3.1 When clutch pedal is released

- The force of the pressure spring acts on the pressure plate, which in turn keeps the clutch disc pressed against the flywheel.
- Pressed against the flywheel, the clutch disc rotates together with the flywheel and transmits the engine power to the transmission drive pinion.



3.2 When clutch pedal is pressed

- The hydraulic pressure from the clutch master cylinder activates the clutch booster or clutch power cylinder. As a result, the release fork shaft activates the release fork, pushing out the clutch shifter as well as the release bearing, which then pushes the release lever.
- The release lever compresses the pressure spring with the lever support pin as the fulcrum and pull back the pressure plate coupled to the clutch cover. As a result, clearance is created between the clutch disc and flywheel, and the engine power is not transmitted to the transmission.

Possible causes / Symptoms		Clutch disengaged but drags	Clutch slips	Clutch does not engage smoothly	Clutch makes noise on disengagement	Clutch makes noise on engagement	Judder when vehicle starting	Clutch pedal requires too much effort	Reference Gr

ON-VEHICLE INSPECTION AND ADJUSTMENT

1. Replacement of Brake Fluid (Clutch System)

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

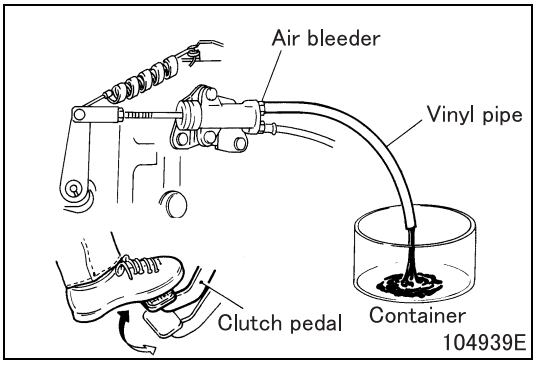
Mark	Parts to be tightened	Tightening torque	Remarks
–	Air bleeder	25 to 34 {18 to 25, 2.5 to 3.5}	–

Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
–	Clutch fluid tank	Brake fluid (SAE J1703 or FMVSS No.116 DOT3)	As required

CAUTION ⚠

- **Brake fluid is corrosive on paintwork. Be careful not to spill it onto the paintwork.**
- **If brake fluid is spilled onto the paintwork, immediately wipe it off.**
- **Be sure to use new Brake Fluid (SAE J1703 or FMVSS No.116 DOT3). Do not mix it with brake fluid of different properties or mineral oil (gas oil, engine oil, gear oil, automatic transmission fluid, etc.). This will alter the original properties of FUSO Brake Fluid, causing the boiling point to drop as well as the clutch rubber parts to swell. Faulty operation of the clutch will result.**
- **Ensure that no foreign matter or water enter into the brake fluid when refilling it, as they will cause faulty clutch operation.**
- **Use a mug exclusively kept for the specified brake fluid. This ensures that no brake fluid of different properties or mineral oil enter into the system.**



1.1 Work before replacement

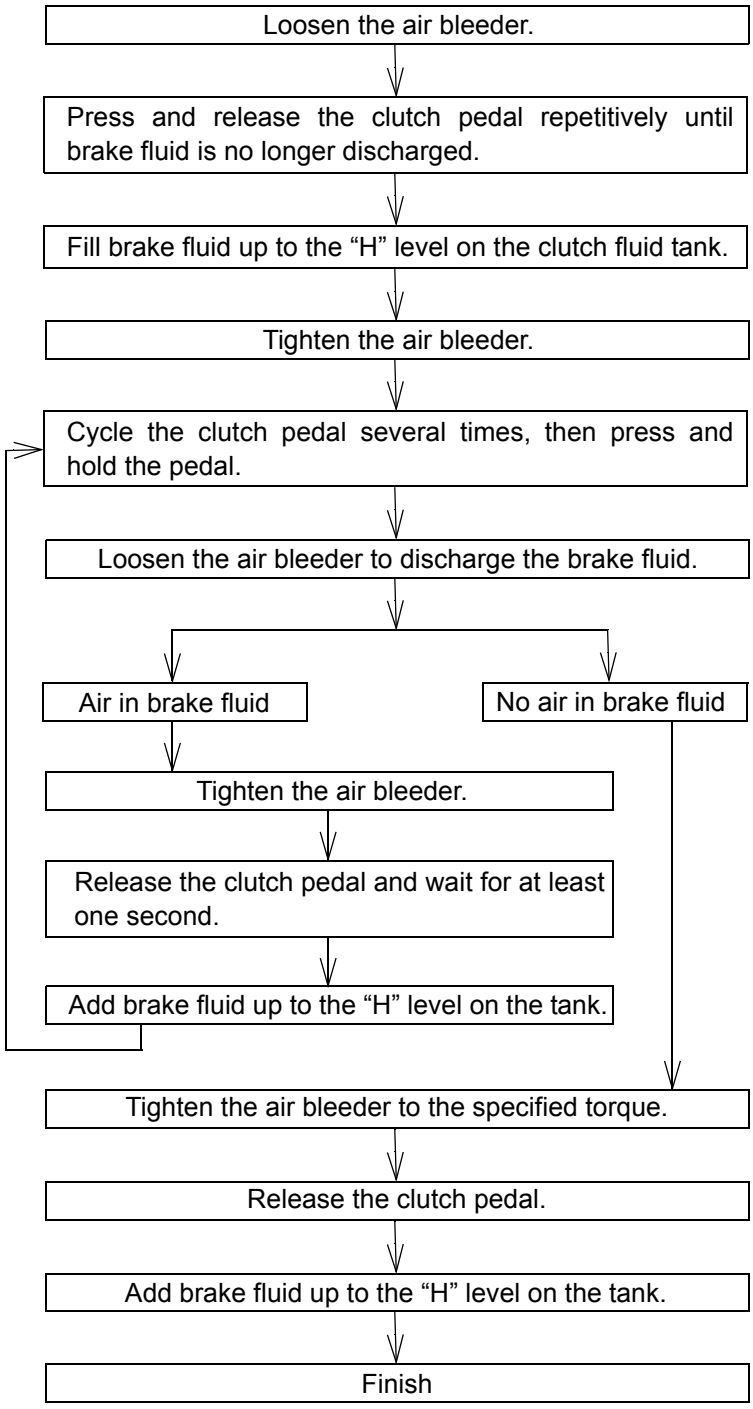
- Install one end of a vinyl pipe onto the air bleeder of the clutch booster or clutch power cylinder. Place the loose end into a container.

1.2 Replacement of brake fluid

- Replace the brake fluid in the following sequence.

CAUTION ⚠

- **Replacement of old brake fluid with new brake fluid in the clutch fluid line can be recognized by a change in color of the brake fluid being discharged through the vinyl pipe.**



2. Air Bleeding of Brake Fluid (Clutch System)

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

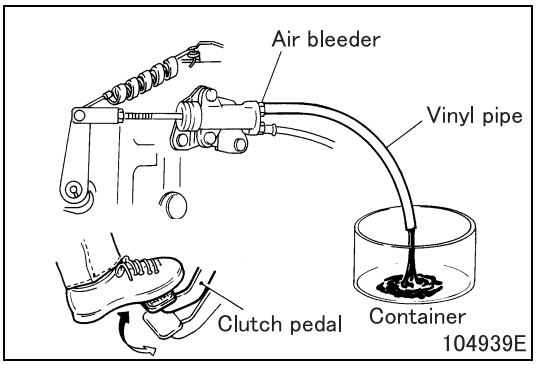
Mark	Parts to be tightened	Tightening torque	Remarks
–	Air bleeder	25 to 34 {18 to 25, 2.5 to 3.5}	–

Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
–	Clutch fluid tank	Brake fluid (SAE J1703 or FMVSS No.116 DOT3)	As required

CAUTION ⚠

- **Brake fluid is corrosive on paintwork. Be careful not to spill it onto the paintwork.**
- **If brake fluid is spilled onto the paintwork, immediately wipe it off.**
- **Be sure to use new Brake Fluid (SAE J1703 or FMVSS No.116 DOT3). Do not mix it with brake fluid of different properties or mineral oil (gas oil, engine oil, gear oil, automatic transmission fluid, etc.). This will alter the original properties of FUSO Brake Fluid, causing the boiling point to drop as well as the clutch rubber parts to swell. Faulty operation of the clutch will result.**
- **Ensure that no foreign matter or water enter into the brake fluid when refilling it, as they will cause faulty clutch operation.**
- **Use a mug exclusively kept for the specified brake fluid. This ensures that no brake fluid of different properties or mineral oil enter into the system.**
- **When the water lamp ◎ in the meter cluster illuminates during work, start the engine to fully charge air pressure.**
- **When no fluid changer (pumping machine) is used, remove the clutch fluid tank, and secure it 35 mm {1.37 in.} above or higher in a simple way.**
- **Replenish brake fluid as necessary during work so that brake fluid in the clutch fluid tank is always between "H" and "L".**

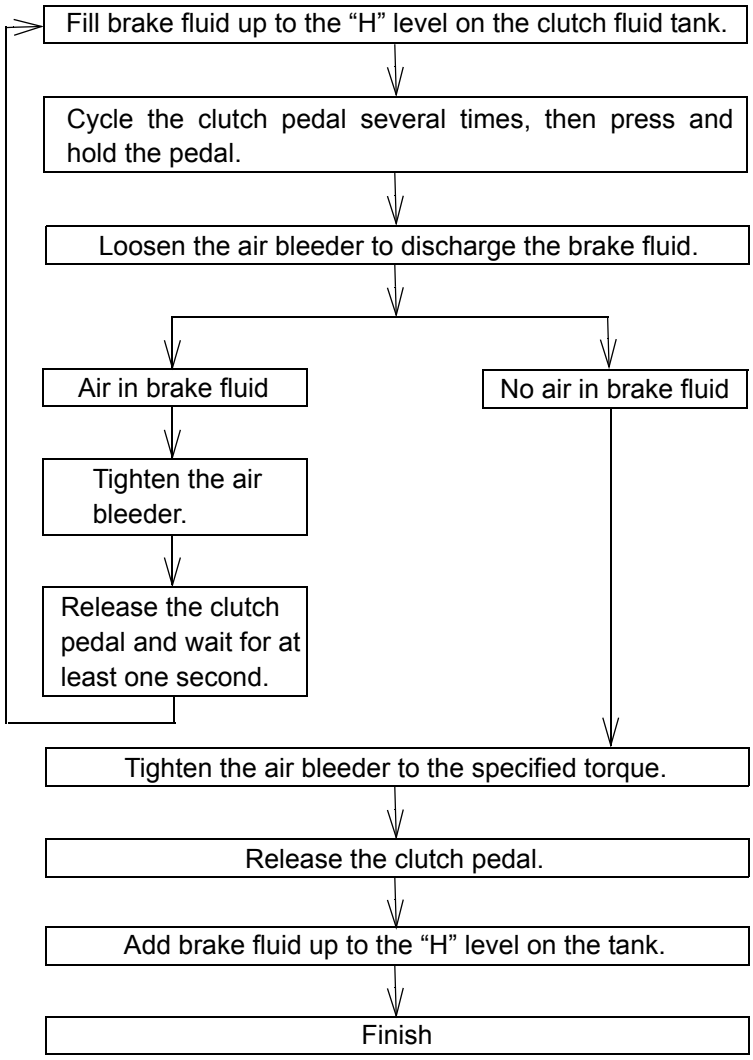


2.1 Work before air bleeding

- Install one end of a vinyl pipe onto the air bleeder in the clutch booster or clutch power cylinder. Place the loose end into a container as in the replacement procedure.

2.2 Air bleeding of brake fluid

- Bleed the air in the following sequence.

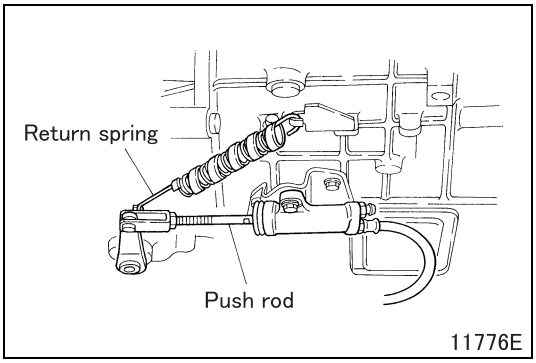


3. Clutch Pedal Play

Service standards (Unit: mm {in.})

Location	Maintenance item	Standard value	Limit	Remedy
–	Clutch power cylinder push rod travel	3.8 {0.15}	–	Adjust or replace
–	Clutch pedal play (clutch master cylinder push rod travel and clutch power cylinder push rod travel)	32 to 44 {1.26 to 1.73}	–	Adjust or replace

- Clutch pedal play is the combination of play on the clutch pedal side (clutch master cylinder push rod travel) and play on the clutch proper side (clutch power cylinder push rod travel), and can be checked in the following manner.



3.1 Clutch power cylinder push rod travel

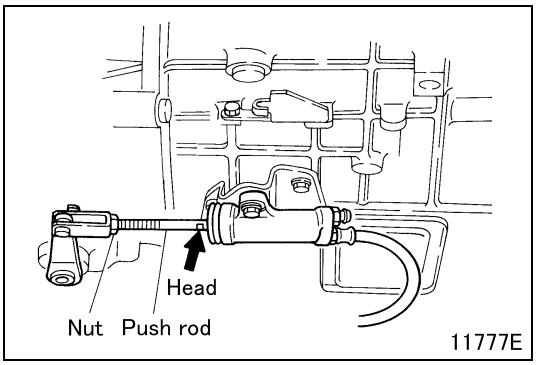
- Perform this work after completing clutch pedal adjustment and air bleeding work.

[Inspection]

- Remove the return spring, and measure the movement (free travel) amount when moving the push rod by hand.
- If the measured distance deviates from the standard value, adjust as follows.

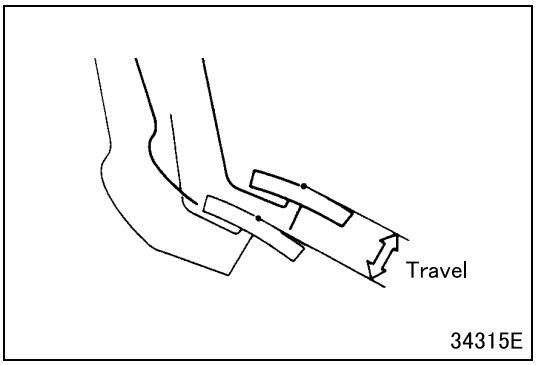
NOTE

- **When measurement is performed immediately after air bleeding work, the movement amount of the push rod is shown less than normal. Perform measurement after depressing the clutch pedal a few times for conditioning.**



[Adjustment]

- Loosen the nut and extend the push rod by turning head of the rod until the rod no longer moves.
- Return the hexagonal nut portion of the rod to the following value from this condition, and tighten the nut.
  Return amount: 3 turns
- If the rod does not return to the above value, the clutch disc has worn beyond the service limit. Replace the clutch disc.
- After adjustment, install the return spring.



3.2 Clutch pedal play

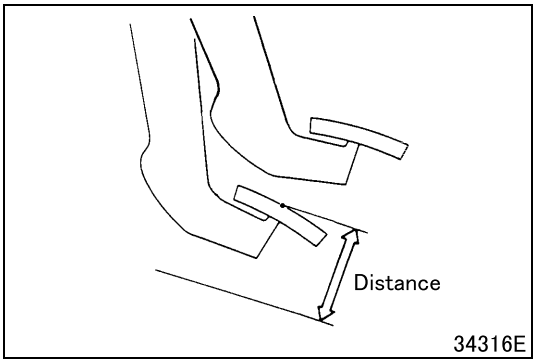
[Inspection]

- Push the clutch pedal by hand and measure the movement amount (movement amount of push rod of clutch master cylinder and movement amount of push rod of clutch power cylinder) until resistance is felt.
- If the measured value deviates from the standard value, readjust clutch pedal play or replace clutch faulty parts.

4. Clearance Between Clutch Pedal and Floor

Service standards (Unit: mm {in.})

Location	Maintenance item	Standard value	Limit	Remedy
–	Clearance between clutch pedal and floor	40 {1.57} or more	–	Adjust or replace



- Perform inspection at the position where the clutch is engaged in the following procedure.
- Apply the parking brake and run the engine at idle.
- Depressing the clutch pedal, shift the gear shift lever to the forward highest gear position.
- Gradually release the clutch pedal, and measure the clearance between the pedal and floor just before the clutch is engaged.

WARNING ⚠

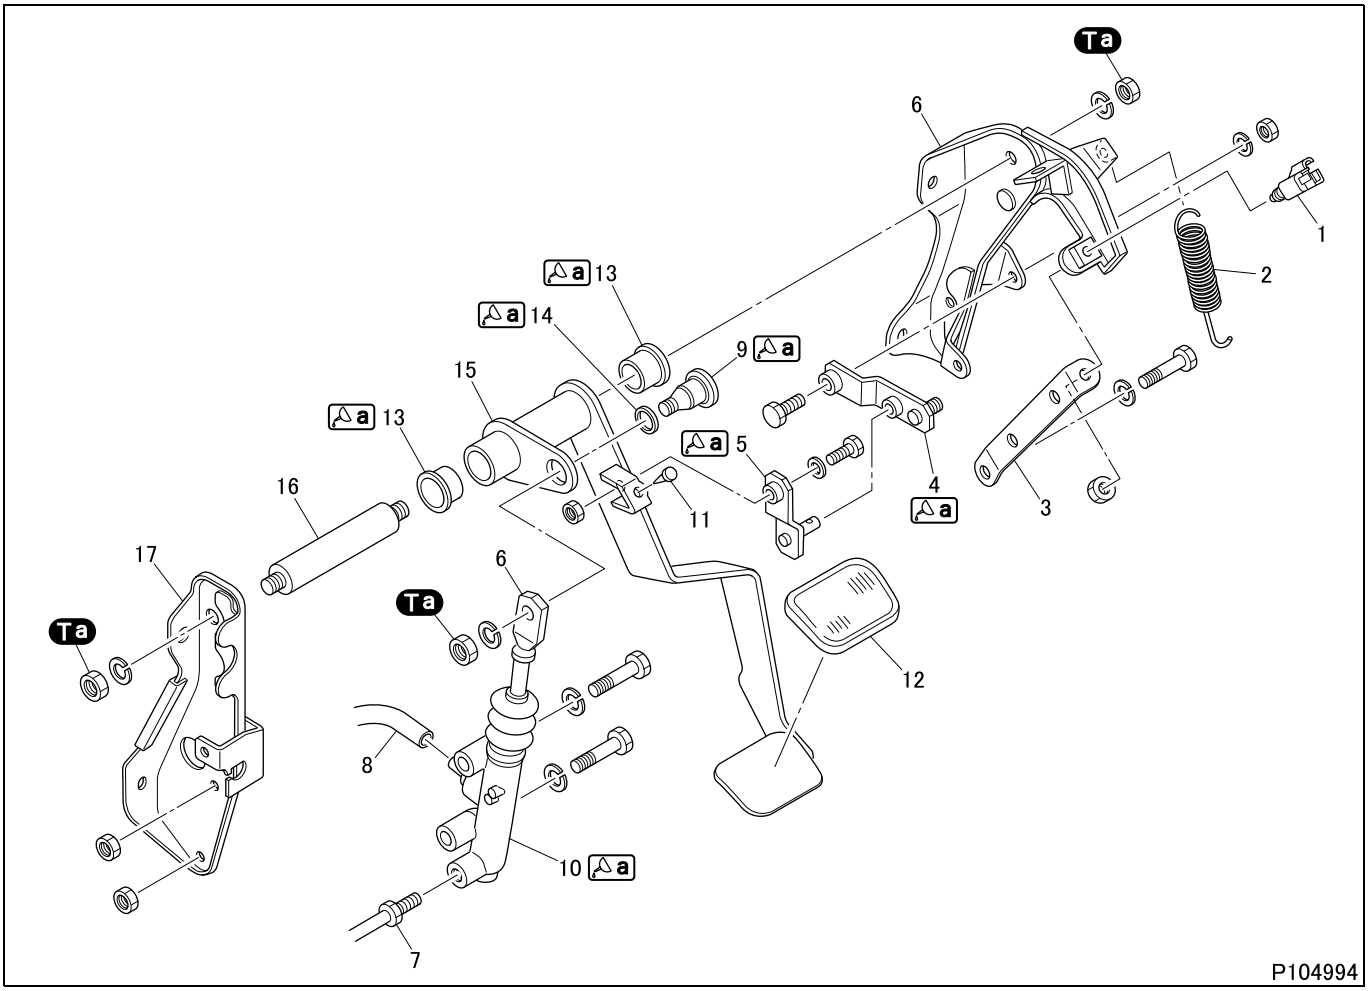
- **Be careful not to allow the vehicle from starting suddenly. Pay full attention to the surrounding condition.**

- If the measured value is less than the standard value, repeat the adjustment of the play of clutch pedal or replace faulty parts.

5. Clutch Action

- Check that depressing the clutch pedal does not create any abnormal noise or require excessive effort.
- Check that gear shifting can be performed easily with the clutch pedal depressed. Check also that the clutch engagement is smooth and without any drag as the pedal is gradually released.
- If any abnormality is encountered, repair or replace faulty parts.

CLUTCH PEDAL



● **Removal sequence**

1 Clutch switch
2 Return spring
3 Clutch switch stay
4 Lever B
5 Lever A
6 Clutch pedal bracket
7 Fluid pipe
8 Fluid hose
9 Offset bolt
10 Clutch master cylinder (See CLUTCH MASTER CYLINDER.)
11 Clutch switch stopper
12 Pedal pad
13 Bushing
14 Bushing
15 Clutch pedal
16 Pedal shaft
17 Clutch pedal bracket

● **Installation sequence**

Follow the removal sequence in reverse.

Service standards (Unit: mm {in.})

Location	Maintenance item	Standard value	Limit	Remedy
2	Return spring load (installed length: 123.5 {4.86})	69.6 N {16 lbs, 7.1 kgf}	–	Replace
9, 14	Clearance between offset bolt and bushing	0.07 to 0.29 {0.0028 to 0.0115}	–	Replace
13, 16	Clearance between bushing and pedal shaft	0.07 to 0.22 {0.0028 to 0.0087}	–	Replace

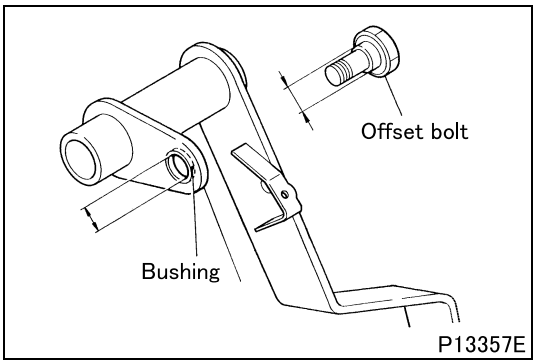
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Nut (pedal shaft mounting)	48.1 ± 9.8 {35 ± 7.2, 4.9 ± 1}	–
	Nut (offset bolt mounting)		

Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Mounting area of offset bolt of clutch master cylinder	Chassis grease [NLGI No.1 (Li soap)]	As required
	Inner surface of bushing		
	Inner surface of bushing of lever A and B		

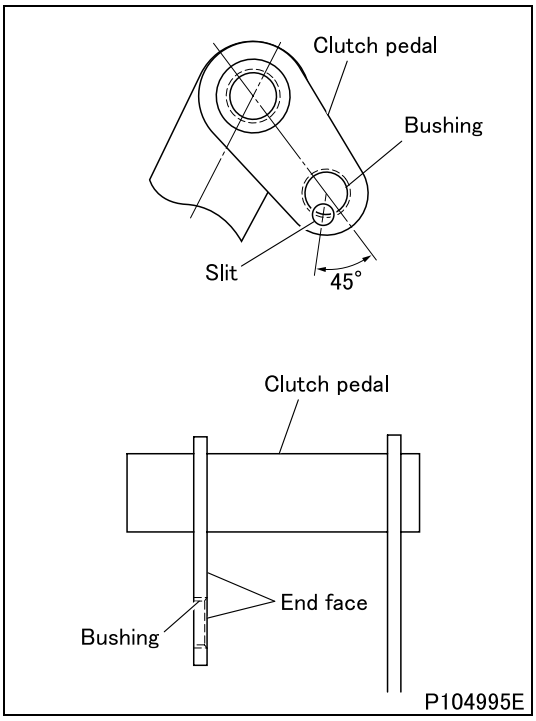
◆Inspection procedure◆



■ Inspection: Clearance between offset bolt and bushing

[Inspection]

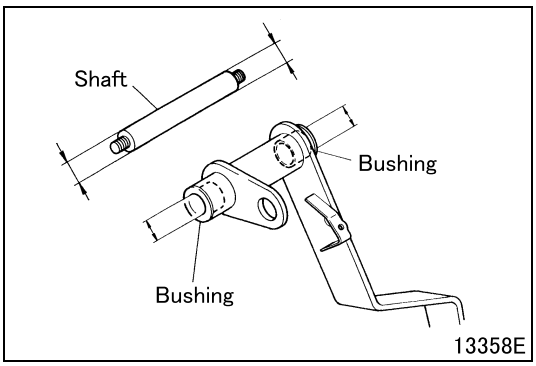
- If the measured value does not conform to the standard value, replace the bushing.



Removal and installation of bushing

[Installation]

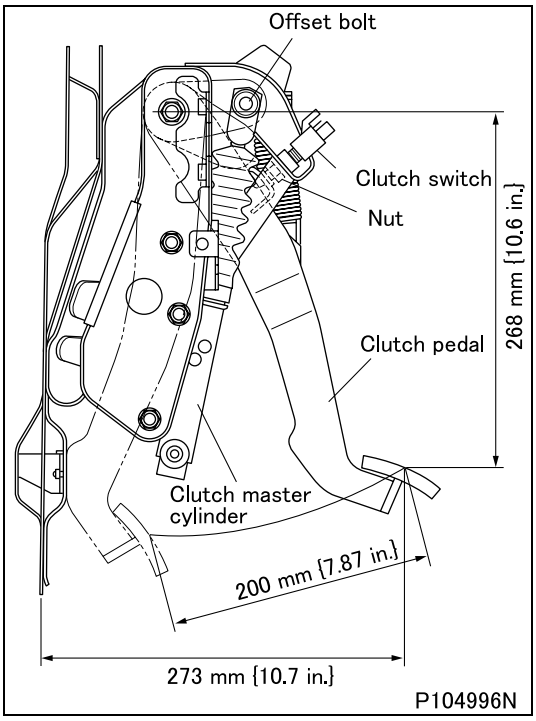
- Adjust the slit of the bushing within the range of the angle shown in the illustration and press the bushing into the end face of the clutch pedal.



■ **Inspection: Clearance between bushing and pedal shaft**

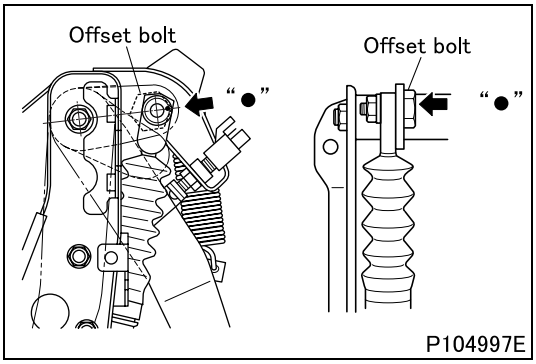
- If the measured value does not conform to the standard value, replace the bushing.

◆Adjustment after assembly◆

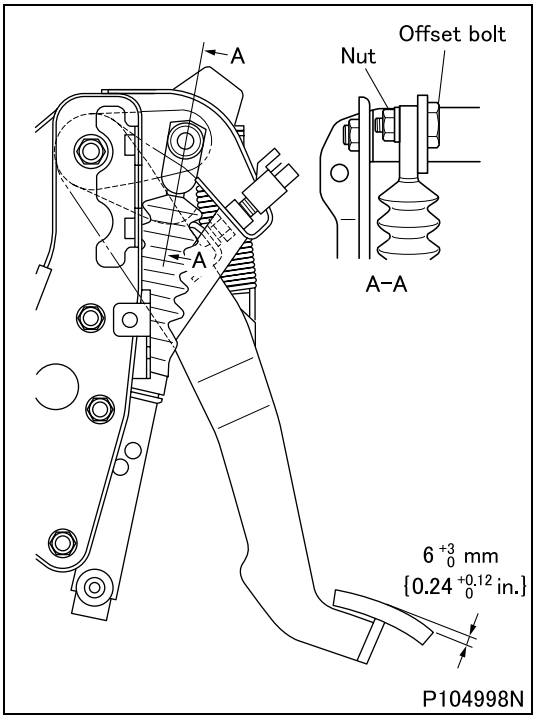


■ **Adjustment: Clutch pedal**

- Loosen the offset bolt.
- Rotate the clutch switch such that the distances indicated in the drawing are achieved on the clutch pedal. Tighten the nut fixing the clutch switch.

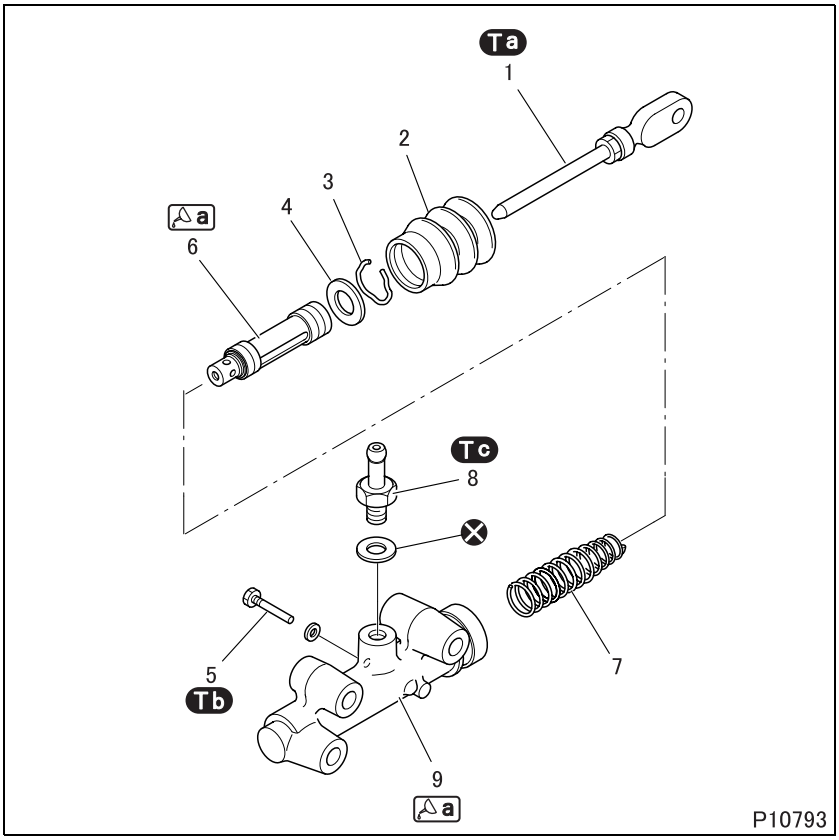


- Prior to the previous steps, temporarily tighten offset bolt such that "•" mark on the bolt is located as illustrated.



- Now, rotate the offset bolt such that the clutch pedal has the play indicated in the drawing at its end. Tighten the nut.

CLUTCH MASTER CYLINDER



● **Disassembly sequence**

1 Push rod
2 Boot
3 Piston stop ring
4 Piston stop plate
5 Supply valve stopper
6 Piston
7 Return spring
8 Nipple
9 Cylinder

⊗: Non-reusable parts

● **Assembly sequence**

Follow the disassembly sequence in reverse.

Repair kit: Piston and boot kit

Service standards (Unit: mm {in.})

Location	Maintenance item	Standard value	Limit	Remedy
6, 9	Clearance between piston and cylinder	0.020 to 0.105 {0.00079 to 0.0041}	0.2 {0.0079}	Replace
7	Free length of return spring	97 {3.82}	92 {3.62}	Replace

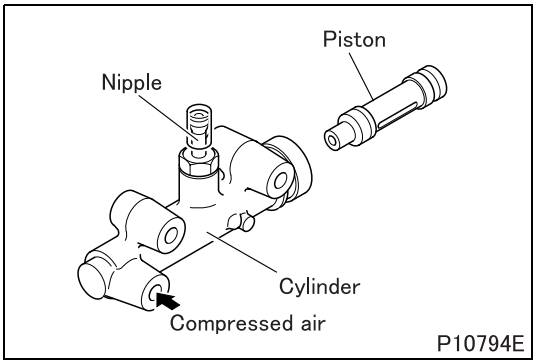
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Push rod (lock nut mounting)	9.8 to 15 {7.2 to 11, 1.0 to 1.5}	–
Tb	Supply valve stopper	1.5 to 2.9 {1.1 to 2.2, 0.15 to 0.30}	–
Tc	Nipple	25 to 34 {18 to 25, 2.5 to 3.5}	–

Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Sliding surfaces between piston and cylinder	Rubber grease	As required

◆Removal procedure◆



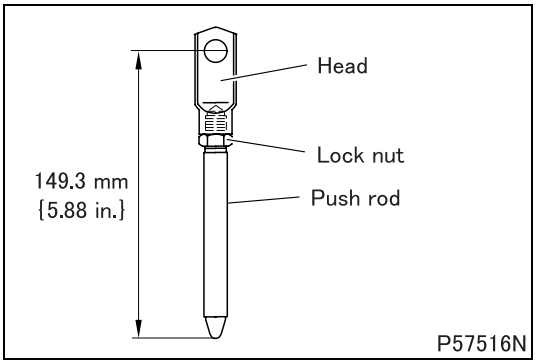
■ **Removal: Piston**

- Close the opening of the nipple on the cylinder. Wrap the cylinder body with a shop towel or equivalent around the opening to catch the piston.
- Feed compressed air gradually starting from 0 kPa {0 psi, 0 kgf/cm^2} to remove the piston.

WARNING ⚠

- **Do not apply compressed air suddenly at high pressure. Otherwise, the piston will fly out with full force.**

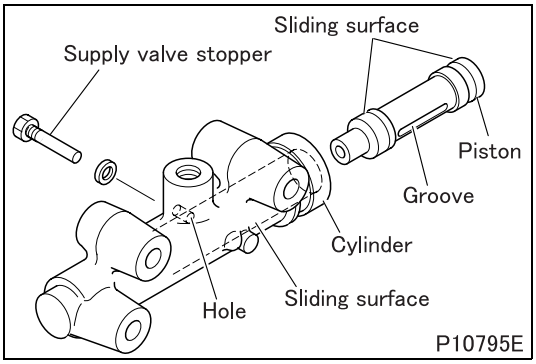
◆Adjustment procedure◆



■ **Adjustment: Push rod length**

- If the illustrated dimension does not conform to the standard value, loosen the lock nut of the push rod and turn the head to adjust.
- After adjustment, tighten the lock nut.

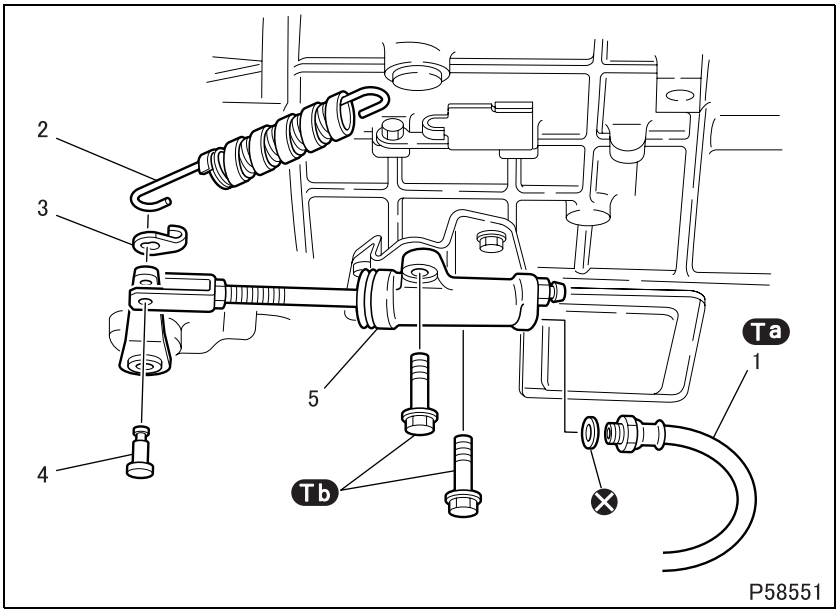
◆Installation procedure◆



■ **installation: Piston**

- Apply grease to sliding surfaces of the piston and cylinder.
- Align the piston groove with the cylinder hole, and use the supply valve stopper as a detent.

CLUTCH POWER CYLINDER



● Removal sequence

1 Fluid hose
2 Return spring
3 Return spring claw
4 Clevis pin
5 Clutch power cylinder
(See later section.)

CAUTION ⚠

- **After removing fluid hose, fit blanking plugs into its openings to prevent fluid from flowing out.**

● Installation sequence

Follow the removal sequence in reverse.

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks

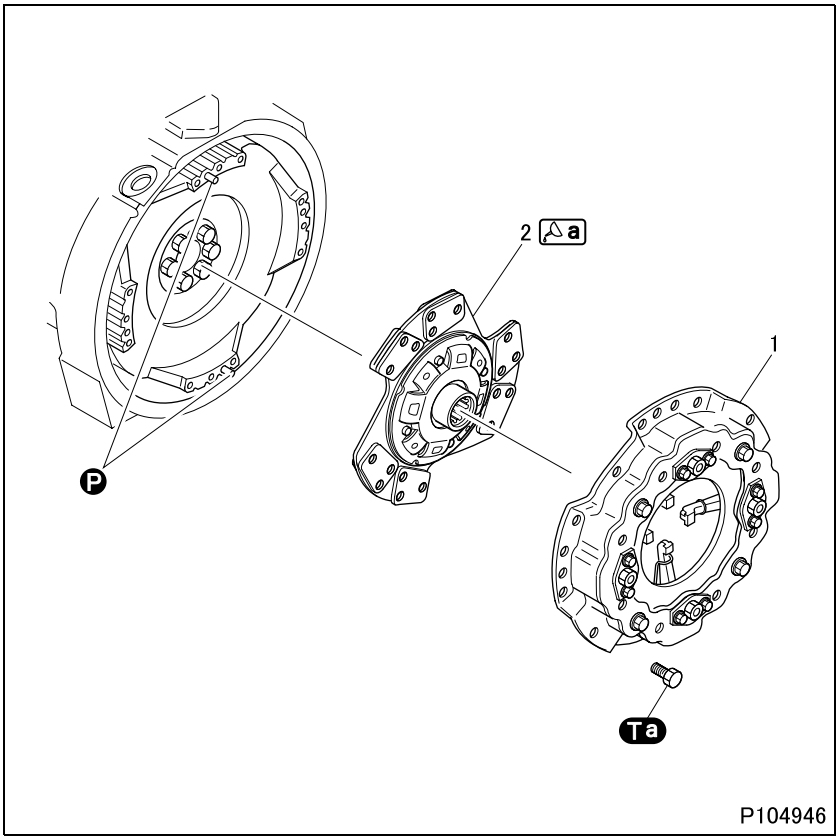
	Cylinder bore		

CLUTCH PROPER



● **Removal sequence**

1 Pressure plate and lever assembly (See later section.)
2 Clutch disc

Ⓟ: Locating pin

WARNING ⚠

- **The pressure plate and lever assembly is heavy, about 26 kg {57 lb}. Handle it with care.**

● **Installation sequence**

Follow the removal sequence in reverse.

CAUTION ⚠

- **Take care not to allow oil and grease on the surface of the clutch disc, because it can cause the clutch to slip.**

Service standards (Unit: mm {in.})

Location	Maintenance item		Standard value	Limit	Remedy
2	Clutch disc	Lateral runout	0 to 1.2 {0 to 0.047}	–	Replace
		Vertical runout	0 to 1.2 {0 to 0.047}	–	Replace
		Play in revolving direction in splines	0.07 to 0.23 {0.0028 to 0.0091}	0.5 {0.020}	Replace
		Depth from facing surface to cup	1.88 to 2.62 {0.074 to 0.103}	0.2 {0.0079}	Replace

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Bolt (clutch cover mounting)	33 to 49 {24 to 36, 3.3 to 5.0}	–

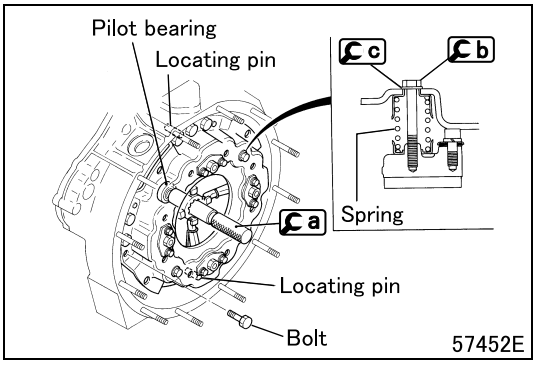
Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Spline surface	Molybdenum disulfide grease [NLGI No.2 (Li soap)]	1.1 to 1.6 g {0.039 to 0.056 oz}
			4.2 to 5.9 g {0.15 to 0.21 oz}

Special tools (Unit: mm {in.})

Mark	Tool name and shape	Part No.	Application
a	Clutch alignment arbor  P01270 A: φ36.2 {1.43}; B: φ20 {0.79}; C: 105 {4.13}	MH061987	Holding clutch disc
b	Stopper bolt  P01292 A: 49 {1.93}; B: 26 {1.02}; C: M10×1.25	43402-09200	Removal and installation of pressure plate and lever assembly (4 bolts to be used)
c	Washer  P57108 A: φ22 {0.87}; B: φ10.5 {0.41}	MH005024	Removal and installation of pressure plate and lever assembly (4 bolts to be used)

◆Removal procedure◆



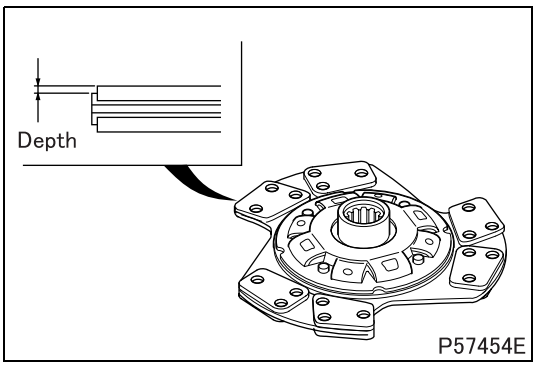
■ Removal: Pressure plate and lever assembly

- Insert a into the pilot bearing of the flywheel to support the clutch disc.
- Secure with b and c at 4 locations, push and compress the diaphragm spring and then remove the bolt.

CAUTION ⚠

- **Be sure to use b and c when removing the bolt. Otherwise, the pressure plate and lever assembly rise with the pressure spring force, damaging the strap plate. In addition, the pressure plate and lever assembly fall off from the locating pin of the flywheel.**

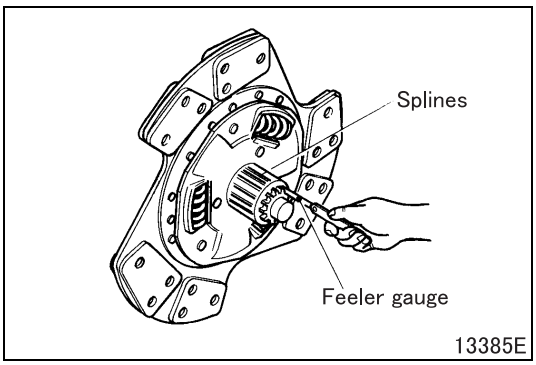
◆Inspection procedure◆



■ **Inspection: Clutch disc**

(1) Depth from facing surface to rivet <Woven> or cup <Ceramic metal>

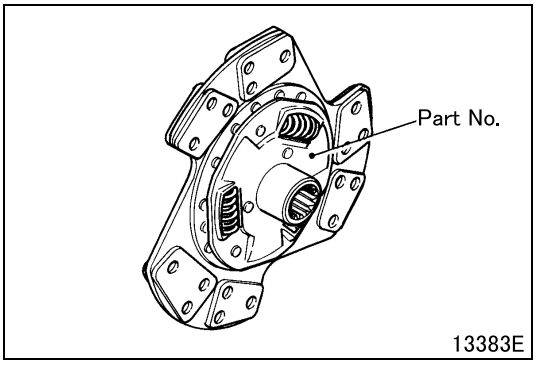
- If the measured value is equal to or less than the limit, replace the clutch disc.



(2) Play in revolving direction in splines

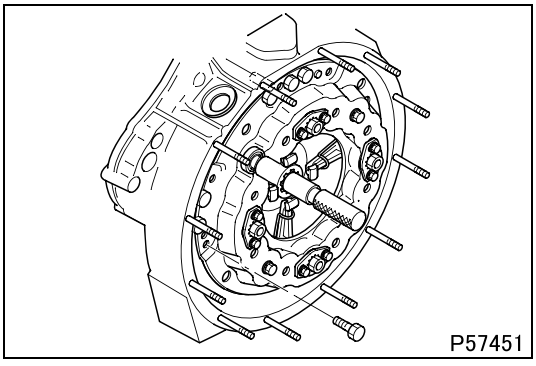
- Reshape a feeler gauge such that it can be inserted into the drive pinion splines. Then, using the gauge, measure the splines for play in revolving direction.
- If the measured value is equal to or exceeds the limit, replace the clutch disc.

◆Installation procedure◆



■ **Installation: Clutch disc**

- Install the clutch disc so that its Part No.can be seen.



■ **Installation: Pressure plate and lever assembly**

- Install the pressure plate and lever assembly by following the removal procedure in reverse.
  (See "■**Removal: Pressure plate and lever assembly**".)
- Tighten the bolts diagonally and gradually to the specified torque.

CAUTION ⚠

- **After installation, be sure to remove Cb and Cc (4 locations). If they are left installed, the clutch cannot be engaged.**

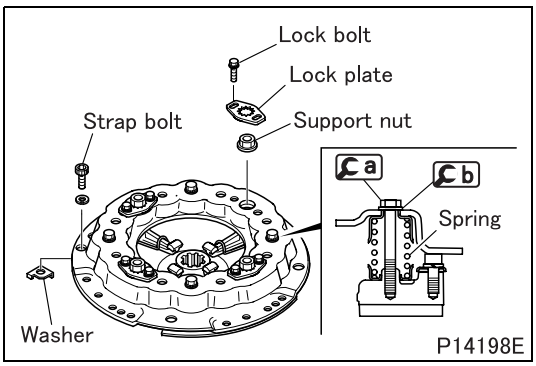
</table>

◆Work before removal◆

■ Alignment mark: Pressure plate and lever assembly

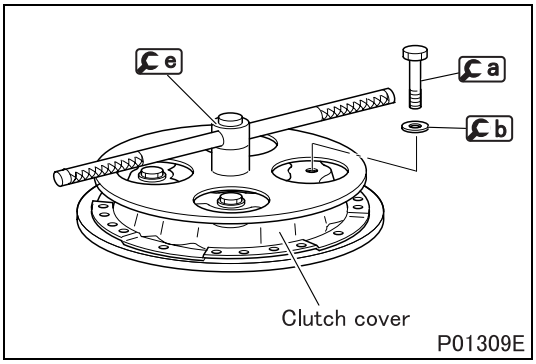
- Make an alignment mark on each joint of parts before disassembly.

◆Removal procedure◆



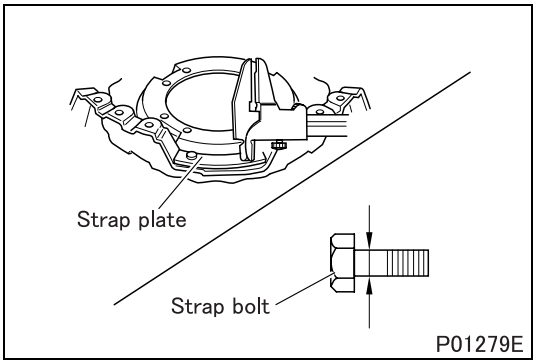
■ **Removal: Clutch cover**

- Secure with a and b at 4 locations and remove the strap bolt, washer, lock bolt, lock plate and support nut while pushing and compressing the pressure spring.



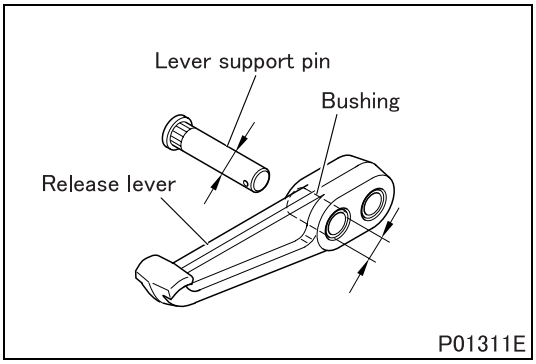
- Remove a and b (4 locations) using e with the pressure spring pushed and compressed.
- Gradually loosen e and remove the clutch cover after the pressure spring becomes ineffective.

◆Inspection procedure◆



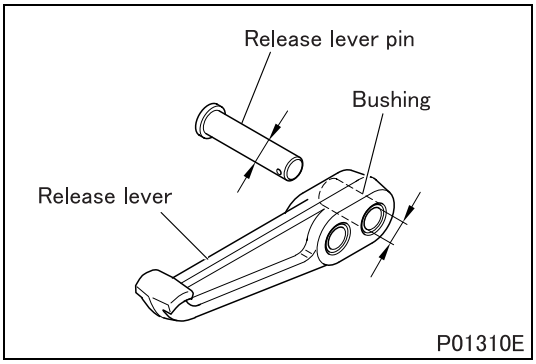
■ **Inspection: Clearance between strap bolt and strap plate of clutch cover**

- If the measured value exceeds the specified limit, replace faulty parts.



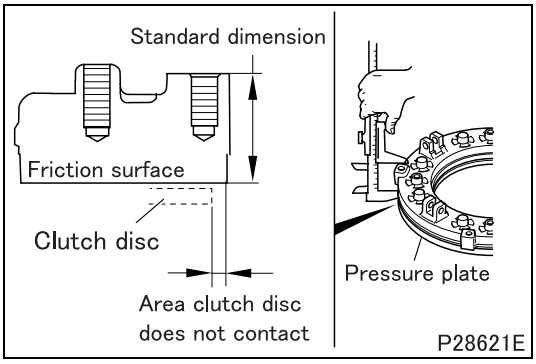
■ **Inspection: Clearance between lever support pin and bushing**

- If the measured value exceeds the specified limit, replace the bushing.



■ **Inspection: Clearance between release lever pin and bushing**

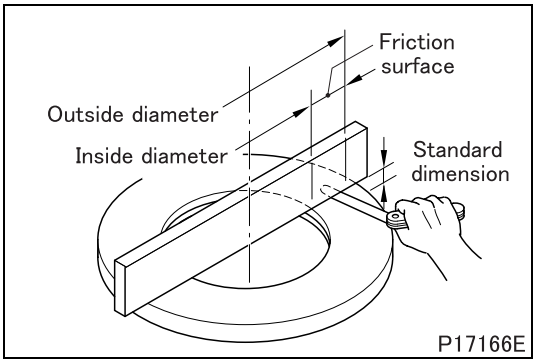
- If the measured value exceeds the specified limit, replace the bushing.



■ **Inspection: Pressure plate**

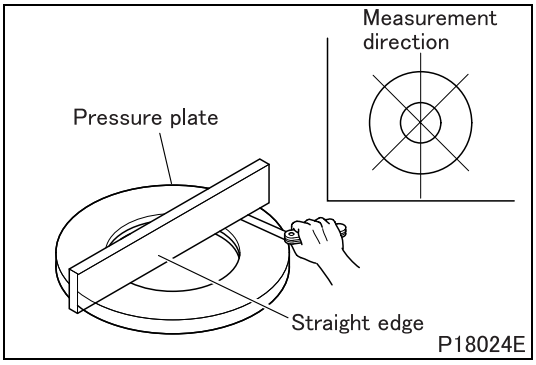
(1) Thickness

- Measure the thickness of the pressure plate at the friction surface in the following procedure. If the measured value exceeds the specified limit, replace the pressure plate.
- Measure the standard dimension (area the clutch disc does not contact).



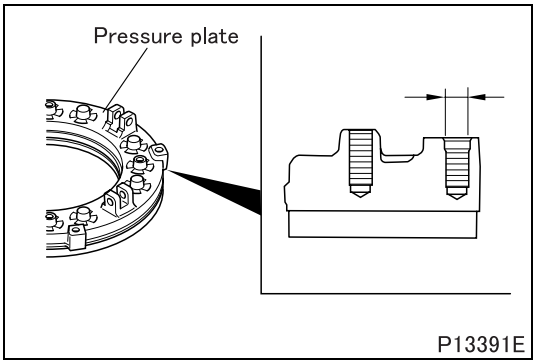
- Measure the clearance between the friction surface (within the illustrated range) and the standard dimension, and deduct this value from the standard dimension. This value is the thickness of the pressure plate.

Outside diameter	370 mm {14.6 in.}
Inside diameter	240 mm {9.45 in.}



(2) Flatness

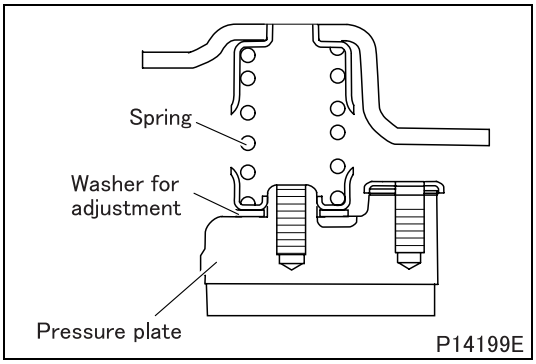
- Measure the clearance between the pressure plate and straight edge. (Consider the pressure plate as a plane.)
- If the measured value exceeds the specified limit, correct or replace the pressure plate.



(3) Inside diameter of strap bolt fitting hole

- If the measured value exceeds the specified limit, replace the pressure plate.

◆Installation procedure◆



■ Installation: Pressure spring

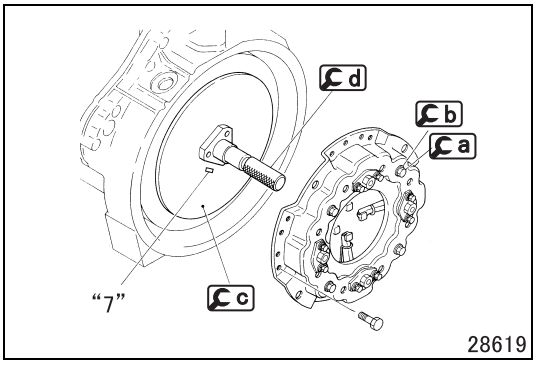
- If the pressure plate is corrected by grinding, assemble between the pressure plate and pressure spring a washer for adjustment equivalent to the correction amount by grinding.

Amount of correction made by grinding	Thickness of adjusting washer
Less than 1 mm {0.039 in.}	Not required
1 to 2 mm {0.039 to 0.079 in.}	1.2 mm {0.047 in.} × 1
2 to 3 mm {0.079 in. to 0.12 in.}	1.2 mm {0.047 in.} × 2 or, 2.3 mm {0.091 in.} × 1

■ Installation: Clutch cover

- To install, follow the removal sequence in reverse. (See "■ **Removal: Clutch cover**".)

◆Work after installation◆



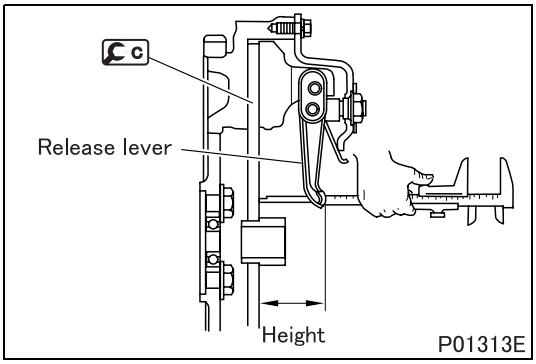
■ Inspection: Height of release lever

[Inspection]

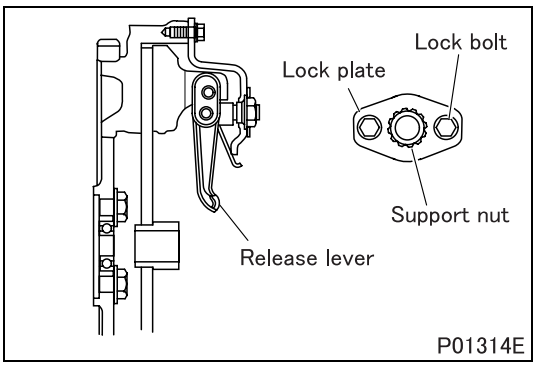
- Install the pressure plate and lever using c and d instead of the clutch disc.
- Install c so that identification mark "7" can be seen.

CAUTION ⚠

- **After installing the pressure plate and lever, be sure to remove a and b (4 locations) to perform inspection and adjustment.**



- Measure the height from c to the top surface of each release lever (4 locations).
- If the measured value deviates from the standard value, make adjustment in the following procedure. Even if the measured value is within the standard value, make adjustment when the mutual difference between each measured value is 0.5 mm or more.



[Adjustment]

- Remove the lock bolt and lock plate, and turn the support nut to adjust the release lever.
- After adjustment, install the lock plate, and secure the support nut. Then, check the height of the release lever.

M E M O

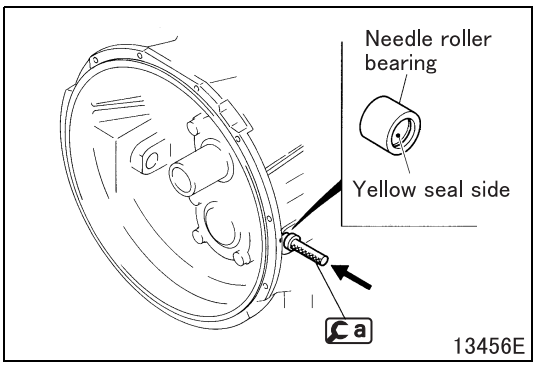
Special tools (Unit: mm {in.})

Mark	Tool name and shape	Part No.	Application
Ca	Needle roller bearing installer A: φ30 {1.18}, B: φ23 {0.91}  P01320	03726-83000	Installation of needle roller bearing installer

◆Installation procedure◆

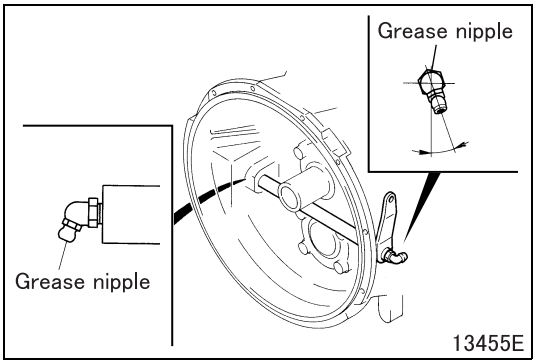


■ **Installation: Needle roller bearing**

- Install the needle roller bearing with the yellow seal side facing outward.

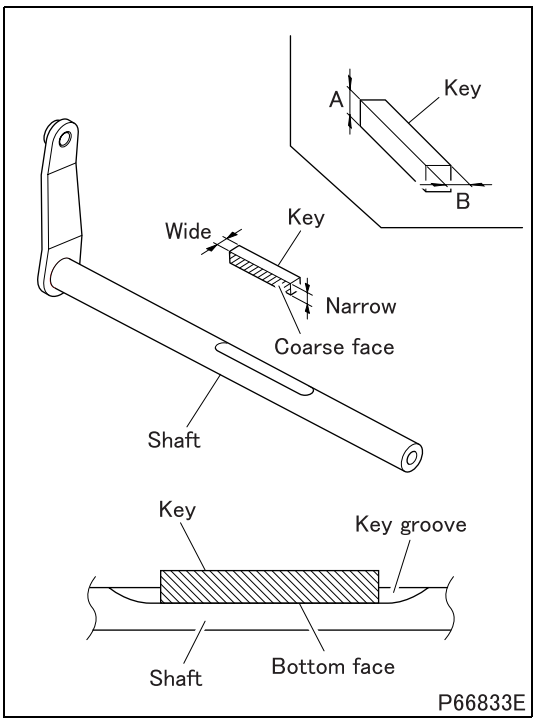
CAUTION ⚠

- **To prevent damage, do not strike the needle roller bearing directly with a hammer when installing it.**



■ **Installation: Grease nipple and connector**

- Install the grease nipple and connector on the clutch housing in the illustrated direction.



■ **Installation: Key**

- Install the key such that the faces with coarse finish face the front and rear of the vehicle.
- If it is difficult to identify the coarse faces, measure the illustrated dimensions A and B. Then, install the key such that the faces with greater (wide) dimensions face up and down.

Width (wide)	$7\ ^{+0.028}_{+0.019}$ mm {$0.28\ ^{+0.0011}_{+0.0007}$ in.}
Width (narrow)	$7\ ^{0}_{-0.13}$ mm {$0.28\ ^{0}_{-0.0051}$ in.}

- The key must be installed in the key groove in the release fork shaft such that it bottoms out and that it is centered in the groove.

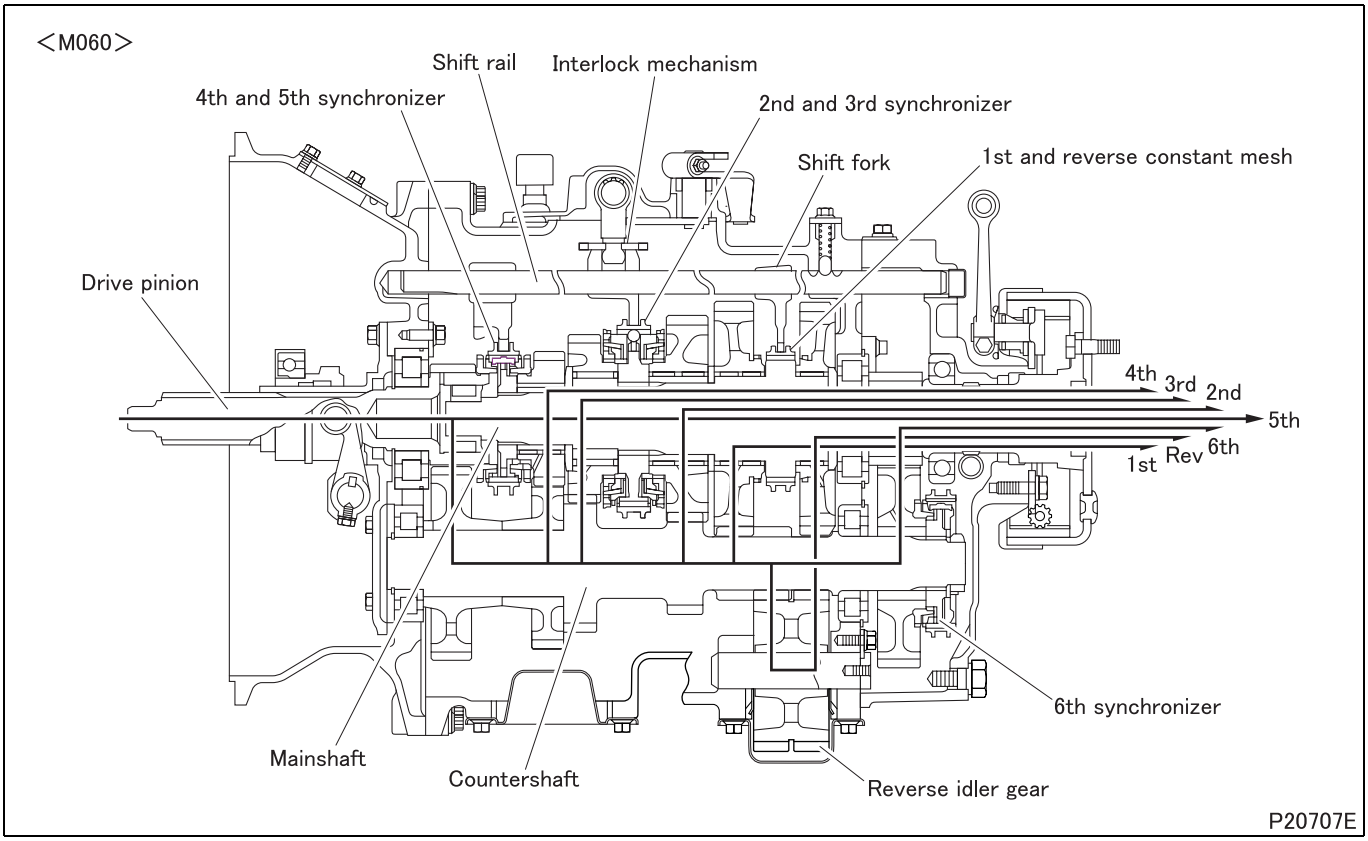
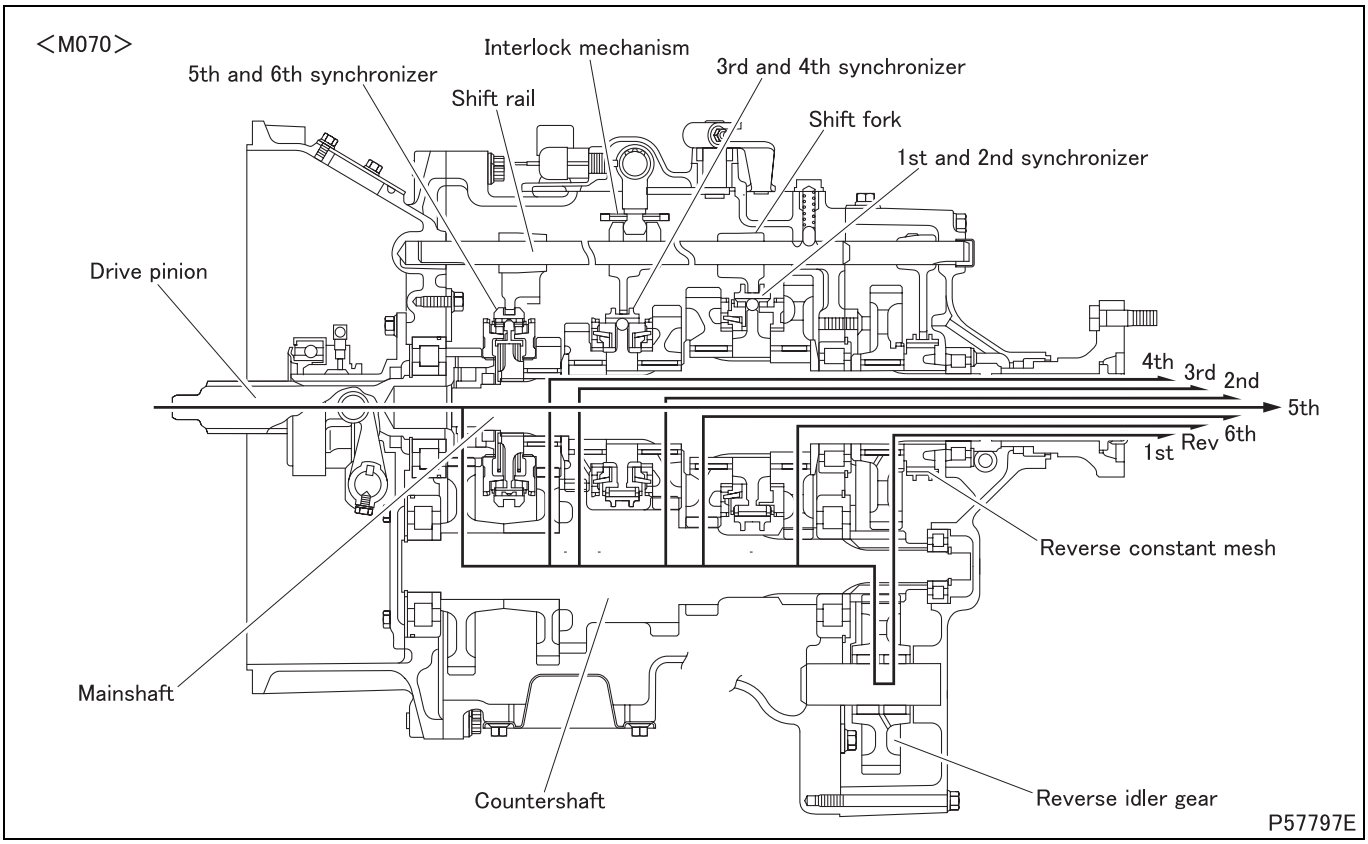
1. Transmission





- The transmission uses an interlock mechanism to avoid double engagement.

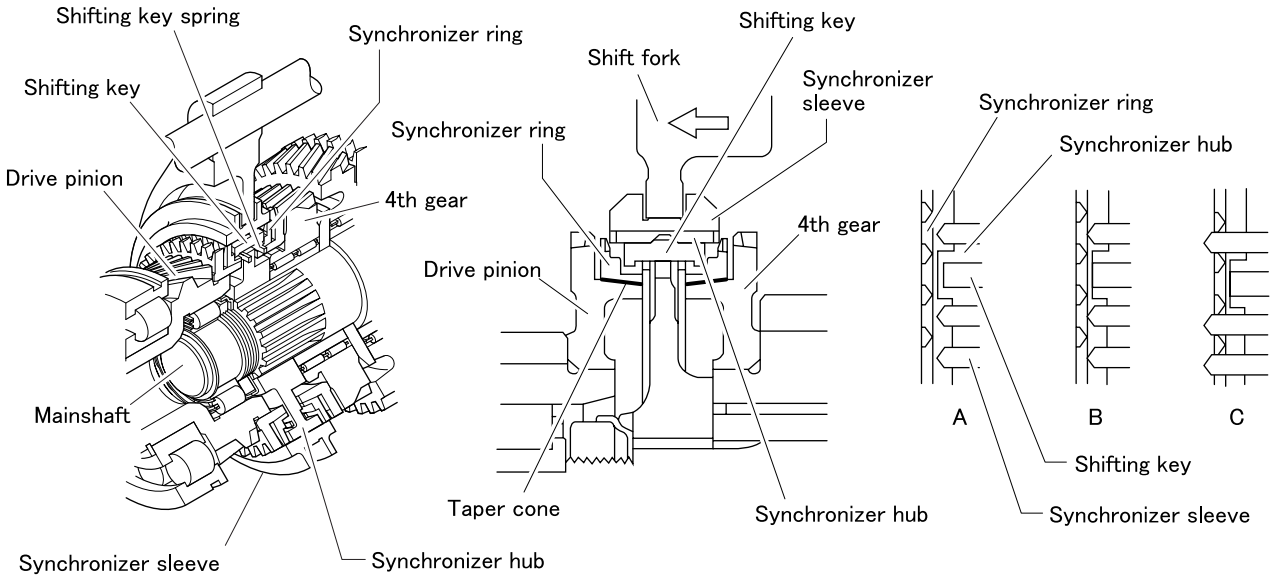
2. Synchromesh Mechanism

- The synchromesh mechanism, when a shift change is made, synchronizes the rotation speed of the mainshaft, drive pinion and synchronizer hub that rotates integrally with the mainshaft with that of the gear to be shifted.
- The synchromesh mechanism is a Warner synchromesh type, and is used depending on the gear position as shown below:

Transmission model / Synchromesh type	M060	M070
Single cone type	4th, 5th, 6th	5th, 6th
Double cone type	2nd, 3rd	2nd, 3rd, 4th

2.1 Single cone type <M060>

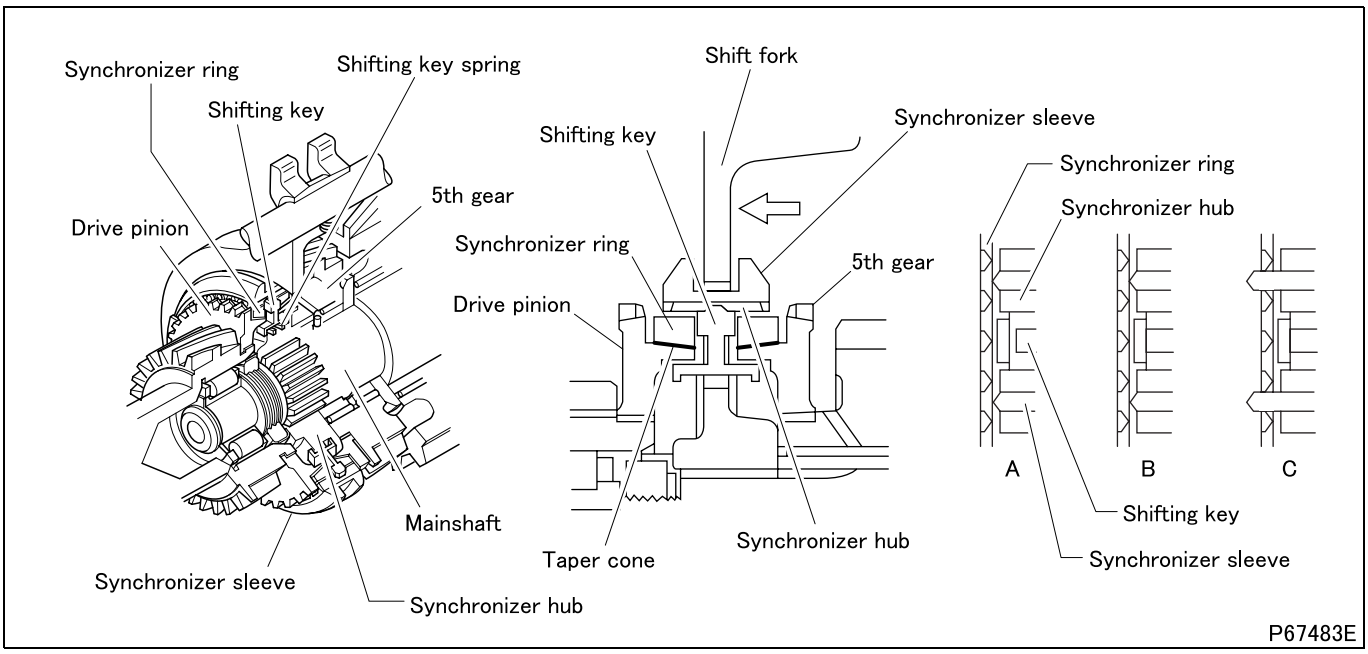
The following descriptions are for 5th (drive pinion) side of 4th and 5th synchronizer.



- The inside of the synchronizer hub engages the spline of the mainshaft and rotates with it. The outside of the synchronizer hub has a spline that engages the synchronizer sleeve and three keyways.
- Shifting keys are inserted into these keyways. When the gear shift is in neutral, the protrusions of the shifting key engages grooves in the synchronizer sleeve and are pressed against the inside of the synchronizer sleeve by shifting keys springs.
- Synchronizer rings are inserted into the respective taper cone of each gear.
- The outer splines of the synchronizer rings engage the synchronizer sleeve. On the synchronizer hub there are three keyways, in which the ends of the shifting key fit. These keyways are wider than the width of protrusions of the shifting keys.
- Synchronizer rings rotate relative to the synchronizer sleeve by the amount of play.
- When the gear shift is in neutral (Figure A), moving the shift fork in the direction of the arrow as illustrated, moves the synchronizer sleeve slightly to the drive pinion. At the same time, the shifting key, the central protrusion of which engages the synchronizer sleeve, moves to the drive pinion and presses the synchronizer ring against the taper cone of the drive pinion (Figure B).
- The taper cones of synchronizer rings, which act as cone clutches, generate friction torque and perform synchronous operation.
- The rotation speed of the synchronizer hub becomes gradually closer to that of the drive pinion gear due to the synchronous operation, and eventually they rotate at the same speed. This allows the synchronizer sleeve to move smoothly to engage the synchronizer hub and gear, completing the shift change (Figure C).

2.2 Single cone type <M070>

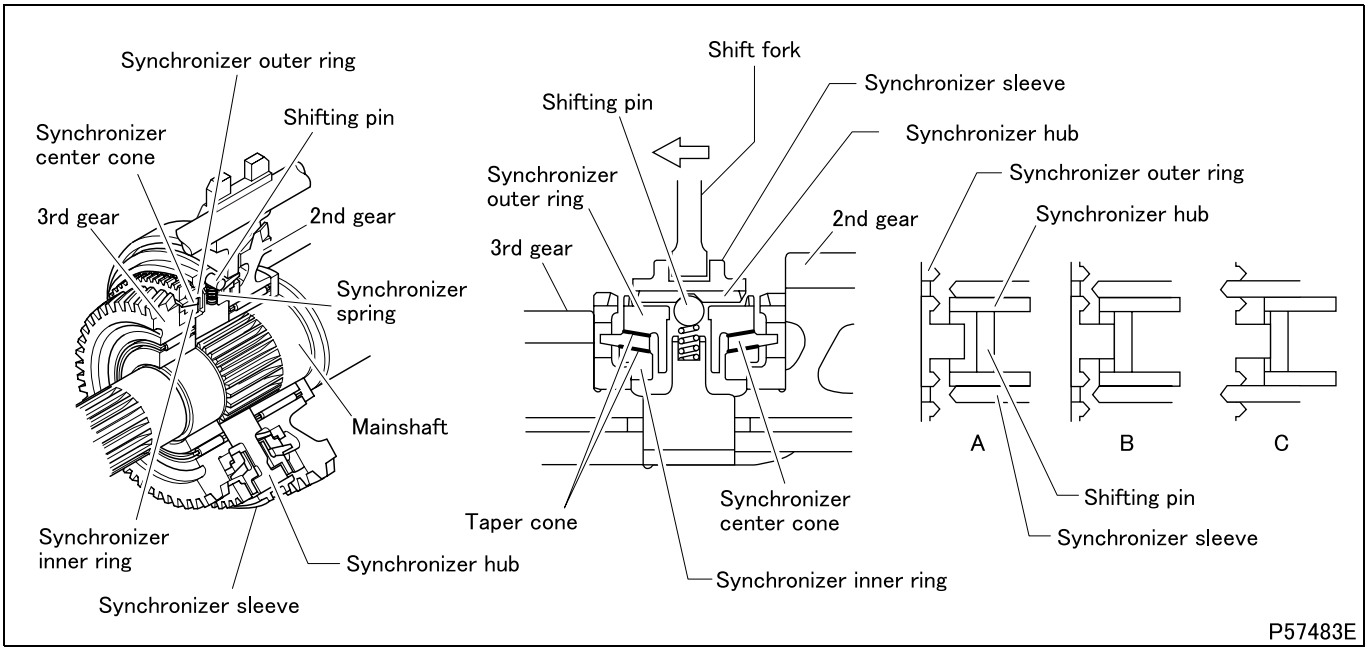
The following descriptions are for 6th (drive pinion) side of 5th and 6th synchronizer.



- The inside of the synchronizer hub engages the spline of the mainshaft and rotates with it. The outside of the synchronizer hub has a spline that engages the synchronizer sleeve and three keyways.
- Shifting keys are inserted into these keyways. When the gear shift is in neutral, the protrusions of the shifting key engages grooves in the synchronizer sleeve and are pressed against the inside of the synchronizer sleeve by shifting keys springs.
- Synchronizer rings are inserted into the respective taper cone of each gear.
- The outer splines of the synchronizer rings engage the synchronizer sleeve. On the synchronizer hub there are three keyways, in which the protrusions of synchronizer rings are inserted. These keyways are wider than the width of the protrusions of the synchronizer rings.
- Synchronizer rings rotate relative to the synchronizer sleeve by the amount of play.
- When the gear shift is in neutral (Figure A), moving the shift fork in the direction of the arrow as illustrated, moves the synchronizer sleeve slightly to the drive pinion. At the same time, the shifting key, the central protrusion of which engages the synchronizer sleeve, moves to the drive pinion and presses the synchronizer ring against the taper cone of the drive pinion (Figure B).
- The taper cones of synchronizer rings, which act as cone clutches, generate friction torque and perform synchronous operation.
- The rotation speed of the synchronizer hub becomes gradually closer to that of the drive pinion gear due to the synchronous operation, and eventually they rotate at the same speed. This allows the synchronizer sleeve to move smoothly to engage the synchronizer hub and gear, completing the shift change (Figure C).

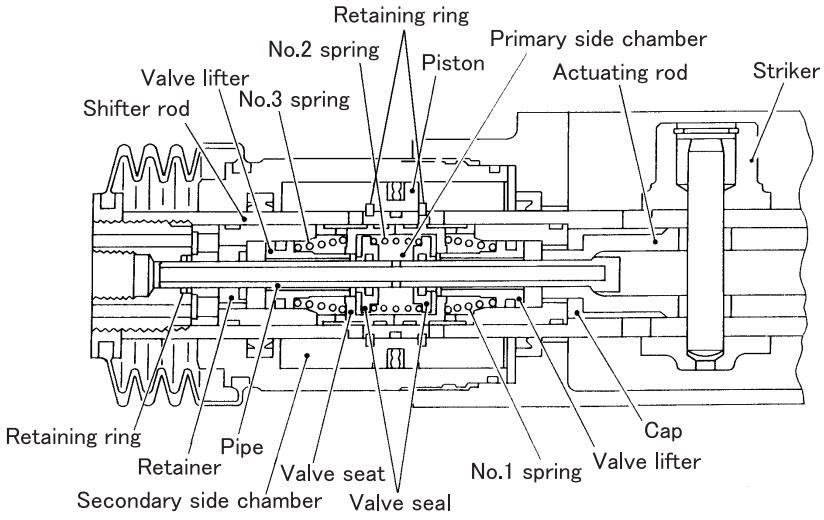
2.3 Double cone type

The following descriptions are for 3rd side of 2nd and 3rd synchronizer <M060>.

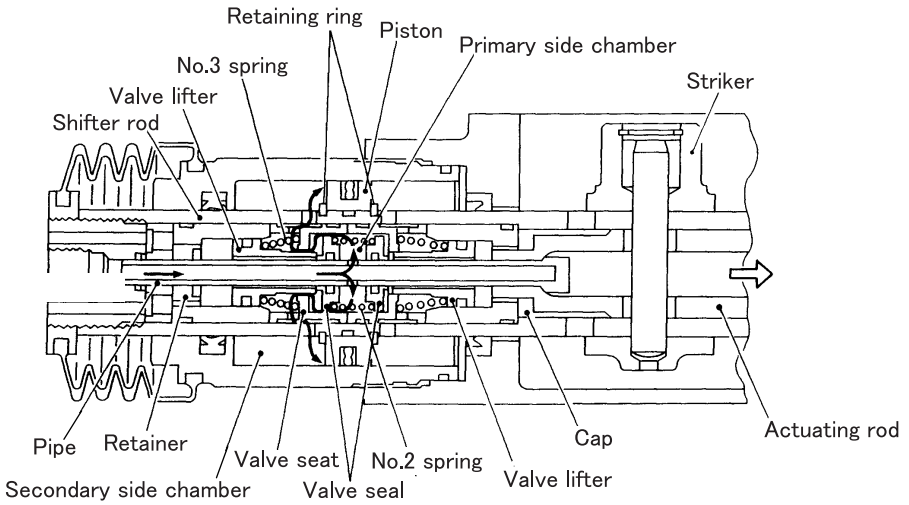


- The synchromesh structure and operation are basically the same as for the single cone type. The synchronizer ring is divided into three parts (synchronizer inner ring, synchronizer center cone and synchronizer outer ring) and the center cone (both the inside and outside surfaces are tapered) is sandwiched between the taper cones of the outer ring and inner ring to shorten the time required for synchronization with cone clutches at two locations.
- Six protrusions on the outside of the synchronizer center cone fit into corresponding gear holes. As in the taper cone of the single cone type, the center cone and the gear are installed as if integrated.
- The inside of the synchronizer hub engages the spline of the mainshaft and rotates with it. The outside of the synchronizer hub has a spline that engages the synchronizer sleeve and three keyways.
- Shifting pins are inserted into these keyways. When the gear shift is in neutral, the shifting pins engage grooves in the synchronizer sleeve and are pressed against the inside of the synchronizer sleeve by synchronizer springs.
- The synchronizer outer ring and synchronizer inner ring are inserted into synchronizer center cones, respectively.
- The outer spline of the synchronizer outer ring engages the synchronizer sleeve. On the synchronizer hub are three grooves in which protrusions of the synchronizer outer ring are inserted. These grooves are wider than the width of protrusions of the synchronizer outer ring.
- The synchronizer outer ring rotates relative to the synchronizer sleeve by the amount of play.
- When the gear shift is in neutral (Figure A), moving the shift fork in the direction of the arrow as illustrated moves the synchronizer sleeve slightly to the 3rd gear. At the same time, the shifting pin, which engages grooves in the synchronizer sleeve, moves to the 3rd gear and presses the synchronizer outer ring against the taper cone of the synchronizer center cone, and in addition, presses the center cone against the synchronizer inner ring (Figure B).
- The taper cones of synchronizer rings, which act as cone clutches, generate friction torque and perform synchronous operation.
- The rotation speed of the synchronizer hub becomes gradually closer to that of the gear of the 3rd gear due to the synchronous operation, and eventually they rotate at the same speed. This allows the synchronizer sleeve to move smoothly to engage the synchronizer hub and gear, completing the shift change (Figure C).

3. Power Shift

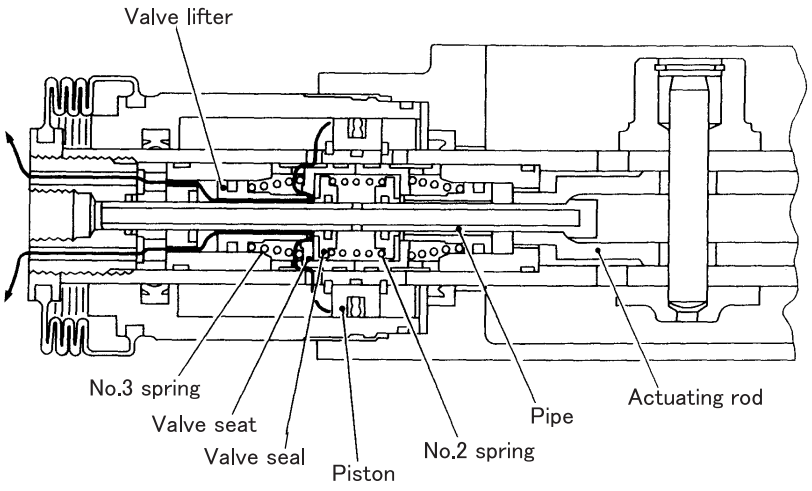


3.1 When activated



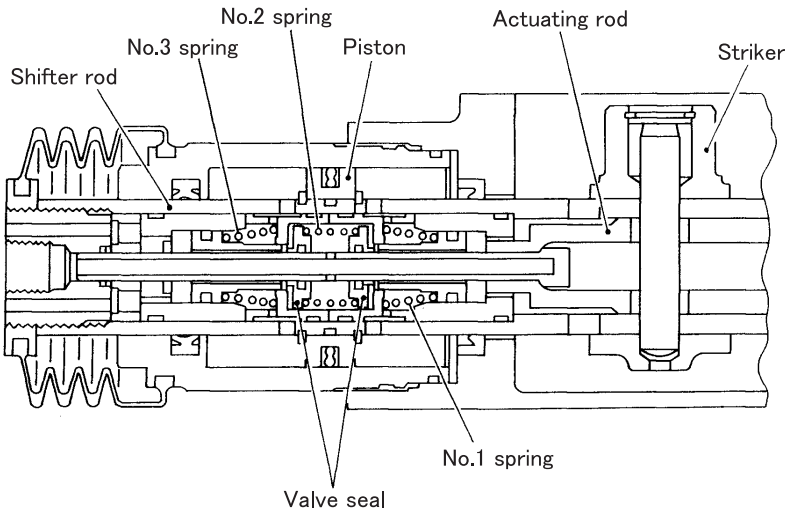
- When actuating rod is moved in the direction of the arrow as illustrated, shifter rod and the actuating rod move relative to this movement. Valve lifter presses No.3 spring against valve seal to overcome the combined repercussive forces of the compressed air acting on the valve seal and No.2 spring. The valve seal separates from valve seat, and the compressed air supplied to primary side chamber is let into secondary side chamber via the opening between the valve seat and the valve seal. The compressed air flows into the cylinder through the hole and groove of the valve seal and the vent hole of shifter rod to put pressure on piston, generating output.
- The output given to piston is transmitted to shifter rod via retaining ring to assist striker which is fixed on the shifter rod. This operates the shift fork on the transmission side, shifting the gears. Thus, gear shifting is completed.
- When the power shift operates in the direction of the arrow as illustrated, the input from the gear shift lever is transmitted by actuating rod via cap, pipe, and retainer fixed on retaining ring. For operation in the opposite direction, all operations are the same in principle as in the direction of the arrow as illustrated, except that the end of the cap, fixed on the end of the actuating rod, presses valve lifter directly.

3.2 When releasing



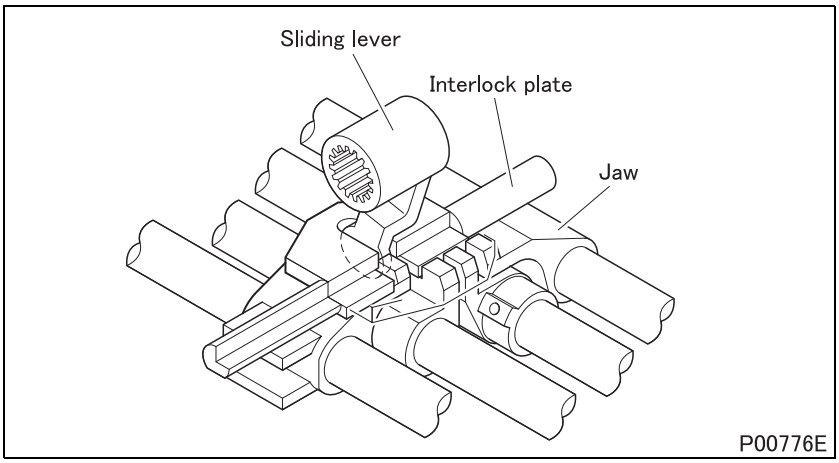
- When gear shifting is completed and the input is released, actuating rod is returned to the valve center position (the condition before operation) by the combined repercussive forces of the compressed air of valve lifter, the steel ball, and valve springs.
  As the valve lifter returns, valve seal seats against valve seat, cutting off the flow of compressed air from primary side chamber to secondary side chamber. As the input rod returns, clearance is generated between the valve lifter and the valve seal.
- The compressed air in the cylinder of secondary side chamber is discharged into the atmosphere through the clearance between valve lifter and pipe. This eliminates the pressure difference between the chambers on both sides of piston, so output is lost.

3.3 When not operating (non-boosting)



- To operate the power shift, that is, to open the valve and let the compressed air into the output chamber, actuating rod on the input side and shifter rod on the output side must generate relative disengagement.
- When the operating force is transmitted from the gear shift lever to actuating rod, and the resistance on the transmission side is less than the combined repercussive forces working on the relative disengagement of the input side and output side (repercussive forces of No.1 to 3 springs; pressure on valve seal; and sliding resistance on various parts), the mechanism, from the actuating rod to striker, is integrated and does not generate relative disengagement. Therefore, the valve does not open, and without boosting operation, piston moves in the cylinder to shift gears.

4. Interlock Mechanism



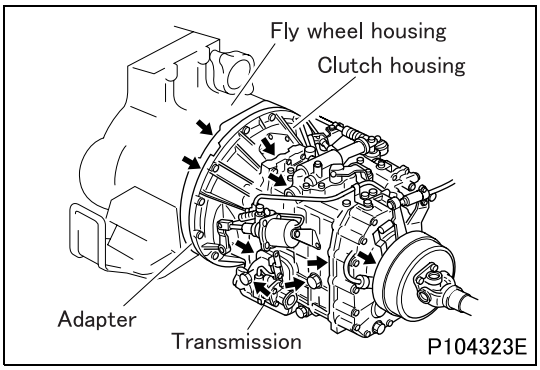
- The interlock mechanism is a mechanism to prevent double engagement of gears.
- The rail beneath the interlock plate locks jaws except jaws shifted by gear shift sliding lever, preventing double engagement of gears.

Possible causes / Symptoms		Gears slip out of engagement	Gears hard to engage	Noise when engine is idling	Noise when cruising	Noise when changing gear	Reference Gr
Transmission body faulty	Mainshaft rear lock nut loose	O	O				
	Mainshaft thrust washer worn	O	O				
	Mainshaft bearings worn or damaged	O	O				
	Mainshaft pilot bearing worn or damaged			O	O		
	Drive pinion bearing worn or damaged			O			
	Countershaft bearings worn or damaged			O			
	Needle bearings of gears worn or damaged			O	O		
	Mainshaft and countershaft bearing bearings worn or damaged				O		
	Mainshaft and countershaft gears backlash excessive				O		
	Spline of gears worn					O	
	Gears damaged				O		
	Transmission oil insufficient				O		
Control mechanisms faulty	Control cable adjustment faulty		O				
	Control cable routing inadequate		O				
	Control cable length inadequate		O				
	Bushings worn	O	O				
	Interlock pin and groove of shift rail worn	O					
	Poppet spring of shift rail fatigued or broken	O					
	Shift rail sliding area worn		O				
	Shift fork jaws worn		O				
	Shift fork broken		O				

Possible causes \ Symptoms			Gears slip out of engagement	Gears hard to engage	Noise when engine is idling	Noise when cruising	Noise when changing gear	Reference Gr
Power shift malfunctioning	Air compressor faulty			O				Gr35A
	Air leakage			O				
	Power shift faulty			O				
Clutch faulty	Clutch disengagement faulty			O			O	Gr21
	Clutch pedal play faulty			O				
Synchronizer faulty	Single-cone type	Wear of contacting surface between synchronizer ring and tapered cone section of the gear		O			O	
	Double-cone type	Wear of contacting surface between synchronizer inner and outer rings and the center cone		O			O	
	Synchronizer ring and synchronizer sleeve spline worn		O					
	Wear on chamfered section of synchronizer ring splines						O	
	Shifting key and shifting pin worn						O	
	Shifting key spring and synchronizer spring deteriorated or damaged						O	
	Synchronizer sleeve worn or damaged					O	O	

ON-VEHICLE INSPECTION AND ADJUSTMENT

1. Inspection of Transmission Oil Leakage



1.1 Inspection of oil leakage at each part of transmission body

- Check the oil leakage at each part of transmission body in visual.
  If the oil leakage is found, replace the defective part.

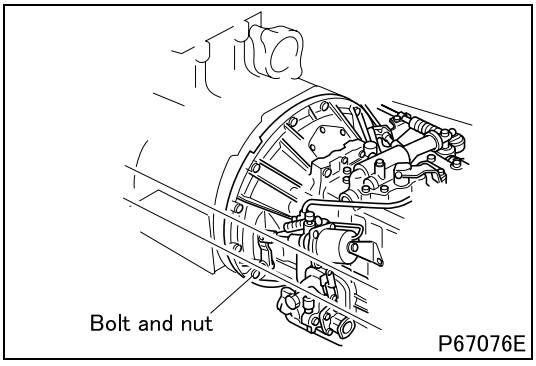
1.2 Inspection of oil leakage around transmission mounting part

- Check there is not oil stain on flywheel housing, spacer and transmission mounting part caused by oil leakage from engine.
- If there is the oil stain, remove the transmission and clean the mounting surface of clutch housing and flywheel housing using brake cleaner etc. after repairing oil leakage part. Because the oil stain may loosen the transmission mounting bolts. (See “REMOVAL AND INSTALLATION OF TRANSMISSION”.)

2. Inspection of Looseness in Transmission Mounting Bolts

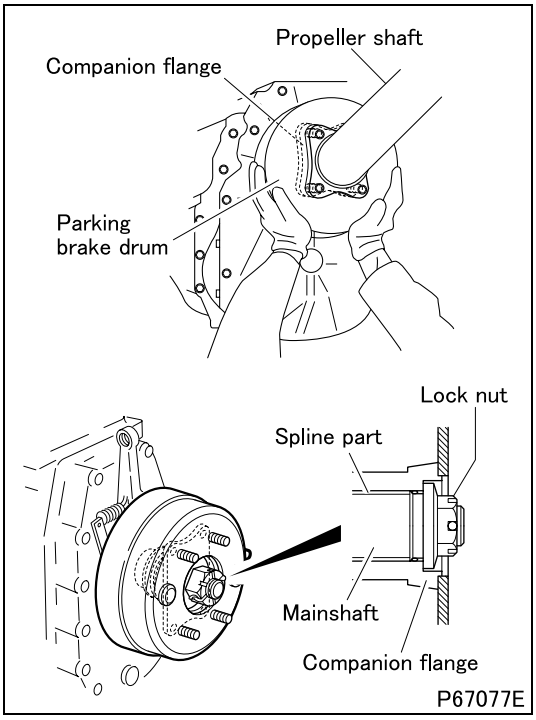
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
–	Bolt or nut (transmission mounting)	40.2 {30, 4.1}	–



- Check the transmission mounting bolts and nuts for looseness.
- Retighten any loose bolt or nut to the specified torque.

3. Inspection of Play and Looseness in Companion Flange



- Check the propeller shaft mounting bolts for looseness. (See Gr25.)
- Move the parking brake drum or companion flange in axial and vertical directions to check for excessive play between the companion flange and mainshaft.
- If excessive play is detected, remove the propeller shaft, then check the lock nut for looseness and the splines on companion flange and mainshaft for abnormalities. If any part is found defective, replace the part. (See the “EXTENSION HOUSING” section.)

4. Inspection and Replacement of Transmission Oil

WARNING ⚠

- **Temperature of transmission oil is high immediately after driving. Perform work when oil is cold.**

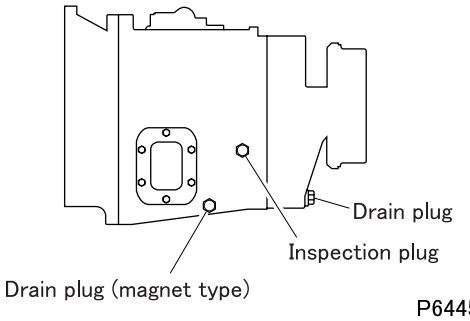
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
–	Inspection plug	68.6 ± 14.7 {51 ± 11, 7.0 ± 1.5}	–
	Drain plug		

Lubricant and/or sealant

Mark	Points of application		Specified lubricant and/or sealant	Quantity
–	Thread area of inspection plug		ThreeBond 1105	As required
	Thread area of drain plug			
–	Transmission case and extension housing	M060	Gear oil General: API GL-3 SAE80 Warm regions: API GL-3 SAE90 Tropical regions: API GL-4 SAE90	6.7 dm^3 {7.1 qts}
		M070		8.1 dm^3 {8.6 qts}

For a model with transmission PTO, the quantity is increased by 0.5 dm^3 {0.5 qts}.



[Inspection]

(1) Inspection of oil quantity

- Remove the inspection plug, and check that transmission oil is filled up to the neck.
- If oil is not sufficient, fill transmission oil from the inspection plug hole up to the neck.
- After filling, apply sealant to the inspection plug and tighten it to the specified torque.

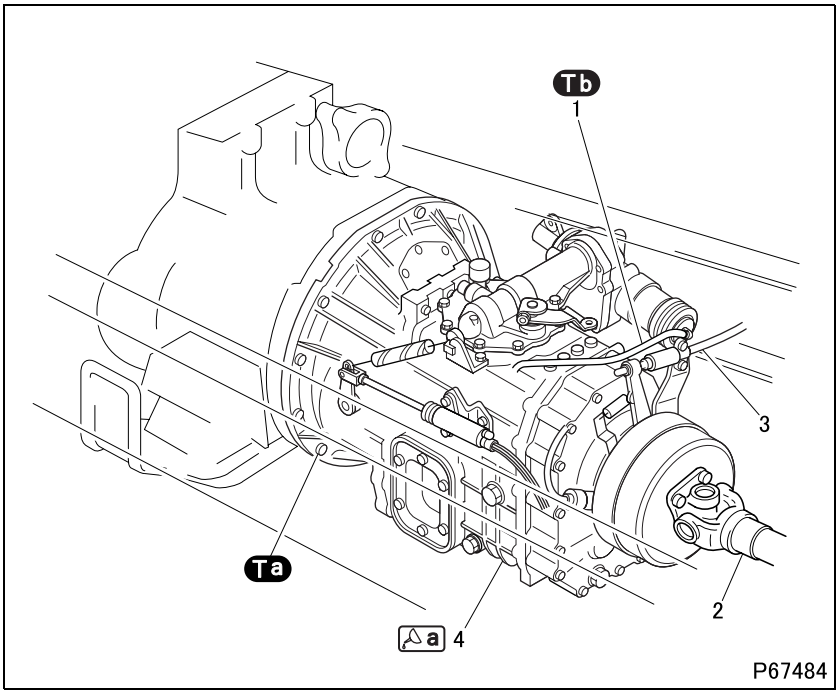
(2) Inspection of oil quality and inclusions

- When draining transmission oil, check for oil quality, metal chips and metal powder.
- The following conditions are indicative of internal troubles; hence overhaul is required.
  - Viscosity is too high
  - A foreign odor
  - Too many metal particles

[Replacement]

- Remove the drain plug to drain transmission oil. Drainage can be made quickly with the inspection plug removed.
- After draining transmission oil, apply sealant to the drain plug and tighten it to the specified torque. Magnet type drain plugs should be cleaned before installation.
- Fill transmission oil of the specified quantity from the inspection plug hole.
- After filling, check that oil is filled up to the neck of the inspection plug hole. If oil is not sufficient, replenish it.
- After completing work, apply sealant to the inspection plug and tighten it to the specified torque.

REMOVAL AND INSTALLATION OF TRANSMISSION



● **Disassembly sequence**

1 Air tube
2 Propeller shaft (See Gr25.)
3 Parking brake cable <M060> (See Gr36A.)
4 Transmission

● **Assembly sequence**

Follow the removal sequence in reverse.

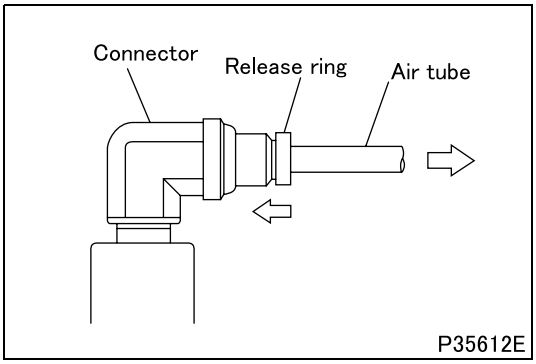
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Nut or bolt (transmission mounting)	40.2 {30, 4.1}	–
Tb	Air tube	20 to 28 {15 to 21, 2.0 to 2.9}	–

Lubricant and/or sealant

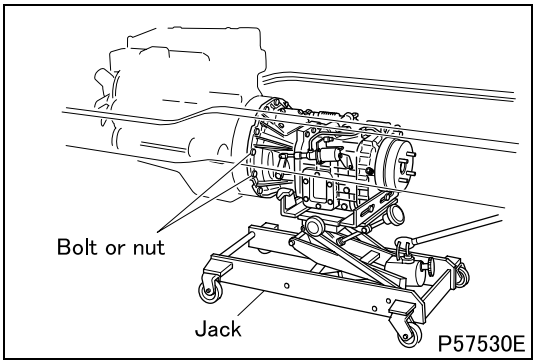
Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Spline of drive pinion	Molybdenum disulfide grease [NLGI No.2 (Li soap)]	As required

◆Removal procedure◆



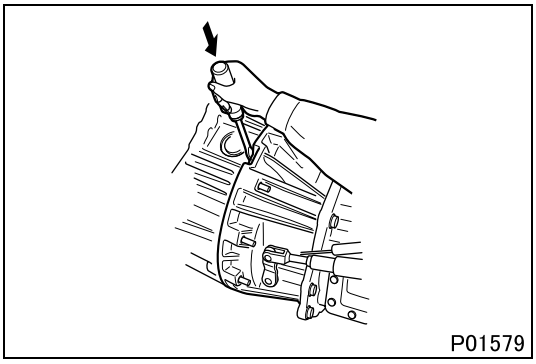
■ **Removal: Air tubes <M060>**

- Pressing the release ring on the tip of the snap-on hose connector against the connector, pull off the air tube.



■ **Removal: Transmission**

- Support the transmission on a transmission jack and remove transmission mounting bolts or nuts.

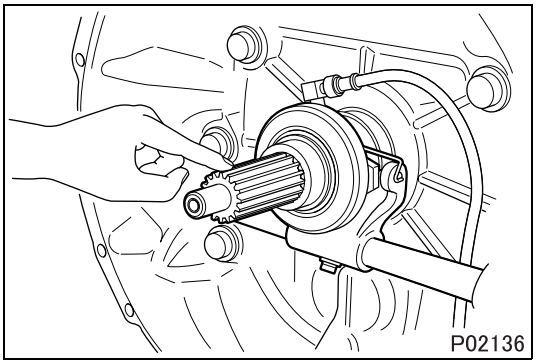


- Insert a screwdriver into the three removal grooves and remove the transmission from the engine.
- Move the transmission backward slowly until the spline of the drive pinion is detached from the clutch.

CAUTION ⚠

- **If the transmission is shaken strongly, there is a risk of damage to the spline that couples the drive pinion with the clutch.**

◆Installation procedure◆

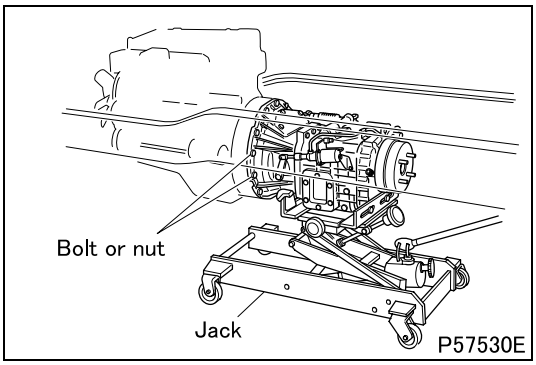


■ **Installation: Transmission**

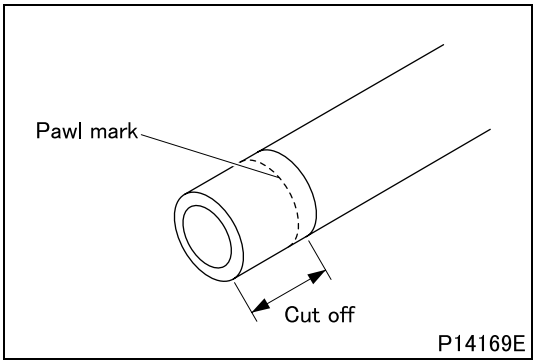
- Check the spline of the drive pinion for rust.
- If rust is found, remove it using a wire brush.
- Rub grease evenly onto the clutch disc sliding surface of the drive pinion using your hand.

CAUTION ⚠

- **Make sure that you apply only the necessary amount of grease because too much grease can drip and cause clutch slip.**

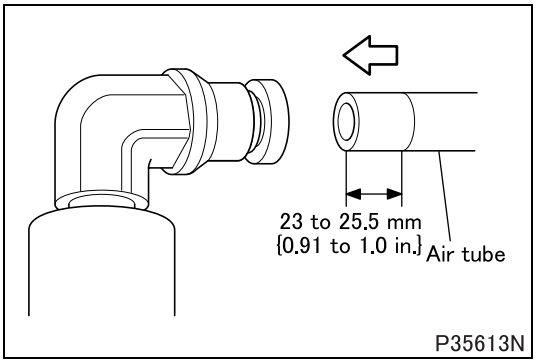


- While supporting the transmission on a transmission jack, insert the drive pinion end into pilot bearing of the flywheel. In so doing, take care of the spline of drive pinion.
- Tighten transmission mounting bolts or nuts to the specified torque.



■ **Installation: Air tubes <M060>**

- When the air tube is disconnected from the snap-on tube connector, a “pawl mark” made by the connector is left on the peripheral surface of the tube end. When the disconnected tube is reused, to avoid possible harm of this mark, cut off the tube end portion at the mark. At the same time, check that the portion of the tube that will go into the connector is free of foreign matter (residual tape, etc.) and any damage on the surface. Cut off damaged portion from the tube.



- Thoroughly remove dirt and grease, if any, from inside the snap-on connector.
- Fit the air tube firmly into the snap-on connector.
- The insertion depth of the air tube into the connector is as shown. If the tube is not inserted to this depth, its connection is incomplete.

GEAR SHIFTER UPPER AND INTERLOCK PLATE

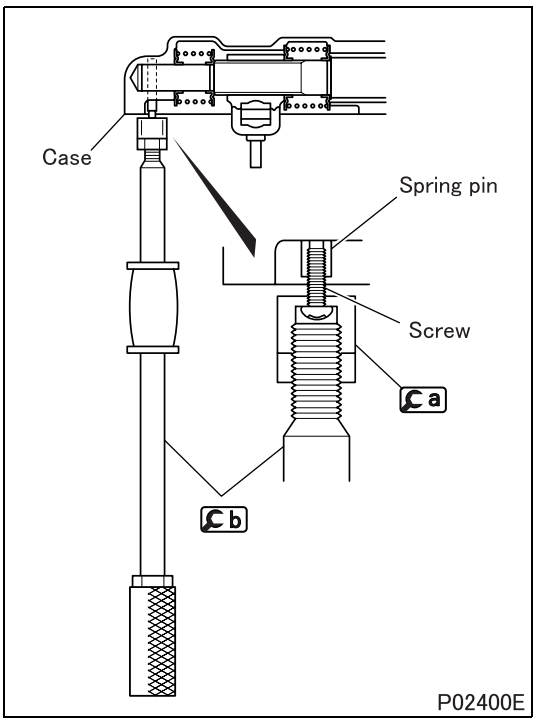
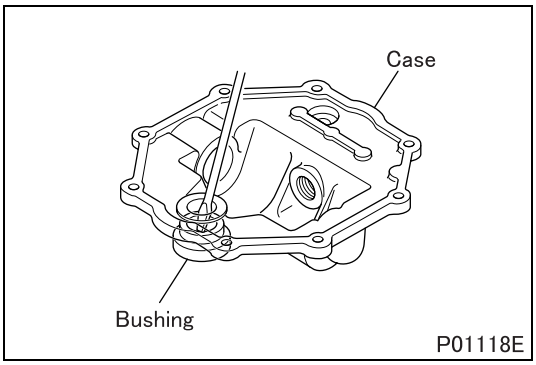
◆**Removal procedure**◆



■ **Removal: Spring pin**

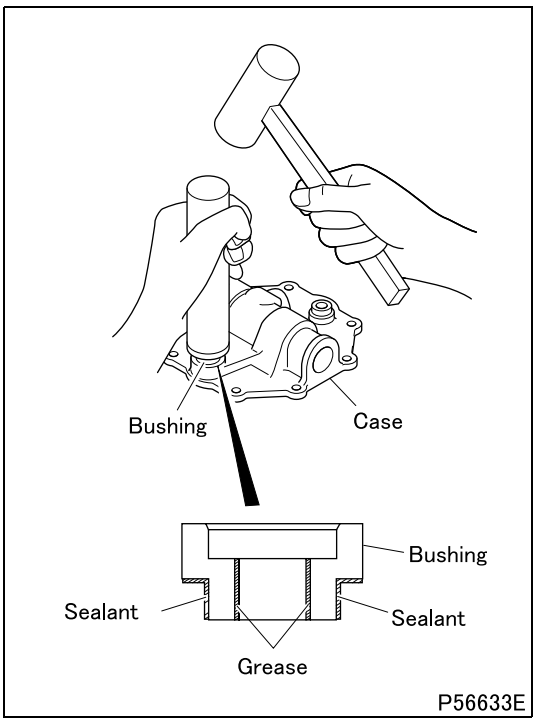
- Tap the spring pin using an M4 tap.
- Insert a with an M4 screw of appropriate length into the spring pin, and remove the spring pin using b.



■ **Removal: Bushing**

- Remove the bushing with a screwdriver while taking care not to damage the gear select lever case.

◆Installation procedure◆



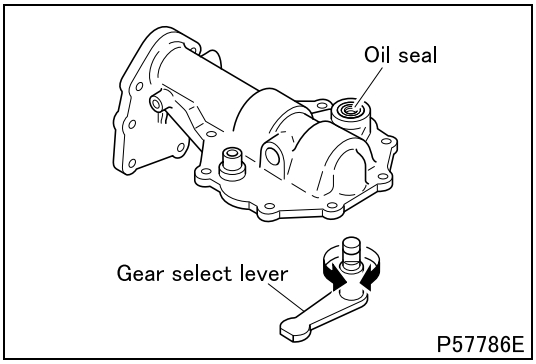
■ **Installation: Bushing**

- Clean the bushing and bushing mounting surface of the select lever case.
- Apply grease to the inner surface of the bushing and sealant to its outer surface.

CAUTION ⚠

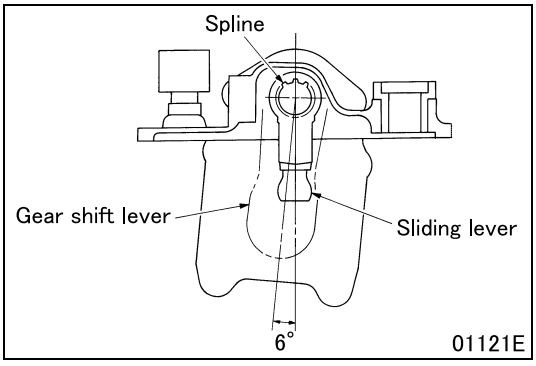
- **Do not allow sealant to adhere to the inner surface of the bushing as it may cause malfunction of the gear select lever.**

- Mount the bushing by evenly tapping it using a round bar of outer diameter of approximately 40 mm {1.57 in.}.



■ **Installation: Gear select lever**

- Install the gear select lever while turning so that the oil seal is not damaged in the lip.



■ **Installation: Gear shift lever**

- Install the gear shift lever aligning with the spline so that it is placed at the illustrated angle to the gear shift sliding lever.

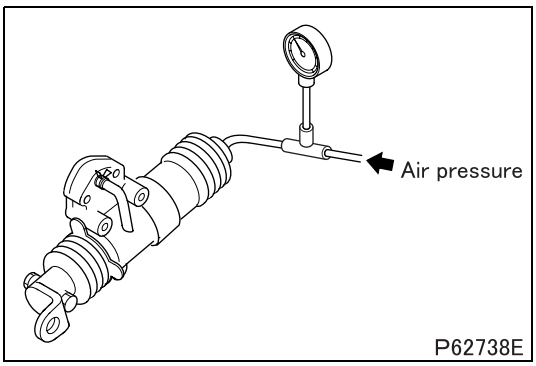
c	Socket wrench A: 46 {1.81}  P02030	ME528895	Removal and installation of cylinder

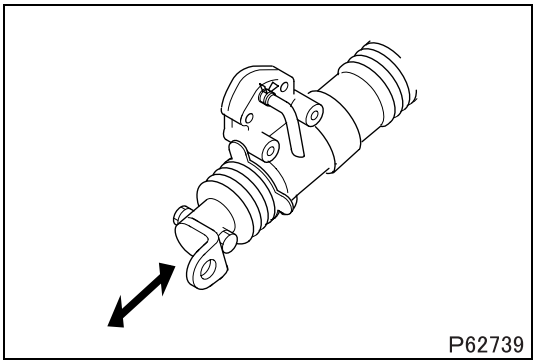
◆Inspection before removal◆



■ **Inspection: Power shift**

(1) Inspection of air tightness

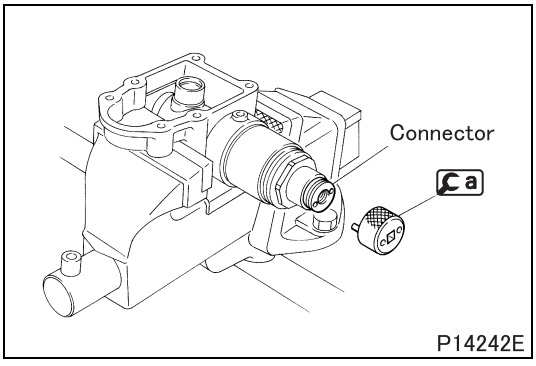
- Apply the specified pressure from the connector, and check air tightness when the power shift is not operating (valve in neutral position) and when it is operating (in both directions of pushing and pulling the valve).
- If the measured value exceeds the limit, replace defective parts.



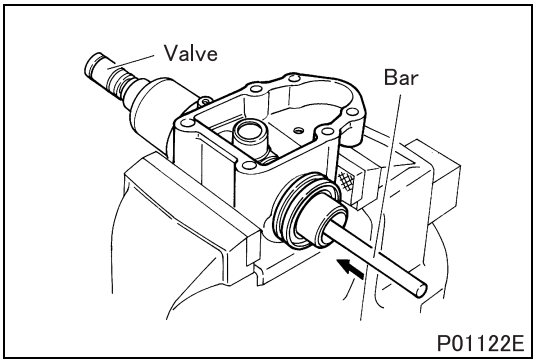
(2) Sliding resistance in shifting direction

- Measure sliding resistance in the shifting direction of the shift cable connecting hole position. Perform shifting for conditioning four or five times before measurement.
- If the measurement exceeds the specified standard value, apply grease on all sliding surfaces.
- After applying grease, measure again; if the measurement deviates from the standard value, replace the defective part(s).

◆Removal procedure◆



■ **Removal: Connector**

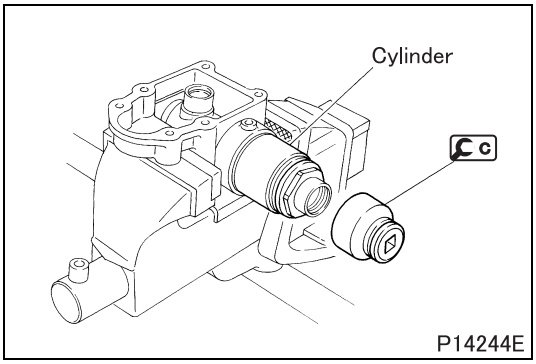


■ **Removal: Valve**

- Gently drive valve out from the shifter rod from the lever side using bar.

CAUTION ⚠

- **Do not drive valve too hard or you will damage the valve parts.**

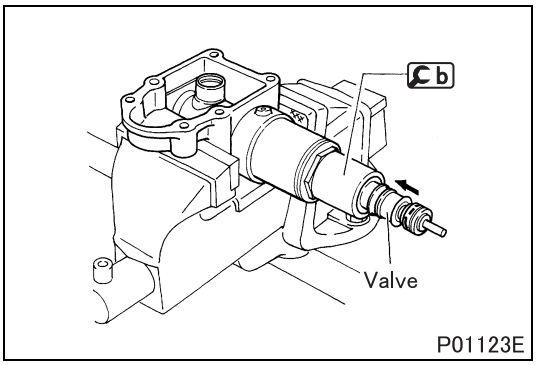


■ **Removal: Cylinder**

◆Installation procedure◆

■ **Installation: Cylinder**

- Install the cylinder by following the removal sequence in reverse. (See "■ **Removal: Cylinder**".)

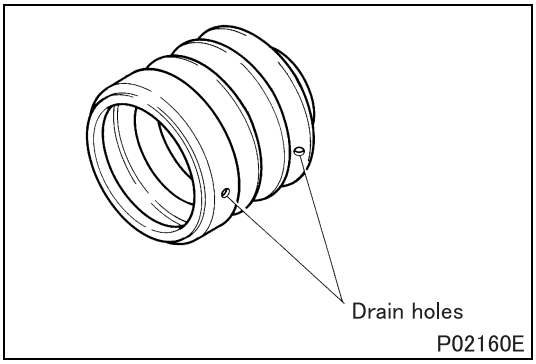


■ **Installation: Valve**

- Apply grease to valve.
- Install valve into the shifter rod using b, taking care not to damage the seals.

■ **Installation: Connector**

- Install the connector by following the removal sequence in reverse. (See "■ **Removal: Connector**".)



■ **Installation: Boot**

- When you install boot on housing, point drain holes downward.

CAUTION ⚠

- **Be careful to assemble springs in the correct order.**

Service standards (Unit: mm {in.})

Location	Maintenance item	Standard value	Limit	Remedy
9	Spring load (installed length 12.35 {0.49})	82 ± 8.2 N {18 ± 1.8 lbs, 8.4 ± 0.8 kgf}	67 N {15 lbs, 6.8 kgf}	Replace
14	Spring load (installed length 10 {0.39})	13 ± 1.3 N {2.9 ± 6.4 lbs, 1.3 ± 0.13 kgf}	9.8 N {2.2 lbs, 1.0 kgf}	Replace
19	Spring load (installed length 12.2 {0.48})	50 ± 5.0 N {11 ± 1.1 lbs, 5.06 ± 0.51 kgf}	40 N {9.0 lbs, 4.1 kgf}	Replace

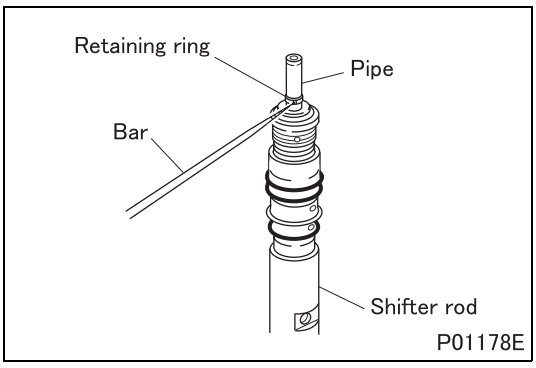
Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
–	All friction surfaces	Multipurpose grease [NLGI No.2 (Li soap)]	As required

Special tools (Unit: mm {in.})

Mark	Tool name and shape	Part No.	Application
a	Insert tool A: 30 {1.18}, B: 10 {0.39}, C: ϕ3.8 {0.15}, D: ϕ7.1 {0.28}  P101238	ME528899	Installation of retaining ring
b	Insert tool A: ϕ30 {1.18}, B: ϕ7 {0.28}, C: 29 {1.14}, D: 35 {1.38}  P101239	ME528896	

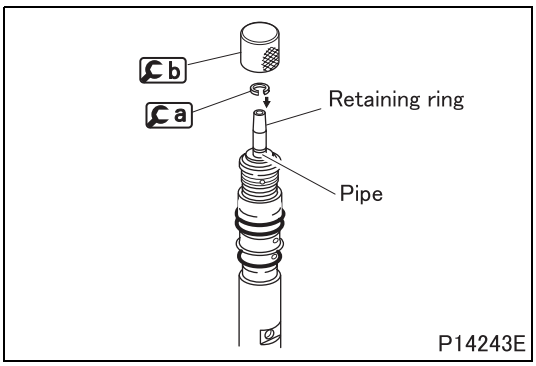
◆Removal procedure◆



■ Removal: Retaining ring

- Secure the rod in a vice with caution.
- Remove the retaining ring from the pipe using something like needle.

◆Installation procedure◆

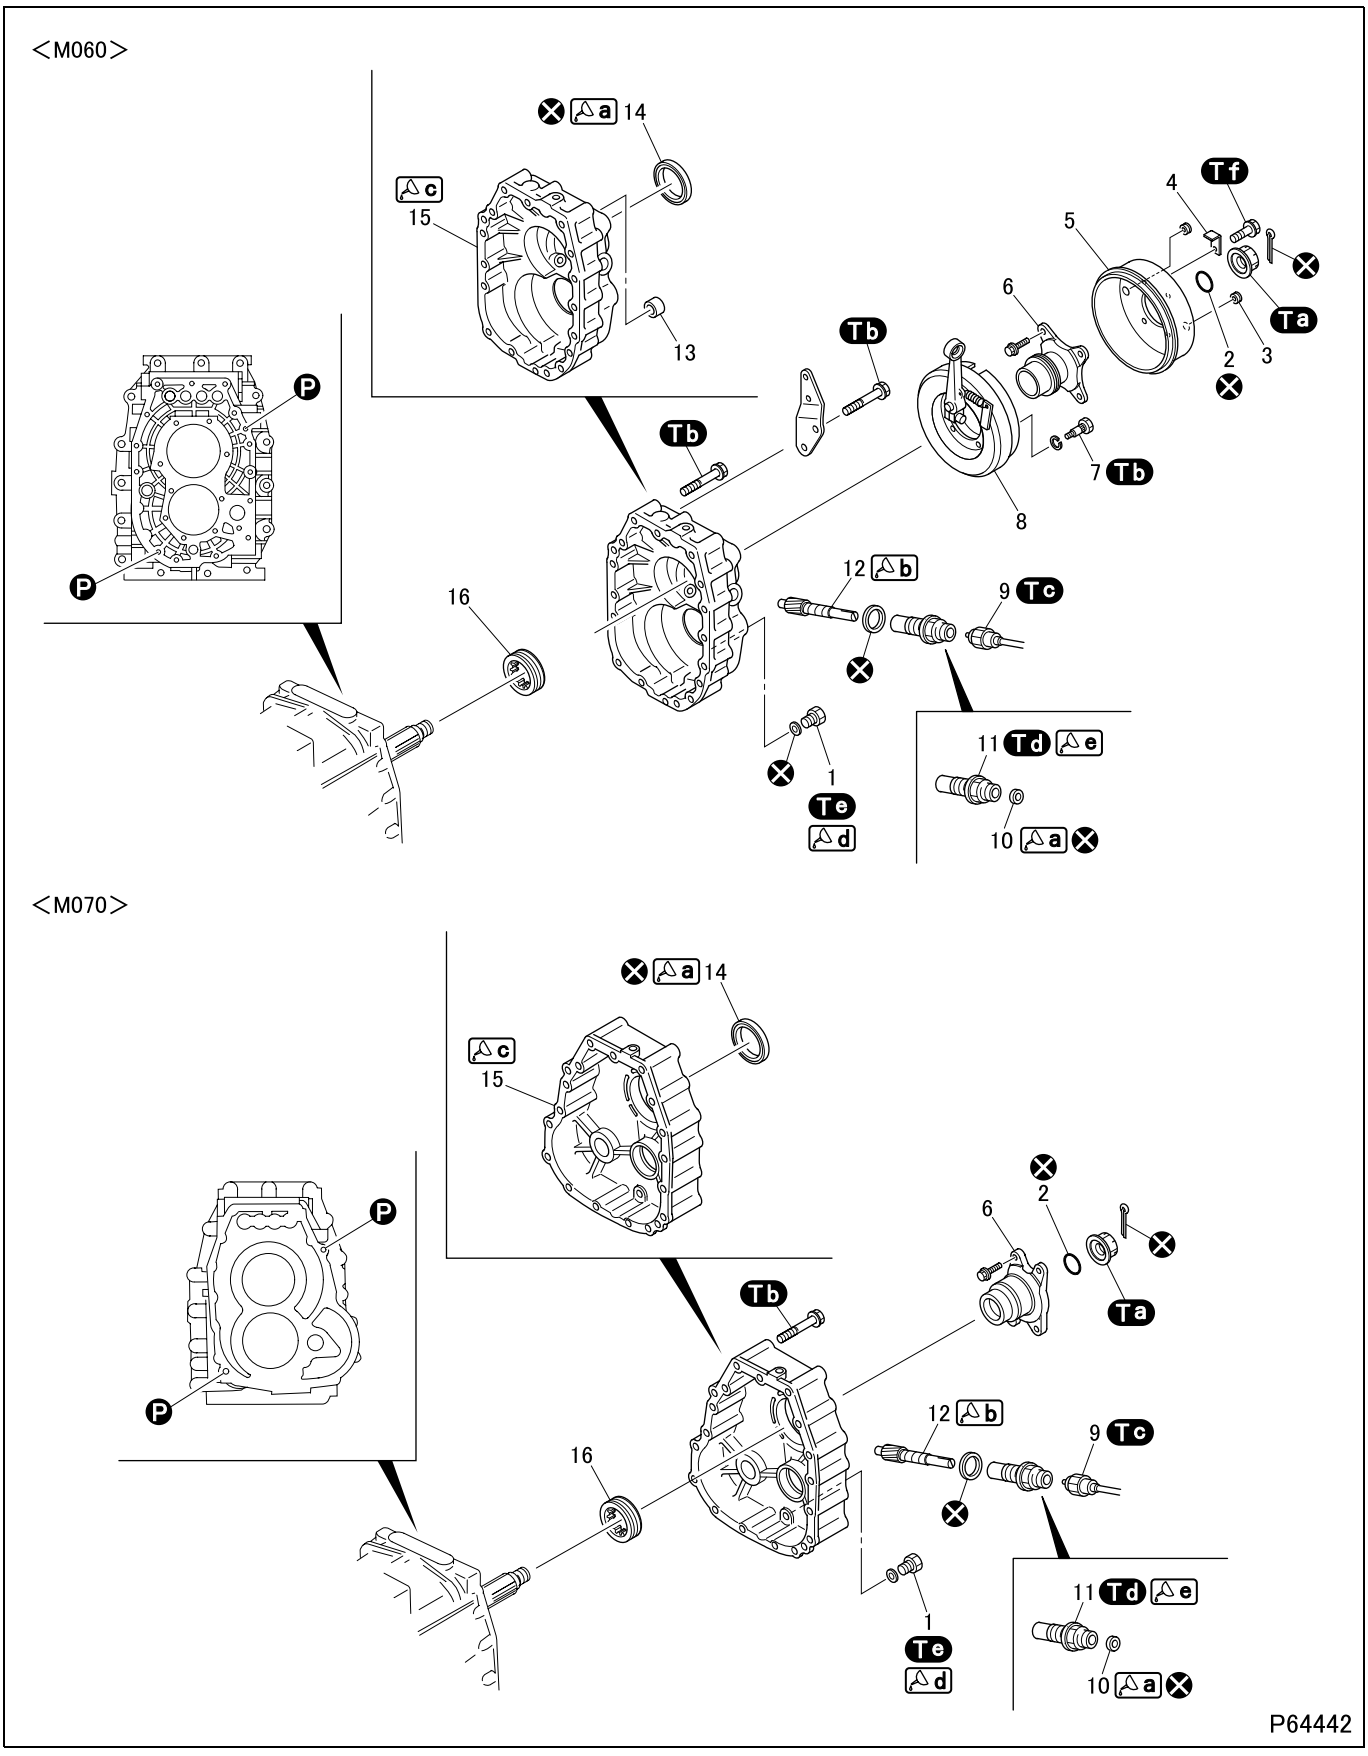


■Installation: Retaining ring

- Attach a to the pipe tip, push the retaining ring in a straight line using b, and secure it in the pipe groove.
- If the ring jams up during installation, reinstall it.

M E M O

EXTENSION HOUSING AND PARKING BRAKE



● **Disassembly sequence**

1 Drain plug
2 O-ring
3 Dust plug
4 Drum plate <M060>
5 Parking brake drum <M060>
6 Companion flange
7 Reamer bolt <M060>>
8 Parking brake support plate and shoe <M060> (See Gr36.)
9 Vehicle speed sensor
10 Oil seal
11 Speedometer gear bushing
12 Speedometer gear
13 Dust plug <M060>
14 Oil seal
15 Extension housing
16 Speedometer worm

Ⓟ: Locating pin
⊗: Non-reusable parts

CAUTION ⚠

- **Do not disassemble parking brake drum and companion flange unless it is absolutely necessary, because they have been adjusted for good balance. When they must be disassembled, make alignment marks and use them as reference at reassembly. The brake drum and companion flange should not be replaced as an individual part.**

● **Assembly sequence**

Follow the disassembly sequence in reverse.

Service standards (Unit: mm {in.})

Location	Maintenance item		Standard value	Limit	Remedy
5	Parking brake drum	Inner diameter	$\phi 254^{+0.5}_{0}$ {$10^{+0.020}_{0}$}	ϕ255.5 {10.1}	Replace

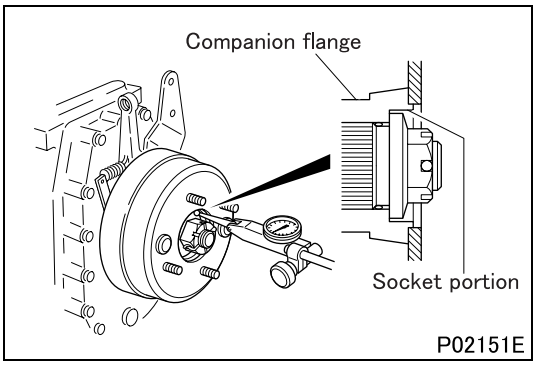
◆Work before removal◆

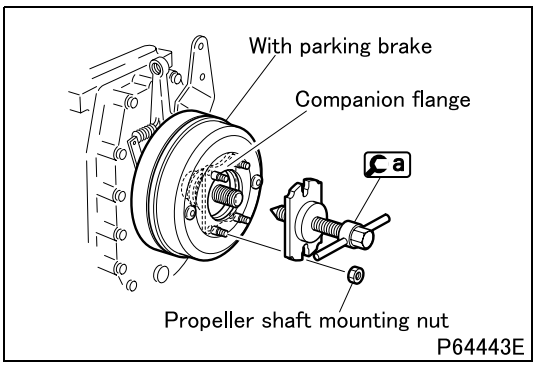


P02151E

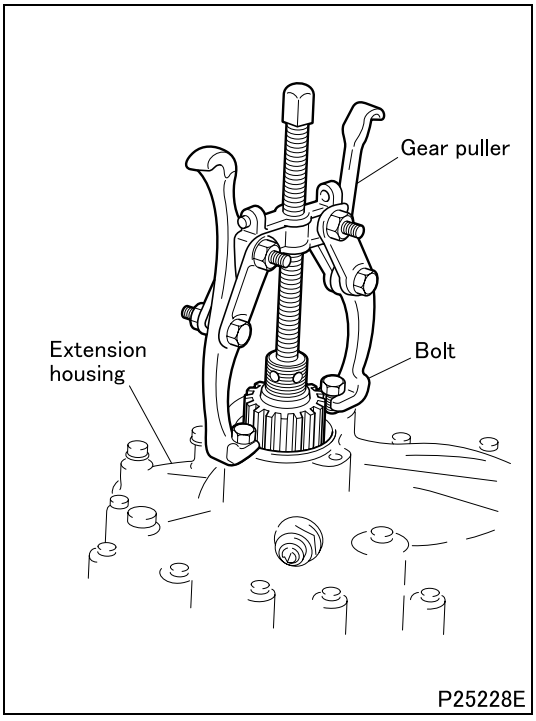
■ **Inspection: Runout at socket portion of companion flange**

- If the measured value exceeds the limit, replace the companion flange.

◆Removal procedure◆



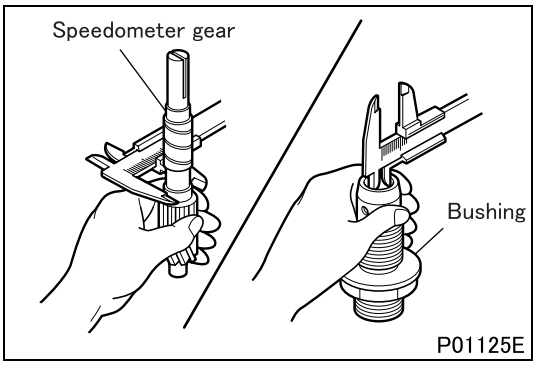
■ **Removal: Companion flange**



■ **Removal: Extension housing**

- Remove the extension housing using support plate and shoe mounting bolts or bolts (M060: M10 × 1.5 mm, M070: M12 × 1.75 mm) and a commercially available gear puller.

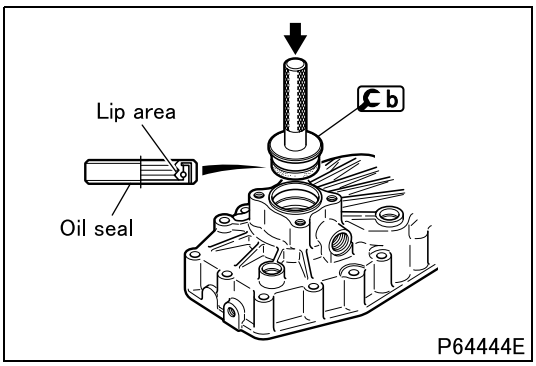
◆Inspection procedure◆



■ **Inspection: Clearance between speedometer gear bushing and speedometer gear**

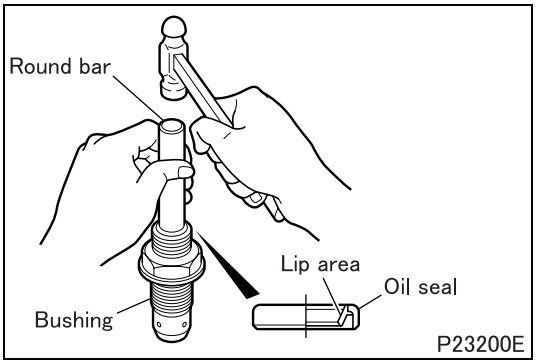
- If the clearance is higher than the limit, replace the faulty parts.

◆Installation procedure◆



■ **Installation: Oil seal**

- Apply grease to the lip area of the oil seal.
- Install the oil seal into the extension housing in the direction as illustrated.



■ **Installation: Oil seal**

- Apply grease to the lip area of the oil seal.
- Install the oil seal evenly in the illustrated direction using a round bar with an outer diameter of approx. 15 mm {0.59 in.}.

Mark	Tool name and shape	Part No.	Application
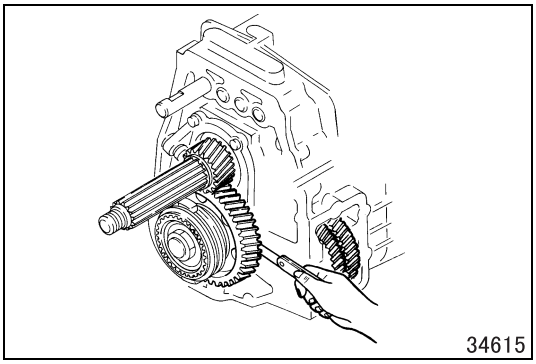
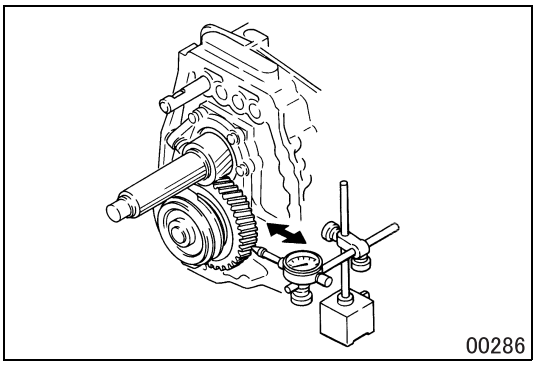
Ca	Single spanner A: 46 {1.81}  P01126	MH061555	Removal and installation of lock nut

◆Work before removal◆



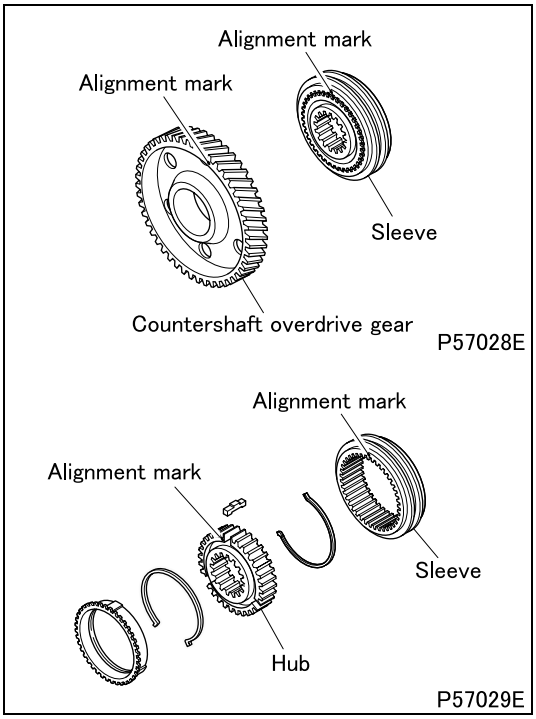
■ **Inspection: End play of countershaft 6th gear**

- Measure the end play using feeler gauge.
- If the measurement exceeds the limit, replace defective parts.



■ **Inspection: Play of countershaft 6th gear in the diameter direction**

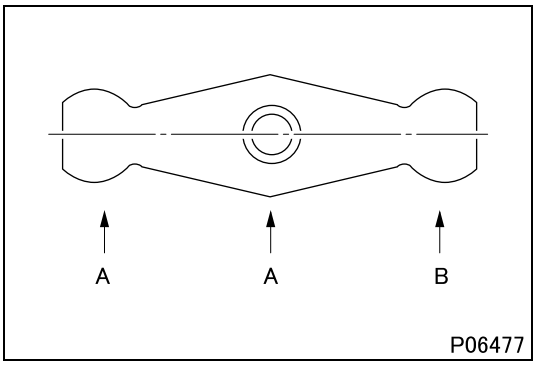
- If the measurement exceeds the limit, replace defective parts.



■ **Alignment mark: Synchronizer sleeve, synchronizer hub and countershaft 6th gear**

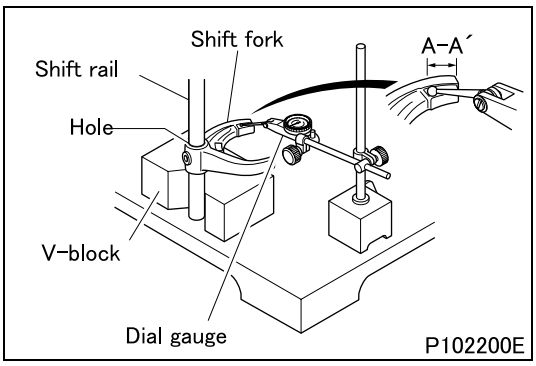
- Put an alignment mark on each one location of the synchronizer sleeve and countershaft 6th gear before disassembly.
- Put an alignment mark on the synchronizer hub in alignment with the alignment mark on the synchronizer sleeve before disassembly.

◆Inspection procedure◆



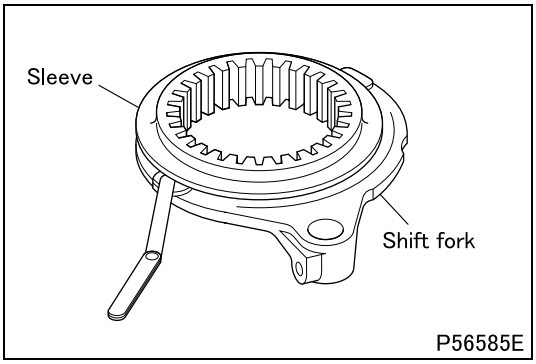
■ **Inspection: Bend of 6th gear shift lever**

- Measure bend B on the basis of illustrated A-A.
- If the measurement exceeds the limit, replace the 6th gear shift lever.



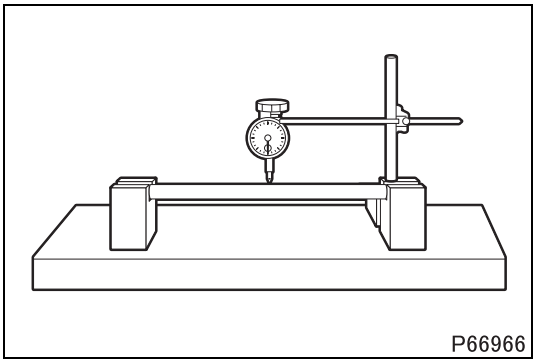
■ **Inspection: Tilt of 6th gear shift fork tip**

- Measure the tilt (difference between A and A´) of claw A-A´ against the 6th gear shift rail hole of 6th gear shift fork with pressing the rail to V-block and standing it vertiaclly.
- If the measurement exceeds the limit, replace the 6th gear shift fork.



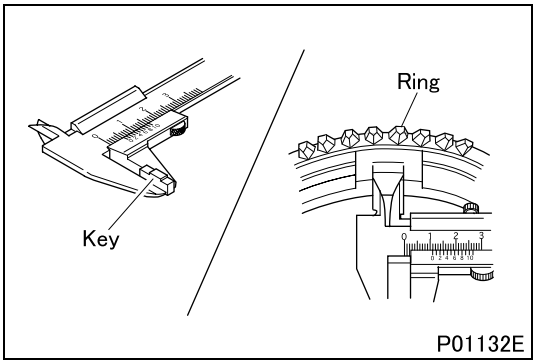
■ **Inspection: Clearance between 6th gear shift fork and synchronizer sleeve**

- If the measurement exceeds the limit, replace defective shift parts.



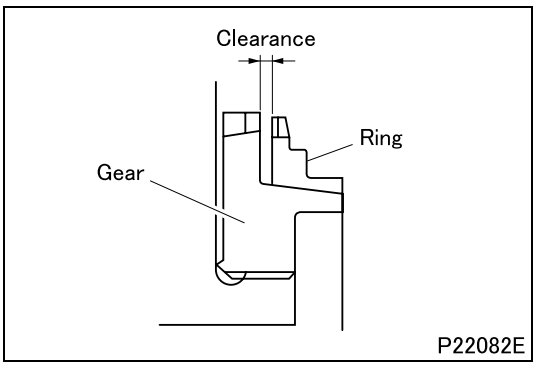
■ **Inspection: Bend of 6th gear shift rail**

- Measure the extent of bending at the middle of the 6th gear shift rail.
- While rotating the 6th gear shift rail by one revolution, read how much the dial gauge needle will move. A half of the reading observed represents the bend, if any, of the shaft.
- If measurement exceeds the limit, replace the 6th gear shift rail.



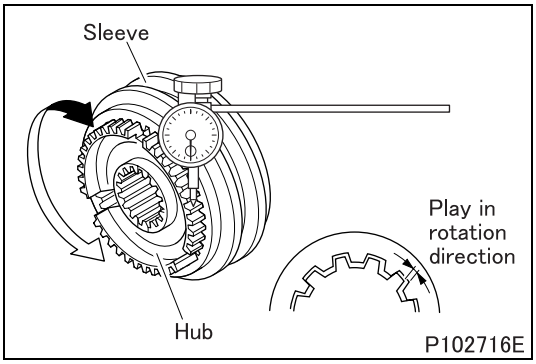
■ **Inspection: Clearance between synchronizer ring keyway and shifting key**

- If the measurement exceeds the limit, replace defective parts.



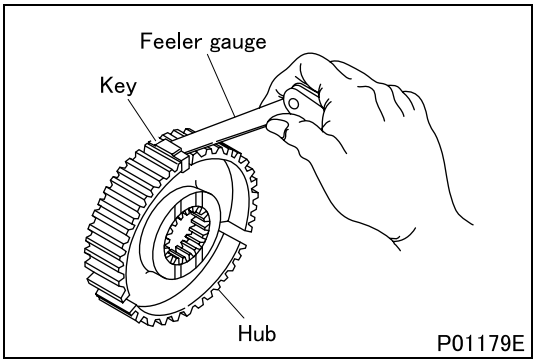
■ **Inspection: Clearance between synchronizer ring and countershaft 6th gear**

- When measuring this value, evenly press the synchronizer ring to the gear side and measure all around the circumference.
- If the measurement is less than the limit, replace both ring and gear.



■ **Inspection: Play of synchronizer sleeve and synchronizer hub in rotation direction**

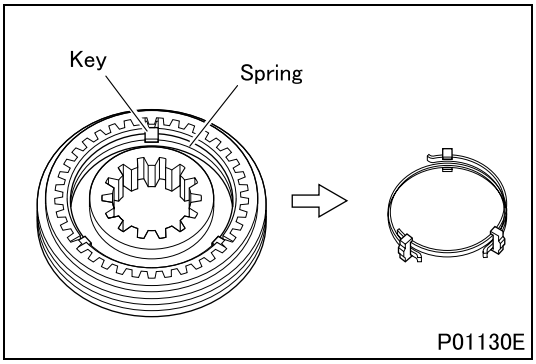
- Hold the synchronizer sleeve and measure the play with rotating the synchronizer hub.
- If the measurement exceeds the limit, replace defective parts.



■ **Inspection: Clearance between shifting key and synchronizer hub keyway**

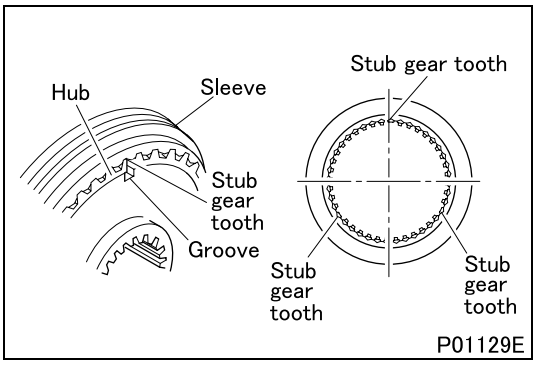
- If the measurement exceeds the limit, replace defective parts.

◆Installation procedure◆



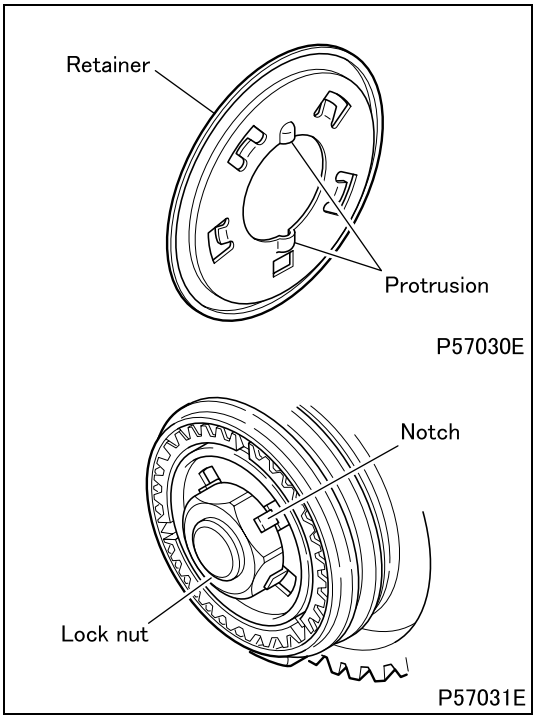
■ **Installation: Shifting key spring**

- After inserting the shifting key into the synchronizer hub groove, install the shifting key spring so that its opening is not located at the shifting key position.
- Install so that openings of the two shifting key springs are not located at the same position.



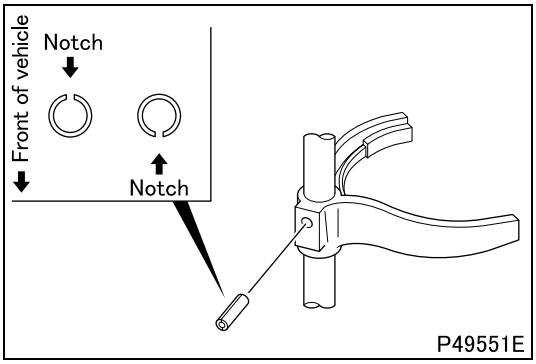
■ **Installation: Synchronizer sleeve and synchronizer hub**

- When replacing the synchronizer sleeve or synchronizer hub with a new one, align the plunger grooves (three locations) of the synchronizer hub with stub gear teeth (three locations) of the synchronizer sleeve to install.



■ **Installation: Shifting key retainer**

- Fit the protrusions (two locations of the shifting key retainer into the grooves of the synchronizer hub to install.
- After tightening with the lock nut, bend four notches of the shifting key retainer toward the lock nut side.



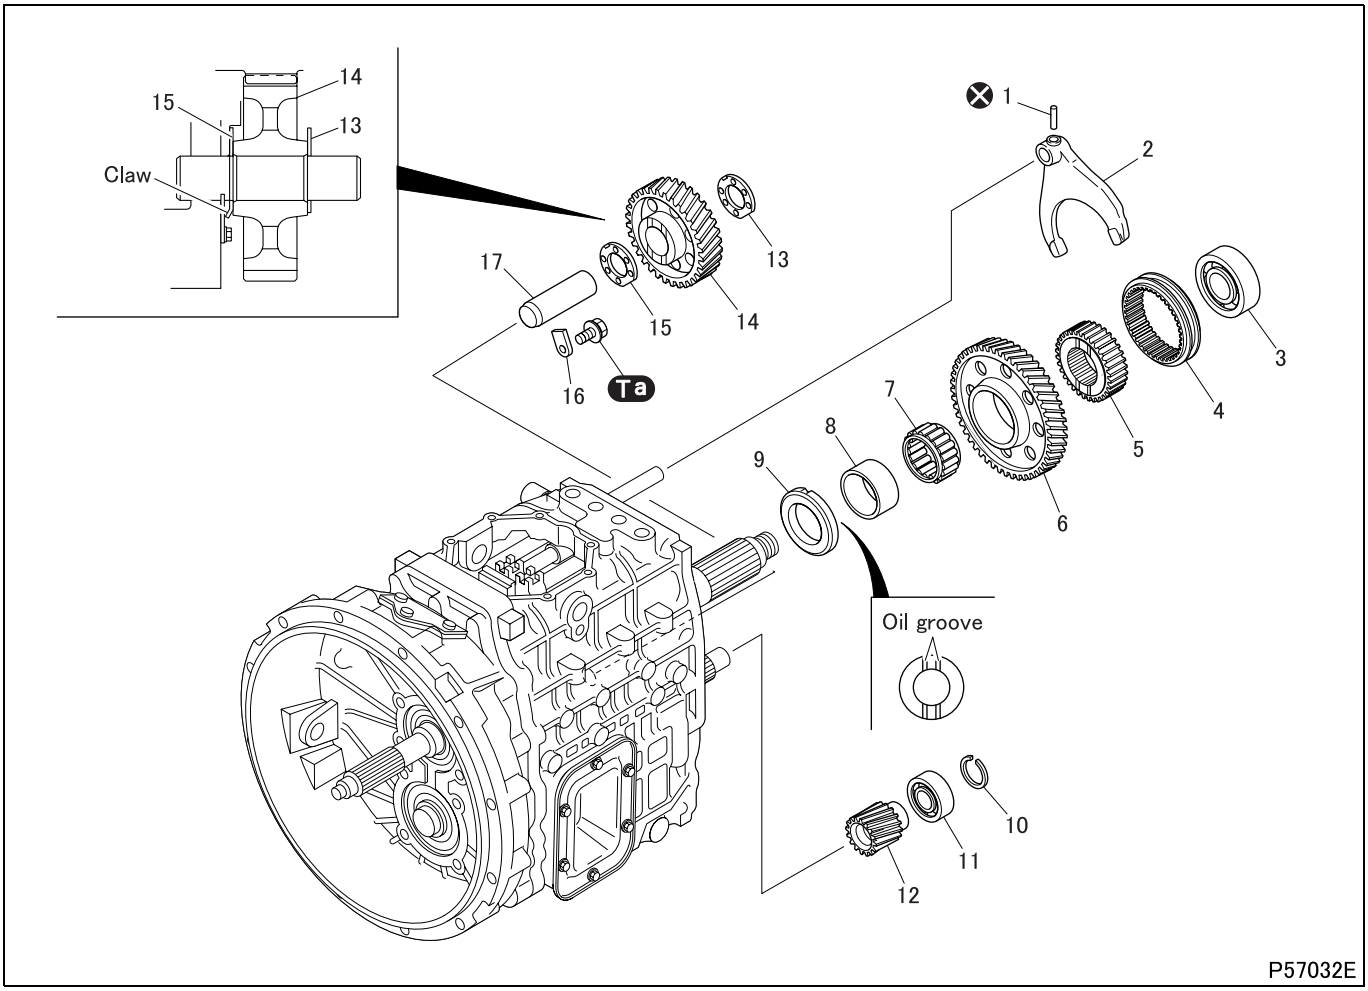
■ **Installation: Spring pin**

- Install the spring pin in the illustrated direction (with the notch of the spring pin facing the front or rear of the vehicle). Install so that the spring pin protrudes from the reverse gear shift fork by 0 to 0.5 mm {0 to 0.020 in.}.

CAUTION ⚠

- **When installing, be careful not to apply load to the 6th gear shift rail.**

REVERSE GEAR AND REVERSE IDLER GEAR <M070>



● **Disassembly sequence**

1 Spring pin
2 Reverse gear shift fork
3 Mainshaft rear rear bearing
4 Synchronizer sleeve
5 Reverse hub

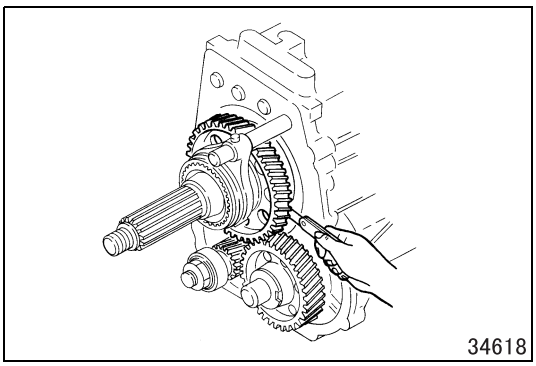
c	Snap ring expander  P01137	MH061268	Removal and installation of snap ring

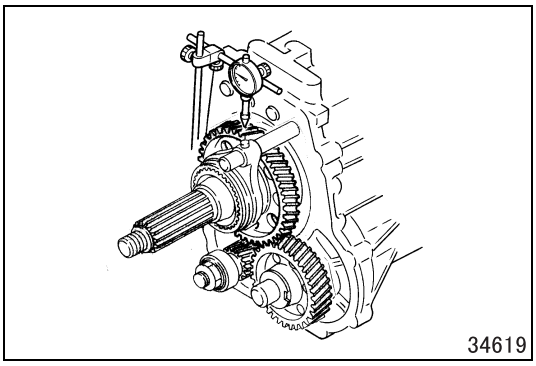
*: Components of puller and installer kit (See puller and installer.)

◆Inspection before removal◆



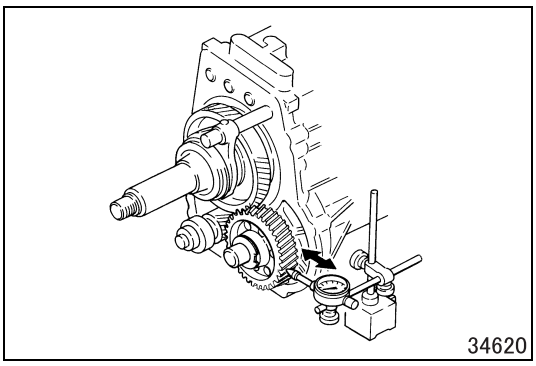
■ **Inspection: End play of mainshaft reverse gear**

- Measure the end play using feeler gauge.
- If the measurement exceeds the limit, replace defective parts.



■ **Inspection: Play of mainshaft reverse gear in the diameter direction**

- If the measured value exceeds the limit, replace defective parts.



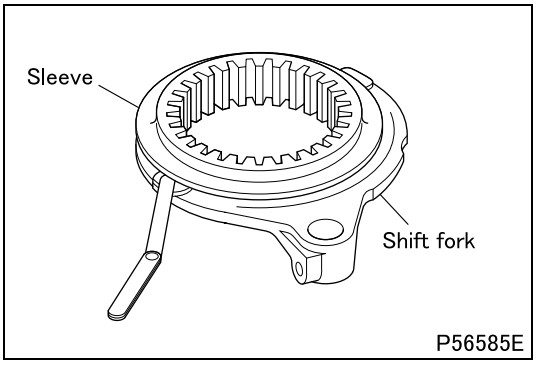
■ **Inspection: Play of reverse idler gear in the diameter direction**

- If the measured value exceeds the limit, replace defective parts.

◆Inspection procedure◆

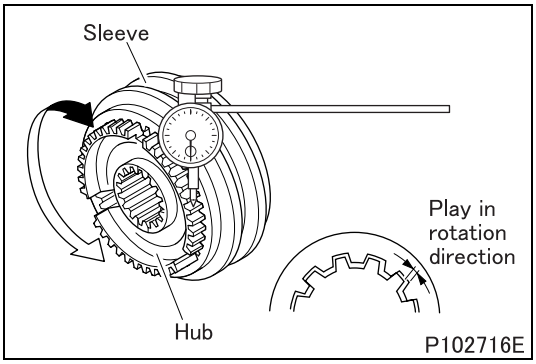
■ **Inspection: Tilt of claws of reverse gear shift fork**

- For the inspection of reverse gear shift fork, see the “Transmission body (SHIFT RAILS AND SHIFT FORKS <M070>)”.



■ **Inspection: Clearance between reverse gear shift fork and synchronizer sleeve**

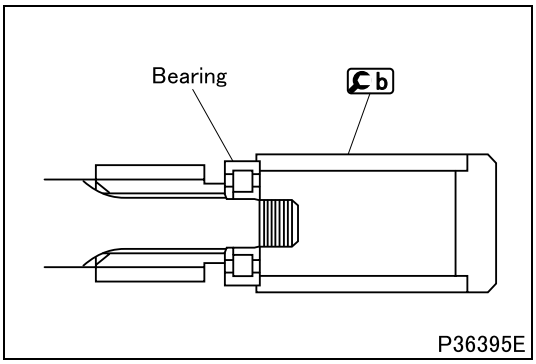
- If the measurement exceeds the limit, replace defective parts.



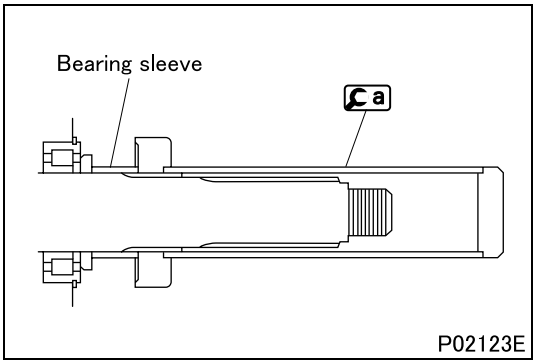
■ **Inspection: Play of synchronizer sleeve and synchronizer hub in rotation direction**

- Hold the synchronizer sleeve and measure the play with rotating the synchronizer hub.
- If the measurement exceeds the limit, replace defective parts.

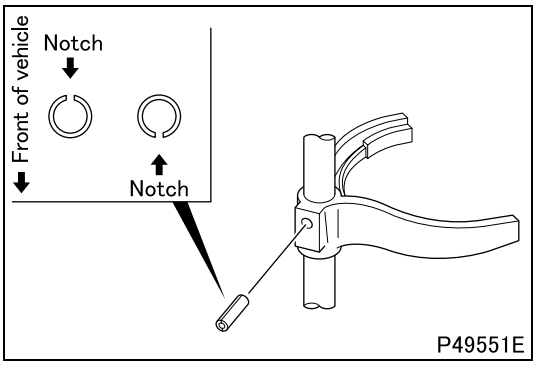
◆Installation procedure◆



■ **Installation: Countershaft rear bearing**



■ **Installation: Mainshaft and reverse gear bearing sleeve**



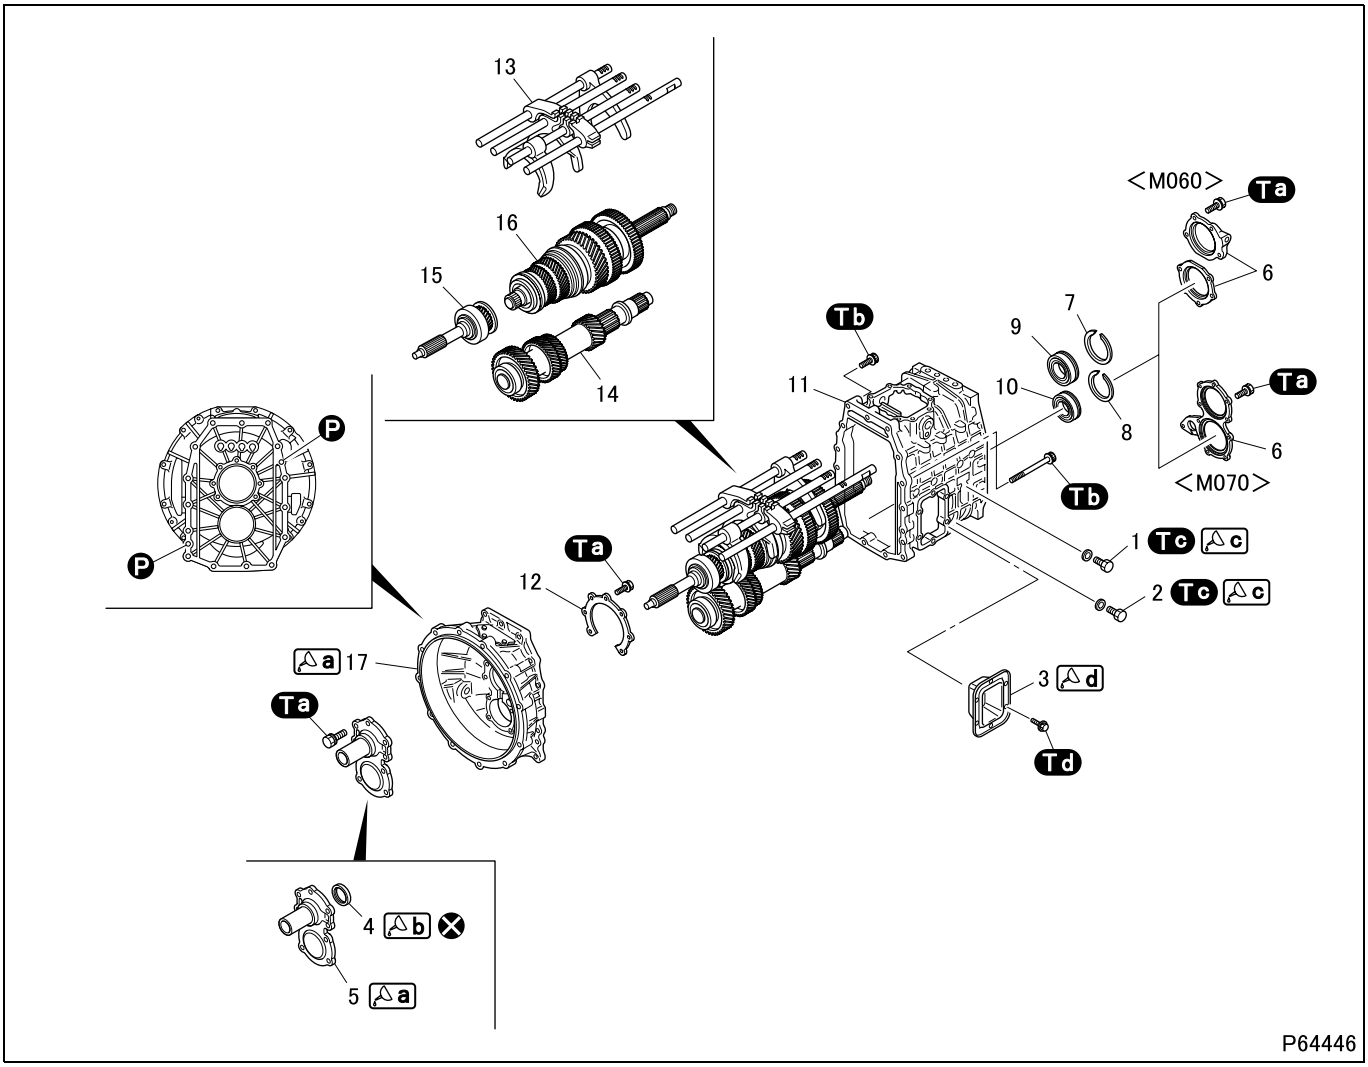
■ **Installation: Spring pin**

- Install the spring pin in the illustrated direction (with the notch of the spring pin facing the front or rear of the vehicle). Install so that the spring pin protrudes from the reverse gear shift fork by 0 to 0.5 mm. {0 to 0.020 in.}

CAUTION ⚠

- **When installing, do not apply load to the shift rail of the transmission body.**

TRANSMISSION BODY



● **Disassembly sequence**

1 Inspection plug
2 Drain plug
3 PTO cover
4 Oil seal
5 Front bearing retainer
6 Rear bearing retainer
7 Snap ring
8 Snap ring
9 Mainshaft rear bearing
10 Countershaft rear bearing
11 Transmission case
12 Drive pinion bearing retainer
13 Shift rail and shift fork (See later section.)
14 Countershaft (See countershaft.)
15 Drive pinion (See drive pinion.)
16 Mainshaft (See mainshaft.)
17 Clutch housing

Ⓟ: Locating pin
⊗: Non-reusable parts

NOTE

- **After removing the front bearing retainer, perform work with the transmission laid vertically on its clutch housing side. Apply a batten to the clutch housing to prevent damage to the drive pinion.**
- **If the countershaft, drive pinion and mainshaft assembly is not to be disassembled, only the shift rail and shift fork can be removed with the assembly still fitted in the clutch housing.**

● **Assembly sequence**

Follow the disassembly sequence in reverse.

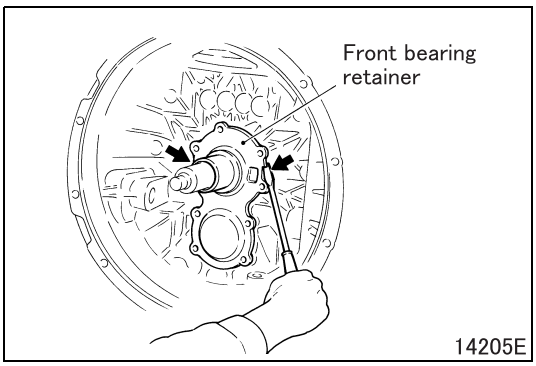
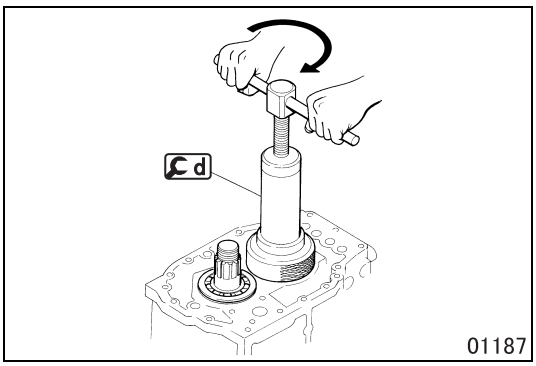
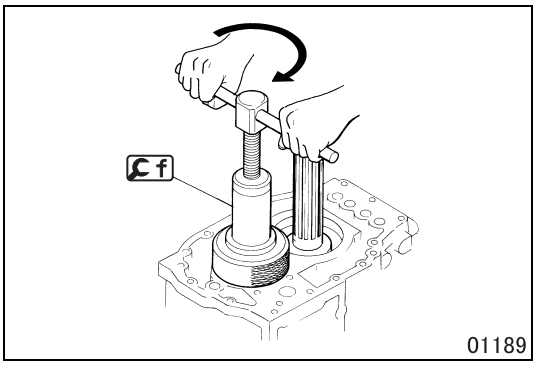
◆Removal procedure◆



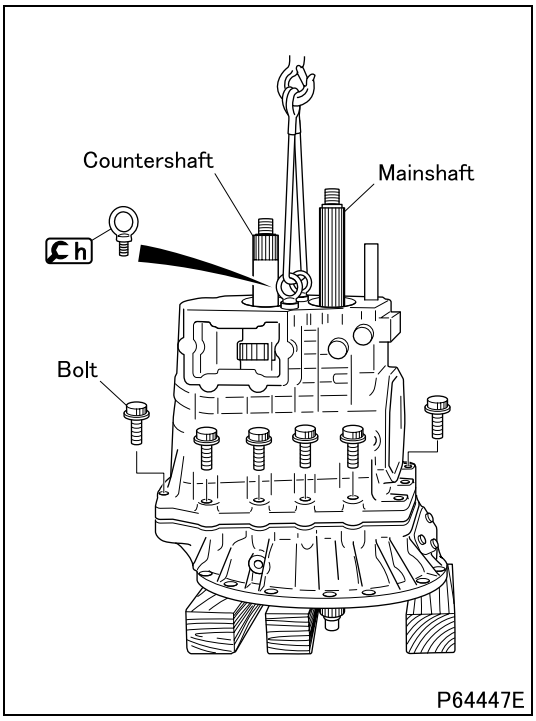
■ Removal: Front bearing retainer



■ Removal: Mainshaft rear bearing



■ Removal: Countershaft rear bearing

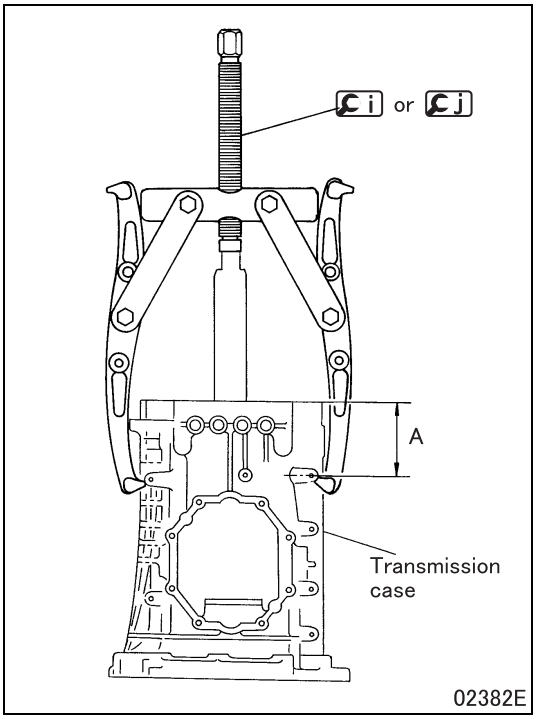


■ Removal: Transmission case

- There are two methods of removing the transmission case, using a crane and using a gear puller.

(1) Method of using a crane

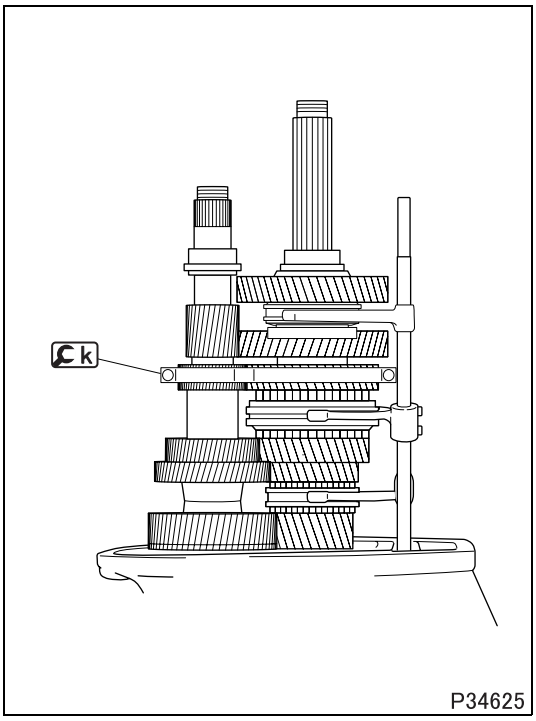
- Attach h to the transmission case and prepare for hoisting it with a crane.
- After removing bolts, hoist the transmission case with a crane and keep hitting the rear ends of the countershaft and mainshaft, and clutch housing. Use a plastic hammer to remove the transmission case.



(2) Method of using a gear puller

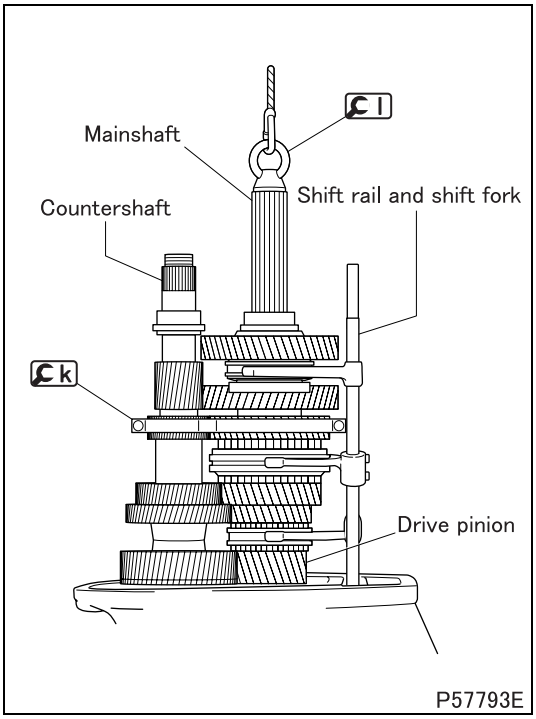
- Attach i or j as illustrated, and remove the transmission case.

Transmission type	A (mm {in.})
M060	97 {3.82}
M070	193.5 {7.62}



■ **Removal: Shift rail and shift fork, countershaft, drive pinion and mainshaft**

- After removing the transmission case, secure the countershaft and the 2nd or 3rd gear area of the countershaft and mainshaft with k for safety. Be sure to tighten the steel lifting band enough to prevent it from coming undone, but not excessively.



- Leave the countershaft and mainshaft secured with [k].
- Install [l] on the mainshaft and make preparations for lifting it up with a crane.
- Secure the shift rail and shift fork with a rubber band to prevent it from coming undone from the mainshaft.
- Apply a batten to the clutch housing or intermediate plate, and while keeping hitting it, hoist the transmission body. Use a plastic hammer to remove the shift rail and shift fork, countershaft, drive pinion and mainshaft.

CAUTION ⚠

- **When lifting up, be sure to support the drive pinion with your hand to prevent it from falling.**

◆Installation procedure◆

■ Installation: Shift rail and shift fork, countershaft, drive pinion and mainshaft

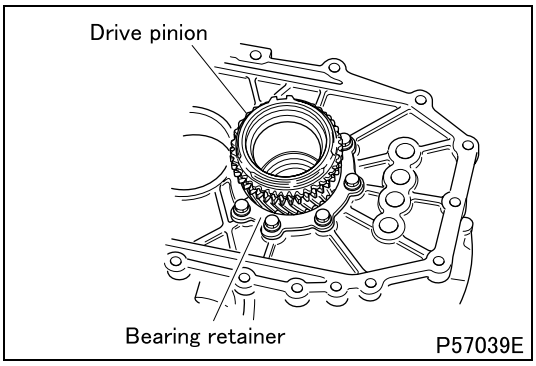
- There are two methods of the installation procedure.

(1) Method 1

- Install the shift rail and shift fork, countershaft, drive pinion and mainshaft by following the disassembly sequence in reverse. (See "**■ Removal: Shift rail and shift fork, countershaft, drive pinion and mainshaft**".)

NOTE

- **Be sure to remove all the special tools used.**

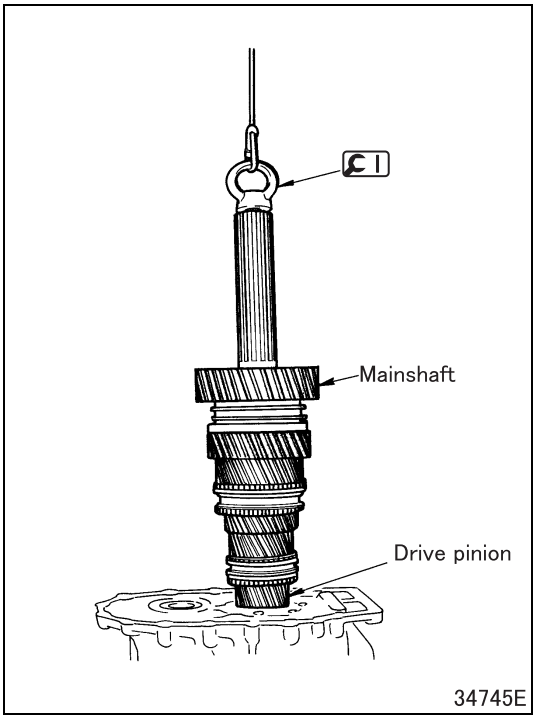


(2) Method 2

NOTE

- **In the case of this method, install with the countershaft front bearing removed. (See Countershaft.)**

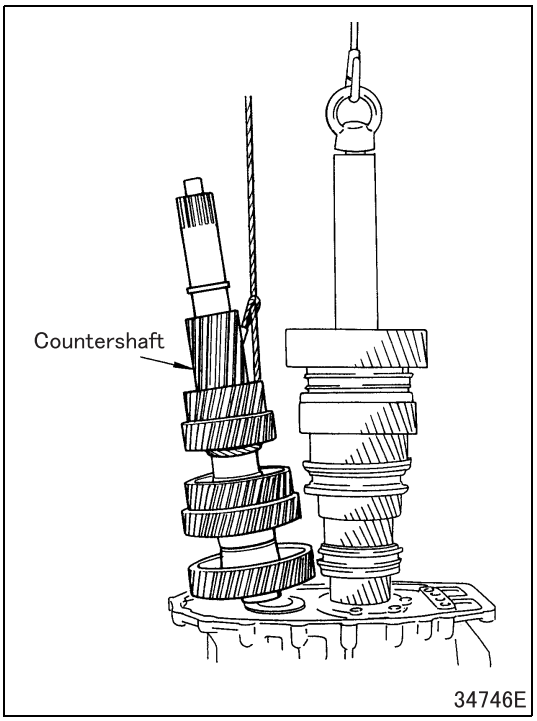
- After installing the drive pinion on the clutch housing or intermediate plate, install the bearing retainer.



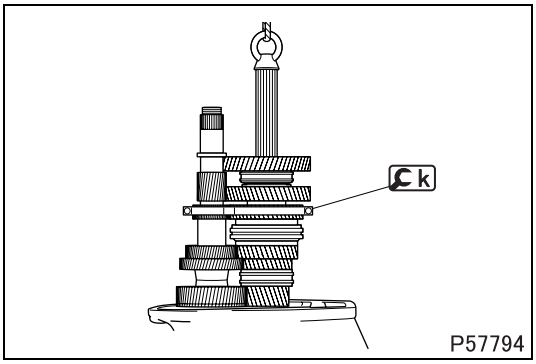
- Install C1 on the rear end of the mainshaft, and hoist it with a crane to install on the drive pinion.

CAUTION ⚠

- **After installation, support the mainshaft with a crane to prevent it from falling down.**



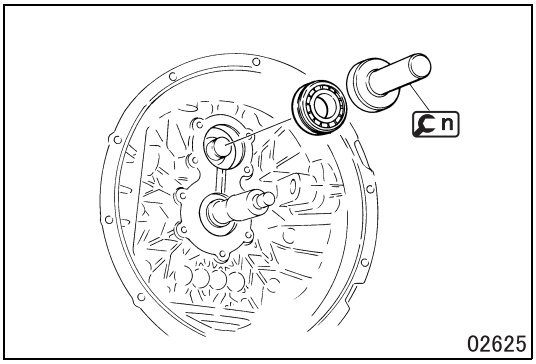
- Install the countershaft on the clutch housing or intermediate plate.



- Fix the 2nd gears or 3rd gears of the countershaft and mainshaft using k to ensure safety. Tighten steel lifting band adequately enough to prevent it from coming undone, but not excessively.
- Install the shift rail and shift fork on the mainshaft.

CAUTION ⚠

- **Be sure to remove all special tools used.**



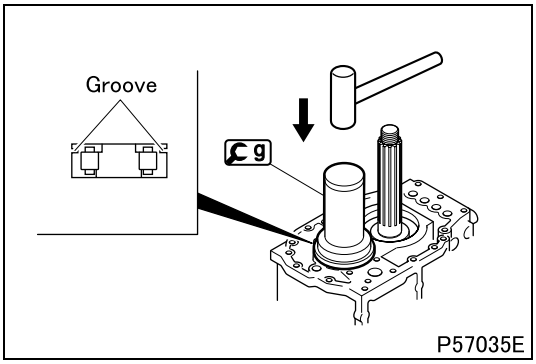
- After installation of the transmission case, place it so that the countershaft faces upward, and install the countershaft front bearing on the clutch housing or intermediate plate using n.

CAUTION ⚠

- **Be sure to install the snap ring of the bearing.**

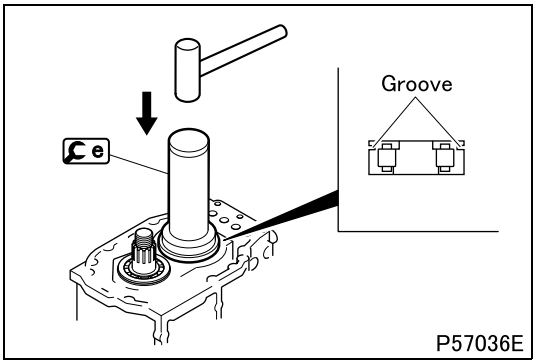
■Installation: Transmission case

- Follow the disassembly sequence in reverse. (See "■ **Removal: Transmission case**".)



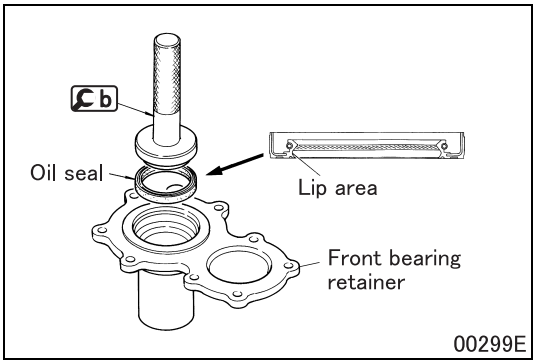
■Installation: Countershaft rear bearing

- Install the countershaft rear bearing on the transmission case in the illustrated direction.



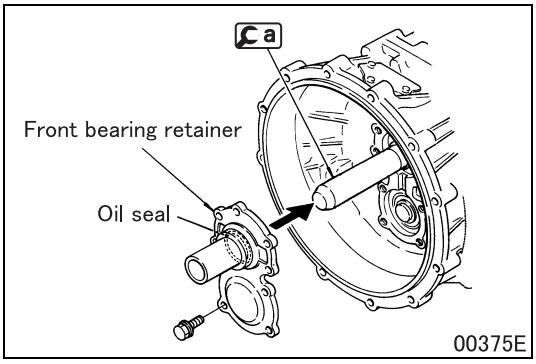
■Installation: Mainshaft rear bearing

- Install the mainshaft rear bearing on the transmission case in the illustrated direction.



■ **Installation: Oil seal**

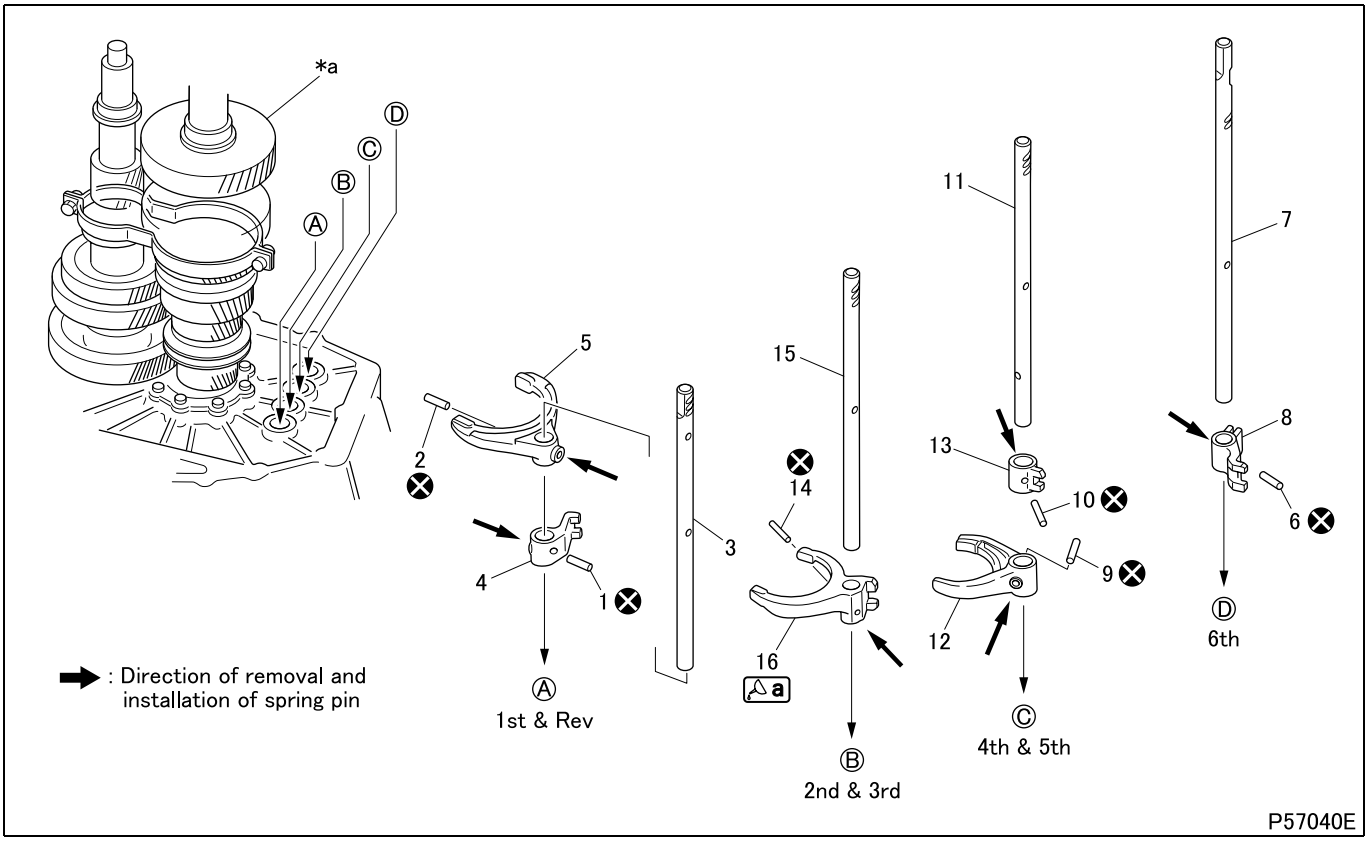
- Apply grease to the lip area of the oil seal and install it on the front bearing retainer in the illustrated direction.



■ **Installation: Front bearing retainer**

- Install a on the drive pinion to protect the oil seal.
- Apply sealant to the clutch housing mounting surface of the front bearing retainer to install.

Shift rail and shift fork <M060>



● Disassembly sequence

1 Spring pin
2 Spring pin
3 1st and reverse gear shift rail
4 1st and reverse gear shift rail jaw
5 1st and reverse gear shift fork
6 Spring pin
7 6th gear shift rail
8 6th gear shift rail jaw
9 Spring pin
10 Spring pin
11 4th and 5th gear shift rail
12 4th and 5th gear shift fork
13 4th and 5th gear shift rail jaw
14 Spring pin
15 2nd and 3rd gear shift rail
16 2nd and 3rd gear shift fork

***a**: Mainshaft
⊗: Non-reusable parts

CAUTION ⚠

- **Do not remove the spring pin for the 4th and 5th gear shift fork (aluminum made) unless replacing the gear shift fork or gear shift rail.**

● Assembly sequence

Follow the disassembly sequence in reverse.

Service standards (Unit: mm {in.})

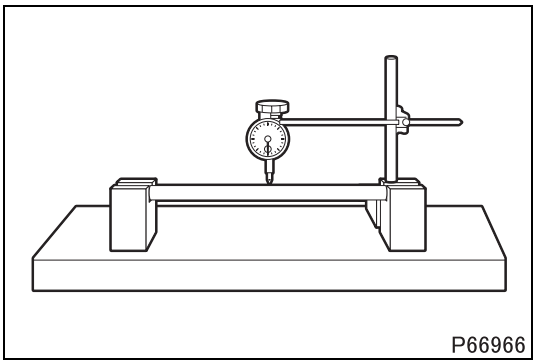
Location	Maintenance item	Standard value	Limit	Remedy
3, 11, 15	Bend of gear shift rail	0 to 0.04 {0 to 0.0015}	0.08 {0.0031}	Replace
5, 12, 16	Tilt of gear shift fork claw	0 to 0.1 {0 to 0.0039}	0.2 {0.0079}	Replace
5, *a	Clearance between 1st and reverse gear shift fork and mainshaft synchronizer sleeve	0.3 to 0.5 {0.012 to 0.020}	1.0 {0.039}	Replace
7	Bend of 6th gear shift rail	0 to 0.05 {0 to 0.0019}	0.09 {0.0035}	Replace

Location	Maintenance item	Standard value	Limit	Remedy
12, *a	Clearance between 4th and 5th gear shift fork and mainshaft synchronizer sleeve	0.3 to 0.6 {0.012 to 0.024}	1.0 {0.039}	Replace
16, *a	Clearance between 2nd and 3rd gear shift fork and mainshaft synchronizer sleeve	0.2 to 0.4 {0.0079 to 0.016}	1.0 {0.039}	Replace

Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	2nd and 3rd shift fork claw	Molykote BR2 plus	As required

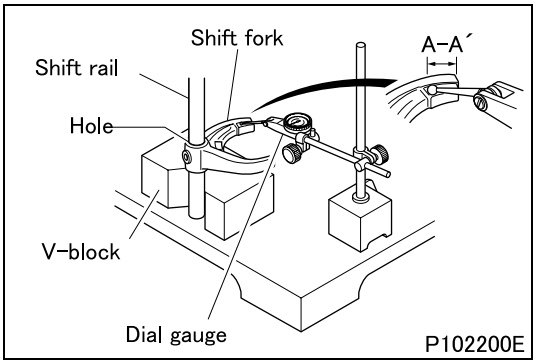
◆Inspection procedure◆



P66966

■ Inspection: Bend of shift rail

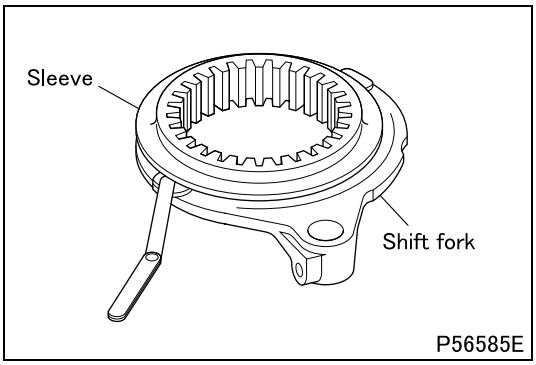
- Measure the extent of bending at the middle of each of gear shift rail.
- While rotating the gear shift rail by one revolution, read how much the dial gauge needle will move. A half of the reading observed represents the bend, if any, of the shaft.
- If measurement exceeds the limit, replace the gear shift rail.



P102200E

■ Inspection: Tilt of gear shift fork claws

- Measure the tilt (difference between A and A´) of claw A-A´ against the gear shift rail hole of gear shift forks with pressing the rail to V-block and standing it vertically.
- If the measurement exceeds the limit, replace the gear shift forks.

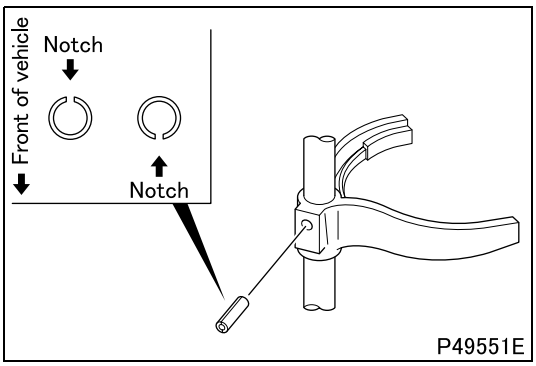


P56585E

■ Inspection: Clearance between gear shift fork and synchronizer sleeve of mainshaft

- If the measurement exceeds the limit, replace defective parts.

◆Installation procedure◆



■ **Installation: Spring pin**

- Install the spring pin in the illustrated direction (the spring pin notch to be positioned forward or rearward of the vehicle). When installing the spring pin, leave 0 to 0.5 mm {0 to 0.020 in.} outside from each gear shift rail or each gear shift rail jaw.

CAUTION ⚠

- **Drive the spring pin carefully so as not to impose too much load on each gear shift rail and each gear shift rail jaw.**
- **The spring pin for the 4th and 5th gear shift fork is different in length from other spring pins.**

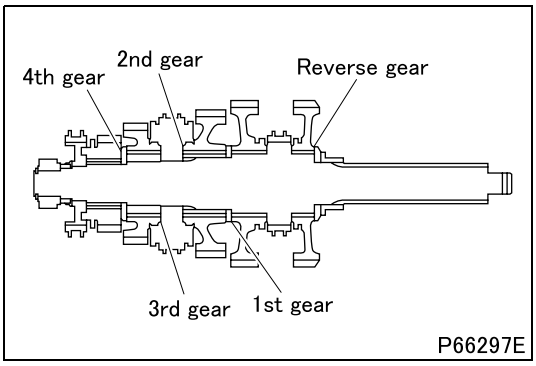
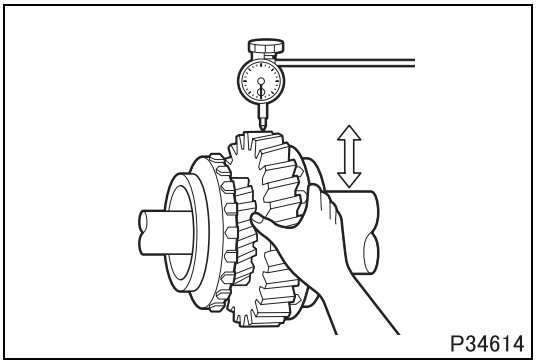
◆Work before removal◆



P66297E

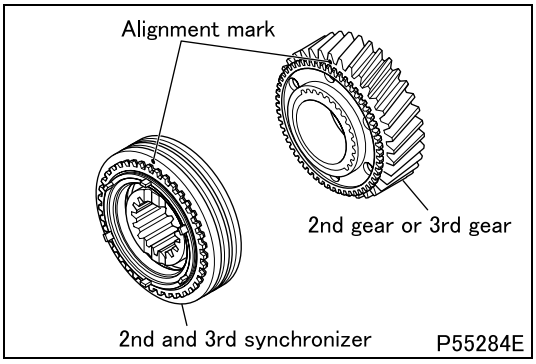
■ Inspection: End play of each gear

- Measure the end play using feeler gauge.
- If the measurement exceeds the limit, replace defective parts.



■ **Inspection: Play of gears in diameter direction**

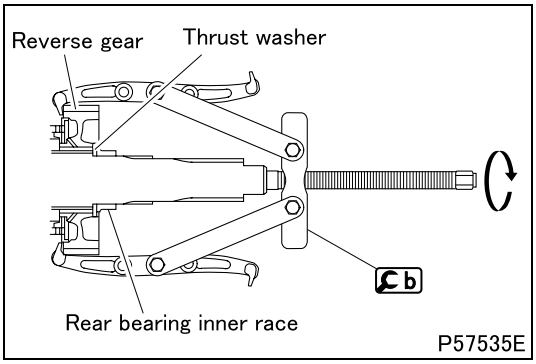
- If the measurement exceeds the limit, replace defective parts.



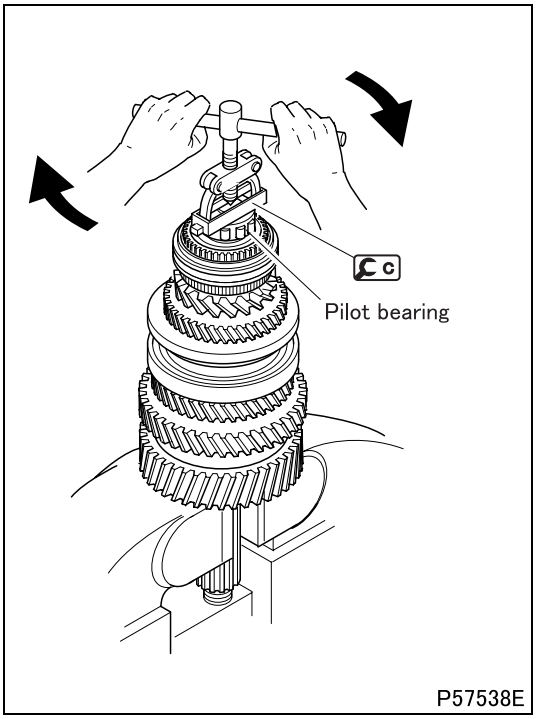
■ **Alignment marks: 2nd gear, 2nd and 3rd synchronizer and 3rd gear**

- Put alignment marks on the 2nd gear, synchronizer sleeve of the 2nd and 3rd synchronizer and 3rd gear, each at one location before disassembly.

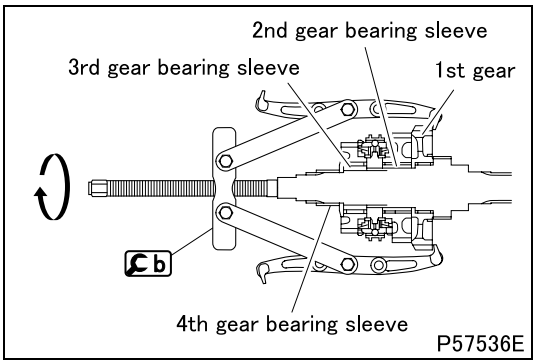
◆Removal procedure◆



■ **Removal: Mainshaft rear bearing inner race**

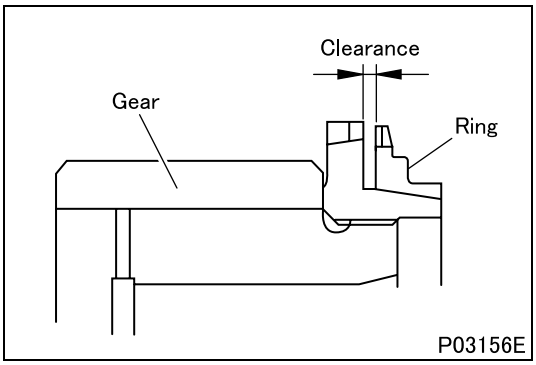


■ **Removal: Pilot bearing**



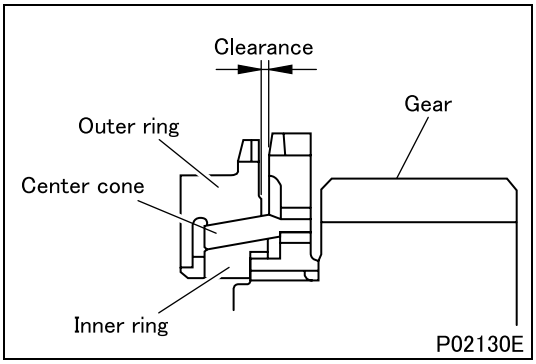
■ **Removal: 4th gear bearing sleeve, 3rd gear bearing sleeve and 2nd gear bearing sleeve**

◆Inspection procedure◆



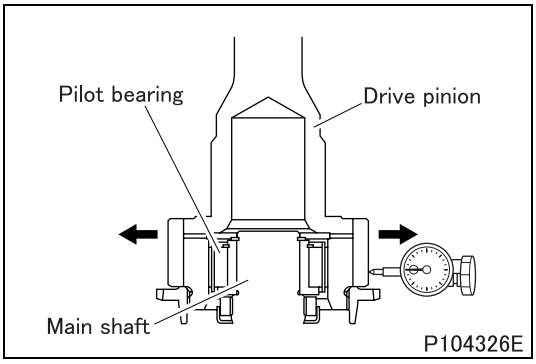
■ **Inspection: Clearance between synchronizer ring of 4th and 5th synchronizer and 4th gear or drive pinion**

- Conduct a measurement on the entire circumference while pressing each synchronizer ring against gears evenly.
- If the measurement is less than the limit, replace both ring and gear.



■ **Inspection: Clearance between synchronizer outer ring of 2nd and 3rd synchronizer and 2nd gear or 3rd gear**

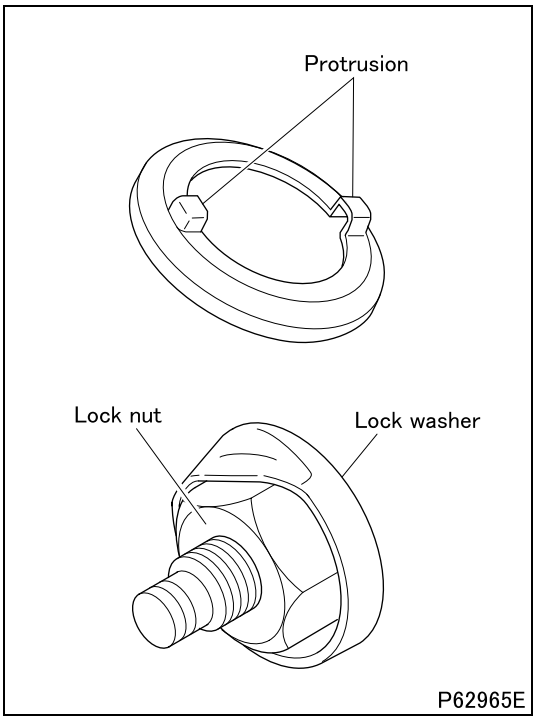
- When measuring the clearance, press each ring and the center cone evenly against the gear and measure all around the circumference.
- If the measurement is less than the limit, replace both ring and gear.



■ **Inspection: Play of pilot bearing in diameter direction**

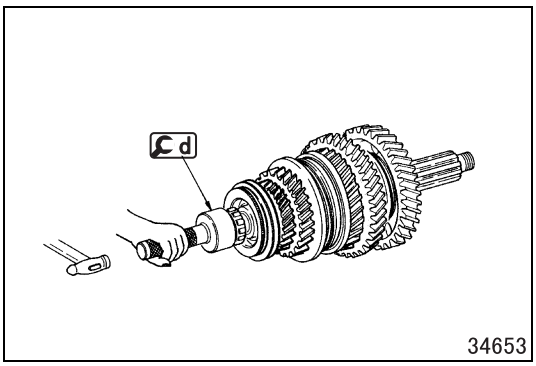
- Carry out the measurement with installing the drive pinion, pilot bearing and main shaft and holding the main shaft as illustrated.
- Measure the play with moving the gear of drive pinion in diameter direction.
- If the measurement exceeds the limit, replace the pilot bearing.

◆Installation procedure◆



■ **Installation: Lock washer**

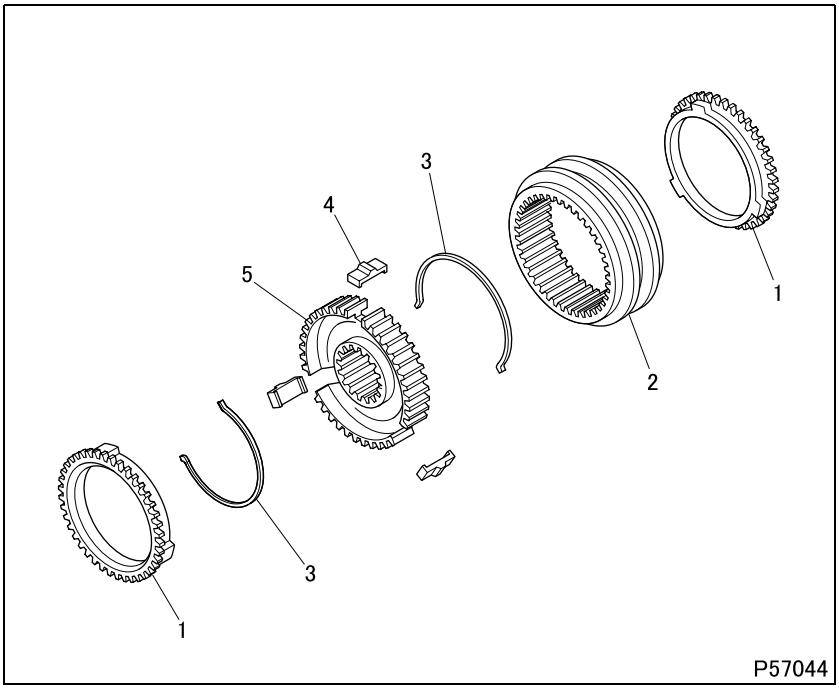
- Install so that protrusions of the lock washer fit into the grooves of the synchronizer hub of the 4th and 5th synchronizer.
- After tightening the lock nut to the specified torque, secure it by bending the lock washer.



■ **Installation: Pilot bearing**

M E M O

4th and 5th synchronizer



● Disassembly sequence

1 Synchronizer ring
2 Synchronizer sleeve
3 Shifting key spring
4 Shifting key
5 Synchronizer hub

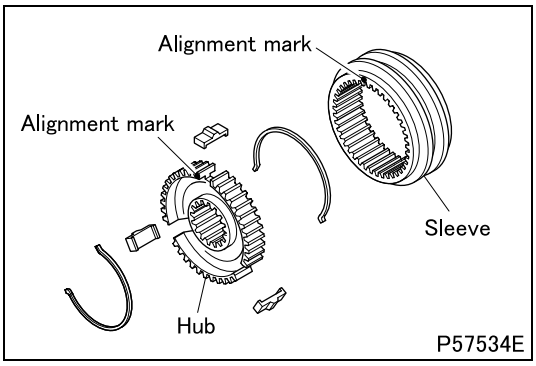
● Assembly sequence

Follow the disassembly sequence in reverse.

Service standards (Unit: mm {in.})

Location	Maintenance item	Standard value	Limit	Remedy
1, 4	Clearance between synchronizer ring keyway and shifting key	4.75 to 4.95 {0.187 to 0.195}	5.8 {0.23}	Replace
2, 5	Play in the rotation direction of synchronizer sleeve and synchronizer hub	0.052 to 0.148 {0.0020 to 0.0058}	0.3 {0.012}	Replace
4, 5	Clearance between shifting key and synchronizer hub keyway	0.05 to 0.20 {0.0020 to 0.0079}	0.5 {0.020}	Replace

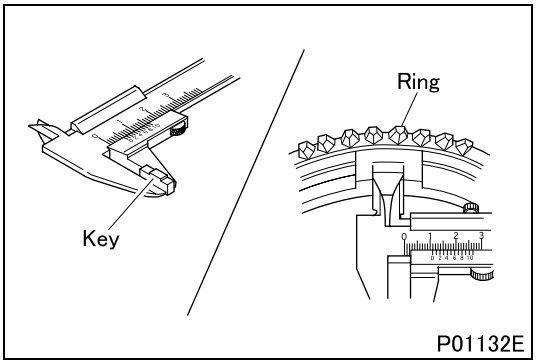
◆Work before removal◆



■Alignment marks: Synchronizer sleeve and synchronizer hub

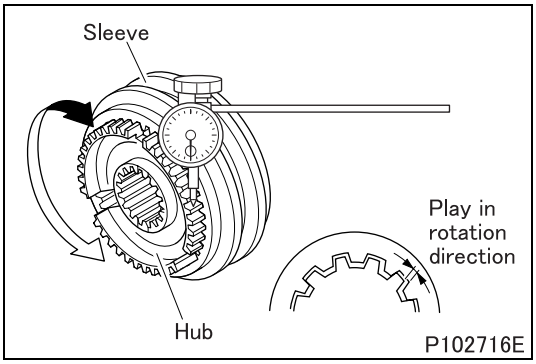
- Put alignment marks on the synchronizer sleeve and synchronizer hub, each at one location before disassembly.

◆Inspection procedure◆



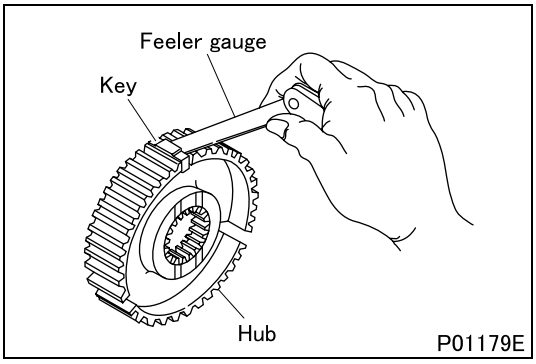
■Inspection: Clearance between synchronizer ring keyway and shifting key

- If measurement exceeds the limit, replace defective parts.



■ **Inspection: Play of synchronizer sleeve and synchronizer hub in rotation direction**

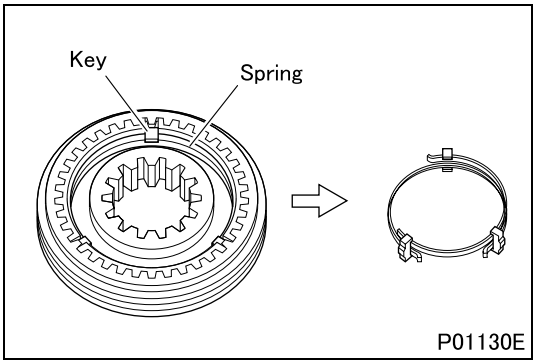
- Hold the synchronizer sleeve and measure the play with rotating the synchronizer hub.
- If the measurement exceeds the limit, replace defective parts.



■ **Inspection: Clearance between shifting key and synchronizer hub keyway**

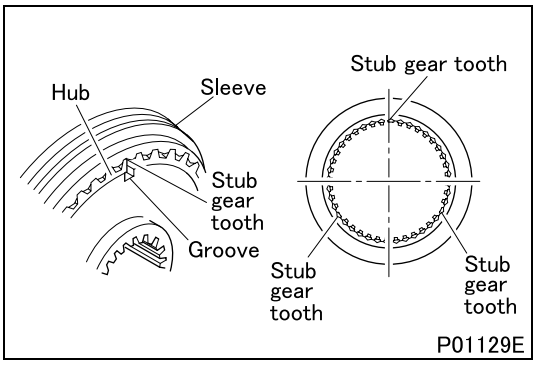
- If measurement exceeds the limit, replace defective parts.

◆Installation procedure◆



■ **Installation: Shifting key spring**

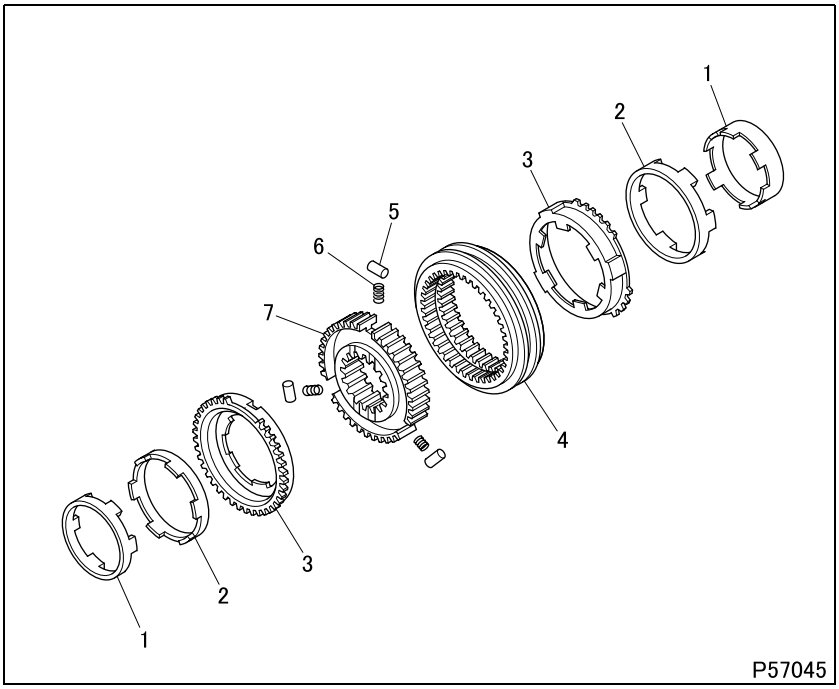
- After inserting the shifting key into the synchronizer hub groove, install the shifting key spring so that its opening is not located at the shifting key position.
- Install so that openings of the two shifting key springs are not located at the same position.



■ **Installation: Synchronizer sleeve and synchronizer hub**

- When replacing the synchronizer sleeve or synchronizer hub with a new one, align the plunger grooves (three locations) of the synchronizer hub with stub gear teeth (three locations) of the synchronizer sleeve to install.

2nd and 3rd synchronizer



● Disassembly sequence

1 Synchronizer inner ring
2 Synchronizer center cone
3 Synchronizer outer ring
4 Synchronizer sleeve

◆Work before removal◆

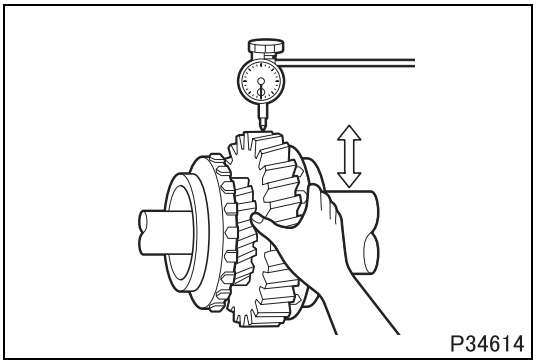
P66443E

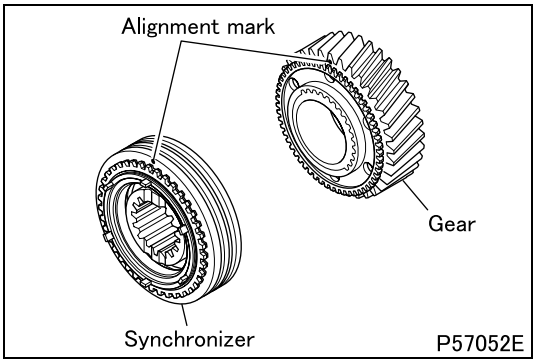
■ Inspection: End play of each gear

- Measure the end play using feeler gauge.
- If the measurement exceeds the limit, replace defective parts.



■ **Inspection: Play of gears in diameter direction**

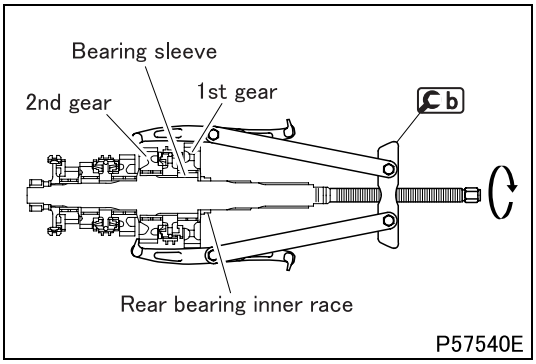
- If the measurement exceeds the limit, replace defective parts.



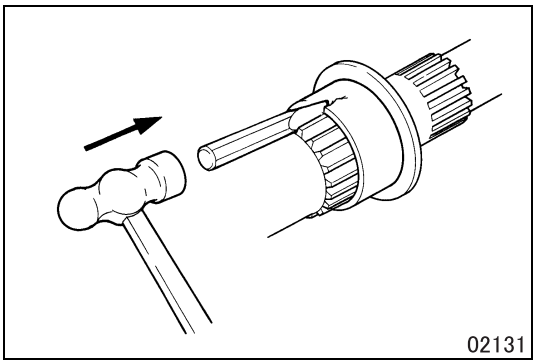
■ **Alignment marks: 2nd gear, 2nd synchronizer, 3rd gear, and 3rd and 4th synchronizer and 4th gear**

- Put alignment marks on each gear and each synchronizer sleeve of the synchronizer, each at one location before disassembly.

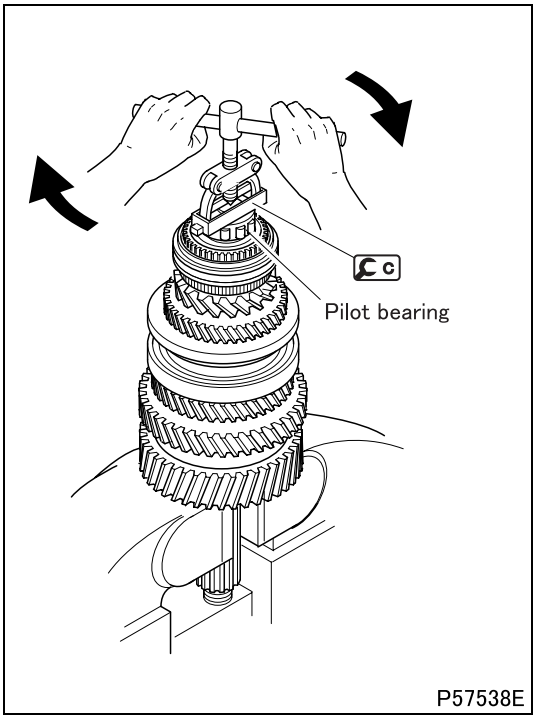
◆Removal procedure◆



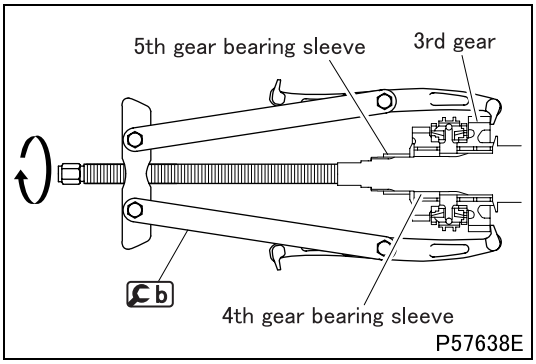
■ **Removal: Mainshaft rear bearing inner race and 1st gear bearing sleeve**



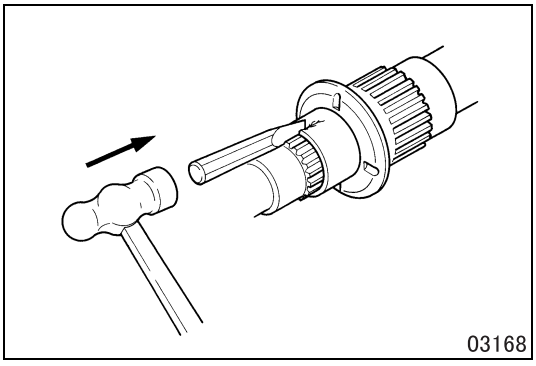
■ **Removal: 2nd gear bearing sleeve**



■ **Removal: Pilot bearing**

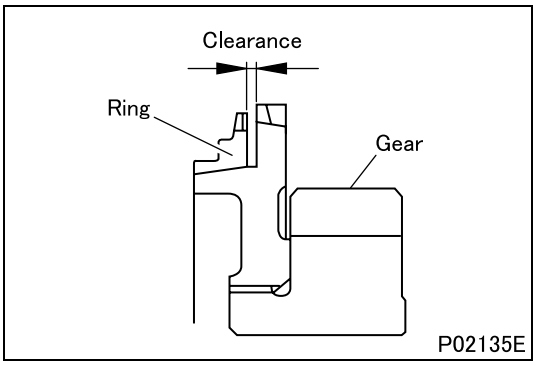


■ **Removal: 5th gear bearing sleeve and 4th gear bearing sleeve**



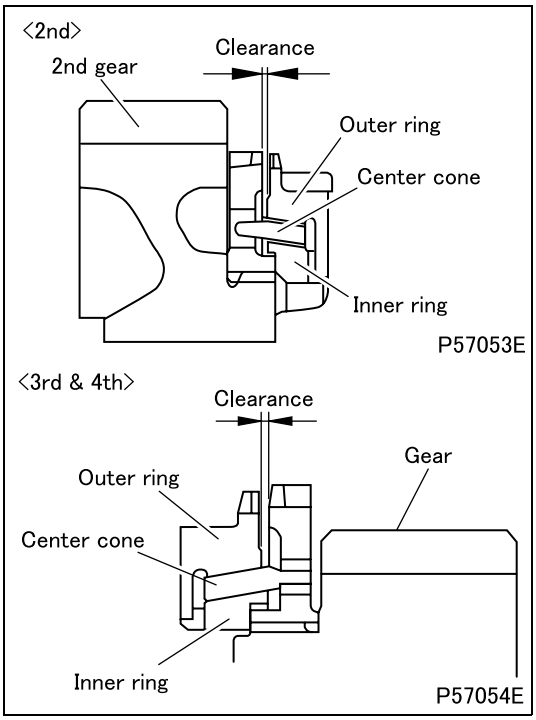
■ **Removal: 3rd gear bearing sleeve**

◆Inspection procedure◆



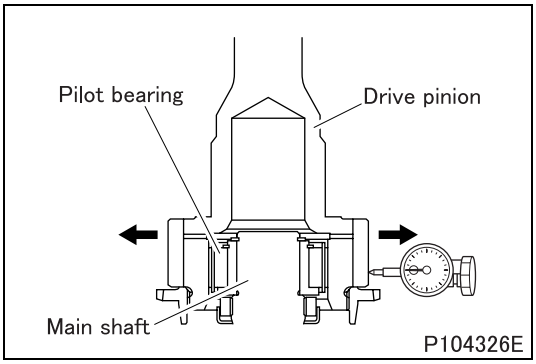
■ Inspection: Clearance between synchronizer ring of 5th and 6th synchronizer and 5th gear or drive pinion

- When measuring the clearance, press each ring evenly against the gear and measure all around the circumference.
- If the measurement is less than the limit, replace the ring together with gear or drive pinion.



■ Inspection: Clearance between each gear and synchronizer outer ring of each synchronizer

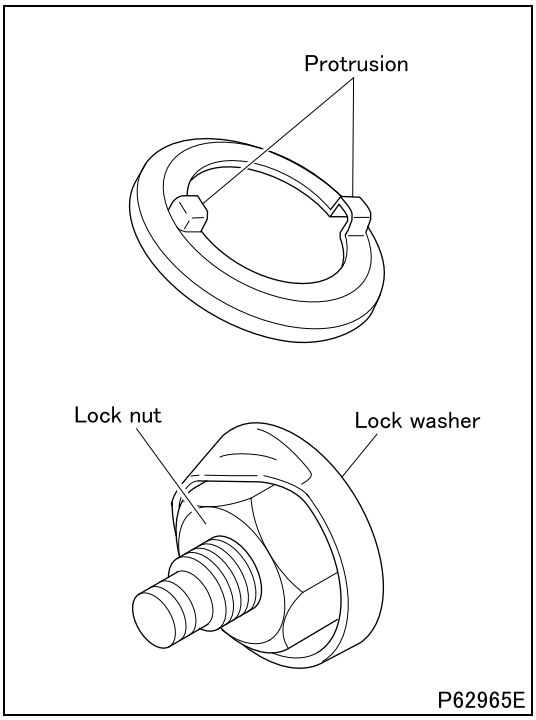
- When measuring the clearance, press each synchronizer ring and center cone evenly against the gear and measure all around the circumference.
- If the measurement is less than the limit, replace both ring and gear.



■ Inspection: Play of pilot bearing in diameter direction

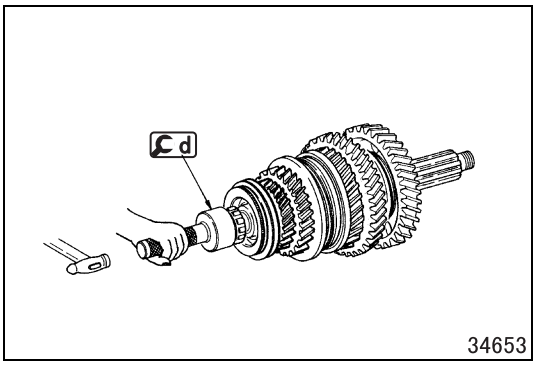
- Carry out the measurement with installing the drive pinion, pilot bearing and main shaft and holding the main shaft as illustrated.
- Measure the play with moving the gear of drive pinion in diameter direction.
- If the measurement exceeds the limit, replace the pilot bearing.

◆Installation procedure◆



■ Installation: Lock washer

- Install so that protrusions of the lock washer fit into the grooves of the synchronizer hub of the 5th and 6th synchronizer.
- After tightening the lock nut to the specified torque, secure it by bending the lock washer.



■ Installation: Pilot bearing

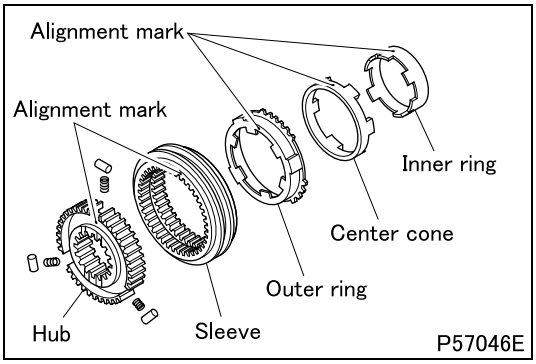
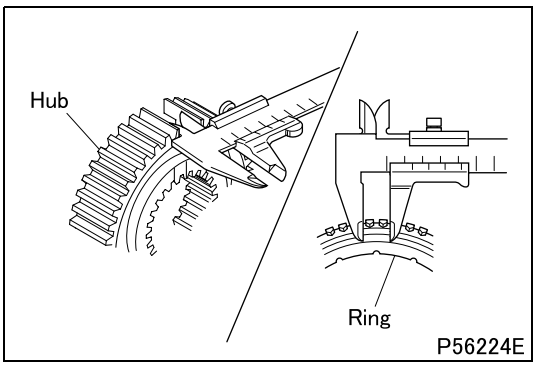
◆Work before removal◆



■Alignment marks: Synchronizer inner ring, center cone, outer ring and sleeve

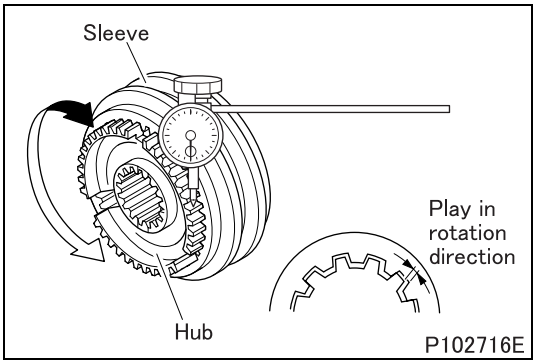
- Put alignment marks on the synchronizer inner ring, center cone, outer ring and hub, each at one location, aligning with the alignment mark on the synchronizer sleeve before disassembly.

◆Inspection procedure◆



■ **Inspection: Clearance between synchronizer outer ring protrusion and synchronizer hub groove**

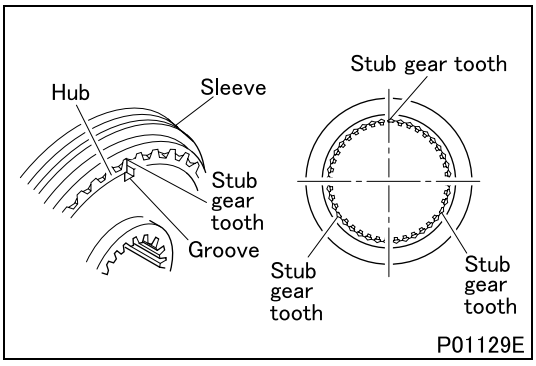
- If measurement exceeds the limit, replace defective parts.



■ **Inspection: Play of synchronizer sleeve and synchronizer hub in rotation direction**

- Hold the synchronizer sleeve and measure the play with rotating the synchronizer hub.
- If the measurement exceeds the limit, replace defective parts.

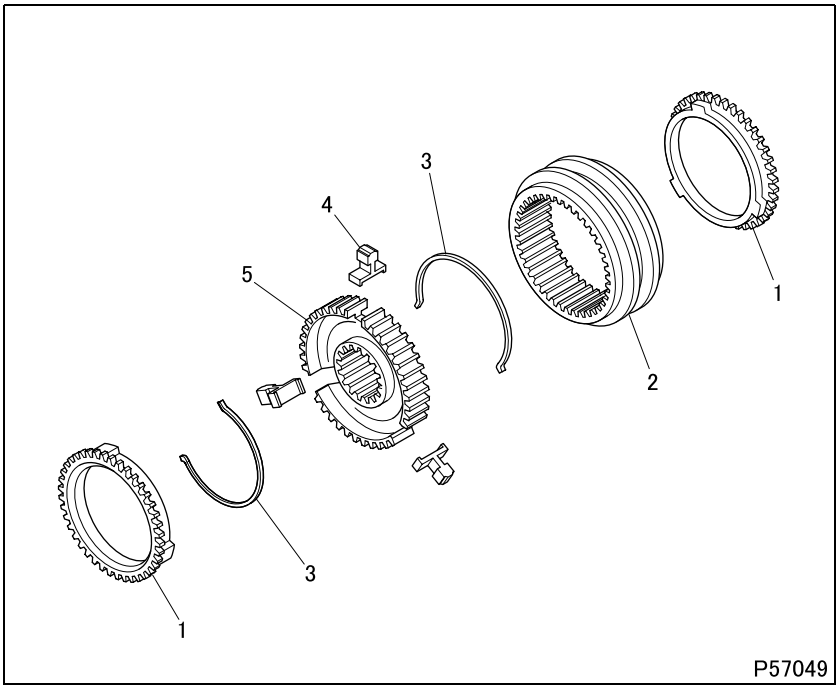
◆Installation procedure◆



■ **Installation: Synchronizer sleeve and synchronizer hub**

- When replacing the synchronizer sleeve or synchronizer hub with a new one, align the plunger grooves (three locations) of the synchronizer hub with stub gear teeth (three locations) of the synchronizer sleeve to install.

5th and 6th synchronizer



● Disassembly sequence

1 Synchronizer ring
2 Synchronizer sleeve
3 Shifting key spring
4 Shifting key
5 Synchronizer hub

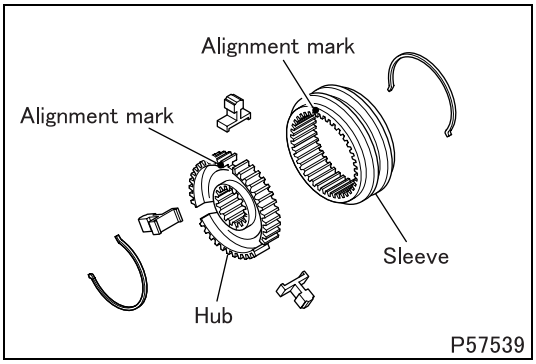
● Assembly sequence

Follow the disassembly sequence in reverse.

Service standards (Unit: mm {in.})

Location	Maintenance item	Standard value	Limit	Remedy
1, 5	Clearance between protrusions of synchronizer ring and synchronizer hub groove	4.7 to 5.3 {0.19 to 0.21}	6.5 {0.26}	Replace
2, 5	Play in the rotation direction of synchronizer sleeve and synchronizer hub	0.052 to 0.148 {0.0020 to 0.0058}	0.3 {0.012}	Replace
4, 5	Clearance between shifting key and synchronizer hub keyway	0.05 to 0.2 {0.0020 to 0.0079}	0.5 {0.020}	Replace

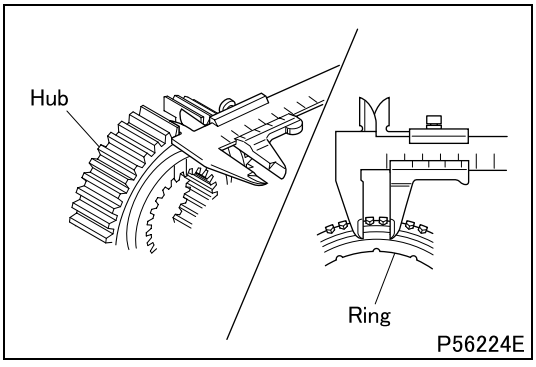
◆Work before removal◆



■Alignment marks: Synchronizer sleeve and synchronizer hub

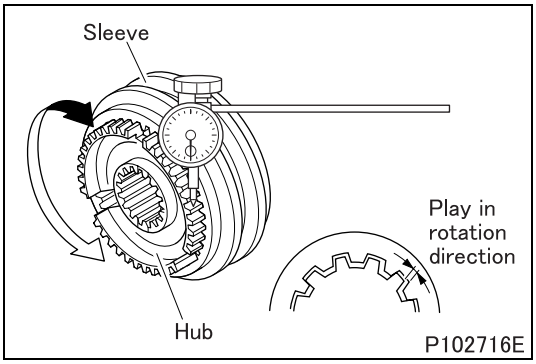
- Put alignment marks on the synchronizer sleeve and synchronizer hub, each at one location before disassembly.

◆Inspection procedure◆



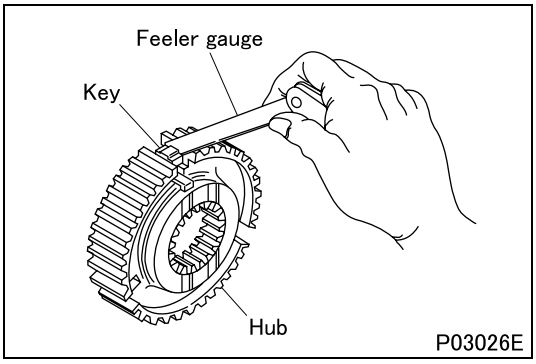
■Inspection: Clearance between synchronizer ring protrusion and synchronizer hub groove

- If measurement exceeds the limit, replace defective parts.



■ **Inspection: Play of synchronizer sleeve and synchronizer hub in rotation direction**

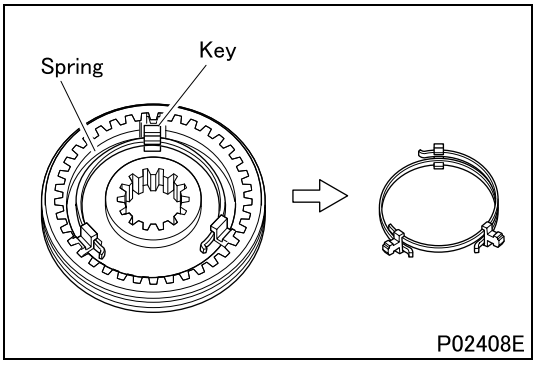
- Hold the synchronizer sleeve and measure the play with rotating the synchronizer hub.
- If the measurement exceeds the limit, replace defective parts.



■ **Inspection: Clearance between shifting key and synchronizer hub keyway**

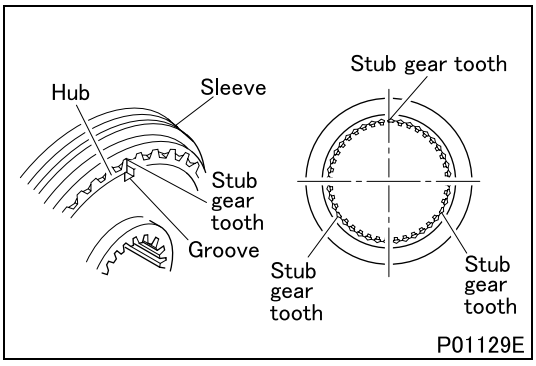
- If measurement exceeds the limit, replace defective parts.

◆Installation procedure◆



■ **Installation: Shifting key spring**

- After inserting the shifting key into the synchronizer hub groove, install the shifting key spring so that its opening is not located at the shifting key position.
- Install so that openings of the two shifting key springs are not located at the same position.



■ **Installation: Synchronizer sleeve and synchronizer hub**

- When replacing the synchronizer sleeve or synchronizer hub with a new one, align the plunger grooves (three locations) of the synchronizer hub with stub gear teeth (three locations) of the synchronizer sleeve to install.

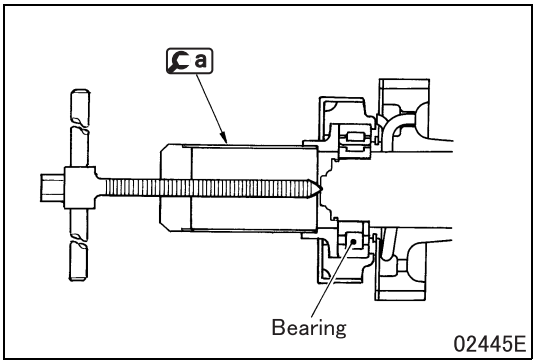
d	Countershaft gear puller A: φ30 {1.18}, B: 60 {2.36}  P01155	ME624243	Removal of countershaft gear
e	Countershaft gear installer A: φ75 {2.95}, B: φ63 {2.48}, C: 120 {4.72}  P01156	MH061740	Installation of countershaft gear

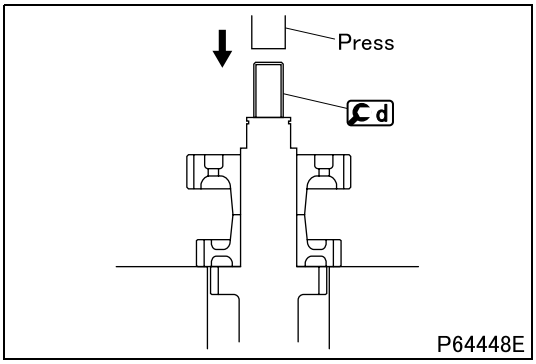
*: Components of puller and installer kit (See puller and installer.)

◆Removal procedure◆



02445E

■ **Removal: Countershaft front bearing**

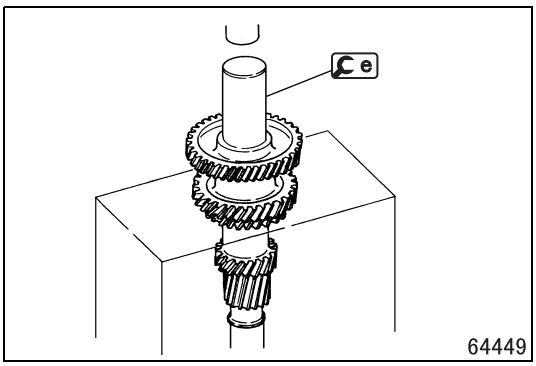


P64448E

■ **Removal: Countershaft constant mesh gear, countershaft 4th gear or countershaft 5th gear**

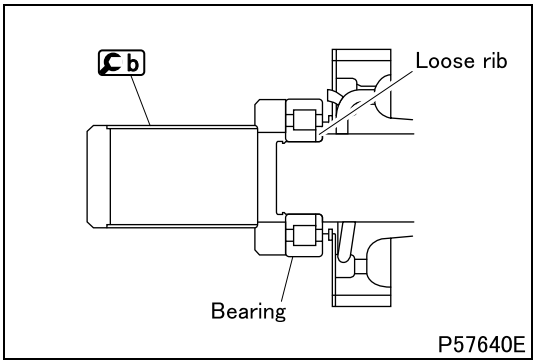
- Use a press.

◆Installation procedure◆



■ **Installation: Countershaft constant mesh gear, countershaft 4th gear or countershaft 5th gear**

- Use a press.



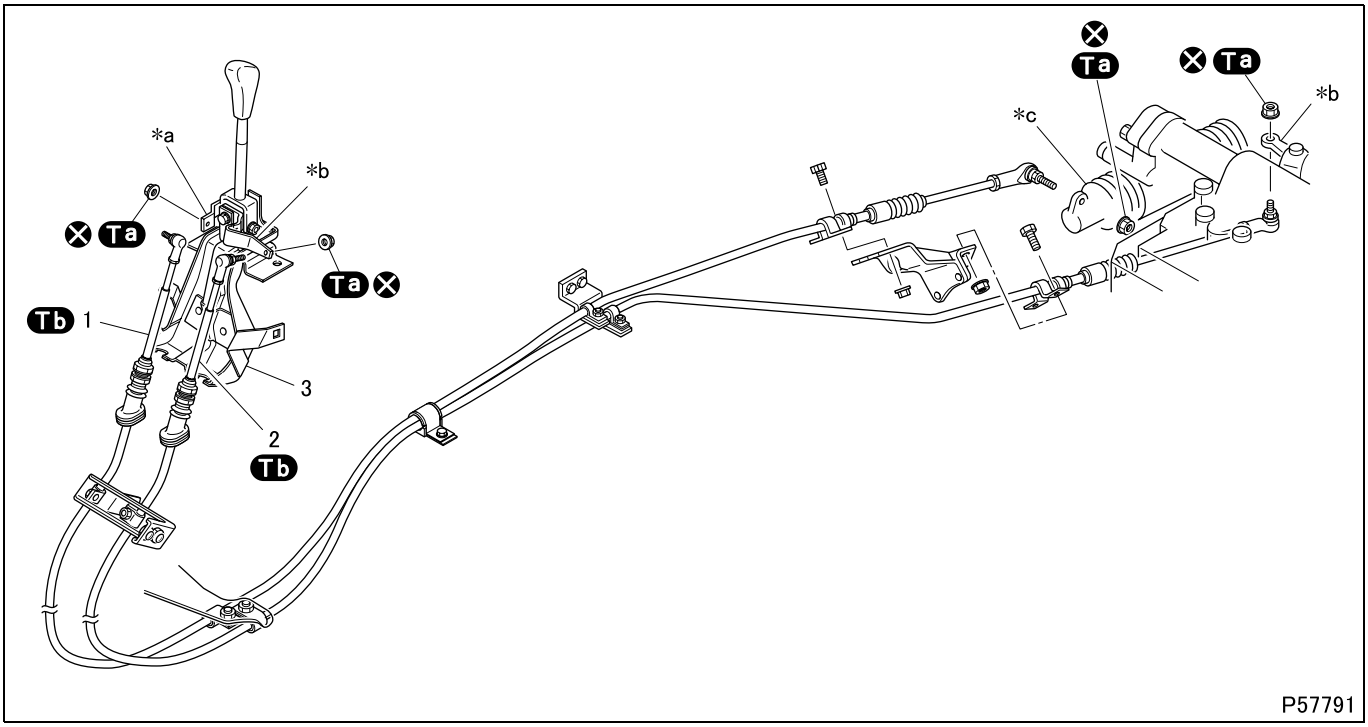
■ **Installation: Countershaft front bearing**

- Install the countershaft front bearing, facing the loose rib in the illustrated direction.

CAUTION ⚠

- **Be careful not to install the countershaft front bearing in the wrong direction. Otherwise, the bearing cannot be removed because the inner shaft of the bearing remains in the countershaft during removal.**

M E M O



● **Removal sequence**

1 Shift cable
2 Select cable
3 Control lever (See later section.)

***a**: Shift lever
***b**: Select lever
***c**: Power shift
⊗: Non-reusable parts

● **Installation sequence**

Follow the removal sequence in reverse.

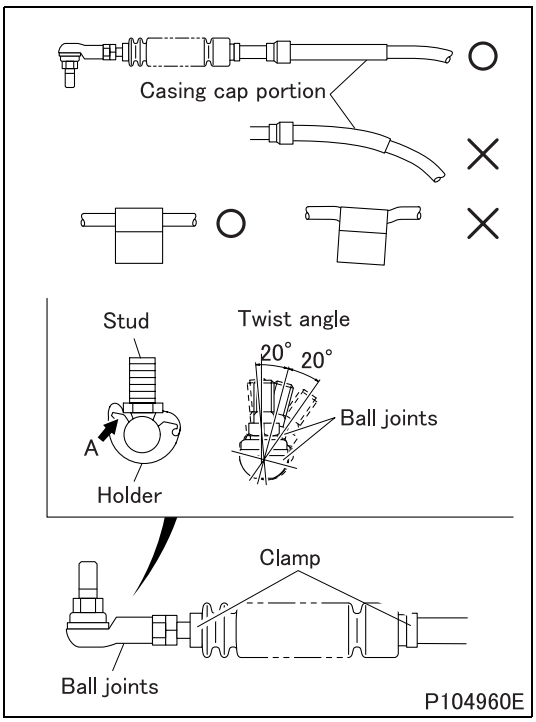
CAUTION ⚠

- **Locking agent is applied to cable mounting nuts. Be sure to replace the nuts when loosening or removing them.**

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Nut (shift cable mounting)	18.6 to 23.5 {14 to 17, 1.9 to 2.4}	–
	Nut (select cable mounting)		
Tb	Lock nut on shift cable	58.8 to 83.4 {43 to 62, 6 to 8.5}	–
	Lock nut on select cable		

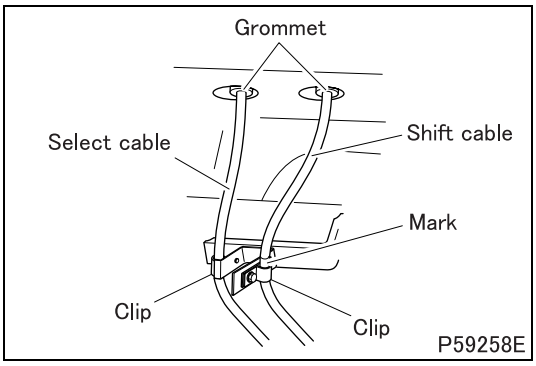
◆Installation procedure◆



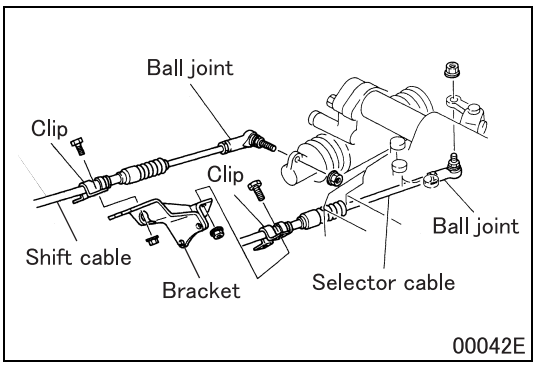
■ **Installation: Shift cable and select cable**

CAUTION ⚠

- **Install the casing cap portion as a straight line.**
- **The radius of the cable bend shall be 200 mm {7.87 in.} or more.**
- **Make sure that there is no obstruction in movement of the cable.**
- **Install the clamps at right angles to the cable.**
- **Do not twist clamps at either ends of the boot.**
- **Check for the identification mark on the shift cable.**
- **The twist angle of ball joints at both ends of the cables shall be 20 degrees or less.**
- **Make sure that the ball joints face the correct direction. Installing them in the wrong direction can remarkably reduce durability of the cables.**



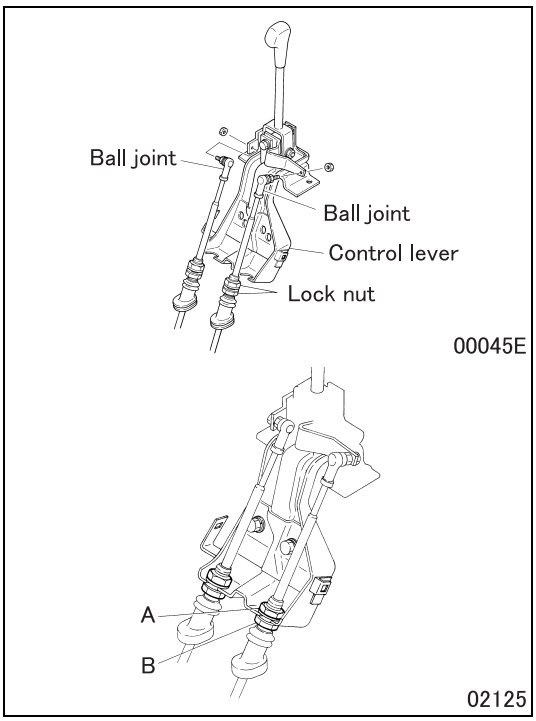
- Insert the shift cable and select cable into the interior from under the cab floor.
- Clamp the shift cable at the marking area.



- Install the cable clip to the bracket temporarily and connect the ball joint to the shift lever or select lever.
- Arrange the cable so that it not twisted, then tighten the clip permanently.

CAUTION ⚠

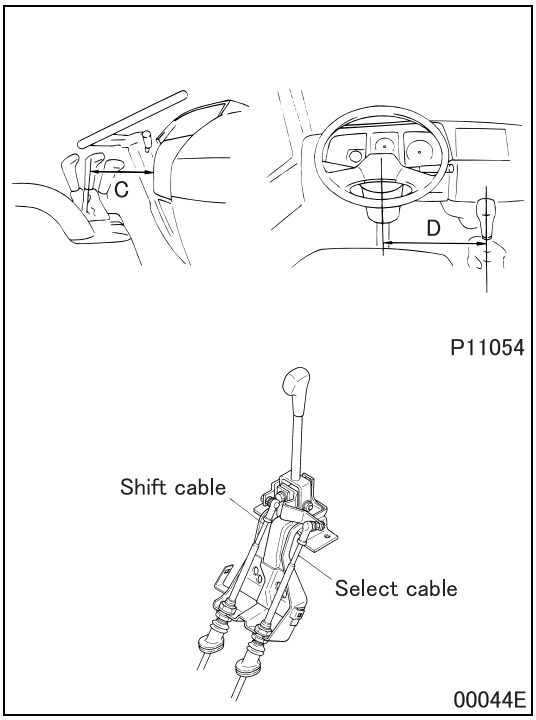
- **Make sure that the ball joint face the correct direction.**



- Tilt the cab down.
- Install the control lever.
- Install the cable on the control lever temporarily and connect the ball joint to the shift lever and select lever. Arrange the cable so that it is not twisted, then tighten lock nuts permanently.

CAUTION ⚠

- **When installing the lock nut, tighten lower nut B. Do not move upper nut A.**



- If the gear shift lever leans to the front or rear, or to the left or right, excessively, adjust the length of the cable and the position of the gear shift lever.

Fore-and-aft direction C (Adjust by shift cable.)

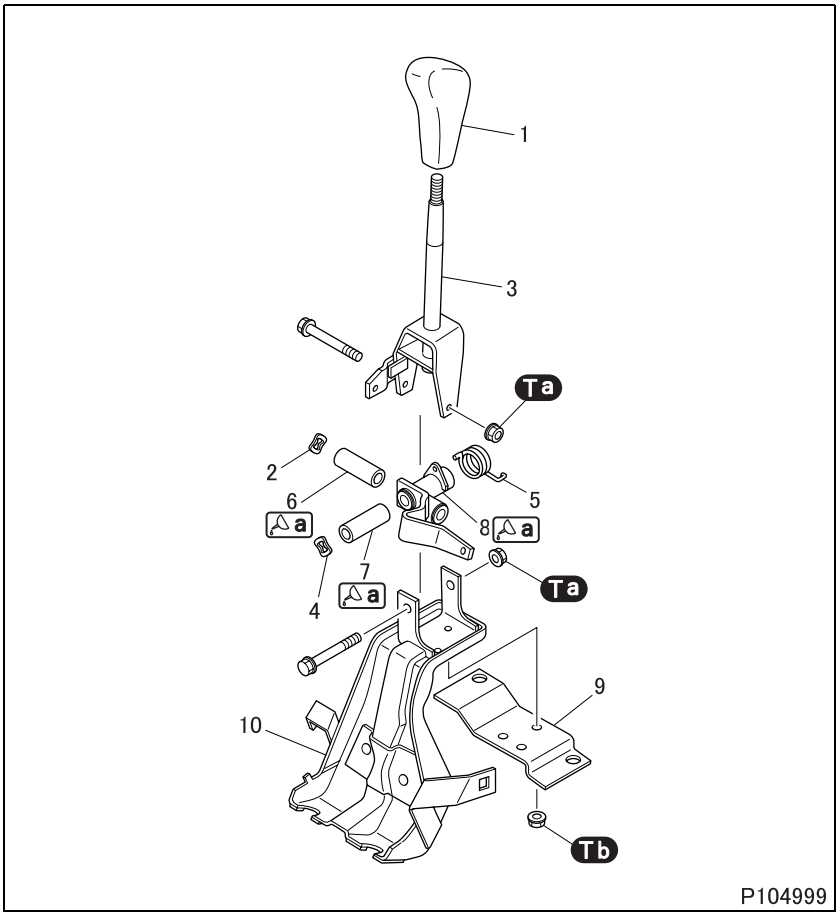
Distance from instrument panel	288 mm {11.3 in.}
To tilt the gear shift lever forward	Shorten the cable.
To tilt the gear shift lever backward	Lengthen the cable.

Left-and-right direction D (Adjust by select cable.)

Distance from the center of the steering wheel with the gear shift lever knob in neutral M060: To the 4th-5th line of the gear shift lever knob M070: To the 3rd-4th line of the gear shift lever knob	410 mm {16.1 in.}
To tilt the gear shift lever to the right	Lengthen the cable.
To tilt the gear shift lever to the left	Shorten the cable.

- Make sure to operate the gear shift lever that it shifts smoothly and selects each position.

Control lever



● **Disassembly sequence**

1 Shift knob
2 Wave washer
3 Shift lever
4 Wave washer
5 Return spring
6 Collar
7 Collar
8 Select lever
9 Bracket
10 Set board

● **Assembly sequence**

Follow the disassembly sequence in reverse.

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Nut (shift lever mounting)	19 to 28 {14 to 21, 1.9 to 2.9}	–
	Nut (select lever mounting)		
Tb	Nut (bracket mounting)	4 to 6 {3.0 to 4.4, 0.4 to 0.6}	–

Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	All sliding areas	Chassis grease [NLGI No.1 (Li soap)]	As required

PULLER AND INSTALLER KIT

- The puller and installer kit consists of principal bearing pullers and installers selected from the special tools necessary for the maintenance of the manual transmission described in this work group.
- For an installer use a component of this kit independently, and for a puller use the components of this kit in combination.

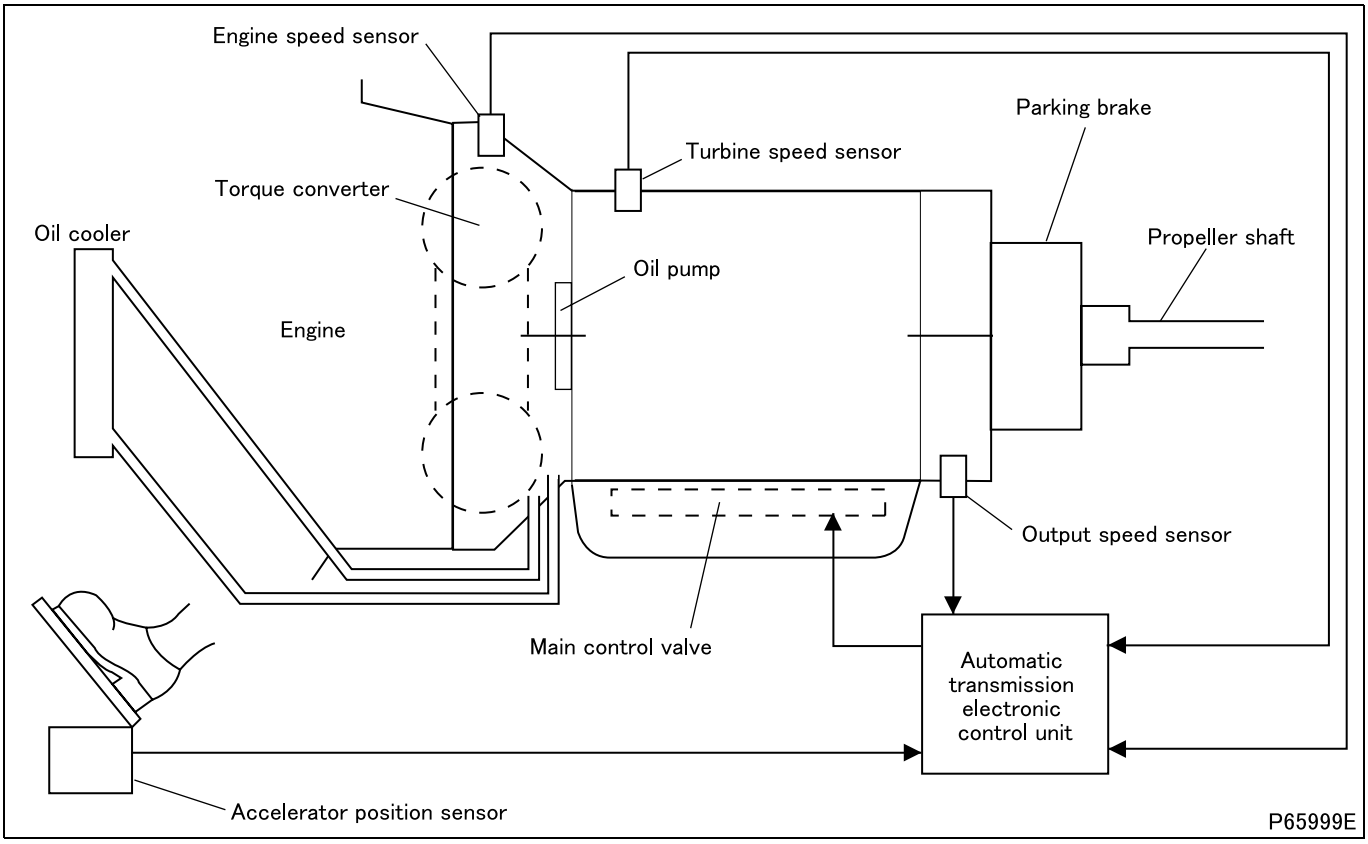
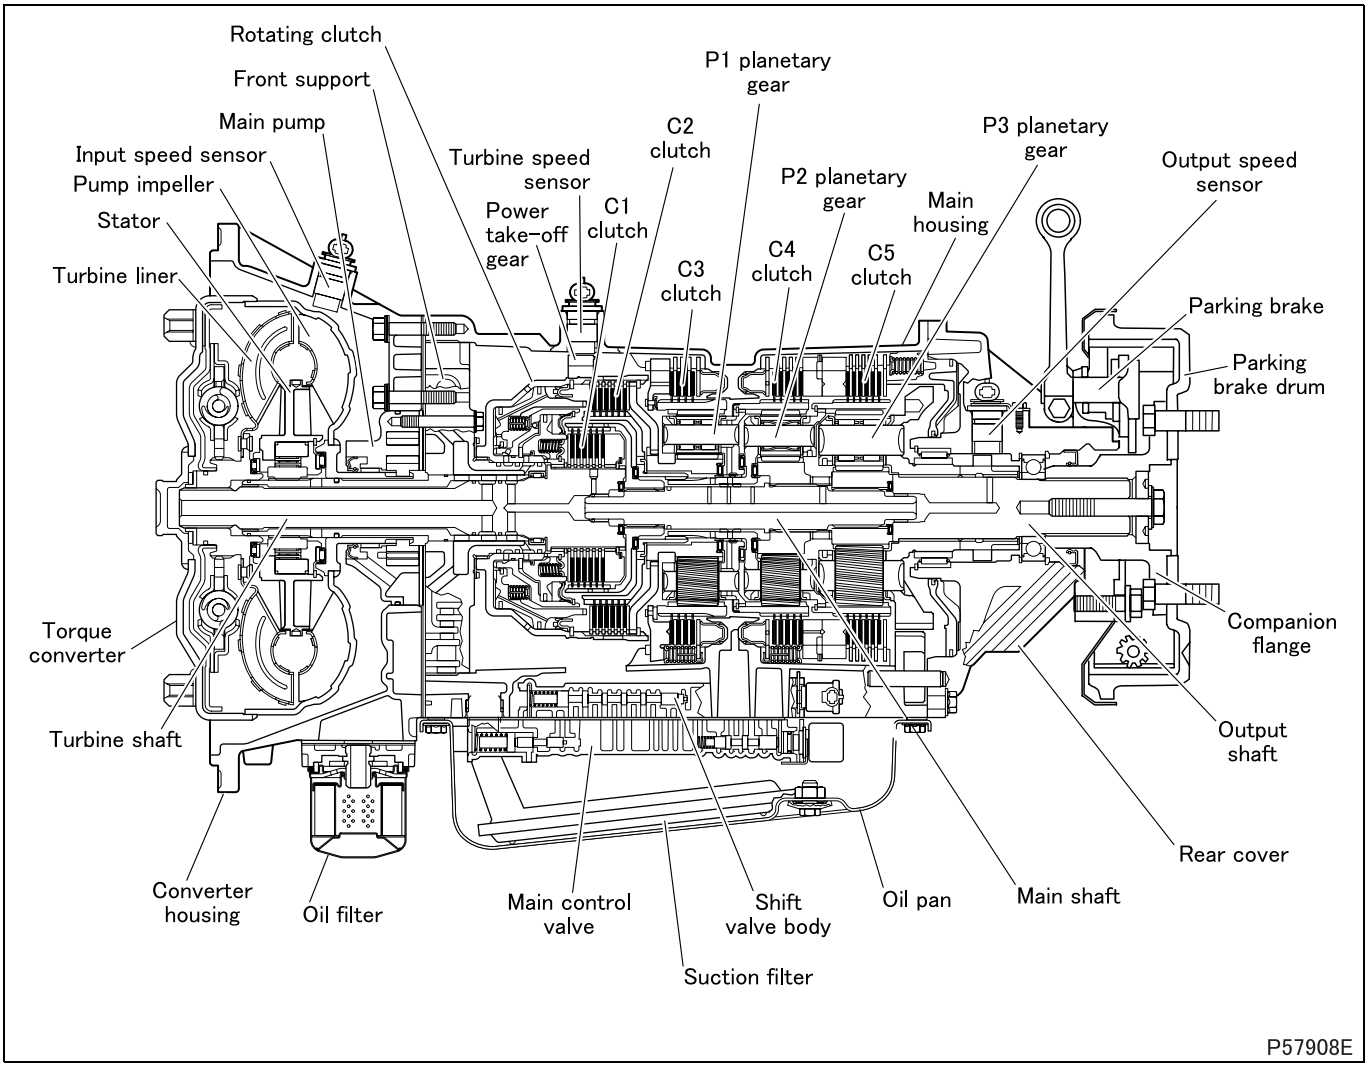
M E M O

1. Outline

- The automatic transmission forms a system in which gearshifts are automatically realized through direction of automatic transmission fluid on various paths by solenoid valves in accordance with sensor information on the vehicle speed, accelerator position, and other aspects of vehicle operation.
- The automatic transmission system provides various control functions. These include a diagnosis function (here, the automatic transmission electronic control unit monitors the main components and warns the driver of any abnormality), a backup function (here, the automatic transmission electronic control unit stops control of the automatic transmission when necessitated by an abnormality and changes the control method to enable continued driving in the event of a relevant abnormality).
- The system consists of an electronically controlled main control valve, a torque converter, planetary gears, clutches, and the automatic transmission electronic control unit and sensors that are used for control of the aforementioned components.



1.1 Automatic transmission



- This automatic transmission is a combination of a torque converter with lock-up mechanism and full automatic 5-speed gear system.

(1) Torque converter
- The torque converter, an input device of the transmission, increases the torque transmitted from the engine as well as acts as a fluid coupling to absorb shocks when starting or shifting. It also improves transmission efficiency by eliminating slippage by the lock-up mechanism over a certain vehicle speed.

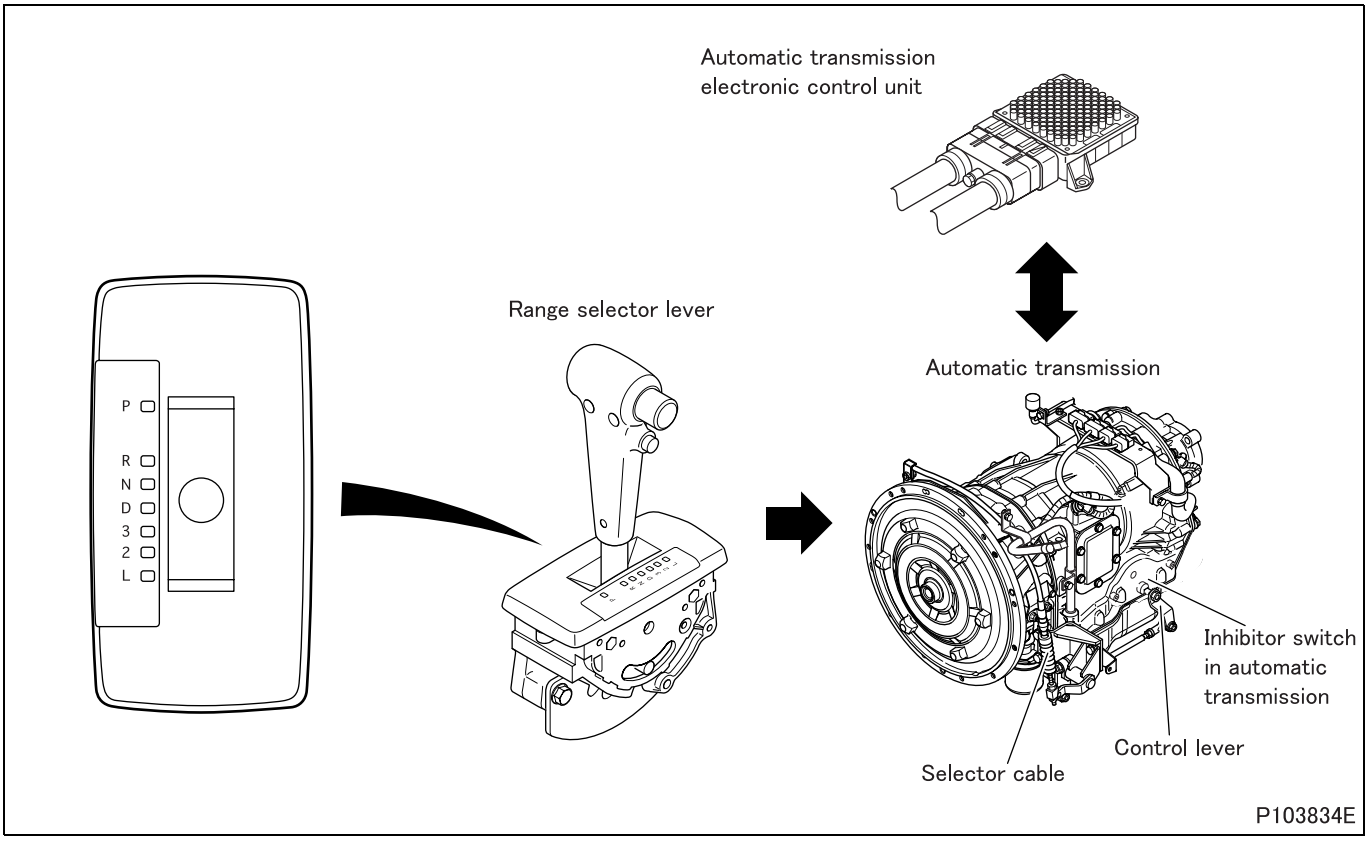
(2) Transmission
- The transmission consists of a gear system of five forward gears and one reverse gear. Gears are shifted by three sets of planetary gear and hydraulically-operated five sets of wet-type multiple disc clutch.

(3) Hydraulic control
- Heavy use of electronic control using a microcomputer for the hydraulic control enables fine shifting control.

(4) Main pump
- The turbine shaft drives the internal gear of the main pump to suck up the oil from the oil pan. The oil is pressurized and fed to the hydraulic control system and each lubrication point.

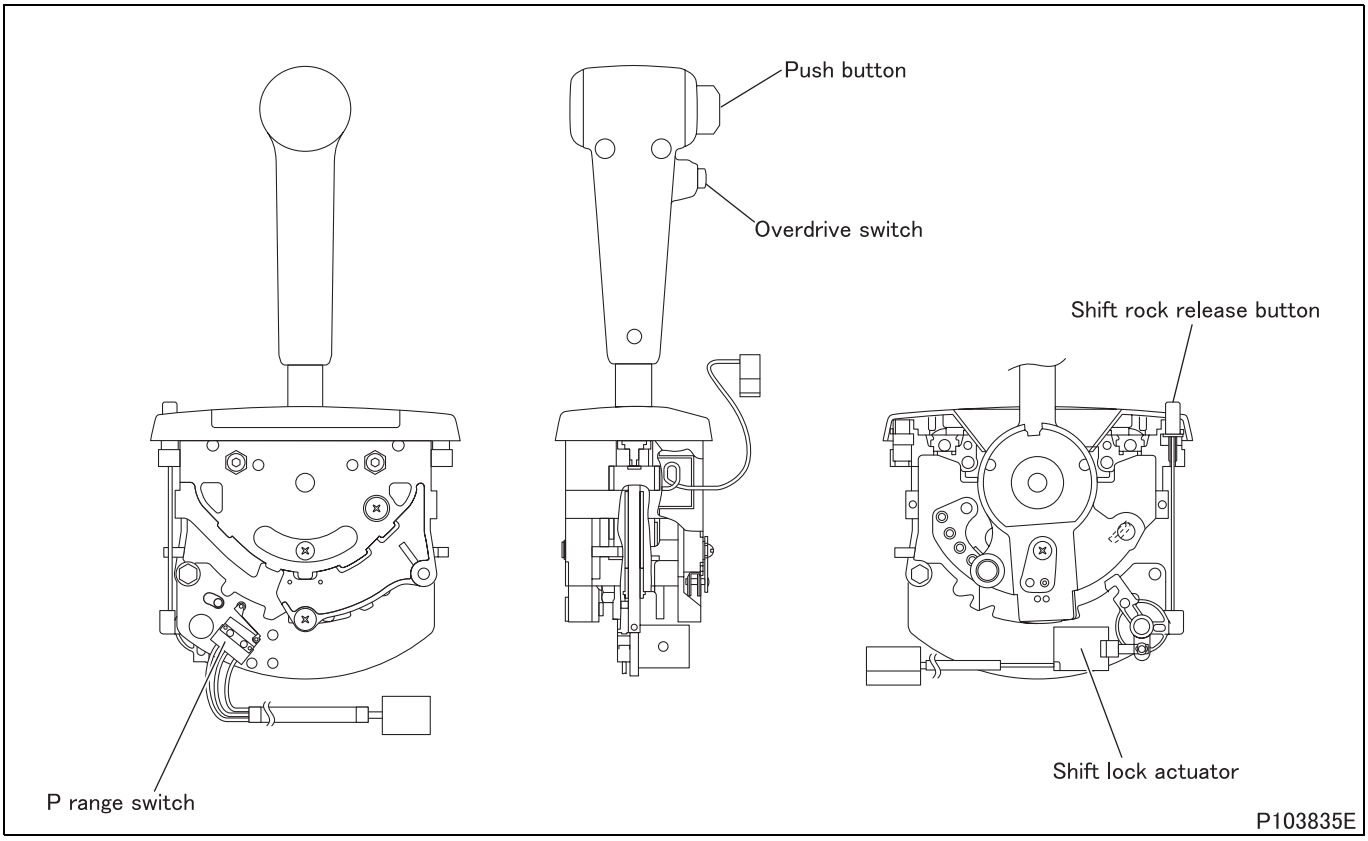
(5) Main control valve and shift valve body
- This unit consists of the shift valves and the control valves. The shift valves are operated by the signals from electronic control unit and change the hydraulic circuits. The control valves are activated by the fluid pressure from the selected circuit and perform changeover of the clutches and regulation of the fluid pressure.

1.2 Automatic transmission control



- When the range selector lever is operated to a desired range position, the control lever is rotated via the selector cable and the selected range is detected by the inhibitor switch.
- The detected range is transmitted to the automatic transmission electronic control unit, which in turn sends a corresponding speed change command to the automatic transmission.

1.3 Range selector lever



- The P range switch detects whether the range selector lever is in P range to control the key interlock function.
- The shift lock actuator is used to control the P shift lock function.
- The shift lock release button releases the P shift lock function mechanically without using the shift lock actuator. This button is used when the P shift lock function is faulty.

(1) Key interlock function

(1.1) Lock condition

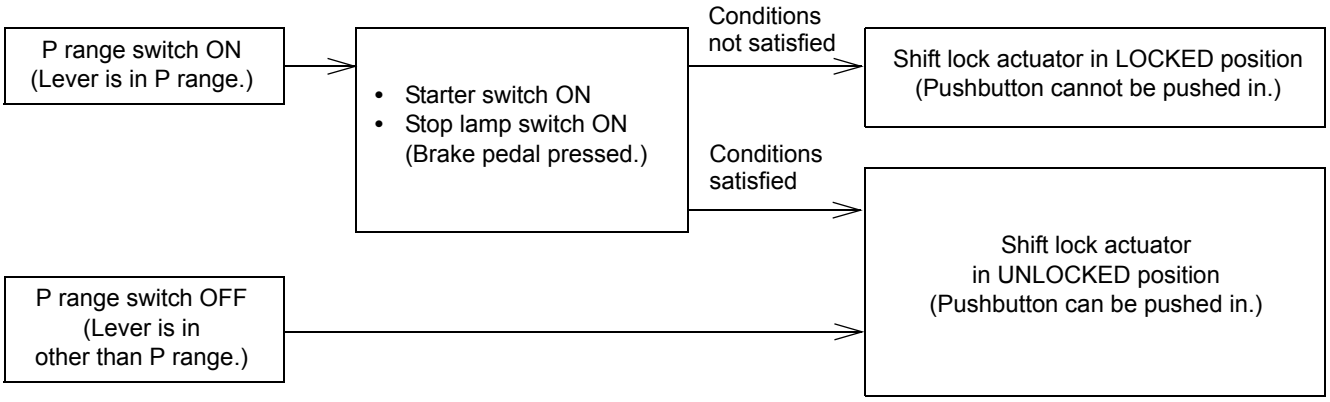
Input signal	Key interlock electronic control unit	Output signal
P range switch OFF (Lever is in other than P range.)	Key interlock activated	Key interlock solenoid ON (Ignition key cannot be turned to the LOCK position.)

(1.2) Lock released

Input signal	Key interlock electronic control unit	Output signal
P range switch ON (Lever is in P range.)	Key interlock released	Key interlock solenoid OFF (Ignition key can be turned to the LOCK position.)

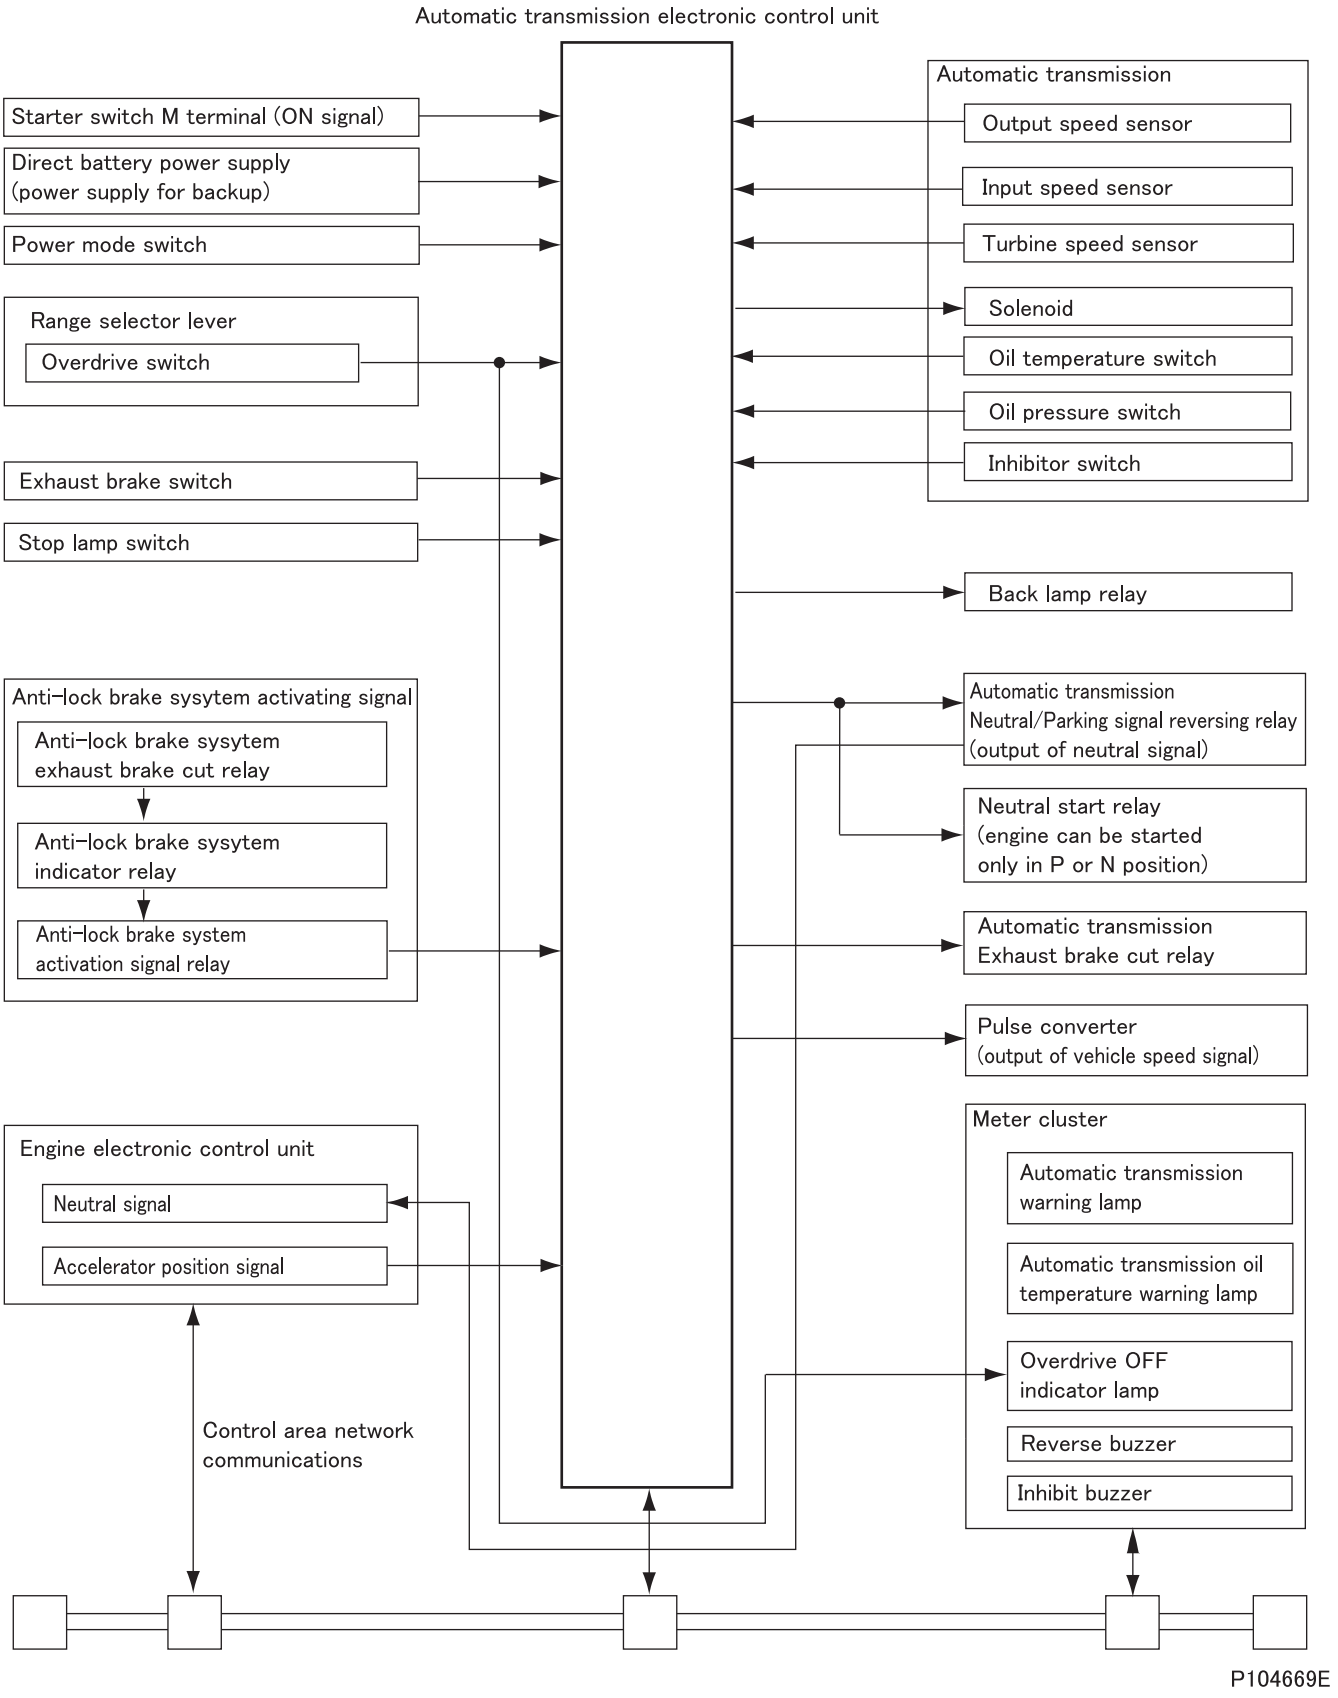
(2) P shift lock function

- When shifting gear from P range, if the operation condition of the shift lock actuator is not satisfied, the pushbutton on the range selector lever cannot be pushed in (the gearshift cannot be performed).



2. Electronic Control System

2.1 System block diagram



Parts name	Main function or working of switch and sensor
Starter switch	Power supply to control unit, etc. (ON position)
Power mode switch	Detection of driving mode switch
Range selector lever	Designation of driving range
Overdrive switch	Detection of overdrive OFF signal
Exhaust brake switch	Detection of exhaust brake operating
Stop lamp switch	Transmission of brake signal
Anti-lock brake system activation signal relay and Anti-lock brake system indicator relay	Detection of anti-lock brake system activating signal
Engine electronic control unit (accelerator position sensor)	Detection of accelerator opening signal (used for shifting control and lock-up control)
Output speed sensor	Detection of vehicle speed (used for shifting control)
Input speed sensor	Detection of engine speed (used for lockup control)
Turbine speed sensor	Detection of turbine revolution (used for shifting control)
Solenoid	Actuation of each solenoid
Oil temperature switch	Detection of automatic transmission fluid temperature (used for oil temperature control)
Oil pressure switch	Operation of shifting clutch
Inhibitor switch	Detection of range selector lever position signal
Automatic transmission warning lamp	Indication of system failure
Automatic transmission oil temperature warning lamp	Warning indication of abnormal rise of oil temperature
Overdrive OFF indicator lamp	Indication of overdrive OFF
Inhibit buzzer	Warning for shifting limit
Automatic transmission Neutral/Parking signal reversing relay	Detection of P and N signal
Neutral start relay	Approval of engine start
Automatic transmission exhaust brake cut relay	Output of exhaust brake cut
Pulse converter	Distribution of vehicle speed pulse signal

2.2 Fail-safe function

<table>
<tr><th>Main faulty content</th><th>Reaction and operation of transmission</th></tr>
<tr><td>Battery voltage too low (faulty power supply)</td><td>• Shifting only to R, 1st, 3rd, 5th is possible.</td></tr>
<tr><td>• Turbine speed sensor faulty
• Output speed sensor faulty</td><td>• Automatic transmission warning lamp illuminates.
• Lock-up is released and the current gear is fixed when moving forward.
• The gear is fixed to neutral when in reverse gear.</td></tr>
<tr><td>Input speed sensor faulty</td><td>• Lock-up is released.
• Normal shifting is possible using turbine speed sensor signal.</td></tr>
<tr><td>Drop in voltage during running (faulty power supply)</td><td>Lockup is released and the gear is fixed to the following.
<table>
<tr><td>Immediately preceding gear</td><td>R, N</td><td>1st</td><td>2nd, 3rd</td><td>4th, 5th</td></tr>
<tr><td>Gear to be changed to</td><td>N</td><td>1st</td><td>3rd</td><td>5th</td></tr>
</table></td></tr>
<tr><td>Solenoid and oil pressure switch faulty</td><td>• Automatic transmission fluid warning lamp illuminates.
• Lock-up is released and the gear is fixed to the specified gear.</td></tr>
<tr><td>Wheels lock by sudden braking</td><td>Lock-up is released. The immediately preceding gear stays on and does not shift. (The transmission is shifted to the 1st gear after the vehicle is stopped.)</td></tr>
<tr><td>Inhibitor switch faulty</td><td>The gear shifts regarding the range as the immediately preceding range.</td></tr>
<tr><td>Throttle signal faulty</td><td>The gear shifts regarding the throttle opening as the specified value.</td></tr>
<tr><td>Control by oil temperature inside oil pan</td><td>• –35 °C {–31 °F} or below: Only 2nd gear and reverse gear can be operated.
• –25 °C {–13 °F} or below: Only 1st to 4th gears and reverse gear can be operated.
• 0 °C {32 °F} or below: Actuation of lockup is halted.
• 127 °C {260 °F} or above: The automatic transmission fluid warning lamp illuminates and shifting to 5th gear is prohibited.</td></tr>
</table>

2.3 Operation of transmission when power is lost

Gear engaged during	When failure occurs driving	When shifting gear		After restarting engine	
		N → R	N → D	N → R	N → D
R	Neutral	Neutral	5th gear	Reverse gear	3rd gear
N	Neutral	Neutral	Neutral	Reverse gear	3rd gear
1st gear	1st gear	Reverse gear	3rd gear	Reverse gear	3rd gear
2nd gear	3rd gear	Reverse gear	3rd gear	Reverse gear	3rd gear
3rd gear	3rd gear	Reverse gear	3rd gear	Reverse gear	3rd gear
4th gear	5th gear	Neutral	5th gear	Reverse gear	3rd gear
5th gear	5th gear	Neutral	5th gear	Reverse gear	3rd gear

1. Failure by Equipment

NOTE

- **If the automatic transmission warning lamp would not turn off, contact Allison service station.**
- **Allison exclusive diagnosis tool is required to read out the diagnosis code.**

Possible causes \ Symptoms		Engine does not start (engine does not run)	Automatic transmission warning lamp does not go out after engine start	Automatic transmission warning lamp sometimes flashes	Automatic transmission warning lamp does not illuminate when starter switch is turned ON	Forward gears and reverse gears do not engage (kept in N)	Gear stays in a forward or reverse gear	Specific shifting is not made	No correct shifting (shock, timing too high or too low)	Excessive creep in 1st and reverse gears	Moves forward in neutral	Moves backward in neutral	Overrun at full throttle acceleration	Clutch slippage, judder	Clutch slippage and judder in 1st, 2nd, 3rd and 4th gears
Engine failure	Idling too high									O	O	O			
	Idling too high (shifting from N to R or D)								O						
	Engine speed too high					O									
	Engine output low							O							
Accelerator signal failure from engine electronic control unit						O			O				O	O	
Lever and cable failure	Range selector lever not engaged in N or R	O													
	Range selector lever failure					O		O							
	Poor adjustment of range selector lever					O		O							
	Control lever failure					O		O							
	Poor adjustment of control lever					O		O							
	Poor adjustment of selector cable					O		O							
Electrical system failure on chassis side	Battery voltage low	O													
	Broken wire, poor connection	O	O	O	O	O		O	O						
	N start circuit failure	O													
	Automatic transmission warning lamp failure		O	O	O										
Electrical system failure on automatic transmission body side	Broken wire, poor connection	O	O	O	O	O		O	O						
	Inhibitor switch failure	O													
	Poor adjustment of inhibitor switch	O													
	Speed sensor failure					O		O	O				O	O	
	Oil temperature sensor failure							O							
Automatic transmission electronic control unit failure	Automatic transmission electronic control unit failure		O		O			O							
	Code recorded in automatic transmission electronic control unit		O												

Possible causes \ Symptoms		Engine does not start (engine does not run)	Automatic transmission warning lamp does not go out after engine start	Automatic transmission warning lamp sometimes flashes	Automatic transmission warning lamp does not illuminate when starter switch is turned ON	Forward gears and reverse gears do not engage (kept in N)	Gear stays in a forward or reverse gear	Specific shifting is not made	No correct shifting (shock, timing too high or too low)	Excessive creep in 1st and reverse gears	Moves forward in neutral	Moves backward in neutral	Overrun at full throttle acceleration	Clutch slippage, judder	Clutch slippage and judder in 1st, 2nd, 3rd and 4th gears
ATF (automatic transmission fluid) failure	ATF level poor								O				O	O	
	ATF level too low					O	O								
	ATF deteriorated								O						
	ATF is overheating							O							
Mechanical failures of automatic transmission body	Mechanical troubles of torque converter, shaft and planetary					O									
	Operation failure of lock-up clutch													O	
	C1 clutch failure								O						
	C1 clutch slippage														O
	C1 clutch plate worn														O
	C1 clutch not disengaged									O	O	O			
	C3 clutch not disengaged									O	O	O			
	Mechanical trouble of C5 clutch					O									
	Clutch clearance excessive								O						
	Slippage of related clutch and piston seal leaks												O		
Oil pressure failure of automatic transmission body	Oil pressure lowered					O	O		O				O	O	
	Control valve failure								O				O		
	Solenoid assembly leaks						O		O				O		

Possible causes	Symptoms	Clutch slippage and judder in 4th and 5th gears	Clutch slippage and judder in 3rd, 5th and reverse gears	Clutch slippage and judder in 2nd gear only	Clutch slippage and judder in 1st and reverse gears	Main oil pressure decline in all ranges	Lubricant pressure decline	Stall revolution high	Stall revolution low	Overheat in all ranges	Blowoff of ATF from breather and level	Occasional noise like a buzzer	ATF leaks from output side	ATF leaks from input side	Contamination of ATF
Engine failure	Engine output high							O							
	Engine output low								O						
	Engine is overheating									O					
Electrical system failure on automatic transmission body side	Oil temperature sensor failure									O					
ATF (automatic transmission fluid) failure	ATF level poor					O	O								
	ATF level too low							O	O		O	O			
	ATF level too high									O	O				
	ATF overheated														O
	ATF bubbles							O	O	O		O			
	ATF not replaced														O
Oil cooler failure	Oil cooler piping clogged, leaking						O			O					
	Oil cooler clogged						O								
	Ventilation to oil cooler hindered									O					
	Mixing of coolant										O				
Mechanical failures of automatic transmission body	Torque converter failure							O	O	O				O	
	C1 clutch slippage							O	O						
	C2 clutch slippage	O													
	C2 clutch plate worn	O

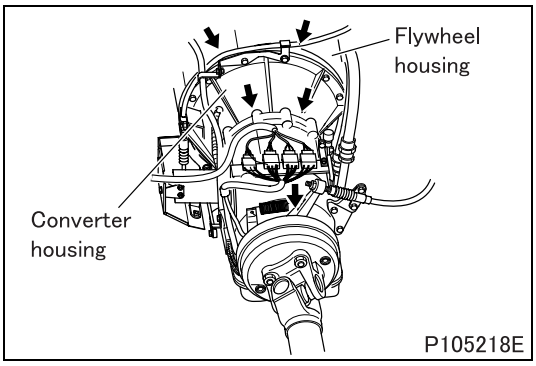
	Companion flange mounting area loosened												O		
	Rear cover failure												O		
	Front support bolt seal failure													O	
	Manifold seal failure													O	
	Main oil pressure plug seal failure													O	

ON-VEHICLE INSPECTION AND ADJUSTMENT

1. Inspection of Automatic Transmission Oil Leakage



1.1 Inspection of oil leakage at each part of transmission body

- Check the oil leakage at each part of automatic transmission body in visual.
  If the oil leakage is found, replace the defective part.

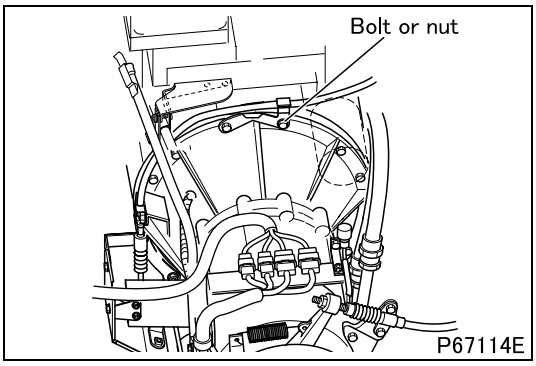
1.2 Inspection of oil leakage around transmission mounting part

- Check there is not oil stain on flywheel housing and automatic transmission mounting part caused by oil leakage from engine.
- If there is the oil stain, remove the automatic transmission and clean the mounting surface of converter housing and flywheel housing using brake cleaner etc. after repairing oil leakage part. Because the oil stain may loosen the automatic transmission mounting bolts. (See “REMOVAL AND INSTALLATION OF AUTOMATIC TRANSMISSION”.)

2. Check for Looseness in Automatic Transmission Mounting Bolts and Nuts

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
–	Bolt or nut (automatic transmission mounting)	40.2 {30, 4.1}	–

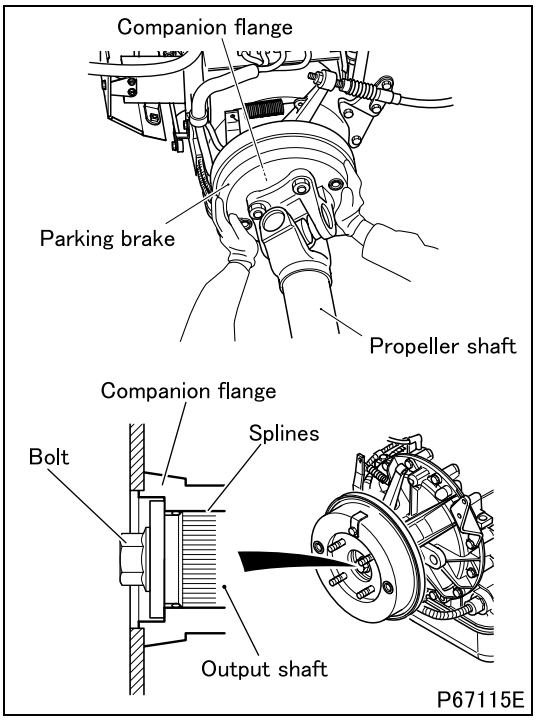


- Check the automatic transmission mounting bolts or nuts for looseness.
- Retighten any loose bolt or nut to the specified torque.

3. Inspection of Play and Looseness in Companion Flange

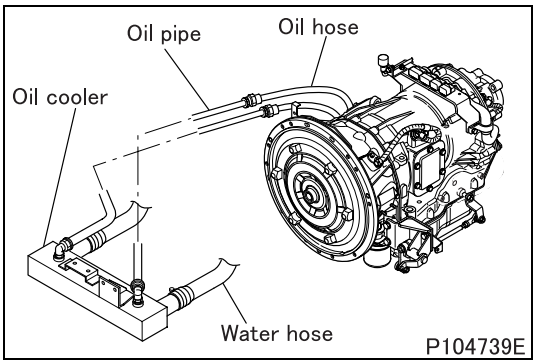
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
–	Bolt (companion flange mounting)	108 to 136 {80 to 100, 11 to 14}	–



- Move the companion flange and parking brake <FK61> in axial and vertical directions to check for excessive play between the companion flange and output shaft.
- If excessive play is detected, remove the propeller shaft, then check the bolt for looseness and the splines on companion flange and output shaft for abnormalities.
- If any bolt is loose, tighten it to the specified torque.
- If the companion flange is found detective, replace the part. (See “parking brake”.)
- If the companion flange is not found defective, the output shaft may be defective, contact the Allison Service Station for repair.

4. Inspection of Automatic Transmission Cooling System



- Check the automatic transmission cooling system for fluid leak and damage. If any abnormality is found, replace the faulty part.

5. Inspection of Automatic Transmission Fluid

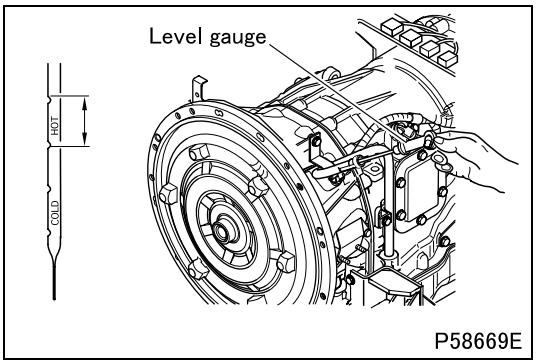
Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
–	Automatic transmission	DEXRON III	As required

- If the automatic transmission fluid level is too low, the fluid is sucked inside with air from the pump and made sponge-like by produced air bubbles. When this occurs, the pressure is dropped and internal clutch may be caused to slip as a result.
- If the automatic transmission fluid level is too high due to improper refilling, the fluid is stirred up by rotating parts to produce air bubbles, bringing out the same result as when the fluid level is too low.
- In either case, air bubbles leads to overheating, oil oxidation and varnish production, preventing proper valve and clutch operations.
- Furthermore, bubbling causes automatic transmission fluid to spout from automatic transmission vent holes and filler tube, which could be mistaken for a leakage of automatic transmission fluid.
- To prevent these, check the exact quantity of automatic transmission fluid by the procedure described in the following.

5.1 Inspection of properties

- If having a burnt smell of automatic transmission fluid or finding out some worn particles of metal or friction materials, it is necessary to overhaul the transmission completely. Check automatic transmission fluid adhering to a level gauge carefully. If there are some doubts in a state of automatic transmission fluid, check the automatic transmission fluid again by it extracting its sample.



5.2 Inspection of quantity of automatic transmission fluid

CAUTION ⚠

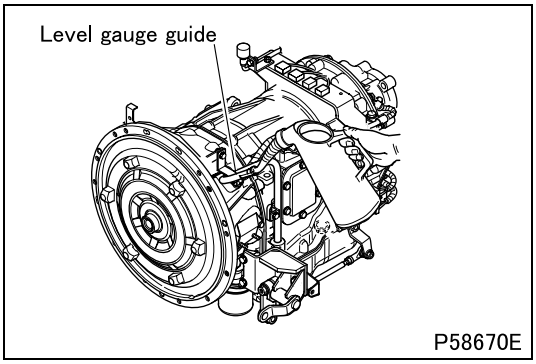
- **Before performing the test, make sure there is no worker in front and at the rear of the vehicle.**

- Run the vehicle until automatic transmission fluid gets sufficiently warm (71 to 93°C {160 to 199°F}) (for reference: run the vehicle for 20 to 30 minutes).
- Place the vehicle on a flat place, engage the parking brake surely, and place chokes securely at the wheels.
- To fill automatic transmission fluid in a hydraulic circuit with the engine at idle, return the range selector lever to P range after putting it in D range and R range. Do not turn off the engine as the ATF level rises higher than the actual level when the engine is stationary.
- Do not raise the engine speed while keeping the engine at idle until the adjustment of quantity of automatic transmission fluid is completed.
- Remove any dirt of the protection cap and the upper part of level gauge guide completely.
- Pull out level gauge with the engine at idle; insert it again after wiping off automatic transmission fluid adhered; and after pulling it out, check the quantity of automatic transmission fluid.
- If automatic transmission fluid is within the HOT range of level gauge, it shows that the quantity of automatic transmission fluid is as specified.

- The COLD level indicated on the level gauge is just for reference when the fluid temperature is low. Inspection should be performed at high fluid temperature after driving.

CAUTION ⚠

- **Since the inspection is conducted with the engine running, be careful of being caught in components, burn hazard, or safety.**



- In case the quantity of automatic transmission fluid is insufficient, replenish DEXRON III to the specified level of the level gauge from level gauge guide.

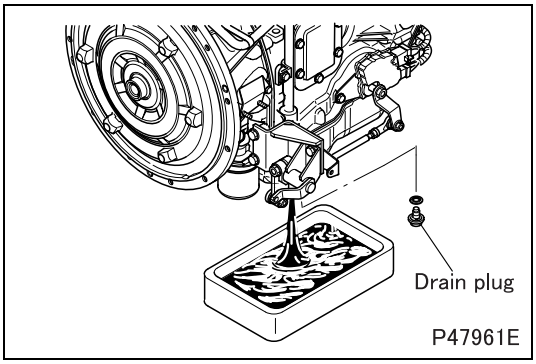
6. Replacement of Automatic Transmission Fluid

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
–	Drain plug	30 to 40 {22 to 30, 3.1 to 4.1}	–

Lubricant and/or sealant

Mark	Points of application		Specified lubricant and/or sealant	Quantity
–	Automatic transmission	FK61	DEXRON III	6 L {6.3 qts}
		Except FK61		9 L {9.5 qts}

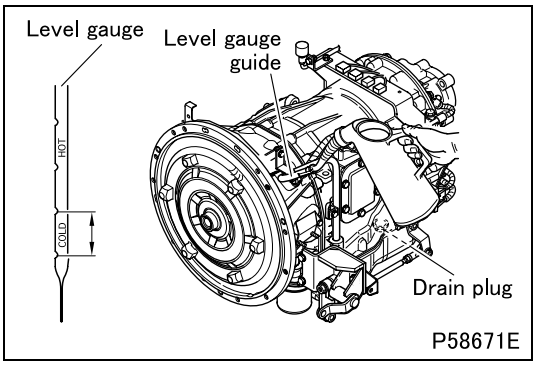


6.1 Discharge

- Place chokes at wheels on a flat place, and put the range selector lever in P range.
- Put an automatic transmission fluid receptacle under the transmission oil pan, then remove drain plug on the oil pan to discharge automatic transmission fluid. During draining, check the condition of the fluid and check if any metallic powder or metal pieces exist in the fluid. (Note that it is impossible to discharge automatic transmission fluid in the hydraulic circuit, the converter, and the oil cooler.) To discharge the automatic transmission fluid quickly, warm-up the engine.

CAUTION ⚠

- **Do not start any work for engine immediately after the engine is shut down. Wait until the engine cools to a safe temperature since a hot engine can cause burns.**



6.2 Pouring in

- Install oil pan drain plug.
- Pour in the specified quantity of DEXRON III from level gauge guide. Be careful not to allow any dust or foreign particles to enter.
- Put the range selector lever in P range, start the engine, and run the engine at idle for approximately one minute.
- After putting the range selector lever in each range, engage it to P range again.

CAUTION ⚠

- **In this process, run the engine at idle only; make sure to avoid revving the engine.**

- Replenish automatic transmission fluid until it reaches the low position of the specified range of level gauge. Then, check the level of automatic transmission fluid. The level of automatic transmission fluid must be within the specified range of the level gauge.
- Immediately after pouring in automatic transmission fluid, it may be difficult to clearly see the level of automatic transmission fluid due to the automatic transmission fluid adhering to the inner wall of level gauge guide; therefore, check the level again after a while.
- As the temperature rises, the level of automatic transmission fluid rises. Therefore, do not pour in automatic transmission fluid above the COLD level (A range) of level gauge while the temperature is low.
- Keep the engine at idle, and pour in automatic transmission fluid gradually while paying attention to the level of automatic transmission fluid.

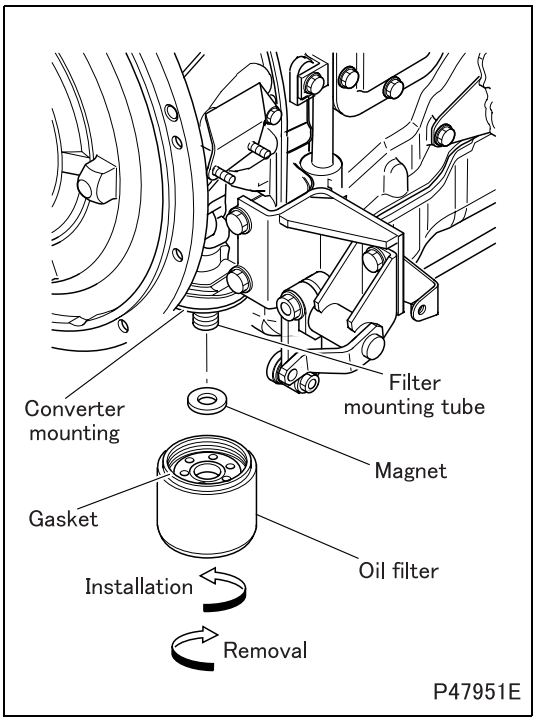
7. Replacement of Oil Filter

Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
–	Gasket of oil filter	DEXRON III	As required

CAUTION ⚠

- **Do not start any work for engine immediately after the engine is shut down. Wait until the engine cools to a safe temperature since a hot engine can cause burns.**



[Removal]

- Remove oil filter using a commercially available filter wrench.
- Remove magnet from filter mounting tube.
- Check for any existence of metallic powder or metal pieces.

[Installation]

- Clean magnet before installation.
- Clean magnet with wash oil.
- Clean the oil filter mounting surface of converter housing.
- Apply a thin coat of “DEXRON III” to gasket of oil filter.
- Screw in the filter by hand until gasket contacts converter housing.
  In addition, tighten it one turn by hand.

CAUTION ⚠

- **Do not overtighten oil filter using a wrench. Overtightening can damage the oil filter, causing leaks of automatic transmission fluid.**

- After installing oil filter, start the engine to make sure that no automatic transmission fluid leaks from gasket.
- Check the quantity of automatic transmission fluid. If the quantity is insufficient, replenish.

8. Stall Test

Service standards

Location	Maintenance item	Standard value	Limit	Remedy
–	Stall revolution	1900 ± 150 rpm	–	Ask for repair.

- Conduct a stall test only as a troubleshooting procedure. Do not conduct a stall test as general inspection or maintenance.

8.1 Purpose

- A stall test is conducted to determine whether power failure is caused by engine troubles or malfunction of the transmission.
- The stall speed is the maximum engine speed when the engine is at full throttle and the torque converter turbine does not rotate, namely in a state of stall.

8.2 Measurement procedure

CAUTION ⚠

- **Before performing the test, make sure there is no worker in front and at the rear of the vehicle.**

- Before starting the test, check the coolant and oil of the engine, and automatic transmission fluid level of the automatic transmission. Also sufficiently warm up the engine and transmission.
  - Place chocks at both front and rear wheels and engage the parking brake to prevent the vehicle from moving. In addition, when pushing the accelerator pedal down, press the foot brake strongly.
  - Start the engine and engage the range selector lever into D range.
  - Push the accelerator pedal down slowly to the full throttle; when the engine becomes stable at a constant speed, read the revolution (stall revolution) quickly, and then take off the foot from the accelerator pedal.

CAUTION ⚠

- **Be sure to set a full stall acceleration time less than 10 seconds and complete the measurement within that time, otherwise overheating of the engine and transmission may result.**

- Put the range selector lever in N range, and run the engine for two minutes between 1200 and 1500 rpm to cool automatic transmission fluid.

8.3 Result of diagnosis

- In case the stall revolution is lower by 150 rpm or more than the standard value, engine failure may be the cause.
- In case the stall revolution is abnormally low (approximately 1/3 of the specified value) even though there is no engine failure such as emitting black smoke, failure inside the torque converter (one-way clutch failure) may be the cause.
- In case the stall revolution is higher by 150 rpm or more than the standard value, slippage inside the transmission, cavitation, bubbling of automatic transmission fluid, or damage to the torque converter may be the cause.
- If the automatic transmission proper is found defective, contact the Allison Service Station for repair.

9. Line Pressure Test

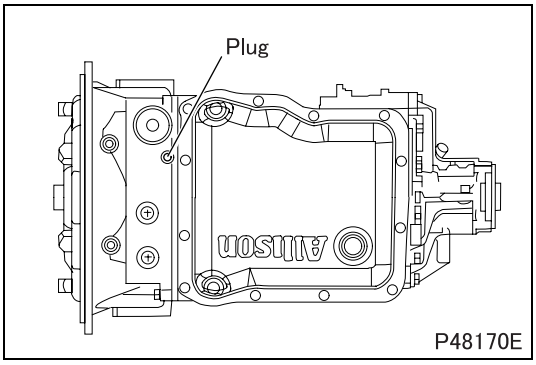
Service standards

Location	Maintenance item			Standard value	Limit	Remedy
–	Line pressure	Engine speed 600 rpm	Forward movement (during lockup deactivated)* R (reverse)	700 to 1280 kPa {100 to 185 psi, 7.1 to 13 kgf/cm^2}	–	Ask for repair.
			N (neutral) P (parking)	800 to 1655 kPa {115 to 240 psi, 8.2 to 17 kgf/cm^2}		
		Engine speed 2100 rpm	Forward movement (during lockup)*	1000 to 1170 kPa {145 to 170 psi, 10.2 to 11.9 kgf/cm^2}		
			Forward movement (during lockup deactivated)* R (reverse) N (neutral) P (parking)	1515 to 1795 kPa {220 to 260 psi, 15.4 to 18.3 kgf/cm^2}		

* See the next page for lockup vehicle speed.

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
–	Plug	10 to 13 {7.4 to 9.6, 1.0 to 1.3}	–



9.1 Purpose

- "Line pressure test" checks the performance of oil pump, function of control valve, and the oil leaking of each component.

9.2 Measurement procedure

- Remove main oil pressure plug (7/16 UNF-2A) on the lower part of the transmission case, and install the pressure gauge.
- Be sure to prevent foreign particles from entering the pressure detecting port.
- Conduct a sufficient warm-up operation, and raise oil temperature to 60 to 80°C {140 to 176°F} (for reference: run the vehicle for 20 to 30 minutes).
- Lift up the vehicle so that the rear wheels can rotate.
- Measure the oil pressure in each range when the engine runs at 600 rpm and 2100 rpm, and make sure whether the result is within the standard value.
- When having finished the measurement, remove foreign particles in the pressure detection port before installing the plug, then tighten plug to the specified torque.

9.3 Diagnosis of result

- The main oil pressure is low in all ranges.
  - Too low automatic transmission fluid level
  - Clogged filter element
  - Clogged suction filter
  - Faulty control valve (leaking or sticking inside)
  - Worn or damaged oil pump
- If the automatic transmission proper is found defective, contact the Allison Service Station for repair.

10. Road Test

Service standards (Unit: km/h {mph})

Location	Maintenance item			Standard value	Limit	Remedy
–	Shifting point (D range) [Economy mode/ Power mode]	At half throttle Accelerator opening: 4/8	1st → 2nd	10 to 13 {6 to 8}/ 12 to 15 {7 to 9}	–	Ask for repair.
			2nd → 3rd	23 to 26 {14 to 16}/ 26 to 29 {16 to 18}	–	
			3rd → 4th	33 to 36 {21 to 22}/ 34 to 37 {21 to 23}	–	
			4th → 5th	48 to 51 {30 to 32}/ 48 to 51 {30 to 32}	–	
		At full throttle Accelerator opening: 8/8	1st → 2nd	16 to 19 {10 to 12}/ 21 to 24 {13 to 15}	–	
			2nd → 3rd	37 to 40 {23 to 44}/ 45 to 48 {28 to 30}	–	
			3rd → 4th	48 to 51 {30 to 32}/ 59 to 62 {37 to 39}	–	
			4th → 5th	68 to 71 {42 to 44}/ 84 to 87 {52 to 54}	–	
		At closed throttle Accelerator opening: 0/8	5th → 4th	45 to 48 {28 to 30}/ 45 to 48 {28 to 30}	–	
			4th → 3rd	32 to 35 {20 to 22}/ 32 to 35 {20 to 22}	–	
			3rd → 2nd	22 to 25 {14 to 16}/ 22 to 25 {14 to 16}	–	
			2nd → 1st	5 to 8 {3 to 5}/ 5 to 8 {3 to 5}	–	
–	Lock-up point [Economy mode/ Power mode] (reference)	At half throttle Accelerator opening: 4/8	OFF → ON	17 to 21 {11 to 13}/ 20 to 23 {12 to 14}	–	Ask for repair.
		At full throttle Accelerator opening: 8/8	OFF → ON	31 to 34 {19 to 21}/ 38 to 41 {24 to 26}	–	
		At closed throttle Accelerator opening: 0/8	ON → OFF	16 to 19 {10 to 12}/ 16 to 19 {10 to 12}	–	

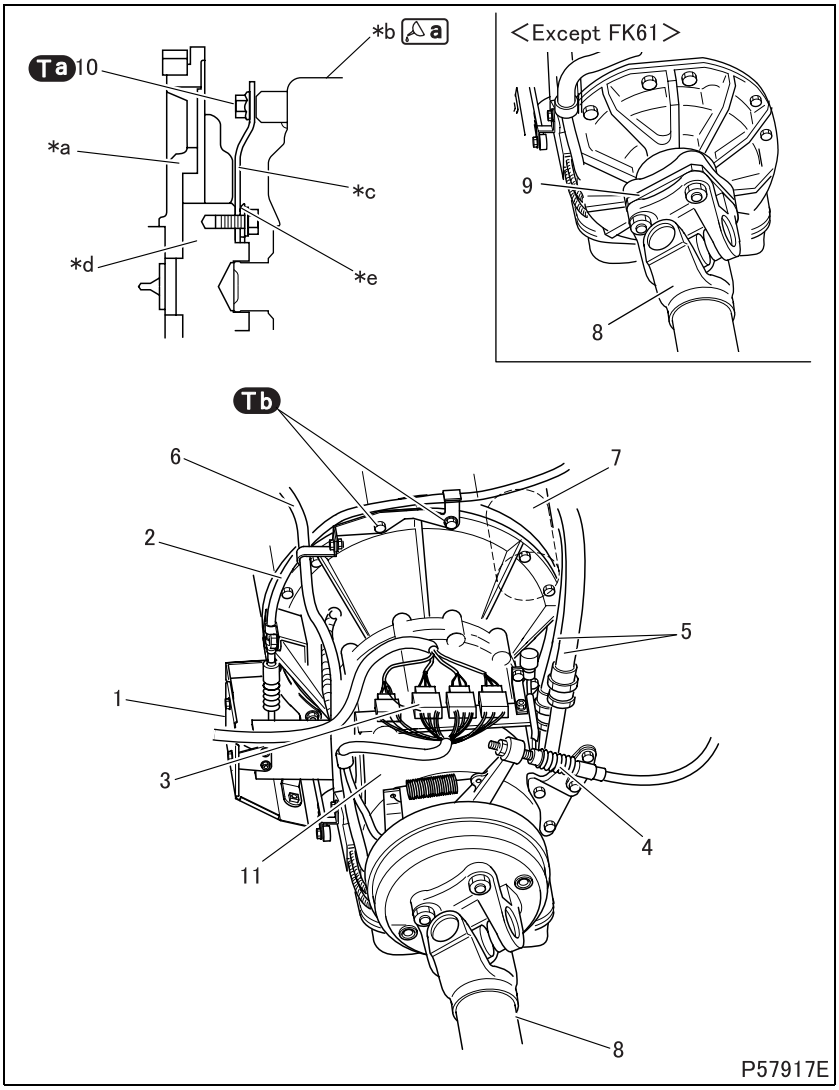
10.1 Measuring procedure

- Before starting the road test, make sure that the transmission fluid level has been checked, the fluid has been inspected and the selector cable has been adjusted.
- During the road test, operate the automatic transmission with gears shifted into different positions and check for the feeling of a gear slip and any other abnormalities.
- Check for too hard or too soft feeling of gear shift.
- Check for shift-up and shift-down points.
- The value shown in the table is calculated under the following condition.
  For the vehicle with different differential ratio or tire size, the vehicle speed varies from the value in the table. In such case, the value should be converted based on such deviation.

Differential ratio	Tire size (radius)
6.166	10R22.5 (0.492)

- If the measurement is out of specification, contact the Allison service station for repair.

REMOVAL AND INSTALLATION OF AUTOMATIC TRANSMISSION



● **Removal sequence**

1 Control cover
2 Selector cable (See AUTOMATIC TRANSMISSION CONTROL.)
3 Harness connector
4 Parking brake cable
5 Oil hose (See OIL COOLER.)
6 Level gauge
7 Starter (See Gr54.)
8 Propeller shaft (See Gr25.)
9 Spacer <Except FK61>
10 Flex bolt
11 Automatic transmission

***a:** Flywheel
***b:** Torque converter
***c:** Flex plate
***d:** Flywheel adapter
***e:** Wear plate

● **Installation sequence**

Follow the removal sequence in reverse.

CAUTION ⚠

- **Be sure to adjust the automatic transmission fluid level after installation. As starting the engine with insufficient automatic transmission fluid can damage the automatic transmission.**

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Flex bolt (connection of flywheel and torque converter)	56 ± 5 {41 ± 3.7, 5.7 ± 0.5}	–
Tb	Bolt or nut (automatic transmission mounting)	40.2 {30, 4.1}	–

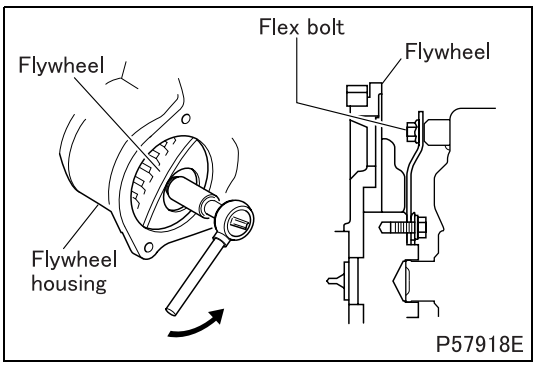
Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Torque converter pilot area	Molybdenum disulfide grease [NLGI No. 2 (Li soap)]	As required

Special tools

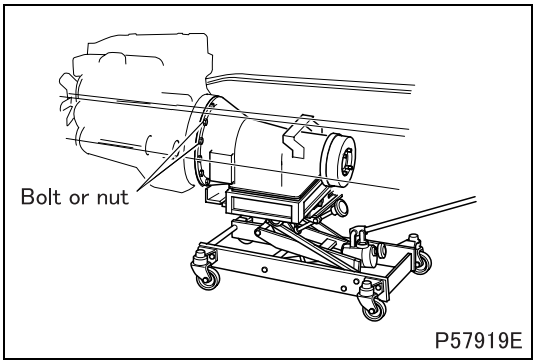
Mark	Tool name and shape	Part No.	Application
a	Converter installer  03726	ME633437	Automatic transmission mounting

◆Removal procedure◆



■ **Removal: Automatic transmission**

- Place the automatic transmission in N range.
- Turn flywheel to remove flex bolts in succession.

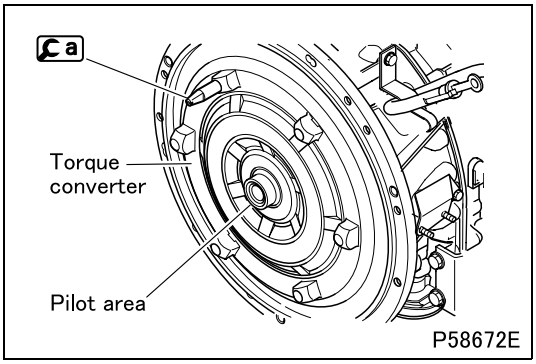


- Pinch the oil pan of automatic transmission with blocks of wood, and support it with jack to remove automatic transmission mounting bolt or nut.
- Remove automatic transmission by pulling it out backward.

CAUTION ⚠

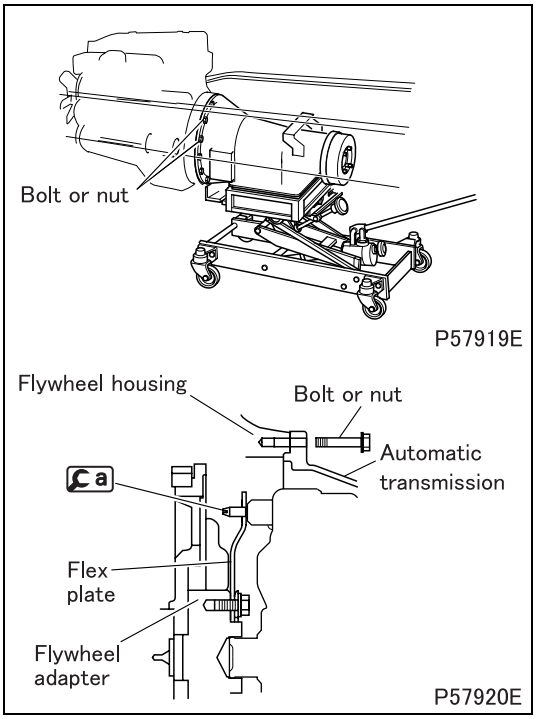
- **Be careful not to allow local force to be applied to the oil pan.**
- **Secure torque converter with wire to prevent it from falling off.**

◆Installation procedure◆

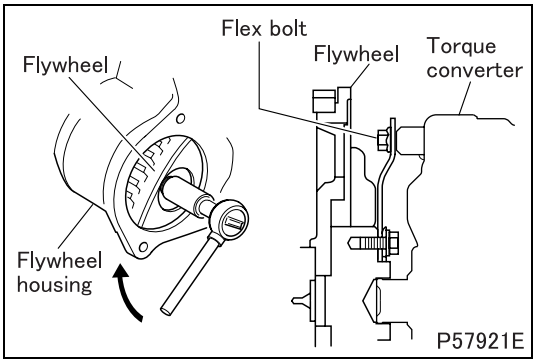


■ **Installation: Automatic transmission**

- Apply grease to pilot area of torque converter.
- Install a at least one location in the tapped hole on the periphery of torque converter.



- Install automatic transmission on flywheel housing so that Ca aligns with the hole in the flex plate installed on the flywheel.
- Tighten automatic transmission mounting bolt or nut to the specified torque.

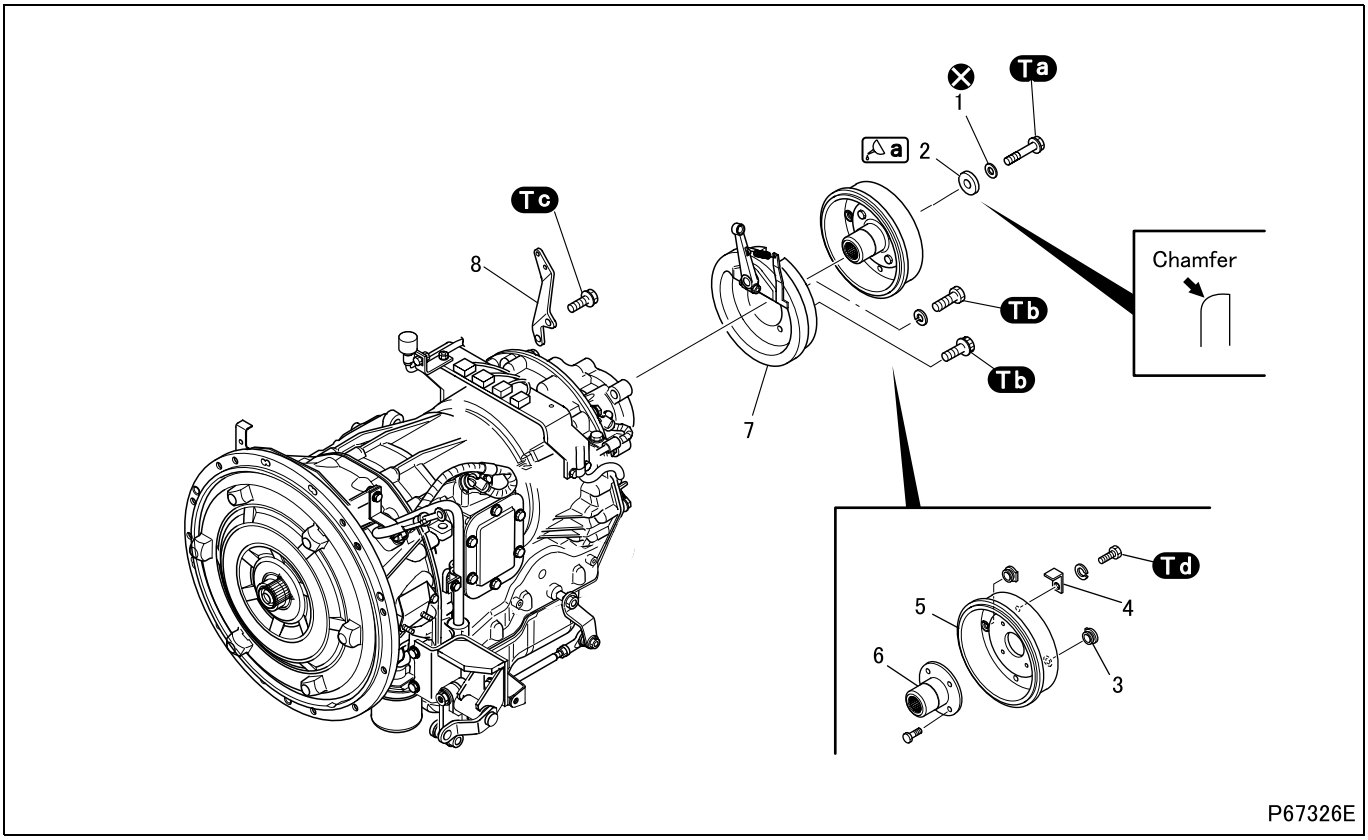


- Turn flywheel, and temporarily tighten flex bolts in succession from the starter window (six locations).
- Where Ca is installed, remove Ca to install flex bolts.
- Finally, fully tighten flex bolts to the specified torque.

CAUTION ⚠

- **Be careful not to drop flex bolts in the clearance between flywheel and torque converter during operation.**

M E M O



● **Disassembly sequence**

1 Sealing washer
2 Retainer washer
3 Dust plug
4 Drum plate
5 Parking brake drum
6 Companion flange
7 Parking brake (See Gr36A.)
8 Wire bracket

⊗: Non-reusable parts

CAUTION ⚠

- **Do not disassemble parking brake drum and companion flange unless necessary since they are balanced. When disassembling them, put mating marks and align them to assemble. In addition, do not replace the parking brake drum or companion flange as a single unit.**

● **Assembly sequence**

Follow the disassembly sequence in reverse.

Service standards (Unit: mm {in.})

Location	Maintenance item		Standard value	Limit	Remedy
5	Parking brake drum	Inner diameter	$\phi 254^{+0.5}_{0}$ {$10^{+0.020}_{0}$}	ϕ255.5 {10.1}	Replace
		Squareness	0 to 0.05 {0 to 0.0020}	–	
		Coaxial trueness	0 to 0.1 {0 to 0.0039}	–	
		Cylindrical trueness	0 to 0.05 {0 to 0.0020}	–	
		Static revolution unbalance	0 to 0.88 N·cm {0 to 0.0065 ft.lbs, 0 to 90 gf·cm}	–	
6	Runout at socket portion of companion flange		0 to 0.15 {0 to 0.0059}	0.5 {0.020}	Replace

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Bolt (companion flange mounting)	108 to 136 {80 to 100, 11 to 14}	–
Tb	Bolt (parking brake mounting)	228 to 266 {170 to 195, 23.3 to 27.1}	–
Tc	Bolt (wire bracket mounting)	51 to 61 {38 to 45, 5.2 to 6.2}	–
Td	Bolt (drum plate mounting)	20 {15, 2.0}	–

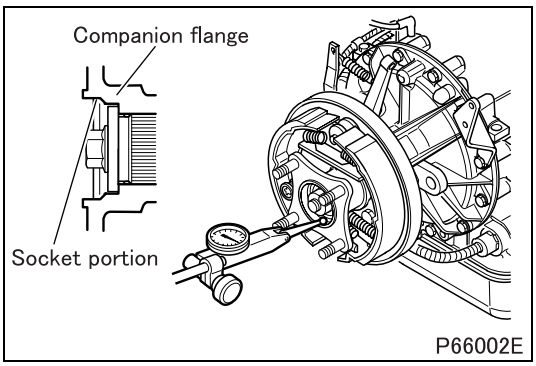
Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Periphery of retainer washer	ThreeBond 1215	As required

Special tools (Unit: mm {in.})

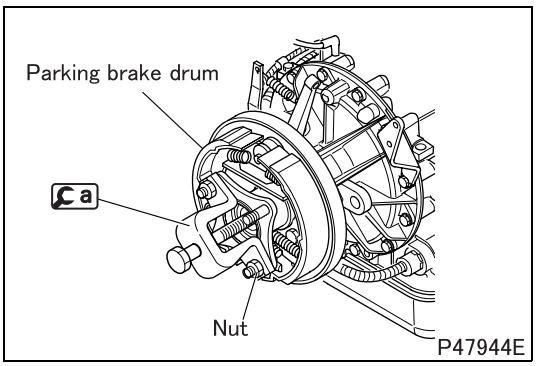
Mark	Tool name and shape	Part No.	Application
a	Flange puller A: 14 {0.55}, B: 122 {4.80}, C: M16 × 2.0 	MC881524	Removal of parking brake drum and companion flange

◆Removal procedure◆



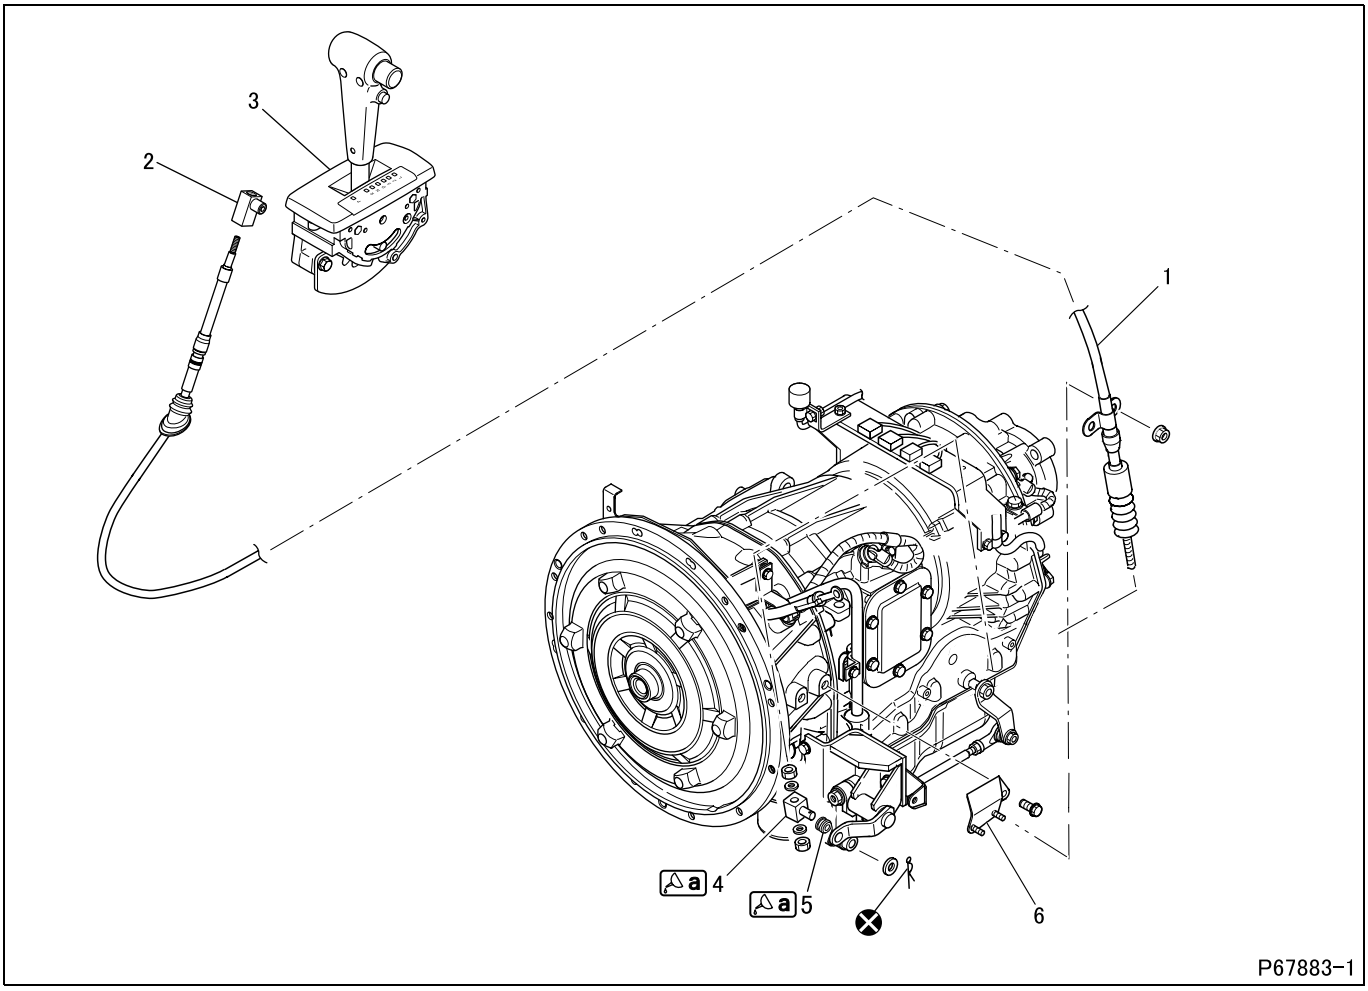
■ **Inspection: Runout of socket portion of companion flange**

- Replace the companion flange if the measured value is higher than the limit.



■ **Removal: Parking brake drum and companion flange**

- Install a using the propeller shaft mounting nut and remove the parking brake drum and companion flange.



● **Removal sequence**

1 Selector cable
2 Pivot
3 Range selector lever
4 Adjuster
5 Bushing
6 Cable bracket

⊗: Non-reusable parts

● **Installation sequence**

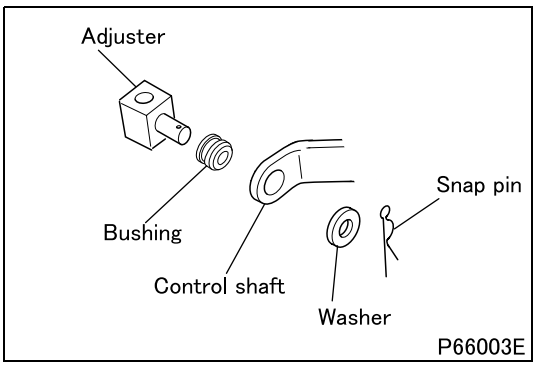
Follow the removal sequence in reverse.

- Be sure to use a nut precoated with thread lock cement to connect the cable to the range selector lever in the cab.

Lubricant and/or sealant

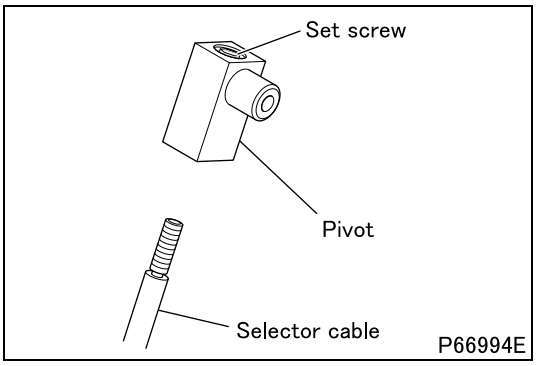
Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Sliding area of adjuster and bushing	Wheel bearing grease [NIGI No.2 (Li soap)]	As required

◆Installation procedure◆



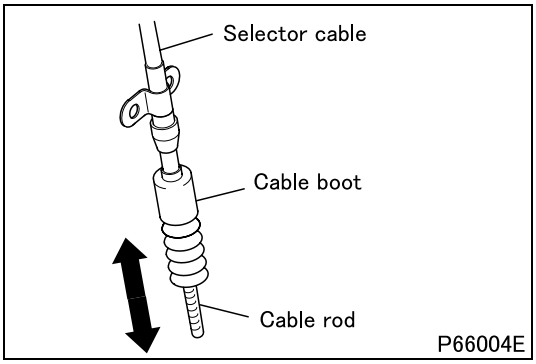
■ **Installation: Adjuster**

- Fit the adjuster to the control shaft and prevent it from coming off with the snap pin. Then, check that the adjuster smoothly rotates in the control shaft.
- If the adjuster does not turn smoothly, replace it together with the washer, snap pin and control shaft. Replace the bushing as well if it is worn out or damaged.



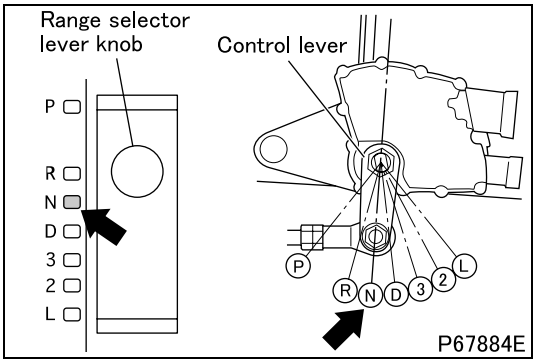
■ **Installation: Pivot**

- Install the pivot onto the threaded end of the selector cable. Using the setscrew on top of it, position the pivot to face in necessary direction.

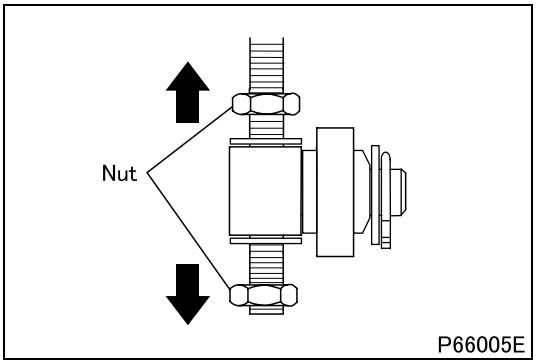


■ **Installation: Selector cable**

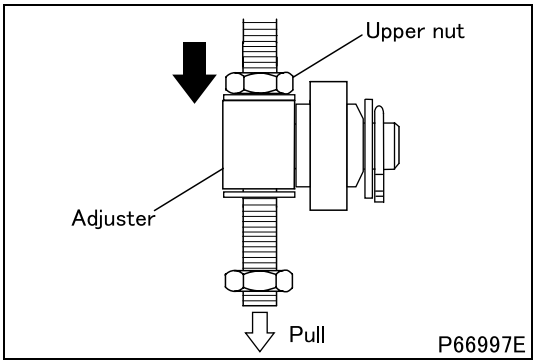
- Connect the selector cable to the interior range selector lever. Then, give strokes to the selector lever and if it does not move smoothly, replace the selector cable.
- Replace the selector cable if the cable boot or cable rod is damaged.



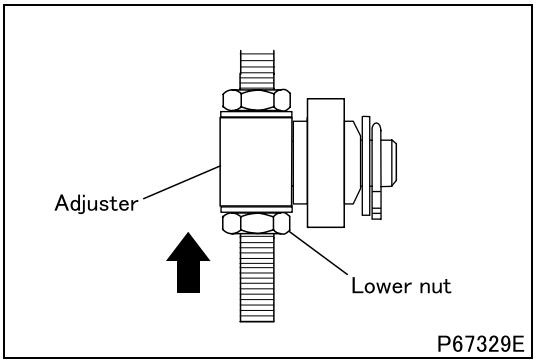
- With the parking brake in operation, set the range selector lever knob and control lever to the respective N range positions.



- Loosen the upper and lower nuts as far as the thread ends of the selector cable.



- Pull down the wire end with a force of 10 to 20 N {7.4 ft.lbs (1 to 2 kgf)}.
- Tighten the upper nut by hand until it contacts the adjuster with the load applied.



- Tighten the lower nut to the specified torque.

CAUTION ⚠

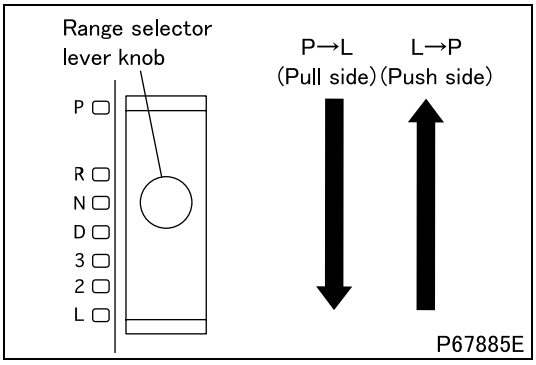
- **When tightening the nut, hold the adjuster in position.**

◆Inspection after installation◆

■Inspection: Selector cable

[Inspection]

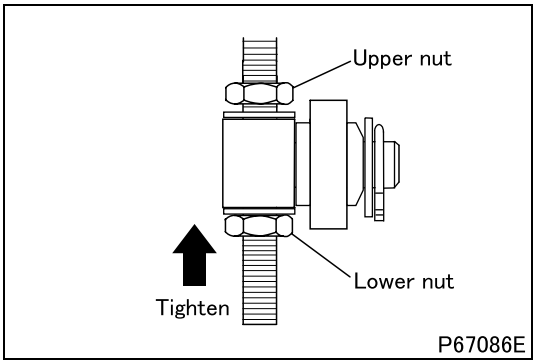
- Park the vehicle on a flat ground and put the chocks under the wheels. Apply the parking brake.
- Place the range selector lever to the P range position.
- Operating the range selector lever from one position to another (P to L range and L to P range), make sure that the lever feels no resistance, the operating physical forces to pull (to the L side) and push (to the P side) are almost equal and that gear shift is felt distinctively.



- Set the starter switch to ON. (Do not start the engine.)
- Operating the range selector lever from one position to another (P to L range and L to P range), check that the lever positions are in agreement with the range positions indicated by the shift position indicator in the meter cluster. (When shifting from R range to P range, move the lever very slowly.)
- See the shift position indicator in the meter cluster to confirm that the transmission is in P range.
- If there is abnormality, adjust the selector cable.

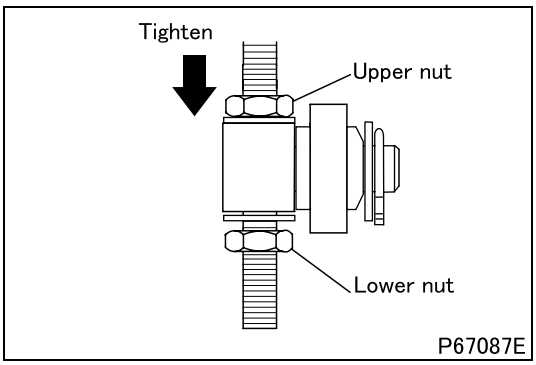
[Adjustment]

<If the lever is heavy when operated in pushing direction (toward P range), or the indication of the shift position indicator is incorrect (deviated in pulling direction)>



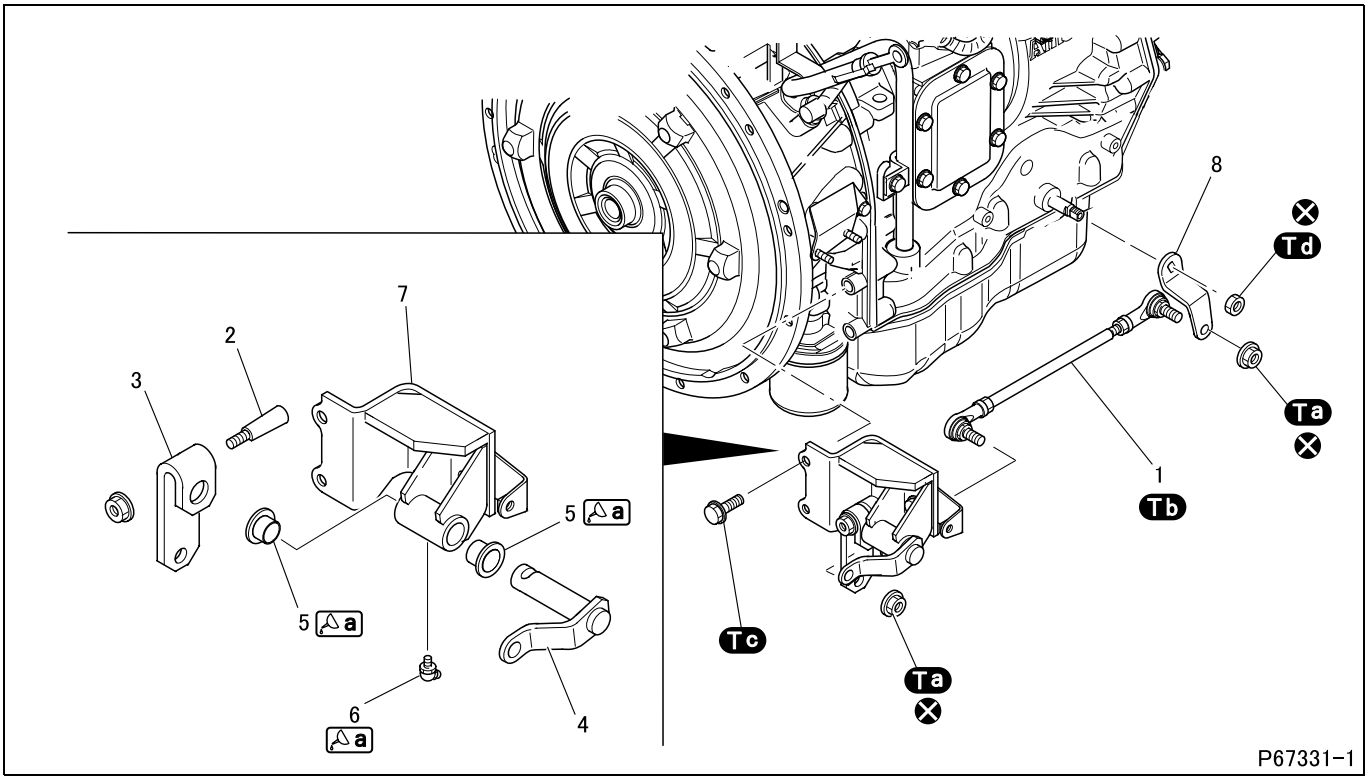
- Loosen the upper nut, and tighten the upper nut as much as a 1/2 turn.
- Tighten the upper nut to the specified torque.
- Perform the above inspection again and repeat the adjustment if necessary.

<If the lever is heavy when operated in pulling direction (toward L range), or the indication of the shift position indicator is incorrect (deviated in pushing direction)>



- Loosen the lower nut, and tighten the upper nut as much as a 1/2 turn.
- Tighten the lower nut to the specified torque.
- Perform the above inspection again and repeat the adjustment if necessary.

Control Lever



● **Disassembly sequence**

1 Shift rod
2 Lock pin
3 Select lever
4 Control shaft
5 Bushing
6 Grease nipple
7 Control bracket
8 Control lever

⊗: Non-reusable parts

- Do not disassemble lever except for replacement.

● **Assembly sequence**

Follow the disassembly sequence in reverse.

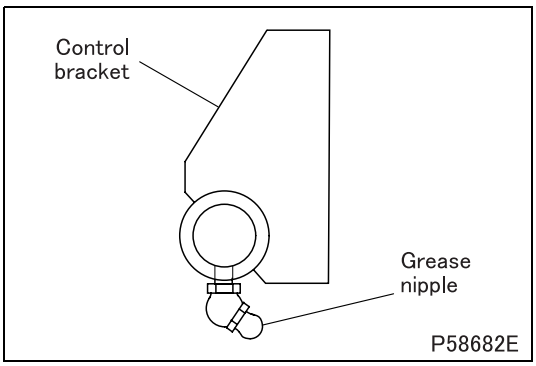
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Nut (shift rod mounting)	39 to 50 {28 to 36, 3.9 to 5.0}	–
Tb	Tightening of shift rod nut	23 to 28 {17 to 20, 2.3 to 2.8}	–
Tc	Bolt (control bracket mounting)	51 to 61 {38 to 45, 5.2 to 6.2}	–
Td	Nut (control lever mounting)	20 to 27 {15 to 20, 2.0 to 2.7}	–

Lubricant and/or sealant

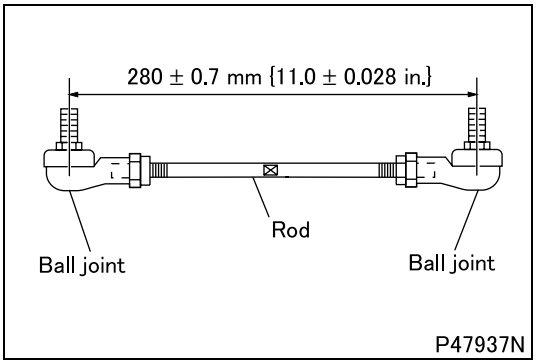
Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Greasing from grease nipple	Chassis grease [NLGI No.1 (Li soap)]	As required
	Inside surface of bushing		

◆Installation procedure◆



■ **Installation: Grease nipple**

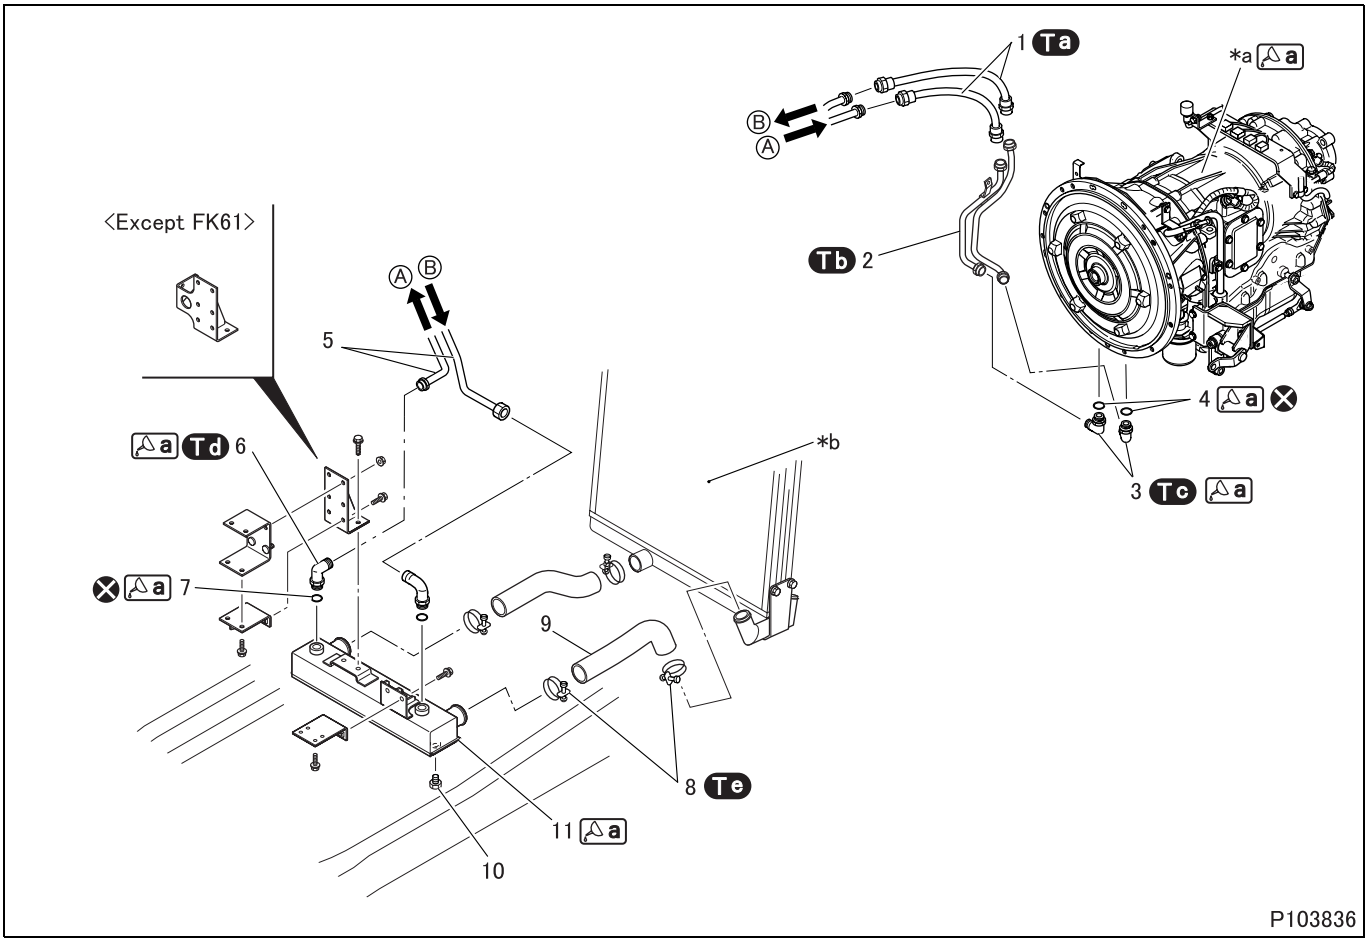
- Screw in grease nipple 2 to 4 mm {0.079 to 0.16 in.} (approx. 3 to 5 turns) to install it to the control bracket in the direction shown in the drawing.



■ **Installation: Shift rod**

- Turn rod to adjust length of shift rod.
- Adjustment should be performed evenly on both the right and left ball joints.

OIL COOLER



● **Removal sequence**

1 Oil hose
2 Oil pipe
3 Connector
4 O-ring
5 Oil pipe
6 Connector
7 O-ring
8 Clamp
9 Water hose
10 Drain plug
11 Oil cooler

***a:** Automatic transmission body
***b:** Radiator
⊗: Non-reusable parts

● **Installation sequence**

Follow the removal sequence in reverse.

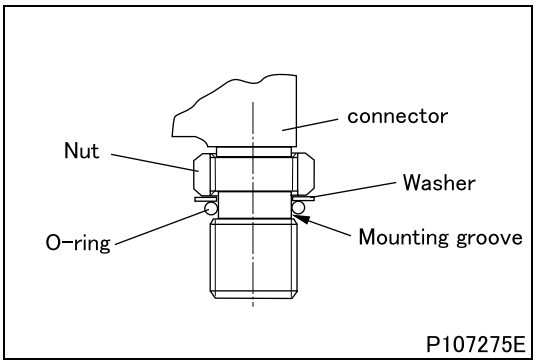
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Oil hose	118 ± 10 {87 ± 7.4, 12.0 ± 1.0}	–
Tb	Oil pipe	51 to 61 {38 to 45, 5.2 to 6.2}	–
Tc	Tightening of connector lock nut	41 ± 6 {30 ± 4.4, 4.2 ± 0.6}	–
Td	Tightening of connector lock nut	80 {59, 8.2} or less	–
Te	Clamp	3.9 ± 0.6 {2.9 ± 0.4, 0.4 ± 0.06}	–

Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	O-ring contact surface of connector	DEXRON III	As required
	O-ring		
	O-ring contact surface of oil cooler		
	O-ring contact surface of automatic transmission body		

◆Installation procedure◆



■ Installation: Connector

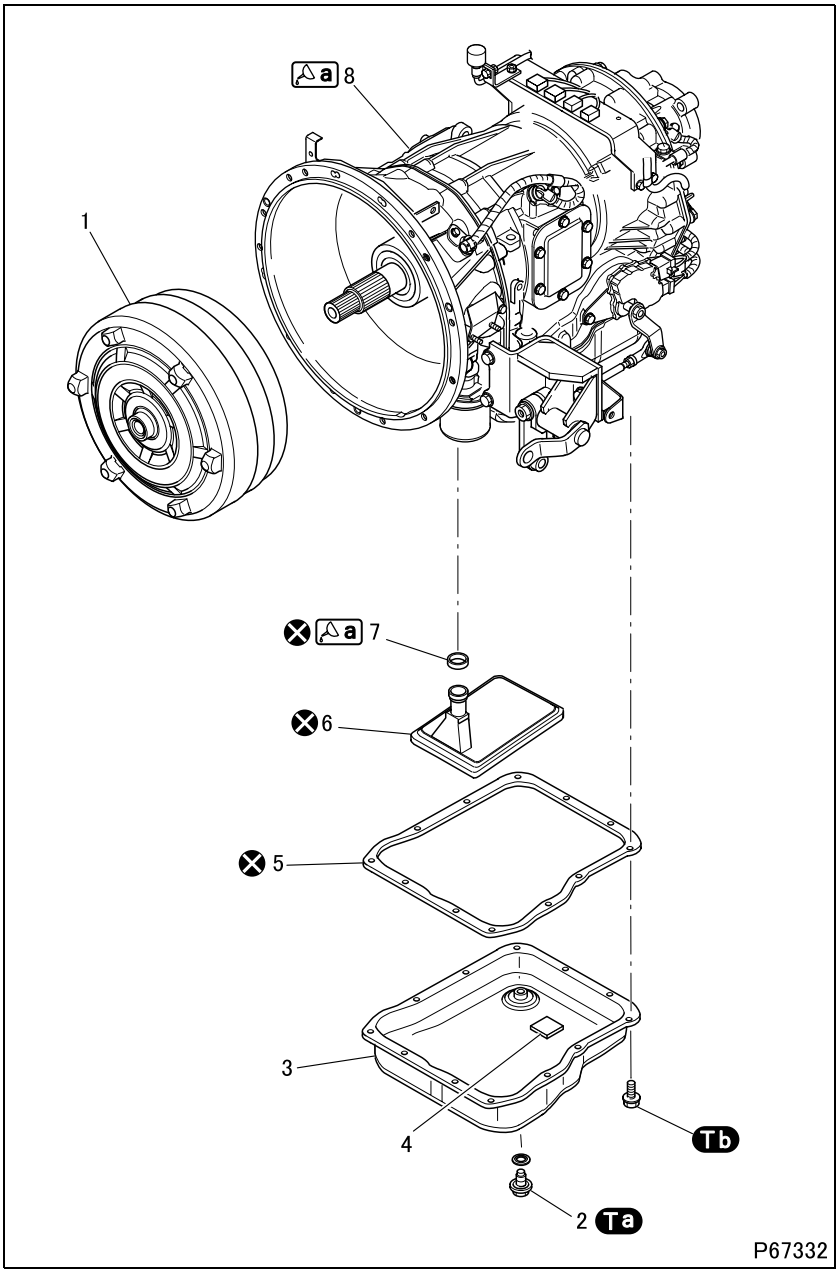
- Tighten the nut of the connector by hand until it touches the connector and install the O-ring securely in the mounting groove.
- Tighten the connector by hand until the washer touches the automatic transmission or oil cooler and then loosen it to the connection angle to the oil pipe.
- While keeping the connector in this position, tighten the nut to the automatic transmission or oil cooler side to the specified torque.

◆Inspection after installation◆

■Inspection: Quantity of automatic transmission fluid

- If any oil line has removed, check the quantity of automatic transmission fluid and add as necessary.

PARTS REPLACEMENT OF AUTOMATIC TRANSMISSION PROPER



● **Disassembly sequence**

1 Torque converter
2 Drain plug
3 Oil pan
4 Magnet
5 Gasket
6 Suction filter
7 Seal ring
8 Automatic transmission

⊗: Non-reusable parts

- Check automatic transmission fluid for discoloration or contamination. Check for leakage of automatic transmission fluid and for metal in the oil pan.

● **Assembly sequence**

Follow the disassemble sequence in reverse.

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Drain plug	30 to 40 {22 to 30, 3.1 to 4.1}	–
Tb	Bolt (oil pan mounting)	24 to 29 {17 to 22, 2.4 to 3.0}	–

Lubricant and/or sealant

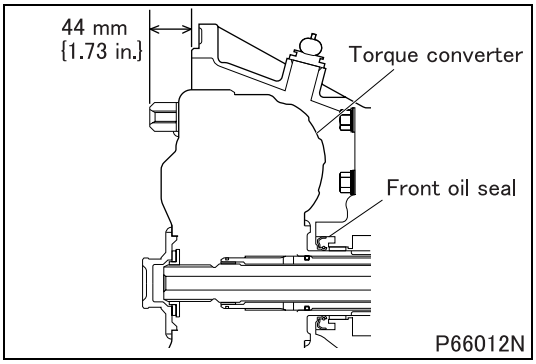
Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Seal ring	DEXRON III	As required
	Front oil seal (automatic transmission)		

◆Cleaning procedure◆

■ **Cleaning: Drain plug, oil pan and magnet**

- Wash the removed drain plug, oil pan and magnet with cleaning solvent.

◆Installation procedure◆



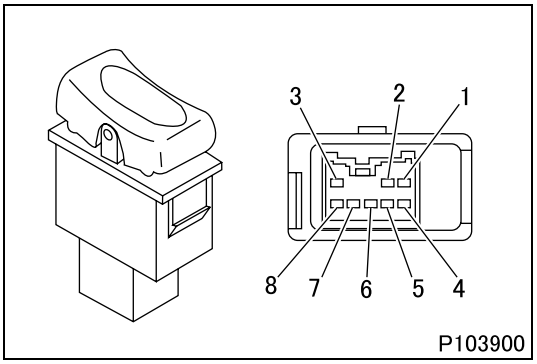
■ **Installation: Torque converter**

- Apply automatic transmission fluid to the front oil seal and install the torque converter.

CAUTION ⚠

- **When inserting the torque converter, do not damage the front oil seal.**

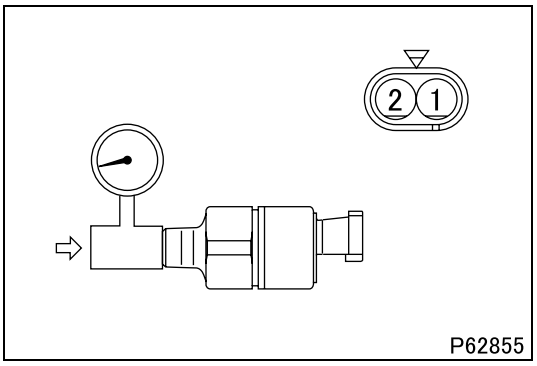
- Measure the depth of the torque converter from its surface to the mounting surface of the case to make sure that the torque converter is installed into position.



#019 Inspection of power mode switch

Switch position	Terminals with continuity	Illumination activated	Night illumination
ON	7 – 8	(+) 4 – 1 (–)	–
OFF	2 – 7	–	

- If any abnormality is found, replace the power mode switch.



#042 Inspection of stop lamp switch

- Perform the following inspection. If any abnormality is found, replace the switch.

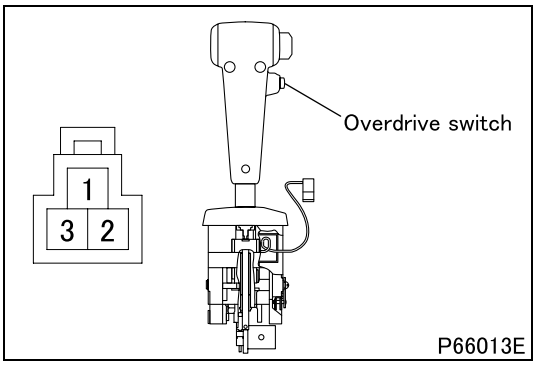
(1) Inspection by applying no air pressure

- Make sure that there is no continuity between terminals 1 and 2.

(2) Inspection by applying air pressure

- Apply air pressure to the switch gradually from 0 kPa {0 psi, 0 kgf/cm^2}.
- Measure the air pressure when continuity is established across terminals 1 and 2, and make sure that the air pressure is within the standard value.

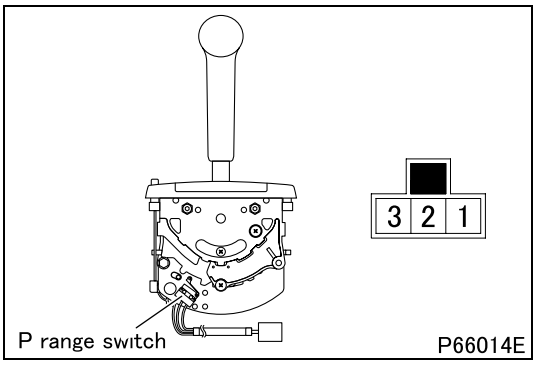
Standard value (operating pressure)	29 ± 9.8 kPa {4.2 ± 1.4 psi, 0.3 ± 0.1 kgf/cm^2}



#150 Inspection of overdrive switch

Switch position	Terminals with continuity
OFF (overdrive enabled)	2 – 3
ON (overdrive disabled)	–

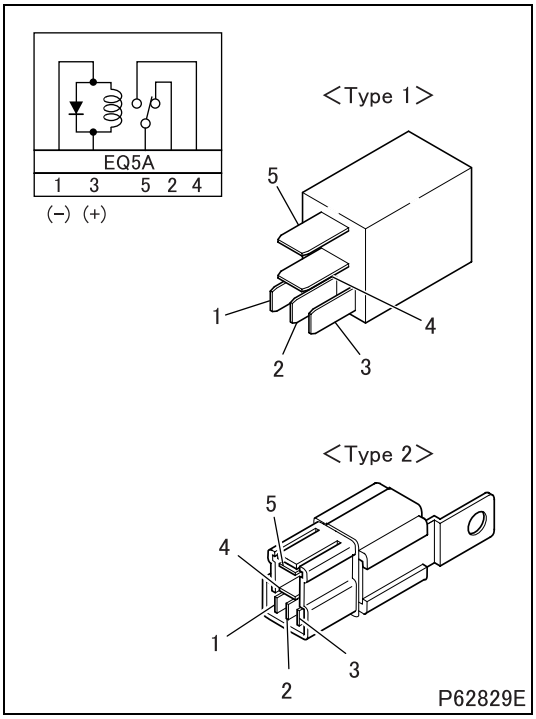
- If any abnormality is found, replace the range selector lever.



#151 Inspection of P range switch

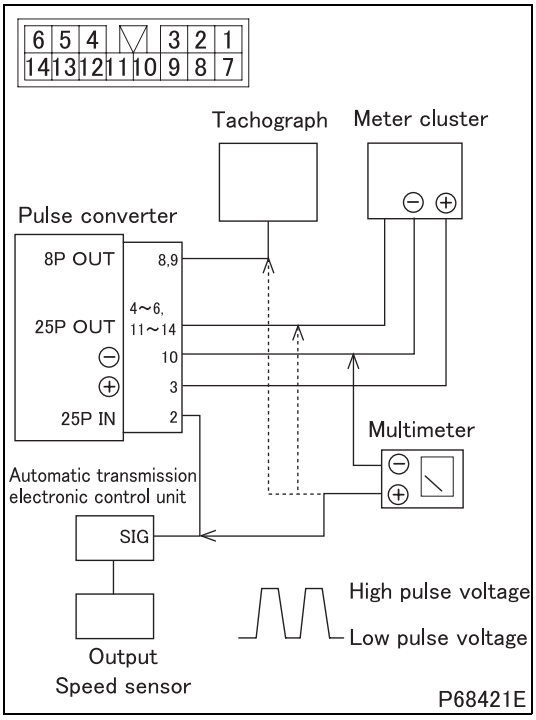
Switch position	Terminals with continuity
P range position	1 – 3
Except P range position	2 – 3

- If any abnormality is found, replace the range selector lever.



#201 Inspection of relay (normally open type, 5-pin)

- Perform a continuity check and an operation check. If there is any abnormality, replace the relay.



#352 Inspection of pulse converter

- Check the pulse converter with the automatic transmission electronic control unit installed in the vehicle.
- With the starter switch in the ON position, slowly turn the wheels by means of a chassis dynamo or any other appropriate means.
- Measure the maximum voltage (high pulse voltage) and minimum voltage (low pulse voltage) values of the voltage between each of input and output terminals and terminal 10 of the pulse converter.

(1) Output measurement

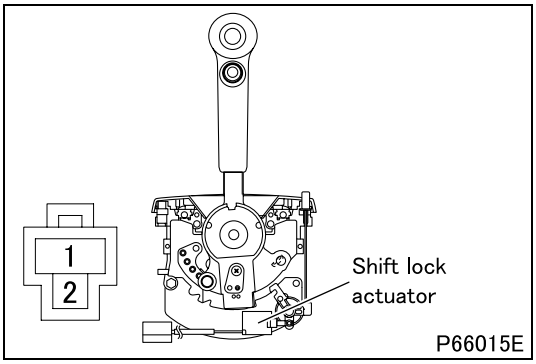
Standard value	8 pulse output (between terminals 8, 9 and 10)	Low pulse voltage	1.5 V or lower
		High pulse voltage	{Input voltage (battery) –0.5 V} or higher
	25 pulse output (between terminals 4 to 6, 11 to 14 and 10)	Low pulse voltage	0.5 V or lower
		High pulse voltage	$8^{+1.5}_{-1.0}$ V

- If measurement deviates from the standard value, conduct input measurement.

(2) Input measurement

Standard value 25 pulse input (between terminals 2 and 10)	Low pulse voltage	0.5 V or lower
	High pulse voltage	8 ± 1 V

- If measurement meets the standard value, signals from the automatic transmission electronic control unit should be normal. Accordingly, replace the pulse converter.
- If measurement deviates from the standard value, check the automatic transmission.



#535 Inspection of shift lock actuator

- This inspection should be performed after the P range switch inspection.
- Shift the range selector lever in P range.
- Check that the pushbutton cannot be pressed (the lever cannot be shifted from P range to other ranges).
- Starting from 0 V, gradually apply direct current voltage between the terminals 1 and 2.
- Measure the voltage when it becomes possible to press in the pushbutton and shift from P range to other ranges.

Standard value (operating voltage)	9 to 16 V

- If any abnormality is found, replace the range selector lever.

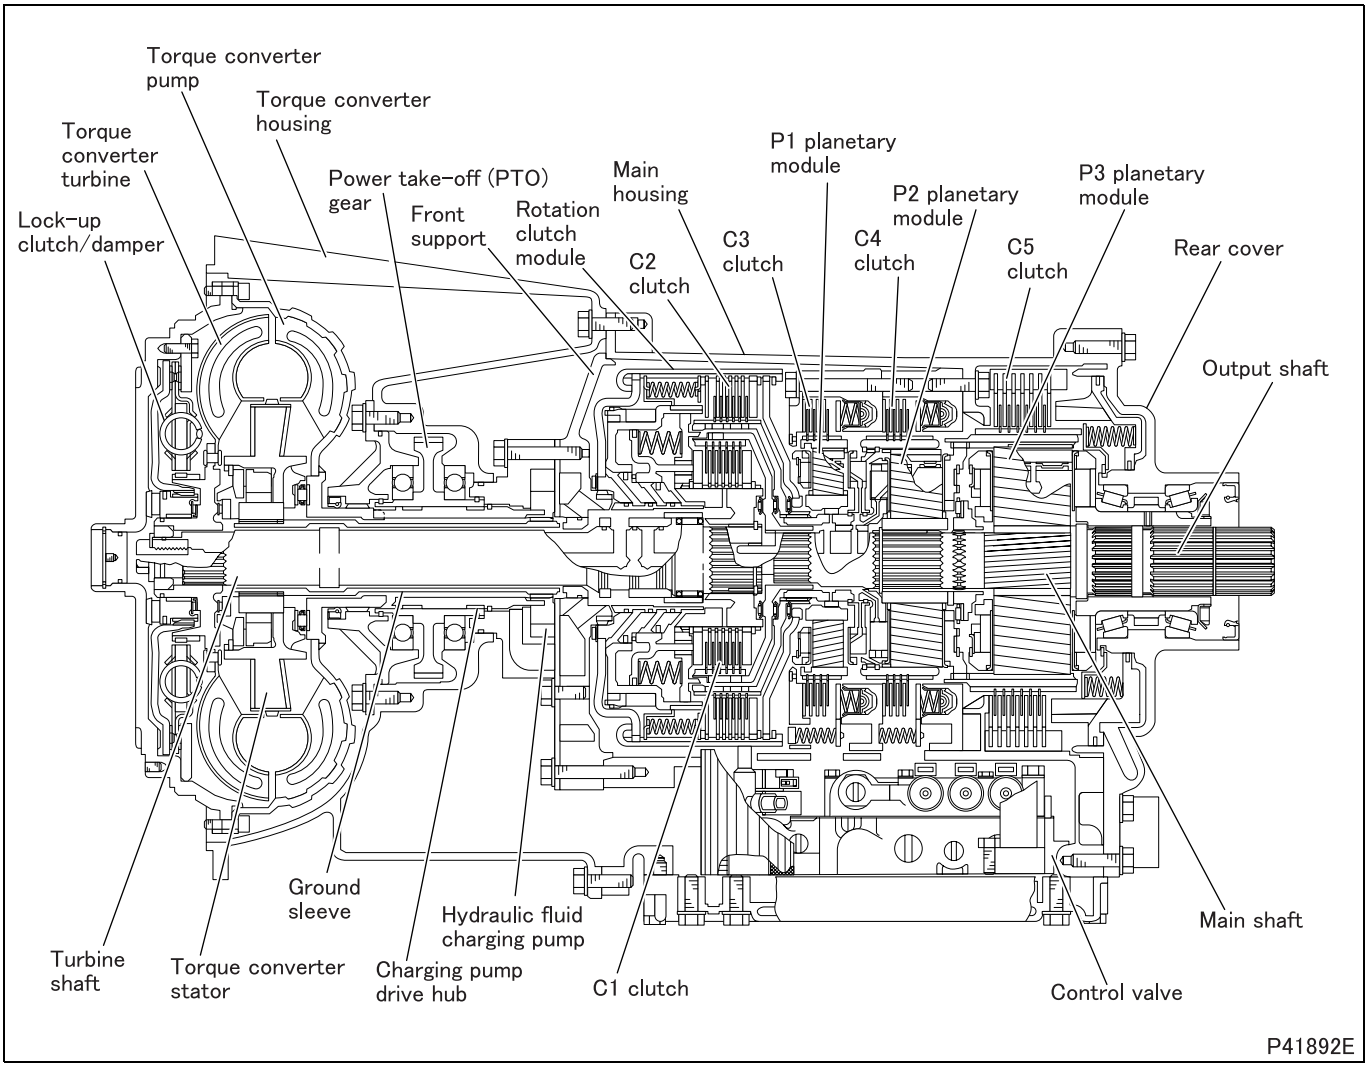
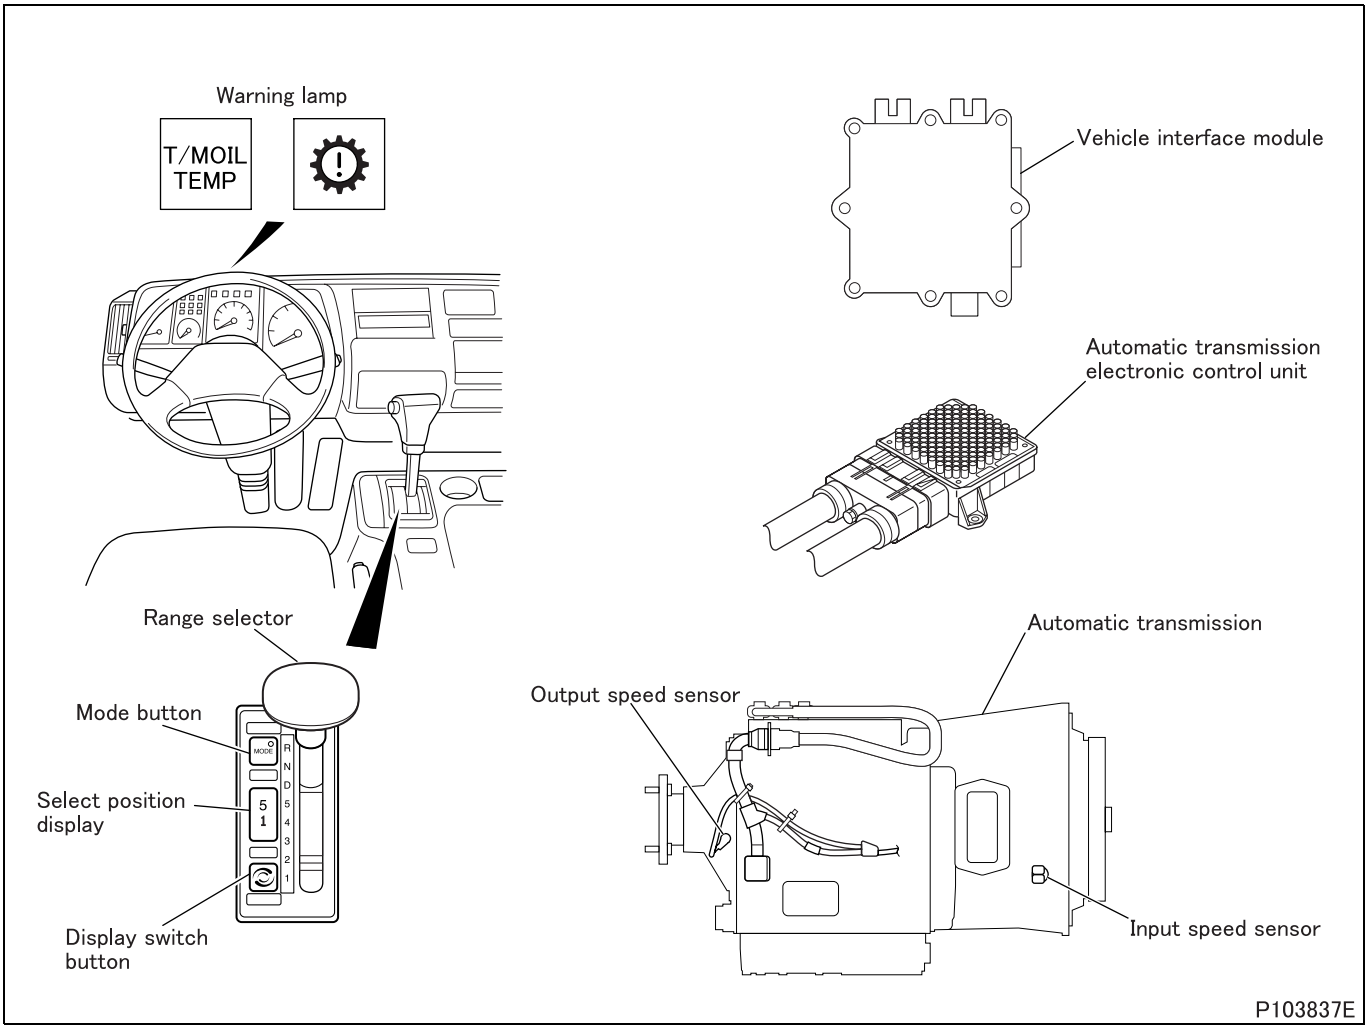
		Overall system dm^3 {L}	31 {31}
Mass of automatic transmission kg {lb}			290 {640}

M E M O

1. Automatic Transmission

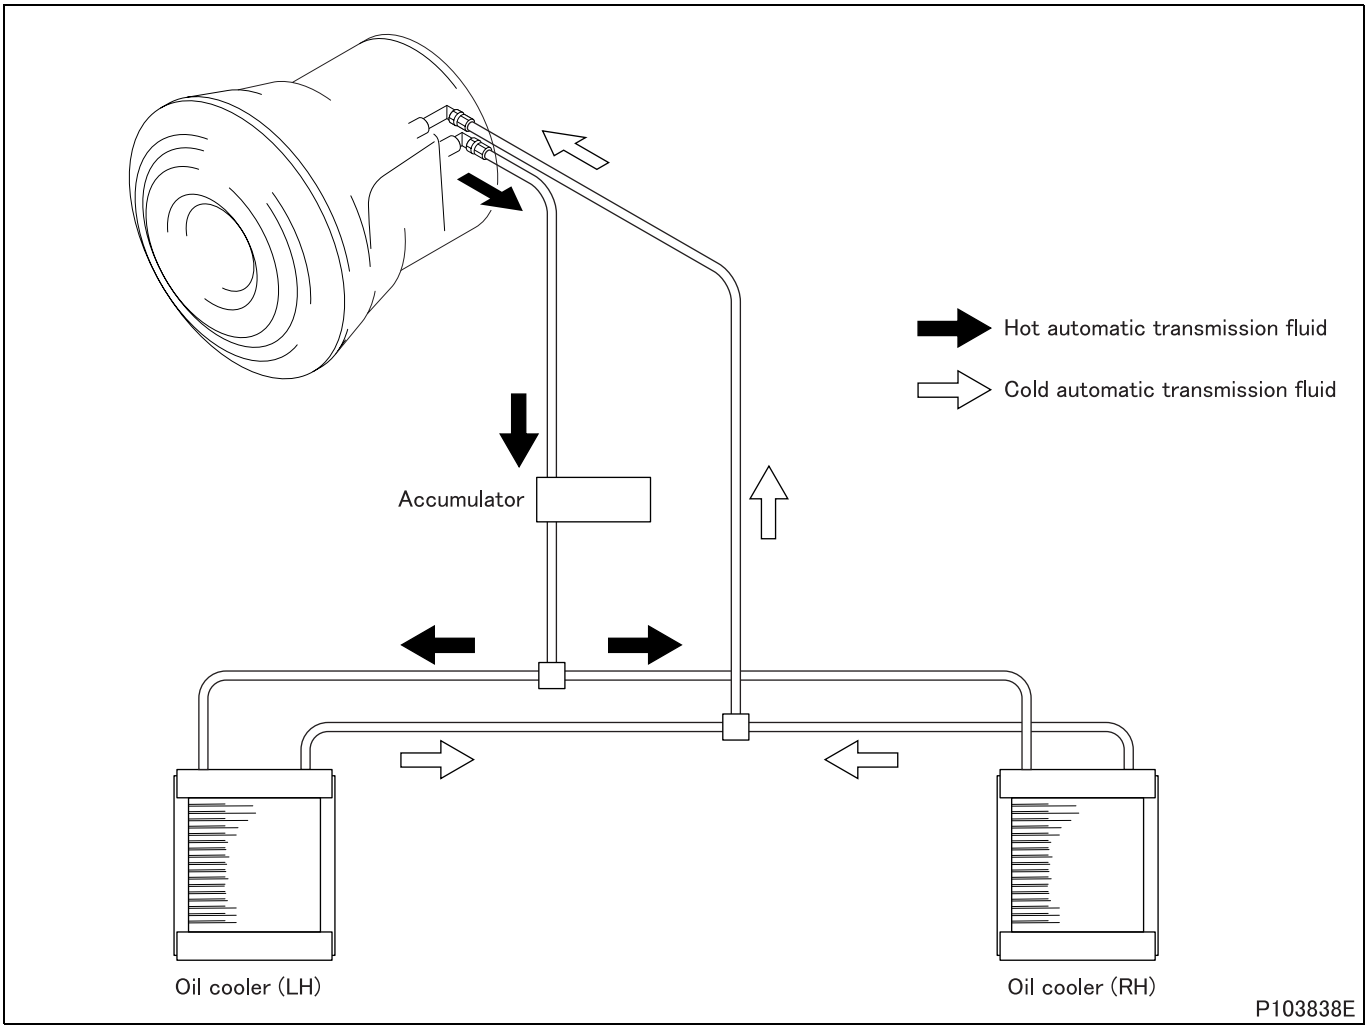


2. Automatic Transmission Control System



- Electronic control (ATEC: Allison Transmission Electronic Control) system is composed of vehicle interface module, automatic transmission electronic control unit, range selector, throttle position sensor, electronic hydraulic valve body, and harnesses connecting these units.
- The automatic transmission electronic control unit receives electric signals, which are sent by each sensor and shift selector, processes them, transmits the signals to an appropriate solenoid, and thereby controls the transmission.

3. Oil Cooler System



- As the automatic transmission operates, the automatic transmission fluid becomes high temperature. Then the high temperature fluid is cooled down by two oil coolers and returned to recirculate in the automatic transmission again.
- The automatic transmission fluid also becomes high pressure due to the operation of the automatic transmission. To regulate the fluid pressure to keep the oil line from overloading, an accumulator is provided.

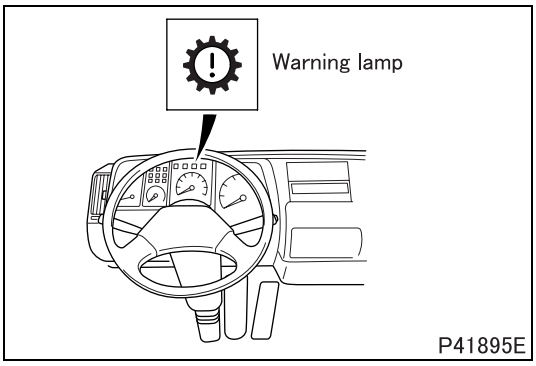
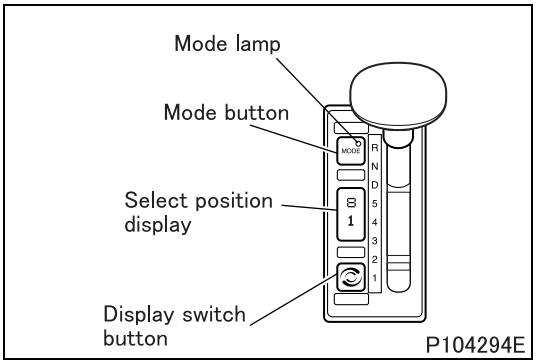
1. Reading/Clearing of Diagnosis Codes



- This automatic transmission is equipped with trouble self-diagnosis function. When detecting abnormality, the function displays occurrence of troubles on warning lamp, as well as memorizes the diagnosis codes in the memory.
- Diagnosis codes are memorized to the maximum five.



1.1 Start of trouble mode (reading of diagnosis codes)

- Park the vehicle at a safe place and apply parking brake.
- Push display switch button of range selector twice.
- Diagnosis codes are indicated in select position display. If “oL” is indicated, push the display switch button again.
- Record the diagnosis codes that are indicated.
  For instance, if indicated in order of “d1”, “P”, “07”, and “22”, it shows that P0722 are memorized in the 1st memory. When nothing is recorded, “--” “--” is repeatedly displayed in sequence.
- There are five memories that memorize the code No. When pushing mode button, the 2nd memory code is displayed following “d2”.
- Whenever pushing mode button, “d3”, “d4”, and “d5” are displayed in sequence, and finally “d1” is indicated back.

1.2 Clearing of diagnosis trouble code No.

- Confirm that the range selector lever is in N range.
- After the repair is completed and mode button is pushed for about 10 seconds, the current and past diagnosis codes are cleared.

NOTE

- **The code number is automatically cleared after the trouble is repaired.**

1.3 Release of diagnosis mode (returning to normal operation mode)

- There are the following two methods to return it to normal operation mode.
- Push the display switch button of range selector.
- Shift the lever from the current range to another range (Reverse, Neutral or Drive).

2. List of Diagnosis Codes

- If a code not in this list is found, ask an Allison service shop for repair.
- If the trouble cannot be solved or if the automatic transmission proper is faulty, ask an Allison service station for repair.
- Be sure to turn off the starter switch before disconnecting the connector from the automatic transmission.

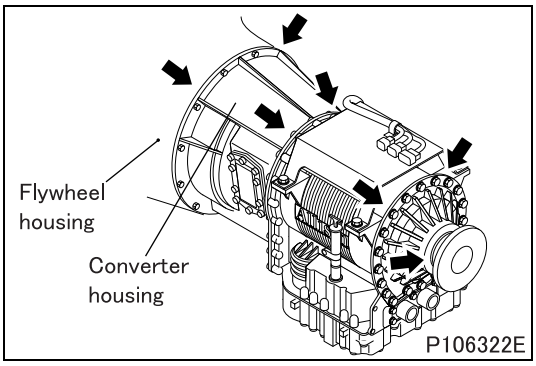
Code	Fault (outline)	Warning	Contents of trouble and points to be inspected
P0218	High ATF temperature	–	Faulty fluid temperature sensor Faulty automatic transmission cooling system (oil cooler)
P0602	No program in electronic control unit	O	Ask an Allison service shop for repair.
P0610	Error related to optional parts	O	Ask an Allison service shop for repair.
P0613	Faulty electronic control unit	–	Ask an Allison service shop for repair.
P0614	Torque control data in engine electronic control unit and automatic transmission electronic control unit unmatched (engine control request disabled)	O	Ask an Allison service shop for repair.
P0634	High electronic control unit internal temperature	O	Check if any heat source exists near the electronic control unit.
P0658 P0659	Faulty power voltage to automatic transmission proper (HSD1)	O	Faulty harness between electronic control unit and automatic transmission (power supply line from electronic control unit to automatic transmission)
P0701	Faulty automatic transmission proper	–	Low ATF level Faulty automatic transmission proper
P0702	Faulty TID (transmission identification) harness	O	Broken TID harness
P0703	Faulty stop lamp signal	–	Faulty harness from electronic control unit to stop lamp relay and stop lamp switch. Faulty stop lamp relay or stop lamp switch
P0708	Faulty range selector	O	Faulty harness between electronic control unit and range selector Faulty range selector
P070C P070D	Faulty oil level sensor in automatic transmission proper	–	Inspect ATF level. Faulty harness between electronic control unit and oil level sensor Faulty oil level sensor
P0711 P0712 P0713	Faulty fluid temperature sensor in automatic transmission proper	O	Faulty harness between electronic control unit and fluid temperature sensor Faulty fluid temperature sensor
P0716 P0717	Faulty turbine speed sensor in automatic transmission proper	O	Faulty harness between electronic control unit and turbine speed sensor Faulty turbine speed sensor
P0719	Faulty anti-lock brake system exhaust brake activation signal	–	Faulty harness from electronic control unit to automatic transmission anti-lock brake system activation signal relay and anti-lock brake system exhaust brake cut relay Faulty relay
P071A	Faulty RELS function (to reduce engine load when stopping)	O	Faulty electronic control unit
P071D	Faulty range changeover prohibition function (general purpose)	O	Faulty electronic control unit
P0721 P0722	Faulty output speed sensor	O	Faulty harness between electronic control unit and output speed sensor Faulty output speed sensor
P0726 P0727	Faulty input speed sensor	–	Faulty harness between electronic control unit and input speed sensor Faulty input speed sensor

Code	Fault (outline)	Warning	Contents of trouble and points to be inspected
P0729	Gear ratio inconsistent (6th)	O	Check ATF level. Faulty input speed sensor Faulty turbine speed sensor Faulty output speed sensor Faulty automatic transmission proper
P0731	Gear ratio inconsistent (1st)	O	
P0732	Gear ratio inconsistent (2nd)	O	
P0733	Gear ratio inconsistent (3rd)	O	
P0734	Gear ratio inconsistent (4th)	O	
P0735	Gear ratio inconsistent (5th)	O	
P0736	Gear ratio inconsistent (Rev)	O	
P0741	Torque converter binds in OFF condition (lock-up control disabled)	O	Faulty TCC solenoid in automatic transmission proper Faulty torque converter
P0776	Solenoid (PCS2) in automatic transmission proper binds in OFF position	O	Faulty harness between electronic control unit and solenoid Faulty turbine speed sensor Faulty output speed sensor Faulty automatic transmission proper
P0777	Solenoid (PCS2) in automatic transmission proper binds in ON position	O	
P0796	Solenoid (PCS3) in automatic transmission proper binds in OFF position	O	Faulty harness between electronic control unit and solenoid Faulty turbine speed sensor Faulty output speed sensor Faulty automatic transmission proper
P0797	Solenoid (PCS3) in automatic transmission proper binds in ON position	O	
P0842 P0843	Faulty fluid pressure switch (PS1) in automatic transmission proper	O	Faulty harness between electronic control unit and pressure switch Faulty automatic transmission proper
P0880 P0881 P0882 P0883	Faulty electronic control unit power voltage	– – O –	Faulty harness from electronic control unit to battery direct power source and starter switch ON power source, and harness between electronic control unit and ground Faulty battery (See Gr54.)
P0894	Abnormal slippage of clutches in automatic transmission proper	O	Check ATF level. Faulty automatic transmission proper
P0960 P0962 P0963	Broken or short circuit of main adjustment solenoid in automatic transmission proper	O	Faulty harness between electronic control unit and solenoid
P0964 P0966 P0967	Broken or short circuit of solenoid (PCS2) in automatic transmission proper	O	Faulty harness between electronic control unit and solenoid
P0968 P0970 P0971	Broken or short circuit of solenoid (PCS3) in automatic transmission proper	O	Faulty harness between electronic control unit and solenoid
P0973 P0974	Short circuit of shift solenoid in automatic transmission proper	O	Faulty harness between electronic control unit and solenoid
P063E P0122 P0123 P1891 P1892	Faulty throttle angle signal	O – – – –	Faulty harness between electronic control unit and engine electronic control unit Faulty fuel system (See Gr13EA.)

Code	Fault (outline)	Warning	Contents of trouble and points to be inspected
P063F P2184 P2185	Faulty engine coolant temperature information	–	Faulty controller area network communication system Faulty fuel system (See Gr13EA.)
P2637	Faulty SEM function (to reduce engine torque when shifting)	O	Faulty electronic control unit
P2641	Faulty LRTP function (to protect automatic transmission by controlling the engine torque using low gears when driving at low speeds)	O	Faulty electronic control unit
P2670 P2671	Faulty power voltage to automatic transmission proper (HSD2)	O	Faulty harness between electronic control unit and automatic transmission (power supply line from electronic control unit to automatic transmission)
P2685 P2686	Faulty power voltage to automatic transmission proper (HSD3)	O	Faulty harness between electronic control unit and automatic transmission (power supply line from electronic control unit to automatic transmission)
P2714	Solenoid (PCS4) in automatic transmission proper binds in OFF position	O	Faulty harness between electronic control unit and solenoid Faulty turbine speed sensor Faulty output speed sensor Faulty automatic transmission proper
P2715	Solenoid (PCS4) in automatic transmission proper binds in ON position	O	
P2718 P2720 P2721	Broken or short circuit of solenoid (PCS4) in automatic transmission proper	O	Faulty harness between electronic control unit and solenoid
P2723	Solenoid (PCS1) in automatic transmission proper binds in OFF position	O	Faulty harness between electronic control unit and solenoid Faulty turbine speed sensor Faulty output speed sensor Faulty automatic transmission proper
P2724	Solenoid (PCS1) in automatic transmission proper binds in ON position	O	
P2727 P2729 P2730	Broken or short circuit of solenoid (PCS1) in automatic transmission proper	O	Faulty harness between electronic control unit and solenoid
P2761 P2763 P2764	Broken or short circuit of TCC solenoid in automatic transmission proper	O	Faulty harness between electronic control unit and solenoid
P2793	Faulty direction information (forwarding, neutral or reversing) from range selector	O	Faulty harness between electronic control unit and range selector
U0001 U0010	Faulty controller area network communication	–	Faulty controller area network communication harness
U0100 U0115	Faulty communication to engine electronic control unit	O	Faulty controller area network communication (between automatic transmission electronic control unit and engine electronic control unit)
U0103	Faulty communication to range selector	O	Faulty controller area network communication (between automatic transmission electronic control unit to range selector)
U0304	Unmatched range selector	O	Replace with correct range selector
U0404	Faulty range selector output signal	O	Faulty range selector

ON-VEHICLE INSPECTION AND ADJUSTMENT

1. Inspection of Automatic Transmission Oil Leakage



1.1 Inspection of oil leakage at each part of transmission body

- Check the oil leakage at each part of automatic transmission body in visual.
  If the oil leakage is found, replace the defective part.

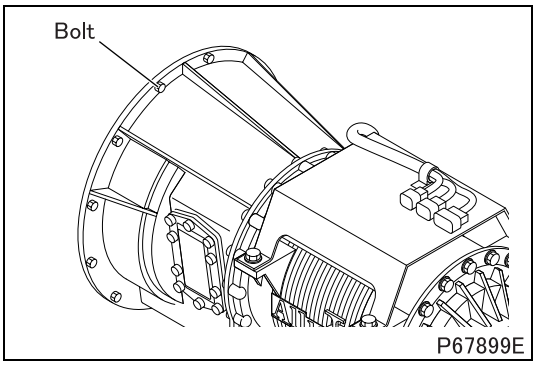
1.2 Inspection of oil leakage around transmission mounting part

- Check there is not oil stain on flywheel housing and automatic transmission mounting part caused by oil leakage from engine.
- If there is the oil stain, remove the automatic transmission and clean the mounting surface of converter housing and flywheel housing using brake cleaner etc. after repairing oil leakage part. Because the oil stain may loosen the automatic transmission mounting bolts. (See “REMOVAL AND INSTALLATION OF AUTOMATIC TRANSMISSION”.)

2. Check for Looseness in Automatic Transmission Mounting Bolts

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
–	Bolt (automatic transmission mounting)	40.2 {30, 4.1}	–

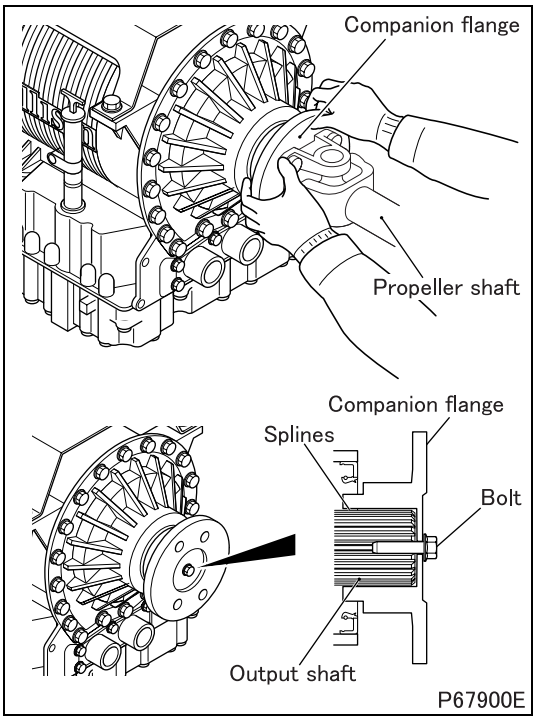


- Check the automatic transmission mounting bolts for looseness.
- Retighten any loose bolt to the specified torque.

3. Inspection of Play and Looseness in Companion Flange

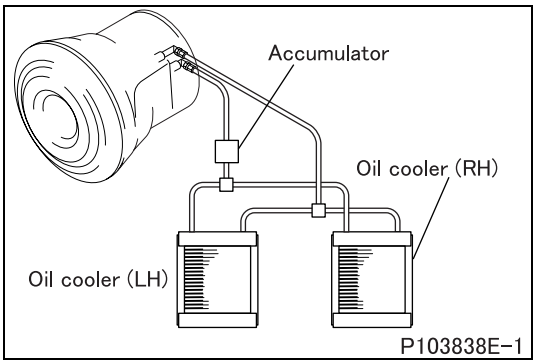
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
–	Bolt (companion flange mounting)	70 to 80 {52 to 59, 7.1 to 8.2}	–



- Move the companion flange in axial and vertical directions to check for excessive play between the companion flange and output shaft.
- If excessive play is detected, remove the propeller shaft, then check the bolt for looseness and the splines on companion flange and output shaft for abnormalities.
- If any bolt is loose, tighten it to the specified torque.
- If the companion flange is found detective, replace the part.
- If the companion flange is not found defective, the output shaft may be defective, contact the Allison Service Station for repair.

4. Inspection of Automatic Transmission Cooling System

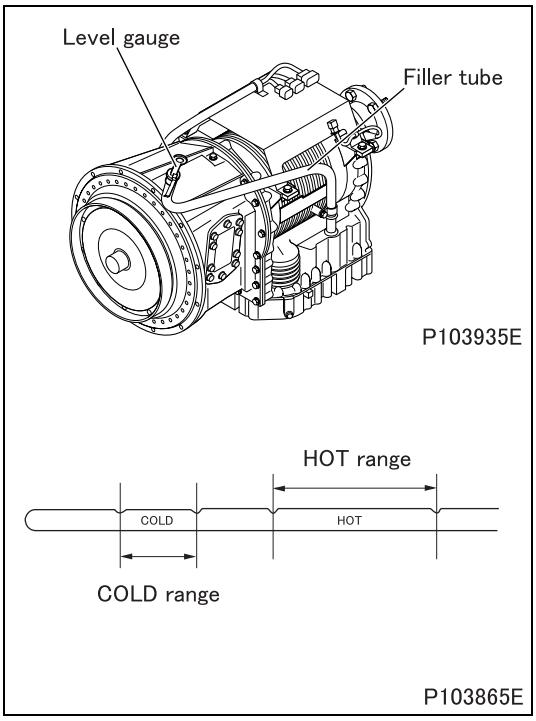


- Check the automatic transmission cooling system for fluid leak and damage. If any abnormality is found, replace the faulty part.

5. Inspection of Automatic Transmission Fluid

Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
–	Automatic transmission	DEXRON III	As required



5.1 Inspection of properties

- If having a burnt smell of automatic transmission fluid or finding out some worn particles of metal or friction materials, it is necessary to overhaul the transmission completely. Check automatic transmission fluid adhering to a level gauge carefully. If there are some doubts in a state of automatic transmission fluid, check the automatic transmission fluid again by it extracting its sample.

5.2 Inspection of quantity of automatic transmission fluid

CAUTION ⚠

- **Before performing the test, make sure there is no worker in front and at the rear of the vehicle.**

- Put the vehicle on a flat place, engage the parking brake surely, and fit the chokes securely at the front (rear) of the front (rear) wheels.
- To fill automatic transmission fluid in a hydraulic circuit with idling the engine, return the range selector lever to N range after putting it repeatedly in each range approximately five (5) times in sequence.
- Extract the level gauge with idling the engine; insert it again after wiping off automatic transmission fluid adhered; and after pulling it out, check quantity of the automatic transmission fluid.
- When the oil temperature is low (15 to 50°C {59 to 122°F}) after starting the engine; if automatic transmission fluid is within a “COLD” range of the level gauge, it shows that the quantity of automatic transmission fluid is as specified.
- When the oil temperature is high (70 to 95°C, {158 to 203°F}) after running the vehicle; if automatic transmission fluid is within a “HOT” range of the level gauge, it shows the quantity of automatic transmission fluid is as specified.

WARNING ⚠

- **Since the inspection is conducted with running the engine, be careful of being caught in components, burn hazard, or the safety.**

NOTE

- **Make sure to inspect the quantity of automatic transmission fluid at the horizontal level.**
- **Make sure to inspect the quantity of automatic transmission fluid with idling the engine at N range since the apparent quantity of automatic transmission fluid increases in a state of the engine stop.**
- **Remove any dirt of the protection cap and the upper part of filler tube completely before pulling the level gauge out.**
- **Do not raise the engine speed with keeping the engine in a state of idling until the adjustment of quantity of automatic transmission fluid is completed.**
- **Reconfirm the automatic transmission fluid level after the vehicle runs actually. In case the quantity of automatic transmission fluid is insufficient, replenish DEXRON III to the specified level of level gauge using filler tube.**

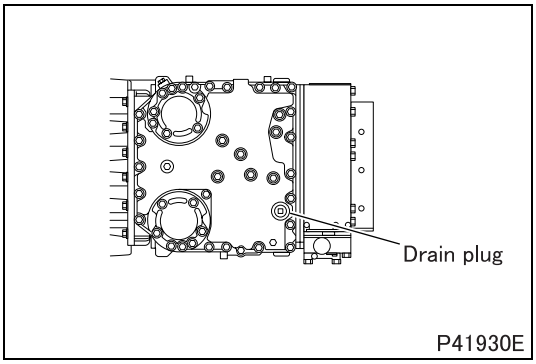
6. Replacement of Automatic Transmission Fluid

Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
–	Automatic transmission	DEXRON III	18 dm^3 {18 L}

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
–	Drain plug	25 to 32 {18 to 24, 2.6 to 3.3}	–



6.1 Discharge

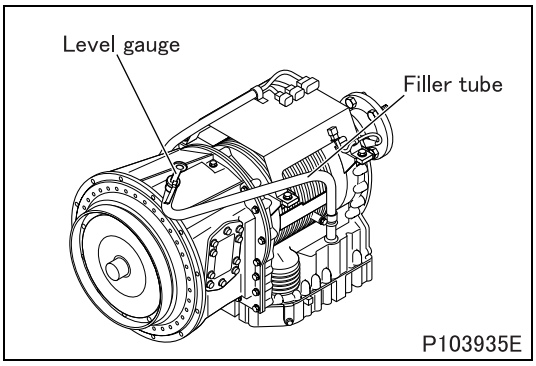
- Put the automatic transmission fluid receptacle under the transmission oil pan; then remove drain plug behind the oil pan to discharge automatic transmission fluid.

WARNING ⚠

- **Do not start any work for engine immediately after the engine is shut down. Wait until the engine cools to a safe temperature since a hot engine can cause burns.**

NOTE

- **The discharge can be made more quickly by warming automatic transmission fluid due to the warm-up operation.**
- **It is impossible to discharge automatic transmission fluid which is located around the hydraulic circuit, the converter, or the oil cooler.**
- **Check any dirt of automatic transmission fluid discharged, and any existence of metallic powder or metal pieces.**



6.2 Injection

- Install oil pan drain plug to its original state.
- Inject automatic transmission fluid in regulation quantity from filler tube.

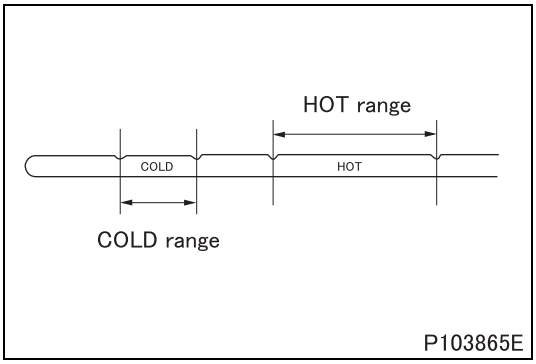
CAUTION ⚠

- **Be careful of the injection so that any dust or foreign particles may not enter.**

- After starting the engine, conduct the idling drive for approximately one (1) minute with engaging the range selector to “N” range.
- After rounding the range selector to each range, engage it to “N” range again.

CAUTION ⚠

- **In this process, only conduct the idling drive for the engine; make sure to avoid just revving the engine.**

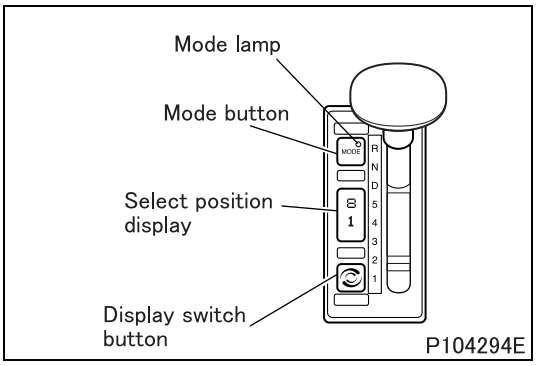


- Replenish automatic transmission fluid until it reaches the low position of the specified range of level gauge. Then, check the level of automatic transmission fluid. The level of automatic transmission fluid must be within the specified range of the level gauge.
  "COLD" range: When temperature is low; 15 to 50°C {59 to 122°F}
  "HOT" range: When temperature is high; 70 to 95°C {158 to 203°F}

NOTE

- **After injecting automatic transmission fluid, it may be difficult to see the level of automatic transmission fluid easily due to the automatic transmission fluid adhering to the inner wall of filler tube; therefore, reconfirm it after a short time.**
- **If injecting automatic transmission fluid too much, the automatic transmission fluid begins to overflow from the air breather; as result, it might be misunderstood that the leakage of automatic transmission fluid be caused.**
- **Inject automatic transmission fluid gradually with letting the engine idle while paying a careful attention to the level of automatic transmission fluid.**

7. Level Check of Automatic Transmission Fluid



- This automatic transmission can check automatic transmission fluid level by operating the range selector.

7.1 Conditions required on check

- Stop the vehicle at a flat place, and put the range selector in “N” position.
  (Neutral must be put in.)
- Automatic transmission fluid must be warm.
  (oil temperature 60 to 104°C {140 to 220°F})
- Stabilize oil level at intervals of two minutes or more after stopping the vehicle.
- Put the engine in a state of idling rotation.

7.2 Check operation

- Push display switch button of the range selector.
- Various code No. are displayed in the position display of the selector following “o” and “L” (indicating check mode of automatic transmission fluid level) after approximately two minutes.

7.3 Judgment of check result

The code No. indicated means as follows:

- “oL”, “oK” ; automatic transmission fluid level is appropriate.
- “oL”, “Lo”, and “XX” ; automatic transmission fluid must be added by approximately XX qts.
- “oL”, “HI”, and “XX” ; automatic transmission fluid must be extracted by approximately XX qts.
- “oL”, “--”, and “XX” ; check the level again based on the following table since the level could not be checked.

Display code No. XX	Contents
“0X”	Settling time too short.
“EL”	The engine speed is too low.
“EH”	The engine speed is too high.
“SN”	The neutral has not been selected.
“TL”	Oil temperature is too low.
“TH”	Oil temperature is too high.
“SH”	Output shaft rotation.
“FL”	Faulty oil level sensor in the automatic transmission body.

7.4 Operation after the check has ended

- There are the following two methods to return it to normal operation mode.
- Push the display switch button of range selector twice.
- Shift the lever from the current range to another range (Reverse, Neutral or Drive).

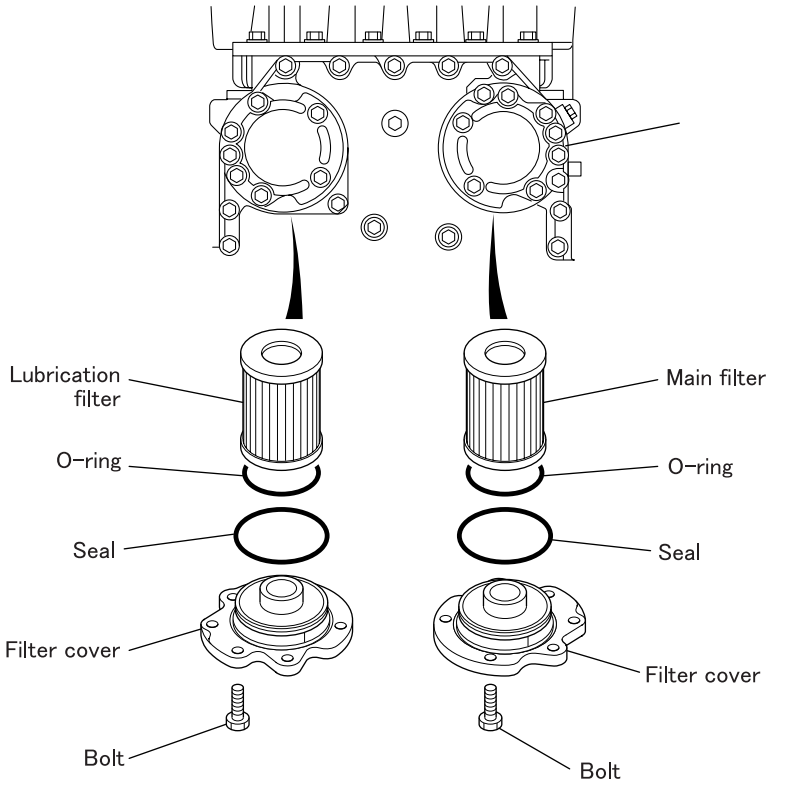
8. Replacement of Oil Filter

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
–	Bolt (installing filter cover)	57 to 68 {42 to 50, 5.8 to 6.9}	–

Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
–	Seal	DEXRON III	As required
–	O-ring		
–	Engagement part of filter		



9. Stall Test

Service standards

Location	Maintenance item	Standard value	Limit	Remedy
–	Stall resolutions	1750 ± 150 rpm	–	Ask for repair.

9.1 Purpose

- "Stall test" checks the friction element in transmission, slide of oneway clutch in torque converter, operation of torque converter, or overall performance of the engine; thereby investigates the cause when the vehicle is malfunctioned due to insufficient power, performance, or others.

9.2 Measurement procedure

CAUTION ⚠

- **Before performing the test, make sure there is no worker in front and at the rear of the vehicle.**

- Before starting the test, check the cooling water and oil of the engine, and automatic transmission fluid level of automatic transmission. Also, conduct sufficient warm-up operation of the engine and transmission.
- Fit the chocks securely at the front (rear) of the front (rear) wheels and engage the parking brake to prevent the vehicle from moving. In addition, when pushing the accelerator pedal down, press the foot brake strongly.
- Start the engine and engage the range selector lever into D range.
- Push the accelerator pedal down slowly to the full acceleration; when the engine comes into a stable speed at a constant speed, read the revolutions (the stall revolutions) quickly, and then take off the foot from the accelerator pedal.

CAUTION ⚠

- **Be sure to set a full stall acceleration time as less than 5 seconds, and complete the measurement during that time.**
- **Be careful for overheating of the engine and transmission.**

- Put the range selector lever in "N" range, and conduct the cooling for two minutes or more per 1000 rpm.

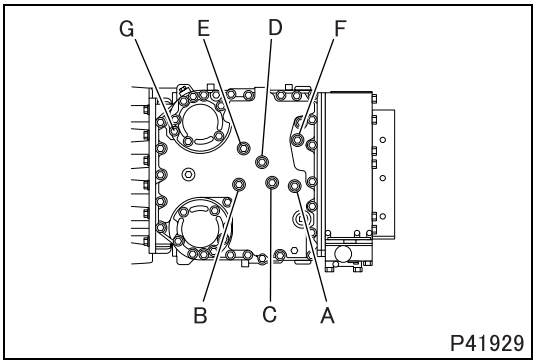
9.3 Result of diagnosis

- In case the stall revolution is too low; if the result of measurement is lower by 150 rpm or more than the standard value, the engine will be malfunctioned. (See Gr13EA.)
- In case the stall revolution is abnormally low (approximately 1/3 of the specified value) even though the engine has no any trouble like emitting black smoke; there may be some abnormality inside the torque converter (one-way clutch failure).
- In case the stall revolution is too high; if the result of measurement is higher by 150 rpm or more than the standard value, the cause may be due to the slide inside the transmission, cavitations, the bubbling of automatic transmission fluid, or damage of the torque converter.
- If the automatic transmission proper is found defective, contact the Allison Service Station for repair.

10. Line Pressure Test

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
–	Plug	10 to 13 {7.2 to 9.4, 1.0 to 1.3}	Ask for repair.



10.1 Purpose

- "Line pressure test" checks the performance of oil pump, function of control valve, and the oil leaking of each component.

10.2 Measurement procedure

- Decide the pressure item to check according to the content of troubles, and measure the line pressure based on the following procedure.
- Remove the plug from the pressure detecting port of the gearbox casing, and install the pressure gauge.
  - A: Main oil pressure
  - B: C1 clutch oil pressure
  - C: C2 clutch oil pressure
  - D: C3 clutch oil pressure
  - E: C4 clutch oil pressure
  - F: C5 clutch oil pressure
  - G: Lock-up oil pressure
- Conduct a sufficient warm-up operation, and raise oil temperature to 60 to 80°C {140 to176°F}.
- Remove the propeller shaft to simulate the running condition.
- Measure the main oil pressure, clutch oil pressures and lock-up clutch pressure at idling condition and simulated running condition. Make sure the following conditions are satisfied.
  - Measured main oil pressure and lock-up clutch oil pressure are within the standard value.
  - The difference between the measured clutch oil pressure and the main oil pressure is 75 kPa {11 psi, 0.8 kgf/cm^2} or lower and also satisfies the standard value.
- After measurement, remove dust and dirt around the pressure detecting ports and tighten the plugs to the specified torque.

CAUTION ⚠

- **Be sure to prevent foreign particles from entering the pressure detecting port.**

10.3 Standard line pressure table

	Engine speed rpm	*Range	Main oil pressure KPa {psi, kgf/cm^2}	Pressure clutch	Clutch oil pressure KPa {psi, kgf/cm^2}	Lock-up clutch oil pressure KPa {psi, kgf/cm^2}
Oil pressure when idling the engine	580 – 620	Neutral	1310 to 1725 {190 to 250, 13 to 18}	C5	1235 to 1725 {180 to 250, 13 to 18}	10 to 35 {1 to 5, 0.1 to 0.4}
		Reverse	1170 to 1585 {170 to 230, 12 to 16}	C3, C5	1095 to 1585 {160 to 230, 11 to 16}	10 to 35 {1 to 5, 0.1 to 0.4}
		1C	870 to 1340 {125 to 195, 8.9 to 14}	C1, C5	795 to 1340 {115 to 195, 8.1 to 14}	10 to 35 {1 to 5, 0.1 to 0.4}
		2C	870 to 1340 {125 to 195, 8.9 to 14}	C1, C4	795 to 1340 {115 to 195, 8.1 to 14}	10 to 35 {1 to 5, 0.1 to 0.4}
Oil pressure when operating	2080 – 2120	Neutral	1805 to 2205 {260 to 320, 18 to 22}	C5	1730 to 2205 {250 to 320, 18 to 22}	160 to 240 {23 to 35, 1.6 to 2.4}
		Reverse	1805 to 2205 {260 to 320, 18 to 22}	C3, C5	1730 to 2205 {250 to 320, 18 to 22}	160 to 240 {23 to 35, 1.6 to 2.4}
		1C	1550 to 1965 {225 to 285, 16 to 20}	C1, C5	1475 to 1965 {215 to 285, 15 to 20}	160 to 240 {23 to 35, 1.6 to 2.4}
		2C	1550 to 1965 {225 to 285, 16 to 20}	C1, C4	1475 to 1965 {215 to 285, 15 to 20}	160 to 240 {23 to 35, 1.6 to 2.4}
		2L	1080 to 1365 {155 to 200, 11 to 14}	C1, C4, LU	1005 to 1365 {145 to 200, 10 to 14}	160 to 240 {23 to 35, 1.6 to 2.4}
		3C	1550 to 1965 {225 to 285, 16 to 20}	C1, C3	1475 to 1965 {215 to 285, 15 to 20}	160 to 240 {23 to 35, 1.6 to 2.4}
		3L	1080 to 1365 {155 to 200, 11 to 14}	C1, C3, LU	1005 to 1365 {145 to 200, 10 to 14}	160 to 240 {23 to 35, 1.6 to 2.4}
		4C	1550 to 1965 {225 to 285, 16 to 20}	C1, C2	1475 to 1965 {215 to 285, 15 to 20}	125 to 200 {18 to 30, 1.3 to 2.0}
		4L	1080 to 1365 {155 to 200, 11 to 14}	C1, C4, LU	1005 to 1365 {145 to 200, 10 to 14}	125 to 200 {18 to 30, 1.3 to 2.0}
		5C	1550 to 1965 {225 to 285, 16 to 20}	C2, C3	1475 to 1965 {215 to 285, 15 to 20}	125 to 200 {18 to 30, 1.3 to 2.0}
		5L	1080 to 1365 {155 to 200, 11 to 14}	C2, C3, LU	1005 to 1365 {145 to 200, 10 to 14}	125 to 200 {18 to 30, 1.3 to 2.0}
		6C	1345 to 1590 {220 to 290, 14 to 16}	C2, C4	1270 to 1590 {185 to 230, 13 to 16}	125 to 200 {18 to 30, 1.3 to 2.0}
		6L	1035 to 1415 {195 to 230, 11 to 14}	C2, C4, LU	960 to 1415 {140 to 205, 9.8 to 14}	125 to 200 {18 to 30, 1.3 to 2.0}

* C: In torque converter (lock-up clutch disengaged), L: In lock-up

10.4 Result of diagnosis

- In case the main oil pressure is low in all ranges:
  - Automatic transmission fluid level; too low
  - Filter Element; clogged
  - Suction filter; clogged
  - Main oil pressure regulator valve; adhered, and the spring; weakening or broken
  - Inside of control module; leaked
  - Oil pump; worn or broken
- In case the oil pressure is low in the specific ranges (each clutch oil pressure):
  - If C1 clutch pressure is low; may cause slide or judder at 1st, 2nd, 3rd, or 4th gear.
  - If C2 clutch pressure is low; may cause slide or judder at 4th, 5th, or 6th gear.
  - If C3 clutch pressure is low; may cause slide or judder at 3rd, 5th, or Rev. gear.
  - If C4 clutch pressure is low; may cause slide or judder at 2nd, or 6th gear.
  - If C5 clutch pressure is low; may cause slide or judder at 1st or Rev. gear.
  - If the lock-up clutch pressure is low; the speed extension of vehicle at 2nd or more gear (in lock-up) may be decreased. Or, the shift will not be performed as it is a shift map.
  - If the automatic transmission proper is found defective, contact the Allison Service Station for repair.

11. Road Test

Service standards (Unit: km/h {mph})

Location	Maintenance item			Standard value	Limit	Remedy
–	Shifting point (D range) [Economy mode/ Power mode]	At half throttle Accelerator opening: 4/8	1st → 2nd	14 to 17 {9 to 11}/ 16 to 19 {10 to 12}	–	Ask for repair.
			2nd → 3rd	27 to 30 {17 to 19}/ 31 to 34 {19 to 21}	–	
			3rd → 4th	36 to 39 {22 to 24}/ 41 to 44 {26 to 27}	–	
			4th → 5th	48 to 51 {30 to 32}/ 55 to 58 {34 to 36}	–	
			5th → 6th	69 to 72 {43 to 45}/ 78 to 81 {49 to 50}	–	
		At full throttle Accelerator opening: 8/8	1st → 2nd	14 to 17 {9 to 11}/ 16 to 19 {10 to 12}	–	
			2nd → 3rd	35 to 38 {22 to 24}/ 40 to 43 {25 to 27}	–	
			3rd → 4th	48 to 50 {30 to 31}/ 54 to 57 {34 to 35}	–	
			4th → 5th	68 to 71 {42 to 44}/ 77 to 80 {48 to 50}	–	
			5th → 6th	93 to 95 {58 to 59}/ 104 to 107 {65 to 67}	–	
		At closed throttle Accelerator opening: 0/8	6th → 5th	61 to 64 {38 to 40}/ 68 to 71 {42 to 44}	–	
			5th → 4th	39 to 42 {24 to 26}/ 40 to 43 {25 to 27}	–	
			4th → 3rd	29 to 32 {18 to 20}/ 30 to 33 {19 to 21}	–	
			3rd → 2nd	20 to 23 {12 to 14}/ 21 to 24 {13 to 15}	–	
			2nd → 1st	6 to 9 {4 to 6}/ 5 to 8 {3 to 5}	–	
–	Lock-up point [Economy mode/ Power mode] (reference)	At half throttle Accelerator opening: 4/8	OFF → ON	20 to 23 {12 to 14}/ 23 to 26 {14 to 16}	–	Ask for repair.
		At full throttle Accelerator opening: 8/8	OFF → ON	24 to 27 {15 to 17}/ 28 to 30 {17 to 19}	–	
		At closed throttle Accelerator opening: 0/8	ON → OFF	14 to 17 {9 to 11}/ 14 to 17 {9 to 11}	–	

11.1 Measuring procedure

- Before starting the road test, make sure that the transmission fluid level has been checked, the fluid has been inspected and the selector cable has been adjusted.
- During the road test, operate the automatic transmission with gears shifted into different positions and check for the feeling of a gear slip and any other abnormalities.
- Check for too hard or too soft feeling of gear shift.
- Check for shift-up and shift-down points.

- The value shown in the table is calculated under the following condition.
  For the vehicle with different differential ratio or tire size, the vehicle speed varies from the value in the table. In such case, the value should be converted based on such deviation.

Differential ratio	Tire size (radius)
6.666	11R22.5 (0.508)

- If the measurement is out of specification, contact the Allison service station for repair.

Follow the disassembly sequence in reverse.

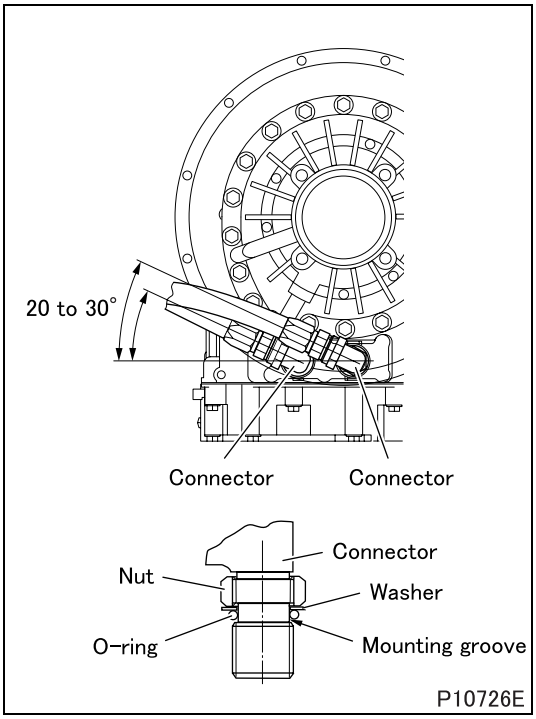
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Eyebolt	73.5 {54, 7.5}	–
Tb	Oil hose	118 {87, 12}	–
	Oil pipe		
Tc	Automatic transmission fluid temperature switch	29 to 39 {22 to 29, 3 to 4}	–
Td	Nut (fan mounting)	4.22 to 5.20 {3.1 to 3.8, 0.4 to 0.5}	–

Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Automatic transmission fluid temperature switch	ThreeBond 1110B	As required
b	O-ring	DEXRON III	As required
	O-ring contact surface of connector		

◆**Installation procedure**◆



■ **Installation: Connector**

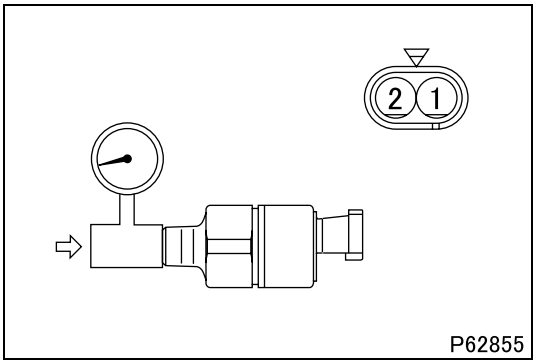
- Tighten the nut of the connector by hand until it touches the connector and install the O-ring securely in the mounting groove.
- Tighten the connector by hand until the washer touches the automatic transmission and then loosen it to the angle shown in the illustration.
- While keeping the connector in this position, tighten the nut to the automatic transmission side.

◆Inspection after installation◆

■**Inspection: Quantity of automatic transmission fluid**

- If any oil line was removed, check the quantity of automatic transmission fluid and add as necessary.

M E M O



#042 Inspection of stop lamp switch

- Perform the following inspection. If any abnormality is found, replace the switch.

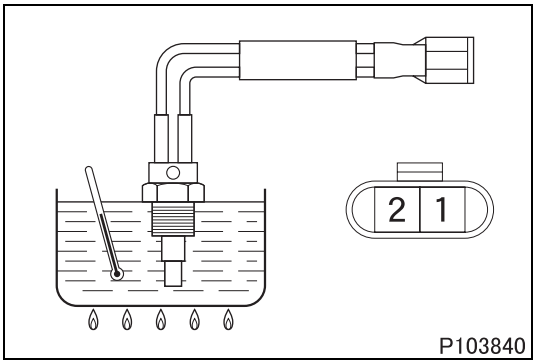
(1) Inspection by applying no air pressure

- Make sure that there is no continuity between terminals 1 and 2.

(2) Inspection by applying air pressure

- Apply air pressure to the switch gradually from 0 kPa {0 psi, 0 kgf/cm^2}.
- Measure the air pressure when continuity is established across terminals 1 and 2, and make sure that the air pressure is within the standard value.

Standard value (operating pressure)	29 ± 9.8 kPa {4.2 ± 1.4 psi, 0.3 ± 0.1 kgf/cm^2}

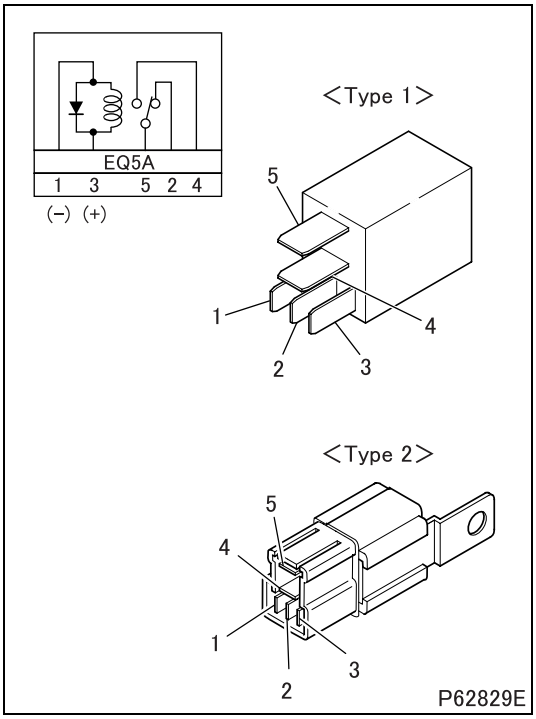


#153 Inspection of automatic transmission fluid temperature switch

- Place the switch in a container.
- Raise the oil temperature to the specified values and stir the oil.
- Measure the operating temperature between terminals 1 and 2 respectively.

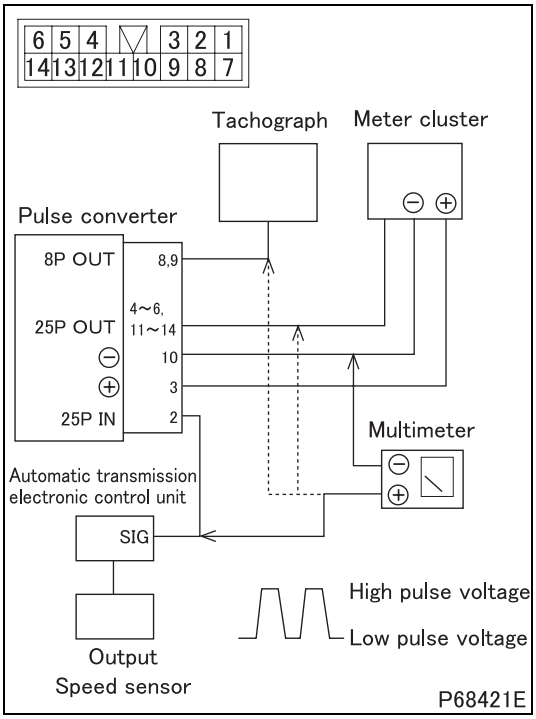
Standard value	When temperature increases (OFF → ON)	108 ± 3°C {225 ± 5.4°F}
	When temperature decreases (ON → OFF)	101°C {215°F} or more

- If the measured value deviates from the standard value, replace the switch.



#201 Inspection of relay (normally open, 5-pin type)

- Perform a continuity check and an operation check. If there is any abnormality, replace the relay.



#352 Inspection of pulse converter

- Check the pulse converter with the automatic transmission electronic control unit installed in the vehicle.
- With the starter switch in the ON position, slowly turn the wheels by means of a chassis dynamo or any other appropriate means.
- Measure the maximum voltage (high pulse voltage) and minimum voltage (low pulse voltage) values of the voltage between each of input and output terminals and terminal 10 of the pulse converter.

(1) Output measurement

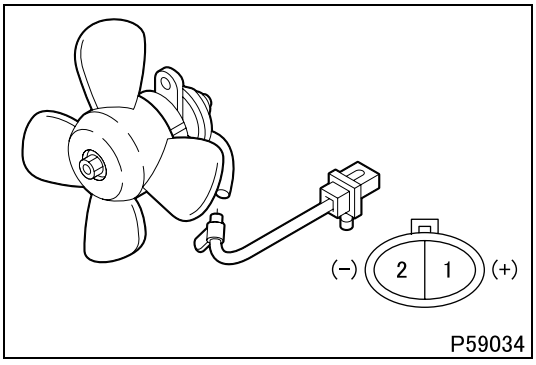
Standard value	8 pulse output (between terminals 8, 9 and 10)	Low pulse voltage	1.5 V or lower
		High pulse voltage	{Input voltage (battery) –0.5 V} or higher
	25 pulse output (between terminals 4 to 6, 11 to 14 and 10)	Low pulse voltage	0.5 V or lower
		High pulse voltage	$8^{+1.5}_{-1.0}$ V

- If measurement deviates from the standard value, conduct input measurement.

(2) Input measurement

Standard value 25 pulse input (between terminals 2 and 10)	Low pulse voltage	0.5 V or lower
	High pulse voltage	8 ± 1 V

- If measurement meets the standard value, signals from the automatic transmission electronic control unit should be normal. Accordingly, replace the pulse converter.
- If measurement deviates from the standard value, check the automatic transmission.



#489 Inspection of motor

- Check that the motor runs when the battery voltage is applied to terminals 1 and 2.
- If there is any abnormality, replace the motor.

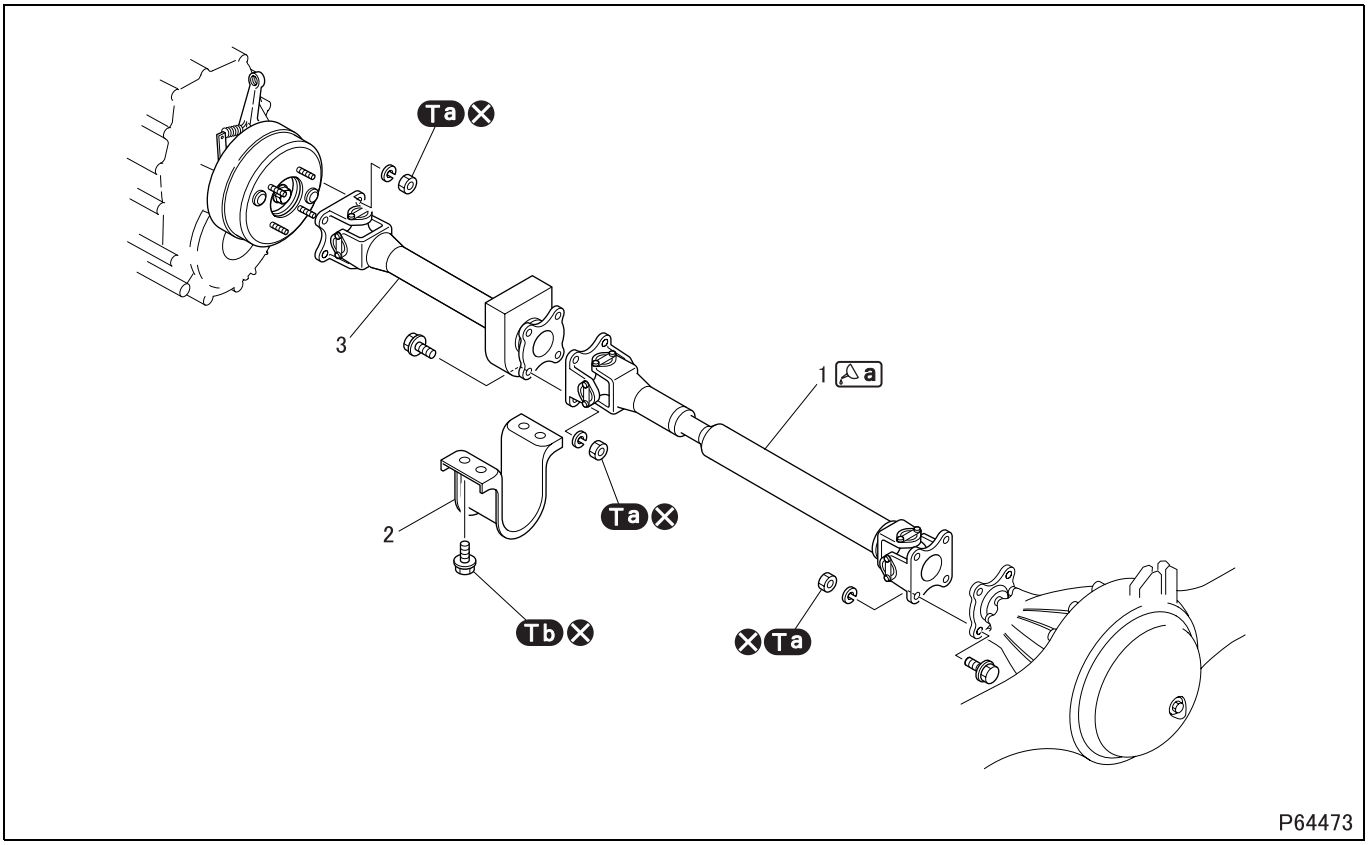
M E M O

REMOVAL AND INSTALLATION OF PROPELLER SHAFT



- Shown above is a tandem propeller shaft. The same service procedure applies to other propeller shafts.

● Removal sequence

1 Propeller shaft <Without center bearing> (See later section.)
2 Center bearing bracket
3 Propeller shaft <With center bearing> (See later section.)

⊗: Non-reusable parts

CAUTION ⚠

- **Securely chock the wheels so that the vehicle does not move.**
- **Do not remove the chocks until the entire operation is completed.**

● Installation sequence

Follow the removal sequence in reverse.

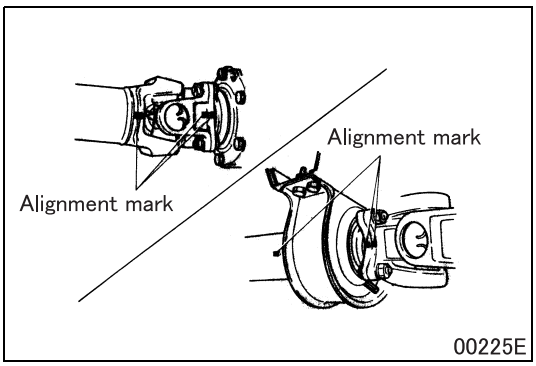
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened		Tightening torque	Remarks
Ta	Nut (propeller shaft mounting)	P8	70 to 100 {51 to 72, 7 to 10}	–
		P10	120 to 180 {87 to 130, 12 to 18}	–
Tb	Bolt (center bearing bracket mounting)		70 to 95 {51 to 69, 7.0 to 9.5}	–

Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Supply through grease nipple of propeller shaft	Wheel bearing grease [NLGI No. 2 (Li soap)]	As required

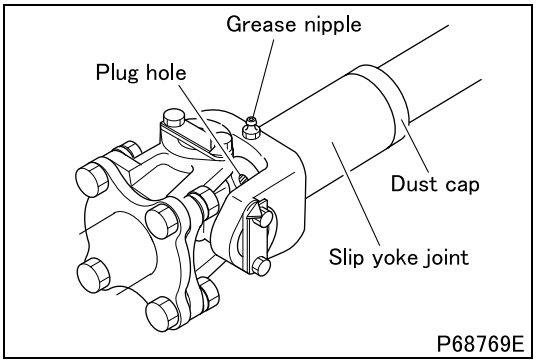
◆Work before removal◆



■ **Alignment mark: Propeller shaft**

- Be sure to make alignment marks before removal.

◆Work after installation◆

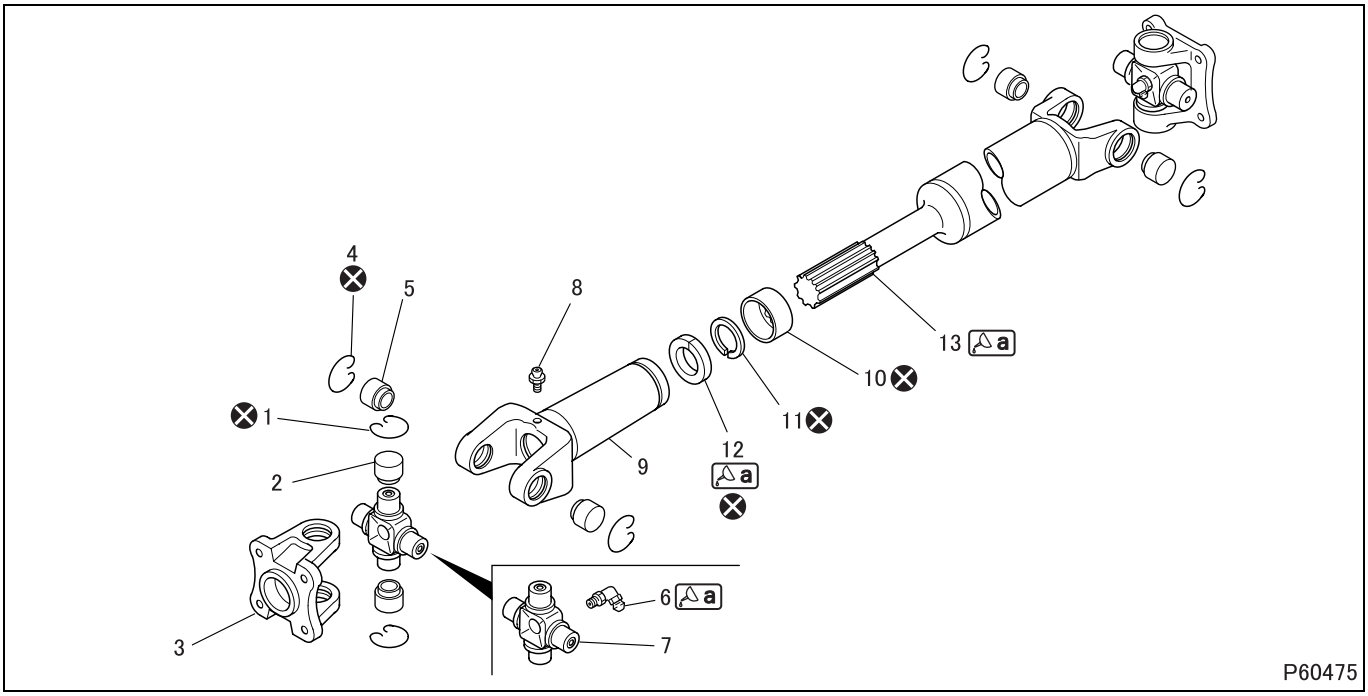


■ **Lubrication: Propeller shaft <Without center bearing>**

- Fill grease through the grease nipple, with the plug hole in the slip yoke joint stopped, until supplied grease overflows from the dust cap side.

PROPELLER SHAFT <P8>

<Without center bearing>



- Balance piece installing position (at flange yoke, slip yoke joint or propeller shaft) depends on the unbalance of the propeller shaft. This illustration is an example.

● Disassembly sequence

1 Snap ring
2 Needle bearing
3 Flange yoke
4 Snap ring
5 Needle bearing
6 Grease nipple
7 Spider
8 Grease nipple
9 Slip yoke joint
10 Dust cap
11 Retainer
12 Cork seal
13 Propeller shaft

⊗: Non-reusable parts

CAUTION ⚠

- **Be careful not to damage the needle bearing because it is fitted with a seal.**

● Assembly sequence

Follow the disassembly sequence in reverse, excepting:
13→10→11→12→9

Repair kit: Universal joint spider kit

CAUTION ⚠

- **Be sure to reinstall removed parts at their original positions.**
- **Correct dynamic balance after replacement of parts.**

- Fill grease through the grease nipple of the slip yoke joint after mounting the propeller shaft to the vehicle. (See REMOVAL AND INSTALLATION OF PROPELLER SHAFT.)

Service standards (Unit: mm {in.})

Location	Maintenance item	Standard value	Limit	Remedy
–	Axial clearance of spider	0 to 0.15 {0 to 0.0059}	–	Adjust
–	Permissible amount of unbalance of propeller shaft (Periphery of pipe)	0.49 N·cm {0.0036 ft.lbs, 50 gf·cm} max./1600 rpm	–	Adjust
2, 3	Clearance between needle bearing and flange yoke ("–" indicates interference.)	–0.031 to 0.010 {–0.0012 to 0.00039}	0.1 {0.0039}	Replace
2, 5, 7	Clearance between needle bearing and spider	0.02 to 0.07 {0.00079 to 0.0028}	0.2 {0.00079}	Replace
5, 9	Clearance between needle bearing and slip yoke joint ("–" indicates interference.)	–0.031 to 0.010 {–0.0012 to 0.00039}	0.1 {0.0039}	Replace
9, 13	Play in rotation direction between slip yoke joint and propeller shaft spline	0.07 to 0.18 {0.0028 to 0.0071}	0.3 {0.012}	Replace
13	Bend of propeller shaft	0 to 0.6 {0 to 0.024}	–	Correct or replace

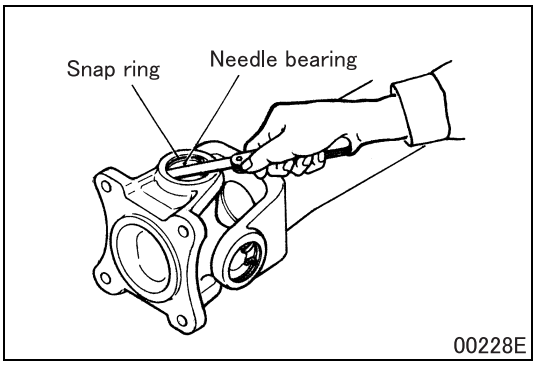
Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Supply through grease nipple	Wheel bearing grease [NLGI No. 2 (Li soap)]	As required
	Inner periphery of cork seal		
	Propeller shaft spline		

Special tools

Mark	Tool name and shape	Part No.	Application
a	Snap ring repressor  00227	MH061001	Removal and installation of snap ring

◆Work before removal◆



■ Inspection: Axial clearance of spider

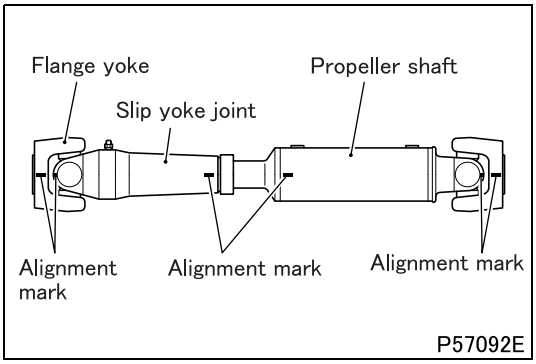
- Press strongly down the needle bearing, and measure clearance between the snap ring and needle bearing.
- If the measurement exceeds the standard value, change snap ring thickness for adjustment.

Variation of snap ring:

Thickness	Identification color
3 mm {0.118 in.}	Green
3.05 mm {0.120 in.}	White
3.1 mm {0.122 in.}	Red
3.15 mm {0.124 in.}	Blue
3.2 mm {0.126 in.}	Yellow

NOTE

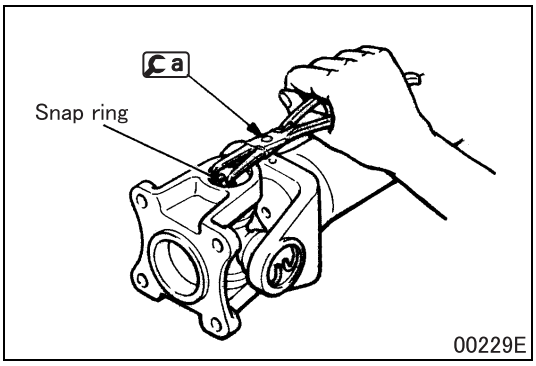
- **Use snap rings for both ends with the same thickness as much as possible to ensure rotation balance.**



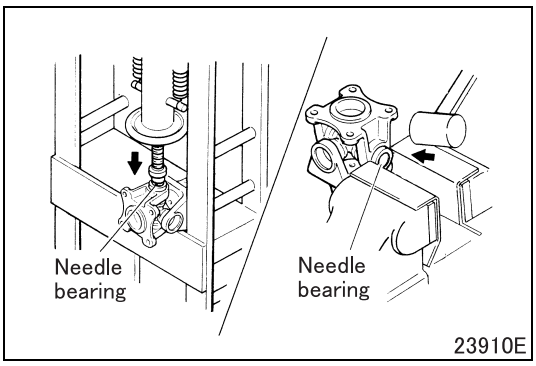
■ **Alignment mark: Propeller shaft**

- To prevent assembly of wrong parts, make alignment marks on flange yoke, slip yoke joint and propeller shaft.

◆Removal procedure◆



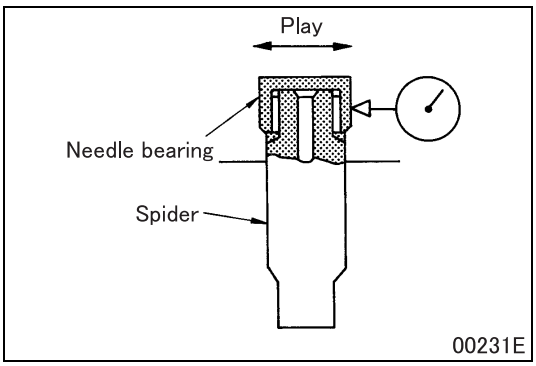
■ **Removal: Snap ring**



■ **Removal: Needle bearing**

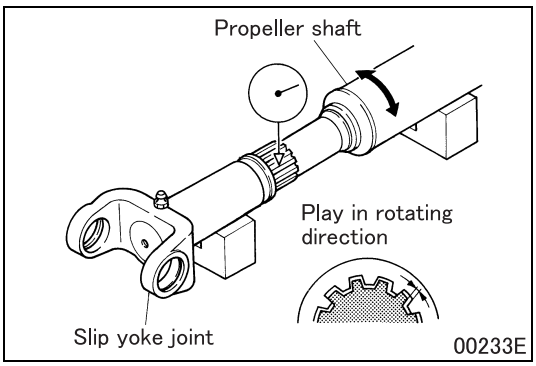
- Make alignment marks on the needle bearing and spider.
- Force out the needle bearing halfway from the yoke using a press, then remove it with a vise.

◆Inspection procedure◆



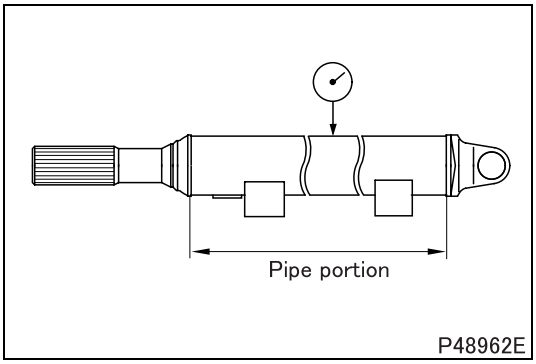
■ **Inspection: Clearance between needle bearing and spider**

- If the measurement exceeds the limit, replace with the universal joint spider kit.



■ **Inspection: Play in rotation direction between slip yoke joint and propeller shaft spline**

- If the measurement exceeds the limit, replace the slip yoke joint and propeller shaft in a set.



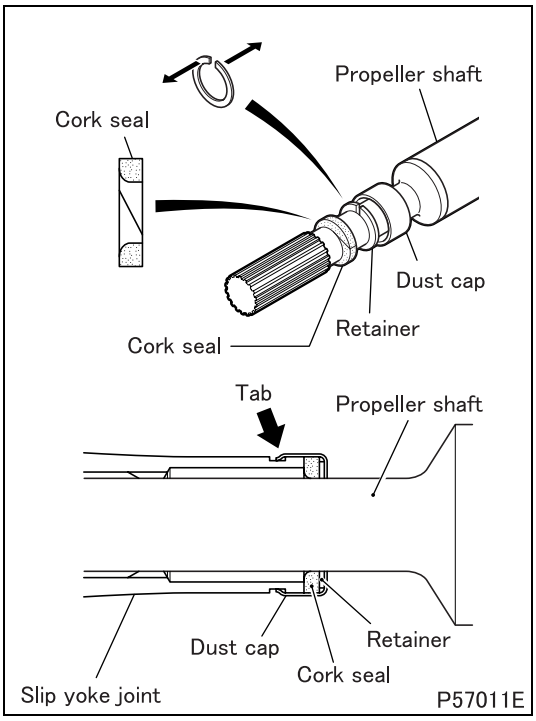
■ **Inspection: Bend of propeller shaft**

- Before measuring the bend of pipe, remove paint from the propeller shaft where the dial gauge is set and the pipe is supported with V blocks using a paint remover.
- Measure bend of propeller shaft at the center of its pipe portion.
- To measure the bend of propeller shaft, turn it fully once and read the dial gauge indicator. The bend is one half of the indicated value.
- If the measurement deviates from the standard value, correct the bend with a press or replace the propeller shaft.

CAUTION ⚠

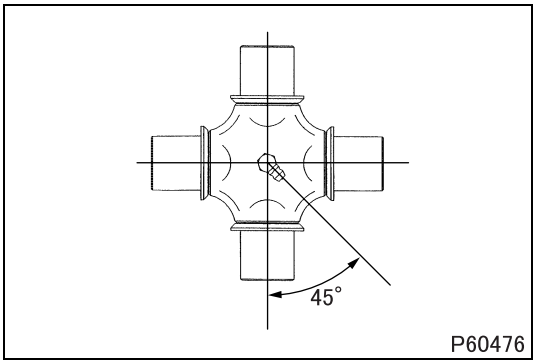
- **Remove paint taking care not to damage the pipe portion of the shaft.**
- **Check the propeller shaft for cracks in the welded area after correcting the bend using a press. If a crack is caused, replace the propeller shaft instead of correcting it by welding.**

◆Installation procedure◆



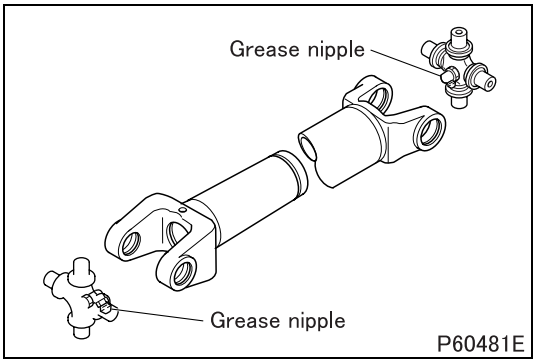
■ **Installation: Dust cap, retainer and cork seal**

- After inserting the dust cap into the propeller shaft, carefully open the retainer right and left, assemble it to the propeller shaft and return it to the original condition.
- Apply grease to the inside circumference of the cork seal and assemble it to the propeller shaft, facing it in the illustrated direction in the same method as the retainer.
- Apply sufficient grease to the splined portion of the propeller shaft, then fit the propeller shaft into the slip yoke joint.
- Press the dust cap against the slip yoke joint in such a way that the cork seal is compressed, and crimp its tabs to engage with the recesses in the slip yoke joint.



■ **Installation: Spider**

- Fit grease nipple to the spider facing it in the illustrated direction.

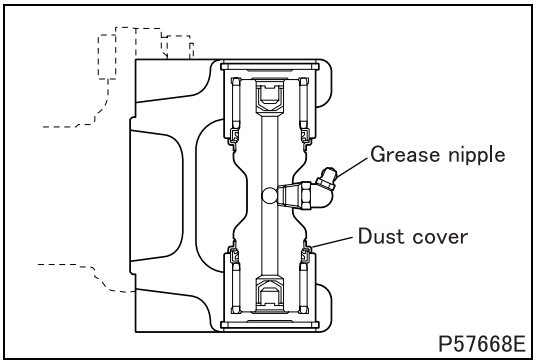


- Install spiders on both ends of the propeller shaft so that their respective grease nipple faces in the same direction.

■ **Installation: Snap ring**

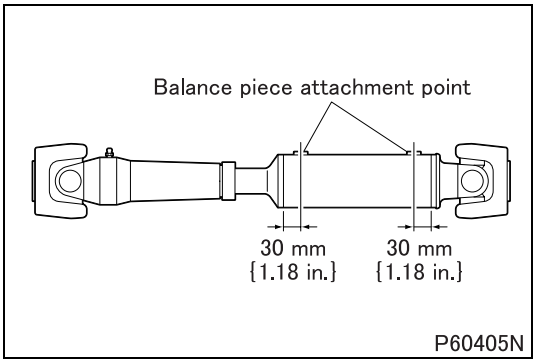
- Install the snap ring by following the removal sequence in reverse.
  (See **"■ Removal: Snap ring"**.)

◆Work after installation◆



■ **Lubrication: Grease nipple**

- Fill grease through the grease nipple until supplied grease overflows from four dust covers of the spider.
- If grease does not overflow from all of the four dust covers or rust, water and dirt come out with grease, replace the spider with the spider kit.



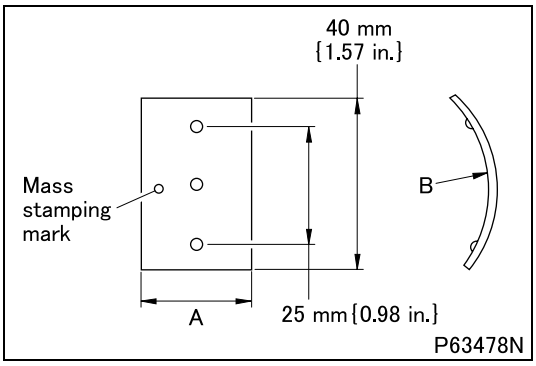
■ **Inspection: Permissible unbalance amount of propeller shaft**

[Inspection]

- Measure the balance amount (dynamic balance) of the propeller shaft on a balancing machine.
- If the measurement deviates from the standard value, adjust the balance amount in the following procedure.

[Adjustment]

- Attach appropriate balance pieces and lock plate to the illustrated points so that the unbalance amount comes within the standard value.
- Maximum balance piece allowance for one point is 120 g {4.23 oz}.
- Use a combination that keeps the number of balance pieces to a minimum.



Types of balance pieces

Mass	Dimension A	Radius B of the bend	Thickness
10 g {0.35 oz}	14 mm {0.55 in.}	41.3 mm {1.63 in.}	2.3 mm {0.091 in.}
20 g {0.71 oz}	28 mm {1.10 in.}	45 mm {1.77 in.}	
40 g {1.41 oz}	55.7 mm {2.19 in.}		
60 g {2.12 oz}	83.5 mm {3.29 in.}

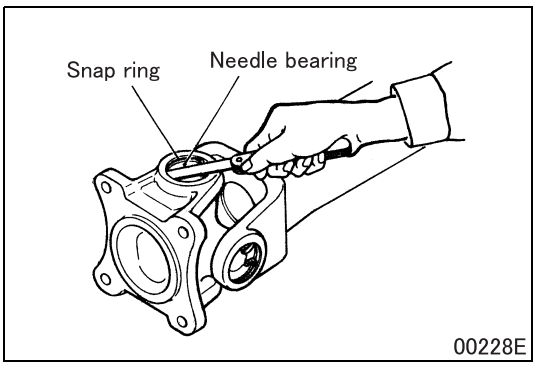
A
50 {1.97}

◆Work before removal◆



■ **Inspection: Axial clearance of spider**

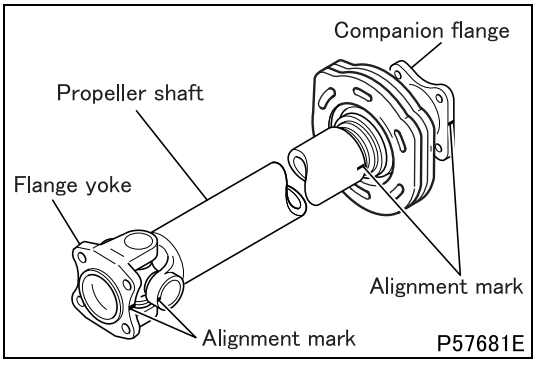
- Press strongly down the needle bearing, and measure clearance between the snap ring and needle bearing.
- If the measurement exceeds the standard value, change snap ring thickness for adjustment.

Variation of snap ring:

Thickness	Identification color
3 mm {0.118 in.}	Green
3.05 mm {0.120 in.}	White
3.1 mm {0.122 in.}	Red
3.15 mm {0.124 in.}	Blue
3.2 mm {0.126 in.}	Yellow

NOTE

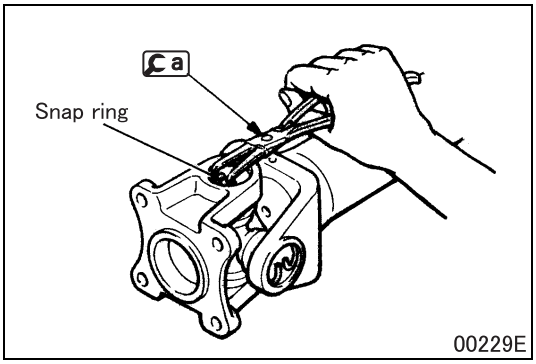
- **Use snap rings for both ends with the same thickness as much as possible to ensure rotation balance.**



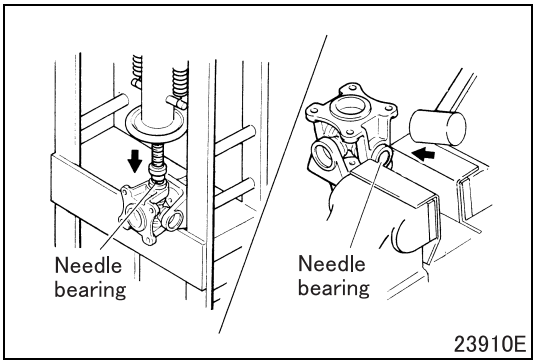
■ **Alignment mark: Propeller shaft**

- To prevent assembly of wrong parts, make alignment marks on flange yoke, companion flange and propeller shaft.

◆Removal procedure◆

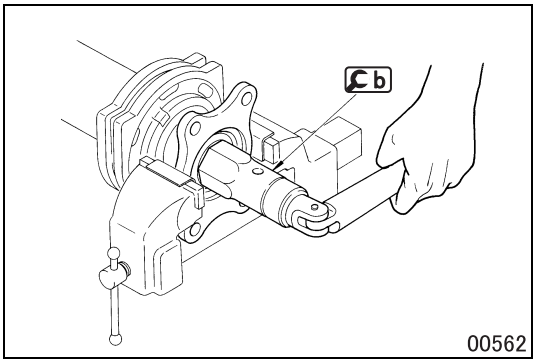


■ **Removal: Snap ring**

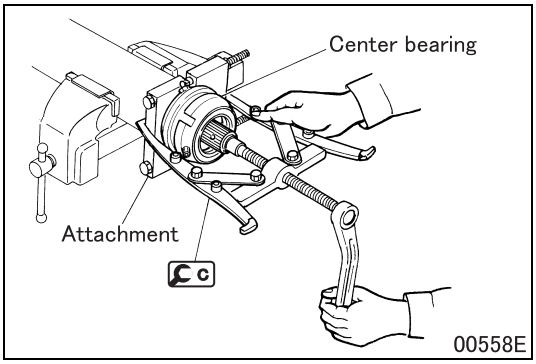


■ **Removal: Needle bearing**

- Make alignment marks on the needle bearing and spider.
- Force out the needle bearing halfway from the yoke using a press, then remove it with a vise.



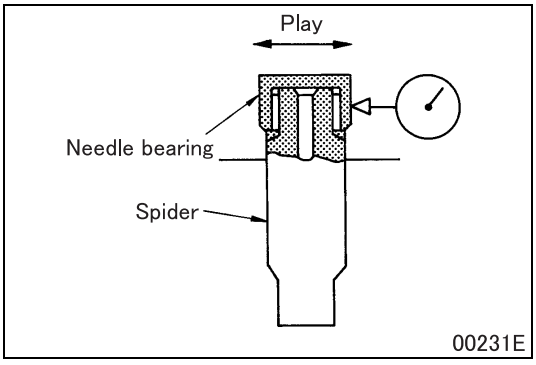
■ **Removal: Companion flange**



■ **Removal: Center bearing**

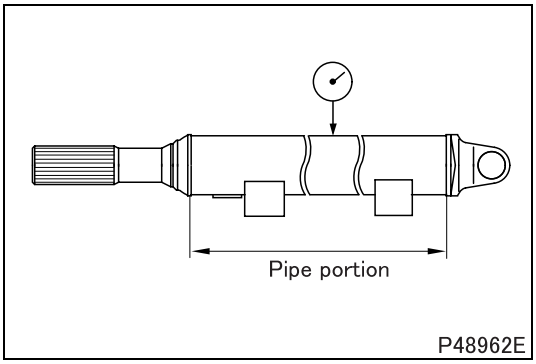
- Using c, remove the center bearing with the aid of the attachment.

◆Inspection procedure◆



■ **Inspection: Clearance between needle bearing and spider**

- If the measurement is higher than the limit, replace with the universal joint spider kit.



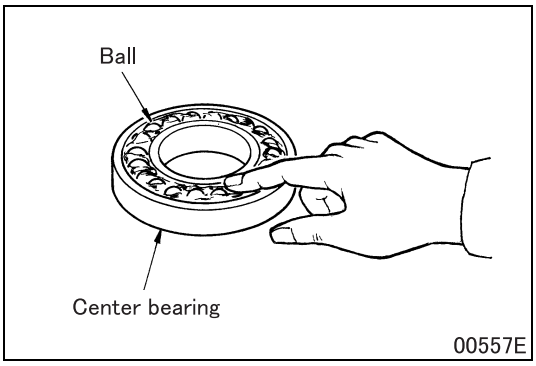
■ **Inspection: Bend of propeller shaft**

- Before measuring the bend of pipe, remove paint from the propeller shaft where the dial gauge is set and the pipe is supported with V blocks using a paint remover.
- Measure bend of propeller shaft at the center of its pipe portion.
- To measure the bend of propeller shaft, turn it fully once and read the dial gauge indicator. The bend is one half of the indicated value.
- If the measurement deviates from the standard value, correct the bend with a press or replace the propeller shaft.

CAUTION ⚠

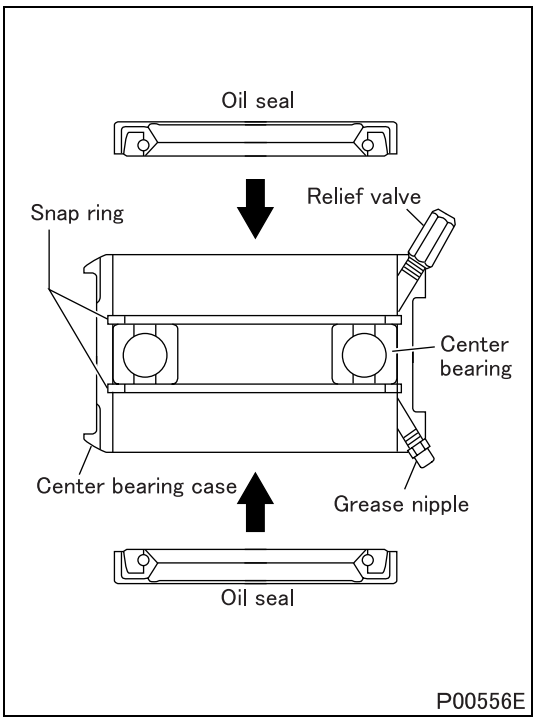
- **Remove paint using care not to damage the pipe portion of the shaft.**
- **Check the propeller shaft for cracks in the welded area after correcting the bend using a press. If a crack is caused, replace the propeller shaft instead of correcting it by welding.**

◆Installation procedure◆



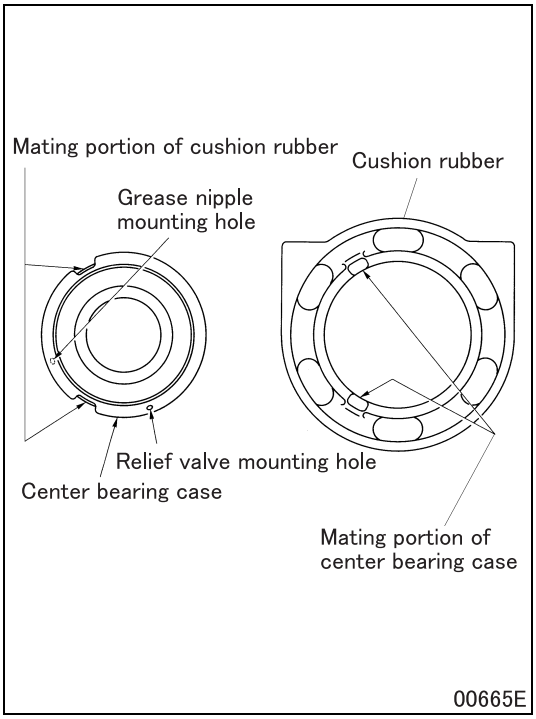
■ **Installation: Center bearing**

- Fill space between balls of the center bearing with grease.



■ **Installation: Oil seal**

- Apply grease to the oil seal lip.
- Install the oil seal in the illustrated direction, aligning it with the end face of the center bearing case.



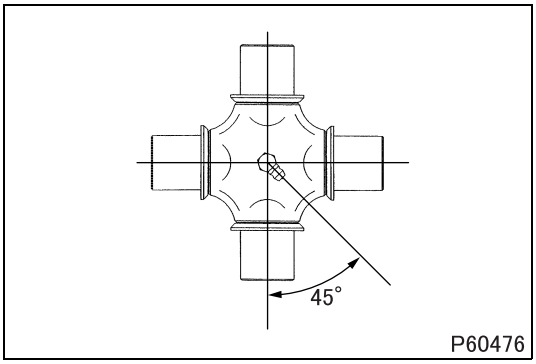
■**Installation: Cushion rubber**

- Fit the illustrated portion of the cushion rubber in the illustrated portion of the center bearing case by aligning them. If it is difficult to fit it in, apply soapy water for smooth fitting.

CAUTION ⚠

- **Grease deteriorates cushion rubber. Be sure to use soapy water.**

- Assemble the cushion rubber so that grease nipple mounting holes face downward.



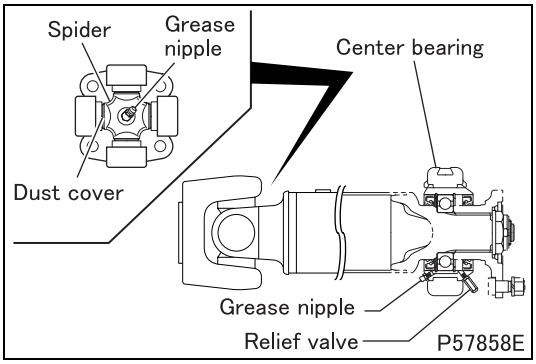
■ **Installation: Grease nipple**

- Fit grease nipple to the spider facing it in the illustrated direction.

■ **Installation: Snap ring**

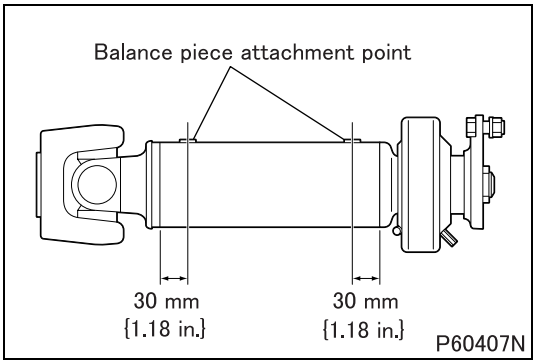
- Install the snap ring by following the removal sequence in reverse.
  (See **"■ Removal: Snap ring"**.)

◆Work after installation◆



■ **Lubrication: Grease nipple**

- Fill grease through the grease nipple until supplied grease overflows from four dust covers of the spider.
- If grease does not overflow from all of the four dust covers or rust, water and dirt come out with grease, replace the spider with the spider kit.
- Fill grease through the grease nipple until supplied grease overflows from the relief valve of the center bearing.



■**Inspection: Permissible unbalance amount of propeller shaft**

[Inspection]

- Measure the balance amount (dynamic balance) of the propeller shaft on a balancing machine.
- If the measurement deviates from the standard value, adjust the balance amount in the following procedure.

[Adjustment]

- Attach appropriate balance pieces and lock plate to the illustrated points so that the unbalance amount comes within the standard value.
- Maximum balance piece allowance for one point is 120 g {4.23 oz}.
- Use a combination that keeps the number of balance pieces to a minimum.

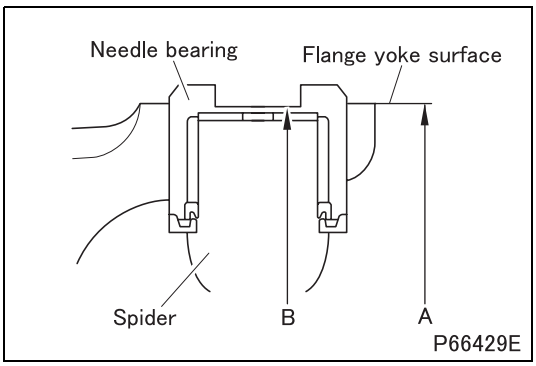
◆Work before removal◆

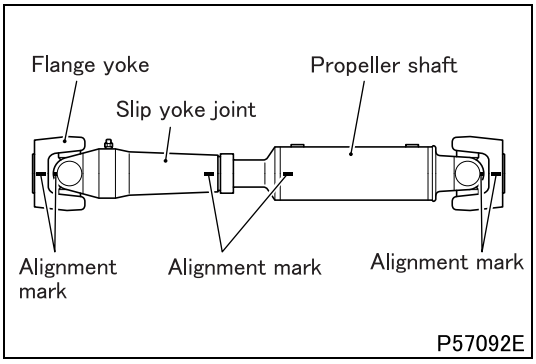


■ **Inspection: Axial clearance of spider**

- Measure the clearance of needle bearing (shim adjusting allowance= A – B).
- If the measurement exceeds the standard value, adjust the clearance by changing thickness of the shim.
  Types of shim: 0.1 mm {0.0039 in.}, 0.2 mm {0.0079 in.}

NOTE

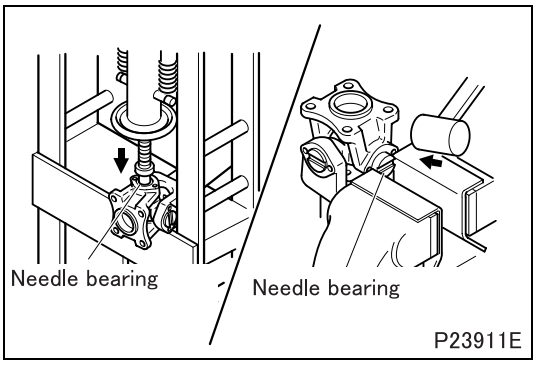
- **Never allow the shim to protrude from the flange yoke surface.**
- **Use shims for both ends with the same thickness as much as possible to ensure rotation balance.**



■ **Alignment mark: Propeller shaft**

- To prevent assembly of wrong parts, make alignment marks on flange yoke, slip yoke joint and propeller shaft.

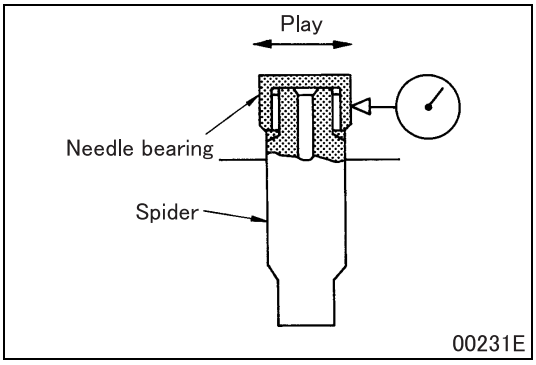
◆Removal procedure◆



■ **Removal: Needle bearing**

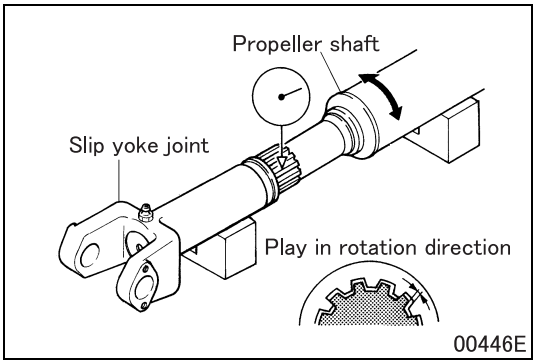
- Make alignment marks on the needle bearing and spider.
- Force out the needle bearing halfway from the yoke using a press, then remove it with a vise.

◆Inspection procedure◆



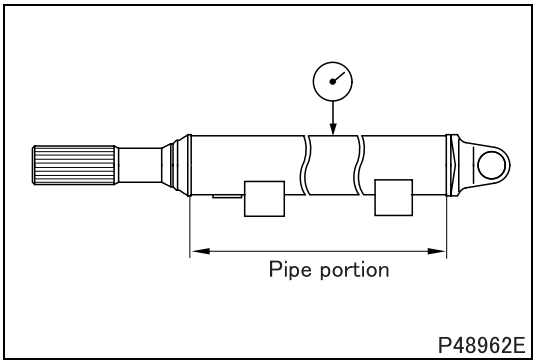
■ **Inspection: Clearance between needle bearing and spider**

- If the measurement exceeds the limit, replace with the universal joint spider kit.



■ **Inspection: Play between slip yoke joint and propeller shaft spline**

- If the measurement exceeds the limit, replace the slip yoke joint and propeller shaft in a set.



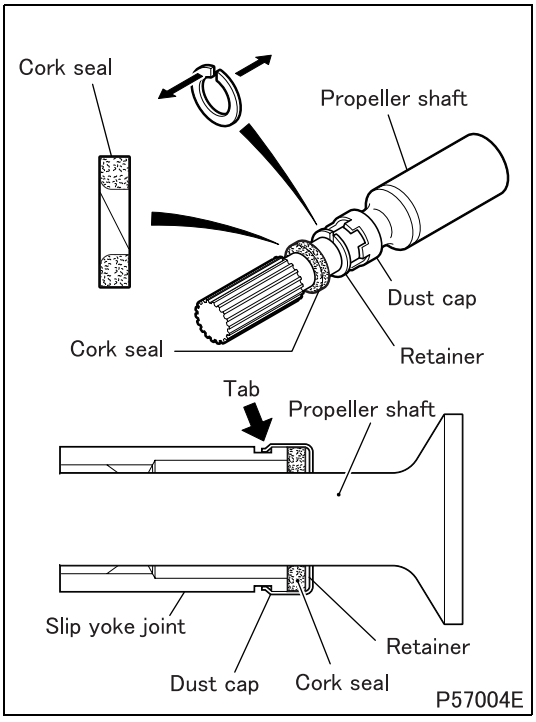
■ **Inspection: Bend of propeller shaft**

- Before measuring the bend of pipe, remove paint from the propeller shaft where the dial gauge is set and the pipe is supported with V blocks using a paint remover.
- Measure bend of propeller shaft at the center of its pipe portion.
- To measure the bend of propeller shaft, turn it fully once and read the dial gauge indicator. The bend is one half of the indicated value.
- If the measurement deviates from the standard value, correct the bend with a press or replace the propeller shaft.

CAUTION ⚠

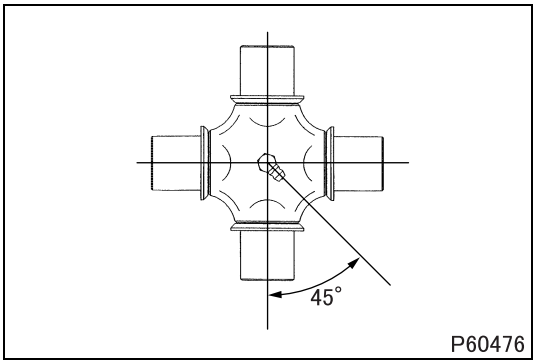
- **Remove paint using care not to damage the pipe portion of the shaft.**
- **Check the propeller shaft for cracks in the welded area after correcting the bend using a press. If a crack is caused, replace the propeller shaft instead of correcting it by welding.**

◆Installation procedure◆



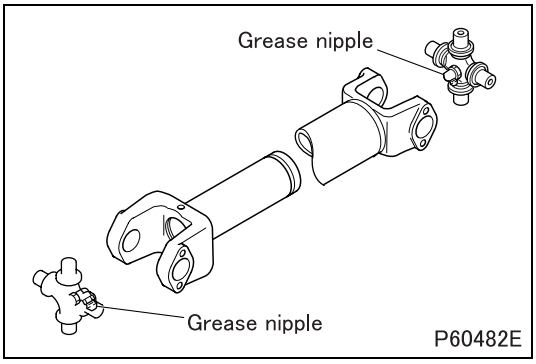
■ **Installation: Dust cap, retainer and cork seal**

- After inserting the dust cap into the propeller shaft, carefully open the retainer right and left, assemble it to the propeller shaft and return it to the original condition.
- Apply grease to the inside circumference of the cork seal and assemble it to the propeller shaft, facing it in the illustrated direction in the same method as the retainer.
- Apply sufficient grease to the splined portion of the propeller shaft, then fit the propeller shaft into the slip yoke joint.
- Press the dust cap against the slip yoke joint in such a way that the cork seal is compressed, and crimp its tabs to engage with the recesses in the slip yoke joint.

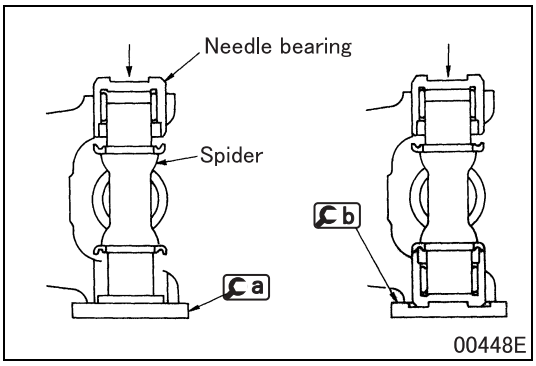


■ **Installation: Spider**

- Fit grease nipple to the spider facing it in the illustrated direction.

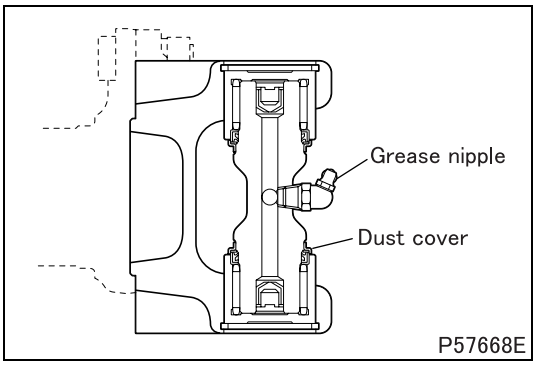


- Install spiders on both ends of the propeller shaft so that their respective grease nipple faces in the same direction.



■ **Installation: Needle bearing**

◆Work after installation◆



■ **Lubrication: Grease nipple**

- Fill grease through the grease nipple until supplied grease overflows from four dust covers of the spider.
- If grease does not overflow from all of the four dust covers or rust, water and dirt come out with grease, replace the spider with the spider kit.

■ **Inspection: Permissible unbalance amount of propeller shaft**

[Inspection]

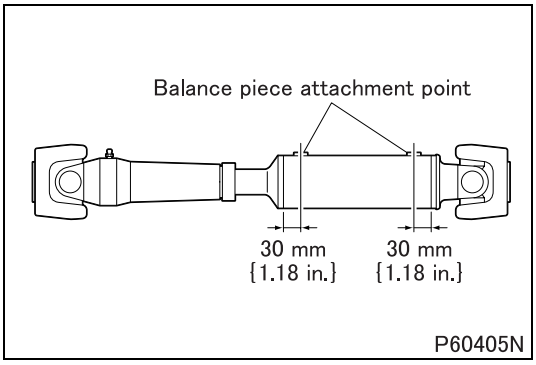
- Measure the balance amount (dynamic balance) of the propeller shaft on a balancing machine.
- If the measurement deviates from the standard value, adjust the balance amount in the following procedure.

[Adjustment]

- Dynamic balance may be corrected either by the polar coordinate method or by the 90° component of force method.

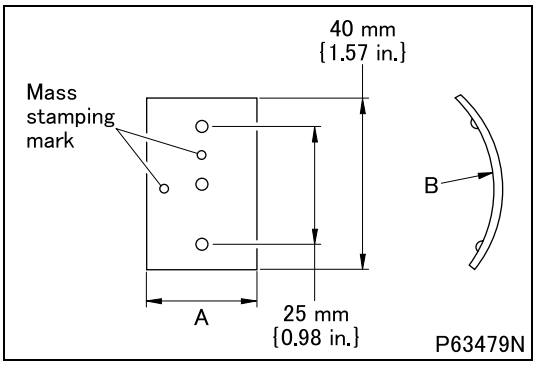
CAUTION ⚠

- The 90° component of force method is preferable for balancing the propeller shaft if the amount of imbalance is large because it requires less balance pieces.



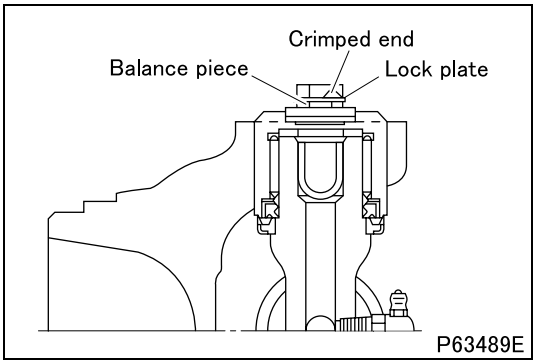
(1) Polar coordinate method

- Attach appropriate balance pieces to the illustrated points so that the unbalance amount comes within the standard value.
- Maximum balance piece allowance for one point is 120 g {4.23 oz}.
- Use a combination that keeps the number of balance pieces to a minimum.



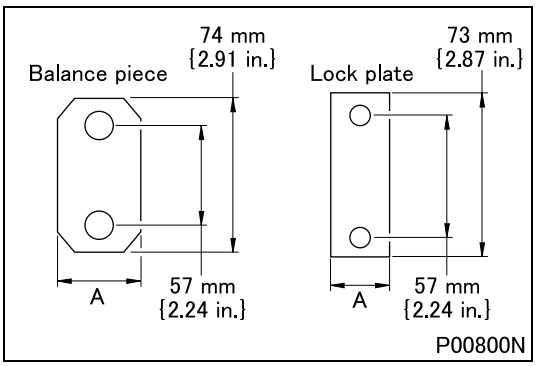
Types of balance pieces

Mass	Dimension A	Radius B of the bend	Thickness
10 g {0.35 oz}	14 mm {0.55 in.}	41.3 mm {1.63 in.}	2.3 mm {0.09 in.}
20 g {0.71 oz}	28 mm {1.10 in.}	45 mm {1.77 in.}	
40 g {1.41 oz}	55.7 mm {2.19 in.}		
60 g {2.12 oz}	83.5 mm {3.29 in.}		



(2) 90° component of force method

- Attach appropriate balance pieces and lock plate to the illustrated points so that the unbalance amount comes within the standard value.
- Maximum balance piece allowance for one point is 120 g {4.23 oz}.
- Use a combination that keeps the number of balance pieces to a minimum.



- Types of lock plate and balance pieces

Part name	Mass	Dimension A	Thickness
Lock plate	8 g {0.28 oz}	18 mm {0.71 in.}	0.8 mm {0.031 in.}
Balance piece	20 g {0.71 oz}	25 mm {0.98 in.}	1.6 mm {0.063 in.}
Balance piece	35 g {1.23 oz}	21.6 mm {0.85 in.}	3.2 mm {0.13 in.}
Balance piece	50 g {1.76 oz}	32.2 mm {1.27 in.}	3.2 mm {0.13 in.}

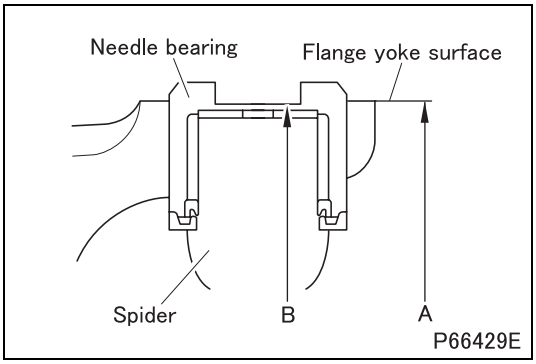
◆Work before removal◆

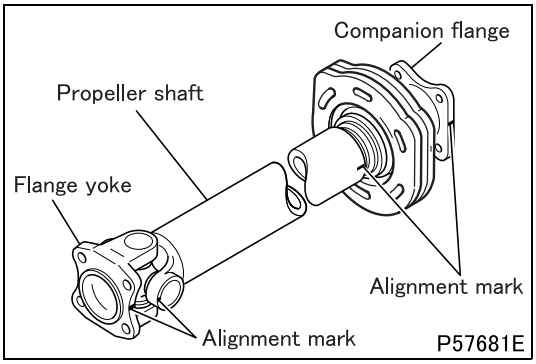


■ **Inspection: Axial clearance of spider**

- Measure the clearance of needle bearing (shim adjusting allowance= A – B).
- If the measurement exceeds the standard value, adjust the clearance by changing thickness of the shim.
  Types of shim: 0.1 mm {0.0039 in.}, 0.2 mm {0.0079 in.}

NOTE

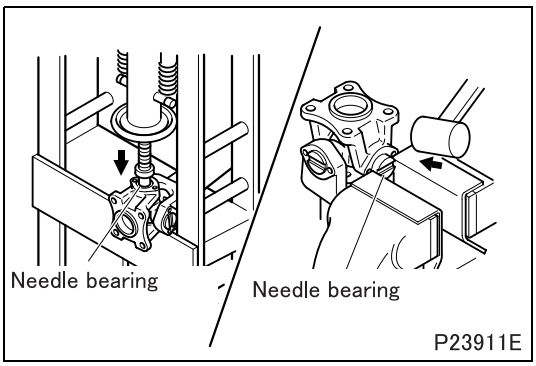
- **Never allow the shim to protrude from the flange yoke surface.**
- **Use shims for both ends with the same thickness as much as possible to ensure rotation balance.**



■ **Alignment mark: Propeller shaft**

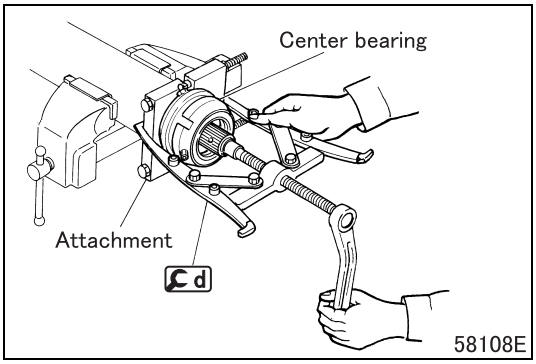
- To prevent assembly of wrong parts, make alignment marks on flange yoke, companion flange and propeller shaft.

◆Removal procedure◆



■ **Removal: Needle bearing**

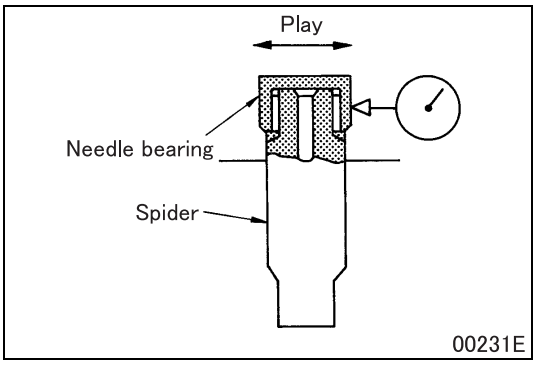
- Make alignment marks on the needle bearing and spider.
- Force out the needle bearing halfway from the yoke using a press, then remove it with a vise.



■ **Removal: Center bearing**

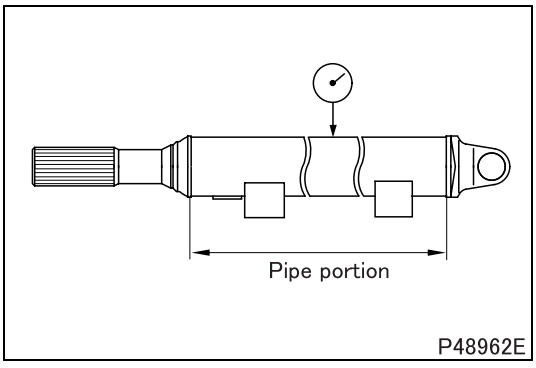
- Using d, remove the center bearing with the aid of the attachment.

◆Inspection procedure◆



■ **Inspection: Clearance between needle bearing and spider**

- If the measurement is higher than the limit, replace with the universal joint spider kit.



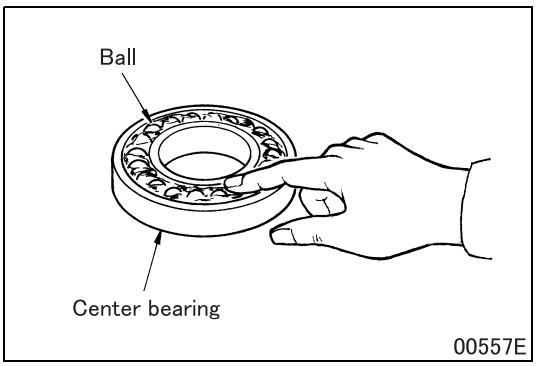
■ **Inspection: Bend of propeller shaft**

- Before measuring the bend of pipe, remove paint from the propeller shaft where the dial gauge is set and the pipe is supported with V blocks using a paint remover.
- Measure bend of propeller shaft at the center of its pipe portion.
- To measure the bend of propeller shaft, turn it fully once and read the dial gauge indicator. The bend is one half of the indicated value.
- If the measurement deviates from the standard value, correct the bend with a press or replace the propeller shaft.

CAUTION ⚠

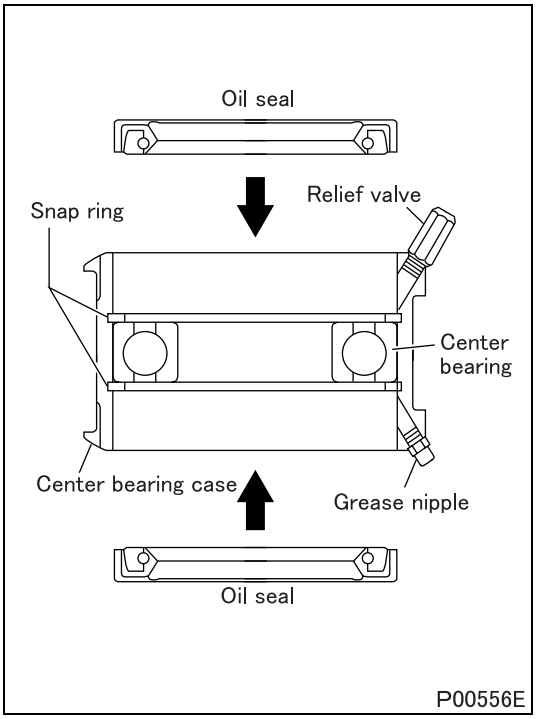
- **Remove paint using care not to damage the pipe portion of the shaft.**
- **Check the propeller shaft for cracks in the welded area after correcting the bend using a press. If a crack is caused, replace the propeller shaft instead of correcting it by welding.**

◆Installation procedure◆



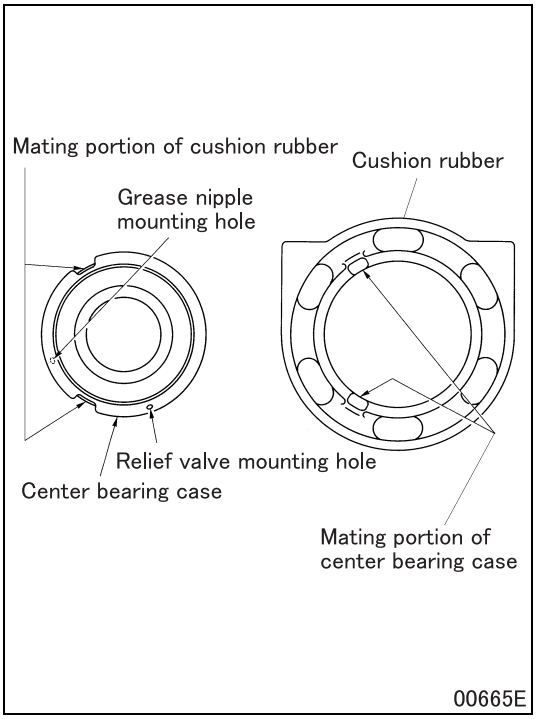
■ **Installation: Center bearing**

- Fill space between balls of the center bearing with grease.



■ **Installation: Oil seal**

- Apply grease to the oil seal lip.
- Install the oil seal in the illustrated direction, aligning it with the end face of the center bearing case.



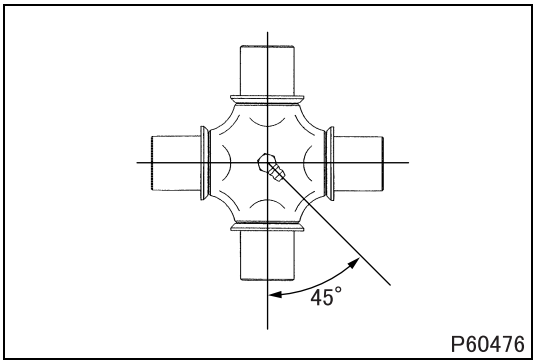
■ **Installation: Cushion rubber**

- Fit the illustrated portion of the cushion rubber in the illustrated portion of the center bearing case by aligning them. If it is difficult to fit it in, apply soapy water for smooth fitting.

CAUTION ⚠

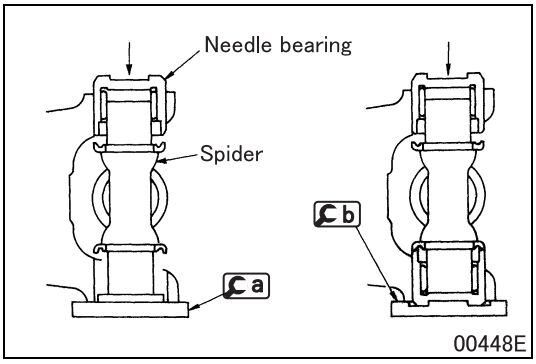
- **Grease deteriorates cushion rubber. Be sure to use soapy water.**

- Assemble the cushion rubber so that grease nipple mounting holes face downward.



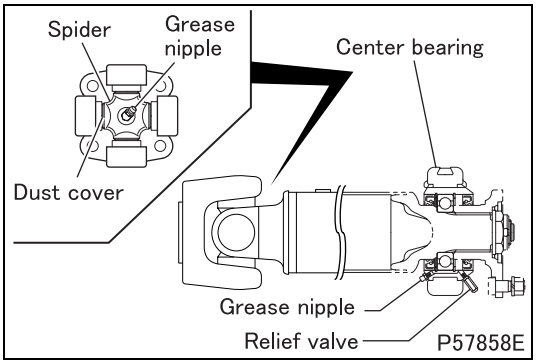
■ **Installation: Grease nipple**

- Fit grease nipple to the spider facing it in the illustrated direction.



■ **Installation: Needle bearing**

◆Work after installation◆



■ **Lubrication: Grease nipple**

- Fill grease through the grease nipple until supplied grease overflows from four dust covers of the spider.
- If grease does not overflow from all of the four dust covers or rust, water and dirt come out with grease, replace the spider with the spider kit.
- Fill grease through the grease nipple until supplied grease overflows from the relief valve of the center bearing.

■ **Inspection: Permissible unbalance amount of propeller shaft**

[Inspection]

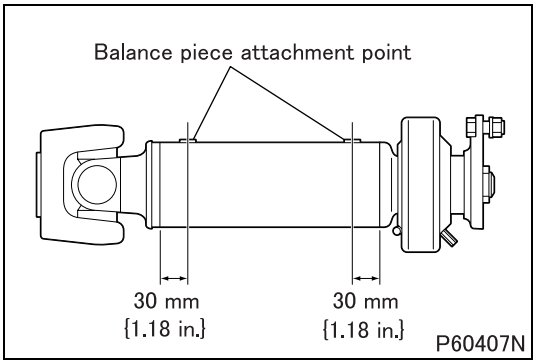
- Measure the balance amount (dynamic balance) of the propeller shaft on a balancing machine.
- If the measurement deviates from the standard value, adjust the balance amount in the following procedure.

[Adjustment]

- Dynamic balance may be corrected either by the polar coordinate method or by the 90° component of force method.

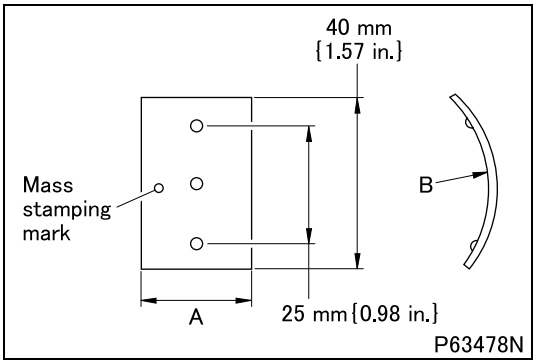
CAUTION ⚠

- **The 90° component of force method is preferable for balancing the propeller shaft if the amount of imbalance is large because it requires less balance pieces.**
- **Use the polar coordinate method for balance correction on the center bearing-installed side of propeller shaft.**



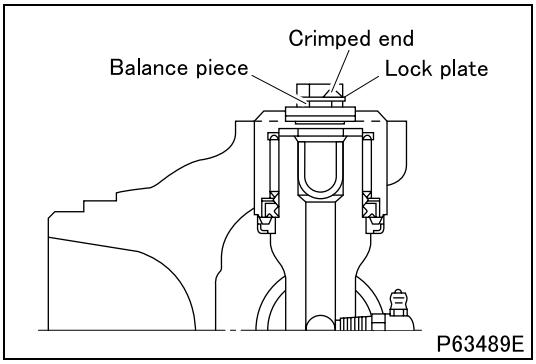
(1) Polar coordinate method

- Attach appropriate balance pieces and lock plate to the illustrated points so that the unbalance amount comes within the standard value.
- Maximum balance piece allowance for one point is 120 g {4.23 oz}.
- Use a combination that keeps the number of balance pieces to a minimum.



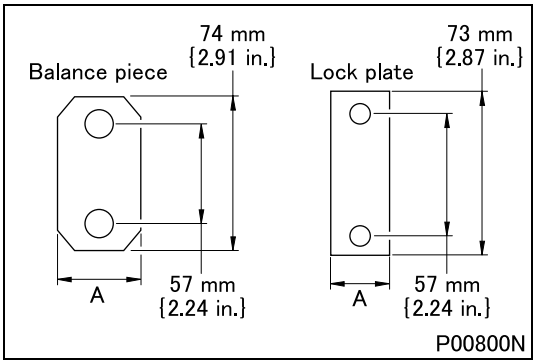
Types of balance pieces

Mass	Dimension A	Radius B of the bend	Thickness
10 g {0.35 oz}	14 mm {0.55 in.}	41.3 mm {1.63 in.}	2.3 mm {0.091 in.}
20 g {0.71 oz}	28 mm {1.10 in.}	45 mm {1.77 in.}	
40 g {1.41 oz}	55.7 mm {2.19 in.}		
60 g {2.12 oz}	83.5 mm {3.29 in.}		



(2) 90° component of force method

- Attach appropriate balance pieces and lock plate to the illustrated points so that the unbalance amount comes within the standard value.
- Maximum balance piece allowance for one point is 120 g {4.23 oz}.
- Use a combination that keeps the number of balance pieces to a minimum.



- Types of lock plate and balance pieces

Part name	Mass	Dimension A	Thickness
Lock plate	8 g {0.28 oz}	18 mm {0.71 in.}	0.8 mm {0.031 in.}
Balance piece	20 g {0.71 oz}	25 mm {0.98 in.}	1.6 mm {0.063 in.}
Balance piece	35 g {1.23 oz}	21.6 mm {0.85 in.}	3.2 mm {0.13 in.}
Balance piece	50 g {1.76 oz}	32.2 mm {1.27 in.}	3.2 mm {0.13 in.}

	Handling of tires inadequate								O	

M E M O

ON-VEHICLE INSPECTION AND ADJUSTMENT

1. Inspection and Adjustment of Wheel Alignment

Before performing inspection and adjustment of wheel alignment, set the vehicle to the following condition.

- Park the vehicle unloaded on a level place.
- The vehicle needs to be equipped with proper size tires.
- If the wear condition of tires on the right is remarkably different from that of tires on the left, replace tires.
- Tires need inflation to specified pressure.
- Correct if the vehicle tilts due to faulty suspension.
- Service all parts of the front axle and ensure that there is no fault such as the following.
  - Play at or loose kingpin
  - Loose front wheel hub
  - Loose bolts used for tightening various parts of tie rod arm, knuckle arm and tie rod
  - Bend of knuckle and front axle
- Adjust play at steering wheel properly.
- For wheel alignment, which is related to the side slip amount, both wheel alignment and the side slip amount must conform to the standard values.

Service standards (Unit: mm {in.})

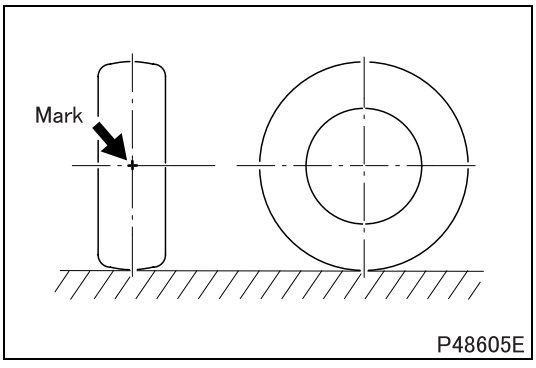
Location	Maintenance item	Standard value	Limit	Remedy
–	Toe-in	1 to 3 {0.039 to 0.12}	–	Adjust
	Camber	1°30' ± 1°00'	–	Replace
	Caster	2°30' $^{+1°30'}_{-1°00'}$	–	Replace
	Kingpin inclination angle	7° ± 30'	–	Replace

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
–	Nut (tie rod end clamp tightening)	82 ± 8 {60 ± 5.9, 8.4 ± 0.8}	Wet

Lubricant and/or sealant

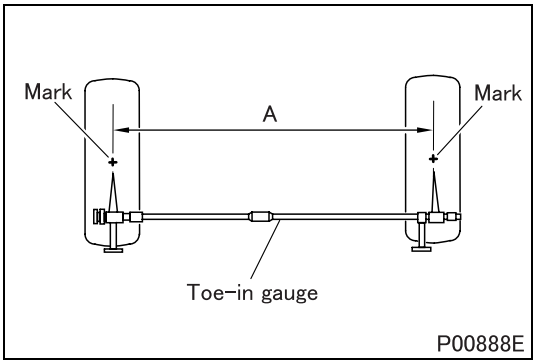
Mark	Points of application	Specified lubricant and/or sealant	Quantity
–	Clamp nut thread of tie rod end	Chassis grease [NLGI No.1 (Li soap)]	As required



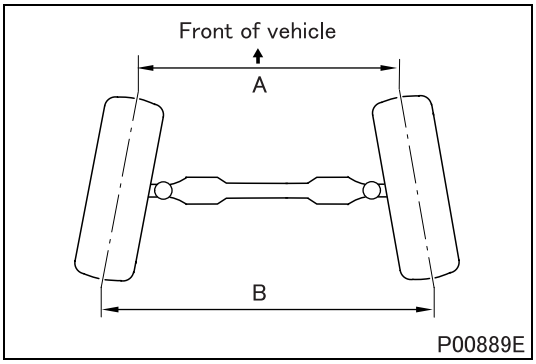
1.1 Inspection and adjustment of toe-in

[Inspection]

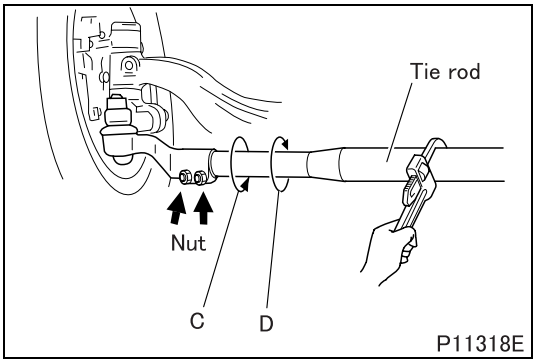
- Direct the front wheels exactly to forward running position.
- Put a mark on both the right and left tires at the height of the front wheel axis in the center of the tire width.



- Align the two points of the toe-in gauge with respective marks and measure distance A between the marks.

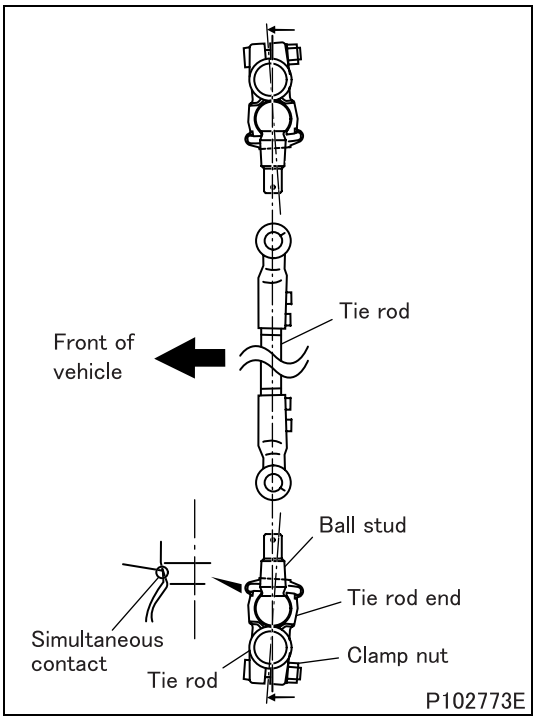


- Push the vehicle to roll the tires 180 degrees.
- Measure distance B between the marks that have moved to the rear of the vehicle.
- If toe-in (difference between A and B) deviates from the standard value, adjust.

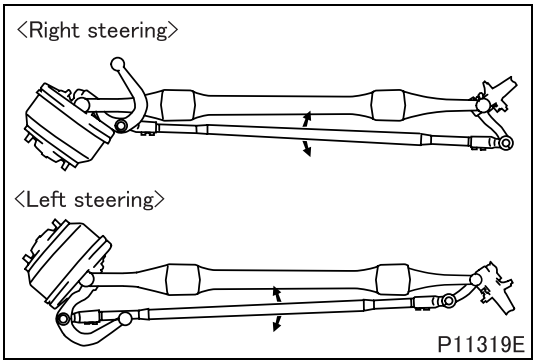


[Adjustment]

★ • Loosen the right and left nuts of tie rod.
- Turn the tie rod with a pipe wrench to adjust the toe-in.
  C: When adjusting to the toe-out direction
  D: When adjusting to the toe-in direction
- After adjustment, apply grease to the nut and tighten it to the specified torque.



- Hold down the tie rod toward the front or rear of the vehicle with the front wheels directed to forward running position so that the right and left tie rod ends are in contact with the ball studs at the same time.
- In this state adjust the toe-in and tighten the clamp nut to secure the tie rod end.

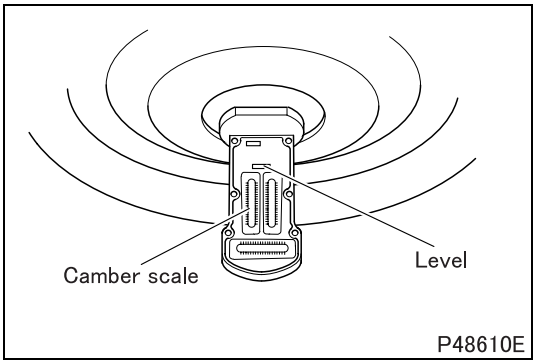


- After adjustment, turn the steering wheel to the extreme left (the state in which the knuckle stopper bolt is contacted), and move the tie rod in the longitudinal direction of the vehicle by hand to make sure that the tie rod moves.
  Do the same for right steering.
  (If the tie rod swings, the tie rod ends should be in contact with the ball studs at the same time.)

WARNING ⚠

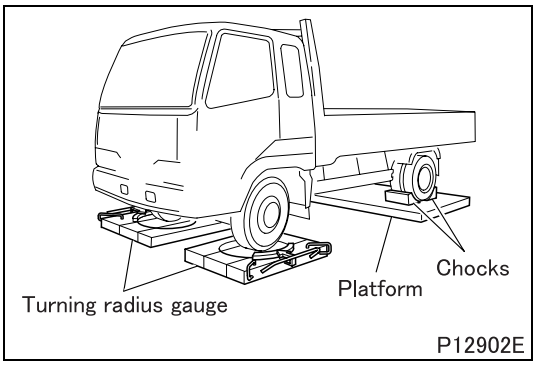
- **Be very careful that your hand, or anything else, is not caught due to the movement of the tie rod when the steering wheel is turned left and right.**

- If the tie rod does not swing, repeat the work from the item marked with ★.



1.2 Inspection of camber

- Direct the front wheels exactly to forward running position.
- Remove the wheel hub cap.
- Wipe off grease from the knuckle end, and bring the camber/caster/kingpin gauge into intimate contact with the front wheel hub.
- Place the level so that the bubble remains in the middle, and read center of bubbles on camber scale in this state to find the camber. Do the same for the right and left front tires.
- If the measured value deviates from the standard value, abnormalities such as wear of kingpin and bushing, loose hub bearing, and bend of knuckle and front axle are suspected. Inspect each part and replace defective parts.



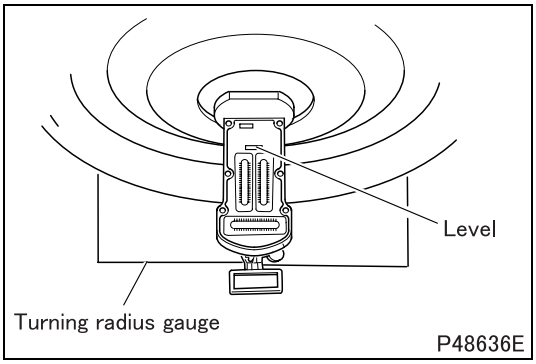
1.3 Inspection of caster and kingpin inclination angle

- Prepare a platform with the same height as the turning radius gauge and place it under the rear wheels so that the vehicle may be placed level.
- Apply chocks to the rear wheels.

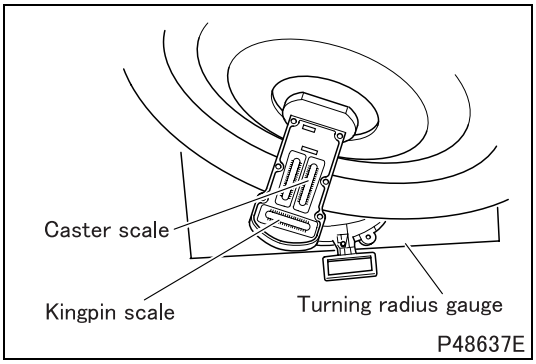
WARNING ⚠

- **Do not remove chocks until the entire operation is completed.**

- Keep the turning radius gauge locked.
- Jack up the vehicle and set the right and left front wheels so that respective ground contact area centers of the two wheels and turn table centers may meet.



- Unfasten locking of the turning radius gauge, and set the scale to 0 degrees.
- As with the camber measurement in Section **1.2**, attach the camber/caster/kingpin gauge and set the level so that the bubble remains in the middle.



- Apply brake pedal, and with brake applied to the front wheels, turn steering wheel slowly from the point of 0 degrees on the turning radius gauge until the direction is changed by 20 degrees to the right side in the case of the right front wheel and to 20 degrees to the case of the left front wheel.

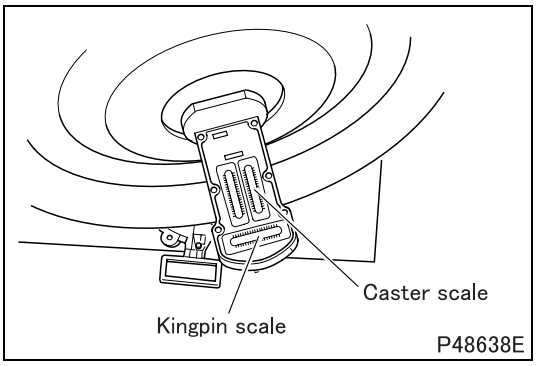
NOTE

- **It is not possible to make exact measurements unless the brake remains applied, otherwise the wheels will turn slightly.**

- After setting the steering at 20 degrees, set the caster scale and the center of the bubble of the kingpin scale to 0 degrees by turning the adjuster.

NOTE

- **Pay attention to the kingpin scale because it has scales for right and left: align the right kingpin scale in the case of the right front wheel, and left kingpin scale in the case of the left front wheel.**



- Reverse this position, turn the steering wheel slowly until the direction of the front wheels changes by 20 degrees in the opposite direction.
- Read the center of the bubbles at this position of the caster scale and kingpin scale to find caster and kingpin inclination angles.
- If the measured value deviates from the standard value, abnormalities such as wear of kingpin and bushing, loose hub bearing, and bend of knuckle and front axle are suspected. Inspect each part and replace defective parts.

2. Inspection and Adjustment of Steering Angle

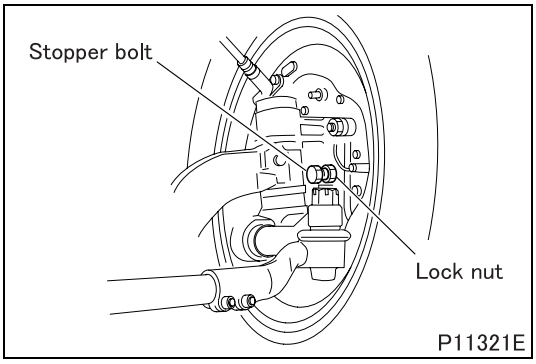
- Perform steering angle inspection and adjustment only after wheel alignment inspection and adjustment has been completed.

Service standards

Location	Maintenance item		Standard value	Limit	Remedy
–	Steering angle	Inside (outside steering angle is for reference only)	51° (38°)	–	Adjust

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
–	Lock nut (knuckle stopper bolt tightening)	71 ± 12 {52 ± 8.9, 7.2 ± 1.2}	–



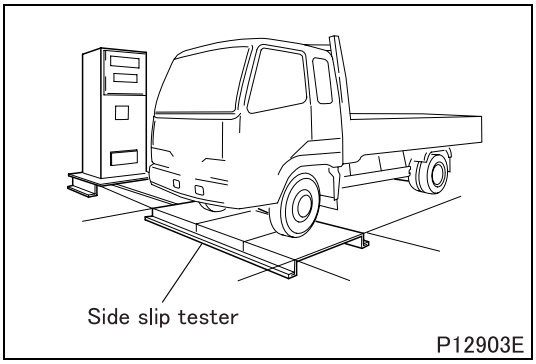
- Set the turning radius gauge and a platform on the vehicle in the same manner as in the case of the caster and kingpin inclination angle measurement performed in Section **1.3**.
- Turn the steering wheel right or left completely from the position where the turning radius gauge is set to 0 degrees, and read the scale of the turning radius gauge to measure the steering angle.
- If the measured value deviates from the standard value, adjust with the knuckle stopper bolt and tighten the lock nut to the specified torque.

3. Inspection of Side Slip

- Perform side slip inspection only after wheel alignment inspection and adjustment has been completed.
- For the side slip amount, which is related to wheel alignment, both the side slip amount and wheel alignment must conform to the standard values.

Service standards (Unit: mm {in.})

Location	Maintenance item	Standard value	Limit	Remedy
–	Side slip amount (per 1 m {3.3 ft.})	3 {0.12} or less	–	Adjust



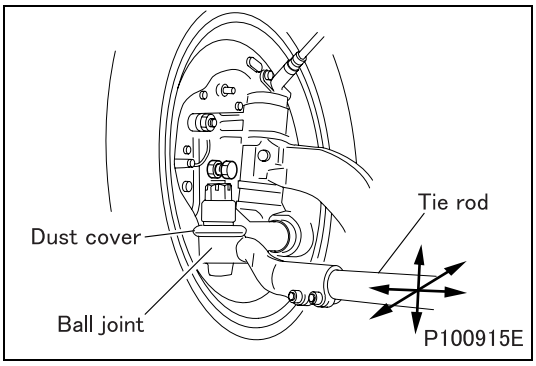
- Set the front wheels exactly to forward running position.
- Move the vehicle forward past the side slip tester as slowly as possible to inspect side slip.

NOTE

- **Pay attention to the following when moving over the side slip tester.**
- **Be sure to hold steering exactly at the forward running position, and make no turn.**
- **Do not apply brake.**
- **Keep the speed constant.**

- If the measured value deviates from the standard value, inspect and adjust wheel alignment.

4. Inspection of Tie Rod End Ball Joint



(1) Play

- Hold the tie rod section of the tie rod with the vehicle kept stationary, and move it in the back-and-forth, up-and-down and right-and-left directions to check for play at ball joints of the tie rod end.

NOTE

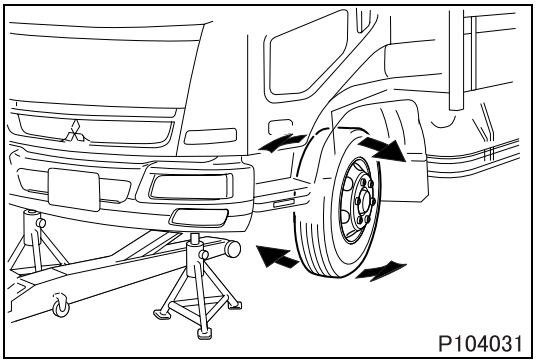
- **Be sure to check for play at ball joints of both right and left sides of the tie rod.**

- If there is play, replace the tie rod end of the tie rod.

(2) Dust cover

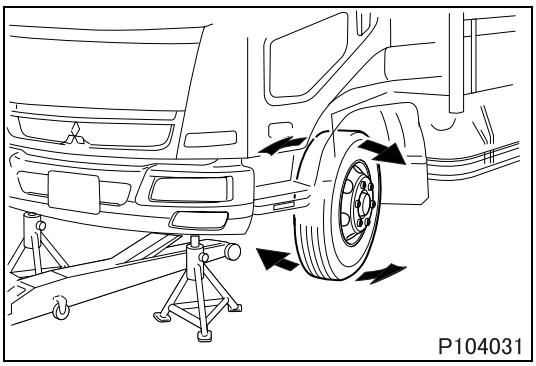
- Check that there are no wear, cracks or damage. Their abnormalities can cause water to enter the ball joint, resulting in premature wear.
- If wear, crack, or damage is present, inspect traces of water entry and occurrence of rust in the ball joint. If any abnormality is found, replace the tie rod end. If no abnormality is found, replace the dust cover and reapply grease.

5. Inspection of Wheel Bearing for Play



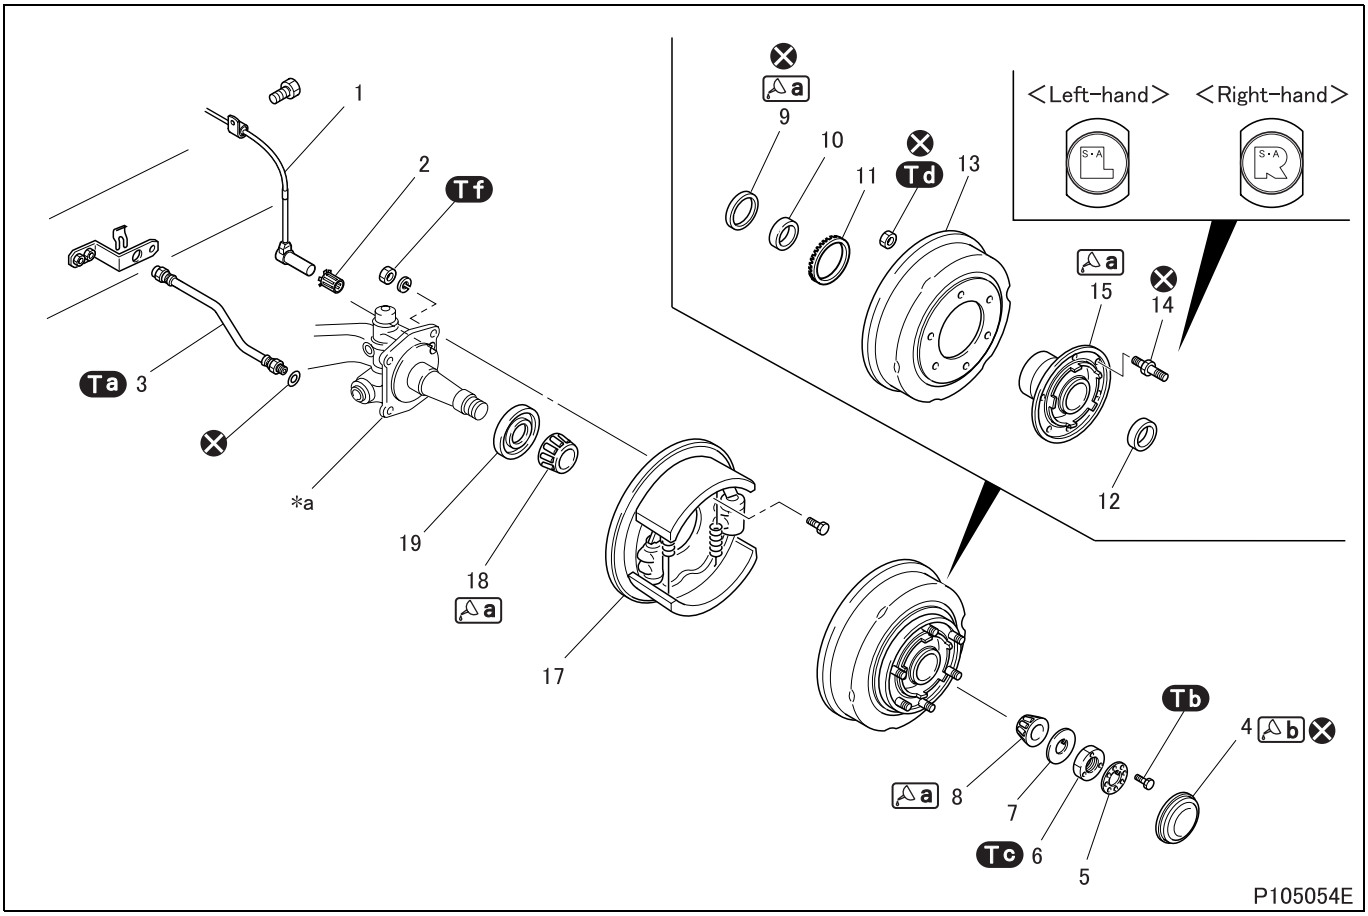
- Jack up the vehicle.
- Try to move the top and bottom of the front tire by hands in the illustrated directions to inspect the wheel bearing for play.
- If play is found with the feel of hands, repeat the inspection procedure while having the brake pedal pressed by another personnel. When the play is removed by operating the brake pedal, the symptom indicates that there is play in the wheel bearing, not in the suspension or other related parts. Then inspect the turning torque of the wheel bearing and adjust it as required. (See WHEEL HUB AND BRAKE DRUM or WHEEL HUB AND ROTOR.)
- If the turning torque of the wheel bearing cannot be adjusted correctly or the play still remains after the adjustment, replace the wheel bearing with a new one. (See WHEEL HUB AND BRAKE DRUM or WHEEL HUB AND ROTOR.)

6. Inspection of Knuckle Joint for Play



- Jack up the vehicle.
- Try to move the top and bottom of the front tire by hands in the illustrated directions to inspect the knuckle joint for play.
- If play is found with the feel of hands, repeat the inspection procedure while having the brake pedal pressed by another personnel. If there is any play, it may be caused by the play in the knuckle joint. Check each part and replace a defective part. (See KNUCKLE AND KING PIN, FRONT AXLE.)

WHEEL HUB AND BRAKE DRUM



● **Disassembly sequence**

1 Wheel speed sensor
2 Spring spacer
3 Brake hose
4 Wheel hub cap
5 Lock plate
6 Lock nut
7 Lock washer
8 Outer bearing inner race
9 Oil seal
10 Inner bearing outer race
11 Anti-lock brake system rotor
12 Outer bearing outer race
13 Brake drum
14 Hub bolt
15 Wheel hub
16 Front drum brake (See Gr35A.)
17 Inner bearing inner race
18 Oil seal retainer

***a**: Knuckle
⊗: Non-reusable parts

CAUTION ⚠

- **Plug the brake hose to prevent entry of dust and dirt after it has been removed.**
- **Store the wheel speed sensor so that its end is not damaged after it has been removed.**

NOTE

- **Do not remove the anti-lock brake system rotor unless replacing it.**
- **Do not disassemble the brake drum and wheel hub unless replacing them.**

● **Assembly sequence**

Follow the disassembly sequence in reverse.

CAUTION ⚠

- **Make sure that the brake hose is not twisted when installing it.**
- **Make sure that the brake lining surface and inner surface of the brake drum of the wheel hub and brake drum are free from grease to avoid malfunction of brakes.**
- **Make sure that the anti-lock brake system rotor and oil seal are not damaged when installing the wheel hub and brake drum on the knuckle.**
- **Adjust brake shoe clearance after assembly. (See Gr35A.)**
- **Bleed air in the brake system after assembly to avoid malfunction of brakes. (See Gr35A.)**

Service standards (Unit: mm {in.})

Location	Maintenance item		Standard value	Limit	Remedy
–	Starting torque of wheel hub bearing (tangential force at hub bolt position with oil seal assembled)		1.0 to 3.9 N·m {0.72 to 2.89 ft.lbs, 0.1 to 0.4 kgf·m} (tangential force: 9 to 35 N {1.98 to 7.94 lbs, 0.9 to 3.6 kgf})	–	Adjust or replace
11	Anti-lock brake system rotor shakes (Assemble it into wheel hub to measure.)		0.05 {0.0020} or less	0.1 {0.0039}	Replace
13	Brake drum	Inside diameter	320 {12.59}	322 {12.67} ※ 321 {12.63}	Correct or replace
		Cylindricity	0.05 {0.0020}	0.2 {0.0079}	

※: Shows the correction limit value.

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Brake hose	21 to 30 {15 to 22, 2.1 to 3.1}	–
Tb	Bolt (lock plate mounting)	7 to 11 {5.1 to 8, 0.7 to 1.1}	–
Tc	Lock nut	200 {145, 20}	Back-off angle 30° (1/12 of a turn)
Td	Nut (brake drum and wheel hub mounting)	322 {235, 32.8}	–
Tf	Nut (front drum brake mounting)	135 {100, 13.8}	–

Lubricant and/or sealant

Mark	Points of application		Specified lubricant and/or sealant	Quantity	
a	Pack space between rollers of bearing inner race		Wheel bearing grease [NLGI No. 2 (Li soap)]	As required	
	Lip area of oil seal				
	Pack inside of wheel hub	Wheel hub body		300 g {11 oz} ※1	Total 395 ± 20 g {14 ± 0.7 oz} ※1
		Around outer bearing		95 g {3.4 oz} ※2	
	Spindle of knuckle			95 g {3.4 oz} ※2	
	Pack outside of wheel hub (wheel cap side)			150 ± 10 g {5.3 ± 0.35 oz} ※1	
b	Wheel hub cap fitting area with wheel hub		Loctite 962T	As required	

※1: For a wheel

※2: For a wheel, either outer bearing neighborhood or knuckle spindle part

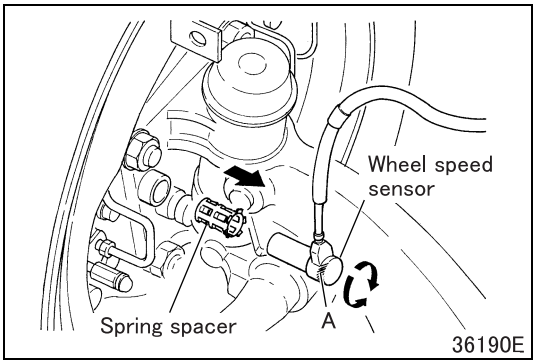
◆Removal procedure◆



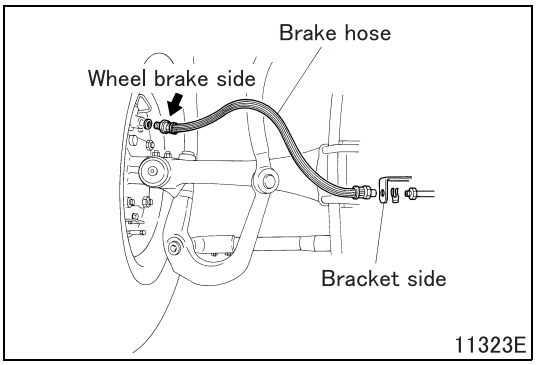
36190E

■ Removal: Wheel speed sensor and spring spacer

- Pinch diagonally shaded area A of the wheel speed sensor with pliers and remove it while turning it a little.

CAUTION ⚠

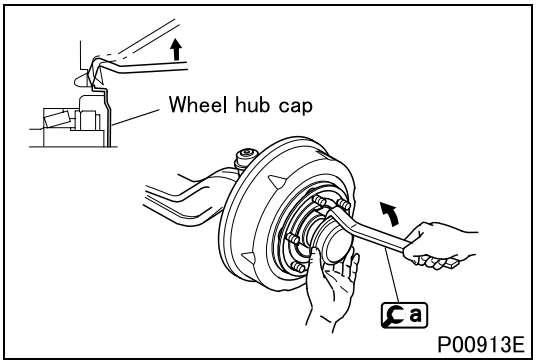
- **When pinching the wheel speed sensor with pliers, do not pinch other areas than the diagonally shaded area.**
- **When removing the wheel speed sensor, never apply excessive force to the sensor, such as hitting with a hammer, prying with a screwdriver or pulling the harness, since these actions can result in the breaking of wire.**
- **If the wheel speed sensor can be removed easily, replace the spring spacer.**



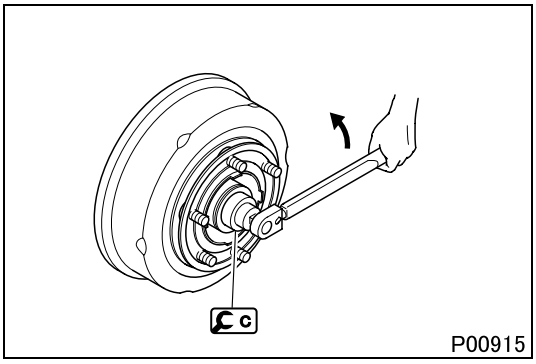
11323E

■ Removal: Brake hose

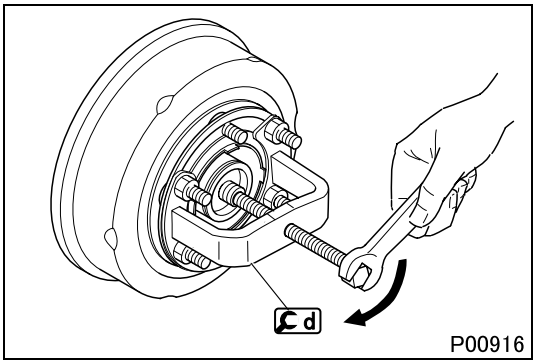
- When removing the brake hose, remove it from the bracket side (frame side) first, and then from the wheel brake side.



■ **Removal: Wheel hub cap**

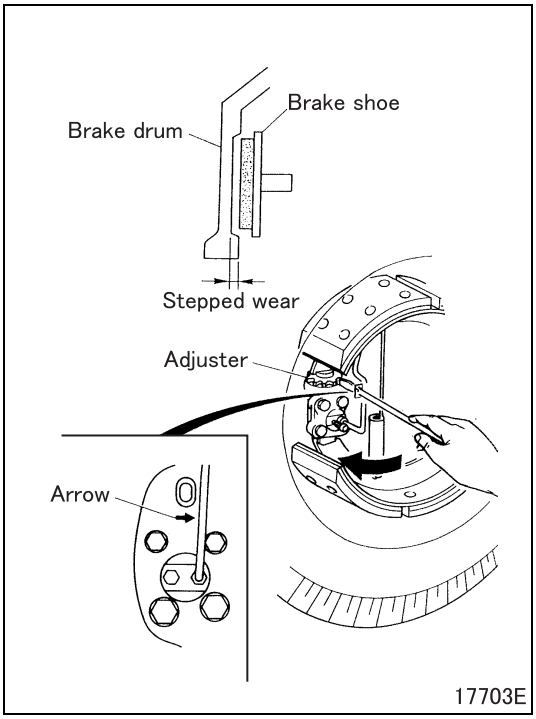


■ **Removal: Lock nut**

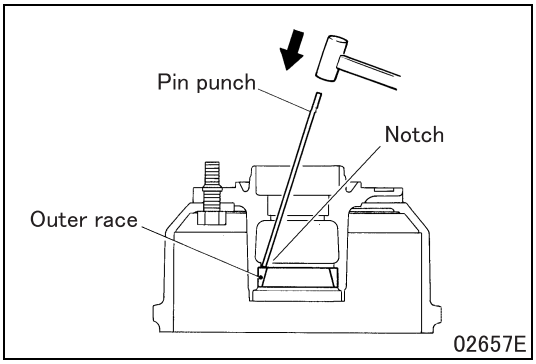


■ **Removal: Wheel hub and brake drum**

- If the brake drum has stepped wear and the wear prevents the wheel hub and brake drum from being removed, the removal can still be effected by taking the following procedure. After the removal, correct or replace the brake drum.

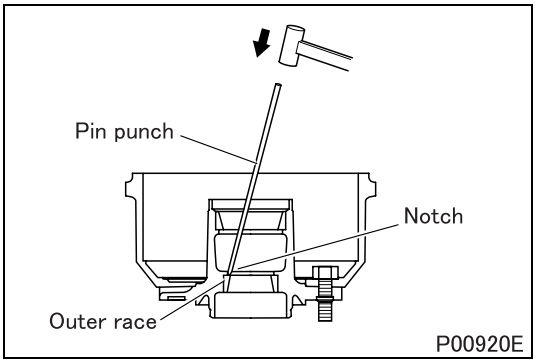


- Turn the adjuster from the adjusting hole in the opposite direction to the arrow on the backing plate to increase the clearance between the brake drum and the brake shoe. Then, remove the wheel hub and brake drum assembly.



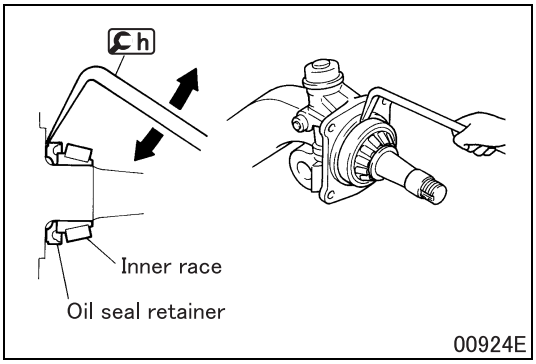
■ **Removal: Inner bearing outer race**

- Drive out the inner bearing outer race by tapping evenly at two notches in the wheel hub.



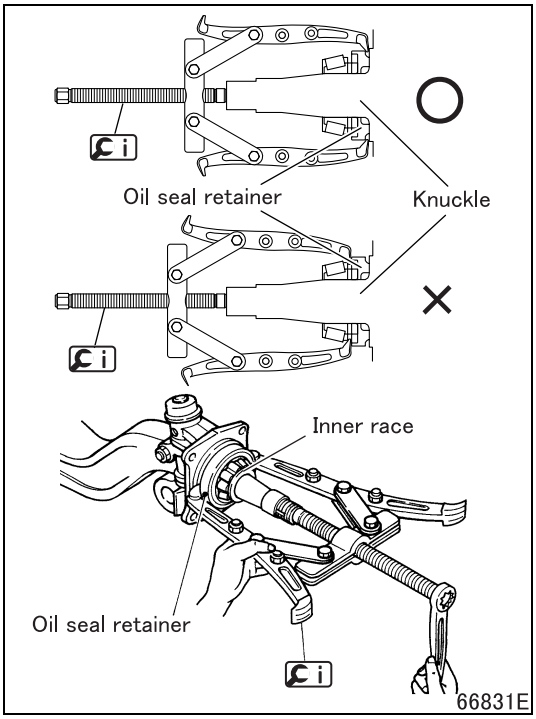
■ **Removal: Outer bearing outer race**

- Drive out the outer bearing outer race by tapping evenly at two notches in the wheel hub.



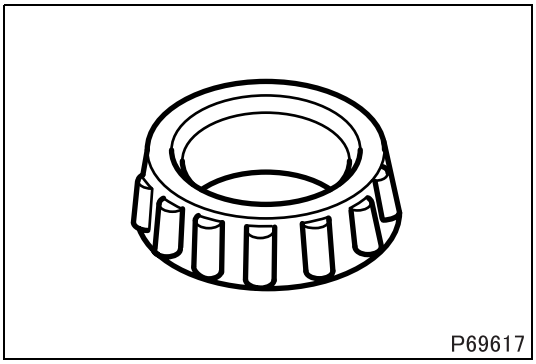
■ **Removal: Inner bearing inner race and oil seal retainer**

- Pry the oil seal retainer using h to open the clearance.



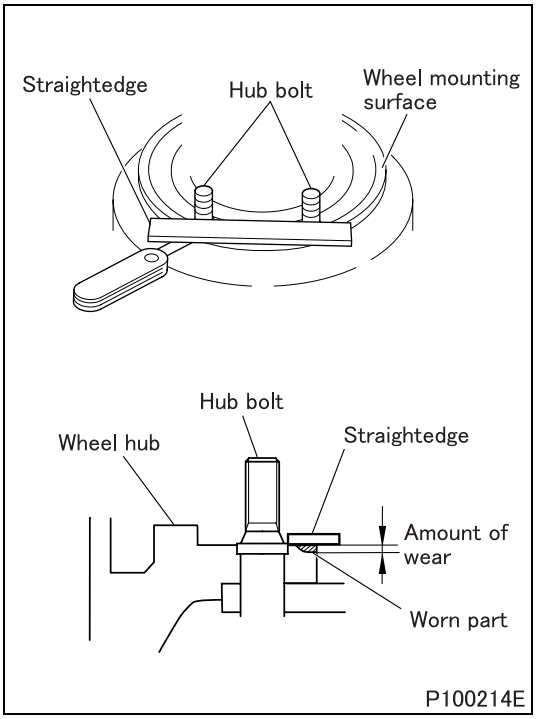
- Hook the claw of i to the clearance between the knuckle and oil seal retainer to remove.

◆Inspection procedure◆



■ **Inspection: Outer bearing inner race**

- Inspect the outer bearing inner race after cleaning the bearing to remove grease completely.
- If any damage, wear, or poor rotating condition is evident in the inner race, replace it with a new one.
- The inner race and the outer race should be replaced as a set.



■ **Inspection: Wheel hub**

(1) Visual inspection

- Check the disc wheel mounting surface of the wheel hub by watching and touching. If there is damage or crack on it, replace the wheel hub.
- Make sure that there is not rust, dust, paint or foreign body on the disc wheel mounting surface of the wheel hub to prevent the wheel nut to loosen.
- If any abnormality is found, remove it with sandpaper.

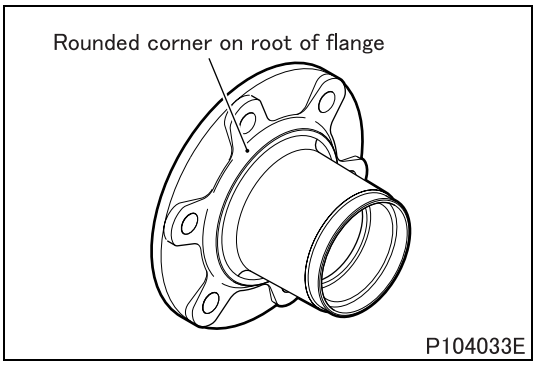
(2) Wear in disc wheel mounting part of wheel hub

- Clean the wheel mounting surface of the wheel hub before inspection.
- Place a straightedge on the hub so as to contact to the two hub bolts on the disc wheel mounting surface.

CAUTION ⚠

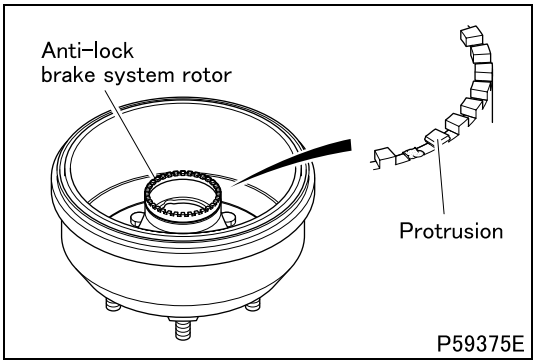
- **Make sure that the straightedge does not run onto the hub bolt.**

- Using feeler gauges to measure the amount of wear at the outer periphery of the wheel hub.
  Measure the amount of wear in the area of every hub bolt.
- If the amount of wear at any point exceeds the following standard value, inspect the crack check of wheel hub.
  Wear standard value: 0.8 mm {0.031 in.}



(3) Crack check

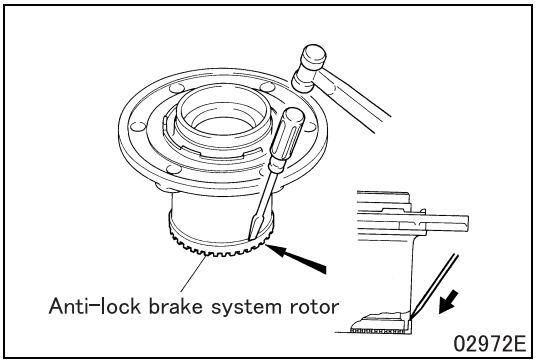
- Check if there is not crack on the entire rounded corner on the root of flange of the wheel hub by magnetic particle or liquid penetrant testing. If crack is found, replace the wheel hub.
- If crack is found on the wheel hub bolt, replace it.
- If there is crack or stepped wear on the wheel hub mounting surface of wheel disc, replace it. (See Gr31.)



■ **Inspection: Anti-lock brake system rotor**

[Inspection]

- Check the protrusions of the anti-lock brake system rotor for chipping and flattening.
- If any abnormality is found, replace the anti-lock brake system rotor.



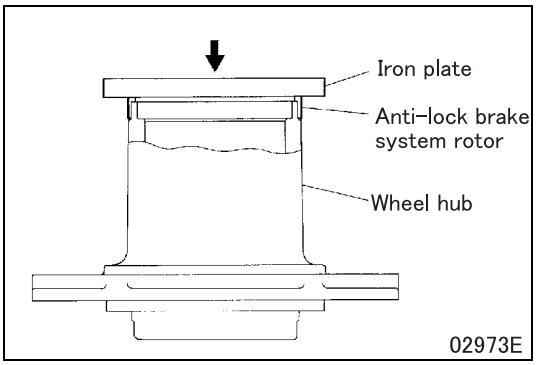
Replacement of anti-lock brake system rotor

[Removal]

- Drive out the anti-lock brake system rotor by tapping evenly at its circumference using a flat-blade screwdriver.

NOTE

- **Be careful not to damage the wheel hub.**

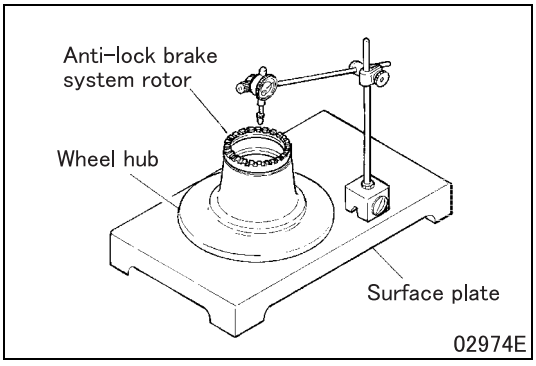


[Installation]

- Warm the anti-lock brake system rotor to approximately 150°C {302°F}, press it evenly using an iron plate, and press it into the wheel hub so that there is no clearance between the wheel hub and the anti-lock brake system rotor.

NOTE

- **When pressing, do not make dents in the rotor.**



[Inspection]

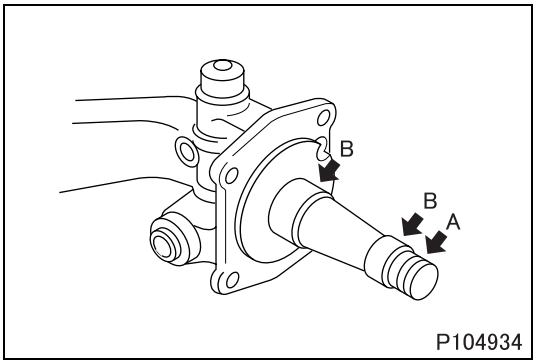
- If runout is out of the standard value, reassemble.
- If runout is out of the standard value after reassembly, replace the defective part(s).

■ **Inspection: Brake drum**

- If cylindricity of the brake drum exceeds the limit or the brake drum has stepped wear and seams, cut the brake drum integrally with the wheel hub within the range of the correction limit.

■ **Inspection: Inner bearing inner race**

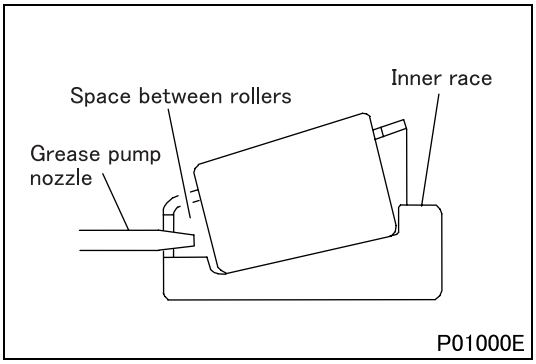
- Inspect the inner bearing inner race in the same manner as for the outer bearing inner race.
  (See "■ **Inspection: Outer bearing inner race**".)



■ **Inspection: Knuckle**

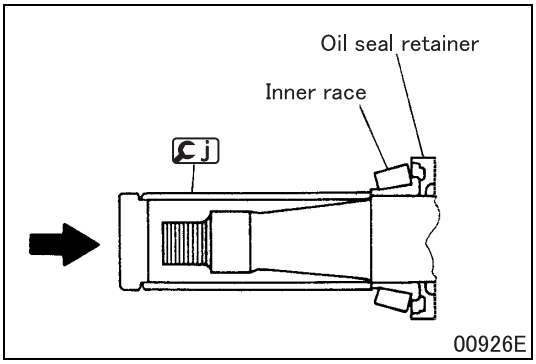
- If the lock nut tightening threads (A) are damaged, repair the damage using a die to ensure accurate adjustment of starting torque.
- Replace the knuckle if it apparently has stepped, tapered, uneven or other abnormal wear or damage in the outer bearing fitting surface (B).

◆Installation procedure◆



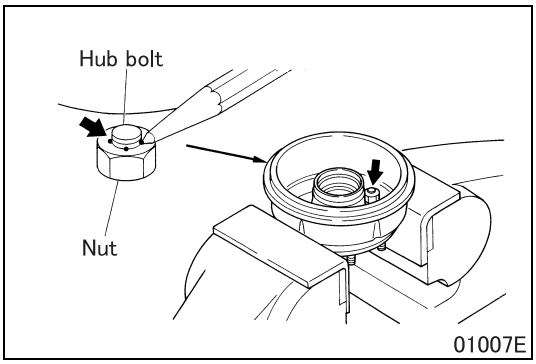
■ **Installation: Packing of grease in inner bearing inner race**

- Insert the grease pump nozzle into the space between rollers of the outer and inner bearing inner race to pack grease sufficiently.



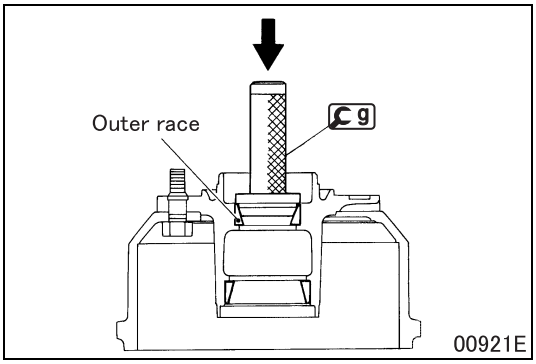
■ **Installation: Inner bearing inner race, oil seal retainer**

- Using j press-fit oil seal retainer and inner bearing inner race simultaneously.

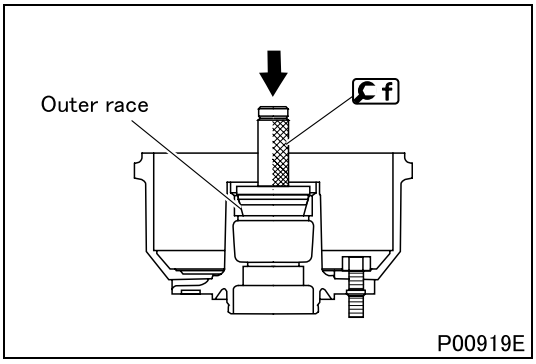


■ **Installation: Hub bolts**

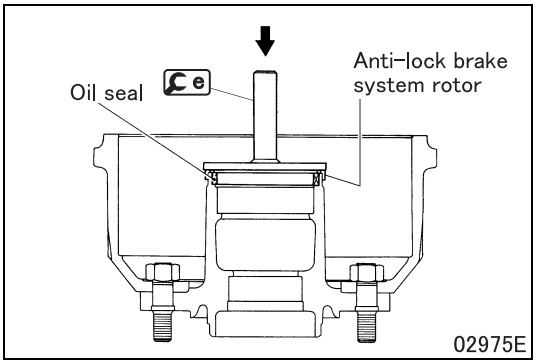
- As for hub bolt, tighten nut at specified torque, and caulk at 4 positions for prevention of loosening.



■ **Installation: Outer bearing outer race**



■ **Installation: Inner bearing outer race**



■ **Installation: Oil seal**

- Use e when press-fitting the oil seal to the wheel hub with the anti-lock brake system rotor already installed.

■ **Installation: Packing of grease in outer bearing inner race**

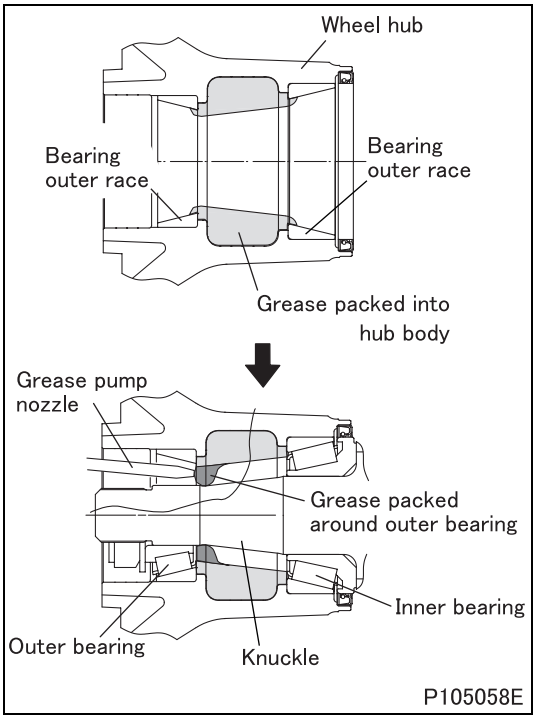
- Follow the same procedure as for packing the inner bearing inner race with grease.
  (See "■ **Installation: Packing of grease in inner bearing inner race**".)

■ **Installation: Packing of grease to inside of wheel hub**

- Pack grease following Manner 1 or Manner 2 shown below.

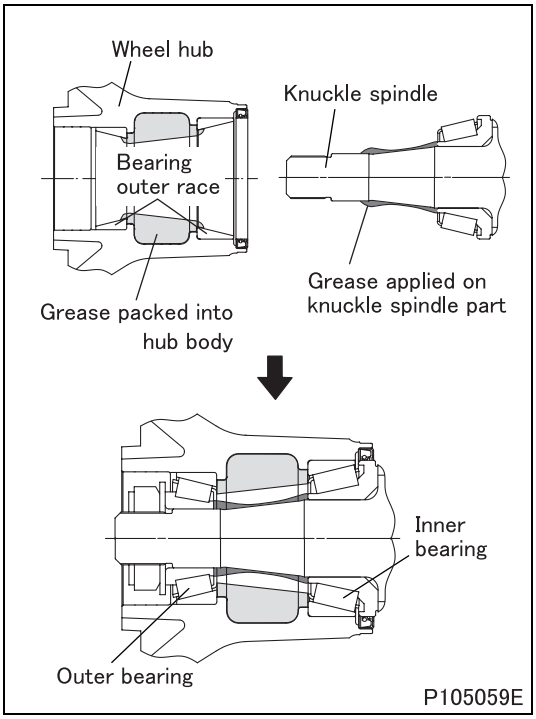
CAUTION ⚠

- **Wheel bearing seized may be caused unless following these manners.**
- **Pack the specific amount of grease measured by measurement cup or etc.**



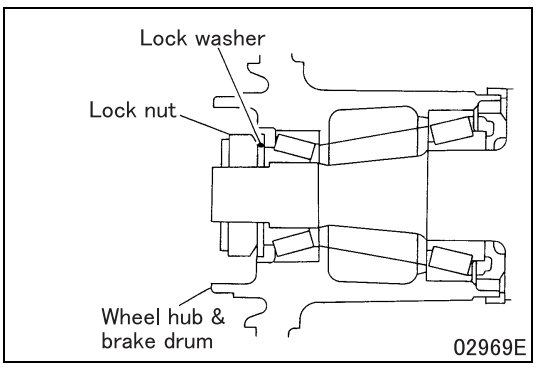
<Manner 1>

- Pack grease in the wheel hub body so much that grease covers the outer and inner bearing outer races to ensure that grease will reach the outer and inner bearings as shown in the drawing.
- After installing the wheel hub in the knuckle, insert a grease pump nozzle into the wheel hub and add grease to around the outer bearing before installing the outer bearing inner race.



<Manner 2>

- Pack grease in the wheel hub body so much that grease covers the outer and inner bearing outer races to ensure that grease will reach the outer and inner bearings as shown in the drawing.
- Before installing the wheel hub in the knuckle, apply grease to the knuckle spindle.



■ Adjustment: Starting torque of wheel hub bearing

CAUTION ⚠

- **Unless this adjustment procedure is performed, seizure of the wheel hub bearing can be caused.**

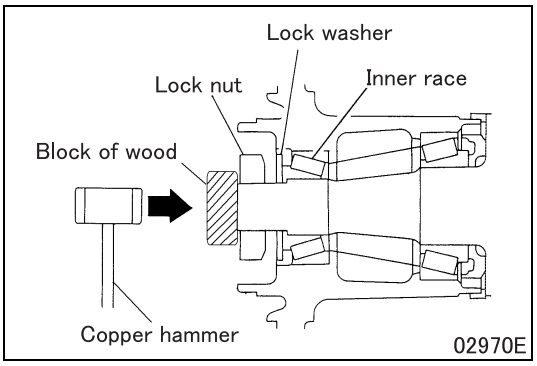
[Adjustment]

- Temporarily tighten the lock nut and make sure that the brake drum and brake shoe do not drag.
- If they drag, make adjustment with the adjuster of the wheel cylinder.

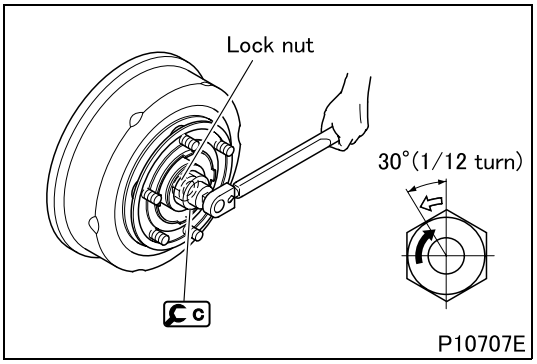
- Gradually tighten the lock nut while turning the wheel hub and brake drum. Tighten the lock nut so that the specified torque is achieved when the wheel hub and brake drum are turned three times or more.

CAUTION ⚠

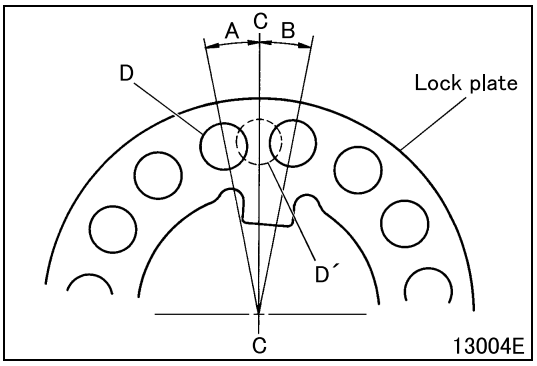
- **Do not tighten the lock nut without turning the wheel hub and brake drum, or tighten it to the specified torque within three turns. Failure to observe the above will make the installed condition of the inner bearing faulty, causing poor rotation and seizure.**



- Perform the following work to pull the outer bearing inner race toward the lock nut side.
- Loosen the lock nut to create clearance between the outer bearing inner race and lock nut.
- Apply a block of wood to the end face of the axle housing, and tap it two or three times while turning the wheel hub and brake drum.

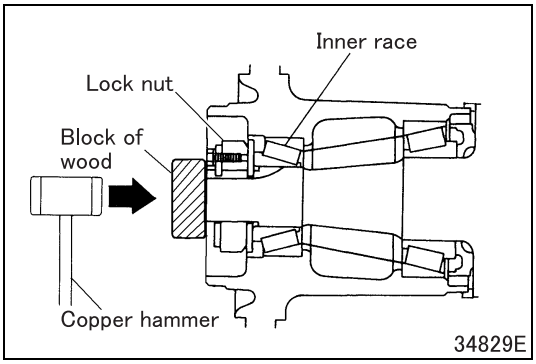


★• Tighten lock nut at specified torque, and after it, return to the loosening direction as shown by the amount of 30 degrees (1/12 turn).

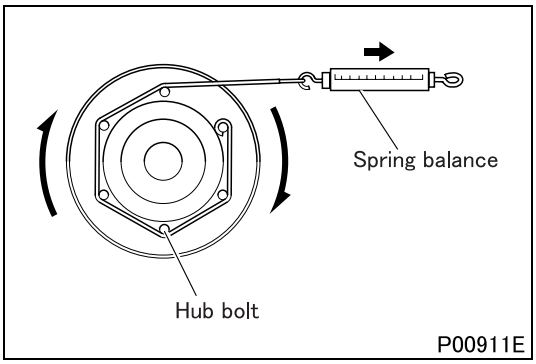


- Fit the lock plate into place and check to ensure that all of the mounting holes in the lock nut and the lock plate are in alignment, and tighten the mounting bolts.
- If the mounting holes of the lock nut and the lock plate are out of alignment, align them by the procedures shown in the following table.

Lock nut hole position	How to align lock plate hole
Range A	Loosen lock nut and align holes.
Range B	Turn over lock plate, loosen lock nut and align holes.
On line C–C	Turn over lock plate and align holes. (Hole position changes from D´ to D.)

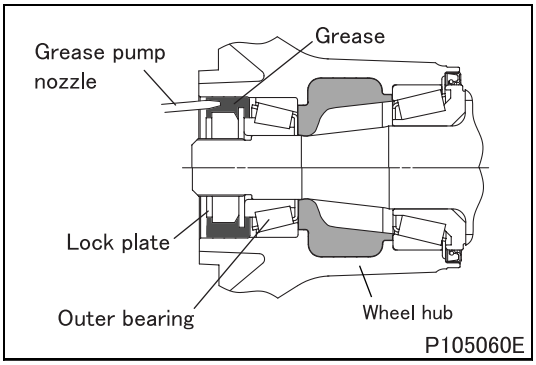


- Perform the following work to pull the outer bearing inner race toward the lock nut side again.
- Apply a block of wood to the end face of the axle housing, and tap it two or three times while turning the wheel hub and brake drum.
- Make sure that there is no looseness in the axial direction.
- Perform a measurement again after adjustment. If the measured value is out of the standard value, repeat the work from the item marked with ★, since adjustment of the lock nut may be insufficient.
- If the result is found to be abnormal, replace the outer and inner bearings.



[Inspection]

- After assembly of the lock nut, fasten a spring balance to hub bolt and measure tangential force.
- If the tangential force meets the specified value, the starting torque will become the standard value.
- If the measurement deviates from the specified value, repeat the work from the item marked with ★, since adjustment of the lock nut may be insufficient.
- If the result is found to be abnormal, replace outer and inner bearings.



■ Installation: Packing of grease in outside of wheel hub

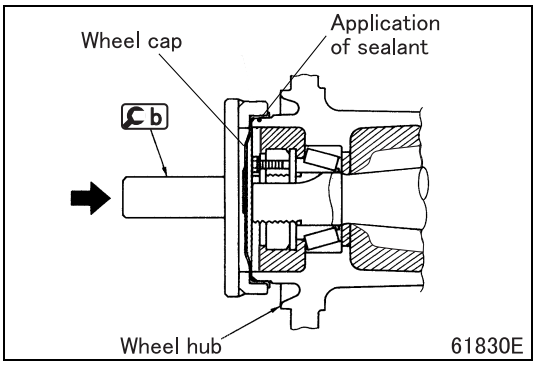
CAUTION ⚠

- **Unless this packing procedure is performed, seizure of the wheel hub bearing can be caused.**
- **For a grease amount, pack the specified amount using a measuring cup.**

- Pack grease up to the lock plate using a grease pump nozzle so that a wall is formed outside the outer bearing as shown in the illustration.

CAUTION ⚠

- **Do not pile grease in the wheel hub cap. Otherwise, grease does not reach the outer bearing, causing poor lubrication of the bearing.**



■ Installation: Wheel hub cap

- Apply sealant to the wheel hub cap fitting surface with the wheel hub, and press the wheel hub cap in the wheel hub using b.

CAUTION ⚠

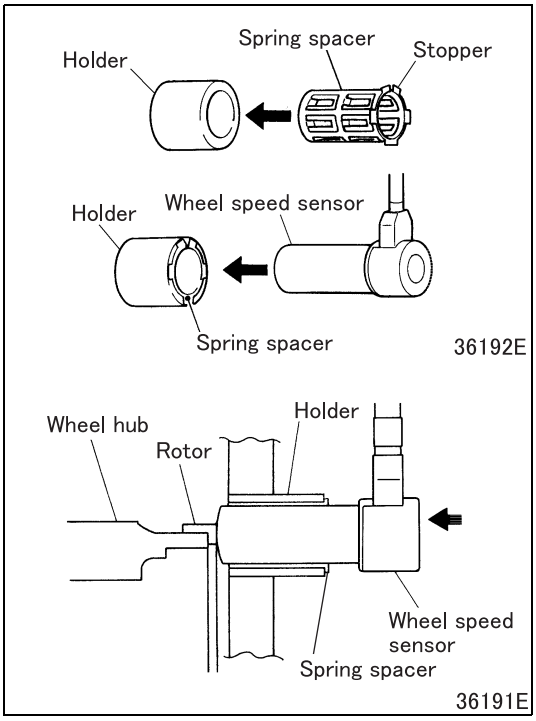
- **Adhesion of grease to the fitting surface with the wheel hub causes water entry and grease leakage.**
- **If the wheel hub cap is tapped with a hammer for installation, the fitting surface is deformed, impairing waterproof effect.**

■ **Installation: Brake hose**

- To install the brake hose, follow the removal procedure in reverse. (See "■ **Removal: Brake hose**".)
- After installing, make sure that the brake hose does not interfere in the peripheral parts.

CAUTION ⚠

- **Make sure that the brake hose is not twisted when installing it.**

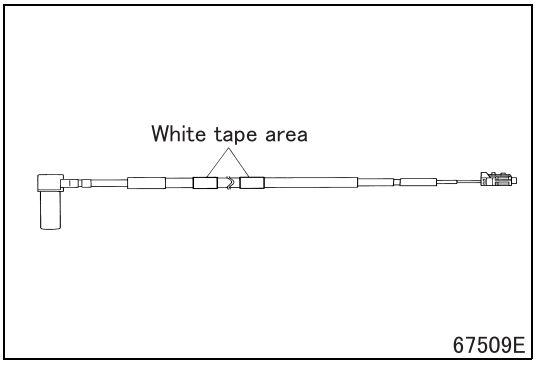


■ **Installation: Wheel speed sensor and spring spacer**

- Insert the spring spacer into the holder of the knuckle and press it in until its stoppers knock against the holder.
- Insert the wheel speed sensor and press it in until it knocks against the rotor with tactile feel.
- Slowly turn the wheel hub and brake drum two or three times (2 seconds per turn) to make sure that they turn smoothly.

CAUTION ⚠

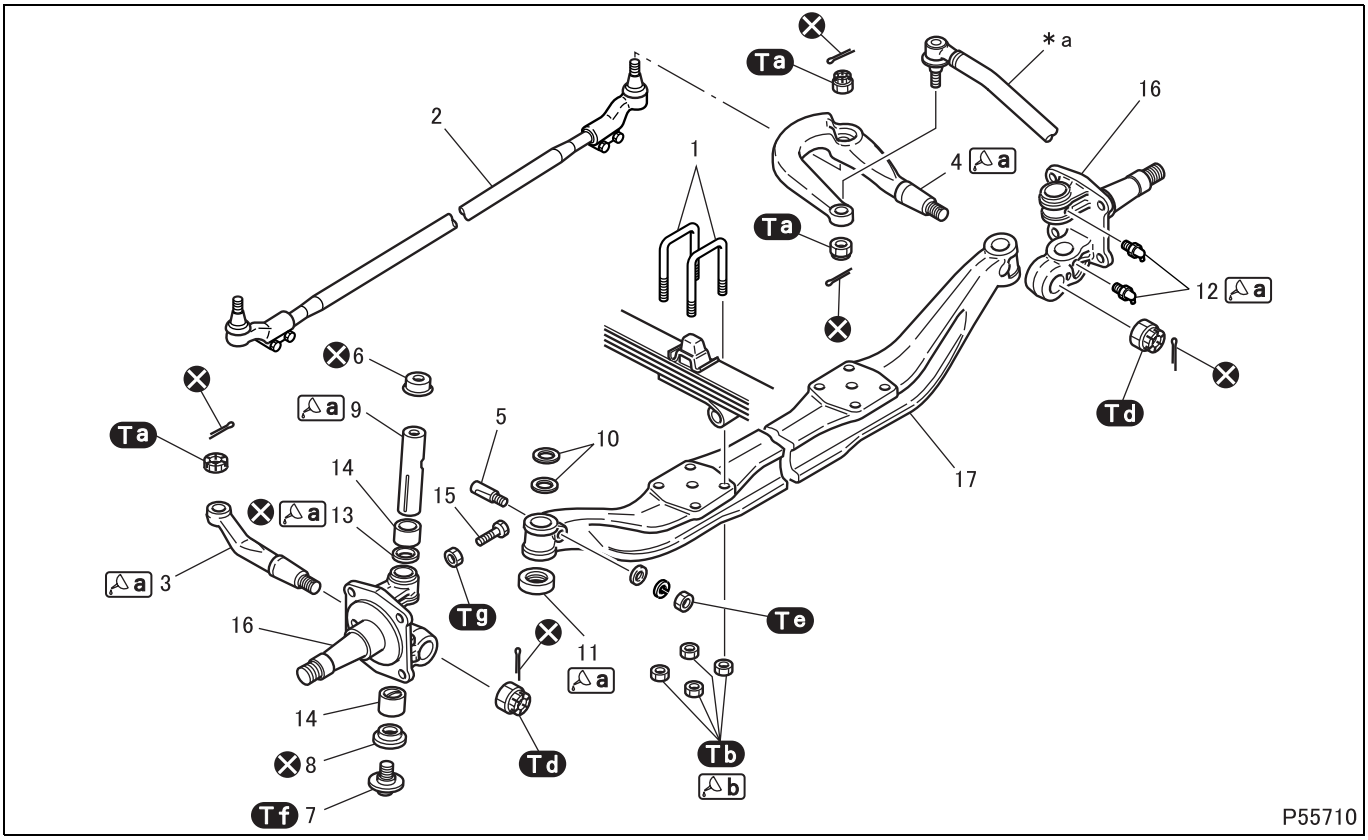
- **When installing the wheel speed sensor, never apply excessive force to the sensor, such as hitting with a hammer, prying with a screwdriver or pulling the harness, since these actions can result in the breaking of wire.**



■ **Installation: Harness of wheel speed sensor**

- Be sure to secure clip positions of the wheel speed sensor harness at the white tape area to avoid interference with other parts, twist and slack.

FRONT AXLE, KNUCKLE AND KINGPIN



● **Disassembly sequence**

1 U-bolt
2 Tie rod (See later section.)
3 Tie rod arm
4 Knuckle arm
5 Set bolt
6 Upper cap
7 Lower cover
8 Dust seal
9 Kingpin
10 Thrust washer
11 Thrust bearing
12 Grease nipple
13 Oil seal
14 Bushing
15 Knuckle stopper bolt
16 Knuckle
17 Front axle

***a**: Drag link
⊗: Non-reusable parts

CAUTION ⚠

- **Do not damage the dust cover of the tie rod when removing the tie rod. Damaging the dust cover may cause water infiltration and wear-out at the early stage.**

NOTE

- **Kingpin may have a blackened surface, but this is due to transcription of the resin of bushing and does not present any problem.**

● **Assembly sequence**

Follow the disassembly sequence in reverse.

Repair kit: Kingpin kit

Service standards (Unit: mm {in.})

Location	Maintenance item		Standard value	Limit	Remedy
9	Outer diameter of kingpin		34.985 to 34.998 {1.377 to 1.378}	34.9 {1.374}	Replace
9, 14	Clearance between kingpin and bushing		0.02 to 0.06 {0.00079 to 0.0024}	0.15 {0.0059}	Replace
9, 17	Clearance between kingpin and axle		0.002 to 0.04 {0.00008 to 0.0157}	0.1 {0.0039}	Replace
14	Inner diameter of bushing (after having been pressed into knuckle)		35.018 to 35.045 {1.378 to 1.379}	–	Replace
16, 17	Vertical clearance between knuckle and front axle		0.1 {0.0039} or less	0.20 {0.0079}	Adjust
17	Front axle	Horizontal bend	2.5 {0.098} or less	7 {0.28}	Replace
		Vertical bend	3 {0.12} or less	7 {0.28}	
		Kingpin inclination angle	7° ± 30’	–	

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
Ta	Nut (drag link mounting)	190 ± 47.5 {140 ± 35, 19.4 ± 4.85}	–
	Nut (tie rod mounting)		
Tb	Nut (U-bolt mounting)	204 to 278 {150 to 205, 20.8 to 28.2}	Wet
Td	Nut (tie rod arm and knuckle arm mounting)	686 ± 98 {505 ± 72, 70 ± 10}	–
Te	Nut (set bolt mounting)	29 {22, 3}	–
Tf	Lower cover	39 ± 10 {29 ± 7, 4 ± 1}	–
Tg	Lock nut (knuckle stopper bolt mounting)	71 ± 12 {53 ± 9.4, 7.3 ± 1.3}	–

Lubricant and/or sealant

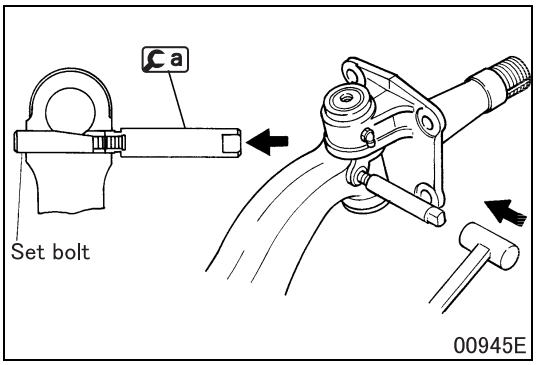
Mark	Points of application	Specified lubricant and/or sealant	Quantity
a	Thread areas of tie rod arm and knuckle arm	Wheel bearing grease [NLGI No. 2 (Li soap)]	As required when parts are reused
	Outer surface of kingpin and fill through-hole		As required
	Pack inside of bearing		
	Packing from grease nipple		Until grease starts overflowing from dust plug
	Oil seal lip		As required
b	Nut thread	Chassis grease [NLGI No.1 (Li soap)]	As required

Special tools (Unit: mm {in.})

Mark	Tool name and shape	Part No.	Application
Ca	Kingpin set bolt remover  00938	MH061688	Removal of set bolt

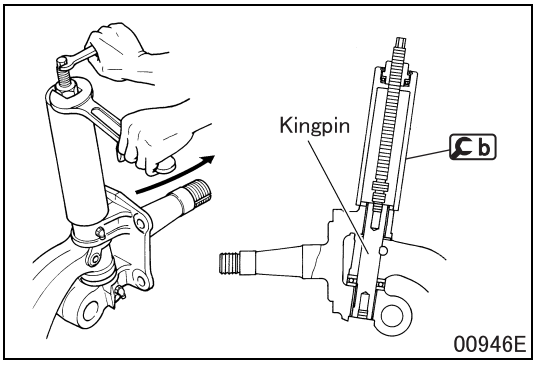
Mark	Tool name and shape	Part No.	Application
b	Kingpin puller  00939 A: M16 × 1.5, B: M22 × 1.5, C: M27 × 1.5	MH061684	Removal of kingpin
c	Oil seal installer A: ϕ35 {1.38}  00940	MH062201	Installation of oil seal
d	Kingpin bushing remover A: ϕ33 {1.30}, B: ϕ35 {1.38}, C: ϕ38.5 {1.52}  00941	MH061037	Removal of oil seal and removal and installation of bushing

◆Removal procedure◆



00945E

■ **Removal: Set bolt**

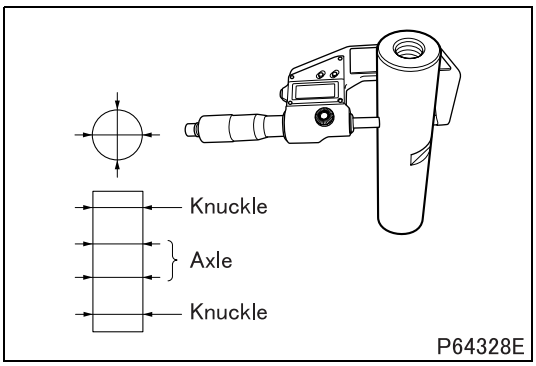


00946E

■ **Removal: Kingpin**

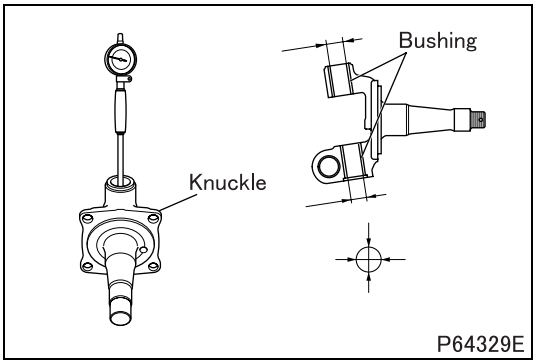
- Screw b into the kingpin threads to remove the kingpin.

◆Inspection procedure◆



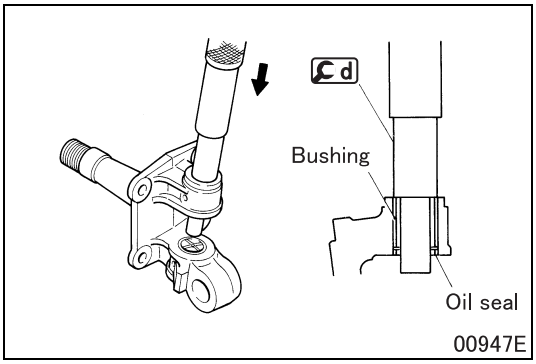
■ **Inspection: Outer diameter of kingpin**

- Take measurement at a total four levels on the kingpin: two levels for the axle fitting portion and one level each for the upper and lower knuckle fitting portions.
- If the measured value is under the limit, replace the kingpin with a new one.



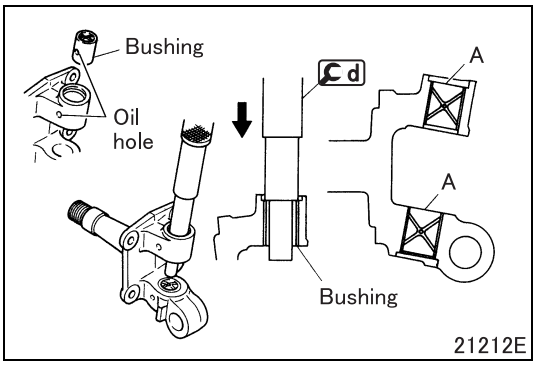
■ **Inspection: Clearance between kingpin and bushing**

- Measure the inner diameter of the upper and lower bushings using a cylinder gauge and calculate the clearance deducting the outer diameter of the kingpin from the inner diameter of the bushing.
  If the clearance exceeds the limit, replace the bushings with new ones.



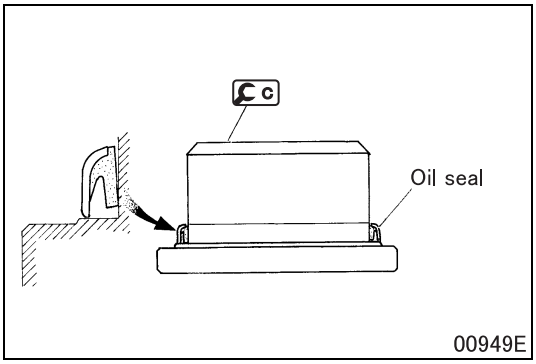
Replace of bushing
[Removal]

- Remove the bushing and the oil seal at the same time using d.

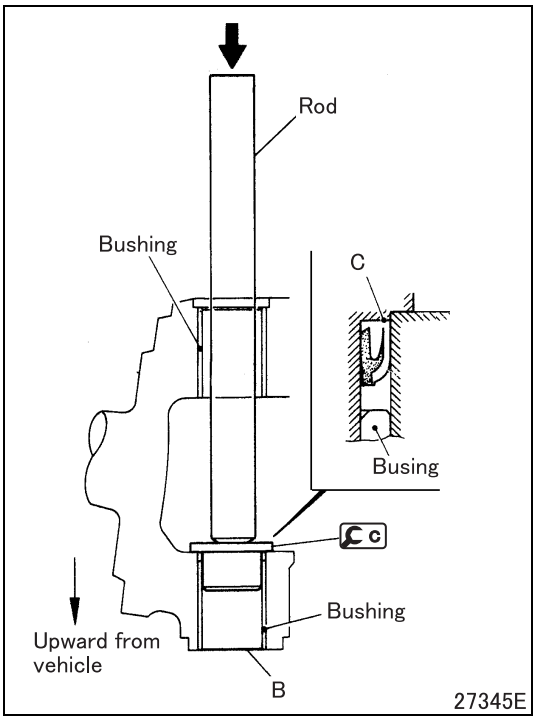


[Installation]

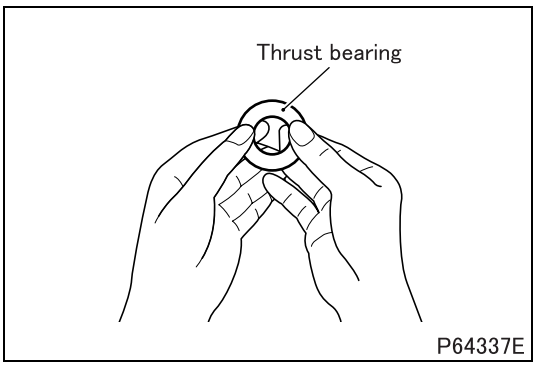
- Install bushing in with oil hole aligned to oil hole of knuckle, until end surface A becomes flush with knuckle end surface.



- Apply grease to lip area of oil seal, and set oil seal on C.

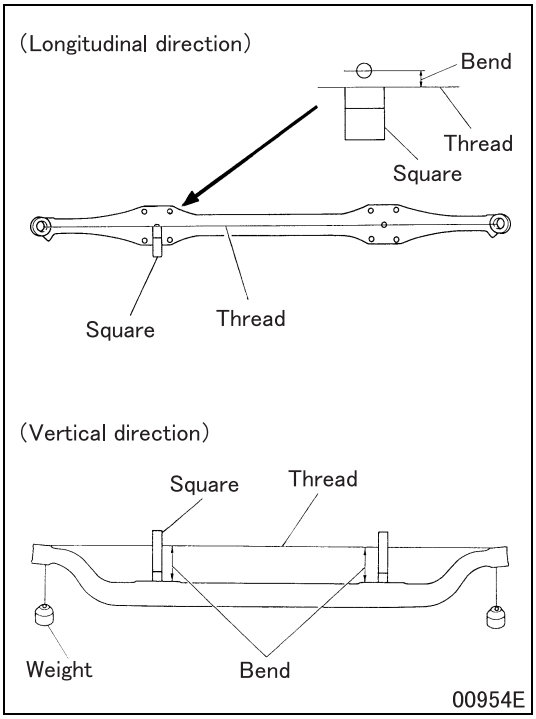


- Next, install C on the knuckle in the illustrated direction.
- Insert rod into kingpin hole, and attach it to C.
- Hit the head using a hammer until C comes to rest at knuckle.
- Make sure that end of bushing at B is flush with knuckle surface.
- End surface of oil seal at C shall not be protruding from knuckle.



■ Inspection: Thrust bearing

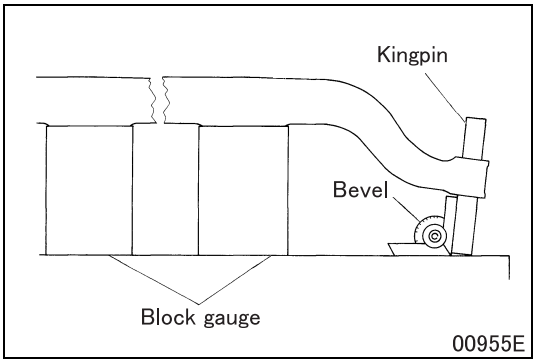
- Inspect the aspect and smooth turning of the thrust bearing. If any crack, damage, or un-smooth turning is found, replace the thrust bearing with a new one.



■ **Inspection: Front axle**

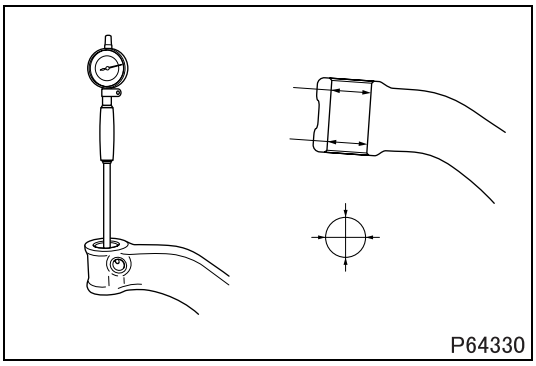
(1) Bend of front axle in the logitudinal direction and vertical direction

- Put a piece of thread through kingpin holes of the front axle and hang weights at both ends.
- Use a square to find bend to each of longitudinal and vertical directions.
- If the measured value exceeds the limit, replace the front axle.



(2) Kingpin inclination angle

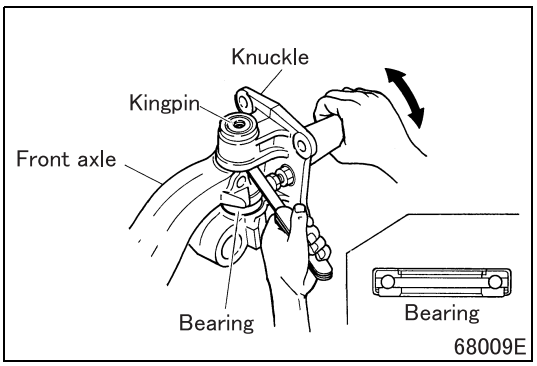
- Set the kingpin on the front axle as illustrated to measure the angle.
- If the measured value deviates from the standard value, replace the front axle.



(3) Clearance between kingpin and front axle

- Measure the inner diameter of the axle's hole where the kingpin is inserted using a cylinder gauge and calculate the clearance deducting the outer diameter of the kingpin from the inner diameter.
  If the clearance exceeds the limit, replace the axle or the kingpin with a new one.

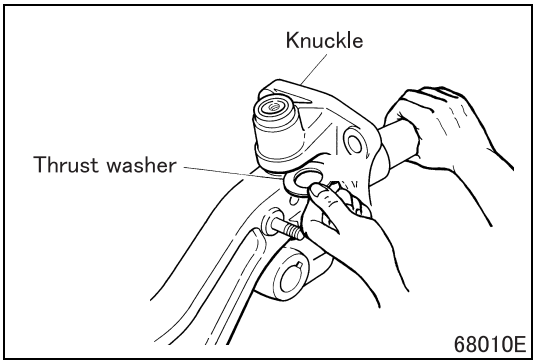
◆Installation procedure◆



■ **Inspection: Thrust washer, bearing, knuckle and front axle**

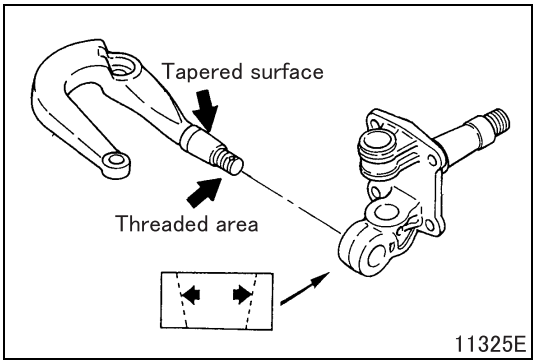
[Inspection]

- Provisionally assemble kingpin and bearing, move 2 or 3 times knuckle to have them fit.
- Measure clearance between front axle upper surface and knuckle downside.
- Adjust if the measured value exceeds the limit.



[Adjustment]

- Kinds of adjusting thrust washers
  2.1 to 2.8 mm {0.083 to 0.110 in.} (8 kinds with every 0.1 mm {0.0039 in.} difference)
- Select a thrust washer so as to make clearance as small as possible.
- After assembly, make sure that the knuckle moves smoothly.



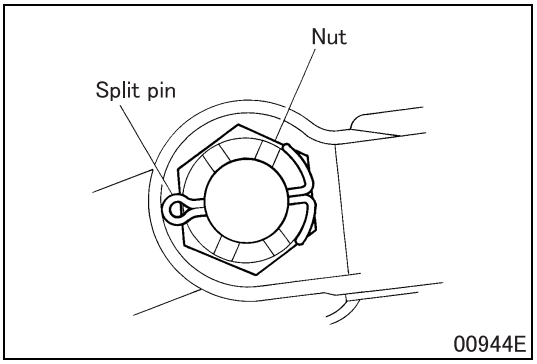
■ **Installation: Knuckle arm and knuckle**

(1) In the case of reassembling any one or both of knuckle arm and knuckle

- Polish the entire tapered surfaces of knuckle arm and knuckle evenly by means of sand paper #120 or above until sand paper score is visible on polished surfaces. (This does not apply to new replacement parts.)
- Clean tapered surfaces of knuckle arm and knuckle, and threaded area of knuckle arm screw.

NOTE

- **Use acetone, cleaning fluid for color check, or equivalent as solvent.**



- Apply grease to threaded area of knuckle arm screw and assemble.

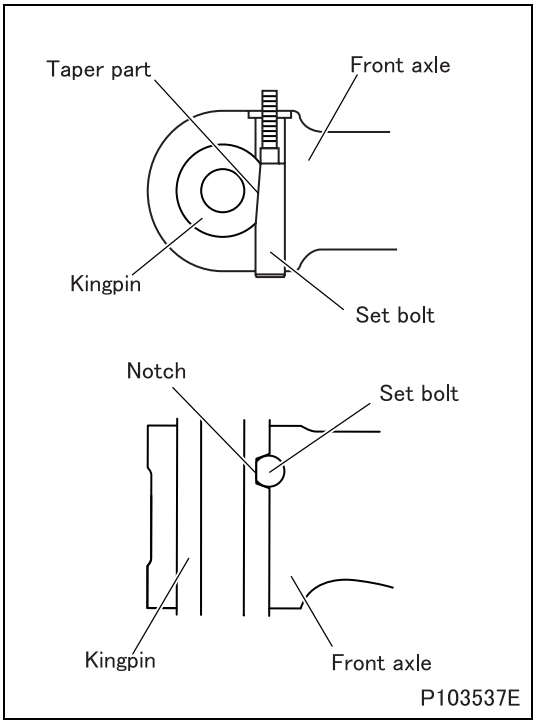
CAUTION ⚠

- **Upon assembling, keep off grease from tapered areas of knuckle and knuckle arm.**

- Tighten nut at specified torque, align pin holes in the course of tightening without fail, insert split pin, and secure it.

(2) When both of knuckle arm and knuckle for assembling are new parts

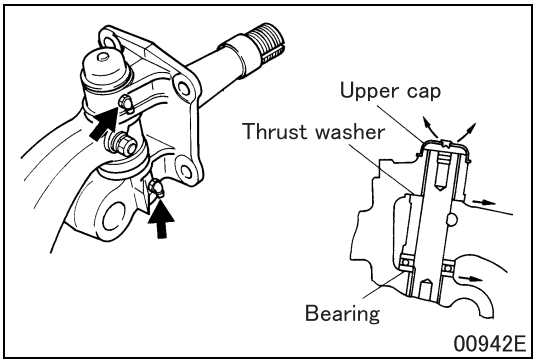
- Clean tapered surfaces and threaded area of knuckle arm and knuckle.
- Tighten new nut at specified torque, align pin holes in the course of tightening without fail, insert split pin, and secure it.



■ **Installation: Set bolt**

- Install the set bolt so that the taper part of the set bolt is aligned with the notch of the kingpin.

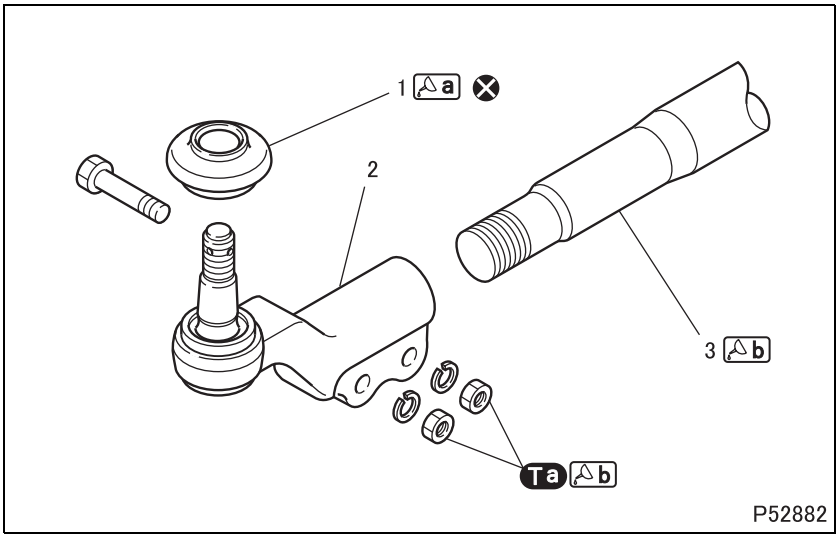
◆Work after assembly◆



■ **Greasing: Grease nipple**

- Supply grease through the grease nipple of the knuckle.
- Supply grease until it overflows from the dust plug of the upper cap, thrust washer and press portion of the bearing.

TIE ROD



● **Disassembly sequence**

1 Dust cover
2 Tie rod end
3 Tie rod

⊗: Non-reusable parts

● **Assembly sequence**

Follow the disassembly sequence in reverse.

NOTE

- **Do not disassemble the tie rod end, as it is of non-disassembly type.**

Service standards (Unit: mm {in.})

Location	Maintenance item		Standard value	Limit	Remedy
2	Ball joint of tie rod end	Play (± 2000 N {± 450 lbs, ± 204 kgf} loaded)	0 to 0.2 {0 to 0.008}	–	Replace
		Rotation torque	0.5 to 8 N·m {0.4 to 5.9 ft.lbs, 0.05 to 0.82 kgf·m}	–	
3	Bend of tie rod		–	2 {0.079}	Correct or replace

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

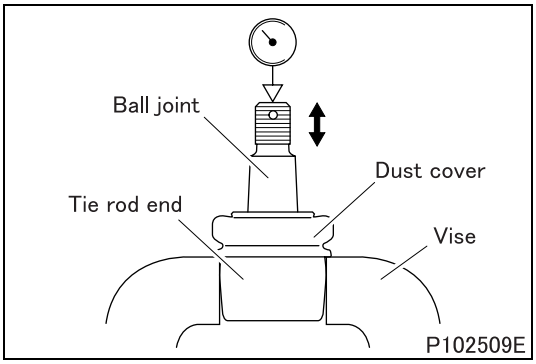
</table>

◆Inspection procedure◆



P102509E

■ Inspection: Tie rod end

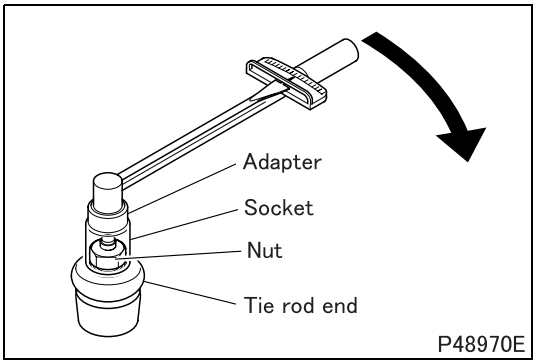
(1) Play

- Fix the tie rod end with a vise.

CAUTION ⚠

- **Take care not to deform or damage the dust cover when fixing it with a vise.**

- The position of the ball joint with applying no load is adjusted to standard position.
- Measure each play of the ball joint with applying the specified push and pull load from the standard position.
- Total each play and if the total deviates from standard value, replace the tie rod end.



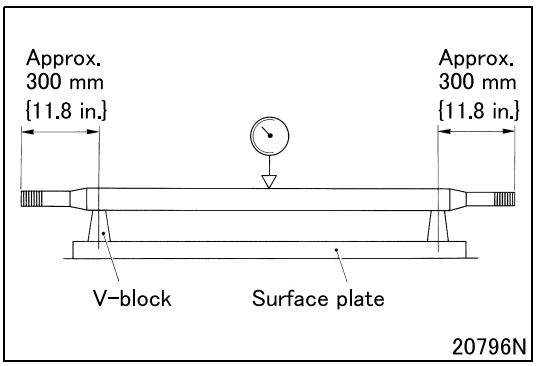
P48970E

(2) Rotation torque

- Install the tie rod mounting nut on the tie rod end.
- Install the socket, adapter and torque wrench to measure the rotation torque.
- If the measured value deviates from the standard value, replace the tie rod end.

(3) Dust cover

- Check that there are no wear, cracks or damage. These abnormalities can cause water to enter the ball joint, resulting in premature wear.
- If wear, crack, or damage is present, inspect traces of water entry and occurrence of rust in the ball joint. If any abnormality is found, replace the tie rod end. If no abnormality is found, replace the dust cover and reapply grease.



■ **Inspection: Bend of tie rod**

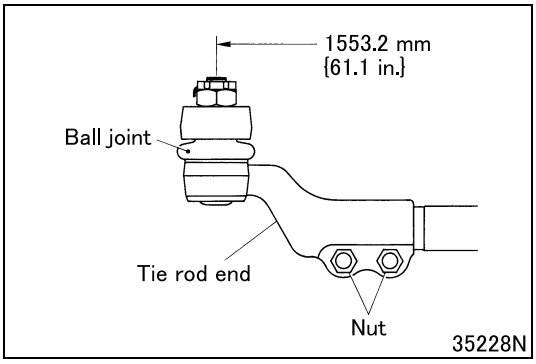
- Measure the bend of the tie rod at its center.

NOTE

- **Give the tie rod one complete turn and read the dial gauge at this time. The bend is one half of the reading.**

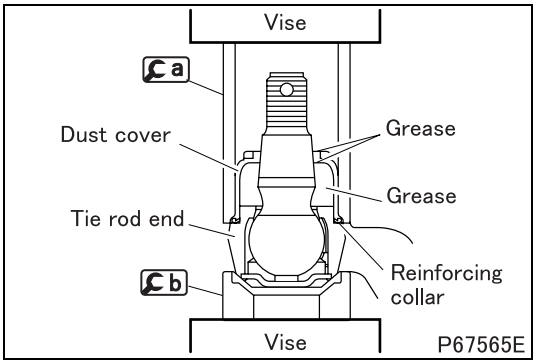
- If the measured value exceeds the limit, correct or replace the tie rod.

◆Installation procedure◆



■ **Installation: Tie rod end**

- Install the tie rod end on the tie rod so that the distance between centers of the ball joint of tie rod ends is to the illustrated dimension, and tighten nuts to the specified torque.



■ **Installation: Dust cover**

- Seal grease in the inside of the dust cover and apply grease to the lip area. Cover the dust cover and tie rod end with a and b as illustrated, and press them using a vise so that the reinforcing collar is brought into intimate contact with the tie rod end.

NOTE

- **Install the dust cover so that it is vertical.**

ON-VEHICLE INSPECTION AND ADJUSTMENT

1. Inspection and Adjustment of Wheel Alignment

Before performing inspection and adjustment of wheel alignment, set the vehicle to the following condition.

- Park the vehicle unloaded on a level place.
- The vehicle needs to be equipped with proper size tires.
- If the wear condition of tires on the right is remarkably different from that of tires on the left, replace tires.
- Tires need inflation to specified pressure.
- Correct if the vehicle tilts due to faulty suspension.
- Service all parts of the front axle and ensure that there is no fault such as the following.
  - Play at or loose kingpin
  - Loose front wheel hub
  - Loose bolts used for tightening various parts of tie rod arm, knuckle arm and tie rod
  - Bend of knuckle and front axle
- Adjust play at steering wheel properly.
- For wheel alignment, which is related to the side slip amount, both wheel alignment and the side slip amount must conform to the standard values.

Service standards (Unit: mm {in.})

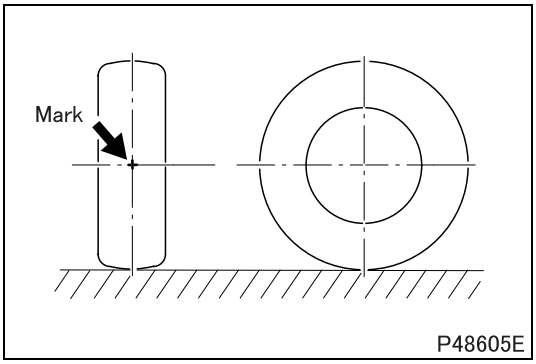
Location	Maintenance item		Standard value	Limit	Remedy
–	Toe-in		1 to 3 {0.039 to 0.12}	–	Adjust
	Camber		1°00' ± 1°00'	–	Replace
	Caster	FK	2°30' $^{+1°30'}_{-1°00'}$	–	Replace
		FM	2°00' $^{+1°30'}_{-1°00'}$		
	Kingpin inclination angle		7° ± 30'	–	Replace

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
–	Nut (tie rod end tightening)	78 ± 12 {58 ± 8.7, 8.0 ± 1.2}	Wet

Lubricant and/or sealant

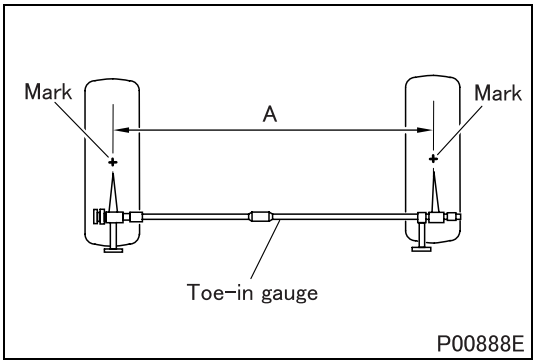
Mark	Points of application	Specified lubricant and/or sealant	Quantity
–	Clamp nut thread of tie rod end	Chassis grease [NLGI No.1 (Li soap)]	As required



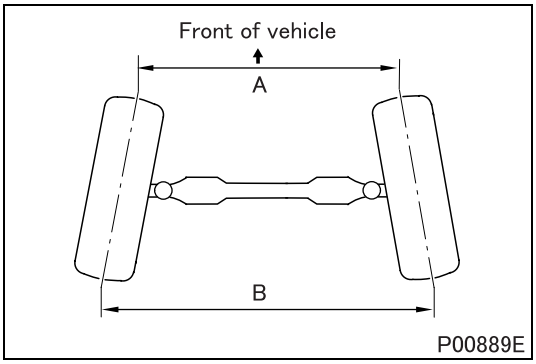
1.1 Inspection and adjustment of toe-in

[Inspection]

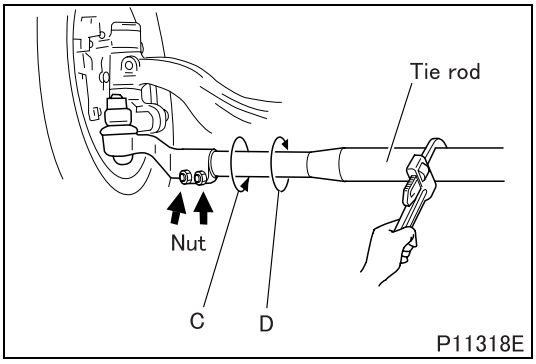
- Direct the front wheels exactly to forward running position.
- Put a mark on both the right and left tires at the height of the front wheel axis in the center of the tire width.



- Align the two points of the toe-in gauge with respective marks and measure distance A between the marks.

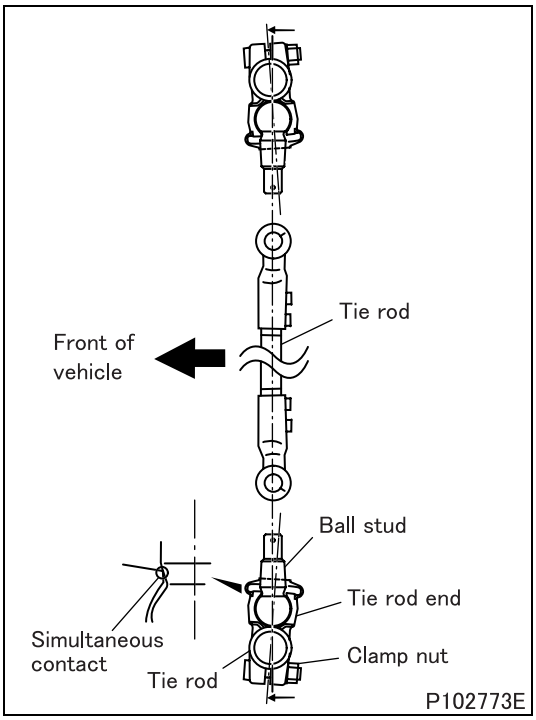


- Push the vehicle to roll the tires 180 degrees.
- Measure distance B between the marks that have moved to the rear of the vehicle.
- If toe-in (difference between A and B) deviates from the standard value, adjust.

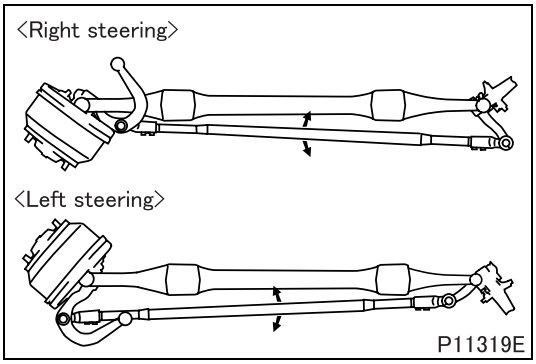


[Adjustment]

★ • Loosen the right and left nuts of tie rod.
- Turn the tie rod with a pipe wrench to adjust the toe-in.
  C: When adjusting to the toe-out direction
  D: When adjusting to the toe-in direction
- After adjustment, tighten the nut to the specified torque.



- Hold down the tie rod toward the front or rear of the vehicle with the front wheels directed to forward running position so that the right and left tie rod ends are in contact with the ball studs at the same time.
- In this state adjust the toe-in and tighten the clamp nut to secure the tie rod end.

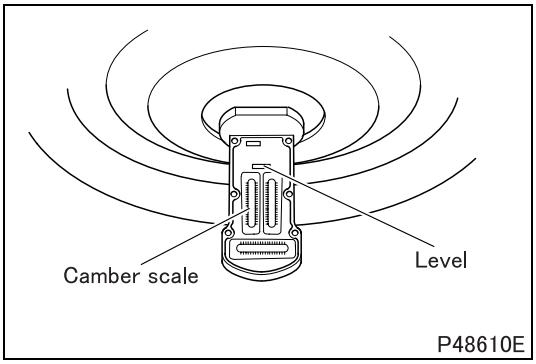


- After adjustment, turn the steering wheel to the extreme left (the state in which the knuckle stopper bolt is contacted), and move the tie rod in the longitudinal direction of the vehicle by hand to make sure that the tie rod moves.
  Do the same for right steering.
  (If the tie rod swings, the tie rod ends should be in contact with the ball studs at the same time.)

WARNING ⚠

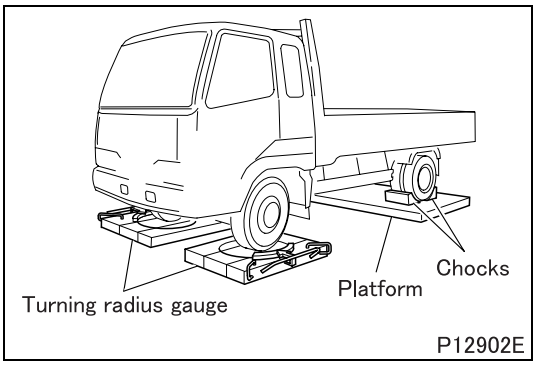
- **Be very careful that your hand, or anything else, is not caught due to the movement of the tie rod when the steering wheel is turned left and right.**

- If the tie rod does not swing, repeat the work from the item marked with ★.



1.2 Inspection of camber

- Direct the front wheels exactly to forward running position.
- Remove the wheel hub cap.
- Wipe off grease from the knuckle end, and bring the camber/caster/kingpin gauge into intimate contact with the front wheel hub.
- Place the level so that the bubble remains in the middle, and read center of bubbles on camber scale in this state to find the camber. Do the same for the right and left front tires.
- If the measured value deviates from the standard value, abnormalities such as wear of kingpin and bushing, loose hub bearing, and bend of knuckle and front axle are suspended. Inspect each part and replace defective parts.



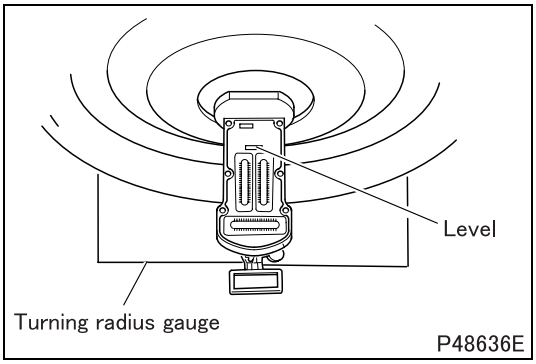
1.3 Inspection of caster and kingpin inclination angle

- Prepare a platform with the same height as the turning radius gauge and place it under the rear wheels so that the vehicle may be placed level.
- Apply chocks to the rear wheels.

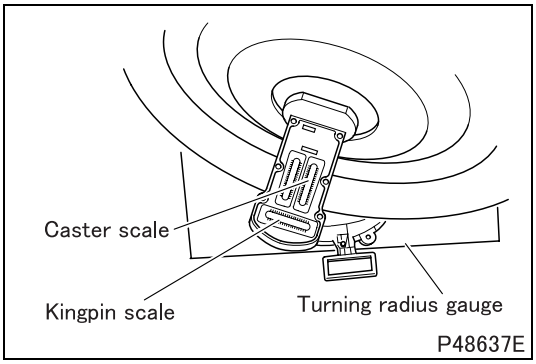
WARNING ⚠

- **Do not remove chocks until the entire operation is completed.**

- Keep the turning radius gauge locked.
- Jack up the vehicle and set the right and left front wheels so that respective ground contact area centers of the two wheels and turn table centers may meet.



- Unfasten locking of the turning radius gauge, and set the scale to 0 degrees.
- As with the camber measurement in Section **1.2**, attach the camber/caster/kingpin gauge and set the level so that the bubble remains in the middle.



- Apply brake pedal, and with brake applied to the front wheels, turn steering wheel slowly from the point of 0 degrees on the turning radius gauge until the direction is changed by 20 degrees to the right side in the case of the right front wheel and to 20 degrees to the case of the left front wheel.

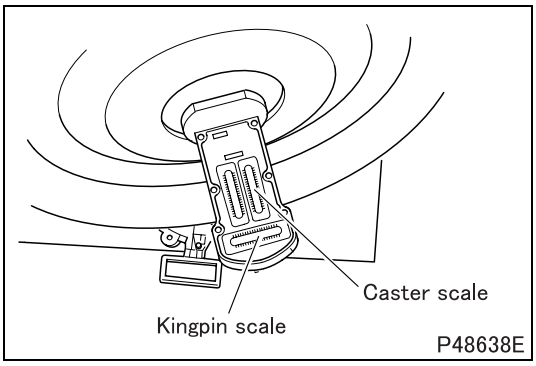
NOTE

- **It is not possible to make exact measurements unless the brake remains applied, otherwise the wheels will turn slightly.**

- After setting the steering at 20 degrees, set the caster scale and the center of the bubble of the kingpin scale to 0 degrees by turning the adjuster.

NOTE

- **Pay attention to the kingpin scale because it has scales for right and left: align the right kingpin scale in the case of the right front wheel, and left kingpin scale in the case of the left front wheel.**



- Reverse this position, turn the steering wheel slowly until the direction of the front wheels changes by 20 degrees in the opposite direction.
- Read the center of the bubbles at this position of the caster scale and kingpin scale to find caster and kingpin inclination angles.
- If the measured value deviates from the standard value, abnormalities such as wear of kingpin and bushing, loose hub bearing, and bend of knuckle and front axle are suspended. Inspect each part and replace defective parts.

2. Inspection and Adjustment of Steering Angle

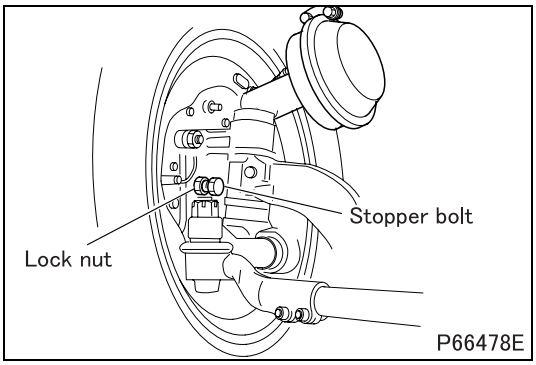
- Perform steering angle inspection and adjustment only after wheel alignment inspection and adjustment has been completed.

Service standards

Location	Maintenance item			Standard value	Limit	Remedy
–	Steering angle	Inside (outside steering angle is for reference only)	FK	43° (37°)	–	Adjust
			FM	40° (33°)		

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
–	Lock nut (knuckle stopper bolt tightening)	71 ± 12 {52 ± 8.9, 7.25 ± 1.2}	–



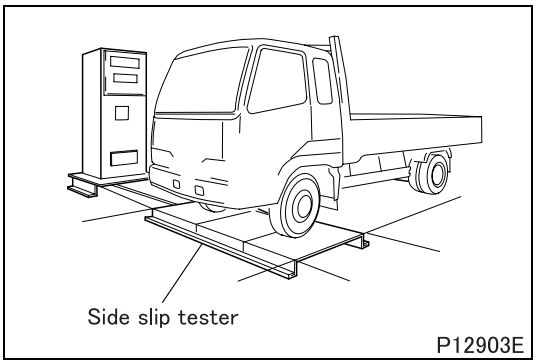
- Set the turning radius gauge and a platform on the vehicle in the same manner as in the case of the caster and kingpin inclination angle measurement performed in Section **1.3**.
- Turn the steering wheel right or left completely from the position where the turning radius gauge is set to 0 degrees, and read the scale of the turning radius gauge to measure the steering angle.
- If the measured value deviates from the standard value, adjust with the knuckle stopper bolt and tighten the lock nut to the specified torque.

3. Inspection of Side Slip

- Perform side slip inspection only after wheel alignment inspection and adjustment has been completed.
- For the side slip amount, which is related to wheel alignment, both the side slip amount and wheel alignment must conform to the standard values.

Service standards (Unit: mm {in.})

Location	Maintenance item	Standard value	Limit	Remedy
–	Side slip amount (per 1 m {3.3 ft.})	3 {0.12} or less	–	Adjust



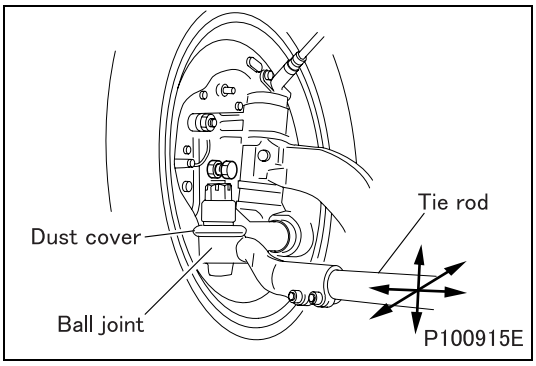
- Set the front wheels exactly to forward running position.
- Move the vehicle forward past the side slip tester as slowly as possible to inspect side slip.

NOTE

- **Pay attention to the following when moving over the side slip tester.**
- **Be sure to hold steering exactly at the forward running position, and make no turn.**
- **Do not apply brake.**
- **Keep the speed constant.**

- If the measured value deviates from the standard value, inspect and adjust wheel alignment.

4. Inspection of Tie Rod End Ball Joint



(1) Play

- Hold the tie rod section of the tie rod with the vehicle kept stationary, and move it in the back-and-forth, up-and-down and right-and-left directions to check for play at ball joints of the tie rod end.

NOTE

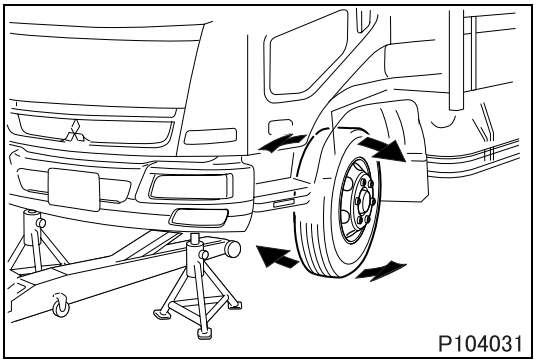
- **Be sure to check for play at ball joints of both right and left sides of the tie rod.**

- If there is play, replace the tie rod end of the tie rod.

(2) Dust cover

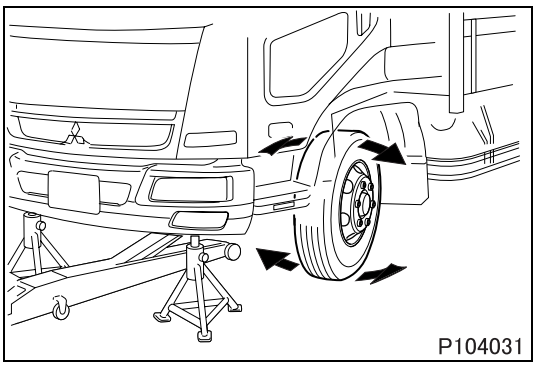
- Check that there are no wear, cracks or damage. Their abnormalities can cause water to enter the ball joint, resulting in premature wear.
- If wear, crack, or damage is present, inspect traces of water entry and occurrence of rust in the ball joint. If any abnormality is found, replace the tie rod end. If no abnormality is found, replace the dust cover and reapply grease.

5. Inspection of Wheel Bearing for Play



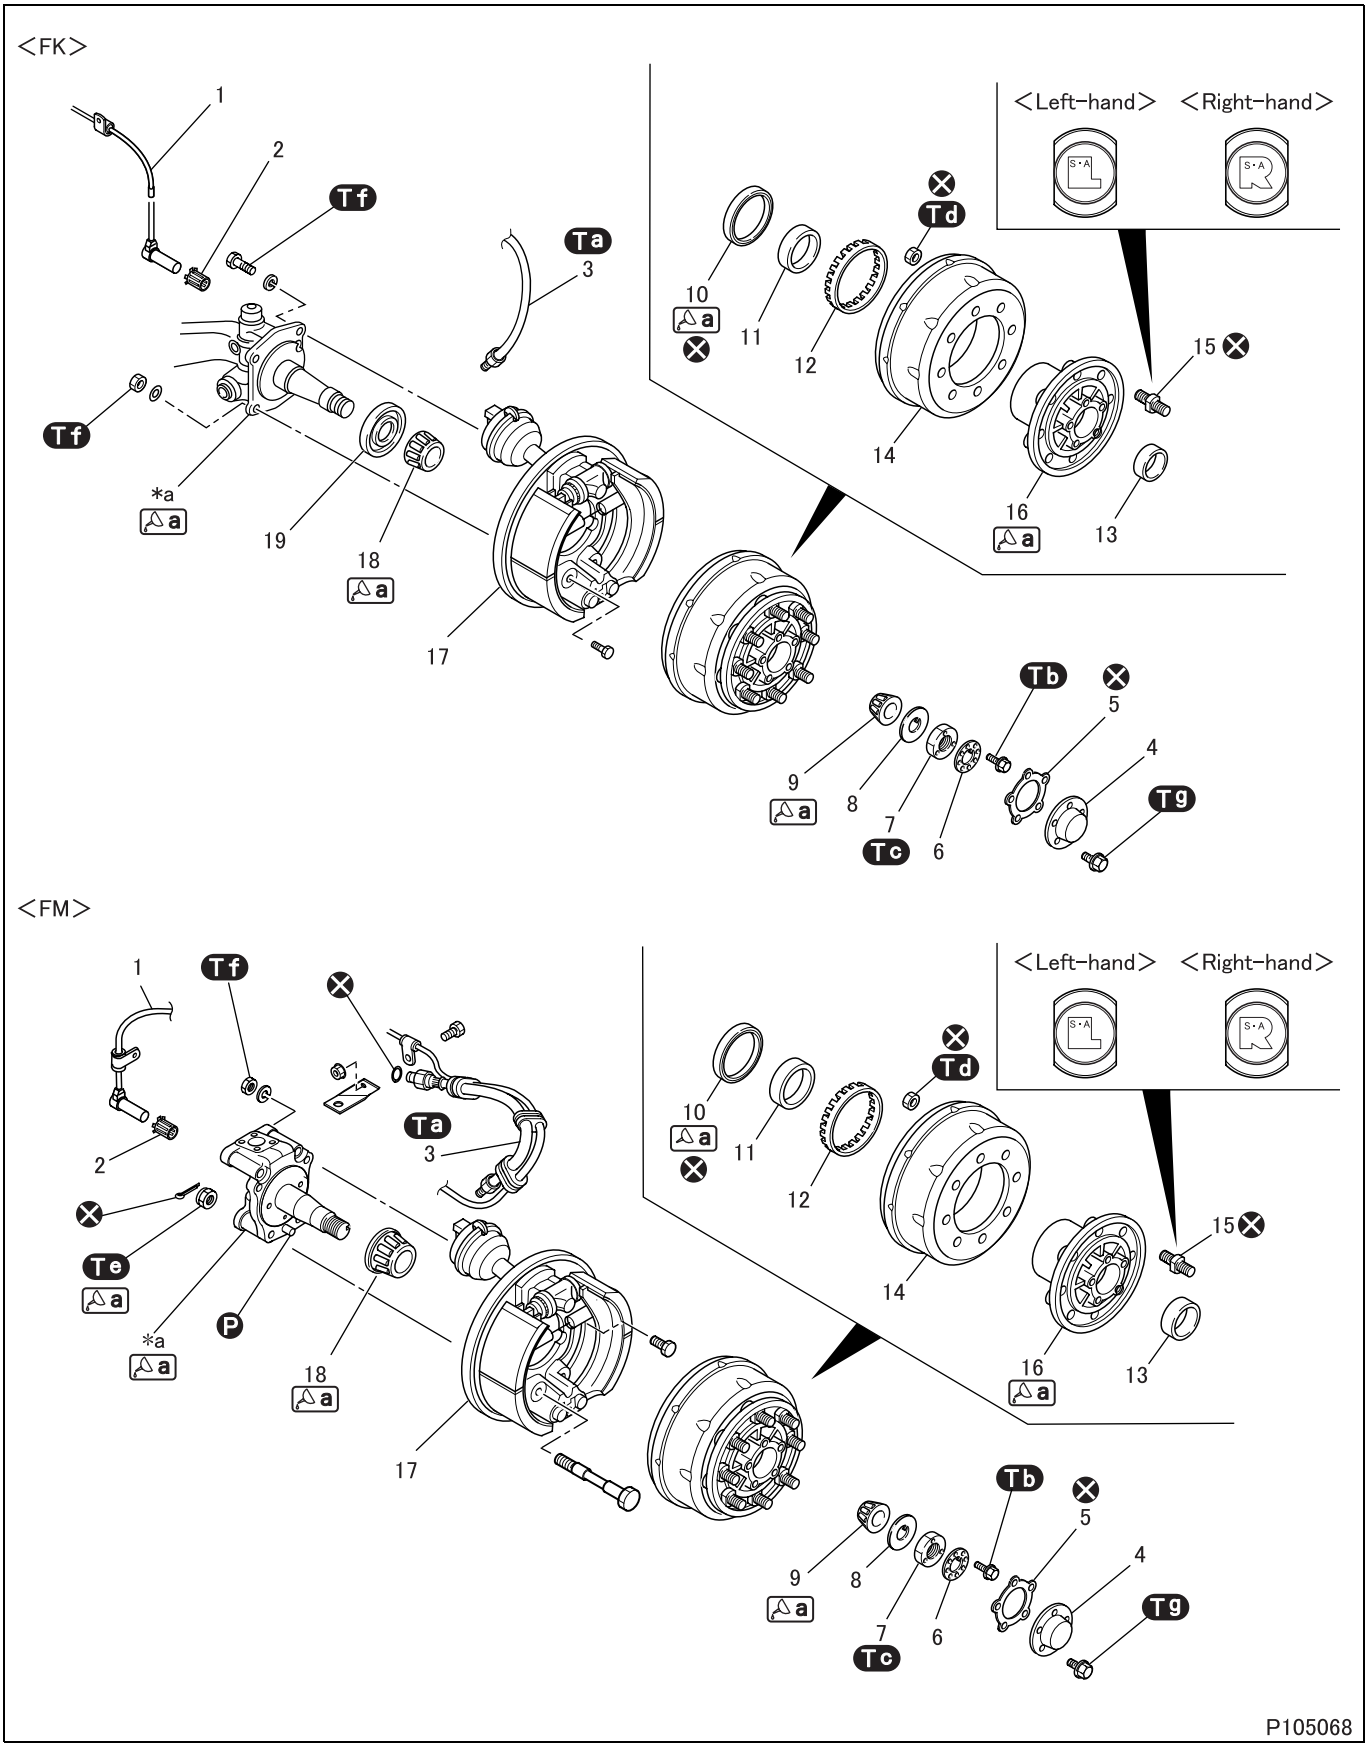
- Jack up the vehicle.
- Try to move the top and bottom of the front tire by hands in the illustrated directions to inspect the wheel bearing for play.
- If play is found with the feel of hands, repeat the inspection procedure while having the brake pedal pressed by another personnel. When the play is removed by operating the brake pedal, the symptom indicates that there is play in the wheel bearing, not in the suspension or other related parts. Then inspect the turning torque of the wheel bearing and adjust it as required. (See WHEEL HUB AND BRAKE DRUM or WHEEL HUB AND ROTOR.)
- If the turning torque of the wheel bearing cannot be adjusted correctly or the play still remains after the adjustment, replace the wheel bearing with a new one. (See WHEEL HUB AND BRAKE DRUM or WHEEL HUB AND ROTOR.)

6. Inspection of Knuckle Joint for Play



- Jack up the vehicle.
- Try to move the top and bottom of the front tire by hands in the illustrated directions to inspect the knuckle joint for play.
- If play is found with the feel of hands, repeat the inspection procedure while having the brake pedal pressed by another personnel. If there is any play, it may be caused by the play in the knuckle joint. Check each part and replace a defective part. (See KNUCKLE AND KING PIN, FRONT AXLE.)

WHEEL HUB AND BRAKE DRUM



● **Disassembly sequence**

1 Wheel speed sensor
2 Spring spacer
3 Brake hose
4 Wheel hub cover
5 Gasket
6 Lock plate
7 Lock nut
8 Lock washer
9 Outer bearing inner race
10 Oil seal
11 Inner bearing outer race
12 Anti-lock brake system rotor
13 Outer bearing outer race
14 Brake drum
15 Hub bolt
16 Wheel hub
17 Front drum brake (See Gr35B.)
18 Inner bearing inner race
19 Oil seal retainer <FK>

∗**a**: Knuckle
Ⓟ: Locating pin
⊗: Non-reusable parts

CAUTION ⚠

- **Plug the brake hose to prevent entry of dust and dirt after it has been removed.**
- **Store the wheel speed sensor so that its end is not damaged after it has been removed.**

NOTE

- **Do not remove the anti-lock brake system rotor unless replacing it.**
- **Do not disassemble the brake drum and wheel hub unless replacing them.**

● **Assembly sequence**

Follow the disassembly sequence in reverse.

CAUTION ⚠

- **Make sure that the brake hose is not twisted when installing it.**
- **Make sure that the brake lining surface and inner surface of the brake drum of the wheel hub and brake drum are free from grease to avoid malfunction of brakes.**
- **Make sure that the anti-lock brake system rotor and oil seal are not damaged when you install the wheel hub and brake drum on the knuckle.**
- **Adjust brake shoe clearance after assembly. (See Gr35B.)**

Service standards (Unit: mm {in.})

Location	Maintenance item			Standard value	Limit	Remedy
–	Starting torque of wheel hub bearing (tangential force at hub bolt position with oil seal assembled)			2.5 to 5.5 N·m {1.81 to 3.98 ft.lbs, 0.25 to 0.55 kgf·m} (tangential force: 18 to 38 N {3.97 to 8.60 lbs, 1.8 to 3.8 kgf})	–	Adjust or replace
12	Anti-lock brake system rotor shakes			0.05 {0.0020} or less	0.1 {0.0039}	Replace
14	Brake drum	Inside diameter	FK	370 {14.57}	372 {14.65} ※371 {14.61}	Correct or replace
			FM	410 {16.14}	414 {16.30} ※412 {16.22}	
		Cylindricity		0.05 {0.0020}	0.2 {0.0079}

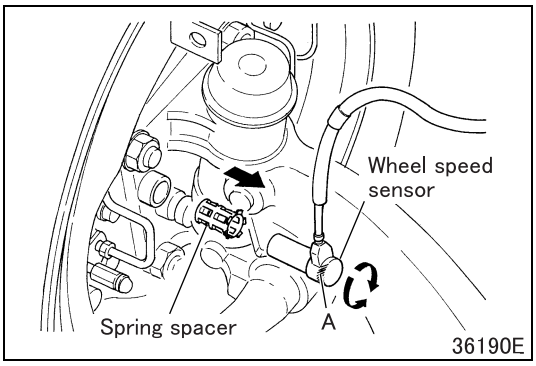
◆Removal procedure◆

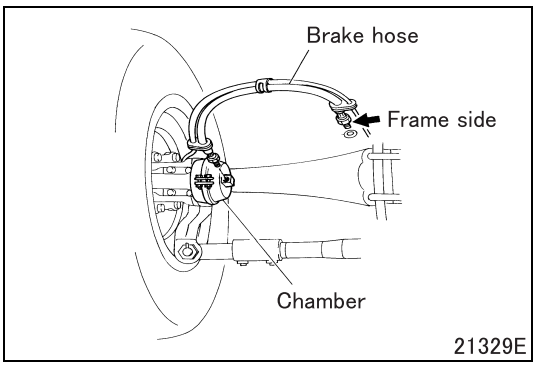


■ Removal: Wheel speed sensor and spring spacer

- Pinch diagonally shaded area A of the wheel speed sensor with pliers and remove it while turning it a little.

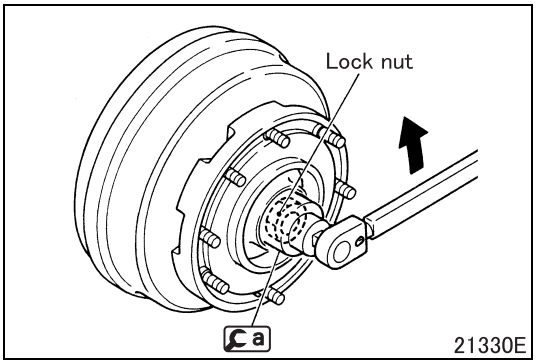
CAUTION ⚠

- **When pinching the wheel speed sensor with pliers, do not pinch other areas than the diagonally shaded area.**
- **When removing the wheel speed sensor, never apply excessive force to the sensor, such as hitting with a hammer, prying with a screwdriver or pulling the harness, since these actions can result in the breaking of wire.**
- **If the wheel speed sensor can be removed easily, replace the spring spacer.**

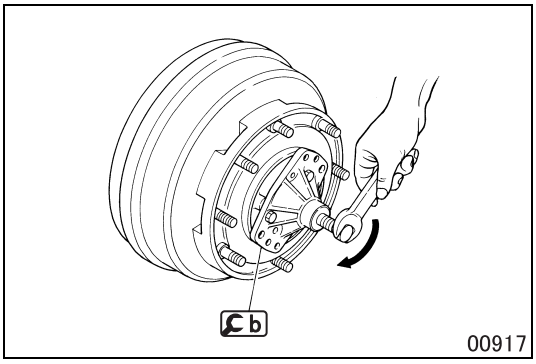


■ Removal: Brake hose

- When removing the brake hose, remove it from the frame side first, and then from the brake chamber side.

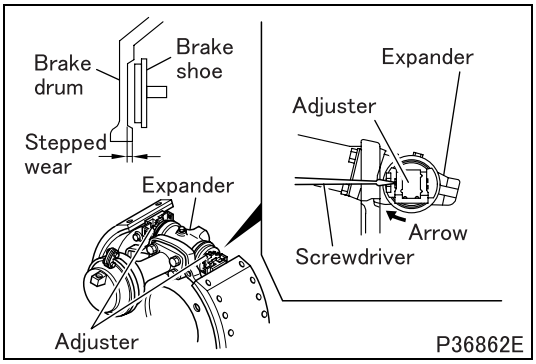


■ **Removal: Lock nut**



■ **Removal: Wheel hub and brake drum**

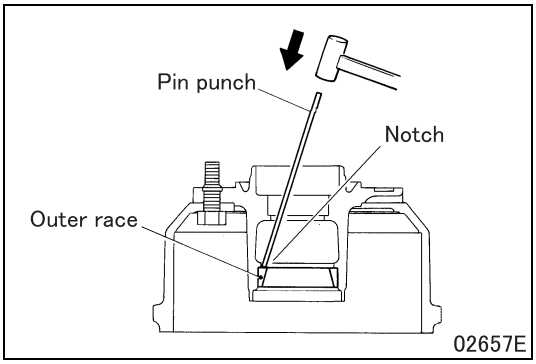
- If the brake drum has stepped wear and the wear prevents the wheel hub and brake drum from being removed, the removal can still be effected by taking the following procedure. After the removal, correct or replace the brake drum.



- Remove the dust cover.
- Turn the adjusting screw of the expander in the direction of the arrow, and widen clearance between the brake drum and brake shoe to remove.

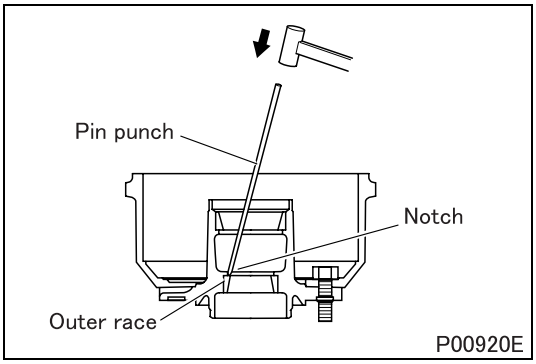
CAUTION ⚠

- **When inserting a flat-blade screwdriver, be careful not to damage the expander boot.**



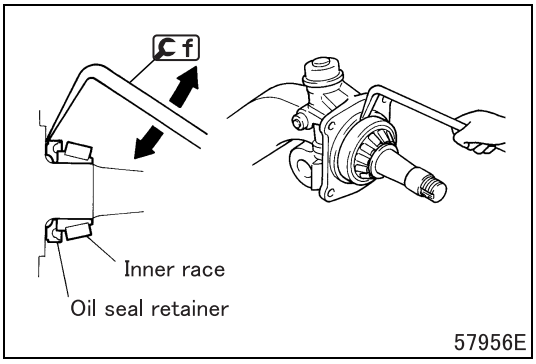
■ **Removal: Inner bearing outer race**

- Drive out the inner bearing outer race by tapping evenly at two notches in the wheel hub.



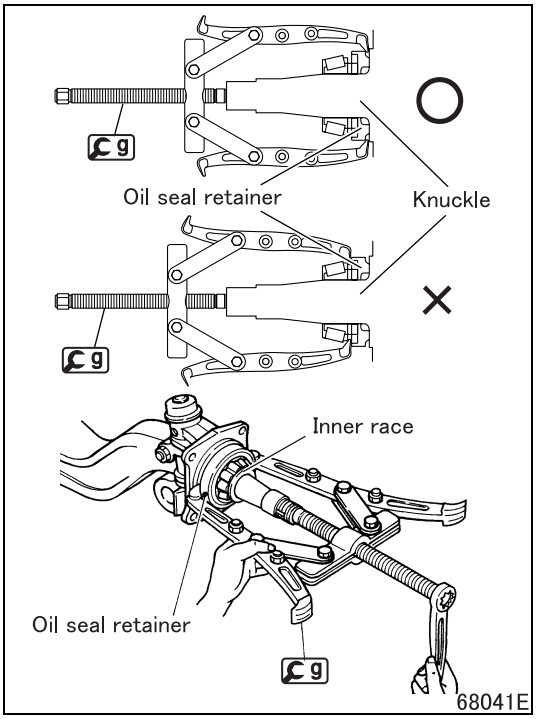
■ **Removal: Outer bearing outer race**

- Drive out the outer bearing outer race by tapping evenly at two notches in the wheel hub.

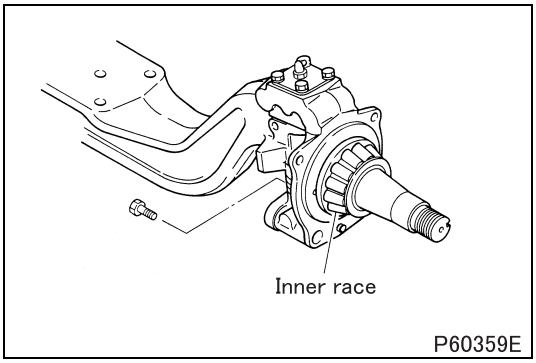


■ **Removal: Inner bearing inner race and oil seal retainer <FK>**

- Pry the oil seal retainer using [f] to open the clearance.

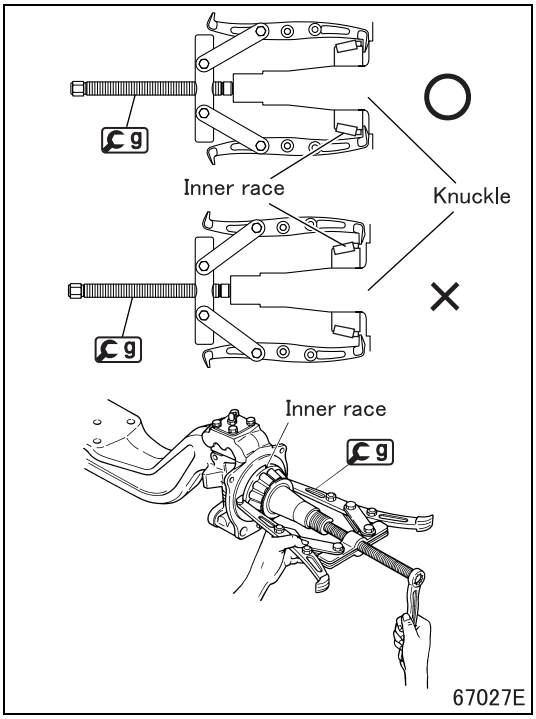


- Hook the claw of [g] to the clearance between the knuckle and oil seal retainer to remove.



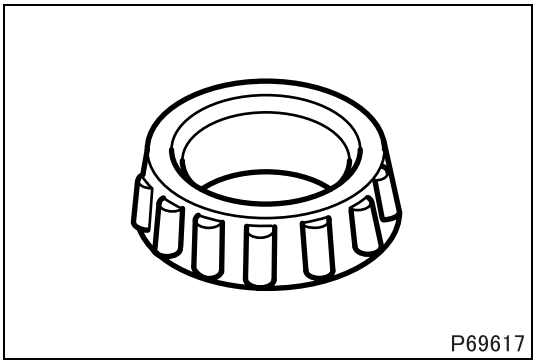
■ **Removal: Inner bearing inner race <FM>**

- Insert two bolts (M14 × 1.5 mm) into the knuckle stopper bolt or screw plug mounting hole of the knuckle evenly to push out the inner bearing inner race.



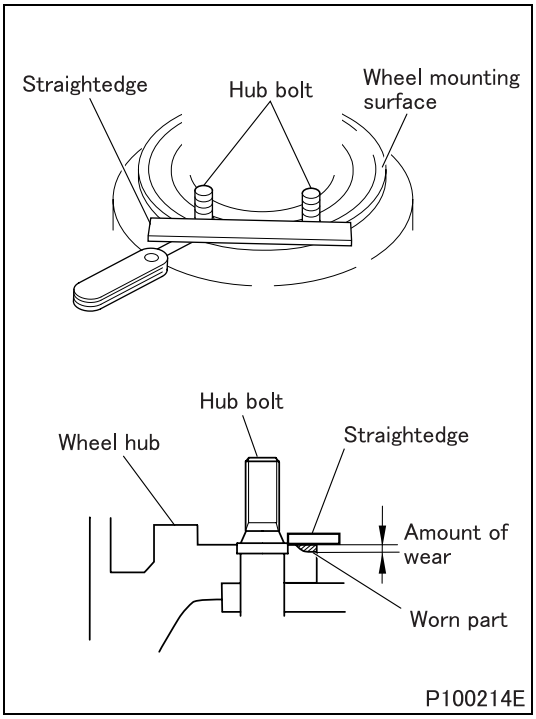
- Hook the claw of g to the clearance between the knuckle and inner bearing race to remove.

◆Inspection procedure◆



■ Inspection: Outer bearing inner race

- Inspect the outer bearing inner race after cleaning the bearing to remove grease completely.
- If any damage, wear, or poor rotating condition is evident in the inner race, replace it with a new one.
- The inner race and the outer race should be replaced as a set.



■ **Inspection: Wheel hub**

(1) Visual inspection

- Check the disc wheel mounting surface of the wheel hub by watching and touching. If there is damage or crack on it, replace the wheel hub.
- Make sure that there is not rust, dust, paint or foreign body on the disc wheel mounting surface of the wheel hub to prevent the wheel nut to loosen.
- If any abnormality is found, remove it with sandpaper.

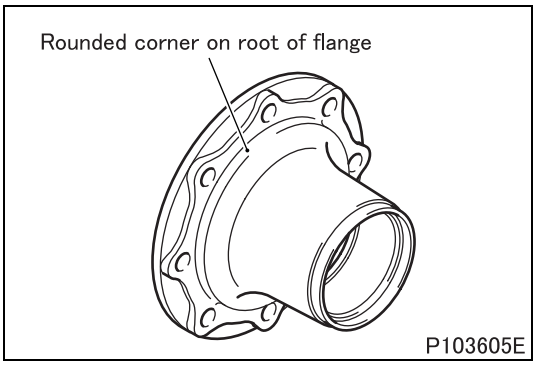
(2) Wear in disc wheel mounting part of wheel hub

- Clean the wheel mounting surface of the wheel hub before inspection.
- Place a straightedge on the hub so as to contact to the two hub bolts on the disc wheel mounting surface.

CAUTION ⚠

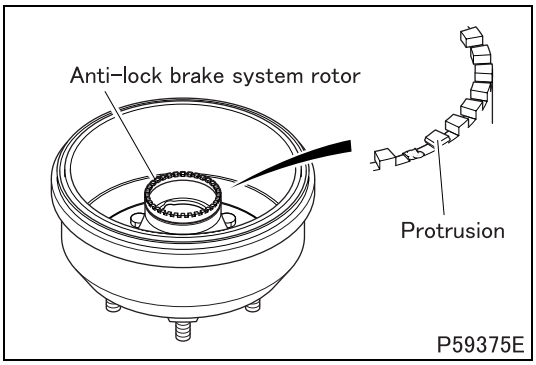
- **Make sure that the straightedge does not run onto the hub bolt.**

- Using feeler gauges to measure the amount of wear at the outer periphery of the wheel hub.
  Measure the amount of wear in the area of every hub bolt.
- If the amount of wear at any point exceeds the following standard value, inspect the crack check of wheel hub.
  Wear standard value: 0.8 mm {0.031 in.}



(3) Crack check

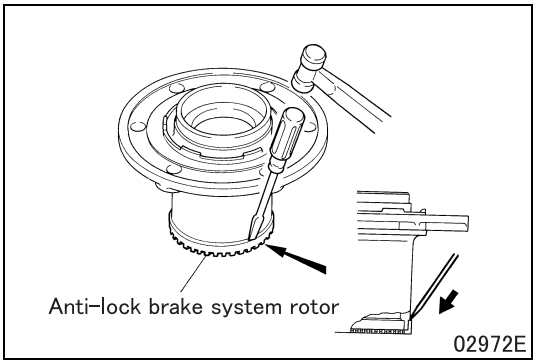
- Check if there is not crack on the entire rounded corner on the root of flange of the wheel hub by magnetic particle or liquid penetrant testing. If crack is found, replace the wheel hub.
- If crack is found on the wheel hub bolt, replace it.
- If there is crack or stepped wear on the wheel hub mounting surface of wheel disc, replace it. (See Gr31.)



■ **Inspection: Anti-lock brake system rotor**

[Inspection]

- Check the protrusions of the anti-lock brake system rotor for chipping and flattening.
- If any abnormality is found, replace the anti-lock brake system rotor.



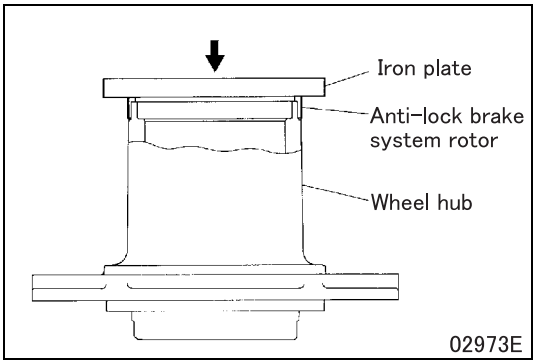
Replacement of anti-lock brake system rotor

[Removal]

- Drive out the anti-lock brake system rotor by tapping evenly at its circumference using a flat-blade screwdriver.

NOTE

- **Be careful not to damage the wheel hub.**

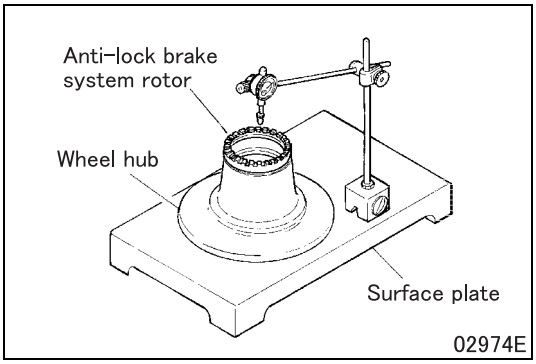


[Installation]

- Warm the anti-lock brake system rotor to approximately 150°C {302°F}, press it evenly using an iron plate, and press it into the wheel hub so that there is no clearance between the wheel hub and the anti-lock brake system rotor.

NOTE

- **When pressing, do not make dents in the rotor.**



[Inspection]

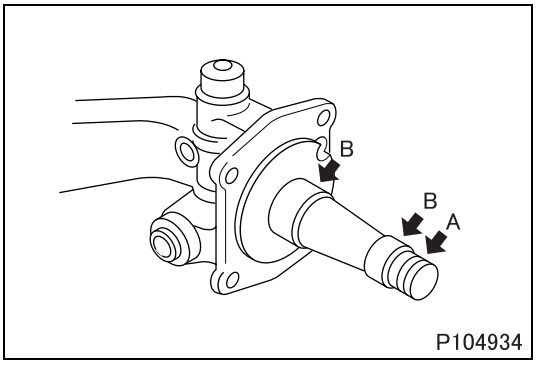
- If runout is out of the standard value, reassemble.
- If runout is out of the standard value after reassembly, replace the defective part(s).

■ Inspection: Brake drum

- If cylindricity of the brake drum exceeds the limit or the brake drum has stepped wear and seams, cut the brake drum integrally with the wheel hub within the range of the correction limit.

■ Inspection: Inner bearing inner race

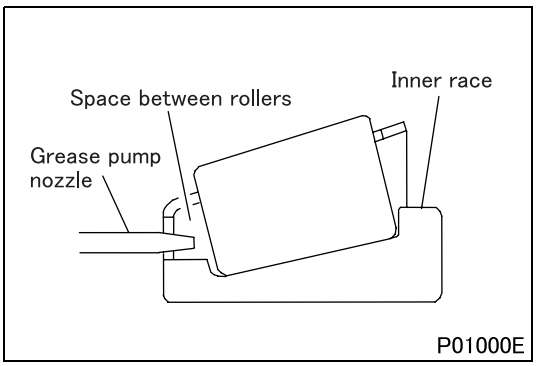
- Inspect the inner bearing inner race in the same manner as for the outer bearing inner race.
  (See "■ **Inspection: Outer bearing inner race**".)



■ Inspection: Knuckle

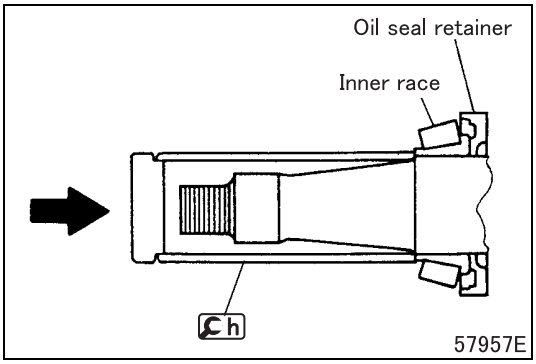
- If the lock nut tightening threads (A) are damaged, repair the damage using a die to ensure accurate adjustment of starting torque.
- Replace the knuckle if it apparently has stepped, tapered, uneven or other abnormal wear or damage in the outer bearing fitting surface (B).

◆Installation procedure◆



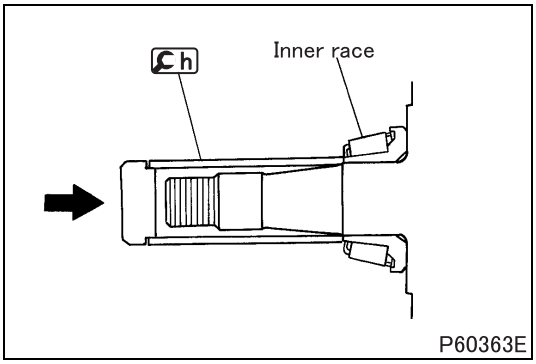
■ **Installation: Packing of grease in inner bearing inner race**

- Insert the grease pump nozzle into the space between rollers of the outer and inner bearing inner race to pack grease sufficiently.



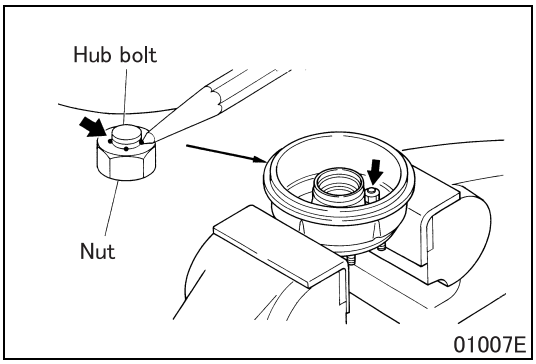
■ **Installation: Inner bearing inner race and oil seal retainer <FK>**

- Using Ch press-fit oil seal retainer and inner bearing inner race simultaneously.



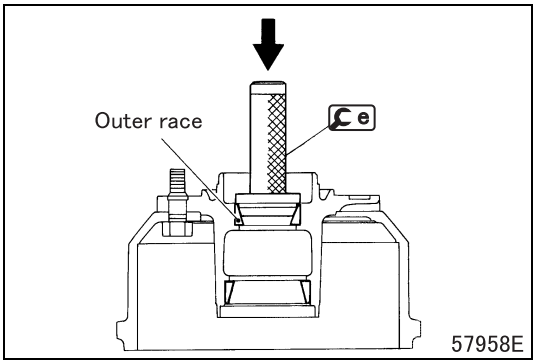
■ **Installation: Inner bearing inner race <FM>**

- Using Ch press-fit inner bearing inner race.

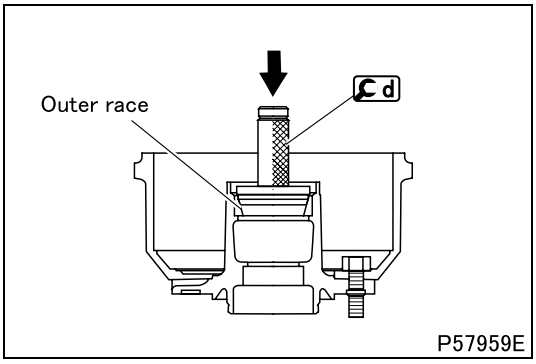


■ **Installation: Hub bolts**

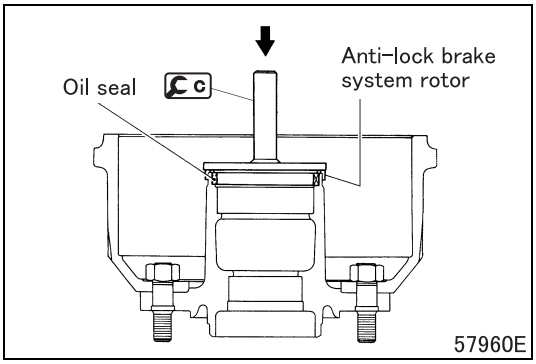
- As for hub bolt, tighten nut at specified torque, and caulk at 4 positions for prevention of loosening.



■ **Installation: Outer bearing outer race**



■ **Installation: Inner bearing outer race**



■ **Installation: Oil seal**

- Use c when press-fitting the oil seal to the wheel hub with the anti-lock brake rotor already installed.

■ **Installation: Packing of grease in outer bearing inner race**

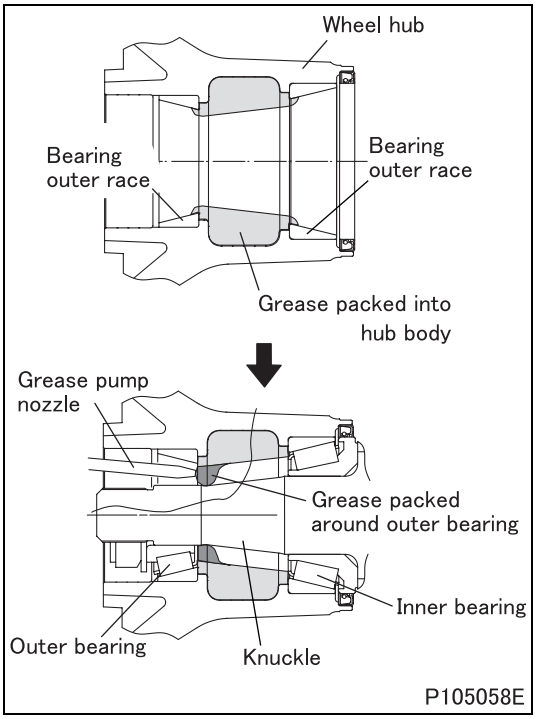
- Follow the same procedure as for packing the inner bearing inner race with grease.
  (See "■ **Installation: Packing of grease in inner bearing inner race**".)

■ **Installation: Packing of grease to inside of wheel hub**

- Pack grease following Manner 1 or Manner 2 shown below.

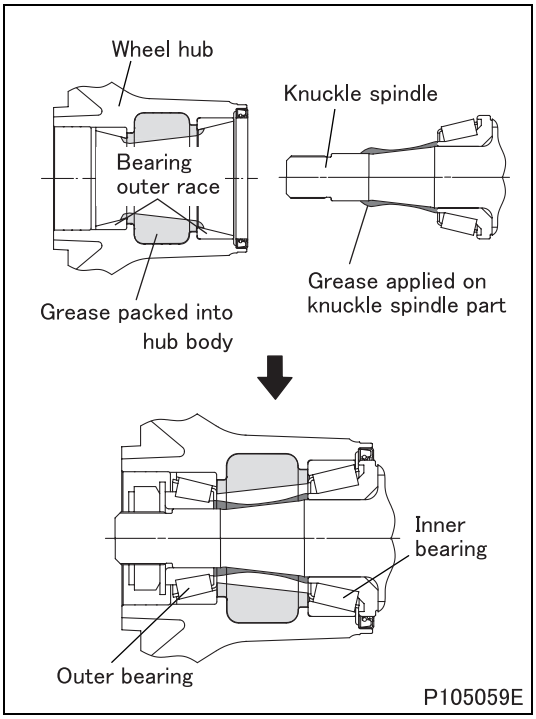
CAUTION ⚠

- **Wheel bearing seized may be caused unless following these manners.**
- **Pack the specific amount of grease measured by measurement cup or etc.**



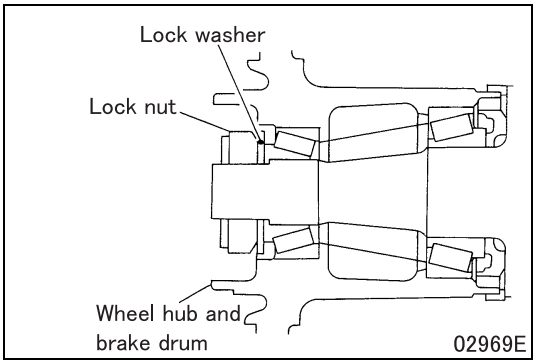
<Manner 1>

- Pack grease in the wheel hub body so much that grease covers the outer and inner bearing outer races to ensure that grease will reach the outer and inner bearings as shown in the drawing.
- After installing the wheel hub in the knuckle, insert a grease pump nozzle into the wheel hub and add grease to around the outer bearing before installing the outer bearing inner race.



<Manner 2>

- Pack grease in the wheel hub body so much that grease covers the outer and inner bearing outer races to ensure that grease will reach the outer and inner bearings as shown in the drawing.
- Before installing the wheel hub in the knuckle, apply grease to the knuckle spindle.



■ **Adjustment: Starting torque of wheel hub bearing**

CAUTION ⚠

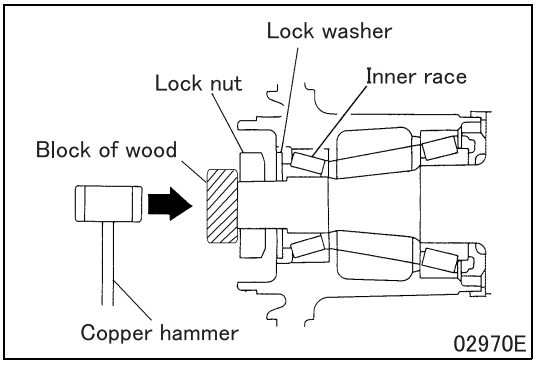
- **Unless this adjustment procedure is performed, seizure of the wheel hub bearing can be caused.**

[Adjustment]

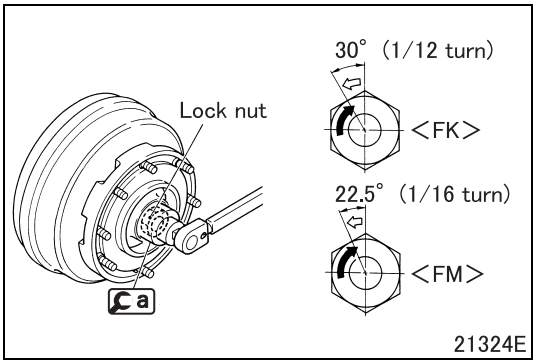
- Temporarily tighten the lock nut and make sure that the brake drum and brake shoe do not drag.
- If they drag, make adjustment with the adjuster of the wheel cylinder.
- Gradually tighten the lock nut while turning the wheel hub and brake drum. Tighten the lock nut so that the specified torque is achieved when the wheel hub and brake drum are turned three times or more.

CAUTION ⚠

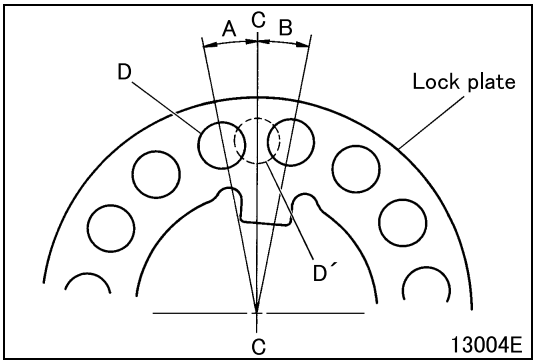
- **Do not tighten the lock nut without turning the wheel hub and brake drum, or tighten it to the specified torque within three turns. Failure to observe the above will make the installed condition of the inner bearing faulty, causing poor rotation and seizure.**



- Perform the following work to pull the outer bearing inner race toward the lock nut side.
- Loosen the lock nut to create clearance between the outer bearing inner race and lock nut.
- Apply a block of wood to the end face of the axle housing, and tap it two or three times while turning the wheel hub and brake drum.

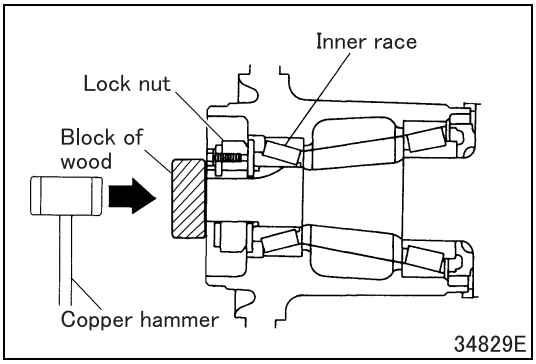


★ • Tighten lock nut at specified torque, and after it, return to the loosening direction as shown by the amount of 30 degrees (1/12 turn) <FK>, 22.5 degrees (1/16 turn) <FM>.

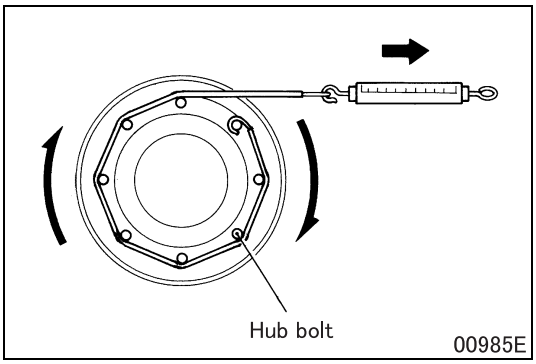


- Fit lock plate into place check to ensure that all of the mounting holes in lock nut and the lock plate are in alignment, and tighten mounting bolts.
- If the mounting holes of lock nut and lock plate are out of alignment, align them by the procedures shown in the following table.

Lock nut hole position	How to align lock plate hole
Range A	Loosen lock nut and align holes.
Range B	Turn over lock plate, loosen lock nut and align holes.
On line C–C	Turn over lock plate and align holes. (Hole position changes from D´ to D.)

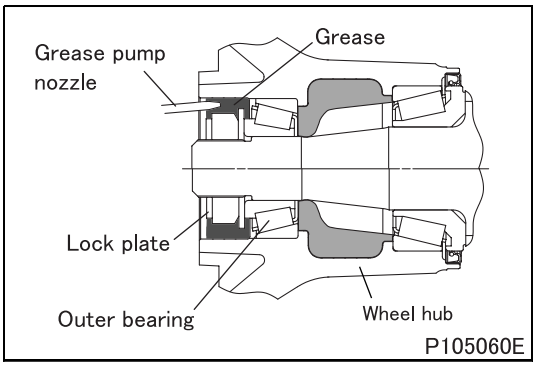


- Perform the following work to pull the outer bearing inner race toward the lock nut side again.
- Apply a block of wood to the end face of the axle housing, and tap it two or three times while turning the wheel hub and brake drum.
- Make sure that there is no looseness in the axial direction.
- Perform a measurement again after adjustment. If the measured value is out of the standard value, repeat the work from the item marked with ★, since adjustment of the lock nut may be insufficient.
- If the result is found to be abnormal, replace the outer and inner bearings.



[Inspection]

- After assembly of the lock nut, fasten a spring balance to hub bolt and measure tangential force.
- If the tangential force meets the specified value, starting torque will become the standard value.
- If the measurement deviates from the specified value, repeat the work from the item marked with ★, since adjustment of the lock nut may be insufficient.
- If the result is found to be abnormal, replace outer and inner bearings.



■ Installation: Packing of grease in outside of wheel hub

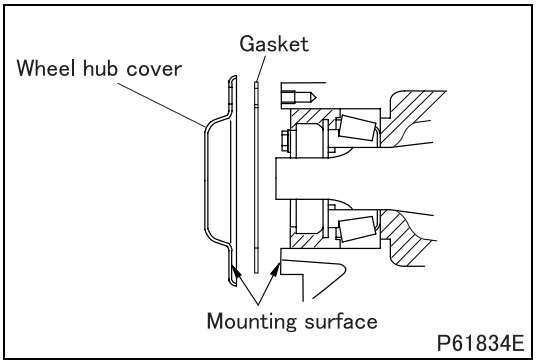
CAUTION ⚠

- **Unless this packing procedure is performed, seizure of the wheel hub bearing can be caused.**
- **For a grease amount, pack the specified amount using a measuring cup.**

- Pack grease up to the lock plate using a grease pump nozzle so that a wall is formed outside the outer bearing as shown in the illustration.

CAUTION ⚠

- **Do not pile grease in the wheel hub cap. Otherwise, grease does not reach the outer bearing, causing poor lubrication of the bearing.**



■ **Installation: Wheel hub cover**

CAUTION ⚠

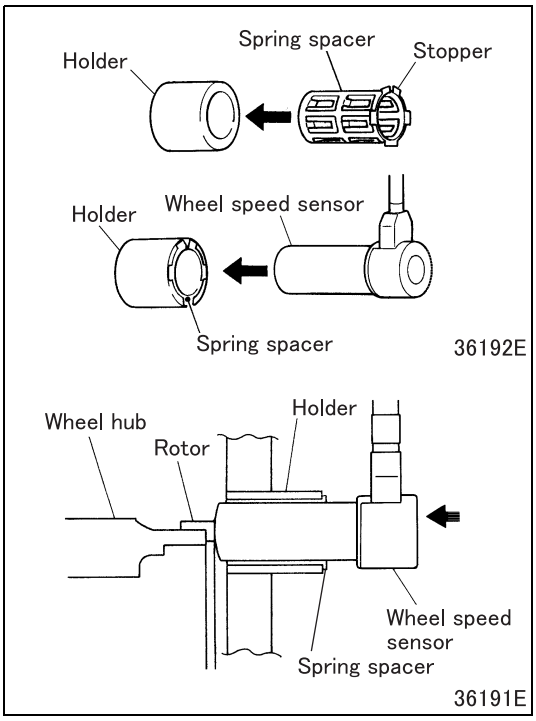
- **Adhesion of grease to the mounting surface with the wheel hub causes water entry and grease leakage.**

■ **Installation: Brake hose**

- To install the brake hose, follow the removal procedure in reverse. (See "■ **Removal: Brake hose**".)
- After installing, make sure that the brake hose does not interfere in the peripheral parts.

CAUTION ⚠

- **Make sure that the brake hose is not twisted when installing it.**

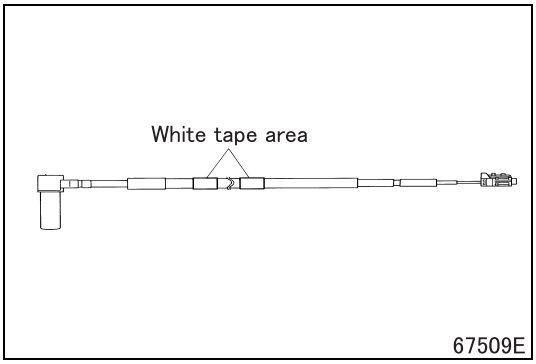


■ **Installation: Wheel speed sensor and spring spacer**

- Insert the spring spacer into the holder of the knuckle and press it in until its stoppers knock against the holder.
- Insert the wheel speed sensor and press it in until it knocks against the rotor with tactile feel.
- Slowly turn the wheel hub and brake drum two or three times (2 seconds per turn) to make sure that they turn smoothly.

CAUTION ⚠

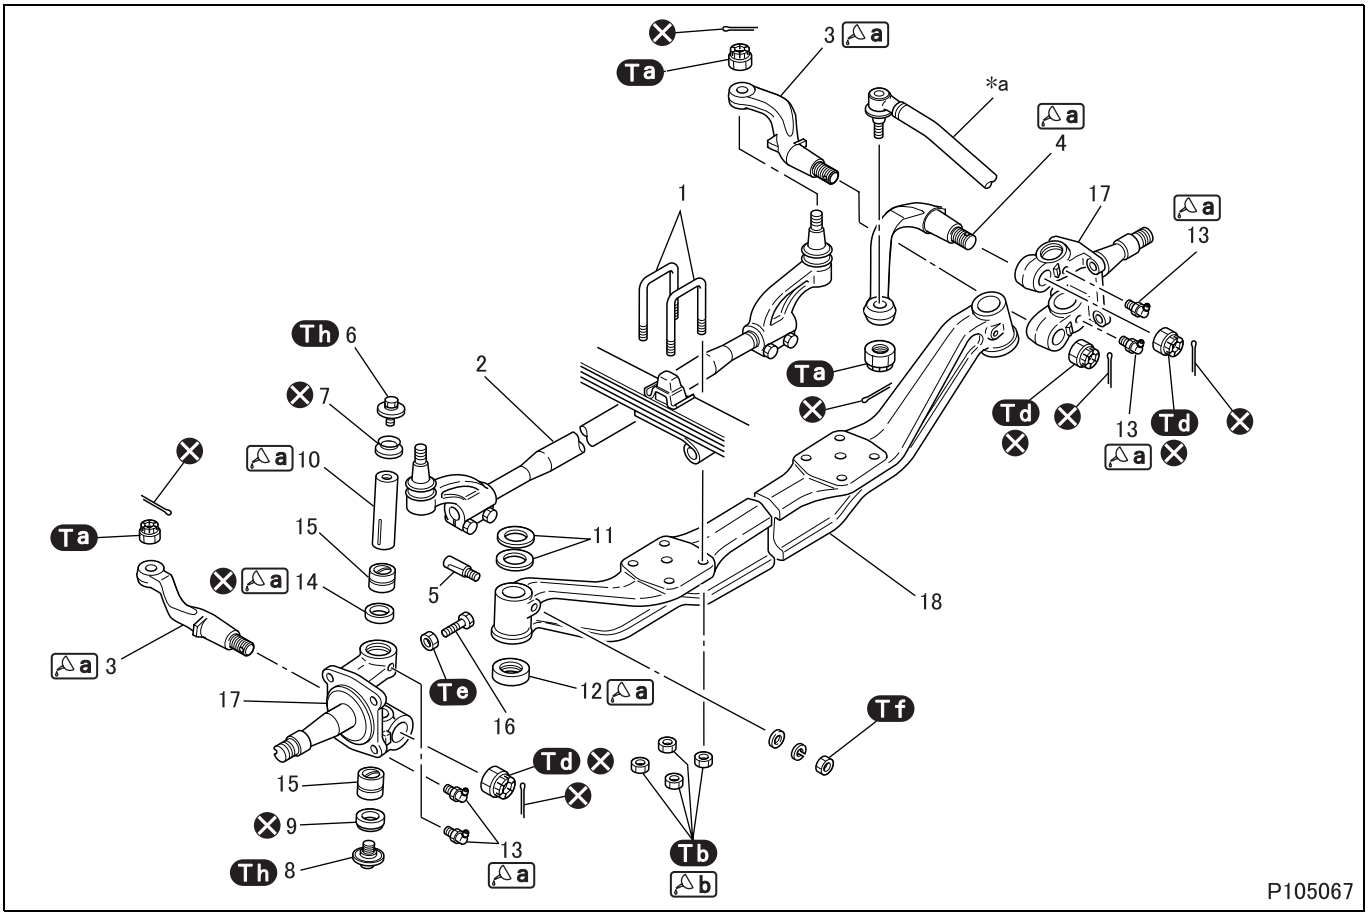
- **When installing the wheel speed sensor, never apply excessive force to the sensor, such as hitting with a hammer, prying with a screwdriver or pulling the harness, since these actions can result in the breaking of wire.**



■ **Installation: Harness of wheel speed sensor**

- Be sure to secure clip positions of the wheel speed sensor harness at the white tape area to avoid interference with other parts, twist and slack.

FRONT AXLE, KNUCKLE AND KINGPIN <FK>



● **Disassembly sequence**

1	U-bolt	**8**	Lower cover	**15**	Bushing
2	Tie rod	**9**	Dust seal	**16**	Knuckle stopper bolt
3	Tie rod arm	**10**	Kingpin	**17**	Knuckle
4	Knuckle arm	**11**	Thrust washer	**18**	Front axle
5	Set bolt	**12**	Thrust bearing		
6	Upper cover	**13**	Grease nipple	***a**	Drag link
7	Dust seal	**14**	Oil seal	⊗	Non-reusable parts

CAUTION ⚠

- **Do not damage the dust cover of the tie rod when removing the tie rod.**
  Damaging the dust cover may cause water infiltration and wear-out at the early stage.

NOTE

- **Kingpin may have a blackened surface, but this is due to transcription of the resin of bushing and does not present any problem.**

● **Assembly sequence**

Follow the disassembly sequence in reverse.

Repair kit: Kingpin kit

Service standards (Unit: mm {in.})

Location	Maintenance item		Standard value	Limit	Remedy
10	Outer diameter of kingpin		44.985 to 44.998 {1.771 to 1.772}	44.9 {1.77}	Replace
10, 15	Clearance between kingpin and bushing		0.02 to 0.06 {0.00079 to 0.0024}	0.15 {0.0059}	Replace
10, 18	Clearance between kingpin and axle		0.002 to 0.04 {0.00008 to 0.0157}	0.1 {0.0039}	Replace
15	Inner diameter of bushing (after having been pressed into knuckle)		45.018 to 45.045 {1.772 to 1.773}	–	Replace
17, 18	Vertical clearance between knuckle and front axle		0.1 {0.0039} or less	0.2 {0.0079}	Adjust
18	Front axle	Horizontal bend	2.5 {0.0098} or less	7 {0.28}	Replace
		Vertical bend	3 {0.12} or less	7 {0.28}

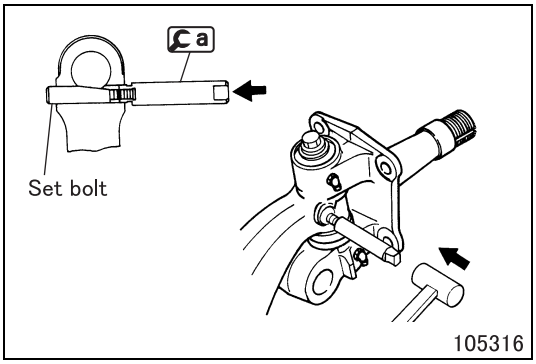
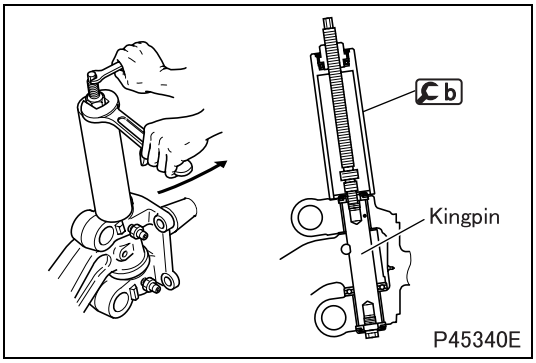
◆Removal procedure◆



105316

■ **Removal: Set bolt**

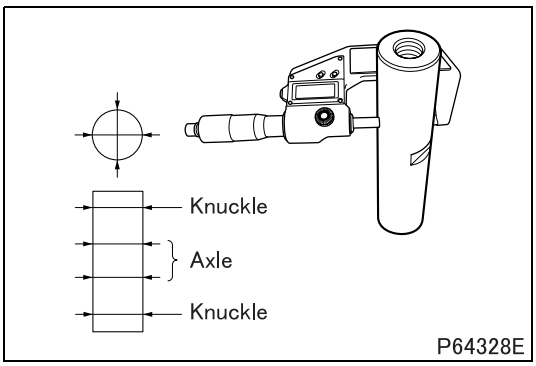


P45340E

■ **Removal: Kingpin**

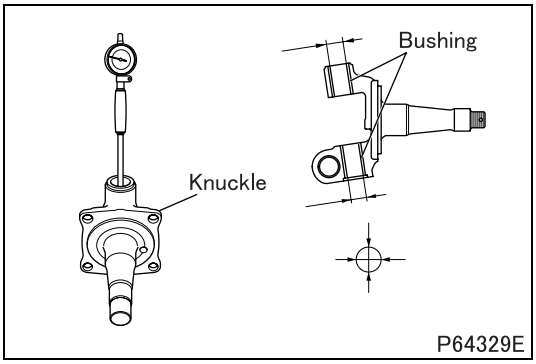
- Screw b into the kingpin threads to remove the kingpin.

◆Inspection procedure◆



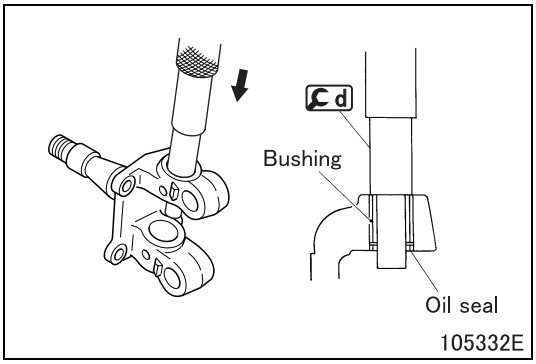
■ **Inspection: Outer diameter of kingpin**

- Take measurement at a total four levels on the kingpin: two levels for the axle fitting portion and one level each for the upper and lower knuckle fitting portions.
- If the measured value is under the limit, replace the kingpin with a new one.



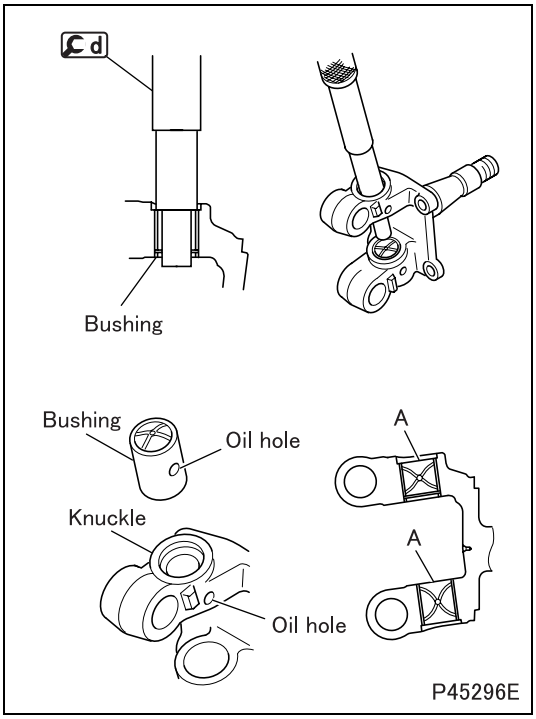
■ **Inspection: Clearance between kingpin and bushing**

- Measure the inner diameter of the upper and lower bushings using a cylinder gauge and calculate the clearance deducting the outer diameter of the kingpin from the inner diameter of the bushing.
  If the clearance exceeds the limit, replace the bushings with new ones.



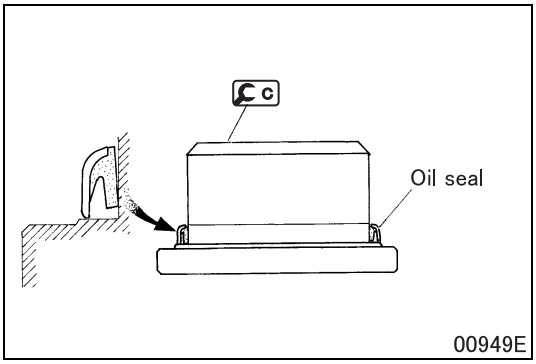
Replace of bushing
[Removal]

- Remove the bushing and the oil seal at the same time using d.

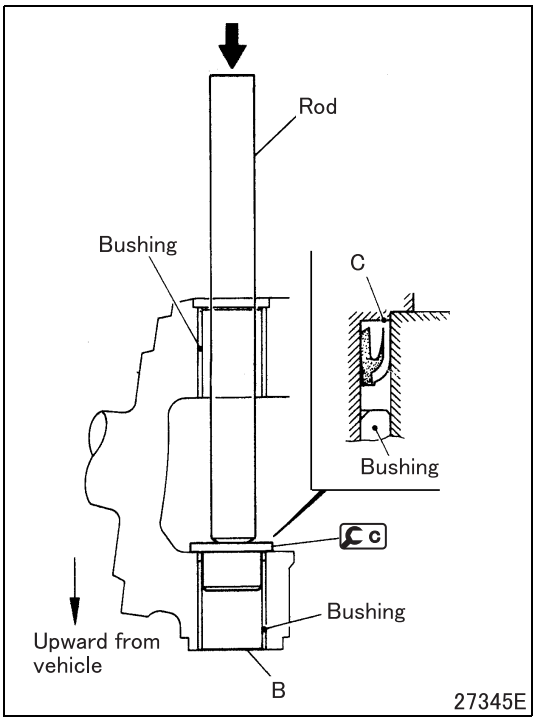


[Installation]

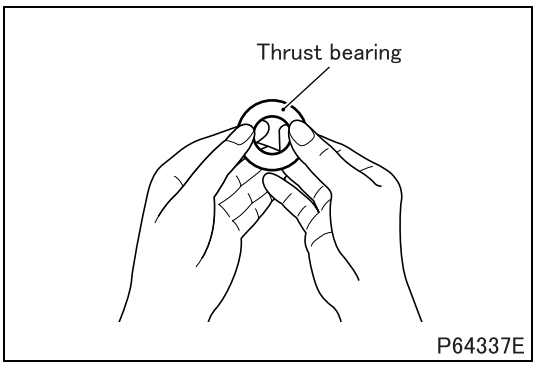
- Install bushing in with oil hole aligned to oil hole of knuckle, until end surface A becomes flush with knuckle end surface.



- Apply grease to lip area of oil seal, and set oil seal on c.

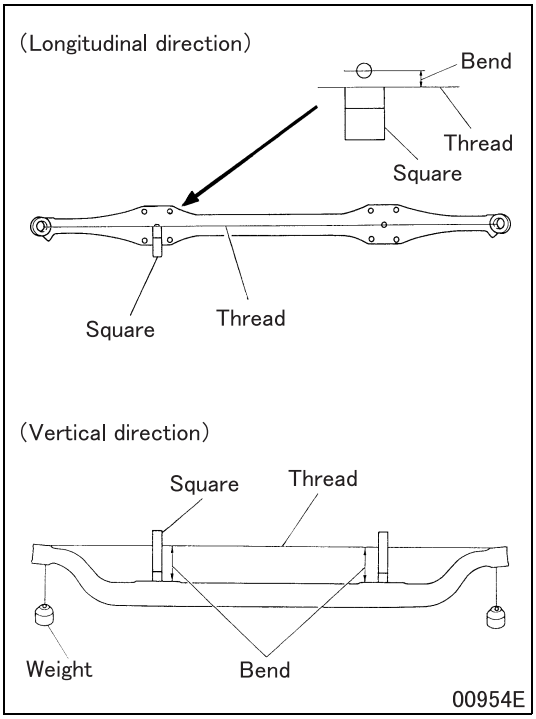


- Next, install c on the knuckle in the illustrated direction.
- Insert rod into kingpin hole, and attach it to c.
- Hit the head using a hammer until c comes to rest at knuckle.
- Make sure that end of bushing at B is flush with knuckle surface.
- End surface of oil seal at C shall not be protruding from knuckle.



■ **Inspection: Thrust bearing**

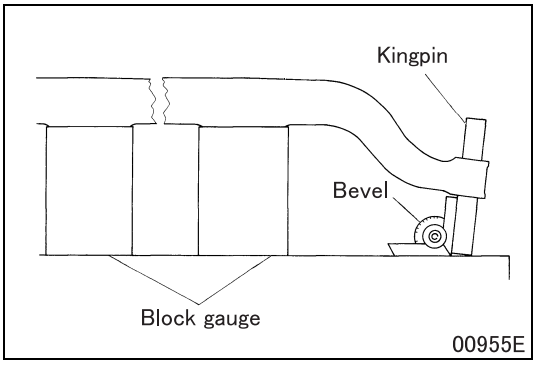
- Inspect the aspect and smooth turning of the thrust bearing. If any crack, damage, or un-smooth turning is found, replace the thrust bearing with a new one.



■ **Inspection: Front axle**

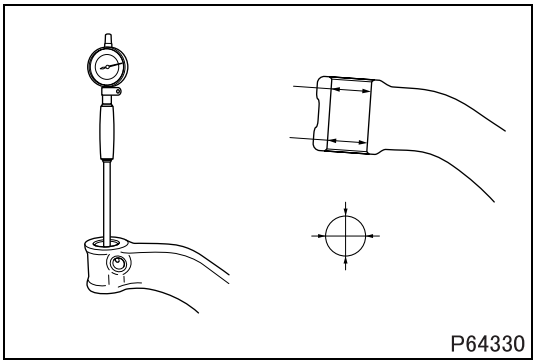
(1) Bend of front axle in the longitudinal direction and vertical direction

- Put a piece of thread through kingpin holes of the front axle and hang weights at both ends.
- Use a square to find bend to each of longitudinal and vertical directions.
- If the measured value exceeds the limit, replace the front axle.



(2) Kingpin inclination angle

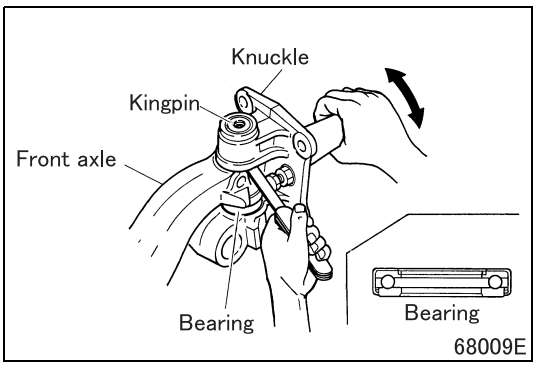
- Set the kingpin on the front axle as illustrated to measure the angle.
- If the measured value deviates from the standard value, replace the front axle.



(3) Clearance between kingpin and front axle

- Measure the inner diameter of the axle's hole where the kingpin is inserted using a cylinder gauge and calculate the clearance deducting the outer diameter of the kingpin from the inner diameter.
  If the clearance exceeds the limit, replace the axle or the kingpin with a new one.

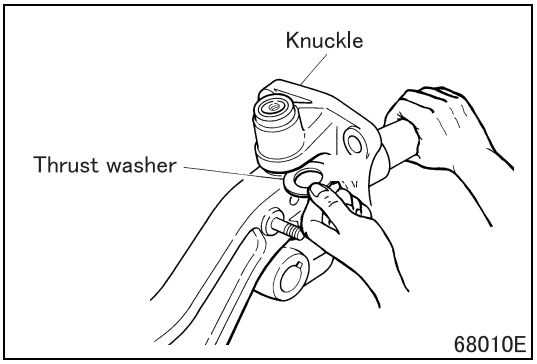
◆Installation procedure◆



■ **Inspection: Thrust washer, bearing, knuckle and front axle**

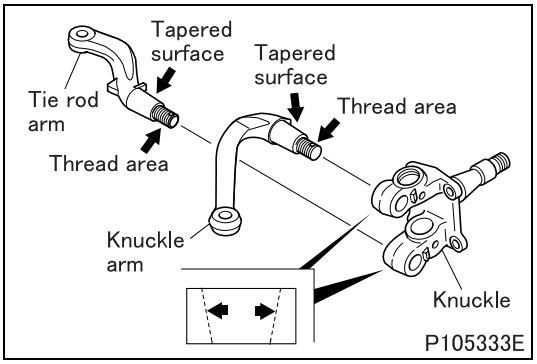
[Inspection]

- Provisionally assemble kingpin and bearing, move 2 or 3 times knuckle to have them fit.
- Measure clearance between front axle upper surface and knuckle downside.
- Adjust if the measured value exceeds the limit.



[Adjustment]

- Kinds of adjusting thrust washers
  2.9 to 3.6 mm {0.114 to 0.142 in.} (8 kinds with every 0.1 mm {0.0039 in.} difference)
- Select a thrust washer so as to make clearance as small as possible.
- After assembly, make sure that the knuckle moves smoothly.



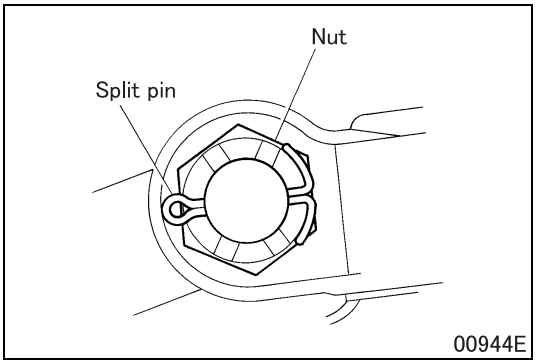
■ **Installation: Tie rod arm, knuckle arm and knuckle**

(1) When any of the tie rod arm, knuckle arm and knuckle, or all of them are reused

- Polish the entire tapered surfaces of tie rod arm, knuckle arm and knuckle evenly by means of sand paper #120 or above until sand paper score is visible on polished surfaces. (This does not apply to new replacement parts.)
- Clean tapered surfaces of knuckle arm and knuckle, and threaded area of knuckle arm screw.

NOTE

- **Use acetone, cleaning fluid for color check, or equivalent as solvent.**



- Apply grease to threaded area of knuckle arm screw and assemble.

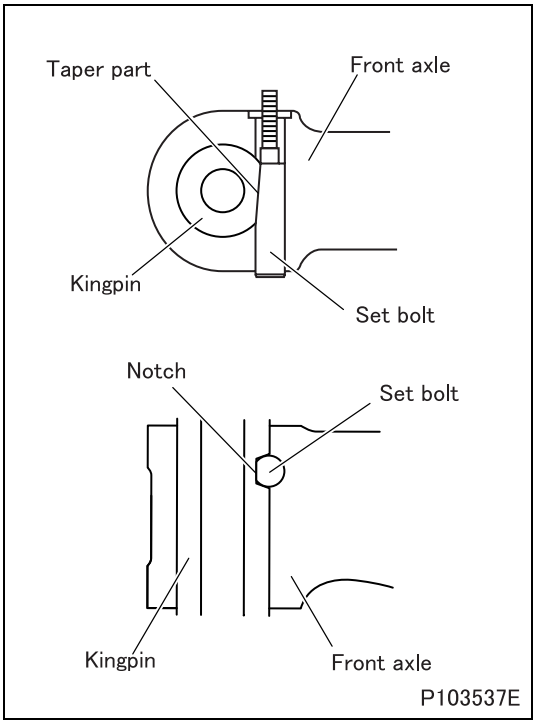
CAUTION ⚠

- **Upon assembling, keep off grease from tapered areas of knuckle and knuckle arm.**

- Tighten nut at specified torque, align pin holes in the course of tightening without fail, insert split pin, and secure it.

(2) When all of tie rod arm, knuckle arm and knuckle for assembling are new parts

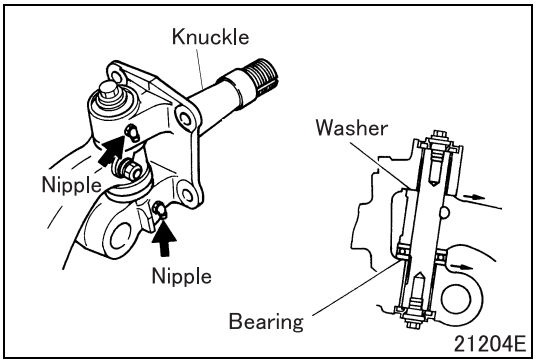
- Clean tapered surfaces and threaded area of tie rod arm, knuckle arm and knuckle.
- Tighten new nut at specified torque, align pin holes in the course of tightening without fail, insert split pin, and secure it.



■ **Installation: Set bolt**

- Install the set bolt so that the taper part of the set bolt is aligned with the notch of the kingpin.

◆Work after assembly◆



■ **Greasing: Grease nipple**

- Supply grease through the grease nipple of the knuckle.
- Supply grease until it overflows from the thrust washer and press portion of the bearing.

FRONT AXLE, KNUCKLE AND KINGPIN <FM>

Mark	Tool name and shape	Part No.	Application
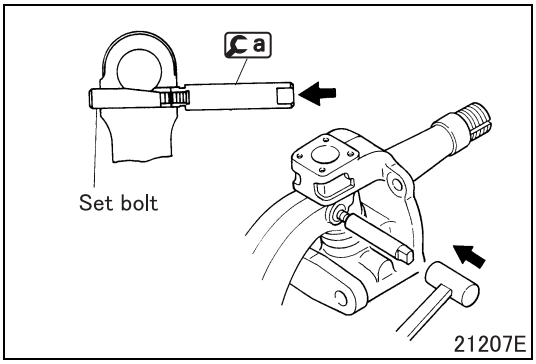
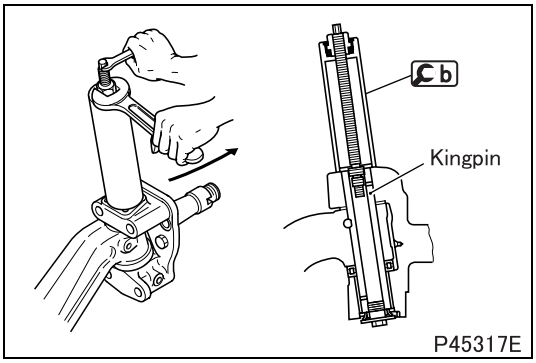
ⓑ	Kingpin puller  00939 A: M16 × 1.5 B: M22 × 1.5 C: M27 × 1.5	MH061684	Removal of kingpin
ⓒ	Oil seal installer A: ϕ50 {1.97}  00940	MH062203	Installation of oil seal
ⓓ	Kingpin bushing remover A: ϕ45 {1.77} B: ϕ50 {1.97} C: ϕ54.5 {2.15}  00941	MH061792	Removal of oil seal and removal and installation of bushing

◆Removal procedure◆



21207E

■ **Removal: Set bolt**

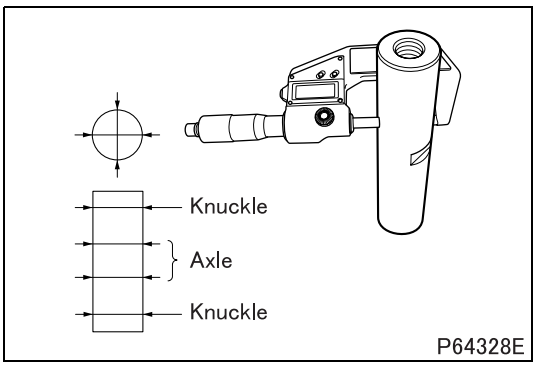


P45317E

■ **Removal: Kingpin**

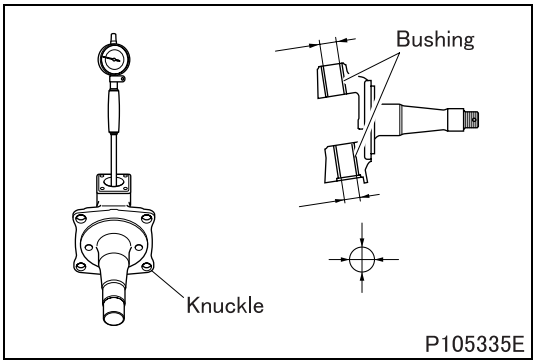
- Screw ⓑ into the kingpin threads to remove the kingpin.

◆Inspection procedure◆



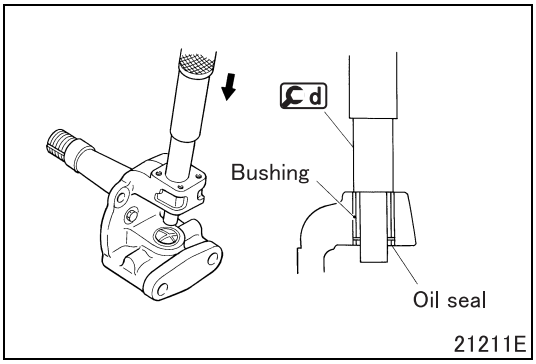
■ **Inspection: Outer diameter of kingpin**

- Take measurement at a total four levels on the kingpin: two levels for the axle fitting portion and one level each for the upper and lower knuckle fitting portions.
- If the measured value is under the limit, replace the kingpin with a new one.



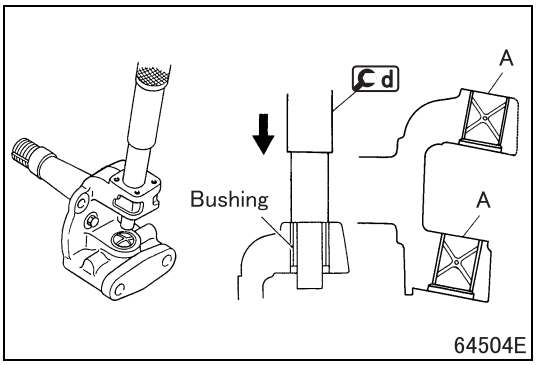
■ **Inspection: Clearance between kingpin and bushing**

- Measure the inner diameter of the upper and lower bushings using a cylinder gauge and calculate the clearance deducting the outer diameter of the kingpin from the inner diameter of the bushing.
  If the clearance exceeds the limit, replace the bushings with new ones.



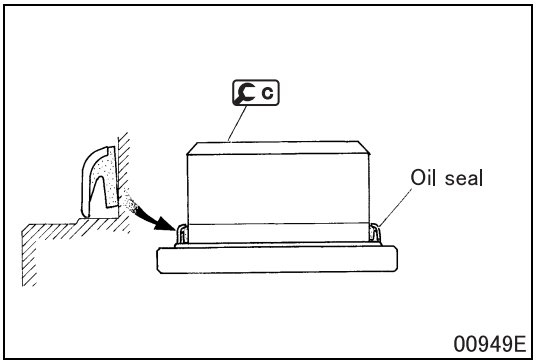
Replace of bushing
[Removal]

- Remove the bushing and the oil seal at the same time using d.

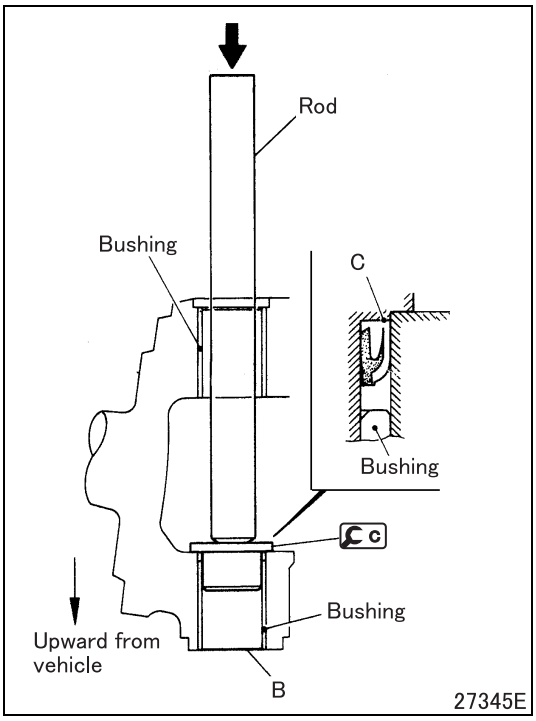


[Installation]

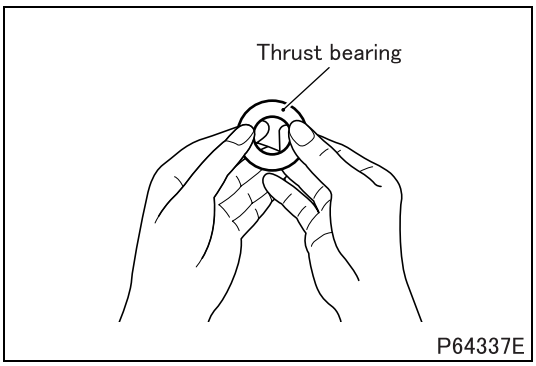
- Install the bushing so that it is flush with the knuckle at A.



- Apply grease to lip area of oil seal, and set oil seal on C.

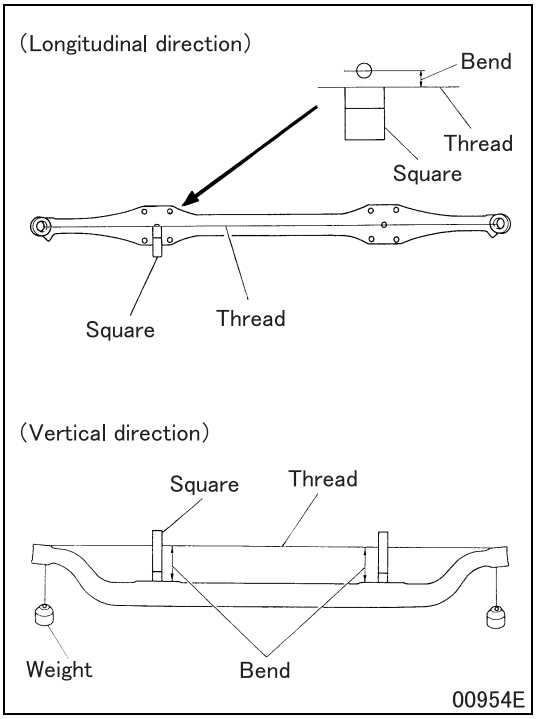


- Next, install C on the knuckle in the illustrated direction.
- Insert rod into kingpin hole, and attach it to C.
- Hit the head using a hammer until C comes to rest at knuckle.
- Make sure that end of bushing at B is flush with knuckle surface.
- End surface of oil seal at C shall not be protruding from knuckle.



■ Inspection: Thrust bearing

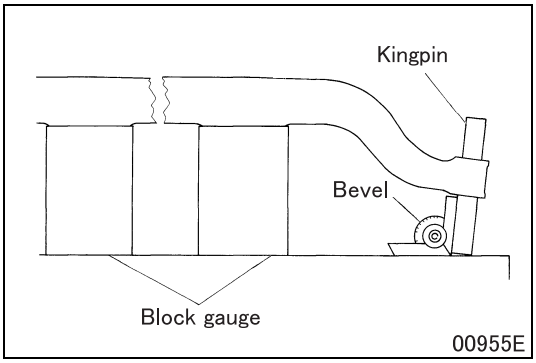
- Inspect the aspect and smooth turning of the thrust bearing. If any crack, damage, or un-smooth turning is found, replace the thrust bearing with a new one.



■ **Inspection: Front axle**

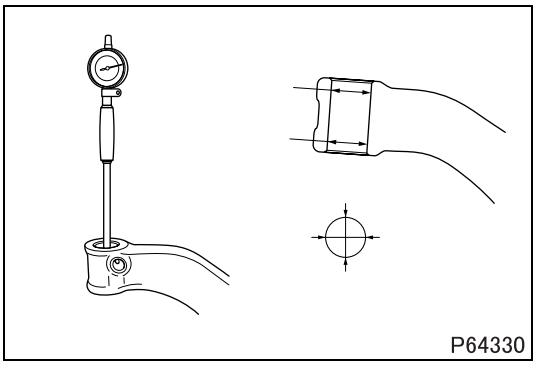
(1) Bend of front axle in the longitudinal direction and vertical direction

- Put a piece of thread through kingpin holes of the front axle and hang weights at both ends.
- Use a square to find bend to each of longitudinal and vertical directions.
- If the measured value exceeds the limit, replace the front axle.



(2) Kingpin inclination angle

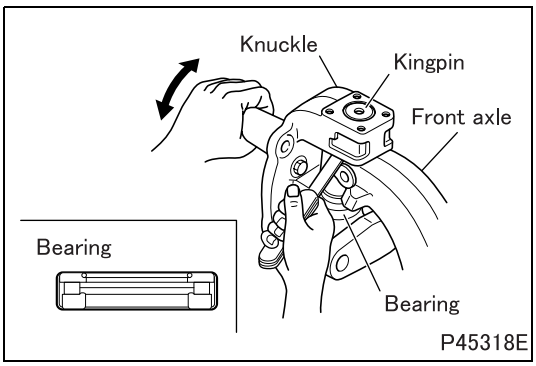
- Set the kingpin on the front axle as illustrated to measure the angle.
- If the measured value deviates from the standard value, replace the front axle.



(3) Clearance between kingpin and front axle

- Measure the inner diameter of the axle's hole where the kingpin is inserted using a cylinder gauge and calculate the clearance deducting the outer diameter of the kingpin from the inner diameter.
  If the clearance exceeds the limit, replace the axle or the kingpin with a new one.

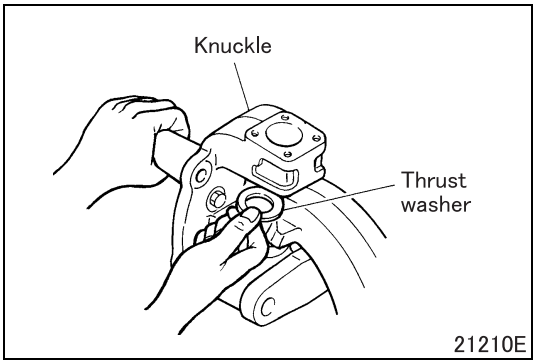
◆Installation procedure◆



■ **Inspection: Thrust washer, bearing, knuckle and front axle**

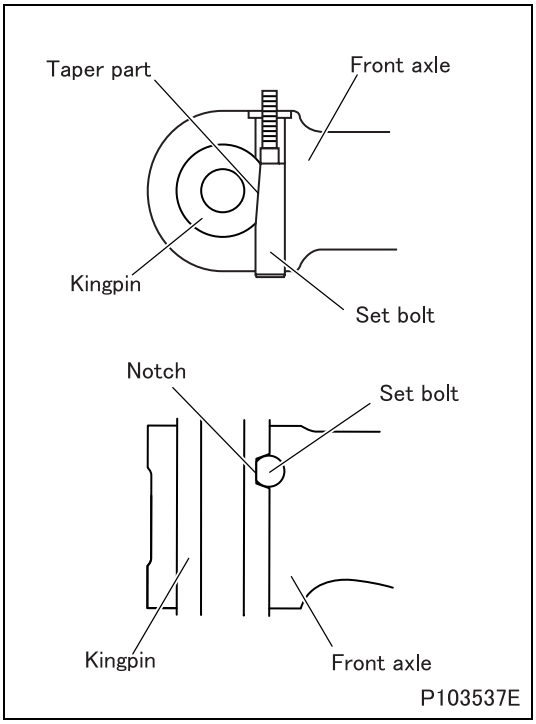
[Inspection]

- Provisionally assemble kingpin and bearing, move 2 or 3 times knuckle to have them fit.
- Measure clearance between front axle upper surface and knuckle downside.
- Adjust if the measured value exceeds the limit.



[Adjustment]

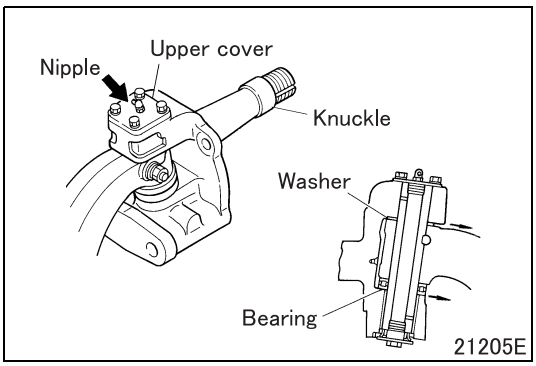
- Kinds of adjusting thrust washers
  2.9 to 3.6 mm {0.114 to 0.142 in.} (8 kinds with every 0.1 mm {0.0039 in.} difference)
- Select a thrust washer so as to make clearance as small as possible.
- After assembly, make sure that the knuckle moves smoothly.



■ **Installation: Set bolt**

- Install the set bolt so that the taper part of the set bolt is aligned with the notch of the kingpin.

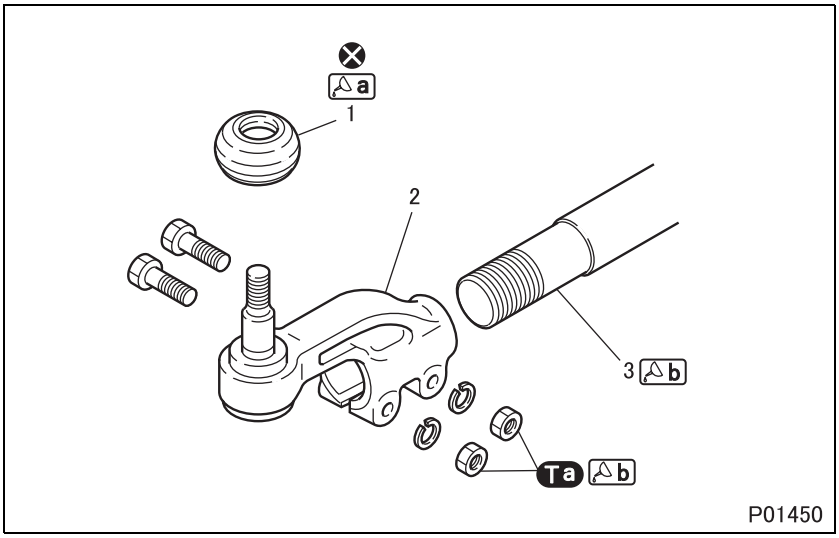
◆Work after assembly◆



■ **Greasing: Grease nipple**

- Supply grease through the grease nipple of the upper cover.
- Supply grease until it overflows from the thrust washer and press portion of the bearing.

TIE ROD



● **Disassembly sequence**

1 Dust cover
2 Tie rod end
3 Tie rod

⊗: Non-reusable parts

● **Assembly sequence**

Follow the disassembly sequence in reverse.

NOTE

- **Do not disassemble the tie rod end, as it is of non-disassembly type.**

Service standards (Unit: mm {in.})

Location	Maintenance item			Standard value	Limit	Remedy
2	Ball joint of tie rod end	Play	430 N {97 lbs, 44 kgf} loaded <FK>	–	0.7 {0.028}	Replace

<FM>
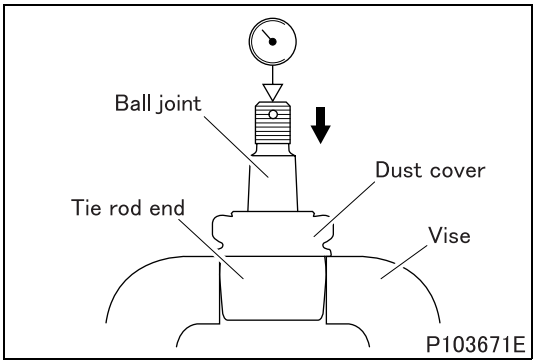
MH061829</td></tr>
</table>

◆Inspection procedure◆



■ **Inspection: Tie rod end**

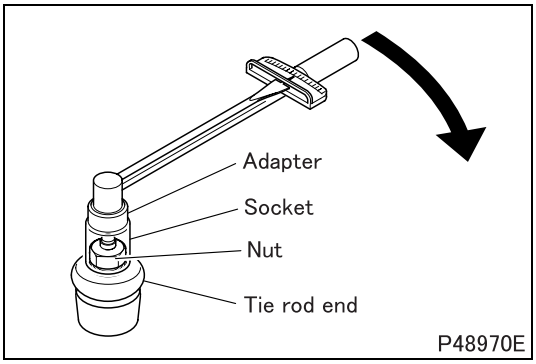
(1) Play

- Fix the tie rod end with a vise.

CAUTION ⚠

- **Take care not to deform or damage the dust cover when fixing it with a vise.**

- If measured value deviates from the standard value with applying the specified load (pushing) to the ball joint, replace the tie rod end.

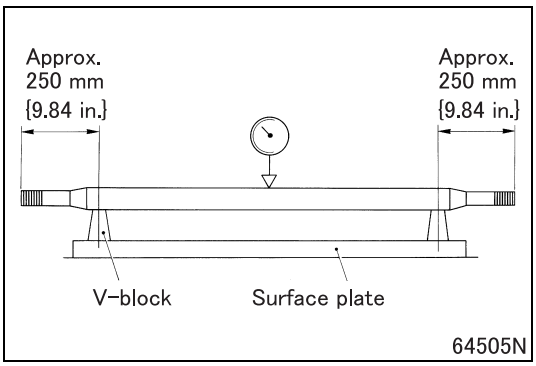


(2) Rotation torque

- Install the tie rod mounting nut on the tie rod end.
- Install the socket, adapter and torque wrench to measure the rotation torque.
- If the measured value deviates from the standard value, replace the tie rod end.

(3) Dust cover

- Check that there are no wear, cracks or damage. These abnormalities can cause water to enter the ball joint, resulting in premature wear.
- If wear, crack, or damage is present, inspect traces of water entry and occurrence of rust in the ball joint. If any abnormality is found, replace the tie rod end. If no abnormality is found, replace the dust cover and reapply grease.



■ **Inspection: Bend of tie rod**

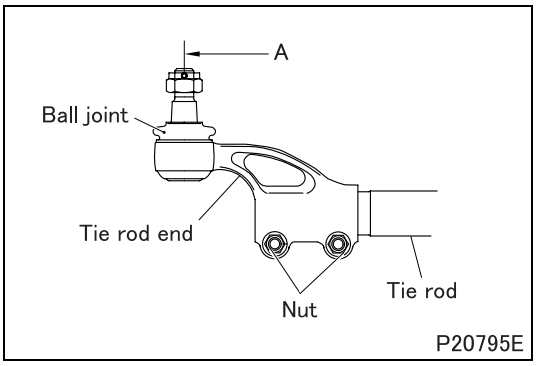
- Measure the bend of the tie rod at its center.

NOTE

- **Give the tie rod one complete turn and read the dial gauge at this time. The bend is one half of the reading.**

- If the measured value exceeds the limit, correct or replace the tie rod.

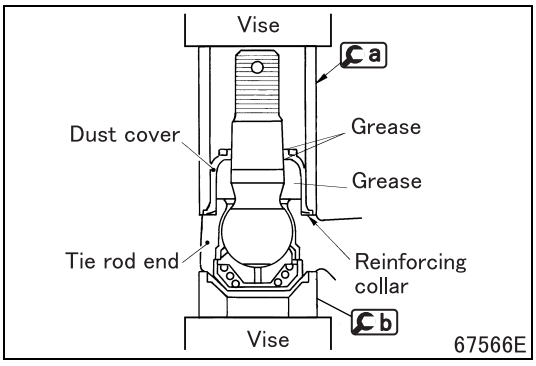
◆Installation procedure◆



■ **Installation: Tie rod end**

- Install the tie rod end on the tie rod so that the distance between centers of the ball joints of tie rod ends is to the illustrated dimension A, and tighten nuts to the specified torque.

  A: 1678 mm {66.1 in.} <FK>
  1672 mm {65.8 in.} <FM>



■ **Installation: Dust cover**

- Seal grease in the inside of the dust cover and apply grease to the lip area. Cover the dust cover and tie rod end with a and b as illustrated, and press them using a vise so that the reinforcing collar is brought into intimate contact with the tie rod end.

NOTE

- **Install the dust cover so that it is vertical.**

ON-VEHICLE INSPECTION AND ADJUSTMENT

1. Adjustment of Wheel Speed Sensor Gap

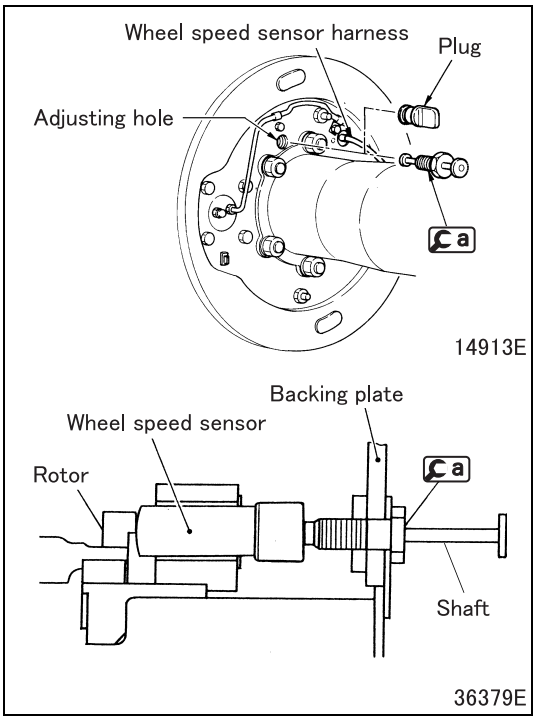
Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
–	Bolt (anchor bracket mounting) <FM>	135 {100, 13.8}	–

Special tools

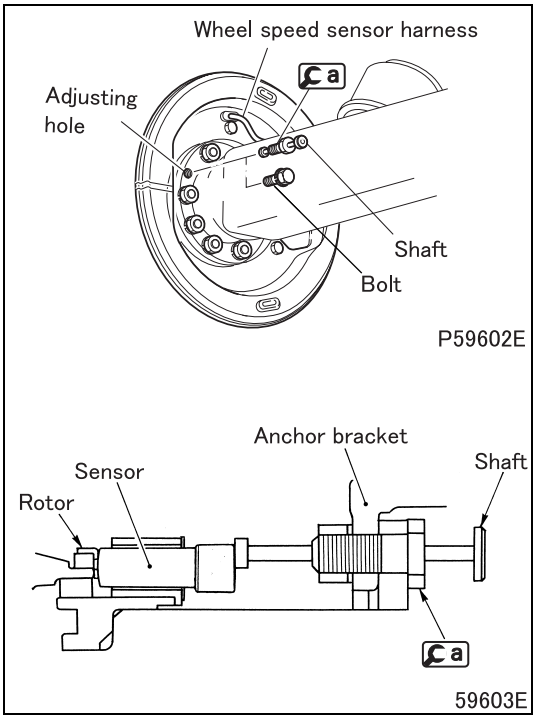
Mark	Tool name and shape	Part No.	Application
a	Adjuster  14912	MH062080	Adjustment of wheel speed sensor gap

- The gap between the wheel speed sensor and the rotor is adjusted by screwing in a and thereby pushing in the sensor. Adjust in the following sequence.



<FK>

- Remove the plug on the back of the backing plate.
- Install a in the adjusting hole.
- Push the shaft of a until the sensor comes into contact with the rotor.
- Never forget to install the plug after adjustment.



<FM>

- Remove the bolt on the back of the anchor bracket.
- Install a in the adjusting hole.
- Push the shaft of a until the sensor comes into contact with the rotor.
- After adjustment, tighten the bolt to the specified torque.

2. Inspection and Replacement of Differential Oil

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened	Tightening torque	Remarks
–	Inspection plug	110 ± 10 {81 ± 7.4, 11 ± 1}	–
	Drain plug		

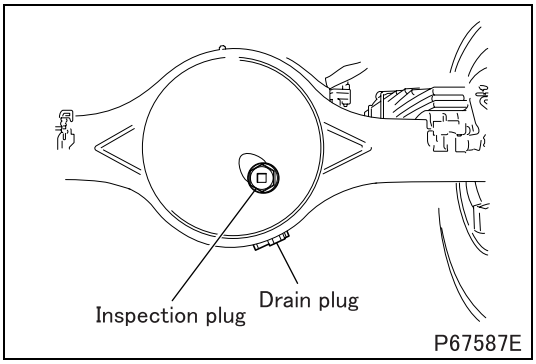
Lubricant and/or sealant

Mark	Points of application	Specified lubricant and/or sealant	Quantity
–	Axle housing	Gear oil: Normal: Maximum air temperature during operation below 40°C {104°F} API GL-5 SAE90 Hot areas: Maximum air temperature during operation above 40°C {104°F} API GL-5 SAE140 or 85W-140	6.5 L {6.9 qts}

- Use this oil under heavily-loaded, severe conditions such as continuous driving on uphill grades. However, the air temperature must be above 10°C {50°F}.

WARNING ⚠

- **The oil temperature is high immediately after the vehicle has stopped, so take care not to scald yourself.**



[Inspection]

(1) Inspection of oil quantity

- Remove the inspection plug, and check that oil is filled up to the neck.
- If oil is not sufficient, fill oil from the inspection plug hole up to the neck.

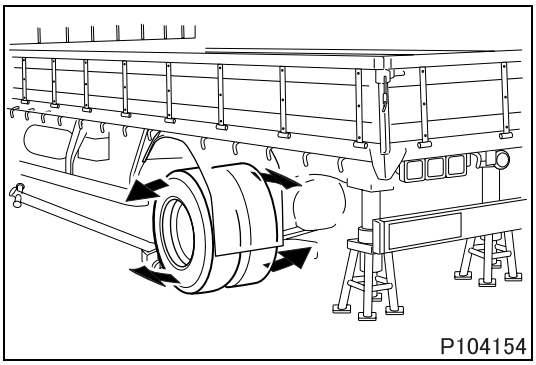
(2) Inspection of oil quality and inclusions

- When draining differential oil, check for oil quality, metal chips and metal powder.
- If an abnormally large amount of metal chips and metal powder is found, disassemble the assembly for service, as abnormalities may be caused inside.

[Replacement]

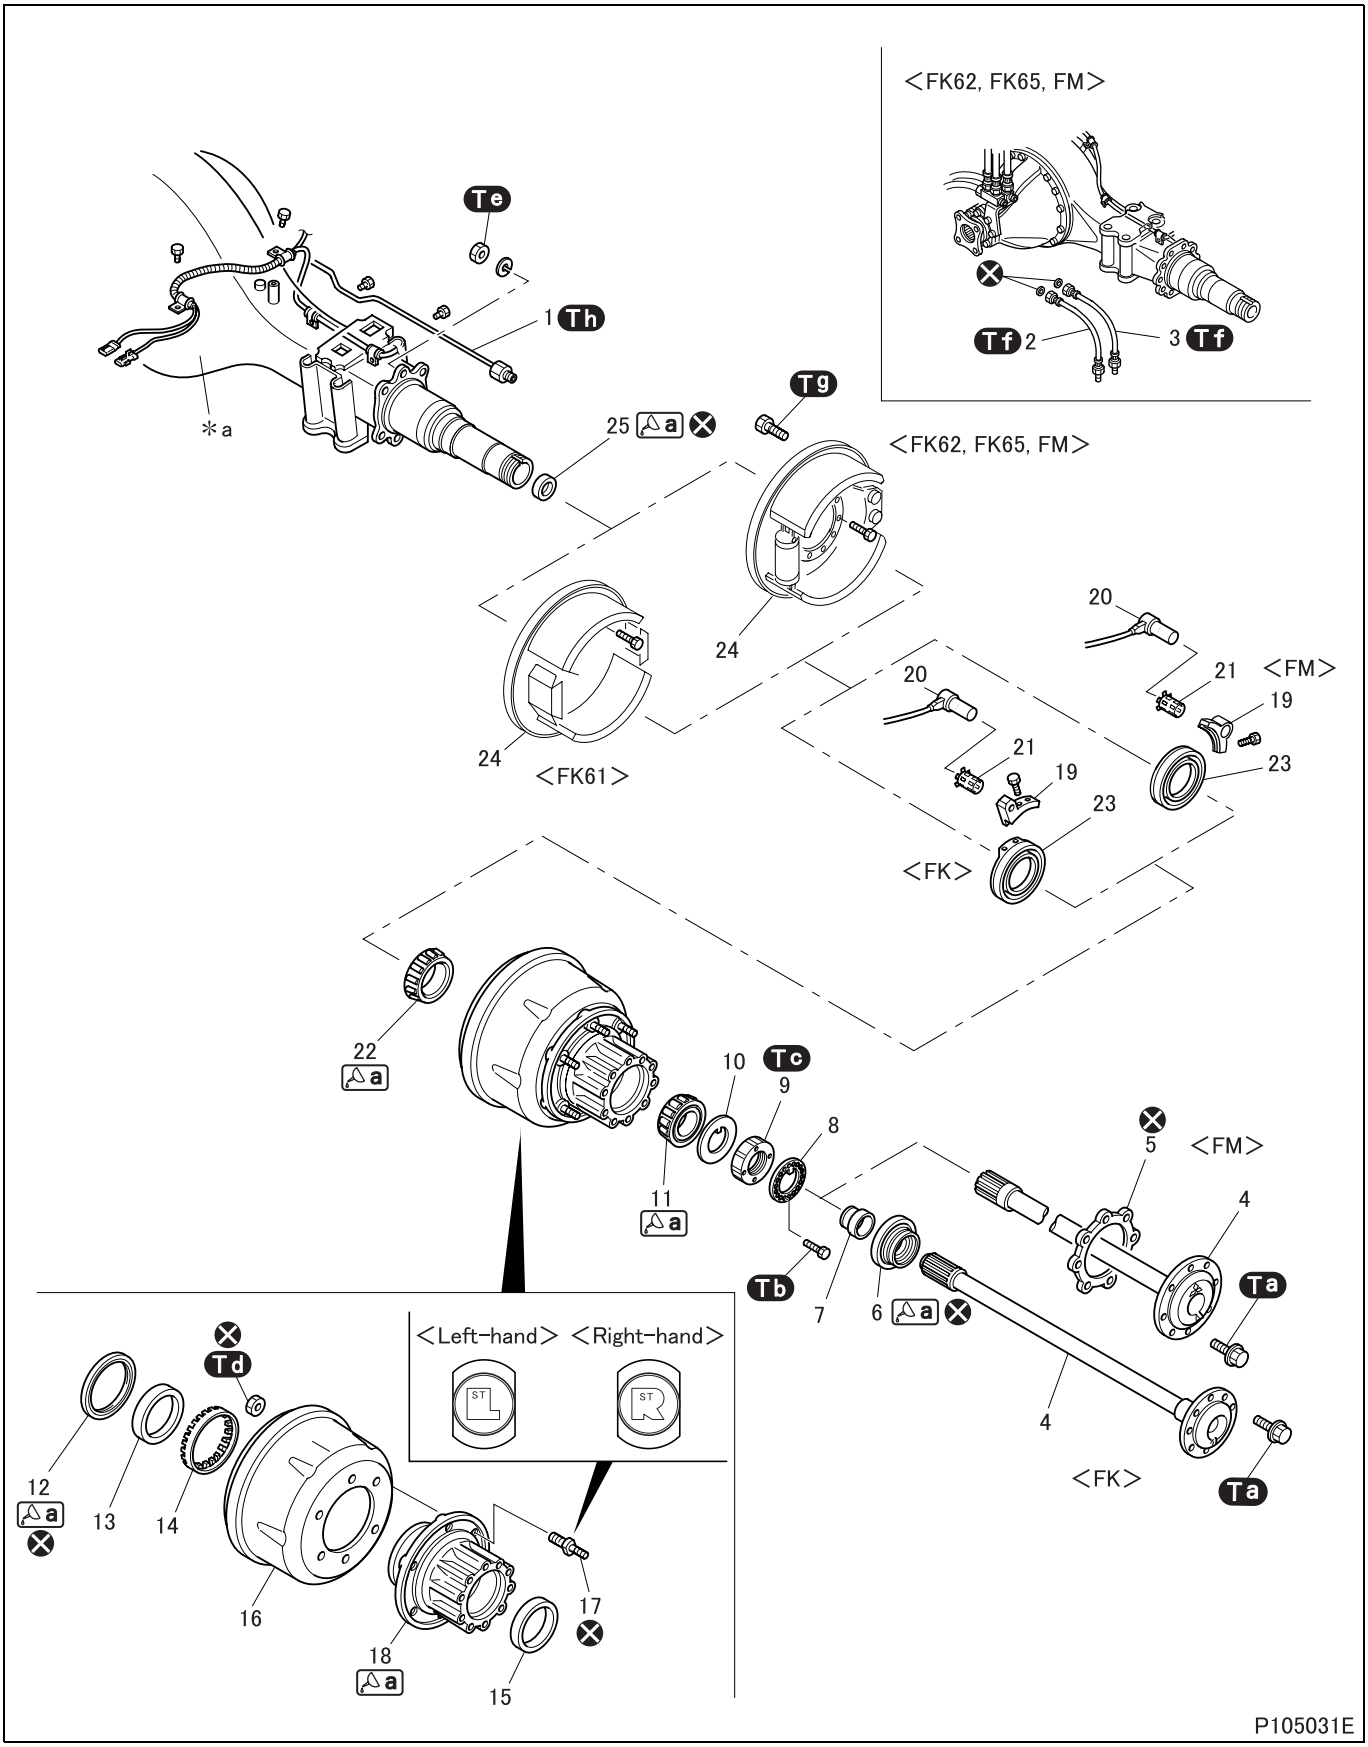
- Remove the drain plug to drain differential oil. Drainage can be made quickly with the inspection plug removed.
- Fill the specified quantity of differential oil from the inspection plug hole.
- After filling, check that oil is filled up to the neck. If oil is not sufficient, replenish it.

3. Inspection of Wheel Bearing for Play



- Jack up the vehicle.
- Try to move the top and bottom of the rear tire by hands in the illustrated directions to inspect the wheel bearing for play.
- If play is found with the feel of hands, repeat the inspection procedure while having the brake pedal pressed by another personnel. When the play is removed by operating the brake pedal, the symptom indicates that there is play in the wheel bearing, not in the suspension or other related parts. Then inspect the turning torque of the wheel bearing and adjust it as required. (See WHEEL HUB AND BRAKE DRUM.)
- If the turning torque of the wheel bearing cannot be adjusted correctly or the play still remains after the adjustment, replace the wheel bearing with a new one. (See WHEEL HUB AND BRAKE DRUM.)

WHEEL HUB AND BRAKE DRUM



● Disassembly sequence

23 Oil seal retainer
24 Drum brake (See Gr35A, B.)
25 Oil seal <FM>

***a**: Axle housing
⊗: Non-reusable parts

CAUTION ⚠

- **Plug the brake pipes and hoses that have been removed to prevent the ingress of dust and other contaminants.**

NOTE

- **Do not disassemble the brake drum and wheel hub unless replacing them.**
- **On the vehicles equipped with a wheel parking brake, release the brake before starting disassembly. <FK62, FK65, FM> (See Gr36B.)**

● Assembly sequence

Follow the disassembly sequence in reverse.

CAUTION ⚠

- **Make sure that the brake lining surface and inner surface of the brake drum of the wheel hub and brake drum are free from grease to avoid malfunction of brakes.**
- **Make sure that the rotor and oil seal are not damaged when installing the wheel hub and brake drum on the axle housing.**
- **Bleed air in the brake system after assembly to avoid malfunction of brakes. <FK61> (See Gr35A.)**
- **After assembly, make the initial adjustment of the brake drum-to-shoe clearance. (See Gr35A, B.)**
- **After assembly, make the adjustment of wheel speed sensor gap. (See "ON-VEHICLE INSPECTION AND ADJUSTMENT".)**

WHEEL HUB AND BRAKE DRUM

Service standards (Unit: mm {in.})

Location	Maintenance item			Standard value	Limit	Remedy
–	Starting torque of wheel hub bearing (tangential force at hub bolt position with oil seal assembled)			2.5 to 5.4 N·m {1.8 to 4.0 ft.lbs, 0.25 to 0.55 kgf·m} <FK61> (tangential force: 22 to 48 N {4.9 to 11 lbs, 2.2 to 4.9 kgf}) <FK62, FK65, FM> (tangential force: 18 to 38 N {4 to 8.6 lbs, 1.8 to 3.9 kgf})	–	Adjust or replace

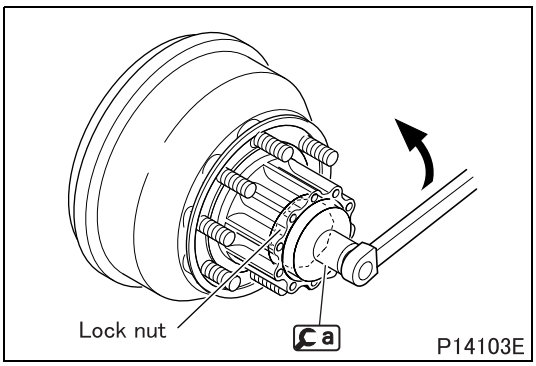
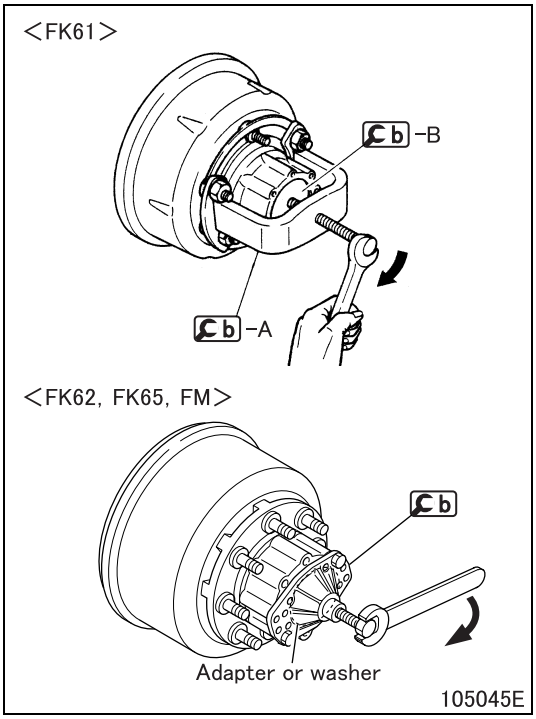
◆Removal procedure◆

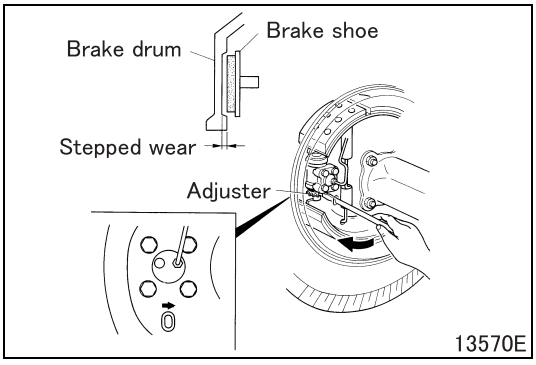


■ **Removal: Lock nut**



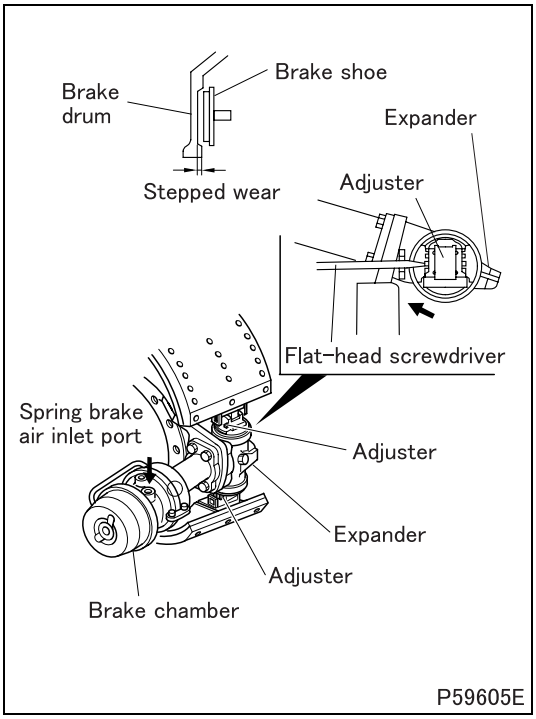
■ **Removal: Wheel hub and brake drum**

- If the brake drum has stepped wear and the wear prevents the wheel hub and brake drum assembly from being removed, the removal can still be effected by taking the following procedure. After removal, correct or replace the brake drum.



<FK61>

- Turn the adjuster from the adjusting hole in the opposite direction to the arrow on the backing plate to increase the clearance between the brake drum and the brake shoe. Then, remove the wheel hub and brake drum.

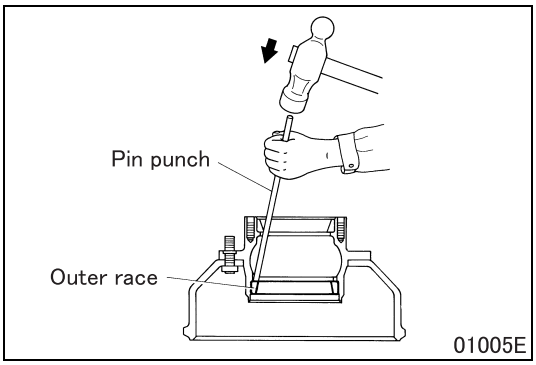


<FK62, FK65, FM>

- Remove the dust cover behind the anchor bracket.
- Release the spring brake. (See Gr35B.)
- Turn the adjuster on the expander in the direction of the arrow to increase the clearance between the brake drum and shoe. Then, remove the wheel hub and brake drum.
- Install the dust cover behind the anchor bracket.

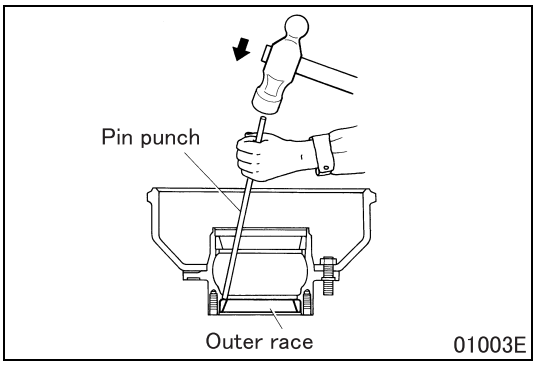
CAUTION ⚠

- **When using a flat-head screwdriver to turn the adjuster, take care not to damage the boots on the expander.**



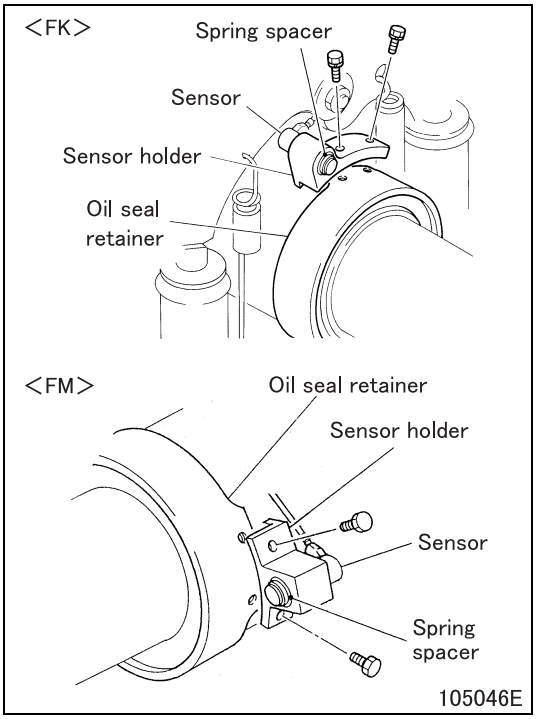
■ Removal: Inner bearing outer race

- Drive out the inner bearing outer race by tapping evenly at four notches in the wheel hub.



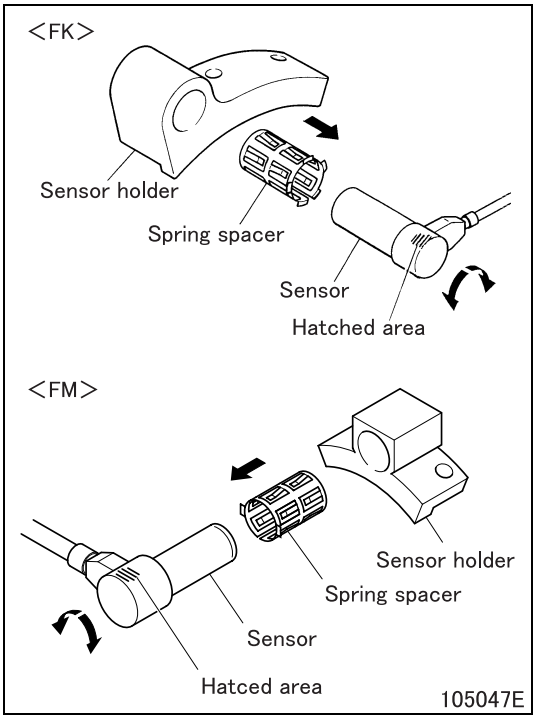
■ Removal: Outer bearing outer race

- Drive out the outer bearing outer race by tapping it evenly at four notches in the wheel hub.



■ **Removal: Sensor holder, wheel speed sensor and spring spacer**

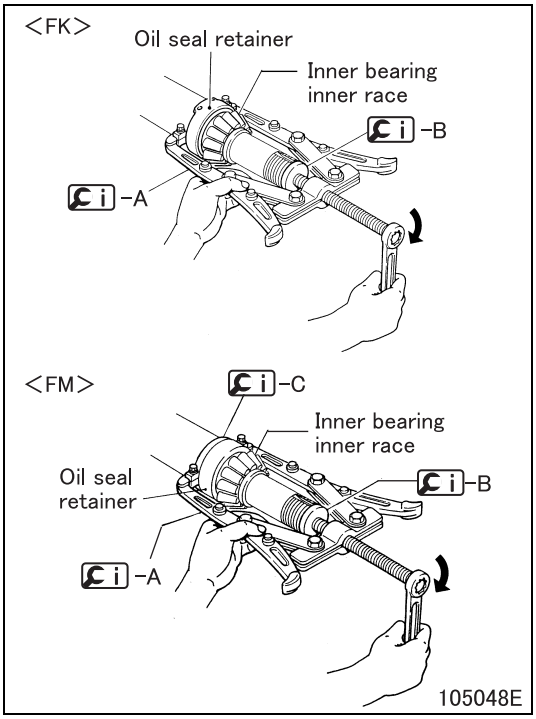
- Remove the wheel speed sensor complete with the sensor holder and spring spacer from the oil seal retainer.



- Pinch hatched area of the wheel speed sensor with pliers and remove it while turning it a little.
- If the wheel speed sensor can be removed easily, replace the spring spacer.

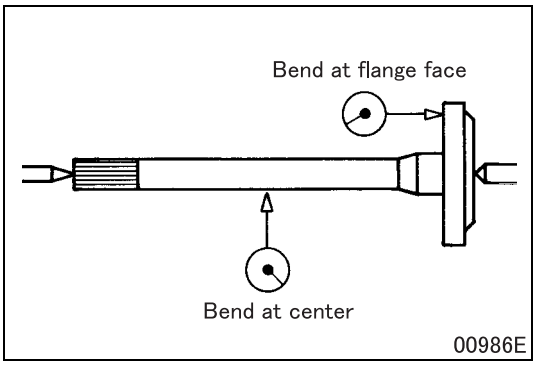
CAUTION ⚠

- **When pinching the wheel speed sensor with pliers, do not pinch other areas than the hatched area.**
- **When removing the wheel speed sensor, never apply excessive force to the sensor, such as hitting with a hammer, prying with a screwdriver or pulling the harness, since these actions can result in the breaking of wire.**



■ **Removal: Inner bearing inner race and oil seal retainer**

◆**Inspection procedure**◆



■ **Inspection: Axle shaft**

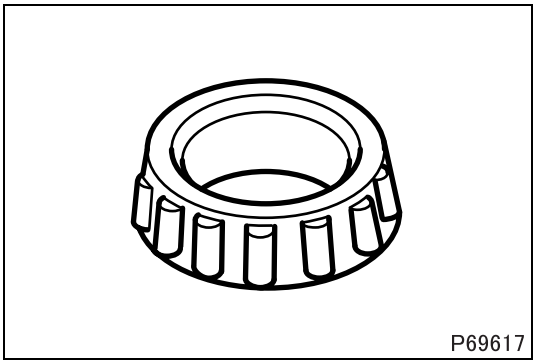
- Perform the following inspection. If the measurement exceeds the limit, replace the axle shaft.

(1) Bend at shaft center

NOTE

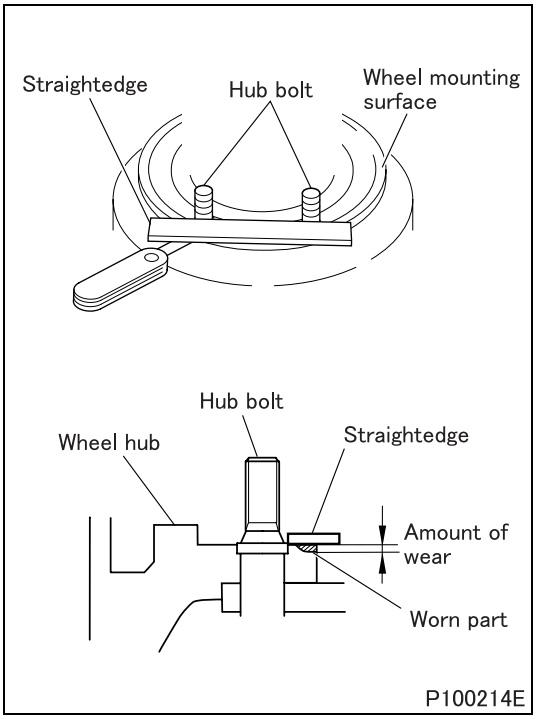
- **Give the axle shaft one complete turn and read the dial gauge at this time. The bend is one half of the reading.**

(2) Bend at flange face



■ **Inspection: Outer bearing inner race**

- Inspect the outer bearing inner race after cleaning the bearing to remove grease completely.
- If any damage, wear, or poor rotating condition is evident in the inner race, replace it with a new one.
- The inner race and the outer race should be replaced as a set.



■ **Inspection: Wheel hub**

(1) Visual inspection

- Check the disc wheel mounting surface of the wheel hub by watching and touching. If there is damage or crack on it, replace the wheel hub.
- Make sure that there is not rust, dust, paint or foreign body on the disc wheel mounting surface of the wheel hub to prevent the wheel nut to loosen.
- If any abnormality is found, remove it with sandpaper.

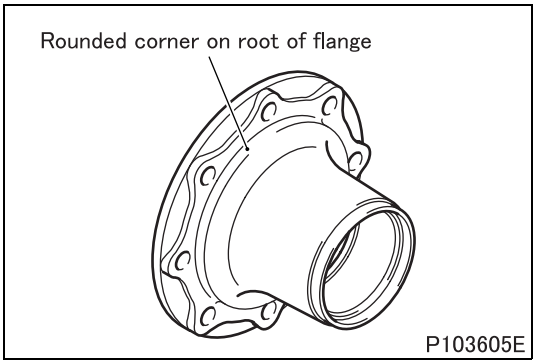
(2) Wear in disc wheel mounting part of wheel hub

- Clean the wheel mounting surface of the wheel hub before inspection.
- Place a straight edge on the hub so as to contact to the two hub bolts on the disc wheel mounting surface.

CAUTION ⚠

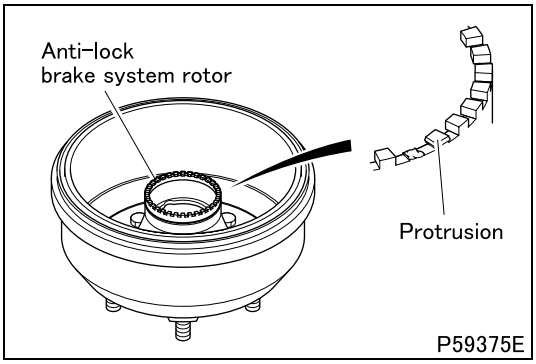
- **Make sure that the straight edge does not run onto the hub bolt.**

- Using feeler gauges to measure the amount of wear at the outer periphery of the wheel hub.
  Measure the amount of wear in the area of every hub bolt.
- If the amount of wear at any point exceeds the following standard value, inspect the crack check of wheel hub.
  Wear standard value: 0.8 mm {0.031 in.}



(3) Crack check

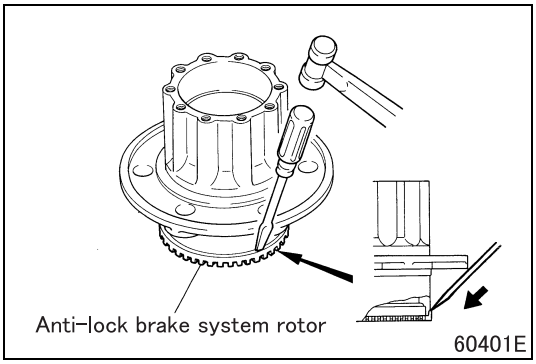
- Check if there is not crack on the entire rounded corner on the root of flange of the wheel hub by magnetic particle or liquid penetrant testing. If crack is found, replace the wheel hub.
- If crack is found on the wheel hub bolt, replace it.
- If there is crack or stepped wear on the wheel hub mounting surface of wheel disc, replace it. (See Gr31.)



■ **Inspection: Anti-lock brake system rotor**

[Inspection]

- Check the protrusions of the anti-lock brake system rotor for chipping and flattening.
- If any abnormality is found, replace the anti-lock brake system rotor.

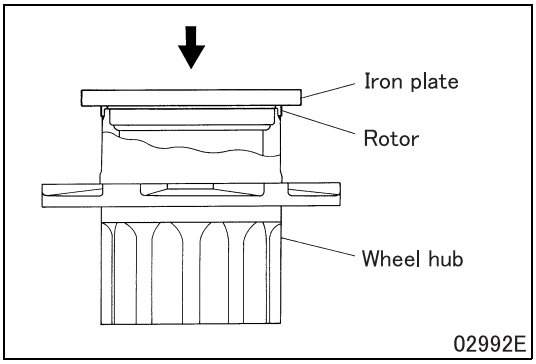


Replacement of anti-lock brake system rotor
[Removal]

- Drive out the anti-lock brake system rotor by tapping evenly at its circumference using a flat-blade screwdriver.

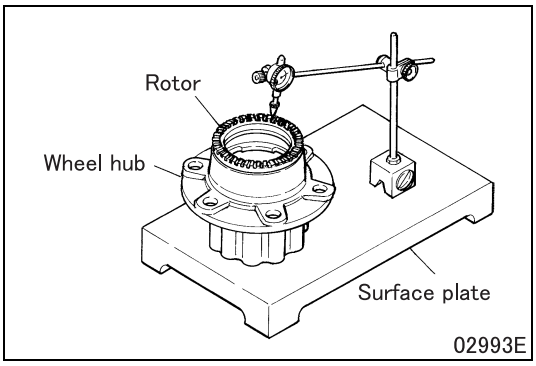
CAUTION ⚠

- **Be careful not to damage the wheel hub.**



[Installation]

- Warm the anti-lock brake system rotor to approximately 150°C {302°F}, press it evenly using an iron plate, and press it into the wheel hub so that there is no clearance between the wheel hub and the anti-lock brake system rotor.

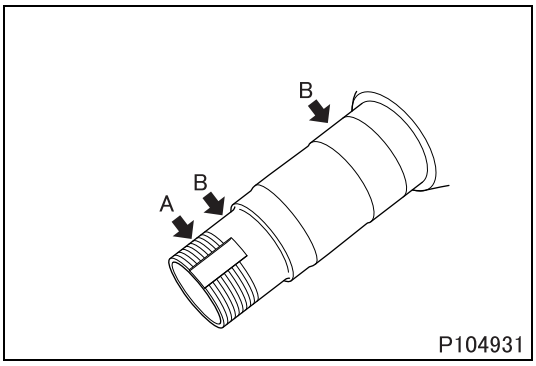


[Inspection]

- If runout is out of the standard value, reassemble.
- If runout is out of the standard value after reassembly, replace the defective part(s).

■ Inspection: Inner bearing inner race

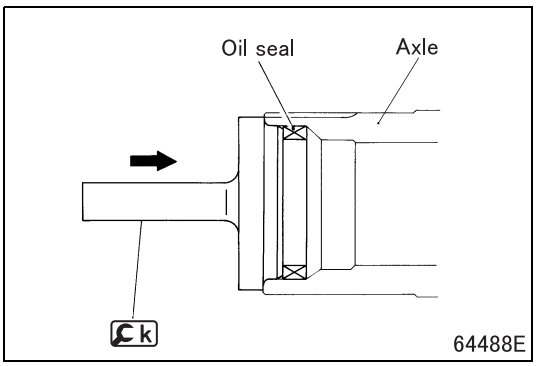
- Inspect the inner bearing inner race in the same manner as for the outer bearing inner race.
  (See "■ **Inspection: Outer bearing inner race**".)



■ Inspection: Axle housing

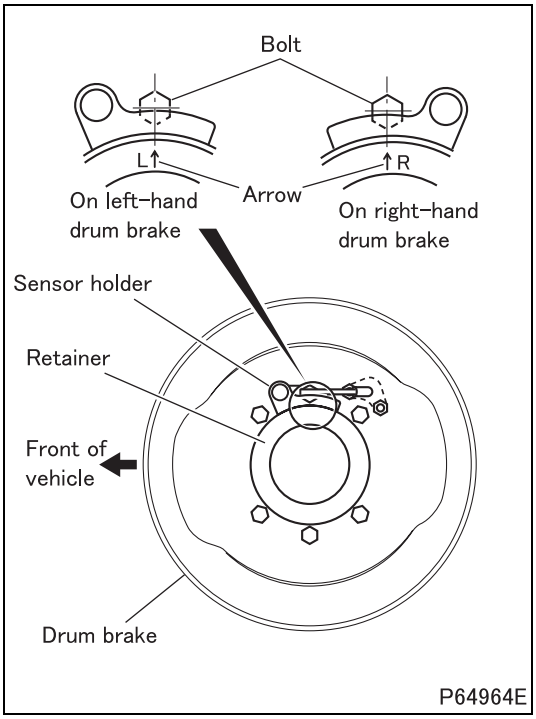
- If the lock nut tightening threads (A) are damaged, repair the damage using a dice to ensure accurate adjustment of starting torque.
- Replace the axle housing if it apparently has stepped, tapered, uneven or other abnormal wear or damage in the outer bearing fitting surface (B).

◆Installation procedure◆



■ **Installation: Oil seal <FM>**

- Install the oil seal evenly along its periphery against the end of the wheel hub.



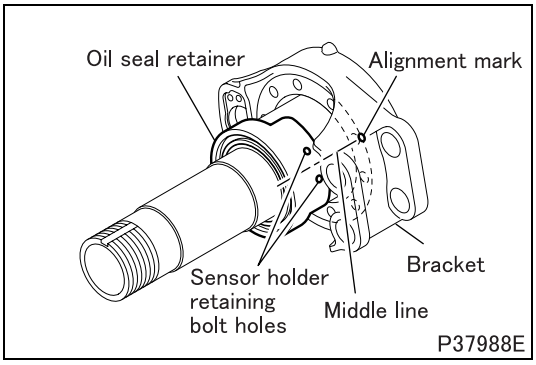
■ **Installation: Inner bearing race, oil seal retainer**

<FK>

- Install the oil seal retainer such that the center of the sensor holder retaining bolt is aligned with the center line of the brake rataining bolt.

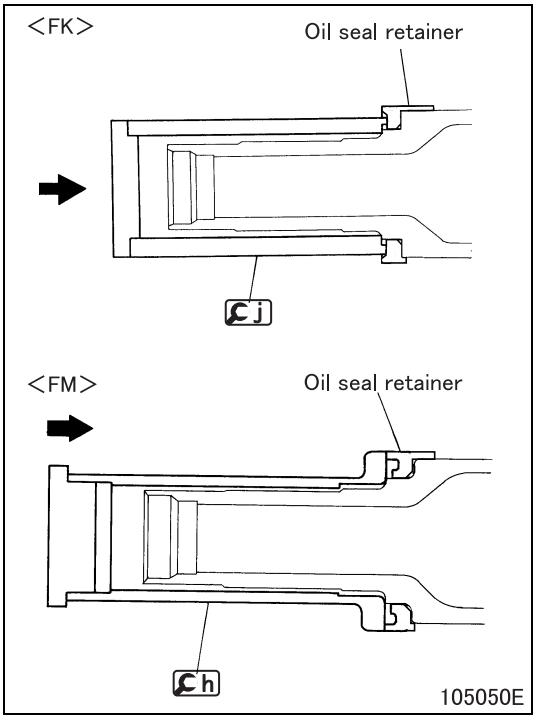
NOTE

- **The illustration on the left shows the left-hand drum brake.**

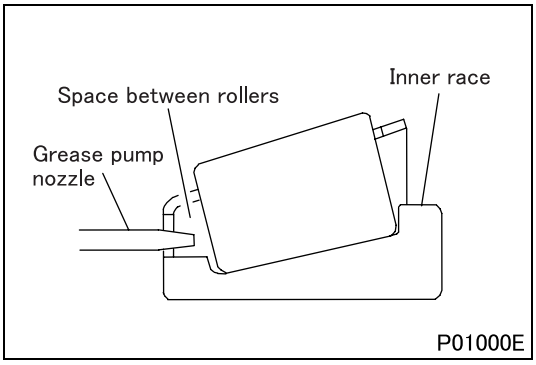


<FM>

- Ensure that the anchor bracket is provided with alignment mark at the location shown in the illustration.
- Install the oil seal retainer such that the middle line between the sensor holder retaining bolt holes is aligned with the alignment mark on the anchor bracket.

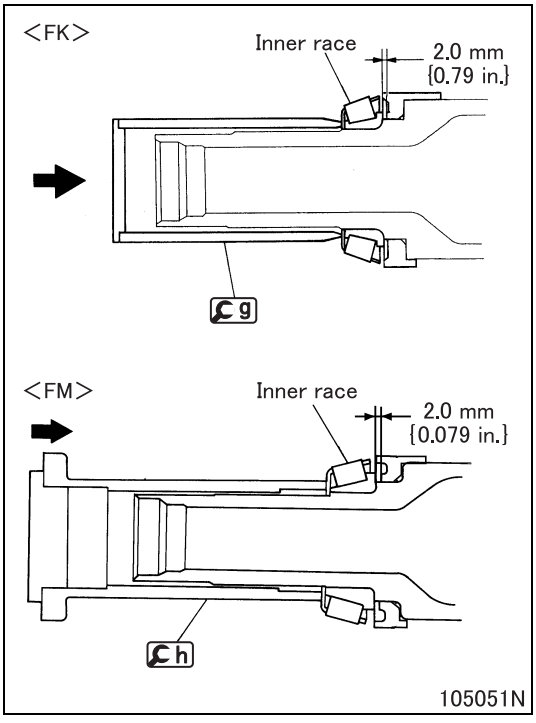


- Install the oil seal retainer until it bottoms out.



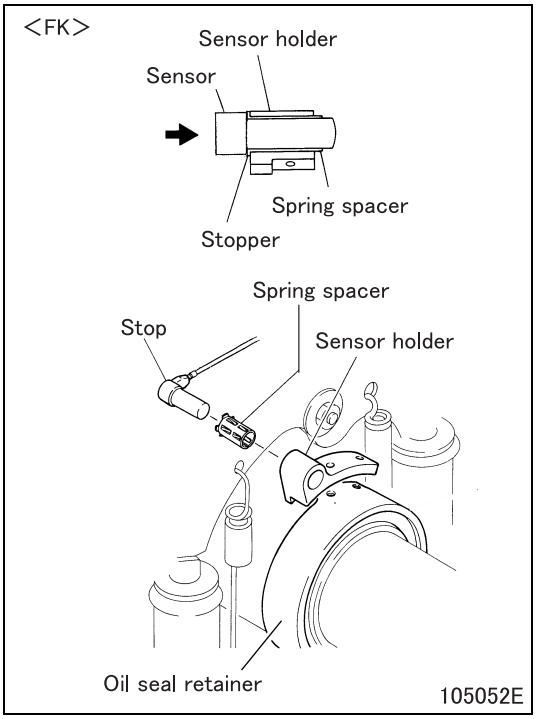
■ **Installation: Packing grease in inner bearing inner race**

- Insert the grease pump nozzle into the space between rollers of the inner bearing inner race to pack grease sufficiently.



■ **Installation: Inner bearing inner race**

- With the inner bearing inner race press-fitted, ensure that the clearance between the inner race and the oil seal retainer is as shown in the illustration.



■ **Installation: Sensor holder, wheel speed sensor and spring spacer**

- From the anchor bracket side, insert the wheel speed sensor into the sensor holder until the stop of the spring spacer and that of the sensor come into contact with the sensor holder.
- Install the assembly of wheel speed sensor, sensor holder and spring spacer onto the oil seal retainer.

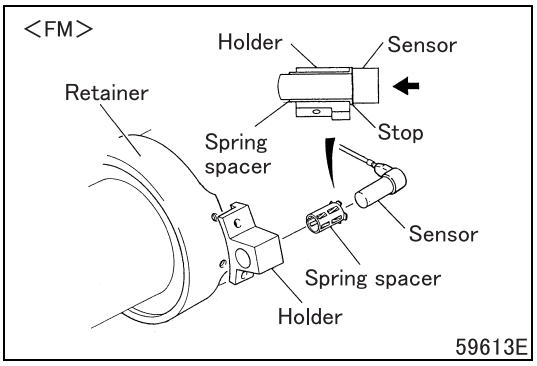
CAUTION ⚠

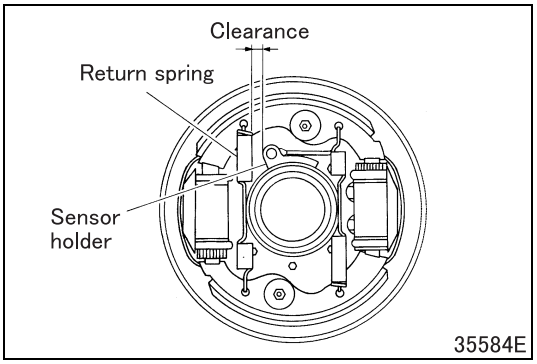
- **When installing the wheel speed sensor, never apply excessive force to the sensor, such as hitting with a hammer, prying with a screwdriver or pulling the harness, since these actions can result in the breaking of wire.**

NOTE

- **Do not install the right-hand wheel speed sensor on the left-hand wheel, and vice versa.**

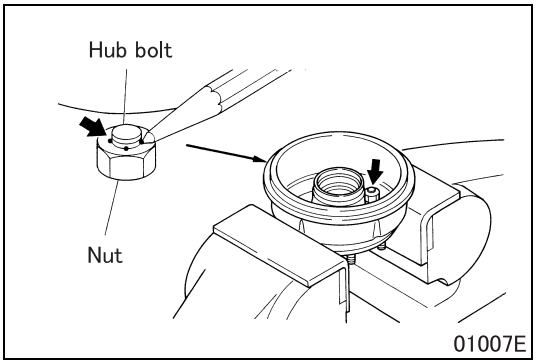
Location	Connector color	Connector shape
Left-hand side	Gray	Male
Right-hand side	Black	Female





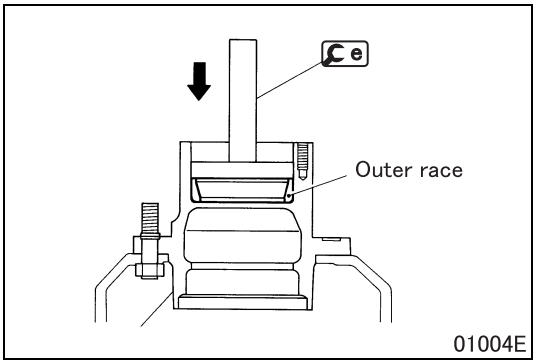
<FK61>

- After installation, ensure that there is at least a 5 mm {0.020 in.} clearance between the sensor holder and return spring. Also, ensure that the wheel speed sensor is free from interference with other parts. The illustration on the left shows the left-hand drum brake.

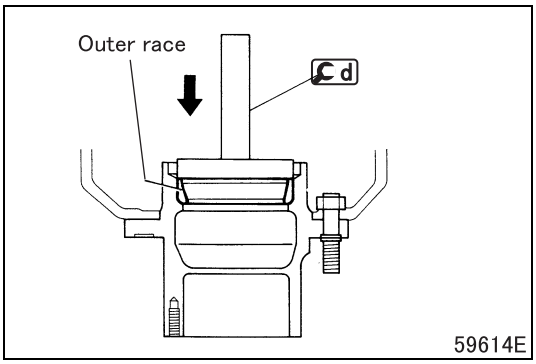


■ **Installation: Hub bolts**

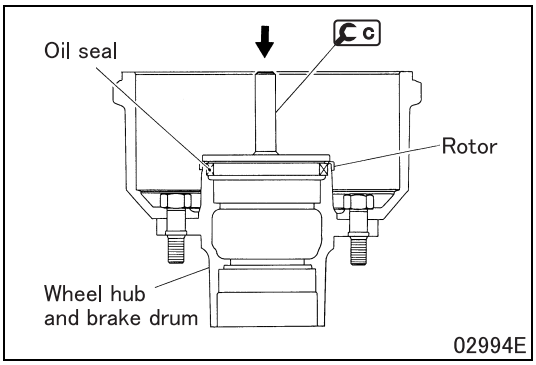
- As for hub bolt, tighten nut at specified torque, and caulk at 4 positions for prevention of loosening.



■ **Installation: Outer bearing outer race**

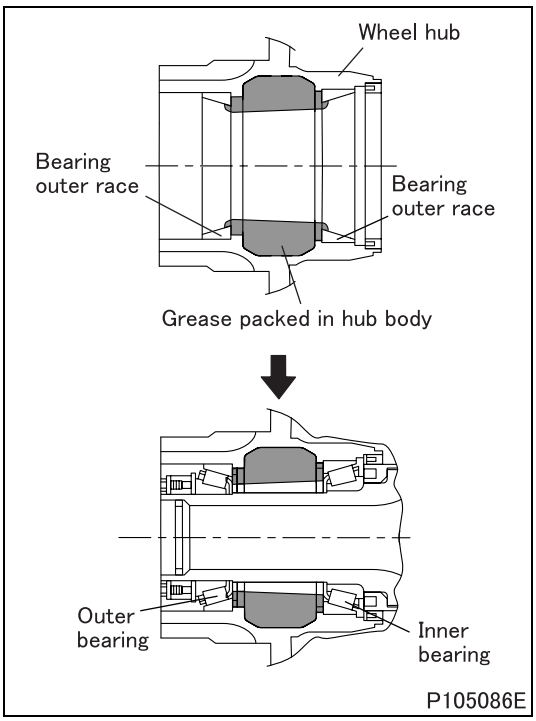


■ **Installation: Inner bearing outer race**



■ **Installation: Oil seal**

- Use c when press-fitting the oil seal to the wheel hub with the anti-lock brake system rotor already installed.
- Apply grease on the lip of the oil seal.

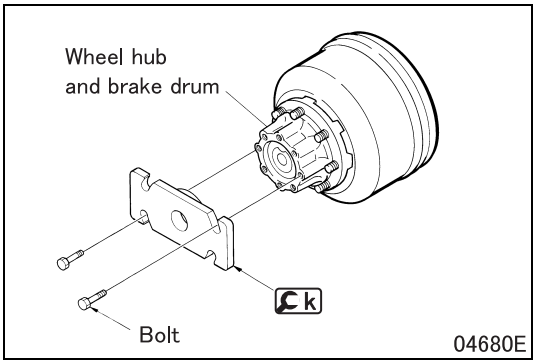


■ **Installation: Packing grease in wheel hub**

CAUTION ⚠

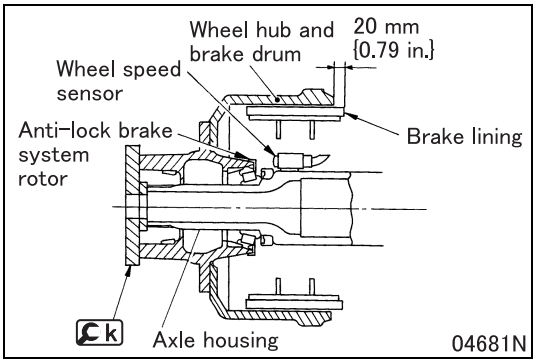
- **Wheel bearing seized may be caused unless following these manners.**
- **Pack the specific amount of grease measured by measurement cup or etc.**

- Pack grease in the wheel hub body so much that grease covers the outer and inner bearing outer races to ensure that grease will reach the outer and inner bearings as shown in the drawing.



■ **Installation: Wheel hub and brake drum**

- Using two bolts, mount Ⓚ on wheel hub and brake drum. <FM>



- Mount wheel hub and brake drum on axle housing and press unitil Ⓚ contacts the end surface of the axle housing. <FM>
- Remove Ⓚ, and mount outer bearing inner race, lock washer and lock nut. Tighten the lock nut slowly. <FM>

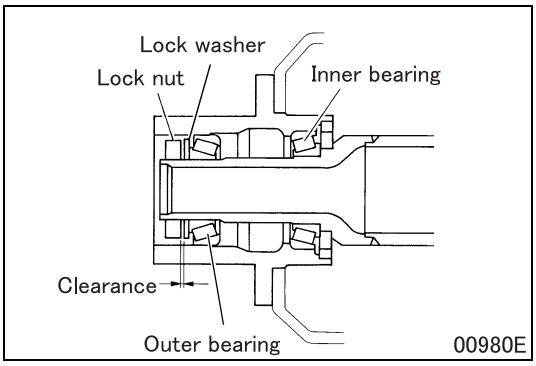
CAUTION ⚠

- **When installing wheel hub and brake drum without using Ⓚ, mount the assembly without jiggling until brake lining extends approximately 20 mm {0.79 in.} from the edge of brake drum. Then, tighten lock nut slowly.**

- With the wheel hub and brake drum installed, adjust the brake shoe clearance.

■ **Installation: Packing grease in outer bearing inner race**

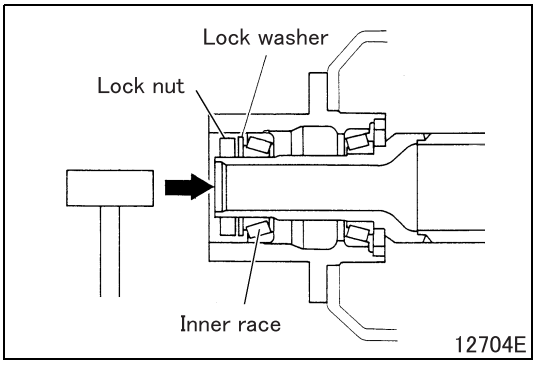
- Follow the same procedure as for packing the inner bearing inner race with grease.
  (See "■ **Installation: Packing grease in inner bearing inner race**".)



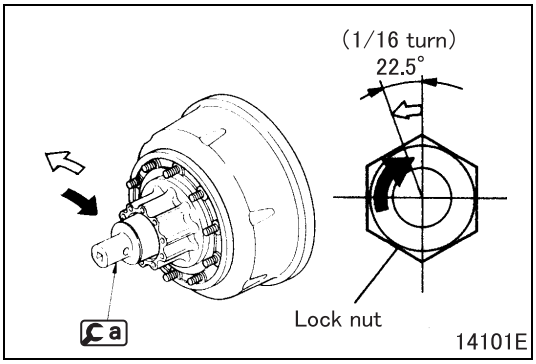
■ **Adjustment: Wheel hub bearing starting torque**

[Adjustment]

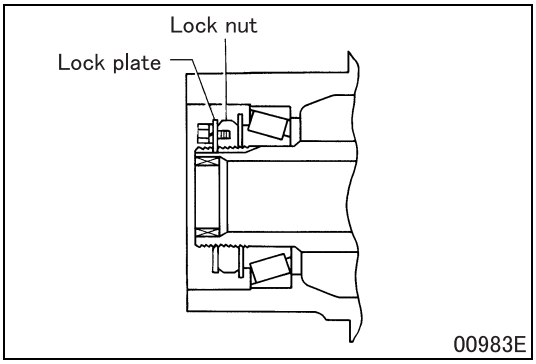
- Install the lock washer and lock nut.
- Rotate the wheel hub and brake drum at least three turns to let the outer and inner bearings settle in and check that there is no drag between brake lining and drum.
- Tighten the lock nut to the specified torque using Ⓐ.
- Loosen the lock nut until there is clearance between the lock nut and lock washer.



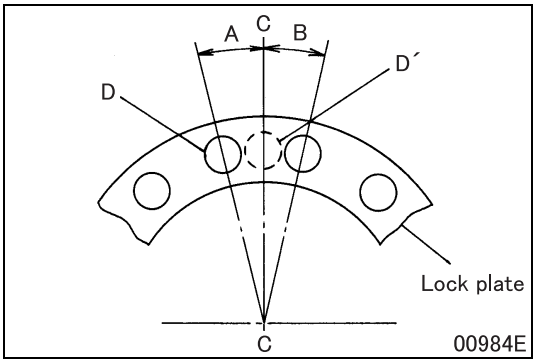
- Perform the following work to pull the outer bearing inner race toward the lock nut side.
- While rotating the wheel hub and brake drum, tap the end of the axle tube a couple of times.



★• Tighten lock nut at specified torque using [a], and after it, return to the loosening direction as shown at the illustration by the amount of 22.5° (1/16 turn).
(★: If the result is not satisfactory by tangential measurement, which will be explained at a later section, repeat the operation from here.)

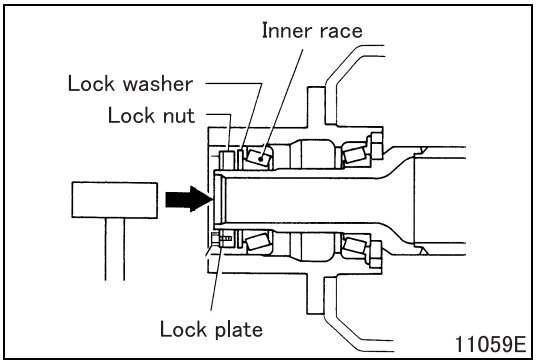


• Fit the lock plate into place and check to ensure that all of the mounting holes in the lock nut and the lock plate are in alignment, and tighten mounting bolts to the specified torque.

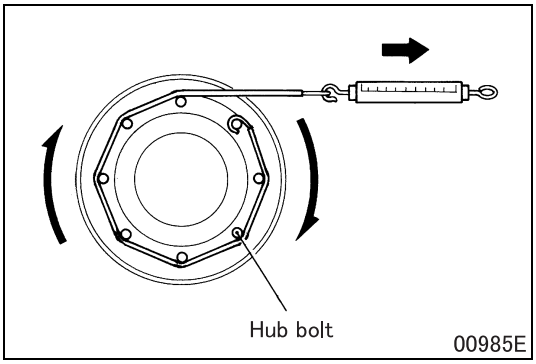


• If the mounting holes of lock nut and lock plate are out of alignment, align them by the procedures shown in the following table.

Lock nut hole position	How to align lock plate hole
Range A	Loosen lock nut and align holes.
Range B	Turn over lock plate, loosen lock nut and align holes.
On line C-C	Turn over lock plate and align holes. (Hole position changes from D´ to D.)



• Perform the following work to pull the outer bearing inner race toward the lock nut side again.
• While rotating the wheel hub and brake drum, tap the end of the axle tube a couple of times.

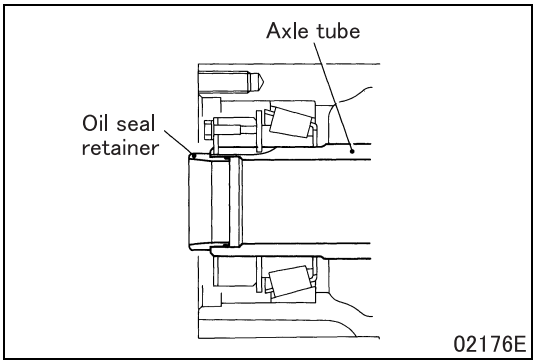


[Inspection]

- After adjustment, install a spring balance around the hub bolts to measure the tangential force.
- If the tangential force meets the specified value, starting torque will become the standard value.
- If the measured tangential force does not meet the standard value, re-adjust the starting torque.
- If tangential force deviates from the nominal value, repeat the operation from the item ★ after.
- If then the result is not satisfactory, replace outer bearings and inner bearings.

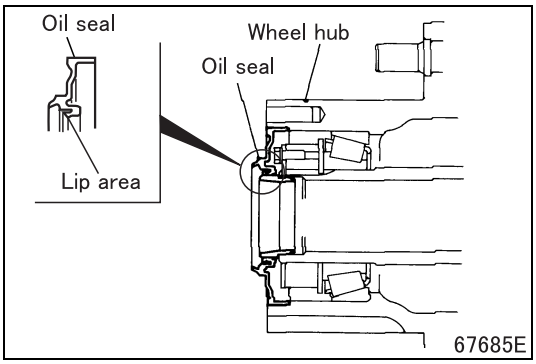
NOTE

- **The starting torque must be measured with installing the oil seal and applying grease on the lip area.**
- **When taking measurements, ensure that there is no drag between the brake lining and drum.**



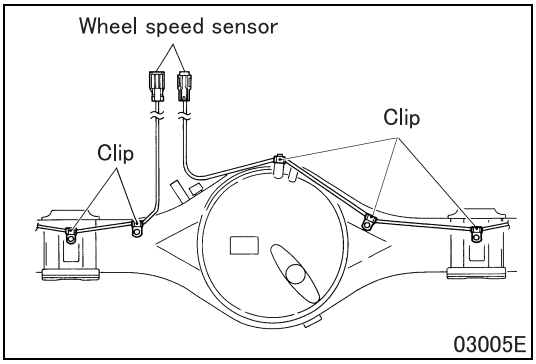
■ Installation: Oil seal retainer <FK>

- Insert the oil seal retainer until it is against the end of the axle tube.



■ Installation: Oil seal <FK>

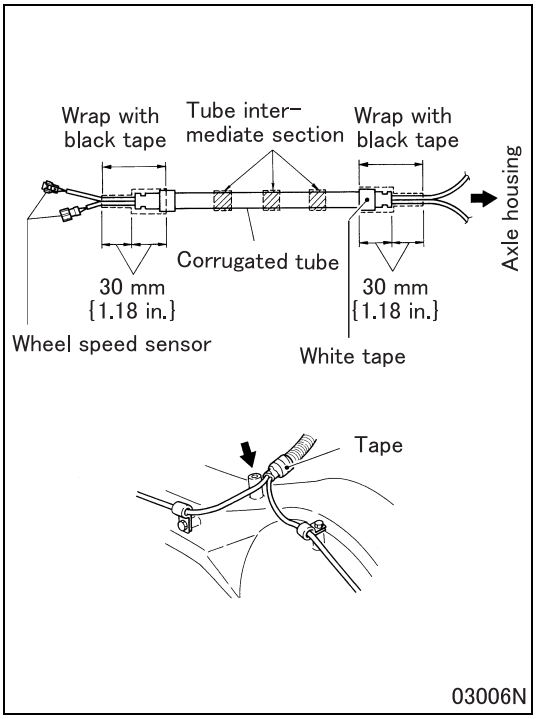
- Apply grease to the lip area of the oil seal and install the oil seal evenly along its periphery against the end of the wheel hub.



■ Installation: Wheel speed sensor harnesses

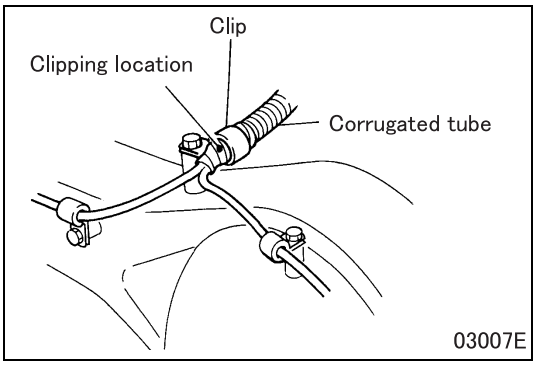
[Clipping harnesses along axle housing]

- Clip the harnesses onto the axle housing, starting from the wheel brakes and along the housing. Ensure that the harnesses are free from interference with other parts, looseness, or kinks.



[Bundling harnesses]

- Bundle the harnesses of the left- and right-hand wheel speed sensors into a corrugated tube.
- Arrange the corrugated tube such that the white-tape portions of the tube are aligned with the clips on the housing. With the tube correctly arranged, face the slit of the corrugated tube down, and wrap both ends of the tube with black tape (designed for harness bundling) in a half lap pattern.
- Additionally wrap the tube with tape at three locations in the tube intermediate section.

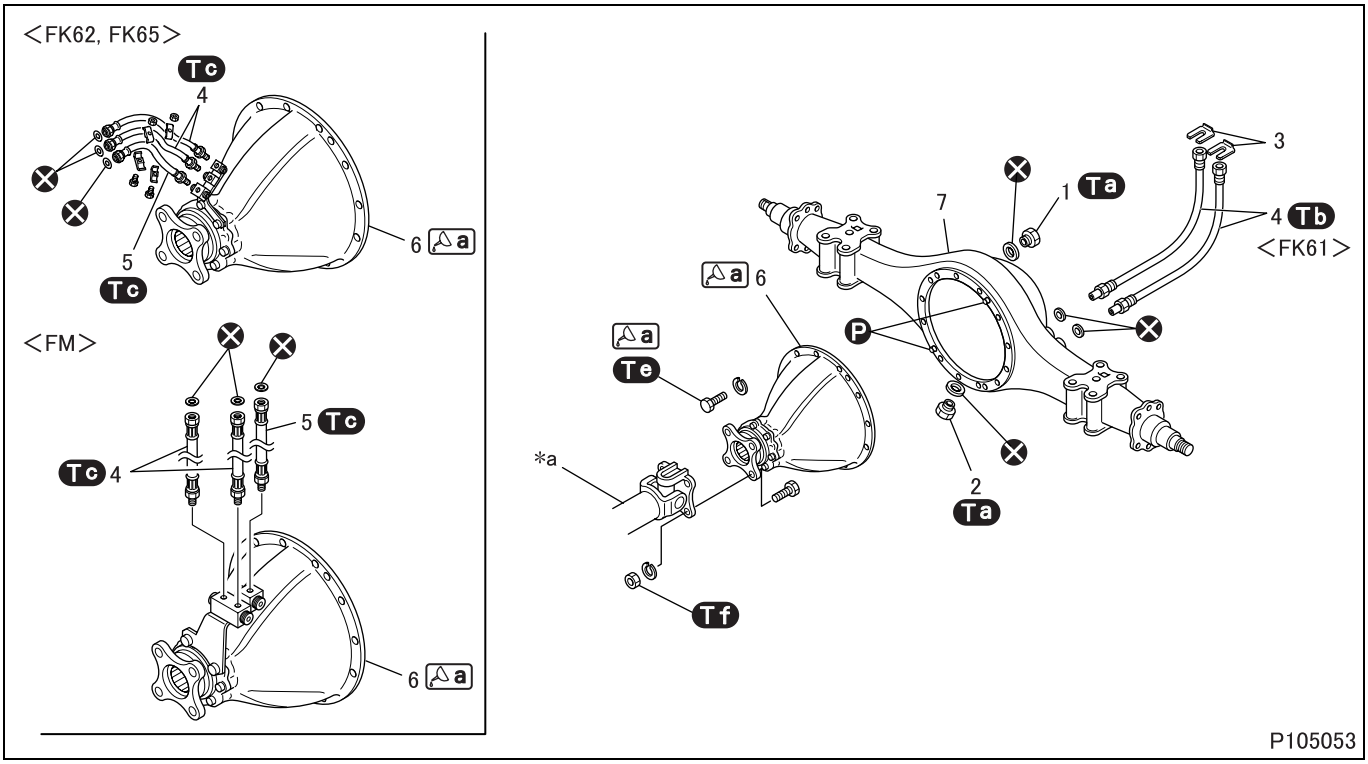


[Fixing harnesses in place]

- Clip the corrugated tube onto the axle housing as shown in the illustration. Also, fix the corrugated tube along the frame using clips.

M E M O

AXLE HOUSING



● **Disassembly sequence**

1 Inspection plug
2 Drain plug
3 Clip <FK61>
4 Brake hose
5 Spring brake hose <FK62, FK65, FM>
6 Reduction and differential (See later section.)
7 Axle housing

***a**: Propeller shaft
Ⓟ: Locating pin
⊗: Non-reusable parts

CAUTION ⚠

- **Plug the brake hoses that have been removed to prevent the ingress of dust and other contaminants.**
- **The suspension parts around the axle housing must be removed. (See Gr34.)**

NOTE

- **Do not remove the axle housing unless defects are evident.**

● **Assembly sequence**

Follow the disassembly sequence in reverse.

NOTE

- **Do not let sealant ooze from the mounting surfaces of reduction and differential.**

Service standards (Unit: mm {in.})

Location	Maintenance item	Standard value	Limit	Remedy
7	Bend of axle housing (B-A)	0.2 {0.0079} or less	2.5 {0.098} or more	Replace

Tightening torque (Unit: N·m {ft.lbs, kgf·m})

Mark	Parts to be tightened		Tightening torque	Remarks
Ta	Inspection plug		110 ± 10 {81 ± 7.4, 11 ± 1}	–
	Drain plug			
Tb	Installation of brake hose (axle housing side)	FK61	21 to 30 {15 to 22, 2.1 to 3.1}	–
Tc	Installation of brake hose (frame side)	FK62, FK65, FM	41.7 ± 2.5 {31 ± 1.8, 4.3 ± 0.3}	–
Te	Bolt (reduction and differential mounting)		98 to 147 {72 to 110, 10 to 15}	–
Tf	Nut (propeller shaft mounting)	P8	70 to 100 {51 to 72, 7.0 to 10}	–
		P10	120 to 180 {87 to 130, 12 to 18}	–
